1 INTRODUCTION

1.1 LOCATION AND SITE FEATURES

The FOX-M Hall Beach DEW Line site is located on the Melville Peninsula's east coast at 68º 46' N and 81º 12' W. The community of Hall Beach is approximately 2 km north of the site.

FOX-M was originally a main site within the original Distant Early Warning (DEW) Line system and was decommissioned in 1989 to become a North Warning System (NWS) Long Range Radar (LRR) station and Logistical Support Site (LSS). The environmental clean-up and demolition of facilities, not required for the LRR site operations, commenced in 2003 and were completed in 2007.

The clean-up included the closure and remediation of 6 existing landfills, the construction of new landfills for the disposal of non-hazardous wastes generated from demolition and collection of site debris as well as a second facility to contain Tier II contaminated soils. Monitoring activities were carried out at the following landfill areas as shown on Figure FOX-M.1:

- Non-Hazardous Waste Landfill (NHWLF)
- G217 – West Landfill
- Billboards Landfill
- Hazmat Storage – East Landfill
- Communications North Landfill
- Communications Northwest Landfill
- Tier II Soil Disposal Facility
- East Beach Landfill

In accordance with the Department of National Defence (DND) – Nunavut Tunngavik Incorporated (NTI) Cooperation Agreement, landfill monitoring is carried out following the site clean-up. Table I hereafter provides a synopsis of field activities performed during the 2010 Landfill Monitoring Program at FOX-M.

Table I: 2010 Monitoring Requirements for FOX-M Landfills

Landfill	Visual Inspection	Soil Sampling	Groundwater Sampling	Thermal Monitoring
Non-Hazardous Waste Landfill	✓	✓	✓

East Beach Landfill	✓	✓	✓	✓

1.2 OBJECTIVES AND SCOPE OF WORK

The objective of the Defence Construction Canada (DCC) Landfill Monitoring Program is to collect sufficient information to assess landfill performances from geotechnical and environmental perspectives. DCC has specified the requirements for the Landfill Monitoring Program in the document *Terms of Reference – Consulting Services for the Collection of Landfill Monitoring Data - FOX-5 Broughton Island and FOX-M Hall Beach DEW Line Sites, Nunavut Territory, Qikiqtaaluk Region, DCC Project # DLC MON*, December 14, 2007. (ToR, reference B).

The scope of work for the Landfill Monitoring Program is defined in the ToR and in Biogenie's accepted proposal dated February 2008 (reference C) that was submitted to DCC. The scope of work generally includes the following activities:

- Landfill Monitoring for each of the FOX-M Landfills
- Visual inspection
- Soil and groundwater sampling
- Thermal monitoring (Tier II Disposal Facility and East Beach Landfill)
- Create photographic record
- Draft and Final reports

1.3 REPORT FORMAT

This report describes the work carried out in August 2010 at eight landfill sites at FOX-M. Results from soil and groundwater sampling, thermal monitoring, and visual inspection of the sites are also presented in the formats described in the ToR. An electronic version of the report and its component tables, figures and data files is included in an Addendum DVD-ROM, which is appended to the report.

The report is organized with a separate chapter for each of the landfill areas. Each chapter contains all relevant information for that landfill during the 2010 Landfill Monitoring Program. The following information is provided for each landfill:

- Visual inspection check-list
- Visual inspection drawing mark-up
- A selection of visual inspection photos
- Thermal monitoring summary (where applicable)
- Summary of 2010 soil analytical data
- Evaluation of 2010 soil analytical data
- Summary of 2010 groundwater analytical data (where applicable)
- Monitoring well development/sampling reports (where applicable)

The printed copy of the report's photographic record includes only an index and thumbnail image of photos for each of the landfill areas. The actual photos are included in electronic format in the Addendum DVD-ROM to the report. Certificates of analysis, QA/QC analytical results and field notes are included in appendices.

2 OUTLINE AND METHODOLOGY

2.1 FIELD PROGRAM STAFF

The 2010 on-site field program at FOX-M took place from August 25 to 28, 2010. Biogenie sub-contracted Sila Remediation Inc. (Sila) from Igloolik, Nunavut to perform the field work. The Sila field program was executed by Mr. Andrew Passalis and five local Inuit representatives.

The team was made up of the following individuals:

- Andrew Passalis, Project Engineer
- Peter Anguratsiak, Field Technician
- Mike Ammaklak, Field Technician
- Robert Innuksuk, Field Technician
- Jaypetee Audlakiak, Wildlife Monitor
- Lily Arnaqjuaq, Wildlife Monitor

2.2 WEATHER CONDITIONS

Seasonal weather conditions were observed during the FOX-M monitoring event, with relatively consistent daily temperatures between 4-6ºC during the four days on site. Skies were mostly cloudy throughout the monitoring event with periods of light rain/drizzle on the mornings of August 25, 26 and 27. Clear skies were noted starting mid-morning on the final day on site. Winds were generally from the north-northeast, moderate and ranging between 10 to 30 km/h over the first three days and increasing to 25-40 km/h on the final day on site.

2.3 VISUAL INSPECTION

Data and information collected during the visual inspection of the FOX-M landfills are included in the visual inspection datasheets. These data sheets include such inspection data as the location of settlement, erosion, frost action, sloughing and cracking, animal burrows, vegetation cover and stress, staining, seepage points, exposed debris, and any other features of note.

Each feature was identified with an alphabetical tag to be used consistently each year in an effort to track changes in condition for each specific feature. New features are added to the checklist and are noted as new observations. This letter is shown on the figures for each landfill along with the symbol for the particular feature.

Digital photos with a measure of scale were taken to show the actual general state of the landfills as well as features of interest. Annotated sketches/diagrams are included in the present report for each landfill.

The photos were taken with a Sony DSC-TX5 10.2 megapixel (MP) digital camera. Full resolution digital jpg copies are furnished on a DVD-ROM appended with the report. The photo log, including the local coordinates from where the photo was taken, orientation (relative to map north), feature of note and picture numbers are included with each landfill report.

2.4 SOIL SAMPLING

The soil sampling methodology conformed to guidance provided in the following Canadian Council of Ministers of the Environment (CCME) documents:

- CCME Guidance Document on the Management of Contaminated Sites In Canada, April 1997, CCME PN 1279. (CCME catalogue - http://www.ccme.ca/pdfs/cat_eng.pdf)
- CCME EPC-NCS62E Guidance Manual on Sampling, Analysis, and Data Management for Contaminated Sites - Volume I: Main Report, Dec 93 (CCME catalogue - http://www.ccme.ca/pdfs/cat_eng.pdf)
- CCME EPC-NCS66E Guidance Manual on Sampling, Analysis, and Data Management for Contaminated Sites - Volume II: Analytical Method Summaries, Dec 93 (CCME catalogue - http://www.ccme.ca/pdfs/cat_eng.pdf)
- Reference method for the Determination of Petroleum Hydrocarbons in Soil – Tier I Method, 2001
- CCME Subsurface Assessment Handbook for Contaminated Sites, March 1994, EPC-NCSRP-48E (http://www.ccme.ca/publications/ceqg_rcqe.html)

For the 2010 monitoring event, 44 soil-sampling stations were visited. One surface sample (0-15 cm depth below surface) and one subsurface sample (40-50 cm depth below surface) were taken at each sampling station. No frozen ground or frost was encountered at the soil stations during the August 2010 sampling survey.

As specified in the ToR, the following soil sampling procedures were adhered to:

- Where required, the soil samples were collected from locations between two to four meter radius of the monitoring wells
- Blind field duplicates (10 %) were collected for Quality Assurance and Quality Control purposes
- Duplicate samples (10 %) were also taken and sent to a second laboratory for quality control purposes
- An additional ten percent of soil samples taken were sent to the owner's representative (ESG OPS CENTRE) in Kingston for archiving as specified by DCC.

The soil samples were analyzed for requested parameters (TPH (F1-F3), total metals and PCBs) as specified by DCC. Table II below summarizes the soil sampling at FOX-M during the August 2010 field program.

Table II: Summary of Soil Sampling at FOX-M, August 2010

Landfill Site	**Soil Sample Locations**					
Non-Hazardous Waste Landfill	FM-12	FM-13	FM-14	FM-15	FM-16	
G217-West Landfill	FM-5	FM-6	FM-7	FM-8		
Billboards Landfill	FM-1	FM-2	FM-3	FM-4		
Hazmat Storage-East Landfill	FM-9	FM-10	FM-11	FM-12		
Communications Northwest Landfill	FM-13	FM-14	FM-15	FM-16		
Communications North Landfill	FM-17	FM-18	FM-19	FM-20	FM-21	FM-22
Tier II Disposal Facility	MW-1	MW-2	MW-3	MW-4	MW-5	
East Beach Landfill	MW-20	MW-21	MW-22	MW-23	MW-24	MW-25
	MW-26	MW-27	MW-28	MW-29	MW-30	MW-31

Notes:
Soil samples annotated as "MW" were collected as per the ToR between 2-4 metres from monitoring wells.
All soil samples were collected from two depths (0-15 cm and 40-50 cm). For 2010 sampling, total no. of soil samples = 112 samples (44 samples x 2 depths + 8 QA/QC + 8 (Inter-laboratory comparison) + 8 for Owner's Representative (ESG Archives)

2.5 GROUNDWATER SAMPLING

The soil sampling methodology conformed to guidance provided in the following Canadian Council of Ministers of the Environment (CCME) documents:

- CCME EPC-NCS62E Guidance Manual on Sampling, Analysis, and Data Management for Contaminated Sites - Volume I: Main Report, Dec 93 (CCME catalogue - http://www.ccme.ca/pdfs/cat_eng.pdf)
- CCME EPC-NCS66E Guidance Manual on Sampling, Analysis, and Data Management for Contaminated Sites - Volume II: Analytical Method Summaries, Dec 93 (CCME catalogue - http://www.ccme.ca/pdfs/cat_eng.pdf).

Wells were purged as specified and measurements of *in situ* temperature, conductivity and pH were taken. Sampling took place when these parameters were stabilized. Turbidity readings were also collected at each station. The samples were not acidified and were not filtered (as directed in ToR).

The 2010 field program included sampling only 9 of the 22 monitoring wells at FOX-M. Twelve well locations were dry or contained insufficient water volumes at the time of monitoring and consequently could not be sampled. One well located at the Non-Hazardous Waste Landfill was also vandalized and could not be sampled. A summary of the sampled monitoring wells is presented in Table III.

Free phase hydrocarbon product was not detected at any of the monitoring well locations. Monitoring Well Development and Sampling Record forms are included in appropriate sections in this report.

Table III: Summary of Groundwater Sampling at FOX-M, August 2010

Landfill Site	**Groundwater Sample Locations**				
Non-Hazardous Waste Landfill	MW-13	MW-15			
Tier II Disposal Facility	MW-1	MW-2	MW-3	MW-4	MW-5
East Beach Landfill	MW-29	MW-30			

Notes:
All monitoring wells were inspected and found to be in good condition with the exception of MW-14 at the NHWLF (casing damaged and well vandalized), MW-21 (casing collar loose) and MW-24 (casing cover broken).
For 2010 sampling, total no. of water samples = 11 samples (9 monitoring well samples + 1 blind duplicate + 1 inter-laboratory duplicate) + 1 field blank + 1 travel blank.

2.6 THERMAL MONITORING

All thermistors at the Tier II Disposal Facility and East Beach Landfill were inspected and found to be in good condition with no significant concerns identified. All analogues/thermocouples were observed to be functioning properly. Data from all functioning thermistors was successfully retrieved and battery levels were noted to be in good condition. Internal memories were reset and clocks were synchronized using the Prolog software.

Specific detailed information regarding temperature data is contained in the report section on the Tier II Disposal Facility and East Beach Landfill.

2.7 FIELD NOTES AND DATA

Field notes from the 2010 landfill monitoring program are included in Appendix B for reference. Notes were written on waterproof field sheets and in field books and the notes scanned to an Adobe pdf document for future reference and back up. Locations of all observations and features for the visual inspection were recorded using a hand-held Garmin Oregon 300 GPS device which included a combination of continuous tracks and discrete waypoints. Data packages collected from the individual vertical thermistors was downloaded directly to a field laptop computer.

2.8 QUALITY CONTROL

Sila implemented standard sample collection techniques to decrease the likelihood of compromising collected samples. The methods used for sample collection are summarized in Sections 2.4 and 2.5 of this report. The following measures were taken to minimize sample cross-contamination:

- All samples were placed directly into the appropriate laboratory-supplied containers (for the particular analysis)
- Soil samples were collected with the use of decontaminated sampling equipment and/or single-use nitrile gloves
- Water samples were collected through the use of dedicated Waterra foot valves and tubing
- All samples were stored in chilled coolers/refrigerators throughout the field program and chilled coolers during subsequent transfer to the commercial airlines and respective laboratories.

Chain of Custody (COC) forms were completed by the Project Engineer after sample collection. The samples were refrigerated prior to off-site shipment in chilled coolers by First Air Cargo to Exova and Maxxam in Ottawa and ESG in Kingston (via Ottawa) where they were checked-in by laboratory representatives. All analysis was completed as specified on COC forms.

2.9 QA/QC PROCEDURES

Sila used standard QA/QC procedures as specified in the ToR and CCME Guidance Documents for this project. The following is a summary table of the analytical QA/QC samples collected:

- 10% Blind Duplicate Samples of soil and water were sent to Exova
- 10% Inter-laboratory Duplicate Samples were sent to Maxxam (looking for variation in procedures causing significant difference in analytical result). Results for both the blind duplicates and the inter-laboratory duplicates can be found in Appendix C as actual values and relative percent differences
- 10% Archival Samples of soil to ESG.

Exova has QA/QC measures for sample analysis. Exova QC samples will typically be introduced into the analytical stream on a batch basis, normally comprising 20% – 30% of the total sample throughout. A batch size of 15 – 20 typically includes one of each control standard, reference standard, surrogate spike, duplicate sample, and method blank. A **control sample** is a blank matrix fortified with analyte of interest and carried through all analytical steps to monitor lab performance (recovery & basis) on clean matrix. A **reference sample** is a sample with predetermined certified characteristics that undergoes the same processing as samples used to evaluate accuracy of procedure. A **surrogate spike** is an organic compound with similar chemical composition and behaviour in the analytical process used to monitor recovery in each sample. A **duplicate sample** occurs when client samples are analyzed in duplicate to monitor reproducibility in analysis and preparation. Finally, a **method blank** is a blank sample matrix carried through the same procedure as the samples and is used to monitor for process contamination.

Maxxam follows similar in-house QA/QC procedures. Exova and Maxxam QA/QC reports can be found in Appendix C.

3 NON-HAZARDOUS WASTE LANDFILL

3.1 BACKGROUND AND MONITORING PROGRAM

The NHWLF is located immediately north of the main station area, approximately 200 m north of the Station POL and 250 m northeast of the module train. The landfill, including granular cover, encompasses a footprint of approximately 17,800 m^2 with the final cover extending between 2.75 to 3.0 m above the surrounding grade. This landfill was constructed for the disposal of non-hazardous wastes derived during site clean-up. Landfill materials are contained by a granular perimeter berm and cover. Four groundwater monitoring wells are installed at the landfill perimeter and another one west of the landfill

The long-term monitoring plan consists of visual monitoring and periodic collection of soil and groundwater samples. The 2010 monitoring of this landfill includes collection of soil and groundwater samples to monitor for the presence of leachate and visual inspection to assess landfill performance. Groundwater monitoring well and soil sample locations are identified on Figure FOX-M.2.

3.2 VISUAL INSPECTION REPORT

The visual inspection of the NHWLF was conducted on August 26, 2010. The Visual Inspection Checklist/Report has been completed as per the ToR and is included as Table IV of this report.

Settlement
Evidence of settlement was not noted.

Erosion
Evidence of erosion was not noted.

Frost Action
Evidence of frost action was not noted.

Evidence of Burrowing Animals
Indications of burrowing animals were not noted.

Re-establishment of Vegetation
Evidence of vegetation was not noted.

Staining
Evidence of staining was not noted on the landfill.

Seepage Points
Evidence of seepage was not noted.

Debris
Evidence of surface debris was not noted on the landfill.

Presence/Condition of Monitoring Instruments
All monitoring well installations appeared to be in good condition at the landfill, with the exception of MW-14 on which the protective casing cover was damaged and monitoring well vandalized (gravel in well).

Other Features of Note

Numerous vehicle tracks were observed on the surface and side slopes of the landfill cover, including several deeper ruts noted along the northwest, north and east side slopes and on the northwest corner of the landfill cover (Feature A). The vehicle tracks/ruts typically extended between 0.1 to 0.3 m in depth and covered approximately 2% of the landfill surface. Minor debris (plywood and geotextile fabric) were also noted in proximity to the landfill's north and northeast sides.

Discussion

The NHWLF performance with respect to containment of the debris within the landfill is rated as acceptable. A visual inspection report, including supporting photos and drawing, is presented in the following pages.

3.3 PRELIMINARY STABILITY ASSESSMENT

The Preliminary Stability Assessment for NHWLF has been completed as per the ToR and is included as Table V hereafter.

Table V: Preliminary Stability Assessment – NHWLF

Feature	Severity Rating	Extent
Settlement	Not observed	None
Erosion	Not observed	None
Frost Action	Not observed	None
Staining	Not observed	None
Vegetation Stress	Not observed	None
Seepage/Ponded Water	Not observed	None
Debris exposure	Not observed	None
Overall Landfill Performance	**Acceptable**	

Performance/ Severity Rating	Description
Acceptable	Noted features are of little consequence. The landfill is performing as designed. Minor deviations in environmental or physical performance may be observed, such as isolated areas of erosion, settlement.
Marginal	Physical/environmental performance appears to be deteriorating with time. Observations may include an increase in size or number of features of note, such as differential settlement, erosion or cracking. No significant impact on landfill stability to date, but potential for failure is assessed as low or moderate.
Significant	Significant or potentially significant changes affecting landfill stability, such as significant changes in slope geometry, significant erosion or differential settlement; scarp development. The potential for failure is assessed as imminent.
Unacceptable	Stability of landfill is compromised to the extent that ability to contain waste materials is compromised. Examples may include: • Debris exposed in erosion channels or areas of differential settlement. • Liner exposed. • Slope failure.

Extent	Description
Isolated	Singular feature
Occasional	Features of note occurring at irregular intervals/locations
Numerous	Many features of note, impacted less than 50% of the surface area of the landfill
Extensive	Impacting greater than 50% of the surface area of the landfill

3.4 LOCATION PLAN

The Location Plan for the NHWLF has been completed as per the ToR and is presented in the following page as Figure FOX-M.2.

3.6 SOIL SAMPLE ANALYTICAL DATA

The soil chemical analysis results and evaluation of analytical data for the 2010 NHWLF samples are presented in Tables VII and VIII respectively. Certificates of analysis results of field duplicates collected as part of the QA/QC program are presented in Appendix C.

Table VII: Soil Chemical Analysis Results – NHWLF

Sample #	Location	Depth (cm)	Cu [mg/kg]	Ni [mg/kg]	Co [mg/kg]	Cd [mg/kg]	Pb [mg/kg]	Zn [mg/kg]	Cr [mg/kg]	As [mg/kg]	Hg [mg/kg]	PCBs [mg/kg]	F1 C_6-C_{10} [mg/kg]	F2 C_{10}-C_{16} [mg/kg]	F3 C_{16}-C_{34} [mg/kg]	TPH C_6-C_{34} [mg/kg]

TPH: Sum of the concentrations of F1, F2 and F3. Concentrations below method detection limits are excluded from the total.

ND: Not detected

*MRL elevated due to matrix interference.

S:\P\CD\8177\FOX-M\T\[10- Soil and GW results FOX-M.xlsx]Soil - NHWLF

Table VIII: Evaluation of 2010 Soil Analytical Data – NHWLF

Parameter	2010
Copper	Concentrations ranged between 4-25 mg/kg with a mean concentration of 6.7 mg/kg. The highest concentration was observed at surface at MW-14, with concentrations at the remaining sample locations ranging between 4-6 mg/kg.
Nickel	Concentrations ranged between 9-15 mg/kg with detectable concentrations at all sample locations and a mean concentration of 12.0 mg/kg. The most elevated concentrations were observed at MW-14 (13 mg/kg - surface, 15 mg/kg - depth), MW-12 (13 mg/kg - surface) and MW-15 (13 mg/kg - surface and depth). The lowest concentration was observed at surface at MW-13.
Cobalt	Concentrations ranged between 2-3 mg/kg with a mean of 2.1 with detectable concentrations noted at all locations. The highest concentration was observed at surface at MW-12, and a concentration of 2 mg/kg at the remaining sample locations.
Cadmium	All reported concentrations were less than the method detection limit (0.5 mg/kg).
Lead	Concentrations ranged between 6-42 mg/kg with a mean of 19.9. The highest concentrations were noted at surface at MW-13 (42 mg/kg) and MW-16 (41 mg/kg), whereas the lowest concentrations were noted at MW-14 (8 mg/kg - surface, 6 mg/kg - depth). Slightly elevated concentrations were also noted at surface at MW-12 (28 mg/kg) and depth at MW-13 (27 mg/kg).
Zinc	Concentrations ranged between 9-14 mg/kg with a mean of 10.5 mg/kg. Slightly elevated concentrations were noted at surface at MW-12 (13 mg/kg) and MW-16 (14 mg/kg), with concentrations at the remaining sample locations ranging between 9-11 mg/kg.
Chromium	Concentrations ranged between 12-23 mg/kg with a mean of 16.0 mg/kg. The highest concentrations were observed at MW-14 (23 mg/kg – depth) and MW-15 (18 mg/kg – surface and depth). The lowest concentration was noted at MW-13 (surface).
Arsenic	Concentrations ranged between 1-3 mg/kg with a mean of 1.7 mg/kg.. The highest concentration was noted at depth at MW-15, with concentrations at the remaining sample locations ranging between 1-2 mg/kg.
Mercury	All reported concentrations were less than the method detection limit (0.1 mg/kg).
PCBs	All reported concentrations were less than the method detection limit (0.02-0.1 mg/kg).
TPH	Concentrations ranged between ND-72 mg/kg with detectable concentrations noted at both surface and depth sample locations at MW-12 and MW-15 and at surface sample locations MW-13, MW-14 and MW-16. The highest TPH concentrations were noted in the surface sample at MW-16 (72 mg/kg) depth.

3.7 GROUNDWATER SAMPLE ANALYTICAL DATA

The groundwater chemical analysis results and evaluation of analytical data for the 2010 NHWLF samples are presented in Tables IX and X. Certificates of analysis and groundwater samples collected as part of the QA/QC program are presented in Appendix C.

Table IX: Groundwater Chemical Analysis Results – NHWLF

Sample #	Location	Cu [mg/L]	Ni [mg/L]	Co [mg/L]	Cd [mg/L]	Pb [mg/L]	Zn [mg/L]	Cr [mg/L]	As [mg/L]	Hg [mg/L]	PCBs [µg/L]	F1 C_6-C_{10} [mg/L]	F2 C_{10}-C_{16} [mg/L]	F3 C_{16}-C_{34} [mg/L]	TPH C_6-C_{34} [mg/L]

TPH: Sum of the concentrations of F1, F2 and F3. Concentrations below method detection limits are excluded from the total.
ND: Not detected

S:\P\CD\8177\FOX-M\T\[10- Soil and GW results FOX-M.xlsx]GW - NHWLF

Table X: Evaluation of 2010 Groundwater Analytical Data – NHWLF

Parameter	2010
Copper	Concentrations ranged between 0.002-0.003 mg/L, with the highest concentration noted at MW-13.
Nickel	Concentrations of 0.01 mg/L were detected in samples collected from both MW-13 and MW-15.
Cobalt	Concentrations ranged between 0.0004-0.0005 mg/L, with the highest concentration noted at MW-13.
Cadmium	Concentrations ranged between <0.0001-0.0001 mg/L, with detectable concentrations noted at only one well location, MW-13.
Lead	All reported concentrations were less than the method detection limit (0.001 mg/L).
Zinc	All reported concentrations were less than the method detection limit (0.01 mg/L).
Chromium	Concentrations of 0.004 mg/L were detected in samples collected from both MW-3 and MW-15.
Arsenic	All reported concentrations were less than the method detection limit (0.001 mg/L).
Mercury	All reported concentrations were less than the method detection limit (0.0001 mg/L).
PCBs	All reported concentrations were less than the method detection limit (0.1 µg/L).
TPH	All reported concentrations were less than the method detection limit.

3.8 MONITORING WELL SAMPLING / INSPECTION LOGS

The monitoring well sampling and inspection logs for MW-12, MW-13, MW-14, MW-15 and MW-16 are included in this section.

2010 Monitoring Well Sampling Log (MW-12)

Site name:	FOX-M
Date of sampling event:	26-Aug-10
Names of samplers:	Andrew Passalis
Monitoring well ID:	MW-12
Facility:	Non-Hazardous Waste Landfill

Known Data	
Depth of installation* (m):	3.00
Length of screened section (m):	1.50
Depth to top of screen* (m):	0.48

Measured Data			
Condition of well:	Good	Procedure/Equipment:	Interface Meter
Procedure/Equipment:	Measuring Tape	Depth to water surface (m):	- (dry)
Well height above ground (m):	0.48	Depth to bottom (m):	1.48
Diameter of well (m):	0.04	Free product thickness (mm):	-

Calculations		Notes	
Depth of water (m):	-	Evidence of sludge:	no
Well volume of water (L):	-	Evidence of freezing/siltation:	no
Static water level* (m):	-		
Length of screen collecting water (m):	-		

Development/Purging Information

Equipment: n/a

4 G217 – WEST LANDFILL

4.1 BACKGROUND AND MONITORING PROGRAM

The G217 – West Landfill is located immediately west of the main access road, approximately 150 m west of the communication billboards and 200 m southwest of the main station area. The landfill, including granular cover, encompasses a footprint of approximately 5,700 m^2 with the final cover extending between 0.75 m to 1.5 m above the surrounding grade. Based on existing information regarding this landfill as a source of contamination, its potential migration pathways and receptors, the G217 – West Landfill was classified as low potential environmental risk. The remediation consisted of removal of surface debris and regrading with the placement of additional granular fill.

The long-term monitoring plan consists of visual monitoring and periodic collection of soil samples. The 2010 monitoring of this landfill includes collection of soil samples to monitor for the presence of leachate and visual inspection to assess landfill performance. There is no instrumentation installed at this landfill.

4.2 VISUAL INSPECTION REPORT

The visual inspection of the G217 – West Landfill was conducted on August 25, 2010. The Visual Inspection Checklist/Report has been completed as per the ToR and is included as Table XI of this report.

Settlement
Evidence of settlement was not noted.

Erosion
Evidence of erosion was not noted.

Frost Action
Evidence of frost action was not noted.

Evidence of Burrowing Animals
Indications of burrowing animals were not noted.

Re-establishment of Vegetation
Evidence of vegetation was not noted.

Staining
Evidence of staining was not noted on the landfill.

Seepage Points
Evidence of seepage was not noted.

Debris
Evidence of surface debris was not noted on the landfill.

Presence/Condition of Monitoring Instruments
There are no monitoring instruments installed at this landfill.

Other Features of Note

Several vehicle tracks/ruts were observed on the northeast and southeast corners of the landfill cover (Feature A). The vehicle tracks/ruts extended between 0.05 to 0.1 m in depth and covered approximately 2% of the landfill surface. Ponded water was also noted in proximity to the north and south sides of the landfill.

Discussion

The G217 - West Landfill performance with respect to containment of the debris within the landfill is rated as acceptable. A visual inspection report, including supporting photos and drawing, is presented in the following pages.

4.3 PRELIMINARY STABILITY ASSESSMENT

The Preliminary Stability Assessment for G217 – West Landfill has been completed as per the ToR and is included as Table XII hereafter.

Table XII: Preliminary Stability Assessment – G217 - West Landfill

Feature	Severity Rating	Extent
Settlement	Not observed	None
Erosion	Not observed	None
Frost Action	Not observed	None
Staining	Not observed	None
Vegetation Stress	Not observed	None
Seepage/Ponded Water	Not observed	None
Debris exposure	Not observed	None
Overall Landfill Performance	**Acceptable**	

Performance/ Severity Rating	Description
Acceptable	Noted features are of little consequence. The landfill is performing as designed. Minor deviations in environmental or physical performance may be observed, such as isolated areas of erosion, settlement.
Marginal	Physical/environmental performance appears to be deteriorating with time. Observations may include an increase in size or number of features of note, such as differential settlement, erosion or cracking. No significant impact on landfill stability to date, but potential for failure is assessed as low or moderate.
Significant	Significant or potentially significant changes affecting landfill stability, such as significant changes in slope geometry, significant erosion or differential settlement; scarp development. The potential for failure is assessed as imminent.
Unacceptable	Stability of landfill is compromised to the extent that ability to contain waste materials is compromised. Examples may include: • Debris exposed in erosion channels or areas of differential settlement. • Liner exposed. • Slope failure.

Extent	Description
Isolated	Singular feature
Occasional	Features of note occurring at irregular intervals/locations
Numerous	Many features of note, impacted less than 50% of the surface area of the landfill
Extensive	Impacting greater than 50% of the surface area of the landfill

4.4 LOCATION PLAN

The Location Plan for the G217 – West Landfill has been completed as per the ToR and is presented as Figure FOX-M.3.

S:\P\CD\8177\FOX-M\T\[10- Soil and GW results FOX-M.xlsx]Soil - G217 West LF

Table XV: Evaluation of 2010 Soil Analytical Data – G217 – West Landfill

Parameter	2010
Copper	Concentrations ranged between 2-7 mg/kg with a mean concentration of 5.6 mg/kg. The highest concentration was observed at FM-6 (surface and depth) and FM-7 (surface), whereas the lowest concentration was observed at depth at FM-7. Concentrations at the remaining sample locations ranged between 5-6 mg/kg.
Nickel	Concentrations ranged between 5-24 mg/kg with a mean concentration of 11.8 mg/kg. The highest and lowest concentrations were observed at depth at FM-8 and FM-7, respectively. Concentrations at the remaining sample locations ranged between 9-12 mg/kg.
Cobalt	Concentrations ranged between 1-3 mg/kg with a mean of 2.4 with detectable concentrations noted at all locations. The highest concentration was observed at surface at FM-5 (surface and depth), FM-6 (surface) and FM-7 (surface). The lowest concentration was noted at depth at FM-7.
Cadmium	All reported concentrations were less than the method detection limit (0.5 mg/kg).
Lead	Concentrations ranged between 3-56 mg/kg with a mean of 13.8. The highest concentrations were noted at surface at FM-6 (23 mg/kg) and FM-7 (56 mg/kg), with a slightly elevated concentration also noted at depth at FM-6 (11 mg/kg). Concentrations at the remaining sample locations ranged between 3-5 mg/kg.
Zinc	Concentrations ranged between 8-483 mg/kg with the highest concentration noted at surface at FM-6, an order of magnitude greater than the next highest concentrations observed at depth at FM-6 (52 mg/kg) and surface at FM-7 (40 mg/kg). Concentrations at the remaining sample locations ranging between 8-14 mg/kg.
Chromium	Concentrations ranged between 8-43 mg/kg with a mean of 17.0 mg/kg. The highest concentrations were observed at FM-7 (23 mg/kg – surface) and FM-8 (43 mg/kg –depth). The lowest concentration was noted at FM-7 (depth), with concentrations at the remaining sample locations ranging between 11-14 mg/kg.
Arsenic	Concentrations ranged between <1-3 mg/kg with detectable concentrations observed at all but one sample location, FM-7 (depth). The highest concentrations were noted at depth at FM-5 and FM-8 and at surface at FM-7.
Mercury	All reported concentrations were less than the method detection limit (0.1 mg/kg).
PCBs	All reported concentrations were less than the method detection limits (0.02-0.4 mg/kg).
TPH	Concentrations ranged between ND-51 mg/kg with detectable concentrations noted at FM-5 (47 mg/kg – depth), FM-6 (51 mg/kg – depth), FM-7 (10 mg/kg – surface) and FM-8 (12 mg/kg – surface). All other TPH concentrations were below the method detection limits.

5 BILLBOARDS LANDFILL

5.1 BACKGROUND AND MONITORING PROGRAM

The Billboards Landfill is located immediately west of the communication billboards on the east side of the main station area. The landfill, including granular cover, encompasses a footprint of approximately 2,500 m^2 with the final cover extending between 0.75 m to 1.0 m above the surrounding grade. Based on existing information regarding this landfill as a source of contamination, its potential migration pathways and receptors, the Billboards Landfill was classified as low potential environmental risk. The remediation consisted of removal of surface debris and regrading with the placement of additional granular fill.

The long-term monitoring plan consists of visual monitoring and periodic collection of soil samples. The 2010 monitoring of this landfill includes collection of soil samples to monitor for the presence of leachate and visual inspection to assess landfill performance. There is no instrumentation installed at this landfill.

5.2 VISUAL INSPECTION REPORT

The visual inspection of the Billboards Landfill was conducted on August 25, 2010. The Visual Inspection Checklist/Report has been completed as per the ToR and is included as Table XVI of this report.

Settlement
Evidence of settlement was not noted.

Erosion
Evidence of erosion was not noted.

Frost Action
Evidence of frost action was not noted.

Evidence of Burrowing Animals
Indications of burrowing animals were not noted.

Re-establishment of Vegetation
Evidence of vegetation was not noted.

Staining
Evidence of staining was at one location along the northwest toe of the landfill (Feature A). The staining consisted of an approximately 1.5m x 1.5m area of rust-coloured soil associated with a low lying ponded area bordering the toe of the landfill. Seepage from the landfill was not observed at the time of the inspection. This feature was not noted during the previous 2009 inspection.

Seepage Points
Evidence of seepage was not noted.

Debris
Evidence of surface debris was not noted on the landfill.

Presence/Condition of Monitoring Instruments
There are no monitoring instruments installed at this landfill.

Other Features of Note

The landfill is located within a low lying area bordered by the station access road to the west and communication pads to the north and east. Ponded water was observed in proximity along the north and south sides of the landfill.

Discussion

The Billboards Landfill performance with respect to containment of the debris within the landfill is rated as acceptable. A visual inspection report, including supporting photos and drawing, is presented in the following pages.

5.6 SOIL SAMPLE ANALYTICAL DATA

The soil chemical analysis results and evaluation of analytical data for the 2010 Billboards Landfill samples are presented in Tables XIX and XX below. Certificates of analysis and results of field duplicates collected as part of the QA/QC program are presented in Appendix C.

Table XIX: Soil Chemical Analysis Results – Billboards Landfill

Table XX: Evaluation of 2010 Soil Analytical Data – Billboards West Landfill

Parameter	2010
Copper	Concentrations ranged between 2-286 mg/kg with the highest concentration noted at surface at FM-2, an order of magnitude greater than the next highest concentration observed at depth at FM-2 (13 mg/kg). Concentrations at the remaining sample locations ranging between 2-8 mg/kg.
Nickel	Concentrations ranged between 5-294 mg/kg with the highest concentration noted at surface at FM-2, an order of magnitude greater than the next highest concentrations observed at surface at FM-3 (19 mg/kg). Concentrations at the remaining sample locations ranging between 5-18 mg/kg.
Cobalt	Concentrations ranged between 1-4 mg/kg with a mean of 2.6 with detectable concentrations noted at all locations. The highest concentration was observed at FM-2 (4 mg/kg – surface and depth). Concentrations at the remaining sample locations ranged between 1-3 mg/kg.
Cadmium	All reported concentrations were less than the method detection limit (0.5 mg/kg).
Lead	Concentrations ranged between 2-8 mg/kg with a mean of 5.4. The highest concentrations were noted at FM-1 (7 mg/kg – surface and depth) and FM-2 (8 mg/kg – surface, 7 mg/kg – depth), whereas the lowest concentration was observed at FM-4 (2 mg/kg – surface and depth).
Zinc	Concentrations ranged between 6-76 mg/kg with a mean of 21.3 mg/kg. The highest concentration was observed at surface at FM-2, whereas the lowest concentrations were observed at FM-4 (6 mg/kg – surface, 7 mg/kg – depth) Concentrations at the remaining sample locations ranged between 11-19 mg/kg.
Chromium	Concentrations ranged between 7-27 mg/kg with a mean of 17.3 mg/kg. The highest concentrations were observed at FM-2 (23 mg/kg – depth) and FM-3 (27 mg/kg – surface and depth). The lowest concentration was noted at FM-4 (surface), with concentrations at the remaining sample locations ranging between 13-16 mg/kg.
Arsenic	Concentrations ranged between 1-3 mg/kg with the highest and lowest concentrations observed at surface at FM-3 and FM-1, respectively.
Mercury	All reported concentrations were less than the method detection limit (0.1 mg/kg).
PCBs	All reported concentrations were less than the method detection limits (0.02-0.1 mg/kg).
TPH	Concentrations ranged between ND-295 mg/kg with detectable concentrations noted in depth sample locations, FM-1 (76 mg/kg), FM-2 (295 mg/kg) and FM-3 (11 mg/kg) and at surface sample FM-4 (11 mg/kg). All other TPH concentrations were below the method detection limits.

6 HAZMAT STORAGE – EAST LANDFILL

6.1 BACKGROUND AND MONITORING PROGRAM

The Hazmat Storage – East Landfill is located on the east side of the East Beach area access road approximately 550 m east of the main station area and 100 m southeast of the intersection with the east-west station connection road. The landfill, including granular cover, encompasses a footprint of approximately 2,300 m^2 with the final cover extending approximately 0.75 m above the surrounding grade. Based on existing information regarding this landfill as a source of contamination, its potential migration pathways and receptors, the Hazmat Storage – East Landfill was classified as low potential environmental risk. The remediation consisted of removal of surface debris and regrading with the placement of additional granular fill.

The long-term monitoring plan consists of visual monitoring and periodic collection of soil samples. The 2010 monitoring of this landfill includes collection of soil samples to monitor for the presence of leachate and visual inspection to assess landfill performance. There is no instrumentation installed at this landfill.

6.2 VISUAL INSPECTION REPORT

The visual inspection of the Hazmat Storage – East Landfill was conducted on August 26, 2010. The Visual Inspection Checklist/Report has been completed as per the ToR and is included as Table XXI of this report.

Settlement
Evidence of settlement was not noted.

Erosion
Evidence of erosion was not noted.

Frost Action
Evidence of frost action was not noted.

Evidence of Burrowing Animals
Indications of burrowing animals were not noted.

Re-establishment of Vegetation
Evidence of vegetation was not noted.

Staining
Evidence of staining was not noted on the landfill.

Seepage Points
Evidence of seepage was not noted.

Debris
Evidence of debris was noted adjacent to the east and northeast sides of the landfill (Feature A). The debris consisted primarily of surface and partially buried metal debris, including corrugated sheet metal, rebar, wire and plywood.

Presence/Condition of Monitoring Instruments
There are no monitoring instruments installed at this landfill.

Other Features of Note
Pairs of vehicle tracks/ruts were observed on the east and northwest corners of the landfill (Feature B). The vehicle tracks/ruts generally extended 0.1 m in depth and covered less than 1% of the landfill surface.

The landfill is located within a low lying area bordered by the East Beach access road to the west and the beach ridge to the east. At the time of the inspection, ponded water surrounded approximately 70% of the landfill perimeter, including the west, south and east sides of the landfill. There was no evidence of erosion or staining associated with the ponded water.

Discussion
The Hazmat Storage - East Landfill performance with respect to containment of the debris within the landfill is rated as acceptable. A visual inspection report, including supporting photos and drawing, is presented in the following pages.

6.3 PRELIMINARY STABILITY ASSESSMENT

The Preliminary Stability Assessment for Hazmat Storage - East Landfill has been completed as per the ToR and is included as Table XXII hereafter.

Table XXII: Preliminary Stability Assessment – Hazmat Storage - East Landfill

Feature	Severity Rating	Extent
Settlement	Not observed	None
Erosion	Not observed	None
Frost Action	Not observed	None
Staining	Not observed	None
Vegetation Stress	Not observed	None
Seepage/Ponded Water	Acceptable	Extensive (perimeter only)
Debris exposure	Acceptable	Occassional (perimeter only)
Overall Landfill Performance	**Acceptable**	

Performance/ Severity Rating	Description
Acceptable	Noted features are of little consequence. The landfill is performing as designed. Minor deviations in environmental or physical performance may be observed, such as isolated areas of erosion, settlement.
Marginal	Physical/environmental performance appears to be deteriorating with time. Observations may include an increase in size or number of features of note, such as differential settlement, erosion or cracking. No significant impact on landfill stability to date, but potential for failure is assessed as low or moderate.
Significant	Significant or potentially significant changes affecting landfill stability, such as significant changes in slope geometry, significant erosion or differential settlement; scarp development. The potential for failure is assessed as imminent.
Unacceptable	Stability of landfill is compromised to the extent that ability to contain waste materials is compromised. Examples may include: • Debris exposed in erosion channels or areas of differential settlement. • Liner exposed. • Slope failure.

Extent	Description
Isolated	Singular feature
Occasional	Features of note occurring at irregular intervals/locations
Numerous	Many features of note, impacted less than 50% of the surface area of the landfill
Extensive	Impacting greater than 50% of the surface area of the landfill

6.4 LOCATION PLAN

The Location Plan for the Hazmat Storage - East Landfill has been completed as per the ToR and is included in Figure FOX-M.5.

S:\P\CD\8177\FOX-M\T\[10- Soil and GW results FOX-M.xlsx]Soil - Hazmat Storage

Table XXV: Evaluation of 2010 Soil Analytical Data – Hazmat Storage - East Landfill

Parameter	2010
Copper	Concentrations ranged between 3-9 mg/kg with a mean of 4.8 mg/kg. The highest and lowest concentrations were noted at surface at FM-12 and at depth at MW-10, respectively. Concentrations at the remaining sample locations ranging between 4-5 mg/kg.
Nickel	Concentrations ranged between 8-11 mg/kg with a mean of 9.6 mg/kg. The highest and lowest concentrations were noted at depth at FM-9 and at depth at MW-10, respectively. Concentrations at the remaining sample locations ranging between 9-10 mg/kg.
Cobalt	Concentrations ranged between 2-3 mg/kg with a mean of 2.3 mg/kg. The highest concentrations were observed at depth at FM-9 and FM-12.
Cadmium	All reported concentrations were less than the method detection limit (0.5 mg/kg).
Lead	Concentrations ranged between 3-9 mg/kg with a mean of 5.1 mg/kg. The highest concentration was noted at surface at FM-11, whereas the lowest concentrations were noted at FM-9 (surface and depth). Concentrations at the remaining sample locations ranging between 4-7 mg/kg.
Zinc	Concentrations ranged between 10-53 mg/kg with a mean of 19.3 mg/kg. The highest concentration was observed at surface at FM-11, whereas the lowest concentrations were observed at FM-10 (10 mg/kg – depth) and FM-9 (11 mg/kg – surface, 12 mg/kg – depth).
Chromium	Concentrations ranged between 10-13 mg/kg with a mean of 11.3 mg/kg. The highest concentration was observed at FM-11(depth), whereas the lowest concentration was noted at FM-10 (depth) and FM-12 (surface).
Arsenic	Concentrations ranged between <1-2 mg/kg with detectable concentrations noted at all locations except FM-10 (surface) and FM-11 (surface and depth). The highest concentration was observed at surface at FM-9 and FM-12.
Mercury	All reported concentrations were less than the method detection limit (0.1 mg/kg).
PCBs	All reported concentrations were less than the method detection limits (0.02-0.1 mg/kg).
TPH	Trace concentrations were noted in one surface sample location, FM-12 (10 mg/kg). All other TPH concentrations were below the method detection limits.

7 COMMUNICATIONS NORTH LANDFILL

7.1 BACKGROUND AND MONITORING PROGRAM

The Communications North Landfill extends north-easterly off the north edge of the tropospheric communications infrastructure pad, approximately 650 m southeast of the main station area. The landfill, including granular cover, encompasses a footprint of approximately 7,000 m^2 with the final cover extending between 0.0 m (level with the communications infrastructure pad) to 0.75 m above the surrounding grade (north of the pad). Based on existing information regarding this landfill as a source of contamination, its potential migration pathways and receptors, the Communications North Landfill was classified as low potential environmental risk. The remediation consisted of removal of surface debris and regrading with the placement of additional granular fill.

The long term monitoring plan consists of visual monitoring and periodic collection of soil samples. The 2010 monitoring of this landfill includes collection of soil samples to monitor for the presence of leachate and visual inspection to assess landfill performance. There is no instrumentation installed at this landfill.

7.2 VISUAL INSPECTION REPORT

The visual inspection of the Communications North Landfill was conducted on August 25 and 26, 2010. The Visual Inspection Checklist/Report has been completed as per the ToR and is included as Table XXVI of this report.

Settlement
Evidence of settlement was not noted.

Erosion
Evidence of erosion was not noted.

Frost Action
Evidence of frost action was not noted.

Evidence of Burrowing Animals
Indications of burrowing animals were not noted.

Re-establishment of Vegetation
Evidence of vegetation was not noted.

Staining
Evidence of staining was not noted on the landfill.

Seepage Points
Evidence of seepage was not noted.

Debris
Evidence of surface and partially buried debris was noted in two general areas on and around the landfill, including: three small pieces of metal debris on the south end of the landfill cover (Feature A) and two pieces of metal debris (plate and pipe) in an area northeast of the landfill (Feature B). Both areas of debris were not observed during the previous 2009 inspection.

Presence/Condition of Monitoring Instruments
There are no monitoring instruments installed at this landfill.

Other Features of Note
Several vehicle tracks/ruts were observed on the southeast, east and southwest sides of the landfill (Feature C). The vehicle tracks/ruts extended between 0.1-0.2 m in depth and covered approximately 1% of the landfill surface.

In addition, an isolated area of ponded water was also noted along the southeast toe of the landfill. Evidence of erosion or staining was not observed within the ponded area.

Discussion
The Communications North Landfill performance with respect to containment of the debris within the landfill is rated as acceptable. A visual inspection report, including supporting photos and drawing, is presented in the following pages.

7.3 PRELIMINARY STABILITY ASSESSMENT

The Preliminary Stability Assessment for Communications North Landfill has been completed as per the ToR and is included as Table XXVII hereafter.

Table XXVII: Preliminary Stability Assessment – Communications North Landfill

Feature	Severity Rating	Extent
Settlement	Not observed	None
Erosion	Not observed	None
Frost Action	Not observed	None
Staining	Not observed	None
Vegetation Stress	Not observed	None
Seepage/Ponded Water	Acceptable	Isolated (perimeter only)
Debris exposure	Acceptable	Isolated
Overall Landfill Performance	**Acceptable**	

Performance/ Severity Rating	Description
Acceptable	Noted features are of little consequence. The landfill is performing as designed. Minor deviations in environmental or physical performance may be observed, such as isolated areas of erosion, settlement.
Marginal	Physical/environmental performance appears to be deteriorating with time. Observations may include an increase in size or number of features of note, such as differential settlement, erosion or cracking. No significant impact on landfill stability to date, but potential for failure is assessed as low or moderate.
Significant	Significant or potentially significant changes affecting landfill stability, such as significant changes in slope geometry, significant erosion or differential settlement; scarp development. The potential for failure is assessed as imminent.
Unacceptable	Stability of landfill is compromised to the extent that ability to contain waste materials is compromised. Examples may include: • Debris exposed in erosion channels or areas of differential settlement. • Liner exposed. • Slope failure.

Extent	Description
Isolated	Singular feature
Occasional	Features of note occurring at irregular intervals/locations
Numerous	Many features of note, impacted less than 50% of the surface area of the landfill
Extensive	Impacting greater than 50% of the surface area of the landfill

7.4 LOCATION PLAN

The Location Plan for the Communications North Landfill has been completed as per the ToR and is included in Figure FOX-M.6.

Table XXX: Evaluation of 2010 Soil Analytical Data – Communications North Landfill

Parameter	2010
Copper	Concentrations ranged between 4-7 mg/kg with a mean of 5.1 mg/kg. The highest concentration was noted at depth at FM-19, whereas the lowest concentration was noted at FM-18 (surface and depth) and at depth at FM-21. Concentrations at the remaining sample locations ranging between 5-6 mg/kg.
Nickel	Concentrations ranged between 11-15 mg/kg with a mean of 13.0 mg/kg. The highest concentration was observed at FM-17 (surface) and FM-19 (depth), whereas the lowest concentration was observed at FM-18 (surface).
Cobalt	Concentrations ranged between 2-3 mg/kg with a mean of 2.8 mg/kg. The lowest concentration was observed at depth at FM-21 and FM-22 and at surface at FM-18.
Cadmium	All reported concentrations were less than the method detection limit (0.5 mg/kg).
Lead	Concentrations ranged between 3-5 mg/kg with a mean of 3.8. The highest concentration was observed at surface at FM-17 and FM-21, whereas the lowest concentration was observed at FM-20 (surface and depth), FM-21 (depth) and FM-22 (depth).
Zinc	Concentrations ranged between 9-22 mg/kg with a mean of 12.9 mg/kg. The highest and lowest concentrations were observed at depth at FM-19 and FM-21, respectively. Concentrations at the remaining sample locations ranged between 10-15 mg/kg.
Chromium	Concentrations ranged between 13-21 mg/kg with a mean of 16.1 mg/kg. The highest concentrations were observed at FM-17 (21 mg/kg – surface), FM-19 (20 mg/kg – depth) and FM-20 (20 mg/kg – surface). Concentrations at the remaining sample locations ranging between 13-16 mg/kg.
Arsenic	Concentrations ranged between <1-2 mg/kg with detectable concentrations noted at all but three sample locations, FM-20 (surface and depth) and FM-21 (depth).
Mercury	All reported concentrations were less than the method detection limit (0.1 mg/kg).
PCBs	All reported concentrations were less than the method detection limits (0.02-0.2 mg/kg).
TPH	Trace concentrations were noted in two depth sample locations, FM-17 (12 mg/kg) and FM-19 (15 mg/kg). All other TPH concentrations were below the method detection limits.

8 COMMUNICATIONS NORTHWEST LANDFILL

8.1 BACKGROUND AND MONITORING PROGRAM

The Communications Northwest Landfill is located off the northwest corner of the tropospheric communications infrastructure pad, approximately 600 m south of the main station area. The landfill, including granular cover, encompasses a footprint of approximately 3,200 m^2 with the final cover extending between 0.5 m to 0.75 m above the surrounding grade. Based on existing information regarding this landfill as a source of contamination, its potential migration pathways and receptors, the Communications Northwest Landfill was classified as low potential environmental risk. The remediation consisted of removal of surface debris and regrading with the placement of additional granular fill.

The long term monitoring plan consists of visual monitoring and periodic collection of soil samples. The 2010 monitoring of this landfill includes collection of soil samples to monitor for the presence of leachate and visual inspection to assess landfill performance. There is no instrumentation installed at this landfill.

8.2 VISUAL INSPECTION REPORT

The visual inspection of the Communications Northwest Landfill was conducted on August 25, 2010. The Visual Inspection Checklist/Report has been completed as per the ToR and is included as Table XXXI of this report.

Settlement
Evidence of settlement was not noted.

Erosion
Evidence of erosion was not noted.

Frost Action
Evidence of frost action was not noted.

Evidence of Burrowing Animals
Indications of burrowing animals were not noted.

Re-establishment of Vegetation
Evidence of vegetation was not noted.

Staining
Evidence of staining was not noted on the landfill.

Seepage Points
Evidence of seepage was not noted.

Debris
Evidence of surface debris was not noted on the landfill.

Presence/Condition of Monitoring Instruments
There are no monitoring instruments installed at this landfill.

Other Features of Note

Several vehicle tracks/ruts were observed on the northeast, southeast and southwest sides of the landfill (Feature A). The vehicle tracks/ruts extended between 0.1 to 0.15 m in depth and covered approximately 3% of the landfill surface.

Discussion

The Communications Northwest Landfill performance with respect to containment of the debris within the landfill is rated as acceptable. A visual inspection report, including supporting photos and drawing, is presented in the following pages.

8.3 PRELIMINARY STABILITY ASSESSMENT

The Preliminary Stability Assessment for Communications Northwest Landfill has been completed as per the ToR and is included as Table XXXII hereafter.

Table XXXII: Preliminary Stability Assessment – Communications Northwest Landfill

Feature	Severity Rating	Extent
Settlement	Not observed	None
Erosion	Not observed	None
Frost Action	Not observed	None
Staining	Not observed	None
Vegetation Stress	Not observed	None
Seepage/Ponded Water	Not observed	None
Debris exposure	Not observed	None
Overall Landfill Performance	**Acceptable**	

Performance/ Severity Rating	Description
Acceptable	Noted features are of little consequence. The landfill is performing as designed. Minor deviations in environmental or physical performance may be observed, such as isolated areas of erosion, settlement.
Marginal	Physical/environmental performance appears to be deteriorating with time. Observations may include an increase in size or number of features of note, such as differential settlement, erosion or cracking. No significant impact on landfill stability to date, but potential for failure is assessed as low or moderate.
Significant	Significant or potentially significant changes affecting landfill stability, such as significant changes in slope geometry, significant erosion or differential settlement; scarp development. The potential for failure is assessed as imminent.
Unacceptable	Stability of landfill is compromised to the extent that ability to contain waste materials is compromised. Examples may include: • Debris exposed in erosion channels or areas of differential settlement. • Liner exposed. • Slope failure.

Extent	Description
Isolated	Singular feature
Occasional	Features of note occurring at irregular intervals/locations
Numerous	Many features of note, impacted less than 50% of the surface area of the landfill
Extensive	Impacting greater than 50% of the surface area of the landfill

8.4 LOCATION PLAN

The Location Plan for the Communications Northwest Landfill has been completed as per the ToR and is included in Figure FOX-M.7

TPH: Sum of the concentrations of F1, F2 and F3. Concentrations below method detection limits are excluded from the total.

ND: Not detected

*MRL elevated due to matrix interference

S:\P\CD\8177\FOX-M\T\[10- Soil and GW results FOX-M.xlsx]Soil - Communications Northwest LF

Table XXXV: Evaluation of 2010 Soil Analytical Data – Communications Northwest Landfill

Parameter	2010
Copper	Concentrations ranged between 3-9 mg/kg with a mean of 5.6 mg/kg. The highest concentrations were noted at surface at FM-14 (8 mg/kg) and at depth at FM-16 (9 mg/kg), whereas the lowest concentration was noted at FM-13 (surface). Concentrations at the remaining sample locations ranging between 4-7 mg/kg.
Nickel	Concentrations ranged between 7-17 mg/kg with a mean of 10.3 mg/kg. The highest and lowest concentrations were observed at FM-16 (depth) and FM-15 (surface), respectively. Concentrations at the remaining sample locations ranged between 8-12 mg/kg.
Cobalt	Concentrations ranged between 1-3 mg/kg with a mean of 2.0 and detectable concentrations noted at all locations. The highest and lowest concentrations were observed at FM-13 (depth) and FM-15 (surface), respectively.
Cadmium	All reported concentrations were less than the method detection limit (0.5 mg/kg).
Lead	Concentrations ranged between 3-10 mg/kg with a mean of 5.6. The highest concentrations were observed at surface at FM-13 (9 mg/kg) and at depth at FM-14 (10 mg/kg), whereas the lowest concentration was observed at FM-15 (surface and depth). Concentrations at the remaining sample locations ranged between 4-6 mg/kg.
Zinc	Concentrations ranged between 6-15 mg/kg with a mean of 11.1 mg/kg. The highest and lowest concentrations were observed at surface at FM-13 and FM-15, respectively. Concentrations at the remaining sample locations ranged between 9-13 mg/kg.
Chromium	Concentrations ranged between 7-27 mg/kg with a mean of 12.0 mg/kg. The highest and lowest concentrations were observed at depth at FM-16 and at surface at FM-15, respectively. Concentrations at the remaining sample locations ranged between 9-14 mg/kg.
Arsenic	Concentrations ranged between <1-2 mg/kg with detectable concentrations noted at all but one surface sample location, FM-16.
Mercury	All reported concentrations were less than the method detection limit (0.1 mg/kg).
PCBs	All reported concentrations were less than the method detection limits (0.02-0.2 mg/kg).
TPH	Concentrations ranged between ND-39 mg/kg with detectable concentrations at FM-13 (13 mg/kg – depth), FM-14 (11 mg/kg – surface), FM-15 (29 mg/kg – surface) and FM-16 (26 mg/kg – surface and 23 mg/kg depth). All other TPH concentrations were below the method detection limits.

9 TIER II DISPOSAL FACILITY

9.1 BACKGROUND AND MONITORING PROGRAM

The Tier II Disposal Facility is situated south of the tropospheric communications infrastructure pad and west of the East Beach Landfill, approximately 800 m south of the main station area. The landfill was constructed with two separate cells, each cell comprised of a double containment system consisting of low permeable saturated clay and geomembrane liner system and the placement of sufficient surface fill to promote freezing of the landfill contents.

The facility encompasses a footprint of approximately 29,000 m^2 with the final cover extending between 3.5-4.0 m above the surrounding grade. Five groundwater monitoring wells are installed at the landfill perimeter, and five thermistors are installed within the landfill footprint to monitor freeze back conditions.

The long term monitoring plan consists of visual monitoring, collection of soil and groundwater samples and monitoring of subsurface ground temperatures.

The 2010 monitoring of this landfill includes visual inspection to verify for evidence of settlement or erosion, collection of soil and groundwater samples to monitor for the presence of leachate and retrieval of data from the thermistors. Locations of groundwater monitoring wells, soil samples and thermistor installations are identified on Figure FOX-M.8. Soil at all stations was sampled as specified. Groundwater from each of the monitoring wells was sampled as per the ToR.

9.2 VISUAL INSPECTION REPORT

The visual inspection of the Tier II Disposal Facility was conducted on August 26, 2010. The Visual Inspection Checklist/Report has been completed as per the ToR and is included as Table XXXVI of this report.

Settlement
Evidence of minor settlement was noted at one location on the east side of the facility (Feature A). Feature A consisted of a subtle surface depression 1 m west of the crest north of VT-03 along the east side of the facility. This feature was not noted during the previous 2009 inspection.

Erosion
Evidence of erosion was not noted.

Frost Action
Evidence of frost action was not observed.

Evidence of Burrowing Animals
Indications of burrowing animals were not noted.

Re-establishment of Vegetation
Indications of vegetation were not noted.

Staining
Evidence of staining was not observed.

Seepage Points
Indications of seepage were not noted.

Debris
One piece of exposed non-woven black geotextile was noted on the northwest side slope of the facility (Feature B). The geotextile material was used in construction of the facility liner system. In addition, one piece of miscellaneous surface metal debris (steel spring) was also noted on the northwest side of the facility.

Presence/Condition of Monitoring Instruments
All monitoring well and thermistor installations were found to be in good condition at the facility.

Other Features of Note
Numerous vehicle tracks/ruts were observed around VT-02 and VT-04 on the surface of the facility (Feature C) and along the north and south side slopes (Feature D). The vehicle tracks/ruts extended between 0.1 to 0.25 m in depth and covered less than 2% of the landfill surface.

Areas of continuous and discontinuous areas of ponded water were present along the south and northeast sides of the facility. Ponded areas along the south side of the facility were associated with active surface runoff and drainage channel extending from the area to the northwest of the access road, whereas ponding along the northeast side appeared to be localized, possibly resulting from former borrow activities that occurred in the area.

Discussion
The Tier II Disposal Facility performance with respect to containment of the debris within the landfill is rated as acceptable. A visual inspection report, including supporting photos and drawing, is presented in the following pages.

9.6 THERMAL MONITORING DATA

All thermistors at the Tier II Disposal Facility were inspected and found to be in good condition with no significant concerns identified. Data from all thermistors was successfully retrieved and all analogues/thermocouples were observed to be functioning properly at the time of inspection. Further review of the downloaded data identified no anomalous temperature readings from any of the thermistor sensors. All clocks exhibited slight drift and were synchronized using the Prolog software.

Battery levels at all thermistor locations were noted as being good with the exception of VT-04 which exhibited "fair" battery levels. Batteries in VT-04 should be changed out during the next scheduled monitoring event. Internal memories were reset and clocks were synchronized using the Prolog software.

9.7 LANDFILL TEMPERATURE DATA FROM DATALOGGERS

Manual resistive and temperature data readings were collected from the thermistor strings as per the ToR. Manual readings and inspection results for each thermistor are presented on the Thermistor Annual Maintenance Reports included in section 9.10. A complete datalogger RAW data set for 2009-2010 period has been forwarded to DCC as per the ToR.

9.8 SOIL SAMPLE ANALYTICAL DATA

The soil chemical analysis results and evaluation of analytical data for the 2010 Tier II Disposal Facility samples are presented in Tables XXXIX and XL respectively. Certificates of analysis and results of field duplicates collected as part of the QA/QC program are presented in Appendix C.

Table XXXIX: Soil Chemical Analysis Results – Tier II Disposal Facility

S:\P\CD\8177\FOX-M\T\[10- Soil and GW results FOX-M.xlsx]Soil - Tier II

Table XL: Evaluation of 2010 Soil Analytical Data – Tier II Disposal Facility

Parameter	2010
Copper	Concentrations ranged between 4-7 mg/kg with a mean concentration of 4.8 mg/kg. The highest concentrations were observed at surface at MW-2, whereas the lowest concentrations were observed in surface and depth samples at MW-1, depth sample from MW-4 and surface sample from MW-5.
Nickel	Concentrations ranged between 9-15 mg/kg with a mean concentration of 12.4 mg/kg. The most elevated concentrations were observed at depth at MW-2 (15 mg/kg) and at surface at MW-3 (14 mg/kg). The lowest concentration was observed at depth at MW-4.
Cobalt	Concentrations ranged between 2-3 mg/kg with a mean of 2.7 and detectable concentrations noted at all locations.
Cadmium	All reported concentrations were less than the method detection limit (0.5 mg/kg).
Lead	Concentrations ranged between 2-7 mg/kg with a mean of 3.9. Trace concentrations were observed at all locations with the highest and lowest concentrations observed at MW-2 (surface) and MW-4 (depth), respectively.
Zinc	Concentrations ranged between 8-15 mg/kg with a mean of 11.4 mg/kg. The highest concentration was observed at MW-2 (surface and depth), whereas the lowest concentration was observed at MW-1 (surface) and MW-4 (depth). Concentrations at the remaining soil sample locations ranged between 9-13 mg/kg.
Chromium	Concentrations ranged between 10-19 mg/kg with a mean of 15.6 mg/kg. The highest and lowest concentrations were observed at depth at MW-2 and MW-4, respectively.
Arsenic	Concentrations ranged between <1-2 mg/kg with detectable concentrations noted at all sample locations with the exception of the depth samples at MW-2, MW-3 and MW-5.
Mercury	All reported concentrations were less than the method detection limit (0.1 mg/kg).
PCBs	All reported concentrations were less than the method detection limits (0.02-0.2 mg/kg).
TPH	All reported concentrations were less than the method detection limit.

9.9 GROUNDWATER SAMPLE ANALYTICAL DATA

The groundwater chemical analysis results and evaluation of analytical data for the 2010 Tier II Disposal Facility samples are presented in Tables XLI and XLII respectively. Certificates of analysis and groundwater samples collected as part of the QA/QC program are presented in Appendix C.

Table XLI: Groundwater Chemical Analysis Results – Tier II Disposal Facility

S:\P\CD\8177\FOX-M\T\[10- Soil and GW results FOX-M.xlsx]GW - Tier II

Table XLII: Evaluation of 2010 Groundwater Analytical Data – Tier II Disposal Facility

Parameter	2010
Copper	Concentrations ranged between 0.001-0.003 mg/L, with the highest and lowest concentrations noted at MW-5 and MW-2, respectively.
Nickel	Concentrations ranged between <0.005-0.026 mg/L, with detectable concentrations noted three sample locations, including MW-1, MW-4 and MW-5. The highest concentration was observed at MW-5, approximately 4 times higher than the other detectable concentrations.
Cobalt	Concentrations ranged between <0.0002-0.0014 mg/L, with detectable concentrations noted at two well locations, MW-1 (0.0014 mg/L) and MW-5 (0.0006 mg/L).
Cadmium	Concentrations ranged between <0.0001-0.0001 mg/L, with detectable concentrations noted at only one well location, MW-2.
Lead	All reported concentrations were less than the method detection limit (0.001 mg/L).
Zinc	Concentrations ranged between <0.01-0.04 mg/L, with detectable concentrations noted at only one well location, MW-2.
Chromium	Concentrations ranged between 0.003-0.026 mg/L, with detectable concentrations noted at all locations. The highest concentration was noted at MW-5, approximately 3-9 times higher that the other sample locations.
Arsenic	All reported concentrations were less than the method detection limits (0.001-0.005 mg/L).
Mercury	All reported concentrations were less than the method detection limit (0.0001 mg/L).
PCBs	All reported concentrations were less than the method detection limit (0.1 µg/L).
TPH	All reported concentrations were less than the method detection limit.

9.10 THERMISTOR ANNUAL MAINTENANCE REPORTS

The thermistor annual maintenance reports for VT-1 to VT-5 are presented in this section.

10 EAST BEACH LANDFILL

10.1 BACKGROUND AND MONITORING PROGRAM

The East Beach Landfill is located southeast of the main station and extends approximately 1.2 km parallel to the ocean shoreline between the Hazardous Materials Storage Area and south end of the site. The landfill consists of two lobes: a main lobe (south) with engineered containment cover encompassing a footprint of approximately 65,500 m^2 and final cover extending approximately 1.25 to 2.0 m above the surrounding grade; and a north lobe with engineered containment cover encompassing a footprint of approximately 6,100 m^2 and final cover extending between 1.5 to 2.0 m above the surrounding grade.

Based on existing information regarding this landfill as a source of contamination, its potential migration pathways and receptors, the landfill was classified as a moderate potential environmental risk. The remediation consisted of partial excavation of the debris within 30 m of the shoreline. The containment system design consisted of the installation of a synthetic liner system anchored into the saturated permafrost around the toe of the landfill and regraded with sufficient granular fill at surface to cause aggradations of permafrost through the landfill contents.

Twelve groundwater monitoring wells are installed at the landfill perimeter, and six thermistors are installed within the landfill footprint to monitor freeze-back conditions.

The long term monitoring plan consists of visual monitoring, collection of soil and groundwater samples and monitoring of subsurface ground temperatures. The 2010 monitoring of this landfill includes visual inspection to verify for evidence of settlement or erosion, collection of soil and groundwater samples to monitor for the presence of leachate and collection of ground temperature data from the thermistors. Locations of groundwater monitoring wells, soil samples and thermistor installations are identified on Figures FOX-M.9 and FOX-M.10.

Soil at all stations was sampled as specified. Where encountered, groundwater from each of the monitoring wells was sampled for all parameters as per the ToR. Insufficient groundwater volumes (dry conditions) were noted at all but two monitoring well locations, including MW-29 and MW-30.

10.2 VISUAL INSPECTION REPORT

The visual inspection of the East Beach Landfill was conducted on August 27, 2010. The Visual Inspection Checklist/Report has been completed as per the ToR and is included as Table XLIII of this report.

Settlement
Evidence of minor settlement was noted at one location on the southwest corner of the landfill (Feature A). Feature A consisted of a 2 m long by 1 m wide surface depression west of the crest on the southwest corner of the landfill. This feature was not noted during the previous 2009 inspection.

Erosion
Evidence of erosion was not noted.

Frost Action
Evidence of frost action was not observed.

Evidence of Burrowing Animals
Indications of burrowing animals were not noted.

Re-establishment of Vegetation
Indications of vegetation were not noted.

Staining
Evidence of staining was not observed.

Seepage Points
Indications of seepage were not noted.

Debris
One piece of partially exposed wire was noted on the west side slope of the landfill (Feature B). In addition, one piece of surface metal debris (rusted bolt cutter) was also noted in the immediate vicinity of the exposed wire. The debris associated with Feature B was not noted during the previous 2009 inspection.

Presence/Condition of Monitoring Instruments
All monitoring well and thermistor installations were found to be in good condition, with the exception of broken protective well covers at MW-21 and MW-24 along the east side of the landfill. Several lock sets were found to be heavily rusted and inoperable and were subsequently replaced with new. All existing lock sets were lubricated at the time of monitoring.

Other Features of Note
Localized vehicle tracks were observed on the surface and side slopes of the landfill, including several deeper ruts noted along the south, east and west sides of the south lobe (Feature C) and northwest and south sides of the north lobe (Feature D). The vehicle ruts typically extended between 0.1 to 0.2 m in depth and are occasional in nature.

Partially buried or exposed debris were observed within 20 m of the landfill toe, including various pieces of metal and wire debris within the east beach ridge, east of the landfill. Debris included an engine block, cable, wood, pipe, wire, tubing, radiator, miscellaneous metal pieces, drum lid. Numerous small pieces of metal surface debris and a partially exposed 1" diameter braided steel cable were also noted south and east of MW-20, respectively.

Relatively continuous and extensive areas of ponded water were present along the west side of the landfill. Ponded areas appear consistent with previous observations. There were no points of seepage or staining noted to be associated with any of the ponded areas.

Discussion
The East Beach Landfill performance with respect to containment of the debris within the landfill is rated as acceptable. Visual inspection report, including supporting photos and drawing, is presented in the following pages.

Overall Landfill Performance:	**Acceptable**									

10.3 PRELIMINARY STABILITY ASSESSMENT

The Preliminary Stability Assessment for East Beach Landfill has been completed as per the ToR and is included as Table XLIV hereafter.

Table XLIV: Preliminary Stability Assessment – East Beach Landfill

Feature	Severity Rating	Extent
Settlement	Acceptable	Isolated
Erosion	Not observed	None
Frost Action	Not observed	None
Staining	Not observed	None
Vegetation Stress	Not observed	None
Seepage/Ponded Water	Acceptable	Extensive (perimeter only)
Debris exposure	Acceptable	Isolated
Overall Landfill Performance	**Acceptable**	

Performance/ Severity Rating	Description
Acceptable	Noted features are of little consequence. The landfill is performing as designed. Minor deviations in environmental or physical performance may be observed, such as isolated areas of erosion, settlement.
Marginal	Physical/environmental performance appears to be deteriorating with time. Observations may include an increase in size or number of features of note, such as differential settlement, erosion or cracking. No significant impact on landfill stability to date, but potential for failure is assessed as low or moderate.
Significant	Significant or potentially significant changes affecting landfill stability, such as significant changes in slope geometry, significant erosion or differential settlement; scarp development. The potential for failure is assessed as imminent.
Unacceptable	Stability of landfill is compromised to the extent that ability to contain waste materials is compromised. Examples may include: • Debris exposed in erosion channels or areas of differential settlement. • Liner exposed. • Slope failure.

Extent	Description
Isolated	Singular feature
Occasional	Features of note occurring at irregular intervals/locations
Numerous	Many features of note, impacted less than 50% of the surface area of the landfill
Extensive	Impacting greater than 50% of the surface area of the landfill

10.4 LOCATION PLAN

The Location Plan for the East Beach Landfill has been completed as per the ToR and is included in Figures FOX-M.9 and FOX-M.10.

10.5 PHOTOGRAPHIC RECORDS

The Photographic Record for East Beach Landfill has been completed as per the ToR and is included in the following pages as Table XLV. The Photographic Record contains only an index and “thumbnail” photographs. Full size photographs are contained in the Addendum DVD-ROM.

Table XLV: Landfill Visual Inspection Photo Log - East Beach Landfill
Site Name: FOX-M, Hall Beach
Landfill: East Beach Landfill
Date Inspected: August 27, 2010
Inspected by: Andrew Passalis, P.Eng.

10.6 THERMAL MONITORING DATA

All thermistors at the East Beach Landfill were inspected and found to be in good condition with no significant concerns identified. Data from all thermistors was successfully retrieved and all analogues/thermocouples were observed to be functioning properly at the time of the inspection. Further review of the downloaded data identified no anomalous temperature readings. All clocks exhibited slight drift and were synchronized using the Prolog software.

No batteries were replaced in 2010 as battery levels at all thermistor locations were noted as being "good".

10.7 LANDFILL TEMPERATURE DATA FROM DATALOGGERS

Manual resistive and temperature data readings were collected from the thermistor strings as per the ToR. Manual readings and inspection results for each thermistor are presented on the Thermistor Annual Maintenance Reports included in section 10.10. A complete datalogger RAW data set for the 2009-2010 period has been forwarded to DCC as per the ToR.

10.8 SOIL SAMPLE ANALYTICAL DATA

The soil chemical analysis results and evaluation of analytical data for the 2010 East Beach Landfill samples are presented in Tables XLVI and XLVII respectively. Certificates of analysis and results of field duplicates collected as part of the QA/QC program are presented in Appendix C.

Table XLVI: Soil Chemical Analysis Results – East Beach Landfill

S:\P\CD\8177\FOX-M\T\[10- Soil and GW results FOX-M.xlsx]Soil - East Beach LF

Table XLVII: Evaluation of 2010 Soil Analytical Data – East Beach Landfill

Parameter	2010
Copper	Concentrations ranged between 4-56 mg/kg with a mean concentration of 11.6 mg/kg. Elevated concentrations were observed at downgradient locations MW-22 (56 mg/kg – surface) and MW-28 (34 mg/kg – depth). Concentrations at all upgradient locations were between 4-6 mg/kg.
Nickel	Concentrations ranged between 9-18 mg/kg with detectable concentrations at all sample locations and a mean concentration of 12.8 mg/kg. The highest concentrations were observed at depth and surface at MW-20 and MW-31 respectively. Concentrations at the remaining upgradient locations ranged between 10-14 mg/kg.
Cobalt	Concentrations ranged between 2-3 mg/kg with a mean of 2.7 with detectable concentrations noted at all locations.
Cadmium	All reported concentrations were less than the method detection limit (0.5 mg/kg).
Lead	Concentrations ranged between 4-91 mg/kg with a mean of 22.5 with detectable concentrations noted at all locations. The most elevated concentrations were noted at downgradient locations MW-22 (82 mg/kg – surface, 50 mg/kg – depth), MW-25 (45 mg/kg – surface, 91 mg/kg – depth) and MW-28 (41 mg/kg – depth). Concentrations at upgradient locations ranged between 4-8 mg/kg.
Zinc	Concentrations ranged between 8-74 mg/kg with a mean of 19.4 with detectable concentrations noted at all locations. The most elevated concentrations were noted at downgradient locations MW-22 (47 mg/kg - surface) and MW-28 (74 mg/kg - depth). Concentrations at upgradient locations ranged between 9-14 mg/kg.
Chromium	Concentrations ranged between 11-30 mg/kg with a mean of 15.8 mg/kg. Slightly elevated concentrations were observed at downgradient locations MW-20 (30 mg/kg – surface) and MW-28 (18 mg/kg – surface and depth). Concentrations at upgradient locations ranged between 11-19 mg/kg.
Arsenic	Concentrations ranged between 1-4 mg/kg with a mean concentration of 2.3 mg/kg. The highest concentration was observed at downgradient locations MW-23 (surface and depth) and MW-27 (depth). Concentrations at upgradient locations ranged between 1-2 mg/kg.
Mercury	All reported concentrations were less than the method detection limit (0.1 mg/kg).
PCBs	All reported concentrations were less than the method detection limits (0.02-0.2 mg/kg).
TPH	All reported concentrations were less than the method detection limit (10-20 mg/kg) with the exception of samples collected at downgradient locations MW-22 (21 mg/kg - surface), MW-23 (22 mg/kg - surface) and MW-24 (13 mg/kg – surface, 23 mg/kg – depth).

10.9 GROUNDWATER SAMPLE ANALYTICAL DATA

The groundwater chemical analysis results and evaluation of analytical data for the 2010 East Beach Landfill samples are presented in Tables XLVIII and XLIX hereafter. As noted above, all of the downgradient wells and upgradient well MW-31 contained insufficient sample volumes (dry conditions) to complete the specified analysis. Certificates of analysis and groundwater samples collected as part of the QA/QC program are presented in Appendix C.

Table XLVIII: Groundwater Chemical Analysis Results – East Beach Landfill

Sample #	Location	Cu [mg/L]	Ni [mg/L]	Co [mg/L]	Cd [mg/L]	Pb [mg/L]	Zn [mg/L]	Cr [mg/L]	As [mg/L]	Hg [mg/L]	PCBs [µg/L]	F1 C_6-C_{10} [mg/L]	F2 C_{10}-C_{16} [mg/L]	F3 C_{16}-C_{34} [mg/L]	TPH C_6-C_{34} [mg/L]

10.11 MONITORING WELL SAMPLING/INSPECTION LOGS

The monitoring well sampling and inspection logs for MW-20 through MW-31 are presented in this section

2010 Monitoring Well Sampling Log (MW-20)

Site name:	FOX-M
Date of sampling event:	27-Aug-10
Names of samplers:	Andrew Passalis
Monitoring well ID:	MW-20
Facility:	East Beach Landfill

Known Data	
Depth of installation* (m):	3.50
Length of screened section (m):	1.50
Depth to top of screen* (m):	0.46

Measured Data			
Condition of well:	Good	Procedure/Equipment:	Interface Meter
Procedure/Equipment:	Tape Measure	Depth to water surface (m):	- (dry)
Well height above ground (m):	0.39	Depth to bottom (m):	1.14
Diameter of well (m):	0.04	Free product thickness (mm):	-

Calculations		Notes	
Depth of water (m):	-	Evidence of sludge:	no
Well volume of water (L):	-	Evidence of freezing/siltation:	no
Static water level* (m):	-		
Length of screen collecting water (m):	-		

Development/Purging Information

Equipment: n/a

2010 Monitoring Well Sampling Log (MW-21)

Site name:	FOX-M
Date of sampling event:	27-Aug-10
Names of samplers:	Andrew Passalis
Monitoring well ID:	MW-21
Facility:	East Beach Landfill

Known Data

Depth of installation* (m):	3.00
Length of screened section (m):	1.50
Depth to top of screen* (m):	0.60

Measured Data

Condition of well:	Good	Procedure/Equipment:	Interface Meter
Procedure/Equipment:	Tape Measure	Depth to water surface (m):	- (dry)
Well height above ground (m):	0.46	Depth to bottom (m):	1.41
Diameter of well (m):	0.04	Free product thickness (mm):	-

Calculations		**Notes**	
Depth of water (m):	-	Evidence of sludge:	no
Well volume of water (L):	-	Evidence of freezing/siltation:	no
Static water level* (m):	-	Protective well cover broken. Collar rivets rusted.	
Length of screen collecting water (m):	-		

Development/Purging Information

Equipment: n/a

Date & Time	Volume Removed (L)	Temperature (^{o}C)	pH	Conductivity (µS/cm)	Turbidity (NTU)	Description of Water
-	-	-	-	-	-	-

Water Sampling		**Soil Sampling**	
Date & Time Collected:		Date and Time Collected:	27-Aug-10
Sample Number - Water:		Sample Number - Soil:	FM10-21WA
			FM10-21WB
			FM10-BD8 (21WB)
Sample Containers:		Sample Containers:	2x250mL glass
			2x250mL glass
			2x250mL glass
Procedure/Equipment:		Procedure/Equipment:	Steel & Plastic Trowels
Water Description:		Soil Description:	Light brown sand, med-cs grained, some gravel
Sampling Equipment Decontamination (Y/N):	n/a	Sampling Equipment Decontamination (Y/N):	Y
Number Washes:	-	Number Washes:	1
Number Rinses:	-	Number Rinses:	1

*From ground surface. Unless this is stated, all measurments are assumed to be from the top of the casing.

APPENDIX A

Range of the Report and Limitation of Responsibilities

RANGE OF THE REPORT AND LIMITATION OF RESPONSIBILITIES

A – Recipient and Use

This report ("Report") was prepared by Biogenie, a division of EnGlobe Corp. ("Biogenie") at the request and for the sole benefit of the Client ("Client"), and is intended to be used exclusively by the Client.

B –Site Conditions

Any description of the target site ("Site"), soil and/or groundwater included in the Report is only provided as an indication to the Client, and unless otherwise specifically mentioned in the Report such description shall not at any time and under any circumstances be used for purposes other than to gain a better understanding of the Site and to fulfil the requirements of the mandate assigned to Biogenie by the Client ("Mandate").

All information, including but not limiting the comprehensiveness of the data, charts, descriptions, drawings, tables, analysis results, compilations, and any conclusion and recommendation included in the Report, shall arise from the direct observation of the Site during a specific period, namely the fulfilment of the Mandate, and from the interpretation of such information and data available during the same period.

The content of the Report shall not apply in any way or to any part of the Site or to any parameter, material or analysis excluded from the Mandate.

Biogenie shall not be held responsible for the presence of any substance or material of a different nature, or of a similar nature but with different concentrations, as those indicated in the Report, and this in any part or parts of the Site excluded from the Mandate.

The content of the Report, including its conclusions and recommendations, shall not apply to any period preceding or following the Mandate. The physiochemical conditions of the Site, and the type and degree of contamination identified on the Site, may vary within a given period depending on a number of factors, especially the current activities taking place on the Site and/or on lands adjacent to the Site.

A review of the Report and/or changes in the parameters, conclusions and/or recommendations may prove to be necessary in the event of a change in the Site conditions or the discovery of pertinent information subsequent to the production of the Report.

C - Legislation, Regulations, Guidelines and Policies

The interpretation of the data and observations concerning the Site, as well as the conclusions and recommendations resulting from these, shall take into account the laws, regulations, standards, policies and/or guidelines applicable to the Project and that are in effect at the time of the fulfilment of the Mandate. In the event no current law, regulation, policy, guideline or standard applies to the project, Biogenie shall take into account proven environmental and professional rules and practices when drawing up the Report.

Any change in the legislation, regulations, standards, policies and/or guidelines applicable to the project may result in the need to review the Report and/or modify its parameters, conclusions and/or recommendations.

D – Use of Report

The Report is intended for the exclusive use of the Client and shall only be used for the purpose it was meant for.

The content of the Report and its conclusions and recommendations only apply to the Site and may not, at any time and under any circumstances, apply to any land adjacent to the Site or to any other land located in the vicinity of the Site.

Any reproduction in any form whatsoever and any distribution or use of the Report, in whole or in part, by a person other that the Client, is strictly forbidden without the prior written consent of Biogenie. Biogenie makes no declaration and pledges no responsibility towards any person other than the Client with regard to the content of the Report and the conclusions and recommendations expressed therein.

Biogenie is in no way responsible for any loss, fine or penalty, or for any expense, damage or other prejudice of any type whatsoever, sustained by a person other than the Client as a result of the unauthorized use of the Report.

No provision of the Report shall be construed as or considered to be a legal opinion of Biogenie’s.

APPENDIX C

Maxxam and Exova QA/QC Reports and Certificates of Analysis

QUALITY ASSURANCE / QUALITY CONTROL

The Quality Assurance/Quality Control (QA/QC) program was implemented to monitor the quality of the analytical results. The main objective of this QA/QC program is to insure that sampling data and analysis results are complete, precise, exact, representative and comparable. The review consisted of evaluating sample collection/handling methodology, general laboratory comments, field (blind) duplicate samples, and inter-laboratory duplicate samples. Samples collected during the monitoring program were submitted to laboratories accredited by the Canadian Association for Environmental Analytical Laboratories (CAEAL).

All samples were collected following strict Biogenie sampling procedures. Samples were uniquely labelled and control was maintained through use of chain of custody forms. All samples were collected in laboratory supplied containers and preserved in insulated coolers. Appropriate QA/QC procedures were adhered to at all times.

Blind duplicate samples were submitted to Exova for intra-laboratory analysis, with additional duplicate samples were sent to Maxxam for inter-laboratory comparison purposes. Both laboratories are situated in Ottawa, Ontario.

The relative percent difference (RPD) is used to evaluate the sample result variability. Average RPD values of less than 100% for soil samples and 30% for groundwater samples are considered an indication of acceptable duplicate sample variability. For groundwater samples, an RPD of greater than 30% may reflect difference in sample turbidity or variance in the sample procedures. Individual RPD values greater than 50% are not considered to reflect acceptable variability. RPD values are not used to evaluate those compounds that are present at concentrations less than five times the method detection limit (MDL).

SOIL SAMPLES

In case of soil samples, eight blind duplicate samples were submitted for intra and inter-laboratory comparisons. Review of results indicated relatively minor differences in concentrations within the Exova metals results when duplicates were compared, and considered to be within acceptable limits. It should be noted that many of individual parameter concentrations were less than five times the MDL. Two RPD values (120% and 127%) for copper were however outside the acceptable range when inter-laboratory duplicates were compared.

All of TPH and PCB concentrations were below the MDL with the exception of trace PCB and/or TPH concentrations in three inter-laboratory samples. The detectable PCB concentration and one TPH concentration were however below the MDL of corresponding inter-laboratory duplicate samples.

GROUNDWATER

In the case of groundwater samples, one blind duplicate sample was submitted for intra and inter-laboratory comparisons. The PCB and TPH duplicate results were below the MDL in both intra and inter-laboratory duplicate comparisons.

Comparisons of intra-laboratory results for total metals indicate RPDs outside acceptable limits for select parameters in both the intra and inter-laboratory duplicate comparisons. RPD values for chromium and copper were 3-4 times higher in the inter-laboratory comparison, when compared to the intra-laboratory results. The RPD for zinc in the inter-laboratory comparison was also outside the acceptable limit.

Results from one field blank indicated trace concentrations of copper with all other metal parameters less than the method detection limit (MDL).
Overall, the soil sample results are coherent and within the same range of results for intra and inter-laboratory samples. In general, the reliability of soil analytical results is considered as good. The laboratory comparisons for TPH and PCBs in groundwater are coherent, whereas the intra and inter-laboratory comparisons for a select number of total metals were outside the acceptable range, suggesting possible variances in turbidity of the samples.

Package 1	7.7°C

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

Sample GZ7774-01: Mercury Analysis: Samples were submitted in unpreserved bottles and analyzed by client request. Results may be biased low due to improper preservation. Results are not valid for regulatory compliance.
F2-F4 Analysis: Due to limited amount of sample available for analyses. a smaller than usual portion of the sample was used . Reporting limits were adjusted accordingly

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) Surrogate recovery was below the lower control limit. This may represent a low bias in some results.

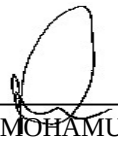
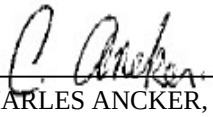
Maxxam Job #: B0B9577

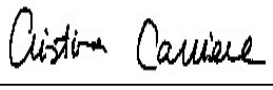
The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).



ABDI MOHAMUD, Senior Analyst

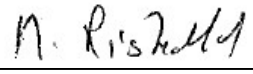


CHARLES ANCKER, B.Sc., M.Sc., C.Chem, Senior Analyst



CRISTINA CARRIERE, Scientific Services

JEEVARAJ JEEVARATRNAM, Senior Analyst



MEDHAT RISKALLAH, Manager, Hydrocarbon Department

==========

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.
