Subject:	Action Items and Follow up on FPK
Date:	Tuesday, May 15, 2012 12:11:51 PM

Hello All;

I have walked the entire area with two of our best equipment operators and they believe that they can safely remove a significant amount of the FPK that has been deposited along the leeward side of the southeast dam. They will use a loader to remove the FPK on and in the snow and dump what is recovered back into the PKCA. They brought the loader down to trial this and it seems like this is a very plausible option. We will begin this process this afternoon. I will take some photographs to document and will prepare a summary for distribution.

This morning I collected samples along three transects. I collected samples at three different locations along each transect. At each sampling location I collected three samples of FPK; 1 for geochemistry, 1 for toxicity and 1 for additional analyses including grain size distribution. These samples will be sent out on the flight this evening.

I will continue to provide updates and welcome advice, comments and additional ideas.

Thank you,
Allison
