REVIEW BY STANTEC IS FOR THE SOLE PURPOSE OF ASCERTAINING GENERAL CONFORMITY WITH DESIGN. CONTRACTOR IS RESPONSIBLE FOR DIMENSIONS, FABRICATION AND CONSTRUCTION METHODS, COORDINATION OF SUB-TRADES, DETAIL DESIGN OF COMPONENTS, AND ERRORS OR OMISSIONS ON SHOP DRAWINGS.

Consultant Approval

STANTEC PROJECT #: 110126045

SUBMITTAL # DA-Veolia-PI-01-PID.Rev3

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

- ✓ Process
- ☐ Structural
- ☐ Mechanical
- ☐ Electrical
- ☐ Other

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

Stantec

EQUIPMENT

- FILTER OR FILTER–SILENCER INLET AIR
- DIFFUSER HEADER
- MIXER HORIZONTAL SURFACE
- HOSE REEL
- CLEANING BRUSH
- MIXER, INLINE STATIC
- VFD — VARIABLE FREQUENCY DRIVE
- MIXER
- MOTOR
- STOP LOG
- WEIR
- LEVEL CONTROL GATE
- COMPRESSOR, PISTON
- PROGRESSIVE CAVITY PUMP
- PUMP, CENTRIFUGAL
- PUMP, ROTARY LOBE
- PUMP, DIAPHRAGM
- PUMP, SUBMERSIBLE
- PUMP, PLUNGER
- PUMP, VERTICAL
- PUMP, GEAR
- PUMP, LINE SHAFT
- PUMP, METERING
- PUMP, METERING
- SUBMERSIBLE PROPELLER PUMP
- SLUICE GATE (NORMALLY CLOSED)
- SLUICE GATE (NORMALLY OPEN)
- WEIR GATE (NORMALLY CLOSED)
- WEIR GATE (NORMALLY OPEN)
- SLIDE GATE (NORMALLY CLOSED)
- SLIDE GATE (NORMALLY OPEN)
- GRINDER / MACERATOR
- HOIST
- SCREW PRESS
- POLYMER DOSING SYSTEM
- ROTARY DRUM THICKENER
- CONVEYOR
- BELT FILTER PRESS
- PRIMARY FILTER
- SHAFTLESS SPIRAL FINE SCREEN
- DAF

EQUIPMENT

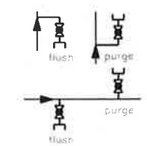
- FLAP GATE
- RECEIVER OR PRESSURE VESSEL
- SCREEN, ROTARY OVERFLOW
- TANK, DOUBLE WALLED
- SILENCER
- TANK
- POSITIVE DISPLACEMENT BLOWER
- CONDENSATE TANK
- EXPANSION JOINT (BELLOWS) — EJ EJ
- LIFTING DAVIT SOCKET

PIPE LINE DEVICES

- INJECTOR
- AIR RELEASE VALVE — ARV
- FLAME ARRESTER
- AIR VACUUM VALVE — AVV
- FLAME ARRESTER WITH THERMAL SHUTOFF VALVE
- MANUAL AIR VENT
- FLAME CHECK
- STRAINER
- TRAP — T
- STATIC MIXER
- SEDIMENT TRAP
- FOOT VALVE
- PRESSURE REDUCING ASSEMBLY — PRA
- AIR SEPARATOR
- GAS DRIP TRAP — DT
- DRAIN — D
- LIQUID SEPARATOR
- SPECTACLE BLIND
- BASKET STRAINER
- CALIBRATION CHAMBER
- RUPTURE DISK (VACUUM RELIEF)
- PULSATION DAMPENER
- RUPTURE DISK (PRESSURE RELIEF)
- SIGHT GLASS
- AIR VENT
- THERMOWELL
- STEAM VENT
- SUCTION GUIDE STRAINER
- QUICK CONNECTOR
- FLOW STRAIGHTENING VANES
- PLUG
- M — MOTORIZED CONTROL DAMPER
- CAP
- RECTANGULAR BALANCING DAMPER
- BLIND FLANGE
- REDUCER
- F — FIRE DAMPER
- FLEXIBLE CONNECTION
- AIR FILTER
- B — BACKDRAFT DAMPER
- HC — HEATING COIL
- CC — COOLING COIL
- LOUVRE
- XX — HARD PIPE UTILITY CONNECTION
- ORIFICE PLATE
- WATER SOFTENER

VALVES

- THREE WAY VALVE SOLENOID VALVE
- PUMP DISCHARGE VALVE (TRIPLE DUTY)
- GATE VALVE (NORMALLY OPEN)
- GAUGE OR ROOT VALVE
- GATE VALVE (NORMALLY CLOSED)
- KNIFE GATE VALVE
- PLUG VALVE (NORMALLY OPEN)
- BALANCING COCK
- PLUG VALVE (NORMALLY CLOSED)
- CIRCUIT BALANCING VALVE
- BALL VALVE (NORMALLY OPEN)
- THERMOSTATICALLY CONTROLLED VALVE
- BALL VALVE (NORMALLY CLOSED)
- PRESSURE AND VACUUM RELIEF VALVE
- BUTTERFLY VALVE
- VACUUM RELIEF VALVE
- CIRCULAR BALANCING DAMPER
- PRESSURE SAFETY VALVE
- GLOBE VALVE
- IN–LINE, SPRING LOADED RELIEF VALVE
- DIAPHRAGM VALVE
- MUD VALVE
- ANGLE VALVE
- SPRAY NOZZLE
- FLOAT VALVE
- CAMLOCK
- PINCH VALVE
- Y–STRAINER — ST
- PRESSURE CONTROL VALVE (EXTERNAL SENSING)
- DOUBLE CHECK VALVE BACKFLOW PREVENTER
- PRESSURE CONTROL VALVE (INTERNAL SENSING)
- VEE BALL VALVE
- BLAST GATE
- BACK PRESSURE CONTROL VALVE
- NEEDLE VALVE
- DOUBLE LEAF CHECK VALVE
- DUCKBILL VALVE
- CHECK VALVE
- DRESSER COUPLING (FLEXIBLE CONNECTION)
- BALL CHECK VALVE
- REDUCED PRESSURE BACKFLOW PREVENTER



FLUSHING/PURGE CONNECTION

SPEC1 | SPEC2 — SPEC CHANGE

VALVE ACTUATORS

- M — MOTOR ACTUATOR
- S — SOLENOID
- PNEUMATIC ACTUATOR
- DIAPHRAGM (PRESSURE BALANCE)
- DIAPHRAGM (SPRING OPPOSED)

MISCELLANEOUS DEVICES

- UTILITY STATION (NUMBER, IF ANY, DESIGNATES TYPE)
- SS — SAMPLER
- FIRE HYDRANT & VALVE
- C — CONTROL UNIT
- VAB — VACUUM BREAKER (BFP TYPE)
- P — PURGE OR FLUSHING CONNECTION

PROCESS LINES

- NEW PROCESS – PRIMARY
- NEW PROCESS – SECONDARY
- NEW PROCESS – TERTIARY
- EXISTING PROCESS
- FUTURE PROCESS
- FUTURE EQUIPMENT, ETC
- VENDOR PACKAGE BOUNDARY
- BOUNDARY MATCHLINE
- EXISTING PIPING AND EQUIPMENT TO BE REMOVED
- ENCLOSURE BOUNDARY
- INSULATION
- S OR E — INSULATION WITH STEAM OR ELECTRIC HEAT TRACE
- PIPING UNDER STRUCTURE

PROCESS AND SIGNAL CROSS REFERENCE SYSTEM

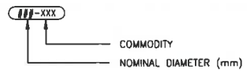
PROCESS AND MECHANICAL EQUIPMENT ABBREVIATIONS LIST

AB	AERATION BLOWER
AC	AIR COMPRESSOR
ACU	AIR CONDITIONING UNIT
AD	AIR DRYER
ADEQ	ADMINISTRATION EQUIPMENT
AF	AIR FILTER
AG	SUBMERSIBLE MIXER
AHU	AIR HANDLING UNIT
AR	AIR RECEIVER
AS	AIR SEPERATOR
ASD	ADJUSTABLE SPEED DRIVE
B	BLOWER
BFP	BELT FILTER PRESS
BFV	BUTTERFLY VALVE
BG	BLAST GATE
BIOF	BIOFILTER
BLR	BOILER
BR	BRUSH
BRM	BARMINUTOR
BV	BALL VALVE
CBD	COARSE BUBBLE DIFFUSER
CBU	COMPOST BUNKER
CC	CALIBRATION CHAMBER
CDR	CLARIFIER DRIVE
CFG	CENTRIFUGE
CFR	CHEMICAL FEEDER (POLYMER, LIME SLAKER, CHLORINATOR, ETC.)
CH	CHILLER
CLT	CLUTCH
CMP	COMPACTOR
COL	COLLECTOR
CON	CONVEYOR
COV	COVER
CP	COMPRESSOR
CPRU	CONTROLLED PRESSURIZATION UNIT
CPT	COMPACTOR
CRN	CRANE OR HOIST
CTU	COMPOST TUNNEL
CV	CONTROL VALVE
CYL	CYLINDER
DAF	DISSOLVED AIR FLOTATION CLARIFIER
DDR	DAF DRIVE
DIST	ROTARY DISTRIBUTOR
EF	EXHAUST FAN
EPR	EVAPORATOR
ENG	ENGINE
ETNK	EXPANSION TANK
F	FAN
FBD	FINE BUBBLE DIFFUSER
FCV	MODULATING CONTROL VALVE
FDR	FERMENTER DRIVE
FE	FLOW ELEMENT
FLT	FILTER
FM	FLOW METER
GBT	GRAVITY BELT THICKENER
GDR	GRINDER/MACERATOR
GV	GLOBE VALVE
HST	HOIST
HSS	HAULED SEPTAGE SCREEN
INC	INCINERATOR
INJ	INJECTOR
KV	KNIFE GATE
LAG	LAGOONS
LCP	LOCAL CONTROL PANEL
LG	LEVEL SIGHT GLASS
LVR	LOUVRE
MCP	MASTER CONTROL PANEL
ME	MECHANISM
MLWC	MIXED LIQUOR WASTING BOX
MXR	MIXER
MWA	MICROWAVE ANALYZER
MV	ON/OFF VALVE
NV	NEEDLE VALVE
ORT	ODOUR REMOVAL TOWER
P	PUMP
PAG	POLYMER AGITATOR
PDC	POWER DISTRIBUTION CENTRE
PDS	POLYMER DOSING SYSTEM
PF	PRIMARY FILTER
PFH	POLYMER FEEDER HOPPER
PLV	PLUG VALVE
PSF	POLYMER SCREW FEEDER
PRV	PRESSURE REDUCING/ REGULATING VALVE
PSV	PRESSURE/VACUUM RELIEF SAFETY VALVE
PTO	POWER TAKE OFF/REDUCER
PV	PRESSURE VESSEL
RDP	RELIEF DAMPER
RDT	ROTARY DRUM THICKENER
RF	RETURN FAN
RV	RELIEF VALVE/RUPTURE DISC (PROCESS RELIEF DAMPER)
SA	SAMPLER (STATION)
SAF	SAFETY EQUIPMENT
SCRB	SCRUBBER
SC	SPRAYED COIL
SCRN	SCREEN
SCUM	SCUM COLLECTION MECHANISM
SEP	SEPARATOR (CYCLONE, DRIP TRAP, STEAM SEPARATOR, AIR SEPARATOR)
SF	SUPPLY FAN
SG	SITE GLASS
SLR	SILENCER
SM	STATIC MIXER
SP	SCREW PRESS
SSV	SAFETY SHUT OFF VALVE
STR	STRAINER (AUTOMATIC)
SV	SOLENOID VALVE
T	TANK (NON-PRESSURIZED)
TK	HVAC TANK
UH	UNIT HEATER
US	UTILITY STATION
UV	ULTRA VIOLET LAMP BANK
V	VALVE
VAC	VACUUM CONVEYOR
VDR	VORTEX DRIVE
VFD	VARIABLE FREQUENCY DRIVE
VCC	VORTEX GRIT CHAMBER
W	WINCH
WSO	WATER SOFTENER

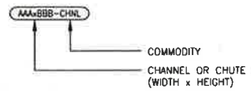
GENERAL NOTES

1. WHERE INFORMATION RELATING TO THE ORIGINAL PLANT CONDITIONS IS SHOWING ON THE DRAWINGS, IT HAS BEEN OBTAINED OR SCANNED FROM INFORMATION SUPPLIED BY OTHERS. PHASE II UPGRADES, CURRENTLY UNDER CONSTRUCTION AT THE TIME OF TENDER OF THIS PROJECT, WERE BASED ON THIS INFORMATION. NUMEROUS FIELD MODIFICATIONS WERE REQUIRED TO ACCOMMODATE INACCURATE INFORMATION ON THE ORIGINAL PLANT. AS-BUILT DRAWINGS INCORPORATING THESE MODIFICATIONS WERE NOT AVAILABLE AT THE TIME OF TENDER. CONSEQUENTLY, THE CONTRACTOR SHOULD MAKE SUFFICIENT ALLOWANCES IN THE AMOUNT OF WORK REQUIRED TO ACCOMMODATE PHASE II MODIFICATIONS.
   WHERE DIMENSIONS OR ELEVATIONS OF EXISTING FACILITIES ARE SHOWN, THEY ARE NOT INTENDED TO INDICATE PRECISE OR CURRENT CONDITIONS. ALL DIMENSIONS AND ELEVATIONS TO BE CHECKED AND CONFIRMED ON SITE BEFORE FABRICATION AND INSTALLATION OF THE EQUIPMENT.
2. THIS DRAWING IS GENERAL IN NATURE. SOME SYMBOLS SHOWN HERE MAY NOT BE USED ON THE CONTRACT DRAWINGS.
3. SEE DRAWING P602 FOR EQUIPMENT AND PIPE COMMODITY DESIGNATION SYSTEMS.
4. SEE DRAWING P603 FOR INSTRUMENTATION SYMBOLS.
5. SYMBOLS ARE ARRANGED ON DRAWINGS AND IN CATEGORIES FOR CONVENIENCE ONLY; SYMBOLS MAY BE USED ON ANY OF THE CONTRACT DRAWINGS.
6. IN PLAN VIEWS, EXISTING PIPE AND EQUIPMENT THAT MAY BE ABOVE OR BELOW SHOWS THROUGH AS FADED LINES. REFER TO SECTIONS FOR RELATIVE ELEVATION OF PLANT UPGRADE PIPE AND EQUIPMENT COMPARED TO EXISTING PIPE AND EQUIPMENT. ALL DIMENSIONS AND ELEVATIONS TO BE CHECKED AND CONFIRMED ON SITE BY THE CONTRACTOR.
7. THE ROUTING OF PIPES AND ASSOCIATED EQUIPMENT MAY BE SHOWN AS APPROXIMATE. OBTAIN ACCEPTANCE OF THE ENGINEER ON EXACT PIPE ROUTING AND EQUIPMENT LOCATIONS IN CONJUNCTION WITH PIPING ISOMETRICS, PRIOR TO INSTALLATION. SMALL DIAMETER PIPE ROUTING FOR LINES 100mm AND LESS NOT SHOWN ON PIPING LAYOUTS UNLESS OTHERWISE NOTED. REFER TO P&ID'S.
8. P&ID'S DO NOT SHOW ALL DRAIN, VENT, OR SAMPLE CONNECTIONS.
9. PROCESS STANDARD DETAILS: IN GENERAL, ALL EXTERIOR ANCHORS SHOULD BE STAINLESS STEEL. ALL INTERIOR ANCHORS CAN BE EITHER STAINLESS STEEL OR GALVANIZED EXCEPT IN THE HEADWORKS AND SLUDGE TREATMENT AND HANDLING AREAS WHERE THE ANCHORS MUST BE STAINLESS STEEL.

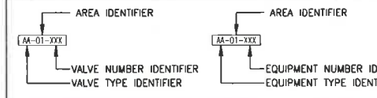
PIPE IDENTIFICATION



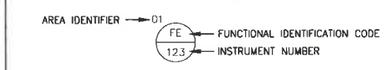
CHANNEL OR CHUTE IDENTIFICATION



VALVE / EQUIPMENT IDENTIFICATION



INSTRUMENTATION EQUIPMENT IDENTIFICATION



REFER TO DRAWING STD P02, "TYPICAL INSTRUMENT IDENTIFICATION" TABLE FOR FURTHER DETAIL.

NOTES

1. THIS DRAWING IS GENERAL IN NATURE, SOME ABBREVIATIONS SHOWN HERE MAY NOT BE USED ON THE CONTRACT DRAWINGS.
2. SEE DRAWING P00 002 FOR PROCESS EQUIPMENT LEGEND AND PIPING SYMBOLS.
3. SEE DRAWING P00 004 FOR INSTRUMENTATION SYMBOLS.

CHANNEL EQUIPMENT TYPE

BFG	BUTTERFLY GATE
CFL	CUT THROAT FLUME
CG	CHANNEL GATE
FG	FIBREGLASS GATE
FLG	FLAP GATE
FSG	FABRICATED SLIDE GATE
HPG	HAND PULL GATE
LCG	LEVEL CONTROL GATE
PBP	PERFORATED BAFFLE PLATE
PFL	PARSHALL FUME
SLG	SLUICE GATE
SL	STOP LOG
SW	STRAIGHT WEIR (USED TO CONTROL LEVELS)
TSV	TELESCOPIC GATE
WG	WEIR GATE
VW	V-NOTCH WEIR

COMMODITIES

COMMODITY ABBREVIATIONS LIST

AL	LIQUID ALUM
BLD	SCRUBBER BLOWDOWN
BSL	BOTTOM SLUDGE
CEN	CENTRATE
CIA	CITRIC ACID
CON	CONDENSATE
CPA	COMPOST PROCESS AIR
CW	COOLING WATER
DCW	DOMESTIC COLD WATER (POTABLE)
DEW	DEWATERING (UNWATERING)
DHW	DOMESTIC HOT WATER (POTABLE)
DHWR	DOMESTIC HOT WATER RETURN (POTABLE)
DPS	DEWATERED PRIMARY SLUDGE
DR	PROCESS DRAINAGE
DS	DEWATERED SLUDGE
DSC	DEWATERED SCREENINGS
DSE	DISINFECTED SECONDARY EFFLUENT
DSL	DIGESTED SLUDGE
DSUB	DAF SUBNATANT
DWS	DEWATERED SLUDGE
EW	EFFLUENT WATER
FE	FINAL EFFLUENT
FIL	FILTRATE
FOA	FOUL AIR
FPW	FIRE PROTECTION WATER
FL	FLOOR DRAIN
FSL	FERMENTER SLUDGE
FSU	FERMENTER SUPERNATANT
GLR	GLYCOL RETURN
GLS	GLYCOL SUPPLY
GR	GRIT SLURRY
HS	HAULED SEPTAGE
HSSC	HAULED SEPTAGE SCREENING
HWR	HOT WATER RETURN
HWS	HOT WATER SUPPLY
IR	INTERNAL RECYCLE
IA	INSTRUMENT AIR
LO	LUBE OIL
ML	MIXED LIQUOR
MSL	MIXED SLUDGE (WASTE ACTIVATED & PRIMARY)
NG	NATURAL GAS
NML	NITRIFIED MIXED LIQUOR
NPW	NON POTABLE WATER
NPWH	NON POTABLE WATER (HOT)
OVF	OVERFLOW
PA	PROCESS AIR
PAC	POLY ALUMINUM CHLORIDE
PE	PRIMARY EFFLUENT
PER	PERMEATE
PI	PRIMARY INFLUENT
PLY	POLYMER
PS	PRIMARY SLUDGE
PSC	PRIMARY SCUM
PW	POTABLE WATER
PWD	PROCESS WASTE DRAIN
RAS	RETURN ACTIVATED SLUDGE
REC	RECIRCULATED SCRUBBER SOLUTION
RHS	RAW HAULED SEPTAGE
RS	RAW SEWAGE
RSC	RAW SCREENINGS
SAL	SAMPLE LINE
SAN	SANITARY SEWER
SC	SECONDARY SCUM
SCR	WASHED SCREENINGS
SE	SECONDARY EFFLUENT
SI	SECONDARY INFLUENT
SHS	SODIUM HYPOCHLORITE SOLUTION
SPY	SCREENED PRIMARY SCUM
SRS	SCREENED RAW SEWAGE
ST	STORM SEWER
SWD	SUMP WASTE DRAIN
TA	TREATED AIR
TSL	THICKENED SLUDGE
TPS	THICKENED PRIMARY SLUDGE
TWAS	THICKENED WASTE ACTIVATED SLUDGE
UTA	UTILITY AIR
UFE	UTILITY FINAL EFFLUENT WATER
UWS	UTILITY SERVICE WATER
VA	VENTILATION AIR
WAS	WASTE ACTIVATED SLUDGE
WPWW	WATER PLANT WASTEWATER

GENERAL ABBREVIATIONS LIST

BOP	BOTTOM OF PIPE
BM	BENCH MARK
CB/MH	CATCH BASIN MANHOLE
C/L	CENTRE LINE
EL	ELEVATION
IP	IRON PIN
MAX	MAXIMUM
NTS	NOT TO SCALE
R 85.80	RIM ELEVATION (METRES)
T.O.S.	TOP OF STEEL OR SUPPORT
HWL	HIGH WATER LEVEL
LWL	LOW WATER LEVEL
B.C.	BEGINNING OF CURVE
C.B.	CATCH BASIN
C.B.T.	CATCH BASIN TOP
CONC	CONCRETE
E.C.	END OF CURVE
HYD	HYDRANT
INV	INVERT
MH	MANHOLE
MS	MILD STEEL
MIN	MINIMUM
R	RADIUS
SS	STAINLESS STEEL
W.M.	WATERMAIN

PLANT AREA CODES

01	INFLUENT PUMPING / PRELIMINARY TREATMENT / PRIMARY TREATMENT
02	SECONDARY TREATMENT
03	SOLIDS HANDLING
04	CHEMICAL DOSING

INSTRUMENT OPERATING FUNCTIONS

ANALYTICAL FUNCTIONS

Cl_2	CHLORINE
NH_3	AMMONIA
LEL	LOWER EXPLOSIVE LIMIT
COMB	COMBUSTIBLE GAS
H_2S	HYDROGEN SULFIDE
pH	pH
DO	DISSOLVED OXYGEN
O_2	OXYGEN
VIB	VIBRATION
SS	SUSPENDED SOLIDS (DENSITY)
CO	CARBON MONOXIDE
NO	NITRIC OXIDE
TSS	TOTAL SUSPENDED SOLIDS
NO_2	NITROGEN DIOXIDE
NO_3	NITRATE
PO_4	PHOSPHORUS

SWITCHING FUNCTIONS

HOA	HAND-OFF-AUTO SELECTION
S/S	START-STOP
OCA	OPEN-CLOSE-AUTO SELECTION
OSC	OPEN-STOP-CLOSE SELECTION
SEL	SELECTOR SWITCH
O/O	ON-OFF SELECTION
O/C	OPEN-CLOSE SELECTION
L/R	LOCAL-REMOTE SELECTION
P/R	PANEL-REMOTE SELECTION
ACK	ACKNOWLEDGE (ALARM)
FOR	FORWARD-OFF-REVERSE
LOR	LOCAL-OFF-REMOTE
ESD	EMERGENCY STOP DEVICE
OVR	INTERLOCK OVERRIDE SWITCH
FWD	FORWARD SELECTION
REV	REVERSE SELECTION

INSTRUMENT SIGNAL SYMBOLS

- INSTRUMENT SUPPLY, PROCESS TAPS
- PNEUMATIC SIGNAL
- ELECTRIC SIGNAL
- CAPILLARY TUBE OR FILLED SYSTEM
- ELECTROMAGNETIC OR SONIC SIGNAL (GUIDED)
- ELECTROMAGNETIC OR SONIC SIGNAL (UNGUIDED)
- SOFTWARE OR DATA LINK
- MECHANICAL LINK
- ETHERNET LINK

PRIMARY ELEMENT SYMBOLS

- ORIFICE PLATE
- VENTURI OR FLOW TUBE
- FLUME
- WEIR
- VARIABLE AREA FLOW INDICATOR (ROTAMETER)
- DIAPHRAGM SEAL
- IN-LINE PRESSURE SENSOR
- VORTEX FLOW SENSOR
- IN-LINE CAPACITANCE FLOW ELEMENT
- MAGNETIC FLOWMETER (M)
- PANAMETRICS FLOWMETER (P)
- SONIC FLOWMETER (DOPPLER OR TRANSIT TIME)
- POSITIVE DISPLACEMENT METER
- THERMAL MASS FLOW ELEMENT (T)
- ANNUBAR
- PITOT TUBE
- PROPELLER OR TURBINE METER
- 01 DIT — DENSITY METER
- CORIOLIS MASS FLOWMETER (C)
- FLOAT LEVEL ELEMENT
- DISPLACEMENT LEVEL ELEMENT
- BUBBLER LEVEL TUBE
- 01 LE — ULTRASONIC/MICROWAVE LEVEL ELEMENT
- 01 LE — RADIO FREQUENCY LEVEL ELEMENT
- 01 LS — VIBRATING TUNING FORK LEVEL SWITCH
- 01 TE — THERMAL SENSING RTD STRIP
- 01 LE — HYDROSTATIC PRESSURE LEVEL SENSOR

MISCELLANEOUS SYMBOLS

- HARDWIRED INTERLOCK - SEE CONTROL PHILOSOPHY FOR SOFT INTERLOCK
- R — RESET FOR LATCH-TYPE OPERATOR
- ANNUNCIATOR HORN
- GROUND
- INSTRUMENT LOOP SHIELD GROUND
- BOND
- A. DETAIL OR SECTION NUMBER
- A — SECT
- TARGET DRAWING
- SOURCE DRAWING (FIRST OCCURANCE)
- SEE DETAIL A — A. DETAIL OR SECTION NUMBER
- TARGET DRAWING
- SOURCE DRAWING (FIRST OCCURANCE)
- SP XX-YYY — SPECIALTY PRODUCT XX = AREA NUMBER YYY = TAG NUMBER
- WATER LEVEL
- MCC — MOTOR CONTROL CENTRE

LINE DESIGNATIONS

- ES — ELECTRIC POWER SUPPLY 120 VAC 60 HZ (UNLESS OTHERWISE NOTED)
- IA — INSTRUMENT QUALITY AIR SUPPLY

	PRIMARY LOCATION ***NORMALLY ACCESSIBLE TO OPERATOR	FIELD MOUNTED	AUXILIARY LOCATION ***NORMALLY ACCESSIBLE TO OPERATOR
DISCRETE INSTRUMENTS	1. * IP1**	2.	3.
SHARED DISPLAY SHARED CONTROL	4.	5.	6.
COMPUTER FUNCTION	7.	8.	9.

STANTEC PROJECT #: 110126045

SUBMITTAL # Project No. 480080

This review by Stantec is for general conformance with the design concept of Stantec's design of the:

- [x] Process
- [ ] Structural
- [ ] Mechanical
- [ ] Electrical
- [ ] Other

component(s) only and does not mean that Stantec has verified or approves the shop drawing(s). The Contractor remains solely responsible for the shop drawing(s) and this review by Stantec does not relieve the Contractor of the Contractor's responsibility for errors or omissions in the shop drawing(s) or for meeting all requirements of the contract documents. This review does not mean that Stantec approves the detailed design inherent in the shop drawing, responsibility for which shall remain with the Contractor submitting same, nor does this review mean that Stantec accepts any deviation of the shop drawing(s) from the contract documents. The Contractor is responsible for confirming all dimensions and correlating them at the job site, for all construction means, methods and techniques, and for coordination of construction work of all trades, including coordination of all shop drawings.

- [ ] NOT REVIEWED

DATE June 14, 2018

BY Alejandro Rojas, P.Eng

- Even though pneumatic actuators are still being presented in the Revision C of the shop drawing submittal, Salsnes confirmed that the valves are intended to be hydraulically operated using the same actuators as per letter that was attached to the submittal.
- Additional cost generated by inaccurate information provided by Salsnes on the air temperature requirements for the primary filter blower operation to be dealt separately with Stantec Project Management.

OVERVIEW

COMPANY BACKGROUND

Trojan Technologies is part of Danaher Corporation's environmental platform. Danaher is a Fortune 200, global science and technology leader.

Trojan Technologies encompasses six businesses: Aquafine, Trojan Marinex, TrojanUV, Salsnes Filter, US Peroxide and VIQUA. The products and services provided by these businesses play vital roles in making various stages of the water treatment process more effective, efficient and sustainable.

Aquafine Aquafine's advanced UV water treatment systems meet the changing requirements and needs of a diverse customer base around the world. They provide UV solutions for TOC reduction, chlorine and chloramine destruction, ozone destruction and disinfection for many applications in the industrial/commercial sector.	Aquafine™
Salsnes Filter Salsnes Filter's patented filter technology removes particles from municipal and industrial process water. Industries such as food, paper, cruise lines and aquaculture use the fully-automated treatment technology to treat effluent, improve the quality of influent or enhance the utilization of raw materials.	salsnes Filter™
Trojan Marinex Trojan Marinex is dedicated to the development of ballast water treatment solutions. Having direct access to decades of industry-defining water treatment expertise has enabled them to develop a suite of systems unlike any other. These systems are purpose-built for the marine environment and provide filtration + ultraviolet disinfection in a single, compact unit.	TROJAN marinex™
TrojanUV TrojanUV designs, manufactures and sells pressurized and open-channel UV disinfection systems for municipal wastewater and drinking water, and UV-oxidation systems for environmental contaminant treatment applications.	TROJAN UV™

US Peroxide US Peroxide provides performance-driven, full-service environmental treatment programs to help purify water, wastewater, soil and air. Applications include turn-key odor and corrosion control solutions for municipal wastewater and drinking water treatment; refinery, gas, oil and petrochemical wastewater applications; industrial wastewater and air quality treatment; in-situ remediation; and UV-oxidation.	USP technologies™ Solutions for a clean environment
VIQUA VIQUA is a leading water treatment technology company focused on providing customers with confidence in their water. In over 100 countries, VIQUA UV systems are disinfecting water in homes, apartment complexes, manufacturing facilities, campgrounds, resorts, hotels and hospitals.	VIQUA

Trojan Technologies continually strives to develop industry-defining technology, making a significant investment each year to ensure unparalleled discovery and development (~5.0% annual investment in R&D).

The Trojan Technologies mission statement:

We enable customers to meet their water quality objectives by providing eco-efficient solutions that reduce and recover costs, energy, resources and space.

Collaboratively solving problems with our customers, we deliver low-risk, innovative technologies that offer sustainable results.

We ensure greater water confidence and environmental stewardship for people, industries and municipalities, improving the lives of over one billion people globally.

CERTIFICATES

The certificates listed below are included on the following pages:

- ISO 9001 Certificate of Registration
- ISO 14001 Certificate of Registration
- OHSAS 18001 Certificate of Registration

bsi.

By Royal Charter

Certificate of Registration

QUALITY MANAGEMENT SYSTEM - ISO 9001:2008

This is to certify that:

Trojan Technologies
3020 Gore Road
London
Ontario
N5V 4T7
Canada

Holds Certificate No: **FM 63961**

and operates a Quality Management System which complies with the requirements of ISO 9001:2008 for the following scope:

Research, design, engineering, and manufacture of ultraviolet (UV) light technologies for wastewater, industrial, and drinking water disinfection applications, and for the destruction of pollutants in liquid streams.

For and on behalf of BSI:

Reg Blake, VP Regulatory Affairs, BSI Group America Inc.

Original Registration Date: 03/27/1998
Effective Date: 07/11/2015
Latest Revision Date: 07/01/2015
Expiry Date: 07/10/2018

...making excellence a habit.™

This certificate remains the property of BSI and shall be returned immediately upon request.
An electronic certificate can be authenticated online. Printed copies can be validated at www.bsigroup.com/ClientDirectory
To be read in conjunction with the scope above or the attached appendix.
Information and Contact: BSI, Kitemark Court, Davy Avenue, Knowlhill, Milton Keynes MK5 8PP. Tel: + 44 845 080 9000
BSI Assurance UK Limited, registered in England under number 7805321 at 389 Chiswick High Road, London W4 4AL, UK.
A Member of the BSI Group of Companies.

ENVIRONMENTAL MANAGEMENT SYSTEM - ISO 14001:2004

This is to certify that:

Trojan Technologies
3020 Gore Road
London
Ontario
N5V 4T7
Canada

Holds Certificate No: **EMS 633149**

and operates an Environmental Management System which complies with the requirements of ISO 14001:2004 for the following scope:

The environmental management system for the control of risks associated with the engineering and assembly of ultraviolet (UV) light technologies for wastewater, industrial, and drinking water disinfection applications, and for the destruction of pollutants in liquid streams.

For and on behalf of BSI:

Reg Blake, VP Regulatory Affairs, BSI Group America Inc.

Original Registration Date: 03/08/2016
Effective Date: 03/08/2016
Latest Revision Date: 03/08/2016
Expiry Date: 09/14/2018

PROJECT & SYSTEM DESCRIPTION

PROJECT DESCRIPTION

Project Name	**Iqaluit, NU**
Salsnes Project Number	**480080**
Specification Section	**46 61 23 Primary Filter**
Annual Average Flow (Current)	**38.50 L/S**
Annual Average Flow (Year 2041)	**50.30 L/S**
Maximum Month Flow (Current)	**46.20 L/S**
Maximum Month Flow (Year 2041)	**60.40 L/S**
Peak Hour Flow (Current)	**115.50 L/S**
Peak Hour Flow (Year 2041)	**151.00 L/S**
Influent TSS (Current)	**153 mg/L**
Influent TSS (Year 2041)	**200 mg/L**
Influent BOD Concentration (Current)	**153 mg/L**
Influent BOD Concentration (Year 2041)	**200 mg/L**
TSS Removal (Average)	**50%**
BOD Removal	**25%**

SYSTEM DESCRIPTION

Filter Model - SF6000	
Quantity Required Filter Outlet Configuration	
One (1)	Left Outlet / Overflow, Left Sludge Outlet
One (1)	Right Outlet / Overflow, Right Sludge Outlet
Filter Specifications	
Filter Frame Material	316L SST
Filter Weight (without Water - includes Blower)	2711 lbs /1230 kgs
Filter Weight (with Water - includes Blower)	5732 lbs / 2600 kgs
Filter Mesh Specifications	
Filter Mesh Material	Polyester
Drive Belt Material	Polyurethane with Kevlar reinforced drive ends
Drive Belt Weight	11 lbs / 5 kgs
Total Filter Mesh Area	23.7 ft^2 / 2.2 m^2
Filter Mesh Opening Size	350um
Filter Connection Information	
Inlet Flange Diameter	14 inch / 350mm ANSI
Outlet and Overflow Flange Diameter	16 inch / 400mm ANSI
Bottom Cold Water Drain Flange Connection Diameter (for sediment flush)	4 inch / 100mm ANSI
De-watering Unit Reject Water Connection Diameter	4 inch /100mm with hose coupling
Hot and Cold Water Connections	1/2 inch / 12mm NPT
Hot and Cold Water Supply Requirements	Tap Water Quality (4 - 6 bar pressure)
Volume of Hot Water Tank Recommended (Provided by others)	79.2 gal / 300L
Hot Water Temperature	185°F / 85°C (Maximum) 160°F / 70°C (Minimum)
Hot Water Usage (at 90 PSI / 6 Bar) (mesh cleaning)	8.0 gpm / 30L/min
Volume Required for Cold Water (sediment flush)	0 - 60 L/ Min
Ventilation Flange Diameter	16 inch / 400mm (Inside Diameter) (Common)
Integrated Sludge De-watering System Information	
Integrated Sludge De-watering System Quantity	One (1) press per filter unit
Integrated Sludge De-watering System Materials	Trough and Lid - 316L Stainless Steel Screw - Carbon Steel
Instrumentation Information	
Pressure Sensor Quantity	One (1) per filter unit

Filter Model - SF6000	
Pressure Sensor Material	Ceramic sensing element / ASTM A-316L Stainless Steel Housing / Vented Polyurethane insulated Cable
Control Power Panel (CPP) Information	
Quantity of Control Power Panels Required	One (1) per Filter Unit
Controller Type	Allen Bradley Compact Logix L16ER
Operator Interface Terminal (OIT) Type	Allen Bradley PanelView 700 (In Seperate Class 1 Div 2 Nema 4X Enclosure)
Network Interface	Ethernet / IP
Environmental Rating	Type 4X / IP65
Mounting	Wall Mounted
Material	Painted Mild Steel
UPS	15 Minute
Variable Frequency Drives (for Filter & Screw Rotation Motor)	Included
Electrical - Voltages	480/277V, 3 Phase, 3 Wire + Ground, 60 Hz
Maximum Distance Between Filter and Control Power Panel	115 feet / 35.0 meters
Control Power Panel Weight	132 lbs / 60 kgs
Control Panel Accreditations	UL
Blower Information	
Quantity of Blowers Required	One (1) per Filter Unit
Blower Model	Kaeser BB69C
Blower Location	Standalone from Filter Unit
Blower Motor Rating	10 hp / 197 CFM
Connected Power	12.0 kW
Rated Power	7.5 kW
Air Knife Pressure	0.32 bar (maximum 0.65 bar)
Blower Weight (with sound enclosure)	672 lbs / 305 kgs
Sludge Box and Sludge Hopper Information	
Sludge Box and Sludge Hopper Quantity	One (1) per two (2) Filter Units

Miscellaneous Equipment	
1	Operator Kit
1	Double-sided Outlet Box
1	Double-sided Sludge Box
1 Set	Anchor Bolts

Spare Parts List	
Quantity	Part Name
1	Spare Filter Mesh
2	Spare Blower Air Filter
1 Set	Spare Bearings
1 Set	Anchor Bolts

Section 1 Specifications

Specifications are subject to change without notice.

SF: 2000	
General	
Environment ambient Temperature	0ºC - 40ºC (32ºF - 104ºF)
Maximum Hydraulic Flow (clean water, filter)	144 m³/hr (0.92 MGD)
Air Knife	
Air Knife Operating Pressure	0,15 -0,25 bar (max 0,4 bar) / 2.1 -3.6 psi (max 5.8 psi)
Filter	
Weight of the filter unit: (may vary based on specific design)	690 kg (1,521 lbs)
Weight with water	1210 kg (2,660 lbs)
Sludge Auger Weight	16 kg (35 lbs)
Typical design flow rate for municipal wastewater	20 liters per second (250 mg per litre)
Water Supply Requirements	Tap Water Quality, 4-6 bar pressure (58-88 psi)
Bottom Drain Flushing Frequency	3 minutes every 24 hours (field adjustable from 1 - 60 minutes between 1 - 24 hours)
Hot and Cold water connection sizes / types	1/2 inch NPT 1/2 inch BSP
Grease	SKF LGWA 2 According to DIN 51825, code KP2N-30 (lithium based)
Control Power Panel	
Environmental	Cooling Fans, Mild Painted Steel, IP54 (Type 12) Cooling Fans, 304 SST, IP54 (Type 12) Air Conditioner, Mild Painted Steel, IP66 (Type 4) Air Conditioner, 304 SST, IP66 (Type 4X)
Cabinet Ambient Temperature Limit	Cooling Fans: 35ºC (95ºF) Air Conditioner: 40ºC (104ºF)
Panel Weight	With Cooling Fans: 60 kgs (132 lbs) With Air Conditioner: 97 kgs (214 lbs)
Electrical	480/277V 3 ph, 3 wire + gnd, 60 Hz 400/230V 3 ph, 3 wire + gnd, 50 Hz
Surge Protection	TVSS
Peak Power for filter unit	13 kVA
Distance Between Filter and Panel	35m (115 ft)

SF: 4000	
General	
Environment ambient Temperature	0ºC - 40ºC (32ºF - 104ºF)
Maximum Hydraulic Flow (clean water, filter)	288 m³/hr (1.82 MGD)
Air Knife	
Air Knife Operating Pressure	0,15 -0,25 bar (max 0,4 bar) / 2.1 -3.6 psi (max 5.8 psi)
Filter	
Weight of the filter unit: (may vary based on specific design)	1,020 kg (2,248 lbs)
Weight with water	1,910 kg (4,200 lbs)
Sludge Auger Weight	34kg (75 lbs)
Typical design flow rate for municipal wastewater	40 liters per second (250 mg per litre)
Water Supply Requirements	Tap Water Quality, 4-6 bar pressure (58-88 psi)
Bottom Drain Flushing Frequency	3 minutes every 24 hours (field adjustable from 1 - 60 minutes between 1 - 24 hours)

SF: 4000	
Hot and Cold water connection sizes / types	1/2 inch NPT 1/2 inch BSP
Grease	SKF LGWA 2 According to DIN 51825, code KP2N-30 (lithium based)
Control Power Panel	
Environmental	Cooling Fans, Mild Painted Steel, IP54 (Type 12) Cooling Fans, 304 SST, IP54 (Type 12) Air Conditioner, Mild Painted Steel, IP66 (Type 4) Air Conditioner, 304 SST, IP66 (Type 4X)
Cabinet Ambient Temperature Limit	Cooling Fans: 35ºC (95ºF) Air Conditioner: 40ºC (104ºF)
Panel Weight	With Cooling Fans: 60 kgs (132 lbs) With Air Conditioner: 97 kgs (214 lbs)
Electrical	480/277V 3 ph, 3 wire + gnd, 60 Hz 400/230V 3 ph, 3 wire + gnd, 50 Hz
Surge Protection	TVSS
Peak Power for filter unit	16.8 kVA
Distance Between Filter and Panel	35m (115 ft)

SF: 6000	
General	
Environment ambient Temperature	0ºC - 40ºC (32ºF - 104ºF)
Maximum Hydraulic Flow (clean water, filter)	576 m³/hr (3.65 MGD)
Air Knife	
Air Knife Operating Pressure	0,15 -0,25 bar (max 0,4 bar) / 2.1 -3.6 psi (max 5.8 psi)
Filter	
Weight of the filter unit: (may vary based on specific design)	1,120 kg (2,469 lbs)
Weight with water	2,450 kg (5390 lbs)
Sludge Auger Weight	53 kg (117 lbs)
Typical design flow rate for municipal wastewater	75 liters per second (250 mg per litre)
Water Supply Requirements	Tap Water Quality, 4-6 bar pressure (58-88 psi)
Bottom Drain Flushing Frequency	3 minutes every 24 hours (field adjustable from 1 - 60 minutes between 1 - 24 hours)
Hot and Cold water connection sizes / types	1/2 inch NPT 1/2 inch BSP
Grease	SKF LGWA 2 According to DIN 51825, code KP2N-30 (lithium based)
Control Power Panel	
Environmental	Cooling Fans, Mild Painted Steel, IP54 (Type 12) Cooling Fans, 304 SST, IP54 (Type 12) Air Conditioner, Mild Painted Steel, IP66 (Type 4) Air Conditioner, 304 SST, IP66 (Type 4X)
Cabinet Ambient Temperature Limit	Cooling Fans: 35ºC (95ºF) Air Conditioner: 40ºC (104ºF)
Panel Weight	With Cooling Fans: 60 kgs (132 lbs) With Air Conditioner: 97 kgs (214 lbs)
Electrical	480/277V 3 ph, 3 wire + gnd, 60 Hz 400/230V 3 ph, 3 wire + gnd, 50 Hz

SF: 6000	
Surge Protection	TVSS
Peak Power for filter unit	16.8 kVA
Distance Between Filter and Panel	35m (115 ft)

Certification	
All Models	CE and UL available

Please read this entire manual before operating this equipment. Pay attention to all danger, warning and caution statements in this manual. Failure to do so could result in serious personal injury or damage to the equipment.

Make sure that the protection provided by this equipment is not impaired. Do not use or install this equipment in any manner other than that specified in installation manual.

2.1 Use of Hazard Information

⚠ DANGER
Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.

⚠ WARNING
Indicates a potentially or imminently hazardous situation which, if not avoided, could result in death or serious injury.

⚠ CAUTION
Indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE
Indicates a situation that is not related to personal injury.

2.2 Precautionary Labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed.

	Electrical equipment marked with this symbol may not be disposed of in European public disposal systems. In conformity with European local and national regulations (EU Directive 2002/96/EC), European electrical equipment users must now return old or end-of life equipment to the Producer for disposal at no charge to the user. ***Note:*** *For recycling, please contact the equipment producer or supplier for instructions on how to return end-of-life equipment, producer-supplied electrical accessories, and all auxiliary items for proper disposal. No equipment is to be returned without authorization. Local recycling programs may be used.*
	This is the safety alert symbol. Obey all safety messages that follow this symbol to avoid potential injury. If on the instrument, refer to the instruction manual for operation or safety information.
	This symbol indicates a risk of electrical shock and/or electrocution exists.
	This symbol indicates that the marked item has stored energy. Obey procedures to wait 5 (five) minutes after disconnecting main power to allow stored energy to dissipate.
	This symbol indicates machine may start automatically without warning.
	This symbol indicates the components of the system have been exposed to biohazardous waste and / or bioaerosols.
	This symbol indicates a rotational pinch hazard.

	This symbol indicates auger entanglement and should stay clear.
	This symbol indicates a belt entanglement hazard. Stay clear of moving/rotating parts.
	This symbol indicates a body crush hazard. People should stay clear from under overhead loads.
	This symbol indicates surfaces may be slippery or there is a potential fall hazard.
	This symbol indicates surfaces may be slippery and there is a potential fall hazard.
	This symbol indicates the marked item could be hot and should not be touched without gloves.
	This symbol indicates the marked item should not be touched.
	This symbol indicates a risk of electrical shock and/or electrocution exists, and that all appropriate lockout tag out procedures must be obeyed.
	This symbol indicates a physical lock is required during operation.
	This symbol indicates to secure the device with a safety device / hook.
	This symbol indicates safety glasses with side protection must be worn as a minimum added protection.
	This symbol indicates a full face shield is required for protection against airborne aerosols.
	This symbol indicates gloves must be worn.
	This symbol indicates safety boots must be worn.
	This symbol indicates respiratory protection is required.

	This symbol indicates hearing protection is required.
	This symbol indicates a hard hat must be worn.
	This symbol indicates the operator must read all available documentation to perform the required procedures.

2.3 Safety Precautions

Read the safety precautions in this section before doing maintenance, service or repair. Obey the instructions in the safety precautions. Failure to follow the instructions in the safety precautions can result in serious injury or death.

⚠ DANGER

Automated Machinery Hazard.

Auger Entanglement and Rotational Pinch Hazard.

- Failure to follow these instructions will result in serious injury or death due to AUTO START, entanglement, or rotational pinch.
- ALWAYS stay clear. This unit may start at any time.
- ALWAYS follow lockout tag out procedures, as required by ***Operation and Maintenance Manual*** before opening lid.
- NEVER operate equipment with lid open.

  Exception: *Inspection and cleaning performed in compliance with* ***Operation and Maintenance Manual*** *by competent personnel only.*

⚠ DANGER

Arc Flash and Shock Hazard - Live Electrical Circuit Present.

Hazardous Voltage.

- Failure to follow these instructions will result in electrical shock, injury or death from electrocution.
- Equipment should be accessed by competent personnel only.
- Uninterruptible Power Supply (UPS) outputs are still live after main disconnect is off and some circuits may continue to be energized.
- Turn off UPS and disconnect plugs from UPS outputs before performing any inspection, repair, service or maintenance.
- Lockout tag out all sources of power before performing any inspection, repair, or maintenance. ***There may be more than one source of power!***

⚠ WARNING

Body Crush Hazard.

- Failure to follow these instructions could result in serious injury or death due to improper lifting procedures and under rated lifting equipment.
- Inspection, repair and maintenance must be performed by competent personnel only.
- ALWAYS secure with safety device.
- ALWAYS stay clear of elevated loads.

⚠ WARNING

Biohazard.

- Failure to follow these instructions could result in serious injury or death due to contact with biohazardous materials.
- Inspection, repair and maintenance must be performed by competent personnel only.
- ALWAYS wear safety glasses and gloves when working on or around the equipment.
- ALWAYS wear respirator when working on or around the equipment when bioaerosols are present.

⚠ CAUTION

Burn Hazard.

- Failure to follow these instructions may result in minor or moderate injury due to burns.
- NEVER touch hot surface.

NOTICE

PPE Required.

Contamination of components is expected within this application due to effluent water. The manufacturer requires operators take all necessary precautions when working around, operating, or working on this equipment.

- ALWAYS use appropriate hearing protection when in an area with airborne noise emissions, A-weighted emission sound pressure, are above 70dB(A). Hearing protection is recommended when working around an operating air blower, air conditioner, or dewatering unit.
- ALWAYS use appropriate eye, hand, and foot protection.
- ALWAYS wear a face shield when inspecting open running equipment.
- ALWAYS wear respirator and appropriate clothing including thick gloves when bioaerosols are present.
- ALWAYS wear appropriate PPE as required by applicable regulations, depending on system application and plant procedures, to protect face, hands, and body from the process liquids, solids, and aerosols.
- ALWAYS follow plant safety procedures and protocols.
- Dispose of contaminated parts/components as per country requirements.

NOTICE

Avoid Injury.

- Read and understand the ***Operation and Maintenance Manual*** before operating this equipment.
- Use personal protective equipment appropriate to work being performed as required by local regulations and ***Operation and Maintenance Manual***.

NOTICE

Only competent personnel should undertake operation, repairs, maintenance, or servicing of equipment described in this manual. Maintain the continuity of the lockout tag out between shifts. If you do not understand the information or procedure explanations in this manual, STOP and contact your Service Provider for assistance.

2.4 Safety Features

The system has safety features that prevent personal injury:

- Emergency shut off
- Keyed Lid Lock
- Disconnects

The information in this manual has been carefully checked and is believed to be accurate. However, the manufacturer assumes no responsibility for any inaccuracies that may be contained in this manual. In no event will the manufacturer be liable for direct, indirect, special, incidental or consequential damages resulting from any defect or omission in this manual, even if advised of the possibility of such damages. In the interest of continued product development, the manufacturer reserves the right to make improvements in this manual and the products it describes at any time, without notice or obligation.

3.1 System Overview

The system is used for primary filtering of municipal wastewater effluent, and for industrial applications such as the fishing industry, fish net laundry facilities, pulp and paper industry, breweries, food processing industry, textile industry, tanneries, cruise ships, etc. The different models all perform the same function, but are scaled for different volumes of water.

3.1.1 System Components

The system is designed and produced to reduce the total suspended solids and consists of the following components.

- Filter - separates liquid from solids
- Air blower - produces air for cleaning the filter mesh
- Control Power Panel (CPP) - provides power and controls to the filter. For certain installations, the functionality of the CPP will be an integrated part of the main control system for the whole plant.

21	Dewatering Unit sludge outlet (optional)	**22**	Outlet, Dewatering Unit Wastewater (optional)

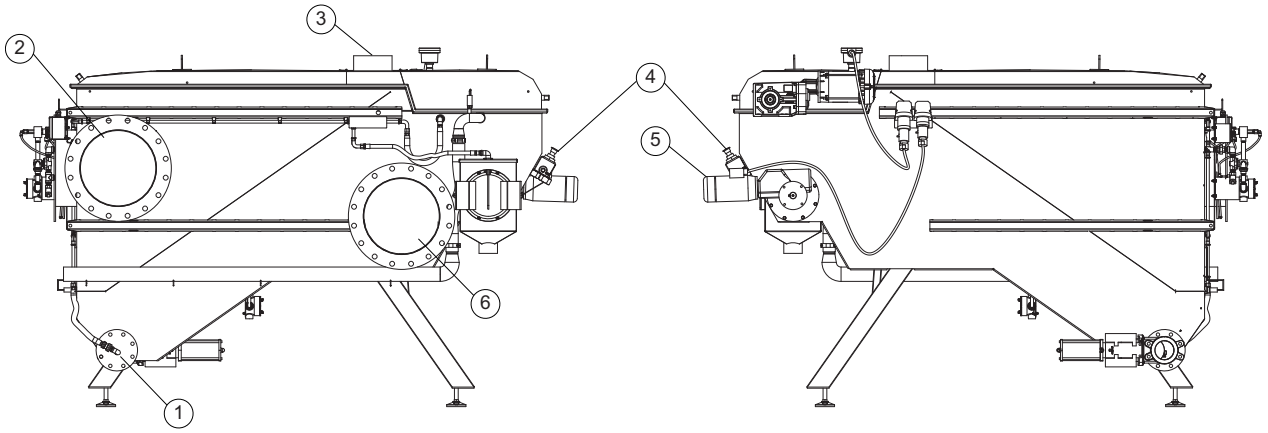

Figure 4 Filter Unit - Details

1	Cold Water Flush	**2**	Outlet
3	Vent (optional)	**4**	Emergency Stop
5	Sludge Conveyor Motor	**6**	Overflow

Filter Mesh
The filter mesh is a holed material that rotates on a belt. The solids above the filter mesh create a “filter mat”. The mat enhances separation performance as particles buildup on the mesh, creating progressively smaller holes that retain increasingly smaller particles. Water that is filtered past the mesh exits through the outlet.

Water Level Sensor
The Water Level Sensor measures the wastewater influent to a certain level allowing the filter mesh to start rotating and creating the filter mat.

Air Knife
The Air Knife is first initiated, air pressure is sensed and the filter mesh begins to rotate. Air Knife uses blower air to remove the filter mat from the filter mesh into the Sludge Conveyor compartment.

Sludge Conveyor
The Sludge Conveyor transports the filter mat out of the filter unit.

Dewatering Unit (Optional)
The Dewatering Unit is used to further reduce the moisture content from the filter mat.

Knife Gate Drain Valve
The Knife Gate Drain Valve opens to remove sediment from the filter during the flush procedure.

3.3 Control Power Panel (CPP)

The CPP houses a Programmable Logic Controller that makes this a completely automated system. A water pressure sensor tells the unit when to rotate the filter mesh (and at what speed), while the PLC simultaneously starts the Air Knife and sludge conveyor.

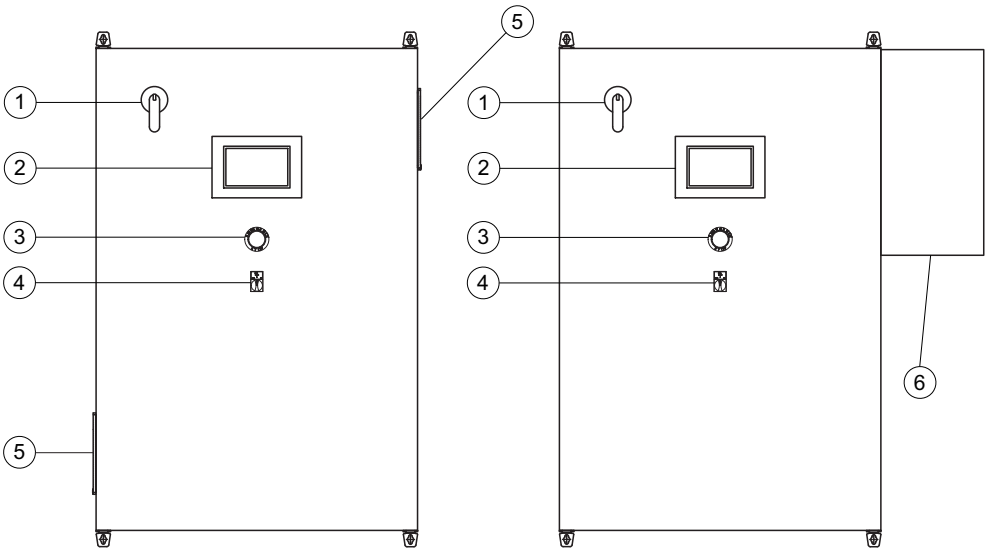

Figure 5 CPP Main Components

1	Disconnect Handle	**2**	Operator Interface Terminal (OIT)
3	Emergency Stop	**4**	Filter Mode Selector Switch
5	Cooling Fan	**6**	Air Conditioner

3.4 Air Blower

The Air Blower works with the Air Knife on the filter unit to clean the filter mesh.

3.5 Acceptable Noise Levels

NOTICE

Hearing protection is recommended when working around an operating air blower, air conditioner, or dewatering unit. Follow plant procedures.

The airborne noise emissions, A-weighted emission sound pressure level is above 70 dB(A) and less than 85 dB(A).

3.6 Patents and Permissions

The system in this manual may be protected by one or more patents in Norway and/or other countries. For a list of patents owned by Salsnes Filter®, go to www.trojantechnologies.com/patents.

No part of this publication may be reproduced, stored in a retrieval system, or transmitted in any form or by any means without written permission of Salsnes Filter®.

3.7 Abbreviations and Acronyms

Table 1 describes the abbreviations and acronyms included in this manual.

Table 1 Abbreviations and Acronyms

Abbreviation/Acronyms	Description
CPP	Control Power Panel
D gain	Derivative gain
HMI	Human Machine Interface
I gain	Integral gain
OIT	Operator Interface Terminal
P gain	Proportional gain
P mode	Proportional mode
PID mode	Proportional Integral Derivative mode
PLC	Programmable Logic Controller
PPE	Personal Protection Equipment
UPS	Uninterrupted Power Supply
VFD	Variable Frequency Drive

⚠ DANGER

Obey all warning and caution statements. Refer to Section 2.

Read and understand this Operation and Maintenance Manual before operating this equipment. Read all user documentation before performing operations, inspections, repair, or maintenance on this equipment.

Only competent personnel should undertake operation, repairs, maintenance, or servicing of equipment described in this section of the manual. If you do not understand the information or procedure explanations in this manual, STOP and contact your Service Provider for assistance.

The parameter values of the control system are set by the manufacturer. These values can be modified according to the current plant conditions in order to achieve optimized operations. These parameters are adjusted on the OIT. Refer to Table 2.

The water flush is set to operate in intervals and for a preset time. Depending on the fat/grease content in the wastewater, which tends to clog the filter mesh, flush interval is adjusted.

The dewatering sludge auger is controlled by a variable frequency drive and is run at a fixed speed depending on the application requirements. It is important that the conveyor screw runs for a certain time after the filter mesh is stopped to empty the tray.

4.1 Overview of Sequence and Principle

The system is controlled by the Control Power Panel (CPP).

1. Raw wastewater enters the system through the inlet.
2. The filter mesh filters the raw wastewater. Filtered water then flows through the outlet.
3. The sludge accumulated on the filter mesh is removed by the air knife device into the sludge outlet.
4. Sludge is transferred by auger through an (optional) dewatering unit.
5. Sludge is then transferred to a sludge collection system (sludge transfer system not supplied).

4.2 Basic Setup Data

The following setup parameters are valid for all units as shown in Table 2.

The CPP supplied has all the default values pre-programmed.

Water levels have the outlet threshold as a reference point zero (0) (Refer to Table 2). A ruler is mounted on the sidewall of the unit to read the actual levels above or below the 0 level.

Table 2 Water levels

	Level pressure transmitter (bottom of level sensor referencing outlet threshold as zero)	Water level - Start (initial value)	Max drive speed level** (initial value)	Water level - Stop (initial value)	Water level - Overflow
SF: 2000	- 45 mm (-1.8 in)	140 mm (5.9 in)	260 mm (10.2 in)	100 mm (3.9 in)	300 mm (11.8 in)
SF: 4000	- 145 mm (- 5.7 in)	160 mm (6.3 in)	280 mm (11.0 in)	120 mm (4.7 in)	320 mm (12.6 in)
SF: 6000	- 145 mm (-5.7 in)	165 mm (6.5 in)	290 mm (11.4 in)	125 mm (4.9 in)	345 mm (13.5 in)

** The motor has reached 60 Hz at this water level. For example, SF: 2000 water level 130mm above 0 will mean the motor is at 50% or 30 Hz.

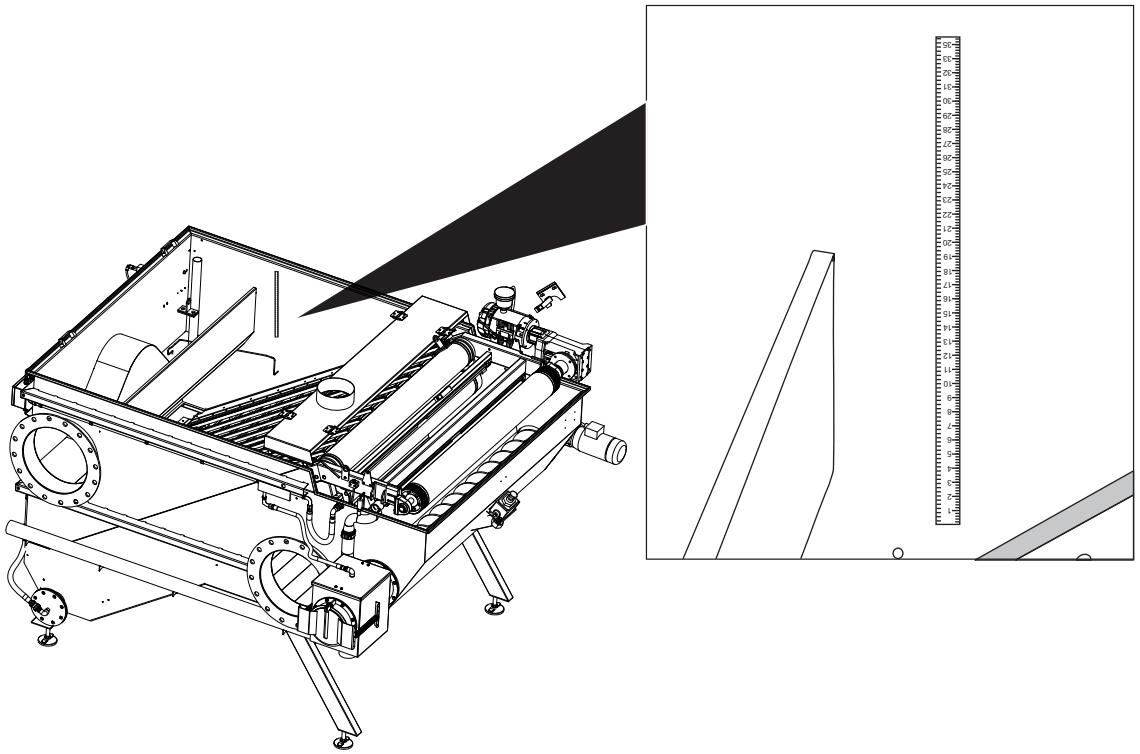

Figure 6 Ruler for Level Measurement

4.3 Switches and Indicators

The following control switches and indicators are needed in the control system for operation of the system. The Filter Mode Selector Switch can be found on the CPP. Refer to Figure 5.

Switch/Indicator	Functions	Description
Filter Mode Selector Switch	Local	Allows filter to run at last pre-set settings. Settings can be adjusted on variable frequency drives.
	Off	Turns system off.
	OIT Mode	Controlled from the Control Power Panel OIT screen.

4.4 Control Modes

The system can run in the following types of Control Modes:

Automatic Control Mode

This mode is used for normal operation, where the filter mesh, sludge auger and water flushing is automatic.

In this mode, the water level sensor provides the inputs to the PLC which are used to control the speed of the filter mesh. The PLC controls the filter mesh, air blower, sludge auger and water flushing. Refer to Table 2 for initial water level settings.

Manual Control Mode

This mode is used for maintenance, test and service purposes of:

- Air Blower Control
- Motor Control
- Valve Control

Local Control Mode

In this mode, the filter mesh and sludge auger both run at the manually entered device speed. The air blower will run continuously. The flush valves and drain valves will not operate.

Off Mode

In this mode, no devices are able to run.

4.5 Navigate Operator Interface Terminal

The OIT on the CPP uses touchscreen technology. Do not use the writing tips of pens or pencils or other sharp objects to make selections on the screen. Use only a clean, dry fingertip or the eraser tip of a pencil.

4.5.1 System Settings

The configuration settings for the system are accessed, reviewed or changed through the System Settings Screens. Push the numeric entry box, enter the value, then push ENTER. Use the pop-up numeric touch pad to enter the desired value.

4.5.1.1 Login Screen

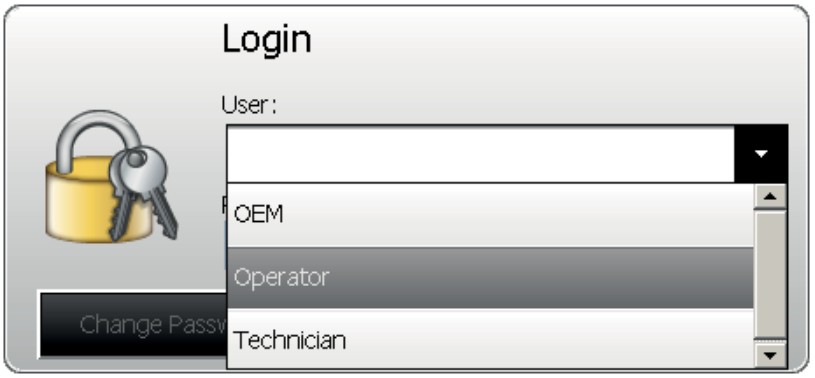

Figure 7 Login Screen

Table 3 Passwords

User	Password
OEM	Access used by Manufacturer only
Technician	Contact your Service Provider
Operator	3333

4.6 Control Power Panel Operation

The CPP contains the control program for the Filter system. The CPP is configured at the factory with inputs and outputs as required for each system. The manufacturer configures the functionality of each of the signals in the control strategy. Daily operation includes monitoring the system functions, and may occasionally require the operator to manually initiate or control processes.

4.6.1 Filter Screen

All OIT screens show navigation buttons around the system. Refer to Figure 8.

	Motor Running (Grey circle with Green Triangle)		Motor Stopped (Grey circle with White Triangle)		Motor Faulted (Grey circle with Red Triangle)
	Valve Open (Grey Valve with Green Rectangle)		Valve Closed (Grey Valve with White Rectangle)		Valve Faulted (Grey Valve with Red Rectangle)

Figure 8 Screen Navigation Buttons

The OIT screens use color codes to help identify types of data. The colored line at the bottom of each screen corresponds with the colored tab currently on display. The Filter Screen displays system status information, system fault indicators and provides the Operator control access.

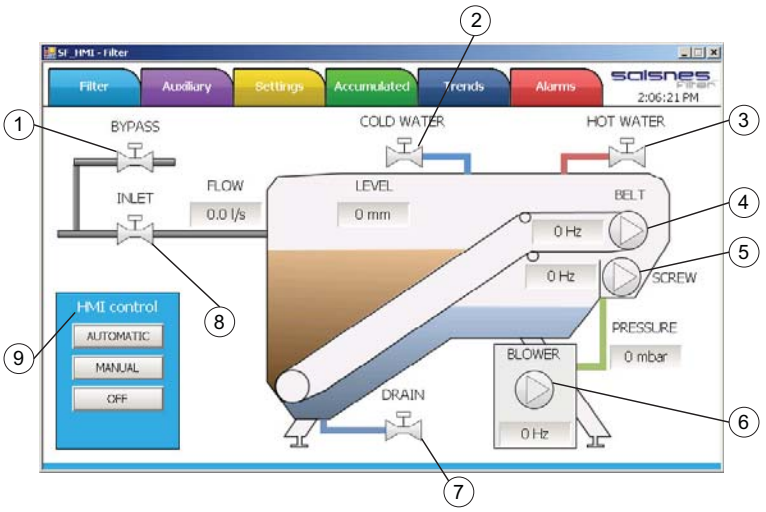

Figure 9 Filter Screen

1	Bypass button	**2**	Cold water button
3	Hot water button	**4**	Belt button
5	Screw button	**6**	Blower button
7	Drain button	**8**	Inlet button
9	OIT (HMI) control (Automatic, Manual, Off) buttons		

Note: *Not all buttons will be active, depending on the systems components.*

The Filter Screen buttons are accessed by selecting the  or  on the Filter Screen located on each device or component.

Note: *The following Filter Screen buttons are displayed below when the unit is set to Manual Mode. Local control buttons are not available when the system is in Automatic Mode.*

Table 4 Filter Screen Buttons

Screen	Description	Screen	Description
	DRAIN VALVE		COLD WATER VALVE
	HOT WATER VALVE		FILTER MOTOR
	SLUDGE SCREW MOTOR		AIR BLOWER
	BYPASS VALVE		INLET VALVE

4.6.2 Auxiliary Screen

The Auxiliary screen is used to show the external equipment that is not standard on the system such as augers, sludge bins, pump stations etc.

Figure 10 Auxiliary Screen

4.6.3 Settings Screens

The Settings Screens are divided into two levels of access.

General Access screens are available at any time using the Operator level Password. Refer to Table 3.

Technician Access screens require the Technician password.

4.6.3.1 Level Control

The Level Control setting screen is used to configure the basic settings for how the system controls the water level.

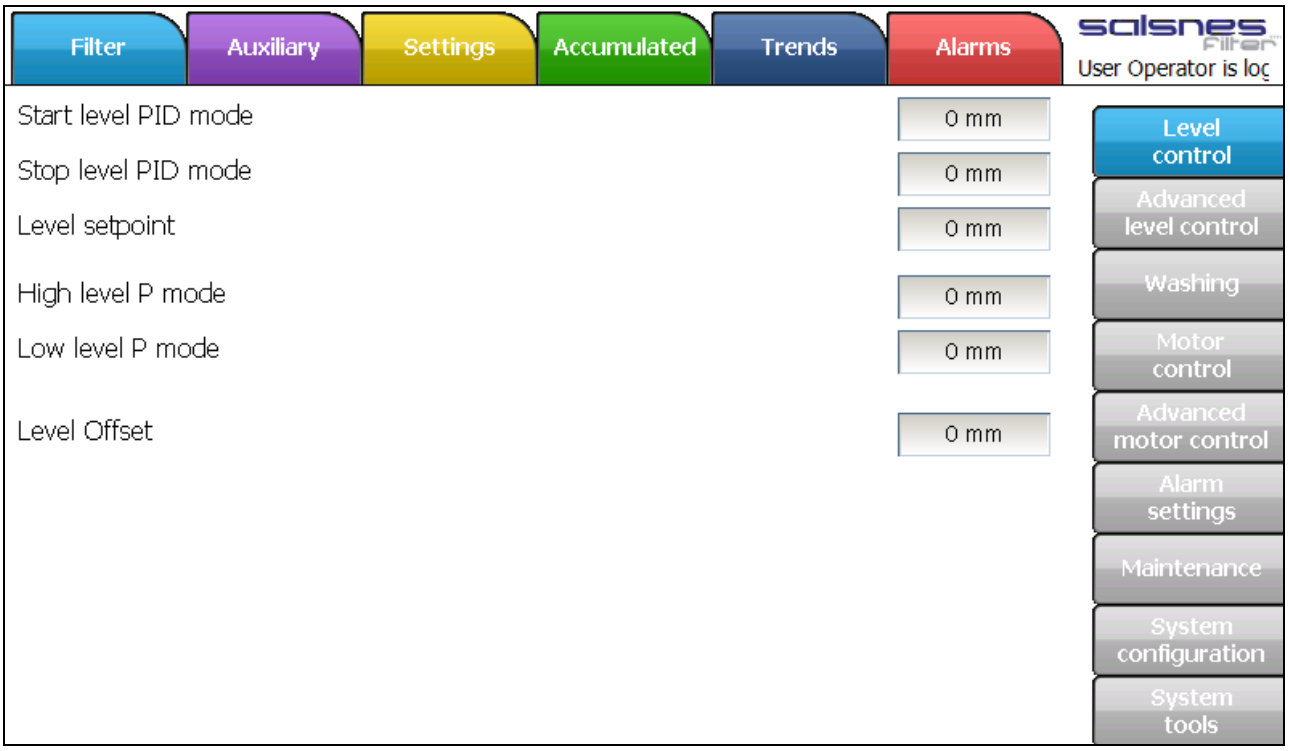

Figure 11 Level Control

Setting	Description	Units	Entry Limits	Security Level
Start Level PID mode	The filter will start when the water level is above this level and the system is in PID mode	mm	None	Operator
Stop Level PID mode	The filter will stop when the water level is below this level and the system is in PID mode. This level must be below the start level.			
Level Setpoint	The water level that the filter will try to maintain when in PID mode			
High level P mode	The water level at which the filter will run at the maximum frequency when in P mode			
Low level P mode	The water level at which the filter will run at the minimum frequency when in P mode			
Level Offset	The correction offset value to apply to the current level sensor reading.			

4.6.3.2 Advanced Level Control

The Advanced Level Control settings screen is used to control how the system responds to changes in level.

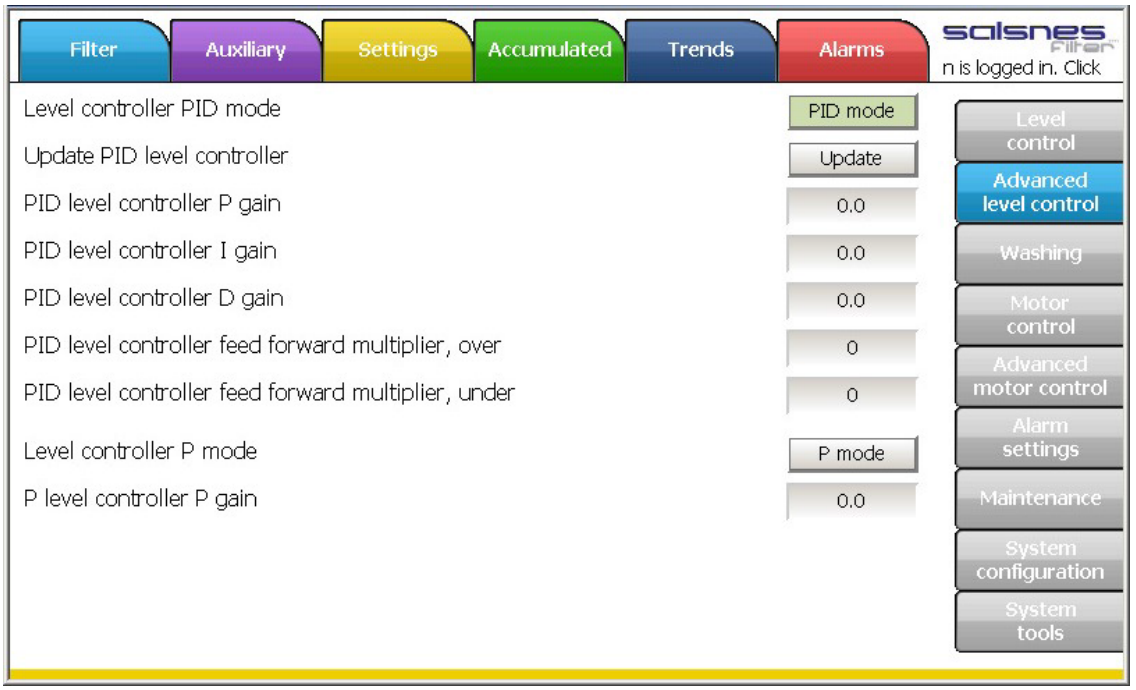

Figure 12 Advanced Level Control

Setting	Description	Units	Entry Limits	Security Level
Level controller PID mode	Sets the controller to use PID level control mode to target a specific water level setpoint using the PID controller to adjust belt speed	None	None	Technician
Update PID level controller	Triggers an update of the PID controller to accept any changes in PID parameters			
PID level controller P gain	Proportional gain of the PID controller			
PID level controller I gain	Integral gain of the PID controller			
PID level controller D gain	Derivative gain of the PID controller			
PID level controller feed forward multiplier, over	Feed forward multiplier of the PID controller when the level is above the target			
PID level controller feed forward multiplier, under	Feed forward multiplier of the PID controller when the level is below the target			
Level controller P mode	Sets the controller to use P level control mode to adjust belt speed as water level changes			
P level controller P gain	Proportional gain of the P controller			

4.6.3.3 Washing

The Washing Setting screen is used to configure the washing frequency and duration. Refer to Section 1 for operational ranges.

Figure 13 Washing

Setting	Description	Units	Entry Limits	Security Level
Cold water wash duty time	Duration that the cold water wash will run for	Seconds	None	Operator
Hot water wash duty time	Duration that the hot water wash will run for			
Cold water wash standby time	Duration between cold water washes	Minutes		
Hot water wash standby time	Duration between hot water washes			

4.6.3.4 Motor Control

The Motor Control Setting screen is used to configure basic motor operation settings and sequences.

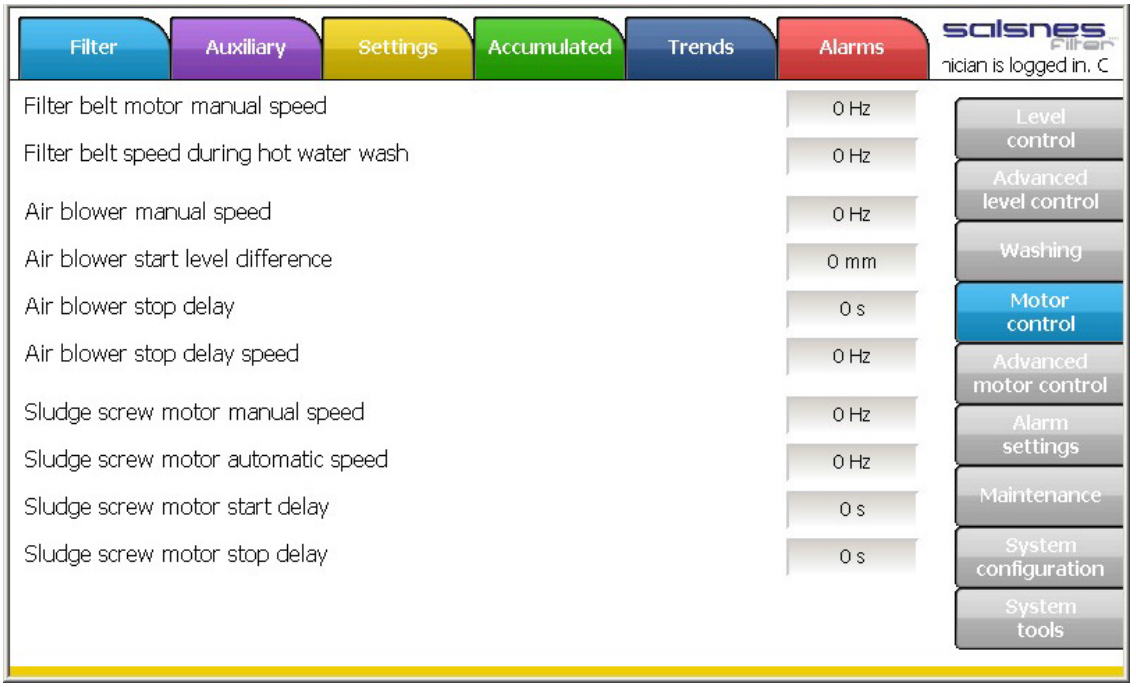

Figure 14 Motor Control

Setting	Description	Units	Entry Limits	Security Level
Filter belt motor manual speed	The speed the filter belt runs when in Manual control mode. This can be adjusted on the filter belt motor popup screen as well. This value is used for speed control when the control mode selector switch is set to Local	Hz	None	Operator
Filter belt speed during hot water wash	The speed the filter belt runs during a hot water wash.			
Air blower manual speed	The speed the air blower runs when in manual control mode. This can be adjusted on the air blower motor popup screen as well. This setting only applies when a VFD is used to control the air blower.			
Air blower start level difference	The distance below the start level setpoint that the air blower starts. The air blower must be running before the filter belt can start.			
Air blower stop delay	The amount of time the air blower remains running once the filter belt stops. This is used to reduce the number of start cycles for the blower.			
Air blower stop delay speed	The speed the air blower runs when the stop delay timer is running. This setting only applies when a VFD is used to control the air blower.			
Sludge screw motor manual speed	The speed the auger runs when in Manual control mode. This can be adjusted on the auger motor popup screen as well. This value is used for speed control when the control mode selector switch is set to Local			
Sludge screw motor manual speed	The speed the auger runs when in Automatic control mode.			

Setting	Description	Units	Entry Limits	Security Level
Sludge screw motor automatic speed	The speed the auger runs when in Automatic control mode.	Hz	None	Operator
Sludge screw motor start delay	The amount of time the filter belt must be running before the auger starts.			
Sludge screw motor stop delay	The amount of time the filter belt must be stopped before the auger stops.			

4.6.3.5 Advanced Motor Control

The Advanced Motor Control Setting screen is used to configure the advanced motor settings and limits.

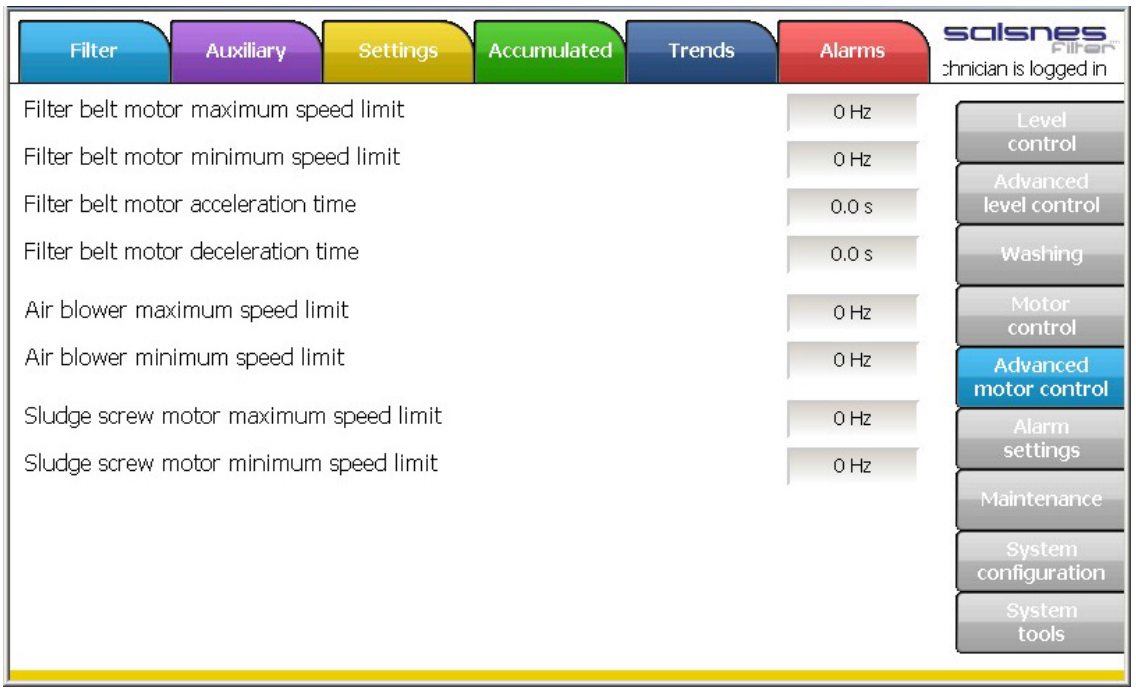

Figure 15 Advanced Motor Control

Setting	Description	Units	Entry Limits	Security Level
Filter belt motor maximum speed limit	The maximum frequency the filter belt motor can run at.	Hz	None	Technician
Filter belt motor minimum speed limit	The minimum frequency the filter belt motor can run at.	Hz		
Filter belt motor acceleration time	The filter belt motor acceleration time	Seconds		
Filter belt motor deceleration time	The filter belt motor deceleration time	Seconds		
Air blower maximum speed limit	The maximum frequency the air blower motor can run at. This setting only applies when a VFD is used to control the air blower.	Hz		
Air blower minimum speed limit	The minimum frequency the air blower motor can run at. This setting only applies when a VFD is used to control the air blower.	Hz		

Setting	Description	Units	Entry Limits	Security Level
Sludge screw motor maximum speed limit	The maximum frequency the auger motor can run at.	Hz	None	Technician
Sludge screw motor minimum speed limit	The minimum frequency the auger motor can run at.			

4.6.3.6 Alarm Settings

The Alarm Setting screen is used to configure operation alarm limits and delay times.

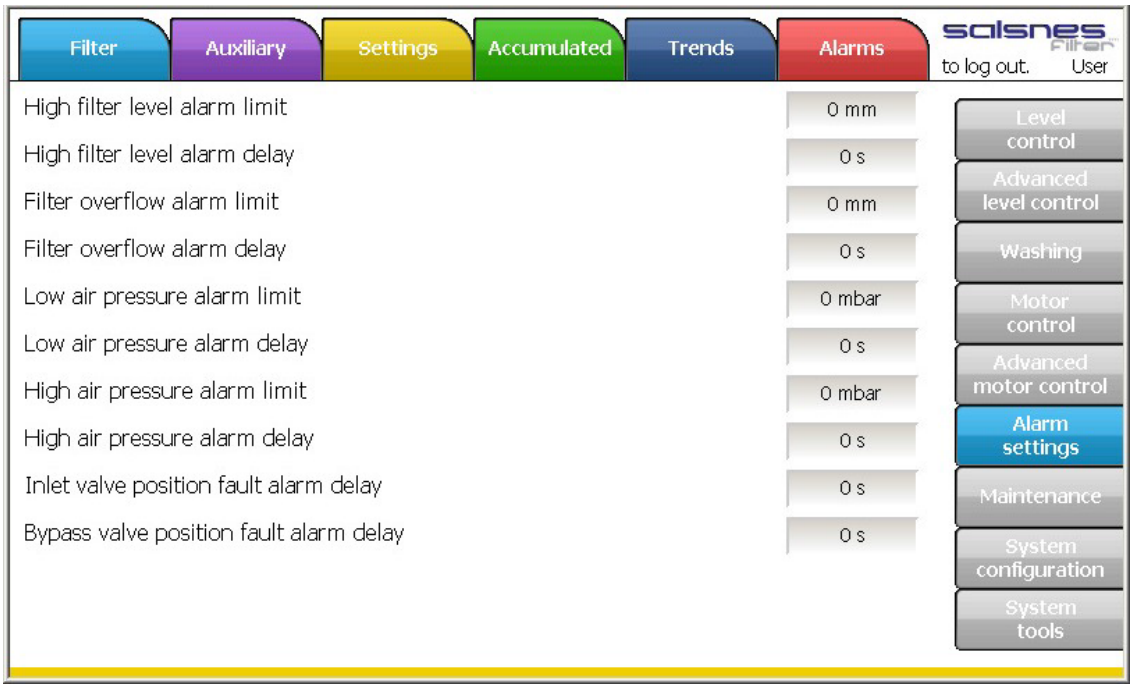

Figure 16 Alarms Settings

Setting	Description	Units	Entry Limits	Security Level
High filter level alarm limit	The alarm will occur if the water level is above this level for the delay time	mm	None	Technician
High filter level alarm delay	The alarm will occur if the water level is above the high limit for this delay time	Seconds		
Filter overflow alarm limit	The alarm will occur if the water level is above this level for the delay time	mm		
Filter overflow alarm delay	The alarm will occur if the water level is above the overflow limit for this delay time	Seconds		
Low air pressure alarm limit	The alarm will occur if the air pressure is below this level for the delay time	mbar		
Low air pressure alarm delay	The alarm will occur if the air pressure is below the low limit for this delay time	Seconds		
High air pressure alarm limit	The alarm will occur if the air pressure is above this level for the delay time	mbar		
High air pressure alarm delay	The alarm will occur if the air pressure is above the high limit for this delay time	Seconds		

Setting	Description	Units	Entry Limits	Security Level
Inlet valve position fault alarm delay	The alarm will occur if the valve has been requested to move to a position and the feedback for that position has not been received for this delay time	Seconds	None	Technician
Bypass valve position fault alarm delay	The alarm will occur if the valve has been requested to move to a position and the feedback for that position has not been received for this delay time	Seconds		

4.6.3.7 Maintenance

The Maintenance Setting screen is used to configure maintenance interval time reminders.

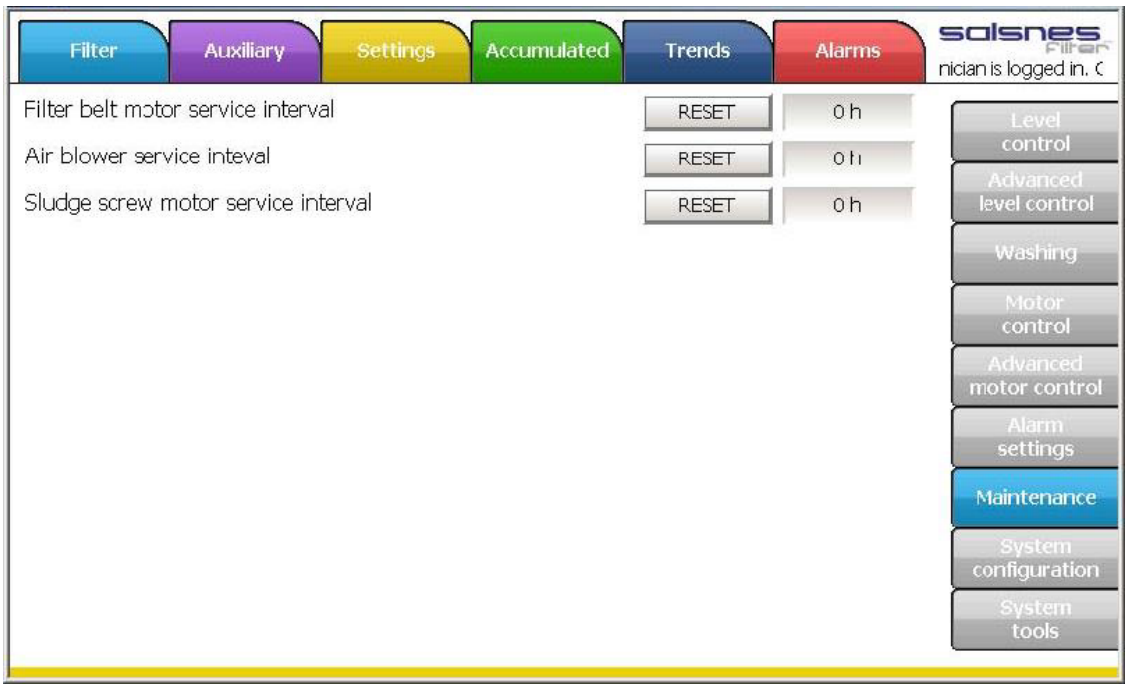

Figure 17 Maintenance

Setting	Description	Units	Entry Limits	Security Level
Filter belt motor service interval	A minor alarm service reminder will occur after the motor has been running for this time	Hours	None	Technician
Air blower service interval	A minor alarm service reminder will occur after the motor has been running for this time			
Sludge screw motor service interval	A minor alarm service reminder will occur after the motor has been running for this time			

4.6.3.8 System Configuration

This feature is for manufacturing Service Providers only.

4.6.3.9 System Tools

The System Tools screen is used to perform control hardware functions and view control hardware operating information.

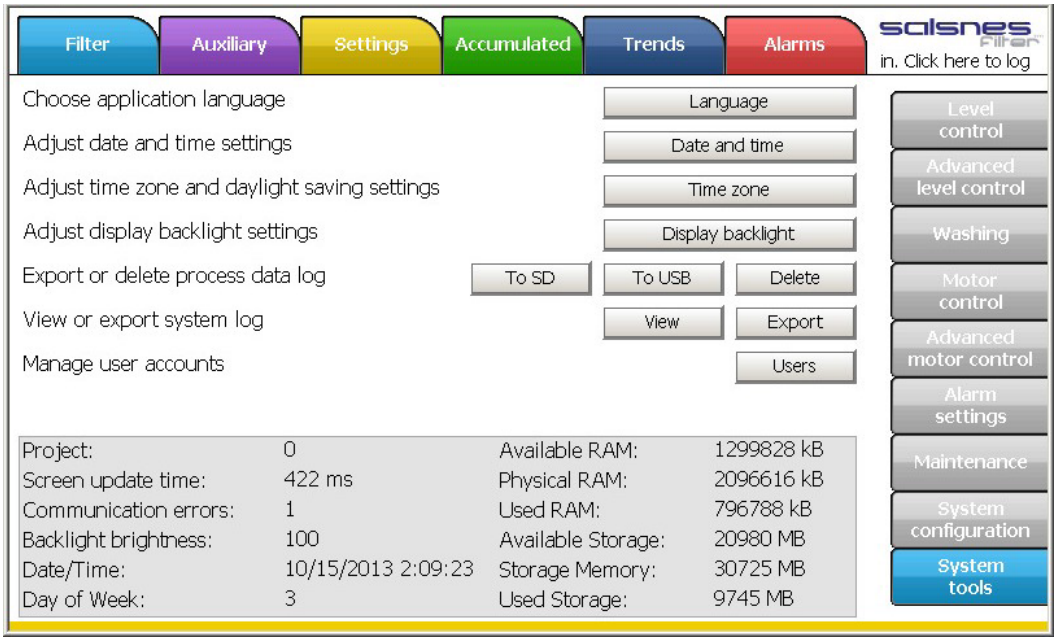

Figure 18 System Tools

Setting	Description	Units	Entry Limits	Security Level
Choose application language	Select the project language for the region	None	None	Technician
Adjust date and time settings	Adjust the data and time for the region			
Adjust time zone and daylight saving setting	Adjust the time zone and daylight saving options for the region			
Adjust display backlight settings	Adjust the backlight settings of the OIT			
Export or delete process data log	Choose which storage method to export the log files to (SD or USB) or delete the log files			
View or export system log	View or export the system logs			
Manage user accounts	Add/remove, change passwords, change security level of user accounts			

4.6.4 Accumulated Screen

The Accumulated Screen displays the runtime status and cycle counts for various filter components for the present day, the previous day and provides a total value. It also displays the number of Filter Overflow events and event duration.

The values are reset by selecting the “RESET” button.

Figure 19 Accumulated screen

4.6.5 Trends Screen

The Trend screen shows trend lines of data logged to an installed user interface Compact Flash card. Each line in the trending window represents the variables that are tracked, and shows the current value for each at the right hand side of the screen. Each line is color-coded.

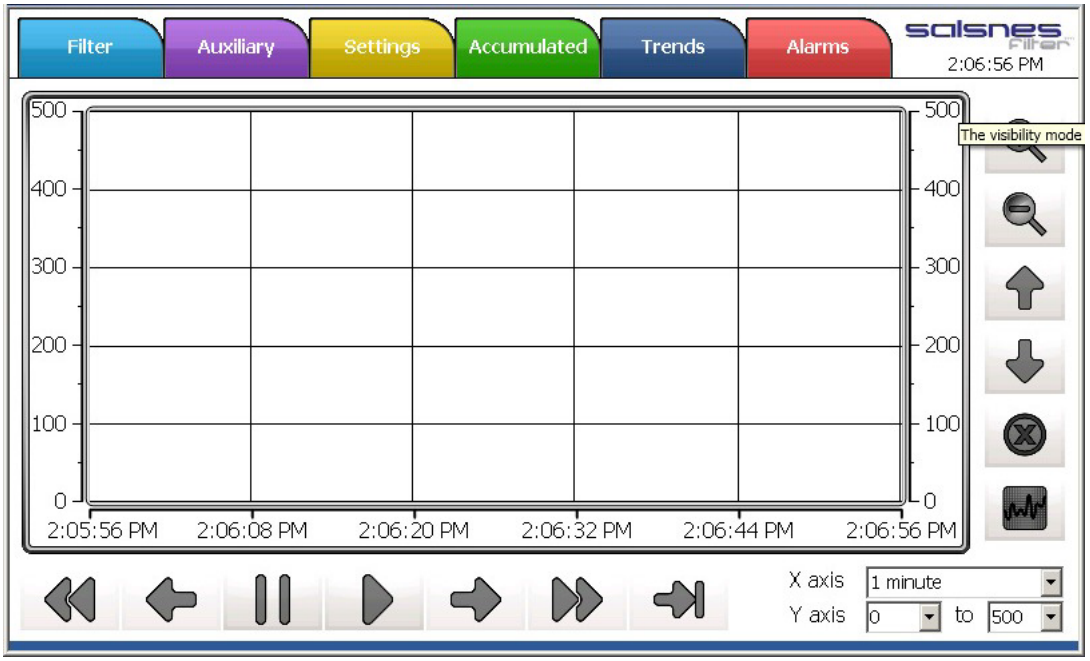

Figure 20 Trends screen

To view Trends:

1. Select  .
2. The Trend legend screen will pop up.

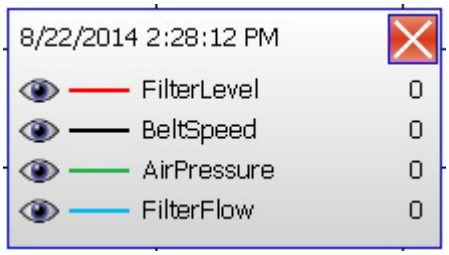

Figure 21 Trend Legend screen

3. Select  to turn the trend on or off from the trend display.

Note: *The value to the right of the trend list displays the current value.*

4.6.6 Alarms Screen

The Alarm screen is used to display any alarm messages for currently active alarm conditions. This screen is displayed first when the alarm button is pushed, on the Screen Navigation bar. The Alarm screen provides an overview of the current active system alarms. The one hundred (100) most recent alarms are displayed on the Alarm screen. When an alarm condition is rectified and no longer active, it is removed from the Alarm screen.

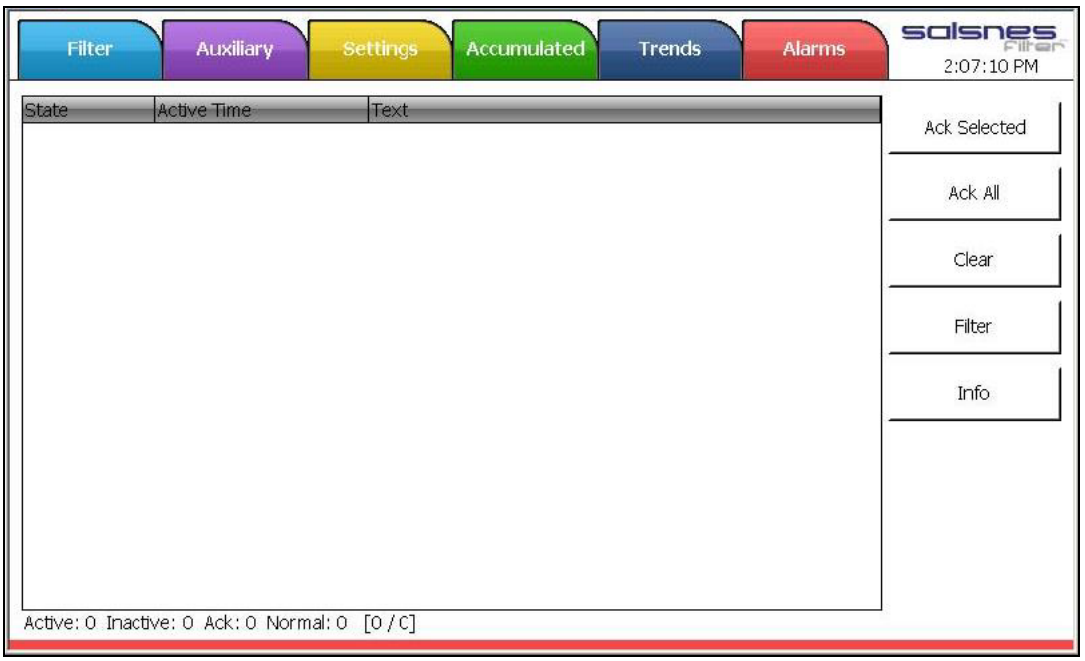

Figure 22 Alarms screen

To acknowledge individual alarms:

1. Touch the alarm on the OIT screen to be cleared.
2. Touch the 

Icon

To acknowledge all active alarms:

1. Touch Ack All Icon.

To Filter Alarms displayed:

1. Touch Filter .
2. The Alarm Event Filter Screen will pop up.

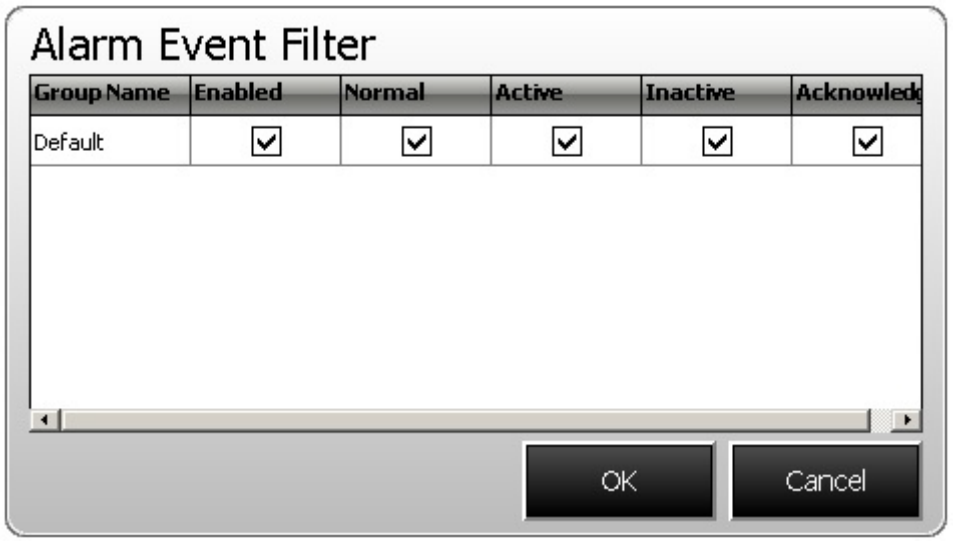

Figure 23 Alarm Event Filter screen

3. Select or deselect alarms to be displayed.

Contact Salsnes Filter™ with the listed information to order replacement parts.

Provide the:

- Product name and model number (refer to the front of this manual)
- Part number and description of the replacement part or accessory

If a replacement part is not listed, contact Salsnes Filter™.

3	Solenoid Valve - 2 Way (UL / CE) - 1/4”	20012293
3	Solenoid Valve - 2 Way (UL / CE) - 3/4”	20012060
4	Solenoid Valve - 4 Way (UL Class 1 / Division 1)	508082

5.5 Operator Kit Components

Item	Description	Part Number
1	Manual Scraper	20032009
2	Lid Key	Contact Manufacturer

5.6 Miscellaneous Parts

Item	Description	Part Number
1	Grease	1073
2	Seal, Auger Shaft	448067
3	Bearing, Auger Shaft	448068-4060
4	Insert, Sludge Compartment	
	SF: 2000	22304104
	SF: 4000	24304104
	SF: 6000	26304101
5	Sealing, Rubber Edge Housing	
	SF: 2000 - Length = 6m	20005012

Item	Description	Part Number
	SF: 4000- Length = 8m	20005012
	SF: 6000- Length = 9m	20005012
6	Sealing, Rubber Cover	
	SF: 2000- Length = 6m	20005013
	SF: 4000- Length = 8m	20005013
	SF: 6000- Length = 9m	20005013

5.7 Blower

Refer to the Blower Manufacturer’s Operational and Maintenance manual for replacement parts.

AC Motors

LEESON

EXPLOSION-PROOF MOTORS

SINGLE PHASE

EXPLOSION-PROOF

FOR HAZARDOUS LOCATIONS

Underwriters Laboratories and Canadian Standards Association Listed

General Specifications:

These explosion proof motors are designed and approved for application in hazardous environments having certain explosive gases or materials present.

Features:

Rugged mechanical construction meeting all requirements for safety. UL and CSA listed.

Double shielded, pre-lubricated ball bearings are standard. All motors have inherent automatic overload protection. NEMA 1.0 Service Factor except as noted. Explosion-proof conduit box included at no extra cost.

Capacitors on single phase designs are mounted inside the motor frame.

Application Notes:

These motors must be applied in accordance with the National Electrical Code, Article #500. A partial listing of explosive agents is noted below. Consult NFPA Publication 497M for a complete listing. No LEESON motors are listed for Class I, Group A or B. Please note subheads above each column for qualifications of LEESON motors.

Class I

Group A: Acetylene

Group B: Butadiene, ethylene oxide, hydrogen, propylene oxide, manufactured gases containing more than 30% hydrogen by volume.

Group C: Acetaldehyde, cyclopropane, diethyl ether, ethylene.

Group D: Acetone, acrylonitrile, ammonia, benzene, butane, ethanol, ethylene dichloride, gasoline, hexane, isoprene, methane (natural gas), methanol, naphtha, propane, propylene, styrene, toluene, vinyl acetate, vinyl chloride, xylene.

Class II

Group E: Aluminum, magnesium and other metal dusts with similar characteristics.

Group F: Carbon black, coke or coal dust.

Group G: Flour, starch or grain dust.

EXCEPT AS NOTED, STEEL FRAME EXPLOSION-PROOF MOTORS ARE *NOT* INVERTER-RATED AND MUST *NOT* BE USED WITH AN INVERTER

CAST IRON EXPLOSION-PROOF – SEE PAGE 50

Explosion Proof Motors have 1.0 Service Factor.

● These motors are totally enclosed, non-ventilated—Others are fan cooled.
□ Motors have mounting holes for NEMA 56 and NEMA 143-5T and a standard NEMA 56 shaft.
▲ These motors are satisfactory for operation on 50 Hz power supply at full rated horsepower.

③ **Catalogue #114636 is approved for Class I, Group C & D – Class II, Group F service only.**

● These motors are totally enclosed, non-ventilated—Others are fan cooled.
□ Combination 56H base motors have mounting holes for NEMA 56 and NEMA 143-5T and a standard NEMA 56 shaft.
▲ These motors are satisfactory for operation on 50 Hz power supply at full rated horsepower.
★ These motors have a 1.15 S.F.
These motors are inverter rated a suitable for use with an inverter. Others are not!
Ⓦ Premium efficiency WATTSAVERe® Motors meet NEMA efficiency requirements.

COMPONENT SPECIFICATION

DESCRIPTION: VALVE, SST SOL 24VDC 1/2NPT **DOC # 508081**

2-Way

Direct Lift, Pilot & Remote Operated Valves
1/4"–2" NPT

General Description:

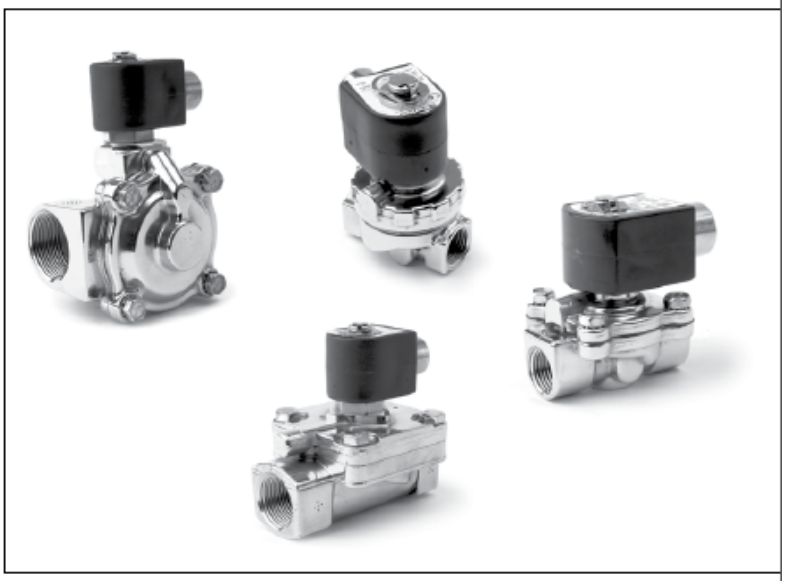
2-Way Direct Lift, Pilot & Remote Operated valves are designed for higher flow and medium to high pressure applications. Pilot operated valves require the minimum pressure differential specified for proper valve operation.

Installation
Valves should be mounted with solenoid coil vertical and upright.

Standard Materials of Construction
Please refer to page A55

Compatible Fluids
Lubricated Air, Inert Gases, Water and Light Oil (300 SSU). Additional fluids compatible with alternate materials of construction (consult factory).

Use of non-lubricated gaseous media can affect valve life.



Electrical Characteristics:

Standard Voltages:
AC –24/60
120/60–110/50
240/60–220/50
DC –12, 24 & 120
For other voltages – consult factory

Coil Classification:
Class F standard
Class H available

Agency Approvals:
Standard valves with NEMA 4X or explosion proof solenoid enclosures are UL Listed and CSA Certified. For additional details, consult factory.

Maximum Ambient Temperature
150°F
Please refer to page A55 for details.

Applications:

- Irrigation systems
- Fire suppression equipment
- Molding equipment
- Cooling of machine tools
- Sterilizers
- Car wash
- Water treatment and purification
- Air compressors and dryers
- Floor cleaning equipment
- Hospital equipment
- Automated systems
- Food processing

DESCRIPTION: VALVE, SST SOL 24VDC 4-WAY **DOC # 508082**

ASCO® RedHat®

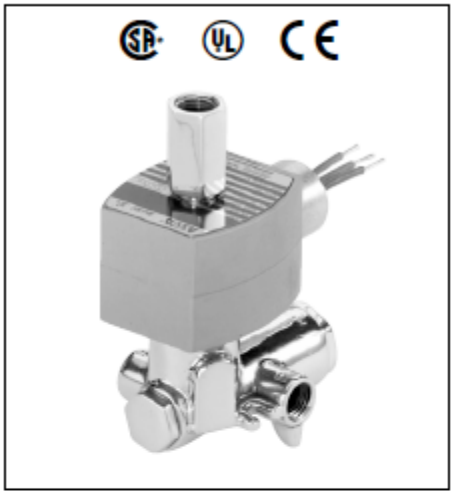
Pilot Operated
General Service Solenoid Valves
Brass and 316 Stainless Steel Bodies • 1/4" NPT

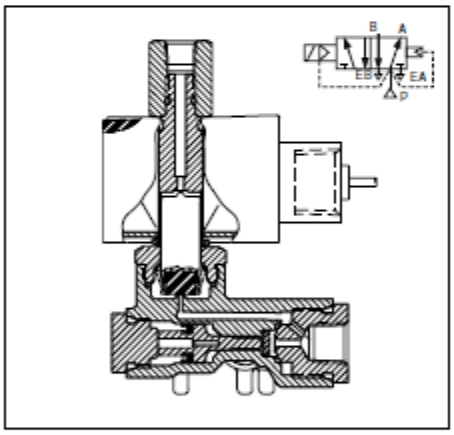
4/2 SERIES 8345

4-WAY

Features

- Compact valves for general service applications
- Low-cost, 4-way valve when low flow is sufficient
- Mountable in any position





Construction

Valve Parts in Contact with Fluids		
Body	Brass	316 Stainless Steel
Seals and Disc	NBR and PA	
Core Tube	305 Stainless Steel	
Core and Plugnut	430F Stainless Steel	
Springs	302 Stainless Steel	
Shading Coil	Copper	Silver
Piston	PA	

Electrical

Standard Coil and Class of Insulation	Watt Rating and Power Consumption				Spare Coil Part Number					
		AC			General Purpose		Explosionproof (EF)		Explosionproof (EV)	
	DC Watts	Watts	VA Holding	VA Inrush	AC	DC	AC	DC	AC	DC
F	11.6	10.1	25	50	238610	238710	238614	238714	274614	274714

Standard Voltages: 24, 120, 240, 480 volts AC, 60 Hz (or 110, 220 volts AC, 50 Hz). 6, 12, 24, 120, 240 volts DC. Must be specified when ordering.
Other voltages are available when required.

Solenoid Enclosures

Standard: Watertight, Types 1, 2, 3, 3S, 4, and 4X.

Optional: Explosionproof and Watertight, Types 3, 3S, 4, 4X, 6, 6P, 7, and 9. (To order, add prefix "EF" or, for Explosionproof Stainless Steel trim and hub on Brass-Bodied valves, add "EV" to catalog number.)

See Optional Features Section for other available options.

Nominal Ambient Temp. Ranges

AC: 32°F to 125°F (0°C to 52°C)
DC: 32°F to 104°F (0°C to 40°C)

Refer to Engineering Section for details.

Approvals

CSA certified. UL listed as General Purpose Valve.
EV8345G081 solenoid only UL approved.
Meets applicable CE directives.

Refer to Engineering Section for details.

Important

A Minimum Operating Pressure Differential must be maintained between the pressure and exhaust ports. Supply and exhaust piping must be full area, unrestricted. ASCO flow controls and other similar components must be installed in the cylinder lines only.

Refer to Engineering Section for details.

BI-DIRECTIONAL KNIFE GATE VALVE

The **EB** model knife gate is a bi-directional valve designed for general industrial service applications. The design of the body and seat assures non-clogging shut off on suspended solids in industries such as:

- Wastewater treatment plants
- Chemical plants
- Food and Beverage
- etc.

Sizes: DN 50 to DN 1200 (larger diameters on request)

Working pressure:

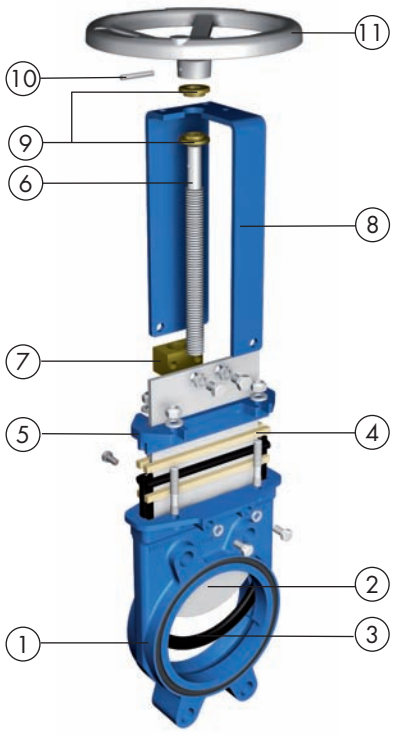
DN 50	to	DN 250:	10 kg/cm²
DN 300	to	DN 400:	6 kg/cm²
DN 450:			5 kg/cm²
DN 500	to	DN 600:	4 kg/cm²
DN 700	to	DN 1200:	2 kg/cm²

Standard flange connection: DIN PN 10
Other flange connections: on request

Directives: DIR 2006/42/CE (MACHINES)
DIR 97/23/CE (PED) Fluid: Group 1(b), 2 (Cat. I, mod. A)
DIR 94/9/CE (ATEX) Ex

Face to face dimensions acc. to EN558-1 serie 20 (replaces K1 DIN3202) up to DN500.

All valves are tested prior to shipping in accordance with the standard developed by the Quality Control Department at ORBINOX.



STANDARD PARTS LIST

MODEL EB

ORBINOX
VALVE SOLUTIONS IN MORE THAN 70 COUNTRIES

DESIGN FEATURES

BODY:
Wafer style cast **monoblock** design internally machined up to DN 500 with reinforced ribs in larger diameters for extra body strength. It allows its installation as end of line from DN50 to DN300.
The design has been developed by a new manufacturing process that machines the inside part of the body, allowing more control in the different dimension tolerances. This allows a perfect adjustment of the body-gate-seal, reducing the torque that keeps the tightness and avoiding any build up of solids that would prevent valve from closing.
The design changes to two part bolted body internally machined from DN 600.
Full port design for greater flow capacity and minimal pressure drop.
The gate guides on full stroke ensure bi-directional shutoff.
Standard EPDM o-ring on flange connection of the valve for sealing.

GATE:
Stainless steel gate, as standard.
Gate is polished on both sides for a greater seal between the gate with both packing and seat.
Gate is fully guided in the body allowing for bi-directional service.

PACKING:
Standard PTFE impregn.synth fibre (ST) with EPDM o-ring for better shut-off.
Long-life braided packing is available in a wide range of materials.

NON RISING STEM:
The standard stainless steel stem offers a high and long corrosion resistant life.

ACTUATORS:
All actuators supplied by **ORBINOX** are interchangeable, and supplied with an standard mounting kit for easy installation on site.

YOKE or ACTUATOR SUPPORT:
Made of EPOXY coated steel (stainless steel available on request).
Compact design makes it extremely robust even under the most severe conditions.

EPOXY COATING:
The epoxy coating on all **ORBINOX** cast iron and carbon steel valve bodies and components is electrostatically applied making the valves to be corrosion resistant with a high quality finished product.
The **ORBINOX** standard colour is RAL-5015 blue.

GATE SAFETY PROTECTION:
ORBINOX automated valves are provided with gate guards in accordance with EU Safety Standards.
The design feature prevents any objects from being caught accidentally while the gate is moving.

OTHER MATERIALS
On request, following materials can be also supplied:

Body:
- Ductile Iron (GGG-40)
- CF8M on some sizes

Gate:
- AISI 316 or 316Ti

Stem:
- AISI 316 or 316 Ti

MODEL EB

ORBINOX
VALVE SOLUTIONS IN MORE THAN 70 COUNTRIES

ACTUATOR TYPES

Manual:

Handwheel (non-rising stem)
Chainwheel (non-rising stem)
Lever
Bevel Gear (non-rising stem)
Handwheel (rising stem)
Others (square nut...)

Automatic:

Double Acting Pneumatic
Electric (rising or non-rising stem)
Single Acting Pneumatic
Hydraulic

All actuators supplied by ORBINOX are interchangeable.

FAIL SAFE SYSTEMS

Used on pneumatic actuated valves

SINGLE ACTING / SPRING RETURN

Available from DN 50 to DN 200

Supply pressure: minimun 5Kg/cm^2-maximum 10Kg/cm^2

Options:
- Fail open
- Fail closed

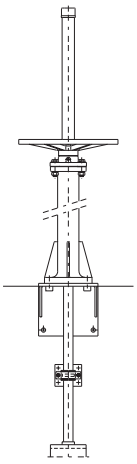
SINGLE ACTING / VOLUME TANK

Available for all sizes (DN>200)

Options:
- Pneumatic Failsafe
- Pneumatic or Electric Failsafe

ACCESSORIES

Mechanical stops
Locking device
Manual override
Solenoid valves
Positioners
Limit switches
Proximity switches
Floor stands
Stem extensions



Wide range of valve extensions available.

For further information about fail safe systems and valve extensions, please see EX chapter.

We recommend consultation with our technical department.

TEMPERATURE CHART

SEAT / SEALS

Material	Max.Temp.(°C)	Applications
EPDM (E)	120	Acid and non mineral oils.
Nitrile (N)	120	Resistance to petroleum products.
On request:		
Viton (V)	200	General chemical service High temperature

More details and other materials on request.

PACKING

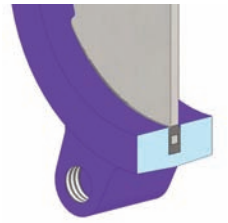
Material	Max. Temp. (°C)	pH
PTFE impregn.synth fibre (ST)	240	2 - 13
Dynapack (DP)	270	2 - 14
Dry cotton (AS)	50	6 - 8
Braided PTFE (TH)	260	0 - 14

NOTE:
All types include an elastomere O-ring (same material as seal), excluding TH.
Standard packing: ST

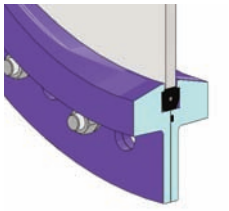
SEAT TYPES

RESILIENT SEAT
This is the standard seat. The joint is seated on the body, fitted with a metallic core, in contact with the gate all over its perimeter. This layout provide an adequate watertightness and seamless liquid flow on both ways, avoiding at the same time any build-up of solids that would prevent the valve from closing. The o-ring is protected by the body itself.

* DN50-500: Moulded seal with an internal steel core.



* DN ≥ 600: Extruded seal with an internal steel wire.



ATEX

Please contact our Orbinox representative for info and availability. Some considerations:

- Hand operated EB valves have been subjected to an ignition risk assessment according to DIN EN 13463: 1-5 and they are out the scope of application of ATEX Directive. Therefore hand operated valves are suitable for ALL ATEX zones.
- Electrical, pneumatical and hydraulically operated valves must be subjected to a conformity assesment of their own and also of the whole unit valve-actuator to get EC Type Approval to Directive 94/9.

MODEL EB

ORBINOX
VALVE SOLUTIONS IN MORE THAN 70 COUNTRIES

PNEUMATIC CYLINDER

- The standard pneumatic actuator (double acting on-off cylinder) consists of:
  - DN 50-250: Aluminum barrels
  - DN≥ 300: Composite barrels
  - Aluminum end caps
  - Stainless Steel (AISI 304) piston rod
  - Nitrile coated steel piston
- Available from DN 50 to DN 800
- Supply Pressure: minimum 3.5 kg/cm² - maximum 10 kg/cm²
  Actuator designed with 6 kg/cm² air supply
- For valves installed in a horizontal position, we recommend U-type support plates and/or actuator support.

- Options (on request):
  - Hard anodized jacket and covers
  - Over / Undersized cylinder
  - Stainless Steel jacket and covers
  - Manual override
  - Fail safe system
  - Travel stops
- Instrumentation (on request):
  - Positioners
  - Solenoid valves
  - Flow regulators
  - Air preparation units

DATA SHEET

STANDARD D/A PNEUMATIC CYLINDER

ORBINOX
VALVE SOLUTIONS IN MORE THAN 70 COUNTRIES

BORE SIZES 100 - 300

Orbinox standard double acting pneumatic cylinders are specifically designed to suit Orbinox knife gate valves.

Main features:

- End caps and barrels up to bore 250mm are made of aluminium
- Barrels with bore 300mm are made of composite*
- Piston rod in stainless steel
- Air supply can vary from 3,5bar up to maximun 10 bar

Options:

- Magnetic limit switches available with special magnetic kit under the piston
- Single acting (up to 200mm bore)
- Manual override system (two piston rods)

Bore sizes (mm):

DN 100, 160, 200, 250, 300

Salsnes Filter AS
v/ Jon Lennart Ness

Moss, 16-08-2012

Statement: Water hydraulic actuated Orbinox Knife gate valves

Fagerberg AS as Orbinox official representative for Norway hereby guaranties that Salsnes Filter AS can use water as supply pressure in order to operate the Orbinox EB-valve with aluminum cylinder. Max water supply pressure is 10 bar, normal 6 bar.

Intrinsically Safe Low Pressure Transmitter

AST44LP

SUBMIT YOUR REQUIREMENTS

The AST44LP is a low pressure **Class I Division 1 intrinsically safe pressure transmitter / pressure transducer** Groups C, D when installed with an approved barrier. With its rugged construction and the best price-to-performance ratio in the industry, the AST44LP is the solution for low pressure measurement for a variety of applications. The AST44LP iss also now available with CSA Single Seal Approval.

Design Benefits

- UL/cUL 913 (CSA 157) Class 1 Div 1 Groups C,D when installed with an approved barrier
- ABS (American Bureau of Shipping) Approved
- High Strength Stainless Steel Construction
- From 0-1 to 0-15 PSI
- Low Static and Thermal Errors
- Unparalleled Price and Performance
- Wide Variety of Liquids and Gases
- EMI/RFI Protection
- Excellent Low Cost Option for External Tank Level Monitoring

Applications / Industries

- Industrial OEM Equipment
- HVAC/R Equipment
- Water Management
- Control Panels
- Pneumatics
- Hydraulic Systems
- Vapor Recovery
- Data Loggers
- External Tank Levels

AST44LP *Intrinsically Safe Low Pressure Transducers / Transmitters*

Class I Division 1 Groups C, D IS with Approved Barrier

OVERVIEW

The AST44LP is a stainless steel pressure transducer with a wide variety of options. With its rugged construction and the best price-to-performance ratio in the industry, the AST44LP is the solution for low pressure measurement in Intrinsically Safe areas.

BENEFITS

- **UL/cUL 913 (CSA 157) Class 1 Div 1 Groups C,D** when installed with an approved barrier
- High Strength Stainless Steel Construction
- No Welds or Internal O-rings
- Wide Operating Temperature
- Pressures from 0-1 to 0-15 PSI
- Low Static and Thermal Errors
- Unparalleled Price and Performance
- Compatible with Liquids and Gases
- EMI/RFI Protection

APPLICATIONS

- Industrial OEM Equipment
- Water Management
- Pneumatics
- Vapor Recovery
- External Tank Levels
- HVAC/R Equipment
- Control Panels
- Hydraulic Systems
- Data Loggers

Performance @ 25°C (77°F)

Accuracy*	< ±0.25% BFSL (< ±0.5% BFSL for 0-1 PSI)
Stability (1 year)	±0.25% FS, typical
Over Range Protection	2X Rated Pressure
Burst Pressure	5X or 75 PSI (whichever is less)
Pressure Cycles	> 100 Million

* Accuracy includes non-linearity, hysteresis & non-repeatability

Storage	-40 to 100°C (-40 to 212°F)
Thermal Limits	
Compensated Range	0 to 55°C (30 to 130°F)
TC Zero	<±1.5% of FS
TC Span	<±1.5% of FS
Other	
Shock	EN 60068-2-27
Vibration	EN 60068-2-6, 60068-2-64, and IEC 68-2-32
EMI/RFI Protection:	Yes
Rating:	IP-66

Electrical Data

Output	**4-20mA**	**1-5VDC, 1-6VDC**
Excitation	10-28VDC	10-28VDC
Output Impedance	>10k Ohms	<100 Ohms, Nominal
Current Consumption:	20mA, typical	5mA, typical
Bandwidth	(-3dB): DC to 250 Hz	(-3dB): DC to 1kHz
Output Noise:	-	<2mV RMS
Zero Offset:	<±1% of FS	<±1% of FS
Span Tolerance:	<±2% of FS	<±1.5% of FS
Output Load:	0-800 Ohms@10-28VDC	10k Ohms, Min.
Reverse Polarity Protection	Yes	Yes

A TROJAN TECHNOLOGIES COMPANY

COMPONENT SPECIFICATION

DESCRIPTION: SENSOR, PRESSURE 1/4BSP 15PSI

DOC # 508055

Ordering Information

AST44LP A 00005 P 4 E 1 000

Series Type

Process Connection
A= 1/4" NPT Male
C= 1/4 BSPP Male
I= 1/4" NPT Female
P= 1/2 MNPT

Pressure Range
Insert pressure code from chart

Pressure Unit
H= Inches H_2O P= PSI

Outputs
3= 1-5V 6= 1-6V
4= 4-20mA (2 wire loop powered)

Electrical*
A= 2 ft. (0.6 m) I= DIN 43650A
B= 4 ft. (1.2 m) L= Conduit, Cable 2 ft.
C= 6 ft. (1.8 m) M= Conduit, Cable 4 ft.
D= 10 ft. (3.0 m) N= Conduit, Cable 6 ft.
E= Mini DIN 43650C P= Conduit, Cable 10 ft.
F= Packard Metripack 150 R= 6 Pin Bendix

Wetted Material
1=316 L

Options
000 = No special options
421 = Bi-Directional Output*

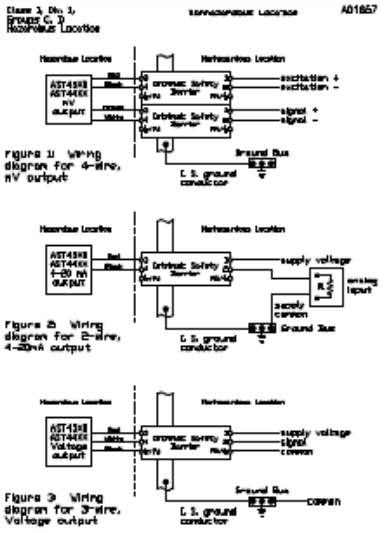
*Consult factory for ranges and availability.
* Wiring information available at: http://www.astsensors.com/wiring.php

Pressure Ranges

Gauge PSIG	Pressure Code
0-1	00001
0-2.5	00069*
0-5	00005
0-7.5	00208*
0-10	00010
0-15	00015

*2.5 and 7.5 PSI Sensor must be ordered in inches of H_2O.

Barrier Installation



The transducers listed below are designed for installation in a Class I, Division 1, Groups C and D, Division 1 hazardous location when connected to Associated Apparatus as described in note 1.

Entity Parameters
Vmax = 28Vdc
Imax = 175mA
Ci = 1.44uF
Li = 0

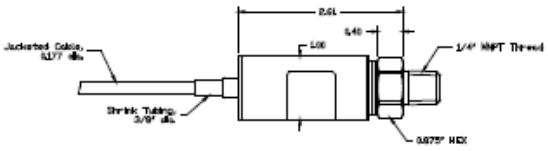
Imax is the total current available from the Associated Apparatus under any condition.

Notes
1 Associated Apparatus shall provide intrinsically safe connections which meet the following parameters.
Voc or Vt ≤ Vmax Ca ≥ Ci + Ccable
Isc or It ≤ Imax La ≥ Li + Lcable

2. Control Room apparatus shall not generate in excess of 250V (Um).

3. Installation should be in accordance with Article 504 in the National Electrical Code, ANSI/NFPA 70.

Dimensional Data



Warranty

Workmanship - AST, Inc. pressure transmitters have a limited one-year warranty to the original purchaser. AST, Inc. will replace or repair, free of charge, any defective transmitter. This warranty does not apply to any units that have been modified, misused, neglected or installed where the application exceeds published ratings. AST44LP is not recommended for use with hydrogen. For hydrogen applications, contact the factory for AST4300, AST4401, & AST4600 model information. AST's sensors are made with pride in New Jersey, USA. If in the area please feel free to stop by for a visit!

Installation/Applications - The purchaser is responsible for media compatibility, functional adequacy, and correct installation of the transmitter.

© 2013 American Sensor Technologies Inc. AST44LP 04/26/13.
All specifications subject to change without notice.

FSPDB

FINGER-SAFE/POWER DISTRIBUTION BLOCKS

SAFETY EVOLVING FINGER-SAFE POWER DISTRIBUTION BLOCKS

Ferraz Shawmut FSPDBs introduce a new level of safety and ease for installing power distribution blocks. An IP20 level of finger safe protection is achieved using FSPDBs, eliminating the need for special covers or custom plexiglass sheets to protect your panels. FSPDBs (sizes 1 to 4) simply snap onto 35mm DIN rail to provide the quickest installation. Modular design also allows for multi pole applications by use of assembly pins. FSPDBs provide a safe, convenient way of splicing cables, splitting primary power into a variety of secondary circuits or providing a fixed junction tap-off point.

Features/Benefits

- **Finger-Safe**
  Fully insulated block ensures touch safe isolation of live parts. Recessed termination screws and wire openings provide IP20 grade protection and qualify as “finger-safe” per IEC 529.
- **Compact Modularity**
  Single or multiple pole configurations in the most compact footprint. Allows users to build smaller or higher density panels.
- **Snap on DIN Rail Mounting**
  Sizes 1 to 4 feature integral DIN rail adaptors allowing for quick and easy installations on 35mm DIN rail yielding lower installed costs.
- **Captive Termination Screws**
  Unique channel design ensures captive metric wire termination screws. Screws can never be lost.
- **Available Accessories**
  For multi-pole panel mounting, simply snap in pins for rigid fit. Cap plugs provide the ability to maintain touch safety on unused openings. Circuit identification markers simply snap into blocks to ID circuits. End anchors provide rigid end stops.
- **Multiple Wire Ratings**
  Provide users more versatility by offering capability of using multiple conductors in #2 and 2/0 openings.

Ratings

- Ampere ratings from 175 to 840A
- 600V rated
- Short Circuit Current Rating 100kA with proper fuse. Contact Technical Services for instruction sheet.

Approvals

- UL Recognized Component - Guide XCFR2, File E73571
- CSA Certified: Class 6228, File 69363

Accessories

CATALOG NO.	DESCRIPTION
FSPIN1	Accessory pin to form multiple pole block
FSCIM1	Circuit identification marker for 2/0 & #2 max. conductors
FSCIM2	Circuit identification marker for 350, 400 & 600 kcmil max. conductors
FSCAP1	Cap plug for spare 2/0 openings
FSCAP2	Cap plug for spare 350 kcmil openings
FSCP3	Cap plug for spare 600 kcmil opening
FSEA	Pair of end anchors

Spring connection with tension clamp Technology
Tension clamp technology is a universal contact system for all common conductor connection types. Its fantastic level of flexibility makes the tension clamp a profitable alternative connection.

General ordering data

Type	ZQV 2.5/20
Order No.	1908960000
Version	Z-series, Cross-connector, For the terminals, No. of poles: 20
GTIN (EAN)	4032248535293
Qty.	20 pc(s).

Spring connection with tension clamp Technology
Tension clamp technology is a universal contact system for all common conductor connection types. Its fantastic level of flexibility makes the tension clamp a profitable alternative connection.

General ordering data

Type	ZPE 6
Order No.	1608670000
Version	PE terminal, Tension clamp connection, 6 mm², 720 A (6 mm²), green / yellow
GTIN (EAN)	4008190259242
Qty.	50 pc(s).

Spring connection with tension clamp Technology
Tension clamp technology is a universal contact system for all common conductor connection types. Its fantastic level of flexibility makes the tension clamp a profitable alternative connection.

General ordering data

Type	ZDK 2.5
Order No.	1674300000
Version	Feed-through terminal, Double-tier terminal, Tension clamp connection, 2.5 mm², 500 V, 20 A, Beige
GTIN (EAN)	4008190444884
Qty.	50 pc(s).

Engineering Data	EPLAN, WSCAD, Zuken E3.S

Features

- 2-channel isolated barrier
- 24 V DC supply (Power Rail)
- Input 2-wire SMART transmitters
- Output 0/4 mA ... 20 mA
- Terminals with test points
- Up to SIL2 acc. to IEC 61508

Function

This isolated barrier is used for intrinsic safety applications.

The device supplies 2-wire SMART transmitters in a hazardous area.

It transfers the analog input signal to the safe area as an isolated current value.

Digital signals may be superimposed on the input signal in the hazardous or safe area and are transferred bi-directionally.

If the HART communication resistance in the loop is too low, the internal resistance of 250 Ω between terminals 8, 9 and 11, 12 can be used.

Test sockets for the connection of HART communicators are integrated into the terminals of the device.

Application

The device supports the following SMART protocols:

- HART
- BRAIN
- Foxboro

Assembly

Accessories

Power feed module KFD2-EB2

The power feed module is used to supply the devices with 24 V DC via the Power Rail. The fuse-protected power feed module can supply up to 100 individual devices depending on the power consumption of the devices. A galvanically isolated mechanical contact uses the Power Rail to transmit collective error messages.

Power Rail UPR-03

The Power Rail UPR-03 is a complete unit consisting of the electrical inset and an aluminium profile rail 35 mm x 15 mm. To make electrical contact, the devices are simply engaged.

Profile Rail K-DUCT with Power Rail

The profile rail K-DUCT is an aluminum profile rail with Power Rail insert and two integral cable ducts for system and field cables. Due to this assembly no additional cable guides are necessary.

Attention

Power Rail and Profile Rail must not be fed via the device terminals of the individual devices!

Mounting	Can be snapped onto hat profile TS35 (EN 60715)
Installation position	any
Insulation voltage input / output	AC 4.0 kV_{eff}
Safe isolation	ja
Operation temperature range	-25 °C … +60 °C
Storage temperature range	-40 °C … +80 °C
Dimensions (w × h × d)	6.2 × 90.0 × 76.0 × mm
Weight	0.035 kg/piece
Connection device	Push-In single wire 0.25 mm^2–2.5 mm^2 / AWG 20–14 fine stranded wire with ferrule 0.25 mm^2–1.5 mm^2 / AWG 20–16
Standards	EN 60947-5-1
Approvals	cULus GL

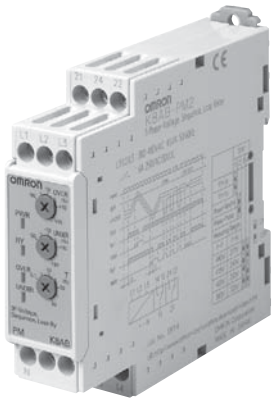
LUTZE SYSTEMATIC TECHNOLOGY

Three-phase Phase-sequence Phase-loss Relay
K8AB-PM

Ideal for monitoring 3-phase power supplies for industrial facilities and equipment.



- Monitor overvoltages, undervoltages, phase sequence, and phase loss for three-phase 3-wire or 4-wire power supplies with just one Unit.
  Switch setting for 3-phase 3-wire or 3-phase 4-wire power supply.
- Two SPDT output relays, 6 A at 250 VAC (resistive load).
  Separate outputs possible for overvoltages and undervoltages.
- World-wide power specifications supported by one Unit (switchable).
- Relay warning status easily monitoring using LED indicator.
- Easy wiring with ferrules
  2×2.5 mm^2 solid or 2×1.5 mm^2 standard ferrules.
- CE mark compliance certified by third party.
  UL certification pending.

Model Number Structure

■ Model Number Legend

K8AB-□□
1 2 3

1. Basic Model
K8AB: Measuring and Monitoring Relays

2. Functions
PM: Three-phase Phase-sequence Phase-loss Relay (Simultaneous upper and lower monitoring)

3. Rated Input Voltage
1: 115, 127, 133, 138, 200, 220, 230, 240 VAC
2: 220, 230, 240, 277, 380, 400, 415, 480 VAC

Ordering Information

■ List of Models

Three-phase Phase-sequence Phase-loss Relay	Rated input (See note 2.)		Model
	3-phase 3-wire mode	200, 220, 230, 240 VAC	**K8AB-PM1**
	3-phase 4-wire mode	115, 127, 133, 138 VAC	
	3-phase 3-wire mode	380, 400, 415, 480 VAC	**K8AB-PM2**
	3-phase 4-wire mode	220, 230, 240, 277 VAC	

Note: 1. Three-phase 3-wire or 4-wire and the input range are switched using a switch.
2. The power supply is shared with the rated input voltage.

Ratings and Specifications

■ Ratings

Rated input voltage	**K8AB-PM1**	Three-phase, three-wire mode: 200, 220, 230, 240 VAC Three-phase, four-wire mode: 115, 127, 133, 138 VAC
	K8AB-PM2	Three-phase, three-wire mode: 380, 400, 415, 480 VAC Three-phase, four-wire mode: 220, 230, 240, 277 VAC
Operation (overvoltage or undervoltage)	**Operating value setting range**	Overvoltage = –30% to 25% of maximum rated input voltage Undervoltage = –30% to 25% of maximum rated input voltage Note: The rated input voltage is switched with a switch.
	Operating value	100% operation at set value
Reset (HYS.)	**Hysteresis**	5% of operating value (fixed)
	Resetting method	Automatic reset
Operating time (T)	**Overvoltage/undervoltage**	0.1 to 30 s (Value when input rapidly changes from 0% to 120%.)
	Phase sequence, phase loss	0.1 max. (Value when input rapidly changes from 0% to 100%.)
Power ON lock (LOCK)		1 s or 5 s error ±0.5 s (Value when input rapidly changes from 0% to 100%. The operating time is the shortest at this point.)
Setting accuracy		±10% of full scale
Time error		±10% of set value (Minimum error: 50 ms)
Input frequency		45 to 65 Hz
Input impedance		100 kΩ min.
Indicators		Power (PWR): Green LED, Relay output (RY): Yellow LED, Alarm outputs (ALM1/2): Red LED
Output relays		Two SPDT relays (6 A at 250 VAC, resistive load), Normally closed operation (normally ON) (separate outputs possible for overvoltages and undervoltages)

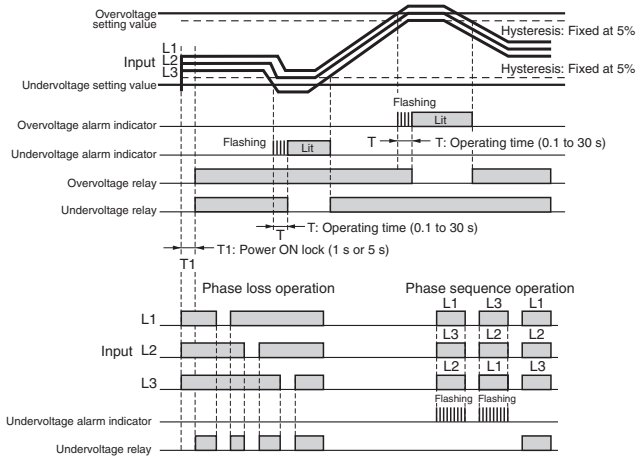
■ Specifications

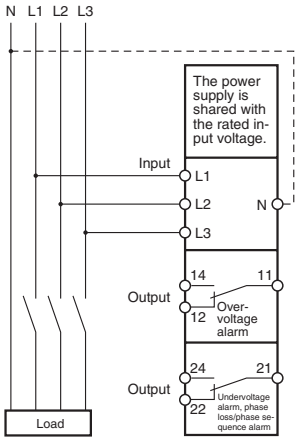
Ambient operating temperature		–20 to 60°C (with no condensation or icing)
Storage temperature		–40 to 70°C (with no condensation or icing)
Ambient operating humidity		25% to 85%
Storage humidity		25% to 85%
Altitude		2,000 m max.
Voltage fluctuation range		85% to 110% of rated input voltage
Input frequency		50/60 Hz ±5 Hz (AC power supply)
Output relays	**Resistive load**	6 A at 250 VAC (cos ϕ = 1) 6 A at 30 VDC (L/R = 0 ms)
	Inductive load	1 A at 250 VAC (cos ϕ = 0.4) 1 A at 30 VDC (L/R = 7 ms)
	Minimum load	10 mA at 5 VDC
	Maximum contact voltage	250 VAC
	Maximum contact current	6 A AC
	Maximum switching capacity	1,500 VA
	Mechanical life	10,000,000 operations
	Electrical life	Make: 50,000 times, Break: 30,000 times
Terminal screw tightening torque		1.2 N·m
Crimp terminals		Two solid wires of 2.5 mm^2, two crimp terminals of 1.5 mm^2 with insulation sleeves, can be tightened together
Insulation resistance		20 MΩ (at 500 V) between charged terminals and exposed uncharged parts 20 MΩ (at 500 V) between any charged terminals (i.e., between input, output, and power supply terminals)
Degree of protection		Terminal section: IP20, Rear case: IP40
Case color		Munsell 5Y8/1 (ivory)
Case material		ABS resin (self-extinguishing resin) UL94-V0
Weight		200 g
Mounting		Mounted to DIN Track or via M4 screws
Dimensions		22.5 (W) x 90 (H) x 100 (D) mm
Installation environment		Overvoltage Category III, Pollution Degree 2
Application standards		EN60255-5/-6
Safety standards		EN60664-1
EMC		EMI: EN61326 Industrial applications Electromagnetic interference wave CISPR11 Group 1, Class A: CISPR16-1/-2 Terminal interference wave voltage CISPR11 Group 1, Class A: CISPR16-1/-2 EMS: EN61326 Industrial applications Electrostatic discharge EN61000-4-2: 8 kV (in air) Radiating radio-frequency electromagnetic field EN61000-4-3: 10 V/m 1 kHz sine wave amplitude modulation (80 MHz to 1 GHz) Burst EN61000-4-4: 1 kV (I/O signal line), 2 kV (power line) Surge EN61000-4-5: 1 kV with line (power line), 2 kV with ground (power line) Conducted RF EN61000-4-6: 3 V (0.15 to 80 MHz) Power frequency magnetic field immunity EN61000-4-8: 30 A/m Voltage dip/short interruptions EN61000-4-11: 0.5 cycle, 0.180° each, polarity 100% (rated voltage)

Connections

■ Wiring Diagram

Overvoltage/Undervoltage and Phase Sequence/Phase Loss Operation Diagram



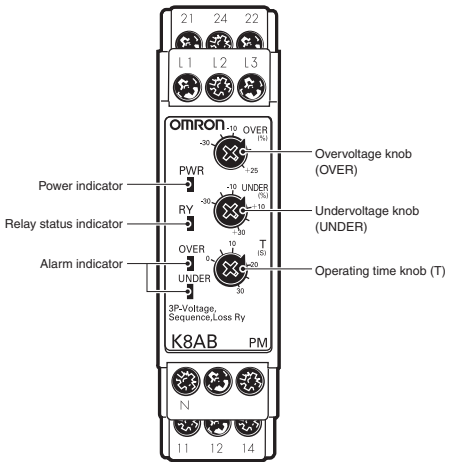


Note: 1. The K8AB-PM output relay is normally operative.

2. The power ON lock prevents unnecessary alarms from being generated during the instable period when the power is first turned on. There is no relay output during timer operation.

Nomenclature

■ Front



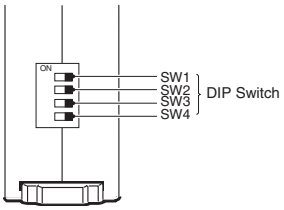
Indicators

Item		Meaning
Power indicator (PWR: Green)		Lit when power is being supplied.
Relay status indicator (RY: Yellow)		Lit when relay is operating (normally lit).
Alarm indicator (ALM: Red)	Overvoltage: Red	Lit for overvoltage. The indicator flashes to indicate the error status after the overvoltage has exceeded the threshold value while the operating time is being clocked.
	Undervoltage: Red	• Lit for an undervoltage or phase loss. The indicator flashes to indicate the error status after the undervoltage has exceeded the threshold value while the operating time is being clocked. • Lit for phase sequence error.

Setting Knobs

Item	Usage
Overvoltage knob (OVER)	Used to set the voltage to –30% to 25% of the rated input voltage.
Undervoltage knob (UNDER)	Used to set the voltage to –30% to 25% of the rated input voltage.
Operating time knob (T)	Used to set the operating time to 0.1 to 30 s.

■ Function Selection DIP Switch



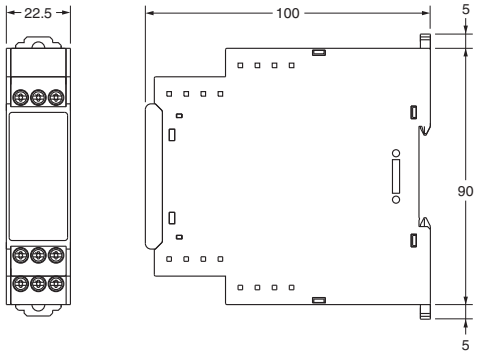
DIP Switch Functions

	Function			Default
SW1	Power ON lock time	OFF	1 s	OFF
		ON	5 s	
SW2	Monitoring mode selector	OFF	3-phase 3-wire power monitoring mode	OFF
		ON	3-phase 4-wire power monitoring mode	

SW3	SW4	Function	3-phase 3-wire mode	3-phase 4-wire mode	Default SW3	Default SW4
OFF	OFF	Rated input voltage switch (K8AB-PM1)	200 VAC	115 VAC	OFF	OFF
ON	OFF		220 VAC	127 VAC		
OFF	ON		230 VAC	133 VAC		
ON	ON		240 VAC	138 VAC		
OFF	OFF	Rated input voltage switch (K8AB-PM2)	380 VAC	220 VAC	OFF	OFF
ON	OFF		400 VAC	230 VAC		
OFF	ON		415 VAC	240 VAC		
ON	ON		480 VAC	277 VAC		

Dimensions

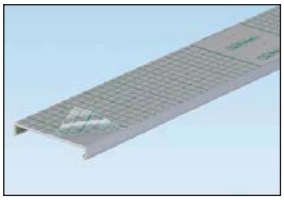
K8AB-PM



Panduct® Type G Wide Slot Wiring Duct

- Wide slot/finger design provides greater sidewall rigidity and can be used with a wide range of wire bundle sizes
- Material: Lead-free PVC
- UL recognized continuous use temperature: 122°F (50°C)
- UL 94 flammability rating of V-0
- Conforms with NFPA 79-2007 section 13.3.1 requirement for flame retardant material
- Provided with mounting holes
- Base and cover length is 6 feet

	E	F
For .5" duct height:	0.37" [9.4]	0.80" [20.3]
0.75" to 2" duct height:	0.31" [7.9]	0.80" [20.3]
3" to 4" duct height:	0.31" [7.9]	1.00" [25.4]
5" duct height:	0.38" [9.4]	1.33" [33.8]



To order cover with protective film add "-F" to part number. 6" cover not available with film.

Base and cover sold separately.
*"H" dimension includes duct and cover.

Safety relays - PSR-SPP- 24UC/ESAM4/3X1/1X2/B - 2900510

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

The figure shows a version with a screw connection

Safety relay for emergency stop and safety door monitoring up to SIL 3 or Cat. 4, PL e according to EN ISO 13849, single or two-channel operation, 3 enabling current paths, nominal input voltage of 24 V AC/DC, plug-in spring-cage terminal block

Why buy this product

- Up to Cat.4/PL e according to EN ISO 13849-1, SILCL 3 according to EN 62061, SIL 3 according to IEC 61508
- Manually monitored and automatic activation in a single device
- Basic insulation
- Single and two-channel control
- 3 enabling current paths, 1 signaling current path

Key Commercial Data

Packing unit	1 STK
Weight per Piece (excluding packing)	137.480 g
Custom tariff number	85364100
Country of origin	Germany

Technical data

Note

Utilization restriction	EMC: class A product, see manufacturer's declaration in the download area

Dimensions

Width	22.5 mm
Height	112 mm
Depth	114.5 mm

Ambient conditions

Ambient temperature (operation)	-20 °C ... 55 °C
Ambient temperature (storage/transport)	-40 °C ... 70 °C

Safety relays - PSR-SPP- 24UC/ESAM4/3X1/1X2/B - 2900510

Technical data

Ambient conditions

Max. permissible relative humidity (operation)	75 % (on average, 85% infrequently, non-condensing)
Max. permissible humidity (storage/transport)	75 % (on average, 85% infrequently, non-condensing)
Shock	15g
Vibration (operation)	10 Hz ...150 Hz, 2g
Maximum altitude	≤ 2000 m (Above sea level)

Input data

Nominal input voltage U_N	24 V AC/DC
Input voltage range in reference to U_N	0.85 ... 1.1
Typical input current at U_N	140 mA AC
	65 mA DC
Voltage at input/start and feedback circuit	approx. 24 V DC
Typical response time	20 ms (man. start)
Typical release time	45 ms (single-channel)
	10 ms (two-channel)
Concurrence input 1/2	∞
Recovery time	1 s
Status display	Green LED
Max. permissible overall conductor resistance	approx. 50 Ω (Input and start circuits at U_N)

Output data

Contact type	3 enabling current paths
	1 signaling current path
Contact material	$AgSnO_2$, + 0.2 µm Au
Minimum switching voltage	10 V AC/DC
Maximum switching voltage	250 V AC/DC
Limiting continuous current	6 A (N/O contact)
	5 A (N/C contact)
Inrush current, minimum	10 mA
Maximum inrush current	6 A
Sq. Total current	72 A^2 ($I_{TH}^2 = I_1^2 + I_2^2 + I_3^2$)
Interrupting rating (ohmic load) max.	144 W (24 V DC, τ = 0 ms)
	288 W (48 V DC, τ = 0 ms)
	77 W (110 V DC, τ = 0 ms)
	88 W (220 V DC, τ = 0 ms)
	1500 VA (250 V AC, τ = 0 ms)
Maximum interrupting rating (inductive load)	48 W (24 V DC, τ = 40 ms)
	40 W (48 V DC, τ = 40 ms)
	35 W (110 V DC, τ = 40 ms)
	33 W (220 V DC, τ = 40 ms)
Switching capacity min.	100 mW

Safety relays - PSR-SPP- 24UC/ESAM4/3X1/1X2/B - 2900510

Technical data

Output data

Output fuse	10 A gL/gG NEOZED (N/O contact)
	6 A gL/gG NEOZED (N/C contact)

General

Relay type	Electromechanical relay with forcibly guided contacts in accordance with EN 50205
Mechanical service life	Approx. 10^7 cycles
Nominal operating mode	100% operating factor
Net weight	137.48 g
Mounting type	DIN rail mounting
Mounting position	any
Degree of protection	IP54
	IP20
Min. degree of protection of inst. location	IP54
Housing color	yellow

Connection data

Connection method	Spring-cage connection
pluggable	Yes
Conductor cross section solid min.	0.2 mm²
Conductor cross section solid max.	1.5 mm²
Conductor cross section flexible min.	0.2 mm²
Conductor cross section flexible max.	1.5 mm²
Conductor cross section AWG min.	24
Conductor cross section AWG max.	16
Stripping length	8 mm

Safety-related characteristic data

Stop category	0
Designation	IEC 61508 - High demand
Safety Integrity Level (SIL)	3
Designation	IEC 61508 - Low demand
Safety Integrity Level (SIL)	3
Designation	EN ISO 13849
Performance level (PL)	e
Category	4
Designation	EN 62061
Safety Integrity Level Claim Limit (SIL CL)	3
Designation	EN 50156
Safety Integrity Level (SIL)	3

Standards and Regulations

Shock	15g

Safety relays - PSR-SPP- 24UC/ESAM4/3X1/1X2/B - 2900510

Technical data

Standards and Regulations

Designation	Air clearances and creepage distances between the power circuits
Standards/regulations	DIN EN 50178/VDE 0160
Rated insulation voltage	250 V
Rated surge voltage/insulation	4 kV / Basic isolation, (safe isolation, reinforced insulation and 6 kV between input circuit and enabling current paths.)
Degree of pollution	2
Overvoltage category	III
Vibration (operation)	10 Hz ...150 Hz, 2g

Environmental Product Compliance

China RoHS	Environmentally friendly use period: unlimited = EFUP-e
	No hazardous substances above threshold values

Hybrid motor starter - ELR H3-I-SC- 24DC/500AC-0,6 - 2900542

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

The figure shows the 9 A version

Hybrid motor starter for starting 3~ AC motors up to 500 V AC and 0.6 A output current, with 24 V DC control voltage, adjustable overload shutdown, and screw connection.

Why buy this product

- 22.5 mm wide
- Low-wear switching
- Space saving
- Reduction in wiring
- Long service life
- Adjustable current for bimetal function
- 3-phase loop bridges

RoHS

Key Commercial Data

Packing unit	1 STK
Weight per Piece (excluding packing)	217.180 g
Custom tariff number	85365040
Country of origin	Germany

Technical data

Device supply

Rated control circuit supply voltage U_S	24 V DC
Control supply voltage range	19.2 V DC ... 30 V DC
Rated control supply current I_S	40 mA
Type of protection	Surge protection
	Reverse polarity protection

Input data

Input name	Control input
Rated actuating voltage U_C	24 V DC
Triggering voltage range	19.2 V DC ... 30 V DC

Hybrid motor starter - ELR H3-I-SC- 24DC/500AC-0,6 - 2900542

Technical data

Input data

Rated actuating current I_C	5 mA (Input type 1)
Switching threshold	9.6 V (“0” signal)
	19.2 V (“1” signal)
Typical turn-off time	< 30 ms
Type of protection	Reverse polarity protection

Output data load output

Output name	AC output
Rated operating voltage U_e	500 V AC
Operating voltage range	42 V AC ... 550 V AC
Rated operating current I_e	0.6 A (AC-51)
	0.6 A (AC-53a)
Mains frequency	50/60 Hz
Load current range	75 mA ... 600 mA (see to derating)
Trigger characteristic in acc. with IEC 60947-4-2	Class 10A
Cooling time	20 min. (for auto reset)
Leakage current	0 mA
Type of protection	Surge protection

Output data reply output

Output name	Acknowledge output
Note	Confirmation: floating change-over contact, signal contact
Contact type	1 PDT
Switching capacity according to IEC 60947-5-1	3 A (230 V, AC15)
	2 A (24 V, DC13)

General

Switching frequency	≤ 2 Hz (Load-dependent)
Mounting position	vertical (horizontal DIN rail, motor output below)
Mounting type	DIN rail mounting
Assembly instructions	alignable, for spacing see derating
Operating mode	100% operating factor
Maximum power dissipation	2.5 W
Minimum power dissipation	0.88 W
Operating voltage display	Green LED
Status display	Yellow LED
Indication	Red LED

Connection data, input side

Connection name	Control circuits
Connection method	Screw connection
Stripping length	8 mm
Screw thread	M3

Hybrid motor starter - ELR H3-I-SC- 24DC/500AC-0,6 - 2900542

Technical data

Connection data, input side

Conductor cross section solid	0.2 mm² ... 2.5 mm²
Conductor cross section flexible	0.2 mm² ... 2.5 mm²
Conductor cross section AWG	24 ... 14
Torque	0.5 Nm ... 0.6 Nm

Connection data, output side

Connection name	Load circuit
Connection method	Screw connection
Stripping length	8 mm
Screw thread	M3
Conductor cross section solid	0.2 mm² ... 2.5 mm²
Conductor cross section flexible	0.2 mm² ... 2.5 mm²
Conductor cross section AWG	24 ... 14
Torque	0.5 Nm ... 0.6 Nm

Ambient conditions

Ambient temperature (operation)	-25 °C ... 70 °C (observe derating)
Ambient temperature (storage/transport)	-40 °C ... 80 °C
Degree of protection	IP20

Dimensions

Width	22.5 mm
Height	99 mm
Depth	114.5 mm

UL data

SCCR	100 kA (500 V AC (fuse: 30 A class CC/30 A class J (high fault)))
	5 kA (500 V AC (fuse: 20 A RK5 (standard fault)))
FLA	0.6 A (500 V AC)
Group installation	20 A (class RK5, SCCR 5kA, #24 - 14 AWG max. solid and stranded)
	30 A (class CC or J, SCCR 100kA, #24 - 14 AWG max, solid and stranded)
Category code	NLDX / NRNT

Insulation characteristics

Rated insulation voltage	500 V
Rated surge voltage	6 kV
Overvoltage category	III
Degree of pollution	2
Designation	Insulation characteristics between the control input and control supply voltage, and auxiliary circuit to the main circuit
Insulation	Safe isolation (IEC 60947-1) at operating voltage ≤ 300 V AC (e.g., 230/400 V AC, 277/480 V AC)
	Safe isolation (EN 50178) at operating voltage ≤ 300 V A (e.g., 230/400 V AC, 277/480 V AC)

Hybrid motor starter - ELR H3-I-SC- 24DC/500AC-0,6 - 2900542

Technical data

Insulation characteristics

	Basic isolation (IEC 60947-1) at operating voltage 300 ... 500 V AC
	Safe isolation (EN 50178) at operating voltage 300 ... 500 V AC
Designation	Isolation characteristics between the control input and control supply voltage to auxiliary circuit
Insulation	Safe isolation (IEC 60947-1) in the auxiliary circuit ≤ 300 V AC
	Safe isolation (EN 50178) in the auxiliary circuit ≤ 300 V AC

Standards and Regulations

Designation	Standards/regulations
Standards/regulations	IEC 60947-1
	IEC 60947-4-2
	IEC 61508
	ISO 13849

Approvals/conformities

UL certificate	NLDX.E228652

Environmental Product Compliance

China RoHS	Environmentally Friendly Use Period = 50

Energy storage device, lead AGM, VRLA technology, 24 V DC, 3.4 Ah, tool-free battery replacement, automatic detection, and communication with QUINT UPS-IQ

Product Description

For continuous monitoring and intelligent management, there is constant communication with the QUINT UPS. Thanks to automatic detection of the energy storage, and tool-free switching during operation, quick installation is possible. The QUINT UPS with IQ technology energy storage leaves the warehouse fully charged.

Why buy this product

- Maximum buffer times
- Lead AGM (Absorbent Glass Mat) technology

Key Commercial Data

Packing unit	1 STK
Weight per Piece (excluding packing)	444.440 g
Custom tariff number	85072080
Country of origin	China

Technical data

Dimensions

Width	85 mm
Height	191 mm
Depth	110 mm

Ambient conditions

Degree of protection	IP20
Ambient temperature (operation)	0 °C ... 40 °C
Ambient temperature (storage/transport)	0 °C ... 40 °C
Max. permissible relative humidity (operation)	≤ 95 %

Input data

Nominal input voltage	24 V DC
Buffer period	4.5 min. (20 A)

Energy storage - UPS-BAT/VRLA/ 24DC/ 3.4AH - 2320306

Technical data

Input data

	3 min. (25 A)

Output data

Nominal output voltage	24 V DC
Output current I_{max}	25 A
Connection in parallel	5
Connection in series	No
Output fuse	1x 25 A

General

IQ technology	Yes
Disposal	Used batteries must not be thrown away with household waste, they should instead be disposed of in accordance with applicable national regulations. They can also be returned to Phoenix Contact or the manufacturer.
Net weight	3.3 kg
Memory medium	Lead rechargeable battery module
Protection class	III
Mounting position	horizontal DIN rail NS 35, EN 60715

Standards and Regulations

Shock	18 ms, 30g, in each space direction (according to IEC 60068-2-27)
Connection in acc. with standard	CUL
Standard - Electrical safety	EN 60950-1/VDE 0805 (SELV)
Standard – Electronic equipment for use in electrical power installations and their assembly into electrical power installations	EN 50178/VDE 0160 (PELV)
Shipbuilding approval	Germanischer Lloyd (EMC 2), ABS, DNV
UL approvals	UL/C-UL listed UL 508
	UL/C-UL Recognized UL 60950
	UL ANSI/ISA-12.12.01 Class I, Division 2, Groups A, B, C, D (Hazardous Location)
Vibration (operation)	< 15 Hz, amplitude ±2.5 mm, 15 - 150 Hz, 2.3g/2.3g according to IEC 60068-2-6
	15 Hz ... 150 Hz, 2.3g, 90 min.

Uninterruptible power supply - QUINT-UPS/ 24DC/ 24DC/ 5 - 2320212

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

Uninterruptible power supply with IQ technology for DIN rail mounting, input: 24 V DC, output: 24 V DC/5 A, including mounted universal DIN rail adapter UTA 107/30

Product Description

The UPS module for 24 V DC with output currents ranging from 5 to 40 A allows you to create a custom solution combining a power supply, UPS module, and energy storage.

Why buy this product

- Easy handling thanks to automatic battery detection, tool-free battery replacement during operation, and communication via the IFS interface
- Optimum use of the buffer time and preventive monitoring of the energy storage
- Rapid battery charging
- Comprehensive signaling and parameterization
- Fast tripping of standard circuit breakers with SFB (selective fuse breaking) technology
- Reliable starting of difficult loads with the static POWER BOOST power reserve with up to 1.5 times the nominal current permanently

RoHS

Power supply unit - QUINT-PS/3AC/24DC/ 5 - 2866734

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

Primary-switched QUINT POWER power supply for DIN rail mounting with SFB (Selective Fuse Breaking) Technology, input: 3-phase, output: 24 V DC/5 A

Product Description

QUINT POWER power supplies with maximum functionality
QUINT POWER circuit breakers magnetically and therefore quickly trip at six times the nominal current, for selective and therefore cost-effective system protection. The high level of system availability is additionally ensured, thanks to preventive function monitoring, as it reports critical operating states before errors occur.
Reliable starting of heavy loads takes place via the static power reserve POWER BOOST. Thanks to the adjustable voltage, all ranges between 5 V DC ... 56 V DC are covered.

Why buy this product

- High level of system availability even in the event of permanent phase failure
- Reliable starting of difficult loads
- Preventive function monitoring

Key Commercial Data

Packing unit	1 pc
GTIN	4 046356 155441
Weight per Piece (excluding packing)	939.6 GRM
Custom tariff number	85044070
Country of origin	Thailand

Technical data

Dimensions

Width	40 mm
Height	130 mm
Depth	125 mm
Width with alternative assembly	122 mm
Height with alternative assembly	130 mm
Depth with alternative assembly	43 mm

Power supply unit - QUINT-PS/3AC/24DC/ 5 - 2866734

Technical data

Ambient conditions

Degree of protection	IP20
Ambient temperature (operation)	-25 °C ... 70 °C (> 60 °C Derating: 2,5 %/K)
Ambient temperature (storage/transport)	-40 °C ... 85 °C
Max. permissible relative humidity (operation)	≤ 95 % (at 25 °C, non-condensing)
Noise immunity	EN 61000-6-2:2005
Maximum altitude	5000 m

Input data

Nominal input voltage range	3x 400 V AC ... 500 V AC
Input voltage range	3x 320 V AC ... 575 V AC
	2x 360 V AC ... 575 V AC
	450 V DC ... 800 V DC
AC frequency range	45 Hz ... 65 Hz
Frequency range DC	0 Hz
Discharge current to PE	< 3.5 mA
Inrush surge current	< 15 A (typical)
Power failure bypass	> 20 ms (400 V AC)
	> 30 ms (500 V AC)
Choice of suitable circuit breakers	6 A ... 16 A (AC: Characteristics B, C, D, K)
Type of protection	Transient surge protection
Protective circuit/component	Varistor, gas-filled surge arrester

Output data

Nominal output voltage	24 V DC ±1 %
Setting range of the output voltage	18 V DC ... 29.5 V DC (> 24 V DC, constant capacity restricted)
Nominal output current	5 A (-25°C ... 60°C, U_{OUT} = 24 V DC)
POWER BOOST	7.5 A (-25°C ... 40°C permanent, U_{OUT} = 24 V DC)
SFB technology current reserve	30 A (12 ms)
Derating	60 °C ... 70 °C (2.5%/K)
Connection in parallel	Yes, for redundancy and increased capacity
Connection in series	Yes
Residual ripple	< 20 mV_{PP} (with nominal values)
Output power	120 W
Typical response time	< 0.06 s
Peak switching voltages nominal load	< 20 mV_{PP} (at nominal values, 20 MHz)
Maximum power dissipation in no-load condition	4 W
Power loss nominal load max.	14 W

General

Net weight	0.7 kg
Operating voltage display	Green LED
Efficiency	> 89 % (at 400 V AC and nominal values)

Power supply unit - QUINT-PS/3AC/24DC/ 5 - 2866734

Technical data

General

Insulation voltage input/output	4 kV AC (type test)
	2 kV AC (routine test)
Protection class	I
MTBF (IEC 61709, SN 29500)	> 1290000 h (25 °C)
	> 680000 h (40°C)
	> 290000 h (60°C)
Mounting position	horizontal DIN rail NS 35, EN 60715
Assembly instructions	Alignable: 5 mm horizontally, 15 mm next to active components, 50 mm vertically

Connection data, input

Connection method	Pluggable screw connection
Conductor cross section solid min.	0.2 mm²
Conductor cross section solid max.	2.5 mm²

Degree of protection	IP20
Ambient temperature (operation)	-10 °C ... 60 °C
Ambient temperature (storage/transport)	-20 °C ... 85 °C
Permissible humidity (operation)	5 % ... 95 % (non-condensing)
Permissible humidity (storage/transport)	5 % ... 95 % (non-condensing)
Air pressure (operation)	86 kPa ... 108 kPa (up to 1500 m above mean sea level)

Interfaces

Industrial Ethernet Switch - FL SWITCH SFNB 8TX - 2891002

Technical data

Interfaces

Interface 1	Ethernet (RJ45)
No. of ports	8 (RJ45 ports)
Connection method	RJ45
Note on connection method	Auto negotiation and autocrossing
Transmission physics	Ethernet in RJ45 twisted pair
Transmission speed	10/100 MBit/s

Function

Basic functions	Unmanaged switch / auto negotiation, complies with IEEE 802.3, store and forward switching mode
Status and diagnostic indicators	LEDs: U_S, link and activity per port

Network expansion parameters

Cascading depth	Network, linear, and star structure: any
Maximum conductor length (twisted pair)	100 m

Supply voltage

Supply voltage	24 V DC
Residual ripple	3.6 V_{PP} (within the permitted voltage range)
Supply voltage range	9 V DC ... 32 V DC
Typical current consumption	140 mA (at U_S = 24 V DC)
Max. current consumption	380 mA (@9 V DC)

General

Mounting type	DIN rail
Type AX	Block design
Net weight	385 g
Housing material	Aluminum

Standards and Regulations

Order No.	2891002
Product key	CNN113
Electromagnetic compatibility	Conformance with EMC Directive 2004/108/EC
Noise emission	EN 61000-6-4
Noise immunity	EN 61000-6-2:2005

Type 2 surge arrester - VAL-CP-3C-350 - 2859547

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

Plug-in surge arrester for 3-phase power supply networks with N and PE in a common conductor (4-conductor system: L1, L2, L3, PEN), with remote indication contact.

Why buy this product

- Plugs can be checked with CHECKMASTER
- With or without floating remote indication contact
- High continuous voltage of 350 V AC for 230/400 V AC networks with high voltage fluctuations
- Modular arrester blocks with ultra-narrow design
- Use of varistors with a low leakage current
- Mechanical coding of all slots
- Optical, mechanical status indication for the individual arresters
- Disconnect device on each individual plug
- Type 2 consistent plug-in surge arresters

Key Commercial Data

Packing unit	1 STK
GTIN	4 017918 960827
GTIN	4017918960827
Weight per Piece (excluding packing)	329.100 g
Custom tariff number	85363080
Country of origin	Germany

Technical data

Dimensions

Height	98 mm
Width	37.25 mm
Depth	71.5 mm
Horizontal pitch	2 Div.

Type 2 surge arrester - VAL-CP-3C-350 - 2859547

Technical data

Ambient conditions

Degree of protection	IP20
Ambient temperature (operation)	-40 °C ... 80 °C
Ambient temperature (storage/transport)	-40 °C ... 80 °C
Altitude	≤ 2000 m (amsl (above mean sea level))
Permissible humidity (operation)	5 % ... 95 %
Shock (operation)	30g (half sinus / 11 ms / 3x ±X, ±Y, ±Z)
Vibration (operation)	5g (10 ... 500 Hz / 2.5 h / X, Y, Z)

General

IEC test classification	II
	T2
EN type	T2
IEC power supply system	TN-C
Mode of protection	L-PEN
Mounting type	DIN rail: 35 mm
Color	gray/blue
	black
Housing material	PBT-FR
Degree of pollution	2
Flammability rating according to UL 94	V-0
Type	DIN rail module, two-section, divisible
Number of positions	3
Surge protection fault message	Optical, remote indicator contact

Protective circuit

Nominal voltage U_N	240/415 V AC (TN-C)
Nominal frequency f_N	50 Hz (60 Hz)
Maximum continuous operating voltage U_C (L-PEN)	350 V AC
Rated load current I_L	40 A (Biconnect M4 fork-type cable lug 6 mm²)
	63 A (TWIN ferrule 2 x 10 mm²)
Nominal discharge current I_n (8/20) µs (L-PEN)	20 kA
Maximum discharge current I_{max} (8/20) µs (L-PEN)	40 kA
Short-circuit current rating I_{SCCR}	25 kA
Voltage protection level U_p (L-PEN)	≤ 1.5 kV
Residual voltage U_{res} (L-PEN)	≤ 1.5 kV (at I_n)
	≤ 1.3 kV (at 10 kA)
	≤ 1.2 kV (at 5 kA)
	≤ 1.1 kV (at 4 kA)
	≤ 1 kV (at 2 kA)
TOV behavior at U_T (L-PEN)	415 V AC (5 s / withstand mode)
	440 V AC (120 min / safe failure mode)

Type 2 surge arrester - VAL-CP-3C-350 - 2859547

Technical data

Protective circuit

Response time t_A (L-PEN)	≤ 25 ns
Max. backup fuse with branch wiring	315 A (gG)
Max. backup fuse with V-type through wiring	40 A (gG / Biconnect M4 fork-type cable lug, 6 mm²)
	63 A (gG / TWIN ferrule 2x 10mm²)

Indicator/remote signaling

Switching function	PDT contact
Operating voltage	5 V AC ... 250 V AC
	125 V DC (200 mA DC)
Operating current	5 mA AC ... 1 A AC
	1 A DC (30 V DC)
Connection method	Pluggable screw connection
Screw thread	M2
Tightening torque	0.25 Nm
Stripping length	7 mm
Conductor cross section flexible	0.14 mm² ... 1.5 mm²
Conductor cross section solid	0.14 mm² ... 1.5 mm²
Conductor cross section AWG	28 ... 16

Connection data

Connection method	Screw connection
Screw thread	M5
Tightening torque	4.5 Nm
Stripping length	16 mm
Conductor cross section flexible	2.5 mm² ... 16 mm²
Conductor cross section solid	2.5 mm² ... 25 mm²
Conductor cross section AWG	12 ... 4

UL specifications

SPD Type	4CA
Maximum continuous operating voltage MCOV (L-L)	700 V AC
Maximum continuous operating voltage MCOV (L-N)	350 V AC
Nom. voltage	277/480 V AC
Mode of protection	L-L
	L-N
Power distribution system	3Y
Nominal frequency	50/60 Hz
Measured limiting voltage MLV (L-L)	3280 V
Measured limiting voltage MLV (L-N)	2000 V
Nominal discharge current I_n (L-L)	20 kA
Nominal discharge current I_n (L-N)	20 kA

Environmental Product Compliance

Type 2 surge arrester - VAL-CP-3C-350 - 2859547

Technical data

Environmental Product Compliance

China RoHS	Environmentally Friendly Use Period = 50

Rockwell Automation

1734 POINT I/O

Digital I/O Modules

The 1734 digital I/O modules support:

- A wide variety of voltage interface capabilities.
- Isolated and non-isolated module types.
- Point-level output fault states for short-circuit and wire-off diagnostics.
- Choice of direct-connect or rack-optimized communications.
- Field-side diagnostics on select modules.
- Safety applications up to and including SIL 3, Cat. 4, PL(e), when using 1734-IB8S or 1734-OB8S with a GuardLogix, SmartGuard 600, or GuardPLC controller.

POINT Digital AC Input Modules

Cat. No.	Inputs	Voltage Category	Input Delay Time, On to Off	On-State Current, Min.	Input Impedance, Nom.	Off-State Current, Max.	PointBus Current (mA)	Power Dissipation, Max.	Terminal Base Unit
1734-IA2	2 Non-isolated, current sinking	120V AC (65V AC...132V AC)	20.0 ms hardware + (0...65 ms selectable)	4.0 mA @ 65V AC, 60 Hz	10.6 kΩ	2.7 mA @ 43V AC	75 mA	0.1 W at 132V AC	1734-TB, 1734-TBS, 1734-TOP, or 1734-TOPS
1734-IA4	4 Non-isolated, current sinking								
1734-IM2	2 Non-isolated, current sinking	220V AC (159V AC...264V AC)		6.2 mA @ 159V AC, 60 Hz	22.3 kΩ	2.9 mA @43V AC			
1734-IM4	4 Non-isolated, current sinking

POINT Digital AC Output Modules

Cat. No.	Outputs	Voltage Category	Output Current Rating	PointBus Current (mA)	Power Dissipation, Max.	Terminal Base Unit
1734-OA2	2 Non-isolated, current sourcing	120/220V AC (74V AC...264V AC)	1.5 A (2 channels @ 0.75 A each)	75 mA	2 W at 264V AC	1734-TB, 1734-TBS, 1734-TOP, or 1734-TOPS
1734-OA4	4 Non-isolated, current sourcing		2.0 A (750 mA per output)		3.5 W at 264V AC	

POINT Digital DC Input Modules

The 1734-IB4D module is a 4-channel 24V DC input module with short-circuit and open-wire diagnostics. Catalog numbers ending with "S" are safety-rated.

Cat. No.	Inputs	Voltage Category	Input Delay Time, On to Off	On-State Current, Min.	On-State Current, Max.	Off-State Current, Max.	PointBus Current (mA)	Power Dissipation, Max.	Terminal Base Unit
1734-IB2	2 current sinking	24V DC (10V DC... 28.8V DC)	0.5 ms hardware + (0...65 ms selectable)	2 mA	5 mA	1.5 mA	75 mA	0.7 W at 28.8V DC	1734-TB or 1734-TBS
1734-IB4	4 current sinking							1.0 W at 28.8V DC	1734-TB, 1734-TBS, 1734-TB3, or 1734-TB3S★
1734-IB4D	4 Sink, diagnostic	24V DC (11V DC... 28.8V DC)	—	2 mA	15 mA	—	50 mA	0.6 W at 28.8V DC	1734-TB, 1734-TBS, 1734-TOP, or 1734-TOPS
1734-IB8	8 current sinking	24V DC (10V DC... 28.8V DC)	0.5 ms hardware + (0...65 ms selectable)	2 mA	5 mA	1.5 mA	75 mA	1.6 W at 28.8V DC	1734-TB or 1734-TBS
1734-IB8S	8 current sinking, safety-rated	24V DC (11V DC... 28.8V DC)	—	3.3 mA	5 mA	1.3 mA	175 mA	2.44 W	1734-TB, 1734-TOP, 1734-TOP3
1734-IV2	2 current sourcing	24V DC (10V DC... 28.8V DC)	0.5 ms hardware + (0...65 ms selectable)	2 mA	5 mA	1.5 mA	75 mA	0.7 W at 28.8V DC	1734-TB or 1734-TBS
1734-IV4	4 current sourcing							1.0 W at 28.8V DC	1734-TB, 1734-TBS, 1734-TB3, or 1734-TB3S★
1734-IV8	8 current sourcing							1.6 W at 28.8V DC	1734-TB or 1734-TBS

★ 1734-TB3 or 1734-TB3S recommended.

POINT Digital DC Output Modules

CompactLogix™ 5370 L1 Programmable Automation Controllers

L16ER-BB1B, -L18ER-BB1B, -L18ERM-BB1B

Features and Benefits

The CompactLogix 5370 L1 controllers combine the power of the Logix architecture with the flexibility of POINT I/O in a compact and affordable package. Ideal for small to mid-size machines, these controllers provide customers the benefits of Integrated Architecture in a lower cost system.

Machine builders and end users can build a better machine by taking advantage of the following features of these controllers:

- Ideal for applications that require low axis motion and I/O point counts
- Support for Integrated Motion on EtherNet/IP
- Support for Device Level Ring (DLR) network topologies
- Built-in energy storage eliminates the need for lithium batteries
- Support for a wide variety of granular POINT I/O modules
- Removable 1GB secure digital (SD) card for fast program save and restore
- Smaller form factor conserves space in control cabinet
- Support for 2 axes Kinematics for simple articulated robotics
- Open socket capability allows support for Modbus TCP as well as devices such as printers, barcode readers and servers

Reduce cost and time to market with CompactLogix 5370 L1 Programmable Automation Controllers.

Expanding on the scalability of the Logix family of controllers, the CompactLogix 5370 L1 programmable automation controllers (PAC) are designed to meet the growing need for a higher performance controller in a compact and affordable package. Offering a reduction in required panel space, the L1 controllers truly enable you to build a high performance, more cost-effective machine.

As part of the Integrated Architecture system, the CompactLogix 5370 L1 controllers use the same programming software, network protocol, and information capabilities as all Logix controllers, providing a common development environment for all control disciplines. Consistent tools and features allow users to lower the cost engineering investment, ease diagnostics and troubleshooting, and speed time to market.

Integrated Motion on EtherNet/IP

The CompactLogix 5370 L1 controller meets the needs of customers looking for performance and cost competitive motion solutions.

- Supports up to 2 axes of integrated motion
- Together with the Kinetix 350, offers cost-effective, scalable motion solution

Network Capabilities

With dual Ethernet ports and an integrated Ethernet switch, these controllers now support Device Level Ring (DLR) network topologies, simplifying integration of components in your control system and reducing system cost. Deploying as a DLR provides resiliency from loss of one network connection and allows replacement of devices one at a time without stopping production. A daisy chain connection reduces the number of Ethernet switches in the control system.

BASE DRIVE INFORMATION

Bulletin Number	PowerFlex 525 AC Drive, with Embedded EtherNet/IP and Safety
Voltage Class	480 VAC, 3 Phase
Output Current	2.3 Amps
Enclosure Type	IP20 NEMA / Open Type
Frame Size	Frame A
Interface Module	Standard
EMC Filtering Options	Filter

GENERAL CABLE CABLING ASSISTANCE

Disclaimer:

Article 310, Table 310.15(B) 16 Allowable Ampacities for Insulated Conductors up to 2000V, Correction Factors, and Other Possible Constraints. It is the responsibility of the Designer, Installer and End User to verify that all NEC, CEC and Local Codes/Standards are strictly adhered too. Consult Rockwell Automation Drive Family Motor Cable Length Restrictions Tables (Rockwell Automation Publication DRIVES-IN001L-EN-P for maximum VFD cable lengths). To protect the motor from reflective waves, limit the length of the motor cables from the drive to the motor. General Cable can provide some direction as to what cables could be considered for use with these drives since NEC Article 430 Motors, Motor Circuits and Controllers would be the minimum guidelines for review. General Cable cannot recommend a specific cable for a specific drive system since we do not know all drive system parameters and customer's applications. Nothing herein is intended to modify, alter or extend any warranties for General Cable products.

Additional Details

Input	Three Phase 380-480V

Signal conditioner - MCR-FL-C-UI-2UI-DCI - 2814854

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

MCR signal multiplier, for doubling and electrical isolation of analog signals, unconfigured

Why buy this product

- Calibrated selectable input and output signals
- 4-way isolation

Key Commercial Data

Packing unit	1 STK
Weight per Piece (excluding packing)	139.400 g
Custom tariff number	85437096
Country of origin	Germany
Note	Made to Order (non-returnable)

Configuration

Input signal	Current [I]
Starting value of input signal	4.0
End value of input signal	20.0
Output signal output 1	4...20 mA [OUT02]
Output signal output 2	4...20 mA [OUT02]
Plant calibration certificate	No plant calibration certific. [NONE]

Technical data

Note

Utilization restriction	EMC: class A product, see manufacturer's declaration in the download area

Dimensions

Width	17.5 mm
Height	99 mm
Depth	114.5 mm

Signal conditioner - MCR-FL-C-UI-2UI-DCI - 2814854

Technical data

Ambient conditions

Ambient temperature (operation)	-25 °C ... 55 °C

Input data

Description of the input	Current input
Number of inputs	1
Configurable/programmable	Yes, preconfigured
Current input signal	0 mA ... 24 mA (freely selectable in 0.1 mA steps)
Max. input current	50 mA
Input resistance current input	50 Ω
Description of the input	Voltage input
Configurable/programmable	Yes, preconfigured
Voltage input signal	0 V ... 12 V (freely selectable in 0.1 V steps)
max. input voltage	30 V
Input resistance of voltage input	200 kΩ

Output data

Output name	Voltage output
Number of outputs	2
Configurable/programmable	Yes, preconfigured
Voltage output signal	0 V DC ... 10 V DC (refer to the order key)
	2 V DC ... 10 V DC
	0 V DC ... 5 V DC
	1 V DC ... 5 V DC
Max. output voltage	15 V
Load/output load voltage output	≥ 10 kΩ
Output name	Current output
Configurable/programmable	Yes, preconfigured
Current output signal	0 mA ... 20 mA (refer to the order key)
	4 mA ... 20 mA
	0 mA ... 10 mA
Max. output current	35 mA
Load/output load current output	≤ 600 Ω

Power supply

Supply voltage range	20 V DC ... 30 V DC
Max. current consumption	< 25 mA

Connection data

Connection method	Screw connection
Conductor cross section solid min.	0.2 mm²
Conductor cross section solid max.	2.5 mm²
Conductor cross section AWG min.	24
Conductor cross section AWG max.	14

Signal conditioner - MCR-FL-C-UI-2UI-DCI - 2814854

Technical data

Connection data

Conductor cross section flexible min.	0.2 mm²
Conductor cross section flexible max.	2.5 mm²
Stripping length	8 mm
Screw thread	M3

General

No. of channels	2
Maximum transmission error	≤ 0.15 % (of final value)
Transmission error, typical	0.05 % (of final value)
Maximum temperature coefficient	< 0.015 %/K
Temperature coefficient, typical	0.0075 %/K
Limit frequency (3 dB)	30 Hz
Step response (10-90%)	12 ms
Protective circuit	Transient protection
Test voltage, input/output/supply	1.5 kV (50 Hz, 1 min.)
Color	green
Housing material	Polyamide PA non-reinforced
Mounting position	any
Conformance	CE-compliant
UL, USA/Canada	Class I, Div. 2, Groups A, B, C, D or Non-Hazardous Locations

Standards and Regulations

Connection in acc. with standard	CUL
Conformance	CE-compliant
UL, USA/Canada	Class I, Div. 2, Groups A, B, C, D or Non-Hazardous Locations

Environmental Product Compliance

China RoHS	Environmentally Friendly Use Period = 50
	For details about hazardous substances go to tab “Downloads”, Category “Manufacturer's declaration”

1489-M Circuit Breakers

Bulletin 1489-M thermal magnetic Circuit Breakers are approved for branch circuit protection in the United States and Canada, and are certified as Miniature Circuit Breakers for IEC applications.

These branch protectors are compatible with many accessories to meet diverse application needs, including UL 508 Listed bus bars for convenience in panel assembly, auxiliary contacts, signal contacts and shunt trips for versatility, and lock out attachments for safety during maintenance.

Features

- Current limiting
- Fast breaking time
- High rated voltage
- Superior shock and vibration resistance to help prevent nuisance tripping
- Dual terminals allow the connection of two wires, or both a wire and bus bar (self declared)
- Terminal design helps prevent wiring misses by directing wires into the terminal openings, even while tightening
- Reversible line and load connections
- Single and multi-pole toggle mount lock out attachments available for Lock Out Tag Out (LOTO)
- RoHS compliant and fully-recyclable device
- Suitable for extreme ambient conditions

1489-M Circuit Breakers	
Rated Voltage	UL/CSA: Max. 480Y/277V AC IEC: Ue 230/400V AC
Interrupting Capacity	UL/CSA: 10 kA IEC: 15 kA
Current Ratings	0.5...63 A
Poles	1, 2, 3
Trip Curves	C, D
Standards Compliance	UL 489 CSA C22.2 No. 5.1 EN 60947-2 GB 14048.2

CPP Item 04
Thermostat, 6A NC - Eldon ETR202 / Page 1/1

Description: Thermostat with NC/NO contacts to manage temperature in panels. ETR202 with a normally closed contact for regulating heaters. ETR201 with a normally open contact for regulating cooling devices or signal devices. Sensor element thermostatic bimetal. Mounting clip for 35 mm DIN rail (EN 60715).

Material: Plastic according to UL94 V-0.

Setting range: 0ºC to 60ºC. Switching temperature difference less than 7ºK, and switching point tolerance ±4ºK.

Switch capacity: 240V AC, 10(2)A. 120V AC, 15(2)A. 24V DC, 30W. Value in brackets for inductive load.

Operating temperature: -20 to +80°C.

Service life: > 100,000 cycles.

Connection: Screw terminal for cable (0.5 to 2.5 mm^2).

	Description	Item no.
	Normally opened contact	ETR201
	Normally closed contact	ETR202

Description: Mounting brackets for safe wall fixing. It includes the sealing washers to guarantee the IP rating. In stainless steel machining is required.

Pack quantity: 4 brackets with mounting accessories.

Material	Item no.
3 mm stainless steel 304	AWS41-304
3 mm stainless steel 316	AWS41-316

Summary of Changes

Topic	Page
Updated system memory to 512 MB RAM and 512 MB storage. Updated user memory to 80 MB, approx, nonvolatile storage for applications.	4, 5, 6

The PanelView™ Plus 7 Performance terminals are operator interface devices. They monitor and control devices that are attached to ControlLogix® and CompactLogix™ 5370 controllers on an EtherNet/IP network. Animated graphic and text displays provide operators a view into the operating state of a machine or process. Operators interact with the control system by using touch screen or keypad input.

Features include the following:

- FactoryTalk® View Machine Edition software, version 8.1, provides a familiar environment for creating HMI applications
- Windows CE operating system with desktop access for configuration and third-party applications
- Connection to ControlLogix or CompactLogix 5370 controllers
- Ethernet communication that can support Device Level Ring (DLR), linear, or star network topologies
- Web browser, Microsoft file viewers, text editor, PDF viewer, remote desktop connection, and media player on the terminal desktop

Environmental Specifications

This table lists environmental specifications for the PanelView Plus 7 Performance terminals.

Attribute	Value
Temperature, operating (1)	0…55 °C (32…131 °F)
Temperature, nonoperating	-25…+70 °C (-13…+158 °F)
Heat dissipation (2)	7-in. DC (touch, and touch with keypad), 51 BTU (typical) 7-in. AC (touch, and touch with keypad), 53 BTU (typical) 9-in. DC, 55 BTU (typical) 9-in. AC, 58 BTU (typical) 10-in. DC (touch, and touch with keypad), 51 BTU (typical) 10-in. AC (touch, and touch with keypad), 56 BTU (typical) 12-in. DC, 60 BTU (typical) 12-in. AC, 67 BTU (typical) 15-in. DC (touch, and touch with keypad), 61 BTU (typical) 15-in. AC (touch, and touch with keypad), 68 BTU (typical) 19-in. DC, 114 BTU (typical) 19-in. AC, 119 BTU (typical)
Altitude, operating	2000M
Relative humidity	5…95% without condensation
Vibration	0.012 pk-pk, 10…57 Hz 2 g peak at 57…500 Hz (3)
Shock, operating	15 g at 11 ms
Shock, nonoperating	30 g at 11 ms
Enclosure ratings	NEMA and UL Type 12, 13, 4X, also rated IP66 as Classified by UL

(1) The 19-inch terminals (2711P-T19C22D9P, 2711P-T19C22D9P-B, 2711P-T19C22A9P, and 2711P-T19C22A9P-B) are rated up to 50 °C (122 °F) operating temperature.
(2) Typical BTU measurements were taken at 25 °C (77 °F).
(3) The 15-inch and 19-inch terminals (2711P-T15C22D9P, 2711P-T15C22D9P-B, 2711P-T15C22A9P, 2711P-T15C22A9P-B, 2711P-B15C22D9P, 2711P-B15C22D9P-B, 2711P-B15C22A9P, 2711P-B15C22A9P-B, 2711P-T19C22D9P, 2711P-T19C22D9P-B, 2711P-T19C22A9P, 2711P-T19C22A9P-B) are rated to: 0.006 in. pk-pk, 10...57 Hz, 1 g peak at 57...640 Hz.

Certifications

This table lists certifications for the PanelView Plus 7 Performance terminals.

Certification[1]	Value
cULus	cULus Listed Industrial Control Equipment for use in Hazardous Locations (E10314) per standards ANSI / ISA 12.12.01 and CSA C22.2 No. 213. rated: • Class I, Div 2, Groups A, B, C, D Enclosure type ratings per UL50 and CSA C22.2 No. 94.2-07. Enclosure ingress protection classified by UL per IEC 60529.
CE (EMC)	European Union 2004/108/EC EMC Directive, compliant with: • EN 61000-6-2; Industrial Immunity • EN 61000-6-4; Industrial Emissions • EN 61131-2; Programmable Controllers
CE (LVD)	European Union 2006/95/EC Low Voltage Directive, compliant with: • EN 61131-2; Programmable Controllers
RCM	Australian Radiocommunications Act, compliant with: • AS/NZS CISPR 11; Industrial Emissions
RoHS	China RoHS, Turkey RoHS, European RoHS
KCC	Certificate of compliance
EtherNet/IP	ODVA conformance tested to EtherNet/IP specifications

(1) When marked. See the Product Certification link at http://www.rockwellautomation.com/global/certification/overview.page for Declarations of Conformity, Certificates, and other certification details.

Technical Specifications

The tables in this section provide technical specifications for the PanelView Plus 7 Performance terminals.

PanelView Plus 7 Performance 7-in and 9-in Terminals

Attribute	7-in. Touch 2711P--T7C22D9P, 2711P--T7C22D9P-B (1) 2711P-T7C22A9P, 2711P-T7C22A9P-B	7-in. Touch with Keypad 2711P-B7C22D9P, 2711P-B7C22D9P-B (1) 2711P-B7C22A9P, 2711P-B7C22A9P-B	9-in. Touch 2711P-T9W22D9P, 2711P-T9W22D9P-B (1) 2711P-T9W22A9P, 2711P-T9W22A9P-B
Operator input	Touch	Touch with keypad	Touch
Display type	TFT Color		
Display size, diagonal	6.5-in.		9-in. widescreen
Viewing area (W x H)	132 x 99 mm (5.2 x 3.9 in.)		196 x 118 mm (7.7 x 4.6 in.)
Display resolution	640 x 480 VGA, 18-bit color graphics		800 x 480 WVGA, 18-bit color graphics
Aspect ratio	4:3		5:3
Brightness, typical	300 cd/m^2 (Nits)		
Backlight life	White light-emitting diode, solid-state Life: 50,000 h min at 40 °C (104 °F) to half-brightness, backlight is not replaceable		
Touch screen	Analog resistive Actuation rating: 1 million presses Operating force: 100 grams		
Battery (real-time clock backup)	Accuracy: +/-2 minutes per month. Battery life: 4 years min at 25 °C (77 °F) Replacement: CR2032 lithium coin cell		
Memory: • System • User	• 512 MB RAM and 512 MB storage • 80 MB, approx, nonvolatile storage for applications		
Secure Digital (SD) card slot	One SD card slot for external storage; supports cat. no. 1784-SD*x* cards		
USB ports: • Host • Device	• Two USB high-speed 2.0 host ports (type A) support removable flash drives for external storage • One high-speed 2.0 device port (type B) that will be functional in a future release		
Operating system	Windows CE with Extended Features and MS Office Viewers (includes FTP, VNC client server, ActiveX controls, PDF reader, third-party device support)		
Ethernet ports	Two 10/100Base-T, Auto MDI/MDI-X Ethernet ports that support Device Level Ring (DLR), linear, or star network topologies		
Software	FactoryTalk View Studio for Machine Edition, FactoryTalk ViewPoint, version 2.6 or later		
Electrical			
Input voltage	24V DC nom (18…30V DC)	100…240V AC	24V DC nom (18…30V DC)	100…240V AC	24V DC nom (18…30V DC)	100…240V AC
Power consumption	50 W max (2.1 A at 24V DC)	105VA	50 W max (2.1 A at 24V DC)	105VA	50 W max (2.1 A at 24V DC)	105VA
Power supply	Supports (SELV) and (PELV) 24V DC supplies (2)	—	Supports (SELV) and (PELV) 24V DC supplies (2)	—	Supports (SELV) and (PELV) 24V DC supplies (2)	—
Mechanical						
Weight, approx	1.2 kg (2.65 lb)		1.47 kg (3.25 lb)		1.58 kg (3.48 lb)	
Dimensions, approx (H x W x D)	170 x 212 x 69.6 mm 6.69 x 8.35 x 2.74 in.		179 x 285 x 69.6 mm 7.05 x 11.22 x 2.74 in.		190 x 280 x 69.6 mm 7.48 x 11.02 x 2.74 in.	
Cutout dimensions, approx (H x W)	142 x 184 mm 5.59 x 7.24 in.		142 x 237 mm 5.59 x 9.33 in.		162 x 252 mm 6.38 x 9.92 in.	

(1) Catalog numbers with a -B extension denote terminals that exclude the Allen-Bradley brand marking. Customers can put their own brand labels on these terminals.
(2) DC-powered terminals support safety extra low voltage (SELV) and protective extra low voltage (PELV) 24V DC power supplies such as cat. nos. 1606-XLP95E, 1606-XLP100E, 2711P-RSACDIN.

1.0 *Salsnes Filter System*

The objective of this document is to provide details regarding the control strategy for the Salsnes Filter (SF) System. The control philosophy outlines the major hardware components, system status, alarm conditions, and modes of operation of the System.

1.1 Glossary

SF	Salsnes Filter
PLC	Programmable Logic Controller
IO	Inputs/Outputs
CPP	Control Power Panel. The CPP contains the local power distribution components for each system. It also houses the PLC, IO, and the Operator Interface Terminal
OIT	Operator Interface Terminal
VFD	Variable Frequency Drive

1.2 System Overview

The SF System uses a PLC based control system that provides optimized control of a mesh Filter Belt. Each SF System is powered by a CPP that houses the PLC, IO, and OIT which provides local control and monitoring. The PLC will control the Filter Belt rotational speed to obtain optimum separation of the incoming material. The speed will be varied by a Filter Motor to maintain a specified water level in the inlet well. The solids are deposited off of the belt into an outlet well, where optional dewatering may be performed by the Sludge Screw.

1.3 Control Strategy Priorities

The strategic operational priorities of the SF System controls are as follows (arranged in order of priority):

- Operator and equipment safety
- Maximize Separation, Thickening, and Dewatering Efficiency

1.4 Safety Features

The SF System control strategy employs an equipment protection interlock and monitors a number of alarm conditions that will result in control actions designed to maximize efficiency.

There is one critical interlock signal that is hardwired to the CPP that will disable the motors in the SF System. This critical interlock is:

- Emergency Stop Push Button
- Dewatering Screw Failure
- Options: Air Pressure Not Present, Ventilation Differential Pressure Alarm, External Sludge Bin Fault

Certain other alarm conditions will trigger a control action that will result in the filter motor running at a fixed high speed. Examples of these types of alarm conditions are more fully described later in this document.

1.5 Alarm Classifications

1.5.1 *Critical*

A critical alarm will cause an immediate system shutdown. Any inlet water will flow from the inlet to the security overflow and no filtration is expected.

1.5.2 *Major*

A major alarm will not stop the filtration process, but the machine will change to a fixed speed (that is adjustable manually) on the Filter Belt to ensure that the system will cope with the flow. Reduced filtration performance is expected.

1.5.3 *Minor*

A minor alarm will have no impact on the system. This alarm is intended to provide warning and maintenance information.

2.0 *CPP IO Layout*

Type	Details	Model
CPU	Allen Bradley Compact Logix Controller	1769-L16ER-BB1B
HMI	Allen Bradley PV +700	2711P-T7C4D8
Embedded Discrete Input	16 Input, 24VDC	Embedded Processor I/O
Embedded Discrete Output	16 Output, 24VDC	Embedded Processor I/O
Discrete Input	8 Input, 24VDC	1734-IB8
Discrete Input	8 Input, 24VDC	1734-IB8
Analog Input	4 Input 0-20mA	1734-IE4C

2.1 Discrete Inputs – Embedded I/O

Channel	Description	Tagname	Range

In2	*Spare*		
In3	*Spare*		

2.6 Communications Layout

Device Description	Address	Subnet Mask	Gateway	Tagname
CPP PLC	192.168.3.11	255.255.255.0	192.168.3.1	
CPP OIT	192.168.3.12	255.255.255.0	192.168.3.1	
CPP Modem	192.168.3.10	255.255.255.0	192.168.3.1	
CPP Filter VFD	192.168.3.13	255.255.255.0	192.168.3.1	07-M320
CPP Sludge Screw VFD	192.168.3.14	255.255.255.0	192.168.3.1	07-M350

3.0 *CPP*

3.1 Standard Operation

3.1.1 *Startup*

The startup sequence is as follows (system in HMI mode, all devices in Automatic):

- If PLC is configured to control the inlet valve, this valve will be opened when the filter is Local On or in HMI mode and a filter Start is requested either through a HMI start request or by a remote SCADA or hardwired Permissive Run request
- System remains idle until the water level in the inlet well reaches the start level set-point
- Once the water level in the inlet well reaches the start level set-point, the following motors will start:
    - Blower Motor (starts at adjustable water level before filter)
    - Blower Motor Cooling Fan
    - Filter Motor
    - Sludge Screw Motor – (after adjustable time delay)
- The Blower Motor must be at full speed in Auto before the Filter Motor will be allowed to start – the blower start level may be adjusted in order to optimize the system
- The filter belt speed may be set using the following configurable modes:
    - PID controlled to maintain a target water level set-point
    - Directly proportional to the water level
    - Fixed speed manual mode
- The Filter Motor will stop if the water level drops below the stop level set-point

3.1.2 *Controlled Shutdown*

The controlled shutdown sequence is as follows:

- System remains running while the water level in the inlet well stays above the stop level set-point
- Once the water level drops below the stop level set-point, the Filter Motor will stop immediately
- The Sludge Screw Motor will stop after a configurable time delay, after the Filter Motor has stopped
- The Blower Motor will then stop after the stop delay time expires
- The Blower Motor Cooling Fan will stop after a hard coded 1-minute time delay, after the Blower Motor has stopped
- Optionally the filter stop sequence may also be triggered by the loss of the plant permissive digital input signal which will also result in the inlet valve being closed (if applicable)
- If system is shutting down due to an operator request to put the filter out of operation (HMI Stop command or SCADA/hardwired loss of permissive run), a Cold Water Washing procedure will trigger before Blower shut-down

3.1.3 *Critical Shutdown*

The critical shutdown sequence is as follows:

- System shutdown signal is issued due to a critical alarm
- The Blower Motor turns off
- The Blower Motor Cooling Fan turns off
- The Filter Motor turns off
- The Sludge Screw Motor turns off
- Inlet valve close (if applicable)
- All valves and motors will shut down simultaneously
- System will not re-start until the critical alarm has been cleared

3.1.4 *Hot Water Flush*

Automatic Hot Water Flushing of the filter mesh and dewatering basin is performed as follows:

- System must be in HMI mode with selected to Automatic Mode, and no critical or major alarms are present
- Cold Water Flush cannot be occurring
- The Hot Water Flush interval time, which is set from the OIT, expires
- The Hot Water Flush Valve opens
- The Filter Motor runs at a constant speed
- The Hot Water Flush Valve closes after the flush duration time expires
- The Filter Motor speed regulation mode goes back to normal control

3.1.5 *Cold Water Flush*

Automatic Cold Water Flushing (not available on the SF1000) of the filtered water basin is performed as follows:

- System must be in HMI mode and all Motors and Valves in Automatic Mode, and no critical or major alarms are present
- System does not need to be moving but must be requested to operate
- Hot Water Flush cannot be occurring
- The Cold Water Flush interval time, which is set from the OIT, expires
- The Cold Water Flush Valve opens
- The Filtered Water Drain Valve, if equipped, opens
- The Cold Water Flush Valve and Filtered Water Drain Valve close after the flush duration time expires
- A Cold Water Flush sequence will also be triggered at the end of a controlled shutdown sequence as described in section 3.1.2

3.2 Operation Modes

3.2.1 *Off*

When the Filter Control Switch is in the “Off” position, the CPP PLC will have no control of the motors or valves.

3.2.2 *On*

When the Filter Control Switch is in the “On” position, the CPP PLC will have no control of the motors or valves. In this mode the filter starters and drives will all be electrically activated and will operate at a fixed speed using the manual speed set-points on the HMI.

3.2.3 *HMI Mode*

When the filter control mode switch is in the “HMI” position the CPP PLC has control of all motors in the system based on the configuration set in the CPP OIT. From the OIT, the filter system HMI mode can be set to “Off”, “Manual”, or “Auto” modes. When the filter system is set to HMI-Manual mode, each motor and valve may be individually requested to be started/opened or stopped/closed. When the filter control mode switch transitions to the “HMI” position, the PLC will automatically set the HMI mode to Automatic and all valves and motors will be automatically controlled by the PLC. The HMI mode must be switched to OFF or Manual if direct operator control of the devices is required.

Normal Operation of the SF System is to have all Motors and valves automatically controlled with the system in HMI Auto mode. Fully automatic operation of the system is described in section ‘3.1 – Standard Operation’. HMI Manual Operation of individual Motors is described later in this document.

3.3 Alarms

Each CPP alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
Main Power Supply Failure	The Phase Monitoring relay detected a loss of main input power on one or more phases.				Enabled
UPS Supply Activated	The UPS has detected a loss of main power and the PLC is now operating on UPS power.	Critical			Enabled
UPS Battery Fault	The UPS has detected that the battery pack is faulted.	None	Enabled		
Emergency Stop Activated	The Emergency Stop located at the Filter is activated. Key Switch Reset is required to enable the system.	None			Enabled
Motor Failure	The Filter Motor, Blower Motor, or Sludge Screw Motor has failed to respond to a control command (start/stop) within a certain amount of time	Critical			Enabled
Service is due (Blower, Sludge Screw, Filter)	Indicates that service is required based on run time of equipment (should be 300 hours initially on blower, then 3000 hours)	None	Enabled		

3.4 Operator Interface

3.4.1 *Display Data*

The OIT will have a System Overview screen that will be used to display system status information and to provide operator control functions.

The System Overview screen will contain the following information:

- System status
- System fault indicators

4.0 *Filter Belt*

4.1 Control Architecture

The Filter Belt, which contains a filter mesh mounted on a removable cartridge, is used to draw waste material from the inlet to outlet sludge conveyor. Water is separated from the material as it is transported on the mesh towards the outlet well.

A Filter Motor, which rotates the Filter Belt, is driven by a VFD that regulates the speed based on a PID control algorithm. The speed is continually regulated in order to maintain an enterable inlet water level set-point. Optionally the system may be configured to operate the filter speed in a proportional mode so that the speed of the filter is proportionally increased as the filter water level increases, but a target water level is not maintained.

The VFD is controlled by a network communication signal controlled from the CPP PLC.

4.2 Operation Modes

4.2.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Filter Belt Motor will not start.

4.2.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Filter Belt Motor will be started by an electrical interlock that will force the motor to run at a fixed speed configured by the manual HMI set-points.

4.2.3 *System Mode HMI - Off*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep motor turned off and will not automatically start the Filter Motor, regardless of Filter level.

4.2.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will start and run Filter Motor according to requests by the operator from the HMI. The speed of the Filter Motor will be controlled by an operator entry on the OIT.

NOTE: This mode should not be used when the filter inlet valve is open unless the blower and sludge screw is also operating.

4.2.5 *System Mode HMI - Auto*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Filter Belt. See section ‘3.1 – Standard Operation’.

4.3 Alarms

Each Filter Belt alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-M320 Fault Filter Cloth	The VFD for the Filter Motor has reported a fault condition				Enabled

4.4 Operator Interface

4.4.1 *Display Data - Overview*

The OIT will have a System Overview screen that will be used to display Filter Belt status information and to provide operator control functions.

The screen will contain the following information:

- Filter Motor status
- Filter Motor fault indicators
- Filter Motor manual control

4.4.2 *Display Data - Information*

- Filter Motor running time (today, yesterday, total)
- Filter Motor starts (today, yesterday, total)

4.4.3 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Filter Belt options and settings:

- Adjust the Mode of the Filter Belt Motor
- Adjust the Start and Stop Level of the Filter Belt Motor
- Level set-point for Filter
- High level alarm set-point
- Minimum and maximum speed
- Filter Acceleration and Deceleration time
- Adjust the speed set-point of the Filter Belt Motor when it is in Manual

5.0 *Blower*

5.1 Control Architecture

The Blower is used to provide air for the Air Knife – Mesh Cleaning System, which is used to blow material off of the filter mesh into the sludge conveyor.

The Blower Motor is driven by a soft starter and maintains a fixed speed based on the selected blower specification.

The soft starter is controlled by a signal communicated from the CPP PLC.

A Blower Cooling Fan is mounted in the Blower enclosure. It will run when the Blower Motor is on, and it will stop when the Blower Motor stops after a hard coded 1 minute time delay.

5.1 Operation Modes

5.1.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Blower Motor and Cooling Motor will not start.

5.1.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Blower Motor and Cooling Motors will be started by an electrical interlock.

5.1.3 *System Mode HMI - Off*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep motor turned off and will not automatically start the Blower Motor and Blower Cooling Motor, regardless of Filter level.

5.1.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will start and run Blower Motor and Blower Cooling Motor according to requests by the operator from the HMI.

5.1.5 *System Mode HMI - Auto*

When the Filter Control Switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Blower. See section ‘3.1 – Standard Operation’.

5.2 Alarms

Each Blower Motor alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-M330 Fault Blower	The Blower Motor has reported a fault condition				Enabled
07-M330A Fault Blower Cooling Fan	The Blower Motor Cooling Fan has reported a fault condition		Enabled		

5.3 Operator Interface - Overview

5.3.1 *Display Data*

The OIT will have a System Overview screen that will be used to display Blower status information and to provide operator control functions.

The screen will contain the following information:

- Blower Motor status
- Blower Motor fault indicators
- Blower Motor manual control

5.3.2 *Display Data - Information*

- Blower Motor running time (today, yesterday, total)
- Blower Motor starts (today, yesterday, total)

5.3.3 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Blower Motor options and settings:

- Adjust the Mode of the Blower Motor
- Start and Stop blower motor in manual mode
- Adjust the Stop Delay time of the Blower Motor
- Adjust the Stop Delay speed of the Blower Motor
- Adjust the speed set-point of the Blower Motor

6.0 *Sludge Screw*

6.1 Control Architecture

The Sludge Screw is used to dewater and/or convey the Sludge that has been transported by the filter mesh. The Sludge is collected and conveyed by the screw where it is optionally pressed and dewatered before exiting the SF System.

The Sludge Screw Motor is driven by a VFD that maintains a fixed speed target based on a configurable setting from the CPP OIT. The Sludge Screw may be operated in forward or reverse direction in manual mode.

The VFD is controlled by a signal communicated from the CPP PLC.

6.2 Operation Modes

6.2.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Sludge Screw will not start.

6.2.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Sludge Screw will be started by an electrical interlock.

6.2.3 *System Mode HMI - Off*

When the System Mode is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep the motor turned off and will not automatically start the Sludge Screw, regardless of Filter level.

6.2.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will start and run the Sludge Screw according to requests by the operator from the HMI. The speed of the Sludge Screw will be controlled by an operator entry on the OIT.

6.2.5 *System Mode HMI - Auto*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Sludge Screw. See section ‘3.1 – Standard Operation’.

6.3 Alarms

Each Sludge Screw Motor alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-M350 Fault Sludge Screw	The VFD for the Sludge Screw Motor has reported a fault condition				Enabled

6.4 Operator Interface

6.4.1 *Display Data - Overview*

The OIT will have a System Overview screen that will be used to display Sludge Screw status information and to provide operator control functions.

The screen will contain the following information:

- Sludge Screw Motor status
- Sludge Screw Motor fault indicators
- Sludge Screw Motor manual control

6.4.2 *Display Data - Information*

- Sludge Screw Motor running time (today, yesterday, total)
- Sludge Screw Motor starts (today, yesterday, total)

6.4.3 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Sludge Screw Motor options and settings:

- Adjust the Mode of the Sludge Screw Motor
- Adjust the Stop Delay time of the Sludge Screw Motor
- Adjust the speed set-point of the Sludge Screw Motor

7.0 *Level Transmitter*

7.1 Control Architecture

An inlet well water level transmitter is required in order to determine when to start and stop the SF System. The water level is also used to control the speed of the Filter Belt. The value is supplied to the CPP PLC via a 4-20 mA analog signal that is passed through a smoothing

algorithm to reduce noise. This signal is then scaled to engineering units based on a full scale level set-point.

7.2 Alarms

Each level transmitter alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-LT300 HL Level Filter	The level is greater than the High Level Alarm value		Enabled		
07-LT300 Overflow Filter	The level is greater than the Overflow limit.		Enabled		
07-LT300 Defect	The level transmitter is not within the allowable 4-20mA range			Enabled	

7.3 Operator Interface

7.3.1 *Display Data - Overview*

The OIT will have a System Overview screen that will be used to display Level Transmitter status information and to provide operator control functions.

The screen will contain the following information:

- Level Transmitter status
- Level Transmitter fault indicators

7.3.2 *Display Data - Information*

- Overflow time (today and yesterday)
- Overflow time total
- # of overflows (today and yesterday)
- Total number of overflows

7.3.3 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Level Transmitter options and settings:

- Adjust the Inlet Well water level set-point
- Adjust the start and stop water level limit
- Adjust the High Level alarm limit
- Adjust the Overflow alarm limit

8.0 *Blower Pressure Transmitter*

8.1 Control Architecture

A pressure transmitter is required in order to determine if the Blower is operating correctly. The value is supplied to the CPP PLC via a 4-20 mA analog signal that is passed through a smoothing algorithm to reduce noise. This signal is then scaled to engineering units based on a full scale pressure set-point.

8.2 Alarms

Each pressure transmitter alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-PT331 LL Pressure Blower	The pressure is less than the Low Level Alarm value				Enabled
07-PT331 HL Pressure Blower	The pressure is greater than the High Level Alarm value		Enabled		
07-PT331 Defect	The pressure transmitter is not within the allowable 4-20mA range				Enabled

8.3 Operator Interface

8.3.1 *Display Data*

The OIT will have a System Overview screen that will be used to display Pressure Transmitter status information and to provide operator control functions.

The screen will contain the following information:

- Pressure Transmitter status
- Pressure Transmitter fault indicators

9.0 *Hot Water Valve*

9.1 Control Architecture

Hot Water is used for filter belt cleaning. All motors must be operating and in Automatic mode before a Hot Water flush will occur. The hot water valve is controlled by the CPP PLC via a discrete open signal, or the OIT in manual mode.

The CPP PLC will automatically perform a Hot Water flush based on a configurable time delay.

The Blower Motor, Blower Motor Cooling Fan, Filter Motor, and Sludge Screw Motor will start when the Hot Water Valve is being commanded to open via the in Auto mode.

9.2 Operation Modes

9.2.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Hot Water valve will not open.

9.2.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Hot Water valve will remain closed.

9.2.3 *System Mode HMI - Off*

When the System Mode is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep the Hot Water valve closed and will not automatically open the Hot Water valve.

9.2.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will open and close the Hot Water valve according to requests by the operator from the HMI.

9.2.5 *System Mode HMI - Auto*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Hot Water valve. See section ‘3.1 – Standard Operation’. The Hot Water flush timer will count down to control the operation of the valve only in HMI-Auto mode. In all other modes, the Hot Water flush timer will be reset and suspended.

9.3 Operator Interface

9.3.1 *Display Data*

The OIT will have System Overview and Flushing screens that will be used to display Hot Water Valve status information and to provide operator control functions.

The screens will contain the following information:

- Valve status
- Adjust the Remote Mode of the Hot Water Valve
- Manual flush one control

9.3.2 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Hot Water Valve options and settings:

- Adjust the automatic Hot Water Flush interval delay time
- Adjust the automatic Hot Water Flush duration time

10.0 *Cold Water Valve*

10.1 Control Architecture

Cold Water is used for flushing of the filtered water basin. The cold water valve is controlled by the CPP PLC via a discrete open signal, or a manual Cold Water Control Switch.

The CPP PLC will automatically perform a Cold Water flush based on a configurable time delay.

10.2 Operation Modes – Off, On, Remote Off, Remote Manual, Auto

10.2.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Cold Water valve will not open.

10.2.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Cold Water valve will remain closed.

10.2.3 *System Mode HMI - Off*

When the System Mode is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep the Cold Water valve closed and will not automatically open the Cold Water valve.

10.2.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will open and close the Cold Water valve according to requests by the operator from the HMI.

10.2.5 *System Mode HMI - Auto*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Cold Water valve. See section ‘3.1 – Standard Operation’. The Cold Water flush timer will count down to control the operation of the valve only in HMI-Auto mode. In all other modes, the Cold Water flush timer will be reset and suspended.

10.3 Operator Interface

10.3.1 *Display Data*

The OIT will have System Overview and Flushing screens that will be used to display Cold Water Valve status information and to provide operator control functions.

The screens will contain the following information:

- Valve status

- Adjust the Remote Mode of the Cold Water Valve
- Manual flush one control

10.3.2 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Cold Water Valve options and settings:

- Adjust the automatic Cold Water Flush interval delay time
- Adjust the automatic Cold Water Flush duration time

11.0 *Operator Interface*

11.1 Alarms

Alarms generated by the CPP PLC will be logged and displayed on the local OIT Alarm screen, as well as being passed to the Plant Control System. Each alarm generated will be time and date stamped at the OIT. The most recent alarms are recorded and displayed in the alarm history register of the OIT.

11.2 Passwords

The OIT for the equipment described within this document will each contain 3 levels of password protection; Operator, Technician and OEM level. Operator level has less user privileges for accessing and changing parameters for the system. Technician level has a higher level of user privileges and OEM level has full system configuration privileges. Users will be prompted to log in if trying to view or operate items with insufficient user privileges. Unique user passwords will not be provided for this system. A system log will record a history of the user log in access.

11.3 Data logging/Trending Screen

The OIT will store data points into a datalog file for retrieval for offline analysis, or for display on a Trend screen. The following data will be stored:

- Filter Level
- Filter Belt Speed
- Blower Air Pressure
- Filter Flow
- Filter Motor Voltage
- Filter Motor Current
- Sludge Screw Motor Voltage
- Sludge Screw Motor Current

12.0 *Interface with Plant Control System*

12.1 Hardwired Status Signals

The filter PLC will provide 3 discrete outputs (Status Bit 1 to 3) which can be configured as desired to provide alarm or operating status information. Multiple outputs may also be assigned to the same alarm output such that if any of the assigned conditions are present, the output contact will be closed. The following signals are available for assignment to these outputs:

- Filter motor running
- Sludge screw running
- Air blower running
- Water sampler pulse
- Cold water flush active
- Hot water flush active
- Drain valve open
- Filter in Automatic mode
- Common Critical Alarm
- Common Major Alarm
- Common Minor Alarm

12.2 SF System interface tag list

SF System interface tag list (SCADA list) will be developed at time of program development and will be provided as a separate “SCADA List” document.

RSLogix 5000 Symbolic Address	RSLogix 5000 Mapped Address	Tag Description	Units

PART I

WARRANTIES

Salsnes Equipment Limited Warranty

January 23, 2013

The following terms and conditions will govern the equipment warranty provided by Salsnes to the Owner/Operator:

Period of Coverage: Salsnes warrants to the Owner/Operator noted above (the "Customer") that if within 12 calendar months from Substantial Completion (as defined below) or 18 calendar months from the date of delivery, whichever comes first, (the "Warranty Period") equipment manufactured by Salsnes (the "Equipment") will be free from defects in material and workmanship and will function in accordance with the specifications agreed to by Salsnes for the Equipment.

"Substantial Completion" is the date on which the Equipment commissioning and start-up is sufficiently completed such that the Equipment is capable of being put into operation by Owner for its intended use.

This warranty applies only to the Salsnes Filter unit and equipment supplied with and included in the purchase agreement and under the following conditions:

- Salsnes Filter ("SF") shall receive the Startup report signed by customer and representative within 30 days of Equipment Startup.
- Any part of the SF unit that fails or is damaged under normal use within the warranty period will be replaced or, at Salsnes Filter's option repaired.
- Any defective items shall be promptly returned to Trojan/Salsnes.

Technical performance: The Salsnes Technical Reliability and Performance Guarantee apply only under the following conditions:

- The application is as per Salsnes recommendations, and designed in a manner that not allows large or heavy particles, stones, etc. to enter into the SF unit and cause damage.
- The technical performance guarantee is contingent upon proper care and maintenance of the unit as detailed within the Operation and Maintenance Manual, and using Salsnes approved parts.
- Ensuring that appropriate maintenance is completed based on type of influent. This may require, but it is not limited to, utilizing a wash system for removal of Fats, Oil and Grease (above 80 mg/l), manual cleaning of mesh, COG's, equipment, etc.

Limitations: This warranty shall not apply to any failure or defect which results from:

- the Equipment not being operated and maintained in strict accordance with instructions specified in the Operation and Maintenance manual or Product Bulletin or which results from mishandling, misuse, neglect, improper storage, improper operation of the Equipment with other equipment furnished by the Customer or by other third parties or from defects in designs or specifications furnished by or on behalf of the Customer by a person other than Salsnes.
- Equipment that has been altered or repaired after start-up by anyone except: (a) authorized representatives of Salsnes, or (b) Customer acting under specific written instructions from Salsnes.
- Use of parts not supplied or approved by Salsnes.

This warranty does not cover:

- Normal wear and tear of the product
- Consumable components
- Corrosion
- Salsnes supplied components that are the subject of a separate warranty
- Costs related to removal, installation, or troubleshooting of a component
- Physical damage
- Improper installation
- Acts of God, terrorism, biological infestations, or input voltage that create operating conditions beyond the minimum or maximum limits listed in the Operations Manual including high input voltage from generators and lightning strikes
- Damage caused by improper return packaging
- Taxes, duties or brokerage fees (if any)
- Failure or damage caused by the use of the SF unit for any purposes or application other than that intended and communicated to Salsnes at time of sale
- Equipment components manufactured by third parties but furnished to Customer by Salsnes are warranted by the original manufacturer, only to the extent of the original manufacturer's warranty

SAFETY DATA SHEETS (SDS)

SAFETY DATA SHEET

KAESER OMEGA LUBRICANT FGB-220

KAESER COMPRESSORS
Built for a lifetime.

Section 1. Identification

GHS product identifier : KAESER OMEGA LUBRICANT FGB-220

Product code : KSROFGB220

Other means of identification : Synthetic Air Compressor Fluid.

Product type : Liquid.

Relevant identified uses of the substance or mixture and uses advised against

Identified uses	
Not available.	
Uses advised against	**Reason**
Not available.	

Supplier's details : Manufactured for Kaeser Compressors Canada Inc.
3760 La Verandrye
Boisbriand, QC Canada J7H 1R5
Phone: 450-971-1414

Emergency telephone number (with hours of operation) : 24 hr. CHEMTREC 1-800-424-9300 / International 1-703-527-3887

Section 2. Hazards identification

OSHA/HCS status : While this material is not considered hazardous by the OSHA Hazard Communication Standard (29 CFR 1910.1200), this SDS contains valuable information critical to the safe handling and proper use of the product. This SDS should be retained and available for employees and other users of this product.

Classification of the substance or mixture : Not classified.

GHS label elements

Signal word : No signal word.

Hazard statements : No known significant effects or critical hazards.

Precautionary statements

Prevention : Not applicable.

Response : Not applicable.

Storage : Not applicable.

Disposal : Not applicable.

Hazards not otherwise classified : None known.

Section 3. Composition/information on ingredients

Substance/mixture : Mixture

Other means of identification : Not available.

CAS number/other identifiers

CAS number : Not applicable.

Section 3. Composition/information on ingredients

Ingredient name	%	CAS number
Butene, homopolymer (products derived from either/or But-1-ene/But-2-ene)	≥25 - <50	9003-29-6

Any concentration shown as a range is to protect confidentiality or is due to batch variation.

There are no additional ingredients present which, within the current knowledge of the supplier and in the concentrations applicable, are classified as hazardous to health or the environment and hence require reporting in this section.

Occupational exposure limits, if available, are listed in Section 8.

Section 4. First aid measures

Description of necessary first aid measures

Eye contact : Immediately flush eyes with plenty of water, occasionally lifting the upper and lower eyelids. Check for and remove any contact lenses. Get medical attention if irritation occurs.

Inhalation : Remove victim to fresh air and keep at rest in a position comfortable for breathing. Get medical attention if symptoms occur.

Skin contact : Flush contaminated skin with plenty of water. Remove contaminated clothing and shoes. Get medical attention if symptoms occur.

Ingestion : Wash out mouth with water. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If material has been swallowed and the exposed person is conscious, give small quantities of water to drink. Do not induce vomiting unless directed to do so by medical personnel. Get medical attention if symptoms occur.

Most important symptoms/effects, acute and delayed

Potential acute health effects

Eye contact : No known significant effects or critical hazards.

Inhalation : No known significant effects or critical hazards.

Skin contact : No known significant effects or critical hazards.

Ingestion : No known significant effects or critical hazards.

Over-exposure signs/symptoms

Eye contact : No specific data.

Inhalation : No specific data.

Skin contact : No specific data.

Ingestion : No specific data.

Indication of immediate medical attention and special treatment needed, if necessary

Notes to physician : Treat symptomatically. Contact poison treatment specialist immediately if large quantities have been ingested or inhaled.

Specific treatments : No specific treatment.

Protection of first-aiders : No action shall be taken involving any personal risk or without suitable training.

See toxicological information (Section 11)

Section 5. Fire-fighting measures

Extinguishing media

Suitable extinguishing media : Use an extinguishing agent suitable for the surrounding fire.

Unsuitable extinguishing media : Do not use water jet.

Specific hazards arising from the chemical : In a fire or if heated, a pressure increase will occur and the container may burst.

Section 5. Fire-fighting measures

Hazardous thermal decomposition products : Decomposition products may include the following materials:
carbon dioxide
carbon monoxide

Special protective actions for fire-fighters : Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training.

Special protective equipment for fire-fighters : Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

Section 6. Accidental release measures

Personal precautions, protective equipment and emergency procedures

For non-emergency personnel : No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilled material. Put on appropriate personal protective equipment.

For emergency responders : If specialised clothing is required to deal with the spillage, take note of any information in Section 8 on suitable and unsuitable materials. See also the information in "For non-emergency personnel".

Environmental precautions : Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers. Inform the relevant authorities if the product has caused environmental pollution (sewers, waterways, soil or air).

Methods and materials for containment and cleaning up

Small spill : Stop leak if without risk. Move containers from spill area. Absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor.

Large spill : Stop leak if without risk. Move containers from spill area. Prevent entry into sewers, water courses, basements or confined areas. Wash spillages into an effluent treatment plant or proceed as follows. Contain and collect spillage with non-combustible, absorbent material e.g. sand, earth, vermiculite or diatomaceous earth and place in container for disposal according to local regulations (see Section 13). Dispose of via a licensed waste disposal contractor. Note: see Section 1 for emergency contact information and Section 13 for waste disposal.

Section 7. Handling and storage

Precautions for safe handling

Protective measures : Put on appropriate personal protective equipment (see Section 8).

Advice on general occupational hygiene : Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Workers should wash hands and face before eating, drinking and smoking. Remove contaminated clothing and protective equipment before entering eating areas. See also Section 8 for additional information on hygiene measures.

Conditions for safe storage, including any incompatibilities : Store in accordance with local regulations. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see Section 10) and food and drink. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabeled containers. Use appropriate containment to avoid environmental contamination.

Section 8. Exposure controls/personal protection

Control parameters

Occupational exposure limits

None.

Appropriate engineering controls : Good general ventilation should be sufficient to control worker exposure to airborne contaminants.

Environmental exposure controls : Emissions from ventilation or work process equipment should be checked to ensure that they are working properly. Use hydrocarbon absorbing respirator if misting.

Individual protection measures

Hygiene measures : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.

Eye/face protection : Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts. If contact is possible, the following protection should be worn, unless the assessment indicates a higher degree of protection: safety glasses with side-shields.

Skin protection

Hand protection : Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary.

Body protection : Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

Other skin protection : Appropriate footwear and any additional skin protection measures should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

Respiratory protection : Use a properly fitted, air-purifying or air-fed respirator complying with an approved standard if a risk assessment indicates this is necessary. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.

Section 9. Physical and chemical properties

Appearance

Physical state : Liquid.

Color : Golden.

Odor : Mild hydrocarbon.

Odor threshold : Not available.

pH : Not applicable.

Pour point : -45°C (-49°F).

Boiling point : >371°C (700°F).

Flash point : Closed cup: 229°C (445°F)

Evaporation rate : Negligible.

Flammability (solid, gas) : Not available.

Lower and upper explosive (flammable) limits : Not available.

Vapor pressure : Not available.

Vapor density : Not available.

Section 9. Physical and chemical properties

Relative density : 0.65.

Solubility : Insoluble in water.

Partition coefficient: n-octanol/water : Not available.

Auto-ignition temperature : Not available.

Decomposition temperature : Not available.

Viscosity : Kinematic (40°C (104°F)): 2.2 cm^2/s (220 cSt)

Section 10. Stability and reactivity

Reactivity : No specific test data related to reactivity available for this product or its ingredients.

Chemical stability : The product is stable.

Possibility of hazardous reactions : Under normal conditions of storage and use, hazardous reactions will not occur.

Conditions to avoid : No specific data.

Incompatible materials : No specific data.

Hazardous decomposition products : Under normal conditions of storage and use, hazardous decomposition products should not be produced.

Section 11. Toxicological information

Information on toxicological effects

Acute toxicity

Product/ingredient name	Result	Species	Dose	Exposure
Butene, homopolymer (products derived from either/or But-1-ene/But-2-ene)	LD50 Dermal	Rabbit	>10250 mg/kg	-
	LD50 Oral	Rat	>34600 mg/kg	-

Irritation/Corrosion

Not available.

Sensitization

Not available.

Mutagenicity

Not available.

Carcinogenicity

Not available.

Reproductive toxicity

Not available.

Teratogenicity

Not available.

Specific target organ toxicity (single exposure)

Not available.

Specific target organ toxicity (repeated exposure)

Not available.

Section 11. Toxicological information

Aspiration hazard

Not available.

Information on the likely routes of exposure : Not available.

Potential acute health effects

Eye contact : No known significant effects or critical hazards.

Inhalation : No known significant effects or critical hazards.

Skin contact : No known significant effects or critical hazards.

Ingestion : No known significant effects or critical hazards.

Symptoms related to the physical, chemical and toxicological characteristics

Eye contact : No specific data.

Inhalation : No specific data.

Skin contact : No specific data.

Ingestion : No specific data.

Delayed and immediate effects and also chronic effects from short and long term exposure

Short term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Long term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Potential chronic health effects

Not available.

General : No known significant effects or critical hazards.

Carcinogenicity : No known significant effects or critical hazards.

Mutagenicity : No known significant effects or critical hazards.

Teratogenicity : No known significant effects or critical hazards.

Developmental effects : No known significant effects or critical hazards.

Fertility effects : No known significant effects or critical hazards.

Numerical measures of toxicity

Acute toxicity estimates

Not available.

Section 12. Ecological information

Toxicity

Not available.

Persistence and degradability

Section 12. Ecological information

Product/ingredient name	Aquatic half-life	Photolysis	Biodegradability
Butene, homopolymer (products derived from either/ or But-1-ene/But-2-ene)	-	-	Readily

Bioaccumulative potential

Product/ingredient name	$LogP_{ow}$	BCF	Potential
Butene, homopolymer (products derived from either/ or But-1-ene/But-2-ene)	7.6 to 7.8	314 to 1882	high

Mobility in soil

Soil/water partition coefficient (K_{OC}) : Not available.

Other adverse effects : No known significant effects or critical hazards.

Section 13. Disposal considerations

Disposal methods : The generation of waste should be avoided or minimized wherever possible. Disposal of this product, solutions and any by-products should at all times comply with the requirements of environmental protection and waste disposal legislation and any regional local authority requirements. Dispose of surplus and non-recyclable products via a licensed waste disposal contractor. Waste should not be disposed of untreated to the sewer unless fully compliant with the requirements of all authorities with jurisdiction. Waste packaging should be recycled. Incineration or landfill should only be considered when recycling is not feasible. This material and its container must be disposed of in a safe way. Empty containers or liners may retain some product residues. Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers.

Section 14. Transport information

	DOT Classification	TDG Classification	IMDG	IATA
UN number	Not regulated.	Not regulated.	Not regulated.	Not regulated.

Special precautions for user : **Transport within user's premises:** always transport in closed containers that are upright and secure. Ensure that persons transporting the product know what to do in the event of an accident or spillage.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code : Not available.

Section 15. Regulatory information

U.S. Federal regulations : **TSCA 8(a) CDR Exempt/Partial exemption**: Not determined

All components are listed or exempted.

Clean Air Act Section 112 (b) Hazardous Air Pollutants (HAPs) : Not listed

Clean Air Act Section 602 Class I Substances : Not listed

History

Date of issue/Date of revision : 12/30/2015

Version : 2

Section 16. Other information

Key to abbreviations : ATE = Acute Toxicity Estimate
BCF = Bioconcentration Factor
GHS = Globally Harmonized System of Classification and Labelling of Chemicals
IATA = International Air Transport Association
IBC = Intermediate Bulk Container
IMDG = International Maritime Dangerous Goods
LogPow = logarithm of the octanol/water partition coefficient
MARPOL 73/78 = International Convention for the Prevention of Pollution From Ships, 1973 as modified by the Protocol of 1978. ("Marpol" = marine pollution)
UN = United Nations

Indicates information that has changed from previously issued version.

Noticetoreader

To the best of our knowledge, the information contained herein is accurate. However, neither the above-named supplier, nor any of its subsidiaries, assumes any liability whatsoever for the accuracy or completeness of the information contained herein.
Final determination of suitability of any material is the sole responsibility of the user. All materials may present unknown hazards and should be used with caution. Although certain hazards are described herein, we cannot guarantee that these are the only hazards that exist.

PART K

FILTER SPECIFICATION

Part 1 General

1.1 SECTION INCLUDES

.1 Requirements for supply, delivery, installation, and commissioning of the following, as required for complete and proper installation:

.1 Two (2) primary filters equipped with continuous loop moving belts with integrated solids dewatering and all ancillary components, including the primary filter blowers, for primary filtration of screened and de-gritted raw wastewater. Supply the primary filters as one complete package from a single Manufacturer. Coordinate dimensions to ensure all equipment fits in the allocated space as indicated in the Drawings.

1.2 RELATED SECTIONS

.1 Section 01 33 00 - Submittal Procedures

.2 Section 01 61 00 – Common Product Requirements

.3 Section 01 78 00 – Closeout Submittals

.4 Section 01 79 00 – Demonstration and Training

.5 Section 01 91 13 – General Commissioning Requirements

.6 Section 40 05 00 – General Provisions Process

.7 Section 40 05 13 – Process Piping

1.4 SUBMITTALS

.1 Product Data:

.1 Provide product data: in accordance with Section 01 33 00 - Submittal Procedures.

.2 A copy of this section indicating conformance or acceptance of each clause. Non-conformance or variation must be indicated by a cross ('X').

.3 A Letter of Compliance, which confirms any variances with the Contract Plans and Specifications, and provides further explanations where necessary to adequately define the scope of supply.

.2 Shop Drawings:

.1 Provide shop drawings: in accordance with Section 01 33 00 - Submittal Procedures.

.2 Dimensional plan and section drawings of the equipment mounted in the structure, showing all utility connections and requirements, and anchor bolt locations. Where applicable, drawings will show connection to associated equipment provided by others.

.3 Approximate weight of each component or piece of equipment.

.4 Manufacturers' catalog information, descriptive literature, specifications, and identifications of material of construction.

.5 Power and control wiring diagrams, including terminal layout with numbers, panel construction and panel layout drawings, and control schematics diagrams. Control diagrams will also include a description of operation.

.6 Manufacturers' performance data for all drives.

.7 Process equipment control philosophy, control system hardware details, I/O list and memory map with addresses for status and control variable points to be made available to Plant Control System (PCS) via communications link.

.8 List of spare parts to be furnished

.3 Operation and Maintenance Data:

.1 Supply maintenance data in accordance with Section 01 78 00 - Closeout Submittals.

1.5 DELIVERY, STORAGE AND HANDLING

.1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements.

.2 Delivery:

.1 Deliver materials to the project in original, unopened packages and labeled to clearly identify product name and manufacturer.

.2 Items to be shipped as complete assemblies expect where partial disassembly is required by transportation regulations or for protection of components.

.3 Wooden crates must not exceed 2.4 m in width x 2.4 m in height so that the equipment can be put in the headworks building utilizing the existing removable wall (2.4 m W x 2.4 m H).

.4 Materials must be packaged to minimize or eliminate the possibility of damage during shipping.

.5 Sequence deliveries to avoid delays, but minimize on site storage.

.3 Storage and Handling:

.1 Store and handle in strict compliance with manufacturer's recommendations.

.2 All materials to be thoroughly inspected upon receipt and all discrepancies, deficiencies, and/or damages to be immediately reported, in writing, to the supplier.

.3 All damages incurred during shipment to be noted on the carrier's Bill of Lading and immediately reported, in writing, to the supplier.

.4 All materials to be properly stored on planks or dunnage, out of water and covered to protect from damage from any cause

1.6 QUALITY ASSURANCE

.1 Contractor responsible for coordination and installation of products provided under this Section.

.2 Furnish all equipment covered by this specification by one Manufacturer, and furnish complete with motor and appurtenances. Equipment to be supplied as a product from a single Manufacturer regularly engaged in the production of equipment for the specified use. The Manufacturer must have the sole responsibility for the proper functioning of the equipment as furnished.

.3 The equipment will include all necessary safety devices, such as machinery guards, emergency stops, warning labels, and similar items.

.4 The equipment must be factory assembled and tested for a minimum of four (4) hours at the factory prior to delivery. Certified results of the testing must be provided to the Engineer.

1.7 WARRANTY

.1 The manufacturer must warrant against any defects in material or workmanship to the equipment and coating for a period of 12 months from start-up.

Part 2 Products

2.1 SYSTEM DESCRIPTION

.1 The primary filters (PF-01-310/PF-01-320) must filter screened raw wastewater prior to the treatment in the MBBR trains. Each primary filter must be equipped with: continuous loop filter belt, compartment access covers, air knife assembly, hot water spray system, a cold-water flush system to maintain filtered water compartment cleanliness and level transmitter for monitoring and belt speed control. Each unit must have an integrated sludge thickening and dewatering system through the utilization of a screw press.

.2 The two primary filters will discharge primary effluent into a common effluent, and overflow box.

.3 The filters will be self-cleaning using process air supplied from two primary filter blowers.

2.2 CAPACITY AND PERFORMANCE REQUIREMENTS

.1 The equipment must be sized for continuous operation (24 hour/day, 365 days/year) and for simultaneous solids separation and thickening.

.2 The primary filter equipment must operate automatically so that at low raw wastewater flows to the plant, one primary filter must operate while the second one must remain in standby. At high raw wastewater flows to the plant, both filters must operate simultaneously and automatically on a duty/assist configuration to be able to treat plant peak hour flows.

.3 The primary filters must be designed to operate within the design conditions specified herein:

.1 Annual Average Flow (current): 38.5 L/s

.2 Annual Average Flow (year 2041): 50.3 L/s

.3 Maximum Month Flow (current): 46.2 L/s

.4 Maximum Month Flow (year 2041): 60.4 L/s
.5 Peak Hour Flow (current): 115.5 L/s
.6 Peak Hour Flow (year 2041): 151 L/s
.7 Influent TSS concentration (current): 153 mg/L
.8 Influent TSS concentration (year 2041): 200 mg/L
.9 Influent BOD concentration (current): 153 mg/L
.10 Influent BOD concentration (year 2041): 200 mg/L

.4 Each primary filter must be designed to filter 121 L/s of raw wastewater proceeding from fine screens.

.5 The primary filters must meet the following performance criteria:

.1 TSS removal required: 50% of the influent TSS (average)
.2 BOD removal required: 25% of the influent BOD (average)
.3 Minimum dewatered sludge solids concentration: 20% TS

2.3 ACCEPTABLE MANUFACTURERS

.1 Salsnes

.2 Approved alternative

2.4 PRIMARY FILTER COMPONENTS

.1 General

.1 Each primary filter must sufficiently be automated to require minimal operator attention.
.2 Each filter unit must be freestanding and designed for installation on the concrete floor of the Headworks building.
.3 The primary filters must be installed as a twin configuration as presented on the drawings. A twin primary filter outlet assembly must be supplied for such a purpose.
.4 The available space for installation of the primary filters in the upper floor of the Headworks building is very limited. The primary filters dimensions must be exactly as presented in the drawings. Files in CAD version of the drawings are being provided for verification.
.5 The scope of supply for the primary filters and associated elements is presented in these technical specifications and in the preliminary PIDs provided with the RFQ.

.2 Each filter unit must be supplied with the following connections:

.1 Inlet: 350 mm diameter, flanged

.2 Outlet: 400 mm diameter, flanged

.3 Overflow: 400 mm diameter, flanged

.4 Drain from filter: 100 mm diameter, flanged

.5 Centrate drain from dewatered sludge effluent: 100 mm diameter, flanged

.6 Air: 100 mm diameter, flanged

.7 Cold water: 12 mm diameter, NPT connection

.8 Hot water: 12 mm diameter, NPT connection

.3 The twin primary filter outlet assembly must be supplied with the following connections:

.1 Connections to primary filter outlets: 400 mm diameter, flanged

.2 Connections to primary filter overflows: 400 mm diameter, flanged

.3 Primary effluent / Overflow outlet: 350 mm diameter, flanged

.4 Common vent on top: 400 mm flanged

.4 Each filter unit must contain one (1) rotating belt filter, air knife belt cleaning system, hot water spray system, cold water flush system, water level sensor, integrated sludge collection and dewatering screw press.

.5 Materials

.1 The filter unit and all welded metal components in contact with effluent must be constructed of 316L stainless steel. No other materials of construction are acceptable.

.6 Primary Filter Internals

.1 The filter belt must be contained in the filter compartment. The filter mesh screen must be constructed of polyethylene with Kevlar-reinforced drive ends. The mesh screen porosity (opening size) must be 350 microns.

.2 A level sensor for monitoring the water level in the influent compartment must be provided. The level sensor must be suitable for use in wastewater applications. The level sensor must have ASTM A-316L stainless steel housing.

.3 An air knife assembly suitable for continuous operation must be provided for removal of solids from the surface of filter belt. The air cleaning device must be fabricated of ASTM A-316L stainless steel and HDPE. The device must be piped to the exterior of the filter compartment for supply air connection.

.4 Filter mesh cleaning is to be performed by forced air. Water can be supplied to the air knife for periodic maintenance purposes only.

.5 Hot water spray nozzles must be provided for cleaning of filter belt and screw press. Spray nozzles and manifolds must be constructed

of 316 stainless steel. A solenoid valve must be provided for automated control of the hot water stream. Manifolds for the hot water supply connection must combine and terminate at a strainer on the exterior of the filter compartment.

.6 A cold water flush manifold must be provided for automated cleaning of the filtered water compartment. A solenoid valve must be provided for automated flush control. Manifold for the cold water supply connection will terminate at a strainer on the exterior of the filter compartment. Drainage of the filtered water compartment must occur via operation of a solenoid valve. Energizing the solenoid valve must vent a hydraulic actuator on a gate valve allowing draining of the filtered water compartment during the cold water flush.

.7 All internal primary filter components must be installed by the Manufacturer prior to the primary filter units being shipped to the job site.

2.5 FILTER UNIT FITTINGS

.1 Flange drilling and bolting patterns for flange connections will be in accordance with ANSI/ASME B-16.5 class 150 (UL)

.2 All threaded connectors to the primary filter unit(s) must be NPT (UL).

2.6 HOT WATER SUPPLY FOR FOG CLEANING

.1 The primary filters must be able to be sprayed with hot water at a flow of 0.5 L/s and at a continuous pressure between 400 to 600 kPa for FOG cleaning.

.2 Hot water temperature at the Filter System is to be at least 70°C and will not exceed 90°C.

.3 Frequency of hot water flush operation must be field-adjustable through the primary filter HMI.

2.7 SLUDGE DEWATERING (INTEGRATED SYSTEM)

.1 The Manufacturer must supply a sludge dewatering system integrated to each primary filter including a wedge wire screen and screw press system.

.2 Provide the dewatering system enclosure of ASTM-A-316L stainless steel and

.3 Provide the screw press (auger) of carbon steel.

.4 The dewatering system must contain an outlet to drain reject water.

2.8 PRIMARY FILTER BLOWERS

.1 Process air for cleaning the filter belt cleaning system must be provided by the primary filter blowers.

.2 Blowers must be provided by the primary filter supplier as part of the overall process package.

.3 Blowers must be sized appropriately for the operation of the primary filters' air knife assemblies.

.4 Each primary filter must operate with an independent primary filter blower.

.5 Operation of the blowers must be automated based on the operation of the primary filters and controlled from the primary filter HMI.

.6 Provide primary filter blowers in enclosures for sound attenuation with all the elements (air filters, suction and discharge silencers, suction and discharge flexible connections, check valves, pressure safety valves, pressure indicators, fans, etc.) as presented in PID P608.

.7 Provide blowers with waterproof enclosures suitable for installation in wet area.

.8 Provide blowers to be able to connect to air ducts. Air ducts will suck air from outside of the building at Iqaluit temperatures.

.9 Supply sound dampening enclosure for blower. Ensure ambient room noise does not exceed 85 dB when enclosure is sealed. Provide a list of predicted sound power levels for the blower and for the blower package when operating at design operating capacity. The predicted sound power levels must be reported in a standard format conforming to the requirements of the Acoustical Engineering Institute.

.10 Provide a cooling fan complete with temperature control.

.11 Acceptable Manufacturers

- .1 Kaeser
- .2 Aerezen
- .3 Gardner Denver (Robuschi)
- .4 Approved alternative

2.9 ANCHOR BOLTS, FASTENERS AND LIFTING LUGS

.1 All anchor bolts must be specified by the primary filter manufacturer and made of stainless steel. The equipment supplier must furnish all anchor bolts, nuts, and washers required for the equipment.

.2 All fasteners must be type stainless steel. The equipment supplier must furnish all fasteners required for the assembly of the equipment.

.3 Provide stainless steel 316L lifting lugs for appropriate lifting of the primary filters for installation and removal at the field.

2.10 CARTRIDGE LIFTING

.1 Cartridges lifting and removal from the primary filters is critical due to reduced space in the Headworks building. The vertical space above the primary filters is limited.

.2 With the answer to the RFQ, Manufacturer must provide a detailed drawing with vertical dimensions presenting the sequence of cartridge lifting that would be accomplished in the field minimizing the required vertical free space above the primary filters. Manufacturer to inform the maximum vertical lifting space required above the primary filters.

.3 Provide four lifting lugs distributed uniformly on the upper side of the cartridge to be able to install two spreader bar systems to balance horizontally the weight of the cartridge on the air when lifted by a hoist. Exact location of lifting lugs from the edges of the cartridge to be recommended by the manufacturer.

.4 Provide two spreader bars for cartridge lifting and all the special elements, devices and tools required for appropriate lifting of the cartridges from the primary filters.

2.11 ELECTRICAL AND CONTROLS

.1 Provide primary filter equipment and primary filter blowers and other applicable elements of the package to be power operated at 480 volts, 3 phases, 60 Hz. Controls to be operated at 120 Volts, single phase.

.2 Primary filters and HMI(s) must be installed in the Headworks building. HMI(s) and all drives and electrical installations located inside the Headworks building must meet requirements for a Class 1, Zone 2 area. All equipment wiring, fittings, devices and terminations inside the Headworks building must be explosion proof.

.3 The control panels for the primary filters and primary filter blowers will be located in the electrical room so the explosion proof requirement is not applicable for such panels.

.4 The primary filter blowers will be installed in a wet area above the MBBR train 1. Provide NEMA 3R waterproof enclosures.

2.12 CONTROLS

.1 The Filter System operation will be controlled from Manufacturer-supplied Control Panels. All equipment controllers, motor starters, drives, etc. must be housed within these panels.

.2 The System Control Panel(s) must each include the following:

.1 Human Machine Interface (HMI): Allen Bradley Panelview Plus HMI terminals must be supplied

.2 Programmable Logic Controller (PLC): Allen-Bradley must be supplied.

.3 Belt filter Variable Frequency Drives (VFD): Allen-Bradley Powerflex

.4 Blower Motor Starter: Allen-Bradley SMC-3

.5 Other starters, as required, for automatic operation of the filter unit(s).

.3 The HMI must be located at the front enclosure door. The panels will have an unfused main disconnect operated from the front of the panel.

.4 Each Control Panel must include an Ethernet switch for communications to the plant SCADA system. Control Panels must be shipped pre-assembled and pre-tested for field wire connections.

.5 The Filter System controls must be completely self-contained and capable of automatic operation. All system control parameters must be accessible at the HMI.

.6 The filter belt speed is to be regulated by the level transmitter located in the inlet compartment. The PLC must automatically control the filter belt speed based on the water level in the inlet compartment.

.7 Hot water spray must be controlled via operator adjustable frequency and duration timers at the HMI.

.8 Cold water flush must be controlled via operator adjustable frequency and duration timers at the HMI.

.9 Blower control must be undertaken through the HMI.

.10 A pressure transducer must be mounted on the air knife bayonet coupling. The PLC must monitor high and low pressure alarms.

2.13 SPARE PARTS

.1 Provide all spare parts (except lubricants) that would be normally required for one (1) year of operation of the primary filters and primary filter blowers.

.2 Provide one (1) filter mesh, 350 microns, for the primary filters.

.3 Provide one set of any special tools required to assemble, disassemble, or maintain the equipment.

Part 3 Execution

3.1 MANUFACTURER'S REPRESENTATIVE

.1 Arrange for a technically qualified Manufacturer's Representative to attend the installation work, certify correct installation, train operating and maintenance staff and undertake the testing of the system for sufficient periods, to ensure the equipment is installed, operated, and maintained in accordance with the manufacturer's recommended procedures.

.2 The minimum periods of site attendance are identified in the following table along with the form to be completed on each of these trips. A "day" is defined as eight working hours on site.

.3 The total number of trips will depend on the Contractor's schedule. The cost of additional trips, to be determined by the Engineer, will be borne by the Contractor.

Item	Description	Total number of days	Form
1	Equipment Delivery		100
2	Installation Assistance (combined with Item 3)		101
3	Witnessing of Equipment Installation	1	102
4	Operator and Maintenance Training (combined with Item 3)	0.5	T1
5	Process Performance Testing	1	103
6	Operator and Maintenance Training (combined with Item 5)	0.5	T2
7	Commissioning	0.5	104
8	Follow-up Inspection	0.5	Report
9	End of Warranty Inspection	0.5	Report

3.2 INSTALLATION

.1 Verify satisfactory delivery of the equipment by completing Form 100, illustrated in Section 01 79 00.

.2 Instruct installer in the methods and precautions to be followed in the installation of the equipment. Certify the Contractor's understanding by completing Form 101, illustrated in Section 01 79 00.

3.3 INSTALLATION WITNESSING

.1 The Contractor must ensure that equipment is installed plumb, square and true within tolerances specified by the Manufacturer and as indicated in the Contract Documents.

.2 The Contractor must ensure the equipment is installed as required to provide satisfactory service.

.3 The Manufacturer's Representative must cooperate with the Contractor to deliver a successful installation as documented by Form 102 illustrated in Section 01 79 00.

3.4 PROCESS PERFORMANCE TESTING

.1 General

.1 Except as modified by this section, conduct testing in accordance with the general requirements of Section 01 79 00.

.2 Submit a report summarizing the operating parameters assessed during the test period, recommending optimal setpoints and listing final testing data in concise tabular form at the conclusion of the test period.

.3 Upon the successful completion of the testing procedure, Form 103 in Section 01 79 00 will be signed.

.2 Start-up

.1 Submit a detailed start-up procedure for approval.

.2 Provide site services of the equipment Manufacturer's Representative for the tuning, monitoring, inspecting, and starting of the equipment during the entire start-up procedure.

.3 Unless otherwise specified water, and electric power will be provided by the Contractor for the start-up period

.4 Subsequent to proper tuning, perform an initial thorough inspection of all system components, including electrical and instrumentation controls

.3 Testing

.1 TSS removal, BOD removal and Dewatered Sludge Solids Concentration must be continuously tested during the Process Performance Testing to ensure equipment compliance with process performance as specified in this technical specification. Equipment Manufacturer must submit a detailed procedure and schedule of sampling and testing for approval.

.2 Begin testing only after completing the start-up procedure.

.1 In the event of unacceptable performance, perform any supplemental testing, analysis, equipment adjustments, modifications, changes, or additions and request a retest of the unacceptable system at no additional cost.

3.5 COMMISSIONING

.1 Contractor and Manufacturer's Representative to be in attendance during commissioning of the process system that includes the equipment specified in this section to ensure the equipment functions as intended in the process system as documented by Form 104, illustrated in Section 01 79 00. Cooperate with the Commissioning Team in developing the Commissioning Plan for this equipment. Provide assistance as required for system programming, start-up and troubleshooting.

3.6 TRAINING

.1 The Manufacturer’s Representative must provide training to the Owner’s Designated Staff in the proper operation and maintenance of the equipment as documented by Forms T1 and T2 in Section 01 79 00.

3.7 FOLLOW-UP INSPECTION

.1 After a period designated by the Owner (approximately 6 months after commissioning), a qualified Manufacturer’s Representative will provide a follow-up inspection of the installation.

.2 Manufacturer’s Representative to submit a report summarizing the performance of the equipment, recommending optimal set points and any operational recommendations.

3.8 END OF WARRANTY INSPECTION

.1 After a period designated by the Owner (approximately 12 months after commissioning), a qualified Manufacturer’s Representative will provide a follow-up inspection of the installation.

.2 Manufacturer’s Representative to submit a report summarizing the performance of the equipment, recommending optimal set points and any operational recommendations.

WASTEWATER TREATMENT PLANT UPGRADE
Primary Filter Supply

Addendum No. 01
February 14, 2018

This Addendum forms part of the Tender Documents and modifies them as stated herein. Addendum issued to active tenderers with documents on record (2 pages not including attachments).

A. CONTRACT SPECIFICATIONS

00 21 00 – Instructions to Bidders

1. **4.1** Add copied to Eslam.Maher@colliersprojectleaders.com.

2. **13.2 Approved Manufacturers**

   Question: Since there is no contractor at this point, please confirm any additional engineering costs for alternative products will be factored into the evaluation and added to the manufacturers' capital costs?

   Response: The Contractor, in this case the Supplier, shall be responsible for any additional engineering costs and others as a result of providing a product which does not conform to the design drawings and specifications, and requires redesign to accommodate.

46 61 23 – Primary Filter:

1. **1.3.1 Clarification:** All equipment installed in the classified area needs to be C1Z2 rated. If all individual components are C1Z2 rated, then the assembled product doesn't need a separate rating, but it's critical that ALL components, connections, etc. be rated appropriately.
2. **2.2.5.1 Clarification:** 50% TSS removal (average) at maximum month flow (60.4 L/s) considering 50% of TSS is greater than filter pore size of 350 microns.
3. **2.2.5.2 Clarification:** 25% TSS removal (average) at maximum month flow (60.4 L/s) considering 50% of TSS is greater than filter pore size of 350 microns.
4. **2.4.2.5 Clarification:** Connection must be 100 mm 125# flanged.
5. **2.4.2.6 Clarification:** 75 mm threaded connection is acceptable.
6. **2.8.6 Clarification:** Reference drawing P608 attached.

7. **2.10.2 Clarification:** It is acceptable to remove the additional spreader bar system and additional lifting lugs requested based on the improvements on the location of the lifting lugs.
8. **2.12.3 Clarification:** One HMI per filter is acceptable.

ITEM: "A" – Two (2) SPECO WasteMaster® Tank Mounted Screw Screens, Model GCPC600 **(EACH)** to include:

- Integral screen tank with hinged access door from type 316L stainless steel. Tank supplied with mounting flange for ultrasonic level sensor, vent and hinged access door.
- Tank shall be sized to allow screen to pivot to an angle parallel with the mounting floor.
- Semi-cylindrical screenings basket from type 316L stainless steel
- Conveyor tube with wear bars from type 316L stainless steel bolted to the transport tube using 316 stainless steel bolts.
- Neoprene side seals fastened to basket to prevent bypass around the screen.
- Shaftless spiral screw from high strength alloy steel with protective primer coating and brushes attached in the basket area. Brushes are supplied in individually replaceable sections each covering 180° of the spiral and shall have nylon bristles molded into a plastic core and attached to the screw with 316 stainless steel fasteners.
- Basket mounted spray bar from type 316L stainless steel.
- Dual chambered dewatering and discharge zone from type 316L stainless steel with hinged access door.
- Dewatering zone drain flush spray system from type 316L stainless steel with manual ball valve.
- Plastic hose for drain connection to direct pressate back into the channel.
- Centralized washing system with type 316 stainless steel piping and rubber reinforced hose, connecting all unit spray locations to single point for customer connection. Includes manual ball valves and solenoids.
- Drive unit with ~~1.5~~ 2 HP TEFC (Class 1, Division 2) motor suitable for 575/3/60 electrical supply.
- Fasteners – 316 stainless steel.
- A stand from type 316L stainless steel is supplied to support the fine screen unit.

2 HP

HARDWARE

- Assembly fasteners from type 316 stainless steel.

CONTROL PANEL AND INSTRUMENTATION

- One (1) NEMA 4X type 316L stainless steel wall mount main control panel suitable for 600/3/60 electrical supply.
- One (1) NEMA 4X Emergency Stop pushbutton station with sealed contacts for use in a Class 1, Zone 2 area.
- Two (2) NEMA 4/7 safety microswitches mounted to tank access door and dewatering/discharge access door (Class 1, Zone 2).
- One (1) NEMA 4x 120V 304SS Body solenoid valve to control water spray functions, suitable for installation in a Class 1, Zone 2 area.
- One (1) Ultrasonic Level Controller: A 120V single point level controller shall be provided in a windowed NEMA 4X polycarbonate enclosure suitable for wall mounting, to receive and interpret a

NOTES:

1. UNIT MATERIAL: SCREEN: 316L SS
   SCREENINGS PRESS: 316L SS
   SPIRAL MATERIAL: HI-STRENGTH ALLOY STEEL
2. AREA CLASSIFICATION:
   INSIDE TANK - HAZARDOUS - CLASS 1, ZONE 1.
   OUTSIDE TANK - HAZARDOUS - CLASS 1, ZONE 2
3. SCREEN DRIVE MOTOR: 1.5 HP, 575 V, 3 PH, 60 HZ
4. SCREEN WEIGHT - 1750 LB [793.8 Kg]
   MOTOR WEIGHT - 41 LB [19 Kg]
   GEAR BOX - 101 LB [46 Kg]
5. WATER REQUIREMENTS:
   SCREEN SPRAY WASH: 24 GPM @ 40 - 60 PSI [1.5L/s @ 275 - 414 kPa]
6. NOT SHOWN: ITEMS 119 - 125. REFER TO PARTS LISTS FOR DESCRIPTIONS, MATERIAL, AND QUANTITIES.
7. PROVIDE SUFFICIENT FLEXIBILITY IN WATER AND ELECTRICAL CONNECTIONS TO ALLOW THE UNIT TO PIVOT OUT OF CHANNEL . ALL INTER CONNECTING PIPING, WIRING, AND CONDUIT FROM UNIT-MOUNTED DEVICES WILL BE SUPPLIED BY OTHERS.
8. CUSTOMER MUST PROVIDE LIFTING DEVICE TO PIVOT UNIT OUT OF TANK LIFTING CAPABILITY MUST EQUAL A MINIMUM OF 60% ON UNIT WEIGHT, APPLIED AT LIFTING POINT SHOWN. TANK MUST BE EMPTY, AND SCREEN BASKET MUST BE CLEAR OF SOLIDS PRIOR TO PIVOTING.
9. BOTTOM OF SCREEN MUST REST FLUSH TO THE TANK FLOOR, TO PREVENT MATERIAL FROM BYPASSING THE SCREEN. SIDE SEALS MUST REST ALONG TANK WALL ON BOTH SIDES TO PREVENT MATERIAL FROM BYPASSING THE SCREEN.
10. STRAINER, SOLENOID VALVES AND WATER HAMMER (SHIPPED LOOSE) TO BE INSTALLED IN WASHWATER SUPPLY LINE.
11. EQUIPMENT MUST BE PROTECTED TO PREVENT SURFACE CONTAMINATION. CONTAMINATION CAN COME FROM WELDING CUTTING, PAINTING AND OTHER SUCH ACTIVITIES IN THE AREA OF THE EQUIPMENT. STAINLESS STEEL SURFACES CONTAMINATED WITH ANY IRON, CHLORIDE CONTAINING MATERIAL AND OTHER SUBSTANCES CAN EXPERIENCE ACCELERATED SURFACE CORROSION AND PITTING.
12. DESIGN IS BASED ON FLOW PARAMETERS PROVIDED. IF THERE ARE SITE SPECIFIC HYDRAULIC REQUIREMENTS (SUCH AS MAXIMUM AND MINIMUM FLOWS), PLEASE CONSULT ENVIRO-CARE REPRESENTATIVE TO ENSURE THAT THE EQUIPMENT CAN MEET ALL REQUIREMENTS. IN SOME CASES, ENVIRO-CARE MAY RECOMMEND A DOWNSTREAM WEIR FOR AVERAGE FLOWS THAT ARE EXTREMELY LOW.
13. THE FOLLOWING DEVICES NEED TO BE FIELD WIRED BY ELECTRICAL CONTRACTOR

- One (1) NEMA 4x 120V 304SS Body solenoid valve to control water spray functions, suitable for installation in a Class 1, Zone 2 area.
- One (1) Ultrasonic Level Controller: A 120V single point level controller shall be provided in a windowed NEMA 4X polycarbonate enclosure suitable for wall mounting, to receive and interpret a

4-20mA scaled signal from an upstream transducer. The controller shall have 6 internal relays and provide an LCD display.

- One (1) ultrasonic level transducer shall be provided. Sensor shall have an ETFE housing with an integral sensor to provide compensation for acoustic variations due to temperature. Sensor shall have a range of 1-33 ft and be supplied with a 33 ft integral cable. Sensor shall be suitable for installation in a Class 1, Division 1, Group D area.

SPARE PARTS (TOTAL)

- One (1) set of spare brushes for each screen.
- No special tools required

FIELD SERVICE (TOTAL)

- Five (5) trips for a total of six (6) days onsite for installation inspection, start-up and operator training.

1. ENVIRO-CARE RESERVES PROPRIETARY RIGHTS TO THIS DRAWING AND THE DATA SHOWN THEREON, WHICH IS SUBMITTED IN CONFIDENCE.

2. IF APPLICABLE, A STAR DENOTES VARIANCE FROM CONTRACT DOCUMENTS AND SHOULD BE PARTICULARLY NOTED.

3. IF APPLICABLE, A CLOUD DENOTES DIMENSIONS WHICH ARE CRITICAL TO THE DESIGN OF THE EQUIPMENT, BUT NOT CLEAR AND/OR NOT PROVIDED IN THE CONTRACT DOCUMENTS.

4. THE FOLLOWING DEFINES THE RESPONSIBILITY OF ENVIRO-CARE WITH REGARD TO THE INFORMATION SHOWN ON THIS DRAWING.

   A. THIS DRAWING IS NOT TO BE USED FOR CONSTRUCTION OR INSTALLATION PURPOSES UNTIL IT HAS BEEN APPROVED BY THE OWNER, THE ENGINEER OR AN AUTHORIZED REPRESENTATIVE.

   B. DIMENSIONS, WEIGHTS, AND OTHER INFORMATION ARE PROVIDED TO ACCOMMODATE THE STRUCTURE TO THE EQUIPMENT AS SHOWN.

   C. ENVIRO-CARE IS NOT RESPONSIBLE FOR ANY CONCRETE STRUCTURE DESIGN. THE ENGINEER IS TO DETERMINE SIZES TO SUIT LOCAL REQUIREMENTS.

   D. ENVIRO-CARE IS NOT RESPONSIBLE FOR DAMAGE, INJURY OR LOSS RESULTING FROM USE OF THE SUPPLIED EQUIPMENT.

   E. CHARGES FOR MODIFICATIONS OR ADDITIONS TO THE EQUIPMENT WILL NOT BE ACCEPTED BY ENVIRO-CARE, UNLESS PRIOR APPROVAL HAS BEEN OBTAINED IN WRITING FROM AN AUTHORIZED ENVIRO-CARE REPRESENTATIVE.

5. ALL CONCRETE, GROUT, CONCRETE REINFORCING, SLIDE GATES, PIPING, VALVES, PIPE SUPPORTS OR FITTINGS, WALL BRACKETS, ELECTRICAL WIRING, CONDUIT, OR ELECTRICAL EQUIPMENT, ERECTION, FIELD PAINTING OR PAINT, FIELD WELDING OR WELD ROD, GREASE, OR LUBRICATING OIL, EXCEPT AS SPECIFICALLY NOTED IS TO BE BY OTHERS, NOT BY ENVIRO-CARE.

6. ALL ONSITE WELDING MUST CONFORM TO THE LATEST STANDARDS OF THE AMERICAN WELDING SOCIETY.

7. SEE PARTS LIST FOR ITEM IDENTIFICATION.

Hex Head Cap Screw

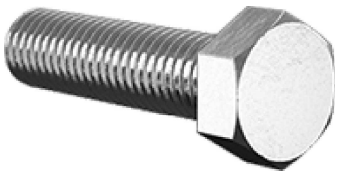
This page intentionally left blank

McMASTER-CARR®

Super-Corrosion-Resistant 316 Stainless Steel Hex Head Screw

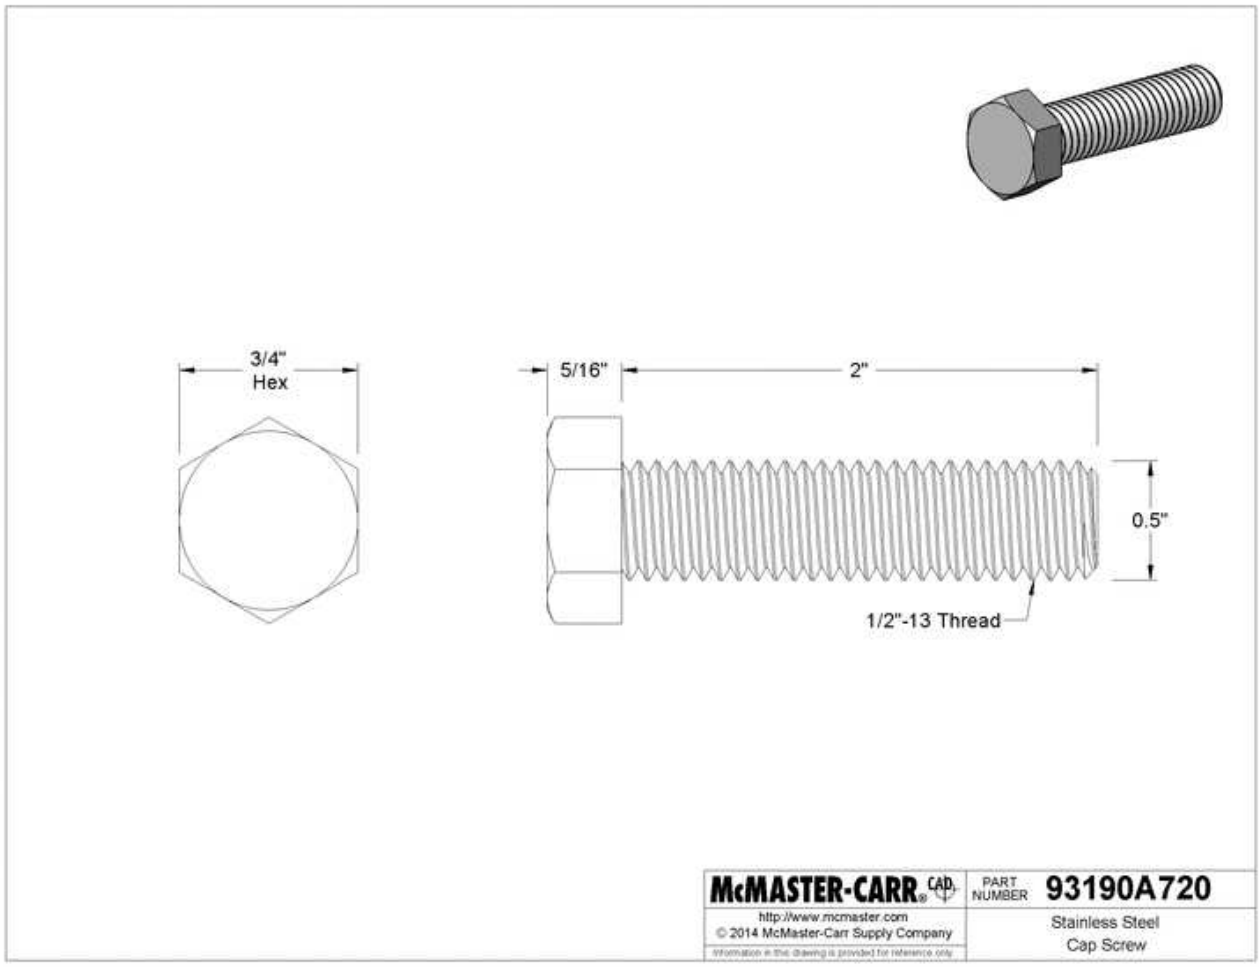
1/2"-13 Thread Size, 2" Long, Fully Threaded

93190A720



Thread Size	1/2"-13
Length	2"
Threading	Fully Threaded
Head Width	3/4"
Head Height	5/16"
Material	316 Stainless Steel
Hardness	Rockwell B70
Tensile Strength	70,000 psi
Screw Size Decimal Equivalent	0.500"
Thread Type	UNC
Thread Spacing	Coarse
Thread Fit	Class 2A
Thread Direction	Right Hand
Head Type	Hex
Hex Head Profile	Standard
Drive Style	External Hex
Specifications Met	ASME B18.2.1
System of Measurement	Inch
RoHS	Compliant

More corrosion resistant than 18-8 stainless steel screws, these screws have excellent resistance to chemicals and salt water. They may be mildly magnetic. Length is measured from under the head.



The information in this 3-D model is provided for reference only.

Force Calculations- Screens

This page intentionally left blank

The following calculations show all loads applied during normal operation of the equipment. The supplied screen will be tank mounted and secured in such a manner to resist any shear and overturning forces. Only one piece of Enviro-Care supplied equipment will require anchoring to the tank support base will be the spiral screen pivoting support stand. The following tension calculations are performed on the farthest upstream bolt if the support stand were to start tipping from the force of the upstream water and the weight of the unit. These calculations are calculated if the screen is only supported by the pivoting stand, and if the screen is 100% blinded (worst case scenario). Please note that the bottom of the tank may also support some of the weight of the screen when it is in the tank, but that additional support is ignored.

This page intentionally left blank

Determine Worst Case Shear Force from Influent Wastewater

Unit Definitions

$\boldsymbol{W_s}$ – is the weight of the Spiral Screen

$\boldsymbol{\rho_{ww}}$ – is the density of raw sewage from ACI 350, Code Requirements for Environmental Engineering Concrete Structures.

$\boldsymbol{h_d}$ – is the maximum upstream water level, from Figure 1: Operation Level and General Arrangement Drawing WEC217259Z

$\boldsymbol{w_t}$ – is the width of the tank, from General Arrangement Drawing WEC217259Z

$\boldsymbol{A_{hydro}}$ – is the area that the force of the influent water acts upon

$\boldsymbol{g}$ – is the acceleration due to gravity

$\boldsymbol{P_{hydro}}$ – is the hydrostatic pressure on the screen if the screen is fully blinded

$\boldsymbol{F_{hydro}}$ – is the hydrostatic force on the pivoting stand if screen is fully blinded

$\boldsymbol{V_{shear}}$ – is the shear force on each bolt that anchors pivoting stand (divided by 5 because the pivoting stand has 5 hex head cap screws)

Calculations

$$W_s = 500kg$$

$$\rho_{ww} = \frac{63lbs}{ft^3} \approx 1010\frac{kg}{m^3}$$

$$h_d = 692mm = 692mm \cdot \frac{m}{1000mm} = 0.692m$$

$$w_t = 635mm = 635mm \cdot \frac{m}{1000mm} = 0.635m$$

$$A_{hydro} = h_d \cdot w_t = 0.692m \cdot 0.635m = 0.43942m^2$$

$$g = 9.81\ \frac{m}{s^2}$$

$$cf = 1N = \frac{1kg \cdot m}{s^2}$$

$$P_{hydro} = \frac{h_d \cdot \rho_{ww} \cdot g}{cf} = 0.692m \cdot 1010\frac{kg}{m^3} \cdot 9.81\frac{m}{s^2} \cdot \frac{1N}{\frac{1kg \cdot m}{s^2}} = \frac{6856.4052N}{m^2} \cdot \frac{1Pa}{\frac{1N}{m^2}} = [\mathbf{6856.4Pa}]$$

$$F_{hydro} = (P_{hydro} \cdot A_{hydro}) = \frac{6856.4N}{m^2} \cdot 0.43942m^2 = [\mathbf{3012.8N}]$$

$$V_{shear} = \frac{F_{hydro}}{5} = \frac{3012.8N}{5} = [\mathbf{602.6N}]$$

Determine Worst Case Shear Force from Influent Wastewater

Unit Definitions

$\boldsymbol{d_b}$ – is the measurement from the downstream edge of the mounting plate to the centerline of the upstream bolt, from General Arrangement drawing WEC217259Z

$\boldsymbol{d_s}$ – is the measurement from the downstream edge of the mounting plate to the centerline of the support stand riser, from General Arrangement drawing WEC217259Z

$\boldsymbol{d_h}$ – is the measurement from the downstream edge of the mounting plate to the location of the support stand riser where the horizontal force is applied **($\boldsymbol{F_{hydro}}$)**, from General Arrangement drawing WEC217259Z

$\boldsymbol{FW_s}$ – is the force of the weight of the Spiral Screen

Calculations

$$d_b = 116\text{mm} = 166\text{mm} \cdot \frac{1m}{1000mm} = 0.116m$$

$$d_s = 100\text{mm} = 100\text{mm} \cdot \frac{1m}{1000mm} = 0.100m$$

$$d_h = 1248\text{mm} = 1248\text{mm} \cdot \frac{1m}{1000mm} = 1.248m$$

$$FW_s = 500kg \cdot 9.81\frac{m}{s^2} = 4905N$$

To determine maximum tensile forces, the sum of the moments about the downstream edge of the pivoting stand mounting plate should equal zero when the screen is 100% blinded and screen is in the tank.

$$\sum M_{O1} = 0$$

$$\left(F_{hydro} \cdot d_h\right) + \left(-FW_s \cdot d_s\right) + \left(T_y \cdot d_b\right) = 0 \text{ So:}$$

$$T_y = \frac{\left(\left(F_{hydro} \cdot d_h\right) + \left(W_s \cdot d_s\right)\right)}{d_b} = \frac{\left(\left(3012.8N \cdot 1.248m\right) + \left(4905N \cdot 0.100m\right)\right)}{0.116m} = \frac{3760N \cdot m + 490.5N \cdot m}{0.116m} = \boldsymbol{[36640N]}$$

$$T_{anchor} = \frac{T_y}{5} = \frac{36640N}{5} = \boldsymbol{[7328N]}$$

L1 = Minimum operation level

L2 = Maximum operation level

NOTES:

1. UNIT MATERIAL: SCREEN: 316L SS
   SCREENINGS PRESS: 316L SS
   SPIRAL MATERIAL: HI-STRENGTH ALLOY STEEL

2. AREA CLASSIFICATION:
   INSIDE TANK - HAZARDOUS - CLASS 1, ZONE 1.
   OUTSIDE TANK - HAZARDOUS - CLASS 1, ZONE 2

3. SCREEN DRIVE MOTOR: 1.5 HP, 575 V, 3 PH, 60 HZ

4. SCREEN WEIGHT - 1750 LB [793.8 Kg]
   MOTOR WEIGHT - 41 LB [19 Kg]
   GEAR BOX - 101 LB [46 Kg]

5. WATER REQUIREMENTS:
   SCREEN SPRAY WASH: 24 GPM @ 40 - 60 PSI [1.5L/s @ 275 - 414 kPa]

6. NOT SHOWN: ITEMS 119 - 125. REFER TO PARTS LISTS FOR DESCRIPTIONS, MATERIAL, AND QUANTITIES.

7. PROVIDE SUFFICIENT FLEXIBILITY IN WATER AND ELECTRICAL CONNECTIONS TO ALLOW THE UNIT TO PIVOT OUT OF CHANNEL . ALL INTER CONNECTING PIPING, WIRING, AND CONDUIT FROM UNIT-MOUNTED DEVICES WILL BE SUPPLIED BY OTHERS.

8. CUSTOMER MUST PROVIDE LIFTING DEVICE TO PIVOT UNIT OUT OF TANK LIFTING CAPABILITY MUST EQUAL A MINIMUM OF 60% ON UNIT WEIGHT, APPLIED AT LIFTING POINT SHOWN. TANK MUST BE EMPTY, AND SCREEN BASKET MUST BE CLEAR OF SOLIDS PRIOR TO PIVOTING.

9. BOTTOM OF SCREEN MUST REST FLUSH TO THE TANK FLOOR, TO PREVENT MATERIAL FROM BYPASSING THE SCREEN. SIDE SEALS MUST REST ALONG TANK WALL ON BOTH SIDES TO PREVENT MATERIAL FROM BYPASSING THE SCREEN.

10. STRAINER, SOLENOID VALVES AND WATER HAMMER (SHIPPED LOOSE) TO BE INSTALLED IN WASHWATER SUPPLY LINE.

11. EQUIPMENT MUST BE PROTECTED TO PREVENT SURFACE CONTAMINATION. CONTAMINATION CAN COME FROM WELDING CUTTING, PAINTING AND OTHER SUCH ACTIVITIES IN THE AREA OF THE EQUIPMENT. STAINLESS STEEL SURFACES CONTAMINATED WITH ANY IRON, CHLORIDE CONTAINING MATERIAL AND OTHER SUBSTANCES CAN EXPERIENCE ACCELERATED SURFACE CORROSION AND PITTING.

12. DESIGN IS BASED ON FLOW PARAMETERS PROVIDED. IF THERE ARE SITE SPECIFIC HYDRAULIC REQUIREMENTS (SUCH AS MAXIMUM AND MINIMUM FLOWS), PLEASE CONSULT ENVIRO-CARE REPRESENTATIVE TO ENSURE THAT THE EQUIPMENT CAN MEET ALL REQUIREMENTS. IN SOME CASES, ENVIRO-CARE MAY RECOMMEND A DOWNSTREAM WEIR FOR AVERAGE FLOWS THAT ARE EXTREMELY LOW.

13. THE FOLLOWING DEVICES NEED TO BE FIELD WIRED BY ELECTRICAL CONTRACTOR
    - SCREEN DRIVE MOTOR: ITEM 104 (QTY 2)

Force Calculations- Tank

This page intentionally left blank

The following calculations show all loads applied during normal operation of the equipment. The supplied tank will be mounted to a metal platform (by others not Enviro-Care) and secured in such a manner to resist any shear and overturning forces. Only one piece of Enviro-Care supplied equipment will require anchoring to the metal platform and will be the tank. The following tension calculations are performed on each of the support stand anchors if the maximum allowed tensile force is applied. This will allow for the calculation of the maximum amount of force that would have to be applied to the GCPC600 for the hex head cap screws to fail. These calculations verify the ability of the selected GCPC600 hex head cap screws used to anchor the tank to the metal platform will withstand all loads applied during the normal operation of the equipment and only under extreme circumstances will the selected hex head cap screws fail. Any additional support from the connection to piping is ignored.

Determine Worst Case Shear Force from Any Force on the GCPC600 Setup Calculations

Unit Definitions

l_t – is the length of the screenings transport tube

r_t – is the radius of the screenings transport tube

A_t – is the area of the screenings transport tube

l_c – is the length of the screenings transport cone

r_{c1} – is the lower radius of the screenings transport cone

r_{c2} – is the radius of the screenings transport cone

l_b – is the length of the screenings basket

A_b – is the area of the screenings basket

r_b – is the radius of the screenings basket

W_{GCPC} – is the weight of the Unit

W_M – is the weight of the motor

W_R – is the weight of the reducer

ρ_{ws} – is the density of wet screenings

V_{tr} – is the volume of the GCPC600 transport tube multiplied by 2/3 because of spiral in the transport tube

V_c – is the volume of the GCPC600 transport cone multiplied by 2/3 because of spiral in the transport cone

V_b – is the volume of the GCPC600 basket multiplied by 2/3 because of spiral in the basket

V_T – is the total volume

W_{ws} – is the weight of the wet screenings

W_T – is the total weight of the GCPC600 when 100% full of wet screenings

Enviro-Care
A WAMGROUP® Company

Setup Calculations

$l_{tr} = 1054mm = \mathbf{1.054m}$

$D_{tr} = 250mm = \mathbf{0.250m}$

$A_{tr} = \pi r^2 = \pi\left(\frac{0.250m}{2}\right)^2 = \mathbf{0.049m^2}$

$l_c = 741mm = \mathbf{0.741m}$

$D_{c1} = 530mm = \mathbf{0.530m}$

$l_b = 1130mm = \mathbf{1.130m}$

$D_b = 530mm = \mathbf{0.530m}$

$A_b = \pi r^2 = \pi\left(\frac{0.530m}{2}\right)^2 = \mathbf{0.221m^2}$

$W_{GCPC} = \mathbf{793.8kg}$

$W_M = \mathbf{19kg}$

$W_R = \mathbf{46kg}$

$$\rho_{ws} = \frac{70lbs}{ft^3} \cdot \frac{16.0185\frac{kg}{m^3}}{\frac{lbs}{ft^3}} \approx \mathbf{1121.29\frac{kg}{m^3}}$$

$$V_{tr} = (A_{tr} \cdot l_{tr}) \cdot \frac{2}{3} = (0.049m^2 \cdot 1.054m) \cdot \frac{2}{3} = \mathbf{0.035m^3}$$

$$V_c = \left(\frac{1}{3}\pi \cdot \left(\left(\frac{D_{c1}}{2}\right)^2 + \left(\left(\frac{D_{c1}}{2}\right) \cdot \left(\frac{D_{c2}}{2}\right)\right) + \left(\frac{D_{c2}}{2}\right)^2\right)\right) \cdot \frac{2}{3} \cdot l_c$$

$$= \left(\frac{1}{3}\pi \cdot \left(\left(\frac{0.530m}{2}\right)^2 + \left(\left(\frac{0.530m}{2}\right) \cdot \left(\frac{0.250m}{2}\right)\right) + \left(\frac{0.250m}{2}\right)^2\right)\right) \cdot \frac{2}{3} \cdot 0.741m$$

$$= \left(\frac{1}{3}\pi \cdot (0.070m^2 + 0.033m^2 + 0.016m^2)\right) \cdot \frac{2}{3} = (0.125m^2) \cdot \frac{2}{3} \cdot 0.741m = \mathbf{0.062m^3}$$

$$V_b = (A_b \cdot l_b) \cdot \frac{2}{3} = (0.221m^2 \cdot 0.530m) \cdot \frac{2}{3} = \mathbf{0.078m^3}$$

$$V_T = V_{tr} + V_c + V_b = 0.035m^3 + 0.741m^3 + 0.062m^3 = \mathbf{0.838m^3}$$

$$W_{ws} = \rho_{ws} \cdot V_t = 1121.29\frac{kg}{m^3} \cdot 0.838m^3 = \mathbf{939.64kg}$$

$$W_T = W_{GCPC} + W_M + W_R + W_{ws} = 793.8kg + 19kg + 46kg + 939.64kg = \mathbf{1798.44kg}$$

Determine Worst Case Shear Force from Any Force on the GCPC600

Unit Definitions

S_T – is the Tensile strength of the ½" hex head cap screw from the cut sheets

A_S – is the tensile stress area from Appendix A

T_L – is the maximum tensile load that the ½" hex head cap screw can withstand

d_{Fh} – is the measurement from the bottom edge of the anchor base to the center of gravity where the horizontal force is applied **(F_h)**, from Figure 5

d_c – is the measurement from one edge of the anchor base to the centerline of the center line of the equipment, from Figure 6 and Figure 7

d_{hh} – is the measurement from one edge of the anchor base to the centerline of the opposite hex head cap screw, from Figure 6 and Figure 7

F_h – is the maximum horizontal force before hex head cap screw failure

FW_E – is the force of the weight of the equipment

T_B – is the maximum tensile load that acts on each bolt

V_{shear} – is the shear force on each bolt

Calculations

$$S_T = 70000psi = 70000psi \cdot \frac{6894.76\frac{N}{m^2}}{psi} = 482633200\frac{N}{m^2} = \mathbf{482.6}\frac{\boldsymbol{MN}}{\boldsymbol{m^2}}$$

$$A_S = 0.142\text{in}^2 = 0.142\text{in}^2 \cdot \frac{645.16mm^2}{in^2} = 91.613mm^2 = \mathbf{0.000091613}\boldsymbol{m^2}$$

First, we must find the maximum allowed tension force.

We use the formula $T_L = S_T \cdot A_S$

$$T_L = S_T \cdot A_S = 482633200\frac{\text{N}}{m^2} \cdot 0.000091613\text{m}^2 = 44215.48N = \mathbf{44.215}\boldsymbol{kN}$$

$$d_{Fh} = 1560\text{mm} = 1560\text{mm} \cdot \frac{1m}{1000mm} = \mathbf{1.560}\boldsymbol{m}$$

$$d_c = 358mm = 358\text{mm} \cdot \frac{1m}{1000mm} = \mathbf{0.358}\boldsymbol{m}$$

$$d_{hh} = 696\text{mm} = 696\text{mm} \cdot \frac{1m}{1000mm} = \mathbf{0.696}\boldsymbol{m}$$

$$FW_E = W_T \cdot 9.81\frac{m}{s^2} = 1798.44kg \cdot 9.81\frac{m}{s^2} = \mathbf{17643}\boldsymbol{N}$$

The maximum tension force acting on one bolt is:

$$T_L = \mathbf{44.215}\boldsymbol{kN}$$

The maximum shear force on 1 bolt is calculated with the formula below:

$$V_{shear} = S_T \cdot 0.60 \cdot A_S = 70000psi \cdot 0.60 \cdot 0.000091613\text{m}^2 = 42000psi$$
$$= 42000psi \cdot \frac{6894.76\frac{N}{m^2}}{psi} \cdot 0.000091613\text{m}^2 = 289579920\frac{N}{m^2} \cdot 0.000091613\text{m}^2$$
$$= [\mathbf{26.530}\boldsymbol{kN}]$$

In this case, we will be determining the maximum amount of force needed before the anchor rods fail. The sum of the moments about the edge of the mounting plate should equal zero when the SAVI VFA is operating normally and is full of wet screenings.

$$\sum M_{O1} = 0$$

$(F_h \cdot d_{Fh}) + (-FW_E \cdot d_c) + (T_L \cdot d_{hh}) = 0$ So:

$$F_h = \frac{\big((T_L \cdot d_{hh}) + (FW_E \cdot d_C)\big)}{d_{Fh}} = \frac{\big((44.215kN \cdot 0.696m) + (1798.44kN \cdot 0.358m)\big)}{1.56m}$$
$$= \frac{(30.774kN \cdot m + 643.842kn \cdot m)}{1.56m} = [\mathbf{432.446}\boldsymbol{kN}]$$

1 1/2	1.500	6	1.406	8	1.492	12	1.581

The tensile stress area is calculated as follows:

$$As = 0.7854\ [D - (0.9743/n)]^2$$

where
As = stress area (in sq.)
D = nominal bolt size (in.)
n = threads per inch

Metric (SI) System Thread Tensile Stress Area (As)

Nom Dia. (mm)	Coarse Thread		Fine Thread	
	Thread Pitch (mm)	Tensile Stress Area (mm sq.)	Thread Pitch (mm)	Tensile Stress Area (mm sq.)
3	0.5	5.03		
3.5	0.6	6.78		
4	0.7	8.78		
5	0.8	14.2		
6	1	20.1		
7	1	28.9		
8	1.25	36.6	1	39.2
10	1.5	58.0	1.25	61.2
12	1.75	84.3	1.25	92.1
14	2	115	1.5	125
16	2	157	1.5	167

33	3.5	694	2	761
36	4	817	3	865
39	4	976	3	1030

The tensile stress area is calculated as follows:

$$A_S = 0.7854\ [D - (0.9743P)]^2$$

where
A_S = stress area (mm sq.)
D = nominal bolt size (mm)
P = thread pitch (mm)

U.S./Metric Conversion Equivalents

Quantity	To Convert	Into	Multiply By		To Convert	Into	Multiply By

PROCESS EQUIPMENT MAINTENANCE SCHEDULE

TAGS	EQUIPMENT	MAINTENANCE TASK	RECOMMENDED MAINTENANCE SCHEDULE
P-01-110/120/130	**Raw Wastewater Pumps**		
	Cable	If the outer jacket is damaged, replace the cable Check that cables do not have any sharp bends and are not pinched	Within the first year of operation, annually thereafter Anually or 4000 hours, whichever comes first
	Connections to Power	Check that the connections are properly secured	Anually or 4000 hours, whichever comes first
	Electrical Cabinets	Check that they are clean and dry	Anually or 4000 hours, whichever comes first
	Impeller	Check the impeller clearance Adjust, the impeller if necessary	Anually or 4000 hours, whichever comes first Depending on running conditions
	Inspection Chamber	Check that resistance between the ground earth and phase lead is more than 5 megohms. Conduct a phase-to-phase resistance check	Anually or 4000 hours, whichever comes first Anually or 4000 hours, whichever comes first
	Junction Box	Check that is clean and dry	Anually or 4000 hours, whichever comes first
	Level Sensors	Check the condition and functionality	Within the first year of operation, frequency of inspection will depend on running conditions and type of sensors.
	Lifting Device	Check that the local safety regulations are followed	Within the first year of operation, annually thereafter
	Lifting Handle	Check the screws Check the condition of lifting handle and chain If necessary, replace.	Within the first year of operation, annually thereafter Within the first year of operation, annually thereafter As required
	O-rings	Replace the oil plug O-rings Replace the O-rings at the entrance or junction cover Grease the new2 o-rings	Anually or 4000 hours, whichever comes first Anually or 4000 hours, whichever comes first
	Overload Protection and other Protections	Check the correct settings	Anually or 4000 hours, whichever comes first
	Personnel Safety Devices	Check the guardrails, covers and other protections	Anually or 4000 hours, whichever comes first
	Rotation Direction	Check the impeller rotation	When pump is returned to service, after any maintenance
	Seal Housing	Fill with new coolant if necessary. Check that the freezing point is lower than 13 Celsius deg.	Up to 24,000 hours or six years, whichever comes first Up to 12,000 hours or three years, whichever comes first
	Terminal Board	Check that the connections are properly secured	Anually or 4000 hours, whichever comes first
	Thermal Contacts	Normally closed circuit; interval 0-1 ohm	Anually or 4000 hours, whichever comes first
	Thermistor	Check the resistance is between 20-250 ohms and the measured voltage is maximum 2 VDC	Anually or 4000 hours, whichever comes first
	Voltage and Amperage	Check the sunning levels	Weekly
SCRN-01-210/220	**Fine Screens**		
	Screen Basket	Clogging	Daily
	Screenings Discharge	Clogging	Daily
	Liquid Return Pipe	Clogging	Daily
	Spray Wash	Clogging of Nozzles	Weekly
	Compaction Zone	Clogging and cleanliness	Weekly
	Screw Reducer and Motor	Vibration & noise - repair or replace	Monthly
	Brushes	Wear - replace if required	100 hours
	Screen Basket	Wear	100 hours
	Fasteners	Tightness	100 hours
	Wear Bars	Wear - replace if required	3 months
	Motor	Lubrication - lubricate if required	Yearly
	Painted Equipment	Corrosion - remove rust and paint as required	Yearly
	Primary Filters		
	Sludge Auger	Inspect and unblock sludge auger.	Weekly
		Clean inside sludge auger area	Monthly
		Inspect liner for wear	Monthly
		Inspect and maintain sludge auger shear bolts	Monthly
		Lubricate gear flange	As needed
	Drive Motors	Inspect gear box and motor	Monthly
		Clean motors	As needed
	Dewatering Unit	Inspect and clean wedge wire screen and spray nozzle	As needed

PROCESS EQUIPMENT MAINTENANCE SCHEDULE

TAGS	EQUIPMENT	MAINTENANCE TASK	RECOMMENDED MAINTENANCE SCHEDULE
PF-01-310/320	Dewatering Unit	Replace the wedge wire screen	As needed
	Air Knife	Inspect air knife pressure gauge	Daily and as needed
		Inspect for even cleaning of the filter mesh	Daily and as needed
		Clean air knife	As needed
	Filter	Check the belt tension and alignment	Monthly
		Test the E-stop on the filter unit	Annually
		Inspect the cover lift seal	Annually
		Inspect the hot water spray nozzles for clogging and cleaning performance	Annually
		Inspect filter mesh for wearing, holes or tears	Weekly
		Clean filter mesh	Monthly and as needed
		Lubricate drive roller and under roller	Annually and as needed
	Level Sensor	Check level sensor offset	Monthly
	Control Power Panel (CPP)	Test E-stop	Annually
		Inspect and resolve active alarms	Daily
		Inspect and clean air filter	Monthly and as needed
		Clean inside and outside of the CPP	As needed
HST-01-350	**Bridge Crane**		
	Header Clap Plate Hardware	Check for full compression of lockwasher. Bolt should be tightened to manufacturer's specifications	Every 2,000 hours or yearly
	Spine Clamp Hardware	Check for full compression of lockwasher. Bolt should be tightened to manufacturer's specifications	Every 2,000 hours or yearly
	Truss Splice Plate	Check for full compression of lockwasher. Bolt should be tightened to manufacturer's specifications	Every 2,000 hours or yearly
	Splice Joint	All bolts should be in contact with track. Check track for alignment and that wheel; rolling surface is flush	Every 2,000 hours or yearly
	Hoist Trolley	Check clevis pin. Check cotter pin. (cotter pin should be fully wrapped around clevis pin). Check clevis bolt and hardware.	Every 2,000 hours or yearly
	End Stops (both runway and bridge)	Check for full compression of lockwasher. If thru bolt is exposed, replace end stops.	Every 2,000 hours or yearly
	Festoon Cable Clamp or Vacuum Hoist Clamp	Check for full compression of lockwasher.	Every 2,000 hours or yearly
	Wheels	Check for cracks, puts, and/or grooves: all of these increase pull forces. If any of these conditions exist, wheels should be replaced.	Every 2,000 hours or yearly
	Aluminum Bridge Assembly Hardware	Check that lockwashers are compressed and nuts tightened to torque specifications. Ensure sheer lug hardware is in required position and tight.	Every 2,000 hours or yearly
	End Trucks	Check for proper clamping hardware attachment. Ensure correct position on bridge to match specified cantilever's. Inspect end truck wheels following instructions for wheels. Standard End Truck: Make sure body is free of any bent materials, cracked or broken welds. Extended End Truck: Check overall condition of tubes. Examine supports for bent materials, cracked or broken welds. Inspect hardware attaching end truck support to tubes. Check wheel plate attachment bolts for any wear and make sure the nylock nut is still in the correct position.	Every 2,000 hours or yearly
B-02-210/220	**Primary Filter Aeration Blowers**		
	Belts	Check belt tension	24 hours after initial commissioning
		Check belt tension	Up to 500 hours or monthly
	Electrical Connections	Check all electrical connections and tighten if necessary	50 hours after initial commissioning
		Check all electrical connections and tighten if necessary	Annually
	Oil	Change lubrication oil	500 hours after initial commissioning
		Check oil level	Up to 500 hours or monthly
		Change lubrication oil FGB 220	Up to 3000 Hours. At least once a year
		Change lubrication oil SB 220	Up to 6000 Hours. At least every two years
	Air Filter	Check oil filter	Up to 3000 Hours. At least once a year

	Piping	Check for leaks	Weekly
		Rinse pipes with lukewarm water	Every 6 months
	Level Transmitter	Calibrate on a regular basis and / or when readings become inaccurate (specific tom each type of use)	Every 6 months
	Static Mixer	Visual Check Clean if required	Weekly
	Feeder	Check shaft seals Grease lubrication	Monthly
	Dissolver Cone	Inspect the cone for the presence of polymer agglomeration. In case of loss of suction, remove and clean eductor with hot water. Inspect weekly to ensure there is no accumulation of polymer or fouling and, if necessary, clean by draining the cone and the eductor with water	Weekly
	Valves	Inspect and clean if required. Refer to supplier's maintenance manual	Every 6 months
	Dosing skid frame or bulk bag unloader	Check the appearance of the structure, paying particular attention to the state of the welds	Monthly
		Check that all bolts are correctly tightened, in particular the vibrator fixing bolts	Monthly
P-04-970/980	**BFP Polymer Dosing Pumps**		
	Drive Unit	Strip down the drive unit	every 5000 operating hours
	Bearings	Remove the bearings	every 5000 operating hours
	All parts	Clean all parts	every 5000 operating hours
	Drive Unit	Renew the lubricant	Refer to O&M manual for drive lubricant renewal interval and amount
	Motor	Lubrication - relubricate if required	Refer to Motor O&M manual for relubrication time interval and amounts

Note: Refer to equipment Operation & Maintenance Manuals for more detailed information on equipment maintenance schedule.

1 Introduction and Safety

1.1 Introduction

Purpose of the manual

The purpose of this manual is to provide necessary information for working with the unit. Read this manual carefully before starting work.

Read and keep the manual

Save this manual for future reference, and keep it readily available at the location of the unit.

Intended use

WARNING:

Operating, installing, or maintaining the unit in any way that is not covered in this manual could cause death, serious personal injury, or damage to the equipment and the surroundings. This includes any modification to the equipment or use of parts not provided by Xylem. If there is a question regarding the intended use of the equipment, please contact a Xylem representative before proceeding.

Other manuals

See also the safety requirements and information in the original manufacturer's manuals for any other equipment furnished separately for use in this system.

1.2 Safety terminology and symbols

About safety messages

It is extremely important that you read, understand, and follow the safety messages and regulations carefully before handling the product. They are published to help prevent these hazards:

- Personal accidents and health problems
- Damage to the product and its surroundings
- Product malfunction

Hazard levels

Hazard level	Indication
 DANGER:	A hazardous situation which, if not avoided, will result in death or serious injury
 WARNING:	A hazardous situation which, if not avoided, could result in death or serious injury
 CAUTION:	A hazardous situation which, if not avoided, could result in minor or moderate injury
NOTICE:	Notices are used when there is a risk of equipment damage or decreased performance, but not personal injury.

Special symbols

Some hazard categories have specific symbols, as shown in the following table.

Electrical hazard	Magnetic fields hazard
 Electrical Hazard:	 CAUTION:

1.3 User safety

All regulations, codes, and health and safety directives must be observed.

The site

- Observe lockout/tagout procedures before starting work on the product, such as transportation, installation, maintenance, or service.
- Pay attention to the risks presented by gas and vapors in the work area.
- Always be aware of the area surrounding the equipment, and any hazards posed by the site or nearby equipment.

Qualified personnel

This product must be installed, operated, and maintained by qualified personnel only.

Protective equipment and safety devices

- Use personal protective equipment as needed. Examples of personal protective equipment include, but are not limited to, hard hats, safety goggles, protective gloves and shoes, and breathing equipment.
- Make sure that all safety features on the product are functioning and in use at all times when the unit is being operated.

1.4 Ex-approved products

Follow these special handling instructions if you have an Ex-approved unit.

Personnel requirements

These are the personnel requirements for Ex-approved products in potentially explosive atmospheres:

- All work on the product must be carried out by certified electricians and Xylem authorized mechanics. Special rules apply to installations in explosive atmospheres.
- All users must know about the risks of electric current and the chemical and physical characteristics of the gas, the vapor, or both present in hazardous areas.
- Any maintenance for Ex-approved products must conform to international and national standards (for example, IEC/EN 60079-17).

Xylem disclaims all responsibility for work done by untrained and unauthorized personnel.

Product and product handling requirements

These are the product and product handling requirements for Ex-approved products in potentially explosive atmospheres:

- Only use the product in accordance with the approved motor data.
- The Ex-approved product must never run dry during normal operation. Dry running during service and inspection is only permitted outside the classified area.
- Before you start work on the product, make sure that the product and the control panel are isolated from the power supply and the control circuit, so they cannot be energized.
- Do not open the product while it is energized or in an explosive gas atmosphere.
- Make sure that thermal contacts are connected to a protection circuit according to the approval classification of the product, and that they are in use.

- Intrinsically safe circuits are normally required for the automatic level-control system by the level regulator if mounted in zone 0.
- The yield stress of fasteners must be in accordance with the approval drawing and the product specification.
- Do not modify the equipment without approval from an Ex-approved Xylem representative.
- Only use parts that are provided by an Ex-approved Xylem representative.
- The thermal detectors fitted to the stator windings shall be connected into the motor control circuit in such a manner as to disconnect the supply to the motor in order to prevent the Temperature Class T3.
- The width of flameproof joints is more than the values specified in the tables of the IEC 60079–1 standard.
- The gap of flameproof joints is less than the values specified in Table 1 of the IEC 60079–1 standard.
- The equipment must be submerged during normal operation.

Guidelines for compliance

Compliance is fulfilled only when you operate the unit within its intended use. Do not change the conditions of the service without the approval of an Ex-approved Xylem representative. When you install or maintain explosion proof products, always comply with the directive and applicable standards (for example, IEC/EN 60079–14).

Minimum permitted liquid level

See the dimensional drawings of the product for the minimum permitted liquid level according to the approval for explosion proof products. If the information is missing on the dimensional drawing, the product must be fully submerged. Level-sensing equipment must be installed if the product can be operated at less than the minimum submersion depth.

Monitoring equipment

For additional safety, use condition-monitoring devices. Condition-monitoring devices include but are not limited to the following:

- Level indicators
- Temperature detectors

1.5 Special hazards

Biological hazards

The product is designed for use in liquids that can be hazardous to your health. Observe these rules when you work with the product:

- Make sure that all personnel who may come into contact with biological hazards are vaccinated against diseases to which they may be exposed.
- Observe strict personal cleanliness.

WARNING: Biological Hazard

Infection risk. Rinse the unit thoroughly with clean water before working on it.

Wash the skin and eyes

Follow these procedures for chemicals or hazardous fluids that have come into contact with your eyes or your skin:

Condition	Action
Chemicals or hazardous fluids in eyes	1. Hold your eyelids apart forcibly with your fingers. 2. Rinse the eyes with eyewash or running water for at least 15 minutes. 3. Seek medical attention.

Condition	Action
Chemicals or hazardous fluids on skin	1. Remove contaminated clothing. 2. Wash the skin with soap and water for at least 1 minute. 3. Seek medical attention, if necessary.

1.6 Protecting the environment

Emissions and waste disposal

Observe the local regulations and codes regarding:

- Reporting of emissions to the appropriate authorities
- Sorting, recycling and disposal of solid or liquid waste
- Clean-up of spills

Exceptional sites

CAUTION: Radiation Hazard

Do NOT send the product to Xylem if it has been exposed to nuclear radiation, unless Xylem has been informed and appropriate actions have been agreed upon.

1.7 Spare parts

CAUTION:

Only use the manufacturer's original spare parts to replace any worn or faulty components. The use of unsuitable spare parts may cause malfunctions, damage, and injuries as well as void the warranty.

1.8 Warranty

For information about warranty, see the sales contract.

2 Transportation and Storage

2.1 Inspect the delivery

2.1.1 Inspect the package

1. Inspect the package for damaged or missing items upon delivery.
2. Note any damaged or missing items on the receipt and freight bill.
3. File a claim with the shipping company if anything is out of order.
   If the product has been picked up at a distributor, make a claim directly to the distributor.

2.1.2 Inspect the unit

1. Remove packing materials from the product.
   Dispose of all packing materials in accordance with local regulations.
2. Inspect the product to determine if any parts have been damaged or are missing.
3. If applicable, unfasten the product by removing any screws, bolts, or straps.
   For your personal safety, be careful when you handle nails and straps.
4. Contact the local sales representative if there is any issue.

2.2 Transportation guidelines

Precautions

DANGER: Crush Hazard

Moving parts can entangle or crush. Always disconnect and lock out power before servicing to prevent unexpected startup. Failure to do so could result in death or serious injury.

Position and fastening

The unit can be transported either horizontally or vertically. Make sure that the unit is securely fastened during transportation, and cannot roll or fall over.

2.2.1 Lifting

Always inspect the lifting equipment and tackle before starting any work.

WARNING: Crush Hazard

1) Always lift the unit by its designated lifting points. 2) Use suitable lifting equipment and ensure that the product is properly harnessed. 3) Wear personal protective equipment. 4) Stay clear of cables and suspended loads.

NOTICE:

Never lift the unit by its cables or hose.

Lifting equipment

Lifting equipment is always required when handling the unit. It must fulfill the following requirements:

- The minimum height (contact your local sales and service representative for information) between the lifting hook and the floor must be sufficient to lift the unit.
- The lifting equipment must be able to hoist the unit straight up and down, preferably without the need for resetting the lifting hook.
- The lifting equipment must be securely anchored and in good condition.

- The lifting equipment must support the weight of the entire assembly and must only be used by authorized personnel.
- Two sets of lifting equipment must be used to lift the unit for repair work.
- The lifting equipment must be dimensioned to lift the unit with any remaining pumped media in it.
- The lifting equipment must not be oversized.

CAUTION: Crush Hazard

Over-dimensioned lifting equipment can lead to injury. A site-specific risk analysis must be done.

2.3 Temperature ranges for transportation, handling and storage

Handling at freezing temperature

At temperatures below freezing, the product and all installation equipment, including the lifting gear, must be handled with extreme care.

Make sure that the product is warmed up to a temperature above the freezing point before starting up. Avoid rotating the impeller/propeller by hand at temperatures below the freezing point. The recommended method to warm the unit up is to submerge it in the liquid which will be pumped or mixed.

NOTICE:

Never use a naked flame to thaw the unit.

Unit in as-delivered condition

If the unit is still in the condition in which it left the factory - all packing materials are undisturbed - then the acceptable temperature range during transportation, handling and storage is: –50°C (–58°F) to +60°C (+140°F).

If the unit has been exposed to freezing temperatures, then allow it to reach the ambient temperature of the sump before operating.

Lifting the unit out of liquid

The unit is normally protected from freezing while operating or immersed in liquid, but the impeller/propeller and the shaft seal may freeze if the unit is lifted out of the liquid into a surrounding temperature below freezing.

Units equipped with an internal cooling system are filled with a mixture of water and 30% glycol. This mixture remains a flowing liquid at temperatures down to –13°C (9°F). Below –13°C (9°F), the viscosity increases such that the glycol mixture will lose its flow properties. However, the glycol-water mixture will not solidify completely and thus cannot harm the product.

Follow these guidelines to avoid freezing damage:

1. Empty all pumped liquid, if applicable.
2. Check all liquids used for lubrication or cooling, both oil and water-glycol mixtures, for the presence of unacceptable amounts of water. Change if needed.

2.4 Storage guidelines

Storage location

The product must be stored in a covered and dry location free from heat, dirt, and vibrations.

NOTICE:

Protect the product against humidity, heat sources, and mechanical damage.

NOTICE:
Do not place heavy weights on the packed product.

Freezing precautions

The unit is frost-proof while operating or immersed in liquid, but the impeller/propeller and the shaft seal may freeze if the unit is lifted out of the liquid into a surrounding temperature below freezing.

Follow these guidelines to avoid freezing damage:

When	Guideline
Before storage	• The unit must be allowed to run for a short time after raising it to discharge remaining pumped liquid. This does not apply to impeller/propeller units. • The discharge opening must be covered in a suitable way, or placed facing down so that any still remaining pumped liquid runs out. • If present, the cooling jacket must be drained manually by opening the air vent screws at the top of the cooling jacket.
After storage	If the impeller/propeller is frozen, it must be thawed by immersing the unit in liquid before operating the unit. NOTICE: Never use a naked flame to thaw the unit.

Long-term storage

If the unit is stored more than six months, then the following apply:

- Before operating the unit after storage, it must be inspected with special attention to the seals and the cable entry.
- The impeller/propeller must be rotated every other month to prevent the seals from sticking together.

Packaging material stacking limit

If the packaging material has an indicated stacking limit, then it is valid for 23°C (73°F) and 50% relative humidity. Depending on the material, other temperature and humidity ranges can reduce the stacking limit.

3 Product Description

3.1 Pump design

The pump is submersible, and driven by an electric motor.

Intended use

The product is intended for moving wastewater, sludge, raw and clean water. Always follow the limits that are given in *Technical Reference* (page 62). If there is a question regarding the intended use of the equipment, please contact a local sales and service representative before proceeding.

DANGER: Explosion/Fire Hazard

Special rules apply to installations in explosive or flammable atmospheres. Do not install the product or any auxiliary equipment in an explosive zone unless it is rated explosion-proof or intrinsically-safe. If the product is EN/ATEX-, MSHA- or FM-approved, then see the specific EX information in the Safety chapter before taking any further actions.

NOTICE:

Do NOT use the unit in highly corrosive liquids.

Spare parts

- Modifications to the unit or installation should only be carried out after consulting with Xylem.
- Original spare parts and accessories that are authorized by Xylem are essential for compliance. The use of other parts can invalidate any claims for warranty or compensation. For more information contact your Xylem representative.

Pressure class

LT	Low head
MT	Medium head
HT	High head
SH	Super high head

Experior® product concept

Experior® is a product concept including N-technology, Premium efficiency motor, and the intelligent control SmartRun®.

Parts

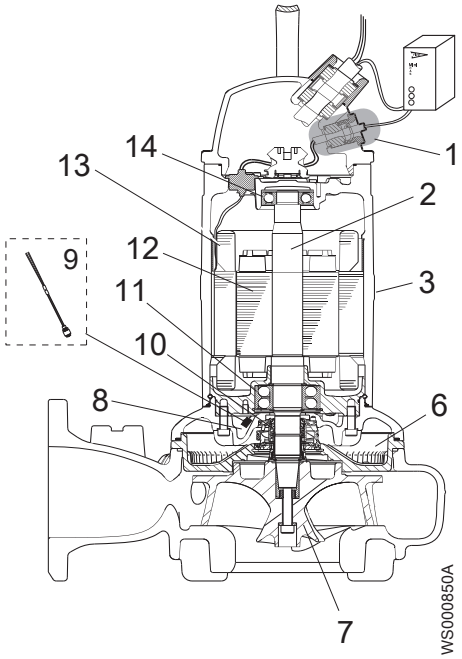

Figure 1: Without cooling jacket

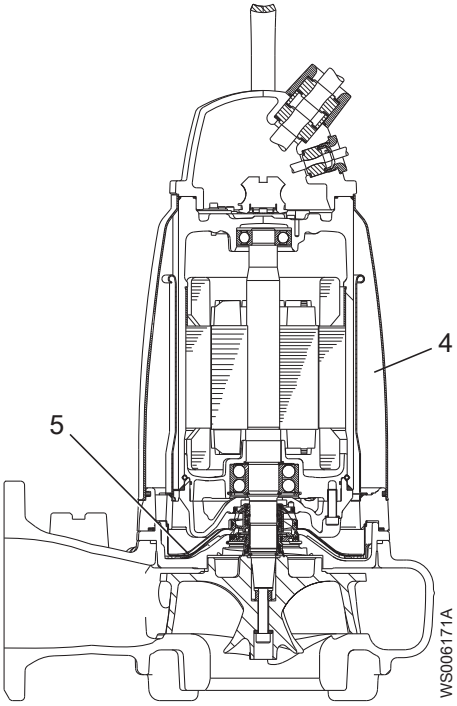

Figure 2: With cooling jacket

Position	Denomination	Description
1	Monitoring sensor	Optional sensor. For information about sensors, see *Monitoring equipment* (page 12).
2	Shaft	Stainless steel, with an integrated rotor
3	Cooling without jacket	The pump is cooled by the ambient liquid.
4	Cooling with jacket	The motor is cooled by a closed loop system. An integrated coolant pump circulates the coolant whenever the pump is operated.
5	Flow diffuser	Provides heat transfer from the coolant to the pumped fluid.
6	Seal housing	Includes a coolant that lubricates and cools the seals; the housing acts as a buffer between the pumped fluid and the electric motor
7	Impeller	N-impeller, a semi-open, two-vane impeller
8	Inspection chamber	Equipped with an FLS10 leakage sensor to prevent damages to the motor
9	FLS10	For information about FLS10, see *Monitoring equipment* (page 12).
10	Mechanical seals	Made of one of the following alternatives: • Alternative 1 – Inner seal: corrosion-resistant cemented carbide WCCR/WCCR – Outer seal: corrosion-resistant cemented carbide WCCR/WCCR • Alternative 2 – Inner seal: corrosion-resistant cemented carbide WCCR/WCCR – Outer seal: silicon carbide RSiC/RSiC
11	Main bearings	Consisting of a two-row angular contact ball bearing
12	Motor	For information about the motor, see *Technical Reference* (page 62).
13	Thermal contact/ Thermistors	For information about the thermal contact and thermistors, see *Monitoring equipment* (page 12).

Position	Denomination	Description
14	Support bearing	Consisting of a two-row ball bearing

3.2 Monitoring equipment

The following applies to the monitoring equipment of the pump:

- The stator incorporates three thermal contacts connected in series that activate the alarm and stops the pump at overtemperature
- The thermal contacts open at 140°C (285°F).
- Ex-approved pumps must have thermal contacts connected to the control panel.
- The sensors must be connected to either the MiniCAS II monitoring equipment or an equivalent equipment.
- The monitoring equipment must be of a design that makes automatic restart impossible.
- The pump is supplied with an inspection sensor FLS 10 for sensing the presence of any liquid in the inspection chamber.
- Information in the junction box shows if the pump is equipped with optional sensors.

Optional sensors

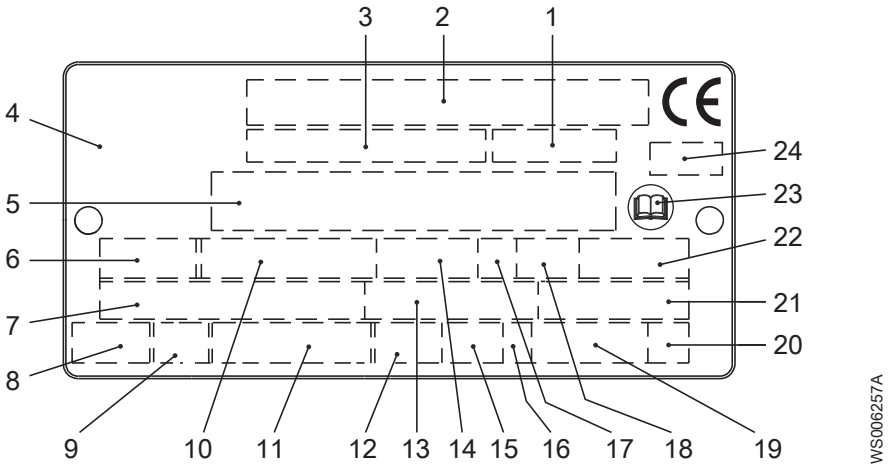
Thermistor Thermistors are optional sensors for measuring the temperature. They are connected in series in the stator and activate the alarm at overtemperature. Thermistors are not applicable to Ex-approved pumps.

NOTICE:

Thermistors must never be exposed to voltages higher than 2.5 V. If the voltage exceeds this value, for example when the control circuit is tested, then the thermistors will be destroyed.

3.3 The data plate

The data plate is a metal label that is located on the main body of the products. The data plate lists key product specifications. Specially approved products also have an approval plate.



1. Curve code or Propeller code
2. Serial number
3. Product number
4. Country of origin

1. Temperature class

3.5 Product denomination

Reading instruction

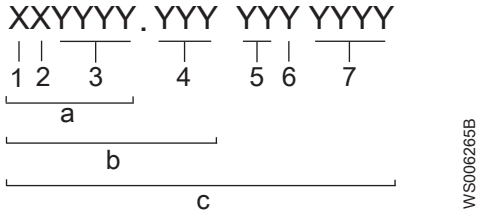
In this section, code characters are illustrated accordingly:

X = letter

Y = digit

The different types of codes are marked up with a, b and c. Code parameters are marked up with numbers.

Codes and parameters



Type of Callout	Number	Indication
Type of code	a	Sales denomination
	b	Product code
	c	Serial number
Parameter	1	Hydraulic end
	2	Type of installation
	3	Sales code
	4	Version
	5	Production year
	6	Production cycle
	7	Running number

4 Installation

4.1 Install the pump

Before starting work, make sure that the safety instructions in the chapter *Introduction and Safety* (page 3) have been read and understood.

DANGER: Electrical Hazard

Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.

DANGER: Inhalation Hazard

Before entering the work area, make sure that the atmosphere contains sufficient oxygen and no toxic gases.

Hazardous atmospheres

DANGER: Explosion/Fire Hazard

Special rules apply to installations in explosive or flammable atmospheres. Do not install the product or any auxiliary equipment in an explosive zone unless it is rated explosion-proof or intrinsically-safe. If the product is EN/ATEX-, MSHA- or FM-approved, then see the specific EX information in the Safety chapter before taking any further actions.

WARNING: Explosion/Fire Hazard

Do not install CSA-approved products in locations that are classified as hazardous in the National Electric Code(TM), ANSI/NFPA 70-2005.

General requirements

These requirements apply:

- Use the pump dimensional drawing in order to ensure proper installation.
- In S-, T-, and Z-installations the pump must be equipped with cooling jacket

Before installing the pump, do the following:

- Provide a suitable barrier around the work area, for example, a guard rail.
- Make sure that equipment is in place so that the unit cannot roll or fall over during the installation process.
- Check the explosion risk before you weld or use electric hand tools.
- Check that the cable and cable entry have not been damaged during transport.
- Always remove all debris and waste material from the sump, inlet piping, and discharge connection, before you install the pump.
- Always check the impeller rotation before lowering the pump into the pumped liquid.

NOTICE:

Do not run the pump dry.

NOTICE:

Never force piping to make a connection with a pump.

Authority regulation

Vent the tank of a sewage station in accordance with local plumbing codes.

Fasteners

- Only use fasteners of the correct size and material.
- Replace all corroded or damaged fasteners.
- Make sure that all the fasteners are correctly tightened and that there are no missing fasteners.

4.1.1 Install with P-installation

In the P-installation, the pump is installed on a stationary discharge connection, and operates either completely or partially submerged in the pumped liquid. These requirements and instructions only apply when the installation is made according to the dimensional drawing.

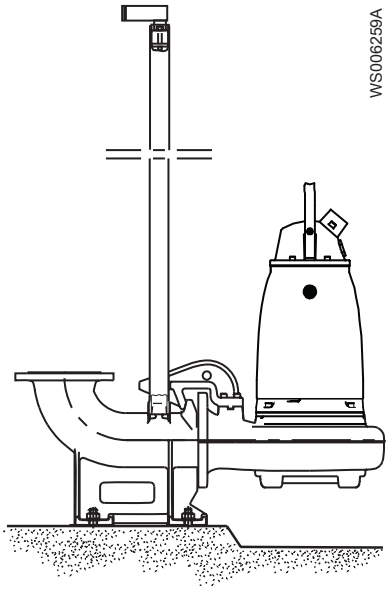


Figure 4: P-installation

These items are required:

- Guide bars
- Guide bar bracket for attaching the guide equipment to the access frame or to the upper part of the sump
- Level regulators or other control equipment for start, stop, and alarm
- Cable holder for holding the cable and regulating the height of the level regulators
- Access frame (with covers) to which the upper guide bar bracket and cable holder can be attached
- Discharge connection for connecting the pump to the discharge line

  The discharge connection has a flange which fits the pump housing flange and a bracket for attaching the guide equipment.
- Fasteners for the discharge connection
- Anchor bolts

1. Run a cable between the sump and the stator and monitoring equipment.

   Make sure that the cable is not sharply bent or pinched.
2. Install the access frame:

   a) Place the access frame in position and align it horizontally.

   b) Grout the frame in place.
3. Grout the anchor bolts in place.

   Be careful when you align and position the discharge connection in relation to the access frame.
4. Place the discharge connection in position, and tighten the nuts.

5. Install the guide bars:
   a) Secure the guide bars in the bracket.
   b) Check that the guide bars are placed vertically. Use a level or a plumb line.
6. Connect the discharge pipe to the discharge connection.
7. Prepare for the level regulator:
   a) Bolt the cable holder to the access frame.
   b) Attach the level regulator cable to the cable holder and adjust the height of the level regulator.
   c) Protect bolts and nuts with a corrosion-preventive compound.
8. Lower the pump along the guide bars.
9. Secure the motor cable:
   a) Fasten the permanent lifting device to the pump and to the access frame. For example, you can use a stainless-steel lifting chain with shackles.
   b) Fasten the cable to the cable holder.

      Make sure that the cable cannot be sucked into the pump inlet or that it is neither sharply bent, or pinched. Support straps are required for deep installations.
   c) Connect the motor cable and the starter and monitoring equipment according to the separate instructions.

      Make sure that the impeller rotation is correct. For more information, see *Check the impeller rotation* (page 32).

Clean all debris from the sump before starting the pump.

4.1.2 Install with S-installation

In the S-installation, the pump is transportable and intended to operate either completely or partially submerged in the pumped liquid. The pump is equipped with a connection for hose or pipe and stands on a base stand.

These requirements and instructions only apply when the installation is made according to the dimensional drawing. For information about the different installation types, see Parts List.

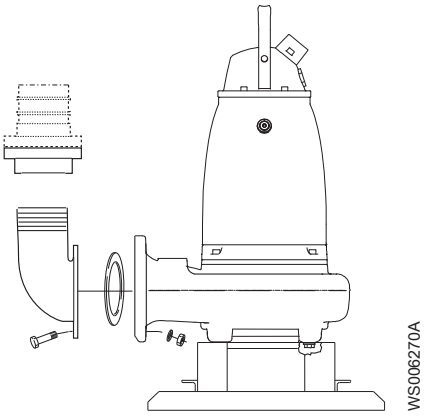

Figure 5: S-installation

1. Run the cable so that it has no sharp bends. Make sure that it is not pinched, and cannot be sucked into the pump inlet.
2. Connect the discharge line.
3. Lower the pump into the sump.
4. Place the pump on the base and make sure it cannot fall over or sink.

Alternatively, the pump can be suspended with a lifting chain just above the sump bottom. Make sure that the pump cannot rotate at start-up or during operation.

5. Connect the motor cable and the starter and monitoring equipment according to the separate instructions.

   Make sure that the impeller rotation is correct. For more information, see *Check the impeller rotation* (page 32).

4.1.3 Install with T/Z-installation

In the T-installation, the pump is installed in a vertical position in a dry well next to the wet sump. These requirements and instructions only apply when the installation is made according to the dimensional drawing.

In the Z-installation, the pump is installed in a horizontal position on a support stand in a dry well next to the wet sump, and a bell-mouth is connected to the inlet pipe. These requirements and instructions are for Z-installations that comply to the dimensional drawing.

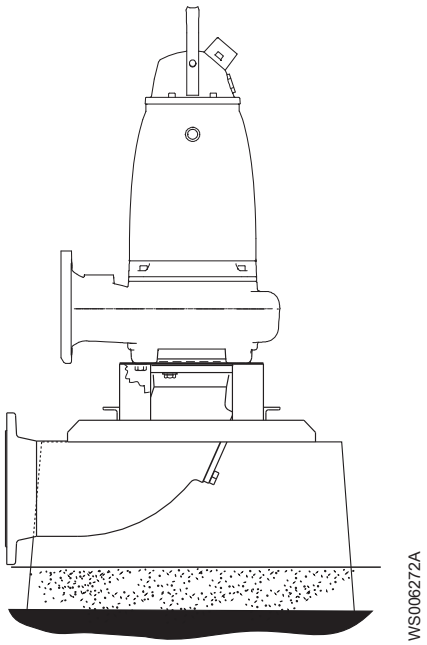

Figure 6: T-installation

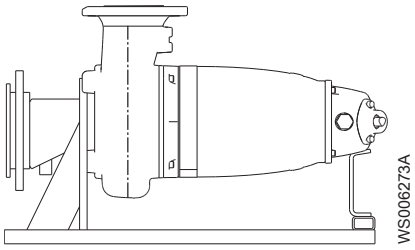

Figure 7: Z-installation

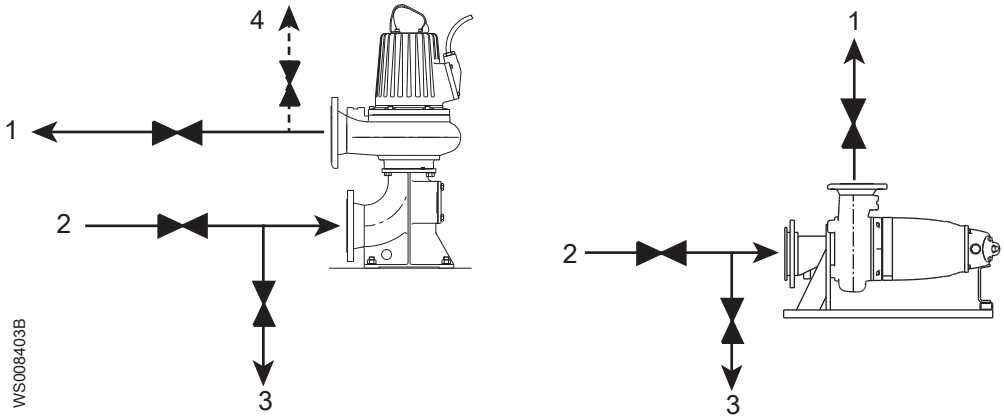
These items are required:

- Support stand and anchor bolts for anchoring the pump to a base
- Inlet elbow for connecting the suction line and discharge line
- Shut-off valves that allow you to remove the pump from service



1. Outlet line
2. Inlet line
3. Line to drain
4. Air vent

Figure 8: T-, Z-installation shutoff and air vent valves (generic pumps shown)

- Air vent on the discharge side between the pump and the check valve
- Level regulators or other control equipment for start, stop, and alarm

NOTICE:

The risk of freezing is particularly high in T- or Z-installations.

1. Fasten the pump:
   a) Use the anchor bolts to bolt the support stand to the concrete base.
   b) Bolt the pump to the support stand and the suction connection.
2. Make sure that the pump is vertical for the T-installation or horizontal for the Z-installation.
3. Connect the suction line and discharge line.
4. Connect the motor cable and the starter and monitoring equipment according to the separate instructions.

   Make sure that the impeller rotation is correct. For more information, see *Check the impeller rotation* (page 32).
5. Make sure that the weight of the pump does not put strain on the piping.

4.2 Make the electrical connections

General precautions

DANGER: Electrical Hazard

Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.

WARNING: Electrical Hazard

Risk of electrical shock or burn. A certified electrician must supervise all electrical work. Comply with all local codes and regulations.

WARNING: Electrical Hazard

There is a risk of electrical shock or explosion if the electrical connections are not correctly carried out, or if there is fault or damage on the product. Visually inspect equipment for damaged cables, cracked casings or other signs of damage. Make sure that electrical connections have been correctly made.

WARNING: Crush Hazard

Risk of automatic restart.

CAUTION: Electrical Hazard

Prevent cables from becoming sharply bent or damaged.

NOTICE:

Leakage into the electrical parts can cause damaged equipment or a blown fuse. Keep the cable ends dry at all times.

Requirements

These general requirements apply for electrical installation:

- The supply authority must be notified before installing the pump if it will be connected to the public mains. When the pump is connected to the public power supply, it may cause flickering of incandescent lamps when started.
- The mains voltage and frequency must agree with the specifications on the data plate. If the pump can be connected to different voltages, then the connected voltage is specified by a yellow sticker close to the cable entry.
- The fuses and circuit breakers must have the proper rating, and the pump overload protection (motor protection breaker) must be connected and set to the rated current according to the data plate and if applicable the cable chart. The starting current in direct-on-line start can be up to six times higher than the rated current.
- The fuse rating and the cables must be in accordance with the local rules and regulations.
- If intermittent operation is prescribed, then the pump must be provided with monitoring equipment supporting such operation.
- If stated on the data plate, then the motor is convertible between different voltages.
- The thermal contacts/thermistors must be in use.
- For FM-approved pumps, a leakage sensor must be connected and in use in order to meet approval requirements.

Cables

These are the requirements to follow when you install cables:

- The cables must be in good condition, not have any sharp bends, and not be pinched.
- The cables must not be damaged and must not have indentations or be embossed (with markings, etc.) at the cable entry.
- The cable entry seal sleeve and washers must conform to the outside diameter of the cable.
- The minimum bending radius must not be below the accepted value.
- If using a cable which has been used before, a short piece must be peeled off when refitting it so that the cable entry seal sleeve does not close around the cable at the same point again. If the outer sheath of the cable is damaged, then replace the cable. Contact a local sales and service representative.
- The voltage drop in long cables must be taken into account. The drive unit's rated voltage is the voltage measured at the cable connection point in the pump.
- The screened cable must be used according to the European CE and EMC requirements if a Variable Frequency Drive (VFD) is used. For more information, contact your local sales and service representative (VFD-supplier).
- Make sure that the cable is long enough for maintenance work.
- For SUBCAB® cables, the twisted pair copper foil must be trimmed.
- All unused conductors must be insulated.

Grounding (earthing)

Grounding (earthing) must be done in compliance with all local codes and regulations.

DANGER: Electrical Hazard

All electrical equipment must be grounded (earthed). Test the ground (earth) lead to verify that it is connected correctly and that the path to ground is continuous.

WARNING: Electrical Hazard

If the power cable is jerked loose, then the ground (earth) conductor must be the last conductor to come loose from its terminal. Make sure that the ground (earth) conductor is longer than the phase conductors at both ends of the cable.

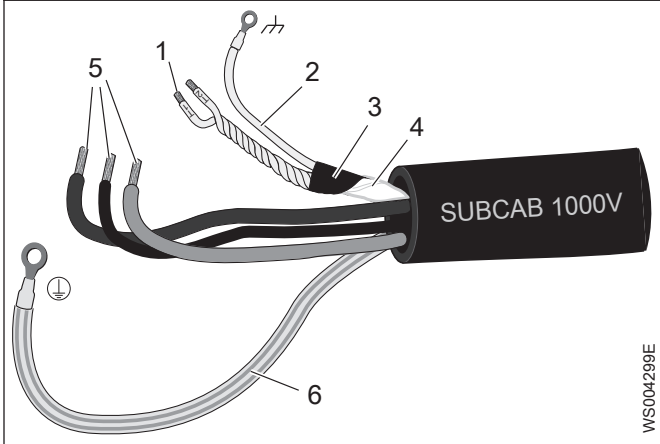
WARNING: Electrical Hazard

Risk of electrical shock or burn. You must connect an additional ground- (earth-) fault protection device to the grounded (earthed) connectors if persons are likely to come into contact with liquids that are also in contact with the pump or pumped liquid.

4.2.1 Prepare the SUBCAB® cables

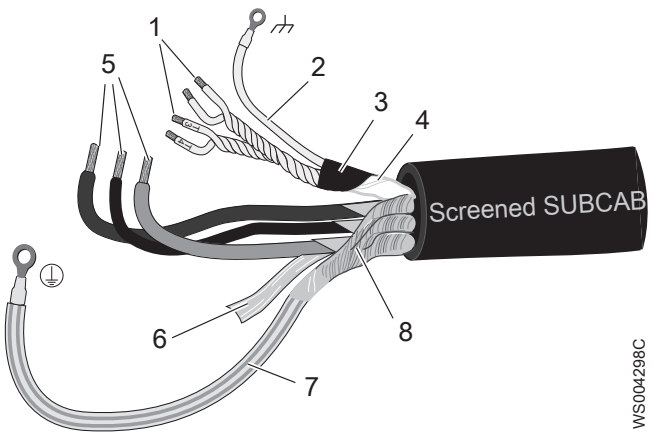
This section applies to SUBCAB® cables with twisted-pair control cores.

The prepared SUBCAB® cable



1. T1+T2 twisted pairs in control element
2. Drain wire in control element (bare copper wire)
3. Screened copper pt-foil
4. Insulation sheath (jacket) or PT-foil for control element
5. Power cores
6. Ground (earth) core

The prepared screened SUBCAB® cable



1. T1+T2 and T3+T4 twisted pairs in control element
2. Drain wire in control element (bare copper wire)
3. Screened copper pt-foil
4. Insulation sheath (jacket) for control element
5. Power cores
6. Aluminum foil
7. Ground (earth) core with green/yellow shrink hose
8. Uncovered screen/braided wire

1. Peel off the outer sheath at the end of the cable.
2. Prepare the control element:
   a) Peel the sheath (if applicable) and the copper foil.

      The copper foil is a screen and is conductive. Do not peel more than necessary, and remove the peeled foil.

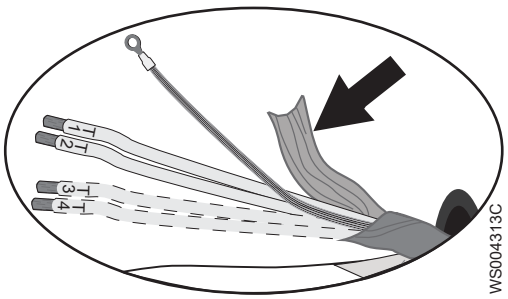


Figure 9: Copper foil on control element.

   b) Put a white shrink hose over the drain wire and the cable terminal.
   c) Fit a cable lug on the drain wire.
   d) Twist T1+T2 and T3+T4.
   e) Put a shrink hose over the control element.

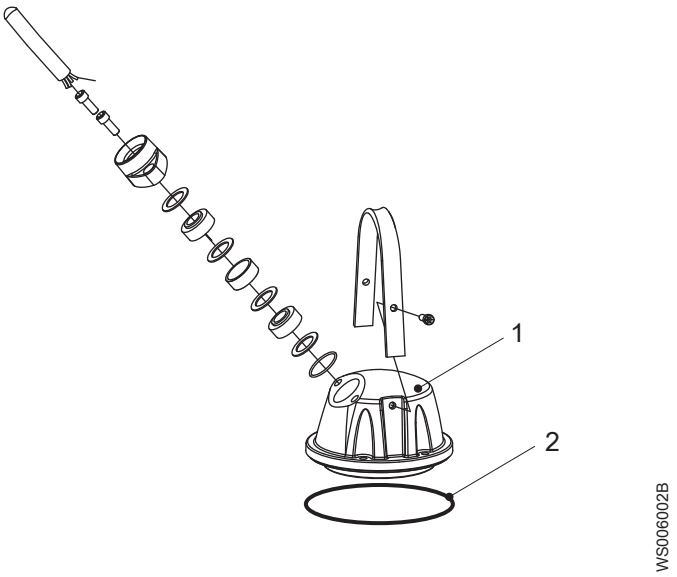
Make sure that the conductive copper foil and drain wire is covered.

3. Prepare the ground (earth) core for SUBCAB™ cable:
   a) Peel the yellow-green insulation from the ground (earth) core.
   b) Check that the ground (earth) core is at least 10% longer than the phase cores in the cabinet.
   c) If applicable, put a cable lug on the ground core.
4. Prepare the ground (earth) core for screened SUBCAB™ cable:
   a) Untwist the screens around the power cores.
   b) Put a yellow-green shrink hose over the ground (earth) core.
      Leave a short piece uncovered.
   c) If applicable, put a cable lug on the screened ground core.
   d) Twist all power core screens together to create a ground (earth) core and fit a cable terminal to the end.
   e) Check that the ground (earth) core is at least 10% longer than the phase cores in the cabinet.
5. How is the connection to ground (earth) made?
   - Screw: Fit cable terminals to the ground (earth) core and the power cores.
   - Terminal block: Leave the core ends as they are.
6. Prepare the main leads:
   a) Remove the aluminum foil around each power core.
   b) Peel the insulation from each power core.

4.2.2 Connect the motor cable to the pump

NOTICE:

Leakage into the electrical parts can cause damaged equipment or a blown fuse. Keep the end of the motor cable dry at all times.



1. Entrance cover
2. O-ring

For more information about the cable entry, see the Parts list.

1. Remove the entrance cover and the O-ring from the stator housing.
   This provides access to the terminal board.
2. Check the data plate to see which connections are required for the power supply.
3. Arrange the connections on the terminal board in accordance with the required power supply.

Links (jumper strips) are not used with the Y/D start.

4. Connect the mains leads (L1, L2, L3, and ground (earth)) according to applicable cable chart.

   The ground (earth) lead must be100 mm (4.0 in.) longer than the phase leads in the junction box of the unit.
5. Make sure that the pump is correctly connected to ground (earth).
6. Connect the control leads to the applicable terminal board.
7. Make sure that any thermal contacts incorporated in the pump are properly connected to the terminal board.
8. Install the entrance cover and the O-ring on the stator housing.
9. Fasten the screws on the entrance flange so that the cable insertion assembly bottoms out.

4.2.3 Connect the motor cable to the starter and monitoring equipment

If there are two power cables, then the cable that is connected to T1 and T2 is labeled. If a separate control cable is used, then the control leads in the power cable are never connected.

DANGER: Explosion/Fire Hazard

Special rules apply to installations in explosive or flammable atmospheres. Do not install the product or any auxiliary equipment in an explosive zone unless it is rated explosion-proof or intrinsically-safe. If the product is EN/ATEX-, MSHA- or FM-approved, then see the specific EX information in the Safety chapter before taking any further actions.

NOTICE:

Either thermal contacts or thermistors are incorporated in the pump.

NOTICE:

Thermal contacts must never be exposed to voltages higher than 250 V, breaking current maximum 5 A. It is recommended that they are connected to 24 V over separate fuses to protect other automatic equipment.

1. If thermal contacts are included in the pump installation, then connect the T1 and T2 control conductors to the MiniCAS II monitoring equipment.

   NOTICE:

   The thermal contacts are incorporated in the stator. Connect them to 24 V over separate fuses to protect other automatic equipment.
2. If thermistors are included in the pump installation, and screened or auxiliary cable is used, then connect T1(1) and T2(2) to the thermistor relay or MAS 711, and T3(3) and T4 (4) to MiniCAS II or MAS 711.
3. Connect the mains leads (L1, L2, L3, and ground (earth)) to the starter equipment.

   For information about the phase sequence and the color codes of the leads, see Cable charts.
4. Check the functionality of the monitoring equipment:

   a) Check that the signals and the tripping function work properly.

   b) Check that the relays, lamps, fuses, and connections are intact.

   Replace any defective equipment.

4.2.4 Cable charts

Description

This topic contains general connection information. It also provides cable charts that show connection alternatives for use with different cables and power supply.

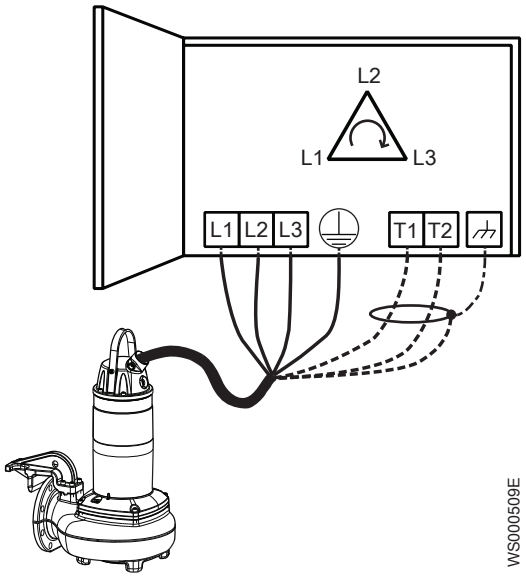


Figure 10: Phase sequence

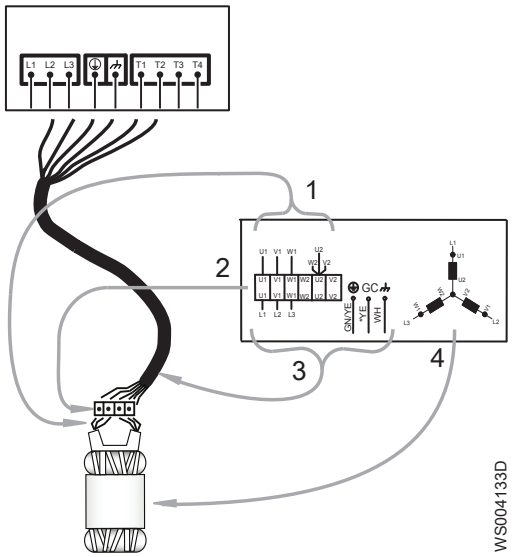
Connection locations

The figures in this section illustrate how to interpret the connection strip symbols.



1. Stator leads
2. Terminal board
3. Power cable leads
4. Stator (internal connection illustrated)

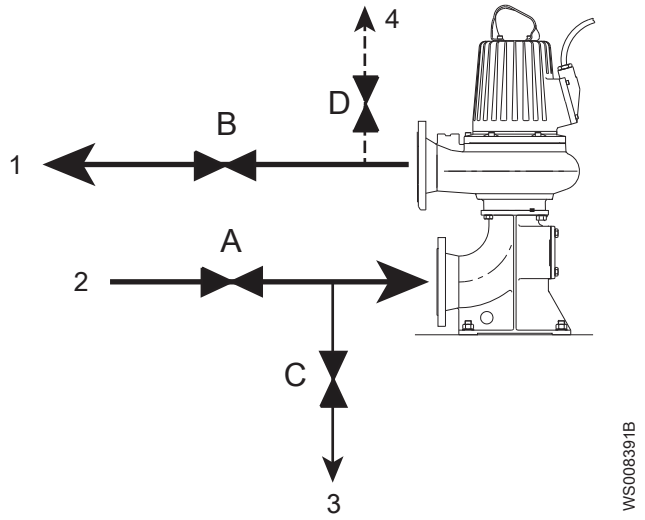
4.3 T-installation: Bleed air before starting pump

1. Open valve D and bleed out the air. See the following figure.



1. Outlet line
2. Inlet line
3. Line to drain
4. Air vent

Figure 22: T-installation, valves A–D

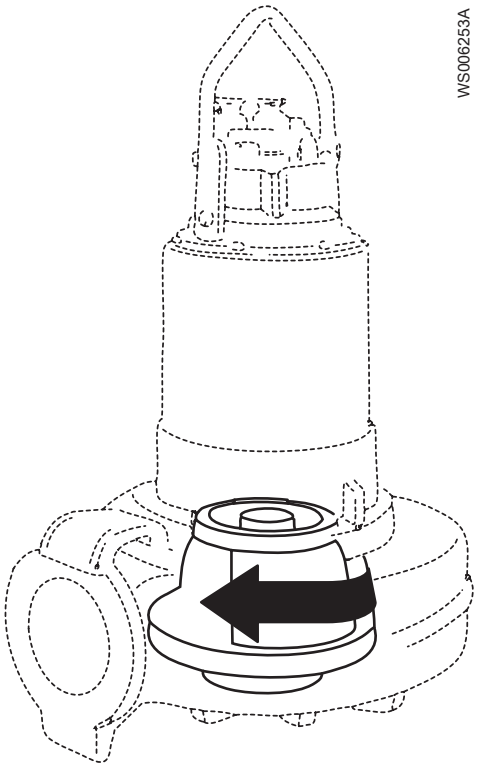
2. Close valve D before the pump is started.

4.4 Check the impeller rotation

CAUTION: Crush Hazard

The starting jerk can be powerful. Make sure nobody is close to the unit when it is started.

1. Start the motor.
2. Stop the motor after a few seconds.
3. Check that the impeller rotates according to this illustration.



The correct direction of impeller rotation is clockwise when you look at the pump from above.

4. If the impeller rotates in the wrong direction, then transpose two phase leads (3-phase) and do this procedure again.

5 Operation

5.1 Precautions

Before taking the unit into operation, check the following:

- All recommended safety devices are installed.
- The cable and cable entry have not been damaged.
- All debris and waste material has been removed.

NOTICE:

Never operate the pump with the discharge line blocked, or the discharge valve closed.

WARNING: Crush Hazard

Risk of automatic restart.

Distance to wet areas

WARNING: Electrical Hazard

Risk of electrical shock or burn. You must connect an additional ground- (earth-) fault protection device to the grounded (earthed) connectors if persons are likely to come into contact with liquids that are also in contact with the pump or pumped liquid.

CAUTION: Electrical Hazard

Risk of electrical shock or burn. The equipment manufacturer has not evaluated this unit for use in swimming pools. If used in connection with swimming pools then special safety regulations apply.

Noise level

NOTICE:

The sound power level of the product is lower than 70 dB(A). However, in some installations the resulting sound pressure level may exceed 70 dB(A) at certain operating points on the performance curve. Make sure that you understand the noise level requirements in the environment where the product is installed. Failure to do so may result in hearing loss or violation of local laws.

5.2 Estimate zinc anode replacement intervals

The mass and surface area of the zinc anodes are designed to protect the pump surface for 1 year in sea water with an average temperature of 20°C (68°F). Shorter inspection intervals and anode replacement can be required, depending upon the water temperature and the chemical composition as well as the presence of other metals in the vicinity of the pump.

The rate of zinc consumption, and the appropriate inspection intervals, can be estimated by measuring how much zinc is consumed during the first two months following installation.

Anodes are replaced when the anode mass is reduced to a selected fraction of its initial mass. The recommended interval for the selection fraction is 0.25–0.50 (25–50%).

1. Remove, weigh, and reinstall one or more of the exterior zinc anodes before starting up the pump.
2. After two months, remove and weigh the same zinc anode or anodes again.

3. Divide the lapsed time in days (between steps 1 and 2) by the anode weight loss in grams to get the calculated anode consumption rate (days/gram).

   If multiple anodes were weighed, then use the anode which has lost the most weight for this calculation.
4. Calculate future replacement intervals so that they occur when the selected fraction of zinc is remaining.

5.3 Start the pump

CAUTION: Crush Hazard

The starting jerk can be powerful. Make sure nobody is close to the unit when it is started.

NOTICE:

Make sure that the rotation of the impeller is correct. For more information, see Check the impeller rotation.

1. Remove the fuses or open the circuit breaker, and check that the impeller can rotate freely.

WARNING: Crush Hazard

Never put your hand into the pump housing.

2. Conduct insulation test phase to ground. To pass, the value must exceed 5 megaohms.
3. Check that the monitoring equipment works.
4. Start the pump.

6 Maintenance

Precautions

Before starting work, make sure that the safety instructions in the chapter *Introduction and Safety* (page 3) have been read and understood.

DANGER: Crush Hazard

Moving parts can entangle or crush. Always disconnect and lock out power before servicing to prevent unexpected startup. Failure to do so could result in death or serious injury.

WARNING: Biological Hazard

Infection risk. Rinse the unit thoroughly with clean water before working on it.

CAUTION: Crush Hazard

Make sure that the unit cannot roll or fall over and injure people or damage property.

Make sure that you follow these requirements:

- Check the explosion risk before you weld or use electrical hand tools.
- Allow all system and pump components to cool before you handle them.
- Make sure that the product and its components have been thoroughly cleaned.
- Make sure that the work area is well-ventilated before you open any vent or drain valves, remove any plugs, or disassemble the unit.
- Do not open any vent or drain valves or remove any plugs while the system is pressurized. Make sure that the pump is isolated from the system and that pressure is relieved before you disassemble the pump, remove plugs, or disconnect piping.

Ground continuity verification

A ground (earth) continuity test must always be performed after service.

Maintenance guidelines

During the maintenance and before reassembly, always remember to perform these tasks:

- Clean all parts thoroughly, particularly O-ring grooves.
- Change all O-rings, gaskets, and seal washers.
- Lubricate all springs, screws, O-rings with grease.

During the reassembly, always make sure that existing index markings are in line.

The reassembled drive unit must always be insulation-tested and the reassembled pump must always be test-run before normal operation.

6.1 Torque values

All screws and nuts must be lubricated to achieve correct tightening torque. Screws that are screwed into stainless steel must have the threads coated with suitable lubricants to prevent seizing.

If there is a question regarding the tightening torques, please contact the local sales and service representative.

Screws and nuts

Table 1: Stainless steel, A2 and A4, torque Nm (ft-lbs)

Property class	M4	M5	M6	M8	M10	M12	M16	M20	M24	M30
50	1.0 (0.74)	2.0 (1.5)	3.0 (2.2)	8.0 (5.9)	15 (11)	27 (20)	65 (48)	127 (93.7)	220 (162)	434 (320)
70, 80	2.7 (2)	5.4 (4)	9.0 (6.6)	22 (16)	44 (32)	76 (56)	187 (138)	364 (268)	629 (464)	1240 (915)
100	4.1 (3)	8.1 (6)	14 (10)	34 (25)	66 (49)	115 (84.8)	248 (183)	481 (355)	–	–

Table 2: Steel, torque Nm (ft-lbs)

Property class	M4	M5	M6	M8	M10	M12	M16	M20	M24	M30
8.8	2.9 (2.1)	5.7 (4.2)	9.8 (7.2)	24 (18)	47 (35)	81(60)	194 (143)	385 (285)	665 (490)	1310 (966.2)
10.9	4.0 (2.9)	8.1 (6)	14 (10)	33 (24)	65 (48)	114 (84)	277 (204)	541 (399)	935 (689)	1840 (1357)
12.9	4.9 (3.6)	9.7 (7.2)	17 (13)	40 (30)	79 (58)	136 (100)	333 (245)	649 (480)	1120 (825.1)	2210 (1630)

Hexagon screws with countersunk heads

For hexagon socket head screws with countersunk head, maximum torque for all property classes must be 80% of the values for property class 8.8 above.

6.2 Change the coolant

This image shows the plugs that are used to change the coolant.

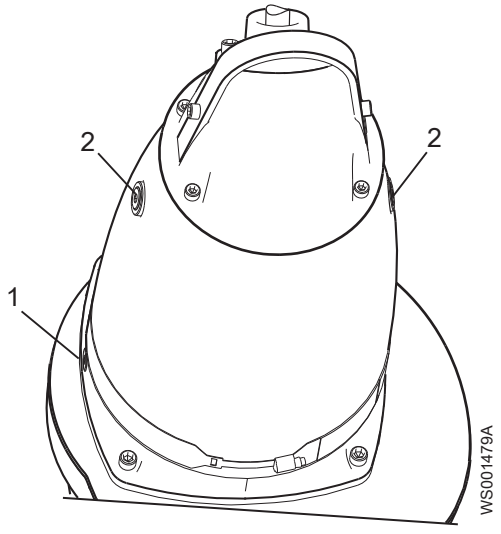


Figure 23: With a cooling jacket

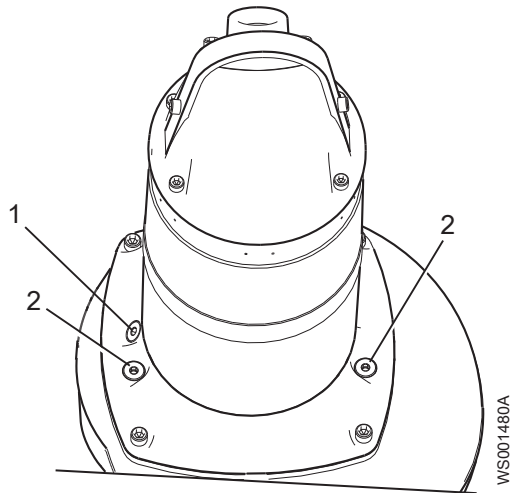

Figure 24: Without a cooling jacket

1. Inspection plug
2. Coolant plugs

6.2.1 Empty the coolant

CAUTION: Compressed Gas Hazard

Air inside the chamber may cause parts or liquid to be propelled with force. Be careful when opening. Hold a rag over the plug to prevent liquid from spraying out.

1. Empty the coolant in the inspection chamber:

a) Remove the inspection plug.

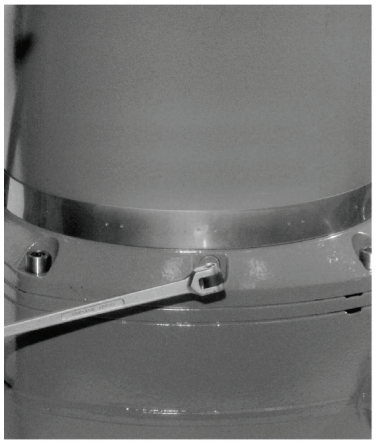

Figure 25: With a cooling jacket

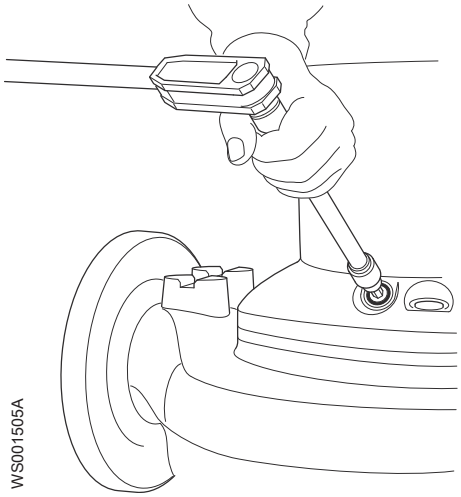

Figure 26: Without a cooling jacket

b) Pump out any coolant from the inspection chamber, as shown here.

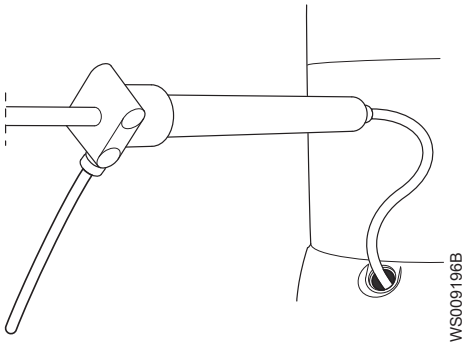

Figure 27: With a cooling jacket

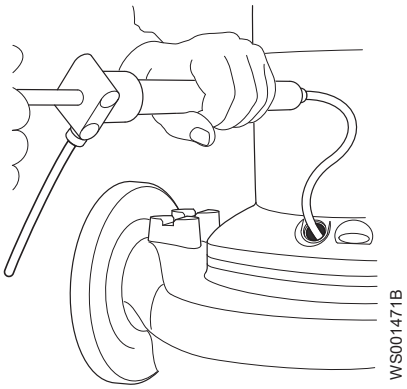

Figure 28: Without a cooling jacket

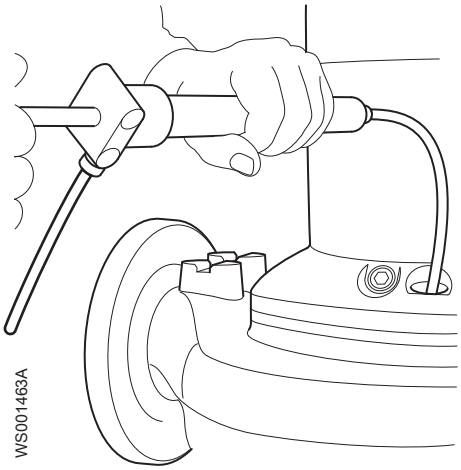
c) Fit a new O-ring and re-install the inspection plug. Tighten the plug.
Tightening torque: 44 Nm (33 ft-lbs)

2. To empty the coolant with the pump upright, do the following:
This method is applicable only for pumps without cooling jackets.
a) Remove the coolant plugs.

CAUTION: Compressed Gas Hazard

Air inside the chamber may cause parts or liquid to be propelled with force. Be careful when opening. Hold a rag over the plug to prevent liquid from spraying out.

b) Use a pump to remove the coolant.



3. If it is necessary to separate the drive unit from the hydraulic unit, then do the following:
   a) Carefully open the coolant plugs to relieve any built-up pressure inside the cooling jacket.

   CAUTION: Compressed Gas Hazard

   Air inside the chamber may cause parts or liquid to be propelled with force. Be careful when opening. Hold a rag over the plug to prevent liquid from spraying out.

   b) After venting any built-up pressure in the cooling jacket, re-install the coolant plugs.
   c) Remove the pump housing screws.
   d) Remove the drive unit from the pump housing.

   NOTICE:

   Do not allow the weight of the pump to rest on any portion of the impeller. The impeller must not be allowed to make contact with the concrete floor or other hard or rough surfaces.

4. To empty the coolant with the pump in a horizontal position, do the following:
   a) Place the pump horizontally, so that one of the coolant plugs is at the lowest point of the pump, to ensure that the coolant will drain completely.

      It is important to empty all of the coolant.
   b) Place a container under the pump.
   c) Remove the coolant plugs and empty the coolant.

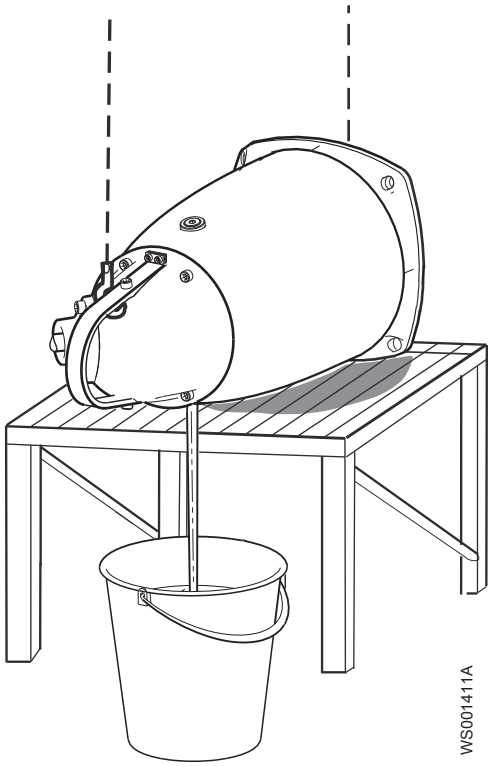


Figure 29: With a cooling jacket

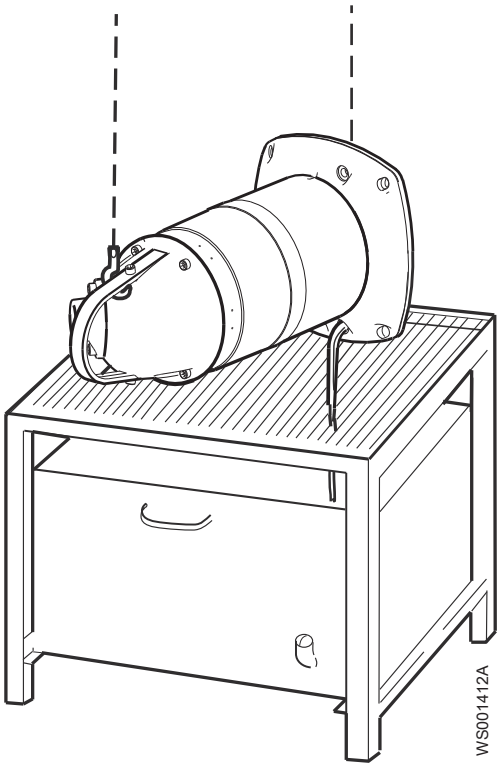

Figure 30: Without a cooling jacket

6.2.2 Fill with coolant

Use a coolant that is a mixture of 70% deionized or distilled water, and 30% DOWCAL 200™ monopropylene glycol. If DOWCAL 200™ from Dow Chemical Company is not available, then contact your local Xylem representative. The monopropylene glycol must fulfill the Xylem material standard M0800.82.0002.

NOTICE:

Deionized or distilled water must be used in the water-glycol mixture.

If the pumped liquid includes potable water or substances to be ingested, then contact your local Xylem sales representative.

1. Fill with coolant until it overflows through the opposite hole, as shown here.

Pump	Quantity, L (qt.)	
	With cooling jacket	Without cooling jacket
3171.091/.095/.181/.185/.350/.390/.660/.670	16.7 (17.6)	4.6 (4.9)
3171.800/.810/.820/.830/.840/.850/.860/.870	24 (25.4)	4.6 (4.9)

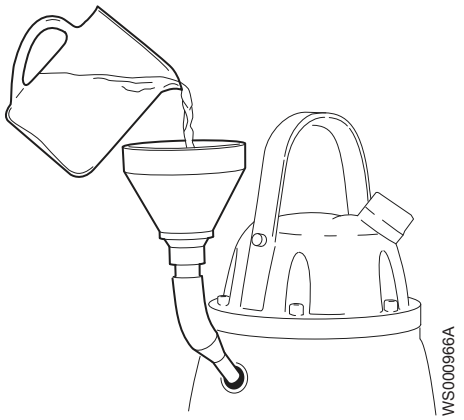

Figure 31: With cooling jacket

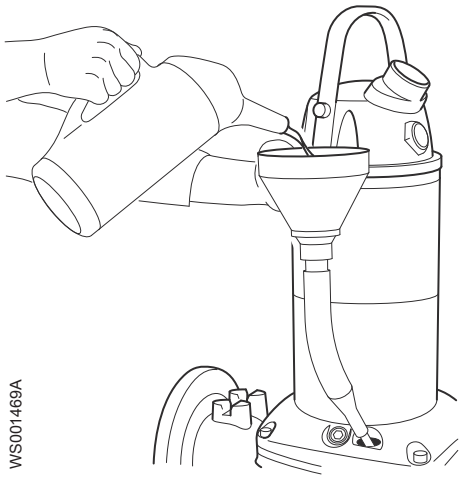

Figure 32: Without cooling jacket

2. Fit new O-rings and re-install the coolant plugs. Tighten the plugs.
   Tightening torque: 44 Nm (33 ft-lb)

6.3 Service the pump

Type of service	Purpose	Inspection interval
Initial inspection	A Xylem-authorized personnel checks the pump condition. From the results, the personnel recommends the intervals for the periodical inspection and major overhaul for the installation.	Within the first year of operation.
Periodical inspection	The inspection prevents operational interruptions and machine breakdowns. The measures to increase performance and pump efficiency are decided for each application. They can include such things as impeller trimming, wear part control and replacement, control of zinc-anodes and control of the stator.	Up to 12,000 hours or three years, whichever comes first. Applies to normal applications and operating conditions at media (liquid) temperatures <40°C (104°F).
Major overhaul	The overhaul lengthens the operating lifetime of the product. It includes the replacement of key components and the measures that are taken during an inspection.	Up to 24,000 hours or six years, whichever comes first. Applies to normal applications and operating conditions at media (liquid) temperatures <40°C (104°F).

NOTICE:

Shorter intervals may be required when the operating conditions are extreme, for example with very abrasive or corrosive applications or when the liquid temperatures exceed 40°C (104°F).

6.3.1 Inspection

Service item	Action
Cable	1. If the outer jacket is damaged, replace the cable. 2. Check that the cables do not have any sharp bends and are not pinched.
Connection to power	Check that the connections are properly secured.
Electrical cabinets	Check that they are clean and dry.
Impeller	1. Check the impeller clearance. 2. Adjust the impeller, if necessary.

Service item	Action
Inspection chamber	1. Drain all liquid, if any. 2. Check the resistance of the leakage sensor. Normal value approximately1200 ohms, alarm approximately 430 ohms.
Insulation	Use a megger maximum 1000 V. 1. Check that the resistance between the ground (earth) and phase lead is more than 5 megohms. 2. Conduct a phase-to-phase resistance check.
Junction box	Check that it is clean and dry.
Level regulators	Check the condition and functionality.
Lifting device	Check that the local safety regulations are followed.
Lifting handle	1. Check the screws. 2. Check the condition of the lifting handle and the chain. 3. If necessary, replace.
O-rings	1. Replace the oil plug O-rings. 2. Replace the O-rings at the entrance or junction cover. 3. Grease the new O-rings.
Overload protection and other protections	Check the correct settings.
Personnel safety devices	Check the guard rails, covers, and other protections.
Rotation direction	Check the impeller rotation.
Seal housing	1. Fill with new coolant, if necessary. 2. Check that the freezing point is lower than -13°C (9°F).
Terminal board	Check that the connections are properly secured.
Thermal contacts	Normally closed circuit; interval 0–1 ohm.
Thermistor	Check the resistance is between 20–250 ohms and the measured voltage is maximum 2 V DC.
Voltage and amperage	Check the running values.

6.3.2 Major overhaul

The basic repair kit includes O-rings, seals, and bearings.

For a major overhaul, do the following in addition to the tasks listed under Inspection.

Service item	Action
Support and main bearing	Replace the bearings with new bearings.
Mechanical seal	Replace with new seal units.

6.3.3 Service in case of alarm

For information about indication values for sensors, see *Sensor connection* (page 30).

Alarm source	Action
FLS10	1. Drain the fluid in the inspection chamber. 2. Check the coolant level. Fill with new coolant if necessary. 3. Check the freezing point (lower than -13°C or 9°F). Check the inspection chamber again after one week of operation. If leakage has occurred, then do the following: 1. Drain the fluid. 2. Change the mechanical seal unit. 3. Replace with new coolant.

Alarm source	Action
The thermistor/Thermal contact	1. Check the coolant level (pump with cooling jacket). 2. Check the start and stop levels.
The overload protection	Check that the impeller can rotate freely.

6.4 Replace the impeller

Required tools:

- 12 mm hexagon bit adapter with an extension of at least a 100 mm (4 in)
- Rod (wood or plastic) for locking the impeller in place

CAUTION: Cutting Hazard

Worn parts can have sharp edges. Wear protective clothing.

NOTICE:

When laying the pump on its side, do not allow the weight of the pump to rest on any portion of the impeller. The impeller must not be allowed to make contact with the concrete floor or other hard and rough surfaces.

NOTICE:

If you fail with the impeller installation, you must redo the installation procedure from the beginning.

6.4.1 Replace the impeller for wet installation

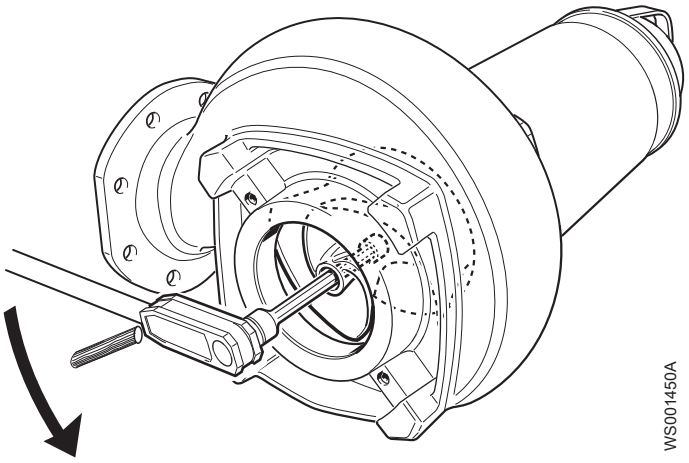
6.4.1.1 Remove the impeller: wet installation

CAUTION: Cutting Hazard

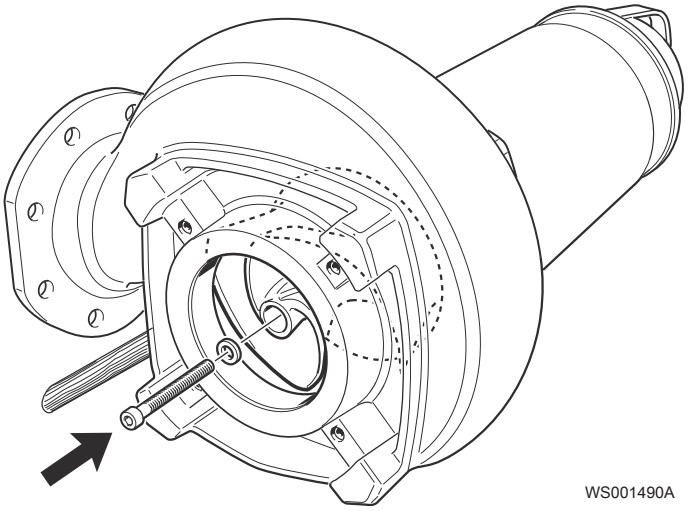
Sharp edges. Wear protective clothing.

1. Place the pump in a horizontal position.
2. Remove the impeller:
   a) Remove the flush valve cover and its O-ring.
   b) Lock the impeller in place by inserting a rod through the hole.
   c) Remove the impeller screw.

   d) Turn the adjustment screw counterclockwise until the impeller breaks free from the shaft.

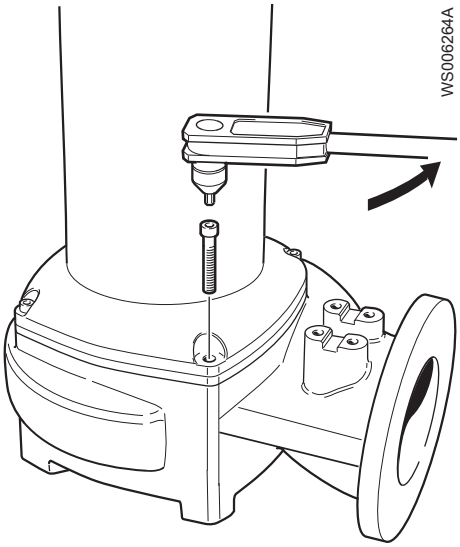


e) Hand-tighten the impeller screw to prevent it from falling off.

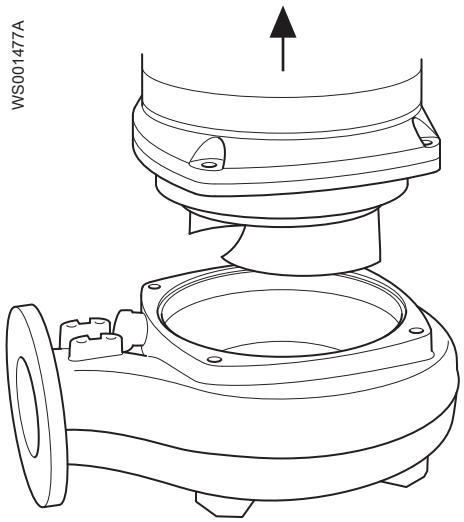


f) Remove the rod.

3. Raise the pump.
4. Remove the drive unit from the pump housing:
   a) Remove the pump housing screws.

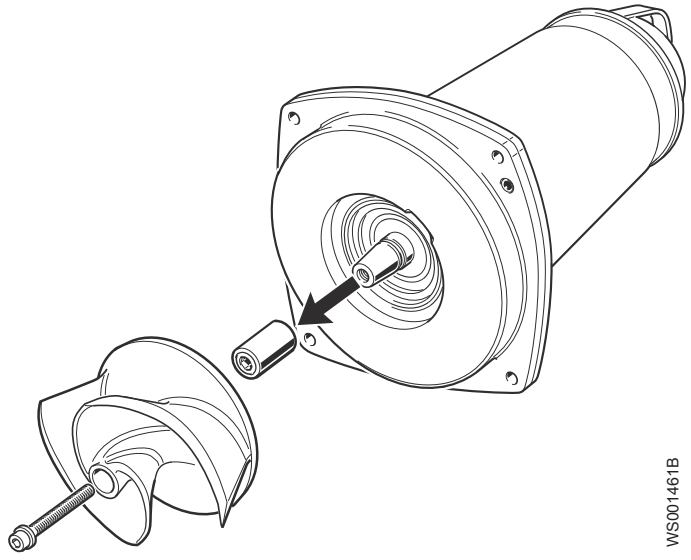


b) Remove the drive unit from the pump housing.



5. Remove the impeller:
   a) Place the drive unit horizontally.
   b) Remove the impeller screw.

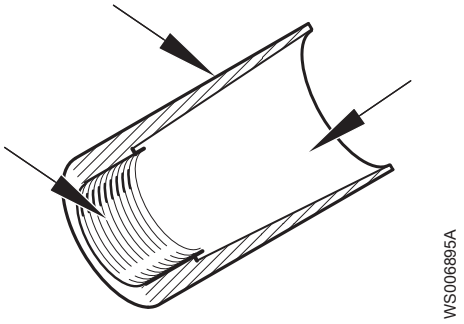
   c) Remove the impeller and the conical sleeve.



6.4.1.2 Install the impeller: wet installation

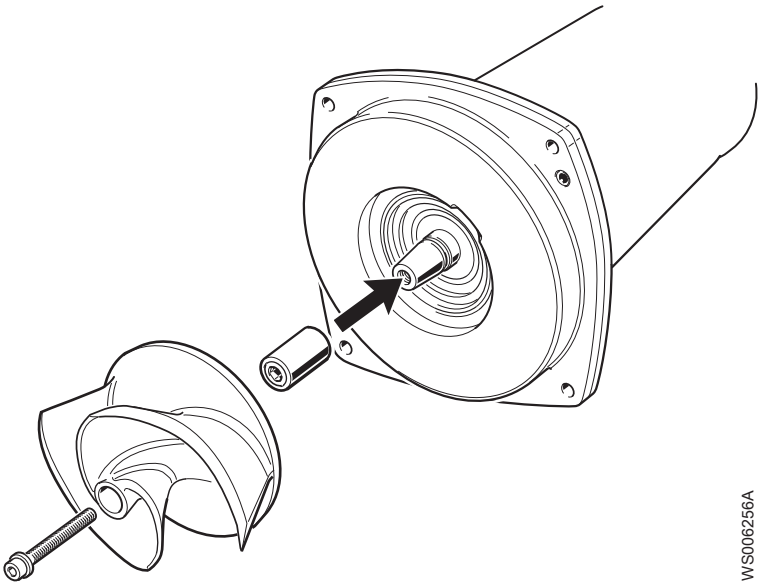
1. Prepare the shaft:
   a) Polish off any flaws with a fine emery cloth.
      The end of the shaft must be clean and free from burrs.
   b) Coat the inner conic, the outer cylindrical surfaces, and the thread of the conical sleeve with a thin layer of grease.
      The proper lubrication is grease for bearings, for example Exxon Mobil Unirex N3, Mobil Mobilith SHC 220 or equivalent.

   NOTICE:
   Surplus grease can cause the impeller to become loose. Remove surplus grease from conical and/or cylindrical surfaces of shafts and/or sleeves.

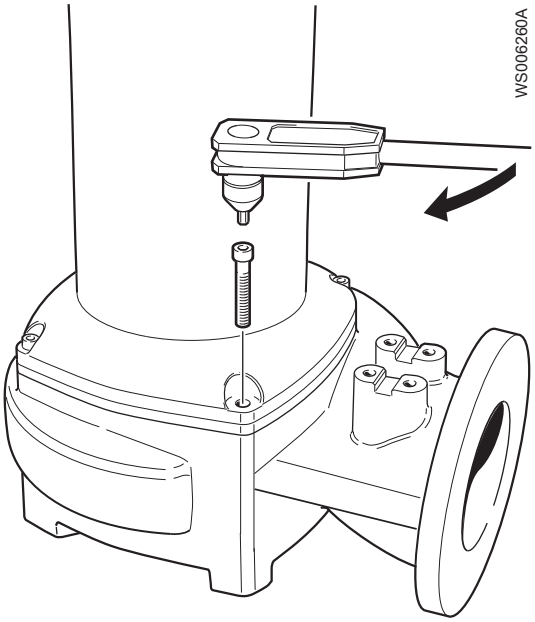


2. Mount the impeller:
   a) Lubricate the threads of the impeller screw and the washer.
      Always use a new impeller screw.
   b) Adjust the adjustment screw so that it is flush with the sleeve.

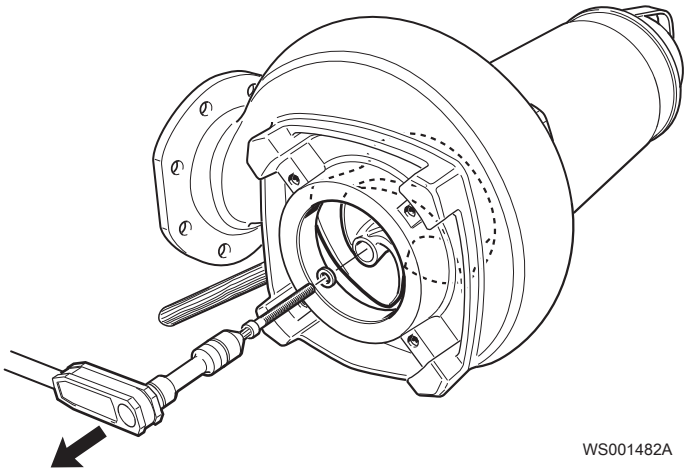
   c) Fit the sleeve and impeller to the shaft.
   d) Hand-tighten the impeller screw to prevent it from falling off.



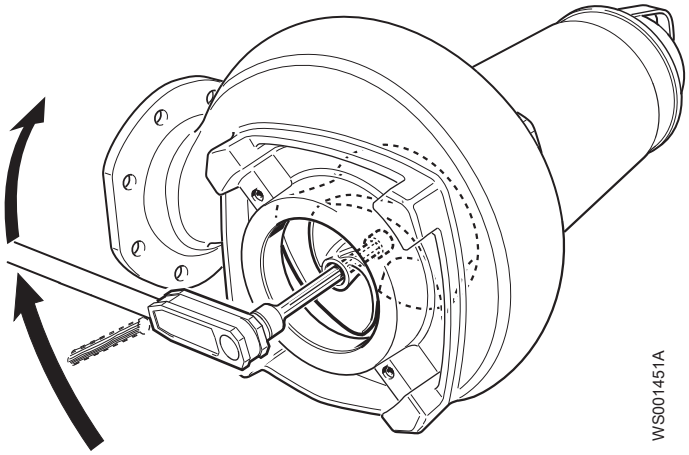
3. Fit the pump housing:
   a) Fit a new and lubricated O-ring on the seal housing cover.
   b) Lubricate the pump housing screws.
   c) Raise the drive unit.
   d) Place the drive unit into the pump housing.
   e) Adjust its position so that the inspection hole is on the same side as the flush valve.
   f) Tighten the screws in diagonal sequence.
      For tightening torque, see *Torque values* (page 36).



4. Remove the impeller screw:
   a) Place the pump horizontally.
   b) Lock the impeller in place by inserting a rod through the hole.
   c) Remove the impeller screw and the washer.



5. Adjust the impeller:
   a) Using a hexagon-bit adapter, turn the adjustment screw clockwise until the impeller makes contact with the pump housing.
      For tightening torque, see *Torque values* (page 36).
   b) Tighten it a further 1/8 turn (45°).



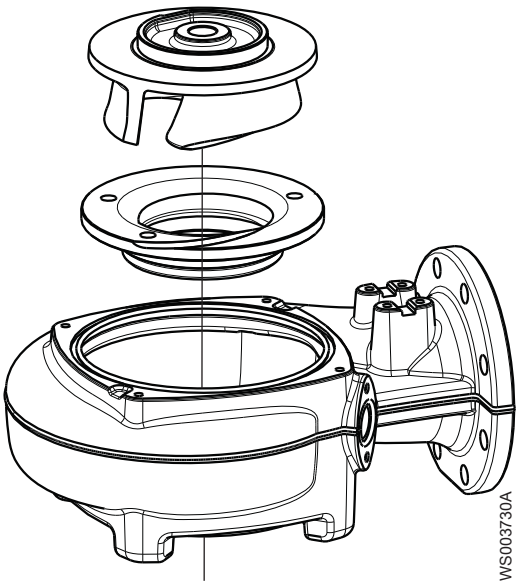
6. Fasten the impeller:
   a) Fit the lubricated washer and impeller screw.
   b) Tighten the impeller screw.
      For tightening torque, see *Torque values* (page 36).
   c) Tighten it a further 1/8 turn (45°).

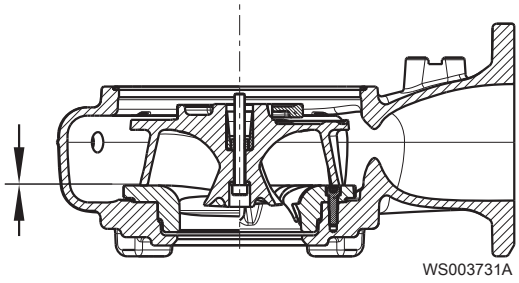
   d) Remove the rod that is used to lock the impeller.

e) Fit the O-ring and flush valve cover and fasten it with screws.
For tightening torque, see *Torque values* (page 36).
f) Check that the impeller can rotate freely.

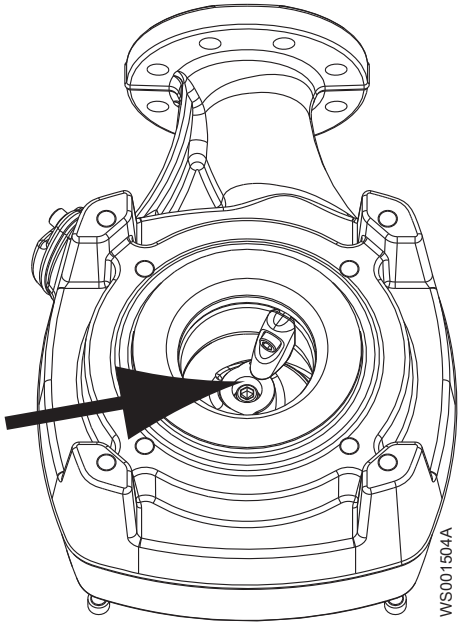
WARNING: Crush Hazard
Beware of the pinch point hazard between the rotating impeller and the guide pin.

7. Check that the clearance between the impeller and the insert ring is 0.1–0.5 mm (0.004–0.02 in).





8. If applicable, adjust the clearance to 0.1–0.5 mm (0.004–0.02 in) between the guide pin and the impeller.

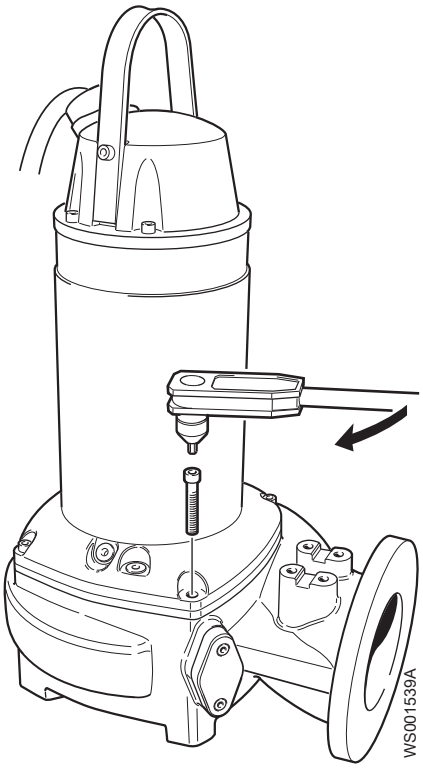


6.4.2 Replace the impeller for dry installation

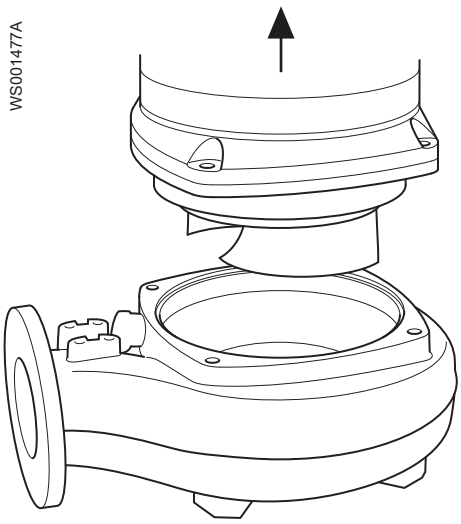
6.4.2.1 Remove the impeller: dry installation

1. Remove the drive unit from the pump housing:

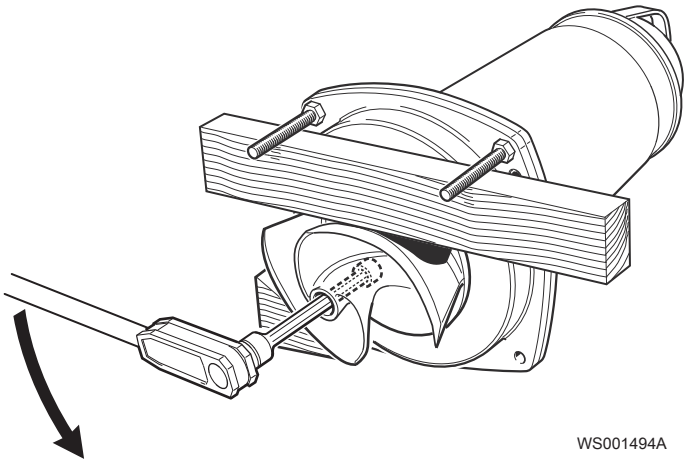
a) Remove the pump housing screws.



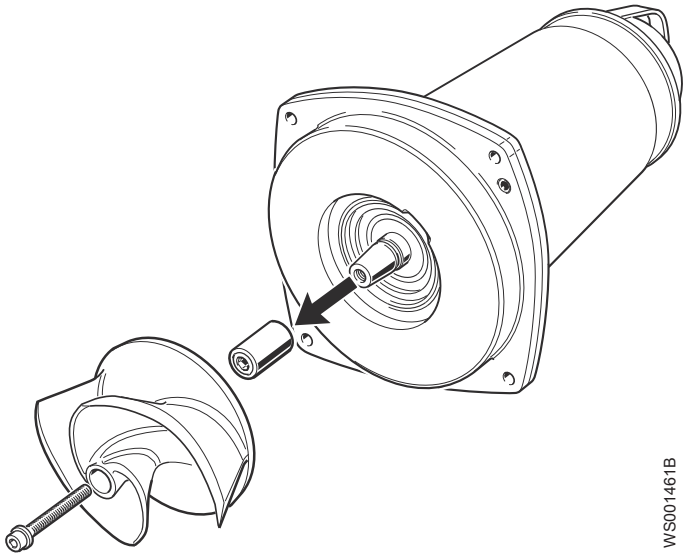
b) Remove the drive unit from the pump housing.



2. Remove the impeller:
   a) Place the drive unit horizontally.
   b) Lock the impeller as shown in the figure.
   c) Remove the impeller screw.



d) Turn the adjustment screw counterclockwise until the impeller breaks free from the shaft.
e) Remove the impeller and the conical sleeve.



6.4.2.2 Install the impeller: dry installation

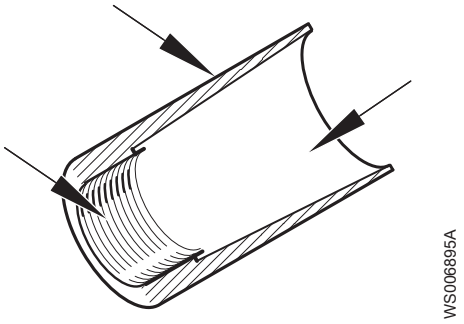
1. Prepare the shaft:
   a) Polish off any flaws with a fine emery cloth.

      The end of the shaft must be clean and free from burrs.
   b) Coat the inner conic, the outer cylindrical surfaces, and the thread of the conical sleeve with a thin layer of grease.

      The proper lubrication is grease for bearings, for example Exxon Mobil Unirex N3, Mobil Mobilith SHC 220 or equivalent.

      NOTICE:

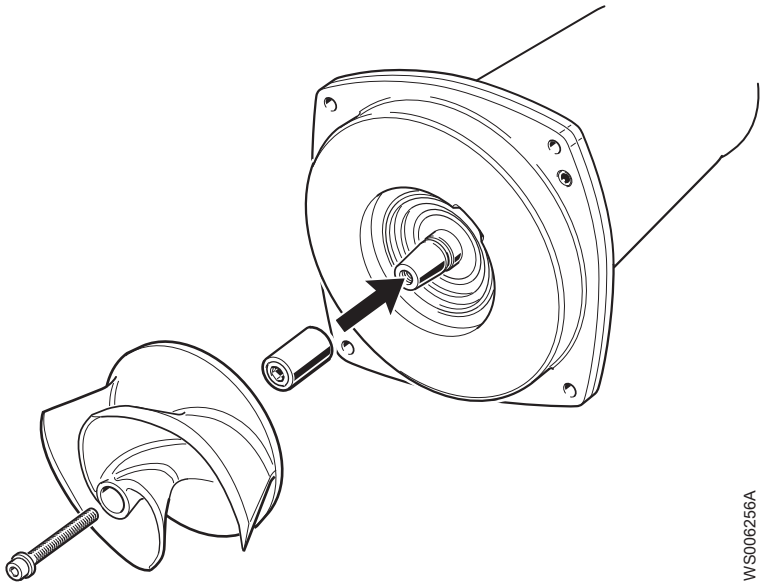
      Surplus grease can cause the impeller to become loose. Remove surplus grease from conical and/or cylindrical surfaces of shafts and/or sleeves.



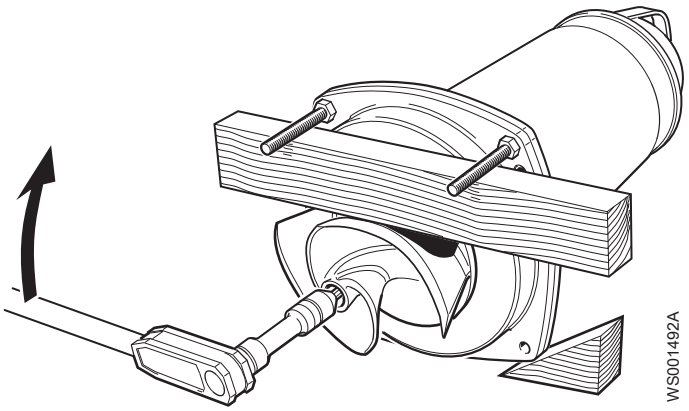
2. Mount the impeller:
   a) Lubricate the threads of the impeller screw and the washer. Always use a new impeller screw.
   b) Unscrew the adjustment screw approximately 5 mm (0.2 in.).

   c) Measure and note the distance A.

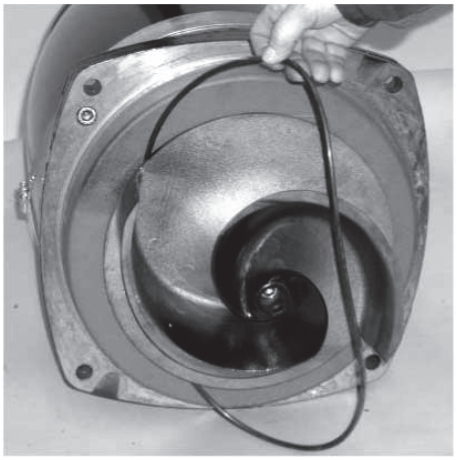
   d) Fit the sleeve and the impeller to the shaft.



e) Fit the impeller screw and washer and tighten.

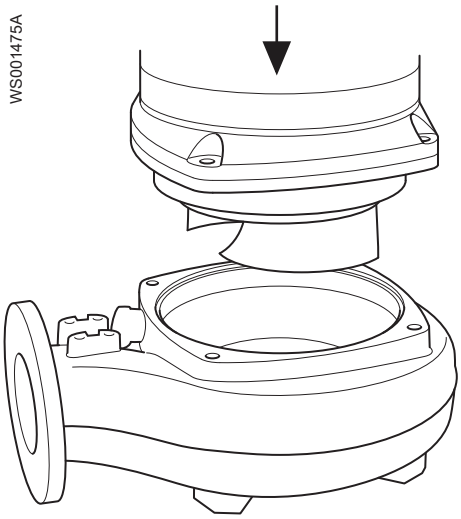


3. Make sure that the O-ring is removed from the seal housing cover.



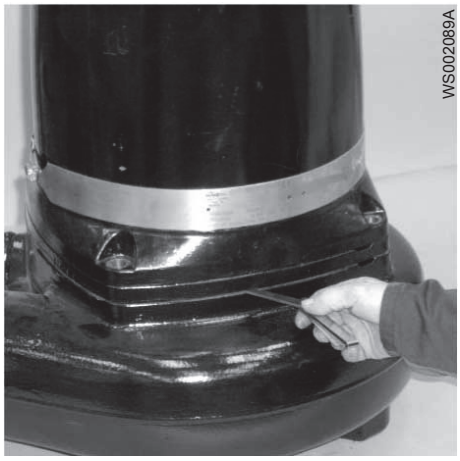
4. Measure the trim distance:
   a) Place the drive unit in the pump housing.

      Make sure that the drive unit is parallel with the pump housing by hand-tightening the pump housing screws.

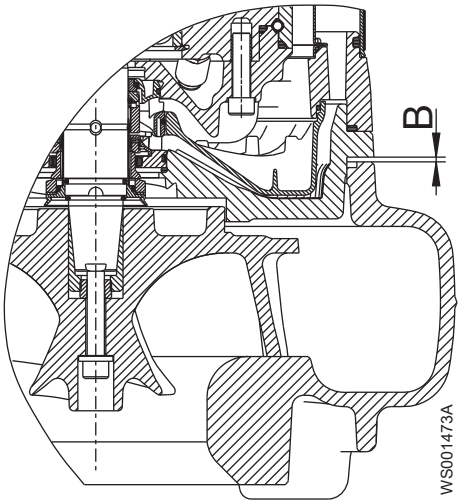


b) Check the distance between the seal housing cover and the pump housing with a feeler gauge.

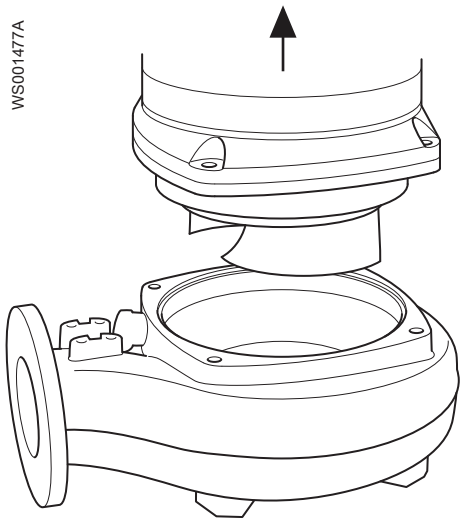
Check diagonally at four points.



c) Note the largest distance B.

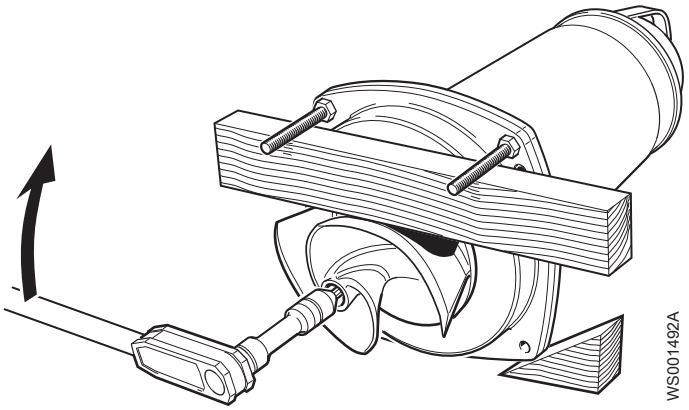


d) Lift the drive unit out of the pump housing and remove the impeller and conical sleeve.



5. Trim to the correct distance:
   a) Calculate the measure C according to the formula shown in the image.

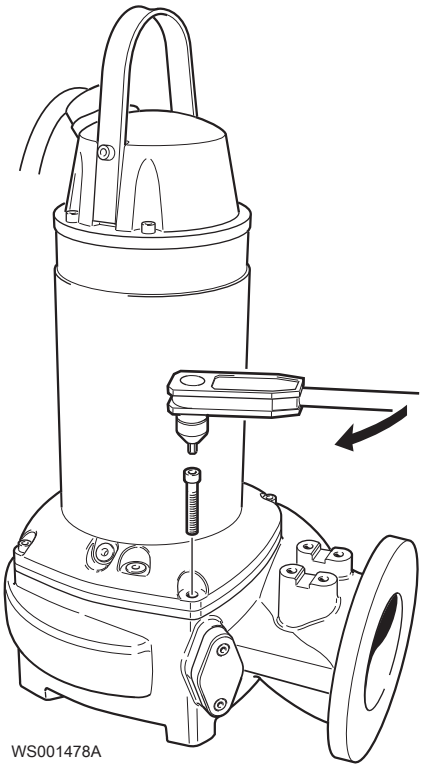
   b) Turn the adjustment screw until C is reached.
6. Fasten the impeller:
   a) Fit the sleeve, impeller, lubricated washer with a lubricated impeller screw.
   b) Tighten the impeller screw.
      For tightening torque, see *Torque values* (page 36).
   c) Tighten it further 1/8 turn (45°).



7. Install the drive unit in the pump housing:
   a) Fit a new and lubricated O-ring to the seal housing cover.

   b) Place the drive unit in the pump housing.

   c) Adjust the position of the drive unit so that the inspection hole is on the same side as the flush valve.
   d) Tighten the lubricated screws diagonally.
      For tightening torque, see *Torque values* (page 36).



If you need to adjust the impeller, redo the replace the impeller procedure from the beginning.

7 Troubleshooting

Introduction

DANGER: Electrical Hazard

Troubleshooting a live control panel exposes personnel to hazardous voltages. Electrical troubleshooting must be done by a qualified electrician.

Follow these guidelines when troubleshooting:

- Disconnect and lock out the power supply except when conducting checks that require voltage.
- Make sure that no one is near the unit when the power supply is reconnected.
- When troubleshooting electrical equipment, use the following:
  - Universal instrument multimeter
  - Test lamp (continuity tester)
  - Wiring diagram

7.1 The pump does not start

DANGER: Crush Hazard

Moving parts can entangle or crush. Always disconnect and lock out power before servicing to prevent unexpected startup. Failure to do so could result in death or serious injury.

NOTICE:

Do NOT override the motor protection repeatedly if it has tripped. Doing so may result in equipment damage.

Cause	Remedy
An alarm signal has been triggered on the control panel.	Check that: • The impeller rotates freely. • The sensor indicators do not indicate an alarm. • The overload protection is not tripped. If the problem still persists: Contact the local sales and service representative.
The pump does not start automatically, but can be started manually.	Check that: • The start level regulator is functioning. Clean or replace if necessary. • All connections are intact. • The relay and contactor coils are intact. • The control switch (Man/Auto) makes contact in both positions. Check the control circuit and functions.
The installation is not receiving voltage.	Check that: • The main power switch is on. • There is control voltage to the start equipment. • The fuses are intact. • There is voltage in all phases of the supply line. • All fuses have power and that they are securely fastened to the fuse holders. • The overload protection is not tripped. • The motor cable is not damaged.

Cause	Remedy
The impeller is stuck.	Clean: • The impeller • The sump in order to prevent the impeller from clogging again.

Always state the serial number of your product, see *Product Description* (page 10).

7.2 The pump does not stop when a level sensor is used

DANGER: Crush Hazard

Moving parts can entangle or crush. Always disconnect and lock out power before servicing to prevent unexpected startup. Failure to do so could result in death or serious injury.

Cause	Remedy
The pump is unable to empty the sump to the stop level.	Check that: • There are no leaks from the piping and/or discharge connection. • The impeller is not clogged. • The non-return valve(s) are functioning properly. • The pump has adequate capacity. For information: Contact the local sales and service representative.
There is a malfunction in the level-sensing equipment.	• Clean the level regulators. • Check the functioning of the level regulators. • Check the contactor and the control circuit. • Replace all defective items.
The stop level is set too low.	Raise the stop level.

Always state the serial number of your product, see *Product Description* (page 10).

7.3 The pump starts-stops-starts in rapid sequence

Cause	Remedy
The pump starts due to back-flow which fills the sump to the start level again.	Check that: • The distance between the start and stop levels is sufficient. • The non-return valve(s) work(s) properly. • The length of the discharge pipe between the pump and the first non-return valve is sufficiently short.
The self-holding function of the contactor malfunctions.	Check: • The contactor connections. • The voltage in the control circuit in relation to the rated voltages on the coil. • The functioning of the stop-level regulator. • Whether the voltage drop in the line at the starting surge causes the contactor's self-holding malfunction.

Always state the serial number of your product, see *Product Description* (page 10).

7.4 The pump runs but the motor protection trips

DANGER: Crush Hazard

Moving parts can entangle or crush. Always disconnect and lock out power before servicing to prevent unexpected startup. Failure to do so could result in death or serious injury.

NOTICE:

Do NOT override the motor protection repeatedly if it has tripped. Doing so may result in equipment damage.

Cause	Remedy
The motor protection is set too low.	Set the motor protection according to the data plate and if applicable the cable chart.
The impeller is difficult to rotate by hand.	• Clean the impeller. • Clean out the sump. • Check that the impeller is properly trimmed.
The drive unit is not receiving full voltage on all three phases.	• Check the fuses. Replace fuses that have tripped. • If the fuses are intact, then notify a certified electrician.
The phase currents vary, or they are too high.	Contact the local sales and service representative.
The insulation between the phases and ground in the stator is defective.	1. Use an insulation tester. With a 1000 V DC megger, check that the insulation between the phases and between any phase and ground is > 5 megaohms. 2. If the insulation is less, then do the following: Contact the local sales and service representative.
The density of the pumped fluid is too high.	Make sure that the maximum density is 1100 kg/m3 (9.2 lb/US gal) • Change the impeller, or • Change to a more suitable pump • Contact the local sales and service representative.
There is a malfunction in the overload protection.	Replace the overload protection.

Always state the serial number of your product, see *Product Description* (page 10).

7.5 The pump delivers too little or no water

DANGER: Crush Hazard

Moving parts can entangle or crush. Always disconnect and lock out power before servicing to prevent unexpected startup. Failure to do so could result in death or serious injury.

NOTICE:

Do NOT override the motor protection repeatedly if it has tripped. Doing so may result in equipment damage.

Cause	Remedy
The impeller rotates in the wrong direction.	• If it is a 3-phase pump, then transpose two phase leads. • If it is a 1-phase pump, then do the following: Contact the local sales and service representative.
One or more of the valves are set in the wrong positions.	• Reset the valves that are set in the wrong position. • Replace the valves, if necessary. • Check that all valves are correctly installed according to media flow. • Check that all valves open correctly.
The impeller is difficult to rotate by hand.	• Clean the impeller. • Clean out the sump. • Check that the impeller is properly trimmed.
The pipes are obstructed.	To ensure a free flow, clean out the pipes.
The pipes and joints leak.	Find the leaks and seal them.

Cause	Remedy
There are signs of wear on the impeller, pump, and casing.	Replace the worn parts.
The liquid level is too low.	• Check that the level sensor is set correctly. • Depending on the installation type, add a means for priming the pump, such as a foot valve.

Always state the serial number of your product, see *Product Description* (page 10).

8 Technical Reference

8.1 Application limits

Data	Description
Liquid temperature	40°C (104°F) maximum For P- and S-installations without a cooling jacket, the pump can be operated only when the sump level is at least 10 mm above the stator housing. Warm-liquid version: 70°C (158°F) maximum Warm-liquid version must have cooling jacket.
pH of the pumped media (liquid)	5.5–14
Liquid density	1100 kg/m³ (9.2 lb per US gal) maximum
Depth of immersion	Maximum 20 m (65 ft)
Other	For the specific weight, current, voltage, power ratings, and speed of the pump, see the data plate of the pump.

8.2 Motor data

Feature	Description
Motor type	Squirrel-cage induction motor
Frequency	50 Hz or 60 Hz
Supply	3-phase
Starting method	• Direct on-line • Star-delta • Soft starter • Variable Frequency Drive (VFD)
Maximum starts per hour	30 evenly spaced starts per hour
Code compliance	IEC 60034-1
Voltage variation without overheating	±10%, if it does not run continuously at full load
Voltage imbalance tolerance	2%
Stator insulation class	H (180°C [360°F])

Motor encapsulation

Motor encapsulation is in accordance with IP68.

Xylem |'zīləm|

1) The tissue in plants that brings water upward from the roots
2) A leading global water technology company

We're a global team unified in a common purpose: creating innovative solutions to meet our world's water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.

Section One: Equipment Information

Technical Information

The Wastemaster® GCPC screen is provided by WAM North America | Enviro-Care Company WAM Group in Cavezzo, Italy. The equipment was designed for safe operation under the specified conditions. Disassembling the protection supplied by the manufacturer can jeopardize the equipment's safety features. The system must be used in the application described by the manufacturer and clearly stated in this manual. Read this manual before moving, installing or performing maintenance on this equipment.

The manufacturer shall not be held responsible for equipment damage or accidents due to the failure to observe the instructions in this manual or for misapplication of the equipment. Unauthorized alterations, changes and the installation of unapproved accessories may void the equipment warranty and any resulting damage will not be the responsibility of the manufacturer.

This Operation and Maintenance manual is an integral part of the machine. It is necessary to keep it complete, available to operating personnel and in a safe place during the service life of the machine. Should you need further copies or revisions of the manual, do not hesitate to contact WAM North America | Enviro-Care.

WAM North America | Enviro-Care Company
1570 St. Paul Avenue
Gurnee, Illinois 60031
Ph: 815-636-8306, Fax: 815-636-8302
www.enviro-care.com

All equipment, including standard "Buyout" items, must be maintained according to each respective manufacturer's operation and maintenance procedures enclosed within this manual to ensure coverage of possible failures while the unit is still under warranty, along with ensuring trouble-free operation for the life of the equipment.

Since the enclosed information is based upon the instructions available at the time of printing,

WAM North America | Enviro-Care reserves the right to make subsequent changes to the manual without obligation to update existing copies.

The contents of this manual are the confidential property of WAM North America | Enviro-Care Inc. Circulation, distribution, or reproduction of this manual in whole or in part without written permission is prohibited by law. Possession of this manual neither confers nor transfers any rights which may be detrimental to WAM North America | Enviro-Care's interests.

This OPERATION and MAINTENANCE MANUAL must be thoroughly read and understood, to ensure compliance with the warranty. All procedures must be followed before erecting and operating the equipment. WAM North America | Enviro-Care will not accept responsibility for damage to the equipment that has not been handled in accordance with the manufacturer's instructions. A brief summary of the warnings and instructions are listed below. For additional information, please refer to the related sections.

- Anti-seize compound MUST be used on all stainless steel fasteners to prevent galling or seizing.
- If grouting is necessary (see general arrangement drawings), do not grout under support stands until final levelling is completed and verified.
- In order to avoid corrosion, touch-up any paint or galvanizing damaged during installation.
- To prevent personal injury, the Wastemaster® GCPC screen **must be shut down before any maintenance or adjustments requiring personal contact are made.** If the unit is opened for inspection, cleaning, or observation, the motor must be locked out electrically in such a manner that it cannot be restarted by anyone during the inspection, cleaning, or observation.
- All fasteners should be checked regularly and tightened as required.
- The equipment must be routinely lubricated according to the Lubrication Schedule and the accessory item instructions enclosed. **Failure to do so will shorten the lifetime of the equipment and void the equipment warranty.**
- Regularly check the wear bars for wear. They should be replaced when approaching 1/8" thick. Failure to maintain wear bars will void warranty.
- If the reducer is removed, keep driveshaft clean of all debris and dirt. Any contamination will make replacing the reducer more difficult and possibly inoperative.
- Equipment must be protected to prevent surface contamination. Contamination can come from welding, cutting, painting and other such activities in the area of the equipment. Stainless steel surfaces contaminated with any iron, chloride containing material and other substances can experience accelerated surface corrosion and pitting.

Danger - Warning

Operating and maintaining this equipment has inherent risks. It is your responsibility to read and understand the Operation and Maintenance Manual prior to working with the equipment. This page is intended to summarize the warnings associated with Enviro-Care's equipment. Where equipment manufactured by others have been provided in conjunction with Enviro-Care's equipment, additional warnings specific to that piece of equipment may only be contained in that section of the manual. Please read and understand all warnings provided in the Manual.

Symbols

Danger - Warning

Indicates situations of serious danger which, if ignored, can be risky for the health and safety of persons.

Caution

Indicates that appropriate behavior must be adopted to avoid posing risk for the health and safety of persons and avoid causing economic damage.

Information

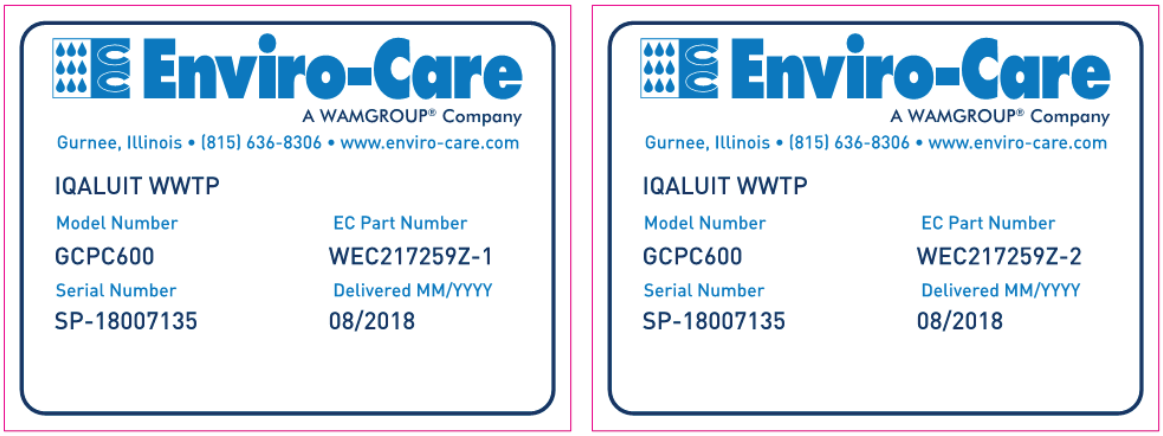
Indicates particularly important technical information which must not be ignored.

Technical Service Statement

If, after following the maintenance instructions in SECTION 4 of this O&M Manual, you require assistance, contact the service department shown below. Please provide the Model and Serial Number of the equipment. Both of these can be found on the name plate attached to the equipment.

Service Department, WAM North America | Enviro-Care
1570 St. Paul Ave.
Gurnee, Illinois 60031
Phone: 815-636-8306, Fax: 815-636-8302

Name Plate



NOTE:
Data on the name plate cannot be modified or removed.

Enviro-Care One-Year Warranty

Warranty Statement and Term:

WAM North America | Enviro-Care Company, Inc. warrants the supplied equipment to the original end user against defects in workmanship or material under normal use and service in compliance with the original design specifications and the maintenance requirements and instructions as found in the Operations & Maintenance Manual.

All WAM North America | Enviro-Care supplied equipment is warranted for twelve (12) months from date of start-up or eighteen (18) months from date of shipment, whichever occurs first.

Warranty Exclusions:

This warranty does not cover costs for labor, standard and/or scheduled maintenance performed, nor does it cover consumables and WAM North America | Enviro-Care parts that, by virtue of their operation, require replacement through normal wear (aka: wear parts), unless a defect in material or workmanship can be determined by WAM North America | Enviro-Care.

Wear parts are defined as brushes, rollers, spray nozzles, drum seals and other items specifically identified in the Operations & Maintenance Manual.

Warranty Coverage:

WAM North America | Enviro-Care's liability is limited to the supply or repair of defective parts returned, freight prepaid by buyer to a location specified by WAM North America | Enviro-Care. Repaired or replacement parts will be shipped to buyer prepaid via standard ground freight. Express or expedited shipments will be at the expense of the buyer.

Exclusions and Exceptions:

This Warranty excludes damage or wear to equipment caused by misapplication of product, improper maintenance, accident, abuse, unauthorized alteration or repair, Acts of God, or installation or operation that is non-compliant with WAM North America | Enviro-Care installation and operations instructions.

WAM North America | Enviro-Care shall not under any circumstances be liable for any incidental or consequential damages arising from loss, damage to property, personal injury or other damage or losses owing to the failure of WAM North America | Enviro-Care's equipment. The liability of WAM North America | Enviro-Care Company, Inc. is limited as set forth above within the time period set forth above.

Information

For owner use to be filled in and kept as part of recording keeping.

This page intentionally left blank

General Description

The WAM North America | Enviro-Care Wastemaster® GCPC Screen provides screening, dewatering, conveying and compacting all in one unit. The unit mounts directly in the tank or (optional installed in a tank) where material larger than the screen openings will be captured in the screen basket. The screenings are then washed and conveyed up the conveyor tube through the compacting/dewatering zone before they are discharged into a suitable receptacle.
To perform as described, the Wastemaster® GCPC will consist of the following:

Screening Section

The screening section consists of a semi-cylindrical, perforated screen basket of durable stainless steel. A shaftless helical screw rotates in the screen basket to transport the screenings to the conveying section. The lower flights are fitted with brushes that clean the screen with every rotation of the screw. Near the top of the screening basket, a spray wash system (if provided) with a ball valve, automatic solenoid valve and spray nozzles direct water to help separate organics from the screenings. To prevent flow from bypassing the screen, elastomeric flaps seal the gap between the screen basket and the tank wall.

Conveying Section

The conveying section consists of a shaftless helical auger housed inside a conveyor tube to dewater and convey the screenings to the compacting/dewatering section. This shaftless screw rides on four replaceable wear bars that run the length of the conveying section. If provided, an optional secondary spray wash system in the conveyor section flushes additional water on to the screenings to further separate the organic material from the screenings.

Compacting/Dewatering Section

The compacting/dewatering section consists of a perforated cylindrical plate mounted at the end of the conveying section. A spray flush is provided to keep the compacting section drain clear. The compacting / dewatering section housing includes a hinged access hatch; an inspection cover with quick opening latches and a safety motor cutout switch to stop the unit whenever the hatch is opened.
For units provided without a compaction zone, a bolted cover without an interlock switch will be provided – please refer to the General Arrangement Drawing for further details.

Drive Unit

The Spiral Screen drive unit consists of an electric motor directly driving a flange-mounted, hollow shaft, helical gear reducer. This unit attaches to the upper end of the compacting/dewatering housing and is bolted to the drive shaft.

Heat Tracing/Freeze Protection **(Optional, Not Provided)**

On heat traced units, the Wastemaster® GCPC wash water lines are fitted with 120V, single phase, 60 Hz flexible self-regulating heat tracing wire to prevent freezing. If required, the transport tube and/or the compaction zone can also be heat-traced. The heat trace system shall have an integral thermostat to regulate the heating element. The heater and thermostat shall be terminated in a NEMA 4X junction box.

The heat traced components are insulated with closed-cell foam insulation and wrapped with foil tape or stainless steel or PVC jacketing.

The control panel shall include integrated heat trace circuits rated for the appropriate wattage as determined by the manufacturer.

Bagger System **(Optional, Not Provided)**

A Longofill bagger system can be provided for containment, odor control and sanitary handling of screenings.

Level Sensor

If provided, a level sensor or float switch monitors water depth in the tank to maximize the efficiency of the spiral screen. Upon detecting a designated high water level, the sensor activates the Spiral Screen unit. The screen will then operate for a designated amount of time to clear the screenings. It is recommended that if the water level reaches a designated critical point, an alarm will be activated. The designated settings are to be established and set in the field.

Spray Wash Assembly

A centralized washing system shall be provided to connect all spray wash systems to a common service connection point. The piping manifold shall be constructed from stainless steel. Washwater solenoids and manual ball valves shall be factory installed with the manifold assembly.

A spray bar is installed inside the compaction enclosure to keep the compaction zone clear and rinse any residual solids from the drain area of the enclosure. Spray bar wash system has been furnished with control solenoid valve, stainless steel piping and fittings and flexible reinforced hoses.

The basket can be provided with a spray bar mounted near the top. Spray bar wash system is furnished with control solenoid valve, stainless steel piping and fittings, flexible reinforced hoses and spray nozzles.

General Precautions

Receiving Material

The equipment pieces and components received may have been shipped from:

1. WAM North America | Enviro-Care, Gurnee, IL.
2. A fabricator acting under WAM North America | Enviro-Care Inc. instructions.
3. A “buy-out” distributor such as a motor or pump manufacturer.

Since there will often be more than one shipment to the job site, it is important to coordinate the receiving and storage of all items accordingly. All material has been thoroughly checked and inspected before shipment. However, there may be times when equipment is missing, damaged in transit or received with broken packaging. When receiving equipment, it is necessary to properly acknowledge receipt and any shortage or damage on the shipping documents. This must be done in a manner that helps assign responsibility to the proper party for the various parts of shipping and receiving equipment.

When receiving a shipment, the following procedures must be followed. These procedures are also listed on the Bill of Lading the shipping company provides and must be signed to prove delivery of the goods. If the following procedures are not followed, WAM North America | Enviro-Care will not be liable for any shortages or damage on your shipments.

Receiving Procedure

Before signing the Bill of Lading (BOL) in receipt of the goods shown thereon, and **before** the driver leaves, do the following:

1. After inspecting the shipment, **note** any damage or shortages (according to what is listed on the BOL). Be as detailed as necessary.
2. Have the driver sign the notation in acknowledgment.
3. Retain a copy (of the notated BOL) for use in filing a freight claim.
4. If there is damage, **notify** WAM North America | Enviro-Care (call 815-636-8306 **immediately** so that arrangements can be made with the carrier, if necessary, to have the damaged goods inspected by their agent.

After signing the BOL and receiving the shipment, do the following:

1. Use the attached/enclosed packing list to further inspect the entire shipment for shortages and/or damage and retain this list for future reference.
2. **Notify** WAM North America | Enviro-Care within **three** (3) working days from date of receipt, of any further shortages or concealed damage. If certain items are missing or damaged, make notes of this on the shipping papers to protect all interests and notify WAM North America | Enviro-Care (815) 636-8306 **immediately.**

Handling and Storage

Please handle the equipment properly when unloading and erecting. All cartons, electrical equipment, and gear drives should be stored under cover and protected from moisture, grit, and mud. All rolled steel sections must be stored on edge or blocked up to prevent distortion. If allowed to lie flat, these items may lose their shape which could hinder erection and proper alignment of the equipment.

Fasteners

All stainless steel erection fasteners shall incorporate anti-seize during assembly. Failure to utilize this will cause significant extra time by the erection and maintenance crews.

Foundation anchor bolts

Notify WAM North America | Enviro-Care immediately if anchor bolts are not received.

Anchor bolts must be placed accurately to avoid future erection difficulties. Where applicable and upon request, WAM North America | Enviro-Care can furnish a template for positioning the anchor bolts. If a template has not been furnished, remember that the location and projection of all anchorage is critical. The specified amount of projection and location are shown on the general arrangement drawings. Prior to equipment installation, clean the threads of all anchorage bolts and oil them.

If using epoxy anchors, confirm the expiration date of the epoxy, typically posted on the packing, prior to mixing and application. Epoxy adhesives have a limited shelf life and shall therefore be provided by the installing contractor, not by WAM North America | Enviro-Care. Installer to adhere to epoxy installation procedures noted on packaging.

Shortages, Discrepancies and Field Charges

Please notify WAM North America | Enviro-Care immediately if any apparent manufacturing discrepancies or shortages are encountered with machinery, since no field charges for alterations or shortages will be accepted unless authorized in writing by our authorized representative.

Fabricated steel parts and assemblies furnished by WAM North America | Enviro-Care are manufactured following best shop practices and standards. However, some misfits and imperfect work may arise. In such cases, the American Institute of Steel Construction Manual, Thirteenth Edition, “Code of Standard Practice”, will apply to erection of this equipment. It reads as follows:

Corrections and Errors

“The correction of minor misfits by moderate amounts of reaming, grinding, welding or cutting, and the drawing of elements into line with drift pins, shall be considered normal erection operations. Errors that cannot be corrected using the foregoing means, or that require major changes in member or Connection configuration, shall be promptly reported to the Owner’s Designated Representatives for Design and Construction and the Fabricator by the Erector, to enable the responsible entity to either correct the error or approve the most efficient and economical method of correction to be used by others.”

Company policy dictates that **no field charges will be allowed without prior approval.** Written authority must be given in the form of a WAM North America | Enviro-Care Field Change Authorization with an associated warranty tracking number, if applicable. The warranty tracking number will be issued when the extent of such modifications and the price for performing these modifications have been agreed upon. In general, when parts require replacement, and WAM North America | Enviro-Care agrees that replacement is necessary, WAM North America | Enviro-Care will furnish the parts. The contractor will remove the defective parts and install the replacement parts at a cost agreed upon by both parties.

Structural Lifting Precautions

All structural components should be lifted and handled as instructed below. Proper handling is necessary to protect special coverings and to ensure ease of assembly during equipment installation.

1. Make sure the equipment being lifted or the lifting equipment cannot come into contact with overhead electrical cables, etc.
2. The lifting and transport of the equipment can be done by means of a suitable lifting system verified for the weight and dimensions of the equipment.
3. All rigging and lifting should be done by experienced personnel.
4. Before the equipment is removed from the delivery trucks, check to be sure the blocking, bracing, and banding securing it to the carrier have been removed and is ready for moving.
5. Use multiple point lifting whenever possible.
6. Always lift and handle the equipment using the eyebolt fixed on the equipment.
7. Always attach the lifting eyebolt by means of hooks with safety fasteners.
8. When lifting structural members of this equipment, avoid twisting or bending the members. Use spreader beams, as necessary, to fully support the pieces as they are lifted.
9. Before lifting the machine from the ground entirely preassembled, make sure that all the nuts and bolts for connection are tight, some attachments could loosen due to transportation.
10. Lift the equipment an inch or two off the trailer to be sure it is free to be moved and balanced correctly. Adjust as necessary.
11. Check the component balance until it is entirely hoisted.

    Hoisting has to be carried out steadily (without jerks and thrusts), never allow it to strike the ground, tank or other equipment.

Danger - Warning

Do not pull, drag, push or dump the structural components off the delivery trucks.
Stand clear as the equipment is lifted.

Explanation of Parts List

Item Numbers

Item numbers identify a part shown on an erection or assembly drawing and correspond to the parts list item number. Item numbers are in balloons on the drawing with an arrow pointing to the part. On the parts list, items numbers are found in the left most column of the Parts List. Item numbers are three-digit numbers.

Part Numbers

Part numbers identify inventory I.D. numbers or drawing numbers of the fabrication drawings. Fabrication drawings are not included in this Operation and Maintenance Manual.

General

Refer to the Enclosure section of this manual for the job specific Parts List(s).

Procedure for Ordering Spare or Replacement Parts

Spare or replacement parts may be ordered from the Aftermarket Sales Department at:

Enviro-Care
1570 St. Paul Ave
Gurnee, IL 60031
Phone: (815) 636-8306
Fax: (847) 672-7968

E-Mail: parts@enviro-care.com
Web: www.enviro-care.com

If you would like to talk directly to an Aftermarket Sales representative during normal business hours (8:00 am to 4:30 pm CST), dial (224) 302-0327.

If you would like to e-mail a spare parts order, simply e-mail your request to us at parts@enviro-care.com and an Enviro-Care representative will process your order and follow up with an Order Acknowledgment.

For convenience, a 'Recommended Spare Parts List' is provided in this manual. This is a guide for the appropriate level of spares to keep on hand minimizing lost time due to unscheduled breakdowns. Each item listed in the Recommended Spare Parts List is identified within one of the following categories:

- Normal Maintenance and wear items
- Long Lead items (minimum downtime)

Should you require further assistance in determining which spare parts are appropriate for your particular situation please contact Enviro-Care's Aftermarket Sales Department.

To avoid unnecessary delays in obtaining the correct spare or replacement parts for your equipment, be sure to give the following information with each order.

1. Identify equipment using the Enviro-Care Project Number. Your equipment is identified as follows:

   Enviro-Care Project Number: WEC217259Z
   Enviro-Care Model Number: GCPC600

2. Identify the part by name and give the number of the drawing on which this part or assembly appears.
3. Identify the part number.
4. Identify the size and include all pertinent dimensions (such as diameter, length, thickness, bore, pitch, etc.) whenever possible.
5. If parts being ordered are electrical in nature, give all pertinent data such as: voltage, amperage, wattage, cycles, speed, power factor, or other information given on the parts nameplate or included in the parts brochure.
6. Submit your written purchase order or request for a quotation, both signing and printing your full name so that Enviro-Care will know whom to contact should further clarification of the inquiry be necessary. All verbal orders must be verified in writing.
7. Give a return address and a shipping address.
8. Give a preferred method of shipping: ie. UPS, truck freight, rail freight, air express, etc..
9. Indicate the quantity desired.
10. Provide instructions for proper invoicing.

Recommended Spare Parts

Quantity	Description
1	Motor cutout switch
1	Set of wear bars with fasteners
1	Set of brushes with fasteners
1	Solenoid valve rebuild kit
1	Set of spray nozzles

Section Two: Installation Instructions

Basic Installation

The sequence and procedures listed below are suggested and should not take precedence over the experience of the erector if, due to special circumstances or available equipment, he should decide to vary the given steps.

If installation is not immediately started upon delivery of the equipment, the appropriate storage procedure must be followed, as described in the ***Storage and Shutdown Precautions*** of this manual.

The Wastemaster® GCPC screen is partially disassembled for shipment. The motor, support leg and discharge chute (if supplied) are typical components that may require field assembly.

1. Open tank cover and remove tank panel (see Figure 2-1) so screw screen can be inserted.

Figure 2-1: Tank panel for screw screen insertion

2. Lift screw screen using the eyebolts welded on body and place in tank (see Figure 2-2). Resecure tank panel and tighten bolts at panel and transport tube support bracket.

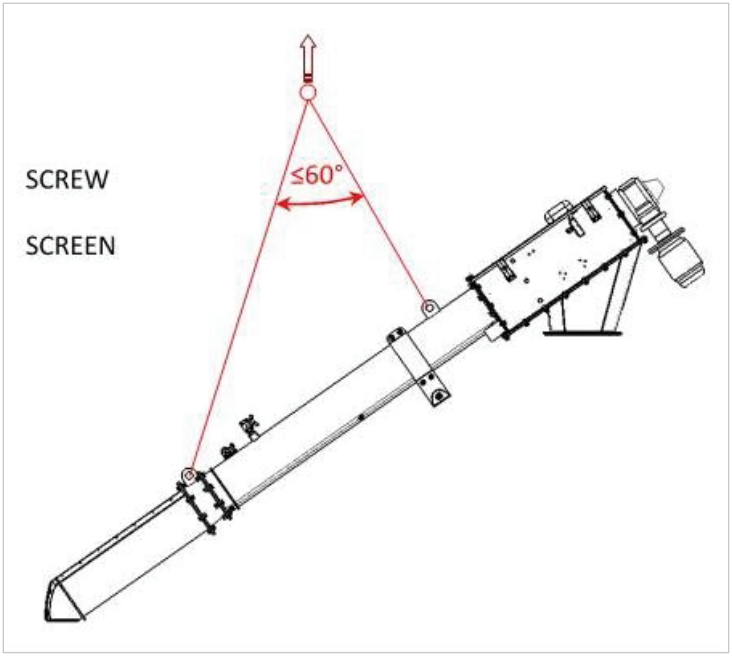

Figure 2-2: Lifting Configuration

3. The bottom of the screen should lay flush with the bottom of the tank and the rubber flaps should seal securely against the sides of the tank as indicated on the general arrangement drawing(s). Tighten all the fasteners for the support frame.
4. Position the machine to obtain position by lifting at lift points on the general arrangement drawing(s). (see Section Six – Enclosures)
5. Position the screens frame in its final location to support unit and anchor to concrete tank.
6. If a spray wash system is provided, connect facility spray wash piping to the pipe connection(s) located as shown on the general arrangement drawing(s).

   Three possible spray zones are contained within the system. One to clean the screen basket surface, another to periodically clean the compaction zone drainage area, and a third to wash the solids as they are conveyed up the transport tube (not typically included on Enviro-Care units).

Figure 2-3: Washing Connections

7. If provided, mount the level sensor or float switch as indicated on the general arrangement drawing(s).

8. Connect the return hose to dewatering zone outlet and place the other end of the hose to direct it in the effluent tank.
9. Install electrical control panel and connect to supply power.
10. A qualified electrician should wire the Wastemaster® GCPC screen drive motor, the motor safety cut-out switch, the level sensor/float switch, the solenoid valve(s), and E-Stop push button. Jog the drive motor. Ensure that the drive shaft rotates in the proper direction, causing the screw to convey material up the basket.
11. Ensure proper screenings receptacle is in place.
12. Unless specifically mentioned in this manual, all piping for connecting spray wash is by others.
13. All wiring external to motors and controls is by others.

Information

Anti-seize compound must be used on all stainless steel fasteners to prevent gailing or seizing.

Final Check for Level

Ensure that the Wastemaster® GCPC screen is level.

1. Leveling nuts are supplied with the anchor rods (two nuts per anchor).
2. Use a carpenter's level to check level of support frame base.
3. If adjustment is necessary, lower or raise the corresponding leveling nuts, as required.
4. When the Wastemaster® GCPC screen is level and properly located, secure the support frame base with top locking nut and grout with a non-shrink grout (not by Enviro-Care).

Caution

Before proceeding with the start/stop of the equipment, check that nothing is obstructing the operation of the equipment.

Before proceeding to start/stop of the equipment, check that all the safety guards and devices are present and in correct working order.

Information

For pivoting units, flexible wiring to electrical connections on the machine is recommended to allow for maintenance.

Section Three: Startup and Operation

Safety Instructions

The equipment is provided with safety devices in areas where it is necessary to clean, check or service the equipment. Do not operate the Machine without the safety devices in operation. The screening's outlet cannot be closed.

1. Only operators who have been trained in safety procedures should be allowed to work on or around this equipment. Exercise caution at all times. Limit access to authorized personnel.
2. In hand mode, avoid rapid successive screen starts/stops.
3. Anyone entering the area should wear adequate safety equipment, such as safety glasses, safety shoes, hard hats, etc. Long hair and loose clothing must be tied back, and jewelry must be removed.
4. Before starting the equipment make sure that all the safety devices are connected and in operation and in as built condition.
5. If the faults do not allow the use of the equipment under full safety conditions, the equipment must be stopped.
6. The equipment can only be used for the purpose for which it was developed.
7. Any modification that can affect the operation of the equipment or the safety condition must be done by WAM North America | Enviro-Care personnel only.
8. WAM North America | Enviro-Care declines all responsibilities for any unauthorized modifications and all the damages caused from those modifications.
9. Do not override the automatic safety devices with manual devices.
10. All the checks, service, etc. operation must be done by authorized and trained/qualified personnel only.
11. Disconnect the power before carrying out any operation or service on the equipment.
12. To avoid any accidental starting of the equipment during inspection, cleaning or servicing of the equipment, the power switch must be in OFF position.
13. The manufacturer declines all responsibilities for any damage to objects and harm to persons caused from the absence and or tampering of safety guards and devices.
14. Periodically check that the safety labels are in good readable condition.
15. Place "Warning" signs in the area of moving parts.
16. Keep all flammable or explosive materials away from the equipment area at all times.
17. Never permit people who have been drinking alcohol, using drugs, taking medication or are otherwise impaired to maintain or repair unit.
18. Inspect equipment frequently for loose bolts or malfunctioning equipment. Fix problems immediately.
19. Do not intervene with material in the conveyor unless the drive is off and power has been locked-out.
20. The helical auger will act as a torsional spring and store a tremendous amount of energy if it becomes caught or jammed in the basket. This could cause serious injury or death if released suddenly. Ensure that no energy is stored in the auger before performing any maintenance on the equipment.
21. It is important that operator safety be stressed. Do not perform maintenance or repairs on moving parts.
22. All the connections must be done by qualified personnel only.
23. The equipment and its components should be properly grounded.

24. When the equipment is operating the personnel must stay at a safe distance from it.

Caution

Do not introduce hands, objects, etc. into the screenings outlet. Suitable notices must be displayed in the area to inform the personnel.

When the equipment is installed in a tank it is mandatory to close the area of the screen basket with a proper cover. If this is not possible it will be necessary to enclose the area with a proper railing system.

Labels and Warnings

The following are labels represent hazards, warnings and information. That may be applied to the machine. Do not remove.

Replace labels if they are not legible.

Contact the manufacturer shown below for replacement. The replacement labels must be applied in the same location on the machine.

Service Department, WAM North America | Enviro-Care
1570 St. Paul Ave.
Gurnee, Illinois 60031
Phone: 815-636-8306, Fax: 815-636-8302

Following are Labels that may be shown on equipment.

a. Residual danger of "high voltage" (yellow and black).
b. Connection to a circuit" (yellow and black).
c. General danger label
d. Residual danger of "crushing" or injury (red and black).
e. Lifting point.

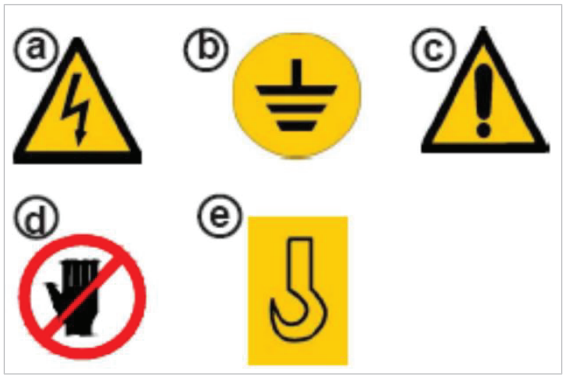

Figure 3-1: Label Icons

Location of Labels and Warnings

Labels may be applied to the machine in locations as indicated in the following figure.

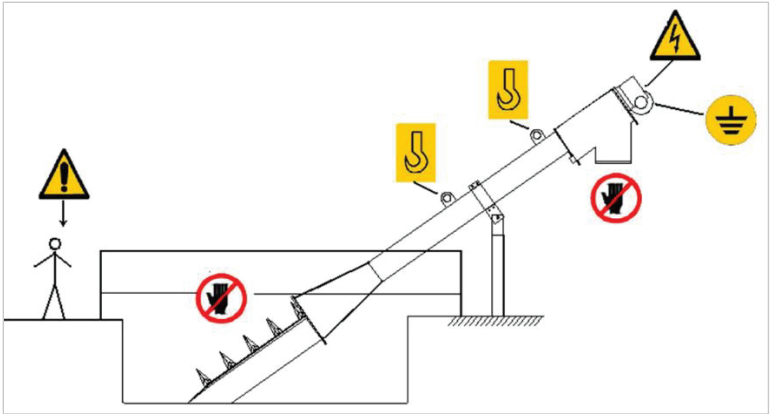

Figure 3-2: GCPC Label Locations

Pre-Startup Instructions

The following is a checklist of items that should be in place and verified as correct prior to the arrival of an Enviro-Care representative, if field service and start-up services have been arranged.

- ☐ Confirm the angle of screen inclination (see assembly drawing(s) for correct angle).
- ☐ Confirm the rubber flaps seal securely against the tank walls.
- ☐ If provided, verify that the ultrasonic level sensor or float switch is installed and wired correctly.
- ☐ If supplied, ensure electrical controls are fully operational.
- ☐ Have wastewater available to witness successful operation of the screen.
- ☐ Carefully read all the OPERATION and MAINTENANCE MANUAL.
- ☐ Check the positioning, the installation and the anchoring of the equipment.
- ☐ Check all the water connections.
- ☐ Check the power supply connections and the cable box: it must be perfectly sealed.
- ☐ Check that the access cover is closed and secured.
- ☐ Check that the direction of rotation of the screw is as per the arrow installed on the equipment.
- ☐ Check that all the safety protection at the inlet and at the outlet are present.
- ☐ Check that all the warning notices are present on the equipment.

Caution

On initial starting, check for conditions that may indicate a faulty functioning such as: vibration, high noise level, irregular rotation, etc.

The above procedure must be applied each time the equipment is starting after a prolonged stop (more than 1 week time).

Field Service Request

Enviro-Care typically requires 2 to 3 weeks' notice to schedule field service personnel for the torque test, installation certification, start-up and training. Advise Enviro-Care of acceptable dates for field service as soon as possible.

Verify all items are ready for inspection (all start-up functions and tests can be performed with temporary power except for confirmation of proper wiring). Any requested changes in the scheduled flight for a field service trip could result in additional charges.

Our field service personnel are to perform the following:

1. Verification of drive unit rotation and lubrication. These procedures are described in the Installation and Lubrication sections of the Operation & Maintenance Manual.
2. Check general clearances and alignments. Verify any installation angles.
3. Confirm proper wiring. This will include any controls or switches.
4. Conduct classroom and field instruction for the facility personnel and the Engineer. Instruction will include operation and maintenance of the equipment. This will take approximately three to four hours. Please schedule with Enviro-Care and advise all necessary facility personnel and the Engineer to attend this instruction.

Equipment Start-Up Request Form

Project Number: **WE217259Z** Requested Date On-Site: / /

Project Name: **Iqaluit WWTP** Alternate Date(s): / /

Contact at Site: _____ Phone / Email: _____

Equipment Type / Model **SPECO Tank Mounted Screen, Model GCPC600**

Yes	No	
☐	☐	Has the mechanical equipment been installed and anchored securely as shown on the General Arrangement Drawings?
☐	☐	Has all mechanical equipment been properly lubricated per Enviro-Care O&M manual (bearings greased, gearboxes filled, remove reducer breather ply O-ring or shipping gasket, etc.)
☐	☐	Have the controls been properly installed and all field wiring completed to the equipment?
☐	☐	Is power available to operate the equipment?
☐	☐	Has all field piping to the equipment (process, washwater supply, air supply, etc.) been completed as shown on the General Arrangement Drawing?
☐	☐	Are all service utilities (washwater, air, etc.) available?
☐	☐	Is all required concrete work complete?
☐	☐	Is process flow available? If flow is not available, Enviro-Care can provide a future trip to adjust equipment for actual operating conditions at an additional charge per our standard field service rate.

We will try to accommodate all requests; however, field service trips are scheduled on a first-come, first-served basis. We encourage you to submit requests with as much advance notice as possible. A **minimum of two weeks notice** is necessary prior to trip departure date to arrange our schedule.

- **Any charges incurred as the result of a customer's request to cancel or change a service trip that has already been scheduled will be added to the invoice.**
- **Any additional time or trips required for Enviro-Care to fulfill the contract obligation as a result of improper or incomplete installation will be added to the invoice.**

Enviro-Care policy requires that startup cannot be performed until payment received is equal to 90% of the contract amount.

Additional field service is available please call to confirm current rates.

I certify and agree that the above items are complete and that the equipment/installation is ready for startup on the requested date

Enviro-Care
A WAMGROUP® Company

Video Agreement Form

This agreement is made this _____ day of _____, 20__, by and between Enviro-Care (hereinafter referred to as “Enviro-Care”), a WAMGroup Company, and _____ _____ (hereinafter referred to as “Owner-Operator”).

In consideration for allowing Owner/operator to videotape Enviro-Care personnel performing maintenance or service, or demonstrating the operation of Enviro-Care supplied equipment, the Owner-Operator and Enviro-Care agree as follows:

1. The videotape is used to aid the Owner-Operator and is not intended to be used as a substitute for safe operating procedure in accord with industry standard(s), training, safety instruction or the operation and maintenance manuals. Enviro-Care assumes no liability for the completeness or accuracy of the videotape alone.

2. Any claim for injury or property damage which arises out of or in connection with the use of the videotape by the Owner-Operator, its employees, or Agents is the sole responsibility of the Owner-Operator.

3. This videotape is for the Owner-Operator’s own use, and the Owner agrees not to sell or transfer the tape to any other party.

4. Upon request, the Owner-Operator must provide Enviro-Care with a copy of the videotape.

5. Owner-Operator must affix the following statement to ALL videotapes and read the following statement at each presentation:

   “THIS VIDEOTAPE IS USED TO AID THE OWNER-OPERATOR AND IS NOT INTENDED TO BE USED AS A SUBSTITUTE FOR SAFE OPERATING PROCEDURE IN ACCORD WITH INDUSTRY STANDARDS, TRAINING, SAFETY-INSTRUCTION OR THE OPERATION AND MAINTENANCE MANUALS. ENVIRO-CARE ASSUMES NO LIABILITY FOR THE COMPLETENESS OR ACCURACY OF THE VIDEOTAPE ALONE.”

6. By signing this, the signer is verifying they understand the above agreement.

Not withstanding the reasonableness of the agreements herein, in the event that a court of competent jurisdiction determines that any part of the agreement be held invalid or unenforceable, the remaining parts shall be valid and enforceable as though the invalid and unenforceable parts had not been included in the agreement.

Start-Up Instructions

1. Ensure components are lubricated in accordance with the lubrication instructions found in the *Maintenance and Parts* section of this manual.
2. Before the equipment is operated, a final mechanical checkout should be performed. Verify:
   - All fasteners are tightened.
   - All moving parts are properly aligned.
   - To ensure that there is no binding or misalignment in the systems, rotate the conveyor slowly by hand, apply power only momentarily, and check for any problems.
3. Initial start-up of the unit;
   - Operate several minutes empty as a break-in period.
   - Observe any abnormal heat build-up, unusual noises, or drive misalignment. Should any of these occur, refer to the Recommended Equipment Maintenance Schedule in the MAINTENANCE section of this manual and take necessary corrective steps.
4. **Begin normal operation**. Do not overload the conveyor. Do not exceed conveyor speed, capacity, material density, or rate of flow for which the conveyor and drive were designed.
5. **Normal operation**: The unit will remove screenings from the waste stream and allow the flow to pass through the screen basket. After a period of time, the screen basket will collect material causing the flow to back up in front of the unit. At this point the level sensor or float switch will start the auger. The screw auger will then run for an adjustable amount of time (typically for 30-60 seconds) to clear screenings from the screen basket and transport them towards the solids discharge. The water level will return to a normal level and the basket will again accumulate screenings.
6. If Enviro-Care has provided controls, refer to control panel drawings in the *Enclosures* section to review all control functions for the supplied equipment.

Section Four: Maintenance and Parts

Equipment Maintenance

1. All fasteners should be checked regularly and tightened as required.
2. Regularly examine all moving parts, including the auger, brushes, and discharge area, to check for excessive wear or misalignment. See maintenance schedule for suggested intervals.
3. Keep the equipment and surroundings clean.
4. Inspect all painted and galvanized surfaces frequently to check for corrosion. Remove any rust found and apply touch-up paint. All painted steel should be inspected once every year and repainted if required.
5. Corrosion may start to appear even on high-grade stainless steels due to external rust or rust films, dirt, chemical or similar residues that settle on the surface and corrode. Dirty stainless steel surfaces should be cleaned regularly as part of regular maintenance. Stainless steel surfaces should be treated with Stainless Shine™ surface cleaner/protector or an equivalent agent that **does not** contain hydrochloric acid and/or chlorides.
6. If the mechanism is to be shut down for an extended period of time, the appropriate *Storage and Shutdown Precautions* must be followed.
7. The equipment must be routinely lubricated according to the *Lubrication Schedule* and the *Accessory Item* instructions enclosed. **Failure to do so will shorten the lifetime of the equipment and void the equipment warranty.**
8. The equipment should be checked regularly for unusual sounds, irregular motion, or other signs of improper operation. If any of these symptoms are discovered, it must be investigated immediately to determine the source of the problem. The mechanism must not be allowed to operate if such problems exist.

Wastemaster® GCPC Screen Maintenance

Prior to working on equipment, power supply to the motor is to be disconnected in a manner which will disallow anyone from reconnecting power without the knowledge of the person who is performing the maintenance.

1. Divert influent away from the Wastemaster® GCPC screen.
2. Run the screen until solids have been conveyed up the auger and the screen is free from screenings.
3. If maintenance requires pivoting from tank, remove grating and any other interferes that would prevent pivoting.
4. (If supplied with a pivoting leg attachment) Attach lifting devices to the lower lifting eyes of the unit. Loosen one bolt on the top of each support leg bracket so the pins are free to pivot when raising unit out of tank.
5. Pivot the screen.
6. Place beams (wood) across the tank and let lower end of unit rest on these.
7. Perform necessary maintenance.
8. When maintenance is completed, lower the screen carefully into the tank and it operating position.
9. Replace or tighten the bolt on the support leg brackets.
10. Ensure that all side seals contact the tank walls and are tightly sealed.
11. Before putting the unit in operation, perform and inspect in accordance with the start-up procedures.
12. Reconnect power supply to motor.
13. Restore full influent flow to screen.

Replacement of the Cleaning Brushes

Prior to working on equipment, disconnect power supply to the motor that will prevent reconnecting power, without the knowledge of the person who is performing the maintenance.

1. Divert flow away from screen tank.
2. Pivot or orient the screen to a safe and convenient working configuration.
3. Shore up and stabilize the screen.
4. Remove fasteners (01) which connect the brush sectors to the spiral section.
5. Remove old wear shoes (02) (if included) and brush sectors (03) and replace with new wear shoes (if included) and brush sectors.
6. Secure new wear shoes and brush sectors with old fasteners (01), or install new fasteners if required.

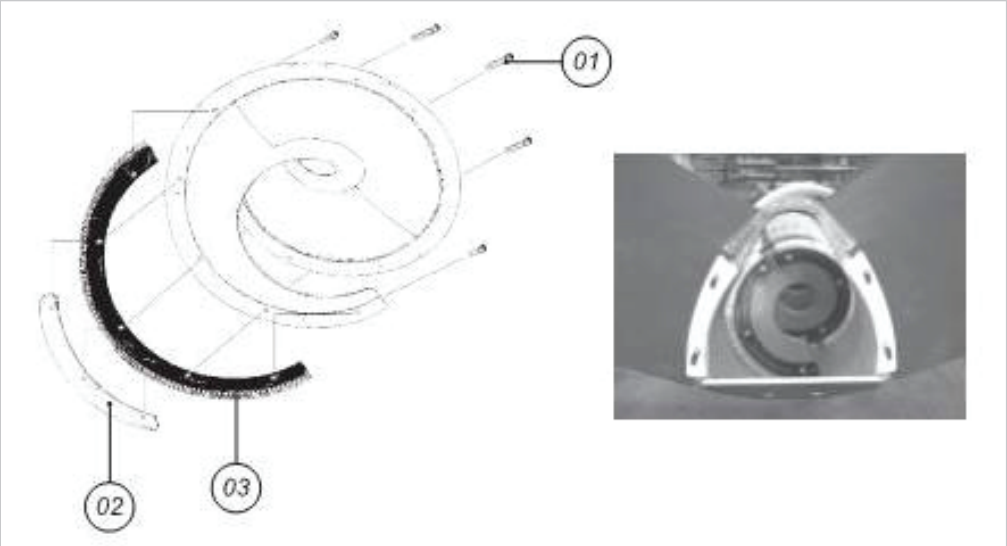

Figure 4-1: Cleaning Brush Assembly

Replacement of the Screen Basket

Prior to working on equipment, disconnect power supply to the motor that will prevent reconnecting power, without the knowledge of the person who is performing the maintenance.

1. Divert flow away from screen tank.
2. Pivot or orient the screen to a safe and convenient working configuration.
3. Shore up and stabilize the screen.
4. Remove fasteners “A” which connect the screen basket to the transport tube.
5. Remove old screen basket “B” and replace with new screen basket “B”.
6. Secure new screen basket to transport tube with existing fasteners, “A”, or new fasteners if required.

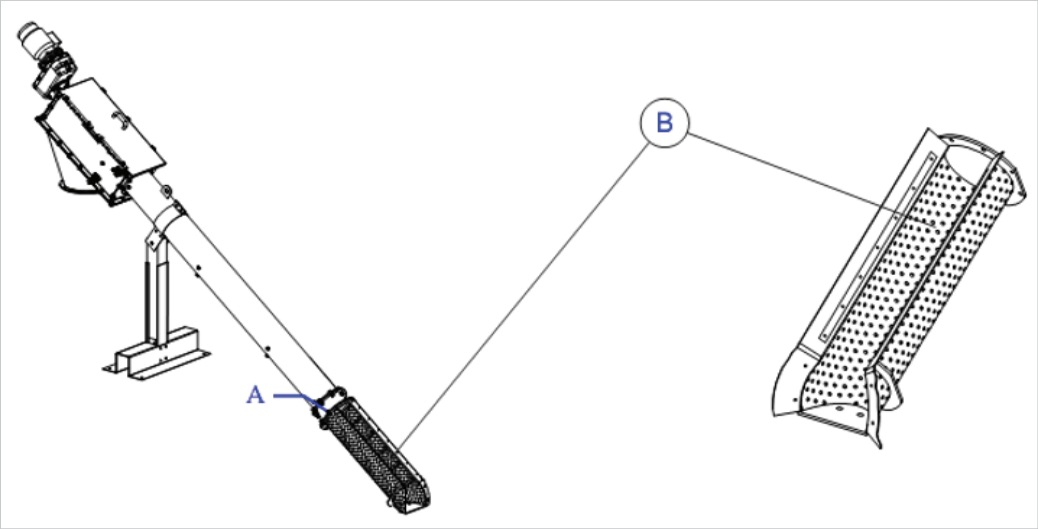

Figure 4-2: Screen Basket

Replacement of the Lateral Flaps on the Basket

Prior to working on equipment, disconnect power supply to the motor that will prevent reconnecting power, without the knowledge of the person who is performing the maintenance.

1. Divert flow away from screen tank.
2. Pivot or orient the screen to a safe and convenient working configuration.
3. Shore up and stabilize the screen.
4. Remove fasteners “A” which connect the elastomer flaps to the screen basket.
5. Remove the flat bar, “B” and the elastomeric flaps, “C” and replace the old elastomeric flaps.
6. Secure new elastomer flaps to the screen basket by replacing the flat bar, “B” and tightening with existing fasteners, “A”, or new fasteners if required.

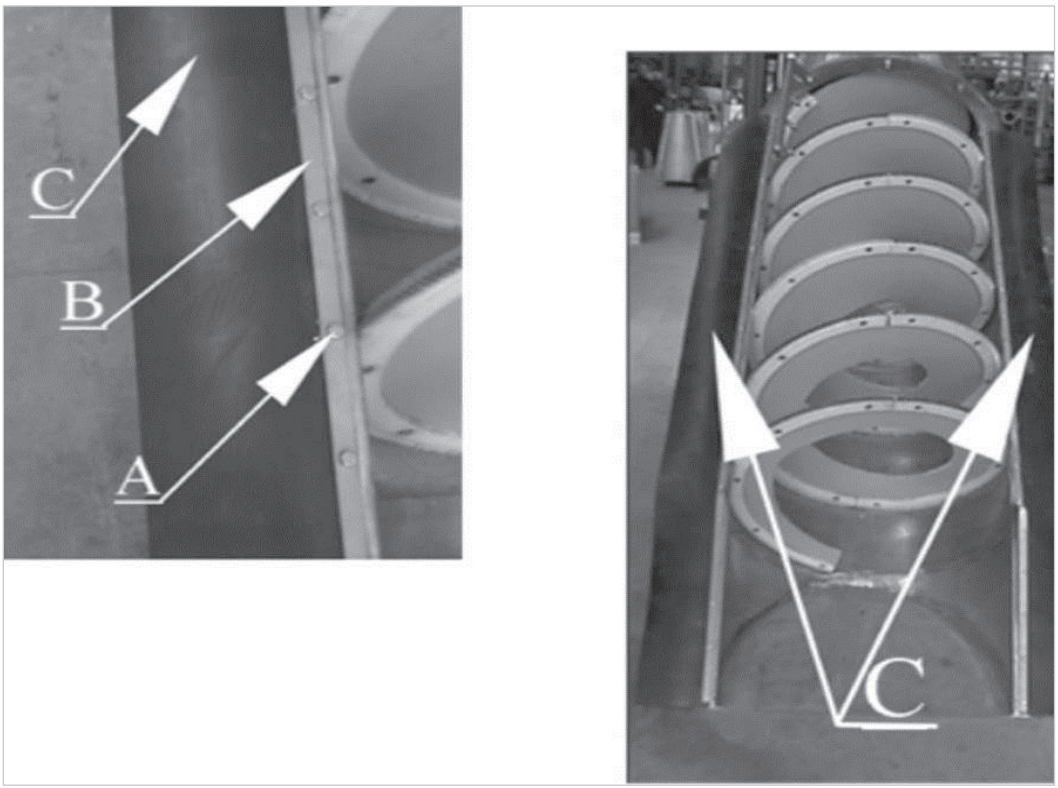

Figure 4-3: Lateral Flaps

Replacement of Wear Bars

Prior to working on equipment, disconnect power supply to the motor that will prevent reconnecting power, without the knowledge of the person who is performing the maintenance.

Wear bars ensure correct movement of shaftless auger and are located in the screen transport tube.

1. Remove the screen basket as described in previous section.
2. Remove blades (fixed and spinning) from the upper box of the screw screen compacting conveyor. (see Figure 4-4)

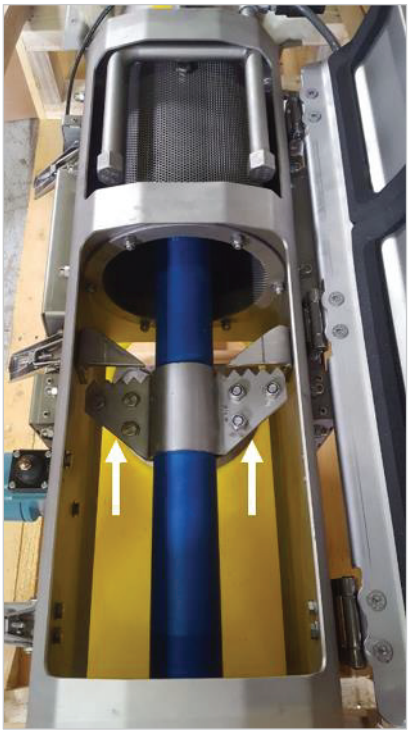

Figure 4-4: Blades to be removed in compaction zone

3. Disconnect the auger shaft from the gear reducer by removing shaft retainer bolt and washer. (see Figure 4-5) If there is a protective cover over the bolt, remove cover first. (see Figure 4-6)

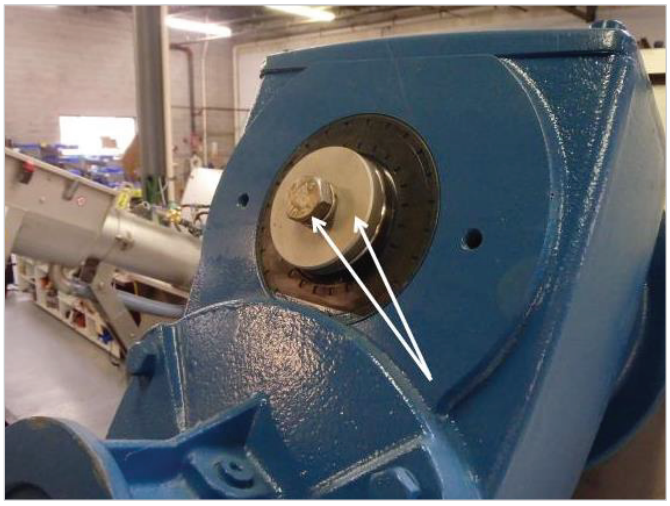

Figure 4-5: Shaft retainer bolt and washer

Figure 4-6: Shaft retainer bolt cover (if included)

4. Extract the auger. Ensure that during extraction the auger doesn't bend; it may cause permanent deformations of the auger shape.

Figure 4-7: Auger removal

5. Replace the wear bars. Take special care not to overtighten the bolts.
6. For assembly, carry out the steps described above in reverse order.

Replacement of Reducer

For the replacement of reducer and support weight of reducer prior to disconnecting.

1. Disconnect all electrical wires from the motor 1. Take special care not damage the internal parts of the machine, especially the brushes located at zone 2.

Figure 4-8: Preparation for reducer removal

2. Secure the auger to prevent movement of auger when reducer is disconnected.
3. Disconnect the auger shaft from the gear reducer by removing the shaft retainer bolt and washer. (see Figure 4-9) If there is a protective cover over the bolt, remove cover first. (see Figure 4-10)

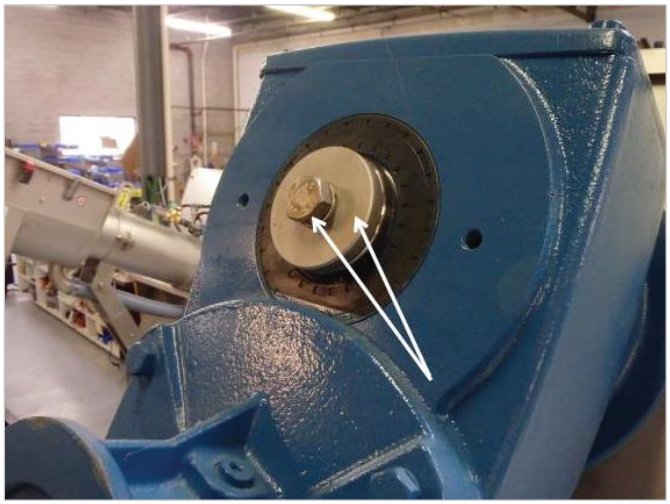

Figure 4-9: Shaft retainer bolt and washer

Figure 4-10: Shaft retainer bolt cover

4. Remove bolts to disconnect reducer from transport tube end plate. (see Figure 4-11)

Figure 4-11: Reducer to end plate fasteners

5. Disconnect the motor from reducer.
6. Replace the reducer.

7. Install motor as follows:

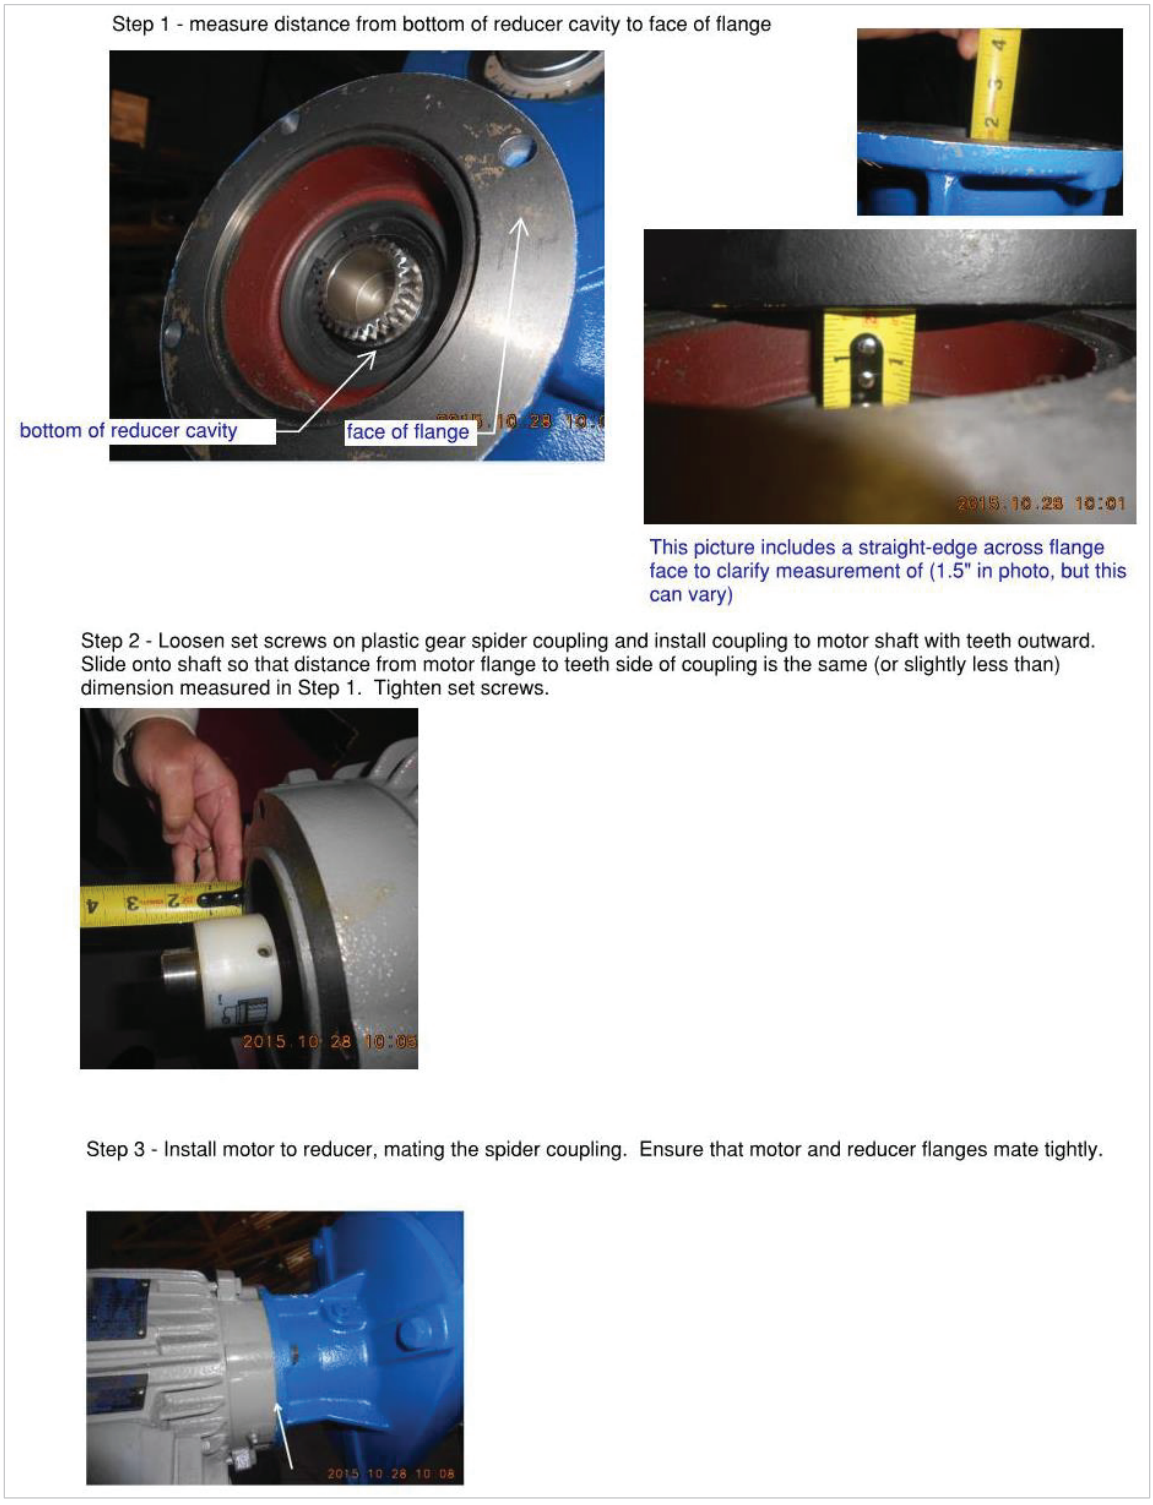

Figure 4-12: Motor installation steps

8. Perform above steps in reverse order to reassemble screen. Ensure all tools are removed from equipment prior to putting it back in service.

Recommended Equipment Maintenance Schedule

Description	Check For	Interval	Action	Tools
Screen Basket	Clogging	Daily		
Screenings Discharge	Clogging	Daily		
Liquid Return Pipe	Clogging	Daily		
Spray Wash	Clogging of Nozzles	Weekly		
Compaction Zone	Clogging & Cleanliness	Weekly		
Screw, Reducer & Motor	Vibration & Noise	Monthly	Repair or Replace	Wrench
Brushes	Wear	100 hours	Replace (if required)	Wrench
Screen Basket	Wear	100 hours		
Fasteners	Tightness	100 hours	Tighten	Wrench
Wear Bars	Wear	3 months	Replace (if required)	Wrench
Reducer	Lubrication	Yearly	Lubricate (if required) (See *Accessory Equipment* section)	Wrench
Motor	Lubrication	Yearly	Lubricate (if required) (See *Accessory Equipment* section)	Wrench, Screwdriver

- If the mechanism is to be shut down for an extended period of time, the **Storage and Shutdown Precautions** must be followed.
- The equipment must be routinely lubricated according to the schedule on the following page and the accessory item instructions enclosed. **Failure to do so will shorten the lifetime of the equipment and void the equipment warranty.**
- The equipment should be checked regularly for unusual sounds, irregular motion, or other signs of improper operation. If any of these symptoms are discovered, it must be investigated immediately to determine the source of the problem. The mechanism must not be allowed to operate if such problems exist
- Inspect all painted and galvanized surfaces frequently to check for corrosion. Remove any rust found and apply touch-up paint. All painted steel should be inspected once every year and repainted if required.
- Regularly examine all wearing parts, including the conveyor, wear bars and screening basket cleaning brushes, to check for excessive wear or misalignment. See **Recommended Equipment Maintenance Schedule** for suggested intervals.

Lubrication Schedule

Description	Lube Type	Fill Amount	Check / Change
Gear Reducer	Mobil SHC 630, or equivalent	7.08 Quarts 6.70 Liters	Yearly
Motor	See specific motor cutsheet	See specific motor cutsheet	See specific motor cutsheet

Equipment Troubleshooting Guide

Symptoms	Cause	Remedy
Spiral does not turn	No power to motor	Check motor troubleshooting guide
	Motor coupler	Install new motor coupler
	Jammed spiral	Check overload and overcurrent device. Check reset pushbutton
Screen does not handle flow rate	Spiral not operating	Inspect screen for large obstructions
	Solids plugging screen basket	Replace brushes
	Confirm downstream water level is at design level	Confirm hydraulics and consult Enviro-Care if necessary
Not discharging solids	Check rotation direction	Put screen in forward. Reverse leads if necessary
	Plugged discharge	Unplug discharge
Excessive solids in effluent	Side seals not sealing	Replace side seals
	Basket not flush with tank floor	Set screen flush with tank floor
	Screen basket damaged	Replace screen basket
Wet solids discharge	Compaction flush runs too frequently	Adjust time “off” settings. Do not run more than 10 seconds
	Compaction zone drain plugged	Unplug drain

Motor Troubleshooting Guide

Symptoms	Cause	Result	Remedy
Motor does not start	Incorrectly connected	Burnout	Connect correctly per diagram on motor
	Incorrect power supply	Burnout	Use only with correct rated power supply
	Fuse out, loose, or open connection	Burnout	Correct open circuit condition
	Open control circuit	None	Correct open circuit condition
	Rotating parts of motor may be jammed mechanically	Burnout	Check and correct: • Bent shaft • Broken housing • Damaged bearing • Foreign material in motor
	Driven machine may be jammed	Burnout	Correct jammed condition
	No power supply	None	Check for voltage at motor and work back to power supply
Motor starts but does not come up to speed	Incorrectly connected	Burnout	Connect correctly per diagram on motor
	Incorrect power supply	Burnout	Use only with correct rated power supply
	Fuse out, loose, or open connection	Burnout	Correct open circuit condition
	Overload	Burnout	Reduce load to bring current to rated limit. Use proper fuses and overload protection
Motor noisy electrically	Incorrectly connected	Burnout	Connect correctly per diagram on motor
	Incorrect power supply	Burnout	Use only with correct rated power supply
	Fuse out, loose, or open connection	Burnout	Correct open circuit condition
Motor runs hot (exceeds rating)	Incorrectly connected	Burnout	Connect correctly per diagram on motor
	Incorrect power supply	Burnout	Use only with correct rated power supply
	Fuse out, loose, or open connection	Burnout	Correct open circuit condition
	Overload	Burnout	Reduce load
	Impaired ventilation	Burnout	Remove obstruction
	Frequent start or stop	Burnout	• Reduce numbers of starts or reversals • Secure proper motor for this duty
	Misalignment between rotor and stator limitations	Burnout	Realign
Noisy mechanically	Misalignment of coupling or sprocket	Bearing failure, broken shaft, stator burnout due to motor drag	Correct misalignment

Symptoms	Cause	Result	Remedy
	Mechanical imbalance of rotating parts	Bearing failure, broken shaft, stator burnout due to motor drag	Find unbalanced part, then balance
	Lack of or improper lubricant	Bearing failure	Use correct lubricant, replace parts as necessary
	Foreign material in lubricant	Bearing failure	Clean out and replace bearings
	Overload	Bearing failure	Remove overload condition, replace damaged parts
	Shock loading	Bearing failure	Correct causes and replace damaged parts
	Mounting acts as amplifier of normal noise	Annoying noise	Isolate motor from base
	Rotor dragging due to worn bearings, shaft, or bracket	Burnout	Replace bearings, shaft, or bracket as needed
Bearing failure	• Misalignment of coupling or sprocket • Mechanical imbalance of rotating parts • Lack of or improper lubricant • Foreign material in lubricant • Overload	Burnout, damaged shaft, damaged housing	• Replace bearings • Correct misalignment • Find unbalanced part, then balance • Use correct **lubricant**, replace parts as necessary • Clean out and replace bearings • Remove overload condition, replace damaged parts
	Entry of water or foreign material into bearing housing	Burnout, damaged shaft, damaged housing	Replace bearings and shield against entry of foreign material (water, dust, etc.) Use proper motor

Typical Motor Burnout Patterns

Symptom	Caused by	Appearance
Shorted coil	Moisture, chemicals, foreign material in motor, damaged windings	Black or burned coil with remainder of winding good
100% failure	• Overload • Stalled • Impaired ventilation • Frequent reversal or starting • Incorrect power	Equally burned all around winding
Single phase condition	Open circuit in one line. The most common causes are loose connections, one fuse out, loose contact in switch	• If 1800 rpm - four equally burned groups at 90 degree intervals • If 1200 rpm - six equally burned groups at 60 degree intervals • If 3600 rpm - two equally burned groups at 180 degrees
	Note: if Y connected, each burned group will consist of two adjacent phase groups. If delta connected, each burned group will consist of one phase group	
Other	• Improper connection • Ground	Irregular burned groups or spot burns

Storage and Shutdown Precautions

Shutdown of Wastemaster® GCPC Screen

To shut down the Wastemaster® GCPC screen, stop flow to the unit and lock out power to drive. If the conveyor is to be inoperative for a prolonged period of time, operate conveyor until cleared of all material and open drain valve to drain unit of all liquid. This is particularly important when the material conveyed tends to harden or become more viscous or sticky, if allowed to stand for a period of time.

Check that all valves and drains are tightly closed and that the drive is operating normally.

Storing before Installation

It is preferable to store mechanical and electrical items indoors in a dry, well-ventilated enclosure with a temperature as constant as possible. The equipment should also be adequately supported to prevent distortion and undue stresses. It should be at least six inches off the floor.

The following instructions also apply if there is to be a period of time between installation and start-up or between start-up and the equipment going on stream. These steps are required to protect against corrosion and assure operating condition.

Whether stored indoors or outdoors, the following steps should be taken:

Short Term Storage or Shutdown (From 30 to 120 days)

1. Cover with a tarpaulin that allows adequate ventilation, drainage, and inspection access in an area protected against wind, direct sunlight, rain, and snow.

2. At least once a month, re-lubricate all items that are grease lubricated and grease exterior surfaces of all seals. Inspect all of the equipment for signs of corrosion and take corrective steps as required.

3. Control Panels and electrical components must be stored inside a clean, dry location.

Long Term Storage or Shutdown (Over 120 days)

1. In addition to those steps shown under "Short Term", the following steps should be taken whether storage is indoors or outdoors:

2. Periodic checks, frequency dependent upon ambient conditions, must be made of painted surfaces for deterioration of paint. Wide variations in ambient temperatures are conducive to condensation with its resultant oxidation. Steps should be taken to protect the affected surfaces. Increasing ventilation and reducing humidity are frequently required. Where equipment is well covered and protected, inspection doors, covers, etc. should be blocked open slightly to increase ventilation. Relatively small areas and shafts can be coated with a waterproof grease or rust inhibitor.

3. Control Panels and electrical components must be stored inside a clean, dry location.

Dismantling and Disposal of the Equipment

In case of dismantling and disposal of the equipment separate the different kinds of material composing the equipment.

1. The plastic, brushes and seals must be separated and disposed in a proper area.
2. The other parts must be recycled as metallic materials.
3. The oil in the gear reducer must be disposed in a proper area.

Information

The dismantling and disposal of the equipment must be done according to the general safety rules and the local environmental laws.

Gearbox Selection

A number of factors are considered when selecting a gear unit, including gearbox rating, service factor, speed and speed variation, horsepower, thermal capacity, ratio, physical size, ambient conditions and cost. Below are some guideline steps to help aid in the gear unit selection.

1. Determine the speed and/or gear ratio
2. Determine the required power or torque
3. Determine Service Factor
4. Select the basic gearbox type and input
5. Determine the required mounting position
6. Select options
7. Checks – overhung load, thrust load, NEMA motor weight, thermal considerations, and other application considerations

1. Speed and Gear Ratio

The first step in selecting a gear unit is determining the final output speed or speeds you need. This speed is normally described in revolutions per minute (rpm). This output speed or speeds is determined by the input speed to the gear unit divided by its gear ratio. Their relationship is described by the following formulas.

$$\text{i (gear ratio)} = \frac{\text{Input speed [rpm]}}{\text{Output speed [rpm]}}$$

$$\text{Output speed [rpm]} = \frac{\text{Input speed [rpm]}}{\text{i (gear ratio)}}$$

To specify a gear unit, you can identify either gear ratio needed or the output speed (rpm) if the input speed is known.

2. Power and Torque

The second step for selecting a gear unit is the required power or torque needed to power the load. Torque in this catalog is normally expressed in pound-inches [lb-in].

$$\text{Power [hp]} = \frac{\text{Torque [lb-in] x speed [rpm]}}{63025}$$

$$\text{Torque [lb-in]} = \frac{\text{Power [hp] x 63025}}{\text{speed [rpm]}}$$

For a proper selection you must ensure that the motor or other prime mover can produce enough torque or power and that the gear unit has adequate torque or power capacity. You must also consider if the power or torque is specified at the input or output of the gear unit. The Helical-worm gear units have lower efficiency than in-line or bevel gear units, therefore helical-worm products efficiency may need to be considered in the selection.

To specify a gear unit you can identify torque or power.

3. Service Factor or Service Class

In addition to power or torque, service factor must also be considered. A service factor is essentially the ratio of extra capacity in a gear unit compared to the power or torque that is needed to run that application. The goal of selecting a gear unit with extra capacity (service factor) is to provide adequate service life in operation.

One reason to apply a larger service factor is if a unit operates more hours per day. If a unit runs 24 hours per day it should normally have a higher service factor than a unit that runs 8 hours per day if you expect the same calendar life.

A second reason for applying a larger service factor is to cope with a more difficult application. Even if it takes the same power and speed to operate a rock crusher as a fan, the rock crusher needs a stronger gearbox (higher service factor) to give the same operating life as the gear unit powering the fan.

The real question is how to determine the proper service factor for a gear unit in an application. Following are four possible methods.

Customer or User Specification

Many customers will have their own service factor guidelines or specifications.

AGMA Service Factoring

American Gear Manufacturers Association (AGMA) publishes lists of recommended service factors for different applications. These service factor recommendations have been determined form the experience of many gear manufactures and are in AGMA standard 6010. See page 68 for additional detail.

AGMA Service Classes

American Gear Manufactures Association (AGMA) has another method for selecting gear units service factors. AGMA standard 6009 lists many applications by a service class (I, II, III) with class I being the simplest applications and class III being the hardest. These application service classes are associated with a range of service factors by the following table.

AGMA Service Class	Service Factor
I	1.00 to 1.39
II	1.40 to 1.99
III	2.00 and above

In the gearmotors selection table each unit is also classified by an AGMA service class. See page 64 for additional detail.

Selection Information

DRIVESYSTEMS

NORD Mass Acceleration Service Factoring

NORD often uses a calculation based system to properly assign a service factor. This system considers hours of operation per day, the severity of the application and the number of times the equipment is cycled. See page 72 for additional detail.

4. Gearbox Type & Input

NORD gear drives are available in a number of mechanical configurations including:

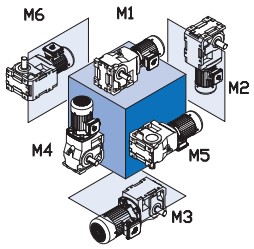
- Helical in-line
- Clincher™ shaft mount
- Right-angle helical-bevel
- Right-angle helical-worm

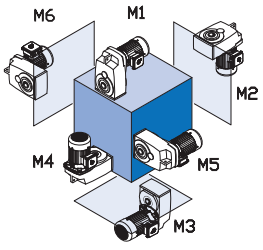
NORD's modular design allows for a number of different inputs to be added to NORD reducers including:

- Integral motor
- NEMA-C and IEC motor adapter
- Solid input shaft
- Servo motor adapter
- Sugar scoop mount
- Top motor mount platform
- NORDISC™ variable speed friction drives
- Titan™ variable speed belt boxes

5. Mounting Position

The gearbox mounting position is an important and often overlooked specification. The mounting position determines how much oil the gear reducer requires, in addition to determining the position of the oil drain, oil fill and vent on the gear drive. NORD offers six basic mounting positions. If your application requires a variation from the six basic mounting positions, please contact NORD.



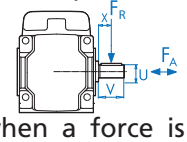


Many gearbox and motor options require a location designation. For example a right-angle helical-bevel unit with a single solid shaft extension requires a shaft extension side location. Please see page 23 for additional options that require location designation.

6. Options

NORD offers a number of mechanical, protective, paint & lubrication options for gear reducers & motors. Please see page 25 for gear unit options & refer to the motor section (Section G) for motor options.

7. Checks



Overhung Load

An overhung or radial load exists when a force is applied at right-angles to a shaft beyond the shaft's outermost bearing. Pulleys, sheaves and sprockets will cause an overhung load when used as a power take-off. The amount of overhung load will vary, depending on the type of power take-off used and where it is located on the shaft.

Overhung load [FQ] can be found in the gearmotor rating tables and input shaft overhung load ratings [FQ1] can be found on pages 58 - 69. Overhung load capacities should not exceed the values in the table to ensure long bearing life. Overhung load capacities are to be applied at the midpoint of the shaft extension and without thrust loads.

To calculate overhung load see page 58.

Thrust Loads (Axial)

Loads that are directed towards or away from the gearbox along the axis of the shaft are called thrust or axial loads. Output shaft thrust capacity [FA] can be found in the gearmotor rating tables. Input shaft capacity [FA1] can be found on pages 68. Thrust load capacities should not exceed the values listed in the tables to ensure long bearing life. Thrust load capacities are listed for pure axial loads with no overhung load. Contact NORD for combination loads or a more exact examination of the application.

NEMA C-face Motor Weight Limits

When mounting a motor to a NORD NEMA C-face motor adapter it is important to consider the motor's weight. Following is a table that includes the maximum motor weight the NEMA adapter can support. If the motor exceeds the listed weight it must be externally supported. When a C-face mounted motor is externally supported care must be taken to ensure that the support system does not impose additional pre-loads on the NEMA motor adapter.

NEMA Weights

Motor FRAME	56C	143TC	145TC	182TC	184TC	210TC

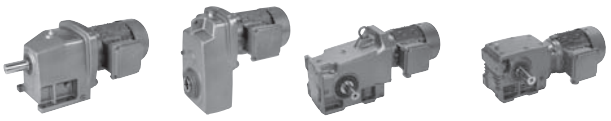
Max Weight [lb]	440	550	770	1100	1540	

Selection Information



Gear Reducer Ratings

The permissible continuous power limit of gear reducers is limited by both the mechanical rating and the thermal rating. The mechanical rating depends upon the material strength of the gear reducer's gears, bearings, housing, shafts, etc. The mechanical input power limit to the reducer is also a function of the mechanical power rating divided by the relevant reducer service factor.

The thermal rating or thermal limit depends upon the amount heat generated within the reducer and is influenced by a variety of factors including:

- Churning or splashing losses in the lubricant which depend upon reducer type, ratio, input style, mounting position or oil fill-level, and the circumferential travel velocities of the gear wheels.
- The actual speed and load conditions. These factors determine load-dependent losses in the gears and frictional losses in the gears, bearings and seal areas.
- Ambient Conditions:
  - Ambient Temperature.
  - Amount of free air circulation around the drive.
  - Possible near-by heat sources.
  - Heat dissipation or the ability of the reducer to transfer heat through the housing, shafts, and the mating sub-structure or mounting surface.

Observing the Reducer's Thermal Limit

When to Contact NORD

Through computer program analysis NORD can evaluate application conditions and the impact they have on a reducer's thermal capacity.

When applying helical in-line, Clincher™ shaft mount, & helical-bevel gear units of case sizes 6 & larger (SK62, SK6282 and SK9072.1 and larger), consult NORD if any two or more of the following conditions apply:

- Gear ratio, $i_{total} \leq 24{:}1$ or $\leq 48{:}1$ for helical-bevel units
- Input power, $P_1 \geq 60$ hp (45 kw)
- Input speed, $n_1 > 1800$
- Vertical positioning (mounting position M2 or M4)
- Input configuration: NEMA C-face, IEC, servo adapter or solid-shaft input (Type-W)
- Elevated ambient temperature ≥ 86° F (30 °C)

When applying helical worm or worm gear units, please consult NORD if one of the following conditions applies:

- Input speed, $n_1 > 1800$
- Vertical positioning (mounting position M2 or M4)
- Input configuration: NEMA C-face, IEC, servo adapter or solid-shaft input (Type-W)
- Elevated ambient temperature ≥ 86° F (30 °C)

Advise NORD of any special application considerations:

- Confined space or limited air circulation
- Exposure to other near-by radiant heat sources
- Dirty or dusty environments
- High altitude operation > 3,280 ft (1000 m) a.s.l.

Dangers of Reducer Overheating

The following problems may result when a reducer's thermal capacity or maximum oil sump temperatures are exceeded:

- Lubrication oxidation, breakdown & deterioration.
- A decrease in lubrication viscosity & film thickness.
- Loss of critical bearing and gear clearances required for proper lubrication.
- Increased contact pressures & increased operating temps. in the critical load zones of the gearing and bearings.
- An increased possibility for metal-to-metal contact and premature component wear.
- A significant reduction in the lubricant's ability to prevent scuffing, pitting, and in extreme cases galling or welding.

Maximum Oil Sump Temperature Limit

To prevent reducer overheating, the reducer's maximum oil sump temperature limit must not be exceeded for prolonged periods of operation (up to 3 hours continuous operation, depending upon reducer size).

Oil Type	Maximum Oil Temperature Limit	
	NORD	AGMA 9005-D94
Mineral	80-85 °C (176-185 °F)	95 °C (203 °F)
Synthetic	105 °C (220 ° F)	107 ° C (225 ° F)

Measures to Expand the Application Range

There are a variety of measures that may be taken in order to protect against thermal overload and expand the application range of the gear reducer. Common examples include the following:

- Recommending a change in lubrication viscosity and/or a specific synthetic lubricant type.
- Applying high-temperature seals.
- Increasing air flow around the gear unit.
- Protecting the reducer from high heat sources.
- Considering an integral motor instead of the bolt-on input assembly covers. In many cases the motor fan will substantially increase air-flow around the gear unit.
- Add an Oil Expansion/Overflow Chamber (Option "OA") or an Oil Reservoir (Option "OT").
- Oil Cooler (Option "OC").
- Water Cooling Cover (Option "WC")

Lubrication

The Importance of Proper Lubrication

Proper gearbox lubrication is essential in order to reduce friction and component wear, and protect against corrosion and rust. Gear lubricants reduce heat and wear by inserting a load-sharing "protective fluid film" between mating parts and preventing direct metal to metal contact. Properly selected lubricants will operate under various film conditions, improve heat transfer, optimize reducer efficiency, absorb shock loads, reduce noise, inhibit foaming, and separate water readily.

Design Considerations

Along with many other factors, the gear designer must consider the type of gearing (helical, bevel, worm, etc.), the gear load and speed conditions, and the expected operating oil temperatures. These factors help determine a generally suitable oil category, a desired additive package, preferred base-oil type, and oil viscosity.

It is important that the consumer be aware of these many design factors before making any changes in the critical areas (oil category, base-oil type, viscosity, etc.) One should consult their preferred lubrication supplier or NORD Gear when questions arise.

Gear Oil Types, Categorized by Base Oil

Mineral Oil with an EP Additive (DIN 51517, Type CLP)

High performance mineral gear oils are carefully engineered and manufactured to improve aging characteristics, minimize friction, offer good wear protection, provide corrosion and oxidation resistance, minimize foam, and separate water. Mineral gear oils are classified as API Group I or II oils, depending upon viscosity.

The standard NORD mineral gear oil has an extreme pressure (EP) additive ISO Viscosity Grade EP220 (AGMA 5 EP) and is generally acceptable for helical and helical-bevel gear units. Good quality mineral oil should have the ability to operate at moderate sump temperatures (up to 80-85 °C) without losing viscosity or thickness. A minimum viscosity index (VI) of 93 or higher is suggested. The oil must also have good film strength to handle shock loads, high torque, and start-up conditions. A minimum FZG Scuffing Load Stage 12 is desirable.

Advantages:

- Most economical of all the gear oil types.
- Generally offers good compatibility with shaft seals, gaskets, paint finishes, etc.
- Offers good corrosion and oxidation protection.
- Effectively reduces internal friction and wear.

When Synthetic Oils Are Used

Synthetic gear oils are suggested when mineral gear oils have reached their performance limit or when they no longer meet certain application requirements. NORD may recommend synthetic oil for any one of the following conditions:

- Severe duty applications or when gears are exposed to frequent starts and stops, high-load or shock.
- For applications in low or high temperature service.
- To extend oil service interval requirements.
- To eliminate the necessity for seasonal oil changes.
- To extend service life of factory-sealed or maintenance-free gear units.
- To take advantage of performance benefits: shear resistance, low traction coefficient, reduced internal friction, improved lubricity, reduced operating temperatures, improved gear efficiency, etc.

Performance Advantages of Synthetic Oil

Compared to mineral oils, synthetic oils provide a number of performance advantages including:

- Ability to operate at higher temperatures without losing viscosity or thickness, due to a much improved viscosity index.
- Improved low-temperature stability due to a lower pour point
- Increased oil change intervals due to superior oxidative and wear resistance
- Lower tendency to form residues and increased resistance to foaming.
- Other benefits may include: very good shear resistance, low traction coefficient, reduced internal friction, improved lubricity, reduced operating temperatures, improved gear efficiency, and extended component life and wear protection.

When application conditions warrant the use of synthetic oil, NORD may suggest a particular type of synthetic oil, depending upon the gear unit type and the application.

Lubrication

Synthetic Hydrocarbon/Polyalphaolefin (SHC/PAO) Oil (DIN 51517, Type CLP-HC)

Synthetic Hydrocarbons (SHC) or Polyalphaolefin (PAO) synthetic base oils offer good miscibility with mineral base oils and are very readily available. SHC/PAO oils are classified as API Group IV oils. The can be formulated with or without anti-wear (AW) or extreme pressure (EP) additives. They can also be formulated for acceptance in food-grade applications.

Advantages:

- Higher viscosity index and therefore greater high-temperature stability than mineral oil.
- Better low-temperature stability and lower pour point than mineral type gear oils
- High surface tension and lower tendency to foam compared to mineral oil, and water-soluble polyglycol gear oils.
- Compatible (miscible) with mineral oil.
- Better water seperability demulsibility than PG oils.

Polyalkylene Glycol or Polyglycol Synthetic Oil (DIN 51517, Type CLP-PG)

Polyalkylene glycol or polyglycol (PAG or PG) synthetic gear oils are made readily available through many lubrication suppliers. PG oils are classified as API Group V gear oils. They can also be formulated for acceptance in food-grade applications.

PG gear oils possess extremely low traction coefficients and a viscosity index higher than any of the other synthetics (often greater than 220 VI), resulting in excellent heat resistant, shear stability, and natural anti-wear properties.

Typical PG gear oils are formulated with a 1:1 or higher ratio of ethylene oxide to propylene oxide (50:50 or 60:40 is common); this makes PG gear oils water soluble, providing them with very good corrosion resistance even when water is present in concentrations that are higher then what is normally allowed.

Advantages:

- PG oils offer the highest viscosity index of any other synthetic resulting in excellent heat resistant, shear stability, and superior natural anti-wear properties without requiring EP-additives.
- PG gears oils minimize internal friction and often result in improved gear efficiency.
- PG oils have significantly higher film strength than mineral and SHC/PAO oils and out perform these oils at higher operating oil temperatures (approaching 80°C or higher).

⚠ CAUTIONS ⚠

Polyglycol (PG) oils are not miscible with other oil types and should never be mixed with mineral oil, hydrosynthesized synthetic or PAO synthetic oils.

Food-Grade Lubricants

Food-grade lubricants should be manufactured in compliance with FDA 212 CFR 178.3570 and should either satisfy the former 1998 USDA Guidelines as an H1 lubricant or currently qualify as a NSF-H1 lubricant. Please consult with lubrication manufacture for more information or visit www.nsf.org

H1 food grade oil can only contain additives which appear on the FDA "approved list" for food safe compounds. H1 oils are generally absent of common zinc-based AW additives, and sulfur-phosphorus based, EP chemistries, commonly found in many industrial gear oils.

Food manufactures control risk and liability by following detailed guidelines outlined by the HACCP (Hazard Analysis and Critical Control Point) program, which includes food-grade H1 lubricants.

Food grade H1 lubricants may be formulated as highly refined mineral oils (white oils), SHC/PAO synthetic oils or PG synthetic oils.

The highly refined nature of good-quality food-grade white-oils provides good long-term oxidative stability and in most cases adequate lubrication under high-load (boundary) conditions. So long as food-grade white oils meet the minimum anti-wear requirements of the normally specified non-food grade oil, they are often acceptable.

Both food-grade white oils and PAO's have an inherent "purity" and absence of polar compounds, making them better than the average mineral oil or even PG oil in terms of demulsibility (water seperability).

Compared to food-grade white-oils, food-grade synthetic PAO or PG oils typically provide:

- Better wear and oxidation resistance.
- Improved high-temperature characteristics.
- Better cold-temperature behavior.

Lubrication

The Importance of Oil Viscosity

Viscosity or the oil's resistance to shear under load, is often considered the single most important property of any gear oil.

NORD Gear Designers have selected the most appropriate ISO viscosity grade of oil, for each type or class of gear reducer. Gear oil viscosity is selected by assuming typical ambient conditions, at rated speed and load conditions.

Important Considerations:

- The correct viscosity selection helps provide proper lubrication and assures that a minimum film thickness is maintained between interacting surfaces.
- The degree to which viscosity changes with temperature or the viscosity index, varies from oil to oil, and depends upon the type of lubricant and additive agents used.
- Selecting too low of a viscosity can result in mixed-boundary (partial metal-to-metal contact) or boundary lubrication (full metal-to-metal contact) conditions, in creasing internal friction heat build-up and wear.
- Selecting too high of a viscosity results in increased churning and squeezing losses in the load zone and excessive heat (especially when peripheral gear speeds are high); Ultimately, this causes the oil temperature to rise and the viscosity to go down, decreasing the effectiveness of the lubricant.

Considering an Oil Viscosity Change

There are three primary reasons to consider a lubrication viscosity change as follows:

1. Low temperature gear oils should be selected so that the pour point is at least 9°F (5°C) lower than the expected minimum ambient temperature. In extreme cases, consider a lower ISO Viscosity rating and test the critical performance of the gear box under cold start-up.

2. High temperature applications may require an increase in the lubricants viscosity to assure proper lubrication conditions in the critical load zones of the gear unit. NORD also recommends switching to synthetic oil if oil sump temperatures exceed 176-185 °F (80-85 °C).

3. In cases of extreme load conditions, gear pairs and antifriction bearings may be more susceptible to scuffing wear. In these operating conditions, it may be beneficial to consider an increased lubrication viscosity and/or lubrication with improved antiwear additive packages.

NORD recommends that the user consult with their primary lubrication supplier when considering changes in oil viscosity.

Maximum Oil Sump Temperature Limit

To prevent reducer overheating, the reducer's maximum oil sump temperature limit must not be exceeded for prolonged periods of operation (up to 3 hours continuous operation, depending upon reducer size).

Oil Type	Maximum Oil Temperature Limit	
	NORD	AGMA 9005-D94
Mineral	80-85 °C (176-185 °F)	95 °C (203 °F)
Synthetic	105 °C (220 ° F)	107 ° C (225 ° F)

Lubrication

Lubrication Types

Proper gearbox lubrication is essential in order to reduce friction, heat, and component wear. Lubricants reduce heat and wear by inserting a protective "fluid boundary" between mating parts and preventing direct metal to metal contact. Lubricants also help prevent corrosion and oxidation, minimize foam, improve heat transfer, optimize reducer efficiency, absorb shock loads and reduce noise.

Mounting position not only determines the proper fill-level but may also have some effect on final reducer assembly. If considering any mounting positions that are not shown as catalog-standard options, it is critical that the customer consult with NORD prior to ordering. Unless otherwise specified, NORD supplies most all gear units (*) factory-filled with the standard lubrication type and the appropriate amount of lubricating oil.

* Gear units SK10282, SK10382, SK11282, SK11382, SK12382, and SK9096.1 are supplied without oil.

Standard Oil Lubricants

Gear Unit Type	Ambient Temperature	Oil Type	ISO Viscosity	Manufacturer Brand / Type
Helical-Inline, Parallel-Shaft, & Helical-Bevel	-4 to 104 °F (-20 to 40 °C)	MIN-EP	VG 220	Shell / Omala 220 ♦
	-40 to 140 °F (-40 to 60 °C)	PAO	VG 220	Mobil SHC 630 ♦
	23 to 104 °F (-5 to 40 °C)	FG	VG 220	Shell / FM 220 ♦
Helical-Worm	-22 to 122 °F (-30 to 50 °C)	PAO	VG 680	Mobil SHC 636 ♦

Optional Oil Lubricants

Gear Unit Type	Ambient Temperature	Oil Type	ISO Viscosity	Manufacturer Brand / Type
Helical-Inline, Parallel-Shaft, & Helical-Bevel	-31 to 176 °F (-35 to 80 °C)	PAO	VG 460	Mobil SHC 634
	-40 to 77 °F (-40 to 25 °C)	PAO	VG 150	Mobil SHC 629
	-40 to 140 °F (-40 to 60 °C)	FG-PAO	VG 220	Shell / Cassida GL 220
Helical-Worm	-40 to 122 °F (-40 to 50 °C)	FG-PAO	VG 460	Shell / Cassida GL 460

Standard Bearing Grease Lubricants

Grease Type / Thickener	Ambient Temperature	NLGI Grade	Manufacturer Brand / Type
Standard (Li-Complex)	-22 to 140 °F (-30 to 60 °C)	NLGI 2	Shell Albida EP LC2 ♦
High Temp (Polyurea)	-13 to 176 °F (-25 to 80 °C)	NLGI 2	Mobil Polyrex EP 2 ♦
Food-Grade (Al-Complex)	-13 to 104 °F (-25 to 40 °C)	NLGI 2	Mobil Grease FM 222 ♦

♦ Stocked Lubricant

Oil Formulation Codes

MIN-EP	Mineral Oil with EP Additive
PAO	Synthetic Polyalphaolefin Oil
PG	Synthetic Polyglycol Oil
FG	Food-Grade Oil
FG-PAO	Food-Grade, Synthetic Polyalphaolefin Oil

Important Notes

- In worm gears avoid using (EP) gear oils that contain sulfur-phosphorous chemistries, as these additives can react adversely with bronze worm gears and accelerate wear.
- Food grade lubricants must be in compliance with FDA 212 CFR 178.3570 and qualify as a NSF-H1 lubricant. Please consult with lubrication manufacture for more information.
- When making a lubrication change, check with the lubrication supplier to assure compatibility and to obtain recommended cleaning or flushing procedures.
- Do not mix different oils with different additive packages or different base oil formulation types. Polyglycol (PG) oils are not miscible with other oil types and should never be mixed with mineral oil, or Polyalphaolefin (PAO) oil.
- Please Consult NORD if considering cold-temperature oils below an ISO Viscosity VG100 or lower.

HELICAL & BEVEL REDUCER LUBRICATION

1. Importance of proper lubrication

Proper gearbox lubrication is essential in order to reduce friction, heat, and component wear. Lubricants reduce heat and wear by inserting a protective "fluid boundary" between mating parts and preventing direct metal to metal contact. Lubricants also help prevent corrosion and oxidation, minimize foam, improve heat transfer, optimize reducer efficiency, absorb shock loads and reduce noise.

Most NORD reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position.

2. Standard oil type

The following tables indicate the standard oil fill type used. Please see user manual U11000 for more specific information and for optional helical and bevel gear lubricants:

Serviceable Gear Units	
Helical In-line	Standard Oil Fill: ISO VG 220, Mineral Oil
Clincher Parallel-Shaft	
Right-Angle Bevel	
NORDBLOC® Series In-line	
NORDBLOC®.1 Series In-line	
Standard Series In-line	

IMPORTANT NOTE

For shipping purposes, the following large Clincher™ gear units are supplied without oil:
• Clincher™ Sizes SK11282, SK11382 and SK12382

Maintenance-free / Lubricated For Life Gear Units	
Clincher™ sizes SK0182NB, SK0282NB & SK1382NB	Standard Oil Fill: ISO VG220 SHC/PAO Synthetic Oil
NORDBLOC® Sizes SK172, SK272, SK371F, SK372, SK373, SK320	

IMPORTANT NOTE

Maintenance-free units are supplied as sealed units with no vent-plug. Consult NORD prior to ordering if interested in ordering any of the above sizes as serviceable gear units.

IMPORTANT NOTE

Consult the sticker adjacent to the fill plug to determine the type of lubricant installed at the factory. Some units have special lubricants designed to operate in certain environments or intended to extend the service life or service temperature range of the lubricant. If in doubt about which lubricant is needed for a certain application, please contact NORD Gear.

3. Lubrication replacement

If the gear unit is filled with mineral oil, the lubricant should be replaced at least after every 10,000 operating hours or after every two years. If the gear unit is filled with synthetic oil, the lubricant should be replaced at least after every 20,000 operating hours or after every four years. Often gear reducers are exposed to extreme ambient conditions, hostile environments, wet conditions, or dirty and dusty operating areas. Especially in these situations, it is important to establish a condition-based oil service interval.

4. Oil viscosity

Viscosity, or the oil's resistance to shear under load, is often considered the single most important property of any gear oil.

- Often one will consider making a viscosity correction to the oil to improve the performance when operating the gear unit at low temperature or high temperature.
- In cases of extreme load conditions, gear pairs and antifriction bearings may be more susceptible to sliding or scuffing wear. In these operating conditions, it may also be beneficial to consider an increased lubrication viscosity and/or a lubrication with improved antiwear additive packages.

IMPORTANT NOTE

The user should consult with their primary lubrication supplier before considering changes in oil type or viscosity.

5. Maximum oil sump temperature limit

To prevent reducer overheating, the reducer's maximum oil sump temperature limit must not be exceeded for prolonged periods of operation (up to 3 hours continuous operation depending upon reducer size).

Oil Type	Maximum Oil Temperature Limit	
	NORD	AGMA 9005-D94
Mineral	80-85°C (176-185°F)	95°C (203°F)
Synthetic	105°C (220°F)	107°C (225°F)

IMPORTANT NOTE

Use caution when specifying gear reducers for high temperature service. If there is concern about exceeding the allowable safe operating temperatures, please consult NORD to discuss alternatives.

HELICAL & BEVEL REDUCER LUBRICATION

6. The importance of routine oil analysis

Routine oil analysis, sound lubrication practices, and good tracking of oil performance trends will help establish proper lubrication maintenance and change-out intervals. To maximize equipment reliability, NORD Gear generally recommends a condition-based lubrication maintenance program. One may take exceptions to this general recommendation on sealed-for-life or maintenance-free gear units or smaller and less costly gear units. In these instances, the replacement cost of the gear unit is often small compared to the costs associated with this type of oil analysis program.

HARMFUL SITUATION

NORD suggests replacing the gear oil if oil analysis indicates any of the following:

- Viscosity has changed by approximately 10% or more.
- Debris particles (silicon, dust, dirt or sand) exceed 25 ppm.
- Iron content exceeds 150-200 ppm.
- Water content is greater than 0.05% (500 ppm).
- The total acid number (TAN) tests indicate a significant level of oxidative break-down of the oil, and a critical reduction in performance; If the TAN number measured changes by more than 5% over the new oil, then an oil change would be recommended.

7. Mounting position and oil fill quantity

All NORD Gear reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position. ***For additional information, please see the seperate mounting position diagrams and the corresponding oil fill quantity tables for the specified gear unit.***

The gearbox nametag will indicate the mounting position that was provided. ***For mounting orientations other than shown in the mounting position charts, please consult NORD Gear.***

HARMFUL SITUATION

Actual oil volume can vary slightly depending upon the gear case size, mounting and ratio. Prior to commissioning the reducer, check the oil-fill level using the reducer's oil-level plug and drain or add additional oil as needed.

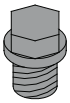
8. Oil plug locations

All gear units are assembled with the oil fill-level, oil-drain and vent plugs installed in their proper locations, according to the specified mounting position. All standard plugs are metric and utilize sealing gaskets between the head of the plug and the reducer housing.

9. Drain and fill-level plugs

All reducer drain plugs are metric socket head cap screws. For easier identification, it is NORD's standard practice to provide a hex-head screw for the fill-level plug. For ease of draining the used oil from the gear reducer, use the socket head screw located at the lowest part of the gearbox.

Drain Plug



Fill Level Plug

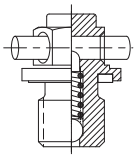
10. Vent plug locations

Reducer venting allows for air pressure differences that occur during operation, between the inner space of the reducer and the atmosphere, while ensuring leak-free operation. The AUTOVENT™ is standard for all vented gear units, unless otherwise noted.

AUTOVENT™ - The AUTOVENT™ helps prevent bearing and gear damage by behaving like a check valve to block the entry of foreign material (water, dust, corrosives, etc.). The breather opens at approximately 2-3 psi during operation and closes tightly as the gearbox cools. This option is perfect for humid conditions and wash-down environments, helping to maintain proper oil cleanliness, and reducing foaming and oxidation. NORD may choose to offer one of two style options as shown in Figure 1. The Type 2 AUTOVENT™ comes closed upon delivery with a transportation sealing plug (see Warning).

Figure 1 AUTOVENT™ Types

Type 1

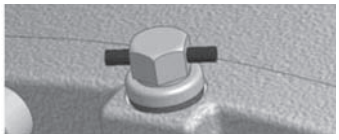


Type 2 with transportation plug

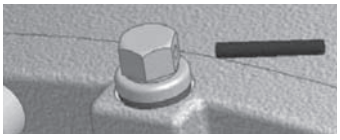
Open Vent - An optional open vent can be supplied by NORD. The open vent comes closed upon delivery with a transportation sealing plug (see Warning).

WARNING

To prevent build-up of excessive pressure, sealed vents must be activated as shown prior to gear unit start up.



Sealed vent



Activated vent

Filtered Vent - NORD may offer an optional filtered vent, which allows gases to permeate, but does not allow dust and debris to pass through the vent.

HELICAL & BEVEL REDUCER LUBRICATION TYPES

Lubrication Tables – Helical and Bevel Gear Units

Standard Oil Lubricants

ISO Viscosity	Oil Type	Ambient Temperature Range	Manufacturer Brand / Type
VG220	MIN-EP	0 to 40 °C (32 to 104 °F)	Mobil / Spartan EP220 ♦ ❶
	PAO	-35 to 60 °C (-31 to 140 °F)	Mobil / SHC630 ♦ ❷

NLGI 2	Standard / Li-Complex	-30 to 60 °C (-22 to 140 °F)	Mobil Grease XHP222 ♦ ❶
	High-Temperature / Polyurea	-25 to 80 °C (-13 to 176 °F)	Mobil Polyrex EP 2 ♦ ❷
	Food-Grade / Al-Complex	-25 to 40 °C (-13 to 104 °F)	Mobil Grease FM222 ♦

♦ Stocked Lubricants

❶ Standard product on serviceable gear units

❷ Standard product on maintenance free gear units

IMPORTANT NOTES

- The "Ambient Temperature" is intended to be an operation guideline based upon the typical properties of all the lubricant. The viscosity and other properties of the lubricant change based upon load, speed, ambient conditions, and reducer operating temperatures. The user should consult with their lubrication supplier & NORD gear before considering changes in oil type or viscosity.
- To prevent reducer overheating, observe the maximum operating oil temperature limits:
  Mineral Oil: 80-85 °C (176 – 180 °F).
  Synthetic Oil: 105 °C (225 °F).
- In the following instances, please consult NORD for specific recommendations:
  - √ Gear units will operate in high ambient temperature conditions exceeding 40 °C (104 °F).
  - √ Gear units will operate in cold ambient temperature conditions approaching 0 °C (32 °F) or lower.
  - √ Lower than an ISO VG100 viscosity oil is being considered for a cold-temperature service.
  - √ Fluid grease is required for lubricating the gear unit.
- Observe the general lubrication guidelines outlined in user manual U10750.

Oil Formulation Codes

MIN-EP - Mineral Oil with EP Additive
PAO-EP - Synthetic Polyalphaolefin Oil with EP Additive
PAO - Synthetic Polyalphaolefin Oil
PG - Synthetic Polyglycol Oil
FG - Food-Grade Oil
FG-PAO - Food-Grade, Synthetic Poyalphaolefin Oil
FG-PG - Food-Grade, Synthetic Polyglycol Oil

Lubrication Notes

- Avoid using (EP) gear oils in worm gears that contain sulfur-phosphorous chemistries, as these additives can react adversely with bronze worm gears and accelerate wear.
- Food grade lubricants must be in compliance with FDA 212 CFR 178.3570 and qualify as a NSF-H1 lubricant. Please consult with lubrication manufacturer for more information.
- When making a lubrication change, check with the lubrication supplier to assure compatibility and to obtain recommended cleaning or flushing procedures.
- Do not to mix different oils with different additive packages or different base oil formulation types. Polyglycol (PG) oils are not miscible with other oil types and should never be mixed with mineral oil or polyalphaolefin (PAO) synthetic oil.

90.1 HELICAL-BEVEL FLANGED OIL FILL QUANTITIES

90.1 Helical-bevel flanged lubrication

Unless otherwise noted below, the following NORD Gear reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position. For additional information, please refer to the "Oil Plug & Vent Locations" documentation for your gear unit.

HARMFUL SITUATION

Actual oil volume can vary slightly depending upon the gear case size, mounting and ratio. Prior to commissioning the reducer, check the oil-fill level using the reducer's oil level plug and drain or add addition oil as needed. The minimum acceptable oil level is 0.15 in (4mm) below the oil level hole.

For mounting orientations other than shown please consult NORD Gear. Reducer modifications may be required.

Oil Levels shown apply to base models and gear units ending in AZ, AF, VZ, & VF.

90.1 HELICAL-BEVEL OIL PLUG & VENT LOCATIONS

Oil plug connections

Prior to commissioning the reducer, check the oil-fill level using the reducer's oil-level plug and drain or add additional oil as needed. The minimum acceptable oil level is 0.15 in (4mm) below the oil level hole. ***For mounting orientations other than shown please consult NORD Gear. New plug locations may be required.***

Troubleshooting

This section identifies some of the most common issues involved with NORD Gear speed reducers , and provides recommendations to assist you in defining and answering your questions as you work with our products. You may also contact our Engineering/Application departments if your questions are not answered in the table below.

Problem With the Reducer		Possible Causes	Suggested Remedy
Runs Hot	Overloading	Load exceeds the capacity of the reducer	Check rated capacity of reducer, replace with unit of sufficient capacity or reduce the load.
	Improper lubrication	Insufficient lubrication	Check lubricant level and adjust up to recommended levels
		Excessive lubrication	Check lubricant level and adjust down to recommended levels.
		Wrong lubrication	Flush out and refill with correct lubricant as recommended
Runs Noisy	Loose foundation bolts	Weak mounting structure	Inspect mounting of reducer. Tighten loose bolts and/or reinforce mounting and structure.
		Loose hold down bolts	Tighten bolts
	Failure of bearings	May be due to lack of lubricant	Replace bearing. Clean and flush reducer and fill with recommended lubricant.
		Overload	Check rated capacity of reducer.
	Insufficient lubricant	Level of lubricant in reducer not properly maintained.	Check lubricant level and adjust to factory recommended level.
Output shaft does not turn	Internal parts are broken or missing	Overloading of reducer can cause damage	Replace broken parts. Check rated capacity of reducer.
		Key missing or sheared off on input shaft.	Replace key.
		Coupling loose or disconnected	Properly allign reducer and coupling. Tighten coupling.
Oil Leakage	Worn seals	Caused by dirt or grit entering seal.	Replace seals. Autovent may be clogged. Replace or clean.
	Unit runs hot or leaks	Overfilled reducer	Check lubricant level and adjust to recommended level.
		Vent clogged.	Clean or replace, being sure to prevent any dirt from falling into the reducer.
	Incorrect fill level	Improper mounting position, such as wall or ceiling mount of horizontal reducer.	Check mounting position on the name tag & verify with mounting chart in manual.

Section 1
General Information

Overview This manual contains general procedures that apply to Baldor Motor products. Be sure to read and understand the Safety Notice statements in this manual. For your protection, do not install, operate or attempt to perform maintenance procedures until you understand the Warning and Caution statements. A Warning statement indicates a possible unsafe condition that can cause harm to personnel. A Caution statement indicates a condition that can cause damage to equipment.

Important: **This instruction manual is not intended to include a comprehensive listing of all details for all procedures required for installation, operation and maintenance. This manual describes general guidelines that apply to most of the motor products shipped by Baldor. If you have a question about a procedure or are uncertain about any detail, Do Not Proceed. Please contact your Baldor distributor for more information or clarification.**

Before you install, operate or perform maintenance, become familiar with the following:

- NEMA Publication MG-2, Safety Standard for Construction and guide for Selection, Installation and Use of Electric Motors and Generators.
- The National Electrical Code
- Local codes and Practices

Limited Warranty

1. Baldor Electric motors are warranted for a period of one (1) year, from date of shipment from the factory or factory warehouse against defects in material and workmanship. To allow for stocking and/or fabrication period and to provide one year of actual service, the warranty period is extended for an additional period of six (6) months for a total of eighteen (18) months from the original date of shipment from the factory or factory warehouse stock. In no case will the warranty period be extended for a longer period. Baldor extends this limited warranty to each buyer of the electric motor for the purpose of resale and to the original purchaser for use.
2. Baldor will, at its option repair or replace a motor which fails due to defects in material or workmanship during the warranty period if:
   a. the purchaser presents the defective motor at or ships it prepaid to, the Baldor plant in Fort Smith, Arkansas or one of the Baldor Authorized Service Centers and
   b. the purchaser gives written notification concerning the motor and the claimed defect including the date purchased, the task performed by the Baldor motor and the problem encountered.
3. Baldor will not pay the cost of removal of any electric motor from any equipment, the cost of delivery to Fort Smith, Arkansas or a Baldor Authorized Service Center, or the cost of any incidental or consequential damages resulting from the claimed defects. (Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above exclusion may not apply to you.) Any implied warranty given by laws shall be limited to the duration of the warranty period hereunder. (Some states do not allow limitations on how long an implied warranty lasts, so the above limitation may not apply to you.)
4. Baldor Authorized Service Centers, when convinced to their satisfaction that a Baldor motor developed defects in material or workmanship within the warranty period, are authorized to proceed with the required repairs to fulfill Baldor's warranty when the cost of such repairs to be paid by Baldor does not exceed Baldor's warranty repair allowance. Baldor will not pay overtime premium repair charges without prior written authorization.
5. The cost of warranty repairs made by centers other than Baldor Authorized Service Centers **WILL NOT** be paid unless first authorized in writing by Baldor.
6. Claims by a purchaser that a motor is defective even when a failure results within one hour after being placed into service are not always justified. Therefore, Baldor Authorized Service Centers must determine from the condition of the motor as delivered to the center whether or not the motor is defective. If in the opinion of a Baldor Authorized Service Center, a motor did not fail as a result of defects in material or workmanship, the center is to proceed with repairs only if the purchaser agrees to pay for such repairs. If the decision is in dispute, the purchaser should still pay for the repairs and submit the paid invoice and the Authorized Service Center's signed service report to Baldor for further consideration.
7. This warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

   Note that **Baldor Super–E® Premium Efficiency** electric motors are warranted for a period of three (3) years. All other terms and conditions of the Limited Warranty statement apply.

Safety Notice:

This equipment contains high voltage! Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt installation, operation and maintenance of electrical equipment.

Be sure that you are completely familiar with NEMA publication MG-2, safety standards for construction and guide for selection, installation and use of electric motors and generators, the National Electrical Code and local codes and practices. Unsafe installation or use can cause conditions that lead to serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.

WARNING: Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.

WARNING: Be sure the system is properly grounded before applying power. Do not apply AC power before you ensure that all grounding instructions have been followed. Electrical shock can cause serious or fatal injury. National Electrical Code and Local codes must be carefully followed.

WARNING: Avoid extended exposure to machinery with high noise levels. Be sure to wear ear protective devices to reduce harmful effects to your hearing.

WARNING: This equipment may be connected to other machinery that has rotating parts or parts that are driven by this equipment. Improper use can cause serious or fatal injury. Only qualified personnel should attempt to install operate or maintain this equipment.

WARNING: Do not by-pass or disable protective devices or safety guards. Safety features are designed to prevent damage to personnel or equipment. These devices can only provide protection if they remain operative.

WARNING: Avoid the use of automatic reset devices if the automatic restarting of equipment can be hazardous to personnel or equipment.

WARNING: Be sure the load is properly coupled to the motor shaft before applying power. The shaft key must be fully captive by the load device. Improper coupling can cause harm to personnel or equipment if the load decouples from the shaft during operation.

WARNING: Use proper care and procedures that are safe during handling, lifting, installing, operating and maintaining operations. Improper methods may cause muscle strain or other harm.

WARNING: Before performing any motor maintenance procedure, be sure that the equipment connected to the motor shaft cannot cause shaft rotation. If the load can cause shaft rotation, disconnect the load from the motor shaft before maintenance is performed. Unexpected mechanical rotation of the motor parts can cause injury or motor damage.

WARNING: Disconnect all electrical power from the motor windings and accessory devices before disassembly of the motor. Electrical shock can cause serious or fatal injury.

WARNING: Do not use these motors in the presence of flammable or combustible vapors or dust. These motors are not designed for atmospheric conditions that require explosion proof operation.

Safety Notice Continued

WARNING: **Motors that are to be used in flammable and/or explosive atmospheres must display the UL label on the nameplate.**

Specific service conditions for these motors are defined in NEC 70-599.

WARNING: **UL rated motors must only be serviced by authorized Baldor Service Centers if these motors are to be returned to a flammable and/or explosive atmosphere.**

Caution: **To prevent premature equipment failure or damage, only qualified maintenance personnel should perform maintenance.**

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load from the motor shaft before moving the motor.**

Caution: **If eye bolts are used for lifting a motor, be sure they are securely tightened. The lifting direction should not exceed a 20° angle from the shank of the eye bolt or lifting lug. Excessive lifting angles can cause damage.**

Caution: **To prevent equipment damage, be sure that the electrical service is not capable of delivering more than the maximum motor rated amps listed on the rating plate.**

Caution: **If a HI POT test (High Potential Insulation test) must be performed, follow the precautions and procedure in NEMA MG-1 and MG-2 standards to avoid equipment damage.**

If you have any questions or are uncertain about any statement or procedure, or if you require additional information please contact your Baldor distributor or an Authorized Baldor Service Center.

Receiving

Each Baldor Electric Motor is thoroughly tested at the factory and carefully packaged for shipment. When you receive your motor, there are several things you should do immediately.

1. Observe the condition of the shipping container and report any damage immediately to the commercial carrier that delivered your motor.
2. Verify that the part number of the motor you received is the same as the part number listed on your purchase order.

Storage

If the motor is not put into service immediately, the motor must be stored in a clean, dry and warm location. Several precautionary steps must be performed to avoid motor damage during storage.

1. Use a “Megger” periodically to ensure that the integrity of the winding insulation has been maintained. Record the Megger readings. Immediately investigate any significant drop in insulation resistance.
2. Do not lubricate bearings during storage. Motor bearings are packed with grease at the factory. Excessive grease can damage insulation quality.
3. Rotate motor shaft at least 10 turns every two months during storage (more frequently if possible). This will prevent bearing damage due to storage.
4. If the storage location is damp or humid, the motor windings must be protected from moisture. This can be done by applying power to the motors’ space heater (if available) while the motor is in storage.

Unpacking

Each Baldor motor is packaged for ease of handling and to prevent entry of contaminants.

1. To avoid condensation inside the motor, do not unpack until the motor has reached room temperature. (Room temperature is the temperature of the room in which it will be installed). The packing provides insulation from temperature changes during transportation.
2. When the motor has reached room temperature, remove all protective wrapping material from the motor.

Handling

The motor should be lifted using the lifting lugs or eye bolts provided.

1. Use the lugs or eye bolts provided to lift the motor. Never attempt to lift the motor and additional equipment connected to the motor by this method. The lugs or eye bolts provided are designed to lift only the motor. Never lift the motor by the motor shaft.
2. If the motor must be mounted to a plate with the driven equipment such as pump, compressor etc., it may not be possible to lift the motor alone. For this case, the assembly should be lifted by a sling around the mounting base. The entire assembly can be lifted as an assembly for installation. Do not lift using the motor lugs or eye bolts provided.

   If the load is unbalanced (as with couplings or additional attachments) additional slings or other means must be used to prevent tipping. In any event, the load must be secure before lifting.

Section 2
Installation & Operation

Overview

Installation should conform to the National Electrical Code as well as local codes and practices. When other devices are coupled to the motor shaft, be sure to install protective devices to prevent future accidents. Some protective devices include, coupling, belt guard, chain guard, shaft covers etc. These protect against accidental contact with moving parts. Machinery that is accessible to personnel should provide further protection in the form of guard rails, screening, warning signs etc.

Location

The motor should be installed in an area that is protected from direct sunlight, corrosives, harmful gases or liquids, dust, metallic particles, and vibration. Exposure to these can reduce the operating life and degrade performance. Be sure to allow clearance for ventilation and access for cleaning, repair, service and inspections. Ventilation is extremely important. Be sure the area for ventilation is not obstructed. Obstructions will limit the free passage of air. Motors get warm and the heat must be dissipated to prevent damage.

These motors are not designed for atmospheric conditions that require explosion proof operation. They must NOT be used in the presence of flammable or combustible vapors or dust.

1. ODP motors are suitable only for indoor applications.
2. TEFC motors are suitable for indoor or outdoor standard service applications.

Mounting

The motor must be securely installed to a rigid foundation or mounting surface to minimize vibration and maintain alignment between the motor and shaft load. Failure to provide a proper mounting surface may cause vibration, misalignment and bearing damage.

Foundation caps and sole plates are designed to act as spacers for the equipment they support. If these devices are used, be sure that they are evenly supported by the foundation or mounting surface.

After installation is complete and accurate alignment of the motor and load is accomplished, the base should be grouted to the foundation to maintain this alignment.

The standard motor base is designed for horizontal or vertical mounting. Adjustable or sliding rails are designed for horizontal mounting only. Consult your Baldor distributor or authorized Baldor Service Center for further information.

Alignment

Accurate alignment of the motor with the driven equipment is extremely important.

1. **Direct Coupling**
   For direct drive, use flexible couplings if possible. Consult the drive or equipment manufacturer for more information. Mechanical vibration and roughness during operation may indicate poor alignment. Use dial indicators to check alignment. The space between coupling hubs should be maintained as recommended by the coupling manufacturer.
2. **End-Play Adjustment**
   The axial position of the motor frame with respect to its load is also extremely important. The motor bearings are not designed for excessive external axial thrust loads. Improper adjustment will cause failure.
3. **Pulley Ratio**
   The pulley ratio should not exceed 8:1.
4. **Belt Drive**
   Align sheaves carefully to minimize belt wear and axial bearing loads (see End-Play Adjustment). Belt tension should be sufficient to prevent belt slippage at rated speed and load. However, belt slippage may occur during starting.

Caution: Do not over tension belts.

Doweling & Bolting

After proper alignment is verified, dowel pins should be inserted through the motor feet into the foundation. This will maintain the correct motor position should motor removal be required. (Baldor motors are designed for doweling.)

1. Drill dowel holes in diagonally opposite motor feet in the locations provided.
2. Drill corresponding holes in the foundation.
3. Ream all holes.
4. Install proper fitting dowels.
5. Mounting bolts must be carefully tightened to prevent changes in alignment. Use a flat washer and lock washer under each nut or bolt head to hold the motor feet secure. Flanged nuts or bolts may be used as an alternative to washers.

Power Connection

Motor and control wiring, overload protection, disconnects, accessories and grounding should conform to the National Electrical Code and local codes and practices.

Conduit Box

For ease of making connections, an oversize conduit box is provided. The box can be rotated 360° in 90° increments. Auxiliary conduit boxes are provided on some motors for accessories such as space heaters, RTD's etc.

AC Power

Connect the motor leads as shown on the connection diagram located on the name plate or inside the cover on the conduit box. Be sure the following guidelines are met:

1. AC power is within ±10% of rated voltage with rated frequency. (See motor name plate for ratings).
   OR
2. AC power is within ±5% of rated frequency with rated voltage.
   OR
3. A combined variation in voltage and frequency of ±10% (sum of absolute values) of rated values, provided the frequency variation does not exceed ±5% of rated frequency.

Performance within these voltage and frequency variations are shown in Figure 2-1.

First Time Start Up

Be sure that all power to motor and accessories is off. Be sure the motor shaft is disconnected from the load and will not cause mechanical rotation of the motor shaft.

1. Make sure that the mechanical installation is secure. All bolts and nuts are tightened etc.
2. If motor has been in storage or idle for some time, check winding insulation integrity with a Megger.
3. Inspect all electrical connections for proper termination, clearance, mechanical strength and electrical continuity.
4. Be sure all shipping materials and braces (if used) are removed from motor shaft.
5. Manually rotate the motor shaft to ensure that it rotates freely.
6. Replace all panels and covers that were removed during installation.
7. Momentarily apply power and check the direction of rotation of the motor shaft.
8. If motor rotation is wrong, be sure power is off and change the motor lead connections. Verify rotation direction before you continue.
9. Start the motor and ensure operation is smooth without excessive vibration or noise. If so, run the motor for 1 hour with no load connected.
10. After 1 hour of operation, disconnect power and connect the load to the motor shaft. Verify all coupling guards and protective devices are installed. Ensure motor is properly ventilated.

Coupled Start Up

This procedure assumes a coupled start up. Also, that the first time start up procedure was successful.

1. Check the coupling and ensure that all guards and protective devices are installed.
2. Check that the coupling is properly aligned and not binding.
3. The first coupled start up should be with no load. Apply power and verify that the load is not transmitting excessive vibration back to the motor though the coupling or the foundation. Vibration should be at an acceptable level.
4. Run for approximately 1 hour with the driven equipment in an unloaded condition.

The equipment can now be loaded and operated within specified limits. Do not exceed the name plate ratings for amperes for steady continuous loads.

Jogging and Repeated Starts Repeated starts and/or jogs of induction motors generally reduce the life of the motor winding insulation. A much greater amount of heat is produced by each acceleration or jog than than by the same motor under full load. If it is necessary to to repeatedly start or jog the motor, it is advisable to check the application with your local Baldor distributor or Baldor Service Center.

Heating - Duty rating and maximum ambient temperature are stated on the motor name plate. Do not exceed these values. If there is any question regarding safe operation, contact your local Baldor distributor or Baldor Service Center.

Section 3
Maintenance & Troubleshooting

WARNING: **UL rated motors must only be serviced by authorized Baldor Service Centers if these motors are to be returned to a flammable and/or explosive atmosphere.**

General Inspection

Inspect the motor at regular intervals, approximately every 500 hours of operation or every 3 months, whichever occurs first. Keep the motor clean and the ventilation openings clear. The following steps should be performed at each inspection:

WARNING: **Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.**

1. Check that the motor is clean. Check that the interior and exterior of the motor is free of dirt, oil, grease, water, etc. Oily vapor, paper pulp, textile lint, etc. can accumulate and block motor ventilation. If the motor is not properly ventilated, overheating can occur and cause early motor failure.
2. Use a “Megger” periodically to ensure that the integrity of the winding insulation has been maintained. Record the Megger readings. Immediately investigate any significant drop in insulation resistance.
3. Check all electrical connectors to be sure that they are tight.

Lubrication & Bearings

Bearing grease will lose its lubricating ability over time, not suddenly. The lubricating ability of a grease (over time) depends primarily on the type of grease, the size of the bearing, the speed at which the bearing operates and the severity of the operating conditions. Good results can be obtained if the following recommendations are used in your maintenance program.

Type of Grease

A high grade ball or roller bearing grease should be used. Recommended grease for standard service conditions is Polyrex EM (Exxon Mobil).

Equivalent and compatible greases include:
Texaco Polystar, Rykon Premium #2, Pennzoil Pen 2 Lube and Chevron SRI.

– Maximum operating temperature for standard motors = 110° C.
– Shut–down temperature in case of a malfunction = 115° C.

Lubrication Intervals

Recommended lubrication intervals are shown in Table 3-1. It is important to realize that the recommended intervals of Table 3-1 are based on average use.

Refer to additional information contained in Tables 3-2 and 3-3.

Table 3-1 Lubrication Intervals *

NEMA / (IEC) Frame Size	Rated Speed - RPM					
	10000	6000	3600	1800	1200	900
Up to 210 incl. (132)	**	2700 Hrs.	5500 Hrs.	12000 Hrs.	18000 Hrs.	22000 Hrs.
Over 210 to 280 incl. (180)			3600 Hrs.	9500 Hrs.	15000 Hrs.	18000 Hrs.
Over 280 to 360 incl. (225)			* 2200 Hrs.	7400 Hrs.	12000 Hrs.	15000 Hrs.
Over 360 to 5800 incl. (300)			*2200 Hrs.	3500 Hrs.	7400 Hrs.	10500 Hrs.

* Lubrication intervals are for ball bearings. For roller bearings, divide the listed lubrication interval by 2.

** For 6205 and 6806 bearings. For 6807 bearings, consult oil mist lubrication (MN401).
Relubrication interval for 6205 bearing bearing is 1550Hrs. (using grease lubrication).
Relubrication interval for 6806 bearing bearing is 720Hrs. (using grease lubrication).

Table 3-2 Service Conditions

Severity of Service	Ambient Temperature Maximum	Atmospheric Contamination	Type of Bearing
Standard	40° C	Clean, Little Corrosion	Deep Groove Ball Bearing
Severe	50° C	Moderate dirt, Corrosion	Ball Thrust, Roller
Extreme	>50° C* or Class H Insulation	Severe dirt, Abrasive dust, Corrosion	All Bearings
Low Temperature	<–30° C **		

* Special high temperature grease is recommended (Dow Corning DC44). Note that Dow Corning DC44 grease does not mix with other grease types. Thoroughly clean bearing & cavity before adding grease.

** Special low temperature grease is recommended (Aeroshell 7).

Table 3-3 Lubrication Interval Multiplier

Severity of Service	Multiplier
Standard	1.0
Severe	0.5
Extreme	0.1
Low Temperature	1.0

Table 3-4 Bearings Sizes and Types

Frame Size NEMA (IEC)	Bearing Description (These are the "Large" bearings (Shaft End) in each frame size)					
	Bearing	OD D mm	Width B mm	Weight of Grease to add * oz (Grams)	Volume of grease to be added	
					in^3	tea-spoon
Up to 210 incl. (132)	6307	80	21	0.30 (8.4)	0.6	2.0
Over 210 to 280 incl. (180)	6311	120	29	0.61 (17)	1.2	3.9
Over 280 to 360 incl. (225)	6313	140	33	0.81 (23)	1.5	5.2
Over 360 to 449 incl. (280)	NU319	200	45	2.12 (60)	4.1	13.4
Over 5000 to 5800 incl. (355)	NU328	300	62	4.70 (130)	9.2	30.0
Spindle Motors						
76 Frame	6207	72	17	0.22 (6.1)	0.44	1.4
77 Frame	6210	90	20	0.32 (9.0)	0.64	2.1
80 Frame	6213	120	23	0.49 (14.0)	0.99	3.3

* Weight in grams = .005 DB

Lubrication Procedure

Be sure that the grease you are adding to the motor is compatible with the grease already in the motor. Consult your Baldor distributor or an authorized service center if a grease other than the recommended type is to be used.

Caution: To avoid damage to motor bearings, grease must be kept free of dirt. For an extremely dirty environment, contact your Baldor distributor or an authorized Baldor Service Center for additional information.

With Grease Outlet Plug

1. Clean all grease fittings.
2. Remove grease outlet plug.
3. If motor is stopped, add the recommended amount of grease.

   If motor is to be greased while running, a slightly greater quantity of grease will have to be added. Add grease slowly until new grease appears at shaft hole in the endplate or purge outlet plug.
4. Re-install grease outlet plug.

Without Grease Outlet Plug

1. Disassemble motor.
2. Add recommended amount of grease to bearing and bearing cavity. (Bearing should be about 1/3 full of grease and outboard bearing cavity should be about 1/2 full of grease.)

Note: Bearing is 1/3 full when only one side of bearing is completely full of grease.

3. Assemble motor.

Sample Lubrication Determination

Assume - NEMA 286T (IEC 180), 1750 RPM motor driving an exhaust fan in an ambient temperature of 43° C and the atmosphere is moderately corrosive.

1. Table 3-1 list 9500 hours for standard conditions.
2. Table 3-2 classifies severity of service as “Severe”.
3. Table 3-3 lists a multiplier value of 0.5 for Severe conditions.
4. Table 3-4 shows that 1.2 in^3 or 3.9 teaspoon of grease is to be added.

Note: Smaller bearings in size category may require reduced amounts of grease.

Accessories

The following is a partial list of accessories available from Baldor.
Contact your Baldor distributor for availability and pricing information.

Note: Space heaters and RTD's are standard on some motors.

Bearing RTD
RTD (Resistance Temperature Detector) devices are used to measure or monitor the temperature of the motor bearing during operation.

Bearing Thermocouples
Used to measure or monitor bearing temperatures.

Bearing Thermostat
Temperature device that activates when bearing temperatures are excessive. Used with an external circuit to warn of excessive bearing temperature or to shut down a motor.

Conduit Boxes
Optional conduit boxes are available in various sizes to accommodate accessory devices.

Cord & Plug Assembly
Adds a line cord and plug for portable applications.

Drains and Breathers
Stainless steel drains with separate breathers are available.

Drip Covers
Designed for use when motor is mounted in a vertical position. Contact your Baldor distributor to confirm that the motor is designed for vertical mounting.

Fan Cover & Lint Screen
To prevent build-up of debris on the cooling fan.

Nameplate
Additional stainless steel nameplates are available.

Roller Bearings
Recommended for belt drive applications with a speed of 1800 RPM or less.

Rotation Arrow Labels
Rotation arrows are supplied on motors designed to operate in one direction only. Additional rotation arrows are available.

Space Heater
Added to prevent condensation of moisture within the motor enclosure during periods of shut down or storage.

Stainless Hardware
Stainless steel hardware is available. Standard hardware is corrosion resistant zinc plated steel.

Winding RTD
RTD (Resistance Temperature Detector) devices are used to measure or monitor the temperature of the motor winding during operation.

Winding Thermocouples
Used to measure or monitor winding temperatures.

Winding Thermostat
Temperature device that activates when winding temperatures are excessive. Used with an external circuit to warn of excessive winding temperature or to shut down a motor.

Note: On some motors, leads for accessory devices are brought out to a separate conduit box located on the side of the motor housing (unless otherwise specified).

Table 3-5 Troubleshooting Chart

Symptom	Possible Causes	Possible Solutions
Motor will not start	Usually caused by line trouble, such as, single phasing at the starter.	Check source of power. Check overloads, fuses, controls, etc.
Excessive humming	High Voltage.	Check input line connections.
	Eccentric air gap.	Have motor serviced at local Baldor service center.
Motor Over Heating	Overload. Compare actual amps (measured) with nameplate rating.	Locate and remove source of excessive friction in motor or load. Reduce load or replace with motor of greater capacity.
	Single Phasing.	Check current at all phases (should be approximately equal) to isolate and correct the problem.
	Improper ventilation.	Check external cooling fan to be sure air is moving properly across cooling fins. Excessive dirt build-up on motor. Clean motor.
	Unbalanced voltage.	Check voltage at all phases (should be approximately equal) to isolate and correct the problem.
	Rotor rubbing on stator.	Check air gap clearance and bearings.
		Tighten “Thru Bolts”.
	Over voltage or under voltage.	Check input voltage at each phase to motor.
	Open stator winding.	Check stator resistance at all three phases for balance.
	Grounded winding.	Perform dielectric test and repair as required.
	Improper connections.	Inspect all electrical connections for proper termination, clearance, mechanical strength and electrical continuity. Refer to motor lead connection diagram.
Bearing Over Heating	Misalignment.	Check and align motor and driven equipment.
	Excessive belt tension.	Reduce belt tension to proper point for load.
	Excessive end thrust.	Reduce the end thrust from driven machine.
	Excessive grease in bearing.	Remove grease until cavity is approximately $^3/_4$ filled.
	Insufficient grease in bearing.	Add grease until cavity is approximately $^3/_4$ filled.
	Dirt in bearing.	Clean bearing cavity and bearing. Repack with correct grease until cavity is approximately $^3/_4$ filled.
Vibration	Misalignment.	Check and align motor and driven equipment.
	Rubbing between rotating parts and stationary parts.	Isolate and eliminate cause of rubbing.
	Rotor out of balance.	Have rotor balance checked are repaired at your Baldor Service Center.
	Resonance.	Tune system or contact your Baldor Service Center for assistance.
Noise	Foreign material in air gap or ventilation openings.	Remove rotor and foreign material. Reinstall rotor. Check insulation integrity. Clean ventilation openings.
Growling or whining	Bad bearing.	Replace bearing. Clean all grease from cavity and new bearing. Repack with correct grease until cavity is approximately $^3/_4$ filled.

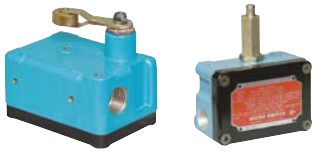
*UL/CSA certified for Class 1, Group B Hydrogen atmosphere.



EX-AR EX-Q

Features
- Non-Sparking Actuators
- Mounts from Four Sides
- Roller Arm Adjustable Through 360°
- ATEX Certified II 2GE EXd11B+H_2 T6, IFCE Certified

Specifications
- 10-20 A @ 125, 250, 480 VAC
- ½ A @ 125 VDC, ¼ A @ 250 VDC
- ⅛ HP @ 125 VAC, ¼ HP @ 250 VAC
- UL Recognized, File #E14274
- CSA Certified, File #LR57324
- Sealing: NEMA 1, 7 (Class I DIV I Groups A, B, C, D) 9 (Class I DIV I Groups E, F, G), (DIV II Groups F, G)
- Operating Temperature: –40°C to 71°C (–90°F to 160°F)

MICRO SWITCH™ Hazardous Location Limit Switches — LSX Series

LSX switches are for use either indoors or outdoors in hazardous atmospheres as they are a completely sealed explosion-proof device. An optional mounting plate provides the same tracking and mounting as the standard HDLS. The majority of HDLS operating heads and circuitry options are available on the LSX. Standard HDLS levers are used, but because of explosion-proof requirements, only nylon rollers or other non-sparking material can be selected. Plunger and cat whisker types listed in the LSX order guide are of non-sparking material. Application proven HDLS head seals are retained to seal the top of the LSX. The circular cover on the front is easily unscrewed to expose the switching elements for wiring or replacement. A screwdriver or bar used on the wrenching lugs extending from the front of the cover allows easy removal or tightening. An o-ring seal is located between the housing and cover. The LSX withstands pressure of an internal explosion and cools the exploding gases below the kindling temperature of the explosive atmosphere. Flame paths are provided by the cover-housing threads and an extended plunger between the switch cavity and head.

Stock No.	Mfr.'s Type	Head Style Actuator	Conduit	Contact Form	O.F.	P.T.	D. T.	O.T.

70119497	LSXP7L	Side Rotary, Momentary	½"-14 NPT	DPDT	0.45 Nm	9°	4°	66°

Features
- Electrical: 10 Amp Thermal
- Single Pole: AC15, A600; DC13, R300
- Double Pole: AC15, B600; DC13, R300
- Variety of Heads and Non-Sparking Actuators
- Field Adjustability Matches Switch to Application
- Momentary, Maintained, or Center Neutral Action
- Choice of Silver or Gold Contacts
- ½ or ¾ Inch Conduit Opening
- UL Listed (File #E61730) and CSA Certified (File #LR57327)
- NEMA/UL 1, 3, 4, 6, 7 (Class 1, Division 1 and 2) Groups B, C, D, 9 (Class 2, Division H2) Groups E, F, G, 13
- Operating Temperature: –12°C to 121°C (–10°F to 250°F), Optional –40°C (90°F)

MICRO SWITCH™ Hazardous Location Limit Switches — BX Series

The BX Series limit switch is similar to the LSX Series except it carries ATEX certification which is required for European applications. These enclosures also meet the European Hazardous Locations Designation: EExd IIC T6 category II 2 GD, SIRA 00ATEX 1037X. The entire series BX complies with the European Directive on Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres (94/9/EC) commonly referred to as the ATEX Directive. Compliance with the Essential Health and Safety Requirements has been assessed by compliance with EN50014 1997 and EN50018 1994. BX products with conduit types ½-14 NPT, ¾-14 NPT also meet the **North American Hazardous Locations Designation:** Class I, Groups B, C and D; Class II, Groups E, F and G comply with **UL Standard:** UL 894, **CSA Standard:** C22.2 No. 25-1966, C22.2 No. 30-M1986.

Features
- UL, CSA, ATEX and IEC Ex
- Sealing — Applicable Portions of IP67 and NEMA 1, 3, 4, 6, 7, 9 and 13
- Durable Metal Housing Provides Enhanced Corrosion Resistance
- Tracking Interchangeability with MICRO SWITCH ML-E1 and HDLS
- Electrical Features Similar to LSX Series
- 10 A Thermal
- Gold Contacts Available for Low Energy Switching
- Fluorocarbon Sealing Available
- –40°C Standard Low Temperature
- Ideal for Petrochemical and Marine Environment

Stock No.	Mfr.'s Type*	Head Style Actuator	Conduit	Contact Form	O.F.	P.T.	D. T.	O.T.
70118676	BXA3K	Side Rotary	½"-14 NPT	SPDT	0.45 N	15°	7°	60°
70118677	BXA4L	Side Rotary	¾"-14 NPT	DPDT	0.45 N	15°	7°	60°
70119432	BX2C4L	Top Plunger	¾"-14 NPT	DPDT	0.45 N	1.78 mm	0.51 mm	4.83 mm
70119433	BX2P4L	Side Rotary	¾"-14 NPT	DPDT	0.45 N	9°	4°	68°

*The standard BX listings have an aluminum die cast housing. BX2 listings are 316L stainless steel.

[illegible] BX2C4L BX2P4L

MICRO SWITCH™ Hazardous Location Limit Switches — CX Series

CX switches are built especially for outdoor use in hazardous atmospheres. These enclosures are constructed to withstand the pressure of an internal explosion. Flame paths cool the exploded gases to a point less than the lowest safe operating temperature of the surrounding gas. O-ring seals make the enclosure weatherproof but are outside of required flame paths so explosion proof requirements are maintained.

Features
- Sealing — Applicable Portions of NEMA 1, 3, 4, 4x, 6, 6p, 7, 9 and 13
- Watertight and Dust-Tight for Outdoor Use
- 4-20 mA Analog Output Available
- UL Listed, File #E14274
- Analog UL File #E68247
- CSA Certified, File #LR57324
- Rugged Cast Aluminum Housing Accepts ¾"-14 NPT Conduit
- Preset Overtravel and Actuating Sequence Can Be Field Adjusted without Tools (All Switches Individually)
- Rotary Types Convert in Seconds to Clockwise, Counterclockwise or Two-Way Operation
- ATEX and IEC Ex Certified Versions Available

Stock No.	Mfr.'s Type	Head Style Actuator	Circuits	O.F.	R.F	P.T.	D. T.	O.T.	Type	Supply Voltage	Current Rating (AC)

if circuit calls for normally open, terminate on 4 & 3 or 8 & 7

if circuit calls for normally closed, terminate on 1 & 2 or 6 & 5

if no control power w closed hatch, try to open hatch and see if you get control power

[1] Gold-plated contacts
[2] Completely fluorocarbon sealed switches are preferred for use in temperatures above 93 °C [200 °F]
For low temperature or high temperature versions, see page 9.

LSX Series

MICRO SWITCH™ LSX SERIES OPERATING HEADS

TOP PLUNGERS: Available with 4,83 mm [0.19 in] minimum overtravel. Top pin plungers are offered in pin plunger, an adjustable plunger, and a roller plunger.

LSXC - Top pin plunger: A copper alloy plunger for in-line actuating motion. Oil-tight seals on plunger and between the operating head and housing are designed to keep out coolant, dust, and chips. Momentary action.

LSXD - Top roller plunger: A copper alloy roller plunger is adjustable to 90° angles to accept cam or slide operation from any of two directions. Boot seal on the plunger. Momentary action.

LSXV - Adjustable top pin plunger: A copper alloy adjustable plunger is designed to simplify the application and decreases installation time. The operating points of the switch can be adjusted from 65,66 mm to 72,0 mm [2.585 in to 2.535 in]. Seals are the same as the pin plunger. Momentary action.

WOBBLE LEVER ACTUATING HEADS: Heads come with either a Delrin® plastic rod or a copper alloy cat whisker. Any movement of the lever (except pull) will actuate the switch.

LSXJ - Plastic rod: Recommended where possible scratching or marring by the actuator is to be avoided.

LSXK - Cat whisker: Copper alloy actuator designed for low operating force applications.

SIDE PLUNGERS: Made of non-sparking copper alloy. Available with 4,83 mm [0.19 in] minimum overtravel. Side plungers are offered in plain plunger, an adjustable pin plunger, and a roller plunger.

LSXE - Side pin plunger: A copper alloy plunger for actuating motion inline with the plunger travel. Actuating head may be rotated in any of four positions, 90° apart. A boot seal on the plunger and a gasket seal between the head and housing is designed to keep out coolant, dust, and chips. Momentary action.

LSXF - Side roller plunger: A copper alloy roller plunger fits close quarters under cams and slides. The head may be rotated in any of four positions, 90° apart. The roller can be turned vertical or horizontal to the switch. Boot seal on plunger. Momentary action.

LSXW - Adjustable side pin plunger: Has the same features of the side plain plunger plus the means to adjust the operating points of the switch from 41 mm to 47,4 mm [1.615 in to 1.865 in]. Momentary action.

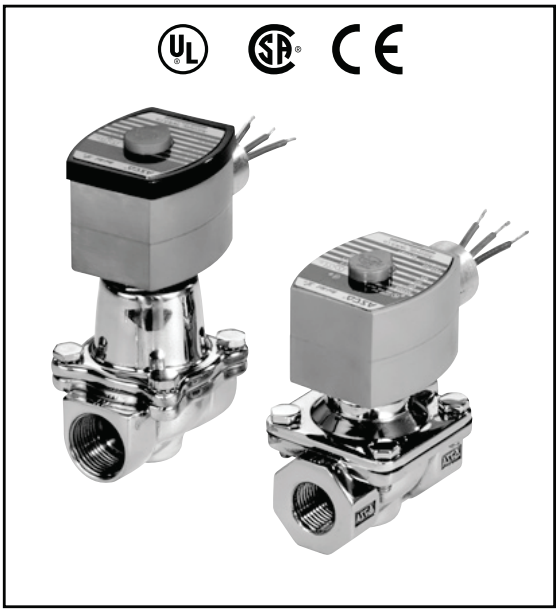
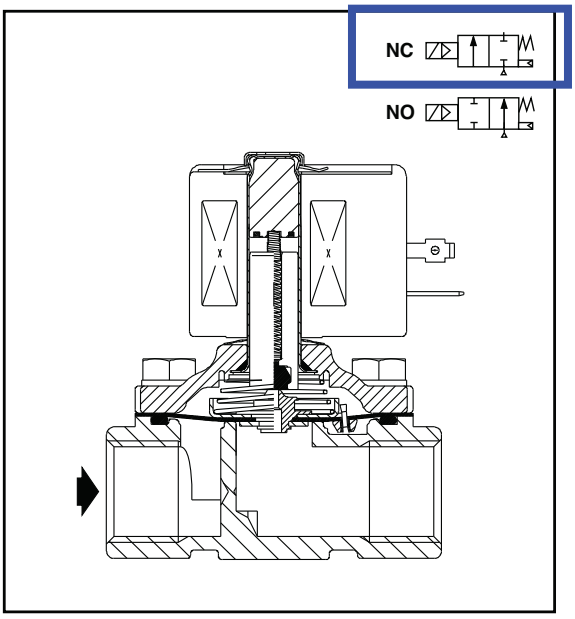
Solenoid Valve – ½”

This page intentionally left blank

Features

- Wide range of pressure ratings, sizes, and resilient materials provide long service life and low internal leakage
- High Flow Valves for liquid, corrosive, and air/inert gas service
- Industrial applications include:
  - Car wash
  - Laundry equipment
  - Air compressors
  - Industrial water control
  - Pumps





Construction

Valve Parts in Contact with Fluids		
Body	Brass	304 Stainless Steel
Seals and Discs	NBR or PTFE	
Disc-Holder	PA	
Core Tube	305 Stainless Steel	
Core and Plugnut	430F Stainless Steel	
Springs	302 Stainless Steel	
Shading Coil	Copper	Silver

Notes: ① 5 psi on Air; 1 psi on Water.
② Valve provided with PTFE main disc.
③ Valve includes Ultem (G.E. trademark) piston.
④ Letter "D" denotes diaphragm construction; "P" denotes piston construction.
⑤ ❍ Safety Shutoff Valve; ● General Purpose Valve. Refer to Engineering Section (Approvals) for details.
⑥ Valves not available with Explosionproof enclosures.
⑦ On 50 hertz service, the watt rating for the 6.1/F solenoid is 8.1 watts.
⑧ AC construction also has PA seating.
⑨ No disc-holder.
⑩ Stainless Steel disc-holder.
‡ Must have solenoid mounted vertical and upright.

Installation & Maintenance Instructions

2-WAY INTERNAL PILOT-OPERATED SOLENOID VALVES
HUNG DIAPHRAGM — 3/8, 1/2 AND 3/4 NPT
NORMALLY CLOSED OPERATION

BULLETINS
8210
8211

Form No.V5825R1

DESCRIPTION

Bulletin 8210's are 2-way, normally closed, internal pilot operated solenoid valves. Valve body and bonnet are of brass construction. Standard valves have a General Purpose, NEMA Type 1 Solenoid Enclosure.

Bulletin 8211's are the same as Bulletin 8210's except the solenoids are equipped with an enclosure which is designed to meet NEMA Type 4 Watertight, NEMA Type 7 (C or D) Hazardous Locations - Class I, Group C or D, and NEMA Type 9 (E, F or G) Hazardous Locations - Class II, Group E, F or G. The explosion-proof/watertight solenoid enclosure is shown on a separate sheet of Installation and Maintenance Instructions, Form No. V-5380.

Bulletin 8210 and 8211 valves with suffix 'HW' in the catalog number are specifically designed for hot water service.

OPERATION

Normally Closed: Valve is closed when solenoid is de-energized and opens when solenoid is energized.

MANUAL OPERATOR (Optional)

Valves with suffix 'MO' in catalog number are provided with a manual operator which allows manual operation when desired or during an interruption of electrical power. To operate valve manually, push in knurled cap and rotate clockwise 180°. Disengage manual operator by rotating knurled cap counterclockwise 180° before operating electrically.

MANUAL OPERATOR LOCATION (Refer to Figure 3)

Manual operator (when shipped from factory) will be located over the valve outlet. Manual operator may be relocated at 90° increments by rotating valve bonnet. Remove bonnet screws (4) and rotate valve bonnet with solenoid to desired position. Replace bonnet screws (4) and torque in a crisscross manner to 110 ± 10 inch pounds.

If valve is installed in system and is operational, proceed in the following manner:

WARNING: Depressurize valve and turn off electrical power supply.

1. Remove retaining cap or clip and slip the entire solenoid enclosure off the solenoid base sub-assembly. CAUTION: When metal retaining clip disengages, it will spring upwards.
2. Remove bonnet screws (4) and rotate valve bonnet to desired position.
3. Replace bonnet screws (4) and torque in a crisscross manner to 110 ± 10 inch pounds.
4. Replace solenoid enclosure and retaining clip or cap.

INSTALLATION

Check nameplate for correct catalog number, pressure, voltage and service.

TEMPERATURE LIMITATIONS

For maximum valve ambient and fluid temperatures refer to chart. The temperature limitations listed are for UL applications. For non UL applications, higher ambient and fluid temperature limitations are available. Consult factory. Check catalog number on nameplate to determine maximum temperatures.

Construction	Coil Class	Catalog Number Prefix	Maximum Ambient Temp. °F.	Maximum Fluid Temp. °F.
A-C Construction (Alternating Current)	A	None or DA	77	180
	F	DF or FT	122	180
	H	HT	140	180
D-C Construction (Direct Current)	A, F or H	None, FT or HT	77	150
Catalog Numbers Suffixed 'HW' A-C Construction (Alternating Current)	A	None or DA	77	210
	F	DF or FT	77	210
	H	HT	122	210

POSITIONING/MOUNTING

Valve may be mounted in any position. For mounting bracket (optional feature) dimensions, refer to Figure 1.

PIPING

Connect piping to valve according to markings on valve body. Apply pipe compound sparingly to male pipe threads only; if applied to valve threads, it may enter the valve and cause operational difficulty. Pipe strain should be avoided by proper support and alignment of piping. When tightening the pipe do not use valve as a lever. Wrenches applied to valve body or piping are to be located as close as possible to connection point. **IMPORTANT: Valves with suffix 'HW' in the catalog number have a special diaphragm material which is specifically compounded for hot water service. This material can be attacked by oil and grease. Wipe the pipe threads clean of cutting oils and use teflon tape to seal pipe joints.**

IMPORTANT: For the protection of the solenoid valve, install a strainer or filter suitable for the service involved in the inlet side as close to the valve as possible. Periodic cleaning is required depending on the service conditions. See Bulletins 8600, 8601 and 8602 for strainers.

WIRING

Wiring must comply with Local and National Electrical Codes. Housings for all solenoids are provided with connections for 1/2 inch conduit. The general purpose solenoid enclosure may be rotated to facilitate wiring by removing the retaining cap or clip. CAUTION: When metal retaining clip disengages it will spring upwards. Rotate to desired position. Replace retaining cap or clip before operating.

NOTE: Alternating Current (A-C) and Direct Current (D-C) Solenoids are built differently. To convert from one to the other, it is necessary to change the complete solenoid including the solenoid base sub-assembly and core assembly.

SOLENOID TEMPERATURE

Standard catalog valves are supplied with coils designed for continuous duty service. When the solenoid is energized for a long period, the solenoid enclosure becomes hot and can be touched with the hand for only an instant. This is a safe operating temperature. Any excessive heating will be indicated by the smoke and odor of burning coil insulation.

MAINTENANCE

WARNING: Turn off electrical power and depressurize valve before making repairs. It is not necessary to remove valve from pipe line for repairs.

© ASCO MM All Rights Reserved. Printed in U.S.A.

50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

CLEANING

A periodic cleaning of all solenoid valves is desirable. The time between cleanings will vary, depending on media and service conditions. In general, if the voltage to the coil is correct, sluggish valve operation, excessive leakage or noise will indicate that cleaning is required.

PREVENTIVE MAINTENANCE

1. Keep the medium flowing through the valve as free from dirt and foreign material as possible.
2. While in service, operate valve at least once a month to insure proper opening and closing.
3. Periodic inspection (depending on media and service conditions) of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. Replace any parts that are worn or damaged.

IMPROPER OPERATION

1. **Faulty Control Circuit:** Check electrical system by energizing solenoid. A metallic click signifies the solenoid is operating. Absence of the click indicates loss of power supply. Check for loose or blown-out fuses, open circuited or grounded coil, broken lead wires or splice connections.
2. **Burned-Out Coil:** Check for open circuited coil. Replace coil if necessary.
3. **Low Voltage:** Check voltage across coil leads. Voltage must be at least 85% of nameplate rating.
4. **Incorrect Pressure:** Check valve pressure. Pressure to the valve must be within range specified on nameplate.
5. **Excessive Leakage:** Disassemble valve and clean all parts. Replace worn or damaged parts with a complete Spare Parts Kit for best results.

COIL REPLACEMENT (Refer to Figure 2)

Turn off electrical power supply and disconnect coil leads. Proceed in the following manner:

1. Remove retaining cap or clip, nameplate and cover. CAUTION: When metal retaining clip disengages, it will spring upwards.
2. Remove spring washer, insulating washer and coil. Insulating washers are omitted when a molded coil is used.
3. Reassemble in reverse order of disassembly paying careful attention to exploded view provided for identification and placement of parts.

CAUTION: Solenoid must be fully reassembled as the housing and internal parts are part of and complete the magnetic circuit. Place insulating washer at each end of coil if required.

VALVE DISASSEMBLY (Refer to Figures 2 and 3)

Depressurize valve and turn off electrical power supply. Proceed in the following manner:

1. Remove retaining cap or clip and slip the entire solenoid enclosure off the solenoid base sub-assembly. CAUTION: When metal retaining clip disengages, it will spring upwards.
2. Unscrew solenoid base sub-assembly and remove bonnet gasket.
3. Remove valve bonnet screws (4) and valve bonnet.
4. For normal maintenance, it is not necessary to disassemble the manual operator (optional feature) unless external leakage is evident. To disassemble remove stem pin, manual operator stem, stem spring and stem gasket.
5. Remove core spring, core/diaphragm sub-assembly and body gasket. CAUTION: Do not damage or distort hanger spring between core/diaphragm sub-assembly.
6. All parts are now accessible for cleaning or replacement. Replace worn or damaged parts with a complete Spare Parts Kit for best results.

VALVE REASSEMBLY

1. Reassemble in reverse order of disassembly paying careful attention to exploded views provided for identification and placement of parts.
2. Replace body gasket and core/diaphragm sub-assembly. Locate the bleed hole in core/diaphragm sub-assembly approximately 45° from the valve outlet.
3. Replace core spring with wide end in core first; closed end protrudes from top of core.
4. If removed, replace manual operator stem, stem spring, stem gasket and stem pin.
5. Replace valve bonnet and bonnet screws (4). Torque bonnet screws (4) in a crisscross manner to 110 ± 10 inch pounds.
6. Replace bonnet gasket and solenoid base sub-assembly. Put solenoid base sub-assembly to 175 ± 25 inch pounds.
7. Replace solenoid enclosure and retaining cap or clip.
8. After maintenance, operate the valve a few times to be sure of proper opening and closing.

SPARE PARTS KITS

Spare Parts Kits and Coils are available for ASCO valves.
Parts marked with an asterisk (*) are supplied in Spare Parts Kits.

ORDERING INFORMATION FOR SPARE PARTS KITS
When Ordering Spare Parts Kits or Coils Specify Valve Catalog Number, Serial Number and Voltage.

Installation&Maintenance Instructions

ASCO Red-Hat II™

OPEN-FRAME, GENERAL PURPOSE, WATERTIGHT/EXPLOSIONPROOF SOLENOIDS

SERIES 8016G/H

— SERVICE NOTICE —

ASCO™ solenoid valves with design change letter "G" or "H" in the catalog number (ex. 8210G1) have an epoxy encapsulated ASCO Red Hat II® solenoid. This solenoid replaces some of the solenoids with metal enclosures and open-frame constructions. Follow these installation and maintenance instructions if your valve or operator uses this solenoid.

DESCRIPTION

Catalog numbers 8016G/H1 and 8016G/H2 are epoxy encapsulated pull-type solenoids. The green solenoid with lead wires and 1/2 conduit connection is designed to meet Enclosure Type 1-General Purpose, Type 2-Dripproof, Types 3 and 3S-Raintight, and Types 4 and 4X-Watertight. The black solenoid on catalog numbers prefixed "EF" is designed to meet Enclosure Types 3 and 3S-Raintight, Types 4 and 4X-Watertight, Types 6 and 6P-Submersible, Type7, Explosionproof Class I, Division1 Groups A, B, C, & D and Type 9, -Dust-Ignitionproof Class II, Division1 Groups E, F & G. The Class II, Groups F & G Dust Locations designation is not applicable for solenoids or solenoid valves used for steam service or when a class "H" solenoid is used. See *Temperature Limitations* section for solenoid identification and nameplate/retainer for service. When installed just as a solenoid and not attached to an ASCO valve, the core has a 0.250-28 UNF-2B tapped hole, 0.38 minimum full thread.

Series 8016G/H are available in:

- **Open-Frame Construction:** The green solenoid may be supplied with 1/4″ spade, screw or DIN terminals. (Refer to Figure 4)
- **Panel Mounted Construction:** These solenoids are specifically designed to be panel mounted by the customer through a panel having a .062 to .093 maximum wall thickness. (Refer to Figure 3 and section on *Installation of Panel Mounted Solenoid*).

Optional Features For Type 1 - General Purpose Construction Only

- **Junction Box:** This junction box construction meets Enclosure Types 2, 3, 3S, 4, and 4X. Only solenoids with 1/4″ spade or screw terminals may have a junction box. The junction box provides a 1/2″ conduit connection, grounding and spade or screw terminal connections within the junction box (See Figure 5).
- **DIN Plug Connector Kit No. K236034:** Use this kit only for solenoids with DIN terminals. The DIN plug connector kit provides a two pole with grounding contact DIN Type 43650 construction (See Figure 6).

OPERATION

When the solenoid is energized, the core is drawn into the solenoid base sub-assembly.

IMPORTANT: When the solenoid is de-energized, the initial return force for the core, whether developed by spring, pressure, or weight, must exert a minimum force to overcome residual magnetism created by the solenoid. Minimum return force for AC construction is 0.69lbs (3.1N) and 0.31 lbs (1.38N) for DC.

INSTALLATION

Check nameplate for correct catalog number, service, and wattage. Check front of solenoid for voltage and frequency.

⚠ WARNING: Electrical hazard from the accessibility of live parts. To prevent the possibility of death, serious injury or property damage, install the open - frame solenoid in an enclosure.

FOR BLACK ENCLOSURE TYPES 7 AND 9 ONLY

⚠CAUTION: To prevent fire or explosion, do not install solenoid and/or valve where ignition temperature of hazardous atmosphere is less than 165°C. On valves used for steam service or when a class "H" solenoid is used, do not install in hazardous atmosphere where ignition temperature is less than 180°C. See nameplate/retainer for service.

NOTE: These solenoids have an internal non-resetable thermal fuse to limit solenoid temperature in the event that extraordinary conditions occur which could cause excessive temperatures. These conditions include high input voltage, a jammed core, excessive ambient temperature or a shorted solenoid, etc. This unique feature is a standard feature only in solenoids with black explosionproof/dust-ignitionproof enclosures (Types 7 & 9).

⚠CAUTION: To protect the solenoid valve or operator, install a strainer or filter, suitable for the service involved in the inlet side as close to the valve or operator as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

Temperature Limitations

For maximum valve ambient temperatures, refer to chart. The temperature limitations listed, only indicate maximum application temperatures for field wiring rated at 90°C. Check catalog number prefix and watt rating on nameplate to determine maximum ambient temperature. See valve installation and maintenance instructions for maximum fluid temperature.

 All Rights Reserved.

©ASCO Valve, Inc.® 50 Hanover Road, Florham Park, New Jersey 07932

NOTE: For steam service, refer to *Wiring* section, *Junction Box* for temperature rating of supply wires.

Temperature Limitations For Series 8016G Solenoids for use on Valves Rated at 6.1, 8.1, 9.1, 10.6 or 11.1 Watts			
Watt Rating	Catalog Number Coil Prefix	Class of Insulation	Maximum § Ambient Temp.
6.1, 8.1, 9.1 & 11.1	None, FB, KF, KP, SC, SD, SF & SP	F	125°F (52°C)
6.1, 8.1, 9.1 & 11.1	HB, HT, KB, KH, SS, ST & SU	H	140°F (60°C)
10.6**	None, KF, SF, SC, HT, KH, ST & SU	F & H	104°F (40°C)
7.1 @ 60Hz (8.1 @ 50Hz)		F & H	175°F (79°C)*
10.6**		F & H	140°F (60°C)

§ Minimum ambient temperature -40°F (-40°C).

* When used with watertight aluminum junction boxers (screw or spade) max. ambient and fluid temperature will be reduced to 157°F (69.4°C)

** 10.6 Watt solenoids rated for 104°F are 8030, 8260, 8316, 8321, 8320, 8360 & 8344 valves while those rated for 140°F are 8040 valves

Temperature Limitations for Series 8003H, 8007H and 8202H solenoids						
		Watt Ratings			Maximum Ambient Temperature	
Prefix ①	Coil Class	AC		DC		
		60 Hz	50 Hz		°C	°F
EF	FT	6.1	8.1	-	52	125
EF	FB	9.1	11.1	-		
	FT	6.1	8.1	-	55	131
	FB	9.1	11.1	-		
	HT	-	-	10.6	40 ②	104②
	HB	-	-	18.6		
EF	HT	-	-	10.6		
EF	HB	-	-	18.6		
	HT	6.1	8.1	-	60 ③	140 ③
	HB	9.1	11.1	-		
EF	HT	6.1	8.1	-		
EF	HB	9.1	11.1	-		

①= EF data applies to Explosionproof coils only.

②= Some DC solenoid valves can be operated at maximum ambient temperature of 55°C / 131°F with reduced pressure ratings. See valve I&M for maximum operating pressure differential ratings.

③= Steam Service Valves have a maximum ambient temperature of 55° C/ 131°F.

Positioning

This solenoid is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area.

Wiring

Wiring must comply with local codes and the National Electrical Code. All solenoids supplied with lead wires are provided with a grounding wire which is green or green with yellow stripes and a 1/2″ conduit connection. To facilitate wiring, the solenoid may be rotated 360°. For the watertight and explosionproof solenoid, electrical fittings must be approved for use in the approved hazardous locations.

Additional Wiring Instructions For Optional Features:

- **Open-Frame solenoid with 1/4″ spade terminals.**

For solenoids supplied with screw terminal connections use #12-18 AWG stranded copper wire rated at 90°C or greater. Torque terminal block screws to10±2 in-lbs [1,0±1,2 Nm]. A tapped hole is provided in the solenoid for grounding, use a #10-32 machine screw. Torque grounding screw to 15-20 in-lbs [1,7-2,3 Nm]. On solenoids with screw terminals, the socket head screw holding the terminal block to the solenoid is the grounding screw. Torque the screw to 15-20 in-lbs [1,7-2,3 Nm] with a 5/32″ hex key wrench.

- **Junction Box**

The junction box is used with spade or screw terminal solenoids only and is provided with a grounding screw and a 1/2″ conduit connection. Connect #12-18 AWG standard copper wire only to the screw terminals. Within the junction box use field wire that is rated 90°C or greater for connections. For steam service use 105°C rated wire up to 50 psi or use 125°C rated wire above 50 psi. After electrical hookup, replace cover gasket, cover, and screws. Tighten screws evenly in a crisscross manner.

- **DIN Plug Connector Kit No. K236034**

1. The open-frame solenoid is provided with DIN terminals to accommodate the plug connector kit.
2. Remove center screw from plug connector. Using a small screwdriver, pry terminal block from connector cover.
3. Use #12-18 AWG stranded copper wire rated at 90°C or greater for connections. Strip wire leads back approximately 1/4″ for installation in socket terminals. The use of wire-end sleeves is also recommended for these socket terminals. Maximum length of wire-end sleeves to be approximately 1/4″. Tinning of the ends of the lead wires is not recommended.
4. Thread wire through gland nut, gland gasket, washer and connector cover.

NOTE: Connector housing may be rotated in 90° increments from position shown for alternate positioning of cable entry.

5. Check DIN connector terminal block for electrical markings. Then make electrical hookup to terminal block according to markings on it. Snap terminal block into connector cover and install center screw.
6. Position connector gasket on solenoid and install plug connector. Torque center screw to 5±1 in-lbs [0,6±1,1 Nm].

NOTE: Alternating current (AC) and direct current (DC) solenoids are built differently and cannot be converted from one to the other by changing the coil.

©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

Installation of Solenoid

Solenoids may be assembled as a complete unit. Tightening is accomplished by means of a hex flange at the base of the solenoid.

Installation of Panel Mounted Solenoid (See Figure 3)

Disassemble solenoid following instruction under *Solenoid Replacement* then proceed.

3/4" Valve Bonnet Construction

1. Install retainer (convex side to solenoid) in 1.312 diameter mounting hole in customer panel.
2. Position spring washer over plugnut/core tube sub-assembly.
3. Install plugnut/core tube sub-assembly through retainer in customer panel then replace solenoid, nameplate and red cap.

15/16" Valve Bonnet Construction

1. Install solenoid base sub-assembly through 0.69 diameter mounting hole in customer panel.
2. Position spring washer on opposite side of panel over solenoid base sub-assembly then replace.

Solenoid Temperature

Standard solenoids are designed for continuous duty service. When the solenoid is energized for a long period, the solenoid becomes hot and can be touched by hand only for an instant. This is a safe operating temperature.

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, turnoff electrical power, depressurize solenoid operator and/or valve, and vent fluid to a safe area before servicing.

Cleaning

All solenoid operators and valves should be cleaned periodically. The time between cleaning will vary depending on medium and service conditions. In general, if the voltage to the solenoid is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep the medium flowing through the solenoid operator or valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. Replace any worn or damaged parts.

Causes of Improper Operation

- **Faulty Control Circuit:** Check the electrical system by energizing the solenoid. A metallic *click* signifies that the solenoid is operating. Absence of the *click* indicates loss of power supply. Check for loose or blown fuses, open-circuited or grounded solenoid, broken leadwires or splice connections.
- **Burned-Out Solenoid:** Check for open-circuited solenoid. Replace if necessary. Check supply voltage; it must be the same as specified on nameplate/retainer and marked on the solenoid. Check ambient temperature and check that the core is not jammed.
- **Low Voltage:** Check voltage across the solenoid leads. Voltage must be at least 85% of rated voltage.

Solenoid Replacement

1. On solenoids with lead wires disconnect conduit, coil leads, and grounding wire.

NOTE: Any optional parts attached to the old solenoid must be reinstalled on the new solenoid.

2. Disassemble solenoids with optional features as follows:
   - **Spade or Screw Terminals**

   Remove terminal connections, grounding screw, grounding wire, and terminal block (screw terminal type only).

NOTE: For screw terminals, the socket head screw holding the terminal block serves as a grounding screw.

   - **Junction Box**

   Remove conduit and socket head screw (use 5/32″ hex key wrench) from center of junction box. Disconnect junction box from solenoid.

   - **DIN Plug Connector**

   Remove center screw from DIN plug connector. Disconnect DIN plug connector from adapter. Remove socket head screw (use 5/32″ hex key wrench), DIN terminal adapter, and gasket from solenoid.

3. Snap off red cap from top of solenoid base sub-assembly.
4. Push down on solenoid. Then using a suitable screwdriver, insert blade in slot provided between solenoid and nameplate/retainer. Pry up slightly and push to remove. Then remove solenoid from solenoid base sub-assembly.
5. Reassemble using exploded views for parts identifcation and placement.

Disassembly and Reassembly of Solenoids

1. Remove solenoid, see *Solenoid Replacement*.
2. Remove spring washer from solenoid base sub-assembly.
3. Unscrew solenoid base sub-assembly.

NOTE: Some solenoid constructions have a plugnut/core tube sub-assembly, bonnet gasket and bonnet in place of the solenoid base sub-assembly. To remove bonnet use special wrench adapter supplied in ASCO Rebuild Kit. For wrench adapter only, order ASCO Wrench Kit No. K218948.

4. The core is now accessible for cleaning or replacement.
5. If the solenoid is part of a valve, refer to basic valve installation and maintenance instructions for further disassembly.
6. Reassemble using exploded views for identification and placement of parts.

Solenoid Enclosures

Standard: Red-Hat II - Watertight, Types 1, 2, 3, 3S, 4, and 4X; Red-Hat - Type 1.

Optional: Red-Hat II - Explosionproof and Watertight, Types 3, 3S, 4, 4X, 6, 6P, 7, and 9; Red-Hat - Explosionproof and Watertight, Types 3, 4, 4X, 7, and 9.
(To order, add prefix "EF" to catalog number, except Catalog Numbers 8210B57, 8210B58, and 8210B59. Valves not available with Explosionproof enclosures.)
See Optional Features Section for other available options.

Nominal Ambient Temperature Ranges:

Red-Hat II/
Red-Hat AC: 32˚F to 125˚F (0˚C to 52˚C)
Red-Hat II DC: 32˚F to 104˚F (0˚C to 40˚C)
Red-Hat DC: 32˚F to 77˚F (0˚C to 25˚C)
(104˚F/40˚C occasionally)
Refer to Engineering Section for details.

Approvals:

CSA certified. Red-Hat II meets applicable CE directives.
Refer to Engineering Section for details.

Notes: ① 5 psi on Air; 1 psi on Water.
② Valve provided with PTFE main disc.
③ Valve includes Ultem (G.E. trademark) piston.
④ Letter "D" denotes diaphragm construction; "P" denotes piston construction.
⑤ ❍ Safety Shutoff Valve; ● General Purpose Valve. Refer to Engineering Section (Approvals) for details.
⑥ Valves not available with Explosionproof enclosures.
⑦ On 50 hertz service, the watt rating for the 6.1/F solenoid is 8.1 watts.
⑧ AC construction also has PA seating.
⑨ No disc-holder.
⑩ Stainless Steel disc-holder.
‡ Must have solenoid mounted vertical and upright.

Installation & Maintenance Instructions

2–WAY INTERNAL PILOTED–OPERATED SOLENOID VALVES
BRASS AND STAINLESS STEEL CONSTRUCTION
NORMALLY CLOSED OPERATION — 1″, 1 1/4″, & 1 1/2″ NPT

SERIES
8210
8211

Form No.V5455R5

NOTICE: See separate solenoid installation and maintenance instructions for information on: Wiring, Solenoid Temperature, Cause of Improper Operation, Coil or Solenoid Replacement.

DESCRIPTION

Series 8210 valves are 2–way normally closed internal pilot–operated solenoid valves designed for general service. Valves are made of rugged forged brass or stainless steel. Series 8210 valves are provided with a general purpose solenoid enclosure.
Series EF8210 and 8211 are the same as Series 8210 except they are provided with an explosionproof or explosionproof/watertight solenoid enclosure.

OPERATION

Normally Closed: Valve is closed when solenoid is de–energized; open when energized.

NOTE: No minimum operating pressure differential required.

Manual Operator (optional feature)

Manual operator allows manual operation when desired or during an electrical power outage. To engage manual operator (open the valve), remove operator cap and gasket base of valve. Turn manual operator stem clockwise as far as possible. Do not force operator stem. Valve will then be in the same position as when the solenoid is energized. To disengage manual operator, turn stem counterclockwise as far as possible.

⚠ CAUTION: Stem must be fully retracted counterclockwise before operating valve electrically.

Replace manual operator cap gasket and cap.

INSTALLATION

Check nameplate for correct catalog number, pressure, voltage, frequency, and service. Never apply incompatible fluids or exceed pressure rating of the valve. Installation and valve maintenance to be performed by qualified personnel.

Future Service Considerations

Provision should be made for performing seat leakage, external leakage, and operational tests on the valve with a nonhazardous, noncombustible fluid after disassembly and reassembly.

Temperature Limitations

For maximum valve ambient and fluid temperatures, refer to chart below. Check catalog number prefix and watt rating on nameplate.

Watt Rating AC/DC	Catalog Number Prefix	Coil Class	Maximum Ambient Temp.	Maximum Fluid Temp.
15.1 & 16.1 AC	None, KF, SF or SC	F	125°F (51.7°C)	180°F (82°C)
	HT, KH, ST or SU	H	140°F (60°C)	180°F (82°C)
30.6 DC	HT	H	104°F (40°C)	77°F (25°C)

Positioning

AC Construction (Alternating Current): Valve is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertical and upright so as to reduce the possibility of foreign matter accumulating in the solenoid base sub–assembly area.

DC Construction (Direct Current): Valve must be mounted with solenoid vertical and upright.

Piping

Connect piping to valve according to markings on valve body. Apply pipe compound sparingly to male pipe threads only. If applied to valve threads, the compound may enter the valve and cause operational difficulty. Avoid pipe strain by properly supporting and aligning piping. When tightening the pipe, do not use valve or solenoid as a lever. Locate wrenches applied to valve body or piping as close as possible to connection point.

⚠ CAUTION: To protect the solenoid valve, install a strainer or filter suitable for the service involved in the inlet side as close to the valve as possible. Clean periodically depending on service conditions. See ASCO Series 8600, 8601 and 8602 for strainers.

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, turn off electrical power, depressurize valve, and vent fluid to a safe area before servicing the valve.

NOTE: It is not necessary to remove the valve from the pipeline for repairs.

Cleaning

All solenoid valves should be cleaned periodically. The time between cleanings will vary depending on the medium and service conditions. In general, if the voltage to the coil is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. In the extreme case, faulty valve operation will occur and the valve may fail to open or close. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep the medium flowing through the valve as free from dirt and foreign material as possible.
- While in service, the valve should be operated at least once a month to insure proper opening and closing.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Causes of Improper Operation

- **Incorrect Pressure:** Check valve pressure. Pressure to valve must be within range specified on nameplate.
- **Excessive Leakage:** Disassemble valve and clean all parts. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

Valve Disassembly

1. Disassemble valve in an orderly fashion using exploded views for identification and placement of parts. Refer to Figure 2 for AC construction; Figure 3 for DC construction.
2. Remove solenoid enclosure. See separate instructions.
3. Unscrew solenoid base sub−assembly. For DC construction, a special wrench is supplied in ASCO Rebuild Kit. For wrench only, Order ASCO Wrench Kit No. K168146−001.
4. Remove bonnet screws, valve bonnet,bonnet gasket, spring retainer (AC construction only) core spring, core/diaphragm sub−assembly and body gasket.
5. For valves equipped with a manual operator, remove cap, cap gasket, bonnet and bonnet gasket. Remove stem assembly with stem gasket from bonnet.
6. All parts are now accessible for cleaning or replacement. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Valve Reassembly

1. Lubricate all gaskets and the disc at the base of the core /diaphragm sub−assembly with DOW CORNING 111® Compound lubricant or an equivalent high−grade silicone grease.
2. Replace body gasket and core/diaphragm sub−assembly. Locate bleed hole in core/diaphragm sub−assembly directly over valve outlet. For 1 1/2″ NPT construction, locate bleed hole in core/diaphragm sub−assembly approximately 30° from valve outlet.
3. Replace core spring and spring retainer (AC construction only). Install small end of core spring in core first, wide end protruding from top of core. For DC construction, install core spring, small end down toward valve body.
4. Replace valve bonnet and bonnet screws. Hand tighten bonnet screws as far as possible.

IMPORTANT: Press firmly down on core/diaphragm sub−assembly to seat diaphragm assembly against valve seat. While holding this position, torque bonnet screws in a crisscross manner to 144 ± 15 in−lbs [16,3 ± 1,7 Nm].

5. Replace bonnet gasket and solenoid base sub−assembly. Torque solenoid base sub−assembly to 175 ± 25 in−lbs [19,8 ± 2,8 Nm]. For DC construction, the solenoid base sub−assembly must be placed inside the housing before assembling into the valve body. Before doing this, read separate lubrication instructions in ***Solenoid Installation & Maintenance Instructions.***
6. For valves provided with a manual operator, replace stem assembly and bonnet (with gaskets). Torque bonnet to 75 ± 10 in−lbs [8,5 ± 1,1 Nm]. Replace cap gasket and cap.
7. Install solenoid. See separate instructions.

⚠ **WARNING: To prevent the possibility of death, serious injury or property damage, check valve for proper operation before returning to service. Also perform internal seat and external leakage tests with a nonhazardous, noncombustible fluid.**

8. Restore line pressure and electrical power supply to valve.
9. After maintenance is completed, operate the valve a few times to be sure of proper operation. A metallic *click* signifies the solenoid is operating.

ORDERING INFORMATION

FOR ASCO REBUILD KITS

Parts marked with an asterisk (*) in the exploded view are supplied in Rebuild Kits. When Ordering Rebuild Kits for ASCO valves, order the Rebuild Kit number stamped on the valve nameplate. If the number of the kit is not visible, order by indicating the number of kits required, and the Catalog Number and Serial Number of the valve(s) for which they are intended.

SERIES 8016G/H

— SERVICE NOTICE —

ASCO™ solenoid valves with design change letter "G" or "H" in the catalog number (ex. 8210G1) have an epoxy encapsulated ASCO Red Hat II® solenoid. This solenoid replaces some of the solenoids with metal enclosures and open-frame constructions. Follow these installation and maintenance instructions if your valve or operator uses this solenoid.

DESCRIPTION

Catalog numbers 8016G/H1 and 8016G/H2 are epoxy encapsulated pull-type solenoids. The green solenoid with lead wires and 1/2 conduit connection is designed to meet Enclosure Type 1-General Purpose, Type 2-Dripproof, Types 3 and 3S-Raintight, and Types 4 and 4X-Watertight. The black solenoid on catalog numbers prefixed "EF" is designed to meet Enclosure Types 3 and 3S-Raintight, Types 4 and 4X-Watertight, Types 6 and 6P-Submersible, Type7, Explosionproof Class I, Division1 Groups A, B, C, & D and Type 9, -Dust-Ignitionproof Class II, Division1 Groups E, F & G. The Class II, Groups F & G Dust Locations designation is not applicable for solenoids or solenoid valves used for steam service or when a class "H" solenoid is used. See *Temperature Limitations* section for solenoid identification and nameplate/retainer for service. When installed just as a solenoid and not attached to an ASCO valve, the core has a 0.250-28 UNF-2B tapped hole, 0.38 minimum full thread.

Series 8016G/H are available in:

- **Open-Frame Construction:** The green solenoid may be supplied with 1/4″ spade, screw or DIN terminals. (Refer to Figure 4)
- **Panel Mounted Construction:** These solenoids are specifically designed to be panel mounted by the customer through a panel having a .062 to .093 maximum wall thickness. (Refer to Figure 3 and section on *Installation of Panel Mounted Solenoid*).

Optional Features For Type 1 - General Purpose Construction Only

- **Junction Box:** This junction box construction meets Enclosure Types 2, 3, 3S, 4, and 4X. Only solenoids with 1/4″ spade or screw terminals may have a junction box. The junction box provides a 1/2″ conduit connection, grounding and spade or screw terminal connections within the junction box (See Figure 5).
- **DIN Plug Connector Kit No. K236034:** Use this kit only for solenoids with DIN terminals. The DIN plug connector kit provides a two pole with grounding contact DIN Type 43650 construction (See Figure 6).

OPERATION

When the solenoid is energized, the core is drawn into the solenoid base sub-assembly.

IMPORTANT: When the solenoid is de-energized, the initial return force for the core, whether developed by spring, pressure, or weight, must exert a minimum force to overcome residual magnetism created by the solenoid. Minimum return force for AC construction is 0.69lbs (3.1N) and 0.31 lbs (1.38N) for DC.

INSTALLATION

Check nameplate for correct catalog number, service, and wattage. Check front of solenoid for voltage and frequency.

⚠ WARNING: Electrical hazard from the accessibility of live parts. To prevent the possibility of death, serious injury or property damage, install the open - frame solenoid in an enclosure.

FOR BLACK ENCLOSURE TYPES 7 AND 9 ONLY

⚠CAUTION: To prevent fire or explosion, do not install solenoid and/or valve where ignition temperature of hazardous atmosphere is less than 165°C. On valves used for steam service or when a class "H" solenoid is used, do not install in hazardous atmosphere where ignition temperature is less than 180°C. See nameplate/retainer for service.

NOTE: These solenoids have an internal non-resetable thermal fuse to limit solenoid temperature in the event that extraordinary conditions occur which could cause excessive temperatures. These conditions include high input voltage, a jammed core, excessive ambient temperature or a shorted solenoid, etc. This unique feature is a standard feature only in solenoids with black explosionproof/dust-ignitionproof enclosures (Types 7 & 9).

⚠CAUTION: To protect the solenoid valve or operator, install a strainer or filter, suitable for the service involved in the inlet side as close to the valve or operator as possible. Clean periodically depending on service conditions. See ASCO Series 8600 and 8601 for strainers.

Temperature Limitations

For maximum valve ambient temperatures, refer to chart. The temperature limitations listed, only indicate maximum application temperatures for field wiring rated at 90°C. Check catalog number prefix and watt rating on nameplate to determine maximum ambient temperature. See valve installation and maintenance instructions for maximum fluid temperature.

 All Rights Reserved.

©ASCO Valve, Inc.® 50 Hanover Road, Florham Park, New Jersey 07932

NOTE: For steam service, refer to *Wiring* section, *Junction Box* for temperature rating of supply wires.

Temperature Limitations For Series 8016G Solenoids for use on Valves Rated at 6.1, 8.1, 9.1, 10.6 or 11.1 Watts			
Watt Rating	Catalog Number Coil Prefix	Class of Insulation	Maximum § Ambient Temp.
6.1, 8.1, 9.1 & 11.1	None, FB, KF, KP, SC, SD, SF & SP	F	125°F (52°C)
6.1, 8.1, 9.1 & 11.1	HB, HT, KB, KH, SS, ST & SU	H	140°F (60°C)
10.6**	None, KF, SF, SC, HT, KH, ST & SU	F & H	104°F (40°C)
7.1 @ 60Hz (8.1 @ 50Hz)		F & H	175°F (79°C)*
10.6**		F & H	140°F (60°C)

§ Minimum ambient temperature -40°F (-40°C).

* When used with watertight aluminum junction boxers (screw or spade) max. ambient and fluid temperature will be reduced to 157°F (69.4°C)

** 10.6 Watt solenoids rated for 104°F are 8030, 8260, 8316, 8321, 8320, 8360 & 8344 valves while those rated for 140°F are 8040 valves

Temperature Limitations for Series 8003H, 8007H and 8202H solenoids						
		Watt Ratings			Maximum Ambient Temperature	
Prefix ①	Coil Class	AC		DC		
		60 Hz	50 Hz		°C	°F
EF	FT	6.1	8.1	-	52	125
EF	FB	9.1	11.1	-		
	FT	6.1	8.1	-	55	131
	FB	9.1	11.1	-		
	HT	-	-	10.6	40 ②	104②
	HB	-	-	18.6		
EF	HT	-	-	10.6		
EF	HB	-	-	18.6		
	HT	6.1	8.1	-	60 ③	140 ③
	HB	9.1	11.1	-		
EF	HT	6.1	8.1	-		
EF	HB	9.1	11.1	-		

①= EF data applies to Explosionproof coils only.

②= Some DC solenoid valves can be operated at maximum ambient temperature of 55°C / 131°F with reduced pressure ratings. See valve I&M for maximum operating pressure differential ratings.

③= Steam Service Valves have a maximum ambient temperature of 55° C/ 131°F.

Positioning

This solenoid is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area.

Wiring

Wiring must comply with local codes and the National Electrical Code. All solenoids supplied with lead wires are provided with a grounding wire which is green or green with yellow stripes and a 1/2″ conduit connection. To facilitate wiring, the solenoid may be rotated 360°. For the watertight and explosionproof solenoid, electrical fittings must be approved for use in the approved hazardous locations.

Additional Wiring Instructions For Optional Features:

- **Open-Frame solenoid with 1/4″ spade terminals.**

For solenoids supplied with screw terminal connections use #12-18 AWG stranded copper wire rated at 90°C or greater. Torque terminal block screws to10±2 in-lbs [1,0±1,2 Nm]. A tapped hole is provided in the solenoid for grounding, use a #10-32 machine screw. Torque grounding screw to 15-20 in-lbs [1,7-2,3 Nm]. On solenoids with screw terminals, the socket head screw holding the terminal block to the solenoid is the grounding screw. Torque the screw to 15-20 in-lbs [1,7-2,3 Nm] with a 5/32″ hex key wrench.

- **Junction Box**

The junction box is used with spade or screw terminal solenoids only and is provided with a grounding screw and a 1/2″ conduit connection. Connect #12-18 AWG standard copper wire only to the screw terminals. Within the junction box use field wire that is rated 90°C or greater for connections. For steam service use 105°C rated wire up to 50 psi or use 125°C rated wire above 50 psi. After electrical hookup, replace cover gasket, cover, and screws. Tighten screws evenly in a crisscross manner.

- **DIN Plug Connector Kit No. K236034**

1. The open-frame solenoid is provided with DIN terminals to accommodate the plug connector kit.
2. Remove center screw from plug connector. Using a small screwdriver, pry terminal block from connector cover.
3. Use #12-18 AWG stranded copper wire rated at 90°C or greater for connections. Strip wire leads back approximately 1/4″ for installation in socket terminals. The use of wire-end sleeves is also recommended for these socket terminals. Maximum length of wire-end sleeves to be approximately 1/4″. Tinning of the ends of the lead wires is not recommended.
4. Thread wire through gland nut, gland gasket, washer and connector cover.

NOTE: Connector housing may be rotated in 90° increments from position shown for alternate positioning of cable entry.

5. Check DIN connector terminal block for electrical markings. Then make electrical hookup to terminal block according to markings on it. Snap terminal block into connector cover and install center screw.
6. Position connector gasket on solenoid and install plug connector. Torque center screw to 5±1 in-lbs [0,6±1,1 Nm].

NOTE: Alternating current (AC) and direct current (DC) solenoids are built differently and cannot be converted from one to the other by changing the coil.

©ASCO Valve, Inc. 50 Hanover Road, Florham Park, New Jersey 07932 www.ascovalve.com

Installation of Solenoid

Solenoids may be assembled as a complete unit. Tightening is accomplished by means of a hex flange at the base of the solenoid.

Installation of Panel Mounted Solenoid (See Figure 3)

Disassemble solenoid following instruction under *Solenoid Replacement* then proceed.

3/4" Valve Bonnet Construction

1. Install retainer (convex side to solenoid) in 1.312 diameter mounting hole in customer panel.
2. Position spring washer over plugnut/core tube sub-assembly.
3. Install plugnut/core tube sub-assembly through retainer in customer panel then replace solenoid, nameplate and red cap.

15/16" Valve Bonnet Construction

1. Install solenoid base sub-assembly through 0.69 diameter mounting hole in customer panel.
2. Position spring washer on opposite side of panel over solenoid base sub-assembly then replace.

Solenoid Temperature

Standard solenoids are designed for continuous duty service. When the solenoid is energized for a long period, the solenoid becomes hot and can be touched by hand only for an instant. This is a safe operating temperature.

MAINTENANCE

⚠ WARNING: To prevent the possibility of death, serious injury or property damage, turnoff electrical power, depressurize solenoid operator and/or valve, and vent fluid to a safe area before servicing.

Cleaning

All solenoid operators and valves should be cleaned periodically. The time between cleaning will vary depending on medium and service conditions. In general, if the voltage to the solenoid is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep the medium flowing through the solenoid operator or valve as free from dirt and foreign material as possible.
- Periodic exercise of the valve should be considered if ambient or fluid conditions are such that corrosion, elastomer degradation, fluid contamination build up, or other conditions that could impede solenoid valve shifting are possible. The actual frequency of exercise necessary will depend on specific operating conditions. A successful operating history is the best indication of a proper interval between exercise cycles.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. Replace any worn or damaged parts.

Causes of Improper Operation

- **Faulty Control Circuit:** Check the electrical system by energizing the solenoid. A metallic *click* signifies that the solenoid is operating. Absence of the *click* indicates loss of power supply. Check for loose or blown fuses, open-circuited or grounded solenoid, broken leadwires or splice connections.
- **Burned-Out Solenoid:** Check for open-circuited solenoid. Replace if necessary. Check supply voltage; it must be the same as specified on nameplate/retainer and marked on the solenoid. Check ambient temperature and check that the core is not jammed.
- **Low Voltage:** Check voltage across the solenoid leads. Voltage must be at least 85% of rated voltage.

Solenoid Replacement

1. On solenoids with lead wires disconnect conduit, coil leads, and grounding wire.

NOTE: Any optional parts attached to the old solenoid must be reinstalled on the new solenoid.

2. Disassemble solenoids with optional features as follows:
   - **Spade or Screw Terminals**

   Remove terminal connections, grounding screw, grounding wire, and terminal block (screw terminal type only).

NOTE: For screw terminals, the socket head screw holding the terminal block serves as a grounding screw.

   - **Junction Box**

   Remove conduit and socket head screw (use 5/32″ hex key wrench) from center of junction box. Disconnect junction box from solenoid.

   - **DIN Plug Connector**

   Remove center screw from DIN plug connector. Disconnect DIN plug connector from adapter. Remove socket head screw (use 5/32″ hex key wrench), DIN terminal adapter, and gasket from solenoid.

3. Snap off red cap from top of solenoid base sub-assembly.
4. Push down on solenoid. Then using a suitable screwdriver, insert blade in slot provided between solenoid and nameplate/retainer. Pry up slightly and push to remove. Then remove solenoid from solenoid base sub-assembly.
5. Reassemble using exploded views for parts identifcation and placement.

Disassembly and Reassembly of Solenoids

1. Remove solenoid, see *Solenoid Replacement*.
2. Remove spring washer from solenoid base sub-assembly.
3. Unscrew solenoid base sub-assembly.

NOTE: Some solenoid constructions have a plugnut/core tube sub-assembly, bonnet gasket and bonnet in place of the solenoid base sub-assembly. To remove bonnet use special wrench adapter supplied in ASCO Rebuild Kit. For wrench adapter only, order ASCO Wrench Kit No. K218948.

4. The core is now accessible for cleaning or replacement.
5. If the solenoid is part of a valve, refer to basic valve installation and maintenance instructions for further disassembly.
6. Reassemble using exploded views for identification and placement of parts.

Ultrasonic Level Controller and Sensor(s)

This page intentionally left blank

Overview

HydroRanger 200 HMI is an ultrasonic level controller for up to six pumps and provides control, differential control, and open channel flow monitoring.

Benefits

- Easy to use HMI display with local four-button programming, menu-driven parameters, and Wizard support for key applications
- English, German, French, Spanish, Chinese, Italian, Portuguese, and Russian texts on the HMI
- Removable terminal blocks for ease of wiring
- Monitors wet wells, weirs and flumes
- Digital communications with built-in Modbus RTU via RS 485
- Compatible with SmartLinx system and SIMATIC PDM configuration software
- Single or dual point level monitoring
- 6 relays
- Auto False-Echo Suppression for fixed obstruction avoidance
- Anti-grease ring/tide mark build-up
- Differential amplifier transceiver for common mode noise rejection and improved signal-to-noise ratio
- Wall and panel mounting options

Application

For water authorities, municipal water, and wastewater plants, HydroRanger 200 HMI is an economical, low-maintenance solution delivering control efficiency and productivity needed to meet today's exacting standards. It offers single point monitoring with all models, and optional dual-point monitoring with 6 relay model. As well, it has digital communications with built-in Modbus RTU via RS 485.

The standard 6 relay HydroRanger 200 HMI will monitor open channel flow and features advanced relay alarming and pump control functions as well as volume conversion. It is compatible with SIMATIC PDM, allowing for PC configuration and set-up. Sonic Intelligence advanced echo-processing software provides increased reading reliability.

HydroRanger 200 HMI uses proven continuous ultrasonic echo ranging technology to monitor water and wastewater of any consistency up to 15 m (50 ft) in depth. Achievable resolution is 0.1 % with accuracy to 0.25 % of range. Unlike contacting devices, HydroRanger 200 HMI is immune to problems caused by suspended solids, harsh corrosives, grease or silt in the effluent, reducing downtime.

- Key Applications: wet wells, flumes/weirs, bar screen control

Technical specifications

Mode of Operation	
Measuring principle	Ultrasonic level measurement
Measuring range	0.3 ... 15 m (1 ... 50 ft), transducer dependent
Measuring points	1 or 2
Input	
Analog	0 ... 20 mA or 4 ... 20 mA, from alternate device, scalable (6 relay model)
Discrete	10 ... 50 V DC switching level Logical 0 ≤ 0.5 V DC Logical 1 = 10 ... 50 V DC Max. 3 mA
Output	
EchoMax transducer	44 kHz
Ultrasonic transducer	Compatible transducers: ST-H and EchoMax series XPS-10, XPS-15/15F, and XRS-5
Relays[1]	Rating 5 A at 250 V AC, non-inductive
• Model with 6 relays	4 SPST Form A/2 SPDT Form C
mA output	0 ... 20 mA or 4 ... 20 mA
• Max. load	750 Ω, isolated
• Resolution	0.1 % of range
Accuracy	
Error in measurement	0.25 % of range or 6 mm (0.24 inch), whichever is greater
Resolution	0.1 % of measuring range or 2 mm (0.08 inch), whichever is greater[2]
Temperature compensation	• -50 ... +150 °C (-58 ... +302 °F) • Integral temperature sensor in transducer • External TS-3 temperature sensor (optional) • Programmable fixed temperature values
Rated operating conditions	
Installation conditions	
• Location	Indoor / outdoor
• Installation category	II
• Pollution degree	4
Ambient conditions	
• Ambient temperature (enclosure)	-20 ... +50 °C (-4 ... +122 °F)

Design	
Weight	
• Wall mount	1.37 kg (3.02 lb)
• Panel mount	1.50 kg (3.31 lb)
Material (enclosure)	Polycarbonate
Degree of protection (enclosure)	
• Wall mount	IP65/Type 4X/NEMA 4X
• Panel mount	IP54/Type 3/NEMA 3
Cable	
• Transducer and mA output signal	2-core copper conductor, twisted, shielded, 300 Vrms, 0.82 mm² (18 AWG), Belden 8 760 or equivalent is acceptable
• Max. separation between transducer and transceiver	365 m (1 200 ft)
Displays and controls	60 x 40 mm (2.36 x 1.57 inch) LCD 240 x 160 pixels resolution
Power supply[3]	
AC version	100 ... 230 V AC ± 15 %, 50/60 Hz, 36 VA (17 W)
DC version	12 ... 30 V DC (20 W)
Certificates and approvals	• CE, RCM[4] • FM, $CSA_{US/C}$, UL listed • $CSA_{US/C}$ Class I, Div. 2, Groups A, B, C and D, Class II, Div. 2, Groups F and G, Class III (wall mount only) • MCERTS Class 2 approved for Open Channel Flow
Communication	• RS 232 with Modbus RTU or ASCII via RJ-11 connector • RS 485 with Modbus RTU or ASCII via terminal blocks • Optional: SmartLinx cards for - PROFIBUS DPV1 - DeviceNet

1) All relays certified for use with equipment that fails in a state at or under the rated maximums of the relays.

2) Program range is defined as the empty distance to the face of the transducer plus any range extension.

3) Maximum power consumption is listed.

4) EMC performance available upon request.

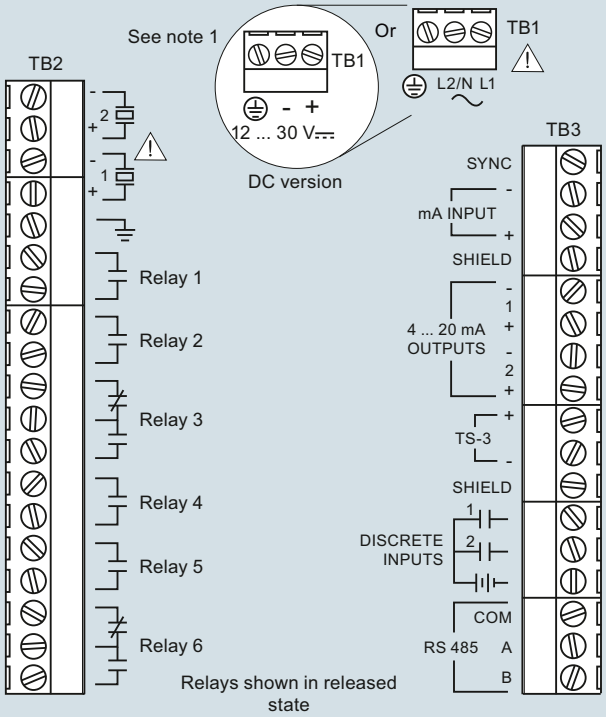
HydroRanger 200 HMI, dimensions in mm (inch)

Schematics



Note:

1. Use 2-core copper wire, twisted, with shield, for expansion up to 365 m (1 200 ft). Route cable in grounded metal conduit, separate from other cables.
2. Verify that all system components are installed in accordance with instructions.
3. Connect all cable shields to the MultiRanger shield connections. Avoid differential ground potentials by not connecting cable shields to ground (earth) anywhere else.
4. Keep exposed conductors on shielded cables as short as possible to reduce noise on the line caused by stray transmissions and noise pickup.

Overview

ST-H transducers use ultrasonic technology to measure level in chemical storage and liquid tanks.

Benefits

- Can be mounted on a 2" (50.8 mm) standpipe
- Immune to corrosive and harsh environments
- Integral temperature sensor

Application

The narrow design of the ST-H allows the transducer to be mounted on a 2" (50.8 mm) standpipe. When mounted correctly, it is completely protected from the process and can even be used in harsh, corrosive environments.

During operation, the ultrasonic transducer emits acoustic pulses in a narrow beam perpendicular to the transducer face. The level transceiver measures the propagation time between pulse emission and reception of the echo to calculate the distance from the transducer to the material. Variations in sound velocity due to changes in temperature within the permissible range are automatically compensated by the integral temperature sensor.

- Key Applications: chemical storage, liquid tanks

Technical specifications

Mode of operation	
Measuring principle	Ultrasonic transducer
Input	
Measuring range	0.3 ... 10 m (1 ... 33 ft)
Output	
Frequency	44 kHz
Beam angle	12°
Accuracy

Water Strainer

This page intentionally left blank

KECKLEY

Style F-150

Y-Strainer
Cast Bronze (ASTM B 584, C84400)
125 lb. Threaded

Style E-150

Y-Strainer
Cast Bronze (ASTM B 584, C84400)
125 lb. Solder Joint

Cast Bronze Y-Strainer

APPLICATIONS

Steam, water, oil or gas where protection from foreign matter in a pipeline is required.

CONSTRUCTION

The Keckley Style F-150 & E-150 stainers are constructed from the finest bronze castings and are machined to exacting specifications.

Solder Joint Ends are in compliance with ASME B16.8 unless otherwise specified.

FEATURES

The Keckley Style F-150& E-150 strainers feature a machined seat in the body and cap for propper alignment and to ensure accurate reseating when servicing is required. These strainers have a straight threaded cap and are furnished standard with a NPT blow-off connection. The gasket is a flat fiber gasket that is compressed between the body and cap for maximum strength and durability. Keckley Style F-150 & E-150 strainers are furnished with a bronze blow-off plug unless otherwise specified.

SCREENS

Standard screens are 20 mesh 304 stainless steel through size 2". Sizes 2-1/2", 3" and 4" are furnished with 3/64" perforated 304 stainless steel screens. All screens are spot welded for maximum strength. Different size perforations and meshes are available in stainless steel, monel, and brass to meet specific media requirements.

SELF CLEANING

Self cleaning is accomplished by opening the valve or drain plug connected to the blow-off port. **Warning:** See Maintenance Instructions on page S6 of the Strainer Information Section for additional precautions and detailed information on servicing the strainer.

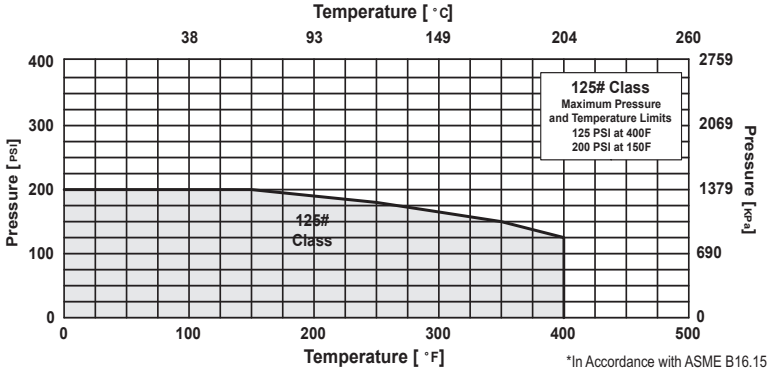
PRESSURE vs. TEMPERATURE CHART
125# Threaded & Solder Joint Bronze (ASTM B 548, C84400)



*In Accordance with ASME B16.15

KECKLEY

PRESSURE DROP CHART

Threaded "Y" Pattern Strainers (Styles B, BDI, E-150, F-150, F-300, SB, SB-7, SSB and SSB-7)

This pressure drop chart is based on the flow of clean water through the Keckley "Y" strainers listed above with screen perforations ranging from 3/64" through 1/8" and is additionally for use with those units equipped with a 20 mesh screen as standard.

TO USE CHARTS:

Find your desired rate of flow (GPM) on the left hand side of the chart. Follow its corresponding horizontal line to the point where it intersects the diagonal line indicating the strainer pipe size. From this point of intersection, follow the vertical line down to the bottom of the chart to determine the approximate pressure drop.

CORRECTION FACTORS:

For finer mesh screens that are backed with a perforated sheet, multiply the pressure drops shown at right by the following:

40 mesh	x 1.2
60 mesh	x 1.4
80 mesh	x 1.6
100 mesh	x 1.7

Series 15M2
Water Hammer Arrestors

Sizes: ½" - 1" (15-25mm)

15M2

What is Water Hammer?

The noise from banging pipes is caused by shocks of high speed water flowing in the piping system when a fixture is suddenly closed. Sudden stoppage of the water (a non-compressible liquid) flowing at a given pressure and velocity causes a surge or spike of pressure and is called water hammer. When this occurs, a pressure wave travels back through the piping until it finds a point of relief.

Dishwashers, clothes washers, fast closing positive shutoff valves incorporated in the system all contribute to creating water shock which is not only annoying but damaging to pipes and appliances. The Watts Series 15M2 incorporates a pre-charged, permanent sealed air chamber to absorb the shock. The sealed chamber prevents the loss of air to the water and insures long and trouble-free life.

Features

- NPT solid hex brass adapter or solder end connection for easy installation
- Approved for installation with no access panel required
- May be installed in new or existing plumbing systems with a standard pipe tee vertically, horizontally or at any angle
- PDI Listed (PDI WH201)
- Maintenance free – piston is the only moving part
- Air pre-load is 60psi (4.2 bar)
- Factory air charged and permanently sealed

Standards

Standard: Listed by IAPMO, ASSE 1010 approved, ANSI A112.26.1M approved, PDI WH201 approved and certified.

Pressure - Temperature

Operating Pressure: Designed to operate on all domestic and commercial lines @ 150psi (10.6 bar) working pressure.

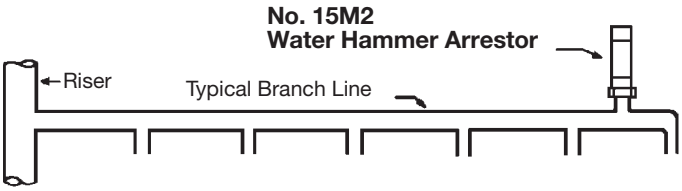
Temperature Range: 33°F to 180°F (0.5°C to 82°C).

Materials

Body:	Copper tubing
Piston:	Polypropylene
Adapter:	Brass
O-ring:	EPDM

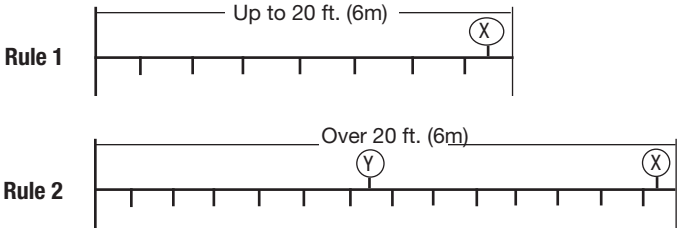
Watts product specifications in U.S. customary units and metric are approximate and are provided for reference only. For precise measurements, please contact Watts Technical Service. Watts reserves the right to change or modify product design, construction, specifications, or materials without prior notice and without incurring any obligation to make such changes and modifications on Watts products previously or subsequently sold.

Sizing and Placement



As shown, it has been established that the preferred location for the water hammer arrestor is at the end of the branch line between the last two fixtures served.

The location of the water hammer arrestor shown above applies to branch lines that do not exceed 20 ft. (6m) in length, from the start of the horizontal branch line to the last fixture supply on this branch line. When the branch line exceeds the 20 ft. (6m) length, an additional water hammer arrestor should be used. This practice is best defined by two rules which have been established to cover the placement of water hammer arrestors.



Rule 1 covers multiple fixture branch lines which do not exceed 20 ft. (6m) in length.

Explanation - Fixture-unit sizing and selection table is used to select the required PDI unit (water hammer arrestor).

Rule 2 covers multiple fixture branch lines which do exceed 20 ft. (6m) in length.

Explanation - Fixture-unit sizing and selection table is used to select the required PDI unit (water hammer arrestor). The sum of the fixture units rating of units X and Y shall be equal to or greater than the demand of the branches.

System pro *M* compact®
Miniature Circuit Breaker SU200 M
for branch circuit protection acc. to UL 489

03-001-124

The miniature circuit breaker SU200 M is ABB's solution for UL 489 branch circuit protection up to 480 Y/277 V AC and 96 V DC. This circuit breaker is an all-round device for AC and DC applications for universal use in North American and global markets due to its approvals acc. to the international standards UL, CSA and IEC. Moreover, SU200 M is fully compatible with System pro *M* compact® UL 489 accessories.

Features

- High performance MCB with 10 kA interrupting capacity acc. to UL 489 / CSA 22.2 No. 5 and 15 kA breaking capacity acc. to IEC/EN 60947-2
- Certified up to I_n = 40 A at 480 Y/277 V AC acc. to UL 489 / CSA 22.2 No. 5
- Certified for AC and DC use acc. to UL and CSA
- 40 °C reference temperature acc. to UL and CSA
- Current limiting acc. to UL 489
- Clear contact position indication in red/green ("real CPI")

Monitoring Relays
1-Phase True RMS AC Over or Under Current
Type DIB01 100A

04-094-000

Ordering Key

DIB 01 C M24 100A

- Housing
- Function
- Type
- Item number
- Output
- Power supply
- Measuring range

Input Specifications

Input (current level)		
DIB01 100A	Built-in current transformer	
Measuring ranges		
Selectable by DIP-switch		**Max current**
2 to 20 A AC		120 A
5 to 50 A AC		120 A
10 to 100 A AC		120 A
Max. current for 30 s	250 A	
Max. current for 1 s	2000 A	

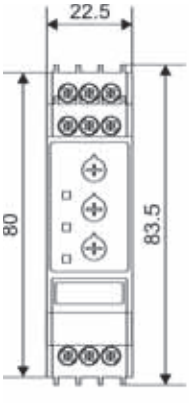
Contact input	
DIB01	Terminals A1, Y1
Disabled	Open
Enabled	< 10 kΩ
Latch disable	> 500 ms

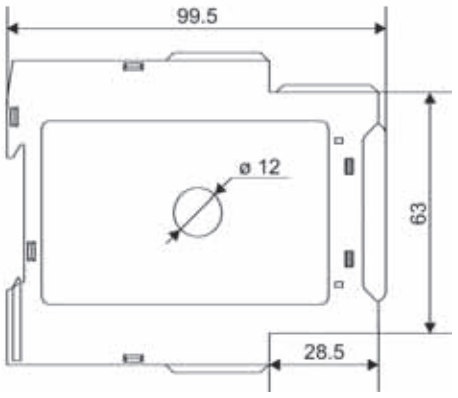
Supply Specifications

Power supply	Overvoltage cat. III (IEC 60664, IEC 60038)
Rated operational voltage through terminals:	
A1, A2	24 VDC - 15% +10% 24 to 240 VAC ± 15% 45 to 65 Hz
Dielectric voltage	
Supply to input	4 kV
Supply to output	4 kV
Input to output	4 kV
Rated operational power	
DC	1 W
AC	1 W / 35 VA

Output Specifications

Output		SPDT relay
Rated insulation voltage		250 VAC
Contact ratings ($AgSnO_2$)		μ
Resistive loads	AC 1	8 A @ 250 VAC
	DC 12	5 A @ 24 VDC
Small inductive loads	AC 15	2.5 A @ 250 VAC
	DC 13	2.5 A @ 24 VDC
Mechanical life		≥ 30 x 10^6 operations
Electrical life		≥ 10^5 operations (at 8 A, 250 V, cos φ = 1)
Operating frequency		≤ 7200 operations/h
Dielectric strength		
Dielectric voltage		≥ 2 kVAC (rms)
Rated impulse withstand volt.		4 kV (1.2/50 μs)





Approvals UL, CSA

Zelio® Plug-in Relays
RXM

Telemecanique

06-058-011

RXM●AB2F7

RXM Miniature Relays (page 4)

2 pole relays; 12 A, 1/2 hp (IEC rating = 12 A)
3 pole relays; 10 A, 1/3 hp (IEC rating = 10 A)
4 pole relays; 8 A, 1/3 hp (IEC rating = 6 A)
4 pole relays; 3 A (low level), 1/16 hp (IEC rating = 3 A)

- Mechanical "relay status" indicator on all relays
- Pilot light option available
- Manual operator optional for all relays
- Built-in marking area

Insulation characteristics

Rated insulation voltage (Ui)		250 V (IEC), 300 V (UL, CSA)
Rated impulse withstand voltage (Uimp)		3.6 kV (1.2/50 µs)
Dielectric strength (rms voltage)	Between coil and contact	2,500 Vac
	Between poles	2,500 Vac
	Between contacts	1,500 Vac

Contact characteristics

Relay type			**RXM2AB●●●**	**RXM3AB●●●**	**RXM4AB●●●**
Number and type of contacts (see page 12)			DPDT	3PDT	4PDT
Contact materials			AgNi		
Conventional thermal current (Ith)	For ambient temperature ≤ 131 °F (55 °C)		12 A	10 A	6 A
Rated operational current	Conforming to IEC in utilization category AC-1	N.O.	12 A	10 A	6 A
		N.C.	6 A	5 A	3 A
	Conforming to UL Resistive @277 Vac, hp @120 Vac		12 A, 1/2 hp	10 A, 1/3 hp	8 A, 1/3 hp
Maximum operating rate In operating cycles/hour	No load		18,000		
	Under load		1,200		
Switching voltage	Maximum		250 Vac/Vdc		
Switching capacity	Minimum		10 mA on 17 V		
	Maximum		3,000 VA	2,500 VA	1,500 VA
Utilization coefficient			20%		
Mechanical durability in millions of operating cycles			10		
Electrical durability in millions of operating cycles	Resistive load		0.1		

Coil characteristics

Average consumption		AC	1.2 VA
		DC	0.9 W
Drop-out voltage threshold		AC	> 0.15 Uc
		DC	> 0.1 Uc
Operating time (response time)	Between coil energization and making of the N.O. contact	AC	20 ms
		DC	20 ms
	Between coil de-energization and making of the N.C. contact	AC	20 ms
		DC	20 ms

Coil voltage Uc			**12 V**	**24 V**	**48 V**	**110 V**	**120 V**	**125 V**	**220 V**	**230 V**	**240 V**

CONTINUOUS HINGE WITH CLAMPS TYPE 4X WALL-MOUNT ENCLOSURES

PENTAIR

11-035-279

ENCLOSURE CATALOG NUMBER	ENCLOSURE DIMENSIONS (IN.)	SUB-PANEL CATALOG NUMBER
A-AHBCSS6LP	A x B x C	A APB

NOTE: 6 indicates 316 Stainless Steel.

APPLICATION

For use in indoor and outdoor corrosive environments that require a water-tight seal, this enclosure's seamless foam-in-place gasket and screw-down clamps provide a secure seal against contaminants.

SPECIFICATIONS

- 14 gauge Type 304 or Type 316L stainless steel bodies and doors
- Seams continuously welded and ground smooth
- Seamless foam-in-place gasket
- Rolled lip around three sides of door
- Stainless steel door clamp assembly
- Hasp and staple for padlocking
- Door removed by pulling stainless steel continuous hinge pin
- Data pocket is high-impact thermoplastic
- Collar studs provided for mounting optional panels
- Exterior hardware on Type 316L stainless steel enclosures matches enclosure material
- Bonding provision on door; grounding stud on body

FINISH

Door, sides, top and bottom have smooth #4 brushed finish.

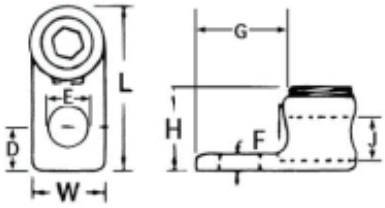
Copper Connectors
T&B Catalog Number: L70
UPC Number: 78378613002
Status: Active
Description:

Type L - Copper Single Conductor, One-Hole Mount for Conductor Range 14 Sol.-4 Str.



Features

	Cold forged from pure electrolytic copper with 99 percent conductivity.

General

Style	Type L - Copper Single Conductor, One-Hole Mount
Material	Copper
Wire Range	14 Sol.-4 Str.

Dimension Information

Length (inches)	1 1/8
Width (inches)	17/32
Height (inches)	35/64
D (inches)	9/32
E (inches)	9/32
F (inches)	3/32
G (inches)	21/32

UWZ Series
AC Hour Meters

INTERMATIC

16-031-000

The UWZ Series Hour Meters are designed to meet IP20 environmental ratings for indoor applications. All models can withstand an IP20 rating or an IP52 rating with the use of a gasket. All models have a light gray color on black background. Tenths and hundreths numerals are yellow. An orange dial adjacent to the hundreths digit provides running indication.

UWZ48V - DIN Rail Mount

A special snap-on socket base enables the unit to be quickly and simply fitted on DIN rail.

Bezel:	1.89" x 1.89" (48 mm x 48 mm)
Capacity:	99,999.99 hours
Mounting:	DIN Rail
Digits:	0.16" high numerals
Voltage:	24, 120 VAC, 60 Hz
Power Consumption:	1VA
Termination:	Combination ¼" spade and screw clamp
Operating Temperature:	-40°F to 160°F (-40°C to 72°C)
Weight:	2.5 oz
Ordering Information:	UWZ48V - voltage/frequency

Flexible Heaters

17-451-000

Flexible Heater Installation Methods

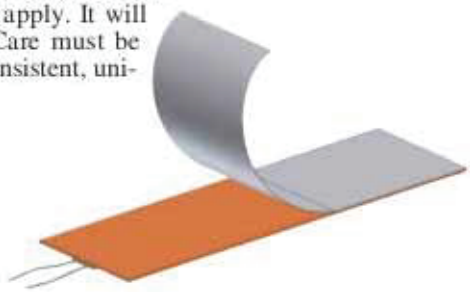
Flexible Heater Pressure Sensitive Adhesive (PSA)

PSA

For ease of attachment specify PSA. Installation is simple: just peel off the protective liner and apply. It will adhere to most clean smooth surfaces. Care must be taken when installing to attain a smooth, consistent, uniform bond to achieve maximum results.

Maximum Temperature:
Continuous – 300°F (149°C)
Intermittent – 500°F (260°C)

Recommended Watt Density:
Under 5 W/in² (0.78 W/cm²)



PSA Plus

A layer of aluminum foil is vulcanized to the back of the heater for added heat dissipation prior to the application of PSA.

UL Recognized: U.S. & Canada E65652

CSA Certified: 043099

Electrical Ratings		
Contact ratings		Refer to the contact ratings tables on page 10-4.
Dielectric strength		2200V for one minute, 1300V for one minute (Logic Reed)
Electrical design life cycles		1 000 000 at max. rated load, 200 000 at max. rated load (Logic Reed)
Mechanical Ratings		
Vibration		10…2000 Hz, 1.52 mm displacement (peak-to-peak) max./ 10 G max. (except Logic Reed)
Shock		1/2 cycle sine wave for 11 ms ≥ 25 G (contact fragility) and no damage at 100 G
Degree of protection		Type 1/4/12/13 (800T); Type 1/4/4X/12/13 (800H); EN/IEC 60529 IP66/65
Mechanical design life cycles		
Push buttons	(Momentary, non-illuminated)	10 000 000 min.
	(Momentary, illuminated)	250 000 min.
	(Push-pull/twist-to-release)	250 000 min.
Selector switches	(Non-illuminated)	1 000 000 min.
	(Illuminated, key-operated)	200 000 min.
Potentiometers		25 000 min.
All other devices		200 000 min.
Contact operation		Shallow, mini, and low-voltage contact blocks: Slow, double make and break Logic Reed and sealed switch contact blocks: Single break magnetic
Wire gauge/Terminal screw torque		#18…14 AWG (#18…10 Max Duty) / 6…8 lb•in
Typical operating forces		
Operators without contact blocks		Flush, extended button, standard mushroom, jumbo plastic mushroom: 2 lbs max. Jumbo and extended aluminum mushroom head: 3.95 lbs max. Maintained selector switch: 3.6 in•lb max.
Spring return selector switches		3.6 in•lb to stop, 0.2 in•lb to return
Illuminated push buttons and push-to-test pilot lights		5 lb max.
2-position push-pull		8.0 lb max. push or pull
3-position push-pull		8 lb max. push to in position or pull to center position (15 lb max. pull to out position)
Twist-to-release or push-pull		9 lbs max. push or pull 30 in•oz max. twist, 6 in•oz minimum return
Potentiometer		Rotational torque 3…12 in•oz; stopping torque 12 in•lb (minimum)
Contact blocks	Standard	1 lb
	Logic Reed	1 lb max.
	Sealed switch	3 lb max. at 0.205 in. plunger travel
	Stackable sealed switch	1 lb max.
	MaxDuty	1.4 lb max.
	PenTUFF	1.4 lb max.
	Self Monitoring	1.6 lb
Environment		
Temperature range	Operating	-40…+131 °F (-40…+55 °C)
	Storage	-40…+185 °F (-40…+85 °C)
Note: Operating temperatures below freezing are based on the absence of moisture and liquids. Consult your local Rockwell Automation sales office or Allen-Bradley distributor for use in lower temperature applications.		
Humidity		50…95% RH from 77…140 °F (25…60 °C) per Procedure IV of MIL-STD-810C, Method 507.1 cycling test

Auxiliary Contacts

Allen-Bradley

22-005-010

Auxiliary Contact Blocks for Front Mounting ❶

- 2- and 4-pole
- Quick and easy mounting without tools
- Electronic-compatible contacts down to 17V, 5 mA
- Mutual positive guidance to the main contactor poles (except for L types)
- Models with equal function with several terminal numbering choices

L = Late break / Early make

Auxiliary contact blocks for front installation ❸

- 2 and 4 poles
- Quick and easy mounting without tools
- Contacts compatible with electronics
- Mutual positive quidance with the main contactor poles (except for L types)
- Models with equal function with several terminal numbering choises

L = late break / early make

Conformity with the low voltage directive	Conforming to 73/23/EEC		EN (IEC) 61131-2 (open equipment)
Conformity with the EMC directive	Conforming to 89/336/EEC		EN (IEC) 61131-2 (Zone B) EN (IEC) 61000-6-2, EN (IEC) 61000-6-3 *(1)* and EN (IEC) 61000-6-4
Degree of protection	Conforming to IEC/EN 60529		IP 20
Overvoltage category	Conforming to IEC/EN 60664-1		3
Degree of pollution	Conforming to IEC/EN 61131-2		2
Ambient air temperature around the device	Operation	**°C (°F)**	- 20 to + 55 (- 4 to + 131) + 40 (+ 104) in an enclosure, conforming to IEC 60068-2-1 and IEC 60068-2-2
	Storage	**°C (°F)**	- 40 to + 70 (- 40 to + 158)
Maximum relative humidity			95% without condensation or dripping water
Maximum operating altitude	Operation	**m (ft.)**	2000 (6562)
	Transport	**m (ft.)**	3048 (10 000)
Mechanical resistance	Immunity to vibration		IEC/EN 60068-2-6, test Fc
	Immunity to mechanical shock		IEC/EN 60068-2-27, test Ea
Resistance to electrostatic discharge	Immunity to electrostatic discharge		IEC/EN 61000-4-2, level 3
Resistance to HF interference (immunity)	Immunity to electromagnetic radiated fields		IEC/EN 61000-4-3, level 3
	Immunity to fast transients in bursts		IEC/EN 61000-4-4, level 3
	Immunity to shock waves		IEC/EN 61000-4-5
	Radio frequency in common mode		IEC/EN 61000-4-6, level 3
	Voltage dips and breaks (∿)		IEC/EN 61000-4-11
	Immunity to damped oscillation waves		IEC/EN 61000-4-12
Conducted and radiated emissions	Conforming to EN 55022/11 (Group 1)		Class B *(1)*
Screw terminals connection capacity (Tightening using Ø 3.5 screwdriver)	Flexible cable with cable end	**mm²**	1 conductor: 0.25 to 2.5, cable: AWG 24 to AWG 14 2 conductors: 0.25 to 0.75, cable: AWG 24 to AWG 18
	Semi-solid cable	**mm²**	1 conductor: 0.2 to 2.5 cable: AWG 25 to AWG 14
	Solid cable	**mm²**	1 conductor: 0.2 to 2.5, cable: AWG 25 to AWG 14 2 conductors: 0.2 to 1.5, cable: AWG 24 to AWG 16
	Tightening torque	**N.m (lbf-in)**	0.5 (4.4)

Processing characteristics

Number of control scheme lines	With LADDER programming		120
Number of function blocks	With FBD programming		Up to 200
Cycle time		**ms**	10 to 50
Response time		**ms**	20 minimum
Back-up time (in the event of power failure)	Day/time		10 years (lithium battery) at 25 °C (77 °F)
	Program and settings		10 years (EEPROM memory cartridge)
Program memory checking			On each power-up
Clock drift			12 min/year 0 to 55 °C (32 to 131 °F) 6 sec/month at 25 °C (77 °F) and calibration
Timer block accuracy			1% ± 2 cycle time

Relay output characteristics

Smart relay type				SR2 ●●●/ SR3 B101●●/ SR3 XT61●●/ SR3 XT101●●
Operating limit values			V	⎓ 5 to 150 ∿ 24 to 250
Contact type				N/O
Thermal current			A	8
Electrical durability for 500 000 operating cycles	Utilization category	DC-12	V	24
			A	1.5
		DC-13	V	24 (L/R = 10 ms)
			A	0.6
		AC-12	V	230
			A	1.5
		AC-15	V	230
			A	0.9
Minimum switching capacity	At minimum voltage of 12 V		mA	10
Low power switching reliability of contact				12 V - 10 mA
Maximum operating rate	No-load		Hz	10
	At Ie (operational current)		Hz	0.1
Mechanical life	In millions of operating cycles			10
Rated impulse withstand voltage (Uimp)	Conforming to IEC/EN 60947-1 and IEC/EN 60664-1		kV	4
Response time	Trip		ms	10
	Reset		ms	5
Built-in protection	Against short-circuits			None
	Against overvoltage and overload			None

Transistor output characteristics

Smart relay type			SR● B●●2BD
Operating limit values		V	19.2 to 30
Load	Nominal voltage	V	⎓ 24
	Nominal current	A	0.5
	Maximum current	A	0.625 at 30 V
Drop-out voltage	At state 1	V	⩽ 2 for I = 0.5 A
Response time	Trip	ms	⩽ 1
	Reset	ms	⩽ 1
Built-in protection	Against overload and short-circuits		Yes
	Against overvoltage *(1)*		Yes
	Against inversions of power supply		Yes

(1) If there is no volt-free contact between the smart relay o

Analog output characteristics (QB, QC)

Analog outputs	Output range		V	∿ 0 to 10
	Type of load			Resistive
	Maximum load		mA	10
	Value of LSB		mV	10
Conversion	Resolution			10 bits
	Conversion time			Smart relay cycle time
	Precision	at 25 °C (77 °F)		± 1% of the full scale value
		at 55 °C (131 °F)		± 1% of the full scale value
	Repeat accuracy at 55 °C (131 °F)			< ± 1%
Isolation	Between analog channel and supply			None
Cabling distance			m (ft.)	10 (32.81) maximum, with shielded cable
Built-in protection	Reverse polarity protection			Yes

Discrete ∼ input characteristics

Smart relay type				SR● ●●●●FU
Nominal value of inputs	Voltage		V	100 to 240
	Current		mA	0.6
	Frequency		Hz	47 to 63
Input switching limit values	At state 1	Voltage	V	⩾ 79
		Current	mA	> 0.17
	At state 0	Voltage	V	⩽ 40
		Current	mA	< 0.5
Input impedance at state 1			kΩ	350
Configurable response time	State 0 to 1 (50/60 Hz)		ms	50
	State 1 to 0 (50/60 Hz)		ms	50
Isolation	Between supply and inputs			None
	Between inputs			None
Protection	Reverse polarity protection			Control instructions not executed

∼ 100 to 240 V supply characteristics

Smart relay type			SR2 ●201FU
Primary	Nominal voltage	V	100 to 240
Voltage limits		V	85 to 264
Nominal input current	Without extensions	mA	100/50
	With extensions	mA	–
Power dissipated	Without extensions	VA	11
	With extensions	VA	–
Micro-breaks	Permissible duration	ms	10
rms insulation voltage		V	1780

• One insert of each color (blue, green, orange, red, and yellow).
⊕ Only available on Bul. 800T, Type 4/13 operators.
‡ If an overlapping cam is required, consult your local distributor.
§ Not available with wing levers.
▲ See Table 1 for cam selections and associated targets.

Specifications•

Electrical Ratings		
Contact ratings		Refer to the contact ratings tables on page 10-4.
Dielectric strength		2200V for one minute, 1300V for one minute (Logic Reed)
Electrical design life cycles		1 000 000 at max. rated load, 200 000 at max. rated load (Logic Reed)
Mechanical Ratings		
Vibration		10…2000 Hz, 1.52 mm displacement (peak-to-peak) max./ 10 G max. (except Logic Reed)
Shock		1/2 cycle sine wave for 11 ms ≥ 25 G (contact fragility) and no damage at 100 G
Degree of protection		Type 1/4/12/13 (800T); Type 1/4/4X/12/13 (800H); EN/IEC 60529 IP66/65
Mechanical design life cycles		
Push buttons	(Momentary, non-illuminated)	10 000 000 min.
	(Momentary, illuminated)	250 000 min.
	(Push-pull/twist-to-release)	250 000 min.
Selector switches	(Non-illuminated)	1 000 000 min.
	(Illuminated, key-operated)	200 000 min.
Potentiometers		25 000 min.
All other devices		200 000 min.
Contact operation		Shallow, mini, and low-voltage contact blocks: Slow, double make and break Logic Reed and sealed switch contact blocks: Single break magnetic
Wire gauge/Terminal screw torque		#18…14 AWG (#18…10 Max Duty) / 6…8 lb•in
Typical operating forces		
Operators without contact blocks		Flush, extended button, standard mushroom, jumbo plastic mushroom: 2 lbs max. Jumbo and extended aluminum mushroom head: 3.95 lbs max. Maintained selector switch: 3.6 in•lb max.
Spring return selector switches		3.6 in•lb to stop, 0.2 in•lb to return
Illuminated push buttons and push-to-test pilot lights		5 lb max.
2-position push-pull		8.0 lb max. push or pull
3-position push-pull		8 lb max. push to in position or pull to center position (15 lb max. pull to out position)
Twist-to-release or push-pull		9 lbs max. push or pull 30 in•oz max. twist, 6 in•oz minimum return
Potentiometer		Rotational torque 3…12 in•oz; stopping torque 12 in•lb (minimum)
Contact blocks	Standard	1 lb
	Logic Reed	1 lb max.
	Sealed switch	3 lb max. at 0.205 in. plunger travel
	Stackable sealed switch	1 lb max.
	MaxDuty	1.4 lb max.
	PenTUFF	1.4 lb max.
	Self Monitoring	1.6 lb
Environment		
Temperature range	Operating	-40…+131 °F (-40…+55 °C)
	Storage	-40…+185 °F (-40…+85 °C)
Note: Operating temperatures below freezing are based on the absence of moisture and liquids. Consult your local Rockwell Automation sales office or Allen-Bradley distributor for use in lower temperature applications.		
Humidity		50…95% RH from 77…140 °F (25…60 °C) per Procedure IV of MIL-STD-810C, Method 507.1 cycling test

Item No. Z7.281.1227.0
Insulated jumper bar IVBWK 4 - 2
Cross connector, insulated for DIN rail terminal blocks type WK ..., 2 -pole

Item No.	Z7.281.1227.0
EAN	4015573156081
order unit	10 Piece(s)

SMALL COMPACT THERMOSTAT

KTO 011 / KTS 011

46-034-000

Technical Data KT 011

Part No.	Contact type	Scale on housing
01140.9-00	normally closed	30 - 140°F
01141.9-00	normally open	30 - 140°F
01146.9-00	normally closed	0 - 60°C
01147.9-00	normally open	0 - 60°C

Sensor element:	Thermostatic bi-metal
Maximum tolerance:	±7.2°F (4K)
Switching difference (hysteresis):	12.6°F ± 5.4°F (7°C ± 3K)
Service life:	100.000 cycles
Switching capacity (max. load):	15A resistive/2A inductive @ 120 VAC
	10A resistive/2A inductive @ 250 VAC
	DC 30W
EMI/EMC compliance:	EN 55014-1-2, EN 61000-3-2, EN 61000-3-3
Connections:	2-pole terminal for AWG 14 max. (2.5 mm²)
Mounting:	Clip for 35 mm DIN rail (EN 50022)
Dimensions (H x W x D):	2.4 x 1.3 x 1.7" (60 x 33 x 43 mm)
Housing:	Plastic, UL94V-0
Weight:	1.27 oz (36 g)
Protection type:	IP 20
Operating/storage temperature:	-49 to 158°F (-45 to 70°C)
Agency approvals:	UL, CSA

CHNF SERIES CONTINUOUS HINGE WITH CLAMPS TYPE 4X JUNCTION BOXES

PENTAIR

11-035-214

ENCLOSURE CATALOG NUMBER	ENCLOSURE DIMENSIONS (IN.)	SUB-PANEL CATALOG NUMBER
A-ABCCHNFSS6	A x B x C	A APB

NOTE:

1. SS - INDICATES 304 STAINLESS STEEL
2. 6 – INDICATES 316 STAINLESS STEEL

APPLICATION

Used in either indoor or outdoor applications, these enclosures combine a rugged continuous hinge, seamless foam-in-place gasket and stainless steel screw-down clamps for a reliable seal that protects components from corrosive environments.

SPECIFICATIONS

- 16 and 14 gauge Type 304 or 316L stainless steel
- Seams continuously welded and ground smooth
- Seamless foam-in-place gasket
- Stainless steel screws and clamps
- Pull stainless steel continuous hinge pin to remove door
- Weldnuts provided for mounting optional panels and terminal block kits
- Bonding provision on door and body

FINISH

Cover and sides of body have smooth #4 brushed finish.

INDUSTRY STANDARDS

UL 50, 50E Listed; Type 3R, 4, 4X, 12; File No. E27567
cUL Listed per CSA C22.2 No 94; Type 3R, 4, 4X, 12; File No. E27567
UL 508A Listed; Type 3R, 4, 4X, 12; File No. E61997
cUL Listed per CSA C22.2 No 94; Type 3R, 4, 4X, 12; File No. E61997

NEMA/EEMAC Type 3R, 4, 4X, 12, 13
CSA File No. 42184: Type 4, 4X, 12
IEC 60529, IP66
Meets NEMA Type 3RX requirements

Note: Modular suffix codes can be used when specifying selector switches with multiple contact blocks.

PenTUFF™ (Low Voltage) Contact Ratings

Minimum DC: 5V, 1 mA
Maximum thermal continuous current I_{th} 2.5 A AC/1.0 A DC. Bulletin 800T units with 800T-XAV contacts have ratings as follows:

Max. Opertnl. Volts U_e	Utilization Category		Rated Operational Currents		
	IEC	NEMA	Volts U_e	Make	Break
AC 300	AC-15	C300	120...300 0...120	1800VA 15 A	180VA 1.5 A
DC 150	DC-13	R150	24...150 0...24	28VA 1.0 A	

Stackable Sealed Switch Contact Ratings

Minimum: 5V, 10 mA (digital); 24V, 1 mA (analog)

Maximum continuous current I_{th} 2.5 A. Bulletin 800T units have control circuit ratings with sealed switch contact blocks as follows:

Max. Opertnl. Volts U_e	Utilization Category		Rated Operational Currents		
	IEC	NEMA	Volts U_e	Make	Break
AC 300	AC-15	C300	120...300 0...120	1800VA 15 A	180VA 1.5 A
DC 150	DC-13	Q150	24...150 0...24	69VA 2.5 A	

MaxDuty Contact Rating

Maximum thermal continuous current I_{th} 24 A.
Pilot Duty — 120V AC, 12 A; 24V DC, 10 A
Motor Ratings — 120V AC, 1.5 Hp; 240V AC, 3 Hp; 24V DC, 10 A FLA/60 A LRA

Logic Reed Contact Ratings

Minimum — DC: 5V, 1 mA
Maximum — DC: 30V, 0.06 A, AC: 150V, 0.15 A
Should only be used with resistive loads.

Product Certifications

Certifications	UR/UL, CSA, CCC, CE
Standards Compliance — CE Marked	NEMA ICS-5; UL 508, EN ISO 13850, EN 60947-1, EN 60947-5-1, EN 60947-5-5

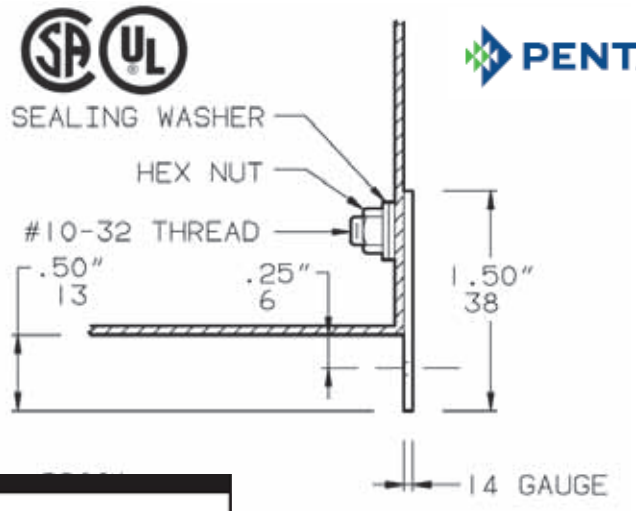
Mounting Bracket Kits

Mounting bracket kits DMFK1 and DMFK2 include two 14 gauge steel external mounting brackets and fasteners. Mounting bracket kit CMFK and CMFKSS each contain four 12 gauge steel or Type 304 stainless steel external mounting brackets and fasteners. Sealing washers are provided with each kit to maintain Type 4 or 12 rating after installation. Steel mounting brackets are zinc plated with clear chromate finish.



Catalog Number	Description
† **DMFK1**	Mounting bracket kit
† **DMFK2**	Mounting bracket kit
† **CMFK**	Steel mounting bracket kit
†† **CMFKSS**	Stainless steel mounting bracket kit
†† **CMTGFT**	Composite mounting bracket kit

† Maintains UL/CSA Type 4 and Type 12.

†† Maintains UL/CSA Type 4 Type 4X, and Type 12.

INDUSTRY STANDARDS

Mounting brackets required to meet UL/CSA external mounting requirements.

UL 508A Listed; Type 3, 3R, 4, 4X, 12, 13; File No. E61997
cUL Listed per CSA C22.2 No 94; Type 3, 3R, 4, 4X, 12, 13; File No. E61997
Enclosure flammability evaluated per UL 508A
Window flammability evaluated per UL 508A

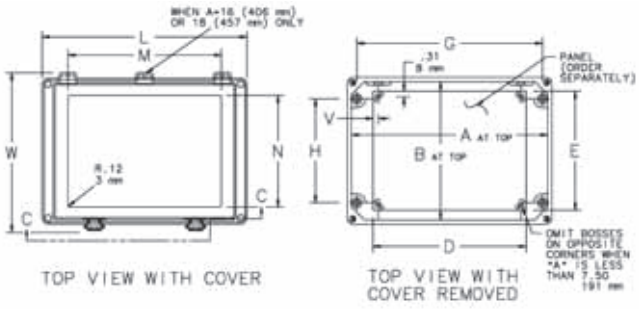
NEMA/EEMAC Type 3, 3R, 4, 4X, 12, 13
CSA File No. 42186: Type 3R, 4, 4X, 12
IEC 60529, IP66
Meets NEMA Type 3RX requirements

APPLICATION

Able to withstand harsh environments, these small enclosures feature a simple, traditional non-metallic design that is suitable for a broad range of applications.

SPECIFICATIONS

- Compression-molded fiberglass material has excellent temperature and chemical resistance qualities and exhibits outstanding physical properties
- Fiberglass material is easily punched, drilled, filed or sawed
- Seamless foam-in-place gasket assures water-tight and dust-tight seal
- Threaded internal bosses provided for mounting optional panels and terminal block kits
- Scratch-resistant polycarbonate windows are permanently bonded in place
- Screw-cover enclosures have easily removable covers attached to body with internal plated steel hinges. Cover securely fastens to the body with four captivated Type 316 stainless steel cover screws.
- Enclosures with quick-release latches have corrosion-resistant polyester hinges and polyester latches with a Type 316L stainless steel bail. Attached with Type 316 stainless steel screws. A Type 316L stainless steel padlock hasp is furnished with each enclosure.
- Sealing washers are furnished with enclosure



FINISH

Fiberglass material is light-gray inside and out. Optional steel panels are painted white. Optional stainless steel, aluminum and composite panels are unpainted.

TRM Time-Delay Midget Fuses

13-030-059

Features/Benefits:

- Numerous ratings for a wide variety of applications
- 250VAC rating in all sizes up to 30A
- Time-delay for circuits with high inrush currrent
- Can be used with UltraSafe™ fuse holders
- 1 1/2" x 13/32" (10mm x 38mm) dimensions

Ratings:

Volts : 250VAC
Amps : 1/10 to 30A

NOTES:

1. UNIT MATERIAL: SCREEN: 316L SS
   SCREENINGS PRESS: 316L SS
   SPIRAL MATERIAL: HI-STRENGTH ALLOY STEEL

2. AREA CLASSIFICATION:
   INSIDE TANK - HAZARDOUS - CLASS 1, ZONE 1.
   OUTSIDE TANK - HAZARDOUS - CLASS 1, ZONE 2

3. SCREEN DRIVE MOTOR: 1.5 HP, 575 V, 3 PH, 60 HZ

4. SCREEN WEIGHT - 1750 LB [793.8 Kg]
   MOTOR WEIGHT - 41 LB [19 Kg]
   GEAR BOX - 101 LB [46 Kg]

5. WATER REQUIREMENTS:
   SCREEN SPRAY WASH: 24 GPM @ 40 - 60 PSI [1.5L/s @ 275 - 414 kPa]

6. NOT SHOWN: ITEMS 119 - 125. REFER TO PARTS LISTS FOR DESCRIPTIONS, MATERIAL, AND QUANTITIES.

7. PROVIDE SUFFICIENT FLEXIBILITY IN WATER AND ELECTRICAL CONNECTIONS TO ALLOW THE UNIT TO PIVOT OUT OF CHANNEL . ALL INTER CONNECTING PIPING, WIRING, AND CONDUIT FROM UNIT-MOUNTED DEVICES WILL BE SUPPLIED BY OTHERS.

8. CUSTOMER MUST PROVIDE LIFTING DEVICE TO PIVOT UNIT OUT OF TANK LIFTING CAPABILITY MUST EQUAL A MINIMUM OF 60% ON UNIT WEIGHT, APPLIED AT LIFTING POINT SHOWN. TANK MUST BE EMPTY, AND SCREEN BASKET MUST BE CLEAR OF SOLIDS PRIOR TO PIVOTING.

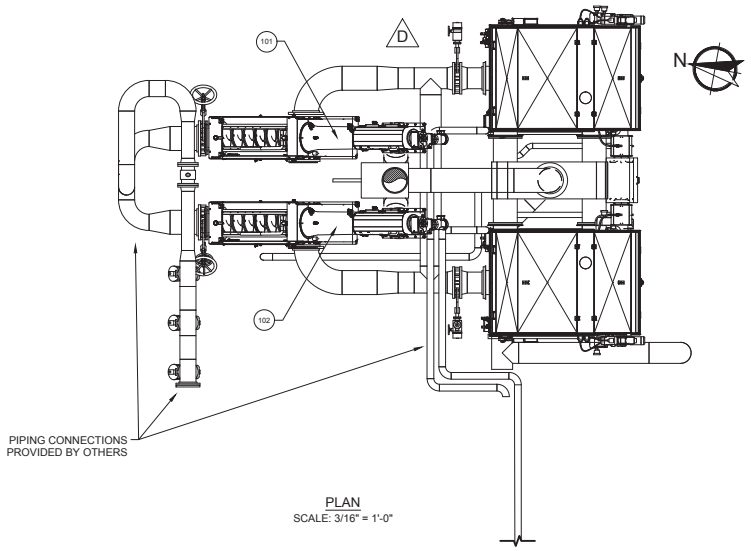
9. BOTTOM OF SCREEN MUST REST FLUSH TO THE TANK FLOOR, TO PREVENT MATERIAL FROM BYPASSING THE SCREEN. SIDE SEALS MUST REST ALONG TANK WALL ON BOTH SIDES TO PREVENT MATERIAL FROM BYPASSING THE SCREEN.

10. STRAINER, SOLENOID VALVES AND WATER HAMMER (SHIPPED LOOSE) TO BE INSTALLED IN WASHWATER SUPPLY LINE.

11. EQUIPMENT MUST BE PROTECTED TO PREVENT SURFACE CONTAMINATION. CONTAMINATION CAN COME FROM WELDING CUTTING, PAINTING AND OTHER SUCH ACTIVITIES IN THE AREA OF THE EQUIPMENT. STAINLESS STEEL SURFACES CONTAMINATED WITH ANY IRON, CHLORIDE CONTAINING MATERIAL AND OTHER SUBSTANCES CAN EXPERIENCE ACCELERATED SURFACE CORROSION AND PITTING.

12. DESIGN IS BASED ON FLOW PARAMETERS PROVIDED. IF THERE ARE SITE SPECIFIC HYDRAULIC REQUIREMENTS (SUCH AS MAXIMUM AND MINIMUM FLOWS), PLEASE CONSULT ENVIRO-CARE REPRESENTATIVE TO ENSURE THAT THE EQUIPMENT CAN MEET ALL REQUIREMENTS. IN SOME CASES, ENVIRO-CARE MAY RECOMMEND A DOWNSTREAM WEIR FOR AVERAGE FLOWS THAT ARE EXTREMELY LOW.

13. THE FOLLOWING DEVICES NEED TO BE FIELD WIRED BY ELECTRICAL CONTRACTOR
    - SCREEN DRIVE MOTOR: ITEM 104 (QTY 2)
    - MOTOR CUT OUT SWITCH: ITEM 111 (QTY 4)
    - SOLENOID VALVES: ITEM 112 (QTY 2), ITEM 113 (QTY 2)
    - CONTROL PANEL: ITEM 117 (QTY 1), ITEM 118 (QTY 1)
    - LEVEL SENSOR ITEM 114 (QTY 2)
    - LEVEL CONTROLLER ITEM 121 (QTY 2), MOUNT NEAR SCREEN MAIN CONTROL PANEL
    - NEMA 4X LOCAL E-STOP (SUITABLE FOR CLASS 1, ZONE 2): ITEM 120 (QTY 2),



PLAN

1. ENVIRO-CARE RESERVES PROPRIETARY RIGHTS TO THIS DRAWING AND THE DATA SHOWN THEREON, WHICH IS SUBMITTED IN CONFIDENCE.

2. IF APPLICABLE, A STAR DENOTES VARIANCE FROM CONTRACT DOCUMENTS AND SHOULD BE PARTICULARLY NOTED.

3. IF APPLICABLE, A CLOUD DENOTES DIMENSIONS WHICH ARE CRITICAL TO THE DESIGN OF THE EQUIPMENT, BUT NOT CLEAR AND/OR NOT PROVIDED IN THE CONTRACT DOCUMENTS.

4. THE FOLLOWING DEFINES THE RESPONSIBILITY OF ENVIRO-CARE WITH REGARD TO THE INFORMATION SHOWN ON THIS DRAWING.

   A. THIS DRAWING IS NOT TO BE USED FOR CONSTRUCTION OR INSTALLATION PURPOSES UNTIL IT HAS BEEN APPROVED BY THE OWNER, THE ENGINEER OR AN AUTHORIZED REPRESENTATIVE.

   B. DIMENSIONS, WEIGHTS, AND OTHER INFORMATION ARE PROVIDED TO ACCOMMODATE THE STRUCTURE TO THE EQUIPMENT AS SHOWN.

   C. ENVIRO-CARE IS NOT RESPONSIBLE FOR ANY CONCRETE STRUCTURE DESIGN. THE ENGINEER IS TO DETERMINE SIZES TO SUIT LOCAL REQUIREMENTS.

   D. ENVIRO-CARE IS NOT RESPONSIBLE FOR DAMAGE, INJURY OR LOSS RESULTING FROM USE OF THE SUPPLIED EQUIPMENT.

   E. CHARGES FOR MODIFICATIONS OR ADDITIONS TO THE EQUIPMENT WILL NOT BE ACCEPTED BY ENVIRO-CARE, UNLESS PRIOR APPROVAL HAS BEEN OBTAINED IN WRITING FROM AN AUTHORIZED ENVIRO-CARE REPRESENTATIVE.

5. ALL CONCRETE, GROUT, CONCRETE REINFORCING, SLIDE GATES, PIPING, VALVES, PIPE SUPPORTS OR FITTINGS, WALL BRACKETS, ELECTRICAL WIRING, CONDUIT, OR ELECTRICAL EQUIPMENT, ERECTION, FIELD PAINTING OR PAINT, FIELD WELDING OR WELD ROD, GREASE, OR LUBRICATING OIL, EXCEPT AS SPECIFICALLY NOTED IS TO BE BY OTHERS, NOT BY ENVIRO-CARE.

6. ALL ONSITE WELDING MUST CONFORM TO THE LATEST STANDARDS OF THE AMERICAN WELDING SOCIETY.

7. SEE PARTS LIST FOR ITEM IDENTIFICATION.

NOTES:
1. FACTORY SETTING '*' NOTES PARAMETERS SET IN THE FIELD.
2. THE ABOVE IS A PARTIAL LISTING OF SETPOINTS. REFER TO THE INSTRUCTION MANUAL FOR A COMPLETE PARAMETER LISTING.
3. ALLOW AT LEAST ONE MINUTE FOR CONTROLLER LEVEL READING TO STABILIZE AFTER RETURNING TO THE RUN MODE.
4. ENSURE THE CORRECT PROFILE IS SELECTED WHEN ALTERING SETPOINTS WITH MULTIPLE FIELDS.

ULC1 – SETPOINT CHANGE INSTRUCTIONS

TO ALTER THE VALUE OF A SETPOINT:

1. PRESS THE RIGHT ARROW TO ACCESS THE MAIN MENU.
2. USE THE UP AND DOWN KEYS TO NAVIGATE THE MENU. USE THE RIGHT ARROW KEY TO ENTER THE HIGHLIGHTED MENU AND THE LEFT KEY TO RETURN TO THE PREVIOUS MENU. THE FUNCTION NUMBER IS BASED ON WHERE EACH SETPOINT IS LOCATED IN THE MENU. FOR EXAMPLE UNIT IS UNDER "SETUP">"SENSOR". SETUP IS THE 2ND ITEM FROM THE MAIN MENU, SENSOR IS THE FIRST ITEM IN THE SETUP MENU, AND UNIT IS THE FIRST ITEM IN THE SENSOR MENU SO THE FUNCTION NUMBER FOR UNIT IS 2.1.1.
3. USE THE RIGHT ARROW TO EDIT A SETPOINT WHEN SELECTED. USE THE UP AND DOWN ARROWS TO MODIFY THE VALUE AND THE LEFT AND RIGHT ARROWS TO SELECT THE FIELD TO MODIFY. USE THE RIGHT ARROW TO EXIT AND SAVE.

SEQUENCE OF OPERATION

CONTROL POWER ON-DELAY:
Each time the control panel power supply is cycled, the programmable relay will allow all solid state devices to become fully energized before enabling the control power circuit.

SPIRAL SCREEN MODES OF OPERATION:
HAND:
When Screen Selector is in the HAND position, the Screen will run per the Screen FOR-OFF-REV selector. In FOR position, the Screen runs in forward continuously. In OFF position, the Screen is off. In REV position, the Screen runs in reverse until operator release (spring-returns to OFF).

AUTO:
When the Screen selector is in the AUTO position and the Screen Permissive contact (from the PCS) is closed, the Screen will start forward when the liquid level in the upstream channel reaches the start level set-point (as determined by the upstream ultrasonic level transducer).

After the liquid level in upstream channel falls below the start level set-point for the time set in the Screen Level Off-Delay Timer, the Screen will shut off.

The Screen will also cycle OFF and ON/FOR (OFF first), per the settings of the Screen Repeat Cycle Timer (adjustable). The Screen Repeat Cycle Timer is provided for 3 possible reasons:
1. To keep the Screen operating periodically in low flow situations.
2. In case there is a failure with the upstream level sensing device.
3. In cold weather conditions, to keep the Screen operating periodically to prevent the screen from freezing.

Notes:
1. Any run of the Screen will reset the Screen Repeat Cycle Timer.
2. After each automatic cycle, the Screen will stop, run in reverse (stop and reverse times are set per Screen Reverse Run Timer), and then return to OFF.
3. If the Screen call-to-run signal remains active for the time set in the Screen Max Continuous Run Timer, the Screen will stop and run in reverse (stop and reverse times are set per Screen Reverse Run Timer). If the call-to-run persists, the Screen will again start to run in the forward direction.
4. Pressing and holding the System Reset pushbutton for 3 seconds will initiate a Screen Run cycle if the Screen selector is in the AUTO position.

COMPACTION ZONE SPRAY MODES OF OPERATION:
HAND:
When the Compaction Zone Spray selector is in the HAND position, the Compaction Zone Spray will run continuously.

⚠A AUTO:
When the Compaction Zone Spray selector is in the AUTO position, the Spray will cycle ON and OFF (ON first) per the settings of the Compaction Zone Spray Repeat Cycle Timer (adjustable). The Compaction Zone Spray will run when the Screen is running in forward or reverse.

BASKET SPRAY MODES OF OPERATION:
HAND:
When the Basket Spray selector is in the HAND position, the Basket Spray will run continuously.

AUTO:
When the Basket Spray selector is in the AUTO position, the Spray will run when the Screen is operating in forward.

SEQUENCE OF OPERATION

EMERGENCY STOP:
If either of the Emergency Stop (E-Stop) pushbutton is pressed the Spiral Screen, the Basket Spray, and the Compaction Zone Spray will stop immediately and the control power on light will de-energize. Screen and Sprays will also stop if the hatch door is opened. To re-set, pull out the E-Stop pushbutton, ensure the hatch door is closed, and press the System Reset pushbutton.

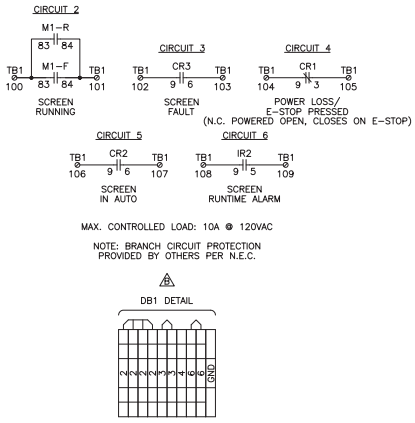
SPIRAL SCREEN FAULTS/Resets:
1. A fault occurs when the Screen Current Monitor is tripped. The Screen will stop immediately, and the Screen Fault light will be illuminated.
   Reset: Push the System Reset button.

2. A fault occurs when the Screen Motor Starter Thermal Overload is tripped. The Screen will stop immediately, and the Screen Fault light will be illuminated.
   Reset: Push the Reset pushbutton on the Screen Motor Starter Thermal Overload located inside the control panel then press the System Reset pushbutton. Unless entry into the control panel is being performed by a qualified electrician, the control panel power should be shut off prior to entry.

3. A fault occurs when the Screen Motor Thermostat (if supplied) is tripped. The Screen will stop immediately.
   Reset: Fault 3 resets automatically when the Screen Motor returns to a safe temperature.

SCREEN ACCUMULATED RUNTIME ALARM:
When the accumulated runtime of the Screen in AUTO reaches the Screen Accumulated Runtime timer the Screen Runtime Alarm will be activated. This will indicate that the duty/standby Screens should alternate. The Screen Runtime Alarm and Accumulated Runtime timer will reset when the Screen Permissive is removed, the Screen is removed from AUTO, or when power is cycled.

DRY OUTPUT CONTACTS



MAX. CONTROLLED LOAD: 10A @ 120VAC

NOTE: BRANCH CIRCUIT PROTECTION PROVIDED BY OTHERS PER N.E.C.

WEC217259Z Iqaluit, Canada Sequence of Operation
GCP Wastemaster Screw Screen

Screens MUST operate in a duty/standby configuration. TBD Local/Remote/Auto

SPIRAL SCREEN MODES OF OPERATION:

HAND:

When Screen Selector is in the HAND position, the Screen will run per the Screen FOR-OFF-REV selector. In FOR position, the Screen runs continuously forward. In OFF position, the Screen is off. In REV position, the Screen runs in reverse until operator release (spring-returns to OFF).

AUTO:

When the Screen selector is in the AUTO position, the Screen will start forward when the liquid level in the upstream channel reaches the start level set-point (as determined by upstream Ultrasonic Level Sensor).

After the liquid level in upstream channel falls below the start level set-point for the time set in the Screen Level Off-Delay Timer, the Screen will shut off.

The Screen will also cycle OFF and ON/FOR (OFF first), per the settings of the Screen Repeat Cycle Timer (adjustable). The Screen Repeat Cycle Timer is provided for 3 possible reasons:

1. To keep the Screen operating periodically in low flow situations.
2. In case there is a failure with the upstream level sensing device.

Notes:

1. Any run of the Screen will reset the Screen Repeat Cycle Timer.
2. After each automatic cycle, the Screen will stop, run in reverse (stop and reverse times are set per Screen Reverse Run Timer), and then return to OFF.
3. If the Screen call-to-run signal remains active for the time set in the Screen Max Continuous Run Timer, the Screen will stop and run in reverse (stop and reverse times are set per Screen Reverse Run Timer). If the call-to-run persists, the Screen will again start to run in the forward direction.
4. Pressing and holding the System Reset pushbutton for 3 seconds will initiate a Screen Run cycle if the Screen selector is in the AUTO position.
5. Because the rotating auger is shaftless, there is no automatic jam logic.

COMPACTION ZONE SPRAY MODES OF OPERATION:

HAND:

When the Compaction Zone Spray selector is in the HAND position, the Compaction Zone Spray will run continuously.

AUTO:

When the Compaction Zone Spray selector is in the AUTO position, the Spray will cycle ON and OFF (ON first) per the settings of the Compaction Zone Spray Repeat Cycle Timer (adjustable). The Compaction Zone Spray is independent of the Screen operation.

BASKET SPRAY MODES OF OPERATION:

HAND:

When the Basket Spray selector is in the HAND position, the Basket Spray will run continuously.

AUTO:

When the Basket Spray selector is in the AUTO position, the Spray will run when the Screen is operating in forward.

March 23, 2018

Enviro-Care
A WAMGROUP® Company

WEC217259Z Iqaluit, Canada Sequence of Operation
GCP Wastemaster Screw Screen

EMERGENCY STOP:

If the Emergency Stop (E-Stop) pushbutton is pressed, the Spiral Screen, the Compaction Zone Spray, and the Basket Spray will stop immediately. Screen and Sprays will also stop if the hatch door is opened. To re-set, pull out E-Stop pushbutton and press the System Reset pushbutton.

SPIRAL SCREEN FAULTS/Resets:

1. A fault occurs when the Screen Current Monitor is tripped. The Screen will stop immediately, and the Screen Fault light will be illuminated.
   Reset: Push the System Reset button.

2. A fault occurs when the Screen Motor Starter Thermal Overload is tripped. The Screen will stop immediately, and the Screen Fault light will be illuminated.
   Reset: Push the Reset pushbutton on the Screen Motor Starter Thermal Overload located inside the control panel. Unless entry into the control panel is being performed by a qualified electrician, the control panel power should be shut off prior to entry.

3. A fault occurs when the Screen Motor Thermostat (if supplied) is tripped. The Screen will stop immediately.
   Reset: Fault 3 resets automatically when the Screen Motor returns to a safe temperature.

4. If heat trace equipment is included (to keep spray wash system from freezing in outdoor installations in cold winter environments), a fault occurs when the heat trace circuit breaker is tripped. When Fault 4 occurs, the operation of the Screen and Sprays is not affected, but the Heat Trace indicator light on the control panel will NOT be illuminated.
   Reset: Reset heat trace circuit breaker inside the control panel. Unless entry into the control panel is being performed by a qualified electrician, the control panel power should be shut off prior to entry.

SYSTEM DESCRIPTION

Filter Model - SF6000	
Quantity Required Filter Outlet Configuration	
One (1)	Left Outlet / Overflow, Left Sludge Outlet
One (1)	Right Outlet / Overflow, Right Sludge Outlet
Filter Specifications	
Filter Frame Material	316L SST
Filter Weight (without Water - includes Blower)	2711 lbs /1230 kgs
Filter Weight (with Water - includes Blower)	5732 lbs / 2600 kgs
Filter Mesh Specifications	
Filter Mesh Material	Polyester
Drive Belt Material	Polyurethane with Kevlar reinforced drive ends
Drive Belt Weight	11 lbs / 5 kgs
Total Filter Mesh Area	23.7 ft^2 / 2.2 m^2
Filter Connection Information	
Inlet Flange Diameter	14 inch / 350mm ANSI
Outlet and Overflow Flange Diameter	16 inch / 400mm ANSI
Bottom Cold Water Drain Flange Connection Diameter (for sediment flush)	4 inch / 100mm ANSI
De-watering Unit Reject Water Connection Diameter	4 inch /100mm with hose coupling
Hot and Cold Water Connections	1/2 inch / 12mm NPT
Hot and Cold Water Supply Requirements	Tap Water Quality (4 - 6 bar pressure)
Volume of Hot Water Tank Recommended (Provided by others)	79.2 gal / 300L
Hot Water Temperature	185°F / 85°C (Maximum) 160°F / 70°C (Minimum)
Hot Water Usage (at 90 PSI / 6 Bar) (mesh cleaning)	8.0 gpm / 30L/min
Volume Required for Cold Water (sediment flush)	0 - 15.8 gal / 0 - 60 L
Ventilation Flange Diameter	8 inch / 200mm (Inside Diameter)
Integrated Sludge De-watering System Information	
Integrated Sludge De-watering System Quantity	One (1) press per filter unit
Integrated Sludge De-watering System Materials	Trough and Lid - 316L Stainless Steel Screw - Carbon Steel
Instrumentation Information	
Pressure Sensor Quantity	One (1) per filter unit
Pressure Sensor Material	Ceramic sensing element / ASTM A-316L Stainless Steel Housing / Vented Polyurethane insulated Cable

Filter Model - SF6000	
Control Power Panel (CPP) Information	
Quantity of Control Power Panels Required	One (1) per Filter Unit
Controller Type	Allen Bradley Compact Logix L16ER
Operator Interface Terminal (OIT) Type	Allen Bradley PanelView 700 (In Seperate Class 1 Div 2 Nema 4X Enclosure)
Network Interface	Ethernet / IP
Environmental Rating	Type 4X / IP65
Mounting	Wall Mounted
Material	Painted Mild Steel
UPS	15 Minute
Variable Frequency Drives (for Blower, Filter & Screw Rotation Motor)	Included
Electrical - Voltages	480/277V, 3 Phase, 3 Wire + Ground, 60 Hz
Maximum Distance Between Filter and Control Power Panel	115 feet / 35.0 meters
Control Power Panel Weight	132 lbs / 60 kgs
Control Panel Accreditations	UL
Blower Information	
Quantity of Blowers Required	One (1) per Filter Unit
Blower Model	Kaeser BB69C
Blower Location	Standalone from Filter Unit
Blower Motor Rating	10 hp / 197 CFM
Connected Power	12.0 kW
Rated Power	7.5 kW
Air Knife Pressure	0.32 bar (maximum 0.65 bar)
Blower Weight (with sound enclosure)	672 lbs / 305 kgs
Sludge Box and Sludge Hopper Information	
Sludge Box and Sludge Hopper Quantity	One (1) per two (2) Filter Units
Miscellaneous Equipment	
1	Operator Kit
1	Double-sided Outlet Box
1	Double-sided Sludge Box
1 Set	Anchor Bolts
Spare Parts List	
Quantity	Part Name
1	Spare Filter Mesh
2	Spare Blower Air Filter
1 Set	Spare Bearings

1.0 *Salsnes Filter System*

The objective of this document is to provide details regarding the control strategy for the Salsnes Filter (SF) System. The control philosophy outlines the major hardware components, system status, alarm conditions, and modes of operation of the System.

1.1 Glossary

SF	Salsnes Filter
PLC	Programmable Logic Controller
IO	Inputs/Outputs
CPP	Control Power Panel. The CPP contains the local power distribution components for each system. It also houses the PLC, IO, and the Operator Interface Terminal
OIT	Operator Interface Terminal
VFD	Variable Frequency Drive

1.2 System Overview

The SF System uses a PLC based control system that provides optimized control of a mesh Filter Belt. Each SF System is powered by a CPP that houses the PLC, IO, and OIT which provides local control and monitoring. The PLC will control the Filter Belt rotational speed to obtain optimum separation of the incoming material. The speed will be varied by a Filter Motor to maintain a specified water level in the inlet well. The solids are deposited off of the belt into an outlet well, where optional dewatering may be performed by the Sludge Screw.

1.3 Control Strategy Priorities

The strategic operational priorities of the SF System controls are as follows (arranged in order of priority):

- Operator and equipment safety
- Maximize Separation, Thickening, and Dewatering Efficiency

1.4 Safety Features

The SF System control strategy employs an equipment protection interlock and monitors a number of alarm conditions that will result in control actions designed to maximize efficiency.

There is one critical interlock signal that is hardwired to the CPP that will disable the motors in the SF System. This critical interlock is:

- Emergency Stop Push Button
- Dewatering Screw Failure
- Options: Air Pressure Not Present, Ventilation Differential Pressure Alarm, External Sludge Bin Fault

Certain other alarm conditions will trigger a control action that will result in the filter motor running at a fixed high speed. Examples of these types of alarm conditions are more fully described later in this document.

1.5 Alarm Classifications

1.5.1 *Critical*

A critical alarm will cause an immediate system shutdown. Any inlet water will flow from the inlet to the security overflow and no filtration is expected.

1.5.2 *Major*

A major alarm will not stop the filtration process, but the machine will change to a fixed speed (that is adjustable manually) on the Filter Belt to ensure that the system will cope with the flow. Reduced filtration performance is expected.

1.5.3 *Minor*

A minor alarm will have no impact on the system. This alarm is intended to provide warning and maintenance information.

2.0 *CPP IO Layout*

Type	Details	Model
CPU	Allen Bradley Compact Logix Controller	1769-L16ER-BB1B
HMI	Allen Bradley PV +700	2711P-T7C4D8

2.6 Communications Layout

Device Description	Address	Subnet Mask	Gateway	Tagname
CPP PLC	192.168.3.11	255.255.255.0	192.168.3.1	
CPP OIT	192.168.3.12	255.255.255.0	192.168.3.1	
CPP Modem	192.168.3.10	255.255.255.0	192.168.3.1	
CPP Filter VFD	192.168.3.13	255.255.255.0	192.168.3.1	07-M320
CPP Sludge Screw VFD	192.168.3.14	255.255.255.0	192.168.3.1	07-M350

3.0 *CPP*

3.1 Standard Operation

3.1.1 *Startup*

The startup sequence is as follows (system in HMI mode, all devices in Automatic):

- If PLC is configured to control the inlet valve, this valve will be opened when the filter is Local On or in HMI mode and a filter Start is requested either through a HMI start request or by a remote SCADA or hardwired Permissive Run request
- System remains idle until the water level in the inlet well reaches the start level set-point
- Once the water level in the inlet well reaches the start level set-point, the following motors will start:
    - Blower Motor (starts at adjustable water level before filter)
    - Blower Motor Cooling Fan
    - Filter Motor
    - Sludge Screw Motor – (after adjustable time delay)
- The Blower Motor must be at full speed in Auto before the Filter Motor will be allowed to start – the blower start level may be adjusted in order to optimize the system
- The filter belt speed may be set using the following configurable modes:
    - PID controlled to maintain a target water level set-point
    - Directly proportional to the water level
    - Fixed speed manual mode
- The Filter Motor will stop if the water level drops below the stop level set-point

3.1.2 *Controlled Shutdown*

The controlled shutdown sequence is as follows:

- System remains running while the water level in the inlet well stays above the stop level set-point
- Once the water level drops below the stop level set-point, the Filter Motor will stop immediately
- The Sludge Screw Motor will stop after a configurable time delay, after the Filter Motor has stopped
- The Blower Motor will then stop after the stop delay time expires
- The Blower Motor Cooling Fan will stop after a hard coded 1-minute time delay, after the Blower Motor has stopped
- Optionally the filter stop sequence may also be triggered by the loss of the plant permissive digital input signal which will also result in the inlet valve being closed (if applicable)
- If system is shutting down due to an operator request to put the filter out of operation (HMI Stop command or SCADA/hardwired loss of permissive run), a Cold Water Washing procedure will trigger before Blower shut-down

3.1.3 *Critical Shutdown*

The critical shutdown sequence is as follows:

- System shutdown signal is issued due to a critical alarm
- The Blower Motor turns off
- The Blower Motor Cooling Fan turns off
- The Filter Motor turns off
- The Sludge Screw Motor turns off
- Inlet valve close (if applicable)
- All valves and motors will shut down simultaneously
- System will not re-start until the critical alarm has been cleared

3.1.4 *Hot Water Flush*

Automatic Hot Water Flushing of the filter mesh and dewatering basin is performed as follows:

- System must be in HMI mode with selected to Automatic Mode, and no critical or major alarms are present
- Cold Water Flush cannot be occurring
- The Hot Water Flush interval time, which is set from the OIT, expires
- The Hot Water Flush Valve opens
- The Filter Motor runs at a constant speed
- The Hot Water Flush Valve closes after the flush duration time expires
- The Filter Motor speed regulation mode goes back to normal control

3.1.5 *Cold Water Flush*

Automatic Cold Water Flushing (not available on the SF1000) of the filtered water basin is performed as follows:

- System must be in HMI mode and all Motors and Valves in Automatic Mode, and no critical or major alarms are present
- System does not need to be moving but must be requested to operate
- Hot Water Flush cannot be occurring
- The Cold Water Flush interval time, which is set from the OIT, expires
- The Cold Water Flush Valve opens
- The Filtered Water Drain Valve, if equipped, opens
- The Cold Water Flush Valve and Filtered Water Drain Valve close after the flush duration time expires
- A Cold Water Flush sequence will also be triggered at the end of a controlled shutdown sequence as described in section 3.1.2

3.2 Operation Modes

3.2.1 *Off*

When the Filter Control Switch is in the “Off” position, the CPP PLC will have no control of the motors or valves.

3.2.2 *On*

When the Filter Control Switch is in the “On” position, the CPP PLC will have no control of the motors or valves. In this mode the filter starters and drives will all be electrically activated and will operate at a fixed speed using the manual speed set-points on the HMI.

3.2.3 *HMI Mode*

When the filter control mode switch is in the “HMI” position the CPP PLC has control of all motors in the system based on the configuration set in the CPP OIT. From the OIT, the filter system HMI mode can be set to “Off”, “Manual”, or “Auto” modes. When the filter system is set to HMI-Manual mode, each motor and valve may be individually requested to be started/opened or stopped/closed. When the filter control mode switch transitions to the “HMI” position, the PLC will automatically set the HMI mode to Automatic and all valves and motors will be automatically controlled by the PLC. The HMI mode must be switched to OFF or Manual if direct operator control of the devices is required.

Normal Operation of the SF System is to have all Motors and valves automatically controlled with the system in HMI Auto mode. Fully automatic operation of the system is described in section ‘3.1 – Standard Operation’. HMI Manual Operation of individual Motors is described later in this document.

3.3 Alarms

Each CPP alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
Main Power Supply Failure	The Phase Monitoring relay detected a loss of main input power on one or more phases.				Enabled
UPS Supply Activated	The UPS has detected a loss of main power and the PLC is now operating on UPS power.	Critical			Enabled
UPS Battery Fault	The UPS has detected that the battery pack is faulted.	None	Enabled		
Emergency Stop Activated	The Emergency Stop located at the Filter is activated. Key Switch Reset is required to enable the system.	None			Enabled
Motor Failure	The Filter Motor, Blower Motor, or Sludge Screw Motor has failed to respond to a control command (start/stop) within a certain amount of time	Critical			Enabled
Service is due (Blower, Sludge Screw, Filter)	Indicates that service is required based on run time of equipment (should be 300 hours initially on blower, then 3000 hours)	None	Enabled		

3.4 Operator Interface

3.4.1 *Display Data*

The OIT will have a System Overview screen that will be used to display system status information and to provide operator control functions.

The System Overview screen will contain the following information:

- System status
- System fault indicators

4.0 *Filter Belt*

4.1 Control Architecture

The Filter Belt, which contains a filter mesh mounted on a removable cartridge, is used to draw waste material from the inlet to outlet sludge conveyor. Water is separated from the material as it is transported on the mesh towards the outlet well.

A Filter Motor, which rotates the Filter Belt, is driven by a VFD that regulates the speed based on a PID control algorithm. The speed is continually regulated in order to maintain an enterable inlet water level set-point. Optionally the system may be configured to operate the filter speed in a proportional mode so that the speed of the filter is proportionally increased as the filter water level increases, but a target water level is not maintained.

The VFD is controlled by a network communication signal controlled from the CPP PLC.

4.2 Operation Modes

4.2.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Filter Belt Motor will not start.

4.2.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Filter Belt Motor will be started by an electrical interlock that will force the motor to run at a fixed speed configured by the manual HMI set-points.

4.2.3 *System Mode HMI - Off*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep motor turned off and will not automatically start the Filter Motor, regardless of Filter level.

4.2.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will start and run Filter Motor according to requests by the operator from the HMI. The speed of the Filter Motor will be controlled by an operator entry on the OIT.

NOTE: This mode should not be used when the filter inlet valve is open unless the blower and sludge screw is also operating.

4.2.5 *System Mode HMI - Auto*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Filter Belt. See section ‘3.1 – Standard Operation’.

4.3 Alarms

Each Filter Belt alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-M320 Fault Filter Cloth	The VFD for the Filter Motor has reported a fault condition				Enabled

4.4 Operator Interface

4.4.1 *Display Data - Overview*

The OIT will have a System Overview screen that will be used to display Filter Belt status information and to provide operator control functions.

The screen will contain the following information:

- Filter Motor status
- Filter Motor fault indicators
- Filter Motor manual control

4.4.2 *Display Data - Information*

- Filter Motor running time (today, yesterday, total)
- Filter Motor starts (today, yesterday, total)

4.4.3 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Filter Belt options and settings:

- Adjust the Mode of the Filter Belt Motor
- Adjust the Start and Stop Level of the Filter Belt Motor
- Level set-point for Filter
- High level alarm set-point
- Minimum and maximum speed
- Filter Acceleration and Deceleration time
- Adjust the speed set-point of the Filter Belt Motor when it is in Manual

5.0 *Blower*

5.1 Control Architecture

The Blower is used to provide air for the Air Knife – Mesh Cleaning System, which is used to blow material off of the filter mesh into the sludge conveyor.

The Blower Motor is driven by a soft starter and maintains a fixed speed based on the selected blower specification.

The soft starter is controlled by a signal communicated from the CPP PLC.

A Blower Cooling Fan is mounted in the Blower enclosure. It will run when the Blower Motor is on, and it will stop when the Blower Motor stops after a hard coded 1 minute time delay.

5.1 Operation Modes

5.1.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Blower Motor and Cooling Motor will not start.

5.1.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Blower Motor and Cooling Motors will be started by an electrical interlock.

5.1.3 *System Mode HMI - Off*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep motor turned off and will not automatically start the Blower Motor and Blower Cooling Motor, regardless of Filter level.

5.1.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will start and run Blower Motor and Blower Cooling Motor according to requests by the operator from the HMI.

5.1.5 *System Mode HMI - Auto*

When the Filter Control Switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Blower. See section ‘3.1 – Standard Operation’.

5.2 Alarms

Each Blower Motor alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-M330 Fault Blower	The Blower Motor has reported a fault condition				Enabled
07-M330A Fault Blower Cooling Fan	The Blower Motor Cooling Fan has reported a fault condition		Enabled		

5.3 Operator Interface - Overview

5.3.1 *Display Data*

The OIT will have a System Overview screen that will be used to display Blower status information and to provide operator control functions.

The screen will contain the following information:

- Blower Motor status
- Blower Motor fault indicators
- Blower Motor manual control

5.3.2 *Display Data - Information*

- Blower Motor running time (today, yesterday, total)
- Blower Motor starts (today, yesterday, total)

5.3.3 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Blower Motor options and settings:

- Adjust the Mode of the Blower Motor
- Start and Stop blower motor in manual mode
- Adjust the Stop Delay time of the Blower Motor
- Adjust the Stop Delay speed of the Blower Motor
- Adjust the speed set-point of the Blower Motor

6.0 *Sludge Screw*

6.1 Control Architecture

The Sludge Screw is used to dewater and/or convey the Sludge that has been transported by the filter mesh. The Sludge is collected and conveyed by the screw where it is optionally pressed and dewatered before exiting the SF System.

The Sludge Screw Motor is driven by a VFD that maintains a fixed speed target based on a configurable setting from the CPP OIT. The Sludge Screw may be operated in forward or reverse direction in manual mode.

The VFD is controlled by a signal communicated from the CPP PLC.

6.2 Operation Modes

6.2.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Sludge Screw will not start.

6.2.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Sludge Screw will be started by an electrical interlock.

6.2.3 *System Mode HMI - Off*

When the System Mode is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep the motor turned off and will not automatically start the Sludge Screw, regardless of Filter level.

6.2.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will start and run the Sludge Screw according to requests by the operator from the HMI. The speed of the Sludge Screw will be controlled by an operator entry on the OIT.

6.2.5 *System Mode HMI - Auto*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Sludge Screw. See section ‘3.1 – Standard Operation’.

6.3 Alarms

Each Sludge Screw Motor alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-M350 Fault Sludge Screw	The VFD for the Sludge Screw Motor has reported a fault condition				Enabled

6.4 Operator Interface

6.4.1 *Display Data - Overview*

The OIT will have a System Overview screen that will be used to display Sludge Screw status information and to provide operator control functions.

The screen will contain the following information:

- Sludge Screw Motor status
- Sludge Screw Motor fault indicators
- Sludge Screw Motor manual control

6.4.2 *Display Data - Information*

- Sludge Screw Motor running time (today, yesterday, total)
- Sludge Screw Motor starts (today, yesterday, total)

6.4.3 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Sludge Screw Motor options and settings:

- Adjust the Mode of the Sludge Screw Motor
- Adjust the Stop Delay time of the Sludge Screw Motor
- Adjust the speed set-point of the Sludge Screw Motor

7.0 *Level Transmitter*

7.1 Control Architecture

An inlet well water level transmitter is required in order to determine when to start and stop the SF System. The water level is also used to control the speed of the Filter Belt. The value is supplied to the CPP PLC via a 4-20 mA analog signal that is passed through a smoothing

algorithm to reduce noise. This signal is then scaled to engineering units based on a full scale level set-point.

7.2 Alarms

Each level transmitter alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-LT300 HL Level Filter	The level is greater than the High Level Alarm value		Enabled		
07-LT300 Overflow Filter	The level is greater than the Overflow limit.		Enabled		
07-LT300 Defect	The level transmitter is not within the allowable 4-20mA range			Enabled	

7.3 Operator Interface

7.3.1 *Display Data - Overview*

The OIT will have a System Overview screen that will be used to display Level Transmitter status information and to provide operator control functions.

The screen will contain the following information:

- Level Transmitter status
- Level Transmitter fault indicators

7.3.2 *Display Data - Information*

- Overflow time (today and yesterday)
- Overflow time total
- # of overflows (today and yesterday)
- Total number of overflows

7.3.3 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Level Transmitter options and settings:

- Adjust the Inlet Well water level set-point
- Adjust the start and stop water level limit
- Adjust the High Level alarm limit
- Adjust the Overflow alarm limit

8.0 *Blower Pressure Transmitter*

8.1 Control Architecture

A pressure transmitter is required in order to determine if the Blower is operating correctly. The value is supplied to the CPP PLC via a 4-20 mA analog signal that is passed through a smoothing algorithm to reduce noise. This signal is then scaled to engineering units based on a full scale pressure set-point.

8.2 Alarms

Each pressure transmitter alarm condition will generate a corresponding system level alarm.

Alarm Description	Alarm Condition	Delay	Classification		
			Minor	Major	Critical
07-PT331 LL Pressure Blower	The pressure is less than the Low Level Alarm value				Enabled
07-PT331 HL Pressure Blower	The pressure is greater than the High Level Alarm value		Enabled		
07-PT331 Defect	The pressure transmitter is not within the allowable 4-20mA range				Enabled

8.3 Operator Interface

8.3.1 *Display Data*

The OIT will have a System Overview screen that will be used to display Pressure Transmitter status information and to provide operator control functions.

The screen will contain the following information:

- Pressure Transmitter status
- Pressure Transmitter fault indicators

9.0 *Hot Water Valve*

9.1 Control Architecture

Hot Water is used for filter belt cleaning. All motors must be operating and in Automatic mode before a Hot Water flush will occur. The hot water valve is controlled by the CPP PLC via a discrete open signal, or the OIT in manual mode.

The CPP PLC will automatically perform a Hot Water flush based on a configurable time delay.

The Blower Motor, Blower Motor Cooling Fan, Filter Motor, and Sludge Screw Motor will start when the Hot Water Valve is being commanded to open via the in Auto mode.

9.2 Operation Modes

9.2.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Hot Water valve will not open.

9.2.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Hot Water valve will remain closed.

9.2.3 *System Mode HMI - Off*

When the System Mode is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep the Hot Water valve closed and will not automatically open the Hot Water valve.

9.2.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will open and close the Hot Water valve according to requests by the operator from the HMI.

9.2.5 *System Mode HMI - Auto*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Hot Water valve. See section ‘3.1 – Standard Operation’. The Hot Water flush timer will count down to control the operation of the valve only in HMI-Auto mode. In all other modes, the Hot Water flush timer will be reset and suspended.

9.3 Operator Interface

9.3.1 *Display Data*

The OIT will have System Overview and Flushing screens that will be used to display Hot Water Valve status information and to provide operator control functions.

The screens will contain the following information:

- Valve status
- Adjust the Remote Mode of the Hot Water Valve
- Manual flush one control

9.3.2 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Hot Water Valve options and settings:

- Adjust the automatic Hot Water Flush interval delay time
- Adjust the automatic Hot Water Flush duration time

10.0 *Cold Water Valve*

10.1 Control Architecture

Cold Water is used for flushing of the filtered water basin. The cold water valve is controlled by the CPP PLC via a discrete open signal, or a manual Cold Water Control Switch.

The CPP PLC will automatically perform a Cold Water flush based on a configurable time delay.

10.2 Operation Modes – Off, On, Remote Off, Remote Manual, Auto

10.2.1 *System Mode - Off*

When the System Mode selector switch is set to OFF, the Cold Water valve will not open.

10.2.2 *System Mode – On*

When the System Mode selector switch is set to ON, the Cold Water valve will remain closed.

10.2.3 *System Mode HMI - Off*

When the System Mode is in the “HMI” position, and the HMI mode is set to “Off”, the CPP PLC will keep the Cold Water valve closed and will not automatically open the Cold Water valve.

10.2.4 *System Mode HMI - Manual*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Manual”, the CPP PLC will open and close the Cold Water valve according to requests by the operator from the HMI.

10.2.5 *System Mode HMI - Auto*

When the System Mode selector switch is in the “HMI” position, and the HMI mode is set to “Auto”, the CPP PLC has control of the Cold Water valve. See section ‘3.1 – Standard Operation’. The Cold Water flush timer will count down to control the operation of the valve only in HMI-Auto mode. In all other modes, the Cold Water flush timer will be reset and suspended.

10.3 Operator Interface

10.3.1 *Display Data*

The OIT will have System Overview and Flushing screens that will be used to display Cold Water Valve status information and to provide operator control functions.

The screens will contain the following information:

- Valve status

- Adjust the Remote Mode of the Cold Water Valve
- Manual flush one control

10.3.2 *Operator Settings*

Users will have access to screens which will allow them to view and modify the following Cold Water Valve options and settings:

- Adjust the automatic Cold Water Flush interval delay time
- Adjust the automatic Cold Water Flush duration time

11.0 *Operator Interface*

11.1 Alarms

Alarms generated by the CPP PLC will be logged and displayed on the local OIT Alarm screen, as well as being passed to the Plant Control System. Each alarm generated will be time and date stamped at the OIT. The most recent alarms are recorded and displayed in the alarm history register of the OIT.

11.2 Passwords

The OIT for the equipment described within this document will each contain 3 levels of password protection; Operator, Technician and OEM level. Operator level has less user privileges for accessing and changing parameters for the system. Technician level has a higher level of user privileges and OEM level has full system configuration privileges. Users will be prompted to log in if trying to view or operate items with insufficient user privileges. Unique user passwords will not be provided for this system. A system log will record a history of the user log in access.

11.3 Data logging/Trending Screen

The OIT will store data points into a datalog file for retrieval for offline analysis, or for display on a Trend screen. The following data will be stored:

- Filter Level
- Filter Belt Speed
- Blower Air Pressure
- Filter Flow
- Filter Motor Voltage
- Filter Motor Current
- Sludge Screw Motor Voltage
- Sludge Screw Motor Current

12.0 *Interface with Plant Control System*

12.1 **Hardwired Status Signals**

The filter PLC will provide 3 discrete outputs (Status Bit 1 to 3) which can be configured as desired to provide alarm or operating status information. Multiple outputs may also be assigned to the same alarm output such that if any of the assigned conditions are present, the output contact will be closed. The following signals are available for assignment to these outputs:

- Filter motor running
- Sludge screw running
- Air blower running
- Water sampler pulse
- Cold water flush active
- Hot water flush active
- Drain valve open
- Filter in Automatic mode
- Common Critical Alarm
- Common Major Alarm
- Common Minor Alarm

12.2 SF System interface tag list

SF System interface tag list (SCADA list) will be developed at time of program development and will be provided as a separate “SCADA List” document.

WARRANTIES

Salsnes Equipment Limited Warranty

January 23, 2013

The following terms and conditions will govern the equipment warranty provided by Salsnes to the Owner/Operator:

Period of Coverage: Salsnes warrants to the Owner/Operator noted above (the "Customer") that if within 12 calendar months from Substantial Completion (as defined below) or 18 calendar months from the date of delivery, whichever comes first, (the "Warranty Period") equipment manufactured by Salsnes (the "Equipment") will be free from defects in material and workmanship and will function in accordance with the specifications agreed to by Salsnes for the Equipment.

"Substantial Completion" is the date on which the Equipment commissioning and start-up is sufficiently completed such that the Equipment is capable of being put into operation by Owner for its intended use.

This warranty applies only to the Salsnes Filter unit and equipment supplied with and included in the purchase agreement and under the following conditions:

- Salsnes Filter ("SF") shall receive the Startup report signed by customer and representative within 30 days of Equipment Startup.
- Any part of the SF unit that fails or is damaged under normal use within the warranty period will be replaced or, at Salsnes Filter's option repaired.
- Any defective items shall be promptly returned to Trojan/Salsnes.

Technical performance: The Salsnes Technical Reliability and Performance Guarantee apply only under the following conditions:

- The application is as per Salsnes recommendations, and designed in a manner that not allows large or heavy particles, stones, etc. to enter into the SF unit and cause damage.
- The technical performance guarantee is contingent upon proper care and maintenance of the unit as detailed within the Operation and Maintenance Manual, and using Salsnes approved parts.
- Ensuring that appropriate maintenance is completed based on type of influent. This may require, but it is not limited to, utilizing a wash system for removal of Fats, Oil and Grease (above 80 mg/l), manual cleaning of mesh, COG's, equipment, etc.

Limitations: This warranty shall not apply to any failure or defect which results from:

- the Equipment not being operated and maintained in strict accordance with instructions specified in the Operation and Maintenance manual or Product Bulletin or which results from mishandling, misuse, neglect, improper storage, improper operation of the Equipment with other equipment furnished by the Customer or by other third parties or from defects in designs or specifications furnished by or on behalf of the Customer by a person other than Salsnes.
- Equipment that has been altered or repaired after start-up by anyone except: (a) authorized representatives of Salsnes, or (b) Customer acting under specific written instructions from Salsnes.
- Use of parts not supplied or approved by Salsnes.

This warranty does not cover:

- Normal wear and tear of the product
- Consumable components
- Corrosion
- Salsnes supplied components that are the subject of a separate warranty
- Costs related to removal, installation, or troubleshooting of a component
- Physical damage
- Improper installation
- Acts of God, terrorism, biological infestations, or input voltage that create operating conditions beyond the minimum or maximum limits listed in the Operations Manual including high input voltage from generators and lightning strikes
- Damage caused by improper return packaging
- Taxes, duties or brokerage fees (if any)
- Failure or damage caused by the use of the SF unit for any purposes or application other than that intended and communicated to Salsnes at time of sale
- Equipment components manufactured by third parties but furnished to Customer by Salsnes are warranted by the original manufacturer, only to the extent of the original manufacturer's warranty

PART F

SAFETY DATA SHEETS (SDS)

SAFETY DATA SHEET

KAESER OMEGA LUBRICANT FGB-220

KAESER COMPRESSORS
Built for a lifetime.

Section 1. Identification

GHS product identifier : KAESER OMEGA LUBRICANT FGB-220

Product code : KSROFGB220

Other means of identification : Synthetic Air Compressor Fluid.

Product type : Liquid.

Relevant identified uses of the substance or mixture and uses advised against

Identified uses	
Not available.	
Uses advised against	**Reason**
Not available.	

Supplier's details : Manufactured for Kaeser Compressors Canada Inc.
3760 La Verandrye
Boisbriand, QC Canada J7H 1R5
Phone: 450-971-1414

Emergency telephone number (with hours of operation) : 24 hr. CHEMTREC 1-800-424-9300 / International 1-703-527-3887

Section 2. Hazards identification

OSHA/HCS status : While this material is not considered hazardous by the OSHA Hazard Communication Standard (29 CFR 1910.1200), this SDS contains valuable information critical to the safe handling and proper use of the product. This SDS should be retained and available for employees and other users of this product.

Classification of the substance or mixture : Not classified.

GHS label elements

Signal word : No signal word.

Hazard statements : No known significant effects or critical hazards.

Precautionary statements

Prevention : Not applicable.

Response : Not applicable.

Storage : Not applicable.

Disposal : Not applicable.

Hazards not otherwise classified : None known.

Section 3. Composition/information on ingredients

Substance/mixture : Mixture

Other means of identification : Not available.

CAS number/other identifiers

CAS number : Not applicable.

Section 3. Composition/information on ingredients

Ingredient name	%	CAS number
Butene, homopolymer (products derived from either/or But-1-ene/But-2-ene)	≥25 - <50	9003-29-6

Any concentration shown as a range is to protect confidentiality or is due to batch variation.

There are no additional ingredients present which, within the current knowledge of the supplier and in the concentrations applicable, are classified as hazardous to health or the environment and hence require reporting in this section.

Occupational exposure limits, if available, are listed in Section 8.

Section 4. First aid measures

Description of necessary first aid measures

Eye contact : Immediately flush eyes with plenty of water, occasionally lifting the upper and lower eyelids. Check for and remove any contact lenses. Get medical attention if irritation occurs.

Inhalation : Remove victim to fresh air and keep at rest in a position comfortable for breathing. Get medical attention if symptoms occur.

Skin contact : Flush contaminated skin with plenty of water. Remove contaminated clothing and shoes. Get medical attention if symptoms occur.

Ingestion : Wash out mouth with water. Remove victim to fresh air and keep at rest in a position comfortable for breathing. If material has been swallowed and the exposed person is conscious, give small quantities of water to drink. Do not induce vomiting unless directed to do so by medical personnel. Get medical attention if symptoms occur.

Most important symptoms/effects, acute and delayed

Potential acute health effects

Eye contact : No known significant effects or critical hazards.

Inhalation : No known significant effects or critical hazards.

Skin contact : No known significant effects or critical hazards.

Ingestion : No known significant effects or critical hazards.

Over-exposure signs/symptoms

Eye contact : No specific data.

Inhalation : No specific data.

Skin contact : No specific data.

Ingestion : No specific data.

Indication of immediate medical attention and special treatment needed, if necessary

Notes to physician : Treat symptomatically. Contact poison treatment specialist immediately if large quantities have been ingested or inhaled.

Specific treatments : No specific treatment.

Protection of first-aiders : No action shall be taken involving any personal risk or without suitable training.

See toxicological information (Section 11)

Section 5. Fire-fighting measures

Extinguishing media

Suitable extinguishing media : Use an extinguishing agent suitable for the surrounding fire.

Unsuitable extinguishing media : Do not use water jet.

Specific hazards arising from the chemical : In a fire or if heated, a pressure increase will occur and the container may burst.

Section 5. Fire-fighting measures

Hazardous thermal decomposition products : Decomposition products may include the following materials:
carbon dioxide
carbon monoxide

Special protective actions for fire-fighters : Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training.

Special protective equipment for fire-fighters : Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

Section 6. Accidental release measures

Personal precautions, protective equipment and emergency procedures

For non-emergency personnel : No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilled material. Put on appropriate personal protective equipment.

For emergency responders : If specialised clothing is required to deal with the spillage, take note of any information in Section 8 on suitable and unsuitable materials. See also the information in "For non-emergency personnel".

Environmental precautions : Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers. Inform the relevant authorities if the product has caused environmental pollution (sewers, waterways, soil or air).

Methods and materials for containment and cleaning up

Small spill : Stop leak if without risk. Move containers from spill area. Absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor.

Large spill : Stop leak if without risk. Move containers from spill area. Prevent entry into sewers, water courses, basements or confined areas. Wash spillages into an effluent treatment plant or proceed as follows. Contain and collect spillage with non-combustible, absorbent material e.g. sand, earth, vermiculite or diatomaceous earth and place in container for disposal according to local regulations (see Section 13). Dispose of via a licensed waste disposal contractor. Note: see Section 1 for emergency contact information and Section 13 for waste disposal.

Section 7. Handling and storage

Precautions for safe handling

Protective measures : Put on appropriate personal protective equipment (see Section 8).

Advice on general occupational hygiene : Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Workers should wash hands and face before eating, drinking and smoking. Remove contaminated clothing and protective equipment before entering eating areas. See also Section 8 for additional information on hygiene measures.

Conditions for safe storage, including any incompatibilities : Store in accordance with local regulations. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see Section 10) and food and drink. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabeled containers. Use appropriate containment to avoid environmental contamination.

Section 8. Exposure controls/personal protection

Control parameters

Occupational exposure limits

None.

Appropriate engineering controls : Good general ventilation should be sufficient to control worker exposure to airborne contaminants.

Environmental exposure controls : Emissions from ventilation or work process equipment should be checked to ensure that they are working properly. Use hydrocarbon absorbing respirator if misting.

Individual protection measures

Hygiene measures : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.

Eye/face protection : Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists, gases or dusts. If contact is possible, the following protection should be worn, unless the assessment indicates a higher degree of protection: safety glasses with side-shields.

Skin protection

Hand protection : Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary.

Body protection : Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

Other skin protection : Appropriate footwear and any additional skin protection measures should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

Respiratory protection : Use a properly fitted, air-purifying or air-fed respirator complying with an approved standard if a risk assessment indicates this is necessary. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.

Section 9. Physical and chemical properties

Appearance

Physical state : Liquid.

Color : Golden.

Odor : Mild hydrocarbon.

Odor threshold : Not available.

pH : Not applicable.

Pour point : -45°C (-49°F).

Boiling point : >371°C (700°F).

Flash point : Closed cup: 229°C (445°F)

Evaporation rate : Negligible.

Flammability (solid, gas) : Not available.

Lower and upper explosive (flammable) limits : Not available.

Vapor pressure : Not available.

Vapor density : Not available.

Section 9. Physical and chemical properties

Relative density : 0.65.

Solubility : Insoluble in water.

Partition coefficient: n-octanol/water : Not available.

Auto-ignition temperature : Not available.

Decomposition temperature : Not available.

Viscosity : Kinematic (40°C (104°F)): 2.2 cm^2/s (220 cSt)

Section 10. Stability and reactivity

Reactivity : No specific test data related to reactivity available for this product or its ingredients.

Chemical stability : The product is stable.

Possibility of hazardous reactions : Under normal conditions of storage and use, hazardous reactions will not occur.

Conditions to avoid : No specific data.

Incompatible materials : No specific data.

Hazardous decomposition products : Under normal conditions of storage and use, hazardous decomposition products should not be produced.

Section 11. Toxicological information

Information on toxicological effects

Acute toxicity

Product/ingredient name	Result	Species	Dose	Exposure
Butene, homopolymer (products derived from either/or But-1-ene/But-2-ene)	LD50 Dermal	Rabbit	>10250 mg/kg	-
	LD50 Oral	Rat	>34600 mg/kg	-

Irritation/Corrosion

Not available.

Sensitization

Not available.

Mutagenicity

Not available.

Carcinogenicity

Not available.

Reproductive toxicity

Not available.

Teratogenicity

Not available.

Specific target organ toxicity (single exposure)

Not available.

Specific target organ toxicity (repeated exposure)

Not available.

Section 11. Toxicological information

Aspiration hazard

Not available.

Information on the likely routes of exposure : Not available.

Potential acute health effects

Eye contact : No known significant effects or critical hazards.

Inhalation : No known significant effects or critical hazards.

Skin contact : No known significant effects or critical hazards.

Ingestion : No known significant effects or critical hazards.

Symptoms related to the physical, chemical and toxicological characteristics

Eye contact : No specific data.

Inhalation : No specific data.

Skin contact : No specific data.

Ingestion : No specific data.

Delayed and immediate effects and also chronic effects from short and long term exposure

Short term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Long term exposure

Potential immediate effects : Not available.

Potential delayed effects : Not available.

Potential chronic health effects

Not available.

General : No known significant effects or critical hazards.

Carcinogenicity : No known significant effects or critical hazards.

Mutagenicity : No known significant effects or critical hazards.

Teratogenicity : No known significant effects or critical hazards.

Developmental effects : No known significant effects or critical hazards.

Fertility effects : No known significant effects or critical hazards.

Numerical measures of toxicity

Acute toxicity estimates

Not available.

Section 12. Ecological information

Toxicity

Not available.

Persistence and degradability

Section 12. Ecological information

Product/ingredient name	Aquatic half-life	Photolysis	Biodegradability
Butene, homopolymer (products derived from either/ or But-1-ene/But-2-ene)	-	-	Readily

Bioaccumulative potential

Product/ingredient name	$LogP_{ow}$	BCF	Potential
Butene, homopolymer (products derived from either/ or But-1-ene/But-2-ene)	7.6 to 7.8	314 to 1882	high

Mobility in soil

Soil/water partition coefficient (K_{OC}) : Not available.

Other adverse effects : No known significant effects or critical hazards.

Section 13. Disposal considerations

Disposal methods : The generation of waste should be avoided or minimized wherever possible. Disposal of this product, solutions and any by-products should at all times comply with the requirements of environmental protection and waste disposal legislation and any regional local authority requirements. Dispose of surplus and non-recyclable products via a licensed waste disposal contractor. Wste should not be disposed of untreated to the sewer unless fully compliant with the requirements of all authorities with jurisdiction. Waste packaging should be recycled. Incineration or landfill should only be considered when recycling is not feasible. This material and its container must be disposed of in a safe way. Empty containers or liners may retain some product residues. Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers.

Section 14. Transport information

	DOT Classification	TDG Classification	IMDG	IATA
UN number	Not regulated.	Not regulated.	Not regulated.	Not regulated.

Special precautions for user : **Transport within user's premises:** always transport in closed containers that are upright and secure. Ensure that persons transporting the product know what to do in the event of an accident or spillage.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code : Not available.

Section 15. Regulatory information

U.S. Federal regulations : **TSCA 8(a) CDR Exempt/Partial exemption:** Not determined

All components are listed or exempted.

Clean Air Act Section 112 (b) Hazardous Air Pollutants (HAPs) : Not listed

Clean Air Act Section 602 Class I Substances : Not listed

Section 15. Regulatory information

Clean Air Act Section 602 Class II Substances : Not listed

DEA List I Chemicals (Precursor Chemicals) : Not listed

DEA List II Chemicals (Essential Chemicals) : Not listed

SARA 302/304

Composition/information on ingredients

No products were found.

SARA 304 RQ : Not applicable.

SARA 311/312

Classification : Not applicable.

Composition/information on ingredients

Name	%	Fire hazard	Sudden release of pressure	Reactive	Immediate (acute) health hazard	Delayed (chronic) health hazard
Butene, homopolymer (products derived from either/or But-1-ene/ But-2-ene)	≥25 - <50	No.	No.	No.	Yes.	No.

State regulations

Massachusetts : None of the components are listed.

New York : None of the components are listed.

New Jersey : None of the components are listed.

Pennsylvania : None of the components are listed.

California Prop.65

This product is not known to contain any chemicals currently listed as carcinogens or reproductive toxins.

International lists

National inventory

Australia : Not determined.

Canada : All components are listed or exempted.

China : Not determined.

History

Date of issue/Date of revision : 12/30/2015

Version : 2

Section 16. Other information

Key to abbreviations : ATE = Acute Toxicity Estimate
BCF = Bioconcentration Factor
GHS = Globally Harmonized System of Classification and Labelling of Chemicals
IATA = International Air Transport Association
IBC = Intermediate Bulk Container
IMDG = International Maritime Dangerous Goods
LogPow = logarithm of the octanol/water partition coefficient
MARPOL 73/78 = International Convention for the Prevention of Pollution From Ships, 1973 as modified by the Protocol of 1978. ("Marpol" = marine pollution)
UN = United Nations

Indicates information that has changed from previously issued version.

Noticetoreader

To the best of our knowledge, the information contained herein is accurate. However, neither the above-named supplier, nor any of its subsidiaries, assumes any liability whatsoever for the accuracy or completeness of the information contained herein.
Final determination of suitability of any material is the sole responsibility of the user. All materials may present unknown hazards and should be used with caution. Although certain hazards are described herein, we cannot guarantee that these are the only hazards that exist.

Safety data sheet

Revision: 28-03-2017
Replaces: 25-11-2016
Version: 04.03/GBR

SECTION 1: Identification of the substance/mixture and of the company/undertaking

1.1. Product identifier

Trade name: LGWA 2

1.2. Relevant identified uses of the substance or mixture and uses advised against

Recommended uses: Lubricating grease

1.3. Details of the supplier of the safety data sheet

Supplier: SKF MAINTENANCE PRODUCTS
Postbus 1008
NL-3430 BA Nieuwegein
The Netherlands
Tel: +31 30 6307200
Email: sebastien.david@skf.com
WWW: www.skf.com

1.4. Emergency telephone number

0870 600 6266 (UK only) Only available to health professionals.

SECTION 2: Hazards identification

2.1. Classification of the substance or mixture

CLP-classification (Regulation (EC) No 1272/2008):

The product shall not be classified as hazardous according to the classification and labelling rules for substances and mixtures.

Most serious harmful effects:

May cause slight irritation to the skin and eyes. Persons with a known allergy to reaction products of bis(4-methylpentan-2-yl)dithiophosphoric acid with phosphorus oxide, propylene oxide and amines, C12-14-alkyl (branched) may exhibit an allergic response to the product.

2.2. Label elements

The product shall not be classified as hazardous according to the classification and labelling rules for substances and mixtures.

Supplemental information: Contains reaction products of bis(4-methylpentan-2-yl)dithiophosphoric acid with phosphorus oxide, propylene oxide and amines, C12-14-alkyl (branched). May produce an allergic reaction. Safety data sheet available on request.

2.3. Other hazards

Assessment to determine PBT and vPvB has not been made.

SECTION 3: Composition/information on ingredients

3.2. Mixtures

Registration number	CAS/ EC Number	Substance	CLP-classification (Regulation (EC) No 1272/2008)	w/w%	Note
.	12001-85-3-J	Naphthenic acids, zinc salts	Aquatic Chronic 2;H411	<2,5	.
.	234-409-2	.	.	.	.

01-211949362	.	reaction products of	Acute Tox. 4;H302 Eye Dam. 1;H318 Skin Sens.	0,1 - 1	.
0-38-XXXX	931-384-6	bis(4-methylpentan-2-yl)dithiophosph	1;H317 Aquatic Chronic 2;H411	.	.
.	.	oric acid with phosphorus oxide,	.	.	.
.	.	propylene oxide and amines,	.	.	.
.	.	C12-14-alkyl (branched)		.	.

Please see section 16 for the full text of H-phrases.

Other information: The mineral oils in the product contain <3% DMSO extract(IP 346). Any letters after the CAS number refer to individual data sets.

SECTION 4: First aid measures

4.1. Description of first aid measures

Inhalation: Seek fresh air. Seek medical advice in case of persistent discomfort.

Ingestion: Wash out mouth thoroughly and drink 1-2 glasses of water in small sips. Seek medical advice in case of discomfort.

Skin: Remove contaminated clothing. Wash skin with soap and water. Seek medical advice in case of persistent discomfort.

Eyes: Flush with water (preferably using eye wash equipment) until irritation subsides. Seek medical advice if symptoms persist.

Other information: When obtaining medical advice, show the safety data sheet or label.

4.2. Most important symptoms and effects, both acute and delayed

May cause slight irritation to the skin and eyes. The product contains small amounts of reaction products of bis(4-methylpentan-2-yl)dithiophosphoric acid with phosphorus oxide, propylene oxide and amines, C12-14-alkyl (branched). Persons with a known allergy may exhibit an allergic response to the product.

4.3. Indication of any immediate medical attention and special treatment needed

No special immediate treatment required. Treat symptoms.

SECTION 5: Firefighting measures

5.1. Extinguishing media

Suitable extinguishing media: Extinguish with powder, foam, carbon dioxide or water mist. Use water or water mist to cool non-ignited stock.

Unsuitable extinguishing media: Do not use water stream, as it may spread the fire.

5.2. Special hazards arising from the substance or mixture

Not flammable, but combustible. Can generate harmful flue gases containing carbon monoxide in the event of fire.

5.3. Advice for firefighters

Move containers from danger area if it can be done without risk. Avoid inhalation of vapour and flue gases – seek fresh air. Wear Self-Contained Breathing Apparatus (SCBA) with chemical resistant gloves.

SECTION 6: Accidental release measures

6.1. Personal precautions, protective equipment and emergency procedures

For non-emergency personnel: Wear gloves. Wear safety goggles if there is a risk of eye splash.

For emergency responders: In addition to the above: Normal protective clothing equivalent to EN 469 is recommended.

6.2. Environmental precautions

Prevent spillage from entering drains and/or surface water.

6.3. Methods and material for containment and cleaning up

Contain and absorb spill with sand or other absorbent material and transfer to suitable waste containers. Wipe up minor spills with a cloth.

6.4. Reference to other sections

See section 8 for type of protective equipment. See section 13 for instructions on disposal.

SECTION 7: Handling and storage

7.1. Precautions for safe handling

Use the product under well-ventilated conditions. Running water and eye wash equipment should be available. Wash hands before breaks, before using restroom facilities, and at the end of work.

7.2. Conditions for safe storage, including any incompatibilities

Store safely, out of reach of children and away from food, animal feeding stuffs, medicines, etc. Keep in tightly closed original packaging. Store in a dry, cool, well-ventilated area. Store at temperatures below 45°C. Do not store with the following: Oxidisers.

7.3. Specific end use(s)

None.

SECTION 8: Exposure controls/personal protection

8.1. Control parameters

Legal basis:	EH40/2005 Workplace exposure limits. Last amended December 2011.
	Contains no substances subject to reporting requirements.

8.2. Exposure controls

Appropriate engineering controls:	Wear the personal protective equipment specified below.
Personal protective equipment, eye/face protection:	Wear safety goggles if there is a risk of eye splash. Eye protection must conform to EN 166.
Personal protective equipment, skin protection:	In the event of direct skin contact, wear protective gloves: Type of material and thickness: Nitrile rubber >0,38mm. Penetration time: >8 hours. Gloves must conform to EN 374.
Personal protective equipment, respiratory protection:	Not required. In case of risk of formation of spray mist, wear respiratory protective equipment with A/P2 filter. Respiratory protection must conform to one of the following standards: EN 136/140/145.
Environmental exposure controls:	Ensure compliance with local regulations for emissions.

SECTION 9: Physical and chemical properties

9.1. Information on basic physical and chemical properties

State:	Fat.
Colour:	Yellow /Brown
Odour:	Characteristic
Odour threshold:	No data
pH (solution for use):	No data
pH (concentrate):	No data
Melting point/freezing point:	No data
Initial boiling point and boiling range:	No data
Flash point:	> 150 °C
Evaporation rate:	No data
Flammability (solid, gas):	No data
Upper/lower flammability limits:	No data
Upper/lower explosive limits:	No data
Vapour pressure:	No data
Vapour density:	No data
Relative density:	< 1,0 g/cm3 (25 °C)
Solubility:	Insoluble in the following: Water.
Partition coefficient n-octanol/water:	No data
Auto-ignition temperature:	No data
Decomposition temperature:	No data
Viscosity:	No data
Explosive properties:	No data
Oxidising properties:	No data

9.2. Other information

None.

SECTION 10: Stability and reactivity

10.1. Reactivity

Reacts with the following: Oxidisers.

10.2. Chemical stability

The product is stable when used in accordance with the supplier's directions.

10.3. Possibility of hazardous reactions

None known.

10.4. Conditions to avoid

Do not expose to heat (e.g. sunlight).

10.5. Incompatible materials

Oxidisers.

10.6. Hazardous decomposition products

Can generate harmful flue gases containing carbon monoxide in the event of fire.

SECTION 11: Toxicological information

11.1. Information on toxicological effects

Acute toxicity - oral:	Ingestion of large quantities may cause discomfort. The product does not have to be classified. Based on existing data, the classification criteria are deemed not to have been met. 12001-85-3-J: Rat: LD50 = 4920 mg/kg LGWA 2: LD50: 5528 mg/kg
Acute toxicity - dermal:	The product does not have to be classified. Based on existing data, the classification criteria are deemed not to have been met. LGWA 2: LD50: 4113 mg/kg
Acute toxicity - inhalation:	The product does not have to be classified. Based on existing data, the classification criteria are deemed not to have been met. LGWA 2: LC50 (Mist): 20,8 mg/l LGWA 2: LC50 (Vapour): 30 mg/l
Skin corrosion/irritation:	May cause slight irritation. The product does not have to be classified. Test data are not available.
Serious eye damage/eye irritation:	Temporary irritation. The product does not have to be classified. Test data are not available.
Respiratory sensitisation or skin sensitisation:	The product contains small amounts of reaction products of bis(4-methylpentan-2-yl)dithiophosphoric acid with phosphorus oxide, propylene oxide and amines, C12-14-alkyl (branched). Persons with a known allergy may exhibit an allergic response to the product. The product does not have to be classified. Test data are not available.
Germ cell mutagenicity:	The product does not have to be classified. Test data are not available.
Carcinogenic properties:	The product does not have to be classified. Test data are not available.
Reproductive toxicity:	The product does not have to be classified. Test data are not available.
Single STOT exposure:	The product does not have to be classified. Test data are not available.
Repeated STOT exposure:	The product does not have to be classified. Test data are not available.
Aspiration hazard:	The product does not have to be classified. Test data are not available.
Other toxicological effects:	On warming/heating, the vapours emitted may cause irritation to the respiratory organs. May cause coughing and breathing difficulties.

SECTION 12: Ecological information

12.1. Toxicity

The product does not have to be classified. Based on existing data, the classification criteria are deemed not to have been met.

Acute toxicity:

12001-85-3-J:
Fish: Lepomis macrochirus: 96hLC50 = 1,53-2 ppm
Crustacea: Daphnia magna: 48hEC50 = 4,6 ppm

12.2. Persistence and degradability

Not expected to be biodegradable. Test data are not available.

12.3. Bioaccumulative potential

No bioaccumulation expected. Test data are not available.

12.4. Mobility in soil

Not expected to be mobile in soil. Test data are not available.

12.5. Results of PBT and vPvB assessment

No assessment has been made.

12.6. Other adverse effects

Oil products may cause soil and water pollution.

German water pollution classification (WGK): 1

SECTION 13: Disposal considerations

13.1. Waste treatment methods

Avoid discharge to drain or surface water. Collect spills and waste in closed, leak-proof containers for disposal at the local hazardous waste site.

EWC code: Depends on line of business and use, for instance 13 02 08* other engine, gear and lubricating oils

Absorbent/cloth contaminated with the product:
EWC code: 15 02 02 absorbents, filter materials (including oil filters not otherwise specified), wiping cloths, protective clothing contaminated by dangerous substances

Uncleansed packaging is to be disposed of via the local waste-removal scheme. Empty, cleansed packaging should be disposed of for recycling.

SECTION 14: Transport information

The product is not covered by the rules for transport of dangerous goods.

14.1. UN number -

14.2. UN proper shipping name -

14.3. Transport hazard class(es) -

14.4. Packing group -

14.5. Environmental hazards -

14.6. Special precautions for user

-

14.7. Transport in bulk according to Annex II of MARPOL73/78 and the IBC Code

-

SECTION 15: Regulatory information

15.1. Safety, health and environmental regulations/legislation specific for the substance or mixture

Special provisions: None.

15.2. Chemical safety assessment

Chemical safety assessment has not been performed.

SECTION 16: Other information

Changes have been made in the following sections:	11, 12
Abbreviation explanations:	PBT: Persistent, Bioaccumulative and Toxic vPvB: Very Persistent and Very Bioaccumulative , STOT: Specific Target Organ Toxicity
Classification method:	Calculation based on the hazards of the known components.
H-phrases:	H302 Harmful if swallowed.

	H317 May cause an allergic skin reaction. H318 Causes serious eye damage. H411 Toxic to aquatic life with long lasting effects.
Training:	A thorough knowledge of this safety data sheet should be a prerequisite condition.
Other information:	This safety data sheet has been prepared for and applies to this product only. It is based on our current knowledge and the information that the supplier was able to provide about the product at the time of preparation. The safety data sheet complies with applicable law on preparation of safety data sheets in accordance with 1907/2006/EC (REACH) as subsequently changed.

Section 1 Specifications

Specifications are subject to change without notice.

SF: 2000	
General	
Environment ambient Temperature	0ºC - 40ºC (32ºF - 104ºF)
Maximum Hydraulic Flow (clean water, filter)	144 m³/hr (0.92 MGD)
Air Knife	
Air Knife Operating Pressure	0,15 -0,25 bar (max 0,4 bar) / 2.1 -3.6 psi (max 5.8 psi)
Filter	
Weight of the filter unit: (may vary based on specific design)	690 kg (1,521 lbs)
Weight with water	1210 kg (2,660 lbs)
Sludge Auger Weight	16 kg (35 lbs)
Typical design flow rate for municipal wastewater	20 liters per second (250 mg per litre)
Water Supply Requirements	Tap Water Quality, 4-6 bar pressure (58-88 psi)
Bottom Drain Flushing Frequency	3 minutes every 24 hours (field adjustable from 1 - 60 minutes between 1 - 24 hours)
Hot and Cold water connection sizes / types	1/2 inch NPT 1/2 inch BSP
Grease	SKF LGWA 2 According to DIN 51825, code KP2N-30 (lithium based)
Control Power Panel	
Environmental	Cooling Fans, Mild Painted Steel, IP54 (Type 12) Cooling Fans, 304 SST, IP54 (Type 12) Air Conditioner, Mild Painted Steel, IP66 (Type 4) Air Conditioner, 304 SST, IP66 (Type 4X)
Cabinet Ambient Temperature Limit	Cooling Fans: 35ºC (95ºF) Air Conditioner: 40ºC (104ºF)
Panel Weight	With Cooling Fans: 60 kgs (132 lbs) With Air Conditioner: 97 kgs (214 lbs)
Electrical	480/277V 3 ph, 3 wire + gnd, 60 Hz 400/230V 3 ph, 3 wire + gnd, 50 Hz
Surge Protection	TVSS
Peak Power for filter unit	13 kVA
Distance Between Filter and Panel	35m (115 ft)

SF: 4000	
General	
Environment ambient Temperature	0ºC - 40ºC (32ºF - 104ºF)
Maximum Hydraulic Flow (clean water, filter)	288 m³/hr (1.82 MGD)
Air Knife	
Air Knife Operating Pressure	0,15 -0,25 bar (max 0,4 bar) / 2.1 -3.6 psi (max 5.8 psi)
Filter	
Weight of the filter unit: (may vary based on specific design)	1,020 kg (2,248 lbs)
Weight with water	1,910 kg (4,200 lbs)
Sludge Auger Weight	34kg (75 lbs)
Typical design flow rate for municipal wastewater	40 liters per second (250 mg per litre)
Water Supply Requirements	Tap Water Quality, 4-6 bar pressure (58-88 psi)
Bottom Drain Flushing Frequency	3 minutes every 24 hours (field adjustable from 1 - 60 minutes between 1 - 24 hours)

SF: 4000	
Hot and Cold water connection sizes / types	1/2 inch NPT 1/2 inch BSP
Grease	SKF LGWA 2 According to DIN 51825, code KP2N-30 (lithium based)
Control Power Panel	
Environmental	Cooling Fans, Mild Painted Steel, IP54 (Type 12) Cooling Fans, 304 SST, IP54 (Type 12) Air Conditioner, Mild Painted Steel, IP66 (Type 4) Air Conditioner, 304 SST, IP66 (Type 4X)
Cabinet Ambient Temperature Limit	Cooling Fans: 35ºC (95ºF) Air Conditioner: 40ºC (104ºF)
Panel Weight	With Cooling Fans: 60 kgs (132 lbs) With Air Conditioner: 97 kgs (214 lbs)
Electrical	480/277V 3 ph, 3 wire + gnd, 60 Hz 400/230V 3 ph, 3 wire + gnd, 50 Hz
Surge Protection	TVSS
Peak Power for filter unit	16.8 kVA
Distance Between Filter and Panel	35m (115 ft)

SF: 6000	
General	
Environment ambient Temperature	0ºC - 40ºC (32ºF - 104ºF)
Maximum Hydraulic Flow (clean water, filter)	576 m³/hr (3.65 MGD)
Air Knife	
Air Knife Operating Pressure	0,15 -0,25 bar (max 0,4 bar) / 2.1 -3.6 psi (max 5.8 psi)
Filter	
Weight of the filter unit: (may vary based on specific design)	1,120 kg (2,469 lbs)
Weight with water	2,450 kg (5390 lbs)
Sludge Auger Weight	53 kg (117 lbs)
Typical design flow rate for municipal wastewater	75 liters per second (250 mg per litre)
Water Supply Requirements	Tap Water Quality, 4-6 bar pressure (58-88 psi)
Bottom Drain Flushing Frequency	3 minutes every 24 hours (field adjustable from 1 - 60 minutes between 1 - 24 hours)
Hot and Cold water connection sizes / types	1/2 inch NPT 1/2 inch BSP
Grease	SKF LGWA 2 According to DIN 51825, code KP2N-30 (lithium based)
Control Power Panel	
Environmental	Cooling Fans, Mild Painted Steel, IP54 (Type 12) Cooling Fans, 304 SST, IP54 (Type 12) Air Conditioner, Mild Painted Steel, IP66 (Type 4) Air Conditioner, 304 SST, IP66 (Type 4X)
Cabinet Ambient Temperature Limit	Cooling Fans: 35ºC (95ºF) Air Conditioner: 40ºC (104ºF)
Panel Weight	With Cooling Fans: 60 kgs (132 lbs) With Air Conditioner: 97 kgs (214 lbs)
Electrical	480/277V 3 ph, 3 wire + gnd, 60 Hz 400/230V 3 ph, 3 wire + gnd, 50 Hz

SF: 6000	
Surge Protection	TVSS
Peak Power for filter unit	16.8 kVA
Distance Between Filter and Panel	35m (115 ft)

Certification	
All Models	CE and UL available

Section 2 Safety Information

Please read this entire manual before operating this equipment. Pay attention to all danger, warning and caution statements in this manual. Failure to do so could result in serious personal injury or damage to the equipment.

Make sure that the protection provided by this equipment is not impaired. Do not use or install this equipment in any manner other than that specified in installation manual.

2.1 Use of Hazard Information

⚠ DANGER

Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.

⚠ WARNING

Indicates a potentially or imminently hazardous situation which, if not avoided, could result in death or serious injury.

⚠ CAUTION

Indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE

Indicates a situation that is not related to personal injury.

2.2 Precautionary Labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed.

	Electrical equipment marked with this symbol may not be disposed of in European public disposal systems. In conformity with European local and national regulations (EU Directive 2002/96/EC), European electrical equipment users must now return old or end-of life equipment to the Producer for disposal at no charge to the user. ***Note:*** *For recycling, please contact the equipment producer or supplier for instructions on how to return end-of-life equipment, producer-supplied electrical accessories, and all auxiliary items for proper disposal. No equipment is to be returned without authorization. Local recycling programs may be used.*
	This is the safety alert symbol. Obey all safety messages that follow this symbol to avoid potential injury. If on the instrument, refer to the instruction manual for operation or safety information.
	This symbol indicates a risk of electrical shock and/or electrocution exists.
	This symbol indicates that the marked item has stored energy. Obey procedures to wait 5 (five) minutes after disconnecting main power to allow stored energy to dissipate.
	This symbol indicates the marked item could inject fluid into the skin.
	This symbol indicates machine may start automatically without warning.
	This symbol indicates the components of the system have been exposed to biohazardous waste and / or bioaerosols.

	This symbol indicates a rotational pinch hazard.
	This symbol indicates auger entanglement and should stay clear.
	This symbol indicates a belt entanglement hazard. Stay clear of moving/rotating parts.
	This symbol indicates a fork lift hazard.
	This symbol indicates a body crush hazard. People should stay clear from under overhead loads.
	This symbol indicates surfaces may be slippery or there is a potential fall hazard.
	This symbol indicates surfaces may be slippery and there is a potential fall hazard.
	This symbol indicates the marked item could be hot and should not be touched without gloves.
	This symbol indicates the marked item should not be touched.
	This symbol indicates to STOP.
	This symbol indicates a risk of electrical shock and/or electrocution exists, and that all appropriate lockout tag out procedures must be obeyed.
	This symbol indicates a physical lock is required during operation.
	This symbol indicates to secure the device with a safety device / hook.
	This symbol indicates safety glasses with side protection must be worn as a minimum added protection.
	This symbol indicates a full face shield is required for protection against airborne aerosols.

	This symbol indicates gloves must be worn.
	This symbol indicates safety boots must be worn.
	This symbol indicates a Tyvek® type suit or coveralls must be worn.
	This symbol indicates respiratory protection is required.
	This symbol indicates hearing protection is required.
	This symbol indicates a hard hat must be worn.
	This symbol indicates a safety harness or fall protection equipment must be worn.
	This symbol indicates the operator must read all available documentation to perform the required procedures.

2.3 Safety Precautions

Read the safety precautions in this section before doing maintenance, service or repair. Obey the instructions in the safety precautions. Failure to follow the instructions in the safety precautions can result in serious injury or death.

⚠ DANGER

Automated Machinery Hazard.

Auger Entanglement and Rotational Pinch Hazard.

- Failure to follow these instructions will result in serious injury or death due to AUTO START, entanglement, or rotational pinch.
- ALWAYS stay clear. This unit may start at any time.
- ALWAYS follow lockout tag out procedures, as required by ***Operation and Maintenance Manual*** before opening lid.
- NEVER operate equipment with lid open.

  Exception: *Inspection and cleaning performed in compliance with* ***Operation and Maintenance Manual*** *by competent personnel only.*

⚠ DANGER

Arc Flash and Shock Hazard - Live Electrical Circuit Present.

Hazardous Voltage.

- Failure to follow these instructions will result in electrical shock, injury or death from electrocution.
- Equipment should be accessed by competent personnel only.
- Uninterruptible Power Supply (UPS) outputs are still live after main disconnect is off and some circuits may continue to be energized.
- Turn off UPS and disconnect plugs from UPS outputs before performing any inspection, repair, service or maintenance.
- Lockout tag out all sources of power before performing any inspection, repair, or maintenance. ***There may be more than one source of power!***

⚠ WARNING

Body Crush Hazard.

- Failure to follow these instructions could result in serious injury or death due to improper lifting procedures and under rated lifting equipment.
- Inspection, repair and maintenance must be performed by competent personnel only.
- ALWAYS secure with safety device.
- ALWAYS stay clear of elevated loads.

⚠ WARNING

Biohazard.

- Failure to follow these instructions could result in serious injury or death due to contact with biohazardous materials.
- Inspection, repair and maintenance must be performed by competent personnel only.
- ALWAYS wear safety glasses and gloves when working on or around the equipment.
- ALWAYS wear respirator when working on or around the equipment when bioaerosols are present.

⚠ CAUTION

Slip and Fall Hazard.

- Failure to follow these instructions may result in injuries due to falls.
- Wet surfaces may be slippery.
- ALWAYS wear slip resistant footwear.
- ALWAYS use Safety Harness or Fall protection equipment when working around channel edge.

⚠ CAUTION

Burn Hazard.

- Failure to follow these instructions may result in minor or moderate injury due to burns.
- NEVER touch hot surface.

NOTICE

PPE Required.

Contamination of components is expected within this application due to effluent water. The manufacturer requires operators take all necessary precautions when working around, operating, or working on this equipment.

- ALWAYS use appropriate hearing protection when in an area with airborne noise emissions, A-weighted emission sound pressure, are above 70dB(A). Hearing protection is recommended when working around an operating air blower, air conditioner, or dewatering unit.
- ALWAYS use appropriate eye, hand, and foot protection.
- ALWAYS wear a face shield when inspecting open running equipment.
- ALWAYS wear respirator and appropriate clothing including thick gloves when bioaerosols are present.
- ALWAYS wear appropriate PPE as required by applicable regulations, depending on system application and plant procedures, to protect face, hands, and body from the process liquids, solids, and aerosols.
- ALWAYS follow plant safety procedures and protocols.
- Dispose of contaminated parts/components as per country requirements.

NOTICE

Avoid Injury.

- Read and understand the ***Operation and Maintenance Manual*** before operating this equipment.
- Use personal protective equipment appropriate to work being performed as required by local regulations and ***Operation and Maintenance Manual***.

NOTICE

Only competent personnel should undertake operation, repairs, maintenance, or servicing of equipment described in this manual. Maintain the continuity of the lockout tag out between shifts. If you do not understand the information or procedure explanations in this manual, STOP and contact your Service Provider for assistance.

2.4 Safety Features

The system has safety features that prevent personal injury:

- Emergency shut off
- Keyed Lid Lock
- Disconnects

The information in this manual has been carefully checked and is believed to be accurate. However, the manufacturer assumes no responsibility for any inaccuracies that may be contained in this manual. In no event will the manufacturer be liable for direct, indirect, special, incidental or consequential damages resulting from any defect or omission in this manual, even if advised of the possibility of such damages. In the interest of continued product development, the manufacturer reserves the right to make improvements in this manual and the products it describes at any time, without notice or obligation.

3.1 System Overview

The system is used for primary filtering of municipal wastewater effluent, and for industrial applications such as the fishing industry, fish net laundry facilities, pulp and paper industry, breweries, food processing industry, textile industry, tanneries, cruise ships, etc. The different models all perform the same function, but are scaled for different volumes of water.

3.1.1 System Components

The system is designed and produced to reduce the total suspended solids and consists of the following components.

- Filter - separates liquid from solids
- Air blower - produces air for cleaning the filter mesh
- Control Power Panel (CPP) - provides power and controls to the filter. For certain installations, the functionality of the CPP will be an integrated part of the main control system for the whole plant.

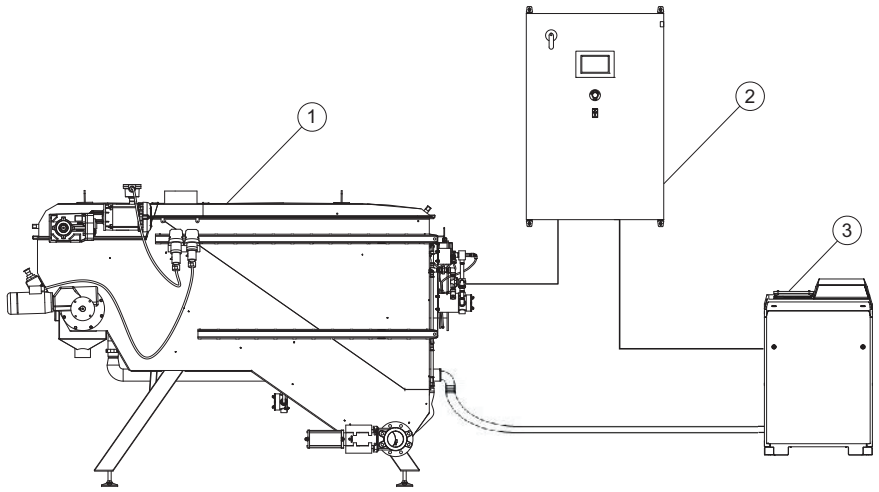

Figure 1 System Major Components

13	Outlet	**14**	Sludge Auger
15	Tension Bar	**16**	Sludge Auger Lid
17	Drain	**18**	Motor, Sludge Screw
19	Motor, Filter Mesh	**20**	Dewatering Unit Lid (optional)
21	Dewatering Unit sludge outlet (optional)	**22**	Outlet, Dewatering Unit Wastewater (optional)

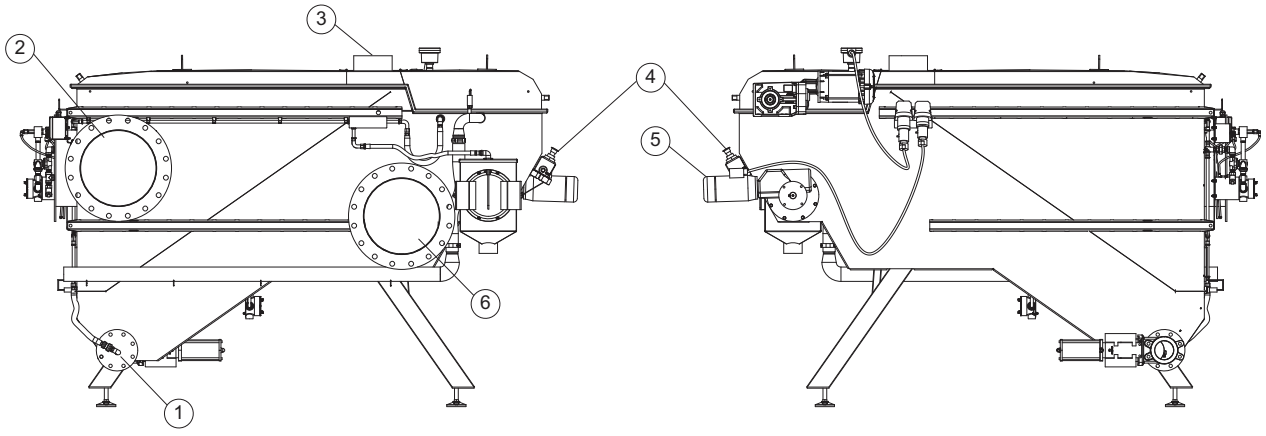

Figure 4 Filter Unit - Details

1	Cold Water Flush	**2**	Outlet
3	Vent (optional)	**4**	Emergency Stop
5	Sludge Conveyor Motor	**6**	Overflow

Filter Mesh
The filter mesh is a holed material that rotates on a belt. The solids above the filter mesh create a “filter mat”. The mat enhances separation performance as particles buildup on the mesh, creating progressively smaller holes that retain increasingly smaller particles. Water that is filtered past the mesh exits through the outlet.

Water Level Sensor
The Water Level Sensor measures the wastewater influent to a certain level allowing the filter mesh to start rotating and creating the filter mat.

Air Knife
The Air Knife is first initiated, air pressure is sensed and the filter mesh begins to rotate. Air Knife uses blower air to remove the filter mat from the filter mesh into the Sludge Conveyor compartment.

Sludge Conveyor
The Sludge Conveyor transports the filter mat out of the filter unit.

Dewatering Unit (Optional)
The Dewatering Unit is used to further reduce the moisture content from the filter mat.

Knife Gate Drain Valve
The Knife Gate Drain Valve opens to remove sediment from the filter during the flush procedure.

3.3 Control Power Panel (CPP)

The CPP houses a Programmable Logic Controller that makes this a completely automated system. A water pressure sensor tells the unit when to rotate the filter mesh (and at what speed), while the PLC simultaneously starts the Air Knife and sludge conveyor.

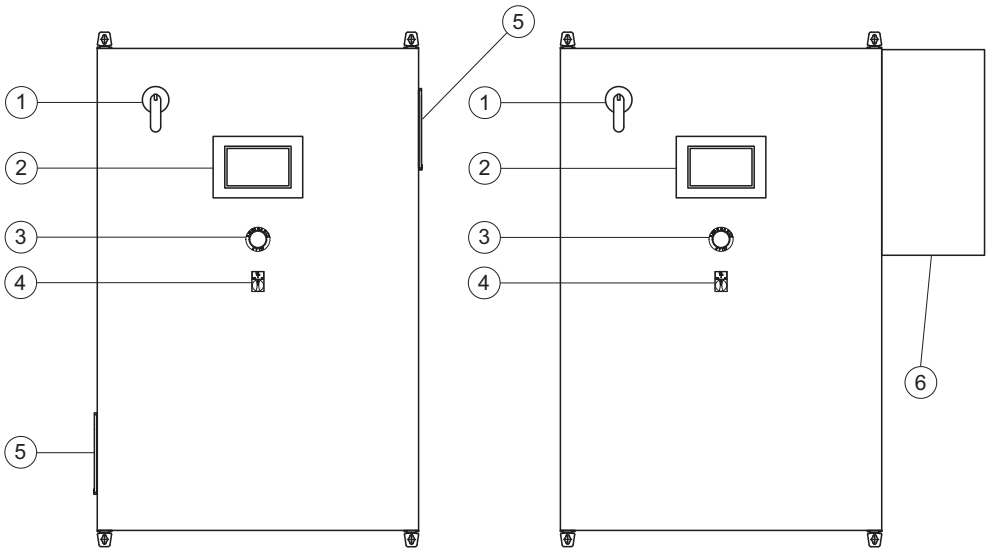

Figure 5 CPP Main Components

1	Disconnect Handle	**2**	Operator Interface Terminal (OIT)
3	Emergency Stop	**4**	Filter Mode Selector Switch
5	Cooling Fan	**6**	Air Conditioner

3.4 Air Blower

The Air Blower works with the Air Knife on the filter unit to clean the filter mesh.

3.5 Acceptable Noise Levels

NOTICE

Hearing protection is recommended when working around an operating air blower, air conditioner, or dewatering unit. Follow plant procedures.

The airborne noise emissions, A-weighted emission sound pressure level is above 70 dB(A) and less than 85 dB(A).

3.6 Patents and Permissions

The system in this manual may be protected by one or more patents in Norway and/or other countries. For a list of patents owned by Salsnes Filter®, go to www.trojantechnologies.com/patents.

No part of this publication may be reproduced, stored in a retrieval system, or transmitted in any form or by any means without written permission of Salsnes Filter®.

3.7 Abbreviations and Acronyms

Table 1 describes the abbreviations and acronyms included in this manual.

Table 1 Abbreviations and Acronyms

Abbreviation/Acronyms	Description
CPP	Control Power Panel
D gain	Derivative gain
HMI	Human Machine Interface
I gain	Integral gain
OIT	Operator Interface Terminal
P gain	Proportional gain
P mode	Proportional mode
PID mode	Proportional Integral Derivative mode
PLC	Programmable Logic Controller
PPE	Personal Protection Equipment
UPS	Uninterrupted Power Supply
VFD	Variable Frequency Drive

⚠ DANGER

Obey all warning and caution statements. Refer to Section 2.

Read and understand this Operation and Maintenance Manual before operating this equipment. Read all user documentation before performing operations, inspections, repair, or maintenance on this equipment.

Only competent personnel should undertake operation, repairs, maintenance, or servicing of equipment described in this section of the manual. If you do not understand the information or procedure explanations in this manual, STOP and contact your Service Provider for assistance.

The procedure in Section 4.1 is the minimum lockout requirement. Use additional precautions, as needed. Obey all site-specific protocols.

4.1 Lockout Tag Out Procedure

4.1.1 Equipment Shutdown

Contact the plant manager or shift supervisor for help regarding equipment location and identification.

1. Ensure no hazards will be created by equipment shutdown.
2. Shutdown all equipment that will need lockout tag out.
3. Ensure all moving parts come to a complete stop.

4.1.2 Deactivate Energy Sources

A hazardous energy source is any energy source that can cause serious personal injury or death. The potential hazardous energy sources in this system are:

1. Identify and deactivate the main isolating device of each energy source:
   -  Electrical energy (Incoming power)
   -  Mechanical (Kinetic Energy)
   -  Thermal (Thermal Energy)
2.  Disconnect all electrical equipment from power:
   - Disconnect all electrical equipment
   - Power off and disconnect electrical power to hard-wired equipment
3.  Dissipate stored electrical energy in capacitors.
4. Close all shut-off valves.

4.1.3 Lockout Tag Out Energy Sources

1. Use a multi-lock scissor adapter to lockout each energy source.
2. Attach a completed lockout tag. Include the required information:
   - Person and company applying the lockout
   - Reason for the lockout
   - Date of the lockout
3. Apply a personal lock.

4.1.4 Verify the Lockout

1. Ensure the volt meter is working correctly with a test before and after measuring the de-energized source:
   a. Test the voltmeter to a known, energized 24 VAC/120 VAC source.
   b. Use the same voltmeter to test the locked-out energy sources to verify that there is no voltage.
   c. Test the voltmeter again to a known, energized 24 VAC/120 VAC source.
2. Ensure the stored energy sources have dissipated.
3. Try to start the de-energized equipment.

4.2 Remove the Lockout Tag Out

When the work is finished, the lockout tag out can be removed.

1. Ensure no hazards will be created by removal of the lockout.
2. Obey manufacturer's instructions and safe work procedures to energize and start the equipment.
3. Clean up the work area.

⚠ DANGER

Obey all warning and caution statements. Refer to Section 2.

Read and understand this Operation and Maintenance Manual before operating this equipment. Read all user documentation before performing operations, inspections, repair, or maintenance on this equipment.Service Provider

Only competent personnel should undertake operation, repairs, maintenance, or servicing of equipment described in this section of the manual. If you do not understand the information or procedure explanations in this manual, STOP and contact your Service Provider for assistance.

5.1 Startup

- Ensure installation is completed. Refer to Installation Manual.

5.1.1 Pre-startup Checklist

Materials:

Procedure:

1. Stay clear from automated machinery. This system can auto start at any time.
2. Ensure area is clear.
3. Spray water on the belts and sealings, if the filter has been out of operation for an extended period of time.
4. Ensure all lids are closed, and the lid lock is engaged, and equipment is ready to operate.
5. Ensure the ventilation system is running as per plant procedures and protocols.
6. Ensure valves/gates are in correct operating position.

5.1.2 System Startup

Prerequisites:

- Pre-startup Checklist. Refer to Section 5.1.1.

Materials:

Procedure:

1. Set the filter mode selector switch to “OIT Mode” on the Control Power Panel (CPP).
2. Remove lockout tag out. Refer to Section 4.
3. On Filter Screen, select OIT control “Automatic” or “Manual” mode. Refer to Figure 9 Item 9.

4. Open the inlet valve.
5. As system water level is achieved, the system will startup.
6. Check Control Power Panel for any alarms.Refer to Section 6.6.6.
7. A the CPP, ensure the air knife pressure is between the acceptable range. Refer to Section 1.
   - If the pressure is too low, check the connections and refer to Section 8.1 for Symptom - Filter Mesh not cleaning.
   - If the pressure is too high, check for blockages or clean the air knife. Refer to Section 7.6.1.

   Note: *To check the pressure at the air blower, refer to the air blower manual for details.*
8. Observe the sludge mass outlet. When sludge mass appears at the sludge mass outlet, the filter unit is functioning properly.

5.1.3 Startup after Emergency Stop

Prerequisites:

- Pre-startup Checklist. Refer to Section 5.1.1.

Materials:

Procedure:

1. Ensure issue is resolved.
2. Pull or twist emergency stop button.
3. Turn the Filter Mode selector switch on the Control Power Panel (CPP) to the off position “0” and then to “Local” or “OIT Mode” to reset the safety relay.
4. Follow startup procedure. Refer to Section 5.1.2.

5.2 Shutdown

5.2.1 Shutdown for Repair or Maintenance

Procedure:

1. Ensure no hazards will be created by equipment shutdown.
2. If inlet valve/gate is manual, isolate and close manually. If inlet valve/gate is automatic, isolate and close at the OIT (HMI) Filter Screen. Refer to Figure 9 Item 8.
3. Open drain valve. Refer to Figure 9 Item 7.
4. Open cold water valve and run for 15 minutes. Refer to Figure 9 Item 3.
5. Turn the Filter Mode Selector Switch on the CPP to the “OFF” position.
6. Turn the Main Disconnect handle on the CPP to shutdown the system. Refer to Section 5.2.1.
7. Lockout tag out components. Refer to Section 4.
8. Ensure all moving parts come to a complete stop.

5.2.2 Emergency Shutdown

The emergency stop button should be used only when absolutely necessary. It will stop all mechanical motion.

Procedure:

1. Push the Emergency Stop Button on the CPP, refer to Figure 5 or at the Filter Unit, refer to Figure 3.

Note: *The location of the emergency stop button at the filter unit may differ depending on the installations. It will stop all mechanical motion.*

⚠ DANGER

Obey all warning and caution statements. Refer to Section 2.

Read and understand this Operation and Maintenance Manual before operating this equipment. Read all user documentation before performing operations, inspections, repair, or maintenance on this equipment.

Only competent personnel should undertake operation, repairs, maintenance, or servicing of equipment described in this section of the manual. If you do not understand the information or procedure explanations in this manual, STOP and contact your Service Provider for assistance.

The parameter values of the control system are set by the manufacturer. These values can be modified according to the current plant conditions in order to achieve optimized operations. These parameters are adjusted on the OIT. Refer to Table 2.

The water flush is set to operate in intervals and for a preset time. Depending on the fat/grease content in the wastewater, which tends to clog the filter mesh, flush interval is adjusted.

The dewatering sludge auger is controlled by a variable frequency drive and is run at a fixed speed depending on the application requirements. It is important that the conveyor screw runs for a certain time after the filter mesh is stopped to empty the tray.

6.1 Overview of Sequence and Principle

The system is controlled by the Control Power Panel (CPP).

1. Raw wastewater enters the system through the inlet.
2. The filter mesh filters the raw wastewater. Filtered water then flows through the outlet.
3. The sludge accumulated on the filter mesh is removed by the air knife device into the sludge outlet.
4. Sludge is transferred by auger through an (optional) dewatering unit.
5. Sludge is then transferred to a sludge collection system (sludge transfer system not supplied).

6.2 Basic Setup Data

The following setup parameters are valid for all units as shown in Table 2.

The CPP supplied has all the default values pre-programmed.

Water levels have the outlet threshold as a reference point zero (0) (Refer to Table 2). A ruler is mounted on the sidewall of the unit to read the actual levels above or below the 0 level.

Table 2 Water levels

	Level pressure transmitter (bottom of level sensor referencing outlet threshold as zero)	Water level - Start (initial value)	Max drive speed level** (initial value)	Water level - Stop (initial value)	Water level - Overflow
SF: 2000	- 45 mm (-1.8 in)	140 mm (5.9 in)	260 mm (10.2 in)	100 mm (3.9 in)	300 mm (11.8 in)
SF: 4000	- 145 mm (- 5.7 in)	160 mm (6.3 in)	280 mm (11.0 in)	120 mm (4.7 in)	320 mm (12.6 in)
SF: 6000	- 145 mm (-5.7 in)	165 mm (6.5 in)	290 mm (11.4 in)	125 mm (4.9 in)	345 mm (13.5 in)

** The motor has reached 60 Hz at this water level. For example, SF: 2000 water level 130mm above 0 will mean the motor is at 50% or 30 Hz.

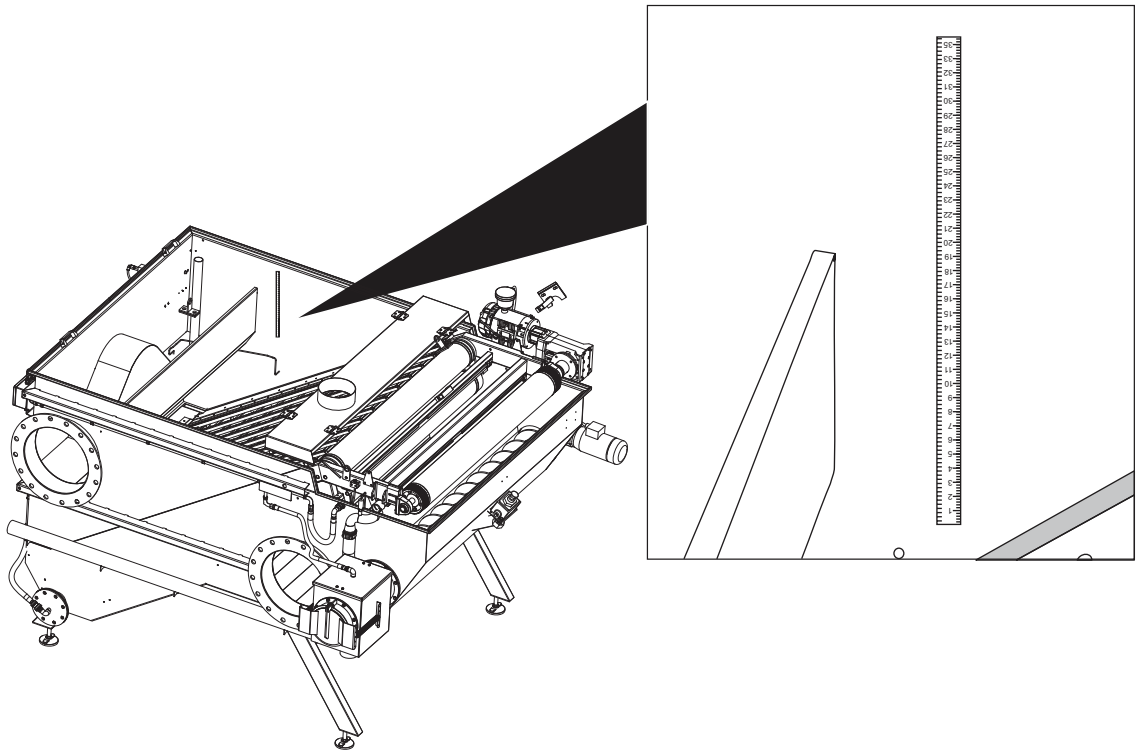

Figure 6 Ruler for Level Measurement

6.3 Switches and Indicators

The following control switches and indicators are needed in the control system for operation of the system. The Filter Mode Selector Switch can be found on the CPP. Refer to Figure 5.

Switch/Indicator	Functions	Description
Filter Mode Selector Switch	Local	Allows filter to run at last pre-set settings. Settings can be adjusted on variable frequency drives.
	Off	Turns system off.
	OIT Mode	Controlled from the Control Power Panel OIT screen.

6.4 Control Modes

The system can run in the following types of Control Modes:

Automatic Control Mode

This mode is used for normal operation, where the filter mesh, sludge auger and water flushing is automatic.

In this mode, the water level sensor provides the inputs to the PLC which are used to control the speed of the filter mesh. The PLC controls the filter mesh, air blower, sludge auger and water flushing. Refer to Table 2 for initial water level settings.

Manual Control Mode

This mode is used for maintenance, test and service purposes of:

- Air Blower Control
- Motor Control
- Valve Control

Local Control Mode

In this mode, the filter mesh and sludge auger both run at the manually entered device speed. The air blower will run continuously. The flush valves and drain valves will not operate.

Off Mode

In this mode, no devices are able to run.

6.5 Navigate Operator Interface Terminal

The OIT on the CPP uses touchscreen technology. Do not use the writing tips of pens or pencils or other sharp objects to make selections on the screen. Use only a clean, dry fingertip or the eraser tip of a pencil.

6.5.1 System Settings

The configuration settings for the system are accessed, reviewed or changed through the System Settings Screens. Push the numeric entry box, enter the value, then push ENTER. Use the pop-up numeric touch pad to enter the desired value.

6.5.1.1 Login Screen

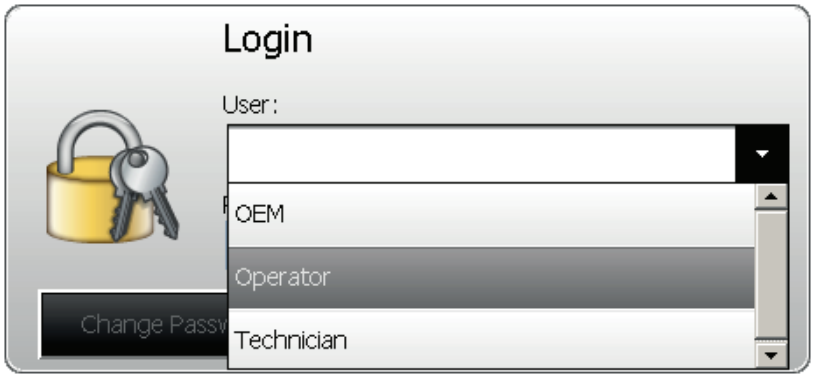

Figure 7 Login Screen

Table 3 Passwords

User	Password
OEM	Access used by Manufacturer only
Technician	Contact your Service Provider
Operator	3333

6.6 Control Power Panel Operation

The CPP contains the control program for the Filter system. The CPP is configured at the factory with inputs and outputs as required for each system. The manufacturer configures the functionality of each of the signals in the control strategy. Daily operation includes monitoring the system functions, and may occasionally require the operator to manually initiate or control processes.

6.6.1 Filter Screen

All OIT screens show navigation buttons around the system. Refer to Figure 8.

	Motor Running (Grey circle with Green Triangle)		Motor Stopped (Grey circle with White Triangle)		Motor Faulted (Grey circle with Red Triangle)
	Valve Open (Grey Valve with Green Rectangle)		Valve Closed (Grey Valve with White Rectangle)		Valve Faulted (Grey Valve with Red Rectangle)

Figure 8 Screen Navigation Buttons

The OIT screens use color codes to help identify types of data. The colored line at the bottom of each screen corresponds with the colored tab currently on display. The Filter Screen displays system status information, system fault indicators and provides the Operator control access.

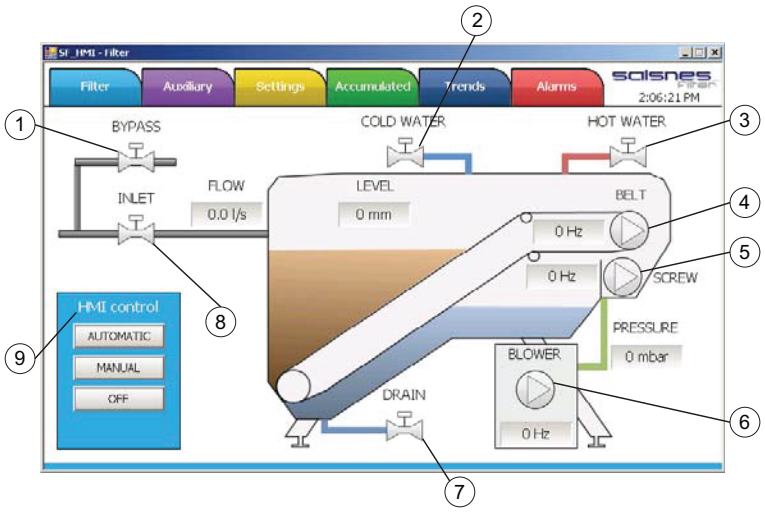

Figure 9 Filter Screen

1	Bypass button	**2**	Cold water button
3	Hot water button	**4**	Belt button
5	Screw button	**6**	Blower button
7	Drain button	**8**	Inlet button
9	OIT (HMI) control (Automatic, Manual, Off) buttons		

Note: *Not all buttons will be active, depending on the systems components.*

The Filter Screen buttons are accessed by selecting the  or  on the Filter Screen located on each device or component.

Note: *The following Filter Screen buttons are displayed below when the unit is set to Manual Mode. Local control buttons are not available when the system is in Automatic Mode.*

Table 4 Filter Screen Buttons

Screen	Description	Screen	Description
	DRAIN VALVE		COLD WATER VALVE
	HOT WATER VALVE		FILTER MOTOR
	SLUDGE SCREW MOTOR		AIR BLOWER
	BYPASS VALVE		INLET VALVE

6.6.2 Auxiliary Screen

The Auxiliary screen is used to show the external equipment that is not standard on the system such as augers, sludge bins, pump stations etc.

Figure 10 Auxiliary Screen

6.6.3 Settings Screens

The Settings Screens are divided into two levels of access.

General Access screens are available at any time using the Operator level Password. Refer to Table 3.

Technician Access screens require the Technician password.

6.6.3.1 Level Control

The Level Control setting screen is used to configure the basic settings for how the system controls the water level.

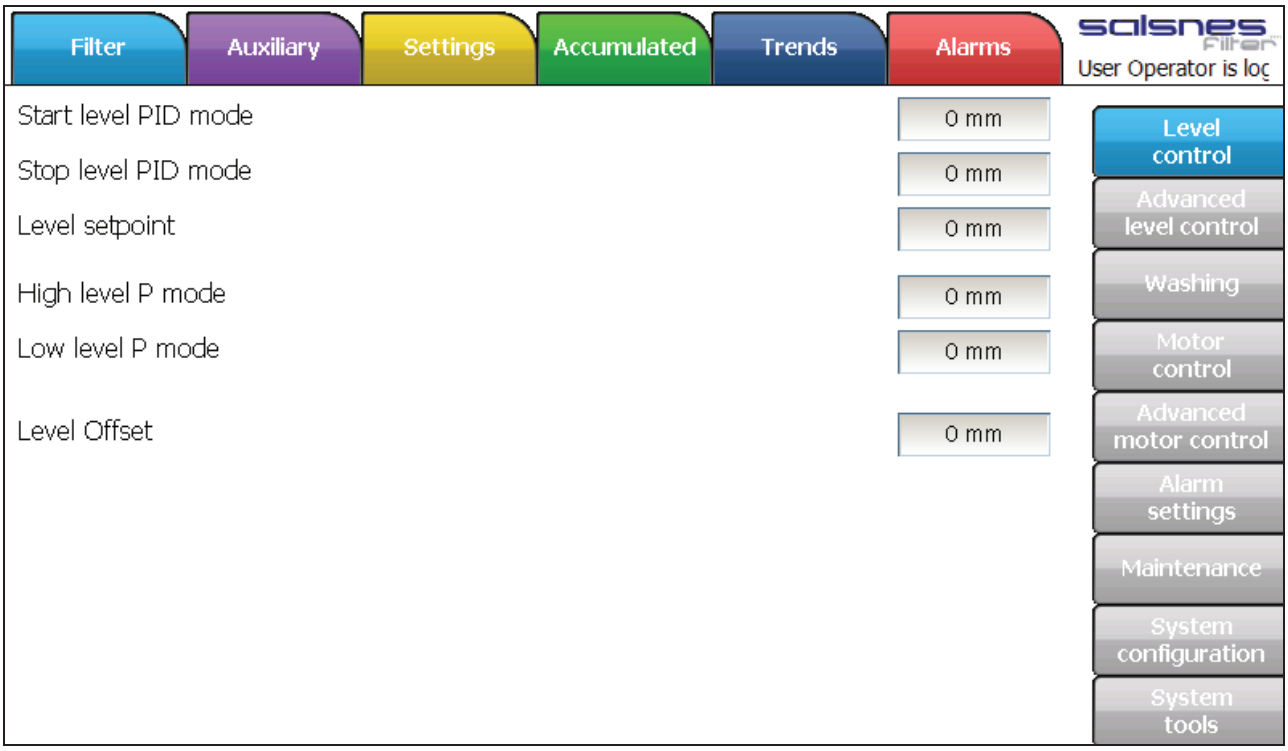

Figure 11 Level Control

Setting	Description	Units	Entry Limits	Security Level
Start Level PID mode	The filter will start when the water level is above this level and the system is in PID mode	mm	None	Operator
Stop Level PID mode	The filter will stop when the water level is below this level and the system is in PID mode. This level must be below the start level.			
Level Setpoint	The water level that the filter will try to maintain when in PID mode			
High level P mode	The water level at which the filter will run at the maximum frequency when in P mode			
Low level P mode	The water level at which the filter will run at the minimum frequency when in P mode			
Level Offset	The correction offset value to apply to the current level sensor reading.			

6.6.3.2 Advanced Level Control

The Advanced Level Control settings screen is used to control how the system responds to changes in level.

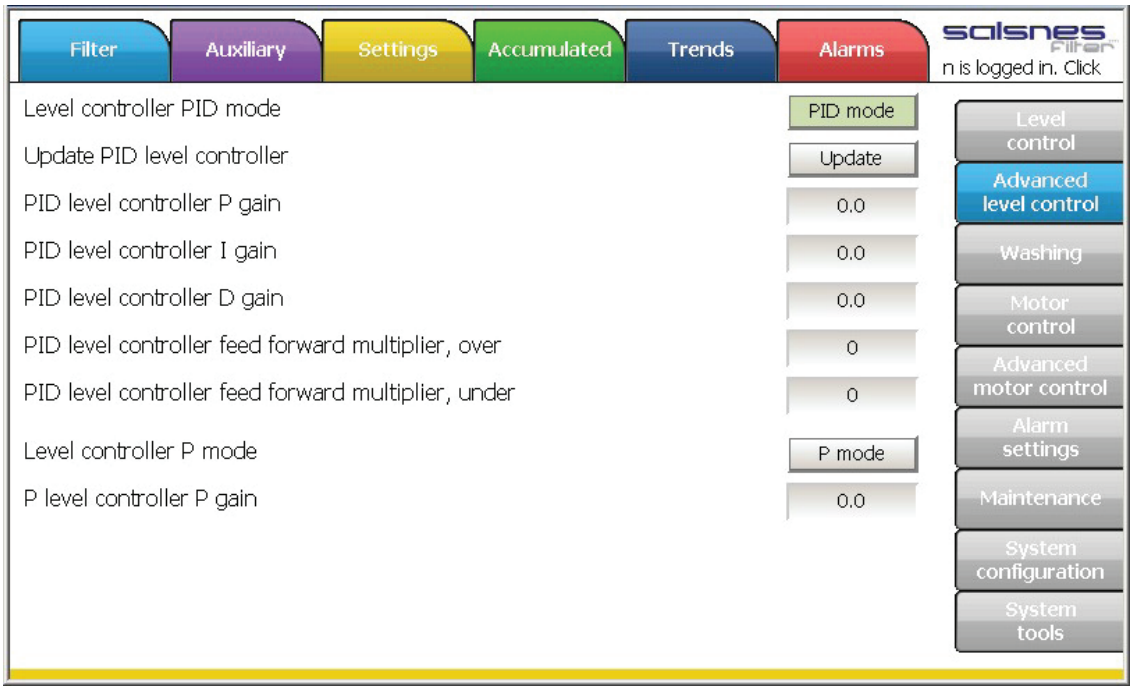

Figure 12 Advanced Level Control

Setting	Description	Units	Entry Limits	Security Level
Level controller PID mode	Sets the controller to use PID level control mode to target a specific water level setpoint using the PID controller to adjust belt speed	None	None	Technician
Update PID level controller	Triggers an update of the PID controller to accept any changes in PID parameters			
PID level controller P gain	Proportional gain of the PID controller			
PID level controller I gain	Integral gain of the PID controller			
PID level controller D gain	Derivative gain of the PID controller			
PID level controller feed forward multiplier, over	Feed forward multiplier of the PID controller when the level is above the target			
PID level controller feed forward multiplier, under	Feed forward multiplier of the PID controller when the level is below the target			
Level controller P mode	Sets the controller to use P level control mode to adjust belt speed as water level changes			
P level controller P gain	Proportional gain of the P controller			

6.6.3.3 Washing

The Washing Setting screen is used to configure the washing frequency and duration. Refer to Section 1 for operational ranges.

Figure 13 Washing

Setting	Description	Units	Entry Limits	Security Level
Cold water wash duty time	Duration that the cold water wash will run for	Seconds	None	Operator
Hot water wash duty time	Duration that the hot water wash will run for			
Cold water wash standby time	Duration between cold water washes	Minutes		
Hot water wash standby time	Duration between hot water washes			

6.6.3.4 Motor Control

The Motor Control Setting screen is used to configure basic motor operation settings and sequences.

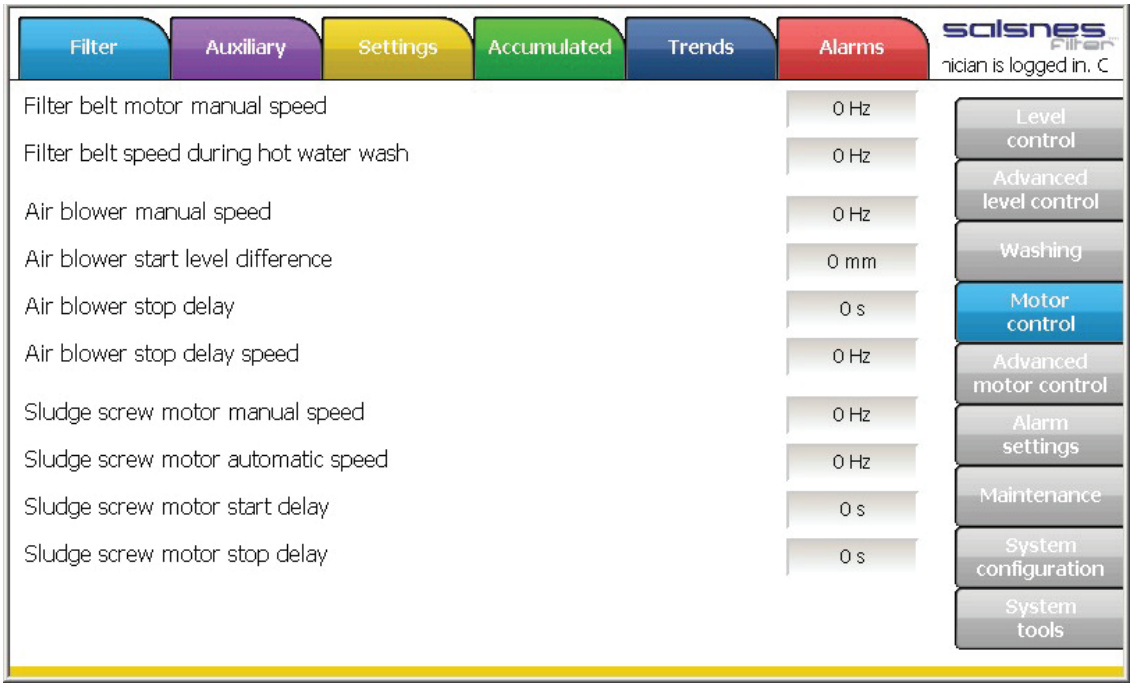

Figure 14 Motor Control

Setting	Description	Units	Entry Limits	Security Level
Filter belt motor manual speed	The speed the filter belt runs when in Manual control mode. This can be adjusted on the filter belt motor popup screen as well. This value is used for speed control when the control mode selector switch is set to Local	Hz	None	Operator
Filter belt speed during hot water wash	The speed the filter belt runs during a hot water wash.			
Air blower manual speed	The speed the air blower runs when in manual control mode. This can be adjusted on the air blower motor popup screen as well. This setting only applies when a VFD is used to control the air blower.			
Air blower start level difference	The distance below the start level setpoint that the air blower starts. The air blower must be running before the filter belt can start.			
Air blower stop delay	The amount of time the air blower remains running once the filter belt stops. This is used to reduce the number of start cycles for the blower.			
Air blower stop delay speed	The speed the air blower runs when the stop delay timer is running. This setting only applies when a VFD is used to control the air blower.			
Sludge screw motor manual speed	The speed the auger runs when in Manual control mode. This can be adjusted on the auger motor popup screen as well. This value is used for speed control when the control mode selector switch is set to Local			
Sludge screw motor manual speed	The speed the auger runs when in Automatic control mode.			

Setting	Description	Units	Entry Limits	Security Level
Sludge screw motor automatic speed	The speed the auger runs when in Automatic control mode.	Hz	None	Operator
Sludge screw motor start delay	The amount of time the filter belt must be running before the auger starts.			
Sludge screw motor stop delay	The amount of time the filter belt must be stopped before the auger stops.			

6.6.3.5 Advanced Motor Control

The Advanced Motor Control Setting screen is used to configure the advanced motor settings and limits.

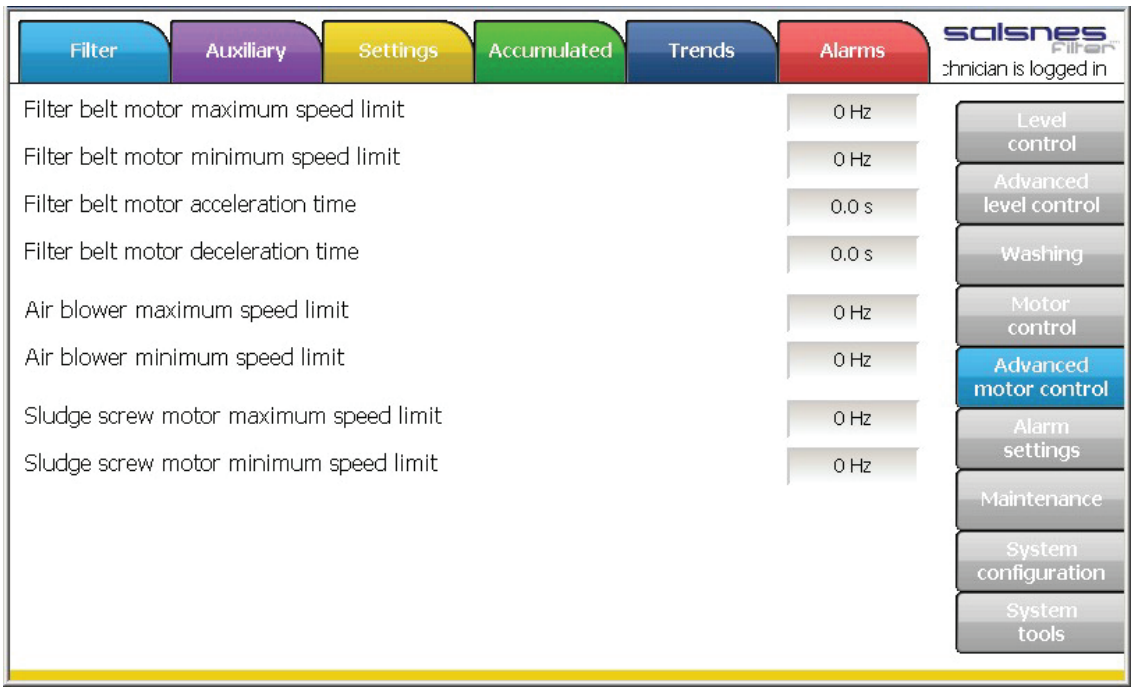

Figure 15 Advanced Motor Control

Setting	Description	Units	Entry Limits	Security Level
Filter belt motor maximum speed limit	The maximum frequency the filter belt motor can run at.	Hz	None	Technician
Filter belt motor minimum speed limit	The minimum frequency the filter belt motor can run at.	Hz		
Filter belt motor acceleration time	The filter belt motor acceleration time	Seconds		
Filter belt motor deceleration time	The filter belt motor deceleration time	Seconds		
Air blower maximum speed limit	The maximum frequency the air blower motor can run at. This setting only applies when a VFD is used to control the air blower.	Hz		
Air blower minimum speed limit	The minimum frequency the air blower motor can run at. This setting only applies when a VFD is used to control the air blower.	Hz		

Setting	Description	Units	Entry Limits	Security Level
Sludge screw motor maximum speed limit	The maximum frequency the auger motor can run at.	Hz	None	Technician
Sludge screw motor minimum speed limit	The minimum frequency the auger motor can run at.			

6.6.3.6 Alarm Settings

The Alarm Setting screen is used to configure operation alarm limits and delay times.

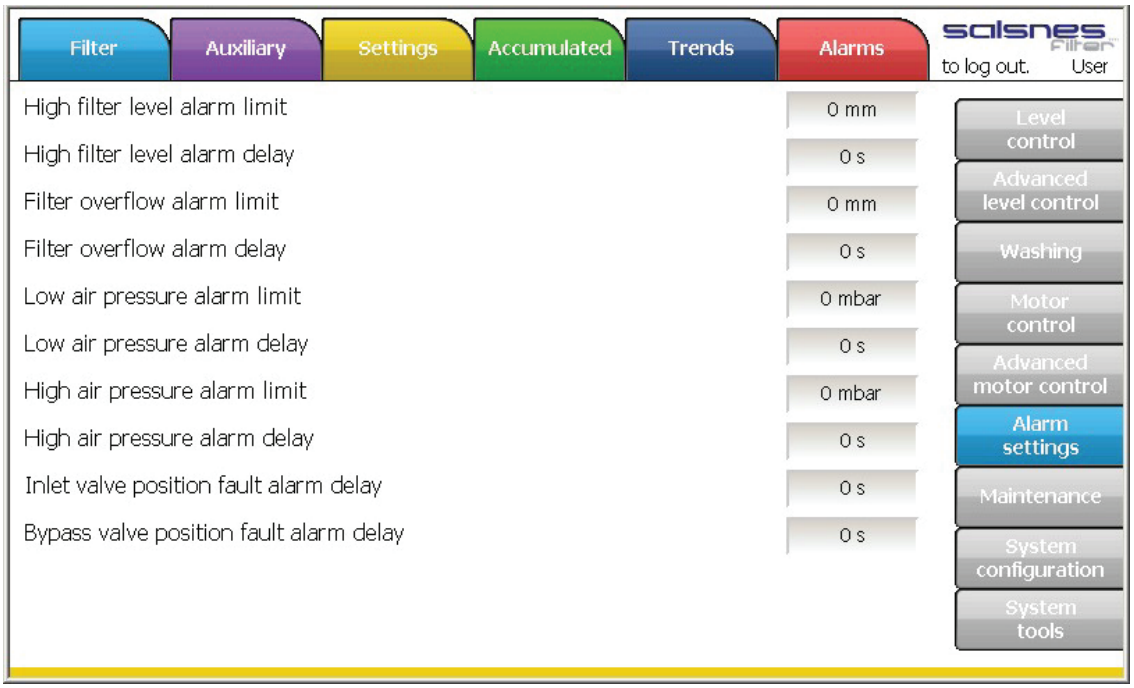

Figure 16 Alarms Settings

Setting	Description	Units	Entry Limits	Security Level
High filter level alarm limit	The alarm will occur if the water level is above this level for the delay time	mm	None	Technician
High filter level alarm delay	The alarm will occur if the water level is above the high limit for this delay time	Seconds		
Filter overflow alarm limit	The alarm will occur if the water level is above this level for the delay time	mm		
Filter overflow alarm delay	The alarm will occur if the water level is above the overflow limit for this delay time	Seconds		
Low air pressure alarm limit	The alarm will occur if the air pressure is below this level for the delay time	mbar		
Low air pressure alarm delay	The alarm will occur if the air pressure is below the low limit for this delay time	Seconds		
High air pressure alarm limit	The alarm will occur if the air pressure is above this level for the delay time	mbar		
High air pressure alarm delay	The alarm will occur if the air pressure is above the high limit for this delay time	Seconds		

Setting	Description	Units	Entry Limits	Security Level
Inlet valve position fault alarm delay	The alarm will occur if the valve has been requested to move to a position and the feedback for that position has not been received for this delay time	Seconds	None	Technician
Bypass valve position fault alarm delay	The alarm will occur if the valve has been requested to move to a position and the feedback for that position has not been received for this delay time	Seconds		

6.6.3.7 Maintenance

The Maintenance Setting screen is used to configure maintenance interval time reminders.

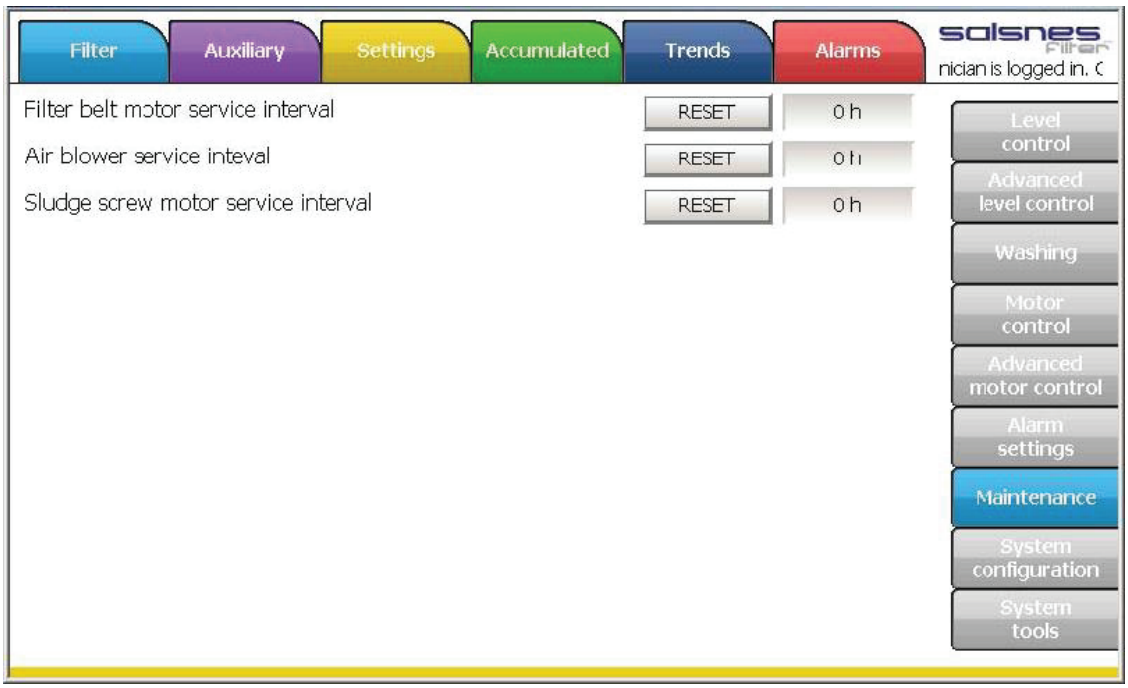

Figure 17 Maintenance

Setting	Description	Units	Entry Limits	Security Level
Filter belt motor service interval	A minor alarm service reminder will occur after the motor has been running for this time	Hours	None	Technician
Air blower service interval	A minor alarm service reminder will occur after the motor has been running for this time			
Sludge screw motor service interval	A minor alarm service reminder will occur after the motor has been running for this time			

6.6.3.8 System Configuration

This feature is for manufacturing Service Providers only.

6.6.3.9 System Tools

The System Tools screen is used to perform control hardware functions and view control hardware operating information.

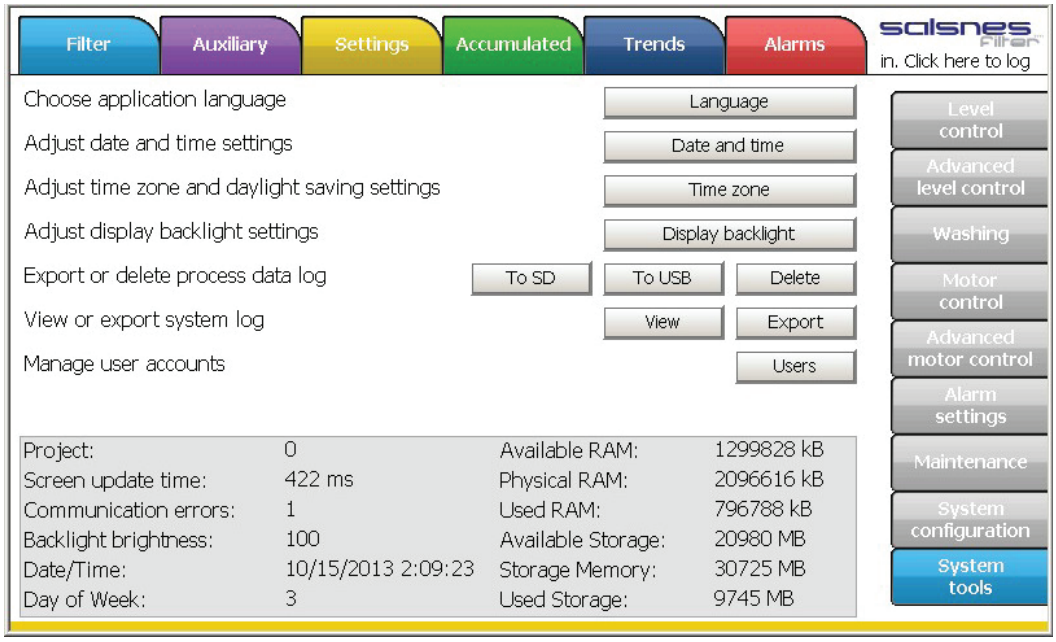

Figure 18 System Tools

Setting	Description	Units	Entry Limits	Security Level
Choose application language	Select the project language for the region	None	None	Technician
Adjust date and time settings	Adjust the data and time for the region			
Adjust time zone and daylight saving setting	Adjust the time zone and daylight saving options for the region			
Adjust display backlight settings	Adjust the backlight settings of the OIT			
Export or delete process data log	Choose which storage method to export the log files to (SD or USB) or delete the log files			
View or export system log	View or export the system logs			
Manage user accounts	Add/remove, change passwords, change security level of user accounts			

6.6.4 Accumulated Screen

The Accumulated Screen displays the runtime status and cycle counts for various filter components for the present day, the previous day and provides a total value. It also displays the number of Filter Overflow events and event duration.

The values are reset by selecting the “RESET” button.

Figure 19 Accumulated screen

6.6.5 Trends Screen

The Trend screen shows trend lines of data logged to an installed user interface Compact Flash card. Each line in the trending window represents the variables that are tracked, and shows the current value for each at the right hand side of the screen. Each line is color-coded.

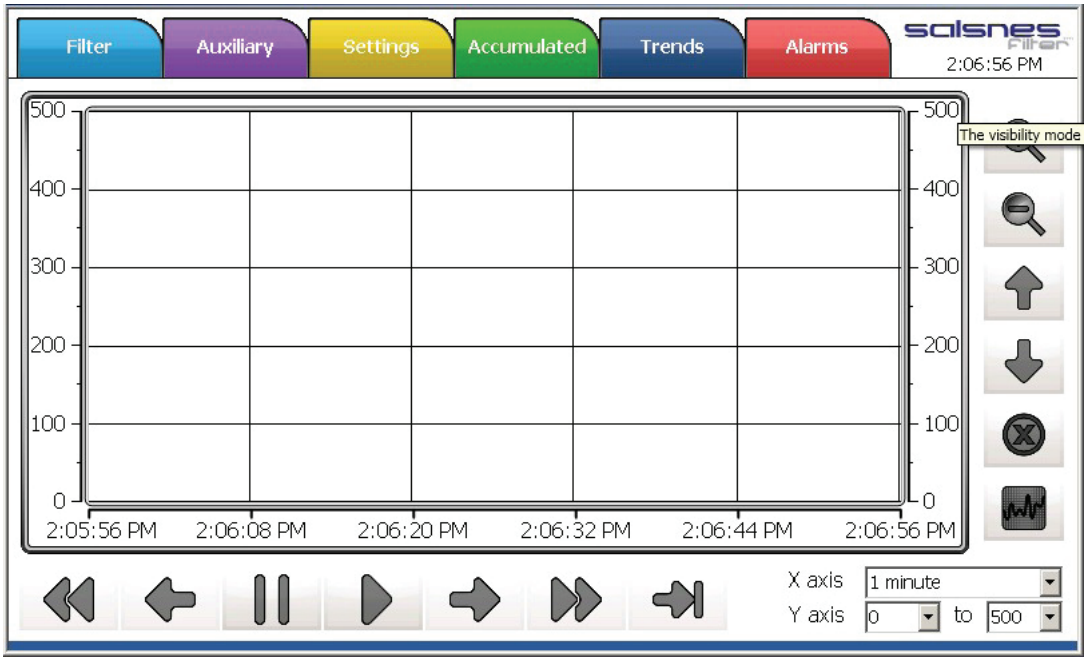

Figure 20 Trends screen

To view Trends:

1. Select  .
2. The Trend legend screen will pop up.

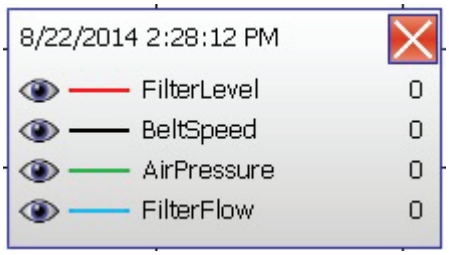

Figure 21 Trend Legend screen

3. Select  to turn the trend on or off from the trend display.

   Note: *The value to the right of the trend list displays the current value.*

6.6.6 Alarms Screen

The Alarm screen is used to display any alarm messages for currently active alarm conditions. This screen is displayed first when the alarm button is pushed, on the Screen Navigation bar. The Alarm screen provides an overview of the current active system alarms. The one hundred (100) most recent alarms are displayed on the Alarm screen. When an alarm condition is rectified and no longer active, it is removed from the Alarm screen.

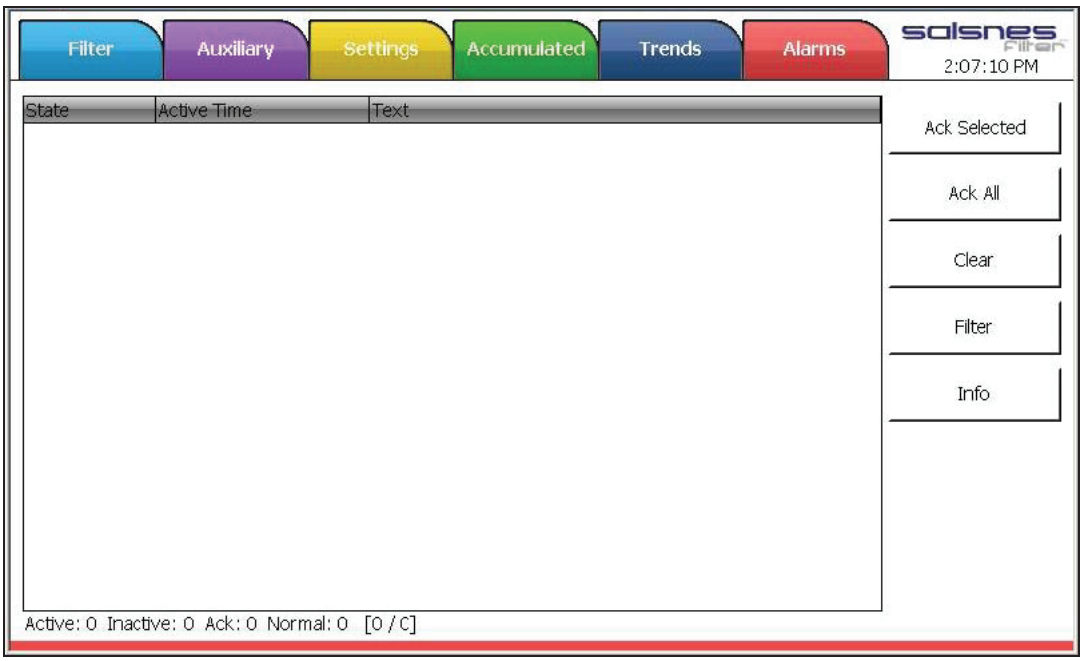

Figure 22 Alarms screen

To acknowledge individual alarms:

1. Touch the alarm on the OIT screen to be cleared.
2. Touch the 

Icon

To acknowledge all active alarms:

1. Touch Ack All Icon.

To Filter Alarms displayed:

1. Touch Filter .
2. The Alarm Event Filter Screen will pop up.

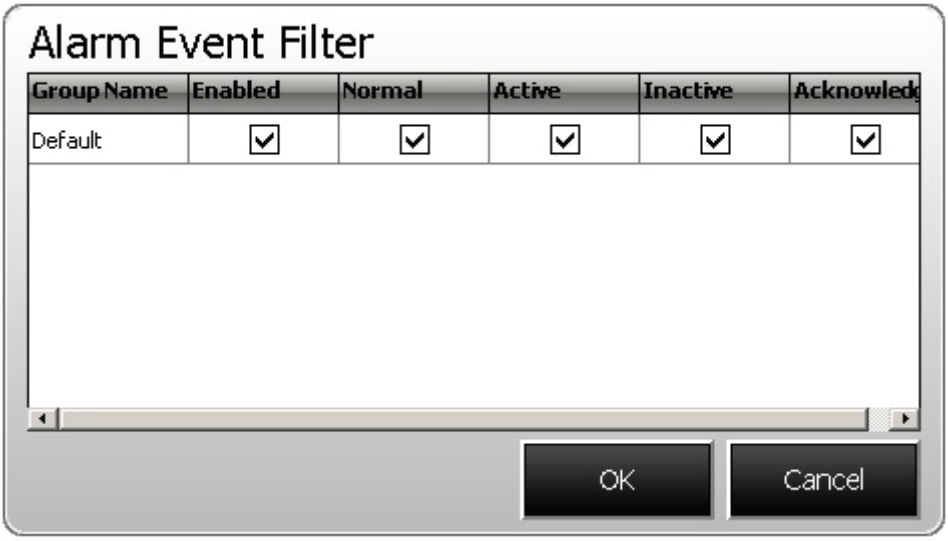

Figure 23 Alarm Event Filter screen

3. Select or deselect alarms to be displayed.

⚠ DANGER

Obey all warning and caution statements. Refer to Section 2.

Read and understand this Operation and Maintenance Manual before operating this equipment. Read all user documentation before performing operations, inspections, repair, or maintenance on this equipment.

Only competent personnel should undertake operation, repairs, maintenance, or servicing of equipment described in this section of the manual. If you do not understand the information or procedure explanations in this manual, STOP and contact your Service Provider for assistance.

7.1 Maintenance Schedule

The manufacturer recommends scheduled complete internal inspections. Routine maintenance consists of partial disassembly, cleaning and visual evaluation of system components. Table 5 describes the periodic maintenance tasks.

Table 5 Maintenance Schedule

Component	Maintenance Requirement	Daily	Weekly	Monthly	As needed	Annually
Sludge Auger	Inspect and unblock sludge auger. Refer to Section 7.5.1.		X			
	Clean inside sludge auger area. Refer to Section 7.5.2.			X		
	Inspect liner for wear. Refer to Section 7.5.3.			X		
	Inspect and maintain sludge auger shear bolts. Refer to Section 7.5.4.			X		
	Lubricate gear flange. Refer to Section 7.4.3.				X	
Drive Motors	Inspect gear box and motor. Refer to Section 7.4.1.			X		
	Clean motors. Refer to Section 7.4.2.				X	
Dewatering Unit (optional)	Inspect and clean wedge wire screen and spray nozzle. Refer to Section 7.7.				X	
	Replace the Wedge Wire Screen. Refer to Section 7.7.2.				X	
Air Knife	Inspect air knife pressure gauge. Refer to Section 7.6.1.	X			X	
	Inspect for even cleaning of the filter mesh. Refer to Section 7.3.4.	X			X	
	Clean air knife. Refer to Section 7.6.1.				X	
Filter	Check the belt tension and alignment. Refer to Section 7.3.9.			X		
	Test the E-stop on the filter unit. Refer to Section 5.2.2.					X
	Inspect the cover lift seal.					X
	Inspect the hot water spray nozzles for clogging and cleaning performance.					X
	Inspect filter mesh for wearing, holes or tears. Refer to Section 7.3.4.		X			
	Clean filter mesh. Refer to Section 7.3.5.			X	X	
	Lubricate drive roller and under roller. Refer to Section 7.3.10.				X	X
Level Sensor	Check Level Sensor Offset. Refer to Section 7.8.2			X		
Control Power Panel (CPP)	Test E-stop. Refer to Section 5.2.2.					X
	Inspect and resolve active alarms. Refer to Section 7.9.1.	X				
	Inspect and clean air filter. Refer to Section 7.9.2.			X	X	
	Clean inside and outside of the Control Power Panel (CPP). Refer to Section 7.9.3.				X	

7.2 Tools and Materials

Symbols	Description	Symbols	Description
	Manual Scraper		Grease Gun
	Water Hose with Spray Nozzle		Soft Cloth or Rag
	3, 6 mm Allen Key		10, 13, 17, 19, 24 mm Wrench
	10, 13, 17, 19 mm Socket		0.4 mm Saw Blade
	Cardboard		Power/Pressure Washer
	Key		Rubber Mallet
	Pry Bar		Screwdriver
	Bucket		Stainless Steel Wire Brush
	Spreader Bar		Cordless Drill
	Lifting Straps		Metal Shear

7.3 Filter

7.3.1 Drain the Filter Unit

Materials:

- Environmentally friendly Degreasing Soap

Procedure:

1. Close the inlet. Refer to Figure 9 Item 8.
2. On Filter Screen, select OIT control “Manual”. Refer to Figure 9 Item 9.
3. Open the Drain valve. Refer to Figure 9 Item 7.
4. Run the filter at 30 hz. Refer to Figure 9 Item 4 and 5.

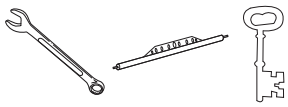
   Note: *Speed is on the Filter Screen.*
5. Initiate the sprayer nozzles by pressing hot water button. Refer to Figure 9 Item 3.
6. Deactivate the sprayer nozzles by pressing hot water button. Refer to Figure 9 Item 3.

7.3.2 Remove Filter Lids

Prerequisites:

- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out the system. Refer to Section 4.

Tools:



Materials:

Procedure:

Note: *Disconnect ventilation piping (if applicable) from the center lid.*

1. Unlock and lift the lid.
2. Disconnect and remove struts (x4) using 13 mm wrench and socket.
3. Disconnect ventilation piping (if applicable) from the center lid.

4. Remove mounting hardware from both sides of the center lid.
5. Attach spreader bar to appropriate crane or lifting device.
6. Connect the spreader bar to the lifting points on the lid.

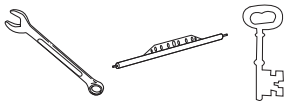
   Note: *Insert spreader bar with longer shaft end in first. Secure with provided clip pins.*

7.3.3 Install Filter Lids

Prerequisites:

- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out the system. Refer to Section 4.
- Connect spreader bar to appropriate crane or lifting device.

Tools:



Materials:

Procedure:

1. Connect the spreader bar to the lifting points on the lid.
2. Lift the lid and install on filter unit.
3. Align the center lid mounting holes and loosely install mounting hardware.
4. Install lid struts.

   Note: *Make sure lid struts are fully tighten and then loosened slightly.*
5. Close lids and verify that locks are properly engaging.
6. Tighten center lid mounting hardware.

7.3.4 Inspect Filter Mesh

Prerequisites:

- Drain the Filter Unit. Refer to Section 7.3.1
- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out the system. Refer to Section 4.
- Open Inlet Lid.

Materials:

Procedure:

1. View the filter mesh for uniform cleanliness.
2. Make sure the belt track lines are up with the cogs on the drive roller.
3. Check the Filter Mesh tension. Readjust belt tension as necessary. Refer to Section 7.3.9.
4. When service is complete, assemble in reverse order of disassembly.

7.3.5 Clean Filter Mesh

Prerequisites:

- Drain the Filter Unit. Refer to Section 7.3.1
- Open the Inlet Lid. Refer to Section 6..

Tools:

Materials:

- Environmentally friendly Degreasing Soap

Procedure:

1. Rotate the filter mesh.
2. Spray degreasing soap water for two revolutions on the filter seam. Clean up spills.
3. Stop filter mesh rotation and soak for 5 minutes. Refer to Figure 9 Item 4 and 5.
4. Initiate filter mesh rotation and flush cycles.
5. Repeat procedure until filter mesh is cleaned. If the filter mesh is not completely clean, additional cleaning with a pressure washer may be required.
6. When service is complete, assemble in reverse order of disassembly.

7.3.6 Remove and Install Filter Frame Assembly

Prerequisites:

- Isolate the filter being maintained. Bypass flow as required per plant procedures. Refer to Section 5.2.1.
- Drain the Filter Unit. Refer to Section 7.3.1
- Clean Filter Mesh. Refer to Section 7.3.5.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.
- Open and Remove Filter Lids. Refer to Section 6.
- Remove Drive Motor and Gear Box. Refer to Section 7.4.4.
- Wait for the air pipe to cool.

Tools:

Materials:

- Grease. Refer to Section 1.

Procedure:

1. Disconnect the air blower pipe. Refer to illustrated steps.
2. Disconnect the hot water line. Clean up spills. Refer to illustrated steps.
3. Connect the spreader bar to the center lifting points on the filter frame assembly. Refer to illustrated steps.
4. Lift the filter frame assembly out of the filter unit. Place the filter frame assembly flat on cardboard, protecting the rollers.

   Note: *Make sure not to damage the filter mesh during removal and installation.*

5. When service is complete, assemble in reverse order of disassembly.

   Notes: *1) During installation, lubricate the drive roller and under roller. Refer to Section 7.3.10.*
   2) After filter frame assembly installation, check and adjust the tension of the filter mesh. Refer to Section 7.3.9.

7.3.7 Remove Filter Mesh

Prerequisites:

- Remove Filter Frame Assembly. Refer to Section 7.3.6.

Tools:

- T25 Torx bit

Materials:

Procedure:

1. Reduce the tension on the filter mesh. Refer to Section 7.3.9.
2. Remove the hex head from the fixing bars (6 mm). Refer to Figure 26.

3. Remove the sealing beam hardware, one bolt on each corner. Remove the sealing beam and sealing plate assembly.

   Note: *Use two people to lift the sealing beam and sealing plate assembly to prevent breaking of the silicone seal. Refer to Figure 24.*

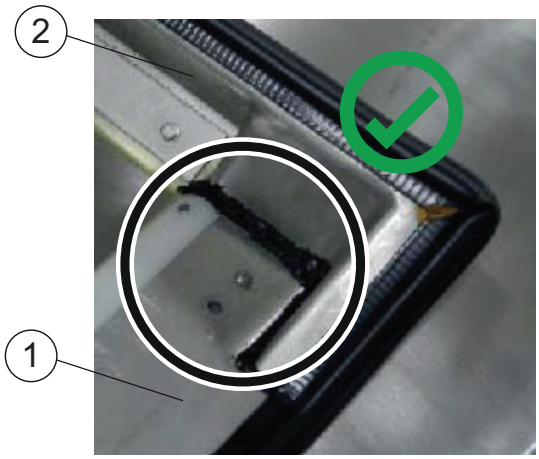

Figure 24 Silicone Seal

1	Fixing Bar	**2**	Sealing Beam

4. Rotate the lifting lugs down. Refer to Figure 26.
5. Remove the strut mounting bracket. Refer to Figure 26.
6. Use a lifting device and strapping, position the filter frame assembly on its side with the motor shaft on top. Refer to Figure 25.
7. Remove the slide bar assemblies on both sides of the filter frame assembly. Refer to Figure 26.

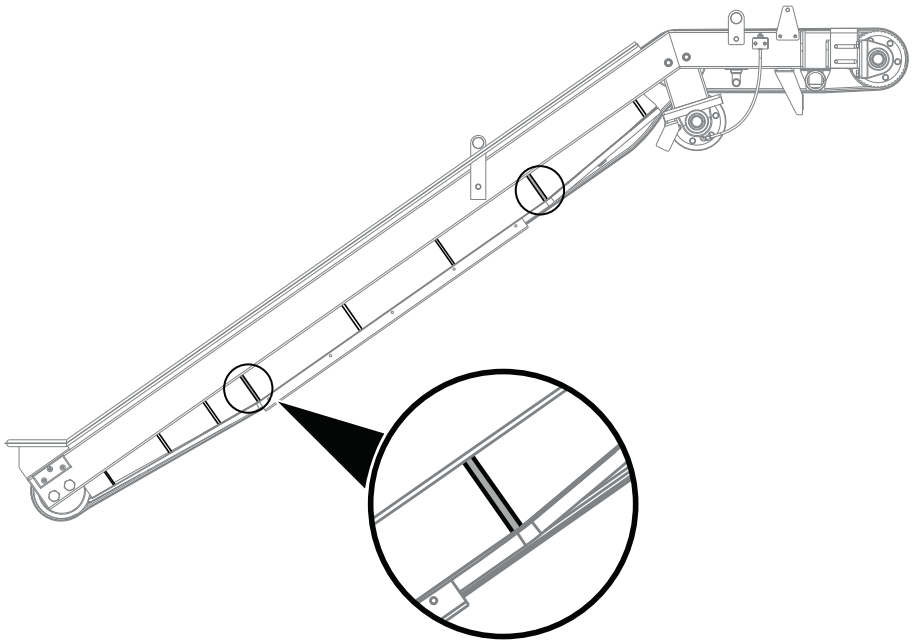

Figure 25 Lifting Points

8. Remove the filter mesh wiper bar hardware.
9. Disconnect the grease tubing from the grease terminal.
10. Remove roller scraper hardware.

11. Remove the under roller hardware.

Notes: *1) Take care when removing the under roller so that it does not become damaged.*

12. Lift the filter frame assembly and slide filter mesh downward.

Note: *Use two people to remove the filter mesh to prevent damage.*

13. Inspect the filter frame and air knife. If excess buildup is visible, use a pressure washer to clear the buildup. Clean up spills.

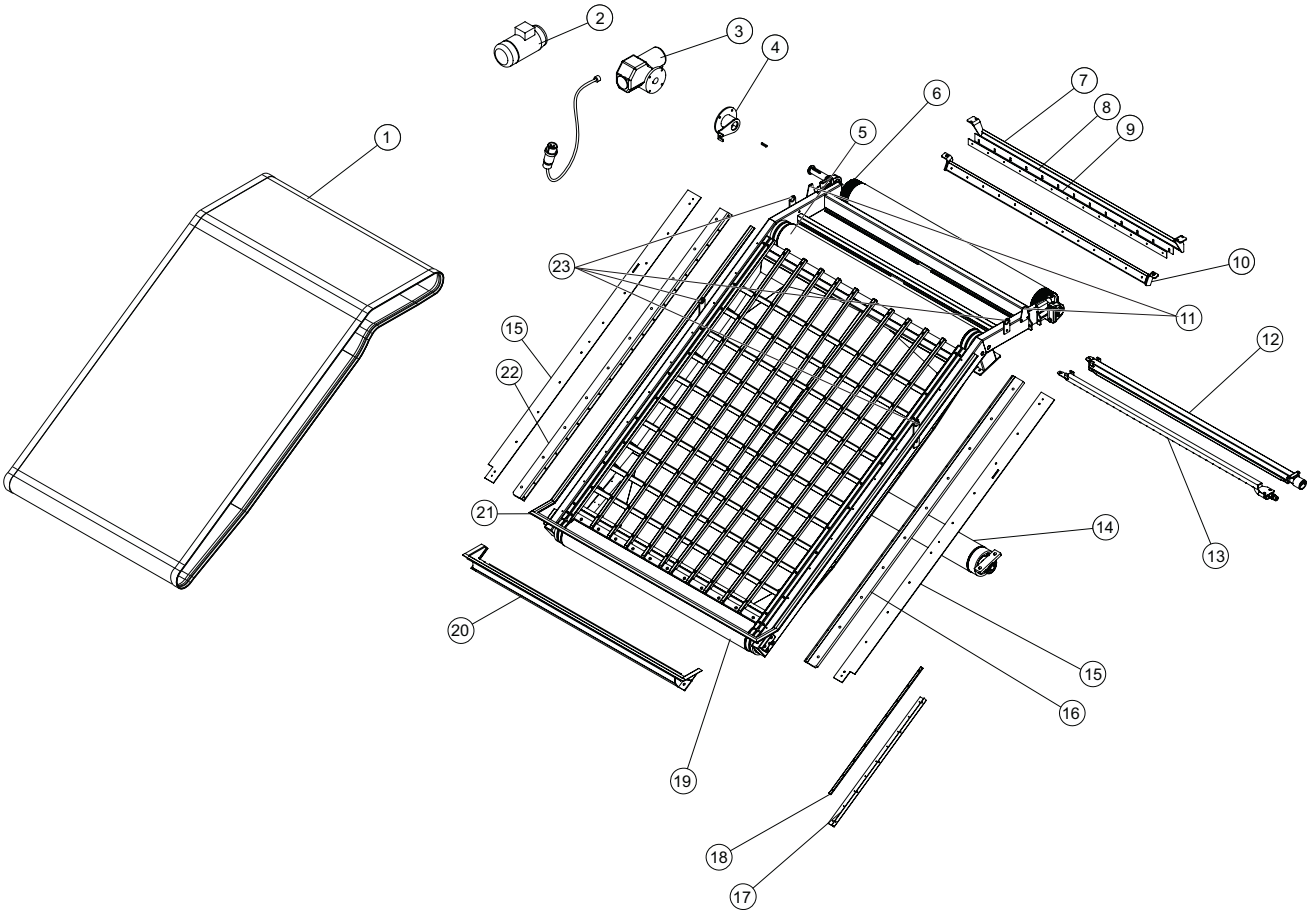

Figure 26 Filter Mesh Assembly

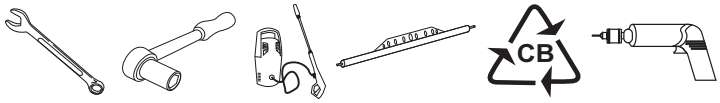
12	Air Knife		

7.3.8 Install Filter Mesh

Prerequisites:

- Remove Filter Mesh. Refer to Section 7.3.7.

Tools:



- T25 Torx bit

Materials:

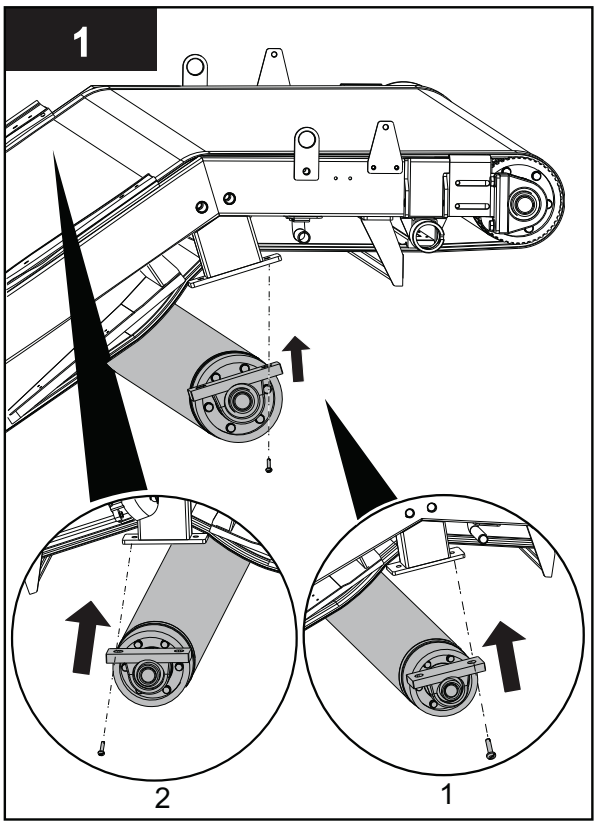
- Silicone
- Filter mesh

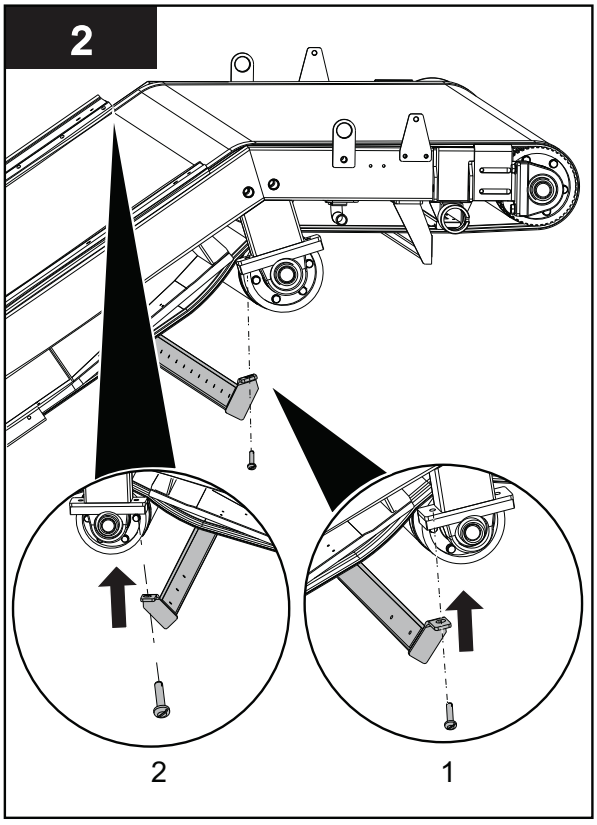
Procedure:

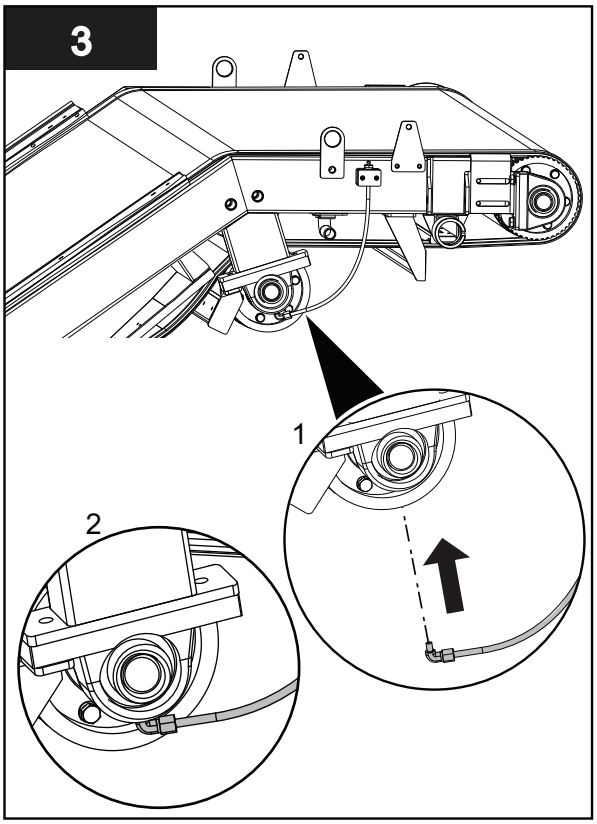
1. Use a lifting device and strapping, position the filter frame assembly on its side with the motor shaft on top.
2. Lift the filter frame assembly above the work surface, allowing adequate space to install filter mesh.
3. Make sure that the arrow on the filter mesh points in the direction of rotation.
4. Align the black seam on the filter mesh with the drive roller.
5. Lower the filter frame assembly and slide filter mesh upward.

   Note: *It is recommended to use two people to install the filter mesh to prevent damage.*
6. Verify the black seam is parallel to the drive roller, this ensure it is installed evenly.

7. To install under roller and roller wiper bar, refer to following illustrations.







8. Install the filter mesh wiper bar. Make sure the wiper is installed in correct orientation. Refer to Figure 27.

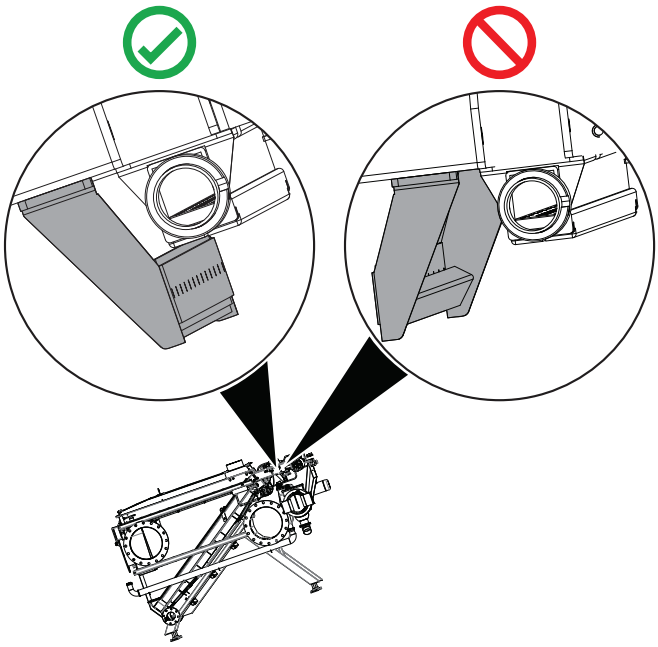


Figure 27 Filter Mesh Wiper

9. Gently lower the filter frame assembly onto a piece of cardboard, protecting the rollers.
10. Install slide bar assemblies on both sides of the filter frame using a cordless drill with T25 Torx Bit. Refer to Figure 26.
11. Place the sealing beam and sealing plate assembly on the filter frame. Refer to Figure 26.

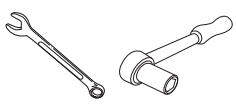
    Note: *Use two people to lift the seal plate and sealing place assembly to prevent breaking the silicone seal.*
12. Inspect the silicone seal. If damaged, remove old silicone and apply new silicone until a proper seal is achieved. Refer to Figure 24.
13. Install M6 bolts on sealing plate, on both sides of the filter frame assembly. Refer to Figure 26.
14. Install M10 bolts on both sides of the bottom sealing beam. Refer to Figure 26.
15. Install filter frame assembly into Filter Unit. Refer to Section 7.3.6.

7.3.9 Check and Adjust Filter Mesh Tension

Prerequisites:

- Drain the Filter Unit. Refer to Section 7.3.1
- Clean Filter Mesh. Refer to Section 7.3.5.
- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.
- Open Sludge Auger Lid. Refer to Section 6.

Tools:



Materials:

Procedure:

1. View the filter mesh tension on each side by pressing the filter mesh down.
2. Use gloved fingertip to press down about 4 kg (9 lbs). The belt should have a slack of approximately 10-20 mm (3/8 in - 3/4 in).
3. To loosen the filter mesh tension:
   a. Using a 13 mm wrench/socket, loosen the side bolts on both sides of the filter frame. Refer to Figure 28.
   b. Using a 19 mm wrench, loosen the tensioning bolts on both sides of the filter frame. Refer to Figure 28.
   c. Push the drive roller towards the air knife.
4. To tighten the filter mesh tension,
   a. Make sure the cogs on the filter mesh align correctly with the cogs on the drive roller.
   b. Align the black seam on the filter mesh to the same reference point on both sides of the frame.
   c. Using a 19 mm wrench, tighten the tensioning bolts on both sides of the filter frame. Refer to Figure 28.
   d. Using a 13 mm wrench/socket, tighten the side bolts on both sides of the filter frame. Refer to Figure 28.
   e. Check that the black seam aligns to the same reference point on both sides of the frame. If aligned, proceed to Step 5. If not aligned, adjust as required.

5. Check if the filter mesh tension is correct. Refer to Steps 1-2.

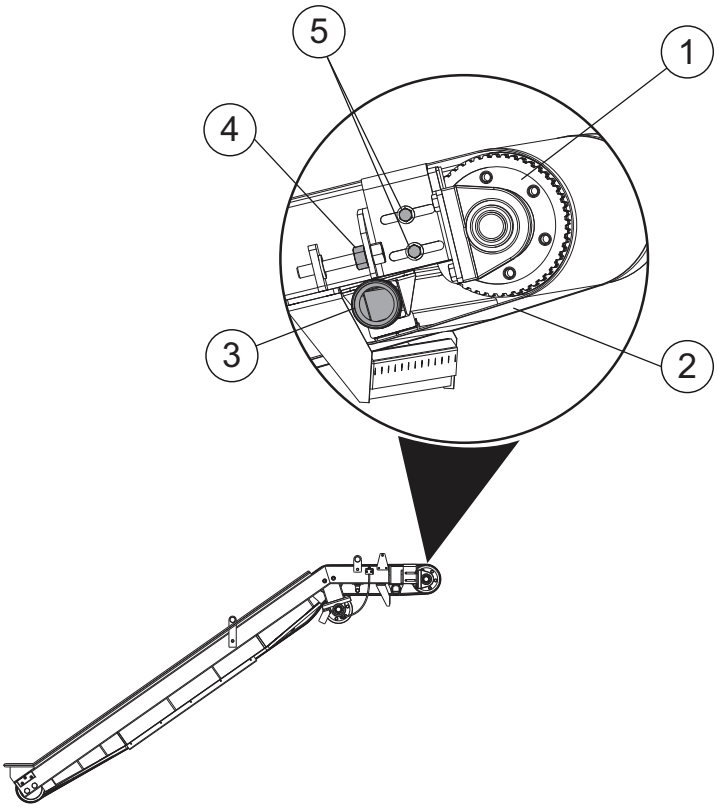


Figure 28 Filter Mesh Tension

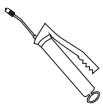
1	Drive Roller	**4**	Tensioning Bolt
2	Filter Mesh	**5**	Side Bolt
3	Air Knife		

7.3.10 Lubricate Drive Roller and Under Roller

Prerequisites:

- Drain the Filter Unit. Refer to Section 7.3.1
- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.
- Open the Sludge Auger Lid. Refer to Section 6.

Tools:



Materials:

- Grease. Refer to Section 1.

Procedure:

1. Apply grease gun to grease port on the drive roller bearings. Apply 3 to 4 injections of grease to each port. Clean up spills.
2. Apply grease gun to remote grease port located on the sides of the Filter Frame for the under roller bearings. Apply 3 to 4 injections of grease to each port.

   Note: *Make sure grease tubing is connected prior to adding grease.*
3. When service is complete, assemble in the reverse order of disassembly.

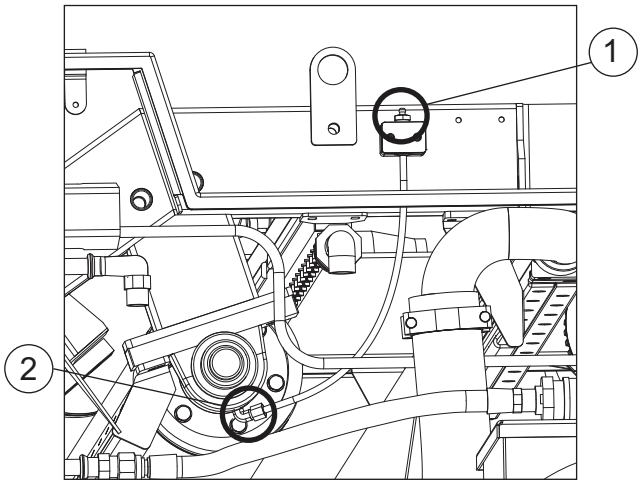


Figure 29 Filter Assembly Grease Ports

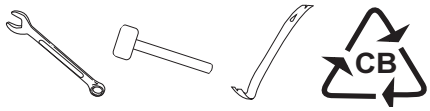
1	Remote Grease Fill Port	**2**	Under-roller Pillow Block Bearings

7.3.11 Replace Drive Roller Bearing

Prerequisites:

- Remove Filter Mesh. Refer to Section 7.3.7.

Tools:



Materials:

- Bearing
- Bearing Housing (if required)

Procedure:

1. Use a wrench to remove drive roller mounting bolts on both sides of the filter frame. Remove the drive roller. Refer to Figure 30.

   Note: *Place the drive roller on a cardboard to prevent any damage to the roller.*

2. Use a pry bar to detach the bearing housing from the drive roller shaft.
3. Remove bearing from bearing housing with a rubber mallet. Install a new bearing into bearing housing.
4. Install bearing housing onto roller shaft using a rubber mallet.

   Note: *Lubricate the drive roller bearing housing after replacement. Refer to Section 7.3.10.*

When service is complete, assemble in the reverse order of disassembly.

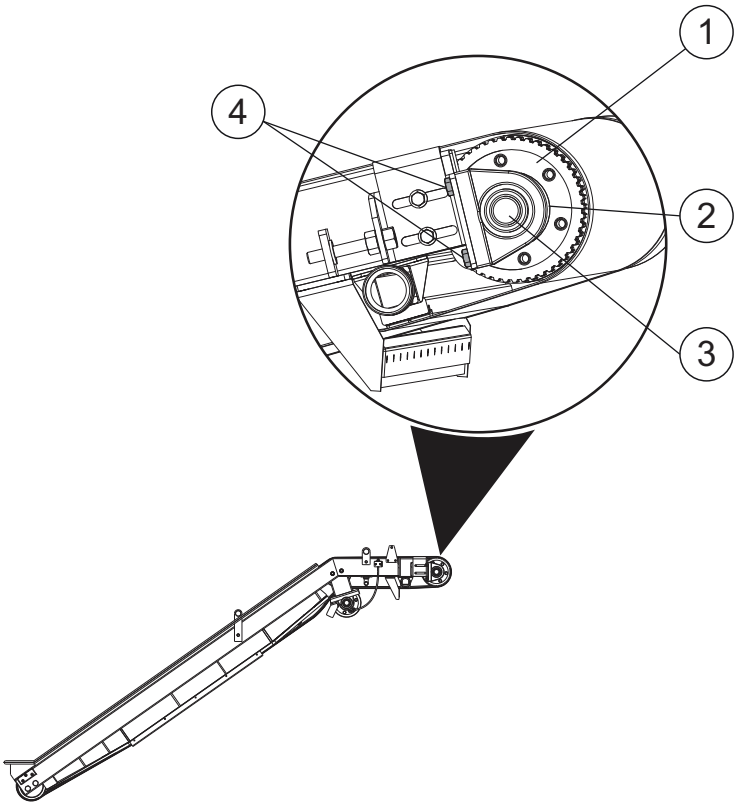


Figure 30 Drive Roller Bearing

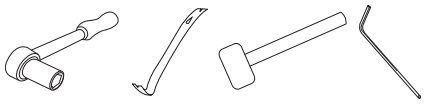
1	Drive Roller	**3**	Bearing
2	Bearing Housing	**4**	Drive Roller - Mounting Bolt

7.3.12 Replace Under Roller Bearing

Prerequisites:

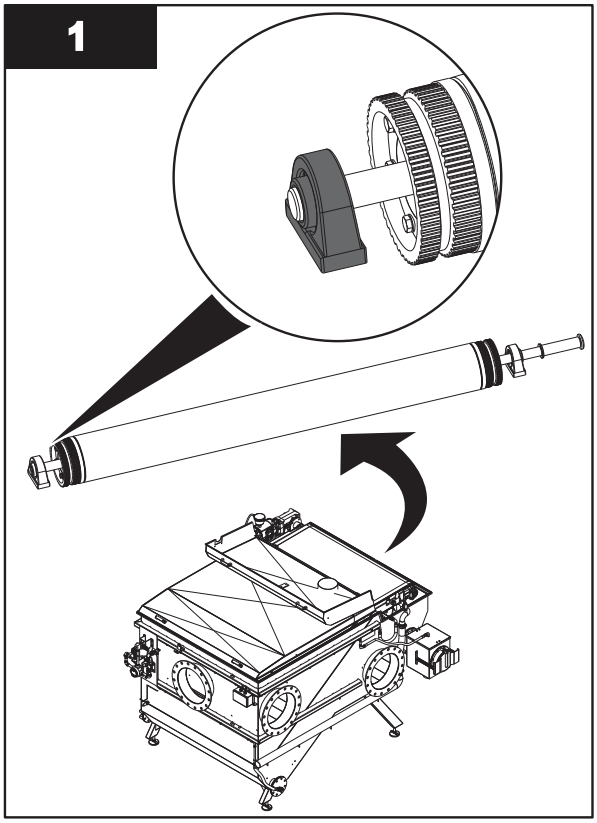
- Remove Filter Mesh. Refer to Section 7.3.7.

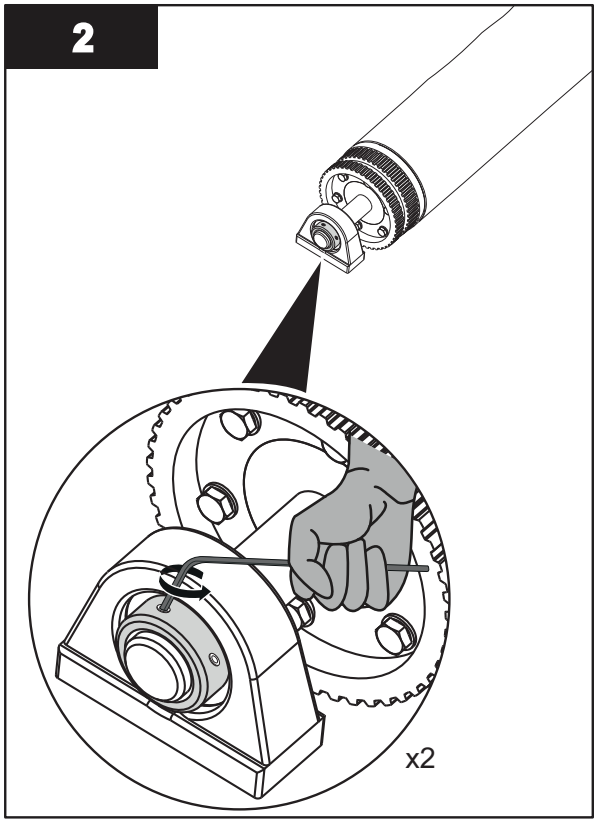
Tools:

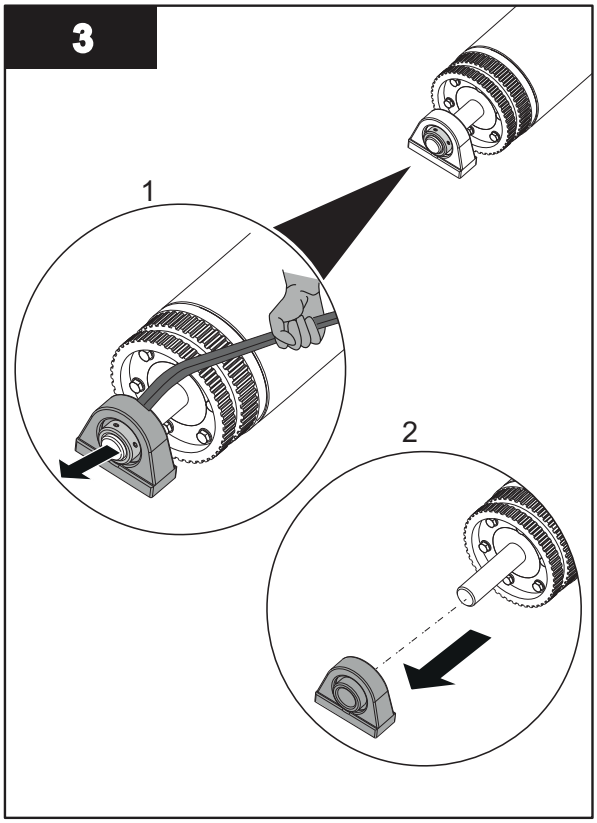


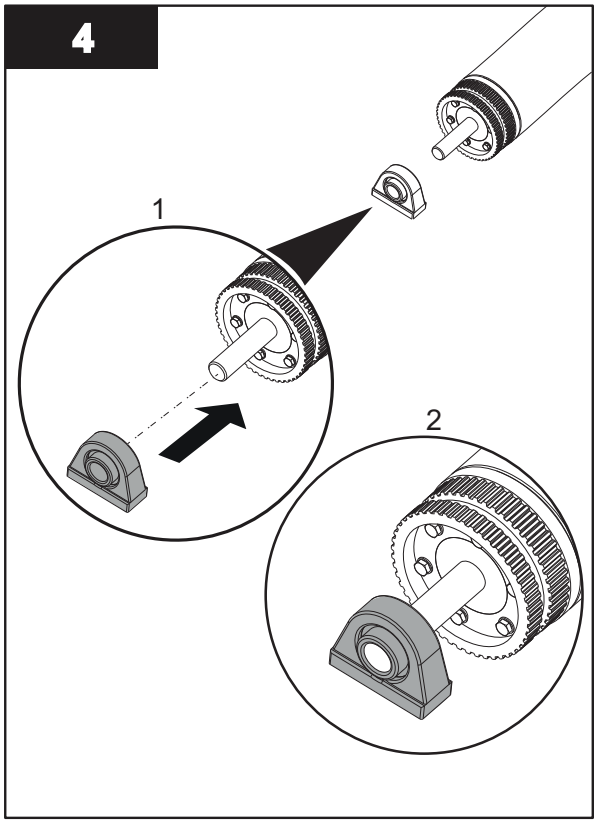
Materials:

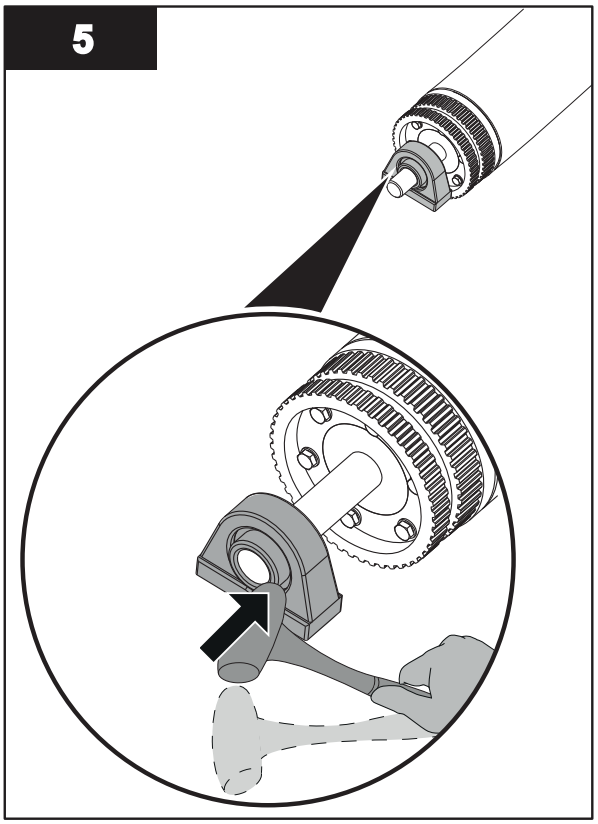
Procedure:

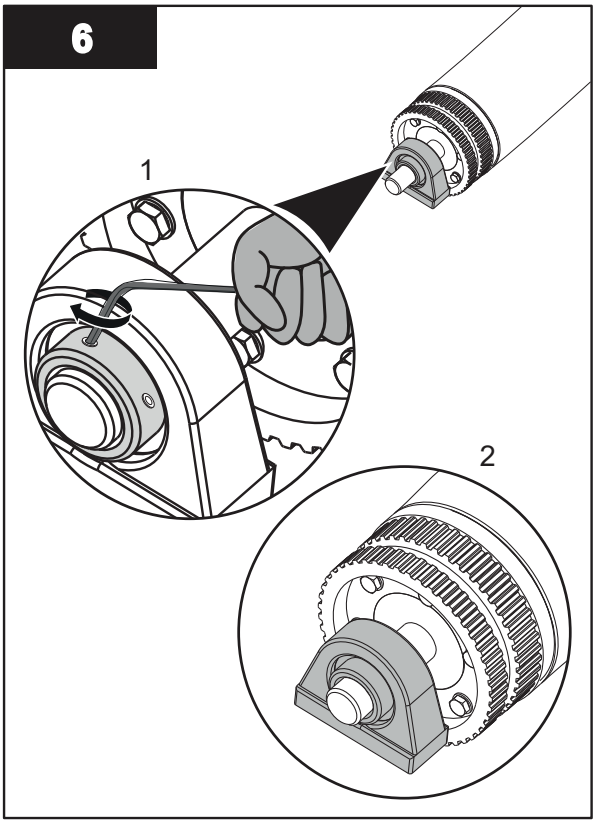












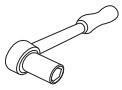
When service is complete, assemble in the reverse order of disassembly.

7.3.13 Remove Guide Roller

Prerequisites:

- Remove Filter Mesh. Refer to Section 7.3.7

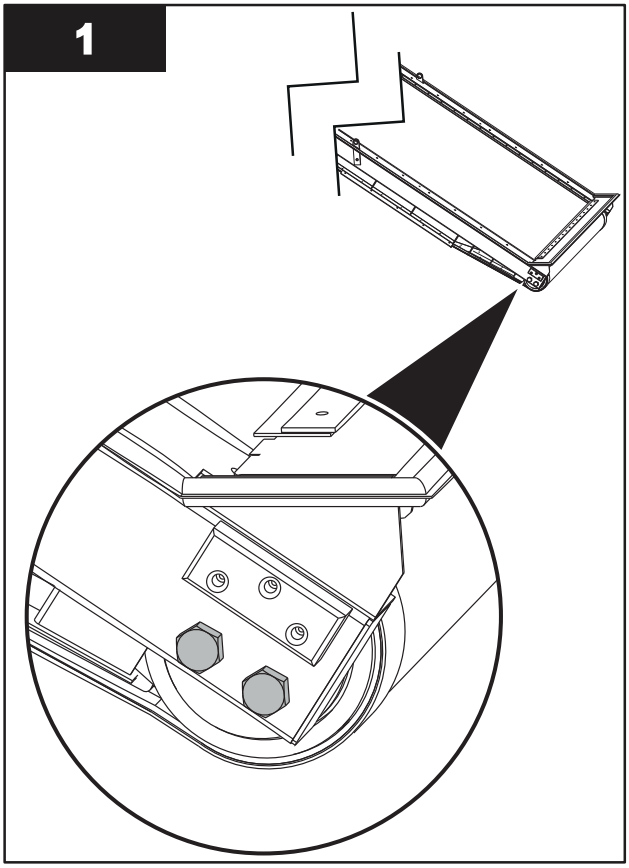
Tools:

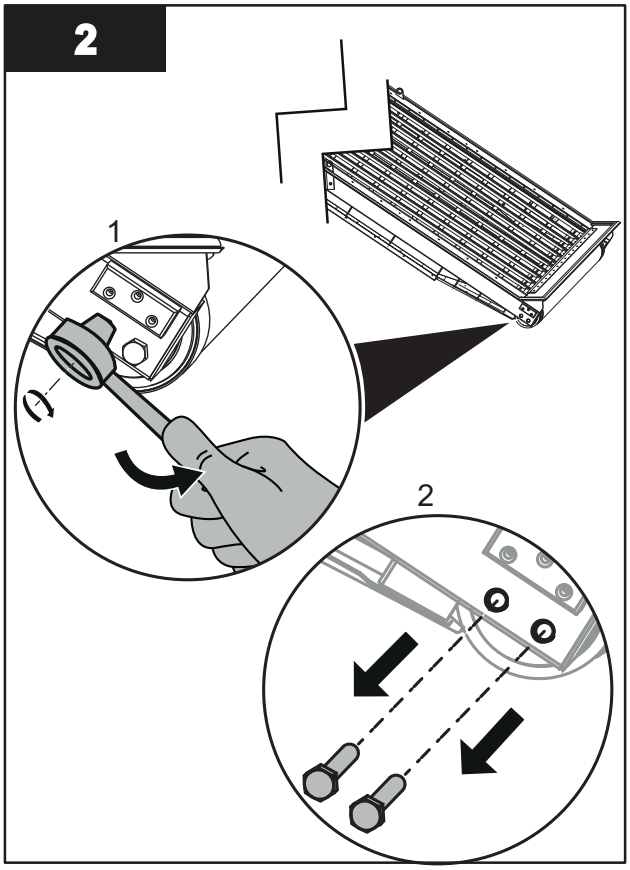


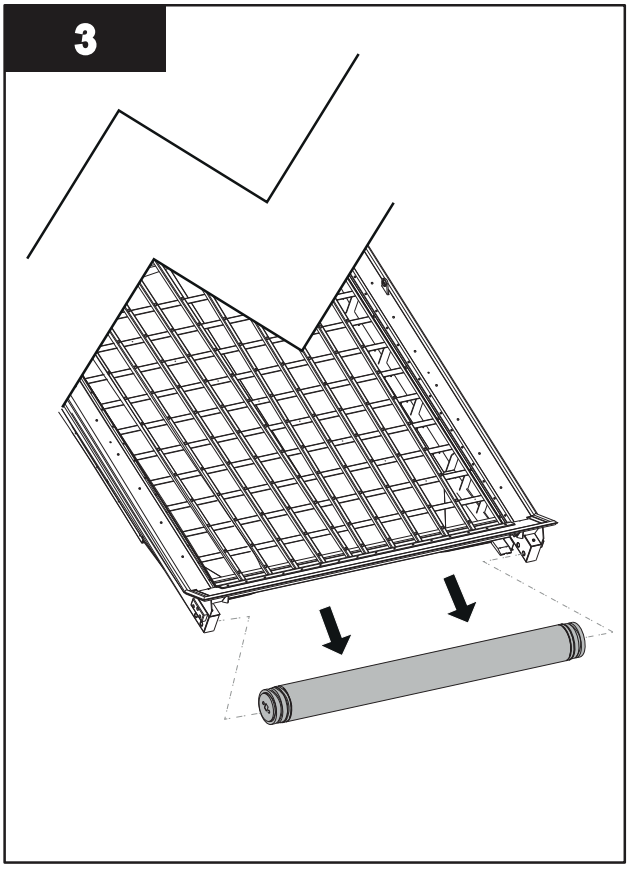
17 mm

Materials:

Procedure:







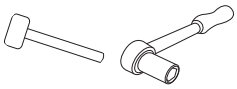
When service is complete, assemble in the reverse order of disassembly.

7.3.14 Replace Guide Roller Bearing

Prerequisites:

- Remove Guide Roller. Refer to Section 7.3.13.

Tools:



13 mm

Materials:

Procedure:

7.4 Motors

7.4.1 Inspect Gear Box and Motor

Each time the system is started up after maintenance, check the motor for excessive noise.

Materials:

Procedure:

1. Inspect gear box for signs of leaking oil
   a. Clean up spills if leaking. Contact service provider.
   b. If leaking is not present proceed to step 2.
2. Operate motor in Manual Mode.

Note: *If excessive noise present, contact your Service Provider.*

7.4.2 Clean Motors

Tools:

Plant air supply or can of compressed air

Materials:

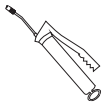
Procedure:

1. Using plant air supply or can of compressed air, blow off the fan.

2. Wipe down the motor and clean up spills.

7.4.3 Lubricate Gear Flange

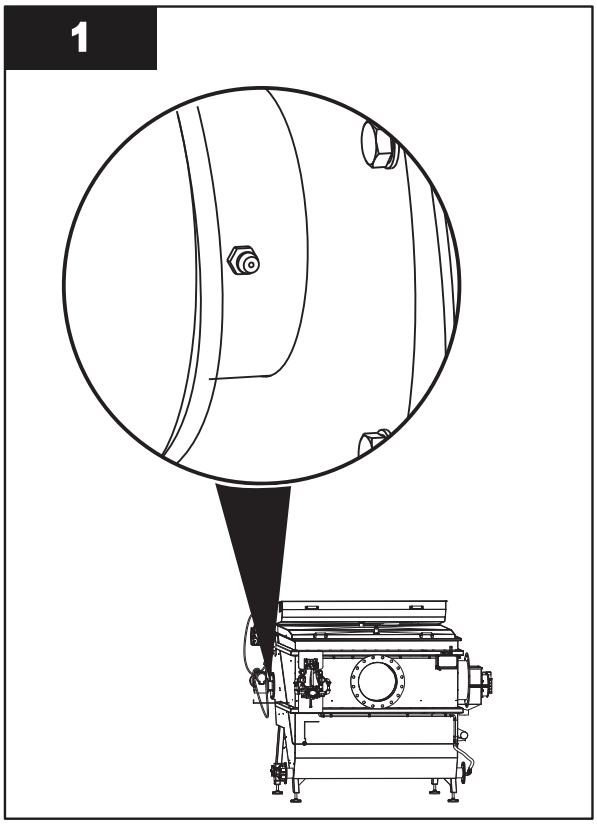
Tools:

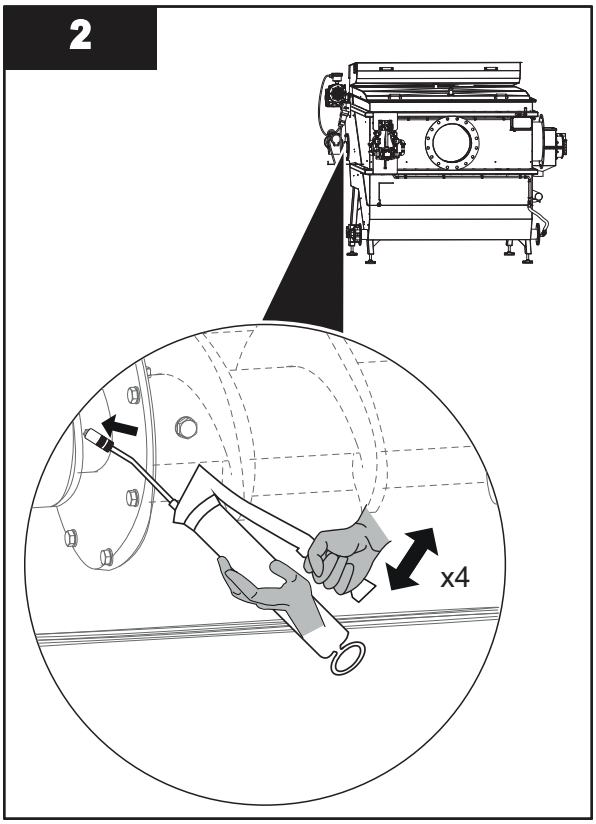


Materials:

- Grease. Refer to Section 1.

Procedure:





1. Connect grease gun to grease port, located on the bottom of the sludge auger gear flange.
2. Inject grease into each grease port until grease is seen exiting the top grease vent.

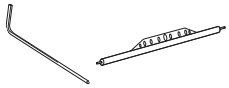
7.4.4 Remove and Install a Filter Mesh Drive Motor and Gear Box

Prerequisites:

- Drain the Filter Unit. Refer to Section 7.3.1

- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.
- Open Sludge Auger lid. Refer to Section 6.

Tools:



Materials:

- Gear box (if needed)
- Drive Motor (if needed)

Procedure:

1. To disconnect:
   a. Connect the spreader bar to the top lifting location on the filter frame assembly.
   b. Lift the filter frame assembly up to 50 mm (2 inches) high.
   c. Use a 6 mm Allen Key, remove the bolt and plate from the Filter Motor Gear Box.
   d. Remove the Drive Motor and Gear Box from the drive shaft and store in a safe location.

   Note: *It is recommended to use a crane or minimum 2 people to lift the drive motor and gear box assembly.*

   Note: *Do NOT damage electrical connections to motor.*

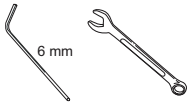
   Note: *If Drive Motor or Gear Box is damaged, contact your Service Provider.*
2. To install:
   a. Align the keyway on the gear box to the shaft.
   b. Align the anti-rotation bracket onto the tensioning bolt bushing.
   c. Push the Drive Motor and Gear Box onto the shaft until it is in place.
3. When service is complete, assemble in the reverse order of disassembly.

7.4.5 Remove and Install a Sludge Auger Drive Motor and Gear Box

Prerequisites:

- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.

Tools:



Materials:

Procedure:

1. Using the Allen Key, remove the bolt and plate from the Sludge Auger Motor Gear Box.
2. Using a wrench, remove the 4 bolts from the Sludge Auger Drive motor mount.
3. Remove the Sludge Auger Motor and Gear Box from the shaft, using minimum 2 operators.

Note: *If Sludge Auger Drive Motor or Gear Box is damaged, contact your Service Provider.*

4. To install a Sludge Auger Motor and Gear Box, use 2 operators to align the keyway on the gear box to the shaft.
5. Push the Sludge Auger Motor and Gear box onto the shaft until it is in place.
6. When service is complete, assemble in the reverse order of disassembly.

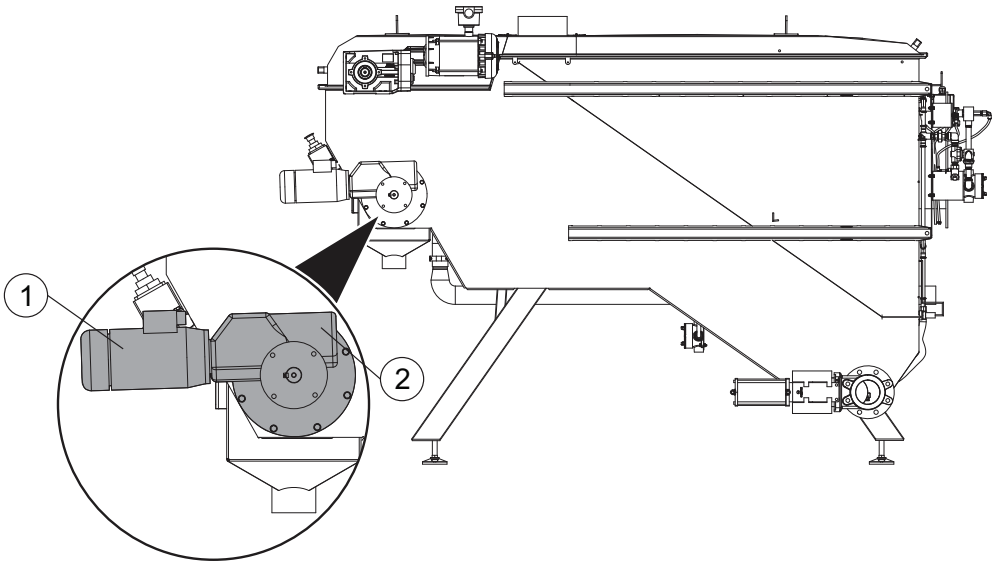


Figure 31 Sludge Auger Drive Motor

1	Drive Motor	**2**	Gear Box

7.5 Sludge Auger

7.5.1 Inspect and Unblock Sludge Auger

Prerequisites:

- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.
- Open Sludge Auger lid. Refer to Section 6.

Tools:

Materials:

Procedure:

1. Inspect for blockages.
2. If blockages are found, use scraper to remove large debris build up in the sludge auger.
3. When service is complete, assemble in the reverse order of disassembly.

7.5.2 Clean Inside Sludge Auger Area

NOTICE

Excessive sludge sticks to the plastic wiper and will dry up and harm the filter mesh if not cleaned regularly. Normally, this is the area with the most buildup of solids.

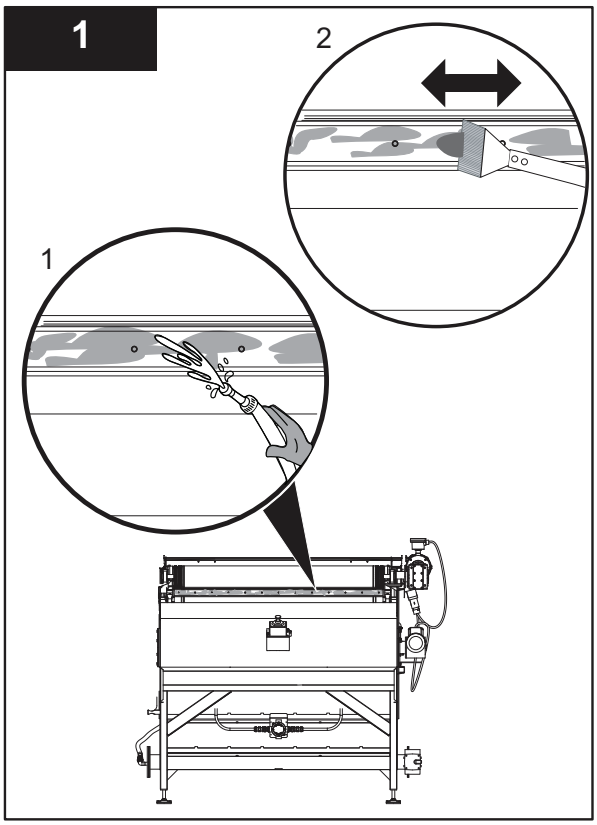
Prerequisites:

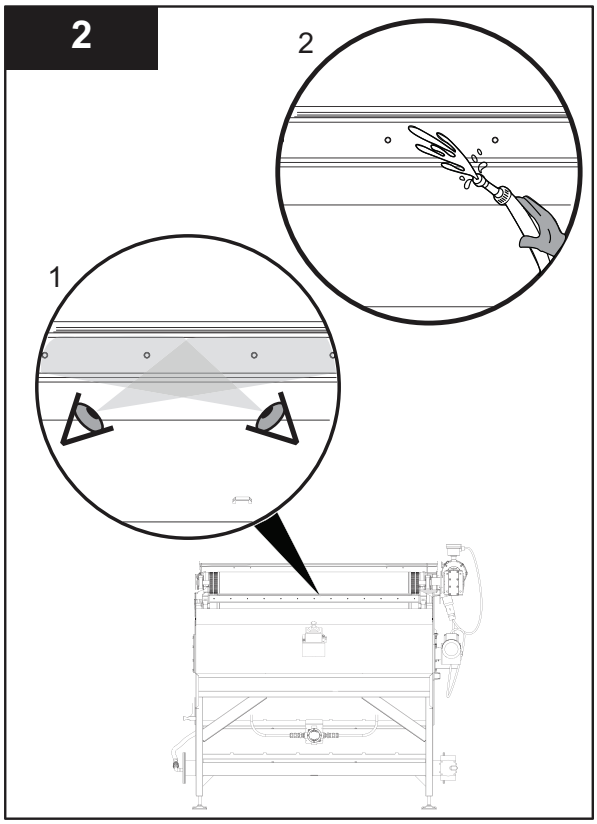
- Unblock Sludge Auger. Refer to Section 7.5.1.

Tools:

Materials:

Procedure:





Notes: *Repeat procedure until area is clear and free of debris. Clean up spills immediately to avoid slipping.*

When service is complete, assemble in the reverse order of disassembly.

7.5.3 Inspect Liner

Prerequisites:

- Clean Sludge Auger area. Refer to Section 7.5.2

Materials:

Procedure:

1. Inspect liner under the sludge auger to ensure there is no exposed metal and the coating is in good condition.
2. If the liner is showing signs of wear, contact your Service Provider for assistance.
3. When service is complete, assemble in the reverse order of disassembly.

7.5.4 Inspect and Maintain Sludge Auger Shear Bolts

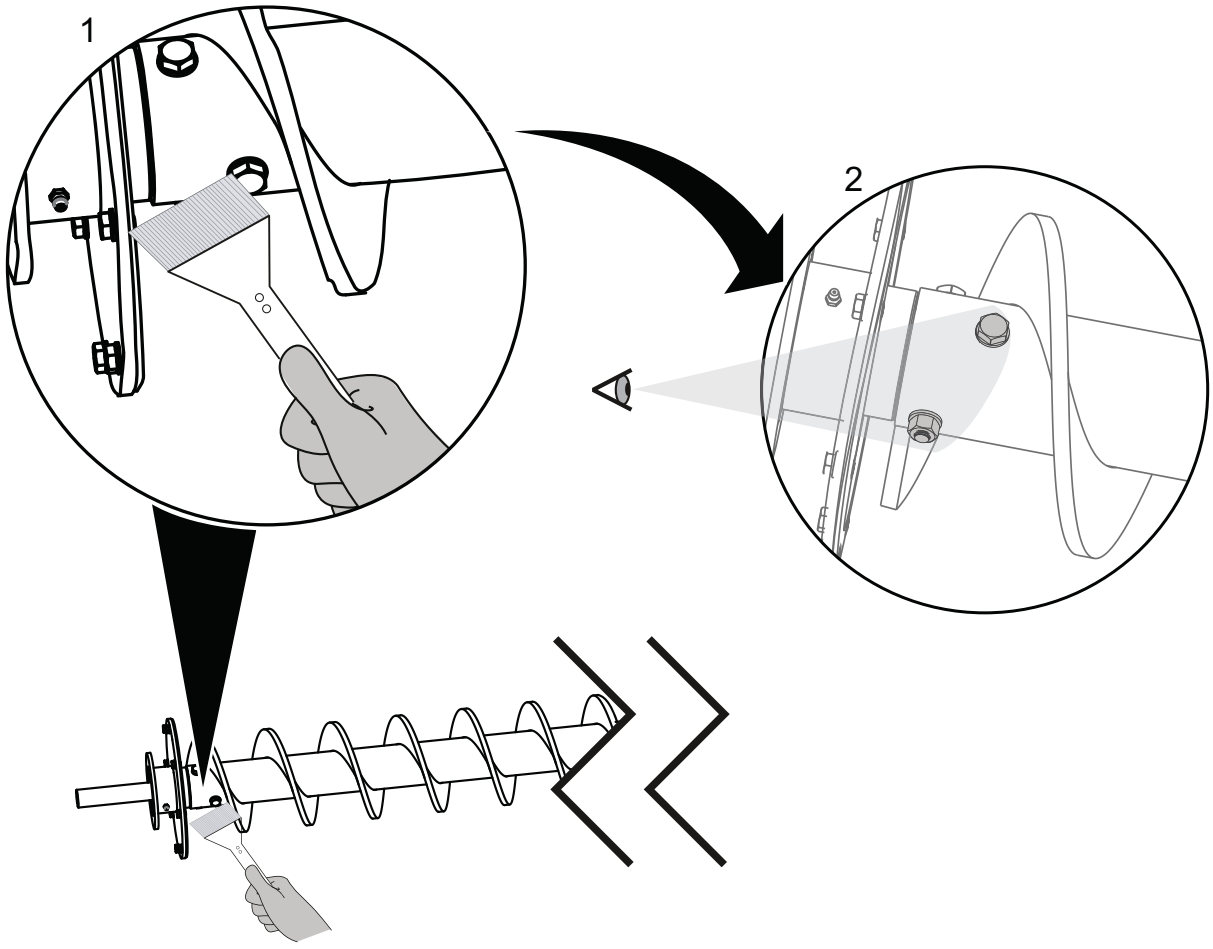
Prerequisites:

- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.
- Open Sludge Auger lid. Refer to Section 6.

Tools:

Materials:

Procedure:



When service is complete, assemble prerequisites in reverse order of disassembly.

7.6 Air Knife

7.6.1 Inspect and Clean Air Knife

NOTICE

Inspect and clean air knife if there is excessive clogging or noted increase of pressure on the pressure gauge or alarm at the CPP.

Tools:

- Feeler gauge

Materials:

- Water

Procedure:

1. Record the pressure displayed on the Filter screen. Refer to Figure 9
2. Record the pressure reading on the pressure gauge at the air blower.

   Note: *If the readings match, proceed to Step 3. If the readings do not match, consult the Troubleshooting guide in Section 8.*

3. Observe the particle distribution on the filter mesh.
   a. If particle distribution is not equal, clean the Air Knife, continue to Step 4.
   b. If particle distribution is equal, no further maintenance task is required.
4. Remove the Filter Frame Assembly. Refer to Section 7.3.6.
5. Remove the Filter Mesh Drive Motor. Refer to Section 7.4.4.
6. Loosen filter mesh tension. Refer to Section 7.3.9.
7. Connect the spreader bar to the top lifting points on the filter frame assembly.
8. Lift the filter frame assembly until the air knife is accessible for removal.
9. Remove the air knife hardware on each end of the air knife. Remove the air knife. Refer to (Figure 32).

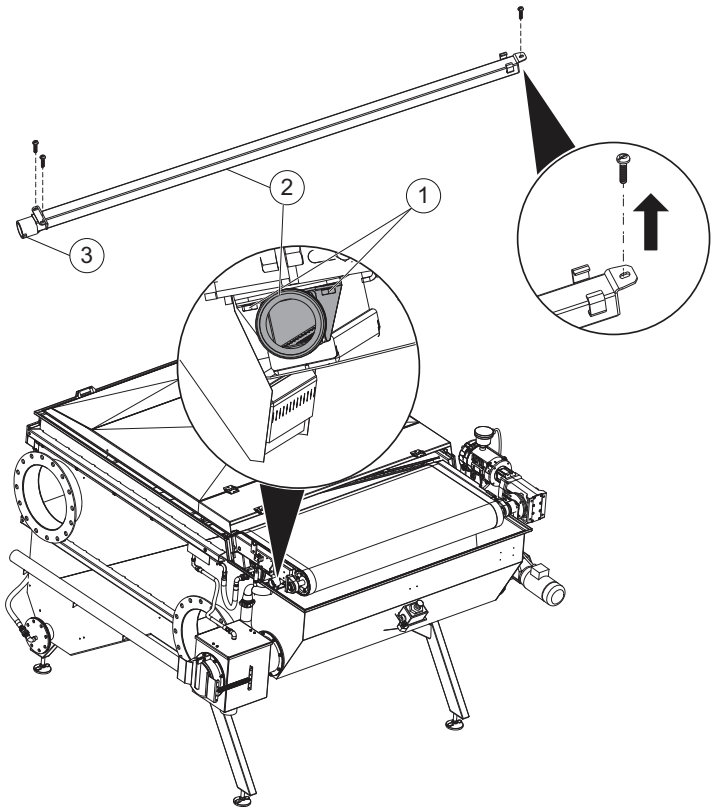


Figure 32 Air Knife

1	Air Knife Hardware	**3**	Air Knife air attachment
2	Air Knife		

10. Use a power washer to spray across the entire length of the air opening.
11. Attach water hose to the opening of the air knife air attachment (Figure 32) and use the 0.4 mm feeler gauge to clean the air opening with a light downward push and a slight back and forth motion.

Note: *Make sure air knife O-ring is not misplaced.*

12. Equal water surface is visible along entire air knife side opening when it is clean. Clean up spills.
13. Repeat step 11 as required.
14. If desired water layer is not achieved, remove the silicone seal and hardware.
15. Disassemble air knife completely and remove blockages.
16. Reassemble and apply silicone seal.

Note: *Allow silicone seal to dry completely before installing the air knife.*

17. When service is complete, assemble in reverse order of disassembly.

7.7 Dewatering Unit (Optional)

7.7.1 Inspect and Clean Dewatering Unit

Prerequisites:

- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.

Tools:

Materials:

- Compressed Air

Procedure:

1. Remove the dewatering unit lid. Refer to Figure 33.
2. Use a water hose to rinse excess debris and buildup off of the wedge wire screen and spray nozzles. Refer to Figure 33.
3. If necessary, gently use a wire brush to clean and remove any buildup from the wedge wire screen and spray nozzles.
4. Use a water hose to rinse wedge wire screen and spray nozzles. Clean up spills.
5. Repeat steps as necessary until all debris and buildup has been removed.
6. Inspect the wedge wire screen for extensive wear or damage. If extensive wear or damage is observed contact your Service Provider.
7. When service is complete, assemble in the reverse order of disassembly.

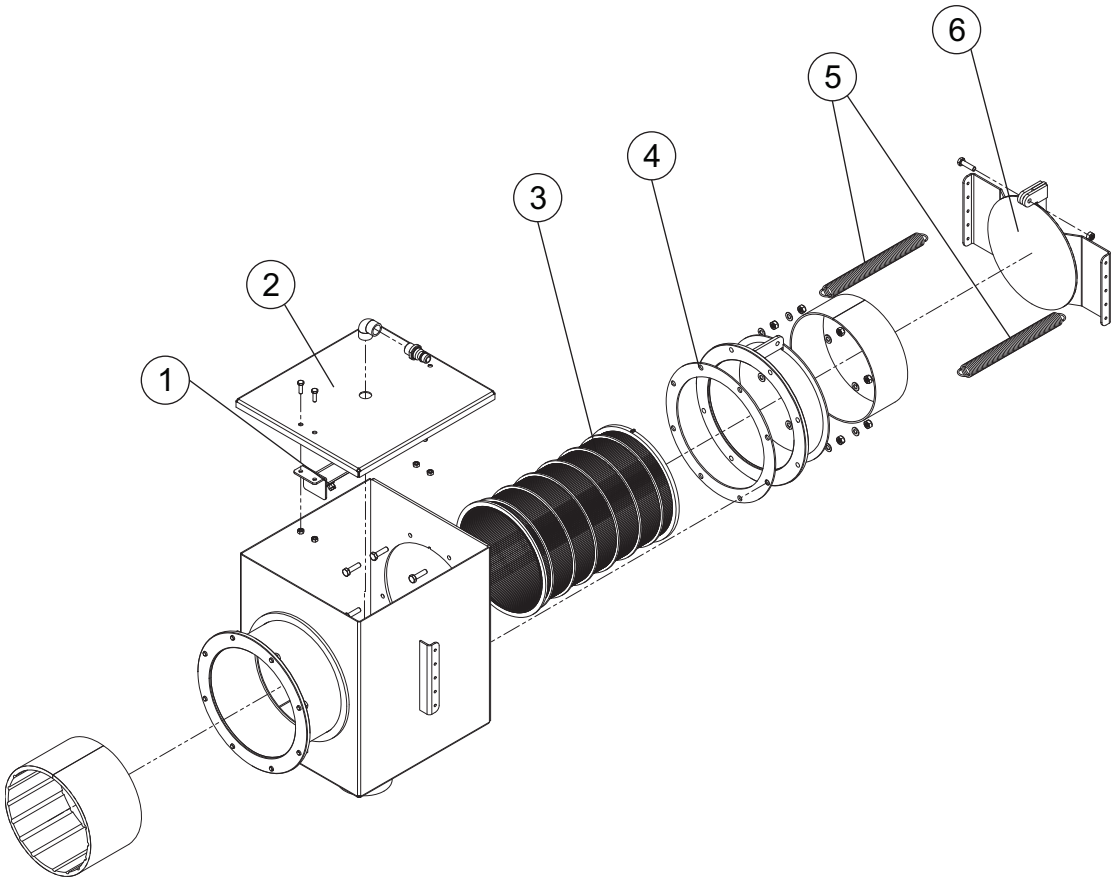

Figure 33 Dewater Unit

1	Spray Nozzle	**2**	Dewatering Unit Cover
3	Dewater Assembly Wedge Wire	**4**	Outlet Spigot Gasket
5	Dewatering Cover Spring	**6**	Sludge Cover Door Plate

7.7.2 Replace Wedge Wire Screen

Prerequisites:

- Bypass and shutdown the filter being inspected. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.

Materials:

Procedure:

1. Remove tension springs from dewatering unit sludge cover.
2. Open sludge cover and remove the wedge wire screen.
3. Replace with new wedge wire screen.
4. When service is complete, assemble in reverse order of disassembly.

7.8 Level Sensor

NOTICE

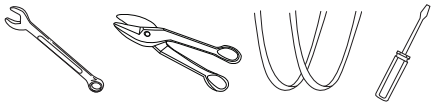
DO NOT use any hard or sharp tools on the membrane surface.

7.8.1 Replace Level Sensor

Prerequisites:

- Drain the Filter Unit. Refer to Section 7.3.1.
- Bypass and shutdown the filter being maintained. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.

Tools:



Materials:

- Level Sensor Assembly

Procedure:

1. Remove Junction Box cover.
2. Disconnect level sensor wiring at terminal blocks. Note the wire color and position.
3. Loosen strain relief, pull cable through.
4. Cut the tie straps that secure the cable to the filter unit.
5. Use adjustable wrench to remove the threaded level sensor.
6. Install new level sensor in reverse order of removal.

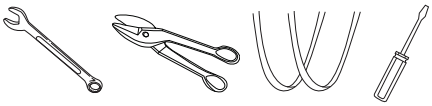
   Note: *Do NOT damage sensor membrane surface.*
7. Perform Level Sensor Offset Adjustment. Refer to Section 7.8.2.
8. When service is complete, assemble in reverse order of disassembly.

7.8.2 Level Sensor Offset Adjustment

Prerequisites:

- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.

Tools:



Materials:

- Level Sensor Assembly

Procedure:

1. Adjustment method 1:
   a. Determine base reference point of zero by bypassing and shutting down the Filter Unit being maintained.

   Note: *Do not drain the Filter Unit.*

   b. Record the level value displayed on the Filter Screen. Refer to Section 6.6.1.

   c. Add the recorded value from the Filter Screen to the current Level Offset value on the Level Control Settings Screen. Refer to Section 6.6.3.1.

   d. Enter the new value into the Level Offset value on the Level Controls Settings Screen. Refer to Section 6.6.3.1.

2. Adjustment method 2:
   a. Record the current level at the ruler. Refer to Section 6.2.

   b. Record the level value displayed on the Filter Screen. Refer to Section 6.6.1.

   c. Subtract the recorded level at the ruler from the value displayed on the Filter Screen.

3. Add the calculated value to the current Level Offset value on the Level Control Settings Screen. Refer to Section 6.6.3.1.
4. Enter the new value into the Level Offset value on the Level Controls Settings Screen. Refer to Section 6.6.3.1.

7.8.3 Clean Level Transmitter and Tube

Prerequisites:

- View the Trends Screen (Refer to Section 6.6.5) to see if a consistent and expected water level is being maintained. If water levels are very inconsistent then a cleaning may be required.
- Bypass and shutdown the filter being maintained.Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.

Tools:

Materials:

- Water

Procedure:

1. Pull the level sensor from its tube and inspect for debris and buildup.
2. Place the level transmitter into a pail of water, carefully agitate to remove debris. Do not damage the end of the level sensor.
3. Use a soft, non-abrasive cloth to remove remaining debris if required.
4. View the level transmitter's tube to ensure it is clean, clean as required.
5. When service is complete, assemble in the reverse order of disassembly.

7.9 Control Power Panel (CPP)

NOTICE

When opening the Control Power Panel (CPP) for any reason, including to clean or inspect the air filter, shutdown the system.

7.9.1 Inspect and Resolve Active Alarms

Procedure:

1. View the system overview Alarm Screen for active alarms and alarm history. Refer to Figure 22.
2. Resolve any active alarms. Refer to Troubleshooting Section 8.
3. Record and keep records of all alarm history. This will assist troubleshooting if alarms repeat during particular times or processes.

7.9.2 Inspect and Clean Air Filter

Prerequisites:

- Bypass and shutdown the filter being maintained. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.

Materials:

- Air Supply or Vacuum Source

Procedure:

1. Access the air filter on the Control Power Panel (CPP).
2. Remove the air filter.
3. Clean the dust off the air filter. If required, replace air filter.
4. When service is complete, assemble in the reverse order of disassembly.

7.9.3 Clean Control Power Panel (CPP)

Prerequisites:

- Bypass and shutdown the filter being maintained. Refer to Section 5.2.1.
- Lockout tag out Control Power Panel (CPP) for associated filter. Refer to Section 4.

Tools:

- Screwdriver

Materials:

- Soapy Water

Procedure:

1. Clean dirt and excess dust off the outside of the Control Power Panel (CPP) with a soft cloth.
2. Clean the OIT with a soft cloth to prevent scratching.
3. Clean dirt/dust on the inside of the Control Power Panel (CPP) with a dry soft cloth.
4. Clean outside areas that may be more dirty with warm soapy water and a soft cloth.
5. When service is complete, assemble in the reverse order of disassembly.

7.10 Air Blower

For any maintenance required for the Air Blower, refer to the Air Blower manufacturers ***Operation and Maintenance manual***.

⚠ DANGER

Obey all warning and caution statements. Refer to Section 2.

Read and understand this Operation and Maintenance Manual before operating this equipment. Read all user documentation before performing operations, inspections, repair, or maintenance on this equipment.

Only competent personnel should undertake operation, repairs, maintenance, or servicing of equipment described in this section of the manual. If you do not understand the information or procedure explanations in this manual, STOP and contact your Service Provider for assistance.

NOTICE

This section includes a comprehensive list of alarms displayed by the Control Power Panel (CPP). Depending on the actual setup of your system, some of the alarms listed may not be applicable to your Control Power Panel (CPP).

8.1 Responding to Filter Component Failure Conditions

Symptom	Possible Cause	Solution
The system does not start OR Communication issue with the VFD	No electricity is being supplied.	Service Provider required to check the power supply to the unit and the fuses in the local CPP.
	Main disconnect is off.	Check the main disconnect, turn on the power, and follow system startup. Refer to Section 5.1.2.
	Failure in the variable frequency drive.	Service Provider required to change the variable frequency drive, and/or repair part.
The system does not start Automatically, only Manually. OR Start level setting could also be wrong, full scale range of the level sensor could be wrong	The level sensor is damaged or requires cleaning.	Ensure the level sensor is clean and is not damaged. Replace sensor, if damaged. Refer to Section 7.8.3.
	Wrong electrical connection between level sensor and CPP.	Service Provider required to check connection. Try to switch the position of the two leads
The system does not stop when in “AUTO” OR Start level setting could also be wrong, full scale range of the level sensor could be wrong	The level sensor is damaged or requires cleaning.	Ensure the level sensor is clean and is not damaged. Replace sensor, if damaged. Refer to Section 7.8.3.
	The Level Sensor Offset may need to be adjusted.	Level Sensor Offset Adjustment. Refer to Section 7.8.2.
	Failure in the level transmitter.	Service Provider required to adjust or change the level sensor.
	Minimum running frequency is higher than the Start frequency, or too high hysteresis.	Service Provider required to reprogram the control system/variable frequency drive.

Symptom	Possible Cause	Solution
Too high air pressure	The air knife is clogged	1.  Clean air knife. Refer to Section 7.6.1. If not corrected, second step is required. 2.  Service Provider required to change air knife.
	Clogged air filter in the compressor	1.  Clean air knife. Refer to Section 7.6.1. If not corrected, second step is required. 2.  Service Provider required to change air knife.
	Defective air compressor blower	 Service Provider required to repair, or change if necessary.
Filter Mesh not cleaning	Hot Water Spray is not working	1.  Confirm hot water supply is working and at correct settings. 2 Service Provider required to service spray bar.
	The air knife pressure is too low	1.  Confirm air blower settings are correct. 2 Confirm air blower intake filter is clean. 3 Confirm air blower piping is connected correctly. 4 Ensure O-ring is installed at air knife connection. Refer to Section 7.6. 5 Service Provider required to service spray bar.
	The air knife is clogged	1.  Clean air knife. Refer to Section 7.6.1. 2 Replace Air Knife. Refer to Section 7.6.1
Filter Mesh is not tracking properly on the filter mesh belt	Foreign objects, and soil deposits are behind the filter mesh belt.	 Remove the filter, rinse the filter mesh and belt, reposition or replace and tighten the belt. Refer to Section 7.3.4.
	The filter mesh belt is too loose.	 Reposition and tighten the belt. Refer to Section 7.3.4.
Whistling noise occurs	Filter Mesh is clogged with grease/fat.	 Clean filter mesh. Refer to Section 7.3.5.
Surface temperature of the gears is high	Normal surface temperature for gears should be 70ºC - 90ºC (158ºF - 194ºF)	 Externally clean gear box and contact Service Provided if oil leaks are detected.

8.2 Responding to Control Power Panel (CPP) Alarms

Active Alarm	Description	Possible Cause	Solution
Supply Voltage Error	The main power feed is over or under voltage	Main power feed is turned off	Follow plant procedure to turn main power feed on.
		Faulty power quality monitor	 Service Provider required to replace power quality monitor.
		Incoming voltage is high	Follow plant procedure to contact local utilities.
			Follow plant procedure to voltage limit setting.
		Incoming voltage is low	Follow plant procedure to contact local utilities.
			Follow plant procedure to correct voltage limit setting.
		Faulty PLC input	 Service Provider required to use 4-20 mA loop calibrator to send signal from flow meter to SCC.
Emergency Stop Active	An E-stop has been activated	Activated E-stop	 Reset E-stop. Refer to Section 5.1.3.
		Wire breakage	 Service Provider required to inspect and repair wiring.
		Faulty E-stop	 Service Provider required to replace E-stop.
		Faulty master control relay	 Service Provider required to replace control relay.
		Faulty PLC input	 Service Provider required to replace PLC input card.
Phase Sequence Error	The main power feed have the phases inverted	Incorrect main power feed wiring	 Service Provider required to correct wiring.
		Wire connection issue	 Service Provider required to correct wiring.
		Faulty power quality monitor	 Service Provider required to replace power quality monitor.
		Faulty PLC input	 Service Provider required to replace PLC input card.
Surge Protection Active	Surge protection tripped	There was a power surge occurrence	 Service Provider required to replace surge protection device.
		Faulty surge protector	 Service Provider required to replace surge protection device.
		Faulty PLC input	 Service Provider required to replace PLC input card.
		Wire connection issue	 Service Provider required to correct wiring.

Active Alarm	Description	Possible Cause	Solution
Main Power Supply Failure	The phase monitoring relay detected a under/over voltage on one or more phases	Utility interruption	Follow plant procedure to call utilities.
		Supply interruption	Follow plant procedure to check upstream protection devices.
		Faulty power quality monitor	 Service Provider required to replace power quality monitor.
		Wire connection issue	 Service Provider required to correct wiring.
UPS Active	The ups has detected a loss of main power and the PLC is now operating on ups power.	Main power supply failure	Refer to “Main power supply failure alarm” for possible causes and solutions.
		24 VDC power supply failure	 Service Provider required to replace 24 VDC power supply.
		Wire connection issue	 Service Provider required to correct wiring.
		Faulty PLC input	 Service Provider required to replace PLC input card.
UPS replace Batteries	The ups has detected that the battery pack is faulted.	Fuse has blown on battery	 Service Provider required to check and replace.
		Batteries have failed	 Service Provider required to replace batteries.
		Wire connection issue	 Service Provider required to correct wiring.
High Level in Filter	Level sensor has indicated a high level	Incorrect set point	 Service Provider required to correct set point.
		Faulty PLC input	 Service Provider required to replace PLC input card.
		Wire connection issue	 Service Provider required to correct wiring.
		Blocked/bad sensor	  Clean sensor. Refer to Section 7.8.3. If not corrected, second step is required.
		The Level Sensor Offset may need to be adjusted.	  Level Sensor Offset Adjustment. Refer to Section 7.8.2.
		Outlet partially blocked or closed	Follow plant procedure to open and clear outlet.
		Filter mesh not clean	 Clean filter mesh. Refer to Section 7.3.5.

Active Alarm	Description	Possible Cause	Solution
High Level in Filter	Level sensor has indicated a high level	Incorrect set point	Service Provider required to correct set point.
		Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Blocked/bad sensor	1 Clean sensor. Refer to Section 7.8.3. If not corrected, second step is required. 2. Service Provider required to replace sensor.
		Outlet partially blocked or closed	Follow plant procedure to open and clear outlet.
		Filter mesh not clean	Clean filter mesh. Refer to Section 7.3.5.
Overflow	Level sensor has indicated a system overflow	Incorrect set point	Service Provider required to correct set point.
		Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Blocked/bad sensor	1 Clean sensor. Refer to Section 7.8.3. If not corrected, second step is required. 2. Service Provider required to replace sensor.
		The Level Sensor Offset may need to be adjusted.	Level Sensor Offset Adjustment. Refer to Section 7.8.2.
		Outlet blocked or closed	Follow plant procedure to open and clear outlet.
		Filter mesh not clean	Clean filter mesh. Refer to Section 7.3.5.

Active Alarm	Description	Possible Cause	Solution
Overflow	Level sensor has indicated a system overflow	Incorrect set point	Service Provider required to correct set point.
		Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Blocked/bad sensor	1 Clean sensor. Refer to Section 7.8.3. If not corrected, second step is required. 2. Service Provider required to replace sensor.
		Outlet blocked or closed	Follow plant procedure to open and clear outlet.
		Filter mesh not clean	Clean filter mesh. Refer to Section 7.3.5.
Level Transmitter Short Circuit	Signal detected is above 20.5 mA	Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Faulty sensor	Service Provider required to replace sensor.
Level Transmitter Open Circuit	Signal detected is below 3.5 mA	Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Faulty sensor	Service Provider required to replace sensor.
Low Air Pressure	Pressure sensor detects air knife has a lower pressure than the set point	Blocked piping from blower to sensor	Follow plant procedure to verify piping is clear from the blower to sensor.
		Blocked/bad sensor	Service Provider required to replace sensor.
		Clogged inlet filter on blower	For any maintenance required for the Air Blower, refer to the Air Blower manufacturers Operation and Maintenance manual.
		Incorrect set point	Service Provider required to correct set point.
		Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Air Knife is not connected	Reconnect air knife.

Active Alarm	Description	Possible Cause	Solution
High Air Pressure	Pressure sensor detects air knife has a higher pressure than the set point	Blocked piping from blower to sensor	Follow plant procedure to verify piping is clear from the blower to sensor.
		Blocked/bad sensor	Service Provider required to replace sensor.
		Clogged air knife	1  Clean air knife. Refer to Section 7.6.1. If not corrected, second step is required. 2. Service Provider required to change air knife.
		Incorrect set point	Service Provider required to correct set point.
		Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
Pressure Transmitter Short Circuit	Signal detected is above 20.5 mA	Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Faulty sensor	Service Provider required to replace sensor.
Pressure Transmitter Open Circuit	Signal detected is below 3.5 mA	Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Faulty sensor	Service Provider required to replace sensor.
Air Blower Overload tripped	Interruption of air blower	Over duty on blower	Refer to manufacturer's manual for reset instructions. Reset and try again.
		Overload value set to low	Service Provider required to adjust overload.
		Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Faulty overload	Service Provider required to replace overload.
Air Blower Service Due	Timer has indicated that the service needs to be completed on the blower	Set point was set for proper maintenance	Service Provider required to perform maintenance/ reset timer.
		Set point was not set correctly	Service Provider required to set the setpoint as per blower manufacturers recommendations.

Active Alarm	Description	Possible Cause	Solution
Flow Meter Short Circuit	Signal detected is above 20.5 mA	Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Faulty sensor	Service Provider required to replace sensor.
Flow Meter Open Circuit	Signal detected is below 3.5 mA	Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Faulty sensor	Service Provider required to replace sensor.
Filter belt Invertor Communication Fault	Motor VFD error	Wire connection issue	Service Provider required to correct wiring.
		Ethernet switch failure	Service Provider required to replace ethernet switch.
Sludge Screw Invertor Communication Fault	Motor VFD error	Wire connection issue	Service Provider required to correct wiring.
		Ethernet switch failure	Service Provider required to replace ethernet switch.
High Temperature in Enclosure	Sensor detect temperature has exceeded 40°C	Air conditioner overload tripped	Refer to “Air conditioner overload tripped” for possible causes and solutions.
		Air conditioner fault	Refer to “Air conditioner fault” for possible causes and solutions.
		Incorrect set point	Service Provider required to correct set point.
		Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Air conditioner set point not correct	Service Provider required to correct set point to maintain to 35°C.
		Faulty sensor	Service Provider required to replace sensor.
Air Conditioner overload tripped	Interruption of enclosure cooling	Faulty air conditioner	Service Provider required to reset and try again.
		Overload value set to low	Service Provider required to adjust overload.
		Faulty PLC input	Service Provider required to replace PLC input card.
		Wire connection issue	Service Provider required to correct wiring.
		Faulty overload	Service Provider required to replace overload.

Active Alarm	Description	Possible Cause	Solution
Air Conditioner Fault	Interruption of enclosure cooling	Circuit breaker tripped	 Service Provider required to reset and try again.
		Air conditioner overload tripped	Refer to “Air conditioner overload tripped” for possible causes and solutions.
		Door switch failure	 Service Provider required to replace sensor.
		Faulty PLC input	 Service Provider required to replace sensor.
		Wire connection issue	 Service Provider required to replace sensor.
		Faulty sensor	 Service Provider required to replace sensor.
Level Offset Setting Out of Range	The offset setting is too high	Faulty sensor	 Service Provider required to replace the Level Sensor.

Contact Salsnes Filter™ with the listed information to order replacement parts.

Provide the:

- Product name and model number (refer to the front of this manual)
- Part number and description of the replacement part or accessory

If a replacement part is not listed, contact Salsnes Filter™.

9.1 Filter

9.1.1 Filter (Internal) Components

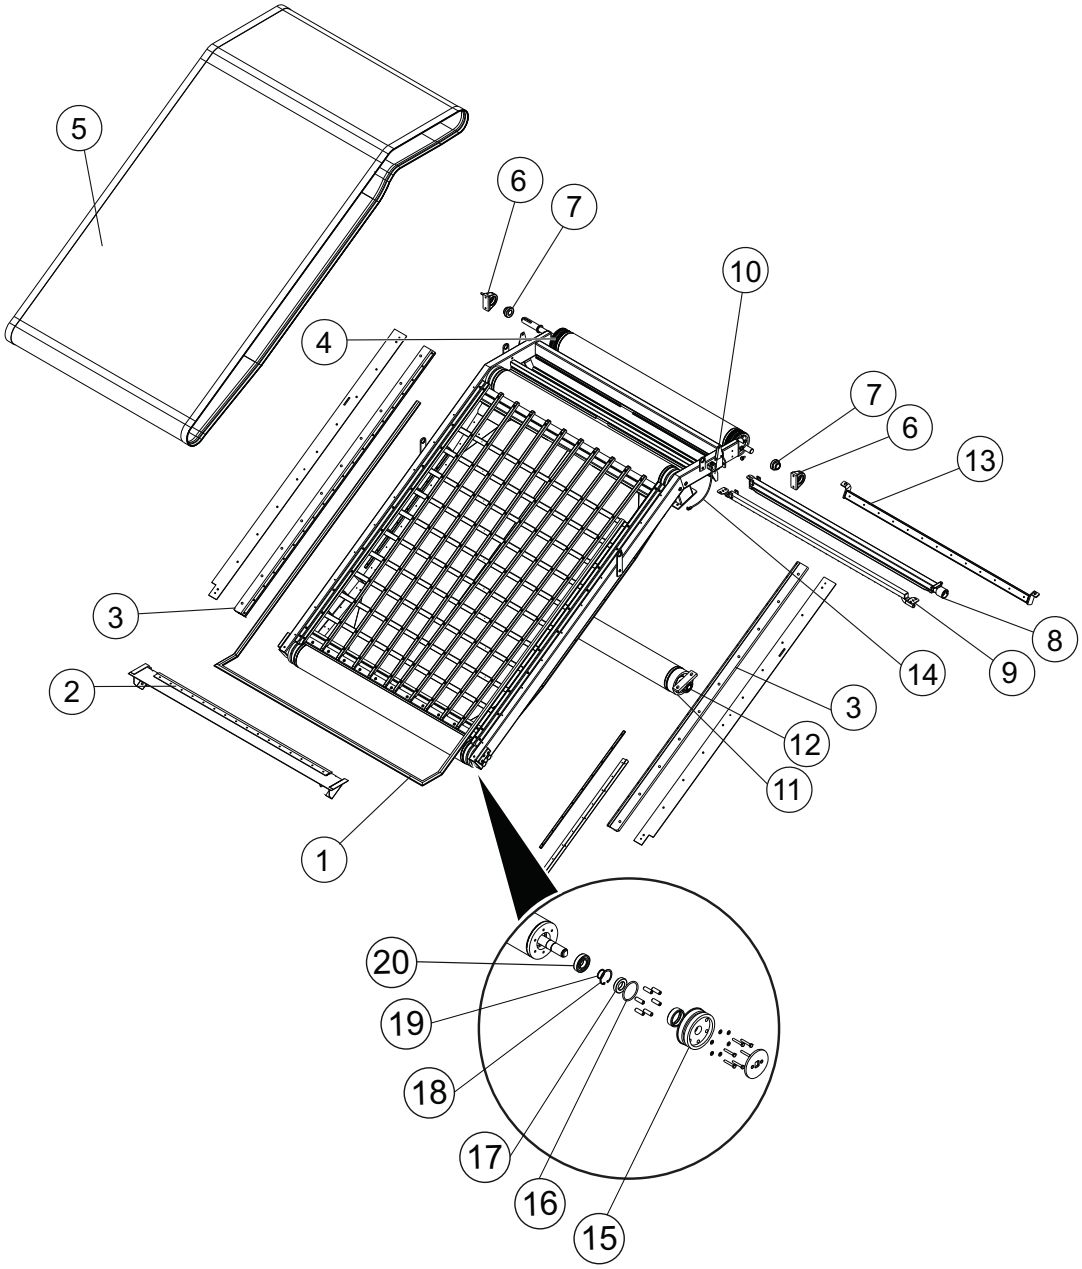


Figure 34 Filter Mesh Assembly

Item	Description	Part Number
1	Filter Gasket	
	SF: 2000- Length 3217 mm	20005011
	SF: 4000- Length 4230 mm	20005011

Item	Description	Part Number
	SF: 6000- Length 5658 mm	20005011
2	Wiper, Sealing Beam (not detailed)	
	SF: 2000	22504836
	SF: 4000	24504836
	SF: 6000	26504836
3	Wiper, Seal Bar	
	SF: 2000(Left Side)	22504812
	SF: 2000(Right Side)	22504811
	SF: 4000(Left Side)	26504812
	SF: 4000(Right Side)	26504811
	SF: 6000(Left Side)	26504812
	SF: 6000(Right Side)	26504811
4	Drive Roller Wheel	20504406
5	Filter Mesh	Contact Service Provider
6	Bearing Housing, Drive Roller	20006053
7	Bearing, Drive Roller	20006030
8	Air Knife	Refer to Section 9.3
9	Spray Bar Nozzle (Hot Water) (not detailed)	20012152
	Spray Bar Nozzle (Cold Water) (not detailed)	10202149
10	Wiper, Sludge Compartment (not detailed)	
	SF: 2000- Length 705 mm	22304102
	SF: 4000- Length 1000 mm	24304102
	SF: 6000- Length 1500 mm	26304102
11	Under Roller Bearing Assembly	
	SF: 2000;SF: 4000; SF: 6000	20006026
12	Under Roller Bearing

13	Under Roller Wiper (not detailed)	
	SF: 2000- Length 705 mm	22304102
	SF: 4000- Length 1000 mm	24304102
	SF: 6000- Length 1500 mm	26304102
14	Grease Tube	20007016
15	Wheel, Guide Roller	20504202
16	O-ring, Guide Roller	421000138
17	Seal, Shaft 35X60X13	421000136
18	Circlip, 60mm	421000141
19	Circlip, 35mm	421000140
20	Bearing	421000139

9.1.2 Filter (External) Components

Description	Part Number
Auger Drive Motor - UL Class 1, Division 1	
SF: 2000; SF: 4000; SF: 6000	508072-001
Drive Motor - UL Class 1, Division 1	
SF: 2000; SF: 4000 SF: 6000	508072-001
Auger Drive Motor - UL	
SF: 2000; SF: 4000 SF: 6000	916865-001
Drive Motor - UL	
SF: 2000; SF: 4000; SF: 6000	916865-001
Auger Gear Box - UL Class 1, Division 1	
SF: 2000	448087-004
SF: 4000;SF: 6000	448041-003
Drive Motor Gear Box - UL Class 1, Division 1	
SF: 2000	448087-001
SF: 4000;SF: 6000	448041-001
Drive Motor - CE	
SF: 2000	20110102
SF: 4000;SF: 6000	20110103
Auger Motor Gear Box - CE	
SF: 2000	20110119
SF: 4000;SF: 6000	20110120
Drive Motor Gear Box - CE	
SF: 2000	20110117
SF: 4000;SF: 6000	20110118

9.2 Dewater Unit Components

Item	Description	Part Number
1	Wedge Wire Screen	
	SF: 2000	22302202
	SF: 4000	24302202
	SF: 6000	26302202
2	Nozzle, 1/8” Flat Spray	20012152
3	Insert	21304211
4	Gasket, Dewatering Unit	
	SF: 2000	22304001
	SF: 4000	24304001
	SF: 6000	20304002
5	Spring	20314201

9.3 Air Knife Components

Item	Description	Part Number
1	Air Knife Assembly	
	SF: 2000	448143
	SF: 4000	448160
	SF: 6000	448124
2	Air Knife O-Ring	20504609
3	Air Knife Plastic	
	SF: 2000	448145
	SF: 4000	448162
	SF: 6000	448126

9.4 Instrumentation Components

Item	Description	Part Number
1	Level Sensor (CE)	421000142
1	Level Sensor (UL)	448173
2	Pressure Transmitter (UL Class 1 / Division 1)	508055
2	Pressure Transmitter (UL / CE)	20215203
3	Solenoid Valve - 2 Way (UL Class 1 / Division 1)	508081
3	Solenoid Valve - 2 Way (UL / CE) - 1/2”	20012175
3	Solenoid Valve - 2 Way (UL / CE) - 1/4”	20012293
3	Solenoid Valve - 2 Way (UL / CE) - 3/4”	20012060
4	Solenoid Valve - 4 Way (UL Class 1 / Division 1)	508082

9.5 Operator Kit Components

Item	Description	Part Number
1	Manual Scraper	20032009
2	Lid Key	Contact Manufacturer

9.6 Miscellaneous Parts

Item	Description	Part Number
1	Grease	1073
2	Seal, Auger Shaft	448067
3	Bearing, Auger Shaft	448068-4060
4	Insert, Sludge Compartment	
	SF: 2000	22304104
	SF: 4000	24304104
	SF: 6000	26304101
5	Sealing, Rubber Edge Housing	
	SF: 2000 - Length = 6m	20005012

Item	Description	Part Number
	SF: 4000- Length = 8m	20005012
	SF: 6000- Length = 9m	20005012
6	Sealing, Rubber Cover	
	SF: 2000- Length = 6m	20005013
	SF: 4000- Length = 8m	20005013
	SF: 6000- Length = 9m	20005013

9.7 Blower

Refer to the Blower Manufacturer’s Operational and Maintenance manual for replacement parts.

Assembly and operating manual

Rotary blower

4 Design and Function
4.1 Machine 32
4.1.1 Blower block 33
4.1.2 Pressure relief valve 33
4.1.3 Compensator 34
4.2 Safety devices 34
4.3 Options 34
4.3.1 Pressure switch 34
4.3.2 Speed monitor 35
4.3.3 Unloaded start valve 35
4.3.4 Temperature gauge switch 37
4.3.5 Pressure sensor 37
4.3.6 Start-up pressure regulating valve 38
4.3.7 Thermostat 39
4.3.8 Pressure gauge 40
4.3.9 Filter maintenance indicator 40
4.3.10 Filter pressure differential switch 40
4.3.11 Check valve 41
4.3.12 Auxiliary heating 42
4.3.13 Outdoor installation 43
4.3.14 Intake from pipe network 43
4.3.15 Sound enclosure 43

5 Installation and Operating Conditions
5.1 Ensuring safety 45
5.2 Installation conditions 45
5.2.1 Determining location and clearances 45
5.2.2 Ensuring adequate ventilation 47
5.3 Outdoor installation 47

6 Installation
6.1 Ensuring safety 48
6.2 Reporting transport damage 49
6.3 Anchoring the machine 49
6.4 Connecting the power supply 49
6.4.1 Connecting the drive motor 50
6.4.2 Under frequency control 50
6.5 Creating the compressed air connection 52
6.6 Safety devices installed by the user 52
6.7 Options 52
6.7.1 Connecting the pressure switch 53
6.7.2 Connecting the speed monitor 53
6.7.3 Connecting the temperature gauge switch 53
6.7.4 Connecting the pressure sensor 53
6.7.5 Connecting the thermostat 53
6.7.6 Connecting the filter pressure differential switch 53
6.7.7 Connecting the auxiliary heater 53
6.7.8 Connecting the suction line 54
6.7.9 Sound enclosure 54
6.8 BB 69 C pr , BB 89 C pr with sound enclosure: Remove transport securing devices 55

7 Initial Start-up
7.1 Ensuring safety 56
7.2 Checking installation and operating conditions 57
7.3 Instructions to be observed before commissioning or re-commissioning 57
7.4 Checking the direction of rotation 58
7.4.1 Drive motor 58
7.4.2 Fan (sound enclosure) 58

8 Operation
8.1 Switching on and off 60
8.1.1 Switching on 60
8.1.2 Switching off 60
8.2 Switching off in an emergency 61
8.3 Checking the fan function (sound enclosure) 61

9 Fault Recognition and Rectification
9.1 Basic instructions 62
9.2 Alarms 62
9.3 Options 63
9.3.1 Sound enclosure faults 63
9.3.2 Faulty pressure sensor 63

10 Maintenance
10.1 Ensuring safety 65
10.2 Maintenance schedule 66
10.2.1 Logging maintenance work 66
10.2.2 Regular maintenance tasks 66
10.2.3 Regular service tasks 67
10.3 Sound enclosure 68
10.4 Drive belt maintenance 68
10.5 Checking the oil level 70
10.6 Replenishing lubricating oil 70
10.7 Changing the oil 71
10.8 Air filter maintenance 72
10.8.1 Filter maintenance indicator 73
10.8.2 Filter pressure differential switch 74
10.8.3 Changing the air filter 74
10.9 Motor maintenance 75
10.9.1 Permanently greased drive motor bearings 75
10.9.2 Sound enclosure fan motor 75
10.10 Testing the pressure relief valve 75
10.11 Checking rotors for contamination 77
10.12 Documenting maintenance and service work 78

11 Spares, Operating Materials, Service
11.1 Note the nameplate 79
11.2 Ordering spares and operating fluids/materials 79
11.3 Spares for service and repair 79
11.3.1 BB 52 C pr 80
11.3.2 BB 69 C pr , BB 89 C pr 86
11.4 KAESER AIR SERVICE 89
11.5 Service Addresses 89
11.6 Completing the contamination declaration 89

12 Decommissioning, Storage and Transport
12.1 De-commissioning 90
12.2 Packing 90

12.3 Transport 91
12.3.1 Safety 91
12.3.2 BB 69 C pr , BB 89 C pr with sound enclosure 91
12.3.3 Transport with a forklift truck 91
12.4 Storage 91
12.5 Disposal 92

1 Regarding this document

1.1 Using this document

This document, hereafter called the service manual, contains important information about all life phases of the machine.

The operating manual is a component of the product. It describes the machine as it was at the time of first delivery after manufacture.

- ➢ Keep the operating manual in a safe place throughout the life of the machine.
- ➢ Supply any successive owner or user with this operating manual.
- ➢ Please insert any amendment or revision of the operating manual sent to you.
- ➢ Enter details from the machine nameplate and individual items of equipment in the table in chapter 2.

1.2 Further documents

Included with this operating manual are additional documents intended to assist in the safe operation of the machine:

- ■ Manufacturer's/installation declaration according to applicable directives.
- ■ Motor manual.

Missing documents can be requested from KAESER.

- ➢ Make sure all documents are complete and observe the instructions contained in them.
- ➢ Make sure you provide the data from the nameplate when ordering documents.

1.3 Copyright

This service manual is copyright protected. Queries regarding use or duplication of the documentation should be referred to KAESER. Correct use of information will be fully supported.

1.4 Symbols and labels

- ➢ Please note the symbols and labels used in this document.

1.4.1 Warnings

Warning notices indicate dangers that may result in injury when disregarded.

Warning notices indicate three levels of danger identified by the corresponding signal word:

Signal term	Significance	Consequences of non-compliance
DANGER	Warns of an imminent danger	Will result in death or severe injury
WARNING	Warns of a potentially imminent danger	May result in death or severe injury
CAUTION	Warns of a potentially dangerous situation	May result in a moderate physical injury

Tab. 1 Danger levels and their definition (personal injury)

Warning notices preceding a chapter apply to the entire chapter, including all sub-sections.

Example:

DANGER
The type and source of the imminent danger is shown here!
The possible consequences of ignoring a warning are shown here.
If you ignore the warning notice, the "DANGER" signal word indicates a lethal or severe injury will occur.
➢ The measures required to protect yourself from danger are shown here.

Warning notes referring to a sub-section or the subsequent action are integrated into the procedure and numbered as an action.

Example:

1. **WARNING!**
   The type and source of the imminent danger is shown here!
   The possible consequences of ignoring a warning are shown here.
   If you ignore the warning notice, the "WARNING" signal word indicates that a lethal or severe injury may occur.
   ➢ The measures required to protect yourself from danger are shown here.
2. Always read and comply with warning instructions.

1.4.2 Potential damage warnings

Contrary to the warnings shown above, damage warnings do not indicate a potential personal injury.

Warning notices for damages are identified by their signal term.

Signal term	Significance	Consequences of non-compliance
NOTE	Warns of a potentially dangerous situation	Damage to property is possible

Tab. 2 Danger levels and their definition (damage to property)

Example:

NOTICE
The type and source of the imminent danger is shown here!
Potential effects when ignoring the warning are indicated here.
➢ The protective measures against the damages are shown here.

➢ Carefully read and fully comply with warnings against damages.

1.4.3 Other alerts and their symbols

This symbol identifies particularly important information.

Material — Here you will find details on special tools, operating materials or spare parts.

Precondition — Here you will find conditional requirements necessary to carry out the task.
The conditions relevant to safety shown here will help you to avoid dangerous situations.

Option H12 — ➢ This symbol denotes lists of actions comprising one stage of a task.
Operating instructions with several steps are numbered in the sequence of the operating steps. Information relating to one option only are marked with an option code (e.g., H12 indicates that this section applies only to machines with sound enclosure). Option codes used in this service manual are explained in chapter 2.2.

Information referring to potential problems are identified by a question mark.
The cause is identified in the help text ...
➢ ... as is a solution.

This symbol identifies important information or measures regarding the protection of the environment.

Further information — Further subjects are introduced here.

2 Technical Specifications

2.1 Nameplate

The machine's nameplate provides the model designation and important technical information.

The nameplate is attached to the machine stand and at the left sidewall of the sound enclosure (Option H12).

The nameplate data relates to Standard intake state of 1013 mbar and 20 °C.

➢ Enter here the nameplate data as a reference:

Feature	Value
Rotary blowers	
Part No.	
Serial No.	
Year of manufacture	
Delivery at p_{max}	
Max. final pressure (a)	
Max. pressure differential	
Rated motor power	
Block RPM	
Ambient temperature	
Overall weight	

Tab. 3 Nameplate

2.2 Option codes

The table contains a list of possible options.

➢ Enter options here as a reference.

Option	Option code	Available?
Operating mode: Gauge pressure	B13	
Pressure switch	C9	
Speed monitor	C10	
Unloaded start valve	C11	
Temperature gauge switch	C13	
Pressure transducer	C14	
Start-up pressure regulating valve	C18	
Thermostat	C19	
Pressure gauge	C20	
Under frequency control	C32	
Filter maintenance indicator	F4	
Filter pressure differential switch	F5	

Option	Option code	Available?
Check valve	G1	
Auxiliary heating	H2	
Outdoor installation	H3	
Piped inlet	H11	
Sound enclosure	H12	

Tab. 4 Option codes

2.3 Weight

The indicated mass refers to the machine including the drive motor, but without options. The actual mass of individual machines depends on equipment fitted.

Machine without sound enclosure

	Mass [kg] *		
Rated motor power [kW]	BB 52 C pr	BB 69 C pr	BB 89 C pr
1.5	100	—	—
2.2	105	—	—
3	110	—	—
4	120	155	160
5.5	130	165	170
7.5	140	175	180
11	—	190	195
15	—	195	200

* Approximate values, actual mass can vary depending on the motor manufacturer

Tab. 5 Mass without sound enclosure

Option H12 Machine with sound enclosure

	Mass [kg] *		
Rated motor power [kW]	BB 52 C pr	BB 69 C pr	BB 89 C pr
1.5	170	—	—
2.2	175	—	—
3	180	—	—
4	190	285	290
5.5	200	295	300
7.5	210	305	310
11	—	320	325

* Approximate values, actual mass can vary depending on the motor manufacturer

	Mass [kg] *		
Rated motor power [kW]	BB 52 C pr	BB 69 C pr	BB 89 C pr
15	—	325	330
* Approximate values, actual mass can vary depending on the motor manufacturer			

Tab. 6 Mass with sound enclosure

2.4 Drive motor

Feature	Value
Rated motor power* [kW]	
Synchronous speed (2 poles/50 Hz) [min^{-1}]	3000
Synchronous speed (2 poles/60 Hz) [min^{-1}]	3600
Enclosure protection*	
* Copy the data from the motor nameplate into the table.	

Tab. 7 Drive motor

The warranty for machine damage is invalid in the following cases, if the damage can be traced to the drive motor:

- The machine is shipped without drive motor.
- The customer supplies the drive motor.

2.5 Temperature

	BB 52 C pr	BB 69 C pr	BB 89 C pr
Maximum block discharge temperature [°C]	160	160	160
Maximum temperature differential [K] *	115	115	115
* Discharge temperature minus inlet temperature			

Tab. 8 Temperature

2.6 Recommended oil

The lubricant type to be used depends on the operating conditions.

	OMEGA FLUID	
	SB220	SF220
Description	Synthetic oil	Synthetic oil
* Special measures are required for oil temperatures >120 °C. Consult KAESER for advice on this subject.		

	OMEGA FLUID	
	SB220	SF220
Application	Suitable for all applications, except food processing.	Specifically for applications where the compressed air comes into contact with foodstuffs.
Oil temperature [°C]	–10 – +120*	–5 – +110
* Special measures are required for oil temperatures >120 °C. Consult KAESER for advice on this subject.		

Tab. 9 Recommended oil

Further information An adhesive label identifying the used lubricant is attached to the blower block.
Information on ordering oil is found in chapter 11.2.

2.7 Lubricating oil charge

The block oil chambers are filled with oil at the factory.

Guide value

	Drive-end	Gear-end
Lubricating oil charge [l]	0.15 ±15 %	0.13 ±15 %

Tab. 10 Lubricating oil charge

2.8 Ambient and intake conditions

The following conditions must be maintained:

- No saliferous atmosphere in the immediate vicinity of the machine.
- The air must be free of chemicals or explosive substances.

	BB 52 C pr	BB 69 C pr	BB 89 C pr
Permissible temperature [°C]	–5 – +40	–5 – +40	–5 – +40
Machine with connected auxiliary heating (Options H2, H12) Permissible temperature [°C]	–15 – +40	–15 – +40	–15 – +40
Relative humidity [%]	0 – 80	0 – 80	0 – 80
Maximum altitude AMSL [m]	1000	1000	1000

Tab. 11 Ambient and intake conditions

Differing ambient and intake conditions require the recalculation of the performance data, and are permissible only upon agreement by the manufacturer.

Further information The wiring diagram for option H12 in chapter 13.5 contains further details of the power supply connection.

2.9 Noise emission

Operating state LOAD under the following conditions:

- Nominal speed
- Nominal flow rate
- Nominal pressure

Measuring condition according to DIN EN ISO 2151 and basic standard ISO 9614–2:

- Measurement distance: 1 m
- Tolerance: ±3 dB(A)
- Sound insulated pipeline

Further information BB 52 C pr : The sound pressure level and sound power level values for your machine are provided in the customer-specific design data sheet in chapter 13.8.

BB 69 C pr , BB 89 C pr : The sound pressure level and sound power level values for your machine are provided in the tables shown in chapter 13.7.

These values refer to the design condition. They do not apply to the control range with frequency converter.

2.10 Power Supply

Basic requirements

The machine is designed in accordance with the conditions for an electrical power supply specified in EN 60204-1 (IEC 60204-1) section 4.3.
In the absence of other user-specified conditions, the limits laid down in this standard must be adhered to.
It is recommended that the user and the supplier reach an agreement on the basis of the EN 60204-1, Annex B.

The machine requires a symmetrical three-phase power supply.
In a symmetrical three-phase supply, the phase displacement and voltages are equal for all phases.

The machine may only be operated from an earthed TN or TT three-phase supply.

Connection to an IT supply is not permitted without taking further measures (earth leak detection, etc.).

When designing and creating an external user-provided switching system, it must be ensured that the load currents can be released only after the presence of the applicable supply voltage has been tested and verified.

In the case of the failure of a supply voltage (load circuit or control circuit), the other voltage must always be switched off as well.

This machine is designed for the operation in an industrial environment with proprietary supply network separated from the public supply by a transformer or generator.

Option C32 **Under frequency control**

Extended demands on a three-phase supply for a machine with frequency converter:

This machine may only be supplied from an earthed TN or TT three-phase supply in which the **neutral point** is earthed.

The machine may not be connected to a three-phase supply in which one of the phases is earthed, as this can lead to dangerous voltage surges.

Connection to an IT network is not permitted without further measures being taken (earth leak detection, specially designed frequency converter, etc.).

Further information The connection diagram in chapter 13.4 contains further details of the power supply connection.

2.11 Power supply specifications

The following supply cable conductor cross sections (copper multi-core) and fusing (slow-blow class gG) are selected according to German DIN VDE 0100-430 (IEC 60364-4-43 and IEC 60364-4-473) and DIN VDE 0298-4 (HD 384.5.523 S2) standards for 30 °C ambient temperature and wiring type C.

➢ For other application conditions, check conductor diameters and change accordingly.

Other conditions would include, for example:

- Higher temperature
- Other cable installation method
- cable lengths >50 m

2.11.1 Mains frequency: 50 Hz

Nominal voltage: 230V±10%/3/50Hz (EN 60034-1)

Tab. 13 Mains supply 400V/3/50Hz

Power supply conditions 400V/3/50Hz

The network conditions apply to machines connected to public mains supplies with the following characteristics.

- Mains frequency: 50 Hz
- Voltage between exterior and neutral lines 220 V...250 V
- Voltage between the exterior lines 380 V...430 V

They do not apply to private power supplies within industrial areas isolated from the public mains.

The motor powers listed in table are intended for operation with a public power supply with a system impedance at the transfer point (house connection) of maximum Z_{max} [Ohm].

The operator must ensure that the machines are only connected to a network that meets these requirements. If necessary, ask the local electricity company for the value of the network impedance.

Direct-online starting

Motor power [kW]	2.2	3	4	5.5	7.5	11	15

2.12 Options

Technical data for the options available for your machine are given in the following.

2.12.1 Option C9 Pressure switch

Feature		Data
Max. contact load at 250 V [A]	Inductive load	0.5
	Resistive load	1.0
Protection (with cover, electrical connection upwards)		IP 54

Tab. 21 Pressure switch (option C9)

Further information The wiring diagram for Option C9 in chapter 13.5 contains further details of the power supply connection.

2.12.2 Option C10 Speed monitor

Sensor

Feature	Data
Rated switching distance Sn [mm]	3 – 4
Installation conditions	Not flush
Output function	DC PNP/NPN
Degree of protection	IP 67

Tab. 22 Speed monitor (Option C10)

Sensor

Feature	Data
Rated voltage [V]	110 – 240 AC/DC (50 – 60 Hz) / 27 DC (typ. 24 DC)
Contact load capacity	6 A (250 V AC); B300, R300
Power consumption [VA]	5
Start override [s]	0,5 – 15
Ambient temperature [°C]	-20 – +70
Degree of protection - enclosure/terminals	IP 40 / IP 20
Connection	16 terminals up to 2.5 mm^2 (AWG 14)

Tab. 23 Speed monitor sensor (Option C10)

Sensor setting

Feature	Data
Start override time [s]	5
Switching point [Imp/min] (basic value)	20
Hysteresis [%]	5
Switching function	II
Switching point multiplier	100

Tab. 24 Speed monitor sensor setting (Option C10)

Further information The wiring diagram for Option C10 in chapter 13.5 contains further details of the power supply connection.

2.12.3 Option C11 Unloaded start valve

Type	AFM 4	AFM 5	AFE 15
Permissible pressure [bar]	0 – 2	0 – 2	0 – 2
Maximum delivery [m^3/min]	4	5	15
Inlet connection (DIN ISO 228–1)	R 1 1/4	R 2 1/2	—
Outlet connection (DIN ISO 228–1)	G 1 1/4	R 2	—
Nominal width (DIN ISO 228–1)	—	—	G 2 A
Voltage [V]	230, 1 ph, 50/60 Hz	230, 1 ph, 50/60 Hz	—
Connecting socket	Type 2508 to DIN 43650 A	Type 2508 to DIN 43650 A	—
Degree of protection	IP 65	IP 65	—

Tab. 25 Unloaded start valve (Option C11)

2.12.4 Option C13 Temperature gauge switch

Feature		Data
Switching capacity at 250 V(AC) [A] Single pole micro-switch with changeover contact	Inductive load	1.5
	Resistive load	5.0
Switching differential of the scale range [%]		< 3
Switching point tolerance [%] (of the scale range related to the cut-out point at rising temperature)		± 0.5
Minimum voltage [V] [AC] Minimum current [mA] (Switching safety)		24 20
Degree of protection	Front	IP 53
	Rear	IP 54

Tab. 26 Temperature gauge switch (Option C13)

Further information The wiring diagram for Option C13 in chapter 13.5 contains further details of the power supply connection.

2.12.5 Option C14 Pressure sensor

Feature	Data
Output signal [mA]	4 – 20
Parasitic energy [V]	U_B = DC 10 – 30
Permissible apparent resistance [Ohm]	$R_A = (U_B [V] - 10 V) / 0.02 A$
Enclosure protection	IP 65

Tab. 27 Pressure sensor (option C14)

Further information The wiring diagram for Option C14 in chapter 13.5 contains further details of the power supply connection.

2.12.6 Option C18 Start-up pressure regulating valve

Model	AFR 10	—
Permissible pressure [bar] (a)	0 – 2	—
Maximum delivery [m^3/min]	10	—
Maximum pressure differential [mbar]	950	—
Regulating range [mbar]	200 – 950	—
Nominal width (DIN ISO 228–1)	G 2 A	—
Control line connection (DIN ISO 228–1)	R 1/8 A	—

Tab. 28 Start-up pressure regulating valve (Option C18)

2.12.7 Option C19, H12 Thermostat

Feature	Data
Spring switch with changeover contact	1–pole
Switching capacity NC contact (1–2)	AC 230 V / 2.5 A / cosϕ=0.6 AC 230 V / 16 A / cosϕ=1 DC 230 V / 0.25 A
Switching capacity NO contact (1-4)	AC 230 V / 2.5 A / cosϕ=0.6 AC 230 V / 6.3 A / cosϕ=1 DC 230 V / 0.25 A
Switching differential scale starting position [%]	6
Switching differential scale end position [%]	1,5

Feature	Data
Degree of protection	IP 54

Tab. 29 Thermostat (Option C19)

Further information The wiring diagram for Option C19 in chapter 13.5 contains further details of the power supply connection.

2.12.8 Option C20 Pressure gauge

Feature	Data
Indicator range [bar]	0 – 1.6

Tab. 30 Pressure gauge (option C20)

2.12.9 Option F4 Filter maintenance indicator

Feature	Data
Indicator range [mbar]	0 – 55

Tab. 31 Filter maintenance indicator (option F4)

2.12.10 Option F5 Filter pressure differential switch

Feature	Data
Pressure differential, adjustable [mbar]	2,5 – 50,0
Voltage [V]	(AC) eff., min. 10 (AC) max. 250 (DC) min. 12 (DC) max. 48
Rated current [A]	(AC) 10
Switching current	(AC) eff., min. 20 mA (AC) max. 6 A, cosφ = 1.0 (AC) max. 3 A, cosφ = 0.6 (DC) min. 20 mA (DC) max. 1 A
Degree of protection	IP 54

Tab. 32 Filter pressure differential switch (Option F5)

Further information The wiring diagram for Option F5 in chapter 13.5 contains further details of the power supply connection.

2.12.11 Option G1 Check valve

BB 52 C pr

Feature	Data
Threaded connection [“]	2 1/2

3 Safety and Responsibility

3.1 Basic instructions

The machine is manufactured to the latest engineering standards and acknowledged safety regulations. Nevertheless, dangers can arise through its operation:

- Danger to life and limb of the operator or third parties,
- Damages to the machine and other material assets.

Disregard of warning or safety instructions can cause serious injuries!

➢ Use this machine only if it is in a technically perfect condition and only for the purpose for which it is intended; observe all safety measures and the instructions in the service manual.

➢ Immediately rectify (have rectified) any faults that could be detrimental to safety!

3.2 Specified use

The machine is designed exclusively for the generation of overpressure in a commercial or industrial environment where air (in the following "compressed air") as delivery medium is approved for use. Any other use is considered incorrect. The manufacturer is not liable for any damages that may result from incorrect use. The user alone is liable for any risks incurred.

➢ Comply with the instructions in this operating manual.

➢ Operate the machine only within its performance limits and under the permitted ambient conditions.

➢ Do not use compressed air for breathing purposes unless it is specifically treated.

➢ Do not use compressed for any application that will bring it into direct contact with foodstuffs unless it is specifically treated.

➢ Operate the blower block only with inlet and outlet ports connected.

3.3 Improper use

Improper usage can cause damage to property and/or (severe) injuries.

➢ Only use the machine as intended.

➢ Never direct compressed air at persons or animals.

➢ Use hot cooling air for heating purposes only if there is no risk to the health of humans or animals. If necessary, hot cooling air should be treated by suitable means.

➢ Do not allow the machine to take in toxic, acidic, flammable of explosive gases or vapours.

➢ Do not operate the machine in areas in which specific requirements with regard to explosion protection are in force.

➢ Intake of solid particles > 0.1 mm is not permitted.

3.4 User's responsibilities

The machine is delivered in a state in which it cannot be activated. The user must equip the machine with a drive motor of >2 kW and a current draw of >10 A, with a lockable main switch and appropriate fusing. The machine must also be equipped with a motor overload protection switch and an EMERGENCY-OFF switch in accordance with applicable local regulations before being commissioned.

3.4.1 Observe statutory and universally accepted regulations

This includes, for example, nationally implemented European directives and/or applicable national legislation, safety and accident prevention regulations.

➢ Observe relevant statutory and accepted regulations during installation, operation and maintenance of the machine.

3.4.2 Determining personnel

Suitable personnel are experts who, by virtue of their training, knowledge and experience as well as their knowledge of relevant regulations can assess the work to be done and recognize the possible dangers involved.

Authorised operators possess the following qualifications:

- are of legal age,
- are conversant with and adhere to the safety instructions and sections of the service manual relevant to operation,
- have received adequate training and authorization to operate electrical and compressed air devices.

Authorised installation and maintenance personnel have the following qualifications:

- are of legal age,
- have read, are conversant with and adhere to the safety instructions and sections of the service manual applicable to installation and maintenance,
- are fully conversant with the safety concepts and regulations of electrical and compressed air engineering,
- are able to recognize the possible dangers of electrical and compressed air devices and take appropriate measures to safeguard persons and property,
- have received adequate training in and authorization for the safe installation and maintenance of this machine.

➢ Ensure that personnel entrusted with operation, installation and maintenance are qualified and authorised to carry out their tasks.

3.5 Dangers

Basic instructions

Information concerning the various forms of danger that can arise during machine operation are found here.

Basic safety instructions are found in this service manual at the beginning of each chapter in the section entitled 'Safety'.

Warning instructions are found before a potentially dangerous task.

3.5.1 Safely dealing with sources of danger

The following describes the various forms of danger that can occur during machine operation.

Electricity

Touching voltage carrying components can result in electric shocks, burns or death.

- ➢ All power supplies must be fitted with lockable isolating devices by the user.
- ➢ Allow only qualified and authorised electricians or trained personnel under the supervision of a qualified and authorised electrician to carry out work on electrical equipment according to electrical engineering regulations.
- ➢ Before commissioning or re-commissioning the machine, the user must ensure adequate protection against electric shock from direct or indirect contact.
- ➢ Before starting any work on electrical equipment:
  Switch off and lock out the power supply isolating device, and verify the absence of any voltage.
- ➢ Switch off any external power sources.
  These may include connections to the machine heater.
- ➢ Use fuses corresponding to machine power.
- ➢ Check regularly that all electrical connections are tight and in proper condition.

Forces of compression

Compressed air is contained energy. Uncontrolled release of this energy can cause serious injury or death. The following information concerns work on components that could be under pressure.

- ➢ Close shut-off valves or otherwise isolate the machine from the distribution network to ensure that no compressed air can flow back into the machine.
- ➢ De-pressurise all pressurised components and enclosures.
- ➢ Allow no person or thing to remain near the blow-off valve during machine operation. In the event of operating pressure being exceeded, hot gas is blown of at high velocity and the valve tension rod is blown upward with great force.
- ➢ Do not carry out welding, heat treatment or mechanical modifications on pressurised components, as this influences the components' resistance to pressure.
  The safety of the machine is then no longer ensured.

Compressed air quality

The composition of the compressed air must be suitable for the actual application in order to preclude health and life-threatening dangers.

- ➢ Use appropriate systems for air treatment before using the compressed air from this machine as breathing air and/or for the processing of foodstuffs.
- ➢ Use lubricating oil compatible with foodstuffs if compressed air can come into contact with them.

Spring forces

Springs under tension or compression store energy. Uncontrolled release of this energy can cause serious injury or death.

Blow-off valves and unloaded-start valves are under powerful spring loading.

➢ Do not open or dismantle any valves.

Rotating components

Touching the extractor fan or the belt drive while the machine is running can result in serious injury.

➢ Do not open the enclosure while the machine is switched on.

➢ Switch off and lock out the power supply disconnecting device, and verify the absence of any voltage.

➢ Wear close-fitting clothes and a hair net if necessary.

➢ Ensure that all covers and safety guards are in place and secured before re-starting.

Temperature

High temperatures are generated during compression. Touching hot components may cause injuries.

➢ Avoid contact with hot components.
These include, for example, blower blocks, silencers, oil and compressed air lines, motors and machine heaters.

➢ Wear protective clothing.

➢ If welding is carried out on or near the machine, take adequate measures to prevent sparks or heat from igniting oil vapours or parts of the machine.

Noise

The sound enclosure absorbs the machine noise to a tolerable level. This function will be effective only if the sound enclosure is closed.

➢ Wear hearing protection if necessary.
The blowing-off of the pressure relief valve can be particularly loud.

Operating fluids/materials

The used operating fluids and materials can cause adverse health effects. Suitable safety measures must be taken in order to prevent injuries.

➢ Strictly forbid fire, open flame and smoking.

➢ Follow safety regulations when dealing with oils, lubricants and chemical substances.

➢ Avoid contact with skin and eyes.

➢ Do not inhale oil mist and vapours.

➢ Do not eat or drink while handling lubricants.

➢ Keep suitable fire extinguishing agents ready for use.

➢ Use only KAESER approved operating materials.

Unsuitable spare parts

Unsuitable spare parts compromise the safety of the machine.

➢ Use only spare parts approved by the manufacturer for use in this machine.

➢ Use only genuine KAESER replacement parts on pressure bearing parts.

Conversion or modification of the machine

Modifications, additions or conversions to or of the machine can result in unpredictable hazards.

- ➢ Do not convert or modify the machine!
- ➢ Prior to any technical modification and expansions of the machine, obtain the written approval of the manufacturer.

Extending or modifying the compressor station

If dimensioned appropriately, pressure relief valves reliably prevent an impermissible rise in pressure. New dangers may arise if you modify or extend the compressed air station.

- ➢ When extending or modifying the compressed air system:
  Check the blow-off capacity of the safety valves prior to installing the new machine.
- ➢ If the blow-off capacity is insufficient:
  install pressure relief valves with larger blow-off capacity.

3.5.2 Safe machine operation

The following is information supporting you in the safe handling of the machine during individual product life phases.

Personal protective equipment

When working on the machine you may be exposed to dangers that can result in accidents with severe adverse health effects.

- ➢ Wear protective clothing as necessary.

Suitable protective clothing (examples):

- Safety workwear
- Protective gloves
- Safety boots
- Eye protection
- Ear protection

Transporting

The weight and size of the machine require safety measures during its transport to prevent accidents.

- ➢ Use suitable lifting gear that conforms to local safety regulations.
- ➢ Allow transportation only by personnel trained in the safe movement of loads.
- ➢ Attach lifting gear only to suitable lifting points.
- ➢ Be aware of the centre of gravity to avoid tipping.
- ➢ Make sure the danger zone is clear of personnel.
- ➢ Do not step onto machine components to climb up the machine.

Assembly

- ➢ Make sure no power is applied when electrical connections are made.
- ➢ Use only electrical cables that are suitable and approved for the surroundings and electrical loads applied.

- ➢ Never dismantle compressed air pipes until they are fully vented.
- ➢ Only use pressure lines that are suitable and approved for the maximum working pressure and the intended medium.
- ➢ Do not allow connection pipes to be placed under mechanical stress.
- ➢ Do not induce any forces into the machine via the connections, so that the compressive forces must be balanced by bracing.
- ➢ Do not step onto machine components to climb up the machine.

Installation

A suitable installation location for the machine prevents accidents and faults.

- ➢ Install the machine in a suitable compressor room.
- ➢ Ensure sufficient and suitable lighting such that the display can be read and work carried out comfortably and safely.
- ➢ Ensure accessibility so that all work on the machine can be carried out without danger or hindrance.
- ➢ If installed outdoors, the machine must be protected from frost, direct sunlight, dust, rain and splashing water.
- ➢ Do not operate in areas in which specific requirements with regard to explosion protection are in force.
  For instance, the requirements of ATEX directive 94/9/EC "Equipment and Protective Systems intended for use in Potentially Explosive Atmospheres".
- ➢ Ensure adequate ventilation.
- ➢ Place the machine in such a manner that the working conditions in its environment are not impaired.
- ➢ Comply with limit values for ambient temperature and humidity.
- ➢ The intake air must not contain any damaging contaminants,
  Damaging contaminants are for instance: explosive or chemically instable gases and vapours, acid or base forming substances such as ammonia, chlorine or hydrogen sulfide.
- ➢ Do not position the machine in the warm exhaust air flow from other machines.
- ➢ Keep suitable fire extinguishing agents ready for use.

Commissioning, operation and maintenance

During commissioning, operation and maintenance you may be exposed to dangers resulting from, e.g., electricity, pressure and temperature. Careless actions can cause accidents with severe adverse effects for your health.

- ➢ Allow maintenance work to be carried out only by authorised personnel.
- ➢ Wear close-fitting, flame-resistant clothing. Wear protective clothing as necessary.
- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Check that there is no voltage on potential-free contacts.
- ➢ Close shut-off valves or otherwise isolate the machine from the distribution network to ensure that no compressed air can flow back into the machine.
- ➢ De-pressurise all pressurised components and enclosures.
- ➢ Allow the machine to cool down.
- ➢ Do not open the sound enclosure while the machine is switched on.
- ➢ Do not open or dismantle any valves.
- ➢ Use only spare parts approved by KAESER for use in this machine.

- ➢ Carry out regular inspections:
  for visible damages,
  of safety installations,
  of the EMERGENCY STOP command device,
  of any components requiring monitoring.
- ➢ Pay particular attention to cleanliness during all maintenance and repair work. Cover components and openings with clean cloths, paper or tape to keep them clean.
- ➢ Do not leave any loose components, tools or cleaning rags on or in the machine.
- ➢ Components removed from the machine can still be dangerous.
  Do not attempt to open or destroy any components taken from the machine.

De-commissioning, storage and disposal

Improper handling of old operating fluids and components represent a danger for the environment.

- ➢ Drain off fluids and dispose of them according to environmental regulations.
  These include, for example, lubricating oil.
- ➢ Dispose of the machine in accordance with local environmental regulations.

3.5.3 Organisational measures

- ➢ Designate personnel and their responsibilities.
- ➢ Give clear instructions on reporting faults and damage to the machine.
- ➢ Give instructions on fire reporting and fire-fighting measures.

3.6 Danger areas

The table gives information on areas dangerous to personnel.

Only authorized personnel may enter these areas.

Function	Danger area	Authorized personnel
Transporting	Within a 3 m radius of the machine.	Installation personnel for transporting preparation. No personnel during transporting.
	Beneath the lifted machine.	No personnel!
Installation	Within the machine. Within 1 m radius of the machine and its power supply cables.	Installation personnel
Operation	Within a 1 m radius of the machine.	Operating personnel
Maintenance	Within the machine. Within a 1 m radius of the machine.	Maintenance personnel

Tab. 48 Danger areas

3.7 Safety devices

Various safety devices ensure safe working with the machine.

- ➢ Do not change, bypass or disable safety devices.

- ➢ Check safety devices for correct function regularly.
- ➢ Do not remove or obliterate labels and notices.
- ➢ Ensure that labels and notices are clearly legible.

Further information More information on safety devices is contained in chapter 4, section 4.2.

3.8 Safety signs

The diagram shows the positions of safety signs on the machine. The table 49 lists the various safety signs used and their meanings.

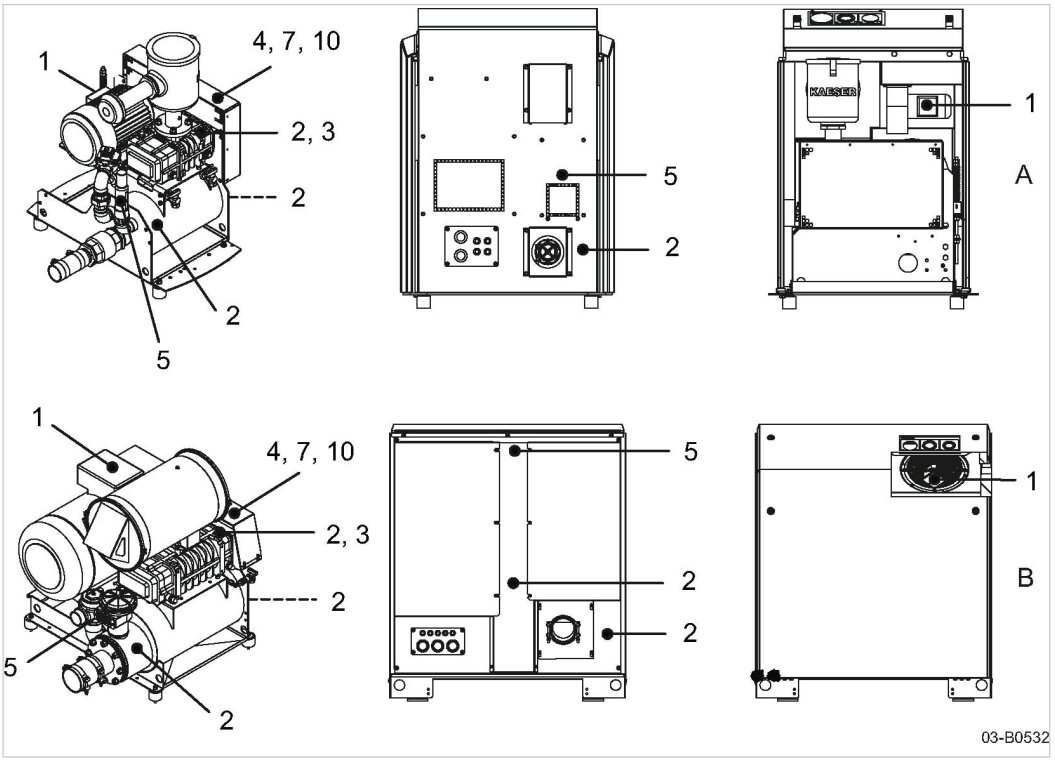

Fig. 1 Position of the safety signs at the machine

Ⓐ BB 52 C pr
Ⓑ BB 69 C pr , BB 89 C pr

Options

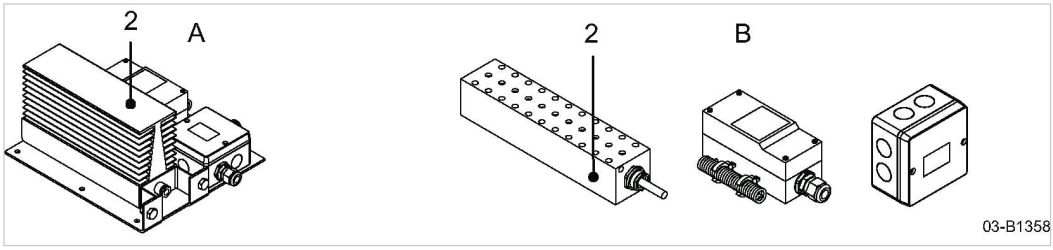

Fig. 2 Safety sign position, standstill heating, Option H2

Ⓐ BB 52 C pr
Ⓑ BB 69 C pr , BB 89 C pr

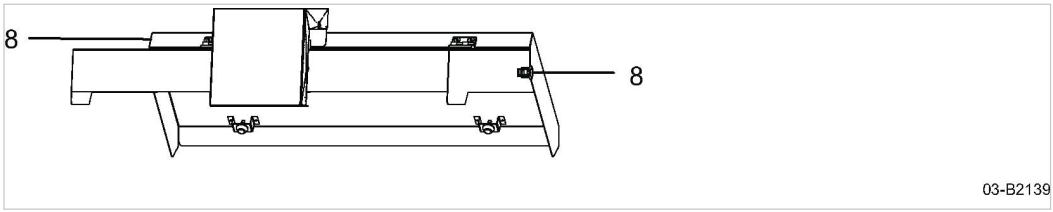

Fig. 3 BB 69 C pr , BB 89 C pr : Safety sign position,weather protection, Option H3

Position	Symbol	Meaning
1		Danger of fatal injury from electric shock! ➢ Before starting any work on electrical equipment: Switch off and lock out the power supply disconnecting device, and verify the absence of any voltage.
2		Hot surface! Risk of burns caused by contact with hot components. ➢ Do not touch the surface. ➢ Wear long-sleeved garments (not synthetics such as polyester) and protective gloves.
3		Rotating rotors. Risk of serious lacerations or even severing of extremities (fingers) from rotating components. ➢ Operate the machine only with an inlet silencer connected. ➢ Prior to any work at the machine: Switch off and lock out the power supply disconnecting device.
4		Rotating belt drive! Risk of serious lacerations or even severing of extremities (fingers) from moving belts. ➢ Never run the machine without a belt guard. ➢ Prior to any work at the machine: Switch off and lock out the power supply disconnecting device.
5		Danger of burns from hot gas! ➢ Do not enter danger zone. ➢ Wear long-sleeved garments (not synthetics such as polyester) and protective gloves.

Position	Symbol	Meaning
7		Noise during machine operation (without sound enclosure) or noise due to opened service panel of the sound enclosure (Option H12)! ➢ Hearing may be damaged. ➢ Wear hearing protection.
8		Injuries (to the hands in particular) due to shearing effects. ➢ Carefully close the flap in the weather protection roof. ➢ Always wear protective gloves.
10		Personal injury or damage to the machine by incorrect operation! ➢ Read and understand the service manual and all safety signs before switching on this machine.

Tab. 49 Safety signs

3.9 In emergency

3.9.1 Correct fire fighting

Suitable extinguishing agents

- Foam
- Carbon dioxide
- Sand or earth

Unsuitable or unsafe extinguishing agents

- Strong jet of water

1. Keep calm.
2. Give the alarm.
3. Switch off the power supply disconnecting device, if possible.
4. Move to safety.
   - Warn persons in danger.
   - Help incapacitated persons.
   - Close the doors.
5. Try to extinguish the fire if you have the skill to do so.

3.9.2 Remove lubricating oil from the skin.

➢ Eye contact:
Rinse eyes thoroughly with lukewarm water and seek medical assistance.

➢ Skin contact:
Wash off immediately.

3.10 Environment protection

- ➢ Store and dispose of operating materials and replaced parts in accordance with local environment protection regulations.
- ➢ Observe national regulations.
  This applies particularly to parts contaminated with lubricating oil.

- ➢ Do not allow lubricating oil to escape to the environment or into the sewage system.

3.11 Warranty

This service manual contains no independent warranty commitment. Our general terms and conditions apply with regard to warranty.

A condition of our warranty is that the machine is used solely for the purpose for which it is intended and under the conditions specified.
Due to the multitude applications for which the machine is suitable the obligation lies with the user to determine its suitability for his specific application.

Furthermore, we accept no warranty obligation for:

- the use of unsuitable parts or operating materials,
- un-authorised modifications,
- incorrect maintenance,
- incorrect repair.

Correct maintenance and repair includes the use of genuine KAESER spare parts and operating materials.

- ➢ Obtain confirmation from KAESER that your specific operating conditions are suitable.

4 Design and Function

4.1 Machine

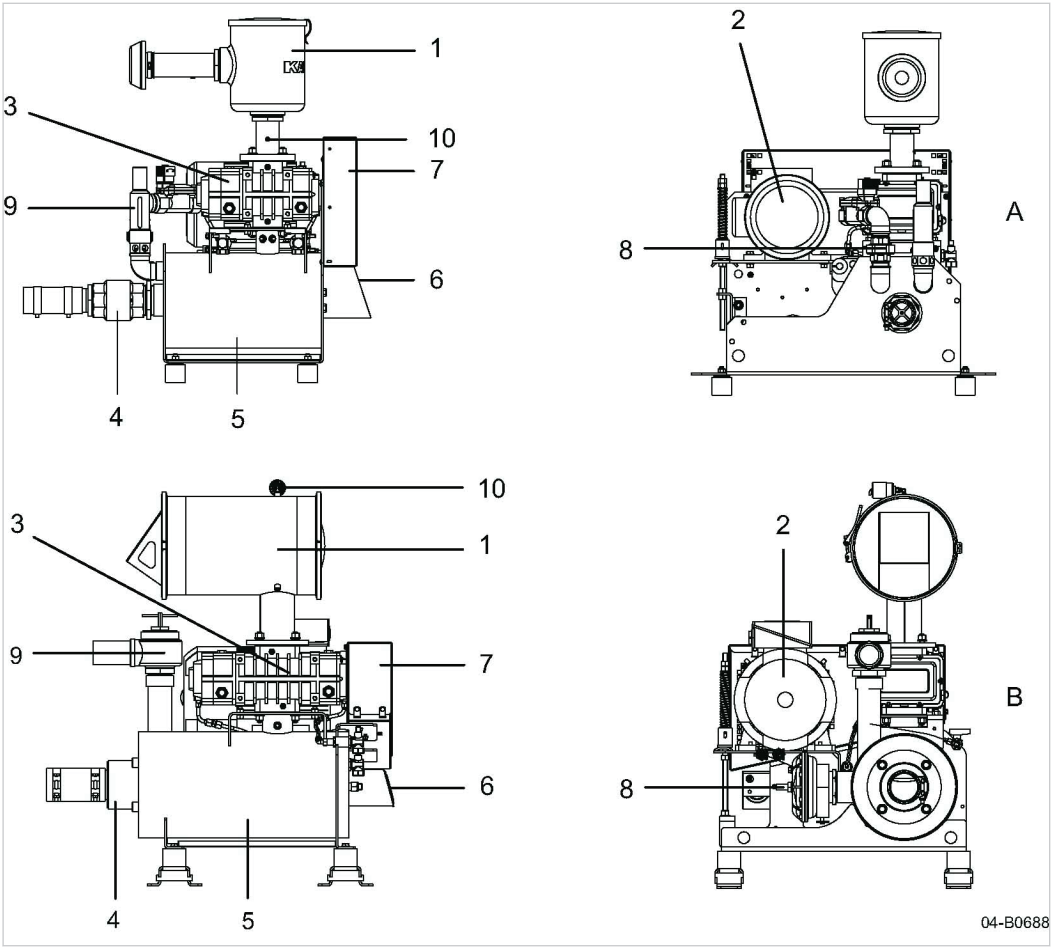

Fig. 4 Machine

A	BB 52 C pr	5	Outlet silencer
B	BB 69 C pr , BB 89 C pr	6	Display (option)
1	Inlet silencer	7	Belt guard
2	Drive motor	8	Unloaded start valve (option)
3	Blower block	9	Pressure relief valve
4	Check plate (option)	10	Filter maintenance indicator (option)

The motor 2 drives the block 3 via belts.

Air is drawn into the inlet silencer 1 and through a filter where it is cleaned.

The air is then pushed from the blower block in vertical direction into the outlet silencer 5, where the process forces pressure build-up.

4.1.1 Blower block

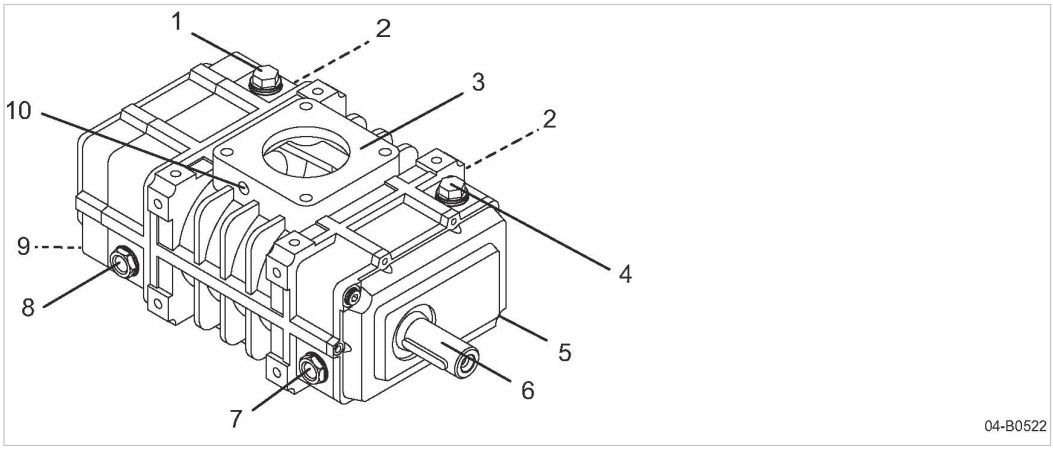

Fig. 5 Blower block

1 Gear-end oil inlet
2 Side gas drainage (closed)
3 Flange connection (both sides)
4 Drive-end oil inlet
5 Drive-end oil drain
6 Drive shaft
7 Drive-end oil sight glass
8 Gear-end oil sight glass
9 Gear-end oil drain
10 Connection for measuring instrument (both sides)

A pair or rotors with intermeshing lobes turn in opposite directions within a casing. The rotors are synchronised by timing gears on one end. Air in the block inlet is trapped between the rotor lobes and the casing and moved round to the discharge port.

As there is no contact between the rotors themselves and the casing, oil film lubrication is not required.

4.1.2 Pressure relief valve

The pressure relief valve protects the system from excessive pressure. It is factory set.

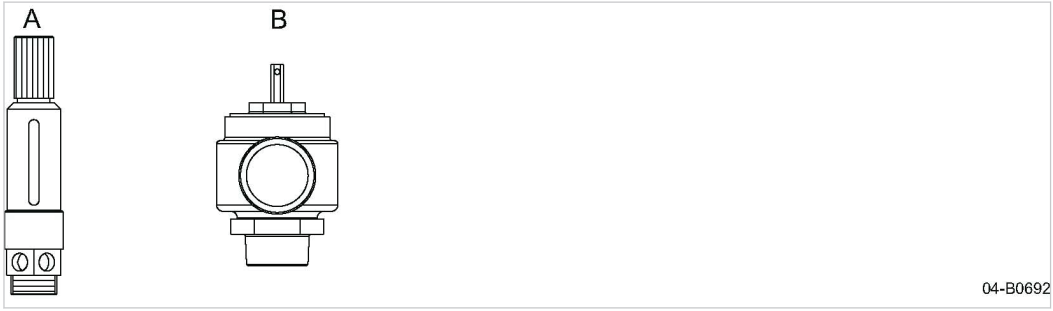

Fig. 6 Pressure relief valve

A BB 52 C pr
B BB 69 C pr , BB 89 C pr

4.1.3 Compensator

The compensator functions as follows:

- Inlet and outlet connections to silencers and accessories,
- Isolates the machine vibrations from the air pipeline.

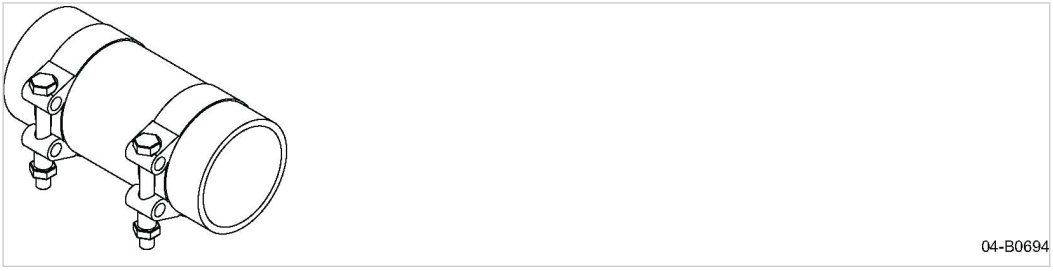

Fig. 7 Compensator

4.2 Safety devices

The following safety devices are provided and may not be modified in any way.

- Blow-off valve.
  The blow-off valve protects the machine from excessive pressure build-up. It is factory set.
- Covers over moving parts and electrical connections:
  These protect against accidental contact.
- Sound enclosure (Option H12):
  The sound enclosure prevents excessive noise emission.
- Drive motor with 3 PTC thermistors:
  They protect the motor against overheating in connection with the user's protection cut-out.

4.3 Options

The options available for your machine are described below.

4.3.1 Option C9 Pressure switch

The pressure switch sends a signal when the set pressure is exceeded.

The pressure switch is factory set according to the customers specification.
In other cases it must be set according to the application..

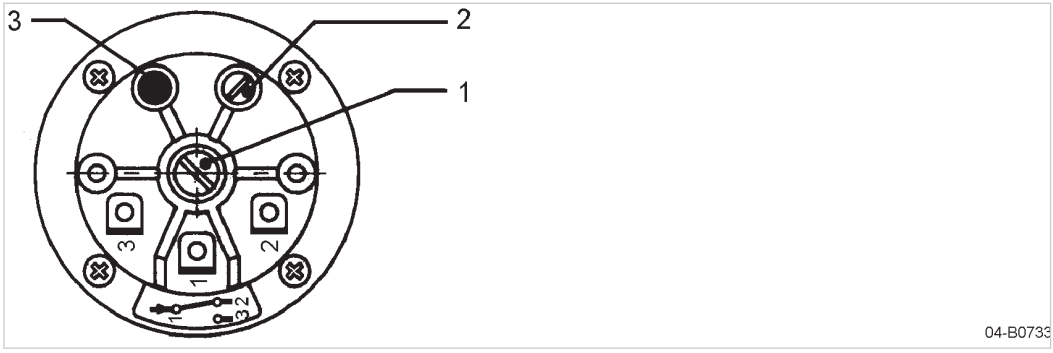

Fig. 8 Pressure switch

[1] Switching point adjusting screw
[2] Switching differential adjusting screw
[3] Screw sealed with a protective coating

The switching point can be adjusted by the screw [1] while the machine is running.
Fine adjustment and switching differential is set with the adjusting screw [2].

The screw [3] is sealed with a protective coating. It is not to be adjusted.

4.3.2 Option C10 Speed monitor

The speed monitor measures the rotational speed of the block rotors.

4.3.3 Option C11 Unloaded start valve

4.3.3.1 AFM 4 , AFM 5

AFM 4 and AFM 5 open the discharge line from the machine to the atmosphere for unloaded starting.

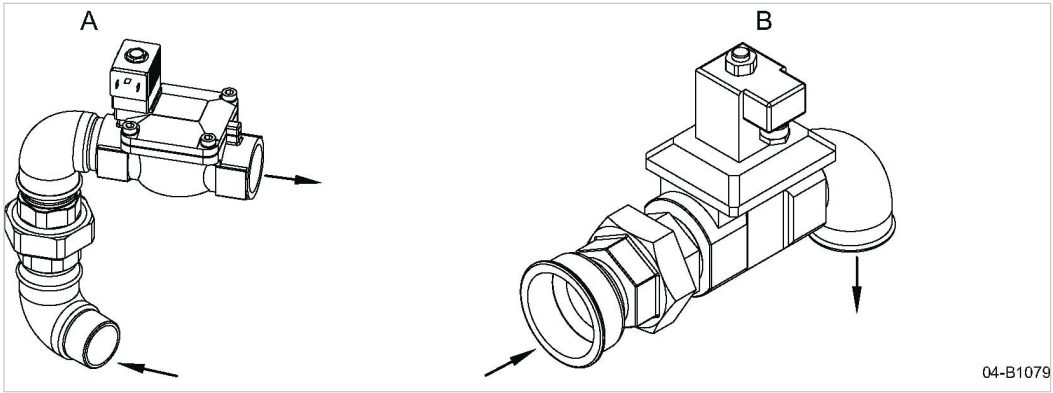

Fig. 9 Unloaded start valve AFM 4 , AFM 5

[A] AFM 4
[B] AFM 5

Functional description

The unloaded start valve is de-energised closed when the machine is switched off. When the machine is switched on and the motor is in the star phase, the unloaded start valve is energised and opens. Air discharged from the block is blown out to atmosphere.

When the motor switches to delta, the unloaded start valve is de-energised and closes.

4.3.3.2 AFE 15

AFE 15 provides an unloaded start of the machine in the star-delta phase. The valve closes when the motor starter switches from star (Y) to delta (Δ).

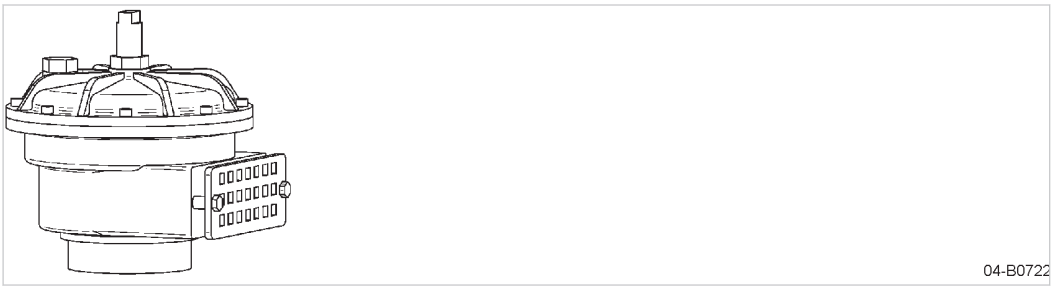

Fig. 10 Unloaded start valve AFE 15

The unloaded start valve is factory set.

Functional description

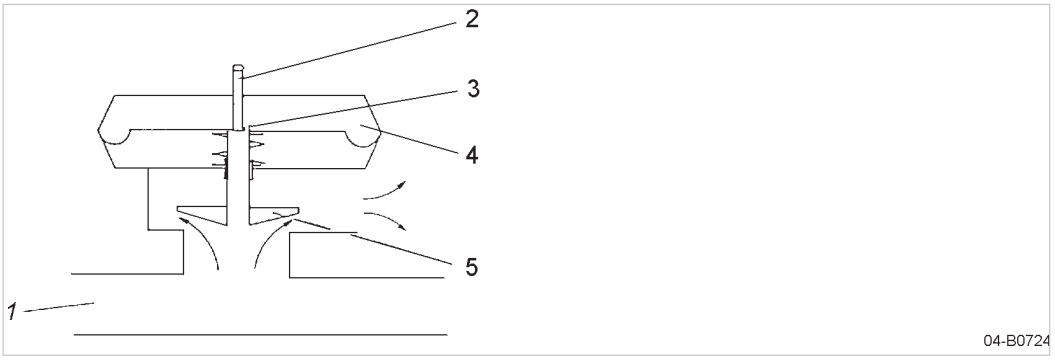

Fig. 11 Diagram of the unloaded start valve AFE 15

[1] Air network
[2] Adjusting screw
[3] Nozzle
[4] Diaphragm chamber
[5] Valve cone

When the machine is shut down the valve cone [5] is open.

When the machine is started, air passes through the blow-off aperture to atmosphere.

Turning the adjusting screw [2] reduces the valve aperture for the valve cone [5] to close at low volume flow.
(To close the valve cone [5], a pressure of 100mbar in the pipe is required.)

Back pressure enters through the nozzle [3] into the upper diaphragm chamber [4] to close the valve cone. The closing time can be influenced by changing the position of the valve cone with the adjusting screw [2].

Changing the closing time with the adjusting screw:

- Clockwise: shorter closing time
- Counterclockwise: longer closing time

4.3.4 Option C13 Temperature gauge switch

The gauge shows the temperature in the block discharge port and has a floating relay changeover contact that can be set to switch at a selected temperature.

The switching point is factory set to 145 °C.

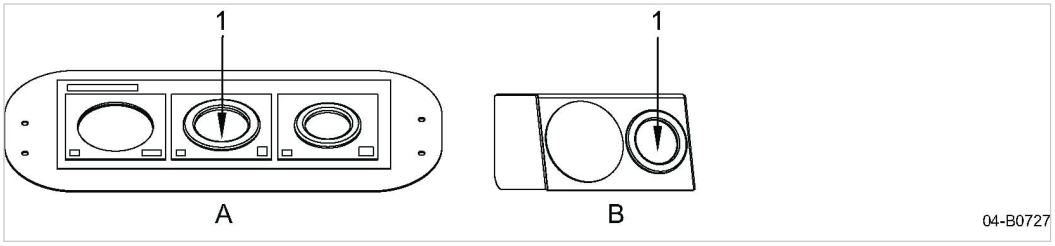

Fig. 12 Location of the temperature gauge

[A] Display: Machine with sound enclosure
[B] Display: Machine without sound enclosure
[1] Temperature gauge

Setting instructions

The switching point can be adjusted by means of the screw beneath the protective cover on the front plate.

Possible adjustment for working conditions on site:

- Block discharge temperature lower than 145 °C
  - If the average block discharge temperature is significantly lower than 145 °C the gauge, switching point can be adjusted down.
    The recommended switching point is the average block discharge temperature + 15 K.
- Block discharge temperature higher than 145 °C
  - If the average block discharge temperature is near to or higher than 145 °C, adjust the switching point upward.
    The maximum permissible value: 155 °C.

4.3.5 Option C14 Pressure sensor

The sensor measures the actual block discharge pressure.

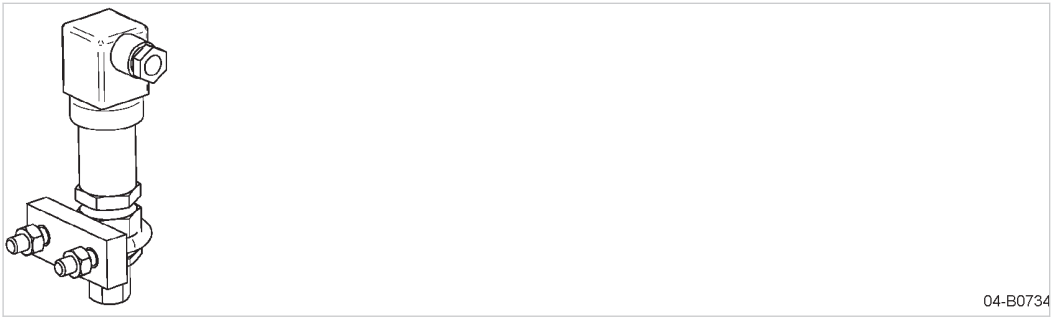

Fig. 13 Pressure sensor

4.3.6 Option C18
Start-up pressure regulating valve

The start-up regulating valve is a medium-controlled valve with the following functions:

- Unloaded starting
- Pressure regulating during operation

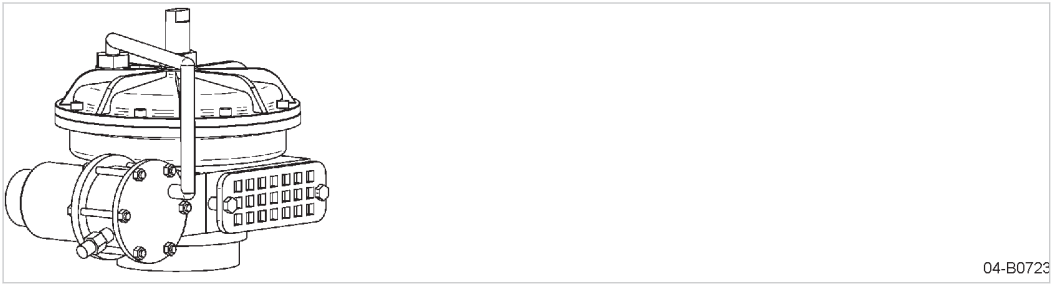

Fig. 14 Start-up pressure regulating valve

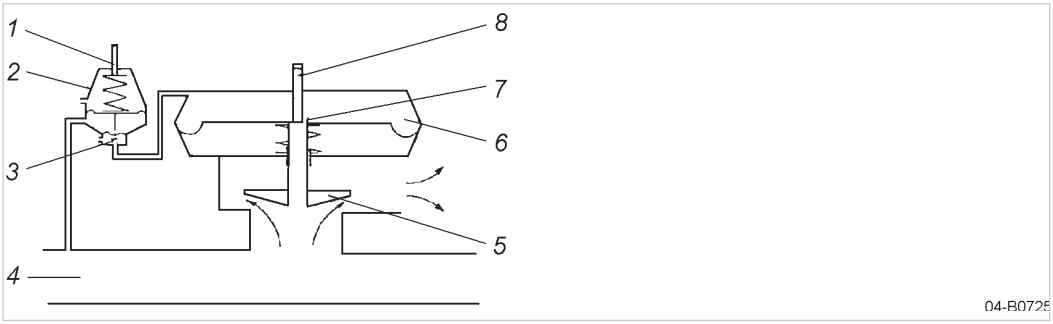

Fig. 15 Principle – Start-up pressure regulating valve

[1] Adjusting screw
[2] Control air regulator
[3] Valve cone
[4] Air network
[5] Valve cone
[6] Diaphragm chamber
[7] Nozzle
[8] Adjusting screw

Unloaded starting

When the machine is stopped the valve cone [5] is open and valve cone [3] closed. When the machine is started, air flows over the valve cone [5] and is blown off to atmosphere. The pressure build-up in the air network [4] is transmitted through the hollow spindle and nozzle [7] into the upper diaphragm chamber [6]. The resulting pressure on the diaphragm closes the valve cone [5].

Changing the closing time:
The valve closing time can be adjusted by changing the nozzle [7] and turning the adjusting screw [8].

- Clockwise: shorter closing time
- Counterclockwise: longer closing time

The unloaded start function only works if the pressure in the air network [4] reaches at least 100 mbar.

Overflow regulation

The control air regulator is set to atmospheric pressure.

After starting, the network pressure and the pressure on the control air regulator [2] rises. As soon as the set network pressure is reached the valve cone [3] opens. Pressure in the upper diaphragm chamber [6] bleeds off to atmosphere and the valve cone [5] opens.

The set network pressure is kept constant.

Changing the pressure setting
Remove the rubber cap from the control regulator to change network pressure. Undo the locknut and adjust the screw with a screwdriver.

- Clockwise: Lower pressure
- Counterclockwise: Higher pressure

Lock the screw in position after adjusting and replace the rubber cap.

4.3.7 Option C19, H12 Thermostat

The thermostat controls the temperature within the sound enclosure.
It consists of a temperature sensor with a floating relay changeover contact.

The switching point is factory set to 60°C.

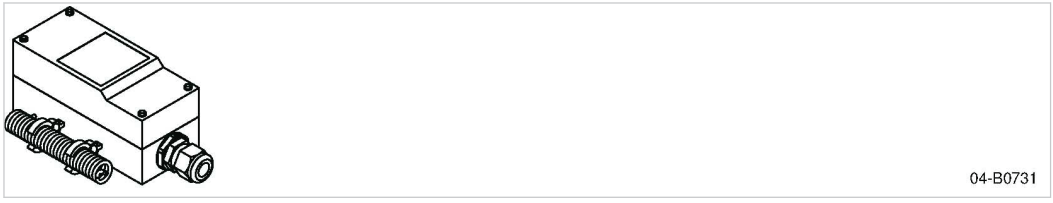

Fig. 16 Thermostat

4.3.8 Option C20
Pressure gauge

The pressure gauge shows the pressure in the blower block discharge port.

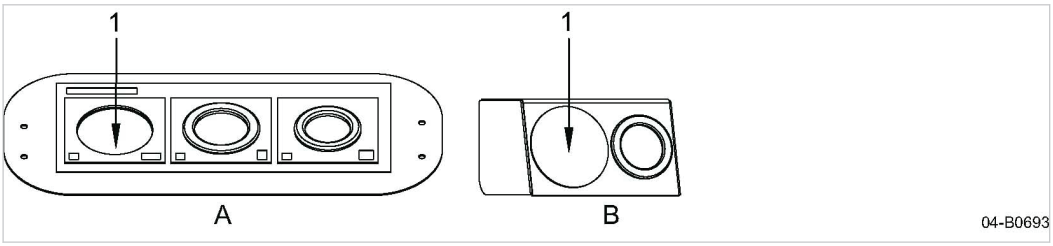

Fig. 17 Location of the pressure gauge

[A] Display: Machine with sound enclosure
[B] Display: Machine without sound enclosure
[1] Pressure gauge

4.3.9 Option F4
Filter maintenance indicator

The maintenance indicator shows when the filter needs maintenance. When the filter becomes clogged and flow resistance rises to a set point, the maintenance signal is given.

4.3.10 Option F5
Filter pressure differential switch

The filter pressure differential switch monitors contamination of the intake filter.

The switch is triggered by pressure differential. Falling below or rising above the set value causes the current flow to switch on, switch off or changeover according to how the switch is wired.

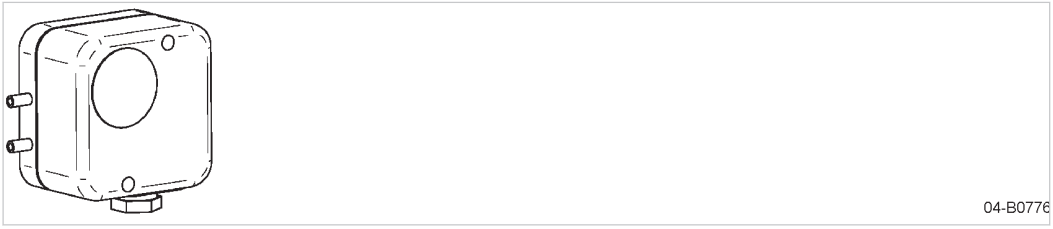

Fig. 18 Filter pressure differential switch

Pressure connection diagram

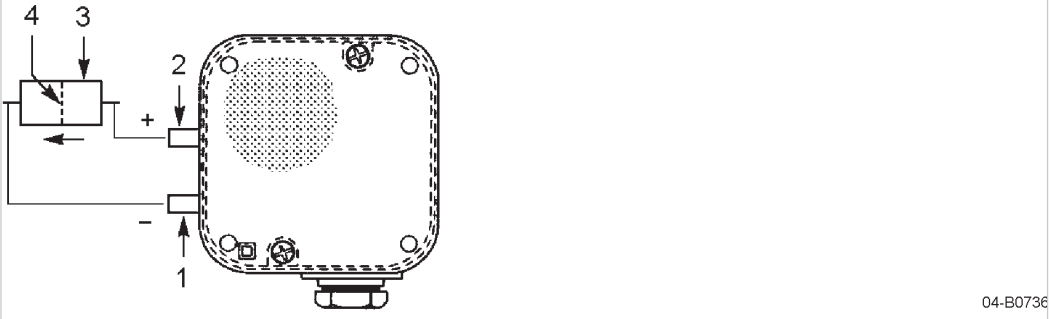

Fig. 19 Pressure connection to the filter pressure differential switch

1	Low pressure connection	3	Inlet silencer
2	Higher pressure connection	4	Filter

Switching function

Fig. 20 Filter pressure differential switch function

Switching with rising pressure:

- 1 NC opens
- 2 NO closes

Switching with falling pressure:

- 1 NC closes
- 2 NO opens

4.3.11 Option G1 Check valve

The check valve prevents a reversal of the normal air flow direction.

The valve is closed when the machine is at standstill.

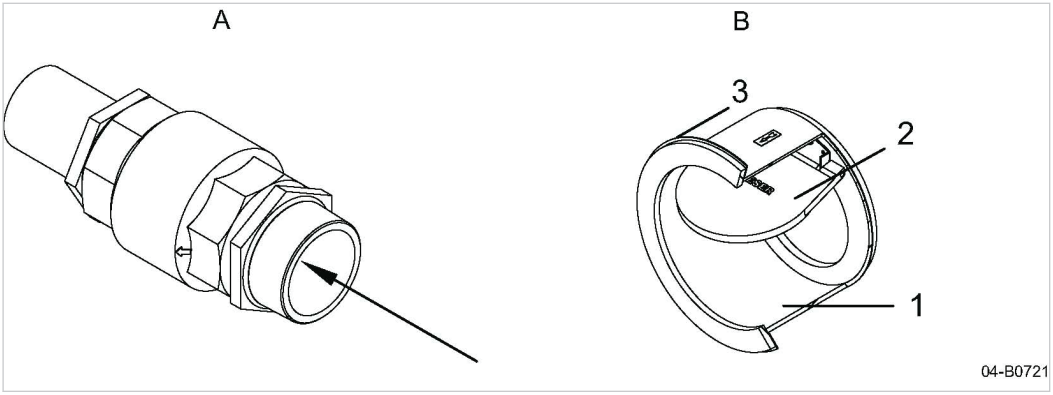

Fig. 21 Check valve

[A] BB 52 C pr
[B] BB 69 C pr , BB 89 C pr
[1] Housing
[2] Closing mechanism
[3] Gasket

4.3.12 Option H2, H12 Auxiliary heating

The auxiliary heating has the following functions:

- Prevents condensation forming on the machine in climates of high humidity.
- Pre-warms the machine when ambient temperatures are below −5 °C.

The heating is designed to raise the machine temperature by about 15 °C.

The thermostat switching point is factory set to 5 °C.

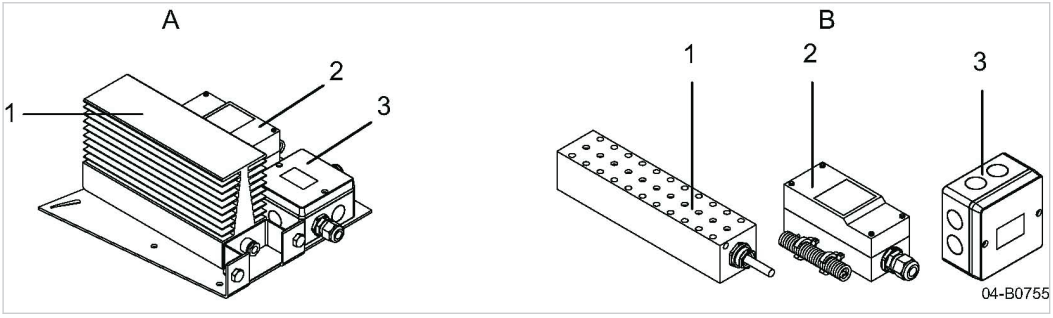

Fig. 22 Auxiliary heating

[A] BB 52 C pr
[B] BB 69 C pr , BB 89 C pr
[1] Radiator
[2] Thermostat
[3] Terminal box

4.3.13 Option H3, H12 Outdoor installation

BB 52 C pr

For an outdoor installation of the machine, the joints at the sound enclosure are sealed with silicon (Option H12).
The instruments are protected against direct sunlight, rain and snow.
A separate insulation of the intake duct protects against moisture.

BB 69 C pr , BB 89 C pr

The sound enclosure (Option H12) is fitted with a weather protection roof.
If the machine is installed outdoors, the sound enclosure in cover roof area and the instruments are protected against direct sunlight, rain and snow.
A separate insulation of the intake duct protects against moisture.

4.3.14 Option H11 Intake from pipe network

The air is drawn from the pipe network into the machine's intake silencer.

4.3.15 Option H12 Sound enclosure

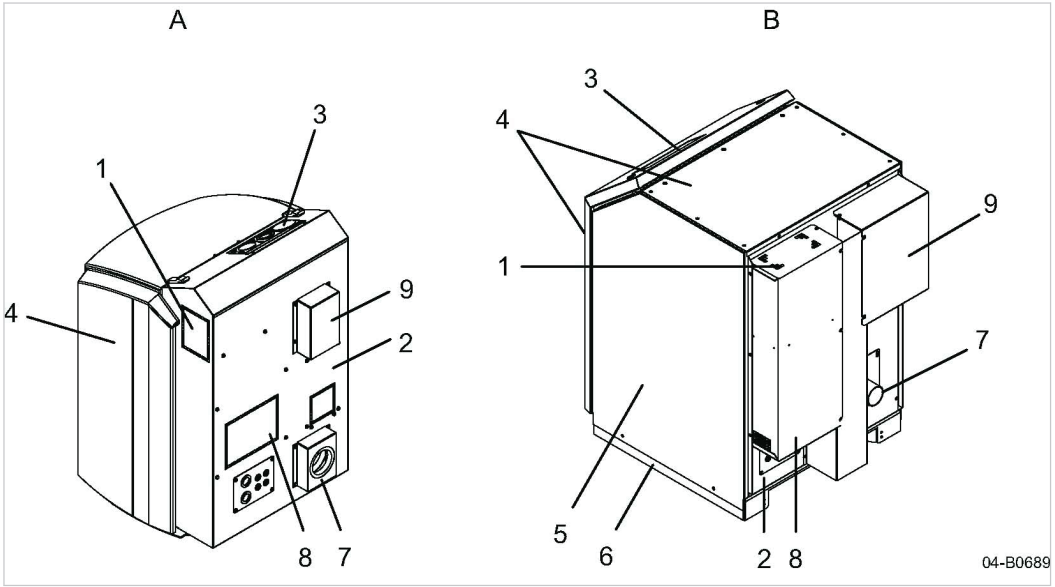

Fig. 23 Sound enclosure overview

- [A] BB 52 C pr
- [B] BB 69 C pr , BB 89 C pr
- [1] Cooling air outlet
- [2] Back plate
- [3] Display (option)
- [4] Removable panel
- [5] Side panel
- [6] Frame
- [7] Pressure line connection
- [8] Cooling air inlet
- [9] Intake air inlet

The motor fan draws cooling air through the inlet [8] into the sound enclosure to cool the drive motor and the machine.

Cooling air flow is supplemented by a fan within the enclosure. Warm air is blown out to protect the machine from overheating.

Air to be compressed is drawn in through the intake air inlet [9]. This ensures that only air at ambient temperature is compressed.

The sound enclosure has a removable access panel [4].
BB 52 C pr : Open the snap fasteners.
BB 69 C pr , BB 89 C pr : Use the supplied key to release the latches.

The sound enclosure has several functions when it is closed:

- Sound insulation
- Protection against contact with components
- Airflow control

The sound enclosure is not suitable for the following uses:

- Persons walking, standing or sitting on the machine.
- Use as resting place or storage of any kind of load.

5 Installation and Operating Conditions

5.1 Ensuring safety

The conditions in which the machine is installed and operated have a decisive effect on safety.

Warning instructions are located before a potentially dangerous task.

Disregard of warning instructions can cause serious injuries!

Complying with safety notes

Disregard of safety notes can cause unforeseeable dangers!

- ➢ Strictly forbid fire, open flame and smoking.
- ➢ If welding is carried out on or near the machine, take adequate measures to prevent sparks or heat from igniting oil vapours or parts of the machine.
- ➢ Do not store flammable material in the vicinity of the machine.
- ➢ The machine is not explosion-proof!
  Do not operate in areas in which specific requirements with regard to explosion protection are in force.
  For instance, the requirements of ATEX directive 94/9/EC "Equipment and Protective Systems intended for use in Potentially Explosive Atmospheres".
- ➢ Ensure sufficient and suitable lighting such that the display can be read and work carried out comfortably and safely.
- ➢ Keep suitable fire extinguishing agents ready for use.
- ➢ Ensure that required ambient conditions are maintained.

Required ambient conditions may be:

- ■ Maintain ambient temperature and humidity
- ■ Ensure the correct composition of the intake air:
  - – clean with no damaging contaminants (e.g., dust, fibres, fine sand)
  - – free of explosive or chemically unstable gases or vapours
  - – free of acid/alkaline forming substances, particularly ammonia, chlorine or hydrogen sulphide.

Noise

The sound enclosure absorbs the machine noise to a tolerable level. This function will be effective only if the sound enclosure is closed.

- ➢ If necessary, wear hearing protection or take hearing protection measures on-site.

5.2 Installation conditions

5.2.1 Determining location and clearances

The machine is intended for installation in an appropriate machine room. Information on distances from walls and ventilation is given below.

The distances quoted are recommended distances and ensure unhindered access to all machine parts.

➢ Please consult KAESER if you cannot comply with these recommendations.

Precondition The floor must be level, firm and capable of bearing the mass.
No special foundation is necessary.

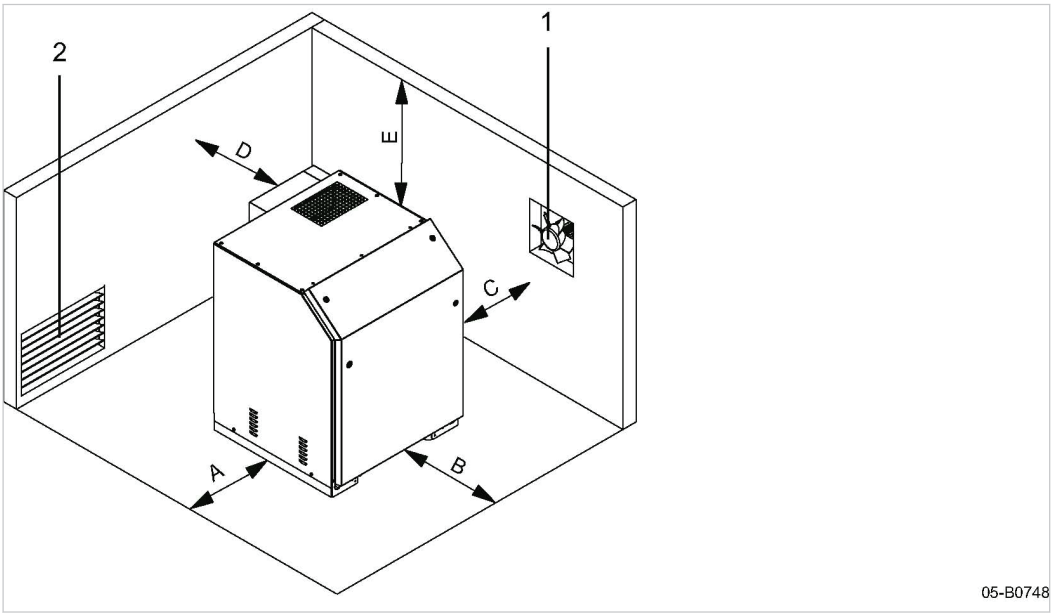

Fig. 24 Recommended machine placement and minimum dimensions [mm]

A	40 or 700	E	700
B	800	1	Exhaust fan
C	0 or 700	2	Air inlet aperture
D	700		

➢ The distance A **or** C must be at least 700 mm.
Version 1: A = 40 mm and C = 700 mm
Version 2: A = 700 mm and C = 0 mm

1. ***NOTICE!***
Ambient temperature too low!
Frozen condensate and highly viscous lubricating oil can cause damage when starting the machine.
➢ Ensure that the temperature of the machine is at least +3 °C before starting.
2. Heat the machine room adequately or install an auxiliary heater.

➢ Ensure accessibility so that all work on the machine can be carried out without danger or hindrance.

➢ Do not position the machine in the warm exhaust air flow from other machines.

➢ When installing multiple machines, ensure that all intake and exhaust air openings are arranged at one side.

➢ Anchoring the machine.

➢ If installed outdoors, protect the machine against frost, direct sunlight, dust and rain.

5.2.2 Ensuring adequate ventilation

If the ventilation is insufficient, a partial vacuum can be created in the room.

- ➢ Ensure that the volume of air flowing into the machine room is at least equivalent to that being removed from it by the machine and exhaust fan.
- ➢ Make sure that the machine and exhaust fan can only operate when the inlet aperture is actually open.
- ➢ Keep the inlet and exhaust apertures free of obstructions so that the cooling air can flow freely through the room.

5.3 Option H3, H12 Outdoor installation

BB 52 C pr

For an outdoor installation of the machine, the joints at the sound enclosure are sealed with silicon (Option H12).
The instruments are protected against direct sunlight, rain and snow.

A separate insulation of the intake duct protects against moisture.

BB 69 C pr , BB 89 C pr

The sound enclosure (Option H12) is fitted with a weather protection roof.
If the machine is installed outdoors, the sound enclosure in cover roof area and the instruments are protected against direct sunlight, rain and snow.

A separate insulation of the intake duct protects against moisture.

6 Installation

6.1 Ensuring safety

Follow the instructions below for safe installation.

Warning instructions are located before a potentially dangerous task.

Disregard of warning instructions can cause serious injuries!

Complying with safety notes

Disregard of safety notes can cause unforeseeable dangers!

- ➢ Follow the instructions in chapter 3 'Safety and Responsibility'.
- ➢ Installation work may only be carried out by authorised personnel.
- ➢ Make sure that no one is working on the machine.
- ➢ Ensure that all panels are closed.

When working on live components

Touching voltage carrying components can result in electric shocks, burns or death.

- ➢ Work on electrical equipment may only be carried out by authorised electricians.
- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Check that there is no voltage on potential-free contacts.

When working on the compressed air system

Compressed air is contained energy. Uncontrolled release of this energy can cause serious injury or death. The following safety concerns relate to any work on components that could be under pressure.

- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Close shut-off valves or otherwise isolate the machine from the distribution network to ensure that no compressed air can flow back into the machine.
- ➢ De-pressurise all pressurised components and enclosures.
- ➢ Do not open or dismantle any valves.

When working on the drive system

Touching voltage carrying components can result in electric shocks, burns or death.
Touching the extractor fan or the belt drive while the machine is running can result in serious injury.

- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Do not open the panels while the machine is switched on.

Further information

Details of authorised personnel are found in chapter 3.4.2.

Details of dangers and their avoidance are found in chapter 3.5.

6.2 Reporting transport damage

1. Check the machine for visible and hidden transport damage.
2. Inform the carrier and the manufacturer in writing of any damage without delay.

6.3 Anchoring the machine

The machine may be anchored to the floor.

The following anchoring elements are shipped with the machine.

- Foundation bolts for machines without sound enclosure.
- Foundation bolts and angle brackets for machines with sound enclosure.

➢ Use the anchoring elements to anchor the machine without stress.

Further information Details of the fixing holes are contained in the dimensional drawing in chapter 13.2.

6.4 Connecting the power supply

Precondition The power supply is switched off,
the device is locked off,
the absence of any voltage has been verified.

The tolerance limits of the mains voltage (power supply) are within the permissible tolerance limits of the nominal voltage (machine).

1. The power supply must only be connected by authorised installation personnel or an authorised electrician.
2. Carry out protection measures as stipulated in relevant regulations (e.g IEC 364 or DIN VDE 0100) and in national accident prevention regulations (BGV A3 in Germany). In addition, observe the regulations of the local electricity supplier.
3. Select supply cable conductor diameters and fusing in accordance with local regulations.
4. The user must provide the machine with a lockable power supply disconnecting device. This could be, for example, a load disconnect switch with fused input. If a circuit breaker is used it must be suitable for the motor starting characteristics.
5. Connect the drive motor to the mains power supply in accordance with the electrical diagrams.
6. The user's safety devices must be correctly connected to the machine's electrical system by a qualified person.
7. If the machine is driven by a frequency converter, observe also the specifications provided in the documentation for this unit.

8. **DANGER!**
   Danger of fatal injury from electric shock!
   ➢ Switch off and lock out the power supply disconnecting device and check the absence of any voltage.
   ➢ When working with the frequency converter:
   Wait at least 5 minutes for dangerous voltages to subside.
9. Connect the machine to the power supply.

6.4.1 Connecting the drive motor

Precondition
The supply isolating device is switched off,
the device is locked off,
the absence of any voltage has been verified.

1. Determine the cable diameters and fusing according to the operation conditions.
2. Connect the drive motor according to the wiring diagram.

Further information
See chapter 2.11 for guidelines on cable diameters and fusing.
See electrical diagram in chapter 13.4.

6.4.2 Option C32 Under frequency control

If the machine is delivered by KAESER including the frequency converter, the regulation behaviour and operating mode of the frequency converter will be preset.

➢ Adapt and optimize the actual properties to the customer system on-site.

1. Comply with the following provisions if you operate machines with a frequency converter:
   - Operate the machine only within its performance limits and under the permitted ambient conditions.
   - The frequency converter must be suitable for the operation of a working machine with constant torque. Models with squared torque may not be used.
   - When operating the machine with frequency converter, the drive motor must be designed as follows:
     - Voltage < 500 V ≥ 75 kW:
       Standard winding and isolated bearing or bearing shield at the control side, regardless of the model.
     - Voltage ≥ 500 V < 75 kW:
       Enhanced winding isolation, standard bearing, regardless of the model.
     - Voltage ≥ 500 V ≥ 75 kW:
       Enhanced winding isolation and isolated bearing or bearing shield at the drive and the control side, regardless of the model.
   - Frequency converters providing a lower initial voltage than the rated motor voltage will cause an increased power consumption and heat development in the drive motor. This results in a reduced nominal motor power that can be utilised and thus a decrease in the machine's regulating range. To avoid damage to the drive motor, please consult with the manuufacturer of the frequency converter.
   - Use a frequency converter with IGBT transistors.
   - The speed change should be approx. 5 Hz per second. This value applies also for the starting ramp from standstill to reaching minimum frequency. Deviating settings, either slower or faster, may be possible after verification by KAESER Service.
   - The frequency converter may be switched to a motor in standstill only, in order to avoid malfunctions.
   - Upon deactivation of the frequency converter, it must be impossible to reactivate it until after complete machine standstill.
   - For a shut-down in the event of a malfunction, integrate the following devices in the user's controller:
     - PTC resistor for monitoring the winding temperature of the drive motor.
     - Thermostat for monitoring the compression discharge temperature.
   - For safety-technical reasons, an automatic restart of the machine is not permitted and must be fully deactivated when parametrising the frequency converter.
   - The maximum conductor length between output frequency converter and drive motor is 30 m. Longer conductors may be possible upon verification by the KAESER Service.
   - Only screened conductors may be used to connect the machine to ensure an EMC compliant connection and machine operation.
     - Do not twist the braided screen of these conductors. The braided screen must be generously spread two-sided across the earth potential.
     - Use only EMC shield clamps or EMC-compliant screwed cable glands.
     - This also applies to other connecting cables, such as the thermistor sensors (PTC) of the drive motor.
2. Consult with KAESER to determine an appropriate frequency converter.

6.5 Creating the compressed air connection

Precondition The machine is factory assembled up to the point of connection to the discharge silencer.
The air main is at atmospheric pressure.

WARNING
Serious injury or death can result from loosening or opening components under pressure.
➢ De-pressurise all pressurised components and enclosures.

If the system has a tendency for air/gas under pressure to flow back to the machine when it is stopped, a non-return device must be installed to allow for unloaded starting of the machine.

➢ Consult KAESER on a suitable check valve and expert installation.

1. Use an elastic connector to create the compressed air connection to the pipeline system or the consumer and install, complying with the torques specified below:

Connection	Torque [Nm]
Compensator, customer pipeline	100

Tab. 50 Torques for customer pipeline

2. Support the weight of the pipework and any other connecting components.

6.6 Safety devices installed by the user

➢ The user must install the necessary safety devices.
- Three PTC thermistor sensors should be installed by the user to protect against drive motor overheating or overloading.
- A motor overload protection switch/overload relay (if not included with the deliverables) must be installed to monitor maximum current draw(s).
- EMERGENCY OFF command device for immediate shut-down of the machine.

➢ The user must monitor the following parameters:
- Permissible final pressure
- Maximum block discharge temperature

➢ Consult KAESER for advice on this subject.

Pressure relief valves and check valves are not regulating means in case of overpressure. The activation of the pressure relief valve constitutes an impermissible operating state requiring immediate remedial measures.

6.7 Options

All options (except BB 52 C pr : (Option H2) are mechanically installed/mounted. The electrical connections and evaluations are the customer's responsibility.

➢ Instructions on individual options should be followed.

6.7.1 Option C9
Connecting the pressure switch

➢ Connecting the pressure switch

Further information See electrical diagram in chapter 13.5.1.

6.7.2 Option C10
Connecting the speed monitor

The sensor and transmitter are mechanically installed.

➢ A speed monitor sensor is supplied separately when ordered individually. Install in the user's control cabinet and wire up.

Further information See chapter 2.12.2 for the sensor settings.
The wiring diagram for the speed monitor is found in chapter 13.5.2.

6.7.3 Option C13
Connecting the temperature gauge switch

➢ Connect the temperature gauge switch.

Further information See electrical diagram in chapter 13.5.3.

6.7.4 Option C14
Connecting the pressure sensor

➢ Connecting the pressure sensor

Further information See chapter 13.5.4.

6.7.5 Option C19
Connecting the thermostat

➢ Connect the thermostat.

Further information See electrical diagram in chapter 13.5.5.

6.7.6 Option F5
Connecting the filter pressure differential switch

➢ Connect the filter pressure differential switch.

Further information See electrical diagram in chapter 13.5.6.

6.7.7 Option H2
Connecting the auxiliary heater

BB 52 C pr

The auxiliary heater is delivered uninstalled. The radiator, thermostat and terminal box are already installed on a mounting plate.

➢ Connect the auxiliary heater in the terminal box.

BB 69 C pr , BB 89 C pr

➢ Connect the auxiliary heater in the terminal box.

Further information See electrical diagram in chapter 13.5.7.

6.7.8 Option H11 Connecting the suction line

If air is sucked in from the pipeline, the inlet silencer is connected using a compensator.

Precondition The compressed air system is vented completely to atmospheric pressure.

➢ Secure the pipeline securely before the compensator.
➢ Connect to the compressed air network.

Further information Dimensional drawings for the pipeline connection is given in chapter 13.2.

6.7.9 Option H12 Sound enclosure

6.7.9.1 Electrical connections

Subsequent work enables the access to the electrical connections of drive motor, fan and accessories.

1. Remove the access panel of the sound enclosure.
   BB 52 C pr : Open the snap fasteners.
   BB 69 C pr , BB 89 C pr : Latches are released by a key supplied with the machine.
2. Make the electrical connections.
3. Insert the access panel, and close the snap fasteners or latches.

6.7.9.2 Connecting the fan

BB 52 C pr : The sound enclosure is fitted with a fan only if the drive motor has a rated power of <4 kW and the machine is operated with frequency converter (Option C32).

The fan motor has a terminal box for direct supply connection.

The drive motor and the fan must run simultaneously.

Ensure correct direction of rotation when connecting the fan. The fan must blow air out of the sound enclosure.

The fan should run on for ca. 15 minutes after machine shut down to avoid temperature peaks inside the sound enclosure.

Precondition The power supply is switched off,
the device is locked off,
the absence of any voltage has been verified.

1. Select sufficient cable length.

2. Connect cables to the terminal box without mechanical stress.
3. Connect the protective earth.

Further information See electrical diagram in chapter 13.5.8.

6.8 Option H12
BB 69 C pr , BB 89 C pr with sound enclosure: Remove transport securing devices

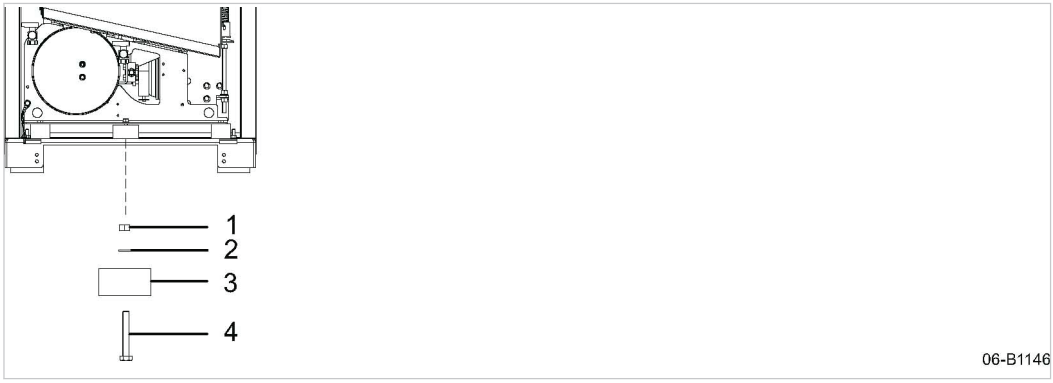

Fig. 25 Removing the transport securing devices

1	Hexagon nut	3	Spacer
2	Washer	4	Screw

Remove the transport securing devices after the machine has been installed.

1. Remove the access panel of the sound enclosure.
2. Remove the transport securing device and store for future transports.

7 Initial Start-up

7.1 Ensuring safety

Here you will find instructions for safe commissioning of the machine.
Warning instructions are located before a potentially dangerous task.

Disregard of warning instructions can cause serious injuries!

Complying with safety notes

Disregard of safety notes can cause unforeseeable dangers!

- ➢ Follow the instructions in chapter 3 'Safety and Responsibility'.
- ➢ Commissioning tasks may only be carried out by authorised personnel!
- ➢ Make sure that no one is working on the machine.
- ➢ Ensure that all panels are closed.

When working on live components

Touching voltage carrying components can result in electric shocks, burns or death.

- ➢ Work on electrical equipment may only be carried out by authorised electricians.
- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Check that there is no voltage on potential-free contacts.

When working on the compressed air system

Compressed air is contained energy. Uncontrolled release of this energy can cause serious injury or death. The following safety concerns relate to any work on components that could be under pressure.

- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Close shut-off valves or otherwise isolate the machine from the distribution network to ensure that no compressed air can flow back into the machine.
- ➢ De-pressurise all pressurised components and enclosures.
- ➢ Do not open or dismantle any valves.

When working on the drive system

Touching voltage carrying components can result in electric shocks, burns or death.
Touching the extractor fan or the belt drive while the machine is running can result in serious injury.

- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Do not open the panels while the machine is switched on.

Further information

Details of authorised personnel are found in chapter 3.4.2.
Details of dangers and their avoidance are found in chapter 3.5.

7.2 Checking installation and operating conditions

➢ Check and confirm all the items in the checklist before commissioning the machine.

To be checked	See chapter	Complied?
➢ Have all packing materials, tool and transport securing means been removed from the machine?	–	
➢ Are the operators fully conversant with safety regulations?	–	
➢ Have all the positioning conditions been complied with?	5	
➢ Has the automatic machine shut-down by the user's safety devices in the event of a fault been realised?	6.6	
➢ Are the power supply cable conductor diameters and fuse ratings adequate?	2.11	
➢ Are the tolerance limits of the mains voltage (power supply) within the permissible tolerance limits of the nominal voltage (machine)?	2.11	
➢ Has the drive motor connection been checked?	6.4	
➢ Has the fan connection (sound enclosure) been checked? (Option H12)	6.7.9.2	
➢ Has the direction of rotation of drive motor and fan (sound enclosure) been checked?	7.4	
➢ All electrical connections checked for tightness? (The check must be repeated after 50 operating hours)	–	
➢ Is there adequate lubricating oil in the drive-end and gear-end of the block? (Level in the centre of the sight glass)	10.5	
➢ Has the connection to the compressed air network been made with a hose or compensator?	6.5	
➢ Has the drive belt tension been checked? (The check must be repeated after 24 operating hours)	10.4	
➢ Has the block drive shaft been turned by hand to check that it turns freely?	–	
➢ Is the machine anchored to the floor without stress?	6.3	
➢ Are the access panel of the sound enclosure and other panels inserted and locked? (Option H12)	4.3.15	
➢ BB 52 C pr : Has the silicone seal protecting the outdoor-installed machine been checked for leaks? (Option H3, H12)	–	

Tab. 51 Installation conditions checklist

7.3 Instructions to be observed before commissioning or re-commissioning

Incorrect or improper commissioning can cause injury to persons and damage to the machine.

➢ Commissioning may only be carried out by authorised installation and service personnel who have been trained on this machine.

Special measures for re-commissioning after storage

Storage period longer than:	Remedy
12 months	➢ Change the lubricating oil. ➢ Have the motor bearings checked by an authorised KAESER Service Technician.
36 months	➢ Have the overall technical condition checked by an authorised KAESER Service Technician.

Tab. 52 Re-commissioning after storage

7.4 Checking the direction of rotation

7.4.1 Drive motor

If the block rotors turn in the wrong direction the direction of airflow through the machine will also be wrong.

An arrow indicating direction of rotation is fixed on the side of the block at the drive end and at the belt guard.

1. *NOTICE!*
   Wrong direction of rotation!
   This may result in machine damage by drawing foreign bodies or excessive vacuum.
   ➢ Ensure the correct direction of rotation.
2. Remove the inlet silencer filter maintenance cover on the inlet silencer or inlet filter and/or remove the inlet non-return valve.
3. Verify the direction of phase rotation with a phase sequence meter.
4. If the direction of rotation is incorrect, interchange the phases L1 and L2.

You do not have a phase sequence meter?

➢ Switch the machine on and off again after 1 second.

➢ Compare the direction of rotation of the motor with the arrows on the belt guard and the blower casing.

➢ If the direction of rotation is incorrect, interchange the phases L1 and L2.

7.4.2 Option H12 Fan (sound enclosure)

BB 52 C pr : The sound enclosure is fitted with a fan only if the drive motor has a rated power of <4 kW and the machine is operated with frequency converter (Option C32).

An arrow is also to be found on the ventilator to indicate its correct direction of rotation.

The fan must blow air out of the sound enclosure.

- ➢ **Single-phase fan:** If the direction of rotation is incorrect, switch the electric connection in the terminal box of the fan. Instructions regarding "Right" and "Left" operation are provided in the cover of the terminal box.
- ➢ **Three-phase fan:** If the direction of rotation is incorrect, interchange the phases L1 and L2.

8 Operation

8.1 Switching on and off

Switching on and off follows to a large extent the procedure established for the equipment provided for this action. The equipment is provided by the user and not part of the scope of supply of the machine unless ordered as an option.

➢ Make sure the machine is technically sound before switching on.
If the machine has a sound enclosure, a check must be made that the fan is fully functional.

8.1.1 Switching on

Switch the machine on only when it is fully stopped.

Maximum frequency of motor starts per hour 6 times

Precondition A suitable unloaded start device is installed in the case of back-pressure.

1. **WARNING!**
   Possible serious injury from compressed air!
   ➢ Make sure that no one is working on the machine.
2. Switch the machine on at the user's control cabinet.

Further information Information on the function of the user's control cabinet should be taken from the cabinet manufacturer's documentation.

Option C32 Under frequency control

Maximum frequency of motor starts per hour: any

Precondition A suitable unloaded start device is installed in the case of back-pressure.

1. **WARNING!**
   Possible serious injury from compressed air!
   ➢ Make sure that no one is working on the machine.
2. Switch the machine on at the frequency converter.

8.1.2 Switching off

➢ Switch the machine off at the user's control cabinet.

Further information Information on the function of the user's control cabinet should be taken from the cabinet manufacturer's documentation.

Option C32 Under frequency control

➢ Switch the machine off at the frequency converter.

8.2 Switching off in an emergency

The machine is not equipped with an emergency stop device. Such a device must be provided by the user unless it is part of an ordered option.

➢ Ensure the machine can be stopped immediately in an emergency.

8.3 Option H12 Checking the fan function (sound enclosure)

BB 52 C pr : The sound enclosure is fitted with a fan only if the drive motor has a rated power of <4 kW and the machine is operated with frequency converter (Option C32).

NOTICE
Overheating inside the sound enclosure!
A standstill of the ventilator can result in a breakdown of the blower block or other components.

➢ If the ventilator stops, immediately provide an alternative flow of cooling air through the sound enclosure.

➢ Check that air is actually being blown out of the enclosure cooling air outlet, e.g. by holding a sheet of paper in front of the outlet.

Further information KAESER Service will advise on suitable measures.

9 Fault Recognition and Rectification

9.1 Basic instructions

The following tables are intended to assist in locating faults.

1. Do not attempt fault rectification measures other than those given in this manual.
2. In all other cases,
   have the fault rectified by an authorised KAESER Service Technician.

9.2 Alarms

Fault	Possible cause	Remedy
Unusual noise when running.	Too much backlash in the timing gears.	Contact KAESER Service.
	Too much play in the rotor bearings.	Contact KAESER Service.
	Rotors not synchronised.	Keep to the pressure differential and speed as specified. Contact KAESER Service.
Block runs too hot.	Pressure differential too great.	Check and correct pressure differential.
	Clogged inlet filter reducing air intake volume.	Clean the inlet filter.
	Rotor clearance too large.	Contact KAESER Service.
Oil leaks from the gas drain.	Oil level too high.	Drain off oil until the correct level is reached.
Oil leaking from around the drive shaft.	Shaft seal defective.	Contact KAESER Service.
Reduced air inlet flow.	Rotor clearance to large because of wear.	Contact KAESER Service.
	Intake resistance too high.	Clean the inlet filter.
Black film on the oil sight glasses.	Oil not changed at the correct interval.	Change the lubricating oil. Clean or renew the sight glass.
	Insufficient oil.	Change the lubricating oil. Clean or renew the sight glass.
	Oil overheated.	Contact KAESER Service.
	Block overloaded.	Contact KAESER Service.
Water in the oil.	Condensate build-up by prolonged storage and high humidity.	Change the lubricating oil.
Pressure relief valve activates.	Inadmissible operating state, operating pressure too high.	Bring the machine to a permissible operational state or shut down.

Fault	Possible cause	Remedy
PTC relay trips out.	Operating pressure too high.	Check and correct pressure differential.

Tab. 53 Faults and remedies

9.3 Options

This section provides remedies for technical faults concerning the machine's optional equipment.

9.3.1 Option H12 Sound enclosure faults

Fault	Possible cause	Remedy
Overheating inside the sound enclosure!	Extractor defective or turning in the wrong direction.	Check connection. Contact KAESER Service.
	Flow of cooling air blocked.	Check and clean cooling air apertures. Check the cooling air inlet temperature.
	Drive motor overloaded.	Check operating conditions.

Tab. 54 Faults and remedies (option H12)

9.3.2 Option C14 Faulty pressure sensor

Fault	Possible cause	Remedy
No output signal.	No power supply, broken wire.	Check power supply and wires.
	Pressure transducer incorrectly connected.	Check power supply and wires.
	No input pressure.	Check pressure feed.
	Electronic defect from power supply voltage surge or external voltage.	Contact KAESER Service.
Output signal does not respond to pressure changes.	Input channel blocked.	Clean the input channel and throttle screw, being careful not to damage the delicate diaphragm.
	Electronic defect from power supply voltage surge or external voltage.	Contact KAESER Service.
	Pressure transducer defective from mechanical overloading.	Contact KAESER Service.

Fault	Possible cause	Remedy
Output signal too high and not responding to pressure changes.	Electronic defect from power supply voltage surge or external voltage.	Contact KAESER Service.

Tab. 55 Faults and remedies (option C14)

10 Maintenance

10.1 Ensuring safety

Follow the instructions below to ensure safe machine maintenance.
Warning instructions are located before a potentially dangerous task.

Disregard of warning instructions can cause serious injuries!

Complying with safety notes

Disregard of safety notes can cause unforeseeable dangers!

- ➢ Follow the instructions in chapter 3 'Safety and Responsibility'.
- ➢ Allow maintenance work to be performed by authorised personnel only.
- ➢ Make sure that no one is working on the machine.
- ➢ Ensure that all panels are closed.

When working on live components

Touching voltage carrying components can result in electric shocks, burns or death.

- ➢ Work on electrical equipment may only be carried out by authorised electricians.
- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Check that there is no voltage on potential-free contacts.

When working on the compressed air system

Compressed air is contained energy. Uncontrolled release of this energy can cause serious injury or death. The following safety concerns relate to any work on components that could be under pressure.

- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Close shut-off valves or otherwise isolate the machine from the distribution network to ensure that no compressed air can flow back into the machine.
- ➢ De-pressurise all pressurised components and enclosures.
- ➢ Do not open or dismantle any valves.

When working on the drive system

Touching voltage carrying components can result in electric shocks, burns or death.
Touching the extractor fan or the belt drive while the machine is running can result in serious injury.

- ➢ Switch off and lock out the power supply isolating device, and verify the absence of voltage.
- ➢ Do not open the panels while the machine is switched on.

Further information

Details of authorised personnel are found in chapter 3.4.2.
Details of dangers and their avoidance are found in chapter 3.5.

10.2 Maintenance schedule

10.2.1 Logging maintenance work

The maintenance intervals given are those recommended for average operating conditions.

➢ Maintenance tasks should be carried out more frequently where operating conditions are unfavourable (e.g. dusty atmosphere) or when the equipment is in constant use.

➢ Adjust the maintenance intervals with regard to local installation and operating conditions.

➢ Keep a log of all maintenance and service work.

This enables the frequency of individual maintenance tasks and deviations from our recommendations to be determined.

Further information A prepared list is provided in chapter 10.12.

10.2.2 Regular maintenance tasks

The table below lists maintenance tasks required.

When operating conditions are unfavourable (e.g. dusty atmosphere) or when the equipment is in constant use, maintenance tasks must be carried out more frequently (shorter intervals).

➢ Carry out maintenance tasks punctually taking ambient and operating conditions into consideration.

Interval	Maintenance task	See chapter
24 hours after initial commissioning	Check belt tension.	10.4
50 hours after initial commissioning	Check all screwed electrical connections and tighten if necessary.	–
500 hours after initial commissioning	Change the lubricating oil.	10.7
Up to 500 h or monthly	Check the oil level.	10.5
	Check belt tension.	10.4
	Check the air filter.	10.8
Up to 1 500 h* at least once a year	Change the SF220 lubricating oil. (An adhesive label identifying the used lubricant is attached to the blower block.)	10.7
Up to 3 000 h annually at the latest	Change the air filter.	10.8
Up to 3 000 h* at least once a year	Change the SB220 lubricating oil. (An adhesive label identifying the used lubricant is attached to the blower block.)	10.7
Annually	Check the pressure relief valve.	10.10
	Check all screwed electrical connections and tighten if necessary.	–

h = operating hours
* The intervals for lubricating oil changes at high thermal stresses must be reduced and can be determined upon analyses of the oil.

Interval	Maintenance task	See chapter
Up to 12 000 h at the latest every 3 years.	Replace the drive belts.	10.4
As required	Check rotors for contamination.	10.11
after 2 years	BB 52 C pr : Check the silicone seal protecting the outdoor-installed machine for leaks and touch up, if necessary. (Option H3, H12)	–

h = operating hours
* The intervals for lubricating oil changes at high thermal stresses must be reduced and can be determined upon analyses of the oil.

Tab. 56 Regular maintenance tasks

10.2.3 Regular service tasks

The table below lists necessary service tasks.

➢ Only an authorised KAESER Service Technician should carry out service work.

➢ Have service tasks carried out punctually taking ambient and operating conditions into account.

Interval	Service task
Up to 12 000 h at the latest every 3 years.	Permanently greased drive motor bearings: Have motor bearings checked.
Up to 12 000 h at the latest every 3 years.	Fan motor (sound enclosure) Have motor bearings checked.
Up to 36 000 h at the latest every 8 years.	Have the compensators and hose lines checked.

h = operating hours

Tab. 57 Regular service tasks

10.3 Option H12 Sound enclosure

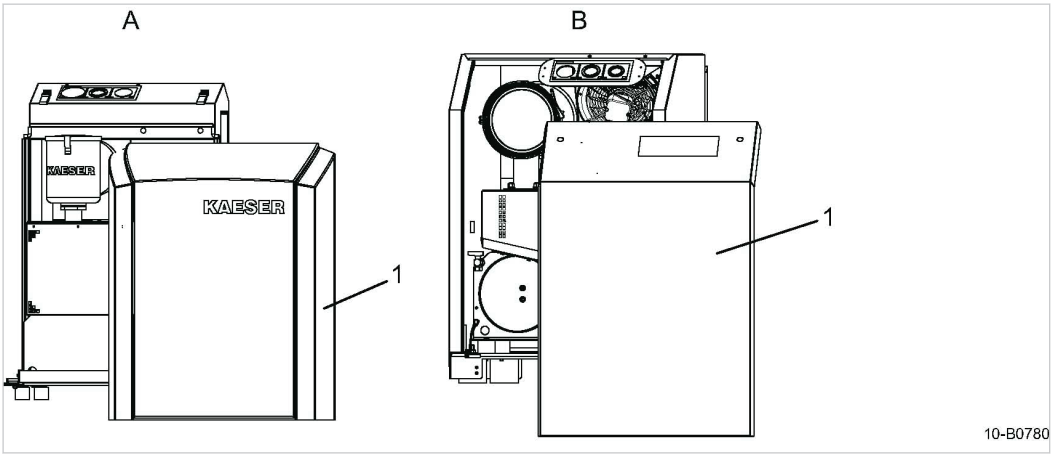

Fig. 26 Sound enclosure

(A) BB 52 C pr
(B) BB 69 C pr , BB 89 C pr
(1) Removable panel

➢ Remove the panel (1) for maintenance work.
BB 52 C pr : Open the snap fasteners.
BB 69 C pr , BB 89 C pr : Use the supplied key to release the latches.

10.4 Drive belt maintenance

Material Spare parts (if required)

Precondition The supply disconnecting device is switched off,
the device is locked off,
the absence of voltage has been verified.

The machine has cooled down.

WARNING
Touching the moving drive belt may result in severe bruising or even loss of limb or extremities.

➢ Switch off and lock out the power supply isolating device and verify the absence of voltage.

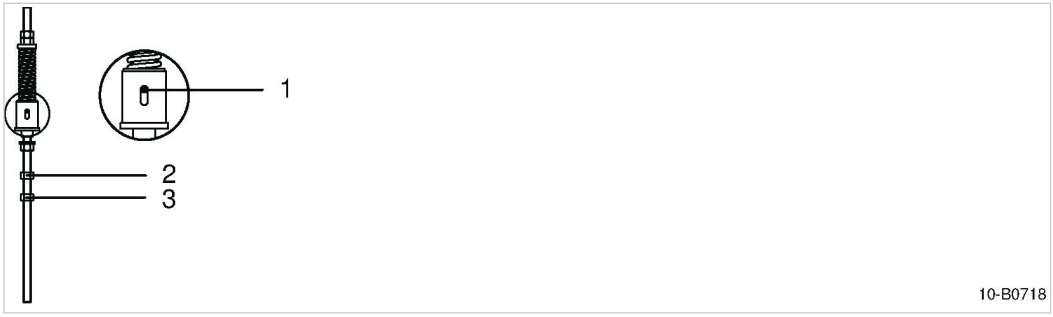

Fig. 27 Drive belt maintenance

[1] Marker pin (shown as: belt tensioning required)
[2] Clamping nut
[3] Clamping nut

Checking the belt tension and adjustment

The tensioning device uses spring force to apply correct tension to the belts.

Adjust the tension when the marker pin reaches the **top** end of the elongated hole.

1. Loosen the locking nut [2].
2. Use the adjusting nut [3] to adjust the spring tension until the marker pin reaches the lower end of the elongated hole.
3. Tighten the locking nut [2].

Visually check for damages.

1. **CAUTION!**
   Danger of pinching between belt and pulley!
   ➢ Work carefully.
2. Turn the pulley by hand so that the entire belt can be inspected for damage.
3. In case of damage: Replace the drive belt immediately.

When individual belts fail in multiple-groove drives, all belts must be replaced.

Changing the belt

1. Remove the belt guard.
2. Loosen the locking nut [3].
3. Turn the adjusting nut [2] to loosen the tension on the belts until they can be removed from the pulley.
4. Install the new set of belts and use the adjusting nut [2] to the adjust tension until the marker pin reaches the lower end of the elongated hole.
5. Tighten the locking nut [3].
6. Replace the belt guard.
7. Check the tension after the new belts have been in operation for 50 hours.

10.5 Checking the oil level

The true oil level can be seen in the oil sight glass only when the machine is stopped.

The gear-end and drive-end oil chambers are not connected.

WARNING
Danger of burns from hot components!
➢ Wear long-sleeved clothing and gloves.

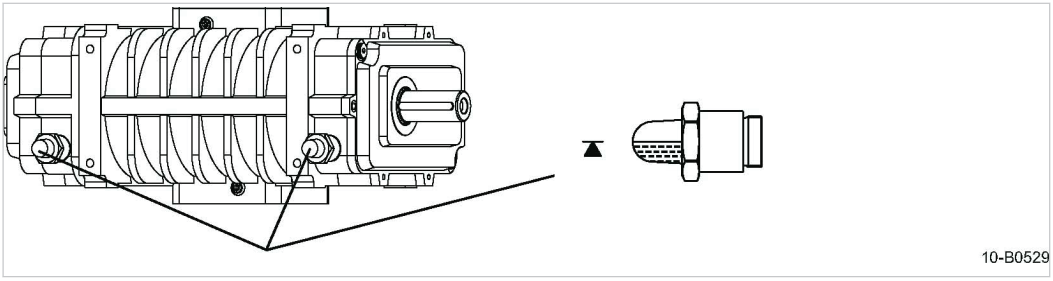

Fig. 28 Checking the oil level

1. Check the oil level in the sight glasses on both ends of the block.
2. Replenish as soon as the level falls 5 mm below the centre of the sight glass.

10.6 Replenishing lubricating oil

Labels giving the oil type for topping up are to be found on the blower block and belt guard.

The machine must be isolated from the compressed air network and completely vented before undertaking any work on the pressure system.

Precondition The power supply disconnecting device is switched off,
the disconnecting device is locked in the off position,
the oil level has settled.

WARNING
Danger of burns from hot components and oil!
➢ Wear long-sleeved clothing and gloves.

NOTICE
Unsuitable oil can damage the block!
➢ Never mix different types of oil.
➢ Never top up with a different type of oil to that already used in the block.

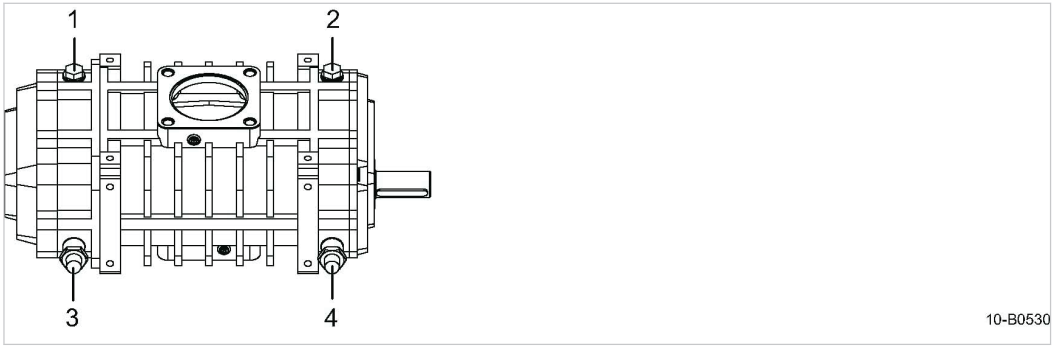

Fig. 29 Replenishing lubricating oil

1 Plug (gear-end oil filling port)
2 Plug (drive-end oil filling port)
3 Gear-end oil sight glass
4 Drive-end oil sight glass

1. Slowly remove the plug 1 and/or 2.
2. Top up until the level is at the marking on the sight glass 3 and/or 4.
3. Screw in the plugs.
4. Visually check for leaks.

10.7 Changing the oil

The machine must be isolated from the compressed air network and completely vented before undertaking any work on the pressure system.

The oil should be changed with the block temperature at 55 °C to ensure the oil flows freely.

Drain the oil thoroughly from the blower block:

- Control end
- Drive end

Material Lubricating oil

Oil receptacle

Precondition The power supply isolating device is switched off,
the device is locked off,
the absence of any voltage has been verified.

WARNING
Danger of burns from hot components and oil!

➢ Wear long-sleeved clothing and gloves.

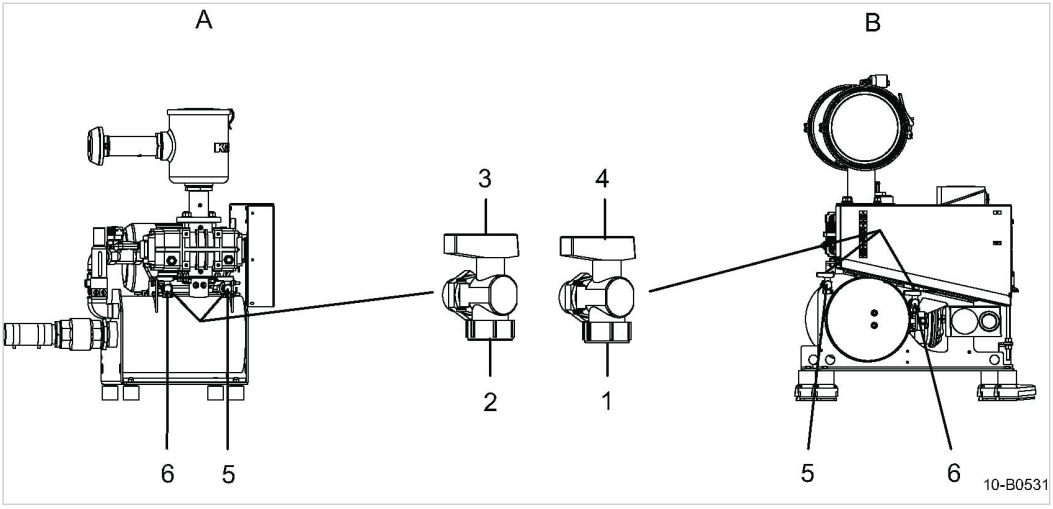

Fig. 30 Changing the oil

[A]	BB 52 C pr	[3]	Oil drain tap
[B]	BB 69 C pr , BB 89 C pr	[4]	Oil drain tap
[1]	Cap	[5]	Drive end
[2]	Cap	[6]	Control end

Drain the oil

1. Prepare an oil receptacle.
2. Open the filler plugs at the oil inlet of the blower block [1] and [2] (Fig. 29).
3. Take off the caps [1] and [2] and open the oil drain taps [3] and [4].
4. Drain the lubricating oil.

Dispose of the old oil in accordance with local environmental protection regulations.

Filling with fresh oil

1. Fill with fresh oil.
2. Allow the oil drain taps to remain open until fresh oil begins to run out (bleeding the oil drain lines).
3. Close the oil drain taps [3] and [4].
4. Check the oil level in both sight glasses (Fig. 29) and top up as necessary.
5. Screw on the caps [1] and [2].
6. Replace and tighten the plugs of the oil inlets at the blower block.
7. Visually check for leaks.

10.8 Air filter maintenance

The air filter protects the supplied pressure system from dirt entering.

NOTICE
Machine damage caused by unsuitable air filter!
Dirt can enter the compressed air system and cause damage to the machine.
➢ Use suitable air filters.

The air filter cannot be cleaned.

10.8.1 Option F4 Filter maintenance indicator

The maintenance indicator shows when the filter needs maintenance. When the filter becomes clogged and flow resistance rises to a set point, the maintenance signal is given.

Machine without sound enclosure

The filter maintenance indicator is installed at the intake silencer.

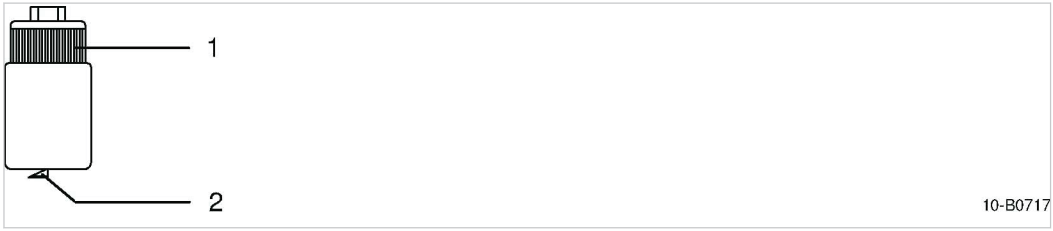

Fig. 31 Filter maintenance indicator
[1] Signal ring
[2] Reset button

1. Change the air filter when the signal ring [1] shows red.
2. Unlatch the signal ring by pressing the reset button [2].

Option H12 Machine with sound enclosure

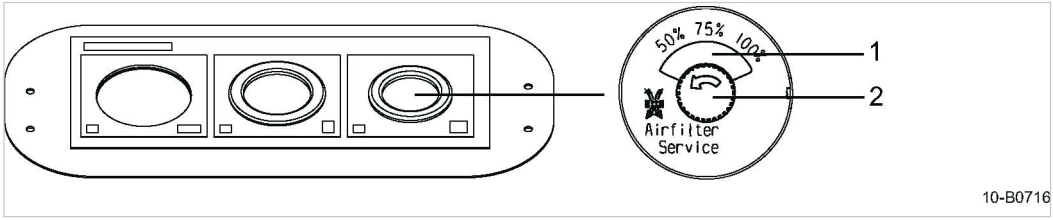

Fig. 32 Filter maintenance indicator (sound enclosure)
[1] Indicator range
[2] Reset button

1. Replace the filter when the maintenance indicator reads more than 50 %.
2. Reset to the indication range [1] by pressing the reset button [2].

10.8.2 Option F5 Filter pressure differential switch

The filter pressure differential switch monitors contamination of the intake filter.

The switch is triggered by pressure differential. Falling below or rising above the set value causes the current flow to switch on, switch off or changeover according to how the switch is wired.

➢ Change the air filter if the pressure differential switch activates.

10.8.3 Changing the air filter

The machine must be isolated from the compressed air network and completely vented before undertaking any work on the pressure system.

Material Spares

Precondition The power supply isolating device is switched off,
the device is locked off,
the absence of any voltage has been verified.

The machine has cooled down.

BB 52 C pr

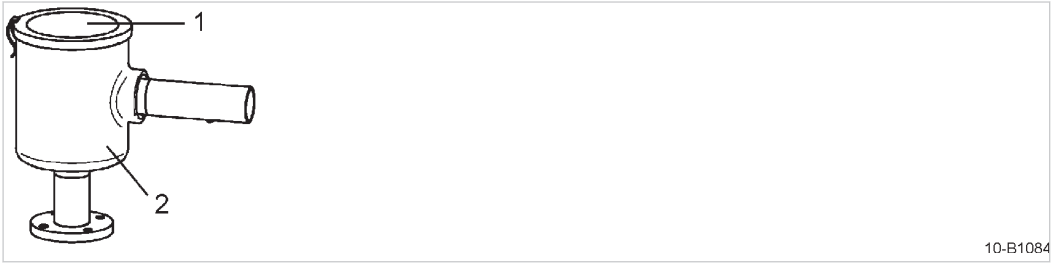

Fig. 33 Change the air filter (BB 52 C pr)

[1] Cover
[2] Inlet silencer

1. Open the snap fastener on the inlet silencer cover [2] .
2. Take off the cover [1].
3. Remove the clogged air filter.
4. Clean all parts and sealing surfaces.
5. Insert the new air filter.
6. Secure the silencer cover.

BB 69 C pr , BB 89 C pr

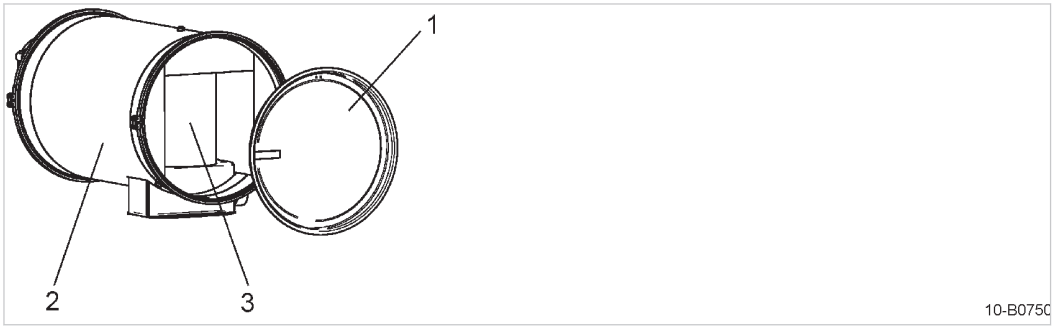

Fig. 34 Change the air filter (BB 69 C pr , BB 89 C pr)

[1] Cover
[2] Inlet silencer
[3] Air filter

1. Open the snap fastener on the inlet silencer cover [2] .
2. Take off the cover [1].
3. Loosen the Velcro strip and remove the air filter [3].
4. Clean all parts and sealing surfaces.
5. Place the new filter in the inlet silencer and secure with the Velcro strip.
6. Secure the silencer cover.

10.9 Motor maintenance

10.9.1 Permanently greased drive motor bearings

The motor bearings are greased for life. Re-greasing is not necessary.

➢ The motor bearings must be checked in the course of regular service calls by an authorised KAESER Service.

Further information For further information to the motor, please consult the motor manual.

10.9.2 Option H12 Sound enclosure fan motor

BB 52 C pr : The sound enclosure is fitted with a fan only if the drive motor has a rated power of <4 kW and the machine is operated with frequency converter (Option C32).

The motor bearings are greased for life. Re-greasing is not necessary.

➢ The motor bearings must be checked in the course of regular service calls by an authorised KAESER Service.

10.10 Testing the pressure relief valve

BB 52 C pr

The free movement of the pressure relief valve's tension rod is checked by hand.

Precondition The machine is switched off.
The machine is fully vented to atmosphere.

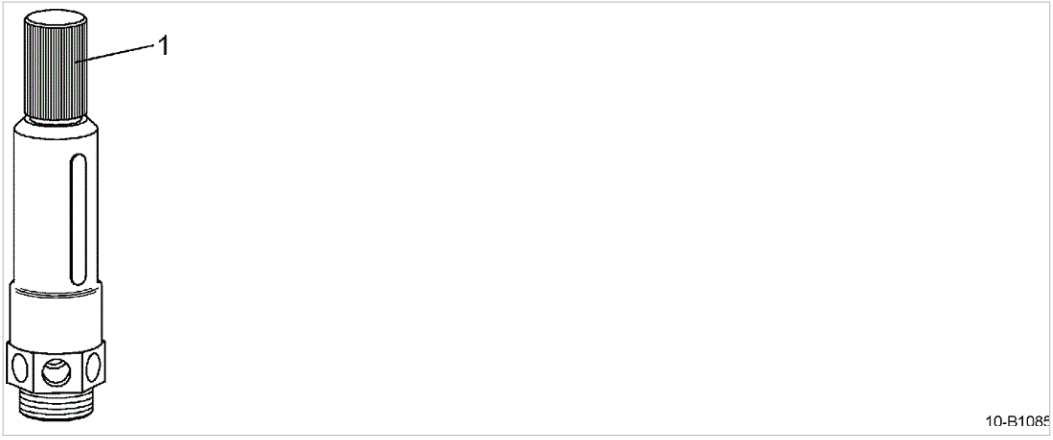

Fig. 35 Checking the pressure relief valve (BB 52 C pr)
[1] Cap

➢ Check the movability of the tension rod by rotating the knurled cap [1].

The valve opens as soon as maximum working pressure is exceeded.

➢ Never operate the machine without a correctly functioning pressure relief valve.
➢ Do **not** adjust the pressure relief valve.
➢ Replace a defective pressure relief valve.

BB 69 C pr , BB 89 C pr

The free movement of the pressure relief valve's tension rod is checked by hand or with a lifting device.

Precondition The machine is switched off.
The machine is fully vented to atmosphere.

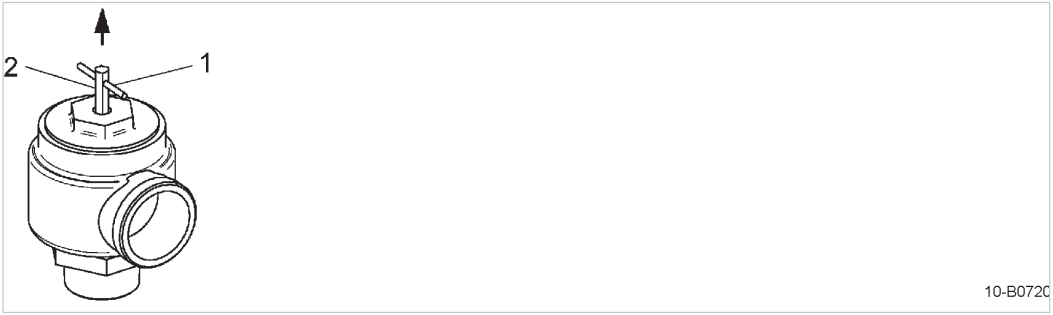

Fig. 36 Checking the pressure relief valve (BB 69 C pr , BB 89 C pr)
[1] Opening lever
[2] Tension rod

➢ Check for free movement of the tension rod [2] by pulling vertically at the opening lever [1].

The valve opens as soon as maximum working pressure is exceeded.

➢ Never operate the machine without a correctly functioning pressure relief valve.

➢ Do **not** adjust the pressure relief valve.
➢ Replace a defective pressure relief valve.

10.11 Checking rotors for contamination

Any dust in the conveyed medium can build up inside the block.

The machine must be isolated from the compressed air network and completely vented before undertaking any work on the pressure system.

Precondition
The power supply isolating device is switched off,
the device is locked off,
the absence of any voltage has been verified.
The machine has cooled down.

CAUTION
Rotating rotors.
Danger of squashing or severing.
➢ Switch off and lock out the power supply isolating device and verify the absence of voltage.

1. Disconnect the flange connections and look for contamination inside the block.
2. If necessary, have the block cleaned by an authorised KAESER Service Technician.

10.12 Documenting maintenance and service work

Machine number:

➢ Enter any maintenance and service work carried out in the list.

Date	Maintenance task carried out	Operating hours	Signature

Tab. 58 Logged maintenance tasks

11 Spares, Operating Materials, Service

11.1 Note the nameplate

The nameplate contains all information to identify your machine. This information is essential to us in order to provide you with optimal service.

➢ Please give the information from the nameplate with every enquiry and order for spares.

11.2 Ordering spares and operating fluids/materials

KAESER spares and operating fluids/materials have the same characteristics as the originals. They are specifically selected for use in KAESER machines.

WARNING
There is risk of personal injury or damage to the machine resulting from the use of unsuitable spares or operating fluids/materials.
Non-Kaeser parts and operating fluids/materials may be unsuitable or of poor quality and can damage the machine or impair its proper function.
Personal injury may result from damage.

➢ Use only original KAESER parts and operating fluids/materials.

➢ Have an authorised KAESER Service Technician carry out regular maintenance.

Machine

Name	Quantity	Number
Air filter	1	1250
Generic filter gasket	1	1251

11.4 KAESER AIR SERVICE

KAESER AIR SERVICE offers:

- Authorised service technicians with KAESER factory training
- Increased operational reliability ensured by preventive maintenance
- Energy savings achieved by avoidance of pressure losses
- optimum conditions for operation of the compressed air system,
- The security of genuine KAESER spares.
- Increased legal certainty as all regulations are kept to.

➢ It make sense to sign a KAESER AIR SERVICE maintenance agreement.
Your advantage:
lower costs and higher compressed air availability.

11.5 Service Addresses

Addresses of KAESER agents are given at the end of this manual.

11.6 Completing the contamination declaration

Every company (user) is responsible for the health and safety of its employees. This extends to personnel who carry out servicing work at the user or service contractor.

A Declaration of Contamination must be completed and signed whenever maintenance or repair work is to be carried out on the machine.

Shipping the machine

Precondition Correct preparation of the machine for shipment.

1. Drain the lubricating oil.
2. Seal all openings.
3. Remove filter elements.
4. Use appropriate packing.
5. Ship in a suitable container.
6. Attach a copy of the Declaration of Contamination to the **outside** of the packing.

Further information A Declaration of Contamination form is provided in chapter 13.6.

12 Decommissioning, Storage and Transport

12.1 De-commissioning

De-commissioning is necessary, for example, under the following circumstances:

- The machine is (temporarily) not needed
- The machine is to be moved to another location.
- The machine is to be scrapped.

Temporary de-commissioning

Precondition The machine can be started at regular intervals.

➢ Run the machine once a week for at least 30 minutes at operating temperature to ensure corrosion protection.

Long-term de-commissioning

Precondition The power supply isolator is switched off (all poles),
the device is locked off,
the absence of voltage has been verified.
The machine is fully vented.

1. Allow the machine to completely cool down.
2. Disconnect all air and electrical connections.
3. Relax the drive belt.
4. Spray the machine inside and out with a preservative to prevent corrosion.
5. Store the machine in a dry, frost-proof room.

Further information Details of preservatives are found in chapter 12.4.

12.2 Packing

A wooden crate is required for overland transport to protect the machine from mechanical damage.
Other measures must be taken for the transport of machines by sea or air. Please contact KAESER SERVICE for more information.

Material Protective plastic sheeting
Wooden transport crate

Precondition The machine is decommissioned.
The machine is dry and cooled down.

1. Wrap the machine fully in plastic sheeting.
2. Protect the machine in a wooden crate against mechanical damages.

12.3 Transport

12.3.1 Safety

Mass and centre of gravity determine the most suitable method of transportation. Both are specified in the dimensional drawings in chapter 13.2.

Precondition Transport only using a forklift truck or lifting gear and only by personnel trained in the safe transportation of loads.

➢ Make sure the danger area is clear of personnel.

12.3.2 Option H12
BB 69 C pr , BB 89 C pr with sound enclosure

➢ Install the transport safety devices (see chapter 6.8).

12.3.3 Transport with a forklift truck

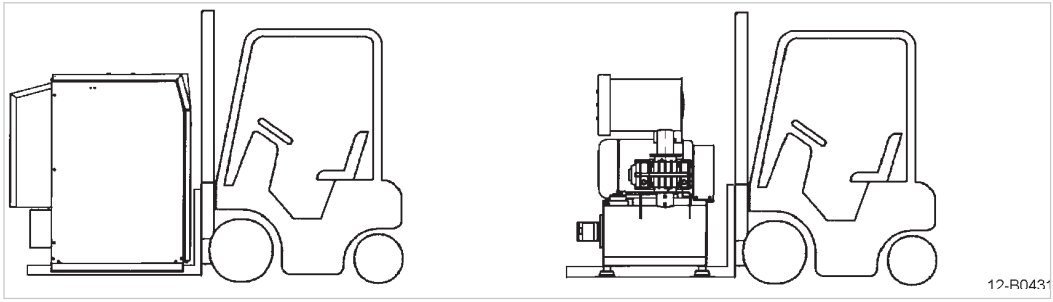

Fig. 37 Transporting with a forklift truck

➢ Drive the forks completely under the machine or pallet and lift carefully.

12.4 Storage

Moisture can lead to corrosion, particularly on the surfaces of the blower block. The storage temperature must not fall below –30 °C.

Advice can be obtained from KAESER on storage and re-commissioning.

CAUTION
Rotating piston!
Danger of squashing or severing of limbs.
➢ Do not reach into the interior of the block.

NOTICE
Moisture and frost can damage the machine!
➢ Prevent ingress of moisture and formation of condensation.

➢ Store the machine in a dry, frost-proof room.

- ➢ Protect the flange connections, drive shaft and delivery space of the block by spraying with appropriate an conservation oil, e.g., ANTICORIT OHK.
- ➢ Seal off the inlet and discharge ports to prevent entry of dirt.
- ➢ Each month, manually turn the motor shaft by about 30°.
- ➢ Change the lubricating oil annually.

After lengthy storage

- ➢ Remove the preservative from the flow chamber with cleaning solvent.
- ➢ Observe the procedures for assembly and initial start-up.
- ➢ Change the lubricating oil.
- ➢ Re-grease the drive motor bearings if they are not of the permanently greased type.
- ➢ Check the condition and tension of the drive belts.

12.5 Disposal

When disposing of a machine, drain out all liquids and remove old filters.

Precondition The machine is decommissioned.

1. Completely drain the oil from the machine.
2. Remove old filters.
3. Hand the machine over to an authorised disposal expert.

- ➢ Components contaminated with oil must be disposed of in accordance with local environment protection regulations.

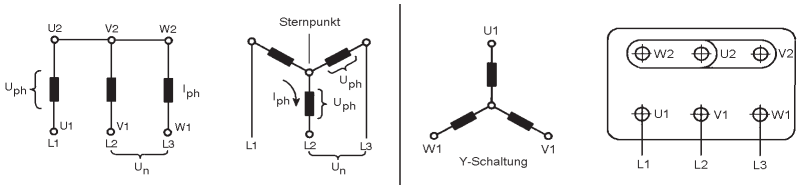
690V Δ - 50Hz	690V Y/Δ / 690V Δ direkt / d.o.l.	
690V Y - 50Hz	690V Y direkt / d.o.l.	
690V Δ - 60Hz		690V Y/Δ / 690V Δ direkt / d.o.l.
690V Y - 60Hz		690V Y direkt / d.o.l.

Sternschaltung
Für eine Sternschaltung müssen die Klemmen W2, U2, V2 zusammengeschlossen und die Stellen U1, V1 und W1 gespeist werden.
Der Phasenstrom und die Phasenspannung:
$I_{ph} = I_n$ $U_{ph} = U_n / \sqrt{3}$
wobei I_n der Netzstrom und U_n die Netzspannung ist.

Star connection
Connecting together the W2, U2, V2 terminals (star point) and connecting to the mains the U1, V1, W1 terminals a star connection is obtained.
The phase current Iph and the phase voltageUph are the following:
$I_{ph} = I_n$ $U_{ph} = U_n / \sqrt{3}$
where I_n the line current and U_n ist the line voltage.

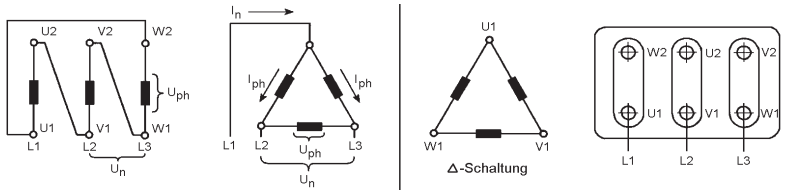
Y



Dreieckschaltung
Für eine Dreieckschaltung muss das Ende der Phase an den Beginn der nächsten Phase angeschlossen werden.
Der Phasenstrom I_{ph} und die Phasenspannung U_{ph} sind:
$I_{ph} = I_n / \sqrt{3}$
$U_{ph} = U_n$
wobei I_n der Netzstrom und U_n die Netzspannung ist.

Delta connection
Connecting the end of each winding to the beginning of the next winding a delta connection is obtained.
The phase current I_{ph} and the phase voltageU_{ph} are the following:
$I_{ph} = I_n / \sqrt{3}$
$U_{ph} = U_n$
where I_n the line current and U_n ist the line voltage.

Δ



Stern-Dreieck-Anlauf:
Der Stern-Dreieck-Anlauf ist die einfachste Art, den Strom und das Anlaufdrehmoment zu reduzieren. Die Motoren, deren Nennspannung bei Dreieckschaltung der Netzspannung entspricht, können mit der Stern-Dreieck-Methode angelassen werden.

Star-Delta starting:
The star-delta starting is an easy way to reduce the starting current and starting torque.
Motors can be started with star-delta starting method whenever the supply voltage correspond to the rated voltage of the motors in delta connections.

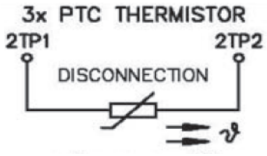
Weitere Optionen für Motoren
more options for motor

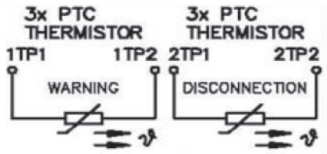
3x Kaltleiter (PTC) für Abschaltung
Anschluss der intergrierten Kaltleiter (PTC) über die Klemmen 2TP1 und 2TP2 im Motorklemmkasten (Achtung: keine Spannung über 2,5V anlegen !)

3x thermistor (PTC) for Disconnection
Please connect the 3 thermistors (3x PTC) on lead 2TP1 und 2TP2 in the terminal box of the motor. (Attention: No voltage higher than 2,5V on T1 and T2 !)



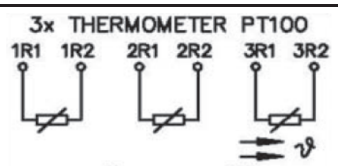
6x Kaltleiter (PTC) für Warnung und Abschaltung
Anschluss der intergrierten Kaltleiter (PTC) über die Klemmen 1TP1/1TP2 + 2TP1/2TP2 im Motorklemmkasten (Achtung: keine Spannung über 2,5V anlegen !)

6x thermistor (PTC) for Warning and Disconnection
Please connect the thermistors (PTC) on lead 1TP1/1TP2+2TP1/2TP2 in the terminal box of the motor. (Attention: No voltage higher than 2,5V on T1 and T2 !)



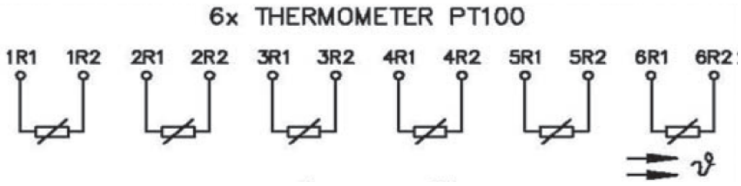
3x Widerstandsthermometer PT100
Anschluss der intergrierten Widerstandsthermometer PT100 über die Klemmen 1R1/1R2 + 2R1/2R2 +3R1/3R2 im Motorklemmkasten.

3x resistance thermometers (PT100)
Please connect the resistance thermometers on lead 1R1/1R2 + 2R1/2R2 +3R1/3R2 in the terminal box of the motor.



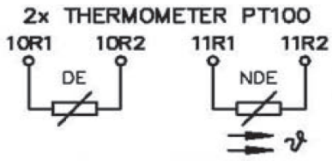
6x Widerstandsthermometer PT100
Anschluss der intergrierten Widerstandsthermometer PT100 über die Klemmen 1R1/1R2 + 2R1/2R2 +3R1/3R2 und 4R1/4R2 + 5R1/5R2 +6R1/6R2 im Motorklemmkasten.

6x resistance thermometers (PT100)
Please connect the resistance thermometers on lead 1R1/1R2 + 2R1/2R2 +3R1/3R2 and 4R1/4R2 + 5R1/5R2 +6R1/6R2 in the terminal box of the motor.



2x PT100 Einschraubthermometer in Grundschaltung bei Wälzlagern
Anschluss der intergrierten Widerstandsthermometer PT100 über die Klemmen 10R1/10R2 + 11R1/11R2 im Motorklemmkasten.

2x PT100 screwed-in resistance thermometers (basic circuit) for rolling-contact bearing
Please connect the resistance themometers on lead 10R1/10R2 + 11R1/11R2 in the terminal box of the motor.



Option Stillstandsheizung:
K45 = 230V (1Ph/N/PE)
K46 = 115V (1Ph/N/PE)

Option Anticondensation heaters:
K45 = 230V (1Ph/N/PE)
K46 = 115V (1Ph/N/PE)

Dieses Dokument beinhaltet einen Sammelplan für alle hier aufgeführten Anlagentypen, Netzspannungen und Frequenzen. Unter welchen tatsächlichen Spannungen, Frequenzen und Umgebungsbedingungen die jeweilige Anlage ausschließlich betrieben werden darf, ist dem Typenschild der Anlage sowie der beiliegenden Betriebsanleitung zu entnehmen.

The document gives collective information on power supply voltages and frequencies for all machines. The voltage and frequency and local conditions under which any particular machine may be used are given on the nameplate of the machine and in the accompanying service manual.

Die Schaltungsunterlagen bleiben unser ausschließliches Eigentum. Sie werden nur zu dem vereinbarten Zweck anvertraut. Kopien oder sonstige Vervielfältigungen einschließlich der Speicherung, Verarbeitung und Verbreitung unter Verwendung elektronischer Systeme dürfen nur zu dem vereinbarten Zweck angefertigt werden. Weder Originale noch Vervielfältigungen dürfen Dritten ausgehändigt oder in sonstiger Weise zugänglich gemacht werden.

The drawings remain our exclusive property. They are entrusted only for the agreed purpose. Copies or any other reproductions, including storage, treatment and dissemination by use of electronic systems must not be made for any other than the agreed purpose. Neither originals nor reproductions must be forwarded or otherwise made accessible to third parties.

13.6 Declaration concerning contamination

KAESER KOMPRESSOREN

Declaration of Contamination
concerning compressors, blowers, vacuum pumps and components

Repair and/or maintenance work will only be carried out on items for which a Declaration of Contamination form has been filled out and attached. **A completed Declaration is required for each item.** Any item not accompanied by a Declaration is liable to be returned untouched. Items that have been contaminated with microbiological, explosive or radioactive substances will only be accepted when accompanied by confirmation that they have been **fully decontaminated** according to regulation.
This Declaration may only be filled out and signed by the authorized representative of the ordering party (sender of the item).

Sender/dept.: _____
Contact name: _____
Address: _____
_____
Phone / Fax: _____

Reason for sending the item:
_____
_____
_____
_____
_____
_____
(use rear side of form if necessary)

Specification of the item:

Model/type name: _____
Part no..: _____
Serial no..: _____
Oil used: _____

Accessories:
_____
_____
_____

Condition of the item:

	yes	no	not known
- has it been used?	☐	☐	☐
- emptied/vented?	☐	☐	☐
- all openings airtight closed?	☐	☐	☐
- cleaned / decontaminated?	☐	☐	☐

Cleaning substance used: _____
Cleaning method: _____

Information on contaminants:

- with what substances has the item been in contact?

13.7 BB 69 C pr , BB 89 C pr : Noise emission

BB 52 C pr : The sound pressure level and sound power level values for your machine are provided in the customer-specific design data sheet in chapter 13.8.

The values for sound pressure levels and sound power levels are provided in the tables below: Each table discusses one model.
The values applicable to the machine result from the combination of the "pressure" row and the "speed" column.

13.7.1 Sound pressure level [dB(A)]

If the texts of the tables are not provided in the chosen language, a translation can be found here.

	Table legend
A	Sound pressure level [dB(A)]
B	Without sound enclosure
C	With sound enclosure
D	Speed [min^{-1}]
E	Pressure [mbar]

13.7.2 Sound power level [dB(A)]

If the texts of the tables are not provided in the chosen language, a translation can be found here.

	Table legend
A	Sound power level [dB(A)]
B	Without sound enclosure
C	With sound enclosure
D	Speed [min^{-1}]
E	Pressure [mbar]

Tab. 66 Sound power level, legend

BB 69 C pr

A:Schallleistungspegel/Sound power level [dB(A)]
B:ohne Schalldämmhaube/without sound enclosure C:mit Schalldämmhaube/with sound enclosure

EC Declaration of Conformity

The undersigned, representing the following manufacturer and the authorized representative established within the Community:

Salsnes Filter AS
Verftsgata 11
P.O. Box 32
N-7801 Namsos
Norway

herewith declare that the product **Salsnes Filter**

Model Type: SF6000 **Serial Number: 480080**
Possible Model Types: SF:1000, SF:2000, SF:4000, SF:6000, SFK:200, SFK:400, SFK:600

is in conformity with the essential requirements laid down in council directives:

2006/42/EC	*Machinery Directive*
2014/30/EU	*EMC Directive*

and with reference to the following EU harmonized standards:

EN ISO 12100:2010	*Safety of machinery.*
EN 60204-1	*Safety of machinery – Electrical equipment of machines.*
EN 61439-1	*Low-voltage Switchgear and Control Gear Assemblies.*
EN 55011	*Group 1, Class A: Industrial, Scientific, and Medical (ISM) Radio-Frequency Equipment*
EN 61000-6-4	*Electromagnetic compatibility - Emission standard for industrial environments*

The related Technical File, as prepared by Salsnes Filter, is held at the offices of Salsnes Filter in Norway. This Declaration of Conformity for the above system will be used by Salsnes Filter, as an authorized representative established within the Community, in accordance with compiling a CE Declaration of Conformity for the entire project of which this complete CE marked system is part.

1 – INTRODUCTION

1.1 – GENERAL DESCRIPTION

LEFT BLANK

Project General Description

Veolia Water Technologies Canada (VWT) was contracted by Pilitak Enterprises Ltd to supply part of the equipment for the upgrade of the wastewater treatment plant of the city of Iqaluit.

VWT is responsible for the supply of the equipment and the control system detailed in Veolia Proposal #TM95602 Rev.1.

The Iqaluit wastewater treatment facility is designed to treat municipal waste water. Following this upgrade, the Iqaluit wastewater treatment plant will be able to treat the 2041 peak hour flow target.

Following a primary treatment (not supplied by VWT), the primary effluent flows by gravity to two Moving Bed Biofilm Reactors (MBBR). Incoming flow is split into the two MBBR reactors. The MBBR reactor ensures the removal of BOD_5. MBBR is a fixed-film process, making it well suited for variable influent flow since the biomass remains within the biological reactor whatever the flow and reacts to changing loads automatically.

MBBR effluent is then clarified using floatation of the suspended solids in a separate downstream dissolved air floatation system (DAF) using Veolia's SPIDFLOW® technology. This secondary clarification step (DAF) ensures that the Total Suspended Solids (TSS) removal target is reached. SPIDFLOW® technology makes it possible to continuously separate solids in suspension for various water qualities through a dissolved air flotation process where air micro-bubbles get attached to suspended solids in order to make them float. The micro-bubbles are created by releasing a flow of pressurized water saturated with dissolved air. Particle and air agglomerations end up on the surface of the flotation unit, before being evacuated from the system by a surface scraper to a sludge hopper.

In addition to the MBBR and SPIDFLOW® DAF equipment, VWT has supplied the following equipment:

- Process air blowers
- DAF polymer make-up system: Veolia HYDRA-POL® 250 system
- DAF polymer dosing skid equipped with three progressive cavity pumps
- Belt Filter Press (BFP) polymer make-up system: Veolia HYDRA-POL® 500 system
- BFP polymer dosing skid equipped with two progressive cavity pumps
- Two progressive cavity TWAS transfer pumps
- Two progressive cavity BFP feed pumps

APPENDIX 12

SAFETY

1 GENERAL

It should be recognized that potential hazards exist in any processing system. By including this section in the operating manual, Veolia Water Technologies Canada Inc. is in no way attempting to override the plant safety rules laid out to the employees by their employer. However, because of our concern for good, efficient operation of the equipment furnished, we recognize our obligation to point out certain hazards. We also recognize that this section cannot cover every possible hazard; rather, it merely points out some of the most common and important ones.

In each plant, the hazards vary slightly because of the particular chemical or material that is being processed. However, there are some safety recommendations that apply to all operations. These hazards can be broken down into three general areas, namely utility hazards (compressed air, electrical, etc.), equipment hazards, and chemical hazards. These three areas will be covered separately in the following sections.

One of the most important ways to avoid hazards is to have a good understanding of the process. Familiarity with the system and good common sense will enable operators to run the system smoothly and safely.

WHMIS Safety Data Sheets (SDS) should be available for each chemical product.

2 OPERATION AND MAINTENANCE MANUAL

It is important that the operator has understood the instructions of use, security and maintenance before using the Veolia Water Technologies Canada Inc. system. The manufacturer can not be held responsible for use or improper maintenance resulting from a breach or non-compliance with instructions. The Operation and Maintenance manual contents must be kept permanently close to Veolia Water Technologies Canada Inc. system in a safe place.

3 PLANT SAFETY PROCEDURES

As stated earlier, the safety rules and guidelines issued to the employees are the primary precautions that are necessary for the prevention of accidents. The employee should be very familiar with these rules. The safety pictograms used in the plant are to be respected at all times.

Operators should always wear the safety equipment that is provided or required by their management. Such items as hard hats, safety shoes, safety glasses, gloves, breathing protection, protective clothing, protection harness and hearing protection are very basic and go a long way in preventing accidents.

Operators should be aware of the location of fire extinguishers, eye wash stations, safety showers, self-contained breathing apparatus, first aid stations, and other safety equipment furnished for the plant.

Good housekeeping will also eliminate safety hazards such as tripping or slipping. When spills happen, the floor should be washed as soon as possible. When construction or maintenance is finished, removing debris also eliminates a hazard. Proper housekeeping is a good indication of safety attitude in general.

Management provided training can always help in making employees more safety conscious. In these seminars, potential hazards can be pointed out. Veolia Water Technologies Canada Inc. will be glad to assist these efforts by furnishing details on its equipment relating to safety as well as on its operation.

Investigation of an accident to determine its cause will help to prevent the same accident from occurring again and will aid in finding a way of correcting or eliminating the hazard.

Remember, safety rules provided by your employer are designed to protect you and should be strictly adhered to. However, as an operator, safety is your responsibility and you should voice any concerns you have and follow through until corrective action is taken.

4 UTILITY HAZARDS

Utility hazards that may exist in the plant may include high-pressure/high-temperature steam, high-voltage electricity, high-pressure water, and high pressure air. Care should be taken when utilizing any of the utilities.

4.1 Steam

Any time steam is used the potential for burns exist. The recommended first aid for burns is to first apply ice or cold water directly to the burn and then cover the area with cool, moist application gauze or bandage material to minimize blistering. If burns are critical (second and third degree), transport the injured person to a medical facility promptly.

Hot surfaces in areas frequented by personnel should be covered with insulation for protection. When hot surfaces must be left exposed, such as steam valves or sight glasses, operators should be warned of the potential hazard displaying pictograms, training, and supervision.

Steam valve packing, steam traps, and pipe fittings that are leaking should be brought to the attention of supervision and repaired as soon as possible. Instrumentation connections and pipeline for steam should be piped with good connections. Valves should be tagged and locked out on equipment that is being worked on where steam is used to prevent someone from opening the valve. At times, steam is used for cleaning lines. Operators should make sure that if hoses are used, they are designed for steam service. Make sure the connections are tight and do not leak.

Drain and sample connections should be suitably identified and piped with proper fittings. Rupture discs, pressure relief valves, and steam trap discharges should be suitably identified and piped in such a way that they do not release steam in an area of access. These must also be periodically checked to make sure that they are in good working order. Precautions should be taken to prevent accidental release of pressurization, which could injure personnel. Water or steam hammering in steam lines should be investigated for the source and stopped as soon as possible to prevent rupture.

4.2 Electrical

As with steam, electrical equipment should never be worked on unless it is turned off and locked and tagged out. The lockout system key should belong to the person doing the repair or the on-site electrician. This will remove the potential danger for electrical shock or accidental start-up.

Electrical hazards fall into three categories: shock, burn, and fire. The severity of electrical shock is dependent on several items, such as the nature of the electrical impulse and the path that the shock takes through the body. Burns are those caused by contact with electrical current. Fire is where a chemical or gas burns or explodes when it comes in contact with an electrical spark.

General first aid for electrical burns is as follows:

- Remove the victim from contact with the electrical current without coming into contact with the current yourself.
- Check for cardiac arrest or respiratory failure.
- Check for points of entry and exit of current.
- Cover burned surface with a clean dressing.
- Splint all fractures.
- Treat for physical shock.
- Transport to a medical facility promptly.

Except for very low voltage exposure (below 24 V) and very low body current (below 0.2 mA), it is difficult to state safe limits for electrical exposure. Even these low energy exposures can be traumatic for people with heart diseases.

Even though most electrical motors and switch boxes are designed to be water tight, it must be recognized that the presence of water around electrical equipment always presents a hazard and therefore should be used with care.

4.3 High Pressure Water

In the case of some pumps, cooling devices, and heat exchanger, high pressure water is used. As with steam, high pressure water can be a hazard if a small leak is not repaired.

Only the proper pressure fittings should be used in the piping system. As stated earlier, leaks should be repaired as soon as possible. Isolation valves on piping that are being repaired should be shut tight and locked out. As with electrical repairs, the lockout system key should be in the possession of the individual working on the piping.

Plant Air

Care should be taken when using plant air to clean equipment, unblock lines, or blow dust off personnel. High pressure air can be very dangerous to personnel, especially in the area of the face. Pressure should be reduced before using the air to blow dust off clothing. Make sure all fittings have good connections and cannot blow loose.

5 EQUIPMENT HAZARDS

5.1 Rotating parts, Hazardous Areas and Confined Spaces

Rotating parts

Since the system includes equipment with rotating parts (eg pumps, mixers, etc.) Operators should avoid wearing loose clothing and jewellery. Loose clothing can present one of the biggest safety hazards that exist when working near equipment in process.

Sharp or protruding surfaces are normally eliminated at areas frequented by personnel. When present in an operating area, the surface should be covered for protection and clearly marked to minimize the danger of contact.

Equipment that is likely to generate high noise levels should be insulated and/or isolated for personal access. If personnel must enter a high noise area, they will wear hearing protection.

Confined Spaces

Before entering or breaking the plane of any vessel, be sure to check if it is a potential Confined Space and if a permit is required for entrance. Vessels that require a Confined Space Entry Permit may include but are not limited to flash tanks, heaters, condensers, and storage tanks.

5.2 Operation and Maintenance

The equipment in its normal use can present a hazard if not operated or repaired in a safe manner. Example of equipment: pumps, valves, instruments, hoses, etc.

All equipment should only be operated and repaired according to the recommended procedures of the manufacturer, and by qualified individuals. For further information on equipment maintenance procedures, proper maintenance tools, and/or the Personal Protective Equipment required, Section 3 - Equipment of this manual should be referenced.

Only recommended spare parts should be used. For instance, when replacing a gasket, verify the proper gasket is selected (pressure steam, corrosive, etc.).

In the repair or replacement of Veolia Water Technologies Canada Inc. furnished equipment, Veolia Water Technologies Canada Inc. specifications should be checked to make sure the correct pressure rating is used.

Maintenance on pumps, piping, etc. should be performed only after valves are locked and tagged or slip blanks are installed to completely isolate the equipment being worked on. Instrumentation and controls should always be kept in good working order to help assure the safe operation of equipment. Never remove instruments or controls out of service until having communicated with the operator and have established a plan to define the operation maintenance steps. If air operated valves are used for isolation, the air line should be removed to prevent inadvertent operation of the valves. When possible the valve can also be locked in position.

When maintenance is finished on equipment, the protective caps provided must be reinstalled. If a protection must be left off, unwary personnel should be notified by using safety pictograms or installing temporary protection. Equipment should never be inspected or maintenance attempted while the equipment is operating. All pumps and various automatic valves may cause harm to an operator if care is not taken.

Before starting the equipment, the operator must verify if the maintenance staff has completed the work, if the pumps are not locked or frozen and whether bare electrical wires are present. He must also check the pipes to ensure there are no leaks and should clean all debris

6 CHEMICAL HAZARDS

WHMIS Safety Data Sheets (SDS) should be available for each chemical product.

Since chemicals or chemical dosage are used during normal operation of treatment facility, the risks of fire, explosion and exposure to toxic chemicals or chemical burns are present. Chemicals that may be used regularly or, for instance, during cleaning including, without limitation, acids, caustics, polymers, ozone, coagulant and microsand. Operators should be made aware of the following:

- All chemicals which are used and any potentially dangerous reaction that could occur.
- Toxicity of all chemicals that are used or could be formed via reactions.
- Acidic or basic properties of all materials used.
- Potential fire or explosion hazards posed by the chemicals.
- Antidotes for exposure to toxic materials.
- Protective clothing that is recommended.
- Any other information that helps make the operators aware of a hazard.

6.1 Chemical Burns

Some treatment plant chemicals can be very acidic or basic and cause serious burns if coming in contact with the skin or eyes. Operators should be careful when opening valves and working on lines and pumps. Safety glasses with side shields are always recommended when working around chemicals. Operators should familiarize themselves with the location and operation of safety showers and eye wash stations. These stations should be inspected and tagged acceptably with a date and signature on a regular basis.

Whenever a leak or spill is sighted, corrective action should be taken immediately and the spill should be cleaned up. It should never be assumed that someone else is aware of the problem or will take care of the spill.

Accordingly, chemical lines should be clearly identified by color coding or other suitable means. Routing of these lines should be in open areas and should avoid major work/access areas wherever possible. This is critical if the vessels and piping are overhead.

Plant areas where these materials are handled should be restricted. A safety briefing for all visitors and/or new personnel is recommended before access is granted.

All plant personnel should be required to wear proper protective clothing when handling or working near these chemicals. A minimum wardrobe should include, but not be limited to, a plastic hard hat, coat, boots and gloves of a resistant material as well as a pair of safety glasses. Safety glasses, even with shields, are not adequate for use in areas where very acidic or basic materials are handled.

Accidental contact with these chemicals should be avoided. Remember, most liquid chemicals resemble water. Good housekeeping practices should be a requirement in areas where these materials are handled.

6.2 Fire and Explosion

A combustible material will spontaneously start to burn when its temperature is raised to its ignition point in the presence of air. The ignition point of all chemicals used in the process should be known and posted for operators. In some cases, the mixture of vapor and air can burn violently in the form of an explosion.

Accordingly, chemicals should not be added to other materials if the effects of the addition are unknown. This includes disposal, which should only be into suitable containers. Sinks and/or sewers are not suitable for disposal.

WARNING: In systems with Actiflo® clarifier, the lamella pack is pre-installed in the settling tank section of the Actiflo®. It is made of a very flammable material. Do not expose it to open flames or sparks. Do not allow any welding works nearby unless special precautions have been taken.

6.3 Toxic Exposure

Since we are dealing with the effects on individuals who may react to various toxic materials to different degrees, it is difficult to establish an absolute evaluation of toxicity. However, most toxic materials do not have particularly adverse effects when present in small amounts. Consequently, the concept of the “threshold limit value” (TLV) has been developed and is defined as a concentration of toxic material below which it is believed nearly all individuals may be repeatedly exposed over a long duration without adverse effects. The TLV for all chemicals used should be on record and easily accessible.

7 SAMPLING AND LINE UNBLOCKING PROCEDURES

7.1 Sampling Procedures

In the course of startup and operation of Veolia Water Technologies Canada Inc. supplied equipment, sampling of the process fluid is generally conducted in order to:

- Verify system instrumentation.
- Adjust system to maintain desired stability of operation.
- Troubleshoot upset conditions.
- Verify system performance meets contractual guarantees.

Regardless of the process fluid being sampled, care should always be taken to assure samples are collected without placing personnel at risk of injury. Personnel who are collecting samples should always practice good safety habits in their collection routine. Personal protective equipment (PPE) should be selected and worn with respect to the type of sample being collected and its means of collection.

PPE required for sampling is dependent on the material, the temperature and pressure, the sampling point, the surrounding conditions, etc. An example of the varying level of PPE required for each given sample is given below. However, the person responsible for sampling should determine for him or herself if his or her level of PPE is adequate for the task. **Remember, YOU are responsible for your safety.**

<u>PPE required for general field work</u>

- Steel-toed work boots, safety glasses, hard hat, leather gloves, hearing protection, respirator, long-sleeved shirt.

<u>Additional PPE required for handling hot, non-hazardous material</u>

- Insulated rubber gloves and face shield with goggles.

<u>Additional PPE required for handling hazardous material</u>

- Consult SDS
- Full body suit, respirator, rubber gloves, face shield with goggles, protective sampling container.

The collector should study the pertinent sampling station specific to his/her process until comfortable he/she can collect a sample from the station in a safe manner that is also representative of the process conditions. The collector should then develop his/her own sampling procedure.

7.2 Unblocking Procedures

The systems processing highly viscous or slurry solutions are prone to produce blocked drains, valves, and/or sampling stations. The operator should expect blocked connections in these systems. As such, the operator will eventually be required to unblock a connection to access a sample or drain a vessel or line. In doing so, the operator should:

- Review the need for proper personal protective equipment (PPE).
- Develop a plan for unblocking the connection
- Obtain the proper equipment to unblock the connection
- Safely implement the unblocking plan

Selecting the proper PPE for use in unblocking a connection is very similar to the PPE required for sampling noted in the previous section. However, unblocking a connection can result in an instantaneous release of fluid or material at velocities or forces much greater than seen during normal sampling methods. The operator should consider "what if" scenarios such as excessive splashing or large volume release after unblocking the connection and determine his/her PPE with these "worst case" conditions in mind.

Before attempting to unblock a connection, the operator should study the situation and develop a safe procedure to unblock the connection. He/she should observe the area around the connection problem in case a quick "get-a-way" should be required. He/she should inform any personnel in the area that may be affected by unblocking the connection. The operator should learn what the material behind the plug is operating at: what temperature, what pH, what pressure, etc. and modify his/her plan accordingly to develop the safest method of releasing the connection. It might be better for him/her to perform an exercise to test the method of unblocking to validate the proposed method.

Any equipment used in the unblocking process should be reviewed for adequacy of use. Is the hose rated for the material, temperature, and pressure expected to be seen by its use? Are the hose and fittings in good condition? If not, replace the unfit equipment with new or adequate equipment. Make sure all connections are tight and proper for the job. In addition, the hose assembly utilized in the unblocking process should be equipped with a bleed-off valve to depressurize the system prior to the dismantling of the connection. If a bleed-off valve does not exist, special care should be taken when dismantling a hose connection because it may still be subject to internal pressure after the release.

Once the plan and the equipment are in place, the operator must focus on the task to be sure the line is unblocked in the safest manner possible. He/she should especially be concerned not only with his/her own safety, but also of others in the area. Cordoning off the area surrounding the blocked connection is advisable. Remember, whatever means is used be it with water, steam, or air, or mechanical means, BE READY FOR ANY CONSEQUENCES when the drain pipe.

Finally, when working with a partner, take special precaution to communicate your plan to avoid harming anyone due to miscommunication.

GENERAL NOTES

1. WHERE INFORMATION RELATING TO THE ORIGINAL PLANT CONDITIONS IS SHOWING ON THE DRAWINGS, IT HAS BEEN OBTAINED OR SCANNED FROM INFORMATION SUPPLIED BY OTHERS. PHASE II UPGRADES, CURRENTLY UNDER CONSTRUCTION AT THE TIME OF TENDER OF THIS PROJECT, WERE BASED ON THIS INFORMATION. NUMEROUS FIELD MODIFICATIONS WERE REQUIRED TO ACCOMMODATE INACCURATE INFORMATION ON THE ORIGINAL PLANT. AS-BUILT DRAWINGS INCORPORATING THESE MODIFICATIONS WERE NOT AVAILABLE AT THE TIME OF TENDER. CONSEQUENTLY, THE CONTRACTOR SHOULD MAKE SUFFICIENT ALLOWANCES IN THE AMOUNT OF WORK REQUIRED TO ACCOMMODATE PHASE II MODIFICATIONS.
   WHERE DIMENSIONS OR ELEVATIONS OF EXISTING FACILITIES ARE SHOWN, THEY ARE NOT INTENDED TO INDICATE PRECISE OR CURRENT CONDITIONS. ALL DIMENSIONS AND ELEVATIONS TO BE CHECKED AND CONFIRMED ON SITE BEFORE FABRICATION AND INSTALLATION OF THE EQUIPMENT.
2. THIS DRAWING IS GENERAL IN NATURE. SOME SYMBOLS SHOWN HERE MAY NOT BE USED ON THE CONTRACT DRAWINGS.
3. SEE DRAWING P602 FOR EQUIPMENT AND PIPE COMMODITY DESIGNATION SYSTEMS.
4. SEE DRAWING P603 FOR INSTRUMENTATION SYMBOLS.
5. SYMBOLS ARE ARRANGED ON DRAWINGS AND IN CATEGORIES FOR CONVENIENCE ONLY; SYMBOLS MAY BE USED ON ANY OF THE CONTRACT DRAWINGS.
6. IN PLAN VIEWS, EXISTING PIPE AND EQUIPMENT THAT MAY BE ABOVE OR BELOW SHOWS THROUGH AS FADED LINES. REFER TO SECTIONS FOR RELATIVE ELEVATION OF PLANT UPGRADE PIPE AND EQUIPMENT COMPARED TO EXISTING PIPE AND EQUIPMENT. ALL DIMENSIONS AND ELEVATIONS TO BE CHECKED AND CONFIRMED ON SITE BY THE CONTRACTOR.
7. THE ROUTING OF PIPES AND ASSOCIATED EQUIPMENT MAY BE SHOWN AS APPROXIMATE. OBTAIN ACCEPTANCE OF THE ENGINEER ON EXACT PIPE ROUTING AND EQUIPMENT LOCATIONS IN CONJUNCTION WITH PIPING ISOMETRICS, PRIOR TO INSTALLATION. SMALL DIAMETER PIPE ROUTING FOR LINES 100mm AND LESS NOT SHOWN ON PIPING LAYOUTS UNLESS OTHERWISE NOTED. REFER TO P&ID'S.
8. P&ID'S DO NOT SHOW ALL DRAIN, VENT, OR SAMPLE CONNECTIONS.
9. PROCESS STANDARD DETAILS: IN GENERAL, ALL EXTERIOR ANCHORS SHOULD BE STAINLESS STEEL. ALL INTERIOR ANCHORS CAN BE EITHER STAINLESS STEEL OR GALVANIZED EXCEPT IN THE HEADWORKS AND SLUDGE TREATMENT AND HANDLING AREAS WHERE THE ANCHORS MUST BE STAINLESS STEEL.

PIPE IDENTIFICATION

CHANNEL OR CHUTE IDENTIFICATION

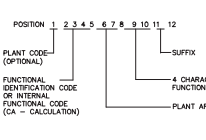
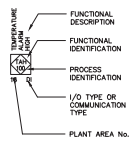
NOTE: ALL DEVICES INTERFACED WITH CDACS MUST FOLLOW THE DIGITAL POINT NAMING CONVENTION.

POINT NAMING CONVENTION



POINT IDENTIFICATION



INSTRUMENT OPERATING FUNCTIONS

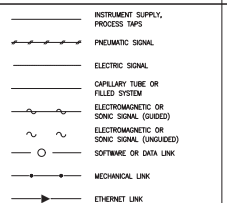
ANALYTICAL FUNCTIONS

Cl_2	CHLORINE
NH_3	AMMONIA
LEL	LOWER EXPLOSIVE LIMIT
COMB	COMBUSTIBLE GAS
H_2S	HYDROGEN SULFIDE
pH	pH
DO	DISSOLVED OXYGEN
O_2	OXYGEN
VIB	VIBRATION
SS	SUSPENDED SOLIDS (DENSITY)
CO	CARBON MONOXIDE
NO	NITRIC OXIDE
TSS	TOTAL SUSPENDED SOLIDS
NO_2	NITROGEN DIOXIDE
NO_3	NITRATE
PO_4	PHOSPHORUS

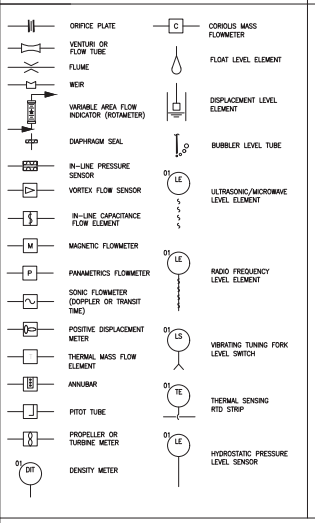
SWITCHING FUNCTIONS

HOA	HAND–OFF–AUTO SELECTION
S/S	START–STOP
OCA	OPEN–CLOSE–AUTO SELECTION
OSC	OPEN–STOP–CLOSE SELECTION
SEL	SELECTOR SWITCH
O/O	ON–OFF SELECTION
O/C	OPEN–CLOSE SELECTION
L/R	LOCAL–REMOTE SELECTION
P/R	PANEL–REMOTE SELECTION
ACK	ACKNOWLEDGE (ALARM)
FOR	FORWARD–OFF–REVERSE
LOR	LOCAL–OFF–REMOTE
ESD	EMERGENCY STOP DEVICE
OVR	INTERLOCK OVERRIDE SWITCH
FWD	FORWARD SELECTION
REV	REVERSE SELECTION

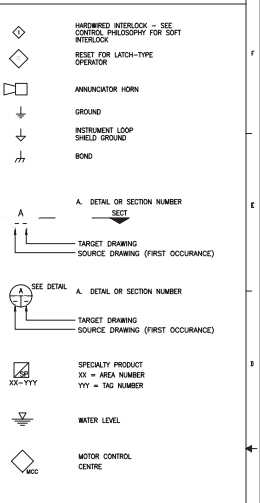
INSTRUMENT SIGNAL SYMBOLS



PRIMARY ELEMENT SYMBOLS



MISCELLANEOUS SYMBOLS



LINE DESIGNATIONS

	PRIMARY LOCATION ***NORMALLY ACCESSIBLE TO OPERATOR	FIELD MOUNTED	AUXILIARY LOCATION ***NORMALLY ACCESSIBLE TO OPERATOR
DISCRETE INSTRUMENTS	1. * IP1**	2.	3.
SHARED DISPLAY SHARED CONTROL	4.	5.	6.
COMPUTER FUNCTION	7.	8.	9.
PROGRAMMABLE LOGIC CONTROL	10.	11.	12.

INSTRUMENT AND FUNCTION SYMBOLS

*SYMBOL SIZE MAY VARY ACCORDING TO THE USER'S NEEDS AND THE TYPE OF DOCUMENT. A SUGGESTED SQUARE AND CIRCLE SIZE FOR LARGER DIAGRAMS IS SHOWN ABOVE. CONSISTENCY IS RECOMMENDED.

**ABBREVIATION OF THE USER'S CHOICE SUCH AS IP1 (INSTRUMENT PANEL #1), IC2 (INSTRUMENT CONSOLE #2), CC3 (COMPUTER CONSOLE #3), ECT., MAY BE USED WHEN IT IS NECESSARY TO SPECIFY INSTRUMENT OR FUNCTION LOCATION.

***NORMALLY INACCESSIBLE OR BEHIND–THE–PANEL DEVICES OR FUNCTIONS MAY BE DEPICTED BY USING THE SAME SYMBOLS BUT WITH DASHED HORIZONTAL BARS, I.E.

CONFIDENTIALITY AND INTERSECTUAL PROPERTY SYSTEM
ALL INFORMATION CONTAINED IN THIS DOCUMENT IS THE EXCLUSIVE PROPERTY OF VEOLIA WATER TECHNOLOGIES CANADA INC. AND ITS AFFILIATES (COLLECTIVELY REFERRED TO AS "VEOLIA") AND IS STRICTLY CONFIDENTIAL. EXCEPT AS EXPRESSLY PROVIDED IN THE INTELLECTUAL PROPERTY LAW, THE VEOLIA CONCEPTS AND INFORMATION CONTAINED HEREIN ARE PROPRIETARY TO VEOLIA AND MAY BE PROTECTED BY PATENT, TRADE SECRET AND/OR COPYRIGHT LAW. YOU MAY USE OUT OF VEOLIA ONLY FOR THE PURPOSES FOR WHICH THE DOCUMENT IS EXPRESSLY SUBMITTED AND NO IMPLIED LICENCE IS GRANTED TO YOU IN THIS REGARD. REPRODUCTION OF THIS DOCUMENT OR ANY PORTION THEREOF, INCLUDING ANY ATTACHMENTS OR EXHIBITS AND ANY COPY MADE OR STORED, REPRODUCED, COPIED, ADAPTED OR SENT TO A THIRD PARTY WITHOUT THE PRIOR EXPRESS WRITTEN CONSENT OF VEOLIA IS STRICTLY PROHIBITED. BY ACCEPTING THIS DOCUMENT, YOU AGREE TO BE BOUND BY THE FOREGOING RESTRICTIONS. YOU ARE NOT AUTHORIZED TO MODIFY ANY INFORMATION CONTAINED HEREIN FOR ANY PURPOSE AND YOU AGREE NOT TO DISCLOSE ANY CONFIDENTIAL INFORMATION CONTAINED HEREIN OR THE EXISTENCE OF THE AGREEMENT WITH VEOLIA WITHOUT THE PRIOR WRITTEN CONSENT OF VEOLIA. UNAUTHORIZED USE OF THIS DOCUMENT OR ANY COPIES THEREOF AND ANY VIOLATION OF YOUR OBLIGATIONS MAY SUBJECT YOU TO CIVIL AND CRIMINAL PENALTIES. VEOLIA RESERVES ALL RIGHTS AND REMEDIES AVAILABLE TO IT. ALL DISPUTES WILL BE GOVERNED BY AND CONSTRUED IN ACCORDANCE WITH THE LAWS OF THE PROVINCE OF ONTARIO AND THE FEDERAL LAWS OF CANADA APPLICABLE THEREIN AT THE EXCLUSIVE JURISDICTION OF THE COURTS OF ONTARIO. YOU AGREE THAT VEOLIA WILL BE ENTITLED TO INJUNCTIVE RELIEF IN THE EVENT OF ANY VIOLATION OF THE TERMS AND CONDITIONS CONTAINED HEREIN. IF ANY PART OF THESE TERMS AND CONDITIONS SHALL BE HELD TO BE UNENFORCEABLE, THE REMAINING PROVISIONS SHALL REMAIN IN FULL FORCE AND EFFECT. YOU AGREE THAT THESE TERMS AND CONDITIONS CONSTITUTE THE ENTIRE AGREEMENT BETWEEN YOU AND VEOLIA WITH RESPECT TO THE SUBJECT MATTER HEREOF AND SUPERSEDE ANY AND ALL PRIOR AGREEMENTS, WHETHER WRITTEN OR ORAL, BETWEEN YOU AND VEOLIA WITH RESPECT TO SUCH SUBJECT MATTER. VEOLIA RESERVES THE RIGHT TO MODIFY THESE TERMS AND CONDITIONS AT ANY TIME AND YOUR CONTINUED USE OF THIS DOCUMENT FOLLOWING THE POSTING OF ANY SUCH MODIFICATION WILL CONSTITUTE YOUR ACCEPTANCE OF ANY SUCH MODIFICATION. YOU MAY NOT ASSIGN THIS AGREEMENT OR ANY RIGHTS HEREUNDER WITHOUT VEOLIA'S PRIOR WRITTEN CONSENT. VEOLIA MAY ASSIGN THIS AGREEMENT TO ANY AFFILIATE WITHOUT YOUR CONSENT. ANY ATTEMPTED ASSIGNMENT IN VIOLATION OF THIS AGREEMENT SHALL BE VOID. THIS AGREEMENT SHALL BE BINDING UPON AND INURE TO THE BENEFIT OF THE PARTIES HERETO AND THEIR RESPECTIVE PERMITTED SUCCESSORS AND ASSIGNS. THIS AGREEMENT MAY BE EXECUTED IN ANY NUMBER OF COUNTERPARTS, EACH OF WHICH WHEN EXECUTED AND DELIVERED SHALL BE AN ORIGINAL, BUT ALL COUNTERPARTS TOGETHER SHALL CONSTITUTE ONE AND THE SAME INSTRUMENT. THE PARTIES AGREE THAT THIS AGREEMENT MAY BE DELIVERED BY EMAIL OR FACSIMILE AND THAT SUCH DELIVERY SHALL BE VALID AND EFFECTIVE AS DELIVERY OF A MANUALLY EXECUTED ORIGINAL COUNTERPART OF THIS AGREEMENT.

		Type			TEFC		
		Manufacturer			WEG		

TECHNICAL DESCRIPTION	**Pump per unit**			**Quantity**	-	3		
				Duty/Stand-by	-	2 Duty / 1 Stand-by		
				Max. simultaneous operating pump	-	2		
				Manufacturer	-	Edur		
				Model	-	LBUX 602 C 160L		
				Recirculation % per pump	**% of Nominal flow**	10 - 18%		
				Power	**HP**	20		
				Flow	**m3/h**	20		
				Head	**psi (bar)**	108 (7.4)		
				Diameter	**NPT**	3 po (suction) / 2.5 po (discharge)		
	Strainer per unit			**Diameter Inlet/outlet**	**mm (in)**	150 (6)		
				Material	-	304 stainless steel (std)		
				Quantity	-	2		
	White water recirculation line			**Recirculation Line diameter**	**mm (in)**	350 (14)		
				Material	-	304 stainless steel (std)		
	Air Mixing			**Air flow**	**SCFM**	150		
				Header Diameter	**mm (in)**	75 (3)		
				Ramification Diameter	**mm (in)**	25 (1)		
OTHER MATERIAL OF CONSTRUCTION	**Bottom Collector**					304 stainless steel		
	Anti-Vortex Baffles				-	304 stainless steel		
	Hardware (Immersed)				-	304 stainless steel		
	Hardware (Surfaced state)				-	304 stainless steel		
CONNECTIONS	**Inlet flange**				**mm (in)**	350 (14)		2
	Outlet flange				**mm (in)**	400 (16)		2
	Drain diameter				**mm (in)**	50 (2)		
	Outlet sludge diameter				**mm (in)**	150 (6)		
	Air washing system diameter				**mm (in)**	50 (2)		2
	White water nozzles diameter				**mm (in)**	150 (6)		2

90 SERIES RIGHT ANGLE HELICAL-BEVEL
SPEED REDUCERS/GEAR MOTORS

NORD DRIVESYSTEMS

PERFORMANCE SPECIFICATIONS

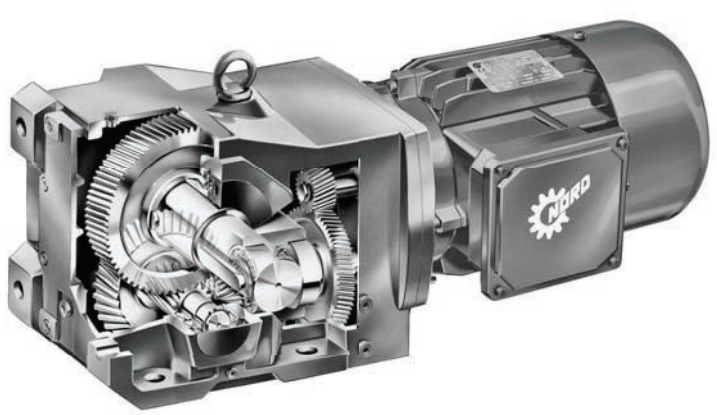
Configuration : right angle
Integral motor HP (min/ max) : 0.16 / 200
Integral motor kW (min/ max) : 0.12 / 160
Typical efficiency : 95.5%
Number of gear reductions : 3 to 6

MOUNTING STYLES

Footed housing style : standard
B5 flange outside diameter range [in] : 7.87 to 25.98
B5 flange outside diameter range [mm] : 200 to 660
Shaft mount housing available
B14 flange outside diameter range [in] : 5.51 to 17.72
B14 flange outside diameter range [mm] : 140 to 450

OPTIONS

NEMA C-face or IEC input adapter
Custom adapter flange
Flange pilot removed
Bolt-on torque arm with shock dampener
Effective drywell with flange



RATIO AND SPEED

Minimum standard ratio : 8.04:1
Maximum standard ratio : 134:32.68
Minimum output speed from 1750 rpm motor : 0.13 rpm
Maximum output speed from 1750 rpm motor : 218 rpm

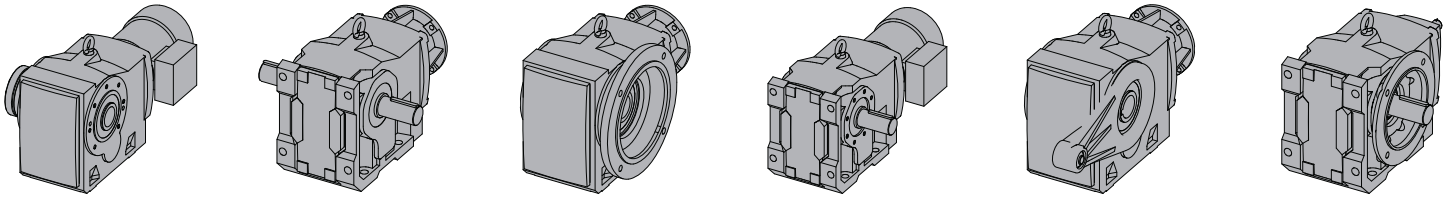
*** Torque may vary by ratio**



90 SERIES RIGHT ANGLE HELICAL-BEVEL

SHAFT DATA

- AISI 1045 or 4140 input and output shaft material
- Inch shaft key dimensions according to AISI B17
- Metric shaft key dimensions according to DIN 6885
- Standard output shaft drill and tap
- 2 hollow shaft keys
- Shrink disc size range [in] : 1.375 to 5.500
- Shrink disc size range [mm] : 35 to 150
- Minimum gripping safety factor range [h6 fit] : 2.6 to 6.3

SHAFT DATA OPTIONS

Double solid output shaft, Shaft fixing element, Custom shaft diameters, Hollow spline per DIN 5480, Custom spline, Cross drilled holes, 304 stainless steel

MOTOR MOUNTING

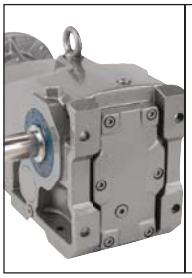
- Integral motor : 1/6 to 200 HP
- C-face adapter frame size range : 56C to 360TC
- IEC adapter [B5] frame size range : IEC 63 to IEC 315
- Sugar scoop motor availability : 56 to 365T
- Top mount platform motor availability : 56 to 405T

MOTOR MOUNTING OPTIONS

Custom motor adapter, Custom coupling diameter

GEARING

- Up to AGMA Class 13 gear quality rating
- 58 Rockwell C minimum gear hardness
- Ground or skive hobbed hard gear teeth finishing
- Standard drop forged gear blanks
- 275% momentary overload capacity
- Standard hunting tooth ratios



HOUSING

- Class 35 gray iron housing material
- Single setup machining method
- UNICASE™ one piece housing design
- Seals directly contact main housing
- Exceptional housing torsional stiffness
- Thick housing wall section
- Castings are dip sealed

BEARINGS

- ABEC-1 quality bearings
- Ball or tapered standard output bearing
- Tapered or spherical heavy-duty output bearing

LUBRICANT & SEALING COMPONENTS

- Factory filled ISO 220 mineral oil
- Standard AUTOVENT™ breather style
- QUADRILIP™ output seal design
- 1 double lip & 1 single lip output shaft oil seals
- Nitrile rubber Oil seals

LUBRICANT & SEALING OPTIONS

Custom synthetic lubricating oil, Custom temperature lubricating oil, Fluid grease lubricant, Food grade lubricating oil, Long term storage preparation, Magnetic drain plug, Bulls eye sight glass, Custom drain plug, Fluorinated rubber oil seal material, Custom oil seals

INTERNAL PARTS ASSEMBLY

- Heavy press fit assembly method
- Standard reversing duty
- Typical backlash range [arc minutes] : 7 to 13

INTERNAL PARTS ASSEMBLY OPTIONS

Internal backstop

ENVIRONMENTAL PROTECTION

- Exterior primer coverage on all metal exterior surfaces
- Water Based Resin paint type
- 316 stainless steel flake paint additive
- H1 USDA incidental contact exposure

ENVIRONMENTAL OPTIONS

Severe duty and washdown duty paint options, Custom paint, Shaft seal covers, High pressure washdown IP66 oil seals

HIGH PERFORMANCE MOTORS

INVERTER DUTY

- Motors conform with NEMA MG-1-2006 Section 31.4.4.2
- Speed range 5:1 constant torque from 60Hz to 12Hz
- Speed range 20:1 constant torque from 80Hz to 4Hz

INVERTER DUTY OPTIONS

- 10:1 Speed range: constant torque from 60Hz to 6Hz
- 1000:1 Speed range: constant torque from 60Hz to 0Hz
- Blower cooling fans
- Incremental encoder
- Class H magnet wire insulation

INTERNATIONAL CERTIFICATIONS

- Underwriters Laboratories Recognized component :
- Canadian Standards Association approved for most installations in Canada :
- CSA approved according to both US and Canadian standards :
- European Union (EU) member states approved according to Low Voltage Directive : CE

MOUNTING STYLES

- Integral motor with speed reducer
- NEMA C-face flange
- DIN B5, IEC FF metric face flange mount
- DIN B14, IEC metric face flange mount
- DIN B3, IEC metric foot mount

ENVIRONMENTAL PROTECTION

- IP55 enclosure protection
- Totally Enclosed Fan Cooled (TEFC)
- Tropical protection

ENVIRONMENTAL OPTIONS

NSD+ severe duty protection, Encapsulated windings for IEEE45 Marine Duty, IP66 enclosure, End bell drain holes, Drip cover (RD), Wind protected double drip cover (RDD), Space heater (SH), Additional epoxy coating on inside surface of motor

MULTIPLE SPEED OPTIONS

- 1800/3600 rpm - 4 pole and 2 pole windings
- 900/3600 rpm - 8 pole and 2 pole windings

STANDARD CONSTRUCTION FEATURES

- Corrosion resistant aluminum alloy housing
- Double coated magnet wire insulation
- Insulation lined slots
- First turn winding protection
- Varnish dipped stator
- Shaft lip seals both end bells
- Inorganic insulation for tropical protection
- Sealed stator to end bell connections
- Cast metal terminal box
- Gasket sealed terminal box
- Non sparking low inertia fan
- Dynamically balanced rotor
- Anti-corrosion coated rotor
- Bearing grease resists water
- Terminal block power connector
- Reversible rotation direction
- Four conduit box locations
- Four cable entry locations
- Threaded cable entry

THERMAL WINDING PROTECTION OPTIONS

- Thermostat sensor (TW)
- Thermistor sensors (TF)

POWER OFF BRAKE

- Ready to go…wired by factory
- Manual hand release lever included
- Downward adjustable torque is included, specification is required
- AC to DC voltage rectifier is included
- IP55 enclosure protection is included

POWER OFF BRAKE OPTIONS

NSD+ severe duty protection, Corrosion protection (RG), Dust protection (SR), Lockable hand release lever (FHL), Oversize brake, Undersize brake, Inverter duty modifications, Faster torque release enhancement, Faster torque stopping enhancement, Current sensing relay for automatic control(IR) Heating circuit (BSH), Micro switch wear indicator, IP 66 enclosure

OTHER OPTIONS

- Over-running clutch (FK)
- Anti-rotation backstop (RLS)
- Extended motor shaft beyond fan cover (WE)
- High inertia metal fan for soft start (Z)
- Quick power disconnect plug (MS1)

SHAFT POWER MONITOR

INSTRUCTION MANUAL

Motor shaft output power measurement

Protected by utility patent SE 9703952-3
International utility patent application pending WO 9925049

01-2551-01-11

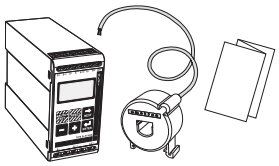
Emotron AB
Mörsaregatan 12
Box 222 25
SE-250 24 Helsingborg
Sweden
Tel.: +46 42 169900
Fax: +46 42 169949
www.emotron.com

1 INSIDE THE BOX ...

This instruction manual describes the installation and commissioning of the M20 load monitor. The M20 supervises induction motor driven equipment and provides alarms when abnormal conditions are detected. The M20's ability to provide reliable monitoring & protection ensures production equipment is optimised and expensive breakdowns and interruptions are minimized. Due to the special method of subtracting motor power losses, the monitor is able to accurately measure the shaft power supplied by the motor to the application. This advanced technique allows the M20 to monitor the "application" load only as opposed to the "total" motor load, which includes the varying motor losses.

- Check the delivery. Your shipment should contain the M20 load monitor, a current transformer and this instruction manual.
- Check carefully that the ordered equipment complies with the motors input voltage and that the current transformer rating is as stated on the delivery packaging.
- Check that the contents have not been damaged in shipping.

Note!
If in doubt contact your supplier before starting to install or commissioning the product.



2 SAFETY

- Study this manual thoroughly before installing and using the monitor.
- The monitor must be installed by qualified personal.
- Always disconnect supply circuits prior to installing.
- The installation must comply with standard and local regulations.
- Pay special attention to this SAFETY section and the part marked "CAUTION!" in the OPERATION section.
- Should questions or uncertainties arise, please contact your local sales outlet or see section 11 SERVICE.

Note!
Do not remove or break the seal on the housing. The warranty will be cancelled.

3 WIRING

This wiring example shows how the M20 can be used to control the starting and stopping circuit of the motor. Other wiring configurations are possible.

1. The current transformer CTMxxx must be placed in the same phase that is connected to terminal 9, phase L1.
2. For single-phase connection see fig 2.

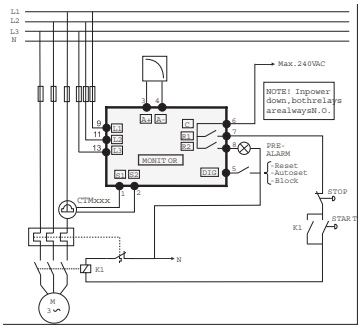


Fig 1. Connection example

Note!
If the START/STOP is connected according to fig. 1, it is recommended that terminals 6 and 7 be by-passed during programming. After the programming is completed the by-pass must be taken out.

3 Continue

ALTERNATIVE EXAMPLE FOR SINGLE-PHASE CONNECTION

This wiring example shows the deviant power connection to be made with regard to a single-phase connection. Refer to fig. 1 for the remaining wiring.

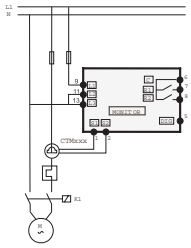

Fig 2. Single-phase connection example.

EXAMPLE - DIGITAL INPUT

The Digital Input use the terminals 5 (DIG) and 6 (C-reference). It can have either a VAC or a VDC signal. See also section 7 ADVANCED FEATURES.

Fig 3. Wiring example for digital input.

4 SELECTION CURRENT TRANSFORMER

FOR MOTORS LESS THAN 100A

1. Check the rated motor current on the motor plate.
2. Compare this value with the current in table 1.
3. From table 1, select the current transformer and the appropriate numbers of windings.

Note!
Max length of the CTM cable is 1 m (39.37 in).

EXAMPLE:

- Rated motor current = 12A.
- Select 10.1-12.5A from the first colon in table 1.
- This gives:
  - CTM025 with 2 windings.

RATED MOTOR CURRENT [A]	CURRENT TRANSFORMER TYPE NUMBER OF WINDINGS			
	CTM 010	CTM 025	CTM 050	CTM 100
0.4 – 1.0	10			
1.01 – 2.0	5			
2.01 – 3.0	3			
3.1 – 5.0	2			
5.1 – 10.0	1			
10.1 – 12.5		2		
12.6 –25.0		1		
26.0 – 50.0			1	
51.0 – 100.0				1

Table 1. CT less than 100A.

Note!
Normally the appropriate Current Transformer (CT) will have been ordered and shipped with the M20, check that this is the case; contact the supplier if in doubt.

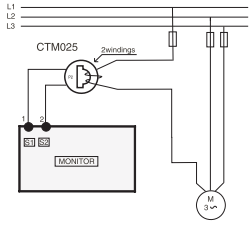

Fig 4. Example CTM 025 with 2 windings for an 12 A motor.

Note!
The transformer connection and orientation are not polarity sensitive.

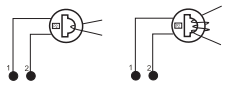

Fig 5. Example 1 and 3 windings.

6:4 Monitor Function (Window 05)

Monitor (Protection)	Indication in window 05	Alarm	Output Relay (default)
OVER- and UNDER-LOAD (default)	–	MAX Main-Alarm	Relay 1 (NC): 6-7
	–	MAX Pre-Alarm	Relay 2 (NO): 6-8
		MIN Pre-Alarm	Relay 2 (NO): 6-8
		MIN Main-Alarm	Relay 1 (NC): 6-7
OVERLOAD	–	MAX Main-Alarm	Relay 1 (NC): 6-7
		MAX Pre-Alarm	Relay 2 (NO): 6-8
UNDERLOAD		MIN Pre-Alarm	Relay 2 (NO): 6-8
	–	MIN Main-Alarm	Relay 1 (NC): 6-7

Programming

1. Go to window 05. The default selection is OVER- and UNDER-LOAD monitor.
2. Press – or + to select UNDERLOAD or OVERLOAD monitor.

OVER- and UNDERLOAD UNDERLOAD OVERLOAD

3. Press ↵ to confirm the change.

Over- and underload monitor

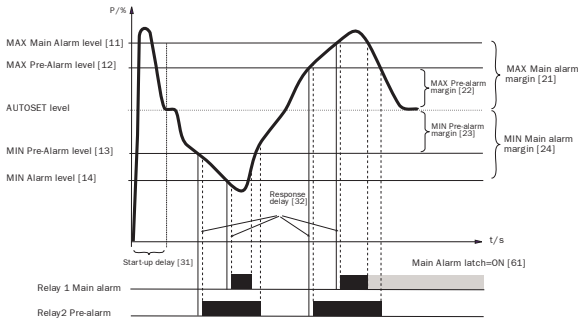

Fig 7. Over- and underload monitor

6:5 Set the START DELAY (window 31)

A START DELAY must be set to allow the motor and machine to speed up and to allow the power in-rush currents to be ignored by the monitor.

Programming

1. Determine in seconds, how long it takes for the motor and machine to reach speed and for the power in-rush to pass. This will be the minimum START DELAY.
2. Go to window 31 (default = 2.0s).
3. Press – or + to set the determined START DELAY time in seconds.
4. Press ↵ to confirm the change.

Example: Start Delay 2.0 s

Fig 8. Start Delay

6:6 Set Alarm levels with AUTOSET

The AUTOSET command performs a measurement of the actual motor load and automatically sets the relevant Alarm levels depending on the selected monitor function.

Protection (Monitor function window 5)	Alarm	Margin Value (Default margins)	Margins (Windows)	Alarm Level at AUTOSET
OVER- and UNDERLOAD (Default)	MAX Main-Alarm	16%	21: MAX Main Alarm margin	Normal machine load+Window 21
	MAX Pre-Alarm	8%	22: MAX Pre-Alarm margin	Normal machine load+Window 22
	MIN Pre-Alarm	8%	23: MIN Pre-Alarm margin	Normal machine load-Window 23
	MIN Main-Alarm	16%	24: MIN Main Alarm margin	Normal machine load-Window 24
OVERLOAD	MAX Main-Alarm	16%	21: MAX Main Alarm margin	Normal machine load+Window 21
	MAX Pre-Alarm	8%	22: MAX Pre-Alarm margin	Normal machine load+Window 22
UNDERLOAD	MIN Pre-Alarm	8%	23: MIN Pre-Alarm margin	Normal machine load-Window 23
	MIN Main-Alarm	16%	24: MIN Main Alarm margin	Normal machine load-Window 24

Programming

1. Start the motor and let it run at the normal machine load, until the START DELAY has expired.
2. Press AUTO SET for 3 seconds. This can be done in any window.
3. The display shows "SEt", to confirm that the AUTOSET level has been measured and the Alarm levels have been set. The display reverts to window 01.

4. If the alarm levels are too high or too low, readjust the appropriate MARGINS (see table above) and perform a new AUTOSET. Alternatively, alarm levels can be set manually - see section 7.

6:7 Set the RESPONSE DELAY (Window 32)

A RESPONSE DELAY allows the machine to remain in an over- or underload condition for a specific time before the alarm relays are activated.

Programming

1. Determine in seconds, how long an under- or overload condition is allowed. This depends on machine properties and behavior. This will be the RESPONSE DELAY.
2. Go to window 32 (default = 0.5s).
3. Press – or + to set the determined RESPONSE DELAY time in seconds.
4. Press ↵ to confirm the change.

Example: RESPONSE DELAY

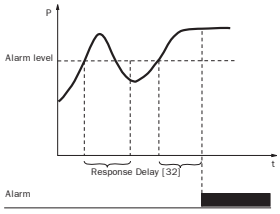

Fig 9. Response Delay

7 ADVANCED FEATURES

Set ALARM LEVELS manually (Window 11-14)

The alarm levels can be set manually, without using the AUTOSET. Also after an AUTOSET has been performed, these levels can be readjusted e.g. for fine-tuning.

Protection (Monitor function window 05)	Alarm levels (Window)	Default
OVER- and UNDERLOAD (Default)	11: MAX Main Alarm	100%
	12: MAX Pre-Alarm	100%
	13: MIN Pre-Alarm	0%
	14: MIN Main Alarm	0%
OVERLOAD	11: MAX Main Alarm	100%
	12: MAX Pre-Alarm	100%
UNDERLOAD	13: MIN Pre-Alarm	0%
	14: MIN Main Alarm	0%

Set MARGINS (window 21-24)

The MARGINS for the AUTOSET can be changed manually. After the adjustment, the AUTOSET action must be performed once again to activated the new margins.

Protection (Monitor function window 05)	Window	Default
OVER- and UNDERLOAD (Default)	21: MAX Main Alarm margin	16%
	22: MAX Pre-Alarm margin	8%
	23: MIN Pre-Alarm margin	8%
	24: MIN Main Alarm margin	16%
OVERLOAD	21: MAX Main Alarm margin	16%
	22: MAX Pre-Alarm margin	8%
UNDERLOAD	23: MIN Pre-Alarm margin	8%
	24: MIN Main Alarm margin	16%

Set HYSTERESIS (Window 33)

The HYSTERESIS of an Alarm level prevents the alarm relay "chattering" if the load fluctuates even in a normal "stable" condition . Apply also for pre-alarm. This feature is normally only used if the "Main Alarm Latch" (Window 61) is set to "OFF". Default = 0%.

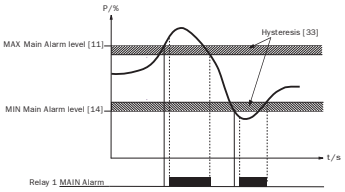

Fig. 10 Hysteresis

Set MAIN ALARM LATCH (Window 61)

The MAIN ALARM LATCH keeps the MAIN ALARM output active, even if the alarm condition has been removed (relay R1). A latched alarm output can be reset by:

- the reset key
- external reset via Digital input (see window 81).
- switching of the power of the monitor (see also "Wiring").

Default = OFF.

Set ALARM AT NO MOTOR CURRENT (Window 62)

The "ALARM AT NO MOTOR CURRENT" gives an alarm if the motor current becomes zero (ON). Default = OFF (No alarm at no motor current).

Set RELAY OUTPUTS (Window 63 and 64)

The RELAY OUTPUTs R1 and R2 can be set to NO or NC contacts.

Note!
If the power to the load monitor is switched off the relay contacts are allways in the NO.

Set DIGITAL INPUT (window 81)

The DIGITAL INPUT can be set for:

RES: External RESET (Default)	to reset an Alarm.
AU: External AUTOSET	to perform an AUTOSET with an external command.
bLo: Block Pre-Alarm	to block the Pre-Alarm function and start the Block timer. If the input is high a Pre-Alarm is blocked, e.g. it is neglected. See also window 82.

Set BLOCK TIMER (window 82)

To set the timer for the blocking time after the Block command is released (see also window 81). Default = 0.0 sec.

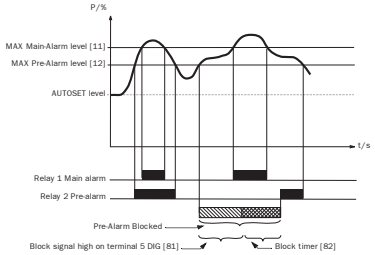

Fig 11. Block timer

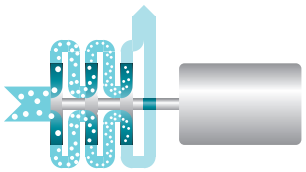
PBU

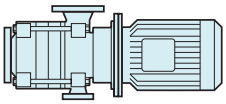


Multiphase
PBU LBU

Horizontal centrifugal pumps for the transport of liquid-gas mixtures and for the enrichment of liquids with gases. A dispersion with very fine bubbles is being achieved. Therefore the multiphase pumps are also acting as dynamic mixer with high shearing forces.

Some main applications are water and wastewater treatment, dissolved air flotation, neutralization, biofuel plants, bio-reactors, ozonation, crude oil water separation on oil fields and oil rigs as well as general process technology.

Other types:



LBU

Advantages

- **High Energy-Efficiency**
  - optimal enrichment and mixing of liquids with gases
  - high degree of dispersion
  - low velocity of flow
  - optimized impeller approach flow
  - low internal friction losses
- **Technical Superiority**
  - open impellers without axial thrust
  - compensation of radial forces by means of diffuser
  - direct gas input acc. to VDMA 24430
- **Process Reliability**
  - gas contents up to 30 %
  - stable creation of micro bubbles
- **Easy Installation**
  - modular construction for customized solutions
  - bloc-design
- **Application**
  - operating pressure up to 40 bar
  - temperature -40° C to +140°C
  - viscosity up to 115 mm²/s

wastewater treatment
DAF dispersion flotation ozonation
micro bubbles
biological sewage works

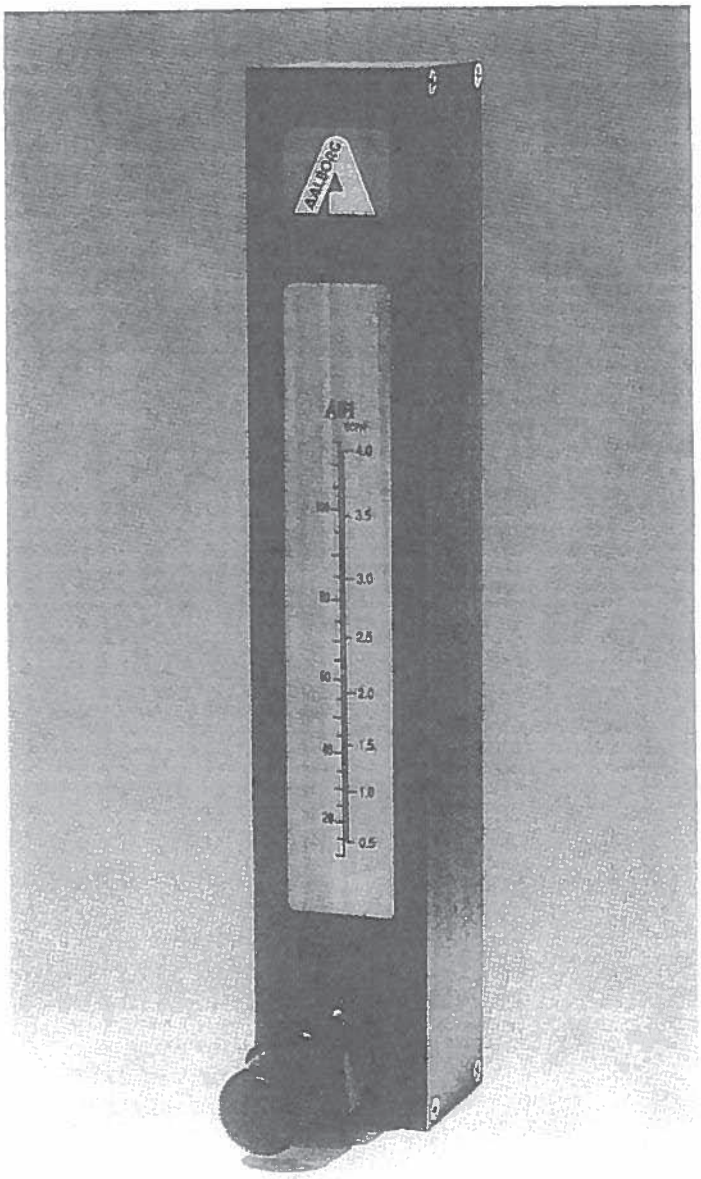
V MEDIUM RANGE PTFE FLOW METERS

Incorporating traditional variable area precision glass technology, these rugged PTFE flow meters offer accurate and economical solutions to medium flow range measurements. **V meters** are designed with unique rotatable scales of dual air-water direct reading graduations showing SCFM and SLPM (air), as well as GPM and LPM (water) markings.

LEAK INTEGRITY

Flow meters are individually tested on a Mass Spectrometer Leak Detector and certified to a leak integrity rating of 1 X 10^{-7} sccs Helium or better.



SPECIFICATIONS

SCALES	Rotatable, direct reading air, (SCFM-SLPM) and water (GPM-LPM). Scale length is 127mm (nominal).
ACCURACY	±5% of full scale.
MAXIMUM TEMPERATURE	150°F (65°C.)
MAXIMUM PRESSURE	100 psig (6.7) bars.
CONNECTIONS	3/8" NPT female in line or horizontal rear.
LEAK INTEGRITY	Individually leak tested and certified.

MATERIALS OF CONSTRUCTION

TUBE SHIELDS	Polycarbonate.
FLOW TUBES	Heavy walled precision formed borosilicate glass.
FLOATS	PTFE.
WETTED PARTS	PTFE, PCTFE.
SEALS	PTFE.

FLOW METER INSTRUCTIONS

GENERAL INFORMATION

Inspect instrument for possible visible damage resulting from shipping. Notify UPS or other carrier as well as the distributor where the flow meter was purchased of any claims.

Flow meters always must be installed in a vertical position, any significant deviation from vertical will affect the readings.

Valves should be closed before installation and opened gradually after all connections are carefully inspected. A leak test is highly recommended especialy when hazardous fluids are involved.

CAUTION: Excessive tightening of valves may damage the orifice.

It is important that all lines to be connected to the flow meter are purged of any dust or other residual contamination prior to installing the meter. All P and S style flow meters are equipped with a filter in the inlet port. In some applications an additional filter should be installed at the inlet of the flow meter.

STICKING FLOATS

Before installing open the valve of the flow meter and check to make sure that the float or floats are moving freely in the flow tube. This is best done by slowly tilting the flow meter from horizontal to vertical while observing if the float is rolling freely.

All meters are thoroughly inspected at the factory prior to shipping and are sealed in polyethylene bags to prevent dirt from entering into the flow passages. Certain small bore flow tubes have a clearance between the float and the inside walls of the flow tube of only a few ten thousandths of an inch. In some cases these flow tubes are found to have floats that are sluggish of not moving due to condensation resulting from temperature changes during shipping.

It is advisable to blow a dry clean gas through the meter to free float.

SAFETY INFORMATION

P and S style flow meters are designed to be operated at pressures not exceeding 200 psig (13.6 bars), or temperatures not exceeding 250 degrees F (121deg.C).

T style flow meters are designed to be operated at pressures not exceeding 100 psig (6.8 bars), or temperatures not exceeding 150 degrees F (65.5deg.C).

NOTE: When using a T style PTFE flow meter, at a pressure and/or temperature greater than standard the leak integrity approaches 1x10. Standard conditions are considered to be 14.7 psia (1 bar) and 70 degrees F (21deg.C).

All meters are factory tested for leakage prior to shipping. For hazardous fluids the flow meter must be re-tested at the time of installation in the system, prior to usage. It is also important that a leak integrity test is performed periodically to maintain safe operating conditions.

Flow meters must be protected from breakage due to external conditions such as objects bumping into or hitting the instrument, extreme vibrations, or attack by corrosive materials. It is the responsibility of the customer to acquaint the operator(s) of this flow meter with all appropriate safety information.

VALVE ALIGNMENT

The built-in needle valve may be positioned at either the inlet or the outlet of the flow meter. Valves are factory installed at the inlet of the flow meter unless otherwise requested.

APPLICATION	VALVE POSITION
Exhaust pressure at Atmospheric conditions	Valve at Inlet
Exhaust pressure other that Atmospheric conditions *	Valve at Outlet
Vacuum	Valve at Outlet
Liquid flow	Valve at Inlet or Outlet

*When using a flow meter with exhaust pressure greater than atmospheric conditions the standard calibrations can not be used. A calibration for the operating pressure must be obtained.

OPERATING INSTRUCTIONS

Close valve (if applicable) before initial use, then pressurize the system.

Slowly open the valve until the float is at the desired flow rate. The flow rate is read at the center of the float.

FLOW TUBE INSTALLATION OR REMOVAL

Remove the Front Shield and Back Plate. **Do not** remove the side panels from the flow meter.

To remove the flow tube:

P style meters: insert a 5/32" hex wrench into the Pressure Nut at the top of the flow meter. While holding the flow tube between your thumb and forefinger, turn the wrench counter clockwise to release the flow tube. Carefully remove the flow tube as not to damage it.

S and T style meters: insert a 3/32" diameter rod in the holes of the Lock Nut at the top of the flow tube. While holding the flow tube between your thumb and forefinger, turn the tool clockwise to release the flow tube. It may be necessary to push the Tube Adapter into the upper block to remove the flow tube.

To reinstall the flow tube reverse the above procedure. Take care to assure that the flow tube is centered, in the meter, at the top and bottom before tightening.

T style meters require additional tightening to insure proper sealing at the flow tube ends. The flow meter should be tightened again 24 hours after the initial tightening.

A leak integrity test is recommended after disassembling any flow meter.

FLOW TUBE CLEANING

If necessary, remove the flow tube from the frame as explained above, and clean as follows:

Insert a plastic rod that will fit into the flow tube with no obstruction, into the bottom of the flow tube and push the retaining plugs and float out of the flow tube. Use tweezers to handle the float and store the float and the plugs in a lint free container. Before removing note the position of the plugs for reference when reassembling.

Using a suitable solvent clean all the parts including the flow tube, dry them by means of a clean stream of air or gas.

To reassemble the flow tube use the push rod to first install the lower plug, next insert the float and then the upper plug.

Test by slowly tilting the flow tube from horizontal to vertical to assure that the float is moving freely. If the float is free follow the instructions above to reinstall the flow tube in the frame.

MAINTENANCE

Under normal operating conditions no special maintenance is required. Dirt or contamination may create problems within the flow tube by causing a restriction in the flow passage. Such conditions can be diagnosed by examining the flow tube. The most obvious indication of obstruction is the float being stuck in the flow tube. If the existence of the contamination is determined the condition may be rectified in a number of ways. The easiest being (if possible), to disconnect the inlet and the outlet of the flow meter and purge the instrument by using a clean and dry stream of gas. The action of the float within the bore of the flow tube very often causes particles to be dislodged through the outlet of the flow meter.

industries served

ISLIP Flow Control products are designed to exacting specifications, and manufactured to the highest standards, resulting in an extensive range of flow controls that are built for dependability, and years of use. IFC's products are found around the globe. From Arizona to Australia, and Singapore to Saudi Arabia, ISLIP is there. We are the manufacturer of choice for professionals who know that quality, service and dependability equal success.

- **Metals & Mining**
- **Pulp & Paper**
- **Oil & Gas**
- **Exploration**
- **Chemicals**
- **Water Treatment**
- **Power Generation**

Whether it is a generating station or water authority in North America, a refining plant in Chile or offshore explorations in Vietnam, IFC delivers solutions.

ISLIP FLOW CONTROLS Inc.
Our Knowledge Sets us Apart.#

For Strainers, Valves and Pipeline Accessories.

Our *Knowledge* Sets Us Apart.

ISLIP Flow Controls is the industry's answer for full-service solutions. We are the knowledge leaders you can depend on to resolve your flow control challenges in the industrial, oil & gas, petrochemical, HVAC and commercial industries.

Working with us means working with a front-line business partner you can trust. It is a customer-focused approach that has made us the manufacturer of choice for Strainers, Valves and Pipeline Accessories. It's exacting professional performance that delivers quick response and exceptional service. And, it is the benefit of intelligent people who have the experience and expertise to create workable solutions tailored to you and your business, project by project.

what sets us apart ?

At ISLIP Flow Controls, we have built an entire company on our dedication to quality. It isn't just our superior products and competitive prices that have made us the manufacturer of choice for users on five continents, it is so much more.

"They speak our language. We like their expertise and understanding of the business…"
Vanessa Nugent, Fluor Canada for the Imperial Oil ULSD Project

It's superb personal service, exacting detail, and a precise knowledge of the industries we work with. We offer solutions that are as individual as we are.

"ISLIP has the answers. They're not afraid to take on the challenge of new applications…"
Amy Ng, Delta Fountains

It's the kind of dependable advice and prompt response that's there when you need it most. With us, expertise and a new solution are just a call away.

"ISLIP offers instant, direct contact…" FMC Smith Meter, Guy Roussel-Dupre

And, it's commitment you can count on. We stock what you need; we ship on time.

"We often get same-day pick up. There's a good inventory. They're easy to work with…"
Greg White, Industrial Mine & Pipe

products

All ISLIP Flow Control products are strictly manufactured and tested in accordance with applicable ASME and CSA standards as well as specific customer requirements.

Visit us online at **www.islipflowcontrols.com** for comprehensive details specifications on all our products. Find helpful downloads, catalogues on all the products we offer, and important certification documents. We will even help you find the right product for your individual applications with our convenient on-line Help List specifier.

When you work with IFC, you'll receive quality products that arrive on time and within budget. They are supported by certifications that carry the kind of assurance you can depend on, backed by a staff of experts who are there when you need them.

IFC manufactures and stocks a full line of Flow Control Products. Most product lines are available in sizes up to 60" in diameter and pressures up to 10,000 PSIG. Readily available and stocked materials of construction are cast and ductile iron, bronze, carbon steel and stainless steel in pressure classes 125 lb through 1500 lb. For extreme and special operating conditions, products manufactured from special alloys can also be supplied.

Ball Valves – One-Piece, Two-Piece & Three-Piece

Temp. Cone, Basket & Plate Strainers

Butterfly Valves – Resilient Seated & High Performance

Silent Check Valves

Dual Disc Check Valves

Duplex/Dual Basket Strainers

Rubber Connectors

Y Strainers

Basket/Simplex Strainers

Suction Diffusers

Triple Duty Valves

Custom-Fabricated Strainers and Valves, including IFC's Self-Cleaning Strainer

who we are

With over 30 years experience, professionals have made ISLIP Flow Controls their number one choice for Strainers, Valves and Pipeline Accessories.

Since founder David Islip formed the business, we have maintained a family company with family values: integrity, commitment to superior service, dedication to solving problems and a continuing responsibility to develop the best products in every market we serve. It is this kind of expertise that allows us to give our customers the buying benefits of a big business and the personal attention of small enterprise.

the ISLIP network

Choosing ISLIP Flow Controls means selecting the style of service you prefer most – working directly with the in-house experts at our Head Office or dealing face-to face with our appointed agents. No matter the choice, you can depend on industry experience and the kind of know-how it takes to solve the toughest problems.

Rest assured local IFC Master Distributors and Representatives are trusted professionals, who carry the face of ISLIP Flow Controls into every business they visit, providing the links that help us play a vital role in day-to-day success in markets across the country, and around the world. They serve as support to Specifiers, Contractors and Engineers, and work on our behalf to introduce IFC products to new markets. With a ready-to-access inventory of our entire product line, your local ISLIP Master Distributor can make a genuine difference on a project when dollars and cents really count.

our promise

Islip Flow Controls has redefined the meaning of exceptional quality and outstanding service. In fact, we have made it a part of how we do business every day. It is our Continuing Commitment to Customer Care and it means we go the extra mile to make sure we always exceed your expectations.

Count on us for

- **Friendly knowledgeable help that's there when you need it**
- **Dependable quality**
- **Delivery that's on-time**
- **Competitive pricing**
- **Customized engineering solutions**

We are your professional resource just a call or click away.

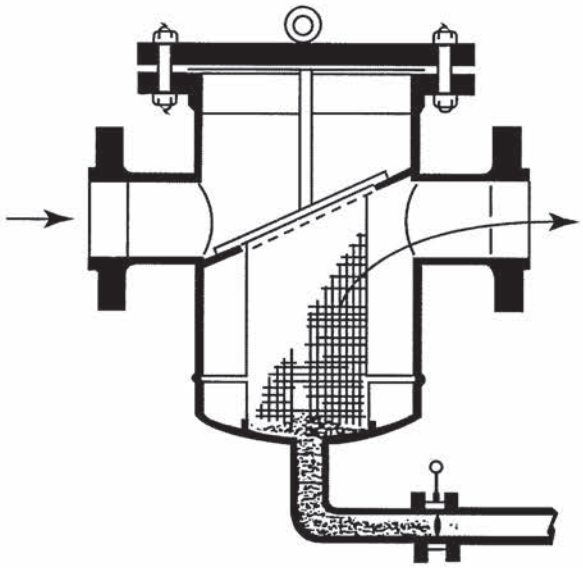
ISLIP FLOW CONTROLS DWG. No.: D–10874–B

SHEET No: 1

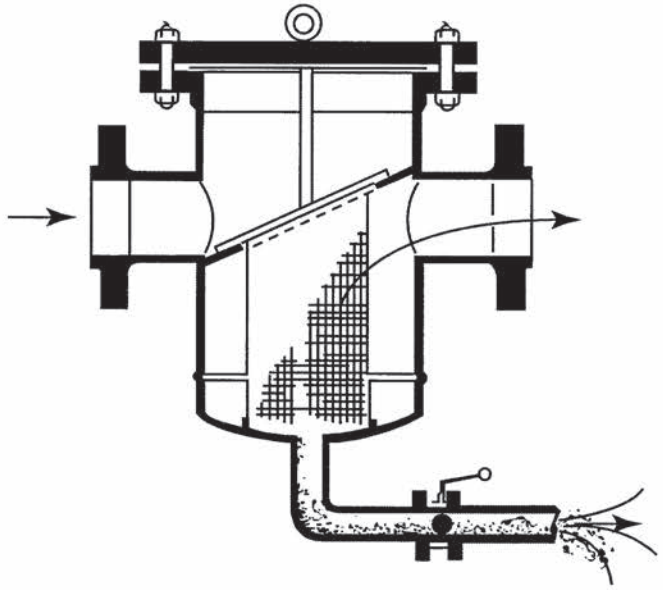
REV: 0

BACKFLUSH/BACKWASH OPTION:

Custom Fabricated simplex and duplex strainers are available with this important option.



(A) Valve closed - dirt accumulated



(B) Valve open - dirt removed thru backwash piping.

In many systems, particularly where solids are heavy and well defined, dirt accumulates as shown above (A). When the backflush valve is open, (B), the differential pressure between the operating pressure and the backflush system removes the dirt, all without shutting the system down. This simple process is referred to as backflushing.

Backwashing occurs when backflushing is supplemented by fluid flowing, under pressure, in the reverse direction into an empty strainer. This flow reversal backwashes the element and removes the residual dirt. Backwashing is often regarded as a second step, used to remove dirt not removed by backflushing.

STEAM JACKET OPTION:

Custom Fabricated simplex basket and tee strainers in all sizes are also available with this option. This modification is designed to have no impact on the function or normal maintenance.

Steam jacketing is available in carbon steel and 316SS for service up to 450°F. Steam jacketing is used to maintain critical fluid temperatures through the strainer. High temperatures are often required to process and transport high viscous fluids.

- Longueur filetée totale / *Total threaded lenght* = **30 mm ± 0,5 mm**
- Longueur minimum sous contre écrou (y compris filetée) = **20 mm dont 17 mm de filet** / *Minimum Lenght after installing the locknut (thread included* de filetage / *20 mm of which 17 of thread*

Note : Les diffuseurs d'eau blanche sont fabriqués par moulage. Les moules ont été spécialement ajustés afin d'assurer une étanchéité parfaite (sans Loctite) avec l'emploi d'adaptateurs avec manchon taraudé femelle Simona (www.simona.de), détail en annexes. L'emploi de Loctite (ou équivalent) est néanmoins vivement recommandé afin de prévenir tout risque de fuite et de desserrement des buses.
Note: Nozzles are molded. The casts have been designed to ensure a leak free connexion, without sealant (Loctite for example) when screwed on a Simona coupling (www.simona.de), details in annexes. Sealant (Loctite or similar) is however highly recommended to prevent any leakage and the nozzles to loosen.

This document contains confidential information which is the property of OTV. It shall not be reproduced or used without the express prior written authorization of OTV.

- Contrôle de la matière des diaphragmes/ ***Material check diaphragms*** : PPE+PS blend (Noryl® 731)
- Contrôle de la matière cône, Manchon et contre écrou : **Polypropylène** / *Material check cone, coupling and loknut:* ***Polypropylen***

<u>Contrôle dimensionnel sur les cotes fonctionnelles / *Principal dimensions check* :</u>

Vérification des cotes fonctionnelles au pied à coulisse, jauge de profondeur, pige.
Contrôler que les cotes fonctionnelles sont dans les tolérances : ± 0,05 mm pour les orifices principalement.
Check that the principal dimensions are according to the tolerances: ± 0,05 mm for the orifices. Use a vernier caliper, and a gauge.

<u>Précautions de stockage / *Storage precautions* :</u>

Les diffuseurs ne doivent pas être stockés en exposition directe à la lumière du soleil : le matériau s'oxyde et devient cassant (les flottateurs doivent être couverts, mais prendre garde également lorsque les buses sont installées). Malgré la bonne résistance à la chaleur du **PP (jusqu'à 70°C),** il est également recommandé de veiller à ne pas les stocker à des températures trop élevées afin de ne pas déformer les diffuseurs. Précaution d'autant plus valable que l'installation est faite dans des pays au climat désertique.
The nozzles should not be stored under direct sun light: material is getting fragile (floatators must be covered, but be careful when the nozzles are installed). Also, despite the good heat resistance of the material ***(up to 70°C),*** *it is recommended not to store them at high temperature so they do not loose their shape. This is specially the case for desert area.*

NOTICE D'INSTRUCTION D'UTILISATION
UTILIZATION GUIDE

Instruction de montage / *Installation instructions* :

➢ Outils nécessaires / *Tools* :

1. Outil spécifique (cf. Annexes). Se rapprocher d'Opalium pour se procurer cet outil. / *Specific tool (cf. Annexes). Opalium is supplying this tool.*
2. Loctite 5331 (à conserver entre 8 et 21 °C) ou similaire (vérifier les conditions de stockage) / *Loctite 5331 (to be stored between 8°C and 21°C) or similar.*

➢ Vérifications d'avant montage / *Preparation* :

1. Vérifier l'état général de la buse, qu'elle ne soit pas abimée (oreille cassée ou pliée), qu'il n'y ait pas de détritus à l'intérieur. Vérifier également le manchon de la rampe de distribution. / *Check the general aspect of the nozzle: clean, no damage (ear not bended or broken for example). Also check the coupling on the distribution pipe.*
2. Vérifier que le diaphragme à 6 trous est visible depuis le cône et celui à 1 trou depuis le manchon. SI cela n'avait pas été fait à la réception du produit, vérifier l'ébavurage de l'orifice unique. / *Make sure that the diaphragm with 6 holes is clearly visible from the cone and the one with hole from the coupling. In case this was not done at the reception of the equipment, check the drilling of the holes, as shown above.*
3. Vérifier que le cône est correctement serré dans le manchon (serrage complet, pas d'ergots l'un sur l'autre : ces ergots, situés sur le cône et le manchon, empêche les 2 parties de se desserrer). / *Check that the cone is correctly screwed on the coupling: complete screwing, no fin on top of each (fins are the small triangle parts that prevent the cone and the coupling to unscrew).*
4. Vérifier, à l'aide de l'outil, que le contre-écrou est bien serré sur la partie haute du manchon. / *Check that the locknut is correctly screwed on the top part of the coupling.*

➢ Installation / *Installation* :

1. Appliquer la Loctite (ou similaire) sur les deux parties à visser (manchon du diffuseur et manchon de la rampe de distribution). / *Apply the Loctite (or equivalent) on both couplings (nozzle and distribution pipe).*
2. Commencer à serrer à la main le diffuseur dans le manchon de la rampe de diffusion, en prenant garde à l'insérer droit. / *Start by manually screwing the nozzle to the distribution pipe. Pay attention to screw vertically.*
3. A l'aide de l'outil, serrer le diffuseur (placer l'outil sur le manchon du diffuseur). Le couple de serrage maximal est de 10 N.m. / *Set the tool on the coupling of the nozzle (not the locknut) and tight it Maximum torque is 10 N.m.*
4. Vérifier, à l'aide de l'outil, que le contre-écrou est bien serré sur la partie haute du manchon. / *Check that the locknut is correctly screwed on the top part of the coupling.*

Ce document comporte des informations confidentielles propriétés d'OTV. Il ne peut être reproduit ou utilisé sans autorisation écrite d'OTV.
This document contains confidential information which is the property of OTV. It shall not be reproduced or used without the express prior written authorization of OTV.

➢ Précautions / *Precautions* :

1. Ne pas utiliser les oreilles du cône à des fins de serrage. Elles sont fragiles, et risquent de se déchirer ou casser. Il ne faut pas utiliser de buses dont les oreilles ont été endommagées. / *Do not use the ears of the nozzles to screw. They are fragile and could break. Nozzles with damages ears shall not be used.*
2. Ne pas utiliser de pinces multiprises ou tout autre outil à dents pour faire le serrage. Les dents endommageraient le diffuseur. Utiliser uniquement cet outil spécifique ou faire le montage manuellement. / *Do not use a pair of pliers or a pipe wrench to tight the nozzle. Such tools would irreversibly damage the nozzle. Only use the specific tool or install them manually.*

➢ Démontage / *Disassembly* :

Pour dévisser le diffuseur de la rampe, utiliser l'outil spécificque sur le manchon du diffuseur. Il est conseillé de limiter les serrages / desserrages des diffuseurs pour ne pas les endommager. Penser à nettoyer les résidus de Loctite. / *To disassemble the nozzle, use only the specific tool employed for the installation. It is recommended to limit the number of installation / removal in order not to damage the nozzle. It also highly recommended to clean the couplings from residual Loctite.*

Les diffuseurs en eux mêmes ne sont pas démontables. Les ergots entre le cône et le manchon seraient endommagés si l'utilisateur tente de desserrer les 2 parties. / *The different parts of the nozzle cannot be disassembled. The fins between the cone and the coupling would be damaged, and become useless for further utilization.*

➢ En cas de problème / *Troubleshooting* :

L'une des causes de chute rapide de la pression et d'augmentation du débit de l'eau blanche peut être le desserrage puis expulsion ou même la casse d'un diffuseur. S'ils ne surviennent pas à la mise en route de l'ouvrage, ces 2 phénomènes sont peu susceptibles d'apparaitre, grâce à l'emploi de Loctite. / *One of the reason why white water pressure could drop, and flow increase is the damage of the nozzle. It could be loosening and ejected or even broken. These 2 phenomena are most likely to occur at the start up of the plant, thank to the use of Loctite.*

Au contraire, si le débit d'eau blanche diminue et la pression augmente, cela peut être dû au colmatage d'un orifice des diaphragmes après un long arrêt (coquillage par exemple en utilisation eau de mer). / *On the other hand, if the flow is reducing but the pressure increasing, this could be due to the clogging of the diaphragms. This could eventually happen after a long break if the white water system was not flushed. Shells could have developed inside it in the case of seawater.*

Finalement, il convient de surveiller le fonctionnement des pompes de recirculation pour s'assurer du fonctionnement normal du système d'eau blanche, spécialement après une longue période d'arrêt durant laquelle le circuit d'eau blanche n'aurait pas été vidangé. / *It is recommended to check on the operation of the white water pumps to ensure the good running of the white water system. Changes in flow, pressure or pump frequency could be the sign of a dysfunction.*

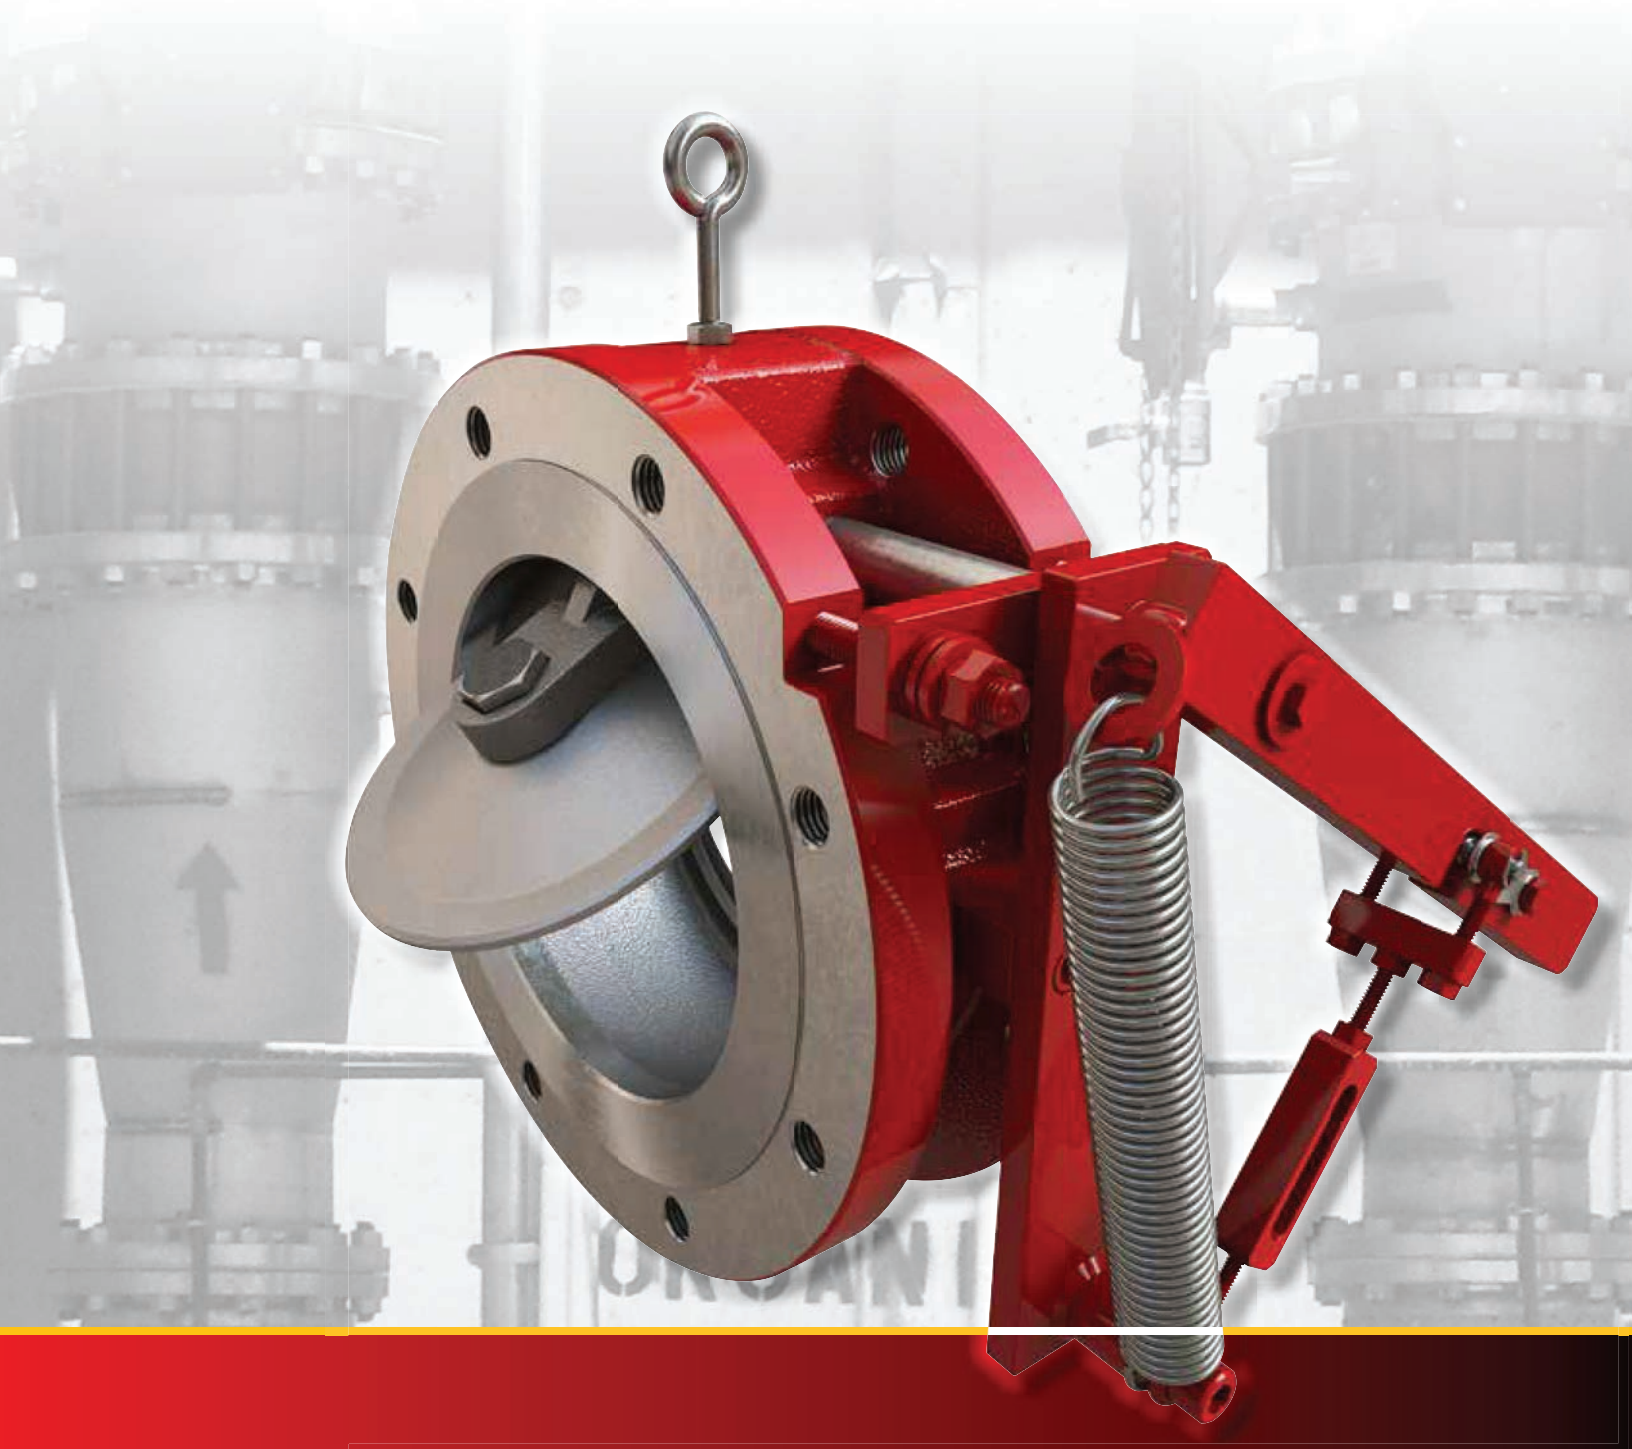
Bray/Rite® Check Valves

1" (25mm) - 60" (1500mm)
ASME Class 125 - 2500



Bray®

WWW.BRAY.COM

YOUR GLOBAL FLOW CONTROL PARTNER™

Rite Corporation, headquartered in Quebec, Canada and founded in 1963, designs and manufactures exceptional Bray/Rite check valves, cam and groove quick couplings, and fluid handling loading and unloading equipment. For over 40 years, Rite has earned a reputation for reliability. This reputation is based on our highest quality manufacturing standards, premium components and thorough control procedures. With a worldwide sales and distribution network, we offer our customers full support wherever the project location.

Our engineers specialize in innovative, individual solutions to industry needs and will assist you with your project requirements. Our knowledgeable sales and support staff are committed to outstanding service and, above all, customer satisfaction. We look forward to recommending a practical and economical solution to your fluid control applications.

Bray/Rite Valves continue to be the premier wafer combination swing check valve. Designed in 1970, their performance remains unsurpassed. The line offers a wide range of valves and accessories, all fully stocked and readily available. Their successful, long term use in applications worldwide has made the Bray/Rite the industry standard for economy, durability and reliability.

State of the Art Check Valves, Bray/Rite is Rite Sized.

Rite's Bray/Rite wafer combination swing check valves are flow–activated and *Rite Sized*. Bray/Rite inlet ports and disc have been shape optimized to achieve a fully open position at low flow rates (3 ft/s on average). Therefore, the Bray/Rite operates exceptionally well in the flow rates typically found in pipelines containing control valves and lines with varying media flows.

Compare the Bray/Rite to typical full-sized swing check valves. Due in part to their oversized, heavier discs, these valves only fully open at an average flow rate of 11 ft/s. When activated at a lower flow rate, these valves loose true controllability and do not fully open. A partially open disc creates an obstruction that produces a higher pressure drop and fluttering of the valve disc – disturbing the flow and increasing the chance of water hammer.

Bray/Rite is *Rite Sized* to eliminate these problems. It has been engineered to accelerate line media through the valve and achieve a virtually unobstructed full opening in low pressure. *Rite Sized*, combined with the limited movement of internal parts during operation, reduces wear – enhancing the long service life of a Bray/Rite valve.

ZERO LEAKAGE Bray/Rite valves, either resilient or metal seated, offer zero leakage in all pressure classifications. Each valve is hydrostatically tested at the factory and shipped with a certificate of compliance to MSS SP61. Rite has achieved zero leakage metal-to-metal sealing by a proven, engineered design backed by high quality manufacturing craftsmanship. As the disc closes toward the seat, the increased velocity of the line media and the unique shape of our seat remove all particles from the sealing surfaces – ensuring zero leakage.

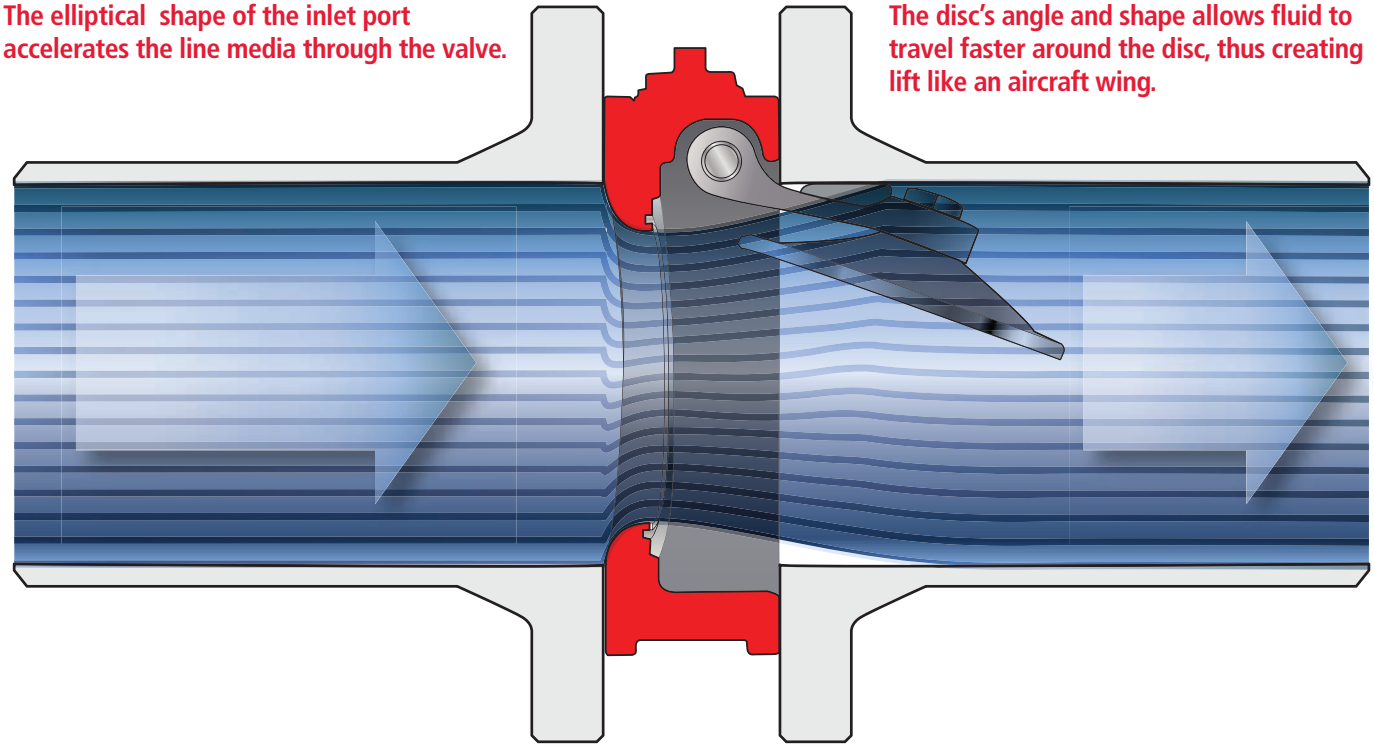
LOW PRESSURE DROPS The low pressure drop of the Bray/Rite valve was achieved by Rite's many years of research and development in combination with universities and federal research agencies. Several theses and papers were published including *Minimizing the pressure loss of wafer type swing check valve ASME 79/MA-NE-5*. These results – primarily the optimum valve diameter and elliptical inlet shape – have been incorporated into the Bray/Rite design. Like a venturi, the aerodynamic shape accelerates the line media through the valve with the lowest possible pressure drop. Pressure drops at the full open position are between 0.5 to 0.7 psi for all size valves. Additionally, the disc shape and mass have been optimized to use the pipeline media flow as a lifting force on the disc, thus allowing a full open valve position in low line velocity.

HIGH FLOW CAPACITY Bray/Rite's valve inlet elliptical shape and optimum diameter, plus its virtually unobstructed opening combine to produce a substantially higher flow capacity (C_V) than other wafer combination swing check valves.

REDUCED WATER HAMMER An additional focus of Rite's R&D program was linked to Water Hammer Prediction. Findings were applied in the design of the valve to largely reduce or eliminate water hammer by closing the valve at the right moment (before reverse flow occurs). The Bray/Rite uses gravity, assisted by an internal spring, to pull the disc toward the closed position on decelerating line media flow. Rite has developed proprietary predictive software to select the best solution for your specific application.

The elliptical shape of the inlet port accelerates the line media through the valve.

The disc's angle and shape allows fluid to travel faster around the disc, thus creating lift like an aircraft wing.



THE RITE ADVANTAGES

Bray/Rite SEATS Zero leakage shut off, even at 0 psi, is achieved through lapped metal seating surfaces. The seat and the disc edges are precisely machined then hand polished for a perfect fit. The disc hinge provides an even force at the disc to seat contact point, ensuring a uniform seal. Controlled tolerances maintain the proper disc to seat alignment. The spring assisted closure tension holds the disc in place when line pressure is removed.

RESILIENT SEATS A dynamic, O-ring seat is contained in a specially designed body groove. As line pressure is applied, the valve disc uniformly compresses the seat into the groove ensuring a zero leakage seal. The seat is easily replaced, simplifying maintenance.

METAL-TO-METAL SEATS Integral metal seats feature an engineered and precision machined angle that minimizes the metal-to-metal contact point between the disc and seat for a perfect seal. Pressure is applied evenly over the disc, eliminating galling and reducing wear.

METAL SEAT INSERT Carbon steel and ductile iron bodies have a stainless steel seat inserted into the body seal area, offering the same precision design as the integral metal-to-metal seat. These bodies are also available with a Resilient Seat Insert.

INHERENTLY FIRE SAFE All Bray/Rite valves are inherently fire safe due to the valve design, materials and construction. In the event of a pipeline fire, both resilient seated and metal seated valves provide metal-to-metal contact between the seat and disc and surpass all leak test standards.

Pressure Drop with Water

Valve Size	Cv	Min Flow to Fully Open Valve		Approx Pressure Drop w/ Water
Inch/ mm		GPM	Ft/ sec.	PSI @ 10 ft/sec.
1 / 25	30	28	10.4	0.78
1.5 / 40	38	68	10.7	2.1
2 / 50	84	46	4.4	1.7
2.5 / 65	137	76	5.1	1.4

60 / 1,500	70,500	62,800	6.2	1.1

Notice the full open stable minimum velocity and the efficiency calculated at a normal velocity of 10 f/sec.

Resilient Seat

Metal-To-Metal Seat

Metal Seat Insert

The convex profile of the disc reacts to line flow like an airfoil. The velocity above the disc is higher than the velocity below, thus effectively creating lift.

PUMPING COST SAVINGS Pumping costs have been often overlooked but are now gaining in importance due to the increasing cost of energy. With Bray/Rite's long service life, its cost is actually insignificant to the end user compared to the energy lost pumping the fluid through the valve. Below is a comparison between different valve styles, assuming all valves are 100% open.

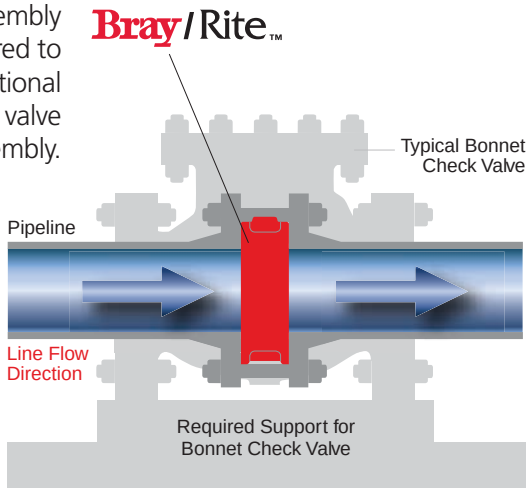
Yearly Energy Costs Comparison At 10 F/S - $0.10/kWh

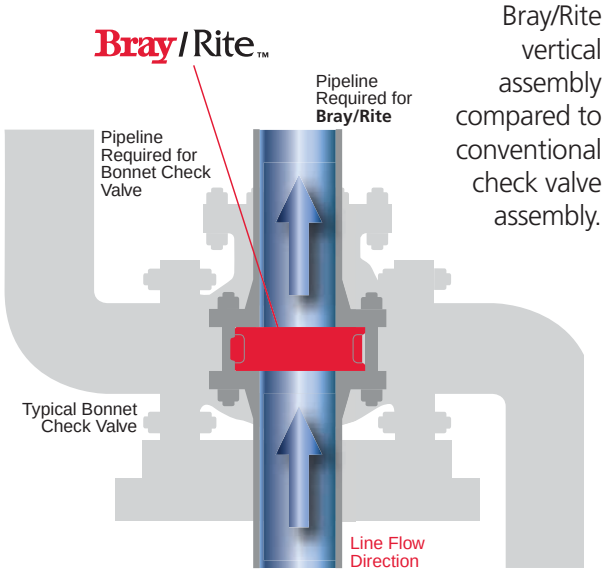
VALVE SIZE / INCHES	2	2.5	3	4	5	6	8	10	12
Bray/Rite	$42	$66	$99	$174	$250	$254	$635	$872	$1,113
Tilting Disc	$50	$66	$102	$161	$250	$272	$425	$606	$739
Center Guided "Silent"	$115	$214	$339	$608	$1,002	$1,409	$2,541	$4,006	$3,447
Full Size Swing Check	$57	$66	$99	$191	$250	$415	$680	$1,002	$1,347
Dual Door	$218	$209	$314	$441	$491	$707	$979	$1,118	$1,282

HORIZONTAL / VERTICAL INSTALLATION

Unlike most conventional check valves, Bray/Rite wafer combination swing check valves are ideal for both horizontal and vertical pipeline installation – requiring only a single line for operation. This greatly increases pipeline layout flexibility and significantly reduces costs. In vertical installations, typical swing check valves must have an offset pipe section installed since these valves only function in a horizontal position. **See factory for vertical down applications.**

Bray/Rite horizontal assembly compared to conventional check valve assembly.

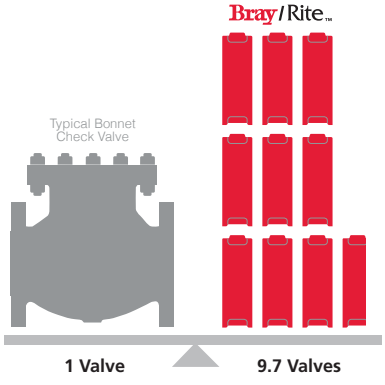




Bray/Rite vertical assembly compared to conventional check valve assembly.

LIGHT WEIGHT & REDUCED SIZE Installation costs are greatly reduced by Bray/Rite's light weight and minimal space requirements. Their compact design minimizes the distance between faces and are easily installed between all flanges.

Bray/Rite valves do not require added support to maintain pipeline integrity and need only 30% of the space of typical full size swing check valves.



THE RITE ACCESSORIES

Bray/Rite has designed and manufactured an extensive range of accessories for specific applications.
Some commonly used accessories and a PVC body uniquely designed for a specific application are shown below. Bray/Rite valves can be fitted with any one or a combination of accessories, including safety caging.

EXTERNAL LEVER & SPRINGS (SA-01)

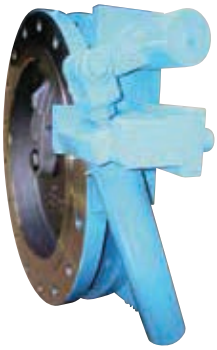
Provide additional external force to anticipate closure in applications where rapid media flow reversal requires the valve to close faster than standard.

Applications: Pump protection when pumping in parallel into a common header.

DUAL WEIGHTS (SA-10)

Two opposing weights, one to adjust cracking pressure and one to counter balance the disc.

Applications: Insures valve is fully open on very low flows.



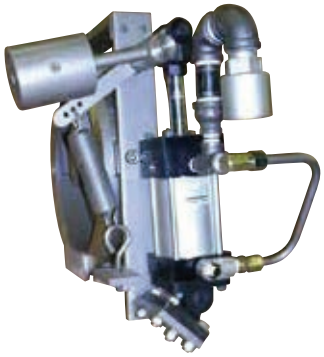
EXTERNAL LEVER & COMPRESSION SPRING (SA-40)

Provide additional force to anticipate valve closure, using an enclosed compression spring, in applications where rapid media flow reversal requires the valve to close faster than standard.

Applications: Pump protection when pumping in parallel into a common header, where spring force required is higher than a SA-01 or if an enclosed spring is preferred.

HYDRAULIC PNEUMATIC SPEED CONTROLS (H-100, SA-50)

Slow the opening of the valve to protect the disc assembly in the last few degrees of travel. These units offer adjustable speed control and are ideal in fluctuating flow applications. The H-100 uses the SA-01 spring. The SA-50 uses the SA-40 compression spring.



EXTERNAL LEVER & WEIGHT (SA-16)

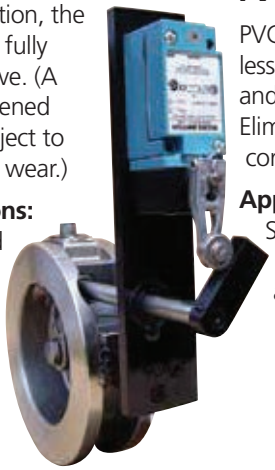
Provide additional external mass to increase the cracking pressure (pressure required to open the disc) and increase the closing force of the moving disc.

Applications: Where increased cracking pressure is required. Waste Water service or where suspended solids are present in the process (the weight will insure inertia induced positive closure). Relief valve with adjustable cracking pressure.

LIMIT SWITCH (SA-2)

Provides remote indication of valve position and a positive indication of flow. If two are installed the first shows the closed position, the second the fully opened valve. (A partially opened valve is subject to premature wear.)

Applications: Automated control systems.



EXTERNAL LEVER, SPRING & WEIGHT (SA-1)

These units use the combination of a weight and spring to add cracking pressure and closing force to the disc.

Applications: Where performing both functions of faster closure and solid handling are required, primarily in waste water

PVC (PEZ SA-4AX)

PVC Body with passivated stainless steel or titanium internals and position indication lever. Eliminates internal body corrosion.

Applications: Used for Salt water, marine life support systems, desalination applications..

SELECTION PROCESS

A **Gather Process Information**
Line Fluid / Pressure / Temperature /Flow Rate / Location / Function

B **Gather Pipe Information**
Size / Material /
Flange Rating / Schedule

C **Select Valve Size** – Based on:
- Full open valve at minimum flow
- or Pipe size

D **Select Design Standard**
- ASME: 125 / 150 / 300
- API 594: 150 / 300 / 400 / 600 / 900 / 1500 / 2500
- PN: 10 / 16 / 25 / 40

E **Verify Conditions**
- Valve full open at minimum flow
- Max velocity 15 f/sec for Liquid
- Max velocity Mach 0.33 for Gas
- Non-reciprocating service
- No accessories required
- Installed with a minimum of 5 pipe diameters upstream and 3 downstream from a disturbance
- Not installed on close coupled multiple pump header

F **Select Model**
If answer is YES to All conditions:
- Select Model 210 (ASME, DIN) Models 201 - 205 (API 594)
- or if ULC FM* approved required select 212 (ASME), 312 (DIN) 2"-12" ONLY

If answer is NO to Any condition:

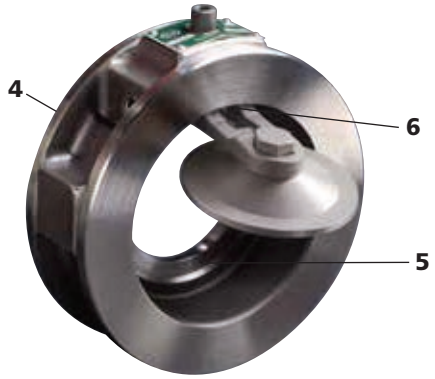
Select Model 260 (ASME, DIN) Models 201 - 205 (API 594)

G **Select Pressure Class and Body, Seat & Spacers Materials, and specific application accessories as required**

ORDERING EXAMPLE

A 6" heavy duty, Class 150 wafer combination swing check valve, carbon steel body with stainless steel inserted seat, stainless steel spacers and an external spring accessory would be written as follows:

06 15 SMZ SA01



SELECTION INFORMATION

Description			Color

* ULC Approved under NFPA No. 11,13,14,15,20,22,24. FM Approved.
** Available in most exotic materials, please consult factory.
*** Inserted pressed-in interference seat at a minimum of 304 SS for carbon steel and ductile iron bodies, or seat is intergral to body.

Note: Spacers are located on both sides of the disc hinge, ensuring a uniform seal.
Note: The standard Bray/Rite is a wafer body style. Flanged Ends, RTJ style and other connections are available, please consult factory.

THE RITE DIMENSIONS

1.0 Introduction to Check Rite Wafer Type Swing Check Valves

Modern piping applications demand better features, performance and economy in a check valve.

Features:

- Simplicity
- Compactness
- Minimum Weight

Performance Characteristics:

- Silent operation
- Non Slamming
- Rapid Response
- Low Pressure Drop
- Bubble Tight Shut-Off

A combination of these features and performance characteristics ensure long service life as characterized by Check Rite.

2.0 Description of Check Rite Valves.

Check Rite valves consist of a compact Body (1) with a single plate Disc (12) attached to a Hinge (2) which in turn is supported by a Hinge Pin (7) inside an off-center body cavity.

The Disc is mechanically biased to the closed position by a torsional Spring (5) located between the two hinge lugs. The Hinge Pin (7) is retained by two NPT Pipe Plugs (8) inside the Body (1). The Seat (3) can be:

- Metal to Metal
- Metal to Buna, Viton or Teflon

An Eyebolt (10) located on the top of the Check Rite valve aids for easy installation.

The Nameplate (11) located on the top pad specifies:

- Size
- Serial Number
- Figure Number (Pressure Class and Materials)
- Ritepro Corporation

Check Rite valves are designed to open when a pressure of less than 1 psi (.07 bar) is applied across the face of the Disc (12).

Check Rite valves are provided for installation inside the bolt circle and between standard flanges, using flat faced asbestos gaskets or as specified.

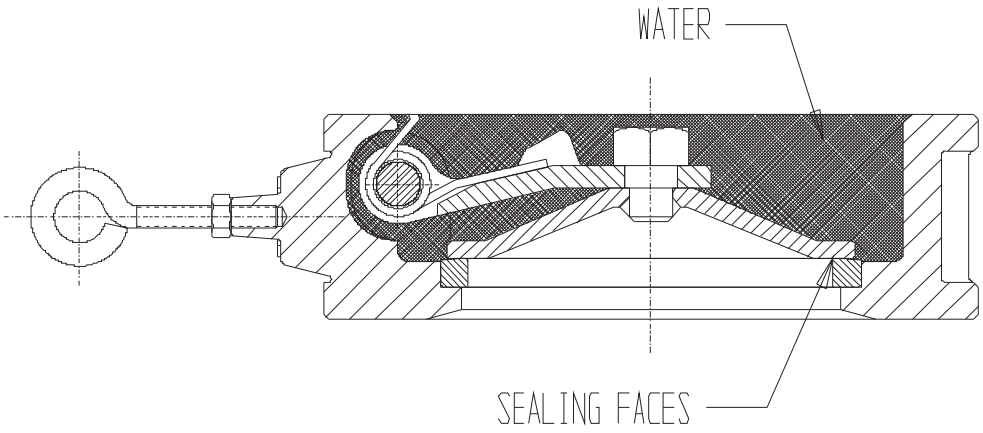
Check Rite valves are normally installed with the Eyebolt pointing vertically upwards in a horizontal run of pipe, with the arrow on the Body pointing in the direction of flow.

> For vertical pipe run applications, the flow direction is the only orientation required in a straight length of pipe.

All Check Rite valves are hydrostatically tested in accordance with MSS-SP-61 test procedures and zero leakage criteria.

In addition a "Zero Head Leakage" test is performed, where the Check Rite valves are placed in a horizontal position (see sketch) with the flow direction pointing vertically upwards.

An internal hydrostatic pressure equivalent to the head of water which can be retained within the downstream portion of the valve body is applied. During this one hour test, no leakage is allowed.



Check Rite valves are manufactured to high quality levels as specified in the applicable standards such as ANSI, MSS, API and CSA.

Check Rite valves in sizes 14" to 42" in classes 125 to 300 and all sizes in the higher pressure classes have a different Hinge-Disc connection which is illustrated on the applicable Specification Sheets.

The standard connection for small valves 2" to 12" classes 125 to 300 is a welded assembly, by means of a Shoulder Pin (4) passing through the Hinge (2) and Seal-welded to the Disc (12). In the larger sizes and higher pressure classes, the Disc (12) is assembled to the Hinge (2) with a Nut (15) and secured by welding.

A heavy duty Hinge (2) is available for valves sizes 2" to 24" in which the Disc (12) is attached to the Hinge (2) with a Nut (15) and a weld is used to secure the components. This is the Model 260-262 valve. All other dimensions, maintenance procedures, and O-Ring sizes apply as stated in this manual.

3.0 Dis-Assembly and Assembly Instructions for Check Rite Wafer Type Swing **Check Valves**

The simple design of the Check Rite valve permits for easy assembly and disassembly.

The following assembly procedure applies to all Check Rite valves.

To Dis-assemble the valve:

a) Place the Body (1) in a horizontal position with the disc assembly showing.
b) Remove the Plugs (8) on either side of the Body (1).
c) Hold the Spring (5) in position and slide the Pin (7) out of the Body (1).
d) Slowly release the pressure on the Spring (5) and remove it from the valve.
e) The Hinge-Disc Assembly can now be lifted from the Body (and disassembled, if required, on large sizes).
f) Remove the Spacers (6).
g) Remove the O-Ring (14) if required.

To re-assemble the valve:

a) Clean all parts with Varsol or other acceptable solvent.
b) Place the Body (1) in a horizontal position with the seating face pointing upwards.
c) If required, insert O-Ring (14) in the seat groove. (See next page for installation instructions).
d) Place the Hinge-Disc Assembly (2,12) in the body cavity.
e) Insert the Pin (7) through the plug hole on either side of the Body and slide a Spacer (6) in between the Body (1) and adjacent hinge lug.
f) Press Torsion Spring (5) between the hinge lugs and body cavity, then advance the Pin (7) through the Spring (5) and the second hinge lug.
g) Slide the second Spacer (6) between the Body and hinge lug and advance the Pin (7) into the Body (1).

Position the Hinge Pin (7) central to the valve body prior to the installation of the retaining Plugs (8).

h) Check that the torsion spring ends are seated properly.
i) Apply Teflon tape or sealing compound on retaining Plugs (8), install Plugs and tighten both sides with an Allen key.

j) **Check:**

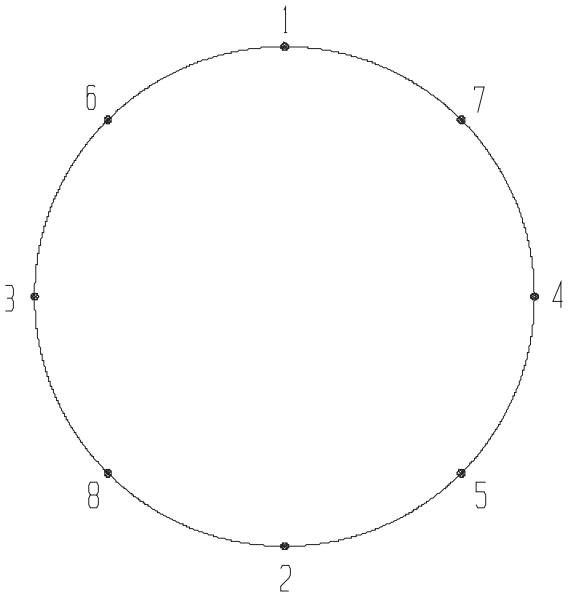
aa) that the valve opens and closes freely.

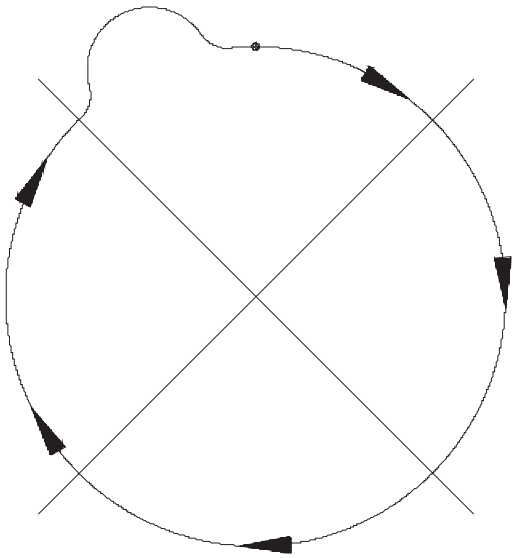
bb) that adequate freedom of movement of the Shoulder Pin-Disc connection is provided for the disc to adapt a self-aligning position with the seat.

IMPORTANT-INSERT O-RING AS FOLLOWS

aa) Place O-Ring (14) on top of seat groove.

bb) To prevent looping, insert the O-Ring as shown by pressing the O-Ring into the groove in the following numerical sequence.





Right Wrong

cc) Having engaged the O-Ring in the groove according to the above illustration, proceed to smooth out the O-Ring using thumb pressure.

It is important to smooth out the O-Ring so that there are no visible ripples or loops.

It should be noted that the O-Ring groove is slightly larger than the O-Ring and it follows that the O-Ring must be hoop stretched to engage the groove.

4.0 Installation Instructions

The stud selection sheet (Specification Sheet E-8) shows the ease with which Check Rite valves are installed.

The valve is inserted between two companion flanges with gaskets on the contact faces. Studs are installed, which will span the valve, and tightened in the same manner as any flange connection.

The Check Rite valve outside diameter is designed to locate the valve in the same centerline as the companion flanges when mounted inside the studs.

The normal installation of a Check Rite valve is for horizontal flow with the hinge pin (7) in the horizontal upper position, or for vertical flow, with the flow direction upwards.

When removing a Check Rite valve from the line, only one half of the studs need to be removed and the others loosened.

IMPORTANT:

1) Check the flow arrow on the body before inserting the Check Rite valve between the flanges.

2) Pipeline flanges must be parallel and have the same pressure class rating as the valve.

3) There must be no obstructions in the flange or pipe bore as this would prevent the valve from opening fully.

If slip-on flanges are used, make sure that no weld projects into the pipe bore.

5.0 Maintenance Requirements and Information

No periodical maintenance work is required for Check Rite valves. For replacement of O-Rings refer to Section 3.0, "Assembly and Dis-assembly of Check Rite Valves".

The standard O-Ring numbers, Plug sizes and Allen key sizes for class 125/150/300 are listed below for valves 2"-42". For other classes, contact the factory.

Valve Size	*O-Ring Size S/N 82*	*O-Ring Size S/N 88*	*Plug Size NPT*	*Allen Key Size*
2"	127	128	1/4"	1/4"
2.5"	133	133	1/4"	1/4"

* Square Head Plug

6.0 Check Rite and Spool Installation

As shown on Specification Sheet E-9, when a standard flanged valve is replaced with a wafer valve, a spool piece can be inserted with the Check Rite valve to obtain the required face to face dimension.

The installation instructions in Section 4.0 above apply.

7.0 Nameplates

Serial Number

The serial number gives the style of the valve internals and the date of manufacture of the valve.

The valve internals are based on either model 210 or 212. The first two digits of the serial number give the model.

82	Model 210
88	Model 212

For standard valves, the date of assembly is included in the Serial Number stamped on the nameplate attached to the valve. The last four digits of the serial number are the month and year of manufacture.

For UL/FM valves, the serial number is specified by UL and can be any numeric value. These valves are identified by the red paint and a special nameplate is used which includes the UL and FM logos. These valves are always based on Model 212.

A unique serial number is given to all special valves (not UL/FM). For special valves (including UL/FM) the month and year of manufacture are either stamped on the nameplate or on the exterior diameter of the flange, depending on valve size.

Figure Number

The figure number consists of at least five alphanumeric characters. The first two give the class of the valve. The next three give the principle materials of construction.

If the valve has a special model number, ie Model 260, this is stamped at the end of the code or if space prohibits this, then either underneath the code or on the outside diameter of the flange. The table on the following page explains the codes used.

UL/FM valves have either 212 or 312 for a figure number. The materials of construction are always cast iron body, buna seat, stainless internals and Teflon spacer. The applicable specification sheet gives more detailed information.

Valve Class	125	150	300	600	900	1500
Code	12	15	30	60	90	150

Body Material	Cast Iron	Ductile Iron	Steel	Stainless Steel
Code	C	D	S	X

Seat Material	Buna N	EPDM	Stainless Steel	Viton
Code	B	E	M	V

Spacer Material	Teflon	Bronze	Stainless Steel
Code	T	Y	Z

For example a class 150 check valve with a ductile iron body, stainless steel seat and Teflon spacers would be stamped: **15DMT**

8.0 Safety Warnings

1. The valve must be installed in the correct line size between flanges of the correct class.
2. The valve materials of construction must be compatible with the fluids being handled.
3. Pressures and temperatures must be kept within the limits specified by the appropriate ANSI standard, ie: B16.1, B16.34, B16.42, or within the limits specified by the particular design. These values are given on the following pages.
4. An arrow on the body indicates the direction of flow through the valve. The valve must be installed with the arrow pointing in the correct direction.
5. For flow in the horizontal direction, the valve shall be installed with the Pin in the horizontal upper position with the eye bolt pointing vertically upwards.
6. The valve must be installed in the correct location in the pipeline. The disc must not open into or against other piping components such as valves, elbows, or tees. For the best performance and life of the valve, a minimum of 10 pipe diameters of straight pipe upstream and downstream of the valve is suggested. Any reduction in this length upstream of the valve reduces the life of the valve proportionally.
7. Plugs must not be removed from the valve while the pipeline is under pressure.
8. Flow rates must be within acceptable limits. Too high a rate may cause extreme pressure drops and erosion of the components. Too low a flow may cause the disc assembly to oscillate and cause wear which may lead to premature failure of the internals.
9. Care should be taken in handling the valve. Mishandling may lead to damage of the sealing components or damage to the externals.
10. Disturbed flow will reduce greatly the life of the valve. Best practice should have 5 straight pipe diameter upstream and 3 downstream.

9.0 Non Shock Pressure -Temperature Ratings

All temperatures in °F and pressures in psi.

Cast Iron (ASTM A126-CLB) **Ratings from ANSI B16.1.**

Bray®

BUTTERFLY VALVES
RESILIENT SEATED

SERIES 30/31 Wafer/Lug
2" - 20" (50mm-500mm)

CELEBRATING 20 YEARS

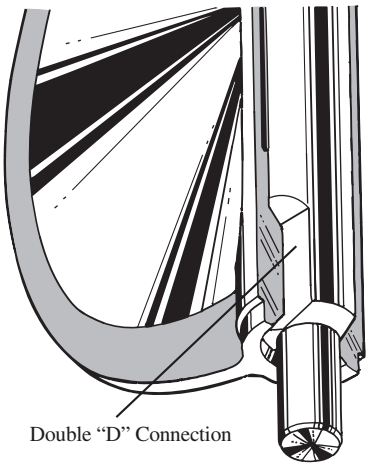
The High Performance Company

SERIES 30

2"–20" (50mm–500mm)
Bray® Controls is proud to offer a high quality line of butterfly valves to meet the requirements of today's market. Combining years of field application experience, research and development, Bray has designed many unique features in the Series 30/31 not previously available. The results are longer service life, greater reliability, ease of parts replacement and interchangeability of components.

DISC AND STEM CONNECTION

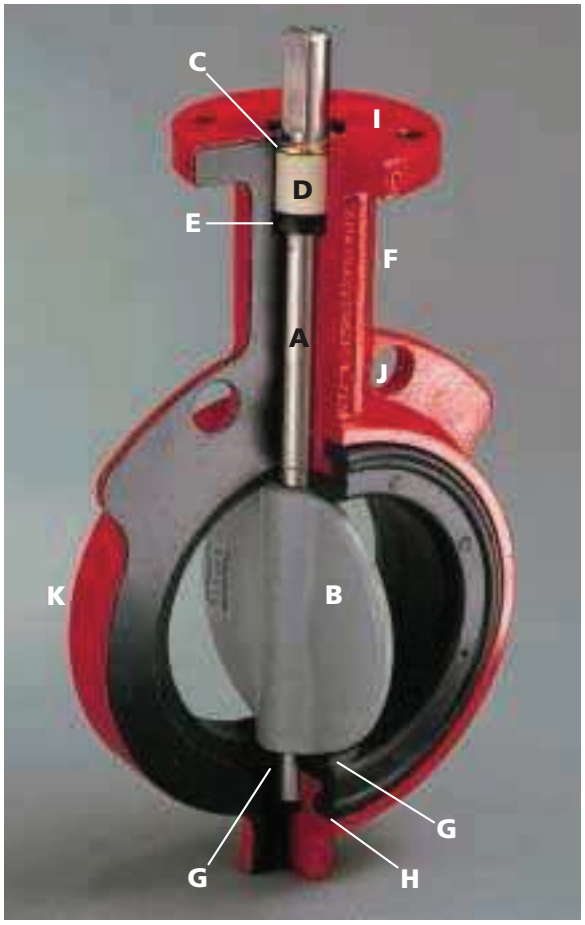
(**A**) Features a high-strength through stem design. The close tolerance, double "D" connection that drives the valve disc is an exclusive feature of the Bray valve. It eliminates stem retention components being exposed to the line media, such as disc screws and taper pins, which commonly result in leak paths, corrosion, and vibration failures. Disc screws or taper pins, due to wear and corrosion, often



Double "D" Connection

require difficult machining for disassembly. Disassembly of the Bray stem is just a matter of pulling the stem out of the disc. Without fasteners obstructing the line flow, the Series 30/31 C_V values are higher than many other valves, turbulence is reduced, and pressure recovery is increased. The stem ends and top mounting flange are standardized for interchangeability with Bray actuators.

DISC (**B**) Casting is spherically machined and hand polished to provide a bubble-tight shut off, minimum torque, and longer seat life. The disc O.D. clearance is designed to work with all standard piping.



STEM BUSHING (D)

Non-corrosive, heavy duty acetal bushing absorbs actuator side thrusts.

STEM SEAL (E)

Double "U" cup seal design is self-adjusting and gives positive sealing in both directions. Prevents external substances from entering the stem bore.

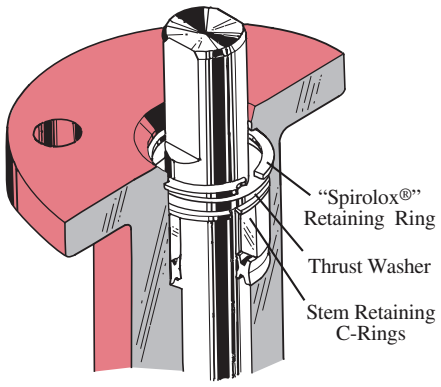
NECK (**F**) Extended neck length allows for 2" of piping insulation and is easily accessible for mounting actuators.

PRIMARY AND SECONDARY SEALS (G)

The Primary Seal is achieved by an interference fit of the molded seat flat with the disc hub. The Secondary Seal is created because the stem diameter is greater than the diameter of the seat stem hole. These seals prevent line media from coming in contact with the stem or body.

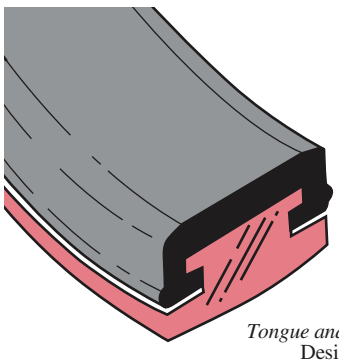
STEM RETAINING ASSEMBLY (C)

The stem is retained in the body by means of a unique Stainless Steel "Spirolox®" retaining ring, a thrust washer and two C-rings, manufactured from brass as standard, stainless steel upon request. The retaining ring may be easily removed with a standard hand tool. The stem retaining assembly prevents unintentional removal of the stem during field service.



BRAY UNIQUE SEAT DESIGN (H)

One of the valve's key elements is Bray's unique *tongue and groove* seat design. This resilient seat features lower torque than many valves on the market today and provides complete isolation of flowing media from the body. The tongue-and-groove seat to body retention method is superior to traditional designs, making field replacement simple and fast. The seat is specifically designed to seal with slip-on or weld-neck flanges. The seat features a molded O-ring which eliminates the use of flange gaskets. An important maintenance feature is



Tongue and Groove Design

*"Spirolox®" designation is a registered trademark of Kaydon Ring and Seal, Inc.

that all resilient seats for Bray butterfly valves Series 20, 21, 30, 31 and 34 are completely interchangeable.

ACTUATOR MOUNTING FLANGE AND STEM CONNECTION (I)
Universally designed to ISO 5211 for direct mounting of Bray® power actuators and manual operators.

FLANGE LOCATING HOLES (J)
Provide quick and proper alignment during installation.

BODY (K) One-piece wafer or lug style. Polyester coating for excellent corrosion resistance. Bray valve bodies meet ANSI 150 pressure ratings for hydrostatic shell test requirements.

DESIGN FEATURES

Bray's Series 30 valve is a wafer version with flange locating holes, and the Series 31 is the companion lug version for dead-end service and other flange requirements. All Bray valves are tested to 110% of full pressure rating before shipment.

A major design advantage of Bray valve product lines is international compatibility. The same valve is compatible with most world flange standards – ANSI Class 125/150, BS 10 Tables D and E, BS 4504 NP 10/16, DIN ND 10/16, AS 2129 and JIS 10. In addition the valves are designed to comply with ISO 5752 face-to-face and ISO 5211 actuator mounting flanges. Therefore, one valve design can be used in many different world markets.

Due to a modular concept of design, all Bray® handles, manual gear operators and pneumatic and electric actuators mount directly to Bray valves. No brackets or adapters are required.

Bray interchangeability and compatibility offers you the best in uniformity of product line and low-cost performance in the industry today.

POLYESTER COATING CORROSION PROTECTION
Bray's standard product offers valve bodies with a polyester coating, providing excellent corrosion and wear resistance to the valve's surface. The Bray polyester coating is a hard, gloss red finish.

Chemical Resistance – resists a broad range of chemicals including: dilute aqueous acids and alkalies, petroleum solvents, alcohols, greases and oils. Offers outstanding resistance to humidity and water.

Weatherability – outdoor tested resistant to ultra-violet radiation.

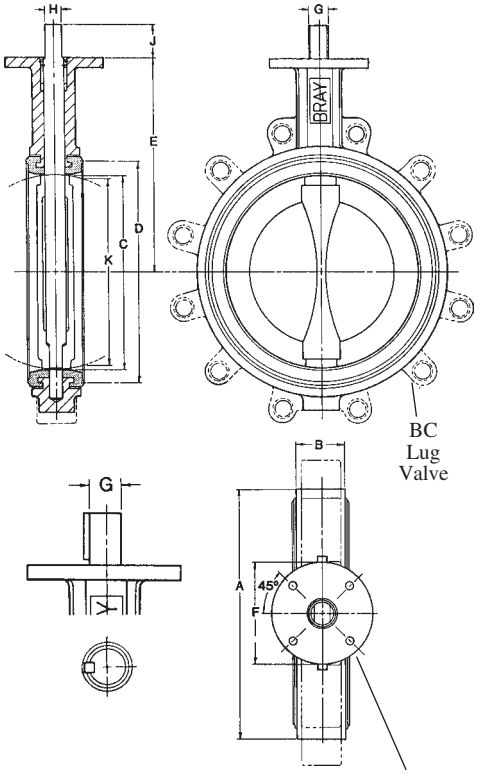
Abrasion Resistance – excellent resistance to abrasion.

Impact Resistance – withstands impact without chipping or cracking.

NYLON 11 COATING
Optionally available for valve bodies where outstanding protection and performance is needed. A thermoplastic produced from a vegetable base, this coating is inert to fungus growth and molds. Nylon 11 is *USDA Approved*, as well as certified to ANSI/NSF 61 for water service.

Corrosion Resistance – superior resistance to a broad range of chemical environments. Salt spray tested in excess of 2,000 hours and seawater immersion tested for over 10 years without corrosion to metal substrates.

Nylon 11 features a very low coefficient of friction and excellent resistance to impact and ultra-violet radiation.



See chart for Actuator Mounting Flange Drilling.

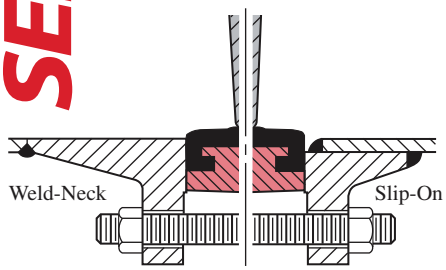
SELECTION DATA

FLANGE REQUIREMENTS

Bray valves are designed for installation between ANSI Class 125/150 lb. weld-neck or slip-on flanges, BS 10 Tables D & E, BS 4504 NP 10/16, DIN ND 10/16, AS 2129 and JIS 10, either flat faced or raised faced. While weld-neck flanges are recommended, Bray has specifically designed its valve seat to work with slip-on flanges, thus eliminating common failures of other butterfly valve designs. When using raised face flanges be sure to properly align valve and flange. Type C stub-end flanges are not recommended.



PRESSURE RATINGS*

For bi-directional bubble-tight shut off, disc in closed position:

Inches	mm	psig	bar
2-12	50-300	175	12
14-20	350-500	150	10

For Dead-end Service Applications:

With *downstream flanges installed* or with *vulcanized seats,* the dead-end pressure ratings are equal to valve bi-directional ratings as stated above. With no downstream flanges or with seats that are not vulcanized, the dead-end pressure rating for 2"-12" valves is 75 psi (5 bar) for 14"-20" valves, 50 psi (3.5 bar).

*Pressure Ratings are based on standard disc diameters. For low pressure application, Bray offers a standard reduced disc diameter to decrease seating torques and to extend seat life, thus increasing the valve's performance and reducing actuator costs for the customer.

VELOCITY LIMITS

For On/Off Services:
Fluids – 30 ft / sec (9m / s)
Gases – 175 ft / sec (54m / s)

C_V VALUES–VALVE SIZING COEFFICIENT

Valve Size		Disc Position (degrees)								
ins	mm	90°	80°	70°	60°	50°	40°	30°	20°	10°
2	50	144	114	84	61	43	27	16	7	1

18	450	17214	14496	10065	5736	3643	2237	1281	507	58
20	500	22339	18812	12535	7144	4536	2786	1595	632	72

C_V is defined as the volume of water in U.S.G.P.M. that will flow through a given restriction or valve opening with a pressure drop of one (1) p.s.i. at room temperature. Recommended control angles are between 25°–70° open. Preferred angle for control valve sizing is 60°–65° open.

EXPECTED SEATING/UNSEATING TORQUES (Lb.-Ins.)

Valve Size		Full-Rated Pressure Valves				Reduced Disc Diameter
		ΔP (PSI)				ΔP (PSI)

18	450	7850	9850	11850	—	5267
20	500	10300	12900	15500	—	6867

Valve Torque Rating – Bray has classified valve torque ratings according to 3 types: non-corrosive lubricating service, general service, and severe service. Torques listed above are for general services. Consult Bray for torque information corresponding to specific applications.

TO USE TORQUE CHART, NOTE THE FOLLOWING:
1) For Bray valves, Series 20, 21, 30, 31 and 34.
2) Review Technical Bulletin No. 1001, Expected Seating/Unseating Torques, for explanation of the 3 service classes and their related seating/unseating torque values for given pressure differentials of Full-Rated and Reduced Disc Diameter valves.
3) Dynamic Torque values are not considered. See Technical Bulletin No. 1002 for evaluation of Dynamic Torque values vs. Seating/Unseating Torque values.
4) Do not apply a safety factor to above torque values when determining actuator output torque requirement.
5) For 3 way assemblies where one valve is opening and other is closing, multiply torque by 1.5 factor.

SPECIFICATIONS

RECOMMENDED SPECIFICATIONS FOR BRAY SERIES 30/31 SHALL BE:

- Polyester coated, cast iron, wafer or lug bodies.
- With flange locating holes that meet ANSI Class 125/150 (or BS 10 Tables D & E, BS 4504 NP 10/16, DIN ND 10/16, AS 2129 and JIS 10) drillings.
- Through-stem direct drive double "D" design requiring no disc screws or pins to connect stem to disc with no possible leak paths in disc/stem connection.
- Stem mechanically retained in body neck and no part of stem or body exposed to line media.
- Tongue-and-groove seat design with primary hub seal and a molded O-ring suitable for weld-neck and slip-on flanges. Seat totally encapsulates the body with no flange gaskets required.
- Spherically machined, hand polished disc edge and hub for minimum torque and maximum sealing capability.
- Equipped with non-corrosive bushing and self-adjusting stem seal.
- Bi-directional and tested to 110% of full rating.
- Bi-directional pressure ratings:
2"-12" valves: 175 psi, 14"-20" valves: 150 psi
Lug bodies for dead end service
With downstream flanges or vulcanized seats, pressure ratings are equal to bi-directional ratings as stated above.
With no downstream flanges or non-vulcanized seats: 2"-12" valves: 75 psi, 14"-20" valves: 50 psi
- No field adjustment necessary to maintain optimum field performance.
- The valve shall be Bray Series 30 wafer / 31 lug or equal.

Halar® is a registered trademark of Ausimont U.S.A., Inc.

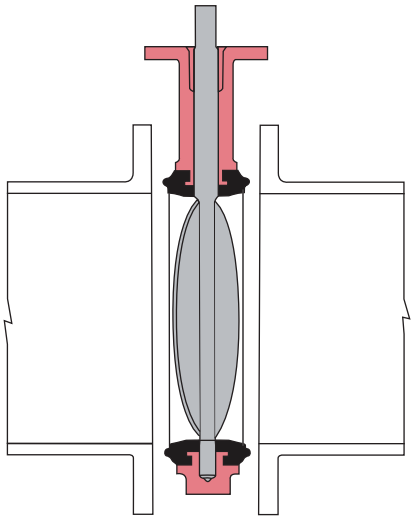
ASSEMBLY

INSTALLATION

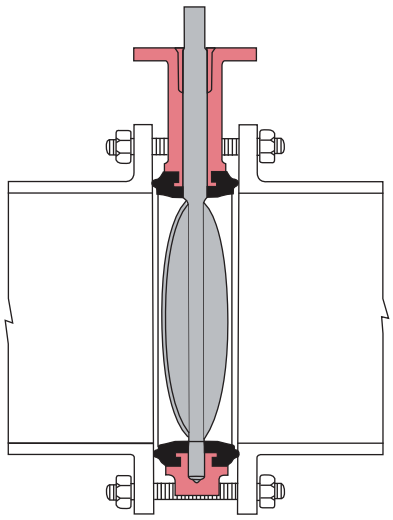
Position the disc in the partially open position, maintaining the disc within the body face-to-face. Place the body between the flanges and install flange bolts. *Do not use flange gaskets.* Before tightening flange bolts, carefully open the disc to the full open position to ensure proper alignment and clearance of the disc O.D. with the adjacent pipe I.D. Leave disc in the full open position and tighten flange bolts per required specification. Once bolts are tightened, carefully rotate disc to closed position to ensure disc O.D. clearance.

MAINTENANCE AND REPAIR

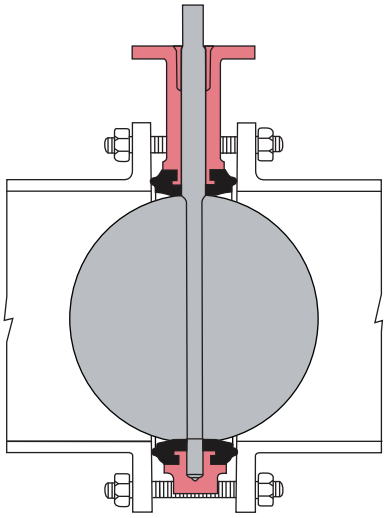
The many Bray features minimize wear and maintenance requirements. No routine lubrication is required. All components – stem, disc, seat, bushing, stem seal, etc., are field replaceable, no adjustment is needed. If components require replacement, remove the valve from the line by placing the disc near the closed position, spread the flanges, support the valve, then remove the flange bolts. No valve maintenance, including removal of manual or power actuators, should be performed until the piping system is completely depressurized.



Disc in the Near Closed Position



Disc in the Partially Open Position



Disc in the Full Open Position

DISASSEMBLY

Remove the handle, gear operator, or actuator from actuator mounting flange. Remove "Spirolox®" retaining ring. Remove stem with its thrust washer and two C-ring stem retainers. Remove bushing and seal. Remove the disc from the seat, protecting disc edge at all times. Push the seat into an oval shape, then remove the seat from the body.

ASSEMBLY

Push the valve seat into an oval and push it into the body with seat stem holes aligned to body stem holes. Push stem into the stem hole of body. For aid in inserting disc, slightly protrude stem beyond the I.D. of the top of the seat. Install a light coating of foodgrade silicone oil (for silicone free applications use soap and water) on the I.D. of seat. Insert the disc into the seat by lining up the disc hole with the stem hole of the seat. Note: the broached double "D" flats in the disc must be toward the bottom of valve body. (Take special care when lining disc up with stem.) With a downward pressure and rotating the stem back and forth, push the stem until the stem touches the bottom of the body stem hole. Make certain that when pushing the stem through disc bottom, the broached flats of stem and disc are aligned. After the stem has engaged the disc, but before the stem is firmly seated in the body, replace the stem seal and bushing. Install the two C-ring stem retainers in the groove in the stem and thrust washer on top of the C-rings. Seat the stem firmly in the body and install the "Spirolox®" retaining ring back into position.

DISTRIBUTOR

All statements, technical information, and recommendations in this bulletin are for general use only. Consult Bray representatives or factory for the specific requirements and material selection for your intended application. The right to change or modify product design or product without prior notice is reserved.

Series 70
Electric Actuator

RUGGED ELECTRIC ACTUATOR FOR ROTARY VALVES

300 TO 18,000 LB-IN OUTPUT TORQUE

Bray Controls' years of proven success in electric actuation, combined with innovative engineering, has produced the Series 70. The Series 70 features on-off or modulating control. This red, round electric actuator for rotary valves delivers highly reliable service.

Bray's unique, customer–friendly designed Control Center has many advantages over present industry standards including:

- **UL, CSA and CE certification of most units**
- **Ease of customer field wiring directly to the terminal strip without interference from other components**
- **Simple and unique manual override handwheel system**
- **Lowest profile and lightest weight actuator on the market**
- **Simple finger or screw driver adjustment of travel limit cams without interference from other components**
- **Highly visible valve status display on most units**
- **Externally adjustable travel stops**
- **Captive housing screws**

Additionally, components not requiring customer access are protected underneath the Power Center cover plate.

LOW PROFILE, COMPACT, HIGH TORQUE DESIGN

The Series 70 is by far the most compact, lowest profile design of any electric actuator delivering comparable torque output. Thorough research and many years of field experience have gone into the development of this state-of-the-art actuator – *the product of the future*. This design offers the advantages of greatly reduced space requirements, lighter weight and ease of installation and maintenance when compared to other electric actuators. When mounted directly to Bray valves, the Series 70 is especially compact.

The Series 70 compared to a typical actuator, both mounted to 4" Bray valves.

DIRECT MOUNTING OF THE SERIES 70 ON BRAY VALVES

Bray actuators mount directly to Bray valves without using any external linkage. Field installation is simple and misalignment is minimized. For sanitary processing and outdoor applications, the Bray direct mounting system reduces the possibility of contamination buildup or corrosion between the valve and actuator. The mounting pattern complies with ISO 5211 and VDI/VDE 3845 (NAMUR recommendations). Standard rotation is 90° reversible. Bray can provide linkages for mounting the Series 70 to other devices requiring 90° rotation. Please consult the Bray factory for further information.

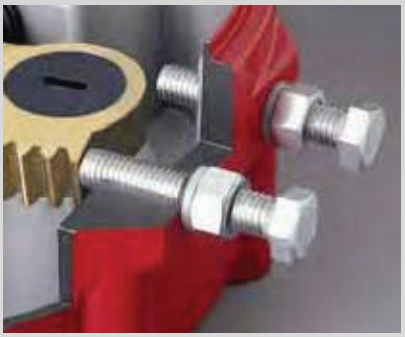
EXTERIOR FEATURES

EXPLOSION PROOF ENCLOSURE

The Series 70 waterproof/explosion proof unit is UL NEMA 4,4x,7&9 listed and certified to specifications for hazardous locations. The rugged, heavy duty housing contains precision machined bores and flanges to meet flame path requirements. Waterproof /explosion proof models are currently available with 800 to 2,000 lb.-in. output torque, continuous or intermittent duty.

MECHANICAL TRAVEL STOPS

Stainless steel mechanical travel stops permit precise field adjustment of actuator movement to specific degrees of rotation. The travel stops are located outside the base for easy readjustment without removing the cover. Stainless steel lock nuts with O-ring seals hold the travel stops securely in place. The travel stops are normally set at the factory to allow 0° and 90° travel.



Series 70 manual override handwheel with optional spinner.

ENCLOSURE (A)
The Series 70 waterproof unit is UL NEMA 4, 4x listed. Die-cast aluminum cover and base are high-quality polyester powder coated for exceptional corrosion, wear, impact and ultra-violet resistance

MANUAL OVERRIDE (B)
A manual override handwheel is standard on all models to rotate the valve without electrical power. A yellow caution stripe around the handwheel hub indicates the handwheel is engaged for manual operation.

CAPTIVE COVER BOLTS (C)
The cover is attached to the base by stain-less steel bolts. When the cover is removed the bolts are held captive in the cover. This prevents time consuming problems caused from lost or misplaced bolts.

VALVE STATUS DISPLAY (D)
The Series 70 features a highly visible valve status display on most units. Prominently labeled and color coded – yellow for open, red for closed – the display indicates valve position through the full range of travel. The display can be seen from almost any angle. Made of high impact, heat and chemical resistant clear polycarbonate, this display withstands caustic wash down and offers excellent corrosion protection. Potential leak paths are eliminated since the indicator cover utilizes a static seal, not a dynamic seal.

ELECTRICAL CABLE CONNECTIONS (E) (Optional) A multi-pin, watertight cable receptacle offers full compatibility with today's industrial wiring systems. Factory pre-wiring prevents errors and allows quick–connect field installation. Cord sets with connection/flying leads or extension cords with connections on both ends can plug directly into the receptacle.

CONDUIT ENTRIES (F)
The Series 70 features two conduit connections in either NPT or metric threads. One entry is for power, one for control wiring.

PILOT DRILLED HOLES FOR LOCAL CONTROL STATION MOUNTING (G)
The conduit entry panel has four holes which may be easily tapped for the installation of optional local Control Station.

CLEAN AND EASY ACCESS TO ALL FIELD WIRING AND ADJUSTMENTS

Bray has specifically engineered the Series 70 Control Center for customer–friendly convenience. Designed like a junction box, the Series 70 offers by far the easiest access to terminal block wiring, cam adjustments and switch installation. Accessories are easily added, either before installation or after installation. Therefore, the time required for field start-up and adjustment is greatly reduced, and maintenance can be performed with assured ease and safety.

Bray's unique design, modular system of components and accessories, and innovative features combine to best meet today's industrial requirements.

TORQUE LIMITING SWITCHING SYSTEM (Optional)

The torque limiting switching system consists of two SPDT mechanical switches and two factory calibrated set screws. The upper cam adjusts the torque limit in the open direction, and the lower cam adjusts the torque limit in the closed direction. The switches independently respond to predetermined loads in both the open and closed travel directions by sensing the movement of the worm shaft, and interrupting the electrical power to the motor. The switches operate at any point of actuator travel.

Torque Limit Switches shown with mounting bracket sectioned for clarity.

SERIES 70 APPLICATIONS

The Series 70 is the ideal choice for process control applications involving:

- Automation and computer systems
- Butterfly, ball, plug and other rotary valves
- Dampers, switches, safety and flow-control devices
- Machine and fixture indexing
- Hostile environments demanding excellent moisture, chemical and corrosion resistance
- Long service life and rugged reliability

INDUSTRIES

Bray's Series 70 Electric Actuators are used in a wide range of industries world wide, including: Chemical, Pharmaceutical, Petroleum Refining and Oilfield, Microelectronics, Pulp and Paper, Water and Waste Water Treatment, Brewing, Food Processing, Beverages, Power, Marine, Mining, Textile and HVAC.

CONTROL CENTER FEATURES

TRAVEL LIMIT SPDT SWITCHES (A)

Bray has provided two SPDT mechanical switches as standard. These durable, high quality switches are mechanically isolated and electrically independent. The dedicated circuits eliminate any voltage cross-over between the switches. This switch combination is used for both open and closed positions of the valve and requires only one cam for each direction of valve travel. Bray's design provides synchronicity between motor control and position display. Switches are easily accessible without interference from other components. Each switch is marked with open or close labels and the cams are color coded, green for open and red for close, eliminating the possibility of making wrong adjustments of travel limits or field wiring errors.

AUXILIARY SWITCHES (Optional)

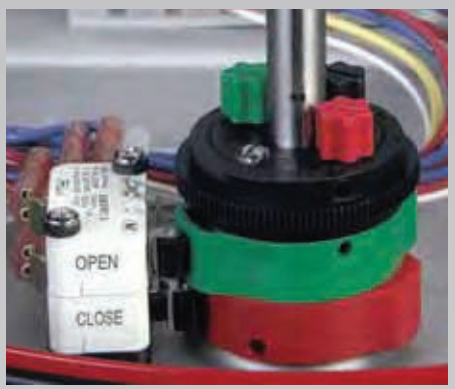
Independent dry-contact SPDT mechanical switches are available to indicate travel position to remote customer control systems.

AUTOMATIC POWER CUTOUT SWITCH (B)

The Series 70 is supplied with a SPDT mechanical switch which cuts power to the motor when the handwheel is engaged for manual operation. This switch also functions as a safety emergency shutdown device that immediately stops the actuator motor even if electrical power is still being applied to the actuator.

CERTIFICATIONS / APPROVALS

Bray has gained UL, CSA and CE certifications on most intermittent and continuous duty actuators. These certifications insure that the Series 70 has been designed to the highest quality requirements and most stringent safety standards worldwide. Substantial resources have been invested to assure our customers that the Series 70 is the best actuator on the market and will remain so.

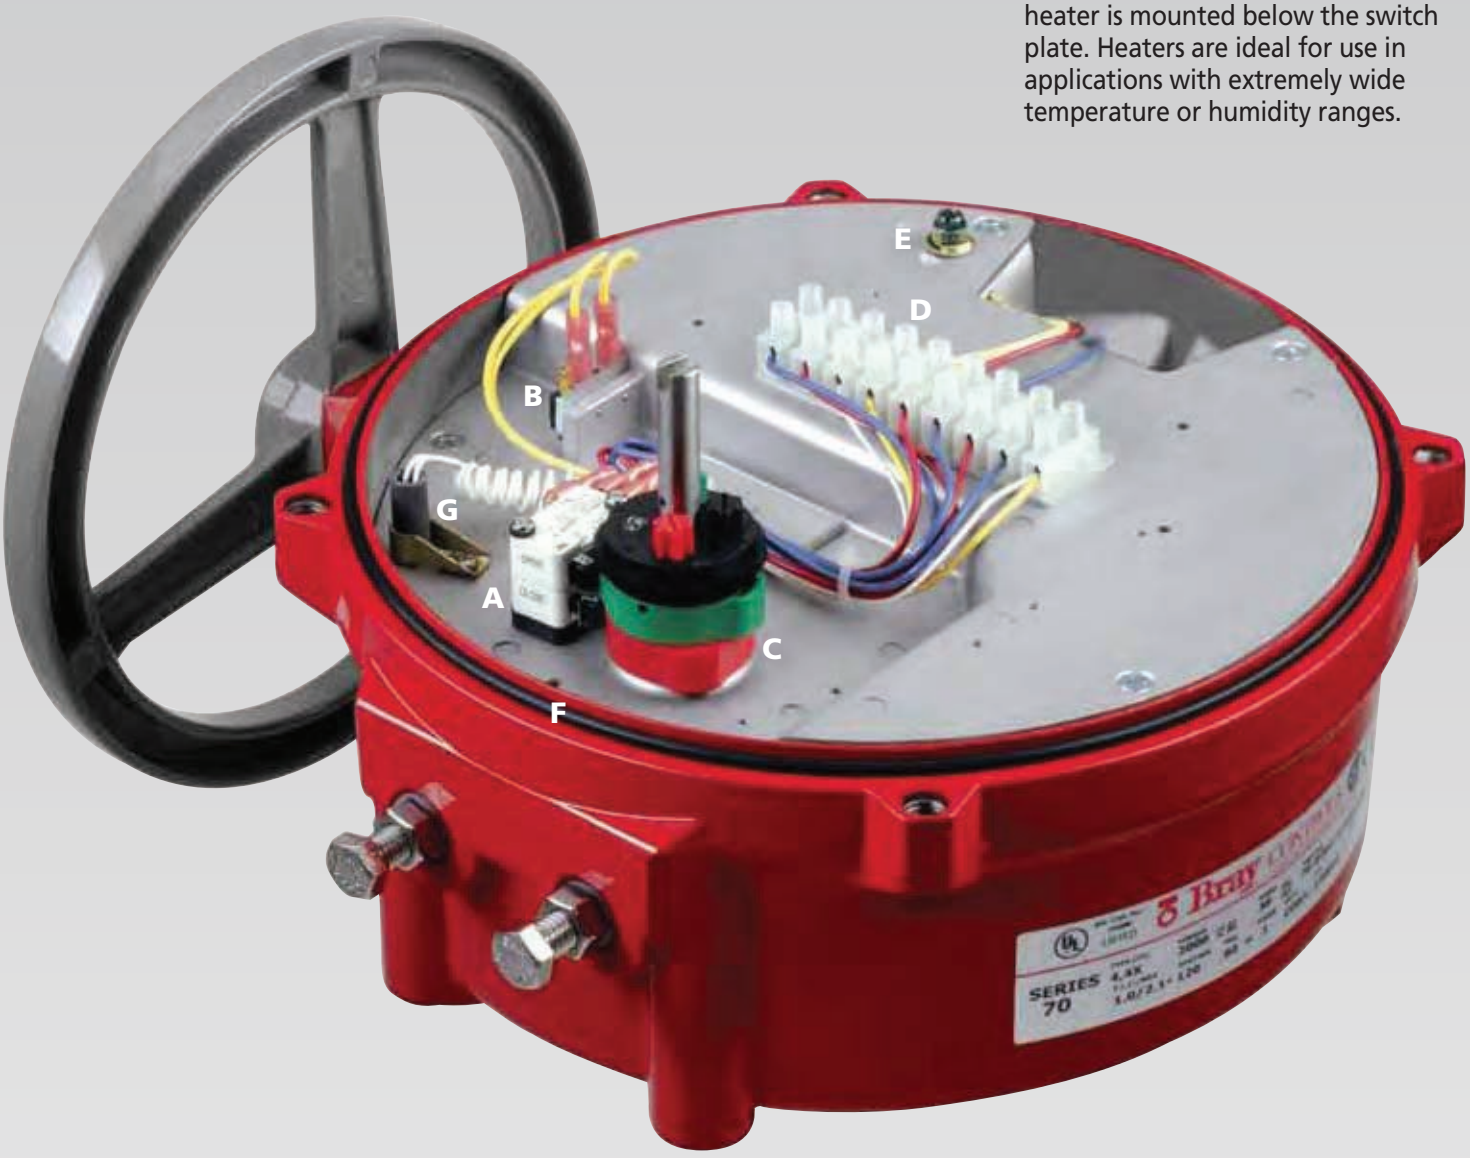


CAMS / CAM ADJUSTMENT (C)
Bray's patented cam design is an outstanding feature of the Series 70. Cams for each switch are *infinitely* adjustable by finger touch or screwdriver with no special tools needed. The adjustment knobs rotate the specially formed cams. Each cam is color coded – the red adjustment knob controls the red cam (close position), and the green knob controls the green cam (open position). Standard factory setting allows 90° travel between open and closed positions.

TERMINAL BLOCK (D)
The actuator switches are pre-wired to a terminal block. The block has been designed for ease of customer wiring without interference from other components and features clearly marked terminal numbers. The block has been placed near the two conduit entries with ample room for running wire leads. A wiring diagram is included inside the cover for easy reference. The ground wire screw (**E**) is plated green and positioned for easy access. With some optional features Bray installs a second terminal block for Bray factory wiring and customer field wiring of additional limit switches.

O-RING SEAL FOR WATERTIGHT ENCLOSURE (F)
The large seal between the cover and base provides a waterproof seal and prevents internal corrosion. The Bray Series 70 O-ring seal is the best design for watertight enclosures and is far superior to commonly used gaskets.

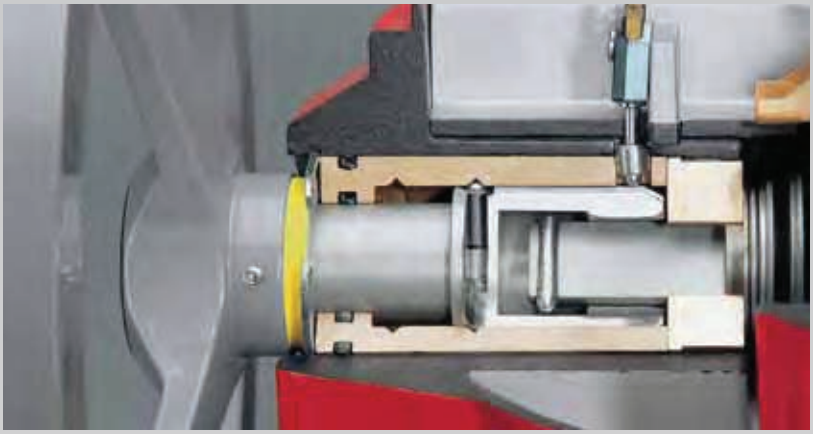
HEATER (G) (Optional)
Pre-wired to the terminal block, a self-regulating heater prevents condensation from collecting inside the actuator, which could cause damage to the electrical components. The heater is mounted below the switch plate. Heaters are ideal for use in applications with extremely wide temperature or humidity ranges.



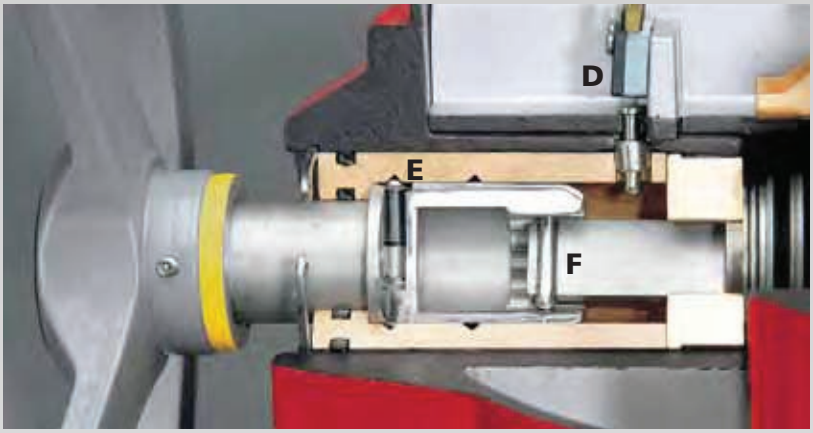
Bray designed the Series 70 to completely separate the Control Center from the Power Center. The Power Center, located in the actuator base, consists of motor, gear train, capacitor, output drive and heater. This design protects the power drive system as each component has been engineered to require no customer servicing. The Power Center components have been uniquely configured to maintain the extremely low profile of the Series 70.

POWER CENTER FEATURES

MOTOR (A), CAPACITOR (B), GEAR TRAIN (C) AND WORM GEAR (H) The Series 70 has a 120 or 220 VAC single phase permanent split-capacitor reversible induction motor. The motor features a built-in thermal overload protector of a bi-metallic strip in the windings set at 275°F (135°C) with automatic reset. The heavy-duty spur gear train is composed of precision cut, multi-staged gears and shafts. The gears and shafts are heat treated high alloy steel and will withstand locked rotor conditions. The gear train is permanently lubricated at the factory. This gear train drives the worm shaft which in turn drives the segmented worm gear output shaft.



Above photograph is a sectional view of the manual override assembly with override disengaged. Photograph below shows manual override engaged.



MANUAL OVERRIDE HANDWHEEL ASSEMBLY

- **Pull to engage for manual operation.**
- **Rotate handwheel to position valve.**
- **Push to disengage for power operation.**

A simple pull engages the handwheel for manual operation. The Bray manual override system ensures positive and fast manual operation without the use of extra tools or levers. When the handwheel is engaged, the electrical power to the motor is cut off by means of the Automatic Power Cutout Switch (**D**). When engaged, the manual override shaft is held in position by a Ball Detent (**E**). The Ball Detent also holds the shaft in position when the handwheel is pushed in to disengage the override. The Drive Pin (**F**) engages and disengages the manual override shaft from the worm and segmented worm gear output shaft. When the handwheel is pushed or pulled, the drive pin smoothly engages the worm shaft.

SELF-LOCKING OUTPUT DRIVE ASSEMBLY

The output drive assembly features a self-locking worm and worm gear drive which holds the valve in the desired position without the need for electro-mechanical braking systems. The worm shaft directly drives the worm gear. The Worm (**G**) is made of chrome-moly steel and the segmented Worm Gear (**H**) is a precision machined aluminum bronze casting. The worm gear and Output Shaft (**I**) are one part. The output shaft is the driving member that positions the valve. The worm gear drives the valve status display shaft which operates the infinitely adjustable cams to limit the electrical travel of the actuator.

MECHANICAL TORQUE LIMITING SYSTEM (**Optional**)

The mechanical torque limiting system consists of a Worm Shaft, a Worm (**G**), a set of Torque Disc Springs (**J**) and a Shaft Groove (**K**) for torque limiting switches. The torque disc springs, located on each side of the worm, resist the linear movement of the worm shaft. The worm shaft is driven against the torque disc springs in response to output torque. The shaft groove actuates the torque limiting switches, located above in the Control Center, to start and stop the motor. (Please refer to the Control Center section on page 4 for description of the Torque Limiting Switching System). The precisely controlled movement of this system is the main torque limiting element of the Series 70.

MODULATING ACTUATOR FOR PRECISION CONTROL OF VALVE POSITION

The Bray Series 70 Electric Actuator can be equipped with a Servo for precise control of valve position. The Servo consists of a microprocessor controlled circuit board and a feedback potentiometer assembly, which both fit entirely within the standard Series 70 actuator housing. The circuit board has terminal blocks for customer field wiring, and other terminals for internal connections to the actuator components. The feedback potentiometer is driven by a gear set connected to the actuator output drive. Also available are Servos capable of serial bus communication, such as DeviceNet.

COMMAND CENTER OPTIONS

SERVO PRO OPERATION

The Servo Pro can be configured by the factory or the customer to accept several types of input signals, such as 4-20 mADC, 0-10 VDC, 0-5 VDC or potentiometer control. Each terminal connection and indicator is clearly labeled to simplify field wiring and operation. The input signal electronically represents the *desired* actuator position, and the internal feedback potentiometer signal electronically represents the *actual* actuator position. The microprocessor constantly compares the two signals, and if a difference is detected, drives the actuator in the proper direction until the signals are equal. When a balance is reached, the microprocessor turns off the actuator motor. The worm gear then mechanically holds the valve in the desired position until the input signal is changed again.

Feedback Potentiometer Gear

SPEED CONTROL

Adjustments are configurable for both open and closed speed control of the actuator motor. In addition, an approach control circuit senses when the actuator is about to reach the desired valve position, and pulses the motor to avoid overshooting the set point.

POTENTIOMETER CALIBRATION

Calibration of the feedback potentiometer is done through a unique gear arrangement that is easily accessible and eliminates the need of any special tools. A simple adjustment of Bray's patented cam drive aligns the potentiometer gear as easily as a travel cam.

SERVO PRO FEATURES / SPECIFICATIONS

Note: Servo is available for modulating service – continuous duty actuators only.

Note: "Standard" is the way the Servo is set at the factory.
"Configurable" means the customer, or the factory, can modify the Servo by setting 10 DIP switches.

POWER INPUT	24 , 120 or 24 0 VAC, 50/60 Hz (power must match motor)
POWER CONSUMPTION	2 Watts (not including actuator power)
INPUT SIGNAL	Standard: 4-20 mADC 250 Ohm Input Impedance. Configurable: 0-10 VDC, 2-10 VDC, 10K Ohm or greater potentiometer, 0-10 VDC has 2.1 K Ohm Input Impedance
CALIBRATION	Single Button Autocalibration
INDICATORS	Power: Green LED Status: Flashing Red / Green LED Motor: Red LED (Close), Green LED (Open)
CONTROL MODES	Standard: Full Range, Direct Acting Reverse Acting, Split Range
FAIL POSITION (Loss of Input Signal)	Standard: Fail Closed Configurable: Fail Open
CONTROL CHARACTERISTIC	Linear
DUTY CYCLE	100%
INTERNAL FEEDBACK	10K Ohm Potentiometer, gear driven
RETRANSMISSION OUTPUT	Standard: 4-20 mADC Configurable: 0-5 VDC, 0-10 VDC, 2-10 VDC Retransmission Output is designed to drive an isolated 250 –500 Ohm resistive load.
SPEED CONTROL	Standard: Full Speed (Speed Control is Disabled) Configurable: Bidirectional – Independent Open and Close Trim Pots adjustment

FEEDBACK POTENTIOMETER
The feedback potentiometer gear has a green rib which should be aligned with the slot on top of the cam-indicator shaft when in the fully open position. This simple alignment ensures the potentiometer will provide the Servo Pro with continuous, accurate actuator-valve position feedback.

VOLTAGE SPIKE PROTECTION
Voltage spikes that can damage electrical equipment are very common in industrial locations. Large voltage spikes can be caused by switching power loads, such as large motor drives, at the customer location. The output stage TRIACs of the Servo Pro are protected against damage from voltage spikes by a special combination of

- limit switch circuitry
- metal oxide varistor (MOV) for transient voltage suppression
- zero crossing detection

DEVICENET SERVO PRO
Bray also offers the Series 70 with the most advanced serial bus communication Servo on the market. The Bray **DeviceNet Servo Pro** is fully ODVA (Open DeviceNet Vendor Association) compliant. Benefits include greatly simplified field wiring and installation, advanced control and diagnostics in real-time from a remote location, and full network integration. Please contact your Bray representative for more information.

CONTROL STATION (Optional)
Bray has designed a manual local electrical control station that flush mounts directly to the Series 70. The Control Station features:

- a local–off–remote control switch
- an open–stop–close switch
- two lights which locally indicate open and closed valve position

The cover plate can be rotated in any 90° increment, allowing the customer to operate and view the station with ease. The enclosure is aluminum and weatherproof (NEMA 4, 4X, IP 65). Additionally, the control station has captive cover bolts and two input ports available in the following thread connections: 3/4" NPT or M25. Two different multi-pin, watertight electrical cable connections are also available.

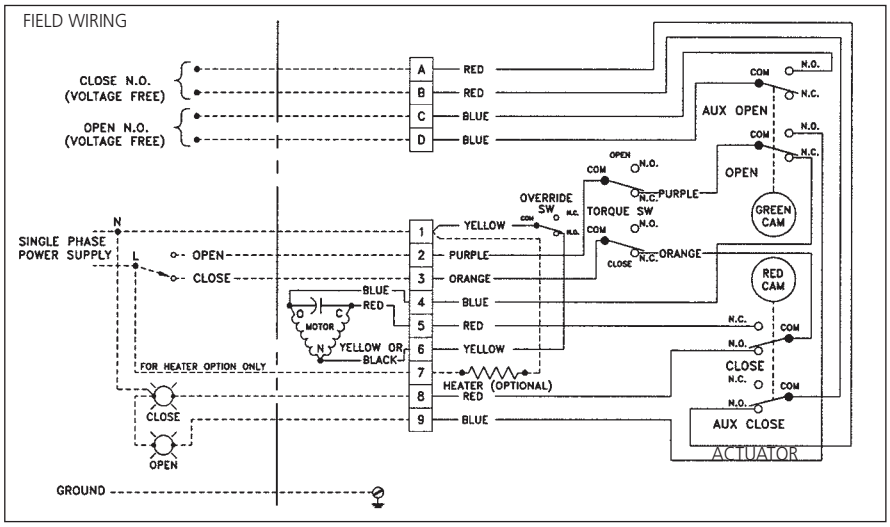
‡ The duty cycle for intermittent on-off operation is 25%. The continuous duty actuator with Servo is rated for 100% modulating operation.
12 VDC, 24 VDC and 3-Phase Motors are available as an option, please consult your Bray representative or the factory.

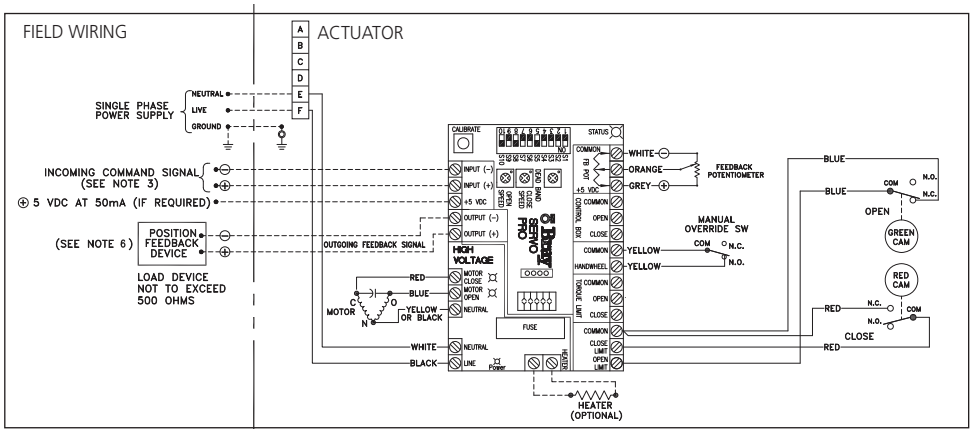
TYPICAL WIRING DIAGRAMS

ON–OFF
With Optional Torque Limit Switches, Auxiliary Limit Switches and Heater

Wiring Diagrams are For Reference Only. Do NOT use for field wiring.



MODULATING–Servo Pro
With Optional Heater



Notes:
1) Actuators are shown in closed position.
2) Manual Override is not engaged.
3) Actuators are shown with optional Heater
4) All switches are Single Pole, Double Throw.
5) Terminal block accepts field wiring from 12-22 AWG, 14-22 AWG for Servo.
6) Modulating Unit: Position Feedback Output is designed to drive an isolated 250 -500 Ohm resistive load.

SPECIFICATIONS

The electric actuator shall be compact and low–profile to greatly reduce space requirements. The actuator shall feature ease of access to field wiring and adjustment. The actuator shall be built to withstand line vibration and shock without failure and shall bolt directly to Bray valve mounting flanges without using brackets.

MOTOR A single phase permanent split-capacitor reversible motor with voltages of 120 and 220 VAC 50/60 Hz shall be standard. Motor insulation shall be Class F or better. The motor shall contain a built-in UL approved automatic reset thermal overload protector set at 275°F (135°C) embedded in motor windings. A variety of 3-Phase 50/60 Hz and DC motors shall be available upon request.

DUTY CYCLE The duty cycle for intermittent on-off operation shall be 25%. The continuous duty actuator with Servo shall be rated for 100% modulating operation.

SELF-LOCKING OUTPUT DRIVE ASSEMBLY The actuator shall have a self-locking output drive assembly consisting of a worm and worm gear output drive mechanism. The output drive assembly shall have precision cut multi-staged gears which will withstand locked rotor conditions. The output drive assembly shall be permanently lubricated at the factory and shall drive a chrome-moly steel worm which drives the composite aluminum bronze segmented worm gear / output shaft.

WIRING Actuator switches shall be pre-wired to a terminal block for ease of access and all internal wiring shall range from 12-22 AWG.

SWITCHES All travel switches shall be Single Pole, Double Throw, Form C type, 10A at 125/250 VAC, 1/2 A at 125 VDC, UL listed and CSA approved. Travel Limit switches shall limit actuator in both the open and closed position of valve travel.

CAMS Cams for each travel limit switch shall be infinitely adjustable by finger touch or screw driver, as provided by Bray's patented design.

CONDUIT ENTRIES All units shall have 2 conduit entries. Conduit entries for models 003 and 005 shall be either 1/2" NPT or M 20. Conduit entries for models 008 – 181 shall be either 3/4" NPT or M 25.

MECHANICAL TRAVEL STOPS Mechanical stainless steel travel stops shall be located outside the actuator for ease of adjustment and contain stainless steel lock nuts to hold the travel stops in place. O-rings provide waterproof seals. The travel stops shall limit the actuator movement to specific degrees of rotation.

MANUAL OVERRIDE All units shall be equipped with an aluminum manual override handwheel to rotate the valve without electrical power. The override assembly shall ensure positive and fast manual operation without the use of extra tools or levers.

EMERGENCY SHUT-OFF An automatic power cutout switch shall be provided to cut power to the motor when actuator handwheel is engaged for manual operation. This switch shall function as a safety emergency shutdown device and shall be accessible from outside the housing.

ENCLOSURE The die-cast aluminum enclosure shall be certified to UL, CSA & CE waterproof standards (NEMA 4, 4X, IP 65). Cover shall be polyester powder coated for exceptional corrosion, wear, impact and UV resistance. The enclosure shall have captive cover bolts, therefore preventing time consuming problems due to lost or misplaced bolts. A UL listed waterproof / explosion proof enclosure (NEMA 4, 4X, 7, 9) shall be available.

VALVE STATUS DISPLAY The actuator shall have a highly visible display prominently labeled to indicate valve position throughout the full range of travel.

TEMPERATURE RATING Actuators shall be designed for temperature ranges of -40°F (-40°C) to +150°F (65°C).

OPTIONAL EQUIPMENT

The actuator shall be designed to include any of the following accessories as an option.

TORQUE LIMITING SYSTEM with 2 SPDT mechanical switches and 2 factory calibrated screws. The worm shaft shall be driven against the torque disc springs in response to the output torque. The switches contact the worm shaft groove in response to predetermined loads and interrupt the electrical power to the motor. Switches shall operate at any point of actuator travel.

HEATER with self-regulating temperature control to prevent condensation buildup. The heater shall be pre-wired to the terminal block. Rated output is 15 W at 24, 120 or 220 VAC.

SERVO A microprocessor controlled Servo shall be available for precise modulating control of valve position in response to an analog input signal. The Servo shall have an analog output signal proportional to actual valve position as standard. This analog signal shall be configurable to either current or voltage output. The Servo shall have voltage spike protection on all Input terminals. Independent adjustments shall be provided for both open and closed Speed Control of the actuator and deadband. Input Signals: 4-20 mADC into 250 Ohm, 0-10 VDC, 0-5 VDC, 10k Ohm or greater potentiometer. 10K Ohm Potentiometer shall be used for internal feedback. Calibration of the Servo shall be accomplished by pressing a single button to initiate the calibration routine. Inputs for the control box and handwheel, LED status indicators and self-diagnostic capability shall also be provided.

DeviceNet Servos shall be available.

CONTROL STATION for manual local electrical operation of the actuator. The Control Station shall flush mount to the actuator and feature a local / off / remote control switch, an open–stop–close switch, and two lights which locally indicate open and closed valve position. The enclosure shall be aluminum and waterproof (NEMA 4, 4X, IP 65).

The Bray Series 70 Electric Actuators
Series 70-003/005, 008/012/020 and 70-030/050/065.

Flow-Tek®

Subsidiary of BRAY INTERNATIONAL, Inc.

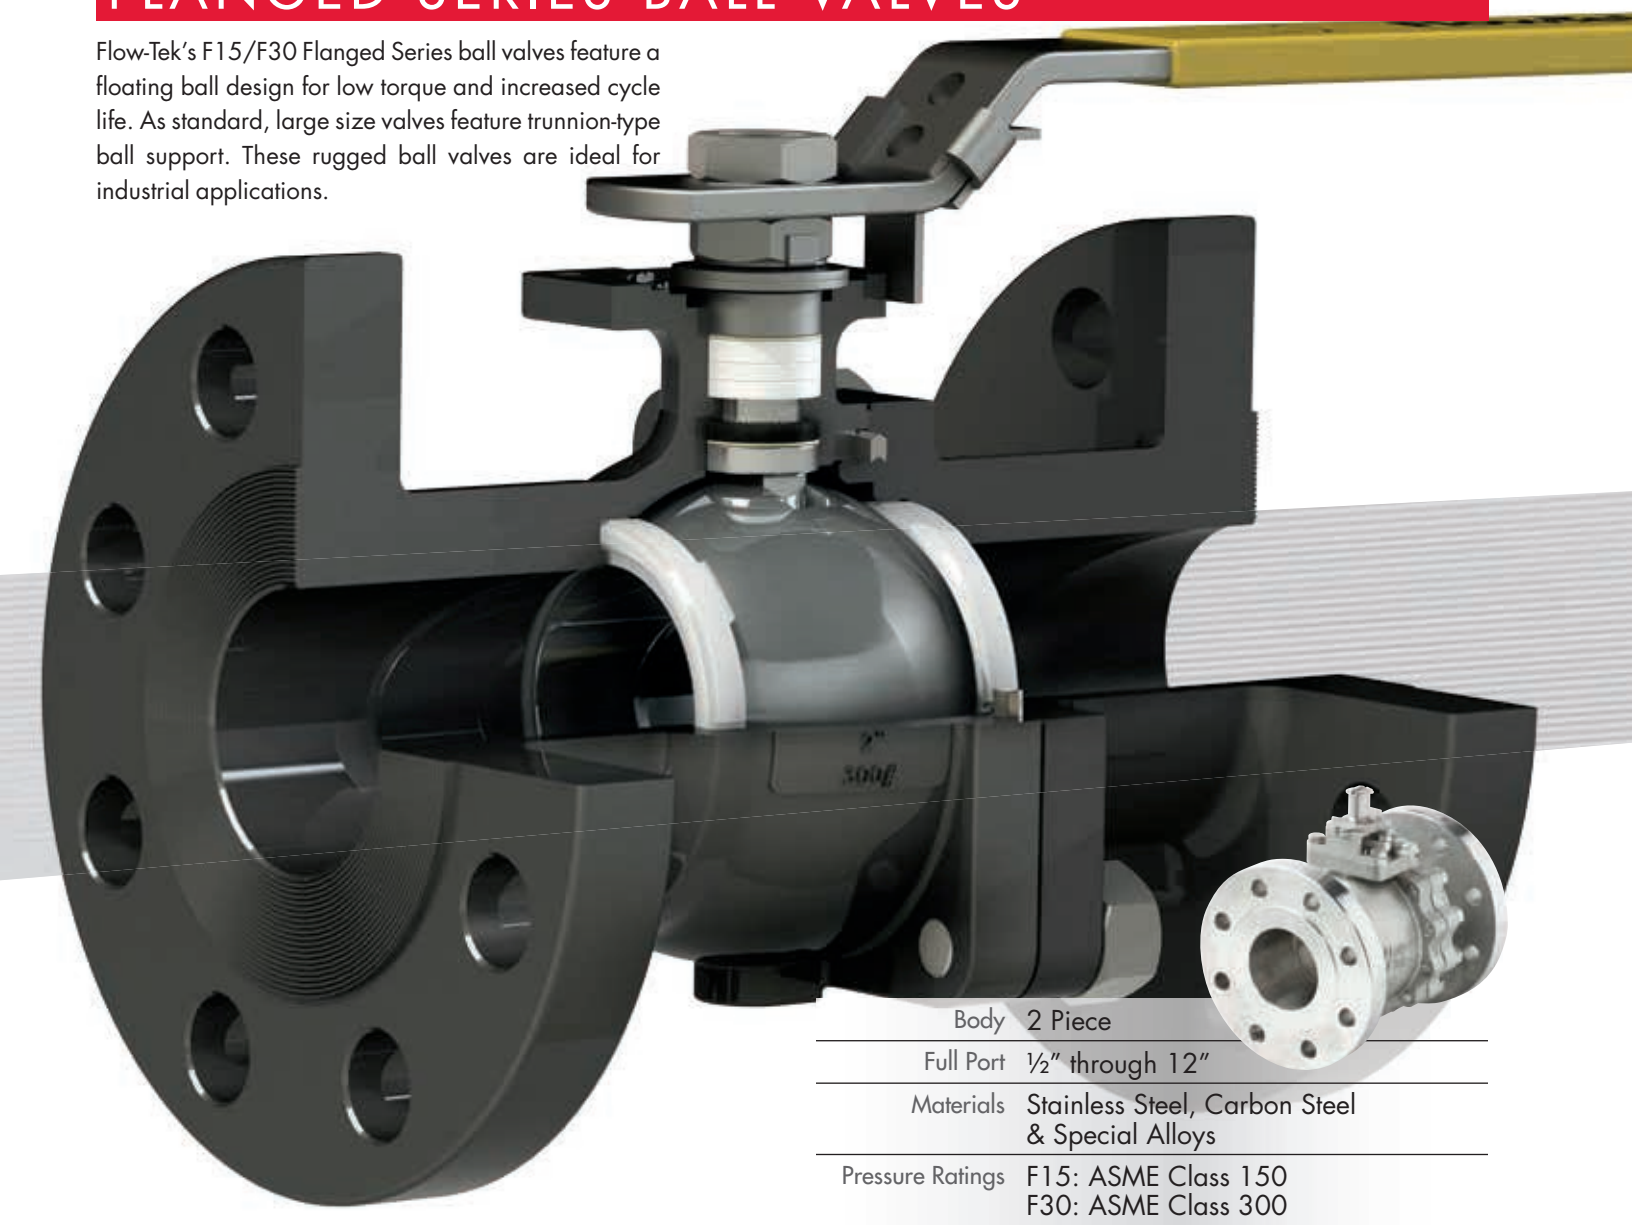
FLANGED SERIES

2 PIECE FLANGED FULL PORT ½" - 12"

F15 - ASME Class 150 | F30 - ASME Class 300

FLANGED SERIES BALL VALVES

Flow-Tek's F15/F30 Flanged Series ball valves feature a floating ball design for low torque and increased cycle life. As standard, large size valves feature trunnion-type ball support. These rugged ball valves are ideal for industrial applications.



Body	2 Piece
Full Port	½" through 12"
Materials	Stainless Steel, Carbon Steel & Special Alloys
Pressure Ratings	F15: ASME Class 150 F30: ASME Class 300

SECURE MOUNT

Flanged Series valves offer ease of automation due to an integrally cast actuator mounting pad which complies with ISO 5211 through 2" valve sizes.

STEM SEALS

Flanged Series ½"– 2" valves feature live-loaded, self-adjusting primary and secondary sealing. Utilizing Belleville washers, the stem seal automatically adjusts to compensate for changes in temperature and normal wear. 2½"– 12" valves utilize an independent packing gland which can be easily adjusted without removing mounting hardware or operator. The packing gland is contoured to more uniformly distribute the load across the packing. The primary stem seal is a combination of a thrust washer and a thrust washer protector. An adjustable stem packing creates a secondary seal between the stem and body. The stem packing is composed of RPTFE V-rings as standard – graphite stem packing is standard on all fire safe valves.

BALL

Flow-Tek balls are precision machined and mirror finished for bubble-tight shut off and less operating torque. As an added safety feature, a hole in the stem slot of each ball equalizes pressure between the body cavity and the line media flow.

BODY

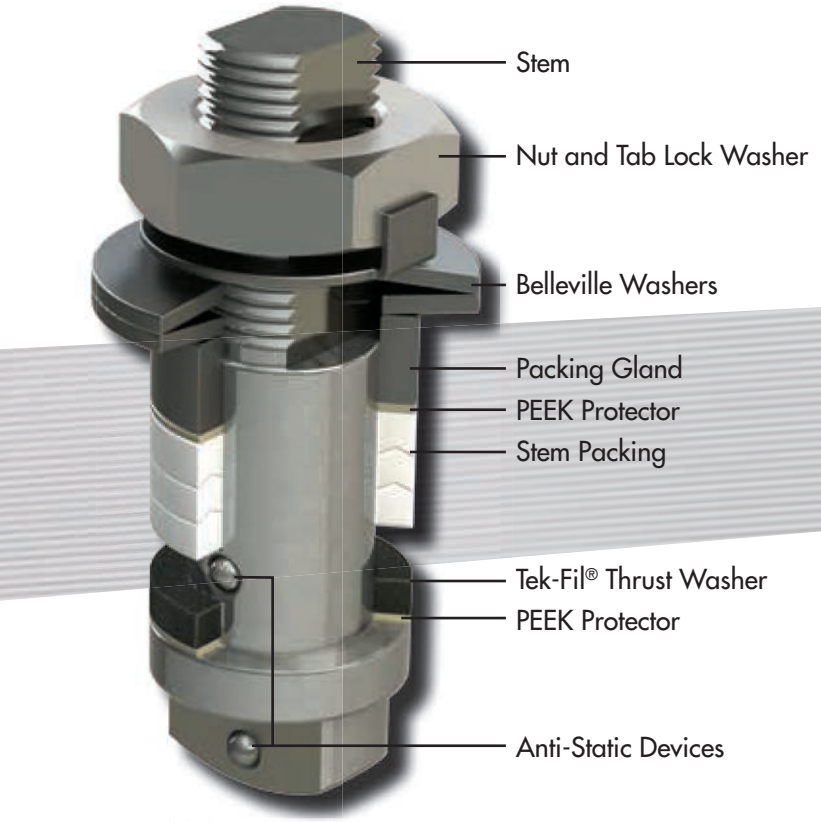
½"– 4" valve bodies are investment cast and solution annealed/ normalized for the highest quality and added strength. All body castings are marked with a foundry heat number for full traceability. Carbon steel bodies are phosphate coated for increased corrosion resistance.

SEAT

Flow-Tek's seat design ensures bi-directional, bubble-tight sealing with low operating torque. All resilient seats feature relief slots or seat O.D. clearance to relieve pressure past the upstream seat, and positive preloading to ensure low pressure/vacuum sealing.

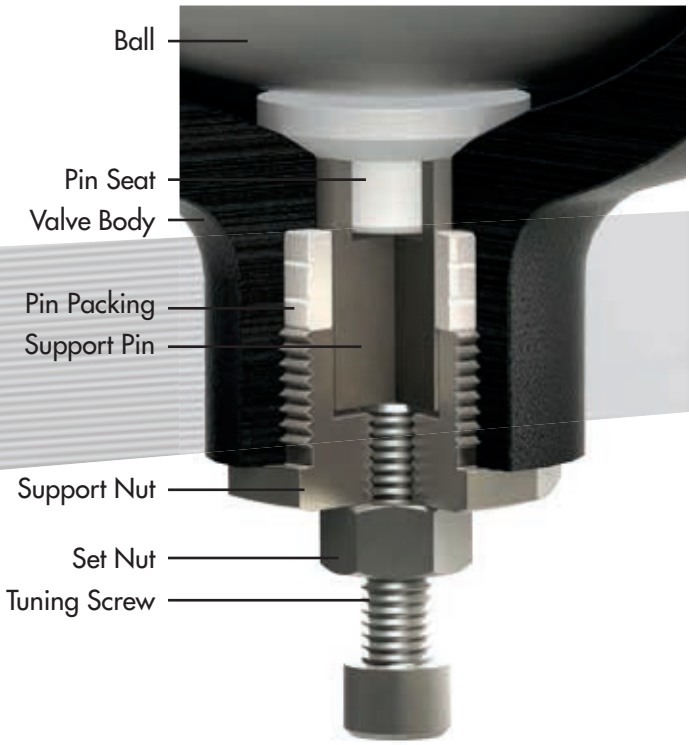
STEM ASSEMBLIES

Flow-Tek manufactures heavy duty, high quality stems with double "D" connection to ball and operator mounting. Stem and ball design ensure positive contact. All Flow-Tek stems are internal entry and blowout proof for maximum safety.



BALL SUPPORT Valve Sizes 6" through 12"

As standard, larger sized valves feature trunnion-type ball support. This support helps to maintain continuous contact between the ball and seats, preventing seat damage and blow-by. The results are less seat wear, lower torque, and longer service life.



SMART STEM Valve Sizes ½" through 2"

Flow-Tek's interchangeable family of valves feature strong, large diameter stems with live-loaded, self-adjusting sealing utilizing Belleville washers which automatically adjust to compensate for changes in temperature and wear. Manual adjustments which can cause damage to the seal and seat are not required. The assembly is secured by a saddle-type lock washer which prevents stem nuts from unthreading in high cycle automation applications.

STEM PACKING

An adjustable V-ring design creates a multiple seal between the stem and body. Each stem assembly is composed of three or four (dependent on valve size) rings providing a very high cycle life by resisting creep and cold flow. The thrust washer and the thrust washer protector combine to provide a primary seal, reduce torque and prevent galling. This arrangement is a Flow-Tek exclusive.

LOCKING DEVICE

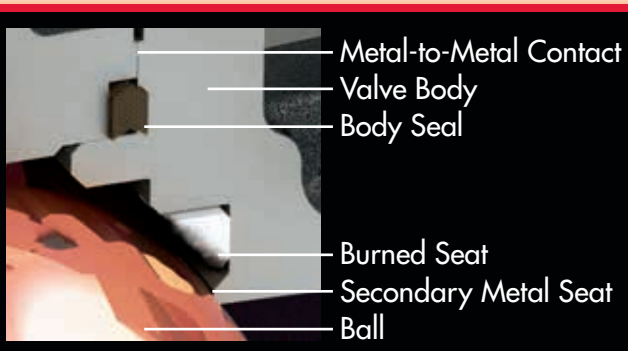
All manually operated valves feature a locking device to prevent accidental movement of ball position. Valves ½"–2" feature a safety trigger that locks the handle in the open or closed position. The handle lock can be bypassed, if needed, with a small bolt through the handle in the release position.

On all sizes a padlock can be added to secure the handle in position, preventing unwanted movement of the ball.

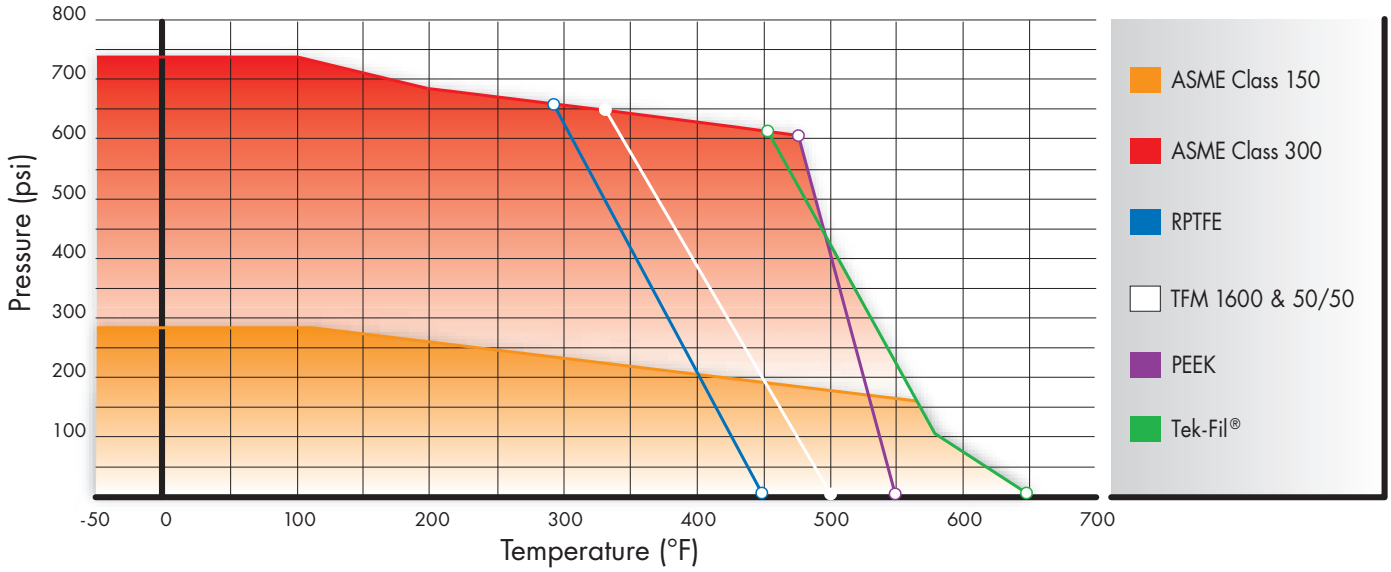
FIRE SAFE - Certified to API 607

Flanged Series valves with graphite stem seals have been thoroughly fire tested and meet these standards.

In the event of a fire, after heat destroys the primary resilient seat, the ball makes contact with the secondary metal seat, forming a secure seal. The body seal, composed of stainless steel and graphite wound into a spiral, prevents external leakage. The graphite stem rings prevent stem leakage.



PRESSURE / TEMPERATURE



Carbon steel valves limited to -20°F

STEAM SERVICE PRESSURE RATINGS: WSP

	TFM Seats		Tek-Fil Seats		PEEK Seats	
	PSI	°F	PSI	°F	PSI	°F

Vacuum service to 29.9 inches Hg. gauge.

SPECIAL OPTIONS/SERVICES

Cavity Fillers	Media Containment Units
Spring Return Handles	NACE
Vented Balls	Polished Internals
Characterized Balls	Special Cleaning
Chlorine Service	Silicone Free

SPECIFICATIONS

- Valve sizes ¼" through 12"
- Design meets MSS-SP-110
- Threaded end connections meet ASME B1.20.1 NPT
- Socket weld end connections meet ASME B16.11
- Butt weld end (Schedule 40) connections meet MSS SP-72 /ASME B16.25
- Flanged end connections meet ASME Class 150

Valve body and end cap connections are high quality investment cast and solution annealed/normalized. Body and end cap wall thickness meets ASME B16.34.

Valve stems are blow-out proof for maximum safety and meet ASME B16.34 specification.

All valves are factory tested to MSS SP-72 and API 598.

SEAT SELECTION

A wide range of seat materials are available to meet most applications. The standard seat is TFM 1600. Options include:

- RPTFE
- Stainless Steel/PTFE (50/50)
- UHMWPE
- Virgin PTFE
- PEEK
- Tek-Fil® (carbon/graphite filled TFM)
- Full metal seats
- Cavity Fillers

PEEK seats offer high pressure/temperature capability. Tek-Fil® seats offer reduced torque in high temperature, high cycle, and steam service applications. TFM 1600 seats offer the exceptional chemical resistance of PTFE plus lower porosity and permeability, improved temperature range and reduced valve torques.

Bray®

SERIES 92/93 Rack & Pinion
Double Acting & Spring Return

PNEUMATIC ACTUATOR

The
High
Performance
Company

SERIES 92/93

Styling, strength, compactness, and simplicity of design have been combined to produce the best rotary actuator on the market today. Bray Controls introduces this newest line of high performance, highest quality pneumatic actuators, the Series 92/93.

Engineering excellence and precision manufacturing has produced a modular product line with reduced overall size requirements and economic savings. In addition all Brayline Accessories are fully modular and directly mount to the actuator – providing flexibility and efficiency at reduced cost.

Bray Series 92/93 actuators are rack and pinion, opposed-piston actuators available in two versions: double acting for rotation of 90°, 135° and 180°, and spring return for 90° rotation. Their ideal use is actuating butterfly, ball or plug valves, but they can be applied anywhere a rotation of 90°, 135° or 180° is needed. Rotated on low friction acetal bearings, Bray units are well suited to handle offset loads to the gear and output shaft assembly.

The Series 92/93 actuators were designed primarily for pneumatic operation up to a maximum pressure of 140 psig (10 Bar) and for temperature ranges of -40°F (-40°C) to +200°F (+95°C). For higher and lower temperature applications, consult factory.

All double acting and spring return units are suitable for both on-off and throttling applications. Actuators which can be actuated with other media such as hydraulic oil or water are also available as an option.

The Series 92/93 is completely enclosed and self contained. The many features minimize maintenance and provide safe, simple disassembly and assembly.

The INTEGRAL PORTING (**A**) reduces the cost of external tubing that is also easily damaged. The unique, lubricated ACETAL PISTON GUIDES (**B**) and RINGS (**C**). Both have a very low coefficient of friction and absorb the side thrusts of the pistons. The piston cylinder walls in the body are honed to a very fine finish thus reducing the overall coefficient of friction. These features extend the life of the actuator and make the Series 92/93 one of the most efficient actuators on the market.

The OUTPUT SHAFT BEARINGS (**D**) on the top and bottom of the pinion are made of low-friction acetal.

The OUTPUT SHAFT and PINION GEAR (**E**) are one-piece, manufactured from hardened alloy steel and zinc-plated for corrosion protection.

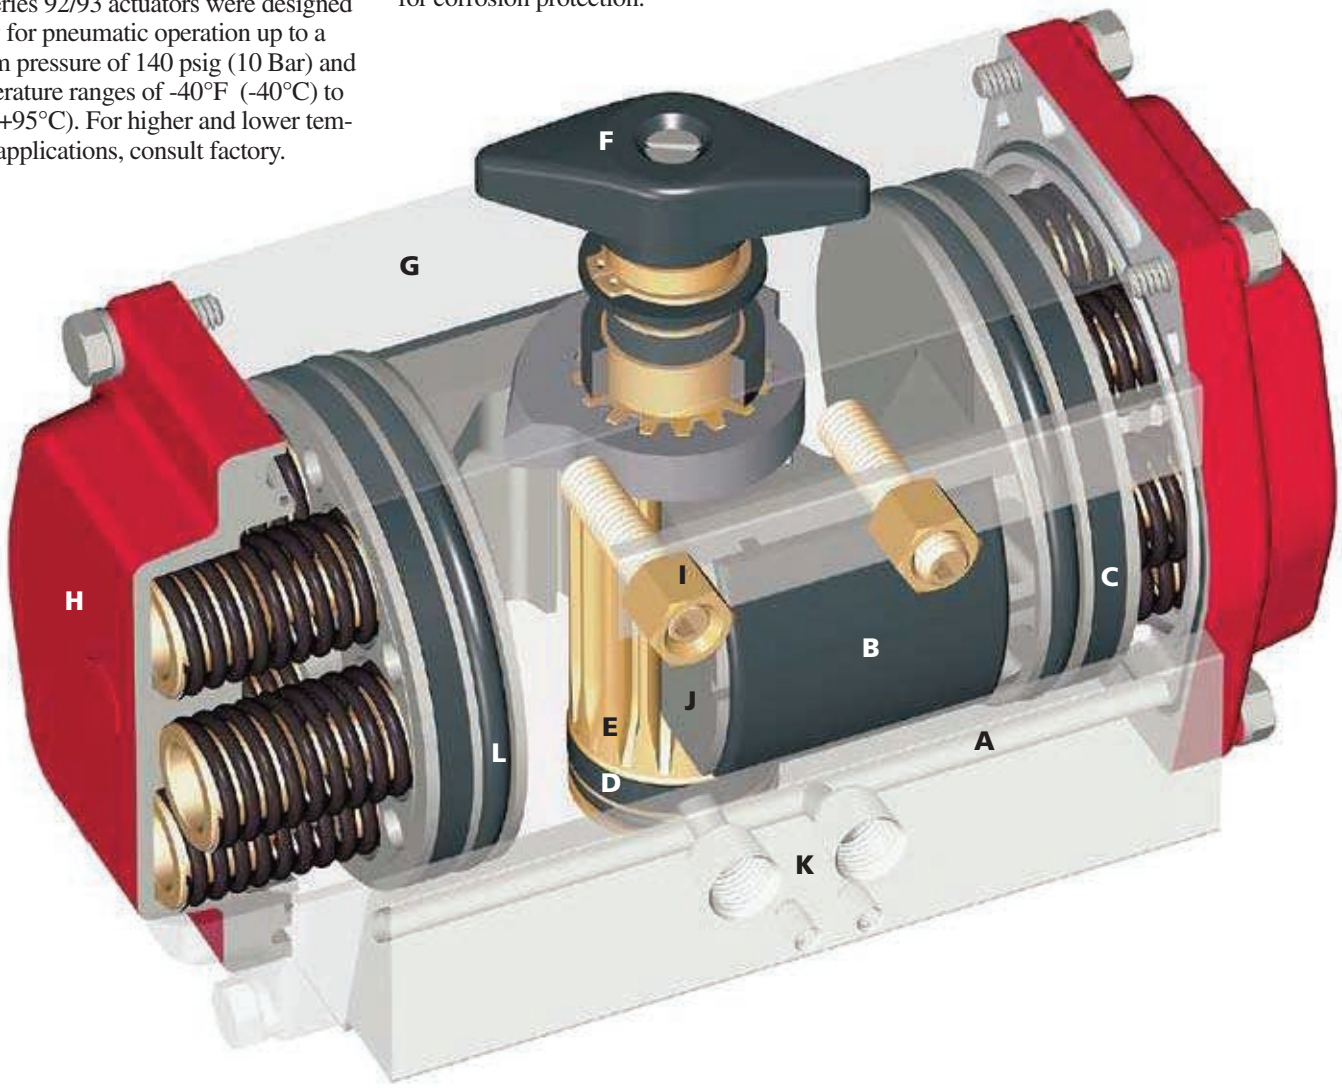
The SHAFT POSITION INDICATOR (**F**) clearly shows open or closed position and is easily removable for MANUAL OVERRIDE FUNCTION of the actuator.

The BODY (**G**) is extruded aluminum with anodized corrosion protective coating. The END CAPS (**H**) are polyester coated for chemical resistance. This coating is resistant to dilute aqueous acids, salts, aliphatic hydrocarbons, detergents, petroleum solvents, alcohols, greases and oils.

The TRAVEL STOP (**I**) adjusting screws limit the travel of the actuator to specific degrees of rotation in both open and closed directions. The PISTONS (**J**) are die-cast aluminum.

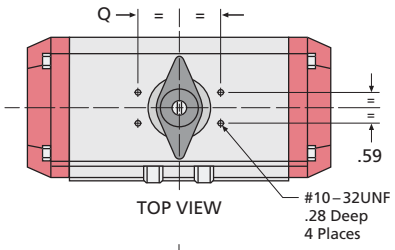
The two PNEUMATIC SUPPLY PORTS (**K**) are 1/8" NPT on size 48 actuators. The other sizes have 1/4" NPT ports. NAMUR interface is standard on all actuator sizes.

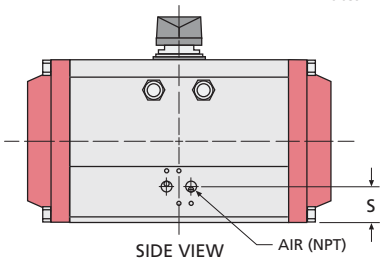
All Bray Series 92/93 actuators have permanently lubricated factory packed bearings and guides. No further lubrication is necessary under normal operating conditions. All seals, including PISTON SEALS (**L**), are permanently lubricated Buna-N O-rings.

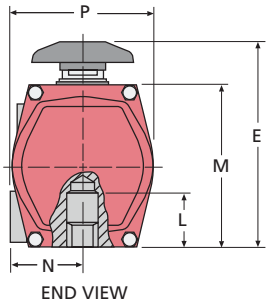


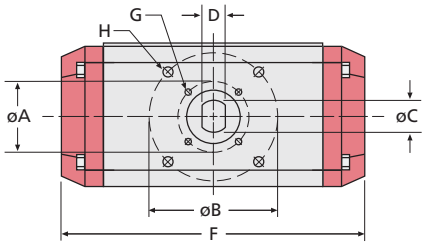
ENGINEERING

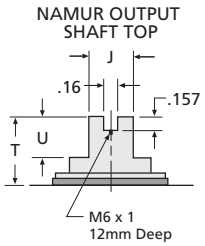
Double Acting/ Spring Return

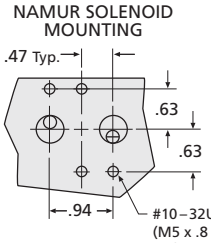












Special Note: Sizes 210 and 255 actuators have end-cap travel stops not bi-directional travel stops. Please consult factory for production release date of bi-directional stops for these size S92/93 actuators.

Note: Double Acting and Spring Return actuators have the same overall dimensions. The double acting unit of the size 48 actuator is optionally available with flat end caps with an F dimension of 4.00.

† ISO "F" means mounting flange-drilling pattern.

* Dimensions for Size 160A in table. Size 160B (keyed stem version) has C dimension of 1.38 and D dimension of .39.

‡ Dimensions for Size 255A in table. Size 255B actuator has a C dimension of 3.00 and D dimension of .75.

** Size 48 has a T dimension of .79 with use of NAMUR top plate.

Actuator Speeds

SIZE	48	63	83	92	118	127	160	210	255
Open Stroke/ Close Stroke	1/4	1/4	1/4	1/4	1/2	1/2	1	2	2 3/4

Note: Times shown are in seconds at 80 PSIG supply pressure with 6ft. tubing having an internal diameter of approximately 1/4". Bray S92/93 actuation times are very dependent on the flow capacity of their air supply. The use of smaller port solenoids, solenoid manifolds, smaller I.D. air supply tubing and/or extended lengths of tubing can significantly reduce the actuation time and/or initial response to the command signal.

Actuator Weights

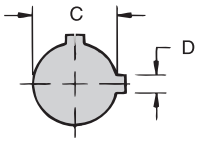
SIZE	48	63	83	92	118	127	160	210	255
Double Acting	1.8	3.4	6.1	8.4	16.4	20.9	38.1	65.0	144.0
Spring Return	2.4	4.1	7.9	10.8	21.7	27.3	52.6	95.3	192.6

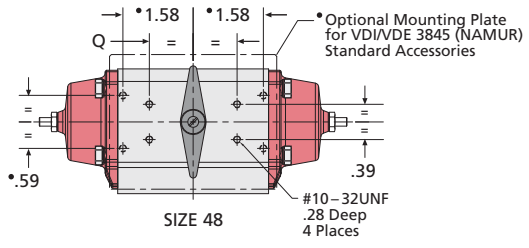
Weights are in lbs. Spring Return unit weights are with full set of springs per piston.

Actuator Volumes (ins³)

SIZE	48	63	83	92	118	127	160	210	255
Counter-clockwise	5.7	9.6	24.8	34.8	73.8	96.7	187.5	360.0	750.0
Clockwise	4.8	13.4	32.6	45.9	95.5	130.8	259.6	450.0	900.0

Counter-clockwise: Air volume in cubic inches required to push pistons apart, full travel.
Clockwise: Air volume in cubic inches required to push pistons together, full travel.

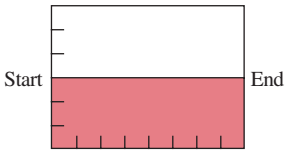




TORQUE

DOUBLE ACTING TORQUE CURVE

Series 92 – (Air to Air)



The Series 92 Actuator has a constant output torque throughout travel from start to end, clockwise or counterclockwise rotation.

BrayLINE ACCESSORIES

TRAVEL STOP Two independent adjusting screws are located on the center of the output shaft to precisely limit the travel of the actuator to specific degrees of rotation. The travel stops permit bidirectional adjustment of actuator movement in both the open and closed positions.

SPRING RETURN Bray's Series 93 spring return models employ a unique cartridge system. The actuator was designed to save both space and cost. The housing length of the spring return unit is the same as the double acting unit. Converting from double acting to spring return actuation is just a matter of removing the end caps and adding the unique spring cartridges. The actuator can be disassembled and assembled without cumbersome equipment or danger to the installer due to springs releasing. 40, 60, 80, and 100 psi services are standard, optional ratings are available.

DIRECT MOUNTING Bray actuators comply with ISO 5211 dimensions and mount directly to Bray valves without using external linkages. Field installation is simple, misalignment is minimized and contamination buildup between valve and actuator is reduced. Bray can provide linkage for mounting actuators to other devices requiring 90° to 180° rotation.

SERIES 63 3-WAY AND 4-WAY SOLENOID VALVE

For electrical operation of pneumatic actuator on-off functions, Bray Series 63 solenoids are direct-mounted to the actuator by NAMUR interface. The pilot operated spool control valve is convertible from 3-Way (3/2) to 4-Way (5/2). Both watertight (NEMA 4, 4X) and explosion proof (NEMA 4,4X,7,9) housings are standard. NPT and IP65 DIN connections are offered with both single and dual coils. The air supply connection is 1/4" NPT and the electrical connection is 1/2" NPT. A manual override screw is located on the top of the valve body. Stainless Steel housings, digital Bus solenoids and a Series 55 speed control that allows independent control in both directions of travel are also available.

VALVE STATUS MONITOR SERIES 50

The Series 50 signals actuator and valve position to local and remote stations. The compact valve status monitor mounts directly to the top of the actuator. Features include finger-touch control cams, captive cover bolts, local position indicator and two conduit entries for easy wiring. Rated for 15 amps at 125 or 250 volts AC, the Series 50 is provided with internal travel switches that are prewired to a terminal block. Standard switches are two single pole double throw (SPDT) micro switches. Available switch options are 4 micro switches, 2 proximity switches, 2 pneumatic switches or potentiometer for continuous read out. The housing is available in waterproof (NEMA 4,4X) or explosion proof (NEMA 4,4X,7,9).

SERIES 52 VALVE STATUS MONITOR

The Bray 2N1 ProxSensor provides 2 proximity sensors in 1 self-contained, fully sealed, compact enclosure. The sensors are completely encapsulated with epoxy resin in a polymer enclosure for superior moisture, chemical and corrosion protection. AC, DC, Intrinsically Safe and BUS Network versions are offered. Features include LED indicators, high visibility pointer for local position indication, non-magnetic targets and multi-pin electrical cable connector. A Valve Position Display is available as an option. AC Sensor units operate on 20-250 VAC with a maximum load current of 500mA. DC Sensor units operate on 10-30VDC with a maximum load current of 200mA. BUS Network powered units with solenoid drive are AS-i, DeviceNet and PROFIBUS DP.

SERIES 6A ELECTRO-PNEUMATIC POSITIONERS

Series 6A intelligent electro-pneumatic positioners offer precise, microprocessor driven flow control and advanced communication combined with the lowest air consumption on the market. For use with either double or single acting actuators, Series 6A positioners can accept an analog 4-20 mA, HART, Foundation Fieldbus or Profibus PA input signal. Features include an LCD display, keypad, auto calibration and adaptive control. Both waterproof (NEMA 4, 4X) and explosion proof (NEMA 4,4X, 7,9) housings are available.

Brayline Accessories and Bray Actuators both comply with VDI/VDE 3845 (NAMUR recommendations).

SPECIFICATIONS

SPACE SAVING MODULAR PRODUCT LINE

The actuator shall be pneumatically operated and must travel a minimum of 90° in each direction and must be able to overtravel at 3% in each direction past 90°. The actuator shall be totally enclosed and contained in a single enclosure, with no external moving parts. All pneumatic passage ways must be integral to the actuator housing so as to eliminate the need for external tubing. Actuator shall be rack and pinion design, and the output torque shall be linear throughout travel. Actuator shall be provided with pistons that have acetal piston guides and rings thus greatly extending the life of the actuator and reducing friction to the minimum. Actuator must be supplied with two independent travel stop adjustments, the 0° and 90° travel positions have travel adjustments of +5° to –5° (see Diagram A below). The actuator shall be provided with mechanical visual position indicator, and the indicator must be able to be removed easily thus exposing the output shaft for use of manually overriding the actuator when needed. The output shaft and pinion must be of one piece and must be manufactured out of hardened alloy steel and zinc plated for corrosion protection. Actuator shall be able to mount in any position without loss of performance. The actuator shall bolt directly to Bray valve mounting flange without need for any brackets.

Actuator housing shall be anodized aluminum and all external fasteners shall be carbon steel, zinc plated. Springs shall be spring steel, coated for corrosion protection. All seals shall be Buna-N and bearings made of lubricated acetal resin.

The actuator shall be factory lubricated. Actuator design must have smooth housing lines so it will self-drain. The actuator shall be factory tested to ensure proper operation.

STANDARD MATERIALS

Body:	Extruded aluminum alloy, anodized
End Caps:	Die cast aluminum alloy with corrosion resistant polyester coating
Pistons:	Die cast aluminum alloy
Output Shaft/Pinion:	Carbon Steel, zinc plated
Travel Stop:	Alloy Steel
Shaft Bearings:	Acetal
Piston Guides:	Acetal
Fasteners:	Stainless Steel
Springs:	Spring Steel, protective coating
O-Ring Seals:	Buna-N
Options:	Polyester coated body exterior Electroless Nickel plated body exterior Hard Anodized body exterior Stainless Steel pinion

SPRING RETURN – MODULAR DESIGN

The Spring Return System for fail-safe services must be installed in the same housing as the double acting actuator, with no additional housing extensions required, therefore saving weight and space. The spring system must be supplied as a self-contained spring cartridge system. This is a safety feature that ensures disassembly of the actuator without danger of spring release when end caps are removed. Actuator shall be Bray Series 92 or 93 or approved equal.

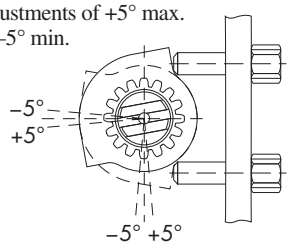
SERVICE DATA:

Actuators shall be designed for pneumatic operation up to a maximum pressure of 140 PSIG (10 Bar) and for temperature ranges of -40°F (-40°C) to +200°F (+95°C). Filtered air is recommended but not required. All double acting and spring return units shall be suitable for both on-off and throttling applications. Optional units shall be able to operate with other media such as hydraulic oil or water, consult factory for further information.

OPTIONAL EQUIPMENT

See Bray brochure #1030 for Solenoid, brochures #1011 and #1029 for Pneumatic and Electro-Pneumatic Positioners and brochures #1012 and #1015 for Valve Status Monitors.

Diagram A Travel Stop Adjustments
The 0° and 90° travel positions have travel adjustments of +5° max. to –5° min.



Caution: Care should be taken not to over adjust the travel stops in too far or out too far.

ACTUATOR COMPONENTS

Item No.	Qty.	Description
1	1	Body
2	2	Piston
3	1	Pinion
4	2	End Cap
5*	12 max.	Spring Cartridge Assembly

SERIES 55
FILTER REGULATORS

The Bray Series 55 Filter Regulator is a 5 micron filter designed to provide nominal filtration removal of solids and liquids from the compressed air with accurate control to any pneumatic control device and are strongly recommended for use with the Bray Series 64 and 6A positioners.

LOCKING KNOB: Allows for downstream pressure adjustment and locks the pressure setting in place.

THREADED COLLAR: Permits easy attachment of bracket for panel mounting.

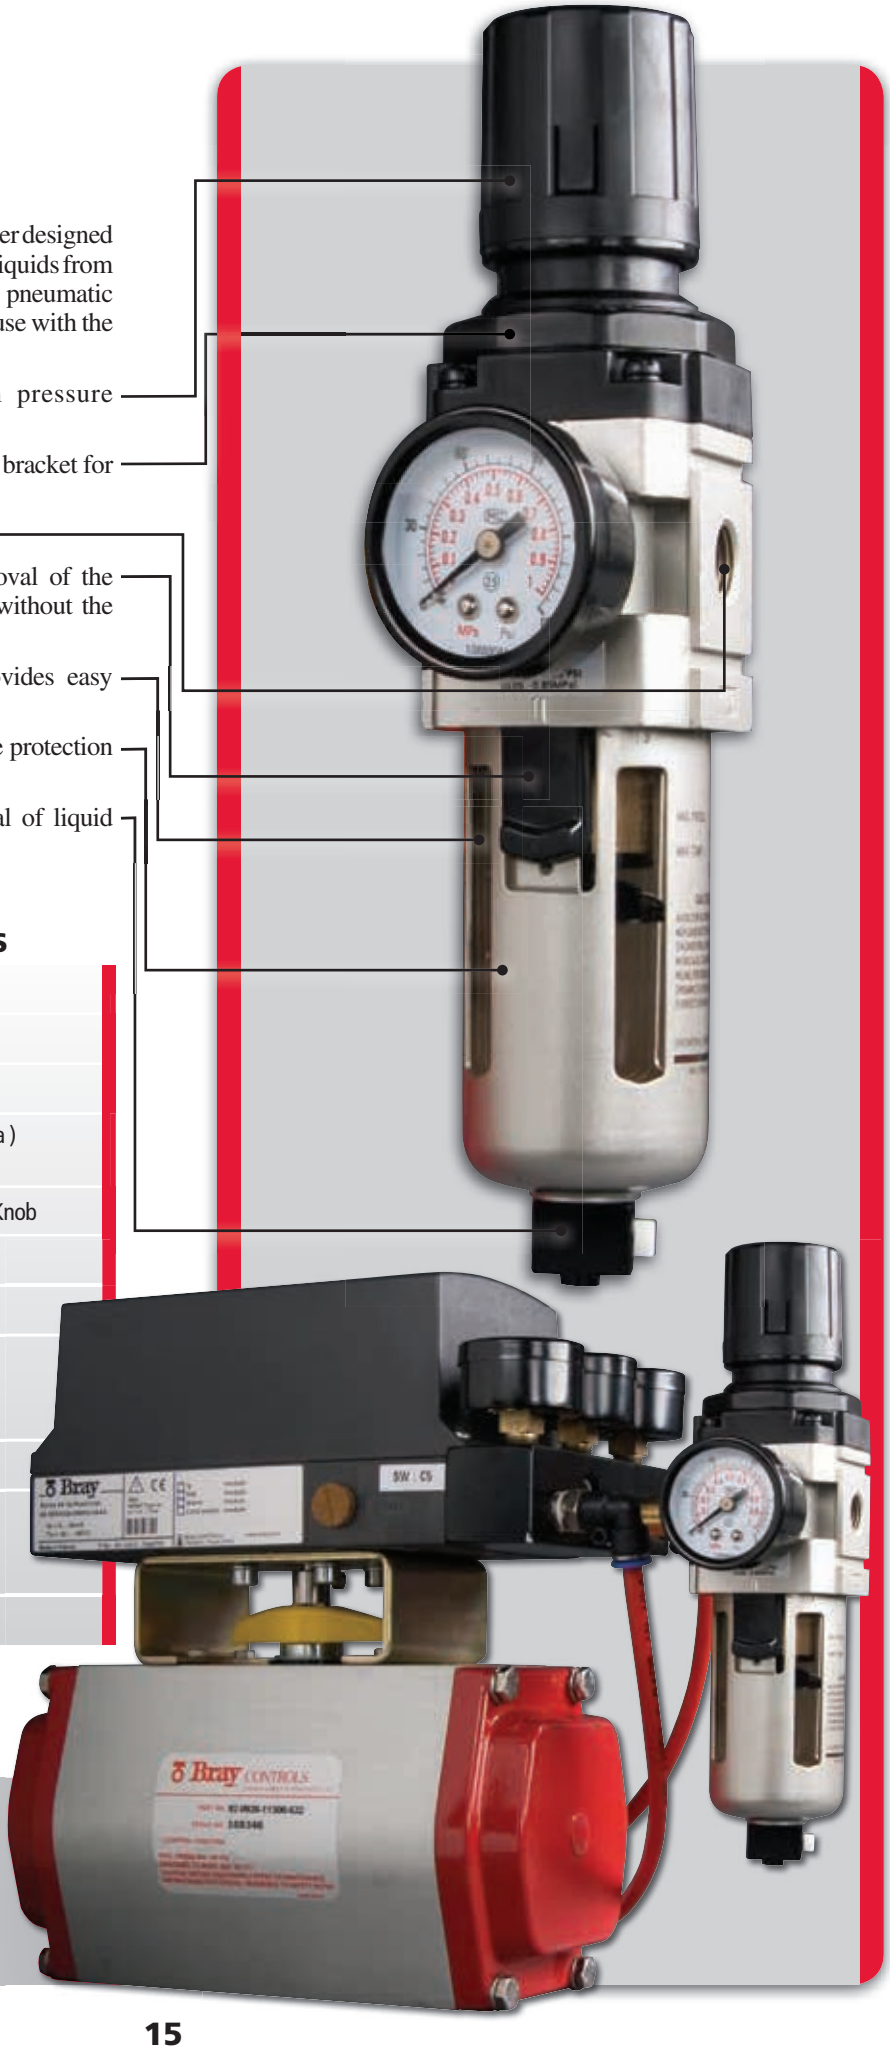
PRESSURE PORTS: 1/4" NPT or 1/4 G Metric

BOWL QUICK RELEASE: Allows for easy removal of the bowl and guard for access to the filter element without the need for special tools.

TRANSPARENT POLYCARBONATE BOWL: Provides easy view of liquid levels.

METAL BOWL GUARD: Provides sturdy breakage protection from external environmental factors.

PUSHBUTTON DRAIN: Allows for easy removal of liquid from the bowl.



SERIES 55 FILTER REGULATORS

Pressure Ports	1/4" NPT or G 1/4
Gauge Ports	G 1/8
Flow (SCFM)*	30
Set Pressure	7 – 125 PSIG (0.05 - 0.85 MPa) (0.5 - 8.6 Bar)
Filter Regulator Body	Zinc / Non-Removable Rising Knob
Bonnet	Plastic
Springs	Steel
Bowls (2 Ounce)	Transparent Polycarbonate with Metal Guard Metal (Zinc) w/Sight Gauge
Filter Element	5 Micron Standard – Plastic
Pressure Ratings**	0 – 250 PSIG (0 - 1.70 MPa) (0 – 17.2 bar)
Temperature Ratings	32°F - 175°F (0°C - 80°C)

*SCFM = Standard cubic feet per minute at 100 psig inlet, 90 psig no flow secondary setting and 10 psig pressure drop.
**Do not attach to pressurized gas bottles.

BrayLINE ACCESSORIES

SERIES 63 NEMA 4 & NEMA 4,4x, 7,9
SINGLE & DUAL COIL NPT & DIN
CONVERTIBLE 3-WAY & 4-WAY

SOLENOIDS

PILOT OPERATED SPOOL CONTROL VALVES

Far superior in performance when compared to the commonly used poppet type valves, the rugged Series 63 delivers long, trouble-free service.

FEATURES

Bray Controls offers the high flow Brayline Series 63 Solenoid Valve. The compact, modular, pilot operated spool control valve is convertible from 3-Way (3/2) to 4-Way (5/2). These units can be used with either spring return or double acting actuators where on/off electrical operation is required. Three standard coil housings/connectors are available: General Purpose Watertight (NEMA 4, 4x) and Explosion Proof (NEMA 4, 4x, 7 & 9) units have 1/2" NPT connections, and IP65 DIN units have cable gland PG9 connectors. All housings types are offered with single or dual coils. The coils are UL recognized and CSA certified. All Series 63 solenoids carry the CE mark.

MANUAL OVERRIDE

Each unit contains as standard a mechanical manual override located on the solenoid valve block. In the event of electrical power failure, overriding is simply a matter of rotating the manual override screw which will divert the air from one chamber of the pneumatic actuator to the other.

DIRECT MOUNTING

Meeting NAMUR (VDI/VDE 3845) standards, all Brayline Series 63 solenoid valves direct mount to the integral porting system of Bray Series 92/93 pneumatic actuators. No external piping is required. Bray's direct mounting permits quick and simple field installation.

SERIES 55 SPEED CONTROL

Speed controls that allow independent control of speed in both directions of actuator travel are optionally available.

CONVERTIBLE 3 & 4 WAY

Solenoid is shipped with both 3-Way (marked 3/2) and 4-Way (marked 5/2) flow plates, flow gaskets, O-rings that mount between flow plate and actuator, and mounting bolts.

OPTIONS

The Series 63 is available in the following options: stainless steel housings, low-powered units and intrinsically safe units. Intelligent, digital Bus solenoids are offered in DeviceNet and Profibus-PA protocols, and AS-I Interface solenoids with IP65 DIN/PG9 cable gland connectors are available. All direct mount to Bray pneumatic actuators.

The High Performance Company

SPECIFICATIONS

COIL HOUSINGS

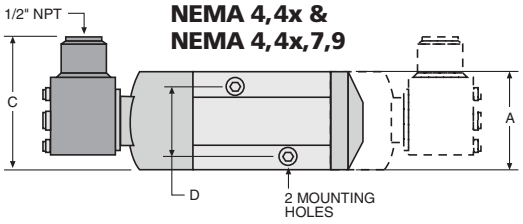
Three standard coil housings are offered. The watertight (NEMA 4, 4x) housing offers a molded and potted coil with UL recognized components and CSA certification. The watertight and explosion proof (NEMA 4,4x,7,9) housing is UL listed and C.S.A. certified for hazardous locations Class I, Div.1 (Groups A-D) and Class II, Div.1 (Groups E-G).
The IP65 DIN housing has UL recognized components and CSA certification.

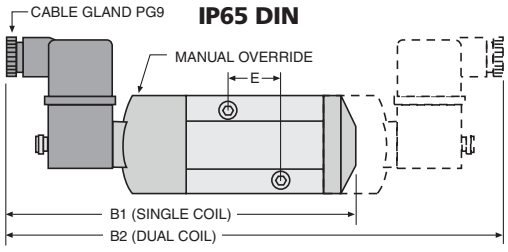
Standard solenoid valves are supplied as single coil units. Double coil units are also available for customers who require actuators to remain in last position during electrical power failure.

VALVE DESIGN Pilot Operated Spool

MEDIA Dry or lubricated air or inert gases

SPRING RETURN ACTUATORS The Series 63 Solenoid Valve fills the spring chamber with supply air rather than drawing air from the surrounding atmosphere. This keeps the spring chamber clean and dry, and improves the performance and service life of the actuator.





ELECTRICAL CHARACTERISTICS

COIL ELECTRICAL:

NEMA Housings:
24, 120, 220, 240 Volts AC, 50-60 HZ
6, 12, 24, 120 Volts DC, 50-60 HZ
IP65 DIN Housings:
24, 120, 240 Volts AC, 50-60 HZ
12, 24, 120 Volts DC, 50-60 HZ
Insulation-Class F Coils Maximum Temperature Rating: 311°F (155°C)

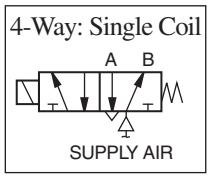
FLOW - 1/4" PIPE: $C_V = .7$
Flow = 30 scfm, 150 psi max.
Note: Bray S92/93 actuation times are very dependent on the flow capacity of their air supply. It is strongly recommended that only the Bray S63 high flow solenoid be used with the Bray S92/93 actuators. The use of smaller port solenoids, solenoid manifolds, small I.D. air supply tubing and/or extended lengths of tubing can significantly reduce the actuation time and/or the initial response to the command signal.

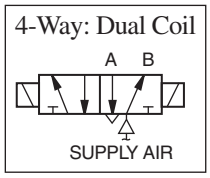
NOMINAL POWER (Watts)
NEMA Housings: A.C - 6.3, DC - 6.9
DIN Housing: A.C - 2.5, DC - 3.0

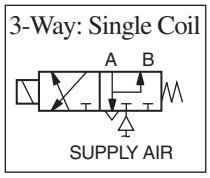
OPERATING SPEED: 10 cycles per minute - with more if needed

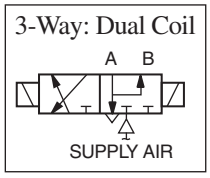
DUTY CYCLE: Continuous

FLOW SCHEMATICS









MECHANICAL CHARACTERISTICS

MOUNTING:

NAMUR (VDI/VDE 3845), mountable in any position, hardware included

MATERIALS:

Body: Anodized Aluminum
Spring: Phosphate treated black steel
Shading Coil: Copper
Seals: NBR + PUR
Core / Tube: Stainless / Brass
End Covers & Plate: 6/6 glass filled polyamide (PA/FV)
Spool: Aluminum
Internal Parts: Zamak, Steel, Acetal

PNEUMATIC PORTS: 1/4" NPT

CONNECTIONS:

NEMA Housings: Electrical: 1/2" NPT
DIN Housing: Electrical: Cable Gland PG9

CONSTRUCTION:

Standard construction is molded and potted coil with 18" leads, Class F Insulation. Other insulation classes available. The IP65 DIN coil and magnet structure are epoxy encased.
Molded Cordsets and connectors are available for IP65 DIN coil housings, please consult Bray representative or factory for further information.

NORMAL AMBIENT TEMPERATURE RANGE

NEMA Housings:
AC: -13°F (-25°C) to +140°F (+67°C)
DC: -13°F (-25°C) to +77°F (+25°C)
DIN Housing: AC & DC:
-13°F (-25°C) to +140°F (+67°C)

OPTIONAL ENCLOSURE:

Low power, intrinsically safe DIN Housing, CENELEC (Ex d,m,em &i) listed.

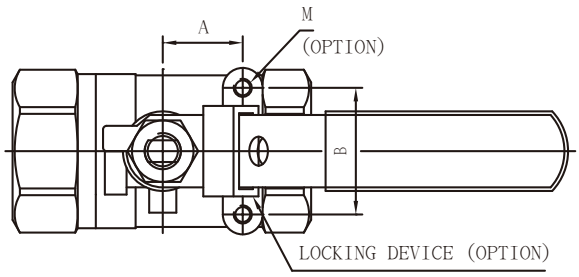
KingTron *Stainless Steel & Carbon Steel valve series*

2-PIECE STANDARD PORT BALL VALVES

FIG. S-212T / C-212T: THREADED ENDS, 2000 PSI(138 BAR) W.O.G..

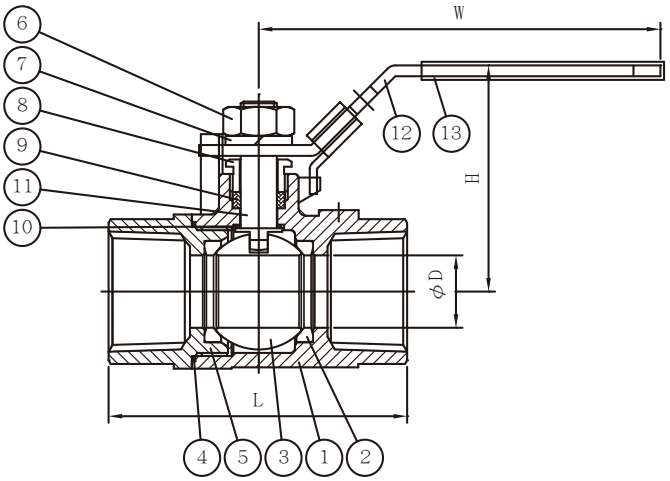
FEATURES:

- Reinforced TFE seats increase durability.
- Adjustable packing gland.
- Bottom-loaded blow-out proof stem.
- Basic design complied with ANSI B16.34 & EN 12516-1.
- NPT threaded ends complied with ANSI B 1.20.1..
- Rc, Rp & G Threaded ends complied with BS 21/2779, JIS B-0203/0202, DIN 259/2999, ISO 228-1, AS1722.1/1722.2 are upon request.
- Tested according to API 598.



MATERIALS LIST:

NO.	PARTS	S-212T	C-212T
1	BODY	ASTM A351-CF8M	ASTM A216-WCB
2	SEAT	REINFORCED PTFE	REINFORCED PTFE
3	BALL	ASTM A351-CF8M/316	ASTM A351-CF8/304
4	GASKET	PTFE	PTFE
5	END CAP	ASTM A351-CF8M	ASTM A216-WCB
6	HANDLE NUT	AISI 304	AISI 304
7	HANDLE WASHER	AISI 304	AISI 304
8	GLAND	AISI 304	AISI 304
9	STEM PACKING	PTFE	PTFE
10	THRUST WASHER	PTFE	PTFE
11	STEM	ASTM A276-316	ASTM A276-304
12	HANDLE	AISI 304	ZINC PLATED STEEL
13	HANDLE COVER	PVC	PVC



OPTIONS:

-L: LOCKING DEVICE. -V: VENTED BALL.
-M: TAPPED MOUNTING PAD. -W: BODY JOINT FULLY WELDED.
-A: ANTI-STATIC DEVICE.

PRATT

Henry Pratt Company

1/2" - 2" Ballcentric® Plug Valve

Engineering Creative Solutions
for Fluid Systems Since 1901

A Tradition of Excellence

With the development of the first rubber seated butterfly valve more than 70 years ago, the Henry Pratt Company became a trusted name in the flow control industry, setting the standard for product quality and customer service. Today Pratt provides the following range of superior products to the water, wastewater and power generation industries.

Butterfly Valves: from 3" to 162"

Rectangular Valves: 1' x 1' to 14' x 16'

Ball Valves —
Rubber Seated: from 4" to 60"
Metal Seated: from 6" to 48"

Plug Valves: from 1/2" to 72", 100% port available up to 48", 3 ways

Air Valves for Water and Wastewater: from 1/2" to 20"

Hydraulic Control Systems

Valve Controls

Energy Dissipating Valves and Fixed Energy Dissipaters

Cone Valves

Check Valves

Plunger Valves

A Commitment to Meeting The Customers' Needs
