1.1 RESPONSE TO KITIKMEOT INUIT ASSOCIATION

KIA-TC-01: SSWQO for Nitrate

Detailed Review Comment

In Section 3.1 Nitrate, Sabina states, "To adopt the hardness dependent equation developed for the Ekati Diamond Mine as the [Site Specific Water Quality Objective] SSWQO for nitrate in Goose Lake (Table 4; Rescan 2012) when hardness concentrations are greater than or equal to 26.4 mg/L as $CaCO_3$ in Goose Lake."

The reviewer agrees that toxicity modifying factors should be taken into consideration when determining parameter guidelines, however information (such as the model used to calculate the guideline) should be provided and reviewed to assess its applicability to Goose Lake and the Hope Bay mine.

Recommendation/Request:

We recommend Sabina,

1. Substantiate that the Ekati Diamond Mine hardness dependent equation for nitrate is appropriate for Goose Lake.

2. Provide the SSWQO derivation document for review.

3. Discuss why a nitrate SSWQO is required for Goose Lake.

Sabina Response:

Part 1: Sabina is proposing to use the maximum concentration from either the generic Canadian Council of Ministers of the Environment (CCME) nitrate water quality guideline (WQG) for the protection of aquatic life, or the hardness-dependent site-specific water quality objective (SSWQO) for nitrate calculated from the hardness dependent equation for nitrate adopted from the Ekati Diamond Mine. Specifically, if the hardness concentration in the sample is less than 26.4 mg/L as $CaCO_3$, then Sabina is proposing to use the generic WQG for the protection of aquatic life of 2.93 mg-N/L for nitrate (CCME 2012) as the SSWQO. If the hardness concentration in the sample is greater than or equal to 26.4 mg/L as $CaCO_3$, then Sabina is proposing to use the hardness-dependent SSWQO equation to calculate the SSWQO for nitrate. The use of the Ekati Diamond Mine hardness dependent equation for nitrate in this way for Goose Lake is appropriate because receiving environment characteristics are comparable between Leslie Lake at the Ekati Mine and Goose Lake at the Back River Project, and there is no scientific basis to conclude that this equation would not be applicable to Goose Lake. In addition, the hardness-based equation developed for Ekati Mine has been used and validated at other mine sites in sub-Arctic environments.

- In developing a SSWQO for the Ekati Mine, Rescan (2012) demonstrated hardness dependency in the available nitrate toxicity data relevant to sub-Arctic environments, which was accepted by regulatory agencies. The hardness-based equation developed by Rescan (2012) is applicable to Goose Lake because the water hardness range predicted for Goose Lake (i.e., approximately 13 to 97 mg/L as $CaCO_3$) is within the range assessed by Rescan (2012) (i.e., 10 to 160 mg/L $CaCO_3$).

- The use of this nitrate hardness dependent equation to derive a SSWQO for nitrate was accepted by the Wek'èezhìi Land and Water Board for the Ekati Diamond Mine. Subsequently, the hardness-dependent equation has been used to calculate approved SSWQOs for nitrate at other diamond mines in northern Canada (e.g., Snap Lake Mine, Gahcho Kué Mine). Adoption of this equation for SSWQO development for Snap Lake was validated through toxicity testing with sensitive invertebrate and fish species as part of nitrogen response planning.

- A comparison of the Ca:Mg ratios (by mass) modelled in Goose Lake during Project Construction and Operations to those measured in Leslie Lake in 2019, downstream of the Long Lake Containment Facility at the Ekati Mine, is provided in Table KIA-TC-1.1. The slight difference in Ca:Mg ratios is due to the relatively higher magnesium content in Leslie Lake compared to the projections in Goose Lake. The variance in magnesium proportion is not considered notable because calcium is judged to have the greater influence on mitigating toxicity of major ions and metals (CCME 2012); therefore, a relatively greater contribution of calcium to overall hardness may enhance the benefits of the increased hardness on ameliorating nitrate toxicity.

Table KIA-TC-1.1: Comparison of Calcium to Magnesium Concentrations and Ratios between Goose Lake and Leslie Lake

Goose Lake[(a)]					
Arc100					
Year	Month	Average Calcium (mg/L)	Average Magnesium (mg/L)	Calcium: Magnesium Ratio	Average Hardness (mg/L as $CaCO_3$)
2023	April	13.8	3.9	3.6	51
2023	August	7.6	2.0	3.8	27
2032	April	23.8	5.5	4.3	82
2032	August	9.6	2.3	4.2	33
Arc200					
Year	Month	Average Calcium (mg/L)	Average Magnesium (mg/L)	Calcium: Magnesium Ratio	Average Hardness (mg/L as $CaCO_3$)
2023	April	13.9	3.9	3.6	51
2023	August	7.4	2.0	3.7	27
2032	April	26.2	6.1	4.3	90
2032	August	9.4	2.3	4.2	33
Arc500

2023	April	13.8	3.9	3.6	50
2023	August	7.3	2.0	3.7	26
2032	April	21.8	5.1	4.3	75
2032	August	9.3	2.2	4.2	32

Table KIA-TC-1.1: Comparison of Calcium to Magnesium Concentrations and Ratios between Goose Lake and Leslie Lake

Arc1000					
Year	Month	Average Calcium (mg/L)	Average Magnesium (mg/L)	Calcium: Magnesium Ratio	Average Hardness (mg/L as $CaCO_3$)
2023	April	15.4	4.3	3.6	56
2023	August	7.2	2.0	3.7	26
2032	April	27.6	6.4	4.3	95
2032	August	9.2	2.2	4.1	32
Tail					
Year	Month	Average Calcium (mg/L)	Average Magnesium (mg/L)	Calcium: Magnesium Ratio	Average Hardness (mg/L as $CaCO_3$)
2023	April	15.9	4.5	3.6	58
2023	August	6.6	1.8	3.6	24
2032	April	22.5	5.2	4.3	78
2032	August	8.2	2.0	4.1	29
Leslie Lake[(b)]					
Year	Month	Average Calcium (mg/L)	Average Magnesium (mg/L)	Calcium: Magnesium Ratio	Average Hardness (mg/L as $CaCO_3$)
2019	April	50	26	2.0	231
2019	August	30	17	1.7	146

mg/L = milligrams per litre; $CaCO_3$ = calcium carbonate.

(a) Calcium and magnesium concentrations and ratios are from the hydrodynamic model of Goose Lake. Predictions are presented at five locations (i.e., Arc100, Arc200, Arc500, Arc1000, and Tail) in Goose Lake. The Arc100 results were calculated by taking the predicted daily maximum concentrations along an arc that is 100 m from the discharge location in Goose Lake and averaging the daily results for each month.

(b) Average concentrations from the 2019 Ekati Mine AEMP (ERM 2020).

Part 2: The SSWQO derivation documents are attached (Attachment FS-B).

Part 3: A nitrate SSWQO is required for Goose Lake because at a constant nitrate discharge concentration of 60 mg-N/L, which is the proposed maximum authorized monthly mean concentration, nitrate concentrations are predicted to exceed the CCME WQG of 2.93 mg-N/L during ice-cover periods (Figure KIA-TC-1.1).

With a proposed maximum authorized monthly mean concentration of 60 mg-N/L, the Project may require treatment of effluent before discharge to Goose Lake. The maximum nitrate concentration in the Primary Pond is predicted to be 97 m-N/L and in Llama Tailings Facility is predicted to be 48 mg-N/L. The opportunity to use a SSWQO for nitrate in Goose Lake will reduce the level of effluent treatment required for the Project, while maintaining protection of aquatic life in Goose Lake.

KIA-TC-02: Total Phosphorus Requires an EQC

Detailed Review Comment

In Section 5.1 Sabina states, "In this report, total phosphorus was not considered a POI because total phosphorus does not have a toxicity based guideline. However, Sabina commits to reviewing the baseline nutrient concentrations in Goose Lake, including total phosphorus concentrations, reviewing predicted total phosphorus concentrations in the discharges to Goose Lake in operations, and determining whether total phosphorus should be a POI. If total phosphorus is identified as a POI, Sabina commits to simulating total phosphorus concentrations in Goose Lake and developing EQC for total phosphorus following the methods described in this report."

Goose Lake is an ultra-oligotrophic lake and is sensitive to changes in nutrients. Given the sources of phosphorus on the mine site, there is the potential to increase total phosphorus concentrations in the lake thereby altering its trophic status resulting in degradation of water quality and aquatic habitat. We specifically highlight the total phosphorus concentrations associated with key infrastructure such as waste rock piles and pits outlined in Appendix C – Water Chemistry Input Data of the June 2020 Back River Project Water and Load Balance Report.

While not toxic total phosphorus can have large ecological implications on the aquatic inhabitants of the lake. To ensure aquatic biota in Goose Lake are protected we recommend Sabina consider total phosphorus a parameter of concern and commit to an EQC for it.

Recommendation/Request:

We recommend Sabina, consider total phosphorus a parameter of concern and commit to an EQC protective of trophic changes to Goose Lake.

Sabina Response:

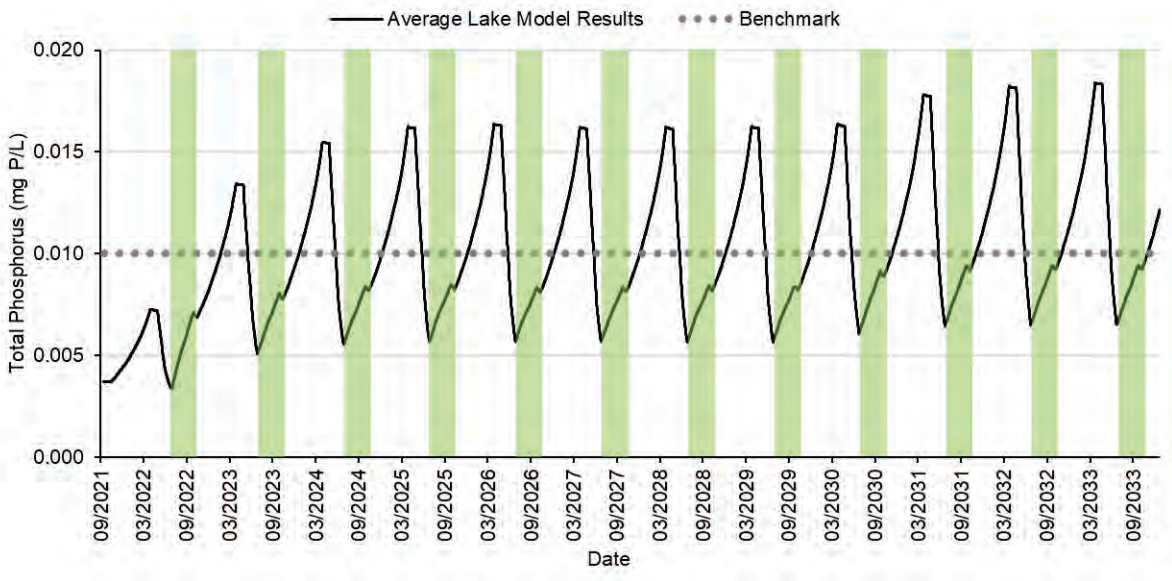
Sabina confirms that total phosphorus was added to the hydrodynamic model of Goose Lake (Goose Lake Model). Based on the screening process to identify parameters of potential concern (POPC), total phosphorus was identified as a POPC. These basis for screening in phosphorus as a POPC was because the predicted average total phosphorus concentration in Goose Lake with effluent discharge from Llama Tailings Facility was 0.088 mg-P/L, which is greater than 0.010 mg-P/L. Predicted average total phosphorus concentrations in Goose Lake were compared to 0.010 mg-P/L, which is the trigger level to maintain oligotrophic status in Goose Lake. The Canadian Council of Ministers of the Environment (CCME 2004) define oligotrophic status as having total phosphorus concentrations that range from 0.004 mg-P/L to 0.010 mg-P/L.

Total phosphorus effluent quality criteria (EQC) were calculated following the same methods described in Golder (2021), except predicted average total phosphorus concentrations in Goose Lake were compared to the trigger level to maintain oligotrophic status during the open-water season. Total phosphorus EQC were calculated for the discharge location in the main body of the lake (Location B; Figure 1 of Golder [2021]) at a discharge rate of 1,900 m^3/day, and an annual discharge period from 1 July to 30 September. The maximum authorized monthly mean EQC for total phosphorus was determined using the Goose Lake Model to identify a constant concentration of total phosphorus that the Project could discharge from tailings facilities or reservoirs to Goose Lake such that average concentrations of total phosphorus in Goose Lake remain below 0.010 mg-P/L during the open-water season.

The proposed maximum authorized monthly mean concentration for total phosphorus is 0.25 mg-P/L and the proposed maximum authorized concentration in a grab sample for total phosphorus is 0.50 mg-P/L. At a maximum authorized monthly mean concentration of 0.25 mg-P/L, average total phosphorus concentrations in Goose Lake are predicted to remain below 0.010 mg-P/L during the open-water season (i.e., time periods shaded in green in Figure KIA-FC-2.1).

It is important to remember that the trigger level of 0.010 mg-P/L for total phosphorus is not toxicity-based (i.e., an increase in phosphorus concentrations does not impart any direct toxicity risk to aquatic life) but is associated with generic trophic levels established for Canadian lakes and rivers (CCME 2004, Environment Canada 2004). For lake environments subject to snow and ice cover conditions that limit productivity due to cold temperatures and limited light penetration into the lake during winter, such as Goose Lake, spring or mean annual open water phosphorus concentrations are considered more appropriate in determining the trophic status in these lakes and therefore more appropriate in determining chlorophyll/algal biomass potential in these lakes (Schindler 1978). Under these conditions, the average total phosphorus concentrations remain well below the upper boundary concentration for oligotrophic conditions (time periods shaded in green in Figure KIA-TC-2.1).

Figure KIA-TC-2.1: Predicted Average Total Phosphorus Concentrations in Goose Lake with a Constant Discharge Concentration of 0.25 mg P/L



Note: The time periods shaded in green represent the open-water period from July 1 to October 15 each year in the hydrodynamic model.

mg/L = milligrams per litre; P = phosphorus.

KIA-TC-03: Maximum Authorized Concentrations of Total Petroleum Hydrocarbons

Detailed Review Comment

In Section 7.3, Sabina states, "It is proposed that the maximum authorized monthly mean concentration and the maximum authorized concentration in a grab sample for TPH be set at 3 mg/L and 6 mg/L, which are the same values as other mines in Nunavut (i.e., Agnico Eagle Mines Limited Water Licence No.: 2AM-WTP1830)." Goose Lake is a fish bearing lake. Introducing TPH may have a detrimental impact on the fish of the lake. To fully understand the implications of increasing the concentrations of TPH on resident fish a discussion must be provided on potential impacts.

Recommendation/Request:

We recommend Sabina provide background information discussing the appropriateness of the proposed maximum authorized monthly mean concentration and maximum authorized concentration in a grab sample for TPH for Goose Lake.

Sabina Response:

The proposed effluent quality criteria for total petroleum hydrocarbons (TPH) are consistent with other projects in the Northwest Territories and Nunavut that have discharges into fish-bearing lakes. Canadian water quality guidelines (WQGs) for TPH have not been developed. However, Alberta Environment and Parks (AEP) has developed groundwater remediation guidelines for natural areas for hydrocarbon fractions F1 (2.2 mg/L) and F2 (1.1 mg/L) (Government of Alberta 2019). The maximum authorized monthly mean concentration proposed for TPH of 3 mg/L is approximately the summation of the groundwater remediation guidelines for the F1 and F2 hydrocarbon fractions. These guidelines are proposed in the absence of Canadian WQGs.

KIA-TC-04: Modeling Scenarios

Detailed Review Comment

In Section 4.0 Sabina states, "One mine-affected inflow (effluent discharge) to Goose Lake, which is from the Primary Pond and Llama Tailings Facility (SRK 2020). Separate model simulations were conducted for the Primary Pond discharge and the Llama Tailings Facility discharge." If there is the potential for effluent from the Primary Pond and Llama Tailings Facility to be discharging simultaneously, then the potential for cumulative effects exists and does not appear to have been considered; a simultaneous discharge scenario should be modeled to characterize that potentiality. We recommend that Sabina re-run modeling with discharges from the Primary Pond and Llama Tailings Facility occurring simultaneously or commit to only one point of discharge.

In Section 6.1.1 Sabina states, "Approximately 50 Goose Lake Model scenarios were performed, which are described below:

- Discharge location: two locations in Goose Lake were evaluated for the effluent discharge (location A in the neck of Goose Lake, and location B in the main body of the lake; Figure 1).
- Discharge rate: two effluent discharge rates were evaluated including 1,900 and 2,500 m^3/d.
- Discharge chemistry: several effluent concentrations for POPC were evaluated.
- Discharge period: two discharge periods during the open water season were evaluated, including 1 July to mid-October and 1 July to 30 September."

The type of discharge was not discussed. Is Sabina considering a single point discharge or a multiport diffuser? Information discussing the type of discharge would provide the reviewer with a better understanding of the mixing of the effluent in Goose Lake.

Two rates of discharge were modeled (1,900 m^3/d and 2,500 m^3/d) but there was no discussion surrounding the expected discharge needs of the mine. Is the lower rate of 1,900 m^3/d reasonable for Sabina? Further, no results for the 2,500 m^3/d scenario were presented in the memo.

Several effluent concentrations for POPCs were modeled but what those concentrations were based on was not discussed or how Sabina chose those concentrations was not discussed. The potential or expected range of concentrations for each POPC would allow the reviewer to determine if the modeled concentrations were reasonable or under predicted.

Recommendation/Request:

We recommend Sabina,

1. Clarify if simultaneous discharges from the Primary Pond and Llama Tailing Facilities is planned or may be required.

2. If there is the potential for simultaneous discharges to Goose Lake, then a scenario modelling the combined discharge is required.

3. Provide mixing characteristics of each potential discharge (i.e. single versus multi-port diffuser.).

4. Provide a discussion surrounding rate of discharge and the needs of the mine and model results for the 2,500 m^3/d discharge scenarios.

5. Provide a range of predicted concentrations for each POPC under each model scenario.

Sabina Response:

Sabina would like to clarify that several Goose Lake model scenarios were completed with varying discharge rates, discharge locations in Goose Lake, discharge time periods, and discharge chemistry. The purpose of the scenarios was to help Sabina arrive at the proposed effluent quality criteria (EQC) in Golder (2021). The proposed EQC were developed for a discharge rate of 1,900 m^3/day, a discharge location in the main basin of Goose Lake (i.e., Location B), and an annual discharge time period from July 1 to September 30.

Parts 1 and 2: Discharges may occur from either the Primary Pond and/or Llama Tailings Facility, however the total discharge volume would not exceed 1900 m^3/day.

Part 3: A diffuser was not included in the hydrodynamic model of Goose Lake because engineering designs for a diffuser have not been completed. Adding a diffuser to the hydrodynamic model will not change the proposed EQC for the Project.

Part 4: Two effluent discharge rates were tested in the hydrodynamic model of Goose Lake: 1,900 and 2,500 m^3/day. The proposed EQC are for a discharge rate of 1,900 m^3/day.

Part 5: As committed to in the Technical Meetings, a hydrodynamic model sensitivity analysis will be included in the next update to the hydrodynamic model.

Reference:

Golder (Golder Associates Ltd.). 2021. Sabina Gold & Silver Corporation Back River Project. Effluent Quality Criteria Report for Effluent Discharged from Tailings Facilities, Tailings Storage Facilities, or Reservoirs - Version 1. Submitted to Sabina Gold & Silver Corporation, Vancouver, BC, Canada.

KIA-TC-05: Predicted Concentrations

Detailed Review Comment

In Section 5.2.2 Sabina states, "The comparison was completed for maximum concentrations in Goose Lake at 1,000 m from the discharge point. As presented in Table 5, maximum concentrations in Goose Lake at 1,000 m from the discharge point were predicted to be higher than maximum concentrations at 100 m, 200 m, and 500 m from the discharge point and at the outlet of Goose Lake."

Typically, the influence of the mine should be closest to the point of discharge and decrease with distance; this understanding is at the core of a regulated mixing zone. It is concerning those concentrations were predicted to increase with distance from the mine between 100 m and 1000 m from the discharge. We recommend Sabina provide a rationale as this is counterintuitive to normal processes.

Recommendation/Request:

We recommend Sabina provide a rationale for the increase in parameter concentrations further from the point of discharge and clarify if the aquatic monitoring program is sufficient to evaluate impacts to the aquatic environment at those locations.

Sabina Response:

Parameter concentrations at locations further from the point of discharge are greater than parameter concentrations at the point of discharge during the ice-cover period (note: there are no discharges under ice). Goose Lake has a unique shape with a narrow and relatively shallow neck. The location further from the discharge point (i.e., 1,000 m) is shallower than where the discharge point is located. During the ice-cover period, the water withdrawn from the lake to form ice has no associated parameter mass (i.e., cryoconcentration), thus, mass is rejected and remains in the smaller volume of water below the ice. As a result, during the ice-cover period, concentrations are predicted to be slightly greater at that shallow location (i.e., 1,000 m from the discharge point) compared to closer to discharge point (e.g., 100 m). Although concentrations at 1,000 m are higher than the other assessment nodes, the elevated concentrations are limited to under ice conditions and remain protective of aquatic life.

Under ice conditions have been and will be monitored as part of the Aquatic Effect Management Plan (AEMP) program. Model predictions for Operations will be evaluated against the monitoring data collected during ice-cover and open-water seasons from various locations in Goose Lake, including shallow locations and deep locations. Sabina's next AEMP update will include a review of the available information and an updated design that allows for appropriate monitoring at the discharge location B in Goose Lake.

Reference: n/a

KIA-TC-06: Total Ammonia Effluent Quality Criteria

Detailed Review Comment

In Section 6.2.1 Sabina states, "The EQC for total ammonia were selected based on maintaining the pH of the effluent and the pH in Goose Lake between 6.0 and 7.3. The EQC for total ammonia are proposed to be 6 mg-N/L and 12 mg-N/L."

In Section 7.1, Sabina states, "The MDMER limits include a pH range between 6.0 and 9.5. It is proposed that the MDMER limits be applied as EQC for effluent discharged from tailings facilities, tailings storage facilities, or other reservoirs."

The expected pH of the effluent needs to be confirmed to determine if the proposed total ammonia EQC is appropriate. If the EQC for total ammonia is selected based on maintaining a pH of the effluent between 6.0 and 7.3 than a more constrained EQC range for pH than outlined in MDMER is required. Furthermore, no background water quality data for Goose Lake was provided to substantiate whether the pH in Goose Lake can be expected to remain between 6.0 and 7.3 with the discharge of effluent. The range of temperatures for both the effluent and Goose Lake should also be provided to substantiate whether the total ammonia EQC is appropriate given the impact temperature can have on concentrations of unionized ammonia.

Recommendation/Request:

We recommend Sabina,

1. Clarify the expected pH range of the effluent and confirm whether an EQC for pH of 6.0 to 7.3 corresponding to the proposed total ammonia EQC is required to prevent deleterious effects to Goose Lake resulting from unionized ammonia.

2. Provide background information discussing the range in pH and temperature for Goose Lake during the discharge period and the expected temperature of the effluent.

Sabina Response:

Part 1: The pH of the effluent will depend on unit operations in the water treatment plant. The Project will have the ability to adjust the pH of the effluent if necessary. The pH range from 6.0 to 7.3 is the baseline pH range in Goose Lake (Golder 2019).

A pH range from 6.0 to 7.3 is not required to meet the Metal and Diamond Mining Effluent Regulations (MDMER) limit for unionized ammonia in the discharge to Goose Lake. The MDMER limit for unionized ammonia is 0.5 mg-N/L. Table KIA-TC-6.1 shows the concentrations of unionized ammonia in the effluent with a maximum authorized monthly mean total ammonia concentration of 6 mg-N/L and a maximum authorized total ammonia concentration in a grab sample of 12 mg-N/L over a pH range from 6.0 to 9.5 and a water temperature of 20°C. At a pH greater than or equal to 8.4 and a total ammonia concentration of 6 mg-N/L, the unionized ammonia concentration in the effluent will be greater than the MDMER limit of 0.5 mg-N/L. At a pH greater than or equal to 8.1 and a total ammonia concentration of 12 mg-N/L, the unionized ammonia concentration in the effluent will be greater than the MDMER limit of 0.5 mg-N/L. Tables KIA-TC-6.2 and KIA-TC-6.3 show how the pH range over which the unionized ammonia concentration in the effluent greater than 0.5 mg-N/L changes as the water temperature decreases. A wider pH range, as provided by MDMER and proposed for the Project (i.e., 6.0 to 9.5) allows for flexibility and accounts for changing water temperatures and varying total ammonia concentrations in the effluent.

Part 2: Baseline data of the pH and temperature ranges observed in Goose Lake are provided in Golder (2019). The temperature of the effluent is expected to be similar to the temperature in Goose Lake.

Table KIA-TC-6.1: Unionized Ammonia Concentrations for the Proposed Total Ammonia Effluent Quality Criteria, a pH Range from 6.0 to 9.5, and a Water Temperature of 20°C

pH	Water Temperature (°C)	Total Ammonia Concentration of 6 mg-N/L	Total Ammonia Concentration of 12 mg-N/L

Golder (Golder Associates Ltd.). 2019. Sabina Gold & Silver Corporation Back River Project - Aquatic Baseline Synthesis Report. Appendix A to the Aquatics Effects Management Plan. Submitted to Sabina Gold & Silver Corporation, Vancouver, BC, Canada. July 2019. Golder Document No.: 18114181-047-RPT-Rev0.

KIA-TC-07: Model Duration

Detailed Review Comment

The model is run from January 2022 to January 3034 during this time several parameters (total arsenic, total iron, total lead, free cyanide, and total aluminum) have an increasing trend overtime. To determine if there is the potential for any of these toxic parameters to exceed their respective benchmarks a longer time frame should be modeled, specifically until parameters reach a steady state. It is difficult to evaluate from the figures in Appendix A if predicted lead concentrations exceed CCME guidelines overtime. Please provide the actual values and not just figures of concentrations to review predicted concentrations and CCME and SSWQOs.

Recommendation/Request:

We recommend Sabina,

1. Run the model until steady state for all parameters is achieved.

2. Provide predicted concentrations of POPCs, pH and hardness (as a toxicity modifying factor) to determine if concentrations of POPCs exceed their respective CCME and SSWQOs over time.

Sabina Response:

Part 1: The model simulation period is limited to the timeframe agreed on in the Technical Meetings (NWB PHC Decision report (NWB, 2021) Appendix D, List of Commitments NO. 3 and 4) *"Sabina to provide additional hydrodynamic model results for years 1 through 10, to assess water quality in Goose Lake including at discharge and other reference stations (e.g., at approx. 100 m, 200 m from each inflow into Goose Lake*). Sabina highlights that the hydrodynamic model presented in this study includes Year 1 to 13 rather than ending at Year 10. The modelled period covers the operational period for which EQC are proposed.

Extending the simulations period beyond Operations to include Closure and Post-Closure will be provided in the updated hydrodynamic model, which will be completed 90 days following approval of the Licence. This model update will incorporate inflow rates and chemistry for the Closure and Post-Closure periods to Goose Lake that will be different than the Operations period; this update will also include commitments made during the technical review phase.

Part 2: The predicted concentrations of parameters of potential concern (POPCs), pH, and hardness in Goose Lake as a result of effluent discharges during Operations are provided in Attachment FS-C: POPCs Goose Lake.

Attachment: FS-C: POPC Goose Lake

KIA-TC-08: POPCs for Discharge Location

Detailed Review Comment

In Section 6.1.1 Sabina states, "Approximately 50 Goose Lake Model scenarios were performed, which are described below:

- Discharge location: two locations in Goose Lake were evaluated for the effluent discharge (location A in the neck of Goose Lake, and location B in the main body of the lake; Figure 1).
- Discharge rate: two effluent discharge rates were evaluated including 1,900 and 2,500 m^3/d.
- Discharge chemistry: several effluent concentrations for POPC were evaluated.
- Discharge period: two discharge periods during the open water season were evaluated, including 1 July to mid-October and 1 July 1 to 30 September."

In Section 6.2, Sabina states, "Effluent quality criteria (Table 13) were calculated for the discharge location in the main body of the lake (Location B; Figure 1), a discharge rate of 1,900 m^3/d, and an annual discharge period from 1 July to 30 September."

Sabina modeled two discharge locations in Goose Lake but did not provide any results from the modeling of discharge from Location A in the neck of the lake. Sabina needs to clarify if discharge to Location A is still under consideration and if so, provide predicted concentrations at the edge of the mixing zone (100m from the point of discharge) to evaluate potential POPCs, and at the outlet of the lake from operation until post closure. EQCs should also be calculated for Discharge Location A.

Recommendation/Request:

We recommend Sabina provide model results for the Goose Neck discharge scenario (Location A), and,

1. Run that model until steady state for all parameters is achieved.

2. Provide actual values of predicted concentrations of POPCs, pH and hardness (as a toxicity modifying factor) to determine if concentrations of POPCs exceed their respective CCME and SSWQOs over time.

3. Calculate EQCs for this discharge location as necessary.

Sabina Response:

Parts 1 and 2: Please see Sabina's response to KIA-TC-7.

Part 3: Please see Sabina's response to KIA-TC-4.

Reference: n/a.

KIA-TC-09: Discrepancies between hydrodynamic models

Detailed Review Comment

Sabina indicates the EQC model presented on May 27, 2021 is consistent with the hydrodynamic model presented in February 2021 stating "Model setup, assumptions, and inputs including bathymetric and meteorological data are consistent with Golder (2021). Modelled constituents as presented in Table 3 are also consistent with Golder (2021)." Model results presented in the February 2021 hydrodynamic model for PN03, the outlet / tail of Goose Lake suggested several parameters will exceed their respective CCME WQOs and SSWQOs, including nitrate, nitrite, arsenic, aluminum, copper and iron. Concentrations of these parameters appear consistently lower in model results presented at the Goose Lake Tail in the May 2021 model.

It is unclear whether the shift to Discharge Location B is entirely responsible for these changes in predicted water chemistry at the outlet of Goose Lake or whether other factors not outlined in the EQC memorandum may be contributing to the difference. The implications to model inputs or the shift from a discharge to Goose Neck via the Llama Tailings Facility to a piped discharge to Location B from the Primary Pond are also unclear.

Recommendation/Request:

Please provide a discussion of the differences in model inputs used for this EQC model and the February 2021 hydrodynamic model including a focused discussion on the differences in predicted water quality at the outlet of Goose Lake. Please describe all inputs and assumptions used for the current hydrodynamic model for review.

Sabina Response:

Sabina confirms Results presented in February 2021 report are for Closure and Post-closure periods. Results presented in the effluent quality criteria (EQC) Report (May 2021) are limited to Operations and specifically for the purpose of proposing EQC. For description of scope of hydrodynamic modelling completed in the EQC Report, please see Sabina's response to KIA-TC-4.

In summary, the inflow rates/chemistries are different in the two models (i.e., February 2021 and May 2021). Concentrations of some water quality constituents are predicted to exceed CCME WQOs at the outlet in February 2021 model/report as a result of inflow rates/chemistry during the Closure Post-Closure periods. In the EQC Report (May 2021), water quality constituent concentrations at the outlet (and in Goose lake) are predicted to remain below their respective CCME WQOs during Operations; this aligns with the model/report purpose of proposing EQC for discharge during the Operations to verify water quality constituent concentrations that screen into requiring EQC remain below CCME WQOs in Goose Lake. As a result, discharge rate, chemistry, and location were adjusted in the EQC Report (May 2021) to meet this objective.

1.2 RESPONSE TO CROWN-INDIGENOUS RELATIONS AND NORTHERN AFFAIRS CANADA

CIRNA-WLA-FS-1: Scope of Amendment

Detailed Review Comment

CIRNAC is of the opinion the scope of licence amendments described in Pre-hearing Conference Decision Report list of issues match those in the application.

These are:

- Goose Site
    - Airstrip Extension
    - Umwelt Underground Extension
    - Total Water Use Increase
    - Waste and Water Management Infrastructure
- Marine Laydown Area
    - Addition of Fuel Transfer Area
    - Airstrip Extension
    - Shoreline Pad Extension
- Winter Ice Road
    - Subbase Upgrade
    - Service/Emergency Camps
    - Total Water Use Increase

Recommendation/Request:

CIRNAC did not submit any comment pertaining directly to the scope of licence

Sabina Response:

Sabina appreciates the comment from CIRNAC.

Reference: n/a

CIRNA-WLA-FS-2: Water Management

Detailed Review Comment

Under this application, Sabina is requesting authorization for increased water use in three areas:

- Goose Lake: increase by 218,700 m^3/year to 608,700 m^3/year;
- Big Lake: increase by 195,750 m^3/year to 273,750 m^3/year; and
- Winter ice road: increase by 1,350 m^3/km/year to 2,025 m^3/km/year.

Sabina is also proposing some changes to timing of construction and operation of water and wastewater management infrastructure on site. CIRNAC submitted seven comments regarding water management, as summarised in Table 1. They are resolved.

Table 1 Status of comments pertaining to water management

Comment #	Issue	Status
IR1	Groundwater inflow to Llama Pit	Resolved
IR2	Methodology for extrapolated water quality and quantity predictions	Resolved
IR4	Treated sewage attenuation	Resolved
IR10	Water withdrawal errors	Resolved
IR12, TC1	Saline water pond permafrost and balance	Resolved
IR16	Goose property waste and water management	Resolved

Groundwater inflow to Llama Pit (IR1): CIRNAC requested a summary of parameters and methodology to estimate the flooding of Llama Pit including groundwater inflow. Sabina directed us to the 2020 Water and Load Balance Model and explained the assumptions used to calculate flooding of the pit.

Methodology for extrapolated water quality and quantity predictions (IR2): The amendment application includes a 250 m extension of the Umwelt Underground. CIRNAC requested further details on the hydraulic and water quality parameters used for the extension zone in the groundwater model. Sabina explained they used a scaling approach and provided details.

Treated sewage attenuation (IR4): The Water Management Plan proposes the use of land discharge for treated sewage without providing details on attenuation prior to entering a watercourse. Sabina responded that the proposed land discharge was assessed in 2018, concentration in the effluent have not changed since then and the adjusted discharge location is accounted for in the updated Water and Load Balance Model.

Water withdrawal errors (IR10): CIRNAC identified some inconsistencies in the additional withdrawal amounts requested between the table and text in Section 2.3.3 of the Modification Package. Sabina clarified the differences were because one quantity referred to the total amount requested and the other was for the additional amount requested.

Saline Water Pond permafrost and balance (IR12, TC1): Umwelt Lake will be used to store saline groundwater and the mine plan involves construction of a dam to increase capacity and form the Saline Water Pond. CIRNAC requested more information on the talik below the pond and yearly volumes in the pond. Sabina directed CIRNAC to a 2017 memo for information on the talik below Umwelt Lake, provided clarifications on the annual water volumes and underlined their commitment to provide an annual comparison of measured groundwater inflow rates to model predictions in the Annual Report.

Goose Property waste and water management (IR16): CIRNAC requested rationale for the nearly two-fold increase in water requested from Goose Property, and information on how the proportionate increase in wastewater was integrated into the Water Management Plan. Sabina responded the additional freshwater need was identified through detailed engineering during the Feasibility Study and that wastewater volumes should only increase marginally and would be managed to meet licence requirements.

Recommendation/Request:

CIRNAC submitted seven comments regarding water management, as summarized in Table 1. They are resolved.

Sabina Response:

Sabina appreciates the comment from CIRNAC.

Reference: n/a

CIRNA-WLA-FS-3: Water Quality

Detailed Review Comment

Sabina provided an updated Water and Load Balance Model that estimated water quantities and quality on site for the duration of the mine operations. CIRNAC submitted five comments regarding water quality, as summarised in Table 2. They were principally requests for clarification and have all been resolved.

Table 2 Status of comments pertaining to water quality

Comment #	Issue	Status
IR8, IR9	Water and Load Balance Model update and incorporation of climate change	Resolved
IR13	Water quality in Saline Water Pond	Resolved
IR14	Lake mixing model	Resolved
TC3	Arsenic concentration in tailings beach sediments	Resolved

Water and Load Balance Model update and incorporation of climate change (IR8,IR9): CIRNAC requested details on what was updated in the 2017 Water and Load Balance Model to create the 2020 model, and how climate change impacts will be captured in sizing of containment infrastructure. Sabina provided a table that clearly identified the changes between the 2017 and 2020 versions of the model and confirmed that climate change predictions had been incorporated when designing berms, culverts and ponds.

Water quality in Saline Water Pond (IR13): Extreme maximum values for many water quality constituents in the Saline Water Pond were presented in Appendix D of the Water and Load Balance and CIRNAC requested a time series model projections to confirm if the values were spurious. Sabina provided time series model projections for ammonia, chloride, sulphate, arsenic and copper for the duration of use of the Saline Water Pond.

Lake mixing model (IR14): Since the salinity of water discharged from the Saline Water Pond to the pit lake has an incidence on development of meromitic conditions in the pit lake, CIRNAC requested discussion on how the salinity and water quantity in the Saline Water Pond might vary during operations and an unexpected work stoppage. Sabina's discussion included graphs of salinity of the different water sources over the duration of the project.

Arsenic concentration in tailings beach sediments (TC3): CIRNAC identified a discrepancy in the concentration of arsenic in the tailings beach in the Water and Load Balance Model and Sabina confirmed the correct concentration for this geochemical source term is 0.081 mg/L, which was used in the model.

Recommendation/Request:

CIRNAC submitted five comments regarding water quality, as summarised in Table 2. They were principally requests for clarification and have all been resolved.

Sabina Response:

Sabina appreciates the comment from CIRNAC.

Reference: n/a

CIRNA-WLA-FS-4: Modelling, Management Plans Manuals and Reports

Detailed Review Comment

For the 2020 amendment five management plans were updated including: Water Management Plan, Interim Closure and Reclamation Plan, Tailings Management Plan, Waste Rock Management Plan and Borrow Pits and Quarry Management Plan. The Water Management Plan includes the Saline Water Management Plan and Water and Load Balance Report as appendices. The hydrodynamic model for Goose Lake was also reviewed, and results from the latest version are integrated in the Effluent Quality Criteria Report for Effluent Discharged from Tailings Facilities, Tailings Storage Facilities, or Reservoirs — Version 1.

CIRNAC submitted 12 comments regarding modelling, management plans, manuals and reports, as summarised in Table 3. Most of the comments on the plans were requests for clarifications, and those requiring follow-up have been flagged to ensure commitments made by Sabina are incorporated into subsequent versions of management plans. CIRNAC has one unresolved comment on the hydrodynamic model for Goose Lake and our concerns relate to the long term water quality in the lake.

Table 3 Status of comments pertaining to modelling, management plans, manuals and reports

Comment #	Issue	Status
IR3	Unanticipated groundwater quantities	Resolved
IR11, TC2	Hydrodynamic model	Unresolved
IR15, IR17	Increase in tailings and waste rock	Resolved
IR18	Mass balance assessment	Resolved
TC4	Criteria for segregating rock	Resolved, follow-up
TC5	Use of ponds as tailings facilities	Resolved
TC6	Temporary PAG stockpiles	Resolved, follow-up
TC7	Quarry site development plans	Resolved, follow-up
TC8	Additional infrastructure in Tailings Management Plan	Resolved, follow-up
TC9	Saline Water Management Plan title	Resolved, follow-up

Unanticipated groundwater quantities (IR3): CIRNAC requested Sabina's standard operating procedures (SOP) for when unanticipated groundwater volumes are encountered during mining. Though Sabina did not provide an SOP, they directed us to the Saline Water Management Plan which includes contingency measures for such encounters and committed to incorporating locations of historic drillholes in a future SOP.

Hydrodynamic model (IR11, TC2): The hydrodynamic model of Goose Lake predicts water quantity and quality in the lake and can be used as a tool to assess the impacts of different water management strategies. Sabina provided a hydrodynamic model on February 12, 2021, which had several deficiencies and the concerning conclusion that the concentration of several parameters (nitrate, nitrite, aluminum, arsenic, chromium, copper and iron) were expected to be above chronic water quality benchmarks for the protection of aquatic life at the outlet of Goose Lake, including during closure and post closure.

Discussion at the technical meeting led to commitments from Sabina to update the model twice:

- once prior to the public hearing to explore the effect of changes to water management on site including discharging during operations instead of waiting for closure to discharge; and
- a second time 90 days following licence approval to incorporate further site data into the model inputs and allow for more time for optimization.

Results from the first update to the model were used to calculate effluent quality criteria in the May 27, 2021 report Effluent Quality Criteria Report for Effluent Discharged from Tailings Facilities, Tailings Storage Facilities, or Reservoirs - Version 1. It is difficult to compare the results with the previous model because the modelling period is shorter, time series data are not presented for the same point, and benchmarks have changed for some of the parameters.

CIRNAC is still concerned with long term water quality based on the data presented, even though modelling was restricted to the 12 year operational period. Many parameters appear to increase in maximum concentration over the 12 years of operation, particularly in the final 3 years. For example, total lead stays below the 0.001 mg/L line until the final three years of operations, and remains below the applicable guideline because the guideline increases with hardness. Similar dynamics are evident in plots of nickel, cadmium, and aluminum. Other parameters increase towards a constant guideline, including arsenic, copper and iron.

During the May 5, 2021 teleconference regarding updates to the model, Sabina's rationale for not modelling the closure and post-closure periods was based on the anticipated expiration of the current water licence prior to closure. CIRNAC is of the opinion that restricting the model to operations defeats one of the purposes of modelling, and argues that the February 12, 2021 model identified problems during closure and post closure prior to them occurring, which will lead to changes in operations to avoid the problem. Likewise, CIRNAC would like to see projected water quality in Goose Lake during closure and post-closure to have confidence that the currently proposed site water management strategy will protect water quality in Goose Lake during operations, closure and post-closure.

CIRNAC recommends the next update to the hydrodynamic model, due 90 days after potential licence approval incorporate more detailed inputs, including field data to be collected this summer, and the forecast period cover operations, closure and post closure. Furthermore, CIRNAC recommends the Water Management Plan be updated to integrate changes to water management on site that are being proposed based on hydrodynamic model findings.

Increase in tailings and waste rock (IR15, IR17): The proposed amendment would lead to a 27.6 Mt increase in waste rock and 7.4 Mt increase in tailings, which were not reflected in the Tailings Management Plan and Waste Rock Management Plan. These have since been updated by Sabina.

Mass balance assessment (IR18): Terms used in the Water and Load Balance Report created confusion between the tailings production volume and settled tailings volume, but Sabina has clarified that 2500 m^3/day in Section 3.2.7 refers to total settled tailings volume and confirmed the correct quantity was used in the model.

Criteria for segregating rock (TC4): CIRNAC identified an inconsistency in how potentially acid generating (PAG) rock was defined in the Mine Waste Rock Management Plan and the 2020 Borrow Pit and Quarry Management Plan. Sabina clarified that PAG rock is defined as having a neutralization potential ratio (NPR) <3 and total sulphur (S) >0.15%, and an addendum will be added to the Mine Waste Rock Management Plan at the next opportunity.

Use of containment ponds as tailings facilities (TC5): The updated Water Management Plan allows for the possibility of using all containment ponds as tailings storage facilities, but Sabina has confirmed this would be restricted to ponds and facilities appropriate for the storage of tailings.

Temporary PAG stockpiles (TC6): The Borrow Pit and Quarry Management Plan allows for the temporary stockpiling of PAG rock, about which CIRNAC requested further information. Sabina has clarified that temporary PAG stockpiles will be within quarry footprints, runoff from the quarries will be monitored, and piles will be in place a shorter period of time than the time for onset of acidic conditions from the rock.

Quarry site development plans (TC7): Sabina still intends to develop quarry development plans specific to each rock quarry, which was unclear but has been clarified.

Additional infrastructure in Tailings Management Plan (TC8): To help track project components still included in the water licence but not part of the current mine plan, CIRNAC recommended the Tailings Management Plan include a section for "other approved infrastructure", as is found in other plans. Sabina agreed to add this as an addendum to the plan at the next opportunity.

Saline Water Management Plan title (TC9): An inconsistency was identified in the title of the Saline Water Management Plan and will be corrected at the next opportunity.

Recommendation/Request:

CIRNAC submitted 12 comments regarding modelling, management plans, manuals and reports, as summarised in Table 3. Most of the comments on the plans were requests for clarifications, and those requiring follow-up have been flagged to ensure commitments made by Sabina are incorporated into subsequent versions of management plans. CIRNAC has one unresolved comment on the hydrodynamic model for Goose Lake and our concerns relate to the long term water quality in the lake.

Sabina Response:

In regards to Hydrodynamic model (IR 11, TC 2), the model simulation period is limited to the timeframe agreed on in the technical meetings (NWB PHC Decision report (NWB, 2021) Appendix D, List of Commitments NO. 3 and 4) *"Sabina to provide additional hydrodynamic model results for years 1 through 10, to assess water quality in Goose Lake including at discharge and other reference stations (e.g., at approx. 100 m, 200m from each inflow into Goose Lake*). Please note that the hydrodynamic model presented in this study includes Year 1 to 13 rather than ending at Year 10. The modelled period covers the operational period for which EQC are proposed.

Extending the simulations period beyond operations to include closure and post-closure will be provided in the updated hydrodynamic model, which will be completed 90 days following approval of the licence. This update will incorporate inflow rates and chemistry for the closure and post-closure period to Goose Lake that will be different than the operations as well the commitments made during the technical review phase.

Reference: n/a

CIRNA-WLA-FS-5: For-Construction Drawings and Reports

Detailed Review Comment

Drawings provided with this 2020 amendment are for the shoreline pad extension at the marine laydown area on Bathurst Inlet. As well, maps highlighting areas where winter ice road subbase upgrade and realignment are planned were provided. CIRNAC submitted two comments regarding for-construction drawings and reports, as summarised in Table 4. They have been resolved.

Table 4 Status of comments pertaining to for-construction drawings and reports

Comment #	Issue	Status
IR6, IR7	Design criteria for event ponds, diversion berms and culverts	Resolved

Design criteria for event ponds, diversion berms and culverts (IR6, IR7): CIRNAC requested justification on the use of a 24-hour event for containment pond design criteria, further information on design conveyance capacities for diversion berms and culverts, and watershed areas for five culverts. Sabina referred to information presented in 2018, stating this amendment did not involve changing design criteria, which still follow best practice.

Recommendation/Request:

CIRNAC submitted two comments regarding for-construction drawings and reports, as summarised in Table 4. They have been resolved.

Sabina Response:

Sabina appreciates the comment from CIRNAC.

Reference: n/a

CIRNA-WLA-FS-6: Monitoring Program

Detailed Review Comment

Most of the discussions on the monitoring program are regarding proposed changes to water management on site and criteria for effluent discharge to Goose Lake. CIRNAC submitted a single comment regarding the monitoring program, as summarised in Table 5. It has been resolved.

Table 5 Status of comment pertaining to wastewater management and treatment

Comment #	Issue	Status
IR5	Active layer groundwater monitoring	Resolved

CIRNAC supports Environment and Climate Change Canada's efforts to ensure that any effluent discharge criteria are protective of the environment and maintain Goose Lake's aquatic health in both the short and long term.

Active layer groundwater monitoring (IR5): CIRNAC requested information on how shallow groundwater would be monitored near mine infrastructure. Sabina replied that any potentially impacted shallow groundwater would be kept within the containment systems, since diversion berms and dams are keyed into permafrost, and therefore monitoring specific to active layer groundwater is not necessary. Moreover, they underlined how the seep surveys and dam inspections will flag any potential shallow groundwater concerns.

Recommendation/Request:

CIRNAC submitted a single comment regarding the monitoring program, as summarised in Table 5. It has been resolved.

Sabina Response:

Sabina appreciates the comment from CIRNAC.

Reference: n/a

CIRNA-WLA-FS-7: Annual Reporting Requirements under Schedule B

Detailed Review Comment

CIRNAC did not submit any comment regarding annual reporting requirements under Schedule B. However, during discussions on other comments some additions to annual reporting requirements have been identified, including:

1. Groundwater: in response to TC1, Sabina has committed to including "an annual comparison of measured groundwater inflow rates to model predictions in the NWB Annual Report, as described in Section 5.1 of the Saline Water Management Plan"

2. Progressive reclamation: CIRNAC is in ongoing discussions with Sabina and the Kitikmeot Inuit Association regarding how best to evaluate progressive reclamation and how that could be captured in the annual reporting requirements. We hope to make a joint submission on this topic.

Recommendation/Request: n/a

Sabina Response:

Sabina reconfirms the commitment to provide an annual comparison of measured groundwater inflow rates to model predictions in the Annual Report and include a commitment within the Draft Water Licence Framework (DWLF).

Sabina confirms ongoing discussions with CIRNAC and the KIA regarding how best to evaluate progressive reclamation and incorporate into annual reporting requirements. In addition, it is also Sabina's intent to hopefully provide a joint submission on this topic in advance of the Public Hearing.

Reference: n/a

CIRNA-WLA-FS-8: Closure and Reclamation Planning

Detailed Review Comment

Sabina shared an Interim Closure and Reclamation Plan with Kitikmeot Inuit Association and CIRNAC in November 2020, accompanied by an updated closure cost re-evaluation. CIRNAC has submitted a single comment regarding closure and reclamation planning to the Board, as summarised in Table 6. This issue is unresolved and CIRNAC is continuing discussions on the topic with the objective of participating in a joint submission to the Board prior to the public hearing scheduled in mid-July 2021.

Table 6 Status of comment pertaining to closure and reclamation planning

Comment #	Issue	Status
IR19	Reclamation plan and cost estimate	Unresolved

Reclamation plan and cost estimate (IR19): Three party discussions have continued with Sabina November 2020 have allowed us to clarify many points, bringing our respective cost estimates closer together. We have yet to agree on a total amount, and have yet to discuss the breakdown of the estimate between land and water owners and between stages/phases. CIRNAC's understanding is that Sabina will be submitting an Interim Closure and Reclamation Plan to the Board that incorporates some of our recommendations. CIRNAC's current reclamation cost estimate is shared in Annex B, though we will be making a further submission that may modify the total amount, and will include split between the holders of security and stages.

The mine plan incorporates progressive reclamation, which is an activity CIRNAC wishes to encourage on all sites. As such, our estimate assumes progressive reclamation will occur as per the mine plan, resulting in a smaller cost estimate than the total of each project component costed individually. CIRNAC and Sabina are discussing mechanisms that would help provide assurance to CIRNAC that progressive reclamation is proceeding as planned. These will likely be presented to the Board in the form of suggested items for the annual report, specifically for Schedule B of an amended water licence.

Recommendation/Request: n/a

Sabina Response:

Sabina confirms multiple three-party discussions with KIA and CIRNAC have been undertaken since November 2020 and Sabina anticipates that agreement on the total closure cost will be achieved in the coming days. Sabina provided an updated total closure cost estimate of $48.2M dated June 21, 2021 to both parties, and CIRNAC has verbally accepted the estimate provided. KIA is currently reviewing this proposal and Sabina is hopeful that a positive response will be received early next week. It is Sabina's intent to provide a joint submission on this topic in advance of the hearing, or independently if necessary, no later than as an exhibit at the hearing.

CIRNA-WLA-FS-9: Discussion on Amended Water Licence Framework (Annex B)

Detailed Review Comment

CIRNAC has reviewed the Draft Water Licence Framework "Addendum" To Support Water Licence Amendment submitted by Sabina on March 16, 2021. Our review has been limited to those terms and conditions pertaining to the amendment. The lack of comments on other proposed changes does not constitute agreement or disagreement on CIRNAC's behalf. We note many proposed changes do not seem to have been discussed during this amendment process.

Detailed comments are included as Annex B.

Recommendation/Request:

Sabina Response:

Sabina has updated the Draft Water Licence Framework (DWLF Ver2 dated 25 June 2021) having taken into account Information Request (IR) and Technical Comment (TC), commitments and Final Submissions from ECCC, KIA, and CIRNAC. Refer to Attachment FS-A: Updated DWLF Ver2.

Sabina notes some minor changes recommended within the DWLF are not significant or material but rather give the NWB and Sabina the ability to interpret some clauses more broadly to minimize need for lengthy amendment processes as Sabina progresses through construction and eventual operation of the mine site.

Part	Item	Page	CIRNAC Comment	Sabina Response
A	1	1-3	Additions to scope of licence. The additions on page 3, as well as the airstrip at the marine laydown area on page 2, match what was discussed during the amendment review. CIRNAC does not recall discussing changes to include reservoirs or de-watering of additional structures and recommends leaving these additions out.	Sabina proposed adding some broad flexibility to operations by including "reservoirs" and "de-watering of additional structures". It's acknowledged that should Sabina submit a modification for additional reservoirs or de-water, it would be subject to T&C under part G of the Licence. Board approval, consistency with existing Project Certificate (No. 007) and the Board's general practice of consultation with parties on any modification received. This proposal is provided to simplify, reduce or avoid the effort of potentially lengthy amendment processes for non-significant modifications, should they arise. (e.g., dewatering of non-fish bearing natural depression in the mine site area prior to construction).

Part	Item	Page	CIRNAC Comment	Sabina Response
E	2	9-10	Removal of condition to provide revised Water Management Plan within 60 days of Minister approval to replace it with a modified repetition of condition 1. During the technical meeting, as noted in the list of commitments found in the Pre-hearing Conference Decision Report, Sabina committed to providing updated management plans, including the water management plan 90 days prior to initiation of proposed activity or within 2021 Annual Report. CIRNAC recommends the commitment be captured in an amended licence	Sabina has re-instated T&C Part E, Item 2 to reflect standard wording and nomenclature used by the NWB in Type A water licenses. Sabina notes that the standard wording applied by the NWB captures the requirement for the Licence "*to take into account commitments made with respect to the submissions received during the technical review of the Application, as well as final submission and issues raised during the Public Hearing process.*"
E	3	10	Modification of maximum water use quantities from Goose and Big Lakes. The modifications match the amendment application. CIRNAC agrees with the proposed change	No further comment
E	5	10	Modification of maximum water use quantities for the winter ice road. The modifications match the amendment application. CIRNAC agrees with the proposed change.	No further comment
E	15	11	Replacement of condition to submit an updated Water and Load Balance Model, with condition to submit updated hydrodynamic model. CIRNAC prefers the wording of commitment #6 in the Pre-Hearing Conference Report list of commitments, then Sabina's proposal in this draft water licence	Sabina has applied consistent wording as applied by the NWB in their Type A water licence for consistency. Sabina notes that the standard wording applied by the NWB captures the requirement for the Licence "*to take into account commitments made with respect to the submissions received during the technical review of the Application, as well as final submission and issues raised during the Public Hearing process, where applicable.*"
Sch. B	New		CIRNAC recommends integrating Sabina's commitment for an annual comparison of measured groundwater inflow rates to model predictions.	Sabina confirms this commitment refer to new T&C No. 18.1 in Schedule B.

Attachment: FS-A: Updated DWLF Ver2 (June 25, 2021)

1.3 RESPONSE TO ENVIRONMENT AND CLIMATE CHANGE CANADA

ECCC-WLA-FS-01: ECCC-WLA-TC-02: Tailings Storage Facility

Reference: Responses to WL Amendment IRs-IMLE, Attachment IR-D (5.2.3 Seepage Analysis)
Responses to WL Amendment TCs-IMLE

Previous ECCC Comment/Recommendation (January 29, 2021)

ECCC noted that the 2-3 m bedrock fracture zone found during the 2015 drill program is of potential concern, depending on how fractured and altered the bedrock fracture zone is. From the description provided by the Proponent (Responses to WL Amendment IRs, Attachment IR-D), it appears that the bedrock fracture zone may be highly fractured and could be a major conduit pathway for water. The mitigation of bulk fill will not prevent the flow of water through the bedrock fracture zone because the fracture zone connects to a recharge source and may be permeable enough to allow flows. It is also not clear whether the Proponent intends to seal off the fracture zone completely using grout. Bulk fill alone may not be enough to prevent flow through the zone.

ECCC acknowledged the Proponent intends to complete "Packer testing… in select drillholes to evaluate bedrock hydraulic conductivity." However, it is unclear whether bedrock hydraulic conductivity test will provide a determination of the hydraulic conductivity of the 2-3 m fracture zone in order to assess the rate of flow through the fracture zone.

ECCC requested the Proponent:

- Provide clarification on whether the packer testing will provide a determination of the hydraulic conductivity of the 2-3 m fracture zone.
- Provide additional information on how the bulk fill will prevent flow through the 2-3m fracture zone.

Proponent Response

In their response, the Proponent acknowledged ECCC's request and confirms that Sabina is committed to complete an infill geotechnical characterization program at the Tailings Storage Facility (TSF) as outlined in Part D, Item 4 of the Type A Water Licence (2AM-BRP1831). The information from the field characterization will ensure that the design meets the required intent of managing seepage through both the foundation and the body of the TSF Dam.

Furthermore, in technical comment response, WT-INAC-TRC-17, the Proponent noted that they will conduct percolation testing immediately prior to Tailings Storage Facility (TSF) Dam construction prior to excavating the key trench for the TSF Containment Dam. This is a series of shallow drillholes (approximately 10 m deep) that will be completed using a blast hole drill at close spacing (about 25 m) along both the upstream and downstream extent of the key trench. Then a falling head hydraulic conductivity test will be completed on each drill hole, using heated water if conditions require it.

Recommendation/Request: ECCC is satisfied with this response, and awaits the results of the further testing by the Proponent to be completed prior to the construction of the tailings storage facility.

Sabina Response:

Sabina appreciates the confirmation from ECCC.

ECCC-WLA-FS-02: Proposed Effluent Quality Criteria – Nitrate

Reference: Aquatic Baseline Synthesis Report

CCME Nitrate Ion Factsheet

CCME Water Quality Guidelines for Protection of Aquatic Life

Effluent Quality Criteria Report for Effluent Discharged from Tailings Facilities, Tailings Storage Facilities, or Reservoirs

Comment Proponent's Conclusion

The Proponent has provided proposed effluent quality criteria (EQC) for use during mine operations. This includes a proposed EQC for nitrate of 60 mg/L (maximum authorized monthly mean) with a maximum authorized concentration in a grab sample of 120 mg/L. The rationale provided for development of this limit is that modelling suggests that if predicted maximum nitrate concentrations in effluent were discharged from the Primary Pond, predicted maximum concentrations of nitrate in Goose Lake would be greater than the Canadian Council of Ministers of the Environment (CCME) chronic water quality guideline for nitrate. It is stated that with a discharge concentration of 60 mg/L, nitrate concentrations in Goose Lake would remain below water quality guidelines for nitrate.

ECCC's Conclusion

Although discharge at these nitrate concentrations would result in nitrate concentrations in Goose Lake remaining below CCME water quality guidelines, this still represents a significant increase from the baseline nitrate concentrations. The baseline data for Goose Lake suggests that nitrate during open water conditions is often below detection limits, with a maximum measured concentration of 0.024 mg-N/L. During the under ice period, concentrations of nitrate range from 0.0076 mg-N/L to 0.094 mg-N/L. The water quality guidelines selected for analysis of EQC include the generic CCME water quality guideline for the protection of aquatic life when hardness concentrations are less than 26 mg/L as CaCO3, and the hardness-dependent Site-Specific Water Quality Objectives (SSWQO) developed for the Ekati Diamond Mine when concentrations are between 26.4 and 94 mg/L $CaCO_3$. The CCME and SSWQO guidelines selected for analysis results in a receiving environment guideline concentration ranging from 2.93-10 mg-N/L. While the receiving environment guidelines are intended to protect against direct toxicity to aquatic life, the guidelines do not consider indirect effects to aquatic life due to nutrient enrichment. With increasing concentrations of nitrate in the aquatic environment there is an increased risk of eutrophication, algal blooms, decrease in overall water quality, and alteration of the plankton and benthic invertebrate community composition. Given the baseline nutrient concentrations, increases in nitrate of this magnitude may result in chronic impacts to sensitive species within the immediate receiving environment as well as impacts to water quality due to nutrient enrichment.

While predictions indicate that Goose Lake will remain below CCME guidelines, given the potential change from baseline nitrate concentrations, and the uncertainty of other nutrient inputs, additional analysis should be completed on the potential nutrient enrichment impacts of discharges into Goose Lake. Predicted nitrogen inputs to Goose Lake should be reviewed in conjunction with the predicted phosphorus inputs to evaluate the potential for nutrient-related changes to water quality (i.e., eutrophication).

Recommendation/Request: ECCC recommends that:

- Predicted total phosphorus and nitrogen inputs be reviewed and the potential for eutrophication in Goose Lake evaluated in the context of increasing nitrogen and total phosphorus loadings.

Sabina Response:

Based on median concentrations of total nitrogen (TN), total phosphorus (TP), and chlorophyll *a* in different areas across the lake, Goose Lake was classified as oligotrophic in the Aquatic Baseline Synthesis Report (Golder 2019). Mean molar ratios of N to P based on 2017 and 2018 data are 120 and 111, respectively, indicating that Goose Lake is strongly phosphorus-limited. Therefore, the predicted increase in TN concentration in Goose Lake is unlikely to result in a proportional increase in primary productivity. However, it may result in some changes in phytoplankton community composition as a result of a potential shift in competitive abilities of different phytoplankton groups. Heterocyst-forming cyanobacteria are able to fix N, which confers a competitive advantage to this group under low N concentrations (Wetzel 2001), and which may not be the case under N enrichment.

Effluent quality criteria were calculated for TP to maintain concentrations in Goose Lake below 0.01 mg-P/L, and thereby to maintain oligotrophic trophic status. Therefore, with the additional P loading from the potential effluent discharges, primary productivity may increase in Goose Lake within the oligotrophic range; however, within the expected range of TP concentration in the lake (i.e., <0.01 mg/L), a large increase in productivity, or a decline in dissolved oxygen concentration associated with increased productivity, is not expected.

From a toxicity-perspective, predicted nitrate concentrations are either below the CCME generic water quality guideline that is conservatively derived to protect the most sensitive species and life-stages indefinitely, or below a site-specific water quality objective accounting for higher hardness levels derived for northern environments with the same protection goal. Comparisons of predicted concentrations in Goose Lake to these benchmarks in the EQC Report (May 2021) submitted by Sabina to satisfy Commitment No.2 from the TM/PHC, indicate that predicted nitrate concentrations in Goose Lake are not expected to result in chronic toxicity to sensitive species within the immediate receiving environment.

ECCC-WLA-FS-03: Potential Treatment

Reference: Effluent Quality Criteria Report for Effluent Discharged from Tailings Facilities, Tailings Storage Facilities, or Reservoirs

Proponent's Conclusion

Table 17 provides a comparison of proposed EQC to predicted effluent concentrations in the Primary Pond and Llama Tailings Facility during operations. In the case of some parameters, the predicted maximum concentrations in either the Primary Pond or the Llama Tailings Facility are greater than the proposed EQC. The Proponent has acknowledged that the Project may require water treatment for chloride, nutrients, total aluminum, iron, and zinc.

ECCC's Conclusion

Although it is acknowledged that several parameters may require treatment in order to meet the EQC proposed by the Proponent, no information has been provided on the potential treatment options and the ability to achieve the proposed criteria.

Recommendation/Request:

ECCC recommends that the Proponent provide additional information on candidate treatment technologies which would achieve the proposed EQC for parameters listed in Table 17, and the timelines for implementing treatment.

Sabina Response:

Sabina anticipates that treatment will be required for the parameters that exceed the proposed effluent quality criteria (EQC). These constituents of potential concern (COPCs) are nitrate, nitrite, total ammonia, total aluminium, total arsenic, total copper, total iron, total selenium, total cyanide, and total phosphorus. A treatment system that targets the COPCs may consist of the following typical unit water treatment processes:

- lime precipitation for metal removal (e.g., aluminum, iron);
- organosulphide for trace metal removal (e.g., arsenic, copper);
- MBBR biological removal of nutrients (e.g., nitrate, nitrite, ammonia, cyanide); and
- iron co-precipitation (ICP) polishing step for phosphorus removal.

Physical/chemical processes, such as lime precipitation, trace metal removal, and ICP processes are widely used in the mining industry, including in cold climates. Biological treatment processes are also applied in northern climates; however, these processes can require heating of the water to operate efficiently. Sabina confirms that effluent treatment will be implemented in advance of discharge to meet all EQC.

Reference:

Effluent Quality Criteria Report for Effluent Discharged from Tailings Facilities, Tailings Storage Facilities, or Reservoirs

ECCC-WLA-FS-04: Monitoring, Action Levels, and Validation of Model Predictions

Reference: Effluent Quality Criteria Report for Effluent Discharged from Tailings Facilities, Tailings Storage Facilities, or Reservoirs

Proponent's Conclusion

The Proponent has provided EQC based on a combination of expected effluent quality, requirements under the Metal and Diamond Mining Effluent Regulations (MDMER), available technology, and maintenance of water quality in Goose Lake below water quality guidelines.

ECCC's Conclusion

For many parameters, the predicted concentrations in the effluent, as well as the predicted concentrations in the receiving environment are dependent on assumptions used in modelling. The modelling suggests that Goose Lake will be protected and concentrations will remain below aquatic life guidelines; however, this should be confirmed through ongoing monitoring. Ongoing analysis should include comparisons of measured data for effluent and water quality to model results to validate the assumptions made during modelling and identify if monitoring trends do not remain within predicted values. In addition, monitoring plans should include establishment of action levels within the receiving environment to detect changes within Goose Lake and serve as an early warning system such that mitigation may be applied in advance of any impacts to Goose Lake.

Recommendation/Request:

ECCC recommends

- The Proponent establish water quality action levels for Goose Lake to detect changes to receiving environment water quality, which would serve as an early warning system for detecting any changes occurring in Goose Lake.
- Upon commencing discharge into Goose Lake, the Proponent should complete model validation, including comparison of measured effluent and water quality data to model predictions such that the model may be adjusted accordingly. These comparisons and analyses, including any model updates, should be included in the annual report.

Sabina Response:

Part 1: As indicated in the current Aquatic Effects Management Plan (AEMP; 2017), Sabina has committed to establishing water quality action levels for Goose Lake within an Adaptive Management Response Framework for the Project. The goal of this response framework is to systematically respond to monitoring results such that the potential for adverse effects related to mine activities is identified, and that necessary follow-up or mitigation actions are undertaken. This will be accomplished by implementing appropriate measures at predefined Action Levels (e.g., Low, Moderate or Medium, and High), which would be triggered well before a significant adverse effect could occur. The current AEMP (2017) will be updated with Low Action Levels for Goose Lake that will serve as an early-warning indication of the potential for adverse effects on water quality.

Part 2: It is Sabina's intention to validate the hydrodynamic model as required by changes in operation or technology. The next update to the hydrodynamic model of Goose Lake will be completed in the third year following the commencement of the Operations Phase.

Effluent Quality Criteria Report for Effluent Discharged from Tailings Facilities, Tailings Storage Facilities, or Reservoirs

ECCC-WLA-FS-05: Aluminum Site Specific Water Quality Objective

Reference: Effluent Quality Criteria Report for Effluent Discharged from Tailings Facilities, Tailings Storage Facilities, or Reservoirs – Section 3.2 (Total Aluminum)

Proponent's Conclusion

The current aluminum chronic water quality guideline used for the Project is the CCME pH-dependent water quality guideline for protection of aquatic life. However, the Proponent has proposed using a modified version of the US EPA (2018) aluminum water quality criterion as a SSWQO in Goose Lake.

ECCC's Conclusion

The Proponent states that they have "modified" the US EPA guideline, to create a SSWQO. However, no information has been provided on how the US EPA guideline, which is based on site pH, total hardness, and dissolved organic carbon (DOC), has been modified to create this site-specific water quality objective.

Recommendation/Request:

ECCC recommends the Proponent provide additional information on how the US EPA aluminum water quality guideline has been modified for application to this site.

Sabina Response:

Although the bioavailability and toxicity of aluminum are mediated by a variety of factors, three water quality factors (i.e., pH, organic carbon, and hardness) have been identified as the most important modifiers of toxicity (Gensemer and Playle 1999; US EPA 2018). The existing Canadian Council of Ministers of the Environment (CCME) water quality guideline (WQG) for aluminum considers only pH as an exposure and toxicity modifying factor (ETMF); however, there is a growing body of evidence to support the consideration of other ETMFs. For example, the United States Environmental Protection Agency (US EPA; 2018) recently revised its freshwater chronic criterion for total aluminum to incorporate pH, hardness, and dissolved organic carbon (DOC) as quantitative ETMFs (US EPA 2018). DeForest et al. (2018) developed multiple linear regression models that incorporate pH, DOC, and hardness as input parameters to normalize acute and chronic aluminum toxicity data to a set of standardized water quality conditions.

The 'modified' derivation method used to develop a site-specific water quality objective (SSWQO) for Goose Lake was based on the quantitative relationships between toxicity modifying factors and aluminum toxicity as documented in DeForest et al. (2018), but with slight refinements to make the output fully compatible with standardized Canadian procedures for SSWQO development (CCME 2007). Specifically, the US EPA criteria are developed using normalized effect concentrations at which 20% effects are observed (IC/EC_{20}s,) which differs from the hierarchy of preferred endpoints recommended in the CCME (2007) guidance, specifically the preference for use of effect concentrations at which 10% effects are observed (IC/EC_{10}s) in a Type A derivation (i.e., where the IC/EC_{10} data are often considered reliable and, therefore, preferred estimates representing a no-effects threshold). Sabina highlights that the modelling tool created by DeForest et al. (2018) allowed an option for selection of IC/EC_{10} endpoints to normalize chronic toxicity data; this option was adopted to develop the aluminum SSWQO, incorporating recent scientific findings on ETMFs while retaining consistency with CCME (2007) derivation procedures (i.e., substitution of IC/EC_{10} endpoints where appropriate).

The DeForest et al. (2018) tool standardized IC/ECx data and generated species mean chronic values for 14 species: three species of fish, nine species of invertebrates, and two species of macrophyte/algae (i.e., aquatic plant-like organisms). All organisms in the DeForest et al. (2018) tool were retained as appropriate surrogates for the freshwater organisms (i.e., fish, invertebrates,

and plants) found in Goose Lake. For seven species (i.e., six invertebrates and one plant) in the Deforest et al. (2018) dataset, IC/EC_{10}s were below no observed effect concentration (NOEC) values measured in the same study. In these cases, the response size was considered too small to be reliable for use as a preferred endpoint representing a no-effects threshold. For these specific species, the next appropriate IC/ECx value was selected (e.g., IC/EC_{20}), according to the CCME (2007) protocol. These selected endpoints provide an appropriate balance between the considerations of effect size and statistical significance in the application of the CCME (2007) hierarchy for selection of a preferred statistical endpoint.

Species mean chronic values from the DeForest et al. (2018) tool were used to develop a species sensitivity distribution (SSD) for each pH, DOC, and hardness combination; the 5% hazard concentration (HC_5) for the lognormal distribution is provided as part of the DeForest et al. (2018) tool. The use of an SSD is consistent with the preferred method of deriving water quality guidelines in Canada (CCME 2007) and is applicable to deriving an SSWQO for aluminum at the Project site. The HC_5 was reviewed to evaluate whether the protection clause (per CCME 2007) should be invoked; that is, whether there is a toxicity value for a sensitive species of interest that falls below the HC_5. Therefore, the SSWQO was selected as the minimum of either the HC_5 or the normalized EC_{10} for Brook Trout (i.e., the most sensitive species on the SSD).

In summary, the derivation method was modified to be compatible with standard approaches to SSWQO development in Canada, while still being focused on the influence of the most important EMTFs on aluminum toxicity.

Attachment FS-A: DWLF Ver2 (June 25, 2021)

Sabina response to TM/PHC Commitment No.7

DRAFT WATER LICENCE FRAMEWORK "ADDENDUM" TO SUPPORT WATER LICENCE AMENDMENT

Proposed changes to Type A Water Licence 2AM-BRP1831 issued by the Nunavut Water Board on September 21, 2018, approved by the Minister of Crown-Indigenous Relations on November 6, 2018.

Qualification: As stated in the application and modification package (October 2020, Ver2), Sabina clarifies that mining areas and associated infrastructure already included in the Project Certificate (PC No. 007; NIRB File No. 12MN036) and the Type A Water Licence (2AM-BRP1831) will remain in the amended licence. Sabina confirms that the scope of activities in Part A, Item 1 of licence, 2AMBRP1831, remains unchanged, that Sabina is not requesting a reduction in Project scope, and that the new scope of activities associated with the 2020 Modification Package will be added to the licence as part of this amendment application.

Rev 1. dated 16 March 2021 changes denoted in red text.
Rev 2. dated 25 June 2021 changes denoted in blue text.

<table>
<tr><td colspan="3">PART A: SCOPE, DEFINITIONS AND ENFORCEMENT</td></tr>
<tr><td>1.</td><td>Scope</td><td></td></tr>
<tr><td></td><td>a. This Licence authorizes the Licensee to the use of Waters and deposit of Waste in support of a Mining Undertaking classified, as per Schedule 1 of the Regulations, at the Back River Project as outlined in the Type "A" Water Licence Application (Application) submitted to the Nunavut Water Board (NWB) on October 4, 2017, and as reviewed throughout the regulatory process.

The Licensee may conduct mining and associated activities at the Back River Project in the Kitikmeot Region of Nunavut at the following project extents:
<table>
<tr><th>Project Extents</th><th>Latitude</th><th>Longitude</th></tr>
<tr><td rowspan="4">Back River Project Areas</td><td>66° 42' N</td><td>107° 50' W</td></tr>

</table>
In general, the scope of the activities, works and Undertakings authorized in accordance with the terms and conditions of the Licence are as follows:
For the Goose Property:
• Withdrawal and use of water from Big Lake and Goose Lake for camp, mining, construction, and associated activities;
• Dewatering of Llama Lake and Umwelt Lake and other water bodies as approved by the Board;
• Quarrying of materials from specified locations;
• Operation of a camp;
• Construction, operation, maintenance of the following project components/ activities:
  • Open pit mines at Llama, Umwelt, Echo, and Goose Main;
  • Underground mines at Llama, Umwelt, Echo, and Goose Main;
  • Mill;
  • Administration, warehousing, and equipment maintenance;
  • Camp;</td><td>Updated</td></tr>
</table>

DRAFT

- Pads;
- Quarry and borrow sites at specified locations;
- All-weather roads and watercourse crossings;
- Site specific Winter Ice Roads;
- Rascal Stream Connectivity (culverts and/or channel realignment);
- All-weather airstrip (including extension); and
- Ice airstrip.

- Construction, operation, maintenance of the following Water Use and Management components/activities:
  - Goose Property Water Supply Facilities;
  - Watercourse crossings including pipelines, channel and bank alterations, culverts, spurs, and erosion control;
  - Flood control, diversion, alteration of flow, or storage by means of dykes or dams or Reservoirs;
  - Runoff management for the Ore Stockpile, Waste Rock Storage Areas, laydown areas, bulk fuel storage, and other mine infrastructure;
  - Goose Property Water Treatment Facilities; and
  - Saline Water Storage.
- Construction, operation, maintenance of the following Waste Disposal and Management components/activities:
  - Goose Property Waste Management Facilities;
  - Sewage Treatment Plant;
  - Landfarms;
  - Landfills;
  - Waste Rock Storage Areas;
  - Tailings Storage Facility and Tailings Facilities; and
  - Effluent discharge.
- Construction, operation, maintenance of the following Materials Handling and Management components/activities:
  - Laydown areas;
  - Petroleum, oils, and lubricants (including bulk fuel storage);
  - Hazardous waste; and
  - Explosive storage/management.

For the Marine Laydown Area (MLA):

- Withdrawal and use of water from MLA Pond S1, Pond S2, Lake 3, and Lake 4 for camp, construction, and associated activities;
- Quarrying of materials from specified locations;
- Operation of a camp;
- Construction, operation, maintenance of the following project components/activities:
  - Administration, warehousing, and equipment maintenance;
  - Camp;
  - Pads;
  - Quarry and borrow sites at specified locations;
  - All-weather roads;
  - Site specific Winter Ice Roads; ~~and~~
  - All-weather airstrip; and
  - Ice airstrip.
- Construction, operation, maintenance of the following Water Use and Management components/activities:
  - MLA Water Supply Facilities;

DRAFT

	• Watercourse crossings including pipelines, channel and bank alterations, culverts, spurs, and erosion control; • Flood control, diversion, alteration of flow, or storage by means of dykes or dams; and • Runoff management for the Ore Stockpile, Waste Rock Storage Areas, laydown areas, bulk fuel storage, and other mine infrastructure. • Construction, operation, maintenance of the following Waste Disposal and Management components/activities: • MLA Waste Management Facilities; • MLA Wastewater Treatment Facilities; • Landfarm; and • Effluent discharge. • Construction, operation, maintenance of the following Materials Handling and Management components/activities: • Floating barge terminal; • Laydown areas; • Petroleum, oils, and lubricants (including bulk fuel storage); • Hazardous waste; ~~and~~ • Shoreline Pad Extension; • Fuel Transfer Area; and • Explosive storage/management. **For the Interconnection Winter Ice Road:** • Withdrawal and use of water from source locations proximal to the Interconnection Winter Ice Road for Ice Road construction and maintenance; and • Construction, operation, and maintenance of the following infrastructure: • Winter Ice Road; • Winter Ice Road Service/Emergency Camps; • WIR subbase upgrades; and • Quarry and borrow sites at specified locations.	
	b. This Licence is issued subject to conditions contained herein with respect to the use of Waters and the deposit of Waste of any type in any Waters or in any place under any conditions where such Waste or any other Waste that results from the deposits of such Waste may enter any Waters. Whenever new Regulations are made or the existing Regulations are amended by the Governor in Council under the Act, or other statutes imposing more stringent conditions relating to the quantity, type or manner under which any such Waste may be so deposited, this Licence shall be deemed to be subject to such requirements.	No Change
	c. Compliance with the terms and conditions of this Licence does not absolve the Licensee from responsibility for compliance with all applicable legislation, guidelines and directives.	No Change
2.	Definitions	
	a. The Licensee shall refer to Schedule A for definitions of terms used in this Licence.	No Change
3.	Enforcement	
	a. Failure to comply with this Licence may be a violation of the *Act*, subjecting the Licensee to the enforcement measures and the penalties provided for in the *Act*. b. All inspection and enforcement services regarding this Licence will be provided by Inspectors appointed under the *Act*. c. For the purpose of enforcing this Licence and with respect to the use of Waters and deposit of Waste by the Licensee, Inspectors appointed under the *Act* hold all powers, privileges and protections that are conferred upon them by the *Act* or by other applicable laws.	No Change

DRAFT

PART B: GENERAL CONDITIONS		
1.	The amount of Water use fees shall be determined and payment of those fees shall be made in accordance with section 12 of the *Regulations*.	No Change
2.	The Licensee shall file an Annual Report with the Board no later than March 31st in the year following the calendar year being reported. The Annual Report shall be developed in accordance with Schedule B.	No Change
3.	The Licensee shall retain and have a copy of this Licence available at the site of operations at all times.	No Change
4.	Any communication with respect to this Licence shall be made in writing to the attention of: Manager of Licensing, Nunavut Water Board P. O. Box 119 Gjoa Haven, NU X0B 1J0 Telephone: (867) 360-6338 Fax: (867) 360-6369 Email: licensing@nwb-oen.ca	No Change
5.	Any notice made to an Inspector shall be made in writing to the attention of: Water Resources Officer Nunavut District, Nunavut Region P.O. Box 100 Iqaluit, NU X0A 0H0 Telephone: (867) 975-4295 Fax: (867) 979-6445	No Change
6.	The Licensee shall submit one (1) electronic copy of all reports, studies, and plans to the Board unless otherwise requested by the Board. Unless otherwise directed by the Board, reports or studies submitted to the Board by the Licensee shall include an executive summary in English, Inuktitut, and Inuinnaqtun.	No Change
7.	This Licence is assignable as provided in Section 44 of the Act.	No Change
8.	The Licensee shall ensure that any document(s) or correspondence submitted by the Licensee to the Board is received and acknowledged by the Manager of Licensing.	No Change
9.	The Licensee shall submit to the Board, at least sixty (60) days prior to any of any changes in operating plans or conditions associated with this Project, written notification of such change.	No Change
10.	The Licensee shall post signs in the appropriate areas to inform the public of the location of the Water Supply Facilities and the Waste Disposal Facilities. All signs must be in English, Inuktitut, and Inuinnaqtun and shall be located and maintained to the satisfaction of an Inspector.	No Change
11.	The Licensee shall, for all Plans submitted under this Licence, include a proposed timetable for implementation. Plans submitted cannot be undertaken without subsequent written Board approval and direction. The Board may alter or modify a Plan if necessary to achieve the legislative objectives and will notify the Licensee in writing of acceptance, rejection or alteration of the Plan. With notice to the Board, the Licensee may rename or consolidate Plans listed in this Licence.	No Change
12.	Unless otherwise directed by the Board in writing, if a Plan is not acceptable to the Board, the Licensee shall provide a revised version to the Board for review within thirty (30) days of notification by the Board.	No Change
13.	The Licensee shall, for all Plans submitted under this Licence, implement the Plans as approved by the Board in writing. Any changes to the plans deemed significant shall be considered as an amendment to the plan(s) or as a modification and must be approved by the Board.	No Change
14.	The Board has approved the following Plans for implementation under the relevant sections in the Licence. a. *Aquatic Effects Management Plan* ~~(October 2017)~~;	Updated

DRAFT

	b. *Borrow Pits and Quarry Management Plan* ~~(October 2017)~~; c. *Environmental Management and Protection Plan* ~~(October 2017)~~; d. *Fuel Management Plan* ~~(October 2017)~~; e. *Hazardous Materials Management Plan* ~~(October 2017)~~; f. *Incineration Management Plan* ~~(October 2017)~~; g. *Interim Closure and Reclamation Plan* ~~(including Interim Closure Cost Estimate) (October 2017)~~; h. *Landfarm Management Plan* ~~(October 2017)~~; i. *Landfill and Waste Management Plan* ~~(October 2017)~~; j. ~~*Mine*~~ *Waste Rock Management Plan* ~~(October 2017)~~; k. *Ore Storage Management Plan* ~~(October 2017)~~; l. *Risk Management and Emergency Response Plan* ~~(October 2017)~~; m. *Road Management Plan* ~~(October 2017)~~; n. *Spill Contingency Plan* ~~(October 2017)~~; o. *Tailings Management Plan* ~~(October 2017)~~; and p. *Water Management Plan* ~~(October 2017)~~.	
15.	The Board has accepted the following Plan for implementation under the relevant Part in the Licence. a. *Quality Assurance/Quality Control Plan* ~~(October 2017)~~.	Updated
16.	Every Plan to be carried out pursuant to the terms and conditions of this Licence shall become a part of this Licence, and any additional terms and conditions imposed upon approval of a Plan by the Board become part of this Licence. All terms and conditions of the Licence should be contemplated in the development of a Plan where appropriate.	No Change
17.	The Licensee shall review the Plans referred to in this Licence as required by changes in operation and/or technology and modify the Plans accordingly. Revisions to the Plans are to be submitted in the form of an Addendum to be included with the Annual Report required by Part B, Item 2, complete with a revisions list detailing where significant content changes are made.	No Change
18.	The expiry or cancellation of this Licence does not relieve the Licensee from any obligation imposed by the Licence, or any other regulatory requirement.	No Change
19.	The Schedules attached to this Licence provide details regarding the requirements associated with specific items in the main body of the Licence and are included in the Schedule to provide greater clarity and as an aid to interpretation for the Licensee. If the Board subsequently determines that an item in any of the Schedules requires revision in order to better reflect the intent and objectives of the Licence, the Board may at its discretion, and upon consulting and providing written notice to the Licensee and interested parties, revise the Schedule accordingly. Unless the Board directs otherwise, such revision may not necessarily be considered as an "Amendment" to the Licence.	No Change
20.	Unless otherwise stated, references in the Licence to any specific legislation, policy, guideline or other regulatory requirement are deemed to refer to the regulatory requirement as may be amended or as may be expressly replaced by successor legislation, policy, guidelines or other regulatory requirements after the Licence is approved by the Minister.	No Change

DRAFT

PART C: CONDITIONS APPLYING TO SECURITY

1.	The Licensee shall furnish and maintain the specified additional reclamation security amounts with the Minister under the Licence in accordance with the schedule and specific stages of infrastructure construction (as defined in Schedule A: Scope, Definitions, and Enforcement) set out below:	No Change

Pending

Timing	Stage of Infrastructure Construction	Reclamation Security to Be Added to Security Held Under the Licence For Each Stage	Total Reclamation Security For Each Stage (Licence and KIA Instruments Combined)
Within 30 days of the cancellation of Water Licence No.: 2BC-BRP1819	**Pre-Existing Infrastructure**	$0	$1,485,666
Sixty (60) days prior to construction	**Initial Infrastructure**	$2,400,005	$3,576,939
Sixty (60) days prior to construction	**Umwelt Open Pit**	$3,969,014	$7,498,853
Sixty (60) days prior to construction	**Tailings Storage Facility**	$14,223,495	$16,813,080
Sixty (60) days prior to construction	**Llama Open Pit**	$3,060,990	$6,296,575
Sixty (60) days prior to construction	**Llama Underground**	$93,198	$549,425
Sixty (60) days prior to construction	**Umwelt Underground**	$1,786,555	$2,140,925
Sixty (60) days prior to construction	**Goose Main Open Pit**	$1,696,673	$2,216,886
Sixty (60) days prior to construction	**Goose Main Underground**	$720,096	$881,832
Sixty (60) days prior to construction	**Echo Open Pit and Underground**	$1,055,704	$1,729,171
TOTAL (ALL STAGES CONSTRUCTED)		**$29,005,730**	**$43,189,352**

DRAFT

DRAFT

	shall, within thirty (30) days of the failure, furnish such additional security to the Minister under the Licence as is required to replace the amount that should have been held by the Kitikmeot Inuit Association.	
9.	The Licensee shall submit to the Board, at least ninety (90) days prior to any material changes to the Undertaking or material changes to the risk of environmental damage associated with the Undertaking that could result in a material change to the reclamation liability associated with the Undertaking (including, but not limited to, updates to the reclamation cost estimate arising from unexpected changes or modifications of the works, activities or stages of infrastructure construction associated with the Undertaking), written notification of such changes.	Pending
10.	The Licensee shall submit, within the updated Interim Closure and Reclamation Plan as per Part J, Item 1, an updated reclamation cost estimate of the total mine closure restoration liability, using the most current version of CIRNAC's RECLAIM Reclamation Cost Estimating Model, its equivalent or other similar method approved by the Board in writing, in accordance with principles of the INAC (as CIRNAC was previously known as) "Mine Site Reclamation Policy in Nunavut" (2002).	Pending
11.	The Licensee shall submit, within the Final Closure and Reclamation Plan as per Part J, Item 2, an updated reclamation cost estimate of the total mine closure restoration liability, using the most current version of CIRNAC's RECLAIM Reclamation Cost Estimating Model, its equivalent or other similar method approved by the Board in writing, in accordance with principles of the "Mine Site Reclamation Policy for Nunavut" (2002). Upon the Project entering into or being maintained in Care and Maintenance, an updated estimate of total mine closure reclamation liability shall be submitted, as above, within twelve (12) months of entering Care and Maintenance and every three (3) years thereafter.	No Change
12.	Upon the Board receiving an updated reclamation cost estimate as required under Part C, Item 10 or 11, the Board may, on its own initiative, or upon application by the Licensee, the Minister and/or the Kitikmeot Inuit Association, conduct a periodic review of the outstanding reclamation liability associated with the Undertaking and may, as the Board considers appropriate, amend the amount of security held under Part C, Item 1. Any submission requesting an amendment to the security provisions of the Licence shall include supporting evidence to justify the amendment and will be processed by the Board as an amendment to the terms and conditions of the Licence.	No Change
13.	The Licensee, the Minister, or the Kitikmeot Inuit Association may apply to amend the amount of security required to be held under the Licence. Any submission requesting a review of the security provisions of the Licence shall include supporting evidence to justify the amendment and will be processed by the Board as an amendment to the terms and conditions of the Licence.	No Change
14.	The security referred to in Part C, Item 1 shall be maintained until such time as the Minister is satisfied that the Licensee has complied with all provisions of the approved ~~Final~~Reclamation and Closure Plan and as it is fully or in part refunded by the Minister pursuant to Section 76(5) of the Act. This clause shall survive the expiry of the Licence or renewals thereof and until full and final reclamation has been completed to the satisfaction of the Minister.	Pending
15.	The Licensee shall submit to the Board, at least sixty (60) days prior to construction of the Tailings Storage Facility, Llama Open Pit, Llama Underground, Umwelt Underground, Umwelt Open Pit, Goose Main Open Pit, Goose Main Underground, ~~and~~ Echo Open Pit, and Echo Underground, a written notification of intent to initiate a new stage of infrastructure construction as per Part C, Item 1.	Updated

DRAFT

PART D:	CONDITIONS APPLYING TO CONSTRUCTION AND OPERATION	
1.	The Licensee shall implement the *Road Management Plan* and *Borrow Pits and Quarry Management Plan* as approved by the Board.	No Change
2.	The Licensee shall submit to the Board for review, at least sixty (60) days prior to Construction, final design and Construction drawings accompanied with a detailed report for the following: a. Water works; b. Waste Disposal/management facilities; and c. Bulk fuel storage facilities.	No Change
3.	The detailed reports referred to in Part D, Item 2 shall include: a. Design rational, requirements, criteria, parameters, standards analysis, methods, assumptions and limitations; b. Site specific data and analysis to support the design and management decisions; c. Geochemical analysis of Waste Rock and fill, demonstrating their Acid Rock Drainage and Metal Leaching characteristics; d. Construction methods and procedures regarding how infrastructure will be put in place, including quality assurance and quality control measures and equipment to be used; e. Technical specifications for sedimentation, erosion control and bank stabilization measures, including proposed materials, location and extent, place methods and quantities required; f. Timetable for submission, including date of Construction and proposed date of commissioning of infrastructure; and g. Where required, signature and seal by the appropriately qualified Engineer.	No Change
4.	The Licensee shall include in the submission under Part D, Item 2 for the Tailings Storage Facility (TSF) Dam, the results of the Infill Geotechnical Characterization Program as discussed during the Application review. This submission shall include a description of the necessary monitoring instrumentation to confirm performance of the TSF Dam.	No Change
5.	The Licensee shall use Waste rock and fill material for Construction only from approved sources that have been demonstrated, by appropriate geochemical analyses, to not produce Acid Rock Drainage and to be Non-Metal Leaching, and free of contaminants, unless otherwise approved by the Board.	Updated
6.	The Licensee shall identify and demark potentially acid generating rock identified through the *Borrow Pits and Quarry Management Plan* for removal and disposal into the Waste Rock Storage Areas, within the boundaries of quarries/borrow pits, or backfill in the underground mines or Tailings Storage Facility and/or Tailings Facilities or as otherwise approved by the Board.	Updated
7.	The Licensee shall implement sediment and erosion control measures prior to and during Construction, and Operations where necessary, to prevent entry of sediment into Water.	No Change
8.	The Licensee shall conduct Construction monitoring, including daily inspections, during Construction activities.	No Change
9.	The Licensee shall conduct visual inspections for runoff/seepage, and conduct sampling where turbidity is observed, for all construction activity during spring freshet and during and after remarkable rainfall events.	No Change
10.	The Licensee shall, during the construction of all engineered structures, provide the required supervision and field checks by an appropriately qualified and experienced Engineer in such a manner that the project specification can be enforced and, where required, the quality control measures can be followed. The Licensee shall maintain all construction records of all engineered structures to be made available at the request of the Board and/or an Inspector.	No Change
11.	The Licensee shall submit to the Board for review, within ninety (90) days of completion of each facility designed to contain, withhold, divert or retain Waters or Wastes during the construction phase, a Construction Summary Report prepared by a qualified Engineer(s) in accordance with Schedule D, Item 1.	No Change
12.	The Licensee shall prevent any chemicals, petroleum products, fuel or wastes associated with the Undertaking from entering any waterbody.	No Change

The total combined use of Waters from MLA Pond S1, Pond S2, Lake 3, and Lake 4, for all purposes, shall not exceed a total of one hundred and ten thousand (110,000) cubic metres per year.</td><td>No Change</td></tr>
</table>

4.	The Licensee shall obtain fresh Water from Llama Lake and Umwelt Lake, or as otherwise approved by the Board for the purposes of dewatering the lakes at Monitoring Program Stations: BRP-02 and BRP-06 (or any replacement Monitoring Program Stations as described in an update to Schedule I). Total combined Water Use for this purpose shall not exceed one million four hundred thousand (1,400,000) cubic metres per year during dewatering (Construction Phase).	Updated
5.	The Licensee shall obtain fresh Water from water sources proximal to the Interconnection Winter Ice Road for the purposes of construction, maintenance, and operation of the Interconnection Winter Ice Road and WIR Service/Emergency Camps. Total combined Water Use for this purpose shall not exceed two thousand and twenty-five (2,025) cubic metres *per* year *per* kilometre of road. Annual construction plans, including water sources and predicted volumes of water use, shall be provided as per Part E, Item 13.	Updated
6.	The Licensee shall not use streams as a Water source unless authorized and approved by the Board in writing.	No Change
7.	The Licensee shall equip all Water intake hoses with a screen of an appropriate mesh size to ensure that fish are not entrained and shall withdraw water at a rate such that fish do not become impinged on the screen.	No Change
8.	The Licensee shall not remove any material from below the ordinary High Water Mark of any Water body unless authorized by the Board in writing.	No Change
9.	The Licensee shall undertake appropriate corrective measures to prevent and/or mitigate impacts to surface Water resulting from the undertaking.	No Change
10.	The Licensee shall implement sediment and erosion control measures prior to and during the undertaking to prevent entry of sediment into Water.	No Change
11.	The Licensee shall implement measures to minimize the generation and deposition of dust and/or sediment into Water arising from road use.	No Change
12.	The Licensee shall carry out regular inspections of all Water management structures during periods of flow and keep the records for review upon request of an Inspector. More frequent inspections may be required at the request of an Inspector. This information may be included in the Annual report required by Part B, Item 2.	No Change
13.	The Licensee shall submit to the Board for review, at least sixty (60) days prior to annual Interconnection Winter Ice Road construction, a technical memorandum. The memorandum will include approximate projected routing (subject to changes year to year based on construction and operational conditions), bathymetry, depth, potential locations of possible water withdrawal, proposed volumes to be extracted including for the ~~sourcing~~–WIR Service/Emergency Camps, and anticipated water level decreases. The contents of the memorandum may be altered at the request of the Board. The memorandum may be submitted as an appendix to the approved Water Management Plan.	Updated
14.	The Licensee shall submit to the Board for review, at least sixty (60) days prior to initiation of dewatering, a Dewatering Plan. The Plan may be submitted as an appendix to the approved *Water Management Plan*.	No Change
15.	~~The Licensee shall submit to the Board for review with the 2018 Annual Report in accordance with Part B, Item 2, an updated Water and Load Balance Model as an appendix to the approved *Water Management Plan*. The updates are to take into account the following:~~	Delete
	~~a. updated 2017-2018 baseline data collection that takes into account seasonal variation; and~~	Delete
	~~b. updated hydrodynamic model.~~	Delete
15.	The Licensee shall submit the Board for review ninety (90) days following approval of the licence an updated hydrodynamic model including mixing zone design. The updates are to take into account commitments made with respect to the submissions received during the technical review of the Application, as well as final submission and issues raised during the Public Hearing process, where applicable.	New
16.	The Water and Load Balance Model shall be reviewed periodically, to reflect changes in operations and/or technology and submit results for review with the Annual Report in accordance with Part B, Item 2 as appendix to the approved *Water Management Plan*.	No Change

<table>
<tr><td colspan="2">PART F: CONDITIONS APPLYING TO WASTE DISPOSAL AND MANAGEMENT</td><td></td></tr>
<tr><td>1.</td><td>The Licensee shall implement the Ore Storage Management Plan, ~~Mine~~ Waste Rock Management Plan, Tailings Management Plan, Landfill and Waste Management Plan, Incineration Management Plan, Landfarm Management Plan, and Hazardous Materials Management Plan as approved by the Board.</td><td>Updated</td></tr>
<tr><td>2.</td><td>The Licensee shall provide at least ten (10) days' notice to the Inspector prior to any planned discharges from any Facilities. The notice shall include the estimated volume proposed for discharge and location. The Inspector and the Licensee may agree in writing to alternate notification requirements for ongoing, frequent, or regularly scheduled discharges.</td><td>No Change</td></tr>
<tr><td>3.</td><td>The Licensee shall perform all land applied discharges in a manner that prevents erosion at the point of discharge and downstream.</td><td>No Change</td></tr>
<tr><td>4.</td><td>The Licensee shall direct all Sewage at the Goose Property to the Sewage Treatment Plant (STP) for treatment. STP Effluent may be discharged into the Tailings Storage Facility, Tailings Facilities~~y~~ or onto land. The Discharge of Effluent onto land from the STP, at Monitoring Program Station BRP-17 or to the Tailings Storage Facility or Tailings Facilities~~y~~ at BRP-17A (or any replacement Monitoring Program Stations as described in an update to Schedule I) shall not exceed the following Effluent quality limits:
<table>

pH	6.0 – 9.5		

22.	The Licensee shall demonstrate that Effluent discharged from a Final Discharge Point at Monitoring Station(s) TBD to Goose Lake is non-acutely lethal under the following test and as stipulated in Schedule J of the Licence. a. Acute Lethality of Effluents to Rainbow Trout (as per Environment Canada's Environmental Protection Series Biological Test Method EPS/1/RM/13 Second Edition December 2000 (with May 2007 amendments).	New
23.	The Licensee shall contain all greywater from WIR service/emergency camps in a sump located at a distance of at least thirty one (31) metres above the ordinary high Water mark of any Water body, at a site where direct flow into a Water body is not possible and no additional impacts are created, or discharge it to a wetland area located at a distance of at least thirty one (31) metres above the ordinary high Water mark of any Water body, at a site where direct flow into a Water body is not possible and no additional impacts are created, unless otherwise approved by the Board in writing	New
24.	All solid and hazardous waste generated at the WIR Emergency/Service Camps will be backhauled to the MLA or Goose Property for disposal in accordance with the *Landfill and Waste Management Plan and Hazardous Materials Management Plan*.	New
25.	The Licensee shall submit for Board review, within ninety (90) days following approval of this Licence by the Minister or no later than the 2021 Annual Report, a revised *Waste Rock Management Plan* and *Tailings Management Plan*. The update are to take into account commitments made with respect to submissions received during the technical review of the Application, as well as final submissions and issues raised during the Public Hearing Process.	New

DRAFT

PART G: CONDITIONS APPLYING TO MODIFICATIONS		
1.	The Licensee may, without written consent from the Board, carry out Modifications provided that such Modifications are consistent with the terms of this Licence and the following requirements are met: a. The Licensee has notified the Board in writing of such proposed Modifications at least sixty (60) days prior to beginning the Modifications; b. Such Modifications do not place the Licensee in contravention of the Licence or the Act; c. Such Modifications are consistent with the applicable terms and conditions of the NIRB Project Certificate No. 007; d. The Board has not, within sixty (60) days following notification of the proposed Modifications, informed the Licensee that review of the proposal will require more than sixty (60) days; and e. The Board has not rejected the proposed Modifications.	No Change
2.	Modifications for which any of the conditions referred to in Part G, Item 1 have not been met can be carried out only with approval from the Board in writing.	No Change
3.	Applications for modifications shall contain: a. A description of the facilities and/or works to be constructed; b. The proposed location of the structure(s); c. Identification of any potential impacts to the receiving environment; d. A description of any monitoring required, including sampling locations, parameters measured, and frequencies of sampling; e. A proposed schedule for construction; f. Drawings of any Engineered Structures stamped by a Professional Engineer; and g. Proposed sediment and erosion control measures.	No Change
4.	The Licensee shall provide to the Board, within ninety (90) days of completion of the Modification, as-built plans and drawings of the Modifications referred to in this Part. These plans and drawings shall be stamped by an Engineer.	No Change

DRAFT

PART H: CONDITIONS APPLYING TO EMERGENCY RESPONSE AND CONTINGENCY PLANNING		
1.	The Licensee shall implement the *Risk Management and Emergency Response Plan, Fuel Management Plan,* and *Spill Contingency Plan* as approved by the Board.	No Change
2.	The Licensee shall prevent any chemicals, petroleum products or unauthorized Wastes associated with the Project from entering Water.	No Change
3.	The Licensee shall provide secondary containment for fuel and chemical storage as required by applicable standards and acceptable industry practice.	No Change
4.	The Licensee shall perform regular inspections in accordance with the Approved *Environmental Protection Plan* and *Fuel Management Plan* of petroleum products storage and containment facilities, fuel tanks and connectors, for leaks and settlement and shall keep a written log of inspections to be made available to an Inspector upon request. More frequent inspections may be requested by an Inspector.	No Change
5.	If the Licensee provides notification under Part J, Item 3, the Licensee shall submit to the Board Addendums for the *Risk Management and Emergency Response Plan, Fuel Management Plan,* and *Spill Contingency Plan* detailing the changes in operations, personnel, responsibilities, availability of equipment and access to the site for assistance.	No Change
6.	The Licensee shall keep a copy of the *Risk Management and Emergency Response Plan* and *the Spill Contingency Plan* at each site of operation.	No Change
7.	The Licensee shall conduct emergency maintenance and servicing on equipment, in designated areas, and shall implement measures to collect motor fluids and other Waste to prevent and contain spills.	No Change
8.	The Licensee shall, subject to Section 16 of the Regulations, report any unauthorized deposits or foreseeable unauthorized deposits of waste and/or discharges of Effluent, and: a. Employ the *Spill Contingency Plan*; b. Report the incident immediately via the 24-Hour NWT/NU Spill Reporting Line (867) 920-8130 and to the Inspector at (867) 975-4295; and c. For each spill occurrence, submit a detailed report to the Inspector and the NWB, no later than thirty (30) days after initially reporting the event, which includes the amount and type of spilled product, the GPS location of the spill, and the measures taken to contain and clean up the spill site.	No Change
9.	The Licensee shall, in addition to Part H, Item 8, regardless of the quantity of release of a harmful substance, report to the NWT/NU Spill Reporting Line and the NWB if the release is near or into a waterbody.	No Change
10.	The Licensee shall prevent any chemicals, petroleum products or Wastes associated with the project from entering Water. All sumps and fuel caches shall be located at a distance of at least thirty-one (31) metres from the ordinary high Water mark of any adjacent Water body and inspected on a regular basis.	New
11.	The Licensee shall conduct any equipment maintenance and servicing in designated areas and shall implement special procedures (such as the use of drip pans) to manage motor fluids and other Waste and contain potential spills.	New

DRAFT

PART I: CONDITIONS APPLYING TO GENERAL AND AQUATIC EFFECTS MONITORING		
1.	The Licensee shall implement the *Environmental Management and Protection Plan* and *Aquatic Effects Management Plan* as approved by the Board and the *Quality Assurance / Quality Control Plan* as accepted by the Board.	No Change
2.	~~The Licensee shall submit for Board approval, prior to March 31, 2019, an updated *Aquatic Effects Management Plan*. The update shall address all comments and commitments made during the regulatory review of the Application.~~	Delete
3.	The Licensee shall install and maintain flow meters or other such devices, or implement suitable methods required for the measuring of Water use and Effluent discharge volumes, to be operated and maintained to the satisfaction of an Inspector.	No Change
4.	The Licensee shall undertake the Monitoring Program provided in the Tables 1 and 2 of Schedule I.	No Change
5.	The Licensee shall submit to the Board, at least sixty (60) days prior to a change in Project Phase (Construction, Operations Stage(s)~~1, Operations Stage 2, and Operations Stage 3~~), a written notification of the intent to change project phase. Notification may be provided separately or in accordance with the monthly monitoring report as per Part I, Item 18	Updated
6.	The Licensee shall establish the locations and GPS coordinates for all Monitoring Program Stations in consultation with an Inspector. Additional and replacement Monitoring Program Stations may be added in consultation with an Inspector.	No Change
7.	The Licensee shall install signs that identify Monitoring Program Stations. All signs must be in English, Inuktitut, and Inuinnaqtun and shall be located and maintained to the satisfaction of an Inspector.	No Change
8.	The Licensee shall measure and record the following on a Monthly basis in cubic metres: a. The volume of fresh Water obtained from Big Lake; b. The volume of fresh Water obtained from Goose Lake; c. The volume of fresh Water obtained from MLA Pond S1, Pond S2, Lake 3, and Lake 4; d. The volume of fresh Water obtained from Llama Lake ~~and~~, Umwelt Lake, and other water bodies approved by the Board for dewatering; e. The volume of fresh Water obtained from each water source for the Interconnection Winter Ice Road and Winter Ice Road Service/Emergency Camps; f. The volume of Reclaim Water obtained from the Primary Water Pond, Tailings Storage Facility and/or Tailings ~~Facility(s)~~Facilities for process water at the process plant~~;~~ or alternative treatment system. g. The estimated volume of greywater and sewage released to the environment and/or to the Tailings Storage Facility and Tailings Facilities; h. The volume of sludge removed from the STP and the location and method of disposal; i. The volume of effluent discharged from Landfarms and Fuel Tank Farms, and Fuel Storage Facilities; ~~and~~ j. The estimated volume of contact water, WRSA Effluent, Ore Stockpile Effluent, or other Effluent/Water streams pumped into the Primary Water Pond, Tailings Storage Facility ~~and/or~~, Tailings Facilities and/or transferred between ponds or facilities; and k. The volume of effluent discharged.	Updated
9.	The Licensee shall measure and record the following on a Monthly basis in tonnes: a. Quantity of Waste placed within the Landfill(s) and Landfarm(s); b. Tonnes of Waste Rock placed into, and total stored at, each Waste Storage Area and other locations approved by the Board; c. Dry tonnes of tailings placed into, and stored at, the Tailings Storage Facility and Tailings Facilities; and d. Tonnes of ore stockpiled and ore processed through the processing plant.	No Change

DRAFT

10.	The Licensee shall undertake a geotechnical inspection, to be carried out annually by a Geotechnical Engineer, between the months of July and September. The inspection shall be conducted in accordance with the *Canadian Dam Safety Guidelines* where applicable and take into account all major earthworks and address the following: a. Tailings Storage Facility and associated ponds, dams, and dykes; b. Geotechnical instrumentation and associated monitoring data; c. Geophysical and permafrost conditions; d. Tailings Storage Facility and Tailings Facilities; e. Open Pit walls; f. All-weather roads and watercourse crossings; g. Waste Rock Storage Area; h. Landfill(s); i. Landfarm(s) j. Fuel Tank Farms and Fuel Storage Facilities; k. Quarries and borrow pits; l. Water management structures; m. Underground openings; n. Underground groundwater conditions; o. Perimeter berms and collection ponds; and p. Stream diversions.	No Change
11.	The Licensee shall submit to the Board for approval, within ninety (90) days of completion of the Inspection in accordance with Part I, Item 10, the Geotechnical Engineer's Inspection Report. The Report shall include a cover letter from the Licensee outlining an implementation plan to address the recommendations of the Geotechnical Engineer.	No Change
12.	The Licensee shall visually monitor and record observations in accordance with the approved *Environmental Management and Protection Plan*, to be made available to an Inspector upon request, during periods of discharge to the land at Monitoring Program Station BRP-15, BRP-16, BRP-43, BRP-44, BRP-45, BRP-49, BRP-51 (or any replacement Monitoring Program Stations as described in an update to Schedule I), as described in Part F, Item 12.	No Change
13.	The Licensee shall keep a digital photographic record of all the Project's watercourse crossings before, during, and after Construction.	No Change
14.	The Licensee shall maintain and implement the Quality Assurance / Quality Control Plan (QA/QC) ~~dated October 2017~~ that was accepted by the Board as part of the Application.	Updated
15.	The Licensee shall annually review the QA/QC Plan and modify the Plan as necessary. Proposed changes shall be submitted to an Accredited Laboratory for approval.	No Change
16.	All analyses shall be conducted as described in the most recent edition of "*Standard Methods for the Examination of Water and Wastewater*" or by other such methods approved by an Analyst.	No Change
17.	All compliance analyses shall be performed in an accredited laboratory according to ISO/IEC Standard 17025. The accreditation shall be current and in good standing.	No Change
18.	The Licensee shall submit to the Board, within thirty (30) days following the month being reported, a Monthly Monitoring Report. The Report shall include: a. All data and information required by this Part and generated by the Monitoring Program in the Tables of Schedule I; b. An assessment of data to identify areas of non-compliance with regulated discharge parameters referred to in this Licence; and c. Reports should document conditions during spring freshet, major rain events, and periods of sustained precipitation including flow measurements, photographs, and notes.	No Change

DRAFT

19.	As noted in Part B, Item 19, changes to the Schedules, including Schedule I, which provides details of the Monitoring Program, may, at the Board's discretion, be considered without requiring an Amendment to the Licence. However, the Board must approve any changes to the Monitoring Program, as outlined in Part I and Schedule I; any request for changes to the Monitoring Program should be submitted to the NWB in writing, and should include the justification for the change.	No Change
20.	Additional monitoring may be imposed by the Inspector.	No Change

DRAFT

PART J: CONDITIONS APPLYING TO ABANDONMENT, RECLAMATION AND CLOSURE		
1.	The Licensee shall implement the approved *Interim Closure and Reclamation Plan*. The Licencee shall submit to the Board for approval within twelve (12) months following the commencement of the Operation Phase an updated *Interim Closure and Reclamation Plan*.	No Change
2.	The Licensee shall submit to the Board for approval, at least twelve (12) months prior to the expected end of planned mining, a Final Closure and Reclamation Plan. The Final Closure and Reclamation Plan shall incorporate revisions, which reflect the pending closed status of the mine, and include: a. Soil Quality Remediation Objectives reflecting the applicable *CCME Guidelines and the Government of Nunavut Environmental Guideline for Site Remediation*; b. Environmental Site Assessment plans in accordance with the applicable Canadian Standards Association (CSA) criteria; and c. An evaluation of the human health and ecological risks associated with the Closure options proposed.	No Change
3.	The Licensee shall submit to the Board, at least sixty (60) days prior to, or as soon as practically possible, written notification of the Licensee's intention to enter into a Care and Maintenance Phase.	No Change
4.	The Licensee shall provide the Board, within thirty (30) days of the Licensee providing notice of intent to enter into Care and Maintenance under Part J, Item 3, a Care and Maintenance Plan that details the Licensee's plans for maintaining compliance with the Terms and Conditions of the Licence.	No Change
5.	The Licensee shall, should the Project remain, or be in Care and Maintenance, submit an updated estimate of total mine closure restoration liability, within twelve (12) months of entering Care and Maintenance and every three (3) years thereafter.	No Change
6.	The Licensee shall review the Plans referred to in this Part as required by changes in operation and/or technology and modify the Plans accordingly. Revisions to the Plans should incorporate design changes and adaptive engineering required and implemented during Construction and reflect actual site conditions and monitoring results over the life of the Project.	No Change
7.	The Licensee shall include, with the Plan submitted under Part J, Items 1, 2, and 5, an updated reclamation cost estimate of the total mine closure restoration liability, using the most current version of CIRNAC's RECLAIM Reclamation Cost Estimating Model, its equivalent or other similar method approved by the Board in writing, in accordance with principles of the INAC (as CIRNAC was previously known as) "*Mine Site Reclamation Policy in Nunavut*" (2002).	No Change
8.	The Licensee shall complete all reclamation work in accordance with the Plan(s) referred to in this Part, as and when approved by the Board in writing.	No Change
9.	The Licensee shall implement Progressive Reclamation of any component of the Project no longer required by the Project.	No Change
10.	The Licensee shall remove any culverts and restore, as practicable, the drainage to match the natural channel. Measures shall be implemented to minimize erosion and sedimentation.	No Change
11.	All roads and airstrip, if any, shall be re-graded, as practicable, to match natural contours to reduce erosion.	No Change
12.	Areas that have been contaminated by hydrocarbons from normal fuel transfer procedures shall be reclaimed to meet objectives as outlined in the Government of Nunavut's *Environmental Guideline for Site Remediation*, (2010 version or current version in place at the time of Reclamation).	No Change

DRAFT

13.	To the extent practical, the Licensee shall contour and stabilize all disturbed areas to a pre-disturbed state upon completion of work.	No Change
14.	The Licensee shall submit to the Board, at least sixty (60) days prior to the Licensee intending to seek Recognized Closed Mine status for the Project, written notification of the intent to seek closure status.	No Change
SCHEDULE A: SCOPE, DEFINITIONS, AND ENFORCEMENT		
Abandonment means the permanent dismantlement of a facility so it is permanently incapable of its intended use. This includes the removal of associated equipment and structures;		No Change
Act means the Nunavut Waters and Nunavut Surface Rights Tribunal Act;		No Change
Acid Rock Drainage (ARD) means the production of acidic leachate, seepage or drainage from underground workings, open pits, ore piles, waste rock, construction rock that can lead to the release of metals to land, groundwater or surface water during the life of the Project and after Closure;		No Change
Acute Lethal Effluent means acutely lethal effluent as defined in the *Metal and Diamond Mining Effluent Regulations* SOR/2002-222 dated June 6, 2002, last amended on December 8, 2017 and as may be further amended from time to time;		No Change
Adaptive Management means a management plan that describes a way of managing risks associated with uncertainty and provides a flexible framework for mitigation measures to be implemented and actions to be taken when specified thresholds are exceeded;		No Change
Addendum means the supplemental text that is added to a full plan or report, usually included at the end of the document and is not intended to require a full resubmission of the revised report. It may also be considered as an appendix or supplement;		No Change
Amendment means a change to any terms and conditions of this Licence through application to the NWB, requiring a change, addition, or deletion of specific terms and conditions of the Licence not considered as a modification;		No Change
Analyst means an Analyst designated by the Minister under section 85 (1) of the Act;		No Change
ANFO Plant means the explosives storage and preparation facility for production of ammonium nitrate fuel oil (ANFO) explosives and includes the ANFO truck wash facility;		No Change
Annually means, in the context of monitoring frequency, one sampling event occurring every 365 days with a minimum of 200 days between sampling events;		No Change
Application for the purposes of this Licence includes the totality of relevant documents filed by the Licensee on the NWB and NIRB public registries in support of the Water Licence application filed in October 2017, application for amendment filed in October 2020, and includes all documents subsequently submitted to the Board throughout the regulatory processes;		Updated
Appurtenant Undertaking means an undertaking in relation to which a use of water or a deposit of Waste is permitted by a licence issued by the Board;		No Change

DRAFT

Board means the Nunavut Water Board established under Article 13 of the *Nunavut Agreement* and under section 14 of the *Act*;	No Change
Borrow Pits means sites where materials, such as gravel or sand, are excavated for the purposes of constructing site infrastructure and facilities;	No Change
Canadian Council of the Ministers of Environment (CCME) means the organization of the Canadian Ministers of Environment that sets guidelines for environmental protection across Canada such as the *Canadian Water Quality Guidelines for the Protection of Aquatic Life*;	No Change
Care and Maintenance in respect of a mine, means the status of the facility when the Licensee ceases gold production (Operations Phase) temporarily for an undefined period of time;	No Change
Chief Administrative Officer means the Executive Director of the Nunavut Water Board;	No Change
Chief Executive Officer means the Chair or Chairperson of the Nunavut Water Board;	No Change
Closure means when an Operator ceases operations at a facility without the intent to resume mining activities in the future;	No Change
Closure Phase means that period of time after the Operations Phase where the Project is no longer producing gold, there is no intention to resume mining activities, and reclamation and remediation of all mine facilities is undertaken. The Closure Phase is not within the scope of this Licence;	No Change
Construction Phase means that period of time where the Project facilities and infrastructure are under construction prior to producing gold during the Operation Phase~~. This phase can be broken into early construction and late construction. The Late Construction phase starts when the Saline Water Pond is ready for use~~;	Updated
Contact Water means any water that may be physically or chemically affected by mining activities, including all runoff and seepage from WRSA, Ore Stockpiles and other mine facilities;	No Change
Dam Safety Guidelines means the *Canadian Dam Association (CDA) Dam Safety Guidelines (DSG)*, (published in 2007, revised in 2013 or subsequent approved editions);	No Change
Deleterious Substances means a substance as defined in section 34(1) of the *Federal Fisheries Act*;	No Change
Deposit means the placement of waste rock, tailings or other solids materials on land or in water;	No Change
Diffuser means an Effluent discharge pipeline within a water body designed to discharge and enhance mixing of Effluent in the receiving environment;	New
Discharge means the release of any water or waste to the receiving environment;	No Change
Domestic Waste means all solid waste generated from the accommodations, kitchen facilities and all other site facilities, excluding those Hazardous Wastes associated with the Project;	No Change
~~Echo Open Pit and Underground~~ ~~collectively means the Echo Open Pit and Echo Underground works;~~	Delete

DRAFT

Echo Open Pit means the open pit located adjacent to Goose Lake named the Echo Open Pit and all directly related facilities as generally described in the Application. The Echo Open Pit is general located above the Echo Underground works;	No Change
Echo Underground means the underground works located adjacent to Goose Lake named the Echo Underground and all directly related facilities as generally described in the Application. The Echo Underground is generally located below the Echo Open Pit;	No Change
Effluent means treated or untreated liquid waste material that is discharged into the environment from all site water management facilities;	No Change
Engineer means a professional engineer registered to practice in Nunavut in accordance with the *Consolidation of Engineers and Geoscientists Act S. Nu 2008, c.2* and the *Engineering and Geoscience Professions Act S.N.W.T. 2006, c.16 Amended by S.N.W.T. 2009, c.12*;	No Change
Engineered Structure means any facility, which was designed and approved by a Professional Engineer registered with the Association of Professional Engineers, Geologists and Geophysicists of Nunavut;	No Change
Environmental Assessment means, in respect of the Project, all material filed with the Nunavut Impact Review Board (NIRB) on the NIRB's Public Registry (established under the authority of Article 12 of the Nunavut Agreement) that is associated with the NIRB's impact assessment (Review) of the Project or modification(s) and associated with the scope of the activities, works and Undertakings authorized in accordance with the terms and conditions of the ~~Licence;~~Project Certificate;	Updated
Final Discharge Point in respect of an effluent, means, as defined in the *Metal and Diamond Mining Effluent Regulations*, SOR/2002-222 (as may be amended from time to time) an identifiable discharge point of a mine beyond which the operator of the mine no longer exercises control over the quality of the effluent;	No Change
Fuel Storage Facility means the fuel storage areas consisting of multiple double walled tanks, temporary berms, and all associated infrastructure;	No Change
Fuel Tank Farm means the fuel storage areas consisting of multiple large permanent tanks, engineered secondary containment areas, and all associated infrastructure;	No Change
Fuel Transfer Area means the fuel storage area at the MLA consisting of permanent tank(s), engineered secondary containment, and all associated infrastructure (e.g., intermediate fuel pump station) near the freight storage area;	New
Geotechnical Engineer means a professional engineer registered with the Association of Professional Engineers, Geologist and Geophysicists of Nunavut and whose principal field of specialization is the engineering properties of earth materials in dealing with manmade structures and earthworks. Such structures and earthworks can include shallow and deep foundations, retaining walls, dams, and embankments;	No Change
Goose Main Open Pit means the open pit located adjacent to Goose Lake named the Goose Main Open P~~p~~it and all directly related facilities as generally described in the Application. The Goose Main Open Pit is generally located above the Goose Main Underground works;	Updated
Goose Main Reservoir means the waterbody at Closure that fills the Goose Main Open Pit;	New

DRAFT

Goose Main Underground means the underground works located adjacent to Goose Lake named the Goose Main Underground and all directly related facilities as generally described in the Application. The Goose Main Underground is generally located below the Goose Main Open Pit;	No Change
Goose Property means the area adjacent to Goose Lake where the mining and milling operations for the Back River Project are located as generally described in the Application;	No Change
Goose Property Waste Management Facilities means the facilities at the Goose Property designed to sort and manage wastes such that combustible wastes are incinerated, Hazardous Wastes are stored prior to trans-shipping to the MLA, and non-combustible waste is sorted and/or stored prior to either trans-shipping to the MLA or disposal in an approved Landfill at the Goose Property;	No Change
Goose Property Water Supply Facilities means the facilities at the Goose Property designed to provide potable, construction, and industrial water. This includes permanent intake structures, pumps, and pipelines at Big Lake and Goose Lake;	No Change
Goose Property Water Treatment Facilities means the facilities at the Goose Property designed to reduce TSS and possibly address other water quality issues when dewatering Llama Lake and Umwelt Lake or any other water bodies approved by the Board and then later when improving the water quality of ~~the Goose Main~~any Tailings Storage Facility, Tailings Facilities, or Reservoir for re-use;	Updated
Grab Sample means an undiluted quantity of material collected at a particular time and place that may be representative of the total substance being sampled at the time and place it was collected;	No Change
Greywater means the component of effluent produced from domestic use (i.e. washing, bathing, food preparation and laundering), but excluding sewage;	No Change
Groundwater means water that occupies pores and fractures in rock and soil below the ground surface in a liquid or frozen state;	No Change
Hazardous Waste means materials or contaminants which are categorized as dangerous goods under the Transportation of Dangerous Good Act 1992 (1992, c. 34) and/or that are no longer used for their original purpose and are intended for recycling, treatment, disposal or storage;	No Change
High Water Mark means the usual or average level to which a body of freshwater rises at its highest point and remains for a sufficient time so as to change the characteristics of the land (ref. Department of Fisheries and Oceans Canada, Operational Statement: Mineral Exploration Activities);	Updated
ICP Metals Scan means elements detected using Inductively Coupled Plasma (ICP) mass spectrometer. Metal parameters chosen to be included in an ICP Metals Scan under the Licence should be consistent with baseline data previously collected and include any metals of concern or interest;	No Change
Incinerator means the controlled-air, batch, dual chamber incinerator at the MLA or the Goose Property as described in the "Incineration Management Plan"~~ dated October 2017~~;	Updated
Initial Infrastructure means all Project facilities and infrastructure not directly related to the open pit mines or underground mines that is not existing or under construction as of the date this Licence was issued. This includes facilities for water management, waste management, milling, mine operations, fuel storage, and materials handling;	No Change
Inspector means an Inspector designated by the Minister under section 85 (1) of the Act;	No Change

DRAFT

Interconnection Winter Ice Road means the annual temporary winter ice road, ~~and~~ associated water crossings and subbase upgrades and specified quarry and borrow sources locations intended to provide a seasonal transportation route between the Marine Laydown Area and the Goose Property as generally described in the Application;	Updated
Interim Closure and Reclamation Plan means a conceptual detailed plan addressing the Reclamation of mine components which will not be closed until the end of the mining operations, and operational detail for components which are to be progressively reclaimed throughout the mine life;	No Change
Landfarm means the facilities designed to remediate hydrocarbon contaminated soils located at the Goose Property and the Marine Laydown Area as generally described in the Application;	No Change
Landfill means the facility designed to contain non-salvageable, non-organic, non-hazardous solid waste from mining activities that cannot be incinerated located at the Goose Property as generally described in the Application;	No Change
Licence means this Type "A" Water Licence 2AM-BRP1831, issued by the Nunavut Water Board in accordance with the Act, to Sabina Gold & Silver Corp. (Sabina) for the Back River Project;	No Change
Licensee means the entity to whom the Licence is issued or to whom the Licence is subsequently assigned;	No Change
Llama Open Pit means the open pit located ~~within the footprint of~~below Llama Lake named the Llama Open Pit and all directly related infrastructure as generally described in the Application. The Llama Open Pit is generally located above the Llama Underground works;	Updated
Llama Reservoir means the waterbody at Closure that fills the Llama Open Pit and the previous Llama Lake;	No Change
Llama Underground means the underground works located ~~within the footprint of~~generally below Llama Lake named the Llama Underground and all directly related infrastructure as generally described in the Application. The Llama Underground is generally located below the Llama Open Pit;	Updated
Marine Laydown Area (MLA) means the Project area on the southwest shore of Bathurst Inlet intended to act as a connection to marine transport, as generally described in the Application;	No Change
MLA Shoreline Pad means a rockfill pad to accommodate offloading facilities at the MLA, as generally described in the Application;	New
MLA Water Supply Facilities means the facilities at the MLA designed to provide potable, construction, and industrial water as generally described in the Application. This includes temporary pumps and transportable tanks for withdrawal of water from MLA Pond S1, Pond S2, Lake 3 and Lake 4; and the desalination plant, marine water intake, and marine water discharge;	No Change
MLA Waste Management Facilities means the facilities at the MLA designed to sort and manage wastes such that combustible wastes are incinerated, Hazardous Wastes are stored prior to shipping South to an approved waste management facility, and non-combustible waste is sorted and/or stored prior to either shipping South to an approved waste management facility or shipping to the Goose Property for disposal in an approved Landfill, as generally described in the Application;	No Change
MLA Wastewater Treatment Facilities means facilities at the MLA designed to reduce the TSS of greywater prior to discharge to land as generally described in the Application. No sewage is treated at the MLA;	No Change

DRAFT

Maximum Average Concentration means the average concentration of any four consecutively collected samples taken from the identical sampling location and taken during any given timeframe;	No Change
Maximum Monthly Mean means the average concentration of all samples collected over a thirty-day period from the identical sampling location;	No Change
Metal Leaching means the mobilization of metals into solution under neutral, acidic or alkaline conditions;	No Change
Minister means the Minister of Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC, formerly the Minister of Indigenous and Northern Affairs Canada);	No Change
Modification means an alteration to a physical work that introduces a new structure or eliminates an existing structure and does not alter the purpose or function of the work;	No Change
Monitoring Program means the program to collect data on surface water and Ground Water quality to assess impacts to the environment of an appurtenant Undertaking;	No Change
Monthly means, in the context of monitoring frequency, one sampling event occurring every thirty (30) days with a minimum of twenty one (21) days between sampling events;	No Change
Non-Contact Water means the runoff originating from areas unaffected by mining activity that does not come into contact with developed areas;	No Change
Nunavut Agreement means the "*Agreement Between the Inuit of the Nunavut Settlement Area and Her Majesty the Queen in Right of Canada*," including its preamble and schedules, and any amendments to that agreement made pursuant to it;	No Change
Operations means the set of activities associated with mining, ore processing and recovery of gold; excluding Construction, decommissioning and permanent Closure activities;	No Change
Operations Phase means the period of time when the Project is producing gold. This phase is preceded by the Construction Phase and followed by the Closure Phase;	No Change
Operations Phase Stage(s)~~1~~ ~~means the period of time when the Project is producing gold and tailings deposit is occurring in the Tailings Storage Facility;~~means the set of activities associated with mining, ore processing and recovery of gold; excluding Construction, decommissioning and permanent Closure activities;	Updated
~~Operations Phase Stage 2~~ ~~means the period of time when the Project is producing gold and tailings deposit is occurring in the Umwelt Tailings Facility;~~	Delete
~~Operations Phase Stage 3~~ ~~means the period of time when the Project is producing gold and tailings deposit is occurring in the Goose Main Tailings Facility;~~	Delete
Operator means the person who operates, has control or custody of, or is in charge of a mine or recognized closed mine;	No Change
Ore Stockpile means a pile of mined ore placed at an underground mine laydown area or adjacent to the plant for later processing through the plant;	No Change

DRAFT

Plant Site Pond means the contact water pond located near the Plant Site Pad designed to be a gathering point for contact water from the Goose Property mine infrastructure including the Ore Stockpiles as generally described in the Application;	New
Post-Closure Phase means that period of time after the Closure Phase where confirmatory water quality, stability, aquatic effects, and ecosystem monitoring is conducted in order to ensure closure objectives have been met. The Post-Closure Phase is not within the scope of this Licence;	No Change
Primary Water Pond means the contact water pond located between the Llama WRSA and Umwelt WRSA designed to be a gathering point for contact water from the Goose Property mine infrastructure including WRSA(s), Ore Stockpiles, and open pits, as generally described in the Application;	No Change
Progressive Reclamation means actions that can be taken during mining operations before permanent Closure, to take advantage of cost and operating efficiencies by using the resources available from mine operations to reduce the overall reclamation costs incurred. It enhances environmental protection and shortens the timeframe for achieving the final Reclamation objectives and goals;	No Change
Project means the Back River Project as outlined in the Final Environmental Impact Statement and supplemental information submitted by Sabina Gold & Silver Corp. (Sabina) to the Nunavut Impact Review Board (NIRB) as well as the associated Water Licence Application, Supporting Documents, and Technical Meeting Information Supplement documents submitted by Sabina to the NWB throughout the regulatory process;	No Change
Quarry or Quarries means the areas of surface excavation for extracting rock material for use as construction materials in the development of infrastructure and facilities;	No Change
Quality Assurance/Quality Control (QA/QC) Quality Assurance means the system of activities designed to better ensure that quality control is done effectively; Quality Control means the use of established procedures to achieve standards of measurement for the three principle components of quality: precision, accuracy and reliability;	No Change
Rascal Stream Connectivity means the facilities designed to convey connectivity between Goose Lake and Rascal Lake via Rascal Stream as generally described in the Application;	New
Receiving Environment means both the aquatic and terrestrial environments that receive any discharge resulting from the Project;	No Change
Reclaim Water means contact water, treated effluent, treated sewage, and ~~t~~Tailings Storage Facility or Tailings Facilities supernatant that is used in the ~~Mill~~ process plant or other treatment systems to offset intake of fresh water from the environment for the same use;	Updated
Reclamation means the process of returning a disturbed site to its natural state or one for other productive uses that prevents or minimizes any adverse effects on the environment or threats to human health and safety;	No Change
Recognized Closed Mine means a recognized closed mine as defined in the *Metal and Diamond Mining Effluent Regulations,* SOR/2002-222 (as may be amended from time to time);	No Change
Regulations means the Nunavut Waters Regulations, SOR/2013-69;	No Change

DRAFT

Remediation means the removal, reduction, or neutralization of substances, wastes or hazardous material from a site in order to prevent or minimize any adverse effects on the environment and public safety now or in the future;	No Change
Reservoir means the waterbody at closure that fills an open pit that acts as a water management facility;	New
Saline Water Pond means the facilities designed to store saline water (groundwater) at the site of the dewatered Umwelt Lake and the berms, dams, dykes intended to increase the capacity of the dewatered lake, as generally described in the Application;	No Change
Saline Water Storage means the facilities designed to store saline water (groundwater) including the Saline Water Pond, Reservoirs, Tailing Storage Facilities, Tailings Facilities, other surface ponds, and various mined out underground works, as generally described in the Application;	Updated
Secondary Containment means an impermeable structure, external to and separate from primary containment, which prevents unplanned spills of hazardous materials and provides a minimum capacity of 110% of the original vessel. Where multiple vessels are stored within the containment, it must provide a minimum capacity equal to the sum of the largest vessel and 10% of the aggregate volume of all other vessels located in the containment. This structure shall also provide containment and control of hoses and nozzles;	No Change
Seepage means any water that drains through or escapes from any structure designed to contain, withhold, divert or retain water or waste. Seepage also includes any flows that have emerged through open pits, runoff from Waste Rock Storage Areas, ore stockpile areas, quarries, Landfill or Landfarm areas;	No Change
Sewage means all toilet wastes and greywater;	No Change
Sewage Treatment Plant means the package sewage treatment plant located at the Goose Property Plant Site as described in the Application document entitled *Landfill and Waste Management Plan* ~~dated October 2017~~;	Updated
Short Term Maximum means the maximum concentration of all samples collected over a 24 hour period, or less, taken from the identical sampling location;	No Change
Soil Quality Remediation Objectives (SQRO's) means the numerical concentration established as target value for soil quality remediation for contaminated sites as determined with guidance provided by the *Canadian Council of Ministers of the Environment (CCME)*;	No Change
Sump means a structure or depression that collects, controls, and filters liquid waste before it is released to the environment. This structure should be designed to prevent erosion while allowing percolation of liquid waste;	No Change
Tailings Facility means an open pit that is utilized to store tailings, waste rock, and/or acts as a water management facility ~~as generally described in the Application;~~(i.e., Llama, Umwelt, Echo, Goose Main);	Updated
Tailings Storage Facility means the purpose-built above ground facility designed to store tailings, waste rock and/or act as a water management facility as generally described in the Application;	No Change
Traditional Knowledge means the practical knowledge that has been gathered through the experience of living in close contact with nature and has been passed along or communicated orally, and handed down from generation to generation;	No Change

DRAFT

Umwelt Open Pit means the open pit located adjacent to Umwelt Lake named the Umwelt Open Pit and all directly related infrastructure as generally described in the Application. The Umwelt Open Pit is generally located above the Umwelt Underground works;	No Change
Umwelt Reservoir means the waterbody at closure that fills the Umwelt Open Pit;	New
Umwelt Underground means the underground works located adjacent to Umwelt Lake named the Umwelt Underground and all directly related infrastructure as generally described in the Application. The Umwelt Underground is generally located below the Umwelt Open Pit;	No Change
Undertaking or Undertakings means an undertaking or undertakings in respect of which Water is to be used or Waste is to be deposited, as classified in Schedule 1 of the *Regulations*;	No Change
Use means use as defined in section 4 of the *Act*;	No Change
Waste means waste as defined in section 4 of the *Act*;	No Change
Waste Disposal Facilities means all facilities designated for the disposal of waste including: Goose Property Sewage Treatment Plant, Water Treatment Plant, Landfill, and Waste Rock Storage Area(s), Hazardous Waste Management Areas, Tailings Storage Facility, Tailings Facilities; Incinerators, as generally described in the Application;	No Change
Waste Rock means all unprocessed rock materials that are or were produced as a result of mining operations and that have no current economic value;	No Change
Waste Rock Storage Area(s) means facilities designed for the storage of Waste Rock and management of runoff and seepage from the Waste Rock;	No Change
Wastewater means the water generated by site activities or that originates on-site and that requires treatment or any other water management activity;	No Change
Water Treatment Plant means the facilities designed for the reduction of TSS (and other treatments if necessary) in dewatering water ~~early in the Project~~ and/or for reduction of TSS and metals in ~~athe Goose Main~~ Tailings Facility, Tailings Storage Facility or Reservoir ~~later in the Project~~;	Updated
Water means water as defined in section 4 of the *Act*;	No Change
Weekly means, in the context of monitoring frequency, one sampling event occurring every 7 days with a minimum of 5 days between sampling events;	No Change
Winter Ice Road Service/Emergency Camps means the camps located adjacent to the WIR to support construction, operation, or maintenance, and provide emergency shelter described in the Application;	New
Winter Ice Road means a road constructed of snow or ice over land or Water, and may include subbase upgrades, as generally described in the Application.	Updated

DRAFT

SCHEDULE B: GENERAL CONDITIONS		
The Annual Report referred to in Part B, Item 2, shall include:		
1.	For the dikes, dams and structures constructed to withhold water or waste: a. An overview of methods and frequency used to monitor deformations, Seepage and geothermal responses; b. A comparison of measured versus predicted performance; c. A discussion of any unanticipated observations including changes in risk and mitigation measures implemented to reduce risk; d. As-built drawings of all mitigation works undertaken; e. Any changes in the design and/or as-built condition and respective consequences of any changes to safety, water balance and water quality; f. Data collected from instrumentation used to monitor earthworks and an interpretation of that data; g. A summary of maintenance work undertaken as a result of settlement or deformation of dikes and dams; and h. The monthly and annual quantities of Seepage from dikes and dams in cubic metres.	No Change
2.	Monthly and annual volume of fresh Water obtained from all sources.	No Change
3.	Summary of Interconnection Winter Ice Road plans implemented in accordance with Part E, Item 13.	No Change
4.	Summary of Dewatering Plans implemented in accordance with Part E, Item 14.	No Change
5.	Summary update to the Water and Load Balance results, if any, including an annual comparison of measured groundwater inflow rates to model predictions.	Updated
6.	Geochemical monitoring results including: a. Operational acid/base accounting and associated test work used for Waste Rock designation (PAG and NPAG rock); b. As-built volumes of Waste Rock used in construction and placed in the Waste Rock Storage Areas with estimated balance of acid generation to acid neutralization capacity in a given sample as well as metal toxicity; c. All monitoring data with respect to geochemical analyses on site and related to roads and quarries; d. Any Leaching observations and tests collected on pit slope and dike exposure; and e. Any geochemical outcomes or observations that could imply or lead to environmental impact.	No Change
7.	Volumes of ore stockpiled.	No Change
8.	Summary of quantities and analysis of Seepage and runoff monitoring from the Tailings Storage Facility, Waste Rock Storage Areas, Landfill(s) and associated dikes/berms.	No Change
9.	A summary report of all general Waste disposal activities including monthly and annual quantities in cubic metres of Waste generated and location of disposal.	No Change
10.	Reporting of Incinerator test results including the materials burned and the efficiency of the Incinerator in relation to effects on Water and the potential Deposit of Waste into Water.	No Change
11.	A list and description of all unauthorized discharges including volumes, spill report line identification number and summaries of follow-up action taken.	No Change
12.	A summary of Modifications and/or major maintenance work carried out on all Water and Waste-related structures and facilities.	No Change
13.	The results and interpretation of the Monitoring Program in accordance with Part I and Schedule I.	No Change
14.	The results of monitoring related to the General and Aquatic Effects Monitoring Program in accordance with Part I Item 1.	No Change
15.	A summary of any progressive Closure and Reclamation work undertaken, including photographic records of site conditions before and after completion of operations, and an outline of any work anticipated for the next year, including any changes to implementation and scheduling.	No Change

DRAFT

16.	An updated estimate of the current reclamation liability based on Project development monitoring, results of restoration research and any changes or modifications to the Appurtenant Undertaking.	No Change
17.	A summary of any studies requested by the Board that relate to Water use, Waste disposal or Reclamation, and a brief description of any future studies planned.	No Change
18.	Where applicable, revisions as Addenda, with an indication of where changes have been made, for plans, reports, and manuals.	No Change
19.	An executive summary in English, Inuktitut, and Inuinnaqtun of all plans, reports, or studies conducted under this Licence.	No Change
20.	A summary of actions taken to address concerns or deficiencies listed in the inspection reports and/or compliance reports filed by an Inspector.	No Change
21.	A summary of public consultation and participation with local organizations and the residents of the nearby communities, including a schedule of upcoming community events and information sessions.	No Change
22.	Any other details on Water use or Waste disposal requested by the Board by November 1st of the year being reported.	No Change
SCHEDULE D: CONDITIONS APPLYING TO CONSTRUCTION		
1.	The Construction Summary Report referred to in Part D Item 11 shall include: a All final design and construction drawings (must be stamped and signed by a Professional Engineer when related to an Engineered Structure). b Site specific data and analysis, including Geochemical analysis of waste rocks and fills, demonstrating their Non Acid Rock Drainage and Non Metal Leaching characteristics, to support the design and management decisions; c A summary of construction activities including photographic records before, during and after construction; d As-built drawings: e Documentation and detailed explanation of field decisions reflecting any deviations from original construction drawings and plans, and how such deviations may affect performance of engineered structures; f Discussion of mitigation measures implemented during construction and effectiveness of measures taken; g Monitoring undertaken in compliance with Part D and/or Part J of the Licence; h Blast vibration monitoring for quarrying activities carried out in close proximity to fish bearing waters; i Monitoring for sediment release from construction areas; and j Monitoring and reporting on use of Water to manage dust emissions from crushing and construction activity.	No change

DRAFT

SCHEDULE I: CONDITIONS APPLYING TO GENERAL AND AQUATIC EFFECTS MONITORING

TABLE 1 - MONITORING GROUP

Group Code	Group Descriptor	Parameters	
A	Field Chemistry	pH, specific conductivity, and temperature.	No Change
B	Flow	Flow datalogger, calculated volume	No Change
C	General Surface runoff	Total Suspended Solids (TSS), Oil and Grease, pH	No Change
D	General Chemistry	Conventional: turbidity, hardness, alkalinity, calcium, chloride, fluoride, magnesium, potassium, sodium, sulphate, total dissolved solids (measured and calculated), TSS, total cyanide, free cyanide, and weak acid dissociable (WAD) cyanide. Nutrients: ammonia, nitrate, nitrite, total phosphorus (TP), and dissolved organic carbon. Total and dissolved metals: aluminum, arsenic, barium, cadmium, chromium, copper, iron, lead, manganese, mercury, molybdenum, nickel, phosphate, selenium, silver, strontium, thallium, uranium, and zinc Other: when required, lab pH and Conductivity	No Change
E	Secondary Containment	TSS, pH, ammonia, total arsenic, total copper, total lead, total nickel, total zinc, benzene, toluene, ethylbenzene, xylene, Oil and Grease	No Change
F	Sewage	Biochemical Oxygen Demand (5-day), TSS, Fecal coliform, ammonia, phosphorus, Oil and Grease, pH	No Change
G	*MDMER* deleterious substances	TSS, total cyanide, total arsenic, total copper, total lead, total nickel, total zinc, and radium-226	No Change
H	*MDMER* toxicity	Acute toxicity (Rainbow Trout and Daphnia magna)	No Change
I	*MDMER* sublethal toxicity	Sublethal toxicity (Fathead Minnow or Rainbow Trout, Ceriodaphnia dubia, Lemna minor, Pseudokirchneriella subcapitata)	No Change
J	Discharge to Marine	Total Suspended Solids, Salinity, total metals (aluminum, arsenic, barium, cadmium, chromium, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, strontium, thallium, uranium, and zinc), oil and grease, and lab pH	No Change
MDMER = Metal and Diamond Mining Effluent Regulations, SOR/2002-222 (as may be amended from time to time)			

DRAFT

TABLE 2 – MONITORING PROGRAM

Monitoring Program Station	Monitoring Type	Description	Mine Phase	Group Code	Frequency	
BRP-G-01 To BRP-G-TBD	Regulated Monitoring	**General Site Runoff** Surficial runoff anywhere at both Goose Property and MLA, including quarries; monitoring for erosion and sedimentation.	Construction	C	Weekly if flow enters a waterbody	No Change
BRP-S-01 to BRP-S-TBD	General Monitoring	**General Seeps** Seepage or runoff from excavated and/or stockpiled material anywhere at both Goose Property and MLA, including quarries, that does not gather into a collection system or the site is reclaimed.	Construction and Operations	A, D	Monthly during flow, or as found	No Change
BRP-01	Regulated Monitoring	**Goose Lake Discharge** (discharge point for release of dewatering effluent with or without treatment)	Construction	A, B, G	Weekly during dewatering	Location Updated
				D	Four times during dewatering, at the same time as the weekly samples	
				H	Once per month during dewatering, at the same time as Group D	
				I	One time during dewatering, at the same time as Group D	
BRP-02	General Monitoring	**Llama Lake** (intake point for dewatering, triggers need for treatment prior to discharge at BRP-01)	Construction	C (TSS only)	Weekly if treatment is required; no sample if treatment is not required	No Change
BRP-03	Verification Monitoring	**Llama Pit** (representative of collected pit water prior to transfer to tailings management facility)	Operations ~~Stage 1 to Operations Stage 2~~	A, G	At Licensee's discretion	Updated
BRP-04	General Monitoring	**Llama Pit Lake** (representative of flooded pit during flooding and before overflow to the downstream environment)	Closure* to Post-Closure*	A, D	Twice per year	No Change
BRP-05	Verification Monitoring	**Llama WRSA Pond** (representative of collected water quality)	Operations ~~Stage 1~~ to Closure*	A, G	At Licensee's discretion	Updated

DRAFT

BRP-06	General Monitoring	**Umwelt Lake** (intake point for dewatering, triggers need for treatment prior to discharge at BRP-01)	Construction	C (TSS only)	Weekly if treatment is required; no sample if treatment is not required	No Change
BRP-07	Verification Monitoring	**Umwelt Pit** (representative of collected pit water prior to transfer to tailings management facility)	Construction to Operations ~~Stage 2~~	A, G	At Licensee's discretion	Updated
BRP-08	General Monitoring	**Umwelt Pit Lake** (representative of flooded pit during flooding and before overflow to the downstream environment)	Closure to Post-Closure*	A, D	Twice per year	No Change
BRP-09	Verification Monitoring	**Umwelt WRSA Pond** (representative of collected water quality, including landfill seepage/runoff)	Construction to Closure (early)*	A, G	At Licensee's discretion	Inactive
BRP-10	Verification Monitoring	**Primary Water Pond** (representative of collected water quality)	Construction to Closure (early)*	A, D	At Licensee's discretion	No Change
BRP-11	Verification Monitoring	**Saline Water Pond** (representative of stored water quality)	Construction (late) to Closure (early)*	A, D	At Licensee's discretion	No Change
BRP-12	General Monitoring	**Big Lake Intake** (intake point for potable and industrial water withdrawal)	Construction to Closure*	A, D	Four times per year	No Change
				B	Weekly	
BRP-13	Verification Monitoring	~~**Ore Stockpile**~~**Plant Site Pond** (representative of collected water quality)	Construction to Closure (early)*	A, D	At Licensee's discretion	Updated
BRP-14	Verification Monitoring	**ANFO Plant** (representative of collected water quality)	Construction to Closure*	A, E	At Licensee's discretion	No Change
BRP-15	Regulated Monitoring	**Goose Fuel Tank Farm** (representative of collected water quality)	Construction to Closure*	A, E	Prior to discharge or transfer of water	Location Updated
BRP-16	Regulated Monitoring	**Goose Hazardous Waste Management Area** (representative of collected water quality)	Construction to Closure*	A, E	Prior to discharge or transfer of water	Location Updated
BRP-17	Regulated Monitoring	**Goose Property Sewage Treatment Plant** (discharge point for treated sewage onto land)	Construction to Closure*	A, F	Prior to discharge	Location Updated
BRP-17A	Regulated Monitoring	**Goose Property Sewage Treatment Plant** (discharge point for treated sewage into Tailings Storage Facility or Tailing Facility)	Construction to Closure*	A, F	Prior to discharge	No Change
BRP-18	General Monitoring	**Llama Watershed Outflow** (representative of non-contact water, PN04 from *Water and Load Balance*)	Operations ~~Stage 1 to~~ Closure*	A, D	Once during freshet, and monthly during	Updated

DRAFT

					upstream construction while visible flow is present at the stations	
BRP-19	General Monitoring	**Echo Outflow** (representative of non-contact water). PN09 from water and load balance	Operations ~~Stage 1~~ to Closure*	A, D	Once during freshet, and monthly during upstream construction while visible flow is present at the stations	Updated
BRP-20	Verification Monitoring	**Echo Pit** (representative of collected pit water prior to transfer to tailings management facility)	Operations ~~Stage 2~~	A, G	At Licensee's discretion	Updated
BRP-21	General Monitoring	**Echo Pit Lake** (representative of flooded pit during flooding and before overflow to the downstream environment)	Closure* to Post-Closure*	A, D	Twice per year	No Change
BRP-22	Verification Monitoring	**Echo WRSA Pond** (representative of collected water quality)	Operations ~~Stage 2~~ to Closure (early)*	A, G	At Licensee's discretion	Updated
BRP-23	General Monitoring	**Gander Pond Outflow** (representative of non-contact water, PN07 from *Water and Load Balance*)	Operations ~~Stage 1~~ to Closure*	A, D	Once during freshet, and monthly during upstream construction while visible flow is present at the stations	Updated
BRP-24	General Monitoring	**Goose Lake Intake** (intake point for potable and industrial water withdrawal)	Operations ~~Stage 1~~ to Closure (early)*	B	Weekly	Location Updated
BRP-25	Verification Monitoring	**Goose Pit** (representative of collected pit water prior to transfer to tailings management facility)	Operations ~~Stage 1 to Operations Stage 2~~	A, G	At Licensee's discretion	Updated
BRP-26	General Monitoring	**Goose Pit Lake** (representative of flooded pit during flooding and before overflow to the downstream environment)	Closure* to Post-Closure*	A, D	Twice per year	No Change
BRP-27	Verification Monitoring	**Goose Main Tailings Facility** (intake point for water treatment, represents pre- treatment water quality)	Operations ~~Stage 3~~ to Closure*	A, G	At Licensee's discretion	Updated

Executive Summary

A site specific water quality objective (SSWQO) was developed for nitrate based on chronic toxicity test data that were available in the literature and from a recent investigation conducted by Nautilus Environmental (2011a and 2011b) on the effect that water hardness has on the toxicity of nitrate.

Acceptable toxicity data were available for: one green algal species (*Pseudokirchneriella subcapitata*); four invertebrates, including two zooplankton (*Ceriodaphnia dubia* and *Daphnia magna*), one epibenthic amphipod (*Hyalella azteca*), and one benthic midge larva (*Chironomus dilutus*); and four fish, two salmonids (*Oncorhynchus mykiss* and *Salvelinus namaycush*), and two non-salmonids (*Pimephales promelas* and *Notropis topeka*). These data met the CCME requirements for establishing a Type A water quality guideline using a Species Sensitivity Distribution (SSD).

The relationship between water hardness and chronic toxicity has been established for four species, each of which was represented in the SSD. The slope of the relationship between water hardness and toxicity was pooled for these four species to establish a slope that could be used to adjust the toxicity data on the basis of the hardness that the test was conducted under. The approach used for hardness correction followed procedures used by the US EPA for incorporating water hardness into water quality benchmarks for metals requiring such adjustment. The pooled slope was 0.9512, which was used to adjust the toxicity data to a common hardness.

The SSD of the hardness-normalized toxicity data was evaluated using five distributions (Fisher Tippett, normal, logistic, Weibull and Gompertz), and the logistic regression was selected as the most appropriate fit. This distribution resulted in an HC_5, which is the concentration that is considered to be protective of at least 95% of species, of 6.5 mg/L NO_3-N at a hardness of 60 mg/L. In August 2011 water hardness in lakes downstream of the Long Lake Containment Facility (Leslie, Moose, Nema and Slipper lakes, and two stations in Lac de Gras) ranged between 7.1 mg/L and 139 mg/L (average 60.9 mg/L).

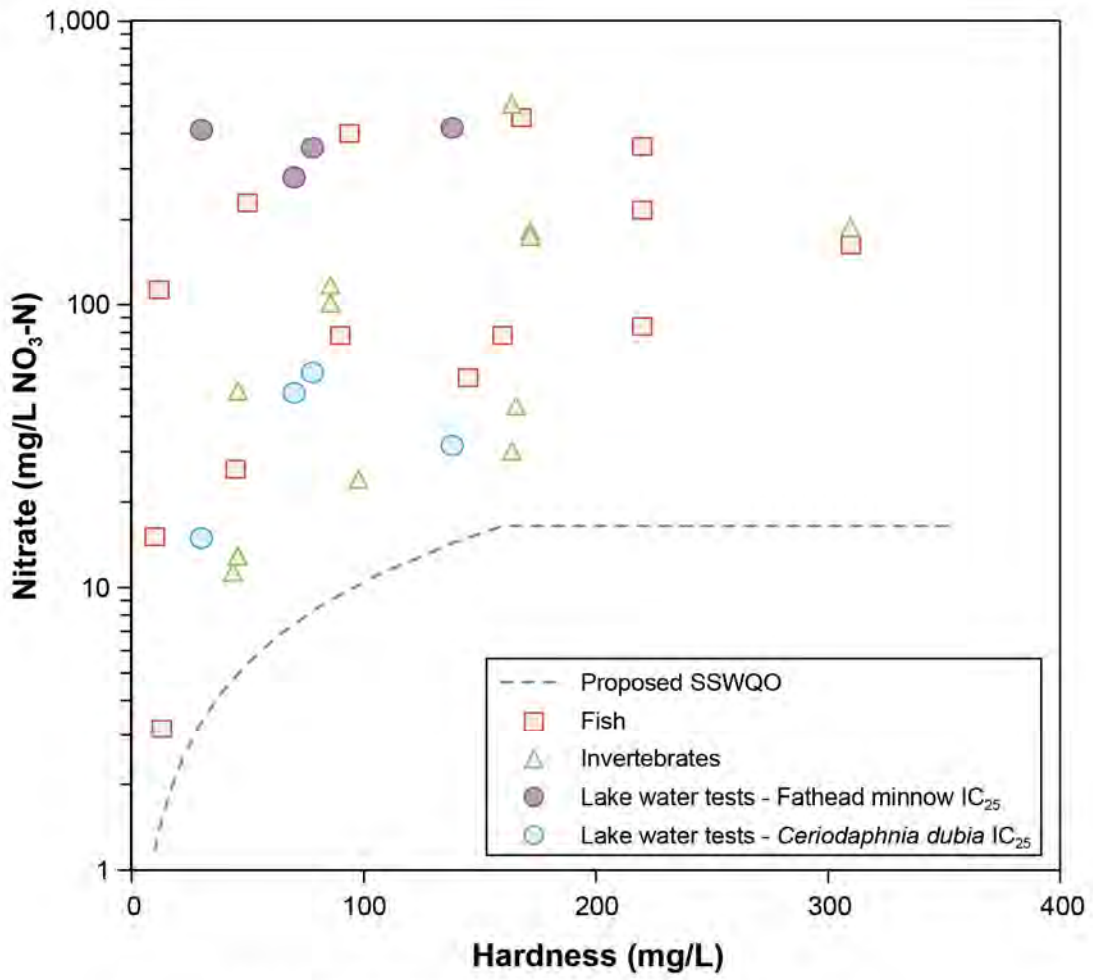
After incorporation of the pooled slope, the final equation for the SSWQO was as follows:

$$WQO = e^{(0.9518 \times \ln(\text{hardness}) - 2.032)}$$

The relationship between water hardness and nitrate toxicity was established across a range of water hardness values of up to approximately 160 mg/L (16.4 mg/L NO_3-N); values with hardness greater than 160 mg/L were conservatively assumed to have the same nitrate values as determined for that water hardness. Figure 1 shows the proposed SSWQO across a range of hardness values (levelling off after 160 mg/L water hardness), as well as toxicity data that were considered primary or secondary quality, tested at water hardness values ranging from 10 mg/L to 310 mg/L. All of the toxicity test thresholds fall above the proposed SSWQO, indicating that the proposed objective is conservatively protective across the full range of water hardness values.

In addition to the ensuring that the requirements for a valid SSWQO derivation were met from the toxicological database as described above, BHP Billiton conducted further site-specific confirmatory tests to increase confidence in the derivation. Tests conducted in water collected from four lakes at EKATI (Slipper, Nema, Moose and Leslie lakes) using an invertebrate (*C. dubia*) and a fish (*P. promelas*) demonstrated that the proposed SSWQO was appropriate under the conditions associated with site waters. An additional reduction in toxicity of nitrate was evident in the site waters, over-and-above that established on the basis of hardness, providing an additional level of safety associated with the proposed SSWQO. This additional protection is associated with the balance of major ions present in the site waters.

Figure 1. Proposed Site Specific Water Quality Objective (SSWQO) for Nitrate as a Function of Water Hardness and Individual Toxicity Test Results for Nitrate



Notes: Each individual point reflects the toxicity threshold from an individual test.
The SSWQO for specific hardness values are provided in Table 4.3.2 in the main text.

1. Introduction

1.1 BACKGROUND

BHP Billiton Canada Inc. (BHP Billiton) operates the EKATI Diamond Mine (EKATI) located approximately 300 km northeast of Yellowknife, Northwest Territories, Canada. The mine site is in the southern Arctic ecoregion.

BHP Billiton is committed to minimizing the impacts of EKATI on the aquatic environment, and to sustainable management of the aquatic environment. BHP Billiton developed the Aquatic Effects Monitoring Program (AEMP) to document any changes that occurred following mine construction, operation, and expansion, and to provide early warnings of environmental changes. The AEMP at EKATI is a requirement specified in BHP Billiton's Class A Water Licence (W2009L2-0001). The Water Licence outlines the regulatory requirements for water quality at EKATI. For several water quality variables there are Water Licence discharge criteria that must not be exceeded. A discharge criterion for nitrate is provided only for effluent discharge from Two-Rock Settlement Pond (Surveillance Network Program (SNP) station 0008-Sa3) located in the Horseshoe Watershed at the Sable development, which has not yet been constructed. There is no discharge criterion for nitrate in effluent discharge from the Long Lake Containment Facility (LLCF) (SNP station 1616-30) or the King Pond Settling Facility (SNP station 1616-43).

Along with discharge water quality, water quality downstream of LLCF and KPSF is also monitored. Receiving water quality is compared to generic national guidelines provided by the Canadian Council of Ministers of the Environment (CCME 2007a). These guidelines do not have any legal or regulatory standing, but are used as default receiving environment benchmarks. For some water quality variables, a site specific water quality objective (SSWQO) is appropriate and provides a modified generic guideline value to better represent local conditions and the biological community present at the site.

The Water Licence does not specify a guideline for nitrate concentrations for SNP stations 1616-30 and 1616-43. However, BHP Billiton has adopted performance standards established by Environment Canada for the agriculture industry (Guy 2008) for nitrate toxicity as part of their assessment of receiving environment quality. This benchmark is 4.7 mg/L NO_3-N, and was considered appropriate for use at EKATI since the approach taken in development of the Ideal Performance Standard (IPS) was largely consistent with current methods employed for development of Canadian water quality guidelines (WQGs), including use of a Species Sensitivity Distribution (SSD) for guideline derivation (CCME 2007b). The toxicity data used in the derivation of the IPS were also largely relevant to EKATI, with the exception that one-third of the data used in development of the IPS were for amphibians. Although amphibians are known to occur in the Northwest Territories, the EKATI area is beyond their known distribution which is generally below the tree line (ENR 2006, 2012a and 2012b). In addition, amphibians have not been observed during the wildlife effects monitoring program (WEMP) or other biological surveys at EKATI (B. Milakovic and K. Kuker personal communication). Regardless, the IPS was considered to be a conservative benchmark for monitoring the receiving environment and more relevant than the existing CCME guideline for nitrate.

The current AEMP was designed to detect effects in the EKATI receiving environment within two major watersheds (Figure 1.1-1). In the Koala Watershed, the AEMP monitors waters downstream of the LLCF, including the LLCF discharge (SNP station 1616-30), Leslie Lake, Leslie-Moose Stream, Moose Lake, Moose-Nero Stream, Nema Lake, Nema Martine Stream, Slipper Lake, Slipper-Lac de Gras Stream, and two lake monitoring sites in Lac de Gras (S2 and S3). Within the King-Cujo Watershed, the AEMP monitors water

downstream of the KPSF including the KPSF discharge (SNP station 1616-43), Cujo Lake, Cujo Outflow Stream, Christine-Lac du Sauvage Stream, and two monitoring sites in Lac du Sauvage (LdS1 and LdS2).

Nitrate concentrations in the Koala watershed have been increasing since commissioning of the mine and have periodically exceeded the water quality objective of 4.7 mg/L NO_3-N in Leslie, Moose and Nema lakes, but not in downstream water bodies (Figure 1.1-2; Appendix A). However similar increases in nitrate have not been observed in streams and lakes of the King-Cujo Watershed (Figure 1.1-3 to 1.1-5; Appendix A).

Recent investigations have established that water hardness plays an important role in modifying the chronic toxicity of anions such as sulphate and chloride (Elphick et al. 2011a and 2011b). Consequently, an investigation was conducted to establish whether water hardness also alters the toxicity of nitrate; the results of these tests have demonstrated that water hardness does indeed reduce the toxicity of nitrate (Nautilus Environmental 2011a and 2011b; Appendix B). The mechanism responsible for this effect has not been definitively established; however, it is likely that the mechanism relates either to competition between ions at passive ionic uptake sites or to effects that the hardness-related ions (i.e., calcium and/or magnesium) have on membrane permeability. The latter mechanism has its basis in osmo-regulation; under low ionic strength conditions, freshwater organisms are limited in their ability to obtain necessary ions from the surrounding media, and may open uptake channels to maximize uptake of essential nutrients, whereas under higher ionic strength conditions, the permeability of the membrane may be reduced, since the organisms have less difficulty acquiring the ions required for homeostasis. Therefore, under low hardness (ionic) conditions, ions including nitrate may have a greater chance of being taken up by organisms than under high hardness conditions when ion channels are more controlled.

The results of AEMP monitoring have indicated that water hardness has increased in water bodies downstream of the LLCF and to a lesser extent, the KPSF (Figures 1.1-2 to 1.1-5; Appendix A). A strong relationship between water hardness and nitrate concentration is observed in samples collected from Leslie, Moose, Nema, and Slipper lakes (Figure 1.1-6), particularly in cases where nitrate concentrations have approached and exceeded the current IPS water quality objective (i.e., in Leslie and Moose Lakes). Thus, any role that water hardness plays in modifying the toxicity of nitrate is highly relevant to this site.

The CCME WQG for nitrate is currently under review and a draft of the revised guideline was issued for public comment in February 2011. As part of this effort, published and otherwise available studies investigating the toxicity of nitrate in short- and long-term exposures have been reviewed by CCME and evaluated for data quality. In addition to the recent review conducted by the CCME, toxicological data for nitrate are available from a recent investigation conducted by Nautilus Environmental (2011a and 2011b); these investigations have increased the available dataset on toxicological effects associated with nitrate, as well as demonstrating the role that water hardness plays in modifying the toxicity of nitrate. In addition, a small amount of additional data were available from other investigations published subsequent to the recent review conducted by CCME and were reviewed. The availability of additional chronic toxicity data, as well as the notable effect of water hardness on toxicity of nitrate, strongly supports development of a SSWQO for nitrate that considers water hardness as a Toxicity Modifying Factor (TMF) per CCME (2007b).

1.2 NITRATE UNITS

The convention for reporting nitrate concentrations differs between jurisdictions and individual investigations, with some reporting concentrations of nitrate as NO_3 and others as nitrogen (i.e., as NO_3-N). The difference between these values corresponds to the proportionate difference between the molar mass of NO_3 (62.005 g/mol) and N (14.007 g/mol). Values reported in the present document are reported as NO_3-N, and data have been corrected, where necessary, using these molar masses (i.e., values reported as NO_3 have been divided by 4.427 and reported here as NO_3-N).

1.3 OBJECTIVES

The recent review of nitrate toxicity conducted by CCME, the additional toxicological data for this anion available from Nautilus Environmental (2011a and 2011b; Appendix B) and others, as well as the role that water hardness has been shown to play in modifying the toxicity of nitrate, provide the basis for developing a SSWQO for nitrate at EKATI. Consequently, the objective of this report is the development of a proposed SSWQO for nitrate for the receiving environment at EKATI.

The focus of this SSWQO is on toxicity relating to long-term exposure to nitrate, for application in receiving environment long-term monitoring. Because hardness also modifies toxicity in short-term tests, it may be appropriate in the future to establish a hardness-linked SSWQO for short-term exposure.

To achieve the above main objective, the following components of deriving a SSWQO for nitrate were completed:

- a brief discussion of existing long-term guidelines relative to their applicability to EKATI (Section 2);
- a description of the methodology used in deriving the SSWQO (Section 3);
- a summarized discussion of the fate and behaviour, chronic toxicity studies, and calculation of the SSWQOs (Section 4); and
- a discussion of uncertainties related to each step of the process (Section 5).

Development of the SSWQOs followed established Canadian procedures for site-specific benchmark calculations and updated methods for their development (CCME 2003, 2007b), and incorporated methods from US EPA (1985) for inclusion of water hardness as a toxicity modifying factor.

2. Review of Current and Historical Water Quality Benchmarks

Rescan™
Engineers and Scientists

2. Review of Current and Historical Water Quality Benchmarks

2.1 BACKGROUND

In Canada, WQGs are used largely as benchmarks for receiving environments, and do not have legal standing for compliance monitoring. The terms guideline, criterion, trigger value and objective are used by different jurisdictions to generally refer to levels for specific chemicals that are considered safe (i.e., pose minimal risk) in the environment. In Canada, these benchmarks are not equivalent to end-of-pipe discharge limits or standards that are specified in discharge permits; they refer to water quality in receiving water bodies.

Historically, Canadian WQGs have been derived using a safety factor approach, as described in CCME (1991). This method involves application of a safety factor (often ten-fold) to the toxicological effect level for the most sensitive species in order to calculate the WQG. This approach generally provides a highly conservative estimate of a concentration of the chemical of interest that would be expected to be safe across a broad spectrum of conditions associated with Canadian environments, as well as accounting for the possibility that species exist that are more sensitive than those that have been tested. However, this approach relies entirely on the results of a single study on a single species and, therefore, is subject to anomalous test results. In addition, in cases where data are only available for a small number of species, it also might not provide adequate protection for all taxa.

Environment Canada has updated procedures for establishing WQGs to include the use of a Species Sensitivity Distribution (SSD) where sufficient data exist (CCME 2007b). This approach involves assembling a cumulative distribution of toxicity endpoints for all species for which data are available and extrapolating the guideline based on the goal of protection of at least 95% of species. A sigmoidal distribution is fit to the data using a number of models, and the model that best fits the cumulative distribution (particularly in the lower tail of the distribution where the data for sensitive species occur) is used to determine the concentration that is expected to be protective of 95% of tested species. This concentration is termed the HC_5 (hazard concentration to 5% of the tested species), and is established as the WQG. Despite the apparent acceptance of effects on 5% of species, this approach is considered to be consistent with the guiding principal of protecting all forms of aquatic life because the distribution is comprised of threshold concentrations that are not expected to affect organisms (CCME 2007b). In addition, a protection clause may be invoked to lower the guideline from the HC_5 in the event that a threshold for a protected or otherwise critical species falls below the calculated WQG value.

WQGs can be calculated using the SSD approach with data from short-term (typically lethal concentration to 50% of tested species [LC_{50}] values from acute toxicity tests) or long-term exposures (threshold values from long-term tests), in order to calculate short-term or long-term guidelines, respectively. The advantage of using an SSD approach (which is termed a Type A guideline), over application of a safety factor (Type B guideline) is that it uses all of the available data to calculate a benchmark, rather than relying on a single data point. As a result, the SSD approach is less subject to individual anomalies within the dataset.

Generic WQGs, whether calculated based on application of a safety factor or use of an SSD, are meant for application across a broad range of water quality conditions and biological community structures. However, site-specific conditions can alter the risk associated with a particular contaminant, as a result of interaction of the substance with water quality characteristics or differences in the

composition of biological communities compared with that available within the dataset used to calculate the generic guideline. Consequently, guidance for derivation of site-specific WQGs (SSWQGs) in Canada has been published by CCME (2003).

2.2 EXISTING GENERIC WATER QUALITY BENCHMARKS

The current CCME WQG for nitrate is 13 mg/L as NO_3 (CCME 2003), which corresponds to 2.9 mg/L NO_3-N. This value was calculated on the basis of application of a ten-fold safety factor to the Lowest Observed Effect Concentration (LOEC) from a test using the Pacific tree frog, *Pseudacris regilla*. This guideline was not considered appropriate for EKATI since amphibians have not been documented as occuring in receiving environments surrounding the EKATI mine. In addition, procedures for development of WQGs have been updated to consider the distribution of species sensitivities, rather than focussing on individual data points (CCME 2007b).

Site-specific toxicity testing was conducted for EKATI in 2003 to evaluate the sensitivity of early life stages of lake trout (*Salvelinus namaycush*) and lake whitefish (*Coregonus clupeaformis*), both of which are resident species of fish in the lakes surrounding EKATI. The purpose of this testing was to establish whether species of fish that occur in sub-Arctic lakes might be different in their sensitivity to nitrate than the amphibian species on which the CCME WQG was based. The tests were conducted using sodium nitrate spiked into dechlorinated municipal tapwater. The results of these tests indicated that both species were sensitive to nitrate, although the results from the test using lake whitefish were complicated by poor survival of the control fish. The results of these tests have been published in the peer reviewed literature (McGurk et al. 2006), and provide the most sensitive published test endpoint for nitrate for any species. The authors concluded that these species of fish were as sensitive as the amphibian species on which the CCME guideline was based. Consequently, the CCME (2003) WQG for nitrate was initially adopted as a WQO for nitrate at EKATI.

In 2008, Environment Canada calculated an Ideal Performance Standard (IPS) for nitrate under the National Agri-Environmental Standards Initiative (NAESI) program (Guy 2008). IPS values were developed as non-regulatory guidelines for water quality in agricultural areas. The guideline value was calculated as the 5^{th} percentile from a SSD, incorporating a total of 12 species, including four invertebrates (*Ceriodaphnia dubia, Daphnia magna, Hyalella azteca* and *Macrobrachium rosenbergii*), four fish (*Oncorhynchus mykiss, Oncorhynchus tshawytscha, Pimephales promelas* and *Salvelinus namaycush*) and four amphibians (*Pseudacris regilla, Rana aurora, Rana pipiens* and *Xenopus laevis*) (Guy 2008). The derivation approach was analogous to revised guidance for deriving CCME type A WQGs (CCME 2007b). The IPS was established as 20.9 mg/L NO_3, which corresponds to 4.7 mg/L NO_3-N. Although this value was calculated for application to agricultural areas, there was nothing in the derivation process that was specific to agricultural sources and, consequently, this value was proposed and implemented as a WQO at EKATI in 2008.

CCME is in the process of revising the Canadian WQG for nitrate using an SSD approach; the draft CCME WQG was released for public comment in February 2011. The process used to develop the draft CCME WQG was largely consistent with that utilized in development of the IPS for nitrate, and followed the SSD approach. In general, the dataset employed by CCME in deriving the draft WQG was consistent with that used in development of the IPS for nitrate. The exceptions were that CCME added a species, the Topeka shiner (*Notropis topeka*), and endpoints for three of the 12 species used in deriving the IPS were different than CCME endpoints because of identification of additional studies or recalculation of the endpoints. The draft CCME WQG is not considered appropriate for application at EKATI since this guideline has not yet been finalized following the public comment period, and it includes species not relevant to the EKATI aquatic community.

WQGs for nitrate have been published in other jurisdictions. For example, the British Columbia WQG is 3 mg/L NO_3-N, based on application of a ten-fold safety factor to data for *Pseudacris regilla* (BCMoE 2009), similar to the existing CCME guideline discussed above. WQGs for nitrate in Australia and New Zealand were established in 2000 (ANZECC/ARMCANZ 2000) and corrected for an error in 2002; the corrected guideline was established as 7.2 mg/L NO_3-N (Hickey 2002), based on application of an acute to chronic ratio to a short-term guideline designed to protect 95% of species. Neither the US EPA nor the European Union has established WQGs for nitrate.

2.3 SUMMARY

The current Canadian WQG for nitrate relies heavily on data for amphibians. Although amphibians are known to occur in the Northwest Territories, the EKATI area is beyond their known distribution which is generally below the tree line (ENR 2006, 2012a and 2012b). In addition, amphibians have not been observed during WEMP or other biological surveys at EKATI (B. Milakovic and K. Kuker personal communication). Furthermore, subsequent to publication of the Canadian WQG (CCME 2003) and the IPS (Guy 2008), additional data have become available on the toxicity of nitrate and its interaction with water hardness (Nautilus Environmental 2011a and 2011b). Consequently, it is appropriate to reconsider the water quality objective that is currently being employed at EKATI and to develop a revised objective which includes all available and appropriate information.

3. Methods

3. Methods

3.1 INTRODUCTION

CCME WQGs are developed in a manner that is expected to be protective at all sites across Canada and accommodating the wide range of conditions that might be observed. Consequently, they typically employ a relatively high degree of conservatism to account for variables that might modify the risk of adverse effects in the environment. Site specific water quality objectives are derived in a manner that takes into consideration the unique characteristics of an individual site, such as biological community structure or physico-chemical characteristics of the environment that alter the potential for toxicity. In rare cases, a site-specific objective may be established at a value that is lower than the generic guideline to protect a critical and sensitive resource; however, typically, a site-specific objective is higher than the generic guideline, since incorporation of site-specific information reduces the need for conservatism that is inherent in the broad applicability of generic benchmarks.

Derivation of the SSWQO for nitrate followed the most recent guidance from CCME (2003, 2007b). The main steps for the derivation of a long-term nitrate SSWQO were as follows:

1. Data compilation of existing information including environmental fate, toxicological data, and modifying factors.
2. Identification of relevant toxicological data.
3. Selection of the approach to be used in deriving SSWQOs based on available data.
4. Calculation of objectives and discussion of results and uncertainties.

3.2 SITE-SPECIFIC WATER QUALITY OBJECTIVE APPROACHES

The CCME (2003) identified four approaches that can be taken to determine SSWQOs for individual substances: 1) the Background Concentration Approach; 2) the Recalculation Approach; 3) the Water Effects Ratio (WER) Approach; and, 4) the Resident Species Approach.

3.2.1 Background Concentration

The Background Concentration Approach involves establishing a SSWQO on the basis of the range of background conditions of the variable of interest. This approach is typically implemented in cases where there are naturally-elevated concentrations of the variable of interest. This is not the case at EKATI.

3.2.2 Recalculation

Using the Recalculation Approach, the existing generic benchmark is recalculated after limiting the dataset to available toxicological data for species that are considered relevant to the site (i.e., resident species or suitable surrogates representing taxa for which toxicological data are not available). Species that are not relevant (e.g., in this case, tropical species and amphibians) are excluded from the dataset in order to create an SSD which provides an appropriate representation of the biological community found at a specific site.

3.2.3 Water Effects Ratio

Using the Water Effects Ratio (WER) Approach, site and laboratory waters are used in parallel toxicity tests in which the substance of interest is introduced to the water to measure the effect that site water has on the toxicity to one or more species. A difference in sensitivity of test organisms between the test

waters provides an indication that the site water modifies the toxicity of the substance of interest. This provides justification to alter the water quality benchmark to account for that difference, because WQGs or similar benchmarks are typically derived from toxicity tests conducted in standardized laboratory water. Environmental and toxicity modifying factors (ETMFs) are characteristics in site water that can alter the behaviour, uptake, or toxicity of a substance to organisms.

3.2.4 Resident Species

Using the Resident Species Approach, species that occur in the environment are tested to evaluate whether they are different in sensitivity from those that have been used to derive the existing benchmark. In the case of nitrate, data have already been collected for resident fish species (McGurk et al. 2006), and much of the available dataset for effects of nitrate on aquatic organisms is considered to be relevant to the site.

3.2.5 Approach Selected for the EKATI SSWQO Calculation

The Recalculation Approach was employed for development of the SSWQG for nitrate at EKATI. This approach was considered appropriate because key species that were used to develop existing Canadian WQGs for nitrate, in particular amphibians, are not relevant to the site. Twelve species were incorporated into development of the IPS for nitrate, and one additional species (i.e., 13 in total) was identified in the draft CCME WQG for nitrate. Four of the species used in each of these derivations were amphibians, and are not considered relevant to the site. In addition, the giant river prawn was included in the previous WQG derivations, but is not considered relevant to the site (see Section 4.2 for rationale). Additional data were identified for inclusion in the SSWQO, including for species already represented in the dataset, as well as for two additional species (an invertebrate and a green alga).

Sub-Arctic lakes, such as those located within the EKATI watersheds, tend to be oligotrophic and, consequently, generally low in nitrate. Thus, the Background Concentration Approach was not useful. Water Effect Ratio tests were also not employed here, since water quality conditions (other than hardness) were not expected to result in significant change in the sensitivity of organisms to nitrate. Additional tests using resident species were not considered necessary to supplement the recalculation approach.

3.3 COMPILATION OF EXISTING INFORMATION

3.3.1 Environmental Fate

As part of the initial step in developing the SSWQOs, data on the physical and chemical interactions of nitrate in aquatic systems were compiled and reviewed.

3.3.2 Toxicity Data

The available literature on chronic toxicity of nitrate have recently been comprehensively reviewed by Environment Canada and/or CCME as part of development of the IPS (Guy 2008) and in the draft Canadian water quality guideline for nitrate. The chronic toxicity data that were considered appropriate for inclusion in those documents were reviewed here and considered for inclusion in the SSWQO for nitrate at EKATI.

In addition, a literature search was conducted to identify recently published studies on chronic toxicity of nitrate that might not have been captured in the literature review conducted by CCME. The focus of this search was on literature published since 2009. Toxicity data were also available from Nautilus Environmental (2011a and 2011b; Appendix B).

3.4 EVALUATION OF RELEVANT TOXICITY DATA

The data available in the compiled toxicity studies were reviewed and classified as either primary, secondary or unacceptable, consistent with the CCME (2007b) criteria for review of toxicological data for consideration in WQG development. Studies were classified as primary if they, at a minimum, met the following criteria: use of measured concentrations; control response reported and acceptable; concentration-response shown or evident from the reported endpoints; ETMF information provided (at least hardness data); study design and replication reported; and, proper statistics used. Studies that provided a minimum of ETMF information (hardness) and control response were classified as secondary data. Studies in which control performance did not meet acceptable limits or where insufficient supporting information was provided were considered unacceptable.

Data that were considered either primary or secondary were included in the SSD, except in cases where other primary or secondary data were available for a different, more sensitive endpoint for that species. In some cases, studies that provided useful information but did not meet the criteria for primary or secondary data quality were used as supporting information but were not used directly in the calculation of the SSWQO. All other studies were excluded from further consideration.

The test duration was evaluated for each study included in the derivation of the long-term SSWQO as outlined in CCME (2007b). Toxicity tests that were suitable for use in derivation of a long-term SSWQO were defined as those that met the following criteria (CCME 2007b):

- *fish* - test durations of ≥ 21 days, or ≥ 7 days if involving the egg or larval stages, based preferentially on non-lethal endpoints of growth, egg/larval development, or reproduction;
- *invertebrates* - non-lethal endpoints (growth, reproduction) from test durations of ≥ 96 hours for shorter lived invertebrates or of ≥ 7 days for longer lived invertebrates, and lethal endpoints from tests of ≥ 21 days for longer lived invertebrates (lethal endpoints for < 21 day tests for shorter lived species were considered on a case-by-case basis); and,
- *plants/algae* - growth test durations exceeding 24 hours.

Studies were screened for relevance in the context of species present at the site. A species was classified as resident if it belonged to the same genus as a species present at EKATI. Toxicity data for species that are present at EKATI were preferred; however, only a limited number of standardized toxicity tests exist for aquatic species. Therefore, in the absence of data for resident species, surrogate species that were taxonomically related to resident taxa (for example, were within the same taxonomic family) or occurred in other sub-Arctic lakes were included to provide a robust and relevant dataset.

3.4.1 Minimum Requirements for SSD Dataset

In order to calculate a chronic SSD, the following are the minimum dataset requirements (CCME 2007b):

- *fish* - require at least three studies on freshwater fish species, including one salmonid and one non-salmonid;
- *invertebrates* - require at least three studies on freshwater invertebrate species, at least one of which is a planktonic crustacean species; and,
- *plants/algae* - at least one plant or algal species is required. In the case where plants or algae are among the most sensitive taxa, a chemical is classed as phytotoxic and thereby requires two studies for an acute SSD, or three studies for a chronic SSD.

3.4.2 SSD Data Selection

Following screening of studies for validity for use in the SSD dataset for nitrate, the complete dataset was examined. Only the most sensitive endpoint from each species was included (e.g., reproduction or growth, not both), resulting in only one data point per species in the SSD. In some cases, similar endpoints were available from more than one test with identical conditions for an individual species. In cases where the tests were considered sufficiently similar, the geometric mean of the values reported in the various studies was calculated and used in the SSD. However, in cases where one data point was considered more sensitive because of a methodological difference, such as use of a different lifestage, a longer test duration, or a more appropriate statistical evaluation of the data, the more sensitive test result was utilized, and the less sensitive data were excluded.

For chronic toxicity tests, a variety of toxicological endpoints may be available, including those based on point estimates (e.g., IC_x or EC_x values, which refer to the concentration of chemical that is expected to "inhibit" or "effect" *x*% of the population) and those based on hypothesis tests (e.g., the No Observed Effect Concentration [NOEC], Lowest Observed Effect Concentration [LOEC] and Maximum Acceptable Toxicant Concentration [MATC]). The NOEC is the highest tested concentration that shows no significant difference relative to the control, the LOEC is the lowest tested concentration that is significantly adversely affected relative to the control, and the MATC is the geometric mean of the NOEC and LOEC.

In general, point estimates derived from regression analysis are the most appropriate endpoint for use in WQG development. CCME (2007b) guidance lists the order of preference for chronic endpoints as follows:

$$\textit{No-Effects Threshold } EC_x/IC_x > EC_{10}/IC_{10} > EC_{11\text{-}25}/IC_{11\text{-}25} > MATC > NOEC > LOEC > EC_{26\text{-}49}/IC_{26\text{-}49} > \textit{Nonlethal } EC_{50}/IC_{50}$$

As shown, regression-based point estimates, such as the EC_{10} or EC_{25}, are generally considered to be more appropriate than hypothesis tests, such as the NOEC, LOEC, and MATC values, since results from hypothesis tests can be significantly affected by aspects of study design, such as replication and spacing between test concentrations (CCME 2007b). However, care needs to be taken in interpretation of EC_{10} and IC_{10} results, since toxicity tests rarely have the statistical power to detect this level of adverse effect with a reasonable degree of confidence. Consequently, where sufficient data were available, the shape of the dose-response and the variability in the dataset were considered carefully to establish the most appropriate endpoint for inclusion in the SSD.

3.5 DERIVATION OF A SSWQO

In the case of nitrate, the Recalculation Approach provided the most appropriate tool for establishing a site-specific objective at EKATI. In addition, there is significant evidence that water hardness plays an important role as a toxicity modifying factor for nitrate (Nautilus Environmental 2011a and 2011b), and hardness is strongly correlated with nitrate concentrations in the receiving environment surrounding EKATI. Thus, in addition to recalculation, an approach following that utilized by the US EPA (1985) in deriving hardness-linked benchmarks for metals (such as zinc, cadium and copper) was employed here in order to incorporate water hardness as a TMF for nitrate. Hardness has not previously been incorporated into WQGs for nitrate since previous investigations have not evaluated the role of this water quality variable on toxicity of nitrate; however, the evidence of this interaction is compelling.

In order to incorporate hardness as a modifying factor, the slopes of the relationships between chronic toxicity and water hardness for four species for which these data were available (three invertebrates, *Ceriodaphnia dubia, Hyalella azteca* and *Chironomus tentans*, as well as one fish, *Pimephales promelas*), were evaluated and compared. The dataset for each species was normalized using the geometric mean of the toxicity endpoints (in this case, IC_{25} values) and the geometric mean of the

hardness values tested. In this manner, the relationships between water hardness and toxicity could be compared between species directly, since this normalization removes the confounding factor of differences in sensitivity. The relationship between water hardness and toxicity was then calculated using a regression of the combined normalized data for all four species, following log transformation of both the normalized toxicity endpoint, and the normalized hardness data. The slope of this relationship was established as the pooled slope for the relationship between toxicity and water hardness. This approach is analogous, and provides identical results, to analysis of covariance (ANCOVA) (US EPA 1985).

Since water hardness alters the toxicity of nitrate, and the available toxicity tests were conducted in waters with a range of hardnesses, it was necessary to adjust the test endpoints to a common hardness using the pooled hardness-toxicity relationship, prior to using the adjusted data to construct the SSD. This step results in estimates for what the toxicity endpoints from the various tests would have been if the tests had all been conducted at the same hardness. The common hardness selected for this purpose was arbitrarily established as 40 mg/L as $CaCO_3$; the actual hardness selected for this purpose has no bearing on the outcome of this evaluation since this just serves to standardize the results to a single hardness so that the SSD can be constructed. Toxicity data were standardized to this common hardness value using the following equation:

$$Endpoint_{(at\ hardness\ 40)} = Endpoint_{(at\ tested\ hardness)} \times e^{[Pooled\ Slope \times (ln\ (common\ hardness\ [i.e.\ 40]) - ln\ (test\ hardness)]}$$

A cumulative distribution of the hardness-standardized toxicity data was then analyzed using SSD Master Version 2.0 (Rodney and Moore 2008). This software package fits data using five model distributions (normal, logistic, Weibull, Gompertz, and Fisher-Tippett). The best model was selected on the basis of Anderson Darling Goodness of fit tests, as well as best professional judgement based on a visual assessment of the plot within the lower tail of the distribution, where data for the most sensitive species occur.

The HC_5 from the selected SSD model was selected for use as the SSWQO at the common hardness (i.e., 40 mg/L hardness), and the pooled slope from the hardness-toxicity relationships was incorporated to provide an equation that could be used to calculate the SSWQO across a range of hardnesses. Since the data used to establish the relationship between water hardness and toxicity only incorporated a maximum hardness of approximately 160 mg/L, the relationship was not extrapolated beyond this hardness, and the SSWQO for waters with hardness exceeding 160 mg/L was conservatively established as the value calculated for 160 mg/L hardness, since it is not known to what extent a further reduction in toxicity would occur with further increase to the water hardness.

Following derivation of the SSWQO for chronic exposure, data gaps and uncertainties were reviewed with respect to the proposed SSWQO and its potential application.

3.6 EVALUATION OF THE SSWQO

The proposed SSWQO, including the hardness-toxicity relationship, was developed on the basis of toxicity tests conducted in laboratory control waters. The mechanism resulting in decreased toxicity of nitrate with increasing water hardness has not been previously established and, consequently, additional tests were conducted to confirm that the relationship established in laboratory-prepared water was also applicable to the ionic conditions associated with the receiving environments at EKATI.

This was accomplished by evaluating the sensitivity of *Ceriodaphnia dubia* and fathead minnows (*Pimephales promelas*) to nitrate added into water collected from four lakes at EKATI (Slipper, Nema, Moose and Leslie lakes) that had a range of water hardness values. Thus, by comparing the relationship of the sensitivity of these organisms at the different levels of hardness values associated with the lakes, with that demonstrated previously with laboratory-prepared waters, it was possible to demonstrate whether a consistent relationship was observed.

4. Results

4. Results

4.1 COMPILATION OF EXISTING INFORMATION

4.1.1 Environmental Fate

Nitrate is an essential nutrient that occurs in the environment as the most oxidized form of nitrogen in the nitrogen cycle (Figure 4.1-1). Within this cycle, nitrogen is converted from nitrogen gas through various forms of biologically-available compounds (e.g., ammonia, nitrite, nitrate), and is a major component of biological materials such as proteins. Nitrogen from the atmosphere is primarily converted to biologically-usable forms by soil-associated nitrogen fixing bacteria and some blue-green algae. Oxidized forms of nitrogen (e.g., HNO_3 and NO_x) also occur as a result of anthropogenic activities such as combustion and are transported in the atmosphere. Available forms of nitrogen can then be oxidized, primarily through bacterial pathways, to nitrate. Nitrogen may be returned to the atmosphere by bacterially-mediated denitrification or volatilization of ammonia.

In the sub-Arctic, aquatic concentrations of nitrogenous compounds occurring from natural processes tend to be low, since nitrogen fixation by soil-dwelling bacteria is limited by climate and geography. Consequently, lakes in this area are generally oligotrophic, containing low concentrations of nitrate and phosphate. At EKATI, nitrate is present in part through the natural processes described above; however, nitrate also occurs as a result of residues from explosives containing ammonium nitrate.

Nitrate that is present in the aquatic environment is essential for primary producers and is actively taken up by plants and algae and incorporated as a major nutrient for production of plant material. To a lesser extent, nitrate is also reduced to ammonia through bacterial pathways, which is also utilized as a nutrient by aquatic plants and algae. Terrestrial ecosystems and most marine environments are commonly nitrogen-limited and, consequently, addition of nitrate to these systems promotes plant growth. In freshwater aquatic systems, this may result in eutrophication; however, in phosphorus-limited aquatic systems, as is the case for most temperate freshwater lakes (Vollenweider 1976), addition of nitrate may not substantively alter primary productivity, since both nitrogen and phosphorus, among other micronutrients, are required for plant growth (Schindler 1974).

Nitrogen compounds may accumulate in sediments as a result of decay of organic matter and, as a result, bottom sediments may act as a sink for nitrogen, although nitrate may also be released from sediments to overlying waters under some conditions.

Nitrate is highly soluble, and typically exists in freshwater aquatic environments as the anion NO_3^-. It may bioconcentrate in algal cells, since it is a nutrient; however, it does not biomagnify through the food-chain. Although nitrate is a nutrient, it may be toxic to aquatic organisms at elevated concentrations. Consequently, it is necessary to establish safe levels for nitrate in the environment.

4.1.2 Chronic Toxicity Data

Chronic toxicity data from long-term exposure were available from 13 studies. These studies are reviewed in Appendix C and evaluated in Section 4.2.

4.2 EVALUATION OF RELEVANT TOXICITY DATA

The results of the review of each study are summarized in Appendix C and rationale for incorporation of toxicity data into the SSD for each included species is provided below. Reasons for exclusion of any data that were included in the CCME draft guideline document are also discussed below. Studies that were included are summarized in Table 4.2-1.

Fish

Rainbow trout (*Oncorhynchus mykiss*): Data for rainbow trout were included in the IPS (Guy 2008) and draft CCME guideline, and are considered appropriate for inclusion in the recalculated SSWQO since salmonids (e.g., lake trout, Arctic grayling and round whitefish) occur in the environment at EKATI. Data were available from two studies (Nautilus Environmental 2011b; Stantec 2006), both of which evaluated the effects of nitrate on early life stage development from embryo through to fry. The value employed in the SSD was the geometric mean of data from four tests conducted by Nautilus Environmental (2011b) across a range of hardnesses, and one by Stantec (2006).

Lake trout (*Salvelinus namaycush*): Data for lake trout were included in the IPS (Guy 2008) and draft CCME guideline, and are considered appropriate for inclusion in the recalculated SSWQO since this species occurs in the environment at EKATI. Data for this species were available from a study conducted by McGurk et al. (2006) evaluating the effect of nitrate on development of eggs through to fry.

Chinook salmon (*Oncorhynchus tshawytscha*): Data for chinook salmon from Westin (1974) were included in the IPS (Guy 2008) and draft CCME guideline but were excluded from the current long-term dataset for EKATI, because no information on the hardness tested was reported for this study. Consequently, it was not possible to evaluate the sensitivity of this species in relation to the other investigations. Data were available for two other salmonids (i.e., rainbow trout and lake trout) both of which were considered to be more relevant to the site since chinook salmon have an anadromous life cycle.

Fathead minnow (*Pimephales promelas*): Data for fathead minnows were included in the IPS and draft CCME guideline, and are considered appropriate for inclusion in the recalculated SSWQO since this species is in the family Cyprinidae, consistent with lake chub, which occur in the environment at EKATI. This species typically occurs in warmer waters than those associated with sub-Arctic environments; however, fathead minnows are commonly used in laboratory testing, and can tolerate temperatures as low as 6°C. Consequently, considering the relatively small number of fish for which chronic toxicity data were available for nitrate, data for this species were included in the SSWQO development. Data for this species were available from three studies; Nautilus Environmental (2011a) evaluated survival and growth of larvae over a seven day period, US EPA (2010) and Adelman et al. (2009) evaluated hatch, survival and growth over a 32 day period. The data from Nautilus Environmental (2011a) were used to establish the relationship between water hardness and toxicity to this species, and the data from US EPA (2010) were used in the SSD; these latter data were considered preferable to those from Nautilus Environmental (2011a) because of the higher degree of sensitivity associated with the longer exposure duration, and were preferable to the data from Adelman et al. (2009) since the latter authors employed pseudo-replication and did not follow standardized test procedures for this species.

Topeka shiner (*Notropis topeka*): Data for the Topeka shiner were included in the draft CCME guideline. This species is not resident in Canada, and is primarily associated with warmer water prairie streams in the central portion of the Great Plains; however, data for this species were included in the recalculated SSWQO, regardless, since this species is in the family Cyprinidae, consistent with lake chub, which occur in the environment at EKATI. Species of the genus *Notropis*, including *N. topeka, N. anogenus* and *N. bifrenatus*, are considered protected in a number of jurisdictions in North America, indicating that fish of this genus may be sensitive to environmental perturbations. Consequently, despite concerns that this

species may not be relevant to the site, it was included in the dataset for calculation of the SSD. Data were available for this species from an investigation conducted by Adelman el al. (2009).

Table 4.2-1. Chronic Toxicity Studies Used in the Species Sensitivity Distribution

Species (common name)	Endpoint	Hardness (mg/L)	Effect level (mg/L NO_3-N)			Reference
			Reported	Adjusted	Species mean	
Salvelinus namaycush (lake trout)	146 d MATC, growth	13	3.2	9.2	9.2	McGurk et al. (2006)
Ceriodaphnia dubia (water flea)	7 d IC_{25}, reproduction	44	11.3	10.3	9.8	Nautilus Environmental (2011a)
	7 d IC_{25}, reproduction	98	23.9	10.2	--	Nautilus Environmental (2011a)
	7 d IC_{25}, reproduction	166	43.4	11.2	--	Nautilus Environmental (2011a)
	7 d MATC, reproduction	164	30.1	7.9	--	Scott and Crunkilton (2000)
Pimephales promelas (fathead minnow)	32 d EC_{20} embryo/larval growth	145	59.8	17.6	17.6	US EPA (2010)
Oncorhynchus mykiss (rainbow trout)	41 d MATC, development	10	15.0	56.1	29.6	Nautilus Environmental (2011b)
	41 d MATC, growth	45	26.0	23.2	--	Nautilus Environmental (2011b)
	41 d MATC, growth	90	77.9	36.0	--	Nautilus Environmental (2011b)
	41 d MATC, growth	160	77.9	20.8	--	Nautilus Environmental (2011b)
	64 d IC_{25}, growth	310	162.2	23.1	--	Stantec (2006)
Hyalella azteca (amphipod)	14 d IC_{25}, growth	46	12.9	11.3	29.7	Nautilus Environmental (2011a)
	14 d IC_{25}, growth	86	117.0	56.5	--	Nautilus Environmental (2011a)
	14 d IC_{25}, growth	172	182.0	45.4	--	Nautilus Environmental (2011a)
	10 d IC_{25}, growth	310	187.5	26.7	--	Stantec (2006)
Chironomus dilutus (midge)	10 d IC_{25}, growth	46	49.0	42.9	44.9	Nautilus Environmental (2011a)
	10 d IC_{25}, growth	86	101.0	48.7	--	Nautilus Environmental (2011a)
	10 d IC_{25}, growth	172	174.0	43.4	--	Nautilus Environmental (2011a)
Notropis topeka (Topeka shiner)	30 d MATC	220	360.1	71.1	71.1	Adelman et al. (2009)
Daphnia magna (water flea)	7 d MATC, reproduction	164	506.9	132.3	132.3	Scott and Crunkilton (2000)
Pseudokirchneriella subcapitata (alga)	72 hr IC_{25}, growth	--	691.0	--	691.0	Nautilus Environmental (2011a)

Adjusted values were adjusted to a hardness of 40 mg/L based on a pooled slope of 0.9512.
ICx (e.g., IC_{20}) is the concentration at which x% of test organisms are expected to be inhibited (e.g., inhibited reproduction).
MATC is the Maximum Acceptable Toxicant Concentration (concentration at threshold for effects; calculated as the geometric mean of the NOEC and LOEC).

Invertebrates

Spiny water flea (*Ceriodaphnia dubia)*: data for *C. dubia* were included in the IPS (Guy 2008) and draft CCME guideline, and are considered appropriate for inclusion in the recalculated SSWQO because a species of this genus occurs in the environment at EKATI. Data were available for this species from three-brood (6 to 8 days) survival and reproduction tests conducted by Nautilus Environmental (2011a) in waters with three hardnesses, and a test reported by Scott and Crunkilton (2000); the geometric mean of these four test endpoints was used in the SSD.

Water flea (*Daphnia magna)*: data for *D. magna* were included in the IPS (Guy 2008) and draft CCME guideline, and are considered appropriate for inclusion in the recalculated SSWQO because species of this genus (e.g., *D. longiremis* and *D. middendorffiana*) occur in the environment at EKATI. Data were available for this species from a 21-day survival and reproduction test conducted by Scott and Crunkilton (2000).

Amphipod (*Hyalella azteca)*: data for *H. azteca* were included in the IPS (Guy 2008) and draft CCME guideline. Although amphipods of the same order as this species do not occur in the lakes surrounding EKATI, gammarid amphipods do occur, and *Hyalella* species occur in other lakes in the region. Consequently, this species is considered appropriate for inclusion in the recalculated SSWQO. Data for this species were available from two studies: Nautilus Environmental (2011a) evaluated the survival and growth over a 14-day period in three water hardnesses, and Stantec (2006) evaluated survival and growth of this species over a 10-day period. Although there is a small difference in the duration of these tests, they were considered to be sufficiently analogous, and the final value for this species utilized in the SSD was the geometric mean of the endpoints from these four tests.

Giant river prawn (*Macrobrachium rosenbergii)*: data for *M. rosenbergii* published by Wickens (1976) were included in both the IPS and the draft CCME guideline. However, this species is not considered appropriate for inclusion in the current recalculation because no decapods occur in the environment surrounding EKATI.

Chironomid midge (*Chironomus dilutus*): data for *C. dilutus* were not available for inclusion in the IPS (Guy 2008) or draft CCME guideline; however, toxicity data for 10-day survival and growth tests are available for three water hardnesses for inclusion in the recalculated guideline (Nautilus Environmental 2011a). This species is considered an appropriate surrogate species, since midges of the genus *Chironomus* occur in lakes at EKATI.

Amphibians

Data for four amphibians (*Pseudacris regilla, Rana aurora, Rana pipiens* and *Xenopus laevis*) were included in derivation of the IPS (Guy 2008) and draft CCME guideline (Schuytema and Nebeker 1999a, 1999b and 1999c; Allran and Karosov 2000). However, they were not considered appropriate for inclusion in the recalculated objective for EKATI, because amphibians distributions are generally below the tree line and have not been observed to occur in environments surrounding the site (ENR 2006, 2012a and 2012b).

Plants and Algae

Green alga (*Pseudokirchneriella subcapitata)*: data for *P. subcapitata* were not available for inclusion in the IPS (Guy 2008) or draft CCME guideline; however, toxicity data are available for inclusion in the recalculated SSWQO from a test conducted by Nautilus Environmental (2011a). This species is considered an appropriate surrogate species, since green algae are a major component of the phytoplankton community at EKATI. Note that the threshold reported for this species was not hardness-

adjusted, since it is not known if hardness affects the toxicity of nitrate to algae. Plants and algae are anticipated to have differing uptake pathways for nitrate compared to animals since nitrate is an essential nutrient for primary producers and is actively accumulated.

The chronic toxicity values among the accepted screened studies ranged from 3.2 to 691 mg/L (9.2 to 691 mg/L following standardization to 40 mg/L hardness as $CaCO_3$). The range of hardness values among screened bioassays was 10 to 310 mg/L as $CaCO_3$, with an average of 127 mg/L.

Water Hardness and Nitrate Toxicity

A recent investigation has established the relationship between water hardness and toxicity of nitrate (Nautilus Environmental 2011a and 2011b; Appendix B). Figure 4.2-1 illustrates the relationship between water hardness and mortality endpoints for two fish species (rainbow trout and fathead minnows) and two invertebrates (*Hyalella azteca* and *Chironomus dilutus*). In each case, a clear reduction in nitrate toxicity (increased LC_{50}) was observed as the hardness of the water increased.

Similarly, Figure 4.2-2 shows the relationship between water hardness and chronic toxicity endpoints for *Ceriodaphnia dubia* (reproduction), *C. dilutus* (growth), *H. azteca* (growth) and fathead minnows (growth). Again, a clear relationship is seen in which toxicity decreases (increased endpoint value) with increasing hardness. Chronic toxicity tests were also conducted using rainbow trout across a range of hardnesses, resulting in a similar pattern of decreased toxicity with increasing hardness (Nautilus Environmental 2011b); however, the data from this study were not amenable to establishing slope relationships, because point estimates could not be calculated from all of the tests and the effects observed were generally small.

The chronic toxicity data presented in Figure 4.2-2 were further evaluated to establish a pooled relationship between water hardness and chronic toxicity endpoints (Table 4.2-2, Figure 4.2-3). The effect levels (i.e., IC_{25} values) and corresponding water hardnesses from the tests were normalized for each species, following which a linear regression of log transformed hardness and chronic toxicity data was performed for each species. Figure 4.2-3 shows the normalized slopes of the relationships for each species, and Figure 4.2-4 provides the pooled slope for all four species. Of interest are the strong relationships (R^2 values ranging from 0.851 to 0.997) and similar slopes for each of the four species, and the strong relationship observed for the combined dataset, indicated by an R^2 value of 0.764, which implies that 76.4% of the variability in the IC_{25} endpoints is effectively explained by hardness (Table 4.2-2). The slope of the combined dataset was 0.9518.

Table 4.2-2. Relationship between Water Hardness and Chronic Toxicity of Nitrate

Species	n	R^2	P	Slope	Notes
Pimephales promelas	4	0.978	0.011	0.705	Good fit

Pooled Normalized Slope of Hardness-Toxicity Relationships for Four Species

Figure 4.2-4

Rescan™
Engineers & Scientists

The pooled slope was used to standardize all of the acceptable chronic toxicity data to a hardness of 40 mg/L, with the exception of the data for the green alga, *P. subcapitata*, which were not adjusted; the adjusted values are also shown in Table 4.2-1. Data for the algal species were not adjusted because it has not been shown whether water hardness alters toxicity to plants and algae, and active uptake mechanisms for nitrate in algae differ substantially from other species, as a result of the essentiality of nitrate to these species. Adjustments of chronic test endpoints to a hardness of 40 mg/L were made using the following equation, which is consistent with the approach used by the US EPA (1985) for hardness-correcting toxicity test data for metals such as zinc, copper and cadmium:

$$Endpoint_{(hardness\ 40\ mg/L)} = Endpoint_{(tested\ hardness)} \times e^{[0.9518 \times (\ln(40) - \ln(test\ hardness))]}$$

4.3 DERIVATION OF SSWQO

From the available chronic toxicity studies, a total of 20 primary and 1 secondary datapoints representing nine species were included in the chronic SSD; these data represent one algal species, four invertebrate species, and four fish species (Table 4.2-1; Appendix C). The four invertebrate species comprised two members of the zooplankton (both cladocerans), one benthic invertebrate (a larval midge), and one epibenthic amphipod. The fish species included two non-salmonids and two salmonids. Therefore, CCME (2007b) data requirements regarding types and number of biological groups were met. In cases where more than one acceptable value was available for an individual species endpoint, the values were combined using the geometric mean to produce a single value for each species.

An SSD was calculated using SSD Master Version 2.0 (Rodney and Moore 2008; Appendix D). Five distributions were tested: Fisher-Tippett, Normal, Logistic, Weibull and Gompertz (Table 4.3-1; Figure 4.3-1; Appendix D). Although the Fisher-Tippett distribution produced the lowest Anderson Darling statistic, indicating the best fit to the data in the tails of the distribution, the logistic distribution was selected for deriving the fifth percentile from the distribution (i.e., the HC_5), since this provided a more conservative estimate of this value (4.39 mg/L at a hardness of 40 mg/L, compared with 7.08 mg/L using Fisher Tippett). The estimate from the Fisher-Tippett distribution provided the highest estimate for the HC_5 from the five models.

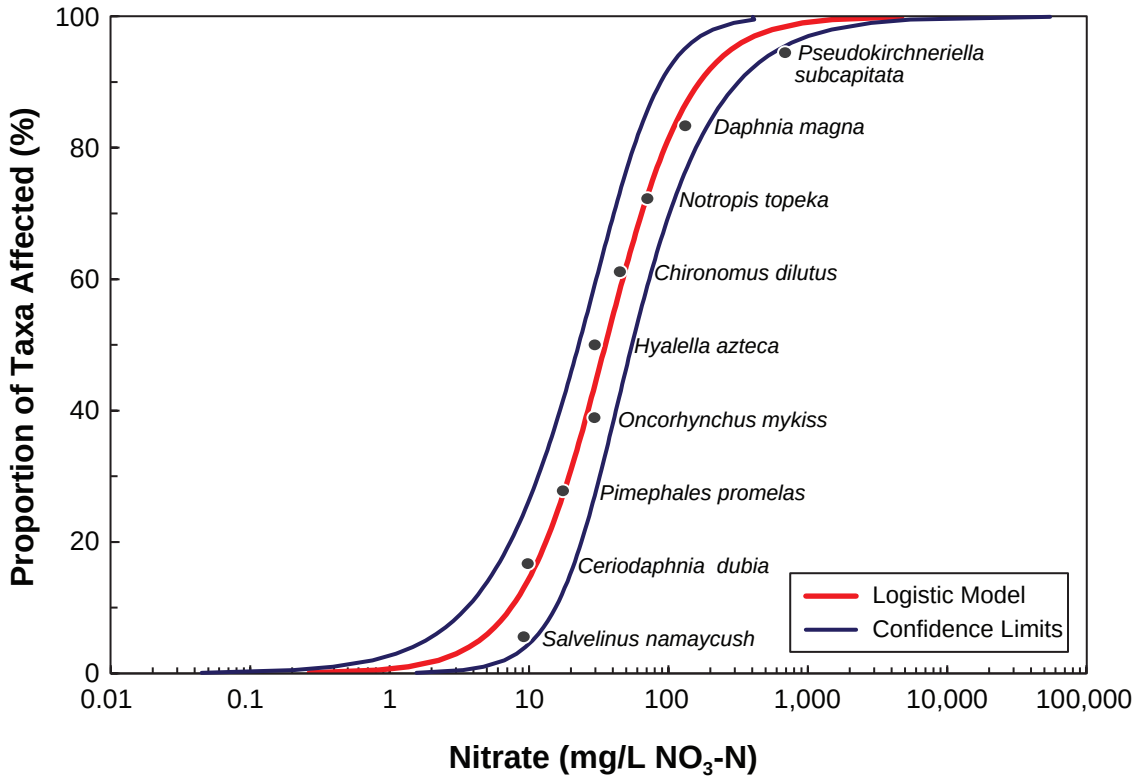
Table 4.3-1. Summary of Results of Species Sensitivity Distribution Calculations Using Five Models

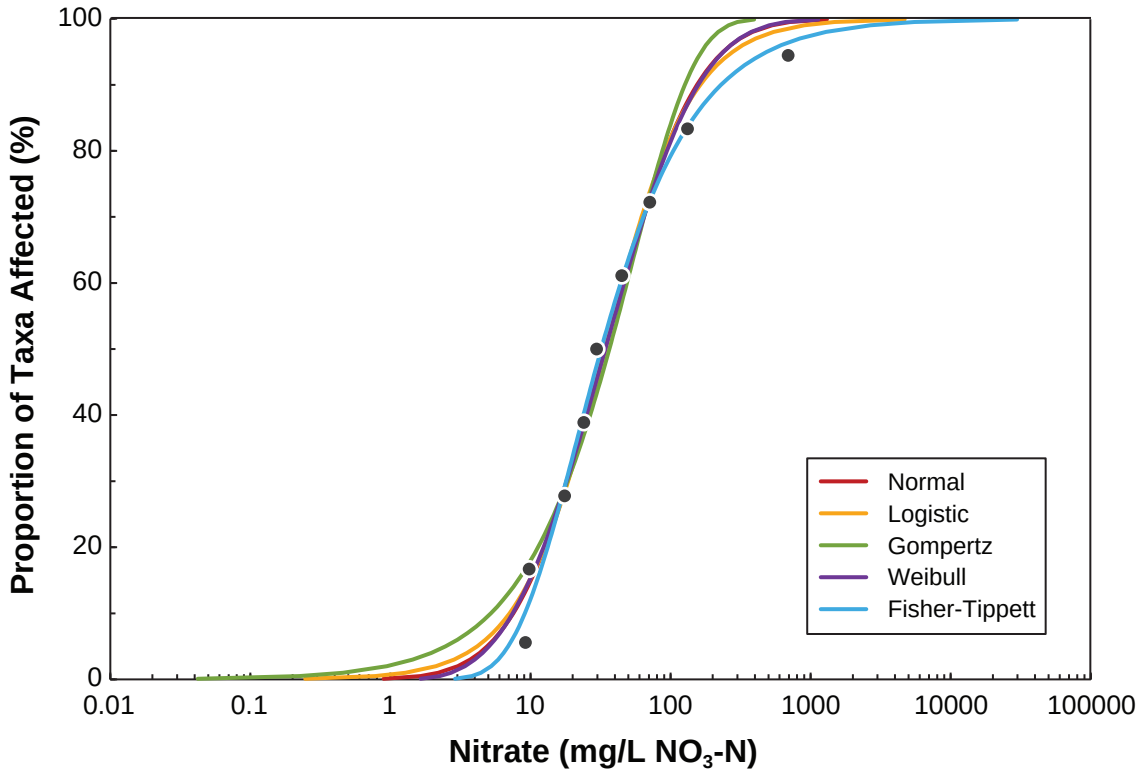
	Normal	Logistic	Gompertz	Weibull	Fisher-Tippett
Are data from Anderson-Darling distribution? (n > 5)	Yes	Yes	Yes	Yes	Yes
A^2	0.341	0.254	1.198	0.371	0.169
HC_5 (µg/L)	5.14	4.39	2.68	5.27	7.08
Lower confidence limit on the mean (expected HC_5)	2.96	1.82	0.54	2.89	5.02
Upper confidence limit on the mean (expected HC_5)	8.91	10.60	13.23	9.62	9.98

A^2 refers to the Anderson Darling statistic.
HC_5 refers to the Hazardous Concentration for 5% of tested species.

The slope of the hardness-toxicity relationship was then combined with this value to produce a final equation for deriving a proposed site-specific hardness-linked water quality objective for the site, as follows:

$$SSWQO_{(hardness\ x)} = e^{(0.9518 \times \ln(hardness\ x) + \ln(4.39) - 0.9518 \times \ln(40))}$$





bhpbilliton resourcing the future

Long-term Species Sensitivity Distributions for Nitrate Using Five Model Distributions and the Selected Normal Model for Derivation of the SSWQO for Nitrate at EKATI

Figure 4.3-1

Rescan™ Engineers & Scientists

which can be simplified to:

$$SSWQO = e^{(0.9518 \times \ln(\text{hardness}) - 2.032)}$$

The proposed SSWQOs calculated on the basis of this equation are summarized for a range of hardnesses in Table 4.3-2. For waters containing more than 160 mg/L water hardness, the water quality objective is proposed for the value obtained at 160 mg/L hardness, since the hardness-toxicity relationships established by Nautilus Environmental (2011a) do not exceed this range and, therefore, further extrapolation of the dataset should be conducted with caution.

Table 4.3-2. Calculated Proposed Site Specific Water Quality Objectives Calculated Across a Range of Hardness Values

Hardness (mg/L)	Proposed SSWQO (mg/L NO_3-N)
20	2.3
40	4.4
60	6.5
80	8.5
100	10.5
120	12.5
140	14.5
160	16.4
>160	16.4

In comparison to the existing CCME guideline and the IPS developed by Environment Canada, the proposed objective is lower under soft water conditions, and higher under hard water conditions. The higher value under hard water conditions is based on recent research (Nautilus Environmental 2011a and 2011b) not previously available regarding the relationship between hardness and nitrate.

4.4 EVALUATION OF APPLICABILITY OF THE SSWQO TO THE SITE

In addition to the ensuring that the requirements for a valid SSWQO derivation were met from the toxicological database as described above, BHP Billiton conducted further site-specific confirmatory tests to increase confidence in the derivation. The results of toxicity tests conducted using nitrate introduced into water from four lakes (Slipper, Nema, Moose and Leslie lakes) at the site are provided in Appendix E. These test results demonstrate that the sensitivity of *Ceriodaphnia dubia* and fathead minnows to nitrate was even lower in site water than in the laboratory water tests that had been used to establish the SSWQO, after taking into consideration differences in hardness. The additional protective effect appears to be provided by the balance of major ions associated with increasing hardness at the site, relative to the balance of ions in the waters used in the laboratory water tests. Chloride, in particular, is higher in the site waters than the laboratory waters, and may be acting as an additional toxicity modifying factor for nitrate, as it does for nitrite. Regardless, the results presented in Appendix E demonstrate that the SSWQO proposed here provides a conservative benchmark for nitrate at the site. Additional protection, over-and-above that incorporated on the basis of hardness, is provided by the ionic characteristics (i.e., balance of major ions) of the site water, and provides an additional safety margin.

The recommended long-term SSWQO for EKATI is intended to be used in routine monitoring of the downstream receiving environment based on continuous exposure to nitrate. This proposed SSWQO is based on updated CCME methodology, recent scientific findings, uses toxicological data specific to the EKATI biological community, has been shown to be protective under site-specific conditions, and is therefore considered appropriate and scientifically defensible for use at EKATI.

5. Uncertainty

5. Uncertainty

5.1 INTRODUCTION

Derivation of a SSWQO is a detailed process involving various steps of data review and analysis (CCME 2003, 2007b). Uncertainties associated with this process are: the accuracy of toxicity endpoints in available studies; selection of appropriate statistical endpoints; the extent to which the available toxicity studies appropriately reflect the biological community at the site; the extent of understanding of chemical fate; and, the statistical extrapolation process in estimation of a benchmark value. Incorporation of a TMF in developing a SSWQO also introduces uncertainty.

5.2 RELEVANCE OF THE TOXICOLOGICAL DATASETS

The uncertainties and limitations of the datasets and SSD approach are discussed in the following sections. The datasets used and extrapolation involved in the SSD process are associated with the largest potential sources of uncertainty.

5.2.1 Inclusion Criteria

Only primary and secondary data were included in the SSD, consistent with CCME (2007b) guidance. Other studies were considered in evaluation of the data, where appropriate, but were not included in the SSD. Of the 21 test endpoints used in the SSD, 20 were classified as primary studies and one was classified as secondary. Therefore, the studies were largely considered to be of high quality and appropriate for derivation of SSWQOs.

5.2.2 Minimum Data Criteria

Wheeler et al. (2002) suggest a minimum of 10 data points be used in estimating an HC_5, whereas the US EPA uses a minimum of eight data points in WQG calculations (US EPA 1985) and Newman et al. (2000) suggest that between 15 to 55 data points may be appropriate. CCME (2007b) does not have a minimum requirement for the number of data in an SSD, although minimum representation from specific taxonomic groups is specified and has been met.

While on the low end of the range of recommended values, the use of nine species in deriving the HC_5 for nitrate in this report is consistent with US EPA (1995) recommendations and meets the specifications of CCME (2007b); however, uncertainty would be reduced with information for additional species.

5.2.3 Endpoints Used in SSD

Of the nine species represented in the SSD, four were based on IC_{25} values, one on an EC_{20}, and four based on an MATC. None of the tests were considered sufficiently robust to calculate an IC_{10} or EC_{10} with a reasonable degree of confidence, since the IC_{10} values fell below the NOEC from the tests. However, 20% to 25% effect levels are appropriate and commonly used estimates for effects thresholds from toxicity tests.

5.2.4 Suitability of Species

The chronic SSD included one algal species, four invertebrates and four fish species, providing a reasonable representation of genera present at EKATI. Primary producers were represented by a green alga; epibenthic and benthic invertebrates were represented by an amphipod and chironomid, respectively; zooplankton were represented by two cladocerans; and, fish were represented by two

salmonids and two non-salmonids. The species represented in the dataset were each considered suitable to reflect conditions at EKATI, with the possible exceptions being the Topeka shiner and fathead minnow, both of which are warmer water fish. However, inclusion of these species was considered appropriate, regardless, based on the presence of cyprinids at EKATI, and the relatively small number of species with available data.

5.2.5 Model Fit

The robustness of a model fit to an SSD is related partly to the number and quality of available toxicological data. This fit depends on fulfilling both the number of representative studies for each biological group, and also having a large enough total number of studies included in the SSD. Model fit also depends on the distribution of available data along the cumulative species distribution plot.

Although the Fisher-Tippett distribution provided the best fit to the data based on the Anderson Darling statistic, the logarithmic model was selected based on professional judgement since this provided a more conservative estimate. The proposed guideline was shown to be protective of all species with available data across a range of hardnesses from 10 to 310 mg/L. This meets CCME (2007b) requirements for ecological protection.

5.3 STANDARDIZATION OF TOXICOLOGICAL DATA

The process of standardizing all toxicological endpoints to a common hardness introduces potential uncertainty. Only the standardized values are used in the SSD plot which is used to derive the HC_5 values. Therefore, it is critical that the relationship used between hardness and toxicity be accurate and appropriate for the range of study endpoints that are standardized. Errors in standardization could greatly affect the SSD plot.

The data available to establish the slope of the hardness-toxicity relationships were from tests ranging in hardness from 40 mg/L to 160 mg/L for three of the species, and from 15 mg/L to 160 mg/L for the fourth species. Consequently, the proposed site-specific objective is only linked to hardness across a range of up to 160 mg/L.

The SSWQO proposed here assumes that the hardness-linked relationship observed in laboratory-prepared water is relevant to conditions at EKATI. Tests have been completed using one invertebrate and one fish species in waters from four lakes at EKATI, encompassing a range of hardness conditions, and have demonstrated that additional protection against toxicity caused by nitrate is provided by the balance of ions associated with waters from the site, over-and-above that provided by hardness (Appendix E).

The current report also uses standardized tests with species that are appropriate representatives of EKATI aquatic communities. The standardization for chronic toxicity to hardness in this report represents best available current scientific knowledge.

5.4 TOLERANCE OF ORGANISMS

The species that comprise the dataset used for development of the SSD for nitrate include members of the zooplankton and phytoplankton, as well as benthic invertebrates and fish. It is not possible to test every species and lifestage that occurs in the environment and, as a result, the possibility exists that a more sensitive species exists in the environment. However, the organisms comprising the SSD represent the major classes of organisms that occur in the environment at EKATI, and include species and test endpoints, such as reproduction tests using *Ceriodaphnia dubia*, that are commonly among the most sensitive to toxicants. Thus, although uncertainty exists regarding untested species and lifestages, the available dataset is expected to adequately represent the ecosystem.

5.5 TOXICITY OF MIXTURES

WQGs are typically established on the basis of toxicity tests conducted using the individual toxicant of interest. However, in the environment, toxicants may be present in combination, and may result in less than additive, additive or more than additive (synergistic) effects. Because nitrate is not known to act in a synergistic manner with other contaminants, mixture effects in the receiving environment resulting in increased toxicity are not expected to occur.

6. Summary

Rescan™
Engineers and Scientists

6. Summary

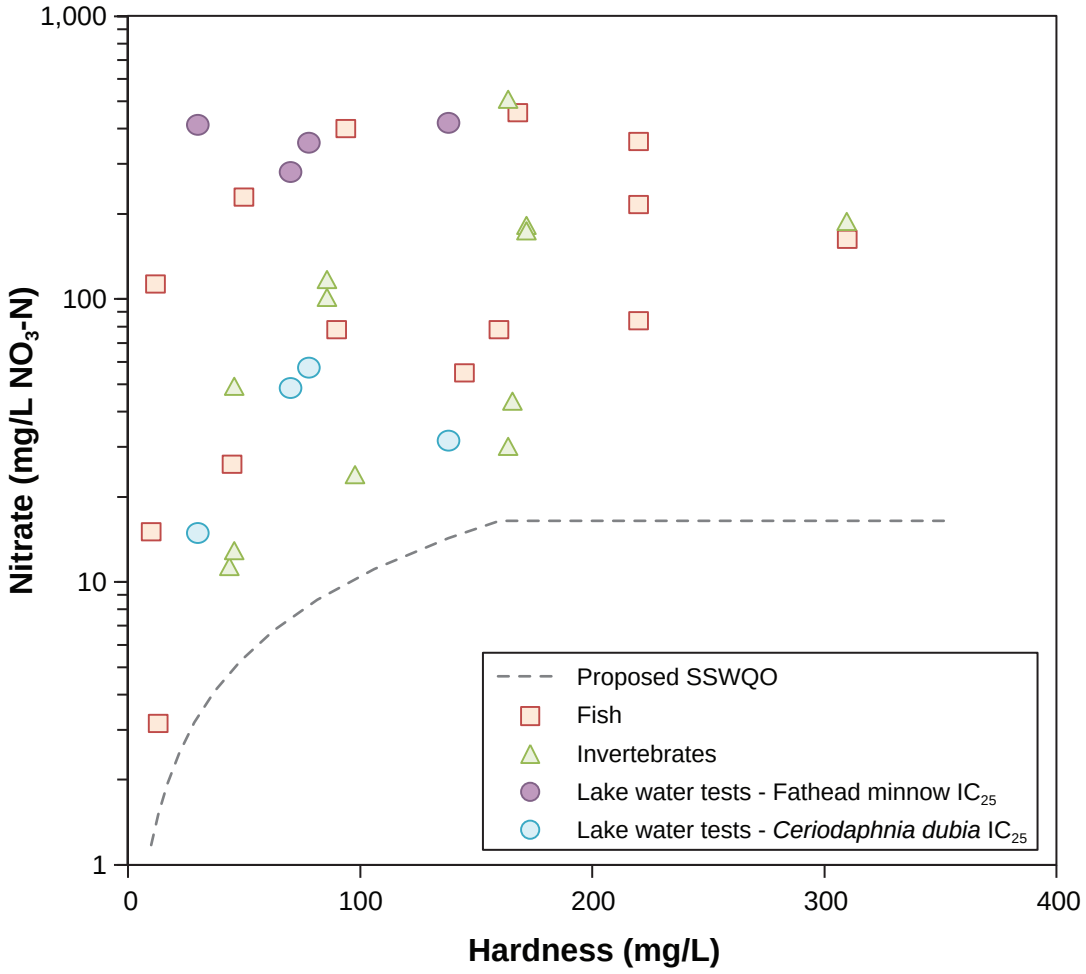
The SSWQO calculated in this report incorporates the effect that water hardness has in modifying the toxicity of nitrate. Under soft water conditions, the proposed objective is lower than the Environment Canada IPS (Guy 2008) calculated for nitrate; however, with increasing water hardness, the proposed objective is higher based on the demonstrated amelioration of nitrate toxicity.

Figure 6.1-1 shows the proposed SSWQO as a function of water hardness, as well as all of the toxicity test data that were considered appropriate for consideration in its development, each presented based on the hardness of the test water in which the test was conducted. All of the endpoint values are greater than the proposed water quality objective line, indicating that the proposed objective is conservatively protective in all cases across the range of water hardnesses and species tested.

Figure 6.1-1 also shows the results of *Ceriodaphnia dubia* and fathead minnow tests from nitrate-spiked tests conducted in water collected from Slipper, Nema, Leslie and Moose lakes; these tests results also are greater than the proposed SSWQO. Of further interest is that the results from these tests indicated that an additional level of protection is provided by the ionic balance of major ions associated with the site waters, over-and-above the benefit provided by water hardness that is incorporated into the SSWQO.

The importance of water hardness in modifying the toxicity of nitrate is clearly of relevance at EKATI, since increasing activities associated with nitrate release co-occur with increasing hardness (Figure 1.1-6). The slope of the relationship between nitrate concentration and hardness is almost identical between Leslie and Moose lakes, but is approximately half that in Nema Lake. This implies that either: 1) there is a source of water hardness in Nema Lake that is not derived from Leslie and Moose lakes; or, 2) there is a natural attenuation of nitrate between Moose and Nema lakes. It appears likely that the latter explanation is the cause of reduced nitrate in Nema Lake, and this suggests that nitrate concentrations will be naturally attenuated in the receiving environment.

The data evaluation described in this report involved an evaluation of safe levels of nitrate from a toxicological standpoint, consistent with WQGs for nitrate produced in Canada. Nitrate is a nutrient and, consequently, an increase in nitrate concentration may represent a risk of nutrient enrichment and a change in lake trophic status. However, potential effects associated with nutrient-loadings to freshwater environments require the presence of both nitrate and phosphate in order to cause detrimental effects. For example, Schindler (1974) demonstrated that experimental addition of sucrose and nitrogen to a lake resulted in eutrophication if phosphorus was also added; however, in the absence of additional phosphorus, the lake remained at pre-fertilization conditions. The lakes around the EKATI Diamond mine are oligotrophic to mesotrophic (i.e., low in nutrients) and phosphorus-limited (i.e., phosphorus concentrations control the growth of algae). Concentrations of phosphorus in effluent released from the EKATI Diamond mine are low and not predicted to increase. Therefore, the risk to a potential change in trophic status of a receiving lake related to nitrate in a phosphorus limited system is negligible.



Notes: Each individual point reflects the toxicity threshold from an individual test.
The SSWQO for specific hardness values are provided in Table 4.3.2 in the main text.

APPENDIX F – *Chironomus dilutus* tests
APPENDIX G – *Pseudokirchneriella subcapitata* tests

1.0 INTRODUCTION

The toxicity of major anions, such as sulphate and chloride, has been shown to be reduced with increasing water hardness using some species (Elphick et al., 2011a and b). However, no evaluations have been reported on the effect of hardness on the toxicity of nitrate. The mechanism resulting in reduced toxicity of sulphate and chloride at elevated hardness has not been definitively described; however, it is likely related to effects of calcium and/or magnesium on the permeability of the membrane or, alternatively, results from competitive exclusion at passive uptake sites by these or other ions. Regardless of the mechanism, it is possible that toxicity of nitrate may similarly be reduced with increasing hardness.

The testing described here was performed to evaluate the role of hardness in modifying the toxicity of nitrate to rainbow trout, fathead minnows, *Ceriodaphnia dubia*, *Hyalella azteca*, and *Chironomus dilutus* (formerly called *Chironomus tentans*). These test species were evaluated for toxicity across a range of three or four hardnesses. In addition, a test with a green alga, *Pseudokirchneriella subcapitata*, was also conducted at a single hardness.

2.0 METHODS

Test waters were prepared by addition of reagent grade salts to meet the target hardness level, with the exception of the very soft water (~15 mg/L) which was used in some of the tests, which was Metro Vancouver dechlorinated municipal tapwater with no added salts. Salt additions followed the ratios of salts specified in USEPA (2003), with the exception of tests using *Hyalella azteca*, which employed a higher concentration of chloride, consistent with recommendations for this species of Environment Canada (1997). Nitrate was introduced by addition of reagent grade sodium nitrate. Hardness and alkalinity was measured in each of the water types used in the tests. At a minimum, nitrate concentrations were measured in all test solutions at test initiation, and in a subset of concentrations bracketing the effect level at test termination (with the exception of the test using *Pseudokirchneriella subcapitata*, which was only measured at test initiation).

Tests using the two fish species were conducted at four hardnesses (approximately 15, 45, 90 and 160 mg/L), whereas the invertebrate species were only tested at the three higher hardnesses. The invertebrates were not tested at the lowest hardness because some of these organisms (in particular, *C. dubia* and *H. azteca*) do not tolerate low ionic strength waters well. Test concentrations were spaced a factor of two apart.

C. dubia were pre-acclimated to the hardness associated with the test for at least two generations prior to initiation of the tests. The other species were not pre-acclimated to the specific hardnesses.

Statistical analyses were conducted using nominal concentrations of nitrate and using CETIS version 1.8 (Tidepool Software).

2.1 Acute toxicity tests

Acute toxicity tests were conducted using rainbow trout and *Hyalella azteca*. Tests were conducted according to Environment Canada guidelines, and following methods summarized in Tables 1 and 2. In the case of *H. azteca*, the test methods followed those specified for conducting reference toxicant tests for this species, typically conducted in conjunction with sediment testing programs.

Table 1. Summary of test conditions: acute tests using rainbow trout and *Hyalella azteca*.

Test species	Rainbow trout	*Hyalella azteca*
Test type	96 hr static	96 hr static
Endpoints	Survival	Survival
Organism source	Fraser Valley Trout Hatchery	Aquatic Biosystems, Fort Collins CO
Organism age	Fry – 0.3 – 0.6 g	6 – 8 days old
Feeding	None	0 and 48 hr, Tetramin
Test chamber	15-L glass aquaria	300 mL glass
Test volume	10 L	200 mL
Test temperature	15 ± 1°C	23 ± 1°C
Control water	Dechlorinated municipal tapwater	Moderately hard synthetic water,
Organisms/replicate	10	10
Number of replicates	1	3
Photoperiod	16 hours light/8 hours dark	16 hours light/8 hours dark
Aeration	Continuous	None
Test Method	Environment Canada (2000)	Environment Canada (1997a)
Acceptability criterion for controls	≥90% survival	≥90% survival

2.2 Chronic toxicity tests

Chronic toxicity tests were conducted across a range of hardnesses using fathead minnows, *Ceriodaphnia dubia, Hyalella azteca* and *Chironomus dilutus*. Tests using fathead minnows and *C. dubia* were conducted according to Environment Canada guidelines for these species (Tables 2 and 3). Tests using *H. azteca* and *C. dilutus* were modified from Environment Canada test methods for evaluating sediments for toxicity; tests were adapted by using control sediment for all exposures, and exposing the organisms to various concentrations of nitrate in the overlying water, which was renewed with freshly prepared solution three times per week (Tables 4 and 5).

A chronic toxicity test was also conducted using *Pseudokirchneriella subcapitata* at a single hardness (~10 mg/L) following Environment Canada procedures, which are summarized in Table 6.

Table 2. Summary of test conditions: 7-d fathead minnow survival and growth test.

Test organism	*Pimephales promelas*
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hr post hatch
Test type	Static-renewal (daily)
Test duration	7 days
Test vessel	375-mL glass jars
Test Treatment	200 mL
Test replicates	3
No. of organisms	10 per replicate
Test temperature	25 ± 1°C
Feeding	*Artemia*, twice daily
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada (1992), EPS 1/RM/22
Test endpoints	Survival and dry weight
Test acceptability criterion for controls	Mean control survival of ≥80% and ≥0.1 mg/amphipod dry weight
Reference Toxicant	NaCl

Table 3. Summary of test conditions: 7-d *Ceriodaphnia dubia* test.

Test type	Static renewal (daily)
Endpoints	Survival and reproduction
Organism source	In-house culture
Organism age	<24 hr old neonates produced within 12 hr
Feeding	*Pseudokirchneriella subcapitata* and dYCT
Test chamber	20 mL glass test tube
Test volume	15 mL
Test temperature	25±1°C
Control water	Moderately hard synthetic water
Number of organisms/replicate	1
Number of replicates	10
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environmental Canada (2007a); EPS 1/RM/21
Test acceptability criterion for controls	≥80% survival; ≥15 young per surviving control

Table 4. Summary of test conditions: 14-d *Hyalella azteca* toxicity test.

Test organism	*Hyalella azteca*
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	6 - 8 d old
Test type	Static-renewal (three times per week)
Test duration	14 days
Test vessel	375-mL glass jars
Test Treatment	100 mL control sediment; 175 mL overlying water
Test replicates	3 replicates per treatment
No. of organisms	10 per replicate
Test temperature	23 ± 1°C
Feeding	1.5 mL of YCT per replicate daily
Photoperiod	16 hours light/8 hours dark
Aeration	Gentle aeration throughout test
Test protocol	Environment Canada (1997a), EPS 1/RM/33
Test endpoints	Survival and dry weight
Test acceptability criterion for controls	Mean control survival of ≥80% and ≥0.1 mg/amphipod dry weight
Reference Toxicant	NaCl

Table 5. Summary of test conditions: 10-d *Chironomus dilutus* toxicity test.

Test organism	*Chironomus dilutus*
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	3rd Instar
Test type	Static renewal (three times per week)
Test duration	10 days
Test vessel	375-mL glass jars
Test Treatment	100 mL sediment; 175 mL overlying water
Test replicates	3 replicates per treatment
No. of organisms	10 per replicate
Test temperature	23 ± 1°C
Feeding	6.0 mg Tetramin in 1.5 mL suspension per replicate daily
Photoperiod	16 hours light/8 hours dark
Aeration	Gentle aeration throughout test
Test protocol	Environment Canada (1997b), EPS 1/RM/32
Test endpoint	Survival and dry weight
Test acceptability criteria for controls	Mean control survival of ≥70%; and ≥0.6 mg dry weight
Reference toxicant	KCl

Table 6. Summary of test conditions: *Pseudokirchneriella subcapitata* growth inhibition test.

Test organism	*Pseudokirchneriella subcapitata*, strain UTCC #37
Origin of Strain	Canadian Phycological Culture Center, University of Waterloo
Test organism source	In-house culture
Test organism age	4- to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test chamber	Microplate
Test solution volume	220 µL
Number of replicates	Four for treatments; eight for control
Control water	Deionized water with added nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Number of organisms/chamber	10,000 cells/mL
Light intensity	3600 to 4400 lux
Photoperiod	Continuous
Aeration	None
Test protocol	Environment Canada (2007b), EPS 1/RM/25
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	≥ 16-fold increase in number of algal cells the control; control must not exhibit a positive or negative trend with Mann-Kendall test; and the coefficient of variation of the control replicates must not exceed 20%.
Reference toxicant	Zinc

3.0 RESULTS

All of the tests met acceptance criteria specified in the test methods. Measured concentrations of nitrate are summarized in Appendix A; measured concentrations were in good agreement with target concentrations of nitrate. The average of the measured concentrations from each test were within 10% of nominal values, with the exception of the soft water test using *Ceriodaphnia dubia*, which had an average measured concentration of nitrate that was an average of 13% higher than nominal. The average of all measurements conducted were 2% (± 9%) higher than nominal and, consequently, nominal data were considered to be appropriate for use in statistical analyses of the data.

Results of acute toxicity tests using rainbow trout and *Hyalella azteca* are provided in Table 7. Chronic toxicity test results for fathead minnows, *Ceriodaphnia dubia, Hyalella azteca* and *Chironomus dilutus* are provided in Table 8. Results of a growth inhibition test using *Pseudokirchneriella subcapitata* are provided in Table 9. Bench-sheets from these tests, as well as printouts of statistical analyses are provided in the Appendices to this report.

Results of reference toxicant (positive control) tests are provided in Table 10. In each case, the reference toxicant test result fell within the range of historical data from the laboratory (mean ± 2 SD), indicating that the sensitivity of the test organisms was appropriate.

Table 7. Results of acute toxicity tests.

Species	Hardness	Endpoint	Value (mg/L NO3-N)	NOEC	LOEC
Oncorhynchus mykiss	11	96 hr LC50	691 (512 – 928)	625	1250
	54	96 hr LC50	1436 (1174 – 1755)	1250	2500
	90	96 hr LC50	1768 (1420 – 2201)	1250	2500
	164	96 hr LC50	1768 (1420 – 2201)	1250	2500
Hyalella azteca	44	96 hr LC50	168 (143 – 197)	76	169
	100	96 hr LC50	485 (435 – 540)	335	736
	164	96 hr LC50	921 (808 – 1049)	783	1650

Table 8. Results of chronic toxicity tests using fathead minnows, *Ceriodaphnia dubia, Hyalella azteca* and *Chironomus dilutus*.

Pseudokirchneriella subcapitata	14/1/2011	Zn	42.7 µg/L	11.9 – 46.6 µg/L	41

4.0 DISCUSSION

The results presented here show a clear relationship between hardness and toxicity for all of the species tested across a range of hardnesses; Figure 1 shows mortality data (LC50 results) for each of the species that were tested. The trend-lines that are shown reflect an exponential (power) relationship, which is equivalent to a linear relationship of log-transformed hardness and LC50 data. Similarly, Figure 2 shows exponential relationships between hardness and toxicity for chronic endpoints (IC25 values). Interestingly, the slopes of the relationships are largely similar between species.

Results of chronic tests presented in Tables 8 and 9 show both IC25, as well as NOEC and LOEC values. The IC25 values from these tests are the most appropriate value to be considered as toxicological thresholds from these tests, since these typically reflect a more sensitive estimate of toxicity than the MATC (i.e., the geometric mean of the NOEC and LOEC). The IC10 values are not considered reliable estimates of a toxicological threshold in these tests since, in almost all cases, the IC10 falls below the NOEC from the test. Consequently, there is very little confidence in the ability to accurately detect a 10% level of effect in these tests.

APPENDIX B – Acute toxicity tests

Rainbow Trout Summary Sheet

Client: BCMA

Start Date/Time: Sept 14/10 @ 1545h

Work Order No.: N/A

Test Species: *Oncorhynchus mykiss*

Sample Information:

Sample ID: Dechlor Nitrate
Sample Date: —
Date Received: —
Sample Volume: —
Other: —

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L $CaCO_3$): ~~10~~ 11
Alkalinity (mg/L $CaCO_3$): ~~8~~ 12

Test Organism Information:

Batch No.: 061610
Source: Trout Lake Lodge
No. Fish/Volume (L): 10/10L
Loading Density: 0.36
Mean Length ± SD (mm): 36 ± 2 Range: 32-40
Mean Weight ± SD (g): 0.36 ± 0.07 Range: 0.25-0.46

SDS Reference Toxicant Results:

Reference Toxicant ID: RT62
Stock Solution ID: 10508
Date Initiated: Aug 23/10
96-h LC50 (95% CL): 5.3 (4.3-6.6) mg/L SDS

Reference Toxicant Mean (2SD Range): 5.2 (4.4-6.1) mg/L SDS
Reference Toxicant CV (%): 8.5

Test Results: The 96-hr LC50 is estimated at 691 mg/L NO_3-N with 95% CL of 512 and 928.

H. azteca Test Summary Sheet (96-hr)

Client: In-house

Start Date/Time: Mar 24/10 @ 1430h

Work Order No.: n/a

Test Species: H. azteca

Sample Information:

Sample ID: Nitrate-MHW
Sample Date: —
Date Received: —
Sample Volume: —

Dilution Water:

Type: Moderately Hard Water
Hardness (mg/L $CaCO_3$): 100
Alkalinity (mg/L $CaCO_3$): 58

Test Organism Information:

Species: Hyalella azteca
Supplier: ABS (Colorado)
Date received: March 23, 2010

NaCl Reference Toxicant Results:

Reference Toxicant ID: HA30
Stock Solution ID: NaCl salt
Date Initiated: March 24, 2010

96-h LC50 (95% CL): 3.73 (3.01-4.63) g/L NaCl

96-h LC50 Reference Toxicant Mean and Range: 4.04 (2.42-6.76) g/L NaCl CV (%): 29.3

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	n/a	
LC50 % (v/v) (95% CL)	485 (435-540)	
IC25 % (v/v) (95% CL)

APPENDIX C – Fathead minnow tests

Fathead Minnow Test Summary Sheet

Client: BCMA

Start Date/Time: Sept 14/10 @ 1630h

Work Order No.: N/A

Test Species: *Pimephales promelas*

Sample Information:

Sample ID: Dechlor-Nitrate
Sample Date: —
Date Received: —
Sample Volume: —

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L $CaCO_3$): 12
Alkalinity (mg/L $CaCO_3$): 16

Test Organism Information:

Batch No.: 091410
Source: ABS, Colorado
Loading Density: N/A

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP45
Stock Solution ID: N/A
Date Initiated: Sept 14, 2010
7-d EC50 (95% CL): 3.9 (3.4-4.5)
7-d IC50 (95% CL): 3.2 (2.7-4.6)

Survival:
Reference Toxicant ~~Acceptable~~ Historical Range: 3.7 - 6.3 CV (%): 14

Biomass
Reference Toxicant ~~Acceptable~~ Historical Range: 3.0 - 5.7 CV (%): 17

Test Results:

	mg NO_3-N/L	
	Survival	Biomass
LC25 % ~~(v/v)~~ (95% CL)	92 (70 - 106)	
LC50 % ~~(v/v)~~ (95% CL)	113 (96 - 130)	
IC25 % ~~(v/v)~~ (95% CL)		66 (43-83)
IC50 % ~~(v/v)~~ (95% CL)		98 (80 - 120)

Fathead Minnow Test Summary Sheet

Client: BCMA

Start Date/Time: Sept 14/10 @ 1615h

Work Order No.: N/A

Test Species: *Pimephales promelas*

Sample Information:

Sample ID: Soft Water - Nitrate
Sample Date: —
Date Received: —
Sample Volume: —

Dilution Water:

Type: Soft Water
Hardness (mg/L $CaCO_3$): 50
Alkalinity (mg/L $CaCO_3$): 36

Test Organism Information:

Batch No.: 091410
Source: ABS, Colorado
Loading Density: N/A

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP45
Stock Solution ID: N/A
Date Initiated: Sept 14, 2010
7-d EC50 (95% CL): 3.9 (3.4-4.5)
7-d IC50 (95% CL): 3.2 (2.7-4.0)

Survival:
Reference Toxicant ~~Acceptable~~ Historical Range: 3.7-6.3 CV (%): 14

Biomass
Reference Toxicant ~~Acceptable~~ Historical Range: 3.0 - 5.7 CV (%): 17

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	n/a	
LC50 % (v/v) (95% CL)	229 (194-270)	
IC25 % (v/v) (95% CL)		205 (N/A - 243)
IC50 % (v/v) (95% CL)		256 (181-287)

Fathead Minnow Test Summary Sheet

Client: BCMA

Start Date/Time: Sept 14/10 @ 1640h

Work Order No.: N/A

Test Species: *Pimephales promelas*

Sample Information:

Sample ID: MHW-Nitrate
Sample Date: —
Date Received: —
Sample Volume: —

Dilution Water:

Type: Moderately Hard Water
Hardness (mg/L $CaCO_3$): 94
Alkalinity (mg/L $CaCO_3$): 66

Test Organism Information:

Batch No.: 091410
Source: ABS, Colorado
Loading Density: N/A

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP45
Stock Solution ID: N/A
Date Initiated: Sept 14/10
7-d EC50 (95% CL): 3.9 (3.4-4.5)
7-d IC50 (95% CL): 3.2 (2.7-4.0)

Survival:
Reference Toxicant ~~Acceptable~~ Historical EPC Range: 3.7-6.3 CV (%): 14

Biomass
Reference Toxicant ~~Acceptable~~ Historical EPC Range: 3.0-5.7 CV (%): 17

Test Results:

	Survival	Biomass
LC25 % (v/v) (95% CL)	n/a	
LC50 % (v/v) (95% CL)	400 (344-465)	
IC25 % (v/v) (95% CL)		340 (154-543)
IC50 % (v/v) (95% CL)		492 (377-581)

Fathead Minnow Test Summary Sheet

Client: MABC

Start Date/Time: Feb 25/11 @ 1630

Work Order No.: n/a

Test Species: *Pimephales promelas*

Sample Information:

Sample ID: Hard Water - Nitrate
Sample Date: n/a
Date Received: n/a
Sample Volume: n/a

Dilution Water:

Type: Hard Water
Hardness (mg/L $CaCO_3$): 168
Alkalinity (mg/L $CaCO_3$): 112

Test Organism Information:

Batch No.: 022511
Source: Aquatic Biosystems
Loading Density: —
Age: Less than 24 hours

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP52
Stock Solution ID: N/A
Date Initiated: Feb 25/2011
7-d EC50 (95% CL): 4.9 (4.1-5.9)
7-d IC50 (95% CL): 3.3 (2.6-4.0)

Survival:

Reference Toxicant Mean ± 2 SD: 4.9 (3.7-6.3) CV (%): 14

Biomass

Reference Toxicant Mean ± 2 SD: 4.2 (3.1-5.7) CV (%): 17

Test Results:

JAB

	Survival	Biomass
LC25 ~~%~~ (~~v/v~~) (95% CL)	n/a	
LC50 ~~%~~ (~~v/v~~) (95% CL)	454 (390 - 530)	
IC25 ~~%~~ (~~v/v~~) (95% CL)		393 (224 - 455)
IC50 ~~%~~ (~~v/v~~) (95% CL)		502 (438-546)

APPENDIX D – *Ceriodaphnia dubia* tests

Ceriodaphnia dubia Summary Sheet

Client: MABC
Work Order No.: n/a

Start Date/Time: Sept 23/10 @ 1445
Set up by: JJT

Sample Information:

Sample ID: Softwater - Nitrate
Sample Date: n/a
Date Received: n/a
Sample Volume: n/a

Test Organism Information:

Broodstock No.: 091610
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 19
Mortality (%) in previous 7 d: 0
Individual female # used ≥8 young on test day: 1, 2, 4, 5, 8, 11, 12, 13, 16, 17

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd58
Stock Solution ID: 09NaCl05
Date Initiated: Sept 28/10

7-d LC50 (95% CL): 1.98 (1.74 - 2.26) g/L NaCL
7-d IC50 (95% CL): 1.24 (~~1.15~~ 1.14 - 1.35) g/L NaCL
JAB

7-d LC50 Reference Toxicant Mean (2SD Range): 1.86 (1.46 - 2.36) g/L NaCL CV (%): 12.9
7-d IC50 Reference Toxicant Mean (2SD Range): 1.15 (0.88 - 1.50) g/L NaCL CV (%): 14.2

Test Results:

mg/L NO_3-N	Survival	Reproduction
LC50 %(v/v) (95% CL)	44.2 (30.4 - 63.8)	
IC25 %(v/v) (95% CL)		11.3 (3.3 - 21.2)
IC50 %(v/v) (95% CL)		25.3 (17.8 - 32.1)

Ceriodaphnia dubia Summary Sheet

Client: MABC
Work Order No.: n/a

Start Date/Time: Feb 17/11 @ 1130h
Set up by: KLB

Sample Information:

Sample ID: Moderately Hard Water - Nitrate
Sample Date: n/a
Date Received: n/a
Sample Volume: n/a

Test Organism Information:

Broodstock No.: 020911
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 27
Mortality (%) in previous 7 d: 0
Individual female # used ≥8 young on test day: 21, 22, 24, 25, 26, 27, 28, 29, 30, 31

NaCl Reference Toxicant Results:

Reference Toxicant ID: CdG4
Stock Solution ID: 10Na01
Date Initiated: Feb 22/11

7-d LC50 (95% CL): 1.85 (1.53-2.23) g/L NaCL
7-d IC50 (95% CL): ~~1.27~~ (1.01 - 1.41) g/L NaCL

Ceriodaphnia dubia Summary Sheet

Client: MABC
Work Order No.: n/a

Start Date/Time: Sept 23/10 @ 1215h
Set up by: JJT

Sample Information:

Sample ID: HardWater-Nitrate
Sample Date: n/a
Date Received: n/a
Sample Volume: n/a

Test Organism Information:

Broodstock No.: 091610
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 23
Mortality (%) in previous 7 d: 0
Individual female # used ≥8 young on test day: 21, 22, 23, 24, 25, 30, 31, 32, 33, 35

NaCl Reference Toxicant Results:

Reference Toxicant ID: JMB ~~Cd96~~ Cd58
Stock Solution ID: 09NaCl05
Date Initiated: JMB ~~Sept 11~~ Sept 28/10

7-d LC50 (95% CL): 1.98 (1.74 - 2.26) g/L NaCL
7-d IC50 (95% CL): 1.24 ~~(1.15~~ - 1.35) g/L NaCL
JMB 11/4

7-d LC50 Reference Toxicant Mean (2SD Range): 1.86 (1.46 - 2.36) g/L NaCL CV (%): 12.9
7-d IC50 Reference Toxicant Mean (2SD Range): 1.15 (0.88 - 1.50) g/L NaCL CV (%): 14.2

Test Results:

$mg NO_3$-N/L	Survival	Reproduction

H. azteca Test Summary Sheet

Client: MABC

Start Date/Time: Dec 30/10 @ 1200h

Work Order No.: n/a

Test Species: H. azteca

Sample Information:

Sample ID: MHW-Nitrate
Sample Date: n/a
Date Received: n/a
Sample Volume: n/a

Dilution Water:

Type: Moderately Hard Water (MHW)
Hardness (mg/L $CaCO_3$): 86
Alkalinity (mg/L $CaCO_3$): 48

Test Organism Information:

Species: H. azteca
Supplier: Aquatic Bio-Systems (Colorado)
Date received: Dec 29/10
Age/Size (Day0): 6-8 day old

NaCl Reference Toxicant Results:

Reference Toxicant ID: HA42
Stock Solution ID: n/a
Date Initiated: Dec 30/10

96-h LC50 (95% CL): 4.6 (3.8-5.6) g/L NaCl

96-h LC50 Reference Toxicant Mean and ~~Range~~ 250: 4.5 (3.0-6.7) g/L NaCl CV (%): 21.9

Test Results:

H. azteca Test Summary Sheet

Client: MABC

Start Date/Time: JAB ~~Jan 7~~ Dec 30/10 @1200h

Work Order No.: n/a

Test Species: H.azteca

Sample Information:

Sample ID: HW-Nitrate
Sample Date: n/a
Date Received: n/a
Sample Volume: n/a

Dilution Water:

Type: Hard Water (HW)
Hardness (mg/L $CaCO_3$): 172
Alkalinity (mg/L $CaCO_3$): 100

Test Organism Information:

Species: H.azteca
Supplier: Aquatic Bio-Systems (Colorado)
Date received: Dec 29/10
Age/Size (Day0): 6-8 day old

NaCl Reference Toxicant Results:

Reference Toxicant ID: HA42
Stock Solution ID: n/a
Date Initiated: Dec 30/10

96-h LC50 (95% CL): 4.6 (3.8-5.6) g/L NaCl

96-h LC50 Reference Toxicant Mean and 2SD Range: 4.5 (3.0-6.7) g/L NaCl CV (%): 21.9

Test Results:

mg NO_3-N/L	Survival	Mean Dry Weight JAB ~~Biomass~~

Chironomus dilutus Test Summary Sheet

Client: MABC

Start Date/Time: Jan 7/11 @ 1200h

Work Order No.: n/a

Test Species: Chironomus dilutus

Sample Information:

Sample ID: SW - Nitrate
Sample Date: n/a
Date Received: n/a
Sample Volume: n/a

Dilution Water:

Type: Soft Water (SW)
Hardness (mg/L $CaCO_3$): 46
Alkalinity (mg/L $CaCO_3$): 22

Test Organism Information:

Species: C. dilutus
Supplier: Aquatic Bio-Systems (Colorado)
Date received: Jan 6/11
Age/Size (Day0): Beginning of third instar

KCl Reference Toxicant Results:

Reference Toxicant ID: CT20
Stock Solution ID: n/a
Date Initiated: Jan 7/11

96-h LC50 (95% CL): 5.2 (3.9 - 7.0) g/L KCl

96-h LC50 Reference Toxicant Mean and Range: 6.7 (4.6 - 9.9) g/L KCl CV (%): 20.9

Test Results:

Chironomus dilutus Test Summary Sheet

Client: MABC

Start Date/Time: Jan 7/11 @ 1200h

Work Order No.: n/a

Test Species: C. dilutus

Sample Information:

Sample ID: MHW - Nitrate
Sample Date: n/a
Date Received: n/a
Sample Volume: n/a

Dilution Water:

Type: Moderately Hard Water (MHW)
Hardness (mg/L $CaCO_3$): 86
Alkalinity (mg/L $CaCO_3$): 48

Test Organism Information:

Species: C. dilutus
Supplier: Aquatic Bio-Systems (Colorado)
Date received: Jan 6/11
Age/Size (Day 0): Beginning of third instar

KCl Reference Toxicant Results:

Reference Toxicant ID: CT20
Stock Solution ID: n/a
Date Initiated: Jan 7/11

96-h LC50 (95% CL): 5.2 (3.9-7.0) g/L KCl

96-h LC50 Reference Toxicant Mean and Range: 6.7 (4.6-9.9) g/L KCl CV (%): 20.9

Chironomus dilutus Test Summary Sheet

Client: MABC

Start Date/Time: Jan 7/11 @ 1200h

Work Order No.: n/a

Test Species: C. dilutus

Sample Information:

Sample ID: HW - Nitrate
Sample Date: n/a
Date Received: n/a
Sample Volume: n/a

Dilution Water:

Type: Hard Water (HW)
Hardness (mg/L $CaCO_3$): 172
Alkalinity (mg/L $CaCO_3$): 100

Test Organism Information:

Species: C. dilutus
Supplier: Aquatic Bio-Systems (Colorado)
Date received: Jan 6/11
Age/Size (Dayo): Beginning of third instar

KCl Reference Toxicant Results:

Reference Toxicant ID: CT20
Stock Solution ID: n/a
Date Initiated: Jan 7/11

96-h LC50 (95% CL): 5.2 (3.9-7.0) g/L KCl

96-h LC50 Reference Toxicant Mean and Range: 6.7 (4.6-9.9) g/L KCl CV (%): 20.9

Test Results:

	Survival	Mean Dry Weight ~~Biomass~~
LC25 % (v/v) (95% CL)	n/a	JAB
LC50 % (v/v) (95% CL)	337 (297-382)	
IC25 % (v/v) (95% CL)		174 (156-188)
IC50 % (v/v) (95% CL)		229 (211-240)

LIST OF APPENDICES

APPENDIX A – Summary of measured nitrate concentrations

APPENDIX B –Toxicity test results

1.0 INTRODUCTION

The toxicity of major anions, such as sulphate and chloride, has been shown to be reduced with increasing water hardness using some species (Elphick et al., 2011a and b). However, no evaluations have been reported on the effect of hardness on the toxicity of nitrate. The mechanism resulting in reduced toxicity of sulphate and chloride at elevated hardness has not been definitively described; however, it is likely related to effects of calcium and/or magnesium on the permeability of the membrane or, alternatively, results from competitive exclusion at passive uptake sites by these or other ions. Regardless of the mechanism, it is possible that toxicity of nitrate may similarly be reduced with increasing hardness.

The testing described here was performed to evaluate the role of hardness in modifying the toxicity of nitrate in chronic exposures using early life stages of rainbow trout. Early life stages of salmonids have been demonstrated to be particularly sensitive to nitrate (McGurk et al. 2006).

2.0 METHODS

Test waters were prepared by addition of reagent grade salts to meet the target hardness level, with the exception of the very soft water (~15 mg/L), which was Metro Vancouver dechlorinated municipal tapwater with no added salts. Tests were conducted at four hardnesses (approximately 15, 45, 90 and 160 mg/L), and salt additions followed the ratios of salts specified in USEPA (2003). Nitrate was introduced by addition of reagent grade sodium nitrate. Hardness and alkalinity was measured in each of the water types used in the tests. Nitrate concentrations were measured in all test solutions at test initiation, and in a subset of concentrations bracketing the effect level at test termination.

Statistical analyses were conducted using nominal concentrations of nitrate and using CETIS version 1.8 (Tidepool Software).

2.1 Toxicity test methods

Toxicity tests were conducted in a similar manner to that described by McGurk et al. (2006) which were based on Environment Canada (1998) procedures for early life stages of salmonids. Similar to the McGurk et al. (2006) study, the test solutions were renewed three times per week, rather than daily, since nitrate did not dissipate in the test containers.

The test procedure was equivalent to the embryo-alevin test, but was extended until the majority of the alevins in the controls were considered to have fully absorbed the yolk-sac and reached the swim-up stage, including swimming actively in the water column. In addition to the usual test endpoints (i.e., survival of normally-developed fry), the fish were weighed, and scored for quantity of residual yolk sac. The latter endpoint was evaluated because McGurk et al. (2006) noted that lake trout exposed to nitrate exhibited a delay in achieving full yolk sac absorption. Residual yolk sac in each of the fish was assigned a value of 0, 1, 2 or 3 at test termination, where a score of zero was assigned to fish in which there was no residual yolk, and a score of 3 was assigned to fish that appeared to have consumed little or no yolk. This assessment was somewhat qualitative and, consequently, in order to maximize consistency, the same biologist assigned yolk sac scores to all of the surviving fry at test termination. Fish that had completely obsorbed their yolk sac were considered to have reached swim-up.

Table 1. Summary of test conditions: rainbow trout early life stage test.

Test organism	*Onchorhynchus mykiss*
Test organism source	Fraser Valley Trout Hatchery
Test organism age	Eggs and milt, fertilized just prior to test initiation
Test type	Static-renewal (three times per week)
Test duration	37 to 40 days
Test vessel	4-L plastic buckets
Exposure volume	2 L
Test replicates	4
No. of organisms	30 per replicate
Test temperature	14 ± 1°C
Feeding	None
Photoperiod	24 hour dark; dim light used during solution renewal
Aeration	Continuous
Test protocol	Environment Canada (1998), EPS 1/RM/28
Test endpoints	Survival, weight, achieving swim-up
Test acceptability criterion for controls	≥60% normal surviving alevins
Reference Toxicant	SDS

3.0 RESULTS

All tests met quality control criteria cited in the method, and measured concentrations of nitrate were in good agreement with the targeted values. Measured values for the nominal 15, 45, 90 and 160 mg/L hardnesses were 10, 50, 92 and 176 mg/L, respectively.

Adverse effects on survival were only observed in the very soft water; an LC10 and LC25 of 147 and 184 mg/L NO3-N were calculated in this test, whereas the LC10 and LC25 were >405 mg/L (i.e., greater than the highest test concentration) in each of the harder waters.

IC25 values for growth metrics (i.e., wet weight and length) were >405 mg/L in all four water types, although statistically-significant departures from control performance were observed in some treatments. IC10 values for wet weight generally increased with increasing water hardness, with calculated values of 95, 176, 132 and 335 mg/L for the 10, 50, 92 and 176 mg/L hardnesses, respectively. IC10 values for length exhibited a less consistent trend, with values reported of 111, >405, 245 and >405 mg/L for the four hardnesses, respectively.

Nitrate exposure was associated with a delay to reach swim-up, in a manner similar to that described in McGurk *at el.* (2006). In very soft water (10 mg/L hardness), the IC10 and IC25 for delayed yolk sac absorption was 13 and 32 mg/L and the NOEC and LOEC were 15 and 45 mg/L NO_3-N, respectively. However, it should be noted that the 15 mg/L treatment was very close to the threshold for being considered statistically significantly different from the control. These values are similar to the LOEC value of 6.25 mg/L reported in McGurk *et al.* (2006), indicating that the sensitivity of lake trout and rainbow trout appears to be comparable in a similar water type. There was no delay in yolk sac absorption in any of the test concentrations tested in the soft (50 mg/L hardness) and hard waters (176 mg/L hardness), resulting in IC10, IC25, and LOEC values of >405 mg/L for these two water types. Conversely, a delay in achieving yolk sac absorption was observed in the 135 and 405 mg/L NO_3-N concentrations in the moderately hard water (92 mg/L hardness), resulting in an NOEC and LOEC of 45 and 135 mg/L in this water type. The IC10 for delayed yolk absorption was 53 mg/L in this water type.

Results of reference toxicant (positive control) tests are provided in Table 3. The reference toxicant test result fell within the range of historical data from the laboratory (mean ± 2 SD), indicating that the sensitivity of the test organisms was appropriate.

Species	Date	Toxicant	Point estimate	Acceptable Range	CV
Oncorhynchus mykiss (7 day embryo)	26/5/2010	SDS	5.2 mg/L	2.5 – 10.8 mg/L	44

4.0 DISCUSSION

The relationship between water hardness and sensitivity to nitrate is clearly present in the data presented in Table 2; however, the results do not definitively demonstrate the slope of the relationship for each of the endpoints, since the sensitivity to nitrate in the moderately hard water (92 mg/L hardness) appeared greater than the soft water (50 mg/L hardness), although clearly sensitivity to nitrate was greatest in the softest water type (10 mg/L hardness). This resulted partly from the fact that the adverse effects were small, generally resulting in adverse effects of less than a 25% departure from control performance. Thus, between-test differences in variability can result in differing statistical sensitivities to detect adverse effects.

Regardless, the data clearly demonstrate that rainbow trout were more sensitive in very soft water than harder waters. The most sensitive IC10 value from the tests conducted was 13 mg/L in the very soft water (for delayed yolk sac absorption), 176 mg/L in the soft water (for fry weight), 53 mg/L in the moderately hard water (for delay in reaching swim-up) and 335 mg/L in the hard water (for fry weight). The fish exposed in the very soft water test, which was comparable in characteristics to the water used by McGurk et al. (2006), were substantially more sensitive to nitrate using each of the four test endpoints, relative to all of the other, harder water types.

Rainbow Trout Embryo-Alevin-Fry Test Summary Sheet

Client: MABC

Start Date/Time: 26-May-10 @1600h

Work Order No.: n/a

Test Species: *Oncorhynchus mykiss*

Sample Information:

Sample ID: Nitrate-Synthetic Soft Water
Sample Date: —
Date Received: —
Sample Volume: —

Dilution Water:

Type: Synthetic Soft Water
Hardness (mg/L $CaCO_3$): 40-60
Alkalinity (mg/L $CaCO_3$): 30-40

Test Organism Information:

Batch No.: 052610
Source: Fraser Valley Trout Hatchery
Loading Density: 30 embryo in 2-L

SDS Reference Toxicant Results:

Reference Toxicant ID: RTE26
Stock Solution ID: 10505
Date Initiated: May 26/10
7-d EC50 (95% CL): 5.1 (4.8-5.3) mg/L SDS

Reference Toxicant Mean ± 2 SD: 5.2 (2.5-10.8) mg/L SDS
Reference Toxicant CV (%): 44

Test Results:

mg/L NO3-N	Survival	% Swimup (Initial)	Wet Weight	Length

Rainbow Trout Embryo-Alevin-Fry Test Summary Sheet

Client: MABC

Start Date/Time: 26-May-10 @1600h

Work Order No.: n/a

Test Species: *Oncorhynchus mykiss*

Sample Information:

Sample ID: Nitrate-Moderately Hard Water
Sample Date: —
Date Received: —
Sample Volume: —

Dilution Water:

Type: Synthetic Moderately Hard Water
Hardness (mg/L $CaCO_3$): 80-110
Alkalinity (mg/L $CaCO_3$): 60-70

Test Organism Information:

Batch No.: 052610
Source: Fraser Valley Trout Hatchery
Loading Density: 30 embryo in 2-L

SDS Reference Toxicant Results:

Reference Toxicant ID: RTE26
Stock Solution ID: 10505
Date Initiated: May 26/10
7-d EC50 (95% CL): 5.1 (4.8-5.3) mg/L SDS

Reference Toxicant Mean ± 2 SD: 5.2 (2.5-10.8) mg/L SDS
Reference Toxicant CV (%): 44

Test Results:

Rainbow Trout Embryo-Alevin-Fry Test Summary Sheet

Client: MABC

Start Date/Time: 26-May-10 @1600h

Work Order No.: n/a

Test Species: *Oncorhynchus mykiss*

Sample Information:

Sample ID: Nitrate- Hard Water
Sample Date: —
Date Received: —
Sample Volume: —

Dilution Water:

Type: Synthetic Hard Water
Hardness (mg/L $CaCO_3$): 160-190
Alkalinity (mg/L $CaCO_3$): 110-120

Test Organism Information:

Batch No.: 052610
Source: Fraser Valley Trout Hatchery
Loading Density: 30 embryo in 2-L

SDS Reference Toxicant Results:

Reference Toxicant ID: RTE 26
Stock Solution ID: 10505
Date Initiated: May 26/10
7-d EC50 (95% CL): 5.1 (4.8-5.3) mg/L SDS

Reference Toxicant Mean ± 2 SD: 5.2 (2.5-10.8) (~~4.8-5.3~~) mg/L SDS JAB
Reference Toxicant CV (%): 44

Test Results:

Appendix C. Chronic Toxicity Studies on Nitrate Available from the Literature

Suitability	Paper class	Group	Species (common name)	Endpoint	Effect Level	Mean Hardness (mg/L)	Chronic Value (mg/L)	Chronic value adjusted to hardness 40 mg/L	Reference	Standardized Method	Appropriate Replication and Design	Measured Concentrations	Use of Sensitive Lifestages	Control Performance	Report Abiotic Factors	Acceptable Dose-response	Statistical Methods Reported	Rationale for Acceptability
ALGAE / PROTISTS / PLANTS																		
S	Primary	Alga	*Pseudokirchneriella subcapitata* (green alga)	Growth	72-h IC25	10	691.0	N/A	Nautilus Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	*P. subcapitata* is a surrogate for the other green algae found at EKATI. The data for this green alga were not hardness-adjusted, since it is not known if the active uptake mechanism employed by primary producers to obtain nitrate is affected by hardness. IC25 was selected since IC10 fell below the NOEC in the test and was considered unreliable. The IC25 was lower than the MATC, and therefore considered preferable.
INVERTEBRATES																		
R	Primary	Invertebrates (planktonic crustacean)	*Ceriodaphnia dubia* (water flea)	Reproduction	7-d IC25	44	11.3	10.3	Nautilius Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	This Cladoceran genus is found at EKATI. IC25 was selected since IC10 fell below the NOEC in the test and was considered unreliable. The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
R	Primary	Invertebrates (planktonic crustacean)	*Ceriodaphnia dubia* (water flea)	Reproduction	7-d IC25	98	23.9	10.2	Nautilius Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	This Cladoceran genus is found at EKATI. IC25 was selected since IC10 fell below the NOEC in the test and was considered unreliable. The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
R	Primary	Invertebrates (planktonic crustacean)	*Ceriodaphnia dubia* (water flea)	Reproduction	7-d IC25	166	43.4	11.2	Nautilius Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	This Cladoceran genus is found at EKATI. IC25 was selected since IC10 fell below the NOEC in the test and was considered unreliable. The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
R	Primary	Invertebrates (planktonic crustacean)	*Ceriodaphnia dubia* (water flea)	Reproduction	7-d MATC	164	30.0	7.8	Scott and Crunkilton, 2000	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	*Ceriodaphnia* sp are residents at EKATI. The data reported are the mean of five tests; the paper reports NOEC and LOEC data, but not point estimates. There was no adverse effect on survival.
R	Primary	Invertebtrates (planktonic crustacean)	*Daphnia magna* (water flea)	Reproduction	7-d MATC	164	506.6	132.3	Scott and Crunkilton, 2000	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	*Daphnia* sp are residents at EKATI. This test procedure is shorter than the typical reproduction test with this species, which is 21 d. The paper reports NOEC and LOEC data from two tests, but not point estimates. There was no adverse effect on survival.
S	Primary	Invertebrate (amphipod)	*Hyalella azteca* (amphipod)	Growtrh	14-d IC25	46	12.9	11.3	Nautilius Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Hyalella are resident in many sub-Arctic lakes, although not at EKATI. They are considered a suitable surrogate. IC25 was selected since IC10 fell below the NOEC in the test and was considered unreliable. The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
S	Primary	Invertebrate (amphipod)	*Hyalella azteca* (amphipod)	Growtrh	14-d IC25	86	117.0	56.5	Nautilius Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Hyalella are resident in many sub-Arctic lakes, although not at EKATI. They are considered a suitable surrogate. IC25 was selected since IC10 fell below the NOEC in the test and was considered unreliable. The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
S	Primary	Invertebrate (amphipod)	*Hyalella azteca* (amphipod)	Growtrh	14-d IC25	172	182.0	45.4	Nautilius Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Hyalella are resident in many sub-Arctic lakes, although not at EKATI. They are considered a suitable surrogate. IC25 was selected since IC10 fell below the NOEC in the test and was considered unreliable. The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
S	Primary	Invertebrate (amphipod)	*Hyalella azteca* (amphipod)	Growtrh	10-d IC25	310	187.5	26.7	Stantec, 2006.	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Hyalella are resident in many sub-Arctic lakes, although not at EKATI. They are considered a suitable surrogate. The test method followed was not a standardized method, but was considered sufficiently analogous to the 14 day test for the results to be combined. IC25 was selected since IC10 fell below the NOEC in the test and was considered unreliable. The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
R	Primary	Invertebrate (chironomid)	*Chironomus dilutus* (midge)	Growtrh	10-d IC25	46	49.0	42.9	Nautilius Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Chironomids occur in the environment at EKATI.The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
R	Primary	Invertebrate (amphipod)	*Chironomus dilutus* (midge)	Growtrh	10-d IC25	86	101.0	48.7	Nautilius Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Chironomids occur in the environment at EKATI.The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
R	Primary	Invertebrate (amphipod)	*Chironomus dilutus* (midge)	Growtrh	10-d IC25	172	174.0	43.4	Nautilius Environmental, 2011a	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Chironomids occur in the environment at EKATI.The IC25 was lower than the MATC, and therefore considered preferable. Survival data were also reported, but were less sensitive.
S	Unacceptable	Invertebrate (amphipod)	*Gammarus pseudolimneaus* (amphipod)	Growth	21-d LOEC	Unknown	>128	Not calculable	Stelzer and Joachim, 2010	No	Yes	Yes	Yes	Yes	No	No	Yes	Mesocosm study. Considered not acceptable since hardness was not reported, and there was no adverse effect observed in the test.
FISH																		
S	Primary	Fish (salmonid)	*Oncorhynchus mykiss* (rainbow trout)	Growth	64-d IC25	310	162.2	23.1	Stantec, 2006.	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Rainbow trout are surrogates for lake trout, lake whitefish, and Arctic grayling with are residents at EKATI. IC25 was selected since IC10 fell below the NOEC in the test and was considered unreliable. The IC25 was lower than the MATC, and therefore considered preferable. Survival and normal development data were also reported, but were less sensitive.
S	Primary	Fish (salmonid)	*Oncorhynchus mykiss* (rainbow trout)	Development	41-d NOEC	10	15.0	56.1	Nautilus Environmental, 2011b	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Rainbow trout are surrogates for lake trout, lake whitefish, and Arctic grayling with are residents at EKATI. The NOEC was selected in this case because it was very close to the minimum significant difference in the test and, therefore, was considered an appropriate estimate of the toxicological threshold.
S	Primary	Fish (salmonid)	*Oncorhynchus mykiss* (rainbow trout)	Growth	41-d MATC	45	26.0	23.2	Nautilus Environmental, 2011b	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Rainbow trout are surrogates for lake trout, lake whitefish, and Arctic grayling with are residents at EKATI. The MATC was selected because it was more sensitive than the EC25.
S	Primary	Fish (salmonid)	*Oncorhynchus mykiss* (rainbow trout)	Growth	41-d MATC	90	77.9	36.0	Nautilus Environmental, 2011b	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Rainbow trout are surrogates for lake trout, lake whitefish, and Arctic grayling with are residents at EKATI. The MATC was selected because it was more sensitive than the EC25.
S	Primary	Fish (salmonid)	*Oncorhynchus mykiss* (rainbow trout)	Growth	41-d MATC	160	77.9	20.8	Nautilus Environmental, 2011b	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Rainbow trout are surrogates for lake trout, lake whitefish, and Arctic grayling with are residents at EKATI. The MATC was selected because it was more sensitive than the EC25.
R	Primary	Fish (salmonid)	*Salvelinus namaycush* (lake trout)	Growth	146-d MATC	13.0	3.2	9.2	McGurk et al, 2006	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Lake trout are resident species at EKATI. Results for survival also reported, but were less sensitive
R	Unacceptable	Fish (salmonid)	*Coregonus clupeaformis* (lake whitefish)	Growth					McGurk et al, 2006	Yes	Yes	Yes	Yes	Poor	Yes	No	Yes	The data were considered unacceptable because of poor control survival
S	Unacceptable	Fish (salmonid)	*Oncorhynchus tshawytscha* (chinook salmon)	Survival (juvenile)					Westin, 1976	No	Yes	Yes	Yes	Yes	No	Yes	Yes	The data were considered unacceptable because water hardness was not reported.
S	Primary	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Growth	7-d MATC	176	506.6	123.7	Scott and Crunkilton, 2000	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Acceptable data, but were not used in the SSD since a more sensitive endpoint was available from USEPA (2010). Data from a 7 d larval exposure.
S	Unacceptable	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Growth	LOEC	176	>1434	>350	Scott and Crunkilton, 2000	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Considered unacceptable since there were no adverse effects observed in the test.
S	Primary	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Growth	11-d MATC	176	506.6	123.7	Scott and Crunkilton, 2000	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Acceptable data, but were not used in the SSD since a more sensitive endpoint was available from USEPA (2010). Data from an 11 d embryo-larval exposure.
S	Primary	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Growth	7-d IC25	12	66.0	207.6	Nautilus Environmental, 2011b	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Acceptable data, but were not used in the SSD since a more sensitive endpoint and longer exposure period was available from USEPA (2010).
S	Primary	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Growth	7-d IC25	50	205.0	165.8	Nautilus Environmental, 2011b	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Acceptable data, but were not used in the SSD since a more sensitive endpoint and longer exposure period was available from USEPA (2010).
S	Primary	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Growth	7-d IC25	94	340.0	150.8	Nautilus Environmental, 2011b	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Acceptable data, but were not used in the SSD since a more sensitive endpoint and longer exposure period was available from USEPA (2010).
S	Primary	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Growth	7-d IC25	168	393.0	100.3	Nautilus Environmental, 2011b	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Acceptable data, but were not used in the SSD since a more sensitive endpoint and longer exposure period was available from USEPA (2010).
S	Primary	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Growth	7-d EC20	145	59.8	17.6	USEPA, 2010	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Species is considered a surrogate for cyprinids that occur t EKATI, including lake chub. The EC20 was used rather than the EC10 since the concentration reported for the EC10 was lower thanthe NOEC, wich was a test concentration that performed as well as the control. Survival data were also reported, but were less sensitive.
S	Secondary	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Growth (embryo-larval)	32-d MATC	220	215.0	42.4	Adelman et al. (2009)	Yes	No	Yes	Yes	Yes	Yes	Yes	Yes	Acceptable secondary data, but were not used in the SSD since a more sensitive endpoint and longer exposure period was available from USEPA (2010). Considered secondary because of use of pseudo-replication.
S	Secondary	Fish (non-salmonid)	*Pimephales promelas* (fathead minnow)	Survival (juvenile)	30-d MATC	220	84.0	16.6	Adelman et al. (2009)	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Non-standard method involving exposure of fish in aquaria. Only two replicates were used, and so results from USEPA (2010) were considered a more appropriate exposure regime for this species and these data were therefore not used.
S	Secondary	Fish (non-salmonid)	*Notropis topeka* (Topeka shiner)	Growth (juvenile)	30-d MATC	220	360.0	71.1	Adelman et al. (2009)	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Non-standard method involving exposure of fish in aquaria. Only two replicates used. Acceptable as secondary data.

Notes:

ICx (e.g. IC20) is the concentration at which x% of test organisms are expected to be inhibited (e.g. inhibited reproduction).
ECx (e.g. EC10) is the concentration at which x% of test organisms are expected to show an effect.
LCx (e.g. LC50) is the concentration at which x% Survival of test organisms is expected.

NOEC is the No Observable Effect Level (highest treatment concentration with no significant difference from controls).
LOEC is the Lowest Observable Effect Level (lowest concentration with an effect significantly different from controls).
MATC is the Maximum Acceptable Toxicant Concentration (geometric mean of the NOEC and LOEC).

APPENDIX A – Summary of measured nitrate concentrations
APPENDIX B – *Ceriodaphnia dubia* tests
APPENDIX C – Fathead minnow tests

1.0 INTRODUCTION

The toxicity of major anions, such as sulphate and chloride, has been shown to be reduced with increasing water hardness using some species (Elphick et al., 2011a and b). In addition, a recent evaluation has demonstrated that hardness also has an effect on the toxicity of nitrate (Nautilus Environmental, 2011a and b). The mechanism resulting in reduced toxicity of anions at elevated hardness has not been definitively described; however, it is likely related to an effect of calcium and/or magnesium on the permeability of the membrane or, alternatively, results from competitive exclusion at passive uptake sites by these or other ions.

The testing described here was performed to demonstrate whether the relationship between water hardness and toxicity of nitrate observed previously in laboratory-prepared waters is applicable to the water quality conditions observed at the EKATI diamond mine site. This was accomplished by evaluating the sensitivity of *Ceriodaphnia dubia* and fathead minnows (*Pimephales promelas*) to nitrate added into water collected from four lakes at EKATI that had a range of hardnesses. Thus, by comparing the relationship of the sensitivity of these organisms at the different levels of hardnesses associated with the lakes, with that demonstrated previously with laboratory-prepared waters, it is possible to demonstrate whether a consistent relationship is observed. Thus, the results of this testing program can be used to establish whether the hardness-toxicity relationship established previously for nitrate can be applied to develop a site-specific water quality objective for nitrate at EKATI.

2.0 METHODS

Water was collected from each of four sites proximate to the EKATI diamond mine: Slipper, Nema, Moose, and Leslie lakes. These lakes were selected because they represent a wide range of hardnesses. Nitrate was introduced by addition of reagent grade sodium nitrate, to produce a range of nitrate concentrations which were then evaluated for toxicity. Test concentrations were chosen based on the toxicological thresholds determined previously for these species using laboratory-prepared waters at similar hardnesses to that observed in the lake samples. Prior to conducting tests, hardness and alkalinity were measured in each of the site waters. Nitrate concentrations were measured in all test solutions at test initiation as well as upon termination.

Statistical analyses were conducted using measured concentrations of nitrate and using CETIS version 1.8 (Tidepool Software).

2.1 *Ceriodaphnia dubia* toxicity tests

Toxicity tests with *Ceriodaphnia dubia* were conducted according to Environment Canada (2007) guidelines, and following methods summarized in Table 1.

Table 1. Summary of test conditions: 7-d *Ceriodaphnia dubia* test.

Test type	Static renewal (daily)
Endpoints	Survival and reproduction
Organism source	In-house culture
Organism age	<24 hr old neonates
Feeding	*Pseudokirchneriella subcapitata* and dYCT (digested yeast, cereal leaves and trout chow)
Test chamber	20 mL glass test tube
Test volume	15 mL
Test temperature	25±1°C
Control water	20% Perier water; Unspiked site water
Number of organisms/replicate	1 neonate
Number of replicates	10
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environmental Canada (2007); EPS 1/RM/21
Test acceptability criterion for controls	≥80% survival; ≥15 young per surviving control

2.2 Fathead minnow toxicity tests

Toxicity tests using fathead minnows were conducted according to Environment Canada (2011) guidelines for this species and following methods summarized in Table 2.

Table 2. Summary of test conditions: 7-d fathead minnow survival and growth test.

Test organism	*Pimephales promelas*
Test organism source	Aquatic BioSystems, Fort Collins, CO
Test organism age	<24 hr post hatch
Test type	Static-renewal (daily)
Test duration	7 days
Test vessel	375-mL glass jars
Test Treatment	200 mL
Test replicates	3
No. of organisms	10 per replicate
Test temperature	25 ± 1°C
Feeding	*Artemia*, twice daily
Photoperiod	16 hours light/8 hours dark
Aeration	None
Test protocol	Environment Canada (2011); EPS 1/RM/22
Test endpoints	Survival and dry weight
Test acceptability criterion for controls	Mean control survival of ≥80% and ≥0.25 mg/fish dry weight

3.0 RESULTS AND DISCUSSION

3.1 Toxicity tests using lake water

Measured concentrations were in good agreement with target concentrations of nitrate; the average of the measured concentrations from each test were within 10% of nominal values. Measured concentrations of nitrate are summarized in Appendix A. All of the tests met acceptance criteria specified in the test methods.

Results of the toxicity tests using *Ceriodaphnia dubia* are provided in Table 3 and in Appendix B. The sample that exhibited the greatest sensitivity to nitrate was the one with the lowest hardness (i.e., Slipper Lake), with higher hardness samples exhibiting lower sensitivities to nitrate. However, a consistent pattern of decreasing sensitivity with increasing hardness was not apparent between the higher hardness lakes. The IC25 for reproduction in Slipper Lake was unusually low in relation to the IC50 for this sample, and appears to be anomalous. For example, the IC25 values from the tests with the other lake waters were within a factor of two to four of the IC50, whereas the IC25 of the Slipper Lake sample was more than ten-fold lower than the IC50, suggesting that it was an anomalous finding. Indeed, the very wide confidence intervals associated with IC25 from this test indicate a low degree of confidence in this estimate. This test was repeated, and the results of this subsequent test are provided in Section 4.0.

Results of the toxicity tests using fathead minnows are provided in Table 4 and in Appendix C. For this species, there was very little effect of hardness on sensitivity to nitrate. In the case of the lowest hardness lake water (i.e., Slipper Lake), there were no adverse effects up to, and including, the highest concentration tested (413 mg/L NO_3-N); higher concentrations of nitrate were not tested for this sample, since a greater degree of sensitivity to nitrate had been anticipated based on the results of previous tests in laboratory waters with a range of hardnesses.

Table 3. Results of *Ceriodaphnia dubia* toxicity tests using lake water samples.

Endpoint	Slipper	Nema	Moose	Leslie
Hardness (mg/L)	28	70	74	138

ICx is the concentration that inhibits reproduction by x%

Values in parentheses indicate the 95% confidence intervals

> indicates that the value exceeds the reported value

The pattern of effect with respect to decreased sensitivity to nitrate with increasing water hardness was not the same in the site waters as had been previously reported for laboratory-prepared waters. However, the sensitivity of both *Ceriodaphnia* and fathead minnows to nitrate was lower than anticipated in the site waters, particularly in the soft water associated with Slipper Lake. Figures 1 and 2 provide a comparison of results of the site water tests to the results from the tests that were conducted previously in laboratory water. The proposed site-specific water quality objective was based on the earlier tests conducted in laboratory water. The sensitivity of both species was consistently lower in the lake waters (i.e., it required more nitrate to exhibit an adverse effect) than was the case in the laboratory waters (Figures 1 and 2). Thus, it appears that a modifying factor resulted in reduced toxicity of nitrate, over and above that observed previously as a function of water hardness.

Figure 1. IC50 for reproduction of *Ceriodaphnia dubia* in lake water tests compared with laboratory water tests, shown on the basis of the water hardness. The lines shown reflect exponential relationships through the data.

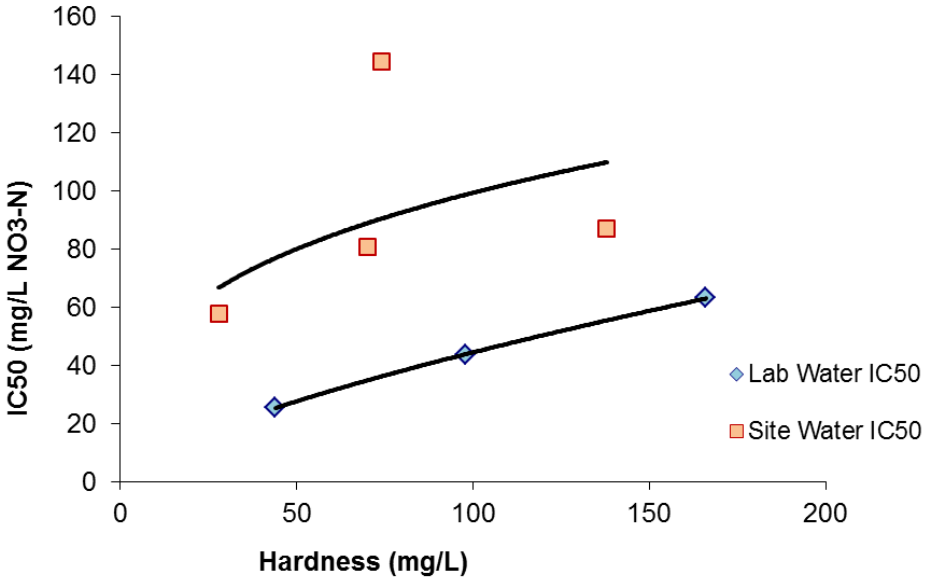

Figure 2. IC50 for growth of fathead minnows in lake water tests compared with water tests, shown on the basis of the water hardness. The lines shown reflect exponential relationships through the data.

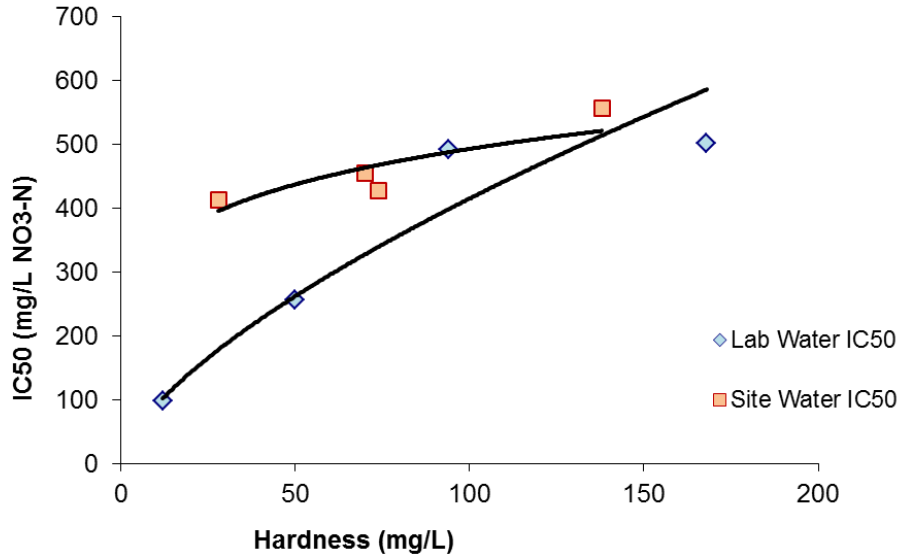

.

3.2 Follow up tests to evaluate effects of ionic composition

The results of testing using the lake waters indicated that the test organisms were less sensitive to nitrate in the lake water samples than they had been in tests conducted previously using laboratory-prepared waters at similar hardness, particularly under conditions of low hardness. In addition, the reduction in toxicity associated with increased hardness was not as pronounced, particularly with fathead minnows. These results suggested that either:

1. the balance of major ions in the site water samples altered the relationship between water hardness and toxicity of nitrate; or
2. that some other modifying factor was present in the lake waters that further reduced toxicity in the samples (i.e., in addition to the effect of hardness).

The actual mechanism behind the reduction in toxicity of nitrate with increasing water hardness has not previously been established. The higher hardness waters tested previously contained increased concentrations of a variety of major ions, including calcium, magnesium, sodium, potassium, bicarbonate, chloride and sulphate. Any one, or a combination of these ions may explain the reduction in toxicity of nitrate as hardness increases, and differences between the balance of major ions in site waters, as compared to the laboratory waters used originally, may explain the lower toxicity observed in the site waters.

In order to demonstrate whether the lower toxicity observed in site water related to a different balance of major ions in the site water compared to the laboratory water, tests were conducted with two laboratory-prepared waters of the same hardness: one that was similar in ionic composition to the laboratory water that was originally tested (Lab Blend), and the other that had a balance of major ions that was consistent with Slipper Lake (Slipper Blend). The waters were prepared by addition of reagent grade salts ($CaSO_4$, Na_2SO_4, $NaHCO_3$, $MgCl_2$, NaCl and KCl) to deionized water in order to achieve the target blend of ions. Since both of these waters were prepared in the laboratory, the results could be used to establish whether the lower sensitivity observed with Slipper Lake water resulted from differences in the ionic composition of the water.

The sensitivity of fathead minnows to nitrate was tested in these two water types; results from these tests are shown in Figure 3, along with the data shown previously for Slipper Lake. The hardness of the Slipper Blend and Lab Blend waters was very similar (22 and 20 mg/L, respectively), and similar to that measured in the Slipper Lake sample (28 mg/L). The IC50 in

the Slipper Blend and the Slipper Lake samples were similar to one another (421 and >413 mg/L NO3-N, respectively); these values are approximately three fold higher than the IC50 in the Lab Blend water (165 mg/L NO3-N) (Table 5).

Figure 3. IC50 for growth of fathead minnows "Lab blend" and "Slipper blend" waters, compared to the test with Slipper Lake water.

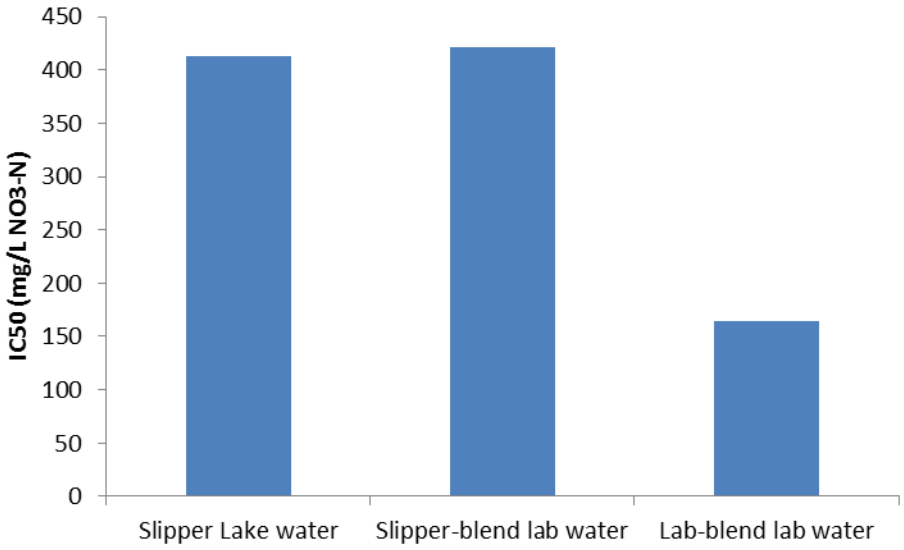

Table 5. Results of fathead minnow toxicity tests.

Endpoint	Lab Blend	Slipper Blend
Hardness (mg/L)	20	22
7-d LC50 (mg/L NO3-N)	161.1 (143.4–181.0)	452.9 (405.5-505.9)
7-d IC50 (mg/L NO3-N)	164.9 (143.2-189.9)	421.2 (NC)
7-d IC25 (mg/L NO3-N)	135.6 (75.3-163.5)	390 (NC)

Notes: LC50 is the concentration that is estimated to be lethal to 50% of exposed organisms.

ICx is the concentration that inhibits reproduction by x%

Values in parentheses indicated the 95% confidence intervals

NC indicates that the confidence intervals were not calculable

Thus, the results indicate that the difference in sensitivity to nitrate observed between laboratory and site waters relates to differences in ionic balance. Specifically, the balance of major ions (calcium, magnesium, sodium, potassium, bicarbonate, chloride and sulphate) observed in lake waters at the site reduced the sensitivity of fathead minnows to nitrate more

than would be expected if the effect was caused entirely by water hardness (i.e., calcium and magnesium), suggesting that some other major ion is regulating toxicity of nitrate in these samples. Based on a review of the ionic balance of the two water types, that other ion is likely either chloride or potassium because these ions were both higher in the "Slipper blend" water than the "Lab blend". Chloride would appear to be the most likely modifying factor, because this is anionic and may compete with nitrate for uptake sites; chloride has previously been demonstrated to exhibit a significant effect on toxicity of nitrite (BCMoE, 2009).

The results presented here demonstrate that a Site Specific Water Quality Objective that is calculated on the basis of the laboratory water tests provides a conservative assessment of risk associated with this anion.

4.0 QUALITY ASSURANCE AND QUALITY CONTROL (QA/QC)

Reference toxicant tests (positive control) were conducted using *C. dubia* and *P. promelas* using sodium chloride as the toxicant. These tests were conducted using similar procedures to those described in section 2.0 for the samples and are used to assess the sensitivity of the test organisms and evaluate consistency of laboratory performance. Results of reference toxicant tests are provided in Table 6. In each case, the reference toxicant test result fell within the range of historical data from the laboratory (mean ± 2 SD), indicating that the sensitivity of the test organisms was appropriate. Water quality characteristics (dissolved oxygen, pH, temperature) remained within suitable ranges throughout the tests.

The results of the initial test with *Ceriodaphnia dubia* using Slipper Lake water demonstrated a large difference (more than ten-fold) between the IC25 and IC50 for reproduction, which appeared to be anomalous based on the results from the other tests. Consequently, this test was repeated using the same sample approximately three weeks later. The IC25 and IC50 for the second test were 52.7 and 102.5 mg/L NO_3-N, respectively, indicating a two-fold difference between the IC25 and IC50, similar to the other samples. Thus, the initial IC25 obtained with this sample does indeed appear to be anomalous.

The geometric mean of the two IC25 values reported here (i.e., 4.2 and 52.7 mg/L) for tests conducted in Slipper Lake water appears appropriate for use in evaluating the sensitivity of nitrate to *C. dubia* in water from this lake. The geometric mean IC25 was 14.9 mg/L NO_3-N.

Table 6. Reference toxicant test results.

Species	Date	Toxicant	Point estimate	Acceptable Range	CV
C. dubia; IC25 reproduction	13/9/2011	NaCl	1.3 g/L	0.9 – 1.5 g/L	15
P. promelas; IC25 growth	15/9/2011	NaCl	3.8 g/L	3.0 – 5.6 g/L	17
P. promelas; IC25 growth	2/11/2011	NaCl	3.8 g/L	3.0 – 5.5 g/L	17

The acceptable range reflects the two standard deviations surrounding the mean performance of the last 20 tests conducted in the laboratory.

APPENDIX B – *Ceriodaphnia dubia* tests

Ceriodaphnia dubia Summary Sheet

Client: Ekati (Rescan)
Work Order No.: 11433

Start Date/Time: Sept 11/11 @ 1500h
Set up by: AWD

Sample Information:

Sample ID: Slipper
Sample Date: Sept 5/11
Date Received: Sept 9/11
Sample Volume: 6 X20 L

Test Validity Criteria:

1) Mean survival of first generation controls is ≥80 %
2) At least 60% of controls have produced three broods within 8 days
3) An average of ≥15 live young produced per surviving female in the control solutions during the first three broods.
4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6 to 8.5

Test Organism Information:

Broodstock No.: 090111
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 27
Mortality (%) in previous 7 d: 0
Individual female # used ≥8 young on test day: 22, 25, 26, 27, 28, 29, 31

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd 72
Stock Solution ID: 11 Na01
Date Initiated: Sept 13/11

7-d LC50 (95% CL): 2.0 (1.7-23.) g/L NaCL
7-d IC50 (95% CL): 1.3 (1.2-1.5) g/L NaCL

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.5-2.3) g/L NaCL CV (%): 12
7-d IC50 Reference Toxicant Mean and Historical Range: 1.2 (0.9-1.5) g/L NaCL CV (%): 15

Test Results:

	Survival	Reproduction
LC50 mg/L N (95% CL)	>80	
IC25 mg/L N (95% CL)		4.2 (1.7-39.7)
IC50 mg/L N (95% CL)		57.8 (33.8-n/a)

Ceriodaphnia dubia Summary Sheet

Client: Ekati (Rescan)
Work Order No.: 11433

Start Date/Time: Sept 30/11 @ 1300h
Set up by: KLB

Sample Information:

Sample ID: Slipper
Sample Date: Sept 5/11
Date Received: Sept 9/11
Sample Volume: 6x 20L

Test Validity Criteria:

1) Mean survival of first generation controls is ≥80 %
2) At least 60% of controls have produced three broods within 8 days
3) An average of ≥15 live young produced per surviving female in the control solutions during the first three broods.
4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6 to 8.5

Test Organism Information:

Broodstock No.: 92111
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 28
Mortality (%) in previous 7 d: 5
Individual female # used ≥8 young on test day: 5, 8, 10, 11, 13, 16

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd 73
Stock Solution ID: 11 Na01
Date Initiated: Oct 13/11

7-d LC50 (95% CL): 1.7 (1.4 - 2.1) g/L NaCL
7-d IC50 (95% CL): 1.2 (1.0 - 1.3) g/L NaCL

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.5 - 2.3) g/L NaCL CV (%): 12
7-d IC50 Reference Toxicant Mean and Historical Range: 1.2 (0.9 - 1.5) g/L NaCL CV (%): 14

Test Results:

	Survival	Reproduction
LC50 ~~%(v/v)~~ mg/L NaCl (95% CL)	>80	
IC25 ~~%(v/v)~~ mg/L NaCl (95% CL)		52.74 (11.6 - 67.4)
IC50 ~~%(v/v)~~ mg/L NaCl (95% CL)		102.5 (78.7 - 128.6)

Ceriodaphnia dubia Summary Sheet

Client: Ekati (Rescan) Start Date/Time: Sept 30/11 @ 1300h

Work Order No.: 11433 Set up by: KLB

Sample Information:

Sample ID: Nema
Sample Date: Sept 5/11
Date Received: Sept 9/11
Sample Volume: 6x 20L

Test Validity Criteria:

1) Mean survival of first generation controls is ≥80 %
2) At least 60% of controls have produced three broods within 8 days
3) An average of ≥15 live young produced per surviving female in the control solutions during the first three broods.
4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6 to 8.5

Test Organism Information:

Broodstock No.: 90111
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 33
Mortality (%) in previous 7 d: 5
Individual female # used ≥8 young on test day: *34, 35, 36, 37, 39, 40*

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd 72
Stock Solution ID: 11 Na01
Date Initiated: Sept 13/11

7-d LC50 (95% CL): 2.0 (1.7 - 2.3) g/L NaCL
7-d IC50 (95% CL): 1.3 (1.2 - 1.5) g/L NaCL

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.5 - 2.3) g/L NaCL CV (%): 12
7-d IC50 Reference Toxicant Mean and Historical Range: 1.2 (0.9 - 1.5) g/L NaCL CV (%): 15

Test Results:

	Survival	Reproduction
LC50 mg/L N (95% CL)	>329	
IC25 mg/L N (95% CL)		48.4 (14.2 - 59.6)
IC50 mg/L N (95% CL)		74.0 (53.9 - 101.7)

Ceriodaphnia dubia Summary Sheet

Client: EKati (Resaan) Start Date/Time: Sept 11/11 @ 1520h
Work Order No.: 11433 Set up by: AwO

Sample Information:

Sample ID: Leslie
Sample Date: Sept 5/11
Date Received: Sept 9/11
Sample Volume: 6 x 20L

Test Validity Criteria:

1) Mean survival of first generation controls is ≥80 %
2) At least 60% of controls have produced three broods within 8 days
3) An average of ≥15 live young produced per surviving female in the control solutions during the first three broods.
4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6 to 8.5

Test Organism Information:

Broodstock No.: 090111
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 24
Mortality (%) in previous 7 d: 0
Individual female # used ≥8 young on test day 31, 32, 34, 36, 37, 39, 40

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd72
Stock Solution ID: 11NaCl
Date Initiated: Sept 13/11

7-d LC50 (95% CL): 2.0 (1.7 - 2.3) g/L NaCl
7-d IC50 (95% CL): 1.3 (1.2 - 1.5) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.5-2.3) g/L NaCl CV (%): 12
7-d IC50 Reference Toxicant Mean and Historical Range: 1.2 (0.9-1.5) g/L NaCl CV (%): 15

Test Results:

	Survival	Reproduction
LC50 mg/L Cl % (v/v) (95% CL)	> 78.5	—
IC25 mg/L Cl % (v/v) (95% CL)	—	31.6 (11.2-49.8)

Ceriodaphnia dubia Summary Sheet

Client: EXATI (Flescan) Start Date/Time: Sept 13/11 @1200h
Work Order No.: 11433 Set up by: KLB

Sample Information:

Sample ID: Moose
Sample Date: Sept 5/11
Date Received: Sept 9/11
Sample Volume: 6 x 20L

Test Validity Criteria:

1) Mean survival of first generation controls is ≥80 %
2) At least 60% of controls have produced three broods within 8 days
3) An average of ≥15 live young produced per surviving female in the control solutions during the first three broods.
4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6 to 8.5

Test Organism Information:

Broodstock No.: 090111
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 36
Mortality (%) in previous 7 d: 5
Individual female # used ≥8 young on test day: 32,24,25,26,28,29,30,31,32,33

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd72
Stock Solution ID: 11 NaCl
Date Initiated: Sept 13/11

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCL
7-d IC50 (95% CL): 1.3 (1.2-1.5) g/L NaCL

7-d LC50 Reference Toxicant Mean and Historical Range: 1.8 (1.5-2.3) g/L NaCL CV (%): 12
7-d IC50 Reference Toxicant Mean and Historical Range: 1.2 (0.9-1.5) g/L NaCL CV (%): 15

Test Results:

	Survival	Reproduction
LC50 $\frac{mg/L\ NaCl}{\%\ (v/v)}$ (95% CL)	~~700~~ KLB 319	—
IC25 $\frac{mg/L\ NaCl}{\%\ (v/v)}$ (95% CL)	—	57.2 (25.2-109.9)
IC50 $\frac{mg/L\ NaCl}{\%\ (v/v)}$ (95% CL)	—	150.9 (85.4-181.6)

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

ALS Test Code	Matrix	Test Description	Method Reference**
ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

APPENDIX C – Fathead minnow tests

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Rescan (Ekati)
Work Order No.: 11432

Start Date/Time: Sept 15/11 @ 1515h
Test Species: *Pimephales promelas*

Sample Information:

Sample ID: Slipper
Sample Date: Sept 5/11
Date Received: Sept 9/11
Sample Volume: 5x 15L

Test Validity Criteria:

The test is invalid if :

1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%

2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6 to 8.5

Dilution Water (initial water quality):

Type: Moderately Hard Synthetic Water
Temperature (°C) 25.0
pH 7.9
Dissolved Oxygen (mg/L) 8.0
Hardness (mg/L $CaCO_3$) 86
Alkalinity (mg/L $CaCO_3$) 68

Test Organism Information:

Batch No.: 91511
Source: Aquatic Biosystems
Age: <24hr

NaCl Reference Toxicant Results:

Reference Toxicant ID: PP62
Stock Solution ID: n/a
Date Initiated: Sept 15/11
7-d EC50 (95% CL): 4.4 (3.7 - 5.2)
7-d IC50 (95% CL): 3.8 (3.6 - 4.3)

Survival:

Reference Toxicant Mean and Historical Range: 4.7 (3.6 - 6.3) CV (%): 16

Biomass:

Reference Toxicant Mean and Historical Range: 4.1 (3.0 - 5.6) CV (%): 17

Test Results:

	Survival	Biomass
LC25 (mg/L) (95% CL)	>413	
LC50 % (mg/L) (95% CL)	>413	
IC25 % (mg/L) (95% CL)		>413
IC50 % (mg/L) (95% CL)		>413

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Rescan (Ekati)
Work Order No.: 11432

Start Date/Time: Sept 15/11 @ 1600h
Test Species: *Pimephales promelas*

Sample Information:

Sample ID:	Nema
Sample Date:	Sept 5/11
Date Received:	Sept 9/11
Sample Volume:	5x 15L

Dilution Water (initial water quality):

Type:	Moderately Hard Synthetic Water
Temperature (°C)	25.0
pH	7.9
Dissolved Oxygen (mg/L)	8.0
Hardness (mg/L $CaCO_3$)	86
Alkalinity (mg/L $CaCO_3$)	68

Test Validity Criteria:

The test is invalid if :

1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%

2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6 to 8.5

Test Organism Information:

Batch No.:	91511
Source:	Aquatic Biosystems
Age:	<24hr

NaCl Reference Toxicant Results:

Reference Toxicant ID:	PP62
Stock Solution ID:	n/a
Date Initiated:	Sept 15/11
7-d EC50 (95% CL):	4.4 (3.7 - 5.2)
7-d IC50 (95% CL):	3.8 (3.6 - 4.3)

Survival:

Reference Toxicant Mean and Historical Range: 4.7 (3.6 - 6.3) CV (%): 16

Biomass:

Reference Toxicant Mean and Historical Range: 4.1 (3.0 - 5.6) CV (%): 17

Test Results:

	Survival	Biomass
LC25 mg/L N (95% CL)	n/a	
LC50 mg/L N (95% CL)	414.0 (328.7 - 521.4)	
IC25 mg/L N (95% CL)		280.9 (155.6 - 394.6)
IC50 mg/L N (95% CL)		453.9 (348.2 - 591.7)

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Rescan (Ekati)
Work Order No.: 11432

Start Date/Time: Sept 15/11 @ 1600h
Test Species: *Pimephales promelas*

Sample Information:

Sample ID:	Leslie
Sample Date:	Sept 5/11
Date Received:	Sept 9/11
Sample Volume:	5x 15L

Dilution Water (initial water quality):

Type:	Moderately Hard Synthetic Water
Temperature (°C)	25.0
pH	7.9
Dissolved Oxygen (mg/L)	8.0
Hardness (mg/L $CaCO_3$)	86
Alkalinity (mg/L $CaCO_3$)	68

Test Validity Criteria:

The test is invalid if :

1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%

2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6 to 8.5

Test Organism Information:

Batch No.:	91511
Source:	Aquatic Biosystems
Age:	<24hr

NaCl Reference Toxicant Results:

Reference Toxicant ID:	PP62
Stock Solution ID:	n/a
Date Initiated:	Sept 15/11
7-d EC50 (95% CL):	4.4 (3.7 - 5.2)
7-d IC50 (95% CL):	3.8 (3.6 - 4.3)

Survival:

Reference Toxicant Mean and Historical Range: 4.7 (3.6 - 6.3) CV (%): 16

Biomass:

Reference Toxicant Mean and Historical Range: 4.1 (3.0 - 5.6) CV (%): 17

Test Results:

	Survival	Biomass
LC25 mg/L N (95% CL)	n/a	
LC50 mg/L N (95% CL)	685.4 (576.9 - 770.0)	
IC25 mg/L N (95% CL)		420.1 (326.6 - 495.9)
IC50 mg/L N (95% CL)		556.7 (478.4 - 647.8)

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Rescan (Ekati)
Work Order No.: 11432

Start Date/Time: Sept 15/11 @ 1600h
Test Species: *Pimephales promelas*

Sample Information:

Sample ID:	Moose
Sample Date:	Sept 5/11
Date Received:	Sept 9/11
Sample Volume:	5x 15L

Dilution Water (initial water quality):

Type:	Moderately Hard Synthetic Water
Temperature (°C)	25.0
pH	7.9
Dissolved Oxygen (mg/L)	8.0
Hardness (mg/L $CaCO_3$)	86
Alkalinity (mg/L $CaCO_3$)	68

Test Validity Criteria:

The test is invalid if :

1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%

2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6 to 8.5

Test Organism Information:

Batch No.:	91511
Source:	Aquatic Biosystems
Age:	<24hr

NaCl Reference Toxicant Results:

Reference Toxicant ID:	PP62
Stock Solution ID:	n/a
Date Initiated:	Sept 15/11
7-d EC50 (95% CL):	4.4 (3.7 - 5.2)
7-d IC50 (95% CL):	3.8 (3.6 - 4.3)

Survival:

Reference Toxicant Mean and Historical Range: 4.7 (3.6 - 6.3) CV (%): 16

Biomass:

Reference Toxicant Mean and Historical Range: 4.1 (3.0 - 5.6) CV (%): 17

Test Results:

	Survival	Biomass
LC25 mg/L N (95% CL)	n/a	
LC50 mg/L N (95% CL)	443.0 (358.2 - 547.8)	
IC25 mg/L N (95% CL)		357.3 (254.6 - 421.7)
IC50 mg/L N (95% CL)		437.9 (373.2 - 513.8)

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Rescan (Ekati)
Work Order No.: 11432

Start Date/Time: Nov 2/11 @ 1430h
Test Species: *Pimephales promelas*

Sample Information:

Sample ID:	Lab Water
Sample Date:	n/a
Date Received:	n/a
Sample Volume:	n/a

Test Validity Criteria:

The test is invalid if :

1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%

2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6 to 8.5

Dilution Water (initial water quality):

Type:	~~Moderately Hard~~ Synthetic Water & Deionized Water
Temperature (°C)	25.0
pH	7.4
Dissolved Oxygen (mg/L)	7.7
Hardness (mg/L $CaCO_3$)	20
Alkalinity (mg/L $CaCO_3$)	4

Fathead Minnow Test Summary Sheet

(7-d *Pimephales promelas* Survival and Growth Test)

Client: Rescan (Ekati)
Work Order No.: 11432

Start Date/Time: Nov 2/11 @ 1430h
Test Species: *Pimephales promelas*

Sample Information:

Sample ID:	Slipper-Blend Water
Sample Date:	n/a
Date Received:	n/a
Sample Volume:	n/a

Test Validity Criteria:

The test is invalid if :

1) for the control solutions, the combined and cumulative incidence of any mortalities, or fish showing loss of equilibrium or other signs of atypical swimming behavior, is >20%

2) the average dry weight of the surviving control fish does not attain 250 ug when the fish are dried and weighed.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4; pH = 6 to 8.5

Dilution Water (initial water quality):

Type:	Deionized Water
Temperature (°C)	25.5
pH	7.1
Dissolved Oxygen (mg/L)	7.6
Hardness (mg/L $CaCO_3$)	22
Alkalinity (mg/L $CaCO_3$)	12

Test Organism Information:

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

1 2

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted For Sample Matrix Effects

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

1 2 3 4

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-COL-VA	Water	Alkalinity by Colourimetric (Automated)	APHA 310.2

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Attention: Ms. Violet Camsell-Blondin, Chair

Dear Ms. Camsell-Blondin

Re: EKATI Diamond Mine – Application for Renewal of Water Licence W2009L2-0001
Supplementary Technical Report Re. Nitrate Site Specific Water Quality Objective

In April 2012, BHP Billiton Canada Inc. (BHP Billiton) provided the Wek'eezhii Land and Water Board (the Board) an Application for Renewal of Type 'A' Water Licence W2009L2-0001 for the EKATI Diamond Mine (the Application). The Application was assigned file number W2012L2-0001 by the Board. The Application included a technical report that developed a site-specific water quality objective (SSWQO) for the nitrate ion in waters around the EKATI Diamond Mine.

While preparing the Application, BHP Billiton heard questions from various parties on whether the SSWQO for nitrate would be protective of lake trout, a species that is present in waters around the EKATI Mine and that had been shown, in a single test, to be sensitive to nitrate in very soft test water. To make sure that all parties would have additional information verifying that lake trout will be adequately protected, BHP Billiton initiated longer-term laboratory testing of lake trout. Those tests have been completed and are reported in the attached technical report. The results verify that the SSWQO for nitrate is protective of lake trout.

The attached technical report is provided as a supplemental submission to the Application. Please contact the undersigned if you have any questions on this submission.

Yours sincerely,

BHP Billiton Canada Inc.

Attention: Eric Denholm, Superintendent- Traditional Knowledge and Permitting

Dear Mr. Denholm:

Re: Toxicity of nitrate to early life stages of lake trout in two water types: very soft water and moderately hard water

Please find the following Nautilus Environmental report titled '*Toxicity of nitrate to early life stages of lake trout in two water types: very soft water and moderately hard water*'. This report was completed as part of the '*2011 Scope of Work for a Site Specific Water Quality Objective (SSWQO) for Nitrate*'. The report provides the results of laboratory testing to provide empirical support for the hardness dependent nitrate SSWQO. Specifically the testing was performed to evaluate whether inclusion of water hardness as a toxicity modifying factor, per the SSWQO developed for EKATI, is appropriate for lake trout. The results demonstrate that increasing water hardness does indeed reduce the sensitivity of early life stages of lake trout to nitrate.

The results of these tests are shown in comparison to the nitrate SSWQO in Figure 1 below. Figure 1 also shows results from the toxicity tests that were used as the basis of the site specific water quality guideline, as well as additional tests using *Ceriodaphnia dubia* and fathead minnows conducted previously in lake waters from EKATI. All of the toxicity test results, including the results of the lake trout tests fall above the proposed hardness dependent SSWQO for nitrate (Figure 1). Based on these findings, the nitrate SSWQO for EKATI is expected to protect the early life stages of lake trout.

Sincerely,

RESCAN™ ENVIRONMENTAL SERVICES LTD.

APPENDIX A –Summary of measured nitrate concentrations

APPENDIX B –Toxicity Test Data: Very Soft Water

APPENDIX C – Toxicity Test Data: Moderately Hard Water

EXECUTIVE SUMMARY

Previous testing has demonstrated that the toxicity of nitrate is reduced as water hardness increases using a variety of species. On the basis of these data, a site-specific water quality objective (SSWQO) has been developed for the EKATI diamond mine, which takes into consideration the hardness of the water, and allows a higher concentration of nitrate at higher hardness.

Early life stages development of lake trout (*Salvelinus namaycush*) is the most sensitive species/endpoint that has been reported for toxicity of nitrate; effects were observed on this species at concentrations as low as 6.25 mg/L NO_3-N (McGurk et al. 2006). However, this test was conducted under very soft water conditions associated with Metro Vancouver municipal tapwater. Thus, on the basis of the findings that sensitivity to nitrate tends to decrease with increasing water hardness, it is likely that the sensitivity of this species to nitrate observed by McGurk et al. (2006) was exacerbated by the low ionic strength of the water that the tests were conducted in, and that the results from that test may not be relevant to situations where water hardness is higher.

Lake trout are an important species in the lakes at EKATI and, since the relationship between water hardness and toxicity has not been established for this species, it was desirable to confirm whether sensitivity of this species does indeed decrease at higher hardness. Consequently, the tests reported here were conducted in waters with two hardness levels to demonstrate whether toxicity is altered by water hardness with this species, in a manner that is similar to other species.

The toxicity of nitrate to early life stages of lake trout was evaluated in two water types: very soft water, which was comprised of dechlorinated Metro Vancouver municipal tap water, which has a hardness of approximately 10 mg/L as $CaCO_3$ and is the same water type employed by McGurk et al. (2006), and moderately hard water, which was prepared by addition of reagent grade salts to dechlorinated tapwater to achieve a hardness of 80 to 100 mg/L as $CaCO_3$, and a similar ratio of major ions (i.e., calcium, magnesium, potassium, sodium, chloride, sulphate and bicarbonate) to that observed at EKATI.

The results of the tests demonstrated a significant reduction in toxicity of nitrate to lake trout at higher hardness. Lake trout alevins exhibited delayed yolk sac absorption in the very soft

water, with an IC_{20} of 2.6 mg/L NO_3-N, however, no effect of nitrate was observed in any of the test concentrations when tested in moderately hard water, indicating that lake trout had no adverse effects when exposed to nitrate as high as 329.8 mg/K NO_3-N. Thus, the results for the test in very soft water were comparable to those reported by McGurk et al. (2006), and the results for the test in moderately hard water demonstrated that this species was substantially less sensitive to nitrate in higher hardness water, and showed no adverse effect at a concentration that was more than 100 times higher than the current Canadian water quality guideline for the protection of freshwater life (3.0 mg/L NO_3-N; CCME, 2012).

The results of the tests reported here support the SSWQO that has been developed for EKATI, in which under soft water conditions a SSWQO that is lower than the current Canadian water quality guideline for nitrate is applicable, and which increases with increasing hardness to an upper bound of approximately 16.4 mg/L at hardness greater than approximately 160 mg/L (Figure 3 herein). The data presented here for lake trout fall above the SSWQO under both very soft water and moderately hard water conditions, indicating that the SSWQO developed for EKATI is protective of this species.

1.0 INTRODUCTION

The toxicity of major anions, such as sulphate and chloride, has been shown to be reduced with increasing water hardness (Elphick et al., 2011a and b). Recent work has demonstrated that toxicity of nitrate to aquatic organisms (including an amphipod, chironomid, daphnid, rainbow trout and fathead minnows) is also reduced with increasing water hardness (Baker et al., 2010), and a site-specific water quality objective (SSWQO) has been developed for BHP Billiton's EKATI diamond mine (EKATI) on the basis of these interactions (Rescan, 2012).

Lake trout, a member of the subfamily Salmonidae, are widely distributed across North America and have been demonstrated to be particularly sensitive to nitrate during early life stages (McGurk et al., 2006). The tests described by these authors were performed on behalf of EKATI, and demonstrated subtle, but statistically-significant adverse effects on the time taken for alevins to fully absorb their yolk sacs, and the growth of these alevins, at concentrations as low as 6.25 mg/L NO_3-N; at this concentration, an 11% reduction in growth was observed. The ecological relevance of a delay in absorption of the yolk is not entirely clear, and the risk at a population level associated with these effects has been questioned (McGurk et al. 2006; Golder Associates 2011). This effect concentration reflects the most sensitive toxicological threshold for nitrate reported in the literature. However, these tests were conducted in very soft water (McGurk et al., 2006) and, consequently, based on the recent findings that water hardness reduces toxicity of nitrate, these results may not be directly applicable to conditions at EKATI where water hardness is higher.

The testing described here was performed to confirm the sensitivity of lake trout to nitrate and to evaluate the role of hardness (from calcium and magnesium ions), or the concentrations of other major ions associated with higher hardness water (e.g., chloride, bicarbonate, sulphate, sodium and potassium), in modifying the toxicity of nitrate to the early life stages of lake trout. Specifically, the test was initiated to determine sensitivity to nitrate in very soft water comparable to that used by McGurk et al. (2006), as well as in a blend of ions consistent with that observed in lakes downstream of the EKATI mine.

2.0 METHODS

2.1 Lake Trout Gamete Collection

Gametes (i.e., eggs and sperm) from ripe, pre-spawn lake trout (*Salvelinus namaycush*) were collected from Shuswap Lake (50° 56′ 00″ N, 119° 17′ 00″; UTM: 11U 339559E, 5644894N), BC Canada, on November 17th and 18th, 2011. Field work was conducted by Rescan fisheries biologists Kevin Esseltine (M.Sc.) and Fraser Ross (B.Sc.) with the assistance of Rodney Hennig (boat operator and guide, Rodney's REEL Fishing, Kelowna, BC). Licenses and permits for the 'Collection of Fish for Scientific Purposes' were issued by Fisheries and Oceans Canada (DFO; License No.: XHAB 170 2011 - Amendment 1) and the BC Ministry of the Environment (BCMoE; Permit No.: KA11-74668), respectively. Lake trout were collected from a location in BC rather than from NWT because of restrictions on transportation of salmonids related to disease control.

Lake trout were targeted using gillnets set at two known lake trout spawning sites on Shuswap Lake. Three gillnet gangs were constructed with three panels of either 1 inch (25 mm) or 1.5 inch (38 mm) stretched mesh. Gillnet panels were sewn together to minimize gaps between panels. Each gillnets gang was fished for a short duration (30 minutes). Small-mesh gillnets set for short duration were a requirement of both the DFO and BCMoE collection permits, and essential for reducing handling stress on spawning lake trout to prevent any incidental mortalities.

Captured lake trout were immediately placed in a tub filled with ambient lake water (7 - 8°C) and allowed to recover. Ripe individuals were 'stripped' of gametes by gentle squeezing of the ventral side of the fish to expel gametes. Male lake trout gametes (i.e., milt) were expelled into small glass jars, and female gametes (i.e., eggs) were expelled into larger Ziplock containers. Each jar or container was labeled with the unique fish identification number and recorded in field notes. Following stripping of gametes from each lake trout, the fish was returned to a bin filled with ambient, well-oxygenated lake water. Once the lake trout was fully recovered, fork length was measured and any tags from previous BCMoE mark-recapture studies were recorded in field notes. Lake trout that were sexually immature or not in ripe condition were released back to the water at the site of capture.

Each sample was immediately placed into a cooler with ice to ensure that samples remained cool (approximately 4 - 5° C). Gamete samples were collected from four female and four male

adults. Once this sample size was obtained, the cooler containing the gamete samples was transported via automobile (approximately 4-hr drive) directly to Nautilus Environmental.

The eggs and milt were received at 2030h on November 18th at Nautilus Environmental and were kept in an environmental chamber at 7°C until the following morning (November 19th), when the eggs and milt were inspected and the test initiated. Holding time of the gametes from collection to test initiation ranged from 24 to 48 hours.

2.2 Toxicity test methods

Toxicity tests were conducted in an equivalent manner to that described by McGurk et al. (2006) which was adapted from Environment Canada (1998) procedures for testing early life stages of salmonids; for comparison, a summary of test conditions from this test and the test conducted by McGurk et al. (2006) is provided in Table 1.

Two tests were conducted simultaneously; one was performed in dechlorinated Metro Vancouver tapwater (approximately 10 mg/L hardness as $CaCO_3$), similar to the water used in the test conducted by McGurk et al. (2006), and a second test was conducted in water prepared to moderately hard conditions (80 to 100 mg/L as $CaCO_3$) but with the same balance of ions as occuring at EKATI; additional details of these water types are provided in Section 2.3.

A subsample of milt from each male was mixed with water and inspected under a microscope to determine sperm viability. Milt was selected and pooled from males that produced sperm with good motility. Sperm from males #2 and #3 were determined to have good motility and were pooled and used for fertilization of the eggs.

Eggs from each female fish were fertilized separately, in the Ziplock containers that they were provided in, using the pooled milt delivered with a glass Pasteur pipette, and the eggs and milt were gently mixed. The containers were left for approximately 20 minutes for fertilization, at which time the eggs were transferred into rearing chambers (4-L food-grade plastic tubs) containing the test solutions, so that water hardening, which involves swelling of the egg and hardening of the chorion resulting from water intake, would take place in the presence of the nitrate test solutions. Four replicates were used, each containing 30 eggs. The eggs were introduced into the test containers using a blocked design, with replicate A of each of the test concentrations receiving eggs from female #1, replicate B receiving eggs from female #2, and so on. In this manner, the performance of the individual fish could be evaluated. The test

containers were randomized within each test to account for subtle temperature variations within the environmental chamber.
The fish were reared in an environmental chamber with air conditioning and digital thermostat; temperature was maintained at 7 ± 1°C. Prior to hatching of the lake trout, the chamber was kept dark (24-hr) and sufficient low-level lighting was provided during water renewals by a single incandescent bulb. The test containers were placed on shelves and black plastic was used to shield the containers. After all of the lake trout had hatched, the chamber was placed on a 11:13 light:dark photoperiod using low-level lighting and the black plastic removed.

In the same manner as the McGurk et al. (2006) study, the test solutions were renewed three times per week, rather than daily, since nitrate did not dissipate in the test containers and the exposure temperature was cold. Eighty percent of the solution was renewed with each water change and care was taken to ensure that the embryos were not disturbed by turbulence during this process.

Test chambers were provided with continuous aeration just below the surface of the water using thin plastic tubing. Aeration was sufficient to maintain dissolved oxygen levels close to saturation, while providing gentle mixing of the water in the test containers throughout the exposure period. Water quality parameters (dissolved oxygen, temperature, conductivity, pH) were measured on the freshly prepared and 48 to 72-hr old solutions during each water change.

The fish were observed before each water change and mortalities were removed and recorded on data sheets. The number of hatched embryos was also recorded to determine if there was significant delay in hatching of lake trout embryos due to the exposure to sodium nitrate. Eggs were determined to have died when the egg had turned partially or fully opaque. Hatched fish were determined to be dead when there was no evidence of movement from any part of the fish, including fins and operculum. Dead eggs were removed using a wide-bore glass pipette and dead fish were removed using a small net.

The test duration was 132 days, included the lifestages incorporated by the embryo-alevin test described by Environment Canada (1998), and was extended until the majority of the alevins (i.e., >50%) in the controls were considered to have fully absorbed the yolk-sac and reached the swim-up stage, including swimming actively in the water column. In addition to the usual test endpoints (i.e., survival of normally-developed fry), the fish were weighed, measured for length and scored for quantity of residual yolk sac. The last of these endpoints was evaluated because McGurk et al. (2006) noted that lake trout exposed to nitrate exhibited a delay in achieving full

yolk sac absorption. Residual yolk sac in each of the fish was assigned a value of 0, 1, 2 or 3 at test termination, where a score of zero was assigned to fish in which there was no residual yolk, and a score of 3 was assigned to fish that appeared to have consumed little or no yolk. The procedure used to evaluate the yolk sac is summarized in Table 2. This assessment was qualitative, but differences between yolk sac condition were readily distinguishable. The same biologist assigned yolk sac scores to all of the surviving fry at test termination, thus providing consistency in this assessment. Point estimates associated with delay in reaching swim-up were calculated on the basis of the proportion of surviving fish that were considered to have completely absorbed their yolk sac at test termination (i.e., fish that were assigned a yolk sac score of zero).

Table 1. Summary of test conditions: lake trout early life stage test.

	Present Study	McGurk et al. (2006)
Test organism source	Shuswap Lake, BC	Great Slave Lake, NWT
Test organism age	Eggs and milt, fertilized just prior to test initiation	Eggs and milt, fertilized just prior to test initiation
Test type	Static-renewal (3 times per week)	Static-renewal (3 times per week)
Test duration	132 days	146 days
Test vessel	4-L plastic buckets	2.5-L plastic jars
Exposure volume	2 L	2 L
Test replicates	4	4
No. of organisms	30 per replicate	30 per replicate
Test temperature	7 ± 1°C	7.5 ± 1°C
Feeding	None	None
Photoperiod	Pre-Hatch: 24 hr dark; dim light used during solution renewal Post-Hatch: 11:13 light:dark	Adjusted periodically to reflect natural photoperiods from 5:19 to 11:13 light:dark

Test acceptability criterion for controls	≥70% fertilization; ≥60% normal surviving alevins	≥60% normal surviving alevins

Table 2. Yolk sac absorption assessment

Yolk Sac Score	Assessment
0	Yolk sac appears fully absorbed. Absence of significant yolk sac coloration.
1	A bulge and orange coloration characteristic of residual yolk present.
2	Small/Medium size yolk sac.
3	Large yolk sac. No change from appearance when initially hatched.

2.3 Water Types

The early life stage tests were conducted in two water types: very soft water (VSW), comprised of dechlorinated Metro Vancouver municipal tapwater with no added salts (hardness ranging from 5 to 15 mg/L) and a moderately hard water (MHW) prepared by addition of reagent grade salts to dechlorinated municipal tapwater to achieve a hardness of 80 to 100 mg/L with a balance of major ions reflective of EKATI lakes in the Koala Watershed. The amount of reagent grade salts added to 200 L of dechlorinated water to prepare the MHW is provided in Table 3.

Table 3. Salts added to dechlorinated tapwater to achieve the MHW blend.

Salt	Grams in 200L	mg/L
NaCl	7.52	37.6
KCl	4.56	22.8
$CaSO_4*2H_2O$	13.148	65.7
$MgCl_2*6H_2O$	17.076	85.4
Na_2SO_4	4.8	24.0
$NaHCO_3$	6.72	33.6

Two 200-L plastic containers, containing the VSW and MHW dilution waters, respectively, were placed in the environmental chamber and provided with continuous aeration for at least 24 h prior to water renewals to ensure that the water temperature was the same as in the test chambers and that the water was fully saturated with respect to dissolved oxygen concentration. These containers were re-filled periodically throughout the exposure, as needed.

Hardness and alkalinity were measured on every new batch of VSW and MHW. Nitrate was introduced by addition of reagent grade sodium nitrate. The nitrate concentrations were prepared using a 0.5 times dilution series, in which each concentration is twice the next lower concentration and half the next higher dilution. The nominal concentrations were: 2.5, 5, 10, 20, and 40 mg/L NO_3-N for the VSW test and 20, 40, 80, 160 and 320 mg/L NO_3-N for the MHW test. Test concentrations were selected in the VSW water test to bracket the threshold for effects reported by McGurk et al. (2006) (i.e., 6.25 mg/L as NO_3-N). A higher range of test concentrations was tested in the MHW test, since it was anticipated that the higher ionic strength associated with this water would reduce the toxicity of nitrate. Nitrate concentrations were measured in all test solutions at test initiation, test termination and in the exposure chambers and in freshly-prepared solutions during a water change at an intermediate point in the test.

2.4 Statistical analyses

Statistical analyses were conducted using the average of the measured concentrations of nitrate and using CETIS version 1.8 (Tidepool Scientific Software, 2007).

3.0 RESULTS

3.1 Measured parameters

Measured concentrations of nitrate were in good agreement with the target concentrations and averaged 106% of the nominal values. The average measured concentrations of nitrate were 2.9, 5.4, 11.0, 21.0 and 43.5 mg NO_3-N/L, and 21.0, 42.0, 84.6, 150.0 and 329.8 mg NO_3-N/L, for the VWS and MHW tests, respectively (Appendix A).

The range of water quality parameters and analyzed concentrations of ions for the test waters are shown in Tables 4 and 5, respectively, where they are compared to the average observed concentrations for four lakes in the Koala watershed. The concentrations of various ions within the MHW blend were lower than observed in Leslie and Moose Lakes and higher than in Nema and Slipper Lakes; the concentrations of ions occurring in the MHW were close to the average of the four lakes. The concentrations of ions in the MWH and the four lakes is shown in Figure 1 on the basis of the molar ratios, relative to calcium present in the water; a similar ratio of the various ions was observed in the four lake waters and the MHW blend of ions. Therefore, the MHW blend provided an appropriate representation of the blend of ions observed in lakes within the Koala watershed.

Table 4. Water quality parameters for test dilution waters and freshwater lakes of the Koala watershed.

Parameter	VSW	MHW	Leslie [a]	Moose [a]	Nema [a]	Slipper [a]
Alkalinity (mg/L)	5 - 10	24 - 30	37 ± 5	37 ± 4	19 ± 3	10 ± 1
Hardness (mg/L)	5 - 13	78 - 90	135 ± 15	136 ± 15	57 ± 5	23 ± 5

3.2 Survival and growth of lake trout

Toxicity test data for tests in VSW and MHW are provided in Appendices B and C, respectively. The percentage of eggs (mean ± SD) in the VSW and MHW control waters that reached the eyed-embryo stage was 74.2 ± 12.6% and 71.7 ± 7.9%, respectively. Thus, the tests in both water types met the test requirement of having had at least 70% fertilization. Control survival at the end of exposure was 61.7 ± 18.2% and 63.3 ± 14.1% as a percentage of eggs added at the start in the VSW and MHW tests, respectively. These rates of survival met the performance criterion specified in the test method of ≥60% survival.

The majority of mortalities that were observed in the tests occurred prior to reaching the eyed-embryo stage, and were lacking in embryonic development, suggesting that the majority of the effect observed on survival was due to reduced fertilization success prior to the start of the test, rather than being related to exposure to nitrate. Regardless, both tests met all of the control performance criteria for accepting the test results, as noted above.

The average day (± Standard Deviation; SD) on which at least 50% of surviving embryos had hatched was Day 83.5 ± 4.2 for the VSW water and Day 87.5 ± 1.9 for the MHW controls. The four day difference between these averages for the controls of the two test types may reflect slight differences in test temperature within the test chamber, since developmental rate is directly affected by temperature, which would become amplified as a result of the substantial duration of the exposure. The average day at which 50% hatch was observed for each concentration is shown in Table 6; no significant effect on time to hatch was observed associated with exposure to sodium nitrate in either water type.

Both the VSW and MHW tests were terminated on Day 132 when it was judged that the majority of fish in the controls had absorbed their yolk sac and were swimming actively in the water column.

Survival of lake trout in the VSW and MHW tests is summarized in Tables 7 and 8, respectively. No significant adverse effects on survival associated with nitrate exposure were observed during any of the stages of lake trout development in either of the water types; these stages included survival from eggs to eyed-stage embryo, survival from eyed-stage embryo to fry, and survival for the complete exposure from egg to fry. The effect levels for survival (e.g., LC_{10}, LC_{20}, values) would be considered to be greater than the highest concentrations tested (i.e., >43.4 and >329.8 mg/L NO_3-N in the VSW and MHW tests, respectively).

Growth of exposed lake trout is summarized in Tables 9 and 10 for the VSW and MHW water types, respectively. The lengths and wet weights of the lake trout exposed to nitrate were not significantly reduced in any of the concentrations tested for either water type, resulting in the inhibition concentration estimated to cause a 10% and 20% inhibitory effect on the exposed organisms (IC_{10} and IC_{20} estimates) of >43.4 and >329.8 mg/L NO_3-N in the VSW and MHW test waters, respectively, for these endpoints.

Measures of developmental delay of fish are also presented in Tables 9 and 10 on the basis of the yolk sac score per fish (a categorical measure, scored from zero to three, of the remaining yolk sac in the fish at test termination), and the percentage of surviving fish that had reached swim-up at the point of test termination (i.e., the percentage of surviving fish that were rated as having a yolk sac score of zero). On this basis, a slight developmental delay was apparent in the VSW test with increasing nitrate concentration (Table 9 and Figure 2). The control fish had an average yolk sac score of 0.12, whereas those exposed to nitrate had average yolk sac scores that ranged from 0.33 to 0.69 in this water type. This effect was small, but is consistent with the results presented by McGurk et al. (2006), who reported that nitrate caused a delay in absorption of yolk in VSW. Presented on the basis of the proportion of surviving fish that had reached swim-up at the end of the test, the IC_{10} and IC_{20} in the VSW test were <2.9 and 2.6 mg/L NO_3-N, respectively. The IC_{10} was reported as <2.9 mg/L because this value fell substantially outside the range of test concentrations (the lowest test concentration was 2.9 mg/L NO_3-N) and, consequently, was not considered to provide a defensible end-point.

Conversely, there was no delay in yolk sac absorption in any of the test concentrations in the MHW test, and no effect of nitrate on proportion of fish reaching the swim-up stage at test termination, indicating that the effect level for developmental delay in this water type was >329.8 mg/L NO_3-N.

Table 9. Growth of *Salvelinus namaycush* in the test conducted in very soft water.

Concentration (mg NO_3-N/L)	Mean (±SD)

4.0 DISCUSSION

The results presented here demonstrated that there were no adverse effects on survival, wet weight or length of lake trout exposed to nitrate in VSW up to and including the highest test concentration of 43.4 mg/L NO_3-N. However, a slight delay in yolk sac absorption associated with exposure to nitrate was observed in this VSW test. This effect was very small, but was detected on the basis of the estimated yolk sac scores for the fish at termination.

These results are consistent with McGurk et al.'s (2006) observation that a developmental delay was the most sensitive endpoint in their tests. Adverse effects were reported by these authors on survival and length of fry, but only at concentrations exceeding those tested in the present study; higher concentrations were not included in the current test because a narrower dose-series was selected to provide better resolution of effects end-points associated with the most sensitive endpoints. Effects on wet weight of fry were reported by McGurk et al. (2006) at concentrations as low as 6.25 mg/L NO_3-N, which was not seen in the present study. It is possible that this relates to differences in the methods employed for termination of the tests. In the McGurk et al. (2006) tests, the exposures continued in each test concentration until the yolk was fully absorbed in the individual concentrations, resulting in different exposure durations for the controls and the various test concentrations. This approach complicates appropriate interpretation of growth metrics, since the fry which were considered to have statistically lower wet weights in their study had been reared for 8 to 28 days longer than the control fish, which would have consequences for energy expenditure and, therefore, growth. Regardless, both studies produced data indicating that lake trout exposed in VSW exhibit delayed utilization of the yolk sac, although the ecological consequence of a small delay in yolk absorption at a population level is unknown.

In contrast to the data reported for VSW, there were no adverse effects using any of the test endpoints in the MHW prepared using the ionic blend present in the Koala watershed. The threshold for adverse effects in this water type would be considered to be greater than the highest test concentration (i.e., >329.8 mg/L as NO_3-N). These results demonstrate that the results reported by McGurk et al. (2006), and observed here in VSW, are only applicable to low ionic strength conditions. Indeed, there were no effects observed using MHW at concentrations of nitrate that were more than 100-times higher than the IC_{20} reported here in VSW.

The testing described here was performed to evaluate whether inclusion of water hardness as a toxicity modifying factor, as per the SSWQO developed for EKATI (Rescan, 2012), is

appropriate for lake trout. The results demonstrate that increasing water hardness does indeed reduce the sensitivity of lake trout to nitrate.

The effect levels reported for lake trout in VSW (~12 mg/L hardness) both here (IC_{20} of 2.6 mg/L NO_3-N) and by McGurk et al. (2006) (a LOEC of 6.25 mg/L NO_3-N) were 1.9 to 4.5 times higher than the SSWQO of 1.4 mg/L NO_3-N for this level of water hardness. Similarly, the effect level reported here for this species at a hardness of 80 to 100 mg/L, >329.8 mg/L, is more than 30 times higher than the SSWQO of 8.5 to 10.5 mg/L NO_3-N for this level of hardness. The results of these tests are shown in comparison to the SSWQO in Figure 3, which also shows results from the toxicity tests that were used as the basis of the SSWQO, as well as additional tests using *Ceriodaphnia dubia* and fathead minnows conducted previously in lake waters from the Koala watershed. As can be seen, all of the toxicity test results, including these new data presented here for lake trout under soft and moderate hardness conditions, fall above the SSWQO. These results demonstrate that the SSWQO will be protective of early life stages of lake trout.

Figure 3. Toxicity test results for lake trout shown in comparison to the SSWQO for EKATI, and data used in the development of that SSWQO.

APPENDIX C – Toxicity Test Data: Moderately Hard Water

Embryo-Alevin-Fry Test Summary Sheet

Client: Rescan

Start Date/Time: Nov 19/11 @ 1045h

Work Order No.: n/a

Test Species: *S.namaycush*

Sample Information:

Test ID: Moose-nitrate
Chemical: Sodium Nitrate (NaNO3)

Dilution Water:

Type: Moderately Hard Water Synthetic Blend
Hardness (mg/L $CaCO_3$): 78-90
Alkalinity (mg/L $CaCO_3$): 24-30

Test Organism Information:

Source: Shuswap Lake
Loading Density: 30 organisms / 2L
Date Organism Received: Nov 18/11

Test Results:

	mg/L NO3-N			
	Survival	% Swim -up	Wet Weight	Length
EC25 (95% CL)	> 329.8			
EC50 (95% CL)	> 329.8			
IC25 (95% CL)		> 329.8	> 329.8	> 329.8
IC50 (95% CL)		> 329.8	> 329.8	> 329.8

Attachment FS-C: POPCs Goose Lake

Support Sabina response to KIA-TC-07 & 08, Part(s) 2

This workbook was prepared in response to KIA-TC-7 part 2 and KIA-TC-8 part 2.

It contains Goose Lake hydrodynamic model predictions for the POPCs at 5 locations.
ARC100 = maximum model predictions along an arc 100 m from the discharge point.
ARC200 = maximum model predictions along an arc 200 m from the discharge point.
ARC500 = maximum model predictions along an arc 500 m from the discharge point.
ARC1000 = maximum model predictions along an arc 1000 m from the discharge point.
Tail = maximum model predictions in the tail of Goose Lake.

Each worksheet includes:
Hardness concentrations, which were calculated from predicted calcium and magnesium concentrations (Column H).
pH (Row 2)
Dissolved organic carbon concentrations (Row 3)

The results in this workbook were presented in Appendix A of the EQC Report (Golder 2021).

pH	-	-	-	-	-	-	-	7.2	6	-	-	-	-	-	7.2	-	-
Dissolved organic carbon (mg/L)	-	-	-	-	-	-	-	-	3.5	-	-	-	-	-	3.5	-	-
