Subject:	dust management at Sabina"s Back River Project
Date:	Thursday, June 28, 2012 8:36:07 AM

Good Morning,
This email is to advise you that for health and safety reasons, Sabina will be starting dust management activities at both George (2BEGEO1015) and Goose (2BEGOO1015) camps due to the current environmental conditions.

These activities will include application of water over an approximate area of 1 to 2 ha at each camp on an as-needed' basis. At George camp, the water source will be George Lake. The intake will be screened to meet DFO intake requirements and the water distributed via pipes and sprinklers for water distribution over the airstrip area prior to use. Other areas will be sprayed with portable units as needed. At Goose camp, the water source will be Goose Lake and water will either be taken from either the existing camp water distribution system or pumped directly into portable sprayer units. Sabina will also be testing the application of the products Duststop and EK50 to assess their usefulness at both of these camps.

This water use and sources have been approved for these water licenses and the water use volumes included within the amended daily amounts. Sabina will track the water use volumes as per regulatory requirements and will include in the annual report. Sabina has also reviewed the Government of Nunavut's Guidelines for Dust Management and will incorporate operating procedures that minimize the water used and impacts to the local area while ensuring the health and safety of personnel on site.

If you have any further questions, please feel free to contact me, Fred Penner or Dave Smith.
Thanks,
Elizabeth
