KIGGAVIK
PROJECT
Valued Components
ᐊᑐᑎᖅᑕᓂᖅᓯᒪᓂᑦ ᐃᑲᓇᖅᑐᐃᓂᖅᓯᒪᔪᓂᑦ
Valued ecosystem and socio-economic components and indicators
Valued components (VCs) are broad ecological and socio-economic elements that are used during an environmental assessment to ensure a complete view is considered when describing the potential effects of a project.
Groups of indicators within each VC are carefully selected by the proponent, with input from regulators and stakeholders. This helps ensure that the environmental assessment is focused on key indicators that are most important to the people and that represent the ecological and socio-economic health of the region.
Within the Kiggavik Project, a VC category can include animals, plants or even measures of community well-being like household income, and time spent engaging in traditional activities. It is important that VCs and their associated indicators have scientific, ecological, social, cultural, economic, historical, archaeological or aesthetic importance.

PROJECT
Environmental Assessment
ᐊᐢᑎᑎᕆᐅᔪᓂᒃ ᖃᐅᔨᓴᕈᑎᖃᕐᓂᖅ
Environmental assessment: achieving sustainable development
An environmental assessment (EA) looks at the interactions of a project with the environment. Some of these interactions may result in various effects. The significance of these effects is considered in the EA.
The Kiggavik Project is being designed to minimize the magnitude, geographic extent, duration, frequency, and probability of potential adverse effects on the natural and socioeconomic environments.
Kiggavik Project progressive reclamation and comprehensive decommissioning plans will be used to return the environment to a condition suitable for traditional uses.
Criteria used to determine the significance of potential effects:
the magnitude and complexity of adverse effects;
the geographical extent and the size of the human and the animal populations likely to be affected;
the frequency and duration of adverse effects;
the reversibility or irreversibility of adverse effects;
the probability of adverse effects occurring.
In addition to individual effects, the EA also considers potential for cumulative adverse effects given past, present and future relevant events. Regulators ultimately decide if a project is likely to have significant adverse environmental effects.
What is an “effect”:
An effect is a change in the natural or socio-economic environments caused by or related to project activities.
