June 2002 Fuel Spill	Note 3	-	-	-	580	-	580	-
Miscellaneous	-		-	-	628	110	628	110
TOTALS	36,600	91,500	55,170	96,352	87,265	87,595	146,825	190,057
TOTAL CONTAMINANTS		**128,100**		**151,522**		**174,860**		**336,882**

Notes:

Note 1 - Some area boundaries have changed from the 2003 4th Quarter report as volumes presented are based on surveyed data which has changed the definition of some of the areas.

Note 2 - DRP estimated metals contaminated soils in the Concentrate Storage Area and the Barge area together as one quantity.

Note 3 - this fuel spill ocurred after the DRP was issued so there was not estimate for it.

Note 4 - Total volumes are based on surveys of remediated areas.

Abreviations:

DRP - Decommissioning and Reclamation Plan

TBA - Areas identified in the DRP as being contaminated but no estimate of volumes were made as investigations were not completed.

TABLE 2
POLARIS MINE - CONTAMINATED SOILS HANDLING TO DECEMBER 31, 2004

HYDROCARBON CONTAMINATED SOILS		METALS CONTAMIANTED SOILS		TOTALS CONTAMINATED SOILS (M^3)		
LRDQL	MINE	LRDQL	MINE	LRDQL	MINE	TOTAL
0	146,844	80,324	109,774	80,324	256,618	336,942

NOTES:

Hydrocarbon Soils include Co-contaminated (Metals & Hydrocarbons)
LRDQL - refers to Little Red Dog Quarry Landfill
MINE - refers to the underground working of the mine

GARROW LAKE EROSION MONITORING

2004 GARROW LAKE EROSION MONITORING PINS

The data recorded in the attached table for the Erosion monitoring pin at Station 10 on July 17, 2004 is incorrect. Not sure whether the wrong pin was measured or if the data was just incorrectly recorded.

However, there is sufficient data to compare 2004 data to 2003 data. There is no sign of erosion at any of the locations being monitored.

There were no pictures or measurements of the erosion pins taken in either June or September due to snow conditions around the lake. In July obtained pictures and measurements of three of the four pins and in August obtained measurements and photographs of all pins.

Pin measurements indicate no significant movements occurred during either of 2003 or 2004.

GARROW LAKE EROSION MONITORING PINS

Month	Distance (cm) - Top of Pin to Ground				Photographs Taken
	Stn. 8	Stn. 9	Stn. 10	Stn. 11

APPENDIX 14

GARROW CREEK EROSION MONITORING

GARROW CREEK EROSIONG MONITORING – POST DAM DECOMMISSIONING

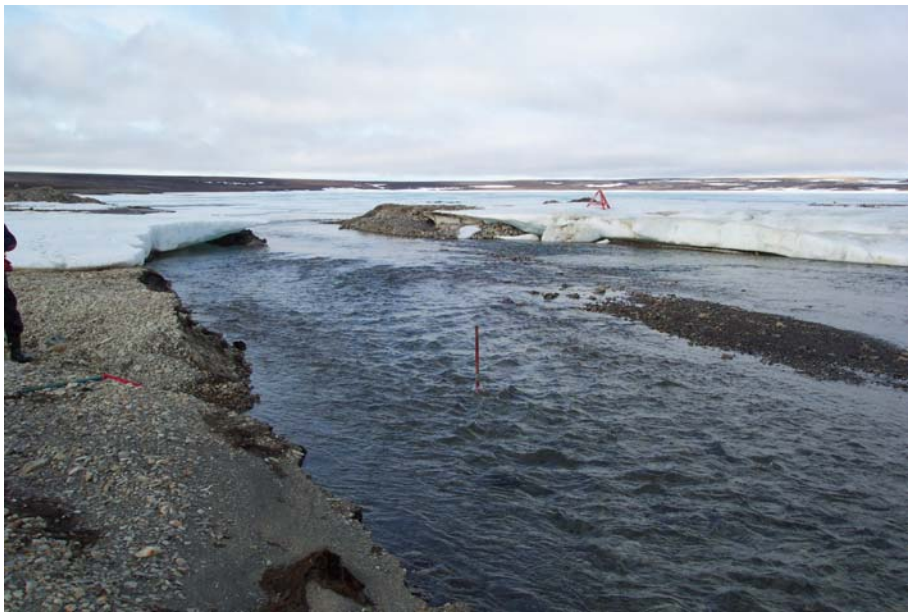
Approvals for the decommissioning of the Garrow dam included monitoring requirements when there were surface flows the first summer the dam was decommissioned. Monitoring included:

1. Erosion Monitoring using rebar pins in the creek bed that are measured weekly during the period of flow,
2. TSS sampling weekly during the period of flow,
3. Photographic records of the creek flow from established locations weekly during the period of flow, and
4. Photographic record at regular intervals along the length of the creek once at the end of the discharge season to document conditions.

1. EROSION MONITORING PINS

Three rebar pins were placed into the creek channel to monitor for erosion of the creek bottom (see photographs below). One pin was placed near the outlet of Garrow Lake, one about midway between the lake and the ocean, and one near the outlet of the creek into the ocean.

Below are photographs of each of the three pins.



Station 12 – Near the outlet of Garrow Lake

Station 13 – Midway between Garrow Lake and the Ocean

Station 14 – Near the Outlet of the Creek into the Ocean

On a weekly basis starting on July 16th, measurements were taken from the top of the pin to the creek bottom. Any erosion of the channel bottom at the location of the pin would be identified by the distance from the top of the pin to the creek bed. The measurements taken during the flow period seem to suggest that the bed of the creek was dynamic and in the case of two of the three monitoring stations, indicated some deposition of material in the stream bed.

GARROW CREEK - EROSION MONITORING DURING DAM DECOMMISSIONING

Station	Location	Date	Height of Pin above Gnd/ Creek Bed (mm)	Height of Water above Creek Bed (mm)	Erosion since date set (mm)	UTM 14 Coords		Comments

2. TSS MEASUREMENTS

On a weekly basis, TSS samples were taken from the Final Discharge Point (designated under MMER). The samples were analyzed by ALS Laboratories in Vancouver. The samples were submitted along with the routine weekly and monthly sampling required under the MMER requirements.

On July 6th, 2004 the TSS results exceeded permit and MMER criteria. This was reported to Environment Canada. At the same time as the TSS sample was collected, samples were also collected for Total Metals and Acute Toxicity. The results indicated that the TSS was not caused by mobilization of tailings but rather from erosion of the creek channel. All metals concentrations in the water were compliant with the Water Licence and MMER criteria. Additionally, the Acute Toxicity testing for Rainbow Trout and Daphnia magna show there was no acute toxicity. All other TSS sampling events during the discharge season were compliant with the Water Licence and the MMER.

10-Aug-24	3	U6897
17-Aug-04	5.3	U7327
24-Aug-04	4.4	U7610
31-Aug-04	14.5	U7699
3-Sep-04	3.3	U8363
7-Sep-04	9.7	U7985

3. PHOTOGRAPHIC RECORD DURING DISCHARGE SEASON

The following photographs were generally taken from the same locations each time to provide a record of flow and creek channel changes that occurred over time during the 2004 discharge period. The requirement was to do this on a weekly basis but this was done on a more frequent basis through July when the flow was at its highest. It is evident from the photographs that some erosion of the channel occurred during the peak flows. The dam was decommissioned prior to spring melt and more water than anticipated was initially released as the ice on the lake and in the channel melted.

4. PHOTOGRAPHIC RECORD OF CREEK CHANNEL NEAR END OF DISCHARGE SEASON

The monitoring program also included the requirement to take a series of photographs along the complete length of Garrow Creek channel once flow for the season had been concluded. Due to weather conditions, the channel would have been under snow before all water had ceased flowing so the photography was done near the end of July when flow was low and before snow covered the landscape. A series of survey markers were set up every 100 metres along the length of the channel starting at Garrow Lake outflow origin through to where the creek discharges into the ocean. The following photographs are identified by the distance from the origin of the creek flow.
