

1 Based on review of the Jericho water license
2 and the KIA recommend to the Nunavut Water Board
3 that the duration of the water license no longer
4 than six years in length. This will allow for one
5 year construction and five years of operation.

6 In this presentation, KIA highlights issues
7 related to the terms of the water license, water
8 use, water flow monitoring of receiving
9 environmental aquatic effects monitoring, discharge
10 limit and planning, among others. The KIA also
11 provide recommendation to address these other
12 issues. The KIA also provide recommendation for
13 security estimate for the entire site of the
14 Jericho project, include Inuit-owned land, that KIA
15 estimate in the base of Inuit value, Inuit
16 recommendation, objectives and Inuit consultation.

17 We trust that our submission to the
18 presentation will be addressed to the Nunavut Water
19 Board. I now turn this presentation over to Geoff
20 Clark who will present the remaining issue and the
21 determination of the Nunavut Water Board regarding
22 Jericho water license application.

23 GEOFF CLARK: Thank you, Raymond.
24 Before I begin, I was wondering if I could borrow
25 that pointer that I think Cam had. And, secondly,
26 I would like to note that KIA was really counting

1 on that great projector that the Nunavut Water
2 Board has, because the one that we have in our
3 office, as you can tell, it is about three times
4 bigger and it is about a third of quality of the
5 projector that the Nunavut Water Board has.

6 So my apologies, if it is hard to read, it is
7 because we found this projector just doesn't
8 project well. So I will try to use this pointer,
9 might help out in a few slides, but in others I
10 might just have to explain a little more.

11 So KIA's first concern relates to water use
12 and the quantity of water. And specifically KIA
13 recommends that the water license include a
14 provision that Tahera describe how it plans to
15 measure or predict the total annual precipitation,
16 including snowfall. Water balancing or water
17 balance modelling of the Jericho project will
18 require continuous measurement of precipitation and
19 other meteorological or weather-related variables
20 using instruments at the Jericho meteorological
21 station. One variable that was not included in
22 Tahera's list was snowfall.

23 Tahera predicts that the Jericho mine will
24 use about 1 percent of the total annual outflow
25 from Carat Lake. It is important to ensure that
26 the water surface elevation of Carat Lake will not

1 significantly change in the event that Tahera's
2 calculations are incorrect. So KIA recommends that
3 the Nunavut Water Board set a limit to the drawdown
4 of the water surface elevation of Carat Lake that
5 should be based on the natural seasonal range of
6 the water surface elevations of Carat Lake.

7 As well, KIA recommends to the Nunavut Water
8 Board that a hydrometric station be established at
9 the outlet of Lake C3 in order to confirm flows out
10 of Lake C3. I will talk a little bit more about
11 that later.

12 KIA has the following recommendations
13 regarding water flows in the mine. And the first
14 one is that it is important that the water flows
15 from the mine be monitored at all key points in the
16 Jericho operation, because this information can be
17 used to predict the future water quality issues at
18 the mine. With this in mind, the KIA recommends
19 that additional monitoring stations be established
20 at ponds A, B and C, if they are built, and all
21 sumps and to monitor seepage around all dams
22 surrounding the PKCA. And PKCA is processed
23 kimberlite containment area.

24 As well, a PKCA dewatering plan or drainage
25 plan will have to be developed in order to drain
26 water from Long Lake before it can be used as a

1 PKCA, and dewatering should only begin after the
2 dewatering plan is approved by the Nunavut Water
3 Board.

4 Fish must be salvaged from Long Lake in
5 consultation with local Inuit before Long Lake is
6 dewatered.

7 KIA has reviewed Tahera's plans for
8 monitoring the waters in the receiving environment
9 and has the following concerns and suggestions.
10 Firstly, KIA is confused by the proposed numbering
11 system that is proposed by Tahera for the
12 surveillance network program, or SNP, and the
13 aquatic effects monitoring program, also called the
14 AEMP. This is because some SNP stations were both
15 listed as SNP and AEMP stations. And KIA
16 recommends that the SNP, a prefix, only be used for
17 water quality stations, and all other stations be
18 listed as aquatic effects monitoring program
19 stations.

20 This is one of the slides that didn't work
21 out. And KIA found that the purpose of some of
22 these SNP stations were confusing. And I will just
23 describe it, instead of worrying about this table,
24 but we found that, for example, SNP13 and 14 were
25 listed by the company that were located in the
26 Jericho River or in that area as downstream control

1 sites. And the KIA considers these sites to be
2 far-field sights because they are located
3 downstream from the effluent discharge, and so it
4 can't be considered true controls. And so the
5 water license should closely specify the purpose of
6 each station and its surveillance protocol.

7 KIA also recommends two additional SNP
8 stations be added to the 15 that are proposed by
9 Tahera, and they are located in these two lakes
10 that are adjacent to the mine site but do not
11 receive any direct drainage from the mine site.
12 These lakes are called Ash Lake and Key Lake, which
13 flow into Lynne Lake, which is proposed to have a
14 surveillance network program water quality station.
15 These lakes are on Inuit-owned land and may be
16 affected by seepage from dams or from other sources
17 of pollution on the site.

18 KIA reviewed Tahera's proposed aquatic
19 effects monitoring program, or AEMP, and suggested
20 the following changes to the Nunavut Water Board.
21 First of all, the combination of SNP and AEMP
22 shouldn't be combined to avoid confusion.

23 And as specified in the NIRB certificate,
24 fish should be added to the sampling program in
25 Jericho Lake. And all biological components,
26 including fish, should be sampled in the Jericho

1 River.

2 Here are examples of some of our suggested
3 additions to the aquatic effects monitoring
4 program. So in the north basin of Jericho Lake,
5 that fish are added to the aquatic effects
6 monitoring program, and that in the Jericho River,
7 as per the NIRB certificate, that all parameters
8 are monitored in the Jericho River. As well, more
9 benthic invertebrate sampling should occur in Lake
10 C3 and Carat Lake at AEMP sites.

11 When KIA reviewed Tahera's proposed discharge
12 limits, KIA used a general guide, discharge limits
13 from the Jericho mine should not be any higher than
14 any other diamond mine in Canada, sorry, in
15 Canada's Arctic for the following reasons: the
16 dilution capacity of Lake C3 is no higher than any
17 other diamond mine in the Arctic.

18 The Nunavut water Board should use precedents
19 set by Ekati, Diavik and Snap Lake due to the
20 efforts spent to set these limits. It is unlikely
21 the discharge limits from other mines will increase
22 in the future, and this license will set a
23 precedent for other Nunavut mines.

24 Unfortunately, what this table shows is the
25 proposed discharge limits for four parameters, one
26 as nitrate N, total chromium, total nickel and

1 total zinc. And these are parameters that KIA
2 specifically wanted to focus on. And what we
3 showed in this table was Tahera's proposed limits,
4 KIA's proposed limits, and then the limits for
5 these four parameters at Ekati, Diavik and Snap
6 Lake. And KIA found that 4 of the 18 discharge
7 parameters proposed by Tahera for the Jericho mine
8 are higher than the highest discharge limit by any
9 other diamond mine in Arctic Canada.

10 KIA recommends to the Nunavut Water Board
11 that the proposed discharge limit for nitrate N,
12 total chromium, total nickel and total zinc should
13 be reduced so that they are not higher than other
14 diamond mines in the Arctic.

15 KIA is concerned that Tahera's dilution
16 modelling of the discharge from Stream C3 into Lake
17 C3 will not be accurate during periods of very low
18 flow into Lake C3. The key to managing the
19 discharge of effluent from Stream C3 is based upon
20 effective dilution in Lake C3.

21 Tahera's discharge limits are based on a
22 predicted ten-fold dilution in Lake C3. During
23 periods of very -- or during very low flow periods,
24 the ten-fold dilution factor may only be achievable
25 by including the entirety of Lake C3 and perhaps
26 parts of Carat Lake. Thus KIA is not convinced

1 that the ten-fold dilution factor will always be
2 achieved through the life of the mine. To help
3 manage this issue, KIA recommends to the Nunavut
4 Water Board that discharge from the PKCA can only
5 be proportionally one-tenth of the flow that is
6 measured leaving Lake C3. At no time should the
7 company allow less than a one-to-ten ratio of PKCA
8 discharge to Lake C3 outlet flow.

9 KIA is also concerned that the dilution will
10 not always be met with the 200-metre mixing zone in
11 Lake C3 proposed by Tahera. KIA recommends that a
12 verification study using field sampling should be
13 conducted by an independent third-party contractor
14 paid by Tahera, and that the terms of reference be
15 developed by the Nunavut Water Board, and that the
16 results would be reported to the Nunavut Water
17 Board.

18 Baseline toxicity tests of water in Long
19 Lake, Lake C3 and Carat Lake should be conducted
20 prior to mine construction so that any observed
21 effects can be factored out of later tests on PKCA
22 effluent. Tahera should be encouraged to develop
23 and conduct these tests on species native to the
24 Arctic.

25 Tahera suggests that if water quality in the
26 PKCA does not meet discharge criteria, that

1 flocculent will be added to the PKCA prior to
2 discharge to remove suspended material in the water
3 of the PKCA.

4 We have already heard some discussion today
5 about possible or whether flocculents are toxic --
6 have toxic effects on fish. However, we don't
7 believe it is advisable to add flocculents to the
8 PKCA because it may go in unbound forms through
9 Stream C3 into Lake C3. And, therefore, KIA
10 recommends that flocculents should not be used to
11 treat PKCA effluent.

12 KIA recommends that the Nunavut Water Board
13 instruct Tahera to prepare plans for the following
14 contingencies in case that Tahera's predictions are
15 wrong.

16 Tahera should describe to the Nunavut Water
17 Board the contingency plan in case permafrost
18 depths are less than the predicted 540 metres. And
19 Tahera should describe as a first contingency how a
20 water treatment plant would be developed and
21 operated if PKCA discharge does not meet discharge
22 limits.

23 The Jericho mine and its abandonment and
24 reclamation. The Jericho mine is about 40 percent
25 on Inuit-owned land. And Kitikmeot Inuit
26 Association beneficiaries are the primary users of

1 all the land around the Jericho site, including
2 Inuit-owned land and Crown land. Thus, KIA has a
3 strong interest in ensuring that the entire site is
4 reclaimed to Inuit standards, and that KIA does not
5 incur residual reclamation liability on Inuit-owned
6 land as a result of the project.

7 The KIA has developed a capacity to
8 independently analyze and assess reclamation
9 security by developing its own proprietary model
10 for assessing security. This model generates
11 security estimates that are based on Inuit values
12 and specific reclamation objectives. KIA staff and
13 board members, with the help of computer modelling
14 and mine reclamation experts, developed this model.

15 The guiding principles of KIA's reclamation
16 security model are to protect the environment, to
17 be sure the site is safe for future use by people
18 and animals, to restore the site for future use by
19 people and animals, and no perpetual care.

20 During the preparation of the reclamation
21 security estimate for the Jericho project, KIA
22 consulted with elected representatives of the
23 Nunavut Land Claim Agreement beneficiaries who
24 represent Inuit from Cambridge Bay, Kugluktuk,
25 Bay Chimo, Bathurst Inlet and Contwoyto Lake.
26 These are called community beneficiary committees

1 or CBCs. Thus KIA received feedback from Inuit on
2 reclamation from those who have lived in the area
3 of the proposed mine site.

4 When consulting the CBCs, the KIA received
5 guidance on several issues related to closure of
6 the Jericho project. Some examples of the advice
7 received from the CBCs include the project at
8 closure should resemble the surrounding landscape,
9 meaning that highly engineered closure designs are
10 not acceptable. For example, jump slopes should
11 look like slopes in mature landscapes with convex
12 shoulders and concave feet, compared to slopes with
13 uniform angles. So this is a diagram showing a
14 slope that's more of a mature and natural profile,
15 and this is an example of a slope with a flat top
16 and a uniform slope angle.

17 Other advice included that slopes of all
18 dumps should be covered with overburden, and all
19 reclaimed sites should be revegetated with plant
20 species adjacent to the mine site.

21 Other advice is that long-term monitoring of
22 many parameters, such as wildlife, vegetation,
23 geotechnical monitoring, water monitoring, and
24 aquatic monitoring should continue long after the
25 mine closes.

26 Other advice is that the open pit edge should

1 be contoured to a low angle so that the open pit
2 minimizes risks to people and wildlife at closure.
3 Another example is that an emergency and local-use
4 air strip and emergency shelter should remain at
5 the site after closure.

6 KIA's reclamation assessment approach using
7 our security model is three-fold. Firstly KIA has
8 used Tahera's estimate in KIA's model, including
9 the commitments made, but not necessarily accounted
10 for in Tahera's security estimate. Then KIA input
11 Inuit values and objectives for reclamation of the
12 Jericho project, including community beneficiary
13 consultation, to develop a final reclamation
14 estimate for the entire site. Then KIA split out
15 though parts of the reclamation estimate that will
16 occur on Inuit-owned land.

17 In our analysis, KIA accepted the costs
18 provide by Nuna Logistics. We went through this
19 estimate, and we found that these -- the estimates
20 for these costs were fair. And this table says the
21 reclamation activities in Tahera's reclamation plan
22 estimated by Nuna Logistics, and that's
23 \$8.4 million. That \$8.4 million is before any
24 contingency factor.

25 In our review of Tahera's reclamation plan,
26 we noted some activities that were stated in the

1 Tahera's reclamation plan but were not quoted in
2 Nuna's cost estimate. So the first thing that we
3 did is KIA estimated and added these new costs to
4 Nuna's estimate, which increased Nuna's estimate by
5 about \$1 million to \$9.4 million, before a
6 contingency was applied. So this is our addition
7 of \$1 million, accounting for items in Tahera's
8 reclamation plan that weren't quoted in Nuna's
9 estimate.

10 Then what KIA did was added the KIA
11 reclamation objectives to this estimate, based on
12 Inuit values and Inuit consultation. And this
13 reclamation estimate increased to \$12.5 million
14 before a contingency. The increased costs related
15 primarily to costs related to reclaiming dump
16 slopes, additional post-closure monitoring and
17 reclamation of the open pit. So this is an
18 addition of about \$3 million.

19 Then KIA split out the portion of the
20 security that applies to Inuit-owned land based on
21 the reclamation activities that will be required
22 for Inuit-owned land. And when this is split out
23 from the reclamation on Crown land, when it is
24 split out from Crown land, this equals about
25 \$3.3 million for Inuit-owned land.

26 The next thing that KIA did is added a

1 contingency factor of 20 percent to our estimate
2 for the entire site and for the Inuit-owned land
3 portion. We felt that the 10-percent contingency
4 was too low, particularly compared to security
5 estimates for other northern mines.

6 KIA also added what is called a discount rate
7 to the reclamation estimate that reduces the cost
8 of reclamation in today's dollars. We added a 2.5
9 percent discount rate, and when this is applied, it
10 generates a net present value in today's dollars
11 that recognizes that many of these reclamation
12 activities occur many years in the future and that
13 Tahera would have to pay for the majority of the
14 security early on in the mine life. So this
15 provides a discount or a cost in today's dollars of
16 what it will cost to fund those activities in the
17 future.

18 With the contingency and discount rate
19 applied, the cost to reclaim the site is
20 \$12.6 million for the entire site, which is down
21 here, and \$3.3 million for the Inuit-owned land
22 portion.

23 The security identified by KIA for
24 Inuit-owned land reclamation, which will have to be
25 part of the land lease with KIA for the lease of
26 IOL, has yet to be completed.

1 In regards to any proposed split of land
2 versus water-related reclamation security on
3 Inuit-owned land, KIA notes that virtually all
4 water from reclamation components runs towards
5 Carat Lake or Lake C3 watersheds from the project
6 footprint. As well, there are a few obvious
7 control points to claim any potentially
8 contaminated water on Inuit-owned land. Thus KIA
9 considers that none of the \$3.3 million assessed
10 for security on Inuit-owned land relates to
11 water-related reclamation.

12 In conclusion, KIA supports appropriate
13 mining development in the Kitikmeot because it has
14 important responsibilities to Kitikmeot Inuit to
15 balance economic development with environmental
16 protection to protect the land, wildlife and Inuit
17 lifestyles.

18 The KIA continues to support the development
19 of Tahera's proposed Jericho diamond mine. Tahera
20 and KIA have signed an Inuit Impact and Benefits
21 Agreement related to the Jericho project, and the
22 IIBA has been reviewed and approved by the Minister
23 of Indian and Northern Affairs Canada and now is in
24 legal force.

25 As part of IIB negotiation, KIA and Tahera
26 addressed the impact of the project on Inuit water

1 rights under Article 20 of the Nunavut Land Claim
2 Agreement, resulting in a water compensation
3 agreement between KIA and Tahera. KIA is satisfied
4 the compensation concerns identified by Tahera that
5 are related to water have been resolved.

6 KIA is involved in surface land management,
7 including licensing and leasing on its lands. The
8 Jericho project is partly on Inuit-owned land.

9 An important item that remains outstanding is
10 the completion of a land lease that Tahera will
11 require for infrastructure on Inuit-owned land
12 parcel C0-05. This will be required before
13 construction on the project begins on that land.

14 In this presentation, KIA identifies issues
15 and provides recommendations to the Nunavut Water
16 Board related to duration of the water license,
17 water use, flows, monitoring, aquatic effects
18 monitoring, discharge limits, discharge protocols
19 and verification and contingency planning, among
20 others. KIA also provides a reclamation and
21 security estimate for the entire site of the
22 Jericho project. KIA also provides an estimate for
23 reclamation of Inuit-owned land only.

24 This estimate is based on our proprietary
25 reclamation security estimation model that is based
26 on Inuit values, Inuit reclamation objectives and

1 Inuit consultation.

2 KIA's reclamation estimate for Inuit-owned
3 land is \$12.6 million for the entire site, of which
4 \$3.3 million is for Inuit-owned land. The
5 reclamation security identified for Inuit-owned
6 land will have to be furnished as part of the land
7 lease for Inuit-owned land, which is yet to be
8 completed between Tahera and KIA.

9 The KIA hopes their input has been helpful to
10 the Nunavut Water Board, to the public and to the
11 other intervenors. And this concludes our
12 presentation. And Dr. Mike McGurk and myself are
13 now available for questions. Thank you.

14 BILL TILLEMAN: Thank you,
15 Mr. Chairman. And as part of the presentation or
16 at least normally what I would do for the Board is
17 suggest, and I'm now doing that, is we file as
18 exhibits a hard copy and also electronic version of
19 their presentation. So they will be marked as
20 numbers 13 and 14 accordingly. Thank you, sir.
