Process – Mechanical Operation & Maintenance Manual

for the Iqaluit Wastewater Treatment Plant

Iqaluit, Nunavut

Expected Year of Completion: 2020

Original Scope: Design and upgrade existing Wastewater Treatment Plant to meet current and future demands.

This manual has been updated to include:

Date	Description of Change
2018-Dec-20	First Draft – Primary Treatment
2019-Dec-6	Second Draft – Primary Treatment, Secondary Treatment and Solids Handling.
2020-Apr-24	Final Compiled Manual

1. INTRODUCTION

1.1 USE OF THE MANUAL

This manual has been prepared to provide operation and maintenance personnel with a clear and concise understanding of how the Wastewater Treatment Facility operates and the steps which must be followed to keep the facility running safely and efficiently.

The primary goal of this manual and of all personnel operating in and around the Wastewater Treatment Plant is the prevention of personnel injury, fire losses and property damage. To meet this goal, the operation and maintenance program includes:

- Emergency procedures to be followed in the event of spills or accidents.
- Specific operating instructions to be learned and followed at all times to promote safe and efficient operation.
- Routine maintenance of all the facility's systems and structures.
- Detailed inspections of all equipment, facilities, system and structures as well as reporting and correcting any deficiencies.
- Proper record keeping.
- Maintaining a supply of parts, material and equipment necessary to keep the facility running safely and efficiently.

This manual has been divided into 9 chapters.

CHAPTER 1 includes a brief description of the contents of the manual, and a discussion of its proper use.

CHAPTER 2 contains an index of the complete contents of the manual.

CHAPTER 3 provides the background and design data of the facility.

CHAPTER 4 provides functional data and schematic information on the systems for the Facility and Treatment System.

CHAPTER 5 compiles component details

CHAPTER 6 describes procedures to be completed during the operation of the facility.

CHAPTER 7 contains a detailed maintenance manual for the products supplied and installed at the facility.

CHAPTER 8 contains a compilation of all inspection and testing certificates for all products supplied and installed at the facility.

CHAPTER 9 contains contact information for service.

APPENDICES contain construction documents (record drawings, specifications, shop drawings, warranties, equipment operation and maintenance manuals).

Personnel must review and be familiar with all chapters of the manual to ensure that they have a thorough working knowledge of the Wastewater Treatment Plant. This will enable them to turn directly to the correct chapter should a reference be required.

CHAPTER 3

3. BACKGROUND AND DESIGN DATA

3.1 BACKGROUND

3.1.1 Prior Facilities

Wastewater management in Iqaluit dates back to 1964 when a sanitary sewer outfall, made of five pipes, discharged raw sewage directly onto the beaches of the community of Frobisher Bay, as it was called back then. Shoreline discharge of raw sewage lasted for 12 years when the construction of several lift stations provided the means to pump sewage to a macerator system at the head of Koojesse Inlet. At the same time, a holding pond was built on the tidal plain at the head of the inlet. This facility operated successfully for several decades. However, several overflow and breaching events demanded improvements in the earth structures, and the perimeter drainage of the facility.

The lagoon performed well with improvements in the earth structures, and the perimeter drainage of the facility. The lagoon performed well as a primary treatment facility, with a continuous discharge. Effluent quality from the lagoon systems varied significantly over the course of the year because the only process at work in the winter months was sedimentation.

In the early 90's, regulatory expectations prompted the City to complete an engineering feasibility study on improving the treatment system. The first attempt to implement a secondary treatment for Iqaluit was a design-build contract that was awarded in 1998 to a contractor that selected a membrane bioreactor (MBR) process. Unfortunately, the inexperience of the design builder in northern wastewater treatment became evident by mid-1999.

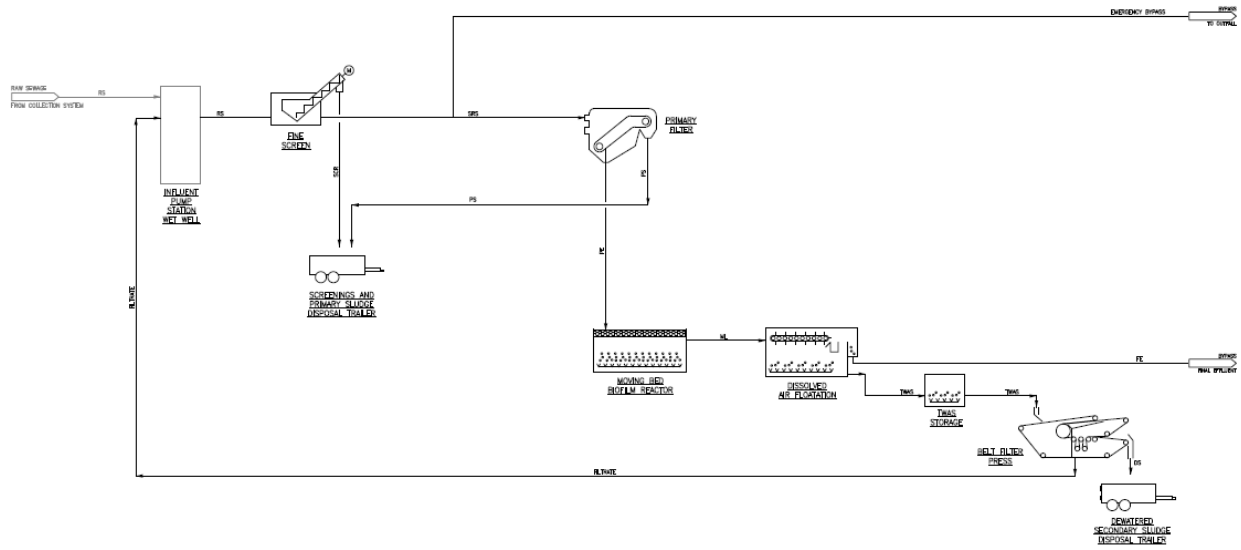
An evaluation of the incomplete sewage treatment plant was performed in 2002 towards conducting remedial work. Phase 1 of the remedial work involved building the primary treatment system in an addition to the original building, and this work was completed in 2006. This process work consisted of an auger screen, and a primary screen (Salsnes Filter or Leap Primary). Phase 2 of the project was to include design and construction of a secondary clarifier to match the hydraulic capacity of the aeration basins. Unfortunately, funding for the project was only sufficient for Phase 1.

The scope of the latest plant project was to upgrade the wastewater treatment plant to meet effluent discharge limits as set out by the Canadian Council of Ministers of the Environment (CCME) Wastewater Systems Effluent Regulation (WSER) regulated federally under the Fisheries Act. The key limits to be met are an effluent concentration of cBOD less than or equal to 20 mg/L and TSS less than or equal to 20 mg/L.

3.1.2 Process Description

The City of Iqaluit's Wastewater Treatment Plant (WWTP) was upgraded to increase treatment capacity and capability to meet more stringent regulatory requirements and service a growing population. The upgraded facility includes preliminary, primary, secondary treatment, as well as a secondary solids dewatering system as indicated in the process flow diagram presented below and on drawing P002 included in Appendix A. The following process units comprise the treatment system:

- Septage Receiving
- Raw Wastewater Storage and Pumping
- Fine Screening and Compaction
- Primary Filtration
- Biological Treatment with Moving Bed Biofilm Reactors (MBBR)
- Mixed Liquor Clarification with Dissolved Air Floatation Units
- Polymer Addition to Mixed Liquor at Inlet of DAF Units
- Thickened Waste Activated Sludge Storage
- Thickened Waste Activated Sludge Dewatering with Belt Filter Press
- Polymer Addition to TWAS at inlet of Belt Filter Press



Process Flow Diagram

3.2 DESIGN DATA

3.2.1 Design Capacity

The City's Planning and Development Department indicated that they expect the population will grow at a slower rate than listed in the 2010 General Plan. Based on this direction, an average annual population growth rate of 1.15% per year was chosen. It is estimated that the Community's population is projected to grow from the estimated 8,315 in 2017 to approximately 10,870 residents by 2041. Based on this consideration, the following table shows the raw wastewater characteristics considered for design:

Design Year		2017 Current	2041Future
Population			
Population	PE	8,315	10,870
Flows			
Average per Capita Flow	m^3/cap/d	0.4	0.4
Average Annual Flow	m^3/d	3,326	4,348
Maximum Month Flow (PF=1.2)	m^3/d	3,991	5,218
Maximum Day Flow (PF=2.0)	m^3/d	6,652	8,696
Peak Hour Flow (PF=3.0)	m^3/d	9,978	13,044
Peak Hour Flow (PF=3.0)	L/s	115	151
Biological Oxygen Demand (BOD)			
Average Day Per Capita Load	kg/cap/d	0.08	0.08
Average Annual Load	kg/d	665	870
Average Annual Concentration	mg/L	200	200
Maximum Month Load (PF=1.2)	kg/d	798	1,044
Chemical Oxygen Demand (COD)			
Average Day Per Capita Load	kg/cap/d	0.16	0.16
Average Annual Load	kg/d	1,315	1,739
Average Annual Concentration	mg/L	400	400
Maximum Month Load (PF=1.2)	kg/d	1,578	2,087
Total Suspended Solids (TSS)			
Average Day Per Capita Load	kg/cap/d	0.08	0.08
Average Annual Load	kg/d	658	870
Average Annual Concentration	mg/L	200	200
Maximum Month Load (PF=1.2)	kg/d	789	1,044
Total Kjeldahl Nitrogen (TKN)			
Average Day Per Capita Load	kg/cap/d	0.017	0.017
Average Annual Load	kg/d	140	185
Average Annual Concentration	mg/L	43	43
Maximum Month Load (PF=1.2)	kg/d	168	222
Total Phosphorus (TP)			
Average Day Per Capita Load	kg/cap/d	0.0025	0.0025
Average Annual Load	kg/d	21	27
Average Annual Concentration	mg/L	6	6
Maximum Month Load (PF=1.2)	kg/d	25	33

3.2.2 Septage Receiving

The City provides wastewater holding tank hauling services to residences which are not connected to the piped wastewater collection system. Holding tanks are pumped out regularly

and the wastewater is currently transported to a rudimentary dump station located upstream of the WWTP, where the wastewater flows by gravity into the WWTP wet well.

3.2.3 Raw Wastewater Pumping

The wet well is located deep below grade and receives flow from two lift stations in the City, which have macerators, and a gravity line which services downtown. From the wet well, raw wastewater is pumped to the screening system by three submersible solids-handling chopper pumps. The following criteria was considered for design:

Parameter	Design Value
Number of Units, Total/Duty	3/2
Type	Submersible Solids Handling Chopper Pump
Design Flow, each, L/s	75.5
Peak Capacity, (two pumps operating) L/s	151
Power, each, kW	19

3.2.4 Fine Screens

Raw wastewater pumped from the wet well is screened through 6 mm-diameter opening fine screens. A hot water spray system is included with the screens to allow for the better management of fats, oils and grease that are present in the collection system. Screenings removed from the screens are washed and compacted and then transferred to the hopper and deposited in the screenings and primary sludge trailer located on the lower level of the Headworks Building for disposal off site. Table 4 provides a summary of the design criteria for the fine screens. Screening equipment functions to remove coarse solids and other large materials in wastewater to enhance downstream treatment and protect equipment. The following criteria was considered for design:

Parameter	Design Value
Number of Units, Total/Duty	2/1
Type	Shaftless Spiral
Design Flow, Annual Average, L/s	50.3
Peak Capacity, each, L/s	151
Opening size, mm	6
Power, kW	1.5

3.2.5 Primary Filters

Screened wastewater coming from the fine screens is directed to the primary filters where wastewater is filtered through fine belts (350 µm opening mesh). The belts are mounted in cartridges inside the filters. The belts rotate continuously on the cartridges during the filtration operation capturing solids out of the incoming wastewater by avoiding the big solids pass through. The filters are also provided with air knifes that clean the solids from the belts. The knifes use compressed air to clean. The air stream is gentle to avoid the solid particles break into smaller pieces. Air cleaning also keeps solids drier for effective dewatering. Air is provided by two positive displacement blowers, one for each primary filter. The filter belt is backwashed with hot water to remove any oil and grease buildup. Solids are dewatered on an integral screw press/compaction zone in the filter and discharged through a chute to the disposal screenings and primary sludge trailer located on the lower level of the Headworks Building for disposal off site. The following criteria was considered for the primary filter design:

Parameter	Design Value
Number of Units, Total/Assist (2041 peak hour flow)	2/1
Design Flow, Average Annual, L/s	50.3
Peak Capacity, each L/s	121
Opening size, microns	350
Auger Power, each kW	0.75
Blower Power each, kW	7.5

3.2.6 Moving Bed Biofilm Reactors (MBBR)

Effluent form the primary filters is conveyed by gravity to the MBBR trains for secondary treatment. MBBR is a submerged attached growth process which uses a conventional bioreactor filled with carrier media suspended in the tank. The carrier media provides a surface for attached growth to take place, while the media is kept suspended and in continuous movement with aeration. Sieves are used to retain the carrier media in the bioreactor tanks, while allowing the treated effluent to flow downstream for further processing. The MBBR system is a single pass system that does not require return activated sludge (RAS) from the solids separation process. Each train is designed to treat 75% of the maximum month ultimate design flow or 45.3 L/s per train. Both MBBR trains operate continuously at the same time. Aeration to the MBBRs is provided by three positive displacement aeration blowers (2 duty/1 stand by) located in the secondary treatment area of the building. The following criteria was considered for design:

Parameter	Design Value
Number of Units	2 MBBR trains (2 aeration cells per train)
Reactor Volume, two trains, m^3	392

Parameter	Design Value
Design Flow, Average Annual, L/s	50.3
Peak Capacity, two trains, L/s	90.6
Air Requirement per MBBR Train, Nm3/hr.	600

3.2.7 Dissolved Air Flotation (DAF) Clarification

The effluent from MBBR trains is clarified by DAF units. Dissolved air is added to the mixed liquor and suspended particles are removed from the liquid stream by bringing the particles to the surface, from where they are skimmed off to a collection tank located inside each DAF unit. The DAF thickens MBBR sludge up to approximately 3 to 4 percent dry solids content in a compact foot print. A dry polymer make-up system is used as aid in the water clarification process. The thickened sludge also called thickened waste activated sludge (TWAS) is pumped from the DAF by the TWAS pumps and stored in the TWAS storage tanks. The DAF units operate continuously in parallel receiving mixed liquor from the MBBR trains. The following criteria was considered for design:

Parameter	Design Value
Number of Units, Duty/Assist	2/1
Design Flow, Annual Average, L/s	50.3
Design Flow Each DAF Unit, (two DAF units operating), L/s	75.5
Hydraulic Capacity Each DAF Unit, (with deterioration of the final effluent quality when only one DAF unit is operational), L/s	151

3.2.8 Solids Dewatering (Belt Filter Press)

The thickened waste activated sludge (TWAS) collected in the TWAS storage tanks is aerated by coarse bubble aeration to keep the solids in suspension and prevent it from turning anaerobic while being stored. Duty/standby solids handling pumps transfer TWAS from the storage tank to the filter press skid for dewatering. A belt filter press uses a perforated belt and mechanical compression to filter and separate the liquid fraction in the sludge from the solids fraction. To accomplish the filtering action under compression, a fabric belt is wound through a series of rollers, in which sludge is fed at the beginning of the belt and "squeezed" by the successive rollers. Once the dewatered cake is scraped from the end of the press, the belt is washed with water to remove residual solids before the belt is returned to the first roller. Flush water is boosted by a booster pump located within the belt filter press skid. Liquid waste from the belt filter press is returned to the influent wet well of the process for treatment. The press belt tracking and tensioning systems are pneumatic. Air is provided by a compressor installed in the skid. A dry

polymer make-up system is used as aid in the TWAS dewatering process. The following criteria was considered for design:

Parameter	Design Value
Number of Units, Duty/Total	1/1
Feed Solids Concentration, %TS	3 - 4
Discharge Solids Concentration, %TS	15 – 19 (estimated)
Design Dry Solids Loading, kg/h	218
Design Flow, m^3/h	7.3
Polymer Dosage, kg/tonne dry solids	3 to 10
Gear Drive Belt Motor, kW	0.75
Compressor Motor, kW	1.5
Booster Pump Motor, kW	5.5

3.2.9 Effluent

Secondary effluent from the DAF units is conducted by an underground pipeline to the final destination. The secondary effluent flows through the retention channel, under an underflow weir (to contain any floatable flammables), then over an overflow weir and finally out through the outfall piping located just above the high-water mark of Frobisher Bay.

3.2.10 Sludge

The screenings from the fine screens and primary sludge from the primary filters discharge into the screenings and primary sludge trailer which for disposal off site.

Dewatered sludge from the belt filter press is discharged in the secondary sludge disposal trailer for disposal off site.

3.3 PROCESS COMMODITIES

The following table identifies the process streams and abbreviations used in the contract documents.

Commodities	Abbreviation
Raw sewage	RS
Screened raw sewage	SRS
Primary effluent	PE
Mixed liquor	ML

Commodities	Abbreviation
DAF subnatant	DSUB
Secondary effluent	SE
Final effluent	FE
Filtrate	FIL
Screenings	SCR
Dewatered primary Sludge	DPS
Waste activated sludge	WAS
Thickened waste activated sludge	TWAS
Dewatered secondary sludge	DWS

END OF CHAPTER 3

CHAPTER 4

4. SCHEMATICS AND FUNCTIONAL DATA

4.1 GENERAL

The following tables describe the location of components of the various systems and the function that each performs. Drawings are referenced for each portion of the wastewater treatment plant.

4.2 RAW WASTEWATER FLOW

(Refer to Drawing P-604 in Appendix A)

The following table identifies the components related to the flow of wastewater from the influent pump station wet well to the fine screens.

No.	Component	Location	Function Performed	Remarks
1	Influent Pump Station Wet Well (T-01-001)	Headworks	Raw influent storage	
2	Raw Wastewater Pump (P-01-110)	Headworks – Influent Pump Station Wet Well	Raw wastewater pumping to the fine screens (On a VFD)	Plant Control System Controlled
3	Raw Wastewater Pump (P-01-120)	Headworks – Influent Pump Station Wet Well	Raw wastewater pumping to the fine screens (On a VFD)	Plant Control System Controlled
4	Raw Wastewater Pump (P-01-130)	Headworks – Influent Pump Station Wet Well	Raw wastewater pumping to the fine screens (On a VFD)	Plant Control System Controlled
5	Check Valve (CV-01-111)	On 200 mm Dia. Raw Sewage Pipeline from the Influent Pump Station Wet Well	Stops back flow of Raw Sewage into the Influent Pump Station Wet Well	
6	Check Valve (CV-01-112)	On 200 mm Dia. Raw Sewage Pipeline from the Influent Pump Station Wet Well	Stops back flow of Raw Sewage into the Influent Pump Station Wet Well	
7	Check Valve (CV-01-113)	On 200 mm Dia. Raw Sewage Pipeline from the Influent Pump Station Wet Well	Stops back flow of Raw Sewage into the Influent Pump Station Wet Well	

No.	Component	Location	Function Performed	Remarks
8	Plug Valve (PLV-01-111)	On 200 mm Dia. Raw Sewage Pipeline from the Influent Pump Station Wet Well	Isolates discharge of Raw Wastewater Pump P-01-110	Normally open
9	Plug Valve (PLV-01-112)	On 200 mm Dia. Raw Sewage Pipeline from the Influent Pump Station Wet Well	Isolates discharge of Raw Wastewater Pump P-01-120	Normally open
10	Plug Valve (PLV-01-113)	On 200 mm Dia. Raw Sewage Pipeline from the Influent Pump Station Wet Well	Isolates discharge of Raw Wastewater Pump P-01-130	Normally open
11	Air/Vacuum Release Valve (ARV-01-100)	On 250 mm Dia. Raw Sewage Pipeline from the Influent Pump Station Wet Well	Release air/vacuum in the influent Raw Sewage pipeline	Normally closed.
12	Flow Meter (FQIT-150, FM-01-150)	On 200 mm Dia. Raw Sewage Pipeline from the Influent Pump Station Wet Well	Measures influent Raw Sewage Flow to the Plant	Signal to Plant Control System
13	Level Indicating Transmitter (LIT-100)	On Influent Pump Station Wet Well	Indicates the Raw Sewage level in the Pump Station Wet Well	Signal to Plant Control System
14	Level Switch (LSLL-111)	On Influent Pump Station Wet Well	Indicates the low low raw sewage level in the Pump Station Wet Well	Signal to Plant Control System
15	Level Switch (LSL-112)	On Influent Pump Station Wet Well	Indicates the low raw sewage level in the Pump Station Wet Well	Signal to Plant Control System
16	Level Switch (LSH-113)	On Influent Pump Station Wet Well	Indicates the high raw sewage level in the Pump Station Wet Well	Signal to Plant Control System
17	Level Switch (LSHH-114)	On Influent Pump Station Wet Well	Indicates the high high raw sewage level in the Pump Station Wet Well	Signal to Plant Control System

4.3 FINE SCREENS

(Refer to Drawing P-605 in Appendix A)

The following table identifies the components related to the flow of wastewater through the fine screens.

No.	Component	Location	Function Performed	Remarks
1	Motorized Knife Gate Valve (KV-01-211)	Headworks Upper Floor	Isolates Fine Screen SCRN-01-210 upstream	Normally Open if screen operating
2	Knife Gate Valve (KV-01-212)	Headworks Upper Floor	Isolates Fine Screen SCRN-01-210 downstream	Normally Open if screen operating
3	Fine Screen (SCRN-01-210)	Headworks Upper Floor	Spiral fine screening of the raw sewage	Plant Control System Controlled
4	Level Indicating Transmitter (LIT-211)	Mounted on Fine Screen SCRN-01-210 tankage	Indicates the raw sewage level in Fine Screen SCRN-01-210	Plant Control System Controlled
5	Pressure Regulating Valve (PRV-01-110)	Headworks Upper Floor	Regulates pressure of screen's wash water	Normally open
6	Ball Valve (BV-01-112)	Mounted on Fine Screen SCRN-01-210 tankage	Isolates the flow of wash water to Fine Screen SCRN-01-210 tank	Normally Open
7	Ball Valve (BV-01-123)	Mounted on Fine Screen SCRN-01-210 tankage	Isolates the flow of wash water to Fine Screen SCRN-01-210 compactor	Normally Open
8	Solenoid Valve (SV-01-120)	Mounted on Fine Screen SCRN-01-210 tankage	Controls the flow of wash water to Fine Screen SCRN-01-210 tank	Plant Control System Controlled
9	Solenoid Valve (SV-01-122)	Mounted on Fine Screen SCRN-01-210 tankage	Controls the flow of wash water to Fine Screen SCRN-01-210 compactor	Plant Control System Controlled
10	Motorized Knife Gate Valve (KV-01-221)	Headworks Upper Floor	Isolates Fine Screen SCRN01-220 upstream	Normally Open if screen operating
11	Knife Gate Valve (KV-01-222)	Headworks Upper Floor	Isolates Fine Screen SCRN01-220 downstream	Normally Open if screen operating
12	Fine Screen (SCRN-01-220)	Headworks Upper Floor	Spiral Fine screening of the raw sewage	Plant Control System Controlled
13	Level Indicating Transmitter (LIT-221)	Mounted on Fine Screen SCRN-01-220 tankage	Indicates the raw sewage level in Fine Screen SCRN-01-220	Signal to Plant Control System

No.	Component	Location	Function Performed	Remarks
14	Ball Valve (BV-01-114)	Mounted on Fine Screen SCRN-01-220 tankage	Isolates the flow of wash water to Fine Screen SCRN-01-220	Normally Open
15	Ball Valve (BV-01-127)	Mounted on Fine Screen SCRN-01-220 tankage	Isolates the flow of wash water to Fine Screen SCRN-01-220 compactor	Normally Open
16	Solenoid Valve (SV-01-124)	Mounted on Fine Screen SCRN-01-220 tankage	Controls the flow of wash water to Fine Screen SCRN-01-220 tank	Plant Control System Controlled
17	Solenoid Valve (SV-01-126)	Mounted on Fine Screen SCRN-01-220 tankage	Controls the flow of wash water to Fine Screen SCRN-01-220 compactor	Plant Control System Controlled
18	Motorized Knife Gate Valve (KV-01-112)	Headworks Lower Floor	Controls screening discharge to the Screenings and Primary Sludge Trailer	Normally Closed. Operated by Operator as required.
19	Motorized Knife Gate Valve (KV-01-112A)	Headworks Lower Floor	Controls primary dewatered solids discharge to the Screenings and Primary Sludge Trailer	Normally Closed. Operated by Operator as required.
20	Knife Gate Valve (KV-01-232)	Headworks Upper Floor	Cross connection of Screened Sewage at Fine Screens effluent	Normally Closed

4.4 PRIMARY FILTRATION

(Refer to Drawing P-606, P-607, and P-608 in Appendix A)

The following table identifies the components related to the flow of wastewater through the primary filters.

No.	Component	Location	Function Performed	Remarks
1	Motorized Knife Gate Valve (KV-01-111, FV-111)	Headworks Upper Floor	Controls screened sewage flow to Primary Filter PF-01-310	Plant Control System Controlled
2	Primary Filter Belt PF-01-310	Headworks Upper Floor	Retains suspended solids from screened sewage	Plant Control System Controlled
3	Primary Filter Screw Press SP-01-330	Headworks Upper Floor	Compresses and dewaters primary sludge	Plant Control System Controlled
4	Ball Valve Influent Sampling Port	Headworks Upper Floor	Primary Filter PF-01-310 influent sampling port	Normally Closed

No.	Component	Location	Function Performed	Remarks
5	Ball Valve Effluent Sampling Port	Headworks Upper Floor	Primary Filter PF-01-310 effluent sampling port	Normally Closed
6	Solenoid Valve (PLV-01-113)	Headworks Upper Floor	Allows flow of Primary Filter PF-01-310 drain to Influent Pumps Station Wet Well	Plant Control System Controlled
7	Ball Valve (BV-01-310)	Headworks Upper Floor	Isolates hot non-potable wash water to Primary Filter PF-01-310/320	Normally Open
8	Pressure Regulating Valve (PRV-01-311)	Headworks Upper Floor	Regulates pressure of hot non-potable wash water line to Primary Filter PF-01-310/320	Normally Open
9	Ball Valve (BV-01-314)	Headworks Upper Floor	Isolates hot non-potable wash water to Primary Filter PF-01-310	Normally Open
10	Solenoid Valve (SV-01-312)	Headworks Upper Floor	Controls flow of hot non-potable wash water to Primary Filter PF-01-310 & screw press SP-01-330	Plant Control System Controlled
11	Ball Valve (BV-01-320)	Headworks Upper Floor	Isolates cold non-potable wash water to Primary Filters PF-01-310/320	Normally Open
12	Pressure Regulating Valve (PRV-01-321)	Headworks Upper Floor	Regulates pressure of cold non-potable wash water to Primary Filters PF-01-310/320	Normally Open
13	Ball Valve (BV-01-324)	Headworks Upper Floor	Isolates flow of cold non-potable wash water to Primary Filter PF-01-310	Normally Open
14	Solenoid Valve (SV-01-322)	Headworks Upper Floor	Controls flow of cold non-potable wash water to Primary Filter PF-01-310	Plant Control System Controlled
15	Motorized Knife Gate Valve (KV-01-121, FV-121)	Headworks Upper Floor	Controls screened sewage flow to Primary Filter PF-01-320	Plant Control System Controlled
16	Primary Filter Belt PF-01-320	Headworks Upper Floor	Retains suspended solids from screened sewage	Plant Control System Controlled
17	Primary Filter Screw Press SP-01-340	Headworks Upper Floor	Compresses and dewaters primary sludge	Plant Control System Controlled
18	Ball Valve Influent Sampling Port	Headworks Upper Floor	Primary Filter PF-01-320 influent sampling port	Normally Closed
19	Ball Valve Effluent Sampling Port	Headworks Upper Floor	Primary Filter PF-01-320 effluent sampling port	Normally Closed

No.	Component	Location	Function Performed	Remarks
20	Solenoid Valve (PLV-01-123)	Headworks Upper Floor	Allows flow of Primary Filter PF-01-320 drain to Influent Pumps Station Wet Well	Plant Control System Controlled
21	Ball Valve (BV-01-315)	Headworks Upper Floor	Isolates hot non-potable wash water to Primary Filter PF-01-320	Normally Open
22	Solenoid Valve (SV-01-313)	Headworks Upper Floor	Controls flow of hot non-potable wash water to Primary Filter PF-01-320 & Screw Press SP-01-340	Plant Control System Controlled
23	Ball Valve (BV-01-325)	Headworks Upper Floor	Isolates flow of cold non-potable wash water to Primary Filter PF-01-320	Normally Open
24	Solenoid Valve (SV-01-323)	Headworks Upper Floor	Controls flow of cold non-potable wash water to Primary Filter PF-01-320	Plant Control System Controlled
25	Motorized Knife Gate Valve (KV-01-001, FV-001)	Headworks Upper Floor	Diverts primary effluent to outfall	Plant Control System Controlled
26	Headworks Bridge Crane Hoist	Headworks Upper Floor	Lifts Primary Filter cartridges for maintenance	Manually Operated
27	Primary Filter Blower (B-02-210)	Secondary Treatment – Above MBBR trains	Supplies air to Primary Filter PF-01-310 air knife valve	Plant Control System Controlled
28	Primary Filter Blower Fan (F-02-215)	Inside Primary Filter Blower PF-01-210 enclosure	Supplies air to Primary Filter Blower PF-01-210 enclosure	Plant Control System Controlled
29	Air Filter (AF-02-212)	Inside Primary Filter Blower PF-01-210 enclosure	Filtrates air at suction of Primary Filter Blower PF-01-210	
30	Silencer (SLR-02-213)	Inside Primary Filter Blower PF-01-210 enclosure	Reduces noise at suction of Primary Filter Blower PF-01-210	
31	Silencer (SLR-02-214)	Inside Primary Filter Blower PF-01-210 enclosure	Reduces noise at discharge of Primary Filter Blower PF-01-210	
32	Pressure Indicator (PI-02-217)	Inside Primary Filter Blower PF-01-210 enclosure	Indicates pressure at discharge of Primary Filter Blower PF-01-210	
33	Check Valve (CV-02-215)	Inside Primary Filter Blower PF-01-210 enclosure	Prevents air back flow to Primary Filter Blower PF-01-210	

No.	Component	Location	Function Performed	Remarks
34	Ball Valve (BV-02-219)	Inside Primary Filter Blower PF-01-210 enclosure	Isolates instrument PI-02-217	Normally Open
35	Pressure Safety Valve (PSV-02-218)	Inside Primary Filter Blower PF-01-210 enclosure	Release excessive air pressure at discharge of Primary Filter Blower PF-01-210	
36	Primary Filter Blower (B-02-220)	Secondary Treatment – Above MBBR trains	Supplies air to Primary Filter PF-01-312 air knife valve	Plant Control System Controlled
37	Primary Filter Blower Fan (F-02-225)	Inside primary Filter Blower PF-01-220 enclosure	Supplies air to primary filter blower PF-01-220 enclosure	Plant Control System Controlled
38	Air Filter (AF-02-222)	Inside primary Filter Blower PF-01-220 enclosure	Filtrates air at suction of Primary Filter Blower PF-01-220	
39	Silencer (SLR-02-223)	Inside primary Filter Blower PF-01-220 enclosure	Reduces noise at suction of Primary Filter Blower PF-01-220 enclosure	
40	Silencer (SLR-02-224)	Inside primary Filter Blower PF-01-220 enclosure	Reduces noise at discharge of Primary Filter Blower PF-01-220 enclosure	
41	Pressure Indicator (PI-02-227)	Inside primary Filter Blower PF-01-220 enclosure	Indicates pressure at discharge of Primary Filter Blower PF-01-220	
42	Butterfly Valve (BFV-02-216)	Secondary Treatment – Above MBBR trains	Isolates process air discharge from Primary Filter Blower B-02-210	Normally Open
43	Butterfly Valve (BFV-02-226)	Secondary Treatment – Above MBBR trains	Isolates process air discharge from Primary Filter Blower B-02-220	Normally Open
44	Check Valve (CV-02-225)	Inside primary Filter Blower PF-01-220 enclosure	Prevents air back flow to Primary Filter Blower PF-01-220	
45	Ball Valve (BV-02-229)	Inside primary Filter Blower PF-01-220 enclosure	Isolates instrument PI-02-217	Normally Open
46	Pressure Safety Valve (PSV-02-228)	Inside primary Filter Blower PF-01-220 enclosure	Release excessive air pressure at discharge of Primary Filter Blower PF-01-220	

4.5 SECONDARY TREATMENT

4.5.1 Aeration Blowers

(Refer to Drawing P-609 in Appendix A)

The following table identifies the components related to the aeration blower system that provides air to the secondary system.

No.	Component	Location	Function Performed	Remarks
1	Air Filter (AF-02-112)	Inside Process Aeration Blower B-02-110 enclosure	Filters suction air to Process Aeration Blower B-02-110	
2	Silencer (SLR-02-113)	Inside Process Aeration Blower B-02-110 enclosure	Reduces noise at suction of Process Aeration Blower B-02-110	
3	Pressure Indicator (PI-107)	Inside Process Aeration Blower B-02-110 enclosure	Indicates air pressure at suction of Process Aeration Blower B-02-110	
4	Pressure Switch (PSL-108)	Inside Process Aeration Blower B-02-110 enclosure	Transmits air pressure at suction of Process Aeration Blower B-02-110	Signal to Plant Control System
5	Ball Valve (BV-02-106)	Inside Process Aeration Blower B-02-110 enclosure	Isolates instrument PI-107/108	Normally Open
6	Process Aeration Blower (B-02-110)	Secondary Treatment - Upper	Supplies air to MBBR trains, TWAS Storage Tanks and DAF units	Plant Control System Controlled
7	Silencer (SLR-02-114)	Inside Process Aeration Blower B-02-110 enclosure	Reduces noise at discharge of Process Aeration Blower B-02-110	
8	Pressure Safety Valve (PSV-02-117)	Inside Process Aeration Blower B-02-110 enclosure	Release excessive air pressure at discharge of Process Aeration Blower B-02-110	
9	Ball Valve (BV-02-116)	Inside Process Aeration Blower B-02-110 enclosure	Isolates instrument PI-117/118	Normally Open
10	Pressure Indicator (PI-02-117)	Inside Process Aeration Blower B-02-110 enclosure	Indicates air pressure at discharge of Process Aeration Blower B-02-110	
11	Pressure Switch (PSL-02-118)	Inside Process Aeration Blower B-02-110 enclosure	Transmits air pressure at discharge of Process Aeration Blower B-02-110	Signal to Plant Control System
12	Temperature Indicator (TI-02-119)	Inside Process Aeration Blower B-02-110 enclosure	Indicates air temperature at discharge of Process Aeration Blower B-02-110	

No.	Component	Location	Function Performed	Remarks
13	Temperature Switch (TI-02-120)	Inside Process Aeration Blower B-02-110 enclosure	Air temperature at discharge of Process Aeration Blower B-02-110	
14	Temperature Switch (TI-02-180)	Secondary Treatment - Upper	Air temperature at Process Aeration Blower B-02-110 enclosure	Signal to Plant Control System
15	Check Valve (CV-02-115)	Inside Process Aeration Blower B-02-110 enclosure	Prevent air backflow to Process Aeration Blower B-02-110	
16	Butterfly Valve (BFV-02-116)	Secondary Treatment - Upper	Isolates Process Aeration Blower B-02-110 downstream	
17	Air Filter (AF-02-122)	Inside Process Aeration Blower B-02-120 enclosure	Filters suction air to Process Aeration Blower B-02-120	
18	Silencer (SLR-02-123)	Inside Process Aeration Blower B-02-120 enclosure	Reduces noise at suction of Process Aeration Blower B-02-120	
19	Ball Valve (BV-02-141)	Inside Process Aeration Blower B-02-120 enclosure	Isolates instrument PI-142/143	
20	Pressure Indicator (PI-02-142)	Inside Process Aeration Blower B-02-120 enclosure	Indicates air pressure at suction of Process Aeration Blower B-02-120	
21	Pressure Switch (PSL-02-143)	Inside Process Aeration Blower B-02-120 enclosure	Transmits air pressure at suction of Process Aeration Blower B-02-120	Signal to Plant Control System
22	Process Aeration Blower (B-02-120)	Secondary Treatment - Upper	Supplies air to MBBR trains, TWAS Storage Tanks and DAF units	Plant Control System Controlled
23	Silencer (SLR-02-124)	Inside Process Aeration Blower B-02-120 enclosure	Reduces noise at discharge of Process Aeration Blower B-02-120	
24	Pressure Safety Valve (PSV-02-127)	Inside Process Aeration Blower B-02-120 enclosure	Release excessive air pressure at discharge of Process Aeration Blower B-02-120	
25	Ball Valve (BV-02-126)	Inside Process Aeration Blower B-02-120 enclosure	Isolates instrument PI-127/128	
26	Pressure Indicator (PI-02-127)	Inside Process Aeration Blower B-02-120 enclosure	Indicates air pressure at discharge of Process Aeration Blower B-02-120	
27	Pressure Switch (PSL-02-128)	Inside Process Aeration Blower B-02-120 enclosure	Transmits air pressure at discharge of Process Aeration Blower B-02-120	Signal to Plant Control System

No.	Component	Location	Function Performed	Remarks
28	Temperature Indicator (TI-02-129)	Inside Process Aeration Blower B-02-120 enclosure	Indicates air temperature at discharge of Process Aeration Blower B-02-120	
29	Temperature Switch (TI-02-130)	Inside Process Aeration Blower B-02-120 enclosure	Air temperature at discharge of Process Aeration Blower B-02-120	
30	Temperature Switch (TI-02-185)	Secondary Treatment - Upper	Air temperature at Process Aeration Blower B-02-120 enclosure	Signal to Plant Control System
31	Check Valve (CV-02-125)	Inside Process Aeration Blower B-02-120 enclosure	Prevent air backflow to Process Aeration Blower B-02-120	
32	Butterfly Valve (BFV-02-126)	Secondary Treatment - Upper	Isolates Process Aeration Blower B-02-120 downstream	
33	Air Filter (AF-02-132)	Inside Process Aeration Blower B-02-130 enclosure	Filters suction air to Process Aeration Blower B-02-130	
34	Silencer (SLR-02-133)	Inside Process Aeration Blower B-02-130 enclosure	Reduces noise at suction of Process Aeration Blower B-02-130	
35	Ball Valve (BV-02-144)	Inside Process Aeration Blower B-02-130 enclosure	Isolates instrument PI-145/146	
36	Pressure Indicator (PI-02-145)	Inside Process Aeration Blower B-02-130 enclosure	Indicates air pressure at suction of Process Aeration Blower B-02-130	
37	Pressure Switch (PSL-02-146)	Inside Process Aeration Blower B-02-130 enclosure	Transmits air pressure at suction of Process Aeration Blower B-02-130	Signal to Plant Control System
38	Process Aeration Blower (B-02-130)	Secondary Treatment - Upper	Supplies air to MBBR trains, TWAS Storage Tanks and DAF units	Plant Control System Controlled
39	Silencer (SLR-02-134)	Inside Process Aeration Blower B-02-130 enclosure	Reduces noise at discharge of Process Aeration Blower B-02-130	
40	Pressure Safety Valve (PSV-02-137)	Inside Process Aeration Blower B-02-130 enclosure	Release excessive air pressure at discharge of Process Aeration Blower B-02-130	
41	Ball Valve (BV-02-136)	Inside Process Aeration Blower B-02-130 enclosure	Isolates instrument PI-137/138	
42	Pressure Indicator (PI-02-137)	Inside Process Aeration Blower B-02-130 enclosure	Indicates air pressure at discharge of Process Aeration Blower B-02-130	

No.	Component	Location	Function Performed	Remarks
43	Pressure Switch (PSL-02-138)	Inside Process Aeration Blower B-02-130 enclosure	Transmits air pressure at discharge of Process Aeration Blower B-02-130	Signal to Plant Control System
44	Temperature Indicator (TI-02-139)	Inside Process Aeration Blower B-02-130 enclosure	Indicates air temperature at discharge of Process Aeration Blower B-02-130	
45	Temperature Switch (TI-02-140)	Inside Process Aeration Blower B-02-130 enclosure	Air temperature at discharge of Process Aeration Blower B-02-130	
46	Temperature Switch (TI-02-190)	Secondary Treatment - Upper	Air temperature at Process Aeration Blower B-02-130 enclosure	Signal to Plant Control System
47	Check Valve (CV-02-135)	Inside Process Aeration Blower B-02-130 enclosure	Prevent air backflow to Process Aeration Blower B-02-130	
48	Butterfly Valve (BFV-02-136)	Secondary Treatment - Upper	Isolates Process Aeration Blower B-02-130 downstream	
49	Pressure transmitter (PIT-02-195)	Secondary Treatment - Upper	Indicates air pressure from blower discharge header	Signal to Plant Control System
50	Butterfly Valve (BFV-02-151)	Secondary Treatment - Upper	Isolates air supply to MBBR2	Normally open
51	Motorized Butterfly Valve (BFV-02-150)	Secondary Treatment - Upper	Controls air flow to MBBR2	Plant Control System Controlled
52	Flow meter (FM-02-152, FE-02-152)	Secondary Treatment - Upper	Measures air flow to MBBR2	Signal to Plant Control System
53	Butterfly Valve (BFV-02-153)	Secondary Treatment - Upper	Isolates air supply to MBBR1	Normally open
54	Motorized Butterfly Valve (BFV-02-155)	Secondary Treatment - Upper	Controls air flow to MBBR1	Plant Control System Controlled
55	Flow meter (FM-02-156, FE-02-156)	Secondary Treatment - Upper	Measures air supply to MBBR1	Signal to Plant Control System
56	Butterfly Valve (BFV-02-171)	Secondary Treatment - Upper	Isolates air supply to TWAS Tanks	Normally open
57	Motorized Butterfly Valve (BFV-02-170)	Secondary Treatment - Upper	Controls air flow to TWAS Storage Tanks	Plant Control System Controlled
58	Flow meter (FM-02-172, FE-02-172)	Secondary Treatment - Upper	Measures air flow to TWAS Storage Tanks	Signal to Plant Control System

4.5.2 Moving Bed Bioreactors (MBBR)

(Refer to Drawing P-610 in Appendix A)

The following table identifies the components related to Moving Bed Bioreactor (MBBR) trains.

No.	Component	Location	Function Performed	Remarks
1	Motorized Knife Gate Valve (KV-02-211, FV-211)	Secondary Treatment - Lower	Controls primary effluent flow to MBBR T-02-210	Plant Control System Controlled
2	MBBR 1 (T-02-210)	Secondary Treatment - Lower	Oxidases organic matter	Plant Control System Controlled
3	Dissolved Oxygen Analyzers (AIT-02-211)	Mounted in the MBBR tank T-02-210 Cell 1	Measures dissolved oxygen concentration in MBBR1 Cell 1	Signal to Plant Control System
4	Dissolved Oxygen Analyzers (AIT-02-212)	Mounted in the MBBR tank T-02-210 Cell 2	Measures dissolved oxygen concentration in MBBR1 Cell 1	Signal to Plant Control System
5	Level Switch High (LSH-02-213)	Mounted in the MBBR tank T-02-210 Cell 1	Senses high water level in MBBR1 Cell1	Signal to Plant Control System
6	Level Switch High (LSH-02-214)	Mounted in the MBBR tank T-02-210 Cell 2	Senses high water level in MBBR1 Cell2	Signal to Plant Control System
7	Butterfly Valve (BFV-02-181)	Secondary Treatment - Lower	Isolates airflow to MBBR tank T-02-210	Manually Operated
8	Butterfly Valve (BFV-02-182)	Secondary Treatment - Lower	Isolates airflow to MBBR tank T-02-210	Manually Operated
9	Butterfly Valve (BFV-02-183)	Secondary Treatment - Lower	Isolates airflow to MBBR tank T-02-210	Manually Operated
10	Butterfly Valve (BFV-02-184)	Secondary Treatment - Lower	Isolates airflow to MBBR tank T-02-210	Manually Operated
11	Motorized Knife Gate Valve (KV-02-221, FV-221)	Secondary Treatment - Lower	Controls primary effluent flow to MBBR T-02-220	Plant Control System Controlled
12	MBBR 2 (T-02-220)	Secondary Treatment - Lower	oxidases organic matter	Plant Control System Controlled
13	Dissolved Oxygen Analyzers (AIT-02-221)	Mounted in the MBBR tank T-02-220	Measures dissolved oxygen concentration in MBBR2	Signal to Plant Control System
14	Dissolved Oxygen Analyzers (AIT-02-222)	Mounted in the MBBR tank T-02-220	Measures dissolved oxygen concentration in MBBR2	Signal to Plant Control System
15	Level Switch High (LSH-02-223)	Mounted in the MBBR tank T-02-220 Cell 1	Senses high water level in MBBR2 Cell1	Signal to Plant Control System
16	Level Switch High (LSH-02-224)	Mounted in the MBBR tank T-02-220 Cell 2	Senses high water level in MBBR2 Cell 2	Signal to Plant Control System
17	Butterfly Valve (BFV-02-191)	Secondary Treatment - Lower	Isolates airflow to MBBR tank T-02-220	Manually Operated

No.	Component	Location	Function Performed	Remarks
18	Butterfly Valve (BFV-02-192)	Secondary Treatment - Lower	Isolates airflow to MBBR tank T-02-220	Manually Operated
19	Butterfly Valve (BFV-02-193)	Secondary Treatment - Lower	Isolates airflow to MBBR tank T-02-220	Manually Operated
20	Butterfly Valve (BFV-02-194)	Secondary Treatment - Lower	Isolates airflow to MBBR tank T-02-220	Manually Operated
21	Knife Gate Valve (KV-02-230, FV-230)	Secondary Treatment - Lower	Directs mixed liquor from MBBR trains to any of the DAF units	Manually Operated, Normally Closed

4.5.3 Dissolved Air Flotation (DAF) Clarification #1

(Refer to Drawing P-611 and P-612 in Appendix A)

The following table identifies the components related to Dissolved Air Flotation Clarification system #1.

No.	Component	Location	Function performed	Remarks
1	Motorized Valve (BFV-02-312, FV-312)	Secondary Treatment - Lower	Controls mixed liquor flow to DAF unit T02-310	Plant Control System Controlled
2	Ball Valve (BV-02-313)	Secondary Treatment - Lower	Isolates DAF subnatant recirculation to the entry zone	
3	Motorized Butterfly Valve (BFV-02-625, FV-625)	Secondary Treatment - Lower	Isolates DAF subnatant recirculation to the white-water injection zone	
4	DAF Tank 1 (T-02-310)	Secondary Treatment - Lower	Mixed liquor clarification and secondary sludge thickening	Plant Control System Controlled
5	DAF 1 Sludge Scraper (DDR-02-311)	Secondary Treatment - Lower	Removes thickened sludge from the flotation zone to the sludge collection zone	Plant Control System Controlled
6	Level Transmitter (LIT-02-331)	Mounted inside the DAF Tank	Senses mixed liquor level in the flotation zone	Signal to Plant Control System
7	Level Switch (LSH-02-332)	Mounted inside the DAF Tank	Senses sludge high level in the sludge collection zone	Signal to Plant Control System
8	Level Switch (LSL-02-333)	Mounted inside the DAF Tank	Senses sludge low level in the sludge collection zone	Signal to Plant Control System
9	TSS Analyzer (AIT-02-334)	Mounted inside the DAF Tank	Senses TSS in the clarified water evacuation zone	Signal to Plant Control System

No.	Component	Location	Function performed	Remarks
10	Butterfly Valve (BFV-02-165)	Secondary Treatment - Lower	Isolates air flow to DAF unit T-02-310 for solids mixing	Manual Operation. Normally closed
11	Butterfly Valve (BFV-02-166)	Secondary Treatment - Lower	Isolates air flow to DAF Unit T-02-310 for solids mixing	Manual Operation Normally closed
12	Butterfly Valve (BFV-02-170)	Secondary Treatment - Lower	Isolates air flow to DAF Unit T-02-310 for solids mixing	Manual Operation Normally closed
13	Butterfly Valve (BFV-02-171)	Secondary Treatment - Lower	Isolates air flow to DAF Unit T-02-310 for solids mixing	Manual Operation Normally closed
14	Butterfly Valve (BFV-02-172)	Secondary Treatment - Lower	Isolates air flow to DAF Unit T-02-310 for solids mixing	Manual Operation Normally closed
15	Plug Valve (PLV-02-301)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-310	Manual Operation Normally closed
16	Plug Valve (PLV-02-302)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-310	Manual Operation Normally closed
17	Plug Valve (PLV-02-303)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-310	Manual Operation Normally closed
18	Plug Valve (PLV-02-304)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-310	Manual Operation Normally closed
19	Plug Valve (PLV-02-305)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-310	Manual Operation Normally closed
20	Pneumatic Actuated Butterfly Valve (BFV-02-309)	Secondary Treatment - Lower	Controls internal DAF subnatant recirculation	Pneumatic Operation. Plant Control System Controlled
21	Pneumatic Actuated Butterfly Valve (BFV-02-310)	Secondary Treatment - Lower	Controls internal DAF subnatant recirculation	Pneumatic Operation. Plant Control System Controlled
22	Plug valve (PLV-02-306)	Secondary Treatment - Lower	Isolates TWAS discharge from DAF Unit T-02-310	Manually Operated
23	Plug valve (PLV-02-307)	Secondary Treatment - Lower	Isolates TWAS drains from DAF Unit T-02-310 to TWAS Pumps	Manually Operated

No.	Component	Location	Function performed	Remarks
24	Plug valve (PLV-02-308)	Secondary Treatment - Lower	Isolates TWAS drains DAF Unit T-02-310 to floor sump	Manually Operated
25	Backpressure valve (BPV-02-1100)	Secondary Treatment - Lower	Isolates mixed liquor back flow to polymer dosing pump	Manually Operated
26	Butterfly valve (BFV-02-317A)	Secondary Treatment - Lower	Isolates DAF subnatant flow from DAF Unit (T-02-310) to White Water Skid	Manually Operated
27	Flow meter (FE-02-317)	Secondary Treatment - Lower	Measures subnatant suction flow from DAF Unit T-02-310 to DAF White Water Pumps	Signal to Plant Control System
28	Butterfly Valve (BFV-02-400)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-310 to White Water Pump P-02-410	
29	Globe Valve (BV-02-401)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-310 to White Water Pump P-02-410	
30	Ball Valve (BV-02-410)	Secondary Treatment - Lower	Isolates air flow to White Water Pump P-02-410	
31	Needle Valve (NV-02-411)	Secondary Treatment - Lower	Adjust air flow to White Water Pump P-02-410	
32	Flow indicator (FI-02-412)	Secondary Treatment - Lower	Indicates air flow to White Water Pump P-02-410	
33	Ball Valve (BV-02-402)	Secondary Treatment - Lower	Isolates pressure indicator PI-404	
34	Ball Valve (BV-02-403)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-404	
35	Pressure Indicator (PI-02-404)	Secondary Treatment - Lower	Indicates pressure at suction of White Water Pump P-02-410	
36	Check Valve (CV-02-404)	Secondary Treatment - Lower	Avoids air backflow to flow indicator FI-412	
37	DAF White Water Pump (P-02-410)	Secondary Treatment - Lower	Recirculates subnatant to DAF Unit T-02-310	Plant Control System Controlled
38	Ball Valve (BV-02-407)	Secondary Treatment - Lower	Isolates pressure indicator PI-409	
39	Ball Valve (BV-02-408)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-409	
40	Pressure Indicator (PI-02-409)	Secondary Treatment - Lower	Indicates pressure at discharge of White Water Pump P-02-410	

No.	Component	Location	Function performed	Remarks
41	Check Valve (CV-02-405)	Secondary Treatment - Lower	Avoids subnatant backflow to White Water Pump P-02-410	
42	Butterfly Valve (BFV-02-406)	Secondary Treatment - Lower	Isolates subnatant recirculation at discharge of White Water Pump P-02-410	
43	Butterfly Valve (BFV-02-415)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-310 to White Water Pump P-02-420	
44	Globe Valve (GLV-02-416)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-310 to White Water Pump P-02-420	
45	Ball Valve (BV-02-425)	Secondary Treatment - Lower	Isolates air flow to White Water Pump P-02-420	
46	Needle Valve (NV-02-426)	Secondary Treatment - Lower	Adjust air flow to White Water Pump P-02-420	
47	Flow indicator (FI-02-427)	Secondary Treatment - Lower	Indicates air flow to White Water Pump P-02-420	
48	Ball Valve (BV-02-417)	Secondary Treatment - Lower	Isolates pressure indicator PI-419	
49	Ball Valve (BV-02-418)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-419	
50	Pressure Indicator (PI-02-419)	Secondary Treatment - Lower	Indicates pressure at suction of White Water Pump P-02-420	
51	Check Valve (CV-02-428)	Secondary Treatment - Lower	Avoids air backflow to flow indicator FI-427	
52	DAF White Water Pump (P-02-420)	Secondary Treatment - Lower	Recirculates subnatant to DAF Unit T-02-310	Plant Control System Controlled
53	Ball Valve (BV-02-422)	Secondary Treatment - Lower	Isolates pressure indicator PI-424	
54	Ball Valve (BV-02-423)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-424	
55	Pressure Indicator (PI-02-424)	Secondary Treatment - Lower	Indicates pressure at discharge of White Water Pump P-02-420	
56	Check Valve (CV-02-420)	Secondary Treatment - Lower	Avoids subnatant backflow to White Water Pump P-02-420	
57	Butterfly Valve (BFV-02-421)	Secondary Treatment - Lower	Isolates subnatant recirculation at	

No.	Component	Location	Function performed	Remarks
			discharge of White Water Pump P-02-420	
58	Butterfly Valve (BFV-02-430)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-310 to White Water Pump P-02-430	
59	Globe Valve (GLV-02-431)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-310 to White Water Pump P-02-430	
60	Ball Valve (BV-02-440)	Secondary Treatment - Lower	Isolates air flow to White Water Pump P-02-430	
61	Needle Valve (NV-02-441)	Secondary Treatment - Lower	Adjust air flow to White Water Pump P-02-430	
62	Flow Indicator (FI-02-442)	Secondary Treatment - Lower	Indicates air flow to White Water Pump P-02-430	
63	Ball Valve (BV-02-432)	Secondary Treatment - Lower	Isolates pressure indicator PI-434	
64	Ball Valve (BV-02-433)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-434	
65	Pressure Indicator (PI-02-434)	Secondary Treatment - Lower	Indicates pressure at suction of White Water Pump P-02-430	
66	Check Valve (CV-02-443)	Secondary Treatment - Lower	Avoids air backflow to flow indicator FI-442	
67	DAF 1 White Water Pump (P-02-430)	Secondary Treatment - Lower	Recirculates subnatant to DAF Unit T-02-310	Plant Control System Controlled
68	Ball Valve (BV-02-437)	Secondary Treatment - Lower	Isolates pressure indicator PI-439	
69	Ball Valve (BV-02-438)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-439	
70	Pressure Indicator (PI-02-439)	Secondary Treatment - Lower	Indicates pressure at discharge of White Water Pump P-02-430	
71	Check Valve (CV-02-435)	Secondary Treatment - Lower	Avoids subnatant backflow to White Water Pump P-02-430	
72	Butterfly Valve (BFV-02-436)	Secondary Treatment - Lower	Isolates subnatant recirculation at discharge of White Water Pump P-02-430	
73	Pressure Indication (PI-02-520)	Secondary Treatment - Lower	Senses pressure of DAF White Water Skid Header	
74	Ball valve (BV-02-523)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-520	

No.	Component	Location	Function performed	Remarks
75	Ball valve (BV-02-527)	Secondary Treatment - Lower	Isolates subnatant flow to PI-520	
76	Motorized Butterfly Valve (BFV-02-511)	Secondary Treatment - Lower	Controls subnatant flow to White Water Strainer STR-02-510	Plant Control System Controlled
77	White Water Strainer 1 (STR-02-510)	Secondary Treatment - Lower	Retains subnatant solids	
78	Pressure Release Valve (PRV-02-527)	Secondary Treatment - Lower	Releases air from the White Water Strainer STR-02-510	
79	Motorized Ball Valve (BV-02-512)	Secondary Treatment - Lower	Controls White Water Strainer STR-02-510 drain to floor sump	Plant Control System Controlled
80	Butterfly Valve (BFV-02-513)	Secondary Treatment - Lower	Isolates subnatant recirculation to DAF Unit T-02-310	Manually Operated
81	Pressure Indicator (PI-02-510)	Secondary Treatment - Lower	Senses pressure at discharge of White Water Strainer STR-02-510	
82	Ball Valve (BV-02-510)	Secondary Treatment - Lower	Drains subnatant line to PI-510	
83	Ball Valve (BV-02-511)	Secondary Treatment - Lower	Isolates subnatant flow to PI-510	
84	Globe Valve (GLV-02-510)	Secondary Treatment - Lower	Isolates strainer STR-02-510 drain to floor sump	Manually Operated
85	Motorized Butterfly Valve (BFV-02-521)	Secondary Treatment - Lower	Controls subnatant flow to White Water Strainer STR-02-520	Plant Control System Controlled
86	White Water Strainer 1 (STR-02-520)	Secondary Treatment - Lower	Retains subnatant solids	
87	Pressure Release Valve (PRV-02-528)	Secondary Treatment - Lower	Releases air from the White Water Strainer STR-02-520	
88	Motorized Ball Valve (BV-02-522)	Secondary Treatment - Lower	Controls the flow of subnatant solids to floor sump	Plant Control System Controlled
89	Butterfly Valve (BFV-02-523)	Secondary Treatment - Lower	Isolates subnatant recirculation to DAF Unit T-02-310	Manually Operated
90	Pressure Indicator (PI-02-525)	Secondary Treatment - Lower	Senses pressure at discharge of White Water Strainer STR-02-520	
91	Ball Valve (BV-02-520)	Secondary Treatment - Lower	Drains subnatant line to PI-520	

No.	Component	Location	Function performed	Remarks
92	Ball Valve (BV-02-521)	Secondary Treatment - Lower	Isolates subnatant flow to PI-520	
93	Globe Valve (GLV-02-520)	Secondary Treatment - Lower	Isolates drain from White water Strainer STR-02-520 to floor sump	Manually Operated
94	Ball Valve (BV-02-525)	Secondary Treatment - Lower	Isolates pressure transmitter PT-527	
95	Ball Valve (BV-02-526)	Secondary Treatment - Lower	Drains line to pressure transmitter PT-527	
96	Pressure Transmitter (PT-02-527)	Secondary Treatment - Lower	Transmits subnatant pressure at discharge of White Water Strainers STR-02-510/520	

4.5.4 Dissolved Air Flotation (DAF) Clarification #2

(Refer to Drawing P-613 and P-614 in Appendix A)

The following table identifies the components related to Dissolved Air Flotation Clarification system #2.

No.	Component	Location	Function performed	Remarks
1	Motorized Valve (BFV-02-332, FV-332)	Secondary Treatment - Lower	Controls mixed liquor flow to DAF unit T02-320	Plant Control System Controlled
2	Ball Valve (BV-02-333)	Secondary Treatment - Lower	Isolates DAF subnatant recirculation to the entry zone	
3	Motorized Butterfly Valve (BFV-02-645, FV-645)	Secondary Treatment - Lower	Isolates DAF subnatant recirculation to the white-water injection zone	
4	DAF Tank (T-02-320)	Secondary Treatment - Lower	Mixed liquor clarification and secondary sludge thickening	Plant Control System Controlled
5	DAF 1 Sludge Scraper (DDR-02-321)	Secondary Treatment - Lower	Removes thickened sludge from the flotation zone to the sludge collection zone	Plant Control System Controlled
6	Level Transmitter (LIT-02-341)	Mounted inside the DAF Tank	Senses mixed liquor level in the flotation zone	Signal to Plant Control System
7	Level Switch (LSH-02-342)	Mounted inside the DAF Tank	Senses sludge high level in the sludge collection zone	Signal to Plant Control System

No.	Component	Location	Function performed	Remarks
8	Level Switch (LSL-02-343)	Mounted inside the DAF Tank	Senses sludge low level in the sludge collection zone	Signal to Plant Control System
9	TSS Analyzer (AIT-02-344)	Mounted inside the DAF Tank	Senses TSS in the clarified water evacuation zone	Signal to Plant Control System
10	Butterfly Valve (BFV-02-365)	Secondary Treatment - Lower	Isolates air flow to DAF unit T-02-320 for solids mixing	Manual Operation. Normally closed
11	Butterfly Valve (BFV-02-366)	Secondary Treatment - Lower	Isolates air flow to DAF Unit T-02-320 for solids mixing	Manual Operation Normally closed
12	Butterfly Valve (BFV-02-370)	Secondary Treatment - Lower	Isolates air flow to DAF Unit T-02-320 for solids mixing	Manual Operation Normally closed
13	Butterfly Valve (BFV-02-371)	Secondary Treatment - Lower	Isolates air flow to DAF Unit T-02-320 for solids mixing	Manual Operation Normally closed
14	Butterfly Valve (BFV-02-372)	Secondary Treatment - Lower	Isolates air flow to DAF Unit T-02-320 for solids mixing	Manual Operation Normally closed
15	Plug Valve (PLV-02-371)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-320	Manual Operation Normally closed
16	Plug Valve (PLV-02-372)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-320	Manual Operation Normally closed
17	Plug Valve (PLV-02-373)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-320	Manual Operation Normally closed
18	Plug Valve (PLV-02-374)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-320	Manual Operation Normally closed
19	Plug Valve (PLV-02-375)	Secondary Treatment - Lower	Isolates sludge drainage from DAF Unit T-02-320	Manual Operation Normally closed
20	Pneumatic Actuated Butterfly Valve (BFV-02-329)	Secondary Treatment - Lower	Controls internal DAF subnatant recirculation	Pneumatic Operation. Plant Control System Controlled
21	Pneumatic Actuated Butterfly Valve (BFV-02-330)	Secondary Treatment - Lower	Controls internal DAF subnatant recirculation	Pneumatic Operation. Plant Control System Controlled
22	Plug valve (PLV-02-326)	Secondary Treatment - Lower	Isolates TWAS discharge from DAF Unit T-02-320	Manually Operated

No.	Component	Location	Function performed	Remarks
23	Plug valve (PLV-02-327)	Secondary Treatment - Lower	Isolates TWAS drains from DAF Unit T-02-320 to TWAS Pumps	Manually Operated
24	Plug valve (PLV-02-328)	Secondary Treatment - Lower	Isolates TWAS drains DAF Unit T-02-320 to floor sump	Manually Operated
25	Backpressure valve (BPV-02-1100)	Secondary Treatment - Lower	Isolates mixed liquor back flow to polymer dosing pump	Manually Operated
26	Butterfly valve (BFV-02-327A)	Secondary Treatment - Lower	Isolates DAF subnatant flow from DAF Unit (T-02-320) to White Water Skid	Manually Operated
27	Flow meter (FE-02-327)	Secondary Treatment - Lower	Measures subnatant suction flow from DAF Unit T-02-320 to DAF White Water Pumps	Signal to Plant Control System
28	Butterfly Valve (BFV-02-450)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-320 to White Water Pump P-02-440	
29	Globe Valve (BV-02-451)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-320 to White Water Pump P-02-440	
30	Ball Valve (BV-02-460)	Secondary Treatment - Lower	Isolates air flow to White Water Pump P-02-440	
31	Needle Valve (NV-02-461)	Secondary Treatment - Lower	Adjust air flow to White Water Pump P-02-440	
32	Flow indicator (FI-02-462)	Secondary Treatment - Lower	Indicates air flow to White Water Pump P-02-440	
33	Ball Valve (BV-02-452)	Secondary Treatment - Lower	Isolates pressure indicator PI-454	
34	Ball Valve (BV-02-453)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-454	
35	Pressure Indicator (PI-02-454)	Secondary Treatment - Lower	Indicates pressure at suction of White Water Pump P-02-440	
36	Check Valve (CV-02-463)	Secondary Treatment - Lower	Avoids air backflow to flow indicator FI-462	
37	DAF White Water Pump (P-02-440)	Secondary Treatment - Lower	Recirculates subnatant to DAF Unit T-02-320	Plant Control System Controlled
38	Ball Valve (BV-02-457)	Secondary Treatment - Lower	Isolates pressure indicator PI-459	
39	Ball Valve (BV-02-458)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-459	

No.	Component	Location	Function performed	Remarks
40	Pressure Indicator (PI-02-459)	Secondary Treatment - Lower	Indicates pressure at discharge of White Water Pump P-02-440	
41	Check Valve (CV-02-455)	Secondary Treatment - Lower	Avoids subnatant backflow to White Water Pump P-02-440	
42	Butterfly Valve (BFV-02-456)	Secondary Treatment - Lower	Isolates subnatant recirculation at discharge of White Water Pump P-02-440	
43	Butterfly Valve (BFV-02-465)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-320 to White Water Pump P-02-450	
44	Globe Valve (GLV-02-466)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-320 to White Water Pump P-02-450	
45	Ball Valve (BV-02-475)	Secondary Treatment - Lower	Isolates air flow to White Water Pump P-02-450	
46	Needle Valve (NV-02-476)	Secondary Treatment - Lower	Adjust air flow to White Water Pump P-02-420	
47	Flow indicator (FI-02-477)	Secondary Treatment - Lower	Indicates air flow to White Water Pump P-02-450	
48	Ball Valve (BV-02-467)	Secondary Treatment - Lower	Isolates pressure indicator PI-469	
49	Ball Valve (BV-02-468)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-469	
50	Pressure Indicator (PI-02-469)	Secondary Treatment - Lower	Indicates pressure at suction of White Water Pump P-02-450	
51	Check Valve (CV-02-478)	Secondary Treatment - Lower	Avoids air backflow to flow indicator FI-477	
52	DAF White Water Pump (P-02-450)	Secondary Treatment - Lower	Recirculates subnatant to DAF Unit T-02-320	Plant Control System Controlled
53	Ball Valve (BV-02-472)	Secondary Treatment - Lower	Isolates pressure indicator PI-474	
54	Ball Valve (BV-02-473)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-474	
55	Pressure Indicator (PI-02-474)	Secondary Treatment - Lower	Indicates pressure at discharge of White Water Pump P-02-450	
56	Check Valve (CV-02-470)	Secondary Treatment - Lower	Avoids subnatant backflow to White Water Pump P-02-450	

No.	Component	Location	Function performed	Remarks
57	Butterfly Valve (BFV-02-471)	Secondary Treatment - Lower	Isolates subnatant recirculation at discharge of White Water Pump P-02-450	
58	Butterfly Valve (BFV-02-480)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-320 to White Water Pump P-02-460	
59	Globe Valve (GLV-02-481)	Secondary Treatment - Lower	Isolates subnatant from DAF Unit T-02-310 to White Water Pump P-02-460	
60	Ball Valve (BV-02-490)	Secondary Treatment - Lower	Isolates air flow to White Water Pump P-02-460	
61	Needle Valve (NV-02-491)	Secondary Treatment - Lower	Adjust air flow to White Water Pump P-02-460	
62	Flow Indicator (FI-02-492)	Secondary Treatment - Lower	Indicates air flow to White Water Pump P-02-460	
63	Ball Valve (BV-02-482)	Secondary Treatment - Lower	Isolates pressure indicator PI-484	
64	Ball Valve (BV-02-483)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-484	
65	Pressure Indicator (PI-02-484)	Secondary Treatment - Lower	Indicates pressure at suction of White Water Pump P-02-460	
66	Check Valve (CV-02-493)	Secondary Treatment - Lower	Avoids air backflow to flow indicator FI-492	
67	DAF White Water Pump (P-02-460)	Secondary Treatment - Lower	Recirculates subnatant to DAF Unit T-02-320	Plant Control System Controlled
68	Ball Valve (BV-02-487)	Secondary Treatment - Lower	Isolates pressure indicator PI-489	
69	Ball Valve (BV-02-488)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-489	
70	Pressure Indicator (PI-02-489)	Secondary Treatment - Lower	Indicates pressure at discharge of White Water Pump P-02-460	
71	Check Valve (CV-02-485)	Secondary Treatment - Lower	Avoids subnatant backflow to White Water Pump P-02-460	
72	Butterfly Valve (BFV-02-486)	Secondary Treatment - Lower	Isolates subnatant recirculation at discharge of White Water Pump P-02-460	
73	Pressure Indication (PI-02-540)	Secondary Treatment - Lower	Senses pressure of DAF White Water Skid Header	

No.	Component	Location	Function performed	Remarks
74	Ball valve (BV-02-543)	Secondary Treatment - Lower	Drains subnatant line to pressure indicator PI-540	
75	Bal valve (BV-02-547)	Secondary Treatment - Lower	Isolates subnatant flow to PI-540	
76	Motorized Butterfly Valve (BFV-02-531)	Secondary Treatment - Lower	Controls subnatant flow to White Water Strainer STR-02-530	Plant Control System Controlled
77	White Water Strainer 1 (STR-02-530)	Secondary Treatment - Lower	Retains subnatant solids	
78	Pressure Release Valve (PRV-02-547)	Secondary Treatment - Lower	Releases air from the White Water Strainer STR-02-530	
79	Motorized Ball Valve (BV-02-532)	Secondary Treatment - Lower	Controls White Water Strainer STR-02-530 drain to floor sump	Plant Control System Controlled
80	Butterfly Valve (BFV-02-533)	Secondary Treatment - Lower	Isolates subnatant recirculation to DAF Unit T-02-320	Manually Operated
81	Pressure Indicator (PI-02-530)	Secondary Treatment - Lower	Senses pressure at discharge of White Water Strainer STR-02-530	
82	Ball Valve (BV-02-530)	Secondary Treatment - Lower	Drains subnatant line to PI-530	
83	Ball Valve (BV-02-531)	Secondary Treatment - Lower	Isolates subnatant flow to PI-530	
84	Globe Valve (GLV-02-530)	Secondary Treatment - Lower	Isolates strainer STR-02-530 drain to floor sump	Manually Operated
85	Motorized Butterfly Valve (BFV-02-541)	Secondary Treatment - Lower	Controls subnatant flow to White Water Strainer STR-02-540	Plant Control System Controlled
86	White Water Strainer (STR-02-540)	Secondary Treatment - Lower	Retains subnatant solids	
87	Pressure Release Valve (PRV-02-548)	Secondary Treatment - Lower	Releases air from the White Water Strainer STR-02-540	
88	Motorized Ball Valve (BV-02-542)	Secondary Treatment - Lower	Controls the flow of subnatant solids to floor sump	Plant Control System Controlled
89	Butterfly Valve (BFV-02-543)	Secondary Treatment - Lower	Isolates subnatant recirculation to DAF Unit T-02-320	Manually Operated
90	Pressure Indicator (PI-02-540)	Secondary Treatment - Lower	Senses pressure at discharge of White Water Strainer STR-02-540	

No.	Component	Location	Function performed	Remarks
91	Ball Valve (BV-02-540)	Secondary Treatment - Lower	Drains subnatant line to PI-540	
92	Ball Valve (BV-02-541)	Secondary Treatment - Lower	Isolates subnatant flow to PI-540	
93	Globe Valve (GLV-02-540)	Secondary Treatment - Lower	Isolates drain from White Water Strainer STR-02-540 to floor sump	Manually Operated
94	Ball Valve (BV-02-545)	Secondary Treatment - Lower	Isolates pressure transmitter PT-547	
95	Ball Valve (BV-02-546)	Secondary Treatment - Lower	Drains line to pressure transmitter PT-547	
96	Pressure Transmitter (PT-02-547)	Secondary Treatment - Lower	Transmits subnatant pressure at discharge of White Water Strainers STR-02-530/540	
97	Flow meter (FE-02-328)	Secondary Treatment - Lower	Measures treated water effluent flow from DAF Units T-02-310/320 to outfall	Signal to Plant Control System

4.5.5 DAF Polymer Feed System

(Refer to Drawing P-615 and P-616 in Appendix A)

The following table identifies the components related to Dissolved Air Flotation Polymer Feed system.

No.	Component	Location	Function performed	Remarks
1	DAF Polymer Vacuum Conveyor (VAC-04-710)	Chemical Dosing Upper	Conveys dry polymer to the polymer feeder	Plant Control System Controlled
2	Level Sensor Low (LSL-04-710)	Chemical Dosing Upper	Senses low level in DAF Polymer Vacuum Conveyor	Plant Control System Controlled
3	DAF Feeder Hopper Polymer Agitator (PAG-04-720)	Chemical Dosing Upper	Solid polymer agitation	Plant Control System Controlled
4	DAF Polymer Screw Feeder (PSF-04-730)	Chemical Dosing Upper	Solids polymer feeding	Plant Control System Controlled
5	Ball Valve (BV-04-710)	Chemical Dosing Upper	Potable water isolation	
6	Pressure Switch (PSL-04-711)	Chemical Dosing Upper	Potable water line low pressure signal	
7	Pressure Indicator (PI-04-712)	Chemical Dosing Upper	Potable water line pressure indication	Signal to Plant Control System

No.	Component	Location	Function performed	Remarks
8	Solenoid Valve (SV-04-713)	Chemical Dosing Upper		
9	Solenoid Valve (SV-04-714)	Chemical Dosing Upper	Controls Potable water flow	
10	Ball Check Valve (BV-04-716)	Chemical Dosing Upper	Prevents potable water backflow from wetting cone to water line	
11	Ball Check Valve (BV-04-717)	Chemical Dosing Upper	Prevents potable water backflow from wetting cone to water line	
12	Injector (IJ-04-715)	Chemical Dosing Upper	Mixes solid polymer with potable water	
13	Check Valve (CV-04-718)	Chemical Dosing Upper	Avoids polymer solution backflow to injector Ij-04-715	
14	Mixer (SM-04-719)	Chemical Dosing Upper	Mixes polymer solution in line to Mixing Tank	
15	DAF Polymer Mixing Tank (T-04-740)	Chemical Dosing Upper	Polymer mixing / preparation	Plant Control System Controlled
16	DAF Polymer Mixer (MXR-04-760)	Chemical Dosing Upper	Mixes polymer in polymer mixing tank	Plant Control System Controlled
17	Polymer Analyzer (AIT-04-741)	Chemical Dosing Upper	Measures conductivity in polymer mixing tank	Signal to Plant Control System
18	Level Transmitter (LIT-04-742)	Chemical Dosing Upper	Indicates/transmits level in polymer mixing tank	
19	Electrically Operated Butterfly Valve (BV-04-743)	Chemical Dosing Upper	Controls flow of polymer solution from polymer mixing tank to polymer aging tank	
20	Ball Valve (BV-04-744)	Chemical Dosing Upper	Isolates drain from polymer mixing tank	Normally Closed
21	DAF Polymer Aging Tank (T-04-750)	Chemical Dosing Upper	Stores polymer solution for dosing to the DAF	Plant Control System Controlled
22	Level Transmitter (LIT-04-746)	Chemical Dosing Upper	Indicates/transmits level in polymer aging tank	Signal to Plant Control System
23	Polymer Analyzer (AE-04-745)	Chemical Dosing Upper	Measures conductivity in polymer aging tank	Signal to Plant Control System
24	Ball Valve (BV-04-747)	Chemical Dosing Upper	Isolates polymer suction from Aging Tank to polymer dosing pumps	
25	Ball Valve (BV-04-750)	Chemical Dosing Upper	Isolates drain from polymer suction line	Normally Closed

No.	Component	Location	Function performed	Remarks
26	Ball Valve (BV-04-760)	Chemical Dosing Upper	Isolates polymer suction to DAF Polymer Dosing Pump P-04-770	
27	Ball Valve (BV-04-763)	Chemical Dosing Upper	Isolates polymer solution to calibration column CC-04-790	
28	Calibration Colum (CC-04-790)	Chemical Dosing Upper	Used to confirm polymer solution flow	
29	Polymer Dosing Pump (P-04-770)	Chemical Dosing Upper	Polymer dosing to DAF Units	Plant Control System Controlled
30	Temperature Element (TE-04-769)	Chemical Dosing Upper	Protects Polymer Dosing Pump P-04-770 against over heating	Signal to Plant Control System
31	Ball Valve (BV-04-785)	Chemical Dosing Upper	Isolates PSH-787	
32	Pressure Switch (PSH-04-787)	Chemical Dosing Upper	High pressure signal for protection of Polymer Dosing Pump P-04-770	Signal to Plant Control System
33	Ball Valve (BV-04-766)	Chemical Dosing Upper	Isolates polymer solution drain	
34	Ball Valve (BV-04-775)	Chemical Dosing Upper	Isolates polymer solution at discharge of Polymer Dosing Pump P-04-770	
35	Pressure Release Valve (BPV-04-772)	Chemical Dosing Upper	Releases pressure at discharge of Polymer Dosing Pump P-04-770	
36	Ball Valve (BV-04-761)	Chemical Dosing Upper	Isolates polymer suction to DAF Polymer Dosing Pump P-04-780	
37	Ball Valve (BV-04-764)	Chemical Dosing Upper	Isolates polymer solution to calibration column CC-04-790	
38	Polymer Dosing Pump (P-04-780)	Chemical Dosing Upper	Polymer dosing to DAF	Plant Control System Controlled
39	Temperature Element (TE-04-770)	Chemical Dosing Upper	Protects Polymer Dosing Pump P-04-780 against over heating	
40	Ball Valve (BV-04-791)	Chemical Dosing Upper	Isolates PI-792/PSH-793	
41	Pressure Switch (PSH-04-792)	Chemical Dosing Upper	High pressure signal for protection of Polymer Dosing Pump P-04-780	
42	Ball Valve (BV-04-767)	Chemical Dosing Upper	Isolates polymer solution drain	

No.	Component	Location	Function performed	Remarks
43	Ball Valve (BV-04-776)	Chemical Dosing Upper	Isolates polymer solution at discharge of Polymer Dosing Pump P-04-780	
44	Pressure Release Valve (PRV-04-773)	Chemical Dosing Upper	Releases pressure at discharge of Polymer Dosing Pump P-04-780	
45	Ball Valve (BV-04-762)	Chemical Dosing Upper	Isolates polymer suction to DAF Polymer Dosing Pump P-04-790	
46	Ball Valve (BV-04-765)	Chemical Dosing Upper	Isolates polymer solution to calibration column CC-04-790	
47	Polymer Dosing Pump (P-04-790)	Chemical Dosing Upper	Polymer dosing to DAF	Plant Control System Controlled
48	Temperature Element (TE-04-771)	Chemical Dosing Upper	Protects Polymer Dosing Pump P-04-790 against over heating	
49	Ball Valve (BV-04-788)	Chemical Dosing Upper	Isolates PSH-790	
50	Pressure Switch (PSH-04-790)	Chemical Dosing Upper	High pressure signal for protection of Polymer Dosing Pump P-04-790	
51	Ball Valve (BV-04-768)	Chemical Dosing Upper	Isolates polymer solution drain	
52	Ball Valve (BV-04-777)	Chemical Dosing Upper	Isolates polymer solution at discharge of Polymer Dosing Pump P-04-790	
53	Pressure Release Valve (BPV-04-774)	Chemical Dosing Upper	Releases pressure at discharge of Polymer Dosing Pump P-04-790	
54	Ball Valve (BV-04-778)	Chemical Dosing Upper	Isolates Polymer Dosing Pumps P-04-780/790	
55	Ball Valve (BV-04-779)	Chemical Dosing Upper	Isolates Polymer Dosing Pumps P-04-770/790	
56	Backpressure Valve (BPV-04-790)	Chemical Dosing Upper	Avoids polymer solution backflow to Polymer Dosing Pump P-04-770/790	
57	Backpressure Valve (BPV-04-791)	Chemical Dosing Upper	Avoids polymer solution backflow to Polymer Dosing Pump P-04-780/790	
58	Pressure Regulating Valve (PRV-04-780)	Chemical Dosing Upper	Regulates potable water dilution line pressure to DAF Polymer Dosing skid	

No.	Component	Location	Function performed	Remarks
59	Ball Valve (BV-04-781)	Chemical Dosing Upper	Isolates potable water dilution line pressure to DAF Polymer Dosing skid	
60	Ball Valve (BV-04-782)	Chemical Dosing Upper	Isolates potable water dilution line pressure to DAF Polymer Dosing skid	
61	Solenoid Valve (SV-04-783)	Chemical Dosing Upper	Controls potable water dilution flow to DAF Polymer Dosing skid	
62	Solenoid Valve (SV-04-784)	Chemical Dosing Upper	Controls potable water dilution flow to DAF Polymer Dosing skid	
63	Flow Indicator (FI-04-785)	Chemical Dosing Upper	Indicates potable water dilution flow to DAF Polymer Dosing skid	
64	Flow Indicator (FI-04-786)	Chemical Dosing Upper	Indicates potable water dilution flow to DAF Polymer Dosing skid	
65	Needle Valve (NV-04-787)	Chemical Dosing Upper	Adjust potable water dilution flow to DAF Polymer Dosing skid	
66	Needle Valve (NV-04-788)	Chemical Dosing Upper	Adjust potable water dilution flow to DAF Polymer Dosing skid	
67	Flow Transmitter (FIT-04-798)	Chemical Dosing Upper	Measures polymer solution flow to DAF Unit T-02-310	
68	Flow Transmitter (FIT-04-799)	Chemical Dosing Upper	Measures polymer solution flow to DAF Unit T-02-320	

4.6 SLUDGE PROCESSING

4.6.1 TWAS Storage Tank

(Refer to Drawing P-617 in Appendix A)

The following table identifies the components related to Thickened Waste Activated Sludge (TWAS) pumping and storage.

No.	Component	Location	Function performed	Remarks
1	Ball Valve (BV-02-612)	Secondary Treatment Lower	Isolates PI-615	
2	Ball Valve (BV-02-613)	Secondary Treatment Lower	Drains line to PI-615	

No.	Component	Location	Function performed	Remarks
3	Pressure Indicator (PI-02-615)	Secondary Treatment Lower	Indicates pressure at suction side of TWAS Pump P-02-610	
4	TWAS Pump (P-02-610)	Secondary Treatment Lower	Pumps TWAS from DAF Unit T-02-310 to TWAS storage tanks (On a VFD)	Plant Control System Controlled
5	Ball Valve (BV-02-616)	Secondary Treatment Lower	Drains line to PI-618 / PSH-619	
6	Ball Valve (BV-02-617)	Secondary Treatment Lower	Isolates line to PI-618 / PSH-619	
7	Pressure Indicator (PI-02-618)	Secondary Treatment Lower	Indicates pressure at discharge of TWAS Pump P-02-610	
8	Pressure Switch (PSH-619)	Secondary Treatment Lower	Transmits pressure at discharge of pump P-02-610 for protection	Signal to Plant Control System
9	Check valve (CV-02-620)	Secondary Treatment Lower	Prevents backflow to TWAS pump P-02-610	
10	Plug valve (PLV-02-620A)	Secondary Treatment Lower	Isolates TWAS flow from pump P-02-610	Normally Open
11	Plug valve (PLV-02-647)	Secondary Treatment Lower	Isolates TWAS pump P-02-610 drain line to floor sump	Normally Closed
12	Ball Valve (BV-02-632)	Secondary Treatment Lower	Isolates line to PI-635	
13	Ball Valve (BV-02-633)	Secondary Treatment Lower	Drains line to PI-635	
14	Pressure Indicator (PI-02-635)	Secondary Treatment Lower	Indicates pressure at suction of TWAS Pump P-02-620	
15	TWAS Pump (P-02-620)	Secondary Treatment Lower	Pumps TWAS from DAF Unit T-02-330 to TWAS storage tanks (On a VFD)	Signal to Plant Control Controlled
16	Ball Valve (BV-02-636)	Secondary Treatment Lower	Isolates PI-638/PSH-639	
17	Ball Valve (BV-02-637)	Secondary Treatment Lower	Isolates line to PI-638/PSH-639	
18	Pressure Indicator (PI-02-638)	Secondary Treatment Lower	Indicates pressure at discharge of TWAS Pump P-02-620	
19	Pressure Switch (PSH-02-639)	Secondary Treatment Lower	Transmits pressure at discharge of pump P-02-620 for protection	Signal to Plant Control System
20	Check valve (CV-02-640)	Secondary Treatment Lower	Prevents backflow to TWAS pump P-02-620	
21	Plug valve (PLV-02-640A)	Solids Handling Lower	Isolates TWAS flow from pump P-02-620	Normally Closed

No.	Component	Location	Function performed	Remarks
22	Plug valve (PLV-02-648)	Solids Handling Lower	Isolates TWAS pump P-02-620 drain line to floor sump	Normally Closed
23	Plug Valve (PLV-02-621)	Solids Handling Lower	Isolates TWAS pump P-02-610 discharge	Normally Open
24	Plug Valve (PLV-02-641)	Solids Handling Lower	Isolates TWAS pump P-02-620 discharge	Normally Open
25	Plug Valve (PLV-02-645)	Solids Handling Lower	Allows DAF Unit T-02-310 to discharge MBBR Train T-02-210	Normally Closed
26	Plug Valve (PLV-02-646)	Solids Handling Lower	Allows DAF Unit T-02-320 to discharge MBBR Train T-02-220	Normally Closed
27	Plug Valve (PLV-02-643)	Solids Handling Lower	Isolates TWAS Tank 1 T-03-630	Normally Open
28	Plug Valve (PLV-02-644)	Solids Handling Lower	Isolates TWAS Tank 1 T-03-640	Normally Open
29	TWAS Aerated Storage Tank (T-03-630)	Solids Handling Lower	TWAS storage	
30	TWAS Aerated Storage Tank (T-03-640)	Solids Handling Lower	TWAS storage	
31	Level Element (LE-03-111)	Solids Handling Lower	Senses TWAS level in TWAS Aerated Storage Tank T-03-630	
32	Level Switch (LSHH-112)	Solids Handling Lower	Indicates the high-high TWAS level in TWAS Tank T-03-630	Signal to PLANT CONTROL SYSTEM
33	Level Switch (LSLL-113)	Solids Handling Lower	Indicates the low-low TWAS level in TWAS Tank T-03-630	
34	Level Element (LE-03-121)	Solids Handling Lower	Senses TWAS level in TWAS Aerated Storage Tank T-03-640	
35	Level Switch (LSHH-122)	Solids Handling Lower	Indicates the high-high TWAS level in TWAS Tank T-03-640	Signal to PLANT CONTROL SYSTEM
36	Level Switch (LSLL-123)	Solids Handling Lower	Indicates the low-low TWAS level in TWAS Tank T-03-640	
37	Plug Valve (PLV-02-675)	Solids Handling Lower	Isolates TWAS camlock connection from TWAS Storage Tank T-03-630	
38	Plug Valve (PLV-02-676)	Solids Handling Lower	Isolates TWAS camlock connection from TWAS Storage Tank T-03-640	

No.	Component	Location	Function performed	Remarks
39	Plug Valve (PLV-03-650)	Solids Handling Lower	Isolates TWAS feed to belt filter press pump P-03-630	Normally Open
40	Plug Valve (PLV-03-651)	Solids Handling Lower	Isolates TWAS feed to belt filter press pump P-03-640	Normally Open
41	Butterfly Valve (BFV-02-175)	Solids Handling Lower	Isolates process air flow to TWAS Aerated Storage Tank T-03-630	Manually Operated
42	Butterfly Valve (BFV-02-176)	Solids Handling Lower	Isolates process air flow to TWAS Aerated Storage Tank T-03-640	Manually Operated
43	Blat Gate (BG-03-652)	Solids Handling Lower	Isolates foul air from TWAS Aerated Storage Tank T-03-630 to atmosphere	Manually Operated
44	Blat Gate (BG-03-653)	Solids Handling Lower	Isolates foul air from TWAS Aerated Storage Tank T-03-640 to atmosphere	Manually Operated

4.6.2 Belt Filter Press Sludge Dewatering

(Refer to Drawing P-618 in Appendix A)

The following table identifies the components related to Belt Filter Press Sludge Dewatering System.

No.	Component	Location	Function performed	Remarks
1	Plug Valve (PLV-03-660)	Solids Handling Lower	Cross connection between TWAS storage tanks discharge	
2	Plug Valve (PLV-03-661)	Solids Handling Lower	Isolates TWAS suction to BFP feed pump P-03-630	
3	Ball Valve (BV-03-662)	Solids Handling Lower	Isolates PI-664	
4	Ball Valve (BV-03-663)	Solids Handling Lower	Drains line to PI-664	
5	Pressure Indicator (PI-03-664)	Solids Handling Lower	Indicates pressure at suction of BFP Feed Pump P-03-630	
6	Belt Filter Press Feed Pump (P-03-630)	Solids Handling Lower	Pumps TWAS to Belt Filter Press BFP-03-650	Plant Control System Controlled

No.	Component	Location	Function performed	Remarks
7	Ball Valve (BV-03-666)	Solids Handling Lower	Isolates PI-668/PSH-669	
8	Ball Valve (BV-03-667)	Solids Handling Lower	Drains line to PI-668/PSH-669	
9	Pressure Indicator (PI-03-668)	Solids Handling Lower	Indicates pressure at discharge of BFP feed pump P-03-630	
10	Pressure Switch (PSH-669)	Solids Handling Lower	Transmits pressure at discharge of BFP Feed Pump P-03-630	Signal to Plant Control System
11	Check Valve (CV-03-670)	Solids Handling Lower	Prevents TWAS backflow to BFP Feed Pump P-03-630	
12	Plug Valve (PLV-03-672)	Solids Handling Lower	BFP Feed Pump P-03-630 discharge	
13	Plug Valve (PLV-03-681)	Solids Handling Lower	Isolates suction of BFP Feed Pump P-03-640	
14	Ball Valve (BV-03-682)	Solids Handling Lower	Isolates PI-684	
15	Ball Valve (BV-03-683)	Solids Handling Lower	Drains line to PI-684	
16	Pressure Indicator (PI-03-684)	Solids Handling Lower	Indicates pressure at suction of BFP Feed Pump P-03-640	
17	Belt Filter Press Feed Pump (P-03-640)	Solids Handling Lower	Pumps TWAS to Belt Filter Press BFP-03-650	Plant Control System Controlled
18	Ball Valve (BV-03-686)	Solids Handling Lower	Isolates PI-688 / PSH-689	
19	Ball Valve (BV-03-687)	Solids Handling Lower	Drains line to PI-688 / PSH-689	
20	Pressure Indicator (PI-03-688)	Solids Handling Lower	Indicates pressure at discharge of BFP Feed Pump P-03-640	
21	Pressure Switch (PSH-689)	Solids Handling Lower	Transmits pressure at discharge of BFP Feed Pump P-03-640	Signal to Plant Control System
22	Check Valve (CV-03-690)	Solids Handling Lower	Prevents backflow to BFP Pump P-03-640	
23	Plug Valve (PLV-03-692)	Solids Handling Lower	Isolates BFP Pump P-03-640 discharge	Manually Operated
24	Flow Meter (FE-695, FM-03-695)	Solids Handling Lower	Measures TWAS flow to belt filter press BFP-03-650	Plant Control System Controlled
25	Plug Valve (PLV-03-693)	Solids Handling Lower	Isolates suction of flow meter FM-03-695 upstream	

No.	Component	Location	Function performed	Remarks
26	Plug Valve (PLV-03-696)	Solids Handling Lower	Isolates discharge of flow meter FM-03-695 downstream	
27	Mixer (MXR-03-698)	Solids Handling Upper	Mixes TWAS with polymer	
28	Belt Filter Press (BFP-03-650)	Solids Handling Upper	Dewaters TWAS	Plant Control System Controlled
29	Butterfly valve (BFV-03-699)	Solids Handling Upper	Isolates filtrate flow from Belt Filter Press BFP-03-650 to Influent Pumps Station Wet Well	Manually Operated
30	Booster Pump (P-03-670)	Solids Handling Upper	Boosts non-potable water pressure to feed Belt Filter Press BFP-03-650	BFP System Controlled
31	Pressure Indicating Transmitter (PIT-606)	Solids Handling Upper	Indicates booster pump discharge pressure	
32	Ball Valve (BV-03-603)	Solids Handling Upper	Isolates non-potable water flow to Booster Pump (P-03-670)	Manually Operated
33	Check Valve (CV-03-601)	Solids Handling Upper	Avoids polymer solution backflow to BFP Polymer Dosing Pumps	
34	Ball Valve (BV-03-602)	Solids Handling Upper	Isolates polymer solution flow to Belt Filter Press BFP-03-650	Manually Operated
35	Ball Valve (BV-03-1500)	Solids Handling Upper	Isolates non-potable water flow to BFP-03-650 at discharge of Booster Pump (P-03-670)	Manually Operated
36	Compressor (C-03-651)	Solids Handling Upper	Controlled by Belt Filter Press Control System	Supplier: Phoenix Process Equipment Co.

4.6.3 Belt Filter Press Polymer Feed System

(Refer to Drawing P-619 and P-620 in Appendix A)

The following table identifies the components related to Belt Filter Press Polymer Feed System.

No.	Component	Location	Function performed	Remarks
1	BFP Polymer Vacuum Conveyor (VAC-04-910)	Chemical Dosing Upper	Conveys dry polymer to the polymer feeder	

No.	Component	Location	Function performed	Remarks
2	Level Sensor Low (LSL-04-910)	Chemical Dosing Upper	Senses low level in DAF Polymer Vacuum Conveyor	Plant Control System Controlled
3	BFP Feeder Hopper Polymer Agitator (PAG-04-920)	Chemical Dosing Upper	Agitates solids polymer	
4	BFP Polymer Screw Feeder (PSF-04-930)	Chemical Dosing Upper	Conveys solid polymer to the wetting cone	
5	Ball Valve (BV-04-910)	Chemical Dosing Upper	Potable water isolation	
6	Pressure Switch Low (PSL-04-911)	Chemical Dosing Upper	Potable water line low pressure signal	
7	Pressure Indicator (PI-04-912)	Chemical Dosing Upper	Potable water line pressure indication	
8	Solenoid Valve (SV-04-913)	Chemical Dosing Upper		
9	Solenoid Valve (SV-04-914)	Chemical Dosing Upper	Controls Potable water flow	
10	Ball Check Valve (BV-04-916)	Chemical Dosing Upper	Isolate potable water flow to wetting cone	
11	Ball Check Valve (BV-04-917)	Chemical Dosing Upper	Isolate potable water flow to wetting cone	
12	Injector (IJ-04-915)	Chemical Dosing Upper	Mixes solid polymer with potable water	
13	Check Valve (CV-04-918)	Chemical Dosing Upper	Avoids polymer solution backflow to injector IJ-04-915	
14	On-line Mixer (SM-04-919)	Chemical Dosing Upper	Mixes polymer solution	
15	BFP Polymer Mixer (MXR-04-960)	Chemical Dosing Upper	Polymer mixing	
16	BFP Polymer Mixing Tank (T-04-940)	Chemical Dosing Upper	Mixes polymer in polymer mixing tank	
17	Electrically Operated Butterfly Valve (BV-04-943)	Chemical Dosing Upper	Controls flow of polymer solution from polymer mixing tank to polymer aging tank	Plant Control System Controlled
18	Ball Valve (BV-04-944)	Chemical Dosing Upper	Isolates drain from polymer mixing tank	
19	Polymer Analyzer (AIT-04-941)	Chemical Dosing Upper	Measures conductivity in polymer mixing tank	
20	Level Transmitter (LIT-04-942)	Chemical Dosing Upper	Indicates/transmits level in polymer mixing tank	

No.	Component	Location	Function performed	Remarks
21	Ball Valve (BV-04-944)	Chemical Dosing Upper	Isolates drain from polymer mixing tank	
22	BFP Polymer Aging Tank (T-04-950)	Chemical Dosing Upper	Stores polymer solution for dosing	
23	Polymer Analyzer (AE-04-945)	Chemical Dosing Upper	Measures conductivity in polymer aging tank	
24	Level Transmitter (LIT-04-946)	Chemical Dosing Upper	Indicates/transmits level in polymer aging tank	
25	Ball Valve (BV-04-947)	Chemical Dosing Upper	Isolates polymer solution suction to BFP Polymer Dosing Pumps	
26	Ball Valve (BV-04-950)	Chemical Dosing Upper	Isolates drain from polymer aging tank	
27	Ball Valve (BV-04-960)	Chemical Dosing Upper	Isolates suction flow to Polymer Dosing Pump P-04-970	
28	Ball Valve (BV-04-962)	Chemical Dosing Upper	Isolates flow to Calibration Column CC-04-990	
29	Calibration Colum (CC-04-990)	Chemical Dosing Upper	Used to confirm polymer flow from Polymer Dosing Pumps	
30	BFP Polymer Dosing Pump (P-04-970)	Chemical Dosing Upper	Polymer dosing to BFP-03-650	
31	Temperature Element (TE-04-966)	Chemical Dosing Upper	Senses temperature in stator of Polymer Dosing Pump P-04-970 for over-heating protection	Signal to Plant Control System
32	Ball Valve (BV-04-985)	Chemical Dosing Upper	Isolates PSH-987	
33	Pressure Switch (PSH-04-987)	Chemical Dosing Upper	Senses high pressure in polymer pump discharge of Polymer Dosing Pump P-04-970	Signal to Plant Control System
34	Ball Valve (BV-04-964)	Chemical Dosing Upper	Isolates polymer solution to drain	
35	Ball Valve (BV-04-970)	Chemical Dosing Upper	Isolates discharge of Polymer Dosing Pump P-04-970 to BFP-03-650	
36	Ball Valve (BV-04-972)	Chemical Dosing Upper	Isolates discharge of P-04-970/980	
37	Pressure Release Valve (PRV-04-968)	Chemical Dosing Upper	Releases pressure at discharge of Polymer Dosing Pump P-04-970	

No.	Component	Location	Function performed	Remarks
38	Ball Valve (BV-04-961)	Chemical Dosing Upper	Isolates suction flow to Polymer Dosing Pump P-04-980	
39	Ball Valve (BV-04-963)	Chemical Dosing Upper	Isolates flow to Calibration Column CC-04-990	
40	BFP Polymer Dosing Pump (P-04-980)	Chemical Dosing Upper	Polymer dosing to BFP-03-650	
41	Temperature Element (TE-04-967)	Chemical Dosing Upper	Senses temperature in stator of Polymer Dosing Pump P-04-980 for over-heating protection	Signal to Plant Control System
42	Ball Valve (BV-04-988)	Chemical Dosing Upper	Isolates PSH-990	
43	Pressure Switch (PSH-04-990)	Chemical Dosing Upper	Senses high pressure in polymer pump discharge of Polymer Dosing Pump P-04-970	Signal to Plant Control System
44	Ball Valve (BV-04-965)	Chemical Dosing Upper	Isolates polymer solution to drain	
45	Ball Valve (BV-04-971)	Chemical Dosing Upper	Isolates discharge of Polymer Dosing Pump P-04-980 to BFP-03-650	
46	Ball Valve (BV-04-973)	Chemical Dosing Upper	Isolates polymer line at discharge of Pump P-04-980	Supplier: Veolia Water Technologies Canada
47	Ball Valve (BV-04-974)	Chemical Dosing Upper	Isolates polymer line at discharge of Pump P-04-970	Supplier: Veolia Water Technologies Canada
48	Pressure Release Valve (PSV-04-969)	Chemical Dosing Upper	Releases pressure at discharge of Polymer Dosing Pump P-04-980	
49	Flow Meter (FIT-04-999, FM-04-999)	Chemical Dosing Upper	Measures polymer solution flow to BFP-03-650	Signal to Plant Control System
50	Backpressure Valve (BPV-04-990)	Chemical Dosing Upper	Avoids polymer solution backflow to Polymer Dosing Pump P-04-970	
51	Backpressure Valve (BPV-04-991)	Chemical Dosing Upper	Avoids polymer solution backflow to Polymer Dosing Pump P-04-980	
52	Pressure Regulating Valve (PRV-04-980)	Chemical Dosing Upper	Regulates potable water line pressure to BFP Polymer Dosing skid	

No.	Component	Location	Function performed	Remarks
53	Ball Valve (BV-04-981)	Chemical Dosing Upper	Isolates potable water flow to BFP Polymer Dosing skid	
54	Solenoid Valve (SV-04-982)	Chemical Dosing Upper	Controls potable water flow to BFP Polymer Dosing skid	
55	Flow Indicator (FI-04-963)	Chemical Dosing Upper	Indicates potable water flow to BFP Polymer Dosing skid	
56	Needle Valve (NV-04-984)	Chemical Dosing Upper	Used to adjust potable water flow to BFP Polymer Dosing skid	

END OF CHAPTER

CHAPTER 5

5. COMPONENT DETAILS

5.1 GENERAL OVERVIEW

The following tables describe the components of the various systems and provide some basic details and settings. For each table, there are drawings that can be referenced to better understand in what part of the Water Treatment Plant the components are located.

5.2 RAW WASTEWATER FLOW

(Refer to Drawing P-604 in Appendix A)

The following table identifies the components related to wastewater flow from the influent pump well to the coarse screens.

No.	Component	Details	Settings	Remarks
1	Influent Pump Station Wet Well (T-01-001)	2.6 m L x 2.6 m W x 7.2 m Depth	Water column inside wet well is 3.325 m max.	
2	Raw Wastewater Pump (P-01-110)	Flygt FP 3171 MT3-436 Submersible Chopper Pump	VFD, Max flow 150 L/s	Supplier: Xylem
3	Raw Wastewater Pump (P-01-120)	Flygt FP 3171 MT3-436 Submersible Chopper Pump	VFD, Max flow 150 L/s	Supplier: Xylem
4	Raw Wastewater Pump (P-01-130)	Flygt FP 3171 MT3-436 Submersible Chopper Pump	VFD, Max flow 150 L/s	Supplier: Xylem
5	Check Valve (CV-01-111)	Valmatic Swing Check Valve Series 7800LW, 200 mm	Normally Open	Supplier: Controles Laurentide
6	Check Valve (CV-01-112)	Valmatic Swing Check Valve Series 7800LW, 200 mm	Normally Open	Supplier: Controles Laurentide
7	Check Valve (CV-01-113)	Valmatic Swing Check Valve Series 7800LW, 200 mm	Normally Open	Supplier: Controles Laurentide
8	Plug Valve (PLV-01-111)	Valmatic Cam-Centric Series 5800R/5900R	Normally Open	Supplier: Controles Laurentide
9	Plug Valve (PLV-01-112)	Valmatic Cam-Centric Series 5800R/5900R	Normally Open	Supplier: Controles Laurentide
10	Plug Valve (PLV-01-113)	Valmatic Cam-Centric Series 5800R/5900R	Normally Open	Supplier: Controles Laurentide

No.	Component	Details	Settings	Remarks
11	Air/Vacuum Release Valve (ARV-01-100)	DeZurik Apco/Hilton SU,3,SCAV,F1,S2,R516-NBR-S2-S2-S2*VTO	Normally Closed. Opens when air in the pipeline	Supplier: Les Controles Provan Assovies (Dezurik)
12	Flow Meter (FQIT-150, FM-01-150)	Endress + Hauser, Promag W400-5W4C2HCKL7/0, 200 mm	Plant flow range 0 – 151 L/s	Supplier: Endress + Hauser Canada
13	Level Indicating Transmitter (LIT-100)	SITRANS LUT-420	Water colum height range inside wet well 0 – 3.3 m	Supplier: Vision Solutions de Procedes
14	Level Switch (LSLL-111)	Xylem ENM-10 Level regulator		Supplier: Xylem
15	Level Switch (LSL-112)	Xylem ENM-10 Level regulator		Supplier: Xylem
16	Level Switch (LSH-113)	Xylem ENM-10 Level regulator		Supplier: Xylem
17	Level Switch (LSHH-114)	Xylem ENM-10 Level regulator		Supplier: Xylem

5.3 FINE SCREENS

(Refer to Drawing P-605 in Appendix A)

The following table identifies the components related to the flow of wastewater through the fine screens.

No.	Component	Details	Settings	Remarks
1	Motorized Knife Gate Valve (KV-01-211)	Orbinox EX Series 10, 250 mm	Normally open when Shaftless Spiral Screen SCRN-01-210 is operating	Supplier: Controles Laurentide
2	Knife Gate Valve (KV-01-212)	Orbinox EX Series 10, 250 mm	Manual Operation. Normally open	Supplier: Controles Laurentide
3	Fine Screen (SCRN-01-210)	SPECO Wastewater Tank mounted Screw Screen GCPC600, Perforated plate 6 mm opening	151 L/s max. capacity	Supplier: Enviro-Care
4	Level Indicating Transmitter (LIT-211)	Ultrasonic level sensor CID1, Echomax ST-H, Siemens Hydroranger	Height range: 0 – 1.4 m (approx.	Supplier: Enviro-Care

No.	Component	Details	Settings	Remarks
		200 level control (Vendor Package)	screen tank depth)	
5	Pressure Reducing Valve (PRV-01-110)	Fisher MR95H-51, 25 mm	274 – 414 kPa	Supplier: Controles Laurentide
6	Ball Valve (BV-01-112)	SPECO Wastewater Tank mounted Screw Screen GCPC600 (Vendor package)	Normally Open	Supplier: Enviro-Care
7	Ball Valve (BV-01-123)	SPECO Wastewater Tank mounted Screw Screen GCPC600 (Vendor package)	Normally Open	Supplier: Enviro-Care
8	Solenoid Valve (SV-01-120)	ASCO, 13 mm (Vendor package)	Controlled by Screen control system	Supplier: Enviro-Care
9	Solenoid Valve (SV-01-122)	ASCO, 25 mm (Vendor package)	Controlled by Screen control system	Supplier: Enviro-Care
10	Motorized Knife Gate Valve (KV-01-221)	Orbinox EX Series 10, 250 mm	Normally open when Shaftless Spiral Screen SCRN-01-220 is operating	Supplier: Controles Laurentide
11	Knife Gate Valve (KV-01-222)	Orbinox EX Series 10, 250 mm	Manual Operation. Normally open	Supplier: Controles Laurentide
12	Fine Screen (SCRN-01-220)	SPECO Wastewater Tank mounted Screw Screen GCPC600, Perforated plate 6 mm opening	151 L/s max. capacity	Supplier: Enviro-Care
13	Level Indicating Transmitter (LIT-221)	Ultrasonic level sensor CID1, Echomax ST-H, Siemens Hydroranger 200 level control (Vendor Package)	Height range: 0 – 1.4 m (approx. screen tank depth)	Supplier: Enviro-Care
14	Ball Valve (BV-01-114)	SPECO Wastewater Tank mounted Screw Screen GCPC600 (Vendor package)	274 – 414 kPa	Supplier: Enviro-Care
15	Ball Valve (BV-01-127)	SPECO Wastewater Tank mounted Screw Screen GCPC600 (Vendor package)	Normally Open	Supplier: Enviro-Care

No.	Component	Details	Settings	Remarks
16	Solenoid Valve (SV-01-124)	ASCO, 13 mm (Vendor package)	Normally Open	Supplier: Enviro-Care
17	Solenoid Valve (SV-01-126)	ASCO, 25 mm (Vendor package)	Controlled by Screen control system	Supplier: Enviro-Care
18	Motorized Knife Gate Valve (KV-01-112)	Orbinox EX Series, 400 mm	Normally Closed. Operated by Operator as Required	Supplier: Controles Laurentide
19	Motorized Knife Gate Valve (KV-01-112A)	Orbinox EX Series, 200 mm	Normally Closed. Operated by Operator as Required	Supplier: Controles Laurentide
20	Knife Gate Valve (KV-01-232)	Orbinox EX Series, 350 mm	Manually Operated. Normally Closed.	Supplier: Controles Laurentide

5.4 PRIMARY FILTRATION

(Refer to Drawing P-606, P-607, and P-608 in Appendix A)

The following table identifies the components related to the flow of wastewater through the primary filters.

No.	Component	Details	Settings	Remarks
1	Motorized Knife Gate Valve (KV-01-111, FV-111)	Orbinox EX Series, 350 mm	Normally Open when Filter Operating	Supplier: Controles Laurentide
2	Primary Filter Belt PF-01-310	Salness filter Model SF6000	121 L/s Max capacity	Supplier: Trojan Technologies
3	Primary Filter Screw Press SP-01-330	Salness filter Model SF6000 (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
4	Ball Valve Influent Sampling Port	2 PC Full Port 1000 WOG	Manually Operated	Supplier: Trojan Technologies
5	Ball Valve Effluent Sampling Port	2 PC Full Port 1000 WOG	Manually Operated	Supplier: Trojan Technologies

No.	Component	Details	Settings	Remarks
6	Solenoid Valve (PLV-01-113)	Asco, as part of Salness filter Model SF6000 (Vendor Package)	Controlled by filter control system	Supplier: Trojan Technologies
7	Ball Valve (BV-01-310)	Jenkins 600 CWP/150 SWP 201 J, 25 mm	Manually Operated	Supplier: Jenkins
8	Pressure Regulating Valve (PRV-01-311)	Fisher MR95H-51, 25 mm	600 kPa	Supplier: Controles Laurentide
9	Ball Valve (BV-01-314)	Jenkins 600 CWP/150 SWP 201 J, 12 mm	Manually Operated	Supplier: Jenkins
10	Solenoid Valve (SV-01-312)	Asco, as part of Salness filter Model SF6000 (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
11	Ball Valve (BV-01-320)	Jenkins 600 CWP/150 SWP 201 J, 25 mm	Manually Operated	Supplier: Jenkins
12	Pressure Regulating Valve (PRV-01-321)	Fisher MR95H-51, 25 mm	400-600 kPa	Supplier: Controles Laurentide
13	Ball Valve (BV-01-324)	Jenkins 600 CWP/150 SWP 201 J, 12 mm	Manually Operated	Supplier: Jenkins
14	Solenoid Valve (SV-01-322)	Asco, part of Salness filter Model SF6000 (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
15	Motorized Knife Gate Valve (KV-01-121, FV-121)	Orbinox EX Series, 350 mm	Normally Open when Filter Operating	Supplier: Controles Laurentide
16	Primary Filter Belt PF-01-320	Salness filter Model SF6000 (Vendor Package)	121 L/s Max capacity	Supplier: Trojan Technologies
17	Primary Filter Screw Press SP-01-340	Salness filter Model SF6000 (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
18	Ball Valve Influent Sampling Port	2 PC Full Port 1000 WOG	Manually Operated	Supplier: Trojan Technologies
19	Ball Valve Effluent Sampling Port	2 PC Full Port 1000 WOG	Manually Operated	Supplier: Trojan Technologies
20	Solenoid Valve (SV-01-123)	Asco, part of Salness filter Model SF6000 (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
21	Ball Valve (BV-01-315)	Jenkins 600 CWP/150 SWP 201 J, 12 mm	Manually Operated	Supplier: Jenkins
22	Solenoid Valve (SV-01-313)	Asco, as part of Salness filter Model SF6000 (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
23	Ball Valve (BV-01-325)	Jenkins 600 CWP/150 SWP 201 J, 12 mm	Manually Operated	Supplier: Jenkins

No.	Component	Details	Settings	Remarks
24	Solenoid Valve (SV-01-323)	Asco, as part of Salness filter Model SF6000 (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
25	Motorized Knife Gate Valve (KV-01-001, FV-001)	Orbinox EX Series, 250 mm	Normally Closed. Open by Operator only in Required Extreme Case of Water Bypass	Supplier: Controles Laurentide
26	Headworks Bridge Crane Hoist	Pro-Tech Pont Rulant, Columbus 5626 A	Manual Operated for Filter cartridge Removal during Maintenance	Supplier: Pro-Tech-Pont Roulant
27	Primary Filter Blower (B-02-210)	Kasser BB69C 10 HP (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
28	Primary Filter Blower Fan (F-02-215)	Part of Kasser BB69C 10 HP (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
29	Air Filter (AF-02-212)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
30	Silencer (SLR-02-213)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
31	Silencer (SLR-02-214)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
32	Pressure Indicator (PI-02-217)	Part of Kasser BB69C 10 HP (Vendor Package)	0-100 kPa	Supplier: Trojan Technologies
33	Check Valve (CV-02-215)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
34	Ball Valve (BV-02-219)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
35	Pressure Safety Valve (PSV-02-218)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
36	Primary Filter Blower (B-02-220)	Kasser BB69C 10 HP (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
37	Primary Filter Blower Fan (F-02-225)	Part of Kasser BB69C 10 HP (Vendor Package)	Controlled by Filter Control System	Supplier: Trojan Technologies
38	Air Filter (AF-02-222)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies

No.	Component	Details	Settings	Remarks
39	Silencer (SLR-02-223)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
40	Silencer (SLR-02-224)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
41	Pressure Indicator (PI-02-227)	Part of Kasser BB69C 10 HP (Vendor Package)	0-100 kPa	Supplier: Trojan Technologies
42	Butterfly Valve (BFV-02-216)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Controles Laurentide
43	Butterfly Valve (BFV-02-226)	Part of Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Controles Laurentide
44	Check Valve (CV-02-215)	Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
45	Ball Valve (BV-02-229)	Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies
46	Pressure Safety Valve (PSV-02-228)	Kasser BB69C 10 HP (Vendor Package)	Manual Operation	Supplier: Trojan Technologies

5.5 SECONDARY TREATMENT

5.5.1 Aeration Blowers

(Refer to Drawing P-609 in Appendix A)

The following table identifies the components related to aeration blower to the secondary system.

No.	Component	Details	Settings	Remarks
1	Air Filter (AF-02-112)	Parto f Aerzen GM-15L, 25HP (vendor package)	1.62 – 13.1 m^3/min	Supplier: Veolia Water Technologies Canada
2	Silencer (SLR-02-113)	Part of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
3	Pressure Indicator (PI-107)	Wika, Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
4	Pressure Switch (PSL-108)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
5	Ball Valve (BV-02-106)	Part of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier:
6	Process Aeration Blower (B-02-110)	Aerzen GM-15L, 25HP (vendor package)	Controlled by Plant Control System	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
7	Silencer (SLR-02-114)	Parto f Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
8	Pressure Safety Valve (PSV-02-117)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
9	Ball Valve (BV-02-116)	Parto f Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
10	Pressure Indicator (PI-02-117)	Wika, Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
11	Pressure Switch (PSL-02-118)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
12	Temperature Indicator (TI-02-119)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
13	Temperature Switch (TI-02-120)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
14	Temperature Switch (TI-02-180)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
15	Check Valve (CV-02-115)	Parto f Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
16	Butterfly Valve (BFV-02-116)	Emerson Keystone K-LOK Series 36, 150 mm	Normally Open. Manual Operation	Supplier: Controles Laurentide
17	Air Filter (AF-02-122)	Parto f Aerzen GM-15L, 25HP (vendor package)	1.62 – 13.1 m^3/min	Supplier: Veolia Water Technologies Canada
18	Silencer (SLR-02-123)	Part of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
19	Ball Valve (BV-02-141)	Part of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
20	Pressure Indicator (PI-02-142)	Wika, Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
21	Pressure Switch (PSL-02-143)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
22	Process Aeration Blower (B-02-120)	Aerzen GM-15L, 25HP (vendor package)	Controlled by Plant Control System	Supplier:
23	Silencer (SLR-02-124)	Parto of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
24	Pressure Safety Valve (PSV-02-127)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
25	Ball Valve (BV-02-126)	Part of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
26	Pressure Indicator (PI-02-127)	Wika, Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
27	Pressure Switch (PSL-02-128)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
28	Temperature Indicator (TI-02-129)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
29	Temperature Switch (TI-02-130)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
30	Temperature Switch (TI-02-185)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
31	Check Valve (CV-02-125)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
32	Butterfly Valve (BFV-02-126)	Emerson Keystone K-LOK Series 36, 150 mm	Normally Open. Manual Operation	Supplier: Controles Laurentide
33	Air Filter (AF-02-132)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
34	Silencer (SLR-02-133)	Part of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
35	Ball Valve (BV-02-144)	Part of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
36	Pressure Indicator (PI-02-145)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
37	Pressure Switch (PSL-02-146)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
38	Process Aeration Blower (B-02-130)	Aerzen GM-15L, 25HP (vendor package)		Supplier:
39	Silencer (SLR-02-134)	Part of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
40	Pressure Safety Valve (PSV-02-137)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
41	Ball Valve (BV-02-136)	Part of Aerzen GM-15L, 25HP (vendor package)	Manual Operation	Supplier: Veolia Water Technologies Canada
42	Pressure Indicator (PI-02-137)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
43	Pressure Switch (PSL-02-138)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
44	Temperature Indicator (TI-02-139)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
45	Temperature Switch (TI-02-140)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
46	Temperature Switch (TI-02-190)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
47	Check Valve (CV-02-135)	Part of Aerzen GM-15L, 25HP (vendor package)		Supplier: Veolia Water Technologies Canada
48	Butterfly Valve (BFV-02-136)	Emerson Keystone K-LOK Series 36, 150 mm	Manually Operated. Normally Open	Supplier: Controles Laurentide
49	Pressure transmitter (PIT-02-195)		Signal to Plant Control System	Supplier:
50	Butterfly Valve (BFV-02-151)	Emerson Keystone K-LOK Series 36, 150 mm	Normally Open. Manual Operation	Supplier: Controles Laurentide
51	Motorized Butterfly Valve (BFV-02-150)	Emerson Keystone K-LOK Series 36, 150 mm	Modulating Controlled by Plant	Supplier: Controles Laurentide

No.	Component	Details	Settings	Remarks
			Control System	
52	Flow meter (FM-02-152, FE-02-152)	Endress & Hauser, t-mass 651, 651-20AA0AD5RABABA	Min Flow: 1.6 m^3/min Nominal Flow: 13.1 m^3/min Max Flow: 50 m^3/min	Supplier: Endress & Hauser
53	Butterfly Valve (BFV-02-153)	Emerson Keystone K-LOK Series 36, 150 mm	Normally Open. Manual Operation	Supplier: Controles Laurentide
54	Motorized Butterfly Valve (BFV-02-155)	Emerson Keystone K-LOK Series 36, 150 mm		Supplier: Controles Laurentide
55	Flow meter (FM-02-156, FE-02-156)	Endress & Hauser, t-mass 651, 651-20AA0AD5RABABA	Min Flow: 1.6 m^3/min Nominal Flow: 13.1 m^3/min Max Flow: 50 m^3/min	Supplier: Endress & Hauser
56	Butterfly Valve (BFV-02-171)	Emerson Keystone K-LOK Series 36, 150 mm	Normally Open. Manual Operation	Supplier: Controles Laurentide
57	Motorized Butterfly Valve (BFV-02-170)	Emerson Keystone K-LOK Series 36, 150 mm		Supplier: Controles Laurentide
58	Flow meter (FM-02-172, FE-02-172)	Endress & Hauser, t-mass 651, 651-20AA0AD5RABABA	Min Flow: 1.6 m^3/min Nominal Flow: 13.1 m^3/min Max Flow: 50 m^3/min	Supplier: Endress & Hauser

5.5.2 Moving Bed Bioreactors (MBBR)

(Refer to Drawing P-610 in Appendix A)

The following table identifies the components related to Moving Bed Bioreactors.

No.	Component	Details	Settings	Remarks
1	Motorized Knife Gate Valve (KV-02-211, FV-211)	Orbinox EX Series, 350 mm	ON/Off Operation.	Supplier: Controles Laurentide

No.	Component	Details	Settings	Remarks
			Controlled by Plant Control System. Normally Open when MBBR Train 1 Operating	
2	MBBR 1 (T-02-210)	Veolia MBBR - K5 AnoxKaldnes media (Vendor Package)	196 m^3 MBBR Capacity. 4.1 m Water Depth. 86 m^3 media.	Supplier: Veolia Water Technologies Canada
3	Dissolved Oxygen Analyzers (AIT-02-211)	Hach 9020000/LXV404.9900552 (Vendor Package)	Range: 0- 20 mg/L	Supplier: Veolia Water Technologies Canada
4	Dissolved Oxygen Analyzers (AIT-02-212)	Hach 9020000/LXV404.9900552 (Vendor Package)	Range: 0- 20 mg/L	Supplier: Veolia Water Technologies Canada
5	Level Switch High (LSH-02-213)	Flygt ENM-10		Supplier: Veolia Water Technologies Canada
6	Level Switch High (LSH-02-214)	Flygt ENM-10		Supplier: Veolia Water Technologies Canada
7	Butterfly Valve (BFV-02-181)	Emerson Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
8	Butterfly Valve (BFV-02-182)	Emerson Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
9	Butterfly Valve (BFV-02-183)	Emerson Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
10	Butterfly Valve (BFV-02-184)	Emerson Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
11	Motorized Knife Gate Valve (KV-02-221, FV-221)	Orbinox EX Series, 350 mm	ON/Off Operation. Controlled by Plant Control System.	Supplier: Controles Laurentide

No.	Component	Details	Settings	Remarks
			Normally Open when MBBR Train 2 Operating	
12	MBBR 2 (T-02-220)	Veolia MBBR - K5 AnoxKaldnes media (Vendor Package)	196 m^3 MBBR Capacity. 4.1 m Water Depth. 86 m^3 media.	Supplier: Veolia Water Technologies Canada
13	Dissolved Oxygen Analyzers (AIT-02-221)	Hach 9020000/LXV404.9900552 (Vendor Package)	Range: 0- 20 mg/L	Supplier: Veolia Water Technologies Canada
14	Dissolved Oxygen Analyzers (AIT-02-222)	Hach 9020000/LXV404.9900552 (Vendor Package)	Range: 0- 20 mg/L	Supplier: Veolia Water Technologies Canada
15	Level Switch High (LSH-02-223)	Flygt ENM-10		Supplier: Veolia Water Technologies Canada
16	Level Switch High (LSH-02-224)	Flygt ENM-10		Supplier: Veolia Water Technologies Canada
17	Butterfly Valve (BFV-02-191)	Emerson Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
18	Butterfly Valve (BFV-02-192)	Emerson Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
19	Butterfly Valve (BFV-02-193)	Emerson Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
20	Butterfly Valve (BFV-02-194)	Emerson Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
21	Knife Gate Valve (KV-02-230, FV-230)	Orbinox EX Series, 350 mm	Manual Operation. Normally Closed.	Supplier: Controles Laurentide

5.5.3 Dissolved Air Flotation (DAF) Clarification #1

(Refer to Drawing P-611 and P-612 in Appendix A)

The following table identifies the components related to Dissolved Air Flotation Clarification system #1.

No.	Component	Details	Settings	Remarks
1	Motorized Valve (BFV-02-312, FV-312)	Keystone, Series GR Resilient Seated Butterfly Valve, 350 mm	ON/OFF Operation. Controlled by Plant Control System. Normally Open when DAF Train 1 Operating	Supplier: Controle Laurentides
2	Globe Valve (GLV-02-313)	AKUJM07, Globe 200 WOG Stainless Steel, 19 mm	Air Purge Valve. Manual Operation.	Supplier: Veolia Water Technologies Canada
3	Motorized Butterfly Valve (BFV-02-625, FV-625)	Bray Series 31 (Vendor Package), 80 mm	ON/OFF Operation, Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
4	DAF Tank 1 (T-02-310)	Veolia Spidflow SFP-650 (Vendor Package)	60.4 L/s Capacity	Supplier: Veolia Water Technologies Canada
5	DAF 1 Sludge Scraper (DDR-02-311)	Veolia Chain Surface Surface Scraper System 5000218036-SA301-22, with 90 Series SK9033.1 Right Angle Helical-Bevel NORD drive and 0.18 kW NORD High Performance Motor, (Vendor Package)	Scrapper mechanism set for the DAF tank dimension by Veolia	Supplier: Veolia Water Technologies Canada
6	Level Transmitter (LIT-02-331)	Endress &Hauser PMP51-CA21JD1FGDR1JA1+AAZ1 (Vendor Package)	Measurement Range: 40 kPa. Overpressure: 600 kPa.	Supplier: Veolia Water Technologies Canada
7	Level Switch (LSH-02-332)	Xylem ENM-10 (Vendor Package)		Supplier: Veolia Water Technologies Canada
8	Level Switch (LSL-02-333)	Xylem ENM-10 (Vendor Package)		Supplier: Veolia Water Technologies Canada
9	TSS Analyzer (AIT-02-334)	Hach Solitax LXV328.99.10002 (Vendor Package)	Measuring Range TSS: 0.001 – 500 G/L. Measuring Range Turbidit	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
			y: 0.001 – 4000 FNU	
10	Butterfly Valve (BFV-02-165)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
11	Butterfly Valve (BFV-02-166)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
12	Butterfly Valve (BFV-02-170)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
13	Butterfly Valve (BFV-02-171)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
14	Butterfly Valve (BFV-02-172)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
15	Plug Valve (PLV-02-301)	Pratt Plug Valve #611A-E1-L-2" (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
16	Plug Valve (PLV-02-302)	Vendor Package, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
17	Plug Valve (PLV-02-303)	Vendor Package, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
18	Plug Valve (PLV-02-304)	Vendor Package, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
19	Plug Valve (PLV-02-305)	Vendor Package, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
20	Pneumatic Actuated Butterfly Valve (BFV-02-309)	311200-11011390 Bray Series 31 (Vendor Package), 300 mm	Modulating Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
21	Pneumatic Actuated Butterfly Valve (BFV-02-310)	311200-11011390 Bray Series 31 (Vendor Package), 300 mm	Modulating Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
22	Plug valve (PLV-02-306)	ValMatic Cam-Centric Plug Valve, 100 mm	Manual Operation. Normally Open	Supplier: Controle Laurentides
23	Plug valve (PLV-02-307)	ValMatic Cam-Centric Plug Valve, 100 mm	Manual Operation. Normally Closed	Supplier: Controle Laurentides
24	Plug valve (PLV-02-308)	ValMatic Cam-Centric Plug Valve, 100 mm	Manual Operation. Normally Closed	Supplier: Controle Laurentides
25	Backpressure Valve (BPV-02-1100)	Chemline Plastics SB12 Series Backpressure/Relief Valve, 38 mm		Supplier: Veolia Water Technologies Canada
26	Butterfly Valve (BFV-02-317A)	Bray Series 31, 100 mm	Manual Operation. Normally open	Supplier: DM Valves
27	Flow meter (FE-02-317)	Endress & Hauser Electromagnetic Flowmeter Promag 400 5W4C80-C6ALHP2DUA1K0A+AAL4Z1(Vendor Package), 80 mm	Flow Range: 1.5 – 50 L/s	Supplier: Veolia Water Technologies Canada
28	Butterfly Valve (BFV-02-400)	Bray Series 31 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
29	Globe Valve (GLV-02-401)	Sharpe #SV45114030 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
30	Ball Valve (BV-02-410)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
31	Needle Valve (NV-02-411)	Built-in with AALBORG Flow indicator (Vendor Package),	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
32	Flow indicator (FI-02-412)	AALBORG V Medium Range PTFE Flow indicator (Vendor package), 10 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
33	Ball Valve (BV-02-402)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
34	Ball Valve (BV-02-403)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
35	Pressure Indicator (PI-02-404)	Ashcroft 25-1009SW-L-02L-30IMV&60 #with 02-310SS-02T-XCK (Vendor Package), 6 mm	Vacuum 4136 kPa	Supplier: Veolia Water Technologies Canada
36	Check Valve (CV-02-404)	FCC90B05, ½ FCC 90B 200 WOG, (Vendor Package) 13 mm		Supplier: Veolia Water Technologies Canada
37	DAF White Water Pump (P-02-410)	EDUR White Water Pump LBUX 602C 160 L (Vendor Package)	5.5 L/s @ 76 m TDH	Supplier: Veolia Water Technologies Canada
38	Ball Valve (BV-02-407)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
39	Ball Valve (BV-02-408)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
40	Pressure Indicator (PI-02-409)	Ashcroft 25-1009SW-L-02L-160# +02-310SS-02T-CG (Vendor Package), 6 mm	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
41	Check Valve (CV-02-405)	Bray Rite Check Valve V0415XE2205 (Vendor Package), 100 mm		Supplier: Veolia Water Technologies Canada
42	Butterfly Valve (BFV-02-406)	Bray Series 31 310400-1101030A (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
43	Butterfly Valve (BFV-02-415)	Bray Series 31 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
44	Globe Valve (GLV-02-416)	Sharpe #SV45114030 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
45	Ball Valve (BV-02-425)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
46	Needle Valve (NV-02-426)	Built-in with AALBORG Flow indicator (Vendor Package),	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
47	Flow indicator (FI-02-427)	AALBORG V Medium Range PTFE Flow indicator (Vendor package), 10 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
48	Ball Valve (BV-02-417)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
49	Ball Valve (BV-02-418)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
50	Pressure Indicator (PI-02-419)	Ashcroft 25-1009SW-L-02L-30IMV&60 #with 02-310SS-02T-XCK (Vendor Package), 6 mm	Vacuum 4136 kPa	Supplier: Veolia Water Technologies Canada
51	Check Valve (CV-02-428)	FCC90B05, ½ FCC 90B 200 WOG, (Vendor Package) 13 mm		Supplier: Veolia Water Technologies Canada
52	DAF White Water Pump (P-02-420)	EDUR White Water Pump LBUX 602C 160 L (Vendor Package)	5.5 L/s @ 76 m TDH	Supplier: Veolia Water Technologies Canada
53	Ball Valve (BV-02-422)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
54	Ball Valve (BV-02-423)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
55	Pressure Indicator (PI-02-424)	Ashcroft 25-1009SW-L-02L-160# +02-310SS-02T-CG (Vendor Package), 6 mm	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
56	Check Valve (CV-02-420)	Bray Rite Check Valve V0415XE2205 (Vendor Package), 100 mm		Supplier: Veolia Water Technologies Canada
57	Butterfly Valve (BFV-02-421)	Bray Series 31 310400-1101030A (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
58	Butterfly Valve (BFV-02-430)	Bray Series 31 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
59	Globe Valve (GLV-02-431)	Sharpe #SV45114030 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
60	Ball Valve (BV-02-440)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
61	Needle Valve (NV-02-441)	Built-in with AALBORG Flow indicator (Vendor Package),	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
62	Flow Indicator (FI-02-442)	AALBORG V Medium Range PTFE Flow indicator (Vendor package), 10 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
63	Ball Valve (BV-02-432)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
64	Ball Valve (BV-02-433)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
65	Pressure Indicator (PI-02-434)	Ashcroft 25-1009SW-L-02L-30IMV&60 #with 02-310SS-02T-XCK (Vendor Package), 6 mm	Vacuum 4136 kPa	Supplier: Veolia Water Technologies Canada
66	Check Valve (CV-02-443)	FCC90B05, ½ FCC 90B 200 WOG, (Vendor Package) 13 mm		Supplier: Veolia Water Technologies Canada
67	DAF White Water Pump (P-02-430)	EDUR White Water Pump LBUX 602C 160 L (Vendor Package)	5.5 L/s @ 76 m TDH	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
68	Ball Valve (BV-02-437)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
69	Ball Valve (BV-02-438)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
70	Pressure Indicator (PI-02-439)	Ashcroft 25-1009SW-L-02L-160# +02-310SS-02T-CG (Vendor Package), 6 mm	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
71	Check Valve (CV-02-435)	Bray Rite Check Valve V0415XE2205 (Vendor Package), 100 mm		Supplier: Veolia Water Technologies Canada
72	Butterfly Valve (BFV-02-436)	Bray Series 31 310400-1101030A (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
73	Pressure Indication (PI-02-520	ASHCROFT 25-1009-SW-L-02-L-160# +02-310SS-02T-CG	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
74	Ball Valve (BV-02-523)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
75	Ball Valve (BV-02-527)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
76	Motorized Butterfly Valve (BFV-02-511)	Bray Series 31 (Vendor Package), 100 mm	ON/OFF Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
77	White Water Strainer 1 (STR-02-510)	IFC B150FSS4BW1-OB (Vendor Package), 100 mm inlet/outlet connections	Manual Operation	Supplier: Veolia Water Technologies Canada
78	Pressure Release Valve (PRV-02-527)	Part of the White Water Strainer (Vendor Package)		Supplier: Veolia Water Technologies Canada
79	Motorized Ball Valve (BV-02-512)	Flow-tek 7108-3R-R-L (Vendor Package), 50 mm	ON/OFF Operation.	Supplier: Veolia Water

No.	Component	Details	Settings	Remarks
			Controlled by DAF Control System	Technologies Canada
80	Butterfly Valve (BFV-02-513)	Bray Series 31 (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
81	Pressure Indicator (PI-02-510)	ASHCROFT 25-1009-SW-L-02-L-160# +02-310SS-02T-CG	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
82	Ball Valve (BV-02-510)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
83	Ball Valve (BV-02-511)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
84	Globe Valve (GLV-02-510)	KITZ AKUJM2 Globe 200 WOG, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
85	Motorized Butterfly Valve (BFV-02-521)	Bray Series 31 (Vendor Package), 100 mm	ON/OFF Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
86	White Water Strainer (STR-02-520)	IFC B150FSS4BW1-OB (Vendor Package), 100 mm inlet/outlet connections	Manual Operation	Supplier: Veolia Water Technologies Canada
87	Pressure Release Valve (PRV-02-528)	Part of the White Water Strainer (Vendor Package)		Supplier: Veolia Water Technologies Canada
88	Motorized Ball Valve (BV-02-522)	Flow-tek 7108-3R-R-L (Vendor Package), 50 mm	ON/OFF Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
89	Butterfly Valve (BFV-02-523)	Bray Series 31 (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
90	Pressure Indicator (PI-02-525)	ASHCROFT 25-1009-SW-L-02-L-160# +02-310SS-02T-CG	Range 0- 1103 kPa	Supplier: Veolia Water

No.	Component	Details	Settings	Remarks
				Technologies Canada
91	Ball Valve (BV-02-520)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
92	Ball Valve (BV-02-521)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
93	Globe Valve (GLV-02-520)	KITZ AKUJM2 Globe 200 WOG, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
94	Ball Valve (BV-02-525)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
95	Ball Valve (BV-02-526)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
96	Pressure Transmitter (PT-02-527)	Endress & Hauser PMP51-CA21JD1PGDRKJA1+AAZ1 (Vendor Package)	Range: 1MPA	Supplier: Veolia Water Technologies Canada

5.5.4 Dissolved Air Flotation (DAF) Clarification #2

(Refer to Drawing P-613 and P-614 in Appendix A)

The following table identifies the components related to Dissolved Air Flotation Clarification system #2.

No.	Component	Details	Settings	Remarks
1	Motorized Valve (BFV-02-332, FV-332)	Keystone, Series GR Resilient Seated Butterfly Valve, 350 mm	ON/OFF Operation. Controlled by Plant Control System. Normally Open when DAF Train 1 Operating	Supplier: Controle Laurentides
2	Globe Valve (GLV-02-333)	AKUJM07, Globe 200 WOG Stainless Steel, 19 mm	Air Purge Valve.	Supplier: Veolia Water

No.	Component	Details	Settings	Remarks
			Manual Operation.	Technologies Canada
3	Motorized Butterfly Valve (BFV-02-645, FV-645)	Bray Series 31 (Vendor Package), 80 mm	ON/OFF Operation, Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
4	DAF Tank (T-02-320)	Veolia Spidflow SFP-650 (Vendor Package)	60.4 L/s Capacity	Supplier: Veolia Water Technologies Canada
5	DAF Sludge Scraper (DDR-02-321)	Veolia Chain Surface Surface Scraper System 5000218036-SA301-22, with 90 Series SK9033.1 Right Angle Helical-Bevel NORD drive and 0.18 kW NORD High Performance Motor, (Vendor Package)	Scrapper mechanism set for the DAF tank dimension by Veolia	Supplier: Veolia Water Technologies Canada
6	Level Transmitter (LIT-02-341)	Endress &Hauser PMP51-CA21JD1FGDR1JA1+AAZ1 (Vendor Package)	Measurement Range: 40 kPa. Overpressure: 600 kPa.	Supplier: Veolia Water Technologies Canada
7	Level Switch (LSH-02-342)	Xylem ENM-10 (Vendor Package)		Supplier: Veolia Water Technologies Canada
8	Level Switch (LSL-02-343)	Xylem ENM-10 (Vendor Package)		Supplier: Veolia Water Technologies Canada
9	TSS Analyzer (AIT-02-344)	Hach Solitax LXV328.99.10002 (Vendor Package)	Measuring Range TSS: 0.001 – 500 G/L. Measuring Range Turbidity : 0.001 – 4000 FNU	Supplier: Veolia Water Technologies Canada
10	Butterfly Valve (BFV-02-365)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
11	Butterfly Valve (BFV-02-366)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
12	Butterfly Valve (BFV-02-370)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation.	Supplier: Veolia Water

No.	Component	Details	Settings	Remarks
			Normally Closed	Technologies Canada
13	Butterfly Valve (BFV-02-371)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
14	Butterfly Valve (BFV-02-372)	Bray Series 31 (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
15	Plug Valve (PLV-02-371)	Pratt Plug Valve #611A-E1-L-2" (Vendor Package), 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
16	Plug Valve (PLV-02-372)	Vendor Package, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
17	Plug Valve (PLV-02-373)	Vendor Package, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
18	Plug Valve (PLV-02-374)	Vendor Package, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
19	Plug Valve (PLV-02-375)	Vendor Package, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
20	Pneumatic Actuated Butterfly Valve (BFV-02-329)	311200-11011390 Bray Series 31 (Vendor Package), 300 mm	Modulating Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
21	Pneumatic Actuated Butterfly Valve (BFV-02-330)	311200-11011390 Bray Series 31 (Vendor Package), 300 mm	Modulating Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
22	Plug valve (PLV-02-326)	ValMatic Cam-Centric Plug Valve, 100 mm	Manual Operation. Normally Open	Supplier: Controle Laurentides
23	Plug valve (PLV-02-327)	ValMatic Cam-Centric Plug Valve, 100 mm	Manual Operation. Normally Closed	Supplier: Controle Laurentides

No.	Component	Details	Settings	Remarks
24	Plug valve (PLV-02-328)	ValMatic Cam-Centric Plug Valve, 100 mm	Manual Operation. Normally Closed	Supplier: Controle Laurentides
25	Backpressure Valve (BPV-02-1100)	Chemline Plastics SB12 Series Backpressure/Relief Valve, 38 mm		Supplier: Veolia Water Technologies Canada
26	Butterfly Valve (BFV-02-237A)	Bray Series 31, 100 mm	Manual Operation. Normally open	Supplier: DM Valves
27	Flow meter (FE-02-327)	Endress & Hauser Electromagnetic Flowmeter Promag 400 5W4C80-C6ALHP2DUA1K0A+AAL4Z1(Vendor Package), 80 mm	Flow Range: 1.5 – 50 L/s	Supplier: Veolia Water Technologies Canada
28	Butterfly Valve (BFV-02-450)	Bray Series 31 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
29	Globe Valve (GLV-02-451)	Sharpe #SV45114030 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
30	Ball Valve (BV-02-460)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
31	Needle Valve (NV-02-461)	Built-in with AALBORG Flow indicator (Vendor Package),	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
32	Flow indicator (FI-02-462)	AALBORG V Medium Range PTFE Flow indicator (Vendor package), 10 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
33	Ball Valve (BV-02-452)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
34	Ball Valve (BV-02-453)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
35	Pressure Indicator (PI-02-454)	Ashcroft 25-1009SW-L-02L-30IMV&60 #with 02-310SS-02T-XCK (Vendor Package), 6 mm	Vacuum 4136 kPa	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
36	Check Valve (CV-02-463)	FCC90B05, ½ FCC 90B 200 WOG, (Vendor Package) 13 mm		Supplier: Veolia Water Technologies Canada
37	DAF 2 White Water Pump 1 (P-02-440)	EDUR White Water Pump LBUX 602C 160 L (Vendor Package)	5.5 L/s @ 76 m TDH	Supplier: Veolia Water Technologies Canada
38	Ball Valve (BV-02-457)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
39	Ball Valve (BV-02-458)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
40	Pressure Indicator (PI-02-459)	Ashcroft 25-1009SW-L-02L-160# +02-310SS-02T-CG (Vendor Package), 6 mm	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
41	Check Valve (CV-02-455)	Bray Rite Check Valve V0415XE2205 (Vendor Package), 100 mm		Supplier: Veolia Water Technologies Canada
42	Butterfly Valve (BFV-02-456)	Bray Series 31 310400-1101030A (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
43	Butterfly Valve (BFV-02-465)	Bray Series 31 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
44	Globe Valve (GLV-02-466)	Sharpe #SV45114030 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
45	Ball Valve (BV-02-475)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
46	Needle Valve (NV-02-476)	Built-in with AALBORG Flow indicator (Vendor Package),	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
47	Flow indicator (FI-02-477)	AALBORG V Medium Range PTFE Flow indicator (Vendor package), 10 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
48	Ball Valve (BV-02-467)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
49	Ball Valve (BV-02-468)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
50	Pressure Indicator (PI-02-469)	Ashcroft 25-1009SW-L-02L-30IMV&60 #with 02-310SS-02T-XCK (Vendor Package), 6 mm	Vacuum 4136 kPa	Supplier: Veolia Water Technologies Canada
51	Check Valve (CV-02-478)	FCC90B05, ½ FCC 90B 200 WOG, (Vendor Package) 13 mm		Supplier: Veolia Water Technologies Canada
52	DAF White Water Pump 2 (P-02-450)	EDUR White Water Pump LBUX 602C 160 L (Vendor Package)	5.5 L/s @ 76 m TDH	Supplier: Veolia Water Technologies Canada
53	Ball Valve (BV-02-472)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
54	Ball Valve (BV-02-473)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
55	Pressure Indicator (PI-02-474)	Ashcroft 25-1009SW-L-02L-160# +02-310SS-02T-CG (Vendor Package), 6 mm	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
56	Check Valve (CV-02-470)	Bray Rite Check Valve V0415XE2205 (Vendor Package), 100 mm		Supplier: Veolia Water Technologies Canada
57	Butterfly Valve (BFV-02-471)	Bray Series 31 310400-1101030A (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
58	Butterfly Valve (BFV-02-480)	Bray Series 31 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
59	Globe Valve (GLV-02-481)	Sharpe #SV45114030 (Vendor Package), 80 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
60	Ball Valve (BV-02-490)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
61	Needle Valve (NV-02-491)	Built-in with AALBORG Flow indicator (Vendor Package),	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
62	Flow Indicator (FI-02-492)	AALBORG V Medium Range PTFE Flow indicator (Vendor package), 10 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
63	Ball Valve (BV-02-482)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
64	Ball Valve (BV-02-483)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
65	Pressure Indicator (PI-02-484)	Ashcroft 25-1009SW-L-02L-30IMV&60 #with 02-310SS-02T-XCK (Vendor Package), 6 mm	Vacuum 4136 kPa	Supplier: Veolia Water Technologies Canada
66	Check Valve (CV-02-493)	FCC90B05, ½ FCC 90B 200 WOG, (Vendor Package) 13 mm		Supplier: Veolia Water Technologies Canada
67	DAF White Water Pump (P-02-460)	EDUR White Water Pump LBUX 602C 160 L (Vendor Package)	5.5 L/s @ 76 m TDH	Supplier: Veolia Water Technologies Canada
68	Ball Valve (BV-02-487)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
69	Ball Valve (BV-02-488)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
70	Pressure Indicator (PI-02-489)	Ashcroft 25-1009SW-L-02L-160# +02-310SS-02T-CG (Vendor Package), 6 mm	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
71	Check Valve (CV-02-485)	Bray Rite Check Valve V0415XE2205 (Vendor Package), 100 mm		Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
72	Butterfly Valve (BFV-02-486)	Bray Series 31 310400-1101030A (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
73	Pressure Indication (PI-02-540)	ASHCROFT 25-1009-SW-L-02-L-160# +02-310SS-02T-CG	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
74	Ball Valve (BV-02-543)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
75	Ball Valve (BV-02-547)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
76	Motorized Butterfly Valve (BFV-02-531)	Bray Series 31 (Vendor Package), 100 mm	ON/OFF Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
77	White Water Strainer 1 (STR-02-530)	IFC B150FSS4BW1-OB (Vendor Package), 100 mm inlet/outlet connections	Manual Operation	Supplier: Veolia Water Technologies Canada
78	Pressure Release Valve (PRV-02-547)	Part of the White Water Strainer (Vendor Package)		Supplier: Veolia Water Technologies Canada
79	Motorized Ball Valve (BV-02-532)	Flow-tek 7108-3R-R-L (Vendor Package), 50 mm	ON/OFF Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
80	Butterfly Valve (BFV-02-533)	Bray Series 31 (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
81	Pressure Indicator (PI-02-530)	ASHCROFT 25-1009-SW-L-02-L-160# +02-310SS-02T-CG	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
82	Ball Valve (BV-02-530)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
83	Ball Valve (BV-02-531)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation.	Supplier: Veolia Water

No.	Component	Details	Settings	Remarks
			Normally Open	Technologies Canada
84	Globe Valve (GLV-02-530)	KITZ AKUJM2 Globe 200 WOG, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
85	Motorized Butterfly Valve (BFV-02-541)	Bray Series 31 (Vendor Package), 100 mm	ON/OFF Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
86	White Water Strainer (STR-02-540)	IFC B150FSS4BW1-OB (Vendor Package), 100 mm inlet/outlet connections	Manual Operation	Supplier: Veolia Water Technologies Canada
87	Pressure Release Valve (PRV-02-548)	Part of the White Water Strainer (Vendor Package)		Supplier: Veolia Water Technologies Canada
88	Motorized Ball Valve (BV-02-542)	Flow-tek 7108-3R-R-L (Vendor Package), 50 mm	ON/OFF Operation. Controlled by DAF Control System	Supplier: Veolia Water Technologies Canada
89	Butterfly Valve (BFV-02-543)	Bray Series 31 (Vendor Package), 100 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
90	Pressure Indicator (PI-02-540)	ASHCROFT 25-1009-SW-L-02-L-160# +02-310SS-02T-CG	Range 0- 1103 kPa	Supplier: Veolia Water Technologies Canada
91	Ball Valve (BV-02-540)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
92	Ball Valve (BV-02-541)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
93	Globe Valve (GLV-02-540)	KITZ AKUJM2 Globe 200 WOG, 50 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
94	Ball Valve (BV-02-545)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
95	Ball Valve (BV-02-546)	KingTron S-212T, (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
96	Pressure Transmitter (PT-02-547)	Endress & Hauser PMP51-CA21JD1PGDRKJA1+AAZ1 (Vendor Package)	Range: 1MPA	Supplier: Veolia Water Technologies Canada
97	Flow meter (FE-02-328)	Endress & Hauser, 5W4C3F-4497/0, 350 mm	Signal to Plant Control System	Supplier: Endress & Hauser

5.5.5 Dissolved Air Flotation (DAF) Polymer Makeup System

(Refer to Drawing P-615 and P-616 in Appendix A)

The following table identifies the components related to Dissolved Air Flotation Polymer Feed system.

No.	Component	Details	Settings	Remarks
1	DAF Polymer Vacuum Conveyor (VAC-04-710)	Tiger-Vac EC-12(G) HEP A Electrically Operated Vacuum Cleaner, Silencer #212440 (Vendor Package)	Automatic Operation. Controlled by DAF Polymer Makeup System	Supplier: Veolia Water Technologies Canada
2	Level Sensor Low LSL-04-710)	Endress & Hauser FTE31-C6DB11 Soliswitch FTE31	Operating Pressure Range: 50 – 150 kPa	Supplier: Veolia Water Technologies Canada
3	DAF Feeder Hopper Polymer Agitator (PAG-04-720)	WAM MBF/073.A/TT/UD4.SST.UO2/F.0.Q (Vendor Package)	Feeding Rate: 2.3 L/min	Supplier: Veolia Water Technologies Canada
4	DAF Polymer Screw Feeder (PSF-04-730)	WAM MBF/073.A/TT/UD4.SST.UO2/F.0.Q (Vendor Package)	Automatic Operation. Controlled by DAF Polymer Makeup System	Supplier: Veolia Water Technologies Canada
5	Ball Valve (BV-04-710)	Chemline Type 21-A-010-E-C (Vendor Package), 25 mm	Manual Operation	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
6	Pressure Switch (PSL-04-711)	Allen Bradley 836T-T253J (Vendor Package)	Adjustable Range: 83 – 1034 kPa	Supplier: Veolia Water Technologies Canada
7	Pressure Indicator (PI-04-712)	ASHCROFT 25-1009SWL-02L-160 PSIG (Vendor Package)	Measuring Range: 0 – 1104 kPa	Supplier: Veolia Water Technologies Canada
8	Solenoid Valve (SV-04-713)	Tekno Valve ASCO 8345G001-120VAC (Vendor Package), 6 mm	Controlled by DAF Polymer Makeup System	Supplier: Veolia Water Technologies Canada
9	Solenoid Valve (SV-04-714)	Tekno Valve ASCO 8210G004-120VAC (Vendor Package), 25 mm	Controlled by DAF Polymer Makeup System	Supplier: Veolia Water Technologies Canada
10	Ball Check Valve (BV-04-716)	Chemline SM2-A-005-E-S (Vendor Package), 13 mm		Supplier: Veolia Water Technologies Canada
11	Ball Check Valve (BV-04-717)	Chemline SM2-A-005-E-S (Vendor Package), 13 mm		Supplier: Veolia Water Technologies Canada
12	Injector (IJ-04-715)	Schutte & Koerting 1.5 " (Vendor Package)		Supplier: Veolia Water Technologies Canada
13	Check Valve (CV-04-718)	Chemline BTA015EC (Vendor Package), 38 mm		Supplier: Veolia Water Technologies Canada
14	In-line Mixer (SM-04-719)	Koflo 1.5-40C-4-6-21-1.1/2" (Vendor Package), 38 mm	Static Mixer Manual Operation	Supplier: Veolia Water Technologies Canada
15	DAF Polymer Mixing Tank (T-04-740)	304L SS (Vendor Package)	Capacity: 250 L	Supplier: Veolia Water Technologies Canada
16	DAF Polymer Mixer (MXR-04-760)	Envirequip EVG01-0.3, 304L SS (Vendor Package)	180 RPM	Supplier: Veolia Water Technologies Canada
17	Polymer Analyzer (AIT-04-741)	Hach LXV404.99.00552 (Vendor Package)	Sensor Range: 200-2,000,000 uS/cm	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
18	Level Transmitter (LIT-04-742)	Endress & Hausser PMC21-CA1V1ECVXJJ (Vendor Package)	Sensor Range: 25 KPa	Supplier: Veolia Water Technologies Canada
19	Electrically Operated Butterfly Valve (BFV-04-743)	Chemline 57A020AEL-A/ER20.12 (Vendor Package), 50 mm	Automatic Operation. Controlled by DAF Polymer Makeup System	Supplier: Veolia Water Technologies Canada
20	Ball Valve (BV-04-744)	Chemline Type 21-A-010-E-C (Vendor Package), 38 mm	Manually Operated	Supplier: Veolia Water Technologies Canada
21	DAF Polymer Aging Tank (T-04-750)	304L SS, (Vendor Package)	Capacity: 250 L	Supplier: Veolia Water Technologies Canada
22	Level Transmitter (LIT-04-746)	Endress & Hausser PMC21-CA1V1ECVXJJ (Vendor Package)	Sensor Range: 25 KPa	Supplier: Veolia Water Technologies Canada
23	Polymer Analyzer (AE-04-745)	Hach LXV404.99.00552 (Vendor Package)	Sensor Range: 200-2,000,000 uS/cm	Supplier: Veolia Water Technologies Canada
24	Ball Valve (BV-04-747)	Chemline Type 21-A-015-E-C (Vendor Package), 38 mm	Manually Operated	Supplier: Veolia Water Technologies Canada
25	Ball Valve (BV-04-750)	Chemline Type 21-A-015-E-C (Vendor Package), 38 mm	Manually Operated	Supplier: Veolia Water Technologies Canada
26	Ball Valve (BV-04-760)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Open.	Supplier: Veolia Water Technologies Canada
27	Ball Valve (BV-04-763)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
28	Calibration Chamber (CC-04-790)	Primary fluid PV-1000 (Vendor Package)	Capacity: 1L. 60 L/h	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
29	Polymer Dosing Pump 1 (P-04-770)	Netszch NM015BY01L06B (Vendor Package)	150 - 250 LPH @ 586 kPag	Supplier: Veolia Water Technologies Canada
30	Temperature Element (TE-04-769)	As part of Polymer Dosing Pump (Vendor Package)	Controlled by Polymer Pump Control System	Supplier: Veolia Water Technologies Canada
31	Ball Valve (BV-04-785)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
32	Pressure Switch (PSH-04-787)	As part of Polymer Dosing Pump (Vendor Package)		Supplier: Veolia Water Technologies Canada
33	Ball Valve (BV-04-766)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
34	Ball Valve (BV-04-775)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
35	Pressure Release Valve (PRV-04-772)	Chemline SB12A005EU (Vendor Package), 13 mm		Supplier: Veolia Water Technologies Canada
36	Ball Valve (BV-04-761)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
37	Ball Valve (BV-04-764)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
38	Polymer Dosing Pump (P-04-780)	Netszch NM015BY01L06B (Vendor Package)	150 - 250 LPH @ 586 kPag	Supplier: Veolia Water Technologies Canada
39	Temperature Element (TE-04-770)	As part of Polymer Dosing Pump (Vendor Package)	Controlled by Polymer Pump Control System	Supplier: Veolia Water Technologies Canada
40	Ball Valve (BV-04-791)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
41	Pressure Switch (PSH-04-792)	As part of Polymer Dosing Pump (Vendor Package)		Supplier: Veolia Water Technologies Canada
42	Ball Valve (BV-04-767)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
43	Ball Valve (BV-04-776)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
44	Pressure Release Valve (PRV-04-773)	Chemline SB12A005EU (Vendor Package), 13 mm		Supplier: Veolia Water Technologies Canada
45	Ball Valve (BV-04-762)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
46	Ball Valve (BV-04-765)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
47	Polymer Dosing Pump (P-04-790)	Netszch NM015BY01L06B (Vendor Package)	150 - 250 LPH @ 586 kPag	Supplier: Veolia Water Technologies Canada
48	Temperature Element (TE-04-771)	As part of Polymer Dosing Pump (Vendor Package)	Controlled by Polymer Pump Control System	Supplier: Veolia Water Technologies Canada
49	Ball Valve (BV-04-788)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
50	Pressure Switch (PSH-04-790)	As part of Polymer Dosing Pump (Vendor Package)		Supplier: Veolia Water Technologies Canada
51	Ball Valve (BV-04-768)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
52	Ball Valve (BV-04-777)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
53	Pressure Release Valve (PRV-04-774)	Chemline SB12A005EU (Vendor Package), 13 mm		Supplier: Veolia Water Technologies Canada
54	Ball Valve (BV-04-778)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
55	Ball Valve (BV-04-779)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
56	Backpressur e Valve (BPV-04-790)	Chemline SB12A010EU+SGA-005-002-P-G+P025-160-BM (Vendor Package)		Supplier: Veolia Water Technologies Canada
57	Backpressur e Valve (BPV-04-791)	Chemline SB12A010EU+SGA-005-002-P-G+P025-160-BM (Vendor Package)		Supplier: Veolia Water Technologies Canada
58	Pressure Regulating Valve (PRV-04-780)	Fisher MR95H-51, 25 mm		Supplier: Controles Laurentide
59	Ball Valve (BV-04-781)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
60	Ball Valve (BV-04-782)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada
61	Solenoid Valve (SV-04-783)	Tekno Valve ASCO 8210G094 (Vendor Package), 13 mm	Controlled by Plant Control System. Normally Closed	Supplier: Veolia Water Technologies Canada
62	Solenoid Valve (SV-04-784)	Tekno Valve ASCO 8210G094 (Vendor Package), 13 mm	Controlled by Plant Control System. Normally Closed	Supplier: Veolia Water Technologies Canada
63	Flow Indicator (FI-04-785)	Chemline FCA00401 (Vendor Package), 13 mm	40 – 400 L/h. Manual Operation.	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
64	Flow Indicator (FI-04-786)	Chemline FCA00401 (Vendor Package), 13 mm	40 – 400 L/h. Manual Operation.	Supplier: Veolia Water Technologies Canada
65	Needle Valve (NV-04-787)	Chemline SM2-A-005-E-S, ball type (Vendor Package), 13 mm	Manual Operation. Normally Open.	Supplier: Veolia Water Technologies Canada
66	Needle Valve (NV-04-788)	Chemline SM2-A-005-E-S, ball type (Vendor Package), 13 mm	Manual Operation. Normally Open.	Supplier: Veolia Water Technologies Canada
67	Flow Transmitter (FIT-04-798)	Endress & Hauser, Promag 50H15, DN 1/2"	Flow to Plant Control System	Supplier: Endress & Hauser
68	Flow Transmitter (FIT-04-799)	Endress & Hauser, Promag 50H15, DN 1/2"	Flow to Plant Control System	Supplier: Endress & Hauser

5.6 SLUDGE PROCESSING

5.6.1 TWAS Storage Tank

(Refer to Drawing P-617 in Appendix A)

The following table identifies the components related to Thickened Waste Activated Sludge (TWAS) Storage.

No.	Component	Details	Settings	Remarks
1	Ball Valve (BV-02-612)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Open	Supplier: ITT Conval Quebec MTL
2	Ball Valve (BV-02-613)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Closed	Supplier: ITT Conval Quebec MTL
3	Pressure Indicator (PI-02-615)	Ashcroft 251009 Series, 6 mm		Supplier: Ashfroft
4	TWAS Pump 1 (P-02-610)	Netszch NM031BY01L06B, 1 HP	Normal Capacity: 936 L/h. Max. Capacity: 1656 L/h	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
5	Ball Valve (BV-02-616)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Closed	Supplier: ITT Conval Quebec MTL
6	Ball Valve (BV-02-617)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Open	Supplier: ITT Conval Quebec MTL
7	Pressure Indicator (PI-02-618)	Ashcroft 251009 Series, 6 mm	1600 kPa	Supplier: Ashcroft
8	Pressure Switch (PSH-619)	Ashcroft type 400		Supplier: Ashcroft
9	Check valve (CV-02-620)	Valmatic Swing Check Valve Series 7800LW, 40 mm		Supplier: Controles Laurentide
10	Plug valve (PLV-02-620A)	Valmatic Camcentric Plug Valve, 40 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
11	Plug valve (PLV-02-647)	Valmatic Camcentric Plug Valve, 100 mm	Manual Operation. Normally Closed	Supplier: Controles Laurentide
12	Ball Valve (BV-02-632)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Open	Supplier: ITT Conval Quebec MTL
13	Ball Valve (BV-02-633)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Closed	Supplier: ITT Conval Quebec MTL
14	Pressure Indicator (PI-02-635)	Ashcroft 251009 Series, 6 mm		Supplier: Ashcroft
15	TWAS Pump 2 (P-02-620)	Netszch NM031BY01L06B, 1 HP	Normal Capacity: 936 L/h. Max. Capacity: 1656 L/h	Supplier: Veolia Water Technologies Canada
16	Ball Valve (BV-02-636)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Closed	Supplier: ITT Conval Quebec MTL
17	Ball Valve (BV-02-637)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Open	Supplier: ITT Conval Quebec MTL

No.	Component	Details	Settings	Remarks
18	Pressure Indicator (PI-02-638)	Ashcroft 251009 Series, 6 mm	1600 kPa	Supplier: Ashcroft
19	Pressure Switch (PSH-02-639)	Ashcroft type 400		Supplier: Ashcroft
20	Check valve (CV-02-640)	Valmatic Swing Check Valve Series 7800LW, 40 mm		Supplier: Controles Laurentide
21	Plug valve (PLV-02-640A)	Valmatic Camcentric Plug Valve, 40 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
22	Plug valve (PLV-02-648)	Valmatic Camcentric Plug Valve, 100 mm	Manual Operation. Normally Closed	Supplier: Controles Laurentide
23	Plug Valve (PLV-02-621)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
24	Plug Valve (PLV-02-641)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
25	Plug Valve (PLV-02-645)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Closed	Supplier: Controles Laurentide
26	Plug Valve (PLV-02-646)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Closed	Supplier: Controles Laurentide
27	Plug Valve (PLV-02-643)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Open if TWAS Tank T-03-630 Being Used	Supplier: Controles Laurentide
28	Plug Valve (PLV-02-644)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Open if TWAS Tank T-03-640 Being Used	Supplier: Controles Laurentide
29	Aerated TWAS Storage Tank 1 (T-03-630)	Concrete Tank, with Xylem 9" Dual LP Aeration Diffuser System	Tank Volume: 109 m^3	Supplier: Existing Tank. Aeration Diffuser System: Xylem

No.	Component	Details	Settings	Remarks
30	Aerated TWAS Storage Tank 2 (T-03-640)	Concrete Tank, with Xylem 9" Dual LP Aeration Diffuser System	Tank Volume: 109 m^3	Supplier: Existing Tank. Aeration Diffuser System: Xylem
31	Level Element (LE-03-111)	Endress & Hauser Prosonic FDU91		Supplier: Endress & Hauser
32	Level Switch (LSHH-112)	Endress & Hauser Liquiphant M FTL51	Measuring Range: 10 m	Supplier: Endress & Hauser
33	Level Switch (LSHH-113)	Endress & Hauser Liquiphant M FTL51		Supplier: Endress & Hauser
34	Level Element (LE-03-121)	Endress & Hauser Prosonic FDU91	Measuring Range: 10 m	Supplier: Endress & Hauser
35	Level Switch (LSHH-122)	Endress & Hauser Liquiphant M FTL51		Supplier: Endress & Hauser
36	Level Switch (LSHH-123)	Endress & Hauser Liquiphant M FTL51		Supplier: Endress & Hauser
37	Plug Valve (PLV-02-675)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Closed	Supplier: Controles Laurentide
38	Plug Valve (PLV-02-676)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Closed	Supplier: Controles Laurentide
39	Plug Valve (PLV-03-650)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Open	Supplier: Controle Laurentides
40	Plug Valve (PLV-03-651)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
41	Butterfly Valve (BFV-02-175)	Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
42	Butterfly Valve (BFV-02-176)	Keystone K-LOK Series 36, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
43	Blast Gate (BG-02-652)	Nordfab, SS 3240	Manual Operation. Normally Open	Supplier: Capt-Air
44	Blast Gate (BG-02-653)	Nordfab, SS 3240	Manual Operation. Normally Open	Supplier: Capt-Air

5.6.2 Belt Filter Press Dewatering

(Refer to Drawing P-618 in Appendix A)

The following table identifies the components related to Belt Filter Press Sludge Dewatering System.

No.	Component	Details	Settings	Remarks
1	Plug Valve (PLV-03-660)	Valmatic Camcentric Plug Valve, 150 mm	Manual Operation. Normally Open	Supplier: Controle Laurentides
2	Plug Valve (PLV-03-661)	Valmatic Camcentric Plug Valve, 100 mm	Manual Operation. Normally Open	Supplier: Controle Laurentides
3	Ball Valve (BV-03-662)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Open	Supplier: ITT Conval Quebec MTL
4	Ball Valve (BV-03-663)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Closed	Supplier: ITT Conval Quebec MTL
5	Pressure Indicator (PI-03-644)	Ashcroft 251009 Series, 6 mm		Supplier: Ashcroft
6	Belt Filter Press Feed Pump (P-03-630)	Netszch NM045BY01L07V	Normal Flow: 7.2 L/h Max. Flow: 10.8 L/h	Supplier: Veolia Water Technologies
7	Ball Valve (BV-03-666)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Open	Supplier: ITT Conval Quebec MTL
8	Ball Valve (BV-03-667)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Closed	Supplier: ITT Conval Quebec MTL
9	Pressure Indicator (PI-03-668)	Ashcroft 251009 Series, 6 mm	1600 kPa	Supplier: Ashcroft
10	Pressure Switch (PSH-669)	Ashcroft type 400		Supplier: Ashcroft
11	Check Valve (CV-03-670)	Valmatic Swing Check Valve Series 7800LW, 80 mm		Supplier: Controles Laurentide
12	Plug Valve (PLV-03-672)	Valmatic Camcentric Plug Valve, 80 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide

No.	Component	Details	Settings	Remarks
13	Plug Valve (PLV-03-681)	Valmatic Camcentric Plug Valve, 100 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
14	Ball Valve (BV-03-682)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Open	Supplier: ITT Conval Quebec MTL
15	Ball Valve (BV-03-683)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Closed	Supplier: ITT Conval Quebec MTL
16	Pressure Indicator (PI-03-684)	Ashcroft 251009 Series, 6 mm		Supplier: Ashcroft
17	Belt Filter Press Feed Pump (P-03-640)	Netszch NM045BY01L07V	Normal Flow: 7.2 L/h Max. Flow: 10.8 L/h	Supplier: Veolia Water Technologies
18	Ball Valve (BV-03-686)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Open	Supplier: ITT Conval Quebec MTL
19	Ball Valve (BV-03-683)	ITT, Diaphragm Type DIA-Flo 1-2401-S-943-SP88CATB	Manual Operation. Normally Closed	Supplier: ITT Conval Quebec MTL
20	Pressure Indicator (PI-03-688)	Ashcroft 251009 Series, 6 mm	1600 kPa	Supplier: Ashcroft
21	Pressure Switch (PSH-689)	Ashcroft type 400		Supplier: Ashcroft
22	Check Valve (CV-03-690)	Valmatic Swing Check Valve Series 7800LW, 80 mm		Supplier: Controles Laurentide
23	Plug Valve (PLV-03-692)	Valmatic Camcentric Plug Valve, 80 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
24	Flow Meter (FE-695, FM-03-695)	Endress & Hauser, 5W4C80-9F267/0, 80 mm	Signal to Plant Control System	Supplier: Endress & Hauser
25	Plug Valve (PLV-03-693)	Valmatic Camcentric Plug Valve, 80 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide
26	Plug Valve (PLV-03-696)	Valmatic Camcentric Plug Valve, 80 mm	Manual Operation. Normally Open	Supplier: Controles Laurentide

No.	Component	Details	Settings	Remarks
27	Mixer (MXR-03-698)	As part of Phoenix LC-1200LS (Vendor Package)	Manually Operated	Supplier: Phoenix Process Equipment Co.
28	Belt Filter Press (BFP-03-650)	Phoenix LC-1200LS (Vendor Package)		Supplier: Phoenix Process Equipment Co.
29	Ball valve (BV-03-699)	Phoenix LC-1200LS (Vendor Package)	Operation through Local Control Panel	Supplier: Phoenix Process Equipment Co.
30	Booster Pump (P-03-670)	Grundfos CR 10-5-A-GJ-A-E-HQQE, 5HP (Vendor Package)	3.5 L/s @ 206 kPa	Supplier: Phoenix Process Equipment Co.
31	Pressure Indicating Transmitter (PIT-606)	Part of Phoenix LC-1200LS (Vendor Package)		Supplier: Phoenix Process Equipment Co.
32	Ball Valve (BV-03-603)	Jenkins 600 CWP, 50 mm	Manually Operated. Normally Open when Belt Filter Press Operating	Supplier: Jenkins
33	Check Valve (CV-03-601)	Chemline BTA015EC (Vendor Package), 13 mm		Supplier: Chemline
34	Ball Valve (BV-03-602)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Chemline
35	Ball Valve (BV-03-1500)	Part of Phoenix LC-1200LS (Vendor Package)	Manually Operated. Normally Open when Belt Filter Press Operating	Supplier: Phoenix Process Equipment Co.
36	Compressor (C-03-651)	Jenny Industrial Stationary, K2A-30UMV-575/3 (Vendor Package)	Controlled by Belt Filter Press Control System	Supplier: Phoenix Process Equipment Co.

5.6.3 Belt Filter Press Polymer Makeup System

(Refer to Drawing P-619 and P-620 in Appendix A)

The following table identifies the components related to Belt Filter Press Polymer Feed System.

No.	Component	Details	Settings	Remarks
1	BFP Polymer Vacuum Conveyor (VAC-04-910)	WAM Vacuum Conveyor HP-500 (Vendor Package)	Automatic Operation. Controlled by BFP Makeup Polymer Control System	Supplier: Veolia Water Technologies Canada
2	Level Sensor Low (LSL-04-910)	Endress & Hauser FTE31-C6DB11 Soliswitch FTE31	Operating Pressure Range: 50 – 150 kPa	Supplier: Veolia Water Technologies Canada
3	BFP Feeder Hopper Polymer Agitator (PAG-04-920)	WAM MBF/073.A/TT/UD4.SST.UO2/F.0.Q (Vendor Package)	Feeding Rate: 2.3 L/min	Supplier: Veolia Water Technologies Canada
4	BFP Polymer Screw Feeder (PSF-04-930)	WAM MBF/073.A/TT/UD4.SST.UO2/F.0.Q (Vendor Package)	Automatic Operation. Controlled by DAF Polymer Makeup System	Supplier: Veolia Water Technologies Canada
5	Ball Valve (BV-04-910)	Chemline Type 21-A-010-E-C (Vendor Package), 25 mm	Manual Operation	Supplier: Veolia Water Technologies Canada
6	Pressure Switch (PSL-04-911)	Allen Bradley 836T-T253J (Vendor Package)	Adjustable Range: 83 – 1034 kPa	Supplier: Veolia Water Technologies Canada
7	Pressure Indicator (PSL-04-912)	Vendor Package	Measuring Range: 0 – 1104 kPa	Supplier: Veolia Water Technologies Canada
8	Solenoid Valve (SV-04-913)	Tekno Valve ASCO 8345G001-120VAC (Vendor Package), 6 mm	Controlled by BFP Polymer Makeup System	Supplier: Veolia Water Technologies Canada
9	Solenoid Valve (SV-04-914)	Tekno Valve ASCO 8210G004-120VAC (Vendor Package), 25 mm	Controlled by BFP Polymer Makeup System	Supplier: Veolia Water Technologies Canada
10	Ball Check Valve (BV-04-916)	Chemline SM2-A-005-E-S (Vendor Package), 13 mm		Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
11	Ball Check Valve (BV-04-917)	Chemline SM2-A-005-E-S (Vendor Package), 13 mm		Supplier: Veolia Water Technologies Canada
12	Injector (IJ-04-915)	Schutte & Koerting PVC Eductor (Vendor Package), 38 mm		Supplier: Veolia Water Technologies Canada
13	Check Valve (CV-04-918)	Chemline BTA015EC (Vendor Package), 38 mm		Supplier: Veolia Water Technologies Canada
14	In-line Mixer (SM-04-919)	Koflo 1.5-40C-4-6-21-1/2" (Vendor Package), 50 mm	Static Mixer Manual Operation	Supplier: Veolia Water Technologies Canada
15	BFP Polymer Mixer (MXR-04-960)	Envirequip EVG01-0.5 304L SS (Vendor Package), 13.5"	181 RPM	Supplier: Veolia Water Technologies Canada
16	BFP Polymer Mixing Tank (T-04-940)	304L SS (Vendor Package)	Capacity: 508 L	Supplier: Veolia Water Technologies Canada
17	Electrically Operated Butterfly Valve (BFV-04-943)	Chemline 57A020AEL-A/ER20.12 (Vendor Package), 50 mm	Automatic Operation. Controlled by BFP Polymer Makeup System	Supplier: Veolia Water Technologies Canada
18	Ball Valve (BV-04-944)	Chemline Type 21-A-015-E-C (Vendor Package), 38 mm	Manually Operated	Supplier: Veolia Water Technologies Canada
19	Polymer Analyzer (AIT-04-941)	Hach Sensor D3725E2T Transmitter LXV404.99.00552 (Vendor Package)	Sensor Range: 200-2,000,000 uS/cm	Supplier: Veolia Water Technologies Canada
20	Level Transmitter (LIT-04-942)	Endress & Hausser PMC21-CA1V1ECVXJJ (Vendor Package)	Sensor Range: 25 KPa	Supplier: Veolia Water Technologies Canada
21	Ball Valve (BV-04-944)	Chemline Type 21-A-010-E-C (Vendor Package), 38 mm	Manually Operated	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
22	BFP Polymer Aging Tank (T-04-950)	304L SS, (Vendor Package)	Capacity: 508 L	Supplier: Veolia Water Technologies Canada
23	Polymer Analyzer (AE-04-945)	Hach Sensor D3725E2T Transmitter LXV404.99.00552 (Vendor Package)	Sensor Range: 200-2,000,000 uS/cm	Supplier: Veolia Water Technologies Canada
24	Level Transmitter (LIT-04-946)	Endress & Hausser PMC21-CA1V1ECVXJJ (Vendor Package)	Sensor Range: 25 KPa	Supplier: Veolia Water Technologies Canada
25	Ball Valve (BV-04-947)	Chemline Type 21-A-015-E-C (Vendor Package), 38 mm	Manually Operated	Supplier: Veolia Water Technologies Canada
26	Ball Valve (BV-04-950)	Chemline Type 21-A-015-E-C (Vendor Package), 38 mm	Manually Operated	Supplier: Veolia Water Technologies Canada
27	Ball Valve (BV-04-960)	Chemline Type 21-A-005-E-C (Vendor Package), 38 mm	Manual Operation. Normally Open when P-04-970 Operating	Supplier: Veolia Water Technologies Canada
28	Ball Valve (BV-04-962)	Chemline Type 21-A-005-E-C (Vendor Package), 38 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
29	Calibration Chamber (CC-04-990)	Primary Fluid PV2-10000 (Vendor Package)	Capacity: 10L. 605 L/h	Supplier: Veolia Water Technologies Canada
30	BFP Polymer Dosing Pump 1 (P-04-970)	Netszch NM021BY01L06B (Vendor Package)	Average Flow: 554 L/hH @ 510 kPa Max. Flow: 600 L/h @ 586 kPa	Supplier: Veolia Water Technologies Canada
31	Temperature Element (TE-04-966)	As part of Polymer Dosing Pump (Vendor Package)	Controlled by Polymer Pump Control System	Supplier: Veolia Water Technologies Canada
32	Ball Valve (BV-04-985)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Open	Supplier: Veolia Water Technologies Canada

No.	Component	Details	Settings	Remarks
33	Pressure Switch (PSH-04-987)	As part of Polymer Dosing Pump (Vendor Package)		Supplier: Veolia Water Technologies Canada
34	Ball Valve (BV-04-964)	Chemline Type 21-A-005-E-C (Vendor Package), 13 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
35	Ball Valve (BV-04-970)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Open when P-04-970 Operating	Supplier: Veolia Water Technologies Canada
36	Ball Valve (BV-04-972)	Chemline Type 21-A-005-E-C (Vendor Package), 25 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
37	Pressure Release Valve (PRV-04-968)	Chemline SB12A010EU (Vendor Package), 25 mm		Supplier: Veolia Water Technologies Canada
38	Ball Valve (BV-04-961)	Chemline Type 21-A-005-E-C (Vendor Package), 38 mm	Manual Operation. Normally Open when P-04-980 Operating	Supplier: Veolia Water Technologies Canada
39	Ball Valve (BV-04-963)	Chemline Type 21-A-005-E-C (Vendor Package), 38 mm	Manual Operation. Normally Closed	Supplier: Veolia Water Technologies Canada
40	BFP Polymer Dosing Pump 2 (P-04-980)	Netszch NM021BY01L06B (Vendor Package)	600 LPH, 85psig	Supplier: Veolia Water Technologies Canada
41	Temperature Element (TE-04-967)	As part of Polymer Dosing Pump (Vendor Package)	Controlled by Polymer Pump Control System	Supplier: Veolia Water Technologies Canada

END OF CHAPTER 5

CHAPTER 6

6. OPERATING PROCEDURES

6.1 GENERAL

The operations portion of this manual should be read in conjunction with Chapter 6 of the Electrical & Instrumentation and Mechanical Operations and Maintenance Manuals. The operating procedures described in this section will relate to the WWTP Process and Mechanical systems.

6.2 WASTEWATER TREATMENT PROCESS CONTROL SYSTEM

The WWTP operates on a continuous basis and in automatic mode. When the plant is called to start, and all equipment is in automatic mode, the Main Plant Control System controls and operates the plant. Various conditions of alarms will be detected and reported to the main Plant Control System. Some will shut the plant equipment down and others will turn on back-up equipment. See the Electrical & Instrumentation Operations and Maintenance Manual for further information on the Plant Control System. The operating procedures and control philosophy outline the normal operation of the WWTP.

6.2.1 Hand-Off-Auto (HOA) and Emergency Shut Down (ESD) Switches

All motors, both VFD and FVNR driven, to have both a Hand-Off-Auto (HOA) switch and local Emergency Shut Down (ESD) switch. The HOA switch are located on the front panel of the starter location, typically at the MCC. The ESD is located on a field-mounted junction box near the motor. Unless otherwise specified, the following apply to all pumps and motors.

Local emergency stop switches for each motor shall prevent the motor from running in either auto or hand and show an alarm on the SCADA system while engaged. The Hand-Off-Auto switch at the MCC shall dictate the following behavior:

- Switch in Off: Motor does not run and cannot be overridden through the motor starter keypad.
- Switch in Hand: Motor starts / stops based on input from the MCC keypad, and in the case of VFDs, operates at the speed indicated on the keypad. Plant Control System input is ignored.
- Switch in Auto: Motor is started, stopped, and speed controlled through I/O from the Plant Control System. Keypad input is ignored.

6.3 RAW WASTEWATER PUMPING

Raw wastewater from the City's collection system enter the Pump Station Influent Wet Well. Three raw wastewater pumps operate in a lead/lag/standby mode to lift the raw wastewater to the fine screens located on the upper floor of the existing headworks building to allows gravity flow through the majority of the WWTP's downstream treatment processes. Influent flow is monitored using a magnetic flow meter on the pumps' discharge header.

Each of the WWTP's three pumps have a maximum capacity of 75.5 L/s. The pumps are equipped with variable frequency driver (VFD) that operates based on the influent flow and level of the influent chamber in a Lead/Lag/Standby operation. With two pumps operating, with a total combined capacity of approximately 151 L/s, sufficient to meet 2038's peak hour flow.

6.3.1 Reference Information

Drawing P-604, Wetwell P&ID.

6.3.2 Operators Interface

The operator interface for the raw wastewater pumps is on the Plant Control System screen. The graphic shows the pumps and their run status. It also shows the present wet well level, as well as the present pumped flow rate. Wetwell level is shown graphically.

A pump controller for each pump is shown. The controller indicates pump run status, speed set point and present value, as well as, fault status bars. "Accumulated Pump Runtime" is shown at the top of the individual controllers.

6.3.3 Normal Operation

Under normal operation, raw wastewater pumps, P-01-110, P-01-120, and P-01-130 operate in a lead/lag/standby configuration. The lead/lag pumps start and stop based on fixed level points in the influent lift station, detected by a level transmitter monitoring the RWW lift station fluid level. The raw wastewater lift station level transmitter will communicate the analog level value for wastewater in the lift station to the PLC. The PLC will start the lead pump at a set level and then vary the speed of the VFD in proportion to the level in the lift station. When the level rises to the set level for lag pump start the PLC will start the lag pump at a speed proportional to the level in the lift station.

When the level falls to the lag pump stop set level, the PLC will stop the lag pump and when the level falls to the lead pump stop set level the PLC will stop the lead pump. At this inlet flow

volume, the control system will wait for the level to rise to the lead pump start level and the above sequence will be available to repeat. After each pump cycle, the lead, lag, and standby roles are rotated.

The PLC/HMI system is configured to allow each of the raw wastewater pumps, P-01-110, P-01-120, and P-01-130 to operate as the lead, lag, or standby pumps. In the event of a pump failure the PLC will alarm the pump as failed on the HMI, and assign the standby pump to operate in the failed pump's function, provided the standby pump is available. Should the standby pump not be operable, the PLC will generate a second alarm to indicate that only one RWW pump is operational and generate an auto dialer call.

The raw wastewater supply to the plant is measured using the magnetic flow meter, FE/FIT-150, located on the discharge side of the influent pumps on the 200 mm diameter forcemain feeding the screening process.

6.3.4 Controls

The Raw Sewage Pumps are controlled by the Plant Control System. They are driven by VFDs located in the MCC.

6.3.5 Normal Equipment Status

Tag #	Description	Status
P-110	RWW Pump 1 (VFD)	In Auto
P-120	RWW Pump 2 (VFD)	In Auto
P-130	RWW Pump 3 (VFD)	In Auto
PLV-01-111	Raw Wastewater Pump P-01-110 Discharge Valve	Open
PLV-01-112	Raw Wastewater Pump P-01-120 Discharge Valve	Open
PLV-01-113	Raw Wastewater Pump P-01-130 Discharge Valve	Open

6.3.6 Manual Operation

When the HOA switch is in the HAND position, the pump will run, regardless of the level in the wetwell. Speed of the pump is set by the speed control potentiometer on the same panel. Either ESD switch will stop the pump. When the HOA switch is in OFF, the pump will not run.

6.3.7 Automatic Operation

When the HOA Switch is in AUTO and the HMI controls are in AUTO, the pumps are automatically controlled by the Plant Control System. The pumps are assigned Lead, Lag and Standby Duty by the control system. The duty of all pumps is auto-rotated after every pump cycle or if a pump becomes unavailable while running.

The pump will start when both ESD switches are inactive, the HOA Switch is in AUTO and the pump is called to run by the Plant Control System.

The pump will shut down when stopped by the Plant Control System, if either of the ESD switches is activated or if the HOA Switch is set to OFF.

When the HOA Switch is in AUTO and the HMI controls are in HAND, the pumps are controlled by the Plant Control System, but the operator selects the speed of the pump, using the pump controls on the HMI.

6.3.7.1 Sequence Normal Operation

Lift Station Level	Action
3.6 m above lift station floor	Level alarm high-high, as detected by LSHH-01-114 Start lead and lag pumps at 100% if set to manual at HMI, start Primary Filter at 100% speed Dialer alarm (refer to next table)
3.4 m above lift station floor	Lag pump start level as detected by LIT-01-100.
3.2 m above lift station floor	100% pump speed level.
1.4 m above lift station floor	Lead pump start level as detected by LIT-01-100.
0.6 m above lift station floor	Lag pump stop level as detected by LIT-01-100.
0.4 m above lift station floor	Lead pump stop level as detected by LIT-01-100 Minimum pump speed level (75% speed).
300 mm above lift station floor	Level alarm low

6.3.8 Abnormal Operation

Any abnormal condition on a running pump will cause the pump to rotate into standby duty. High and low level alarms are annunciated per the below table.

6.3.8.1 Abnormal Operation Alarms

Abnormal Condition	Action	Alarm	Annunciation
Lead or Lag pump fails	Start standby pump as duty pump to operate in the failed pump's position.	Alarms	HMI
Standby pump fails when called to operate	Standby pump fails (only 1 pump available).	Alarms	HMI and Dial Out
LAHH in Lift Station LSHH-114	See above.	LAHH Alarms	Main PLC and Dial Out

6.3.9 HMI Screens and Alarm Indication

The operator interface for these pumps is on the Plant Control System Lift Station screen.

A Pump Controller for each pump is shown. The controller indicates pump run status, speed set point and present value, as well as fault status bars. Accumulated Pump Runtime is shown for the individual controllers.

HAND and AUTO modes can be selected by clicking on the Mode button. In HAND, a speed setpoint becomes visible and active on the selected controller. The speed of the pump is selected by entering the desired speed.

There are four information boxes at the bottom of the controller. The first indicates Run Status – either Running or Stopped. The second will indicate "Pump on Local Operation or E-Stop pressed" if either condition is present. The third box indicates a motor fault at the VFD. The fourth box will indicate the presence of a leak at the pump motor.

6.4 FINE SCREENS

The fine screens are of the shaftless spiral type integrated with transport, compaction, and dewatering zones in the same unit. The fine screens operate in a duty/standby mode, with each capable of meeting the design peak hour flow. Screened raw wastewater then flows by gravity to the primary process. Screenings removed by the fine screens are washed and compacted prior to being discharged in the disposal trailer to be hauled for final disposal.

6.4.1 Reference Information

Drawing P-605, Screening P&ID.

6.4.2 Normal Operation

Flow from the raw wastewater pumps is measured with flowmeter (FM-01-150) and manually directed to either shaftelss spiral screen (SCRN-01-210) or (SCRN-01-220). The screens operate in a duty/standby configuration. Each screen has a rated capacity of 151 L/s and 6 mm opening size. One screen can handle the peak hour flow to the plant. Upon a trigger to operate, the unit will run for an adjustable time as per the settings on the off-delay timer.

Each screen is equipped with level indicator transmitters (LIT-01-211/221) to control the water level inside the unit. The influent flow from the raw wastewater pumps to the operational screen is shutdown if a high-water level condition is reached in the screen.

During the screening operation, an internal spray bar cleans the screen and the solids compaction zone of the unit utilizing non-potable water from the plant utility system. Solenoid valves (SV-01-120/122/124/126) provide for the spray system cycle per the setting on their own repeat timer whenever the motor is running.

Screenings from the fine screens flow to the screenings/primary sludge disposal trailer; the automated on/off valve (KV-01-112) allows the flow of screenings to the trailer during normal operation. The valve is closed when the fine screens are not operational, and/or the trailer is not available to receive screenings.

6.4.3 Controls

Each fine screen is composed of three control zones: screen zone, compaction zone spray and basket spray zone. Each zone can operate in Manual (HAND) position and in Automatic (AUTO) position.

6.4.4 Normal Valve and Switch Positions

Tag #	Description	Position

BV-01-114	Non-potable Water Supply Valve to SCRN-01-220	Open
BV-01-127	Non-potable Water Supply Valve to SCRN-01-220	Open
SV-01-124	Non-potable Water Supply Solenoid Valve to SCRN-01-220	Auto
SV-01-126	Non-potable Water Supply Solenoid Valve to SCRN-01-220	Auto
KV-01-232	Cross-connection Fine Screens Discharge	Closed
KV-01-112	Screenings Discharge Valve	Auto
LIT-01-211	Level Indicator Transmitter in SCRN-01-210	Auto
LIT-01-221	Level Indicator Transmitter in SCRN-01-220	Auto

NOTE 1: Fine screens operate in a duty/standby configuration. Selection of screen to be operational is manual by operator.

6.4.5 Manual Operation

6.4.5.1 Spiral Screen:

When screen selector is in HAND position, the screen will run per the screen FOR-OFF-REV selector. In FOR position, the screen runs continuously forward. In OFF position, the screen is off. In REV position, the screen runs in reverse until operator release (spring-returns to OFF).

6.4.5.2 Compaction Zone Spray:

When the compaction zone spray selector is in the HAND position, the compaction zone spray will run continuously.

6.4.5.3 Basket Spray:

When the basket spray selector is in the HAND position, the basket spray will run continuously.

6.4.6 Automatic Operation

6.4.6.1 Spiral Screen:

When the screen selector is in the AUTO position, the screen will start forward when the liquid level in the upstream channel reaches the start level set-point (as determined by upstream ultrasonic level sensor).

After the liquid level in upstream channel falls below the start level set-point for the time set in the screen level off-delay timer, the screen will shut off.

The screen will also cycle OFF and ON/FOR (OFF first), per the settings of the screen repeat cycle timer (adjustable). The screen repeat cycle timer is provided for two possible reasons:

- To keep the screen operating periodically in low flow situations
- In case there is a failure with the upstream level sensing device.

Any run of the screen will reset the screen repeat cycle timer.

After each automatic cycle, the screen will stop, run in reverse (stop and reverse times are set per screen reverse run timer) and then return to OFF.

If the screen call-to-run signal remains active for the time set in the screen max continuous run timer, the screen will stop and run in reverse (stop and reverse times are set per screen reverse run timer). If the call-to-run persists, the screen will again start to run in the forward position.

Pressing and holding the system reset pushbutton for 3 seconds will initiate a screen run cycle if the screen selector is in the AUTO position.

Because the rotating auger is shaftless, there is no automatic jam logic.

6.4.6.2 Compaction Zone Spray:

When the compaction zone spray selector is in the AUTO position, the spray will cycle ON and OFF (ON first) per the settings of the compaction zone repeat cycle timer (adjustable). The compaction zone spray is independent of the screen operation.

6.4.6.3 Basket Spray:

When the basket spray selector is in the HAND position, the spray will run when the screen is operating in forward.

6.4.7 Abnormal Operation

If the emergency stop (E-Stop) pushbutton is pressed, the spiral screen the compaction zone spray and the basket spray will stop immediately. Screen and spray will also stop if the hatch door is opened. To re-set, pull out E-Stop pushbuttons and press the system reset pushbutton.

6.4.8 Fine Screen Alarm Indication

6.4.8.1 Spiral Screen Faults/Resets:

- A fault occurs when the screen current monitor is tripped. The screen will stop immediately, and the screen fault light will be illuminated. For reset, push the system reset button.
- A fault occurs when the screen motor starter thermal overload is tripped. The screen will stop immediately, and the screen fault light will be illuminated. For reset, push the reset pushbutton on the screen motor starter thermal overload located inside the control panel. Unless entry into the control panel is being performed by a qualified electrician, the control panel power should be shut off prior to entry.
- A fault occurs when the screen motor thermostat is tripped. The screen will stop immediately. This fault resets automatically when the screen motor returns to a safe temperature.

For a timer description and initial timer settings refer to the fine screen sequence of operation.

6.5 PRIMARY FILTERS

Primary filters are used for ultra-fine screening and solids retention to provide the same removal efficiency as conventional primary sedimentation. The primary filters (PF-01-310/320) receive raw wastewater flow by gravity from the fine screens (SCRN-01-210) or (SCRN-01-220). The primary filter unit contains a belt filter which captures influent TSS and BOD on a filter mat, increasing the removal of TSS and BOD as the thickness of the filter mat increases. Filtered primary effluent then flows by gravity to the MBBR tanks. Solids are thickened to 4% to 6% solids content on the belt and are removed as the filter mat rotates past an air knife. Primary sludge removed by the primary filters is deposited in the screenings/primary sludge disposal trailer located in the lower floor of the headworks building.

6.5.1 Reference Information

- Drawing P-606 Primary Filter 1 P&ID
- Drawing P-607 Primary Filter 2 P&ID
- Drawing P-608 Primary Filter Blowers P&ID

6.5.2 Normal Operation

6.5.2.1 Primary Filters

Each primary filter is sized for 121 L/s and will operate in a lead/lag mode of operation to meet the 2041 peak hour flow of 151 L/s. Under average flows to the plant, one filter will be operating. Each primary filter is equipped with a level indicator transmitter (LIT-01-115/125) with a level element located in the influent compartment of the unit. The primary filter belt operates based on the sensed level in that compartment. During high flow events, greater than average flows, the second primary filter is automatically engaged by opening automated knife gate valves (KV-01-111) or (KV-01-121) at the inlet of the unit.

The primary filter belt and the screw press are equipped with variable frequency drives to vary the operational speed of the units and regulate the filtration process. An air knife assembly connected to primary filter blowers (B-02-210/220) functions to continuously remove solids from the surface of the filter cartridge. A primary filter integrated sludge dewatering system, consisting of a wedge wire screen and screw press (SP-01-330/340), thickens, and dewaters the sludge. Dewatered sludge is deposited in the screening/primary sludge solids disposal trailer.

Each primary filter is equipped with a non-potable hot water connection for internal flushing to remove fats, oils and grease from the filter belt that may build up over time and impede the filter operation. The non-potable hot water flow to the units is controlled by solenoid valves (SV-01-312/113) and the frequency of the non-potable hot water flushing operation is field-adjustable through the HMI of the unit.

A non-potable cold-water connection to the primary filter and the screw press is also provided for automated internal cleaning of each unit. Like the hot water flushing, the non-potable cold-water flow to the units is controlled by solenoid valves (SV-01-322/323) and the frequency of the non-potable cold-water flushing operation is field-adjustable through the HMI of the unit.

The whole operation of the primary filters including the air knife assemblies, the screw presses, the primary filter blowers, is controlled from the HMI provided for each unit. Complete control description of the primary filters is presented on the respective shop drawing submittal.

6.5.2.2 Primary Filter Blowers

Two primary filter blowers (B-01-210/220) provide air to the primary filter air knife for removing solids from the primary filter belt. Each blower is sized to service one primary filter. The primary filter blowers operate in duty/assist like the primary filters.

6.5.3 Controls

The Salsnes Filter uses a Programable Logic Computer (PLC) based control system that provides optimized control of a mesh filter belt. Each Salsnes filter is powered by a Control Power Panel (CPP) that houses the PLC, IO and OIT which provides local control and monitoring. The PLC controls the filter belt rotational speed to obtain optimum separation of the incoming material.

The speed is varied by a filter motor to obtain a specified water level in the inlet week. The solids are deposited off of the belt into an outlet well, where optional dewatering may be performed by the sludge screw.

The Salsnes filter system control strategy employs an equipment protection interlock and monitors a number of alarm conditions that result in control actions designed to maximize efficiency. There is one critical interlock signal that is hardwired to the CPP that will disable the motors in the Salsnes filter. The critical interlock is emergency stop pushbutton, dewatering screw failure and options of air pressure not present, ventilation differential pressure alarm and external sludge bin fault.

6.5.4 Normal Valve and Switch Positions

Tag #	Description	Position
KV-01-111	Primary Filter PF-01-310 Isolation Valve	Auto (Open or Closed)
BV-01-310	Hot non-potable Water Supply to Primary Filters	Open
BV-01-320	Cold non-potable Water Supply to Primary Filters	Open
BV-01-314	Hot non-potable Water Supply to PF-01-310	Open
SV-01-312	Solenoid Valve Hot non-potable Water Supply to PF-01-310	Auto
BV-01-324	Cold non-potable Water Supply to PF-01-310	Open
SV-01-322	Solenoid Valve Cold non-potable Water Supply to PF-01-310	Open

SV-01-323	Solenoid Valve Cold non-potable Water Supply to PF-01-340	Auto
SV-01-123	Filtrate from PF-01-320	Auto
LIT-01-125	Level Indicator Transmitter in PF-01-320	Auto
PT-01-126	Level Indicator Transmitter in PF-01-320	Auto
BFV-02-216	Air Discharge from Blower B-02-210 Isolation Valve	Open
BFV-02-226	Air Discharge from Blower B-02-220 Isolation Valve	Open

6.5.5 Manual Operation

When the filter control switch is in the OFF position, the CPP PLC will have no control of the motors or valves.

When the filter control switch is in the ON position, the CPP PLC will have no control of the motors or valves. In this mode the filters starters and drives will all be electrically activated and will operate at a fixed speed using the manual speed setpoints on the HMI.

6.5.5.1 Filter Belt

The filter belt, which contains a filter mesh mounted on a removable cartridge is used to draw waste material from the inlet to outlet sludge conveyor. Water is separated from the material as it is transported on the mesh towards the outlet well.

A filter motor, which rotates the filter belt, is driven by VFD that regulates the speed based on a PID control algorithm. The speed is continuously regulated in order to maintain an enterable inlet water level set-point. Optionally the system may be configured to operate the filter speed in a proportional mode so that the speed of the filter is proportionally increased as the filter water level increases, but a target water level is not maintained.

When the system mode selector switch is set to OFF, the filter belt motor will not start.

When the system mode selector switch is set to ON, the filter belt motor will be started by an electrical interlock that will force the motor to run at a fixed speed configured by the manual HMI set-points.

When the system mode selector switch is in the HMI position and the HMI mode is set to OFF, the CPP PLC will keep motor turned off and will not automatically start the filter motor, regardless of filter level.

When the system mode selector switch is in the HMI position, and the HMI mode is set to MANUAL, the CPP PLC will start and run filter motor according to requests by the operator from the HMI. The speed of the filter motor sill be controlled by an operator entry on the OIT.

This mode should not be used when the filter inlet valve is open unless the blower and sludge screw is also operating.

6.5.5.2 Blower

The blower is used to provide air for the air knife – mesh cleaning system which is used to blow material off of the filter mesh into the sludge conveyor.

The blower motor is driven by a soft starter and maintains a fixed speed based on the selected blower specification. The soft starter is controlled by a signal communicated from the CPP PLC. A blower cooling fan is mounted in the blower enclosure. It will run when the blower motor is on, and it will stop when the blower motor stops after a hard coded 1 minute time delay.

When the system mode selector switch is set to OFF, the blower motor and cooling motor will not start.

When the system mode selector switch is set to ON, the blower motor and cooling motors will be started by an electrical interlock.

When the system mode selector switch is in the HMI position and the HMI mode is set to OFF, the CPP PLC will keep motor turned off and will not automatically start the blower motor and blower cooling motor, regardless of filter level.

When the system mode selector switch is in the HMI position, and the HMI mode is set to MANUAL, the CPP PLC will start and run blower motor and blower cooling motor according to requests by the operator from the HMI.

6.5.5.3 Sludge Screw

The sludge screw is used to dewater and/or convey the sludge that has been transported by the filter mesh. The sludge is collected and conveyed by the screw where it is optionally pressed and dewatered before exiting the Salsnes filter system.

The sludge screw motor is driven by a VFD that maintains a fixed speed target based on a configurable setting from the CPP OIT. The sludge screw may be operated in forward or reverse direction in manual mode. The VFD is controlled by a signal communicated from the CPP PLC.

When the system mode selector switch is set to OFF, the sludge screw will not start.

When the system mode selector switch is set to ON, the sludge screw will be started by an electrical interlock.

When the system mode is in the HMI position, and the HMI mode is set to MANUAL, the CPP PLC will start and run the sludge screw according to requests by operator from the HMI. The speed of the sludge screw will be controlled by an operator entry on the OIT.

6.5.5.4 Hot Water Valve

Hot water is used for filter belt cleaning. All motors must be operating in automatic mode before a hot water flush will occur. The hot water valve is controlled by the CPP PLC via a discrete open signal, or the OIT in manual mode.

The CPP PLC will automatically perform a hot water flush based on a configurable time delay. The blower motor, blower motor cooling fan, filter motor, and sludge screw motor will start when the hot water valve is being commanded open via the in AUTO mode.

When the system mode selector switch is set to OFF, the hot water valve will not open.

When the system mode selector switch is set to ON, the hot water valve will remain closed.

When the system mode selector switch is in the HMI position, and the HMI mode is set to OFF, the CPP PLC will keep the hot water valve closed and will not automatically open the hot water valve.

When the system mode selector switch is in the HMI position, and the HMI mode is set to MANUAL, the CPP PLC will open and close the hot water valve according to requests by the operator from the HMI.

6.5.5.5 Cold Water Valve

Cold water is used for flushing of the filtered water basin. The cold water valve is controlled by the CPP PLC via a discrete open signal, or manual cold water control switch. The CPP PLC will automatically perform a cold water flush based on a configurable time delay.

When the system mode selector switch is set to OFF, the cold water valve will not open.

When the system mode selector switch is set to ON, the cold water valve will remain closed.

When the system mode is in the HMI position, and the HMI mode is set to OFF, the CPP PLC will keep the cold water valve closed and will not automatically open the cold water valve.

When the system mode is in the HMI position, and the HMI mode is set to MANUAL, the CPP PLC will open and close the cold water valve according to requests by the operator from the HMI.

6.5.6 Automatic Operation

The Salsnes Filter and its accessories are normally operated in full Automatic mode.

When the filter control mode switch is in the HMI position the CPP PLC has control of all motors in the system based on the configuration set in the CPP Operated Interface Terminal (OIT). From the OIT, the filter system HMI mode can be set to OFF, MANUAL or AUTO modes. When the filter system is set to HMI-Manual mode, each motor and valve may be individually requested to be started/opened or stopped/closed. When the filter control mode switch transitions to the HMI position, the PLC will automatically set the HMI mode to automatic and all valves and motors will be automatically controlled by the PLC. The HMI mode must be switched to OFF or Manual if direct operator control of the devices is required.

Normal operation of the Salsnes filter system is to have all motors and valves automatically controlled with the system in HMI AUTO mode. Fully automatic operation of the system is described in section 3.1 – Standard Operation of the Salsnes filter control philosophy.

6.5.6.1 Filter Belt Drive

When the system mode selector switch is in the HMI position and the HMI mode is set to “AUTO, the CPP PLC has control of the filter belt. Fully automatic operation of the system is described in section 3.1 – Standard Operation of the Salsnes filter control philosophy.

6.5.6.2 Blower

When the filter control switch is in the HMI position, and the HMI mode is set to AUTO, the CPP PLC has control of blower. Fully automatic operation of the system is described in section 3.1 – Standard Operation of the Salsnes filter control philosophy.

6.5.6.3 Sludge Screw

When the system mode selector switch is in the HMI position, and the HMI mode is set to AUTO, the CPP PLC has control of the sludge screw. Fully automatic operation of the system is described in section 3.1 – Standard Operation of the Salsnes filter control philosophy.

6.5.6.4 Level Transmitter

An inlet well water level transmitter is required in order to determine when to start and stop the Salsnes filter system. The water level is also used to control the speed of the filter belt. The value is supplied to the CPP PLC via 4-20 mA analog signal that is passed through a smoothing algorithm to reduce noise. This signal is then scaled to engineering units based on a full-scale level set-point.

6.5.6.5 Blower Pressure Transmitter

A pressure transmitter is required in order to determine if the blower is operating correctly. The value is supplied to the CPP PLC via a 4-20 mA analog signal that is passed through a smoothing algorithm to reduce noise. This signal is then scaled to engineering units based on a full-scale pressure set-point.

6.5.6.6 Hot Water Valve

When the system mode selector switch is in the HMI position, and the HMI mode is set to AUTO, the CPP PLC has control of the hot water valve. Fully automatic operation of the system is described in section 3.1 – Standard Operation of the Salsnes filter control philosophy. The hot water flush timer will count down to control the operation of the valve only in HMI-AUTO mode. In all other modes, the hot water flush timer will be reset and suspended.

6.5.6.7 Cold Water Valve

When the system mode selector switch is in the HMI position, and the HMI mode is set to AUTO, the CPP PLC has control of the cold water valve. . Fully automatic operation of the system is described in section 3.1 – Standard Operation of the Salsnes filter control philosophy. The cold water flush timer will count down to control the operation of the valve only in HMI-AUTO mode. In all other modes, the cold water flush timer will be reset and suspended.

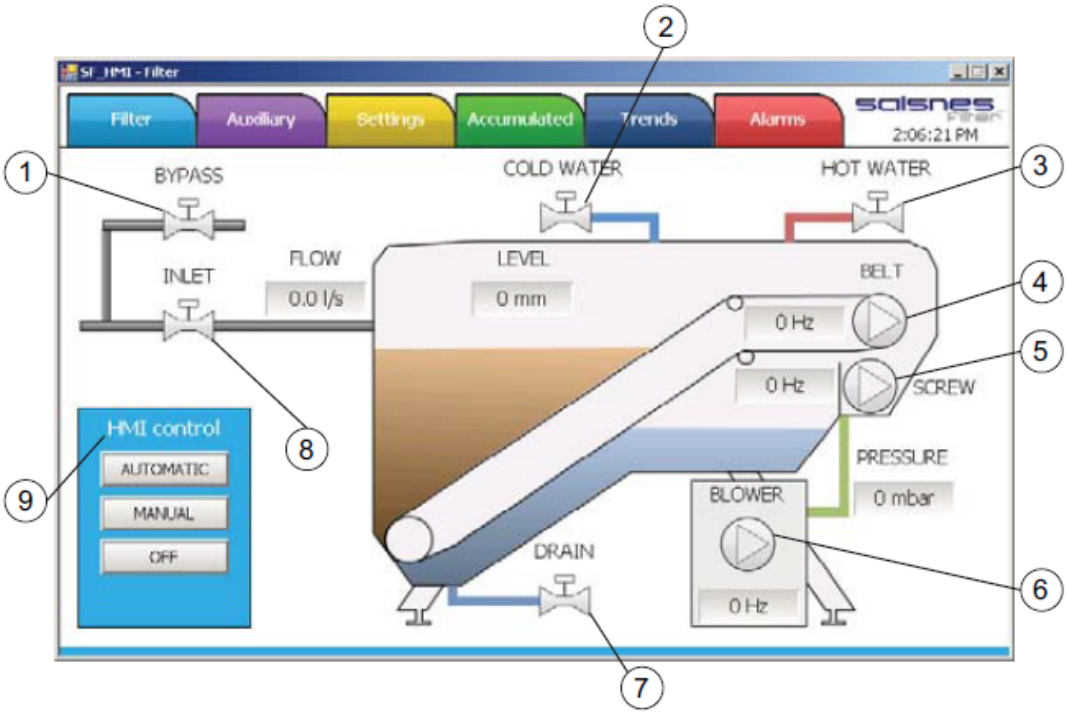
6.5.7 Abnormal Operation

Under abnormal operation, the Salsnes filter can be shut down following this seuqnce:

- System shutdown sequence is issued due to a critical alarm;
- The blower motor turns off;
- The blower motor cooling fans turns off;
- The filter motor turns off;
- The sludge screw motor turns off;
- Inlet valve close;
- All valves and motors will shut down simultaneously;
- System will not re-start until the critical alarm has been cleared.

6.5.8 HMI Screens and Alarm Indication

The operator interface for the Primary Filter is on the Primary Filter screen on the OIT. The OIT screens use color codes to help identify types data. The filter screen displays filter status information, system fault indicators and provides the operator control access. A sample filter screen is presented below.



Key: 1- Bypass Button, 2- Cold Water Button, 3- Hot Water Button, 4- Belt Button, 5- Screw Button, 6- Blower Button, 7- Drain Button, 8- Inlet Button, 9- Operator Interface Control Buttons.

Not all buttons will be active, depending on the systems components.

For complete information on the filter screens, refer to the Salsnes Filter System SF Series Submittal Manual Original Instructions Edition 6.

6.6 SECONDARY TREATMENT

Secondary treatment of the primary effluent is accomplished using a moving bed biofilm reactor (MBBR) followed by dissolved air flotation (DAF) units.

Two MBBR trains (T-02-210/220) are installed. Each MBBR train consists of two cells disposed within a bioreactor tank filled with carrier media suspended in the tank. A blower aeration system (B-02-110/120/130) provides the air required for biological treatment and functions to keep the media in constant suspension while periodically sloughing off accumulated biomass.

The MBBR is followed by high rate secondary clarification using DAF units (T-02-310/320). Dissolved air and sometimes polymer are added the mixed liquor, and suspended particles are removed from the liquid stream by bringing the particles to the surface, from where they are skimmed off to a collection tank. The collected thickened waste activated sludge is pumped to TWAS Storage Tanks (T-03-630/640) prior to the solids thickening process. Final clarified effluent from the DAF is discharged to the existing WWTP outfall.

6.6.2 Normal Operation

6.6.2.1 Moving Bed Biofilm Reactors (MBBR)

The MBBR is a flow-through process; the process operates based on influent flow load. Each MBBR train is online and primary influent is continuously fed to both trains that work in parallel. Each MBBR train can treat the 75% of the 2041 maximum month flow or 45.3 L/s. Both MBBR trains operating can pass hydraulically the 2041 peak hour flow (151 L/s) to the plant.

Primary effluent flows by gravity from the primary filters (PF-01-310/320) to the MBBR reactors. The influent flow is split into two MBBR trains (T-02-210/220). Flow splitting is not entirely equal as splitting occurs through pipelines of different length to each MBBR train due to the location of the primary filters in the headworks building, the location of the MBBR units in the secondary treatment area and the configuration of the existing plant building.

6.6.2.2 MBBR Blowers

Aeration to the MBBR trains is provided by three positive displacement process aeration blowers (B-02-110/120/130) (two duty/one standby) located in the upper level of the secondary treatment area. The blowers provide 10 m^3/min at 46 kPa to each MBBR train. The MBBR blowers also provide process air to the TWAS storage tanks (T-03-630/640) (3.1 m^3/min at 46 kPa to each TWAS storage tank) to keep the TWAS solids in suspension and very sporadically to the DAF units (T-02-310/320) for bottom sludge agitation.

Each process aeration blower is provided with a variable frequency drive to vary the air flow being supplied to the MBBR system and the TWAS storage tanks as per requirements from the process.

6.6.2.3 Aeration System

A coarse bubble aeration system within the MBBR cells covers the tanks bottom surface. The aeration system provides optimum oxygen transfer to the fixed biomass and maintains homogenous MBBR media mixing over the reactor cell volume.

6.6.2.4 Dissolved Air Floatation Clarifiers

The DAF units (T-02-310/320) are used for total suspended solids (TSS) removal from the MBBR trains (T-02-210/220) effluent. Mixed liquor from the MBBR trains flows into the DAF units by gravity. Each DAF unit is comprised of a floatation tank, inlet distribution plate, air distribution nozzles, an anti-vortex floatation system, a treated water collector pipe system and a mechanical sludge scraper (DDR-02-311/321).

The DAF tanks contain various zones. Inflow occurs in the upper part of the entry zone and underflows a watertight wall to the white-water injection zone. The clarified water overflows from the white-water injection zone to the flotation zone and is discharged to the clarified water evacuation zone by a collector located at the bottom of the flotation zone. The floated sludge

(TWAS) in the flotation zone is brought to the surface and directed to the sludge collection zone by the scrapper mechanism (DDR-02-311/321). TWAS is suctioned from the sludge collection zones of the DAF units by the TWAS pumps (P-02-610/620) and sent to the TWAS storage tanks (T-03-630/640).

Each DAF unit is also equipped with a white-water flotation system which includes a white-water pumping system (P-02-410/420/430/440/450/460) followed by white-water solids removal system with strainers (STR-02-510/520/530/540). In the white-water flotation system, a portion of the water from the DAF flotation zone is pressurized and recirculated to the white-water injection zone of the DAF units to produce microbubbles used to obtain the solids flotation effect in the system.

Each DAF unit can treat the 2041 maximum month flow of 60.4 L/s and both DAF units can treat the peak hour flow of 151 L/s. The DAF units are provided with Local Control Panel (LCP) with PLANT CONTROL SYSTEM for control integration of the control operation of the MBBR trains, DAF units, white-water pumps, and strainers. The LCP is also integrated to the Control Plant System.

6.6.2.5 DAF Polymer Preparation / Dilution System

Polymer addition increases total suspended solids removal performance in the DAF units. Polymer is not required continuously. Polymer may be required for the DAF system when mixed liquor flow and/or suspended solids concentrations reach above average levels.

Dry polymer is delivered to site in 25 kg bags. A polymer preparation/dilution system (PDS-04-700) is available to automatically prepare a homogeneous polymer solution at approximately 0.3%. The system is an automatically controlled, sequentially batching unit consisting of a hopper suited with a vacuum loading station, high shear, first stage pre-wetting system, medium shear transition mixer, a mix tank with a low shear mixer and an aging tank. All the elements of the DAF polymer preparation/dilution system are controlled from the local control panel supplied with the unit. The system can be operated automatically or manually.

A polymer dosing pump skid composed of three DAF Polymer Dosing Pumps (P-04-770/780/790) is available for polymer solution pumping from the polymer preparation/dilution system to the influent water pipelines to the DAF units. Each of the two duty polymer dosing pumps pump polymer solution to each DAF unit with a common shared spare dosing pump.

The DAF units are equipped with online effluent total suspended solids (TSS) sensors/transmitters (AIT-02-334/344) to continuously measure total suspended solids in the effluent. When final effluent TSS is higher than an operator input setpoint, typically slightly lower than the 20 mg/L target for the plant, polymer dosage is activated at polymer setpoint dosage established by operator. If effluent TSS remains higher, polymer dosage is increased by the operator.

Polymer dosage can also be regulated based on flow, according to the final effluent flow measurement from the plant effluent flowmeter (FQIT-02-328).

Dilution water lines for polymer post-dilution as required are available at the discharge headers from the polymer dosing pumps conveying the polymer solution to the DAF influent pipeline.

6.6.2.6 Effluent Flow Metering Chamber

Final effluent flows by gravity from the DAF units to the outfall and it is discharged to the ocean. Effluent flow is monitored by a magnetic flowmeter (FQIT-02-328) installed on the effluent water line for such a purpose.

6.6.3 Controls

Water and air flows to the MBBR units are automatically controlled. The primary effluent water flow to the MBBR units is controlled with on/off knife gate automated control valves and the air flow from each blower to each MBBR unit is controlled with butterfly automated control valves.

Each MBBR unit is equipped with level sensor for water level control and dissolved oxygen (DO) probes for dissolved oxygen control.

Both MBBR trains are operating in a parallel configuration under normal operation conditions.

Water flow to the DAF units is automatically controlled with automated butterfly on/off valves. Water level in the flotation zone and sludge level in the sludge collection zone of the DAF units are controlled with level sensors. Total suspended solids are monitored in the clarified water zone.

6.6.5 Manual Operation

The MBBR trains and DAF units are not intended to be operated in manual. DAF Level control system makes it difficult to operate the DAF units in manual. Manual operation would require the operator to manually modulate the DAF effluent weir to maintain a more or less constant water level in the unit; this is possible if the influent flow rate is relatively constant. Other systems that can operate manually are the sludge scraper and the white-water pumps.

6.6.6 Automatic Operation

6.6.6.1 Moving Bed Biofilm Reactors (MBBR)

The system has the option to operate a single train during low loading conditions to save energy and avoid nitrification. The second MBBR train is put into idle mode with the aeration off most of the time and pulsed using an on/off timer to keep biomass alive. When this condition continues for longer durations, the MBBR train is alternated to keep biomass nourished. Alternation is accomplished through the actuated open/closed valves (KV-02-211/221) installed at the inlet of each MBBR train.

Each MBBR reactor train is split into two cells. Sieves are used to retain the carrier media in the MBBR cells, while allowing the treated effluent to flow downstream to the DAF units.

Each MBBR cell is equipped with dissolved oxygen (DO) sensors/transmitters (AIT-02-211/212/221/222) to monitor the oxygen level in the system. The desired DO set point is fixed by operator and a DO control loop is used to modulate the process air feed flow from the process

aeration blowers (B-02-110/120/130) to the cells through the actuation of modulating process air control valves (BFV-02-150/155).

For each MBBR train, the DO control loop will be based on the DO measurement in Cell1 of each train (AIT-02-211 for train 1 and AIT-02-221 for train 2). DO measurement in Cells 2 (AIT-02-212 and AIT-02-222) is for additional operator information for the monitoring of the MBBR efficiency.

A minimum air feed flow is set, which corresponds to the minimum flow required to keep MBBR media in suspension. This minimum air flow is referred to as the minimum mixing intensity. The DO probes are automatically cleaned using a blast of compressed air at fixed intervals set on a timer.

Walls separating the cells of each MBBR train are provided with penetrations at the bottom to be able to fill both cells at the same time avoiding rupture of such walls due to hydrostatic differences. Blockage of the penetrations is detected by a difference of more than 500 mm in the water level within the cells. Differences between water level readings of level switches installed in cell 1 and cell 2 of each MBBR train generate a high priority alarm.

The control of the MBBR units is closely integrated with the control of the DAF units. Each cell of each MBBR train is equipped with high water level switches (LSH-02-213/214/223/224). A high-level detection leads to a high priority alarm requiring operator intervention. High level within the MBBR reactors could be caused for instance by closed DAF inlet isolation valves (BFV-02-312/332). A high-level detection stops feed to the MBBR unit by closing the respective actuated open/closed valve (KV-02-211/221) installed at the inlet of the MBBR train.

If actuated open/close valves (KV-02-211/221) need to be closed at the same time, (this could happen when both MBBR trains cannot receive additional influent flow) and the fine screens (SCRN-01-210 or 220) and the primary filters (PF-01-310/320) must be kept operational due to high influent flows to the plant, the automated secondary emergency bypass valve (KV-01-001) will open during the high flow event allowing the primary effluent to flow to the outfall.

6.6.6.2 Dissolved Air Floatation Clarifiers

Under normal operating conditions the MBBR and DAF processes act as a treatment train with MBBR train 1 coupled with DAF unit 1 and MBBR train 2 coupled with DAF unit 2.

The DAF units use automatic level control. The control loop measures the DAF water level in the flotation zone using level indicator transmitters (LIT-02-331/341) and modulates flow to keep the level constant by adjusting the motorized modulating valves (BFV-02-309/310/329/330). Water level outside of a pre-set range (too low or too high) generates a level alarm. This condition can be caused due to a dysfunction of the flow control loop. For instance, a mechanical problem with the modulating valves requires operator attention since low water level will impact sludge scraping capacity; whereas, a high-water level will lead to water overflow into the float sludge zone.

The DAF units are also provided with high water level switches (LSH-02-332/342) to raise a high priority alarm when a severe problem occurs with the level control system. For instance, if the maximum design flow of the plant is sent to a single DAF unit with the effluent level control weir stuck in a high-level position, the sludge outlet valve closes to prevent flooding of the sludge holding tank and all the flow passes through the DAF unit and overflows the effluent weir. At this point the unit is out of service, the automated influent isolation valve (BFV-02-312/332) closes and the second DAF unit automatically starts if not already in operation.

Each DAF unit is equipped with three white water pumps. White-water for each DAF unit can be generated using either one or two white-water pumps. When influent flows are low, as measured by the DAF effluent flowmeter (FIT-02-317/327) installed at the discharge side of the DAF units, operating a single white-water pump can reduce operation cost. The second white-water pump starts when flows increase, at a threshold rate set by operator. Each DAF unit is provided with a third white-water pump as an installed standby. Activation of the standby pump requires operator intervention to open and close manual isolation valves upstream and downstream the white-water pumps.

When a single white-water pump is running, only half of the white-water injection nozzles located in the injection zone are in use. This is achieved by the automatic operation of the white-water injection valve (BFV-02-625/645).

The white-water system in each DAF unit includes the following control items:

- A white-water flowmeter (FIT-02-317/327) installed at the suction side of the white-water pumps monitors the white-water flow rate. to confirm it is always either 50% or 100% of a fixed value. Lower flow rates indicate clogging of the white-water circuit or lower pumping capacity, which could be caused by too much air inlet flow and is detrimental for process efficiency. A low flow system alarm is triggered while the system remains in operation, requiring operator investigation of the cause of the reduced flow.

- Each white-water pump (P-02-410/420/430/440/450/460) use manual air inlet valves on the air inlet to adjust air flow.

- Strainers (STR-02-510/520/530/540) are provided for each DAF unit white-water system to protect the injection nozzles from blockage. The operation of the strainers is controlled through automated valves (BFV-02-511/521/531/541). Automated strainer cleaning valves (BFV-02-512/522/532/542) are actuated on a periodic basis by timer to flush the strainers for a couple of seconds. Operator sets the timer sequence.

- The white-water pressure is to be quite constant at around 550 kPa in the white-water header. A deviation from this target means something is wrong with the white-water system operation. Pressure is monitored with pressure transmitters (PT-02-527/547) installed at the discharge side of the strainers. A high-pressure alarm is generated if for instance the white-water nozzles are beginning to clog, or if white-water injection valve is not

opening properly. A low-pressure alarm means clogged strainers, requiring cleaning by operator, or reduced pumping capacity.

The sludge scraper (DDR-02-311/321) of each DAF unit runs automatically when the DAF unit is in operation. The scraper motor runs on VFD; the scraper operation is either at constant speed set by operator or based on an on/off timer set also by operator.

The sludge collection zone of each DAF units is equipped with low (LSL-02-333/343) and high (LSH-02-332/342) level switches to monitor sludge level.

The number of DAF units in operation (one or two) is controlled according to DAF feed flow as measured by the flowmeter (FQIT-02-328) installed on the water effluent line to the outfall. At flows lower than an operator setpoint, a single unit is in operation. This is undertaken by closing the on/off automated inlet valve (BFV-02-312/332) to the second DAF unit.

Fully manual operation of the DAF units is difficult due to the modulating DAF level control system. Manual operation requires the operator to manually modulate the DAF effluent weir to maintain a more or less constant water level in the unit; this is possible if the influent flow rate is relatively constant. Other systems that can be operated manually are the sludge scraper and the white-water pumps.

6.6.7 Abnormal Operation

Under abnormal operating conditions, when one DAF unit is out of service, the other DAF unit has the hydraulic capacity to pass the peak hour flow coming from both MBBR trains with effluent water quality that could be degraded during this period.

6.7 SOLIDS HANDLING

Thickened waste activated (TWAS) sludge accumulated in the sludge collection zones of the DAF units is pumped by the TWAS pumps (P-02-610/620) to two TWAS storage tanks (T-03-630/640). The TWAS storage tanks are provided with coarse bubble aeration to keep the solids in constant suspension and prevent the sludge from going anaerobic while being stored prior to dewatering.

Belt filter press feed pumps (P-03-630/640) pump the TWAS from the storage tanks (T-03-630/640) to the belt filter press (BFP-03-650) for dewatering. Dewatering takes place three days a week for seven hours per day, at maximum month flow design conditions.

The belt filter press uses a perforated belt and mechanical compression zone to filter and separate the liquid fraction in the sludge from the solids fraction. Dewatered sludge discharges directly into a dewatered solids disposal trailer located on the lower floor of the secondary building. The filtrate (waste liquid from the dewatering process) is returned by gravity to the wet well pumping station (T-01-001) in the headworks building for primary treatment.

6.7.2 Normal Operation

6.7.2.1 TWAS Pumps

Each DAF unit is provided with a duty TWAS pump (P-02-610/620). The TWAS pumps are required to allow for transfer of TWAS from the sludge collection zones of the DAF units (T-02-310/320) to the TWAS storage tanks (T-03-630/640). The TWAS pumps are provided with VFDs for thickened sludge flow variation.

The control of the TWAS pumps is integrated with the control of the DAF units. The operation of the TWAS pumps is continuous as per the sludge production from the DAF units. The TWAS pumps are linked and protected by low- and high-level switches (LSL-02-333/343) installed in the in the sludge collection zones of the DAF units.

6.7.2.2 TWAS Storage Tanks

The two TWAS storage tanks (T-03-630/640) provide storage and coarse bubble aeration to the TWAS prior to dewatering. The two tanks are interconnected via a high-level opening between the tanks. TWAS can be stored in each storage tank for approximately 5 days. The tanks can be operated independently, one tank can be operated while the other is in standby if required.

Aeration to the TWAS storage tanks is provided by the process aeration blowers (B-02-110/120/130) at a rate of approximately 3.1 m^3/min at 46 kPa. The air flow to the TWAS storage tanks is controlled with an automated modulating air control valve (BFV-02-170) that opens or closes depending on the water level in the tanks monitored by level indicator transmitters (LIT-03-111/121).

6.7.2.3 Belt Filter Press Feed Pumps

Duty/standby belt filter press feed pumps (P-03-630/640) transfer TWAS from the TWAS storage tanks (T-03-630/640) to the belt filter press (BFP-03-650) for dewatering. The pumps are provided with VFDs with capacity to vary the TWAS feed flow to the BFP.

The belt filter press feed pumps are protected by the low-low (LSLL-03-113/123) and high-high (LSHH-03-112/122) water level switches installed in the TWAS storage tanks.

6.7.2.4 Belt Filter Press

The control of the belt filter press pumps (P-03-630/640), belt filter press (BFP-03-650) and belt filter press polymer dosing system (PDS-04-900) is integrated to the Plant Control System.

The operation of the belt filter press feed pumps and the belt filter press equipment is manually initiated by operator. The belt filter press equipment including, the belt filter press feed pumps, the air compressor, the water booster pumps and the belt filter press are controlled from the local control panel located on the belt filter press skid. Once the belt filter press operation is initiated, the polymer dosing pump system operation is also started.

6.7.2.5 Belt Filter Press Polymer Preparation / Dilution System

Polymer is required for the TWAS thickening operation. Dry polymer is delivered to site in 25 kg bags. A polymer preparation/dilution system (PDS-04-900) is available to automatically prepare a homogeneous polymer solution at approximately 0.5%. The system is an automatically controlled, sequentially batching unit consisting of a hopper suited with a vacuum loading station, high shear, first stage pre-wetting system, medium shear transition mixer, a mix tank with a low shear mixer and an aging tank. All the elements of the DAF polymer preparation/dilution system are controlled from the local control panel supplied with the unit. The system can be operated automatically or manually.

A polymer dosing pump skid composed of two pumps (P-04-970/980) (duty/standby) is available for polymer solution pumping from the polymer preparation/dilution system (PDS-04-900) to the

belt filter press (BFP-03-650). The polymer dosing pumps are equipped with variable frequency drives for the operator to manually adjust the polymer flow to the belt filter press during the dewatering operation. The control of the polymer dosing pump system is integrated with the controls of the belt filter press system.

Polymer solution flow to the BFP unit is measured with the flow indicator-transmitter (FIT-04-999). Dilution water lines for polymer post-dilution as required are available at the discharge header from the polymer dosing pumps conveying the polymer solution to the belt filter press.

6.7.3 Controls

Controls in the belt filter press are installed for the following devises:

- Air Compressor FVNR Starter
- Belt Wash Water FVNR Starter
- Belt Filter Press Variable Frequency Drive
- Sludge Feed Pump Variable Frequency Drive
- Polymer Pump SCR Controller
- Cake Conveyor FVNR Starter
- Conveyor Thumper FVNR Starter

Note 2: Only one BFP Feed Pump P-03-630 or P-03-640 will be operational during the sludge dewatering process.

6.7.5 Manual Operation

The Belt Filter press is not intended to operate in manual.

6.7.6 Automatic Operation

When the AUTO Start pushbutton is pressed, the system will begin a cascade start in the following order:

- The alarm horn will pulse for 10 seconds signaling an automatic startup is in progress.
- The belt wash water pump will start running after the horn stops.
- The cake conveyor will start.
- The BFP will start.
- The system will be in Prewash mode. This should be set for approximately two minutes to allow for pre-wetting of the filter belts and allow the tracking and tension systems to stabilize. The Prewash cycle – press to test pilot light will flash during this cycle and remain on when Prewash cycle is complete. The length of this cycle can be adjusted by operator.
- The sludge feed pump and polymer feed pump will start after prewash cycle is complete and sludge will be delivered to the BFP. The system will continue to dewater sludge as long as sludge is delivered to the BFP, the polymer dosage is correct and there is no faults.

When the AUTO STOP pushbutton is pressed, the system will begin a cascade stop in the following order:

- The sludge feed pump and polymer feed pump signals will stop immediately.
- The post wash cycle – press to test pilot light will flash during the post wash cycle.
- The post wash cycle should be set for 30 minutes or greater to allow the remaining sludge to be processed through the belt filter press.
- The belt wash waster pump will continue running to continue clean the filter during this cycle.
- The operator may hose down and clean up the area during this cycle. All material should be cleaned from the belt filter press.
- After the press has stopped the belt wash water pump, the cake conveyor will stop.
- Post wash cycle is now complete and the system is ready to begin a new cycle.

6.7.7 Abnormal Operation

When an alarm occurs in the system, pressing the ALARM SILENCE push button can silence it. If the alarm is not corrected, the system will sound a nuisance alarm chirp of the horn. This will chirp every 5 minutes until the alarm is cleared. Once the fault has been corrected, the operator presses the ALARM RESET pushbutton to clear the fault and then presses the AUTO START pushbutton to initiate a restart of the BFP. The system alarm horn will sound with each new system alarm. Each new alarm must be silenced, and the operator must take the necessary steps to correct the alarm.

In the event the Belt Filter Press has a belt tracking or belt tension fault, the belt press will stop, causing the Sludge Feed Pump and Polymer Feed Pump to stop. The Belt Wash Water will continue running. If the fault will be cleared quickly, the Belt Wash Pump may continue running. However, if the fault will take some time to correct, the pump should be shut down to avoid damaging the belts by continuously impinging the belt wash water at a single spot on the belt.

To correct a belt tracking fault, the operator must place the BELT PRESS MAINTENANCE CONTROL - JOG/RUN selector switch in the JOG position, then jog the belts forward and/or reverse using the BELT PRESS MAINTENANCE BELT JOG - REV/OFF/FWD selector switch until tracking is restored.

Reverse jogging of the belt must be done slowly (12 Hz recommended) and carefully since the tracking mechanism works in reverse when running backwards. The operator then places the JOG/RUN selector switch in the RUN position. The operator must press the ALARM RESET pushbutton to clear the fault and then press AUTO START. This will restart the cycle of operation and the Prewash cycle should be long enough to clean up residual sludge left on the belts when the fault occurred.

Each piece of equipment may be started by placing the HOA switch in HAND and pressing the START pushbutton. The START pushbuttons have no effect in AUTO mode. The safety interlocks will remain operational to protect the operator and/or the equipment, but the process interlocks are overridden in this mode. While the entire system can be run in HAND all devices must be in AUTO to run the system in AUTO mode. To fully run the system an operator would start the Compressor, the Belt Filter Press, and the Booster Pump. After the belts are wetted and the tracking system has stabilized the operator would start the sludge feed pump and the polymer system. The speed of the Press, the Sludge Pump, and Polymer Pump would then be adjusted to meet process requirements.

END OF CHAPER 6

CHAPTER 7

7. MAINTENANCE PROCEDURES AND SERVICE INFORMATION

7.1 GENERAL

To ensure uninterrupted use, equipment should be regularly inspected, tested, and proper repairs made and recorded. The objective is to minimize equipment operating problems and prevent failures by making minor or necessary repairs before major difficulties occur. The importance of record keeping cannot be over-emphasized. Good maintenance protects the owner's interest with manufacturer warranties, continuity, or maintenance despite staff turnovers and equipment reliability track record.

Environmental and operating conditions are key elements affecting proper and reliable operation of equipment. Costly repairs can be minimized if the following items are attended to:

KEEP IT CLEAN

KEEP IT TIGHT

7.1.1 Keep It Clean

Day-to day accumulation of normal atmospheric particles, lint, metallic particles form mechanical equipment cause problems with equipment over a long period of time. An accumulation affects equipment reliability and operating life. ALL equipment should be regularly cleaned.

7.1.2 Keep It Tight

All contactors and control devices operate with high speed movement. This motion creates vibration that can loosen hardware and other parts. External vibration from equipment may cause the loosening of hardware and connections in any equipment. All hardware and connections should be tightened regularly. This simple procedure takes only a small amount of time and can save hours of searching for intermittent problems. All rotating equipment such as motors are affected by vibrations. This can cause alignment problems, which can result in bearing failures.

7.1.3 Renewal Parts

Availability of parts can be a major problem these days as distributors are keeping very low inventories in a move to economize. This may make any part a long delivery item. For this reason local distributors should be contacted and parts availability assessed.

Any critical part affecting the reliability of the system should be ordered, recorded and stored by the maintenance department.

7.1.4 Parts and Equipment Ordering Procedure

During the first year of operation, the Contractor should be contacted for any replacement parts required. This will ensure that parts covered by warranty will be replaced under warranty. Failure to contact the Contractor may result in difficulties in obtaining warranty replacement.

Following the first year of operation, it is recommended that the Contractor also be contacted as many of the suppliers have a wholesale only policy. If it is necessary to purchase parts directly from the original supplier, the following information is required.

Make

Model No.

Year of Installation

Installing Contractor

Description of Part Required (i.e. Fan Bearing)

Part No. if Available

When quoting a part number contained in manufacturer's catalogue, always provide the date of the catalogue you are referring to, as these numbers are often subject to change. The equipment supplier will have the latest edition of the manufacturer's catalogue.

If the original supplier is no longer in business, contact the contractor who will be able to suggest an alternate source of supply.

7.1.5 Scheduled Preventive Maintenance Program

Scheduled preventive maintenance is an effective means to improve services from systems and equipment. Where failure of equipment can result in shutdown, scheduled preventive maintenance is an economical alternative.

<u>Causes of Equipment Failure</u>

An effective maintenance program will attempt to remove or reduce causes of equipment failure. Common failure initiating causes are:

- Loose and broken belts
- Misaligned pulleys
- Dirty or plugged filters
- Dirty or plugged coils

- Worn bearings
- Improper lubrication and oiling or lack of
- Persistent overloading
- Above normal temperatures
- Below normal temperatures
- Obstruction of ventilation by foreign objects or material
  (blockage of air, dirt on components etc.)
- Normal deterioration from age
- Severe weather conditions

The scheduled preventive maintenance suggestions presented will be applicable to most equipment, but all of the suggestions given in any one section may not be applicable to the particular mechanical component being maintained. Most of the work may be done by the building operator but some may have to be left to the discretion of the building operator.

When equipment repair is necessary, please refer to the Manufacturer Data section provided in this manual. The frequency, which the tasks should be done as indicated.

Most maintenance can be done by average personnel, with a minimum need for specialized service.

7.1.6 Maintenance Legend

D		Daily
W		Weekly
M		Monthly
SA		Semi-Annually
A		Annually
PMI		Per Manufacturer's Instructions
AN		As Necessary

7.2 GENERAL MAINTENANCE

Maintenance to be conducted as per recommendations of components suppliers.

Item	Maintenance Operations	Inspection Frequency	Remarks
Valves	Check for proper operation	A	
Actuated Valves	Follow maintenance schedule in the manufacturer's manual	PMI

7.3 MAINTENANCE SCHEDULE

Maintenance to be conducted as per recommendations of components suppliers. **Appendix C** provide a suggested maintenance schedule.

7.4 MAINTENANCE MANUALS

For all maintenance and inspection schedules, please refer to the manuals provided by component suppliers (**Appendix D**) and manufacturers and as shown in maintenance schedule (**Appendix C**), shop drawings (**Appendix B**) and contact service information (**Appendix F**). Maintenance manuals of the following major process components are provided in **Appendix D**.

- Raw Wastewater Pumps
- Shaftless Spiral Screens
- Salsness Primary Filters
- Process Blowers
- MBBR System
- DAF Systems
- TWAS and BFP Feed Pumps
- DAF Polymer Makeup system
- Phoenix Belt Filter Press
- Sludge Dewatering Polymer Makeup system

7.5 SPARE PARTS LIST

Spare part list is provided in **Appendix E**.

END OF CHAPTER 7

CHAPTER 8

8. TESTING AND CERTIFICATION

Mandatory testing as per water license requirements and recommended testing, to monitor the process operation of the main units of the Iqaluit wastewater treatment plant to ensure appropriate operation, are listed in **Appendix G.**

Testing records, certificates and equipment warranties are also provided in **Appendix G**.

CHAPTER 9

9. CONTACT SERVICE INFORMATION

Owner, consulting engineer, contractors and main suppliers contact service information is grouped in **Appendix F**.

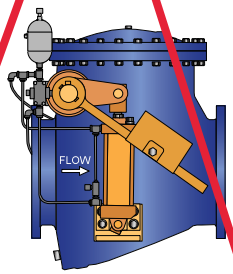
Side Oil Cushion



3-Stage
Side Oil Cushion

A. 100% Flow Area

Energy savings provided with 100% unrestricted flow area.

B. Disc Stabilization

The fluid dynamic convex disc provides for lift, stabilization and strength.

C. Adjustable Stop

Adjustable resilient open stop to prevent disc flutter for applications outside the typical flow ranges.

D. Full Domed Access Cover with Vent Port

Full domed access cover allows for ease of maintenance without removing the valve from the line. The vent port allows the addition of an air release valve or pressure gauge.

E. Non-Clog Design

The unrestricted full flow area combined with smooth streamline contouring allows for passage of large solids to prevent potential clogging.

F. Seating Options

The field replaceable synthetic seat, with integral O-ring, assures positive seating at high and low pressures. Body seats are stainless steel to extend the life of the valve and are also field replaceable.

When operating conditions require a metal-to-metal seat, the disc is fitted with a precision machined aluminum bronze seating surface. The disc seat seals against the field replaceable aluminum bronze body seat for reliable operation under harsh conditions.

G. Fusion Bonded Epoxy

Fusion Bonded Epoxy (FBE) is provided standard on the interior and exterior of the valve. The FBE is NSF/ANSI 61 certified and complies with AWWA C550.

H. Heavy Duty Disc Connections

Heavy duty shaft and disc retaining pins constructed of high tensile stainless steel for superior strength, wear resistance and extended life.

I. Mounting Pads

Integral mounting pads provide vertical support for ease of installation. The pads are integral to both flanges and are standard on Series 7800 valves. When necessary for installation, mounting pads can be provided on Series 7900 valves.

J. Closure Versatility

The Series 7800 AWWA Swing Check Valve is available with multiple field adjustable closure options: Air Cushion, Lever & Weight and Lever & Spring. The Series 7900 is available with either bottom or side oil cushions.

The Val-Matic Swing Check Valve incorporates many design features and characteristics that will provide energy savings, ease of maintenance and extended valve life. The valve is designed for municipal and industrial water and wastewater applications and fully complies with ANSI/AWWA C508 and MSS SP-71/MSS SP-136.

Closure Versatility

7800 Air Cushion, Lever & Weight, Lever & Spring

The Series 7800 Swing Check Valves can be supplied with Air Cushion, Lever & Weight or Lever & Spring for control of the disc closure. The Lever & Weight or Lever & Spring designs are suitable for installation in horizontal or vertical pipelines and are easily adjustable in the field. When rapid flow reversal occurs, the Swing Check Valves can be supplied with dual lever arms, weights and springs. A fully enclosed and adjustable Air Cushion can be added to the standard Lever & Weight to control valve operation and reduce water hammer.

7900 Oil Cushion

The Series 7900 Swing Check Valves include single or dual lever arms with weights and are equipped with either side or bottom oil cushions. The bottom oil cushion provides adjustable control of the final 10% of disc closure. The side oil cushion allows for independent adjustment of closure speeds in either 2- or 3- stages.

Ductile Iron Construction

Val-Matic provides standard Swing Check Valves with ductile iron construction rated to 250 psig Cold Working Pressure (CWP). Ductile iron provides greater strength and toughness than conventional gray iron materials. With ductile iron construction, the body, disc, and disc arm can safely withstand high stresses and shock loads.

Seating System

Val-Matic Swing Check Valves are offered with either drop-tight resilient seating or aluminum bronze metal seating.

Resilient Seating System

For resilient seated valves, the body is fitted with a 300 series stainless steel seat that is raised from the body to assure sealing in applications with high solids. A molded resilient seat mounted on the disc has integral O-ring sealing surfaces for drop tight sealing at high and low pressures. Both seats are secured with stainless steel fasteners and are field replaceable without removing the valve from the line. (See Figure 1)

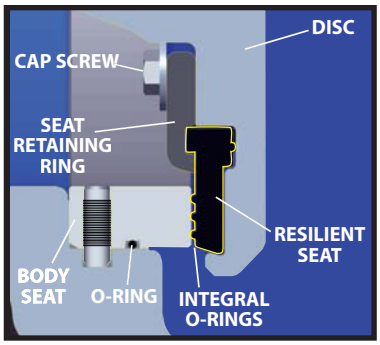


Figure 1 - Resilient Seating System

Metal Seating System

For metal seated valves, the body is fitted with an aluminum bronze seat secured to the body. The body seat mates with a second aluminum bronze seat integral with the disc. (See Figure 2)

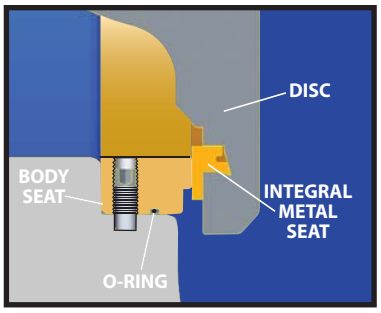

Figure 2 - Metal Seating System

Shaft Seal System

V-Type Packing

The Series 7800 Swing Check Valves are designed with an enhanced V-Type packing system to prevent overload of the packing, the most common reason for packing leakage and failure. To prevent the packing from being over tightened, the shaft seal incorporates POP™ (Packing Overload Protection) Shims with pull tabs. Adjustment is easily accomplished by removing shims as necessary utilizing the pull tab feature. (See Figure 3)

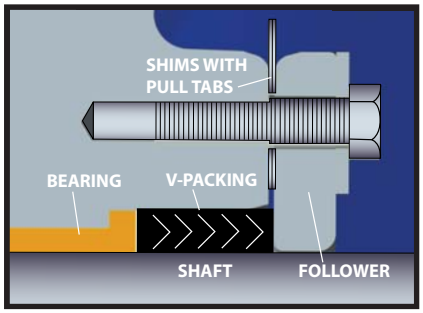

Figure 3 - Series 7800 Shaft Seal System V-Packing

O-ring Cartridge

The Series 7900 Swing Check Valves are designed with dual O-ring seals contained in a corrosion resistant cartridge to provide low torque during operation. (See Figure 4)

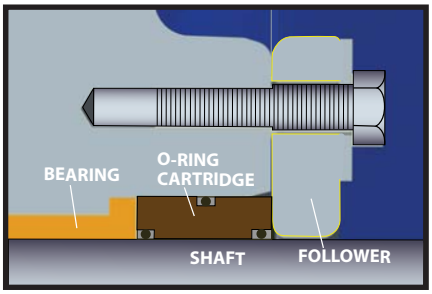

Figure 4 - Series 7900 Shaft Seal System O-ring Cartridge

Corrosion Resistance

The body and disc are fully encapsulated with NSF/ANSI 61 certified fusion bonded epoxy per AWWA C550 to prevent corrosion and provide extended service life. The shaft, disc pins, and seat hardware are constructed of stainless steel for maximum corrosion resistance even in severe service. Lead-Free Bronze bushings are provided in the body to provide smooth and reliable disc closure.

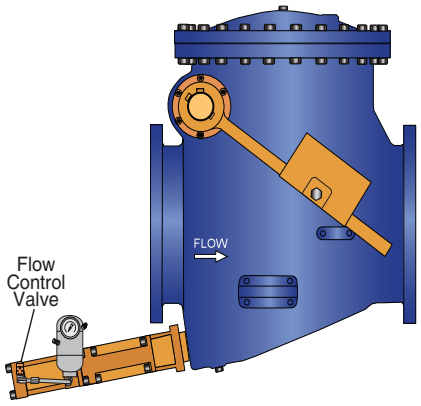
Principle of Operation

Oil Cushion Valves

The Series 7900 Oil Cushion Swing Check Valves are ideal in any number of installation configurations including single or multiple pump systems to reduce slamming and reduce system pressure surges. The Series 7900 Check Valve is offered with optional bottom or side oil cushions to aid in disc closure in pump systems even after a power failure. The oil cushions include high pressure hydraulic oil cylinders, flow control valves, and full-rated disc connections. With oil cushions, the movement of the disc is precisely controlled. An adjustable flow control valve regulates the flow of hydraulic oil out of the cylinder, which in-turn controls movement of the disc closure.

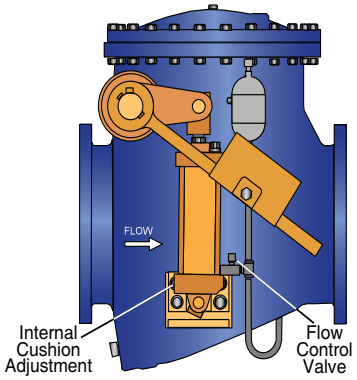
Series 7900B Bottom Oil Cushion

In high pressure applications where rapid flow reversals are expected, the last 10% of closure can be controlled to prevent slamming by using a Bottom Oil Cushion consisting of a hydraulic cylinder and snubber rod that contacts the valve disc near the end of travel. When there is flow through the valve, the valve disc lifts off of the snubber rod and opens normally as the flow rate increases. When the valve is open, the air pressure in the accumulator extends the cylinder which pushes the snubber rod into the valve body. When flow stops, the disc closes rapidly through 90% of its travel and then strikes the snubber rod. The last 10% of closure is then controlled in 1-3 seconds by the hydraulic cylinder as the oil flow is metered through the adjustable flow control valve.



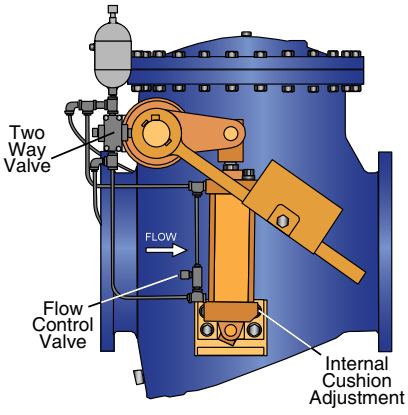
Series 7900S2 2-Stage Side Oil Cushion

When control of the full valve closure is desired to reduce system surges, a 2-Stage Oil Cushion can be used consisting of a high pressure hydraulic cylinder and lever that is directly attached to the shaft. When there is flow through the valve, the valve opens normally while the shaft lever extends the cylinder. When flow stops, the lever contracts the cylinder and the speed of closure is controlled in 5-30 seconds by the oil flow through the adjustable flow control valve for Stage 1. During the last 10% of travel, the closure is controlled in 1-3 seconds using the internal cylinder cushion adjustment for Stage 2.



Series 7900S3 3-Stage Side Oil Cushion

For long pipelines, when control of full valve travel is desired in multiple stages, a 3-Stage Oil Cushion can be used to control the closing speed of the Check Valve at three rates. The 3-Stage Oil Cushion consists of a high pressure hydraulic cylinder, a lever that is directly attached to the shaft, and a cam-operated 2-way directional valve that is used to direct flow to a flow control valve. When there is a flow through the Check Valve, the valve opens normally while the hinge pin lever extends the cylinder. When flow stops, the Check Valve closes rapidly while the lever contracts the cylinder for Stage 1. When the valve travels to the 50% position (adjustable), the 2-way valve closes, and the oil flow from the cylinder is directed through the adjustable flow control valve in 5-30 seconds for Stage 2. During the last 10% of travel, the closure is controlled in 1-3 seconds using the internal cylinder cushion adjustment for Stage 3.



Application Chart

A variety of closure mechanisms allows selection of the correct Swing Check Valve for every application. This application chart illustrates the range of use for the various Swing Check configurations.

Pumping systems with low static head and gradual pipeline flow deceleration may be best served by a conventional lever & weight or air cushion Swing Check. Higher static head applications benefit from a rapid spring assisted closure. When severe deceleration is present in a pumping system, oil cushioned closure provides an economical and reliable means of preventing surges associated with transients while greatly minimizing the potential for check valve slam. The adjustability of closure times on oil cushion Swing Check Valves allows operation to be tailored for each application.

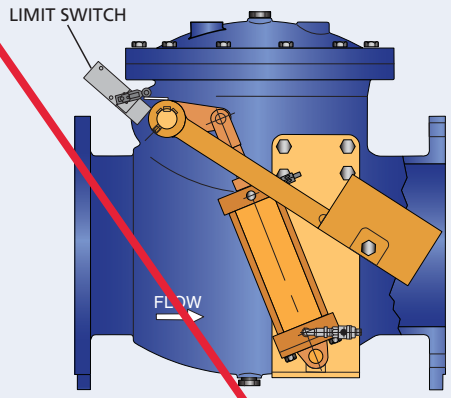
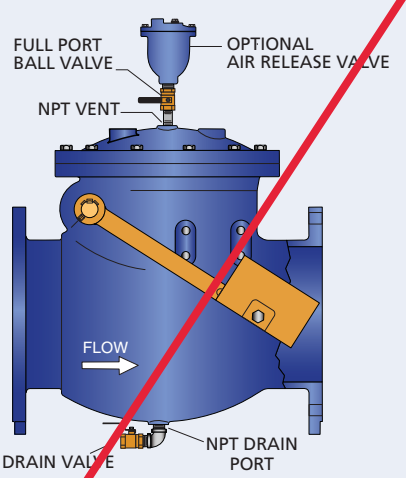
Accessories/Options

Limit Switch



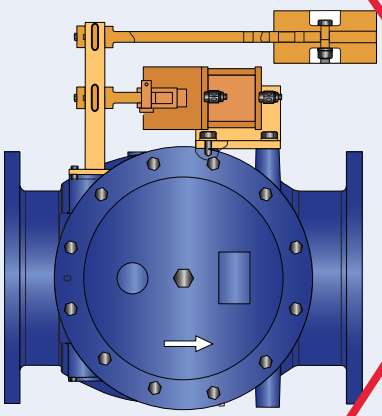
Limit Switch available to indicate open and/or closed valve position for offsite monitoring.

Air Valve Vent & Drain Valve



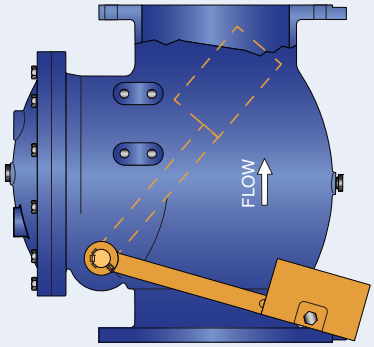
An air release valve prevents the collection of air in the valve and downstream piping to prevent water hammer and system flow restrictions. The drain facilitates maintenance and the removal of silt.

Reverse Mount



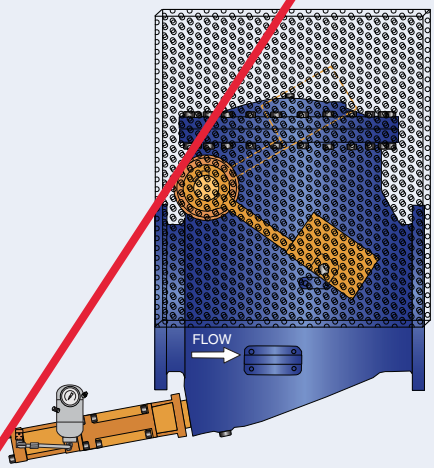
Reverse mount is used to accommodate specific field conditions.

Vertical Installation



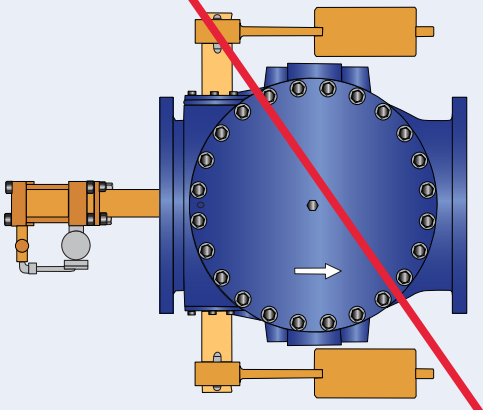
Vertical installation can accommodate specific field conditions and flow up applications.

Safety Guard



The Safety Guard meets OSHA requirements and can be supplied for all lever weight and cushion assemblies.

Dual Weights



Dual weights are availabe to provide rapid closure.

Series 7800 Specifications

SCOPE

1.1 This specification covers the design, manufacture, and testing of 2 in. (50 mm) through 48 in. (1200 mm) Swing Check Valves suitable for cold working pressures of 250 psig.
1.2 The check valve shall be of the full flow body type, with a domed access cover and vent port.
1.3 The check valve shall be capable of accepting air cushion, lever and weight or lever and spring.

STANDARDS AND APPROVALS

2.1 The valves shall be designed, manufactured and tested in accordance with American Water Works Association Standard ANSI/AWWA C508 and in accordance with Manufacturers Standardization Society Standard Practice MSS SP-71 or MSS SP-136.
2.2 The valves used in potable water service shall be certified to NSF/ANSI 61, Drinking Water System Components – Health Effects, and certified to be Lead-Free in accordance with NSF/ANSI 372.
2.3 Manufacturer shall have a quality management system that is certified to ISO 9001 by an accredited, certifying body.

CONNECTIONS

3.1 The Valves shall be provided with flanges drilled in accordance with ASME B16.1, Class 125 iron flanges or ASME B16.42, Class 150 for ductile iron flanges.

DESIGN

4.1 The valve body shall be full flow equal to nominal pipe diameter at all points through the valve and shall be equipped with a threaded adjustable open stop. The body seat shall be O-ring sealed and field replaceable without removing the valve from the line. The end flanges shall contain integrally cast mounting pads.
4.2 The top access port shall be full size, allowing removal of the disc without removing the valve from the line. The access cover shall be domed in shape to provide flushing action over the disc for operating in lines containing high solids content.
4.3 The disc shall be of one-piece construction and connected to the shaft with a disc arm and two pivot pins to provide pivot action to allow self-adjusting seating at all pressures. 14" and larger discs shall be convex shape for lift, stabilization and strength.
4.4 When specified, the disc seat shall be resilient with integral O-ring type sealing surface for drop tight shut-off at high and low pressures and for easy replacement in the field without removing the valve from the line.
4.5 When specified, metal seated valves shall have aluminum bronze seats.
4.6 The shaft seals shall consist of V-type packing in a fixed gland with an adjustable follower designed to prevent over compression of the packing and to meet design parameters of the packing manufacturer. Removable, slotted shims shall be provided under the follower flanges to provide for adjustment and prevent over loading of the packing.
4.7 When specified, the valve shall be factory equipped with a lever and weight assembly. The lever shall be equipped with three holes for adjusting the bolted weight assembly. When the valve is closed, the lever and weight shall be located 30 degrees below horizontal.
4.8 When specified, the valve shall be factory equipped with a lever and air cushion assembly mounted between the weight assembly and the valve body. The air cushion assembly shall consist of a clevis mounted tie-rod type closed cylinder with speed control valves.
4.9 When specified, the valve shall be factory equipped with a lever and spring assembly. The spring shall be mounted to a bracket on the side of the valve body with a bolt assembly to adjust the spring tension.

MATERIALS

5.1 The valve body, cover and disc shall be constructed of ASTM A536 Grade 65-45-12 ductile iron for sizes 2 in. (50 mm) through 24 in. (600 mm) and ASTM A126 class B, gray iron for sizes 30 in. (800mm) through 48 in. (1200mm), with optional body material ASTM A536 Grade 65-45-12 ductile iron.
5.2 The exterior and interior of the valve shall be coated with an NSF/ANSI 61 approved fusion bonded epoxy coating.
5.3 The removable body seat shall be constructed of ASTM A276, Type 304 stainless steel.
5.4 The removable resilient seat shall be precision molded Buna-N (NBR), ASTM D2000-BG. When specified, optional seat material includes EPDM.
5.5 The disc, arm, and external levers shall be ductile iron.

OPTIONS

6.1 A pre-wired limit switch shall be provided (when specified) to indicate open/closed position to a remote location. The mechanical type limit switch shall be activated by the external arm and rated for NEMA 4, 6, or 6P and shall have U.L. rated 5 amp, 125 or 250 VAC contacts.
6.2 When specified, the lever and weight assembly shall be enclosed within a removable safety guard constructed of perforated metal for visibility.

MANUFACTURE

7.1 Manufacturer shall demonstrate a minimum of five (5) years' experience in the manufacture of swing check valves.
7.2 All valves shall be hydrostatically and seat tested per AWWA C508 to demonstrate leakage criteria and structural integrity. When requested, the manufacturer shall provide test certificates, dimensional drawings, parts list drawings, and operation and maintenance manuals.
7.3 Swing Check Valves shall be Series 7800 (resilient seated) or 7800M (metal seated) and equipped with AC (air cushion), LW (lever and weight), or LS (lever and spring) as manufactured by Val-Matic® Valve & Mfg. Corporation, Elmhurst, IL USA or approved equal.

Series 7900 Specifications

SCOPE

1.1 This specification covers the design, manufacture, and testing of 8 in. (200 mm) through 48 in. (1200 mm) Swing Check Valves suitable for water and wastewater service.

1.2 The Cold Working Pressure rating of the valves shall be 200 psig for 8 in. (200 mm) to 12 in. (300 mm) sizes and 150 psig for 14 in. (350 mm) and larger.

1.3 The Swing Check Valve shall be of the full waterway body type, with a drain port and domed access cover with vent port.

1.4 A Bottom Oil Cushion with Lever and Weight shall be provided on sizes 8 in. (200 mm) to 48 in. (1200 mm) when specified.

1.5 A 2-Stage or 3-Stage Side Oil Cushion and Lever and Weight shall be provided on sizes 8 in. (200 mm) to 24 in. (600 mm) when specified.

STANDARDS AND APPROVALS

2.1 The valves shall be designed, manufactured and tested in accordance with American Water Works Association Standard ANSI/AWWA C508 and in accordance with Manufacturers Standardization Society Standard Practice MSS SP-136.

2.2 The valves used in potable water service shall be certified to NSF/ANSI 61, Drinking Water System Components - Health Effects, and certified to be Lead-Free in accordance with NSF/ANSI 372.

2.3 Manufacturer shall have a quality management system that is certified to ISO 9001 by an accredited, certifying body.

CONNECTIONS

3.1 The Valves shall be provided with flanges drilled in accordance with ASME B16.42, Class 150 for ductile iron flanges.

DESIGN

4.1 The valve body shall be full flow equal to nominal pipe diameter area at all points through the valve and shall be equipped with a threaded adjustable open stop. The body seat shall be O-ring sealed and field replaceable without removing the valve from the line.

4.2 The top access port shall be full size, allowing removal of the disc without removing the valve from the line. The access cover shall be domed in shape to provide flushing action over the disc for operating in lines containing high solids content.

4.3 The disc shall be of one-piece construction and connected to the shaft with a disc arm and two pivot pins to provide pivot action to allow self-adjusting seating at all pressures. Discs shall be convex shape for lift, stabilization and strength.

4.4 When side oil cushions are specified, the shaft and keys shall be sized to withstand the full differential pressure torque.

4.5 When specified, metal seated valves shall have aluminum bronze seats.

4.6 When specified, resilient seated valves shall have a disc seat of a resilient material with integral O-ring type sealing surface for drop tight shut-off at high and low pressures and for easy replacement in the field without removing the valve from the line.

4.7 The shaft seals shall be a replaceable lead free bronze O-ring cartridge type.

4.8 Valves shall be factory equipped with a lever and weight assembly. The lever shall be equipped with three holes for adjusting the bolted weight assembly. The 8 in. oil cushion valves shall have one weight and lever assembly; 14 in. and larger valves shall be factory equipped with two lever and weight assemblies. When the valve is closed, the lever and weight shall be located 30 degrees below horizontal.

4.9 A bottom oil cushion shall be factory installed to provide hydraulic control of the final 10% of valve closure and reduce water hammer normally associated with rapid flow reversal conditions on pump shut down. The cushion shall consist of a high pressure hydraulic cylinder, adjustable external flow control valve, pressurized oil reservoir and piping designed to control the closing speed of the last 10% of travel in 1-5 seconds. A cushion spacer which connects the cylinder to the valve shall have an air gap to prevent hydraulic fluid from entering the valve and contaminating the water system. A snubber rod fitted with O-ring seals and rod wiper scrapers shall make contact with the lower portion of the disc during closure.

4.10 When specified, on side oil cushion valves as 2-stage oil cushion, the control function is as follows: During closure, the oil cylinder controls the speed of closure. As the check valve closes, oil from the bottom port of the cylinder is controlled by the Flow Control valve, typically 5-30 seconds. During the last 10% of travel, the closure is controlled using the internal cushion adjustment, typically 1-3 seconds.

4.11 When specified on side oil cushion valves as 3-stage oil cushion, the control function is as follows: During closure, the oil cylinder controls the speed of closure in three stages. As the check valve closes, oil from the bottom port of the cylinder flows freely through the 2-way valve allowing the valve to close rapidly, typically 1 to 2 seconds. When the valve travels to the 50% closed position (adjustable), the 2-way valve closes. The oil now is controlled by the Flow Control Valve, typically 5-30 seconds. During the last 10% of travel, the closure is controlled using the internal cushion adjustment, typically 1-3 seconds.

MATERIALS

5.1 The valve body, cover and disc shall be constructed of ASTM A536 Grade 65-45-12 ductile iron.

5.2 The shaft shall be ASTM A276, T304 stainless steel for bottom oil cushion valves and ASTM A564 T630 H900 alloy stainless steel for side oil cushion valves.

5.3 The exterior and interior of the valve shall be coated with an NSF/ANSI 61 approved fusion bonded epoxy coating.

5.4 The removable body seat and integral metal disc seat shall be constructed of aluminum bronze C95400.

5.5 The optional resilient seated disc seat shall be precision molded Buna-N (NBR), ASTM D2000-BG. When specified, optional seat material includes EPDM.

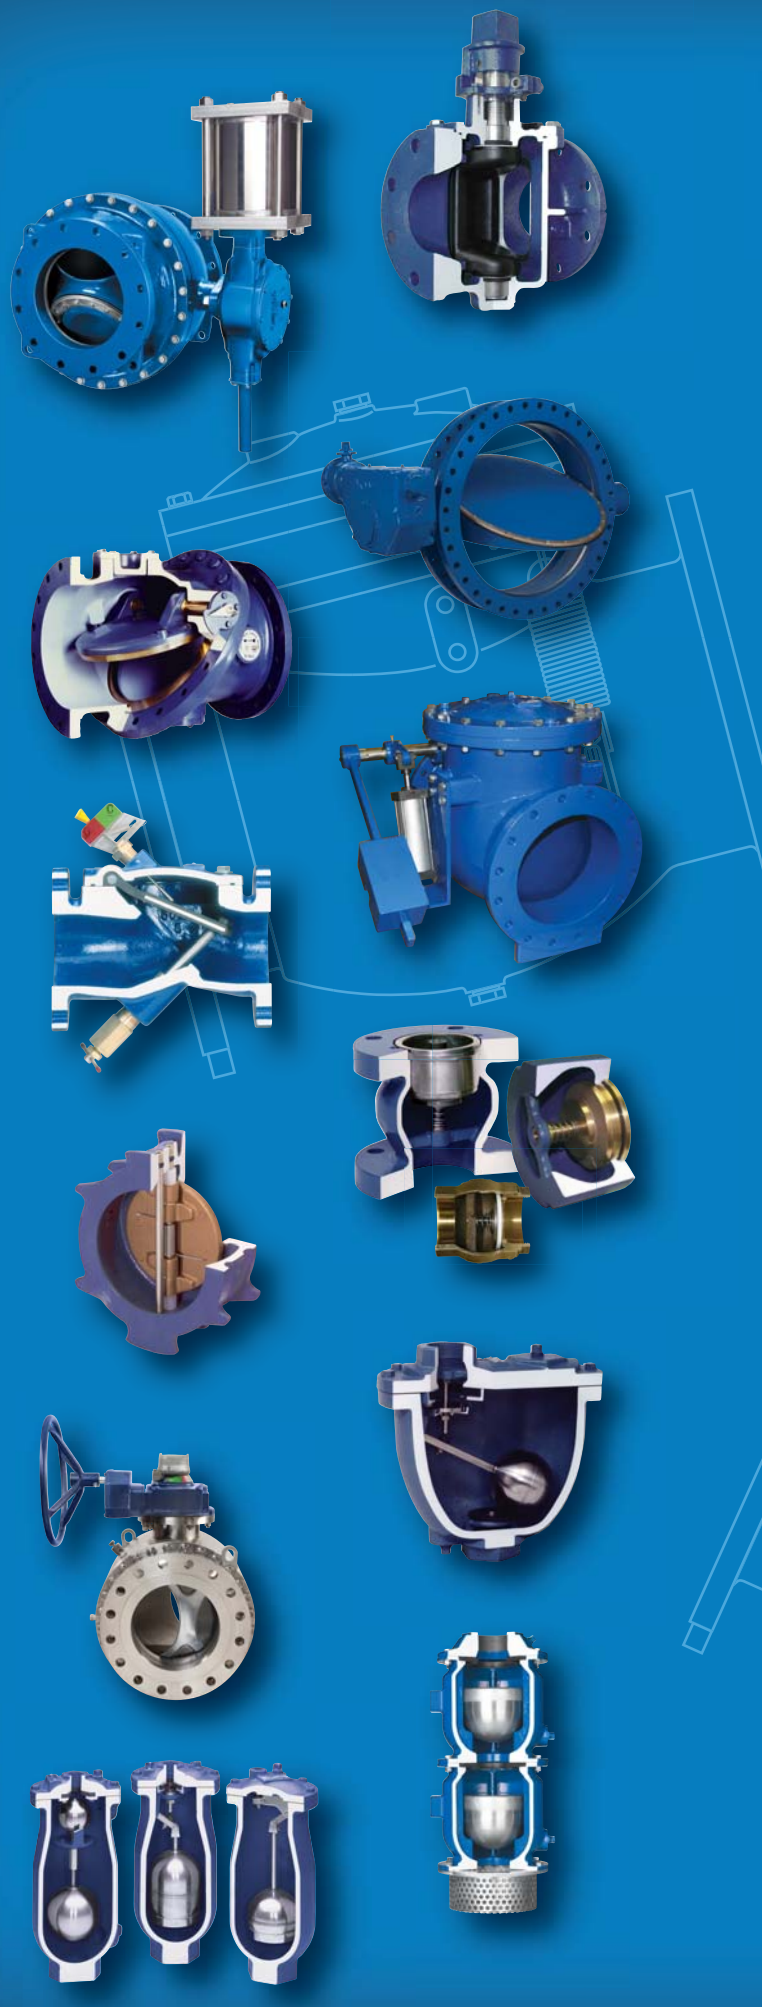
5.6 The disc arm and external levers shall be ASTM A536 Grade 65-45-12 ductile iron.

MANUFACTURE

6.1 Manufacturer shall demonstrate a minimum of five (5) years' experience in the manufacture of swing check valves.

6.2 All valves shall be hydrostatically and seat tested per AWWA C508 to demonstrate zero leakage and structural integrity. When requested, the manufacturer shall provide test certificates, dimensional drawings, parts list drawings, and operation and maintenance manuals.

6.3 Swing Check Valves shall be Series 7900B and 7900S as manufactured by Val-Matic® Valve & Mfg. Corporation, Elmhurst, IL USA or approved equal.



VAL-MATIC®

Val-Matic's quality of design and meticulous workmanship has set the standards by which all others are measured. Quality design features such as the **Ener•G® Ball Valve** with its energy efficient design, fusion bonded epoxy and adjustable resilient seating....**Cam-Centric® Plug Valves** have more requested features than any other eccentric plug valve....**American-BFV® Butterfly Valves** include a field replaceable seat without the need for special tools....**Tilted Disc® Check Valves** with high strength and wear resistant aluminum bronze trim as standard....**Silent Check Valves** featuring combined resilient/metal-to-metal seating....**Sure Seal Foot Valves** provided with a heavy duty stainless steel screened inlet....**Swing-Flex® and Surgebuster® Check Valves** designed with an unrestricted full flow area....**Dual Disc® Check Valves** utilizing stabilized components to provide extended life....**Air Release, Air/Vacuum and Combination Air Valves** provided standard with Type 316 stainless steel trim....**VaultSafe®** family of products includes the **FloodSafe® Inflow Preventer**, **FrostSafe®** two-way damper and the **VentSafe®** vent pipe security cage. The **QuadroSphere® Trunnion Ball Valve** features a unique ball design with recessed surfaces creating additional flow paths to provide a self-cleaning action and reduced wear and torque.

Val-Matic is totally committed to providing the highest quality valves and outstanding service to our customers. Complete customer satisfaction is our goal.

Make the Change to Quality!

VAL-MATIC®

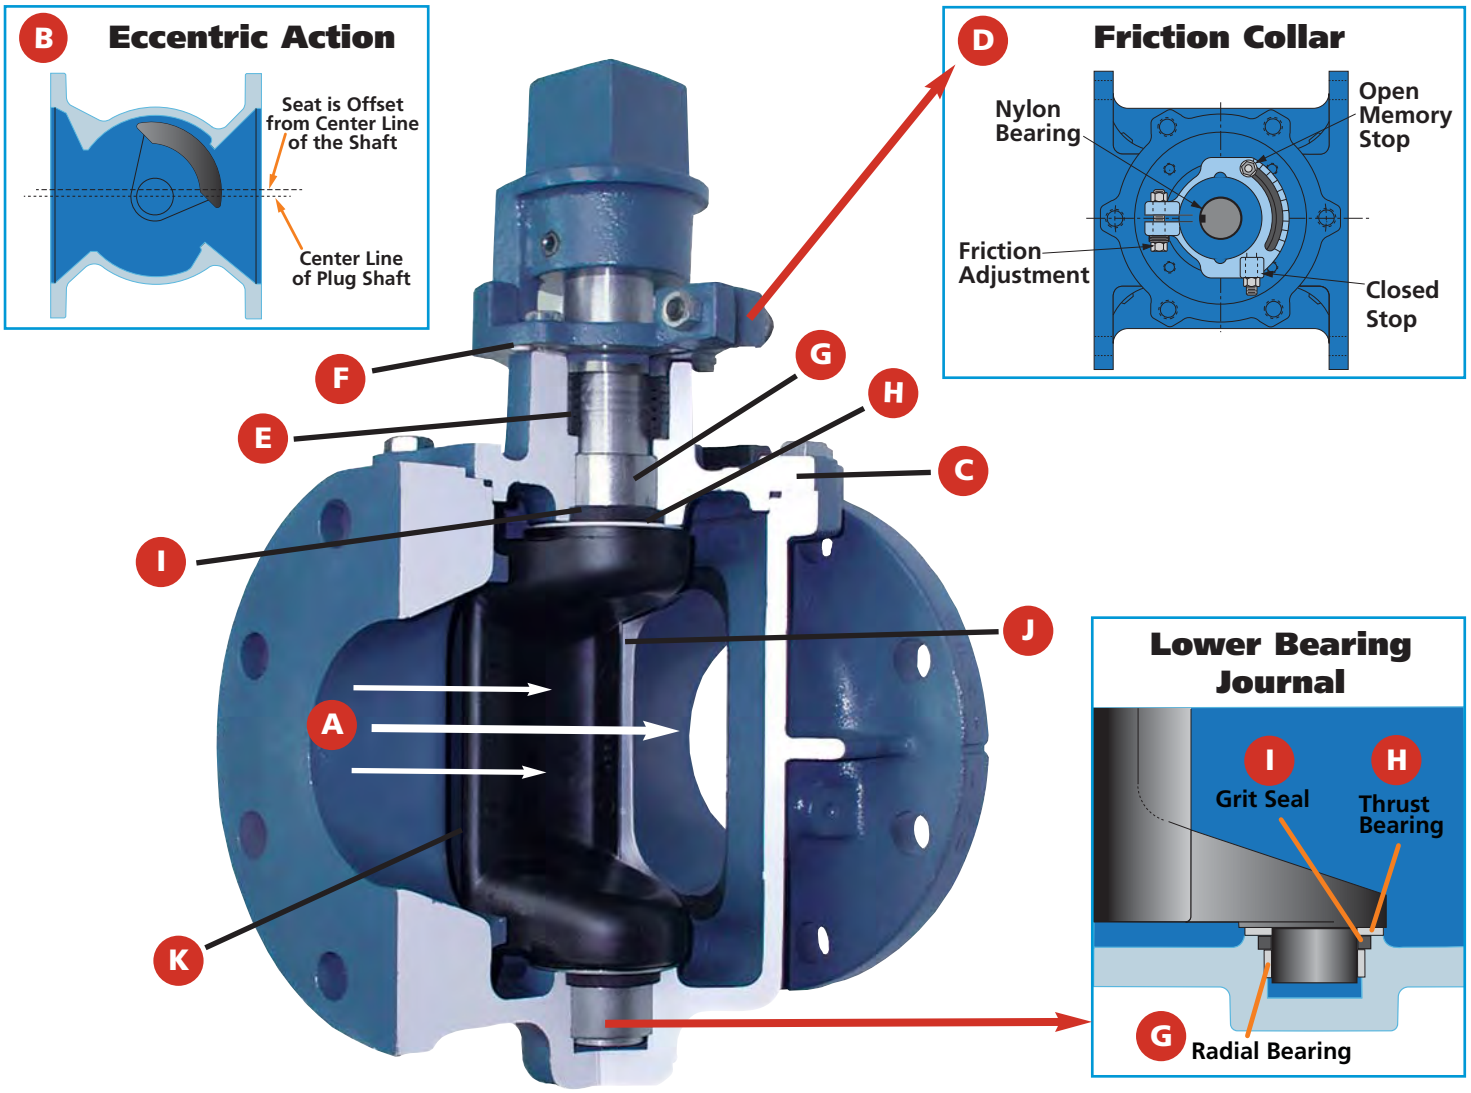
CAM-CENTRIC® The Eccentric Plug Valve

Cam-Centric® Standard Port Plug Valves

www.valmatic.com

Meets AWWA C517
NSF/ANSI 372 Certified

Feature Highlights



A. Non-Clog Design

The flow area and smooth streamline contouring allows passage of large solids to prevent potential clogging and provide low headloss.

B. Eccentric Action

Provides positive shut off in both directions with wear resistant action and low torque.

C. Full Top Access Cover

Provides accessibility for inspection without removal of the valve from the line.

D. Friction Collar with Memory Stop

Secures valve plug in any position and includes a nylon bearing for ease of operation.

E. V-Type Packing

Field adjustable and replaceable without removal of worm gear or motor actuators.

F. Removable POP™ Shims

Packing Overload Protection Shims protect packing by preventing overload during field adjustment.

G. Radial Bearings

Heavy Duty, T316 Stainless Steel, Permanently Lubricated.

H. Thrust Bearing

Upper: PTFE - Provides ease of actuation during operating conditions.
Lower: Stainless Steel - Prevents wear to plug and Grit-Guard.

I. Grit-Guard™ Shaft Seal

The *Val-Matic Exclusive* Grit-Guard™ shaft seal extends packing and bearing life by reducing wear and infultration of grit.

J. Seat

The robotic pulsed-arc welded 95% nickel raised seat is corrosion and wear resistant.

K. Plug

Fully rubber encapsulated molded plug eliminates exposed surfaces for maximum resistance to corrosion and wear.

Proven Design

With installations worldwide, the Val-Matic Cam-Centric® Plug Valve has proven itself as the preferred valve for wastewater, industrial waste and process applications. The Cam-Centric® Plug Valve is a ¼ turn eccentric plug valve allowing cost effective, low torque actuation for pump control, shut-off and throttling service. The valve's eccentric action rotates the plug in and out of the seated position with minimal contact, thereby preventing high torque and wear to the valve seat and plug. The combination of the eccentric action, stainless steel bearings, Grit-Guard™ seals and heavy duty nickel seat assures long life with minimal maintenance.

Preferred Features

The Cam-Centric® Plug Valve features a shaft sealing system that utilizes V-Type packing, a packing follower and a Grit-Guard™ seal for ease of maintenance and to reduce wear. The Grit-Guard™ seals reduce wear by preventing grit and media from reaching the bearings and packing to prevent plug lock up. The seals are standard in both the upper and lower journals (Figures 1 & 2). To prevent the packing from being over tightened, the shaft seal incorporates POP™ (Packing Overload Protection) Shims. The packing is easily adjusted by removing the POP™ shims as necessary utilizing the pull tab feature (Figure 1). Adjustment or replacement of the V-Type packing can be done without removal of the gear, motor or cylinder actuator.

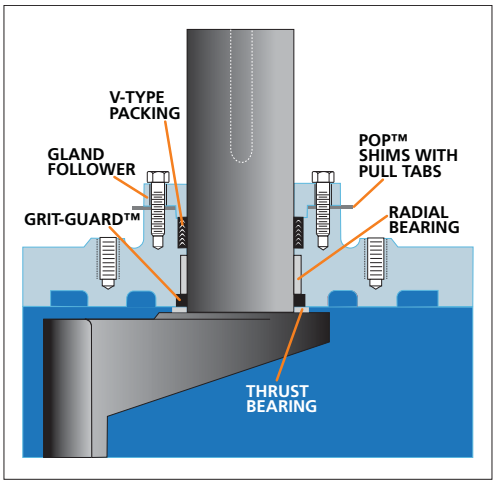


Figure 1. Upper Bearing Journal

The Cam-Centric® bearing package consists of permanently lubricated, T316 stainless steel radial bearings in both the upper and lower journals. The upper thrust bearing is made of PTFE and the lower thrust bearing is T316 stainless steel.

The Cam-Centric® Plug Valve utilizes a contoured and totally encapsulated molded plug to reduce corrosion and wear in severe abrasive applications. Its ductile iron construction provides strength and rigidity to withstand dynamic forces from flow and pressure.

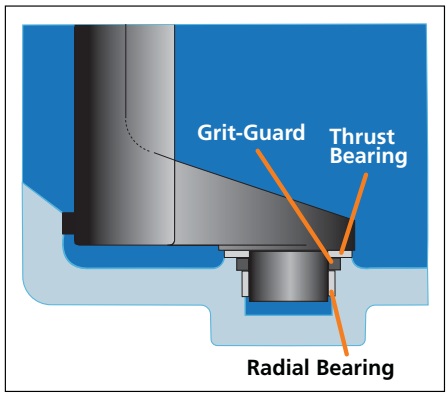

Figure 2. Lower Bearing Journal

The valve seat is a welded overlay of 95% pure nickel applied directly to the body on a machined surface using a state-of-the-art robotic welding system for a consistent, high quality weld (Figure 3).

Figure 3. Robotic welding of nickel seat

Advanced Technology

Incorporating the latest in valve technology assures a high-quality valve that will provide long service. The design process utilized solid Modeling and Finite Element Analysis (FEA) of the key structural components. Flow and torque data was derived from flow tests, mathematical models and Computational Fluid Dynamics (CFD). Manufacturing technology uses automated process control in the foundry and ISO 9001 controlled manufacturing processes. Every valve is tested in accordance with AWWA C517 and MSS SP-108 on automated hydraulic test rigs with gauges calibrated per ISO standards.

Actuation

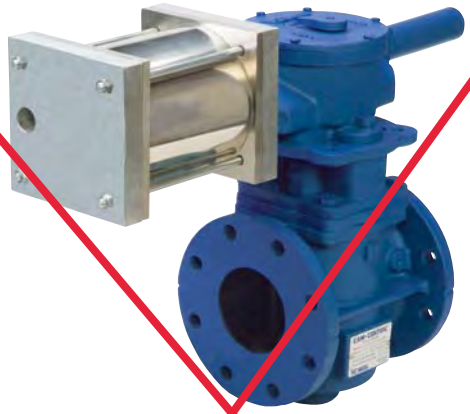
The Cam-Centric® Plug Valve is available with a wide range of actuation options, from simple lever operation to advanced pump control systems. Options include 2" operator nuts, worm gears, chainwheels, electric motor and cylinder actuation. A wide variety of accessories such as floor stands and extended bonnets are also available (see accessories on page 7). Val-Matic Engineering personnel work closely with cylinder and electric actuation manufacturers to assure actuator/valve compatibility. This ensures the actuator you specify will deliver the performance you expect when utilized with a Cam-Centric® Plug Valve.

Direct Nut operated valve with memory stop:

- Adjustable open memory stop for system balancing
- Adjustable close stop
- Adjustable friction collar
- For use with lever accessories

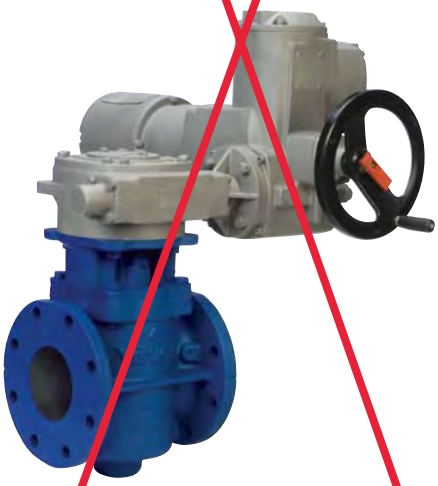
Val-Matic Worm Gears:

- Heavy Duty, totally enclosed and sealed
- For above ground and buried service applications
- Bronze radial bearings and roller thrust bearings provide smooth operations and extended life



Val-Matic Cylinder Actuation:

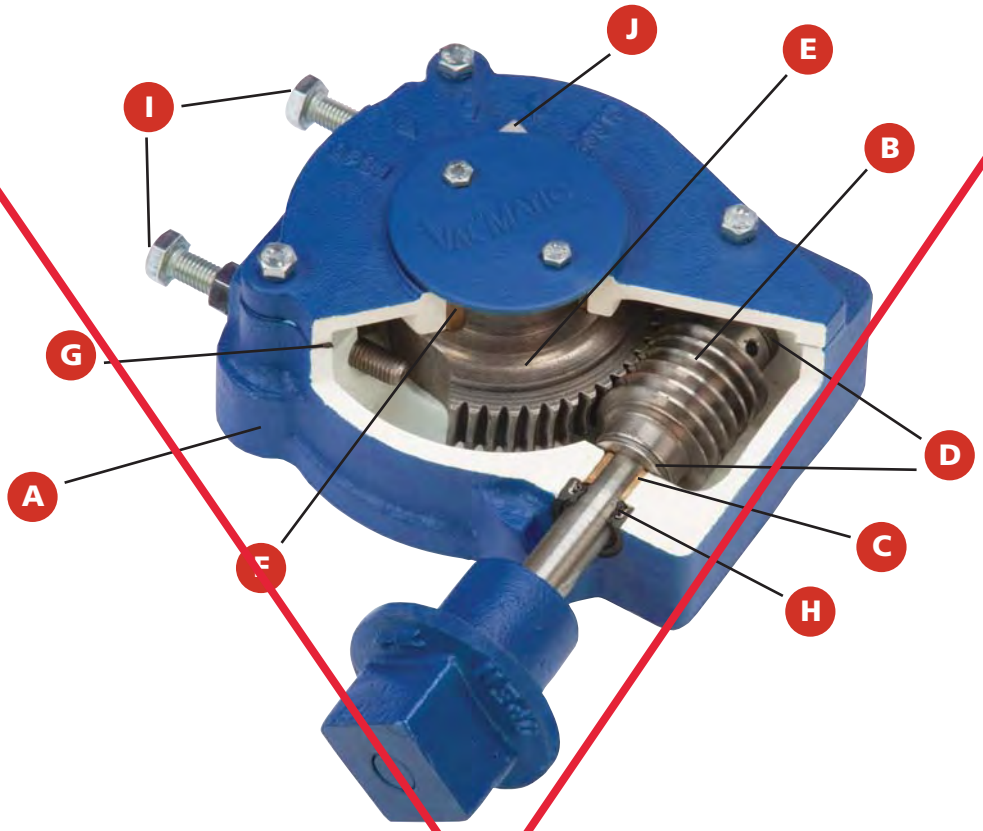
- Compliance with AWWA C541 for Power Actuation
- Pneumatic/Hydraulic
- Single Acting or Double Acting
- Fail Open/Closed for power failure
- Modulating Service
- Throttling Service
- Limit Switches, Solenoid Valves, Positioners
- Manual Overrides
- Pump Control



Electric Actuation:

- 110 Single Phase, 230/460 Three Phase
- Compliance with AWWA C542 for Power Actuation
- Modulating Service
- Throttling Service
- Remote push button control and indication
- Torque Switches, Limit Switches
- De-clutchable handwheels
- Available from a wide variety of manufacturers

Worm Gear Features



Val-Matic Worm Gear

A valve actuator must perform to the same level as the valve. The Val-Matic worm gear is designed and built to provide the same long term service as our Cam-Centric® Plug Valve. The exclusive bearing package in the worm gear includes four bronze sleeve bearings and two roller thrust bearings. This exclusive package assures smooth operation and long life regardless of the valve's orientation or application. The ductile iron segment gear coupled with the upper and lower bronze radial bearings exceed the requirements of AWWA C517 for strength and durability. All worm gears are designed to exceed, a rim pull of 200 pounds on handwheels and input torques of 300 foot pounds for operator nuts without damage. Buried service worm gears are grease packed, sealed and include stainless steel shafts. Worm gears can be provided with handwheels, chainwheels or 2" operator nuts.

A. Housing

Heavy duty, totally enclosed and sealed.

B. Worm

Hardened steel for durability and long life.

C. Radial Shaft Bearings

Bronze shaft bearings extend life and provide ease of operation (rear shaft bearing not visible).

D. Roller Thrust Bearings

Provides smooth operation and extends life.

E. Segment Gear

Heavy duty ductile iron for high strength. Provided with precision bore and keyway for connection to the valve shaft in multiple positions.

F. Segment Gear Radial Bearings

Upper and lower bronze bearings provide ease of operation and extend life (lower bearing not visible).

G. Cover Gasket

Seals housing and prevents foreign material or moisture from entering actuator and prevents loss of grease.

H. Shaft Seal

Prevents foreign material from entering the actuator.

I. External Stops

Both open and closed stops are external and easily adjustable.

J. Position Indicator

Displays precise plug position on above ground service.

Installation Instructions

The installation of the valve is important for its proper operation. The valve is capable of flow in either direction but the maximum operating pressure can vary with the location of the seat end (Figure 5). The words "SEAT END" are marked on the valve flange.

SUSPENDED SOLIDS SERVICE: For fluids containing suspended solids, special orientations are needed to prevent debris from collecting in the valve. For horizontal installations (Figure 6), the valve should be installed with the flow entering the seat end of the valve and the shaft in a horizontal position with the plug up when open. For vertical installations (Figure 7), the valve must be installed with the seat end up regardless of flow direction.

CLEAN SERVICE: For both horizontal and vertical installations, install in the direct pressure orientation (pressure opposite the seat end).

AIR AND GAS SERVICE: Install valve in the direct pressure orientation (pressure opposite the seat end). Lubricate plug face with FDA approved silicone grease such as Dow Corning #7 before installation. Gear actuators are required for gas service applications.

PUMP DISCHARGE SERVICE: On all horizontal pump discharge applications, the seat end should be towards the pump.

BURIED SERVICE: Gear actuators are recommended for buried valves to hold the valve in position and provide multi-turn closure to prevent water hammer. The valve should be installed with the shaft horizontal and the actuator nut directed upwards. The valve box or extension pipe should be installed so that the actuator nut and extension stem turn freely.

*Asterisk indicates length includes reducing bushing.

Notes: 1. Flange drilling conforms to ANSI B16.1, Class 125.
2. Mechanical Joint (MJ) Ends conform to ANSI/AWWA C110/A21.10.
3. Threaded Ends conform to ANSI/ASME B1.20.1.
4. Handlevers (i.e. 4L) Chainlevers (i.e. 3CL) and Chain (1CN) are ordered separately.

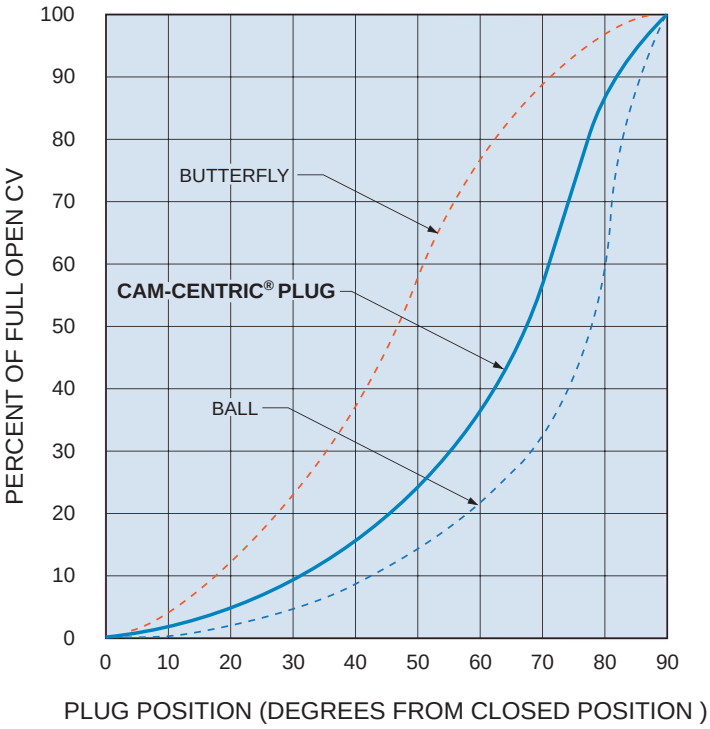
*Asterisk indicates valve model numbers without spur gear

Notes:
1. Replace Handwheel (HW) diameter in the model number (i.e. /7A08) with 02 for 2" square operating nut (i.e./7A02).
2. Add a C suffix to model number to include Chainwheel Kit (i.e. 5804R/7A08C).
3. Available with ISO/PN drilling.
4. Consult factory for larger sizes.

Flow Characteristics



INHERENT PUMP CONTROL FLOW CHARACTERISTICS

To control pressure surges and provide good-controllability, the flow characteristics of valves should be considered.

The graph at left shows the inherent flow characteristics at a constant ΔP for various valves.

The Plug Valve has an inherent flow characteristic similar to a ball valve. When installed in a pipeline, the plug valve will approximate a linear flow characteristic because the piping system pressure losses will shift the flow curve to the left. A linear installed flow characteristic will help control surges and provide a wide range of controllability.

Installations

Cam-Centric® Plug Valve with worm gear actuator and chainwheel

Cam-Centric® Plug Valve with Val-Matic Swing-Flex®

Cam-Centric® Plug Valve with Val-Matic dual body combination AIr Valve

Cam-Centric® Plug Valve with motor actuator

Cam-Centric® Plug Valve with worm gear actuator

Cam-Centric® Plug Valve with worm gear actuator and extension stem

2-Way Specification

SCOPE

1.1 This specification covers the design, manufacture, and testing of 1/2 in. (15 mm) through 3 in. (80 mm) Threaded Eccentric Plug Valve, 2 ½ in. (60 mm) through 54 in. (1350 mm) Eccentric Plug Valve suitable for water or wastewater service with pressures up to 250 psig (1725 kPa).
1.2 Plug Valves shall be quarter-turn, non-lubricated with resilient encapsulated plug.

STANDARDS AND APPROVALS

2.1 2 ½ in. (60 mm) through 54 in. (1350 mm) plug valves shall be designed, manufactured and tested in accordance with American Water Works Association Standard ANSI/AWWA C517.
2.2 All Plug Valves shall be certified Lead-Free in accordance with NSF/ANSI 372.
2.3 Manufacturer shall have a quality management system that is certified to ISO 9001 by an accredited, certifying body.

CONNECTIONS

3.1 Threaded valves shall have threaded NPT full size inlets. The connection shall be hexagonal for a wrench connection.
3.2 Flanged valves shall have flanges with drilling to ANSIB16.1, Class 125.
3.3 Mechanical Joint valves shall fully comply with ANSI/AWWA C111/A21.11.

DESIGN

4.1 Threaded and all other valves under 4" (100mm) shall have port areas of not less than 100% of pipe area. Port areas on other sizes are 85% on 16" (400 mm) and smaller, 80% on 18"-24" (150 mm- 600 mm), and 75% on 30" (800 mm) and larger.
4.2 Threaded valve seat shall be a machined seating surface.
4.3 2 ½ in. (60 mm) through 54 in. (1350 mm) plug valves shall have a valve seat that is a welded overlay of 95% pure nickel applied directly to the body on a pre-machined, cast seating surface and machined to a smooth finish.
4.4 Threaded valves shall have shaft seals which consist of V-type lip seal in a fixed gland with a resilient O-ring spring.
4.5 2 ½ in. (60 mm) through 54 in. (1350 mm) plug valves shall have shaft seals which consist of V-type packing in a fixed gland with an adjustable follower designed to prevent over compression of the packing and to meet design parameter of the packing manufacturer. Removable POP™ shims shall be provided under the follower flanges to provide for adjustment and prevent over tightening.
4.6 Permanently lubricated, radial shaft bearings shall be supplied in the upper and lower bearing journals. Thrust bearings shall be provided in the upper and lower journal areas, except for threaded type which only have upper thrust bearings.
4.7 Both the packing and bearings in the upper and lower journals shall be protected by a Grit-Guard™ "drip tight" Buna-N shaft seal located on the valve shaft to minimize the entrance of grit into the bearing journal and shaft seal areas.
4.8 The threaded valve body shall have 1/8" NPT upstream and downsteam pressure ports.

MATERIALS

5.1 Valve bodies and covers shall be constructed of ASTM A126 Class B cast iron for working pressures up to 175 psig (1200 kPa) and ASTM A536 Grade 65-45-12 for working pressures up to 250 psig (1725 kPa). The words "SEAT END" shall be cast on the exterior of the body seat end.
5.2 Threaded valve plugs in sizes 1/2 in. (15 mm) through 3 in. (80 mm) shall be of one-piece construction and made of ASTM A126 Class B cast iron fully encapsulated with a resilient facing per ASTM D2000-BG and ANSI/AWWA C517 requirements.
5.3 2 ½ in. (60 mm) through 54 in. (1350 mm) plugs shall be of one-piece construction and made of ASTM A126 Class B cast iron or ASTM A536 Grade 65-45-12 ductile iron and fully encapsulated with resilient facing per ASTM D2000-BG and ANSI/AWWA C517 requirements.
5.4 Threaded valves shall have radial shaft bearings constructed of self-lubricating Type 316 stainless steel. The top thrust bearing shall be PTFE.
5.5 2 ½ in. (60 mm) through 54 in. (1350 mm) plug valves shall have radial shaft bearings constructed of self-lubricating Type 316 stainless steel. The top thrust bearing shall be PTFE. The bottom thrust bearing shall be self-lubricating Type 316 stainless steel. Cover bolts shall be corrosion resistant with zinc plating.

ACTUATION

6.1 Threaded valves shall be equipped with a hand lever with a dial indicator and open memory stop.
6.2 Valves 2 ½ in. (60 mm) to 8 in. (200 mm) and 4 in. (100mm) to 6 in. (150 mm) 100% ported shall be equipped with a 2 inch square nut for direct quarter turn operation. The packing gland shall include a friction collar and an open position memory stop. The friction collar shall include a nylon sleeve to provide friction without exerting pressure on the valve packing.
6.3 When specified valves 4 in. (100 mm) and larger shall include a totally enclosed and sealed worm gear actuator with position indicator (above ground service only) and externally adjustable open and closed stops. The worm segment gear shall be ASTM A536 Grade 65-45-12 ductile iron with a precision bore and keyway for connection to the valve shaft. Bronze radial bearings shall be provided for the segment gear and worm shaft. Alloy steel roller thrust bearings shall be provided for the hardened worm.
6.4 All gear actuators shall be designed to withstand, without damage, a rim pull of 200 lb. on the hand wheel and an input torque or 300 ft-lbs. for nuts.
6.5 Buried service actuators shall be packed with grease and sealed for temporary submergence to 20 feet of water. Exposed worm shafts shall be stainless steel.

OPTIONS

7.1 When specified, the valve port area shall have not less than 100% of pipe area.
7.2 The interior and exterior of the valve shall be coated with an NSF/ANSI 61 approved fusion bonded epoxy.
7.3 The interior of the valve shall be coated with 8 mils SG-14 glass lining or 1/8" soft rubber lining.

MANUFACTURE

8.1 Manufacturer shall demonstrate a minimum of ten (10) years' experience in the manufacture of plug valves. When requested, the manufacturer shall provide test certificates, dimensional drawings, parts list drawings and operation and maintenance manuals.
8.2 The exterior of the valve for above ground service shall be coated with a universal alkyd primer. Valve exterior for buried service shall be coated with an epoxy coating.
8.3 Valve shall be marked with the Serial Number, Manufacturer, Size, Cold Working Pressure (CWP) and the Direct and Reverse Actuator Pressure Ratings on a corrosion resistant nameplate.
8.4 Plug Valves shall be Series # 5800RTL (Threaded), 5800R (Flanged), 5800HP (Flanged), 5900R (Mechanical Joint) or 5900HP (Mechanical Joint) as manufactured by Val-Matic Valve and Mfg. Corporation, Elmhurst, IL. USA or approved equal.

Val-Matic's quality of design and meticulous workmanship has set the standards by which all others are measured. Quality design features such as the AWWA **Ener•G® Ball Valve** with its energy efficient design, fusion bonded epoxy and adjustable resilient seating....**Cam-Centric® Plug Valves** have more requested features than any other eccentric plug valve....**American-BFV® Butterfly Valves** include a field replaceable seat without the need for special tools....**Tilted Disc® Check Valves** with high strength and wear resistant aluminum bronze trim as standard....**Silent Check Valves** featuring combined resilient/metal-to-metal seating and are **NSF/ANSI 61 & 372 Certified**....**Sure Seal Foot Valves** provided with a heavy duty stainless steel screened inlet....**Swing-Flex® and Surgebuster® Check Valves** designed with an unrestricted full flow area....**Swing Check Valves** with field adjustable closure versatility....**Dual Disc® Check Valves** utilizing stabilized components to provide extended life....**Air Release, Air/Vacuum and Combination Air Valves** provided standard with Type 316 stainless steel trim....**VaultSafe®** family of products includes the **FloodSafe® Inflow Preventer**, **FrostSafe®** two-way damper and the **VentSafe®** vent pipe security cage. The **QuadroSphere® Trunnion Ball Valve** features a unique ball design with recessed surfaces creating additional flow paths to provide a self-cleaning action and reduced wear and torque.

Val-Matic is totally committed to providing the highest quality valves and outstanding service to our customers. Complete customer satisfaction is our goal. **Make the change to quality, specify Val-Matic!**

Knife gate valve KV01 250, 350 and 400mm

Orbinox EX series 14" Knife Gate valve, Cast iron body, 304 AISI SS gate, Nitrile seat, ST packing, ANSI 150 flanged ends, Unidierecitonal design, c/w rising stem handwheel

MODEL EX SERIES 10

ORBINOX
VALVE SOLUTIONS IN MORE THAN 70 COUNTRIES

WAFER STYLE KNIFE GATE VALVE

The EX(SER.10) model knife gate is an uni-directional wafer valve designed for general industrial service applications. The design of the body and seat assures non-clogging shut off on suspended solids in industries such as:

- Pulp and Paper
- Wastewater treatment plants
- Food and Beverage
- Mining
- Power plants
- Chemical plants
- Bulk handling
- Etc.

Sizes: DN 2"/50mm to DN 48"/1200mm (larger diameters on request)

Working pressure:

DN 2"/ 50mm to DN 10"/ 250mm	150 psi/ 10 bar
DN 12"/300mm to DN 16"/ 400mm	90 psi/ 6 bar
DN 18"/450mm	75 psi/ 5 bar
DN 20"/500mm to DN 24"/ 600mm	60 psi/ 4 bar
DN 28"/700mm to DN 48"/1200mm	30 psi/ 2 bar

Standard flange connection:

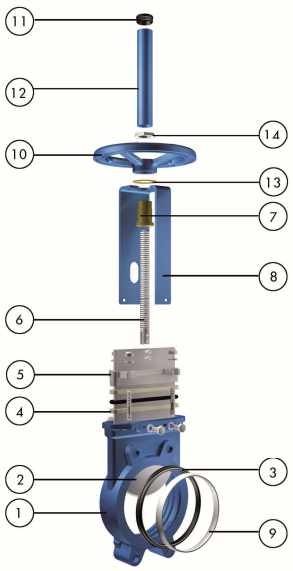
DIN PN 10 and ANSI B16.5 (class 150)

Other flange connections available on request

DIN PN 6 DIN PN 16 DIN PN 25
BS "D" and "E" ANSI 125

Directives: 2006/42/CE (MACHINES)
2014/68/EU (PED) Fluid: Group 1(b), 2 (Cat. I. mod. A)
2014/34/EU (ATEX)

All valves are tested prior to shipping in accordance with the standard developed by the Quality Control Department at ORBINOX.



STANDARD PARTS LIST

Part:	Cast Iron:	Stainless Steel:
1.- Body	GJL250(GG25)	CF8M
2.- Gate	AISI 304	AISI 316
3.- Seat	Metal/Metal or EPDM	
4.- Packing	PTFE Impreg. Synth. Fibre (With a EPDM O-Ring)	
5.- Gland Follower	Alum. (DN2"/50mm to DN12"/300mm) or Ductile Iron (DN14"/350mm a DN48"/1200mm)	CF8M
6.- Stem	AISI 430	
7.- Stem nut	Brass	
8.- Yoke	EPOXY-coated Carbon Steel	
9.- "A" ring	AISI 304	AISI 316
10.- Handwheel	GJS400 (GGG40)	
11.- Cap	Plastic	
12.- Stem Protector	EPOXY-coated Carbon Steel	
13.- Friction Washer	Brass	
14.- Nut	Zinc Plated Carbon Steel	

MODEL EX SERIES 10

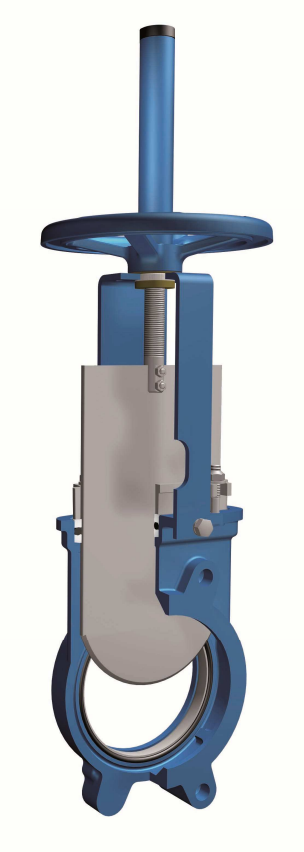
VALVE SOLUTIONS IN MORE THAN 70 COUNTRIES

DESIGN FEATURES

BODY:
Wafer style cast monoblock with raised faces and reinforcing ribs in large diameters for extra body strength. Internal cast-in gate wedges and guides allow for a tighter shut-off between gate and seat. Full port design for greater flow capacity and minimal pressure drop. The internal body design avoids any accumulation of solids that would prevent the valve from closing.



GATE:
Stainless steel gate. Gate is polished on both sides to avoid jamming and seat damage. Bottom of the gate edge is machined to a bevel to cut through solids for a tighter seal in the closed position. The thickness and/or material of the gate can be changed on request for higher pressure requirements.

SEAT: (resilient)
Unique design that mechanically locks the seal in the internal of the valve body with a stainless steel retainer ring. Standard EPDM also available in different materials such as Viton, PTFE, etc.

PACKING:
Long-life packing with several layers of braided fibre plus an EPDM o-ring, with an easy access packing gland ensuring a tight seal. Long-life braided packing is available in a wide range of materials.

STEM:
The standard stainless steel stem offers a long corrosion resistant life. For rising stem handwheel actuators only, a stem protector is provided for additional protection against dust while the valve is in the open position.

ACTUATORS:
All actuators supplied by ORBINOX are interchangeable, and supplied with a standard mounting kit for installation purposes on site.

YOKE or ACTUATOR SUPPORT:
Made of EPOXY coated steel (stainless steel available on request). Compact design makes it extremely robust even under the most severe conditions.

EPOXY COATING:
The epoxy coating on all ORBINOX cast iron and carbon steel valve bodies and components is applied by means of an electrostatic process, making the valves corrosion-resistant with a high quality finished surface.The ORBINOX standard colour is RAL-5015 blue.

GATE SAFETY PROTECTION:
ORBINOX automated valves are provided with gate guards in accordance with EU Safety Standards.The design feature prevents any objects from being caught accidentally while the gate is moving.
* IN EUROPE ONLY

ORBINOX
VALVE SOLUTIONS IN MORE THAN 70 COUNTRIES

OTHER OPTIONS

Bonnet (Fig.1):
Assures tight seal to atmosphere.
Reduces packing maintenance.

V-port:
60 degree and pentagonal port design. Selection depends on the desired fluid control type.

Flush ports (Fig.2):
Allow for cleaning of solids trapped within the body cavities that can obstruct the flow or prevent the valve from closing. Depending on the process, purging can be made with air, steam, liquids, etc.

Other materials of construction:
Ductile iron, carbon steel, stainless steels (AISI 317, ...), special alloys (254SMO, Hastelloys, ...), etc.

Fabricated valves :
ORBINOX designs, produces and delivers special fabricated valves for special process conditions (big sizes and/or high pressures).

EXT (full lug design):
Modified version of the EX model with full lug design for end of line applications. Standard flange connection from DIN PN 10, ANSI 150, to AS "D". Sizes available up to DN 24"/600mm.

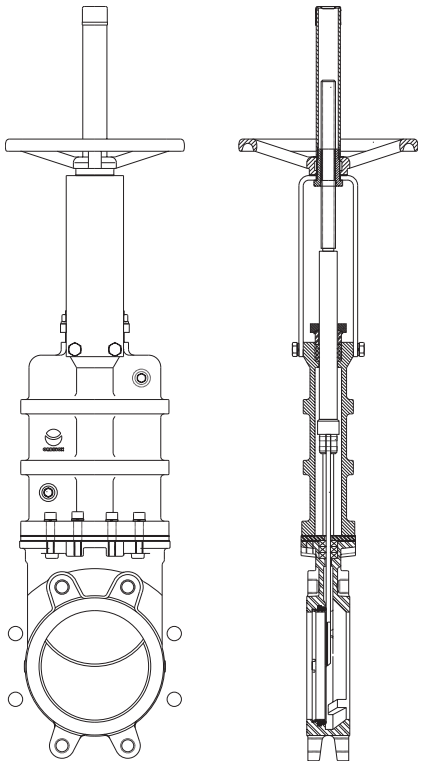


Fig.1

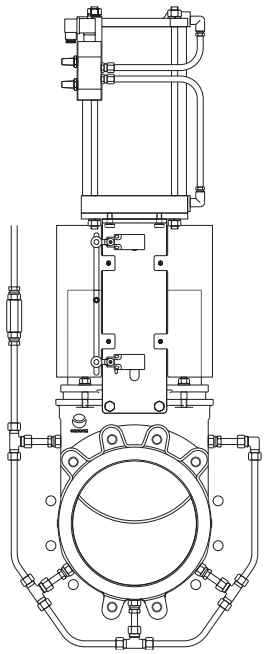

Fig.2

SURFACE TREATMENTS

Valve components can be protected or coated for a longer life expectancy, depending on the application of the valves and the valve service conditions. At ORBINOX we can offer alternative treatments and coatings for the different valve components to improve their properties against abrasion (Stellite, Polyurethane...), against corrosion (Halar, Rilsan, Galvanised...) and against adherence (Polishing, PTFE...).

ATEX

Please contact our ORBINOX representative for information and availability.
Some considerations:

- Hand operated EX(SER.10) valves have been subject to an ignition risk assessment according to the DIN EN 13463: 1-5 standard and they are out the scope of application of ATEX Directive. Therefore hand operated valves are suitable for ALL ATEX zones.
- Electrical, pneumatical and hydraulically operated valves must be subject to a conformity assessment of their own and also of the whole unit valve actuator to get EC Type Approval to Directive 2014/34.

We recommend consultation with our technical department.

TEMPERATURE CHART

SEAT / SEALS

Material	Max.T (Fº)	(ºC)	Applications
Metal/Metal	>482	>250	High temp./Low tightness
EPDM (E)	248	120	Acids and non mineral oils
Nitril (N)	248	120	Resistance to petroleum products
Viton (V)	392	200	Chemical service /High temp.
Silicon (S)	482	250	Food service / High temp.
PTFE (T)	482	250	Corrosion resistance

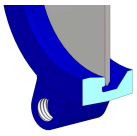
More details and other materials under request

PACKING

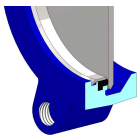
Material	Max.T (Fº)	(ºC)	pH
Dry cotton (AS)	122	50	6-8
PTFE impregn. synth. fibre (ST)	464	240	2-13
Braided PTFE (TH)	500	260	0-14
Graphited (GR)	1112	600	0-14
Ceramic fibre (FC)	2192	1200	--

NOTE: all types include an elastomere O-ring (same material as seal), excluding TH, GR and FC.

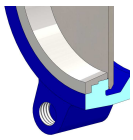
SEAT TYPES



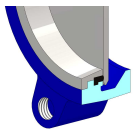
METAL/METAL
For applications with:
- High temperature
- High density media application
- In those cases when full tightness is not required



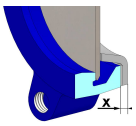
RESILIENT TYPE "A"
- Standard resilient seat.
- Temperature limitations according to the selectred seat material. Review the above chart or contact our Technical Department for more information.
- Seat with replaceable retainer ring



TYPE "B" SEAT (metal/metal)
For applications with:
- High temperature
- High density media application
- In those cases when full tightness is not required
- Replaceable design without dismantling the valve



TYPE "B" SEAT (resilient)
- Temperature limitations according to the selected seat material. Review the above chart or contact our Technical Department for more information.
- Replaceable and reinforced seat ring available in different materials such as: stainless steel, CA1 5, Ni Hard,...



DEFLECTION CONE "C"
- Deflects the media away from any valve internal exposed parts (gate guides, seat,...)
- Material: AISI 316, CA15, Ni-Hard, etc.
- Face-to-face dimension increases:

DN 2"/50mm to DN 10"/250mm X = 0.35"/9mm
DN 12"/300mm to DN 24"/600mm X = 0.47"/12mm
Larger diameters on request

VALVE EXTENSIONS

The extension on a valve allows the operator to open or close the valve from a distance. Different types of extensions can be used depending on the application and the distance from the gate to the actuator.

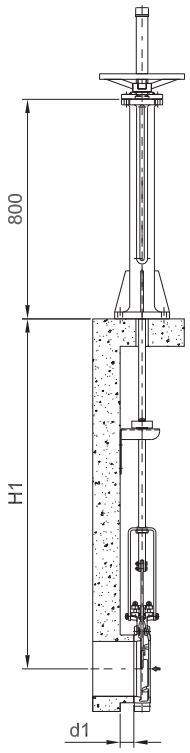

Fig.1

1 - Floor stand

- A pipe of the required length is added to the valve stem.
- Stem and yoke assembly remain in the original position.
- A floor stand is normally used at the top of the extension for actuator installation purposes.
- Required dimensions:
  H1: distance from centre line of the pipe to the base of the floor.
  d1: (wall bracket) distance from the wall to the face of the connecting flange.

Notes:

a- Any type of actuator can be mounted on the floor stand such as Handwheel, Gear, Electric, etc.
b- A wall bracket (Fig. A) is recommended at every 59"/1.5m. This prevents any deviation or buckling of the extension rod.
c- Standard construction of the floor stand is fabricated carbon steel. Other materials are available on request. (Fig. 1)
d- A position indicator (optional) can be installed for easy visibility of the percentage of opening of the valve.
e- Availability of supports for actuator floor stands (Fig. 2) upon request.

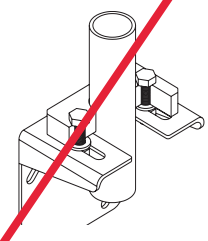

Fig. A

STANDARD PARTS LIST	
Parts:	**Material:**
Spindle	AISI 303
Stem	AISI 304
Wall bracket	Carbon Steel- Epoxy coated
Slider	Nylon
Floor stand	Cast Iron- Epoxy coated

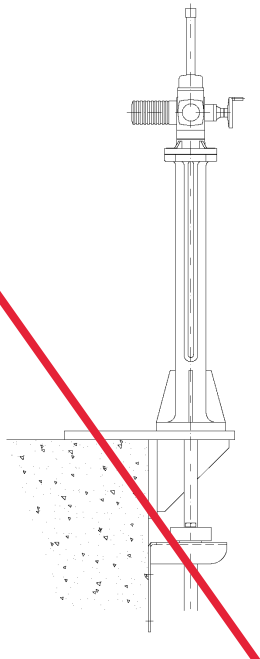

Fig.2

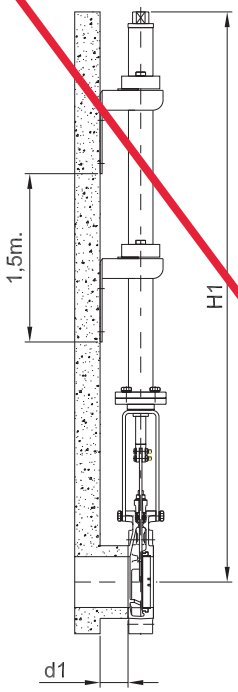
ORBINOX
VALVE SOLUTIONS IN MORE THAN 70 COUNTRIES

2.- Tube

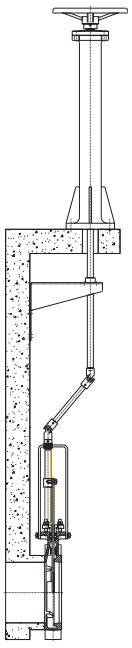


- Stem and yoke assembly remains in its original position.
- Handwheel is replaced by a tube, which rotates at the time of operating the valve.
- Stem rises and lowers within the tube.
- Ideal for surface box operation, valve can be operated with a T-bar and a square nut.
- Required dimensions:
  H1: distance from centre line of the pipe to the base of the floor.
  d1: (wall bracket) distance from the wall to the face of the connecting flange.

Notes:

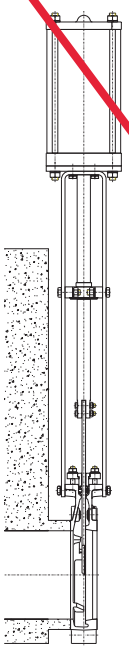
1. Handwheel or square nut operated only.
2. A wall bracket (Fig. A) is recommended at every 59"/1.5m. This prevents any deviation or buckling of the extension rod.
3. Standard construction of the extension is carbon steel epoxy coated. Other materials are available on request.

3 - Universal joint



- Universal joints are used in those cases where the alignment of the extension between valve and actuator is not feasible.
- Please contact our technical department for more information.

4 - Extended support plates



- Ideal where long extensions are not required.
- Guide bearing is installed at the mid point to prevent any deflection of the rod.

GEAR

- Recommended for valves larger than DN 14"/350mm and working pressures greater than 50psi (3.5 bar)

- Consists of:
  - Stem
  - Yoke
  - Bevel Gear Actuator with Handwheel

- Available from DN 8"/200mm to DN 50"/1200mm

- Options:
  - Locking device
  - Extension
  - Chainwheel
  - Rising stem and non-rising stem

- Standard reduction ratio of 4:1

PNEUMATIC CYLINDER

- The standard pneumatic actuator (double acting on-off cylinder) consists of:
  - DN ≤ 10"/250mm: Aluminum barrels
  - DN ≥ 12"/300mm: Composite barrels
  - Aluminum end covers
  - Stainless steel (AISI 304) piston rod
  - Nitrile coated steel piston
- Available from DN 2"/50mm to DN40"/ 1000mm
- Supply Pressure: min. 50psi (3.5 bar)- max. 150psi (10 bar). Actuator designed with 85psi (6 bar)air supply.
- For valves installed in a horizontal position, we recommend U-type support plates and/or actuator support.
- Options:
  - Hard anodized barrel and cover
  - Stainless steel barrel and covers
  - Over/Undersized cylinder
  - Manual override
  - Fail safe system (Page EX-14)
  - Limit switches
- Instrumentation (on request):
  - Positioners
  - Solenoid valves
  - Flow regulators
  - Air preparation units

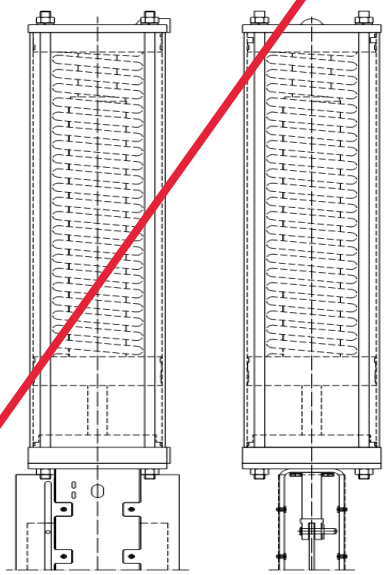
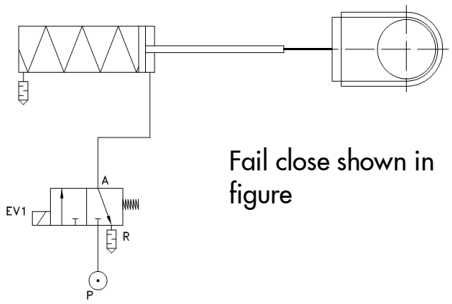
FAIL SALE SYSTEM

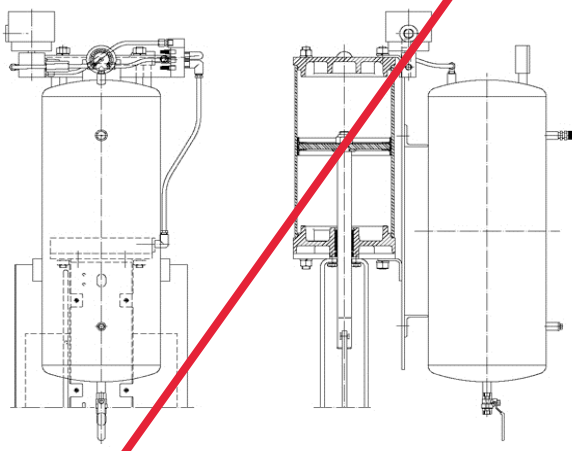
SINGLE ACTING (SPRING RETURN)

- This actuator (single acting cylinder) consists of:
  - Aluminum barrel and covers
  - Steel spring
  - Stainless Steel (AISI 304) piston rod
  - Nitrile coated steel piston
- Available from DN 2"/50mm to DN 12"/300mm
- Supply pressure:
  min. 75 psi / (5 bar) - max. 150 psi / (10 bar)
- Options:
  - Fail open
  - Fail close



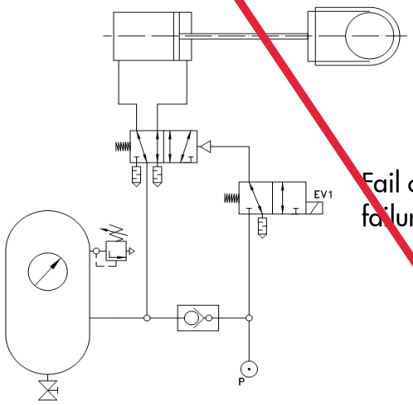


Fail close shown in figure



DOUBLE ACTING WITH AIR TANK

- Fail safe systems consists of: double acting pneumatic cylinder, air tank and all the neccessary elements according to the available options (solenoid valve, spool valve,...)
- Different solution available (pressure switches,...)
- Available for all diameters
- Supply Pressure:
  min. 50 psi / (3.5 bar) - max. 150 psi / (10 bar)



Fail close in power failure shown in figure

ELECTRIC ACTUATOR

- Consists of:
  - Electric actuator
  - Rising stem
  - Motor support yoke flange acc. to ISO 5210 / DIN 3338
- The standard electric motor is equiped with:
  - Manual emergency operation
  - Limit switches (open/closed)
  - Torque switches
- Available from DN 2"/50mm to DN 48"/1200mm
- Wide range of types and marks available to meet customer's needs
- Option:
  - Non rising stem

Actuator for KV01 250mm

EIM SPEC SHEET

EIM electric multi turn actuator, M2CP series, CSA (Class I, II, III Div 1, Groups D, E, F, G, T4A) rated enclosure, 30 RPM, Open/Close functionnality, 16 contact position switches, Reversing contactor, Solid state starter, 115 VAC / 1 Ph / 60 Hz power supply, Momentary push buttons controls, Space heater and thermostat, c/w declutchable handwheel

EMERSON

Specifications

This section lists the specifications for the MR95 Series regulators. Factory specification such as type, maximum inlet pressure, maximum temperature, maximum outlet pressure, spring range, orifice size and seat material are stamped on the nameplate fastened on the regulator at the factory.

Available Constructions

Type MR95L: Pressure reducing regulator for outlet pressures from 2 to 30 psig / 0.14 to 2.1 bar. 1/4 in. to 1 in. body sizes only.

Type MR95H: Pressure reducing regulator for outlet pressures from 5 to 150 psig / 0.34 to 10.3 bar.

Type MR95HP: Pressure reducing regulator for outlet pressures from 15 to 400 psig / 1.0 to 27.6 bar (soft-seated).

Type MR95HT: High temperature pressure reducing regulator for outlet pressures from 15 to 300 psig / 1.0 to 20.7 bar (metal seat) and up to 650°F / 343°C.

Type MR95LD: Pressure reducing differential regulator for differential set pressures from 2 to 30 psi / 0.14 to 2.1 bar with maximum inlet pressure up to 300 psi / 20.7 bar and maximum outlet pressure up to 125 psi / 8.6 bar. 1/4 in. to 1 in. body sizes only.

Type MR95HD: Pressure reducing differential regulator for differential set pressures from 5 to 150 psi / 0.34 to 10.3 bar with maximum inlet/outlet pressures up to 300 psig / 20.7 bar.

Type MR95HDP: Pressure reducing differential regulator for differential set pressures from 5 to 150 psi / 0.34 to 10.3 bar with maximum inlet/outlet pressures up to 600 psi / 41.4 bar.

Body and Orifice Sizes

1/4 NPT body:
0.284 in. / 7.22 mm orifice

1/2 in. / DN 15 body:
0.416 in. / 10.56 mm orifice

3/4 and 1 in. / DN 20 and 25 bodies:
0.631 in. / 16.02 mm orifice

1-1/2 and 2 in. / DN 40 and 50 bodies (not available for Types MR95L and MR95LD):
1.142 in. / 29 mm orifice

End Connection Styles

See Tables 1 and 2

Outlet or Differential Pressure Ranges[1]

See Table 3

Maximum Cold Working Pressures of Body Size and Material[1]

See Table 4

Maximum Temperature Ranges of Diaphragm and Seat Materials[1][2]

See Table 5

Maximum Temperature Ranges of Body Materials[1][2]

See Table 5

Spring Case Construction

Drilled Untapped Hole:
Standard for Types MR95L, MR95H, MR95HP and MR95HT

1/4 NPT Vent:
Standard for Types MR95LD, MR95HD and MR95HDP
Optional for Types MR95L, MR95H, MR95HP and MR95HT

Pressure Setting Adjustment

Adjusting screw:
Standard for Types MR95L, MR95H, MR95HP and MR95HT only

Handwheel:
Standard for Types MR95LD, MR95HD and MR95HDP
Optional for 1/2 in. / DN 15 body size of Types MR95L, MR95H, MR95HP and MR95HT

Tee handle:
Optional for other body sizes (except 1/2 in. / DN 15) of Types MR95L, MR95H, MR95HP and MR95HT

Pressure Registration

Internal or External

Shutoff Classification Per ANSI/FCI 70-3-2004

Metal Seats: Class IV
Elastomer Seats: Class VI or better
PTFE: Class IV

Flow and Sizing Coefficients

See Table 6

1. The pressure/temperature limits in this Bulletin and any applicable standard or code limitation for this regulator should not be exceeded.
2. Pressures and/or the body end connection may decrease these maximum temperatures.

3/4 and 1 in. / DN 20 and 25 bodies: 22 lbs / 10 kg
1-1/2 and 2 in. / DN 40 and 50 bodies: 55 lbs / 25 kg
MR95L Series
1/4 NPT body: 7 lbs / 3.2 kg
1/2 in. / DN 15 body: 15 lbs / 6.8 kg
3/4 and 1 in. / DN 20 and 25 bodies: 35 lbs / 16 kg

Introduction

The MR95 Series regulators are compact, large-capacity, direct-operated pressure regulators (see Figure 1). The units are available in 1/4 NPT through 2 in. / DN 50 sizes and are offered in several different end connection configurations. They are designed to handle pressures up to 1000 psig / 68.9 bar and temperatures up to 650°F / 343°C.

These products can help solve the toughest pressure control applications. Typical applications include superheated steam, steam injection, steam tracing, nitrogen purging, boiler feed water, process chemicals, cooling water, test fixtures, wash tanks, sterilizers/autoclaves, fuel lines, pneumatic supply and many others.

Features

- **Handwheels/Tee Handles—**Allow easy pressure setting changes and are standard on Types MR95LD, MR95HD and MR95HDP and optional on the Types MR95L, MR95H, MR95HP and MR95HT regulators.
- **Versatile—**Can be used with all process media including air, steam, gas, water, liquids (oils and process chemicals) and oxygen.
- **Tight Shutoff With Elastomer Seats—**Metal seats available for high temperatures.
- **Direct-Operated—**Design maximizes speed of response.
- **Robust—**Up to 1000 psig / 68.9 bar inlet pressure.
- **P_1 = P_2—**Inlet equals outlet rating in Types MR95H, MR95HD and MR95HDP up to 300 psig / 20.7 bar.
- **Rugged Construction—**Available in a variety of body and spring case materials to address the toughest service conditions. Severe service elastomers and corrosion resistant trims are also available and provide excellent fluid compatibility.
- **Differential Pressure Capability—**Spring-loaded Polytetrafluoroethylene (PTFE) packing and tapped connections permit pressure loading of the Types MR95LD, MR95HD and MR95HDP spring cases.
- **Special Service Capabilities—**Optional materials are available for applications handling sour gases, cryogenics and superheated steam.
- **Large Turndown Ratio—**No need for low C_v trims at low flows.
- **Graphite Gaskets—**For high temperature applications up to 650°F / 343°C (optional).
- **Set Pressures up to 400 psig / 27.6 bar**
- **Multiple End Connection Options—**To match your application.
- **Easy Maintenance—**Seating parts are easily accessible by removing the plug on the bottom of the regulator.
- **API 614 Compliant—** Steel or Stainless steel constructions with Stainless steel trim meet API 614 requirements.

1. For Types MR95LD, MR95HD and MR95HDP regulators, the pressure ranges indicate the differential pressure that can be obtained with the indicated spring. The differential pressure (spring setting) is added to the spring case loading pressure to determine the actual outlet pressure.
2. Springs meet NACE MR0175-2002 and NACE MR0103 requirements only for applications in which the spring is not exposed to the sour gas.
3. Available in Inconel®.

Inconel® is a mark owned by Special Metals Corporation.

1. The pressure/temperature limits in this Bulletin and any applicable standard or code limitation should not be exceeded.
2. The pressure limits given are based on the body size and body materials only. Actual pressure limits of the assembled regulator may decrease and vary depending on the temperature, body end connection, diaphragm, seat and/or trim material of the regulator.
3. See Tables 1 and 2 for all available body sizes.
4. Not available for 1/4 NPT body size.

Monel® is a mark owned by Special Metals Corporation.
Hastelloy® C is a mark owned by Haynes International, Inc.

Table 5. *MR95 Series Temperature Capabilities*[1][2]

TRIM MATERIAL	SEAT	DIAPHRAGM	O-RING	DIAPHRAGM PROTECTOR	GASKET	TEMPERATURE	
						°F	°C
Nitrile (NBR)	✓		✓			-40 to 180	-40 to 82

1. To obtain capacities for regulators using metal diaphragms, multiply the table values by 0.8.
2. To obtain capacities for regulators with reduced flow orifices, multiply the table values by 0.7.

Table 12. *Air Capacities[1][2] in SCFH / Nm³/h for 1/4 NPT and 1/2 through 1 in. / DN 15 through 25 Types MR95H, MR95HD and MR95HDP Regulators with Elastomer Diaphragm*

1. To obtain capacities for Type MR95HT (metal diaphragm), multiply the table values by 0.6. Capacity data for 1000 psig / 69.0 bar inlet is not applicable for Type MR95HT (Type MR95HT max. inlet = 600 psig / 41.4 bar).
2. To obtain capacities for regulators with reduced flow orifices, multiply the table values by 0.7.

Table 15. *Air Capacities[1] in SCFH / Nm³/h for 1-1/2 through 2 in. / DN 40 through 50 Type MR95HP (Elastomer Diaphragm) Regulator*

RECOMMENDED OUTLET/ DIFFERENTIAL PRESSURE RANGE, psig/psi / bar	PRESSURE				REGULATOR BODY SIZE, IN. / DN

▭ - Denotes capacities limited by boost.

1. To obtain capacities for regulators with reduced flow orifices, multiply the table values by 0.7.

Table 16. *Steam Capacities[(1)(2)] for 1/4 NPT and 1/2 through 1 in. / DN 15 through 25 Types MR95L and MR95LD Regulators with Metal Diaphragm*

1. Capacities are based in lbs/h / kg/h of saturated steam.
2. To obtain capacities for regulators with reduce flow orifices, multiply the table values by 0.7.

Table 17. *Steam Capacities[1][2] for 1/4 NPT and 1/2 through 1 in. / DN 15 through 25 Types MR95H, MR95HD and MR95HDP Regulators with Metal Diaphragm*

1. Capacities are based in lbs/h / kg/h of saturated steam.
2. To obtain capacities for regulators with reduce flow orifices, multiply the table values by 0.7.

Table 18. *Steam Capacities[1][2] for 1-1/2 through 2 in. / DN 40 through 50 Types MR95H, MR95HD and MR95HDP Regulators with Metal Diaphragm*

▭ - Denotes capacities limited by boost.

1. Capacities are based in lbs/h / kg/h of saturated steam.
2. To obtain capacities for regulators with reduce flow orifices, multiply the table values by 0.7.

Table 21. *Water Capacities[1][2] in GPM / L/min for 1/4 NPT and 1/2 through 1 in. / DN 15 through 25 Types MR95L and MR95LD Regulators with Elastomer Diaphragm*

▭ - Denotes capacities limited by boost.

1. To obtain capacities for regulators with reduced flow orifices, multiply the table values by 0.7.

Table 24. *Water Capacities[1][2] in GPM / L/min for 1/4 NPT and 1/2 through 1 in. / DN 15 through 25 Type MR95HP (Elastomer Diaphragm) Regulator*

RECOMMENDED OUTLET/ DIFFERENTIAL PRESSURE RANGE, psig/psi / bar	PRESSURE				REGULATOR BODY SIZE, IN. / DN															
	Outlet/ Differential Setting		Inlet		1/4 NPT				1/2 / 15				3/4 / 20				1 / 25			
					Droop				Droop				Droop				Droop			
					10%		20%		10%		20%		10%		20%		10%		20%

- Capacities not tested due to cavitation regime.

1. To obtain capacities for regulators with metal diaphragms or for Type MR95HT, multiply the table values by 0.6. Capacity data for 1000 psig / 69.0 bar inlet is not applicable for Type MR95HT (Type MR95HT max. inlet = 600 psig / 41.4 bar).
2. To obtain capacities for regulators with reduced flow orifices, multiply the table values by 0.7.

Table 25. *Water Capacities[1][2] in GPM / L/min for 1-1/2 through 2 in. / DN 40 through 50 Type MR95HP (Elastomer Diaphragm) Regulator*

- Denotes capacities limited by boost.
- Capacities not tested due to cavitation regime.

1. To obtain capacities for Type MR95HT (metal diaphragm), multiply the table values by 0.6. Capacity data for 1000 psig / 69.0 bar inlet is not applicable for Type MR95HT (Type MR95HT max. inlet = 600 psig / 41.4 bar).
2. To obtain capacities for regulators with reduced flow orifices, multiply the table values by 0.7.

- Denotes capacities limited by boost.
- Capacities not tested due to cavitation regime.

1. To obtain capacities for Type MR95HT (metal diaphragm), multiply the table values by 0.6. Capacity data for 1000 psig / 69.0 bar inlet is not applicable for Type MR95HT (Type MR95HT max. inlet = 600 psig / 41.4 bar).
2. To obtain capacities for regulators with reduced flow orifices, multiply the table values by 0.7.

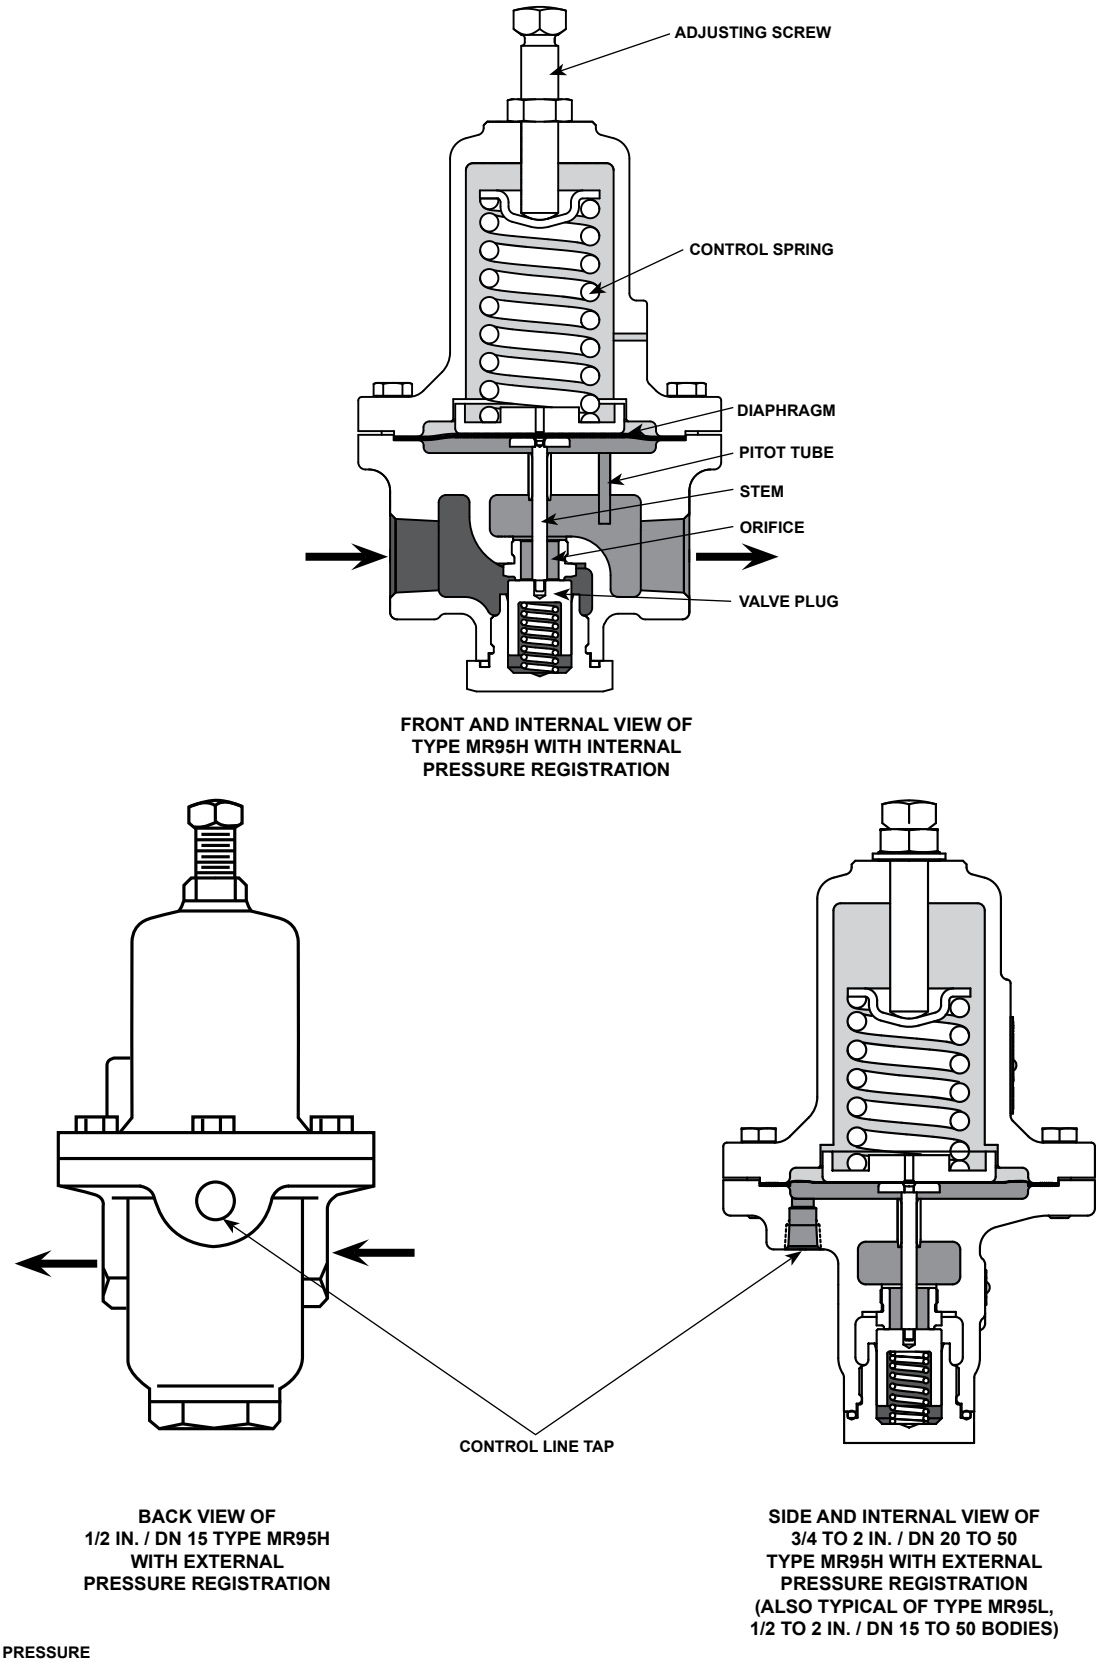

Figure 2. *MR95 Series Operational Schematics*

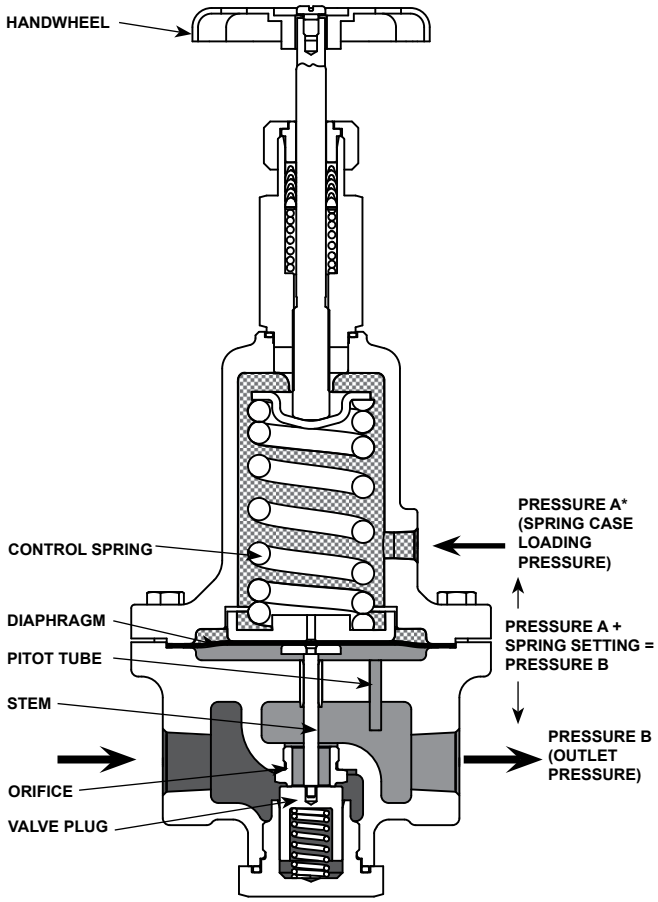
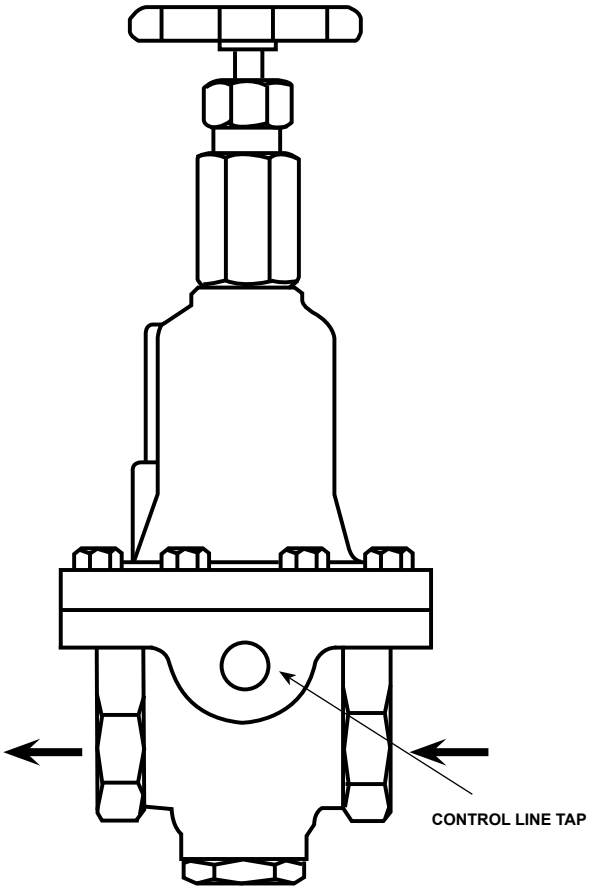
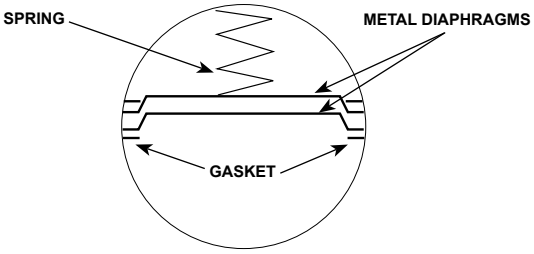


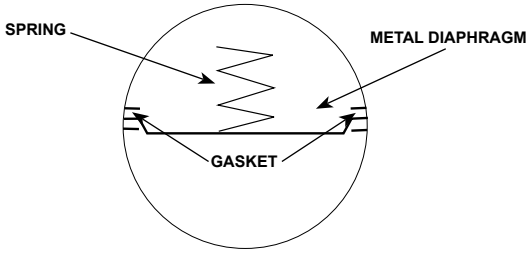
FRONT AND INTERNAL VIEW OF TYPES MR95HD AND MR95HDP WITH INTERNAL PRESSURE REGISTRATION



BACK VIEW OF TYPES MR95HD AND MR95HDP WITH EXTERNAL PRESSURE REGISTRATION



TYPE MR95H WITH 2 METAL DIAPHRAGMS (ALSO TYPICAL OF TYPES MR95HT AND MR95L EXCEPT FOR TYPE MR95L WITH 1/4 NPT BODY SIZE, 2 to 6 psi / 0.14 to 0.41 bar RANGE)



TYPE MR95L (1/4 NPT, 2 to 6 psi / 0.14 to 0.41 bar RANGE) WITH METAL DIAPHRAGM

INLET PRESSURE
OUTLET PRESSURE
LOADING PRESSURE

*PRESSURE A MAY BE SUPPLIED BY ANOTHER PRESSURE SYSTEM OR A MANUAL LOADING REGULATOR.

Figure 2. *MR95 Series Operational Schematics (continued)*

Principle of Operation

The MR95 Series (refer to Figure 2) is a direct-operated regulator. Downstream pressure is registered internally or externally through a control line to the under side of the diaphragm. When the downstream pressure is at or above the set pressure, the disk is held against the orifice, restricting fluid flow through the regulator. When demand increases, downstream pressure drops slightly allowing the spring to extend, moving the stem down and the disk away from the orifice. This allows fluid flow through the body to the downstream system. Types MR95H, MR95L, MR95HP and MR95HT use spring force to regulate outlet pressure. Types MR95HD, MR95HDP and MR95LD use spring force to maintain a differential pressure between spring case loading pressure and outlet pressure.

Installation

The MR95 Series regulators may be installed in any position, as long as flow will be in the same direction as that indicated by the body arrow. The Types MR95H, MR95L, MR95HT and MR95HP regulators should be installed so that their spring case vents are protected from anything that might clog them.

Emerson Process Management Regulator Technologies, Inc. (Emerson) provides an instruction manual with every regulator shipped. Refer to this for complete installation, operation and maintenance instructions. Included is a complete list of individual parts and recommended spare parts.

NACE Compliance

Optional materials are available for applications handling sour gases. These constructions comply with the recommendations of NACE International sour service standards.

The manufacturing processes and materials used by Emerson assure that all products specified for sour gas service comply with the chemical, physical and metallurgical requirements of NACE MR0175 ISO-2002 and/or NACE MR0103. Optional materials are available to meet ANSI/NACE MR0175/ ISO 15156, please contact your local Sales Office for special ordering instructions. Customers have the responsibility to specify correct materials. Environmental limitations may apply and shall be determined by the user.

Capacity Data

The capacity information on the following pages is based on three droop factors, 10%, 20% and 40%. Droop is deviation from the setpoint of the regulator and is usually stated in percentage of setpoint value.

For highest capacity and the most accurate control within a particular type of the MR95 Series regulators, use the lowest range spring that can be adjusted to the desired setpoint (see Table 3 for part numbers of appropriate springs for each body size).

If closer control is necessary, a regulator of larger capacity or different design should be selected, so that the necessary flow can be obtained with a smaller droop factor.

Sometimes it may be necessary to interpolate the capacity table data to determine capacity for outlet settings not given. To maintain accuracy, it is important when interpolating to stay within a spring range if possible. The following is a procedure for interpolating the data to calculate flow:

1. Determine which spring is to be used.
2. Find the two outlet settings (P_2a and P_2b) that bracket the actual outlet pressure P_2.
3. For a given body size and inlet pressure, find the capacity Qa for P_2a and Qb for P_2b.
4. Use the following formula to determine the interpolated capacity (Q):

$$\frac{Qb - Qa}{P_2b - P_2a} = \frac{Qb - Q}{P_2b - P_2}$$

Example:
P_1 = 100 psig / 6.9 bar
1/4 NPT Type MR95H with 15 to 30 psig / 1.0 to 2.1 bar spring range

P_2 = 20 psig / 1.4 bar
Determine air capacity, Q

Solution:

Qa = 1100 SCFH / 28.8 Nm^3/h
P_2a = 15 psig / 1.0 bar
Qb = 1700 SCFH / 46.5 Nm^3/h
P_2b = 30 psig / 2.1 bar

$$\frac{1700 - 1100}{30 - 15} = \frac{1700 - Q}{30 - 20}$$

Q = 1300 SCFH

$$\frac{46.5 - 28.8}{2.1 - 1.0} = \frac{46.5 - Q}{2.1 - 1.4}$$

Q = 35 Nm^3/h

Note

The same interpolation procedure can be used for different inlet pressures.

Contact your local Sales Office if you should have any questions about selecting the proper regulator.

Air Capacities

Regulating capacities at selected pressures and outlet pressure flows are given in SCFH (60°F and 14.7 psia) of air. To determine the equivalent capacities for other gases, multiply the table capacities by the following appropriate conversion factors: 1.29 for 0.6 specific gravity natural gas, 0.808 for propane, 0.707 for butane or 1.018 for nitrogen. For gases of other specific gravities, divide by the square root of the appropriate specific gravity.

Then, if capacity is desired in Nm^3/h at 0°C and 1.01325 bar, multiply SCFH by 0.0268.

Capacities in Tables 11, 12, 13, 14 and 15 are for regulators using elastomer diaphragms. Depending on regulator construction, a multiplier must be used to convert to capacities for regulators using metal diaphragms.

To determine wide-open flow capacity for relief valve sizing of air at a temperature of 60°F, use the equation for critical pressure drops (absolute outlet pressure equal to one-half or less than one-half the absolute inlet pressure).

$$Q = P_{1(abs)}C_g$$

where,

Q = Gas flow, SCFH (60°F and 14.7 psia)

$P_{1(abs)}$ = Absolute inlet pressure, psia (add 14.7 psi to gauge inlet pressure to obtain absolute inlet pressure)

C_g = Wide-open gas sizing coefficient from Table 6

For pressure drops lower than critical (absolute outlet pressure greater than one-half the absolute inlet pressure), use the sizing nomographs in Fisher™ Catalog 10 or the Fisher Sizing Program.

To obtain capacities in Nm^3/h at 0°C and 1.01325 bar, multiply the capacity determined in SCFH by 0.0268.

Steam Capacities

Capacities in Tables 16, 17, 18, 19 and 20 are in lbs/h of saturated steam. To obtain capacities in kg/h, multiply the capacities given in the table by 0.4535. Capacities have been calculated for stainless steel diaphragms only since steam service exceeds the elastomer diaphragm temperature limits.

To determine wide-open flow capacity for relief valve sizing of steam, use the equation for critical pressure drops (absolute outlet pressure equal to one-half or less than one-half absolute inlet pressure).

$$Q = P_{1(abs)}C_s$$

where,

Q = Steam flow, lbs/h

$P_{1(abs)}$ = Absolute inlet pressure, psia (add 14.7 psi to gauge inlet pressure to obtain absolute inlet pressure)

C_s = Wide-open steam sizing coefficient from Table 6

For pressure drops lower than critical (absolute outlet pressure greater than one-half absolute inlet pressure), use the sizing nomographs in the Fisher Sizing Program.

Water Capacities

All water capacities in Tables 21, 22, 23, 24 and 25 are in gallons per minute (GPM). Capacities in Tables 21, 22 and 24 are for regulators using only elastomer diaphragms. Depending on regulator size, a multiplier, given in these tables, must be used to convert to capacities for regulators using metal diaphragms.

To determine flow capacity for liquid relief valve sizing, refer to the Fisher Sizing Program using the C_v coefficients given in Table 6. The K_m values listed in Table 6 can be used to predict choked flow on liquid service.

To convert capacities to m^3/h, multiply GPM by 0.2271.

Ordering Information

When ordering, complete the ordering guide on this page. Refer to the Specifications section on pages 2 and 3. Review the description to the right of each specification and the information in each referenced table or figure. Specify your choice whenever a selection is offered.

Ordering Guide

Type (Select One)
- ☐ MR95L (Low pressure)
- ☐ MR95LD (Low pressure differential)
- ☐ MR95H (High pressure)
- ☐ MR95HD (High pressure differential, must be Steel or Stainless steel construction)
- ☐ MR95HDP (High pressure differential, must be Steel or Stainless steel construction)
- ☐ MR95HP (High pressure, soft-seated)
- ☐ MR95HT (High pressure/temperature, must be Steel or Stainless steel construction)

Body Size (Select One)
- ☐ 1/4 NPT(1)
- ☐ 1/2 in. / DN 15
- ☐ 3/4 in. / DN 20
- ☐ 1 in. / DN 25
- ☐ 1-1/2 in. / DN 40 (not available for MR95L Series)
- ☐ 2 in. / DN 50 (not available for MR95L Series)

Body Material and End Connection Style(2)
(See Tables 1 and 2, Select One)

Gray Cast Iron

☐ 80 to 400 psig / 5.5 to 27.6 bar, Unpainted***
1-1/2 and 2 in. / DN 40 and 50 body sizes
17-4 PH Stainless steel Spring
☐ 15 to 100 psig / 1.0 to 6.9 bar, Unpainted***
☐ 60 to 300 psig / 4.1 to 20.7 bar, Unpainted***

Replacement Parts Kit (Optional)
☐ Yes, send one replacement parts kit to match this order.

Monel® and Inconel® are marks owned by Special Metals Corporation.
Hastelloy® C is a mark owned by Haynes International, Inc.
1. Alloy 6 is not available for 1/4 in. size.
2. Only available with Stainless steel seat, orifice/valve plug, valve plug guide and stem/stem guide.
3. Available for 3/4 and 1 in. / DN 20 and 25 body sizes only.

Butterfly valve BFV07 - 75, 100 and 150

Keystone K-LOK Series 36 - 150 ASME
Style: Wafer,
SIZE: All
Body: Stainless Steel
Disc: 316 Stainless Steel
Stem: 17-4 PHSS
Seat/Back
Ring: RTFE/SS
Packing: Teflon
Bearings: SS, Body
Gaskets: Graphite
Flange Drilling: ASME 125/150
Mounting: Keystone Actuator mount
Actuation: Gear - Blue

EMERSON

KEYSTONE SERIES 36 AND 37 K-LOK HIGH PERFORMA

K-LOK Series 36 - ASME 150
K-LOK Series 37 - ASME 300

GENERAL APPLICATIONS

- Modulating service
- Airport refueling
- Hydrocarbon processing
- Chemical/petrochemical processing
- Purified gas
- Steam and vacuum services
- Power and utilities
- Refrigeration
- HVAC
- Alumina refining

TECHNICAL DATA

Size range:	DN 50 - 600 (NPS 2 - 24) See note below for DN 750 - 900 (NPS 30-36)
Vacuum rating:	1.016×10^{-3} mm (4×10^{-5} in) Hg
Body style:	Wafer, lug and double flanged
Pressure rating:	Series 36 - ASME 150 Series 37 - ASME 300
Temperature rating:	-40°C to 538°C (-40°F to 1000°F)

Metal seated, fire-safe and DN 750-900 (NPS 30-36) valves are available. For more information on these items see Figures 360/362 data sheet (VCTDS-00032).

Lug and double flange bodies are full rated for bidirectional dead end service.

FEATURES AND BENEFITS

- K-LOK polymer and elastomer seats provide bi-directional, drop-tight shut-off in vacuum as well as at full rated differential pressure. Its unique design does not rely on pressure to assist sealing therefore seals at high and low pressures, as well as dirty services. A variety of materials allows optimum seat life in all applications.
- Blow-out resistant shaft is standard on all valves for increased safety.
- Unique packing design allows for use in pressure as well as vacuum without modification or special assembly.
- Disc taper pins are tangentially positioned half in disc and half in shaft, placing them in compression rather than shear, which eliminates potential for failure.
- Rocker-shaped gland bridge compensates for uneven adjustment of gland nuts reducing packing leaks.
- Integrally cast disc position stop perfectly locates the disc in seat, achieving maximum seat and seal life.
- Extended neck allows for 50 mm (2") of pipeline insulation.
- Integrally cast mounting pad provides direct mounting of actuators eliminating the need for costly brackets and couplings.
- Flattened body bore at shaft journal ports positions shaft bearings near disc, providing maximum shaft support resulting in reduced wear and longer life.

PRINCIPLES OF OPERATION

Double offset disc/shaft

K-LOK's unique two-piece shaft and double-offset disc/shaft design allows for high cycling and creates a lower disc profile with increased capacity and a rangeability of 33:1.

In addition to increasing the flow area across the disc, this design minimizes wear points between seat and disc.

The first offset is achieved by locating the shafts downstream of the center-line of the seat. This allows for a totally unobstructed 360° sealing surface.

The second offset locates the shafts off-center of the vertical axis of the seat.

The combination of these two offsets creates a camming effect as the disc swings into and out of the seat. The disc lifts quickly out of the seat in the first few degrees of travel and does not contact the seat again until it is nearly closed. There are no wear points between the seat and disc, while operating torques are reduced and seat life is extended.

Adjustable shaft packaging (polymer seated valves)

The K-LOK's unique shaft packing is composed of 3 rings of braided PTFE rope between one PTFE V-ring at the top and bottom. The packing operates on an interference fit with the body and therefore will seal in pressure and vacuum. Many other manufacturers' designs will require special packing for vacuum services.

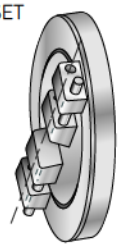
This packing is easily field adjustable without the need to remove actuation due to its unique inverted packing adjustment bolts. Another important feature is the use of a rocker shaped packing gland bridge that compensates for uneven tightening of the packing gland bolts eliminating packing leaks due to uneven packing compression.

Blow-out resistant shaft (BOR)

The Keystone K-LOK high performance butterfly valve contains a blow-out resistant shaft as a standard. This is achieved by machining a groove in the shaft that allows a snap ring to lock into the shaft groove.

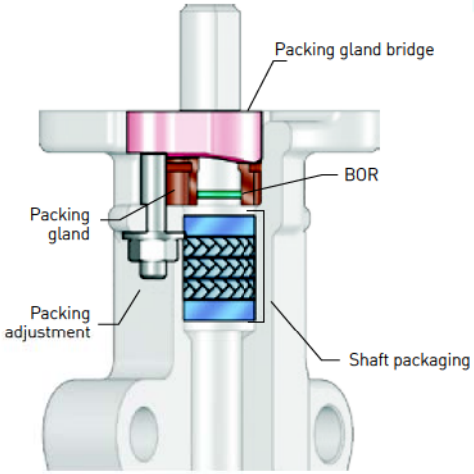
The packing gland follower is provided with an undercut on its lower surface which encapsulates the locked in snap ring. This design provides positive retention of the shaft in the unlikely event of a shaft breakage.

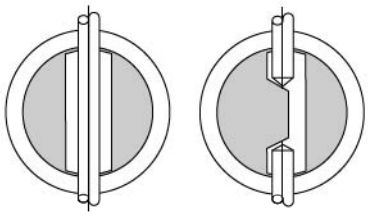
DOUBLE OFFSET



FIRST OFFSET

SECOND OFFSET





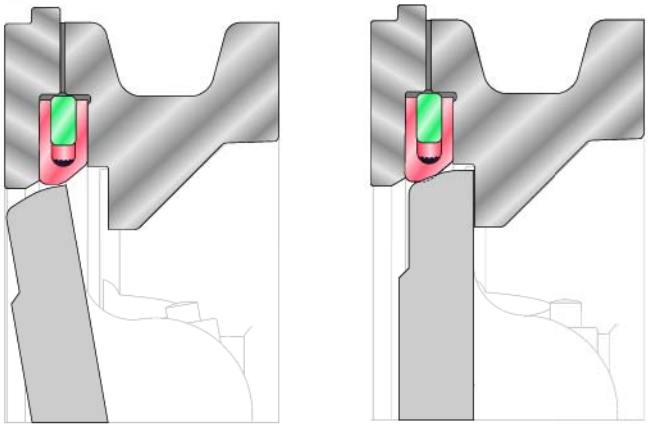
Aspect ratio = open area ÷ disc area

Two-piece shaft vs. one-piece shaft

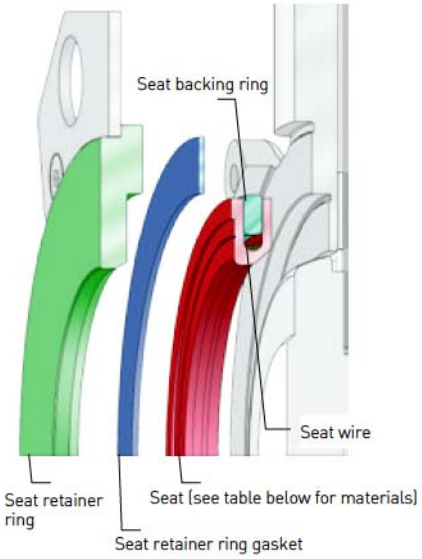
K-LOK's disc geometry maximizes flow capacity by increasing the available flow area through the valve. This increase in disc efficiency results in a higher valve C_v.

Standards and specifications applicable for K-LOK®		
ASME	B16.34	Steel valves
	B31.3	Chemical plant and petroleum refinery piping
	B16.5	Steel pipe flanges and flange fittings
MSS	SP-6	Standard finishes for pipe flanges
	SP-25	Standard marking systems for valves
	SP-55	Quality standard for steel casting
	SP-61	Pressure testing of steel valves
	SP-68	High pressure offset disc butterfly valves
API	609	Butterfly valves (most models)
	607	Fire-test for soft seated quarter-turn valves
	598	Valve inspection and test, upon request
NSF/ANSI Standard 61		Potable water, upon request
PED/CE		European directive, upon request

SEAT DESIGN



SEAT REPLACEMENT



SEAT DESIGN

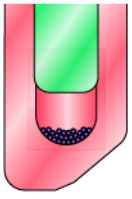
The K-LOK seat is a true interference seat design and unlike most other manufactures does not rely on line pressure to assist in sealing. All seats seal drop-tight bi-directionally at low and high pressure as well as vacuum. Given the interference seat design the K-LOK will also operate in dirty services where most pressure assist valves fail.
Polymer (PTFE, RTFE and UHMWPE) seats incorporate a unique design consisting of a stainless steel braided wire winding, enclosed in a U-shape envelope to provide seating energy and memory. This wire winding allows axial flexibility in both directions of flow. The winding also allows radial flexibility when the disc is not fully closed, reducing seat/disc interference, seat wear and shaft torque. When the disc closes, it provides circumferential stiffness and assures the required disc/seat seals tight in both vacuum and pressure.
Elastomer seats are molded around a stack of V-shaped steel rings that provide the same stability, support and flexure as the wire windings in polymer seats.

SEAT REPLACEMENT

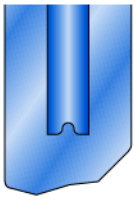
All seats for the Keystone K-LOK are easily field replaceable. Simply remove seat retainer ring, rotate disc to fully closed position and replace seat assembly and gasket. Dis-assembly of the disc and shaft is not required. Seat retaining ring gaskets are not used with elastomer seats.

SEAT MATERIALS

Seat	Material	Typical applications
1. RTFE	Reinforced polytetrafluoroethylene	HVAC, steam, chlorine, ammonia, nitrogen, water, gasoline, vacuum
2. PTFE	Polytetrafluoroethylene	Pharmaceuticals, air, potable water, dyes, white mediums
3. UHMWPE	Ultra high molecular weight polyethylene	Abrasives, suspended solids, scaling mediums
For seats 1 thru 3		
Wire wrap	Stainless steel braided wire	
Seat backing ring	Polyester or phenolic Stainless steel	General purpose services up to 93°C (200°F) Steam, ammonia, elevated temperature services



Seat	Material	Typical applications
4. EPDM	-	Water based mediums, slurry applications, abrasives
5. NBR	-	Oil based mediums, slurry applications, abrasives
6. Fluoroelastomer (FKM)	-	Elevated temperatures, slurry applications, abrasives
For seats 4 thru 6		
Metal insert	Carbon steel	



SEAT TIGHTNESS

All polymer seated valves are factory tested for bi-directional drop tight shut-off at 10% above the rated pressure. This exceeds the ANSI FCI 70-2 standard which establishes a service of six leakage classes for control valves as per below:

ANSI/FCI 70-2 CONTROL VALVE SEAT LEAKAGE, TOLERANCES, AND TEST SPECIFICATIONS

ANSI B16.104-1976	Maximum leakage			Test medium	Pressure and temperature
Class VI	Nominal port diameter DN (NPS)	Bubbles per minute[3]	ml. per minute	Air or nitrogen	Service ΔP or 3.4 bar differential, whichever is lower, at 10°C - 52°C (50°F - 125°F)
	50 (2)	3	0.45		
	65 (2½)	4	0.60		
	80 (3)	6	0.90		
	100 (4)	11	1.70		
	150 (6)	27	4.00		
	200 (8)	45	6.75		
Class V	5×10^{-12} m³/sec/bar differential/mm port dia.			Water	Service ΔP at 10°C - 52°C (50°F - 125°F)
Class IV	0.01% valve capacity at full travel			Air or water	Service ΔP or 3.4 bar differential, whichever is lower, at 10°C - 52°C (50°F - 125°F)

NOTES

1. K-LOK polymer and elastomer seats meet or exceeds ANSI Class VI shut-off.
2. K-LOK metal seats and fire-safe seats (post fire exposure) meet or exceeds ANSI Class IV shut-off.
3. Using the ANSI/FCI specified calibrated measuring device.

Reference ANSI/FCI 70-2 for further information.

496°C - 538°C	250	250	250	200	250

NOTES

1. Surrounding air temperature is assumed to be 21°C. For every degree over 38°C of the surrounding air, deduct 2 degrees from the maximum temperature ranges shown under the Pipeline fluid temperature column. (Example: 52°C) external temperature reduces maximum temperature values under the Pipeline fluid temperature column to 163, 210, 265, 315, etc.)
2. Valves may be insulated or uninsulated.
3. Brackets may be open rectangular tubes or the standard closed Keystone tubular shaft extension.
4. All actuators have a maximum service temperature (outside atmosphere). These temperature limitations apply regardless of K-LOK extension lengths.

VACUUM RATING

The combination of interference fit seats and bi-directional packing makes the K-LOK especially well suited for vacuum service.
Standard K-LOK high performance valves are rated to an absolute pressure of 1.316×10^{-3} mm Hg.
Higher vacuum applications are available.

NOTES

C_V is the volume of water in US GPM that will pass through a valve with a pressure drop of 1 psi at 60° F.

SEATING AND UN-SEATING TORQUE

Seating and un-seating torques are a function of the size of the valve and the shutoff pressure of the system.
Specific torque ratings can be found in the seating/un-seating chart at the intersection of the 'size' row and the 'shutoff pressure' column.
Torques listed are for PTFE and RTFE seated valves. For different seat materials, specific multipliers are to be used as stated.
All torques listed are for normal service conditions (i.e. operating frequency is a minimum of once per month; disc corrosion is expected to be mild or minor, the media is a clean gas, liquid or steam, and is non-abrasive) and chemical effects upon the seat are minor.

* CAE and CAG mounting codes apply for shaft mounting of UHMWPE seats.

NOTES

1. Torques are applicable only to PTFE and RTFE seats in noncorrosive or non-abrasive services such as water.
2. For other seat materials, select the torque applicable for the maximum differential pressure and multiply by the following factor:
   EPDM/NBR/Fluoroelastomer (FKM): x 1.4
   UHMWPE (clean service): x 1.3
3. For corrosive, abrasive or other services than water, multiply by the following factor:
   High solids slurry: x 1.5
   Dry gas: x 2.0
   Dry powders: x 2.7
   Liquids other than water: x 1.2
   Lubricating fluids: x 0.8
   For services that combine unfriendly conditions such as extreme temperatures and high solids, or corrosive with high temperatures, contact your sales representative.

Rev 01

BFV-02-150, BFV-02-155, BFV-02-170

[Nunami-DH]
- Required signals to PLC:
4-20mA position control (OK)
4-20mA position feedback (OK)
dry contact auto/manual operation (contractor to confirm or provide alternate)
dry contact overload/torque alarm (contractor to confirm or provide alternate)
- Manual operation must be capable of overriding 4-20mA signal.

MODEL EM-800

gearing system and a handwheel manual override to produce maximum torques in a compact package.

BETTIS on/off electric actuator,
Ductile iron body,
Nema 4X and CSA certified,
Size 810,
2x SPDT switches,
Heater,
Thermostat,
Internal brake,
Female output drive,
100% duty cycle,
115 VAC / 1 Ph, / 60 Hz,
30 second operation,
Modulating

STANDARD FEATURES

- Two year warranty
- Heater and thermostat installed in all actuators
- Case hardened steel spur gear train is permanently lubricated
- Operating temperatures:
  -40° F with standard heater activated, to +140° F
- Single phase capacitor run motor with thermal overload protection
- Enclosure certified to weatherproof C.S.A. specifications that conform to NEMA type 1, 2, 3,3R, 4 and 12
- Handwheel manual operation
- Mechanical position indicator
- Captive hex bolts on enclosure
- Dual 3/4-inch NPT machined conduit entrances
- Two single pole double throw travel-stop limit switches with adjustable cams and 2 aux S.P.D.T.
- Female drive
- Weight: 65-70 lbs (type 4), 150-160 lbs (explosion-proof)
- Two mechanical torque limit switches

OPTIONAL FEATURES

- Dual purpose weatherproof and explosion-proof enclosures are certified by Canadian Standards Association for services: Class I Groups C,D, Division I; Class II Groups E,F,G Division I that conform to NEMA type 7 and 9
- Standard 1K potentiometer, other ranges provided upon request
- Electronic proportional positioner for 4-20 mA, 1-5 vDC, or 0-10 vDC control input and 4-20mA output signal
- Optional voltages
  220 VAC 50/60 Hz single phase
  220 VAC 50/60 Hz 3 phase
- Relay control
- Maximum of four additional single pole double throw auxiliary limit switches with adjustable cams
- Electromechanical brake
- Canadian Standards Association general purpose for electrical certification available under file #LR90062

ULTANT APPROVAL

Environment inside a WWTP is considered wet. In order to accept dissimilar metals (ductile iron Victaulic joints on stainless steel pipelines, contractor to provide vapour barrier wraps on the joints to protect them from moisture and so avoid potential corrosion issues. Re-submit shop drawing confirming that vapour barrier wraps will be provided per joint.

STANTEC PROJECT #: 110126045

SUBMITTAL # DA-MP-09R3- VIctaulic coupling (SS pipe)

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

- ☑ Process
- ☐ Structural
- ☐ Mechanical
- ☐ Electrical
- ☐ Other

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

AGS rolled groove

1.0 PRODUCT DESCRIPTION

Available Sizes

- 14 – 78"/DN350 - DN1950

Maximum Working Pressure

- 14 – 24"/DN350 – DN600: 350 psi/2413 kPa
- 26 – 42"/DN650 – DN950: 300 psi/2068 kPa
- 44 – 50"/DN1100 – DN1250: 232 psi/1599 kPa
- 54 – 62"/DN1350 – DN1550: 175 psi/1206 kPa
- 72"/DN1800 – 125 psi/861 kPa
- 78"/DN1950 – 100 psi/689 kPa

Function

- Unique wedge-shaped key profile increases allowable pipe end separation, resulting in easier assembly
- Style W77 AGS coupling in 26 – 78"/DN650 – DN1950 sizes, features lifting lugs integrated into the housings to help ease handling during installation.
- Provide limited linear and angular pipe movement at the pipe joint that can be used to compensate for thermal growth of piping systems, vibration attenuation, seismic, differential settlement and other applications requiring flexibility.

NOTES

- Style W77 AGS couplings are provided with FlushSeal™ gaskets for a variety of services. Please specify gasket grade when ordering. Please refer to publication 05.01 for gasket service ratings.
- Style W77 AGS flexible couplings can also be used on abrasive/slurry services in combination with an AGS *Vic-Ring*. See publication 16.12.

2.0 CERTIFICATION/LISTINGS

FM c UL us LISTED

NOTES

- Sizes 377mm, 426mm and 480mm are not UL, NSF and FM approved.
- See publication 02.06: Victaulic Potable Water Approvals ANSI/NSF for potable water approvals if applicable.
- Download publication 10.01 for Fire Protection Certifications/Listings Reference Guide.

ALWAYS REFER TO ANY NOTIFICATIONS AT THE END OF THIS DOCUMENT REGARDING PRODUCT INSTALLATION, MAINTENANCE OR SUPPORT.

3.0 SPECIFICATIONS – MATERIAL

Housing: Ductile iron conforming to ASTM A536, Grade 65-45-12. Ductile iron conforming to ASTM A395, Grade 65-45-15 available upon special request.

Housing Coating: (specify choice)

☐ Standard: Orange enamel.

☑ Optional: Hot dipped galvanized and others.

☐ Optional: Fusion Bonded Epoxy.

NOTE

- For additional coating options contact Victaulic.

Coupling Gasket: (specify choice[1])

☑ **Victaulic Grade "E" FlushSeal™ EPDM**
EPDM (Green stripe color code). Temperature range –30°F to +230°F/–34°C to +110°C. May be specified for hot water service within the specified temperature range plus a variety of dilute acids, oil-free air and many chemical services. UL Classified in accordance with ANSI/NSF 61 for cold +73°F/+23°C and hot +180°F/+82°C potable water service and ANSI/NSF 372. **NOT COMPATIBLE FOR USE WITH PETROLEUM SERVICES OR STEAM SERVICES.**

☐ **Victaulic Grade "T" Nitrile**
Nitrile (Orange color code). Temperature range –20°F to +180°F/–29°C to +82°C. May be specified for oil related services, including air with oil vapor, this gasket may be specified for temperatures rated up to +180°F/+82°C. For water related services, this gasket may be specified for temperatures rated up to +150°F/+66°C. For oil free, dry air services, this gasket may be specified for temperatures rated up to +140°F/+60°C. **NOT COMPATIBLE FOR USE WITH HOT WATER SERVICES OR STEAM SERVICES.**

☐ **Victaulic Grade "L" Silicone**
Silicone (Red color code). Temperature range –30°F to +350°F/–34° C to +177° C. May be specified for dry heat, air without hydrocarbons to +350°F/+177°C and certain chemical services.

☐ **Others**
For alternate gasket selection, reference publication 05.01: Victaulic Seal Selection Guide - Elastomeric Seal Construction.

[1] Services listed are General Service Guidelines only. It should be noted that there are services for which these gaskets are not compatible. Reference should always be made to the latest Victaulic Seal Selection Guide for specific gasket service guidelines and for a listing of services which are not compatible.

Bolts/Nuts: (specify choice[2])

☑ Standard: Carbon steel oval neck track bolts meeting the mechanical property requirements of ASTM A449. Carbon steel heavy hex nuts meeting the mechanical property requirements of ASTM A563 Grade B. Track bolts and heavy hex nuts are zinc electroplated per ASTM B633 ZN/FE5, finish Type III (imperial) or Type II (metric).

☐ Optional: Stainless steel oval neck track bolts meeting the mechanical property requirements of ASTM A193 Grade B8M, Class 2 (316 stainless steel). Stainless steel heavy hex nuts meeting the mechanical property requirements of A194 Grade 8M (316 stainless steel), condition CW, with galling reducing coating.

For 26 – 78"/DN650 – DN1950 sizes:

☐ Washers: Plated carbon steel, flat. SAE high strength conforming to ASTM F436 or high strength stainless steel.

[2] Optional bolts/nuts are available in imperial and metric sizes.

NOTES

- WARNING: FOR ONE TIME FIELD TEST ONLY, the Maximum Joint Working Pressure may be increased to 1 ½ times the figures shown.
- Metric thread size bolts are available (color coded gold) for all coupling sizes upon request. Contact Victaulic for details.
- The outside diameter, ovality, and surface finish including flat spots and imperfections shall not vary more than the limits of API 5L end tolerance.
- See publication 25.09: Advanced Groove System (AGS) Roll Groove Specifications for proper groove specifications.
- Additional wall thicknesses available. For performance on additional pipe wall thicknesses contact Victaulic.
- For additional pipe sizes, please contact Victaulic.

6.0 NOTIFICATIONS

⚠ WARNING

- **When grooving pipe for use with AGS products, Victaulic roll grooving tools must be quipped with AGS roll sets (RW for steel or RWX for stainless steel).**
- **RWX grooving rolls are identified by a silver color and the designation "RWX" on the front of the roll sets.**
- **Victaulic AGS products MUST NOT be installed on pipe that is prepared with original-type grooving roll sets.**
- **To ensure proper pipe end preparation refer to publication 25.09 for AGS (Advanced Groove System) roll groove pipe specifications.**

Failure to follow these instructions will cause grooves that are not within Victaulic AGS specifications, resulting in joint failure, serious personal injury, and property damage.

User Responsibility for Product Selection and Suitability
Each user bears final responsibility for making a determination as to the suitability of Victaulic products for a particular end-use application, in accordance with industry standards and project specifications, and the applicable building codes and related regulations as well as Victaulic performance, maintenance, safety, and warning instructions. Nothing in this or any other document, nor any verbal recommendation, advice, or opinion from any Victaulic employee, shall be deemed to alter, vary, supersede, or waive any provision of Victaulic Company's standard conditions of sale, installation guide, or this disclaimer.

Intellectual Property Rights
No statement contained herein concerning a possible or suggested use of any material, product, service, or design is intended, or should be constructed, to grant any license under any patent or other intellectual property right of Victaulic or any of its subsidiaries or affiliates covering such use or design, or as a recommendation for the use of such material, product, service, or design in the infringement of any patent or other intellectual property right. The terms "Patented" or "Patent Pending" refer to design or utility patents or patent applications for articles and/or methods of use in the United States and/or other countries.

Note
This product shall be manufactured by Victaulic or to Victaulic specifications. All products to be installed in accordance with current Victaulic installation/assembly instructions. Victaulic reserves the right to change product specifications, designs and standard equipment without notice and without incurring obligations.

Installation
Reference should always be made to the Victaulic installation handbook or installation instructions of the product you are installing. Handbooks are included with each shipment of Victaulic products, providing complete installation and assembly data, and are available in PDF format on our website at www.victaulic.com.

Warranty
Refer to the Warranty section of the current Price List or contact Victaulic for details.

Trademarks
Victaulic and all other Victaulic marks are the trademarks or registered trademarks of Victaulic Company, and/or its affiliated entities, in the U.S. and/or other countries.

COUVERTURE ISOLANTE
INSULATING BLANKET

ISOTEX-AW1700

Depuis 1989, la compagnie I.P.I. Inc. confectionne des couvertures isolantes pour hautes et basses températures. La couverture isolante ISOTEX est utilisée pour remplacer l'isolation conventionnelle qui est installée sur la tuyauterie, les instruments industriels et autres. Elle est munie d'attaches Velcro, de corde, de crochet et autres lui permettant ainsi d'être réutilisable. Son installation est simple et rapide étant donné que les tissus et les isolants utilisés pour sa confection sont souples et flexibles. La coupe et l'assemblage des matériaux se fait en usine permettant ainsi de simplifier le travail sur le chantier. /

Since 1989, the company I.P.I. Inc. makes insulating coverage for high and low temperatures. The insulating coverage ISOTEX is used to replace the conventional insulation usually put over piping in industrial fields and others. They are made of supple and flexible material with high insulating quality. The use of Velcro, ropes, chains and hooks permit the cover to be easily adjusted. The blanket is removable and reusable.

Températures d'utilisation recommandées / *recommended temperatures*
entre –22°F et 350°F / *Between –30°C and 177°C*

Lieux d'installation / *recommended utilities*
Pour l'extérieur et autres/ For outdoors and others

General Notes:

a. Material: Carbon Steel with chemical composition and mechanical strength equivalent to ASTM A 105.
b. Finish: Galvanized to ASTM A 123
c. Drilling: 1 1/2" to 24" ASME B16.5 Class150, 30" to 48" ASME B16.47 Class150 serie "A"
d. Suggested Maximum Working Pressure : See technical section.
e. Other diameter and thickness available upon request.

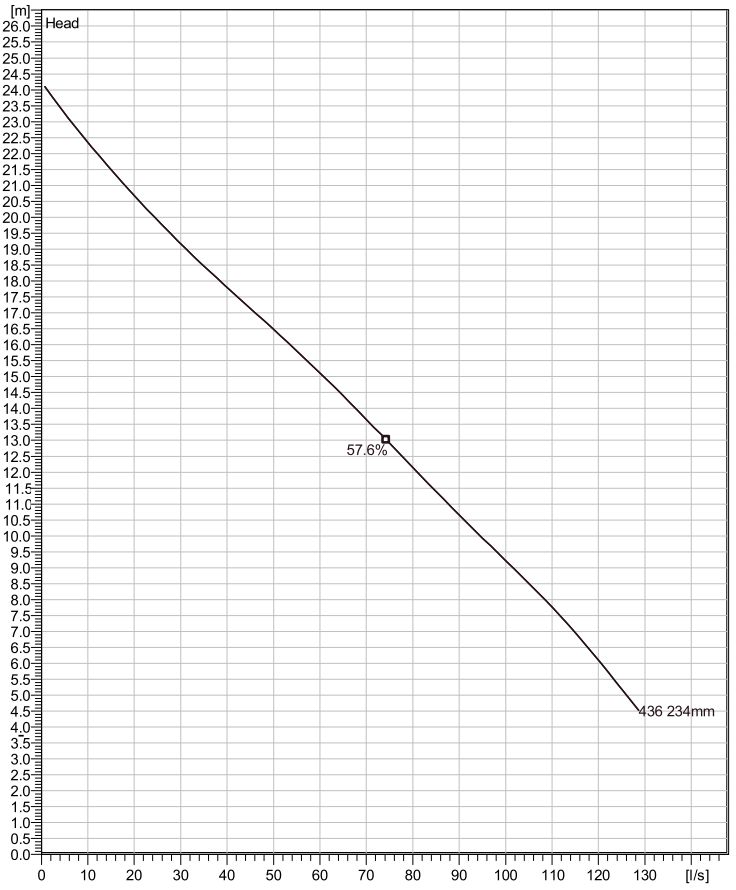
Submersible chopper pumps (3x)

Project:Iqaluit WWTP Upgrade
Our ref: 18-25-0213

FP 3171 MT 3~ 436

Technical specification



Water, pure *Curve ISO*

Note: Picture might not correspond to the current configuration.

General

Open screw type cutting impellers and single volute casing for liquids containing long fibres and large solids. F3153 and F3171 are new designs with high efficiency combined with excellent cutting performance.

Impeller

Impeller material	Hard-Iron
Discharge Flange Diameter	5 7/8 inch
Suction Flange Diameter	5 7/8 inch
Impeller diameter	234 mm
Number of blades	2

Motor

Motor #	F3171.350 25-14-4AA-W 25hp Standard
Stator variant	6
Frequency	60 Hz
Rated voltage	600 V
Number of poles	4
Phases	3~
Rated power	25 hp
Rated current	24 A
Starting current	154 A
Rated speed	1760 rpm
Power factor	
1/1 Load	0.84
3/4 Load	0.79
1/2 Load	0.68
Motor efficiency	
1/1 Load	87.5 %
3/4 Load	88.5 %
1/2 Load	88.5 %

Configuration

XP cl1 div 1

Installation: P - Semi permanent, Wet

INSTALLATION PROCEDURE

1 – SIT THE LOWER PIPES ON THE BOSS ON THE DISCHARGE ELBOW.
2 – INSERT THE LOWER SLEEVES OF THE INTERMEDIATE HOLDER IN THE PIPES.
3 – BOLT DOWN THE INTERMEDIATE GUIDE BAR HOLDER ON THE ANCHOR POINT.
4 – TORQUE THE BOLTS UNTIL THE EXPANSION SLEEVES GRIP THE PIPES.
5 – SIT THE UPPER PIPES ON THE UPPER SLEEVES AND PUSH DOWN TO SECURE.
6 – INSERT THE SLEEVES OF THE UPPER GUIDE BAR HOLDER IN THE PIPE AND TORQUE THE BOLTS UNTIL THEY GRIP THE PIPES.
7 – BOLT DOWN THE UPPER GUIDE BAR HOLDER TO THE ANCHOR POINT.

RECOMMENDED BOLTING MATERIAL : 2 BOLTS 7/16"–14 UNC

Our ref: 18-25-0213

SWAY CONTROL RING
P/N 13–50 70 06
S/S 304

Qty: (6)

THE SWAY CONTROL RING IS USED TO:

- REDUCE THE MOVEMENT OF THE FLOATS.
- AVOID THE POSSIBILITY, IN A TURBULANT ENVIRONMENT, THAT THE FLOAT CABLES BE ENTANGLED TOGETHER AND INTERFERE WITH EACH OTHER FOR PROPER FUNCTIONING.

DIMENSIONS ARE IN mm

1 Introduction and Safety

1.1 Introduction

CAUTION:

- Read this manual carefully before installing and using the product. Improper use of the product can cause personal injury and damage to property, and may void the warranty.
- In addition to these instructions, also pay attention to universal safety and accident prevention regulations.
- Save this manual for future reference, and keep it readily available at the location of the system controller.

Purpose of this manual

The purpose of this manual is to provide the necessary information for:

- Installation
- Operation
- Maintenance

1.2 Safety terminology and symbols

About safety messages

It is extremely important that you read, understand, and follow the safety messages and regulations carefully before handling the product. They are published to help prevent these hazards:

- Personal accidents and health problems
- Damage to the product
- Product malfunction

Hazard levels

Hazard level	Indication
 DANGER:	A hazardous situation which, if not avoided, will result in death or serious injury
 WARNING:	A hazardous situation which, if not avoided, could result in death or serious injury
 CAUTION:	A hazardous situation which, if not avoided, could result in minor or moderate injury
NOTICE:	• A potential situation which, if not avoided, could result in undesirable conditions • A practice not related to personal injury

Electrical hazards

Electrical hazards are indicated by the following specific symbol. This symbol warns for presence of a dangerous voltage.

Electrical Hazard:

1.3 User safety

Introduction

All government regulations, local health and safety directives must be observed.

Prevent danger due to electricity

All danger due to electricity must be avoided. Electrical connections must always be carried out in compliance with the following:

- The standard connections shown in the product documentation that is delivered together with the product
- All international, national, state, and local regulations. (For details, consult the regulations of your local electricity supplier.)

For more information about requirements, see sections dealing specifically with electrical connections.

1.4 Product warranty

Coverage

Xylem undertakes to remedy faults in products from Xylem under these conditions:

- The fault is due to defects in design, materials, or workmanship.
- The fault is reported to a Xylem representative within the warranty period.
- The product is used only under the conditions described in this manual.
- All service and repair work is done by qualified and authorized personnel. All modifications must be done by qualified technicians.
- Genuine Xylem parts are used.

Limitations

The warranty does not cover faults caused by these situations:

- Deficient maintenance
- Improper installation
- Modifications or changes to the product and installation made without consulting Xylem
- Incorrectly executed repair work
- Normal wear and tear

Xylem assumes no liability for these situations:

- Bodily injury
- Material damage
- Economic loss

Warranty claim

Xylem products are high quality products with expected reliable operation and long life. However, should the need arise for a warranty claim, then contact your Xylem representative.

Qualification of personnel

WARNING: Electrical Hazard

Risk of electrical shock or burn. A certified electrician must supervise all electrical work. Comply with all local codes and regulations.

All work on the product must be carried out by certified electricians or Xylem authorized mechanics.

Xylem disclaims all responsibility for work done by untrained, unauthorized personnel.

1.4.1 Support

Xylem only supports products that have been tested and approved. Xylem does not support unapproved equipment.

2 Transportation and Storage

2.1 Inspect the delivery

Inspect the package

1. Inspect the package for damaged or missing items upon delivery.
2. Note any damaged or missing items on the receipt and freight bill.
3. File a claim with the shipping company if anything is out of order.

   If the product has been picked up at a distributor, make a claim directly to the distributor.

Inspect the product

1. Remove packing materials from the product.

   Dispose of all packing materials in accordance with local regulations.
2. Inspect the product to determine if any parts are damaged or missing.
3. If applicable, unfasten the product by removing any screws, bolts, or straps.

   For your personal safety, be careful when you handle nails and straps.
4. Contact your sales representative if anything is out of order.

3 Product Description

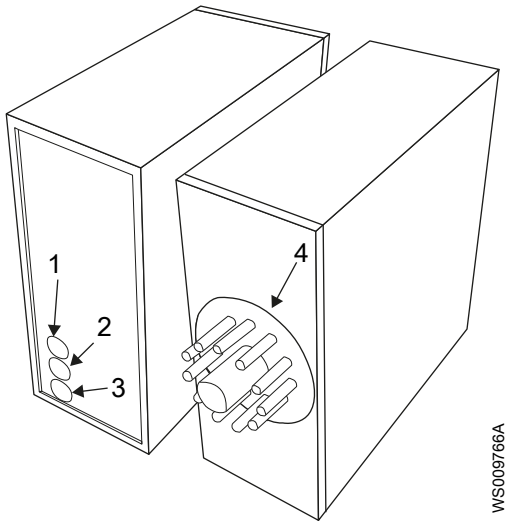
3.1 Product design

The MiniCAS II overall purpose is to protect pumps and mixers. It is a monitoring relay for temperature and leakage sensors and is made to plug into a standard 11-pin socket.

The relay monitors the following sensors:

Type	Description
Thermal contact	Temperature sensor for detection of high temperature in the stator winding
FLS	Float switch for leakage detection in pumps and mixers
FLS10	Float switch for leakage detection in the inspection chamber
CLS	Water-in-oil sensor for detection of excessive water in the oil chamber

3.2 Parts



1. **LEAKAGE** LED
2. **TEMPERATURE** LED
3. **SUPPLY** LED
4. 11-pin contact

3.3 Approvals

MiniCAS II Version	Part No.	Approval
24 V AC/DC	83 58 57	CE, UR, CSA
120 V AC	40–50 10 98	CE, UR, CSA
230 V AC	40–50 15 60	CE

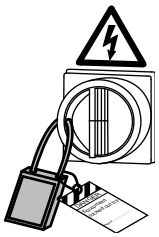
4 Installation

Precautions

Before starting work, make sure that the safety instructions in the chapter *Introduction and Safety* on page 2 have been read and understood.

DANGER: Electrical Hazard

Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.



DANGER: Electrical Hazard

All electrical equipment must be grounded (earthed). Test the ground (earth) lead to verify that it is connected correctly and that the path to ground is continuous.

WARNING: Electrical Hazard

Risk of electrical shock or burn. A certified electrician must supervise all electrical work. Comply with all local codes and regulations.

WARNING: Electrical Hazard

There is a risk of electrical shock or explosion if the electrical connections are not correctly carried out, or if there is fault or damage on the product. Visually inspect equipment for damaged cables, cracked casings or other signs of damage. Make sure that electrical connections have been correctly made.

CAUTION: Electrical Hazard

Prevent cables from becoming sharply bent or damaged.

External switch

This product cannot be used as an emergency stop device.

An external switch or circuit breaker must be provided near the installation to enable the pump to be isolated from the power supply.

4.1 Do not install in an explosive zone

NOTICE:

Do not use this unit in environments that may contain flammable/explosive or chemically aggressive gases or powders.

4.2 Connect the MiniCAS II

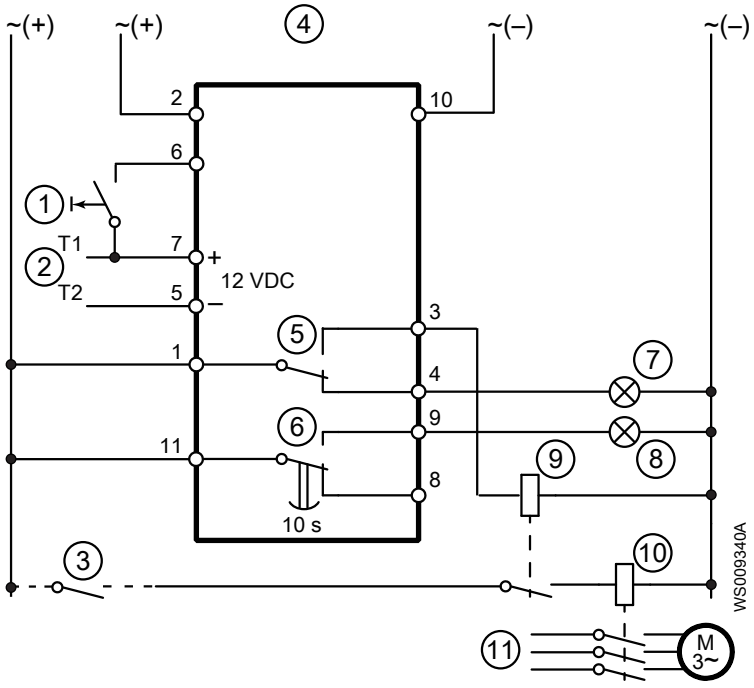
An 11-pin socket must be installed in the pump control panel.

The MiniCAS II is used in one of two ways:

- Both overtemperature and leakage alarms stop the pump
- Overtemperature alarm stops the pump and leakage alarm is only indicated.

1. Connect the wires to the 11-pin socket terminals according to the applicable diagram. See *Terminals* on page 15.
   - Overtemperature and leakage stop the pump

   - Overtemperature stops the pump and leakage is only indicated



Position	Description
1	Alarm reset

Position	Description
2	Sensor circuit
3	Start and stop by a pump controller
4	Power supply
5	High temperature relay
6	Leakage detection relay
7	High stator temperature alarm lamp
8	Leakage alarm lamp
9	Auxiliary relay
10	Pump contactor
11	Pump main supply

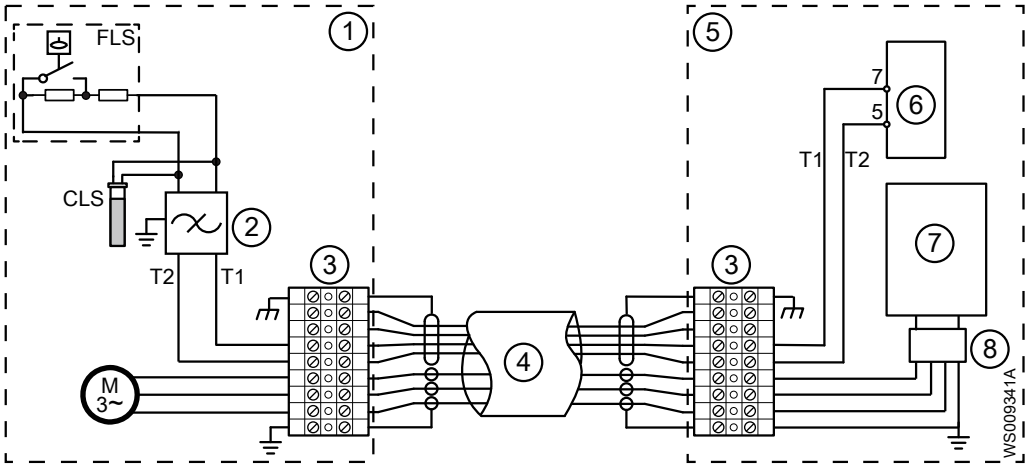
2. Insert the MiniCAS II into the 11-pin socket.

4.3 Prevent interference from a variable frequency drive

Interference from a variable frequency drive (VFD) can cause nuisance tripping of the CLS sensor.

1. Connect a filter between the sensor and the terminal block in the junction box, see *Filter kits* on page 18 and *Filter connection diagrams* on page 17.

   Usually with VFD and CLS, this filter is preinstalled.



1. Pump with junction box
2. Filter
3. Terminal block
4. Screened SUBCAB® cable
5. Control panel
6. MiniCAS II
7. VFD
8. EMC filter

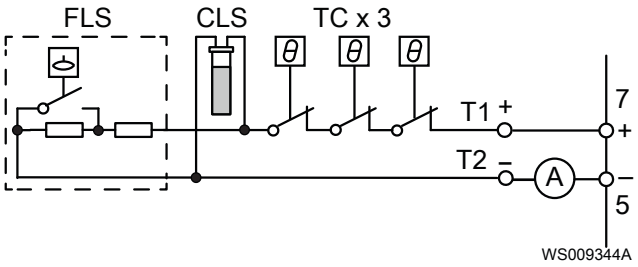
2. Connect the cable to the control panel.

   Do not exceed 40 m (130 ft) due to the occurrence of harmonic distortion.

3. Connect an EMC filter between the VFD output and the control panel.

4.4 Check the sensor output current

1. Connect a multimeter in series with the sensor circuit.



2. Make sure that the measured values correspond to the applicable sensor combination values.
3. See *Sensor combinations* on page 16 for the no fault values.

5 Operation

5.1 The current levels for alarm lights

When the current level is between 3–22 mA, it is only the **SUPPLY** LED that is light.

Current level (mA)	Type of alarm
> 22	Leakage alarm
< 3	Overtemperature alarm

5.2 LED indications

Symptom	Cause	Remedy
The leakage indicator LED is lit.	There is a leakage in the pump.	Service the pump. For information, see *Check which sensor tripped the leakage alarm* on page 12.
	There is an earth fault in the sensor circuit wiring.	See *Check for an earth fault in the sensor circuit* on page 12 .
The temperature indicator LED is lit.	A thermal contact is open.	Service the pump.
	The CLS is connected with the wrong polarity in series with the temperature switches.	Change polarity on the sensor output of the relay.
The sensor output voltage is low.	There is an earth fault in the sensor circuit wiring.	See *Check for an earth fault in the sensor circuit* on page 12.
	The relay has a fault.	Replace the relay.
The leakage indicator is nuisance tripping.	The drive unit has CLS and VFD, and is not protected by a filter.	Install a filter in the drive units junction box, see *Filter kits* on page 18
	The drive unit has a CLS and no VFD, but the fault is due to interference from other drive units.	Install a filter on the sensor output of the relay.

5.3 Reset the alarms after a fault indication

After a leakage fault, the relay resets automatically.

After an overtemperature fault, the relay requires a manual reset.

Select one of the following steps to reset the relay:

- Push the external push-button that is connected to pin 6 and pin 7.
  When using the 24 V relay, pin 6 and pin 2 also resets.
- Interrupt the power supply for a short while.

6 Troubleshooting

Precautions

Before starting work, make sure that the safety instructions in the chapter *Introduction and Safety* on page 2 have been read and understood.

DANGER: Electrical Hazard

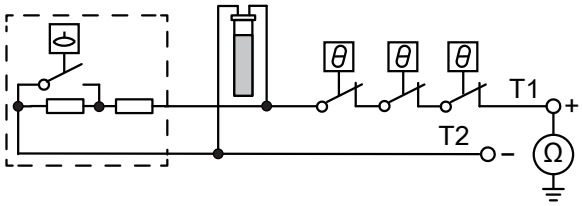
Troubleshooting a live control panel exposes personnel to hazardous voltages. Electrical troubleshooting must be done by a qualified electrician.

DANGER: Electrical Hazard

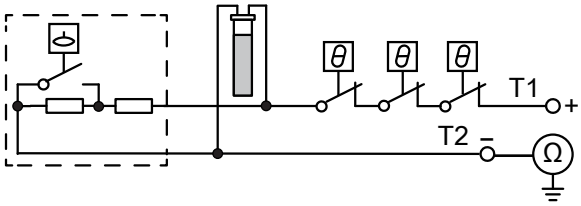
Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.

6.1 Check for an earth fault in the sensor circuit

1. Measure between the T1 wire and ground (earth).



2. Measure between the T2 wire and ground (earth).



3. When the value is lower than one megaohm, inspect the circuit wiring in the pump.
   A lower value indicates an earth fault.

6.2 Check which sensor tripped the leakage alarm

The sensor circuit has a CLS and FLS connected.

1. Select one of the following steps to disconnect the power to the relay:

Condition	Action
No pump runs.	Switch off the power to the control panel and switch it back on.

Condition	Action
The second pump in a dual pumping station runs.	Pull out the relay from the socket and insert it back.

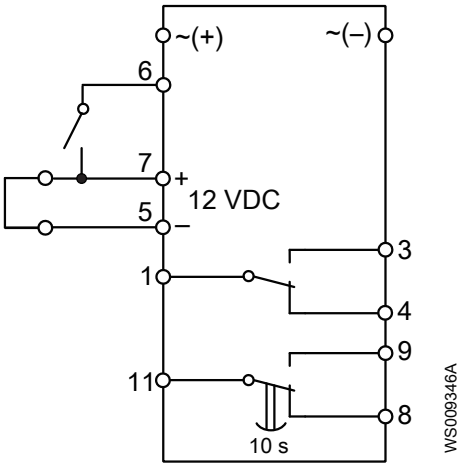
2. Measure the time for the leakage alarm to trip from the moment the relay is powered.

Delay time	Sensor tripping the alarm
10 s	FLS
15 s	CLS

6.3 Test the function of the relay

1. Simulate a normal condition.
   a) Connect a 1 kilohm resistor in series with an ammeter to the sensor output.
   b) Connect terminal 6 and 7 to reset the relay.

   Only the supply LED lights up and the meter shows 12 mA if the condition is normal.
2. Simulate the temperature alarm.
   a) Disconnect the resistor.
      The temperature LED is lit.
   b) Reconnect the resistor.
      The temperature LED is still lit.
   c) Connect terminal 6 and 7 for a short while to reset the relay.
      The temperature LED is turned off.
3. Simulate the leakage alarm.
   a) Connect a lead between terminal 5 and 7.



This short circuit does not damage the unit.

b) Keep the short circuit closed for 10 s.
   The leakage LED is lit.
c) Remove the lead between terminal 5 and 7.
   The leakage LED is turned of.

7 Technical Reference

7.1 Dimensions

Parameter	Value mm (in)
(W×H×D)	33×79×75 (1.29×3.11×2.95)

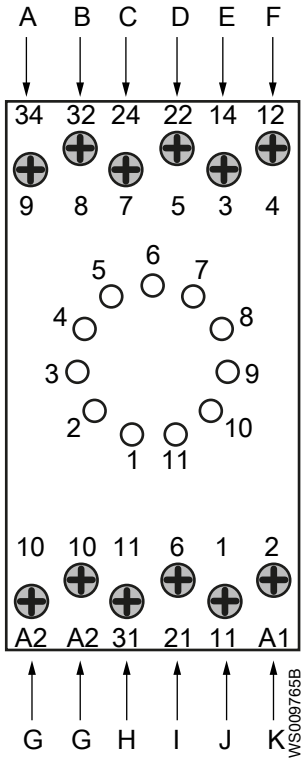
7.2 Environmental requirements

Parameter	Value
Temperature	-25° C – +60° C
Operating humidity	Relative humidity, non-condensing: 90%

7.3 Electrical data

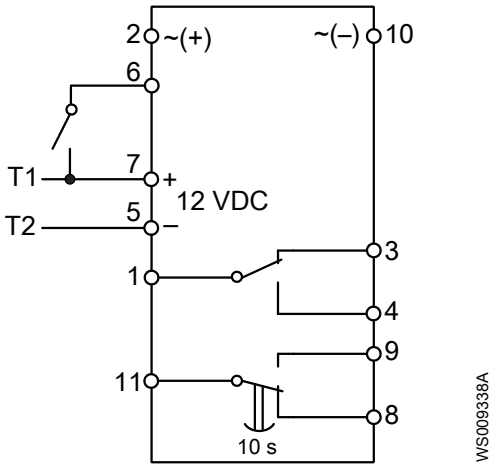
Version	24 VDC	24 VAC	120 VAC	230 VAC
Supply voltage	24	24	120	230
Supply voltage tolerance	-2%–25%	-17%–25%,	±15%	
Frequency	-	50–60 Hz		
Relay resistive contact rating	24 VDC, 250 VAC, 5 A			
Relay inductive contact rating	24 VDC, 250 VAC, 2 A			
Sensor output voltage	12 VDC, ±5%			
Required power supply	5 W			

7.4 Terminals



A	Leakage relay, normal output
B	Leakage relay, alarm output
C	Sensor input, T2
D	Sensor input, T1
E	Temperature relay, normal output
F	Temperature relay, alarm output
G	Power supply, -
H	Leakage relay, input
I	Reset, input
J	Temperature relay, input
K	Power supply, +

7.5 Circuit functions



Relay connections	Description
1–3	Normal temperature
1–4	Overtemperature
2–10	Power supply: 24 V AC/DC, 120 VAC, or 230 VAC
5–7	Sensor input from drive unit sensors: 12 V
6–7	Alarm reset
11–8	No leakage
11–9	Leakage

7.6 Sensor combinations

The T1 and T2 wires are connected to the sensor input of the relay. Overtemperature always results in 0 mA sensor output current. The value of the current can vary within 10%.

Combination	Configuration	No fault (mA)	Leakage (mA)
FLS Thermal contacts		7.8	36
FLS10 Thermal contacts		10	28
CLS Thermal contacts	 CLS must be connected with the correct polarity: brown = + and black = –.	5.5	29

Combination	Configuration	No fault (mA)	Leakage (mA)
FLS CLS Thermal contacts	 CLS must be connected with the correct polarity: brown = + and black = –.	13.3	36–42
Thermal contacts 1 kilohm resistor		12	-

Xylem |'zīləm|

1) The tissue in plants that brings water upward from the roots;
2) a leading global water technology company.

We're a global team unified in a common purpose: creating advanced technology solutions to the world's water challenges. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. Our products and services move, treat, analyze, monitor and return water to the environment, in public utility, industrial, residential and commercial building services, and agricultural settings. With its October 2016 acquisition of Sensus, Xylem added smart metering, network technologies and advanced data analytics for water, gas and electric utilities to its portfolio of solutions. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise with a strong focus on developing comprehensive, sustainable solutions.

N&N TRAILERS REMORQUES

HD SERIES
SOLID. POWERFUL. DURABLE.

MODEL **RD-82X192, 21K**

The rugged and powerful HD tipping trailer is designed for heavy-duty work. Tough and reliable, the HD is the ideal trailer for transporting oversized loads and moving heavy machinery.

THE N&N ADVANTAGE

N&N tipping trailers offer the benefit of galvanized metal construction and a telescopic cylinder at the front of the dump box. They can be custom fit to perfectly meet your needs with.

STANDARD FEATURES

- Galvanized axles
- Heat shrink connectors
- Aluminum toolbox
- HMV bumper puck between
- bed and frame
- Smart battery charger (1.5 A)
- Cold weather harness
- 12 tons telescopic cylinder 3 stages
- Aluminum tarp protector
- 72'' Galvanized ramps undermount
- Double acting door
- Adjustable coupler 5 positions
- Slipper spring suspension
- Rectangular 2X6X¼ tubing frame
- Reinforced spring hangers
- Stabilizer legs
- Plank holders
- Led lights
- Radial tires on galvanized rims
- Checker plate fenders
- Cross members on 16'' C/C
- 12 000LBS drop leg jack
- 4X Welded D-rings
- Tarp and roller
- 23'' high side inside box

SPECIFICATIONS

USABLE WIDTH	82 in
USABLE LENGTH	192 in
AXELS	3 x 7,000 lbs
BRAKES	Electric
TIRES	ST-235/80R16 10 ply
WEIGHT WHEN EMPTY	4,600 lbs
LOAD CAPACITY	18,150 lbs
TRAILER LENGTH	252 in
TRAILER WIDTH	102 in
DECKING	Steel 11 GA
RAMPS CAPACITY	10,000 Lbs
FINISH	Hot dipped galvanized

DEMAND GENUINE PARTS

When you choose Parts Star™ by Columbus McKinnon, you'll be purchasing genuine Columbus McKinnon parts designed to fit the Hurricane 360° hoist's exact specifications, maintaining warranty requirements and the integrity of the unit's superior design and safety features.

Get everything you need for a complete and professional repair with Parts Star Total Repair Kits. Popular Hurricane 360° repair parts are also available in easy-to-order bulk packaging so the parts you need are always on hand.

CM PARTS STAR BY COLUMBUS MCKINNON

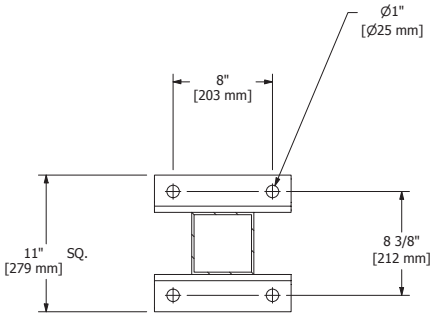
PROTECT AGAINST UNSAFE LIFTING CONDITIONS

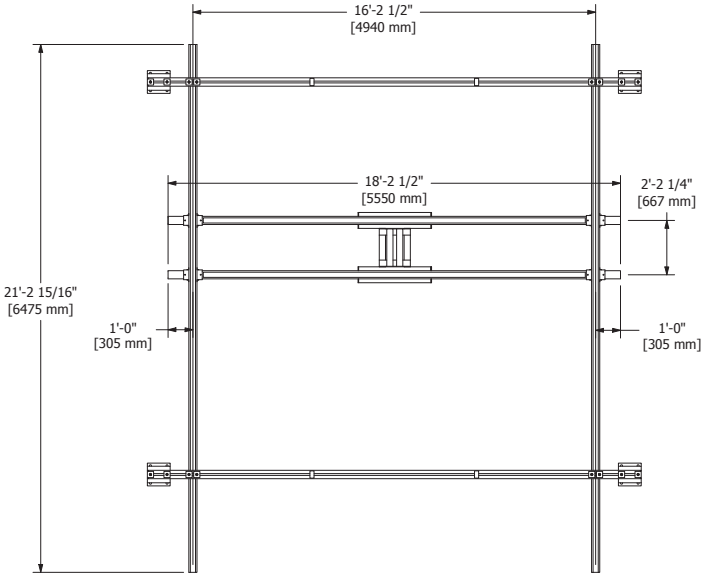
All CM Hurricane 360° units feature the Tri-Point Hook Inspection™ system to help protect the operator against unsafe lifting conditions. Hurricane 360° load hooks come with 3 distinct raised points the operator can use to measure the hook to detect any indication of overload or deformation.

TRI-POINT HOOK INSPECTION

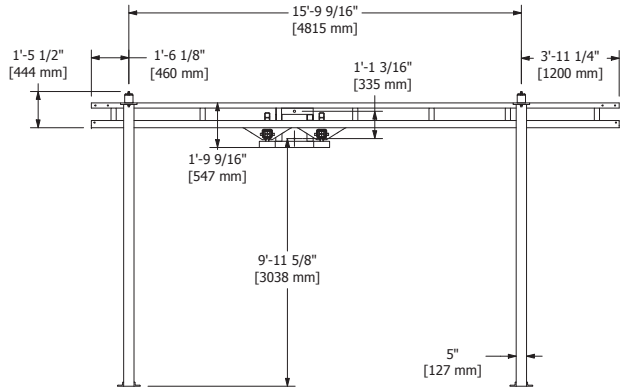
Technical data
Capacity; 2000 LBS/BR
Bridge over all length; 5550 mm
Bridge series; 2000
Runway over all length; 6475 mm
Runway series; 2000

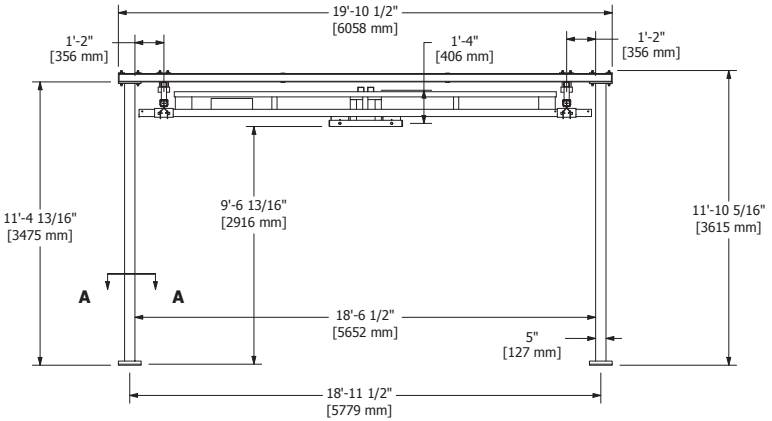
Bridge trolley travel is 4420 mm
Endtruck travel is 5650 mm
Anchor bolt load; 5226 LBS





SECTION A-A





NOTES

Hangers are on 6096 mm centers maximum with a 1220 mm cantilever on each end standard.
Hangers position tolerance = +/- 63.5 mm
Hangers must be within 1220 mm of splice joint
Do not scale from drawing
Dimensions are steel to steel and may vary

Durlon 8500 Gaskets

8500 Aramid-Inorganic/NBR Rubber Binder

COMPRESSED SHEET GASKET MATERIAL § ASTM F104: F712120-A9B3E12K5L151M6

application:

Our workhorse material, DURLON® 8500 is excellent in steam, natural gas, soybean processing and with new generation refrigerants. A high quality general service gasket material for use in a wide range of services in pulp and paper, food, beverage, pharmaceutical, chemical, refinery, gas pipeline and general industry.DURLON® 8500 exhibits good compressibility and recovery, excellent sealability, flexibility and cutting characteristics.

composition:

DURLON® 8500 contains high-strength aramid and inorganic fibers bonded with high-grade Nitrile (NBR) rubber.

fire testing:

DURLON® 8500 has successfully passed a modified version of the API 607 fire test. The duration of the direct flame portion of the test is 30 minutes and the flange temperature must reach 1200°F in the first 15 minutes. The internal pressure is held at a constant 30 psig. After the flame is shut off, the fixture is immediately water quenched with an overhead water blast. Leakage must not exceed 100 ml/min after a 6 minute cool down to successfully pass the test. Subsequent leakage testing is also performed.

anti-stick properties:

Much effort has gone into improving the anti-stick release agents of all compressed DURLON® products. All DURLON® compressed gasket materials have passed the MIL-G-24696B Navy Adhesion Test (366°F/48 hrs).

typical properties:

Color:	Green, branded
Fiber:	Aramid/Inorganic
Binder:	Nitrile (NBR)
Fluid Services:	Saturated Steam, Oils, Fuels, Dilute Acids & Alkalis, Solvents, Refrigerants
Density:	1.7 g/cm^3 (106 lbs./ft^3)
Tensile Strength, ASTM F152:	2,000 psi (13.8 MPa)
Compressibility, ASTM F36:	8 to 16%
Recovery ASTM F36:	50%
Temperature	
Range:	-100 to 700°F (-73 to 371°C)
Continuous, max:	548°F (287°C)
Pressure, max:	1500 psig (103 bar)
Fluid Resistance - ASTM F146	
IRM 903 oil, 5 h/300°F (149°C)	
Thickness Increase:	0 to 15%
Weight Increase:	15%
ASTM Fuel B 5 h/70°F (21°C)	
Thickness Increase:	0 to 10%
Weight Increase:	10%
Sealability	
ASTM F37 (Fuel A):	0.01 mL/hr
ASTM F37 (Nitrogen):	0.4 mL/hr
Volume Resistivity, ASTM D257:	4.2 x 10^{13} ohm-cm
Dielectric Breakdown, ASTM D149:	11.7 kV/mm (297 V/mil)
DIN 3535 Gas Permeability:	0.03 cc/min
Creep Relaxation ASTM F38:	20%
Flexibility, ASTM F147:	10x
ASTM F104 Line Call-Out:	F712120-A9B3E12K5L151M6

Note: ASTM properties based on 1/16" sheet thickness except ASTM F38, which is based on 1/32" sheet thickness. This is a general guide only and should not be the sole means of accepting or rejecting this material. The data listed here falls within the normal range of product properties but should not be used to establish specification limits nor used alone as the basis of design.

*For applications above Class 300, consult your representative.

L441

Compressed Sheet Gasket Material

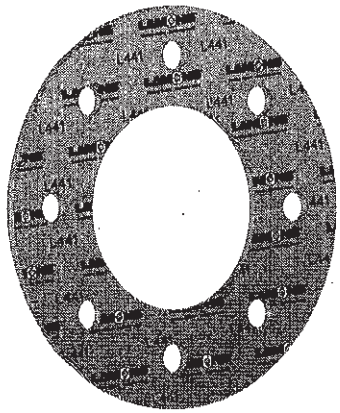
Description:

L441 is a general service sheet gasket material with a wide range of application potential. Manufactured with a formulation of high quality fillers, premium aramid / inorganic fibers and a nitrile rubber binder,

Applications and Characteristics:

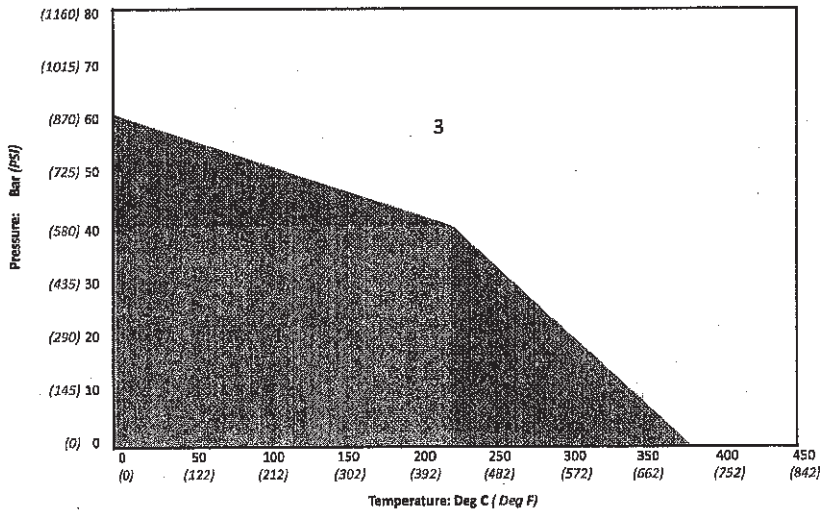
- Excellent sealing ability
- Good chemical resistance
- Creep relaxation minimization
- Great Recovery

sheet gasket materials are supplied with anti-stick coating as standard.
Can be manufactured with wire insert.



Creep Relaxation	ASTM F-38B (1/32")	20%
Residual Stress	DIN 52913 (50 MPa @ 175°C)	28 MPa
	BS7531 (40 MPa @ 300°C)	20 MPa
Sealability	ASTM F-37A (1/32")	0.25 ml/hr
Gas Leakage	DIN 3535/6	< 1.0 ml/min
Compressibility	ASTM F-36 J	7 - 17%
Recovery	ASTM F-36 J	50% min
Tensile Strength	ASTM F-152	2000 psi (14 MPa)
Weight Increase	ASTM F-146 after immersion in Fuel B for 5 Hrs @ 73°F (23°C)	25% max
Thickness Increase	ASTM F-146	
	ASTM Oil 1, 5 hrs / 300°F (149°C)	0 - 5%
	ASTM Oil 3, 5 hrs / 300°F (149°C)	0 - 5%
	ASTM Fuel A, 5 Hrs / 73°F (23°C)	0 - 5%
	ASTM Fuel B, 5 Hrs / 73°F (23°C)	0 - 7%
Standard Line Callout	ASTM F-104	F712121B3E22M5
m & y values	1/16" thickness	1/8" thickness
m	2.5	3.2
y	3800	4100
Dielectric Strength	ASTM D149-95a	15 kV/mm
Leachable Chlorides	FSA Method (Typical)	100 ppm
Density		112 lbs/ft³ (1.8 g/cc)
Color	Blue	
Thickness Range	1/64" (0.4 mm) to 1/8" (3.2 mm)	
Sheet Size Availability	Max: 120" x 60" (3 m x 1.5 m)	

L441 PRESSURE / TEMPERATURE GRAPH



All Pressure / Temperature values are based on 1/16" (1.5 mm) gasket thickness.

1. Suitable (Chemical Compatibility has to be considered).
2. Please contact Lamons Engineering department for clarification. engineering@lamons.com
3. Not Suitable.

PIPE SPECIFICATION DATASHEET – SS2

FITTINGS AND APPURTENANCES

ITEM	SIZE (mm)	MATERIAL	RATING	SPECIFICATION	REMARKS
Van Stone Flanges, Rolled Angle FF or RF	75 – 1200	304L St. Steel 304L SS Steel Backing Flange	Cl 125	Flanges: ASTM A774 Pattern: ANSI B16.1	Note 1
Ell – Short Radius Ell – Long Radius Tees, Reducers Reducing Outlets, Y	75 – 1200	304L Stainless Steel, Single Longitudinal Weld Seam	Same as Pipe	General: MSS SP43 Material: ASTM A774 Dimensions: ANSI B16.1	Note 2
3-Piece Ell	350 – 550	304L Stainless Steel, Single Longitudinal Weld Seam	Same as Pipe	Material: ASTM A778 Dimensions: ANSI B16.1	
5-Piece Ell	600 – 1200	304L Stainless Steel	Same as Pipe	Material: ASTM A778 Dimensions: ANSI B16.1	
Cap	75 – 1200	304L Stainless Steel	Same as Pipe	Material: ASTM A778 Dimensions: ANSI B16.1	
Expansion Couplings	75 – 1200	Synthetic Rubber Galvanized Steel Flange	Same As Pipe		
Bolts		Stainless Steel	Hex. Head	ASTM A193 Gr. B8, Cl 1	
Nuts	≥ 25 mm >25 mm	Stainless Steel	Hex. Heavy Hex.	ASTM A194 Gr. 8	
Flange Gaskets	75 – 250	Reinforced Synthetic Fibre-Nitrile Binder	1.6 mm thick		
Flange Gaskets	>300	Reinforced Synthetic Fibre-Nitrile Binder	3.2 mm thick		

INSPECTION AND TESTING

Pneumatic at 150 kPag for 24 hour period.
Visual and random nondestructive testing for welds.

CLEANING AND CONDITIONING

1. Remove debris.
2. Passivate all piping after completion of welding.

NOTES

1. Flanges shall be Van Stone type, with galvanized mild steel backing rings, drilled and faced to Class 150 in accordance with ANSI B16.5. In submerged and exterior locations use stainless steel back-up rings.
2. Provide beveled edges for all welded fittings and connections.
3. The drawings may indicate coupling, flanges, or other joints that may be disassembled at a minimum number of locations. In addition, provide joints noted in these specification sheets at the specified maximum spacing to allow for pipe disassembly through the remainder of the pipe runs. Contractor is to locate.
4. For PA piping, insulation shall be a minimum 50 mm thickness and as required for personnel protection at the design temperature of the pipe ensuring the surface temperature is below 40 deg C.
5. Pipe spools to be shop fabricated. Field welds require approval by Engineer.

FITTINGS AND APPURTENANCES

ITEM	SIZE (mm)	MATERIAL	RATING	SPECIFICATION	REMARKS
Ell – Short Radius Ell – Long Radius Tees, Reducers Reducing Outlets, Y	75 – 750	Ductile Iron	Class 125	ASTM A606	ANSI B16.3
Plug	75 – 750	Ductile Iron	Class 125		
Flange Adaptors	75 – 750	Mild Steel	Class 125	ASTM A53 ANSI B16.1 ASTM A181/A181M	
Bolts			Hex. Head	ASTM A307 Gr. A	
Nuts			Hex. Head	ASTM A563M Gr. A	
Flange Gaskets	75 – 750	BI Neoprene	1.6mm thick		
Groove Joint Gaskets	75 – 750			AWWA C606	Note 3

INSPECTION AND TESTING

Hydrostatic test with clean water.

CLEANING AND CONDITIONING

Remove debris and flush with water at minimum velocity of 1.0 m/s.

NOTES

1. Where noted on the drawings use high strength pipe (DI3)
2. Finish fittings in the same manner as the pipe.
3. Comply with manufacturer's recommendations for grooved joint gaskets.
4. Provide joints at noted spacing for pipe disassembly or as per lengths provided, nominal 6m spacing.

FITTINGS AND APPURTENANCES					
ITEM	**SIZE (mm)**	**MATERIAL**	**RATING**	**SPECIFICATION**	**REMARKS**

Grooved end fittings	75 - 600	Ductile iron	Same as pipe and couplings	ASTM A536, Victaulic	Note 12

INSPECTION AND TESTING

Refer to Section ~~15050 Piping Systems~~ 40 05 13 "Process Piping" for other requirements.
ASME B31.3 for steam piping.
Visual and random nondestructive testing for welds.

CLEANING AND CONDITIONING

Remove debris and flush with water at a minimum velocity of 1.0 m/s.

NOTES

1. See Section ~~15261~~40 05 19 "Thermal Insulation" for Pipes and Equipment.
2. Tape wrap butt welded joints after welding. Plain end or grooved joints and valves shall be protected with a polyethylene sheath or a shrink sleeve attached to the pipe with tape wrap.
3. Finish fittings, etc. in same manner as pipe.
4. Provide full faced gaskets for flat face flanges and ring gaskets for raised face flanges.
5. Comply with manufacturer's recommendations for grooved joint gaskets. Use end seal type gaskets on epoxy lined pipe. NSF 61 approval required for potable water service.
6. Provide beveled edges for all welded fittings.
7. Underground joints at 6.0 m on center or as shown on the drawings shall be groove jointed or flex coupled.
8. Field touch up linings and coatings after welding.
9. Epoxy lining not required for the following services: HWS, HWR, GLSS, GLSR.
10. Not applicable to engine exhaust service (EEX).
11. For engine exhaust, use high temperature non-asbestos fibre gaskets, 500 deg C minimum.
12. Linings for potable water service shall meet the requirements of NSF 61.
13. Use rigid couplings except where flexible coupling is specifically indicated.
14. The drawings indicate coupling, flanges, or other joints that may be disassembled at a minimum number of locations. In addition, provide joints noted in these specification sheets at the specified maximum spacing to allow for pipe disassembly through the remainder of the pipe runs. Contractor is to locate.

PIPE SPECIFICATION DATASHEET – MS3

FITTINGS AND APPURTENANCES

ITEM	SIZE (mm)	MATERIAL	RATING	SPECIFICATION	REMARKS
Steel Flange	60 – 1050	Steel Flange	Cl 150, FF	ANSI B16.5	
Steel, Plain End	60 – 1050	Flexible Joint	Cl 150	ANSI B16.5

Flange Gaskets	60 – 300	Bl. Neoprene	1.6 mm thick		Note 2
Flange Gaskets	>300	Bl. Neoprene	3.2 mm thick		Note 2
Grooved Joint Gaskets	60 – 1050			AWWA C606	Note 3

INSPECTION AND TESTING

Test sample lines at 1000 kPa (operating pressure of 400-600 kPa)

CLEANING AND CONDITIONING

Remove debris and flush with water at minimum velocity of 1.0 m/s.

NOTES

1. Finish valves, fittings, etc., in same manner as pipe.
2. Provide full-faced gaskets for flat face flanges and ring gaskets for raised face flanges.
3. Comply with manufacturer's recommendations for grooved joint gaskets.
4. Provide beveled edges for all welded fittings and connections.
5. Field touch-up linings and coatings after welding. Do not weld piping where access for touch-ups is restricted.
6. Slip-on flanges shall be provided except where noted otherwise herein or in the drawings. Provide weldneck flanges (mild steel pipe) on each side of fittings and wafer body valves.
7. Brush clean steel pipe to SSPC-P3 standard prior to painting.
8. The drawings indicate coupling, flanges, or other joints that may be disassembled at a minimum number of locations. In addition, provide joints noted in these specification sheets at the specified maximum spacing to allow for pipe disassembly through the remainder of the pipe runs. Contractor is to locate.

PIPE SPECIFICATION DATASHEET – SS1

Flanges	20 – 65	316L Stainless Steel, Socket Weld	CL 150	Socket Weld Forged: ASTM A182/A182M ANSI B16.5	
Flange Gaskets	20 – 65	Compressed inorganic fibre with Nitrile binder, 1.6mm thick			
Weldolets		316L Stainless Steel			
Expansion Couplings Flange	>65	316L Stainless Steel 316L Stainless Steel	Same as Pipe		
Bolts			Hex. Head	ASTM A193 Gr. B Cl. 1	
Nuts	≤ 25 mm >25 mm		Hex. Heavy Hex.	ASTM A194 Gr. B	
Flange Gaskets	65– 250 >300	Kevlar w/ Neoprene Kevlar w/ Neoprene	1.6 mm thick 3.2 mm thick		Note 3 Note 3

Norclair suggests black neoprene for the discharge chute lflange gaskets as temperature and pressure are not an issue.

INSPECTION AND TESTING

As per CGA B105

Visual and Random non destructive testing for welds.

CLEANING AND CONDITIONING

Remove debris and flush with water at minimum velocity of 1.0 m/s.

NOTES

1. Joints at specific spacings for pipe disassembly.
2. Provide beveled edges for all welded fittings and connections.
3. Provide full-faced gaskets for flat face flanges and ring gaskets for raised face flanges.
4. Passivate all welds after completion.
5. Provide purge connection in each pipe run as per CGA B105.
6. Purge system with nitrogen before being placed into service.
7. Do not use graphite based products to avoid carbon contamination of stainless steel pipe.
8. For pipe sizes less than 65mm, use 316L stainless steel pipe, schedule 40, ASTM A312 and fittings to ASTM A182, socketweld type.

ROXUL®
The Better Insulation™

Technical Product Information

ROXUL Enerwrap 80

BLANKET INSULATION 15080*
PROCESS PIPING & EQUIPMENT
INSULATION 40 42 00**

General Product Information:

ROXUL® products are mineral wool fibre insulations made from basalt rock and slag. This combination results in a non-combustible product with a melting point of approximately 2150°F (1177°C), which gives it excellent fire resistance properties. ROXUL mineral wool is a water repellent yet vapour permeable material.

Description & Common Applications:

The ENERWRAP® 80 product is a flexible faced industrial blanket mineral wool insulation that is lightweight, water repellent, fire resistant and sound absorbent. ENERWRAP 80 is used to insulate surfaces such as pipes, vessels, boilers, furnaces, structural members and irregularly shaped mechanical equipment.

Compliance and Performance:

ASTM C 553	Mineral Fiber Blanket Thermal Insulation	Type VII, Complies
City Of Los Angeles Approval		RR 25444

Fire Performance:

ASTM E 136	Behaviour of Materials at 750°C (1382°F)	Non-Combustible
CAN4 S114	Test for Non-Combustibility	Non-Combustible
ASTM E 84(UL 723)	Surface Burning Characteristics	Flame Spread - Passed Smoke Developed - Passed
CAN/ULC S102	Surface Burning Characteristics	Flame Spread - Passed Smoke Developed - Passed

Maximum Service Temperature:

ASTM C 411	Hot Surface Performance	In Compliance with ASTM C612 @ 1200°F(650°C)

Dimensional Stability:

ASTM C 356	Linear Shrinkage	1.49% @ 1200°F (650°C)

Moisture Resistance:

ASTM C 1104	Moisture Sorption	0.01%

Thermal Resistance:

ASTM C 518 (C 177)	R-value/inch @ 75°F	4.2 hr.ft².F/Btu***
	RSI value/25.4 mm @ 24°C	0.74 m²K/W

Corrosive Resistance:

ASTM C 665	Corrosiveness to Steel	Pass
ASTM C 795 ****	Stainless Steel Stress Corrosion Specification as per Test Methods C871 and C692: U.S. Nuclear Regulatory Commission, Reg. Guide #1.36: U.S. Military Specifications MIL-I-24244 (all versions including B and C)	Conforms

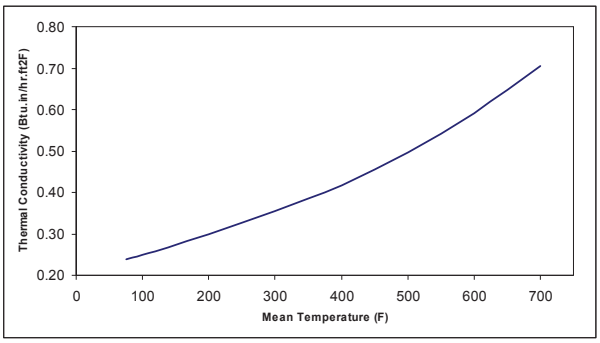
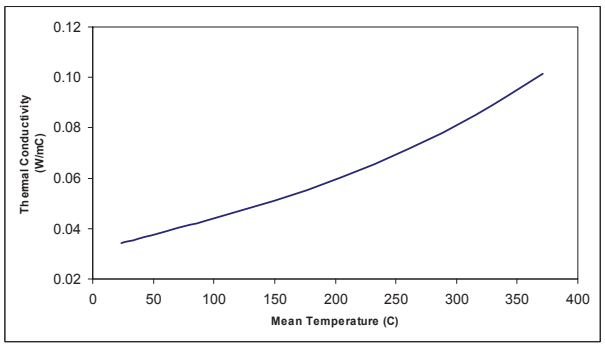
ROXUL Enerwrap 80





Density:

ASTM C 553-92 – Nominal	8.0 lb/ft^3	128 kg/m^3
ASTM C 553-08 – Actual		
≥ 2" thickness	5.68 lb/ft^3	91 kg/m^3

Available Facing:

- Black fibrous glass scrim for single and multi-layer applications
- Reinforced foil facing for single layer applications as special order only (minimum order quantities required).

Key Application Qualifiers:

- Flexibility
- Non-combustibility
- Low moisture sorption
- Fire resistant
- Excellent thermal resistance
- Does not rot or sustain vermin
- Does not promote growth of fungi or mildew
- CFC and HCFC free product and process
- Made from natural and recycled materials

Other ROXUL Products:

Please consult ROXUL for all your insulation needs. We have an extensive range of products for all applications from pipe insulation to commercial products to residential batts. ROXUL invites all inquiries and will act promptly to service all of your requirements.

**** "Provisions for lot testing may be required, consult manufacturer."

Note:

As ROXUL Inc. has no control over installation design and workmanship, accessory materials or application conditions, ROXUL Inc. does not warranty the performance or results of any installation containing ROXUL Inc's. products. ROXUL Inc's. overall liability and the remedies available are limited by the general terms and conditions of sale. This warranty is in lieu of all other warranties and conditions expressed or implied, including the warranties of merchantability and fitness for a particular purpose.

ALUMINUM ROLL JACKETING WITH POLYSURLYN MOISTURE RETARDER

DESCRIPTION

ITW Insulation Systems Canada's Roll Jacketing is manufactured from 3000 series alloys, conforming to ASTM B-209 designation, half-hard temper (H-14) and heavier gauges quarter-hard (H-12) lock-forming quality.

Percent of Alloying Elements – Aluminum and Normal Impurities Constitute Remainder

Alloy	Manganese	Magnesium
3105	.6	.50

Mechanical Properties (typical)

Ultimate (ksi)	Yield (ksi)	Elongation (%)
25	23	4

Shear (ksi)	Mod. Of Elasticity (ksi x 10 power 3)
15	10.0

The exterior side of this product is bare aluminum (please see note on "waterstaining" under the Technical info tab on this website). The interior of the jacketing is protected by a factory heat sealed 3 mil three layer co-extruded Polysurlyn film.

ITW's aluminum roll jacketing is available in smooth, stucco embossed or 3/16 corrugations (cross-crimped) finishes.

RECOMMENDED USES

Roll Jacketing is recommended for insulated piping, tanks and vessels less than 8 feet in diameter. Deep corrugated sheets are recommended for diameters greater than 8 feet.

Thickness (Inches) & Suggested Applications	
.016" (.4mm) & .020" (.5mm)	The standard for industrial use. Recommended over insulation lines up to 36" O.D. including insulation
.024" (.6mm)	A heavier weight jacketing used on larger diameter lines and large equipment up to 8 feet in diameter.
.032" (.8mm)	Used in special applications where extra thickness and protection is required, such as fabricated tank head covers and other special fabrications.
.040" (1.0mm)	Available in rolls and sheets, where extra heavy gauges are required because of severe mechanical abuse or special fabricating requirements, such as flat ducts or precipitators. Also recommended for areas subject to high wind conditions.

ITW Insulation Systems Canada

CHILDERS – PERMACLAD

Aluminum Jacketing with Polysurlyn Moisture Retarder

ITW Insulation Systems Canada's most specified Jacketing Product is Aluminum with Polysurlyn Moisture Retarder. The aluminum is manufactured from a 3000 series alloy conforming to ASTM B-209 designation, half hard (H-14 Temper) in lighter gauges and quarter hard (H-12 Temper, lock forming quality) in heavier (.032 & .040) gauges. The jacketing is protected on the inside with a factory heat laminated Polysurlyn Film.

ALUMINUM SUBSTRATE - AA3105 H14

Chemical Composition (Limits)

Silicon	Iron	Copper	Mn	Mg	Cr	Nickel	Zinc	Titanium	Other	Al
0.6	0.7	0.30	0.30-0.8	0.20-0.8	0.20		0.40	0.10	.15	remainder

Mechanical Properties (typical)

Ultimate (ksi)	Yield (ksi)	Elongation (%)	Shear (ksi)	Mod. Of Elasticity (ksi x 10 power 3)
25	23	4	15	10.0

Polysurlyn Moisture Retarder

Due to its superior performance characteristics, ITW recommends polysurlyn moisture retarder as best practice replacing the old standard Polykraft Moisture Retarder. Polysurlyn consists of a 3 mil thickness three layer co-extrusion of polyethylene and Dupont's surlyn® which is heat laminated in our ISO 9001:2000 Quality System certified plants.

Physical Properties

- No paper to absorb and hold moisture
- WVTR= Water Vapor Transmission Rate (21 grams/100 square inches/day)
- Auto ignition temperature of kraft paper is approximately 450 degrees F. Polysurlyn has flash point above 650° F.
- There is no effect on the porosity of the polysurlyn film with occasional exposure to 250° F or continuous exposure to 180° F temperature. Thermogravimetric testing shows polysurlyn does not begin to decompose until 410° F.

For cold rooftop work and hot cyclical applications, ITW Insulation Systems Canada recommends Thermoclad® Plus as best practice due to it's superior corrosion resistance characteristics.

REQUEST FOR INFORMATION

No : RFI-31

Revision :

Date : July 3, 2018

PROJECT : **Wastewater Treatment Plant WWTP Iqaluit**

CONTRACT N° : **2018-062**

SUBJECT : Process

DETAILS : As indicated on detail plan P505 of section B and on the attached detail, we would like to know what type of insulation is required for the "vent" section located outside the building?

REFERENCE

Technical spec. - Section : _____

Drawing - N° - rev. : _____

Other : _____

PREPARED BY : *Sandra Rousseau* (*NAME*) _____ (*SIGNATURE*) July 3, 2018 (*DATE*)

Technical Answer : For the part outside the building, the insulation should be minimum 50mm mineral wool with an aluminum or stainless steel wrapped covering.

2 PC Full Port 1000 WOG Ball Valve, Threaded

Purge, flush and sample points valves
Threadolet to be welded on site.
Stantec to indiquate on site location of drain, purge, flush, sample points,...
As per Stantec instructions:
- If the flushing connection is on top of a pipe provide 38 mm in diameter elements;
- If the flushing connection is on a blind flange or Victaulic cap, provide 50 mm in diameter elements.
- Drain connections to be the same size of flushing connections and to be located at low points of all lines.
- For sample connections provide 25 mm in diameter elements.

DESIGN FEATURES

- Blow-out-proof stem design
- Steam Rating: 125 PSI WSP
- Temperature range: -50°F to 450°F
- Locking device
- Threaded type: ANSI B1.20.1 (NPT)

ORIGINAL SHEET - ISO A1

NOTES

1. THE ARRANGEMENT OF PRIMARY FILTERS 1 AND 2 SHARES A UNIQUE FOUL AIR PIPLINE TO ATMOSPHERE.
2. REPLACE EXISTING MANUAL VALVE WITH NEW ELECTRICALLY OPERATED OPEN/CLOSE VALVE.
3. INSULATE AND HEAT TRACE ALL FOUL AIR OUTSIDE PIPING.
4. CONTRACTOR TO SUPPLY AND INSTALL ANALOG SIGNAL SPLITTER INSIDE PRIMARY FILTER 2 CONTROL PANEL FOR LIT-01-125. SEE PC-10X FOR DETAILS.

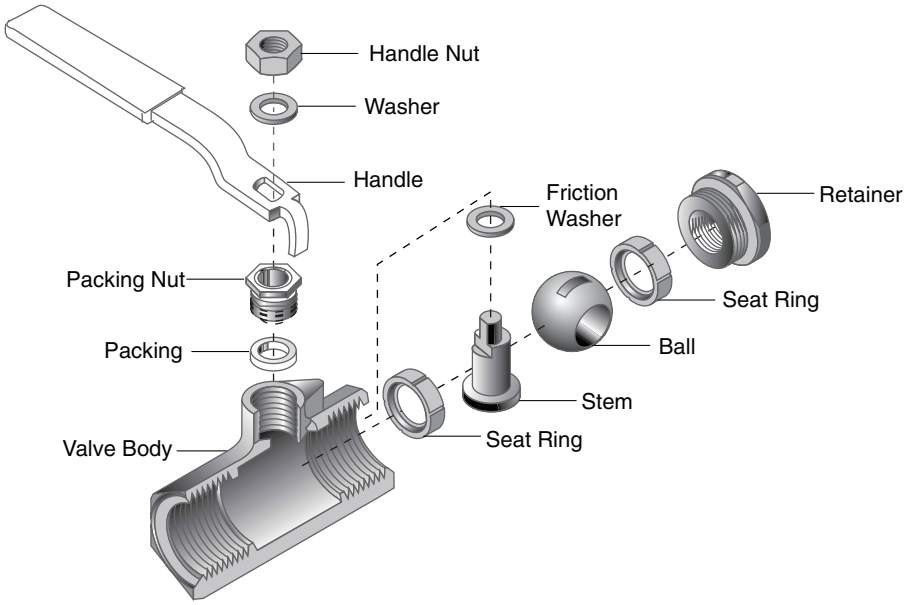
Key Features, Options and Pressure-Temperature Ratings

Jenkins® ball valves are general purpose two-piece end entry ball valves that covers the full spectrum of industrial and commercial applications.



Jenkins® Ball Valve Key Features and Options:

- **Blow-Out Proof Stem**
  The internally loaded stem has an integral thrust collar which prevents stem removal while the valve is installed.

- **Adjustable Packing**
  The packing may be tightened to compensate for wear throughout the life of the valve.

- **Lever Handle**
  Heavy duty lever handles are standard for easy operation. All handles include a vinyl insulator sleeve for protection from high or low temperatures.

- **Options Include**
  Memory Stop
  Extension Stems
  Tee Handles
  Stainless Steel Lever Handles
  Locking Handles

- **CGA Approved**
  Jenkins® threaded ends ball valves are Canadian Gas Association Approved.

- **AGA Approved**
  Jenkins® threaded end ball valves are American Gas Association Approved.

- **UL/FM Approved**
  Figures 201J & 201SJ, size ¼" – 2" are Underwriter's Laboratory/Factory Mutual Approved.

TYPICAL SERVICE
PW, NPW COLD, NPW HOT.

VALVE MATERIALS		VALVE DESCRIPTION	
ITEM	MATERIAL	Reference Document	Note 2
Body	Bronze or Forged Brass	Size Range	10 mm to 65 mm
Ball	Bronze or Chrome plated brass - floating	Rating	Class 125
Seats	PTFE	Body/Valve Ends	Female Threaded (Note 3)
Shaft	Bronze or Stainless Steel (Note 1)	Pattern	Compact, Regular Port
		Operator	Lever
		Actuator	

NOTES

1. Blowout-proof stem.
2. When this valve is installed into a gas service it must comply with the applicable requirements.
3. Provide threaded end cap and chain when used for draining service.

CONSULTANT APPROVAL

Lengths of spools are not being revised. Contractor to review in detail and ensure all lengths meet contract requirements.

STANTEC PROJECT #: 110126045

SUBMITTAL # DA-MP-28R2 Screen Discharge Chute Detail 15

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

☑ Process ☐ Electrical
☐ Structural ☐ Other
☐ Mechanical

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

Micro-Lok®

Fiber Glass Pipe Insulation

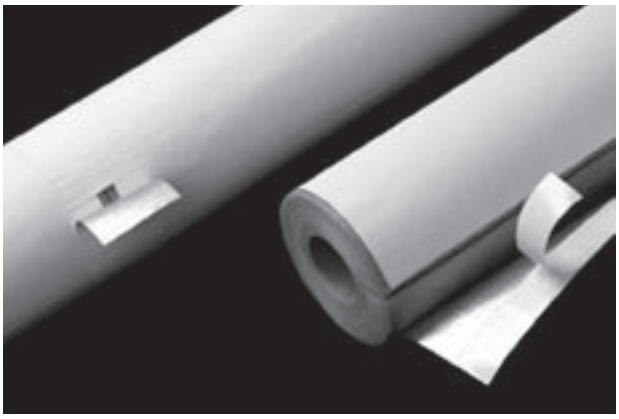
Description

Micro-Lok fiber glass pipe insulation is made from glass fibers bonded with a thermosetting resin and produced in 36" (0.92 m) lengths. Jacketed with a reinforced vapor retarder facing and a factory-applied, longitudinal acrylic adhesive closure system, Micro-Lok is designed for application temperatures from 0°F to 850°F (-18°C to 454°C). Section joints are sealed with butt strips which are supplied from the factory. **Micro-Lok AP-T Plus** may be painted with a latex paint after installation.

The factory-installed tape system permits installation at ambient temperatures down to 15°F (-9°C), and will not soften or separate when exposed to high ambient temperatures and humidity.

Uses

Micro-Lok fiber glass pipe insulation is suitable for installation over hot, cold, concealed and exposed piping systems with operating temperatures up to 850°F (454°C). Weather-protective jacketing is required for outdoor applications. Pipes operating below ambient temperatures require all joints to be sealed with the factory-applied, self-seal lap and butt strips.



Operating Temperature Limits: 0°F to 850°F (-18°C to 454°C)

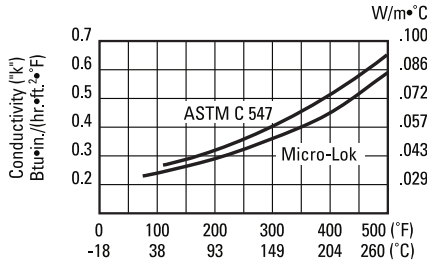
Specification Compliance

ASTM C 1136 (Jacketing) (Replaces HH-B-100B, Type I & II)
ASTM C 547 Type I (Replaces HH-I-558B, Form D, Type III, Class 12, Class 13 up to 850°F [454°C])
MIL-I-22344C
New York City MEA # 330-85-M
NFPA 90A & 90B, FHC 25/50

Physical Properties

Service Temp. Range	0°F to 850°F (-18°C to 454°C)
Moisture Sorption	<0.2% by volume
Alkalinity	<0.6% expressed as Na_2O
Corrosivity	Does not accelerate
Capillarity	Negligible (after 24 hours)
Shrinkage	None
Fungi & Bacteria Resistance	Does not breed or promote
Surface Burning Characteristics	Composite FHC 25/50 per ASTM E 84, UL 723, NFPA 255, CAN/ULC S102-M88
Limited Combustibility	NFPA 259
Jacketing	ASTM C 1136 (Type I)
Water Vapor Permeance (ASTM E 96 - Procedure A)	.02 perms max.
Beach Puncture (ASTM D 781)	50 oz. in./in. (58 SI) tear min.
Tensile Strength (ASTM D 828)	45 lbs./in. (7.9N/mm) width min. (MD) 30 lbs./in. (5.23N/mm) width min. (CD)

Thermal Conductivity ("k")



Mean Temperature	°F	75	100	200	300	400	500
	°C	24	38	93	149	204	260
Btu•in/(hr•ft²•°F)		.23	.24	.29	.36	.45	.59
W/m•°C		.033	.035	.042	.052	.065	.085

ASTM Test Methods & Guidelines

C 356.....Linear Shrinkage
C 411.....Hot Surface Performance
C 547.....Pipe Insulation
C 585.....Simplified Dimensional Standards for Nesting [Except $^3/_4$" (20 mm) IPS, 1" (25 mm) IPS, and $1^5/_8$" (41mm) CT]
C 1136.....Vapor Barrier Jacketing (Type I)

Micro-Lok®

3*	76	1/2 - 18	13 - 457	5/8 -12 1/8	16 - 308

* Contact the nearest Regional Sales Office for availability.

Qualifications for use

A sufficient thickness of insulation must be used to keep the maximum surface temperature of Micro-Lok AP-T Plus below 150°F (66°C). In addition, at operating temperatures above 500°F (260°C), Micro-Lok pipe insulation must be applied in a thickness ranging from 2" (51 mm) minimum to 6" (152 mm) maximum.

During initial heat-up to operating temperatures above 350°F (177°C), an acrid odor and some smoke may be given off as the organic binders used in the fiber glass pipe insulation begin to decompose. When this occurs, caution should be exercised to ventilate the area well. This loss of binder does not directly affect the thermal performance of the pipe insulation, but the compressive strength and resiliency of the product are reduced. For applications with excessive physical abuse or vibration at high temperatures, consult your local Performance Materials Division territory manager for alternate material recommendations.

Application Recommendations.
AP-T Plus Jacket and Butt Strips.

1. Do not apply Micro-Lok insulation with AP-T Plus jacketing if air temperature is below 15°F (-9°C) or above 130°F (54°C) due to the effect of temperature on tape performance. We recommend stapling when application falls outside this temperature range.

2. If stored below 15°F (-9°C) or above 130°F (54°C), insulation cartons should stand within the recommended temperature range for 24 hours prior to application.

3. Once release paper is removed, both adhesive and lap must be kept free of dirt and water, and the lap sealed immediately.

4. When adhered, the lap and butt strips must be pressurized by rubbing firmly with a plastic squeegee or the back of a knife blade to assure positive closure.

Printed in USA

Johns Manville

Zeston 2000® Series White PVC Insulated Fitting Covers and Jacketing

Features

- Protect insulated or bare pipes
- Meets most requirements for federal, state and local fire-safety codes
- Accepted for commercial, institutional, industrial and residential projects in all parts of the US
- System is uncomplicated and easy to install
- UV-resistant for outdoor applications
- Long-lasting protection and an attractive finished appearance
- Available with Hi-Lo Temp fiber glass inserts

Applications

- Commercial, institutional and industrial applications

Construction

- Covering and jacketing manufactured from high-impact, gloss white, UV-resistant polyvinyl chloride jacketing

Application Recommendations

- Wrap the Hi-Lo Temp fiber glass insert completely around the pipe fitting without overly compressing it or leaving any voids
- Ensure that the insulation insert covers all exposed surfaces
- Install the Zeston PVC fitting cover over the pipe fitting and fiber glass insert by securing the throat of the Zeston PVC insert using either serrated tacks, Perma-Weld adhesive or Zeston Z-Tape
- If applied in an outdoor setting or exposed to the sun, precautions should be taken to account for expansion joints

ZESTON 2000 SERIES WHITE PVC
INSULATED FITTING COVERS AND JACKETING

Johns Manville

Zeston 2000® Series White PVC Insulated Fitting Covers and Jacketing

Qualifications For Use

Hot Systems

- Use proper insulation thickness to ensure PVC covers are kept below 150°F (66°C)
- PVC covers should be kept away from contact with and/or exposure to sources of direct or radiated heat
- For fittings where operating temperatures exceed 250°F (121°C) or where pipe insulation thickness is greater than 1½" (38mm), two or more layers of Hi-Lo Temp insulation inserts are required beneath the fitting cover (refer to MECH-261 Zeston Hi-Lo Temp Inserts)

Cold Systems

- An approved vapor-barrier compatible with PVC must be applied between pipe insulation and fitting cover and on fitting cover throat overlap seal. Please refer to Insulspec MECH-261 on jm.com
- For fittings where operating temperature is below 45°F (7°C) or where the pipe insulation thickness is greater than 1½ " (38mm), two or more layers of Hi-Lo Temp insulation inserts are required beneath fitting cover (refer to MECH-261 Zeston Hi-Lo Temp Inserts)

Refrigerant Systems and Cold Systems In Severe Ambient Conditioning

- Mitered pipe insulation segments, fabricated or pre-molded insulation shapes may be used in lieu of Hi-Lo temp insulation inserts
- An intermediate vapor-barrier compatible with PVC is required to completely seaL the insulation prior to installing the Zeston 2000 PVC fitting cover
- Care should be taken to ensure the vapor barrier mastic is applied between the pipe insulation and the fitting cover and on the fitting cover throat overlap seam

Totally Sealed Systems (USDA Approval)

- 20 or 30 mil (0.5 mm or 0.8mm) Zeston PVC jacketing should be applied to pipe insulation in conjunction with Zeston PVC fitting covers
- Circumferential and longitudinal jacket and fitting cover seams should be sealed with Zeston Perma-Weld solvent welding adhesive
- Circumferential seams should be a minimum of 1" (25mm) overlap and longitudinal seams should be 1½"- 2" (38mm to 51mm) overlap
- Upon completion, all seams should visually be checked for seal and, if necessary, touched up
- Slip joints are periodically required between fixed supports and on continuous long runs of straight piping.
- To implement a slip joint, increase the circumferential overlap to 8" to 10" (203 mm to 254 mm) and apply a flexible white caulking in the overlap area to maintain a sealed system
- Refer to Zeston installation instructions CI-35 at www.jm.com

STANTEC PROJECT #: 110126045

SUBMITTAL # DA-MP-32R3 BFP

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

- ☑ Process
- ☐ Electrical
- ☐ Structural
- ☐ Other
- ☐ Mechanical

Stantec

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

Objet : RE: Iqaluit WWTP - Shop drawing DA-MP-38

Hello Again Hugo,

As discussed last week, please find attached the partial Rev3 of the engineering submittal for Iqaluit. I don't mean to further complicate things, but since our last discussion we've been informed that the air compressor motor is only available in ODP (no longer in TEFC), and our parts department discovered some of the spare part numbers required updating. So all those changes are incorporated as follows:

Section 6 – Tab 3: Air compressor motor no longer available in TEFC housing; changed to ODP.
Section 6 – Tab 5: Pump model changed from CR 15-4 to CR 10-5; pump motor changed from 7.5 HP to 5 HP.
Section 7: Updated part numbers for belts, lever arm, lever roller, and set collars; removed obsolete valve.

We should be good to go assuming there are no issues with these changes, but please let me know if you guys or Stantec have any questions.

Thanks,

Jeremy Taylor
Project Manager
Phone: +1-502-499-6198 ext. 181

…

Much appreciated, Hugo, we are full speed ahead at this point.

I have another item to bring your attention to:

As we've begun the procurement process, we've discovered our pump supplier had quoted us the wrong water boost pump for the application. The only impacts will be that the pump model number will change, and the pump motor will go from 7.5 HP [5.5 kW] down to 5 HP [~3.7 kW]. Our electrical guys had already anticipated a 5 HP motor based on previous systems, so the panel will not be affected, nor will any of the GA drawings. Do you think I need to revise the submittal, or is this a change that can be approved in the same manner as the flange change?

Thanks,
Jeremy Taylor
Project Manager

Electric Stationary Compressors

Standard Features

- Heavy-duty single or two stage cast iron compressor pump Made in Somerset, PA USA
- Splash lubricated
- Oil sight glass
- Belt driven with a large flywheel for extra cooling and easier start-up
- Each unit is filled with Jenny Ultimate Blue Compressor Pump Oil
- Directional air shroud for reduced pump temperatures
- Totally enclosed heavy-duty belt guard
- Tank gauge
- Tanks are powder coated and ASME certified
- 60 gallon tanks and larger are ASME National Board certified
- Protectively mounted fittings
- Manual tank drain(s)
- Large canister intake filter with replaceable filter elements
- Special unloading valves to assist in motor starting
- Pressure relief safety valve

BOOSTER PUMP

Manufacturer:	Grundfos
Model:	CR 10-5 Vertical Multistage Centrifugal Pump
Capacity:	52 GPM @ 100 PSI output (70 psi boost)
Motor:	5 HP, 575V/3 Ph/60 Hz, TEFC

Note: 52 GPM @ 30 PSI required at water inlet from the plant. The Grundfos Pump will boost up to the required pressure of 100 PSI for belt cleaning. Plant water must contain less than 200 PPM solids. Max solids is 20 mesh. Maintain flooded suction at Pump inlet.

Qty.	Description
1	**CR 10-5 A-GJ-A-E-HQQE**

Product No.: 96126734
Vertical, non-self-priming, multistage, in-line, centrifugal pump for installation in pipe systems and mounting on a foundation.

The pump has the following characteristics:
- Impellers and intermediate chambers are made of
- The shaft seal has assembly length according to EN 12756.
- Power transmission is via cast iron split coupling.

Controls:
Frequency converter: NONE

Liquid:
Pumped liquid: Water
Liquid temperature range: -4 .. 248 °F
Liquid temperature during operation: 68 °F
Density: 62.29 lb/ft³

Technical:
Pump speed on which pump data are based: 3461 rpm
Rated flow: 53.3 US GPM
Rated head: 191.3 ft
Pump orientation: Vertical
Shaft seal arrangement: Single
Code for shaft seal: HQQE
Curve tolerance: ISO9906:2012 3B

Materials:
Base: Cast iron
EN 1561 EN-GJL-200
ASTM A48-25B
Impeller: Stainless steel
EN 1.4301
AISI 304
Bearing: SIC

Installation:
Maximum operating pressure: 232 psi
Max pressure at stated temp: 232 psi / 250 °F
232 psi / -4 °F
Type of connection: ANSI / JIS
Size of inlet connection: DN 50
2 inch
Size of outlet connection: DN 50

STANTEC PROJECT #: 110126045

SUBMITTAL # DA-MP-34 (2018-12-17)

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

☐ Architectural ☐ Structural ☐ Mechanical ☑ Electrical ☑ Other Instrumentation

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

Actuated butterfly valve BFV02 - 350mm

Keystone GR,
STYLE: Lug,
SIZE: DN0350/ NPS 14'',
BODY: Ductile Iron,
DISC :Aluminium Bronze,
STEM: 431 Stainless Steel,
SEAT: NBR FG , F
LANGE DRILLING:
ASME 150,
BETTIS on/off electric actuator, Ductile iron body, Nema 4X and CSA certified, Size 820, 2x SPDT switches, Heater, Thermostat, Internal brake, Female output drive, 100% duty cycle, 115 VAC / 1 Ph, / 60 Hz, 60 second operation

EMERSON

KEYSTONE SERIES GR RESILIENT SEATED BUTT

GRW/GRL

A heavy duty industrial resilient seated butterfly valve
GRW - Wafer body design
GRL - Lugged body design

GENERAL APPLICATION

Water, air, dry bulk conveying etc. These valves are for any service where a drop-tight shut-off with maximum flow area is required.

TECHNICAL DATA

Sizes:	DN 50 - 900 (NPS 2 - 36)
Pressure:	16 bar DN 50 - 300 (230 psi NPS 2 - 12) 10 bar DN 350 - 900 (150 psi NPS 14 - 36)
Reinforced seat:	16 bar DN 350 - 600 (230 psi NPS 14 - 24)
End of line:	10 bar DN 50 - 300 (150 psi NPS 2 - 12) 6 bar DN 350 - 900 (90 psi NPS 14 - 36)
Reinforced seat:	10 bar DN 350 - 600 (150 psi NPS 14 - 24)
Vacuum service:	0.4 bar (5.8 psia)
Temperature:	-40°C to +160°C (-40 °F to +320°F)
Flange accommodation:	PN 6/10/16 ASME 125/150 JIS 10K BS Table E AS4087 PN 16 AS2129 Table E

FEATURES

- Wafer and lugged body design with face-to-face dimension, according to EN 558 Series 20 and API 609.
- Designed according to EN 593 and API 609.
- The seat is field replaceable and fully isolates the body and shaft from the flow.
- Primary shaft sealing exceeds the pressure rating of the valve and prevents leakage through shaft area to atmosphere.
- A secondary shaft sealing provides back-up safety.
- A molded-in O-ring in the seat for flange sealing eliminates the need for gaskets.
- Shaft seals prevent moisture penetrating into the shaft area.
- The two piece shaft allows for a thin disc and provides minimal obstruction to flow (up to DN 300/ NPS 12).
- Rounded polished disc edge gives full concentric sealing, lower torques, longer seat life and drop-tight shut-off.
- Body locating holes allow ease of installation and centering between the flanges.
- Extended body neck allows for pipe insulation.
- Top and bottom shaft bearings for optimized support and minimum friction and decreased torque.
- Top bushing absorbs actuator side thrust loads.
- All valves comply to Pressure Equipment Directive (2014/68/EU) Module B + D, CE Marking.
- Available approvals: NSF/ANSI 61, ACS, KIWA, WRAS, DVGW-G, ABS, CU-TR.

NOTES

1. 'Q' dimension is the minimum allowable pipe or flange inside diameter at the centered body face to protect the disc sealing edge against damage when opening the valve.
2. 'H' dimension refers to flat on shaft.
3. Weight may vary depending on trim materials used.
4. DN 50 - actual shaft dimension is 12 mm x 8 mm A/F and is fitted with an adaptor to produce a BAC connection.
5. øYY dimension is to the outside of the seat.
6. øM dimension is to the O-ring seal.

NOTES

1. 'Q' dimension is the minimum allowable pipe or flange inside diameter at the centered body face to protect the disc sealing edge against damage when opening the valve.
2. 'H' dimension refers to flat on shaft.
3. Weight may vary depending on trim materials used.
4. NPS 2 - actual shaft dimension is ½ in x ⅓ in A/F and is fitted with an adaptor to produce a BAC connection.
5. øYY dimension is to the outside of the seat.
6. øM dimension is to the O-ring seal.

For ASME 125/150 - flange bolt threads for NPS 2-16 are UNC
- flange bolt threads for NPS 18-36 are 8UN

NOTES

1. 'Q' dimension is the minimum allowable pipe or flange inside diameter at the centered body face to protect the disc sealing edge against damage when opening the valve.
2. 'H' dimension refers to flat on shaft.
3. Weight may vary depending on trim materials used.
4. NPS 2 - actual shaft dimension is ½ in x ⅓ in A/F and is fitted with an adaptor to produce a BAC connection.
5. Valve size NPS 36 is tapped flange design and has no separate lugs.
6. øYY dimension is to the outside of the seat.
7. øM dimension is to the O-ring seal.

* All seat materials drop tight

** Per material listed in the material specification tables

For non-PED requirements with EPDM seats, valves can be rated to a minimum temperature of -40°C.

Maximum temperature for ductile iron disc/epoxy ctd. (DN 350-900) is 120°C.

Maximum temperature for ductile iron disc/nylon ctd. is 60°C.

NOTES

3.5 U/C refers to reduced diameter disc option.

1. Duplex shaft not suitable for these conditions, use only 431 stainless steel or super duplex.

TORQUE APPLICATION FACTOR CATEGORIES

Application I

Clean liquid lubricating media (water, clean oils, lube oil, mineral oil, etc.); and with no deposit or chemical attack, valve operated at least once a week.
Temperature range from 0°C to maximum temperature rating of the elastomer seat.

Application II

Other liquid media and lubricating gases (aqueous liquids, such as food and beverage, water, etc.); and with minor deposit or chemical attack, valve operated at least once a month.
Temperature range from 0°C to maximum temperature rating of the elastomer seat.

Application III

a. Dry non-abrasive media or gases (non-abrasive powders and dry gas); or
b. Fluids with moderate deposit or chemical attack; or
c. Valves operated less than once a month.

Temperature range from 0°C to maximum temperature rating of the elastomer seat.

Application IV

a. Dry abrasive media and degreasing applications (sand, cement, silicone free, oxygen cleaned); or
b. Liquids with severe deposit; or
c. Valves not frequently operated (once a year).

All above with temperature range from -10°C to maximum temperature rating of the elastomer seat.

NOTES

1. For applications with temperatures above or below the guidelines above, please consult factory.
2. For dry service valves it is suggested to use U/C discs (reduced diameter) when service conditions are less than 3.5 bar.

NOTES

50 U/C refers to reduced diameter disc option.

1. Duplex shaft not suitable for these conditions, use only 431 stainless steel or super duplex.

TORQUE APPLICATION FACTOR CATEGORIES

Application I

Clean liquid lubricating media (water, clean oils, lube oil, mineral oil, etc.); and with no deposit or chemical attack, valve operated at least once a week.
Temperature range from 32°F to maximum temperature rating of the elastomer seat.

Application II

Other liquid media and lubricating gases (aqueous liquids, such as food and beverage, water, etc.); and with minor deposit or chemical attack, valve operated at least once a month.
Temperature range from 32°F to maximum temperature rating of the elastomer seat.

Application III

a. Dry non-abrasive media or gases (non-abrasive powders and dry gas); or
b. Fluids with moderate deposit or chemical attack; or
c. Valves operated less than once a month.

Temperature range from 32°F to maximum temperature rating of the elastomer seat.

Application IV

a. Dry abrasive media and degreasing applications (sand, cement, silicone free, oxygen cleaned); or
b. Liquids with severe deposit; or
c. Valves not frequently operated (once a year).

All above with temperature range from 15°F to maximum temperature rating of the elastomer seat.

NOTES

1. For applications with temperatures above or below the guidelines above, please consult factory.
2. For dry service valves it is suggested to use U/C discs (reduced diameter) when service conditions are less than 50 psi.

VALVE SEATING AND UNSEATING TORQUES (Nm) (REINFORCED SEAT)

	Valve size (DN)				
Differential pressure (bar)	**350**	**400**	**450**	**500**	**600**

10	1297	1755	2300	2936	4509
14	-	-	-	-	-
16	-	-	-	-	-

NOTES

As the reinforced seat is intended for high pressure applications the base torque commences at 1000 kPa/10 bar.
Reinforced seats are suitable for:

- Severe vacuum application (use 10 bar torque values).
- High line velocities up to 12 m/s for liquids.
- Pressure testing during erection and commissioning.

TORQUE APPLICATION FACTOR CATEGORIES

Application I
Clean liquid lubricating media (water, clean oils, lube oil, mineral oil, etc.);
and with no deposit or chemical attack, valve operated at least once a week.
Temperature range from 0°C to maximum temperature rating of the elastomer seat.

Application II
Other liquid media and lubricating gases (aqueous liquids, such as food and beverage, water, etc.);
and with minor deposit or chemical attack, valve operated at least once a month.
Temperature range from 0°C to maximum temperature rating of the elastomer seat.

Application III
a. Dry non-abrasive media or gases (non-abrasive powders and dry gas); or
b. Fluids with moderate deposit or chemical attack; or
c. Valves operated less than once a month.
Temperature range from 0°C to maximum temperature rating of the elastomer seat.

NOTES

1. For applications with temperatures above or below the guidelines above, please consult factory.

EMERSON. CONSIDER IT SOLVED.™

THE ENGINEERED SOLUTION

Introduction

For more than 40 years, Bettis Corporation has been recognized worldwide for providing industry with high performance pneumatic and hydraulic valve actuators. The addition of the Bettis line of TorqPlus electric actuators carries on the tradition of product quality, innovation and service reliability.

Bettis TorqPlus actuators are specifically designed for quarter-turn operating applications — ball, butterfly and plug valves; dampers; vents and similar uses. TorqPlus actuators are available in a wide range of output torques and operating speeds to fit your specific requirements.

The Bettis Engineered Solution

Most electric actuators in use today are designed to meet a range of torque and speed requirements for use in industrial applications. Controls and optional accessories are often available, added at the factory while being assembled. Heretofore, not much attention has been given to field upgrades, inventory modifications or parts replacement during servicing.

The Bettis TorqPlus actuators, instead, provide its users with a unique modular approach. The actuators are manufactured with pre-tapped holes in the base plate to accommodate a myriad of control and accessory components, available in more than 200 easy-to-install kits to fit virtually every requirement imaginable. Kits are available, depending on the actuator model, to add:

- Heaters and thermostats
- Potentiometers
- Servo controls
- Motor brakes
- Positioners and transmitters
- Control stations
- Multi-turn operation
- PLC interface

All of the components can be added inside the CSA type 4/4x weatherproof housing or the CSA type 4/4x, 7 and 9 weatherproof/explosion proof housings.

Advantages

The Bettis TorqPlus, and the modular concept, offers its users significant advantages:

- **Compact Design** – The actuators provide maximum torque output relative to its small design housing.
- **Custom Control Standards** – By offering an almost endless number of control and accessory combinations, Bettis electric actuators can effectively be designed to virtually any end use.
- **Modular Construction** – The modular design allows the actuators to be easily field modified and serviced. Accessory kits can be stored for future use without consuming a large amount of storage space.
- **High Strength Gearing** – We precision-machine our gears from hardened alloy steel, and run in needle bearings. The result is efficiency, smooth energy transfer, quiet operation and, best of all, long service life.
- **Low Maintenance** – Permanent lubrication reduces the need for scheduled maintenance. The actuators are supplied with low temperature lubricant, allowing the units to perform in temperatures to -40°F (-40°C). All operational parts are fully enclosed in the housing eliminating all contact with the environment.
- **Guaranteed Torques** – As with other Bettis actuators, we guarantee our published output torque values. If any Bettis TorqPlus actuator fails to meet its specified torque output under normal use, we will replace it.
- **Duty Cycle** – All Bettis actuators are rated for a duty cycle of at least 30% (one motor-on period followed by two motor-off periods). Higher duty cycles (up to 100%), which can allow for up to 1200 starts per hour, at normal ambient temperatures are available.

TYPICAL SPECIFICATIONS

The following information may be used as a guide to compose specifications for Bettis TorqPlus Electric Actuators. Bettis supplies Electric Actuators that meet or exceed all of the specifications stated below except the Model EM-100 (which is not equipped with a manual override feature or dual conduit entrances).

1. General
The actuator shall consist of a sand cast CSA* Certified enclosure complete with an internal high-torque reversible electric motor, terminal block, heat-treated alloy steel gearing, a minimum of two (2) 1⁄2" NPT conduit connections and a two (2) year original manufacturer's warranty.

2. Actuator Sizing
All actuator torques must be published and must be guaranteed, by the original manufacturer, as minimum values.

The actuator shall be sized to produce a torque equal to or greater than the maximum valve torque, including safety factor, as stated by the valve manufacturer for the service, operating conditions and ambient temperature intended.

3. Ambient Temperature Range
The actuator shall be suitable for normal operation in ambient temperatures ranging from -40 to +140 °F (-40 to +60°C). For temperatures below 32°F (0°C), high-humidity environments or all outdoor applications the actuator shall be supplied with an electric heater and thermostat.

4. Electric Motors
The actuator motor shall be of the reversible, high-torque, open frame ventilated design with built-in automatic resetting thermal overload protection, a minimum 30% duty cycle rating and be UL* and CSA* Certified Motors of 1⁄4 hp or less with not more than 7 amps of locked rotor current draw. When single phase motors are selected, they shall be supplied as a permanent split capacitor type operating from a 1Ph/60Hz/ 115VAC or 220VAC supply.

5. Reduction Gearing
The actuator shall use exclusively cut alloy gearing. All power gearing shall be grease lubricated for long life.

6. Limit Switches
All limit switches shall be independently operated by adjustable cams in each direction of operation. Provisions shall be made for up to six (6) additional cam operated switches, each being capable of operation at any point of travel.

7. Torque Limit Switches
All actuators of 2,000 lb-in (226 Nm) output torque or greater, shall be supplied with two (2) mechanical torque limiting switches which shall be responsive to maximum torque encountered in both directions of travel.

8. Manual Override
Transfer to manual operation from motor operation shall not require the use of hand levers, solenoid shifters or handwheel depression and the transfer shall be positive and reliable.

Actuators of less than 1700 lb-in, except for the model 100, shall be supplied with a disengageable manual override mechanism. Disengagement of the motor drive shall permit the use of a wrench on the output shaft flats and shall by-pass the power gear drive and motor for manual operation.

Actuators of 2,000 lb-in (226 Nm) or greater output torque shall be supplied with a handwheel which will not rotate during motor operation, but must be operational at all times without danger of injury to operator. The handwheel shall not require more than 50 lbs. of rim force to operate under the most adverse conditions and be capable of assisting or opposing the motor without any form of declutching.

9. Enclosure
The actuator enclosure shall be a high-strength sand casting and must be certified by CSA*, or equal third party tester, as acceptable for use in the following locations:

9.1 Non-hazardous indoor or outdoor location to protect against wind-blown dust and rain, splashing water and hose-directed water (i.e. CSA Enclosure 4 – Weatherproof, conforms to IP-65).

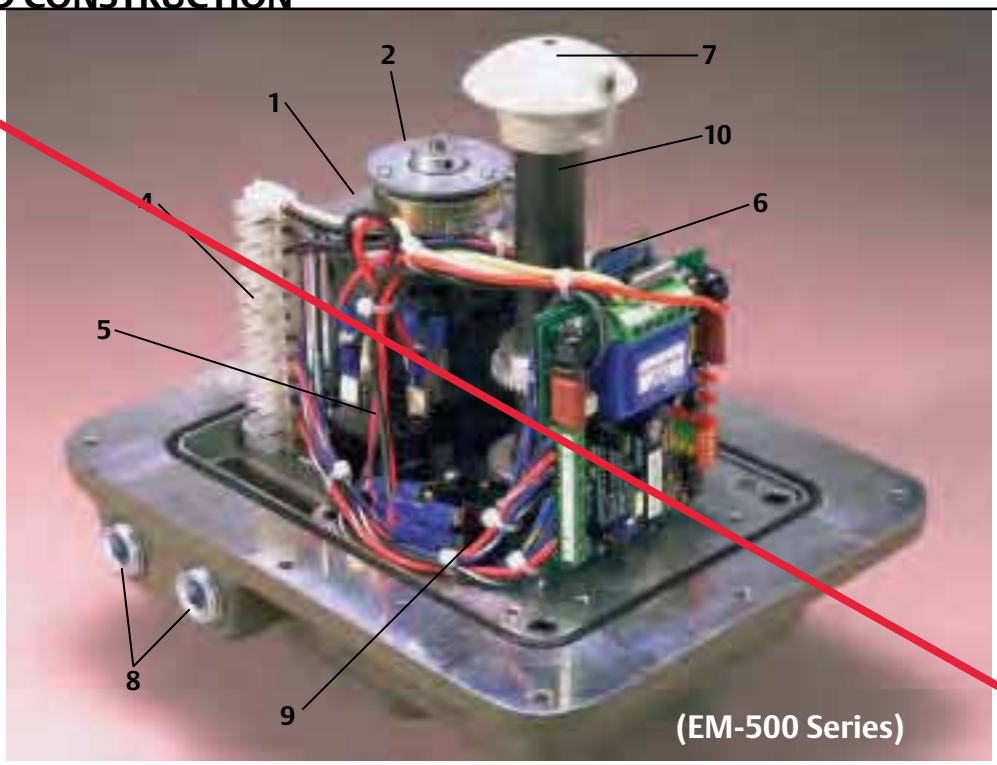
9.2 Hazardous locations classified as Class I and II, Groups C, D, E, F and G as defined in the National Electrical Code **plus** non-hazardous locations to protect against wind-blown dust and rain, splashing water and hose-directed water (i.e. CSA Enclosure 4 and 7 – Explosion-proof and Weatherproof).

*CSA is Canadian Standards Associations, Rexdale Ontario, Canada M9W 1R3

*UL is Underwriters Laboratories, Inc., Northbrook, IL 60062

*NEMA is National Electrical Manufacturers Association, Washington, D.C. 20037

DESIGN AND CONSTRUCTION



These very rugged and versatile electric actuators take full benefit of precision-machining which allows every model to provide maximum torque output relative to its compact design configuration and contains a minimum of parts to reduce vibration, lessen noise and resist harsh service. Utilizing a combination of spur, worm and planetary power gearing reduction systems, the Bettis TorqPlus actuators incorporate the most efficient, powerful and appropriate drive design for service excellence.

1. Motors. Available in Single Phase, 3 Phase and DC voltages, all motors are custom built for high-torque, low current draw and the highest duty cycle ratings offered. Single phase motors are capacitor run type and three phase are squirrel cage induction type both having integral self resetting thermal cut-outs.

2. Brakes. Offered for all AC and DC motors, they are capable of a holding force equal to the output torque ratings of each actuator model.

3. Heater and Thermostat. Securely mounted and appropriately sized to insure ample protection even in the worst environments (not visible in photo).

4. Terminal Strips. Standard in all models and allow easy plus efficient actuator installation.

5. Capacitors. Used on all single phase AC units, each capacitor is peak voltage rated and of improved design for maximum service life.

6. Potentiometers. Precision mechanically linked to actuator output drive for continuous position signaling.

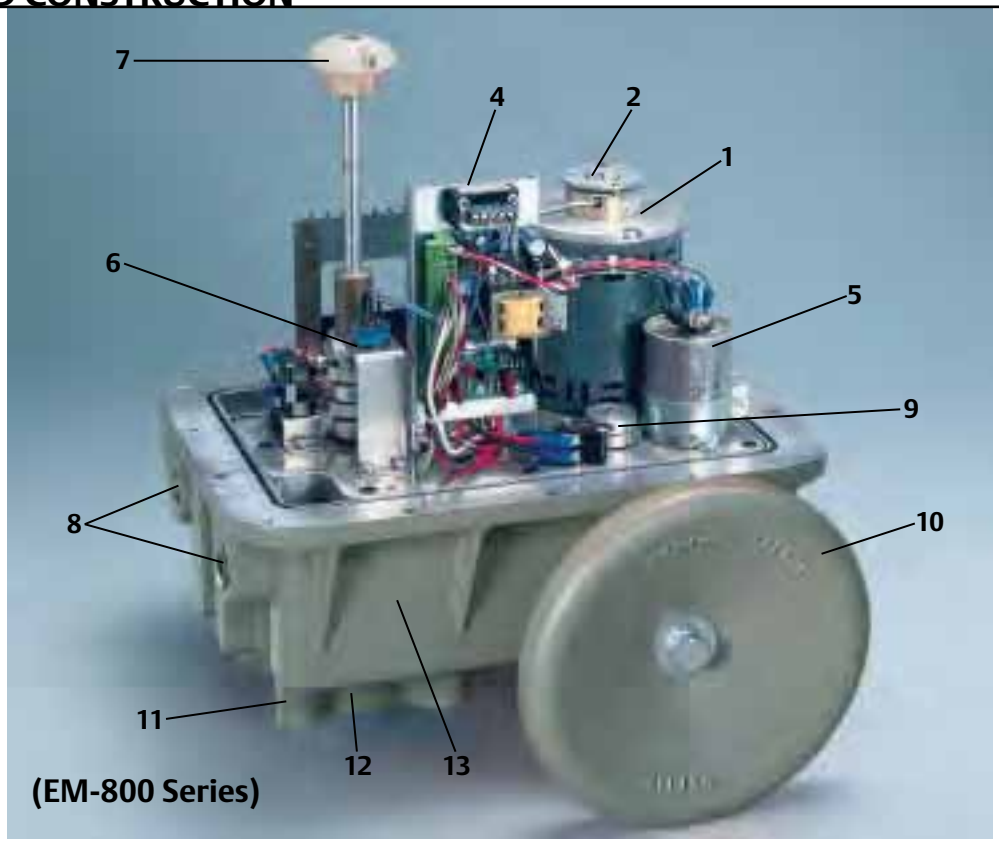
7. Position Indicator. Mechanically driven and easily viewed at top of actuator to insure or confirm actual actuator and driven device position at all times (not available on compact Model EM-100).

8. Dual Conduit Connections. Standard on all models, except EM-100, allows full electrical code access of all wiring through two NPT connections.

9. Torque Limit Switches. Standard for the high-torque 800-Series of Bettis TorqPlus actuators. These mechanical switches eliminate potential driven device damage due to over torque conditions in either direction of operation.

10.Manual Override. Standard in all models except the EM-100, manual override capability is offered in two forms; Declutchable and Direct Acting.

DESIGN AND CONSTRUCTION



(EM-800 Series)

Model EM-300 and the complete 500-Series offer a Declutchable design which disengages the power gear drive from the output shaft. Manual operation is accomplished by rotating the exposed output shaft drive flats with an open end wrench after the position indicator knob is pulled up. Return to full automatic operation is as easy as removing the wrench and lowering the position indicator knob to allow the mechanism to re-engage upon application of power. Should power be applied during manual operation, the declutchable design will not allow the output shaft to rotate.

The 800-Series offers a Direct Acting handwheel design which allows completely safe operation at any time and with never more than 50 pounds of rim pull force. Operating independent of the motor but directly into the power gear drive, the handwheel does not rotate during automatic operation of the actuator, requires no engagement action for manual operation and may be rotated with or without power to the unit.

11. Enclosures. Made from high strength sand castings, enclosures are rated for applications in both Non-hazardous and Hazardous locations. As an option, the Bettis TorqPlus is also available with a CSA Certified combination Hazardous and Non-hazardous enclosure for indoor and outdoor protection in locations classified Class I and II, Groups C, D, E, F and G as defined in the National Electrical Code plus protects against wind-blown dust, wind-blown rain, splashing water and hose-directed water.

12. Output Drives are corrosion resistant. Female drives are available in a variety of DIN/ISO 8-point sizes. Male drives are also available on models 300 and 500. The EM-800 series is provided with bored drive sleeve with double keyways.

13. Powder Coat Finish. A polyester external coating developed to serve as both a high durability impact and chemical resistant finish. With up to 160 lb-in ASTM D2794 impact resistance, over 1000 hours ASTM B117 salt spray rating and 1000+ hours ASTM D2247 humidity resistance, this protective finish will stay in place and do the job.

TorqPlus™ Electric Actuators

MODEL EM-100

Torque 100 IN/LB – 350 IN/LB

The Engineered Solution

Bettis TorqPlus quality line of electric actuators are designed for quarter turn applications — ball, butterfly and plug valves; dampers; vents and similar uses. TorqPlus actuators are manufactured in a wide range of **guaranteed** output torques and operating speeds to fit your specific requirements.

The Model EM-100 actuators offer compactness with a rugged design to develop maximum torque in a small package.

STANDARD FEATURES

Two year warranty
Permanently lubricated gear train
Stainless steel output drive sleeve
Operating temperatures:
-40°F with heater activated, to +140° F
Unidirectional motor with thermal overload protection and mechanical brake for 100 in/lb model
Single phase capacitor run motor with thermal overload protection and internal motor brake for 250 in/lb and 350 in/lb models
Enclosure certified to weatherproof C.S.A. specifications that conform to Nema type 1, 2, 3, 3R, 4, 4X, & 12
Two single pole double throw travel-stop limit switches with adjustable cams
Female DIN/ISO output drive sleeve and DIN/ISO bolt pattern
Operational in any mounting orientation
Weight: 5 lbs
Single 1/2-inch NPT conduit entrance

OPTIONAL FEATURES

Maximum of two additional single pole double throw auxiliary limit switches
Heater and thermostat
Canadian Standards Association general purpose for electrical certification available under file #LR90062
Standard 1KΩ potentiometer. Other ranges provided upon request.
Relay control
Electronic proportional positioner for 4-20 mA, 1-5 VDC, or 0-10 VDC control input and 4-20mA output signal
Optional voltages
230 VAC 50/60 Hz single phase
12/24 VDC
24 VAC

MODEL EM-100

Torque 100 IN/LB – 350 IN/LB

TorqPlus™ Electric Actuators

MODEL EM-300

Torque 150 IN/LB – 600 IN/LB

The Engineered Solution

Bettis TorqPlus quality line of electric actuators are designed for quarter turn applications — ball, butterfly and plug valves; dampers; vents and similar uses. TorqPlus actuators are manufactured in a wide range of **guaranteed** output torques and operating speeds to fit your specific requirements.

The Model EM-300 actuators combine compactness with manual override capability and an extensive array of available options for a broad spectrum of applications.

STANDARD FEATURES

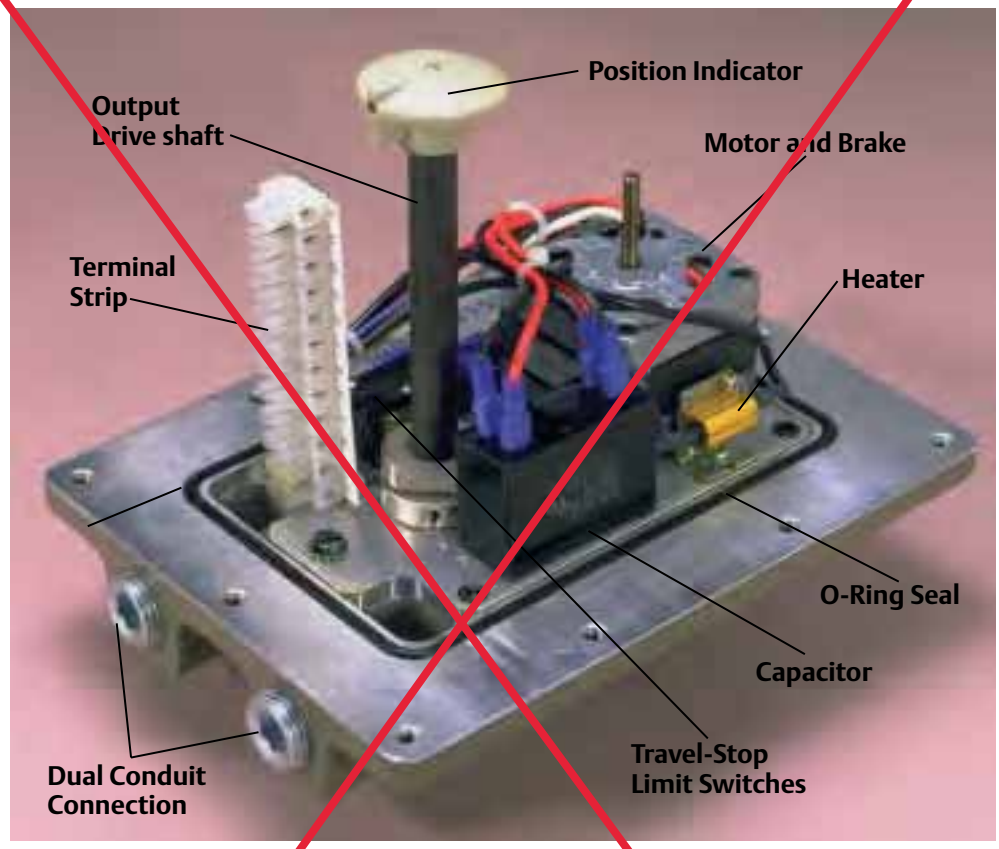
Two year warranty
Heater and thermostat installed in all actuators
Case hardened steel spur gear train is permanently lubricated
Hardened steel drive shaft
Female DIN/ISO F04 output drive and bolt pattern or male output drive
Operating temperatures:
-40° F with standard heater activated to +140° F
Single phase capacitor run motor with thermal overload protection
Internal motor brake on 4 and 10 second units
Enclosure certified to weatherproof C.S.A. specifications that conform to NEMA type 1, 2, 3, 3R, 4, 4X & 12
Two single pole double throw travel-stop limit switches with adjustable cams
Declutchable manual override with position indicator
Dual 1/2-inch NPT conduit entrance
Operational in any mounting orientation.
Weight: 11 to 12 lbs

OPTIONAL FEATURES

75% or 100% extended duty cycle motors
Electromechanical brake for 15 second and 30 second units
Standard 1KΩ potentiometer. Other ranges provided upon request.
Relay control
Electronic proportional positioner for 4-20 mA, 1-5 VDC, or 0-10 VDC control input and 4-20mA output signal
Optional voltages
230 VAC 50/60 Hz single phase
12/24 VDC
24 VAC
Maximum of four additional auxiliary single pole double throw auxiliary limit switches with adjustable cams.
Handwheel
Canadian Standards Association general purpose for electrical certification available under file #LR90062
Dual purpose weatherproof and explosion-proof enclosures are certified by Canadian Standards Association for services: Class I Groups C,D, Division I; Class II Groups E,F,G Division I that conform to NEMA type 7 and 9

MODEL EM-300

Torque 150 IN/LB – 600 IN/LB



MODEL EM-300 SERIES									
TORQUE		SPEED 90°	MODEL	LOCKED ROTOR AMP				MOTOR DUTY CYCLE @ 75°F

** Locked rotor current for all 75% and 100% duty cycle motors is 0.50 amp*

**75% and 100% duty cycle motors are available for 115 VAC service*

TorqPlus™ Electric Actuators

MODEL EM-500

Torque 350 IN/LB – 1600 IN/LB

The Engineered Solution

Bettis TorqPlus quality line of electric actuators are designed for quarter turn applications — ball, butterfly and plug valves; dampers; vents and similar uses. TorqPlus actuators are manufactured in a wide range of **guaranteed** output torques and operating speeds to fit your specific requirements.

The Model EM-500 Series are designed for the entire mid-range of torques and operating speeds, with a rugged versatility that is hard to beat.

STANDARD FEATURES

Two year warranty
Heater and thermostat installed in all actuators
Hardened steel spur gear train is permanently lubricated
Hardened steel drive shaft
Female DIN/ISO F07 output drive and F07/F10 bolt pattern or male output drive
Operating temperatures:
-40° F with standard heater activated, to +140° F
Single phase capacitor run motor with thermal overload protection
Enclosure certified to weatherproof C.S.A. specifications that conform to NEMA type 1, 2, 3, 3R, 4, 4X and 12
Declutchable manual override with position indicator
Dual 1/2-inch NPT machined conduit entrances
Captive hex bolts on enclosure
Operational in any mounting orientation
Two single pole double throw end of travel stop limit switches with adjustable cams
Weight: 17 to 18 lbs

OPTIONAL FEATURES

Electromechanical brake
Standard 1KΩ potentiometer, other ranges provided upon request
Electronic proportional positioner for 4-20mA, 1-5 VDC, or 0-10 VDC control input, and 4-20mA output signal
Relay control
Optional voltages
220 VAC 50/60 Hz single phase
12/24 VDC
24 VAC
Maximum of four additional single pole double throw auxiliary limit switches with adjustable cams
Handwheel
Dual purpose weatherproof and explosion-proof enclosures are certified by Canadian Standards Association for services: Class I Groups C,D, Division I; Class II Groups E,F,G Division I that conform to NEMA type 7 and 9
Canadian Standards Association general purpose for electrical certification available under file #LR90062

TorqPlus™ Electric Actuators

MODEL EM-800

Torque 2,000 IN/LB – 20,000 IN/LB

The Engineered Solution

Bettis TorqPlus quality line of electric actuators are designed for quarter-turn applications – ball, butterfly,

[Nunami-DH]
- Required signals to PLC:
4-20mA position control (OK)
4-20mA position feedback (OK)
dry contact auto/manual operation (contractor to confirm or provide alternate)
dry contact overload/torque alarm (contractor to confirm or provide alternate)
- Manual operation must be capable of overriding 4-20mA signal.

STANDARD FEATURES

Two year warranty
Heater and thermostat installed in all actuators
Case hardened steel spur gear train is permanently lubricated
Operating temperatures:
-40° F with standard heater activated, to +140° F
Single phase capacitor run motor with thermal overload protection
Enclosure certified to weatherproof C.S.A. specifications that conform to NEMA type 1, 2, 3,3R, 4 and 12
Handwheel manual operation
Mechanical position indicator
Captive hex bolts on enclosure
Dual 3/4-inch NPT machined conduit entrances
Two single pole double throw travel-stop limit switches with adjustable cams and 2 aux S.P.D.T.
Female drive
Weight: 65-70 lbs (type 4), 150-160 lbs (explosion-proof)
Two mechanical torque limit switches

IONAL FEATURES

Dual purpose weatherproof and explosion-proof enclosures are certified by Canadian Standards Association for services: Class I Groups C,D, Division I; Class II Groups E,F,G Division I that conform to NEMA type 7 and 9
Standard 1K potentiometer, other ranges provided upon request
Electronic proportional positioner for 4-20 mA, 1-5 vDC, or 0-10 vDC control input and 4-20mA output signal
Optional voltages

TorqPlus™ Electric Actuators

MODEL EM-SR5

Torque 300 IN/LB – 1,600 IN/LB

The Engineered Solution

Bettis TorqPlus has taken the lead in offering compact, cost effective Spring Return Electric Actuator Packages. Three models offer a variety of solutions when one needs to protect a system upon loss of power. These actuators have been designed for dampers, small butterfly, ball and plug valves.

The Model EM-SR5 Series is designed for use in environments where automatic closing/opening is required upon loss of power, with a rugged versatility that is hard to beat.

When power is available, the device operates like a normal quarter turn, open/close or modulating actuator. Under powered operation, the spring pack travels with the movement of the actuator. Under powered stopped conditions, the actuator and spring are held in position via the electric mechanical brake. Upon loss of power, the spring is released and drives the actuator to the predesignated failsafe position. The failsafe positioning can be provided for either the CCW limit or to the CW limit.

STANDARD FEATURES

Two year warranty
Heater and thermostat
Case hardened steel spur gear train is permanently lubricated
Operating temperatures:
-40° F, with standard heater activated, to +140° F
Thermally protected permanent split capacitor motor
Electromechanical brake
CW or CCW spring return
Dual 1/2-inch NPT conduit entrances
Captive hex bolts on enclosure
Operational in any mounting orientation
Limit switches with independent end of travel cams
Male output drive on all models or female DIN/ISO F04 or F05 output drive on 10, 15 and 30 second models
Adjustable mechanical stop at the fail safe position
Visual position indicator
Enclosure certified to weatherproof C.S.A. specifications that conform to NEMA type 1, 2, 3, 3R, 4, 4X and 12

OPTIONAL FEATURES

Modulating service (separate enclosure)
Standard 1KΩ potentiometer, other ranges provided upon request
Optional 220 VAC 50/60 Hz motor
Up to four auxiliary switches with adjustable cams
Canadian Standard Association general purpose for electrical certification available under file #LR90062
Dual purpose weatherproof and explosion-proof enclosures are certified by Canadian Standards Association for services: Class I Groups C,D, Division I; Class II Groups E,F,G Division I that conform to NEMA type 7 and 9

☐ Type 4 and 7 CSA Certified for: hazardous and non-hazardous indoor and outdoor locations to protect against wind-blown dust and rain, splashing water and hose-directed water plus locations classified as Class I and II, Groups C, D, E, F and G as defined in the National Electrical Code.

Integral Control Items (as required)

☐ Motor Brake (standard on EM-100 in 1Ph/60Hz/115VAC and all 800-Series with torques of 6,000 lb-in or greater)
☐ Multi-Turn Control: Set for _____ output turns (maximum of 30)
☐ Heater and Thermostat: 1Ph/ _____ Hz/ _____ VAC
☐ Three Position Operation: Set for _____ °/ _____ °/ _____ ° Stops
☐ Control Relay for: ☐ normally clockwise or ☐ normally counterclockwise operation and operating on ☐ 1Ph/_____Hz/ _____ VAC or ☐ _____ VDC
☐ Single Feedback Potentiometer: _____ Ohm/4 Watt
☐ Electronic Positioner: with ☐ 4-20mA or ☐ 0-10v or ☐ 1-5v input and set for minimum output at ☐ clockwise or ☐ counterclockwise position
☐ Electronic Position Transmitter: 4-20 mA output set for minimum output at ☐ clockwise or ☐ counterclockwise position

Separate Controls (as required)

☐ Manual Operating Station: ☐ Type 4 or ☐ Type 7 enclosure suitable for ☐ wall mounting or ☐ close coupling
☐ 1Ph/ _____ Hz/ _____ VAC to include:
☐ (_____) _____ Position Selector Switch marked _____ / _____ / _____
☐ (_____) Push Buttons marked _____ / _____ / _____
☐ (_____) Lights marked and colored _____-_____ /_____-_____ / _____-_____
☐ (_____) Reversing Starter with 1 Ph/ _____ Hz/ _____ VAC control voltage
☐ Other _____
_____
_____

PRODUCT IDENTIFICATION

All Bettis TorqPlus Electric Actuators are manufactured with a product descriptive nameplate to insure its proper application and continuing identification. The following represents the typical information included on the nameplate and the meaning.

Model: Model – Operating Speed – Enclosure Type – Motor Voltage – Configuration

Torque: Rated Output Torque (lb-in)

Speed Sec 90: Seconds Per 90 Degrees Operation

Voltage: Motor Voltage (Ph/Hz/V)

LR Amps: Locked Rotor Amp Draw

Duty Cycle %: Effective Motor Run Capability

Serial: Individual Unit Serial Number

Mfg MM-YY: Month & Year of Unit Manufacturer

Enclosure: Rated Enclosure Type

DEFINITIONS

A.C. – Alternating current/voltage flowing in both directions alternately.

Amphere (Amp) – The unit of electric current, defined in terms of the force between a pair of wires.

Auxiliary Switch – A switch used to energize or de-energize other equipment (such as lights or pumps). Supplied with its own cam to synchronize other equipment at any point of travel.

Capacitor – A device having the property of storing an electrical charge.

CSA – Canadian Standards Association

D.C. – Direct current/voltage which has a constant value rated to zero. Steady current in one direction.

Duty Cycle – A mathematical calculation, expressed as a percent, to indicate available motor-on (running) time without endangering an over heating condition which would terminate actuator operation.

Using an actuator with a 10 seconds/90° operating speed and rated for a 50% duty cycle as an example, safe, non-interrupting operational periods would be: One 10 second motor-on period followed by one 10 second motor-off period. Total calculation time is 20 seconds of which 50% is motor-on time.

Proper application of the duty cycle rating allows ample time for the motor to dissipate internal heat and thereby not cause a thermal overload cutoff.

Enclosure – The housing that surrounds the actuator's operating parts. It can either be weatherproof or explosion proof. The enclosure generally protects the electrical equipment from the environment and/or prevents an explosion within the enclosure from causing an external explosion.

Hertz – Unit of frequency. Equal to one cycle per second.

NEMA – Acronym for National Electrical Manufacturers Association.

NEMA 4 – Rating designation for weatherproof enclosures. Pliable gaskets are used on all metal-mating parts to prevent moisture from entering.

NEMA 7 – Rating designation for enclosures suitable for containing internal explosion without rupturing the enclosure and without igniting surrounding gases in the atmosphere. Metal-to-metal sealing is required in these rated products.

Ohm – International unit of electrical resistance. The resistance in ohms between two points is defined by the DC voltage divided by the DC current flowing between the points.

Reversing Starter – Its purpose is to connect, disconnect and reverse electricity to the motor. Also called reversing contractor, reversing controller or integral starter.

Torque Limit Switches – Switches designed to monitor physical variables or operating states and to open circuits in the event of pre-set limits being exceeded.

Volt – Unit of potential difference or electrical potential. It represents the amount of work done per unit charge in moving a charge from one place to another.

CONTROLS AND OPTIONS

Multi-Turn Operation

Option allows for multiple revolution on non-rising stem devices.

Electrical Mechanical Motor Brake

Available for all actuator models. Brakes are employed to eliminate motor run-on and to insure that the actuator and driven device maintain their position. Recommended applications include; all resilient seated valves, valves with high flow rates, all modulating services and any time in which increased position control is needed.

Three Position Control

Typically used for multiported valves, operation can be set for 0°-45°-90° or 0°-90°-180° with a stop at mid position from one extreme or both.

Potentiometers

Mechanically linked to the actuators output to provide a resistance signal proportional to the actuator's and driven device's position. Used to give continuous feedback to control panels, modulating position control and other closed loop devices.

Torque/Current Trip Module
(for DC Motors)

Protects the valve and actuator from excessive torque conditions by comparing the motor current with a *factory adjustable* trip value.
Provides *dynamic braking,* in order to improve positioning accuracy at both mid and end of travel stop points. (**Caution:** A mechanical brake should also be used in conjunction with the dynamic brake feature, for applications that require the valve to be held in place after stopping.)

Control Latching Relay

Allows the actuator to run full travel upon receiving a ***non-maintained*** control signal, ranging from 0-240VAC or 0-110VDC.

Control Relay

Provides a means of opening and closing a valve with a variety of standard AC or DC ***maintained*** control signals, such as 120 VAC, 24 VAC, 12 or 24 VDC.
Can be used for a *fail* close (or open) application upon *loss of the control signal.* An internal coil (designed to be continuously energized) maintains the open signal to the actuator. When the signal is removed, the coil de-energizes, causing the actuator to close.

Additional Control Options

Up to 6 SPDT aux. limit switches
Electronic Transmitters (4-20mA output from a DC transmitter or 4-20mA, 0-10V output from an AC transmitter)
Dual 1k ohm potentiometers
Two speed operation (pulse timer package)
Unidirectional controls (up to 30 rotations)
Control stations including buttons, lights, selector switches
3-phase motor controls
Three position operation (such as 0-45-90 or 0-90-180 degrees)
Torque seating for multi-turn and quarter turn
Torque switch trip indication

CONTROL STATIONS

Control Stations are available in a variety of standard weatherproof wall-mounted and close-coupled configurations using the following 5-digit code system:

CS – **1st 2nd 3rd 4th 5th**

1st indicates the number of pushbuttons

2nd indicates the number of lights

3rd indicates the number of positions on the first selector switch (such as Local-Remote)

4th indicates the number of positions on a second selector switch (such as Open-Stop-Close)

5th indicates close-coupled (C) or wall-mount (W)

CS-0223C would indicate **0-buttons, 2-lights, 2-position selector switch** (usually Local-Remote), **3-position selector switch** (usually Open-Stop-Close), **Close-coupled** to the actuator.

Standard configurations include:

CS-0003* CS-0223* and CS-3220*

CS-0023* CS-0203*

(* **C** for closed-coupled or **W** for wall-mount)

Typical Options

Timer packages, control relays, special labeling, LED lights, pad lockable switches, space heaters and Canadian Underwriter Laboratory labels.

Additional options for 3-phase wall-mounted CS's include starters, control transformers, and overload relays.

Remote Signal Generator

The Remote Signal Generator (**RSG**) (supplied in a wall-mounted enclosure) produces a 4-20mA output signal, by manually rotating the dial. From a remote location, this output signal can then be used to position or throttle an actuator equipped with an integral modulating board.

The RSG can also be used in conjunction with a closed-coupled "**CS**" control station.

SERVO POSITIONING SYSTEMS

The Bettis Electric C1397 and C1415 Servo Positioners are proportional motor controllers for actuator modulating applications. The C1397 is for actuators with AC powered split phase motors. The C1415 is for use with 12 or 24VDC powered actuators. These controls are designed to proportionally position an actuator and the driven device by comparison of a varying external input command and a mechanically linked potentiometer. Input commands can be 0-10V, 1-5V, or 4-20mA. The servo also allows for three responses to command signal loss (1-5V and 4-20mA only); fail in place, fail to full clockwise (CW) position, or fail to full counterclockwise (CCW) position.

Features and Benefits

Digital micro-control allows:
- Pushbutton programming - eliminates Span and Zero pots
- 10-bit resolution
- Off-line calibration - eliminates the need for loop calibrators

Available in multiple power supply configurations:
AC 120/230V; DC 12/24V

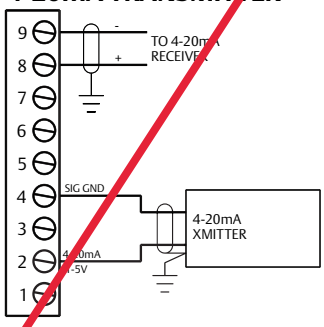
Onboard manual jog buttons

AC controller includes speed control

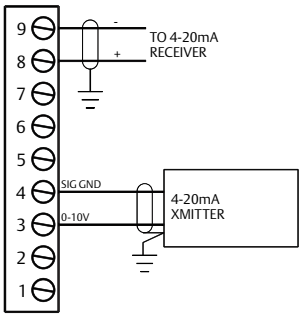
DC controller includes:
- Torque trip with relay output
- Dynamic braking for accurate stopping

Signal Wiring

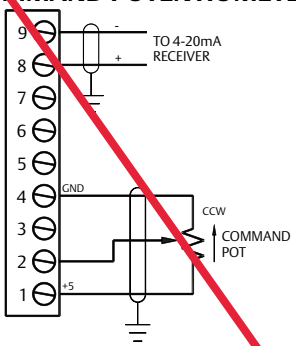
4-20mA TRANSMITTER



0-10V TRANSMITTER



COMMAND POTENTIOMETER



SPECIFICATIONS

Power Supply
C1397S 115VAC ± 10% 50/60Hz
C1397D 230VAC ± 10% 50/60Hz
C1415 12/24VDC Jumper configurable

Signal Inputs
All signal inputs are digitized to 10 bits of resolution.

0-10 VDC Compound Input: 200kohm input impedance.

1-5 VDC Command Input: 100kohm input impedance. Loss of signal threshold is 75% of low signal.

4-20 mA Command Input: 250ohm input impedance. Loss of signal threshold is 75% of low signal.

Feedback Input: 5 VDC excitation voltage. 1Mohm input impedance. Use with 1000ohm potentiometer.

4-20mA Output
300ohm maximum load impedance. 10-bit A/D.

Motor Outputs
C1397 When mounted in accordance with guidelines below, outputs will supply a maximum locked rotor load current (LRA) of 5A with less than 5/10mA (115/230VAC) of leakage current.
C1415 Continuous current 3A; Peak 5A.

External Fuses
C1397 Employ fusing per actuator motor LRA to a maximum of 5A.
C1415 Employ fusing per actuator motor LRA to a maximum of 5A. Consult factory for additional application details on DC powered units.

Environmental
Operating temperature: +32°F to +158°F (0°C-70°C)
Storage temperature: -40°F to +185°F (-40°C-85°C)
Relative humidity: 0 to 90% non-condensing

Notes: 1. Operating speed is nominal at rated torques. Final operating speed may vary depending on actual service.
2. Actuators with 12VDC motors will have an operating speed of approximately 40% longer (slower) than that shown.
3. CF – Consult Factory
4. Bettis does not recommend the use of any actuator for any modulating application with an operating speed of 10 seconds or less.

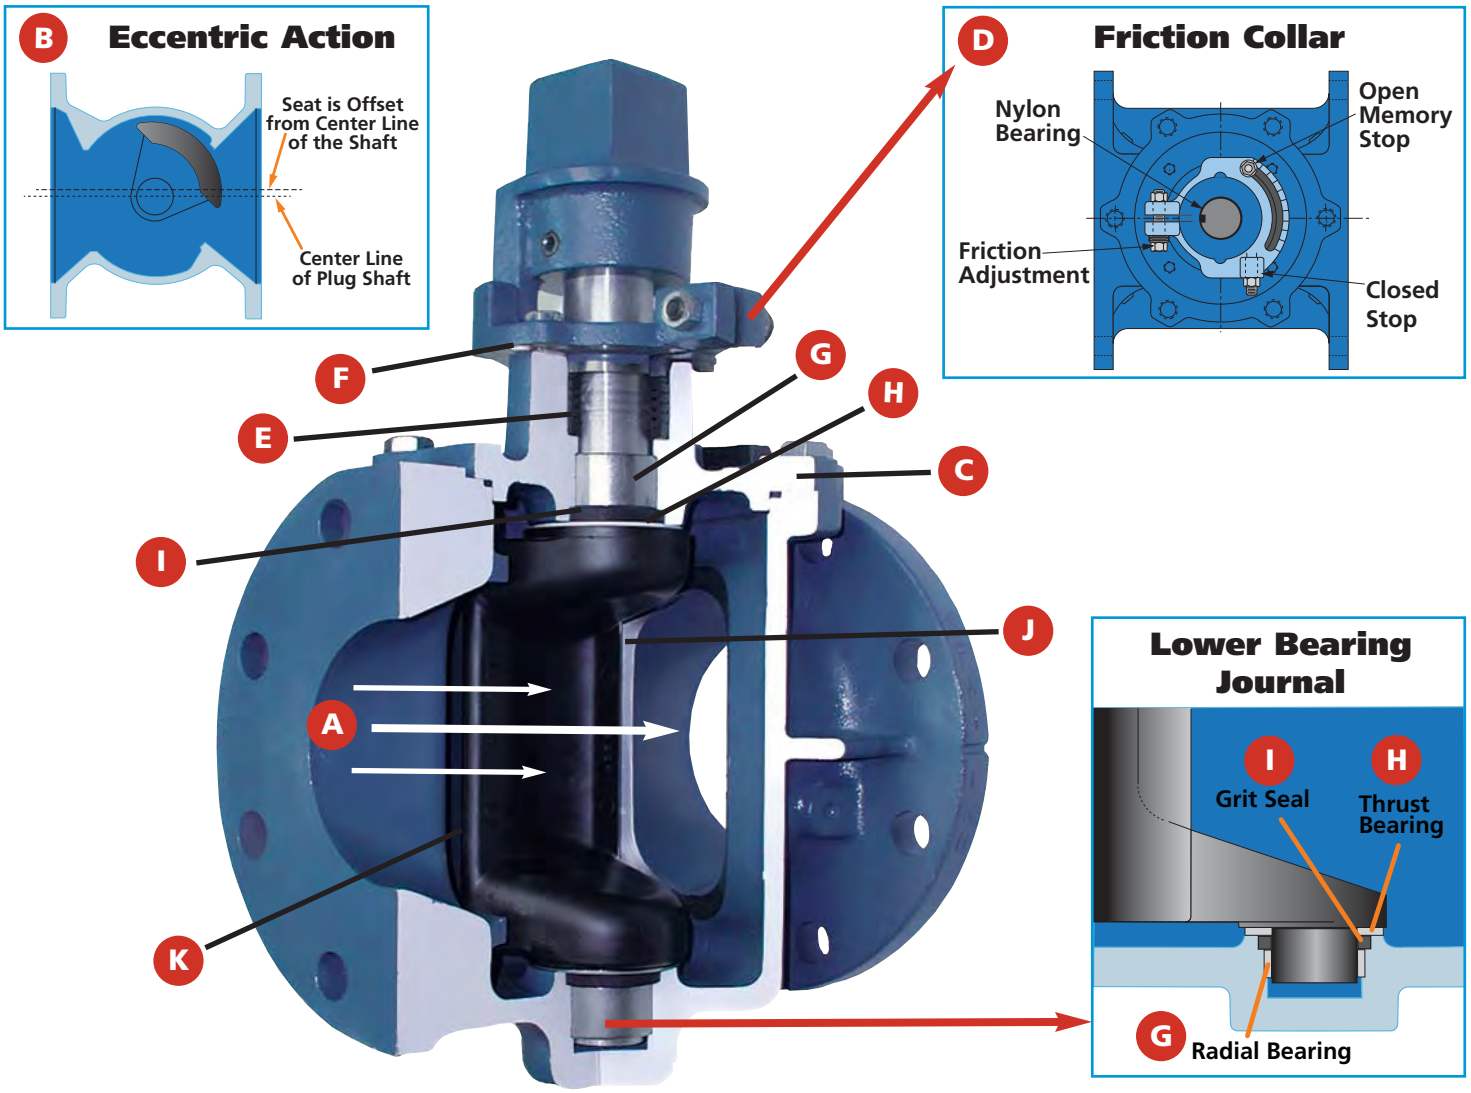
Cam-Centric® Standard Port Plug Valves

www.valmatic.com

Meets AWWA C517
NSF/ANSI 372 Certified

Feature Highlights



A. Non-Clog Design

The flow area and smooth streamline contouring allows passage of large solids to prevent potential clogging and provide low headloss.

B. Eccentric Action

Provides positive shut off in both directions with wear resistant action and low torque.

C. Full Top Access Cover

Provides accessibility for inspection without removal of the valve from the line.

D. Friction Collar with Memory Stop

Secures valve plug in any position and includes a nylon bearing for ease of operation.

E. V-Type Packing

Field adjustable and replaceable without removal of worm gear or motor actuators.

F. Removable POP™ Shims

Packing Overload Protection Shims protect packing by preventing overload during field adjustment.

G. Radial Bearings

Heavy Duty, T316 Stainless Steel, Permanently Lubricated.

H. Thrust Bearing

Upper: PTFE - Provides ease of actuation during operating conditions.
Lower: Stainless Steel - Prevents wear to plug and Grit-Guard.

I. Grit-Guard™ Shaft Seal

The *Val-Matic Exclusive* Grit-Guard™ shaft seal extends packing and bearing life by reducing wear and infultration of grit.

J. Seat

The robotic pulsed-arc welded 95% nickel raised seat is corrosion and wear resistant.

K. Plug

Fully rubber encapsulated molded plug eliminates exposed surfaces for maximum resistance to corrosion and wear.

Proven Design

With installations worldwide, the Val-Matic Cam-Centric® Plug Valve has proven itself as the preferred valve for wastewater, industrial waste and process applications. The Cam-Centric® Plug Valve is a ¼ turn eccentric plug valve allowing cost effective, low torque actuation for pump control, shut-off and throttling service. The valve's eccentric action rotates the plug in and out of the seated position with minimal contact, thereby preventing high torque and wear to the valve seat and plug. The combination of the eccentric action, stainless steel bearings, Grit-Guard™ seals and heavy duty nickel seat assures long life with minimal maintenance.

Preferred Features

The Cam-Centric® Plug Valve features a shaft sealing system that utilizes V-Type packing, a packing follower and a Grit-Guard™ seal for ease of maintenance and to reduce wear. The Grit-Guard™ seals reduce wear by preventing grit and media from reaching the bearings and packing to prevent plug lock up. The seals are standard in both the upper and lower journals (Figures 1 & 2). To prevent the packing from being over tightened, the shaft seal incorporates POP™ (Packing Overload Protection) Shims. The packing is easily adjusted by removing the POP™ shims as necessary utilizing the pull tab feature (Figure 1). Adjustment or replacement of the V-Type packing can be done without removal of the gear, motor or cylinder actuator.

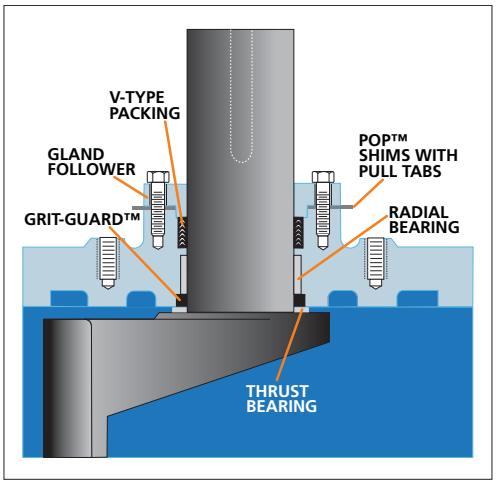


Figure 1. Upper Bearing Journal

The Cam-Centric® bearing package consists of permanently lubricated, T316 stainless steel radial bearings in both the upper and lower journals. The upper thrust bearing is made of PTFE and the lower thrust bearing is T316 stainless steel.

The Cam-Centric® Plug Valve utilizes a contoured and totally encapsulated molded plug to reduce corrosion and wear in severe abrasive applications. Its ductile iron construction provides strength and rigidity to withstand dynamic forces from flow and pressure.

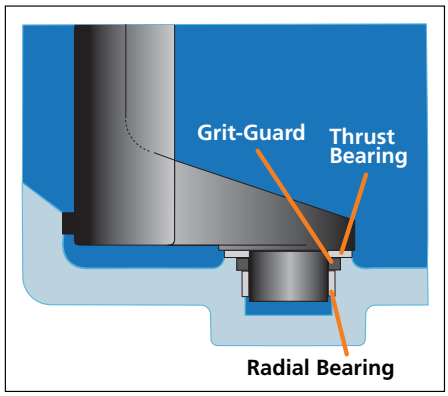

Figure 2. Lower Bearing Journal

The valve seat is a welded overlay of 95% pure nickel applied directly to the body on a machined surface using a state-of-the-art robotic welding system for a consistent, high quality weld (Figure 3).

Figure 3. Robotic welding of nickel seat

Advanced Technology

Incorporating the latest in valve technology assures a high-quality valve that will provide long service. The design process utilized solid Modeling and Finite Element Analysis (FEA) of the key structural components. Flow and torque data was derived from flow tests, mathematical models and Computational Fluid Dynamics (CFD). Manufacturing technology uses automated process control in the foundry and ISO 9001 controlled manufacturing processes. Every valve is tested in accordance with AWWA C517 and MSS SP-108 on automated hydraulic test rigs with gauges calibrated per ISO standards.

Actuation

The Cam-Centric® Plug Valve is available with a wide range of actuation options, from simple lever operation to advanced pump control systems. Options include 2" operator nuts, worm gears, chainwheels, electric motor and cylinder actuation. A wide variety of accessories such as floor stands and extended bonnets are also available (see accessories on page 7). Val-Matic Engineering personnel work closely with cylinder and electric actuation manufacturers to assure actuator/valve compatibility. This ensures the actuator you specify will deliver the performance you expect when utilized with a Cam-Centric® Plug Valve.

Lever, if installed bellow 2m

Direct Nut operated valve with memory stop:

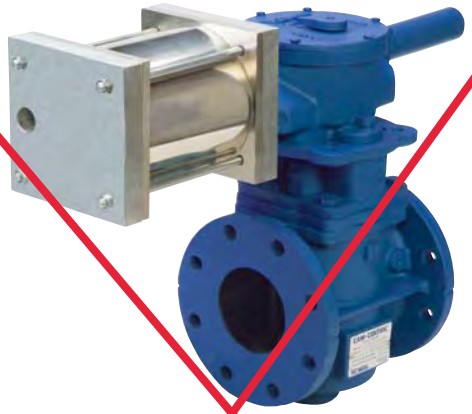
- Adjustable open memory stop for system balancing
- Adjustable close stop
- Adjustable friction collar
- For use with lever accessories

Chainwheel (if installed above 2m) as per construction drawing

See page 16
HC, 2019-01-30

Val-Matic Worm Gears:

- Heavy Duty, totally enclosed and sealed
- For above ground and buried service applications
- Bronze radial bearings and roller thrust bearings provide smooth operations and extended life



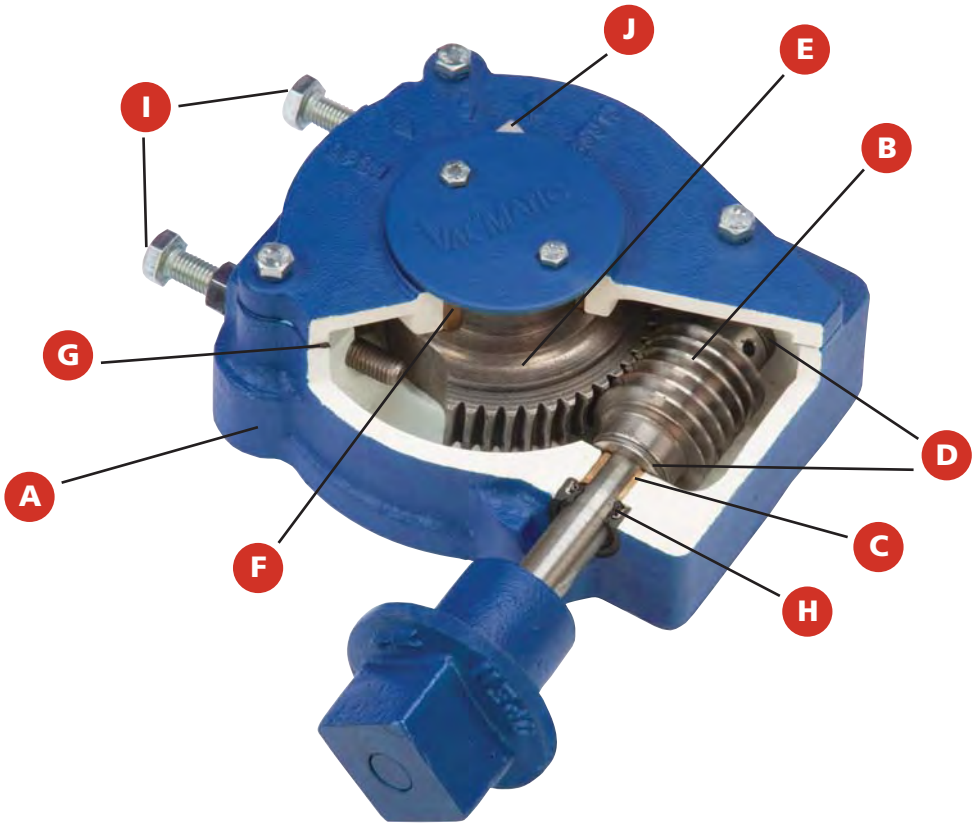
Val-Matic Cylinder Actuation:

- Compliance with AWWA C541 for Power Actuation
- Pneumatic/Hydraulic
- Single Acting or Double Acting
- Fail Open/Closed for power failure
- Modulating Service
- Throttling Service
- Limit Switches, Solenoid Valves, Positioners
- Manual Overrides
- Pump Control

Electric Actuation:

- 110 Single Phase, 230/460 Three Phase
- Compliance with AWWA C542 for Power Actuation
- Modulating Service
- Throttling Service
- Remote push button control and indication
- Torque Switches, Limit Switches
- De-clutchable handwheels
- Available from a wide variety of manufacturers

Worm Gear Features



Val-Matic Worm Gear

A valve actuator must perform to the same level as the valve. The Val-Matic worm gear is designed and built to provide the same long term service as our Cam-Centric® Plug Valve. The exclusive bearing package in the worm gear includes four bronze sleeve bearings and two roller thrust bearings. This exclusive package assures smooth operation and long life regardless of the valve's orientation or application. The ductile iron segment gear coupled with the upper and lower bronze radial bearings exceed the requirements of AWWA C517 for strength and durability. All worm gears are designed to exceed, a rim pull of 200 pounds on handwheels and input torques of 300 foot pounds for operator nuts without damage. Buried service worm gears are grease packed, sealed and include stainless steel shafts. Worm gears can be provided with handwheels, chainwheels or 2" operator nuts.

A. Housing

Heavy duty, totally enclosed and sealed.

B. Worm

Hardened steel for durability and long life.

C. Radial Shaft Bearings

Bronze shaft bearings extend life and provide ease of operation (rear shaft bearing not visible).

D. Roller Thrust Bearings

Provides smooth operation and extends life.

E. Segment Gear

Heavy duty ductile iron for high strength. Provided with precision bore and keyway for connection to the valve shaft in multiple positions.

F. Segment Gear Radial Bearings

Upper and lower bronze bearings provide ease of operation and extend life (lower bearing not visible).

G. Cover Gasket

Seals housing and prevents foreign material or moisture from entering actuator and prevents loss of grease.

H. Shaft Seal

Prevents foreign material from entering the actuator.

I. External Stops

Both open and closed stops are external and easily adjustable.

J. Position Indicator

Displays precise plug position on above ground service.

Installation Instructions

The installation of the valve is important for its proper operation. The valve is capable of flow in either direction but the maximum operating pressure can vary with the location of the seat end (Figure 5). The words "SEAT END" are marked on the valve flange.

SUSPENDED SOLIDS SERVICE: For fluids containing suspended solids, special orientations are needed to prevent debris from collecting in the valve. For horizontal installations (Figure 6), the valve should be installed with the flow entering the seat end of the valve and the shaft in a horizontal position with the plug up when open. For vertical installations (Figure 7), the valve must be installed with the seat end up regardless of flow direction.

CLEAN SERVICE: For both horizontal and vertical installations, install in the direct pressure orientation (pressure opposite the seat end).

AIR AND GAS SERVICE: Install valve in the direct pressure orientation (pressure opposite the seat end). Lubricate plug face with FDA approved silicone grease such as Dow Corning #7 before installation. Gear actuators are required for gas service applications.

PUMP DISCHARGE SERVICE: On all horizontal pump discharge applications, the seat end should be towards the pump.

BURIED SERVICE: Gear actuators are recommended for buried valves to hold the valve in position and provide multi-turn closure to prevent water hammer. The valve should be installed with the shaft horizontal and the actuator nut directed upwards. The valve box or extension pipe should be installed so that the actuator nut and extension stem turn freely.

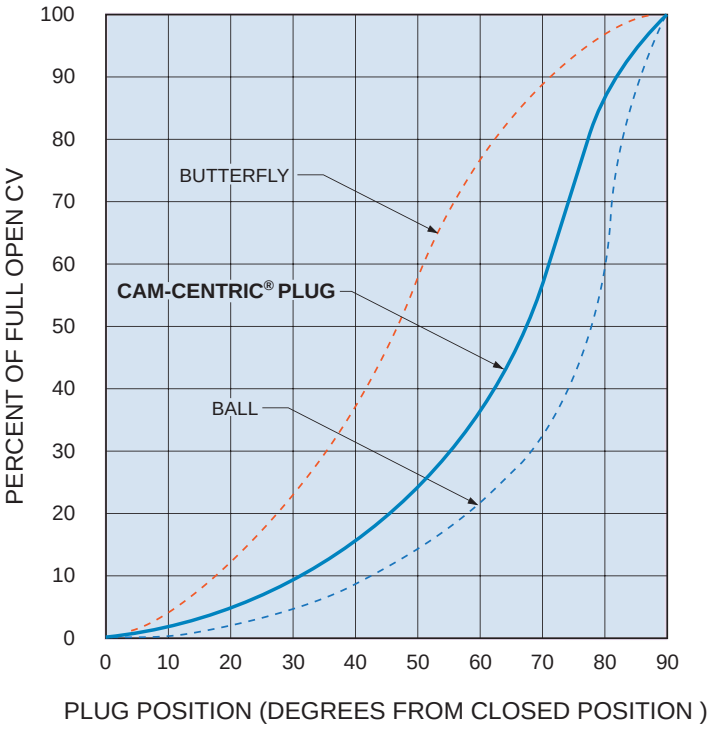
*Asterisk indicates valve model numbers without spur gear

Notes:
1. Replace Handwheel (HW) diameter in the model number (i.e. /7A08) with 02 for 2" square operating nut (i.e./7A02).
2. Add a C suffix to model number to include Chainwheel Kit (i.e. 5804R/7A08C).
3. Available with ISO/PN drilling.
4. Consult factory for larger sizes.

Flow Characteristics



INHERENT PUMP CONTROL FLOW CHARACTERISTICS

To control pressure surges and provide good-controllability, the flow characteristics of valves should be considered.

The graph at left shows the inherent flow characteristics at a constant ΔP for various valves.

The Plug Valve has an inherent flow characteristic similar to a ball valve. When installed in a pipeline, the plug valve will approximate a linear flow characteristic because the piping system pressure losses will shift the flow curve to the left. A linear installed flow characteristic will help control surges and provide a wide range of controllability.

2-Way Specification

SCOPE

1.1 This specification covers the design, manufacture, and testing of 1/2 in. (15 mm) through 3 in. (80 mm) Threaded Eccentric Plug Valve, 2 ½ in. (60 mm) through 54 in. (1350 mm) Eccentric Plug Valve suitable for water or wastewater service with pressures up to 250 psig (1725 kPa).
1.2 Plug Valves shall be quarter-turn, non-lubricated with resilient encapsulated plug.

STANDARDS AND APPROVALS

2.1 2 ½ in. (60 mm) through 54 in. (1350 mm) plug valves shall be designed, manufactured and tested in accordance with American Water Works Association Standard ANSI/AWWA C517.
2.2 All Plug Valves shall be certified Lead-Free in accordance with NSF/ANSI 372.
2.3 Manufacturer shall have a quality management system that is certified to ISO 9001 by an accredited, certifying body.

CONNECTIONS

3.1 Threaded valves shall have threaded NPT full size inlets. The connection shall be hexagonal for a wrench connection.
3.2 Flanged valves shall have flanges with drilling to ANSIB16.1, Class 125.
3.3 Mechanical Joint valves shall fully comply with ANSI/AWWA C111/A21.11.

DESIGN

4.1 Threaded and all other valves under 4" (100mm) shall have port areas of not less than 100% of pipe area. Port areas on other sizes are 85% on 16" (400 mm) and smaller, 80% on 18"-24" (150 mm- 600 mm), and 75% on 30" (800 mm) and larger.
4.2 Threaded valve seat shall be a machined seating surface.
4.3 2 ½ in. (60 mm) through 54 in. (1350 mm) plug valves shall have a valve seat that is a welded overlay of 95% pure nickel applied directly to the body on a pre-machined, cast seating surface and machined to a smooth finish.
4.4 Threaded valves shall have shaft seals which consist of V-type lip seal in a fixed gland with a resilient O-ring spring.
4.5 2 ½ in. (60 mm) through 54 in. (1350 mm) plug valves shall have shaft seals which consist of V-type packing in a fixed gland with an adjustable follower designed to prevent over compression of the packing and to meet design parameter of the packing manufacturer. Removable POP™ shims shall be provided under the follower flanges to provide for adjustment and prevent over tightening.
4.6 Permanently lubricated, radial shaft bearings shall be supplied in the upper and lower bearing journals. Thrust bearings shall be provided in the upper and lower journal areas, except for threaded type which only have upper thrust bearings.
4.7 Both the packing and bearings in the upper and lower journals shall be protected by a Grit-Guard™ "drip tight" Buna-N shaft seal located on the valve shaft to minimize the entrance of grit into the bearing journal and shaft seal areas.
4.8 The threaded valve body shall have 1/8" NPT upstream and downsteam pressure ports.

MATERIALS

5.1 Valve bodies and covers shall be constructed of ASTM A126 Class B cast iron for working pressures up to 175 psig (1200 kPa) and ASTM A536 Grade 65-45-12 for working pressures up to 250 psig (1725 kPa). The words "SEAT END" shall be cast on the exterior of the body seat end.
5.2 Threaded valve plugs in sizes 1/2 in. (15 mm) through 3 in. (80 mm) shall be of one-piece construction and made of ASTM A126 Class B cast iron fully encapsulated with a resilient facing per ASTM D2000-BG and ANSI/AWWA C517 requirements.
5.3 2 ½ in. (60 mm) through 54 in. (1350 mm) plugs shall be of one-piece construction and made of ASTM A126 Class B cast iron or ASTM A536 Grade 65-45-12 ductile iron and fully encapsulated with resilient facing per ASTM D2000-BG and ANSI/AWWA C517 requirements.
5.4 Threaded valves shall have radial shaft bearings constructed of self-lubricating Type 316 stainless steel. The top thrust bearing shall be PTFE.
5.5 2 ½ in. (60 mm) through 54 in. (1350 mm) plug valves shall have radial shaft bearings constructed of self-lubricating Type 316 stainless steel. The top thrust bearing shall be PTFE. The bottom thrust bearing shall be self-lubricating Type 316 stainless steel. Cover bolts shall be corrosion resistant with zinc plating.

ACTUATION

6.1 Threaded valves shall be equipped with a hand lever with a dial indicator and open memory stop.
6.2 Valves 2 ½ in. (60 mm) to 8 in. (200 mm) and 4 in. (100mm) to 6 in. (150 mm) 100% ported shall be equipped with a 2 inch square nut for direct quarter turn operation. The packing gland shall include a friction collar and an open position memory stop. The friction collar shall include a nylon sleeve to provide friction without exerting pressure on the valve packing.
6.3 When specified valves 4 in. (100 mm) and larger shall include a totally enclosed and sealed worm gear actuator with position indicator (above ground service only) and externally adjustable open and closed stops. The worm segment gear shall be ASTM A536 Grade 65-45-12 ductile iron with a precision bore and keyway for connection to the valve shaft. Bronze radial bearings shall be provided for the segment gear and worm shaft. Alloy steel roller thrust bearings shall be provided for the hardened worm.
6.4 All gear actuators shall be designed to withstand, without damage, a rim pull of 200 lb. on the hand wheel and an input torque or 300 ft-lbs. for nuts.
6.5 Buried service actuators shall be packed with grease and sealed for temporary submergence to 20 feet of water. Exposed worm shafts shall be stainless steel.

OPTIONS

7.1 When specified, the valve port area shall have not less than 100% of pipe area.
7.2 The interior and exterior of the valve shall be coated with an NSF/ANSI 61 approved fusion bonded epoxy.
7.3 The interior of the valve shall be coated with 8 mils SG-14 glass lining or 1/8" soft rubber lining.

MANUFACTURE

8.1 Manufacturer shall demonstrate a minimum of ten (10) years' experience in the manufacture of plug valves. When requested, the manufacturer shall provide test certificates, dimensional drawings, parts list drawings and operation and maintenance manuals.
8.2 The exterior of the valve for above ground service shall be coated with a universal alkyd primer. Valve exterior for buried service shall be coated with an epoxy coating.
8.3 Valve shall be marked with the Serial Number, Manufacturer, Size, Cold Working Pressure (CWP) and the Direct and Reverse Actuator Pressure Ratings on a corrosion resistant nameplate.
8.4 Plug Valves shall be Series # 5800RTL (Threaded), 5800R (Flanged), 5800HP (Flanged), 5900R (Mechanical Joint) or 5900HP (Mechanical Joint) as manufactured by Val-Matic Valve and Mfg. Corporation, Elmhurst, IL. USA or approved equal.

Val-Matic's quality of design and meticulous workmanship has set the standards by which all others are measured. Quality design features such as the AWWA **Ener•G® Ball Valve** with its energy efficient design, fusion bonded epoxy and adjustable resilient seating....**Cam-Centric® Plug Valves** have more requested features than any other eccentric plug valve....**American-BFV® Butterfly Valves** include a field replaceable seat without the need for special tools....**Tilted Disc® Check Valves** with high strength and wear resistant aluminum bronze trim as standard....**Silent Check Valves** featuring combined resilient/metal-to-metal seating and are **NSF/ANSI 61 & 372 Certified**....**Sure Seal Foot Valves** provided with a heavy duty stainless steel screened inlet....**Swing-Flex® and Surgebuster® Check Valves** designed with an unrestricted full flow area....**Swing Check Valves** with field adjustable closure versatility....**Dual Disc® Check Valves** utilizing stabilized components to provide extended life....**Air Release, Air/Vacuum and Combination Air Valves** provided standard with Type 316 stainless steel trim....**VaultSafe®** family of products includes the **FloodSafe® Inflow Preventer**, **FrostSafe®** two-way damper and the **VentSafe®** vent pipe security cage. The **QuadroSphere® Trunnion Ball Valve** features a unique ball design with recessed surfaces creating additional flow paths to provide a self-cleaning action and reduced wear and torque.

Val-Matic is totally committed to providing the highest quality valves and outstanding service to our customers. Complete customer satisfaction is our goal. **Make the change to quality, specify Val-Matic!**

RE: WWTP UPGRADE - IQALUIT
Sanitaire #: 18-9418SC

SUB: Change From Wideband Diffuser to Dual Pod Assembly

STANTEC COMMENT:

Inform if the proposed 9" Dual LP diffusers are considered coarse bubble diffusers or fine bubble.

XYLEM RESPONSE:

The 9" Dual Pod Diffusers use the LP Membrane, which is a fine bubble membrane. We use the LP membrane for a number of different applications, including aerobic digesters and aerated sludge holding tanks where the air will be periodically turned off. The Dual Pod is designed specifically to replace wideband coarse bubble diffusers for on/off applications.

Wideband diffusers cannot effectively prevent backflow using check valves. The check valves become clogged over time and fail. Sanitaire has tested this. One of our competitors used to offer this as a feature, but no longer promotes it.

STANTEC COMMENT:

Confirm that the proposed 9" Dual LP diffusers are recommended by Xylem Sanitaire for agitation and suspension of 3-4% thickened waste activated sludge without plugging.

XYLEM RESPONSE:

We use the Dual Pod diffusers for aerobic digesters. Normally, we recommend mechanical mixing or jet aeration above 4% solids. For air mixing above 3% solids, we design with a higher airflow up to 0.83 L/(m3·s) (50 SCFM/1000 ft3). In this application, maximum airflow per diffuser exceeds that requirement for mixing. The membrane is self-sealing and won't allow the sludge to flow into the header when the air is off, which is why we use it for these types of applications.

Xylem Inc., Sanitaire Products
9333 N. 49th St., Brown Deer, WI 53223
Tel +1.414.365.2200

STANTEC COMMENT:

> Xylem Sanitaire to provide recommendation on the type of diffusers that will be better for this specific 3-4% TWAS agitation/suspension (the previously proposed wide band series or the new 9" Dual LP series) and the specific reasons.

XYLEM RESPONSE:

> The Dual Pod diffusers (9" LP membranes) are better.
>
> As mentioned above, we recommend LP membranes for any sludge application where the air will operate intermittently. Some confusion occurs with the wide band diffusers being characterized as non-clog. This really only applies when in constant operation. The top of the diffuser creates an air reservoir that prevents fibers and grit from getting to the orifice at the connector. When the air is off, the sludge can flow into the header and clog the pipe resulting in the necessity to clean the header. At higher concentrations, sludge in the pipe can congeal to the point that a high airflow will not blow it out of the pipe.

PROJECT: IQUALUIT, CANADA - WWTP **SANITAIRE #: 18-9418SC**

SPECIFICATION DEVIATIONS R.1 (2/20/2019)

1.) 2.8 Diffusers
.3 Provide non-clog band type diffusers, with no flexible or moving parts.

RESPONSE: Xylem has provided flexible membrane diffuser pod assembly (DUAL POD) at the request of providing a system that prevents backflow.

XYLEM RESPONSE TO STANTEC COMMENTS R.0 (2/20/2019)

1.) Xylem does not have a P. ENG with NAPEG stamp.
2.) Xylem's experience has found coarse bubble diffusers with submerged backflow valves clog very easily. Xylem's solution to back flow prevention is to provide LP - Dual Pod assemblies in lieu of coarse bubble diffusers. The membrane diffuser prevents back flow, and is suitable for the air rates in the specification.
3.) Noted. Contractor to provide isolation valves.
4.) Noted. Manufacturer representative will witness testing.
5.) Noted. Dual Pod assembly is longer than previously submitted coarse bubble diffuser.
6.) Noted. Dual Pod assembly is longer than previously submitted coarse bubble diffuser.
7.) Noted. Contractor to provide isolation valves.
8.) Noted. Manufacturer representative will witness performance testing.
9.) Noted. Dual Pod assembly is longer than previously submitted coarse bubble diffuser.
10.) Noted. Dual Pod assembly is longer than previously submitted coarse bubble diffuser.

STANTEC / REVIEWED COMMENTS R.0 (1/9/2019)

1.) NAPEG P. ENG stamp is required.
2.) Other coarse bubble aeration system manufacturers provide back flow prevention on diffusers that avoid water back flow if the air is shut off. This provides huge savings in maintenance. What is Sanitaire's solution to this maintenance issues? Nothing developed yet?
3.) Then, contractor to supplied specified isolation valves.
4.) Process performance testing to be attended in the field by the manufacturer representative as specified.
5.) Per drawing E-1 Sheet 1/3, it seems that the diffusers are not providing full coverage of the tank floor. Longer diffusers would be required to cover the full floor area as specified.
6.) Per drawing E-1 Sheet 1/3, it seems that the diffusers are not providing full coverage of the tank floor. Longer diffusers would be required to cover the full floor area as specified.
7.) Isolation valves must be provided as specified by contractor.
8.) Manufacturer representative to attend and support contractor on equipment performance testing. (Item 5: 3 days)
9.) Diffuser length is too short. Diffusers do not cover the full bottom area of the tanks. Solids suspensions could be compromised at these areas. Provide longer diffusers that cover the full tank floor area as specified.
10.) Diffuser length is too short. Diffusers do not cover the full bottom area of the tanks. Solids suspensions could be compromised at these areas. Provide longer diffusers that cover the full tank floor area as specified.

WARRANTY

IQUALUIT, CANADA - WWTP

COARSE BUBBLE AERATION DEVICES
Sanitaire contract no. 18-9418SC

Xylem Water Solutions USA, Inc. – Sanitaire Brand (Seller) warrants all equipment supplied by it per Specification Section 46 51 21 of the Contract Documents (COARSE BUBBLE DIFFUSERS) to be free from defects in material and workmanship for a period of twelve (12) months from the date of Substantial Completion. Substantial Completion shall be defined as when the Owner receives beneficial use of the warranted equipment.

If within such warranty period any such equipment is proved to Seller's satisfaction to be defective, Seller shall, at its option, repair or replace the defective equipment or part without charge. Such repair or replacement shall be Seller's sole liability, and buyer's sole remedy, for breach of warranty, and is conditioned upon:

- Seller's receipt of written notice of any alleged defect within ten (10) calendar days of its discovery.
- Receipt by Seller of full payment for goods and services provided under this contract.
- The warranted equipment has not been repaired or altered by others without Seller's written authorization.

- The warranted equipment shall be properly installed, and operated and maintained, in accordance with Seller's written instructions provided to the end user.

- Decomposition or deformation resulting from chemical action, wear caused by the presence of abrasive materials, and replaceable or consumable material reaching its useful life, shall not constitute defects under the foregoing warranty.

THE FOREGOING WARRANTY IS IN LIEU OF, AND SELLER DISCLAIMS, ALL OTHER EXPRESS AND IMPLIED WARRANTIES (EXCEPT OF TITLE), INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSE. SELLER'S RESPONSIBILITIES UNDER THE FOREGOING WARRANTY ARE SELLER'S SOLE LIABILITY WITH RESPECT TO EQUIPMENT, PARTS OR SERVICES MANUFACTURED OR FURNISHED BY IT, OR ANY UNDERTAKINGS, ACTS OR OMISSIONS RELATING THERETO; AND SELLER SHALL HAVE NO OTHER LIABILITY WITH RESPECT THERETO, WHETHER BASED ON BREACH OF CONTRACT, NEGLIGENCE OR OTHER TORT OR ON ANY STRICT LIABILITY THEORY. IN NO EVENT SHALL SELLER BE LIABLE FOR ANY CONSEQUENTIAL OR INCIDENTAL DAMAGES.

PROJECT: IQUALUIT, CANADA - WWTP **SANITAIRE #: 18-9418SC**

DIMENSION / FABRICATION VERIFICATION SHEET

Please verify all dimensions and elevations, including inside tank dimensions, dropleg locations, and elevations of dropleg connection, face of flanges, flat floor and high point, low Point elevations of sloped floor. Please reply to these items when returning the approved submittals. Lack of response will delay the processing of this contract.

I have reviewed all dimensions and request Xylem to release droplegs, manifolds, and air distributors for fabrication based on the approved submittal or in accordance with the marked up drawings in the returned approved as noted submittal.

☐ Release For Fabrication

☐ DO NOT Release For Fabrication

SITE CONTACT SHIPPING VERIFICATION

To ensure quality delivery of the proposed equipment in this submittal booklet, please provide the exact address that the equipment is expected to be delivered and any pertinent information for the jobsite. (i.e. Gate Information, Site Superintendent, No Friday Deliveries, Contact 2 Days Prior to Truck Arrival)

Address: 1100 Montée Masson

City, State, Zip: Laval, Qc, H7E 4P2

Recipient Name: Hugo Chartier

Recipient Title: Project Manager

Recipient Phone: 450-688-4012, ext 706

Recipient Email: hchartier@norclair.ca

Requested Ship Date: May 15th 2018, to be confirmed
(10 Weeks from Approval)

Additional Comments:

(NOTE: Requests for splitting the delivery of equipment into multiple shipments following mutual order acceptance will increase the cost of this project and a quote will be provided for additional freight costs.)

XYLEM GENERAL COMMENTS

1. The gussets on the diffuser connectors are suitable for use as lifting lugs.

2. All items furnished by Xylem are for installation by others.

3. Any valves on the air supply piping are supplied by others.

4. Bolts, gaskets, insulators and hardware for connecting the Xylem supplied dropleg to the air supply piping are supplied by others.

5. Any penetrations, wall sleeves, wall spools or seals required for installation of the Xylem supplied equipment are supplied by others.

6. Chemical treatment or lubrication of threaded stainless steel assemblies is supplied and installed by others.

7. Painting and protective coatings for any component supplied by Xylem are not included in the Xylem scope of supply for this contract.

8. The Xylem supplied stainless steel dropleg, manifold, and air distributor assemblies for the SANITAIRE equipment are fabricated by Felker Brothers in Marshfield, WI. Their welding procedures and qualifications were developed in accordance with ASME IX. Felker Brothers welders are current to date with ASME IX. Felker Brothers is ISO 9001:2000 certified.

9. The Xylem supplied welded stainless steel dropleg, manifold, and air distributor assemblies are cleaned in accordance with ASTM A380-88 Section 6.2.11. The acid solution is as defined in ASTM A380 Table A2.1 Annex A2. Materials have a final rinse using ordinary industrial or potable water and are dried in conformance with ASTM A380 Section 8.3. Xylem can provide cleaning notification or verification if required.

10. Expansion joints with fixed supports are not required by Xylem for manifolds or headers less than 36 METERS in length.

11. No special tools other than those shown on the drawings are required for equipment maintenance.

12. No spare parts other than those specified are required or recommended by Xylem.

13. The final equipment Installation, Operation & Maintenance (IOM) Manual is transmitted after submittal approval and before shipment.

14. A Bill of Materials is included in the final IOM Manual

15. Information on equipment storage, protection, and handling before and after installation are included in the IOM Manual.

16. Erection drawings marked “Approved For Construction” with piece marks are included with the final IOM Manual.

17. Instructions for the installation of SANITAIRE equipment are included in the IOM Manual.

18. Warranty information is included in the final IOM Manual.

19. Perform the Inspection, Level, Uniformity, Leakage and Operations Tests per the specifications and the instructions in the IOM Manual.

20. Xylem will provide manufacturer's services as specified. All equipment, materials and manpower required for specified testing in the field is supplied by others.

21. Qualifications of the manufacturer's field service representative can be supplied when inspection, startup or training is requested.

22. Xylem utilizes the pre-printed IOM Manual for training.

23. Video taping of training sessions for the Owner's personnel, if required, is supplied by others.

24. Xylem's fabrication tolerances allow +/- 10 [mm] variation in elevation from diffuser to diffuser along a header's length as measured at the diffuser connector. Angular variations of the threaded connector may cause the outboard ends of the diffuser to vary by an additional +/- 10 [mm] for a total range of outboard tip elevation variation of +/- 20 [mm]. For proper air distribution the diffuser levels should be adjusted around an average elevation for all diffusers in the assembly.

INTRODUCTION

This manual covers the Installation, Start-up, Plant Operation, Maintenance and Repair of SANITAIRE Coarse Bubble Aeration Systems.

This manual is used for SANITAIRE Fixed and Removable Header Coarse Bubble Aeration Systems. The format and text of this manual have not been edited for specific projects or specification requirements.

Distinct sections are included for the installation of both system types. The installing Contractor should follow the instructions for the supplied system.

Before beginning the installation process, the installing Contractor should make sure the Sanitaire Erection “E” drawings are in their possession. The “E” drawings have the required component part number designations and are essential for proper installation.
Submittal “S” drawings do not contain the detailed information necessary to install the equipment properly. **DO NOT** use “S” drawings to lay out or install the equipment.

The Safety Alert Symbol means ATTENTION! BECOME ALERT! YOUR SAFETY IS INVOLVED!

! CAUTION

This symbol and signal word indicate a potentially hazardous situation which, if not avoided, MAY result in minor or moderate injury. This symbol MAY also be used to alert against unsafe practices.

CAUTION

This signal word indicates a situation which if not avoided, MAY result in product or property damage.

The precautions listed in this manual are not all-inclusive. If a procedure, method, tool or part is not specifically recommended, you must satisfy yourself that it is safe for you and others, and that the system will not be damaged or made unsafe as a result of your decision.

This material may not be copied, reproduced or stored in an electronic retrieval system without prior written approval from Sanitaire.

© Copyright Sanitaire 1999

INSTALLATION AND START-UP

RECEIVING AND SITE STORAGE

The equipment is delivered by flat bed trailer trucks. Before the arrival of the truck, select a dry, level area to temporarily store the equipment.

The aeration headers, manifolds and droplegs are shipped in maximum lengths of 41'-0". The diffusers, supports, support hardware and ancillary equipment are packed in boxes, if possible, according to item and size and shipped to the jobsite on pallets. The diffusers are shipped in cardboard boxes on wooden pallets. The diffusers should not be removed from the original packaging until final installation on the headers.

Unload the piping system components using a forklift or crane with a minimum 2000 lb. lifting capacity. Care must be taken during handling to avoid damage, particularly to the flanged ends and diffuser connectors. Nylon straps should be used to lift the piping off the truck. All equipment should be stored on blocks in a level position to avoid damage before installation.

DO NOT stack shipping units.

DO NOT store the units where snow removal or other heavy equipment could cause damage.

PHYSICAL INVENTORY

Sanitaire provides shipping lists for all components used for the SANITAIRE Coarse Bubble Aeration System as part of the project I, O & M manual. In addition, each shipment has a packing list of all items delivered.

Before installation, take a physical inventory of all components (by comparing the shipping and packing lists) and immediately report any missing or damaged items to the Sanitaire Production Department.

FIXED HEADER

CAUTION

Completely read the following instructions and review all Sanitaire Erection "E" drawings before beginning installation.

Definitions

- DROPLEG - The pipe that connects the airmain to the manifold.
- MANIFOLD - The pipe that connects the dropleg to the headers. There are no diffusers on this pipe.
- HEADER - The pipe that connects the manifolds to the diffusers. The diffuser connectors and diffusers are mounted on this pipe.
- DIFFUSER - The device attached to the header that distributes the air to the liquid.

Dropleg Installation (Fixed Header)

CAUTION

Before installing the upper dropleg section, all dirt and debris must be removed from the air main. The air blowers are normally used for this operation. The air filtration equipment should be installed and operating before blowing out the air main. Blowers may require a minimum back pressure when operating. Be sure to follow the blower manufacturer's requirements.

If dropleg supports are not installed, the air main must be capable of supporting the full weight of the upper stainless steel portion of the dropleg during system installation. If the air main is not capable of supporting the full weight of the upper stainless steel portion of the dropleg during system installation, temporary dropleg supports must be installed to prevent damage to the air main.

1. Locate the proper dropleg. All droplegs have a part number marked on the piece. This part number also appears on the Erection drawings for identification. Remove the protective plastic or wooden end plugs from the dropleg.

2. Using the Erection drawings, locate the dropleg connection point and mark the centerline location of the dropleg on the tank floor. Before connecting the upper portion of the dropleg to the air main, install any dropleg wall supports which may be required.

3. Attach the upper portion of the dropleg to the air main.

NOTE

When the upper dropleg is installed properly, it should be vertical with its centerline location as shown on the Erection drawings.

4. Use the installed stainless steel upper dropleg and the Erection drawings to locate and lay out the centerline of the manifold or header. All components of the system are referenced from the dropleg location.

NOTE

The manifold centerline may be located directly under the dropleg or offset from it. Review the Erection drawings before manifold or header layout. If the system does not have a manifold, proceed to the Header Installation section.

Manifold Installation (Fixed Header)

Use the Erection drawings and shipping lists to locate all manifold anchors and supports.

Sanitaire manufactures two types of manifold assemblies. They are the **in-line** manifold and the **raised** manifold. The manifold installation procedure covers both types.

The **in-line** manifold attaches to the headers with flanges or clamp couplings. Either the centerline or invert elevations of the manifold and headers are the same.

The **raised** manifold attaches to the headers with an adjustable support connection and clamp coupling. See Figure 1. The centerline elevation of the raised manifold is approximately 2'-0" higher than the centerline of the air header.

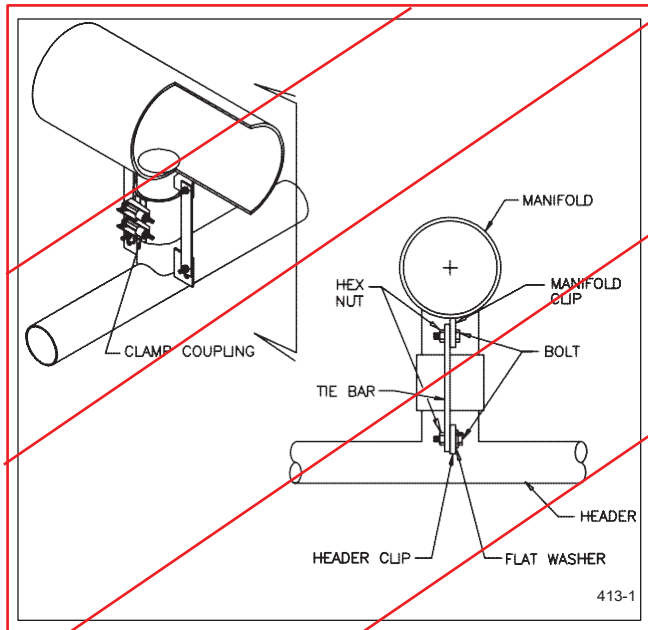

Figure 1. Adjustable Support Connection

1. The manifold layout centerline should be already established by the dropleg installation. Using the Erection drawings, mark the locations of the manifold supports. These locations are indexed from the centerline of the dropleg.

2. Following the Erection drawings, mark the manifold anchor locations at the specific support locations.

NOTE

Anchor spacings, sizes and embedments vary according to pipe size and support design. Be sure to accurately follow the anchor bolt settings and size information shown on the Erection drawings. Follow the anchor manufacturer's edge distance guidelines at sumps, construction joints and expansion joints.

3. Locate the proper manifold sections and lower them into the tank. Remove the protective end plugs and orient the pieces in the correct position. All sections have a part number marked on the piece. This part number also appears on the Erection drawings for identification. Before installing the anchors, lay the manifold section next to the anchor layout to check for possible interference with manifold connections.

NOTE

If interference does occur, the supports can be relocated providing the maximum support spacing does not exceed 17'-6".

CAUTION

Sanitaire supplies stainless steel materials only. The use of carbon steel anchors, hardware or support materials on SANITAIRE equipment is not acceptable. Installation of non-stainless materials will cause equipment failure.

4. Drill and set all manifold anchors according to the anchor manufacturer's installation instructions. The required anchor projection and embedment distances are shown on the Erection drawings.

NOTE

Sanitaire most frequently supplies expansion or adhesive type drill and set anchor bolts. Make sure you know which type your system incorporates and review the anchor bolt installation information provided in the project I, O & M manual. If your system incorporates a concrete pedestal support with embedded stainless steel "L" bolt anchors, follow the pedestal design and anchor locations shown on the Erection drawings. See Figure 2.

5. Located all floor mounted manifold supports and support hardware supplied by Sanitaire. See Figure 3.

NOTE

Sanitaire manufactures various types of supports depending on the piping configuration, size and field conditions. Job specific support details and hardware sizes are shown on the Erection drawing support details. Support assembly and hardware quantities are listed on the shipping and bolt usage lists in the project I, O & M manual.

6. Place each support assembly and hardware set at its designated location on the tank floor as shown on the Erection drawings.

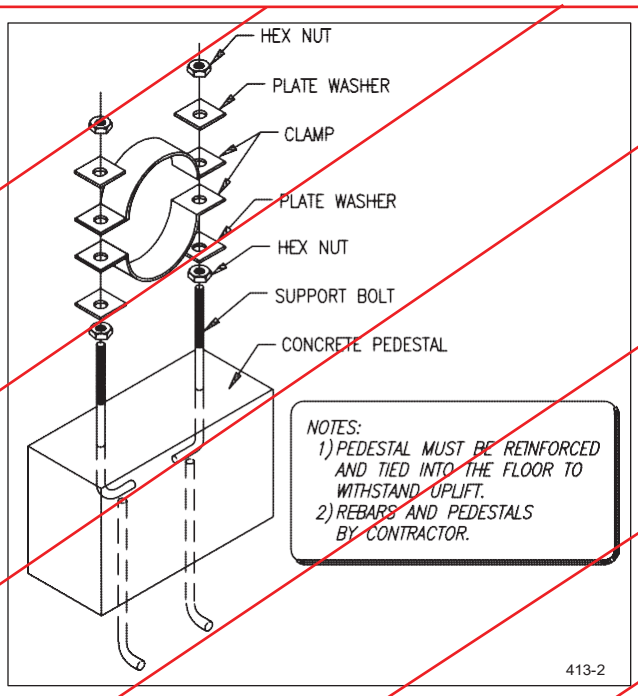

Figure 2. Concrete Pedestal Support

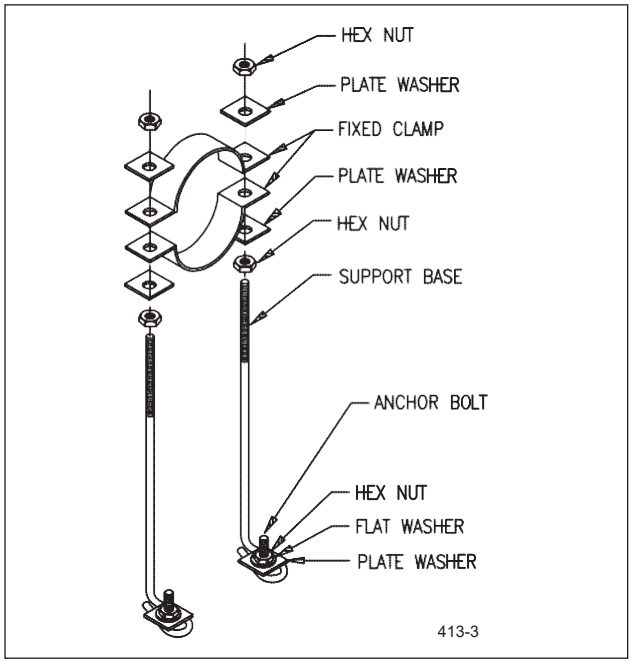

Figure 3. Simple Support

INSTALLATION AND START-UP

7. Place the support bases on the anchor bolts. Secure the support base to the anchor bolts with the stainless steel washers and nuts provided by Sanitaire. **Tighten the anchor bolts to the torque values listed in the anchor manufacturer's installation instructions.** Rod type bases must have a plate washer installed on the anchor bolt above the support base before installation of the anchor flat washer and nut.

CAUTION

Failure to properly torque expansion anchor bolts at installation reduces their load carrying capacity. Normal buoyant loads on the piping may then cause support assembly failure with resultant piping damage.

NOTE

For rod type support bases with diagonal struts, mount the strut on the support base above the plate washer before placement of the anchor bolt flat washer and nut.

8. Install the lower pipe support vertical adjusting nuts, washers and bottom band clamp or crosstree. Using a laser leveling system, adjust the lower support assembly to the correct elevation. If a band clamp support is used, the elevation of the clamp flange is the same as the manifold centerline elevation shown on the Erection drawings. If a crosstree style support is used, the crosstree elevation is the manifold centerline elevation shown on the Erection drawings minus one half the outside diameter of the pipe.

9. Place the stainless steel manifold piping on the support bottom band clamp or crosstree per the Erection drawings. Install the piece at the dropleg connection first and work away from the dropleg location. The clamp coupling for the dropleg to manifold connection should be temporarily installed at this time. See Figure 4. Installation instructions for the clamp coupling are included in the project I, O & M manual.

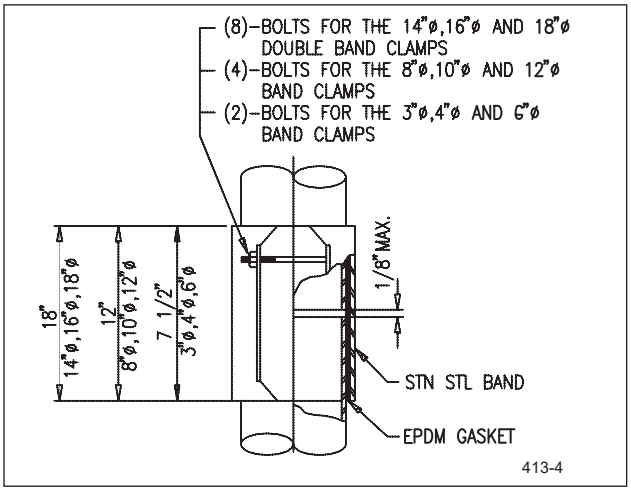

Figure 4. Clamp Coupling

NOTE

The following must be considered when setting the manifold pieces on the support bases:

A) Manifold piping flanges should be no closer than six inches to a support assembly.

B) SANITAIRE Fixed Header Coarse Bubble Aeration Systems normally have a fixed support at some point in the system. The fixed support may be floor or wall mounted. See Figures 5 and 6. If your system has a floor mounted frame or pedestal fixed support, be sure the fixing clip that is welded to the invert of the pipe mates up with the fixing link of the support base. If your system has a wall or floor mounted "T" bracket fixed support, make sure that the welded fin on the manifold is close enough to mate with the mounted "T" bracket. Do not mount the "T" bracket until the manifold leveling procedure is completed.

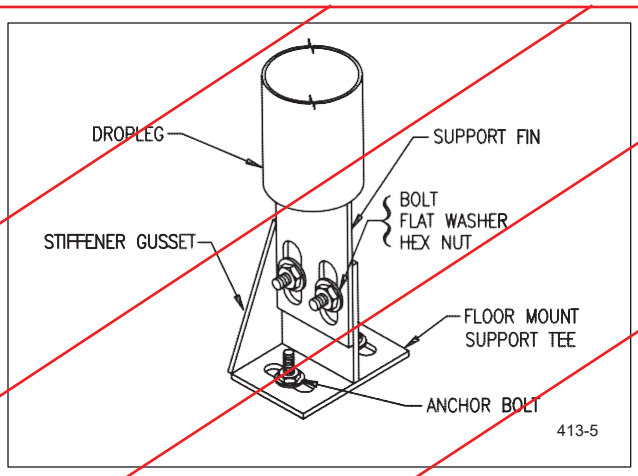

Figure 5. Floor Mount Fixed Support

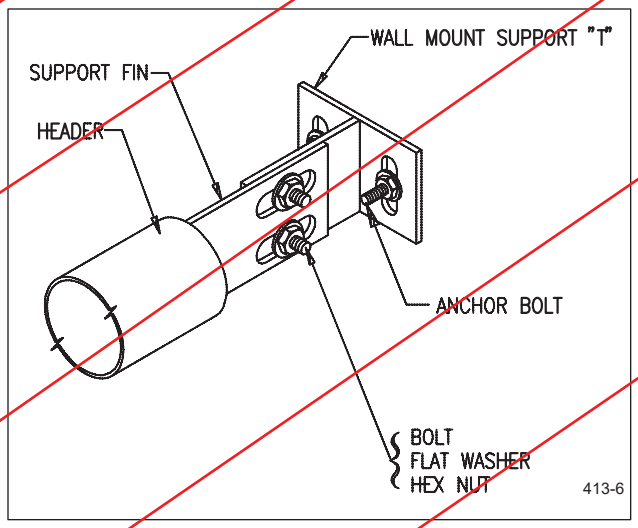

Figure 6. Wall Mount Fixed Support

10. Assemble all manifold joints. Sanitaire provides two types of manifold joints; flanged and expansion. Make sure all gaskets and O-rings are in place.

NOTE

Assemble, but do not fully tighten the joints until all necessary piping rotation for leveling purposes is complete.

11. Loosely install the top band clamp or "U" bolt on the proper support bases. Use the correct quantity, size and type of hardware on each support. Refer to the bolt usage list and Erection drawing support details.

12. Check all manifold sections for level. Start at the dropleg and adjust the piping heights as required using the **BOTTOM** vertical adjusting nuts. The manifold section which connects to the dropleg must be rotated as required so that any inclusive header connection ports are level horizontally for **in-line** manifolds or plumb vertically for **raised** manifolds. Install and tighten the **TOP** nuts on the band clamps or crosstrees **ONLY** on the support closest to the dropleg.

NOTE

If your system has "U" bolt type supports, tighten the bottom nuts on the "U" bolt only until light contact is made between the "U" bolt and manifold. Lock the "U" bolt in place by tightening the top nut.

13. Wall or floor mounted "T" bracket fixed supports, if supplied with your system, must be mounted now before continuing with the rest of the installation. Their installation is accomplished as follows:

A) Locate the "T" bracket as shown on the Erection drawings.

B) Set the "T" bracket on the tank wall or floor to match up with the fin welded on the manifold.

C) Mark the required anchor bolt locations.

D) Drill and set the anchors according to the anchor manufacturer's installation instructions. The required anchor projection and embedment distances are shown on the Erection drawings.

NOTE

A manifold section which connects to the "T" bracket may need to be removed in order to drill the anchor bolt holes. Place the manifold section back on the support stands when the anchors are set.

A) Secure the "T" bracket to the wall or floor using the anchor hardware. **Tighten the anchor bolts to the torque values listed in the anchor manufacturer's installation instructions.**

CAUTION

Failure to properly torque expansion anchor bolts at installation reduces their load carrying capacity. Normal buoyant loads on the piping may then cause support assembly failure with resultant piping damage.

B) Install the connecting hardware between the fixing fin and the "T" bracket.

14. If your system has a floor mounted frame or pedestal fixing support, install the fixing links and draw the hardware down tight. See the Erection drawings for fixed support details.

15. Rotate any remaining manifold sections per step 9. Tighten down all manifold flange or expansion joints using an alternating sequence pattern to provide equal torque distribution across the flange face. Make sure all gaskets and O-rings are in place. Expansion joint bolts must be double nutted. See Figures 7 and 8.

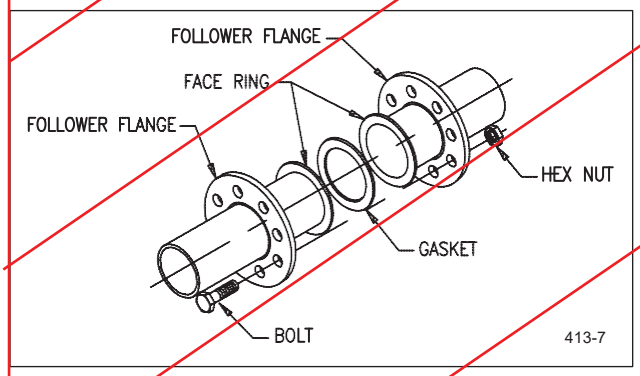

Figure 7. Sanitaire Flange

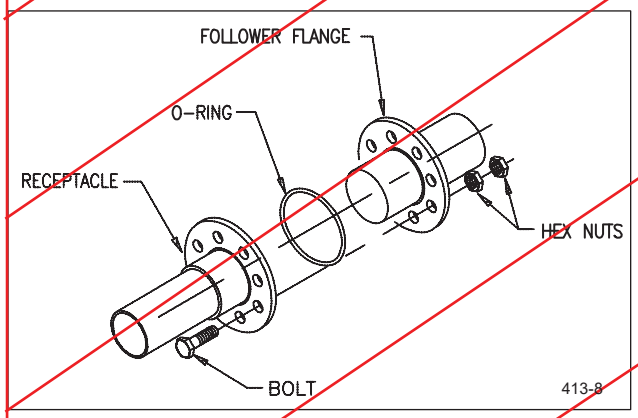

Figure 8. Expansion Joint

16. All manifold band clamps or "U" bolts can now be fully tightened as described in step 12.

17. Check the bolt on each removable end cap and tighten as required.

18. Fully tighten the dropleg clamp coupling hardware to the installation torque shown on the Erection drawings.

Header Installation (Fixed Header)

The following sections cover the installation of the air headers. Sanitaire manufactures headers for use without manifolds, headers attached to an inline manifold and headers attached to a raised manifold.

Header Installation Without Manifold (Fixed Header)

1. The air header centerline is set by the dropleg centerline. Using the Erection drawings, mark the locations of the header supports. These locations are indexed from the centerline of the dropleg.

2. Using the Erection drawings, mark the anchor locations at each support location.

NOTE

Anchor spacings, sizes and embedments vary according to pipe size and support design. Be sure to accurately follow the anchor bolt settings and size information shown on the Erection drawings. Follow the anchor manufacturer's edge distance guidelines at sumps, construction joints and expansion joints.

3. Locate the proper air header sections and lower them into the tank. Remove the protective end plugs and orient the pieces in the correct position. All sections have a part number marked on the piece. This part number also appears on the Erection drawings for identification. Before installing the anchors, lay the air header section next to the anchor layout to check for possible interference with joints or diffuser connectors.

NOTE

If interference does occur, the supports can be relocated providing the maximum support spacing does not exceed 17'-6".

CAUTION

Sanitaire supplies stainless steel materials only. The use of carbon steel anchors, hardware or support materials on SANITAIRE equipment is not acceptable. Installation of non-stainless materials will cause equipment failure.

4. Drill and set all header anchors according to the anchor manufacturer's installation instructions. The required anchor projection and embedment distances are shown on the Erection drawings.

NOTE

Sanitaire most frequently supplies expansion or adhesive type drill and set anchor bolts. Make sure you know which type your system incorporates and review the anchor bolt installation information provided in the project I, O & M manual. ~~If your system incorporates a concrete pedestal support with embedded stainless steel "L" bolt anchors, follow the pedestal design and anchor locations shown on the Erection drawings. Refer to Figure 2.~~

5. Locate all floor mounted header supports and support hardware supplied by Sanitaire. Refer to Figure 3.

NOTE

Sanitaire manufactures various types of supports depending on the piping configuration, size and field conditions. Job specific support details and hardware sizes are shown on the Erection drawing support details. Support assembly and hardware quantities are listed on the shipping and bolt usage lists in the project I, O & M manual.

6. Place each support assembly and hardware set at its designated location on the tank floor as shown on the Erection drawings.

7. Place the support bases on the anchor bolts. Secure the support base to the anchor bolts with the stainless steel washers and nuts provided by Sanitaire. **Tighten the anchor bolts to the torque values listed in the anchor manufacturer's installation instructions.** Rod type bases must have a plate washer installed on the anchor bolt above the support base before installation of the anchor flat washer and nut.

CAUTION

Failure to properly torque expansion anchor bolts at installation reduces their load carrying capacity. Normal buoyant loads on the piping may then cause support assembly failure with resultant piping damage.

NOTE

For rod type support bases with diagonal struts, mount the strut on the support base above the plate washer before placement of the anchor bolt flat washer and nut.

8. Install the lower pipe support vertical adjusting nuts, washers and bottom band clamp or crosstree. Using a laser leveling system, adjust the lower support assembly to the correct elevation. If a band clamp support is used, the elevation of the clamp flange is the same as the header centerline elevation shown on the Erection drawings. ~~If a crosstree style support is used, the crosstree elevation is the header centerline elevation shown on the Erection drawings minus one half the outside diameter of the pipe.~~

9. Place the stainless steel header piping on the support bottom band clamp ~~or crosstree~~ per the Erection drawings. Install the piece at the dropleg connection first and work out from there. The clamp coupling for the dropleg / header connection should be temporarily installed at this time. Refer to Figure 4. Installation instructions for the clamp coupling are included in the project I, O & M manual.

NOTE

The following must be considered when setting the header pieces on the support bases:

A) Header pipe flanges and diffuser connectors should be no closer than six inches to a support assembly.

B) SANITAIRE Fixed Header Coarse Bubble Aeration Systems have a fixed support at some point in the system. The fixed support may be floor or wall mounted. Refer to Figures 5 and 6. If your system has a floor mounted frame or pedestal fixed support, make sure the fixing clip that is welded to the invert of the pipe mates up with the fixing link of the support base. If your system has a wall or floor mounted "T" bracket fixed support , make sure that the welded fin on the header is close enough to mate with the mounted "T" bracket. Do not mount the "T" bracket until the header leveling procedure is completed.

10. Assemble all header joints. Sanitaire provides two types of header joints; flanged and expansion. Make sure all gaskets and O-rings are in place.

NOTE

Assemble, but do not fully tighten the joints until all necessary piping rotation for leveling purposes is complete.

11. Loosely install the top band clamp or "U" bolt on the proper support bases. Use the correct quantity, size and type of hardware on each support. Refer to the bolt usage list and Erection drawing support details.

12. Install and level the SANITAIRE diffusers. Refer to the Diffuser Installation and Leveling section.

13. Check all header pipe sections and diffusers again for level. Start at the dropleg and adjust the piping heights as required using the **BOTTOM** vertical adjusting nuts. Install and tighten the **TOP** nuts on the clamps or crosstrees **ONLY** on the support closest to the dropleg.

NOTE

If your system has "U" bolt type supports, tighten the bottom nuts on the "U" bolt only until light contact is made between the "U" bolt and manifold. Lock the "U" bolt in place by tightening the top nut.

14. Wall or floor mounted "T" bracket fixed supports, if supplied with your system, must be mounted now before continuing with the rest of the installation. Their installation is accomplished as follows:

A) Locate the "T" bracket as shown on the Erection drawings.

B) Set the "T" bracket on the tank wall or floor to match up with the fin welded on the header.

C) Mark the required anchor bolt locations.

D) Drill and set the anchors according to the anchor manufacturer's installation instructions. The required anchor projection and embedment distances are shown on the Erection drawings.

NOTE

A header section may need to be removed in order to drill the anchor bolt holes. Place the header section back on the support stands when the drilling is complete. Reassemble the removed header section.

E) Secure the "T" bracket to the wall or floor using the anchor hardware. **Tighten the anchor bolts to the torque values listed in the anchor manufacturer's installation instructions.**

CAUTION

Failure to properly torque expansion anchor bolts at installation reduces their load carrying capacity. Normal buoyant loads on the piping may then cause support assembly failure with resultant piping damage.

F) Install the connecting hardware between the fixing fin and the "T" bracket.

15. If your system has a floor mounted frame or pedestal fixing support, install the fixing links and draw the hardware down tight. See the Erection drawings for fixed support details.

16. Tighten down all header flange or expansion joints using an alternating sequence pattern to provide equal torque distribution across the flange face. Make sure all gaskets and O-rings are in place. Expansion joint bolts must be double nutted. Refer to Figures 7 and 8.

17. All header support band clamps or "U" bolts can now be fully tightened as described in step 13.

18. Fully tighten the dropleg clamp coupling hardware to the installation torque shown on the Erection drawings.

19. Check the bolt on each removable end cap and tighten as required. See Figure 9.

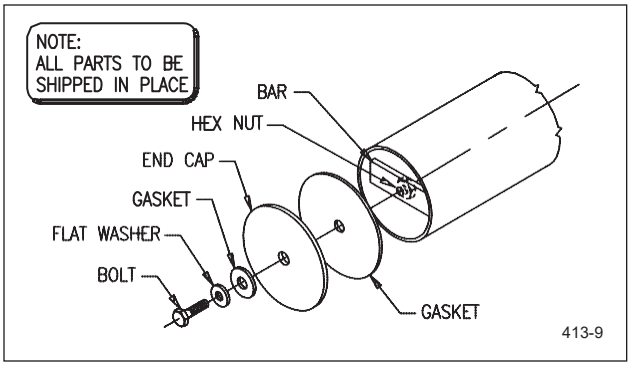

Figure 9. Removable End Cap

20. Proceed to the Aeration System Start-up Procedure section.

Header Installation With Manifold (Fixed Header)

1. The air header centerlines are set by the manifold connection centerlines. Using the Erection drawings, mark the locations of the header supports. These locations are indexed from the centerline of the manifold.

2. Using the Erection drawings, mark the anchor locations at each support location.

NOTE

Anchor spacings, sizes and embedments vary according to pipe size and support design. Be sure to accurately follow the anchor bolt settings and size information shown on the Erection drawings. Follow the anchor manufacturer's edge distance guidelines at sumps, construction joints and expansion joints.

3. Locate the proper air header sections and lower them into the tank. Remove the protective end plugs and orient the pieces in the correct position. All sections have a part number marked on the piece. This part number also appears on the Erection drawings for identification. Before installing the anchors, lay the air header section next to the anchor layout to check for possible interference with joints or diffuser connectors.

NOTE

If interference does occur, the supports can be relocated providing the maximum support spacing does not exceed 17'-6".

CAUTION

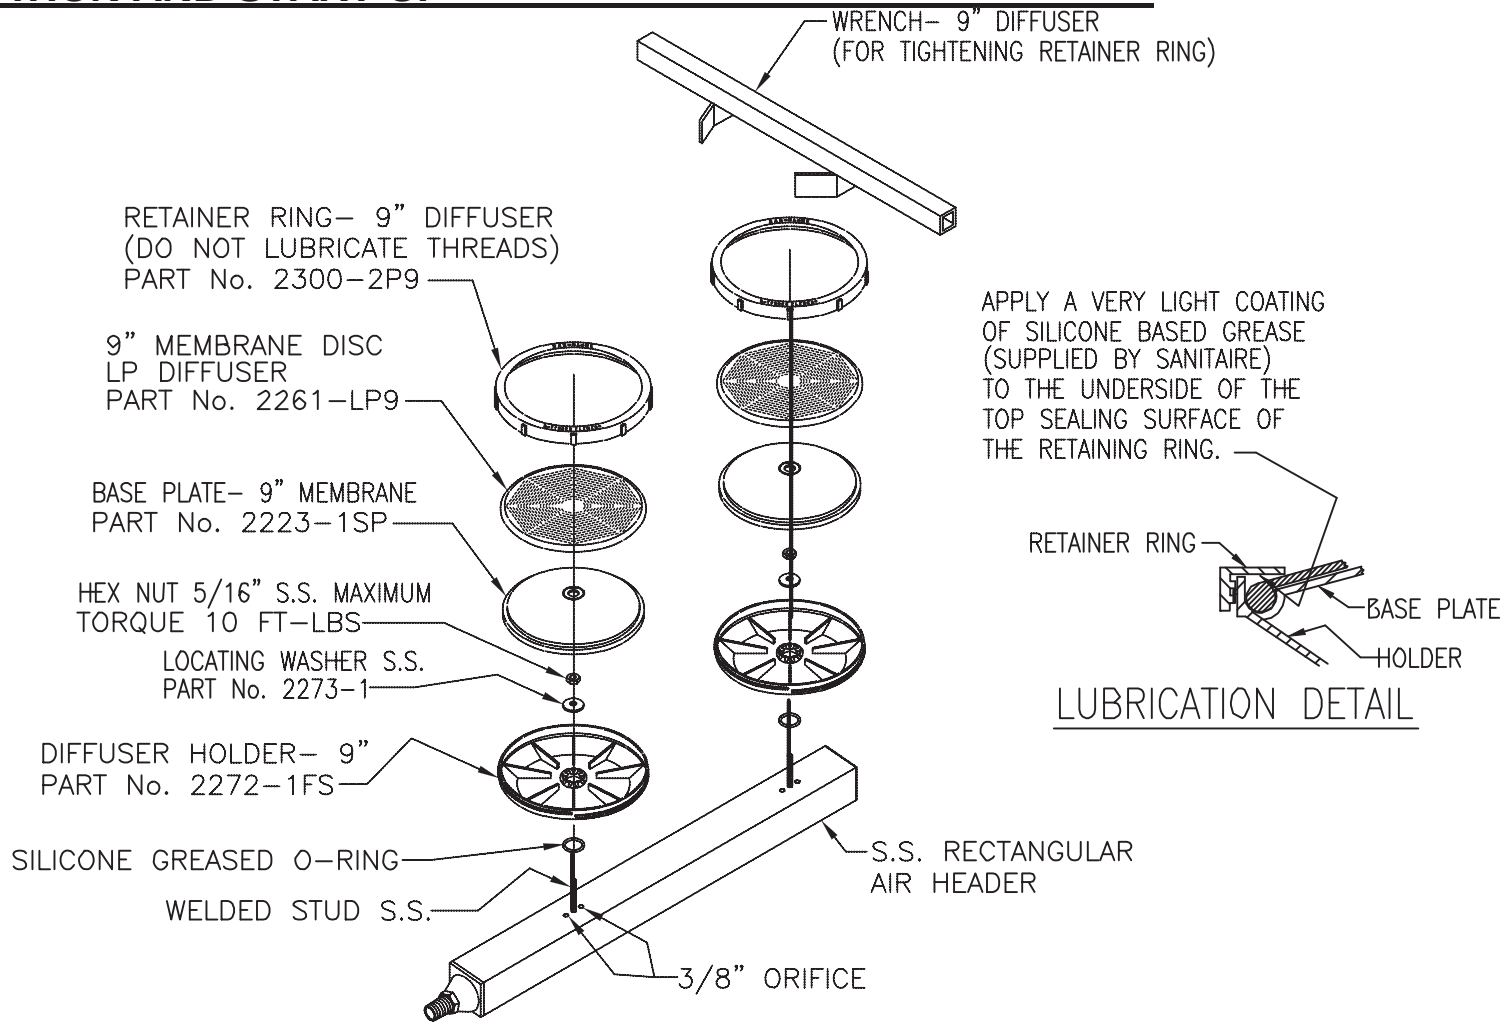
Sanitaire supplies stainless steel materials only. The use of carbon steel anchors, hardware or support materials on SANITAIRE equipment is not acceptable. Installation of non-stainless materials will cause equipment failure.

4. Drill and set all header anchors according to the anchor manufacturer's installation instructions. The required anchor projection and embedment distances are shown on the Erection drawings.

NOTE

Sanitaire most frequently supplies expansion or adhesive type drill and set anchor bolts. Make sure you know which type your system incorporates and review the anchor bolt installation information provided in the project I, O & M manual. If your system incorporates a concrete pedestal support with embedded stainless steel "L" bolt anchors, follow the pedestal design and anchor locations shown on the Erection drawings. Refer to Figure 2.

INSTALLATION AND START-UP



LUBRICATION DETAIL

9"ø DUAL LP DIFFUSER ASSEMBLY

Sanitaire a xylem brand BROWN DEER, WISCONSIN 53223	THIS DRAWING IS THE PROPERTY OF XYLEM AND IS SUBMITTED IN CONFIDENCE. IT IS NOT TO BE DISCLOSED, USED OR DUPLICATED WITHOUT PERMISSION OF XYLEM.	DIFFUSER ASSEMBLY 9" DUAL LP DETAIL	DRAWN BY	DATE	EQUIP.	STANDARD NO. FB–9B	JOB
			CHKD BY	DATE			
			APPVD BY	DATE	REV.	SHEET OF	DWG NO.

REV 1				REV 3			
REV 2				REV 4			

7. Install the lower pipe clamp sections on all air distributor and drainline supports.

   Use the same technique as described in paragraph 6 of the dropleg and manifold installation section. The air distributor centerline elevation is shown in the erection drawings.

   The air distributor centerline elevation tolerance is ± 1/4" (6 mm).

8. Starting from the manifold, assemble the remaining air distributors in the support stands. Refer to step #3 of the air distributor and drainline installation section for joint assembly instructions.

9. Install the top half of the pipe clamp on each support and loosely install the top hex nuts.

10. Again, starting near the manifold, place a hand level on the top of diffuser holder perpendicular to the centerline of the distributor pipe. See Figure 28.

Figure 28

11. Rotate the distributor section until the pod is level.

12. Hold the pipe section level and tighten all fixed joints and/or anchor support clamps on sections which have an expansion joint.

13. After tightening, recheck for level both perpendicular and parallel to the distributor section.

14. Continue this procedure for all distributor and drainline sections.

15. Tighten all guide support nuts.

CAUTION

The guide support will be loose around the pipe – this is a design feature. Do not attempt to wrap anything around the pipe to pull the clamps tight against the pipe. See Figure 29.

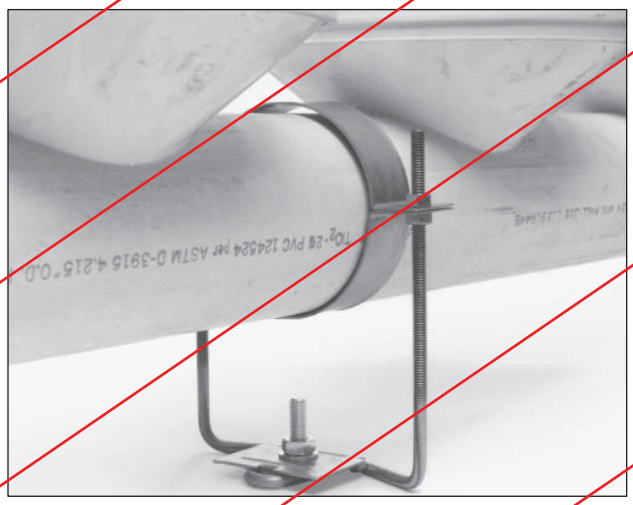

Figure 29

PURGE SYSTEM INSTALLATION

Sanitaire provides two types of purge system.

The most commonly used purge system consists of a sump and evacuation pipe.

- The sump for systems using in-line manifolds is built into the manifold pipe as shown in Figure 30A.

DIFFUSER INSTALLATION AND LEVELING

1. SANITAIRE coarse bubble stainless steel D-24 and D-12 diffusers are manufactured with 3/4" dia. NPT male connectors. See Figure 14. Various process applications require smaller diameter orifices to provide enough back pressure to evenly distribute the air flow throughout the system. Sanitaire has developed the following color coded factory installed orifice inserts:

COLOR	DIAMETER
Black	5/16"
White	3/8"
Gold	7/16"
Green	1/2"
Red	9/16"
Yellow	5/8"

NOTE

The 3/4" diameter orifice requires no insert. Check the equipment data sheets and shipping list in the project I, O & M manual to insure that the correct inserts have been installed.

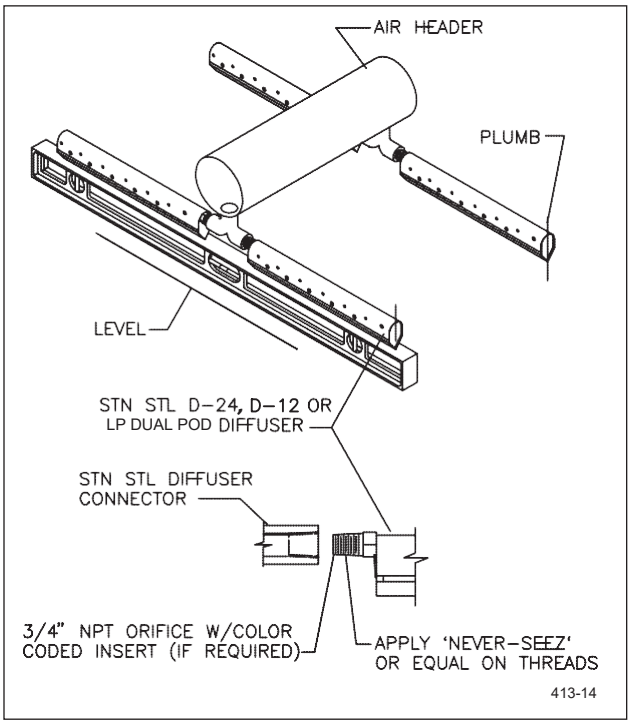

Figure 14. Diffuser Installation

2. See the Erection drawings for proper diffuser installation location. The number (1 or 2) of diffusers per connector varies from system to system depending on the process and available air rates. Threaded plugs are supplied for single diffuser installations.

3. A commercial thread compound such as NEVER-SEEZ, manufactured by Never-Seez Compound Corporation in Broadview, Illinois, or equal must be applied to the male diffuser connector threads before diffuser installation. Sanitaire does not supply any thread compound.

CAUTION

Failure to use a thread lubricant will cause the stainless steel threads to gall or strip.

NOTE

If diffusers are removed following the initial installation, thread compound must be applied upon reinstallation.

4. The diffusers should be screwed on by hand as far as possible. Wrench tighten the stainless steel D-24 and D-12 diffusers until the “V” shaped bottom deflector is pointed directly toward the floor. Make at least one complete turn after hand tightening to insure proper thread engagement.

5. After the diffusers are installed, the diffusers should be leveled as close as possible to a common horizontal plane. This can be accomplished by rotating the header pipe at the joint. Following this initial leveling, return to the appropriate header installation section for your system.

NOTE

Sanitaire's fabrication tolerances allow ± 3/8" variation in elevation from diffuser to diffuser along a header's length as measured at the threaded diffuser connection. Angular variations of the threaded connection may cause the outboard ends of the diffuser to vary by an additional ± 3/8" for a total range of outboard diffuser tip elevation variation of ± 3/4". For proper air distribution, the diffuser levels should be adjusted around an average elevation for all the diffusers in an assembly.

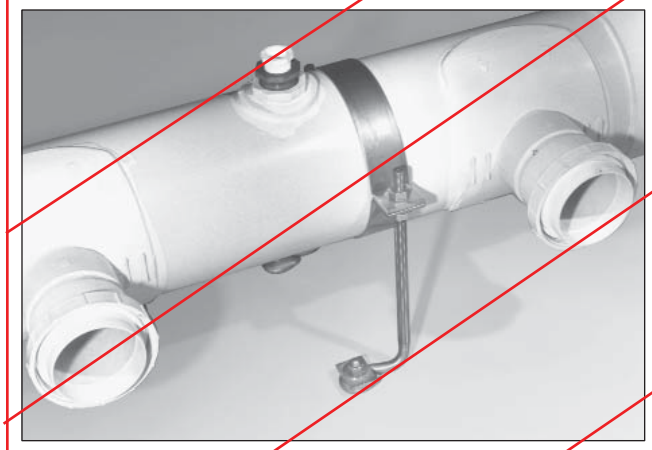

Figure 30A

- The sumps for systems using the raised manifold is attached to an air distributor or drainline section as shown in Figure 30B.

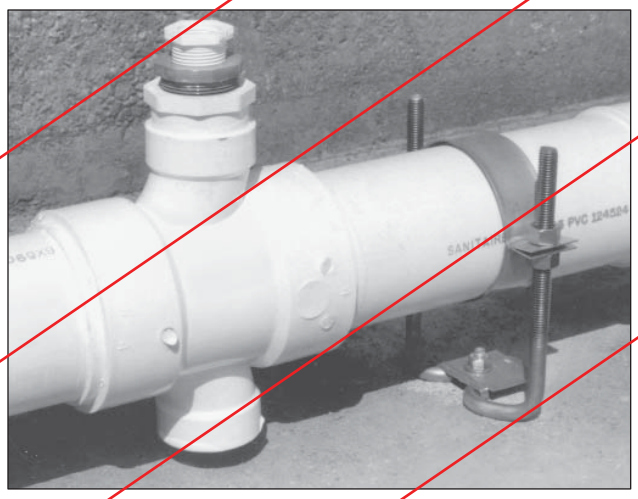

Figure 30B

- The evacuation pipe consists of 3/4" Ø (20 mm) Schedule 80 PVC pipe, fittings, and a valve mounted to the tank wall. See erection drawings for installation details.

The second type of purge system is the continuous purge system as shown in Figure 31. The manifold or an air distributor section is tapped at a low point and a membrane tube is attached. The membrane tube is placed at an elevation lower than the manifold or air distributor section.

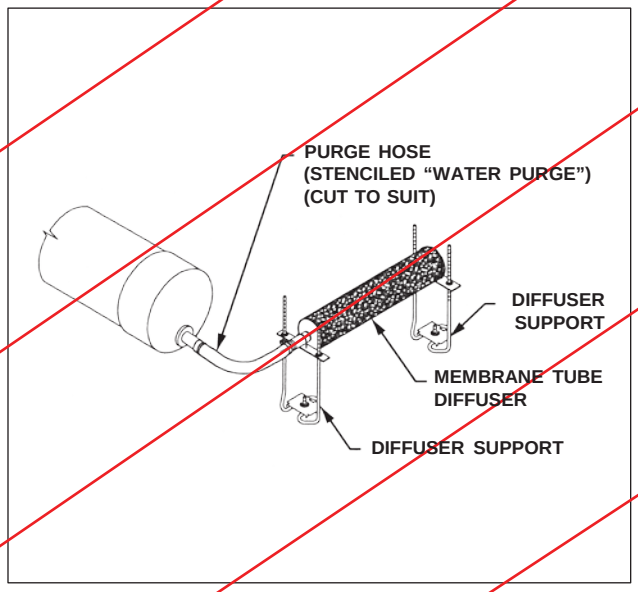

Figure 31

DIFFUSER INSTALLATION

Sanitaire manufacturers ~~two (2) types of~~ fine bubble disc diffusers. These are the ~~Ceramic Disc or the~~ Rubber Membrane Disc.

Some general installation guidelines, are as follows:

1. Install the diffusers just prior to the scheduled start-up of the aeration basin.

2. The diffuser holder must be cleaned prior to diffuser installation. See Figure 32.

3. Check the erection drawings for the location of possible blank diffuser sites and plug the orifice hole in accordance with Figure 37 and the installation instructions found on page 15.

Figure 32

To Install CERAMIC DISC diffusers:

1. Set the diffuser disc in the holder with the dished side and peripheral stepped edge up.

2. Lubricate the diffuser "O"-ring with a small amount of the lubricant provided by Sanitaire.

3. Place the diffuser "O"-ring in the slot or void between the diffuser holder vertical wall and the raised portion of the diffuser disc. See Figure 33.

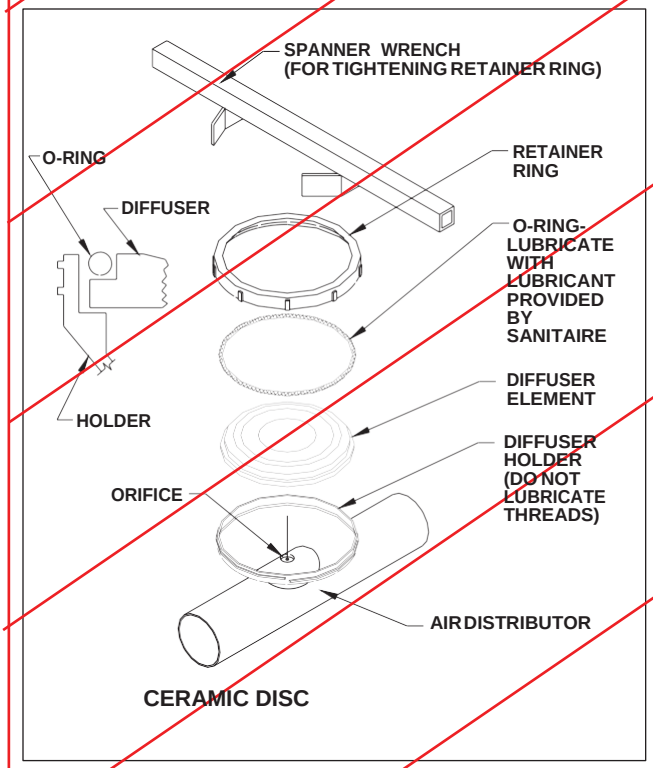

Figure 33

4. Turn the retaining ring to a hand-tight position making sure the "O"-ring stays in place.

5. Using the retaining ring spanner wrench, turn the retaining ring an additional 1/4 turn. See Figure 34.

Figure 34

To Install MEMBRANE DISC diffusers:

1. Set the diffuser PVC subplate in the diffuser holder with the flat side up. See Figure 35.

Figure 35

2. Place the membrane disc over the subplate. The integral "O"-ring should naturally fit down into the void created between the diffuser holder vertical wall and subplate.

3. Lubricate the diffuser retaining ring with a small amount of lubricant provided by Sanitaire by turning the ring upside down and swabbing the lubricant on the underside of the top surface of the retaining ring. See Figure 36.

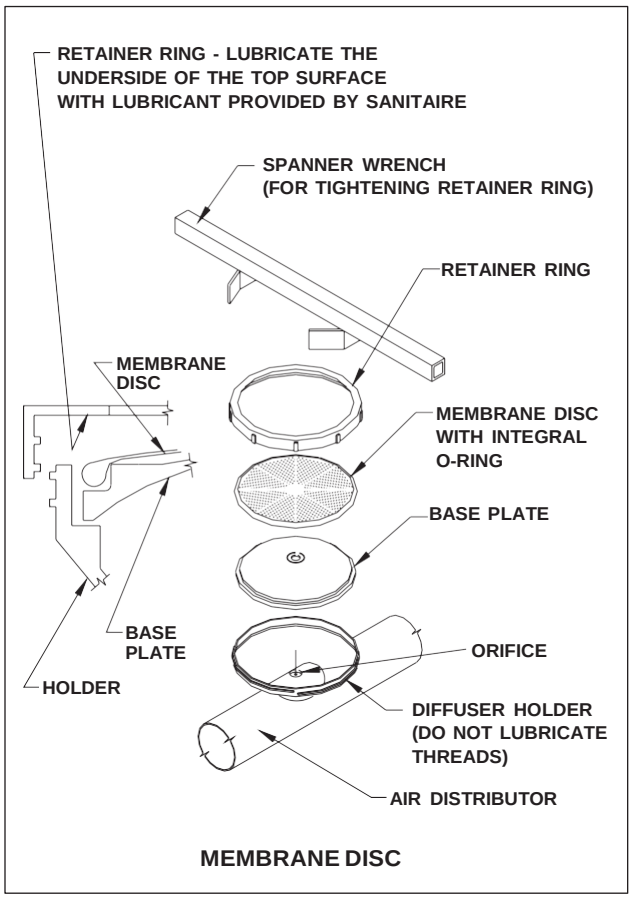

Figure 36

4. Turn the retaining ring to a hand-tight position.

5. Using the retaining ring spanner wrench, turn the retaining ring an additional 1/4 turn. See Figure 34.

BLANK DIFFUSER SITE ORIFICE PLUG INSTALLATION

Some projects will call for some of the diffusers to be initially not put into operation or left “BLANK”. These diffusers may be put into operation as process demand dictates.

Locate “BLANK” diffuser sites and plug the orifice as shown in Figure 37 and described on the erection drawings.

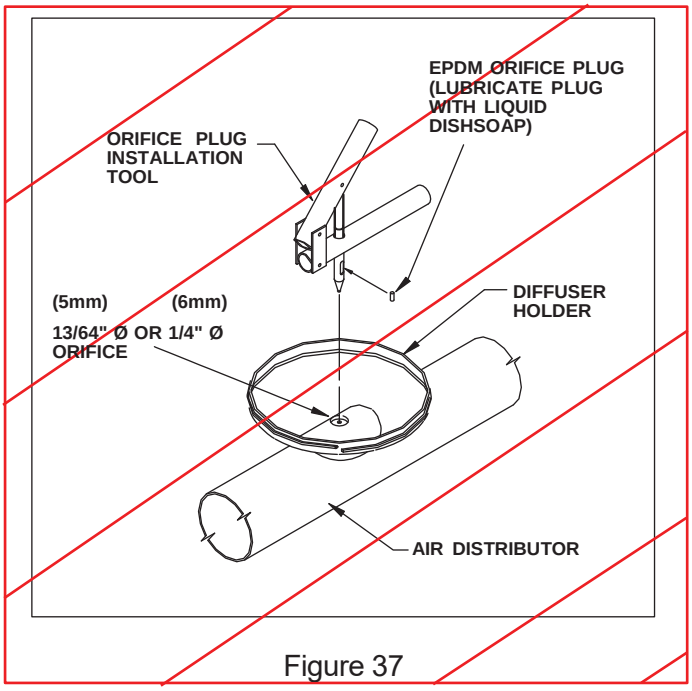

Figure 37

AERATION SYSTEM START-UP PROCEDURE

Once the aeration system is installed, perform a final tank inspection and look for loose nuts, missing or improperly placed hardware, missing retaining rings, non-connected joints, etc.; and make any repairs prior to following this start-up procedure.

NOTE

The start-up procedure should be completed prior to the site visit by Sanitaire service personnel or an authorized representative. This practice will save time for all parties involved.

The start-up procedure is as follows:

1. Fill the aeration tank with clean water to a level 1" (25 mm) below the top of the diffusers. While filling, proceed with steps 2-5. Step 6 will require a visual level inspection with the water level 1" (25 mm) below the top of the diffuser.

CAUTION

Water should be introduced to the basin at a rate and direction so that no abnormal stresses are imposed on the aeration pipe network that could cause damage.

2. While filling, disconnect each of the purge hoses from the sumps (not required on continuous purge systems).

3. When the water level reaches a point just over the top of the air distributor pipe, turn the air on at a low air flow rate of approximately 0.5 scfm/diffuser (0.85 m^3/hr/diffuser).

4. Check all submerged fixed, flanged, or expansion joints for air bubbles, which indicate leaks, and repair as required.

NOTE

Leaking at fixed and expansion joints is generally due to one of three conditions:

- *"O"-ring pinched or out of place (most common).*
- *Joint retaining ring cross threaded on spigot.*
- *Joint not tight.*

! CAUTION

When repairing pipe joints, turn off the air supply to the grid being worked on.

5. With the air ON, check each purge sump operation. Any water trapped in the pipe should be discharging from the sump assembly.

   If neither air or water is being discharged, check the sump eductor tube air orifice hole (see Figure 38). This hole may be plugged with debris or possibly glued over during manufacturing. Redrill or clean out as required and reassemble.

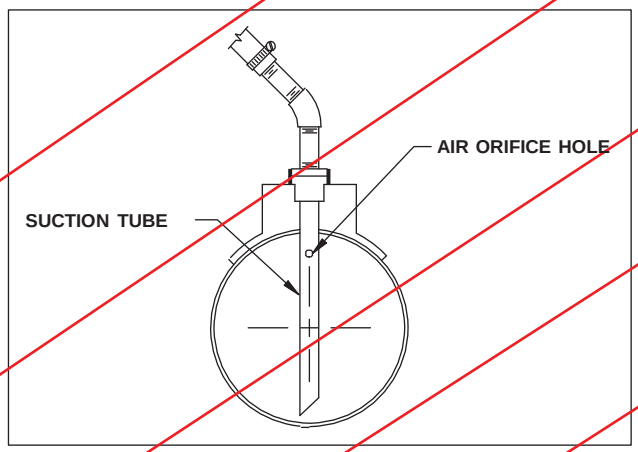

Figure 38

6. Turn the water supply OFF as it approaches a level 1" (25 mm) below the top of the diffusers. With the water OFF check the level of the aeration system. The distance from the top of the perimeter of the diffuser measured to the static water level should be relatively constant ± 1/4" (6 mm) for all diffuser heads. Raise, lower, or rotate the air distributor sections as required in order to level the aeration system.

7. Increase the air rate to about 1-1.5 scfm/diffuser (1.7 - 2.6 m^3/hr/diffuser) and turn the water supply back on.

8. Fill the basin to a maximum water level of 2" - 3" (50-75 mm) over the diffusers.

9. Check all diffuser units for uniform air distribution. Air should be discharging uniformly across the diffuser surface. See Figure 39.

Figure 39

Excessive air discharge as indicated by large coarse bubbles around the perimeter or "halo" of the diffuser indicates a loose retaining ring or improperly seated "O"-ring (see Figure 40). To correct this situation use the retaining ring spanner wrench to back off the retaining ring. Then reseat the "O"-ring and retighten to a hand-tight plus 1/4 turn position.

If no air is discharging from the diffuser surface, the air control orifice may be plugged with debris. To correct this situation, remove the diffuser assembly, clear the orifice (a welding rod or nail works well), and reinstall the diffuser.

Figure 40

10. Once the system is leak free and is purged of all entrapped water, reattach the purge hoses to the purge sumps.

11. Use a soap solution to check for leaks at the clamp coupling or flange joint which joins the PVC and stainless steel portions of the drop-leg.

12. Continue filling the basin to a point 3'-4' (1 m) over the diffusers.

NOTE

If your system has a raised manifold (ref. Figure 4), check for manifold flanged or fixed joint connection leaks as the water level rises and repair as required.

13. Allow the system to operate 3-4 hours in this mode prior to introducing the mixed liquor.

PLANT OPERATION

PRINCIPLES

The removal of carbonaceous BOD, the coagulation of non-settable colloidal solids, and the stabilization of organic matter are accomplished biologically using a variety of microorganisms (principally bacteria) in the activated sludge process. The microorganisms convert the colloidal and dissolved carbonaceous organic matter into various gases and cell tissue through synthesis.

Aerobic systems require the presence of molecular oxygen to maximize the conversion of the organic matter through a complex series of Biochemical Oxidation and Reduction Reactions.

Oxygen needed by the microorganisms is transferred to the mixed liquor by aeration. The fine bubble aeration system takes compressed atmospheric air and passes it through the diffuser element forming millions of fine bubbles that pass through the mixed liquor. Diffusion makes the oxygen in the compressed air accessible to the microorganisms.

Typically, fine bubble aeration systems are twice as efficient as coarse bubble systems. This translates to a 50% reduction in the required air volume to treat the same waste. Fine bubble systems are more efficient due to the increase in contact surface area between the air bubble and wastewater which makes the diffusion of the oxygen quicker/unit volume.

The drawback to the increased efficiency is that overtime fine bubble aeration systems may foul and require cleaning.

DIFFUSER OPERATING AIR FLOW RANGE

For CERAMIC DISC (air flow per diffuser):

SIZE	MIN	MAX
9" (230 mm)	0.5 scfm. (0.85 m^3/hr)	3.0 scfm (5.0 m^3/hr)
7" (178 mm)	0.35 scfm (0.6 m^3/hr)	2.0 scfm (3.5 m^3/hr)

NOTE

Above listed air flow rates are general design standards. Actual project design may vary.

Ceramic disc operating requirements:

1. Do not operate below the minimum air flow requirements. Solids settling will occur which results in a loss in oxygen transfer efficiency and possible diffuser fouling.

2. Non-operating ceramic discs allow mixed liquor to enter the pipe network. Do not intentionally shut off the air flow to the ceramic discs in a submerged state.

For MEMBRANE DISC (air flow per diffuser):

SIZE	MIN	MAX
9" (230 mm)	~~0.5 scfm (0.85 m^3/hr)~~	~~Short term: 7 scfm (11.9 m^3/hr) Long term: 4 scfm (6.8 m^3/hr)~~
7" (178 mm)	0.35 scfm (0.6 m^3/hr)	Short term: 4.8 scfm (8.1 m^3/hr) Long term: 3.0 scfm (5.0 m^3/hr)

NOTE

Above listed air flow rates are general design standards. Actual project design may vary.

9" DIA. SSII LP MEMBRANE DISC

MIN AIR RATE: 1.0 SCFM
SHORT TERM MAX AIR RATE: 25.0 SCFM
LONG TERM MAX AIR RATE: 12.0 SCFM

Membrane disc operating requirements:

1. When operating, do not reduce the air flow rate below the recommended minimums. Solids settling will occur which results in a loss of oxygen transfer efficiency and possible diffuser fouling.

2. Membrane disc systems are designed for continuous or intermittent submerged process use. Idle systems should be supplied with an alternate source of mixing.

NOTE

Solids will settle on the diffuser surface of idle systems and may promote diffuser fouling. The results of intermittent use are as follows:

- *A higher airflow and pressure may be required to lift the membrane disc off the subplate and start the grid.*
- *The diffuser may have to be cleaned if a sufficient loss in Oxygen Transfer efficiency is observed.*

General notes regarding air flow range

- The most common design average air flow range is 1 to 2 scfm/Diffuser (1.7 to 3.5 m^3/hr/Diffuser).
- Operating above this range results in a lower oxygen transfer efficiency and increased diffuser headloss.
- It may be necessary to operate at a higher airflow rate in order to meet the oxygen demand.
- Operating below this range will yield a slightly higher oxygen transfer efficiency, however, mixing requirements must be considered.

MIXING, D.O. LEVELS AND MINIMUM DIFFUSER AIR FLOW RATES

The generally accepted activated sludge plant mixing air rate standard is 0.12 scfm/$Ft.^2$ (2.2 m^3/hr/m^2) of tank surface area.

Often times conservative design will specify more diffusers with a higher minimum air flow requirement than is required by the process demand or mixing in a specific area. This is most common at the end of long plug flow reactors. The result of this is a high area D.O. level.

If the operator feels this D.O. level is not needed, the simplest solution is to take some of the diffuser units out of service by plugging the orifice as shown in the installation instructions. See Figure 37.

NOTE

Minimum mixing requirements must still be adhered to.

DIFFUSER FOULING

Operating experience shows that all fine bubble disc diffusers may foul or become clogged with continuous operation.

The rate of fouling, type of foulant, and strength of foulant depends primarily on the constituents in the wastewater.

The results of diffuser fouling include:

- loss of oxygen transfer efficiency due to bubble coalescence and coarse bubbling
- increased pressure requirements
- increased air demand.
- increased operating costs.

Diffuser fouling is divided into two categories: water side and air side. Air side fouling is very rare but does warrant some consideration. Water or mixed liquor side fouling is most common.

Causes of diffuser fouling include:

on WATER side:

- Fibrous material adhering to the edges of the diffuser units.
- Oils and greases in the wastewater.
- Precipitated deposits of iron and carbonates.
- Biological growths of slime.

SANITAIRE®

on AIR side:

- Dust and dirt from unfiltered or inadequately filtered air.
- Rust and scale from air main corrosion.
- Oxidation and subsequent flaking of bituminous air main coatings.
- Construction debris
- Mixed liquor solids entering through system leaks or cracks.

Several ways of determining if the diffusers are fouled are discussed in the preventative maintenance section of this manual.

The corrective action for fouled diffusers is cleaning. This is discussed in the yearly maintenance and diffuser cleaning section of this manual.

PREVENTATIVE MAINTENANCE

MOISTURE PURGE

Moisture enters the pipe system in three ways:

- Condensate build-up inside the pipe system due to high blower discharge temperatures and moist or humid air (primary cause).
- Minor leaks in the pipe system.
- Back flow through ceramic diffusers caused by a loss of air.

NOTE

Membrane diffusers are designed to seal on the subplate and prevent moisture from entering the system.

The effects of entrapped moisture are:

- Increased air velocity and headloss.
- Poor air distribution.

Sanitaire manufactures two types of purge systems: a standard, manually operated system (most common) and a continuous purge system.

The standard system uses a sump with an eductor line that extends from the grid to above the water surface and ends with a manual ball valve. To operate this system simply open the ball valve and the trapped liquid will be purged from the system. Close the valve when the water flow stops and a mist appears.

NOTE

For maximum purge results, lower the air flow to the grid. The air velocity will be reduced and more of the liquid will be forced to the sump.

The purge frequency is site determined; however, once a week is a good rule of thumb.

The second type of purge system is the continuous purge system which employs a diffuser unit attached to the bottom of the manifold or drainline. The entrapped moisture is continuously purged from the system.

The continuous purge systems are used on grids where it is not possible to reach a purge valve safely from a walkway.

AIR BUMPING

Air bumping is a technique that can be employed by operators to temporarily reduce back pressure in the system. Air bumping is the act of increasing the air flow rate per diffuser for 20-30 minutes once per week. An air rate per diffuser of 3 Scfm (5 m^3/hr) is generally used.

This practice will aid in sloughing off settled debris and may extend the period between diffuser cleanings.

POWER FAILURES AND LOSS OF AIR SUPPLY

The results of a power failure (loss of air supply) on each diffuser type are as follows:

for CERAMIC DISC diffusers:

- Solids settle on diffuser surface.
- Filtered mixed liquor penetrates the diffuser and enters the pipe network.
- Short term affect: none.
- Long term affect: fouling may occur on the surface and within the diffuser disc.

When the air supply is restored, the air pressure will build and the flow will reduce until sufficient water is pushed out of the system to allow air to be released through the diffusers.

NOTE

It is suggested that the operator open the purge valves as soon as possible after a power outage and evacuate the system. If the liquid is left in the system the flow will be reduced and the operating pressure will be higher than normal.

for MEMBRANE DISC diffusers:

- Solids settle on diffuser surface.
- Short term affect: none.
- Long term affect: the potential of surface fouling is possible and the diffusers may require a cleaning. This is generally the case for long term intermittently used membrane disc systems (i.e., Anoxic Zones, Batch Reactors).
- May require operator to shut off adjacent grids or turn on additional blowers to increase the air flow rate and force the membrane off the subplate surface. This is again generally the case for long term intermittently used membrane disc aeration systems.

VISUAL INSPECTION

Visually inspect the aeration basin surface pattern. The flow should be, for the most part, a nice quiescent pattern. Some coarse bubbling at the basin inlet may occur due to surfactants in the wastewater and is generally dispersed shortly downstream.

Excessive coarse bubbling throughout the tank indicates the diffusers may be fouling.

Large boiling in an isolated area indicates a failure in the submerged pipe system.

Visual inspection is an ongoing preventative maintenance step and can be done while taking routine samples, dissolved oxygen readings, etc.

AIR MAIN INSPECTION

Air main leaks are easily identified and usually are caused by loose joints or degraded gaskets. These types of leaks should be repaired quickly in order to prevent loss of system efficiency.

OPERATING PRESSURE AND AIRFLOW

Most blower systems are equipped with discharge pressure gauges. The operator should keep a regular log of pressure readings. A continuous increase in operating pressure indicates diffuser fouling. Likewise, a continuous increase in air demand without a change in the aeration basin loading indicates diffuser fouling.

SANITAIRE®

Fine Bubble Grid Aeration System
TROUBLESHOOTING GUIDE

Problem	Cause	Action
VISUAL INSPECTION		
Poor air distribution	Diffusers not level	Level system
	Grid flooded	Operate grid purge system
	Plugged orifice	Clean orifice
	Insufficient air	Provide more air
	Solids settling	Provide more air to grid
Visible mounding of air in one location	Broken pipe	Repair (see repair procedures)
Coarse bubbling (large bubbles)	Diffuser fouling	Clean diffusers (see cleaning procedure)
Air discharge from air main	Loose joints, degraded gaskets, or degraded air main	Repair as required
OPERATIONAL PROBLEMS		
Low D.O. Concentration	Too little air	Increase air flow
High D.O. Concentration	Too much air	Decrease air flow
		Decrease quantity of diffusers in service
Increased operating pressure	Diffuser fouling	Clean diffusers (see cleaning procedure)
	Line blockage or valve closed	Check air lines and valves
Increased air requirement/ no load change	Diffuser fouling	Clean diffusers (see cleaning procedure)
	Leak in air system	Inspect and repair as required

WARNING:

Prior to draining a tank, please READ these instructions carefully to minimize the potential for heat related damage to the Aeration System.

BASIN DRAINING PROCEDURE

Before draining a basin for diffuser inspection, tank cleaning or other maintenance operations, do the following:

- Place the basin in a manual mode to override any automatic 0.0./blower control systems.
- Adjust the grid(s) air control valve(s) to deliver an air flow rate equivalent to 0.5 scfm per diffuser or to a 25% open position if air flow metering is not available.
- AERATION TANK - Stop RAS flow to the basin.
- AEROBIC DIGESTER - Stop WAS flow to the basin.
- Turn off the air completely to the basin when the liquid level reaches 1 to 2 Ft. above the diffusers.
- When cleaning diffusers, the air can be turned on for short periods of time for the grid being cleaned.

NOTE: As the basin is draining, monitor the amount of air flowing to che submerged grid(s). THE AIR FLOW SHOULD BE KEPT TO A MINIMUM. THIS WILL PREVENT EXCESS HEAT BUILD-UP FROM DAMAGING THE PVC OR CPVC PIPING SYSTEM WHILE KEEPING THE SOLIDS IN SUSPENSION.

Refer to pages 27 and 28 for Diffuser Cleaning Procedure.

YEARLY MAINTENANCE AND DIFFUSER CLEANING

MAINTENANCE SCHEDULE

Sanitaire recommends the following maintenance schedule be observed at least once per year.

1. Drain down each tank.
2. Remove excess settled solids if any have accumulated.
3. Clean diffusers.
4. Inspect support hardware to ensure all components are intact and tight.
5. Inspect diffuser retaining rings to make sure all rings are in place and tight.
6. Inspect fixed and expansion joint retaining rings to make sure all rings are tight.

NOTE

For items 4-6, refer to the Installation Instructions.

LUBRICATION SCHEDULE

Since there are no moving parts on the SANITAIRE Fine Bubble Aeration Systems, a formal lubrication schedule is not required.

Three components require lubrication at the time of initial installation and future repairs. These components are:

- Ceramic Disc Diffuser "O"-Ring
- Membrane Disc Diffuser Retaining Ring
- ~~Expansion Barrel, 4" Ø black "O" Ring~~

Lubricate these items with the lubricants provided by Sanitaire and in accordance with the Installation Instructions.

CERAMIC DISC DIFFUSER CLEANING METHOD

1. Drain aeration basin (the air should remain on as basin is drained).
2. With the air left on – at approximately 1 scfm (1.7 m^3/hr) per diffuser – hose off each disc for twenty seconds with clean water at a nozzle pressure of 60 psig. Turn off the air supply when completed.
3. Put on the following safety equipment: eye goggles, rubber gloves, boots, sleeves, and apron. A breathing apparatus should be available in the event it is needed.

! CAUTION

Acid can be harmful if misused. Follow all manufacturers precautions and directions. Wear appropriate safety equipment. Do not breath acid vapors. Do not allow acid to make contact with eyes, skin or hair.

4. Carefully prepare a 50% by volume solution of 18˚ baume muriatic acid. Always add the acid to water.
5. Using an acid resistant compression sprayer, apply a uniform covering of the acid solution to all diffuser elements.

NOTE

Do not spray the acid solution on the stainless steel supports and hardware.

6. Allow the acid solution to sit on the diffusers for 30 minutes.
7. Turn the air back on at a rate of 1 scfm (1.7 m^3/hr) per diffuser and repeat the hosing procedure for 10 seconds per diffuser.
8. Inspect the aeration system to determine if any hardware was loosened or broken during the cleaning.

9. ~~Review and follow the start-up procedure as found in the Installation and Start-up Section of this manual.~~

MEMBRANE DISC DIFFUSER CLEANING METHOD

1. Drain aeration basin (the air should remain on as basin is drained).

2. With the air left on at approximately 1 scfm (1.7 m^3/hr) per diffuser, hose off each disc for twenty seconds with a clean water source at a nozzle pressure of 60 psig.

3. Turn off the air flow to the aeration grid being cleaned.

4. If required, use a rag or soft bristle brush to scrub each diffuser to remove stubborn slime growth, chemical precipitates, or oils. Do not use acids or aggressive cleaners.

5. Turn the air back on at a rate of 1 scfm (1.7 m^3/hr) per diffuser and repeat the hosing procedure for 10 seconds per diffuser.

6. Visually inspect the aeration system to determine if any hardware was loosened or broken during cleaning.

7. Review and follow the start-up procedure as found in the Installation and Start-up Section of this manual.

SANITAIRE®

LONG TERM STORAGE PROCEDURES

The procedure below was developed to protect the piping and diffusers from environmental damage.

NOTE

It must be understood that Sanitaire assumes no responsibility for damage or cleaning requirements as a result of long term storage.

For use when the aeration system is not in use, air is not available and flooding is undesirable.

1. Drain the tank dry and clean out solids and debris.

NOTE

The floor drains should remain open to prevent water from standing in the pipe system and tank. Equipment flooded by overflows or misdirected sewage flows will probably require cleaning before being placed in service.

CAUTION

Standing water allowed to freeze around the pipe may crush the pipe.

2. Before bringing the system on line, check all hardware for tightness. Check the gaskets and O-ring seals for deterioration or leakage. Replace as required.

ASSEMBLY INFORMATION

- Droplegs, manifolds, and headers are shipped to the jobsite assembled in lengths of 6 meters or less. If total header lengths required are greater than 6 meters the sections must be bolted together. The connection is a follower flange factory welded to the individual sections.

- The dropleg is shipped loose to the jobsite for field connection to header. Connection is a leveling flange with securing bolts.

- Diffusers must be installed on the header in the field. No special tools are needed for tightening.

- Supports must be assembled in the field.

EQUIPMENT WEIGHTS

DROPLEGS: 32 [kg]
MANIFOLDS: 50 [kg]

MAINTENANCE REQUIREMENTS

DAILY

1. No routine maintenance required.

WEEKLY

1. No routine maintenance required.

MONTHLY

1. No routine maintenance required.

BI YEARLY

1. No routine maintenance required.

YEARLY

1. Drain tank.
2. Remove excess settled solids if any have accumulated.
3. Clean diffusers. See I,O&M manual.
4. Inspect support hardware to ensure all components are intact and tight.

- **NO LUBRICATION OF PARTS OR LUBRICATION SCHEDULE IS REQUIRED.**

A. The Air Main headloss (piping, fittings, valves, instrumentation, etc.) between the blower and the aeration assembly dropleg connections.

B. Potential for increased headloss resulting from diffuser fouling and/or aging. Please refer to the US EPA Fine Pore Design Manual (EPA/625/1-89/023), WEF Manual of Practice FD-13, and other technical publications for a detailed discussion on this subject. Note that this headloss consideration relates to all Fine Pore systems regardless of supplier or type of diffuser element.

C. Increased diffuser submergence during Peak Flow conditions.

JCM 166 Fabricated Lug All Stainless Steel Clamps

The JCM 166 Fabricated Lug All Stainless Steel Clamp offers an economical solution to problems such as breaks, splits, cracks, holes in all types of pipe. Available in standard sizes for cast iron, ductile iron, IPS PVC, C-900/905 PVC, steel, asbestos cement, polyethylene. The 166 is a stainless steel clamp that offers all the benefits of stainless: corrosion resistance, lightweight, flexible yet strong. The JCM 166 is especially recommended for hot soil conditions and corrosive environments.

The full circumferential gasket provides a complete repair while the molded in stainless steel bridge plate provides the full stainless steel barrier to aggressive elements.

JCM 166 Fabricated Lug All Stainless Steel Clamp Couplings with EPDM Gasket - Material Specifications

BOLTING ASSEMBLY:	18-8 Type 304 Stainless Steel
BAND:	18-8 Type 304 Stainless Steel
BOLTS AND NUTS:	18-8 Type 304 Stainless Steel
GASKET:	EPDM - has excellent resistance to aging factors including ozone, oxygen, elevated temperatures and fluctuations in weather. Recommended for service in hot water, steam and dry heat. Suitable for popular chemicals - ketones, alcohols, phosphate ester hydraulic fluids, glycols, dilute acids and alkalies. Maximum temperature 300°F wet. Not suitable for petroleum.

EPDM Gasket Material

Property	**Typical Value**
Service Temperature	**275°F Operating/ 300°F Maximum**
Tensile Strength	**1450 psi**
Elongation	**200%**

Strong Stainless Steel Studs - permanently attached to eliminate loose parts and nuts are treated to speed installation and prevent seizing.

Thick Gridded Gasket - with long tapered ends and recessed bridge plate assure even gasket pressure throughout range - without wrinkling or crimping.

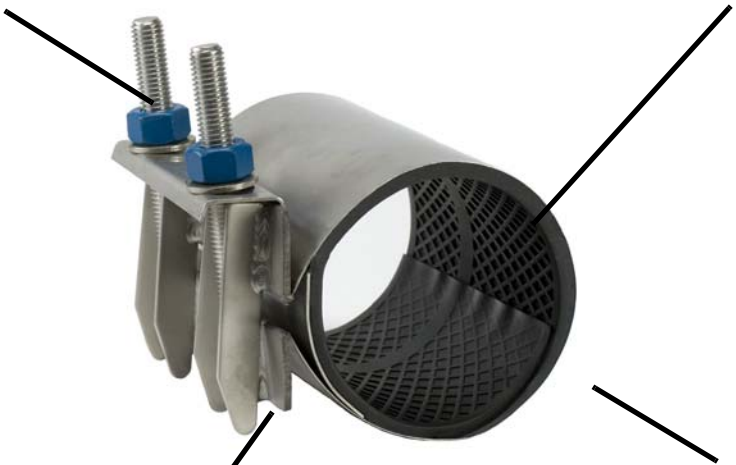

Image Reflects 7” Clamp Width

Positive Attachment of Band to Lugs - strong TIG welds eliminate mechanical weaknesses and prevents band separation. Thick stainless lifter bar plate prevents distortion or warpage during tightening.

Type 304 Stainless Steel Band - conforms to pipe irregularities, maintaining sealing pressure over the entire gasket.

NSF Certified to NSF/ANSI 61

JCM 166 Fabricated Lug Stainless Steel Universal Clamps

The JCM 166 Fabricated Lug All Stainless Steel Clamp offers an economical solution to problems such as breaks, splits, cracks, holes in all types of pipe. Available in standard sizes, the 166 is a stainless steel clamp that offers all the benefits of stainless: corrosion resistance, lightweight, flexible yet strong.

HOW TO ORDER

1. Determine O.D. of pipe.
2. Select proper clamp O.D. range and band width.
3. Determine Model Number.
4. Specify clamp number.
   Example: To fit Cast Iron pipe, 6.90 O.D. with 6" width, order: 166-0690-6

Available Options Upon Request

- Pipe sizes and ranges not listed
- Conductive Buttons
- Specialty Gaskets
- Other Sizes and Ranges

1. Clamp width should be equal to or greater than the pipe diameter for higher working pressures.
2. Not recommended for use for joining plain end pressure pipe.
3. Other ranges and widths available upon request.
4. Clamps do not prevent lateral movement of pipe. Applications in which the pipe may move out of the clamp, proper anchorage of the pipe must be provided.

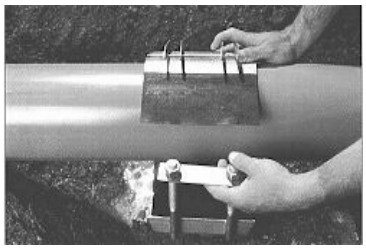
NSF
Certified to NSF/ANSI 61

JCM 166 Fabricated Lug All Stainless Steel Clamp Couplings with EPDM Gasket

INSTALLATION INSTRUCTIONS

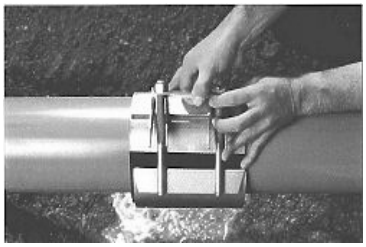
Failure to follow installation instructions will result in voided product warranty

1. Clean and scrape pipe. Remove any dirt or debris that would interfer with the complete sealing of the gasket around the pipe. Lubricate the pipe with soapy water. Do not use oil base pipe lubricant.
   Trick of the Trade: Place a mark on the pipe to each side of the damaged area equal to the width of the clamp. This presents a visual mark to center the repair clamp over the damage area (1/2 of this distance is center).



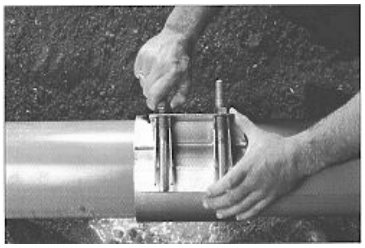
2. Inspect pipe for integrity, size and outside diameter. Confirm the proper size and range of repair clamp. Confirm proper outlet type and size.

3. Open the repair clamp by loosening (without removing) the nuts to the top of the stainless studs/bolts. Disengage the locking “C-Plate” and lift plate to open clamp. Wrap repair clamp around the pipe centering the clamp over the damaged area.



4. Tuck tapered gasket(s) in place ensuring there are no folds in the tapered edge.

5. Loosely close the clamp around the pipe by lifting the C-Plate(s) lip over the lug system stainless receiver bar, meeting the stud and fingers, and lock in place. Rotate the clamp slightly in the direction of the arrow stamped on the clamp band to ensure the tapered gasket lies flat under the clamp. **For Tapped Clamps:** Rotate tapped outlet into proper position.



6. Complete tightening of the clamp by squeezing the lugs together and tighten the nuts. Start at the center bolt and work out toward clamp ends, alternating from one side to the other for equal gap between clamp halves. Continue tightening sequence to reach the appropriate torque levels.

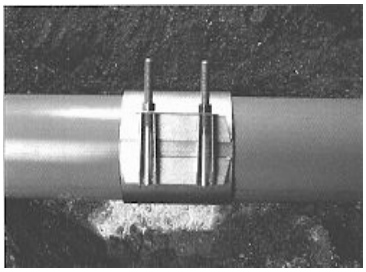
7. Tighten the nuts evenly with a hand wrench to the following torque values. To ensure proper torque level, wait 15 minutes and retighten to recommended torque. *Trick of the Trade: Pneumatic wrenches could cause the stainless nuts to seize on the stainless steel studs.*

5/8” Bolts/Studs tighten to 70 Foot Pounds of Torque*

8. For JCM 163 Tapped Clamps, proceed with tapping process.

***Ensure proper torque level with a field grade torque wrench equal to the JCM 905 Torque Wrench. Thin wall, small diameter & flexible types of pipe are subject to many variables which affect torque values. Use descretion when tightening fittings on thin wall, small diameter & flexible pipe in order to not crush or severly deform the pipe.**

Note: Universal Clamp Couplings do not provide restraint of pipe ends. For applications in which pipe may pull out of clamp, external restraint must be provided.



INT1660212

JCM Industries, Inc. / P. O. Box 1220 / Nash, TX 75569-1220

Recommendations For Installation Of Fittings With Stainless Steel Bolts And Nuts

This JCM Quality Fitting is equipped with 18-8 stainless steel bolts and nuts for superior corrosion resistance. It is the nature of stainless steel fasteners to gall and freeze if not properly handled. This undesirable characteristic is due to the inherent properties of the stainless material. The galling and freezing action is often triggered by the presence of metal chips, burrs and grains of sand on the threads of the bolts and nuts.

Extra care has been taken by JCM prior to assembly and packing of this fitting to assure a trouble-free installation.

1. The nuts and bolts are made from material of different hardness so that they have different strengths.
2. Standard 5/8” and 3/4” nuts are coated with a special (antiseize) coating. Additional lubricant may be needed. Oversized stainless steel hardware is provided without lubrication to prevent a build up of dirt, sand or grit during shipment. **A Molybdenum-Base lubricant is recommended.**
3. Each nut is assembled by hand to be sure that it went on the bolt freely.
4. The bolts and nuts are handled carefully to avoid damage to the threads.
5. The bolts and nuts are made to exacting specifications to assure that the correct material is used and that the thread form is correct.

The specially coated nuts supplied by JCM help to eliminate the galling caused by overtorquing, but **the bolts must be kept clean and not pitched or thrown into the tool bucket during installation.** During field installation, the threads MUST BE KEPT CLEAN AND FREE FROM NICKS.

When a mild steel or bronze bolt is used, the low ultimate strength of the material allows the nut to tear itself free. Not so with 18-8 Stainless Steel. The ultimate strength of the material is so great, that it increases rapidly with cold work. However, once foreign matter such as a grain of sand wedges the threads, or the thread form is altered by over-torquing, the nuts cannot be removed.

NOTE: Installation of this fitting with a pneumatic wrench may cause seizure of the nut. **A JCM 901 Master Wrench or JCM 905 Torque Wrench with Deep Socket is recommended.**

LEED®: Credit 4.1-Low Emitting Materials

The Leadership in Energy and Environmental Design (LEED) Green Building Rating system™ is the nationally accepted benchmark for the design, construction, and operation of high performance green buildings.

1.0 Product Description

The Hilti HIT-HY 200 Adhesive Anchoring System is used to resist static, wind and seismic tension and shear loads in normal-weight concrete having a compressive strength, f'_c, of 2,500 psi to 8,500 psi (17.2 MPa to 58.6 MPa). It is suitable to be used in cracked and uncracked concrete as defined per ICC-ES, ACI, and CSA.

Hilti HIT-HY 200 Adhesive is an injectable two-component hybrid adhesive. The two components are separated by means of a dual-cylinder foil pack attached to a manifold. The two components combine and react when dispensed through a static mixing nozzle attached to the manifold. Hilti HIT-HY 200 Adhesive is available in two options, Hilti HIT-HY 200-A, and Hilti HIT-HY 200-R. Both options utilize the same technical data. Hilti HIT-HY 200-A will have shorter working times and curing times than Hilti HIT-HY 200-R. The packaging for each is different which helps the user distinguish between the two adhesives.

Hilti HIT-HY 200 Adhesive comes with three cleaning options:

1. Traditional cleaning methods comprised of steel wire brushes and air nozzles,
2. Self-cleaning methods using the Hilti TE-CD or TE-YD hollow carbide drill bits used in conjunction of a Hilti vacuum cleaner that will remove drilling dust, automatically cleaning the hole, or
3. Use of the Hilti HIT-Z and HIT-Z-R threaded rods where hole cleaning is not required after drilling the hole. (Exceptions: If base material temperature is less than 41° F (5° C) or if diamond core drilling is used, then cleaning of the drilled hole is required).

Elements that are suitable for use with this system are as follows: threaded steel rods, Hilti HIS-(R)N steel internally threaded inserts, steel reinforcing bars and Hilti HIT-Z and HIT-Z-R specialty rods.

Information on Working Time and Cure Time on page 54

HIT-HY 200 Adhesive Anchoring System

2.0 Technical Data

2.1 Testing and Product Evaluation

Hilti HIT-HY 200 has been tested in accordance with ICC Evaluation Services (ICC-ES) Acceptance Criteria for Post-Installed Adhesive Anchors in Concrete Elements (AC308).

Hilti has had Hilti HIT-HY 200 evaluated according to AC308 and has received ESR-3187 from ICC-ES.

2.2 Adhesive Anchor Design Codes

2.2.1 United States

For post-installed and cast-in anchor systems, design calculations are performed according to ACI 318 Appendix D. This has been a requirement of the International Building Code (IBC) since 2003. ACI 318-11 Appendix D introduced for the first time specific equations for the design of adhesive anchor systems using threaded rod or rebar. Prior to this only post-installed expansion and undercut anchors and cast-in headed studs were recognized.

Prior to the publication of ACI 318-11, designers of post-installed adhesive anchor systems used ACI 318-08 Appendix D and Section 3.3 of AC308 which provides amendments to Appendix D. These amendments provide the relevant equations to design a post-installed adhesive anchor.

At the time of this publication, ESR-3187 for Hilti HIT-HY 200 includes the design provisions for ACI 318-08 and AC308 Section 3.3.

2.2.2 Canada

CSA A23.3-04 Annex D provides the required limit states design equations for post-installed mechanical anchors, and for cast-in headed studs. At the time of this publication, Annex D, which is a non-mandatory part of the Canadian code, does not address adhesive anchor design or test criteria.

Since Annex D does not provide guidance for the design of adhesive anchor systems, it is the position of Hilti that the design provisions of ACI 318-11 Appendix D can be used for the design of Hilti HIT-HY 200 in Canada. The foundations of a proper adhesive anchor design are now well established through ACI 318-11 and a proper chemical anchor design in the United States would be also relevant in Canada. It will be shown in later sections how to relate the results from technical data in this supplement to the Canadian design standard.

2.3 Design of Hilti HIT-HY 200 Adhesive Anchor System

2.3.1 Using technical data in ESR-3187

Technical data for the system components of Hilti HIT-HY 200 can be found in ICC-ES ESR-3187. This includes:

- Hilti HIT-HY 200-A and Hilti HIT-HY 200-R adhesives (with the same technical data).
- Hilti HIT-Z(-R) threaded rod which requires no cleaning.
- Standard threaded rods and rebar.
- Hilti HIS-(R)N internally threaded inserts.
- Hilti TE-CD and TE-YD hollow drill bits which automatically clean the drilled holes, for use with standard threaded rods, rebar, and the Hilti HIS-(R)N internally threaded inserts and have the same technical data as standard cleaning methods.

A designer can use the data in ESR-3187 to calculate the capacity of the Hilti HIT-HY 200 system in the following manner:

- For the Hilti HIT-Z(-R) threaded rods with no cleaning. This is a torque controlled adhesive anchor system, and at the time of this publication there are no provisions in ACI 318 Appendix D to design this system. A proposed design would be according to ACI 318-11 or ACI 318-08 Appendix D and AC308 Section 3.3 amendments to ACI 318.
- For standard threaded rods, rebar and the Hilti HIS-(R)N internally threaded inserts, a design using either ACI 318-11 Appendix D or ACI 318-08 Appendix D and AC308 Section 3.3 amendments to ACI 318 would be appropriate.

The tables from ESR-3187 are not included in this supplement, but can be found by downloading ESR-3187 from www.us.hilti.com or on the ICC-ES website at www.icc-es.org, or by contacting your local Hilti representative.

2.3.2 Using Hilti PROFIS Anchor Design Software

The Hilti PROFIS Anchor Design Software is the most innovative and comprehensive design software available for accurate and complete anchor designs.

For Hilti HIT-HY 200, the data from ESR-3187 is used as the data base for the program. PROFIS Anchor calculates the design capacity of the anchor system according to ACI 318-08 Appendix D and AC308 Section 3.3 amendments to ACI 318. The PROFIS Anchor HIT-HY 200 portfolio consists of the same system components listed in section 2.3.1.

This is the most accurate and best way to optimize the anchor design, especially for anchor systems with multiple anchors,

HIT-HY 200 Adhesive Anchoring System

complicated loading, edge distance constraints, and numerous other conditions.

Hilti PROFIS Anchor Design Software can be downloaded at www.us.hilti.com (US) or www.hilti.ca (Canada). Contact your local Hilti representative for a demonstration on this software at your office.

2.3.3 Using the New Hilti Simplified Design Tables

In lieu of providing a copy of ESR-3187 design tables in this supplement, Hilti is providing a new, simple approach for designing an anchor according to the current codes described in Section 2.2. Refer to Section 2.4 for a description of these new innovative tables.

2.4 Hilti Simplified Design Tables

The Hilti Simplified Design Tables is not a new "method" of designing an anchor that is different than the provisions of ACI 318 Appendix D or CSA A23.3 Annex D. Rather, it is a series of pre-calculated tables and reduction factors meant to help the designer create a quick calculation of the capacity of the Hilti anchor system, and still be compliant with the codes and criteria of ACI and CSA.

The Hilti Simplified Design Tables are formatted similar to the Allowable Stress Design (ASD) tables and reduction factors which was a standard of practice for design of post-installed anchors.

The Hilti Simplified Design Tables combine the simplicity of performing a calculation according to the ASD method with the code-required testing, evaluation criteria and technical data in ACI Appendix D and CSA Annex D.

2.4.1 Simplified Tables Data Development

The Simplified Tables have two table types. The single anchor capacity table and the reduction factor table.

Single anchor capacity tables show the design strength (for ACI) or factored resistance (for CSA) in tension and shear for a single anchor. This is the capacity of a single anchor with no edge distance or concrete thickness influences and is based on the assumptions outlined in the footnotes below each table.

Reduction factor tables are created by comparing the single anchor capacity to the capacity that includes the influence of a specific edge distance, spacing, or concrete thickness, using the equations of ACI 318-11 Appendix D.

2.4.2 Hilti HIT-Z(-R) Anchor Rods

The single anchor tension capacity is based on the lesser of concrete breakout strength or pullout strength:

ACI/AC308: $\Phi N_n = \min | \Phi N_{cb} ; \Phi N_{pn} |$

CSA: $N_r = \min | N_{cbr} ; N_{cpr} |$

$\Phi N_n = N_r$

The shear value is based on the pryout strength.

ACI/AC308: $\Phi V_n = \Phi V_{cp}$

CSA: $V_r = V_{cpr}$

$\Phi V_n = V_r$

Concrete breakout and pryout are calculated according to ACI 318 Appendix D and CSA A23.3 Annex D using the variables from ESR-3187. These values are equivalent.

Pullout for torque controlled adhesive anchors is not recognized in ACI or CSA, so this is determined from AC308 Section 3.3 and the value of $N_{p,uncr}$ or $N_{p,cr}$ from ESR-3187. This is a similar approach to mechanical anchor pullout strength. ACI and CSA values are equivalent.

2.4.3 Standard Threaded Rods, Rebar, and Hilti HIS-(R)N Internally Threaded Inserts

The single anchor tension capacity is based on the lesser of concrete breakout strength or bond strength:

ACI: $\Phi N_n = \min | \Phi N_{cb} ; \Phi N_a |$

CSA/ACI: $N_r = \min | N_{cbr} ; N_a |$

$\Phi N_n = N_r$

The shear value is based on the pryout strength.

ACI: $\Phi V_n = \Phi V_{cp}$

CSA/ACI: $V_r = V_{cpr}$

$\Phi V_n = V_r$

Concrete breakout is calculated according to ACI 318 Appendix D and CSA A23.3 Annex D using the variables from ESR-3187. These values are equivalent.

Bond strength is not recognized in CSA, so this is determined from ACI 318-11 Appendix D for both the US and Canada.

2.4.4 Steel Strength for All Elements

The steel strength is provided on a separate table and is based on calculations from ACI 318 Appendix D and CSA A23.3 Annex D. ACI and CSA have different reduction factors for steel strength, thus the values for both ACI and CSA are published.

2.4.5 How to Calculate Anchor Capacity Using Simplified Tables

The process for calculating the capacity of a single anchor or anchor group is similar to the ASD calculation process currently outlined in the 2011 North American Product Technical Guide Volume 2: Anchor Fastening Technical Guide on page 19.

The design strength (factored resistance) of an anchor is obtained as follows:

Tension:

ACI: $N_{des} = n \bullet min \mid \Phi N_n \bullet f_{AN} \bullet f_{RN} ; \Phi N_{sa} \mid$

CSA: $N_{des} = n \bullet min \mid N_r \bullet f_{AN} \bullet f_{RN} ; N_{sr} \mid$

Shear:

ACI: $V_{des} = n \bullet min \mid \Phi V_n \bullet f_{AV} \bullet f_{RV} \bullet f_{HV} ; \Phi V_{sa} \mid$

CSA: $V_{des} = n \bullet min \mid V_r \bullet f_{AV} \bullet f_{RV} \bullet f_{HV} ; V_{sr} \mid$

where:

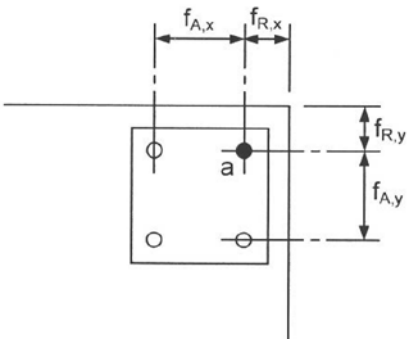
- n = number of anchors
- N_{des} = design resistance in tension
- ΦN_n = design strength in tension considering concrete breakout, pullout, or bond failure (ACI)
- ΦN_{sa} = design strength in tension considering steel failure (ACI)
- N_r = factored resistance in tension considering concrete breakout, pullout, or bond failure (CSA)
- N_{sr} = factored resistance in tension considering steel failure (CSA)
- V_{des} = design resistance in shear
- ΦV_n = design strength in shear considering concrete failure (ACI)
- ΦV_{sa} = design strength in shear considering steel failure (ACI)
- V_r = factored resistance in shear considering concrete failure (CSA)
- V_{sr} = factored resistance in shear considering steel failure (CSA)
- f_{AN} = adjustment factor for spacing in tension
- f_{RN} = adjustment factor for edge distance in tension
- f_{AV} = adjustment factor for spacing in shear
- f_{RV} = adjustment factor for edge distance in shear
- f_{HV} = adjustment factor for concrete thickness in shear (this is a new factor that ASD did not use previously)

Adjustment factors are applied for all applicable near edge and spacing conditions.

For example, the capacity in tension corresponding to the anchor group based on worst case anchor “a” in the figure below is evaluated as follows:

ACI: $N_{des} = 4 \bullet \Phi N_n \bullet f_{A,x} \bullet f_{A,y} \bullet f_{R,x} \bullet f_{R,y}$

CSA: $N_{des} = 4 \bullet N_r \bullet f_{A,x} \bullet f_{A,y} \bullet f_{R,x} \bullet f_{R,y}$



Note: designs are for orthogonal anchor bolt patterns and no reduction factor for the diagonally located adjacent anchor is required.

Where anchors are loaded simultaneously in tension and shear, interaction must be considered. The interaction equation is as follows:

ACI: $$\frac{N_{ua}}{N_{des}} + \frac{V_{ua}}{V_{des}} \leq 1.2$$

CSA: $$\frac{N_f}{N_{des}} + \frac{V_f}{V_{des}} \leq 1.2$$

where:

- N_{ua} = Required strength in tension based on factored load combinations of ACI 318 Chapter 9.
- V_{ua} = Required strength in shear based on factored load combinations of ACI 318 Chapter 9.
- N_f = Required strength in tension based on factored load combinations of CSA A23.3 Chapter 8.
- V_f = Required strength in shear based on factored load combinations of CSA A23.3 Chapter 8.

The full tension strength can be permitted if:

ACI: $$\frac{V_{ua}}{V_{des}} \leq 0.2$$

CSA: $$\frac{V_f}{V_{des}} \leq 0.2$$

HIT-HY 200 Adhesive Anchoring System

The full shear strength can be permitted if:

ACI: $\frac{N_{ua}}{N_{des}} \leq 0.2$

CSA: $\frac{N_f}{N_{des}} \leq 0.2$

2.4.6 Allowable Stress Design (ASD)

The values of N_{des} and V_{des} developed from Section 2.4.5 are design strengths (factored resistances) and are to be compared to the required strength in tension and shear from factored load combinations of ACI 318 Chapter 9 or CSA A23.3 Chapter 8.

The design strength (factored resistance) can be converted to an ASD value as follows:

$$N_{des,ASD} = \frac{N_{des}}{\alpha_{ASD}}$$

$$V_{des,ASD} = \frac{V_{des}}{\alpha_{ASD}}$$

where:

α_{ASD} = Conversion factor calculated as a weighted average of the load factors for the controlling load combination.

An example for the calculation of α_{ASD} is as follows:

Controlling strength design load combination is 1.2D + 1.6L, % contribution is 30% D, 70% L

α_{ASD} = 1.2 x 0.30 + 1.6 x 0.70 = 1.48

2.4.7 Seismic Design

To determine the seismic design strength (factored resistance) a reduction factor, α_{seis}, is applied to the applicable table values. This value of α_{seis} will be in the footnotes of the relevant design tables.

The value of α_{seis} for concrete / bond / pullout failure is based on 0.75 times a reduction factor determined from testing. The total reduction is footnoted in the tables.

The value of α_{seis} for steel failure is based on testing and is typically only applied for shear. There is no additional 0.75 factor. The reduction is footnoted in the tables.

The factored load and associated seismic load combinations that will be compared to the design strength (factored resistance) can be determined from ACI or CSA provisions and national or local code requirements. An additional value for $\phi_{non\text{-}ductile}$ may be needed based on failure mode or ductility of the attached components.

2.4.8 Sustained Loads and Overhead Use

Sustained loading is calculated by multiplying the value of ΦN_n or N_r by 0.55 and comparing the value to the tension dead load contribution (and any sustained live loads or other loads) of the factored load. Edge, spacing, and concrete thickness influences do not need to be accounted for when evaluating sustained loads.

Consideration of sustained loads is based on ACI 318-11 Appendix D. Since sustained loading is not addressed in CSA A23.3 Annex D, it is reasonable to use this approach for CSA based designs.

2.4.9 Accuracy of the Simplified Tables

Calculations using the Simplified Tables have the potential of providing a design strength (factored resistance) that is exactly what would be calculated using equations from ACI 318 Appendix D or CSA A23.3 Annex D.

The tables for the single anchor design strength (factored resistance) for concrete / bond / pullout failure or steel failure have the same values that will be computed using the provisions of ACI and CSA.

The load adjustment factors for edge distance influences are based on a single anchor near an edge. The load adjustment factors for spacing are determined from the influence of two adjacent anchors. Each reduction factor is calculated for the minimum value of either concrete or bond failure. When more than one edge distance and/or spacing condition exists, the load adjustment factors are multiplied together. This will result in a conservative design when compared to a full calculation based on ACI or CSA. Additionally, if the failure mode in the single anchor tables is controlled by concrete failure, and the reduction factor is controlled by bond failure, this will also give a conservative value (and vice versa).

The following is a general summary of the accuracy of the simplified tables:

- Single anchor tables have values equivalent to a calculation according to ACI or CSA.
- Since the table values, including load adjustment factors, are calculated using equations that are not linear, linear interpolation is not permitted. Use the smaller of the two table values listed. This provides a conservative value if the application falls between concrete compressive strengths, embedment depths, or spacing, edge distance, and concrete thickness.
- For one anchor near one edge, applying the edge distance factor typically provides accurate values

provided the failure mode of the table values is the same. If the failure mode is not the same, the values are conservative.

- For two to four anchors in tension with no edge reductions, applying the spacing factors provides a value that is equivalent to the ACI and CSA calculated values, provided the controlling failure modes of the table values are the same. If the failure mode is not the same, the values are conservative.
- The spacing factor in shear is conservative when compared to two anchors with no edge distance considerations. This factor is based on spacing near an edge and can be conservative for installations away from the edge of the concrete member. Note: for less conservative results, it is possible to use the spacing factor in tension for this application if there is no edge distance to consider.
- The concrete thickness factor in shear is conservative when compared to an anchor with no edge influences. This factor is based on applications near an edge. In the middle of a concrete member this is conservative. Note: for less conservative results, this factor can be ignored if the application is not near an edge.
- The load adjustment factors are determined by calculations according to ACI 318-11 Appendix D. This is more conservative than ACI 318-08 Appendix D because the $\psi_{g,Na}$ factor, which is always greater than or equal to 1.0, does not need to be calculated. Thus, some calculations will be more conservative than a calculation from the Hilti PROFIS Anchor Design Software (PROFIS uses ACI 318-08).

IMPORTANT NOTE:

For applications such as a four bolt or six bolt anchor pattern in a corner in a thin slab, the calculation can be up to 80% conservative when compared to a calculation according to ACI or CSA, and when using the Hilti PROFIS Anchor Design Software. It is always suggested to use the Hilti PROFIS Anchor Design Software or perform a calculation by hand using the provisions of ACI and CSA to optimize the design. This is especially true when the Simplified Table calculation does not provide a value that satisfies the design requirements. The fact that a Simplified Table calculation does not exceed a design load does not mean the HIT-HY 200 Adhesive system will not fulfill the design requirements. Additional assistance can be given by your local Hilti representative.

2.4.10 Limitations Using Simplified Tables

There are additional limitations that the Simplified Tables do not consider:

- Load Combinations: Table values are meant to be used with the load combinations of ACI 318 Section 9.2 and CSA A23.3 Chapter 8.
- Supplementary Reinforcement: Table values, including reduction factors, are based on Condition B which does not consider the effects of supplementary reinforcement, nor is there an influence factor that can be applied to account for supplementary reinforcement.
- Eccentric loading: Currently, there is not a method for applying a factor to the tables to account for eccentric loading.
- Moments or Torsion: While a designer can apply a moment or torsion to the anchor system and obtain a specific load per anchor, the tables themselves do not have specific factors to account for moments or torsion applied to the anchor system.
- Standoff: Standoff is not considered in the steel design tables.
- Anchor layout: The Simplified Tables assume an orthogonal layout.

As stated above, while the Simplified Tables are limited in application, the designer can use the Hilti PROFIS Anchor Design Software which does account for the conditions noted above.

There may be additional applications not noted above. Contact Hilti with any questions for specific applications.

	25 (635)	97,500 (433.7)	106,805 (475.1)	119,905 (533.4)	127,100 (565.4)	210,000 (934.1)	230,045 (1023.3)	258,260 (1148.8)	273,755 (1217.7)

1 See Section 2.4 for explanation on development of load values.
2 See Section 2.4.6 to convert design strength (factored resistance) value to ASD value.
3 Linear interpolation between embedment depths and concrete compressive strengths is not permitted.
4 Apply spacing, edge distance, and concrete thickness factors in tables 52 - 65 as necessary. Compare to the steel values in tables 51 and 52. The lesser of the values is to be used for the design.
5 Data is for temperature range A: Max. short term temperature = 104° F (40° C), max. long term temperature = 75° F (24° C).
For temperature range B: Max. short term temperature = 176° F (80° C), max. long term temperature = 122° F (50° C) multiply above value by 0.80.
For temperature range C: Max. short term temperature = 248° F (120° C), max. long term temperature = 162° F (72° C) multiply above value by 0.70.
Short term elevated concrete temperatures are those that occur over brief intervals, e.g., as a result of diurnal cycling. Long term concrete temperatures are roughly constant over significant periods of time.
6 Tabular values are for dry concrete conditions. For water saturated concrete multiply design strength (factored resistance) by 0.85.
7 Tabular values are for short term loads only. For sustained loads including overhead use, see Section 2.4.8.
8 Tabular values are for normal weight concrete only. For lightweight concrete multiply design strength (factored resistance) by λ_a as follows:
For sand-lightweight, λ_a = 0.51. For all-lightweight, λ_a = 0.45.

HIT-HY 200 Adhesive Anchoring System

Table 49 — Hilti HIT-HY 200 Adhesive Design Strength (Factored Resistance) with Concrete / Bond Failure for Fractional Threaded Rod in Cracked Concrete [1,2,3,4,5,6,7,8,9]

Anchor Diameter in. (mm)	Effective Embedment Depth in. (mm)	Tension — ΦN_n or N_r				Shear — ΦV_n or V_r			
		f'_c = 2500 psi (17.2 Mpa) lb (kN)	f'_c = 3000 psi (20.7 Mpa) lb (kN)	f'_c = 4000 psi (27.6 Mpa) lb (kN)	f'_c = 6000 psi (41.4 Mpa) lb (kN)	f'_c = 2500 psi (17.2 Mpa) lb (kN)	f'_c = 3000 psi (20.7 Mpa) lb (kN)	f'_c = 4000 psi (27.6 Mpa) lb (kN)	f'_c = 6000 psi (41.4 Mpa) lb (kN)

	25 (635)	58,070 (258.3)	58,070 (258.3)	58,070 (258.3)	61,555 (273.8)	125,075 (556.4)	125,075 (556.4)	125,075 (556.4)	132,580 (589.7)

1 See Section 2.4 for explanation on development of load values.
2 See Section 2.4.6 to convert design strength (factored resistance) value to ASD value.
3 Linear interpolation between embedment depths and concrete compressive strengths is not permitted.
4 Apply spacing, edge distance, and concrete thickness factors in tables 52 - 65 as necessary. Compare to the steel values in tables 51 and 52. The lesser of the values is to be used for the design.
5 Data is for temperature range A: Max. short term temperature = 104° F (40° C), max. long term temperature = 75° F (24° C).
For temperature range B: Max. short term temperature = 176° F (80° C), max. long term temperature = 122° F (50° C) multiply above value by 0.80.
For temperature range C: Max. short term temperature = 248° F (120° C), max. long term temperature = 162° F (72° C) multiply above value by 0.70.
Short term elevated concrete temperatures are those that occur over brief intervals, e.g., as a result of diurnal cycling. Long term concrete temperatures are roughly constant over significant periods of time.
6 Tabular values are for dry concrete conditions. For water saturated concrete multiply design strength (factored resistance) by 0.85.
7 Tabular values are for short term loads only. For sustained loads including overhead use, see Section 2.4.8.
8 Tabular values are for normal weight concrete only. For lightweight concrete multiply design strength (factored resistance) by λ_a as follows:
For sand-lightweight, λ_a = 0.51. For all-lightweight, λ_a = 0.45.
9 Tabular values are for static loads only. For seismic loads, multiply cracked concrete tabular values by the following reduction factors:
3/8-in to 3/4-in diameter - α_{seis} = 0.60
7/8-in to 1-1/4-in diameter - α_{seis} = 0.75
See Section 2.4.7 for additional information on seismic applications.

	>48 (1219)												1.00												

1 Linear interpolation not permitted
2 Shaded area with reduced edge distance is permitted provided the installation torque is reduced to 0.30 T_{max} for $5d \le s \le$ 16-in. and to 0.5 T_{max} for $s >$ 16-in.
3 Spacing factor reduction in shear, f_{AV}, assumes an influence of a nearby edge. If no edge exists, then $f_{AV} = f_{AN}$.
4 Concrete thickness reduction factor in shear, f_{HV}, assumes an influence of a nearby edge. If no edge exists, then $f_{HV} = 1.0$.

HIT-HY 200 Adhesive Anchoring System

1 Linear interpolation not permitted
2 Shaded area with reduced edge distance is permitted provided the installation torque is reduced to 0.30 T_{max} for $5d \le s \le$ 16-in. and to 0.5 T_{max} for $s >$ 16-in.
3 Spacing factor reduction in shear, f_{AV}, assumes an influence of a nearby edge. If no edge exists, then $f_{AV} = f_{AN}$.
4 Concrete thickness reduction factor in shear, f_{HV}, assumes an influence of a nearby edge. If no edge exists, then $f_{HV} = 1.0$.

1 Linear interpolation not permitted
2 Shaded area with reduced edge distance is permitted provided the installation torque is reduced to 0.30 T_{max} for $5d \le s \le$ 16-in. and to 0.5 T_{max} for $s >$ 16-in.
3 Spacing factor reduction in shear, f_{AV}, assumes an influence of a nearby edge. If no edge exists, then $f_{AV} = f_{AN}$.
4 Concrete thickness reduction factor in shear, f_{HV}, assumes an influence of a nearby edge. If no edge exists, then $f_{HV} = 1.0$.

1 Linear interpolation not permitted
2 Shaded area with reduced edge distance is permitted provided the installation torque is reduced to 0.30 T_{max} for $5d \le s \le$ 16-in. and to 0.5 T_{max} for $s >$ 16-in.
3 Spacing factor reduction in shear, f_{AV}, assumes an influence of a nearby edge. If no edge exists, then $f_{AV} = f_{AN}$.
4 Concrete thickness reduction factor in shear, f_{HV}, assumes an influence of a nearby edge. If no edge exists, then $f_{HV} = 1.0$.

1 Linear interpolation not permitted
2 Shaded area with reduced edge distance is permitted provided the installation torque is reduced to 0.30 T_{max} for $5d \le s \le$ 16-in. and to 0.5 T_{max} for $s >$ 16-in.
3 Spacing factor reduction in shear, f_{AV}, assumes an influence of a nearby edge. If no edge exists, then $f_{AV} = f_{AN}$.
4 Concrete thickness reduction factor in shear, f_{HV}, assumes an influence of a nearby edge. If no edge exists, then $f_{HV} = 1.0$.

1 Linear interpolation not permitted
2 Shaded area with reduced edge distance is permitted provided the installation torque is reduced to 0.30 T_{max} for $5d \le s \le$ 16-in. and to 0.5 T_{max} for $s >$ 16-in.
3 Spacing factor reduction in shear, f_{AV}, assumes an influence of a nearby edge. If no edge exists, then $f_{AV} = f_{AN}$.
4 Concrete thickness reduction factor in shear, f_{HV}, assumes an influence of a nearby edge. If no edge exists, then $f_{HV} = 1.0$.

HIT-HY 200 Adhesive Anchoring System

1 Linear interpolation not permitted
2 Shaded area with reduced edge distance is permitted provided the installation torque is reduced to 0.30 T_{max} for $5d \le s \le$ 16-in. and to 0.5 T_{max} for $s >$ 16-in.
3 Spacing factor reduction in shear, f_{AV}, assumes an influence of a nearby edge. If no edge exists, then $f_{AV} = f_{AN}$.
4 Concrete thickness reduction factor in shear, f_{HV}, assumes an influence of a nearby edge. If no edge exists, then $f_{HV} = 1.0$.

HIT-HY 200 Adhesive Anchoring System

2.4.14 Installation Instructions

Installation Instructions For Use (IFU) are included with each product package. They can also be viewed or downloaded on-line at **www.us.hilti.com (US)** and **www.hilti.ca (Canada)** — "Service/Technical Info >> Technical Downloads >> Anchoring Systems". Because of the possibility of changes, always verify that downloaded IFU are current when used. Proper installation is critical to achieve full performance. Training is available on request. Contact Hilti Technical Services for applications and conditions not addressed in the IFU.

CONSULTANT APPROVAL

STANTEC PROJECT #: 110126045

SUBMITTAL # DA-MP-37-Victaulic couplings (DI piping)

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

- ☑ Process
- ☐ Structural
- ☐ Mechanical
- ☐ Electrical
- ☐ Other

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

Victaulic® Grooved Coupling
Style 31

23.02

Patented

1.0 PRODUCT DESCRIPTION

Available Sizes

- 2 – 36"/DN80 – DN900

Pipe Material

- Ductile Iron with a minimum wall thickness of ANSI/AWWA C151/A21.51, Class 53

Maximum Working Pressure

- Up to 500 psi/3450 kPa

Function

- Provides a fully restrained pipe joint to the published maximum allowable working pressure.
- Joints are rigid or flexible depending on groove style.
- Rigid joints resist axial and angular movement.
- Flexible joints allow for restrained axial and angular movement to the couplings published capabilities.

2.0 CERTIFICATION/LISTINGS

Coupling design, materials and testing conform to the requirements of AWWA C606 standard for Grooved and Shouldered Joints.

NOTES

- Refer to Victaulic publication 10.01 for details

ALWAYS REFER TO ANY NOTIFICATIONS AT THE END OF THIS DOCUMENT REGARDING PRODUCT INSTALLATION, MAINTENANCE OR SUPPORT.

3.0 SPECIFICATIONS – MATERIAL

Housing: Ductile iron conforming to ASTM A536, Grade 65-45-12. Ductile iron conforming to ASTM A395, Grade 65-45-15, is available upon special request.

Housing Coating: (specify choice)

- ☐ Standard: Phenolic Alkyd Primer (2.5 mil).
- ☐ Optional: Orange enamel.
- ☐ Optional: Coal tar epoxy coating (3 mils).
- ☐ Organic zinc primer (3 mils).
- ☐ Bituminous coating.

NOTE

- Others available, contact Victaulic.

Gasket: (specify choice[1])

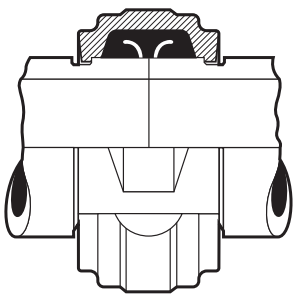
- ☐ **Grade "M" FlushSeal™**
  Halogenated Butyl (Brown color code). Temperature range –20°F to +200°F/–29°C to +93°C. Specially compounded to conform to ductile pipe surfaces. Recommended for water service within the specified temperature range plus a variety of dilute acids, oil-free air, and many chemical services. UL classified in accordance with ANSI/NSF 61 for cold +86° F/+30°C potable water service. NOT RECOMMENDED FOR PETROLEUM SERVICES.
- ☐ **Grade "S" FlushSeal™**
  Nitrile (Red color code). Temperature range –20°F to +180°F/–29°C to + 82°C. Specifically compounded to conform to ductile pipe surfaces. Recommended for petroleum products, air with oil vapors, vegetable and mineral oils within the specified temperature range; except hot air over +140° F/+60° C and water over +150° F/+66°C. NOT RECOMMENDED FOR HOT WATER SERVICES.

[1] Services listed are General Service Guidelines only. It should be noted that there are services for which these gaskets are not compatible. Reference should always be made to the latest Victaulic Seal Selection Guide for specific gasket service guidelines and for a listing of services which are not compatible.

Bolts/Nuts: (specify choice)

- ☐ Standard: Carbon steel oval neck track bolts meeting the mechanical property requirements of ASTM A449 (imperial) and ISO 898-1 Class 9.8 (M10-M16) Class 8.8 (M20 and greater). Carbon steel hex nuts meeting the physical and chemical requirements of ASTM A563 Grade B (imperial - heavy hex nuts) and ASTM A563M Class 9 (metric - hex nuts). Track bolts and hex nuts are zinc electroplated per ASTM B633 ZN/FE5, finish Type III (imperial) or Type II (metric).
- ☐ Optional: Stainless steel oval neck track bolts meeting the requirements of ASTM F593, Group 2 (316 stainless steel), condition CW. Stainless steel heavy hex nuts meeting the requirements of ASTM F594, Group 2 (316 stainless steel), condition CW, with galling-resistant coating.[2]

[2] Optional bolts/nuts are available in imperial size only.



Exaggerated for Clarity

[3] Number of bolts required equals number of housing segments. Metric thread size bolts are available (color coded gold) for all coupling sizes upon request. Contact Victaulic for details.

NOTES

- WARNING: Depressurize and drain the piping system before attempting to install, remove, or adjust any Victaulic piping products.
- WARNING: FOR ONE TIME FIELD TEST ONLY, the Maximum Joint Working Pressure may be increased to 1 ½ times the figures shown.

4 Allowable Pipe End Separation and Deflection figures show the maximum nominal range of movement available at each joint for pipe prepared to flexible cut grooved specifications. Pipe cut grooved to rigid cut grooved specifications does not permit expansion and contraction.

5 Working Pressure and End Load are total, from all internal and external loads, based on AWWA class 53 or higher ductile iron pipe radius cut grooved in accordance with Victaulic published radius cut groove dimensions.

NOTE

- WARNING: FOR ONE TIME FIELD TEST ONLY, the Maximum Joint Working Pressure may be increased to 1 ½ times the figures shown.

No statement contained herein concerning a possible or suggested use of any material, product, service, or design is intended, or should be constructed, to grant any license under any patent or other intellectual property right of Victaulic or any of its subsidiaries or affiliates covering such use or design, or as a recommendation for the use of such material, product, service, or design in the infringement of any patent or other intellectual property right. The terms "Patented" or "Patent Pending" refer to design or utility patents or patent applications for articles and/or methods of use in the United States and/or other countries.

Note
This product shall be manufactured by Victaulic or to Victaulic specifications. All products to be installed in accordance with current Victaulic installation/assembly instructions. Victaulic reserves the right to change product specifications, designs and standard equipment without notice and without incurring obligations.

Installation
Reference should always be made to the Victaulic installation handbook or installation instructions of the product you are installing. Handbooks are included with each shipment of Victaulic products, providing complete installation and assembly data, and are available in PDF format on our website at www.victaulic.com.

Warranty
Refer to the Warranty section of the current Price List or contact Victaulic for details.

Trademarks
Victaulic and all other Victaulic marks are the trademarks or registered trademarks of Victaulic Company, and/or its affiliated entities, in the U.S. and/or other countries.

Victaulic® Transition Couplings
Style 307

23.03

Patented

1.0 PRODUCT DESCRIPTION

Available Sizes

- 3 – 12"/DN80 – DN300

Maximum Working Pressure

- Up to 500 psi/3450 kPa

Application

- Provides direct transition from cut or roll grooved IPS pipe to AWWA ductile iron pipe. For TWAS pumps assembly
- Provides a rigid pipe joint designed to restrict axial or angular movement.

Pipe Material

- Steel and ductile iron.

2.0 CERTIFICATION/LISTINGS

NOTE

- Refer to Victaulic publication 10.01 for details

ALWAYS REFER TO ANY NOTIFICATIONS AT THE END OF THIS DOCUMENT REGARDING PRODUCT INSTALLATION, MAINTENANCE OR SUPPORT.

3.0 SPECIFICATIONS – MATERIAL

Housing: Ductile iron conforming to ASTM A536, Grade 65-45-12. Ductile iron conforming to ASTM A395, Grade 65-45-15, is available upon special request.

Housing Coating: (specify choice)

☐ Standard: Orange enamel.

On request the following are available:

☐ Alkyd-phenolic primer (1.5 mil).

☐ Coal tar epoxy coating (3 mils).

☐ Optional: Organic zinc primer (3 mils).

☐ Optional: Bituminous coating.

☐ Optional: Hot dipped galvanized.

NOTE

- Others available, contact Victaulic.

Gasket: (specify choice[1])

☐ **Grade "M" Flush-Seal™**
Halogenated Butyl (Brown color code). Temperature range –20°F to +200°F/–29°C to +93°C. Specially compounded to conform to ductile pipe surfaces. Recommended for water service within the specified temperature range plus a variety of dilute acids, oil-free air, and many chemical services. UL classified in accordance with ANSI/NSF 61 for cold +86°F/+30°C potable water service. NOT RECOMMENDED FOR PETROLEUM SERVICES.

☐ **Grade "S" Flush-Seal™**
Nitrile (Red color code). Temperature range –20°F to +180°F/–29°C to + 82°C. Specifically compounded to conform to ductile pipe surfaces. Recommended for petroleum products, air with oil vapors, vegetable and mineral oils within the specified temperature range; except hot air over +140° F/+60° C and water over +150° F/+66°C. NOT RECOMMENDED FOR HOT WATER SERVICES.

1 Services listed are General Service Guidelines only. It should be noted that there are services for which these gaskets are not compatible. Reference should always be made to the latest Victaulic Seal Selection Guide for specific gasket service guidelines and for a listing of services which are not compatible.

Bolts/Nuts: (specify choice[2])

☐ **Standard:** Carbon steel oval neck track bolts meeting the mechanical property requirements of ASTM A449 (imperial) and ISO 898-1 Class 9.8 (M10-M16) Class 8.8 (M20 and greater). Carbon steel hex nuts meeting the mechanical property requirements of ASTM A563 Grade B (imperial – heavy hex nuts) and ASTM A563M Class 9 (metric – hex nuts). Track bolts and hex nuts are zinc electroplated per ASTM B633 ZN/FE5, finish Type III (imperial) or Type II (metric).

☐ **Optional (imperial):** Stainless steel oval neck track bolts meeting the mechanical property requirements of ASTM F593, Group 2 (316 Stainless Steel), condition CW. Stainless steel heavy nuts meeting the mechanical property requirements of ASTM F594, Group 2 (316 stainless steel), condition CW, with galling reducing coating.

2 Optional bolts/nuts are available in imperial size only.

6.0 NOTIFICATIONS

- WARNING: FOR ONE TIME FIELD TEST ONLY, the Maximum Joint Working Pressure may be increased to 1 ½ times the figures shown.
- For field installation only. Style 307 Transition couplings are essentially rigid and do not permit expansion/contraction.

⚠ WARNING

- **Read and understand all instructions before attempting to install, remove, adjust, or maintain any Victaulic piping products.**
- **Depressurize and drain the piping system before attempting to install, remove, adjust, or maintain any Victaulic piping products.**
- **Wear safety glasses, hardhat, and foot protection.**

Failure to follow these instructions could result in death or serious personal injury and property damage.

[5] Working Pressure and End Load are total, from all internal and external loads, based on AWWA class 53 ductile iron pipe radius cut grooved in accordance with ANSI/AWWA C-606 and Victaulic specifications. Contact Victaulic for performance on other pipe.

NOTE

- WARNING: FOR ONE TIME FIELD TEST ONLY, the Maximum Joint Working Pressure may be increased to 1½ times the figures shown.

6.0 NOTIFICATIONS

Important Installation Considerations

- The gasket seating surfaces on the pipe and on the face of the mating flange must be free from gouges, indentations and deformities of any type for proper sealing. Refer to the installation instructions for complete information.
- Vic-Flange Adapters must be assembled so there is no interference with mating components.
- When wafer or lug-type valves are used adjoining a Victaulic fitting, check disc dimensions to ensure proper clearance.
- Vic-Flange Adapters must not be used as anchor points for tie rods across non-restrained joints.
- Mating Vic-Flange Adapters to rubber faced flanges, valves, etc. requires the use of a Vic-Flange Washer. Refer to the "Vic-Flange Washer Notes" section below.
- The lettering on the outside of the gasket must face the gasket pocket of the Vic-Flange Adapter. When installed correctly, the lettering on the gasket will not be visible.
- When mating two Vic-Flange Adapters, the hinge points/ draw bolt locations must be staggered, and a flange washer (3" – 12") or transition ring (14" – 24") must be used between the two Vic-Flange Adapters.

 © 2017 Victaulic Company. All rights reserved.

6.0 NOTIFICATIONS (Continued)

Vic-Flange Adapters require a smooth, hard surface at the mating flange face for proper sealing. Some applications, for which the Vic-Flange Adapter is otherwise well suited, do not provide an adequate mating surface. In such cases, a metal Vic-Flange Washer is recommended for insertion between the Vic-Flange Adapter and the mating flange to provide the necessary sealing surface. To ensure the proper Vic-Flange Washer is supplied, always specify the product style and size when ordering.

A. When mating to a serrated flange – a flange gasket should be used against the serrated flange. The Vic-Flange Washer should then be inserted between the Vic-Flange Adapter and the flange gasket.

B. When mating to a wafer-type valve that is rubber lined and partially rubber-faced (smooth or not) – the Vic-Flange Washer should be placed between the valve and the Vic-Flange Adapter.

C. When mating to a rubber-faced flange, valve, etc. – the Vic-Flange Washer must be placed between the Vic-Flange Adapter and the rubber-faced flange.

D. When mating to components (valves, strainers, etc.) where the component flange face has an insert – follow the same arrangement as if the Vic-Flange Adapter was being mated to a serrated flange. Refer to application "A" above.

E. When mating AWWA cast flanges to IPS flanges – the Vic-Flange Transition Ring is placed between the two Vic- Flange Adapters with the draw bolt locations staggered. If one flange is not a Vic-Flange Adapter (i.e. flanged valve), a flange gasket must be placed against that flange. The Vic-Flange Washer must then be inserted between the flange gasket and the Vic-Flange gasket. NOTE: Transition rings, rather than Vic-Flange Washers, must be used when mating Style 741 Vic-Flange Adapters to Style 341 Vic-Flange Adapters in sizes 14 – 24" (DN350 – DN600).

Torque Requirements

Vic-Flange adapters should be installed using the bolt torque listed below:

- 14 – 16" Sizes: 250 – 300 ft. lbs. (339 – 407 N•m)
- 18 – 20" Sizes: 300 – 350 ft. lbs. (407 – 475 N•m)
- 24" Size: 350 - 400 ft. lbs. (475 – 542 N•m)

Exceeding these values may create leakage. Additional levels of torque will not enhance gasket sealing.

CONSULTANT APPROVAL

STANTEC PROJECT #: 110126045

SUBMITTAL # DA-MP-38R1 Identification

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

☑ Process ☐ Electrical
☐ Structural ☐ Other
☐ Mechanical

Stantec

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

Objet: Iqaluit WWTP: DA-MP-39 DI2 piping
Pièces jointes: image004.emz; DA-MP-39-DI2 piping (TWAS to BFP) (2019-02-12).pdf

Sandra,
Please see attachment for approval.

Note that:

- Pump intake is 60mm higher than on Stantec drawings as per Veolia shop drawing.
- PI and PSH mounting details will be provided in another shop drawing.
- Grooved DI spools are limited in length. For safety issues, Victaulic recommends 200mm to be the minimum length. Shop fabricated can be somewhat shorter. Therefore, spool T5B and associated reducer will have to be made of stainless steel.

Thanks

STANTEC PROJECT #: 110126045

SUBMITTAL # DA-MP-40 PIT, PSH, BV16

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

- [x] Process
- [ ] Structural
- [ ] Mechanical
- [ ] Electrical
- [ ] Other

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

REVIEW BY STANTEC IS FOR THE SOLE PURPOSE OF ASCERTAINING GENERAL CONFORMITY WITH DESIGN. CONTRACTOR IS RESPONSIBLE FOR DIMENSIONS, FABRICATION AND CONSTRUCTION METHODS, COORDINATION OF SUB-TRADES, DETAIL DESIGN OF COMPONENTS, AND ERRORS OR OMISSIONS ON SHOP DRAWINGS.

- General comments within
- Regarding pressure switches, it is assumed the pressure switch for aeration blowers (PSL-02-130 on drawing P609) for low pressure identification will be submitted as a shop drawing in the future

Data Sheet

1009 Stainless Steel Case Gauge

FEATURES

- Meets ASME B40.100 specifications
- Corrosion resistant SS case
- Dry gauges are field fillable
- Power***Flex***™ movement provides superior resistance to shock, vibration and pulsation
- True Zero™ reduces reading errors by using "zero box" instead of conventional dial pins
- ***PLUS!***™ performance available for liquid filled performance with a dry gauge
- MSL helium leak tested to $1X10^{-6}$ scc/s
- Ventable fill plug
- Accessory kits for easy panel mounting

TYPICAL USES

- Pumps and compressors
- Boilers
- Equipment skids
- Specialized OEM equipment
- Hydraulics and pneumatics
- Severe ambient conditions

SPECIFICATIONS

Accuracy:	ASME B40.100, Grade 1A, ±1% of span (Dry) ±1.5% of span (Liquid filled)
Dial Sizes:	2½" (63mm), 3½" (100mm)
Ranges:	Minimum 0-15 psi, maximum 0-15,000 psi, vacuum and compound
Wetted Materials	
Tube:	316L SS tube
Process Connection:	316L SS socket (SW) Aluminum bronze socket (AW)
Non Wetted Materials	
Window:	Polycarbonate (Std.), Safety glass (XSG), Polysulfone (XPS) 3½" Dial only
Dial:	Black figures on white background, aluminum
Pointer:	Black, aluminum, adjustable (Std.), micrometer (XMP)
Movement:	Power***Flex*** movement Bottom plate – 304 SS Upper plate – 304 SS Pin – 304 SS Hairspring assembly – 304 SS Pinion – 304 SS Segment – Glass filled polyester
Case:	304 SS (Std.), 316L SS (XYW)
Ring:	304 SS (Std.), 316L SS (XYW)
Process Connection Location:	Lower, Back, Top, 3 o'clock, 9 o'clock
Process Connection Sizes:	⅛ NPT, ¼ NPT (see ordering code for more options)

KEY BENEFITS

- IP65 Rating
- NEMA 4X
- CRN Approved
- PED
- *PLUS!*™ Performance (XLL)

Dampening:	Glycerin case fill (Std. liquid fill), Silicone case fill (XGV), Halocarbon case fill (XGX), ***PLUS!*** Performance (XLL)
Weather Protection:	IP65 (Plug closed), IP54 (Plug vented) NEMA 4X (Plug closed)
Approvals:	CRN, RoHS, PED

Data Sheet

B-Series Switches – Pressure, Differential Pressure & Hydraulic

FEATURES

- Adjustable setpoints 15-100% of range
- Fixed or limited adjustable deadband
- Wide selection of switch elements
- Explosion proof enclosure provides uncompromising protection
- Special designs for NACE & fire applications
- SIL 3 Capable (B and D series only)

TYPICAL USES

- Offshore oil rigs
- Chemical and petrochemical plants
- Pulp and papermills
- Steel mills
- Power plants
- Water and sewage-treatment plants
- Other corrosive environments

SIL 3 CAPABLE

- Highly reliable
- Designed for use in wide range of applications
- Pressure ranges from vacuum to 7500 psi

FACTORY SEALED

NOTES:

1. Switches may generally be set between 15% and 100% of nominal range on increasing pressure. Consult factory for applications where setpoints must be lower.
2. All deadbands are given in English units as shown in the nominal range column. Deadbands shown are for switches with Buna N diaphragm.

Approximate deadbands for optional diaphragms:

Viton:	Multiply Buna N value by 1.4
Teflon:	Multiply Buna N value by 1.2
Stainless Steel:	Multiply Buna N value by 1.7
Monel:	Multiply Buna N value by 1.7

3. Deadbands given are for zero static working pressure.
4. For approximate deadbands for dual switch elements, multiply the single switch element by 1.6.
5. Proof pressure is 4000 psi with stainless steel and monel welded diaphragms.

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

B-Series Switches – Pressure, Differential Pressure

ORDERING CODE

Example: B4 20 B XPK 600#

Enclosure

B4 - Pressure switch, Type 400, watertight enclosure meets NEMA 3, 4, 4X, 13 and IP66 requirements.

B7 - Pressure switch, Type 700, explosion-proof enclosure meets Div. 1 & 2, NEMA 7, 9 and IP66 requirements. Standard housing epoxy coated aluminum. Use variation code XYW for 316SS housing.

D4 - Differential pressure switch, Type 400, water-tight enclosure meets NEMA 3, 4, 4X, 13 and IP66 requirements.

D7 - Differential pressure switch, Type 700, explosion- proof enclosure meets Div. 1 & 2, NEMA 7, 9 and IP66 requirements. Standard housing epoxy coated aluminum. Use variation code XYW for 316SS housing.

Switch Element Selection - UL/CSA Listed SPDT

20 - Narrow deadband ac, 15A - 125/250 Vac. Estimated dc rating, 0.4A, 120 Vdc (not UL listed).

21 - Ammonia service, 5A - 125/250 Vac

22 - Hermetically sealed switch, narrow deadband, 5A - 125/250 Vac. Estimated dc. rating, 2.5A, 28 Vdc (not UL listed).

23 - Heavy duty ac, 22A - 125/250 Vac

24 - General purpose, 15A - 125/250/480 Vac, ½A - 125 Vdc, ¼A - 250 Vdc; 6A, 30 Vdc. (Standard switch)

25 - Heavy duty dc, 10A - 125 Vac or dc, ⅛ HP - 125 Vac or dc. Not available with psid ranges.

26 - Sealed environment proof, 15A - 125/250 Vac. Estimated dc rating, 0.4A, 120 Vdc (not UL listed).

27 - High temperature 300°F, 15A - 125/250 Vac

28 - Manual reset trip on, increasing 15A - 125/250 Vac. Not available with type 700 enclosure.

29 - Manual reset trip on decreasing, 15A - 125/250 Vac. Not available with type 700 enclosure.

31 - Low level (gold) contacts, 1A - 125 Vac

32 - Hermetically sealed switch, general purpose, 11A - 125/250 Vac, 5A - 30 Vdc

42 - Hermetically sealed switch, gold contacts, 1A - 125 Vac

50 - Variable deadband, 15A - 125/250 Vac

Switch Element Selection - UL/CSA Listed Dual (2 SPDT)

61 - Dual narrow deadband, 15A - 125/250 Vac. Estimated dc rating, 0.4A, 120 Vdc (not UL listed).

62 - Dual sealed environment proof, 15A - 125/250 Vac. Estimated dc rating, 0.4A, 120 Vdc (not UL listed).

63 - Dual high temp. 300°F, 15A - 125/250 Vac

64 - Dual general purpose, 15A - 125/250/480 Vac, ½A- 125 Vdc, ¼A - 250 Vdc

65 - Dual ammonia service, 5A - 125/250 Vac

67 - Dual hermetically sealed switch, narrow deadband, 5A - 125/250 Vac. Wires cannot be terminated inside B400 switch enclosure. Estimated dc. rating, 2.5A, 28 Vdc (not UL listed).

68 - Dual hermetically sealed switch, general purpose, 11A - 125/250 Vac 5A, 30 Vdc. Wires cannot be terminated inside B400 switch enclosure.

70 - Dual low level gold contacts, 1A - 125 Vac

71 - Dual hermetically sealed switch, gold contacts, 1A - 125 Vac. Wires cannot be terminated inside B400 switch enclosure.

B-Series Switches – Pressure, Differential Pressure & Hydraulic

OPTIONAL FEATURES AND ACCESSORIES

B-SERIES SWITCH OPTIONS

		Appicable Switch Series					
		Pressure		Differential Pressure		H	
Code	Description	(psi)	(in. H_2O)	(psi)	(in. H_2O)		Notes
XBP	Wall Mounting Bracket in. H_2O		•		•		
XCH	Chained Cover	•	•	•	•	•	
XC8	CSA Approval ✓	•	•	•	•		Standard on 400 Series
XCN	ATEX Directive 94/9/EC/IECEx Rating	•	•	•	•		700 Series only.
XD2	Dual Seal Rating (700 Series only)	•			•		
XFM	FM Approval – Single Element	•	•	•	•		N/A on all combinations.
	FM Approval – Dual Element	•	•	•	•		N/A on all combinations.
XFP	Fungus Proofing	•	•	•	•	•	
XFS	Factory Adjusted Setpoint	•	•	•	•	•	Advise static or working pressure for differential pressure switches.
XG3	Belleville Actuator	•					64 or 68 element only. N/A on all combinations.
XG5	UL Limit Control to 150″ H_2O				•		Buna N and Viton diaphragm. N/A on all combinations.
XG6	UL Limit Control to 600 psi	•					Buna N and Viton diaphragm.N/A on all combinations.
XG7	Secondary Chamber with Vent	•					SS diaphragm required. Teflon diaphragm is the backup. NEMA 7 only.
XG8	Steam Limit Control to 300 psi	•					
XG9	Fire Safe Welded Actuator	•					Stainless steel diaphragm only.
XHS	High Static Differential Pressure			•			12 Buna N and Viton diaphragm – 15#D & 30#D only.
XHX	High Pressure, 40 psi, (static) d/p only 160 psi (proof) d/p only 100 psi (proof) pressure only (″ H_2O)		•		•		
XJK	Left Conduit Connection	•	•	•	•	•	Standard on 700 Series. N/A with DPDT element on 400 Series.
XJL	¾″ to ½″ Reducing Bushing	•	•	•	•	•	
XJM	Metric Electrical Conduit Conn. M20 x 1.5	•	•	•	•	•	
XK3	Terminal Block (700 Series only)	•	•	•	•		Terminal Blocks standard with 700 dual switches.
XLE	6 foot Leads on the Micro Switch	•	•	•	•	•	
XNH	Tagging Stainless Steel	•	•	•	•	•	
XNN	Paper Tag	•	•	•	•	•	
XPK	Pilot Light(s) Top Mounted	•	•	•	•	•	N/A on 700 Series.
XPM	¾″ Sealed Conduit Connection w/16″ Lead Wires	•	•	•	•	•	
XTA	316 Stainless Steel Pressure Connection for in. H_2O Range		•		•		
XTM	2″ Pipe Mounting Bracket	•	•	•	•		
XUD	316 Stainless Steel Pressure Conn.			•			
X06	Pressure Connection: ½ NPT Male, ¼ NPT Female 316 Stainless Steel (Combination)	•	•	•	•		Standard with 1000 and 3000 psi ranges. Bottom connection only on DP in H_2O ranges.
X07	½ NPTF Press. Conn., 316 SS	•	•	•	•		N/A with Monel diaphragm.
X6B	Cleaned for Oxygen Service	•		•			Buna N cannot be cleaned for oxygen service.
X9F	Inches of Water Housing for Outdoor Use		•				
XYW	316SS Housing	•	•	•	•		
XMD	Metric Range on Label	•	•	•	•	•

B-Series Switches – Pressure, Differential Pressure & Hydraulic

Ashcroft Inc. supplies highly reliable Ashcroft® switches and controls for industrial and process applications. We begin with rock-solid designs, matching the most appropriate technology with the safety and reliability requirements of the applications. The materials of construction are specified to Ashcroft's exacting standards, and product is built to last in the toughest applications. Our modern, responsive manufacturing facility is supported by an extensive network of stocking distributors and factory sales offices located in virtually every part of the world. Special application assistance is always just a telephone call away.

The Ashcroft B-Series switch line is designed to satisfy most switch requirements. Materials of construction have been selected for long life. A wide variety of precision switch elements are available to meet every application requirement, including hermetically sealed contacts for added reliability and safety. The actuators we use have been proven in more than 20 years of service in the world's plants and mills. Special designs are available for fire safety, NACE, limit control and other more stringent requirements. Simplicity and ease of use are stressed to improve reliability of the installation.

Applications include: pumps, compressors, washers, filters, degreasers, evaporators, recovery systems, food processing, ground support equipment, reverse osmosis systems, heat exchangers, hydraulic systems, lubrication systems, marine equipment, textile machinery, heating and air conditioning equipment.

Pressure & Differential Pressure Switches

B-Series pressure, differential pressure and vacuum switches use two different actuators depending on setpoint requirements. For setpoints between 2 and 3000 psi, the simple, rugged diaphragm-sealed piston actuator is used. This design features high reliability and choice of actuator seal materials for virtually every application. An optional welded design is also available for setpoints up to 1000 psi for maximum reliability. This design is available in 316 SS or Monel. Differential pressure models use a unique, dual diaphragm-sealed piston design that features very high static operating pressures and small size.

For setpoints between 4.5 and 150 inches of H_2O, a large diaphragm is used for increased sensitivity in both pressure and differential pressure designs with good choice of materials of construction.

All standard models feature ±1 percent of range setpoint repeatability and a minimum of 400 percent of range proof pressures.

These standard designs perform well in applications where shock and vibration could be a problem and may be used in conjunction with Ashcroft diaphragm seals in extreme services such as slurries or abrasive process fluids.

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

Type 200 Series Welded or Bonded Diaphragm Seal

TYPE 200 SHOWN

When isolation of the process from an instrument is required, Ashcroft offers a comprehensive line of diaphragm seals. Seal types include threaded, flanged, in-line threaded, in-line flanged, in-line socket weld, in-line butt weld, saddle and sanitary seals. Also available is a complete offering of isolation or iso-rings and isolation or iso-spools.

APPLICATIONS

- Elevated process temperatures
- Corrosive service
- Isolation of the process for safety
- Suspended solids in the process
- Sanitary connections
- Replacement of process dead leg
- Ease of cleaning between batches

FEATURES

- A metal diaphragm is welded to the top housing. Elastomeric diaphragms are bonded to the top housing. Either provides a double positive seal.
- A fill/bleed connection is standard, which permits filling the seal and instrument simultaneously after evacuation and allows the fill to flow into the completed unit.
- A thin Teflon PTFE gasket between the diaphragm and bottom housing ensures a leak-tight corrosion resistant seal even at high pressure.
- Top housing and pressure instrument are removable.
- Continuous-duty design will prevent loss of process fluid if pressure instrument is removed or fails.

SPECIFICATIONS

Model Number:	Type 200, 201, 202, 203, 204, 205, 206, 207, 208
Process Connection Size:	See Table A
Instrument Connection Size:	¼, ½ NPT
Diaphragm Material:	See Table B
Bottom Housing Materials:	See Table C
Filling Fluid:	See Table E

OPTIONS	**Code**
316 stainless steel top housing	**YT**
Stainless steel clamp rings and flanged ring – includes 300 stainless steel clamping bolts (1500 psi max)	**SE**
300 series stainless steel clamping bolts (max pres is 1500 psi)	**SB**
Pipe plugs for flushing connections – pipe plugs are available in the same materials as bottom housings per Table C	**PU**
5000 psi pressure rating Threaded inlet and metal diaphragm only	**HP**
Welded instrument to diaphragm seal	**DU**
Dual flushing connections (½ NPT) (Limited to 2″ thru 3″ flanged seals	**DB**
Ring joint (Flanged seal only)	**RJ**
Flat face (Flanged seal only)	**FF**
Clean for gaseous oxygen or strong oxidizing agent applications.	**6B**

HOW TO ORDER:

1. From Table A...select TYPE NUMBER based on process connection, process connection size and diaphragm type/construction. (e.g., Threaded/1″/capsule–code-10-200)
2. From Table B...select DIAPHRAGM MATERIAL. (e.g., 316L stainless steel–code S)
3. From Table C...select BOTTOM HOUSING MATERIAL. (e.g., 316 stainless steel–code S)
4. From Table D...select INSTRUMENT CONNECTION size. (e.g., 1/4 NPT–code 02T)
5. From Table E...select FILLING FLUID, if diaphragm seal will be attached to instrument. (e.g., Glycerin–code CG)

Typical Code: 10–200SS–02T–CG

All specifications are subject to change without notice.
All sales subject to standard terms and conditions.

Notes:

(1) 150, 300, 600, 900, 1500 & 2500 class flanges.
(2) 1″ 150 thru 8″ 300 class flanges only.
(3) Metal diaphragms welded; Teflon, Kalrez & Viton diaphragms bonded.
(4) Temp limits:–40/400°F.
(5) Max. pressure: 500 psi, Temp. limits:–40/350°F.
(6) Use on applications where NACE standard MR-01-75 2003 is standard.
(7) Maximum press./temp. Threaded: 200 psi/74°F, 125 psi/125°F, 80 psi/150°F. Flanged: 75 psi/100°F.
(8) Type 202 only.
(9) Temp. Limits: –40/300°F.
(10) Only available in 1″, 1½″, & 2″ 150 class, Types 202 max. press./temp. – 270 psi and 150°F. Consult factory for conditions beyond these limits.
(11) Max. pressure: 500 psi, Temp. limits:30/212°F.
(12) Maximum pressure/temp.: 200 psi and 180°F.
(13) Type 200: ¼ or ½ NPT only. Larger sizes offered with solvent weld joint. N/A in 201 or 203 design.
(14) Includes Titanium top housing.
(15) Type 200 only available in 1/4 NPT or 1/2 NPT. 3/4″ & 1″ size avalable as solvent welded joint only.
(16) CK for 50cSt, DJ for 10 cSt

All specifications are subject to change without notice.
All sales subject to stadard terms and conditions.

Flange Gasket and Storage Recommendations
Actuator Diaphragm Identification

Flange Gasket Recommendations

The use of a flange gasket is advisable when installing flanged diaphragm valves in a conventional piping system. Flange surfaces are best sealed with elastomeric type gaskets. However, the elastomeric gasket material must be chemically compatible with the service media, and must meet the applicable temperature and pressure requirements.

Plastic lined valves can be installed without a gasket when connecting to plastic lined piping. Installing a plastic lined valve to unlined piping must be avoided due to potential damage to the lining at the flange face, resulting in leakage.

Do not tighten each bolt in consecutive order either in a clockwise or counterclockwise direction. Use the criss-cross method when tightening flange bolts. Consult your piping supplier or piping engineer for the correct torque values to use.

Storage Recommendations

Lined Valves

Lined piping and valves should be stored, between delivery and use, away from direct sunlight, heat or outdoor seasonal weathering. Products with flexible type linings may be stored outdoors, providing the components are covered with protective tarpaulins and are not subjected to extreme temperature conditions.

Equipment lined with semi hard and especially bone hard materials must be protected and stored, preferably indoors, and should never be subjected to extreme cold climatic conditions because thermal stress and expansion may introduce cracking.

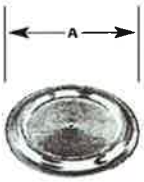
Diaphragm Shelf Life and Storage Recommendations

Diaphragm Material	Diaphragm Grade	Diaphragm Shelf Life
Buna N	DP & P	6 Years
Butyl	B & W1	10 Years
EPDM	M, M1 & 17	6 Years
Natural Rubber	S	4 Years
Neoprene	T	6 Years
Viton	V	10 Years
PTFE	TM, R2	14 Years

Storage Instructions:
Until the diaphragms are to be installed, they should be kept in a covered, adequately ventilated and dry location, preferably in their original containers. Storage temperatures should not cycle rapidly and should be maintained between 40° and 120° F.

Actuator Diaphragm Identification

	Actuator Diaphragms						
Size	#12	#25	#50	#75	#101	#130	#250
A	6 5/8 in	9 7/8 in	13 5/16"	14 in	15 11/16 in	17 9/16 in	21 7/16in
Bolt Holes	12	18	<——— NONE ———>				
	maximum recommended air pressure: 85 psi						



Facts and Recommended Guidelines

Dia-Flo Diaphragm Valve Facts you should be aware of...

All .75 in flanged valves (except solid plastic) are identical to 1in valves except the body end flanges accommodate .75 in flange dimensions. Therefore, bonnet assemblies and diaphragms for such bodies use 1in bonnet assemblies and diaphragms.

Similarly, 1.25 in valves (flanged or unflanged) use 1.5 in bonnet assemblies and diaphragms.

Diaphragm material properties become weaker with increasing temperature. Therefore, diaphragms operating at elevated temperatures are not to be used at maximum pressures. See pressure/temperature charts.

Cast iron, ductile iron and carbon steel should not be used below -20°F (-29°C) per ANSI standards.

Dia-Flo Diaphragm Airmotor actuators are designed to operate with air pressures up to 85 psi. The maximum pressure differential between upper and lower chambers is also 85 psi.

Maximum operating line pressure for valves equipped with dualrange bonnet assemblies is 100 psi.

Dualrange bonnet assemblies are only available on weir type valves, 1in through 6 in size.

Straightway valves are not ideal for throttling service due to poor control capability.

Straightway valves are not recommended for vacuum service.

Actuated DiaFlo valves used on vacuum service applications will require an additional amount of actuation pressure in order to open the valve. The total amount applied will be higher than that found in the applicable sizing chart, in order to compensate for the effect of the vacuum.

Large fail close (#25 and above) actuators are supplied as standard with travel stops.

Fail open and double acting valves are not normally supplied with travel stops, so if the available supply pressure exceeds the required pressure to close the valve, then the actuator should be ordered with a travel stop option or the supply pressure should be reduced using a regulator.

A minimum of 20 psi line pressure is required to utilize the direct loaded bonnet assembly. Direct loaded bonnets are always provided with diaphragms in the molded closed position.

When you specify a double-acting actuator with a top-mounted,single-acting positioner, the standard arrangement is that the bottom chamber is supplied with a cushion regulator. This will result in a fail open valve.

Recommended Guidelines for Weir and Straightway Valves

Maximum Velocity:	15 - 20 ft/sec for clear liquids 8 - 10 ft/sec for slurries
Maximum Solids percentages:	Weir Valves - not to exceed 15% Straightway Valves* - up to 30% * For solids between 30% and 50%, consult factory 50% and above - Not Recommended
Maximum allowable pressure drop across weir valve:	25% of Pinlet absolute

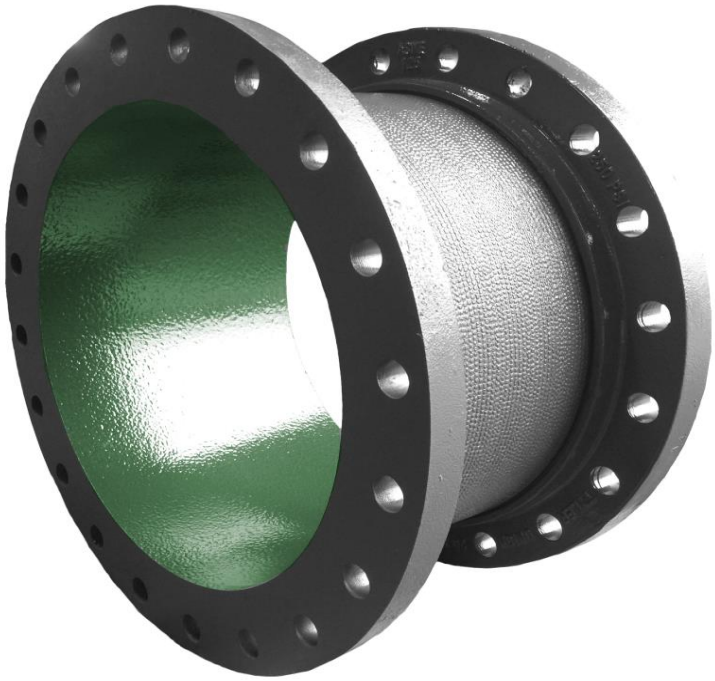
CBGL911 GLASS LINING

REV 2016

APPLICATION

Glass lining inside of ductile iron pipe has been used successfully for over 40 years. Most commonly used for it's "non stick" characteristics to convey fluids containing higher solids concentration such as sludge, scum, and grease in sewage service and wastewater treatment plant applications.



CBGL911 LINING MATERIAL

Glass lined pipe shall conform to ASTM B1000-15. The standard of quality shall be CBGL911. The glass powder shall be specifically formulated and shall be vitreous and inorganic. The lining must be proven to be successful in conveying sludge, scum, and grease in sewage service and wastewater treatment plant applications.

Any request for substitution of material must be accompanied by a successful history of lining ductile iron pipe and fittings which are used in these applications. The lining Applicator must be an ISO 9001:2000 certified company and must be able to provide recent third party, independent test reports verifying the following results. The lining Applicator must have a minimum of 5 years proven experience in production of glass lined ductile iron piping.
These physical and chemical tests must have been performed on coupons from the applicators regular production lined ductile iron pipe and/or fittings.

1. ASTM D-792 test for density in the range of 2.5 to 3.0 grams per cubic centimeter.
2. Immersion testing using ASTM C-283-97 (2002) in a solution of 8% sulfuric acid at a temperature of 148 degrees F. (64 degrees C) for a period of 10 minutes minimum. The glass shall have a minimum loss of surface gloss and a weight loss of no more than 2 milligrams per square inch (.31 mg per square centimeter).
3. Glass shall have no observed evidence of corrosion when exposed to an HCl solution of 3 pH and separately to a Na OH solution of 1 OpH; both elevated in temperature to 125 degrees F. (52 degrees C) for 10 minutes minimum.
4. Glass shall be capable of withstanding an instantaneous thermal shock of 350 degrees F. (176 degrees C) without cracking, crazing, blistering or spalling.
5. Glass lining have a minimum hardness of 6 on the MOHS scale.

WHY USE GLASS LINING?

Glass Lined ductile iron pipe assists in keeping your systems clean and free from clogging. Glass lining also helps protect the pipe from abrasion present in grit removal and other sewer process systems.

Glass lining is a porcelain material and common sewer materials resist sticking to it like they do with epoxy lining materials.

CBGL911 glass lining is also excellent for high temperature requirements where other protective linings cannot remain in service.

Did you know that you can get process valves with CBGL911 glass lining? Many valve manufacturers currently supply CBGL911 glass lined valves

Struvite buildup in sludge piping system

CBGL911 LINING APPLICATION

A. Surface Preparation

The entire surface area to receive the glass compound shall be inspected for the presence of oil, grease, or any other soluble substances. Any areas found with contamination shall be solvent cleaned to completely remove these substances. After cleaning, all surface areas shall be mechanically ground so as to remove any casting imperfections leaving only a smooth surface with no raised projections. Finally, the entire surface area to be lined shall be struck with a blast media so that all remaining impurities from the cleaning operations are removed. Only tightly adhering cast-in oxides may be left on the surface.

Surface grinding prep for a ductile iron casting

B. Lining

After surface preparation, the interior of the pipe or fitting shall receive an application of base glass compound which has been suspended in a water carrier. After the water has evaporated, the pipe or fitting shall be oven-fired at a temperature of 1375 degrees F. (746 degrees C) in order to fuse the glass to the metal surface. The subsequent finish coats are similarly processed with a resultant lining thickness of 10 mils (.25mm) minimum.

INSPECTION

CBGL911 Glass Lined Valve Components

1. All ductile iron pipe and fittings shall be checked for thickness using a magnetic film thickness gage by the method outlined in SSPC-PA2 Film Thickness Rating.

2. The lining shall be in accordance with the Applicator's industry standard tolerance for coverage and continuity. All pipe and fittings shall be visually inspected after lining at the Applicator's facility. Each and every pipe or fitting shall be tested with a 67.5 volt Tinker Rasor electronic device with a wetted sponge to determine the presence of pinholes or voids. Excessive pinholes shall be cause for rejection at the Applicator's facility.

3. Each and every pipe or fitting shall be marked on the interior glass surface using a permanent marker; the date of application and tests, the facility location and the number of acceptable pinholes detected. Quality Assurance reports will be maintained at the Applicator's facility evidencing all work performed and data recorded.

4. The Owner/or his Representative may witness at the Applicator's facility; the glass application process, review the Quality Assurance Reports and witness the actual tests conducted upon his product, all prior to the product leaving the facility. This may be done by written Specification or by sufficient notice to the Applicator to allow coordination of the visit.

CERTIFICATION

The Applicator must be able to supply a notarized Certificate of Compliance attesting to the fact that the glass lining has met all of the requirements of this specification and that the material lined has met the applicable standards of AWWA and ANSI where noted.

CBGL911 GLASS LINING

HANDLING

Glass lined pipe and fittings must be handled only from the exterior surfaces; no forks, straps, hooks, etc; shall come into contact with the interior surface of glass. Pipe and fittings that have been altered after it left the Applicator's facility, such as field cuts or further fabrication, may not exhibit the same tested results as was documented at the Applicator's facility.

HC: Exterior coating is MacroPoxy 5500 (brick red color)

FIELD REPAIR

CBGL911 Glass repair Epoxy shall be used for touch-up or repair in accordance with the Manufacturer's recommendation below.

1. Remove burrs caused by field cutting of ends or handling damage and smooth out the edge of the lining if rough.

2. Remove all traces of oil, grease, asphalt, dust,dirt, etc.

3. Remove any damaged lining caused by field cutting operations' or handling and clean any exposed metal by sanding or scraping. Sandblasting or power tool cleaning roughening is also acceptable. It is recommended that any loose lining be removed by chiseling, cutting, or scraping into well-adhered lined area before patching. Be sure to overlap at least 1" of lining in the area to be repaired.

4. With the area to be sealed or repaired absolutely clean and suitably roughened, apply a coat of CBGL Glass Repair Epoxy using the following procedure:

a. Mixing procedure - The Repair Kit for CBGL 911 Glass Lining contains two small cans of CBGL 911 Glass Repair Epoxy. CBGL 911 Glass Repair Epoxy is a two-component epoxy and the contents of the small container shall be mixed with the contents of the large container. if less than the full contents of each can is to be mixed, the material may be mixed using the mixing ratio printed on the labels. Add Q4-5311 Part B to A4-5311 Part A. Mix thoroughly with enclosed paddle. All activated material must be used within one hour of mixing.

b. Application of Material- After the material has been thoroughly mixed, it can be applied to the properly prepared surface by brush. Brushing is usually best due to the fact that the areas to be repaired are usually small.

5. It is important to coat the entire freshly cut exposed metal surface of the cut pipe end. To ensure proper sealing, overlap at least one inch of the lining with this repair material.

TECHNICAL DATA CBGL 911 GLASS REPAIR EPOXY

DESCRIPTION:	A brushable polyamidoamine epoxy designed for sealing cut ends and repairs when pipes are lined with CBGL 911 Glass Lining.
LIMITATIONS:	CBGL911 Glass Repair Epoxy should be used over glass or bare metal for repairing cut ends of pipe or damaged areas in CBGL Glass Lining. The Glass Repair Epoxy must be used over properly prepared ductile iron surfaces or roughened glass lining.
SURFACE PREPARATION	The surface preparation shall be equal to the specifications for the project or as outlined in the touch-up procedure. Do not apply glass repair epoxy over wet or frozen surfaces,or over glass surfaces that have not been roughened.
DRY FILM: THICKNESS:	As outlined in specifications, usually 3.0 to 5.0 mils per coat in two coats for 6.0 to 10.0 mils dry film thickness.
APPLICATION:	Brush
THINNING:	Thin or cleanup with Methyl Ethyl Ketone.
PHYSICAL DATA:	VOLATILE ORGANIC CONTENTS: 2.90 lbs. per gallon
SAFETY DATA:	See individual product label for safety and health data information. Individual Material Safety Data Sheets are available upon request.

Ductile Iron AWWA (Cast) Fittings

AWWA FITTINGS
Victaulic fittings for AWWA size pipe are supplied with rigid radius grooves in accordance with ANSI/AWWA C-606. Fittings conform to ANSI A21.10/AWWA C-110 for center-to-end dimensions and AWWA C-153 or ANSI A21.10/AWWA C-110 for wall thickness.

While most requirements are specified "black" or non-coated, fittings can be supplied with an alkyd-phenolic primer, or bituminous coating. Coal tar epoxy and other coatings are also available. The standard black asphalt coating used on our cement lined AWWA size fittings is NSF 61 Listed. Cast surfaces will be provided with surface equivalent to SSPC-SP6 prior to coating unless specified otherwise. Fittings are available with flanged ends wherever grooved ends are shown.

Linings include cement/mortar Type 2 (standard) and others. Fittings can readily be prepared for glass lining by others.

Fittings are rated for working pressures to 350 psi/2400 kPa (ductile iron) in 3 – 12"/80 – 300 mm sizes and to 250 psi/1725 kPa (gray iron) in sizes 3 – 12"/ 80 – 300 mm, and to 250 psi/1725 kPa (ductile iron), or 150 psi/1035 kPa (gray iron) for 14"/350 mm and larger. Victaulic fittings shown have an end-to-end dimension tolerance of ±⅛" in all sizes and styles.

CAST FITTINGS – TAPPED
Victaulic can supply tapped fittings on order to ANSI B16.1 dimension locations. Specify fitting size, tap location by letter on order.

BASE FITTINGS
Grooved end base 90° elbows and base tees are available with dimensions to ANSI B16.1.

MATERIAL SPECIFICATIONS

Fitting: Ductile iron conforming to ASTM A-536, Grade 65-45-12. Ductile iron conforming to ASTM A-395, grade 65-45-15 is available upon special request.

Fitting Coating: (specify choice*)

- **Standard on request:**
  - Non-coated
  - Alkyd-phenol primer
  - Bituminous coating

HC: Exterior coating is MacroPoxy

- **Optional:**
  - Coal tar epoxy coating
  - Cement/mortar lining – Type II
  - Glass Lining
  - Other linings available. Contact Victaulic.

* Coatings are applied per manufacturer's recommended mils.

+ 90° reducing elbows are available with a base. Contact Victaulic for details.

IMPORTANT NOTES:

Bolt hole template shown for round base is the same as for the flange of the supporting pipe size, except using only four holes in all cases so placed as to straddle center lines.

The bases of these fittings are intended for support in compression and are not to be used for anchors or supports in tension or sheer.

Grooved end base 90° elbows (#X-90 CDI) and base tees (#X-CDI) are available with dimensions to ANSI B16.1.

Side base fittings are available. Contact Victaulic for details.

For Center to End dimensions, refer to corresponding fitting without the base.

MACROPOXY® 5500
LOW VOC POTABLE WATER EPOXY

PART A B58-X740 SERIES
PART B B58VX740 HARDENER
PART B B58VX745 OAP HARDENER

Revised: Nov. 02, 2015

PRODUCT INFORMATION

4.86

PRODUCT DESCRIPTION

MACROPOXY 5500 is a high solids, polyamidoamine epoxy tank lining developed for potable water storage tanks. Superior spray and performance properties make **MACROPOXY 5500** ideal for field or shop applications.

- Low odor, Low VOC
- Outstanding application properties
- Recommended for potable water

PRODUCT CHARACTERISTICS

Finish: Semi-Gloss
Color: Red Primer; White, ~~Light Blue and Beige Topcoats~~ Topcoat is brick red
Volume Solids: 74% ± 2%, mixed
Weight Solids: 82% ± 2%, mixed
VOC (EPA Method 24): <100 g/L; 0.83 lb/gal
Mix Ratio: 1:1 by volume

Primer Recommended Spreading Rate per coat:

B58RX740	Minimum	Maximum
Wet mils (microns)	**3.0** (75)	**8.0** (200)
Dry mils (microns)	**2.0** (50)	**6.0** (150)
~Coverage sq ft/gal (m^2/L)	**197** (4.8)	**593** (14.4)
Theoretical coverage sq ft/gal (m^2/L) @ 1 mil / 25 microns dft	**1187** (29.1)	

NOTE: Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

Primer Drying Schedule @ 6.0 mils wet (150 microns):

B58RX740	@ 50°F/10°C	@ 77°F/25°C *50% RH*	@ 100°F/38°C
To touch:	2 hours	1.5 hours	1 hour
To handle:	24 hours	16 hours	5 hours
To recoat:			
minimum:	48 hours	16 hours	5 hours
maximum:	3 months	3 months	3 months
Cure for:			
immersion:	14 days*	7 days	7 days
Pot Life:	3 hours	1.5 hours	1 hour
Sweat-in-time:	None	None	None

If maximum recoat time is exceeded, abrade surface before recoating.
Drying time is temperature, humidity, and film thickness dependent.
*For **Potable Water Service**, allow a minimum of 7 days at/above 77°F (25°C) cure to service. Sterilize and rinse per AWWA C652.

Topcoats Recommended Spreading Rate per coat:

	Minimum	Maximum
Wet mils (microns)	**8.0** (200)	**18.0** (400)
Dry mils (microns)	**6.0** (150)	**14.0** (350)
~Coverage sq ft/gal (m^2/L)	**79** (1.9)	**197** (4.8)
Theoretical coverage sq ft/gal (m^2/L) @ 1 mil / 25 microns dft	**1187** (29.1)	

NOTE: Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

PRODUCT CHARACTERISTICS (CONT'D)

Topcoats Drying Schedule @ 10.0 mils wet (250 microns):

	@ 50°F/10°C	@ 77°F/25°C *50% RH*	@ 100°F/38°C
To touch:	2 hours	1.5 hours	1 hour
To handle:	24 hours	16 hours	5 hours
To recoat:			
minimum:	48 hours	16 hours	5 hours
maximum:	3 months	3 months	3 months
Cure for:			
immersion:	14 days*	7 days	7 days
Pot Life:	3 hours	1.5 hours	1 hour
Sweat-in-time:	None	None	None

If maximum recoat time is exceeded, abrade surface before recoating.
Drying time is temperature, humidity, and film thickness dependent.
*For **Potable Water Service**, allow a minimum of 7 days at/above 77°F (25°C) cure to service. Sterilize and rinse per AWWA C652.

Shelf Life:	24 months, unopened Store indoors at 40°F (4.5°C) to 100°F (38°C).
Flash Point:	75°F (24°C), Seta Flash, mixed
Reducer/Clean Up:	Reducer R7K111

RECOMMENDED USES

- For potable water service, consult WWW.NSF.ORG
- Water treatment plants
- Complies with AWWA D102 for ICS #1, #2, & #5; for OCS #5 & #6
- Complies with AWWA D102 Meets the requirements of AWWA C210

PERFORMANCE CHARACTERISTICS

Substrate*: Steel
Surface Preparation*: SSPC-SP10/NACE 2
System Tested*:
1 ct. Macropoxy 5500 @ 6.0 mils (150 microns) dft
*unless otherwise noted below

Test Name	Test Method	Results
Abrasion Resistance	ASTM D4060, CS17 wheel, 1000 cycles, 1 kg load	120 mg loss
Adhesion	ASTM D4541	>1700 psi
Corrosion Weathering	ASTM D5894, 36 cycles, 12,000 hours	Rating 10 per ASTM D714 for blistering; Rating 9 per ASTM D616 for rusting
Direct Impact Resistance	ASTM D2794	30 in. lb.
Dry Heat Resistance	ASTM D2485	250ºF(121ºC)
Flexibility	ASTM D522, 180° bend, 1" mandrel	Pass
Humidity Resistance	ASTM D4585, 6000 hours	No blistering, cracking or rusting
Immersion	18 months fresh and salt water	Rating 10 per ASTM D714 for blistering; Rating 10 per ASTM D616 for rusting
Pencil Hardness	ASTM D3363	4H

Epoxy coatings may darken or discolor following application and curing.
Above are typical results and should not be construed as a specification.

DISCLAIMER

The information and recommendations set forth in this Product Data Sheet are based upon tests conducted by or on behalf of The Sherwin-Williams Company. Such information and recommendations set forth herein are subject to change and pertain to the product offered at the time of publication. Consult your Sherwin-Williams representative to obtain the most recent Product Data Information and Application Bulletin.

SURFACE PREPARATION

Surface must be clean, dry, and in sound condition. Remove all oil, dust, grease, dirt, loose rust, and other foreign material to ensure adequate adhesion.

Refer to product Application Bulletin for detailed surface preparation information.

Minimum recommended surface preparation:

Iron & Steel
- Atmospheric: SSPC-SP2/3
- Immersion: SSPC-SP10/NACE 2, 2-4 mil (50-100 micron) profile

Ductile Iron Pipe: NAPF 500.03.03

TINTING

Do not Tint.

APPLICATION CONDITIONS

Surface / Material Temperature:	50°F (10°C minimum, 120°F (50°C) maximum with surface temp 5ºF (2.8°C) above dew point
Air Temperature:	50°F (10°C) minimum, 100°F (38°C) maximum
Relative Humidity:	85% maximum. At least 5°F (2.8°C) above dew point

ORDERING INFORMATION

Packaging:
- Part A: 1 gallon (3.78L) and 5 gallon (18.9L) containers
- Part B: 1 gallon (3.78L) and 5 gallon (18.9L) containers

Weight: 13.3 ± 0.2 lb/gal ; 1.6 Kg/L, mixed, may vary by color

SAFETY PRECAUTIONS

Refer to the MSDS sheet before use.

Published technical data and instructions are subject to change without notice. Contact your Sherwin-Williams representative for additional technical data and instructions.

WARRANTY

The Sherwin-Williams Company warrants our products to be free of manufacturing defects in accord with applicable Sherwin-Williams quality control procedures. Liability for products proven defective, if any, is limited to replacement of the defective product or the refund of the purchase price paid for the defective product as determined by Sherwin-Williams. NO OTHER WARRANTY OR GUARANTEE OF ANY KIND IS MADE BY SHERWIN-WILLIAMS, EXPRESSED OR IMPLIED, STATUTORY, BY OPERATION OF LAW OR OTHERWISE, INCLUDING MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

APPLICATION BULLETIN

4.86

SURFACE PREPARATIONS

Surface must be clean, dry, and in sound condition. Remove all oil, dust, grease, dirt, loose rust, and other foreign material to ensure adequate adhesion.

Carbon Steel, Immersion Service:
The surface shall be abrasive blasted to SSPC-SP10/NACE No. 2 Near-White Blast Cleaning with a 2-4 mil (50-100 micron) profile. The anchor profile shall be sharp with no evidence of a peen surface. The finished surface shall be free of all visible oil, grease, dust, dirt, mill scale, rust, coating, oxides, corrosion products, and other foreign matter with no more than 5% staining. After blasting, all dust and loose residue should be removed from the surface by acceptable means. Coat steel the same day as it is prepared and prior to the formation of rust.

Iron & Steel: Minimum surface preparation is Hand Tool Clean per SSPC-SP2. Remove all oil and grease from surface by Solvent Cleaning per SSPC-SP1. For better performance, use Commercial Blast Cleaning per SSPC-SP6/NACE 3, blast clean all surfaces using a sharp, angular abrasive for optimum surface profile (2 mils / 50 microns). Prime any bare steel within 8 hours or before flash rusting occurs.

Ductile Iron Pipe: Minimum surface preparation is Power Tool Clean per NAPF 500.03.02. Remove all oil and grease from surface by Solvent Cleaning per NAPF 500.03.01. For better performance, use Blast Cleaning per NAPF 500.03.03, blast clean all surfaces using a sharp, angular abrasive for optimum surface profile. Prime any bare DIP before flash rusting occurs.

APPLICATION CONDITIONS

Temperature:	50°F (10°C) minimum, 120°F (50°C) maximum (air, surface, and material) At least 5°F (2.8°C) above dew point
Relative humidity:	85% maximum

APPLICATION EQUIPMENT

The following is a guide. Changes in pressures and tip sizes may be needed for proper spray characteristics. Always purge spray equipment before use with listed reducer. Any reduction must be compliant with existing VOC regulations and compatible with the existing environmental and application conditions.

Reducer/Clean Up ..... Reducer R7K111

Airless Spray
- Pressure.....2700-3000 psi
- Hose.....3/8" ID with 1/4" whip
- Tip 519-525
- Filter .....none
- Reduction.....As needed up to 10% by volume

Brush
- Brush.....Nylon/Polyester or Natural Bristle
- Reduction.....As needed up to 10% by volume

Roller
- Cover .....3/8" woven with solvent resistant core
- Reduction.....As needed up to 10% by volume

If specific application equipment is not listed above, equivalent equipment may be substituted.

Certified to NSF/ANSI 61

MACROPOXY® 5500
LOW VOC POTABLE WATER EPOXY

PART A	B58-X740	SERIES
PART B	B58VX740	HARDENER
PART B	B58VX745	OAP HARDENER

Revised: Nov. 02, 2015

APPLICATION BULLETIN

4.86

APPLICATION PROCEDURES

Surface preparation must be completed as indicated.

Mix contents of each component thoroughly with low speed power agitation. Make certain no pigment remains on the bottom of the can. Then combine one part by volume of Part A with one part by volume of Part B. Thoroughly agitate the mixture with power agitation.

If reducer solvent is used, add only after both components have been thoroughly mixed.

Apply paint at the recommended film thickness and spreading rate as indicated below:

Primer Recommended Spreading Rate per coat:

B58RX740	Minimum	Maximum
Wet mils (microns)	**3.0** (75)	**8.0** (200)
Dry mils (microns)	**2.0** (50)	**6.0** (150)
~Coverage sq ft/gal (m^2/L)	**197** (4.8)	**593** (14.4)
Theoretical coverage sq ft/gal (m^2/L) @ 1 mil / 25 microns dft	**1187** (29.1)	

NOTE: Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

Primer Drying Schedule @ 6.0 mils wet (150 microns):

B58RX740	@ 50°F/10°C	@ 77°F/25°C *50% RH*	@ 100°F/38°C
To touch:	2 hours	1.5 hours	1 hour
To handle:	24 hours	16 hours	5 hours
To recoat:			
minimum:	48 hours	16 hours	5 hours
maximum:	3 months	3 months	3 months
Cure for:			
immersion:	14 days*	7 days	7 days

If maximum recoat time is exceeded, abrade surface before recoating.

Drying time is temperature, humidity, and film thickness dependent.

Pot Life:	3 hours	1.5 hours	1 hour
Sweat-in-time:	None	None	None

*For **Potable Water Service**, allow a minimum of 7 days at/above 77°F (25°C) cure to service. Sterilize and rinse per AWWA C652.

Topcoats Recommended Spreading Rate per coat:

	Minimum	Maximum
Wet mils (microns)	**8.0** (200)	**18.0** (400)
Dry mils (microns)	**6.0** (150)	**14.0** (350)
~Coverage sq ft/gal (m^2/L)	**79** (1.9)	**197** (4.8)
Theoretical coverage sq ft/gal (m^2/L) @ 1 mil / 25 microns dft	**1187** (29.1)	

NOTE: Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

Topcoats Drying Schedule @ 10.0 mils wet (250 microns):

	@ 50°F/10°C	@ 77°F/25°C *50% RH*	@ 100°F/38°C
To touch:	2 hours	1.5 hours	1 hour
To handle:	24 hours	16 hours	5 hours
To recoat:			
minimum:	48 hours	16 hours	5 hours
maximum:	3 months	3 months	3 months
Cure for:			
immersion:	14 days*	7 days	7 days

If maximum recoat time is exceeded, abrade surface before recoating.

Drying time is temperature, humidity, and film thickness dependent.

Pot Life:	3 hours	1.5 hours	1 hour
Sweat-in-time:	None	None	None

*For **Potable Water Service**, allow a minimum of 7 days cure to service. Sterilize and rinse per AWWA C652.

Application of coating above maximum or below minimum recommended spreading rate may adversely affect coating performance.

CLEAN UP INSTRUCTIONS

Clean spills and spatters immediately with R7K111. Clean tools immediately after use with R7K111. Follow manufacturer's safety recommendations when using any solvent.

PERFORMANCE TIPS

Note: Once maxiumum pot life is exceeded, product may be sprayable but will not hold sag.

Stripe coat all crevices, welds, and sharp angles to prevent early failure in these areas.

When using spray application, use a 50% overlap with each pass of the gun to avoid holidays, bare areas, and pinholes. If necessary, cross spray at a right angle.

Spreading rates are calculated on volume solids and do not include an application loss factor due to surface profile, rough-ness or porosity of the surface, skill and technique of the applicator, method of application, various surface irregularities, material lost during mixing, spillage, over thinning, climatic conditions, and excessive film build.

Excessive reduction of material can affect film build, appearance, and adhesion.

Do not mix previously catalyzed material with new.

Do not apply the material beyond recommended pot life.

In order to avoid blockage of spray equipment, clean equipment before use or before periods of extended downtime with Reducer R7K111.

Tinting is not recommended for immersion service.

Do not use Quik-Kick Epoxy Accelerator.

Insufficient ventilation, incomplete mixing, miscatalyzation, and external heaters may cause premature yellowing.

Excessive film build, poor ventilation, and cool temperatures may cause solvent entrapment. Avoid entrapment by following the recommended application procedures.

For Immersion Service: Electrical holiday inspection should be performed in accordance with NACE SP 0188 "Discontinuity (Holiday) Testing of Protective Coatings" or ASTM D 5162-91 "Standard Practice for Discontinuity (Holiday) Testing of Non-conductive Protective Coating of Metallic Substrates."

Refer to Product Information sheet for additional performance characteristics and properties.

SAFETY PRECAUTIONS

Refer to the MSDS sheet before use.

Published technical data and instructions are subject to change without notice. Contact your Sherwin-Williams representative for additional technical data and instructions.

DISCLAIMER

The information and recommendations set forth in this Product Data Sheet are based upon tests conducted by or on behalf of The Sherwin-Williams Company. Such information and recommendations set forth herein are subject to change and pertain to the product offered at the time of publication. Consult your Sherwin-Williams representative to obtain the most recent Product Data Information and Application Bulletin.

WARRANTY

The Sherwin-Williams Company warrants our products to be free of manufacturing defects in accord with applicable Sherwin-Williams quality control procedures. Liability for products proven defective, if any, is limited to replacement of the defective product or the refund of the purchase price paid for the defective product as determined by Sherwin-Williams. NO OTHER WARRANTY OR GUARANTEE OF ANY KIND IS MADE BY SHERWIN-WILLIAMS, EXPRESSED OR IMPLIED, STATUTORY, BY OPERATION OF LAW OR OTHERWISE, INCLUDING MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

PROVIDE FLANGES OF SS304L AS PER ASTM A774 "ASTM A774/A774M, As-Welded Wrought Austenitic Stainless Steel Fittings for General Corrosive Service at Low and Moderate Temperatures"

INSPECTION AND TESTING

Pneumatic at 150 kPag for 24 hour period.
Visual and random nondestructive testing for welds.

CLEANING AND CONDITIONING

1. Remove debris.
2. Passivate all piping after completion of welding.

NOTES

1. Flanges shall be Van Stone type, with galvanized mild steel backing rings, drilled and faced to Class 150 in accordance with ANSI B16.5. In submerged and exterior locations use stainless steel back-up rings.
2. Provide beveled edges for all welded fittings and connections.
3. The drawings may indicate coupling, flanges, or other joints that may be disassembled at a minimum number of locations. In addition, provide joints noted in these specification sheets at the specified maximum spacing to allow for pipe disassembly through the remainder of the pipe runs. Contractor is to locate.
4. For PA piping, insulation shall be a minimum 50 mm thickness and as required for personnel protection at the design temperature of the pipe ensuring the surface temperature is below 40 deg C.
5. Pipe spools to be shop fabricated. Field welds require approval by Engineer.

ALTHOUGH THIS NOTE STATES TO PROVIDE BACKING RINGS OF GALVANIZED MILD STEEL, FOR THIS SPECIFIC CASE PROVIDE SS 304L BACKING RINGS TO AVOID POTENTIAL GALVANIC CORROSION ISSUES DUE TO DISCIMILAR METALS.

HC. 2019-04-24:
As agreed before (see DA-MP-10 and RFI-038), there is no need for SS backing ring unless piping is submerged, therefore only process air connections in the TWAS tanks will be made with SS304L backing ring.

PA piping not shown will be field fabricated.

DRAWING NO. ES11A-0598

ERN 12391

The Bray Series 30/31 features a high strength one piece stem design utilizing an efficient internal disc to stem connection. This resilient seated butterfly valve provides a primary and secondary seal between the disc and seat as well as the stem and seat which ensures the total encapsulation of the line media and zero external leakage.

Product Description
Body – Ductile Iron ASTM A536 with polyester red coating
Style – Lug, according to ANSI class 125/150
Disc – Aluminum Bronze
Seat – Buna-N Bonded
Stem – 416SS
Bushing – Acytal
Stem seal – Buna n
Operation Pressure – 250 PSI
Operator
10 position manuel operated lever

PRESSURE RATINGS

BIDIRECTIONAL BUBBLE TIGHT SHUT OFF – Standard Disc* Downstream flanges and disc in closed position		
Series 30/31 Standard Disc*	2"-12" (50-300mm)	175 psi (12 bar)
	14"-20" (350-500mm)	150 psi (10.3 bar)
DEAD END SERVICE – Lug Bodies and Standard Disc* No downstream flanges and disc in closed position		
Series 31	2"-12" (50-300mm)	75 psi (5.2 bar)
	14"-20" (350-500mm)	50 psi (3.4 bar)
BODY: 250 psi (17.2 bar) CWP		

*For low pressure (50 psi) applications, Bray offers a standard reduced disc diameter to decrease seating torques and extend seat life, thus increasing the valve's performance and reducing actuator costs.

VELOCITY LIMITS FOR ON/OFF SERVICES

FLUIDS: 30 ft/sec (9 m/s)	**GASES:** 175 ft/sec (54 m/s)

1 – **STEM RETAINING ASSEMBLY:** The stem is retained in the body by means of a unique stainless steel Spirolox® retaining ring, a thrust washer and two C-rings, manufactured from brass as standard, stainless steel upon request.

2 – **STEM BUSHING:** Non-corrosive, heavy duty acetal bushing absorbs actuator side thrust.

3 – **STEM SEAL:** Double "U" cup seal design is self-adjusting and gives positive sealing in both directions.

4 – **PRIMARY AND SECONDARY SEALS:** These seals prevent line media from coming in contact with the stem or body. The primary seal is an interference fit of the molded seat flat with the disc hub. The secondary seal is created because the stem diameter is greater than the diameter of the seat stem hole.

5 – **BODY:** One piece wafer or lug style. Polyester coating for excellent corrosion resistance. Nylon 11 coating is available as an option.

6 – **SEAT:** Bray's tongue and groove seat design provides complete isolation of flowing media from the body. The seat also features a molded o-ring which eliminates the use of flange gaskets.

7 – **DISC:** Casting is spherically machined and hand polished to provide a bubble tight shutoff, minimum torque, and longer seat life. Bray's resilient Nylon 11 coating comes as standard.

8 – **STEM:** Precision double "D" disc to stem connection drives the disc without the need for screws or pins. The close tolerance, double "D" connection that drives the valve disc is an exclusive feature of the Bray valve. Disassembly of the Bray stem is just a matter of pulling the stem out of the disc.

BALL VALVE

Brand – BRAY/FLOWTEK
Model – F15

Diametre:
2 inches (50mm)

.....

Product Description
Body – Stainless steel ASTM A351 Gr. CF8M, 2-Pieces
Style – Full port, Flanged ANSI class 125/150
Ball – Stainless Steel ASTM A351 Gr. CF8M
Seat – TFM
Stem – Stainless steel 316
Operation Pressure – ASME class 150

Operator
Manuel operated lever

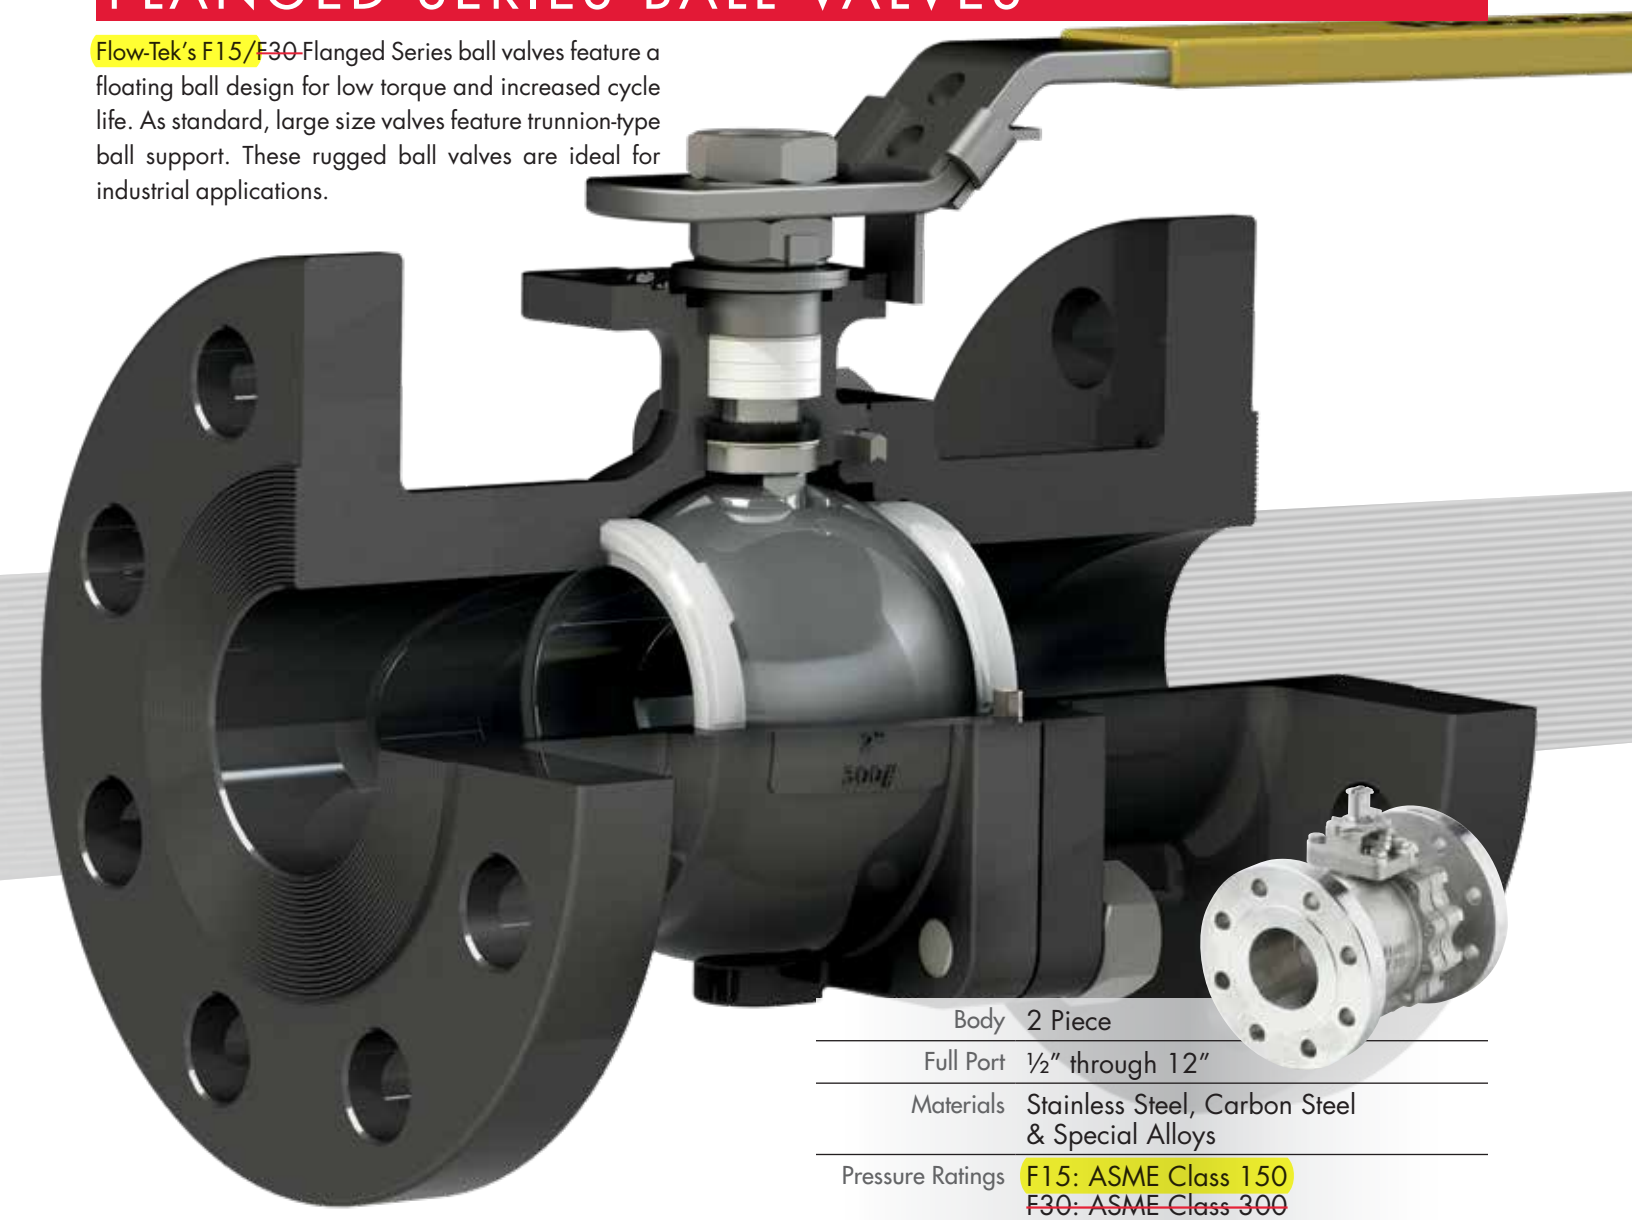
FLANGED SERIES

2 PIECE FLANGED FULL PORT ½" - 12"

F15 - ASME Class 150 | ~~F30 - ASME Class 300~~

FLANGED SERIES BALL VALVES

Flow-Tek's F15/~~F30~~ Flanged Series ball valves feature a floating ball design for low torque and increased cycle life. As standard, large size valves feature trunnion-type ball support. These rugged ball valves are ideal for industrial applications.



Body	2 Piece
Full Port	½" through 12"
Materials	Stainless Steel, Carbon Steel & Special Alloys
Pressure Ratings	F15: ASME Class 150 ~~F30: ASME Class 300~~

SECURE MOUNT

Flanged Series valves offer ease of automation due to an integrally cast actuator mounting pad which complies with ISO 5211 through 2" valve sizes.

STEM SEALS

Flanged Series ½"– 2" valves feature live-loaded, self-adjusting primary and secondary sealing. Utilizing Belleville washers, the stem seal automatically adjusts to compensate for changes in temperature and normal wear. 2½"– 12" valves utilize an independent packing gland which can be easily adjusted without removing mounting hardware or operator. The packing gland is contoured to more uniformly distribute the load across the packing. The primary stem seal is a combination of a thrust washer and a thrust washer protector. An adjustable stem packing creates a secondary seal between the stem and body. The stem packing is composed of RPTFE V-rings as standard – graphite stem packing is standard on all fire safe valves.

BALL

Flow-Tek balls are precision machined and mirror finished for bubble-tight shut off and less operating torque. As an added safety feature, a hole in the stem slot of each ball equalizes pressure between the body cavity and the line media flow.

BODY

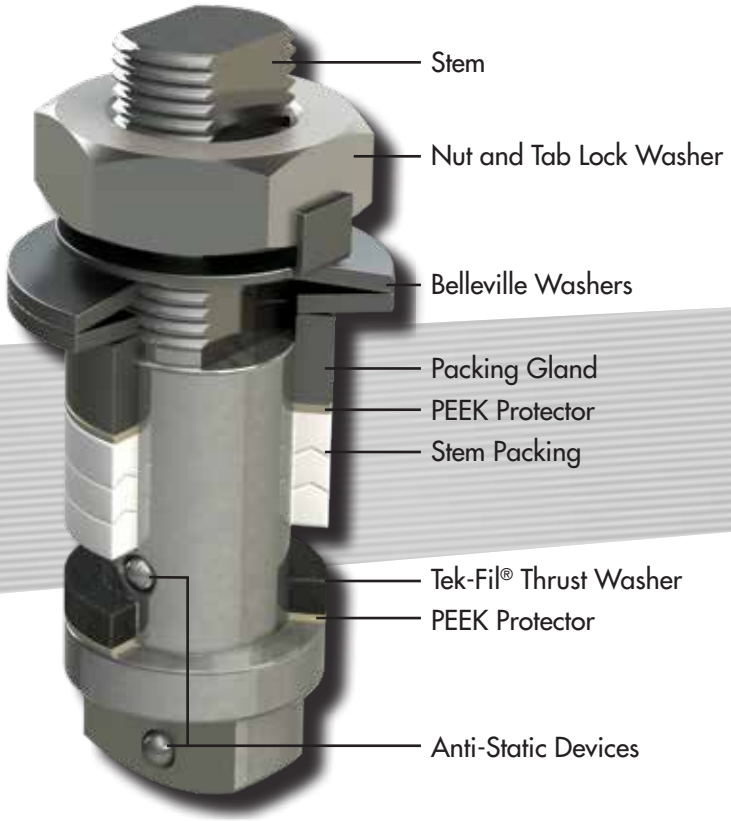
½"– 4" valve bodies are investment cast and solution annealed/ normalized for the highest quality and added strength. All body castings are marked with a foundry heat number for full traceability. Carbon steel bodies are phosphate coated for increased corrosion resistance.

SEAT

Flow-Tek's seat design ensures bi-directional, bubble-tight sealing with low operating torque. All resilient seats feature relief slots or seat O.D. clearance to relieve pressure past the upstream seat, and positive preloading to ensure low pressure/vacuum sealing.

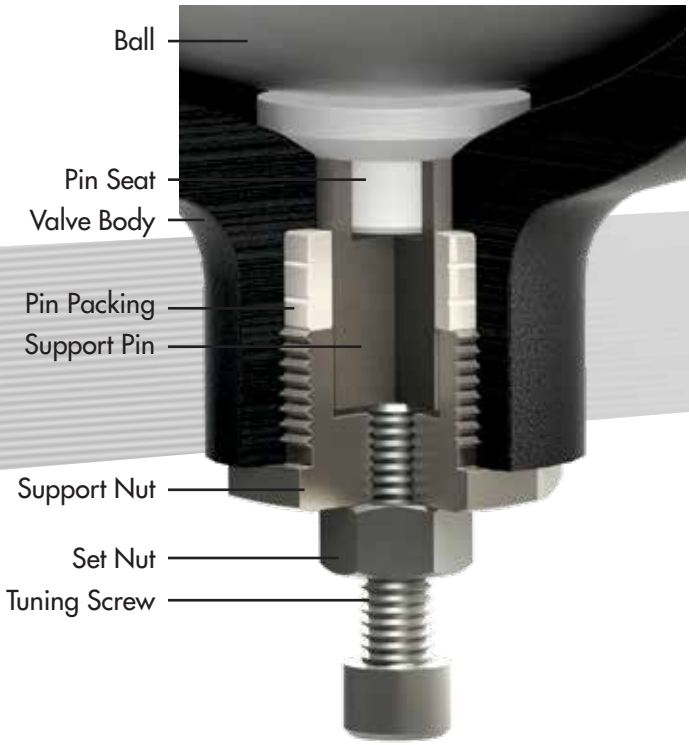
STEM ASSEMBLIES

Flow-Tek manufactures heavy duty, high quality stems with double "D" connection to ball and operator mounting. Stem and ball design ensure positive contact. All Flow-Tek stems are internal entry and blowout proof for maximum safety.



BALL SUPPORT Valve Sizes 6" through 12"

As standard, larger sized valves feature trunnion-type ball support. This support helps to maintain continuous contact between the ball and seats, preventing seat damage and blow-by. The results are less seat wear, lower torque, and longer service life.



SMART STEM Valve Sizes ½" through 2"

Flow-Tek's interchangeable family of valves feature strong, large diameter stems with live-loaded, self-adjusting sealing utilizing Belleville washers which automatically adjust to compensate for changes in temperature and wear. Manual adjustments which can cause damage to the seal and seat are not required. The assembly is secured by a saddle-type lock washer which prevents stem nuts from unthreading in high cycle automation applications.

STEM PACKING

An adjustable V-ring design creates a multiple seal between the stem and body. Each stem assembly is composed of three or four (dependent on valve size) rings providing a very high cycle life by resisting creep and cold flow. The thrust washer and the thrust washer protector combine to provide a primary seal, reduce torque and prevent galling. This arrangement is a Flow-Tek exclusive.

LOCKING DEVICE

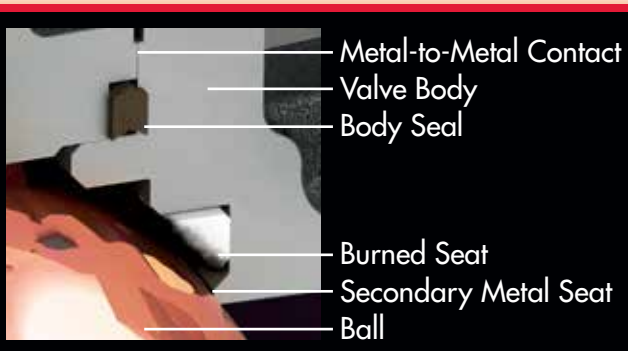
All manually operated valves feature a locking device to prevent accidental movement of ball position. Valves ½"–2" feature a safety trigger that locks the handle in the open or closed position. The handle lock can be bypassed, if needed, with a small bolt through the handle in the release position.

On all sizes a padlock can be added to secure the handle in position, preventing unwanted movement of the ball.

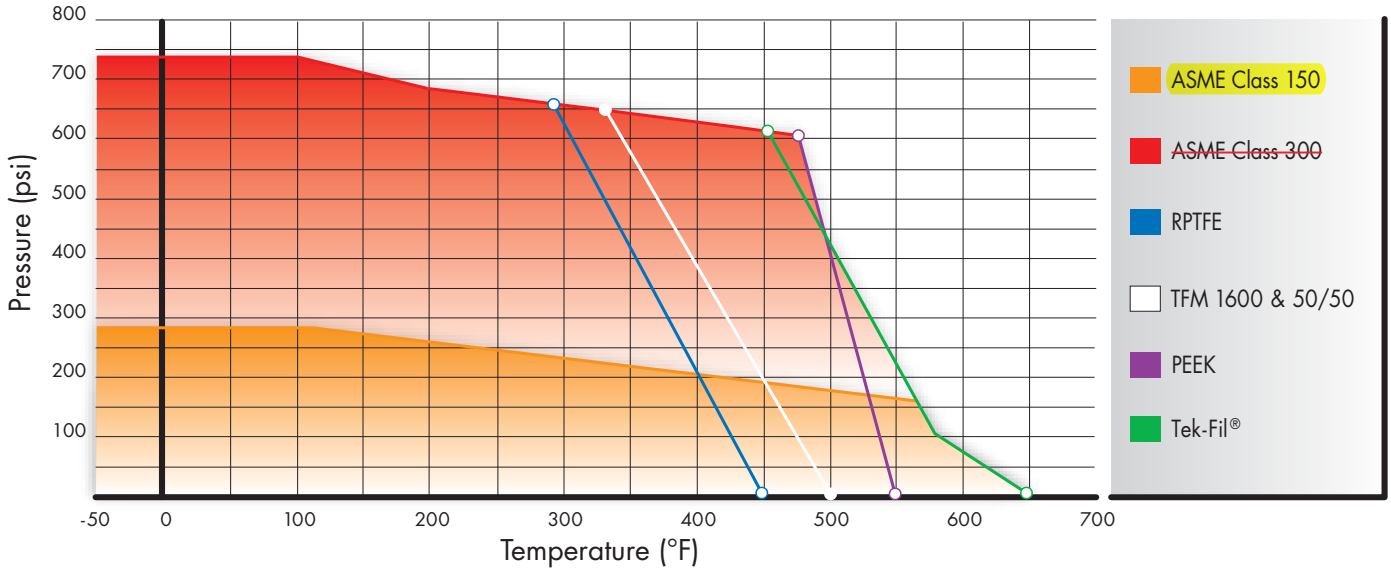
FIRE SAFE - Certified to API 607

Flanged Series valves with graphite stem seals have been thoroughly fire tested and meet these standards.

In the event of a fire, after heat destroys the primary resilient seat, the ball makes contact with the secondary metal seat, forming a secure seal. The body seal, composed of stainless steel and graphite wound into a spiral, prevents external leakage. The graphite stem rings prevent stem leakage.



PRESSURE / TEMPERATURE



Carbon steel valves limited to -20°F

STEAM SERVICE PRESSURE RATINGS: WSP

SEAT SELECTION

A wide range of seat materials are available to meet most applications. The standard seat is TFM 1600. Options include:

- ~~RPTFE~~
- ~~Stainless Steel/PTFE (50/50)~~
- ~~UHMWPE~~
- ~~Virgin PTFE~~
- ~~PEEK~~
- Tek-Fil® (carbon/graphite filled TFM)
- ~~Full metal seats~~
- ~~Cavity Fillers~~

PEEK seats offer high pressure/temperature capability. Tek-Fil® seats offer reduced torque in high temperature, high cycle, and steam service applications. TFM 1600 seats offer the exceptional chemical resistance of PTFE plus lower porosity and permeability, improved temperature range and reduced valve torques.

SPECIFICATIONS

- Valve sizes ¼" through 12"
- Design meets MSS-SP-110
- Threaded end connections meet ASME B1.20.1 NPT
- Socket weld end connections meet ASME B16.11
- Butt weld end (Schedule 40) connections meet MSS SP-72 /ASME B16.25
- Flanged end connections meet ASME Class 150

Valve body and end cap connections are high quality investment cast and solution annealed/normalized. Body and end cap wall thickness meets ASME B16.34.

Valve stems are blow-out proof for maximum safety and meet ASME B16.34 specification.

All valves are factory tested to MSS SP-72 and API 598.

ISO 9001

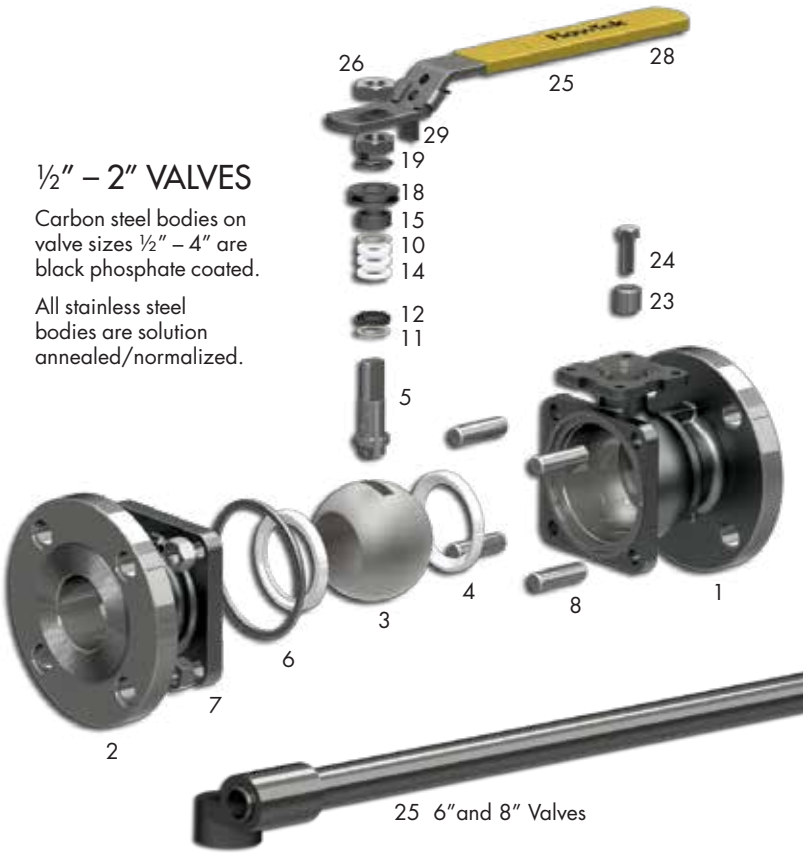
* Quantity depends on valve size.
** RPTFE packing is composed of 3 or 4 pieces depending on size.
Graphite packing is composed of a single piece.
*** Ductile Iron used forvalve sizes ≥ 2½".

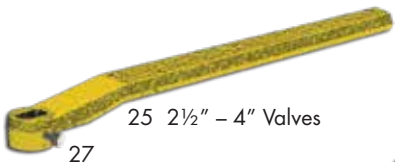
Flow-Tek offers the seat, body seal, thrust washer and stem packing as recommended spare parts. These parts are available as a packaged repair kit.

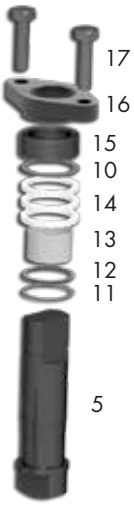
½" – 2" VALVES

Carbon steel bodies on valve sizes ½" – 4" are black phosphate coated.

All stainless steel bodies are solution annealed/normalized.







2½" – 12" VALVES

Ball support is included on 6"-12" F15 valves and 6"-12" F30 valves.

F15/F30 DIMENSIONS ½" – 2" VALVES (15mm - 50mm)

[1] Impact testing requirements are not checked for supports

Skirt design thickness, largest of the following + corrosion = 0.0753 in

The governing condition is due to weight, compressive stress at the base, operating & corroded.

The skirt thickness of 0.105 in is adequate.

Results Summary							
Loading	**Condition**	**Tensile or Compressive Side**	**Governing Skirt Location**	**Temperature (° F)**	**Allowable Stress (psi)**	**Calculated Stress/E (psi)**	**Required thickness (in)**

$= 755.67 / (\pi*3.38*13\,626*1) + 48*104.2 / (\pi*3.38^2*13\,626*1)$
$= 0.0155$ in

Base Plate 7 x 7 x 1/2"

Inputs	
Base configuration	single base plate without gussets
Base plate material	A-240-304
Base plate allowable stress, S_p	20 000 psi
Foundation compressive strength	1 658 psi
Concrete ultimate 28-day strength	3 000 psi
Bolt circle, BC	6.5"
Base plate inner diameter, D_i	1"
Base plate outer diameter, D_o	7"
Base plate thickness, t_b	0.5"
Anchor Bolts	
Material	A-307 gr B
Allowable stress, S_b	15 000 psi
Bolt size and type	0.5" coarse threaded
Number of bolts, N	4
Corrosion allowance (applied to root radius)	0"
Anchor bolt clearance	0.125"
Bolt root area (corroded), A_b	0.13 in^2
Diameter of anchor bolt holes, d_b	0.625"
Initial bolt preload	15% (2 250 psi)
Bolt at 0°	No

Results Summary							
Load	Vessel condition	Base V (lb_f)	Base M (lb_f-ft)	W (lb)	Required bolt area (in^2)	t_r Base (in)	Foundation bearing stress (psi)
Weight	operating, corroded	100	712.5	787.5	0.0746	0.4552	451.05
Weight	operating, new	100	712.5	787.5	0.0746	0.4552	451.05
Weight	empty, corroded	100	712.5	37.5	0.0871	0.4521	444.96
Weight	empty, new	100	712.5	37.5	0.0871	0.4521	444.96

Anchor bolt load (governing)

P = -W / N + 48 * M / (N*BC)
= -37.46 / 4 + 48 * 712.5 / (4*6.5)
= 1 306.09 lb_f

Required area per bolt = P / S_b = 0.0871 in^2

The area provided (0.126 in^2) by the specified anchor bolt is adequate.

Support calculations (Jawad & Farr chapter 12, governing)

Base plate width, t_c:	3	in
Average base plate diameter, d:	4	in
Base plate elastic modulus, E_s:	28.0E+06	psi
Base plate yield stress, S_y:	30 000	psi

E_c = 57 000*Sqr(3 000) = 3 122 019 psi

n = E_s/E_c = 28.0E+06 / 3 122 019 = 8.9686

t_s = (N*A_b) / (π*d)
= (4*0.126) / (π*4)
= 0.0401 in

From table 12.4 for k = 0.263103:

K_1 = 2.5225, K_2 = 1.4072
L_1 = 0.9478, L_2 = 2.2828, L_3 = 0.8347

Total tensile force on bolting

T = (12*M - W *(L_1 + L_3)) / (L_2 + L_3)
= (12*712.5 - 787.46 *(0.9478 + 0.8347)) / (2.2828 + 0.8347)
= 2 292.48 lb_f

Tensile stress in bolts use the larger of f_s or bolt preload = 2 250 psi

f_s = T / (t_s * (d / 2) * K_1)
= 2 292.48 / (0.0401 * (4 / 2) * 2.5225)
= 11 330 psi

Total compressive load on foundation

C_c = T + W + Bolt Preload
= 2 292.48 + 787.46 + 1 134
= 4 213.94 lb_f

Foundation bearing stress

$f_c = C_c / (((t_c - t_s) + n*t_s)*(d / 2)*K_2)$
= 4 213.94 / (((3 - 0.0401) + 8.9686*0.0401)*(4 / 2)*1.4072)
= 451 psi

As f_c <= 1 658 psi the base plate width is satisfactory.

$k = 1 / (1 + f_s / (n*f_c))$
= 1 / (1 + 11 330 / (8.9686*451))
= 0.263103

Base plate required thickness (governing)

$t_r = (3*f_c*L^2 / S_p)^{0.5}$
= $(3*451*1.75^2 / 20\ 000)^{0.5}$
= 0.4552 in

The base plate thickness is satisfactory.

SB12 Series Back Pressure/Relief Valves

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered as Category C Fittings Consult Chemline

NSF 3 Certified to NSF/ANSI 61

SERIES: SB12

SIZES: 3/8" – 4" 1.5in

ENDS: True Union Socket, Threaded or ChemFlare™[1] Spigot[2] Bodies with Plain, Socket, Threaded or Flanged ends

DIAPHRAGM: PTFE Bonded EPDM

SEALS: EPDM, FKM (Viton®)

True Union Ends
Easy installation and maintenance

The Chemline SB Series Back Pressure/ Relief Valve has two functions. As a ***back pressure valve***, installed in-line downstream of a pump, the back pressure below the metering pump is maintained. When installed in the branch of a tee it is a ***pressure relief valve***. The valve stays closed until inlet pressure reaches the set pressure which is adjusted by turning the spring tensioning bolt. Inlet pressure acts upward against the piston allowing excess pressure to flow upwards through the orifice.

The SB12 Series has a built-in check valve function, desirable for dosing applications. It is not so sensitive as to open with every pulsation from a metering pump.

features

True Union Ends
- Easy installation and maintenance
- Eliminate chemical leakage problems common with old fashioned threaded connections

Long Cycling Life
- Dynamic seal is PTFE bonded EPDM for high chemical resistance
- This moulded diaphragm is designed for superior sealing and flex life

Superior Performance in Dosing Systems
- Valves are hydraulically designed for very low hysteresis ("backlash") and to eliminate chatter
- Built-in check (non-return) function
- Valve opening depends on inlet pressure only and is uneffected by changes in downstream (back) pressure

CRN Registration numbers by province
- Ontario: OC10134.5
- Newfoundland: OC10134.50
- Alberta: OC10134.52
- Saskatchewan/Manitoba/Quebec: OC10134.56
- New Brunswick: OC10134.57
- Nova Scotia: OC10134.58
- P.E.I.: OC10134.59
- British Columbia: not required

technical

Set Pressure Ranges
- 1/2" to 2" – 5 to 150 psi
- 2-1/2" and 3" – 7.5 to 150 psi
- 2-1/2" to 4" – 4 to 60 psi (optional)
- 4" – 7.5 to 90 psi

Maximum Viscosity
- 120cP is maximum recommended service viscosity

[1] For ChemFlare™ end connectors, consult Chemline.
[2] PP and PVDF spigot ends have DIN dimensions and will butt fuse directly to Chemline PP and PVDF piping systems.
[3] PVC valves with EPDM or FKM (Viton®) seals are certified under NSF/ANSI Standard 61 for contact with drinking water.

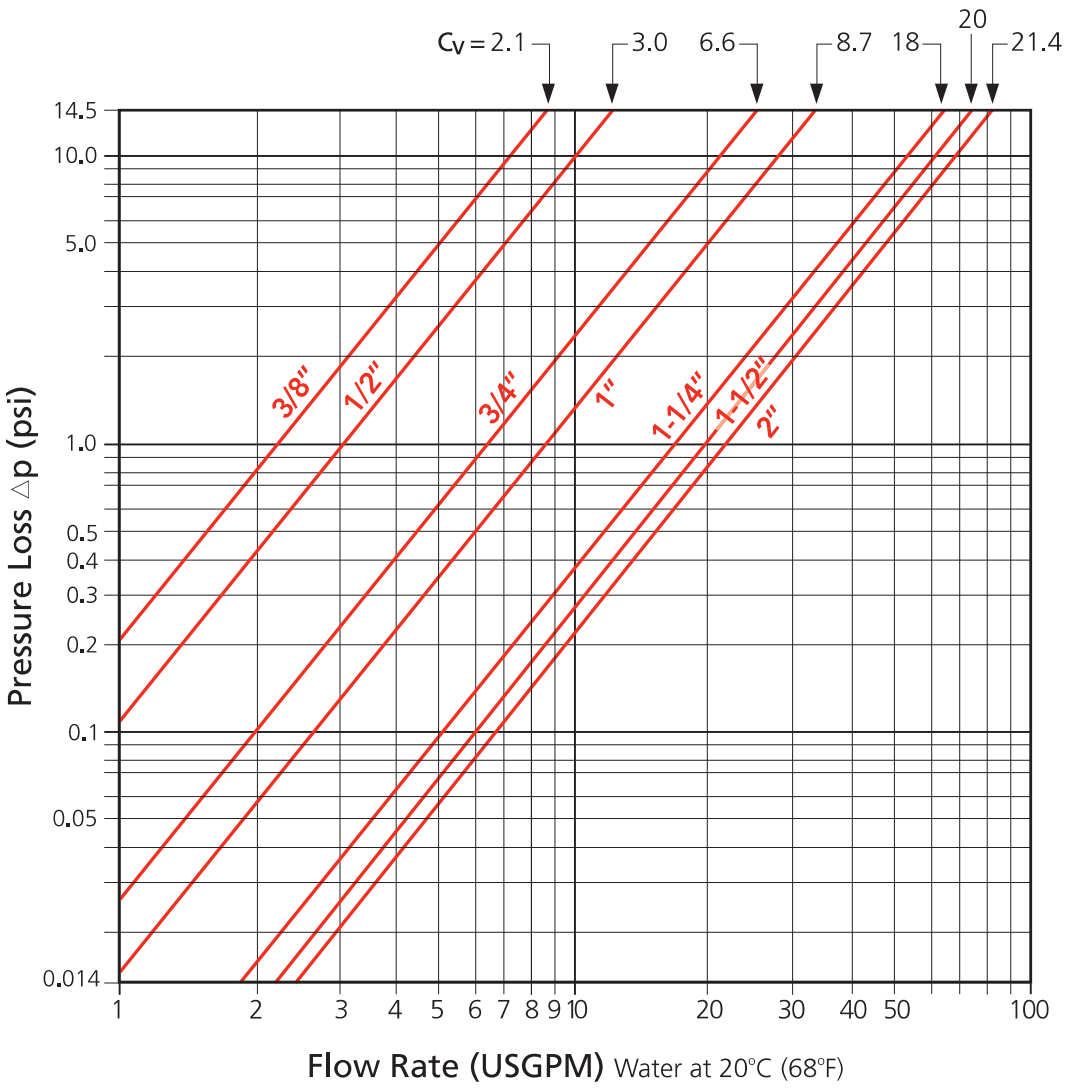
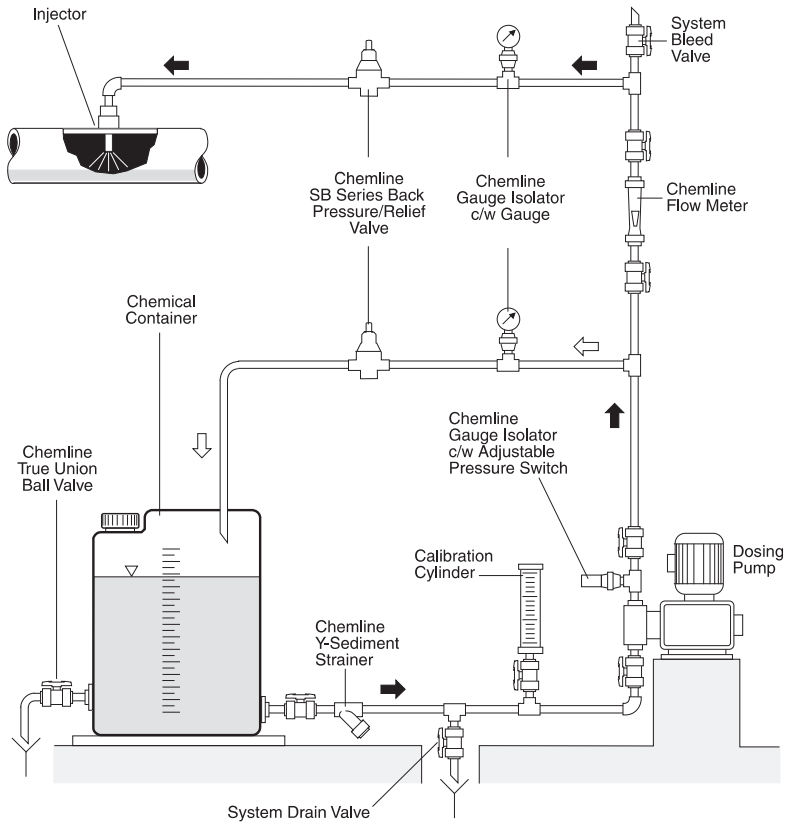
SB12 Series Back Pressure/Relief Valves 1/2” to 2”

pressure loss nomogram for SB12 valves 3/8” to 2”

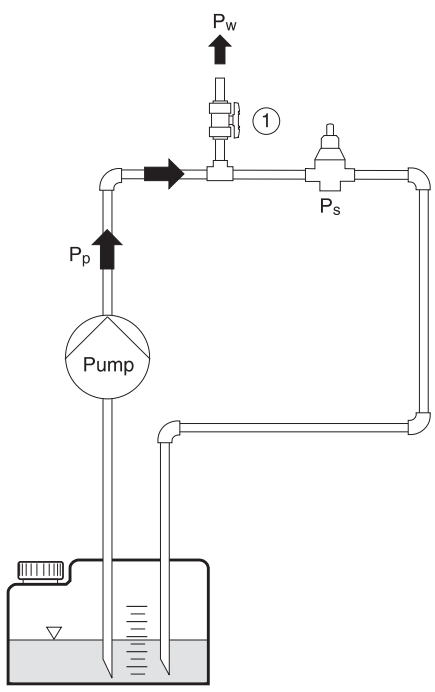


typical dosing system schematic



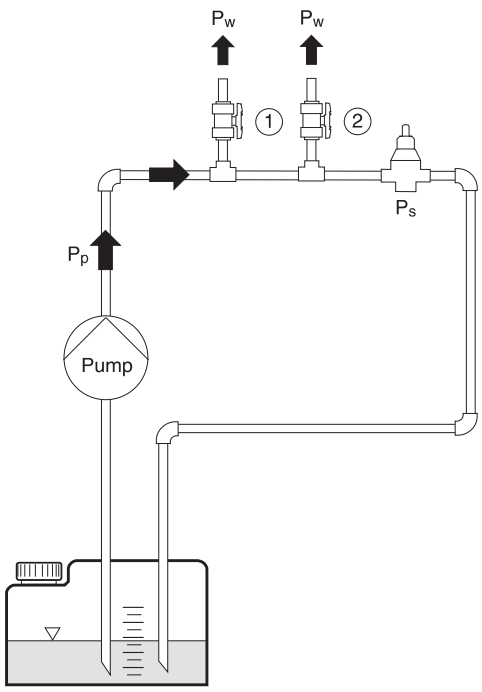
application of pressure relief valves

Constant System Pressure



$P_p \geq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

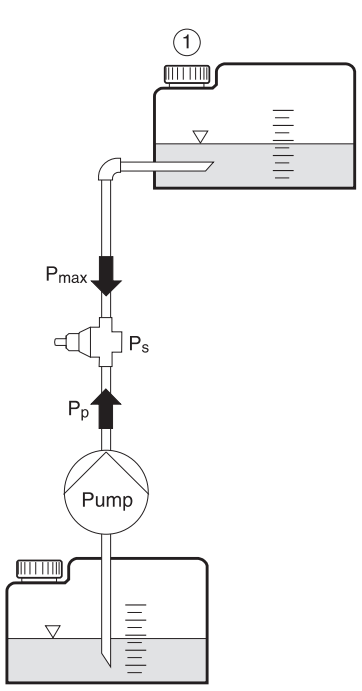
Consumer 1 and/or 2 Open, Valve Closes



$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Non-Return Valve

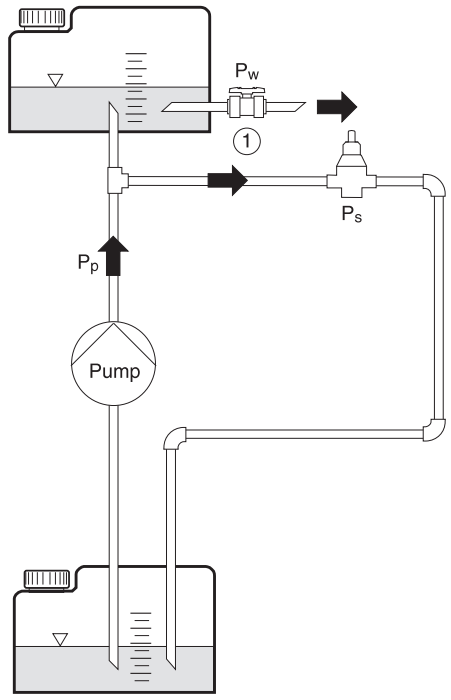
Container 1 is located above the pump



$P_s \geq P_{max}$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

Overflow Valve

Pressure of container or application system should not exceed the maximum pressure value



$P_s \leq P_w$
$P_p \geq P_s$ → valve opens
$P_p \leq P_s$ → valve closed

P_w = Working Pressure
P_p = Pump Pressure
P_s = Set Pressure

SB12 Series Back Pressure/Relief Valves 1/2" to 2"

working pressure vs. flow rate

The curves show the relationship between the working pressure and the approximate flow rate through the valve for water at 20°C (68°F) . These values will vary depending on:

- The configuration of the piping and the pressure losses associated with it
- The fluid if not water at 20°C (68°F)
- Whether the pressure is rising or falling, hysteresis is approximately 4 psi for 1/2" to 2" valves. For valves 2-1/2" to 4", hysteresis is approximately 14.5 psi.

operation examples

1. The valve is set closed at 100 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 100 psi
   - working pressure = 110 psi
   - opening pressure = approximately 104 psi
2. The valve is set closed at 50 psi. At a pressure increase of 10 psi, a flow of approximately 1.0 USGPM will be reached.
   - set pressure = 50 psi
   - working pressure = 60 psi
   - opening pressure = approximately 54 psi

Gauge Isolators

CHEMLINE PLASTICS
SUPERIOR FLOW SOLUTIONS

PVC PP PVDF

CRN Registered Consult Chemline

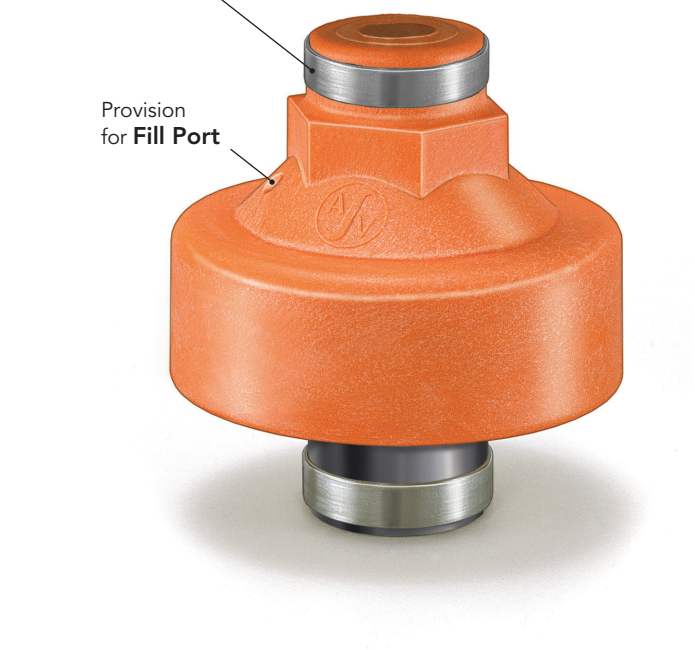
NSF[4] Certified to NSF/ANSI 61

SERIES: SG

INLET CONNECTION: 1/4" or 1/2" Threaded[1]

INSTRUMENT CONNECTION: 1/4" or 1/2" Threaded

DIAPHRAGM: PTFE



Chemline SG Series Gauge Isolators allow inexpensive pressure gauges, or any other pressure instrument to be used in corrosive services. The upper chamber (gauge side) is filled with a stable fluid such as glycol or glycerine[2]. A diaphragm separates it from the lower chamber which receives the media under pressure.

The 1/2" gauge connection allows use of the popular 4" and 4-1/2" diameter gauges. Pressure switches or transmitters may also be installed. Customers can easily fill isolators and install their own gauges.

features

Easy to Mount Gauges

- It is easy to fill an isolator and field mount a gauge. No special equipment is required.
- Will accept popular 4" and 4-1/2" diameter gauges

Provision for Fill Port

- Housing may be drilled and tapped by Chemline or customer for a threaded fill port. This is used for filling isolator using a vacuum filling station

High Chemical Resistance

- Choice of body materials for a wide range of applications
- PTFE bonded EPDM dished diaphragm for high chemical resistance and sensitivity

Heavy Duty Design for Safety

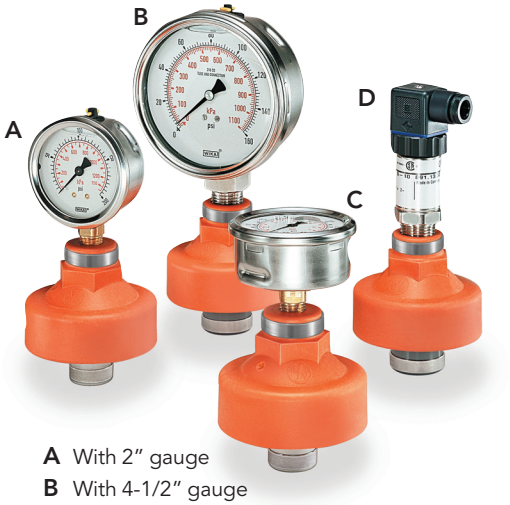
- PPG[3] top chamber
- Heavy wall connection ports

CRN Registration number by province

- Ontario: OH16085.5

Optional Gauges

- Isolators are available alone or with gauge mounted and prefilled with glycol[2]

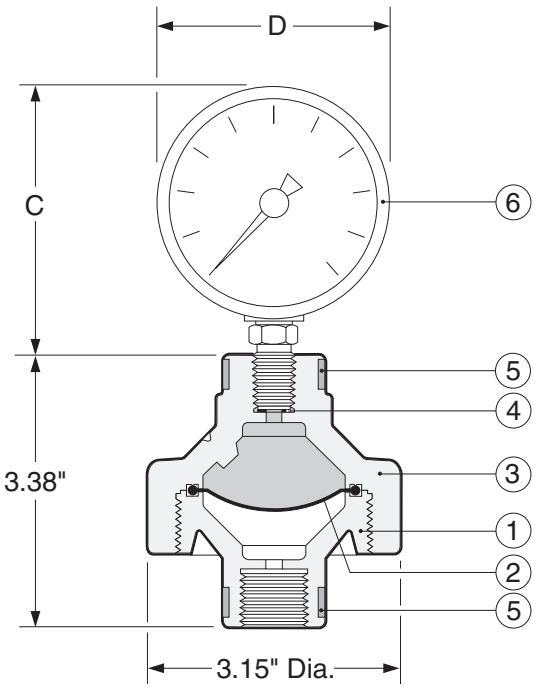


A With 2" gauge
B With 4-1/2" gauge
C With 2" back mount gauge
D With pressure transmitter

[1] Other available inlet connections are 1/2" socket or 1/2" to 1" flanged.
[2] Other fluids are available for special applications such as chlorine service.
[3] Glass reinforced polypropylene.
[4] PVC isolators are certified under NSF/ANSI Standard 61 for contact with drinking water.

06/14 ©Chemline Plastics Limited 2014
Chemline is a registered trade mark of Chemline Plastics Limited

Gauge Isolators



PARTS

No.	Part	Pcs.	Materials
1	Body	1	PVC, PP, PVDF
2	Diaphragm	1	PTFE
3	Bonnet	1	PPG[1]
4	Gasket	1	EPDM
5	Stainless Steel Bands	2	304 SS
6	Optional Gauge	1	See below

[1]PPG = Glass reinforced polypropylene

OPTIONAL GAUGES

- Chemline offers the gauges listed below mounted to isolator and prefilled with glycol, glycerine or special fluid for chlorine applications. These gauges have dials and cases filled with either glycol (standard), glycerine or silicon for corrosion resistance and dampening.
- Chemline SG gauge isolators are not recommended for vacuum applications. They will not affect the gauge accuracy as low as approximately 3 psi. The accuracy depends on the process conditions and the gauge installed on it.

OTHER OPTIONS

- **Flanged** inlet connections
- **Threaded Fill Port** – drilled, tapped and plugged
- Chemline will mount any pressure instrument supplied free issue by customer

DIMENSIONS (Gauge Isolator with optional gauge installed) INCHES

Optional Gauge Ordering No.	Gauge Diameter	Gauge Connection	Housing	Bourdon Tube	Window	Accuracy	Dimensions C	Dimensions D(max.)

STANTEC PROJECT #: 110126045

SUBMITTAL # DA-Veolia-DS-01 Spidflow Rev 02

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

- [ ] Architectural
- [x] Electrical
- [ ] Structural
- [ ] Other
- [ ] Mechanical

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

Stantec

90 SERIES RIGHT ANGLE HELICAL-BEVEL
SPEED REDUCERS/GEAR MOTORS

NORD DRIVESYSTEMS

PERFORMANCE SPECIFICATIONS

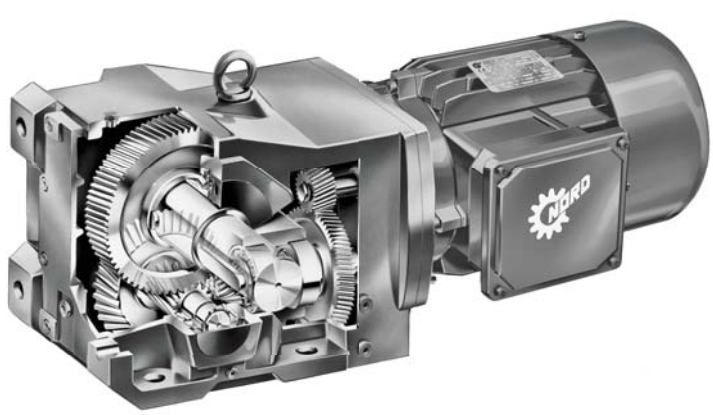
Configuration : right angle
Integral motor HP (min/ max) : 0.16 / 200
Integral motor kW (min/ max) : 0.12 / 160
Typical efficiency : 95.5%
Number of gear reductions : 3 to 6

MOUNTING STYLES

Footed housing style : standard
B5 flange outside diameter range [in] : 7.87 to 25.98
B5 flange outside diameter range [mm] : 200 to 660
Shaft mount housing available
B14 flange outside diameter range [in] : 5.51 to 17.72
B14 flange outside diameter range [mm] : 140 to 450

OPTIONS

NEMA C-face or IEC input adapter
Custom adapter flange
Flange pilot removed
Bolt-on torque arm with shock dampener
Effective drywell with flange



RATIO AND SPEED

Minimum standard ratio : 8.04:1
Maximum standard ratio : 134:32.68
Minimum output speed from 1750 rpm motor : 0.13 rpm
Maximum output speed from 1750 rpm motor : 218 rpm

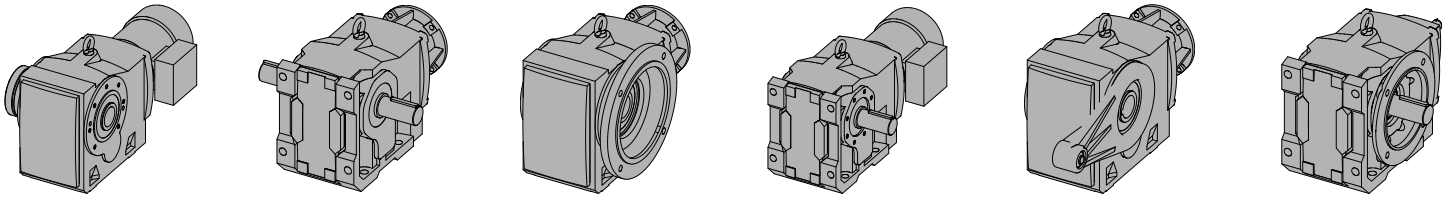
*** Torque may vary by ratio**



90 SERIES RIGHT ANGLE HELICAL-BEVEL

SHAFT DATA

- AISI 1045 or 4140 input and output shaft material
- Inch shaft key dimensions according to AISI B17
- Metric shaft key dimensions according to DIN 6885
- Standard output shaft drill and tap
- 2 hollow shaft keys
- Shrink disc size range [in] : 1.375 to 5.500
- Shrink disc size range [mm] : 35 to 150
- Minimum gripping safety factor range [h6 fit] : 2.6 to 6.3

SHAFT DATA OPTIONS

Double solid output shaft, Shaft fixing element, Custom shaft diameters, Hollow spline per DIN 5480, Custom spline, Cross drilled holes, 304 stainless steel

MOTOR MOUNTING

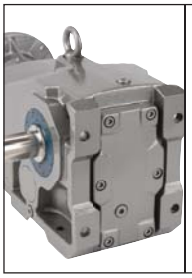
- Integral motor : 1/6 to 200 HP
- C-face adapter frame size range : 56C to 360TC
- IEC adapter [B5] frame size range : IEC 63 to IEC 315
- Sugar scoop motor availability : 56 to 365T
- Top mount platform motor availability : 56 to 405T

MOTOR MOUNTING OPTIONS

Custom motor adapter, Custom coupling diameter

GEARING

- Up to AGMA Class 13 gear quality rating
- 58 Rockwell C minimum gear hardness
- Ground or skive hobbed hard gear teeth finishing
- Standard drop forged gear blanks
- 275% momentary overload capacity
- Standard hunting tooth ratios



HOUSING

- Class 35 gray iron housing material
- Single setup machining method
- UNICASE™ one piece housing design
- Seals directly contact main housing
- Exceptional housing torsional stiffness
- Thick housing wall section
- Castings are dip sealed

BEARINGS

- ABEC-1 quality bearings
- Ball or tapered standard output bearing
- Tapered or spherical heavy-duty output bearing

LUBRICANT & SEALING COMPONENTS

- Factory filled ISO 220 mineral oil
- Standard AUTOVENT™ breather style
- QUADRILIP™ output seal design
- 1 double lip & 1 single lip output shaft oil seals
- Nitrile rubber Oil seals

LUBRICANT & SEALING OPTIONS

Custom synthetic lubricating oil, Custom temperature lubricating oil, Fluid grease lubricant, Food grade lubricating oil, Long term storage preparation, Magnetic drain plug, Bulls eye sight glass, Custom drain plug, Fluorinated rubber oil seal material, Custom oil seals

INTERNAL PARTS ASSEMBLY

- Heavy press fit assembly method
- Standard reversing duty
- Typical backlash range [arc minutes] : 7 to 13

INTERNAL PARTS ASSEMBLY OPTIONS

Internal backstop

ENVIRONMENTAL PROTECTION

- Exterior primer coverage on all metal exterior surfaces
- Water Based Resin paint type
- 316 stainless steel flake paint additive
- H1 USDA incidental contact exposure

ENVIRONMENTAL OPTIONS

Severe duty and washdown duty paint options, Custom paint, Shaft seal covers, High pressure washdown IP66 oil seals

HIGH PERFORMANCE MOTORS

INVERTER DUTY

- Motors conform with NEMA MG-1-2006 Section 31.4.4.2
- Speed range 5:1 constant torque from 60Hz to 12Hz
- Speed range 20:1 constant torque from 80Hz to 4Hz

INVERTER DUTY OPTIONS

- 10:1 Speed range: constant torque from 60Hz to 6Hz
- 1000:1 Speed range: constant torque from 60Hz to 0Hz
- Blower cooling fans
- Incremental encoder
- Class H magnet wire insulation

INTERNATIONAL CERTIFICATIONS

- Underwriters Laboratories Recognized component :
- Canadian Standards Association approved for most installations in Canada :
- CSA approved according to both US and Canadian standards :
- European Union (EU) member states approved according to Low Voltage Directive : CE

MOUNTING STYLES

- Integral motor with speed reducer
- NEMA C-face flange
- DIN B5, IEC FF metric face flange mount
- DIN B14, IEC metric face flange mount
- DIN B3, IEC metric foot mount

ENVIRONMENTAL PROTECTION

- IP55 enclosure protection
- Totally Enclosed Fan Cooled (TEFC)
- Tropical protection

ENVIRONMENTAL OPTIONS

NSD+ severe duty protection, Encapsulated windings for IEEE45 Marine Duty, IP66 enclosure, End bell drain holes, Drip cover (RD), Wind protected double drip cover (RDD), Space heater (SH), Additional epoxy coating on inside surface of motor

MULTIPLE SPEED OPTIONS

- 1800/3600 rpm - 4 pole and 2 pole windings
- 900/3600 rpm - 8 pole and 2 pole windings

STANDARD CONSTRUCTION FEATURES

- Corrosion resistant aluminum alloy housing
- Double coated magnet wire insulation
- Insulation lined slots
- First turn winding protection
- Varnish dipped stator
- Shaft lip seals both end bells
- Inorganic insulation for tropical protection
- Sealed stator to end bell connections
- Cast metal terminal box
- Gasket sealed terminal box
- Non sparking low inertia fan
- Dynamically balanced rotor
- Anti-corrosion coated rotor
- Bearing grease resists water
- Terminal block power connector
- Reversible rotation direction
- Four conduit box locations
- Four cable entry locations
- Threaded cable entry

THERMAL WINDING PROTECTION OPTIONS

- Thermostat sensor (TW)
- Thermistor sensors (TF)

POWER OFF BRAKE

- Ready to go…wired by factory
- Manual hand release lever included
- Downward adjustable torque is included, specification is required
- AC to DC voltage rectifier is included
- IP55 enclosure protection is included

POWER OFF BRAKE OPTIONS

NSD+ severe duty protection, Corrosion protection (RG), Dust protection (SR), Lockable hand release lever (FHL), Oversize brake, Undersize brake, Inverter duty modifications, Faster torque release enhancement, Faster torque stopping enhancement, Current sensing relay for automatic control(IR) Heating circuit (BSH), Micro switch wear indicator, IP 66 enclosure

OTHER OPTIONS

- Over-running clutch (FK)
- Anti-rotation backstop (RLS)
- Extended motor shaft beyond fan cover (WE)
- High inertia metal fan for soft start (Z)
- Quick power disconnect plug (MS1)

EL-FI® M20

SHAFT POWER MONITOR

INSTRUCTION MANUAL

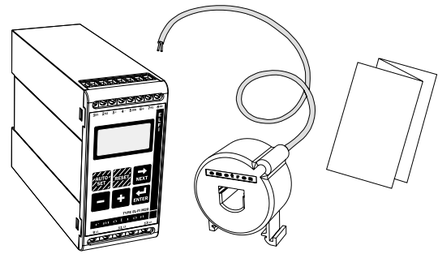
Motor shaft output power measurement

1 INSIDE THE BOX ...

This instruction manual describes the installation and commissioning of the M20 load monitor. The M20 supervises induction motor driven equipment and provides alarms when abnormal conditions are detected. The M20's ability to provide reliable monitoring & protection ensures production equipment is optimised and expensive breakdowns and interruptions are minimized. Due to the special method of subtracting motor power losses, the monitor is able to accurately measure the shaft power supplied by the motor to the application. This advanced technique allows the M20 to monitor the "application" load only as opposed to the "total" motor load, which includes the varying motor losses.

- Check the delivery. Your shipment should contain the M20 load monitor, a current transformer and this instruction manual.
- Check carefully that the ordered equipment complies with the motors input voltage and that the current transformer rating is as stated on the delivery packaging.
- Check that the contents have not been damaged in shipping.

Note!
If in doubt contact your supplier before starting to install or commissioning the product.



2 SAFETY

- Study this manual thoroughly before installing and using the monitor.
- The monitor must be installed by qualified personal.
- Always disconnect supply circuits prior to installing.
- The installation must comply with standard and local regulations.
- Pay special attention to this SAFETY section and the part marked "CAUTION!" in the OPERATION section.
- Should questions or uncertainties arise, please contact your local sales outlet or see section 11 SERVICE.

Note!
Do not remove or break the seal on the housing. The warranty will be cancelled.

3 WIRING

This wiring example shows how the M20 can be used to control the starting and stopping circuit of the motor. Other wiring configurations are possible.

1. The current transformer CTMxxx must be placed in the same phase that is connected to terminal 9, phase L1.
2. For single-phase connection see fig 2.

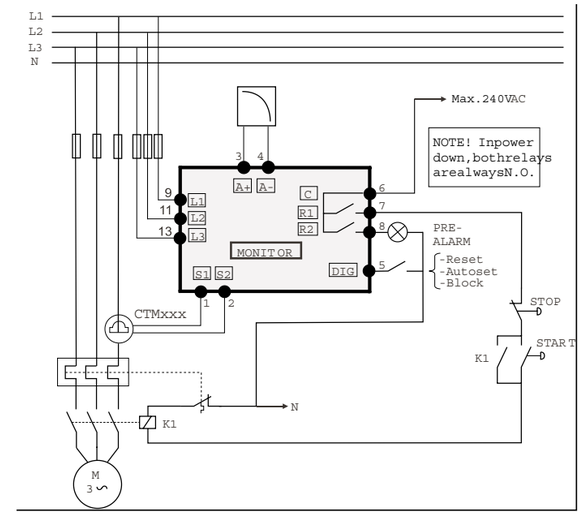


Fig 1. Connection example

Note!
If the START/STOP is connected according to fig. 1, it is recommended that terminals 6 and 7 be by-passed during programming. After the programming is completed the by-pass must be taken out.

3 Continue

ALTERNATIVE EXAMPLE FOR SINGLE-PHASE CONNECTION

This wiring example shows the deviant power connection to be made with regard to a single-phase connection. Refer to fig. 1 for the remaining wiring.

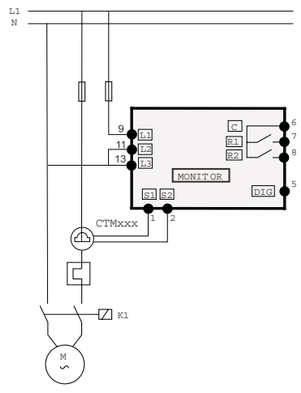

Fig 2. Single-phase connection example.

EXAMPLE - DIGITAL INPUT

The Digital Input use the terminals 5 (DIG) and 6 (C-reference). It can have either a VAC or a VDC signal. See also section 7 ADVANCED FEATURES.

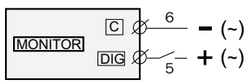

Fig 3. Wiring example for digital input.

4 SELECTION CURRENT TRANSFORMER

FOR MOTORS LESS THAN 100A

1. Check the rated motor current on the motor plate.
2. Compare this value with the current in table 1.
3. From table 1, select the current transformer and the appropriate numbers of windings.

Note!
Max length of the CTM cable is 1 m (39.37 in).

EXAMPLE:

- Rated motor current = 12A.
- Select 10.1-12.5A from the first colon in table 1.
- This gives:
  - CTM025 with 2 windings.

RATED MOTOR CURRENT [A]	CURRENT TRANSFORMER TYPE NUMBER OF WINDINGS			
	CTM 010	CTM 025	CTM 050	CTM 100
0.4 – 1.0	10			
1.01 – 2.0	5			
2.01 – 3.0	3			
3.1 – 5.0	2			
5.1 – 10.0	1			
10.1 – 12.5		2		
12.6 –25.0		1		
26.0 – 50.0			1	
51.0 – 100.0				1

Table 1. CT less than 100A.

Note!
Normally the appropriate Current Transformer (CT) will have been ordered and shipped with the M20, check that this is the case; contact the supplier if in doubt.

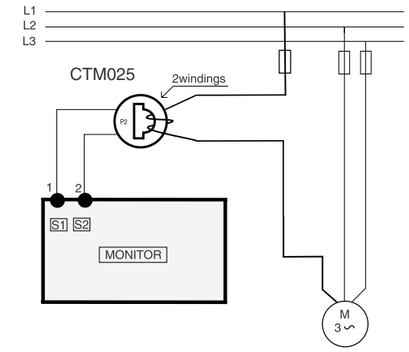

Fig 4. Example CTM 025 with 2 windings for an 12 A motor.

Note!
The transformer connection and orientation are not polarity sensitive.

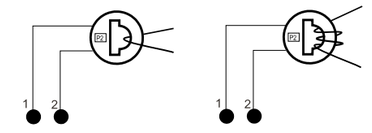

Fig 5. Example 1 and 3 windings.

6:4 Monitor Function (Window 05)

Monitor (Protection)	Indication in window 05	Alarm	Output Relay (default)
OVER- and UNDER-LOAD (default)	—	MAX Main-Alarm	Relay 1 (NC): 6-7
	—	MAX Pre-Alarm	Relay 2 (NO): 6-8
		MIN Pre-Alarm	Relay 2 (NO): 6-8
		MIN Main-Alarm	Relay 1 (NC): 6-7
OVERLOAD	—	MAX Main-Alarm	Relay 1 (NC): 6-7
		MAX Pre-Alarm	Relay 2 (NO): 6-8
UNDERLOAD		MIN Pre-Alarm	Relay 2 (NO): 6-8
	—	MIN Main-Alarm	Relay 1 (NC): 6-7

Over- and underload monitor

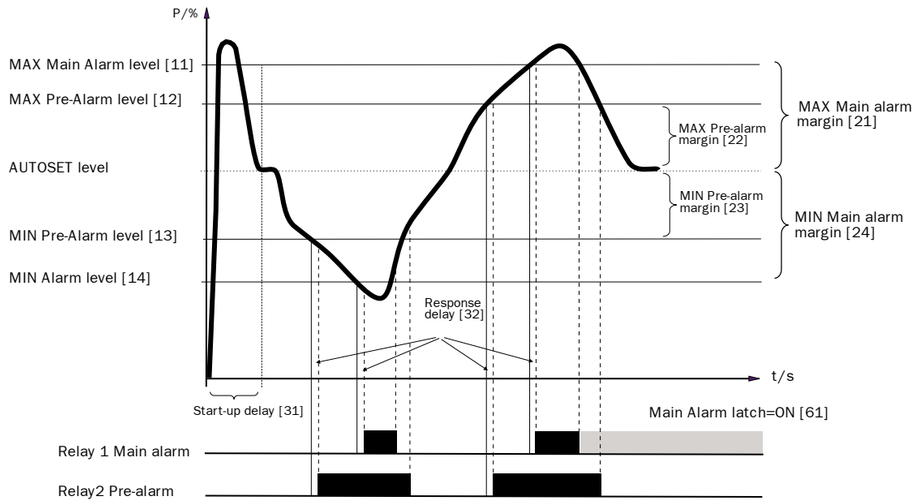

Fig 7. Over- and underload monitor

Programming

1. Go to window 05. The default selection is OVER- and UNDER-LOAD monitor.
2. Press − or + to select UNDERLOAD or OVERLOAD monitor.

OVER- and UNDERLOAD UNDERLOAD OVERLOAD

3. Press ↵ ENTER to confirm the change.

6:5 Set the START DELAY (window 31)

A START DELAY must be set to allow the motor and machine to speed up and to allow the power in-rush currents to be ignored by the monitor.

Programming

1. Determine in seconds, how long it takes for the motor and machine to reach speed and for the power in-rush to pass. This will be the minimum START DELAY.
2. Go to window 31 (default = 2.0s).
3. Press − or + to set the determined START DELAY time in seconds.
4. Press ↵ ENTER to confirm the change.

Example: Start Delay 2.0 s

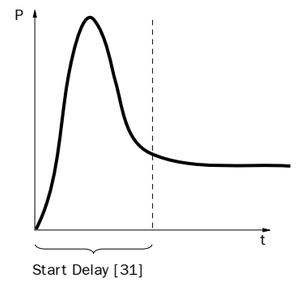

Fig 8. Start Delay

6:6 Set Alarm levels with AUTOSET

The AUTOSET command performs a measurement of the actual motor load and automatically sets the relevant Alarm levels depending on the selected monitor function.

Protection (Monitor function window 5)	Alarm	Margin Value (Default margins)	Margins (Windows)	Alarm Level at AUTOSET
OVER- and UNDERLOAD (Default)	MAX Main-Alarm	16%	21: MAX Main Alarm margin	Normal machine load+Window 21
	MAX Pre-Alarm	8%	22: MAX Pre-Alarm margin	Normal machine load+Window 22
	MIN Pre-Alarm	8%	23: MIN Pre-Alarm margin	Normal machine load-Window 23
	MIN Main-Alarm	16%	24: MIN Main Alarm margin	Normal machine load-Window 24
OVERLOAD	MAX Main-Alarm	16%	21: MAX Main Alarm margin	Normal machine load+Window 21
	MAX Pre-Alarm	8%	22: MAX Pre-Alarm margin	Normal machine load+Window 22
UNDERLOAD	MIN Pre-Alarm	8%	23: MIN Pre-Alarm margin	Normal machine load-Window 23
	MIN Main-Alarm	16%	24: MIN Main Alarm margin	Normal machine load-Window 24

Programming

1. Start the motor and let it run at the normal machine load, until the START DELAY has expired.
2. Press AUTO SET for 3 seconds. This can be done in any window.
3. The display shows "SEt", to confirm that the AUTOSET level has been measured and the Alarm levels have been set. The display reverts to window 01.

3 seconds

4. If the alarm levels are too high or too low, readjust the appropriate MARGINS (see table above) and perform a new AUTOSET. Alternatively, alarm levels can be set manually - see section 7.

6:7 Set the RESPONSE DELAY (Window 32)

A RESPONSE DELAY allows the machine to remain in an over- or underload condition for a specific time before the alarm relays are activated.

Programming

1. Determine in seconds, how long an under- or overload condition is allowed. This depends on machine properties and behavior. This will be the RESPONSE DELAY.
2. Go to window 32 (default = 0.5s).
3. Press − or + to set the determined RESPONSE DELAY time in seconds.
4. Press ↵ ENTER to confirm the change.

Example: RESPONSE DELAY

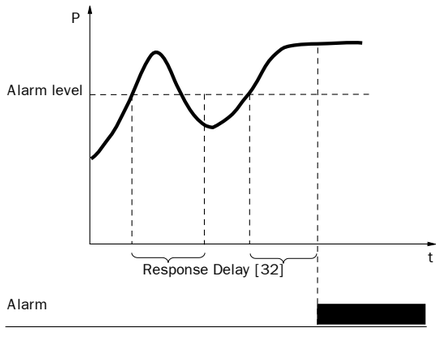

Fig 9. Response Delay

7 ADVANCED FEATURES

Set ALARM LEVELS manually (Window 11-14)

The alarm levels can be set manually, without using the AUTOSET. Also after an AUTOSET has been performed, these levels can be readjusted e.g. for fine-tuning.

Protection (Monitor function window 05)	Alarm levels (Window)	Default
OVER- and UNDERLOAD (Default)	11: MAX Main Alarm	100%
	12: MAX Pre-Alarm	100%
	13: MIN Pre-Alarm	0%
	14: MIN Main Alarm	0%
OVERLOAD	11: MAX Main Alarm	100%
	12: MAX Pre-Alarm	100%
UNDERLOAD	13: MIN Pre-Alarm	0%
	14: MIN Main Alarm	0%

Set MARGINS (window 21-24)

The MARGINS for the AUTOSET can be changed manually. After the adjustment, the AUTOSET action must be performed once again to activated the new margins.

Protection (Monitor function window 05)	Window	Default
OVER- and UNDERLOAD (Default)	21: MAX Main Alarm margin	16%
	22: MAX Pre-Alarm margin	8%
	23: MIN Pre-Alarm margin	8%
	24: MIN Main Alarm margin	16%
OVERLOAD	21: MAX Main Alarm margin	16%
	22: MAX Pre-Alarm margin	8%
UNDERLOAD	23: MIN Pre-Alarm margin	8%
	24: MIN Main Alarm margin	16%

Set HYSTERESIS (Window 33)

The HYSTERESIS of an Alarm level prevents the alarm relay "chattering" if the load fluctuates even in a normal "stable" condition . Apply also for pre-alarm. This feature is normally only used if the "Main Alarm Latch" (Window 61) is set to "OFF". Default = 0%.

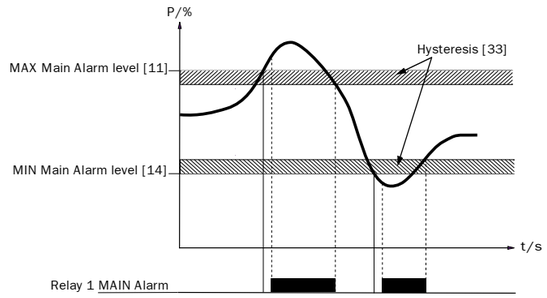

Fig. 10 Hysteresis

Set MAIN ALARM LATCH (Window 61)

The MAIN ALARM LATCH keeps the MAIN ALARM output active, even if the alarm condition has been removed (relay R1). A latched alarm output can be reset by:

- the reset key
- external reset via Digital input (see window 81).
- switching of the power of the monitor (see also "Wiring").

Default = OFF.

Set ALARM AT NO MOTOR CURRENT (Window 62)

The "ALARM AT NO MOTOR CURRENT" gives an alarm if the motor current becomes zero (ON). Default = OFF (No alarm at no motor current).

Set RELAY OUTPUTS (Window 63 and 64)

The RELAY OUTPUTs R1 and R2 can be set to NO or NC contacts.

Note!
If the power to the load monitor is switched off the relay contacts are allways in the NO.

Set DIGITAL INPUT (window 81)

The DIGITAL INPUT can be set for:

RES: External RESET (Default)	to reset an Alarm.
AU: External AUTOSET	to perform an AUTOSET with an external command.
bLo: Block Pre-Alarm	to block the Pre-Alarm function and start the Block timer. If the input is high a Pre-Alarm is blocked, e.g. it is neglected. See also window 82.

Set BLOCK TIMER (window 82)

To set the timer for the blocking time after the Block command is released (see also window 81). Default = 0.0 sec.

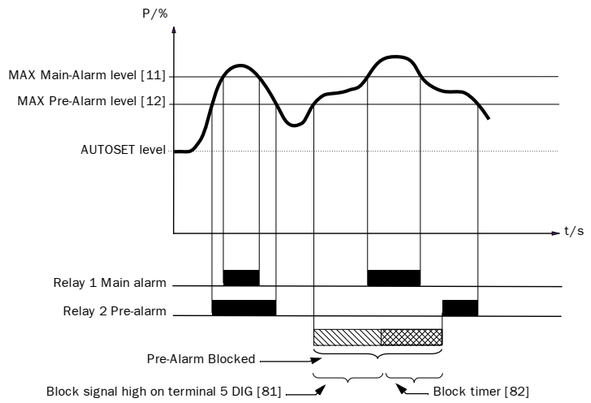

Fig 11. Block timer

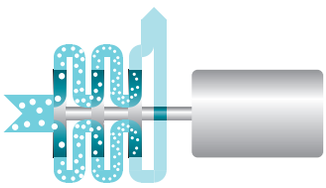
PBU

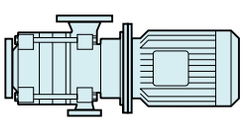


Multiphase
PBU LBU

Horizontal centrifugal pumps for the transport of liquid-gas mixtures and for the enrichment of liquids with gases. A dispersion with very fine bubbles is being achieved. Therefore the multiphase pumps are also acting as dynamic mixer with high shearing forces.

Some main applications are water and wastewater treatment, dissolved air flotation, neutralization, biofuel plants, bio-reactors, ozonation, crude oil water separation on oil fields and oil rigs as well as general process technology.

Other types:



LBU

Advantages

- **High Energy-Efficiency**
  - optimal enrichment and mixing of liquids with gases
  - high degree of dispersion
  - low velocity of flow
  - optimized impeller approach flow
  - low internal friction losses
- **Technical Superiority**
  - open impellers without axial thrust
  - compensation of radial forces by means of diffuser
  - direct gas input acc. to VDMA 24430
- **Process Reliability**
  - gas contents up to 30 %
  - stable creation of micro bubbles
- **Easy Installation**
  - modular construction for customized solutions
  - bloc-design
- **Application**
  - operating pressure up to 40 bar
  - temperature -40° C to +140°C
  - viscosity up to 115 mm²/s

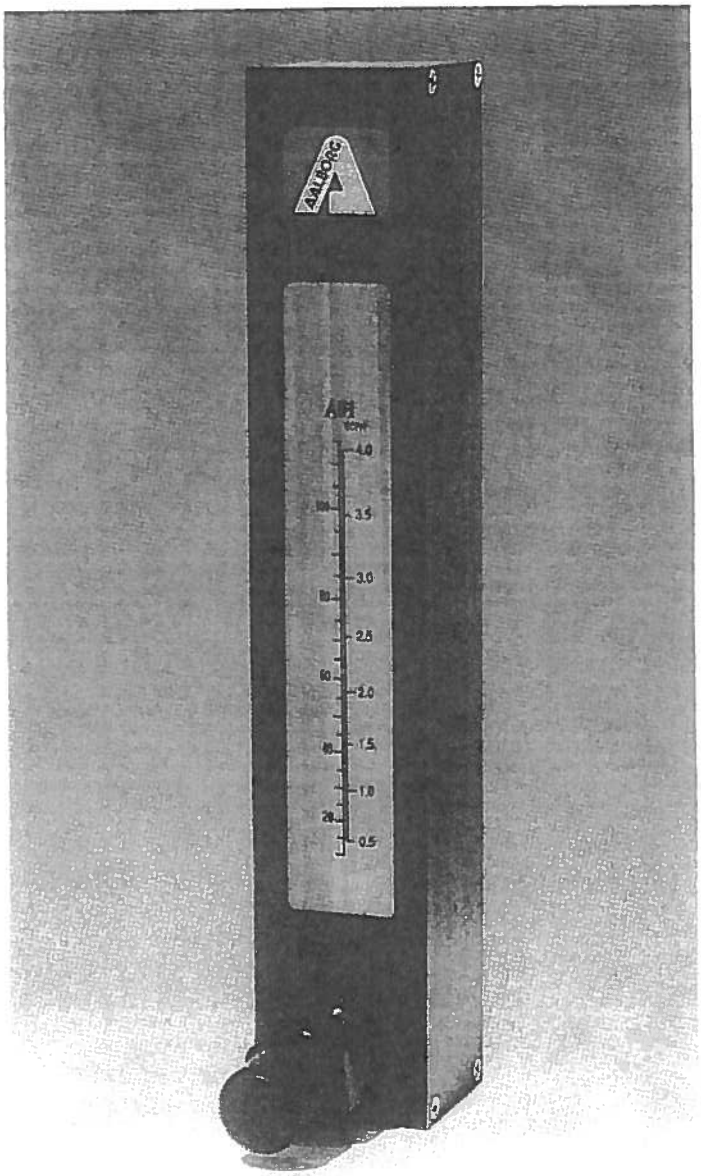
V MEDIUM RANGE PTFE FLOW METERS

Incorporating traditional variable area precision glass technology, these rugged PTFE flow meters offer accurate and economical solutions to medium flow range measurements. **V meters** are designed with unique rotatable scales of dual air-water direct reading graduations showing SCFM and SLPM (air), as well as GPM and LPM (water) markings.



LEAK INTEGRITY

Flow meters are individually tested on a Mass Spectrometer Leak Detector and certified to a leak integrity rating of 1 X 10^{-7} sccs Helium or better.

SPECIFICATIONS	
SCALES	Rotatable, direct reading air, (SCFM-SLPM) and water (GPM-LPM). Scale length is 127mm (nominal).
ACCURACY	±5% of full scale.
MAXIMUM TEMPERATURE	150°F (65°C.)
MAXIMUM PRESSURE	100 psig (6.7) bars.
CONNECTIONS	3/8" NPT female in line or horizontal rear.
LEAK INTEGRITY	Individually leak tested and certified.

MATERIALS OF CONSTRUCTION	
TUBE SHIELDS	Polycarbonate.
FLOW TUBES	Heavy walled precision formed borosilicate glass.
FLOATS	PTFE.
WETTED PARTS	PTFE, PCTFE.
SEALS	PTFE.

FLOW METER INSTRUCTIONS

GENERAL INFORMATION

Inspect instrument for possible visible damage resulting from shipping. Notify UPS or other carrier as well as the distributor where the flow meter was purchased of any claims.

Flow meters always must be installed in a vertical position, any significant deviation from vertical will affect the readings.

Valves should be closed before installation and opened gradually after all connections are carefully inspected. A leak test is highly recommended especialy when hazardous fluids are involved.

CAUTION: Excessive tightening of valves may damage the orifice.

It is important that all lines to be connected to the flow meter are purged of any dust or other residual contamination prior to installing the meter. All P and S style flow meters are equipped with a filter in the inlet port. In some applications an additional filter should be installed at the inlet of the flow meter.

STICKING FLOATS

Before installing open the valve of the flow meter and check to make sure that the float or floats are moving freely in the flow tube. This is best done by slowly tilting the flow meter from horizontal to vertical while observing if the float is rolling freely.

All meters are thoroughly inspected at the factory prior to shipping and are sealed in polyethylene bags to prevent dirt from entering into the flow passages. Certain small bore flow tubes have a clearance between the float and the inside walls of the flow tube of only a few ten thousandths of an inch. In some cases these flow tubes are found to have floats that are sluggish of not moving due to condensation resulting from temperature changes during shipping.

It is advisable to blow a dry clean gas through the meter to free float.

SAFETY INFORMATION

P and S style flow meters are designed to be operated at pressures not exceeding 200 psig (13.6 bars), or temperatures not exceeding 250 degrees F (121deg.C).

T style flow meters are designed to be operated at pressures not exceeding 100 psig (6.8 bars), or temperatures not exceeding 150 degrees F (65.5deg.C).

NOTE: When using a T style PTFE flow meter, at a pressure and/or temperature greater than standard the leak integrity approaches 1x10. Standard conditions are considered to be 14.7 psia (1 bar) and 70 degrees F (21deg.C).

All meters are factory tested for leakage prior to shipping. For hazardous fluids the flow meter must be re-tested at the time of installation in the system, prior to usage. It is also important that a leak integrity test is performed periodically to maintain safe operating conditions.

Flow meters must be protected from breakage due to external conditions such as objects bumping into or hitting the instrument, extreme vibrations, or attack by corrosive materials. It is the responsibility of the customer to acquaint the operator(s) of this flow meter with all appropriate safety information.

VALVE ALIGNMENT

The built-in needle valve may be positioned at either the inlet or the outlet of the flow meter. Valves are factory installed at the inlet of the flow meter unless otherwise requested.

APPLICATION	VALVE POSITION
Exhaust pressure at Atmospheric conditions	Valve at Inlet
Exhaust pressure other that Atmospheric conditions *	Valve at Outlet
Vacuum	Valve at Outlet
Liquid flow	Valve at Inlet or Outlet

*When using a flow meter with exhaust pressure greater than atmospheric conditions the standard calibrations can not be used. A calibration for the operating pressure must be obtained.

OPERATING INSTRUCTIONS

Close valve (if applicable) before initial use, then pressurize the system.

Slowly open the valve until the float is at the desired flow rate. The flow rate is read at the center of the float.

FLOW TUBE INSTALLATION OR REMOVAL

Remove the Front Shield and Back Plate. **Do not** remove the side panels from the flow meter.

To remove the flow tube:

P style meters: insert a 5/32" hex wrench into the Pressure Nut at the top of the flow meter. While holding the flow tube between your thumb and forefinger, turn the wrench counter clockwise to release the flow tube. Carefully remove the flow tube as not to damage it.

S and T style meters: insert a 3/32" diameter rod in the holes of the Lock Nut at the top of the flow tube. While holding the flow tube between your thumb and forefinger, turn the tool clockwise to release the flow tube. It may be necessary to push the Tube Adapter into the upper block to remove the flow tube.

To reinstall the flow tube reverse the above procedure. Take care to assure that the flow tube is centered, in the meter, at the top and bottom before tightening.

T style meters require additional tightening to insure proper sealing at the flow tube ends. The flow meter should be tightened again 24 hours after the initial tightening.

A leak integrity test is recommended after disassembling any flow meter.

FLOW TUBE CLEANING

If necessary, remove the flow tube from the frame as explained above, and clean as follows:

Insert a plastic rod that will fit into the flow tube with no obstruction, into the bottom of the flow tube and push the retaining plugs and float out of the flow tube. Use tweezers to handle the float and store the float and the plugs in a lint free container. Before removing note the position of the plugs for reference when reassembling.

Using a suitable solvent clean all the parts including the flow tube, dry them by means of a clean stream of air or gas.

To reassemble the flow tube use the push rod to first install the lower plug, next insert the float and then the upper plug.

Test by slowly tilting the flow tube from horizontal to vertical to assure that the float is moving freely. If the float is free follow the instructions above to reinstall the flow tube in the frame.

MAINTENANCE

Under normal operating conditions no special maintenance is required. Dirt or contamination may create problems within the flow tube by causing a restriction in the flow passage. Such conditions can be diagnosed by examining the flow tube. The most obvious indication of obstruction is the float being stuck in the flow tube. If the existence of the contamination is determined the condition may be rectified in a number of ways. The easiest being (if possible), to disconnect the inlet and the outlet of the flow meter and purge the instrument by using a clean and dry stream of gas. The action of the float within the bore of the flow tube very often causes particles to be dislodged through the outlet of the flow meter.

ISLIP Flow Control products are designed to exacting specifications, and manufactured to the highest standards, resulting in an extensive range of flow controls that are built for dependability, and years of use. IFC's products are found around the globe. From Arizona to Australia, and Singapore to Saudi Arabia, ISLIP is there. We are the manufacturer of choice for professionals who know that quality, service and dependability equal success.

ISLIP Flow Controls is the industry's answer for full-service solutions. We are the knowledge leaders you can depend on to resolve your flow control challenges in the industrial, oil & gas, petrochemical, HVAC and commercial industries.

Working with us means working with a front-line business partner you can trust. It is a customer-focused approach that has made us the manufacturer of choice for Strainers, Valves and Pipeline Accessories. It's exacting professional performance that delivers quick response and exceptional service. And, it is the benefit of intelligent people who have the experience and expertise to create workable solutions tailored to you and your business, project by project.

what sets us apart ?

At ISLIP Flow Controls, we have built an entire company on our dedication to quality. It isn't just our superior products and competitive prices that have made us the manufacturer of choice for users on five continents, it is so much more.

"They speak our language. We like their expertise and understanding of the business…"
Vanessa Nugent, Fluor Canada for the Imperial Oil ULSD Project

It's superb personal service, exacting detail, and a precise knowledge of the industries we work with. We offer solutions that are as individual as we are.

"ISLIP has the answers. They're not afraid to take on the challenge of new applications…"
Amy Ng, Delta Fountains

It's the kind of dependable advice and prompt response that's there when you need it most. With us, expertise and a new solution are just a call away.

"ISLIP offers instant, direct contact…" FMC Smith Meter, Guy Roussel-Dupre

And, it's commitment you can count on. We stock what you need; we ship on time.

"We often get same-day pick up. There's a good inventory. They're easy to work with…"
Greg White, Industrial Mine & Pipe

ISLIP FLOW CONTROLS Inc.
Our Knowledge Sets us Apart.

products

All ISLIP Flow Control products are strictly manufactured and tested in accordance with applicable ASME and CSA standards as well as specific customer requirements.

Visit us online at **www.islipflowcontrols.com** for comprehensive details specifications on all our products. Find helpful downloads, catalogues on all the products we offer, and important certification documents. We will even help you find the right product for your individual applications with our convenient on-line Help List specifier.

When you work with IFC, you'll receive quality products that arrive on time and within budget. They are supported by certifications that carry the kind of assurance you can depend on, backed by a staff of experts who are there when you need them.

IFC manufactures and stocks a full line of Flow Control Products. Most product lines are available in sizes up to 60" in diameter and pressures up to 10,000 PSIG. Readily available and stocked materials of construction are cast and ductile iron, bronze, carbon steel and stainless steel in pressure classes 125 lb through 1500 lb. For extreme and special operating conditions, products manufactured from special alloys can also be supplied.

Ball Valves – One-Piece, Two-Piece & Three-Piece

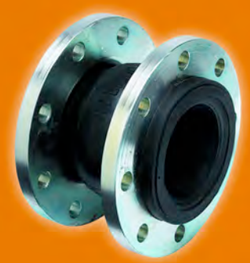
Temp. Cone, Basket & Plate Strainers

Butterfly Valves – Resilient Seated & High Performance

Silent Check Valves

Dual Disc Check Valves

Duplex/Dual Basket Strainers



Rubber Connectors

Y Strainers

Basket/Simplex Strainers

Suction Diffusers

Triple Duty Valves

Custom-Fabricated Strainers and Valves, including IFC's Self-Cleaning Strainer

who we are

With over 30 years experience, professionals have made ISLIP Flow Controls their number one choice for Strainers, Valves and Pipeline Accessories.

Since founder David Islip formed the business, we have maintained a family company with family values: integrity, commitment to superior service, dedication to solving problems and a continuing responsibility to develop the best products in every market we serve. It is this kind of expertise that allows us to give our customers the buying benefits of a big business and the personal attention of small enterprise.

the ISLIP network

Choosing ISLIP Flow Controls means selecting the style of service you prefer most – working directly with the in-house experts at our Head Office or dealing face-to face with our appointed agents. No matter the choice, you can depend on industry experience and the kind of know-how it takes to solve the toughest problems.

Rest assured local IFC Master Distributors and Representatives are trusted professionals, who carry the face of ISLIP Flow Controls into every business they visit, providing the links that help us play a vital role in day-to-day success in markets across the country, and around the world. They serve as support to Specifiers, Contractors and Engineers, and work on our behalf to introduce IFC products to new markets. With a ready-to-access inventory of our entire product line, your local ISLIP Master Distributor can make a genuine difference on a project when dollars and cents really count.

our promise

Islip Flow Controls has redefined the meaning of exceptional quality and outstanding service. In fact, we have made it a part of how we do business every day. It is our Continuing Commitment to Customer Care and it means we go the extra mile to make sure we always exceed your expectations.

Count on us for

- **Friendly knowledgeable help that's there when you need it**
- **Dependable quality**
- **Delivery that's on-time**
- **Competitive pricing**
- **Customized engineering solutions**

We are your professional resource just a call or click away.

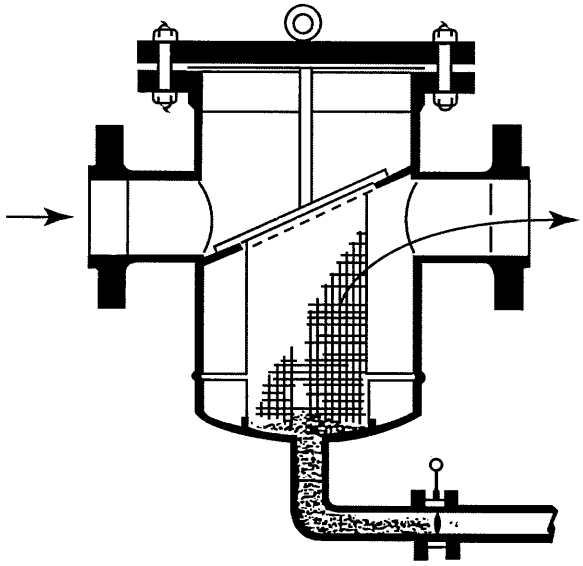
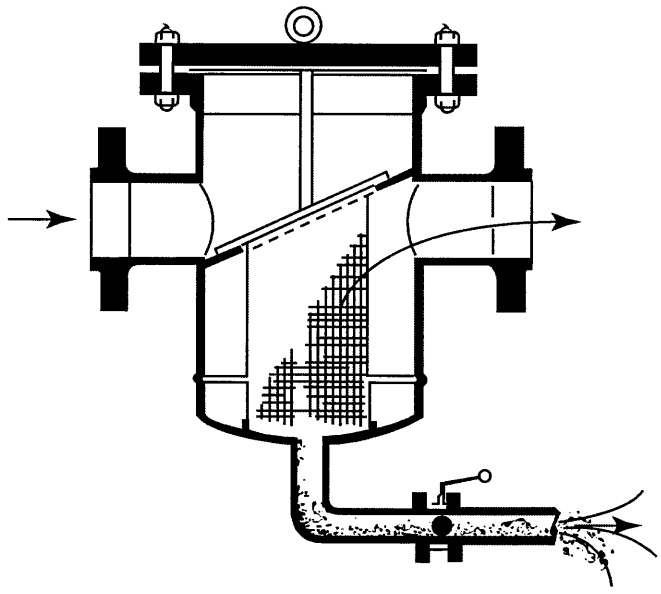
BACKFLUSH/BACKWASH OPTION:

Custom Fabricated simplex and duplex strainers are available with this important option.



(A) Valve closed - dirt accumulated



(B) Valve open - dirt removed thru backwash piping.

In many systems, particularly where solids are heavy and well defined, dirt accumulates as shown above (A). When the backflush valve is open, (B), the differential pressure between the operating pressure and the backflush system removes the dirt, all without shutting the system down. This simple process is referred to as backflushing.

Backwashing occurs when backflushing is supplemented by fluid flowing, under pressure, in the reverse direction into an empty strainer. This flow reversal backwashes the element and removes the residual dirt. Backwashing is often regarded as a second step, used to remove dirt not removed by backflushing.

STEAM JACKET OPTION:

Custom Fabricated simplex basket and tee strainers in all sizes are also available with this option. This modification is designed to have no impact on the function or normal maintenance.

Steam jacketing is available in carbon steel and 316SS for service up to 450°F. Steam jacketing is used to maintain critical fluid temperatures through the strainer. High temperatures are often required to process and transport high viscous fluids.

Caractéristiques / *Design criteria* :

Pression de travail / *Operating pressure)* / Débit (*flow)* :

Il existe 3 différents diffuseurs capables de délivrer différents débits unitaires moyens. Le nombre de diffuseurs est à sélectionner en fonction de ces débits unitaires moyens. /
3 types of nozzle are available, each delivering a different unit average flow at the operation pressure. The number of nozzles has to be chosen according to these unit average flows.

	Pressions en amont de buse - operating pressure (bar)								
	3	**3,5**	**4**	**4,5**	**5**	**5,5**	**6**	**6,5**	**7**
Buse n°	Débit- flow (m3/h)								
3,7	*0,85*	*0,90*	*0,95*	*1,00*	*1,05*	*1,09*	*1,13*	*1,16*	*1,21*
3,5	*0,78*	*0,82*	*0,88*	*0,92*	*0,97*	*1,01*	*1,04*	*1,08*	*1,12*
3,3	*0,68*	*0,73*	*0,76*	*0,80*	*0,83*	*0,87*	*0,90*	*0,93*	*0,96*

Les valeurs de débits sont données avec une tolérance de ± 5 %.
The flow values are provided with a tolerance of ± 5%.

Encombrement / *Size* :

- Hauteur totale / *Total height* = **160 mm ± 2 mm (suivant serrage)**
- Diamètre haut du cône / *Cone top diameter* = **75 mm ± 0,5 mm**

Dimensions utiles pour la liaison avec la conduite de distribution d'eau blanche (manchon) / *Useful information for its installation on the white water circuit* :

- Filetage selon norme E 03 004/005 (pas du gaz) / *Thread according to the norm E 03 004/005 (gas thread)*

Ce document comporte des informations confidentielles propriétés d'OTV. Il ne peut être reproduit ou utilisé sans autorisation écrite d'OTV.
This document contains confidential information which is the property of OTV. It shall not be reproduced or used without the express prior written authorization of OTV.

- Longueur filetée totale / *Total threaded lenght* = **30 mm ± 0,5 mm**
- Longueur minimum sous contre écrou (y compris filetée) = **20 mm dont 17 mm de filet** / *Minimum Lenght after installing the locknut (thread included* de filetage / *20 mm of which 17 of thread*

Note : Les diffuseurs d'eau blanche sont fabriqués par moulage. Les moules ont été spécialement ajustés afin d'assurer une étanchéité parfaite (sans Loctite) avec l'emploi d'adaptateurs avec manchon taraudé femelle Simona (www.simona.de), détail en annexes. L'emploi de Loctite (ou équivalent) est néanmoins vivement recommandé afin de prévenir tout risque de fuite et de desserrement des buses.
Note: Nozzles are molded. The casts have been designed to ensure a leak free connexion, without sealant (Loctite for example) when screwed on a Simona coupling (www.simona.de), details in annexes. Sealant (Loctite or similar) is however highly recommended to prevent any leakage and the nozzles to loosen.

Ce document comporte des informations confidentielles propriétés d'OTV. Il ne peut être reproduit ou utilisé sans autorisation écrite d'OTV.
This document contains confidential information which is the property of OTV. It shall not be reproduced or used without the express prior written authorization of OTV.

PROCEDURE DE RECEPTION
ACCEPTANCE PROCEDURE

Avant de procéder à l'installation, vérifier que le matériel n'est pas endommagé et que la livraison est complète.
Prior to proceed with the installation, check that the equipment are not damage and the order complete.

Contrôle du conditionnement / *Packaging check* :

Toutes les crépines sont rangées dans un carton conventionnel. / *All the nozzles are store in a regular cardboard.*
Tous les cartons seront rangés sur palettes filmées. / *All cardboard boxes are stored on film wrapped pallets.*

Contrôle d'identification du matériel / *Material identification check* :

- La désignation du matériel / *Equipment designation*
- Le nom ou le numéro de l'affaire / *Project name or reference*
- Le nombre de colis / *Number of cardboard boxes*
- Le nombre de pièces pour la livraison / *Number of nozzles*
- Le poids du colis / *Weight of the shipment*

Contrôle du marquage / *Marking check* :

Zone de marquage : l'une des deux oreilles : EBOTV
Marking area: one of the ear: EBOTV –

Contrôle d'aspect / *Visual aspect check* :

Un contrôle visuel doit être réalisé sur un échantillon. *A visual check must be performed on sampled items.*

- Contrôle de l'ébavurage : Toutes les pièces doivent être ébavurées soigneusement, tout particulièrement l'orifice du diaphragme à 1 trou. *Deburring check: All parts must be correctly deburred, especially the diaphragm with 1 hole:*

Ce document comporte des informations confidentielles propriétés d'OTV. Il ne peut être reproduit ou utilisé sans autorisation écrite d'OTV.
This document contains confidential information which is the property of OTV. It shall not be reproduced or used without the express prior written authorization of OTV.

- Contrôle de la matière des diaphragmes/ ***Material check diaphragms*** : PPE+PS blend (Noryl® 731)
- Contrôle de la matière cône, Manchon et contre écrou : **Polypropylène** / *Material check cone, coupling and loknut:* ***Polypropylen***

<u>Contrôle dimensionnel sur les cotes fonctionnelles / *Principal dimensions check* :</u>

Vérification des cotes fonctionnelles au pied à coulisse, jauge de profondeur, pige.
Contrôler que les cotes fonctionnelles sont dans les tolérances : ± 0,05 mm pour les orifices principalement.
Check that the principal dimensions are according to the tolerances: ± 0,05 mm for the orifices. Use a vernier caliper, and a gauge.

<u>Précautions de stockage / *Storage precautions* :</u>

 Les diffuseurs ne doivent pas être stockés en exposition directe à la lumière du soleil : le matériau s'oxyde et devient cassant (les flottateurs doivent être couverts, mais prendre garde également lorsque les buses sont installées). Malgré la bonne résistance à la chaleur du **PP (jusqu'à 70°C),** il est également recommandé de veiller à ne pas les stocker à des températures trop élevées afin de ne pas déformer les diffuseurs. Précaution d'autant plus valable que l'installation est faite dans des pays au climat désertique.
The nozzles should not be stored under direct sun light: material is getting fragile (floatators must be covered, but be careful when the nozzles are installed). Also, despite the good heat resistance of the material ***(up to 70°C),*** *it is recommended not to store them at high temperature so they do not loose their shape. This is specially the case for desert area.*

Ce document comporte des informations confidentielles propriétés d'OTV. Il ne peut être reproduit ou utilisé sans autorisation écrite d'OTV.
This document contains confidential information which is the property of OTV. It shall not be reproduced or used without the express prior written authorization of OTV.

NOTICE D'INSTRUCTION D'UTILISATION
UTILIZATION GUIDE

Instruction de montage / *Installation instructions* :

➢ Outils nécessaires / *Tools* :

1. Outil spécifique (cf. Annexes). Se rapprocher d'Opalium pour se procurer cet outil. / *Specific tool (cf. Annexes). Opalium is supplying this tool.*
2. Loctite 5331 (à conserver entre 8 et 21 °C) ou similaire (vérifier les conditions de stockage) / *Loctite 5331 (to be stored between 8°C and 21°C) or similar.*

➢ Vérifications d'avant montage / *Preparation* :

1. Vérifier l'état général de la buse, qu'elle ne soit pas abimée (oreille cassée ou pliée), qu'il n'y ait pas de détritus à l'intérieur. Vérifier également le manchon de la rampe de distribution. / *Check the general aspect of the nozzle: clean, no damage (ear not bended or broken for example). Also check the coupling on the distribution pipe.*
2. Vérifier que le diaphragme à 6 trous est visible depuis le cône et celui à 1 trou depuis le manchon. SI cela n'avait pas été fait à la réception du produit, vérifier l'ébavurage de l'orifice unique. / *Make sure that the diaphragm with 6 holes is clearly visible from the cone and the one with hole from the coupling. In case this was not done at the reception of the equipment, check the drilling of the holes, as shown above.*
3. Vérifier que le cône est correctement serré dans le manchon (serrage complet, pas d'ergots l'un sur l'autre : ces ergots, situés sur le cône et le manchon, empêche les 2 parties de se desserrer). / *Check that the cone is correctly screwed on the coupling: complete screwing, no fin on top of each (fins are the small triangle parts that prevent the cone and the coupling to unscrew).*
4. Vérifier, à l'aide de l'outil, que le contre-écrou est bien serré sur la partie haute du manchon. / *Check that the locknut is correctly screwed on the top part of the coupling.*

➢ Installation / *Installation* :

1. Appliquer la Loctite (ou similaire) sur les deux parties à visser (manchon du diffuseur et manchon de la rampe de distribution). / *Apply the Loctite (or equivalent) on both couplings (nozzle and distribution pipe).*
2. Commencer à serrer à la main le diffuseur dans le manchon de la rampe de diffusion, en prenant garde à l'insérer droit. / *Start by manually screwing the nozzle to the distribution pipe. Pay attention to screw vertically.*
3. A l'aide de l'outil, serrer le diffuseur (placer l'outil sur le manchon du diffuseur). Le couple de serrage maximal est de 10 N.m. / *Set the tool on the coupling of the nozzle (not the locknut) and tight it Maximum torque is 10 N.m.*
4. Vérifier, à l'aide de l'outil, que le contre-écrou est bien serré sur la partie haute du manchon. / *Check that the locknut is correctly screwed on the top part of the coupling.*

Ce document comporte des informations confidentielles propriétés d'OTV. Il ne peut être reproduit ou utilisé sans autorisation écrite d'OTV.
This document contains confidential information which is the property of OTV. It shall not be reproduced or used without the express prior written authorization of OTV.

➢ Précautions / *Precautions* :

1. Ne pas utiliser les oreilles du cône à des fins de serrage. Elles sont fragiles, et risquent de se déchirer ou casser. Il ne faut pas utiliser de buses dont les oreilles ont été endommagées. / *Do not use the ears of the nozzles to screw. They are fragile and could break. Nozzles with damages ears shall not be used.*
2. Ne pas utiliser de pinces multiprises ou tout autre outil à dents pour faire le serrage. Les dents endommageraient le diffuseur. Utiliser uniquement cet outil spécifique ou faire le montage manuellement. / *Do not use a pair of pliers or a pipe wrench to tight the nozzle. Such tools would irreversibly damage the nozzle. Only use the specific tool or install them manually.*

➢ Démontage / *Disassembly* :

Pour dévisser le diffuseur de la rampe, utiliser l'outil spécificque sur le manchon du diffuseur. Il est conseillé de limiter les serrages / desserrages des diffuseurs pour ne pas les endommager. Penser à nettoyer les résidus de Loctite. / *To disassemble the nozzle, use only the specific tool employed for the installation. It is recommended to limit the number of installation / removal in order not to damage the nozzle. It also highly recommended to clean the couplings from residual Loctite.*

Les diffuseurs en eux mêmes ne sont pas démontables. Les ergots entre le cône et le manchon seraient endommagés si l'utilisateur tente de desserrer les 2 parties. / *The different parts of the nozzle cannot be disassembled. The fins between the cone and the coupling would be damaged, and become useless for further utilization.*

➢ En cas de problème / *Troubleshooting* :

L'une des causes de chute rapide de la pression et d'augmentation du débit de l'eau blanche peut être le desserrage puis expulsion ou même la casse d'un diffuseur. S'ils ne surviennent pas à la mise en route de l'ouvrage, ces 2 phénomènes sont peu susceptibles d'apparaitre, grâce à l'emploi de Loctite. / *One of the reason why white water pressure could drop, and flow increase is the damage of the nozzle. It could be loosening and ejected or even broken. These 2 phenomena are most likely to occur at the start up of the plant, thank to the use of Loctite.*

Au contraire, si le débit d'eau blanche diminue et la pression augmente, cela peut être dû au colmatage d'un orifice des diaphragmes après un long arrêt (coquillage par exemple en utilisation eau de mer). / *On the other hand, if the flow is reducing but the pressure increasing, this could be due to the clogging of the diaphragms. This could eventually happen after a long break if the white water system was not flushed. Shells could have developed inside it in the case of seawater.*

Finalement, il convient de surveiller le fonctionnement des pompes de recirculation pour s'assurer du fonctionnement normal du système d'eau blanche, spécialement après une longue période d'arrêt durant laquelle le circuit d'eau blanche n'aurait pas été vidangé. / *It is recommended to check on the operation of the white water pumps to ensure the good running of the white water system. Changes in flow, pressure or pump frequency could be the sign of a dysfunction.*

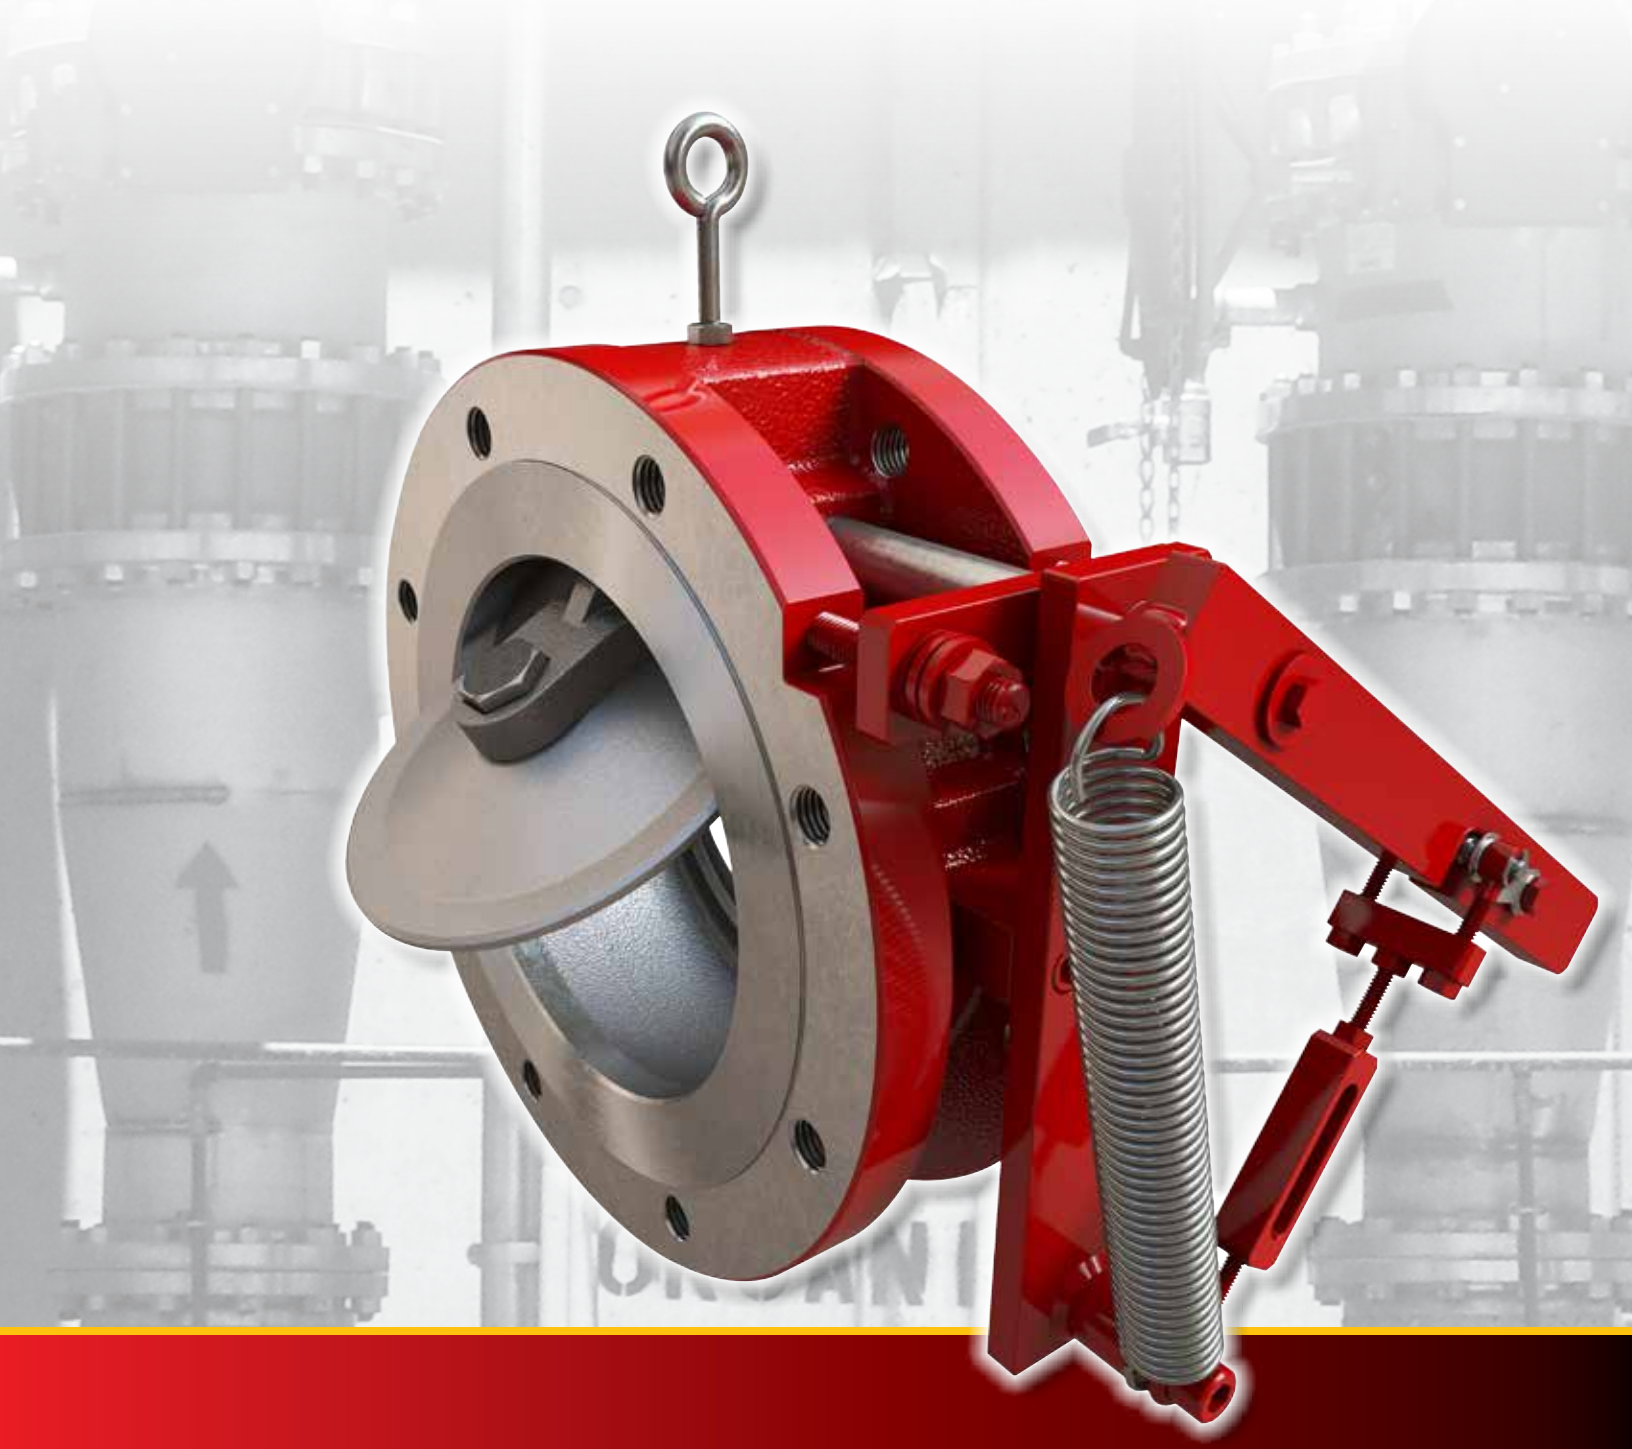
ASME Class 125 - 2500



Bray®

WWW.BRAY.COM

YOUR GLOBAL FLOW CONTROL PARTNER™

Rite Corporation, headquartered in Quebec, Canada and founded in 1963, designs and manufactures exceptional Bray/Rite check valves, cam and groove quick couplings, and fluid handling loading and unloading equipment. For over 40 years, Rite has earned a reputation for reliability. This reputation is based on our highest quality manufacturing standards, premium components and thorough control procedures. With a worldwide sales and distribution network, we offer our customers full support wherever the project location.

Our engineers specialize in innovative, individual solutions to industry needs and will assist you with your project requirements. Our knowledgeable sales and support staff are committed to outstanding service and, above all, customer satisfaction. We look forward to recommending a practical and economical solution to your fluid control applications.

Bray/Rite Valves continue to be the premier wafer combination swing check valve. Designed in 1970, their performance remains unsurpassed. The line offers a wide range of valves and accessories, all fully stocked and readily available. Their successful, long term use in applications worldwide has made the Bray/Rite the industry standard for economy, durability and reliability.

State of the Art Check Valves, Bray/Rite is Rite Sized.

Rite's Bray/Rite wafer combination swing check valves are flow–activated and *Rite Sized*. Bray/Rite inlet ports and disc have been shape optimized to achieve a fully open position at low flow rates (3 ft/s on average). Therefore, the Bray/Rite operates exceptionally well in the flow rates typically found in pipelines containing control valves and lines with varying media flows.

Compare the Bray/Rite to typical full-sized swing check valves. Due in part to their oversized, heavier discs, these valves only fully open at an average flow rate of 11 ft/s. When activated at a lower flow rate, these valves loose true controllability and do not fully open. A partially open disc creates an obstruction that produces a higher pressure drop and fluttering of the valve disc – disturbing the flow and increasing the chance of water hammer.

Bray/Rite is *Rite Sized* to eliminate these problems. It has been engineered to accelerate line media through the valve and achieve a virtually unobstructed full opening in low pressure. *Rite Sized*, combined with the limited movement of internal parts during operation, reduces wear – enhancing the long service life of a Bray/Rite valve.

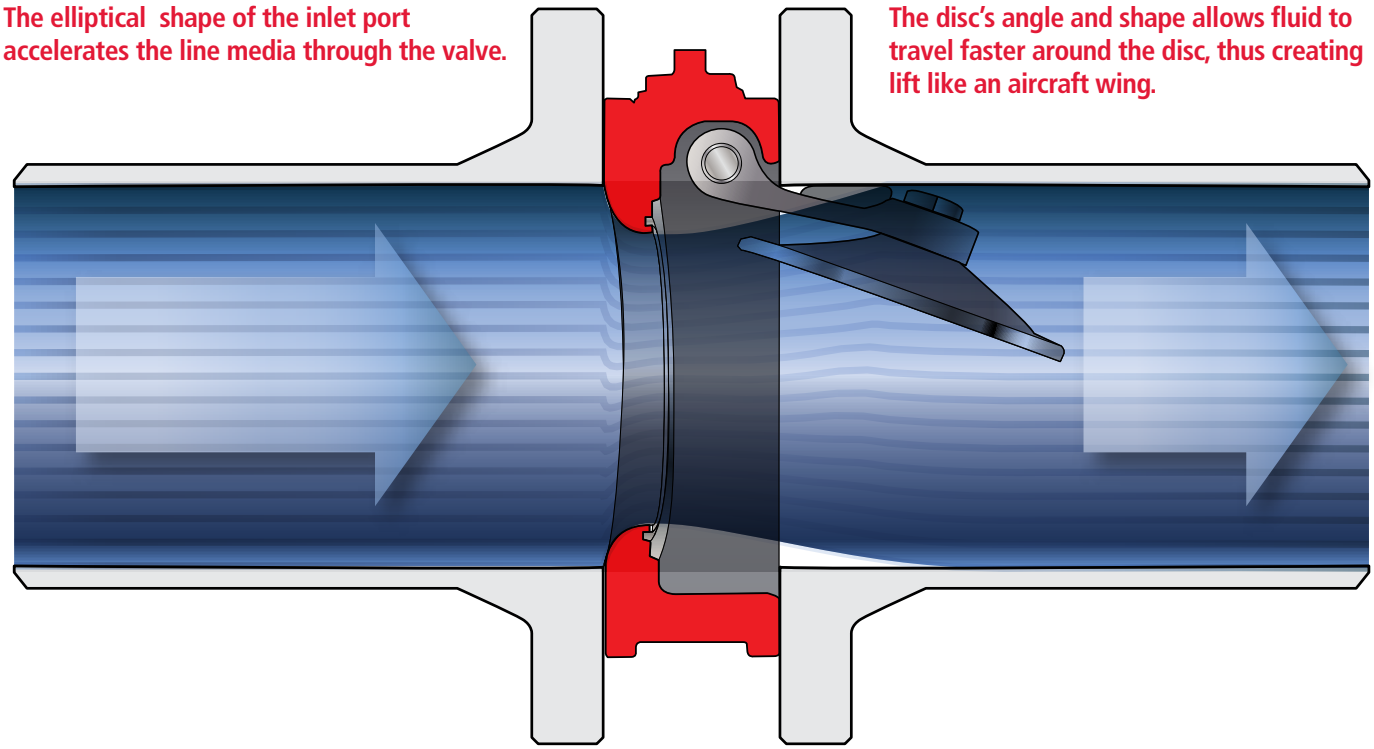
ZERO LEAKAGE Bray/Rite valves, either resilient or metal seated, offer zero leakage in all pressure classifications. Each valve is hydrostatically tested at the factory and shipped with a certificate of compliance to MSS SP61. Rite has achieved zero leakage metal-to-metal sealing by a proven, engineered design backed by high quality manufacturing craftsmanship. As the disc closes toward the seat, the increased velocity of the line media and the unique shape of our seat remove all particles from the sealing surfaces – ensuring zero leakage.

LOW PRESSURE DROPS The low pressure drop of the Bray/Rite valve was achieved by Rite's many years of research and development in combination with universities and federal research agencies. Several theses and papers were published including *Minimizing the pressure loss of wafer type swing check valve ASME 79/MA-NE-5*. These results – primarily the optimum valve diameter and elliptical inlet shape – have been incorporated into the Bray/Rite design. Like a venturi, the aerodynamic shape accelerates the line media through the valve with the lowest possible pressure drop. Pressure drops at the full open position are between 0.5 to 0.7 psi for all size valves. Additionally, the disc shape and mass have been optimized to use the pipeline media flow as a lifting force on the disc, thus allowing a full open valve position in low line velocity.

HIGH FLOW CAPACITY Bray/Rite's valve inlet elliptical shape and optimum diameter, plus its virtually unobstructed opening combine to produce a substantially higher flow capacity (C_V) than other wafer combination swing check valves.

REDUCED WATER HAMMER An additional focus of Rite's R&D program was linked to Water Hammer Prediction. Findings were applied in the design of the valve to largely reduce or eliminate water hammer by closing the valve at the right moment (before reverse flow occurs). The Bray/Rite uses gravity, assisted by an internal spring, to pull the disc toward the closed position on decelerating line media flow. Rite has developed proprietary predictive software to select the best solution for your specific application.



THE RITE ADVANTAGES

Bray/Rite SEATS Zero leakage shut off, even at 0 psi, is achieved through lapped metal seating surfaces. The seat and the disc edges are precisely machined then hand polished for a perfect fit. The disc hinge provides an even force at the disc to seat contact point, ensuring a uniform seal. Controlled tolerances maintain the proper disc to seat alignment. The spring assisted closure tension holds the disc in place when line pressure is removed.

RESILIENT SEATS A dynamic, O-ring seat is contained in a specially designed body groove. As line pressure is applied, the valve disc uniformly compresses the seat into the groove ensuring a zero leakage seal. The seat is easily replaced, simplifying maintenance.

METAL-TO-METAL SEATS Integral metal seats feature an engineered and precision machined angle that minimizes the metal-to-metal contact point between the disc and seat for a perfect seal. Pressure is applied evenly over the disc, eliminating galling and reducing wear.

METAL SEAT INSERT Carbon steel and ductile iron bodies have a stainless steel seat inserted into the body seal area, offering the same precision design as the integral metal-to-metal seat. These bodies are also available with a Resilient Seat Insert.

INHERENTLY FIRE SAFE All Bray/Rite valves are inherently fire safe due to the valve design, materials and construction. In the event of a pipeline fire, both resilient seated and metal seated valves provide metal-to-metal contact between the seat and disc and surpass all leak test standards.

Pressure Drop with Water

Valve Size	Cv	Min Flow to Fully Open Valve		Approx Pressure Drop w/ Water
Inch/ mm		GPM	Ft/ sec.	PSI @ 10 ft/sec.

Notice the full open stable minimum velocity and the efficiency calculated at a normal velocity of 10 f/sec.

Resilient Seat

Metal-To-Metal Seat

Metal Seat Insert

The convex profile of the disc reacts to line flow like an airfoil. The velocity above the disc is higher than the velocity below, thus effectively creating lift.

PUMPING COST SAVINGS Pumping costs have been often overlooked but are now gaining in importance due to the increasing cost of energy. With Bray/Rite's long service life, its cost is actually insignificant to the end user compared to the energy lost pumping the fluid through the valve. Below is a comparison between different valve styles, assuming all valves are 100% open.

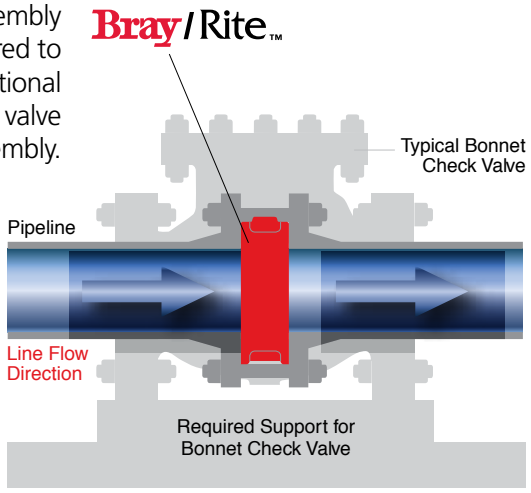
Yearly Energy Costs Comparison At 10 F/S - $0.10/kWh

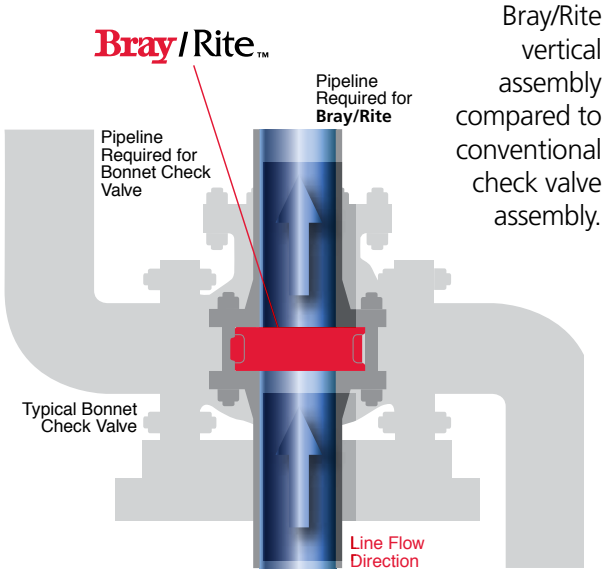
VALVE SIZE / INCHES	2	2.5	3	4	5	6	8	10	12
Bray/Rite	$42	$66	$99	$174	$250	$254	$635	$872	$1,113
Tilting Disc	$50	$66	$102	$161	$250	$272	$425	$606	$739
Center Guided "Silent"	$115	$214	$339	$608	$1,002	$1,409	$2,541	$4,006	$3,447
Full Size Swing Check	$57	$66	$99	$191	$250	$415	$680	$1,002	$1,347
Dual Door	$218	$209	$314	$441	$491	$707	$979	$1,118	$1,282

HORIZONTAL / VERTICAL INSTALLATION

Unlike most conventional check valves, Bray/Rite wafer combination swing check valves are ideal for both horizontal and vertical pipeline installation – requiring only a single line for operation. This greatly increases pipeline layout flexibility and significantly reduces costs. In vertical installations, typical swing check valves must have an offset pipe section installed since these valves only function in a horizontal position. **See factory for vertical down applications.**

Bray/Rite horizontal assembly compared to conventional check valve assembly.

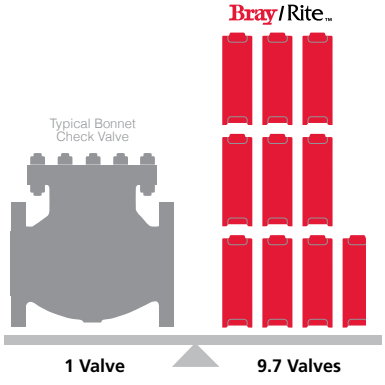




Bray/Rite vertical assembly compared to conventional check valve assembly.

LIGHT WEIGHT & REDUCED SIZE Installation costs are greatly reduced by Bray/Rite's light weight and minimal space requirements. Their compact design minimizes the distance between faces and are easily installed between all flanges.

Bray/Rite valves do not require added support to maintain pipeline integrity and need only 30% of the space of typical full size swing check valves.



THE RITE ACCESSORIES

Bray/Rite has designed and manufactured an extensive range of accessories for specific applications.
Some commonly used accessories and a PVC body uniquely designed for a specific application are shown below. Bray/Rite valves can be fitted with any one or a combination of accessories, including safety caging.

EXTERNAL LEVER & SPRINGS (SA-01)

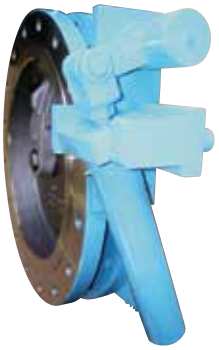
Provide additional external force to anticipate closure in applications where rapid media flow reversal requires the valve to close faster than standard.

Applications: Pump protection when pumping in parallel into a common header.

DUAL WEIGHTS (SA-10)

Two opposing weights, one to adjust cracking pressure and one to counter balance the disc.

Applications: Insures valve is fully open on very low flows.



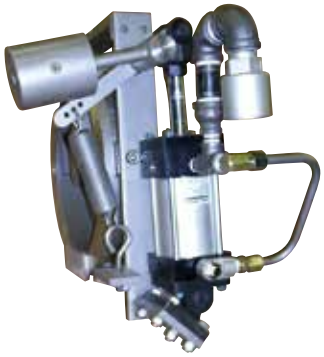
EXTERNAL LEVER & COMPRESSION SPRING (SA-40)

Provide additional force to anticipate valve closure, using an enclosed compression spring, in applications where rapid media flow reversal requires the valve to close faster than standard.

Applications: Pump protection when pumping in parallel into a common header, where spring force required is higher than a SA-01 or if an enclosed spring is preferred.

HYDRAULIC PNEUMATIC SPEED CONTROLS (H-100, SA-50)

Slow the opening of the valve to protect the disc assembly in the last few degrees of travel. These units offer adjustable speed control and are ideal in fluctuating flow applications. The H-100 uses the SA-01 spring. The SA-50 uses the SA-40 compression spring.



EXTERNAL LEVER & WEIGHT (SA-16)

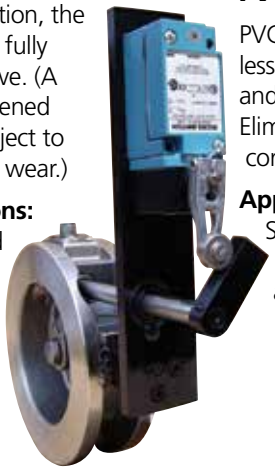
Provide additional external mass to increase the cracking pressure (pressure required to open the disc) and increase the closing force of the moving disc.

Applications: Where increased cracking pressure is required. Waste Water service or where suspended solids are present in the process (the weight will insure inertia induced positive closure). Relief valve with adjustable cracking pressure.

LIMIT SWITCH (SA-2)

Provides remote indication of valve position and a positive indication of flow. If two are installed the first shows the closed position, the second the fully opened valve. (A partially opened valve is subject to premature wear.)

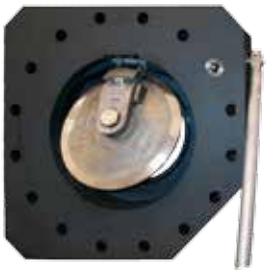
Applications: Automated control systems.



EXTERNAL LEVER, SPRING & WEIGHT (SA-1)

These units use the combination of a weight and spring to add cracking pressure and closing force to the disc.

Applications: Where performing both functions of faster closure and solid handling are required, primarily in waste water



PVC (PEZ SA-4AX)

PVC Body with passivated stainless steel or titanium internals and position indication lever. Eliminates internal body corrosion.

Applications: Used for Salt water, marine life support systems, desalination applications..

SELECTION PROCESS

A **Gather Process Information**
Line Fluid / Pressure / Temperature /Flow Rate / Location / Function

B **Gather Pipe Information**
Size / Material /
Flange Rating / Schedule

C **Select Valve Size** – Based on:
- Full open valve at minimum flow
- or Pipe size

D **Select Design Standard**
- ASME: 125 / 150 / 300
- API 594: 150 / 300 / 400 / 600 / 900 / 1500 / 2500
- PN: 10 / 16 / 25 / 40

E **Verify Conditions**
- Valve full open at minimum flow
- Max velocity 15 f/sec for Liquid
- Max velocity Mach 0.33 for Gas
- Non-reciprocating service
- No accessories required
- Installed with a minimum of 5 pipe diameters upstream and 3 downstream from a disturbance
- Not installed on close coupled multiple pump header

F **Select Model**
If answer is YES to All conditions:
- Select Model 210 (ASME, DIN) Models 201 - 205 (API 594)
- or if ULC FM* approved required select 212 (ASME), 312 (DIN) 2"-12" ONLY

If answer is NO to Any condition:

Select Model 260 (ASME, DIN) Models 201 - 205 (API 594)

G **Select Pressure Class and Body, Seat & Spacers Materials, and specific application accessories as required**

ORDERING EXAMPLE

A 6" heavy duty, Class 150 wafer combination swing check valve, carbon steel body with stainless steel inserted seat, stainless steel spacers and an external spring accessory would be written as follows:

06 15 SMZ SA01

1.0 Introduction to Check Rite Wafer Type Swing Check Valves

Modern piping applications demand better features, performance and economy in a check valve.

Features:

- Simplicity
- Compactness
- Minimum Weight

Performance Characteristics:

- Silent operation
- Non Slamming
- Rapid Response
- Low Pressure Drop
- Bubble Tight Shut-Off

A combination of these features and performance characteristics ensure long service life as characterized by Check Rite.

2.0 Description of Check Rite Valves.

Check Rite valves consist of a compact Body (1) with a single plate Disc (12) attached to a Hinge (2) which in turn is supported by a Hinge Pin (7) inside an off-center body cavity.

The Disc is mechanically biased to the closed position by a torsional Spring (5) located between the two hinge lugs. The Hinge Pin (7) is retained by two NPT Pipe Plugs (8) inside the Body (1). The Seat (3) can be:

- Metal to Metal
- Metal to Buna, Viton or Teflon

An Eyebolt (10) located on the top of the Check Rite valve aids for easy installation.

The Nameplate (11) located on the top pad specifies:

- Size
- Serial Number
- Figure Number (Pressure Class and Materials)
- Ritepro Corporation

Check Rite valves are designed to open when a pressure of less than 1 psi (.07 bar) is applied across the face of the Disc (12).

Check Rite valves are provided for installation inside the bolt circle and between standard flanges, using flat faced asbestos gaskets or as specified.

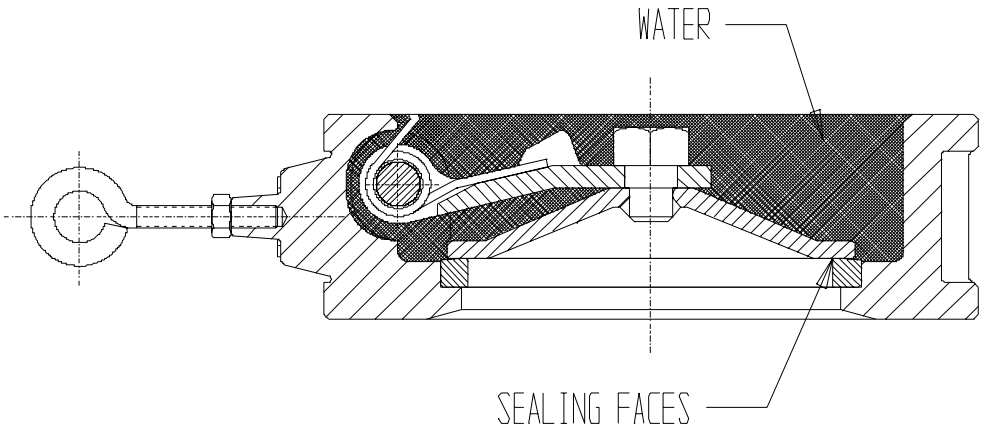
Check Rite valves are normally installed with the Eyebolt pointing vertically upwards in a horizontal run of pipe, with the arrow on the Body pointing in the direction of flow.

> For vertical pipe run applications, the flow direction is the only orientation required in a straight length of pipe.

All Check Rite valves are hydrostatically tested in accordance with MSS-SP-61 test procedures and zero leakage criteria.

In addition a "Zero Head Leakage" test is performed, where the Check Rite valves are placed in a horizontal position (see sketch) with the flow direction pointing vertically upwards.

An internal hydrostatic pressure equivalent to the head of water which can be retained within the downstream portion of the valve body is applied. During this one hour test, no leakage is allowed.



Check Rite valves are manufactured to high quality levels as specified in the applicable standards such as ANSI, MSS, API and CSA.

Check Rite valves in sizes 14" to 42" in classes 125 to 300 and all sizes in the higher pressure classes have a different Hinge-Disc connection which is illustrated on the applicable Specification Sheets.

The standard connection for small valves 2" to 12" classes 125 to 300 is a welded assembly, by means of a Shoulder Pin (4) passing through the Hinge (2) and Seal-welded to the Disc (12). In the larger sizes and higher pressure classes, the Disc (12) is assembled to the Hinge (2) with a Nut (15) and secured by welding.

A heavy duty Hinge (2) is available for valves sizes 2" to 24" in which the Disc (12) is attached to the Hinge (2) with a Nut (15) and a weld is used to secure the components. This is the Model 260-262 valve. All other dimensions, maintenance procedures, and O-Ring sizes apply as stated in this manual.

3.0 Dis-Assembly and Assembly Instructions for Check Rite Wafer Type Swing **Check Valves**

The simple design of the Check Rite valve permits for easy assembly and disassembly.

The following assembly procedure applies to all Check Rite valves.

To Dis-assemble the valve:

a) Place the Body (1) in a horizontal position with the disc assembly showing.
b) Remove the Plugs (8) on either side of the Body (1).
c) Hold the Spring (5) in position and slide the Pin (7) out of the Body (1).
d) Slowly release the pressure on the Spring (5) and remove it from the valve.
e) The Hinge-Disc Assembly can now be lifted from the Body (and disassembled, if required, on large sizes).
f) Remove the Spacers (6).
g) Remove the O-Ring (14) if required.

To re-assemble the valve:

a) Clean all parts with Varsol or other acceptable solvent.
b) Place the Body (1) in a horizontal position with the seating face pointing upwards.
c) If required, insert O-Ring (14) in the seat groove. (See next page for installation instructions).
d) Place the Hinge-Disc Assembly (2,12) in the body cavity.
e) Insert the Pin (7) through the plug hole on either side of the Body and slide a Spacer (6) in between the Body (1) and adjacent hinge lug.
f) Press Torsion Spring (5) between the hinge lugs and body cavity, then advance the Pin (7) through the Spring (5) and the second hinge lug.
g) Slide the second Spacer (6) between the Body and hinge lug and advance the Pin (7) into the Body (1).

Position the Hinge Pin (7) central to the valve body prior to the installation of the retaining Plugs (8).

h) Check that the torsion spring ends are seated properly.
i) Apply Teflon tape or sealing compound on retaining Plugs (8), install Plugs and tighten both sides with an Allen key.

j) **Check:**

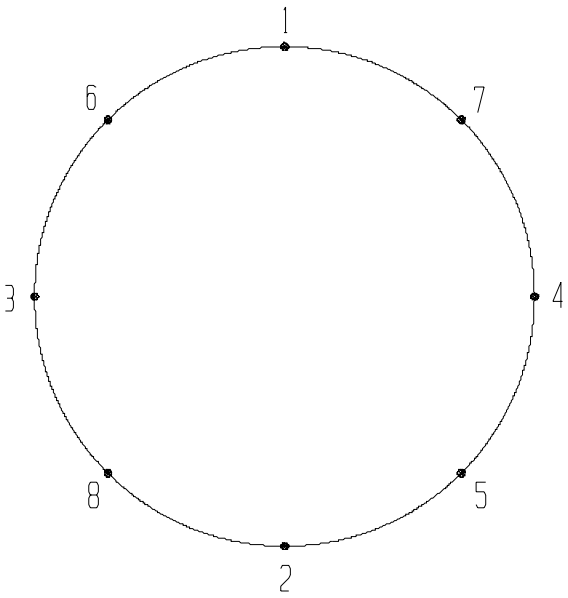
aa) that the valve opens and closes freely.

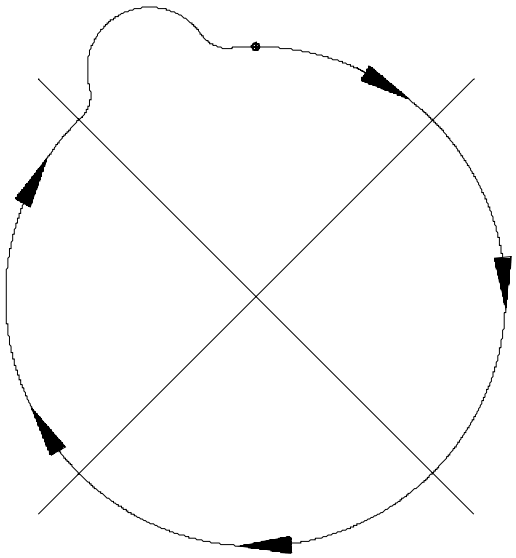
bb) that adequate freedom of movement of the Shoulder Pin-Disc connection is provided for the disc to adapt a self-aligning position with the seat.

IMPORTANT-INSERT O-RING AS FOLLOWS

aa) Place O-Ring (14) on top of seat groove.

bb) To prevent looping, insert the O-Ring as shown by pressing the O-Ring into the groove in the following numerical sequence.





Right Wrong

cc) Having engaged the O-Ring in the groove according to the above illustration, proceed to smooth out the O-Ring using thumb pressure.

It is important to smooth out the O-Ring so that there are no visible ripples or loops.

It should be noted that the O-Ring groove is slightly larger than the O-Ring and it follows that the O-Ring must be hoop stretched to engage the groove.

4.0 Installation Instructions

The stud selection sheet (Specification Sheet E-8) shows the ease with which Check Rite valves are installed.

The valve is inserted between two companion flanges with gaskets on the contact faces. Studs are installed, which will span the valve, and tightened in the same manner as any flange connection.

The Check Rite valve outside diameter is designed to locate the valve in the same centerline as the companion flanges when mounted inside the studs.

The normal installation of a Check Rite valve is for horizontal flow with the hinge pin (7) in the horizontal upper position, or for vertical flow, with the flow direction upwards.

When removing a Check Rite valve from the line, only one half of the studs need to be removed and the others loosened.

IMPORTANT:

1) Check the flow arrow on the body before inserting the Check Rite valve between the flanges.

2) Pipeline flanges must be parallel and have the same pressure class rating as the valve.

3) There must be no obstructions in the flange or pipe bore as this would prevent the valve from opening fully.

If slip-on flanges are used, make sure that no weld projects into the pipe bore.

5.0 Maintenance Requirements and Information

No periodical maintenance work is required for Check Rite valves. For replacement of O-Rings refer to Section 3.0, "Assembly and Dis-assembly of Check Rite Valves".

The standard O-Ring numbers, Plug sizes and Allen key sizes for class 125/150/300 are listed below for valves 2"-42". For other classes, contact the factory.

Valve Size	*O-Ring Size S/N 82*	*O-Ring Size S/N 88*	*Plug Size NPT*	*Allen Key Size*
2"	127	128	1/4"	1/4"
2.5"	133	133	1/4"	1/4"
3"	141	141	3/8"	5/16"
4"	235	235	3/8"	5/16"
5"	243	242	3/8"	5/16"
6"	249	248	3/8"	5/16"
8"	260	259	1/2"	3/8"

12"	448	447	3/4"	9/16"
14"	449		3/4"	9/16"
16"	453		3/4"	9/16"
18"	455		3/4"	9/16"
20"	458		1"	5/8"
24"	462		1"	5/8"
30"	471		1 1/2" *	1 1/4" *
36"	473		1 1/2" *	1 1/4" *
42"	3/8 x110"		2" *	1 5/16" *

* Square Head Plug

6.0 Check Rite and Spool Installation

As shown on Specification Sheet E-9, when a standard flanged valve is replaced with a wafer valve, a spool piece can be inserted with the Check Rite valve to obtain the required face to face dimension.

The installation instructions in Section 4.0 above apply.

7.0 Nameplates

Serial Number

The serial number gives the style of the valve internals and the date of manufacture of the valve.

The valve internals are based on either model 210 or 212. The first two digits of the serial number give the model.

82	Model 210
88	Model 212

For standard valves, the date of assembly is included in the Serial Number stamped on the nameplate attached to the valve. The last four digits of the serial number are the month and year of manufacture.

For UL/FM valves, the serial number is specified by UL and can be any numeric value. These valves are identified by the red paint and a special nameplate is used which includes the UL and FM logos. These valves are always based on Model 212.

A unique serial number is given to all special valves (not UL/FM). For special valves (including UL/FM) the month and year of manufacture are either stamped on the nameplate or on the exterior diameter of the flange, depending on valve size.

Figure Number

The figure number consists of at least five alphanumeric characters. The first two give the class of the valve. The next three give the principle materials of construction.

If the valve has a special model number, ie Model 260, this is stamped at the end of the code or if space prohibits this, then either underneath the code or on the outside diameter of the flange. The table on the following page explains the codes used.

UL/FM valves have either 212 or 312 for a figure number. The materials of construction are always cast iron body, buna seat, stainless internals and Teflon spacer. The applicable specification sheet gives more detailed information.

Valve Class	125	150	300	600	900	1500
Code	12	15	30	60	90	150

Body Material	Cast Iron	Ductile Iron	Steel	Stainless Steel
Code	C	D	S	X

Seat Material	Buna N	EPDM	Stainless Steel	Viton
Code	B	E	M	V

Spacer Material	Teflon	Bronze	Stainless Steel
Code	T	Y	Z

For example a class 150 check valve with a ductile iron body, stainless steel seat and Teflon spacers would be stamped: **15DMT**

8.0 Safety Warnings

1. The valve must be installed in the correct line size between flanges of the correct class.
2. The valve materials of construction must be compatible with the fluids being handled.
3. Pressures and temperatures must be kept within the limits specified by the appropriate ANSI standard, ie: B16.1, B16.34, B16.42, or within the limits specified by the particular design. These values are given on the following pages.
4. An arrow on the body indicates the direction of flow through the valve. The valve must be installed with the arrow pointing in the correct direction.
5. For flow in the horizontal direction, the valve shall be installed with the Pin in the horizontal upper position with the eye bolt pointing vertically upwards.
6. The valve must be installed in the correct location in the pipeline. The disc must not open into or against other piping components such as valves, elbows, or tees. For the best performance and life of the valve, a minimum of 10 pipe diameters of straight pipe upstream and downstream of the valve is suggested. Any reduction in this length upstream of the valve reduces the life of the valve proportionally.
7. Plugs must not be removed from the valve while the pipeline is under pressure.
8. Flow rates must be within acceptable limits. Too high a rate may cause extreme pressure drops and erosion of the components. Too low a flow may cause the disc assembly to oscillate and cause wear which may lead to premature failure of the internals.
9. Care should be taken in handling the valve. Mishandling may lead to damage of the sealing components or damage to the externals.
10. Disturbed flow will reduce greatly the life of the valve. Best practice should have 5 straight pipe diameter upstream and 3 downstream.

9.0 Non Shock Pressure -Temperature Ratings

Bray®

BUTTERFLY VALVES

RESILIENT SEATED

SERIES 30/31 Wafer/Lug

2" - 20" (50mm-500mm)

CELEBRATING 20 YEARS

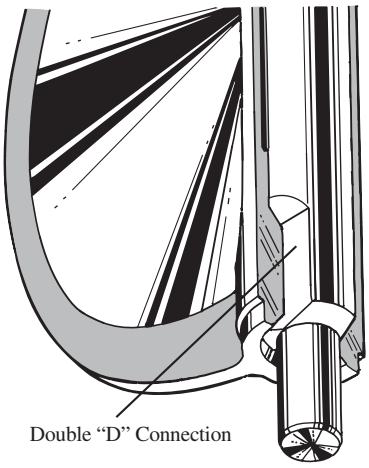
The High Performance Company

SERIES 30

2"–20" (50mm–500mm)
Bray® Controls is proud to offer a high quality line of butterfly valves to meet the requirements of today's market. Combining years of field application experience, research and development, Bray has designed many unique features in the Series 30/31 not previously available. The results are longer service life, greater reliability, ease of parts replacement and interchangeability of components.

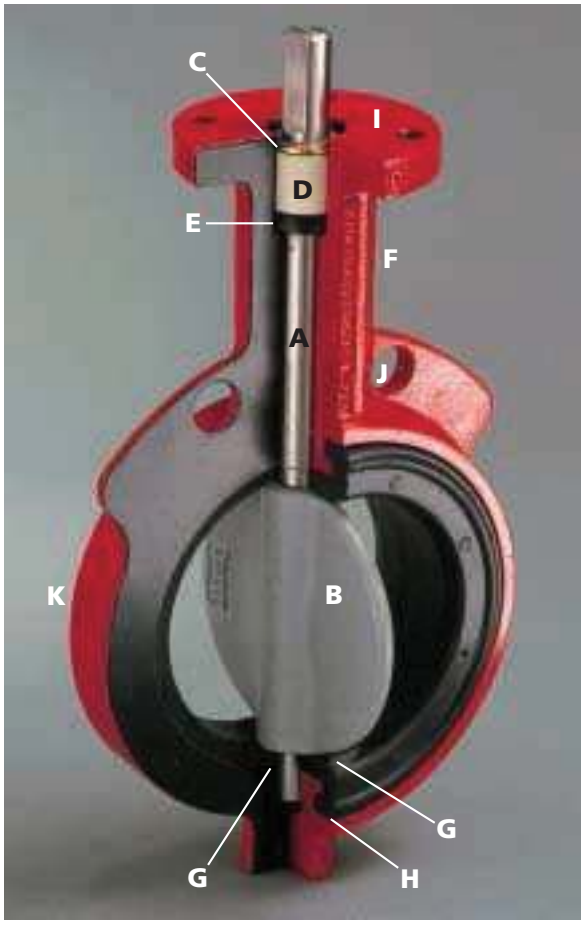
DISC AND STEM CONNECTION

(**A**) Features a high-strength through stem design. The close tolerance, double "D" connection that drives the valve disc is an exclusive feature of the Bray valve. It eliminates stem retention components being exposed to the line media, such as disc screws and taper pins, which commonly result in leak paths, corrosion, and vibration failures. Disc screws or taper pins, due to wear and corrosion, often



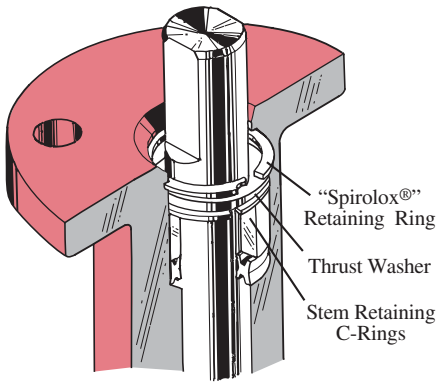
require difficult machining for disassembly. Disassembly of the Bray stem is just a matter of pulling the stem out of the disc. Without fasteners obstructing the line flow, the Series 30/31 C_V values are higher than many other valves, turbulence is reduced, and pressure recovery is increased. The stem ends and top mounting flange are standardized for interchangeability with Bray actuators.

DISC (**B**) Casting is spherically machined and hand polished to provide a bubble-tight shut off, minimum torque, and longer seat life. The disc O.D. clearance is designed to work with all standard piping.



STEM RETAINING ASSEMBLY (C)

The stem is retained in the body by means of a unique Stainless Steel "Spirolox®" retaining ring, a thrust washer and two C-rings, manufactured from brass as standard, stainless steel upon request. The retaining ring may be easily removed with a standard hand tool. The stem retaining assembly prevents unintentional removal of the stem during field service.



STEM BUSHING (D)

Non-corrosive, heavy duty acetal bushing absorbs actuator side thrusts.

STEM SEAL (E)

Double "U" cup seal design is self-adjusting and gives positive sealing in both directions. Prevents external substances from entering the stem bore.

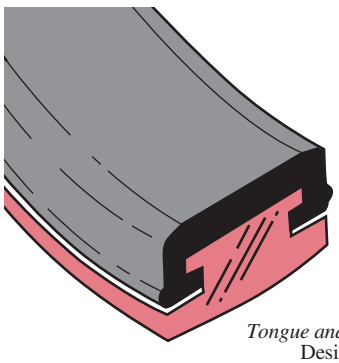
NECK (**F**) Extended neck length allows for 2" of piping insulation and is easily accessible for mounting actuators.

PRIMARY AND SECONDARY SEALS (G)

The Primary Seal is achieved by an interference fit of the molded seat flat with the disc hub. The Secondary Seal is created because the stem diameter is greater than the diameter of the seat stem hole. These seals prevent line media from coming in contact with the stem or body.

BRAY UNIQUE SEAT DESIGN (H)

One of the valve's key elements is Bray's unique *tongue and groove* seat design. This resilient seat features lower torque than many valves on the market today and provides complete isolation of flowing media from the body. The tongue-and-groove seat to body retention method is superior to traditional designs, making field replacement simple and fast. The seat is specifically designed to seal with slip-on or weld-neck flanges. The seat features a molded O-ring which eliminates the use of flange gaskets. An important maintenance feature is



Tongue and Groove Design

*"Spirolox®" designation is a registered trademark of Kaydon Ring and Seal, Inc.

that all resilient seats for Bray butterfly valves Series 20, 21, 30, 31 and 34 are completely interchangeable.

ACTUATOR MOUNTING FLANGE AND STEM CONNECTION (I)
Universally designed to ISO 5211 for direct mounting of Bray® power actuators and manual operators.

FLANGE LOCATING HOLES (J)
Provide quick and proper alignment during installation.

BODY (K) One-piece wafer or lug style. Polyester coating for excellent corrosion resistance. Bray valve bodies meet ANSI 150 pressure ratings for hydrostatic shell test requirements.

DESIGN FEATURES

Bray's Series 30 valve is a wafer version with flange locating holes, and the Series 31 is the companion lug version for dead-end service and other flange requirements. All Bray valves are tested to 110% of full pressure rating before shipment.

A major design advantage of Bray valve product lines is international compatibility. The same valve is compatible with most world flange standards – ANSI Class 125/150, BS 10 Tables D and E, BS 4504 NP 10/16, DIN ND 10/16, AS 2129 and JIS 10. In addition the valves are designed to comply with ISO 5752 face-to-face and ISO 5211 actuator mounting flanges. Therefore, one valve design can be used in many different world markets.

Due to a modular concept of design, all Bray® handles, manual gear operators and pneumatic and electric actuators mount directly to Bray valves. No brackets or adapters are required.

Bray interchangeability and compatibility offers you the best in uniformity of product line and low-cost performance in the industry today.

POLYESTER COATING CORROSION PROTECTION
Bray's standard product offers valve bodies with a polyester coating, providing excellent corrosion and wear resistance to the valve's surface. The Bray polyester coating is a hard, gloss red finish.

Chemical Resistance – resists a broad range of chemicals including: dilute aqueous acids and alkalies, petroleum solvents, alcohols, greases and oils. Offers outstanding resistance to humidity and water.

Weatherability – outdoor tested resistant to ultra-violet radiation.

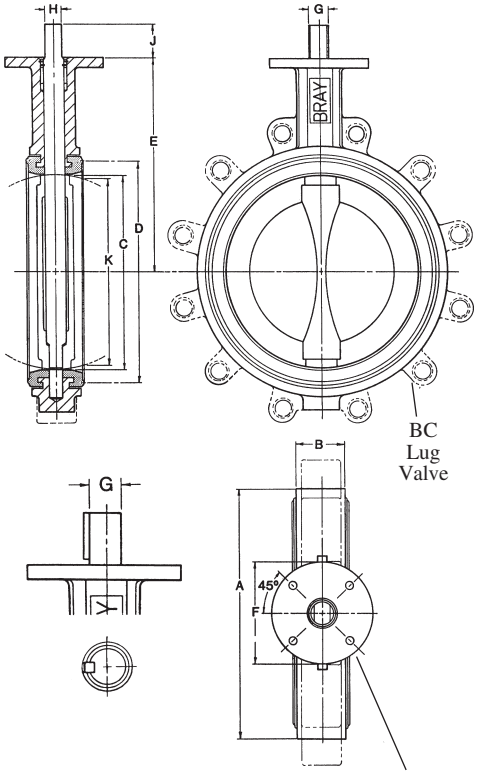
Abrasion Resistance – excellent resistance to abrasion.

Impact Resistance – withstands impact without chipping or cracking.

NYLON 11 COATING
Optionally available for valve bodies where outstanding protection and performance is needed. A thermoplastic produced from a vegetable base, this coating is inert to fungus growth and molds. Nylon 11 is *USDA Approved*, as well as certified to ANSI/NSF 61 for water service.

Corrosion Resistance – superior resistance to a broad range of chemical environments. Salt spray tested in excess of 2,000 hours and seawater immersion tested for over 10 years without corrosion to metal substrates.

Nylon 11 features a very low coefficient of friction and excellent resistance to impact and ultra-violet radiation.



See chart for Actuator Mounting Flange Drilling.

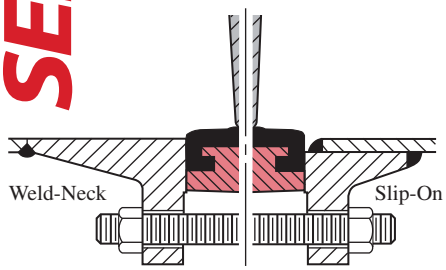
SELECTION DATA

FLANGE REQUIREMENTS

Bray valves are designed for installation between ANSI Class 125/150 lb. weld-neck or slip-on flanges, BS 10 Tables D & E, BS 4504 NP 10/16, DIN ND 10/16, AS 2129 and JIS 10, either flat faced or raised faced. While weld-neck flanges are recommended, Bray has specifically designed its valve seat to work with slip-on flanges, thus eliminating common failures of other butterfly valve designs. When using raised face flanges be sure to properly align valve and flange. Type C stub-end flanges are not recommended.



PRESSURE RATINGS*

For bi-directional bubble-tight shut off, disc in closed position:

Inches	mm	psig	bar
2-12	50-300	175	12
14-20	350-500	150	10

For Dead-end Service Applications:

With *downstream flanges installed* or with *vulcanized seats,* the dead-end pressure ratings are equal to valve bi-directional ratings as stated above. With no downstream flanges or with seats that are not vulcanized, the dead-end pressure rating for 2"-12" valves is 75 psi (5 bar) for 14"-20" valves, 50 psi (3.5 bar).

*Pressure Ratings are based on standard disc diameters. For low pressure application, Bray offers a standard reduced disc diameter to decrease seating torques and to extend seat life, thus increasing the valve's performance and reducing actuator costs for the customer.

VELOCITY LIMITS

For On/Off Services:
Fluids – 30 ft / sec (9m / s)
Gases – 175 ft / sec (54m / s)

C_V VALUES–VALVE SIZING COEFFICIENT

Valve Size		Disc Position (degrees)

C_V is defined as the volume of water in U.S.G.P.M. that will flow through a given restriction or valve opening with a pressure drop of one (1) p.s.i. at room temperature. Recommended control angles are between 25°–70° open. Preferred angle for control valve sizing is 60°–65° open.

EXPECTED SEATING/UNSEATING TORQUES (Lb.-Ins.)

20	500	10300	12900	15500	—	6867

Valve Torque Rating – Bray has classified valve torque ratings according to 3 types: non-corrosive lubricating service, general service, and severe service. Torques listed above are for general services. Consult Bray for torque information corresponding to specific applications.

TO USE TORQUE CHART, NOTE THE FOLLOWING:
1) For Bray valves, Series 20, 21, 30, 31 and 34.
2) Review Technical Bulletin No. 1001, Expected Seating/Unseating Torques, for explanation of the 3 service classes and their related seating/unseating torque values for given pressure differentials of Full-Rated and Reduced Disc Diameter valves.
3) Dynamic Torque values are not considered. See Technical Bulletin No. 1002 for evaluation of Dynamic Torque values vs. Seating/Unseating Torque values.
4) Do not apply a safety factor to above torque values when determining actuator output torque requirement.
5) For 3 way assemblies where one valve is opening and other is closing, multiply torque by 1.5 factor.

SPECIFICATIONS

RECOMMENDED SPECIFICATIONS FOR BRAY SERIES 30/31 SHALL BE:

- Polyester coated, cast iron, wafer or lug bodies.
- With flange locating holes that meet ANSI Class 125/150 (or BS 10 Tables D & E, BS 4504 NP 10/16, DIN ND 10/16, AS 2129 and JIS 10) drillings.
- Through-stem direct drive double "D" design requiring no disc screws or pins to connect stem to disc with no possible leak paths in disc/stem connection.
- Stem mechanically retained in body neck and no part of stem or body exposed to line media.
- Tongue-and-groove seat design with primary hub seal and a molded O-ring suitable for weld-neck and slip-on flanges. Seat totally encapsulates the body with no flange gaskets required.
- Spherically machined, hand polished disc edge and hub for minimum torque and maximum sealing capability.
- Equipped with non-corrosive bushing and self-adjusting stem seal.
- Bi-directional and tested to 110% of full rating.
- Bi-directional pressure ratings:
2"-12" valves: 175 psi, 14"-20" valves: 150 psi
Lug bodies for dead end service
With downstream flanges or vulcanized seats, pressure ratings are equal to bi-directional ratings as stated above.
With no downstream flanges or non-vulcanized seats: 2"-12" valves: 75 psi, 14"-20" valves: 50 psi
- No field adjustment necessary to maintain optimum field performance.
- The valve shall be Bray Series 30 wafer / 31 lug or equal.

Halar® is a registered trademark of Ausimont U.S.A., Inc.

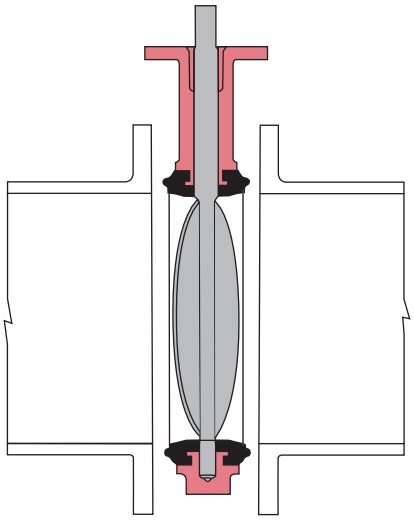
ASSEMBLY

INSTALLATION

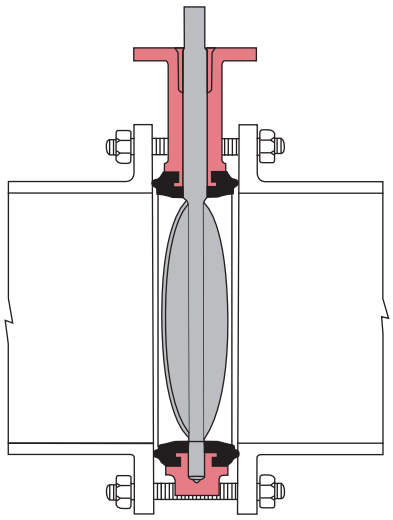
Position the disc in the partially open position, maintaining the disc within the body face-to-face. Place the body between the flanges and install flange bolts. *Do not use flange gaskets.* Before tightening flange bolts, carefully open the disc to the full open position to ensure proper alignment and clearance of the disc O.D. with the adjacent pipe I.D. Leave disc in the full open position and tighten flange bolts per required specification. Once bolts are tightened, carefully rotate disc to closed position to ensure disc O.D. clearance.

MAINTENANCE AND REPAIR

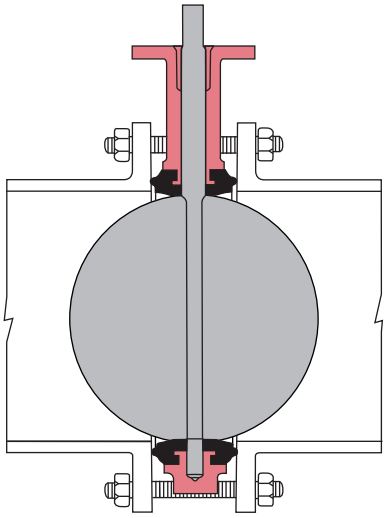
The many Bray features minimize wear and maintenance requirements. No routine lubrication is required. All components – stem, disc, seat, bushing, stem seal, etc., are field replaceable, no adjustment is needed. If components require replacement, remove the valve from the line by placing the disc near the closed position, spread the flanges, support the valve, then remove the flange bolts. No valve maintenance, including removal of manual or power actuators, should be performed until the piping system is completely depressurized.



Disc in the Near Closed Position



Disc in the Partially Open Position



Disc in the Full Open Position

DISASSEMBLY

Remove the handle, gear operator, or actuator from actuator mounting flange. Remove "Spirolox®" retaining ring. Remove stem with its thrust washer and two C-ring stem retainers. Remove bushing and seal. Remove the disc from the seat, protecting disc edge at all times. Push the seat into an oval shape, then remove the seat from the body.

ASSEMBLY

Push the valve seat into an oval and push it into the body with seat stem holes aligned to body stem holes. Push stem into the stem hole of body. For aid in inserting disc, slightly protrude stem beyond the I.D. of the top of the seat. Install a light coating of foodgrade silicone oil (for silicone free applications use soap and water) on the I.D. of seat. Insert the disc into the seat by lining up the disc hole with the stem hole of the seat. Note: the broached double "D" flats in the disc must be toward the bottom of valve body. (Take special care when lining disc up with stem.) With a downward pressure and rotating the stem back and forth, push the stem until the stem touches the bottom of the body stem hole. Make certain that when pushing the stem through disc bottom, the broached flats of stem and disc are aligned. After the stem has engaged the disc, but before the stem is firmly seated in the body, replace the stem seal and bushing. Install the two C-ring stem retainers in the groove in the stem and thrust washer on top of the C-rings. Seat the stem firmly in the body and install the "Spirolox®" retaining ring back into position.

DISTRIBUTOR

All statements, technical information, and recommendations in this bulletin are for general use only. Consult Bray representatives or factory for the specific requirements and material selection for your intended application. The right to change or modify product design or product without prior notice is reserved.

Series 70
Electric Actuator

RUGGED ELECTRIC ACTUATOR FOR ROTARY VALVES

300 TO 18,000 LB-IN OUTPUT TORQUE

Bray Controls' years of proven success in electric actuation, combined with innovative engineering, has produced the Series 70. The Series 70 features on-off or modulating control. This red, round electric actuator for rotary valves delivers highly reliable service.

Bray's unique, customer–friendly designed Control Center has many advantages over present industry standards including:

- **UL, CSA and CE certification of most units**
- **Ease of customer field wiring directly to the terminal strip without interference from other components**
- **Simple and unique manual override handwheel system**
- **Lowest profile and lightest weight actuator on the market**
- **Simple finger or screw driver adjustment of travel limit cams without interference from other components**
- **Highly visible valve status display on most units**
- **Externally adjustable travel stops**
- **Captive housing screws**

Additionally, components not requiring customer access are protected underneath the Power Center cover plate.

LOW PROFILE, COMPACT, HIGH TORQUE DESIGN

The Series 70 is by far the most compact, lowest profile design of any electric actuator delivering comparable torque output. Thorough research and many years of field experience have gone into the development of this state-of-the-art actuator – *the product of the future*. This design offers the advantages of greatly reduced space requirements, lighter weight and ease of installation and maintenance when compared to other electric actuators. When mounted directly to Bray valves, the Series 70 is especially compact.

The Series 70 compared to a typical actuator, both mounted to 4" Bray valves.

DIRECT MOUNTING OF THE SERIES 70 ON BRAY VALVES

Bray actuators mount directly to Bray valves without using any external linkage. Field installation is simple and misalignment is minimized. For sanitary processing and outdoor applications, the Bray direct mounting system reduces the possibility of contamination buildup or corrosion between the valve and actuator. The mounting pattern complies with ISO 5211 and VDI/VDE 3845 (NAMUR recommendations). Standard rotation is 90° reversible. Bray can provide linkages for mounting the Series 70 to other devices requiring 90° rotation. Please consult the Bray factory for further information.

EXTERIOR FEATURES

EXPLOSION PROOF ENCLOSURE

The Series 70 waterproof/explosion proof unit is UL NEMA 4,4x,7&9 listed and certified to specifications for hazardous locations. The rugged, heavy duty housing contains precision machined bores and flanges to meet flame path requirements. Waterproof /explosion proof models are currently available with 800 to 2,000 lb.-in. output torque, continuous or intermittent duty.

MECHANICAL TRAVEL STOPS

Stainless steel mechanical travel stops permit precise field adjustment of actuator movement to specific degrees of rotation. The travel stops are located outside the base for easy readjustment without removing the cover. Stainless steel lock nuts with O-ring seals hold the travel stops securely in place. The travel stops are normally set at the factory to allow 0° and 90° travel.

Series 70 manual override handwheel with optional spinner.

ENCLOSURE (A)
The Series 70 waterproof unit is UL NEMA 4, 4x listed. Die-cast aluminum cover and base are high-quality polyester powder coated for exceptional corrosion, wear, impact and ultra-violet resistance

MANUAL OVERRIDE (B)
A manual override handwheel is standard on all models to rotate the valve without electrical power. A yellow caution stripe around the handwheel hub indicates the handwheel is engaged for manual operation.

CAPTIVE COVER BOLTS (C)
The cover is attached to the base by stain-less steel bolts. When the cover is removed the bolts are held captive in the cover. This prevents time consuming problems caused from lost or misplaced bolts.

VALVE STATUS DISPLAY (D)
The Series 70 features a highly visible valve status display on most units. Prominently labeled and color coded – yellow for open, red for closed – the display indicates valve position through the full range of travel. The display can be seen from almost any angle. Made of high impact, heat and chemical resistant clear polycarbonate, this display withstands caustic wash down and offers excellent corrosion protection. Potential leak paths are eliminated since the indicator cover utilizes a static seal, not a dynamic seal.

ELECTRICAL CABLE CONNECTIONS (E) (Optional) A multi-pin, watertight cable receptacle offers full compatibility with today's industrial wiring systems. Factory pre-wiring prevents errors and allows quick–connect field installation. Cord sets with connection/flying leads or extension cords with connections on both ends can plug directly into the receptacle.

CONDUIT ENTRIES (F)
The Series 70 features two conduit connections in either NPT or metric threads. One entry is for power, one for control wiring.

PILOT DRILLED HOLES FOR LOCAL CONTROL STATION MOUNTING (G)
The conduit entry panel has four holes which may be easily tapped for the installation of optional local Control Station.

CLEAN AND EASY ACCESS TO ALL FIELD WIRING AND ADJUSTMENTS

Bray has specifically engineered the Series 70 Control Center for customer–friendly convenience. Designed like a junction box, the Series 70 offers by far the easiest access to terminal block wiring, cam adjustments and switch installation. Accessories are easily added, either before installation or after installation. Therefore, the time required for field start-up and adjustment is greatly reduced, and maintenance can be performed with assured ease and safety.

Bray's unique design, modular system of components and accessories, and innovative features combine to best meet today's industrial requirements.

TORQUE LIMITING SWITCHING SYSTEM (Optional)

The torque limiting switching system consists of two SPDT mechanical switches and two factory calibrated set screws. The upper cam adjusts the torque limit in the open direction, and the lower cam adjusts the torque limit in the closed direction. The switches independently respond to predetermined loads in both the open and closed travel directions by sensing the movement of the worm shaft, and interrupting the electrical power to the motor. The switches operate at any point of actuator travel.

Torque Limit Switches shown with mounting bracket sectioned for clarity.

SERIES 70 APPLICATIONS

The Series 70 is the ideal choice for process control applications involving:

- Automation and computer systems
- Butterfly, ball, plug and other rotary valves
- Dampers, switches, safety and flow-control devices
- Machine and fixture indexing
- Hostile environments demanding excellent moisture, chemical and corrosion resistance
- Long service life and rugged reliability

INDUSTRIES

Bray's Series 70 Electric Actuators are used in a wide range of industries world wide, including: Chemical, Pharmaceutical, Petroleum Refining and Oilfield, Microelectronics, Pulp and Paper, Water and Waste Water Treatment, Brewing, Food Processing, Beverages, Power, Marine, Mining, Textile and HVAC.

CONTROL CENTER FEATURES

TRAVEL LIMIT SPDT SWITCHES (A)

Bray has provided two SPDT mechanical switches as standard. These durable, high quality switches are mechanically isolated and electrically independent. The dedicated circuits eliminate any voltage cross-over between the switches. This switch combination is used for both open and closed positions of the valve and requires only one cam for each direction of valve travel. Bray's design provides synchronicity between motor control and position display. Switches are easily accessible without interference from other components. Each switch is marked with open or close labels and the cams are color coded, green for open and red for close, eliminating the possibility of making wrong adjustments of travel limits or field wiring errors.

AUXILIARY SWITCHES (Optional)

Independent dry-contact SPDT mechanical switches are available to indicate travel position to remote customer control systems.

AUTOMATIC POWER CUTOUT SWITCH (B)

The Series 70 is supplied with a SPDT mechanical switch which cuts power to the motor when the handwheel is engaged for manual operation. This switch also functions as a safety emergency shutdown device that immediately stops the actuator motor even if electrical power is still being applied to the actuator.

CERTIFICATIONS / APPROVALS

Bray has gained UL, CSA and CE certifications on most intermittent and continuous duty actuators. These certifications insure that the Series 70 has been designed to the highest quality requirements and most stringent safety standards worldwide. Substantial resources have been invested to assure our customers that the Series 70 is the best actuator on the market and will remain so.

CAMS / CAM ADJUSTMENT (C)
Bray's patented cam design is an outstanding feature of the Series 70. Cams for each switch are *infinitely* adjustable by finger touch or screwdriver with no special tools needed. The adjustment knobs rotate the specially formed cams. Each cam is color coded – the red adjustment knob controls the red cam (close position), and the green knob controls the green cam (open position). Standard factory setting allows 90° travel between open and closed positions.

TERMINAL BLOCK (D)
The actuator switches are pre-wired to a terminal block. The block has been designed for ease of customer wiring without interference from other components and features clearly marked terminal numbers. The block has been placed near the two conduit entries with ample room for running wire leads. A wiring diagram is included inside the cover for easy reference. The ground wire screw (**E**) is plated green and positioned for easy access. With some optional features Bray installs a second terminal block for Bray factory wiring and customer field wiring of additional limit switches.

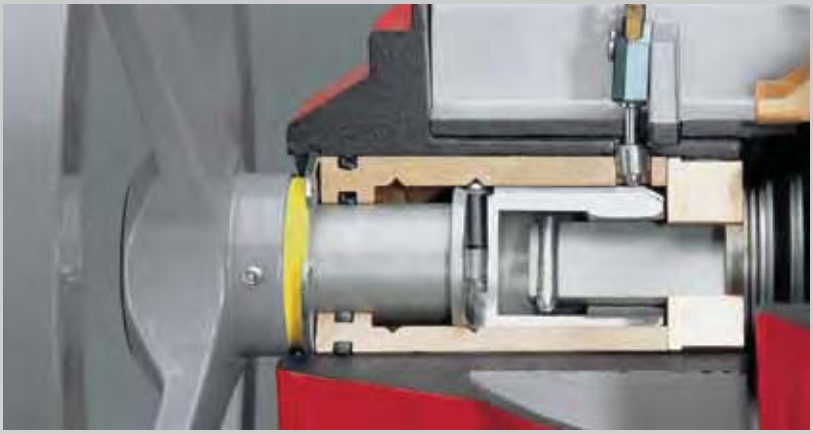
O-RING SEAL FOR WATERTIGHT ENCLOSURE (F)
The large seal between the cover and base provides a waterproof seal and prevents internal corrosion. The Bray Series 70 O-ring seal is the best design for watertight enclosures and is far superior to commonly used gaskets.

HEATER (G) (Optional)
Pre-wired to the terminal block, a self-regulating heater prevents condensation from collecting inside the actuator, which could cause damage to the electrical components. The heater is mounted below the switch plate. Heaters are ideal for use in applications with extremely wide temperature or humidity ranges.

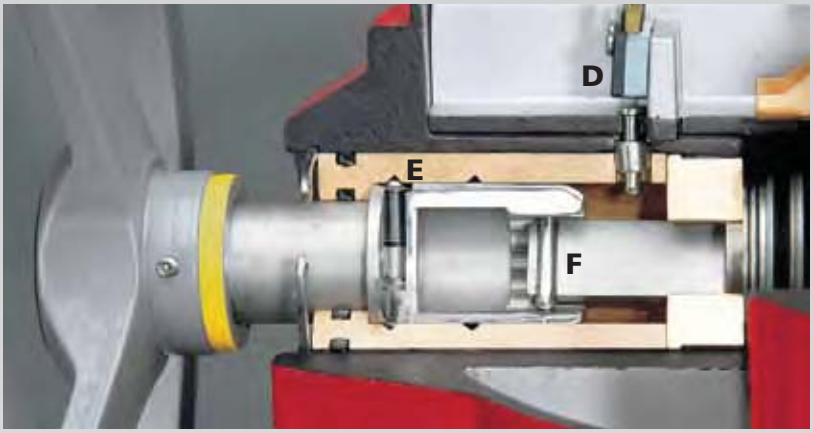
Bray designed the Series 70 to completely separate the Control Center from the Power Center. The Power Center, located in the actuator base, consists of motor, gear train, capacitor, output drive and heater. This design protects the power drive system as each component has been engineered to require no customer servicing. The Power Center components have been uniquely configured to maintain the extremely low profile of the Series 70.

POWER CENTER FEATURES

MOTOR (A), CAPACITOR (B), GEAR TRAIN (C) AND WORM GEAR (H) The Series 70 has a 120 or 220 VAC single phase permanent split-capacitor reversible induction motor. The motor features a built-in thermal overload protector of a bi-metallic strip in the windings set at 275°F (135°C) with automatic reset. The heavy-duty spur gear train is composed of precision cut, multi-staged gears and shafts. The gears and shafts are heat treated high alloy steel and will withstand locked rotor conditions. The gear train is permanently lubricated at the factory. This gear train drives the worm shaft which in turn drives the segmented worm gear output shaft.



Above photograph is a sectional view of the manual override assembly with override disengaged. Photograph below shows manual override engaged.



MANUAL OVERRIDE HANDWHEEL ASSEMBLY

- **Pull to engage for manual operation.**
- **Rotate handwheel to position valve.**
- **Push to disengage for power operation.**

A simple pull engages the handwheel for manual operation. The Bray manual override system ensures positive and fast manual operation without the use of extra tools or levers. When the handwheel is engaged, the electrical power to the motor is cut off by means of the Automatic Power Cutout Switch (**D**). When engaged, the manual override shaft is held in position by a Ball Detent (**E**). The Ball Detent also holds the shaft in position when the handwheel is pushed in to disengage the override. The Drive Pin (**F**) engages and disengages the manual override shaft from the worm and segmented worm gear output shaft. When the handwheel is pushed or pulled, the drive pin smoothly engages the worm shaft.

SELF-LOCKING OUTPUT DRIVE ASSEMBLY

The output drive assembly features a self-locking worm and worm gear drive which holds the valve in the desired position without the need for electro-mechanical braking systems. The worm shaft directly drives the worm gear. The Worm (**G**) is made of chrome-moly steel and the segmented Worm Gear (**H**) is a precision machined aluminum bronze casting. The worm gear and Output Shaft (**I**) are one part. The output shaft is the driving member that positions the valve. The worm gear drives the valve status display shaft which operates the infinitely adjustable cams to limit the electrical travel of the actuator.

MECHANICAL TORQUE LIMITING SYSTEM (**Optional**)

The mechanical torque limiting system consists of a Worm Shaft, a Worm (**G**), a set of Torque Disc Springs (**J**) and a Shaft Groove (**K**) for torque limiting switches. The torque disc springs, located on each side of the worm, resist the linear movement of the worm shaft. The worm shaft is driven against the torque disc springs in response to output torque. The shaft groove actuates the torque limiting switches, located above in the Control Center, to start and stop the motor. (Please refer to the Control Center section on page 4 for description of the Torque Limiting Switching System). The precisely controlled movement of this system is the main torque limiting element of the Series 70.

MODULATING ACTUATOR FOR PRECISION CONTROL OF VALVE POSITION

The Bray Series 70 Electric Actuator can be equipped with a Servo for precise control of valve position. The Servo consists of a microprocessor controlled circuit board and a feedback potentiometer assembly, which both fit entirely within the standard Series 70 actuator housing. The circuit board has terminal blocks for customer field wiring, and other terminals for internal connections to the actuator components. The feedback potentiometer is driven by a gear set connected to the actuator output drive. Also available are Servos capable of serial bus communication, such as DeviceNet.

COMMAND CENTER OPTIONS

SERVO PRO OPERATION

The Servo Pro can be configured by the factory or the customer to accept several types of input signals, such as 4-20 mADC, 0-10 VDC, 0-5 VDC or potentiometer control. Each terminal connection and indicator is clearly labeled to simplify field wiring and operation. The input signal electronically represents the *desired* actuator position, and the internal feedback potentiometer signal electronically represents the *actual* actuator position. The microprocessor constantly compares the two signals, and if a difference is detected, drives the actuator in the proper direction until the signals are equal. When a balance is reached, the microprocessor turns off the actuator motor. The worm gear then mechanically holds the valve in the desired position until the input signal is changed again.

Feedback Potentiometer Gear

SPEED CONTROL

Adjustments are configurable for both open and closed speed control of the actuator motor. In addition, an approach control circuit senses when the actuator is about to reach the desired valve position, and pulses the motor to avoid overshooting the set point.

POTENTIOMETER CALIBRATION

Calibration of the feedback potentiometer is done through a unique gear arrangement that is easily accessible and eliminates the need of any special tools. A simple adjustment of Bray's patented cam drive aligns the potentiometer gear as easily as a travel cam.

SERVO PRO FEATURES / SPECIFICATIONS

Note: Servo is available for modulating service – continuous duty actuators only.

Note: "Standard" is the way the Servo is set at the factory.
"Configurable" means the customer, or the factory, can modify the Servo by setting 10 DIP switches.

POWER INPUT	24 , 120 or 24 0 VAC, 50/60 Hz (power must match motor)
POWER CONSUMPTION	2 Watts (not including actuator power)
INPUT SIGNAL	Standard: 4-20 mADC 250 Ohm Input Impedance. Configurable: 0-10 VDC, 2-10 VDC, 10K Ohm or greater potentiometer, 0-10 VDC has 2.1 K Ohm Input Impedance
CALIBRATION	Single Button Autocalibration
INDICATORS	Power: Green LED Status: Flashing Red / Green LED Motor: Red LED (Close), Green LED (Open)
CONTROL MODES	Standard: Full Range, Direct Acting Reverse Acting, Split Range
FAIL POSITION (Loss of Input Signal)	Standard: Fail Closed Configurable: Fail Open
CONTROL CHARACTERISTIC	Linear
DUTY CYCLE	100%
INTERNAL FEEDBACK	10K Ohm Potentiometer, gear driven
RETRANSMISSION OUTPUT	Standard: 4-20 mADC Configurable: 0-5 VDC, 0-10 VDC, 2-10 VDC Retransmission Output is designed to drive an isolated 250 –500 Ohm resistive load.
SPEED CONTROL	Standard: Full Speed (Speed Control is Disabled) Configurable: Bidirectional – Independent Open and Close Trim Pots adjustment

FEEDBACK POTENTIOMETER
The feedback potentiometer gear has a green rib which should be aligned with the slot on top of the cam-indicator shaft when in the fully open position. This simple alignment ensures the potentiometer will provide the Servo Pro with continuous, accurate actuator-valve position feedback.

VOLTAGE SPIKE PROTECTION
Voltage spikes that can damage electrical equipment are very common in industrial locations. Large voltage spikes can be caused by switching power loads, such as large motor drives, at the customer location. The output stage TRIACs of the Servo Pro are protected against damage from voltage spikes by a special combination of

- limit switch circuitry
- metal oxide varistor (MOV) for transient voltage suppression
- zero crossing detection

DEVICENET SERVO PRO
Bray also offers the Series 70 with the most advanced serial bus communication Servo on the market. The Bray **DeviceNet Servo Pro** is fully ODVA (Open DeviceNet Vendor Association) compliant. Benefits include greatly simplified field wiring and installation, advanced control and diagnostics in real-time from a remote location, and full network integration. Please contact your Bray representative for more information.

CONTROL STATION (Optional)
Bray has designed a manual local electrical control station that flush mounts directly to the Series 70. The Control Station features:

- a local–off–remote control switch
- an open–stop–close switch
- two lights which locally indicate open and closed valve position

The cover plate can be rotated in any 90° increment, allowing the customer to operate and view the station with ease. The enclosure is aluminum and weatherproof (NEMA 4, 4X, IP 65). Additionally, the control station has captive cover bolts and two input ports available in the following thread connections: 3/4" NPT or M25. Two different multi-pin, watertight electrical cable connections are also available.

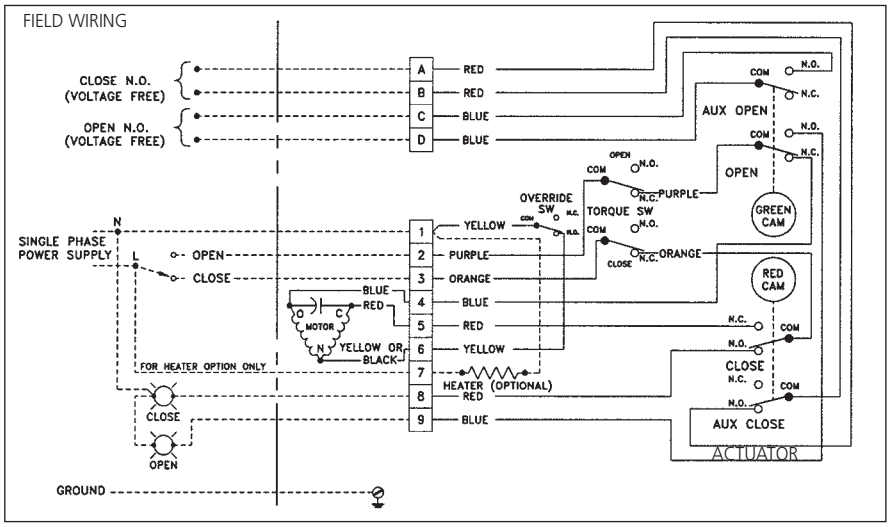
‡ The duty cycle for intermittent on-off operation is 25%. The continuous duty actuator with Servo is rated for 100% modulating operation.
12 VDC, 24 VDC and 3-Phase Motors are available as an option, please consult your Bray representative or the factory.

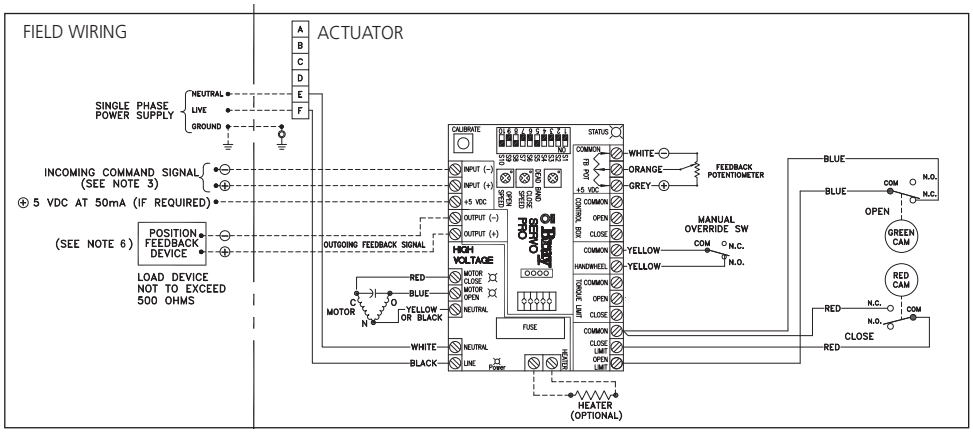
TYPICAL WIRING DIAGRAMS

ON–OFF
With Optional Torque Limit Switches, Auxiliary Limit Switches and Heater

Wiring Diagrams are For Reference Only. Do NOT use for field wiring.



MODULATING–Servo Pro
With Optional Heater



Notes:
1) Actuators are shown in closed position.
2) Manual Override is not engaged.
3) Actuators are shown with optional Heater
4) All switches are Single Pole, Double Throw.
5) Terminal block accepts field wiring from 12-22 AWG, 14-22 AWG for Servo.
6) Modulating Unit: Position Feedback Output is designed to drive an isolated 250 -500 Ohm resistive load.

SPECIFICATIONS

The electric actuator shall be compact and low–profile to greatly reduce space requirements. The actuator shall feature ease of access to field wiring and adjustment. The actuator shall be built to withstand line vibration and shock without failure and shall bolt directly to Bray valve mounting flanges without using brackets.

MOTOR A single phase permanent split-capacitor reversible motor with voltages of 120 and 220 VAC 50/60 Hz shall be standard. Motor insulation shall be Class F or better. The motor shall contain a built-in UL approved automatic reset thermal overload protector set at 275°F (135°C) embedded in motor windings. A variety of 3-Phase 50/60 Hz and DC motors shall be available upon request.

DUTY CYCLE The duty cycle for intermittent on-off operation shall be 25%. The continuous duty actuator with Servo shall be rated for 100% modulating operation.

SELF-LOCKING OUTPUT DRIVE ASSEMBLY The actuator shall have a self-locking output drive assembly consisting of a worm and worm gear output drive mechanism. The output drive assembly shall have precision cut multi-staged gears which will withstand locked rotor conditions. The output drive assembly shall be permanently lubricated at the factory and shall drive a chrome-moly steel worm which drives the composite aluminum bronze segmented worm gear / output shaft.

WIRING Actuator switches shall be pre-wired to a terminal block for ease of access and all internal wiring shall range from 12-22 AWG.

SWITCHES All travel switches shall be Single Pole, Double Throw, Form C type, 10A at 125/250 VAC, 1/2 A at 125 VDC, UL listed and CSA approved. Travel Limit switches shall limit actuator in both the open and closed position of valve travel.

CAMS Cams for each travel limit switch shall be infinitely adjustable by finger touch or screw driver, as provided by Bray's patented design.

CONDUIT ENTRIES All units shall have 2 conduit entries. Conduit entries for models 003 and 005 shall be either 1/2" NPT or M 20. Conduit entries for models 008 – 181 shall be either 3/4" NPT or M 25.

MECHANICAL TRAVEL STOPS Mechanical stainless steel travel stops shall be located outside the actuator for ease of adjustment and contain stainless steel lock nuts to hold the travel stops in place. O-rings provide waterproof seals. The travel stops shall limit the actuator movement to specific degrees of rotation.

MANUAL OVERRIDE All units shall be equipped with an aluminum manual override handwheel to rotate the valve without electrical power. The override assembly shall ensure positive and fast manual operation without the use of extra tools or levers.

EMERGENCY SHUT-OFF An automatic power cutout switch shall be provided to cut power to the motor when actuator handwheel is engaged for manual operation. This switch shall function as a safety emergency shutdown device and shall be accessible from outside the housing.

ENCLOSURE The die-cast aluminum enclosure shall be certified to UL, CSA & CE waterproof standards (NEMA 4, 4X, IP 65). Cover shall be polyester powder coated for exceptional corrosion, wear, impact and UV resistance. The enclosure shall have captive cover bolts, therefore preventing time consuming problems due to lost or misplaced bolts. A UL listed waterproof / explosion proof enclosure (NEMA 4, 4X, 7, 9) shall be available.

VALVE STATUS DISPLAY The actuator shall have a highly visible display prominently labeled to indicate valve position throughout the full range of travel.

TEMPERATURE RATING Actuators shall be designed for temperature ranges of -40°F (-40°C) to +150°F (65°C).

OPTIONAL EQUIPMENT

The actuator shall be designed to include any of the following accessories as an option.

TORQUE LIMITING SYSTEM with 2 SPDT mechanical switches and 2 factory calibrated screws. The worm shaft shall be driven against the torque disc springs in response to the output torque. The switches contact the worm shaft groove in response to predetermined loads and interrupt the electrical power to the motor. Switches shall operate at any point of actuator travel.

HEATER with self-regulating temperature control to prevent condensation buildup. The heater shall be pre-wired to the terminal block. Rated output is 15 W at 24, 120 or 220 VAC.

SERVO A microprocessor controlled Servo shall be available for precise modulating control of valve position in response to an analog input signal. The Servo shall have an analog output signal proportional to actual valve position as standard. This analog signal shall be configurable to either current or voltage output. The Servo shall have voltage spike protection on all Input terminals. Independent adjustments shall be provided for both open and closed Speed Control of the actuator and deadband. Input Signals: 4-20 mADC into 250 Ohm, 0-10 VDC, 0-5 VDC, 10k Ohm or greater potentiometer. 10K Ohm Potentiometer shall be used for internal feedback. Calibration of the Servo shall be accomplished by pressing a single button to initiate the calibration routine. Inputs for the control box and handwheel, LED status indicators and self-diagnostic capability shall also be provided.

DeviceNet Servos shall be available.

CONTROL STATION for manual local electrical operation of the actuator. The Control Station shall flush mount to the actuator and feature a local / off / remote control switch, an open–stop–close switch, and two lights which locally indicate open and closed valve position. The enclosure shall be aluminum and waterproof (NEMA 4, 4X, IP 65).

The Bray Series 70 Electric Actuators
Series 70-003/005, 008/012/020 and 70-030/050/065.

Flow-Tek®
Subsidiary of BRAY INTERNATIONAL, Inc.

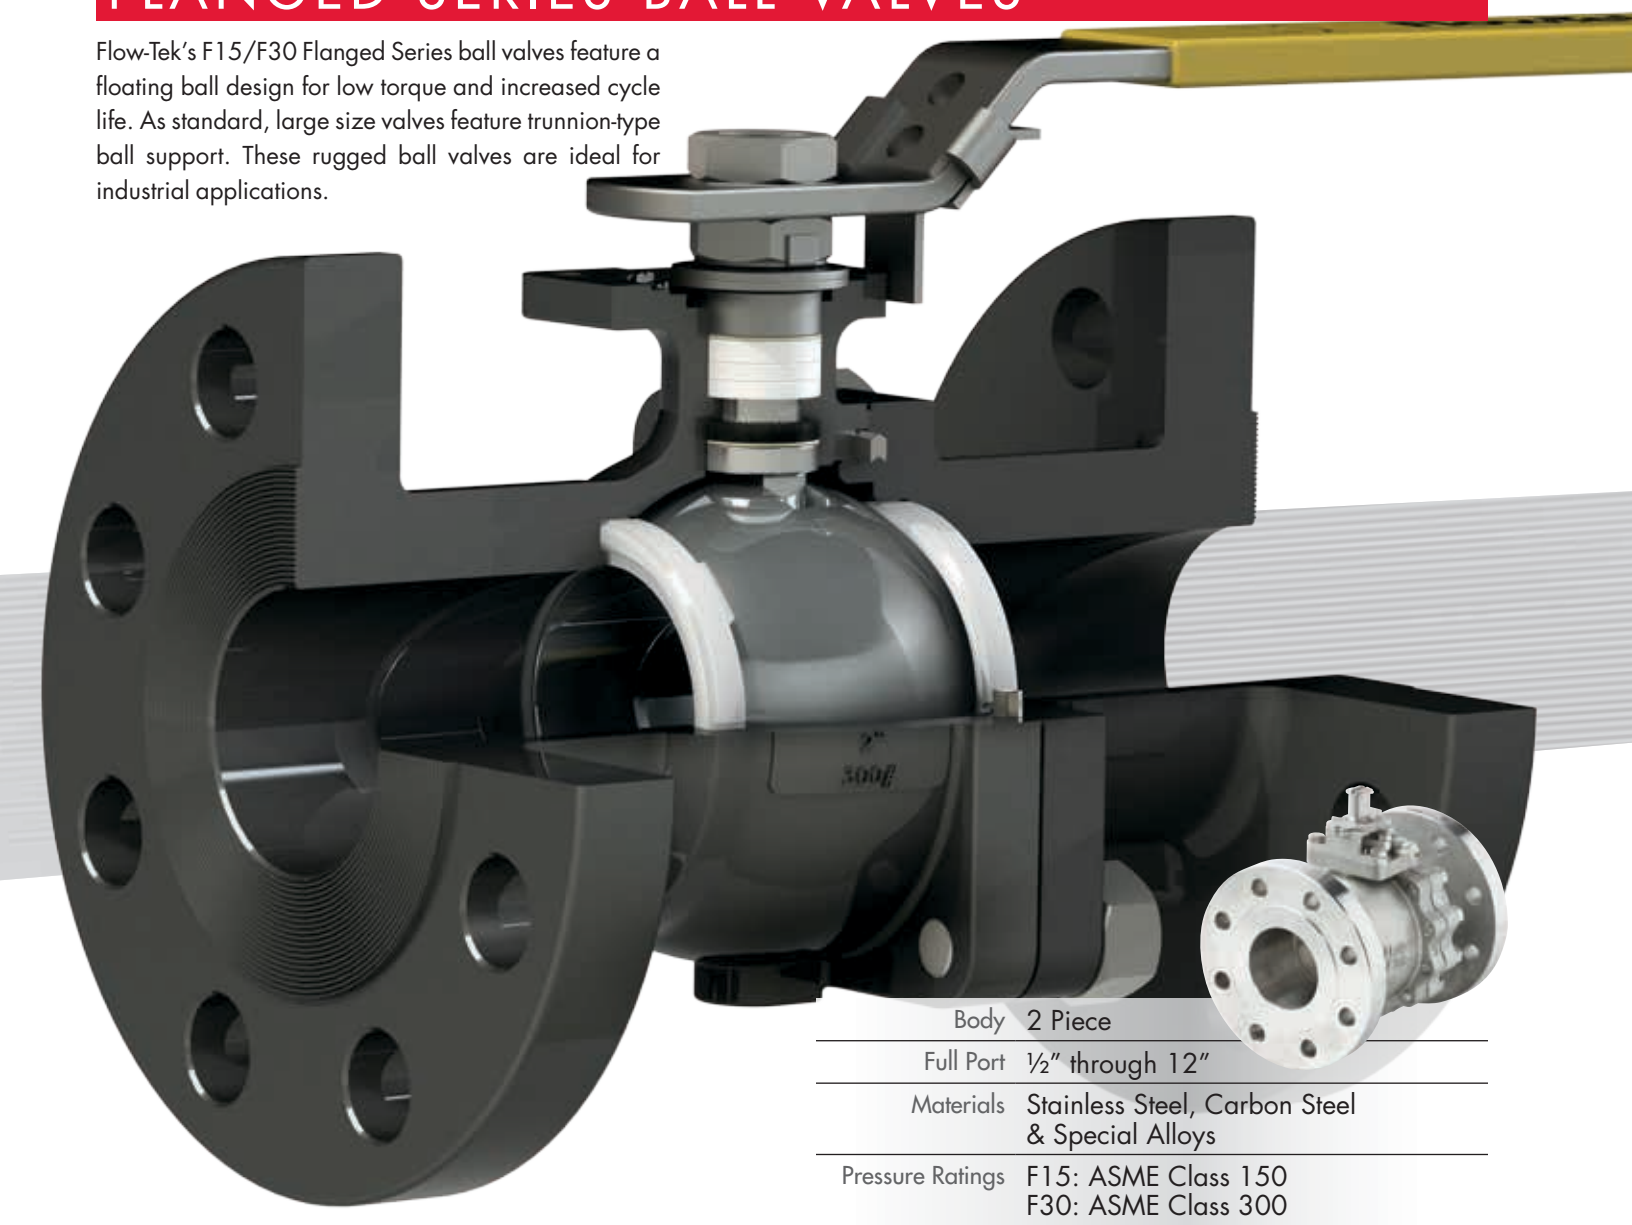
FLANGED SERIES

2 PIECE FLANGED FULL PORT ½" - 12"

F15 - ASME Class 150 | F30 - ASME Class 300

FLANGED SERIES BALL VALVES

Flow-Tek's F15/F30 Flanged Series ball valves feature a floating ball design for low torque and increased cycle life. As standard, large size valves feature trunnion-type ball support. These rugged ball valves are ideal for industrial applications.



Body	2 Piece
Full Port	½" through 12"
Materials	Stainless Steel, Carbon Steel & Special Alloys
Pressure Ratings	F15: ASME Class 150 F30: ASME Class 300

SECURE MOUNT

Flanged Series valves offer ease of automation due to an integrally cast actuator mounting pad which complies with ISO 5211 through 2" valve sizes.

STEM SEALS

Flanged Series ½"– 2" valves feature live-loaded, self-adjusting primary and secondary sealing. Utilizing Belleville washers, the stem seal automatically adjusts to compensate for changes in temperature and normal wear. 2½"– 12" valves utilize an independent packing gland which can be easily adjusted without removing mounting hardware or operator. The packing gland is contoured to more uniformly distribute the load across the packing. The primary stem seal is a combination of a thrust washer and a thrust washer protector. An adjustable stem packing creates a secondary seal between the stem and body. The stem packing is composed of RPTFE V-rings as standard – graphite stem packing is standard on all fire safe valves.

BALL

Flow-Tek balls are precision machined and mirror finished for bubble-tight shut off and less operating torque. As an added safety feature, a hole in the stem slot of each ball equalizes pressure between the body cavity and the line media flow.

BODY

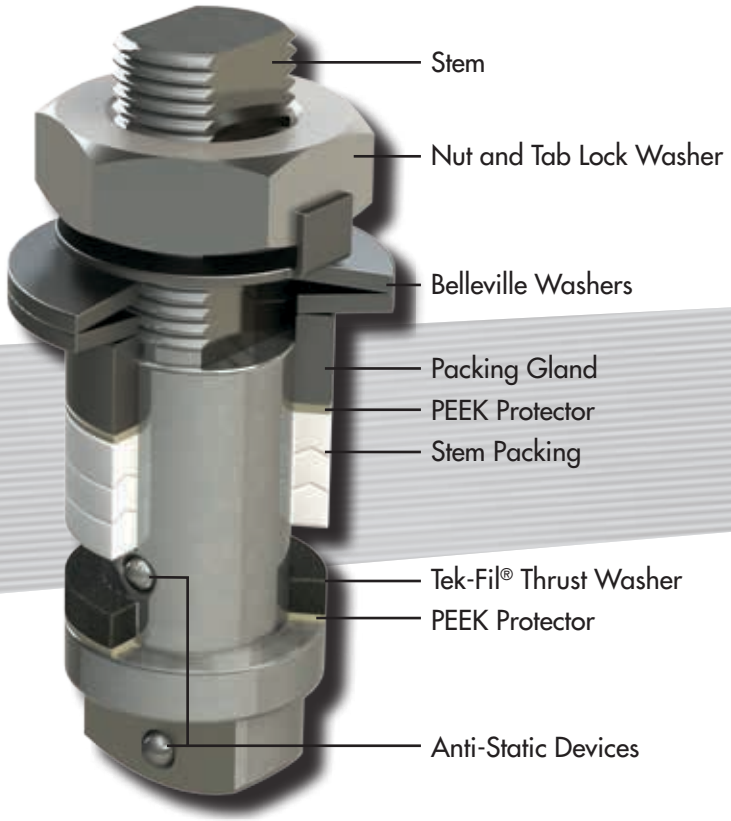
½"– 4" valve bodies are investment cast and solution annealed/ normalized for the highest quality and added strength. All body castings are marked with a foundry heat number for full traceability. Carbon steel bodies are phosphate coated for increased corrosion resistance.

SEAT

Flow-Tek's seat design ensures bi-directional, bubble-tight sealing with low operating torque. All resilient seats feature relief slots or seat O.D. clearance to relieve pressure past the upstream seat, and positive preloading to ensure low pressure/vacuum sealing.

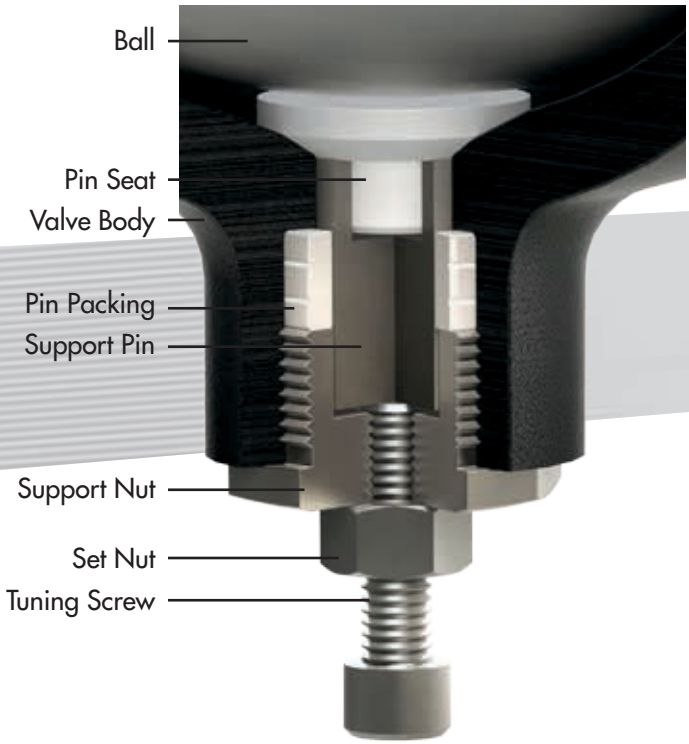
STEM ASSEMBLIES

Flow-Tek manufactures heavy duty, high quality stems with double "D" connection to ball and operator mounting. Stem and ball design ensure positive contact. All Flow-Tek stems are internal entry and blowout proof for maximum safety.



BALL SUPPORT Valve Sizes 6" through 12"

As standard, larger sized valves feature trunnion-type ball support. This support helps to maintain continuous contact between the ball and seats, preventing seat damage and blow-by. The results are less seat wear, lower torque, and longer service life.



SMART STEM Valve Sizes ½" through 2"

Flow-Tek's interchangeable family of valves feature strong, large diameter stems with live-loaded, self-adjusting sealing utilizing Belleville washers which automatically adjust to compensate for changes in temperature and wear. Manual adjustments which can cause damage to the seal and seat are not required. The assembly is secured by a saddle-type lock washer which prevents stem nuts from unthreading in high cycle automation applications.

STEM PACKING

An adjustable V-ring design creates a multiple seal between the stem and body. Each stem assembly is composed of three or four (dependent on valve size) rings providing a very high cycle life by resisting creep and cold flow. The thrust washer and the thrust washer protector combine to provide a primary seal, reduce torque and prevent galling. This arrangement is a Flow-Tek exclusive.

LOCKING DEVICE

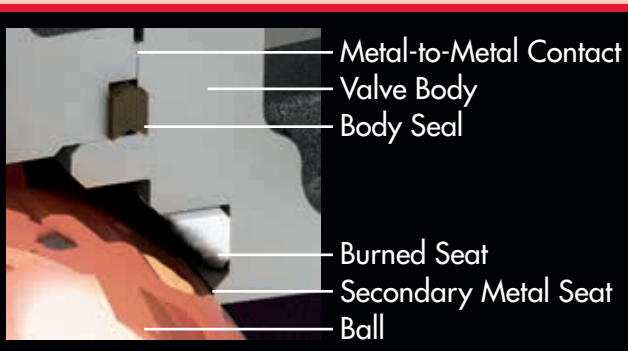
All manually operated valves feature a locking device to prevent accidental movement of ball position. Valves ½"–2" feature a safety trigger that locks the handle in the open or closed position. The handle lock can be bypassed, if needed, with a small bolt through the handle in the release position.

On all sizes a padlock can be added to secure the handle in position, preventing unwanted movement of the ball.

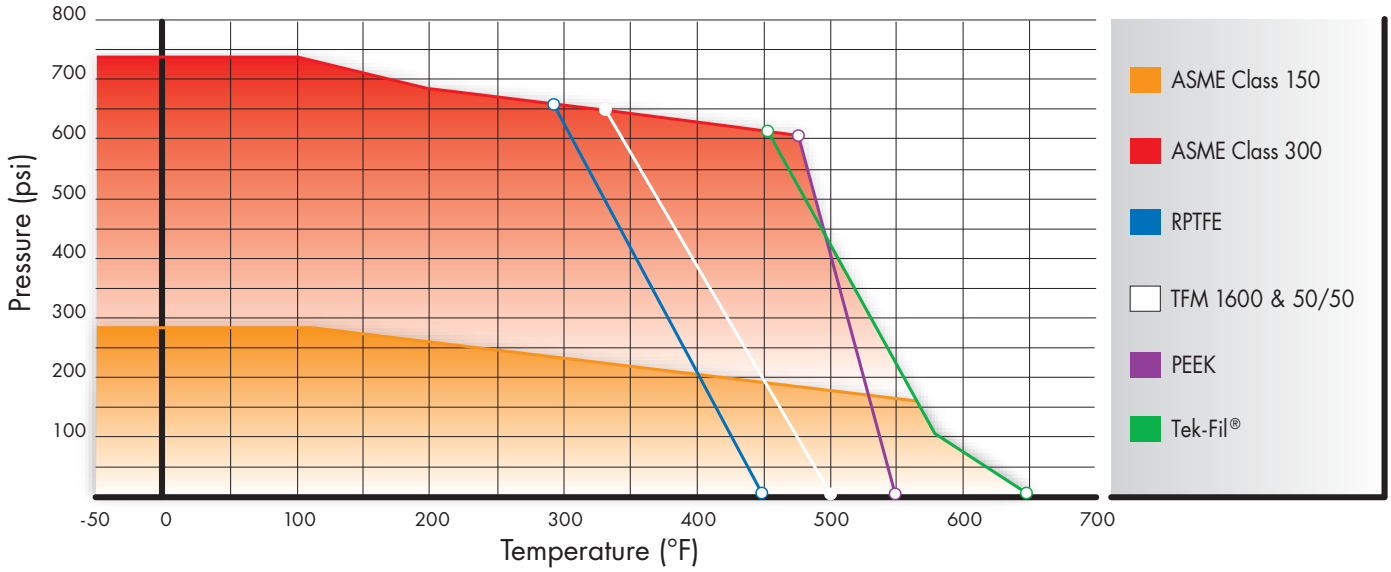
FIRE SAFE - Certified to API 607

Flanged Series valves with graphite stem seals have been thoroughly fire tested and meet these standards.

In the event of a fire, after heat destroys the primary resilient seat, the ball makes contact with the secondary metal seat, forming a secure seal. The body seal, composed of stainless steel and graphite wound into a spiral, prevents external leakage. The graphite stem rings prevent stem leakage.



PRESSURE / TEMPERATURE



Carbon steel valves limited to -20°F

STEAM SERVICE PRESSURE RATINGS: WSP

	TFM Seats		Tek-Fil Seats		PEEK Seats	
	PSI	°F	PSI	°F	PSI	°F

Vacuum service to 29.9 inches Hg. gauge.

SPECIAL OPTIONS/SERVICES

Cavity Fillers	Media Containment Units
Spring Return Handles	NACE
Vented Balls	Polished Internals
Characterized Balls	Special Cleaning
Chlorine Service	Silicone Free

SPECIFICATIONS

- Valve sizes ¼" through 12"
- Design meets MSS-SP-110
- Threaded end connections meet ASME B1.20.1 NPT
- Socket weld end connections meet ASME B16.11
- Butt weld end (Schedule 40) connections meet MSS SP-72 /ASME B16.25
- Flanged end connections meet ASME Class 150

Valve body and end cap connections are high quality investment cast and solution annealed/normalized. Body and end cap wall thickness meets ASME B16.34.

Valve stems are blow-out proof for maximum safety and meet ASME B16.34 specification.

All valves are factory tested to MSS SP-72 and API 598.

SEAT SELECTION

A wide range of seat materials are available to meet most applications. The standard seat is TFM 1600. Options include:

- RPTFE
- Stainless Steel/PTFE (50/50)
- UHMWPE
- Virgin PTFE
- PEEK
- Tek-Fil® (carbon/graphite filled TFM)
- Full metal seats
- Cavity Fillers

PEEK seats offer high pressure/temperature capability. Tek-Fil® seats offer reduced torque in high temperature, high cycle, and steam service applications. TFM 1600 seats offer the exceptional chemical resistance of PTFE plus lower porosity and permeability, improved temperature range and reduced valve torques.

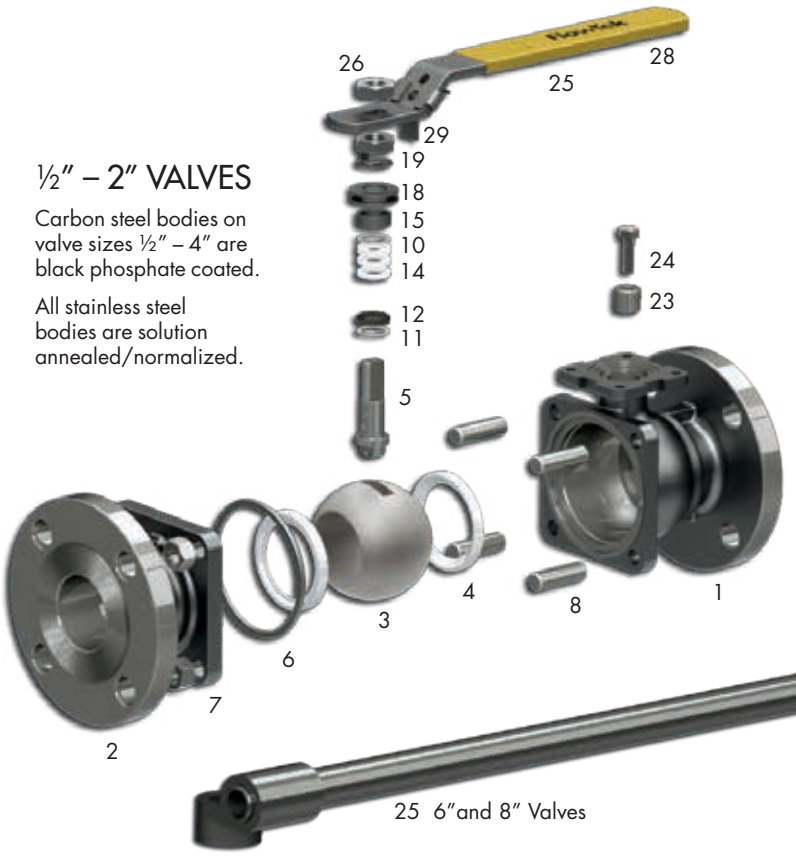
* Quantity depends on valve size.
** RPTFE packing is composed of 3 or 4 pieces depending on size.
Graphite packing is composed of a single piece.
*** Ductile Iron used forvalve sizes ≥ 2½".

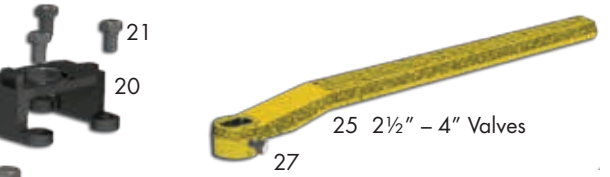
Flow-Tek offers the seat, body seal, thrust washer and stem packing as recommended spare parts. These parts are available as a packaged repair kit.

½" – 2" VALVES

Carbon steel bodies on valve sizes ½" – 4" are black phosphate coated.

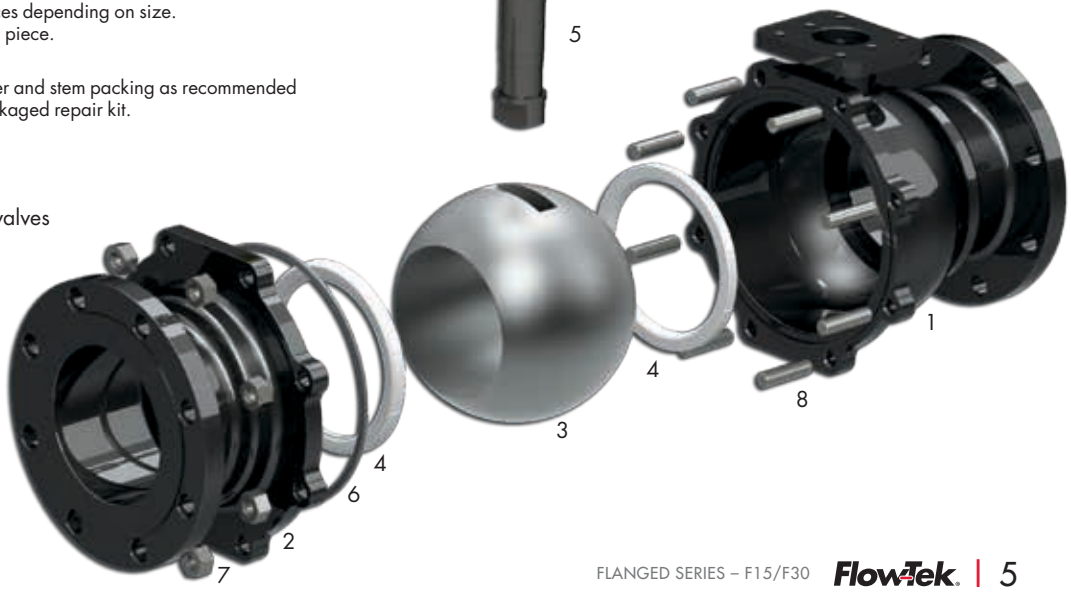
All stainless steel bodies are solution annealed/normalized.





2½" – 12" VALVES

Ball support is included on 10"-12" F15 valves and 6"-12" F30 valves.



F15/F30 DIMENSIONS ½" – 2" VALVES (15mm - 50mm)

[1] For 8" F30: K=1.61, L=3.42

[2] For 10" F30: L=3.82, P=2.165

NOTE 1: Ball Support as shown on Page 2 is included on 10"-12" F15 and 6"-12" F30 valves.

NOTE 2: 2½", 3" & 4" valves feature a NAMUR stem slot for ease of limit switch mounting.

Face to Face dimensions meet ASME B16.10 long pattern in all sizes and short pattern sizes up to 4" F15 and up to 6" F30.

***Torque** at maximum rated pressure, clean water, TFM 1600 seating material. Other seat materials exhibit different torques. Please refer to TB 1005 for specific torques.

Bray®

SERIES 92/93 Rack & Pinion
Double Acting & Spring Return

PNEUMATIC ACTUATOR

The High Performance Company

SERIES 92/93

Styling, strength, compactness, and simplicity of design have been combined to produce the best rotary actuator on the market today. Bray Controls introduces this newest line of high performance, highest quality pneumatic actuators, the Series 92/93.

Engineering excellence and precision manufacturing has produced a modular product line with reduced overall size requirements and economic savings. In addition all Brayline Accessories are fully modular and directly mount to the actuator – providing flexibility and efficiency at reduced cost.

Bray Series 92/93 actuators are rack and pinion, opposed-piston actuators available in two versions: double acting for rotation of 90°, 135° and 180°, and spring return for 90° rotation. Their ideal use is actuating butterfly, ball or plug valves, but they can be applied anywhere a rotation of 90°, 135° or 180° is needed. Rotated on low friction acetal bearings, Bray units are well suited to handle offset loads to the gear and output shaft assembly.

The Series 92/93 actuators were designed primarily for pneumatic operation up to a maximum pressure of 140 psig (10 Bar) and for temperature ranges of -40°F (-40°C) to +200°F (+95°C). For higher and lower temperature applications, consult factory.

All double acting and spring return units are suitable for both on-off and throttling applications. Actuators which can be actuated with other media such as hydraulic oil or water are also available as an option.

The Series 92/93 is completely enclosed and self contained. The many features minimize maintenance and provide safe, simple disassembly and assembly.

The INTEGRAL PORTING (**A**) reduces the cost of external tubing that is also easily damaged. The unique, lubricated ACETAL PISTON GUIDES (**B**) and RINGS (**C**). Both have a very low coefficient of friction and absorb the side thrusts of the pistons. The piston cylinder walls in the body are honed to a very fine finish thus reducing the overall coefficient of friction. These features extend the life of the actuator and make the Series 92/93 one of the most efficient actuators on the market.

The OUTPUT SHAFT BEARINGS (**D**) on the top and bottom of the pinion are made of low-friction acetal.

The OUTPUT SHAFT and PINION GEAR (**E**) are one-piece, manufactured from hardened alloy steel and zinc-plated for corrosion protection.

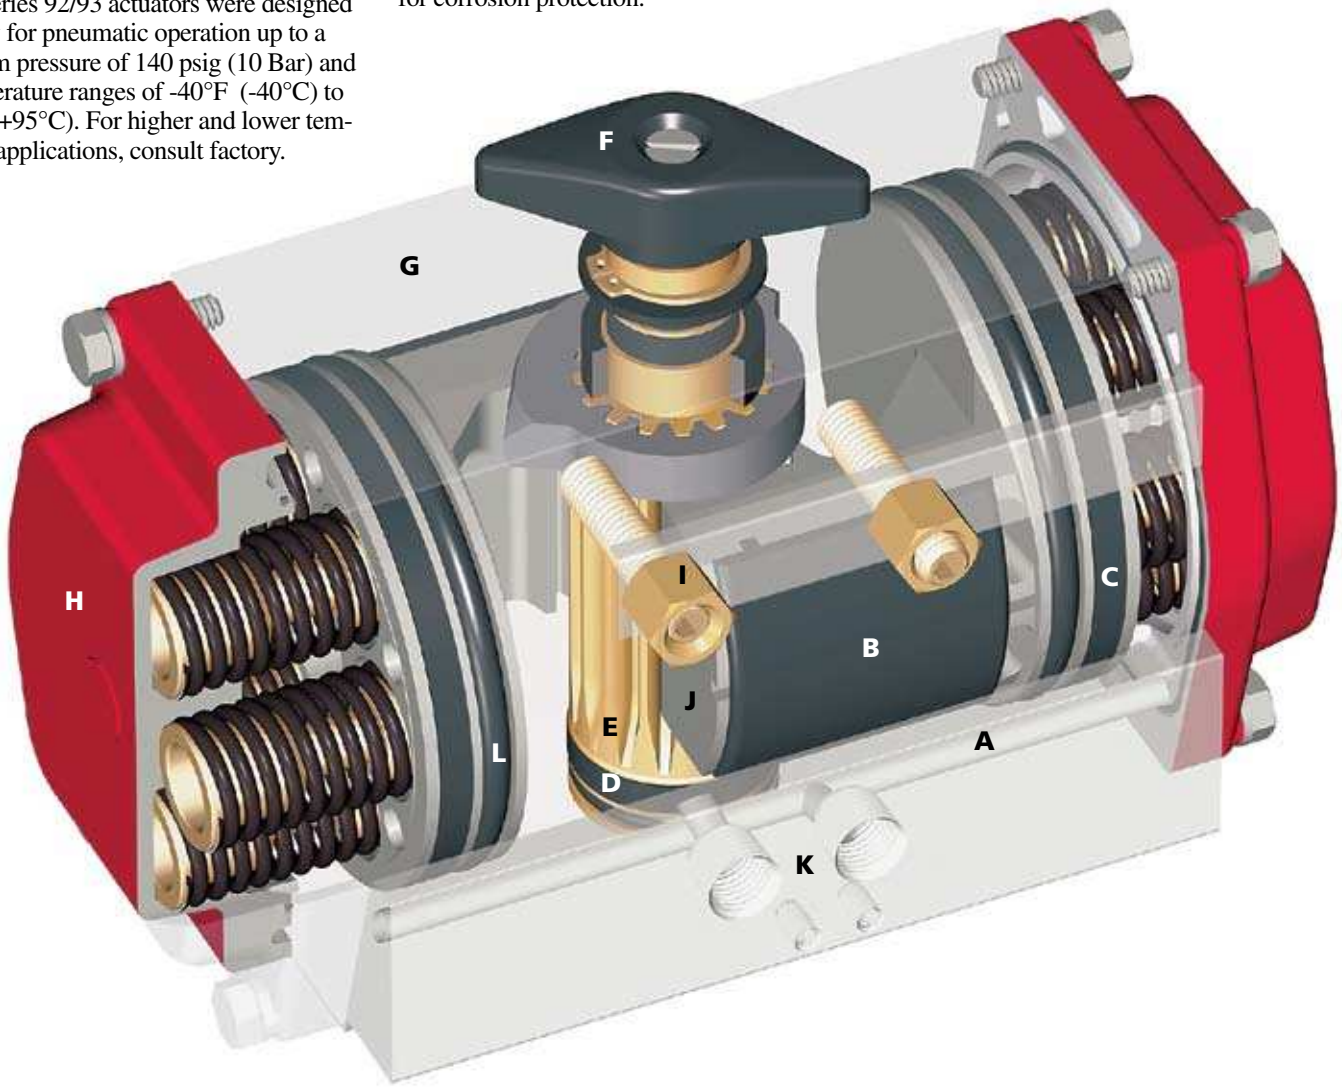
The SHAFT POSITION INDICATOR (**F**) clearly shows open or closed position and is easily removable for MANUAL OVERRIDE FUNCTION of the actuator.

The BODY (**G**) is extruded aluminum with anodized corrosion protective coating. The END CAPS (**H**) are polyester coated for chemical resistance. This coating is resistant to dilute aqueous acids, salts, aliphatic hydrocarbons, detergents, petroleum solvents, alcohols, greases and oils.

The TRAVEL STOP (**I**) adjusting screws limit the travel of the actuator to specific degrees of rotation in both open and closed directions. The PISTONS (**J**) are die-cast aluminum.

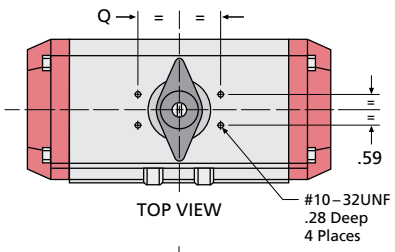
The two PNEUMATIC SUPPLY PORTS (**K**) are 1/8" NPT on size 48 actuators. The other sizes have 1/4" NPT ports. NAMUR interface is standard on all actuator sizes.

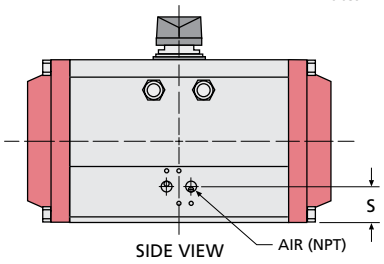
All Bray Series 92/93 actuators have permanently lubricated factory packed bearings and guides. No further lubrication is necessary under normal operating conditions. All seals, including PISTON SEALS (**L**), are permanently lubricated Buna-N O-rings.

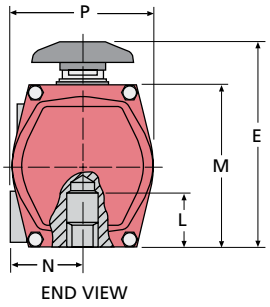


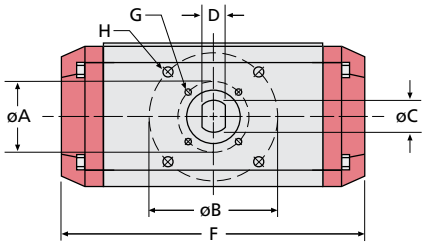
ENGINEERING

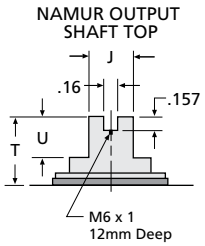
Double Acting/ Spring Return

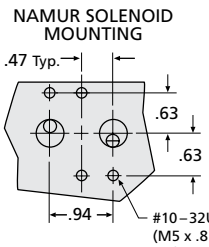












Special Note: Sizes 210 and 255 actuators have end-cap travel stops not bi-directional travel stops. Please consult factory for production release date of bi-directional stops for these size S92/93 actuators.

Note: Double Acting and Spring Return actuators have the same overall dimensions. The double acting unit of the size 48 actuator is optionally available with flat end caps with an F dimension of 4.00.

† ISO "F" means mounting flange-drilling pattern.

* Dimensions for Size 160A in table. Size 160B (keyed stem version) has C dimension of 1.38 and D dimension of .39.

‡ Dimensions for Size 255A in table. Size 255B actuator has a C dimension of 3.00 and D dimension of .75.

** Size 48 has a T dimension of .79 with use of NAMUR top plate.

Actuator Speeds

SIZE	48	63	83	92	118	127	160	210	255
Open Stroke/ Close Stroke	1/4	1/4	1/4	1/4	1/2	1/2	1	2	2 3/4

Note: Times shown are in seconds at 80 PSIG supply pressure with 6ft. tubing having an internal diameter of approximately 1/4". Bray S92/93 actuation times are very dependent on the flow capacity of their air supply. The use of smaller port solenoids, solenoid manifolds, smaller I.D. air supply tubing and/or extended lengths of tubing can significantly reduce the actuation time and/or initial response to the command signal.

Actuator Weights

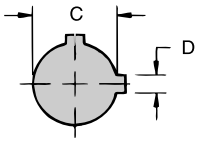
SIZE	48	63	83	92	118	127	160	210	255
Double Acting	1.8	3.4	6.1	8.4	16.4	20.9	38.1	65.0	144.0
Spring Return	2.4	4.1	7.9	10.8	21.7	27.3	52.6	95.3	192.6

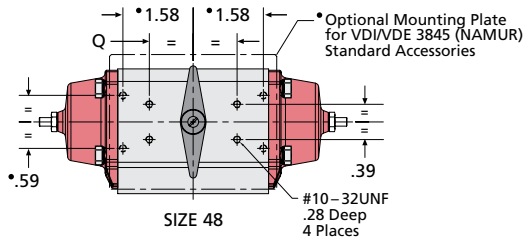
Weights are in lbs. Spring Return unit weights are with full set of springs per piston.

Actuator Volumes (ins³)

SIZE	48	63	83	92	118	127	160	210	255
Counter-clockwise	5.7	9.6	24.8	34.8	73.8	96.7	187.5	360.0	750.0
Clockwise	4.8	13.4	32.6	45.9	95.5	130.8	259.6	450.0	900.0

Counter-clockwise: Air volume in cubic inches required to push pistons apart, full travel.
Clockwise: Air volume in cubic inches required to push pistons together, full travel.

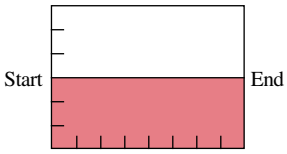




TORQUE

DOUBLE ACTING TORQUE CURVE

Series 92 – (Air to Air)



The Series 92 Actuator has a constant output torque throughout travel from start to end, clockwise or counterclockwise rotation.

TRAVEL STOP Two independent adjusting screws are located on the center of the output shaft to precisely limit the travel of the actuator to specific degrees of rotation. The travel stops permit bidirectional adjustment of actuator movement in both the open and closed positions.

SPRING RETURN Bray's Series 93 spring return models employ a unique cartridge system. The actuator was designed to save both space and cost. The housing length of the spring return unit is the same as the double acting unit. Converting from double acting to spring return actuation is just a matter of removing the end caps and adding the unique spring cartridges. The actuator can be disassembled and assembled without cumbersome equipment or danger to the installer due to springs releasing. 40, 60, 80, and 100 psi services are standard, optional ratings are available.

DIRECT MOUNTING Bray actuators comply with ISO 5211 dimensions and mount directly to Bray valves without using external linkages. Field installation is simple, misalignment is minimized and contamination buildup between valve and actuator is reduced. Bray can provide linkage for mounting actuators to other devices requiring 90° to 180° rotation.

BrayLINE ACCESSORIES

SERIES 63 3-WAY AND 4-WAY SOLENOID VALVE
For electrical operation of pneumatic actuator on-off functions, Bray Series 63 solenoids are direct-mounted to the actuator by NAMUR interface. The pilot operated spool control valve is convertible from 3-Way (3/2) to 4-Way (5/2). Both watertight (NEMA 4, 4X) and explosion proof (NEMA 4,4X,7,9) housings are standard. NPT and IP65 DIN connections are offered with both single and dual coils. The air supply connection is 1/4" NPT and the electrical connection is 1/2" NPT. A manual override screw is located on the top of the valve body. Stainless Steel housings, digital Bus solenoids and a Series 55 speed control that allows independent control in both directions of travel are also available.

VALVE STATUS MONITOR SERIES 50 The Series 50 signals actuator and valve position to local and remote stations. The compact valve status monitor mounts directly to the top of the actuator. Features include finger-touch control cams, captive cover bolts, local position indicator and two conduit entries for easy wiring. Rated for 15 amps at 125 or 250 volts AC, the Series 50 is provided with internal travel switches that are prewired to a terminal block. Standard switches are two single pole double throw (SPDT) micro switches. Available switch options are 4 micro switches, 2 proximity switches, 2 pneumatic switches or potentiometer for continuous read out. The housing is available in waterproof (NEMA 4,4X) or explosion proof (NEMA 4,4X,7,9).

SERIES 52 VALVE STATUS MONITOR
The Bray 2N1 ProxSensor provides 2 proximity sensors in 1 self-contained, fully sealed, compact enclosure. The sensors are completely encapsulated with epoxy resin in a polymer enclosure for superior moisture, chemical and corrosion protection. AC, DC, Intrinsically Safe and BUS Network versions are offered. Features include LED indicators, high visibility pointer for local position indication, non-magnetic targets and multi-pin electrical cable connector. A Valve Position Display is available as an option. AC Sensor units operate on 20-250 VAC with a maximum load current of 500mA. DC Sensor units operate on 10-30VDC with a maximum load current of 200mA. BUS Network powered units with solenoid drive are AS-i, DeviceNet and PROFIBUS DP.

SERIES 6A ELECTRO-PNEUMATIC POSITIONERS
Series 6A intelligent electro-pneumatic positioners offer precise, microprocessor driven flow control and advanced communication combined with the lowest air consumption on the market. For use with either double or single acting actuators, Series 6A positioners can accept an analog 4-20 mA, HART, Foundation Fieldbus or Profibus PA input signal. Features include an LCD display, keypad, auto calibration and adaptive control. Both waterproof (NEMA 4, 4X) and explosion proof (NEMA 4,4X, 7,9) housings are available.

Brayline Accessories and Bray Actuators both comply with VDI/VDE 3845 (NAMUR recommendations).

SPECIFICATIONS

SPACE SAVING MODULAR PRODUCT LINE

The actuator shall be pneumatically operated and must travel a minimum of 90° in each direction and must be able to overtravel at 3% in each direction past 90°. The actuator shall be totally enclosed and contained in a single enclosure, with no external moving parts. All pneumatic passage ways must be integral to the actuator housing so as to eliminate the need for external tubing. Actuator shall be rack and pinion design, and the output torque shall be linear throughout travel. Actuator shall be provided with pistons that have acetal piston guides and rings thus greatly extending the life of the actuator and reducing friction to the minimum. Actuator must be supplied with two independent travel stop adjustments, the 0° and 90° travel positions have travel adjustments of +5° to –5° (see Diagram A below). The actuator shall be provided with mechanical visual position indicator, and the indicator must be able to be removed easily thus exposing the output shaft for use of manually overriding the actuator when needed. The output shaft and pinion must be of one piece and must be manufactured out of hardened alloy steel and zinc plated for corrosion protection. Actuator shall be able to mount in any position without loss of performance. The actuator shall bolt directly to Bray valve mounting flange without need for any brackets.

Actuator housing shall be anodized aluminum and all external fasteners shall be carbon steel, zinc plated. Springs shall be spring steel, coated for corrosion protection. All seals shall be Buna-N and bearings made of lubricated acetal resin.

The actuator shall be factory lubricated. Actuator design must have smooth housing lines so it will self-drain. The actuator shall be factory tested to ensure proper operation.

STANDARD MATERIALS

Body:	Extruded aluminum alloy, anodized
End Caps:	Die cast aluminum alloy with corrosion resistant polyester coating
Pistons:	Die cast aluminum alloy
Output Shaft/Pinion:	Carbon Steel, zinc plated
Travel Stop:	Alloy Steel
Shaft Bearings:	Acetal
Piston Guides:	Acetal
Fasteners:	Stainless Steel
Springs:	Spring Steel, protective coating
O-Ring Seals:	Buna-N
Options:	Polyester coated body exterior Electroless Nickel plated body exterior Hard Anodized body exterior Stainless Steel pinion

SPRING RETURN – MODULAR DESIGN

The Spring Return System for fail-safe services must be installed in the same housing as the double acting actuator, with no additional housing extensions required, therefore saving weight and space. The spring system must be supplied as a self-contained spring cartridge system. This is a safety feature that ensures disassembly of the actuator without danger of spring release when end caps are removed. Actuator shall be Bray Series 92 or 93 or approved equal.

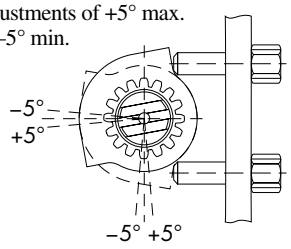
SERVICE DATA:

Actuators shall be designed for pneumatic operation up to a maximum pressure of 140 PSIG (10 Bar) and for temperature ranges of -40°F (-40°C) to +200°F (+95°C). Filtered air is recommended but not required. All double acting and spring return units shall be suitable for both on-off and throttling applications. Optional units shall be able to operate with other media such as hydraulic oil or water, consult factory for further information.

OPTIONAL EQUIPMENT

See Bray brochure #1030 for Solenoid, brochures #1011 and #1029 for Pneumatic and Electro-Pneumatic Positioners and brochures #1012 and #1015 for Valve Status Monitors.

Diagram A Travel Stop Adjustments
The 0° and 90° travel positions have travel adjustments of +5° max. to –5° min.



Caution: Care should be taken not to over adjust the travel stops in too far or out too far.

SERIES 55
FILTER REGULATORS

The Bray Series 55 Filter Regulator is a 5 micron filter designed to provide nominal filtration removal of solids and liquids from the compressed air with accurate control to any pneumatic control device and are strongly recommended for use with the Bray Series 64 and 6A positioners.

LOCKING KNOB: Allows for downstream pressure adjustment and locks the pressure setting in place.

THREADED COLLAR: Permits easy attachment of bracket for panel mounting.

PRESSURE PORTS: 1/4" NPT or 1/4 G Metric

BOWL QUICK RELEASE: Allows for easy removal of the bowl and guard for access to the filter element without the need for special tools.

TRANSPARENT POLYCARBONATE BOWL: Provides easy view of liquid levels.

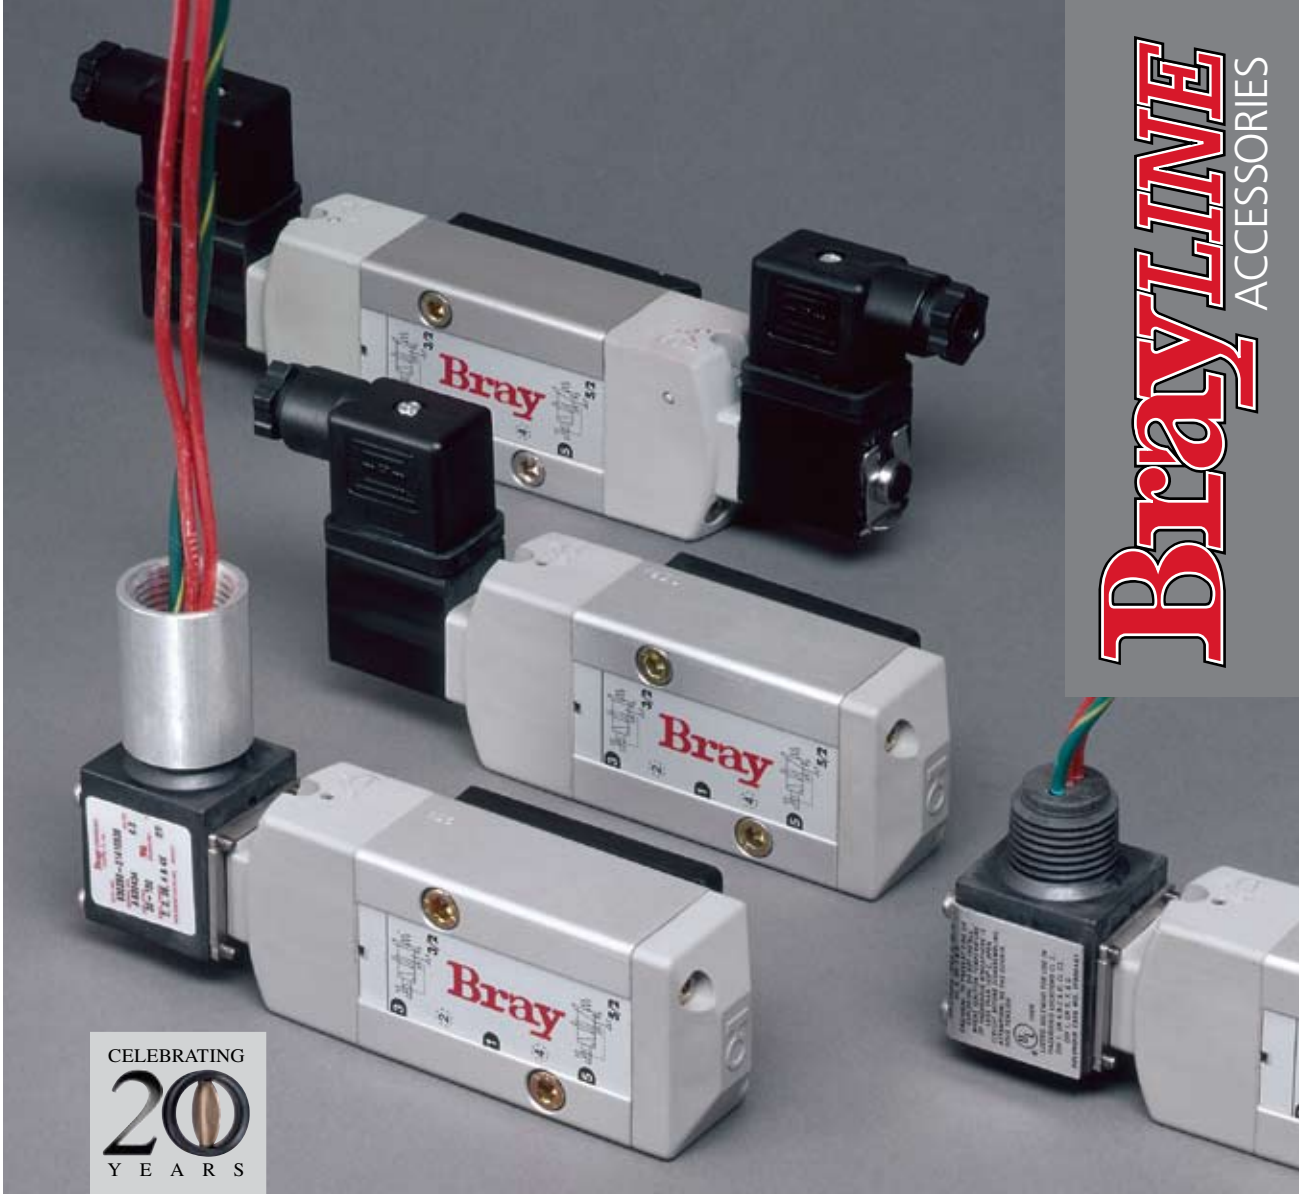
METAL BOWL GUARD: Provides sturdy breakage protection from external environmental factors.

PUSHBUTTON DRAIN: Allows for easy removal of liquid from the bowl.

SERIES 55 FILTER REGULATORS

Pressure Ports	1/4" NPT or G 1/4
Gauge Ports	G 1/8
Flow (SCFM)*	30
Set Pressure	7 – 125 PSIG (0.05 - 0.85 MPa) (0.5 - 8.6 Bar)
Filter Regulator Body	Zinc / Non-Removable Rising Knob
Bonnet	Plastic
Springs	Steel
Bowls (2 Ounce)	Transparent Polycarbonate with Metal Guard Metal (Zinc) w/Sight Gauge
Filter Element	5 Micron Standard – Plastic
Pressure Ratings**	0 – 250 PSIG (0 - 1.70 MPa) (0 – 17.2 bar)
Temperature Ratings	32°F - 175°F (0°C - 80°C)

*SCFM = Standard cubic feet per minute at 100 psig inlet, 90 psig no flow secondary setting and 10 psig pressure drop.
**Do not attach to pressurized gas bottles.



BrayLINE ACCESSORIES

SERIES 63 NEMA 4 & NEMA 4,4x, 7,9
SINGLE & DUAL COIL NPT & DIN
CONVERTIBLE 3-WAY & 4-WAY

SOLENOIDS

PILOT OPERATED SPOOL CONTROL VALVES

Far superior in performance when compared to the commonly used poppet type valves, the rugged Series 63 delivers long, trouble-free service.

FEATURES

Bray Controls offers the high flow Brayline Series 63 Solenoid Valve. The compact, modular, pilot operated spool control valve is convertible from 3-Way (3/2) to 4-Way (5/2). These units can be used with either spring return or double acting actuators where on/off electrical operation is required. Three standard coil housings/connectors are available: General Purpose Watertight (NEMA 4, 4x) and Explosion Proof (NEMA 4, 4x, 7 & 9) units have 1/2" NPT connections, and IP65 DIN units have cable gland PG9 connectors. All housings types are offered with single or dual coils. The coils are UL recognized and CSA certified. All Series 63 solenoids carry the CE mark.

MANUAL OVERRIDE

Each unit contains as standard a mechanical manual override located on the solenoid valve block. In the event of electrical power failure, overriding is simply a matter of rotating the manual override screw which will divert the air from one chamber of the pneumatic actuator to the other.

DIRECT MOUNTING

Meeting NAMUR (VDI/VDE 3845) standards, all Brayline Series 63 solenoid valves direct mount to the integral porting system of Bray Series 92/93 pneumatic actuators. No external piping is required. Bray's direct mounting permits quick and simple field installation.

SERIES 55 SPEED CONTROL

Speed controls that allow independent control of speed in both directions of actuator travel are optionally available.

CONVERTIBLE 3 & 4 WAY

Solenoid is shipped with both 3-Way (marked 3/2) and 4-Way (marked 5/2) flow plates, flow gaskets, O-rings that mount between flow plate and actuator, and mounting bolts.

OPTIONS

The Series 63 is available in the following options: stainless steel housings, low-powered units and intrinsically safe units. Intelligent, digital Bus solenoids are offered in DeviceNet and Profibus-PA protocols, and AS-I Interface solenoids with IP65 DIN/PG9 cable gland connectors are available. All direct mount to Bray pneumatic actuators.

The High Performance Company

SPECIFICATIONS

COIL HOUSINGS

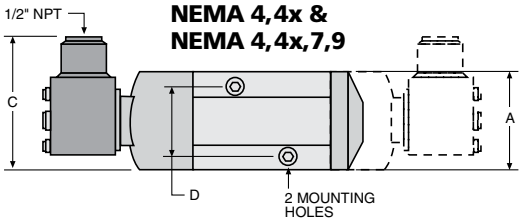
Three standard coil housings are offered. The watertight (NEMA 4, 4x) housing offers a molded and potted coil with UL recognized components and CSA certification. The watertight and explosion proof (NEMA 4,4x,7,9) housing is UL listed and C.S.A. certified for hazardous locations Class I, Div.1 (Groups A-D) and Class II, Div.1 (Groups E-G).
The IP65 DIN housing has UL recognized components and CSA certification.

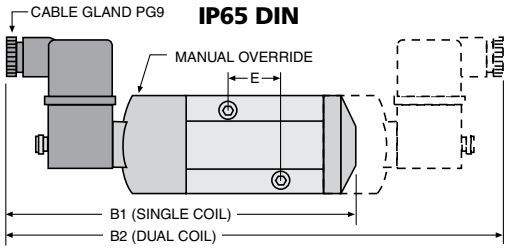
Standard solenoid valves are supplied as single coil units. Double coil units are also available for customers who require actuators to remain in last position during electrical power failure.

VALVE DESIGN Pilot Operated Spool

MEDIA Dry or lubricated air or inert gases

SPRING RETURN ACTUATORS The Series 63 Solenoid Valve fills the spring chamber with supply air rather than drawing air from the surrounding atmosphere. This keeps the spring chamber clean and dry, and improves the performance and service life of the actuator.





ELECTRICAL CHARACTERISTICS

COIL ELECTRICAL:

NEMA Housings:
24, 120, 220, 240 Volts AC, 50-60 HZ
6, 12, 24, 120 Volts DC, 50-60 HZ
IP65 DIN Housings:
24, 120, 240 Volts AC, 50-60 HZ
12, 24, 120 Volts DC, 50-60 HZ
Insulation-Class F Coils Maximum Temperature Rating: 311°F (155°C)

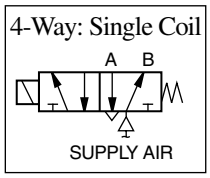
FLOW - 1/4" PIPE: $C_V = .7$
Flow = 30 scfm, 150 psi max.
Note: Bray S92/93 actuation times are very dependent on the flow capacity of their air supply. It is strongly recommended that only the Bray S63 high flow solenoid be used with the Bray S92/93 actuators. The use of smaller port solenoids, solenoid manifolds, small I.D. air supply tubing and/or extended lengths of tubing can significantly reduce the actuation time and/or the initial response to the command signal.

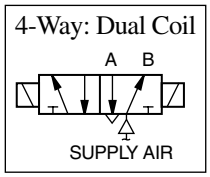
NOMINAL POWER (Watts)
NEMA Housings: A.C - 6.3, DC - 6.9
DIN Housing: A.C - 2.5, DC - 3.0

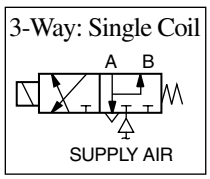
OPERATING SPEED: 10 cycles per minute - with more if needed

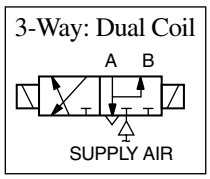
DUTY CYCLE: Continuous

FLOW SCHEMATICS









MECHANICAL CHARACTERISTICS

MOUNTING:

NAMUR (VDI/VDE 3845), mountable in any position, hardware included

MATERIALS:

Body: Anodized Aluminum
Spring: Phosphate treated black steel
Shading Coil: Copper
Seals: NBR + PUR
Core / Tube: Stainless / Brass
End Covers & Plate: 6/6 glass filled polyamide (PA/FV)
Spool: Aluminum
Internal Parts: Zamak, Steel, Acetal

PNEUMATIC PORTS: 1/4" NPT

CONNECTIONS:

NEMA Housings: Electrical: 1/2" NPT
DIN Housing: Electrical: Cable Gland PG9

CONSTRUCTION:

Standard construction is molded and potted coil with 18" leads, Class F Insulation. Other insulation classes available. The IP65 DIN coil and magnet structure are epoxy encased.
Molded Cordsets and connectors are available for IP65 DIN coil housings, please consult Bray representative or factory for further information.

NORMAL AMBIENT TEMPERATURE RANGE

NEMA Housings:
AC: -13°F (-25°C) to +140°F (+67°C)
DC: -13°F (-25°C) to +77°F (+25°C)
DIN Housing: AC & DC:
-13°F (-25°C) to +140°F (+67°C)

OPTIONAL ENCLOSURE:

Low power, intrinsically safe DIN Housing, CENELEC (Ex d,m,em &i) listed.

Henry Pratt Company

1/2" - 2" Ballcentric® Plug Valve

Engineering Creative Solutions
for Fluid Systems Since 1901

A Tradition of Excellence

With the development of the first rubber seated butterfly valve more than 70 years ago, the Henry Pratt Company became a trusted name in the flow control industry, setting the standard for product quality and customer service. Today Pratt provides the following range of superior products to the water, wastewater and power generation industries.

Butterfly Valves: from 3" to 162"

Rectangular Valves: 1' x 1' to 14' x 16'

Ball Valves –
Rubber Seated: from 4" to 60"
Metal Seated: from 6" to 48"

Plug Valves: from 1/2" to 72", 100% port available up to 48", 3 ways

Air Valves for Water and Wastewater: from 1/2" to 20"

Hydraulic Control Systems

Valve Controls

Energy Dissipating Valves and Fixed Energy Dissipaters

Cone Valves

Check Valves

Plunger Valves

A Commitment to Meeting The Customers' Needs

Henry Pratt valves represent a long-term commitment to both the customer and to a tradition of product excellence. This commitment is evident in the number of innovations we have brought to the industries we serve. In fact, the Henry Pratt Company was the first to introduce many of the flow control products in use today, including the first rubber seated butterfly valve, one of the first nuclear N-Stamp valves, and the bonded seat butterfly valve.

Innovative Products For Unique Applications

Though many of the standard valves we produce are used in water filtration and distribution applications, Pratt has built a reputation on the ability to develop specialized products that help customers to meet their individual operational challenges.

Creative Engineering for Fluid Systems

Pratt's ability to provide practical solutions to complex issues is demonstrated by the following case histories.

Earthquake Proof Valves

Pratt designed and manufactured hydraulically actuated valves for a water storage application so that the valves would automatically operate in the event of earthquakes. This led to the development of a valve that will withstand acceleration forces of up to 6gs.

Custom Actuation/Isolation Valves

Pratt has designed and manufactured nuclear quality quarter-turn valves and parts since the first nuclear-powered generating plants were built. Our custom valves are able to close in a millisecond, using specially designed Pratt electro-pneumatic actuators.

Valves Designed for Harsh Environments

Pratt designed and manufactured a 144" diameter butterfly valve for the emergency cooling system at a jet engine test facility. The valve was designed to supply water to help dissipate the tremendous heat generated by the engines during testing.

PRATT
Henry Pratt Company

Through experience, commitment and creative engineering, Pratt is uniquely suited to provide superior products for our customers' special needs.
For more information, contact our corporate headquarters in Aurora, Illinois.

Scope of Line

The Henry Pratt criteria of quality, reliability, safety and value are embodied in the Ballcentric® Plug Valve setting higher standards for dependable performance with excellent features achieved by the utilization of the very latest design and manufacturing techniques.

- Computer Aided Design
- High Integrity Casting
- CNC manufacturing delivers consistent sizes on all components

All complemented by a rigorous Quality Control System

Body

The Ballcentric® Plug Valve body casting is ASTM A536 65-45-12 ductile iron using high pressure molding techniques. Threaded connection available on 1/2"-2" sizes. Flanged connection available on 2" size.

Flange diameter, thickness and drilling conform to ANSI B16.1 Class 125.

Seat

The valve seat shall be furnished with an overlay of corrosion and abrasion resistant epoxy.

Stem Seal

High integrity sealing by combining the advantages of a resilient and abrasion resistant U-Cup seal. From vacuum to high pressure, the self-adjusting sealing system (per AWWA C504) gives positive, trouble-free service and is retained independently of the plug stem or external torque device, thereby eliminating periodic maintenance.

Bearings

The plug rotates in permanently lubricated stainless steel bearings, located in the body and bonnet, along with upper and lower PTFE thrust washers which ensure consistently low operating torque.

Plug

Supported on integral trunnions, the plug is totally encapsulated with an elastomer that is molded to the casting providing tight shut off even under vacuum conditions. High integrity corrosion-free sealing is achieved by a variety of abrasion resistant elastomers which protect the plug right up to the trunnions. When assembled, the light compression of the elastomers onto PTFE thrust washers prevents entry of abrasive materials into the bearings.

Bonnet Seal

Superior “O” ring sealing with metal/metal contact means lower bolting stresses compared with compression gaskets.

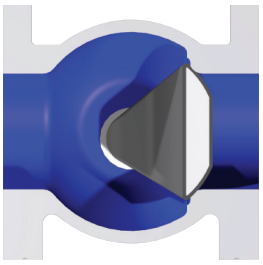
Flow

The full round port design with streamlined internal contours gives the highest industry capacity straight through flow in the full open position, reducing turbulence and pressure drop and the effect of erosive media. Handling of sludges and slurries is therefore enhanced.

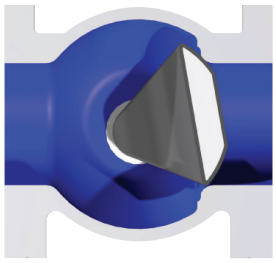
Travel Stops

Adjustable open and closed travel stops are fitted as standard on both wrench and gear operated Ballcentric® Plug Valves.

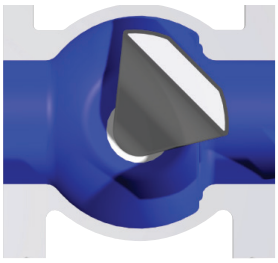
Features and Benefits



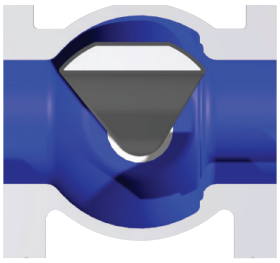
- Valve in closed position for bubble tight shut-off
- Normal flow direction gives pressure assisted sealing
- Torques are low even in reverse flow



- Plug rotates away from the seat for instant opening
- Seat wear and operating torque reduced
- No further seat contact until valve is closed again



- Design of Ballcentric® plug valve allows modulating control over the full 90˚ travel
- Ideally suited for balancing service
- Standard rotary valve provides control and tight shut off in one valve



- Plug is out of flow path when fully open
- Straight through, uninterrupted smooth flow
- Round port reduces turbulence and erosion, lowers pumping costs and can be “pigged” to clean the pipeline

Installation

The Ballcentric® Plug Valve is suitable for flow and shut-off in either direction. Seat end downstream is the preferred orientation and any reverse flow requirement should be stated at the time of order. For use on fluids with suspended solids, installation with the seat upstream and the valve stem horizontal is recommended with plug rotation to the top of the valve.

In-Line Maintenance

In the unlikely event of stem leakage, the stem seals can be easily replaced without removing the bonnet. Access to the body for cleaning or inspection does not require removal from the line.

Modular Construction

Design of the bonnet and stem allows for on-site adaption of gear operators, power actuators, or extension devices on to standard valves. Conversion can be easily undertaken without removing the valve bonnet, thereby minimizing downtime.

Power Operation

Pneumatic, electric or hydraulic operation is available, complete with accessories such as limit switches, solenoid valves and positioners when required.

ELASTOMERS AVAILABLE FOR BALLCENTRIC® PLUG VALVE

Nitrile

A general purpose material sometimes referred to as BUNA-N or HYCAR with a -20°F to 212°F temperature range. Used on sewage, water, hydrocarbon and mineral oils.

EPDM

An excellent polymer for use on chilled water through to LP steam applications having a temperature range of -35°F to 250F. Resistance to many acids, alkalies, detergents, phosphate esters, alcohols and glycols is an added benefit.

Neoprene

This versatile material shows outstanding resistance to abrasion and ozone. Chemical resistance to a wide range of petroleum base products and dilute acids and alkalies. Temperature range -20°F to 225°F.

Viton

Retention of mechanical properties at high temperature is an important feature of this elastomer: temperature range is -10°F to 300°F. It also has excellent resistance to oils, fuels, lubricants and most mineral acids and aromatic hydrocarbons.

Note: Viton not for water or steam applications.

Elastomer Selection Chart

Technical Information

Cerabar M PMC51, PMP51, PMP55

Process pressure measurement
Pressure transmitter with ceramic and metallic sensors; With analog electronics or communication via HART, PROFIBUS PA or FOUNDATION Fieldbus

Application

The Cerabar M pressure transmitter is used for the following measuring tasks:
- Absolute pressure and gauge pressure measurement in gases, steams or liquids in all areas of process engineering and process measurement technology
- Level, volume or mass measurements in liquids
- High process temperature
  - without diaphragm seals up to 130°C (266°F), for a maximum of 60 minutes 150 °C (302 °F)
  - with diaphragm seals up to 400°C (752°F)
- High pressure up to 400 bar (6000 psi)
- International usage thanks to a wide range of approvals

Your benefits

- Very good reproducibility and long-term stability
- High reference accuracy: up to ±0.15%, as PLATINUM version: ±0.075%
- Turn down up to 100:1
- End-to-end modularity for differential pressure, hydrostatics and pressure (Deltabar M – Deltapilot M – Cerabar M), e.g.
  - replaceable display
  - universal electronics
- Easy commissioning without the need for an operating tool
- Easy and safe menu-guided operation
  - on-site via display module
  - via 4 to 20 mA with HART
  - via PROFIBUS PA
  - via FOUNDATION Fieldbus
- Device versions compliant with ASME-BPE
- Used for process pressure monitoring up to SIL2, certified to IEC 61508 Edition 2.0 and IEC 61511 by TÜV NORD

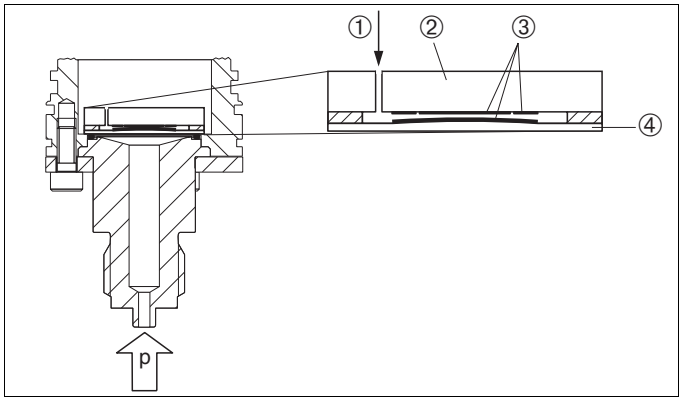
Cerabar M – Product family	**PMC51** P01-PMC51xxx-16-xx-xx-xx-000 **With capacitive measuring cell and ceramic process isolating diaphragm (Ceraphire®)**	**PMP51** P01-PMP51xxx-16-xx-xx-xx-000 **With piezoresistive measuring cell and metallic welded process isolating diaphragm**	**PMP55** P01-PMP55xxx-16-xx-xx-xx-000 **With diaphragm seal**
Field of application	– Gauge pressure and absolute pressure – Level		
Process connections	– Thread – EN flanges DN 25 – DN 80 – ANSI flanges 1" – 4" – JIS flanges 50 A – 100 A – Flush-mounted hygienic connections	– Thread – EN flanges DN 25 – DN 80 – ANSI flanges 1" – 4" – JIS flanges 25 A – 100 A – Prepared for diaphragm seal mount – Flush-mounted hygienic connections	– Wide range of diaphragm seals
Measuring ranges	From –100/0 to 100 mbar (–1.5/0 to 1.5 psi) to –1/0 to 40 bar (–15/0 to 600 psi)	From –400/0 to 400 mbar (–6/0 to 6 psi) to –1/0 to 400 bar (–15/0 to 6000 psi)	
OPL [1]	Max. 60 bar (900 psi)	Max. 600 bar (9000 psi)	
Process temperature range	–40 to +130 °C (–40 to +266°F) For a maximum of 60 minutes: +150 °C (+302 °F)	–40 to +130°C (–40 to +266°F) For a maximum of 60 minutes: +150 °C (+302 °F)	–70 to 400 °C (–94 to +752 °F) depending on the filling oil
Ambient temperature range	– Without LCD display: -40 to +85°C (–40 to +185 °F) – With LCD display: –20 to +70°C (–4 to +158°F) (extended temperature application range (-40 to 85°C (-40 to 185°F)) with restrictions in optical properties such as display speed and contrast) – Separate housing: –20 to +60°C (–4 to +140°F) – Diaphragm seal systems depending on the version		
Reference accuracy	– Up to ±0.15% of the set span – PLATINUM version: up to ±0.075% of the set span		Up to ±0.15% of the set span
Supply voltage	– 11.5 to 45 V DC (versions with plug-in connection 35 V DC) – For intrinsically safe device versions: 11.5 to 30 V DC		
Output	4 to 20 mA, 4 to 20 mA with superimposed HART protocol		
Options	– PMP51, PMP55: NACE-compliant materials – PMC51, PMP51, PMP55: inspection certificate 2.2 or 3.1 or other certificates – 3A approval and EHEDG approval – Specific firmware versions – Initial device settings – Separate housing – Broad range of accessories		
Specialties	– Metal-free measurement with PVDF connection – Special cleaning of the transmitter to remove paint-wetting substances, for use in paint shops	– Process connections with minimum oil volume – Gas-tight, elastomer-free	– Wide range of diaphragm seals – For extreme medium temperatures – Process connections with minimum oil volume – Completely welded versions

1) OPL = over pressure limit; depends on the lowest-rated element, with regard to pressure, of the selected components

Measuring principle

Ceramic process isolating diaphragm used in PMC51 (Ceraphire®)

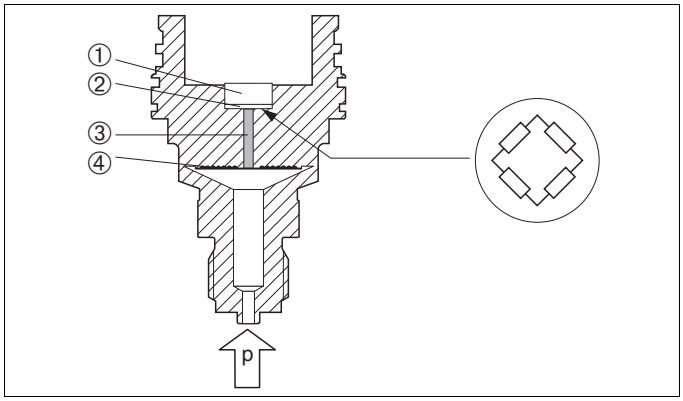


P01-PMC71xxx-03-xx-xx-xx-000

Ceramic sensor

1 Air pressure (gauge pressure sensors)
2 Ceramic substrate
3 Electrodes
4 Ceramic process isolating diaphragm

Metallic process isolating diaphragm used in PMP51 and PMP55



P01-PMP7xxxx-03-xx-xx-xx-000

Metallic sensor

1 Silicon measuring element, substrate
2 Wheatstone bridge
3 Channel with fill fluid
4 Metallic process isolating diaphragm

Ceramic process isolating diaphragm used in PMC51 (Ceraphire®)

The ceramic sensor is a dry sensor, i.e. the process pressure acts directly on the robust ceramic process isolating diaphragm and deflects it. A pressure-dependent change in capacitance is measured at the electrodes of the ceramic substrate and the process isolating diaphragm. The measuring range is determined by the thickness of the ceramic process isolating diaphragm.

Advantages:
- Guaranteed overload resistance up to 40 times the nominal pressure
- Thanks to ultrapure 99.9% ceramic (Ceraphire®, see also "www.endress.com/ceraphire")
  - extremely high chemical stability, comparable with Alloy C
  - less relaxation
  - high mechanical stability
- Can be used in absolute vacuum
- Outstanding surface finish, $R_a \leq 0.3$ µm (11.8 µin)

Metallic process isolating diaphragm used in PMP51 and PMP55

PMP51

The operating pressure deflects the process isolating diaphragm and a fill fluid transfers the pressure to a resistance bridge (semiconductor technology). The pressure-dependent change in the bridge output voltage is measured and evaluated.

Advantages:
- Can be used for process pressure up to 400 bar (6000 psi)
- High long-term stability
- Guaranteed overload resistance up to 4 times the nominal pressure
- Significantly less thermal effect compared to diaphragm seal systems

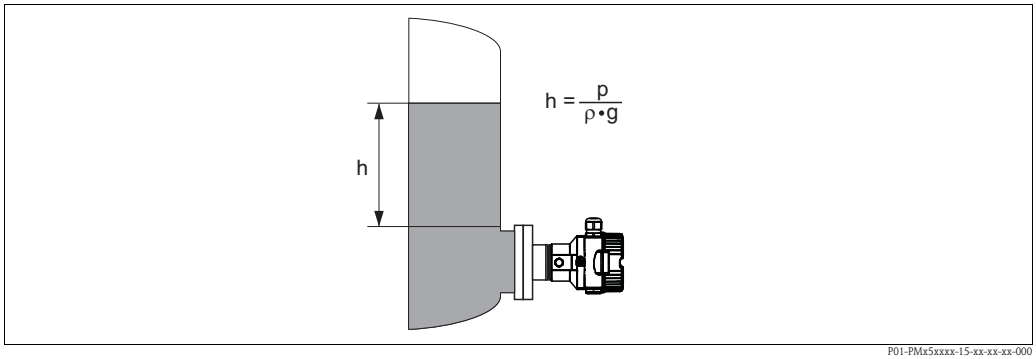
PMP55

The operating pressure acts on the process isolating diaphragm of the diaphragm seal and is transferred to the process isolating diaphragm of the sensor by a diaphragm seal fill fluid. The process isolating diaphragm is deflected and a fill fluid transfers the pressure to a resistance bridge. The pressure-dependent change in the bridge output voltage is measured and evaluated.

Advantages:
- Depending on the version, can be used for process pressure up to 400 bar (6000 psi) and simultaneous extreme process temperatures
- High long-term stability
- Guaranteed overload resistance up to 4 times the nominal pressure

Level measurement (level, volume and mass)

Function and design



P01-PMx5xxxx-15-xx-xx-xx-000

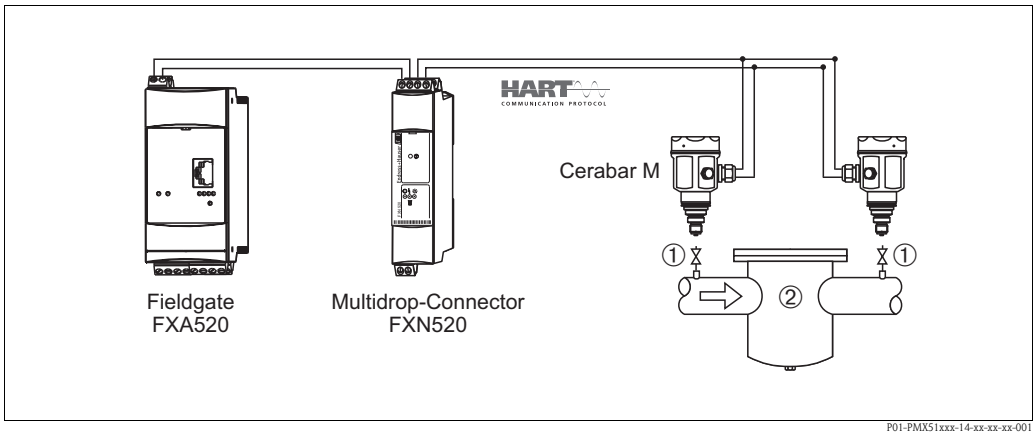
Level measurement

h *Height (level)*
p *Pressure*
ρ *Density of the medium*
g *Gravitation constant*

Your benefits

- Choice of different level measuring modes in the device software
- Volume and mass measurements in any tank shapes by means of a freely programmable characteristic curve
- Choice of diverse level units
- Has a wide range of uses, even in the following cases:
  – in the event of foam formation
  – in tanks with agitators or screen fittings
  – in the event of liquid gases

Electrical differential pressure measurement with gauge pressure sensors



P01-PMX51xxx-14-xx-xx-xx-001

1 *Shut-off valves*

2 *e.g. filter*

In the example given, two Cerabar M devices (each with a gauge pressure sensor) are interconnected. The pressure difference can thus be measured using two independent Cerabar M devices.

Caution!
If using intrinsically safe devices, strict compliance with the rules for interconnecting intrinsically safe circuits as stipulated in IEC60079-14 (proof of intrinsic safety) is mandatory.

System integration (except analog electronics)

The device can be fitted with a tag name and a preset bus address, see → 82 ff "Ordering information" feature 895 "Identification:" version "Z1" and "Z2".

Communication protocol

- 4 to 20 mA without communication protocol (analog electronics)
- 4 to 20 mA with HART communication protocol
- PROFIBUS PA
  - The Endress+Hauser devices meet the requirements of the FISCO model.
  - Due to the low current consumption of 11 mA ± 1 mA, the following number of devices can be operated on one bus segment if installing as per FISCO:
    - up to 8 Cerabar M for Ex ia, CSA IS and FM IS applications
    - up to 31 Cerabar M for all other applications, e.g. in non-hazardous areas, Ex nA, etc.

  Further information on PROFIBUS PA can be found in Operating Instructions BA00034S "PROFIBUS DP/PA: Guidelines for planning and commissioning" and in the PNO Guideline.
- FOUNDATION Fieldbus
  - The Endress+Hauser devices meet the requirements of the FISCO model.
  - Due to the low current consumption of 16 mA ± 1 mA, the following number of devices can be operated on one bus segment if installing as per FISCO:
    - up to 6 Cerabar M for Ex ia, CSA IS and FM IS applications
    - up to 22 Cerabar M for all other applications, e.g. in non-hazardous areas, Ex nA, etc.

  Further information on FOUNDATION Fieldbus, such as requirements for bus system components can be found in Operating Instructions BA00013S "FOUNDATION Fieldbus Overview".

Input

Measured variable

- Analog electronics: Absolute pressure and gauge pressure
- HART electronics: Absolute pressure and gauge pressure, from which level (level, volume or mass) is derived

Measuring range

PMC51 – with ceramic process isolating diaphragm (Ceraphire®) for gauge pressure

Nominal value	Range limit		Smallest calibratable span (preset at the factory) [1]	MWP [2]	OPL [3]	Vacuum resistance	Version in the order code [4]

1) Recommended turn down: Max 10:1.
Factory calibration turn down: Max 20:1, higher on request or configurable in the device.

2) The MWP (maximum working pressure) for the measuring device depends on the lowest-rated element, with regard to pressure, of the selected components, i.e. the process connection (→ 🖹 33 ff) has to be taken into consideration in addition to the measuring cell (→ see Table above). Pay attention to the pressure-temperature dependence also. For the appropriate standards and other information, see → 🖹 32, "Pressure specifications" section.

3) OPL: over pressure limit depends on the lowest-rated element, with regard to pressure, of the selected components

4) Version in the order code → see also → 🖹 82 ff, feature 70 "Sensor range"

PMP51 and PMP55 – metallic process isolating diaphragm for gauge pressure

400 bar (6000 psi)	0	+400 (+6000)	20 (300)	400 (6000)	600 (9000)		2W

1) Recommended turn down: Max 10:1.
Factory calibration turn down: Max 20:1, higher on request or configurable in the device.

2) The MWP (maximum working pressure) for the measuring device depends on the lowest-rated element, with regard to pressure, of the selected components, i.e. the process connection (→ 🖹 33 ff) has to be taken into consideration in addition to the measuring cell (→ see Table above). Pay attention to the pressure-temperature dependence also. For the appropriate standards and other information, see → 🖹 32, "Pressure specifications" section.

3) OPL: over pressure limit (= sensor overload limit)

4) The vacuum resistance applies to the measuring cell at reference conditions. The pressure and temperature application limits of the selected filling oil must also be observed for the PMP55. → 🖹 77, "Diaphragm seal filling oils" section.

5) Version in the order code → 🖹 82 ff, feature 70 "Sensor range"

Explanation of terms

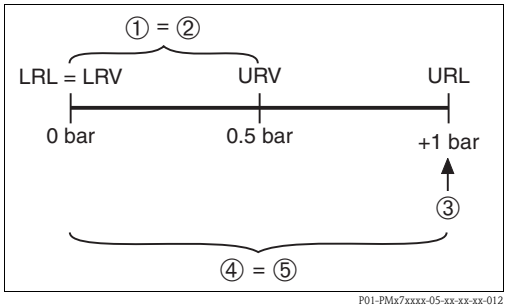
Explanation of terms: turn down (TD), set span and span based on zero point

Case 1:
- |Lower range value (LRV)| ≤ |Upper range value (URV)|

Example:
- Lower range value (LRV) = 0 bar
- Upper range value (URV) = 0.5 bar (7.5 psi)
- Nominal value (URL) = 1 bar (15 psi)

Turn down:
- TD = URL / |URV| = 2:1

Set span:
- URV – LRV = 0.5 bar (7.5 psi)
  This span is based on the zero point.



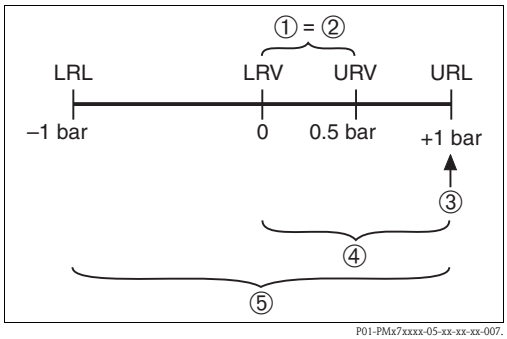
Example: 1 bar (15 psi) measuring cell

Case 2:
- |Lower range value (LRV)| ≤ |Upper range value (URV)|

Example:
- Lower range value (LRV) = 0 bar
- Upper range value (URV) = 0.5 bar (7.5 psi)
- Nominal value (URL) = 1 bar (15 psi)

Turn down:
- TD = URL / |URV| = 2:1

Set span:
- URV – LRV = 0.5 bar (7.5 psi)
  This span is based on the zero point.



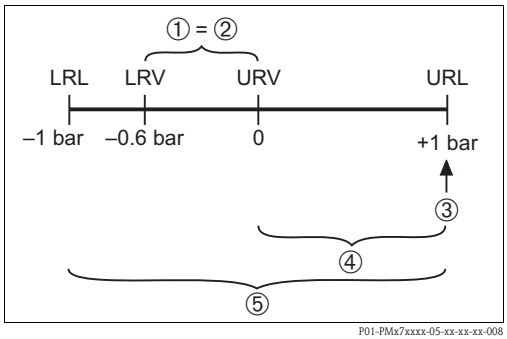
Example: 1 bar (15 psi) measuring cell

Case 3:
- |Lower range value (LRV)| ≥ |Upper range value (URV)|

Example:
- Lower range value (LRV) = –0.6 bar (–9 psi)
- Upper range value (URV) = 0 bar
- Nominal value (URL) = 1 bar (15 psi)

Turn down:
- TD = URL / |LRV| = 1.67:1

Set span:
- URV – LRV = 0.6 bar (–9 psi)
  This span is based on the zero point.



Example: 1 bar (15 psi) measuring cell

1 Set span
2 Span based on zero point
3 Nominal value ≙ upper range limit (URL)
4 Nominal measuring range
5 Sensor measuring range
LRL Lower range limit
URL Upper range limit
LRV Lower range value
URV Upper range value

Output

Output signal

- 4 to 20 mA analog, 2-wire
- 4 to 20 mA with superimposed digital communication protocol HART 6.0, 2-wire
- Digital communication signal PROFIBUS PA (Profile 3.02)
- Digital communication signal FOUNDATION Fieldbus

Signal range

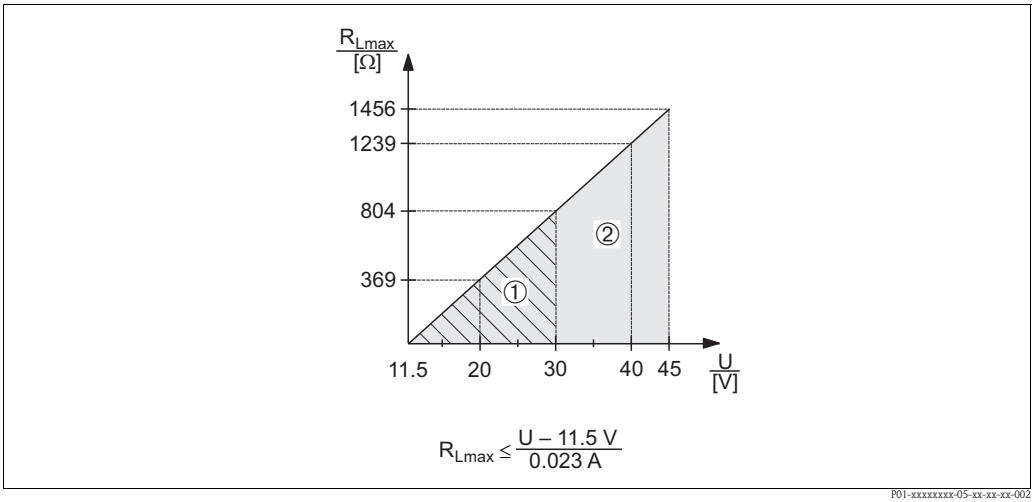
4 to 20 mA analog, 4 to 20 mA HART: 3.8 to 20.5 mA

Signal on alarm

As per NAMUR NE 43

- 4 to 20 mA Analog:
  - Signal overshoot: > 20.5 mA
  - Signal undershoot: < 3.8 mA
  - Min Alarm (3.6 mA)
- 4 to 20 mA HART
  Options:
  - Max. alarm: can be set from 21 to 23 mA (factory setting: 22 mA)
  - Hold measured value: last measured value is held
  - Min. alarm: 3.6 mA
- PROFIBUS PA: can be set in the Analog Input block,
  Options: Last Valid Out Value (factory setting), Fail-safe Value, Status Bad
- FOUNDATION Fieldbus: can be set in the Analog Input block,
  Options: Last Good Value, Fail-safe Value (factory setting), Wrong Value

Load - 4 to 20 mA analog and 4 to 20 mA HART



Load diagram

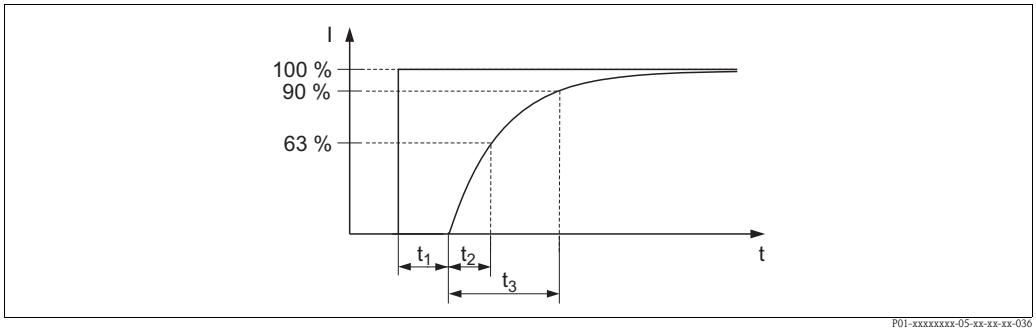
1 Power supply 11.5 to 30 V DC for intrinsically safe device versions
2 Power supply 11.5 to 45 V DC (versions with plug-in connector 35 V DC) for other types of protection and for uncertified device versions
R_{Lmax} Maximum load resistance
U Supply voltage

Note!
When operating via a handheld terminal or via a PC with an operating program, a minimum communication resistance of 250 Ω must be taken into account.

Resolution

- Current output: 1 µA
- Display HART: can be set (factory setting: presentation of the maximum accuracy of the transmitter)

Dead time, Time constant



Presentation of the dead time and the time constant

Dynamic behavior: current output (analog electronics)

	Type	Dead time (t_1) [ms]	Time constant T63 (= t_2) [ms]	Time constant T90 (= t_3) [ms]
max.	PMC51	60	40	50
max.	PMP51	40	40	50
max.	PMP55	PMP51 + influence of the diaphragm seal		

Dynamic behavior: current output (HART electronics)

	Type	Dead time (t_1) [ms]	Time constant T63 (= t_2) [ms]	Time constant T90 (= t_3) [ms]
max.	PMC51	50	85	200
max.	PMP51	70	80	185
max.	PMP55	PMP51 + influence of the diaphragm seal		

Dynamic behavior: digital output (HART electronics)

	Type	Dead time (t_1) [ms]	Dead time (t_1) [ms] + Time constant T63 (= t_2) [ms]	Dead time (t_1) [ms] + Time constant T90 (= t_3) [ms]
min.	PMC51	210	295	360
max.		1010	1095	1160
min.	PMP51	210	285	345
max.		1010	1085	1145
max.	PMP55	PMP51 + influence of the diaphragm seal		

Reading cycle

- Acyclic: max. 3/s, typical 1/s (depends on command # and number of preambles)
- Cyclic (Burst): max. 3/s, typical 2/s

The Cerabar M commands the BURST MODE function for cyclic value transmission via the HART communication protocol.

Cycle time (Update time)

Cyclic (Burst): min. 300 ms

Response time

- Acyclic: min. 330 ms, typical 590 ms (depends on command # and number of preambles)
- Cyclic (Burst): min. 160 ms, typical 350 ms (depends on command # and number of preambles)

Dynamic behavior: PROFIBUS PA

	Type	Dead time (t_1) [ms]	Dead time (t_1) [ms] + Time constant T63 (= t_2) [ms]	Dead time (t_1) [ms] + Time constant T90 (= t_3) [ms]
min.	PMC51	85	170	235
max.		1185	1270	1335
min.	PMP51	85	160	220
max.		1185	1260	1320
max.	PMP55	PMP51 + influence of the diaphragm seal		

Reading cycle

- Cyclic: max. 30/s (dependent on the number and type of function blocks used in a closed-control loop)
- Acyclic: typical 25/s

Cycle time (update time)

min. 100 ms
The cycle time in a bus segment in cyclic data communication depends on the number of devices, on the segment coupler used and on the internal PLC cycle time.

Response time

- Cyclic: approx. 8 to 13 ms (depends on Min. Slave Interval)
- Acyclic: approx. 23 to 35 ms (depends on Min. Slave Interval)

Dynamic behavior: FOUNDATION Fieldbus

	Type	Dead time (t_1) [ms]	Dead time (t_1) [ms] + Time constant T63 (= t_2) [ms]	Dead time (t_1) [ms] + Time constant T90 (= t_3) [ms]
min.	PMC51	95	180	245
max.		1095	1180	1245
min.	PMP51	95	170	230
max.		1095	1170	1230
max.	PMP55	PMP51 + influence of the diaphragm seal		

Reading cycle

- Cyclic: max. 10/s (dependent on the number and type of function blocks used in a closed-control loop)
- Acyclic: typical 5/s

Cycle time (update time)

Cyclic: min. 100 ms

Response time

- Cyclic: max. 20 ms (for standard bus parameter settings)
- Acyclic: typical 70 ms (for standard bus parameter settings)

Damping

A damping affects all outputs (output signal, display).

- Via on-site display, handheld terminal or PC with operating program, continuous from 0...999 s
- Via DIP-switch on the electronic insert, switch position "on" (= set value) and "off" (= damping switched off)
- Factory setting: 2 s

Data of the FOUNDATION Fieldbus interface

Basic data

Device Type	0x1019
Device Revision	01 (hex)
DD Revision	0x01021
CFF Revision	0x000102
ITK Version	5.2.0
ITK Certification Driver No.	IT067700
Link-Master (LAS) capable	Yes
Link Master / Basic Device selectable	Yes; Factory setting: Basic Device
Number of VCRs	44
Number of Link Objects in VFD	50
Number of FB-Schedule Objects	40

Virtual communication references (VCRs)

Permanent Entries	44
Client VCRs	0
Server VCRs	5

Min. inter PDU delay	12
Max. response delay	40

Transducer Blocks

Block	Content	Output values
TRD1 Block	Contains all parameters related to the measurement	■ Pressure or level (channel 1) ■ Process temperature (channel 2) ■ Measured pressure value (channel 3) ■ Max. pressure (channel 4) ■ Level before linearization (channel 5)
Diagnostic Block	Contains diagnostic information	Error code via DI channels (channel 10 to 15)
Display Block	Contains parameters to configure the onsite display	No output values

Function blocks

Block	Content	Number of blocks	Execution time	Functionality
Resource Block	The Resource Block contains all the data that uniquely identify the device. It is an electronic version of a nameplate of the device.	1		enhanced
Analog Input Block 1 Analog Input Block 2	The AI Block receives the measuring data from the Sensor Block, (selectable via a channel number) and makes the data available to other function blocks at its output. Enhancement: digital outputs for process alarms, fail safe mode.	2	25 ms	enhanced
Digital Input Block	This block contains the discrete data of the Diagnose Block (selectable via a channel number 10 to 15) and provides them for other blocks at the output.	1	20 ms	standard
Digital Output Block	This block converts the discrete input and thus initiates an action (selectable via a channel number) in the DP Flow Block or in the im TRD1 Block. Channel 20 resets the counter for max. pressure transgressions value and Channel 21 resets the Totalizer.	1	20 ms	standard
PID Block	The PID Block serves as a proportional-integral-derivative controller and is used almost universally for closed-loop-control in the field including cascade and feedforward. Input IN can be indicated on the display. The selection is performed in the Display Block (DISPLAY_MAIN_LINE_CONTENT).	1	40 ms	standard
Arithmetic Block	This block is designed to permit simple use of popular measurement math functions. The user does not have to know how to write equations. The math algorithm is selected by name, chosen by the user for the function to be performed.	1	35 ms	standard
Input Selector Block	The Input Selector Block facilitates the selection of up to four inputs and generates an output based on the configured action. This block normally receives its inputs from AI Blocks. The block performs maximum, minimum, average and 'first good' signal selection. Inputs IN1 to IN4 can be indicated on the display. The selection is performed in the Display Block (DISPLAY_MAIN_LINE_1_CONTENT).	1	30 ms	standard
Signal Characterizer Block	The Signal Characterizer Block has two sections, each with an output that is a non-linear function of the respective input. The non-linear function is generated by a single look-up table with 21 arbitrary x-y pairs.	1	40 ms	standard
Integrator Block	The Integrator Block integrates a variable as a function of the time or accumulates the counts from a Pulse Input Block. The block may be used as a totalizer that counts up until reset or as a batch totalizer that has a setpoint, where the integrated or accumulated value is compared to pre-trip and trip settings, generating a binary signal when the setpoint is reached.	1	35 ms	standard

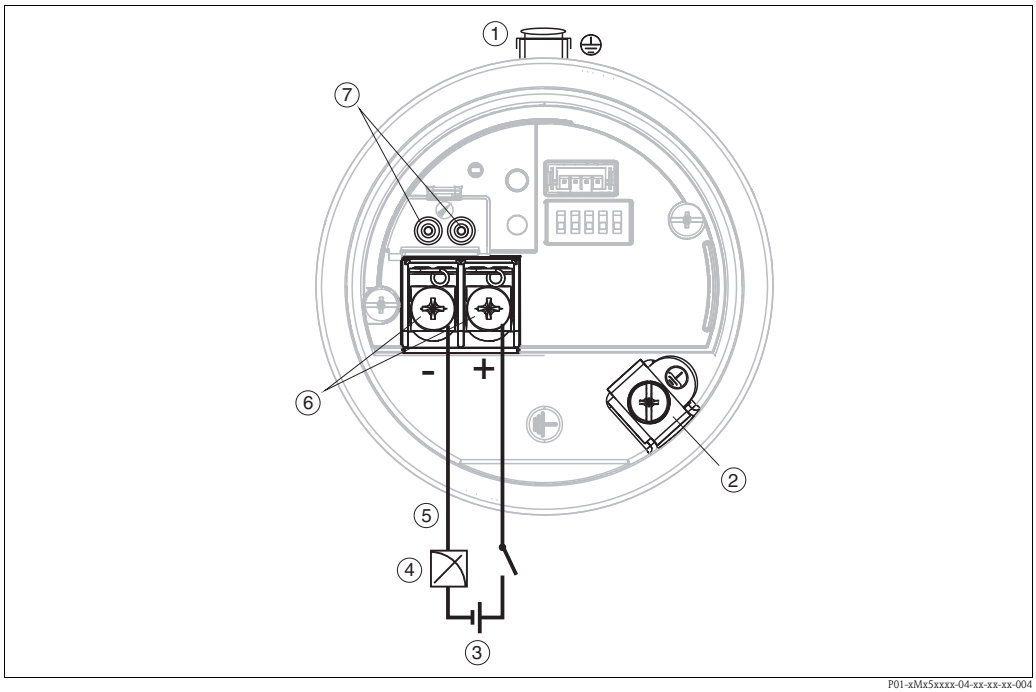
Additional function block information:

Instantiate Function Block	YES
Number of instantiate blocks	20

Power supply

Electrical connection

Note!
- When using the measuring device in hazardous areas, installation must comply with the corresponding national standards and regulations and the Safety Instructions or Installation or Control Drawings.
  → 98 ff, "Safety Instructions" and "Installation/Control Drawings" sections.
- According to IEC/EN61010 a suitable disconnector has to be installed for the device
- HART: Overvoltage protection HAW569-DA2B for the non-hazardous area, ATEX II 2 (1) Ex ia IIC and IEC Ex ia can be ordered as an option (see "Ordering information" section).
- Protective circuits against reverse polarity, HF influences and overvoltage peaks are installed.
- The digital communication signal is transmitted to the bus via a 2-wire connection. The bus also provides the power supply.



P01-xMx5xxxx-04-xx-xx-xx-004

Electrical connection

1 External grounding terminal
2 Internal grounding terminal
3 Supply voltage → 18
4 4...20 mA for HART devices
5 For HART and FOUNDATION Fieldbus devices: With a handheld terminal, all the parameters can be configured anywhere along the bus line via menu operation.
6 Terminals
7 For HART devices: test terminals, see section "Taking 4 to 20 mA test signal"

4 to 20 mA Analog, 4 to 20 mA HART

Taking 4 to 20 mA test signal

A 4 to 20 mA test signal may be measured via the test terminals without interrupting the measurement.

PROFIBUS PA

For further information on the network structure and grounding, and for further bus system components such as bus cables, see the relevant documentation, e.g. Operating Instructions BA00034S "PROFIBUS DP/PA: Guidelines for planning and commissioning" and the PNO Guideline.
Cable specifications:
Use a twisted, shielded two-wire cable, preferably cable type A

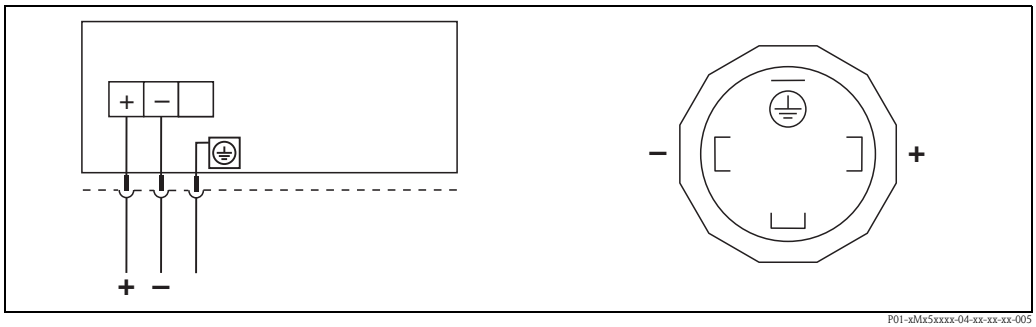
Note!
For further information on the cable specifications, see Operating Instructions BA00034S "PROFIBUS DP/PA: Guidelines for planning and commissioning", the PNO Guideline 2.092 PROFIBUS PA User and Installation Guideline" and IEC 61158-2 (MBP).

FOUNDATION Fieldbus

The digital communication signal is transmitted to the bus via a 2-wire connection. The bus also provides the power supply. For further information on the network structure and grounding and for further bus system components such as bus cables, see the relevant documentation, e.g. Operating Instructions BA00013S "FOUNDATION Fieldbus Overview" and the FOUNDATION Fieldbus Guideline.
Cable specifications:
Use a twisted, shielded two-wire cable, preferably cable type A

Note!
For further information on the cable specifications, see Operating Instructions BA00013S "FOUNDATION Fieldbus Overview", FOUNDATION Fieldbus Guideline and IEC 61158-2 (MBP).

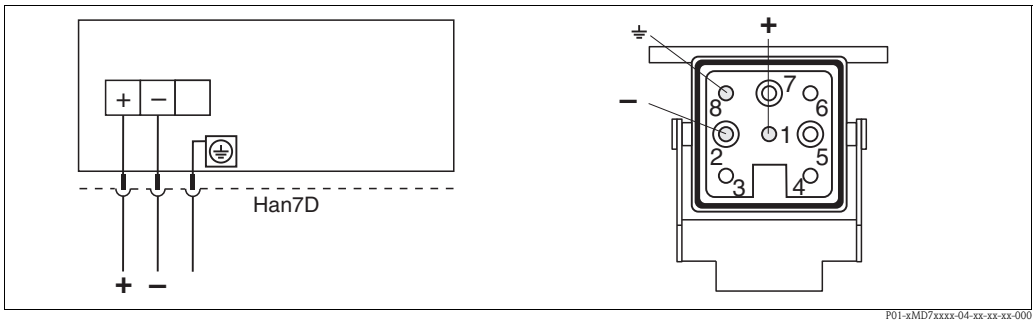
Devices with valve connector



Left: electrical connection for devices with a valve connector
Right: view of the connector at the device

Material: PA 6.6

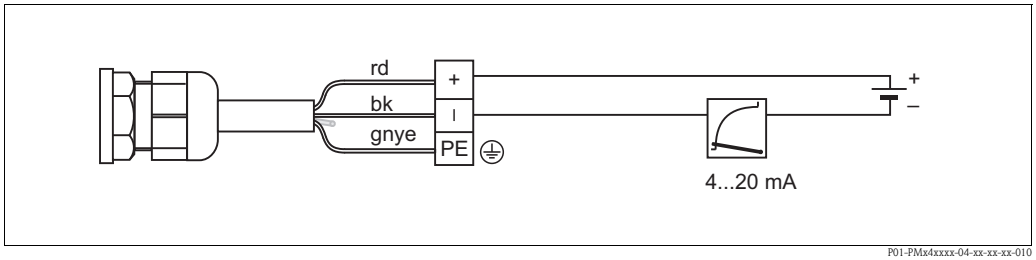
Devices with Harting plug Han7D



Left: electrical connection for devices with Harting plug Han7D
Right: view of the plug connector at the device

Material: CuZn

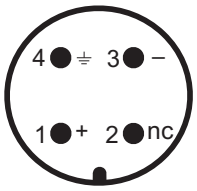
Connecting the cable version



rd = red, bk = black, gnye = green-yellow

Devices with M12 plug

PIN assignment for M12 connector



PIN	Meaning
1	Signal +
2	Not assigned
3	Signal –
4	Earth

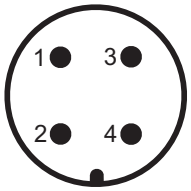
Endress+Hauser offers the following accessories for devices with an M12 plug:
Plug-in jack M 12x1, straight
- Material: body PA; coupling nut CuZn, nickel-plated
- Degree of protection (fully locked): IP66/67
- Order number: 52006263

Plug-in jack M 12x1, elbowed
- Material: body PBT/PA; coupling nut GD-Zn, nickel-plated
- Degree of protection (fully locked): IP66/67
- Order number: 71114212

Cable 4x0.34 mm² (20 AWG) with M12 socket, elbowed, screw plug, length 5 m (16 ft)
- Material: body PUR; coupling nut CuSn/Ni; cable PVC
- Degree of protection (fully locked): IP66/67
- Order number: 52010285

Devices with 7/8" plug

PIN assignment for 7/8" connector



PIN	Meaning
1	Signal –
2	Signal +
3	Shield
4	Not assigned

External thread: 7/8 - 16 UNC
- Material: housing / body CuZn, nickel-plated
- Protection: IP66/68

Cable gland

Approval	Type	Clamping area
Standard, II1/2G Exia, IS	Plastic M20x1.5	5 to 10 mm (0.2 to 0.39 in)
ATEX II1/2D, II1/2GD Exia, II3G Ex nA	Metal M20x1.5 (Ex e)	7 to 10.5 mm (0.28 to 0.41 in)

Terminals

For wire cross-sections of 0.5 to 2.5 mm² (20 to 14 AWG).

Supply voltage

Note!
- When using the measuring device in hazardous areas, installation must comply with the corresponding national standards and regulations and the Safety Instructions or Installation or Control Drawings.
- All explosion protection data are given in separate documentation which is available upon request. The Ex documentation is supplied as standard with all devices approved for use in explosion hazardous areas. → 98 ff, "Safety Instructions" and "Installation/Control Drawings" sections.

4 to 20 mA, 4 to 20 mA HART

Type of protection	Supply voltage
■ Intrinsically safe	11.5 ... 30 V DC
■ Other types of protection ■ Devices without certificate	11.5 ... 45 V DC (Versions with plug-in connection 35 V DC)

PROFIBUS PA

■ Version for non-hazardous areas: 9 to 32 V DC

FOUNDATION Fieldbus

■ Version for non-hazardous areas: 9 to 32 V DC

Start-up current HART

12 mA or 22 mA (selectable)

Current consumption

■ PROFIBUS PA: 11 mA ± 1 mA, switch-on current corresponds to IEC 61158-2, Clause 21
■ FOUNDATION Fieldbus: 16 mA ± 1 mA, switch-on current corresponds to IEC 61158-2, Clause 21

Cable entry

→ 🖹 82 ff, feature 50 "Electrical connection".

Cable specification

■ Endress+Hauser recommends using twisted, shielded two-wire cables.
■ Terminals for wire cross-sections 0.5 to 2.5 mm^2 (20 to 14 AWG)
■ Cable outer diameter: 5 to 9 mm (0.2 to 0.35 in) depends on the used cable gland (→ 🖹 18)

Residual ripple

No influence on 4 to 20 mA signal up to ± 5 % residual ripple within the permitted voltage range [according to HART hardware specification HCF_SPEC-54 (DIN IEC 60381-1)]

Influence of power supply

≤ 0.001% of URL/1 V

Performance characteristics – general

Reference operating conditions

■ As per IEC 60770
■ Ambient temperature T_A = constant, in the range of: +21 to +33°C (+70 to +91°F)
■ Humidity φ = constant, in the range of: 5 to 80 % RH
■ Ambient pressure p_A = constant, in the range of: 860 to 1060 mbar (12.47 to 15.37 psi)
■ Position of the measuring cell: constant, in range: ±1° horizontally
■ Input of LOW SENSOR TRIM and HIGH SENSOR TRIM for lower range value and upper range value
■ Span based on zero point
■ Material of the process isolating diaphragm PMC51: Al_2O_3 (aluminum-oxide ceramic, Ceraphire®)
■ Material of the process isolating diaphragm PMP51 and PMP55: AISI 316L
■ Filling oil PMP51 and PMP55: silicone oil
■ Supply voltage: 24 V DC ± 3 V DC
■ Load with HART: 250 Ω

Uncertainty of measurement for small absolute pressure ranges

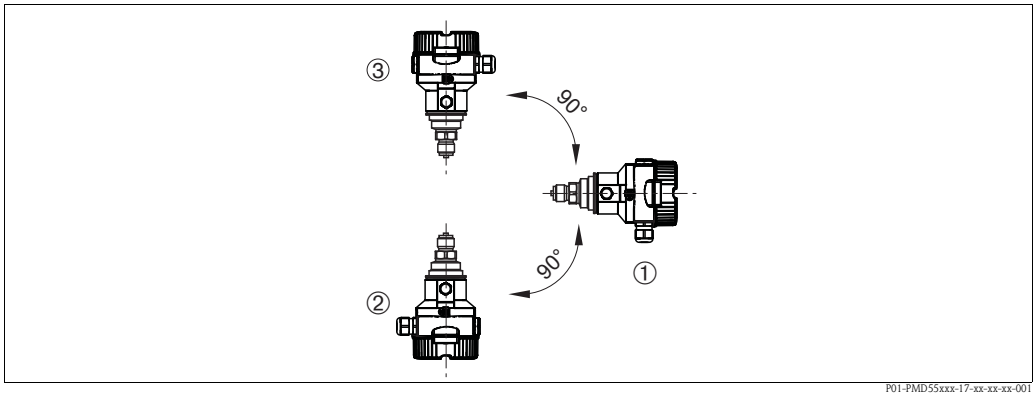
The smallest expanded uncertainty of measurement that can be returned by our standards is:
■ 0.4% of the measured value in the range of 1 to 30 mbar
■ 1% of the measured value in the range < 1 mbar.

Long-term stability

PMC51	Measuring range	Long-term stability of URL / 1 year
PMC51 with thread or flange	≤ 1 bar (15 psi)	±0.2 %
	> 1 bar (15 psi)	±0.1 %
PMC51 with hygienic process connection	≤ 1 bar (15 psi)	±0.35 %
	> 1 bar (15 psi)	±0.2 %

PMP51	Long-term stability of URL / 1 year
Measuring range	
≤ 1 bar (15 psi)	±0.25 %
> 1 bar to 10 bar (15 to 150 psi)	±0.1 %
40 bar (600 psi)	±0.1 %
100 bar (1500 psi)	±0.1 %
400 bar (6000 psi)	±0.1 %

Influence of orientation



Measuring error in mbar (psi)

	① Axis of the diaphragm perpendicular	② Diaphragm points up	③ Diaphragm points down
PMC51	Calibration position, no measuring error	< +0.2 mbar (0.003 psi)	< -0.2 mbar (0.003 psi)
PMP51 with process connections 1/2" thread and silicone oil		< +4 mbar (0.06 psi)	< -4 mbar (0.06 psi)
PMP51 with process connections > thread 1/2" and flanges		< +10 mbar (0.145 psi) This value is doubled for inert oil.	< -10 mbar (0.145 psi) This value is doubled for inert oil.

Note!
Position-dependent zero point shift can be corrected at the device. → 🖹 26, "General installation instructions" section and → 🖹 78 ff, "Installation instructions" section.

Warm-up period

- 4 to 20 mA analog: ≤1.5 s
- 4 to 20 mA HART: ≤5 s
- PROFIBUS PA: ≤8 s
- FOUNDATION Fieldbus: ≤20 s (after a TOTAL-reset ≤45 s)

Performance characteristics – ceramic process isolating diaphragm

Reference accuracy – PMC51

The reference accuracy comprises the non-linearity according to limit point setting, hysteresis and non-reproducibility as per IEC 60770. The data refer to the calibrated span.

Operating conditions (installation)

General installation instructions

- The position-dependent zero point shift can be corrected:
  – directly at the device via operating keys on the electronic insert
  – directly at the device via operating keys on the display (except analog electronics)
  – via digital communication if the cover is not open (except analog electronics)
  Note!
  In hazardous areas, comply strictly with the safety instructions when the housing cover is closed and open.
- Endress+Hauser offers a mounting bracket for installing the device on pipes or walls.
  See also → 🖹 26, "Wall and pipe mounting" section.
- Use flushing rings for flange and cell diaphragm seals if medium buildup or clogging can be expected at the diaphragm seal connection. The flushing ring can be inserted between the process connection and the diaphragm seal. Thanks to the two lateral flushing bore holes, material buildup in front of the process isolating diaphragm can be rinsed away and the pressure chamber can be ventilated.
- To guarantee the leak-tightness of the transmitter, Endress+Hauser recommends that only genuine cable glands be used (also available as spare parts).

Measuring arrangement for devices without diaphragm seal – PMC51, PMP51

Cerabar M transmitters without diaphragm seals are mounted as per the norms for a manometer (DIN EN 837-2). We recommend the use of shutoff devices and siphons. The orientation depends on the measuring application.

Pressure measurement in gases

- Mount Cerabar M with shutoff device above the tapping point so that any condensate can flow into the process.

Pressure measurement in steams

- Mount Cerabar M with siphon above the tapping point.
- Fill the siphon with liquid before commissioning.
  The siphon reduces the temperature to almost the ambient temperature.

Pressure measurement in liquids

- Mount Cerabar M with shutoff device below or at the same level as the tapping point.

Level measurement

- Mount Cerabar M below the lowest measuring point (zero point of the measurement).
- Do not mount the device at the following positions: In the filling curtain, in the tank outlet or at a point in the container which could be affected by pressure pulses from an agitator or a pump.
- The calibration and functional test can be carried out more easily if you mount the device downstream of a shutoff device.

Measuring arrangement for devices with diaphragm seal – PMP55

- → 🖹 76, "Planning instructions for diaphragm seal systems" section.

Wall and pipe mounting

For installing the device on pipes or walls, Endress+Hauser provides a mounting bracket which is included in the scope of supply or can be ordered as a separate accessory (part no. 71102216).
For the dimensions, see → 🖹 66.

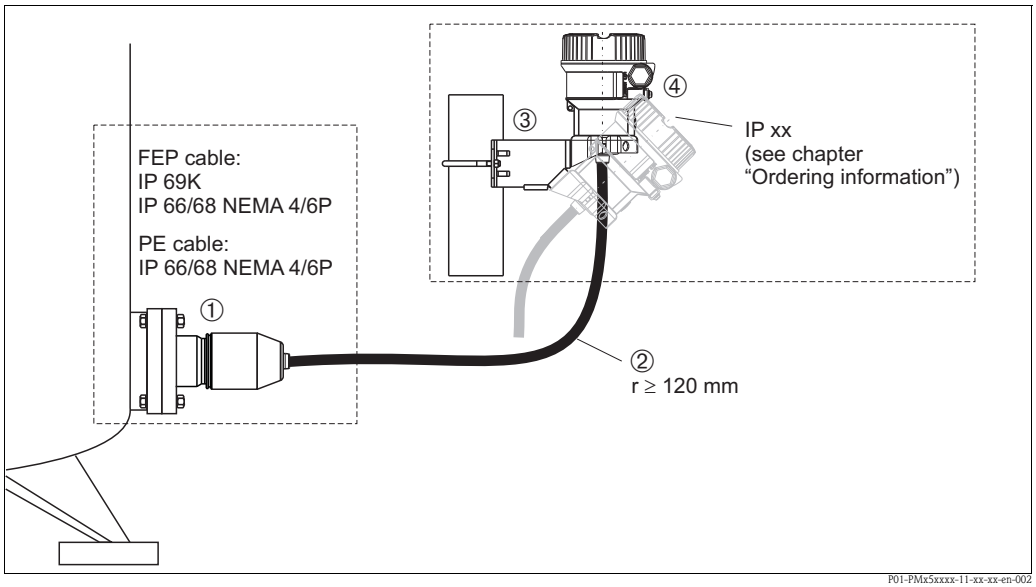
"Separate housing" version

With the "separate housing" version, you are able to mount the housing with the electronics insert at a distance from the measuring point. This version allows for trouble-free measurement:
- Under particularly difficult measuring conditions (at installation locations that are cramped or difficult to access)
- If extreme cleaning of the measuring point is required
- If the measuring point is exposed to vibrations
- For space-saving installations

You can choose between different cable versions:
- PE (2 m (6.6 ft), 5 m (16 ft) and 10 m (33 ft))
- FEP (5 m (16 ft)).

→ 82 ff, feature 600, "Separate housing".

For the dimensions, → 66.



In the case of the "separate housing" version, the sensor is delivered with the process connection and cable ready mounted. The housing and a mounting bracket are enclosed as separate units. The cable is provided with a socket at both ends. These sockets are simply connected to the housing and the sensor.

1 Process connection with sensor
2 Cable, both ends are fitted with a socket
3 Mounting bracket provided, suitable for pipe and wall mounting (for pipes from 1 1/4" up to 2" diameter)
4 Housing with electronic insert

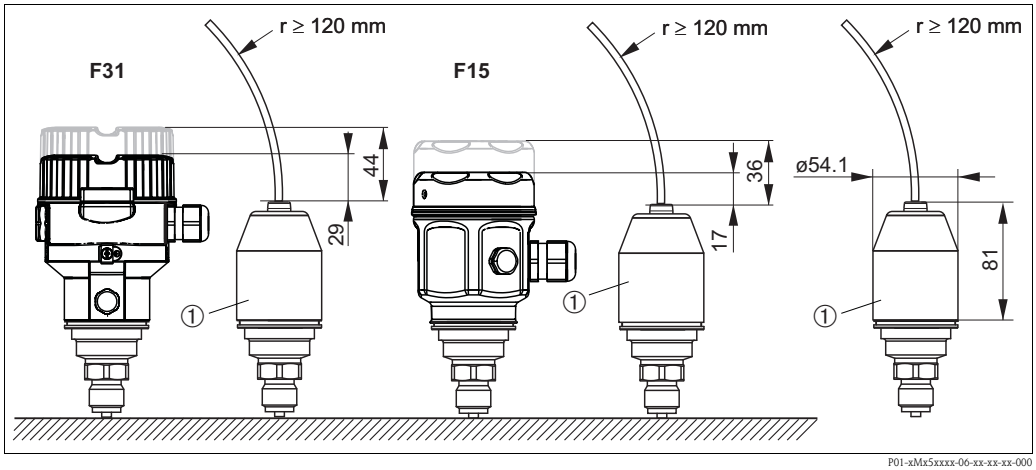
Degree of protection for the process connection and sensor with the use of
- FEP cable:
  - IP 69K
  - IP 66 NEMA 4/6P
  - IP 68 (1.83 mH_2O for 24 h) NEMA 4/6P
- PE cable:
  - IP 66 NEMA 4/6P
  - IP 68 (1.83 mH_2O for 24 h) NEMA 4/6P

Technical data of the PE and FEP cable:
- Minimum bending radius: 120 mm (4.72 in)
- Cable extraction force: max. 450 N (101 lbf)
- Resistance to UV light

Use in hazardous area:
- Intrinsically safe installations (Ex ia/IS)
- FM/CSA IS: for Div.1 installation only

Reduction in installation height

If the separate housing is used, the mounting height of the process connection is reduced compared to the dimensions of the standard version (see graphic).



Oxygen applications

Oxygen and other gases can react explosively to oils, grease and plastics. As a result, the following are some of the precautions that must be taken:
– All components of the system, such as measuring devices, must be cleaned in accordance with the BAM (DIN 19247) requirements.
– Depending on the materials used, a certain maximum temperature and maximum pressure must not be exceeded for oxygen applications.

The devices suitable for gaseous oxygen applications are listed in the following table with the specification p_{max}.

Ordering code for devices[1] cleaned for oxygen applications	**p_{max} for oxygen applications**	**T_{max} for oxygen applications**
PMC51 [2] – devices with sensors, nominal value < 10 bar (150 psi)	Over pressure limit (OPL) of sensor[3], [4]	60°C (140°F)
PMC51 [2] – devices with sensors, nominal value ≥ 10 bar (150 psi)	40 bar (600 psi)	60°C (140°F)
PMP51 PMP55 [2]	Depends on the lowest-rated element, with regard to pressure, of the selected components: over pressure limit (OPL) of sensor [3], process connection (1.5 x PN) or fill fluid (160 bar (2320 psi))	85°C (185°F)

1) Only device, not accessory or enclosed accessory

2) Feature 570 "Service" version "HB"

3) → 82 ff "Ordering information", feature 70 "Sensor range"

4) PMC51 with PVDF thread or PVDF flange p_{max} = 15 bar (225 psi)

PWIS cleaning

Special cleaning of the transmitter to remove paint-wetting substances, for use in paint shops
→ 85 feature 570 "Service", version "HC".

Ultrapure gas applications

Endress+Hauser also provides devices which have been cleaned of oil and grease for special applications, such as for ultrapure gas. No special restrictions regarding the process conditions apply to these devices.

→ 82 ff, "Ordering information PMC51", feature 570 "Service" version "HA".
→ 88 ff, "Ordering information PMP51", feature 570 "Service" version "HA".

Applications with hydrogen

With regard to materials in which hydrogen formation takes place, hydrogen atoms can diffuse through the metallic process isolating diaphragm. This can result in incorrect measurement results.
Endress+Hauser offers process isolating diaphragms with a gold/rhodium coating for such instances.

→ 87 ff "Ordering information PMP51" and
→ 92 ff "Ordering information PMP55", feature 170 "Membrane Material" version "M".

Operating conditions (environment)

Ambient temperature range

Version	PMC51	PMP51	PMP55
Without LCD display	–40°C to +85°C (–40°F to +185°F)		
With LCD display [1]	–20°C to +70°C (–4°F to +158°F)		
With M12 plug , elbowed	–25°C to +85°C (–13°F to +185°F)		
With separate housing	–20°C to +60°C (–4°F to +140°F) (installation without insulation)		—
Diaphragm seal systems	—	—	→ 🖹 76

1) Extended temperature application range (–40°C to +85°C (–40°F to +185°F)) with restrictions in optical properties such as display speed and contrast

Note!
For high-temperature applications, either a PMP55 with a temperature isolator or with a capillary can be used. If vibrations also occur in the application, Endress+Hauser recommends you use a PMP55 with a capillary. If a PMP55 with a temperature isolator or capillary is used, we recommend a suitable bracket for mounting (see "Wall and pipe mounting" section on → 🖹 26).
For devices for use in hazardous areas, see Safety Instructions, Installation or Control Drawing. (→ 🖹 98 ff, "Safety Instructions" and "Installation/Control Drawings" sections)

Storage temperature range

Version	PMC51	PMP51	PMP55
Without LCD display	–40°C to +90°C (–40°F to +194°F)		
With LCD display	–40°C to +85°C (–40°F to +185°F)		
With M12 plug , elbowed	–25°C to +85°C (—13°F to +185°F)		
With separate housing	–40°C to +60°C (–40°F to +140°F)		—
Diaphragm seal systems	—	—	→ 🖹 76

Degree of protection

- → 🖹 82 ff, feature 50 "Electrical connection".
- Separate housing (→ 🖹 27)

Climate class

Class 4K4H (air temperature: –20 to 55°C (–4 to +131°F), relative humidity: 4 to 100%) satisfied as per DIN EN 60721-3-4 (condensation possible).

Vibration resistance

Device/Additional option	Test standard	Vibration resistance
Devices without mounting bracket	GL VI-7-2 ■ Part 7: Guidelines for the Performance of Type Approvals ■ Chapter 2: Test Requirements for Electrical / Electronic Equipment and Systems	guaranteed for 5 to 25 Hz: ±1.6 mm (0.06 in); 25 to 100 Hz: 4 g in all 3 planes
	IEC 61298-3 IEC 60068-2-6	guaranteed for 10 to 60 Hz: ±0.35 mm (0.01 in); 60 to 2000 Hz: 2 g in all 3 planes
Devices with mounting bracket	IEC 61298-3 IEC 60068-2-6	guaranteed for 10 to 60 Hz: ±0.15 mm (0.01 in); 60 to 500 Hz: 2 g in all 3 planes

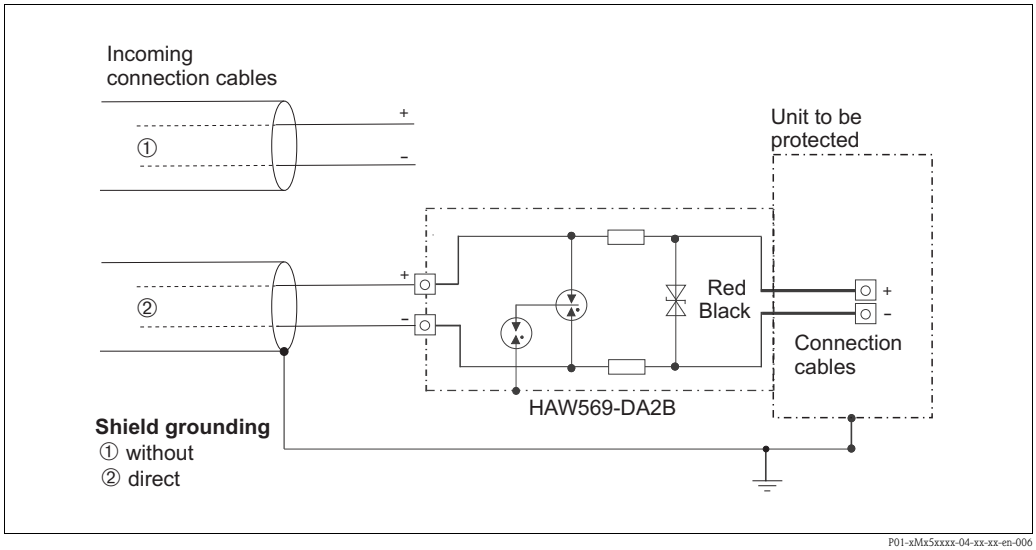
Note!
For high-vibration applications, either a PMC51/PMP51 with a separate housing or a PMP55 with a capillary can be used. We recommend a suitable bracket for mounting (see "Wall and pipe mounting" section on → 26).

Electromagnetic compatibility

- Electromagnetic compatibility as per all the relevant requirements of the EN 61326 series and NAMUR Recommendation EMC (NE21). Details can be found in the Declaration of Conformity (in the Download area of "www.de.endress.com", "search area - Approvals and Certificates", "Manufact. Declaration").
- Maximum deviation: < 0.5 % of span

Overvoltage protection (optional)

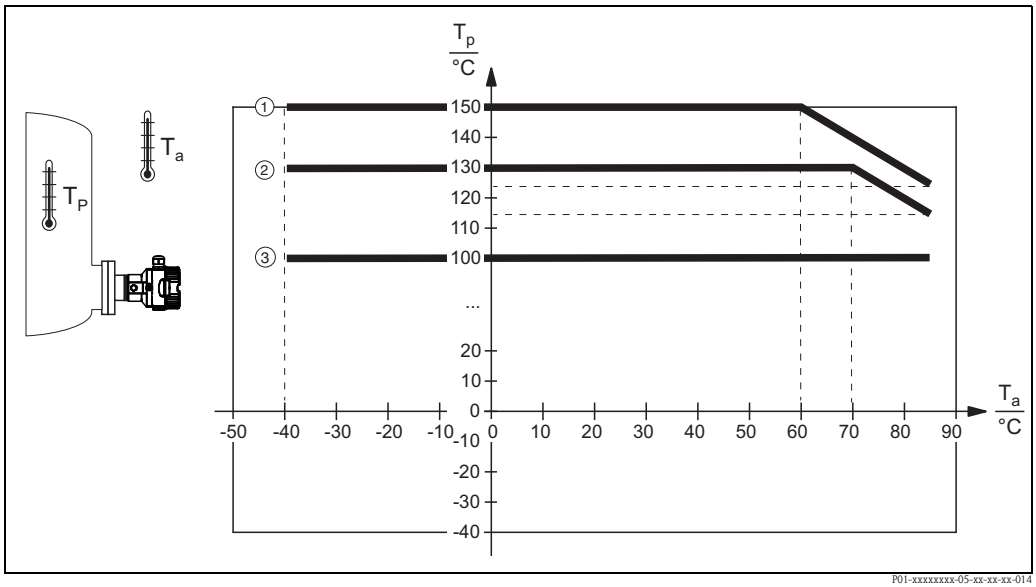
The device can be fitted with overvoltage protection, see → 82 ff "Ordering information" feature 610 "Accessory mounted:" version "NA". The overvoltage protection is mounted at the factory on the housing thread (M20x1.5) for the cable gland and is approx. 70 mm (2.76 in) in length (take additional length into account when installing). The device is connected as illustrated in the following graphic.
For details refer to TI001013KEN, XA01003KA3 and BA00304KA2.



P01-xMx5xxxx-04-xx-xx-en-006

Operating conditions (process)

Process temperature range PMC51



T_a = Ambient temperature; T_p = Process temperature; ①, ② and ③ see following chapter.

Process temperature limits

PMC51 (with ceramic process isolating diaphragm)

- ③: –40 to +100°C (–40 to +212°F) for threaded process connections or flange process connections
- ②: –40 to +130°C (–40 to +266°F) for hygienic process connections
- ①: For a maximum of 60 minutes: +150 °C (+302 °F)
- Observe the process temperature range of the seal. See also the following table.

Version for feature 190 in the order code	Seal	Notes	Process temperature range	
			Thread or flange	Hygienic process connection
A	FKM Viton	-	-20 to +100°C (-4 to +212°F)	-
A [1]	FKM Viton	cleaned for O2 application	-5 to +60°C (+23 to +140°F)	-
B	FKM Viton	FDA [2], 3A Class I, USP Class VI	-5 to +100°C (+23 to +212°F)	-5 to +150 °C (+23 to +302°F)
F	NBR	FDA [2]	-10 to +100°C (-14 to +212°F)	-
H	NBR, Low temperature	-	-40 to +100°C (-40 to +212°F)	-
G	HNBR	FDA [2], 3A Class I, KTW, AFNOR, BAM	-25 to +100°C (-13 to +212°F)	-20 to +125 °C (-4 to +257°F)
J	EPDM 70	FDA [2]	-40 to +100°C (-40 to +212°F)	-
K	EPDM 291	FDA [2], 3A Class II, USP Class VI, DVGW, KTW, W270, WRAS, ACS, NSF61	-	-15 to +150 °C (+5 to +302°F)
L	FFKM Kalrez 6375	-	+5 to +100°C (+41 to +212°F)	-
M	FFKM Kalrez 7075	-	+5 to +100°C (+41 to +212°F)	-
N	FFKM Kalrez 6221	FDA [2], USP Class VI	-5 to +100°C (+23 to +212°F)	-5 to +150 °C (+23 to +302°F)
P	Fluoroprene XP40	FDA [2], USP Class VI, 3A Class I	+5 to +100°C (+41 to +212°F)	+5 to +150 °C (+41 to +302°F)
S	VMQ Silicone	FDA [2]	-35 to +85°C (-31 to +185°F)	-20 to +85 °C (-4 to +185°F)

1) With feature 570 "Service", version "HB - Cleaned for oxygen service"

2) Suitable for foods FDA 21 CFR 177.2600

Applications with jumps in temperature

Extreme jumps in temperature can result in temporary measuring errors. Temperature compensation takes effect after several minutes. Internal temperature compensation is faster the smaller the jump in temperature and the longer the time interval involved.
For further information please contact your local Endress+Hauser Sales Center.

PMP51 (with metallic process isolating diaphragm)

Description	Temperature operating range
Process connections with internal process isolating diaphragm	-40 to +125°C (-40 to +257°F)
Process connections with flush-mounted process isolating diaphragm, G 1 A, G 1 1/2 A, G 2 A, 1 NPT, 1 1/2 NPT, 2 NPT, M 44 x 1.25, EN/DIN, ANSI and JIS flanges	-40 to +100°C (-40 to +212°F)
Process connections with flush-mounted process isolating diaphragm, G 1/2 A, M 20x1.5	-20 to +85°C (-4 to +185°F)
Hygienic process connections	–40 to +130 °C (–40 to +266 °F) For a maximum of 60 minutes: +150 °C (+302 °F)

PMP55 (with diaphragm seal)

- Depending on the diaphragm seal and filling oil from -70°C (-94°F) up to +400°C (+752°F). Observe the temperature application limits → 📄 76.

Note!
- The PTFE foil used is designed to protect the unit against abrasion. It does not provide protection against corrosive media.
- Do not use diaphragm seals with 0.25 mm (0.01 in) PTFE foil on AISI 316L (1.4435/1.4404) for vacuum applications, upper temperature limit +204 °C (+399 °F).
- For oxygen applications, observe → 📄 28, "Oxygen applications" section.

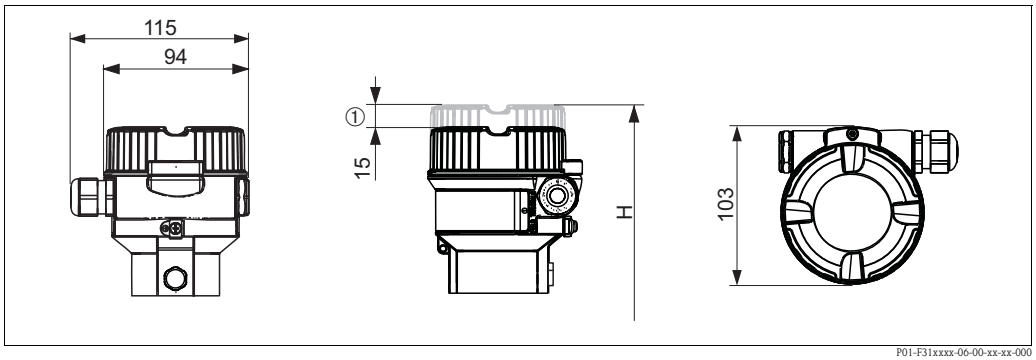
Pressure specifications

- The maximum pressure for the measuring device depends on the lowest-rated element with regard to pressure.
  See the following sections:
  – → 📄 8 ff, "Measuring range" section
  – "Mechanical construction" section.
  The MWP (maximum working pressure) is specified on the nameplate. This value refers to a reference temperature of +20°C (68°F), or 100°F (38°C) for ANSI flanges, and may be applied to the device for an unlimited time. Observe temperature dependency of the MWP.
- The pressure values permitted at higher temperatures can be found in the following standards:
  – EN 1092-1: 2001 Tab. 18 [1]
  – ASME B 16.5a – 1998 Tab. 2-2.2 F316
  – ASME B 16.5a – 1998 Tab. 2.3.8 N10276
  – JIS B 2220.
- The test pressure corresponds to the over pressure limit of the device (over pressure limit OPL = 1.5 x MWP [2]) and may be applied for only a limited time period in order to avoid permanent damage.
- The Pressure Equipment Directive (EC Directive 97/23/EC) uses the abbreviation "PS". The abbreviation "PS" corresponds to the MWP (maximum working pressure) of the measuring device.
- In the case of sensor range and process connection combinations where the OPL (over pressure limit) of the process connection is smaller than the nominal value of the sensor, the device is set at the factory, at the very maximum, to the OPL value of the process connection. If you want to use the entire sensor range, select a process connection with a higher OPL value (1.5 x PN; PN = MWP).
- In oxygen applications, the values for "p_{max} and T_{max} for oxygen applications" as per → 📄 28, "Oxygen applications" may not be exceeded.
- Avoid steam hammering! Steam hammering can cause zero point drift.
  Recommendation:
  Residue (such as condensation or drops of water) can remain at the process isolating diaphragm after CIP cleaning and lead to local steam hammering if immediately steam is introduced. In practice, drying the process isolating diaphragm (e.g. by blowing off excess moisture) has proven to be a successful way of avoiding steam hammering.

1) With regard to their stability-temperature property, the materials 1.4435 and 1.4404 are grouped together under 13EO in EN 1092-1 Tab. 18. The chemical composition of the two materials can be identical.
2) The equation does not apply for PMP51 and PMP55 with a 40 bar (600 psi) - or a 100 bar (1500 psi) - measuring cell.

Mechanical construction

F31 aluminum housing dimensions



Front view, left-hand side view, top view
① The cover with viewing window is 15 mm (0.59 in) higher than the cover without viewing window.

Process connections PMP55 (with diaphragm seal) - continued

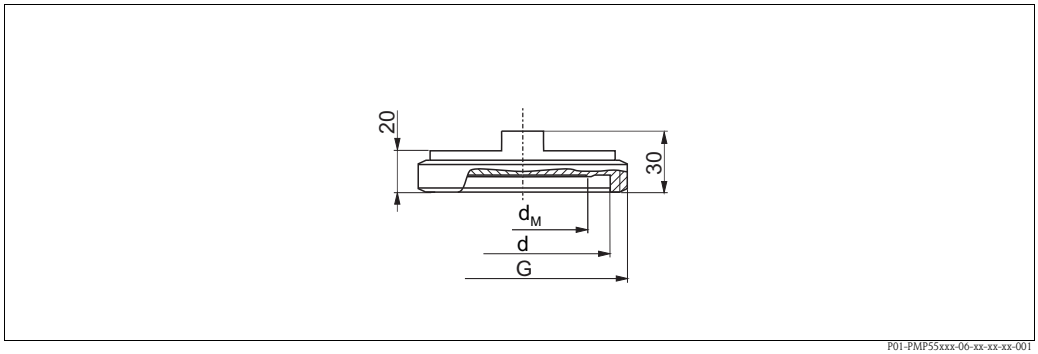
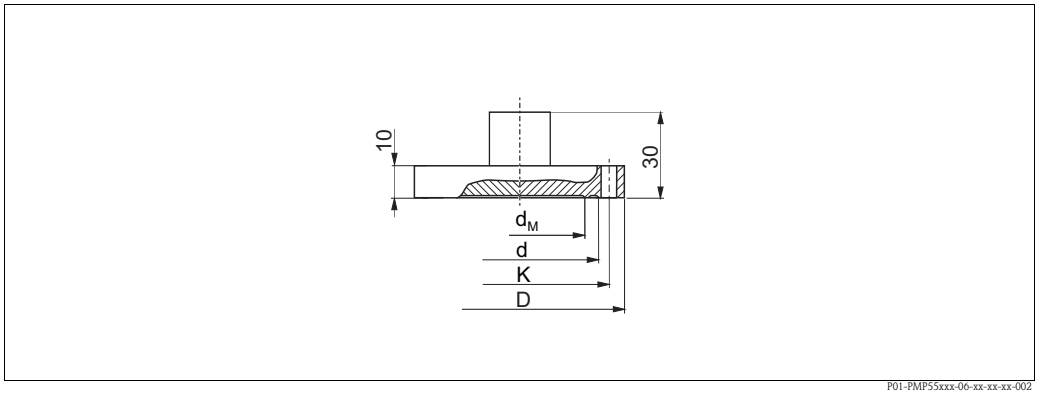
Aseptic screwed union, threaded connection, DIN 11864-1 Form A; pipe DIN 11866-A



Process connection PMP55, material AISI 316L, surface roughness of the surfaces in contact with the medium Ra ≤ 0.8 µm (31.5 µin) as standard. Lower surface roughness, see feature 570 "Service" version HK.

	Threaded adapter				Diaphragm seal	
Version	Nominal diameter	Nominal pressure	Diameter d [mm]	Thread G	Max. diaphragm diameter d_M [mm]	Weight Diaphragm seal [kg]
NCJ	DN 40	PN 16	55	Rd 65 x 1/6	35	1.5
NDJ	DN 50		67	Rd 78 x 1/6	45	2.3

Aseptic flange connection, DIN 11864-2 Form A; pipe DIN 11866-1



Process connection PMP55, material AISI 316L, surface roughness of the surfaces in contact with the medium Ra≤ 0.8 µm (31.5 µin) as standard. Lower surface roughness, see feature 570 "Service" version HK.

	Collar flange					Diaphragm seal	
Version	**Nominal diameter**	**Nominal pressure**	**Hole circle diameter** **K** [mm]	**Seal diameter** **d** [mm]	**Outer diameter** **D** [mm]	**Max. diaphragm diameter** **d_M** [mm]	**Diaphragm seal weight** [kg]

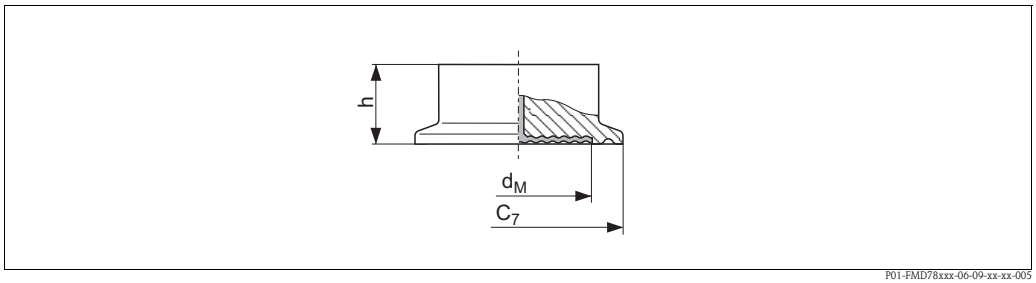
NXJ	DN 40		65	53.7	82	35	1.7
NZJ	DN 50		77	65.7	94	45	2.2

Tri-Clamp ISO 2852

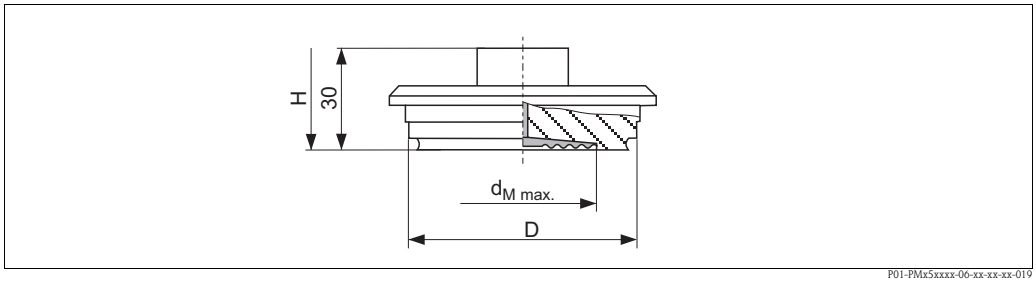


Process connection PMP55, material: AISI 316L, surface roughness of the surfaces in contact with the medium R_a≤ 0.8 µm (31.5 µin) as standard. Lower surface roughness, see feature 570 "Service" version HK.

Version	**Nominal diameter ISO 2852**	**Nominal diameter DIN 32676**	**Nominal diameter** **[in]**	**Diameter** **C_7 [mm]**	**Max. diaphragm diameter** **d_M [mm]**	**Height** **h [mm]**	**Diaphragm seal weight** **[kg]**
TCJ	DN 25	DN 25	1	50.5	24	37	0.32
TJJ [1)]	DN 38	DN 40	1 1/2	50.5	34	30	1.0
TDJ [1)]	DN 51	DN 50	2	64	48	30	1.1
TFJ	DN 76.1	–	3	91	73	30	1.2

1) Diaphragm seal versions optionally in conformity with ASME-BPE for use in biochemical processes, wetted surfaces R_a ≤ 0.38 µm (15 µin), electropolished; to be ordered using feature 570 "Service", version "HK" in the order code. In combination with the order version "electropolished", the wetted parts of the 1-½" and 2" Tri-Clamp connections are made of 316L (1.4435) with a delta-ferrite content of < 1% (welding seams excluded).

Varivent N for pipes

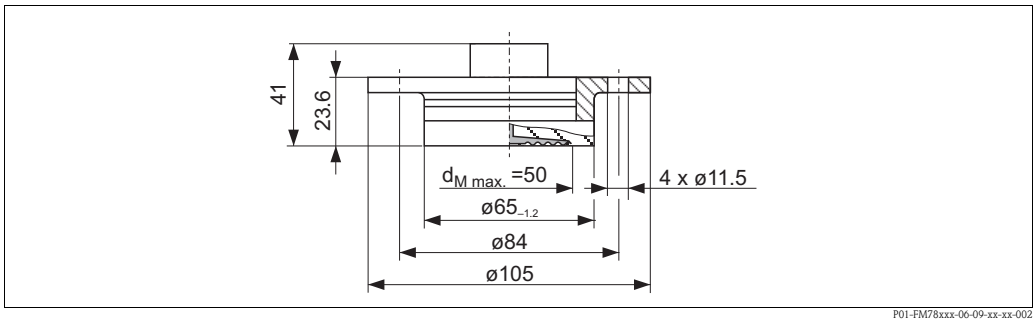


Process connection PMP55, material AISI 316, 3A, surface roughness of the surfaces in contact with the medium $R_a \leq$ 0.8 µm (31.5 µin) as standard. Lower surface roughness, see feature 570 "Service" version HK.

Version	Description	Nominal pressure [bar]	Diameter D [mm]	Max. diaphragm diameter d_M [mm]	Max. installation height H [mm]	Diaphragm seal weight [kg]
TQJ	Type F for tubes DN 25 - DN 32	PN 40	50	30	250	0.6
TRJ [1]	Type N for tubes DN 40 - DN 162		68	64		0.8

1) Diaphragm seal versions optionally in conformity with ASME-BPE for use in biochemical processes, wetted surfaces $R_a \leq$ 0.38 µm (15 µin), electropolished; to be ordered using feature 570 "Service", version "HK" in the order code. In combination with the order version "electropolished", the wetted parts of the Varivent connection are made of 316L (1.4435) with a delta-ferrite content of < 1% (welding seams excluded).

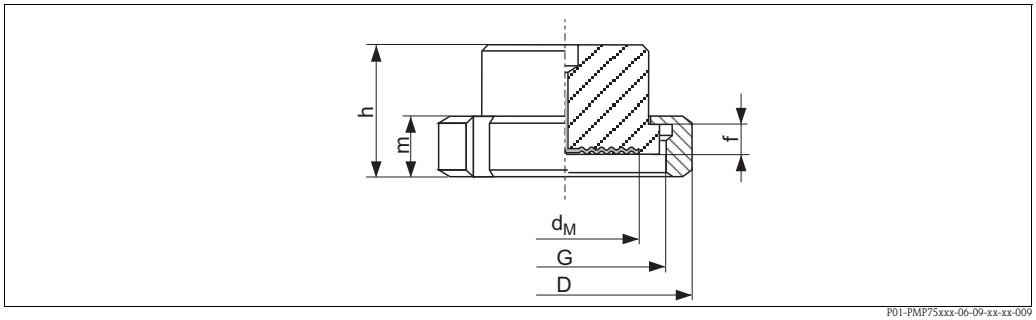
DRD DN50 (65 mm)



Process connection PMP55, surface roughness of the surfaces in contact with the medium $R_a \leq$ 0.8 µm (31.5 µin) as standard. Lower surface roughness, see feature 570 "Service" version HK.

Version	Material	Nominal pressure	Diaphragm seal weight [kg]
TIJ	AISI 316L	PN 25	0.75

SMS nozzles with coupling nut



Process connection PMP55, material AISI 316L, surface roughness of the surfaces in contact with the medium Ra≤ 0.8 µm (31.5 µin) as standard. Lower surface roughness, see feature 570 "Service" version HK.

Version	Nominal diameter	Nominal pressure	Diameter	Adapter height	Thread	Height	Height	Max. diaphragm diameter	Diaphragm seal weight
			D	f	G	m	h	d_M
