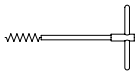
ATTENTION

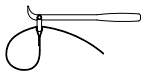
Mechanical seals are precision parts of high quality. Therefore, the installation must be effected with care. Gentle handling and extreme neatness are essential.

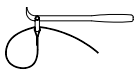
- Clean mechanical seal housing (333)
- Evenly press counter-ring with o-ring into mechanical seal housing (333). To facilitate assembly, the o-ring should be moistened with a lubricant (diluted fluid soap).

ATTENTION

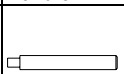
- Oil or grease must not be used to facilitate assembly.
- Install mechanical seal housing (333) to lantern (200) and onsure correct position of flushing connections.
- Remove plug-in shaft (307), burrs and roughness and clean the unit.
- Check / adjust set dimension of mechanical seal on plug-in shaft (307). Moisten plug-in shaft (307) and elastomer parts of mechanical seal with lubricant (diluted fluid soap).
- Slip mechanical seal onto plug-in shaft (307) as far as set ring.
- Lubricate drive shaft (ANT) with antiseize graphite petroleum.
- Moisten splash ring (310) and plug-in shaft (307) with pin joint grease, (for type, please see index) and slip splash ring (310) onto output shaft of drive. Note installating position of splash ring and refer to description on splash ring.
- Move rotating unit (RTE) through mechanical seal housing (333) and splash ring (310) and slip splash ring (310) onto output shaft of drive (ANT). Push in plug-in shaft pin (309) in horizontal position.
- Position of splash ring:
  Collar of splash ring shall be fitted in a distance of about 0.5 mm to lantern (200).

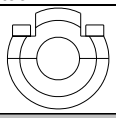


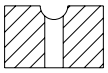


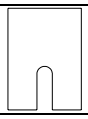


Range: MD, MDF



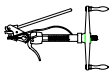






To avoid the expenses incurred by lengthy stop periods of the pump, seepex recommend the acquisition of a set of wearing parts and a set of gaskets.
The table below shows the contents of these sets.

Part designation	small set of wearing parts	big set of wearing parts	set of gaskets	Item number acc. to sectional drawing of pump and parts list
	Number			
Rotor		1		600
Stator 2)	1	1		601
Universal joint sleeve		1		405
Coupling rod pin		2		402
Guide bush 2)		-		-
Coupling rod		1		400
Coupling rod bush 2)		-		-
Casing gasket			1	501
Holding band, small 2)		-		-
Holding band, large 2)		2		406
Packing ring set 2) 3)	1	1		301
Mechanical seal 3)			1	330
Sealing ring			4	571, 726
Splash ring			1	310
O-ring			1	572
Plug-in shaft 2)		1		307
Special joint grease				098 1 cart. 300 gr (c. 315cm³) grease quantity per pin joint, see tech.
Tool				Essential for assembly, see Point 9, document OM.SPT.01



2) see tools Point 9., document OM.SPT.01
3) Item 330 and item 301 (as an alternative) depend on the pump design. With regard to the pump design, refer to the appertaining data sheet and the sectional drawing. See Point 9.

INDUSTRIES

OPERATING MANUAL

This document was drawn up observing the EC directives
"Machinery" 98/37/EC, EN ISO 12100-2 and the German Standard VDI 4500

In case of this mechanical seal is operated in **explosion area an appropriate additional operating manual,** following EC directives 94/9/EC (ATEX 95), has to be observed **by all means**! If required this could be ordered at BURGMANN.

BURGMANN MECHANICAL SEAL (M.S.)

Type MG1/dw-00 and versions

applies to all mechanical seals of the same series

dw = specified shaft diameter

These instructions are intended for the assembly, operating and control personnel and should be kept at hand on site.

PLEASE READ this manual carefully and OBSERVE the information contained as to:

- **Safety**
- **Installation**
- **Transport / Storage**
- **Operation**
- **Information about the product**
- **Servicing**

If there are any unclear points please contact BURGMANN by all means!

Keywords and Symbols

Following symbols for particularly important information are used:

"Attention, please pay special attention to these sections of text"

DANGER! Draws attention to a direct hazard that will lead to injury or death of persons

WARNING! Draws attention to the risk that a hazard could lead to serious injury or death of persons

CAUTION! Draws attention to a hazard or unsafe method of working that could lead to personal injury or damage to equipment

ATTENTION! Identifies a potentially dangerous situation. If it is not avoided the product or something in its vicinity could be damaged

IMPORTANT! Identifies tips for use and other particularly useful information.

GENERAL SAFETY NOTES

Any person being involved in assembly, disassembly, start up, operation and maintenance of the BURGMANN Mechanical Seal must have read and understood this Instruction Manual and in particular the safety notes. We recommend the user to have this confirmed.

BURGMANN Mechanical Seals are manufactured on a **high quality level** (quality management EN ISO 9001: 2000) and they keep a **high working reliability**. Yet, if they are **not operated** within their **intended purpose** or handled **inexpertly** by untrained personnel they may cause **risks**.

The machine has to be set up in such a way that seal leakage can be led off and disposed properly and that any personal injury caused by spurting product in the event of a seal failure is avoided.

Any operation mode that affects the **operational safety** of the mechanical seal is not permitted.

Unauthorised modifications or alterations are **not permitted** as they affect the **operational safety** of the mechanical seal.

BURGMANN mechanical seals must be installed, operated, maintained, removed or repaired by **authorised**, **trained and instructed personnel only.**

The **responsibilities** for the respective jobs to be done **have to be determined clearly and observed** in order to prevent unclear competencies from the point of **security**.

Any work to be done on the mechanical seal is **generally** only **permitted** when the seal is **neither operating nor pressurised**.

WARNING! Seals that have been used with **hazardous substances must be properly cleaned** so that there is no possible **danger** to people or to the environment.

Apart from the notes given in this manual the general **regulations for worker's protection and those for prevention of accidents** have to be observed.

Instructions for worker's protection

WARNING! If the **medium to be sealed** and/or the **supply liquid** is subject to the **Hazardous Substances Regulation** (GefStoffV), the **instructions for handling dangerous substances** (safety data sheets to EU Directive 91/155/EEC) and the **accident prevention regulations** have be observed.

Medium to be sealed and/or **supply medium may escape** if the seal **fails**. Injury of persons and environment may be **prevented by the user** providing for splash protection and wearing safety goggles. Care has to be taken by the user for **proper disposal** of the leakage. The user has to control these measures.

The **user** has to **check** what **effects a failure** of the mechanical seal might have and what safety measures have to be taken to prevent **personal** injury or damage to the environment.

TRANSPORT / STORAGE

Transport

If not specified differently by contract the BURGMANN standard packing is used which is suitable for dry transport by truck, train or plane. The warning signs and notes on the packing must be observed.

In addition seaworthy packing may become necessary.

Notes for income inspection:
- Check packaging for visible damages.
- Open packaging carefully. Do not damage or lose parts supplied separately.
- Check if consignment is complete (delivery note). Inform the supplier immediately in writing if parts are damaged or missing.

The mechanical seal has to be protected from damage during transport and storage. The transport case in which the seal is supplied is well suited for this purpose and should be kept for a possible return transport.

ATTENTION! If the machine as well as the mechanical seal installed into the machine are transported together the shaft has to be protected from deflection and shocks.

Packing and storage

The following recommendations apply to all BURGMANN mechanical seals which have been supplied and stored in their **undamaged original packaging**, as well as to seals which have been installed in a machine (e.g. pump, compressor, agitator, etc.) but have not yet been put into operation.

BURGMANN mechanical seals and spare parts are super finished and repeatedly tested machine elements. For the storage special conditions have to be followed.

Sliding materials and elastomers are subject to material-specific and time-based alterations (distortion, ageing) which might reduce the full efficiency of the mechanical seals. Yet, this may be avoided by observing the storage instructions.

For the stock keeping of elastomers special conditions are required. For all rubber-elastic parts the rules of DIN 7716 resp. of ISO 2230-1973 (E) are valid.

Conveniences for storing of mechanical seals
- dust free
- moderately ventilated
- constantly tempered
  - relative air humidity below 65 %,
  - temperature between 15 °C and 25 °C.

Protect the seal from
- direct exposure to heat (sun, heating)
- **ultraviolet light** (halogen or fluorescent lamps, sunlight, arc welding)
- presence or development of **ozone** (arc welding, mercury vapour lamps, high-voltage devices, electric motors)

➢ **risk of embrittlement** of elastomeric materials

It has to be differentiated between:
- **M.S. stored** in the stock room
- **M.S. installed** in the machine, but not yet in operation.

☐ **M.S. in the stock**

IMPORTANT! Store the **seal in the original packing** lying on a **flat surface**.

- Check the packaging periodically for damages.
- Plastic sheet packagings with humidity indicators have to be checked every 8 weeks. The check has to be recorded.

➢ Packings **exceeding 50 % rel. humidity** values have to be sent to the manufacturer or the **nearest BURGMANN service centre** for inspection and new packaging.

Duly stored mechanical seal:
- Latest 3 years after delivery of the mechanical seal
- For reasons of safety shipment of the M.S. to BURGMANN resp. nearest BURGMANN service centre for

➢ Exchange of all secondary seals and springs
➢ Verification of the flatness of the faces
➢ Perhaps static pressure test.

☐ **M.S. installed into the machine:**

ATTENTION! A **preservation** of the BURGMANN mechanical seals is **not allowed**.

Check in case of a preservation of complete machines with mechanical seals installed BURGMANN has to be contacted.
- **Do not** use corrosion protection agents.

➢ Risk of deposition and possibly chemical attack of the secondary seals.

Due to longer erecting times of new designed plants the period between delivery of the mechanical seal and on the other hand its installation and start up may exceed the period of 2-3 years.

Latest after 3 years and in time before the planned start-up of the plant the seal has to be dismantled and to be sent to the manufacturer or the nearest BURGMANN service centre where it can be checked and reconditioned, if necessary.

Damages caused by **improper** storage may **not** be claimed with reference to the **warranty** on the BURGMANN company**.**

INFORMATION ABOUT THE PRODUCT

All technical information given is based on the results of extensive testing and on BURGMANN's long term practical experience. However, in view of the great diversity of possible applications the technical data can only be taken as being of approximate nature. We can only guarantee the safe and efficient functioning in individual cases if we have been comprehensively informed of the operating conditions to which they will be subject, and if this has been confirmed in a separate agreement.

Manufacturer and country of origin

Burgmann Industries GmbH & Co. KG
Äußere Sauerlacher Str. 6-10
D - 82515 Wolfratshausen

Germany

Declaration by the manufacturer

within the meaning of the EC-directive "MACHINERY" 98/37/EG

A mechanical seal does **not function independently**. It is intended to be incorporated into or assembled with machinery.

Type designation

BURGMANN Mechanical Seal **MG1/dw-00**

Designated use

This mechanical seal is **exclusively** designed for the use in the specified application. A **different utilisation** or a utilisation going beyond the specification is considered **contrary to its designated use** and excludes a liability by the manufacturer.

Operation under conditions lying **outside** those limits stated in paragraph **"Operating limits"** is considered **contrary to its designated use**.

Should the seal be **operated under different conditions or at a different application** BURGMANN has to be asked for **recognition as safe in advance**.
- **Changes** to operating conditions **have to** be documented.

Operating limits

ATTENTION! Operating limits depend on the materials, the media to be sealed and the diameter of the sealing. (If there are any unclear points please contact BURGMANN.)

Shaft diameter	(dw)	:	10 - 100 mm
Pressure to be sealed	(p1)	:	12 bar g
Temperature to be sealed	(t1)	:	-20 ... 120° C
Max. sliding speed	(vg)	:	10 m/s

Operation under several limit values **simultaneously** should be **avoided** as higher loads (pressure, temperature, speed) can increase wear or lead to **damage** of sliding faces or elastomers. This could result in a shorter service life and in the **risk** of a sudden seal failure **endangering** men and environment.

The **selection** of the mechanical seal (type, suitability, materials) should be done **by BURGMANN staff** or other **authorised** persons. A wrong selection by unauthorised persons is **not covered by** BURGMANN's **warranty**.

Further information about the operating conditions can be found in the BURGMANN assembly drawing MG1/dw-00 or in the specification sheets of the machine manufacturer.

Materials

The materials of the mechanical seal depend on the application and are fixed in the order.

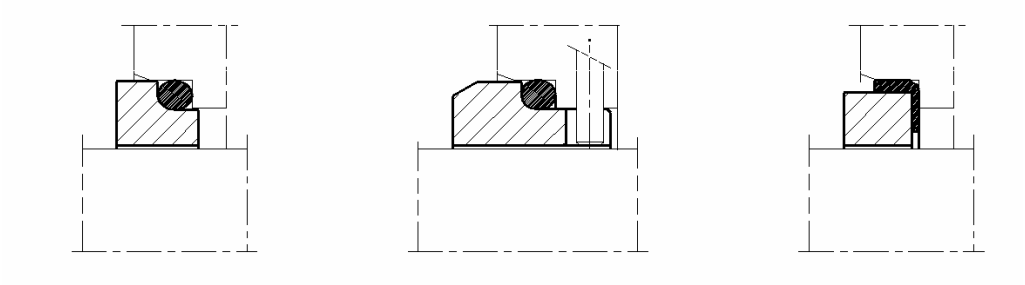
Drawings, diagrams

Assembly drawing MG1/dw-00

The original assembly drawing in its latest edition (latest revision) only is decisive for both the design of M.S. as well as the utilisation of this manual.

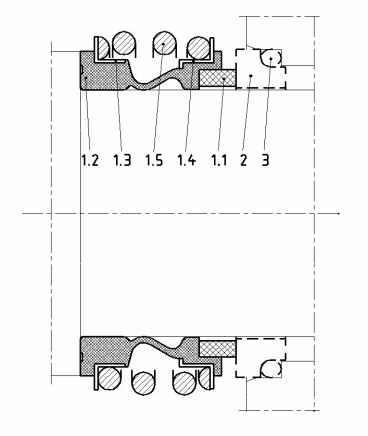
In the following description all figures in parentheses, e.g. (2) define the respective part item no. in fig. 1. The part item no. may vary from those stated in the assembly drawing.

Versions



- **MG12/…**
- **MG13/…**
- **MG1S20/…**
- **RMG12/…**
- **MG1 MULTIPLE M.S.**

The mechanical seal type MG1 can also be used as **multiple mechanical seal** (also in combination with seal types of other series) in **tandem arrangement** with quench (API, plan 52) or as **dual mechanical seal** with barrier fluid (API, plan 53). Consultation with the BURGMANN company is recommended.



ATTENTION! PTFE o-rings or double-PTFE-wrapped o-rings **may** not be used at seat versions **without torsion lock**.

This operating manual applies also to the mentioned seal versions with slight modifications and/or to combinations with seats not stated in this manual.

Seat Versions

Description and function

- **single seal**
- **unbalanced**
- **bi-directional**
- **stationary seat** (2)
- **o-ring** (3)
- **rotating seal face** (1.1)
- **elastomeric bellow** (1.2)
- **cylindrical single spring** (1.5)
- **no glued joints**
- **materials of the sliding parts replaceable**
- **for media containing solids** (e.g. sewage applications)
- **rotating, torsion-free elastomeric bellows** serving as
  - face housing
  - secondary sealing element
  - drive collar
- **torque transmission** from the seal face by means of "L"-rings and a rotating, cylindrical single spring
- **axial movability**
  d_w: 10 … 12 mm ±0,5 mm
  d_w: 14 … 18 mm ±1,0 mm
  d_w: 20 … 26 mm ±1,5 mm
  d_w: 28 … 100 mm ±2,0 mm

Required space, connecting dimensions

The required mounting space for the mechanical seal is decisive for the design of the housing parts by the machine manufacturer. The connecting dimensions have to be checked by the machine manufacturer by means of the BURGMANN drawing before mounting the mechanical seal.

Supply of M.S.

The mechanical seal has to be constantly wetted by liquid medium. The medium to be sealed must not damage the M.S. neither chemically (e.g. corrosion, embrittlement) nor physically (e.g. erosion, abrasion).

For a safe operation of the mechanical seal we recommend to apply **at inboard** the most suitable **type of circulation** described in **API 610 / 682**. This measure protects the seal cavity from deposition of solids.

To operate multiple seals special supply systems are required. Please contact BURGMANN.

Emissions

A mechanical seal is a **dynamic seal** that **cannot be free of leakage** due to physical and technical reasons. Seal design, manufacture tolerances, operating conditions, running quality of the machine, etc. mainly define the leakage value. In fact, compared to other sealing systems there is **few leakage**.

WARNING! If the **medium to be sealed** and/or the **supply liquid** is subject to the **Hazardous Substances Regulation** (GefStoffV), the **instructions for handling dangerous substances** (safety data sheets to EU Directive 91/155/EEC) and the **accident prevention regulations** have be observed.

A possibly increased leakage during start-up will decrease to a normal quantity after the running-in period of the sliding faces.

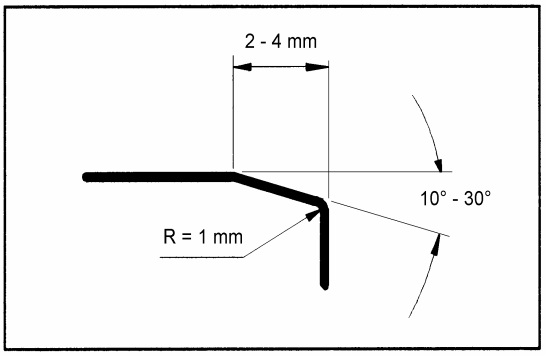
If this is not the case or if there are other malfunctions the mechanical seal has to be shut down, removed and checked for reasons of safety.

The leakage can be liquid or gaseous. Its aggressiveness corresponds to that of the medium to be sealed.

Leakage of mechanical seal at outboard side has to be drained and disposed properly.

IMPORTANT! Components which may get in contact with the leakage have to be corrosion-resistant or have to be adequately protected.

INSTALLATION



Assembly utilities

- ethyl alcohol
- cellulose-tissue (no rag, no cloth!)
- o-ring lifter
- water and washing up liquid
- cardboard discs

Preparation for assembly

ATTENTION! The seal should remain **packed** until the following working steps have been completely **terminated**.

Check the parts of the machine for:

- **chamfered edges**
  (sliding cones i.e. 2 mm / 30° or in accordance with EN 12756)
- radiused transitions
- **mating fits** and o-ring surfaces:
  fine finished **Rz 10 µm** (= N7 = CLA 63)

- **Shaft surface** in the area of the mechanical seal finished according to EN 12756: **Ra = 0.8 µm** (= N6 = CLA 32).
- **Shoulder** or stop device for the bellows of the mech. seal to take up axial forces

Check at the machine:
- damage of connecting surfaces to the M.S.
- mating dimensions, rectangularity and concentricity to the shaft axis.

Run-out accuracy of the shaft (acc. to DIN ISO 5199):
- Shaft diameters up to 50 mm: max. 0.05 mm
- Shaft diameters 50 mm - 100 mm: max. 0.08 mm

- Prepare the place of assembly, take away any not required tool, cuttings, dirty cleaning wool etc.

- Cover the work bench with a piece of clean, non-fibrous cardboard.

Assembly / installation

BURGMANN mechanical seals are super-finished and repeatedly tested machine elements whose handling during assembly in particular of sliding materials and elastomers requires special care during several procedures.

For installation the assembly drawing of mechanical seal has to be observed.

IMPORTANT! The mechanical seal has to be installed under the cleanest conditions and very carefully.

- Unpack the seal and check seal face, seat and elastomer bellows for possible damages.
- ➢ Never place the seal faces or seats on their sliding faces without having covered them adequately.

- Check before starting assembly:
  - ▫ complete availability of all components by means of the drawing
  - ▫ all components have to be clean and in perfect condition.

- Sprinkle the elastomer bellows and the shaft with low-surface-tension water (add washing up liquid) or ethyl alcohol to decrease frictional force during assembly of the seal.

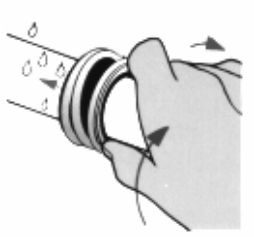
⚠

Oil or grease as assembly agent is not permitted in any case.

ATTENTION! **Do never force** during installation.

ATTENTION! **Avoid unnecessary rotation** of the shaft (damage of the sliding faces is possible).

ATTENTION! **Avoid knocking the seal!** Damage to mechanical seals has an adverse effect on their safe operation.



Possible installation order:

- Feed the **degreased** sealing element (o-ring, rubber cup) onto the seat.

If present:
- At the seat mark the position of the rear slot beside the sliding face.
- Align the seat with the torque transmission pin.

- Cover the sliding face of the seat with a cardboard washer
- Press the seat slowly and without interruption into its position.
  - ➢ Use plenty of water or alcohol as lubricant.
  - ➢ Use a distance sleeve, if necessary.
- Remove the cardboard washer from the sliding face.
- Check the rectangular position of the seat to the shaft axis.

- Mount the seal cover with the seat installed before.
- Clean the sliding faces thoroughly with ethyl alcohol and paper tissues (**no fabric, no cloths!**).
  - ➢ In case of material **"BUKO"** (carbon graphite) wipe it until the paper tissues stay clean.
  - ➢ Do not touch the sliding faces any more with bare fingers.
  - ➢ Mount the sliding faces absolutely dry, dust-free and clean. Do not use any lubricants!

- Push rotating seal unit (bellows unit) with a slow clockwise turn onto the shaft.
- Stick to the dimensions in the assembly drawing!
  - ➢ If necessary use a mounting sleeve.
  - ➢ For long pushing distances add liquid several times.

- Check "L" rings, spring and seal face for correct fit.

- Mount stop device for bellows unit to take up axial forces.
  - ➢ Stick to the dimensions in the assembly drawing **by all means!**

- Further assembly of the machine in accordance with the instructions of the machine manufacturer.

OPERATION

Instructions for safe operation

For a single mechanical seal the **pressure in the seal chamber** (stuffing box pressure) has to be **higher** than the ambient pressure at the machine at any time. Otherwise the machine will **suck in air** via the sliding faces, which will result in **dry-running** and consequent **failure** of the mechanical seal.

Damages due to dry-running are excluded from the warranty.

During every state of operation the mechanical seal has to be constantly wetted by the **medium** to be sealed **in its liquid form**, in particular when the machine is **started** or **stopped**. The machine design has to be such as to take this necessity into consideration.

If the medium to be pumped builds deposits or tends to solidify during cooling down or standstill of the machine the stuffing box has to be flushed with suitable clean liquid. The flow and the liquid should be determined by the user.

If the operation limit values and the instructions given in this manual are followed a trouble-free operation of the mechanical seal can be expected.

Instructions for start up

Safety checks before start up

- Torque transmission between mechanical seal and shaft duly installed
- Supply connections tightened pressure-sealed
- Disposal connections installed environmentally safe

For a safe operation of the mechanical seal we recommend to apply **at inboard** the most suitable **type of circulation** described in **API 610 / 682**. This measure protects the seal cavity from deposition of solids.

- Flood machine and seal cavity (stuffing box) with medium and vent thoroughly.

▫ Now the seal is ready for operation.

SERVICING

Maintenance

A correctly operated mechanical seal needs **low maintenance**. Wear parts, however, have to be replaced, if necessary.

A duly operation includes a regular check of the following parameters:
- Temperature
- Leakage (drainage) rate of the mechanical seal

An inspection of the mechanical seal should be carried out during a revision of the complete plant. We recommend to have this inspection be performed by responsible BURGMANN personnel.

If the mechanical seal is removed during a revision of the plant it has to be replaced by a new one.

Directives in case of failure

Try to define the kind of failure and record it.

- In the event of **excessive leakage**, note changes in the leakage amount and switch the pump off if necessary.
- ➢ If a constant amount is leaking in a steady flow, the mechanical seal is damaged.
- In the event of a **inadmissible temperature rise**, the machine **has to** be stopped for safety reasons.

If there is a **malfunction** which you cannot correct on your own, or if the cause of malfunction is not clearly recognisable please immediately contact the nearest **BURGMANN agency**, a BURGMANN service centre or the BURGMANN headquarters.

During the **warranty period** the BURGMANN mechanical seal must only be disassembled with approval of the manufacturer or when a representative is present.

After-sales service by BURGMANN

BURGMANN's customer service department offers a comprehensive service package covering consultancy, engineering, standardisation, installation, commissioning as well as damage analysis right through to seminars on sealing technology.

Addresses are listed in the known BURGMANN Design Manuals as well as in various other BURGMANN brochures.

Address of headquarters:

Burgmann Industries GmbH & Co. KG
Postfach 1240
D - 82515 Wolfratshausen

Germany

☎ +49 (0) 81 71-23 0
Fax +49 (0) 81 71-23 12 14
www.burgmann.com

Reconditioning (repair)

If **reconditioning** is necessary, the complete **seal** should be sent **to the manufacturer**, as this is the best way to find out which components can be reconditioned or which parts must be replaced in order to ensure an optimum tightness.

If, **for compelling reasons**, **a reconditioning** has to be carried out **on site** (e.g. no. spare seal on stock, long transport, problems with customs) the seal may be repaired in a clean room by **trained** personnel of the user under the direction of **BURGMANN mechanics**.

Disassembly / removal

- Stop the machine as instructed, allow to cool, depressurise and ensure that pressure cannot build up again.
- Work on the M.S. is only permitted when the machine is at a standstill and depressurised.
- There must be no product on the M.S. ⇒ if necessary drain the machine and rinse it out.
- Isolate the machine to prevent it starting up unexpectedly.
- Comply with the safety notes (safety data sheets).

IMPORTANT! When removing, please observe **by all means**:

- current **accident prevention regulations**
- **regulations for handling hazardous substances**

WARNING! Seals that have been used with **hazardous substances must be properly cleaned** so that there is no possible **danger** to people or to the environment.

IMPORTANT! The packaging used to transport the seal must

- be **identified** with the relevant **hazard symbol** and
- **include** the **safety data sheet** for the product and/or supply medium

The order of disassembly to remove the mechanical seal out of the machine depends on the design of the machine and should be determined by the machine manufacturer.

- Remove the seal in the reverse sequence as described for assembly (set up).

Spare parts

- Only BURGMANN original spare parts must be used. Otherwise
  - **Risks** of a seal failure, **endangering** persons and environment.
  - The BURGMANN guarantee for the mechanical seal **lapses**.
- For a quick exchange a complete **spare seal** should be on stock.

Required details for enquiries and orders

For enquiries and orders the following details are required:

- BURGMANN commission no.
- Drawing no. of M.S. **MG1/dw-00**
  dw = specified shaft diameter
- Part item no., designation, material, number of pieces with reference to the drawing.

Address of headquarters product field **FA**
Standard Mechanical Seals

Burgmann Industries GmbH & Co. KG
Postfach 1240

Disposal of the BURGMANN mechanical seal

Usually, the BURGMANN mechanical seals can be easily disposed after a thorough cleaning.

- Metal parts (steels, stainless steels, non-ferrous heavy metals) divided into the different groups belong to scrap metal waste.
- Ceramic materials (synthetic carbons, ceramics, carbides) belong to waste products. They can be separated from their housing materials, as are physiologically recognised as safe.
- Synthetic materials/plastics (elastomers, PTFE) belong to special waste.

CAUTION! Material containing fluorine must not be burnt.

IMPORTANT! Some of the synthetic materials, divided into the different groups can be recycled.

Copyright

The **Burgmann Industries GmbH & Co. KG** (Germany) holds the copyright to this document. Customers and operators of mechanical seals are free to use this document in the preparation of their own documentation. No claims of any type or form can be derived in such instance.

We reserve the right to carry out technical modifications of the product, even if they have not yet been considered in this manual.

Retain These Safety Instructions For Future Use

INSPECTION OF UNIT

Thoroughly inspect the equipment for any shipping and handling damage before accepting shipment from the freight company. If any of the goods called for in the bill of lading or express receipt are damaged or the quantity is short, do not accept until the freight or express agent makes an appropriate notation on your freight bill or express receipt. If any concealed loss or damage is discovered later, notify your freight carrier or express agent at once and request him to make an inspection. We will be very happy to assist you in collecting claims for loss or damage during shipment; however, this willingness on our part does not remove the transportation company's responsibility in reimbursing you for collection of claims or replacement of material. Claims for loss or damage in shipment must not be deducted from the NORD Gear invoice, nor should payment of the NORD Gear invoice be withheld awaiting adjustment of such claims, as the carrier guarantees safe delivery.

If considerable damage has been incurred and the situation is urgent, contact the nearest NORD Gear Sales Office for assistance. Please keep a written record of all communications.

RECORD NAMEPLATE DATA

Locate the gear reducer nameplate and record all nameplate data for future reference.

SK _____ S/N _____

RATIO _____ MAX TORQUE _____ RPM _____ MTG. POS _____

STORAGE

PROPER STORAGE UNTIL INSTALLED

Keep unit in a dry, temperature controlled area. If stored other than said, long term storage methods must be applied to the unit including complete fill with lubricant. Protect machined surfaces and rotate shafts periodically. Prior to putting unit into service, drain lubricant and refill to proper level as determined by the mounting position.

PROPER HANDLING OF THE UNIT

Exercise care to prevent damage to the unit when moving. Lift only at designed lifting points. Do not attach other machinery and lift by the unit lifting points. The lifting points are to be used to lift the unit only. Insure that adequate safety measures are taken to protect personnel during transportation. Protect the mounting surface from damage.

INSTALLATION OF UNIT

To ensure long service and dependable performance, an enclosed gear drive must be rigidly supported and the shafts accurately aligned. The following describes the minimum precautions required to accomplish this end.

FOUNDATION
The responsibility for the design and construction of the foundation lies with the user. The foundation must be adequate to withstand normal operating loads and possible overloads while maintaining alignment to attached system components under such loads.

MOUNTING POSITION
Unless a unit is specifically ordered for inclined mounting, the foundation must be level and flat. The lubrication system may not operate properly if the unit is not mounted in the position for which it is designed. It may be desirable to elevate the foundation to facilitate oil drainage.

CONCRETE FOUNDATION
If a concrete foundation is used, steel mounting pads and bolts of sufficient size to distribute the stress into the concrete should be grouted into the foundation.

STEEL FOUNDATION
If a structural steel foundation is used (i.e. wide flange beams or channels), a base plate or sole plate of suitable thickness should be used and should extend under the entire unit.

FOOT MOUNTED UNITS
Use shims under the feet of the unit to align the output shaft to the driven equipment. Make sure that all feet are supported so that the housing will not distort when it is bolted down. Improper shimming will reduce the life of the unit and may cause failure. Dowel pins may be installed to prevent misalignment and ensure proper realignment if removed for service.

FLANGE MOUNTED UNITS
If a structural steel foundation is used (i.e. wide flange beams or channels), a base plate or sole plate of suitable thickness should be used and should extend under the entire unit. If a bulk head plate is used it should be of proper strength to minimize buckling distortions.

Flange Pilot 'AK' or 'AK1' tolerance
Metric (mm)

> ∅ 50 ≤ ∅ 80 = +0.012/-0.007
> ∅ 80 ≤ ∅ 120 = +0.013/-0.009
> ∅ 120 ≤ ∅ 180 = +0.014/-0.011
> ∅ 180 ≤ ∅ 230 = +0.016/-0.013
> ∅ 230 ≤ ∅ 315 = +0.000-0.032

> ∅ 15.748 ≤ ∅ 19.685 = +0.000/-0.0016

BOLT STRENGTH
Bolt size, strength and quantity should be verified to insure proper torque reaction capacity whatever the mounting arrangement.

PRIME MOVER MOUNTING
Align the prime mover to the reducer-input shaft using shims under the feet. Make sure that the feet are supported. Dowel the prime mover to its foundation.

SHAFT CONNECTIONS
When connecting shafts to either the input or output of the reducer, consider the following instructions.

FITS
Clearance or interference fits for coupling hubs should be in accordance with ANSI/AGMA 9002-A86 or as follows.

Output and Input shaft Diameter tolerance
Metric (mm)

≤ ∅ 18 = +0.012/+0.001

> ∅ 0.938 ≤ ∅ 1.125 = 3/8-16 x 0.9 deep
> ∅ 1.125 ≤ ∅ 1.375 = 1/2-13 x 1.1 deep
> ∅ 1.375 ≤ ∅ 1.875 = 5/8-11 x 1.4 deep
> ∅ 1.875 ≤ ∅ 3.250 = 3/4-10 x 1.7 deep
> ∅ 3.250 = 1-8 x 2.2 deep

Outboard pinion and sprocket fits should be as recommended by the pin sprockets with interference fits should be heated according to the manufacturer's recommendations, generally 250°F to 300°F, (120°C to 150° C) before assembling to the shaft.

LOCATION
Coupling hubs should be mounted flush with the shaft ends, unless specifically ordered for overhung mounting. Pinions, sprockets and sheaves should be mounted as close as possible to the unit housing to minimize bearing loads and shaft deflections.

COUPLING ALIGNMENT
Shaft couplings should be installed according to the coupling manufacturer's recommendations for gap, angular and parallel alignment. In many installations, it is necessary to allow for thermal and mechanical shaft movement when determining shaft alignment. The coupling manufacturer's recommendations should be followed.

AXIAL DISPLACEMENT
The gap between shaft ends should be the same as the specified coupling gap unless overhung mounting of the coupling hub is specified. The coupling gap and shaft gap must be sufficient to accommodate any anticipated thermal or mechanical axial movement.

ANGULAR ALIGNMENT
Insert a spacer or shim stock equal to the required coupling gap between the coupling hub faces and measure the clearance using feeler gauges. Repeat this at the same depth at 90-degree intervals to determine the amount of angular misalignment.

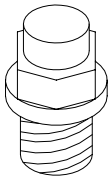
PARALLEL ALIGNMENT
Mount a dial indicator to one coupling hub, and rotate this hub, sweeping the outside diameter of the other hub. The parallel misalignment is equal to one-half of the total indicator reading. Another method is to rest a straight edge squarely on the outside diameter of the hubs at 90-degree intervals and measure any gaps with feeler gauges. The maximum gap measurement is the parallel misalignment.

CHECKING ALIGNMENT
After both angular and parallel alignments are within specified limits, tighten all foundation bolts securely and repeat the above procedure to check alignment. If any of the specified limits for alignment are exceeded, realign the coupling.

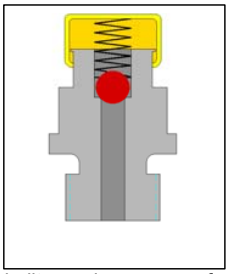
SPROCKET OR SHEAVE ALIGNMENT
Align the sheaves or sprockets square and parallel by placing a straight edge across their faces. Alignment of bushed sheaves and sprockets should be checked after bushings have been tightened. Check horizontal shaft alignment by placing a level vertically against the face of the sheave or sprocket. Adjust belt or chain tension per the manufacturer's specified procedure.

OUTBOARD PINION ALIGNMENT
Align the pinion by adjusting the gear tooth clearance according to the manufacturer's recommendations and checking for acceptable outboard pinion tooth contact. The foundation bolts may have to be loosened and the unit moved slightly to obtain this contact. When the unit is moved to correct tooth contact, the prime mover should be realigned.

RECHECK ALIGNMENT
After a period of operation, recheck alignment and adjust as required.



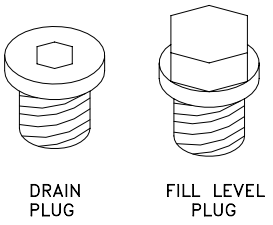
1. Properly install unit on a rigid foundation
   - adequately supported
   - securely bolted into place
   - leveled so as not to distort the gear case
2. Properly install couplings suitable for the application and connected equipment.
3. Ensure accurate alignment with other equipment.
4. Furnish and install adequate machinery guards as needed to protect operating personnel and as required by the applicable standards of the Occupational Safety and Health Administration (OSHA), and by other applicable safety regulations;
5. Ensure that driving equipment is running in the correct direction before coupling to reducers with backstops (designed to operate only in a specific direction) or machinery designed to operate only in one direction.



CHANGES IN PERFORMANCE SPECIFICATIONS
Owner has the responsibility to consult with NORD GEAR if such items such as applied loads, operating speeds or other operating conditions have changed.

WARNING:
LOCK OUT POWER before any maintenance is performed. Make absolutely sure that no voltage is applied while work is being done on the gearbox.

START-UP
1. Ensure that switches, alarms, heaters, coolers and other safety and protection devices are installed and operational for their intended purpose.
2. Verify that the installed mounting position is the same as the nametag mounting position. If not, adjust the oil level accordingly and relocate the vent plug, fill plug and drain plug according to the mounting position. See following.



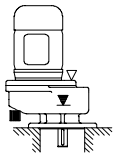
AUTOVENT PLUG
The Autovent plug is brass in color and will be located at the highest point on the gearbox. It operates like a check-valve to allow the reducer to relieve internal pressure while preventing lubricant contamination during cooling. A spring presses a ball or plunger against a machined orifice until pressure exceeds 2 psi. Above 2 psi the air is allowed to escape depressurizing the gearcase. When internal pressure drops below 2 psi, the autovent re-seals closing the unit to the outside environment. After shutdown, the reducer cools along with the air inside the reducer. The unit will temporarily maintain a slight vacuum until normalization occurs. NORD Gear supplies an Autovent as a standard feature.

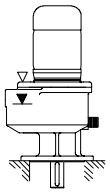
AUTOVENT PLUG

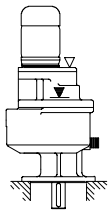
The Autovent releases built-up air pressure from inside the gearbox (Max. pressure 2 psi).

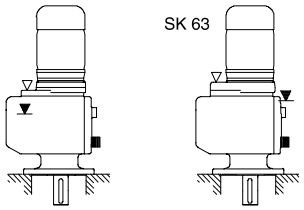
FILL LEVEL & DRAIN PLUGS
The drain plugs are metric socket head cap screws. They will be located at the lowest part of the gearbox for ease of draining. The fill level plug is a hex head cap screw. It will be located between the Autovent and drain plug. Both types of plugs will have gaskets included to prevent oil from leaking.

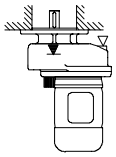
Two types of plugs for maintenance

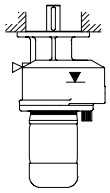


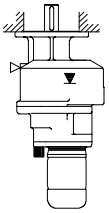


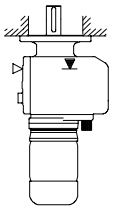


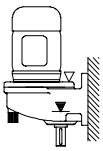


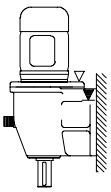


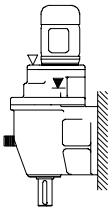


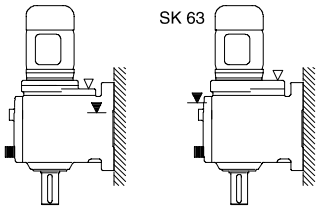


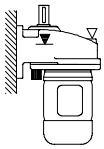


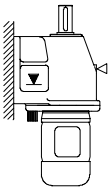


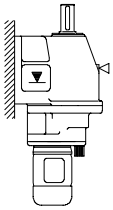


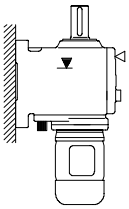












LUBRICANT
All NORD reducers are shipped from the factory properly filled with lubricant and all plugs are installed according to the mounting position given on the reducer nametag. Acceptable oil fill level is within ½ inch of the bottom of the fill plug threads.

OPERATION AND MAINTENANCE CHECKLIST
1. Operate the equipment as it was intended to be operated
2. Do not overload.
3. Run at correct speed.
4. Maintain lubricant in good condition and at proper level.
5. Dispose of used lubricant in accordance with applicable laws and regulations.
6. Apply proper maintenance to attached equipment at prescribed intervals recommended by the manufacturer.
7. Perform periodic maintenance of the gear drive as recommended by NORD.

MOUNTING POSITIONS

These charts detail the mounting positions for horizontal and vertical mounting. The Autovent, oil fill plug and drain plug are indicated on each mounting position picture. The factory set mounting position and plug locations match that shown on the gearbox nametag. For mounting orientations other than shown consult NORD Gear.

MAINTENANCE

Mineral lubricant should be changed every 10,000 service hours or after two years. For synthetic oils, the lube should be changed every 20,000 service hours or after four years. In case of extreme operating (e.g. high humidity, aggressive environment or large temperature variations), shorter intervals between changes are recommended.

OIL SPECIFICATIONS

NORD supplies all reducers filled with oil from the factory. Consult the sticker adjacent to the fill plug to determine the type of lubricant installed at the factory. Standard lubricant is ISO VG220 mineral-based oil. However, some units have special lubricants designed to operate in certain environments or to extend the service life of the lubricant. If in doubt about which lubricant is needed, contact NORD Gear.

-40 to 230°F (-40 to 110°C)	*Food Grade* - Synthetic	Lubriplate	SFL1

LUBRICANT CAPACITY

Each reducer has the oil level and oil quantity adjusted according to the mounting position shown in the tables. When replacing the oil, consult the tables below to determine the proper amount of oil to be installed according to the reducer size and mounting position. Note that this is approximate and the final level will be adjusted when the reducer is installed. Acceptable oil fill level is within ½ inch of the bottom of the fill plug threads.

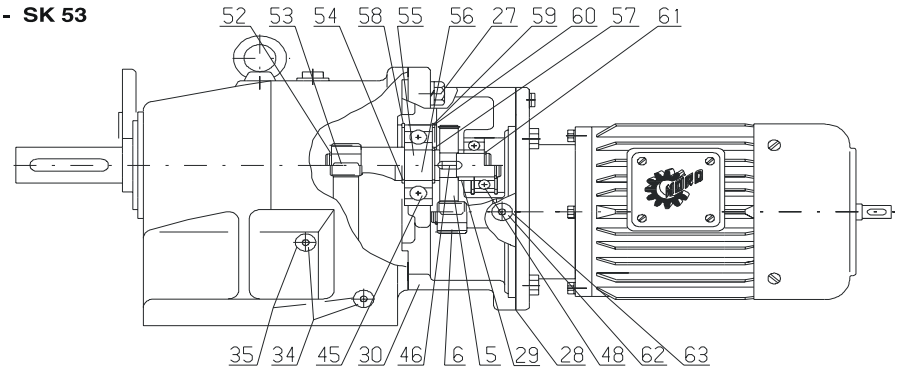
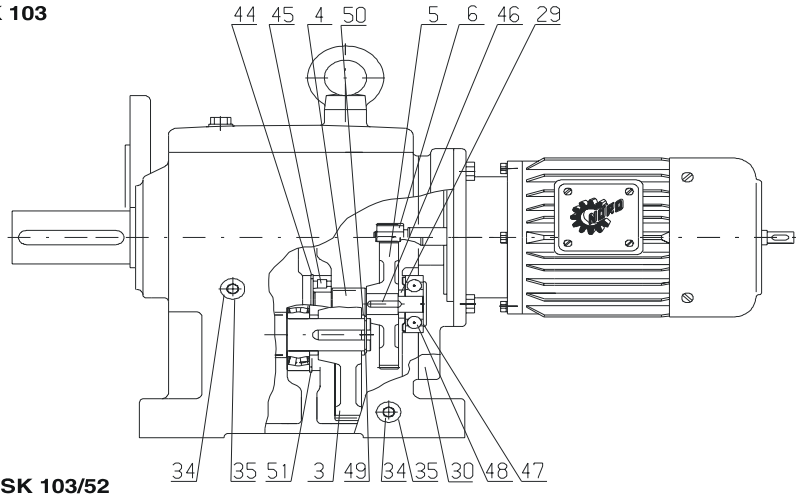
RECOMMENDED SPARE PARTS



Bearings – *all* Gaskets – *all* Shims – *all*
Seals – *all* Seal Plugs – *all*

IMPORTANT!



When ordering parts, it is necessary to have the ***NORD SERIAL NUMBER*** from the unit the parts are for. The serial number will dictate the correct parts for that particular unit. The gearbox nameplate will have the serial number on it.

NOTES

TROUBLE SHOOTING

PROBLEM WITH THE REDUCER		POSSIBLE CAUSES	SUGGESTED REMEDY
Runs Hot	Overloading	Load exceeds the capacity of the reducer	Check rated capacity of reducer, replace with unit of sufficient capacity or reduce load
	Improper lubrication	Insufficient lubrication	Check lubricant level and adjust up to recommended levels
		Excessive lubrication	Check lubricant level and adjust down to recommended levels
		Wrong lubrication	Flush out and refill with correct lubricant as recommended
Runs Noisy	Loose foundation bolts	Weak mounting structure	Inspect mounting of reducer. Tighten loose bolts and/ or reinforce mounting and structure
		Loose hold down bolts	Tighten bolts
	Worn RV Disc	Overloading unit may result in damage to disc	Disassemble and replace disc. Recheck rated capacity of reducer.
	Failure of Bearings	May be due to lack of lubricant	Replace bearing. Clean and flush reducer and fill with recommended lubricant.
		Overload	Check rated capacity of reducer.
	Insufficient Lubricant	Level of lubricant in the reducer not properly maintained.	Check lubricant level and adjust to factory recommended level.
Output Shaft Does Not Turn	Internal parts are broken	Overloading of reducer can cause damage.	Replace broken parts. Check rated capacity of reducer.
		Key missing or sheared off on input shaft.	Replace key.
		Coupling loose or disconnected.	Properly align reducer and coupling. Tighten coupling.
Oil Leakage	Worn Seals	Caused by dirt or grit entering seal.	Replace seals. Autovent may be clogged. Replace or clean.
		Overfilled reducer.	Check lubricant level and adjust to recommended level.
		Autovent clogged.	Clean or replace, being sure to prevent any dirt from falling into the reducer.
		Improper mounting position, such as wall or ceiling mount of horizontal reducer.	Check mounting position. Name tag & verify with mounting chart in manual.

INSTALLER: PLEASE LEAVE THIS MANUAL FOR THE OWNER'S USE
OWNER: READ AND SAVE THESE INSTRUCTIONS

SAFETY INSTRUCTIONS

⚠ This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

⚠ WARNING
Before installing, using, or servicing this product, carefully read and fully understand the instructions including all warnings, cautions, & safety notice statements. To reduce risk of personal injury, death and/or property damage, follow all instructions for proper motor installation, operation and maintenance.

These instructions are not intended as a complete listing of all details for installation, operation, and maintenance. If you have any questions concerning any of the procedures, STOP, and call the appropriate Regal-Beloit motor company.

    - 3.4.5.3 Jogging and/or repeated starts

4.0 MAINTENANCE
- 4.1 General Inspection

4.1.1 Ventilation
4.1.2 Insulation
4.1.3 Electrical Connections
4.2 Lubrication and Bearings
4.2.1 Grease Type
4.2.2 Bearing Operating Temperature
4.2.3 Lubrication Interval
4.2.4 Lubrication Procedure
4.2.5 Lubrication Example
4.3 Trouble Shooting
4.3.1 General Trouble-Shooting Warnings
4.3.2 Trouble-Shooting Cause / Corrective Action

motor is suitable for use on Pulse Width Modulated (PWM) type VFD power. In addition, the nameplate must be marked with the inverter rating; for example, "2:1 CT", "2 to 1 Constant Torque", etc.

1.0 INSTALLER/OWNER/OPERATOR RESPONSIBILITY:

1.1 ELECTRICAL SAFETY

WARNING: ELECTRICAL SHOCK HAZARD

Electrical connections shall be made by a qualified electrical personnel in accordance with all applicable codes, ordinances and sound practices. Failure to follow these instructions could result in serious personal injury, death and/or property damage. Only qualified personnel who are familiar with the applicable National Code (USA = NEC) and local codes should install or repair electrical motors and their accessories.

WARNING: ELECTRICAL LIVE CIRCUIT HAZARD

Do not touch electrically live parts. Disconnect, lockout and tag input power supply before installing or servicing motor (includes accessory devices). Use a voltmeter to verify that power is off before contacting conductors.

WARNING: ELECTRICAL GROUNDING HAZARD

Failure to properly ground motors, per the National Electrical Code (NEC) Article 430 and local codes may cause serious injury or death to personnel. For general information on grounding refer to NEC Article 250. (Also see "Ground Connections section 3.4.4").

WARNING: AUTOMATIC RESET PROTECTOR HAZARD

Do not use automatic reset protectors if automatically restarting the motor will place personnel or equipment at risk. . Failure to follow this instruction could result in serious personal injury, death and/or property damage

WARNING: MANUAL RESET PROTECTOR HAZARD

If a tripped manual reset thermal protector is exposed to a temperature less than –7°C (20°F) it may reset and restart the motor automatically. If an application requires a motor with a manual reset thermal protector that will be operated at temperatures less than –7°C (20°F) contact the manufacturer to review the application / motor requirements. Failure to follow this instruction could result in serious personal injury, death and/or property damage

1.2 MECHANICAL SAFETY

WARNING: LOOSE PARTS HAZARD

Before starting the motor, remove all unused shaft keys and loose rotating parts to prevent them from flying off. Failure to follow these instructions could result in serious personal injury, death and/or property damage.

WARNING: ROTATING PARTS HAZARD

Keep extremities, hair, jewelry and clothing away from moving parts. Failure to follow these instructions could result in serious personal injury, death and/or property damage.

1.3 ENVIRONMENTAL SAFETY

WARNING: HAZARDOUS LOCATIONS

(1) The NEC and the local authority having jurisdiction must be consulted concerning the installation and suitability of motors for use in Hazardous Locations. The local authority having jurisdiction must make the final determination of what type of motor is required. The application and operation is beyond the control of the motor manufacturer.

(2) Division 1 Hazardous Locations motors can only be modified or reworked by the manufacturer or a facility that is Listed under UL's category "Motors and Generators, Rebuilt for use in Hazardous Locations". Failure to follow these instructions could result in serious personal injury, death and/or property damage.

(3) Do not use a Hazardous Locations motor with a Variable Frequency Drive (VFD) unless the motor nameplate specifically states that the

2.0 RECEIVING AND INSPECTION

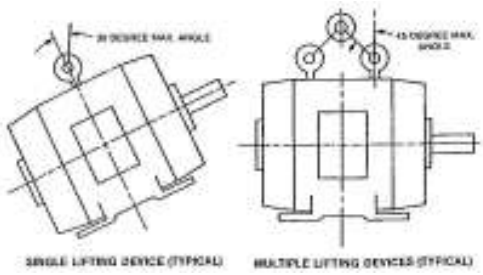
2.1 INITIAL INSPECTIONS

2.1.1 CHECK PACKING LIST AND INSPECT the packaging to make certain no damage has occurred in shipment. If there is visible damage to the packaging, unpack and inspect the motor immediately. Claims for any damage done in shipment must be made by the purchaser against the transportation company.

2.1.2 TURN MOTOR SHAFT by hand to be certain that it rotates freely. Note: Shaft seals and bearing seals may add drag.

2.1.3 CHECK NAMEPLATE for conformance with purchase order requirements and compliance with power supply and control equipment requirements.

2.2 HANDLING:



WARNING: FALLING OBJECT HAZARD

Eyebolts or lifting lugs, where provided, are intended for lifting only the motor and accessories mounted by the motor manufacturer (unless specifically stated otherwise on the motor). Utilizing the motor lifting provision to lift other components such as pumps and gear boxes could result in serious personal injury, death and/or property damage.

WARNING: FALLING OBJECT HAZARD

Before using the lifting provision, check the eyebolts and/or other lifting means to assure they are not bent or damaged and are completely threaded, seated & secured to the motor. Equipment to lift motor must have adequate lifting capacity. While lifting the motor DO NOT stand under or in the vicinity of the motor. Failure to follow these instructions could result in serious personal injury, death and/or property damage.

2.2.1 LIFTING ANGLE LIMITATIONS

2.3 STORAGE: Motors, not put into service immediately, must be stored indoors in a clean, dry location. Avoid locations with large temperature swings that will result in condensation. Motors must be covered to eliminate airborne dust and dirt. If the storage location exhibits high vibration, place isolation pads under motor to minimize damage to motor bearings.

2.3.1 BEARING LUBRICATION: Bearings are grease packed at the factory; relubrication upon receipt of motor or while in storage is not necessary. If stored more than one year, add grease per lubrication instructions (Table 4-4) before start-up.

2.3.2 SHAFT ROTATION: It is recommended that the motor shaft be rotated 5 to 10 rotations every three months to distribute the grease in the bearings. This will reduce the chance for corrosion to form on the bearing rolling elements and raceways. Note: Shaft seals and bearing seals may add drag.

2.3.3 DAMP OR HUMID STORAGE LOCATIONS: Treat unpainted flanges, shafts, and fittings with a rust inhibitor. Apply appropriate power to the motor's space heaters (if so equipped)

3.0 INSTALLATION AND OPERATION

⚠ **WARNING:** Only qualified personnel who are familiar with the appropriate national code, local codes and sound practices should install or repair electrical motors and their accessories. Installation should conform to the appropriate national code as well as local codes and sound practices. Failure to follow these instructions could result in serious personal injury, death and/or property damage.

⚠ **WARNING: ELECTRICAL LIVE CIRCUIT HAZARD**
Do not touch electrically live parts. Disconnect, Lockout and Tag input power supply before installing or servicing motor (includes accessory devices). Use a voltmeter to verify that power is off before contacting conductors.

3.1 LOCATION

3.1.1 SELECTING A LOCATION: Consideration should be given to environment and ventilation. Motors should be installed in an area that is protected from direct sunlight, corrosives, harmful gases or liquids, dust, metallic particles, and vibration. A motor with the proper enclosure for the expected operating condition should be selected. Provide accessible clearance for cleaning, repair, service, and inspections (See section 3.1.3 for construction clearances). The location should be considered for possible future motor removal / handling. The free flow of air around the motor should not be obstructed.

3.1.2 AMBIENT TEMPERATURE LIMITS: The ambient temperatures of the air inlet to the motor should not exceed 40°C (104°F) or be less than -30°C (-22°F) unless the motor nameplate specifically states an ambient temperature outside of these limits. The ambient inside an enclosure built around the motor shall not exceed the nameplate ambient. For ambient temperatures outside of these limits consult the motor manufacturer.

⚠ **CAUTION: INSULATION DEGRADATION WARNING**
Insulation at high temperatures ages at an accelerated rate. Each 10°C increase in temperature reduces the insulation life by one half.

⚠ **WARNING: HAZARDOUS LOCATIONS AMBIENT LIMIT:** Division 1 Hazardous Locations motors shall **NOT** be operated below –25°C (-13°F) ambient. (Low temperatures reduce the component mechanical properties.)

3.1.3 CONSTRUCTION SELECTION per LOCATION:

3.1.3.1 DRIPPROOF (OPEN) MOTORS are intended for use indoors where the atmosphere is relatively clean, dry, and non-corrosive. Recommended a minimum clearance of ½ the shaft height between vent openings and the nearest obstruction.

3.1.3.2 TOTALLY ENCLOSED MOTORS are suitable for indoor or outdoor standard service applications.

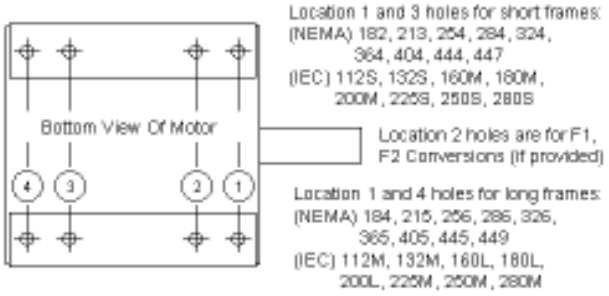
TEAO or AOM (Totally Enclosed Air Over) motors must be mounted in the air stream. When the motor nameplate states a minimum airflow the motor must be mounted in an air stream meeting this minimum value.

TEFC (Totally Enclosed Fan Cooled) motors must meet a minimum distance of ½ the shaft height between the fan guard grill openings and the nearest obstruction.

3.1.3.3 HAZARDOUS LOCATIONS MOTORS: Hazardous Locations motors are intended for installations in accordance with NEC Article 500. For all installations involving Hazardous Locations motors, consult the applicable national codes, local codes, and the authority having jurisdiction.

Division 1 Installations – includes Class I & II: Use only motors that are UL Listed and CSA Certified or UL Listed and UL Certified for Canada. These motors bear a separate nameplate that includes the UL Listing Mark and CSA Certification Mark or includes the UL Listing Mark and the UL Mark for Canada. This plate also bears the phrase: " Electric motor for Hazardous Locations" and is marked with the Class, Group and Operating Temperature Code.

Division 2 Installations – Class I only: Use only motors that are CSA Certified and bear the CSA Certification Mark. These motors include a phrase on the main motor nameplate that indicates the motor is CSA Certified for Class I, Division 2 / Zone 2 locations.



Division 2 Installation – Class II only: Use only Class II motors as described above under "Division I Installations".

⚠ **WARNING: EXPLOSION HAZARD**
A motor should never be placed in an area with a hazardous process or where flammable gases or combustible materials may be present unless it is specifically designed and nameplated for this type of service. Hazardous Locations motors are intended for installations in accordance with NEC Article 500. For all installations involving Hazardous Locations motors, consult the NEC, local codes, and the authority having jurisdiction. Failure to follow these instructions could result in serious personal injury, death and/or property damage. (For other limitations see section 1.3)

3.2 MOUNTING MOTOR:

3.2.1 RIGID BASE (FOOTED): The motor must be securely installed to a rigid foundation or a mounting surface to minimize vibration and maintain alignment between the motor shaft and the load's shaft. The mounting surfaces of the four mounting pads must be flat within 0.01 inches for 210 frame & smaller; 0.015 inches for 250 frame & larger. [IEC 0.25 mm for 130 frame & smaller, 0.38 mm for 160 frame & larger]. This may be accomplished by shims under the motor feet. For special isolation mounting, contact manufacturer for assistance

3.2.2 RIGID BASE HOLE SELECTION -6 OR 8 HOLES

3.2.3 VERTICAL MOUNTING:

CAUTION: ENCLOSURE PROTECTION CAUTION: Most Dripproof rigid base (footed) motors do **NOT** meet "Dripproof" requirements when mounted vertically. If the motor is located in unprotected environments, the addition of a drip cover may be available. Drip covers not available for cast iron rigid base motors.

⚠ **WARNING: FALLING OBJECT HAZARD**
The lifting provision on standard horizontal footed motors is not designed for lifting the motor in a vertical shaft up or shaft down position. (see 2.2.1 lifting angles). Lifting method / provisions for

mounting a rigid base (footed) motor vertically is the responsibility of the installer.

VERTICAL SHAFT DOWN: Most standard horizontal motors thru 449 Fr. (excluding brake motors) can be mounted in a vertical shaft down orientation. For vertical brake motors see section 3.3.6.2.

VERTICAL SHAFT UP:

WARNING: HAZARDOUS LOCATIONS VERTICAL MOUNT: Hazardous locations motors must **NOT** be mounted vertically shaft up without approval by the motor manufacturer. Without proper retaining provisions the rotor may move axially and contact components, creating a spark hazard.

Belted or Radial Load when mounted vertically: The following frame sizes / constructions with applied (axial) down loads within the limit stated are acceptable when mounted vertical shaft up.

Table 3-1 Belted or Radial Load Applications (All speeds)

Frame Size	Enclosure	Construction	Shaft Up OK	Max Applied Down Load[3]
56	TEFC & ODP	Steel	Yes	25 lbs
140	TEFC	Steel & Cast Iron	Yes	25 lbs
	ODP	Steel	Yes	25 lbs
180	TEFC	All	Yes	35 lbs
	ODP	Steel	Yes	35 lbs
210	TEFC	All	Yes	40 lbs
	ODP	Steel	Yes	40 lbs
250	TEFC	All	Yes	40 lbs
	ODP	Steel	Yes	40 lbs
		Cast Iron	No[2]	N/A
280-320	320 TTFC models	Cast Iron	Eng[1]	N/A
	All Other TEFC	Cast Iron & Aluminum	Yes	30 lbs
	ODP	Cast Iron	No[2]	N/A
	TEFC & ODP	Steel	Build Up Only[4]	N/A
360 & Up	TEFC	Cast Iron	Build Up Only[4]	N/A
	ODP	Cast Iron	No[2]	N/A
	TEFC & ODP	Steel	Build Up Only[4]	N/A

Notes:

1 For TEFC model numbers beginning with 324TTFC or 326TTFC consult the motor manufacturer to determine if a build up motor is required.

2 The max applied down load is any applied load external to the motor, including such things as sheave weight, fan loads, axial belt force, pump load, etc. If the application is direct drive with no applied radial load, consult the motor manufacturer.

3 "Build-up only", refers to motors that are specifically ordered and built for shaft up applications. It does not imply that all build-up motors are suitable for shaft up applications.

3.3 APPLICATION ASSEMBLY TO MOTOR:

CAUTION: EQUIPMENT DAMAGE:
Do not connect or couple motor to load until correct rotational direction is established.

3.3.1 GENERAL: PROPER ALIGNMENT of the motor and driven equipment minimizes vibration levels, maximizes bearing life, and extends the overall life of the machinery. Consult the drive or equipment manufacturer for more information.

CAUTION: BEARING FAILURE
During assembly do NOT force components onto the shaft. Striking or hammering the component may result in bearing damage.

3.3.2 DIRECT COUPLING: Use flexible couplings if possible. For applications that apply radial, axial or moment loading on the motor shaft see section 3.3.3.

CAUTION: BEARING FAILURE
Unless approved by the motor manufacturer do **NOT** direct couple a vertical shaft up or roller bearing motor. Direct coupling a vertical shaft up motor or a motor with a roller bearing may result in bearing damage.

3.3.3 DIRECT CONNECTED: Radial loading for direct connected equipment (gears, fans etc.) must be approved by the motor manufacturer unless within the maximum overhung load limits (Table 3-2). Combined loading (axial, radial and/or moments) must be approved by motor manufacturer. For belted loads see section 3.3.4.

Table 3-2 Maximum Radial Load (lbf) @ Middle of the Shaft Extension Length

Frame Number	Motor Rated RPM			
	3600	1800	1200	900
143T	106	166	193	210
145T	109	170	199	218
182T	187	230	261	287
184T	193	237	273	301
213T	319	317	470	510
215T	327	320	480	533
254T	500	631	729	793
256T	510	631	736	820
284T	-	866	990	1100
286T	-	871	1005	1107
324T	-	950	1100	1215
326T	-	950	1113	1230
364T	-	1078	1365	1515
365T	-	1078	1380	1540
404T	-	1388	1590	1762
405T	-	1400	1610	1780
444T	-	1580	1795	2005
445T	-	1520	1795	1985
447T	-	1455	1765	1985
449T	-	1640	1885	2130

Values based on 26,280 hrs B-10 Life
For "End of Shaft" Load multiply value by 0.88
To convert from lbf to N multiply value by 4.4482.

3.3.4 BELTED:

The goal of any belted system is to efficiently transmit the required torque while minimizing the loads on the bearings and shafts of the motor and driven equipment. This can be accomplished by following four basic guidelines:

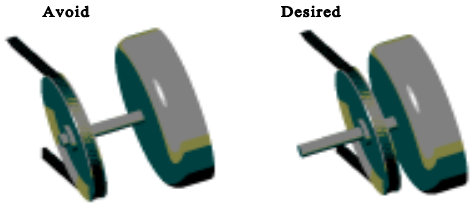
1. Use the largest practical sheave diameter.
2. Use the fewest number of belts possible.
3. Keep sheaves as close as possible to support bearings.
4. Tension the belts to the lowest tension that will still transmit the required torque without slipping. It is normal for V-belts to squeal initially when line starting a motor

3.3.4.1 Sheave Diameter Guidelines:

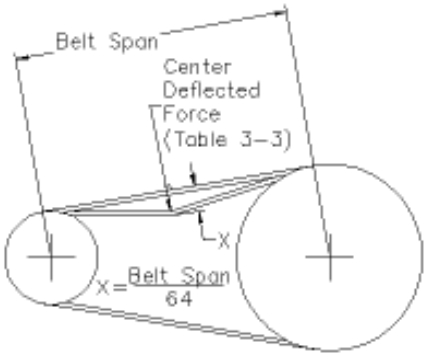
In general, smaller sheaves produce greater shaft stress and shaft deflection due to increased belt tension. See Table 3-3 for recommended minimum sheave diameters. Using larger sheaves increases the contact with belts which reduces the number of belts required. It also increases the belt speed, resulting in higher system efficiencies. When selecting sheaves, do not exceed the manufacturer's recommended maximum belt speed, typically 6,500 feet per minute for cast iron sheaves. Determine belt speed by the following formula:

Figure 1

$$\textbf{BELT SPEED (Ft/min)} = \frac{Shaft\ RPM\ x\ 3.14\ x\ Sheave\ Dia\ (inches)}{12}$$



3.3.4.2 Number of Belts



In general, use the fewest number of belts that will transmit the required torque without slipping. See Table 3-3 for recommended maximum number of belts. Each belt adds to the tension in the system, which increases load on the shafts and bearings. Belts are most efficient when operated at or near their rated horsepower.
If the sheaves have more grooves than the number of belts required, use the grooves closest to the motor.

3.3.4.3 Sheave Location

Install sheaves as close to the housing as possible to increase the bearing life of the motor and driven equipment

Figure 2

3.3.4.4 Belt Tension

CAUTION: Equipment Failure Caution
Belt tensioning by feel is **NOT** acceptable. Tensioning by "feel" can be very misleading, and can damage motor and equipment.
It is normal for V-belts to squeal initially when line starting a motor.

In general, belt tensions should be kept as loose as possible while still transmitting the required torque without slipping. Belt tensions must be measured with a belt tension gage. These inexpensive gages may be obtained through belt manufacturers, or distributors.

Proper belt tension is determined by measuring the force required to deflect the center of the belt a given distance. The proper deflection (in inches) is determined by dividing the belt span in inches by 64. Calculate the proper deflection and then see Table 3-3 for the required “Deflected Force” to achieve that deflection.
After tensioning the belt, rotate the sheaves for several rotations or operate the system for a few minutes to seat belts into the grooves, then re-tension the belts. New belts will stretch during use, and should be retensioned after the first eight hours of use.

Table 3-3 Recommended Minimum Sheave Diameters, Belt Type, Number of Belts and Deflected Force

Motor Hp	1200 rpm				1800 rpm				3600 rpm			
	Min Sheave Dia (in)	Belt Type	Max # of Belts	Avg. Deflected Force (lbs)	Min Sheave Dia (in)	Belt Type	Max # of Belts	Avg. Deflected Force (lbs)	Min Sheave Dia (in)	Belt Type	Max # of Belts	Avg. Deflected Force (lbs)

700					19.0	8V	12	27.3				
800					20.0	8V	13	28.2				

Contact Motor Manufacturer when Belting 3600 rpm Motors Greater than 25 HP

Notes:

1. Horsepower is the nameplate motor horsepower, and RPM is the motor (driver) speed.
2. Minimum sheave diameters are from NEMA standards where applicable.
3. **For variable speed applications or values outside these recommendations, consult motor manufacturer.**
4. Selections are based on a 1.4 service factor, 5 to 1 speed ratio and various Power Transmission Manufacturers' catalogs.
5. These selections are for Narrow V-belt sections only. Consult manufacturer for details on conventional V-belt sections (A, B, C, D and E), or other belt types.
6. "Average Deflected Force is per section 3.3.4.4 of this document and is the force required to deflect the center of a belt 1/64 of the belt span distance. Tolerance on this force is ±1 lbf for forces ≤10 lbs, and ±2 lbs for forces >10 lbs as measured utilizing a belt tension gage.
7. When more than one belt is required the belts must be a matched set (matched for length).
8. If possible, the lower side of the belt should be the driving side to increase the length of wrap on the sheave).
9. For belted loads do not exceed 125% of 60 Hz operating RPM.

3.3.5 VFD (Variable Frequency Drives) OPERATION:

⚠ WARNING: VFD Motors with Reset Thermal Protectors
UL Recognition, UL Listing, or CSA certification does not apply to motors that are equipped with a manual or automatic reset thermal protector when the motor is operated on VFD power.

⚠ WARNING: Power Factor Correction Capacitors:
Power factor correction capacitors should never be installed between the drive and the motor.

⚠ CAUTION: VFD / Motor Setup:
It is the responsibility of the startup personnel during set up of the VFD / motor system to properly tune the drive to the motor for the specific application per the VFD user manual. The correct voltage boost and volts per hertz settings are application dependent and unique to each motor design. Failure to connect over temperature devices (when provided) will void the warranty.

3.3.5.1 Overspeed Capability:

Belted loads: Do not exceed 125% of 60 Hz operating RPM.

Table 3-4 Maximum Safe Continuous Speed (RPM) For Coupled and Direct Connected Loads

NEMA / [IEC] Frame Size	2-Pole	4, 6, or 8 Pole
56-180 [80-110]	7200 *	5400 *
210-250 [130-160]	5400 *	4200*
280 [180]	5400 *	3600
320 [200]	4500 *	3600
360 [225]	4500 *	2700
400-440 [250-280]	3600	2700
>440 [>280]	3600	1800

* = Fan cooled motors (Totally Enclosed & Hazardous Locations Motors) are limited to a maximum safe continuous speed of 4000 RPM **For higher speeds or shortened duty cycle contact motor manufacturer**

3.3.5.2 Cable Lengths: For optimum insulation life, limit VFD to motor cable lengths of general purpose motors

to Table 3-5 values. Definite purpose VFD motors may accommodate longer cable lengths. For additional information contact motor manufacturer.

Table 3-5 Max Cable Lengths General Purpose Motors
These values are based on 3 kHz carrier frequency. Add suitable VFD output-side filters when exceeding the listed values.

Frame Size	230V	460 V	575 V
NEMA 56-320	600 ft.	125 ft.	40 ft.
NEMA 360-5011	1000 ft.	225 ft.	60 ft.
IEC 80-200	180 m.	40 m.	12 m.
IEC 225-280.	300 m.	70 m.	18 m.

3.3.5.3 VFD Grounding: Equipment grounding conductors may be run in the same conduit as the AC motor power leads. This wire must be used as the equipment ground for the motor and not as the fourth current carrying wire of a "WYE" motor circuit. The grounded metal conduit carrying the output power conductors can provide EMI shielding, but the conduit does not provide an adequate ground for the motor; a separate grounding conductor must be used. Grounding the motor neutral (WYE) of a VFD powered motor may result in a VFD ground fault trip. Improper grounding of an inverter fed motor may result in frame voltages in excess of 500 Volts. Refer to Grounding section 3.4.4

3.3.5.4 VFD – Single Phase:

CAUTION: SINGLE PHASE MOTOR FAILURE:
Single Phase motors are **NOT** suitable for use on VFD power. Connecting a Single Phase Motor to a VFD voids the warranty.

3.3.5.5 Stray Voltage on Accessory Leads:

VFD's will couple stray (common-mode) voltage to motor-mounted RTDs, thermistors, thermostats and space heaters. The leads of these elements must be properly insulated and control input circuits must be designed to withstand this common-mode voltage.

3.3.6 ACCESSORIES / PROVISIONS:

3.3.6.1 General: Carefully read and understand the accessory manufacturer's instructions, supplied with motor. Contact the manufacturer for additional information.

3.3.6.2 Brake Motors:

CAUTION: Vertical Motor Premature Brake Failure
Motors with brakes that are designed for vertical applications are equipped with springs to support the brake pressure plate. Mounting a horizontal brake motor vertically shaft up or down may require a pressure plate spring modification. Failure to modify the brake for the vertical application may result in premature brake failure. If in question, consult brake literature or brake manufacturer.

Brake Solenoid Wiring: Do NOT connect the brake solenoid to the output of a VFD. The brake solenoids must be wired to 50/60 Hz line power

3.3.6.3 Space Heaters:

Motors provided with space heaters have two leads that are brought into the conduit box or into an auxiliary box. These leads are marked "H1", "H2" ("H3", "H4" if a second space heater is supplied). See the space heater nameplate on motor for heater rating.

WARNING: DIVISION 2 EXPLOSION HAZARD
The space heater temperature rating when used in Class I, Division 2 motors shall **NOT** exceed 80% of the auto ignition temperature of the hazardous gas or vapor. See the space heater nameplate on motor for heater Temperature Code and heater rating. Failure to follow this instruction could result in serious personal injury, death and/or property damage

3.3.6.4 Thermal Protection:

General Information: When thermal protection is provided, one of the following will be stamped on the nameplate:

1. **"THERMALLY PROTECTED"** This motor has built in thermal protection. Thermal protectors open the motor circuit electrically when the motor overheats or is overloaded. The protector cannot be reset until the motor cools. If the protector is automatic, it will reset itself. If the protector is manual, disconnect motor from power supply. After protector cools (five minutes or more) press the reset button and reapply power to the motor. In some cases a motor is marked "Auto" and the connection diagram on the motor will identify T'Stat leads – see "2 " below. (See warnings on Manual and Automatic reset protectors - section 1.1)

2. **"WITH OVERHEAT PROTECTIVE DEVICE"**: This motor is provided with an overheat protective device that does not directly open the motor circuit. Motors nameplated with this phrase have either thermostats, thermisters or RTD's. The leads to these devices are routed into the motor conduit box or into an auxiliary box. The lead markings are defined on the nameplate (normally "P1", "P2") . The circuit controlled by the overheat protection device must be limited to a maximum of 600 volts and 360 volt-amps. See connection decal provided inside the terminal box cover. Failure to connect these over temperature devices (when provided) will void the warranty.

   WARNING: EXPLOSION HAZARD
   For Hazardous Locations motors provided with thermostats UL and the NEC require connection of thermostat leads into the control portion of a manual reset start circuit. Failure to follow this instruction could result in serious personal injury, death and/or property damage

Resistance Temperature Detectors (RTD): When winding and/or bearing RTDs are provided the RTD lead markings are defined on the nameplate. (Normally "R1", "R2", "R3" etc.)

3.3.6.5 RTD Alarm & Trip Settings:

Tables 3-6 & 3-7 are suggested initial RTD alarm and trip settings. For motors found to operate significantly below these values the settings may be reduced accordingly.

Table 3-6 Winding RTD – Temperature Limit (°C) 40 °C Max Ambient

Motor Load	Class B Temp Rise≤ 80°C		Class F Temp Rise≤ 105°C	
	Alarm	Trip	Alarm	Trip
Up to 1.0 SF	130	140	155	165
>1.0 to 1.15 SF	140	150	160	165

Table 3-7 Bearing RTD – Temperature Limit (°C) 40 °C Max Ambient

Ambient	Alarm	Trip
Up to 40**°C**	95	100
> 40**°C**	110	115
Bearings that are Heat Stabilized to 150 **°C**	130	135

3.3.7 GUARDS:

WARNING: ROTATING PARTS HAZARD
When devices are assembled to the motor shaft, be sure to install protective devices such as belt guards, chain guards, and shaft covers. These devices must protect against accidental contact with extremities, hair, and clothing. Consider the application and provide guarding to protect personnel. Remove all unused shaft keys and loose rotating parts to prevent them from flying off and causing bodily injury. Failure to follow this warning could result in serious personal injury, death and/or property damage.

3.4 ELECTRICAL CONNECTIONS:

WARNING: ELECTRICAL HAZARDS

Before proceeding read Section 1-1 on Electrical Safety. Failure to follow the instructions in Section 1-1 could result in serious personal injury, death and/or property damage

3.4.1 POWER SUPPLY / BRANCH CIRCUIT

WARNING: POWER SUPPLY INCOMPATIBILITY HAZARD

Check power supply to make certain that voltage, frequency and current carrying capacity are in accordance with the motor nameplate. Failure to match motor nameplate values could result in serious personal injury, death and/or property damage

WARNING: BRANCH CIRCUIT SUPPLY HAZARD

Motor and control wiring, fusing, overload protection, disconnects, accessories and grounding must always conform to the applicable electrical codes as well as local codes and sound practices.

3.4.1.1 Branch Circuit Supply to a motor should include a disconnect switch, short circuit current fuse or breaker protection, motor starter (controller) and correctly sized thermal elements or overload relay protection.

3.4.1.2 Fuses, Breakers, Overload Relays

Short Circuit Current Fuses or Breakers are for the protection of the branch circuit. Starter or motor controller overload relays are for the protection of the motor. Each of these should be properly sized and installed per the applicable electrical codes as well as local codes and practices.

WARNING: PROTECTIVE DEVICE DISABLED HAZARD

DO NOT bypass or disable protective devices. Protection removal could result in serious personal injury, death and/or property damage

3.4.1.3 AC Power Supply Limits

Motors are designed to operate within the following limits at the motor terminals:

1- AC power is within +/- 10 % of rated voltage with rated frequency applied. (Verify with nameplate ratings) **OR**

2- AC power is within +/- 5% of rated frequency with rated voltage **OR**

3- A combined variation in voltage and frequency of +/- 10% (sum of absolute values) of rated values, provided the frequency variation does not exceed +/-5% of rated frequency.

4- For 3 phase motors the line to line full load voltage must be balanced within 1%.

5- If the motor is rated 208-230V, the voltage deviations must be calculated from 230V.

CAUTION: Reduced Motor Performance

Operation outside of these limits will degrade motor performance and increase operating temperature.

3.4.2 TERMINAL BOX:

3.4.2.1 Conduit Opening: For ease of connections, motors are typically provided with large terminal boxes. Most motors have conduit access in 90 degree increments, the terminal box conduit opening is typically provided via knockouts, holes with covers, or the terminal box is rotate-able. Fabricated conduit boxes may have a removable plate for the installer to provide correctly sized hole(s).

3.4.2.2 Hazardous Locations Motors:

WARNING: EXPLOSION HAZARDS

(1) Terminal Boxes mounted to motor with a pipe nipple: If a pipe nipple mounted terminal box is removed or rotated it must be reassembled with a minimum of five full threads of engagement.

(2) Component Removal: Do not set a terminal box component on its machined surfaces. Prior to component reassembly wipe clean all machined surfaces.

(3) Machined Surface Gap (Hazardous Locations Terminal Boxes): The gap between mating surfaces with the machined terminal box MUST BE LESS THAN 0.002 inches. This gap must be checked with a feeler gage along the entire perimeter. If there is visible damage to the mating surfaces, or if the gap between these surfaces exceeds 0.002 inches, DO NOT complete the installation and contact the motor manufacturer. Failure to follow these instructions could result in serious personal injury, death and/or property damage

3.4.3 LEAD CONNECTIONS

Electrical connections to be made per nameplate connection diagram or separate connection plate. In making connections follow the applicable electrical code as well as local codes and practices.

WARNING: ELECTRICAL CONNECTION HAZARD

Failure to correctly connect the motor leads and grounding conductor can result in injury or death. Motor lead connections can short and cause damage or injury if not well secured and insulated.

3.4.3.1 Wire Size (Single Phase) Requirements

The minimum wire size for Single Phase, 115 & 230 Volt Circuits must meet table 3-8 for a given distance between motor and either Fuse or Meter Box.

Table 3-8 Minimum Wire Gage Size Single Phase 115 & 230 Volt Circuits

Distance (Feet) - Motor to Fuse or Meter Box								
Motor	100 Ft.		200 Ft.		300 Ft.		500 Ft.	
HP	115	230	115	230	115	230	115	230
1/4	14	14	10	12	8	10	6	8
1/3	12	14	10	12	6	10	4	8
1/2	10	12	8	10	6	8	4	6
3/4	10	12	6	10	4	8	2	6
1	8	10	6	8	4	6		4
1 1/2	4	10	0	8		6		4
2		8		6		4		2
3		8		6		4		2
5		6		4		2		0

3.4.3.2 Extension Cords (Single Phase Motors):

Where an extension cord(s) is utilized to provide power to the motor the extension cord(s) must be…(1) the proper gauge size per table 3-8, (2) in good working condition (3) properly grounded.

3.4.4 GROUND CONNECTION(S):

WARNING: ELECTRICAL GROUNDING HAZARD

For general information on grounding (USA) refer to NEC Article 250. Improper grounding of an inverter fed motor may result in frame voltages in excess of 500 Volts. In making the ground connection, the installer must make certain that a good electrical connection is obtained between motor and grounding lead. Failure to properly ground motors, per the applicable national code (such as NEC Article 430) and local codes may cause serious injury or death to personnel.

Primary "Internal" Ground: A grounding conductor must be connected to the grounding terminal provided in the terminal housing. This grounding terminal is either a ground screw, ground lug, or a tapped hole to be used with a separately provided ground screw. The internal grounding feature is accessible inside the terminal housing and must be used as the primary grounding connection.

Secondary "External" Ground: Some motors are provided with a supplemental grounding terminal located on the external surface of the motor frame or feet. This external terminal is for supplemental bonding connections where local codes permit or require such connection

3.4.5 START UP:

WARNING: ELECTRICAL SHOCK HAZARD:

Be certain that all connections are secure and the conduit box cover is fastened in place before electrical power is connected. Failure to follow these instructions could result in serious personal injury, death, and/or property damage.

⚠ WARNING: LOOSE & ROTATING PARTS HAZARD
Before proceeding read Section 1-2 on Mechanical Safety. Failure to follow the instructions in Section 1-2 could result in serious personal injury, death and/or property damage

⚠ WARNING: EXCESSIVE SURFACE TEMPERATURE HAZARD
Motors with the temperature code stated on the nameplate are designed to operate within this limit. Improper application or operation can cause the maximum surface temperature to be exceeded. A motor operated in a Hazardous Location that exceeds this surface temperature limit increases the potential of igniting hazardous materials. *Therefore, motor selection, installation, operation, and maintenance must be carefully considered to ensure against the following conditions:* (1) Motor load exceeds service factor value, (2) Ambient temperature above nameplate value, (3) Voltages outside of limits (3.4.1.3), (4) Loss of proper ventilation, (5) VFD operation exceeding motor nameplate rating, (6) Altitude above 3300 feet / 1000 meters, (7) Severe duty cycles, (8) Repeated starts, (9) Motor stall, (10) Motor reversing, and (10) Single phase operation. Failure to follow these instructions could result in serious personal injury, death and/or property damage.

⚠ CAUTION: HOT SURFACE
Normal motor surface temperatures may exceed 90 ° C (194° F). Touching the motor frame may cause discomfort or injury. Surface temperatures should only be measured with suitable instruments and not estimated by hand touch.

3.4.5.1 Start Up - No Load Procedure

1. **Check Instructions:** Before startup carefully read and fully understand these instructions including all warnings, cautions, and safety notice statements.
2. **Motor out of storage after more than three months:** Check winding insulation integrity with a Megger. If winding resistance to ground is less than 1.5 Meg-ohms consult the local authorized service shop before energizing the motor.
3. **Check Installation: Mechanical** - Check tightness of all bolts and nuts. Manually rotate the motor shaft to ensure motor shaft rotates freely. Note: Shaft & bearing seals will add drag.
   Electrical - Inspect all electrical connections for proper terminations, clearance, mechanical tightness and electrical continuity. Be sure to verify connections are made per the nameplate connection diagram or separate connection plate. Replace all panels and covers that were removed during installation before energizing the motor.
4. **Energize Motor: Check Rotation**
   If practical check motor rotation before coupling to the load. Unlock the electrical system. Momentarily provide power to motor to verify direction of rotation. If opposite rotation is required, lock out power before reconnecting motor. If motor has a rotational arrow only operate the motor in the rotation identified. Reapply power to ensure proper operation.
5. **Record No Load Amps, Watts & Voltage:**
   Recommend - To establish a baseline value check and record the no load amps, watts, and voltage.

3.4.5.2 Start Up – Load Connected Procedure

1. **Check Instructions:** Before startup carefully read and fully understand these instructions including all warnings, cautions, & safety notice statements.
2. **Coupling Installation:** Check that the connected equipment is properly aligned and not binding. Check that all guards and protective devices are properly installed.
3. **Energize Motor:** When all personnel are clear of the machine, apply power and verify that the load is not transmitting excessive vibration back to the motor though the shaft or the foundation. Verify that motor amps are within nameplate rating. For repeated starts see 3.4.5.3. The equipment can now be fully loaded and operated within specified limits as stated on the nameplate.

3.4.5.3 Jogging and/or Repeated Starts

Do not start more than twice in succession under full load. Repeated starts and/or jogs of induction motors can cause overheating and immediate failure. Contact the motor manufacturer if it is necessary to repeatedly start or jog the motor.

4.0 MAINTENANCE:

⚠ WARNING: Hazardous Locations Motor Repair HAZARD:
Division 1 Hazardous Locations motors can only be modified or repaired by the manufacturer or a facility that is Listed under UL's category "Motors and Generators, Rebuilt for use in Hazardous Locations". Failure to follow these instructions could result in serious personal injury, death and/or property damage.

⚠ WARNING: ELECTRICAL SHOCK HAZARD
Electrical connections are to be made by qualified electrical personnel in accordance with all applicable codes, ordinances and sound practices. Failure to follow these instructions could result in serious personal injury, death and/or property damage. Only qualified personnel who are familiar with the applicable national codes, local codes and sound practices should install or repair electric motors and their accessories.

⚠ WARNING: ELECTRICAL LIVE CIRCUIT HAZARD
Do not touch electrically live parts. Disconnect, lockout and tag input power supply before installing or servicing motor (includes accessory devices).

4.1 GENERAL INSPECTION

Inspect the motor approximately every 500 hours of operation or every three months, whichever occurs first. Keep the motor clean and the ventilation and fin openings clear. The following steps should be performed at each inspection:

4.1.1 VENTILATION: Check that the ventilation openings and/or exterior of the motor is free of dirt, oil, grease, water, etc, which can accumulate and block motor ventilation. If the motor is not properly ventilated, overheating can occur and cause early motor failure.

4.1.2 INSULATION: Use a "Megger" periodically to ensure that the integrity of the winding insulation has been maintained. Record the Megger readings. If winding resistance to ground is less than 1.5 Meg-ohms consult the local authorized service shop before re-energizing the motor.

4.1.3 ELECTRICAL CONNECTIONS: Check all electrical connectors to be sure that they are tight.

4.2 LUBRICATION & BEARINGS:

The lubricating ability of grease (over time) depends primarily on the type of grease, the size of the bearing, the speed at which the bearing operates and the severity of the operating conditions. Longer bearing life can be obtained if the listed recommendations are followed:

NOTE: If lubrication instructions are provided on the motor nameplate, the nameplate instructions will supersede these instructions. Motors marked "Permanently Lubricated" do not require additional service.

⚠ CAUTION: BEARING / MOTOR DAMAGE WARNING
Lubricant should be added at a steady moderate pressure. If added under heavy pressure bearing shield(s) may collapse. Over greasing bearings greatly increases bearing friction and can cause premature bearing and/or motor failure.

4.2.1 GREASE TYPE (unless nameplate states otherwise):
Nameplate Ambient Temperature between -30°C (-22°F) to 65°C (150°F) inclusive: Recommended grease for standard service conditions is Mobil Polyrex ® EM. Equivalent and compatible greases include: Texaco Polystar RB, Rykon Premium #2, Pennzoil Pen 2 Lube, Chevron SRI & Mobil SHC 100.

Nameplate Ambient Temperature below -30°C (-22°F): Special low temperature grease is recommended, such as Aeroshell 7 or Beacon 325 for ball bearings and Mobil SHC 100 for roller bearings.

Nameplate Ambient Temperature above 65°C (150°F): Dow Corning DC44 or equivalent, a special high temperature grease is required. Note that Dow Corning DC44 grease does not mix with other grease types.

4.2.2 BEARING OPERATING TEMPERATURE:

⚠ CAUTION: HOT SURFACE

The external surface temperature of the end shield (bracket) bearing hub may reach 100° C (212° F) during normal operation. Touching this surface may cause discomfort or injury. Surface temperatures should only be measured with suitable instruments and not estimated by hand touch.

For RTD settings see Table 3-7.

4.2.3 LUBRICATION INTERVALS: (For motors with regreasing provisions)

Eq. 4.2 Lubrication Interval = [(Table 4-1) hrs] x [Interval Multiplier (Table 4-2)] x [Construction Multiplier (Table 4-3)]

Table 4-1 Lubrication Intervals (Hours) These values are based on average use.

NEMA / [IEC] Frame Size	Operating Speed – RPM (See Table 3.4 for Maximum Operating Speed)					
	<7200	<5400	<4500	<3600	<1800	<1200
56-180 [80-110]	2500 Hrs.	4000 Hrs	5000 Hrs	6000 Hrs.	17000 Hrs.	20000 Hrs.
210-250 [130-160]		2500 Hrs	4000 Hrs	5000 Hrs.	12000 Hrs.	16000 Hrs.
280 [180]		2000 Hrs	3000 Hrs	4000 Hrs.	10000 Hrs.	14000 Hrs.
320 [200]			2000 Hrs	3000 Hrs.	9000 Hrs.	12000 Hrs.
360 [225]			1500 Hrs	2000 Hrs.	8000 Hrs.	10000 Hrs.
400-440 [250 – 280]				1500 Hrs.	4000 Hrs.	7000 Hrs.
>440 [>280]				1000 Hrs.	3000 Hrs.	5000 Hrs.

Seasonal Service: If motor remains idle for more than six months, Lubricate at the beginning of the season, then follow lubrication interval.

Do not exceed maximum safe operating speed Table 3-4 without manufacturer's approval

Table 4-2 Service Conditions

Use highest level Multiplier: Maximum Ambient Temperature and Contamination are independent factors

Severity of Service	Maximum Ambient Temperature	Atmospheric Contamination	Multiplier
Standard	Less than 40° C (104° F)	Clean, Slight Corrosion, indoors, less than 16 hrs per day	1.0
Severe	Above 40° C (104° F) to 50° C	Moderate dirt or Corrosion or outdoors or more than 16 hrs per day	0.5
Extreme	Greater than 50° C or Class H Insulation	Severe dirt or Abrasive dust or Corrosion	0.2

Table 4-3 Construction Multiplier

Construction	Multiplier
Angular Contact or Roller Bearing	0.5
Vertical Motor	0.5
All others	1.0

Table 4-4 Relubrication Amounts

Frame Size		Volume		
NEMA	IEC	Cu. In.	Fluid oz	ml
48-56	80	0.25	0.14	4.0
143-145	90	0.25	0.14	4.0
182-184	110	0.50	0.28	8.0
213-215	130	0.75	0.42	12.5
254-256	160	1.00	0.55	16.0
284-286	180	1.50	0.83	25.0
324-326	200	2.00	1.11	33.0
364-365	225	3.00	1.66	50.0
404-405	250	3.80	2.11	62.0
444-449	280	4.10	2.27	67.0
>449	>280	4.50	2.50	74.0

For regreasing while operating multiply volume by 125%.

4.2.4 LUBRICATION PROCEDURE: (For Motors with Regreasing Provisions)

CAUTION: BEARING DAMAGE WARNING
Added grease must be compatible with the original equipment's grease. If a grease other than those stated in 4.2.1 is to be utilized contact the motor manufacturer. Nameplate information supersedes section 4.2.1 (GREASE TYPE). New grease must be free of dirt. Failure to follow these instructions and procedure below may result in bearing and/or motor damage.

For an extremely dirty environment, contact the motor manufacturer for additional information.

LUBRICATION PROCEDURE:

1. Clean the grease inlet plug or zerk fittings prior to regreasing.
2. (If present) Remove grease drain plug and clear outlet hole blockage.

CAUTION: GREASE DRAIN PLUGGED:
Old grease may completely block the drain opening and must be mechanically removed prior to regreasing. Forcing a blocked drain open by increased greasing pressure may collapse bearing shields and / or force excess grease through the bearings and into the motor.

3. Add grease per Table 4-4
4. Re-install grease inlet and drain plugs (if removed).

WARNING: EXPLOSION HAZARD
Do NOT energize a Hazardous Locations motor without all grease fittings properly installed.

4.2.5 EXAMPLE: LUBRICATION

Assume - NEMA 286T (IEC 180), 1750 RPM Vertical motor driving an exhaust fan in an ambient temperature of 43° C and the atmosphere is moderately corrosive.

1. Table 4-1 list 10,000 hours for standard conditions.
2. Table 4-2 classifies severity of service as "Severe" with a multiplier of 0.5.
3. Table 4-3 lists a multiplier value of 0.5 for "Vertical"
4. (Eq. 4.2) Interval = 10,000 hrs x 0.5 x 0.5 = 2500 hrs

Table 4-4 shows that 1.5 in^3 of grease is to be added.

Relubricate every 2,500 hrs of service with 1.5 in^3 of recommended grease.

4.3 TROUBLE-SHOOTING

WARNING: READ INSTRUCTIONS:
Before trouble-shooting a motor, carefully read and fully understand the warnings, cautions, *&* safety notice statements in this manual.

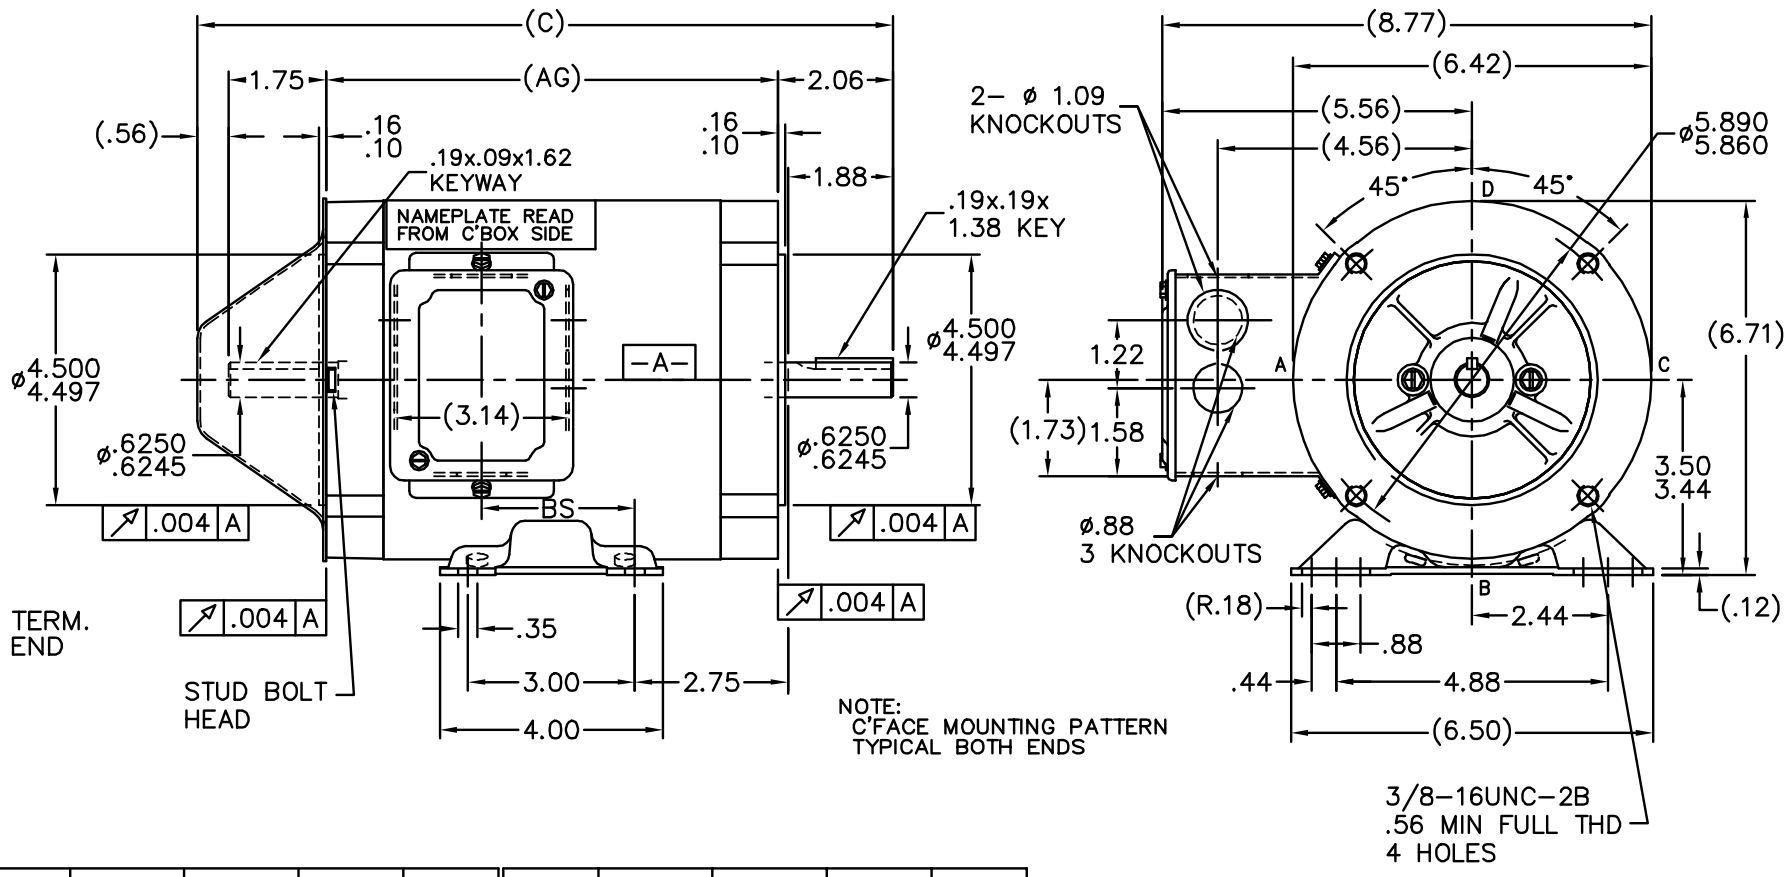
WARNING: Hazardous Locations Motor Repair:
Motors nameplated for use in Division 1 Hazardous Locations can only be disassembled, modified or repaired by the plant of manufacturer or a facility that is Listed under UL's category "Motors and Generators, Rebuilt for use in Hazardous Locations". Failure to follow these instructions could result in serious personal injury, death and/or property damage

CAUTION: DISASSEMBLY APPROVAL REQUIRED:
Motor disassembly must be performed by a party approved by the motor manufacturer. To disassemble the motor without approval voids the warranty.

4.3.1 GENERAL TROUBLE-SHOOTING WARNINGS

1. **DISCONNECT POWER TO THE MOTOR BEFORE PERFORMING SERVICE OR MAINTENANCE.**
2. **Discharge all capacitors before servicing motor.**
3. **Always keep hands and clothing away from moving parts.**
4. **Be sure required safety guards are in place before starting equipment.**
5. **If the problem persists contact the manufacturer.**

4.3.2 Motor Trouble-shooting Cause / Corrective Action - Table 4-5



Issue:	Likely Cause:	Corrective Action:
Motor fails to start upon initial installation:		
A.)	Supply voltage is too low or is severely unbalanced (one phase is low or missing).	(1) Check power supply fuses (2) Match motor lead wiring to nameplate connection diagram and supply voltage (3) Ensure that steady state supply voltage at motor terminals is within limits (see section 3.4.1.3). Correct as needed (4) Obtain correct motor to match actual supply voltage.
B.)	Motor leads are miswired at conduit box.	
C.)	Driven load exceeds motor capacity	(1) Verify that motor & load turn freely (2) Disconnect motor from load & ensure motor turns freely. Note: Roller bearings make noise when motor is uncoupled and shaft is rotated (3) Verify that motor starts when disconnected from load (4) Remove excessive / binding load if present.
D.)	Load is jammed.	
E.)	Fan guard is bent and making contact with fan	Replace fan guard & fan (if blades are damaged)
F.)	VFD with power factor capacitors installed	Remove power factor correction capacitors if equipped
G.)	VFD with motor neutral lead grounded	Ensure that motor neutral lead is ungrounded
H.)	VFD programmed incorrectly	(1) Repeat checks listed above (2) Verify that VFD current limit and starting boost are set correctly (5) Double-check motor and feedback parameter settings and VFD permissives (6) Repeat autotune (for vector drives) procedure (7) Consult VFD supplier.
Motor has been running, then slow down, stalls, or fails to restart:		
A.)	Supply voltage has drooped or has become severely unbalanced	(1) Replace fuse or reset circuit breaker. Allow motor to cool down before resetting manual protector on motor. **Warnings** - See section 1.1 for automatic and manual reset protector warnings (2) Verify that rated and balanced supply voltage has been restored before restarting motor. Measure voltage during restart. Ensure that steady state supply voltage at motor terminals is within limits (see section 3.4.1.3).
B.)	Motor is overloaded	(1) Verify that motor & load turn freely. Repair binding components as needed (2) Reduce driven load to match motor capacity or increase motor size to match load requirements.
C.)	Motor bearings are seized	
D.)	Load Is jammed.	
E.)	VFD will not restart motor after tripping	(1) Check fault codes on VFD and follow VFD troubleshooting procedures (2) Verify that VFD input voltage is balanced and within limits (3) Remove excessive mechanical load if present.
F.)	Capacitor failure on single phase motor (if equipped)	**Warning: Potential Shock Hazard**: Contact service shop to check capacitor.
Motor takes too long to accelerate:		
A.)	Motor leads are not connected correctly	Match motor lead wiring to nameplate diagram.
B.)	Supply voltage has drooped or become severely unbalanced.	(1) Ensure that steady state supply voltage at motor terminals is within limits (see section 3.4.1.3). Correct as needed (2) Obtain correct motor to match actual supply voltage.
C.)	Load exceeds motor capability	Determine correct motor size and contact motor representative to obtain replacement motor.
D.)	Faulty start capacitor (Single Phase)	Motor may be too small for load. Record acceleration time. Start capacitors may fail if acceleration time exceeds 3 seconds.
E.)	Mechanical Failure	(1) Check to make sure motor & load turn freely (2) Disconnect motor from load & ensure motor turns freely
Motor rotates in the wrong direction:		
A.)	Incorrect wiring connection at motor	[Single Phase] Reconnect motor according to wiring schematic provided. Note: Some motors are non-reversible
		[Three Phase] Interchange any two power supply (phase) leads.
Motor overheats or overload protector repeatedly trips		
A.)	Driven Load is excessive	(1) If motor current exceeds nameplate value, ensure that driven load has not increased. Correct as needed. (2) If new motor is a replacement, verify that the rating is the same as the old motor. If previous motor was a special design, a general purpose motor may not have the correct performance.
B.)	Ambient temperature too high	Most motors are designed to operate in an ambient up to 40 °C. (See section 4.2.2 Hot Surface Caution)
C.)	Motor cooling fins and/or vent openings blocked	Remove foreign materials – clear vent openings, fan guard air inlets and frame fins (TEFC motors)
D.)	Insufficient Air Flow	TEAO (Totally Enclosed Air Over) motors: Measure airflow next to motor surface and obtain minimum requirements from motor manufacturer.

	E.)	Motor is started too frequently	See section 3.4.5.3
	F.)	Supply voltage too low, too high, or unbalanced	(1) Ensure that steady state supply voltage at motor terminals is within limits (see section 3.4.1.3) Correct as needed (2) Reconnect motor per input voltage (3) Obtain correct motor to match power supply.
Motor Vibrates			
	A.)	Motor misaligned to load.	Realign load
	B.)	Load out of balance (Direct drive application)	(1) Ensure that load is dynamically balanced: (2) Remove motor from load and inspect motor by itself. Verify that motor shaft is not bent. Rule of thumb is 0.002" runout for shafts extension lengths up to 3.00". Add 0.0005" per every additional inch of shaft length beyond 3.00".
	C.)	Uneven tension on multiple belts	Mixing new with used belts. Replace multiple belt applications with a complete set of matched belts.
	D.)	Driven load operating at resonant point / natural frequency.	(1) De-energize motor and record vibration as load coasts from 100% speed to 0 RPM. If vibration drops immediately, vibration source is electrical. If levels do not drop immediately, source is mechanical (2) Redesign system to operate below the resonant point (3) On VFD-driven loads, program skip frequencies to bypass resonant points (4) Increase carrier frequency to obtain <3% THD current (5) On variable torque loads reduce volts/hertz below base speed.
	E.)	VFD torque pulsations	(1) Adjust VFD to obtain <3% THD current @ rated motor current (2) Adjust VFD stability for smooth operation. Vector drives may be unstable at light load.
	F.)	Motor miswired at terminal box	Match motor lead wiring to nameplate connection diagram.
	G.)	Uneven, weak or loose mounting support.	Shim, strengthen or tighten where required.
	H.)	Motor bearings defective	Test motor by itself. If bearings are bad, you will hear noise or feel roughness. Roller bearings are normally noisy when operated without load. If sleeve bearing, add oil per nameplate instructions. For motors with regreasing provisions, add grease per relubricating instructions (see section 4.2.3). If noise persists contact warranty service.
	I.)	Motor out of balance	Disconnect from load. Set motor on rubber pads on solid floor. Secure a ½ height key in shaft keyway and energize from balanced power supply @ rated voltage. Record vibration levels and compare with appropriate standards. If excessive vibration persists contact motor manufacturer.

Bearings repeatedly fail.			
	A.)	Load to motor may be excessive or unbalanced	(1) If belt drive check system per section 3.3.4. (2) Other than belting, check loading on motor shaft. An unbalanced load will also cause the bearings to fail. (3) Check runouts of mating components, such as a C-face and pump flange.
	B.)	Bearings contaminated.	Motor enclosure not suitable for environment. Replace with correct enclosure construction
	C.)	Incorrect grease or bearings for ambient extremes.	See section 4.2.1
	D.)	VFD bearing damage	Ground brush, common mode filter, or insulated bearings must be added. Contact motor manufacturer.
Motor, at start up, makes a loud rubbing, grinding, or squealing noise.			
	A.)	Contact between rotating and stationary components	Belt squeal during across the line starting is normal: (1) Verify that supply voltage is within limits (see section 3.4.1.3). (2) Ensure that motor lead wiring matches nameplate connection diagram: (3) Isolate motor from load. (4) To locate point of contact turn motor shaft by hand. (5) If point of contact is not located contact motor service shop.
Start capacitors repeatedly fail.			
	A.)	The motor acceleration time is too long	Motor may be too small for load. Record acceleration time. Start capacitors may fail if acceleration time exceeds 3 seconds.
	B.)	Motor is being started too frequently	Excessive starting will damage motor capacitors. Contact motor manufacturer if motor is started more than 20 times/hour or if acceleration time exceeds 3 seconds.
	C.)	Motor voltage low	Verify that voltage at the motor terminals is within limits (see section 3.4.1.3).
	D.)	Defective start switch inside motor	Motor internal switch failure overheats start capacitor. Contact service shop or motor manufacturer.
Run capacitor fails.			
	A.)	High ambient temperature	Verify that the ambient does not exceed motor's nameplate value

	B.)	Input voltage exceeds limit	Verify that voltage to the motor terminals is within limits (see section 3.4.1.3).
	C.)	Power surge to motor (caused by lightning strike or other high transient voltage).	If a common problem, install surge protector.

Warranty Card

Complete and return to validate warranty

Please complete this card and return it to **seepex** Inc. By using this card, the valid warranty period will commence at the pump "start-up" date. If this card is not completed the warranty coverage period will commence on the date the pump is shipped from the **seepex** factory. This card must be completed and mailed no later than one year from the date of shipment.

User Entity: _____

Mailing Address: _____

_____

_____

Contact Person: _____

Phone Number: _____

Fax Number: _____

Pump Model # _____

Pump Commission #: _____

Pumped Product: _____

Diff. Pressure: _____ Flow Rate: _____

Temperature: _____ Visosity: _____

Solids Size: _____ Solids %: _____

Was the pump delivered as scheduled? __ Yes __ No

Was the appearance of the pump acceptable? __ Yes __ No

Did the pump suffer any freight damage? __ Yes __ No

Did the pump perform as expected? __ Yes __ No

Did you receive: - Data Sheets? __ Yes __ No

-O&M Manuals? __ Yes __ No

Did you local seepex distributor contact you to arrange a start-up? __ Yes __ No

TERMS & CONDITIONS OF SALES AND/OR REPAIR

The following terms and conditions shall apply to an order for all or any part the articles covered by this quotation unless specifically excepted therein:

Prices
Any prices quoted shall only be valid for orders placed within 30 days from the date of issue of the quotation. Prices are F.O.B. our plant in U.S. or Canadian dollars. We reserve the right to correct typographical or clerical errors.

Terms
All orders are subject to approval by our Credit Department. Unless otherwise stated, if payment for the invoice due is not made within thirty (30) days after shipment, administration fees of eighteen percent (18%) per year (equivalent to a nominal monthly interest rate of 1½%) will be applied on overdue accounts. The terms and conditions herein set forth are based upon tariffs, taxes, foreign exchange rates, delivery, and other conditions in effect on the date of this contract. In the event changed conditions, legislations, regulations, or other matters shall become applicable to any quotation, contract, or delivery hereunder, any increased exchange, duties, taxes, ocean freight, or other charges resulting from such action shall be for the customer's account and **seepex**, Inc. may charge such increased duties, taxes, or charges to the customer.

Unless the order includes the appropriate exemption certificates and/or licenses, duties, and taxes levied by Federal, State, or other governments are required to be charged automatically at the rate imposed at time of importation/shipment. Any change in law, regulations, or Government Department practice which causes a variation of any kind in the applicable charges from the amounts allowed for the quotation, shall result in an equivalent change in the price quoted.

Until payment is made in full, **seepex**, Inc. shall retain the right, without notice, to repossess and/or retain the items, and/or dispose of them, for its benefit and hold the customer responsible for any loss. Customer agrees to enter into any agreements, contracts, or notices required to confirm such rights.

Security
In order to secure any obligations due to **seepex**, Inc. from the customer (whether or not under this contract) the customer grants and confirms in **seepex**, Inc. a security interest in:

a) the merchandise covered by this contract, and
b) in all property and funds of the customer now or hereafter in **seepex**, Inc. possession, whether or not arising out of this contract, and in all additions, accessions, and proceeds of such merchandise and/or property. The customer hereby authorizes **seepex**, Inc. to sign alone any financing statement or statements and to do all and any other things which may be necessary to perfect such security interest.

Cancellation
After acceptance, orders may be canceled only with our approval and payment in accordance with contract by the customer for work performed and/or material expenses incurred by us to date of cancellation. We reserve the right to cancel the order if the customer's financial condition, in our sole judgment, places the payment in jeopardy.

Return
No credit will be allowed for returns unless our authorization in writing for such returns has been obtained beforehand. A copy of this authorization is to be returned with the item as the packing slip.

Shipment

a) Handling Charge: Customer shall be responsible for making all arrangements for shipment of the order with a suitable carrier. In the event that customer requests that seepex make arrangements for shipment, then customer agrees to pay to seepex, in addition to the applicable shipping charges, a handling charge in the amount of 10% of the shipping charges with a minimum $5.00 to a maximum charge of $150.00, with special services requiring additional charges.
b) New Articles: Where shipping instructions indicate no exact routing, our best judgement will be used in determining routing but we shall not be liable for any charges beyond F.O.B. point. If changes are made at customer's request in a) F.O.B. point, b) in our normal routing from either the manufacturers' or our own plants and in these changes involve extra costs, such costs shall be for the customer's account, unless otherwise noted on the **seepex** price quotation.
c) Repair Work: Defined as work and services performed by **seepex**, Inc. All orders shall be delivered to and picked up from our plant unless otherwise specified. All costs of delivery shall be for the customer's account unless otherwise agreed to in writing prior to shipment.
d) All Orders: On collect freight shipments, cartage charges from plant to carrier are for customer's account. Title to articles passes to customer upon delivery to carrier acting as customer's agent subject to any right of retention by us. All claims for shortage in, and damages in, shipment or otherwise must be reported to carrier immediately upon receipt with copy or report to ourselves within five (5) days.

Guarantee

a) New Articles: We guarantee articles of our manufacture against defects in material and/or workmanship for a period of three (3) years from date of acceptance, providing that the articles have been installed, maintained, and operated in accordance with our recommendations and instructions.
b) Repair Work: Defined herein as work and services performed by **seepex**, Inc. We guarantee all work and services performed by us against defect arising from workmanship and/or materials provided by us for a period of ninety (90) calendar days from the date of shipment to customer.
c) All Orders: Claims shall be submitted promptly in writing to **seepex**, Inc. Replacement and/or repair under guarantee shall be made F.O.B. our plant. Our liability under these guarantees is limited to the replacement and/or repair only of defective material or workmanship and in no event shall **seepex**, Inc. be liable for any loss or damage of whatever kind of nature out of defects in material and/or workmanship, or resulting from delay, or loss of use of articles, or any installation into which the article may be installed, or arising out, of the contract of the work or service or from negligence.

seepex, Inc. shall not be liable for any loss or damage resulting from delay and/or late delivery due to causes beyond our reasonable control. In no event shall seepex, Inc. be liable for any claim exceeding the amount of this order. Our guarantee on products of other than our own manufacture is limited to the guarantee extended to us by the original manufacturer. On any claims for repairs and/or replacement under such guarantee, all costs incurred by us which are not underwritten by the original manufacturers shall be for the claimant's account. Except as stated above no representations, conditions, or warranties are made with respect to products, work, or services, express or implied verbal or otherwise, including warranties of merchantability and fitness. Our guarantee and warranty shall not apply to materials or workmanship which have been subject to misuse, neglect, or accident.
seepex, Inc. shall be held free and harmless from any dispute or claim anywhere arising relating to infringement of patent, design, trademark, or copyright of items, sold or repaired under this contract.

Property **rights and risks**
The customer's property at all times shall remain at the risk of the customer while being worked on by our personnel or on our premises and shall not be responsible for any loss or damage to the customer's property resulting from any cause whatsoever.

Title to and rights in relation to item sold under this contract/quotations shall remain with **seepex**, Inc. until such items are paid for, subject to risk on products sold passing to the customer upon acceptance by a carrier or other, which shall constitute good delivery.

TOP VALVE * PAT

Back Pressure & Pressure Relief Valves

Designed to Enhance the ACCURACY and SAFETY of Metering Pumps

Back Pressure/Anti-Siphon and Pressure Relief Valves

- Long life diaphragm
- Range to 350 PSIG
- Built-in air release and optional gauge port
- Available in PVC, CPVC, PVDF, polypropylene, Teflon, stainless steel, Alloy 20 and Hastelloy C
- 7 sizes (1/4" - 2" threaded, flanged or socket)
- Color coded handles indicate size at a glance
- High temperature valves available to (300°F/149°C)

Back Pressure/Anti-Siphon and Pressure Relief Valves

Description

This line of diaphragm style, back pressure/anti-siphon and pressure relief valves features a completely adjustable pressure range to 350 PSIG and a built-in air release to reduce priming difficulties. The valves are available in sizes from 1/4" through 2", eight materials of construction, offer a three year warranty and are available with socket weld, flanged or special threaded connections. High temperature to (300°F/149°C) valves are available. *CRN certification available. Please contact factory.*

Ordering Information e.g. Part # TVBP50-S/S-V-S

TV - B - P - 50 - S/S - V - S

TOP VALVE

Valve Type:
B = Backpressure
P = Pressure Relief
P2 = Pressure Relief (2 port)

Valve Style or Connection:
P = Backpressure, FNPT thr'd
R = Pressure Relief, FNPT thr'd
FW = Welded Flange
FT = Thr'd Companion Flanged
F = Flanged Non-Metallic
S = Socket
B = BSP thread
T = High Temperature (300°F/149°C)
H = High Pressure (to 350 psig)

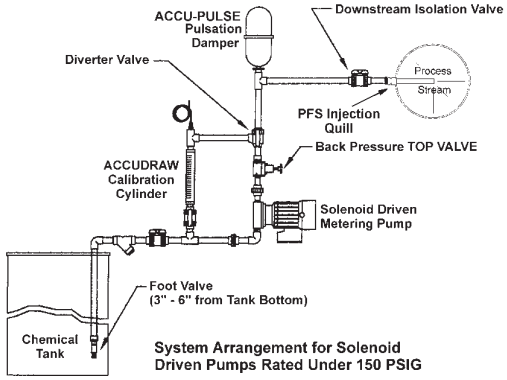
Valve Port Connection Size:
25 = 1/4" 10 = 1"
45 = 1/4" X 1/2" 15 = 1 1/2"
50 = 1/2" 20 = 2"
75 = 3/4"

Standard Top: PVC/CPVC
Top Options:
A = Aluminum Top
S = 316L S/S Top
C = CPVC Top
P = Polycarbonate Top

Miscellaneous Options:
E = EPDM Diaphragm
P = PVC Diaphragm
V = Viton Diaphragm
G = Gauge Port

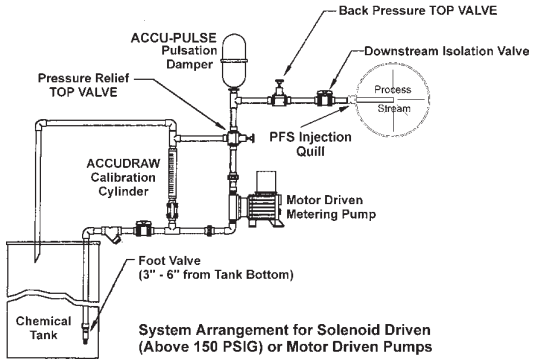
Body Material of Construction:
PVC = polyvinylchloride
CPVC= Corzan
PP = polypropylene
TFE = 24% glass filled Teflon
PVDF= polyvinylfluoride
S/S = 316L Stainless Steel
ALL20= Alloy 20
Hast = Hastelloy C 276

Flow Rates



Flow capacity through TOP VALVE back pressure/anti-siphon and pressure relief valves under continuous flow conditions **@ 50 PSIG** with ambient temperature water.

Size	1/4"	1/4" / 1/2"	1/2"	3/4"	1"	1 1/2"	2"
Flow rate USGPM	4	4	6	8	14	25	40



Note: Capacities will increase with pressure. If pressure is doubled, flow rate wll approximately double. For capacities of valves with pulsating flow, use approximately 1/3 of the given flow rates.

Typical Installations

The installations below are typical installation examples only. Consult your engineering department for the appropriate installation of your application or call Primary Fluid Systems Inc. for advice.

Installations

Installation "A"
(using return to tank)

Installation "B"
(using bottom connection with dust cover)

Conversion Factors

1 ml = 1 cc
1000 ml = 1 liter
ml/sec X 60 = ml/min
1 US gal/min X 0.063 = liters/sec
1 US gal = 3.786 liters

CORPORATION STOPS

LEFT BLANK

PFS Corporation Stops

PFS Corporation Stops have been designed to inject chemical into the center stream of the flow.

- **isolation valve allows for ease of maintenance**
- **available in 6 materials of construction**
- **wetted components have comparable or greater chemical resistance than quill construction material**
- **standard and custom lengths available**
- **connection in NPT, metric or flanged**
- **standard 1/8" orifice discharge and optional 1/4" for higher flow**

TABLE OF CONTENTS

Safety Instructions.....2
Applications and Operating Ranges.....2-4
Installation.....5
Electrical 6-7
Operation.....7-8
Maintenance 9-12
Troubleshooting Guide.....13
Repair Parts 14-17

Carefully read and follow all safety instructions in this manual or on pump.

This is the safety-alert. When you see this symbol on your pump or in this manual, look for one of the following signal words and be alert to the potential for personal injury.

⚠ DANGER warns about hazards that **will** cause serious personal injury, death or major property damage if ignored.

⚠ WARNING warns about hazards that **can** cause serious personal injury, death or major property damage if ignored.

⚠ CAUTION warns about hazards that **will** or **can** cause minor personal injury or property damage if ignored.

The word **NOTICE** indicates special instructions which are important but not related to hazards.

To avoid serious or fatal personal injury and possible property damage, carefully read and follow the safety instructions.

1. **Install pump according to all code requirements.**
2. **Compare pump nameplate data with desired operating range.**
3. **Pump only liquids compatible with pump component materials (that is, liquids that will not attack the pump).**
4. **Make sure plumbing is adequate to handle system pressure.**
5. **Periodically perform maintenance inspection on pump and system components.**
6. **Wear safety glasses at all times when working on pumps.**

INSPECT THE SHIPMENT

The vertical multistage centrifugal inline pump has been carefully inspected and packaged to assure safe delivery. Inspect the pump and fittings and report to the carrier any items which are damaged or missing.

CONFIRM THAT YOU HAVE THE RIGHT PUMP

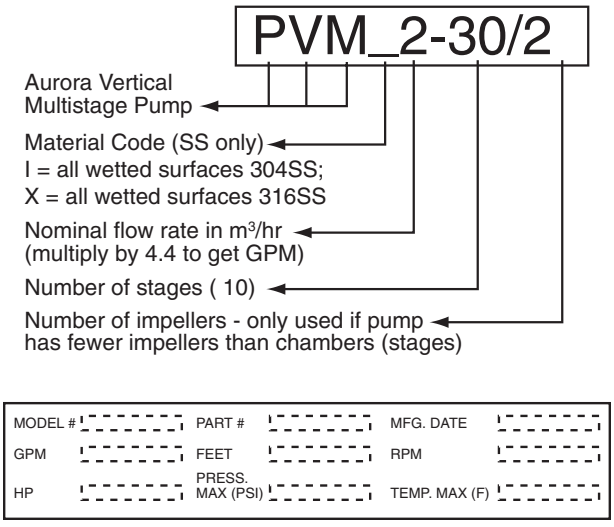

FIGURE 1 - Model Plate Information

APPLICATIONS AND OPERATING RANGES

Aurora multistage in-line centrifugal pumps are designed for liquid transfer, circulation, and pressure boosting of hot or cold clean water or other thin, non-explosive liquids, not containing solid particles or fibers, which will not chemically attack the pump materials.

Typical applications include:

- Municipal water supply and pressure boosting
- Boiler feed and condensate systems
- Cooling water systems
- Irrigation
- Fire fighting

Maximum Ambient Temperature.....104° F(40° C)

Liquid Temperature Range .....5° F to 250° F (-15° C to +121° C)

Maximum Permissible Operating Pressure Curves.....See Figure 4

Maximum Inlet Pressure: ..... Table II shows the maximum permissible inlet pressure. However, the actual inlet pressure plus the pressure when the pump is running against a closed valve must always be lower than the *"Maximum Permissible Operating Pressure".*

Electrical Data: .....See Motor Nameplate

Dimensions and Port to Port Lengths : .....See Figures 2A, 2B, 3A and 3B, Pages 3 and 4

* Measurements represent the largest number possible for each Model.

NOTE: PVMI models are 304 stainless steel; PVMX models are 316 stainless steel.

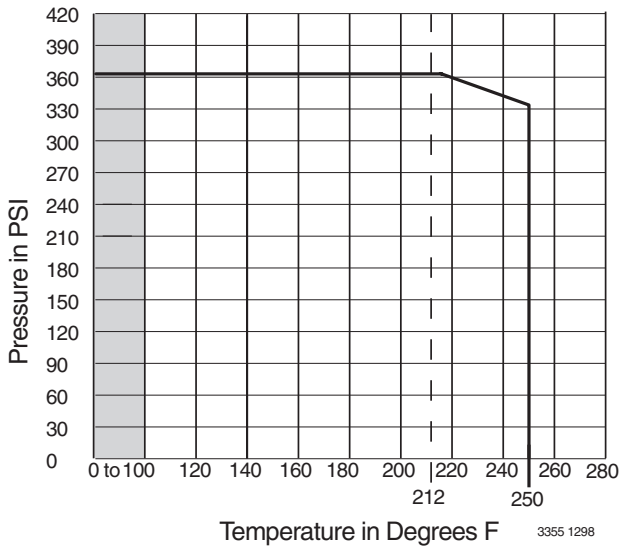

FIGURE 4 - Maximum Permissible Operating Pressure

TABLE III – Permissible Operating Pressures

PVM2-30/2 to PVM2-180
PVM4-20/1 to PVM4-160
PVM8-20/1 to PVM8-160
PVM16-30/2 to PVM16-120

Model Number		Maximum Inlet Pressure (PSI)
PVM2	30/2 - 60	145
	70 - 180	220
PVM4	20/1 - 20	90
	30 - 80/7	145
	80 - 160	220
PVM8	20/1 - 40	90
	50 - 160	145
PVM16	30/2 - 30	90
	40 - 120	145

INSTALLATION

⚠WARNING **Hazardous voltage. Voltage can shock, burn, or cause death.** Ground pump motor correctly before connecting to power supply, per article 250-80 of the National Electrical Code (NEC) in the U.S., or the Canadian Electrical Code (CEC), as applicable.

Location

Locate pump in a dry, well-ventilated area, not subject to freezing or extreme variations in temperature.

Mount pump a minimum of 6" from any obstruction or hot surface. Install the pump with the motor shaft vertical. Make sure that an adequate supply of cool air reaches the motor cooling fan. Maximum ambient air temperature is 104° F (40° C).

For open systems requiring suction lift, locate the pump as close to the water source as possible.

Foundation

Foundation should be concrete or a similarly rigid foundation to provide a secure, stable mounting base for the pump.

Secure pump to foundation using all bolt holes. Refer to Figures 2 and 3 for bolt plate dimensions. Be sure that all four pads on the base are properly supported.

Shim pump base to make sure that pump is level.

Piping

⚠WARNING **Explosion and burn hazard. Do not run pump with discharge valve closed; the water in the pump may boil, with risk of explosion and steam burns to anyone near.** If there is any danger of the pump running against a closed discharge valve, install a pressure relief or bypass valve in the discharge pipe to allow for minimum liquid flow through the pump. Minimum liquid flow through the pump is needed for cooling and lubrication of the pump (See Table IV). Run the bypass/relief valve and discharge pipe to a floor drain or a tank for collection.

Suction pipe should be adequately sized (See Table V) and run as straight and as short as possible to keep friction losses to a minimum. Pipes, valves, and fittings must have a pressure rating equal to or greater than the maximum system pressure.

TABLE IV – Minimum Pumping Rates

Type	Liquid Temperature +5° F to +250° F
PVM2	1 GPM
PVM4	2 GPM
PVM8	4 GPM
PVM16	8 GPM

TABLE V – Minimum Suction Pipe Sizes

Type	Pipe Size
PVM2	1-1/4" Nominal Diameter, Schedule 40 Pipe
PVM4	1-1/4" Nominal Diameter, Schedule 40 Pipe
PVM8	2" Nominal Diameter, Schedule 40 Pipe
PVM16	2" Nominal Diameter, Schedule 40 Pipe

Pressure check the discharge piping as required by codes or local regulations.

"Inlet" and "Outlet" are marked on the pump base to show the direction of the liquid flow through the pump.

Install anti-vibration mountings on either side of the pump if a minimum noise level is desired.

Install isolation valves in both inlet and outlet pipes near the pump (see Figure 5). This allows for removal of pump for service without draining the system and isolation of the pump in case of a flooded suction condition.

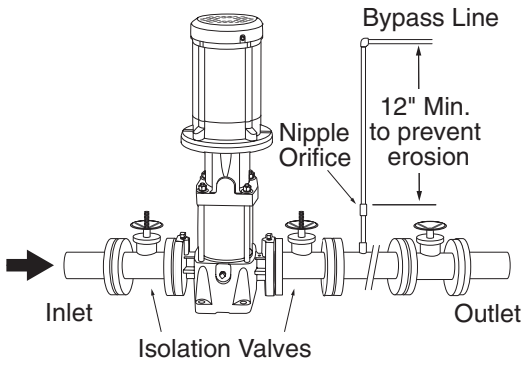

FIGURE 5 - Bypass required if pump might operate with discharge valve closed. See Table IV for minimum required flow through pump to prevent overheating and to ensure lubrication.

If the system pressure is greater than the pumps maximum inlet pressure the limits of the pump can be exceeded if the discharge pressure backs up to the inlet side of the pump. Installation of a check valve in the discharge pipe is recommended to prevent this condition.

Make sure, especially on the inlet side of the pump, that there are no airlocks in the system. See Figure 6 for correct pipe work to avoid airlocks. The suction pipe should be level or slightly rising.

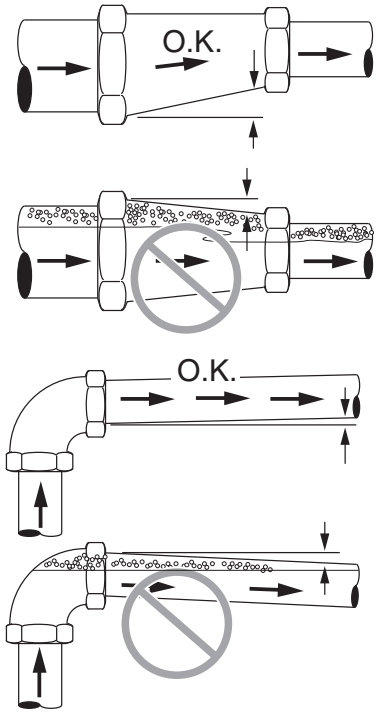

FIGURE 6 - Install Pipe Correctly to Prevent Air Locks

Support all piping independently of the pump so the weight of the piping system does not strain the pump case. Make sure that the expansion and contraction of the piping system from temperature variations cannot put a strain on the pump.

If the system or pump must be drained periodically (especially if the discharge pipe is horizontal or slopes downward away from the pump), install a loop and vacuum valve as shown in Figure 7 to protect the pump against running dry. The highest point of the loop should be at least as high as the lowest point of the motor. This loop/valve combination will allow the pump and the system to be drained independently of one another.

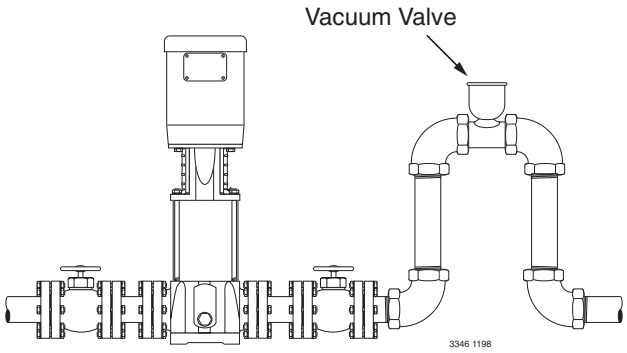

FIGURE 7 - Loop and Vacuum Valve Installation

ELECTRICAL

⚠WARNING **Hazardous voltage. Can shock, burn or cause death.** All electrical work should be performed by a qualified electrician in accordance with the National Electrical Code and all local codes and regulations. Make sure that the motor voltage, phase, and frequency match the incoming electrical supply. The proper operating voltage and other electrical information can be found on the motor nameplate. These motors are designed to run up to ±10% of the nameplate-rated voltage. The wiring connection diagram can be found on either a plate attached to the motor or on a diagram inside the terminal box cover.

- **If voltage variations are greater than ±10% do not operate the pump.**
- Incorrect voltage can cause fire or serious damage to the motor and voids warranty.
- Ground the pump motor correctly before connecting it to the power supply.
- Follow the wiring instructions when connecting the motor to the power lines.

Position of Terminal Box

To turn the motor so that the terminal box faces the right direction, proceed as follows:

1. Disconnect the power to the pump motor.

2. Remove the coupling guards (use a screwdriver).
3. Remove the couplings.
4. Remove the bolts that fasten the motor to the pump.
5. Turn the motor to the required position (in quarter-turn increments).
6. Follow steps 10 - 20 under "Motor Replacement", on Page 9.

Field Wiring

All wiring connections and wiring sizes must meet National Electrical Code and local requirements.

Motor Protection

See the motor nameplate for electrical connection/wiring diagram.

Aurora pumps must be used with the proper size and type of motor starter to ensure protection against damage from low voltage, phase failure, current imbalances and overloads. The overload should be sized to trip at the full-load current rating of the motor.

OPERATION

Priming

⚠WARNING **Hazardous pressure.** Do not run the pump with the discharge valve closed; the water in the pump may boil, causing risk of explosion and steam burns to anyone nearby.

⚠WARNING **Hazardous voltage.** Disconnect all power to the pump before servicing or working on the pump. Make sure that the power is locked out and that the pump cannot be accidentally started.

NOTICE: Under no circumstances should the pump be operated without flow through the pump. **Never** operate the pump dry.

Operation of closed systems or open systems with the liquid level above the pump priming plug:

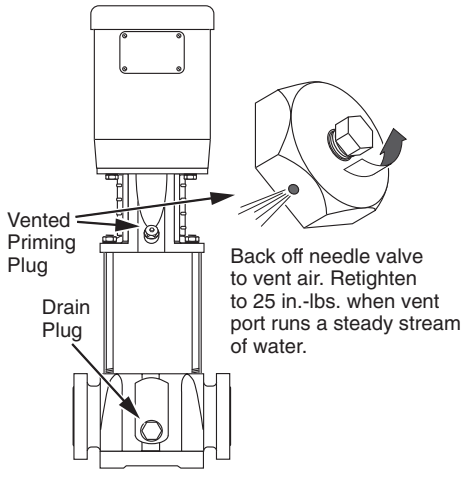

FIGURE 8 - Priming and Drain Plugs

1. Close the discharge isolating valve and loosen the needle valve located in the assembly in the pump head (Figure 8). Do not remove the needle valve.

NOTICE: On PVMI(X)2/4 models, remove the coupling guard for access to the vent plug.

⚠WARNING **Risk of water damage and injury. Watch the direction of the priming plug and make sure that the liquid escaping from it does not injure persons nearby or damage the motor or other components. In hot water installations, pay particular attention to the risk of injury from scalding hot water.**

2. Slowly open the isolation valve in the suction pipe until a steady stream of liquid runs out the vent in the priming port.
3. Tighten needle valve to 25 inch-pounds. Completely open isolation valves.

NOTICE: Please turn to "Starting", Page 8, before proceeding any further.

Operation of open systems with the liquid level below the top of the pump:

NOTICE: The suction pipe requires a check valve or isolation valve.

1. Close the discharge isolation valve.
2. Remove the vented priming plug.
3. Pour liquid through the priming port until the suction pipe and the pump are completely filled with liquid.
4. Replace the vented priming plug and tighten it securely.
5. Repeat steps 1-4 until the pump is primed.

NOTICE: Please turn to "Starting", Page 8, before proceeding any further.

Checking Direction of Rotation

NOTICE: Do not disconnect the motor from the shaft to check the direction of rotation. If you remove the coupling, then you must adjust the shaft position when you reinstall it. This must be done before starting the pump.

Arrows on the pump head show the correct direction of rotation. When seen from the motor fan, the pump should rotate *counterclockwise* (↶). For pump motors without a fan remove one of the coupling guards and look at the coupling to determine the direction of rotation. Turn off the pump and replace coupling guard.

NOTICE: Do not check the direction of rotation until the pump has been filled with liquid. See "Priming", at left and above.

1. Switch power off.
2. Remove the coupling guard and rotate the pump shaft to be certain it can turn freely. Replace the coupling guard.
3. Verify that the electrical connections are in accordance with the wiring diagram on the motor.
4. If the fan is visible, turn on and off to verify rotation.
5. To reverse the direction of rotation, first switch OFF the power supply.

6. On three-phase motors, switch 2 of the 3 power leads on the load side of the starter. On single-phase motors, see the connection diagram on the motor nameplate. Change the wiring as indicated.

⚠WARNING **Hazardous voltage.** Voltage can shock, burn or cause death. Ground the pump motor correctly before connecting to power supply per article 250-80 of National Electrical Code (NEC) in the U.S., or the Canadian Electrical Code (CEC), as applicable.

7. Switch on the power supply and recheck the direction of motor rotation.

Starting

1. If a suction line isolation valve has been installed, check to be sure that it is completely opened.
2. For initial starting, the isolation valve in the discharge pipe should be almost closed.
3. Start the pump.
4. When the piping system has been filled with liquid, slowly open the discharge isolation valve until it is completely open. Opening the valve too fast may result in water hammer in the discharge pipe. If the pump or system start to rattle, the pump is cavitating; to avoid damage to the pump, reduce the flow through the discharge isolation valve until the rattling stops. If this does not give adequate flow for your installation, call your installer or system designer.
5. Record the voltage and amperage of the motor. Adjust the motor overloads if required.
6. If pressure gauges have been installed, check and record operating pressures.
7. Check all controls for proper operation.

Motor Bearings

For the greasing schedule and greasing procedure of the motor bearings follow the motor manufacturers recommendations.

Calculating Minimum Inlet Pressure:

Minimum inlet pressure is required to avoid cavitation in the pump and is calculated as follows:

$H = Pb - NPSHR - H_f - H_V - H_S$

H = Minimum Inlet Pressure in Feet of Head

Pb = Barometric Pressure in Feet

1 Bar = 29.53 inches of Mercury (Hg)

1 PSI = 2.31 Ft of Head

1 Bar = 33.5 Ft. of Head

NPSHR = Net Positive suction head required. To be read from the NPSHR curve, Figure 9, at the highest flow the pump will be delivering.

H_f = Friction Loss in suction pipe in ft of head

H_V = Vapor pressure in feet of head (See Table VI).

H_S = A safety margin of 1.64 ft of head

Example for PVM8:

If: Flow = 60 GPM

Pb = 1 Bar = 29.53 Inches of Mercury*

(Convert from Bar to Feet of Head)

1 Inch of mercury = 1.13′ feet of water

T = 100° F

NPSHR = 10′ (See Figure 9)

H_f = 10′ of 2″ Steel Pipe @ 11.9′ of loss per 100′ of Pipe (H_f = 11.9′/10′ = 1.19′)

H_V = 2.195′ (from Table VI)

H_S = 1.64′ (safety factor from above)

Then: $H = 33.5' * - NPSHR ** - H_f - H_V - H_S$

H = 33.5′ - 10′ - 1.19′ - 2.195′ - 1.64 = 18.475′

H = 18.475′ = Minimum Inlet Pressure

* 1 Bar = 14.5 PSI x 2.31 Ft of Head = 33.5′

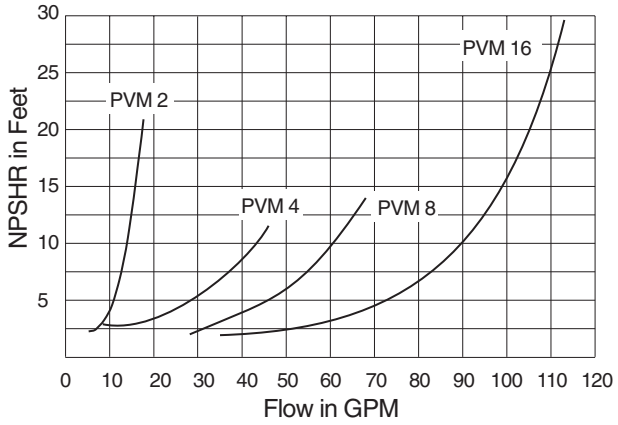

FIGURE 9 - PVM2 through PVM16
Net Positive Suction Head Requirement (NPSHR)

TABLE VI – Vapor Pressure of Water

Temperature in °F (°C)	Vapor Pressure in PSIA (kPa)	Absolute Pressure in Feet (M) of Water
32 (0)	0.089 (.61)	0.205 (.062)
40 (4.4)	0.122 (.84)	0.281 (.086)
60 (15.6)	0.256 (1.77)	0.592 (.180)
80 (26.7)	0.507 (3.50)	1.172 (.358)
100 (37.8)	0.95 (6.55)	2.195 (.669)
120 (48.9)	1.695 (11.69)	3.914 (1.193)
140 (60.0)	2.892 (19.94)	6.681 (2.036)
160 (71.1)	4.745 (32.72)	10.961 (3.341)
180 (82.2)	7.515 (51.84)	17.36 (5.291)
200 (93.3)	11.529 (79.49)	26.632 (8.117)
210 (98.9)	14.125 (97.39)	32.629 (9.945)
212 (100)	14.698 (101.34)	33.952 (10.349)
220 (104.4)	17.188 (118.51)	39.704 (12.102)
230 (110.0)	20.78 (143.28)	48.002 (14.631)
240 (115.6)	24.97 (172.17)	57.681 (17.581)
248 (120.0)	28.79 (188.51)	66.505 (20.271)

MAINTENANCE

Motor Replacement

For Key Numbers, refer to the Exploded View, Figure 14, Page 14 for PVM2 and PVM4 Series Models, Figure 16, Page 16 for PVMI/X2 and PVMI/X4 Models, Figure 15, Page 15 for PVM8 and PVM16 Series Models, and Figure 17, Page 17 for PVMI/X8 and PVMI/X16 Series Models.

⚠WARNING **Hazardous voltage.** Disconnect all power to the pump before servicing or working on pump. Make sure that power is locked out and that pump cannot be accidentally started.

1. Disconnect the power to the pump motor.
2. Close the nearest suction and discharge valves.
3. Remove the coupling guards (Key No. 4) by prying them loose with a screw driver.
4. Remove the socket head screws (Key No. 3) and the coupling halves (Key No. 2) from the shaft (Key No. 16A). For additional reference, see Figure 12, Page 10.

   NOTICE: Socket head screws are metric. See Table VIII on Page 12 for specific metric driver sizes.
5. Remove the shaft pin (Key No. 5).
6. Remove the capscrews (Key No. 12), flatwashers (Key No.10), and lockwashers (Key No.11) that hold the motor (Key No. 1) and the motor bracket (Key No. 7) together.
7. Pull the old motor up and off of the motor bracket. **NOTICE:** Note the location of the conduit box on the motor.
8. Thoroughly clean the surfaces of the mounting flanges on the new motor and the pump end.
9. Install the new motor on the pump with the conduit box in the desired position.
10. Lubricate the capscrews (Key No. 12) with oil.
11. Reinstall the lockwashers, flatwashers, and capscrews that hold the motor and the motor bracket together, then tighten evenly and diagonally. See Table VIII, Page 12 for torque specifications.
12. Reinstall the shaft pin (Key No. 5) in the shaft.
13. Reinstall the coupling halves (Key No. 2) on the pump and motor shaft. Make sure to engage the shaft pin (Key No. 5).

    NOTICE: Be sure coupling surfaces are thoroughly clean prior to assembly.
14. Snug up the socket head screws (Key No. 3) until the coupling begins to bind and then loosen 1/2 turn.
15. Draw up the capscrews evenly so the gap between the coupling halves is equal on both sides (See Figure 10A).

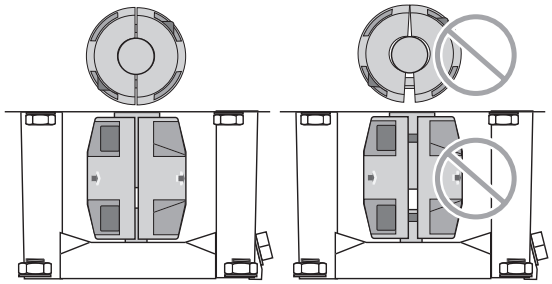

FIGURE 10A - Make Sure that the Coupling Halves are Evenly Tightened

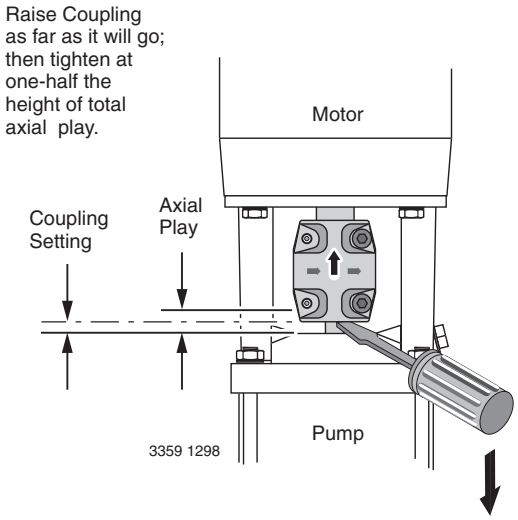

FIGURE 10B - Vertically (axial) Centering the Coupling

16. Insert a screw driver under the coupling (See Figure 10B).
17. Raise the pump shaft to its highest point.
18. Lower the shaft halfway back down the distance you just raised it and retighten the capscrews. See Figure 10.

    NOTICE: Torque settings are critical to prevent coupling movement. Refer to Table VIII, Page 12 for torque specifications.
19. Rotate the shaft to make sure that there is no interference. If rubbing is noted repeat steps 16, 17, and 18 above and readjust pump shaft height.
20. Reinstall the coupling guards by snapping them into place.

    NOTICE: The guards should be in place before the unit is run.
21. Open the suction and discharge valves. Turn the power back on.

Replacing Pump Stack

For Key Numbers, refer to the Exploded View, Figure 14 on Page 14, for the PVM2 and PVM4 Series Models and Figure 15 on Page 15 for PVM8 and PVM16 Series Models.

⚠WARNING Hazardous pressure. Do not run pump with discharge valve closed; the water in the pump may boil, causing risk of explosion and steam burns to anyone nearby.

1. Follow steps 1-8 under "Motor Replacement" section on Page 9; then proceed with step 2 below.
2. Remove the four staybolt nuts, flatwashers, and lockwashers (Key Nos. 8, 9A, and 9B) from the staybolts (Key No. 19).

   NOTICE: It is not necessary to remove the staybolts when replacing the stack.
3. Lift the motor bracket (Key No. 7) off of the pump body.

   NOTICE: Note the position of the priming plug. The priming plug must be returned to its original position during reassembly.
4. Remove and discard upper sleeve gasket (Key No. 17).
5. Clean gasket seat.
6. Remove and replace round spring ring (PVM2 and PVM4) or stack spring (PVM8 and PVM16) (Key No. 13).
7. Pull the old stack (16A through 16L) out of the stainless steel sleeve (Key No. 18) by pulling straight up on the pump shaft (Key No. 16A).
8. Remove the stainless steel sleeve (Key No. 18).
9. Remove and discard the bottom sleeve gasket (Key No. 17).
10. Clean the gasket seat.
11. Remove and discard the O-Ring (Key No. 21A) from the suction/discharge (Key No. 21 PVM2 and PVM4 only).
12. Cast Iron Models Only: Clean the O-Ring seat and install a new O-Ring (Key No. 21A).
13. Install a new lower sleeve gasket.
14. Install the new stack without the stainless steel sleeve.

    NOTICE: Be sure to align either the small priming hole or the suction interconnector pin hole (located on the bottom stage of the stack) properly in the base of the Suction/Discharge (Key No. 21). See Figure 11 (not necessary on PVMI/X models).
15. Use a rubber mallet to tap the stainless steel sleeve (Key No. 18) into place.
16. Install a new mechanical shaft seal (Key Nos. 14A and 14B, or Key Nos 15A through 15G). Refer to "Mechanical Seal Disassembly and Mechanical Seal Reassembly" sections, Pages 11 and 12.
17. Install a new upper sleeve gasket (Key No. 17).
18. Install a new round spring ring or stack spring (Key No. 13).
19. Reinstall the motor bracket (Key No. 7) on the pump body. Align the priming plug (Key No. 6) to its original position.
20. Oil the threads on the staybolts (Key No. 19).
21. Replace the lockwashers, flatwashers, and staybolt nuts (Key Nos. 8, 9A and 9B) and cross-torque the staybolts. See Table VIII, Page 12, for torque specifications.
22. Reinstall the motor (Key No. 1) on the motor bracket (Key No. 7) and turn the motor to the desired terminal box position.
23. Follow steps 10 - 21 under "Motor Replacement", Page 9. You have now finished changing out the impeller stack.

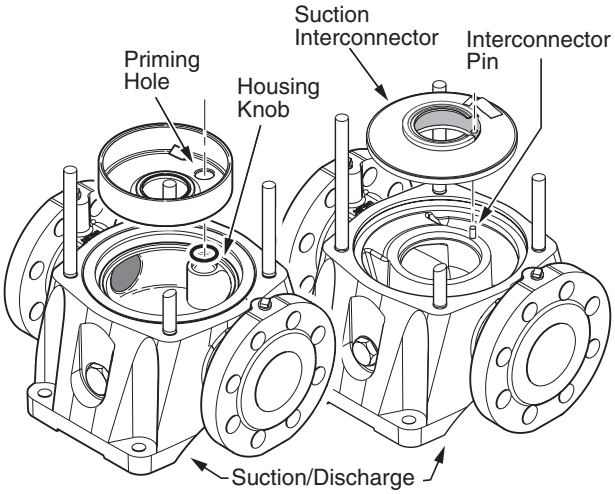

FIGURE 11 - PVM2, PVM4 – Align Small Priming Port. PVM8, PVM16 – Align Interconnector Pin. No alignment is necessary on PVMI/X models.

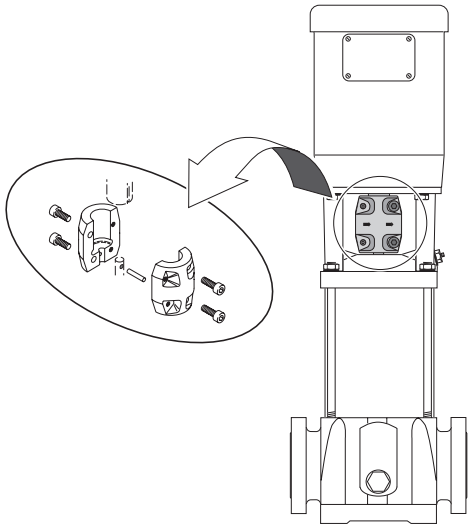

FIGURE 12 - Remove the Socket Head Screws and the Coupling Halves

Seven Part Mechanical Seal/Disassembly:

See Figure 13 for Seal Key Numbers.

See Figures 14 through 17 for Pump Key Numbers.

⚠WARNING Hazardous voltage. Can Shock, burn or cause death. Disconnect power to pump before disassembly.

1. Follow Steps 1-8 under "Motor Replacement" Page 9, and proceed with step 2 below.
2. Remove the four nuts, lockwashers and washers (Key Nos. 8, 9A, and 9B) from the staybolts (Key No. 19).
3. The shaft seal consists of an O-Ring (Key No. 15A), the stationary half of the mechanical seal (Key No. 15B), the rotating half of the mechanical seal (Key No. 15C), a second O-Ring (Key No. 15D - inside No. 15C), a flat washer (Key No. 15E), a spring (Key No. 15F), and a mechanical drive ring (Key No. 15G), in that order, see Figure 13, below. Turn the pump head upside down and remove the stationary part of the seal (Key No. 15B) from the seal seat in the base of the motor bracket.

   NOTICE: Use care not to chip or scratch the seal seat during disassembly and assembly.

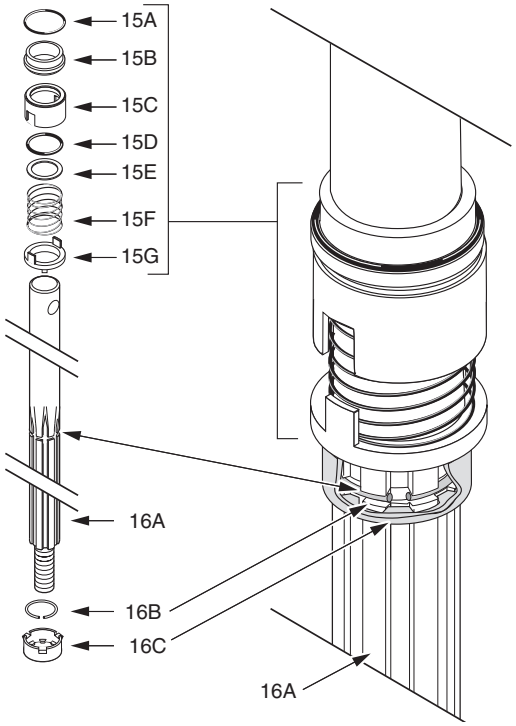

FIGURE 13

4. Clean the seal seat with a wet cloth.
5. Remove the rotating parts of the seal by twisting and pulling up on them until they come off of the shaft (Key Nos.15C and 15D, 15E, 15F, and 15G). Discard the old seal.

Seven Part Mechanical Seal Reassembly:

NOTICE: Before assembly check and clean all sealing and gasket surfaces with a clean wet cloth. Replace all seals, gaskets and O-Rings.

1. Turn the motor bracket (Key No.6) upside down.
2. Moisten the seal seat (in the motor bracket) with a small amount of water.
3. Lubricate the larger diameter O-Ring (Key No. 15A) with a small amount of water and install it on the stationary half of mechanical seal (Key No. 15B).
4. Press the stationary half of the shaft seal (Key No. 15B) with O-Ring (Key Nos. 15A and 15B) into the seal seat of the motor bracket. Use finger pressure only. If a tool is used, protect the seal face from tools with a clean cloth.

   NOTICE: Be sure the seal is installed evenly to avoid pinching the O-Ring.
5. Lubricate smaller diameter O-Ring (Key No. 15D) with water and press it into the rotating half of the mechanical seal (Key No.15C).
6. Install the mechanical drive ring (Key No. 15G) on the shaft (Key No. 16A). Be sure the drive ring butts up against the mechanical seal spacer (Key No. 16C).
7. Install the spring (Key No.15F) up against the drive ring on the shaft .
8. Install the flatwasher (Key No.15E) on the shaft, against the spring.
9. Install the rotating half of the mechanical seal (Key No.15C) on the shaft. Align the grooves on the rotating half of the mechanical seal with the teeth on the mechanical drive ring (Key No. 15G).
10. Follow Steps 11 - 23 under "Replacing Pump Stack", Page 10.

Frequency of Starts and Stops

Check pump cycling frequency and make sure that the pump is not starting more than:

TABLE VII – Maximum Number of Cycles

Cycles	Motor HP Rating
20 times per hour	1/2 - 5 HP motors
15 times per hour	7- 1/2 - 15 HP motors
10 times per hour	20 and 25 HP motors

Frost Protection

1. If you do not use your pump during seasons of frost, drain it and add a glycol based antifreeze (50/50 mixture) to avoid damage.

⚠ CAUTION **Risk of water damage and injury. Watch the direction of the priming plug and make sure that liquid escaping from it does not injure persons nearby or damage the motor or other components. In hot water installations, pay particular attention to the risk of injury from scalding hot water.**

2. Upon restart dispose of spent antifreeze properly.
3. Do not replace the drain plug or tighten the priming plug until you put the pump back in service again.

Regular Maintenance Checks

The following checks should be made at regular intervals:

1. The pump meets required performance and is operating smoothly and quietly.
2. There are no leaks.
3. The motor is not overheating.
4. Remove and clean all strainers and filters in the system.
5. Verify amp draw – check motor amperage.
6. Pump wear rings and shaft require no regular maintenance.

TROUBLESHOOTING GUIDE

⚠WARNING Hazardous voltage and risk of sudden starts. Disconnect all power to the pump before servicing or working on pump. Make sure that power is locked out and that pump cannot be accidentally started.

PROBLEM	CAUSE
1. Motor does not run when started	A. Power failure B. Fuses blown C. Motor starter overload has tripped out D. Main contacts in motor starter are not making contact or the coil is faulty E Control circuit fuses are defective F. Motor is defective
2. Motor starter overload trips out immediately when power supply is switched on	A. One fuse has blown B. Contacts in motor overload relay are faulty C. Cable connections are loose or faulty D. Motor winding is defective E. Pump mechanically blocked F. Overload setting is too low
3. Motor starter overload trips out occasionally	A. Overload setting is too low B. Low voltage at peak times
4. Motor starter has not tripped out but the motor does not run	A. Check 1 A), B), D,) and E)
5. Pump capacity is not constant	A. Pump inlet pressure is too low B. Suction pipe/pump partly blocked C. Pump is sucking air
6. Pump runs but gives no water	A. Suction pipe/pump blocked B. Foot or non-return valve is blocked in closed position C. Leakage in suction pipe D. Air in suction pipe or pump E. Motor rotates in the wrong direction
7. Pump runs backwards when switched off	A. Leakage in suction pipe B. Foot or non-return valve is defective C. Foot valve is blocked in open or partly open position D. Non return valve leaks or is blocked in open or partly open position E. Discharge valve is defective
8. Leakage from shaft seal	A. Pump shaft position is incorrect B. Shaft seal is defective
9. Noise	A. Cavitation is occurring in the pump B. Pump does not rotate freely (That is, there is increased frictional resistance) because of incorrect shaft position

INSTALLATION & OPERATION MANUAL
MIX-TECH MIXERS

S E C T I O N 1 - INSPECTION

- Make sure that all mixer parts have been removed from the crate(s) before discarding.
- Each mixer should be carefully checked for any possible shipping damage. Any shipping damage should be reported to the TRANSPORT COMPANY immediately.
- Check the paint and make any necessary touch-ups.

S E C T I O N 2 - INSTALLATION

- Most mixer problems can be avoided by following proper installation and operation instructions. The following is a list of hints to help insure proper installation and therefore satisfactory mixer service.
- Please read all appropriate instruction manuals prior to proceeding with the installation of the mixers.

C AU T I O N

- Lock-out the motor starter if any person is in the tank.
- Remove wick from the breather vent plug.
- DO NOT Paint breather / vent plug

MOST COMMON PROBLEMS: Mixer Shaft(s) not vertical; Impeller going through liquid level

- Make sure the impeller blades have been installed onto the hubs in the proper position with regards Rotation and Direction of flow. Please also note that the impellers blades are installed with the hubs ears always backing the blade into the flow. Also be sure that the leading edge and not the trailing edge is presented into the flow and that the angle at the impeller tip (angle of attack) from the horizontal is closer to 15° rather than to 75°.

C A U T I O N

- If the angle of attack (at the impeller tip is closer to 75°, either an incorrect hub in combination with the correct impeller blade (OR VICE VERSA) has been incorrectly assembled to make an incorrect matching of possible hub and blade combinations. For help in determining what the correct combination should be, Please refer to the mixer nameplate that will have the Rotation and direction of thrust written. Once you know the combination, refer to the pictorial guide of impeller / hub installation positions A, B, C or D.

- Depending on whether the concave or the convex surface is facing the fluid, if the angle of attach at the impeller is closer to 75°, the HP drawn will be 2 to 3 times greater than what it should be. This could result in overloading the motor and damaging the mixer.

- Make sure that the impeller blades are installed in the correct position for the required rotation. e.g. if the impeller blades are installed up-side-down, the pumping capacity will be reduced by about 65%. Check the mixer nameplate for the flow direction and install the impeller blades to suit.

C A U T I O N

POTENTIALLY DAMAGING SITUATIONS FOR MIXERS

- Prolonged operation of the mixer (impeller) at the liquid interface causes increased stress on the shaft & impeller for which the system was not designed to accommodate. Damage could result.
- Installations where there is a large hydraulic flow (or Velocity) in the mixer reservoir. : Make sure that if should such a flow is present, that the flow is baffled or dispersed over a larger area (as opposed to directed flow via a pipe), or that the flow be re-directed away form the impeller/shaft assembly, or is introduced evenly e.g via a weir. If this cannot be done, this external hydraulic flow will exert additional un-designed for stress loads and deflection on the mixer shaft and impeller which could result in component failure.

C A U T I O N

- Before permanently wiring the motor, check for the correct rotation of the low speed shaft. Normal is Clock-wise looking down from the top of the tank, although the reverse may also be required. Please check mixer nameplate for other instructions. (e.g. Letters A, B, C or D)

- Read and follow the instructions of all tags and nameplates before operating.
- Check the mixer full load motor amperage and voltage before operating any mixer.
- It is recommended that the mixer impeller be rotated by hand in order to check for smooth operation. **N.B**: For crown & worm drives, remove the fan cover and rotate the fan manually.
- Always operate the mixer in a fluid which had a specific gravity and viscosity less than or equal to the design specific gravity and viscosity.
- Do not dump the contents of large bags of chemicals directly onto the rotating mixer impeller(s); but add the contents into the reservoir gradually. This will also promote better mixing.
- Before starting the mixer, make sure the impeller is not buried in solids or a "set-up" fluid Note: If solids have settled-out, then dilute or jog the mixer clockwise then counterclockwise
- Please check that there is no directed flow from an external source at the impeller or shaft unless the mixer was specifically designed to accommodate these additional stress loads, as mixers could be damaged.
- During START-UP, please listen for unusual noises and check for excessive vibration.
- Check the temperature of the motor and gear reducer. The temperature should not exceed 180º F. (82ºC) If they are too hot, please stop the operation of the mixer and contact MIX-TECH immediately.
- Measure the motor amperage. The measured amperage must be less than the nameplate rating nameplate value. If the amps are over, please check the rotational speed of the gear reducer/mixer output shaft. Place a piece of tape onto the shaft (or use an RPM counter if available, and count the number of revolutions for a period of e.g. 10 seconds using your watch second hand. Multiply the result by (6) for 60 Hz operation and this will provide you with the rotational speed of the mixer. Check Rotation, & impeller blade installation to be sure they are correct. If the power draw remains high, please check with MIX-TECH

Note: - Record the full load motor amperage (FLA) and measure them every (3) months.
- Some motor amperage readings are poor indicators at low loads

C A U T I O N:

- **DO NOT STAY IN THE TANK DURING MIXER ROTATION**
- Never use the mixer impeller as a foot stand or support for body weight - as such actions could damage the mixer as well as result in serious bodily injury.

- As with any rotating equipment, in order to avoid injury, extreme care should be taken to avoid contacting the rotating parts including not connecting the motors to the electrical power source until the mixer is completely assembled. Then, vacate the tank prior to operating the mixer.

- Before making field changes of motor horsepower, mixer speed, shaft length, impeller diameter or width, etc. be sure to consult with ENVIREQUIP, MIX TECH DIVISION.

- After any plant electrical work has been done, check that the mixer(s) rotation(s) are correct as power lines may have been reversed**.**

S E C T I O N 3 - MIXER ASSEMBLY: - Closed tanks are Flange Mounted

- Open tank models usually are mounted on a steel structure. Level the drive as closely as possible. This assures that the shaft will turn in a true vertical position. Incorrect mounting is often a cause of mechanical difficulty with a mixer. Unless specified on the mixer assembly drawing, the mixer extension shaft is designed to run in a true vertical position. Never angle or side mount the mixers.

- While operating, there is random fluid motion in the vessel that exerts great forces on the extension shaft of the mixer. The mixer accommodates these forces since they are transmitted directly to the support mounting(s). Therefore, the mounting system must be rigid. It must support the static mixer weight as well as live mixer reactions that result from Torque and Bending Moment. It is not enough to design the support system for acceptable levels of stress. It must be rigid enough to take care of Start-up torque load (2.5 times the Torque), and preclude large deflections that may result in mixer vibration.

- When designing the support structure to accommodate bending moments, be sure that the structure is sufficiently rigid so that the mixer extension shaft will not move more than 1/32" per (10) feet (0.8 m per 3.05 meters) of shaft length due to deflection of the support structure.

- After the gear drive (with the motor already flange mounted onto the drive) has been properly installed, the mixer extension shaft should be installed into the gear drive's hollow output shaft (quill shaft) and fastened in the quill shaft with the thrust plate and secured in position with the threaded bolt provided - use Locktite Blue (or equivalent), or in the case of an output shaft coupling, bolt the mating flanges together.

- Mixer blades over 20" in diameter are generally bolted to a welded hub. Check the welds on the hub on your yearly overall inspection.

- These mixers are supplied with the finest electric motors available. They are manufactured by a nationally known manufacturer, (e.g. NORD, WEG, Brook etc). Under normal operating conditions, within specified temperatures, proper installation and maintenance, these motors are guaranteed to deliver rated output.

- In order to get top performance from any electric motor, be sure that there is plenty of air circulation and a minimum of obstructions. On fan cooled motors, be sure not to choke off the suction inlets, also be sure to check the allowable temperature that's indicated on the motor nameplate. Don't decrease the service life of a motor by operating it at excessively high ambient temperature.

- In order to avoid damage to the motor during temporary overloads, jams, etc. be sure that correctly sized overload protection is provided. Starter overload heater elements can be sized from the full load current of the motor as shown on the motor nameplate. It is advisable to consult a supplier of motor control equipment when selecting thermal overload heaters.

- Before the motor is permanently wired, check to be sure that the output shaft rotation is correct (Normally clockwise looking down from the mixer drive, but sometimes counterclockwise depending on the process requirements)

C A U T I O N:

- Make sure to check rotation of the mixer before it is operated. To reverse the rotation of standard 3 phrase electric motors, simply switch any two power leads.

M O T O R S P E C I F I C A T I O N S: 1800 RPM - (4) pole

- NORD motors carry the CE mark in accordance with the Low Voltage Directive
- NORD motors are designed to operate at elevations up to 1000 m (3300 ft) above sea level

Altitude: up to 1000 m	= 100% output	Ambient Temp = 40° C
Above 1000 up to 2000 m	= 92% output	Ambient Temp.= 32° C
Above 2000 up to 3000 m	= 83% output	Ambient Temp = 24° C
Above 3000 up to 4000 m	= 74% output	Ambient Temp = 16° C

- NORD motors are designed to operate with a maximum ambient temperature of 40° C (104°F) - for higher temperatures, motors have to be de-rated or an upgraded insulation used.

Ambient Temperature:	(104°F)	40° C = 100%
		45° C = 95%
		50° C = 89%
		55° C = 83%
		60° C = 67%
		70° C = 64%

EXAMPLE: A motor designed for an output of 100 HP to operate in the mining area of Bolivia (altitude 4000 m above sea level). **NOTE**: 1000 meters = 3281 Feet
Output reduction: the maximum allowable output of the motor would be 74% (74 HP)

Ambient temperature limit: the motor may operate at its rated output of 100 HP provided that the ambient temperature does not exceed 16° C

Note: You can operate over 3300 feet, but you have to de-rate the motor

- Voltages: Canada 575/3/60,TEFC; USA 460/3/60, TEFC; Europe 400/3/50, IP55 ; Australia 415/3/50
- **Tolerances Voltage & Frequency**: ± 10% based on rated voltage; Line frequency tolerance ± 5%. Combined **MAXIMUM** variation in voltage and frequency ± 10%
- MG1 Part 31 suitable for inverter service
- Insulation Class is Class F (non organic)
- High-efficiency design for motors 1 HP and up
- Service Factor 1.15
- The Standard Nord motor fan is a non-sparking
- Each Nord motor uses a terminal block
- Integral Nord motor (unless Nema motor with "C" flange)

S E C T I O N 5 - Pedestals: Shaft & Gearbox Removal - EVG SERIES

- Series EVG standard design of the dry-well pedestal and shaft catcher is one where the flinger (for the dry well) and the shaft catcher are one-in-the-same part serving both purposes.

SHAFT REMOVAL AND / OR TO REMOVE THE GEAR REDUCER:- **See assembly dwg**

i) Lock-out electrical power to the electric motor.
ii) If the electrical wiring is not long enough to allow removal of the gear reducer, dis-connect the motor wiring.
iii) Remove the safety cover located on top of the gear reducer exposing the bolt (# 3) and top plate (# 4) which holds the shaft (# 12).
iv) Slowly remove the top bolt.(# 3).
v) As the bolt is loosened, the shaft and impeller assembly will be lowered a distance of about 0.125" (3.175 mm).
vi) After the bolt has been loosened sufficiently, the flinger (# 8) will come into contact with the Pedestal to the inner support pipe (# 11) and stop there.
vii) Remove the bolts holding together the Adaptor plate Reducer to Pedestal top plate (# 7).
viii) Lift-off the complete gear reducer unit the gearbox clears the shaft.
ix) Inside of the Pedestal (# 10), you can now see the flinger (#8) which rests on the Collar / Clamp (2) Bolts / Shaft catcher (# 9).
x) Prior to un-doing the set screws on the collar / Clamp, make preparation to handle the shaft which will now fall through the dry well (# 11) and into the tank.
xi) Once the shaft is secured loosen the set screws on the Flinger assembly or Clamp bolts (# 9).
xii) **To Reinstall the shaft** (et al) follow the above procedure in Reverse.

Note: In older designs, the flinger was welded-onto the shaft. In that case, the shaft can only be removed vertically through the top of the Pedestal.

C A U T I O N:

- Prior to loosening the (3) set screws on the flinger/shaft-catcher, please ensure that there is some means of holding the shaft in-place (if no Clamp supplied, use (2) pieces of wood 4" x 4" or 6" x 6" with tightening bolts to hold the shaft in place via friction) IF NOT, THE SHAFT WILL DROP INTO THE TANK possible causing damage to the equipment or vessel and bodily injury. Shafts are often of sufficient weight to cause serious bodily injury or even death were it not properly secured.

- You may want to install a plastic hose in the pedestal so that you can monitor if the gear reducer is losing oil and collecting in the dry-well pedestal.

A Split Collar is used to prevent the shaft from accidentally falling from the gear reducer:

NOTE: On older Series EVG, there may not be a Split Ring but rather a flinger that rests on the dry well seal to hold the shaft in-place

- (i) Insert eye-bolt in top centre of the impeller shaft.
  (ii) Slowly lift up the complete impeller shaft assembly a distance of 6 mm (0.25").
  (iii) Remove the split collar that rests against the top of the quill shaft of the gearbox.
  (iv) Slowly lower the complete shaft/impeller assembly a distance of 10 to 12 mm (0.375"to 0.50".
  (v) At this point, the flinger/clamp ass'y will come into contact with the pedestal top inner support pipe/Dry-well
  (vi) Remove bolts.
  (vii) Lift off the complete gear reducer until the gearbox clears the shaft and eye-bolt.
  (viii) The reinstall the gear drive, follow the above procedure in reverse

---

S E C T I O N 5 - SHAFTS, IMPELLERS & FLANGED COUPLINGS

SHAFT - STRAIGHTNESS:

- When shipped, the mixer extension shaft was straight to within 0.003" per foot (0.25 mm per meter) of shaft length for mixers equipped with centre-less ground shafts (Special Order/ uncommonly used). If the shaft does not appear to be damaged, but the run-out is greater than the above standard, the shafting supplied may have been "smooth-turn" (more commonly used), which might not be dimensionally
  the same over the entire length of the shaft. This is probably still acceptable. In such cases, or where it might be difficult to obtain an accurate shaft run-out value, we may apply another rule: 0.25 to 0.50% of the impeller diameter = the maximum shaft run-out at the bottom of the shaft. e.g:

50" diameter impeller	0.14 to 0.28"
100" diameter impeller	0.26 to 0.53"
150"diameter impeller	0.40 to 0.67"

S E C T I O N 5 - SHAFTS, IMPELLERS & FLANGED COUPLINGS

- Flanges are used as shaft couplings when shaft extensions exceed approx 12'-0" (3.65 m) Ensure that the bolts are tightened and that a product like Never Seize (or equivalent) is used. Refer to the table (in this manual) for torque tightening values

  Recheck bolt tightness after 1500 hours (or (3 months)

These couplings are welded onto the shafts with (4 to 6) gussets and are not removable.

C A U T I O N:

- Handle the shaft carefully to be sure that it is not bent.

- After the shaft has been installed, check it for straightness. Storage and handling may have resulted in a bend. To check it, an indicator is placed at the end of the shaft, and the high speed shaft is then rotated by hand. Runout of the total shaft should not be greater than the above \references values. If the runout is greater than the above values, the shaft can be re-straightened in the field. To re-straighten the shaft, follow this procedure:

- Where the maximum, positive readout is found, place the indicator on that side of the shaft.

- Heat the shaft at a point of 180° from the indicator, (and just below the first in-tank coupling if applicable), apply heat just below the mounting nozzle.

- The shaft will grow toward the indicator as heat is applied to it. However, DO NOT permit the surface temperature to go over 500° F (260° C). Use Tempilstics or equivalent

- The shaft will straighten since it will draw more than it grows.

- After each heating process, rotate the shaft and recheck until the straightness is within tolerance to meet the allowable tolerance

- To install any impeller, simply slide the impeller hub onto the extension shaft above the shaft keyway. Install Hook type (Gib) key into the keyway making sure that the pin is inserted into the

  correct hole for proper impeller location. Lower the hub (with or without blades bolted-on) down onto the key. Tighten set screw. Bolt -on blades if not already done.

NOTE: All MIX-TECH Portable mixers operate at least 35% below the 1st Critical speed or harmonic frequency - There is no danger of "hitting-on" or approaching the 1st Critical speed - (Unless specifically mentioned otherwise)

- Please refer to the specific manufacturer's installation and operating manual.
- Correct lubrication practices are essential to long life and satisfactory performance of a gear drive. Be sure to use the right lubricants as recommended. With proper lubrication

maintenance, the gear drive will carry its rated design load and provide years of satisfactory operation.

S E C T I O N 6 - SHAFTS, IMPELLERS & COUPLINGS

IMPELLERS

- Make sure that the impeller blades have been installed onto the hubs in the proper position with regard Rotation and Direction of flow. Please also note that the impellers blades are installed with the hubs ears always backing the blade into the flow. Also be sure that the leading edge and not the trailing edge is presented into the flow and that the angle at the impeller tip (angle of attack) from the horizontal is closer to 15º rather than to 75º.

C A U T I O N

- If the angle of attack (at the impeller tip is closer to 75º, either an incorrect hub in combination with the correct impeller blade (OR VICE VERSA) has been incorrectly assembled to make an incorrect matching of possible hub and blade combinations. For help in determining what the correct combination should be, please refer to the mixer nameplate that will have the Rotation and direction of thrust written. Once you know the combination, refer to the pictorial guide of impeller / hub installation positions A, B, C or D.

- Depending on whether the concave or the convex surface is facing the fluid, if the angle of attach at the impeller is closer to 75º, the HP drawn will be 2 to 3 times greater than what it should be. This could result in overloading the motor and damaging the mixer.

- Make sure that the impeller blades are installed in the correct position for the required rotation. e.g. if the impeller blades are installed up-side-down, the pumping capacity will be reduced by about 65%. Check the mixer nameplate for the flow direction and install the blades to suit.

S E C T I O N 7 - GEAR DRIVE MAINTENANCE

C A U T I O N:

- By following instructions, many premature gear and bearing failures can be avoided.

- Keeping a maintenance log is highly recommended.

- Lubricant used in the gear case must be free of dirt, metal particles and other contaminants. Use only new oil. Strain the oil if there is any possibility that it contains contaminants.

- To equalize pressure inside and outside the gear case, a breather vrnt is installed on top of the unit. This breather normally requires no maintenance, and must not be blocked. Check hole for free breathing.

PORTABLE MIXERS:

Lubrication For PORTABLE MIXERS (**Series "EHG"**), the Crown & worm gear reducers are filled for life (20,000 hours or (4) years) with synthetic oil

C A U T I O N:

- For shipment, the gear-case is drained of oil (EXCEPT FOR NORD drives) - Be sure to fill the gear case with the proper lubricant to the proper level. Install breather. DO NOT OVERFILL - N.B: if the reducer is already filled, (as is the case with NORD drives), Do not forget to install the breather(s) or the seals may fail.

- **RECOMMENDED LUBRICANTS FOR NORD HELICAL GEARING**:
  These Nord Gear reducers are factory-filled with Shell Omala 220 mineral oil or with Chevron ISO FM 220 food grade oil (if required), or equivalent:
  or with Shell Omala 220 regular mineral oil fill when the mixer is provided with a dry well seal unless otherwise specified:

  N.B: A reducer previously filled with Shell Omala 220 mineral can be drained (as much as practical to achieve), and Chevron ISO FM 220 substituted without any harmful chemical reactions or reduction to the lubricating quality of the new (or old) oil.

- Please note that the gear reducers for MIX-TECH'S "EVG" series are Nord Parallel shaft drives. The top output bearing is grease packed although there is not grease nipple. Please remove the seal and re-pack the bearing with grease. (please refer to NORD instruction attached)

- The output shaft seals are "Quadrilip" having (2) discrete grease filled pockets

---

S E C T I O N 7 - GEAR DRIVE MAINTENANCE FOR SERIES EVG & EVGX parallel Shaft design gear reducers:

- **RECOMMENDED OIL CHANGE INTERVALS IN NORD IOM: -**
  Synthetic lubricants should be changed every 20,000 service hours or (4) years;
  Mineral oils should be changed every 10,000 service hours or after (2) years. See gear reducer service manual (IOM).

C A U T I O N:

Units should be checked out periodically for increased noise, surface temperature, vibration, shaft

movement, and amperage draw. Units with inspection covers should not be operated with the inspection covers removed.

PROCEDURE FOR RE-GREASING THE UPPER OUTPUT BEARING equipped with Tapered roller bearing option:

- Remove upper output shaft seal(s).
- Inspect bearing cavity for presence of grease. The bearing cavity should be packed to approximately 1/3 full with grease.
- If required, inject grease into the taper roller bearing until the cavity is filled to 1/3. A Needle Nozzle is generally required on the grease gun, because the shim(s) partially cover the access to the bearing cavity**.**
- Install new upper output seals**.**

Note: The other bearings in these gearboxes are open and are submerged in oil.

The recommended interval for changing the gearbox oil is every 10,000 hours of operation.

- The standard ambient temperature selected is 15 to 125° F (9 to 52° C) for the gear reducer**.**
- Some Gear reducers are equipped with bulls-eye oil level indicators**, others have a plug.**

S E C T I O N 8 - BOLTS

- Impeller blades & other in-tank fasteners are supplied as standard with lock-washers.

C A U T I O N:

- Extreme care should be taken to see that locking devices are properly installed and to be sure that the bolts/studs are properly tightened and lubricated.

It is recommended that all in-tank fasteners (and all other bolts), be rechecked for tightness after the first 1500 hours of operation and subsequently, at each scheduled shut-down and that a suitable lubricant be used e.g. Never seize or equivalent.

RECOMMENDED BOLT TORQUE VALUES:

BOLT SIZE	TIGHTENING TORQUE (Foot Pounds)		
½" - 13	50	1.25" - 7	580
5/8" - 11	100	7/8" - 9	190
3/4" - 10	190	1.50" - 6	1000
1" - 8	290		

NOTE: Tighten all bolts as specified. Lubricate all fasteners with an anti-seize product. If no lubrication is used when tightening the bolts as specified, multiply the table values by 1.3

GEAR REDUCER & MOUNTING PLATE BOLTS:

These bolts are also subject to high loads and should be properly torqued to prevent bolt stretch and/or reducer wobble. For situations with large reducers or long shafts with large reducers, use additional care to make sure that these bolts are installed and torqued properly

This "Turn of the nut Method" can be summed up in one sentence: "Turn the Nut ½ to 2/3 turns beyond the snug tight position, "this applies to any bolt of any size. However, fasteners should be clean, rust free and lightly oiled.

In cases where the nut is not accessible, the bolt may be turned ½ to 3/4 turn beyond snug tight.

LEVER ARM SYSTEM	Bolt size	Lever Arm
	1/4 - 3/8"	6" handle
	7/16" - 5/8"	12" handle
	3/4" - 1.125"	24" handle
	1.25" and over	36" handle

Note: This lever arm system should be used with or without lock-washers. If lock-washers show sign of splitting or fatigue, they must be replaced

S E C T I O N 9 - OPERATION

- The mixers that you have purchased have been designed to accommodate all the loads that will be encountered in the normal course of operation.

C A U T I O N:

- Care must be taken to avoid prolonged operation of the mixer impeller(s) at liquid interface. These mixers were not designed to operate under those severe conditions and could become damaged.

S E C T I O N 10 - MOTOR REMOVAL & INSTALLATION OF MOTORS:

- For Nema "C " Flanged motors (not integral motors)
  The motors supplied have been installed onto the reducers. In the event of motor maintenance, remove the bolts which hold the gear reducer's Nema "C" flange adaptor to the motor's "C" face. Remove the coupling half and service the standard NEMA motor as required. INSTALLATION: reverse the procedure. Please refer to **"COUPLING ENCLOSED"** cross sectional drawing which shows the mounting distance 1 13/16" (46.03 mm). Note that the coupling is keyed onto the motor shaft (key provided).

- In the case of NORD integral motors, remove the bolts. The motor can then be removed exposing the high speed pinion gear mounted on the motor shaft. The motor can then be serviced as required.

S E C T I O N 11 - TROUBLE-SHOOTING / MIXER PERFORMANCE

- **PERFORMANCE**: If you find that the mixer is not performing according to your expectations, one of the things that directly affects mixer performance is Baffles (or lack thereof)

Note: Also check that the impeller blades are in the correct configuration A, B, C or D, that the correct blades are matched to the correct hubs and that the rotation is correct.(Please refer to Section 6 Pages 7, 8 & 9 for more information.

N.B: Baffles always help any mixer application by providing the means to convert rotational motion into to top-to-bottom- pumping/mixing.

- If the viscosity of the fluid is over 25,000 cp, then baffles are not necessary.

- If the vessel is rectangular in shape, baffles may not be necessary.

- In circular or square vessels, the use of baffles is mandatory.

- OTHER METHODS of achieving top-to-bottom motion without using baffles:
  - Off-centering the mixer by 20% (uses the vessel as a baffle)
  - Angle mounting (into a quadrant)- often seen on Portable mixers. If you want to angle-mount a larger mixer, please check to be sure that the shaft was designed to accept these additional stress loads.

- **OIL LEAK(S)** problems with Nord Gear reducers: In order to be able to address the

- **OIL LEAK(S)** For Series EVG supplied with a flinger / shaft Catcher & dry well seal:

NOTE: For Series **EVGX**, There is an oil overflow plastic pipe indicating oil leak>

- If one of the (2) output oil seals were to fail (very rare), then the oil would migrate down the output shaft, and be pumped by the flinger into the moat surrounding the dry well pipe. Any such leak would be contained by our sealed pedestal. (access to it is by a plug). Any other oil leak will be visible on the outside of the gear reducer

SYMPTOM	REASON(S)	SOLUTION
Oil leak on the reducer	Vent plug not installed Vent plug painted over Vent plug failure	Clean up oil and remove the vent plug If this stops the leak, change the vent plug
Oil leak on top of the reducer	Motor and/or top bolts not tightened	Use Teflon tape and tighten bolts
Oil leak on top of reducer	Too much oil in the reducer will be forced out of the vent	Check oil level and adjust to site glass
Oil leak on end plate	Bolts loose	Tighten bolts
Oil leak on top of the reducer	Gasket between motor and the reducer failed	Replace gasket and silicone dealant
Sign of oil on the reducer	Drain pipe & valve damaged	Use Teflon tape /sealant to try to reseal
Oil leaking on reducers with "C" flanged motor(s)	if the vent was not installed, plugged or faulty, the oil presure in the reducer might have exceeded 2 psi causing the input oil seal to "blow-out"	Change the input oil seal

- **NOISE**: Under normal circumstances, Mix-Tech mixers operate quietly and without vibration. If there is a metal-on-metal noise, check to see if the top bolt # 3 is properly tightened to the shaft. If the bolt is not, the shaft will lower than it should be and the flinger/shaft catcher may be touching the dry well pipe

- **HEAT**: Check the temperature of the Reducer and motor. If hot, check the oil level.

NOTE: On Series EVG & EVGX, an oil expansion chamber is supplied to minimize problems with over-filling of oil into the gearcase

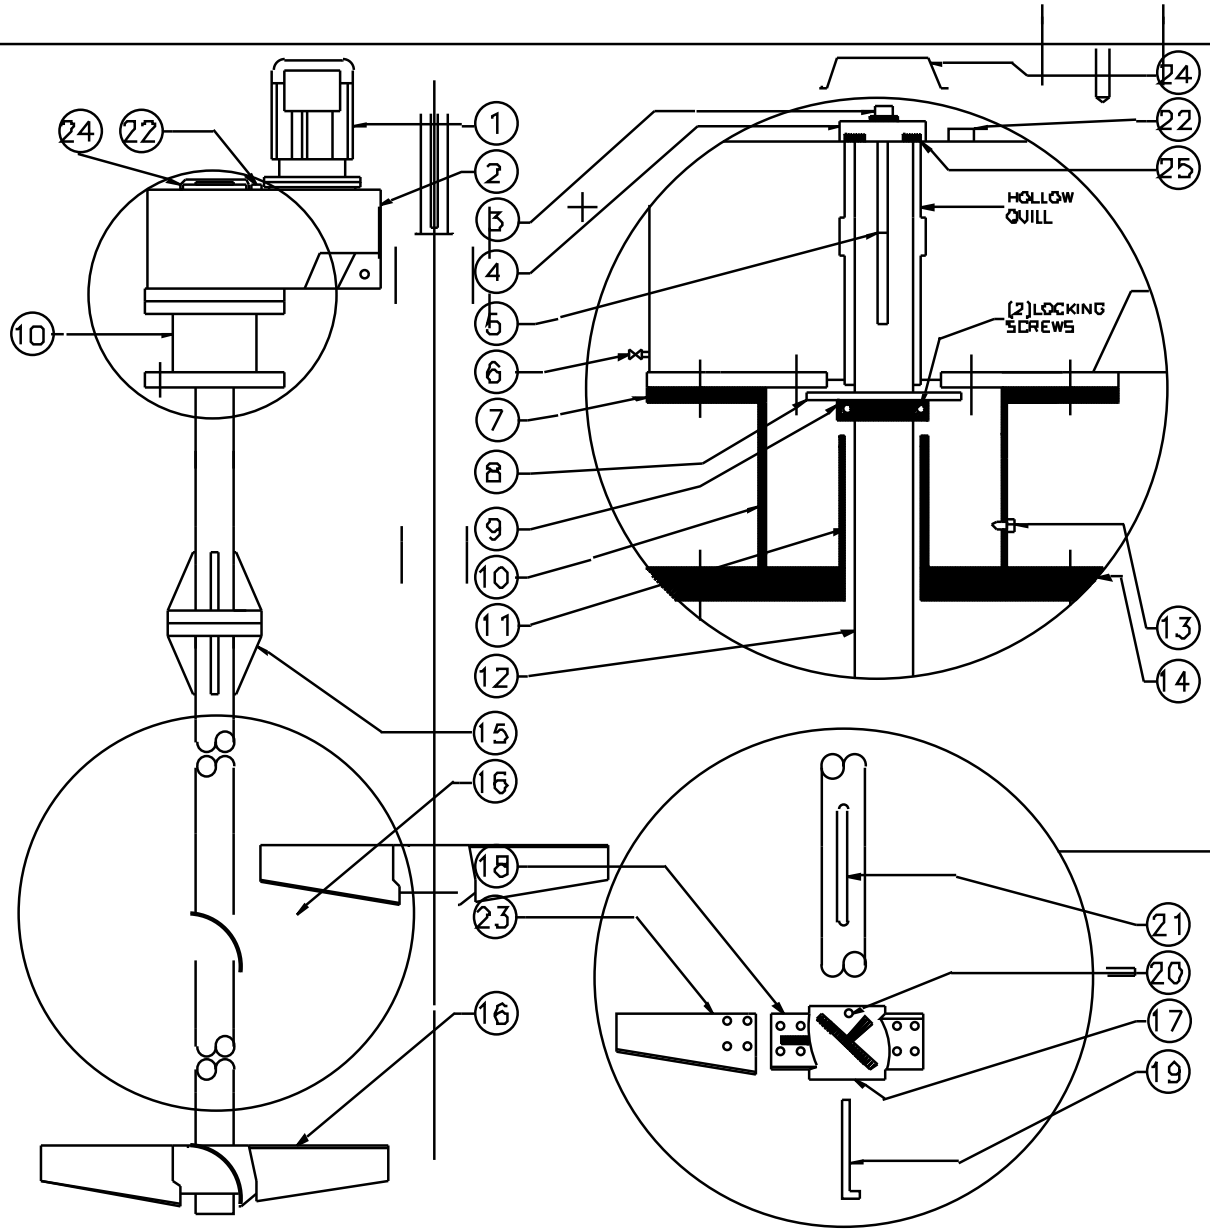
- These mixers should provide long and satisfactory service. Only the finest materials were employed in their manufacture. However, if any defects in materials or workmanship occur, the defective part(s) must be returned to ENVIREQUIP (div 6335772 Canada Inc), **MIX TECH Division**, freight prepaid. ENVIREQUIP reserves the right to repair or replace, at its discretion, any part that proves to have been defective in materials or workmanship.

- ENVIREQUIP is not responsible for the warranties on components purchased, e.g. motors, but will endeavour to help to obtain resolution of any problem(s) with any of our sub-supplier(s) as regards their warranties.

- ENVIREQUIP specifically excludes any liability as to loss of production, improper use of the equipment, abuse, any other liability expressed or implied that exceed the limited warranty given as applies to the equipment being free of defects in materials and/or workmanship.

- ENVIREQUIP's warranty is for (2) years against defects in materials or workmanship and also includes a process warranty.

- This Process warranty only applies to the actual conditions that were specified at the time of bidding.



- Please refer to the terms and conditions as well as to the warranty for complete details.

ENVIREQUIP

MIX-TECH MIXERS - WARRANTY - SERVICE

WARRANTY

ENVIREQUIP offers a 2 Year warranty against defects on materials and workmanship and a process warranty providing that the process information provided at the time on which the mixer selection was based is correct.

SERVICE

MIX-TECH have shipped mixers to many parts of the world. MIX-TECH provide sales and service in North America through our own staff and through our network of distributors and representatives. For the MIX-TECH Series EVG mixers, the drives are Nord Gear. Because MIX-TECH do not remove the nameplates from the original Nord drive, our clients have the original serial numbers of the drive(s). For any problems or for new applications, please contact us directly toll free at 1-866-819-6123 or fax us at 1-613-874-2629.

Additionally, Nord provide sales and service in hundreds of locations in most countries worldwide. You are never far from service anywhere in the world.

CONTACT US

From all of us at **ENVIREQUIP**, we thank our clients very much for your interest in our equipment and for your patronage. We promise to continue to manufacture top quality, rugged equipment, that is energy-efficient, feature-packed, at a reasonable price. Contact us toll free at 1-866-819-6123, fax us at 1-613-874-2629, send e-mails to : envireqp@glen-net.ca or visit our web site at www.envirequip-wtem.com

Or contact Vivendi one of our licensees for water and waste water applications at 1-514-334-7230.

For a mixer selection and quotation, please call, fax, e-mail, check our web site, or write to us, and we will be pleased to provide you with a prompt energy-efficient mixer quotation.

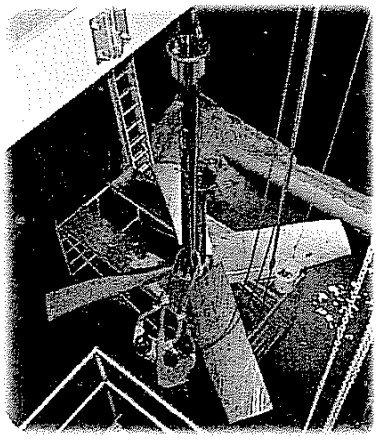
MIX-TECH



DYNAMIC MIXERS

EVG & EVG-FP SERIES

1/4 TO 200 HP

MIX-TECH FEATURES:

- Large service factors on gear drives - minimum 2.5.
- Shaft stress to 9000 psi maximum.
- Impeller / Hub / Coupling 6000 psi maximum.
- All drives are capable of reverse rotation.
- Optional pedestal with shaft catcher design, that allows removal of the gear drive without disturbing the wet end.
- "FP" Option: The reducer is totally isolated from the random hydraulic loads imposed by the shaft & impeller assembly.
- Large shaft capability operating at 65% of the shaft's 1st Harmonic frequency or Critical Speed.
- Mounting options: Steel base, pedestals and custom.
- Seal options: HPLRSB, LPSB, Lip seals, Single, Double, Dry-Running or Cartridge seals.
- Motor options: Nord integral Standard; Nema motors, hydraulic & pneumatic motors also available.
- Full range of impellers including **ENVIROFOIL**.

Δ Warnung
Es wird vorausgesetzt, daß die grundsätzlichen Planungsarbeiten der Anlage sowie Transport, Montage, Installation, Inbetriebnahme, Wartung und Reparaturen von qualifiziertem Personal ausgeführt bzw. durch verantwortliche Fachkräfte kontrolliert werden. Bei Arbeiten am Getriebemotor muß garantiert sein, daß keinerlei Spannung anliegt, und dieser gegen Wiedereinschaltung gesichert ist.

Δ Warnung
Veränderungen gegenüber dem Normalbetrieb (höhere Leistungsaufnahme, Temperaturen, Schwingungen, Geräusche usw. oder Ansprechen der Überwachungseinrichtungen) lassen vermuten, daß die Funktion beeinträchtigt ist. Zur Vermeidung von Störungen, die ihrerseits mittelbar oder unmittelbar schwere Personen- oder Sachschäden bewirken könnten, muß das zuständige Wartungspersonal dann umgehend verständigt werden.

Δ Im Zweifelsfall die entspechenden Betriebsmittel sofort abschalten!

Aufstellung, Vorbereitung
- Transportösen am Getriebe sind für das Gewicht des Antriebs ausgelegt
- Fundamente ausreichend bemessen und schwingungsfrei ausführen
- Getriebe oder -motor fest und ohne Verspannung montieren
- ausreichende Belüftung vorsehen
- serienmäßiges Innengewinde nach DIN-EN 332 zum Aufziehen von Verbindungselementen auf die Wellen benutzen
- Schläge auf die Wellen vermeiden (Lagerbeschädigung!)
- Maschine und Getriebe möglichst mit elastischen Kupplungen verbinden
- vor dem Einschalten Abtriebselemente aufziehen bzw. Paßfeder sichern
- bei Aufsteckgetrieben mit Drehmomentstütze Gummipuffer verwenden

Elektrischer Anschluß
- Motoranschluß nach Schaltbild vornehmen
- Übereinstimmung von Netzspannung und Frequenz mit den Typenschild-Daten sicherstellen
- Sichere Schutzleiterverbindung herstellen
- evtl. falsche Drehrichtung korrigieren durch Vertauschen von 2 Phasen
- Nicht benötigte Kabeleinführungsöffnungen und den Kasten selbst staub- und wasserdicht verschließen
- Überbelastung und Phasenausfall durch Schutzschalter vorbeugen
- Einstellen des Motorschutzschalters auf Nennstrom
- Schaltbilder auf der letzten Seite

Inbetriebnahme
- bei längeren Lagerzeiten besondere Vorkehrungen treffen (siehe Werknormblatt "Langzeitlagerung")
- Lage der Ölstandschraube nach Bauformtabellen des entsprechenden Kataloges feststellen
- Prüfen des Ölstandes
- Entfernen des Verschlußstopfens vor Inbetriebnahme (Überdruck!), ggf. Druckentlüftungsschraube montieren
- Normale Erstbefüllung: siehe Schmierstofftabelle
- Luftgekühlte Motoren sind für Umgebungstemperaturen von - 20°C bis +40°C sowie Aufstellungshöhen â 1.000 m über NN ausgelegt
- Der Einsatz im Ex-Bereich ist nicht zulässig, sofern nicht ausdrücklich hierfür vorgesehen

Δ Caution
It is presumed that fundamental project work as well as all work with regard to transport, assembly, installation, starting-up, maintenance and repair is performed by qualified personnel or supervised by skilled labour taking overall responsibility. Make absolutely sure that no voltage is applied at all while work is being done on the geared motor. Drive must also be secured against switching on.

Δ Caution
Any deviation from normal operating conditions (increased power consumption, temperature, vibrations, noise etc.) or warning signals by monitoring equipment suggest malfunction. Inform the responsible maintenance personnel at once to prevent the trouble from getting worse and causing, directly or indirectly, serious physical injury or material damage.

Δ In case of doubt disconnect the machine immediately!

Preparing and performing installation
- Lifting devices on the drive are designed to carry the drive weight
- the foundation (base) should be of adequate size and vibration-proof
- install gear unit or geared motor rigid and braceless
- ensure sufficient ventilation
- make use of tapped hole (DIN-EN 332) to suit fastening to the shaft end
- avoid shocks on shafts (bearing damage!)
- preferably use flexible coupling between output shaft and driven machine
- fit output elements to shaft end or secure feather key before starting the motor
- use torque arm with rubber buffer on shaft mounting gearboxes

Connection of motor
- Connect motor according to diagram
- make sure that mains voltage/frequency are in accordance with nameplate information
- make secure protective conductor conection
- if motor is running in reverse direction, interchange two phases
- Close unused cable entrances holes and the box itself in a dust- and watertight manner.
- install protective switches to prevent overload and phase failure
- set motor protection switch to nominal current
- wiring diagrams on the last page

Starting up
- in case of long-time storage take special precautions (as provided in works standard sheet "Extended Storage")
- check position of oil-level plug with help of mounting position tables in applicable catalogue
- check oil-level
- prior to starting-up, remove vent plug from vent screw if necessary
- if not specified otherwise, first oil filling as is shown in list of lubricants
- air-cooled motors are designed for ambient temperautres between -20°C and +40°C and for installation at altitudes â 1.000 m above M.S.L.
- Their use in hazardous areas is prohibited unless they are expressly intended for such use (follow additional instructions)

Δ Avertissement
Il est impératif que les travaux fondamentaux de l'installation, ainsi que tous les travaux de transport, montage, installation, mise en exploitation, entretien et réparation soient accomplis par du personnel qualifié et contrôlés par des techniciens spécialisés dans ce domaine. Avant toute intervention sur le motoréducteur, il faut s'assurer que celui-ci n'est plus sous tension et que la remise sous tension soit interdite.

Δ Avertissement
Si en utilisation normale, des modifications de fonctionnement apparaissent telles que puissance absorbée trop élevée, température élevée, vibrations fortes, bruit intense etc. ou en rapport avec les contrôles techniques, cela laisse supposer que différentes fonctions de l'appareil peuvent être détériorées. Pour éviter ensuite des problèmes, qui pourraient entraîner de graves accidents corporels ou de graves dégats matériels, le personnel d'entretien compétent doit immédiatement être informé.

Δ Si vous êtes dans le doute, coupez immédiatement l'alimentation!

Mise en place, préparation
- Le matériel utilisé pour la manutention doit tenir compte du poids de l'équipement
- prendre largement les dimensions des embases et les réaliser exemptes de vibrations
- monter les réducteurs et motoréducteurs solidement et sans haubanage
- prévoir une aération suffisante
- prévoir le taraudage conforme à la norme DIN-EN 332 pour monter des accouplements sur les arbres d'entrée et de sortie
- éviter de donner des coups sur les arbres (cela pourrait détériorer le roulement!)
- lier autant que possible la machine et le réducteur avec des accouplements élastiques
- avant la mise en service, enlever l'élément d'accouplement ou/et fixer la clavette
- utiliser pour l'exécution arbre creux avec bras de réaction une butée en caoutchouc

Branchements électriques
- brancher le moteur selon le schéma
- s'assurer que la tension du réseau et la fréquence correspondent aux données inscrites sur la plaque signalétique
- Le cable de raccordement doit être protégé
- corriger un éventuel mauvais sens de rotation par une inversion de deux phases
- Les entrées de câbles non utilisées doivent être obturées, la boîte elle-même devant être fermée de façon à être étanche à l'eau et à la poussiére
- prévoir une protection électrique contre les surcharges, court-circuit et défaut de phases
- régler la protection électrique suivant l'intensité nominale du moteur
- schéma de branchement à la derniére page

Mise en fonctionnement
- si un stockage longue durée du réducteur est prévu, il faut prendre les dispositions nécessaires (voir spécification "Stockage longue durée")
- vérifier que la vis de niveau d'huile corresponde à la position de montage du réducteur (voir catalogue)
- contrôler le niveau d'huile
- enlever la mèche de la vis d'évent avant la mise en route (pour éviter une surpression) ou fixer le clapet d'évent sur le réducteur
- pour le premier remplissage voir le tableau des lubrifiants
- les moteurs autoventilés sont dimensionnés pour des températures ambiantes comprises entre -20°C et +40°C, ainsi que pour une altitude â 1000 mètres au-dessus du niveau de la mer
- Leur utilisation dans des atmosphères explosives est interdite, à moins qu'elles ne soient expressément prévues à cet effet (respecter les indications supplémentaires)

Wartung
MOTOR
- Staubablagerungen entfernen (Überhitzung!)
- Wälzlager ausbauen, reinigen und einfetten
- Es ist zu beachten, daß der gesamte Freiraum um das Lager ca. 1/3 mit Fett gefüllt ist
- Schmierstoffsorten siehe nächste Seite

GETRIEBE
- regelmäßige Ölstandskontrolle
- Wechseln des Schmierstoffes alle 10.000 Betriebsstunden oder spätestens nach 2 Jahren.
- Doppelte Fristen bei synthetischen Produkten
- Verkürzung der Schmierstoffwechselintervalle bei extremen Betriebsbedingungen (hohe Luftfeuchtigkeit, aggressive Umgebung und hohe Temperaturschwankungen)
- Verbinden des Schmierstoffwechsels mit gründlicher Reinigung des Getriebes

Bei den Getrieben SK 0282 NB und SK 1382 NB mit Lebensdauerschmierung sind diese Arbeiten nicht notwendig.

Δ Synthetische und mineralische Schmierstoffe nicht miteinander mischen! Das gilt auch für die Entsorgung der Schmierstoffe!

Maintenance
MOTOR
- remove dust deposit (overheating)
- dismount anti-friction bearings for cleaning and refill with grease
- ensure that the bearing cage is packed to about 1/3 with grease, distribute evenly
- select proper type of lubricating grease from following table

GEARBOX
- regular oil level check
- change lubricant every 10.000 working hours or after two years at the latest.
- combine the lubricant change with thorough cleaning of gear unit
- lubricant changing intervals will be twice as long if synthetic products are used
- extreme working conditions (high air humidity, aggressive media and large temperature variations) call for reduced lubricant changing intervals

The gearboxes SK 0282 NB and SK 1382 NB are supplied with lifetime-lubrication. Therefore they do not require the a.m. maintenance for gearboxes.

Δ Synthetic and mineral lubricants must not be mixed either for filling or for disposal!

Entretien
DU MOTEUR
- enlever la poussière du moteur (échauffement)
- démonter les roulements, les nettoyer et les regraisser
- la cage des roulements doit être remplie au 1/3 environ
- lubrifiant voir tableau ci-après

DU REDUCTEUR
- vérifier régulièrement le niveau d'huile
- vidanger le lubrifiant après 10.000 heures de fonctionnement ou au plus tard après 2 ans d'utilisation.
- profiter de la vidange pour effectuer un nettoyage approfondi du réducteur
- pour des lubrifiants synthétiques, ce délai peut être doublé
- réduire les intervalles entre les vidanges dans des conditions d'utilisation extrêmes (hygrométrie élevée, ambiance agressive ou variations importantes des températures)

Pour le réducteurs SK 0282 NB et SK 1382 NB lubrifiés à vie, ces préconisations d'entretien ne sont pas nécessaires.

Δ Des lubrifiants synthétiques et minéraux ne doivent pas être mélangés! Ceci s'applique également pour le retraitement des lubrifiants!

* Die Getriebetypen **SK 10282 / SK 10382** und **SK 11282 / SK 11382** werden im Normalfall ohne Öl geliefert.
* Types **SK 10282 / SK 10382** and **SK 11282 / SK 11382** are supplied without lubricant as a standard.
* Les réducteurs **SK 10282 / SK 10382** et **SK 11282 / SK 11382** sont livrés sant huile.

Die Normalbefüllung der Getriebe ist Mineralöl. Synthetisches Öl ist gegen Mehrpreis lieferbar.
Standard lubricant for the gearboxes is mineral-oil. Synthetic oil is available at a surcharge.
Les réducteurs sont remplis d'huile minérale. Ils peuvent être remplis d'huile synthétique contre supplément de prix.

HINWEIS / REMARK / REMARQUE:
Ölfüllmengen sind ca.Angaben. Ölniveau anhand der Ölkontrollschrauben prüfen.
Filling quantities are approx. figures. Oil level must be checked according to oil-level plugs.
Les quantités d'huile sont données à titre indicatif. Vérifier la quantité d'huile grâce à la vis de niveau d'huile.

Hinweis:
Diese Tabelle stellt vergleichbare Schmierstoffe unterschiedlicher Hersteller dar. Innerhalb einer Viskosität und Schmierstoffsorte kann der Ölhersteller gewechselt werden. Beim Wechsel der Viskosität bzw. der Schmierstoffsorte muß Rücksprache mit uns gehalten werden, da sonst keine Gewährleistung für die Funktionstüchtigkeit unserer Getriebe übernommen werden kann.

Note:
This table lists compatible lubricants of different suppliers. Within the same viscosity class and type of lubricant the supplier can be chosen freely. In case you change the viscosity class resp. the type of lubricant you should contact us in advance as otherwise we cannot assure the proper function of our drive and the warranty becomes void.

Indication:
Ce tableau présente les lubrifiants comparables des différents fabricants. Si l'on respecte les critères de viscosité et le type de lubrifiant, on peut uiliser n'importe quelle marque d'huile après ne vidange. Afin de pouvoir garantir un bon fonctionnement de nos réducteurs, veuillez nous consulter avant de remplacer un lubrifiant par un autre possédant des caractéristiques différentes de viscosité et de type.

Hohlwelle mit Schrumpfscheibe - Montage - Demontage und Wartungshinweise
Hollow shaft with shrink-discs - Assembly - Dismantling suggestions and maintenance
Exécution des arbres creux avec frette de serrage - Montage - Démontage et entretien

Montageablauf:

1. Entfernen der Transportsicherung zwischen den Flanschen, falls vorhanden.
2. Anziehen der Spannschrauben (leicht von Hand) bis das Spiel zwischen den Flanschen und dem Innenring beseitigt ist. Der Innenring muß noch leicht drehbar sein.
3. Einfetten der Bohrung des Innenringes, dadurch leichte Montage der Schrumpfscheibe auf die Getriebehohlwelle.
4. Aufsetzen der Getriebehohlwelle auf die Maschinenwelle.

Maschinenwellenschaft und Hohlwellenbohrung müssen im Bereich der Schrumpfverbindung absolut fettfrei sein.
Die Maschinenwelle vor der Montage im Bereich, welche später Kontakt mit der Bronzebuchse der Hohlwelle hat, einfetten. Die Bronzebuchse nicht einfetten, um bei der Montage eine Befettung des Schrumpfsitzes zu vermeiden.

5. Durch leichtes Anziehen der Spannschrauben positionieren sich die Spannflansche automatisch.
6. Festziehen der Spannschrauben der Reihe nach im Uhrzeigersinn über mehrere Umläufe - nicht überkreuz - 1/4 bis 1/2 Schraubenumdrehung pro Umlauf.Die Spannschrauben mit einem Drehmoment- schlüssel bis zu dem auf der Schrumpfscheibe oder in der Maßtabelle angegebenen Anzugsdrehmoment anziehen.

Demontageablauf:

1. Spannschrauben der Reihe nach über mehrere Umläufe lösen, pro Umlauf ca. 1/4 Umdrehung. Spannschrauben nicht aus ihrem Gewinde entfernen - **Unfallgefahr!!**
2. Die Spannflansche sind vom Konus des Innenringes zu lösen.
3. Abnehmen des Getriebes von der Maschinenvollwelle.

Wartung der Schrumpfscheiben:
Eine montierte Schrumpfscheibe ist wartungsfrei. War eine Schrumpfscheibe längere Zeit im Einsatz und wurde demontiert, dann ist sie vor der erneuten Montage zu zerlegen und zu reinigen. Nach der Reinigung sind die Kegelflächen (Konus) der Spannflansche und des Innenringes mit Molykote G-Rapid Plus oder vergleichbarem Schmierstoff einzustreichen. Die Schrauben sind im Gewinde und Kopfauflage mit normalem Fett zu behandeln.

Installation instructions:

1. Remove transportation spacers (if provided) located between outer collars.
2. Lightly handtighten locking screws to eliminate play between outer collars and inner ring. You should still be able to easily turn inner ring.
3. Lightly lubricate the bore of the shrink-disc to facilitate easy mounting onto hollow-shaft of reducer.
4. Fit shrink-disc onto hollow-shaft and mount hollow-shaft reducer onto solid shaft.

Hollow- and solid shaft must be clean and free from any lubricant.
Exception: Grease solid shaft at end where it will make contact with bronze bushing of the hollow-shaft when it is mounted. Never grease the front of the solid shaft which makes contact under the shrink-disc. Tighten locking screws only after mounting the hollowshaft onto the solid shaft.

5. Now tighten locking screws only lightly to position outer collars.
6. Use torque wrench and equally tighten all screws one after another (never cross wise) in a clockwise or counter clockwise sequence by approximately 1/4 to 1/2 turn until specified tightening torque (per table) is reached.

Removal:

1. Loosen locking screws in sequence in several steps by using approximately 1/4 turns. **Danger** - Do not remove locking screws completely.
2. Loosen the outer collars from the double tapered inner ring.
3. Remove hollow-shaft reducer from solid shaft.

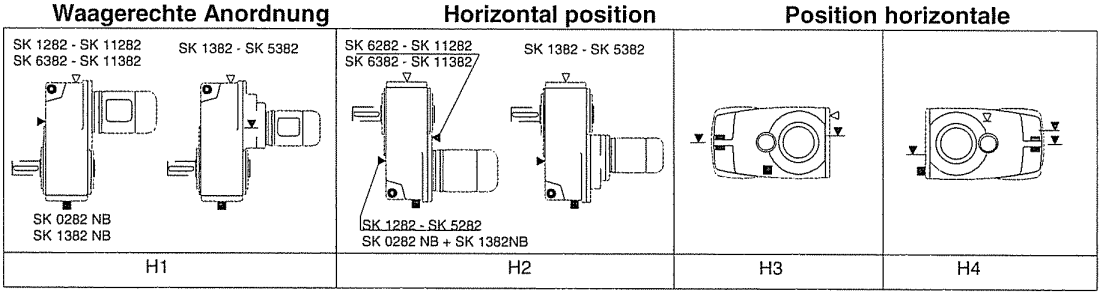
Maintenance:
An installed shrink-disc is maintenance free. Before reinstalling (after prolonged use) it should be taken apart and thorougly cleaned. Relubricate the taper of the outer collars and of the inner ring with Molycote G-Rapid plus or equivalent. Regrease screw threads and head contact area with mulitpurpose grease.

Procédure de Montage:

1. Les éventuelles protections de transport placées entre les surfaces de serrage doivent être retirées.
2. Les vis de serrage doivent être légèrement serrées à la main, jusqu'à ce qu'il n'y ait plus de jeu entre les surfaces de serrage. L'anneau intérieur doit toutefois pouvoir encore être tourné aisément.
3. L'alésage (D1) de la bague intérieure de la frette doit être légèrement graissé. De la sorte, le montage de la frette sur l'arbre creux est facilité.
4. Positionner l'arbre creux réducteur sur l'arbre machine.

L'arbre machine et l'arbre creux doivent absolument être exempt - de - graisse - au niveau de la liaison par frette.
Préalablement au montage, l'arbre machine doit être graissé à l'endroit du position-nement prévu de la bague bronze de l'arbre creux. Ne pas graisser la bague bronze, pour éviter un graissage du siège de la frette lors du montage.

5. Serrer légèrement les vis de serrage de la frette, afin que les surfaces de serrage se positionnent automatiquement.
6. Serrer les vis dans le sens des aiguilles d'une montre les unes après les autres, en plusieurs fois, en faisant à chague fois d' 1/4 à 1/2 tour de vis. Ne pas serrer en diagonale! Utiliser une clef dynamométrique pour le serrage. Les couples de serrage sont indiqués sur les frettes, ou doivent être relevés sur les plans.



Procédure de démontage:

1. Les vis de serrage doivent être desserrées dans l'ordre, les unes après les autres, en plusieures fois, avec environ 1/4 de tour par vis à chaque fois. Ne pas sortir les vis du filetage. **Risque d'accident!!**
2. Le plan de serrage doit être écarté du cône de la bague intérieure.
3. Retirer le réducteur de l'arbre machine.

Entretien des frettes de serrage:
Une frette de serrage montée ne nécessite aucun entretien. Si une frette utilisée depuis un certain temps est demontée, un nettoyage préalable à toute nouvelle utilisation est nécessaire. Après nettoyage, les surfaces coniques de serrage et la bague intérieure doivent être enduites de Molykote G-Rapid Plus ou d'un type de graisse analogue. Les filetages et têtes de vis doivent être graissés normalement.

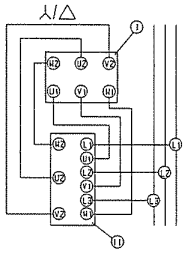
Die Getriebe **SK 0282 NB und SK 1382 NB** sind mit mineralischen Ölen befüllt. Es gibt keine Entlüftungs- oder Ölablaßschrauben.
Die Getriebe **SK 1282 – SK 11382** sind ebenfalls mit Mineralöl befüllt. Diese Getriebe haben Entlüftungs-, Ölstand- und Ölablaßschrauben. (siehe Bauformen)



The Gear Units **SK 0282 NB and SK 1382 NB** are lubricated with mineral-oil. There are no vent or drain plug.
The standard-lubrication for sizes **SK 1282 – SK 11382** is also mineral-oil. There are vent and drain plugs (see mounting positions).

Les réducteurs **SK 0282 NB** sont remplis d'huile minérale. Il n'y a aucune vis ni clapet d'évent.
Les réducteurs **SK 1282 – SK 11382** sont remplis d'huile minérale (voir positions de montage).

INTRODUCTION

1. General

   This manual includes general motor description and operation, inspection, testing and fault isolation procedures and information, general lubrication instructions and materials, general installation, removal, and handling instructions, and general repair and parts information.

2. Related Publications

   The related publications listed in Table 1 provide additional information to support maintenance and fault isolation of the motor and its installation.

DESCRIPTION AND OPERATION

1. General

   This manual provides general installation and maintenance information for the NORD family of motors described in this section.

2. Description

   The NORD motors covered in this manual are single phase and poly-phase motors (refer to Table 2), can be single speed or two-speed, and may include the options listed in the Motor Options Section. Motor options, electrical requirements, performance characteristics, and motor data are identified on the motor nameplate. The nameplate drawing is provided in Figure 1. Definition of each entry field is provided in Table 2.

3. Operation

   The motors described in this manual are alternating current (AC) induction motors, single speed or two-speed, and convection-cooled, fan cooled, or blower cooled. The motors may use single phase or three phase alternating current.

   Cooling options include convection cooling (TENV), fan cooling (TEFC), and blower cooling (TEFB). Because the fan is mounted on the motor shaft, the fan speed is identical to the motor speed, and the cooling capacity varies with the motor speed. The blower uses its own motor and a separate power supply to provide a specific airflow and cooling capacity. The blower power data are provided in Table 8.

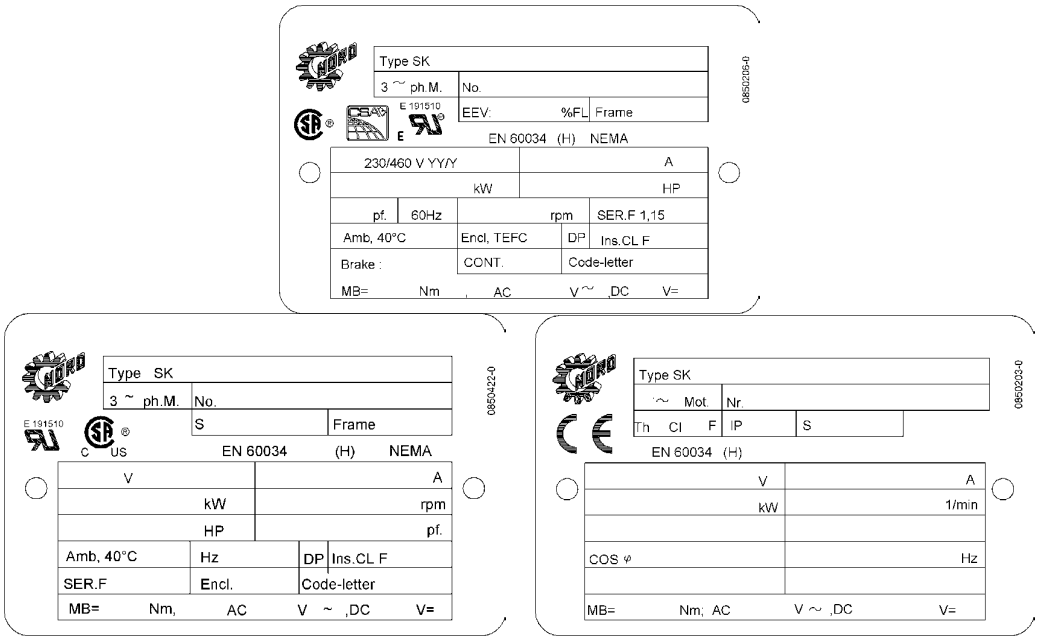

Figure 1. Motor Nameplates

Field	Definition	Field	Definition
Type	Model Number	DP	Drip Proof
3~ph.M.	Number of Motor Phases	Ins. Cl	Insulation Class
No.	Motor Number	SER. F	Service Factor (allowable horsepower loading)
S	Duty Cycle (i.e. S1, S3-40%)	Encl.	Enclosure Description
Frame	Motor Frame Size	Code	NEMA Code Letter
V	Motor Voltage	EEV	
A	Motor Full-Load Amperage	COS φ	Power Factor
HP	Motor Horsepower	MB=	Motor Brake Force (Newton Meters)
rpm	Motor Speed	AC	Alternating Current
pf.	Power Factor	V~	AC Voltage
Amb	Maximum Ambient Temperature	V=	DC Voltage
Hz	Motor Power Frequency		

Table 2. Nameplate Data

INSPECTION

1. Inspection Interval
   Inspect the motor after every 500 operating hours.

2. Inspection Criteria
   Inspect the motor according to the criteria in Table 3.

CAUTION: IF IT IS NECESSARY TO CLEAN THE MOTOR EXTERIOR, DO NOT USE SHOP AIR. SHOP AIR CAN FORCE CONTAMINANTS INTO THE MOTOR, AND CAN CAUSE THE BLOWN CONTAMINANTS TO AFFECT OTHER COMPONENTS.

Inspect	Check	Action
Motor exterior	Check the external surfaces for contamination. Accumulation of dirt and fibrous deposits must be removed.	Clean the motor external surfaces using clean, lint-free cloths. Clean deposits from between cooling fins using a vacuum cleaner and a stiff-bristled nylon brush.
	Check the external surfaces for oil film and greasy deposits.	Clean the oil film and greasy deposits from the motor surface using clean, lint-free cloths. If necessary, moisten the cloth with an approved non-flammable, residue-free solvent. Do not pour solvent on the motor.
	Check for evidence of damage or overheating.	If the motor has physical damage, replace the motor.
Motor mountings	Make sure the mounting hardware is secure.	If the mounting hardware is not secure, check the motor/gearbox alignment, and tighten the mounting hardware.
Motor electrical connections	Check that all electrical connections are secure.	If the electrical connections are not secure, tighten them.
	Check the electrical connections for evidence of arcing.	Loose electrical connections can cause arcing, which is evident by discoloration and charring. If you find evidence of arcing, replace the damaged connections.
Insulation resistance	Using an ohmmeter, check and record the resistance of motor winding insulation.	Compare the current resistance reading to previous readings. If the resistance drops significantly, perform an internal inspection for insulation damage or deterioration.
Motor Brake	On motors that have a brake, use a feeler gauge to check the air gap in between the brake pad and the rotor according to NORD Gear Corporation Manual BIM-1090, Motor Brakes Installation and Maintenance Instructions.	If the air gap exceeds the maximum allowed for that brake configuration provided in the manual, adjust the air gap or replace the brake pad according to the instructions in NORD Gear Corporation Manual BIM-1090, Motor Brakes Installation and Maintenance Manual.

Table 3. Motor Inspection Criteria

TESTING AND FAULT ISOLATION

1. General

NOTE: NORD electric motors do not require periodic testing. However, if a motor is removed from its installation, NORD recommends that the motor be checked according to the static and dynamic testing provided below before it is reinstalled. Finding a condition that will require future repair before the motor is reinstalled decreases the overall maintenance time.

This section provides general test information and functional checks for the types of motors covered by this manual. All tests provided below may not apply to all motor types and models. Read and understand the tests and checks before performing them on your motor. Understand how the test or check is to be performed and the pass/fail criteria.

Record and date all measurements taken. Retain the measurements in a file. Comparing current and previous measurements is useful in tracking motor condition and brake wear, if the motor is equipped with a brake.

If the motor fails any of the test procedures provided below, use the fault isolation procedures to determine the motor problem. Refer to the REPAIR section to determine if the failure is a repairable failure.

2. Testing

A. Static Testing

1. The motor can only be static tested if it is disconnected from the component it drives and securely mounted on a fixture or mounting plate. These tests are usually conducted when a motor has been removed for any reason other than failure
2. Turn the motor shaft slowly by hand. Feel and listen for evidence of a failed bearing, which is indicated by a rough feel as the shaft rotates, and by noise.
3. Check for smooth rotation, with no evidence of binding or catching. If the shaft does not rotate smoothly, or binds or catches, the bearings are worn or failing, lack lubrication, or are contaminated.
4. Check the motor shaft for side play by applying pressure at right angles to the shaft in several places around the circumference. If the shaft moves perceptibly, the front bearing is worn.
5. If the motor shaft feels rough as it is turned or makes unusual noise, the motor bearings are failing, lack lubrication, or are contaminated. Replace the motor bearings, or clean and re-lubricate the bearings, as applicable. Refer to the REPAIR section.
6. If the bearing shaft shows play in the bearing, the bearing is worn or failing. Replace the motor bearings according to the REPAIR section.

B. Dynamic Testing

1. Find the motor voltage and rated load current values as listed on the motor nameplate.
2. Using a volt-ohmmeter, verify that the motor power supply is in the correct range.
3. Run the motor with no load. As the motor is operating, listen for unusual motor noise and check for excessive vibration. Vibration and motor noise are indications of bearing contamination, lack of lubrication, damage, or failure.
4. Use an ammeter to measure the no-load current. Record the no-load current for comparison with previous readings, and for reference during future testing.
5. If the motor passes the no-load test, operate the motor at rated load and check and record the current.
6. Check the motor operating temperature at rated load. If the motor operates at a higher than normal temperature, the motor is failing.
7. If the motor has an integral brake, check the brake operating temperature. If the brake operates at a higher than normal temperature, the brake is not releasing completely. Refer to the REPAIR section.

3. Fault Isolation

If the motor has failed or does not meet the requirements of any of the tests described above, use the fault isolation procedures provided in Table 4, Motor Fault Isolation. The table is based on the assumption that the motor has been operating correctly, and that a problem has occurred. If a newly installed motor does not operate correctly, the problem is an installation problem.

Fault	Check	Corrective Action
Motor doesn't operate	Check the circuit breaker.	The breaker has tripped. Reset the breaker. If the breaker trips immediately, the motor windings have shorted. Replace the motor.
	Check the motor and the gearbox separately to determine which has failed.	Replace the motor or the gearbox, as applicable.
	If the breaker has not tripped, check the power circuitry to the motor.	If the power circuitry has opened, repair the power circuitry.
	Check for an open in the motor windings.	If the motor windings have an open circuit, replace the motor.
Motor is noisy	Separate the motor from its gearbox and check the shaft bearings by hand according to the TEST instructions.	If the bearings feel rough, replace the bearings according to the instructions in REPAIR.
Motor thermal protection trips	Check the motor exterior for an excessive accumulation of oil and dirt that can inhibit cooling.	If the motor exterior is excessively dirty, clean the motor surface using clean, lint-free cloths. If the motor has a finned casing, use a vacuum cleaner and a stiff-bristled nylon brush to remove dirt and debris from between the fins.
	If the motor has a vented enclosure, check the vent openings to make sure they are clear.	If necessary, clean the vent openings.
	Visually check for heat-discolored paint, which is evidence of a motor overheat.	If the motor casing shows heat discoloration, the motor is failing. Replace the motor.
	Check the system load.	If the load applied to the system is above rated load, it should be reduced, if possible, to avoid affecting motor life.
Motor slows during operation	Check for increased load.	If the load has increased beyond rated load, correct the overload condition to prevent damage to the motor.
	Check for supply voltage drop.	Supply voltage must be within 10 percent of nominal voltage. If the supply voltage is less than 90 percent of rated voltage, correct the supply voltage to avoid damage to the motor.
	Check the gearbox and the motor bearings for wear and drag that increases as the system temperature rises.	If the gearbox drag increases during operation, repair the gearbox. If the motor bearing drag increases as the motor operates, replace the bearings according to REPAIR.

Table 4. Motor Fault Isolation

LUBRICATION

1. General

NORD motor frame sizes 63 up to and including 225 are prelubricated, therefor require no lubrication during normal operation.

Frame sizes 250 and larger will have grease fittings for regreasing the motor bearings. Relubricate bearings every six months (more often if conditions require) using a polyurea base grease, No. 2 consistency & stabilized against oxidation.

REMOVAL, INSTALLATION, AND HANDLING

1. General

Removing, installing, and handling any NORD electric motor follow the same general procedures. Follow the general procedures provided below. Observe all WARNINGs and CAUTIONs.

If you have any questions about the procedure to use to handle, install, or remove a specific motor, call NORD Gear Corporation. Please read the following WARNINGS & CAUTIONS prior to any work on the motor.

WARNING: **IF THE MOTOR HAS AN INTEGRAL BRAKE, VERIFY THAT THERE IS NO LOAD ON THE GEARBOX BEFORE RELEASING THE BRAKE. THIS WILL PREVENT POSSIBLE INJURY AND POTENTIAL EQUIPMENT DAMAGE FROM A DROPPED LOAD.**

WARNING: **THE MOTOR ELECTRICAL POWER HAS DANGEROUS CURRENT LEVELS. TO PREVENT SERIOUS INJURY, SHUT DOWN THE POWER TO THE MOTOR AT ITS CIRCUIT BREAKER OR POWER SWITCH BEFORE REMOVING OR INSTALLING ANY MOTOR. LOCK OUT THE BREAKER OR SWITCH AND POST IT WITH AN "OUT OF SERVICE" PLACARD.**

WARNING: **LARGE MOTORS ARE HEAVY, EASY TO UNBALANCE, AND ARE AWKWARD TO LIFT AND MOVE. EVEN SMALLER MOTORS ARE HEAVY. HAVE ASSISTANCE WHEN LIFTING AND MOVING HEAVY MOTORS. IF NECESSARY, USE APPROPRIATE LIFTING DEVICES TO LIFT AND MOVE HEAVY MOTORS.**

CAUTION: **TO PREVENT DAMAGE TO THE MOTORSHAFT, BEARINGS, AND THE MATING HUB/SHEAVE IN THE GEARBOX, MAINTAIN SHAFT ALIGNMENT WHILE REMOVING THE MOTOR FROM ITS GEARBOX.**

2. Removal

A. Drain the oil from the mating gearbox, or rotate the motor/gearbox assembly so that the motor is up, to prevent oil from spilling from the gearbox when the motor is removed.
B. Shut down the power to the motor at the main circuit breaker or power switch. Lock out the breaker or switch and place an "OUT OF SERVICE" placard on the breaker or switch.
C. Disconnect the wiring to the motor. Tag each wire as it is disconnected.
D. Prepare the motor for removal by supporting the motor appropriately. For smaller motors, use assistance to steady the motor or support it. For larger motors, use mechanical lifting or support devices to steady and support the motor.
E. Remove the bolts and washers securing the motor to the its mounting.
F. Maintain motor shaft alignment, and move the motor away from its mounting pad until the motor shaft clears its mating hub/sheave or gearmesh. If the motor shaft is a keyed shaft, keep the drive key with the motor.
G. Remove and discard the flange gasket. Clean the gasket material from the flange.

3. Installation with NEMA and IEC Flanges

Refer to NORD Gearbox Inputs Installation and Maintenance Instructions in BIM1009.

A. Make sure the flanges are clean and free of gasket material. Install a new gasket between the mating flanges, if applicable.
B. Carefully move the motor to insert the motor shaft and its hub/sheave into the adapter spline, making sure the shaft key enters the mating keyway.
C. Seat the motor flange against the mating flange. Install the mounting bolts and tighten them securely.
D. Reconnect the wiring to the motor. Refer to Figure 2 for the motor and options connection diagrams.

4. Removing and Replacing C-Face Motors

A. Shut off the power to the motor and post the shutoff with an "OUT OF SERVICE" placard. Disconnect the wiring to the motor. Tag each wire as it is disconnected.
B. Support the motor. Remove four bolts securing the motor to the NEMA or IEC adapter.

NOTE: The bolts securing the motor to the adapter are retained using a medium strength thread locker such as blue Loctite.

C. Pull the motor straight out from the adapter.
D. Measure and record the dimension from the coupling to the motor flange. Use this dimension to locate the coupling on the replacement motor.
E. Install a new drive key in the keyway, staking the key or using Loctite to retain the key in the keyway, according to the following instructions:

1) If the drive key is not trapped in the keyway (the keyway is open at both ends), stake and install the drive key as follows:

a. Make sure the keyway is free of contamination so that the drive key will seat properly.
b. Add a few drops of an approved lubricant to the keyway.
c. Place the drive key on an appropriate surface with the shaft side of the drive key up. Stake the key in two places near each long edge to deform the edge outward.

CAUTION: SUPPORT THE MOTOR SHAFT BEFORE STAKING THE KEY TO PREVENT DAMAGE TO THE MOTOR BEARINGS.

d. Support the motor shaft in V-blocks. Place the key with the staked surface down over the key slot. Place a sheet of copper shimstock, or equivalent, on the drive key and tap it into the keyway using a hammer.
e. Check the key to make sure it is fully seated and securely retained.

2) Install and Loctite the drive key as follows:

a. Make sure the keyway is clean of old Loctite and is free of oil film.
b. Apply Loctite primer and medium strength (blue) Loctite to the surface of the key and keyway according to the Loctite instructions.

CAUTION: IF THE DRIVE KEY IS TO BE LOCTITED IN PLACE, CLEAN ALL THE LOCTITE FROM THE SURFACE OF THE DRIVE KEY AND THE MOTOR SHAFT TO PREVENT POSSIBLE BONDING OF THE COUPLING AND SPLINE SHAFT TO THE DRIVE KEY.

c. Install the drive key and center it in the keyway. Cure the Loctite according to Loctite instructions.

F. Clean all contamination and corrosion from the mating flanges.
G. Support the motor and mount it to the adapter.
H. Apply a medium strength thread locking compound such as blue Loctite to the bolt threads according to the instructions. Install the bolts and tighten them securely.
I. Reconnect the wiring to the motor. Refer to Figure 2 for the motor and options connection diagrams.

5. Removing and Replacing Integral Motors

A. Shut off the power to the motor and post the shutoff with OUT OF SERVICE. Disconnect the wiring to the motor. Tag each wire as it is disconnected.
B. Support the motor and remove the bolts securing the motor to the gearbox.

NOTE: Most integral motor installations have mounting bolts accessible from the motor exterior. If the bolts are not visible, unbolt the input flange from the gearbox. Remove four bolts that mount the motor. Remove and discard the Dubo gaskets from the bolts.

C. Remove the motor from the gearbox.
D. Clean the gasket faces on the motor and gearbox, making sure no cleaning debris enters the gearbox.
E. Check the replacement motor to make sure the motor flange, motor shaft, and motor pinion are identical to the motor that was removed.
F. Place a new gasket between the gearbox and new motor.
G. Position the motor on the gearbox, making sure the input pinion meshes with the input gear. Rotate the motor as necessary to align the bolt holes and seat the motor flange. Make sure the gasket remains properly aligned and seated.
H. Apply a medium strength thread locking compound such as blue Loctite to the bolt threads according to the instructions. Install the bolts and tighten them securely.

NOTE: If the motor/gearbox installation uses an input flange, mount the input flange to the motor using four mounting bolts and new Dubo gasket. Tighten the bolts securely.

CAUTION: DO NOT TO MIX TYPES OF OIL.

I. Check the gearbox oil level. If necessary fill the gearbox or add oil to bring the gearbox oil to the correct level. Check the installation and maintenance manual for your gearbox to find the correct oil for the gearbox.
J. Reconnect the wiring to the motor. Refer to Figure 2 for the motor and options connection diagrams.

6. Handling and Lifting

A. Before lifting any motor, disconnect all electrical connections. Tag each wire as it is disconnected.
B. Disconnect the motor from the gearbox. Do not lift the motor while it has other equipment attached to it.
C. If the motor has provisions for a lifting eye, turn in an appropriately sized lifting eye and lock it in place with the locking nut. Lift the motor by the lifting eye using an appropriate lifting device.
D. If the motor does not have provisions for a lifting eye, seek assistance or use appropriate lifting devices as necessary.

7. Storage

If the motor is not in service, store it according to the following conditions:

A. Cover the motor and store it in a clean warehouse environment protected from dust and fluids.
B. If the motor has internal heaters, power the heaters during storage if the storage environment is extremely humid. The heaters will prevent moisture buildup in the motor interior.
C. Before placing the motor in service, visually inspect the motor exterior for evidence of deterioration during storage. Turn the motor shaft by hand to make sure the shaft turns smoothly and freely.

CONNECTION DIAGRAMS

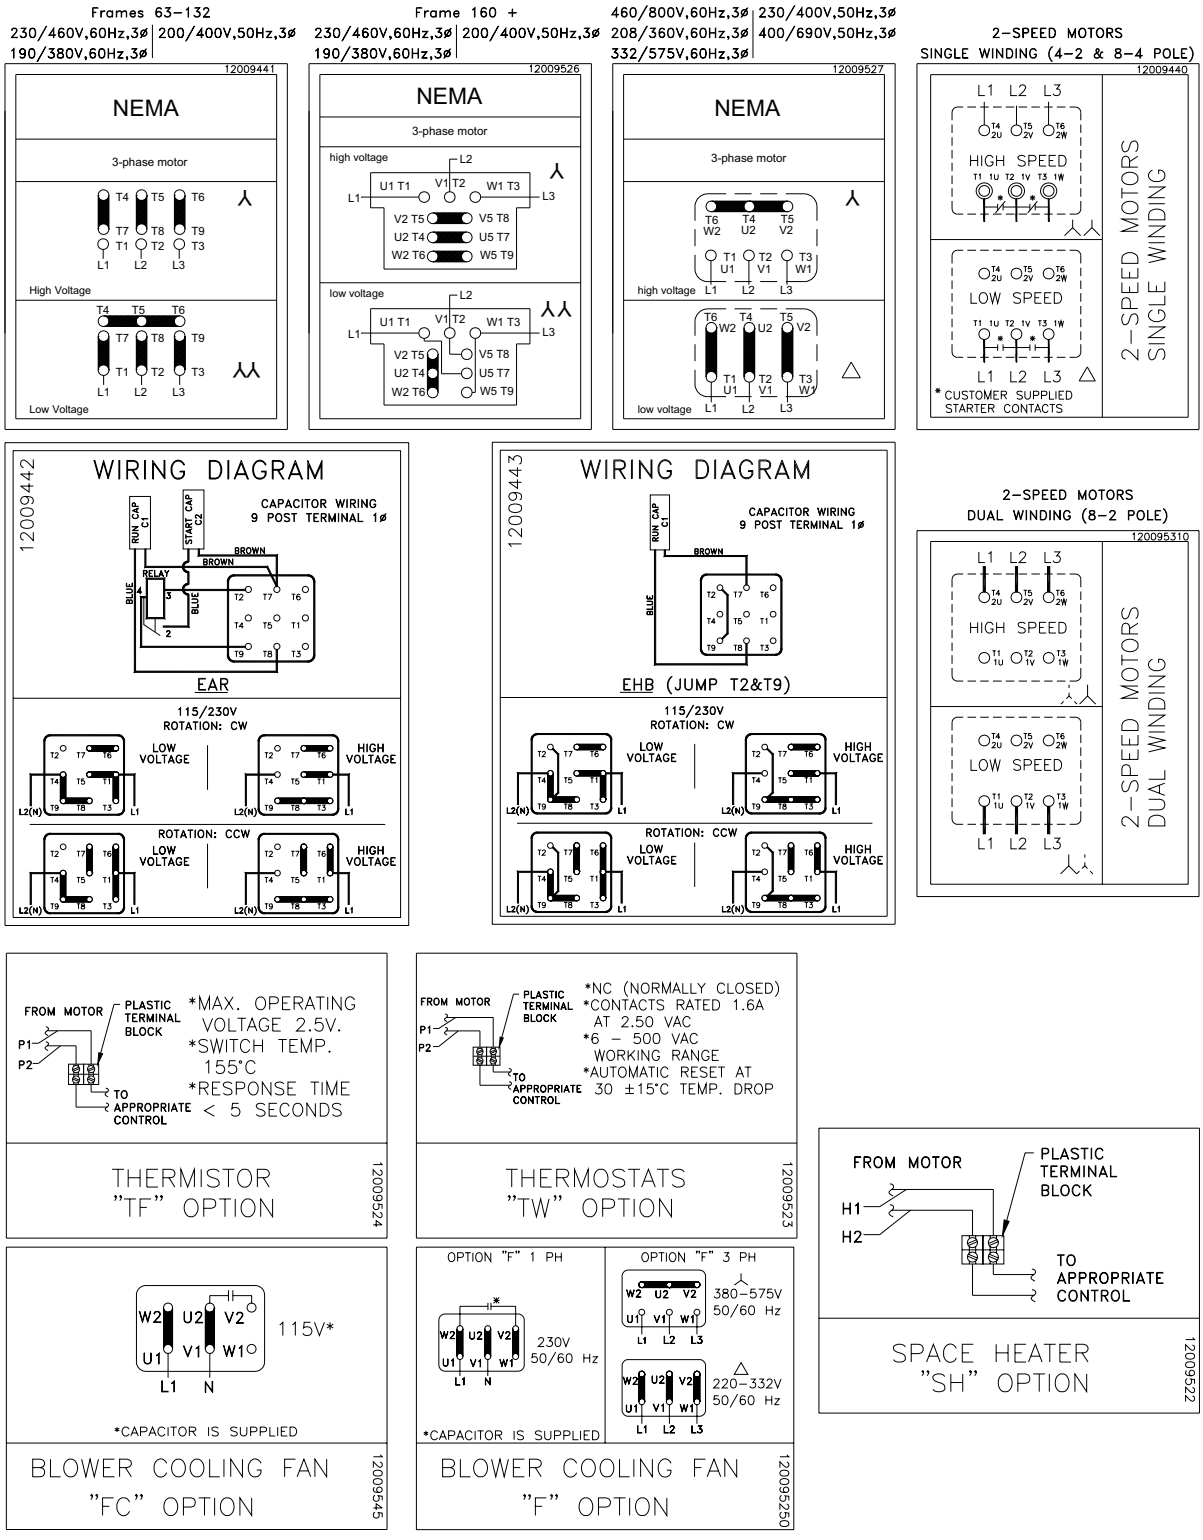

Figure 2. Motor Connection and Wiring Diagrams

REPAIR

1. General

These instructions can be generally applied to NORD motor applications. The exploded view provided in the PARTS INFORMATION section shows the parts orientation for NORD motors.

To procure replacement parts from NORD, contact NORD's customer service department (refer to INTRODUCTION). Provide NORD with the motor part number and serial number, and the item reference number and nomenclature from the parts information figure, which will identify the part for your motor application.

A. The following parts must be replaced if they are removed:

- Oil seal (904), Oil seal (933)
- Gasket (909), Gasket (910), Gasket (921)
- Gasket on plug (961)
- Self-locking screws (907-1, 908-1, 923, 932-1, 940-1)

B. If the following parts are removed, inspect them, and replace them if they are deformed:

- Retaining ring (919), Retaining ring (947), Retaining ring (948)
- Fan clip (952)

C. Disassemble the motor according to the general exploded view in PARTS INFORMATION. Disassemble only as far as necessary to replace the failed parts.

D. Whenever the motor is disassembled, clean all dust and contamination from the motor interior using a vacuum cleaner and a soft-bristled nylon brush.

PARTS LIST

1. General

Refer to Figure 4 for parts information. If you are ordering a part, provide the model and serial number of your motor. This will determine the part number you need.

Part Number	Part Description	Qty per Assembly
900	Rotor Assembly	1
902	A-Endbell	1
904	Oil Seal	1
905	Bearing	1
906	Preload Spring	1
907	T-Box Frame	1
907-1	Screw	4
908	T-Box Cover	1
908-1	Screw	4
909	T-Box Frame Gasket	1
910	T-Box Cover Gasket	1
916	Stator Assembly	1
918	Drive Key	1
919	Retaining Ring	1
920	Oil Plug	1
921	Gasket	1
923	Screw	4
929	Bearing	1
932	B-Endbell	1
932-1	Screw	4
933	Oil Seal	1
939	Fan	1
940	Fan Cowl	1
940-1	Screw	4
947	Retaining Ring	1
948	Retaining Ring	1
952	Fan Clip	1
960	NPT Thread Adapter	1
961	Plug (includes O-ring)	1
***	Spur Drive Gear (alternate to integral bevel gear)	AR
TBLK	Terminal Block	1
TBLK-1	Screw, Terminal Block Mounting	2
ø ø ø	Jumper Bar (not illustrated)	AR

MOTOR OPTIONS & NOMENCLATURE

1. General

NORD offers many options for its motors. The option code will be shown in the motor nomenclature. Below are the available options

Code	Description		Code	Description
BRE	See Brake BIM1090	With Brake	**OL**	TENV Motor – Without Fan
RG		Brake – Corrosion Protected	**OL/H**	TENV Motor - Without Fan & Cover
SR		Brake – Dust Protected	**RD**	Canopy Cover
HL		Brake – Manual Hand Release	**RDD**	Double Canopy Cover
FHL		Brake – Lockable Manual Release	**RLS**	Backstop
MIK		Brake – Microswitch	**SH**	Motor Space Heater
IR		Brake – Current Sensing Relay	**TF**	Thermistor
KD	Condensation Holes		**TW**	Thermostat
KB	Condensation Holes - Plugged		**WE**	2nd Motor Shaft End
MS	Power Plug Connector		**WU**	High Slip Rotor
NSD+	NORD Severe Duty Plus Protection		**Z**	High Inertia Motor Ran
EHBU	Single Phase, Run Capacitor		**H**	Energy Efficient
EARU	Single Phase, Start Cap/Run Cap		**IP66**	IP66 Environmental Protection
F	Blower Cooling Fan - 3ph & 1ph		**ISO H**	Class H Insulation
FC	Blower Cooling Fan - 1ph		**EP**	Epoxy Dipped Windings
IG	Incremental Encoder		**FK**	Over Running Clutch
VR	5:1 Constant Torque Rated Motor		**VN**	10:1 Constant Torque Rated Motor
VW	20:1 Constant Torque Rated Motor		**VZ-F**	1000+:1 Constant Torque Rated Motor

Table 5. Motor Option Codes

Technical information follows for THERMISTORS, THERMOSTATS, SPACE HEATERS (Table 6), ENCODERS (Table 7) & BLOWER COOLING FAN (Table 8).

Thermistors (Option TF)

- Connection Diagram shown on Page 12
- Three PTC (Positive Temperature Coefficient) temperature sensitive resistors are wired in series
- One PTC on each phase of the stator winding
- The leads will be labeled P1 and P2 in the terminal box
- This unit must be connected to a Motor Control Protection module such as a Kriwan INT69 or a Variable Frequency Drive with PTC inputs

All wiring must be done by qualified personnel and adhere to all local codes.

WARNING: Thermistors will automatically reset.

Thermistor Ratings:

- Switching temperature 310°F(155°C)
- Maximum operating voltage 2.5 volts
- Resistance at 25°C less than or equal to 300 Ohms
- Response time < 5 seconds

Thermostats (Option TW)

- Connection Diagram shown on Page 12
- Three temperature sensitive, bimetallic switches with normally closed contacts wired in series
- One switch on each phase of the stator winding
- The leads will be labeled P1 and P2 in the terminal box

All wiring must be done by qualified personnel and adhere to all local codes.

WARNING: Thermistors will automatically reset.

Thermostat Ratings:

- Switching temperature 310°F (155°C)
- Switch contacts 1.6A at 250 VAC
- Permissible working 6 to 500 VAC
- Automatically resetting with 30 ± 15°C drop below switching temperature
- Resistance less than 50 mΩ
- Switch rebound less than 1 millisecond
- 10g shock in all directions
- 2,000 VAC Insulation rating
- 10,000 cycles
- Normally closed

Space Heaters (Option SH)

- Connection Diagram shown on Page 12
- Space Heaters are mounted directly on the motor winding
- The leads are brought into the terminal box and labeled H1 and H2
- They require a separate voltage supply and must not be energized when the motor is energized
- The heaters will keep the winding of the motor approximately 5°C above the surrounding ambient

FRAME SIZE	WATTAGE	VOLTAGES	HEATER P/N	HEATER STRIPS/MTR
63 & 71	18W	110V	18900770	1
		230V	18900780	
		460V	18900790	
80	25W	110V	18900820	1
		230V	18900800	
		460V	18900810	
90 – 112	50W	110V	18900820	2
		230V	18900800	
		460V	18900810	
132-180	100W	110V	18900830	2
		230V	18900840	
		460V	18900850	
200 & 225	120W	110V	18900860	2
		230V	18900870	
		460V	18900880	

Table 6. Space Heater Data

Encoder (Option IG)

- Standard encoder manufacturer is Heidenhain (www.heidenhain.com)
- All encoders will be enclosed inside the fan shroud
- Incremental, Quadrature, Differential, Marker Channel
- IP 64 Protection
- IG1 = 1024PPR, IG2 = 2048PPR, IG4 = 4096PPR
- RS422 & Push/Pull available
- 5V or 10-30V available

Color	Signal		Pin (optional mating plug)	Heidenhain Callouts	Explanation
	Push-pull	RS 422			
Pink	---	$\overline{B}$ (B-)	1	$\overline{U_{a2}}$	Signal line
Blue	---	Sensor (+)	2	U_P	Sense Supply Voltage

Table 8. Blower Cooling Fan Data

MOTOR

Standards

All motors are in accordance with existing standards and regulations, such as the electrical characteristics in accordance with NEMA MG 1 and IEC 34.1, part 5, 6, 7, 8, and 9.

CE	NORD motors carry the CE mark in accordance with the Low Voltage Directive and if installed properly the Electromagnetic Compatibility Directive (EMC). The CE mark is required for instillation in European Union (EU) member states.
	NORD motors from frame size 63 to 132M are an Underwriters Laboratories Recognized component per UL standard 1004. Motors from frame size 160 and larger will be UL recognized components in the future.
	NORD motors are Canadian Standards Association approved according to CSA Standard C22.2 No. 100-92. This approval is necessary for most installations in Canada. CSA is also a Nationally Recognized Testing Laboratory (NRTL) in the United States.

EPAct

The NORD high efficiency line of motors conform to the efficiency levels as defined in The Energy Policy and Conservation Act (EPAct) of 1992. The NORD high efficiency line of motors also conforms to the required efficiency levels in Canada as defined in Canada's Energy Efficiency Regulations.

Inverter/Vector Duty

NORD motors are Inverter/Vector Duty. The construction of the NORD motors insulating system takes into account the non-sinusoidal waveforms produced by variable frequency drives. NORD uses high grade insulating components and the uses extra first turn protection to ensure long service life when connected to inverters. NORD motors can produce full torque at zero speed if properly sized, selected, and controlled.

Low Inertia

The motor inertia in all NORD motors is extremely low. This allows for a much more dynamic motor control. NORD motors can cycle more frequently and require less mechanical energy to start than standard NEMA frame motors. This leaves more energy to start the load. Low motor inertia is a particularly advantage when using NORD motors with inverters or vector controllers.

MOTOR

High Torque

The NORD motor design produces higher motor starting torque. This is achieved through improved rotor design and construction.

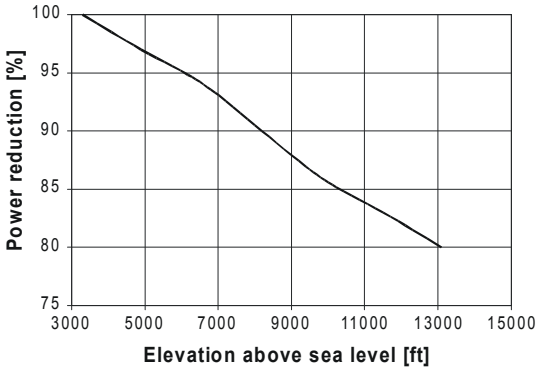
Non Sparking Fan

The standard NORD motors fan is a non-sparking design. The fan will also provide proper airflow in either direction of rotation.

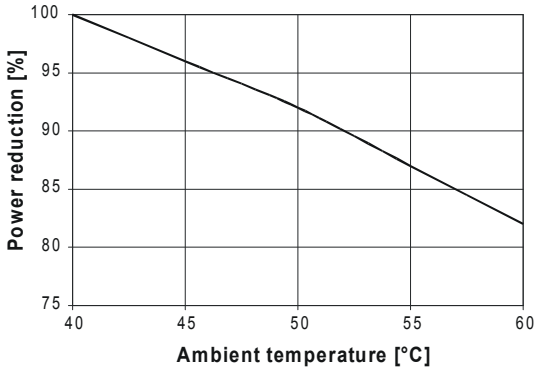
Terminal Block

Each NORD motor uses a terminal block. A terminal block is a superior method of wire termination as compared to pigtail leads. A terminal block ensures long term reliability of the power connections.

Insulation Class



NORD motors are constructed with a thermal class F insulating system. The motors are also designed for a class B temperature rise (80 °C). The use of class F insulation with a class B temperature rise provides increased operating life. Motors constructed with class H insulation are also available as an option.



Ambient Temperature

NORD motors are designed to operate as standard with a maximum ambient temperature of 40°C (104°F). If the motors operating environment exceeds 40°C the motor either needs to be de-rated (see table below) or use an upgraded insulation.

Elevation

NORD motors are designed to operate at an elevation of up to 3300-ft (1000 m) above sea level. If the motors installation elevation exceeds this the motor either needs to be de-rated (see table below) or use an upgraded insulation.

Duty Classes

All motor ratings in this catalog are based on continuous duty operation (S1), i.e. operation with a constant load state whose duration is sufficient to reach the thermal steady state condition. S2 is a short-time operation, meaning operation with a constant load for a specified limited time followed by a pause until the motor is completely cooled down to ambient.

S3 is a periodic operation not under the influence of the start-up, consisting of repeated similar cycles each comprised of a period with constant load and a pause. The starting current should not noticeably affect the warming-up. For duty types S2 and S3 it is necessary to determine the duration of the operation time and the cycle time, moments of inertia of driven machine and its speed required torque on starting breaking method.

If a motor is designed for 100% continuous duty, S1, and shorter cycle duration factor is required; the motor power can be increased according to the table:

Duty class		Power increase factor
S2	Operation time: 60 min	1.1
	30 min	1.2
Short-time	10 min	1.4
S3	Duty cycle, ED: 60%	1.1
	40%	1.15
	25%	1.3
Periodic	15%	1.4

$$\%ED = \frac{Sum\ of\ operation\ periods}{Cycle\ time} \times 100$$

Service Factor

Motors rated 230/460V-60Hz and 330/575V-60Hz have a service factor of 1.15. All other motors have a service factor of 1.0.

Available Voltages

Standard voltages for North America:
230/460V-60Hz
330/575V-60Hz
Standard international voltages:
230/400V-50Hz (3hp and smaller) – usable on 380-415V supply voltages
400/690V-50Hz (larger than 3hp) – usable on 380-415V supply voltages
Other voltages are available

Tolerances Voltage and Frequency

Voltage tolerance ±10% based on rated voltage. Line frequency tolerance of ±5%. Combined variation in voltage and frequency of ±10%. In accordance with NEMA standard MG 1.

Enclosure

Standard enclosure type: Totally Enclosed Fan Cooled (TEFC) with an IP55 enclosure rating. Other enclosure ratings are available including Totally Enclosed Non-Ventilated (TENV), Totally Enclosed Blower Cooled (TEBC), and IP65.

NORD Severe Duty (NSD) – optional

NORD offers a protection package for the motors know as NORD Severe Duty (NDS). This additional motor protection is for wet and corrosive environments. The additional motor protection will ensure that the motor has a long trouble free service life in harsh operating environments. The following additional protections are provide with the NDS package:

- Internal coating for additional electrical insulation and moisture protection (windings, rotor and internal surfaces)
- Condensation weep holes in motor and conduit box low points
- Corrosion resistant hardware
- Additional top coat of Stainless Steel Paint

Epoxy Dipped Windings – optional

For additional protection in extremely wet environments the motor windings can be dipped in epoxy for improved moisture protection. The motor is also treated with the standard NORD Severe Duty (NSD) protection package.

Tropical Protection – optional

For hot tropical wet environments the motor can be treated to prevent fungus from growing inside the motor. This treatment includes an anti-fungal epoxy dip and the NORD Severe Duty (NSD) treatment

Overload Protection

Current-controlled motor-protection must be set according to rated current shown on the motor nameplate. Operation involving high starting frequency, short-term duty or large temperature-differences should be covered by internal motor thermal measuring devices.

Thermostat (TW) – optional

Upon reaching the limit temperature this device automatically cuts the control-circuit. After the temperature has fallen below the trip limit the thermostat switch will re-set. Contact-rating: 250 VAC, 1.6 A.

Thermistor Sensors (TF) – optional

Thermistors require external tripping-device. Upon reaching the limit temperature the thermistors change their resistance suddenly. In connection with a tripping device this property is employed to monitor the motor temperature. The relay built into the tripping-device has a make-and-break-contact, which is used in the control wiring.

High Inertia Fan (Z) – optional

An optional cast iron motor cooing fan is available. This fan is used as a mechanical soft start and/or soft stop. This fan adds inertial to the motor. The high inertial fan can also be used for a flywheel effect, to store mechanical energy. This can be helpful where the are rapid load changes that need to be smoothed. The cast iron fan replaces the standard plastic motor fan.

Canopy Drip Cover (RD) – optional

For installations where the fan end of the motor is mounted up allowing water to fall into the motor's fan guard, NORD offers a canopy drip cover to block this falling water.

Starting Frequency

One major advantage of NORD motors and brakemotors is the ability to operating in high start-stop applications. Due to the motors optimized design, NORD motors can, under some conditions, cycle thousands of times an hour. This means that a NORD brake motor can often be used to replace a clutch brake system.

If the motor or brakemotor is used with an Inverter or Vector drive the motors cycling capacity can be increased even more.

Following factors have to be considered when calculating the permissible starting frequency:

- Z_O no-load starting frequency [starts/hour]
- Z_{zul} permissible starting frequency [starts/hour]
- J_{mot} moment of inertia of motor [Lb-in^2]
- J_{red} external moment of inertia reduced to motor shaft [Lb-in^2]
- T_a required starting torque [Lb-in]
- T_l load torque after starting [Lb-in]

The permissible frequency of switching may be calculated as follows.

$$Z_{zul} = \frac{1 - \frac{T_l}{T_a}}{1 + \frac{J_{red}}{J_{mot}}}$$

Blower Cooling Fan– optional

To Whom It May Concern:

Thank you for your recent purchase. Please find the following Installation & Operations Manuals for your purchase order # NC01-042950 referencing our Sales Order # 61395. If you have any questions or concerns, please give our office a call at the phone number provided below.

Sincerely,

Karen Fleming
Administrative Assistant
McLanahan Corporation
(615) 451-4440

ref: 2X2D-McL

This Manual Covers the

2” x 2” LPT Pump

with Dry Gland

P/N 09101002011

Supplied to:	John Meunier Inc.
Date:	05.15.09
Order Number:	61395
Customer P.O. Number:	NC01-042950
Serial Numbers:	20093041, 20093042, 20093043, 20093044

Should you have any questions regarding the installation and/or operation of the equipment you have purchased, please contact our Process Equipment Department at (615) 451-4440.

ref: 2X2D-McL

Dear Gentlemen:

The accompanying manual and parts lists are for the **2" x 2" LPT Pump with Dry Gland** you recently purchased. We suggest you become familiar with the enclosed literature to assure the proper installation of this equipment.

We also recommend you purchase the replacement parts listed on the enclosed proposal. Having these recommended spare parts at your plant will assure minimum down time in order to perform periodic maintenance and will also eliminate the expense of air freight of critical parts. Should you require other parts not listed, they are available for immediate shipment from our inventory.

If any additional information regarding your LPT equipment is required, please feel free to call.

Sincerely,

McLanahan Corporation

LPT FINES RECOVERY EQUIPMENT

EQUIPMENT FURNISHED:

(1) 2” x 2” LPT Pump complete with:

- Field replaceable molded rubber casing liners and impeller
- Dry Gland
- Grease lubricated bearing housing assembly
- Adjustable overhead motor table

ref: 2X2D-McL

RECOMMENDED SPARE PARTS

LPT PUMP MANUAL – APPENDIX I
Long Term Storage

General:

The following are recommendations in reference to long term storage of LPT Pumps and Drives, LPT does not accept liability for components under these conditions. Documentation and photographic evidence is necessary for warranties to apply.

Preventive Maintenance for Stored Rotating Spares

In the absence of data on premature bearing failures and armature/shaft sag and imbalance, we recommend a general procedure as follows:

The motor shaft targets should generally be used on any motor of 50 HP or higher. They also should be used on fans and any other large rotating equipment that sits in storage for lengthy periods of time. By rotating these shafts monthly (or more depending on the floor vibrations), you are preventing armature and shaft sag as well as false brinelling of the bearings into the races.

You may also find some other smaller motors that have premature bearing failures after prolonged storage in your facility. This would be evidence to apply the shaft targets and rotation to smaller motors.

The motor shaft targets should be attached to the shafts with double-stick foam tape. A monthly color chart should be hung on the wall in the equipment storage area to indicate the "color of the month."

What is False Brinelling?

"This condition can occur whenever a non-rotating bearing is subjected to external vibration. (Note: There is another type of brinelling called true brinelling that occurs in rotating bearings.) When the bearing isn't turning, a protective oil film cannot form between the races and the rotating elements. Thus, there can be metal-to-metal contact between the races and rotating elements, and the small, relative motion between these parts causes wear marks on both races at the location of each rotating element. False brinelling can occur during transportation (typically truck or rail) and during motor storage if the storage area is subject to vibration. False brinelling occurs frequently with the bearings of motors installed on "spare" or "backup" systems in the plant. A typical example of this is parallel motor/pumps where one system is considered to be the primary system and the other system only a backup. The primary system may run for weeks, months, or even longer before the backup system is ever energized. The problem is that even though the backup is not running, it is actually "piped" into the system. Vibrations associated with the running system are being constantly transmitted to the backup system. Thus, severe false brinelling can occur on both the backup motor and pump bearings."

- *Extract from Office of Industrial Technologies Web Site*

Pump:

It is recommended that the Pump is stored in a clean, dry, vibration free environment. The shaft should be manually rotated every 3 months (or at the same interval as recommended by the electric motor manufacturer). The natural rubber linings and components should be protected in keeping with the recommendations below.

LPT PUMP MANUAL – APPENDIX I
Long Term Storage

Electric Motor

The following information is reprinted from the WEG "Installation and Maintenance Manual for NEMA low Voltage Electric Motors"

2.3 Storage

Motors should be raised by their eyebolts and never by their shafts. It is important that high rating three-phase motors be raised by their eyebolts. Raising and lowering must be steady and joltless, otherwise bearings may be harmed. When motors are not immediately installed, they should be stored in their normal upright position in a dry even temperature place, free of dust, gases and corrosive atmosphere. Other objects should not be placed on or against them. Motors stored over long periods are subject to loss of insulation resistance and oxidation of bearings.

Bearings and lubricant deserve special attention during prolonged periods of storage. Depending on the length and conditions of storage it may be necessary to regrease or change rusted bearings. The weight of the rotor in an inactive motor tends to expel grease from between the bearing surfaces thereby removing the protective film that impedes metal-to-metal contact. As a preventive measure against the formation of corrosion by contact, motors should not be stored near machines which cause vibrations, and every 3 month their shafts should be rotated manually.

Insulation resistance fluctuates widely with temperature and humidity variations and the cleanliness of components. When a motor is not immediately put into service it should be protected against moist, high temperatures and impurities, thus avoiding damage to insulation resistance. If the motor has been in storage more than six month or has been subjected to adverse moisture conditions, it is best to check the insulation resistance of the stator winding with a megohmeter. If the resistance is lower than ten megohms the windings should be dried in one of the two following ways:
1) Bake in oven at temperatures not exceeding 194 degrees F until insulation resistance becomes constant.
2) With rotor locked, apply low voltage and gradually increase current through windings until temperature measured with thermometer reaches 194 degrees F. Do not exceed this temperature.
If the motor is stored for an extensive period, the rotor must be periodically rotated.
Should the ambient conditions be very humid, a periodical inspection is recommended during storage. It is difficult to prescribe rules for the true insulation resistance value of a machine as resistance varies according to the type, size and rated voltage and the state of the insulation material used, method of construction and the machine's insulation antecedents. A lot of experience is necessary in order to decide when a machine is ready or not to be put into service. Periodical records are useful in making this decision.

The following guidelines show the approximate values that can be expected of a clean and dry motor, at 40°C test voltage in applied during one minute.

Insulation resistance Rm is obtained by the formula:

$$Rm = Vn + 1$$

Where: Rm - minimum recommended insulation resistance in MΩ with winding at 40°C
Vn - rated machine voltage in kV

In case the test is carried out at a temperature other than 40°C, the value must be corrected to 40°C using an approximated curve of insulation resistance v.s temperature of the winding with the aid of Figure 2.1; it's possible verify that resistance practically doubles every 10°C that insulating temperature is lowered.

Example:
Ambient temperature = 50°C
Motor winding resistence at 50°C = 1.02 MΩ
Correction to 40°C

LPT PUMP MANUAL – APPENDIX I
Long Term Storage

$R_{40°C} = R_{50°C} \times K_{50°C}$
$R_{40° C} = 1.02 \times 1.3$
$R_{40° C} = 1.326$ M&

The minimum resistance Rm will be:
Rm = Vn + 1
Rm = 0.440 + 1
Rm = 1.440 MΩ

On new motors, lower values are often attained due to solvents present in the insulating varnishes that later evaporate during normal operation.
This does not necessarily mean that the motor is not operational, since insulating resistance will increase after a period of service. On motors which have been in service for a period of time much larger values are often attained. A comparison of the values recorded in previous tests on the same motor under similar load, temperature and humidity conditions, serves as a better indication of insulation condition than that of the value derived from a single test. Any substantial or sudden reduction is suspect and the cause determined and corrective action taken.
Insulation resistance is usually measured with a MEGGER.
In the event that insulation resistance is inferior to the values derived from the above formula, motors should be subjected to a drying process.

2.3.1 Drying the windings

This operation should be carried out with maximum care, and only by qualified personnel. The rate of temperature rise should not exceed 5°C per hour and the temperature of the winding should not exceed 105°C. An overly high final temperature as well as a fast temperature increase rate can each generate vapour harmful to the insulation.

Temperature should be accurately controlled during the drying process and the insulation resistance measured at regular intervals. During the early stages of the drying process, insulation resistance will decrease as a result of the temperature increase, but the resistance will increase again when the insulation becomes dryer.

The drying process should be extended until successive measurements of insulation resistance indicate that a constant value above the minimum acceptable value has been attained. It is extremely important that the interior of the motor be well ventilated during the drying operation to ensure that the dampness is really removed.

Heat for drying can be obtained from outside sources (an oven), energization of the space heater (optional), or introducing a current through the actual winding of the motor being dried.

Electric machines should be installed in order to allow an easy access for inspection and maintenance. Should the surrounding atmosphere be humid, corrosive or contain flammable substances or particles, it is essential to ensure an adequate degree of protection. The installation of motors in environments where there are vapours, gases or dusts, flammable or combustible materials, subject to fire or explosion, should be undertaken according to appropriate and governing codes, such as NEC Art. 500 (National Electrical Code) and UL-674 (Underwriters Laboratories, Inc.) Standards.

Under no circumstances can motors be enclosed in boxes or covered with materials which may impede or reduce the free circulation of ventilating air. Machines fitted with external ventilation should be at least 50cm from the wall to permit the passage of air. The opening for the entry and exit of air flow should never be obstructed or reduced by conductors, pipes or other objects. The place of installation should allow for air renewal at a rate of 700 cubic feet per minute for each 75 HP motor capacity.

LPT PUMP MANUAL – APPENDIX I
Long Term Storage

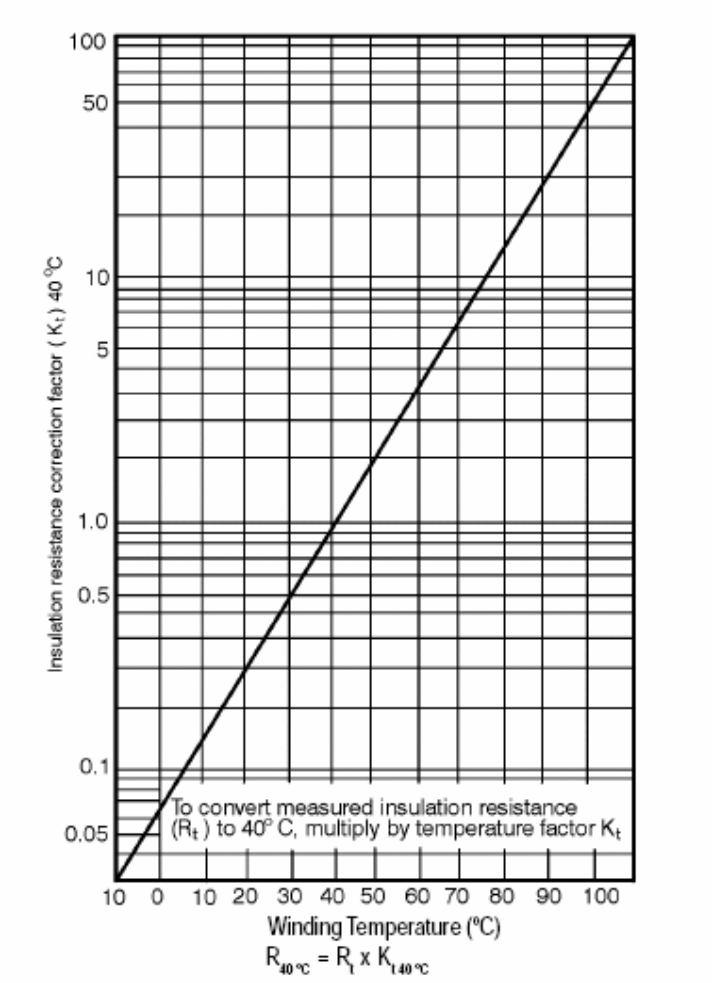

Figure 2.1

- *- Extract from WEG Manual*

Rubber Products:

Rubber products in storage can be adversely affected by the following: temperature, humidity, ozone, sunlight, oils, solvents, corrosive liquids and fumes, insects and rodents, and radiation.

The warehousing area should be relatively cool, dark, and free from dampness and mildew. All rubber products should be used on a first-in, first-out basis since even under these conditions an unusual length of time in storage can result in the deterioration of certain products.

The ideal storage temperature for rubber products is 50 to 70 degrees F (10 to 21 degrees C) with a maximum limit of 100 degrees F (38 degrees C.) If stored below 32 degrees F (0 degrees C) some products may become stiff and should be warmed before being placed in service. Rubber products should not be stored near sources of heat, such as radiators and base heaters.

LPT PUMP MANUAL – APPENDIX I
Long Term Storage

Rubber products should not be stored under conditions of high or low humidity.

To protect against the adverse effects of ozone, rubber products should not be stored near electrical equipment that may generate ozone and should not be stored for any lengthy period in geographical areas of known high ozone concentrations. Exposure to direct and reflected sunlight should also be avoided.

Whenever feasible, rubber products should be stored in their original shipping containers, especially when such containers are wooden crates or cardboard cartons, since this will provide protection against the deteriorating effects of oils, solvents, and corrosive liquids and will also afford some protection against ozone and sunlight.

Since certain rodents and insects thrive on rubber products, adequate protection should be provided against them.

ATTENTION PLANT OPERATORS

HANG NEAR YOUR PUMP

LPT Model IIIr Centrifugal Pump

fitted with

Dry Gland "D" Type

---

1. BEFORE STARTING THE PUMP:

The belts are not installed at the factory. Make sure that the motor has been wired to provide the correct direction of rotation. Bump the motor with **the belts removed** when running for the first time or after electrical work to ensure correct direction of rotation. **Failure to remove the belts can result in the impeller unscrewing and damaging the pump if rotation is in wrong direction.**

2. STARTING UP AND RUNNING THE PUMP:

With the pump full of water, start the pump. The pump should immediately start pumping. UNDER NO CIRCUMSTANCE SHOULD THE PUMP BE ALLOWED TO CONTINUE RUNNING IF THERE IS NO PUMPED DISCHARGE, DUE TO THE HEAT BUILD UP THAT CAN RESULT.

If by accident the pump has run without pumped discharge for more than two or three minutes, it must be stopped immediately and the cause of the problem investigated. Should the pump wet end be opened up after such an occurrence, care must be exercised as there could be high temperatures present in the pump casing.

3. PRIMING:

The LPT centrifugal pump is NOT self priming. For this reason the pump must be installed with a flooded suction, or with the appropriate system for suction lift.

4. ADJUSTING THE "D" TYPE DRY GLAND:

Adjustment of the gland should be done with the pump in operation, when first installed or after new gland parts have been fitted. On starting, it is common for the gland to leak. In fact, if it does not leak, back off the Adjusting Nuts slightly until it does leak with a generous flow and then retighten the Adjusting Nuts until the leak reduces to a few drips a minute. (2 to 5 drops per minute is

normal.) Care must be exercised not to over tighten, which could damage the face seal.

5. STOPPING THE PUMP:

Before stopping the pump, it is advisable to run the pump on clear water before turning it off, to prevent solids from settling out in the pump casing.

6. LUBRICATION

Comes from the factory fully greased. The Shaft Bearings should be greased with the correct grade of grease
(i.e. "Shell Alvania Grease 3" or equivalent). Every 1000 hours of operation, inject grease by six strokes of a regular size (2" diameter body) grease gun.

7. MAINTENANCE:

Except for attention to the gland while the pump is in operation, there is no daily maintenance required on the pump. It is essential, however, that routine inspections be carried out, with the first such inspection taking place approximately three months from startup. This inspection should provide some idea of the wear rate, which will be a guide for scheduling future inspections and maintenance. For dismantling and reassembly of the pump, see the Instruction Manual supplied with the pump.

8. SPARES:

Recommended spare parts are listed in the Instruction Manual. It is recommended that a supply of the wear parts listed be kept in stock so as to minimize down time in the event of failure of the part.

Assembly of Dry Gland - Hard Wear Face & Gland Adjuster (2” x 2” shown)

1. Check all components

2. Extrude epoxy from package & mix thoroughly

3. Apply epoxy to outer rim of Hard Wear Face (D11)

4. Place ‘O’ Ring (D10) on outer rim of Hard Wear Face (D11). Position ‘O’ Ring at leading edge.

5. Position Hard Wear Face & ‘O’ Ring into Gland Adjuster (D03U)

6. Using a slight twisting motion Carefully push Hard Wear Face into Adjuster

7. Wipe off excess epoxy

8. Place a heavy object on top of the assembly until dry (min 30 minutes)

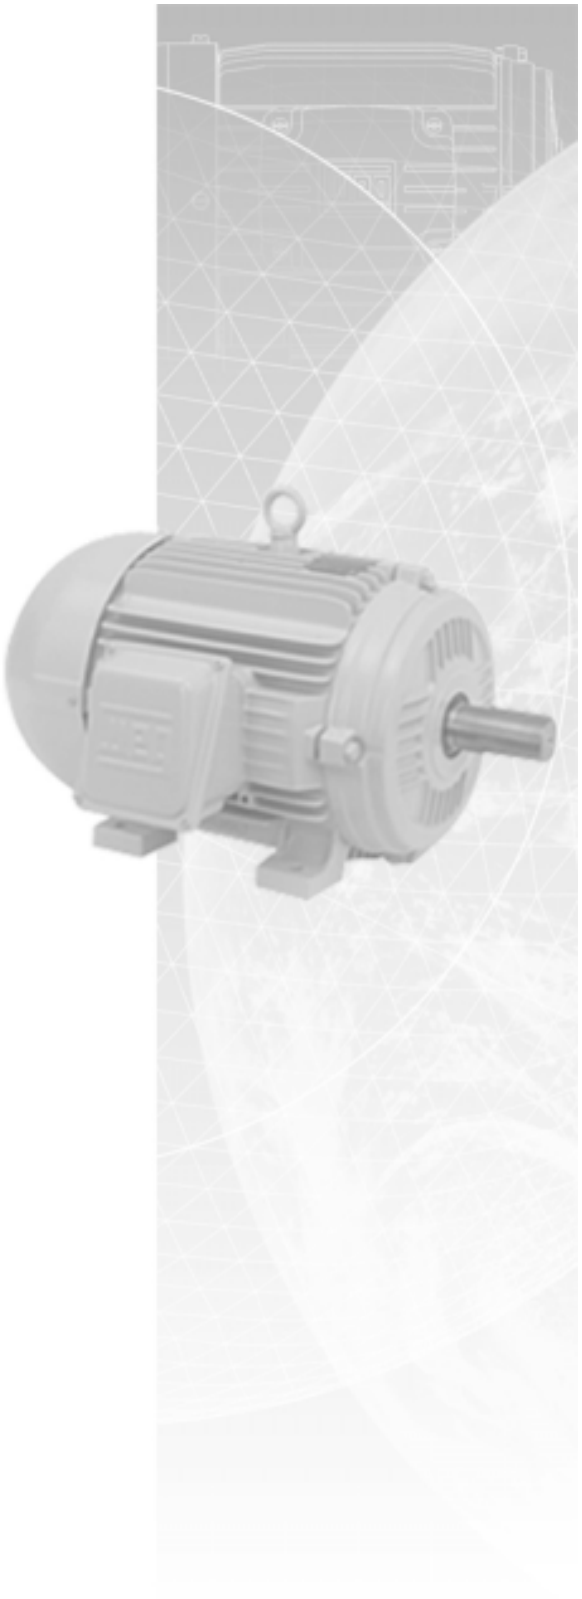
INSTALLATION AND MAINTENANCE MANUAL FOR NEMA LOW VOLTAGE ELECTRIC MOTORS



The electric motor is the item of equipment most widely used by man in his pursuit of progress, as virtually all machines and many renowned inventions depend upon it.
By virtue of the prominent role the electric motor plays in the comfort and welfare of mankind, it must be regarded and treated as a prime power unit embodying features that merit special attention, including its installation and maintenance.
This means that the electric motor should receive proper attention.
Its installation and routine maintenance require specific care to ensure perfect operation and longer life of the unit.
THE WEG ELECTRIC MOTOR INSTALLATION AND MAINTENANCE MANUAL provides the necessary information to properly install, maintain and preserve the most important component of all equipment:

THE ELECTRIC MOTOR!

1. Introduction

This manual covers all the three-phase and single-phase asynchronous squirrel-cage induction motors, from 140T to 580T frame sizes.

The motors described in this manual are subject to continuous improvement and all information is subject to change without notice.
For further details, please consult WEG.

2. Basic Instructions

2.1 Safety Instructions

All personnel involved with electrical installations, either handling, lifting, operation and maintenance, should be well-informed and up-to-date concerning the safety standards and principles that govern the work and carefully follow them.
Before work commences, it is the responsibility of the person in charge to ascertain that these have been duly complied with and to alert his personnel of the inherent hazards of the job in hand.
It is recommended that these tasks be undertaken only by qualified personnel and they should be instructed to:

- avoid contact with energized circuits or rotating parts,
- avoid by-passing or rendering inoperative any safeguards or protective devices,
- avoid extended exposure in close proximity to machinery with high noise levels,
- use proper care and procedures in handling, lifting, installing, operating and maintaining the equipment, and
- follow consistently any instructions and product documentation supplied when they do such work.

Before initiating maintenance procedures, be sure that all power sources are disconnected from the motor and accessories to avoid electric shock.
Fire fighting equipment and notices concerning first aid should not be lacking at the job site; these should be visible and accessible at all times.

2.2 Delivery

Prior to shipment, motors are factory-tested and balanced. They are packed in boxes or bolted to a wooden base.
Upon receipt, we recommend careful handling and a physical examination for damage which may have occurred during transportation.
In the event of damage and in order to guaranty insurance coverage, both the nearest WEG sales office and the carrier should be notified without delay.

2.3 Storage

Motors should be raised by their eyebolts and never by their shafts. It is important that high rating three-phase motors be raised by their eyebolts. Raising and lowering must be steady and joltless, otherwise bearings may be harmed.
When motors are not immediately installed, they should be stored in their normal upright position in a dry even temperature place, free of dust, gases and corrosive atmosphere.
Other objects should not be placed on or against them.
Motors stored over long periods are subject to loss of insulation resistance and oxidation of bearings.

Bearings and lubricant deserve special attention during prolonged periods of storage. Depending on the length and conditions of storage it may be necessary to regrease or change rusted bearings. The weight of the rotor in an inactive motor tends to expel grease from between the bearing surfaces thereby removing the protective film that impedes metal-to-metal contact.
As a preventive measure against the formation of corrosion by contact, motors should not be stored near machines which cause vibrations, and every 3 month their shafts should be rotated manually.

Insulation resistance fluctuates widely with temperature and humidity variations and the cleanliness of components. When a motor is not immediately put into service it should be protected against moist, high temperatures and impurities, thus avoiding damage to insulation resistance.
If the motor has been in storage more than six month or has been subjected to adverse moisture conditions, it is best to check the insulation resistance of the stator winding with a megohmeter.
If the resistance is lower than ten megohms the windings should be dried in one of the two following ways:

1) Bake in oven at temperatures not exceeding 194 degrees F until insulation resistance becomes constant.
2) With rotor locked, apply low voltage and gradually increase current through windings until temperature measured with thermometer reaches 194 degrees F. Do not exceed this temperature.

If the motor is stored for an extensive period, the rotor must be periodically rotated.
Should the ambient conditions be very humid, a periodical inspection is recommended during storage. It is difficult to prescribe rules for the true insulation resistance value of a machine as resistance varies according to the type, size and rated voltage and the state of the insulation material used, method of construction and the machine's insulation antecedents. A lot of experience is necessary in order to decide when a machine is ready or not to be put into service. Periodical records are useful in making this decision.

The following guidelines show the approximate values that can be expected of a clean and dry motor, at 40°C test voltage in applied during one minute.

Insulation resistance Rm is obtained by the formula:

$$Rm = Vn + 1$$

Where: Rm - minimum recommended insulation resistance in MΩ with winding at 40°C
Vn - rated machine voltage in kV

In case the test is carried out at a temperature other than 40°C, the value must be corrected to 40°C using an approximated curve of insulation resistance v.s temperature of the winding with the aid of Figure 2.1; it's possible verify that resistance practically doubles every 10°C that insulating temperature is lowered.

Example:

Ambient temperature = 50°C
Motor winding resistence at 50°C = 1.02 MΩ
Correction to 40°C

$$R_{40°C} = R_{50°C} \times K_{50°C}$$

$$R_{40°C} = 1.02 \times 1.3$$

$$R_{40°C} = 1.326\ M\Omega$$

The minimum resistence Rm will be:

$$Rm = Vn + 1$$

$$Rm = 0.440 + 1$$

$$Rm = 1.440\ M\Omega$$

On new motors, lower values are often attained due to solvents present in the insulating varnishes that later evaporate during normal operation. This does not necessarily mean that the motor is not operational, since insulating resistance will increase after a period of service.
On motors which have been in service for a period of time much larger values are often attained. A comparison of the values recorded in previous tests on the same motor under similar load, temperature and humidity conditions, serves as a better indication of insulation condition than that of the value derived from a single test. Any substantial or sudden reduction is suspect and the cause determined and corrective action taken.
Insulation resistance is usually measured with a MEGGER.
In the event that insulation resistance is inferior to the values derived from the above formula, motors should be subjected to a drying process.

2.3.1 Drying the windings

This operation should be carried out with maximum care, and only by qualified personnel. The rate of temperature rise should not exceed 5°C per hour and the temperature of the winding should not exceed 105°C. An overly high final temperature as well as a fast temperature increase rate can each generate vapour harmful to the insulation.
Temperature should be accurately controlled during the drying process and the insulation resistance measured at regular intervals.
During the early stages of the drying process, insulation resistance will decrease as a result of the temperature increase, but the resistance will increase again when the insulation becomes dryer.
The drying process should be extended until sucessive measurements of insulation resistance indicate that a constant value above the minimum acceptable value has been attained. It is extremely important that the interior of the motor be well ventilated during the drying operation to ensure that the dampness is really removed.
Heat for drying can be obtained from outside sources (an oven), energization of the space heater (optional), or introducing a current through the actual winding of the motor being dried.

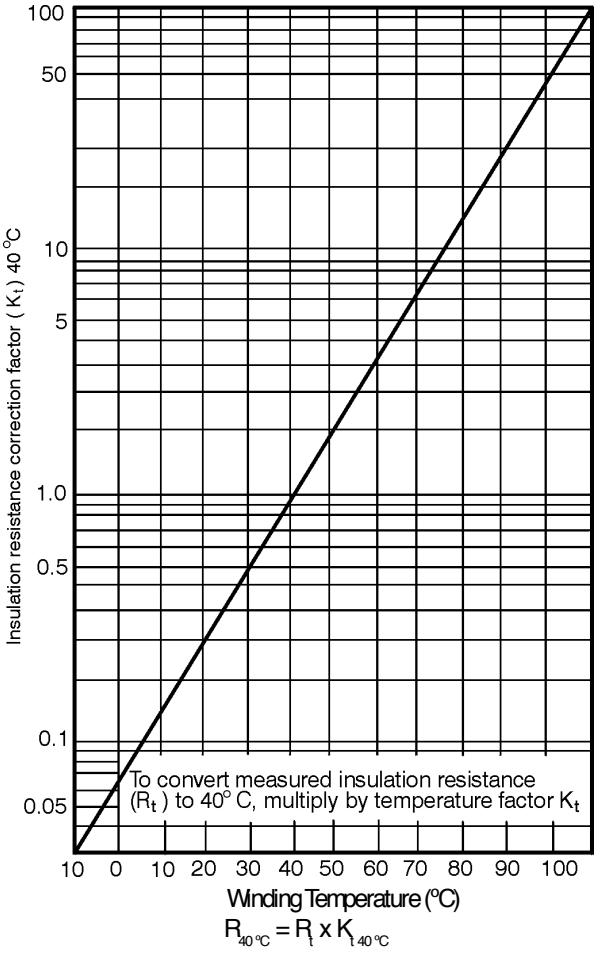

Figure 2.1

3. Installation

Electric machines should be installed in order to allow an easy access for inspection and maintenance. Should the surrounding atmosphere be humid, corrosive or contain flammable substances or particles, it is essential to ensure an adequate degree of protection.
The installation of motors in environments where there are vapours, gases or dusts, flammable or combustible materials, subject to fire or explosion, should be undertaken according to appropriate and governing codes, such as NEC Art. 500 (National Electrical Code) and UL-674 (Underwriters Laboratories, Inc.) Standards.
Under no circumstances can motors be enclosed in boxes or covered with materials which may impede or reduce the free circulation of ventilating air. Machines fitted with external ventilation should be at least 50cm from the wall to permit the passage of air.
The opening for the entry and exit of air flow should never be obstructed or reduced by conductors, pipes or other objects.
The place of installation should allow for air renewal at a rate of 700 cubic feet per minute for each 75 HP motor capacity.

3.1 Mechanical Aspects

3.1.1 Foundation

The motor base must be levelled and as far as possible free of vibrations. A concrete foundation is recommended for motors over 100 HP. The choice of base will depend upon the nature of the soil at the place of erection or of the floor capacity in the case of buildings.
When dimensioning the motor base, keep in mind that the motor may occasionally be run at a torque above that of the rated full load torque.
Based upon Figure 3.1, foundation stresses can be calculated by using the following formula:

$$F1 = 0.2247\ (0.009 \times g \times G - 213\ Tmáx/A)$$

$$F2 = 0.2247\ (0.009 \times g \times G + 213\ Tmax/A)$$

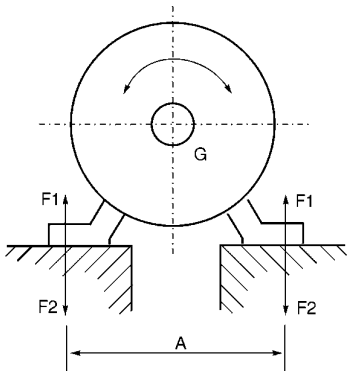

Figure 3.1 - Base stresses

Where:

F1 and F2 - Lateral stress (Lb)
g - Force of gravity (32.18 ft/s²)
G - Weight of motor (Lb)
Tmax - Maximum torque (Lb . Ft)
A - Obtained from the dimensional drawing of the motor (in)

Sunken bolts or metallic base plates should be used to secure the motor to the base.

3.1.2 Types of Bases

a) Slide Rails

When motor drive is by pulleys the motor should be mounted on slide rails and the lower part of the belt should be pulling.
The rail nearest the drive pulley is positioned in such a manner that the adjusting bolt be between the motor and the driven machine.
The other rail should be positioned with the bolt in the opposite position, as shown in Figure 3.2.
The motor is bolted to the rails and set on the base. The drive pulley is aligned such that its center is on a plane with the center of the driven pulley and the motor shaft and that of the machine be parallel.

The belt should not be overly stretched, see Figure 3.11.
After the alignment, the rails are fixed.

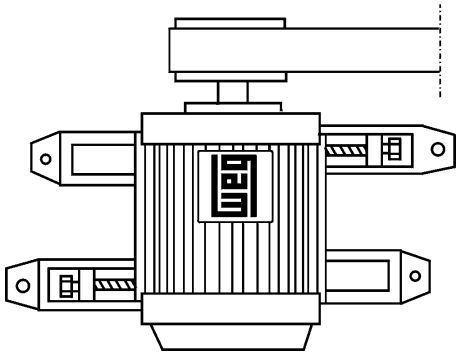

Figure 3.2 - Positioning of slide rails for motor alignment

b) Foundation Studs

Very often, particularly when drive is by flexible coupling the motor is anchored directly to the base with foundation studs.
It is recommended that shim plates of approximately 0.8 inches be used between the foundation studs and the feet of the motor for replacement purposes. These shim plates are useful when exchanging one motor for another of larger shaft height due to variations allowed by standard tolerances.
Foundation studs should neither be painted nor rusted as both interfere with to the adherence of the concrete, and bring about loosening.
After accurate alignment and levelling of the motor, the foundation studs are cemented and their screws tightened to secure the motor.

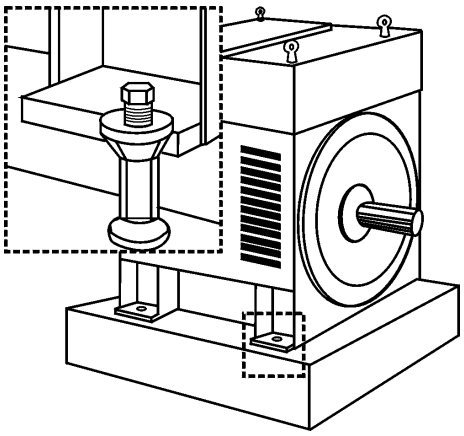

Figure 3.3 - Motor mounted on a concrete base with foundation studs

3.1.3 Alignment

The electric motor should be accurately aligned with the driven machine, particularly in cases of direct coupling. An incorrect alignment can cause bearing failure vibrations and even shaft rupture.
The best way to ensure correct alignment is to use dial gauges placed on each coupling half, one reading radially and the other exially - Figure 3.5.

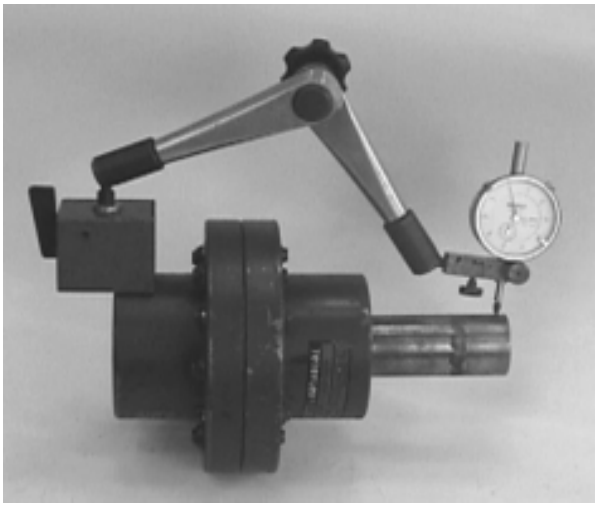

Figure 3.5 - Alignment with dial gauges

Thus, simultaneous readings are possible and allow for checking for any parallel (Figure 3.6a) and concentricity deviations (Figure 3.6b) by rotating the shafts one turn.
Gauge readings should not exceed 0.02 inches. If the installer is sufficiently skilled, he can obtain alignment with feeler gauges and a steel ruler, providing that the couplings are perfect and centered - Figure 3.6c.

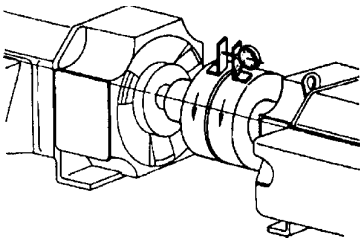

Figure 3.6a - Deviation from parallel

Figure 3.6b - Deviation from concentricity

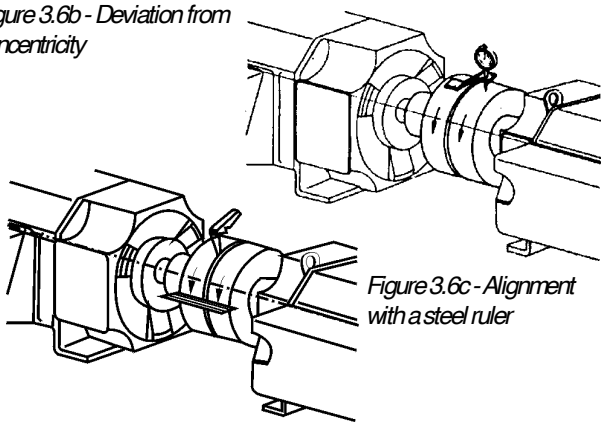

Figure 3.6c - Alignment with a steel ruler

3.1.4 Coupling

a) Direct Coupling

Direct coupling is always preferable due to its lower cost, space economy, no belt slippage and lower accident risk.
In the case of speed ratio drives, it is also common to use a direct coupling with a reducer (gear box).

CAUTION: Carefully align the shaft ends using, whenever feasible, a flexible coupling.

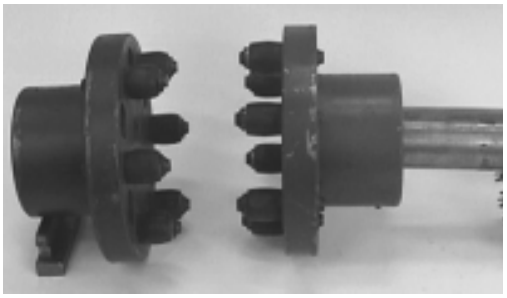

Figure 3.7 - A type of direct coupling

b) Gear Coupling

Poorly aligned gear couplings are the cause of jerking motions which bring about the vibration of the actual drive and vibrations within the motor.

Therefore, due care must be given to perfect shaft alignment: exactly parallel in the case of straight gears, and at the correct angle for bevel or helical gears.
Perfect gear engagement can be checked by the insertion of a strip of paper on which the teeth marks will be traced after a single rotation.

c) Belt and Pulley Coupling

Belt coupling is most commonly used when a speed ratio is required.
Assembly of Pulleys: To assemble pulleys on shaft ends with a keyway and threaded end holes the pulley should be inserted halfway up the keyway merely by manual pressure.
On shafts without threaded end holes the heating of the pulley to about 80°C is recommended, or alternatively, the devices illustrated in Figure 3.8 may be employed.

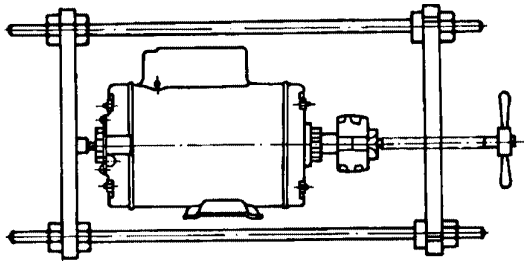

Figure 3.8 - Pulley mounting device

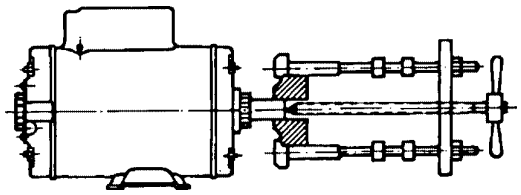

Figure 3.8a - Pulley extractor

Hammers should be avoided during the fitting of pulleys and bearings. The fitting of bearings with the aid of hammers leaves blemishes on the bearing races. These initially small flaws increase with usage and can develop to a stage that completely impairs the bearing.
The correct positioning of a pulley is shown in Figure 3.9.

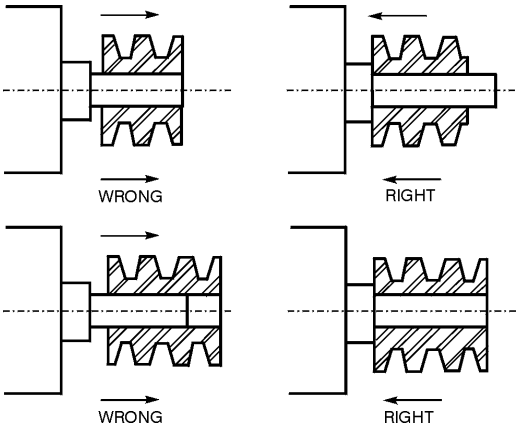

Figure 3.9 - Correct positioning of pulley on the shaft

RUNNING: To avoid needless radial stresses on the bearings it is imperative that shafts are parallel and the pulleys perfectly aligned. (Figure 3.10).

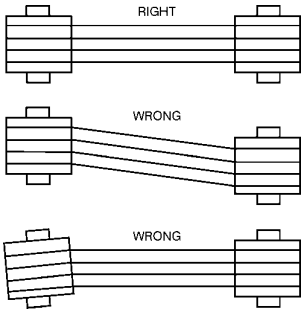

Figure 3.10 - Correct pulley alignment

Laterally misaligned pulleys, when running, transmit alternating knocks to the rotor and can damage the bearing housing. Belt slippage can be avoided by applying a resin (rosin for example).
Belt tension should be sufficient to avoid slippage during operation (Figure 3.11).
Pulleys that are too small should be avoided; these cause shaft flexion because belt traction increases in proportion to a decrease in the pulley size. Table 1 determines minimum pulley diameters, and Tables 2 and 3 refer to the maximum stresses acceptable on motor bearings up to frame 580. Beyond frame size 600, an analysis should be requested from the WEG engineering.

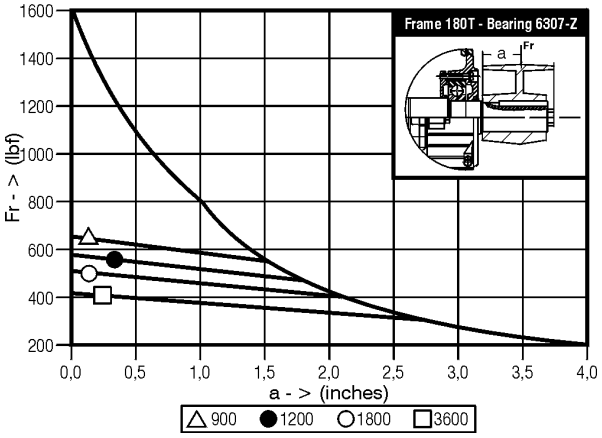
The maximum radial load for each frame are determined, by graphs.

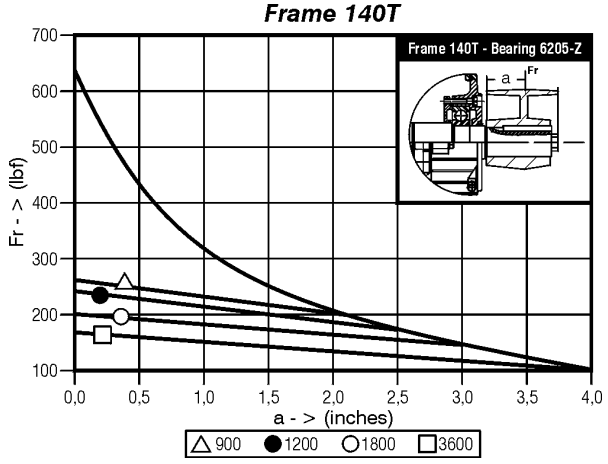
INSTRUCTIONS ON HOW TO USE THE GRAPHS

1 - Maximum radial load on shaft.
2 - Maximum radial load on bearings.



Where: X - Half of pulley width (inches)
Fr- Maximum radial load in relation to the diameter and pulley width.

Example:
Verify whether a 2HP motor, II Pole, 60Hz withstands a radial load of 110Lb, considering a pulley width of 4 inches.



Frame: 145T
Fr: 110Lb
X: 2 inches

1 - Mark the distance X
2 - Find out line N = 3600 for bearing
Based on the above, this bearing withstands a radial load of 130Lb.

3.2 Electrical Aspects

3.2.1 Feed System

Proper electric power supply is very important. The choice of motor feed conductors, whether branch or distribution circuits, should be based on the rated current of the motors as per NFPA-70 Standard article 430.
Tables 4, 5 and 6 show minimum conductor gauges sized according to maximum current capacity and maximum voltage drop in relation to the distance from the distribution center to the motor, and to the type of installation (Overhead or in ducts).

To determine the conductor gauge proceed as follows:

a) Determine the current by multiplying the current indicated on the motor nameplate by 1.25 and then locate the resulting value on the corresponding table.
If the conductor feeds more than one motor, the value to be sought on the table should be equal 1.25 times the rated current of the largest motor plus the rated current of the other motors.
In the case of variable speed motors, the highest value among the rated currents should be considered.
When motor operation is intermittent, the conductors should have a current carrying capacity equal or greater, to the product of the motor rated current times the running cycle factor shown on Table 7.

***Table 7** - Running cycle factor*

Motor Short

Motor short time rating / Duty Classification	5min	15min	30 at 60min	Continuos
Short (operating valves, activating contacts etc)	1.10	1.20	1.50	-
Intermittent (passenger or freight elevators, tools, pumps, rolling bridges etc)	0.85	0.85	0.90	1.40
Cyclic (rolling mills,mining machines etc)	0.85	0.90	0.95	1.40
Variable	1.10	1.20	1.50	2.00

b) Locate the rated voltage of the motor and the feed network distance in the upper part of the corresponding table. The point of intersection of the distance column and the line referring to current will indicate the minimum required gauge of the conductor.

Example:
Size the conductors for a 15 HP, three-phase, 230V, 42A, motor located 200 feet from the main supply with cables laid in conduits.

a) Current to be located: 1.25 x 42A = 52.5A
b) Closest value on table 6:55A
c) Minimum gauge: 6 AWG

3.2.2 Starting of Electric Motor

Induction motors can be started by the following methods:

Direct Starting

Whenever possible a three-phase motor with a squirrel cage rotor should be started directly at full supply voltage by means of a contactor (Connection diagram a). This method is called Direct-on-Line (DOL) starting.
There are DOL starter assemblies available combining a three-pole contactor, a bimetal relay (overload protection device), and a fuse (short circuit protection on branch circuit).
DOL starting is the simplest method, only feasible however, when the locked rotor current (LRC) does not influence the main electric supply lines.
Initial locked rotor current (LRC) in induction motors reach values six to eight times the value of the full load current. During starting by the DOL method, starting current can reach these high levels. The main electrical supply should be rated sufficiently, such that during the starting cycle no supply disturbance to others on the power network is caused by the voltage drop in the main supply.
This can be achieved under one of the following situations:

a) The rated main supply current is high enough for the locked rotor current not to be proportionally high.
b) Motor locked rotor current is low with no effect on the networks.
c) The motor is started under no-load conditions with a short starting cycle and, consequently, a low locked rotor current with a transient voltage drop tolerable to other consumers.

Starting with a compensating switch (auto-transformer starting)

Should direct on line starting not be possible, either due to restrictions imposed by the power supply authority or due to the installation itself, reduced voltage indirect starting methods can be employed to lower the locked rotor current. The single line connection diagram (C) shows the basic components of a compensating switch featuring a transformer (usually an auto-transformer) with a series of taps corresponding to the different values of the reduced voltage. Only three terminals of the motor are connected to the switch, the other being interconnected as per diagram, for the indicated voltage.

Star-Delta starting

It is fundamental to star-delta starting that the three-phase motor has the necessary numbers of leads for both connections:

6 leads for Y/Δ
or 12 leads for YY/ΔΔ

All the connections for the various voltages are made through terminals in the terminal box in accordance with the wiring diagram that accompanies the motor. This diagram may be shown on the nameplate or in the terminal box.
The star-delta connection is usually used only in low-voltage motors due to normally available control and protection devices. In this method of starting the locked rotor current is approximately 30% of the original LRC. The locked rotor torque is reduced proportionally as well. For this reason, it is very important before deciding to use

***Table 4** - Wire and cable gauges for single-phase motor installation (voltage drop < 5%) (in conduits)*

Note: The above indicated values are orientative. For guaranteed values, contact the Local Power Company.

star-delta starting to verify if the reduced locked rotor torque in "STAR" connection is enough to accelerate the load.

3.2.3 Motor Protection

Motor circuits have, in principle, two types of protection: motor overload, locked rotor and protection of branch circuit from short circuits. Motors in continuous use should be protected from overloading by means of a device incorporated into the motor, or by an independent device, usually a fixed or adjustable thermal relay equal or less than to the value derived from multiplying the rated feed current at full load by:

- 1.25 for motors with a service factor equal or superior to 1.15 or;

- 1.15 for motors with service factor equal to 1.0.

Some motors are optionally fitted with overheating protective detectors (in the event of overload, locked rotor, low voltage, inadequate motor ventilation) such as a thermostat (thermal probe), thermistor (PTC), RTD type resistance which dispense with independent devices.

THERMOSTAT (THERMAL PROBE)**:** Bimetallic thermal detectors with normally closed silver contacts. These open at pre-determined temperatures. Thermostats are series connected directly to the contactor coil circuit by two conductors.

THERMISTORS: Semi-conductor heat detectors positive temperature coeficient (PTC) that sharply change their resistance upon reaching a set temperature. Thermistors, depending upon the type, are series or parallel-connected to a control unit that cuts out the motor feed, or actuates an alarm system, in response to the thermistors reaction.

RESISTANCE TEMPERATURE DETECTORS (RTD) - PT 100: The resistance type heat detector (RTD) is a resistance element usually manufactured of copper or platinum.
The RTD operates on the principle that the electrical resistance of a metallic conductor varies linearly with the temperature. The detector terminals are connected to a control panel, usually fitted with a temperature gauge, a test resistance and a terminal changeover switch.

Subject to the desired degree of safety and the client's specification, three (one per phase) or six (two per phase) protective devices can be fitted to a motor for the alarm stems, circuit breaker or combined alarm and circuit breaker, with two leads from the terminal box to the alarm or circuit breaker system and four for the combined system (alarm and circuit breaker).
Table 9 compares the two methods of protection.

3.3 Start-up

3.3.1 Preliminary Inspection

Before starting a motor for the first time, it will be necessary to:

a) Remove all locking devices and blocks used in transit and check that the motor rotates freely;

b) Check that the motor is firmly secured and that coupling elements are correctly mounted and aligned.;

c) Ascertain that voltage and frequency correspond to those indicated on the nameplate. Motor performance will be satisfactory with main supply voltage fluctuation within ten per cent of the value indicated on the nameplate or a frequency fluctuation within five per cent or, yet, with a combined voltage and frequency variance within ten per cent;

d) Check that connections are in accordance with the connection diagram shown on the nameplate and be sure that all terminal screws and nuts are tight;

e) Check the motor for proper grounding. Providing that there are no specifications calling for ground-insulated installation, the motor must be grounded in accordance with prevalent standard for grounding electrical machines. The screw identified by the symbol ⏚ should be used for this purpose.
This screw is generally to be found in the terminal box or on one foot of the frame;

f) Check that motor leads connecting with the mains, as well as the control wires and the overload protection device, are in accordance with Nema Standards;

g) If the motor has been stored in a damp place, or has been stopped for some time, measure the insulating resistance as recommended under the item covering storage instructions;

h) Start the motor uncoupled to ascertain that it is turning in the desired direction. To reverse the rotation of a three-phase motor, invert two terminal leads of the mains supply.
High voltage motors bearing an arrow on the frame indicating rotation direction can only turn in the direction shown.

3.3.2 The First Start-up

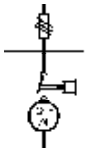
Three-Phase Motor with Cage Rotor:
After careful examination of the motor, follow the normal sequence of starting operations listed in the control instructions for the initial start-up.

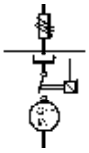
3.3.3 Operation

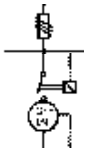
Drive the motor coupled to the load for a period of at least one hour while watching for abnormal noises or signs of overheating.
Compare the line current with the value shown on the nameplate.
Under continuous running conditions without load fluctuations this should not exceed the rated current times the service factor, also shown on the nameplate.
All measuring and control instruments and apparatus should be continuously checked for anomalies, and any irregularities corrected.

3.3.4 Stopping

Warning:







To touch any moving part of a running motor, even though

disconnected, is a danger to life and limb.

Three-phase motor with cage rotor:
Open the stator circuit switch. With the motor at a complete stop, reset the auto-transformer, if any, to the "start" position.

Notes:
- The ZZ bearings from 6201 to 6307 do not require relubrication as its life time is about 20,000 hours.
- Tables 1 and 2 are intended for the lubrication period under bearing temperature of 70ºC (for bearings up to 6312 and NU 312) and temperature of 85ºC (for bearings 6314 and NU 314 and larger).
- For each 15ºC of temperature rise, the relubrication period is reduced by half.
- The relubrication periods given above are for those cases applying Polyrex® EM grease.
- When motors are used on the vertical position, their relubrication interval is reduced by half if compared to horizontal position motors.

Compatibility of Polyrex® EM grease with other types of grease:

Containing polyurea thickener and mineral oil, the Polyrex® EM grease is compatible with other types of grease that contain:
- Lithium base or complex of lithium or polyurea and highly refined mineral oil.
- Inhibitor additive against corrosion, rust and anti-oxidant additive.

Notes:
- Although Polyrex® EM is compatible with types of grease given above, we do no recommended to mix it with any other greases.
- If you intend to use a type of grease different than those recommended above , first contact WEG.
- On applications (with high or low temperatures, speed variation, etc), the type of grease and relubrification interval are given on an additional nameplate attached to the motor.

4. Maintenance

A well-designed maintenance program for electric motors can be summed up as: periodical inspection of insulation levels, temperature rise, wear, bearing lubrication and the occasional checking of fan air flow.
Inspection cycles depend upon the type of motor and the conditions under which it operates.

4.1 Cleanliness

Motors should be kept clean, free of dust, debris and oil. Soft brushes or clean cotton rags should be used for cleaning. A jet of compressed air should be used to remove non-abrasive dust from the fan cover and any accumulated grime from the fan and cooling fins.
Oil or damp impregnated impurities can be removed with rags soaked in a suitable solvent.
Terminal boxes fitted to motors with IP55 protection should be cleaned; their terminals should be free of oxidation, in perfect mechanical condition, and all unused space dust-free.
Motors with IPW 55 protection are recommended for use under unfavourable ambient conditions.

4.2 Lubrication

Proper lubrication extends bearing life.

Lubrication Maintenance Includes:

a) Attention to the overall state of the bearings;
b) Cleaning and lubrication;
c) Critical inspection of the bearings.

Motor noise should be measured at regular intervals of one to four months. A well-tuned ear is perfectly capable of distinguishing unusual noises, even with rudimentary tools such as a screw driver, etc., without recourse to sophisticated listening aids or stethescopes that are available on the market.
A uniform hum is a sign that a bearing is running perfectly. Bearing temperature control is also part of routine maintenance.
Constant temperature control is possible with the aid of external thermometers or by embedded thermal elements. WEG motors are normally equipped with grease lubricated ball or roller bearings.
Bearings should be lubricated to avoid metallic contact of the moving parts, and also for protection against corrosion and wear. Lubricant properties deteriorate in the course of time and mechanical operation: furthermore, all lubricants are subject to contamination under working conditions.
For this reason lubricants must be renewed and any lubricant consumed needs replacing from time to time.

4.2.1 Periodical Lubrication

WEG motors are supplied with sufficient grease for a long running period. Lubrication intervals, the amount of grease and the type of bearing used in frames 140T to 580T are to be found in Tables 11, 12 and 13.
Lubrication intervals depend upon the size of the motor, speed, working conditions and the type of grease used.

4.2.2 Quality and Quantity of Grease

Correct lubrication is important!
Grease must be applied correctly and in sufficient quantity as both insufficient or excessive greasing are harmful.
Excessive greasing causes overheating brought about by the greater resistance encountered by the rotating parts and, in particular, by the compacting of the lubricant and its eventual loss of lubricating qualities.
This can cause seepage with the grease penetrating the motor and dripping on the coils.

GREASES FOR MOTOR BEARINGS

For operating temperatures from -30 to 170ºC	
Type	**Supplier**
Polyrex® EM	Esso

4.2.3 Lubricating Instructions

a) Frame 140T to 210T motors
Frame 140T to 210T size motors are not fitted with grease nipples. Lubrication is carried out during periodical overhauls when the motor is taken apart.

Cleaning and Lubrication of Bearings

With the motor dismantled and without extracting the bearings from the shaft, all existing grease should be removed and the bearings cleaned with Diesel oil, kerosene or other solvent, until thoroughly clean.
Refill the spaces between the balls or rollers and the bearing cages with grease immediately after washing. Never rotate bearings in their dry state after washing.
For inspection purposes apply a few drops of machine oil. During these operations maximum care and cleanliness is recommended to avoid the penetration of any impurities or dust that could harm the bearings. Clean all external parts prior to reassembly.

b) Frame 360T to 580T Motors
Motors above 360T frame size are fitted with regreasable bearing system.
The lubrication system from this frame size upwards was designed to allow the removal of all grease from the bearing races through a bleeder outlet which at the same time impedes the entry of dust or other contaminants harmful to the bearing.
This outlet also prevents injury to the bearings from the well-known problem of over-greasing.

It is advisable to lubricate while the motor is running, to allow the renewal of grease in the bearing case.
Should this procedure not be possible because of rotating parts in the proximity of the nipple (pulleys, coupling sleeves, etc.) that are hazardous to the operator the following procedure should be followed:
- Inject about half the estimated amount of grease and run the motor at full speed for approximately a minute; switch off the motor and inject the remaining grease.
The injection of all the grease with the motor at rest could cause penetration of a portion of the lubricant through the internal seal of the bearing case and hence into the motor.

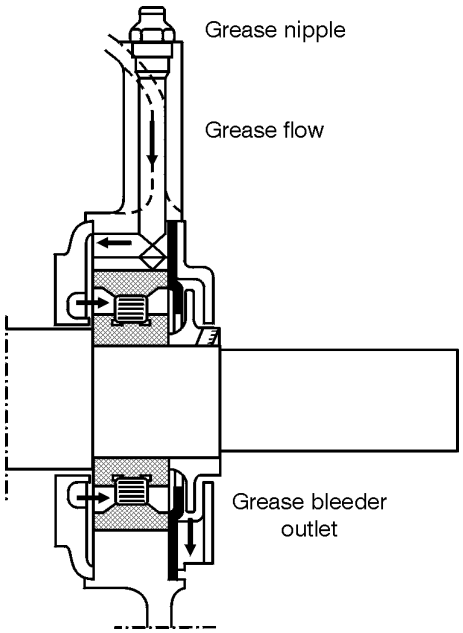

Figure 4.1 - Bearings and lubrication system

Nipples must be clean prior to introduction of grease to avoid entry of any alien bodies into the bearing.
For lubricating use only a manual grease gun.

Bearing Lubrication Steps

1. Cleanse the area around the grease nipples with clean cotton fabric.
2. With the motor running, add grease with a manual grease gun until the lubricant commences to be expelled from the bleeder outlet, or until the quantity of grease recommended in Tables 12 or 13 has been applied.
3. Allow the motor to run long enough to eject all excess grease.

4.2.4 Replacement of Bearings

The opening of a motor to replace a bearing should only be carried out by qualified personnel.
Damage to the core after the removal of the bearing cover can be avoided by filling the gap between the rotor and the stator with stiff paper of a proper thickness.

Providing suitable tooling is employed, disassembly of a bearing is not difficult.
The extractor grips should be applied to the sidewall of the inner ring to be stripped, or to an adjacent part.
To ensure perfect functioning and to prevent injury to the bearing parts, it is essential that the assembly be undertaken under conditions of complete cleanliness and by competent personnel.
New bearings should not be removed from their packages until the moment of assembly.
Prior to fitting a new bearing, ascertain that the shaft has no rough edges or signs of hammering.

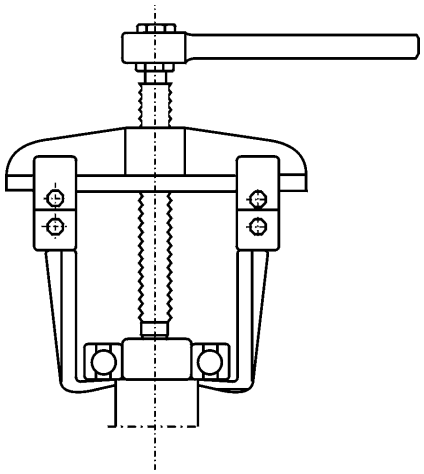

Figure 4.2 - A bearing extractor

During assembly bearings cannot be subjected to direct blows.
The aid used to press or strike the bearing should be applied to the inner ring.

4.3 Air Gap Checking (Large Rating Open Motors)

Upon the completion of any work on the bearings check the gap measurement between the stator and the rotor using the appropriate gazes.
The gap variation at any two vertically opposite points must be less than 10% of the average gap measurement.

4.4 Explosion Proof Motor Repair Steps

4.4.1 Objective

In view of the heavy liability associated with burning of motors of this type, this product has been designed and manufactured to high technical standards, under rigid controls. In addition, in many areas it is required that explosion proof motors ONLY be repaired by licensed personnel or in licensed facilities authorized to do this type of work.
The following general procedures, safeguards, and guidelines must be followed in order to ensure repaired explosion proof motors operate as intended.

4.4.2 Repair Procedure and Precautions

Dismantle the damaged motor with appropriate tools without hammering and/or pitting machined surfaces such as enclosure joints, fastening

holes, and all joints in general.
The position of the fan cover should be suitably marked prior to removal so as to facilitate reassembly later on.
Examine the motor's general condition and, if necessary, disassemble all parts and clean them with kerosene. Under no circumstances should scrapers, emery papers or tools be used that could affect the dimensions of any part during cleaning.
Protect all machined parts against oxidation by applying a coating of vaseline or oil immediately after cleaning.

STRIPPING OF WINDINGS
This step requires great care to avoid knocking and/or denting of enclosure joints and, when removing the sealing compound from the terminal box, damage or cracking of the frame.

IMPREGNATION
Protect all frame threads by inserting corresponding bolts, and the joint between terminal box and frame, by coating it with a non-adhesive varnish (ISO 287 - ISOLASIL).
Protective varnish on machined parts should be removed soon after treating with impregnating varnish. This operation should be carried out manually without using tools.

ASSEMBLY
Inspect all parts for defects, such as cracks, joint incrustations, damaged threads and other potential problems.
Assemble using a rubber headed mallet and a bronze bushing after ascertaining that all parts are perfectly fitted.
Bolts should be positioned with corresponding spring washers and evenly tightened.

TESTING
Rotate the shaft by hand while examining for any drag problems on covers or fastening rings.
Carry out running tests as for standard motors.

MOUNTING THE TERMINAL BOX
Prior to fitting the terminal box all cable outlets on the frame should be sealed with a sealing compound (Ist layer) and an Epoxy resin (ISO 340) mixed with ground quartz (2nd layer) in the following proportions:

340A resin	50 parts
340B resin	50 parts
Ground quartz	100 parts

Drying time for this mixture is two hours during which the frame should not be handled and cable outlets should be upwards.
When dry, see that the outlets and areas around the cables are perfectly sealed.
Mount the terminal box and paint the motor.

4.4.3 Miscellaneous Recommendations

- Any damaged parts (cracks, pittings in machined surfaces, defective threads) must be replaced and under no circumstances should attempts be made to recover them.
- Upon reassembling explosion proof motors IPW55 the substitution of all seals is mandatory.
- Should any doubts arise, consult WEG.

5. Malfunctioning

Most malfunctions affecting the normal running of electric motors can be prevented by maintenance and the appropriate precautions.
While ventilation, cleanliness and careful maintenance are the main factors ensuring long motor life, a further essential factor is the prompt attention to any malfunctioning as signalled by vibrations, shaft knock, declining insulation resistance, smoke or fire, sparking or unusual slip ring or brush wear, sudden changes of bearing temperatures.
When failures of an electric or mechanical nature arise, the first step to be taken is to stop the motor and subsequent examination of all mechanical and electrical parts of the installation.
In the event of fire, the installation should be isolated from the mains supply, which is normally done by turning off the respective switches.
In the event of fire within the motor itself, steps should be taken to restrain and suffocate it by covering the ventilation vents.
To extinguish a fire, dry chemical or $C0_2$ extinguishers should be used - never water.

5.1 Standard Three-Phase Motor Failures

Owing to the widespread usage of asynchronous three-phase motors in industry which are more often repaired in the plant workshops, there follows a summary of possible failures and their probable causes, detection and repairs.
Motors are generally designed to Class B or F insulation and for ambient temperatures up to 40°C.
Most winding defects arise when temperature limits, due to current overload, are surpassed throughout the winding or even in only portions thereof. These defects are identified by the darkening or carbonizing of wire insulation.

5.1.1 Short Circuits Between Turns

A short circuit between turns can be a consequent of two coinciding insulation defects, or the result of defects arising simultaneously on two adjacent wires. As wires are randomly tested, even the best quality wires can have weak spots. Weak spots can, on occasion, tolerate a voltage surge of 30% at the time of testing for shorting between turns, and later fail due to humidity, dust or vibration.
Depending on the intensity of the short, a magnetic hum becomes audible.
In some cases, the three-phase current imbalance can be so insignificant that the motor protective device fails to react. A short circuit between turns, and phases to ground due to insulation failure is rare, and even so, it nearly always occurs during the early stages of operation.

5.1.2 Winding Failures

a) One burnt winding phase

This failure arises when a motor runs wired in delta and current fails in one main conductor.
Current rises from 2 to 2.5 times in the remaining winding with a simultaneous marked fall in speed. If the motor stops, the current will increase from 3.5 to 4 times its rated value.
In most instances, this defect is due to the absence of a protective switch, or else the switch has been set too high.

b) Two burnt winding phases

This failure arises when current fails in one main conductor and the motor winding is star-connected. One of the winding phases remains currentless while the others absorb the full voltage and carry an excessive current.
The slip almost doubles.

c) Three burnt winding phases

Probable cause 1
Motor only protected by fuses; an overload on the motor will be the cause of the trouble.
Consequently, progressive carbonizing of the wires and insulation culminate in a short circuit between turns, or a short against the frame occurs.
A protective switch placed before the motor would easily solve this problem.

Probable cause 2
Motor incorrectly connected. For example: A motor with windings designed for 230/400V is connected through a star-delta switch to 400V connection.
The absorted current will be so high that the winding will burn out in a few seconds if the fuses or a wrongly set protective switch fail to react promptly.

Probable cause 3
The star-delta switch is not commutated and the motor continues to run for a time connected to the star under overload conditions.
As it only develops 1/3 of its torque, the motor cannot reach rated speed. The increased slip results in higher ohmic losses arising from the Joule effect. As the stator current, consistent with the load, may not exceed the rated value for the delta connection, the protective switch will not react.
Consequent to increased winding and rotor losses the motor will overheat and the winding burn out.

Probable cause 4
Failures from this cause arise from thermal overload, due to too many starts under intermittent operation or to an overly long starting cycle.
The perfect functioning of motor operating under these conditions is only assured when the following values are heeded:
a) number of starts per hour;
b) starting with or without load;
c) mechanical brake or current inversion;
d) acceleration of rotating masses connected to motor shaft;
e) load torque vs. speed during acceleration and braking.

The continuous effort exerted by the rotor during intermittent starting brings about heavier losses which provoke overheating.
Under certain circumstances with the motor idle there is a possibility that the stator winding is subjected to damage as a result of the

heating of the motor. In such a case, a slip ring motor is recommended as a large portion of the heat (due to rotor losses) is dissipated in the rheostat.

5.1.3 Rotor Failures

If a motor running under load conditions produces a noise of varying intensity and decreasing frequency while the load is increased, the reason, in most cases, will be an unsymmetrical rotor winding.
In squirrel-cage motors the cause will nearly always be a break in one or more of the rotor bars; simultaneously, periodical stator current fluctuations may be recorded. As a rule, this defect appears only in molded or die cast aluminum cages.
Failures due to spot heating in one or another of the bars in the rotor stack are identified by the blue coloration at the affected points.
Should there be failures in various contiguous bars, vibrations and shuddering can occur as if due to an unbalance, and are often interpreted as such. When the rotor stack acquires a blue or violet coloration, it is a sign of overloading.
This can be caused by overly high slip, by too many starts or overlong starting cycles. This failure can also arise from insufficient main voltage.

5.1.4 Bearing Failures

Bearing damage is a result of overloading brought about by an overly taut belt or axial impacts and stresses.
Underestimating the distance between the drive pulley and the driven pulley is a common occurrence.
The arc of contact of the belt on the drive pulley thus becomes inadmissibly small and thereby belt tension is insufficient for torque transmission.
In spite of this it is quite usual to increase belt tension in order to attain sufficient drive.
Admittably, this is feasible with the latest belt types reinforced by synthetic materials.
However, this practice fails to consider the load on the bearing and the result is bearing failure within a short time.
Additionally there is the possibility of the shaft being subjected to unacceptably high loads when the motor is fitted with a pulley that is too wide.

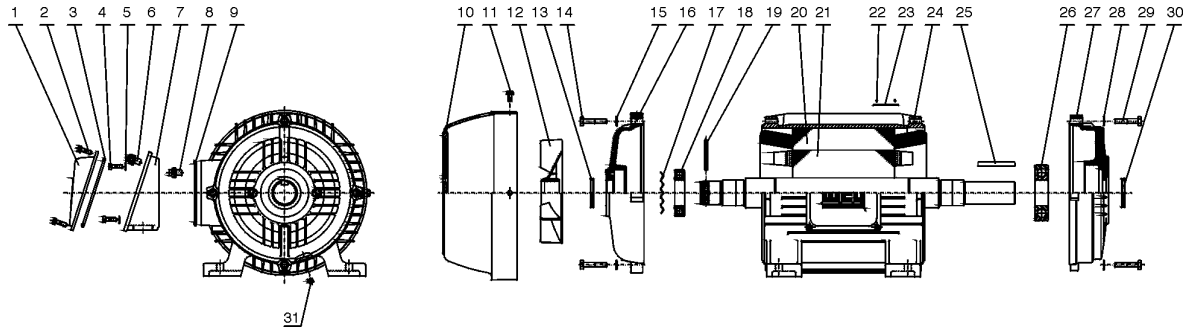
5.1.5 Shaft Fractures

Although bearings traditionally constitute the weaker part, and the shafts are designed with wide safety margins, it is not beyond the realm of possibility that a shaft may fracture by fatigue from bending stress brought about by excessive belt tension.
In most cases, fractures occur right behind the drive end bearing.
As a consequence of alternating bending stress induced by a rotating shaft, fractures travel inwards from the outside of the shaft until the point of rupture is reached when resistance of the remaining shaft cross-section no longer suffices.
Avoid additional drilling the shaft (fastening screw holes) as such operations tend to cause stress concentration.

5.1.6 Unbalanced V-Belt Drives

The substitution of only one of a number of other parallel belts on a drive is frequently the cause of shaft fractures, as well as being malpractice.
Any used, and consequently stretched belts retained on the drive, especially those closest to the motor, while new and unstretched belts are placed on the same drive turning farther from the bearing, can augment shaft stress.

5.1.7 Damage Arising from Poorly Fitted Transmission Parts or Improper Motor Alignment



Damage to bearing and fracture in shafts often ensue from inadequate fitting of pulleys, couplings or pinions. There parts “knock” when rotating. The defect is recognized by the scratches that appear on the shaft or the eventual scalelike flaking of the shaft end.
Keyways with edges pitted by loosely fitted keys can also bring about shaft failures.
Poorly aligned couplings cause knocks and radial and axial shaking to shaft and bearings.
Within a short while these malpractices cause the deterioration of the bearings and the enlargement of the bearing cover bracket located on the drive end side.
Shaft fracture can occur in more serious cases.

5.2 Troubleshooting chart

FAILURE	PROBABLE CAUSE	CORRECTIVE MEASURES
Motor fails to start	• No voltage supply • Low voltage supply • Wrong control connections • Loose connection at some terminal lug • Overload	• Check feed connections to control system and from this to motor. • Check voltage supply and ascertain that voltage remains within 10% of the rated voltage shown on the motor nameplate. • Compare connections with the wiring diagram on the motor nameplate. • Tighten all connections. • Try to start motor under no-load conditions. If it starts, there may be an overload condition or a blocking of the starting mechanism. Reduce load to rated load level and increase torque.
High noise level	• Unbalance • Distorted shaft • Incorrect alignment • Uneven air gap • Dirt in the air gap • Extraneous matter stuck between fan and motor casing • Loose motor foundation • Worn bearings	• Vibrations can be eliminated by balancing rotor. If load is coupled directly to motor shaft, the load can be unbalanced. • Shaft key bent; check rotor balance and eccentricity. • Check motor aligment with machine running. • Check shaft for warping or bearing wear. • Dismantle motor and remove dirt or dust with jet of dry air. • Dismantle motor and clean. Remove trash or debris from motor vicinity. • Tighten all foundation studs. If necessary, realign motor. • Check lubrication. Replace bearing if noise is excessive and continuous.
Overheating of bearings	• Excessive grease • Excessive axial or radial strain on belt • Deformed shaft • Rough bearing surface • Loose or poorly fitted motor end shields • Lack of grease • Hardened grease cause locking of balls • Foreign material in grease	• Remove grease bleeder plug and run motor until excess grease is expelled. • Reduce belt tension. • Have shaft straightened and check rotor balance. • Replace bearings before they damage shaft. • Check end shields for close fit and tightness around circumference. • Add grease to bearing. • Replace bearings. • Flush out housings and relubricate.
Intense bearing vibration	• Unbalanced rotor • Dirty or worn bearing • Bearing rings too tight on shaft and/or bearing housing • Extraneous solid particles in bearing	• Balance rotor statically and dynamically. • If bearing rings are in perfect condition, clean and relubricate the bearing, otherwise, replace bearing. • Before altering shaft or housing dimensions, it is advisable to ascertain that bearing dimensions correspond to manufacturer's specifications. • Take bearing apart and clean. Reassemble only if rotating and support surfaces are unharmed.
Overheating of motor	• Obstructed cooling system • Overload • Incorrect voltages and frequecies • Frequent inversions • Rotor dragging on stator • Unbalanced electrical load (burnt fuse, incorrect control)	• Clean and dry motor; inspect air vents and windings periodically. • Check application, measuring voltage and current under normal running conditions. • Compare values on motor nameplate with those of mains supply. Also check voltage at motor terminals under full load. • Exchange motor for another that meets needs. • Check bearing wear and shaft curvature. • Check for unbalanced voltages or operation under single-phase condition.

1. Introduction

Aggregate Processing Division of McLanahan, is a major manufacturer of process plants for the minerals industry. The LPT Model IIIr is the latest generation of successful abrasion/corrosion resistant slurry handling Pumps.

This manual should be carefully read before attempting to install or operate this LPT Model IIIr Pump.

Service, Selection and Support

Total Service

From design to installation and beyond, McLanahan engineers are available to give advice on your slurry pumping needs and problems.

The LPT Model IIIr range has been designed to offer a wide choice of pump sizes to suit most slurry pumping applications. A standard questionnaire is available to ensure that the most complex installation, as well as the more straightforward pumping application, receives individual consideration.

McLanahan can also advise on the ancillary components within the pumping system. The provision of low head loss valves, gland feed pumps, priming devices and flexible bends, all incorporating application specific linings for trouble-free life, are an important aspect of ensuring a totally successful pump installation

Design Specifications and Options

The LPT Model lllr standard casing is designed for a maximum working pressure of 88 psi (6 bar). A high pressure casing is available, rated at 272 psi (18.5 bar). Please contact McLanahan for pressures higher than this.

The pump units in the LPT Model lllr range are designated by the size of suction and discharge ports. Units up to 4" (100mm) have equal size suction and discharge, above this the Model lllr has a larger suction than discharge. Size is given in inches (mm) i.e. 8"/6" (200/150) Model lllr has an 8" (200mm) suction port and a 6" (150mm) discharge port.

Suction and discharge flanges are universal and are available in ASA150 drilling patterns as standard. Other drilling patterns (metric & BS4504) are available to special order. Orientation of discharge to 4 positions according to installation requirements.

The LPT Model lllr pump components are designed and manufactured in accordance with appropriate International Quality Standards, such as lSO9000.

Important Notes

- **The maintenance of rotating machinery should be done by experienced mechanics.**
- **Protective clothing and proper tools and lifting equipment, all in good condition, must be used.**
- **Do not lift heavy weights without mechanical aids.**
- **Do not take any risks with your health and safety.**
- **If a pump has run without discharge, the fluid temperature and pressure may be dangerously high. Refer to paragraph 17.1 and 17.11 c.**
- **The casing suspension arm is fitted as a maintenance aid only. Refer to Note 3, page 17.**
- **The installer must ensure that guards are fitted in accordance with national & local regulations.**

2.1. Design Condition (To be filled in by distributor or owner)

The following data should be completed as a record of the duty for which the pump was originally sold. During its lifetime the pumping requirements may change, if so, the new speed and operating conditions must be carefully engineered. McLanahan engineers are able to assist you in doing this if required. US units are used unless otherwise noted

10	Liner Nut Set
11	Suction Bush Stud Set
12	Casing to Pedestal Stud Set
13	Gland Assembly ("H" Type shown)
14	Flinger
15	Bearing Assembly
16	Motor Platform Assembly (not shown)
17	Pedestal Caps
18	Pedestal
19	Axial Positioning Jack (not shown)
20	Pedestal Cap Screws
21	Gland Holding Screw Set
23	Eyebolt - Casing (not shown)
24	Inside Gland Cover (not shown)
25	S & D Flang Stud Set (not shown)
26	Drain Plug Stud Set (not shown)
31	Shaft Gland (not shown)

Optional Parts (not shown)		
Part No.		Description
28	C01	Suspension Arm
	C02	Crawl
	C03	Supporting Disc
	C04	Supporting Bracket
	C05	Eyebolt
16	M01	C01
	M02	C02
	03	C03
	M04	C04
	M05	Crossbar Support Collar
29		Belt Guard
30		Shaft Spanner

*Removable suction bush & liner from LP6x5 (150/125) upwards.

4.2. Bearing Housing Assembly

Cross Section Through Bearing Assembly

Bearing Assembly Parts List	
Part No.	Description
B01	Bearing Housing
B02	Shaft
B03	End Cover
B04	Front Cover
B05	End Bearing
15 B06	Front Bearing
B07	Tab Washer
B08	Lock Nut
B09	End Grease Seal
B10	Front Grease Seal
B11	Bearing Cover Set Screws
B12	Grease Nipples
B13	Bearing Housing Cover Seals

5. Parts List and Part Reference Numbers

Spare Parts

The part is fully identified by the number on the cross section drawing followed by the discharge branch size. For example an impeller for the 2"/2" (50/50) rubber pump is Part Number 08-050. The material description must also be given i.e. Linatex, nitrile, etc.

McLanahan CORPORATION

7. Gland Options & Part Numbers

Gland Seals

The Gland is usually the weakest point on any Pump and requires most attention and maintenance. All glands need cooling and lubrication between the sliding surfaces, so a drip from the glands is normal. All glands must be finally adjusted while the pump is running.

The LPT Glands have been developed to try to minimise the attention and service needed, but this depends on the pressure of the fluid being pumped, the size and shape of the solid particles and the concentration of the solid particles in the liquid. Three unique seal arrangements have been developed and McLanahan engineers can give advice regarding the optimum selection for a specific duty.

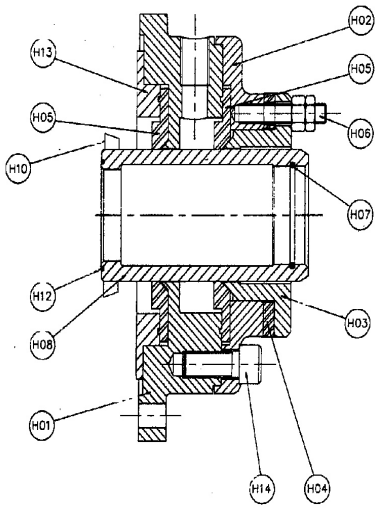
7.1. "H" and "P" Glands

The Slurry pressure at the gland is reduced by back pump out vanes on the impeller, and when fitted the Rubber axial expeller, which is a stretch fit on the shaft of the "H" and "P" glands.

The solids are restrained by the outward Centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the "H" Gland, the adjusting gland must be eased **outwards** to increase the sealing pressure. The geometric shape of the Gland Seal is carefully designed to give a good seal, while limiting the amount of "digging" onto the gland sleeve.

The gland sealing water must be as clean as possible and at a pressure of about 3 – 5 psi (2 – 4m water gauge) above the discharge pressure. With a high flushing water pressure you get greater water use and greater dilution of the pumped slurry without any benefit to the seal.

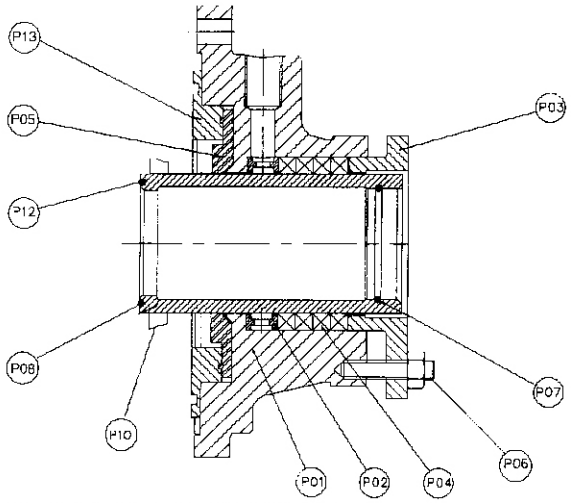


7.2. "D" Gland

This is a unique type of mechanical seal. The Face Seal runs against the hard Wearing Face.

The Face Seal acts as a spring and if any grit particles get between the rotating rubber and stationary Wear Face it is pressed into the Rubber. The Face Seal is a stretch fit on the shaft sleeve. As the gland pressure increases, so the rubber extends axially and increases the pressure at the rubbing interface. So great care must be taken not to over tighten the adjusting sleeve.

When the pump is first started, ensure that the adjusting nuts are finger tight. When the pump runs, adjust the gland nuts so that there are approximately 5 drops per minute from the gland. This should reduce to 1 drop occasionally, and run satisfactorily for up to a year without further attention in a good application.

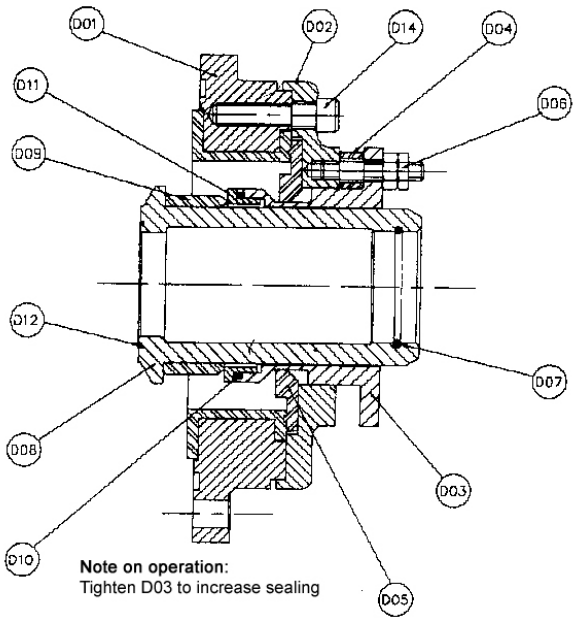


7.3. Sectional Arrangement – "H" Gland Assembly

Note on operation:
Loosen H06 to increase sealing.

Hydrostatic Gland Assembly	
Part No.	Description
H01	Gland Housing Hose Connector
H02	Gland Cover
H03	Adjusting Gland
H04	Resilient Gasket
H05	Gland Seal
H06	Adjusting Stud Set
H07	Sleeve O-Ring
H08	Gland Sleeve
H10	Axial Expeller
H11	Lantern Ring (not shown) 12"/10" (300/250) only
H12	Impeller O-Ring
H13	Gland Locating Ring
H14	Gland Cover Set Screw

7.4. Sectional arrangement – "P" Gland Assembly



Note on operation: Tighten P03 to increase sealing

Packed Gland Assembly	
Part No.	Description
P01	Gland Housing Hose Connector
P02	Lantern Ring
P03	Adjusting Gland
P04	Packing Rings
P05	Gland Seal
P06	Adjusting Stud Set
P07	Sleeve O-Ring
P08	Gland Sleeve
P10	Axial Expeller
P11*	Backing Ring (not shown)
P12	Impeller O-Ring
P13	Gland Locating Ring
P14*	Gland Cover Set Screw Set

*used on 10x8 (250/200) and 12x10 (300/250)

7.5. Sectional Arrangement - "D" Gland Assembly

D Gland Assembly	
Part No.	Description
D01	Gland Housing
D02	Gland Cover
D03	Adjusting Sleeve
D04	Linatex Washer
D05	Gland Seal
D06	Adjusting Stud Set
D07	Sleeve O-Ring
D08	Gland Sleeve
D09	Linatex Face Seal
D10	Face O-Ring
D11	Wearing Face
D12	Impeller O-Ring
D13	Gland Locating Ring (not shown) only on (4”/4”
D14	(100/100)
D15	Gland Cover Set Screw Spacer Ring (not shown) Only on 10”/8” (250/200) and 12”/10” (300/250)

Do not overtighten the adjusting nuts part D06

8. "Pumptec" Computer Software

Many complex calculations are needed In order to

- size a pump
- establish the optimum pipeline carrying velocity
- de-rate the pump for a slurry duty
- calculate pipeline friction head losses
- calculate power absorbed,
- analyze the system head

To perform these calculations, McLanahan Corporation uses unique software named "Pumptec".

Where McLanahan Corporation has selected the Pump using Pumptec, a printout of the operating conditions; pipe configuration and curve is included in the Appendix of this manual.

When any change of duty is envisaged, the pump can usually accommodate it with a change of V-belt sheave ratios and a different speed, but it is essential to recalculate all the duty parameters and to check that the motor and drive will not be overloaded under any normal operating condition.

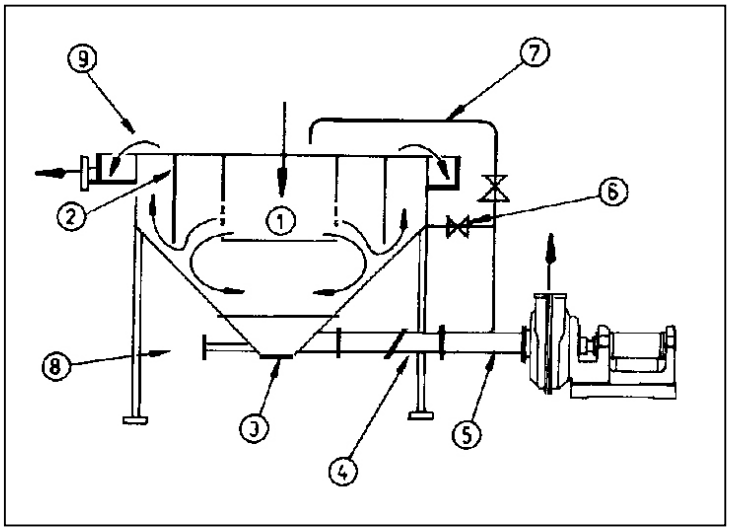
When making any change to your pump system, please refer these changes to McLanahan Corporation so the correct combination of speed and power is selected.

Input criteria required:

- Volume to be pumped
- Percent solids
- Gradation of solids (top size & 50% passing size)
- Specific Gravity of Solids
- Specific Gravity of Liquid
- Temperature of Liquid
- Elevation above sea level
- Height of liquid level in tank
  (if negative suction, height from liquid surface to centre line of pump inlet)
- Vertical height from Pump inlet to discharge point
- Pressure required at delivery point
- Pipe diameter (inside diameter important)
- Pipe material
- Pipe fittings – type and quantity

9. General Pump Suction Requirements

A pump does not “suck” as fluid has no tensile strength. The centrifugal expulsion of fluids creates a low pressure area at the eye of the impeller, and atmospheric pressure, plus any static head, pushes fluid into the pump. It is therefore essential that suction systems do not restrict flow from the sump into the pump. With slurries, this is even more important as the solids themselves can settle and cause obstructions to flow.



Short unobstructed pipelines with facilities for easy draining, removal and cleaning are essential.

A trap to remove tramp material is desirable.

Air entrained in the slurry reduces the pump’s capacity and head, and an air vent pipe on the suction pipe close to the pump inlet is often essential.

The pump will operate best if the flow velocity approaching the impeller is evenly distributed across the suction eye, and is sensibly axial and without swirl. Intake conditions in the sump, such as the formation of vortices, or in the suction pipeline, such as a sharp bend just before the pump, cause an uneven flow over the eye of the impeller, and impair pump performance.

The Desliming and Feed Regulating Sump shown below incorporates the best features in good sump design.

1. Feed Distribution Box/Tramp Material Trap.
2. Anti-Turbulence/Air Release Baffles.
3. Replaceable Lined Suction Box.
4. Removable Split Pipe or Flexible Hose to facilitate maintenance.
5. Short Simple Suction Piping.
6. Start Up Suction Line (Optional)
7. Air Vent Line (Optional).
8. Injection Water Line (Optional) or Drain/Dump Port.

10. Installation

The following notes cover most situations, but certain installations will require additional checks.

10.1. Noise

Because of its heavy construction, rigid bearing housing and the sound attenuation due to the rubber lining, the noise generated by a bare shaft LPT pump is low, less than 70dB(A).

The noise emission from a complete pump and drive unit will be dependent upon various factors including that from the motor, its fan and the V-belt drive. To obtain an indication of the noise level generated by a specific complete unit take the highest component noise level, generally the motor, and multiply by 1.15. I.e. dB (A) pump + dB (A) motor + dB (A) drive = 1.15 x dB (A) motor.

Other factors, including the piping system and hydraulically generated noise as well as any reflected noise, will affect the final installed figure.

10.2. Foundations

Holding down bolts, bolt holes in steel work or pockets in concrete must be checked for location and dimension to match the pump certified drawing. The foundations must be rigid.

The pump base must be set level in its final position, and be rigidly supported at each holding down bolt before the holding down bolts are tightened. It is unacceptable to twist the base by uneven tightening of the holding down bolts.

10.3. Pipe work

The suction and delivery pipe work must be independently supported, and the pump must not be used as an anchor to pull the pipes into position.

Provision for simple removal of suction and delivery pipe work to facilitate unblocking and servicing the pump, and dumping solids in an emergency situation should be checked.

Areas that could cause restriction on the suction side should be checked.

The possibility of thermal expansion in the pipe work causing undue loads on the pump should be checked.

Check that the pipe work matches up to the pump without strain.

The lining on the LPT Model IIIr is continued out to form gaskets on the suction and discharge flanges, therefore the use of joint rings or additional gaskets is not necessary. Connections to the pump should be made using flat faced flanges only.

When fitting LPT pumps to rubber-lined equipment such as valves, hose or lined pipe, a steel gasket must be used.

10.4. Power

Check that the motor voltage, power and starter rating and supply match.

10.5. Gland Services

If gland sealing water is required, the quantity, quality and availability should be checked.

10.6. Access

Crane capacity and access routes from the delivery point should be checked. Access for maintenance, protection from flooding, and ventilation for motor cooling must be checked.

10.7. Impeller Adjustment Axially

The position of the rotating element must be set so that there is a minimum running clearance, approximately 1mm, between the suction bush and the impeller, the bearing housing must then be locked in position. This clearance should be checked by bolting a dummy flange or stub pipe to the suction flange this ensures any movement of the rubber lining on connection is allowed for. Once connected to suction and delivery lines, the unit should be checked for free rotation.

10.8. Coupling Alignment

The pump and motor couplings must be aligned in accordance with good engineering practice and axial or radial run out must be less than 0.05 mm total indicated reading on a clock gauge. With Vee-belt pulleys, the faces of the couplings must be exactly in line, and the shafts must be parallel to each other. A check with a straight edge or string line across the pulley faces should have no visible gap.

10.9. Motor Rotation

Before the belts are fitted or the couplings are connected, the direction of rotation of the motor must be checked. Incorrect motor rotation can cause the impeller to screw off and destroy the pump.

10.10. Tension V-belts

When the motor's direction of rotation is correct, fit the V-belts and tension them in accordance with the maker's recommendation. In general, a quarter to a half twist of the belt will be possible at the centre of the belt using a finger and a thumb. Check the tension again after a few hours running.

10.11. Belt Guard

The belt guard provided with this pump unit is manufactured with the shaft aperture fully closed with mesh. On installation of the vee belt drive and determination of pulley centres, the shaft guard is offered up and the mesh relieved locally to allow the shafts to pass through. Allowance may be required for movement of shafts when belt tensioning.

The mesh should be relieved and a guard should be fitted in a manner which prevents accidental contact with the rotating parts of the drive assembly.

The installer must ensure the guard is installed in the accordance with national and local regulations.

10.12. Gland Service

Check that gland water supply and protection systems are working, when these are fitted.

10.13. Greased Bearings

The pump bearings will have been greased at the factory and over greasing can cause them to overheat, so check the bearings, but do not over grease them. Suitable grease types are Shell Alvania 3, Mobil EP2, Caltex LS3 or their equivalents.

10.14. Final Checks

Check that all nuts and bolts are tight; the gland adjusting nuts are finger tight; that no loose material is lying around the pump set; that the guards are securely fitted and the pump is safe to start.

THE RUNNING SPEED OF THE PUMP MUST NOT EXCEED THE FOLLOWING:

Pump	1½x1½	2x2	3x3n	4x4	6x5	8x6	10x8	12x10
MAX RPM.	2750	2400	2100	1600	1400	1200	1200	900

10.15. Electrical Installation

This equipment must be installed and controlled in accordance with applicable national and local regulations.

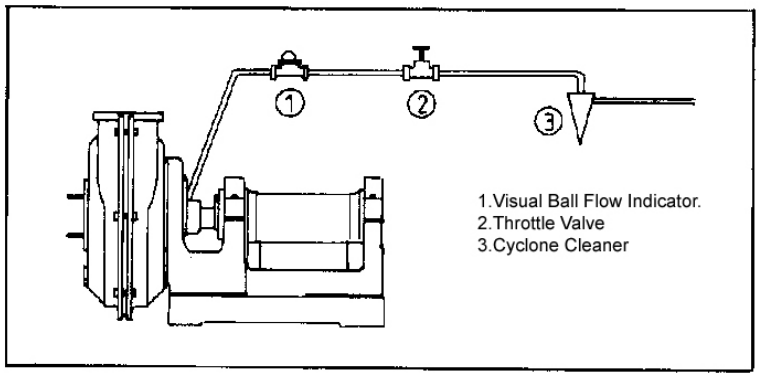
11. Gland Services

On the hydrostatic gland and also on the packed gland, it is usually necessary to have a clean water flushing supply to the gland.

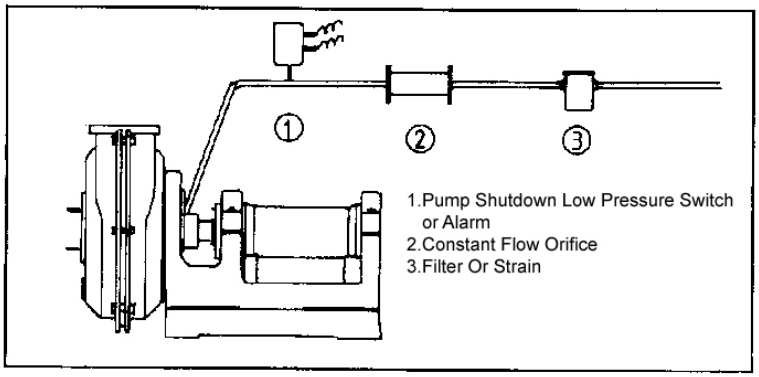
The pressure should be 3 – 5 psi (2 – 4 m) water gauge above the pump discharge pressure (remember to include the S.G. of the slurry) and the flow rate should be approximately in accordance with the table below.

Pump	units	1½x1½	2x2	3x3n	4x4	6x5	8x6	10x8	12x10
Water flow.	USgpm	1	1	1	2	2	2	3	4
Water flow.	liter/sec	0.04	0.04	0.05	0.07	0.07	0.09	0.1	0.2

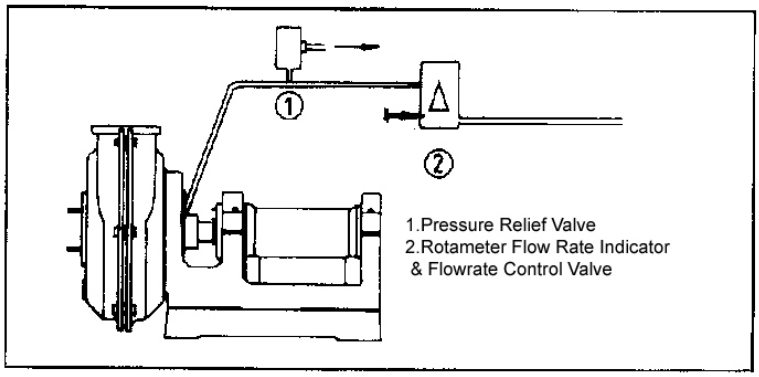
The gland flushing water should be clean. The life of the gland and gland sleeve is related to the cleanliness of the flushing water, and although a few particles will not do instant damage, the seal life will be reduced. Slurry must not be used.



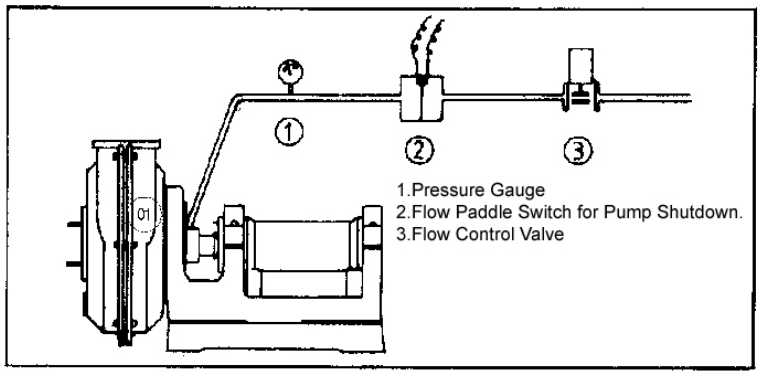
There are many combinations of flow control devices which may be used, and a few of these are shown on the next diagram. The objective is to maintain a secure supply of clean flushing water to extend the gland life.



With pumps in series, there are three main ways of supplying gland service water.



- Individual dedicated pumps at the correct pressure and flow rate.
- One large pump at the highest pressure throttling down the supply to each pump in the series.
- One multi-stage pump tapping off a supply at a different stage to each pump in the series.



11.1. Gland Service Water Systems

Below are some typical Gland Service systems. Any selection of items may be combined.

12. Lubrication and Cooling

The bearings are grease lubricated and additional grease need only be added about twice a year. Do not over grease the bearings.
The bearing assemblies are all checked in the factory to prove that they are correctly assembled

The bearings are designed to run at high temperatures, maximum 120° C, and the grease has to be compatible with this operating condition. Clean grease must be used.

If water gets into the bearings, the assembly must be stripped, thoroughly dried and regreased, and any seal failure corrected.

Recommended greases are Shell Alvania 3, Mobile EP2, Caltex LS3 or their equivalents.

13. Start up Procedure

It is recommended to follow this routine every time a pump is started although it is appreciated that many units will be operated remotely.

a. Check the free rotation of the pump.
b.
c. Check gland services water is running, if required.
d.
e. At first start, or after any work on the electric motor terminal box, check direction of rotation **WITH DRIVE BELTS REMOVED**
f.
g. Check the pump is primed.
h.
i. Check that all guards are in place and that the pump is safe to run.
j.
k. Start the pump.
l.
m. If the pipeline is empty and there is no discharge valve (i.e. due to abrasive nature of the product), the pump motor may be overloaded for a period and the pump may cavitate. This condition should be examined to evaluate the possible long term effect on the equipment.
n.
o. Check the pump for noise, vibration or any hot spots.
p.
q. Adjust the gland to maintain a drip, which is necessary for lubrication and for cooling.

14. Shutdown Procedure

This depends ultimately on the system and process flow requirements, but the following procedure is recommended.
a. Stop the flow of solids into the sump.
b. Turn the sluicing water or run system on water only to wash out the pump and delivery pipeline.
c. Shut down the pump.
d. Shut down the gland service water system

In cold weather, the pump and auxiliary equipment should be drained to prevent freezing damage.

15. Disassembly Procedure

Check that all power is switched off and isolated, and that it is safe electrically and mechanically to work the pump.

The following sequence is a general guide to stripping the pump for inspection. Refer to Cross Section drawings in Appendix. Where a gland part is mentioned the part for the H gland is referred to.

On sizes up to the 4x4 (100/100) there is no separate suction bush and liner.

a. Remove the suction pipe and inspect for wear.
b. Check the suction bush liner **01** for wear, noting any uneven wear pattern and position. Check the axial clearance
c. Between the suction bush liner **01** and the eye of the impeller **08** (or on smaller pumps between the casing liner and eye of the impeller.)
d. Remove nuts **11** and suction bush **02**. The suction bush liner **01** is pushed out of the suction bush **02** from the suction side. Some water spread under the lip of the suction bush liner **01** will lubricate its passage out of suction bush **02**.
e. Remove casing bolts **09** having supported the suction side casing **03**. Lift off the suction side casing **03**. A crane is necessary on the larger pumps.
f. Remove liner nuts **10** and inspect the suction side liner **04**. Note unusual wear patterns, cracks, tears or deterioration of the lining.
g. The impeller **08** is exposed for inspection. Hold the shaft **B02** using a spanner, which is a good fit, on the flats between the gland **13** and the flinger **14**. The impeller **08** is screwed onto the shaft **B02** with an Acme right hand thread. The impeller **08** may be very tightly locked onto the shaft **B02** and may need an impact force or a long lever to loosen it. If the impeller is to be used again, protect the rubber against damage. Inspect the impeller **08** and note unusual wear patterns in the flow passages and back or front pump out vanes. Check that the "O" ring behind the impeller **08** has sealed against the gland sleeve **H08** and slurry has not corroded the impeller or shaft thread. This "O" ring **H12** should be replaced at every strip-down.
h. Remove the axial expeller **H10,** which is a stretch fit on the gland sleeve **H08**. If 'D' gland is fitted the gland sleeve should be removed at this point.
i. Support the gland side casing **05**, undo the casing to pedestal nuts **12** and remove casing half along with the gland assembly **13**. Undo the gland holding screws **21** and remove the gland assembly **13**. Undo liner nuts **10**, the casing liner can now be removed for inspection, note any unusual wear patterns.
j. Remove bearing pedestal caps **17**, and fixings **20** and unfasten the axial positioning jack **19**, to enable bearing assembly to be removed.
k. To disassemble the bearing assembly, remove the gland sleeve **H08**, the flinger **14** and the bearing covers **B03** and **B04**. The bearings can be inspected at this stage. If there is no sign of damage, the bearings should not be disturbed, and the bearings should merely be washed out with mild solvent oil and regreased.
l. Press the shaft **B02** with the bearing **B05** still fitted out of the bearing housing **B01**. Push the shaft from the impeller side out of the bearing housing. The inner ring of front bearing **B06** will still be attached to the shaft and can be removed later.
m. The remainder of the front bearing **B06** can then be withdrawn from housing **B01.**
n. Loosen the tab washer B07 undo locknut B08 and pull the end bearing **B05** off the shaft.

Notes:

1. The 2x2 (50/50), 3x3 (80/80) and 4x4 (100/100) pumps do not have a loose suction bush liner **01** and suction bush **02**.
2. The 10x8 (250/200) and larger sizes have an Inside Gland Cover **24** which is held in position by **H14** / **P14** / **D14**. Undo **H14** and withdraw the Inside Gland Cover **24** from the impeller side.
3. The Casing Suspension Arm is fitted as a maintenance aid ONLY and as such may be used to support singularly, either of the Casing Halves and its associated liner, or the Impeller. It must not be used for any other purpose. (Suspension arm not fitted to 1½x1½ and 2x2 (50/50) pump.)

Wear and Replacement of Parts

To obtain the best service and performance from the pump, periodic routine inspections should be carried out and the pump has been particularly designed for this purpose. It is not possible to state at what intervals these inspections should be made because the rate of wear varies considerably from one application to the next. However, it is suggested that initially the pump be allowed to run for a period of say, three months, and an examination of the pump will then give some idea of the length of life which may be expected from the rubber covered parts.

16. Assembly Procedure

Before assembly, ensure all parts are clean and free of old grease and dirt. The new bearings or replacement bearings should be generously filled with grease between the rollers. Check the Neoprene grease seals **B09** and **B10** are sound, and not soft or distorted. Replace if necessary.

a. Clamp the shaft **B02** horizontally in a vice. Heat the spherical roller end bearing **B05** in an oil bath or induction heater to 240˚F (115˚C) and fit it to the drive end of the shaft **B02** using clean insulated gloves. Ensure the inner ring of the bearing **B05** is hard against its seat by tapping it with a brass pin. Fit the tab washer **B07** and the lock nut **B08.**

b. Fit the inner ring of the front bearing **B06** to the impeller end of the shaft **B02** ensuring that it is hard against its seat, by tapping with a brass pin.

c. Clamp bearing housing **B01** securely, grease bearing **B05**. Fit shaft **B02** and end bearing **B05** assembly into housing. Ensure outer race of bearing **B05** is hard against seat.

d. Fit neoprene seal **B09** and bearing cover seal **B13** to end cover **B03** and fix to bearing housing **B01** using set screws **B11**.

e. Mount bearing housing **B01** vertically with front end upwards and wedge shaft **B02** so it is central in the housing. Fill front bearing **B06** with grease and carefully tap outer ring into bearing housing **B01**.

f. Fit neoprene seal **B10** and bearing seal cover **B13** to front cover **B04** and fix to bearing housing **B01** using set screws **B11**. Fit V-Ring Seal **B17** to Shaft **B02** and place with slight tension against Front Cover **B04**. Fit Flinger Ring **14** to Shaft **B02** and locate in position using Screw Clamp supplied with Flinger Ring.

g. Set bearing housing assembly into pedestal **18** and loosely assemble bearing pedestal caps **17** with pedestal cap screws **20** and fit axial positioning jack **19**. Very occasionally, shims are required for shaft alignment; if factory fitted, the thickness of shim required will be stamped on the vertical face of the pedestal adjacent to the pedestal cap stud.

h. If 'D' gland is to be fitted – Loosely assemble gland components as shown on page 10 taking care not to damage the wearing face when fitting, leaving out at this stage the gland sleeve **D08**, 'O' rings **D12** and **D07** and face seal **D09**. Fit the gland side liner **06** into the gland side casing **05** securing with liner nuts **10**. Bolt the gland assembly loosely to the casing **05**. Fit the casing **05** and gland assembly to the pedestal **18** using fixings **12**, taking care not to damage the wearing face against the shaft **B02** on assembly. Fit the 'O' rings **D12**, **D07** and face seal **D09** to gland sleeve **D08** and slide home onto shaft, through casing and into the gland assembly. Carefully align gland components (specifically check concentricity of gland parts relative to the shaft) and tighten all fixings.

i. If 'H' or 'P' gland is to be fitted – Fit 'O' rings **H12** / **P12** and **H07** / **P07** to gland sleeve **H08** / **P08** and slide home on to the shaft. Loosely assemble gland components as shown on pages 9 and 10, slide over shaft **B01** and onto the gland sleeve. Fit the gland side liner **06** into the gland side casing **05** securing with liner nuts **10**. Fit the casing **05** to the pedestal **18** using fixings **12**. Carefully align the components of the gland assembly (specifically check concentricity of gland parts relative to the shaft) and fit to the casing **05**. The axial expeller **H10** / **P10** a stretch fit over the gland sleeve can then be fitted.

j. Smear the Impeller thread on the shaft **B02** with protective long life graphite grease before screwing on the impeller, ensuring that the Impeller 'O' ring is fitted into the Gland Sleeve.

k. Fit the suction side liner **04** in the suction side casing **03** using liner nuts **10**.

l. Fit the suction bush liner **01** inside the suction bush **02** (using soapy water assists this process) and bolt it to the suction side casing **03** using the bolts **11**. Match up the suction side casing to the gland side casing, and bolt the two side casings together. Check the two half liners match up, and press back the liners into the casings to ensure a minimum mismatch at the joint line and at the delivery flange.

m. Check the concentricity of the fit between suction bush liner **01** and the impeller **08**.

n. Using the axial positioning jack **19** adjust the impeller **08** towards the suction bush liner **01** keeping the holding down studs **20** loose. Check the axial clearance between the impeller and the suction bush liner **01**. A steel ring or dummy flange should be bolted to the suction flange to simulate any distortion in the suction bush liner **01** when connected to the suction pipe, before the axial clearance is checked. This clearance should be set at approximately 1/32" (1mm). Rotate the shaft to ensure effective clearance.

o. Tighten the bearing holding down nuts **20** and the axial positioning jack **19**.

17. Troubleshooting

IF A PUMP FAILS TO PUMP THROUGH A BLOCKAGE SWITCH OFF IMMEDIATELY AND READ THESE FAULT FINDING NOTES CAREFULLY TO RECTIFY THE SITUATION.

TAKE EXTREME CARE AS THE PUMP MAY BE FILLED WITH SCALDING STEAM AND SOLIDS AT A HIGH PRESSURE.

17.1. No Discharge When Pump Runs

THE PUMP MUST NOT BE ALLOWED TO RUN IF IT DOES NOT DISCHARGE. If by mischance the pump has been allowed to run for more than a few minutes without discharge then **STOP IT AT ONCE.**

TAKE EXTREME CARE IN DISMANTLING AFTER SUCH AN OCCURRENCE DUE TO HIGH TEMPERATURE AND PRESSURE WHICH MAY BE PRESENT IN THE PUMP CASING. DO NOT REMOVE THE DRAIN PLUG UNTIL THE FLUID TEMPERATURE IN THE PUMP HAS DROPPED. (SEE 17.11c).

a. Air Lock
The commonest cause of failure of a newly installed pump to discharge when run for the first time is an air lock in the casing. Even when a pump is well below water level, (drawing from a Feed Regulating Sump for instance), it may retain a large bubble inside the casing which prevents the start of pumping. This phenomenon is far more likely with horizontal undershot discharge branch arrangements than any other practical configuration. It is least likely with horizontal overshot arrangements.

If you suspect air lock as the cause of failure to pump, start and stop pump several times to drive the air out, a fraction at a time. When using this procedure ensure that you do not damage the motor starter or burn out the motor itself by trying too many starts in a short period of time. The number of permissible attempts will vary with the equipment installed but usually it is safe to try one start every three to four minutes.

b. Inadequate Prime
In installations where the pump has to be primed, either by jet or venturi effect in the suction pipe, or by vacuum pump on the delivery side, failure to pump may be caused by inadequate prime. This is usually rectified, by allowing more time for priming to occur.

It is possible when “jet priming” to have such a small amount of priming water that the pump will never prime, and in this case more water for the priming operation will be needed.

Usually, the diameter of the priming branch should be at least one third of the diameter of the suction pipe [2” (50mm) will prime 6” (150mm), 3” (80mm) will prime 8” (200mm) etc.], and the minimum water required is about 30% of the **Pump** capacity.

If priming is by vacuum pump there must be a valve or at least an air-lock on the delivery side and the vacuum pump must be able to “beat” the air leakage through the gland. To assist in this, always attempt to prime with the gland water running – no matter what style of priming is being attempted.

c. Installation Faults
Failure to discharge on start-up can be caused by installation faults of which the commonest is inadequate sump capacity. The result of installing a sump with inadequate capacity is to risk repeated air-locks of the pump. This can happen when the pump reduces the water level, either allowing a vortex to form – which air-locks the pump – or (when water is introduced to the sump) it entrains so much air that it produces the same effect.

A small sump can easily prevent any discharge reaching the end of the pump discharge line. The only remedy is to extend the sump capacity. We recommend sumps of at least one minute’s pumping time as a minimum. (This recommendation does not apply to feed regulating sumps in sand plants where greater capacity is required).

Other installation faults are more obvious – such as tramp material lodged over a pump suction or a kinked suction hose.

17.2. Brief Discharge Only

a. Air Lock

A pump with a suction lift and partial air lock will often start to pump at a greatly reduced rate after each start, then give up altogether. At the discharge end of the pipe this may appear as a brief surge followed by failure.

This problem can only be overcome by closer attention to the priming system.

b. Obstructed Suction

If the suction line is obstructed either by tramp material or a delaminated suction hose lining, the pump may start well but when the discharge rate rises the suction obstruction so throttles the pump that it quickly fails by gross cavitation.

Detection of this sort of condition is difficult, and generally the only certain way of finding out what is happening is the use of a vacuum gauge immediately before the pump suction. An obstructed suction line will be indicated by a sudden increase in vacuum reading immediately before the failure.

c. Lack of Delivery Resistance

A pump which is required to pump with a suction lift or with a fair length of suction pipe, but with practically no resistance on the delivery side, (e.g. short, open-ended, discharge branch or nozzle), may pump briefly then fail. The reason for this is that centrifugal pumps on open discharge need positive pressure on the suction eye to prevent gross cavitation. If the installation does not provide sufficient positive pressure on the suction side the pump will fail.

Usually, the easiest way to overcome this difficulty is to artificially create resistance on the delivery side, by extending the pipe work or introducing a valve or other resistance, such as an orifice.

17.3. Pumps Water But Not Solids

a. Air Leaks on Suction Side

Badly made joints in the suction line or air entrainment with feed into a sump may be insufficient in themselves, to prevent a pump from pumping water satisfactorily. However, when solids are introduced – particularly, coarse solids – the pump has a more arduous duty; it has to entrain the solids into the fast moving stream in the suction pipe. In effect it has to “dredge” the solids into the stream. Even if the solids were already moving in the right general direction, they must be accelerated up to the water velocity and thus they act as a suction resistance for the pump.

The result of the introduction of solids into an aerated system, which the pump can only marginally handle, when pumping water alone, will cause failure.

Air leaks can usually be detected as water leaks when the pump is not running; where water can get out air can get in. Air entrainment with the feed can sometimes be overcome by the use of baffles in the sump, such that the air bubbles have time to rise to the surface before being drawn down to the suction.

b. Poor Suction Line

A long suction line, or a line of too small a diameter, or a line with a restriction (sudden step-downs in diameter are the worst) may allow a pump to appear to handle water adequately, but not allow it to handle solids. The reasons for this are explained in 17.3(a) above.

Rework of the suction line is the only solution to this problem. If the line is increased in diameter it should be brought to the pump inlet diameter by a specially rolled flanged taper pipe. It must not be stepped down by a mismatch.

c. Electric Motor Wrongly Wired

Most Squirrel Cage Induction motors can be wired in two ways: “Star” or “Delta”. In order to reduce the surge in current when a motor is brought “on line”, some users start their motors in “Star” because this mode gives good starting torque and a reduced starting current surge, and then change to running their motors in “Delta” once smooth starting has been achieved. The “Delta” mode of powering the motor increases the speed close to synchronous speed – which is maximum – and maintains practically a constant speed under variations in load.

If a motor is left to run continuously in “Star” it will vary its speed dramatically with load. Hence, if a mistake has been made in the wiring of the motor it may well appear that the pump pumps water but will not pick up solids, the reason being that on “Star” the motor speed drops when the solids load comes on.

To detect this fault the easiest method is to check the speed of the motor shaft and compare it with the Nameplate rating. There should not be more than a few RPM difference between Nameplate RPM rating and actual speed – no matter what load the pump is pulling.

Correction of this fault is a matter for an electrician.

17.4. Overloads for Motor Trip Out

a. Wrong Pump Speed

The power drawn by a centrifugal pump discharging through a given delivery system is approximately proportional to the cube of its speed. If the speed is changed by, say 20% to 1.2 times the original speed, you can expect its power demand to rise by the cube of 1.2, i.e. 1.728, or nearly 73% above the original. Even a rise in speed of 10% to 1.1 times the original speed, will give a rise of 33% in power demanded by the pump.

The relationship is not exact but is close enough for field calculations purposes.

If a pump is run at the wrong speed it can make a very considerable difference to the load drawn from the motor.

Calculation of the correct pump speed is based on:

- Flow rate to be pumped;
- Difference in height between pump and discharge points;
- Length, diameter, and inner surface of pipeline through which pump must deliver;
- Number of elbows, bends, valves, other fittings in pipeline;
- Equipment at end of pipeline such as hydrocyclones, pressurised distributors, jets etc.;
- Grading, tonnage, and specific gravity of solids to be pumped;
- Pump performance curves.

As far as fault finding is concerned, the actual RPM of a pump should be compared with the RPM specified. Corrections to pump speed can be made by pulley changes.

b. Changed Pipeline System

It is not uncommon for a pump speed to be calculated on the basis of a pipeline system intended to be used at the time of the negotiations for the purchase of the pump, but to be commissioned into service with a very different pipeline system. A client may say “But, it’s not such a high lift so the pump does not have to work so hard”. Unfortunately, at a given pump speed a pump will pump a larger gallon age through a shorter pipeline, (or lesser vertical height), and will take more power – not less.

When confronted with this situation, the only thing to do is to calculate the correct Head and RPM and make a pulley change. The affinity rule explained under 17.4 a) can be used or the drive recalculated.

c. Low Voltage

The power consumed by an electric motor is the product of the voltage, amperage and power factor for the motor. Without going too deeply into the matter, if a pump demands a certain power from the motor, the motor in turn will demand corresponding amperage from the electric supply system. If, however, the voltage of the electric supply system happens to be lower than normal, then the motor will draw extra amps to meet the pump's power demand. In this way the power consumed by the motor, (the product of voltage, amperage and power factor) remains unchanged.

The sort of circumstances where lower than standard voltages might be encountered are:

- When power supply is from a generator set
- At the end of a long trailing cable;
- At the end of an electric supply system remote from the nearest transformer substation;
- In an area where very heavy start-up loads can occur, such as near large crusher stations or long conveyor installations.

Low voltage can readily cause a motor overload by drawing higher than expected amps, this being in no way related to the pump.

If low voltage is suspected as the cause of motor overload, a qualified electrician should be called in.

d. Wrongly Set Overload Protection

All motor starting equipment has some form of overload protection equipment built into the system so that a burnt out motor or locked-rotor motor does not cause more extensive damage. If a motor repeatedly drops out on overload, and there is no other readily apparent reason, the electrical overload protection equipment should be checked.

e. Mechanical Fault in Pump

The pump shaft should be free to turn by hand. Remove the Vee-belts and check the pump shaft for freedom to turn. If there is no resistance the fault must be in the motor. If a jarring or resistance can be felt when attempting to turn the pump shaft, drop off the suction pipe and check the clearance between the impeller and suction plate, and for blockages.

If this proves clear, then remove the suction bush and look for marks on the surface of the impeller which might indicate if the impeller has been rubbing. If this proves clear rotate the shaft again to ascertain if the resistance is still present and if it is then remove the impeller, and inspect the gland side liner. If there is still no evidence of rubbing, rotate the shaft by hand again to check that the resistance is still present, then remove the gland sleeve. If the resistance can still be felt by hand it can only be the bearings of the pump.

The remedy for the faults which may be revealed by this step-by-step approach are:

- Impeller rubs on suction bush: release bearing housing, set impeller to suction bush clearance by adjusting position of bearing housing until impeller runs free. Tighten bearing housing. Replace suction pipe. Realign belt drive.
- Impeller rubs on gland half lining; reset the suction bush clearance. Check for movement of casing liner.
- Seizure in the gland area. Strip and inspect.
- Shaft tight in bearings; there is no simple field remedy if the pump shaft is found to be tight in the bearings, the rotating assembly must be removed and stripped for inspection of the bearings and grease seals.

f. Air Entrainment

In sump-fed pump systems air entrainment with the pump feed can produce periodic overloads on the motor by the following sequence of events:

- Air entrainment with feed gives the pump a “spongy” pulp which reduces the pump throughput and power.
- Flow through the sump is reduced allowing air in the feed now entering the sump to escape to surface. Solids, of course, reach the pump suction.
- The pump now has a largely de-aired pulp of far greater percentage solids than intended, and the power demand rises. At this stage the pump may choke. This is a dangerous condition.
- Pump entrains the accumulated solids into suction pipeline and begins to pump normally again, increasing throughput through sump.
- Air entrainment begins to reach pump suction again and sequence repeats.
- Air entrainment can permanently reduce slurry throughput and make it appear as if the pump is not working.

In small installations this surge may be repeated at three minute intervals, and in large installations it may take as long as five minutes for the full cycle to be completed. If the cycle terminates at stage (3) the pump may explode, if allowed to run blocked.

12.1 Pump Handles Only A Limited Percentage Solids

g. Pump Speed Incorrect

With increasing solids feed into a pumping system three major factors will limit the percentage solids handled:

- Friction resistance increases leaving less pressure on the delivery side to maintain the velocity in the pipeline;
- Critical (settling) velocity for the pulp in the pipeline increases;
- Pump performance “drops” so that the total head generated by the pump diminishes.

Clearly if the pump speed has been calculated for water only, then increasing tonnages of solids are fed into the system, the combination of factors (1) & (3) above may soon produce a situation where the pipeline velocity is too low to maintain movement of the solids (factor 2). See 17.11c).

h. Air Entrainment

Under 17.3(a) above there is an explanation of how a pump can handle water, but fails when solids are introduced to the system, due to air entrainment. The same fault can sometimes explain why a pump performs apparently satisfactorily on pulp up to a certain percentage solids, then “gives up” when this is passed. See previous.

i. Poor Suction Line

A suction line layout as described in 17.3 b) is far worse as the percentage solids is increased and can become completely blocked. See 17.11c).

j. Cavitation

If a pump is expected to draw relatively coarse solids from a sump below the pump centreline, depending on the speed of the pump and its capacity in relation to the flow rate being handled, it may suffer from cavitation. When this happens, (and the onset is often quite sudden and sharp), the total head generated by the pump diminishes dramatically. As described previously, the conditions for blocking a line are suddenly created, namely; reduced delivery pressure for maintaining flow combined with increased requirement for velocity in the pipeline.

Generally, if cavitation is the source of the trouble there is ample evidence: audible cavitation “rattle” in the pump or from the bearings, sudden reduction in power demand, the gland leaks or draws air, and there is a dramatic drop in delivery pressure.

The solution to the problem is to make the suction arrangements as smooth as possible without restrictions, and to arrange for the feed to come gradually up to load without sudden surges of solids. If these measures do not overcome the problem it may be necessary to change the suction line to a size larger and fit a flat topped taper-piece to the pump suction. If trouble persists, a larger pump will have to be installed. Something effective must be done as the situation is potentially dangerous.

17.5. Gland Will Not Seal Adequately

a. Poor Adjustment

The outer seal of a Hydrostatic gland assembly must be allowed to rub lightly on the gland sleeve for an effective seal to be maintained. If the gland adjuster is pushed in too far this will lift the seal off the sleeve and the gland will leak profusely. Most people when seeing a leaking gland immediately think to "tighten it up". *With the Hydrostatic gland the gland adjuster must be moved outwards to reduce leakage*.

Type D and P glands, should be tightened for reduction of leakage in the same way as standard packed glands in water pumps. *Over tightening should be avoided, especially on 'D' glands* as a drip is always necessary to lubricate the rubber face seal.

b. Dry Running

The glands will not be damaged by a few seconds running without lubrication and cooling by water, but if either gland is run for any length of time without water in the pump there is danger of melting the rubber seals. If a Type D gland has been correctly adjusted this is a fairly remote danger because without hydraulic pressure to force the rubber seal against the gland seat, the seal should run without touching the seat. However, in general terms, do not run a Linatex pump in dry conditions because of the danger of damaging the gland seals.

Once seals have been damaged in this way they have to be replaced.

c. Too Much Sealing Pressure

Too much water pressure in either type of gland can make the glands almost impossible to seal reliably. With Hydrostatic glands the solution to the problem is to insert a pressure control in the gland water line. With Type D glands the problem usually only arises with pumps being run in series or as booster pumps. In either case, the only solution is to convert the pump over to H gland or P gland and provide suitably pressured gland water.

d. Inadequate Prime

The "snore" condition for operating a pump is very difficult to seal without unacceptable leakage. Under this condition a pump continuously receives a good proportion of air drawn in with the pulp from the sump, in which the level is too low, or the sump has inadequate capacity, or both. The sump should contain a minimum of one minute's pumping time.

17.6. Excessive Heat in Drive

a. Slack V-belts

The commonest cause for generation of heat in the drive to a newly installed pump is undoubtedly lack of tension in the V-belts. All V-belts should be tensioned periodically, and newly commissioned drives should be re-tensioned an hour or so after start up.

This fault is easily detected, (pulleys are the hottest part of the drive), as the belts will have been slipping.

b. Hot Pump Bearings

On high speed duties it is to be expected that the bearings will run hotter than on low speed duties. Providing the shaft is free spinning by hand, the heat generated while running under power is probably immaterial. At 150°F (65°C) the assembly will be uncomfortable to the hands for more than a second or two, but this is not unduly hot for the bearing assemblies. If the bearing is failing the shaft will not run free.

c. Inadequate Lubrication of Pump Bearings

The bearings will be charged with grease before despatch from the factory. Details of lubricants are given in this Manual. See section 12.

Addition of grease should be tried if bearings become very hot or noisy. Excess greasing should be avoided.

d. Motor Runs Hot

The usual reason for motors running hot is that they are intended to! With Continuous Maximum Rated motors the temperature rises are surprising and are allowed for in the design of the motor and the selection of the insulation in it.

Generally, heat from a motor can be safely ignored provided the amperage drawn is lower or equal to the nameplate rating. Many motors are fitted with Thermistors in the windings, which sense the temperature rise and are wired to operate a cut-out relay if the temperature exceeds a safe limit.

If a pump is choked when the motor starts the protection must trip out the supply to the motor.

Bearing troubles in motors are generally indicated by noise as well as heat, and can sometimes be detected by use of a long-stemmed screwdriver. The blade of the screwdriver is pushed against the bearing cover and the ear of the investigator pushed up to the handle. With a limited amount of experience bearing "rumble" can quite easily be detected.

17.7. Sudden Reduction in Discharge

a. Change in Feed Conditions

Operators do not always recognise a pump as simply one element in a complete system and any change in that system will bear on all the parts of it. For instance, if a screen, rejecting plus ¼" (6 mm) material is worn and passes 1" (25 mm) stones, this affects the pump performance. The suction resistance of the larger stones will cause the suction pressure to reduce and have less head available for pushing the pulp through the delivery side piping.

At the pump, the larger stones will make a significant difference to the pump performance, decreasing flow and potentially causing damage to Impeller and Linings.

In the pipeline, the large stones will probably progress by "saltation", that is, leaping along the bottom of the pipe. The rest of the pulp is fully in suspension and has to flow past these slow moving obstacles. Overall this means the resistance of the pipeline to flow has increased. Thus again reducing flow.

So a simple fault like a screen cloth with a hole in it can cause a sudden reduction in discharge. If it causes the pipeline to block, the condition is potentially dangerous. See 17.11 c).

Other changes in the feed conditions which must be investigated are; increased tonnage of solids, change of grading of solids, change in manner of introduction of solids to pump system. On this last count, a plant which was started up in summer, and is bin-fed via a vibrating feeder, will perform differently in winter, when the wetter feed "hangs up" in the feed bin and collapses down onto the feeder intermittently in larger dollops.

b. Air Leaks on the Suction Pipe

A pipe which has been steadily wearing away from the inside may break through to the open air near a flange, (in a welded area), at the bottom of the pipe, (where the coarsest solids run). In a suction pipe this will almost certainly allow air into the pipe with all the resultant ills described elsewhere

Frequently, a pinhole leak will not let enough air into a pump for any of the five faults listed to become critical. So operators, being human, postpone the repair or replacement of the worn pipe. The last chapter of the saga occurs surprisingly quickly and usually on nightshift – when fault produces a blocked pipeline.

c. Suction Blockage

In dredging applications there is always the danger that the pump suction will be suddenly submerged in collapsed solids from the surrounding pit contours. When pumping from a sump the same thing can happen when solids, which have been clinging precariously to the steel sides of the sump, subside and momentarily block the pump suction.

If the pump is feeding a fair length of delivery piping, it will not be possible for the long column of pulp in that piping to come instantly to rest when the suction gets blocked. It will be appreciated that the pulp in an 8" (200 mm) pipe, way 1000 ft (300 m) long, moving at 10ft/sec (3 m/sec) has considerable momentum. It just cannot be stopped dead in the same short length of time it takes to block the suction.

The result is a massive reduction in pressure throughout the system. It can cause a massive "water hammer" and surges that can split the pump casing, valves and piping. This can cause hoses to collapse – delivery as well as suction, and almost invariably leads to a great gulp of air being sucked through the pump gland. Usually this is sufficient to air lock the pump.

Often, operators attribute the pump failure to the gland, instead of to the conditions at the end of the suction pipe, and this seems the logical explanation to a person standing beside a pump, who heard the air hiss into gland, and then has to contend with the resultant air-lock. However, the trouble starts at the end of the suction pipe, the gland collapse occurs afterwards.

In dredging applications the answer is to exercise better control over the pit development. In sump-fed systems, the feed pulp can sometimes be directed to flush away any build-up of solids on the sides or valleys of the sump. If this is not possible, a larger capacity take-off box at the base of the sump must improve the situation. The blocked pipeline situation is potentially dangerous. See 17.11c)

d. Tramp Material

The simplest explanations of a fault should never be overlooked. If the complaint is a sudden reduction in discharge: drain the sump and before removing any pipe work or dismantling the pump in any way, have a look at the take-off box at the base of the sump. Loose rubber, house bricks, steel off-cuts have all been found at the outlet to the pump at one time or another. Plastic garden hose inside the impeller passages was found to have a dramatic effect on pump capacity, in an installation which had given satisfaction for the previous three years.

12.2 Sudden Increases in Power Demand

e. Damage Inside Pump

If a client has not had occasion to open his pump before he may not realise what can happen to the inside of his pump as it wears away day by day. The following list gives the results of abrasion which will give an increase in power demand, in order of frequency of occurrence.

- Excessive gap between impeller and suction bush.
- Cut or ripped rubber in suction bush or casing gland rubbing against impeller.
- Worn out cutwater.
- Worn out or broken casing liners.
- Impeller worn through back shroud.
- Impeller passages worn significantly wider than intended.

f. Change in Pipeline System

Clients may alter a discharge pipe layout so the static lift is reduced or the length of pipe shortened, thinking to themselves "the pump won't have to work so hard now". Actually, in these circumstances the pump pumps a larger gallonage and takes more power not less.

g. Low Voltage

A new installation near the pump site can make a significant difference to the voltage available, depending on the electric distribution system in the area. Lower volts mean higher current for the same power output of the motor.

h. Changed Pump Speed
It has been known for electricians who have been called in to do maintenance on a motor to dismount both pump and motor pulleys, then when reassembling the pumpset, to mistakenly interchange the pulleys. Depending on the pulley ratio this may have spectacular results.

i. Air Entrainment
In sump-fed pump systems air entrainment can produce cyclic pump overload as explained in 17.4f). This fault can be caused by a change in the gallonage fed to sump, or the direction in which it is fed to a sump. It can also be caused by a casual change to the feed type baffle arrangement in the sump.

17.8. Rapid Component Wear

a. Air Entrainment
As an experiment place some sand in an empty bottle, fill the bottle to the very top with water, place the palm of one hand over the top and shake the bottle. You will find it difficult to move the sand vigorously against your hand. Now tip out a third of the water, and repeat the test. You will undoubtedly feel the sand in the air-water froth hitting your palm.

The point of the experiment is to show how much more readily sand can move around in froth than it can in water without air bubbles. Therefore any air leaks in the suction side accelerate abrasion.

If air entrainment is severe enough to produce an air lock in the presence of solids and water, the result is an escalation of the abrasion rate.

Air entrainment can also cause severe abrasion indirectly. As explained in 17.2, with cyclic changes in pulp density due to air, the pump may have to handle, periodically, far denser pulp than intended. This also is an abrasive accelerator.

b. Properties of the Solids
Some solids have worse properties from the point of view of abrasion than others.

- Sharp edged particles are worse than round particles, so crushed materials are generally worse than natural sands.
- Course gradings are worse than fines.
- The specific gravity of the material makes a difference.

When confronted with a rapid abrasion problem, always reduce pump speed if possible. A larger pump with its larger diameter impeller will be rotating slower at the suction eye of the impeller for a given head than a smaller pump. So, if wear on the leading edge of the vanes is a problem, a larger pump would help.

c. Change in Feed Conditions
If a pump operates satisfactorily for some time then suddenly begins to wear out components in quick succession, look for some change in feed conditions. Extra tonnage, coarser grading, higher proportion of crushed material, and so on. Sometimes an operator is unaware that conditions have changed for the pump.

A case in point would be a rod mill circuit producing crushed sand minus 4 mesh (5 mm) from a feed which is minus 3/8" (10 mm). If a pump is used to pump the rod mill discharge to some screening equipment and the screen oversize returns to the mill, a reduction in capacity of this screening equipment will make a big change in the duty for the pump. However, to the operator, the same tonnage rate throughput is maintained by the circuit, so the pump duty is unchanged in his mind. In fact, a reduction in screen capacity (for instance, by partial blinding, of the screen cloth) will produce an increase in circulating load and a corresponding increase in pump pulp density.

Another less involved example would be the pumping of sand from a river deposit. These deposits are notoriously variable, so the proportion of crushed sand in relation to natural can vary widely. To the

operator however, sand is sand, and the fact that the pump is now handling, say 80% crushed material, while three months ago it was 60% natural sand may not appear significant.

If there is a permanent change in feed conditions which makes component life unsatisfactory, look into modifying the pump.

If there is no suitable pump selection, the pump duty may have to be split up, and a two stage pumpset installed. Each pump will run at about 70% of the speed of a single unit for the same duty and this speed reduction will make a very significant change to the abrasion rate.

d. Shaft Misalignment

After some years of service it occasionally happens that the saddles on the pedestal which support the bearing housing get worn and thus allow the shaft to point downwards. If this problem is severe enough the eccentricity of the shaft through the gland will be such that the gland will not seal properly. A further problem will be that there will be a misalignment between the eye of the impeller and the suction bush, which will detract from pump performance. If this happens, the best answer is to buy a new pedestal. This will almost certainly be cheaper and quicker than trying to build up the saddles and then remachining. A temporary expedient is to pack the saddles with shims, but inevitably these get lost during impeller adjustment.

17.9. Mechanical Failure

a. Broken Shaft

Typically, the only broken shafts in LPT pumps are those where there has been tramp material in the feed, or a bearing has seized, or slurry has worn through the gland sleeve and wear has weakened the shaft, in each case it is easy to see the cause.

b. Broken Pedestal or Casing

The front bracket of the pump pedestal although quite massive to look at can be broken from the box section of the pedestal by the simple expedient of starting the pump backwards. If this is done the impeller begins to unscrew from the shaft and, as it does so, strikes the suction bush. This is immovable, being trapped by the flange of the suction pipe work. So something has to give.

Occasionally, with older shafts, the thread in the shaft is stripped instead of the pedestal being broken.

We do not recommend attempting to weld broken pedestals, alignment problems are too difficult. The cheapest and quickest way out for a customer is to buy a new pedestal.

The running backwards of a pump is an electrical problem. It is very simply overcome and no electrician worth his salt will allow this to happen as they are supposed to check motor direction of rotation prior to fitting the V-belts onto the pulleys.

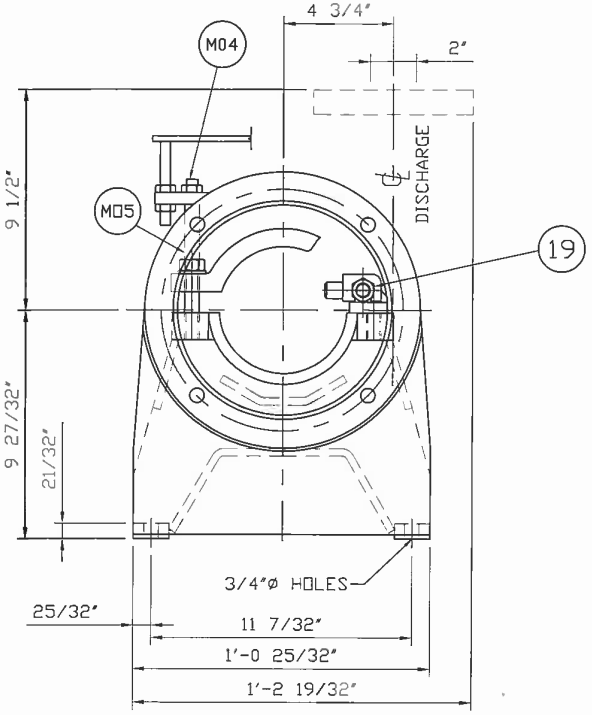
c. Pump Explodes

The centrifugal pump – LPT or any other – can potentially explode by running it with pulp, or water, in the casing but no discharge. An example of how this can happen is in a pump drawing pulp from a sump and pumping to a cyclone or through a rising pipeline. If the pump gets a sudden surge of solids, which blocks off the suction, flow will cease. In the delivery line the solids will settle in the rising pipe, but will be unable to enter the casing because the impeller is still spinning there.

We now have a plug in the suction pipe, and in the delivery pipe, with a spinning impeller in between. The pump goes on absorbing power as the impeller rotates and the power raises the fluid temperature. Ultimately, the water will boil and the pressure generated may be enough to explode the pump head or destroy the rubber.

This is an extremely dangerous situation, and if a pump head feels unusually warm and is not discharging, switch off the power, immediately. Under no circumstances approach the pump until the pump head has been relieved of pressure – preferably through the suction or discharge pipe work by flushing away the

solids plugs. If a pump is going to explode, there is almost certainly considerable leakage of steam from the gland.



Important Note: *Even if the pump does not feel hot, take extreme care when dismantling as the pump may be full of scalding water.*

Do not remove the drain plug until certain the fluid temperature in the pump has reduced. If in doubt carefully clear blockages in manner described above.

McLanahan CORPORATION

AGGREGATE PROCESSING DIVISION

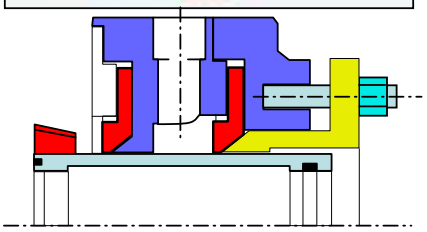
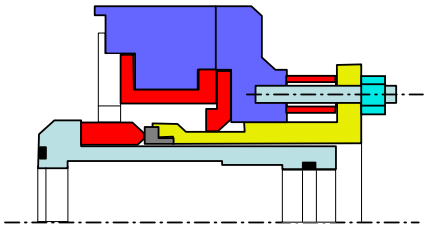
CENTRIFUGAL PUMPS

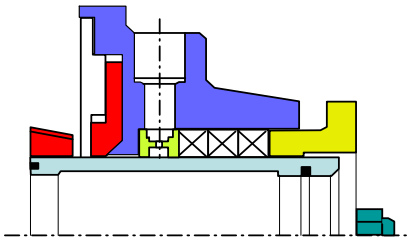


The McLanahan 'LPT' range of horizontal spindle, centrifugal slurry pumps are ruggedly designed for the most arduous duties. Vertical configuration on special order; Vortex Flow Impellers available for fibrous materials.



Linings:

Field replaceable, wet end linings are available in Natural Rubber, white Food Grade Rubber, Nitrile and High Chrome Iron.

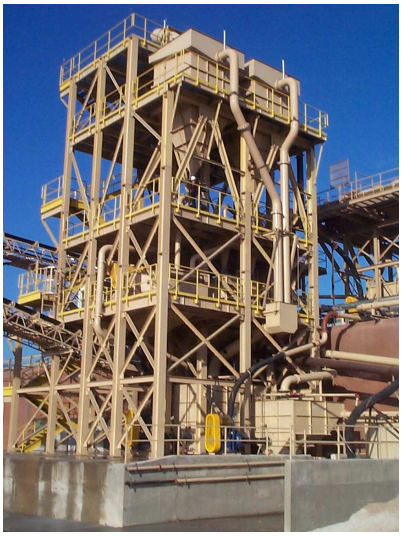


Gland configurations include:

- **Dry Gland** – a unique self lubricating design that does not require an external water supply.

- **Hydrostatic Gland** – a simple, low maintenance design; requires minimal external flushing water.

- **Packed Gland** – for the traditionalist; requires external flushing water



Equipment, systems & process innovation – since 1835

PUMP SERVICE

Total Service

From design to installation and beyond, McLanahan engineers are available to give advice on your slurry pumping needs and problems. The IIIr range has been designed to offer a wide choice of pump sizes to suit most slurry pumping applications.

Pumptec: Computer Aided Support

To complement and facilitate optimum selection of your slurry system, LPT uses "Pumptec".

This unique computer program:

- Analyzes the effects of changing slurry density
- Calculates the P_{50} particle size from a sieve analysis
- Calculates settling velocities and select pipe sizes
- Calculates pipeline frictional losses in various pipe materials and pipe fittings
- Calculates the pump duty and selects a pump and drive based on input parameters
- Prints full application and selection data including NPSH, BEP, RPM, HP, etc.

Troubleshooting is made easier using Pumptec to evaluate different scenarios.

McLanahan CORPORATION

AGGREGATE PROCESSING DIVISION

LPT PUMP APPLICATIONS

Sand plants

Feeding sand and water to all types of classification and dewatering plants; effluent water transfer duties.

Coal preparation plants

For dense medium circuits; feeding hydrocyclones; filtrate pumping; handling the underflow from thickeners; disposal of effluent, etc.

Chemical manufacturing & Environmental applications

LPT pumps, by virtue of their various rubber linings, are suitable for pumping many chemical solutions, acid or alkaline, at moderate temperatures and for the disposal of effluent.

Cement manufacture

Slurry feed to : tube mill circuits; thickener feed and underflow; flotation plant circuits.

Metalliferous mining

Mill circuits; feeding hydrocyclones; cyanide plant filter residues; concentrates; tailings disposal and other pulp and slurry handling duties.

Irrigation systems and dredging

Silt removal in dams and canal sand traps.

Paper mills

China clay slurries; paper stock; effluent disposal.

Steel works and manufacturing applications

Pickling acid distribution circuits in plate and wire de-scaling plants; abrasive wet scrubber blow-down.

Power stations

Boiler house ash disposal; de-scaling plants.

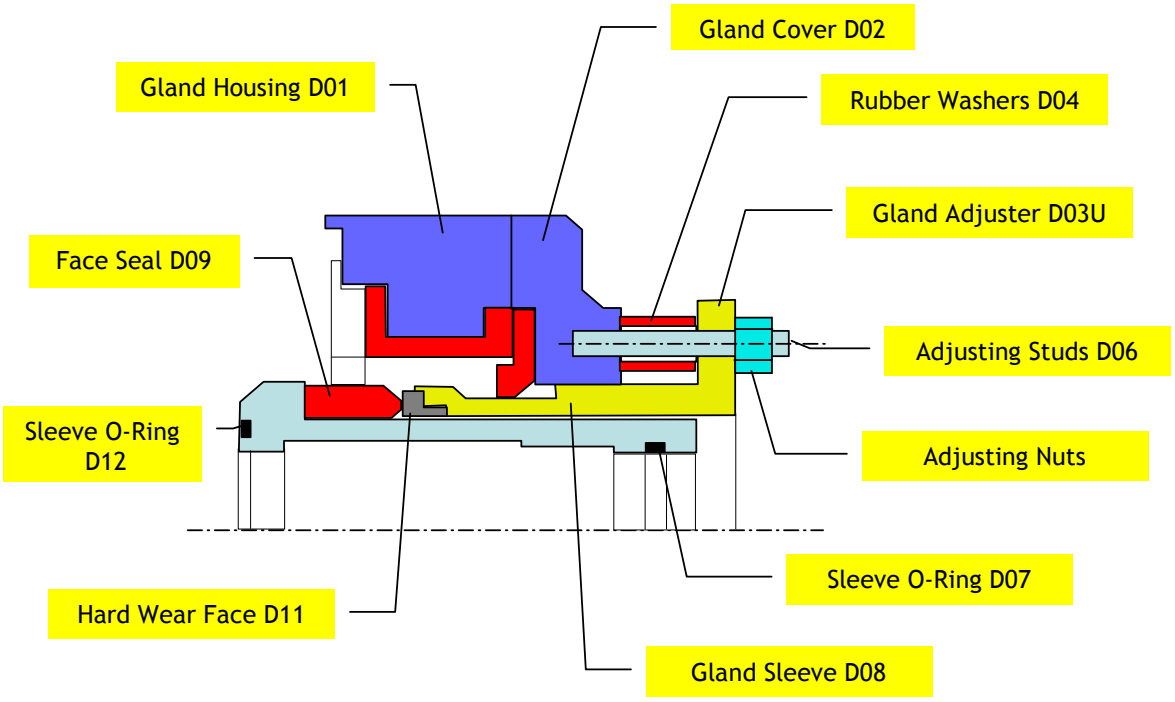
China clay production

Feeding slurry to hydrocyclones and for general use in the preparation of china clay.

Glass manufacturing

Feeding polishing media; sand plants; handling effluent.

McLanahan CORPORATION



AGGREGATE PROCESSING DIVISION

'DRY' GLAND

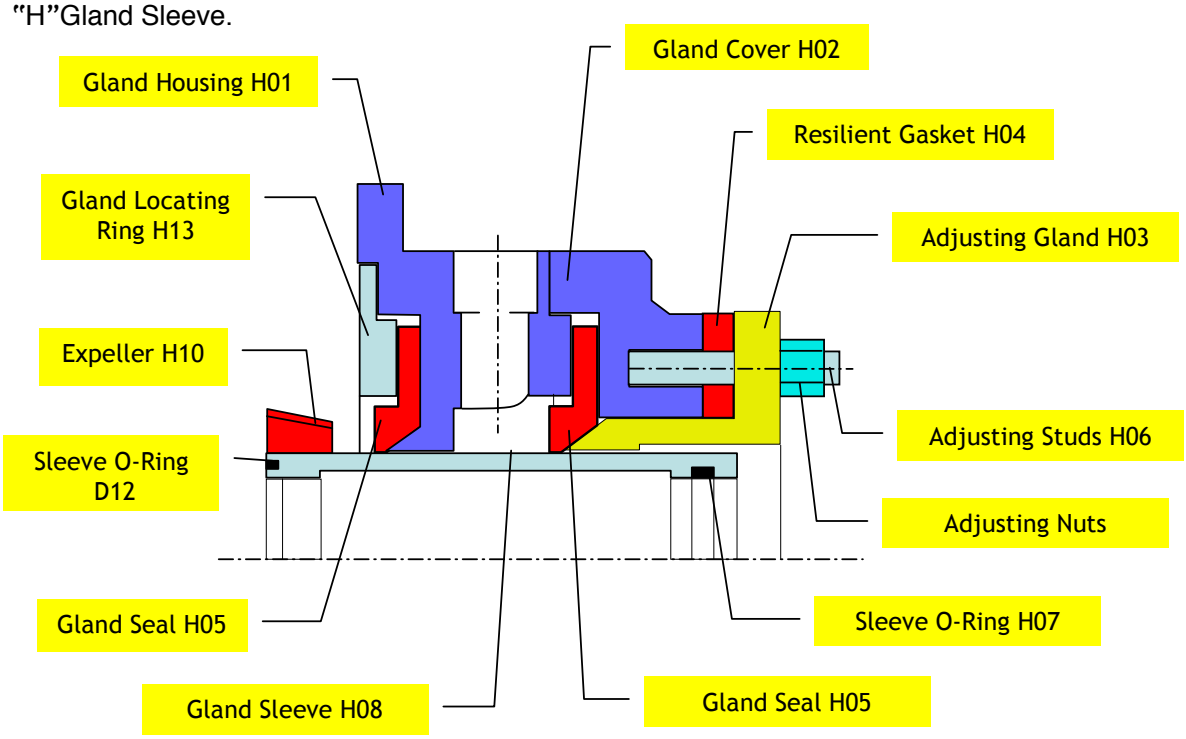
a.k.a. 'D' type Gland

Is a unique proprietary design and is unlike conventional mechanical seals. A rotating rubber 'Face Seal' is adjusted against a static 'Hard Wear Face'; it is 'self-lubricating' in that pressure from inside the Pump head forces small amounts of liquid between the surfaces for lubrication.

Note: The term 'dry' is derived from the fact that the gland needs no external water source to lubricate the gland, small amounts of water and fines do exit the pump and accumulate at its base.

The Face Seal acts as a spring and if any grit particles get between the rotating rubber and stationary Wear Face it is pressed into the Rubber. The Face Seal is a stretch fit on the shaft sleeve. As the gland pressure increases, so the rubber extends axially and increases the pressure at the rubbing interface.

When the pump is running, adjust the gland nuts so that there are approximately 5 drops per minute from the gland. This should reduce to 1 drop occasionally, and run satisfactorily for up to a year without further attention in a typical application.



McLanahan CORPORATION

AGGREGATE PROCESSING DIVISION

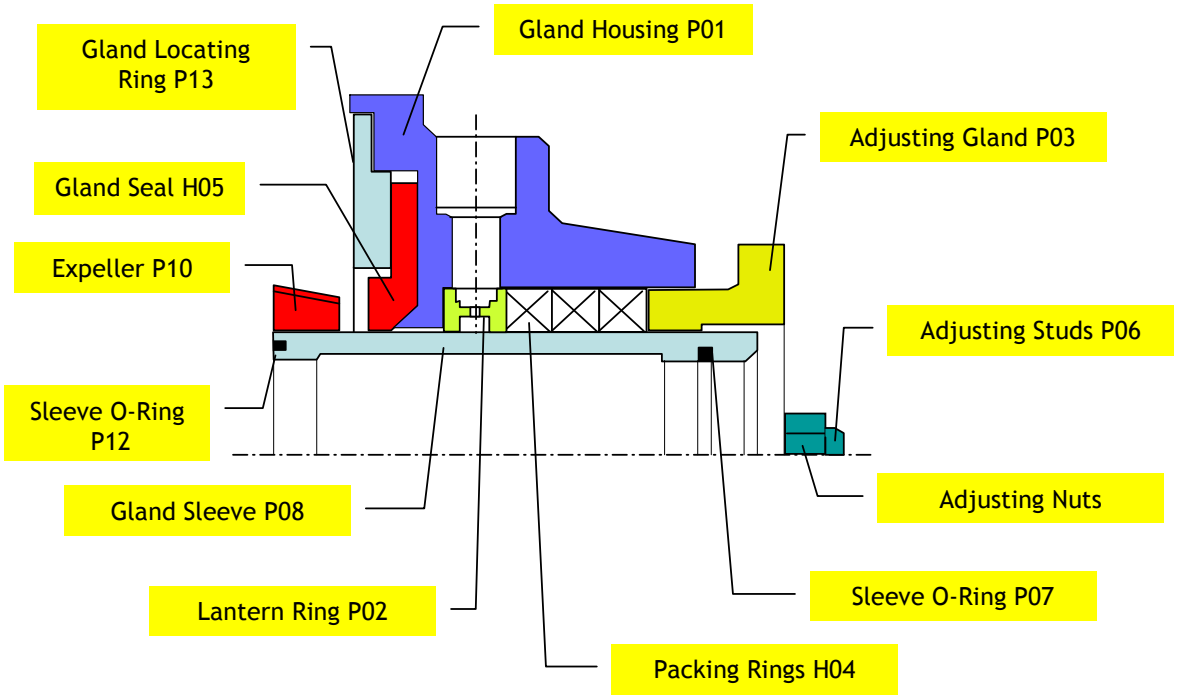
HYDROSTATIC GLAND

a.k.a. 'H' type Gland

Is a unique proprietary design with the lowest maintenance and longest life, the unique rubber gland seal is designed to deflect inwards to provide and effective seal. The Slurry pressure at the gland is reduced by back pump out vanes on the impeller, and, when fitted, the Rubber axial expeller, which is a stretch fit on the shaft of the "H"Gland Sleeve.

The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the 'H' Gland, the adjusting gland must be eased outwards to increase the sealing pressure. The geometric shape of the Gland Seal is carefully designed to give a good seal, while limiting the amount of 'digging' onto the gland sleeve.



The gland sealing water must be as clean as possible at a pressure of about 5 psi (4m water gauge) above the discharge pressure and at a volume of between 1 to 5 gpm depending on pump size. With a high flushing water pressure you get greater water use and greater dilution of the pumped slurry without any benefit to the seal.

McLanahan CORPORATION

AGGREGATE PROCESSING DIVISION

PACKED GLAND

a.k.a. 'P' type Gland
Is a classic 'stuffing box' design where sealing is obtained by compressing the gland packing rings onto the shaft sleeve. The gland offers the capacity to seal the pump even at high pressures, for instance in series pumping.

The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the 'P' Gland, the adjusting gland must be adjusted inwards to increase the sealing pressure. The geometric shape of the Gland Seal is carefully designed to give a good seal, while limiting the amount of "digging" onto the gland sleeve.

The gland sealing water must be as clean as possible at a pressure of about psi (4m water gauge) above the discharge pressure and at a volume of between 1 to 5 gpm depending on pump size. With a high flushing water pressure you get greater water use and greater dilution of the pumped slurry without any benefit to the seal.

A pressure fed grease supply can be used with the 'P' gland, but then care must be taken to use synthetic rubber parts which are a special order.

INDUSTRIAL & MARINE COATINGS

PRODUCT INFORMATION

Revised 5/2002

PRODUCT DESCRIPTION

MACROPOXY 646 NSF FAST CURE EPOXY is a high solids, high build, fast drying, polyamide epoxy certified by NSF to Standard 61 as a tank lining for potable water storage tanks. The high solids content ensures adequate protection of sharp edges, corners, and welds.

- Approved by NSF to Standard 61 for potable water storage tanks of 1,500 gallons and larger and pipe interiors of 36" and greater
- Suitable for use in USDA inspected facilities

RECOMMENDED USES

- As an interior tank lining for potable storage water tanks
- Immersion service - potable water tanks: Meets NSF Standard 61 for use in potable water storage tanks
- Suitable for use with cathodic protection systems

PRODUCT CHARACTERISTICS

Finish: Semi-Gloss

Color: Mill White and Light Blue

Volume Solids: 72% ± 2%, mixed
Mill White

Weight Solids: 85% ± 2%, mixed
Mill White

VOC (EPA Method 24): Unreduced: 235 g/L; 1.96 lb/gal
mixed Reduced 10%: 290 g/L; 2.41 lb/gal

Mix Ratio: 1:1 by volume

Recommended Spreading Rate per coat:

Wet mils:	7.0 - 13.5
Dry mils:	5.0 - 10.0*
Coverage:	116 - 232 sq ft/gal approximate

NOTE: Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

* See Recommended Systems

Drying Schedule @ 7.0 mils wet and 50% RH:

	@ 40°F	@ 77°F	@ 100°F
To touch:	4-5 hours	2 hours	1½ hours
To handle:	48 hours	8 hours	4½ hours
To recoat:			
minimum:	48 hours	8 hours	4½ hours
maximum:	3 months	3 months	3 months
Cure for			
service:	10 days	7 days	4 days
immersion:	14 days	7 days	4 days

If maximum recoat time is exceeded, abrade surface before recoating. Drying time is temperature, humidity and film thickness dependent.

Pot Life:	10 hours	4 hours	2 hours
Sweat-in-time:	30 minutes	30 minutes	15 minutes

Shelf Life: 36 months

Flash Point: 60°F, TCC, mixed

Reducer/Clean Up: Reducer, R7K15

PERFORMANCE CHARACTERISTICS

System Tested: (unless otherwise indicated)
Substrate: Steel
Surface Preparation: SSPC-SP10
1 ct. Macropoxy 646 NSF Fast Cure Epoxy @ 6.0 mils dft

Abrasion Resistance:
Method: ASTM D4060, CS17 wheel, 1000 cycles, 1 kg load
Result: 84 mg loss

Accelerated Weathering - QUV, Zinc Clad II HS Primer:
Method: ASTM D4587, QUV-A, 12,000 hours
Results: passes

Adhesion:
Method: ASTM D4541
Result: 830 psi

Corrosion Weathering, Zinc Clad II HS Primer:
Method: ASTM D5894, 36 cycles, 12,000 hours
Result: Rating 10 per ASTM D714 for blistering
Rating 9 per ASTM D610 for rusting

Direct Impact Resistance:
Method: ASTM D2794
Result: 30 in. lb.

Dry Heat Resistance:
Method: ASTM D2485
Result: 250°F

Exterior Durability:
Method: 1 year at 45° South
Result: Excellent, chalks

Flexibility:
Method: ASTM D522, 180° bend, 3/4" mandrel
Result: Passes

Immersion:
Method: 1 year fresh and salt water
Result: Passes, no rusting, blistering, or loss of adhesion

Irradiation-Effects on Coatings used in Nuclear Power Plants
Method: ANSI 5.12 / ASTM D4082-89
Result: Passes

Pencil Hardness:
Method: ASTM D3363
Result: 3H

Permeability Rating:
Method: ASTM D1653
Result: 0.154 mg/cm²

Salt Fog Resistance, Zinc Clad II HS Primer::
Method: ASTM B117, 6,500 hours
Result: Rating 10 per ASTM D610 for rusting
Rating 9 per ASTM D1654 for corrosion

Slip Coefficient, Mill White:
Method: AISC Specification for Structural Joints Using ASTM A325 or ASTM A490 Bolts
Result: Class A, 0.36

Epoxy coatings may darken or discolor following application and curing.

PRODUCT INFORMATION

RECOMMENDED SYSTEMS

Immersion and atmospheric:

Steel:
2 cts. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft/ct

Steel, Shop Applied System, New Construction, AWWA D102:
1 ct. Macropoxy 646 NSF @ 3.0 - 6.0 mils dft
1-2 cts. Macropoxy 646 NSF @ 5.0 - 10.0 milds dft/ct

Concrete/Masonry, smooth:
2 cts. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft/ct

Concrete Block:
1 ct. Kem Cati-Coat HS Epoxy Filler/Sealer @ 10.0 - 20.0 mils dft, as needed to fill voids and provide a continuous substrate.
2 cts. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft/ct

Maximum dry film thickness allowed by NSF for Macropoxy 646 NSF Fast Cure Epoxy is 20 mils for two coats.

Atmospheric:

Steel:
1 ct. Recoatable Epoxy Primer @ 4.0 - 6.0 mils dft
2 cts. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft/ct

Steel:
2 cts. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft/ct
1-2 cts. Acrolon 218 Polyurethane @ 3.0 - 6.0 mils dft/ct
or Hi-Solids Polyurethane @ 3.0 - 5.0 mils dft/ct

Steel:
2 cts. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft/ct
1-2 cts. Tile-Clad HS Epoxy @ 2.5 - 4.0 mils dft/ct
or Armor-Tile HS @ 2.5 - 4.0 mils dft/ct

Steel:
1 ct. Zinc Clad II HS @ 3.0 - 6.0 mils dft
1 ct. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft
1-2 cts. Acrolon 218 Polyurethane @ 3.0 - 6.0 mils dft/ct

Steel:
1 ct. Zinc Clad III HS @ 3.0 - 5.0 mils dft
or Zinc Clad IV HS @ 3.0 - 5.0 mils dft
1 ct. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft
1-2 cts. Acrolon 218 Polyurethane @ 3.0 - 6.0 mils dft/ct

Aluminum:
2 cts. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft/ct

Galvanizing:
2 cts. Macropoxy 646 NSF @ 5.0 - 10.0 mils dft/ct

The systems listed above are representative of the product's use. Other systems may be appropriate.

SURFACE PREPARATION

Surface must be clean, dry, and in sound condition. Remove all oil, dust, grease, dirt, loose rust, and other foreign material to ensure good adhesion.
Refer to product Application Bulletin for detailed surface preparation information.
Minimum recommended surface preparation:

Iron & Steel	
Atmospheric:	SSPC-SP2/3
Immersion:	SSPC-SP10, 2-3 mil profile
Aluminum:	SSPC-SP1
Galvanizing:	SSPC-SP1
Concrete & Masonry	
Atmospheric:	SSPC-SP13/NACE 6
Immersion:	SSPC-SP13/NACE 6-4.3.1 or 4.3.2

TINTING

Tinting is not recommended for immersion service.

APPLICATION CONDITIONS

Temperature:	40°F minimum, 110°F maximum (air, surface, and material) At least 5°F above dew point
Relative humidity:	85% maximum

Refer to product Application Bulletin for detailed application information.

ORDERING INFORMATION

Packaging:	
Part A:	1 and 5 gallon containers
Part B:	1 and 5 gallon containers
Weight per gallon:	12.7 ± 0.2 lb mixed, may vary by color

SAFETY PRECAUTIONS

Refer to the MSDS sheet before use.

Published technical data and instructions are subject to change without notice. Contact your Sherwin-Williams representative for additional technical data and instructions.

APPLICATION BULLETIN

Revised 5/2002

SURFACE PREPARATION

Surface must be clean, dry, and in sound condition. Remove all oil, dust, grease, dirt, loose rust, and other foreign material to ensure adequate adhesion.

Iron & Steel, Atmospheric Service:
Minimum surface preparation is Hand Tool Clean per SSPC-SP2. Remove all oil and grease from surface by Solvent Cleaning per SSPC-SP1. For better performance, use Commercial Blast Cleaning per SSPC-SP6, blast clean all surfaces using a sharp, angular abrasive for optimum surface profile (2 mils). Prime any bare steel within 8 hours or before flash rusting occurs.

Iron & Steel, Immersion Service:
Remove all oil and grease from surface by Solvent Cleaning per SSPC-SP1. Minimum surface preparation is Near White Metal Blast Cleaning per SSPC-SP10. Blast clean all surfaces using a sharp, angular abrasive for optimum surface profile (2-3 mils). Remove all weld spatter and round all sharp edges by grinding. Prime any bare steel the same day as it is cleaned.

Aluminum
Remove all oil, grease, dirt, oxide and other foreign material by Solvent Cleaning per SSPC-SP1.

Galvanized Steel
Allow to weather a minimum of six months prior to coating. Solvent Clean per SSPC-SP1 (recommended solvent is VM&P Naphtha). When weathering is not possible, or the surface has been treated with chromates or silicates, first Solvent Clean per SSPC-SP1 and apply a test patch. Allow paint to dry at least one week before testing adhesion. If adhesion is poor, brush blasting per SSPC-SP7 is necessary to remove these treatments. Rusty galvanizing requires a minimum of Hand Tool Cleaning per SSPC-SP2, prime the area the same day as cleaned.

Concrete and Masonry, Atmospheric Service:
For surface preparation, refer to NACE 6/SSPC-SP13. Surfaces should be thoroughly clean and dry. Concrete and mortar must be cured at least 28 days @ 75°F. Remove all loose mortar and foreign material. Surface must be free of laitance, concrete dust, dirt, form release agents, moisture curing membranes, loose cement and hardeners. Fill bug holes, air pockets and other voids with a cement patching compound. Weathered masonry and soft or porous cement board must be brush blasted or power tool cleaned to remove loosely adhering contamination and to get to a hard, firm surface. Laitance must be removed by etching with a 10% muriatic acid solution and thoroughly neutralized with water.

Concrete and Masonry, Immersion Service:
For surface preparation, refer to SSPC-SP13/NACE 6, Section 4.3.1 or 4.3.2.

Previously Painted Surfaces
If in sound condition, clean the surface of all foreign material. Smooth, hard or glossy coatings and surfaces should be dulled by abrading the surface. Apply a test area, allowing paint to dry one week before testing adhesion. If adhesion is poor, or if this product attacks the previous finish, removal of the previous coating may be necessary. If paint is peeling or badly weathered, clean surface to sound substrate and treat as a new surface as above.

APPLICATION CONDITIONS

Temperature:	40°F minimum, 110°F maximum (air, surface, and material) At least 5°F above dew point
Relative humidity:	85% maximum

APPLICATION EQUIPMENT

The following is a guide. Changes in pressures and tip sizes may be needed for proper spray characteristics. Always purge spray equipment before use with listed reducer. Any reduction must be compatible with the existing environmental and application conditions.

Reducer/Clean Up ..... Reducer R7K15

Airless Spray
- Pump 30:1
- Pressure ..... 2800 - 3000 psi
- Hose ..... 1/4" ID
- Tip ..... .017" - .023"
- Filter ..... 60 mesh
- Reduction ..... as needed up to 10% by volume

Conventional Spray
- Gun ..... DeVilbiss MBC-510
- Fluid Tip ..... E
- Air Nozzle 704
- Atomization Pressure .... 60-65 psi
- Fluid Pressure ..... 10-20 psi
- Reduction ..... as needed up to 10% by volume
- Requires oil and moisture separators

Brush
- Brush..... Nylon/Polyester or Natural Bristle
- Reduction ..... as needed up to 10% by volume

Roller
- Cover ..... 3/8" woven with phenolic core
- Reduction ..... as needed up to 10% by volume

If specific application equipment is listed above, equivalent equipment may be substituted.

FAST CURE EPOXY

PART A	B58WX610	MILL WHITE
PART A	B58LX600	LIGHT BLUE
PART B	B58VX600	HARDENER

APPLICATION BULLETIN

APPLICATION PROCEDURES

Surface preparation must be completed as indicated.

Mix contents of each component thoroughly with power agitation. Make certain no pigment remains on the bottom of the can. Then combine one part by volume of Part A with one part by volume of Part B. Thoroughly agitate the mixture with power agitation. Allow the material to sweat-in as indicated prior to application. Re-stir before using.

If reducer solvent is used, add only after both components have been thoroughly mixed, after sweat-in.

Apply paint to the recommended film thickness and spreading rate as indicated below:

Recommended Spreading Rate per coat:

Wet mils:	7.0 - 13.5
Dry mils:	5.0 - 10.0*
Coverage:	116 - 232 sq ft/gal approximate

NOTE Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

* See Recommended Systems

Drying Schedule @ 7.0 mils wet and 50% RH:

	@ 40°F	@ 77°F	@ 100°F
To touch:	4-5 hours	2 hours	1½ hours
To handle:	48 hours	8 hours	4½ hours
To recoat:			
minimum:	48 hours	8 hours	4½ hours
maximum:	3 months	3 months	3 months
Cure for			
service:	10 days	7 days	4 days
immersion:	14 days	7 days	4 days

If maximum recoat time is exceeded, abrade surface before recoating. Drying time is temperature, humidity and film thickness dependent.

Pot Life:	10 hours	4 hours	2 hours
Sweat-in-time:	30 minutes	30 minutes	15 minutes

Application of coating above maximum or below minimum recommended spreading rate may adversely affect coating performance.

PERFORMANCE TIPS

Stripe coat all crevices, welds, and sharp angles to prevent early failure in these areas.

When using spray application, use a 50% overlap with each pass of the gun to avoid holidays, bare areas, and pinholes. If necessary, cross spray at a right angle

Spreading rates are calculated on volume solids and do not include an application loss factor due to surface profile, roughness or porosity of the surface, skill and technique of the applicator, method of application, various surface irregularities, material lost during mixing, spillage, overthinning, climatic conditions, and excessive film build.

Excessive reduction of material can affect film build, appearance, and adhesion.

Do not mix previously catalyzed material with new.

Do not apply the material beyond recommended pot life.

In order to avoid blockage of spray equipment, clean equipment before use or before periods of extended downtime with Reducer R7K15.

Tinting is not recommended for immersion service.

Quik-Kick Epoxy Accelerator is acceptable for atmospheric use. **Do not use Quik-Kick Epoxy Accelerator for immersion service when NSF certification is required.** See data page 4.99 for details.

Refer to Product Information sheet for additional performance characteristics and properties.

CLEAN UP INSTRUCTIONS

Clean spills and spatters immediately with Reducer R7K15. Clean tools immediately after use with Reducer R7K15. Follow manufacturer's safety recommendations when using any solvent.

SAFETY PRECAUTIONS

Refer to the MSDS sheet before use.

Published technical data and instructions are subject to change without notice. Contact your Sherwin-Williams representative for additional technical data and instructions.

Section 3 -- HAZARDS IDENTIFICATION

ROUTES OF EXPOSURE

INHALATION of vapor or spray mist.

EYE or SKIN contact with the product, vapor or spray mist.

EFFECTS OF OVEREXPOSURE

EYES: Irritation.

SKIN: Prolonged or repeated exposure may cause irritation.

INHALATION: Irritation of the upper respiratory system.

May cause nervous system depression. Extreme overexposure may result in unconsciousness and possibly death.

SIGNS AND SYMPTOMS OF OVEREXPOSURE

Headache, dizziness, nausea, and loss of coordination are indications of excessive exposure to vapors or spray mists.

Redness and itching or burning sensation may indicate eye or excessive skin exposure.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE

May cause allergic skin reaction in susceptible persons.

CANCER INFORMATION

For complete discussion of toxicology data refer to Section 11.

Section 4 -- FIRST AID MEASURES

EYES: Flush eyes with large amounts of water for 15 minutes. Get medical attention.

SKIN: Wash affected area thoroughly with soap and water. Remove contaminated clothing and launder before re-use.

INHALATION: If affected, remove from exposure. Restore breathing. Keep warm and quiet.

INGESTION: Do not induce vomiting. Get medical attention immediately.

Section 5 -- FIRE FIGHTING MEASURES

FLASH POINT	LEL	UEL
85 F PMCC	1.0	7.0

FLAMMABILITY CLASSIFICATION

RED LABEL -- Flammable, Flash below 100 F (38 C)

EXTINGUISHING MEDIA

Carbon Dioxide, Dry Chemical, Foam

UNUSUAL FIRE AND EXPLOSION HAZARDS

Closed containers may explode when exposed to extreme heat.

Application to hot surfaces requires special precautions.

During emergency conditions overexposure to decomposition products may cause a health hazard. Symptoms may not be immediately apparent. Obtain medical attention.

SPECIAL FIRE FIGHTING PROCEDURES

Full protective equipment including self-contained breathing apparatus should be used.

Water spray may be ineffective. If water is used, fog nozzles are preferable. Water may be used to cool closed containers to prevent pressure build-up and possible autoignition or explosion when exposed to extreme heat.

Continued on page 3

Section 6 -- ACCIDENTAL RELEASE MEASURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED

Remove all sources of ignition. Ventilate the area.

Remove with inert absorbent.

Section 7 -- HANDLING AND STORAGE

STORAGE CATEGORY

DOL Storage Class IC

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE

Contents are FLAMMABLE. Keep away from heat, sparks, and open flame.

During use and until all vapors are gone: Keep area ventilated - Do not smoke - Extinguish all flames, pilot lights, and heaters - Turn off stoves, electric tools and appliances, and any other sources of ignition.

Consult NFPA Code. Use approved Bonding and Grounding procedures.

Keep container closed when not in use. Transfer only to approved containers with complete and appropriate labeling. Do not take internally. Keep out of the reach of children.

Section 8 -- EXPOSURE CONTROLS/PERSONAL PROTECTION

PRECAUTIONS TO BE TAKEN IN USE

Use only with adequate ventilation.

Avoid contact with skin and eyes. Avoid breathing vapor and spray mist.

Wash hands after using.

This coating may contain materials classified as nuisance particulates (listed "as Dust" in Section 2) which may be present at hazardous levels only during sanding or abrading of the dried film. If no specific dusts are listed in Section 2, the applicable limits for nuisance dusts are ACGIH TLV 10 mg/m3 (total dust), 3 mg/m3 (respirable fraction), OSHA PEL 15 mg/m3 (total dust), 5 mg/m3 (respirable fraction).

VENTILATION

Local exhaust preferable. General exhaust acceptable if the exposure to materials in Section 2 is maintained below applicable exposure limits. Refer to OSHA Standards 1910.94, 1910.107, 1910.108.

RESPIRATORY PROTECTION

If personal exposure cannot be controlled below applicable limits by ventilation, wear a properly fitted organic vapor/particulate respirator approved by NIOSH/MSHA for protection against materials in Section 2.

When sanding or abrading the dried film, wear a dust/mist respirator approved by NIOSH/MSHA for dust which may be generated from this product, underlying paint, or the abrasive.

PROTECTIVE GLOVES

Wear gloves which are recommended by glove supplier for protection against materials in Section 2.

EYE PROTECTION

Wear safety spectacles with unperforated sideshields.

OTHER PRECAUTIONS

This product must be mixed with other components before use. Before opening the packages, READ AND FOLLOW WARNING LABELS ON ALL COMPONENTS.

Intentional misuse by deliberately concentrating and inhaling the contents can be harmful or fatal.

HAZARDOUS DECOMPOSITION PRODUCTS

By fire: Carbon Dioxide, Carbon Monoxide

HAZARDOUS POLYMERIZATION

Will not occur

Section 11 -- TOXICOLOGICAL INFORMATION

CHRONIC HEALTH HAZARDS

Ethylbenzene is classified by IARC as possibly carcinogenic to humans (2B) based on inadequate evidence in humans and sufficient evidence in laboratory animals. Lifetime inhalation exposure of rats and mice to high ethylbenzene concentrations resulted in increases in certain types of cancer, including kidney tumors in rats and lung and liver tumors in mice. These effects were not observed in animals exposed to lower concentrations. There is no evidence that ethylbenzene causes cancer in humans.

Prolonged overexposure to solvent ingredients in Section 2 may cause adverse effects to the liver, urinary and reproductive systems.

IARC's Monograph No. 93 reports there is sufficient evidence of carcinogenicity in experimental rats exposed to titanium dioxide but inadequate evidence for carcinogenicity in humans and has assigned a Group 2B rating. In addition, the IARC summary concludes, "No significant exposure to titanium dioxide is thought to occur during the use of products in which titanium is bound to other materials, such as paint."

Reports have associated repeated and prolonged overexposure to solvents with permanent brain and nervous system damage.

INDUSTRIAL & MARINE COATINGS

ACROLON™ 218 HS

ACRYLIC POLYURETHANE

PART A	B65-600	GLOSS SERIES
PART A	B65-650	SEMI-GLOSS SERIES
PART B	B65V600	HARDENER

PRODUCT INFORMATION

Revised 2/04

PRODUCT DESCRIPTION

ACROLON 218 HS acrylic polyurethane is a VOC compliant, polyester modified, aliphatic, acrylic polyurethane formulated specifically for in-shop applications. Also suitable for industrial applications. A fast drying, high gloss urethane that provides color and gloss retention for exterior exposure.

- Can be used directly over organic zinc rich primers (epoxy zinc primer and moisture cure urethane zinc primer)
- Suitable for use in USDA inspected facilities
- Color and gloss retention for exterior exposure
- Fast dry

RECOMMENDED USES

Specifically formulated for in-shop applications.

For use over prepared metal and masonry surfaces in industrial environments such as:

- Structural steel
- Rail cars and locomotives
- Conveyors
- Bridges
- Offshore platforms - exploration and production
- Tank exteriors
- Pipelines
- Ships

PRODUCT CHARACTERISTICS

Finish: High Gloss or Semi-Gloss

Color: Wide range of colors available

Volume Solids: 65% ± 2%, mixed, may vary by color
Ultra White

Weight Solids: 78% ± 2%, mixed, may vary by color
Ultra White

VOC (EPA Method 24): Pure White, mixed

Unreduced:	287 g/L; 2.4 lb/gal
Reduced 10%:	336 g/L; 2.8 lb/gal
Reduced 15%:	360 g/L; 3.0 lb/gal

Mix Ratio: 6:1 by volume, 1 gallon or 5 gallon mixes premeasured components

Recommended Spreading Rate per coat:

Wet mils:	4.5 - 9.0
Dry mils:	3.0 - 6.0
Coverage:	175 - 346 sq ft/gal approximate

NOTE: Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

Drying Schedule @ 6.0 mils wet @ 50% RH:

	@ 50°F	@ 77°F	@ 120°F
To touch:	2 hours	30 minutes	20 minutes
To handle:	10 hours	6 hours	4 hours
To recoat:			
minimum:	12 hours	8 hours	6 hours
maximum:	3 months	3 months	3 months
To cure:	14 days	7 days	5 days

Drying time is temperature, humidity, and film thickness dependent.

Pot Life: 4 hours | 2 hours | 45 minutes
(reduced 5% with Reducer R7K15)

Sweat in Time: none | none | none
If maximum recoat time is exceeded, abrade surface before recoating.

Shelf Life:
Part A: 36 months, unopened
Part B: 12 months, unopened
Store indoors at 40°F to 100°F

Flash Point: 55°F, Seta, mixed

Reducer/Clean Up:

Spray	Reducer R7K15
Brush/Roll	Reducer #132, R7K132

PERFORMANCE CHARACTERISTICS

System Tested: (unless otherwise indicated)
Substrate: Steel
Surface Preparation: SSPC-SP10
1 ct. Macropoxy 646 @ 6.0 mils dft
1 ct. Acrolon 218 HS Gloss @ 4.0 mils dft

Abrasion Resistance: [1]
Method: ASTM D4060, CS17 wheel, 1000 cycles, 1 kg load
Result: 43 mg loss

Accelerated Weathering, with Diamond-Clad Clear Coat:
Method: ASTM D4587, QUV-A, 10,000 hours
Results: 100% gloss retention

Adhesion:
Method: ASTM D4541
Result: 975 psi

Corrosion Weathering: [2]
Method: ASTM D5894, 9 cycles, 3024 hours
Result: Rating 10 per ASTM D610, for rusting
Rating 10 per ASTM D714, for blistering

Direct Impact Resistance: [1]
Method: ASTM D2794
Result: 50 in. lb.

Dry Heat Resistance: [1]
Method: ASTM D2485, Method A
Result: 200°F

Flexibility: [1]
Method: ASTM D522, 180° bend, 1/8" mandrel
Result: Passes

Humidity Resistance: [2]
Method: ASTM D4585, 100°F, 1500 hours
Result: Rating 10 per ASTM D610 for rusting
Rating 10 per ASTM D714 for blistering

Pencil Hardness:
Method: ASTM D3363
Result: 3H

Salt Fog Resistance: [2]
Method: ASTM B117, 7000 hours
Result: Rating 10 per ASTM D610 for rusting
Rating 9 per ASTM D714 for blistering

[1] Finish coat only tested
[2] Primer: Zinc-Clad II HS
Intermediate: Macropoxy 646
Finish: Acrolon 218 HS

Meets the requirements of SSPC Paint No. 36, Level 3.

PRODUCT INFORMATION

RECOMMENDED SYSTEMS

Steel:
1 ct. Macropoxy 646 @ 5.0 - 10.0 mils dft
1-2 cts. Acrolon 218 HS Acrylic Polyurethane @ 3.0 - 6.0 mils dft/ct

Steel:
1 ct. Zinc Clad II HS @ 3.0 - 5.0 mils dft
1 ct. Macropoxy 646 @ 5.0 - 10.0 mils dft
1-2 cts. Acrolon 218 HS Acrylic Polyurethane @ 3.0 - 6.0 mils dft/ct

Steel:
1 ct. Zinc Clad IV @ 3.0 - 5.0 mils dft
1-2 cts. Acrolon 218 HS Acrylic Polyurethane @ 3.0 - 6.0 mils dft/ct

Steel:
1 ct. Corothane I - GalvaPac Zinc Primer @ 3.0 - 4.0 mils dft
1-2 cts. Acrolon 218 HS Acrylic Polyurethane @ 3.0 - 6.0 mils dft/ct

Steel:
1 ct. Epoxy Mastic Aluminum II @ 6.0 mils dft
1-2 cts. Acrolon 218 HS Acrylic Polyurethane @ 3.0 - 6.0 mils dft/ct

Steel:
1 ct. Recoatable Epoxy Primer @ 4.0 - 6.0 mils dft
1-2 cts. Acrolon 218 HS Acrylic Polyurethane @ 3.0 - 6.0 mils dft/ct

Concrete/Masonry:
1 ct. Kem Cati-Coat HS Epoxy Filler/Sealer @ 10.0 - 20.0 mils dft
1-2 cts. Acrolon 218 HS Acrylic Polyurethane @ 3.0 - 6.0 mils dft/ct

Aluminum/Galvanizing:
1 ct. DTM Wash Primer @ 0.7 - 1.3 mils dft
1-2 cts. Acrolon 218 HS Acrylic Polyurethane @ 3.0 - 6.0 mils dft/ct

The systems listed above are representative of the product's use. Other systems may be appropriate.

SURFACE PREPARATION

Surface must be clean, dry, and in sound condition. Remove all oil, dust, grease, dirt, loose rust, and other foreign material to ensure adequate adhesion.

Refer to product Application Bulletin for detailed surface preparation information.

Minimum recommended surface preparation:
* Iron & Steel: SSPC-SP6, 1-2 mils profile
* Galvanizing: SSPC-SP1
* Concrete & Masonry: SSPC-SP13/NACE 6

* Primer required

TINTING

Tint with 844 Colorants.
- Extra white tints at 100% tint strength
- Ultradeep base tints at 150% tint strength

Five minutes minimum mixing on a mechanical shaker is required for complete mixing of color.

APPLICATION CONDITIONS

Temperature:	40°F minimum, 120°F maximum (air, surface, and material)
	At least 5°F above dew point
Relative humidity:	85% maximum

Refer to product Application Bulletin for detailed application information.

ORDERING INFORMATION

Packaging:	1 gallon mix:	5 gallon mix:
Part A:	.86 gal	4.29 gal
Part B:	.14 gal	0.71 gal
(premeasured components)		
Weight per gallon:	11.2 ± 0.2 lb mixed, may vary with color	

SAFETY PRECAUTIONS

Refer to the MSDS sheet before use.

Published technical data and instructions are subject to change without notice. Contact your Sherwin-Williams representative for additional technical data and instructions.

The statements made herein are based on our research and/or the research of others believed to be accurate.

PART A	B65-650	SEMI-GLOSS SERIES
PART B	B65V600	HARDENER

APPLICATION BULLETIN

Revised 2/04

SURFACE PREPARATION

Surface must be clean, dry, and in sound condition. Remove all oil, dust, grease, dirt, loose rust, and other foreign material to ensure adequate adhesion.

Iron & Steel

Remove all oil and grease from surface by Solvent Cleaning per SSPC-SP1. Minimum surface preparation is Commercial Blast Cleaning per SSPC-SP6. For better performance, use Near White Metal Blast Cleaning per SSPC-SP10. Blast clean all surfaces using a sharp, angular abrasive for optimum surface profile (1-2 mils). Prime any bare steel the same day as it is cleaned or before flash rusting occurs.

Aluminum

Remove all oil, grease, dirt, oxide and other foreign material by Solvent Cleaning per SSPC-SP1. Primer required

Galvanized Steel

Allow to weather a minimum of six months prior to coating. Solvent Clean per SSPC-SP1. When weathering is not possible, or the surface has been treated with chromates or silicates, first Solvent Clean per SSPC-SP1 and apply a test patch. Allow paint to dry at least one week before testing adhesion. If adhesion is poor, brush blasting per SSPC-SP7 is necessary to remove these treatments. Rusty galvanizing requires a minimum of Hand Tool Cleaning per SSPC-SP2, prime the area the same day as cleaned or before flash rusting occurs.

Poured Concrete

New

For surface preparation, refer to SSPC-SP13/NACE 6. Surfaces must be clean, dry, sound and offer sufficient profile to achieve adequate adhesion. Minimum substrate cure is 28 days at 75°F. Remove all form release agents, curing compounds, salts, efflorescence, laitance, and other foreign matter by sandblasting, shotblasting, mechanical scarification, or suitable chemical means. Refer to ASTM D4260. Rinse thoroughly to achieve a final pH between 6.0 and 10.0. Allow to dry thoroughly prior to coating.

Old

Surface preparation is done in much the same manner as new concrete, however, if the concrete is contaminated with oils, grease, chemicals, etc., they must be removed by cleaning with a strong detergent. Refer to ASTM D4258. Form release agents, hardeners, etc. must be removed by sandblasting, shotblasting, mechanical scarification, or suitable chemical means. If surface deterioration presents an unacceptably rough surface, Kem Cati-Coat Epoxy HS Filler/Sealer is recommended to patch and resurface damaged concrete.

Fill all cracks, voids and bugholes with Sher-Plate Epoxy Patch.

Always follow the ASTM methods listed below:

ASTM D4258 Standard Practice for Cleaning Concrete.
ASTM D4259 Standard Practice for Abrading Concrete.
ASTM D4260 Standard Practice for Etching Concrete.
ASTM F1869 Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete.
SSPC-SP 13/Nace 6 Surface Preparation of Concrete.

APPLICATION CONDITIONS

Temperature:	40°F minimum, 120°F maximum (air, surface, and material) At least 5°F above dew point
Relative humidity:	85% maximum

APPLICATION EQUIPMENT

The following is a guide. Changes in pressures and tip sizes may be needed for proper spray characteristics. Always purge spray equipment before use with listed reducer. Any reduction must be compatible with the existing environmental and application conditions.

Reducer/Clean Up:
Spray ..... Reducer R7K15
Brush/Roll ..... Reducer #132, R7K132
If reducer is used, reduce at time of catalyzation.

Airless Spray
Pressure ..... 2500 - 2800 psi
Hose ..... 3/8" ID
Tip ..... .013" - .017"
Filter ..... 60 mesh
Reduction ..... As needed up to 15% by volume

Conventional Spray
Gun ..... Binks 95
Cap 63P
Atomization Pressure .. 50 - 70 psi
Fluid Pressure ..... 20 - 25 psi
Reduction ..... As needed up to 15% by volume

Brush
Brush ..... Natural Bristle
Reduction ..... As needed up to 15% by volume

Roller
Cover ..... 3/8" woven with phenolic core
Reduction ..... As needed up to 15% by volume

If specific application equipment is listed above, equivalent equipment may be substituted.

THE SHERWIN-WILLIAMS COMPANY

Industrial and Marine Coatings

INDUSTRIAL & MARINE COATINGS

ACROLON™ 218 HS

ACRYLIC POLYURETHANE

PART A	**B65-600**	**GLOSS SERIES**
PART A	**B65-650**	**SEMI-GLOSS SERIES**
PART B	**B65V600**	**HARDENER**

APPLICATION BULLETIN

APPLICATION PROCEDURES

Surface preparation must be completed as indicated.

Mix contents of each component thoroughly with power agitation. Make certain no pigment remains on the bottom of the can. Then combine six parts by volume of Part A with one part by volume of Part B (premeasured components). Thoroughly agitate the mixture with power agitation. Re-stir before using.

If reducer is used, reduce at time of catalyzation.

Apply paint at the recommended film thickness and spreading rate as indicated below:

Recommended Spreading Rate per coat:

Wet mils:	4.5 - 9.0
Dry mils:	3.0 - 6.0
Coverage:	175 - 346 sq ft/gal approximate

NOTE: Brush or roll application may require multiple coats to achieve maximum film thickness and uniformity of appearance.

Drying Schedule @ 6.0 mils wet @ 50% RH:

	50°F	**@ 77°F**	**@ 120°F**
To touch:	2 hours	30 minutes	20 minutes
To handle:	10 hours	6 hours	4 hours
To recoat:			
minimum:	12 hours	8 hours	6 hours
maximum:	3 months	3 months	3 months
To cure:	14 days	7 days	5 days
Pot Life:	4 hours	2 hours	45 minutes
(reduced 5% with Reducer R7K15)			
Sweat in Time:	none	none	none

Application of coating above maximum or below minimum recommended spreading rate may adversely affect coating performance.

PERFORMANCE TIPS

Stripe coat all crevices, welds, and sharp angles to prevent early failure in these areas.

When using spray application, use a 50% overlap with each pass of the gun to avoid holidays, bare areas, and pinholes. If necessary, cross spray at a right angle.

Spreading rates are calculated on volume solids and do not include an application loss factor due to surface profile, roughness or porosity of the surface, skill and technique of the applicator, method of application, various surface irregularities, material lost during mixing, spillage, overthinning, climatic conditions, and excessive film build.

Excessive reduction of material can affect film build, appearance, and adhesion.

Do not apply the material beyond recommended pot life.

Do not mix previously catalyzed material with new.

In order to avoid blockage of spray equipment, clean equipment before use or before periods of extended downtime with Reducer #132, R7K132.

Mixed coating is sensitive to water. Use water traps in all air lines. Moisture contact can reduce pot life and affect gloss and color.

E-Z Roll Urethane Defoamer is acceptable for use. See data page 5.99 for details.

Refer to Product Information sheet for additional performance characteristics and properties.

CLEAN UP INSTRUCTIONS

Clean spills and spatters immediately with Reducer #132, R7K132. Clean tools immediately after use with Reducer #132, R7K132. Follow manufacturer's safety recommendations when using any solvent.

SAFETY PRECAUTIONS

Refer to the MSDS sheet before use.

Published technical data and instructions are subject to change without notice. Contact your Sherwin-Williams representative for additional technical data and instructions.

The statements made herein are based on our research and/or the research of others believed to be accurate.
No guarantee of their accuracy is made however, and such statements may be changed without notice.

Section 3 -- HAZARDS IDENTIFICATION

ROUTES OF EXPOSURE

INHALATION of vapor or spray mist.

EYE or SKIN contact with the product, vapor or spray mist.

EFFECTS OF OVEREXPOSURE

EYES: Irritation.

SKIN: Prolonged or repeated exposure may cause irritation.

INHALATION: Irritation of the upper respiratory system.

May cause nervous system depression. Extreme overexposure may result in unconsciousness and possibly death.

SIGNS AND SYMPTOMS OF OVEREXPOSURE

Headache, dizziness, nausea, and loss of coordination are indications of excessive exposure to vapors or spray mists.

Redness and itching or burning sensation may indicate eye or excessive skin exposure.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE

May cause allergic respiratory and/or skin reaction in susceptible persons or sensitization. This effect may be delayed several hours after exposure.

CANCER INFORMATION

For complete discussion of toxicology data refer to Section 11.

Section 4 -- FIRST AID MEASURES

EYES: Flush eyes with large amounts of water for 15 minutes. Get medical attention.

SKIN: Wash affected area thoroughly with soap and water. Remove contaminated clothing and launder before re-use.

INHALATION: If any breathing problems occur during use, LEAVE THE AREA and get fresh air. If problems remain or occur later, IMMEDIATELY get medical attention.

INGESTION: Do not induce vomiting. Get medical attention immediately.

Section 5 -- FIRE FIGHTING MEASURES

FLASH POINT	LEL	UEL
55 F PMCC	0.8	13.1

FLAMMABILITY CLASSIFICATION

RED LABEL -- Flammable, Flash below 100 F (38 C)

Continued on page 3

EXTINGUISHING MEDIA

Carbon Dioxide, Dry Chemical, Foam

UNUSUAL FIRE AND EXPLOSION HAZARDS

Closed containers may explode when exposed to extreme heat.

Application to hot surfaces requires special precautions.

During emergency conditions overexposure to decomposition products may cause a health hazard. Symptoms may not be immediately apparent. Obtain medical attention.

SPECIAL FIRE FIGHTING PROCEDURES

Full protective equipment including self-contained breathing apparatus should be used.

Water spray may be ineffective. If water is used, fog nozzles are preferable. Water may be used to cool closed containers to prevent pressure build-up and possible autoignition or explosion when exposed to extreme heat.

Section 6 -- ACCIDENTAL RELEASE MEASURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED

Remove all sources of ignition. Ventilate the area.

Remove with inert absorbent.

Section 7 -- HANDLING AND STORAGE

STORAGE CATEGORY

DOL Storage Class IB

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE

Contents are FLAMMABLE. Keep away from heat, sparks, and open flame.

During use and until all vapors are gone: Keep area ventilated - Do not smoke - Extinguish all flames, pilot lights, and heaters - Turn off stoves, electric tools and appliances, and any other sources of ignition.

Consult NFPA Code. Use approved Bonding and Grounding procedures.

Keep container closed when not in use. Transfer only to approved containers with complete and appropriate labeling. Do not take internally. Keep out of the reach of children.

Section 8 -- EXPOSURE CONTROLS/PERSONAL PROTECTION

PRECAUTIONS TO BE TAKEN IN USE

NO PERSON SHOULD USE THIS PRODUCT, OR BE IN THE AREA WHERE IT IS BEING USED, IF THEY HAVE CHRONIC (LONG-TERM) LUNG OR BREATHING PROBLEMS OR IF THEY EVER HAD A REACTION TO ISOCYANATES.

Use only with adequate ventilation.

Avoid contact with skin and eyes. Avoid breathing vapor and spray mist.

Wash hands after using.

This coating may contain materials classified as nuisance particulates (listed "as Dust" in Section 2) which may be present at hazardous levels only during sanding or abrading of the dried film. If no specific dusts are listed in Section 2, the applicable limits for nuisance dusts are ACGIH TLV 10 mg/m3 (total dust), 3 mg/m3 (respirable fraction), OSHA PEL 15 mg/m3 (total dust), 5 mg/m3 (respirable fraction).

VENTILATION

Local exhaust preferable. General exhaust acceptable if the exposure to materials in Section 2 is maintained below applicable exposure limits. Refer to OSHA Standards 1910.94, 1910.107, 1910.108.

Continued on page 4

RESPIRATORY PROTECTION

Where overspray is present, a positive pressure air supplied respirator (TC19C NIOSH/MSHA approved) should be worn. If unavailable, a properly fitted organic vapor/particulate respirator approved by NIOSH/MSHA for protection against materials in Section 2 may be effective. Follow respirator manufacturer's directions for use. Wear the respirator for the whole time of spraying and until all vapors and mists are gone. NO PERSONS SHOULD BE ALLOWED IN THE AREA WHERE THIS PRODUCT IS BEING USED UNLESS EQUIPPED WITH THE SAME RESPIRATOR PROTECTION RECOMMENDED FOR THE PAINTERS.

When sanding or abrading the dried film, wear a dust/mist respirator approved by NIOSH/MSHA for dust which may be generated from this product, underlying paint, or the abrasive.

PROTECTIVE GLOVES

To prevent skin contact, wear gloves which are recommended by glove supplier for protection against materials in Section 2.

EYE PROTECTION

Wear safety spectacles with unperforated sideshields.

OTHER PROTECTIVE EQUIPMENT

Use barrier cream on exposed skin.

OTHER PRECAUTIONS

This product must be mixed with other components before use. Before opening the packages, READ AND FOLLOW WARNING LABELS ON ALL COMPONENTS.

Intentional misuse by deliberately concentrating and inhaling the contents can be harmful or fatal.

Section 9 -- PHYSICAL AND CHEMICAL PROPERTIES

PRODUCT WEIGHT	10.64 lb/gal	1275 g/l

CONDITIONS TO AVOID

None known.

INCOMPATIBILITY

None known.

HAZARDOUS DECOMPOSITION PRODUCTS

By fire: Carbon Dioxide, Carbon Monoxide

HAZARDOUS POLYMERIZATION

Will not occur

Continued on page 5

Section 11 -- TOXICOLOGICAL INFORMATION

CHRONIC HEALTH HAZARDS

Ethylbenzene is classified by IARC as possibly carcinogenic to humans (2B) based on inadequate evidence in humans and sufficient evidence in laboratory animals. Lifetime inhalation exposure of rats and mice to high ethylbenzene concentrations resulted in increases in certain types of cancer, including kidney tumors in rats and lung and liver tumors in mice. These effects were not observed in animals exposed to lower concentrations. There is no evidence that ethylbenzene causes cancer in humans.

Crystalline Silica (Quartz, Cristobalite) is listed by IARC and NTP. Long term exposure to high levels of silica dust, which can occur only when sanding or abrading the dry film, may cause lung damage (silicosis) and possibly cancer.

Methyl Ethyl Ketone may increase the nervous system effects of other solvents.

Prolonged overexposure to solvent ingredients in Section 2 may cause adverse effects to the liver, urinary, blood forming and reproductive systems.

Persons sensitive to isocyanates will experience increased allergic reaction on repeated exposure.

Reports have associated repeated and prolonged overexposure to solvents with permanent brain and nervous system damage.

KREBS ENGINEERS

GENERAL

KREBS Cyclones are the result of an intensive research and development program initiated in 1950. Each unit represents a product of advanced design, careful engineering, quality materials and the finest workmanship.

The information in the following pages is directed toward a better understanding of cyclone principles and operation, so that the potential for every KREBS Cyclone is realized.

KREBS engineers cyclone installations by studying the operating data and customer objectives. The cyclone selections are based on the large amount of operating data accumulated by our staff of engineers and our continuing research. When data is not available or is incomplete, studies in our laboratory and pilot plant are recommended. The pilot plant is equipped for complete, full-scale cyclone classification studies. Predictable performances resulting from these studies have been proven in numerous subsequent field installations. An important part of this service is the analysis of the test results by our staff of metallurgical and chemical engineers as related to the overall plant operation.

You are invited to avail yourself of these facilities and services for the study of your classification problems.

KREBS ENGINEERS

Installation

Small KREBS Cyclones are crated and shipped completely assembled. When removing the cyclone from the shipping crate, care should be taken to account for all of the parts. This can be checked against the packing slip.

Pump, Sump and Piping

Correct design of the pump and sump is probably the most important factor in establishing an efficient cyclone operation.

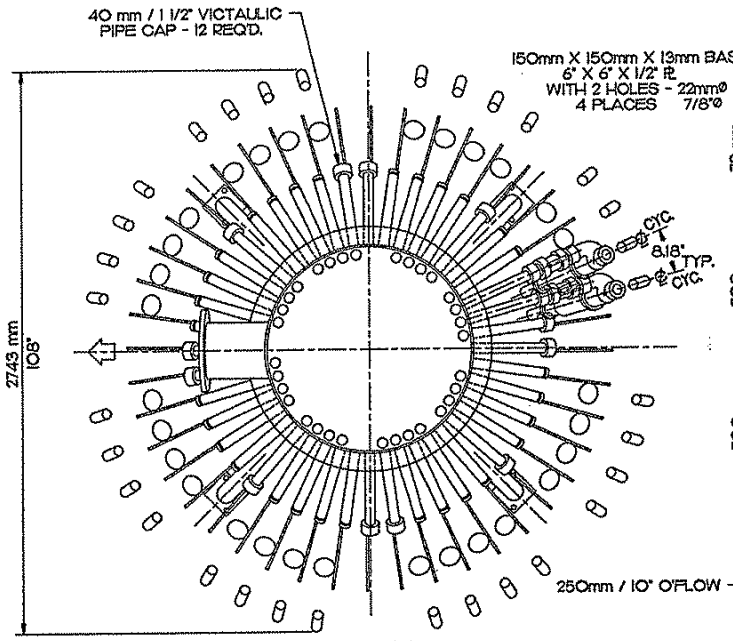
Conversion of flow and velocity to kinetic energy in a cyclone is derived from the energy supplied from the pump. Each adjustment of the cyclone variables will influence the pumping to some degree. This will be discussed in the section entitled "Operation". A constant volume to the cyclone is important. Momentary fluctuations are generally the result of entrained air in the slurry.

A constant level in the sump is critical, but by no means an indication that the cyclone is receiving a constant and uniform volume of feed. If the needle of the pressure gauge fluctuates rapidly, it is a definite indication that there is entrained air in the pump discharge slurry. To correct this problem, the entering stream should be prevented from carrying entrapped air to the suction of the pump. This can be done by mounting a sloping plate in the sump, well below the normal level of the slurry. An annular opening between the plate and the edges of the sump of about one inch around its entire periphery will generally be sufficient to allow the total volume of slurry to pass from the upper compartment to the lower section.

It is permissible to return part or all of the overflow product to the sump to maintain a constant level. It must be remembered that the greater the slime content of the feed slurry to a cyclone, the more difficult it becomes to make a given separation. The use of recycled overflow product should be handled with caution, as there is always a danger of recirculating an excess quantity and consequently increasing the slime content of the feed slurry.

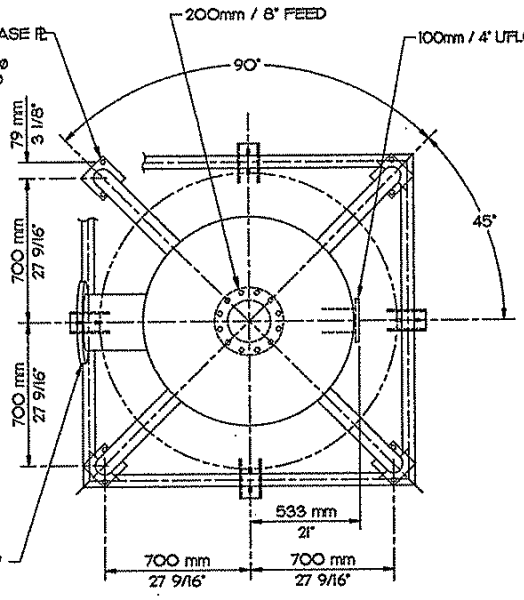
Where water is available and the overflow product is an important consideration, fresh water should be added as a means of volume control.

The overflow product should discharge to atmosphere as close to the cyclone as possible. If the overflow pipe is carried directly to an elevation below the inlet of the cyclone, a siphoning action can be created. This will cause coarser particles to be carried to the cyclone overflow product. The overflow should be available for sampling.



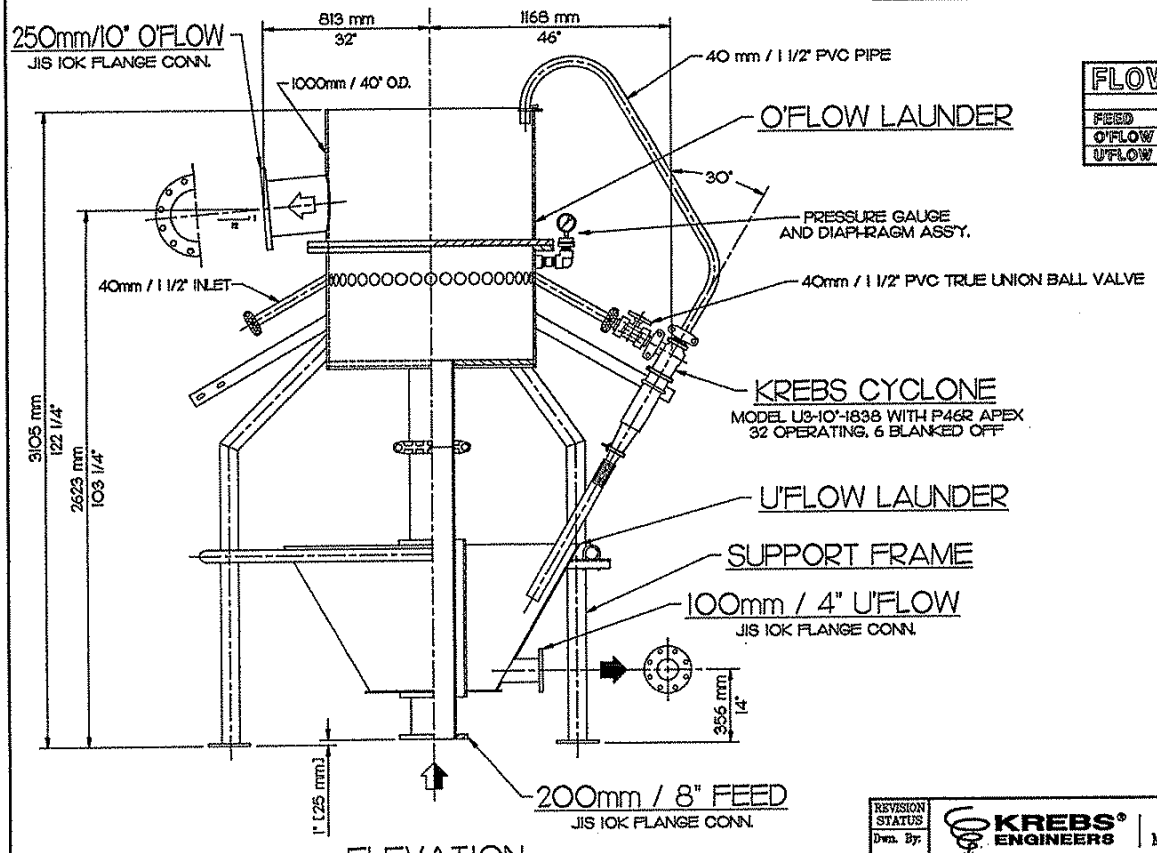
The underflow discharge should be open for visual inspection, as it is important to be able to observe the characteristics of this flow. The underflow should be maintained with a 20-30 degree spray discharge. A "rope" discharge is an indication that there is excess crowding of solids at the apex orifice. This will cause coarse oversize solids to be carried into the overflow product. The underflow product should also be available for sampling.

Installation (cont'd)



Multiple Installations

A radial manifold system assures an even feed distribution to each cyclone. The take-offs should be equally spaced around the perimeter of the central distribution pot. The overflow and underflow launders must be properly sized to allow for collection and distribution of the streams. KREBS ENGINEERS will design and fabricate radial manifolds. Drawing number M1440 illustrates a typical radial manifold system for small diameter cyclones.



An inline manifold system can be used if the feed is very dilute and not subject to segregating in the system. An inline system is generally easier to design and build than a radial system and consequently is less expensive. An inline system does not assure equal feed to each cyclone. Drawing number M1536 illustrates a typical inline manifold system.

GENERAL ARRANGEMENT
6 MODEL UI-1434 KREBS CYCLONES
IN-LINE MANIFOLD SYSTEM

R.N. M5536ANC | C | © KREBS ENGINEERS 1997 | DWG. NO. MI536

Operation

The primary consideration in selecting the proper size and design of cyclone is the classification objective, not the capacity. The proper relationship between the inlet orifice the vortex finder diameter, and the apex diameter is engineered by the staff of KREBS Engineers for each specific classification objective.

There is seldom any necessity for changing the size of these orifices unless the classification objectives or plant operating conditions are altered.

Numerous factors influence the operation of a cyclone. Following is a brief discussion of some factors influencing cyclone operation (which the operator is normally able to control while the cyclone is operating).

Feed Dilution

Feed dilution is the most effective control available. The use of additional dilution water will always result in a finer and sharper separation. The dilution water can also be adjusted to maintain a constant level in the sump, although the operator must be aware of the potential change in the separation. For very dilute feeds, the change in the separation will be minimal.

Pressure Management

Pressure drop across the cyclone is the pressure differential between the cyclone inlet and overflow. When the cyclone discharges to atmosphere, a condition we usually recommend, the inlet pressure is the pressure drop.

The pressure drop is merely an indication of the energy required to force a given volume through the cyclone and not an indication of a developed force-pattern or throughput. Excessive pressure results in high pump operating and maintenance costs and should be avoided. We generally do not recommend pressure drops above 50 psi.

The higher the pressure drop, the greater the throughput capacity of the cyclone. A higher pressure drop will also produce a finer separation.

Cyclone Orifices

The following describes the effect the various orifices have on the cyclone performance. Changing the orifice requires shutting down the system.

Inlet Orifice

The main function of the inlet orifice is to provide a smooth flow pattern at the point of entry into the cyclone. All of KREBS Cyclones are designed with an involuted entry that preorients the solids prior to reaching the tangential point of contact with the cylinder wall. This minimizes turbulence and allows KREBS Cyclones to produce finer and sharper separations.

An increase in the inlet area will increase the capacity of the cyclone. It will also coarsen the separation slightly. All of KREBS Cyclones, three inches and smaller in diameter, have fixed inlet areas.

Operation (cont'd)

Vortex Finder

The vortex finder has the greatest impact on the operating results of all the orifices. The vortex finder also has a large effect on the cyclone capacity at a given pressure drop. It also affects the cyclone separation significantly.

The larger the vortex finder diameter, the greater the cyclone capacity at a given pressure drop. A larger diameter vortex finder will also coarsen the cyclone separation.

Apex Orifice

The only function of the apex orifice is to discharge the coarse solids in such a manner that the maximum underflow density and smoothness of discharge are obtained. The apex should be large enough to produce a 20-30 degree cone discharge, but should not be used to control the cyclone separation. The apex should never be so small that a "rope" discharge exists. A "rope" discharge is an indication that the apex is not allowing all of the coarse solids out and consequently some are being forced out the cyclone overflow. Both fixed and manually adjustable apexes are available on KREBS small diameter cyclones.

Maintenance

It is important to maintain smooth surfaces on the interior of the cyclone. The cyclones should be inspected on a regular basis. When the interior surfaces become worn or uneven, the part should be replaced. After experience has been gained in operating the cyclones under given conditions, a regular maintenance schedule can be determined.

Once the apex opens more than 10% of it's original size, it should be replaced.

Common Problems and Solutions

Problem 1:

There are very coarse solids in the cyclone overflow.

Solution:

This is normally an indication that the apex is too small and coarse solids are being forced to the cyclone overflow. The apex diameter should be increased until a constant 30 degree cone angle is obtained on the discharge. The fixed apexes can be cut off to increase the diameter. An adjustable apex will have to be replaced with a larger one if it is in the full open position.

Problem 2:

The cyclone pressure drop fluctuates wildly.

Solution:

This is an indication that a constant level in the sump is not being maintained or that air is entrained in the slurry. If the pump is pumping more feed volume than is going to the slump, the sump level will go down. Eventually the pump will cavitate and the pressure drop across the cyclone will be very erratic. Slowing the pump down or increasing the dilution water to the sump will maintain a constant sump level.

Air usually enters the pump suction because the feed to the sump is pointing directly down into the pump suction. Change the feed so that it angles against a side wall of the sump or install a baffle plate as described in the installation section.

Problem 3:

The separation is not fine enough.

Solution:

Increase the dilution water to the feed. If the feed is already dilute or if diluting the feed is not possible, increase the cyclone pressure drop. This will require speeding up the pump and installing a smaller diameter vortex finder. If the separation is still not fine enough, smaller diameter cyclones will probably required.

Problem 4:

The underflow is too dilute.

Solution:

This is an indication that the apex is too large. Decrease the apex diameter until a 30 degree cone discharge is obtained. Do not decrease the apex diameter to the point of "roping" the discharge. The adjustable apexes can be decreased by tightening the worm driven clamp. The fixed apexes will have to be replaced with a smaller size.

Calculations

TONNAGE:

1) Solids: $TPH = GPM\ SLURRY \times S.G.\ SLURRY \times \%\ SOLIDS$

Slurry: $\frac{TPH\ SOLIDS}{\%\ SOLIDS}$

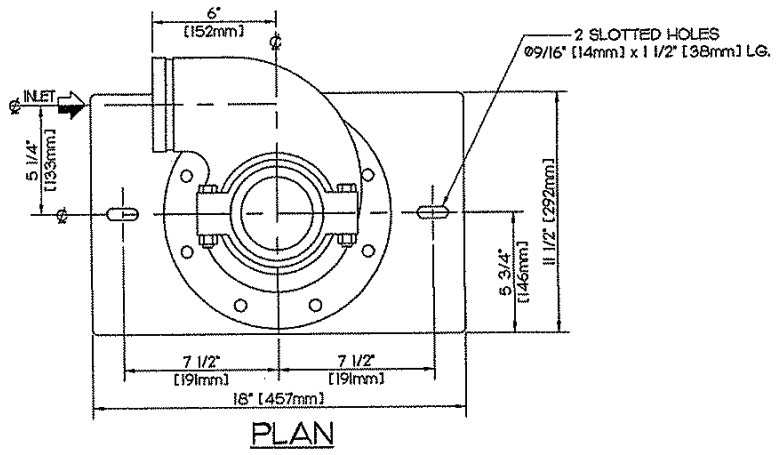
2) PULP SPECIFIC GRAVITY:

$$S.G.\ PULP = \frac{100 \times S.G.\ SOLIDS \times S.G.\ LIQUID}{100 \times S.G.\ SOLIDS - \%\ SOLIDS\ (S.G.\ SOLIDS - S.G.\ LIQUID)}$$

3) PERCENT SOLIDS IN PULP

$$\% = \frac{TPH\ SOLIDS}{TPH\ SLURRY} \times 100$$

4) GALLONS PER MINUTE:



$$GPM\ SLURRY = \frac{TPH\ SOLIDS \times 4}{S.G.\ SLURRY \times \%\ SOLIDS}$$

5) $$\%\ SOLIDS\ BY\ VOLUME = \frac{\%\ SOLIDS\ BY\ WEIGHT \times S.G.\ PULP}{S.G.\ SOLIDS}$$

6) $$\frac{GPM}{ONE\ TPH\ SOLIDS} = \frac{4}{\%\ SOLIDS \times S.G.\ PULP}$$

Section 2 - Hazards Identification

HMIS Ratings: Health: 0 **Fire:** 1 **Physical Hazard:** 0
*Hazard Scale: 0 = Minimal 1 = Slight 2 = Moderate 3 = Serious 4 = Severe * = Chronic hazard*
NFPA Ratings: Health: 0 **Fire:** 1 **Reactivity:** 0
Hazard Scale: 0 = Minimal 1 = Slight 2 = Moderate 3 = Serious 4 = Severe

Emergency Overview

Product is a white, inert, solid bead or pellet with slight odor. This product is not considered flammable according to OSHA, but will burn on prolonged exposure to flame or high temperature. Slipping hazard.

Potential Health Effects: Eyes

Contact with hot or molten material may cause severe thermal injury, including in extreme contact possible blindness. Contact of powder or fines with eye may cause mechanical irritation.

Potential Health Effects: Skin

Contact with hot or molten material may cause severe thermal burns. Contact of powder or fines with skin may cause mild irritation, that is increased by mechanical rubbing or if skin is dry.

Potential Health Effects: Ingestion

Ingestion of this product is unlikely. However, ingestion of product may produce mild gastrointestinal irritation and disturbances.

Potential Health Effects: Inhalation

Inhalation of fine particles may cause respiratory irritation. Fumes produced during thermal processing may cause irritation to the respiratory system.

Section 3 - Composition / Information on Ingredients

CAS #	Component	Percent by Wt.
9003-55-8	Styrene-Butadiene polymer	94-100

Additional Information

This product may be regulated, have exposure limits or other information identified as the following: Nuisance particulates.
This product is NOT considered hazardous under 29 CFR 1910.1200 (Hazard Communication).
This material is NOT a controlled product under Canadian WHMIS regulations.
This material is NOT REGULATED as a hazardous material/dangerous goods for transportation.

See Section 8 for applicable exposure limits. See Section 11 for applicable toxicity data.

Section 4 - First Aid Measures

First Aid: Eyes

Remove contact lenses, if it can be done safely. Immediately flush eyes with water for at least 15 minutes, while holding eyelids open. Seek medical attention if symptoms develop or persist.

First Aid: Skin

For skin contact, wash affected area with soap and water. Seek medical attention, if symptoms develop or persist. In case of contact with molten product, cool rapidly with water and seek immediate medical attention. Do not attempt to remove molten product, or molten product that has cooled, from skin without medical assistance.

First Aid: Inhalation

Move affected individual to non-contaminated air. Loosen tight clothing such as a collar, tie, belt or waistband to facilitate breathing. Seek immediate medical attention if the individual is not breathing, unconscious or if any other symptoms persist.

First Aid: Ingestion

Material is not expected to be absorbed from the gastrointestinal tract. DO NOT INDUCE VOMITING. Loosen tight clothing such as a collar, tie, belt or waistband. Seek immediate medical attention.

First Aid: Notes to Physician

Burns should be treated as thermal burns. Molten resin will come off as healing occurs; therefore, immediate removal from skin is not necessary. Treatment for overexposure should be directed at controlling the symptoms and clinical condition of the patient. After adequate first aid, no further treatment is necessary, unless symptoms reappear. Ingested material should pass through the digestive system without injury.

Section 5 - Fire Fighting Measures

See Section 9: Physical Properties for flammability limits, flash point and autoignition information.

General Fire Hazards

This product is not considered flammable according to OSHA, but will burn on prolonged exposure to flame or high temperature. High concentration of airborne powders or dust may form explosive mixture with air.

Explosion Hazards

Accumulated fine dusts may form an explosive mixture with air. Take precautionary measures to prevent contact with electrostatic discharges. Risk of dust/air explosion is increased if flammable vapors are present.

Hazardous Combustion Products

Styrene, butadiene, carbon dioxide, carbon monoxide.

Extinguishing Media

Dry chemical, foam, carbon dioxide, or water fog or spray. Avoid high pressure, direct water stream that may spread molten or burning resins.

Fire Fighting Equipment/Instructions

Position upwind. Keep unnecessary personnel away. Move containers from fire area if you can do so without risk. Fight fire from maximum distance or use unmanned holders or monitor nozzles. Fire fighters should wear full-face, self-contained breathing apparatus and thermal protective clothing. Avoid inhaling any smoke and combustion products. Cool containers with flooding quantities of water until well after the fire is out. Control runoff waters to prevent entry into sewers, drains, underground or confined spaces and waterways.

Section 6 - Accidental Release Measures

Evacuation Procedures

Isolate area. Keep unnecessary personnel away.

Spills

Stop leak and contain spill. Prevent entry into sewers, drains, underground or confined spaces, and waterways. Spilled product may create a dangerous slipping hazard. Use appropriate tools to put the spilled solid in an appropriate recovery or waste disposal container. Reuse or recycle where possible. Meet any applicable regulations.

Special Procedures

Contact local police and appropriate emergency telephone numbers provided in Section 1. Ensure statutory and regulatory reporting requirements in the applicable jurisdiction are met.

Wear appropriate protective equipment and clothing during clean up. Individuals without appropriate protective equipment should be excluded from area of spill until cleanup has been completed.

See Section 8 for recommended Personal Protective Equipment and see Section 13 for waste disposal considerations.

Section 7 - Handling and Storage

Handling Procedures

Handle in contained and properly designed equipment systems. Use with adequate ventilation. Avoid ingestion and inhalation. Keep away from uncontrolled heat and incompatible materials. Ground all material handling and transfer equipment to dissipate build-up of static electricity. Keep handling areas free of loose pellets and dust accumulation. Mechanical operations involving this material should be done in such a manner as to prevent or minimize dust generation. Small amounts of fines or dust contained in granular resins may accumulate in material handling systems. If permitted to accumulate, these fines or dust can, under certain conditions, pose an explosion hazard. Every effort should be made to prevent suspension, concentration or accumulation of fines or dusts in, or around, material handling systems. For additional information on control of static and minimizing potential dust and fire hazards, refer to NFPA 654, "Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids, 2006 Edition." Spilled product may create a dangerous slipping hazard.

Storage Procedures

Storage area should be clearly identified, well illuminated, and clear of obstruction. Adequate security must be provided so that unauthorized personnel do not have access to product. Store in grounded, properly designed and approved vessels and away from incompatible materials. Store and use away from heat, sparks, open flame, or any other ignition source. Use non-sparking ventilation systems, approved explosion-proof equipment, and intrinsically safe electrical systems.

DO NOT enter filled bulk containers and attempt to walk over product, due to risk of slipping and possible suffocation. Use a fall arrest system when working near open bulk storage containers.

See Section 8 for recommended Personal Protective Equipment and see Section 10 for information on incompatibilities.

Section 8 - Exposure Controls / Personal Protection

Exposure Guidelines

A: General Product Information

Refer to published exposure limits - utilize effective control measures and PPE to maintain worker exposure to concentrations that are below these limits. Ensure that eyewash stations and safety showers are proximal to the workstation location.

B: Component Exposure Limits

ACGIH, OSHA, NIOSH, EPA, Alberta, and Ontario exposure limit lists have been checked for major components listed with CAS registry numbers. Other exposure limits may apply, check with proper authorities.

Styrene-Butadiene polymer (9003-55-8)

ACGIH:	10 mg/m3 TWA (inhalable particles, recommended); 3 mg/m3 TWA (respirable particles, recommended) (related to Particulates (insoluble or poorly soluble) not otherwise specified (PNOS))
OSHA:	15 mg/m3 TWA (total dust); 5 mg/m3 TWA (respirable fraction) (related to Particulates not otherwise regulated)
Alberta:	10 mg/m3 TWA (total particulate); 3 mg/m3 TWA (respirable particulate) (related to Particulates not otherwise regulated)
Ontario:	10 mg/m3 TWAEV (inhalable); 3 mg/m3 TWAEV (respirable) (related to Particulates (insoluble or poorly soluble) Not Otherwise Classified (PNOC))

ENGINEERING CONTROLS

Maintain worker exposure below recommended exposure limits by providing adequate local exhaust ventilation. Use non-sparking, grounded ventilation systems separate from other exhaust systems. Ensure that eyewash stations and safety showers are proximal to the workstation location.

PERSONAL PROTECTIVE EQUIPMENT

Personal Protective Equipment: Eyes/Face

Wear safety glasses during normal handling. Wear full-face shield during thermal processing if contact with molten material is likely.

Personal Protective Equipment: Skin/Hands/Feet

Use impervious gloves when handling product. Wear safety footwear with good traction to help prevent slipping. Work clothing that sufficiently prevents skin contact should be worn, such as coveralls and/or long sleeves and pants.

Personal Protective Equipment: Respiratory

If engineering controls and ventilation is not sufficient to prevent build up of aerosols, vapors or dusts, appropriate NIOSH/MSHA approved air-purifying respirators or self-contained breathing apparatus (SCBA) appropriate for exposure potential should be used. Air supplied breathing apparatus must be used when oxygen concentrations are low or if airborne concentrations exceed the limits of the air purifying respirators.

Personal Protective Equipment: General

Personal protective equipment (PPE) should not be considered a long-term solution to exposure control. Employer programs to properly select, fit, maintain, and train employees to use equipment must accompany PPE. Consult a competent industrial hygiene resource, the PPE manufacturer's recommendation, and/or applicable regulations to determine hazard potential and ensure adequate protection.

Section 9 - Physical & Chemical Properties

Physical State and Appearance:	Solid, beads or pellets	**Color:**	White
Odor:	Slight odor	**pH:**	Not applicable
Vapor Pressure:	Not applicable	**Vapor Density @ 0ºC (Air=1):**	Not applicable
Melting Point:	105ºC-135ºC (221ºF-275ºF)	**Boiling Point:**	Not applicable
Solubility (H2O):	Insoluble	**Specific Gravity (Water=1):**	1.04 g/cc, 104 kg/m
Dispersion Properties:	Is not dispersed in cold water	**Softening Point:**	79ºC-127ºC (174ºF-261ºF)
Flash Point:	345ºC-360ºC (653ºF-680ºF) (Combustible Flash Ignition Temperature)	**Flammability Classification:**	Not considered flammable according to OSHA.
Flash Point Method:	Not available	**Auto Ignition:**	427ºC (800ºF)
Lower Flammable Limit (LFL):	Not available	**Upper Flammable Limit (UFL):**	Not available

Section 10 - Stability & Reactivity Information

Chemical Stability

This material is stable under normal use conditions for shock, vibration, pressure, and ambient temperature.

Instability

Decomposition temperature: 300ºC (572ºF)

Chemical Stability: Conditions to Avoid

Avoid processing material over 300ºC (572ºF).

Incompatibility

Not resistant to oxidizing agents, dissolves in organic solvents.

Hazardous Polymerization

Will not occur.

Corrosivity

Not expected to be corrosive.

Hazardous Decomposition

Styrene, butadiene, carbon dioxide, carbon monoxide

Section 11 - Toxicological Information

A: Acute Toxicity - General Material Information

Material is considered essentially inert and non-toxic. Exposure to high levels of dusts may be irritating to the eyes. Skin/eye contact with molten or heated material may cause burns. Vapors/heated fumes may be irritating to the respiratory system.

B: Acute Toxicity - LD50/LC50

No LD50/LC50's are available for this product's components.

C: Chronic Toxicity - General Material Information

No additional information available.

D: Chronic Toxicity - Carcinogenic Effects

ACGIH, EPA, IARC, OSHA, and NTP carcinogen lists have been checked for selected similar materials or those components with CAS registry numbers.

Styrene-Butadiene polymer (9003-55-8)

IARC: Supplement 7, 1987; Monograph 19, 1979 (Group 3 (not classifiable))

Section 12 - Ecological Information

Ecotoxicity

The information below is based on knowledge of this product's components and the ecotoxicity of similar products. Sewer/waterway obstruction: If aquatic animals ingest pellets, digestive tract obstruction may occur. Product is not expected to be toxic, but small particles may cause adverse physical effects in aquatic and terrestrial organisms.

Environmental Fate/Mobility

Sinks in water. Pellets are persistent in aquatic and terrestrial systems. Product should be recovered from water and land following spills. This product has not been found to migrate through soils.

Persistence/Degradability

Pellets are persistent in aquatic and terrestrial systems. Do not allow product to enter sewer or waterways. Not expected to biodegrade.

Bioaccumulation/Accumulation

Pellets may accumulate in the digestive systems of birds and aquatic life, causing injury and possible death due to starvation.

Section 13 - Disposal Considerations

U.S./Canadian Waste Number & Descriptions

A: General Product Information

This product, if discarded, is not expected to be hazardous waste according to US or Canadian regulations. Check Local, State, Federal and Provincial Environmental Regulations prior to disposal.

The recommended disposal methods for polymers in order of preference are: 1) clean and reuse if possible; 2) contact resin broker; 3) contact plastic recycler; 4) incinerate with waste heat recovery and/ or 5) landfill. Reuse, recycling, storing, transportation, and disposal must be in accordance with applicable federal, state/ provincial and local regulations. DO NOT ATTEMPT TO DISPOSE OF BY UNCONTROLLED IGNITION.

See Section 7: Handling and Storage and Section 8: Exposure Controls/Personal Protection for additional information that may be applicable for safe handling and the protection of employees.

Waste generator is advised to carefully consider hazardous properties and control measures needed for other materials that may be found in the waste.

B: Component Waste Numbers

No EPA Waste Numbers are applicable for this product's components.

Section 14 - Transportation Information

Transportation Information

This material is not regulated as a hazardous material for transportation.

Section 15 - Regulatory Information

A: International Regulations

The monomers are listed by EINECS for styrene-butadiene copolymer.

Component Analysis - International Inventory Status

Component	CAS #	US - TSCA	CANADA - DSL	EU - EINECS
Styrene-Butadiene polymer	9003-55-8	Yes	Yes	Exempt

B: USA Federal & State Regulations

Ongoing occupational hygiene, medical surveillance programs, or site emission or spill reporting may be required by Federal or State regulations. Check for applicable regulations.

USA OSHA Hazard Communication Class

This product is not considered hazardous under 29 CFR 1910.1200 (Hazard communication).

USA Right-to-Know - Federal

None of this product's components are listed under SARA Section 302 (40 CFR 355 Appendix A), SARA Section 313 (40 CFR 372.65), or CERCLA (40 CFR 302.4).

USA Right-to-Know - State

None of this product's components are listed on the state lists from NJ or PA. Some components (including those present only in trace quantities, and therefore not listed in this document) may be included on the Right To Know lists of other U.S. states. The reader is therefore cautioned to contact his or her INEOS NOVA representative for further U.S. State Right-To-Know information.

C: Canadian Regulations - Federal and Provincial

Canadian Environmental Protection Act (CEPA): The components of this product are on the Domestic Substances List (DSL), or are exempt, and are acceptable for use under the provisions of CEPA.

WHMIS Ingredient Disclosure List (IDL)

No components are listed in the WHMIS Ingredient Disclosure List (IDL).

WHMIS Classification

Workplace Hazardous Materials Information Systems (WHMIS): This product has been classified in accordance with Canadian Controlled Product Regulations (CPR) hazard criteria and this MSDS contains complete CPR-required information. Not controlled under WHMIS (Canada).

Provincial Regulations

Ongoing occupational hygiene, medical surveillance programs, or site emission or spill reporting may be required by Federal or Provincial regulations. Check for applicable regulations.

Section 16 - Other Information

Label Information

PRECAUTIONS: Product is a white, inert, solid bead or pellet with slight odor. This product is not considered flammable according to OSHA, but will burn on prolonged exposure to flame or high temperature. Slipping hazard.

FIRST AID:
SKIN: For skin contact, wash affected area with soap and water. Seek medical attention, if symptoms develop or persist. In case of contact with molten product, cool rapidly with water and seek immediate medical attention. Do not attempt to remove molten product, or molten product that has cooled, from skin without medical assistance.
EYES: Remove contact lenses, if it can be done safely. Immediately flush eyes with water for at least 15 minutes, while holding eyelids open. Seek medical attention if symptoms develop or persist.
INHALATION: Move affected individual to non-contaminated air. Loosen tight clothing such as a collar, tie, belt or waistband to facilitate breathing. Seek immediate medical attention if the individual is not breathing, unconscious or if any other symptoms persist.
INGESTION: Material is not expected to be absorbed from the gastrointestinal tract. DO NOT INDUCE VOMITING. Loosen tight clothing such as a collar, tie, belt or waistband. Seek immediate medical attention.

IN CASE OF A LARGE SPILL: Stop leak and contain spill. Prevent entry into sewers, drains, underground or confined spaces, and waterways. Spilled product may create a dangerous slipping hazard. Use appropriate tools to put the spilled solid in an appropriate recovery or waste disposal container. Reuse or recycle where possible. Meet any applicable regulations.

Shipping Management Plan, Version 2

AGNICO EAGLE

MEADOWBANK DIVISION

WHALE TAIL PIT

Shipping Management Plan

APRIL 2018

VERSION 2

EXECUTIVE SUMMARY

The Shipping Management Plan for the Whale Tail Pit Project (the Project) was developed in accordance with federal legislation, notably the *Canada Shipping Act* and the *Arctic Waters Pollution Prevention Act,* and associated regulations. It also recognizes the international conventions and protocols signed by Canada. Agnico Eagle Mines Limited (Agnico Eagle) will provide the necessary human, material, and financial resources to meet or exceed the legal requirements attributable to the company that arise from shipping-related activities. Shipping contractors will be encouraged to do the same. Agnico Eagle and its shipping contractors will carry third party liability insurance.

All shipping will be carried out during the open water season and will follow recommended shipping routes for the annual sea lift to Baker Lake and other Kivalliq Region communities. There will not be any ice breaking to extend the shipping season.

Dry cargo multipurpose vessels and fuel tankers will arrive at a lightering point near Helicopter island where they will anchor approximately 1 kilometre (km) from the island. Dry cargo will be lightered onto tug-assisted barges and fuel will be lightered onto smaller shuttle tankers for transport through the Baker Lake access passage (Chesterfield narrows, south channel) to the Meadowbank Mine barge unloading facilities and laydown area in Baker Lake.

It is Agnico Eagle's intent to prioritize the road transport of hazardous materials, including explosive-related materials, to the Project site to avoid having such cargo remain in storage in Baker Lake. Other contingency measures associated with shipping-related activities include the Project's Spill Contingency Plan, Emergency Response Plan, and Oil Pollution Emergency Plan (OPEP). Risk and hazard assessments of shore-based marine response activities will be undertaken as part of training the Emergency Response Team.

Navigation through the Labrador Sea, Hudson Strait, and Hudson Bay is not challenging during the open water season. Navigation through Chesterfield Inlet also does not represent a major risk with exception of two locations; at Deer Island and Target Rock where passages are narrow and have strong currents. No major hazards are identified along the shipping and tug-barge routes under normal conditions.

All ship, tug and tanker Masters will use electronic charts and other electronic navigational aids to provide safety in transit, reduce the risk of accidents, remain within recommended shipping routes and follow their internal navigation charts and guides (e.g., Navigation Arctic Guide) based on their experience. In addition, there are some Project-specific measures concerning navigation in Chesterfield Inlet, including careful assessment of the conditions before entering the inlet, travelling during daytime when possible and good visibility, and making bound-up travel with tidal flood when possible.

Passage through locations with shipping and boating traffic will be coordinated to avoid shipping conflicts, and speed will be reduced where possible to ensure safety. To maximize the safety of the persons travelling in boats near Chesterfield Inlet, Agnico Eagle or the shipping contractor will inform the community of the shipping activities, promote actions that will allow the ship and the small boats to see one another, and, through the Community Liaison Committee, will recommend that all those in small boats wear personal floatation devices.

On board waste management (solid and hazardous wastes, sewage) will be the responsibility of shipping contractors. Agnico Eagle will require the shipping contractors to conform to the *Ballast Management Control and Management Regulations*, which should reduce the risk of invasive species being introduced as a result of shipping activities. Agnico Eagle expects to contract vessels that meet applicable environmental requirements in addition to being reliable and having a superior safety record.

Care will be taken to avoid disturbing marine mammals within the shipping lanes as much as possible and a Marine Mammal and Seabird Observer (MMSO) will be assigned to the ship crew. Ship crew will monitor the shipping lane for marine mammals during transits in Hudson Strait up to the lightering point near Helicopter Island. As in the past, monitoring will continue using Inuit Marine Wildlife Monitoring aboard the vessels between Helicopter Island and Baker Lake, in accordance with NIRB Project Certificate Condition 36 (NIRB 2006). Mitigation measures may comprise, if safe to do so, slowing the ship and maintaining a safe distance from marine mammals.

Vessels contracted by Agnico Eagle will be required to have an approved Shipboard Oil Pollution Emergency Plan (SOPEP). If an environmental emergency occurs along the shipping routes, the SOPEP will be activated. If needed, close coordination will be maintained with Agnico Eagle's shore-based supervisors who can activate Agnico Eagle's Emergency Response Plan and OPEP to provide assistance to a vessel. Accidents or malfunctions during transit will be reported to Transport Canada. Spills would also be reported to the Environmental Emergencies 24-Hour Report Line and, if necessary, advice would be requested from the Regional Environmental Emergencies Team. Assistance could be sought from nearby ships and the Canadian Coast Guard.

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited – Meadowbank Division (Agnico Eagle) has gained extensive experience in shipping fuel and dry cargo to the Meadowbank Mine since its construction began in 2008 and commercial production in 2010. The extension of the Meadowbank mine through the Whale Tail Pit Project (the Project) will utilize shipping arrangements already in use for the Meadowbank Mine and will not incur a net increase in shipping volume within Hudson Bay and Hudson Strait, or a change in shipping procedures (Figure 1-1).

This plan was prepared to comply with the Whale Tail Pit NIRB Project Certificate 008 Condition 37 (NIRB 2018).

1.1 Shipping Needs

A total of approximately 60,000 tonnes of dry cargo (equipment and supplies) and 66.8 million litres of diesel fuel will be required annually for the operations of the Project. To meet these needs, a total of three to eight vessels will annually deliver dry goods, and two to three tankers will annually deliver diesel fuel for the Project.

All shipping will be carried out during the open water season (typically from July to late October) and will follow recommended shipping routes[1] that are presently in use for the annual sea lift to Chesterfield Inlet, Baker Lake and other communities.

The priorities in shipping dry cargo and fuel will be:

- the protection of the crew and others in small boats that the ship may come across;
- the protection of the marine environment; and
- the preservation of the ship and its cargo.

All ships, tugs, and tankers will be equipped with electronic navigational aids. Ships will not be serviced in Chesterfield Inlet and will arrive with enough fuel for the return voyage south.

1.2 Shipping Routes

The marine transport of dry cargo will be comprised of five main segments, all within established shipping lanes:

- Bécancour, Québec on the St. Lawrence River, along the coast of Labrador to Hudson Strait;
- through Hudson Strait to Hudson Bay (see Appendix A for marine hydrographic charts showing the shipping lanes);

[1] Agnico Eagle's shipping routes within Nunavut are non-compulsory pilotage areas during the ice free shipping season.

- across Hudson Bay to the mouth of Chesterfield Inlet;
- through Chesterfield Inlet to an anchorage point at Helicopter Island at the head of Chesterfield Inlet; and
- through Chesterfield Narrows to the hamlet of Baker Lake (located on northwest shore of Baker Lake).

Dry cargo will be loaded on multipurpose (MPP) vessels, class: GL + 100 A5 E3 (LOA 138.98 m, draft 8 m, freight capacity ~ 19,000 m^3) in eastern ports, almost exclusively Bécancour, and delivered directly to the lightering point near Helicopter Island by Nunavut Sealink and Supply Inc. (NSSI). Currently, the contracted vessels supply cargo to both Agnico Eagle operations and the nearby communities. The first vessels of the year will normally arrive in July or early August. As these ships are too large to navigate Chesterfield Narrows (navigational passage between Chesterfield Inlet and Baker Lake), they will anchor near Helicopter Island (Figure 1-1) at the head of Chesterfield Inlet, where the dry cargo will be lightered onto barges for transport to Baker Lake. Up to eight MPP vessels will arrive throughout the open water shipping season delivering dry cargo. All ships will be equipped with complete electronic navigation aids for navigation in restricted waters.

Fuel (diesel (USLD) and Jet A) will be loaded on marine fuel tankers (LOA 130 m, draft 8 m, freight capacity ~ 10 million litres) and delivered to the lightering point near Helicopter Island by Petro-Nav inc. a subsidiary of Groupe Desgagnes. Once the fuel tankers are securely anchored, fuel is transferred to smaller shuttle tankers (LOA ~110 m, draft 4.6 m, fuel capacity ~2,900 m^3 diesel). The shuttle tankers then transport the fuel shipment through Chesterfield Narrows to the Meadowbank Mine fuel storage area in Baker Lake. Shuttle tankers will do approximately 13 trips in July or August (delivering 50 million litres total) and 5 trips in October (delivering 16.8 million litres total). On average, up to four million litres of fuel is delivered per tanker shipment.

1.3 Lightering Procedures

1.3.1 Dry Cargo

After dry cargo vessels have anchored at Helicopter Island, dry cargo will be lightered onto barges in preparation for transportation to the Meadowbank barge unloading facilities in Baker Lake. During lightering onto the barges, attention will be directed to ensuring the barges are secured alongside or anchored, with due consideration being given to the prevailing and expected wind, weather, and tide conditions.

The tug-assisted barge used to ferry dry cargo to Baker Lake will be highly manoeuvrable and capable of transiting the access passage with its changing current patterns. Navigation will proceed at a slow speed in periods of low visibility. Traffic through the access passage will be coordinated through communication between the tugs to avoid shipping conflicts and to ensure safety.

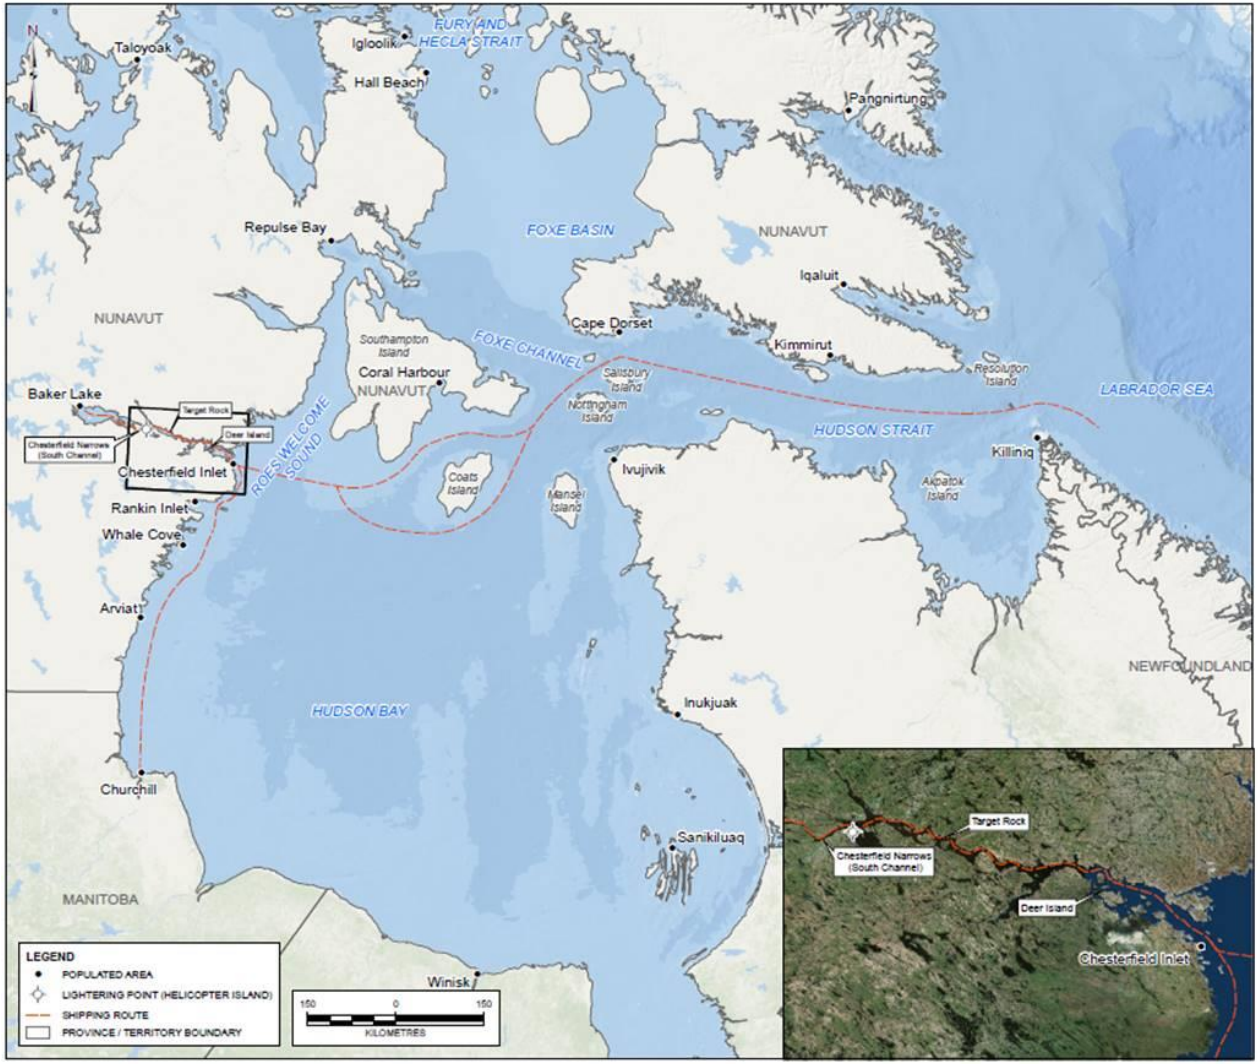

Figure 1-1 Shipping Route

The Master of each vessel (including tugs, barges, large and small tankers, and cargo ships) will be responsible for safe navigation of their vessels between the port of departure and point of destination (Helicopter Island and Baker Lake). For tugs, this also includes responsibility for navigational safety of the barge they are towing or pushing. When a barge is laid alongside a dry cargo vessel for lightering containers or equipment, a loading supervisor on the ship will take charge of the barge.

Outgoing containers, cargo and materials will be loaded on barges in Baker Lake, and then transported to Helicopter Island where it will be loaded onto the cargo ship for the return trip to southern ports. Outgoing cargo could include construction equipment being demobilized following the completion of construction and/or hazardous or other waste being sent to a certified waste management facility for treatment, recycling and/or disposal in another provincial or territorial jurisdiction.

1.3.2 Diesel Fuel

It is expected that the large tankers delivering diesel fuel will anchor in the same general location as the dry cargo vessels (i.e., near Helicopter Island; Figure 1-1). Transfer of fuel will occur from the tanker to a smaller shuttle tanker that can navigate the passage between Helicopter Island and Baker Lake. The shuttle tanker will be offloaded at the Meadowbank Mine barge unloading facilities and the fuel will be transported to the Meadowbank Mine tank farm. Contingency measures related to the transfer of fuel are described in the Oil Pollution Emergency Plan (OPEP).

1.3.3 Explosives and Hazardous Materials

A minimum amount of explosives will be stored at the Whale Tail Pit site. The existing emulsion plant at the Meadowbank Mine will be maintained with deliveries on an as need basis during operations. The Project will primarily use emulsion based explosives during construction and operations to minimize the use of ammonium nitrate/fuel oil (ANFO).

It is Agnico Eagle's intent to prioritize the road transport of hazardous materials, including explosive-related materials, to the Project site to avoid having such cargo remain in storage at Baker Lake. Sensitive products such as explosives, boosters and caps will be transported directly to the Project site. However, in the eventuality of a delay in their transit to the mine site, these products will be temporarily stored at the Meadowbank Mine laydown area in Baker Lake according to applicable regulations which include locked storage under constant surveillance. All handling, transport, storage, manufacture and use of explosives will be subject to federal approval under the *Explosives Act*, and the *Nunavut Mine Health and Safety Act*.

Sodium cyanide is used to optimize gold recovery from the ore. This product will continue to be used at the Project. Due to transportation restrictions, normally a full year's supply of sodium cyanide will be transported and stored on site. The product will be transported, stored, handled, transferred and used in compliance with appropriate legislation and applicable Best Management Practices. Agnico Eagle is a signatory to the International Cyanide Management Code.

Hazardous waste and contaminated soil will be managed on a yearly basis; consequently there will be little to no accumulation of such wastes at the Project site during operations, subject to seasonal shipping considerations. Hazardous waste will not be incinerated but returned south via a dry-cargo vessel for treatment, recycling and/or disposal in a certified waste management facility. Agnico Eagle will contract shipping companies that are certified under the IMDG code (International Maritime Dangerous Goods).

SECTION 2 • RELATED DOCUMENTS

The Shipping Management Plan (the Plan) covers the scope of shipping activities for the Project.

Management and monitoring plans for the Project that provided input to the Shipping Management Plan include the following:

- Spill Contingency Plan;
- Emergency Response Plan;
- Oil Pollution Emergency Plan; and
- Shipboard Oil Pollution Emergency Plan (shipping companies).

2.1 Spill Contingency Plan

The cornerstone of spill contingency planning for Agnico Eagle is the Spill Contingency Plan covering all spills on land, water, and ice. The Spill Contingency Plan, coupled with the Emergency Response Plan, describes the processes to be followed when responding to a spill to the environment.

2.2 Emergency Response Plan

The Emergency Response Plan (ERP) focuses on responding to all emergencies in a timely and adequate manner. It commits Agnico Eagle to being prepared for and providing adequate resources - qualified personnel and equipment - to handle a wide variety of emergency situations.

Risk and hazard assessments of shore-based marine response activities will be undertaken as part of training for the Agnico Eagle Emergency Response Team (ERT).

2.3 Oil Pollution Emergency Plan

The Oil Pollution Emergency Plan complements the Spill Contingency Plan and should not be construed as superseding it. The OPEP only provides contingency planning for storage of hydrocarbon products at the Meadowbank Mine laydown area in Baker Lake.

The OPEP complies with the requirements for procedures, equipment and resources as set out in the *Canada Shipping Act* (s.s. 660.2(4)) specific to the fuel handling facility, the bulk incoming transfer of fuel from ship-to-shore and spill scenarios directly relating to this operation. Further, the OPEP provides direction to Agnico Eagle personnel and/or contractors, and to Agnico Eagle's ERT in emergency spill response situations. It also contributes in developing oil pollution scenarios, defining the roles and responsibilities of management and responders, and outlining the measures taken to prevent spills. The OPEP seeks to minimize potential health and safety hazards, environmental damage, and cleanup costs.

Spills resulting from ship-to-ship fuel transfer will be the responsibility of the shipping companies contracted by Agnico Eagle and the vessel's Master. Agnico Eagle will provide assistance wherever possible in the event of a spill in these instances.

2.4 Shipboard Oil Pollution Emergency Plan

The Shipboard Oil Pollution Emergency Plan (SOPEP) will contain all information and operational instructions as required by the International Marine Organization's "*Guidelines for the Development of the Shipboard Marine Pollution Emergency Plan*". Vessels contracted by Agnico Eagle will be required to have an approved SOPEP. The preparation of the SOPEP is the responsibility of the shipping company and is maintained by the vessel's Master. However, close coordination will be maintained with Agnico Eagle's shore-based supervisors who can activate the ERP and OPEP in providing assistance to a vessel in the near-shore area. These two plans will have close links to the SOPEP and, as required, will include training exercises at regular intervals to ensure ship and shore can cooperate in responding to any spill of fuel or any other hazardous product. Shipboard Oil Pollution Emergency Plans will be required to include how vessel contractor(s) will maintain spill equipment, and the frequency and framework for training vessel personnel in vessel-based spill response. This may include, but not be limited to:

- spill equipment audits;
- maintaining posted list of spill equipment;
- requirements for spill response drills; and
- on-going training refreshers (e.g., annual renewals).

Accidents or malfunctions during transit will be reported to Transport Canada. If the accident involves the loss of fuel or chemicals, the SOPEP would be activated and on-board spill response materials and equipment put to use. Spills would also be reported to the Government of Nunavut Spill Line and to the Environmental Emergencies 24-Hour Report Line and, if necessary, advice would be requested from the Regional Environmental Emergencies Team. Assistance could be sought from nearby ships and the Canadian Coast Guard (CCG). Spill response resources such as those maintained by the CCG at select locations along the Kivalliq Region coast could be dispatched to the spill site.

Outside help could be requested for major accidents such as accidental grounding/stranding of a vessel. Under these circumstances, the safety of the crew and maintaining the integrity of the vessel would be the first priority.

SECTION 3 • APPLICABLE FEDERAL ACTS, REGULATIONS AND GUIDELINES

The Shipping Management Plan was prepared in accordance with federal legislation outlined in Table 3-1. Numerous regulations exist under the *Canada Shipping Act* and these can be found at www.tc.gc.ca. The regulations included here are most relevant to the environment and the Plan.

Table 3-2 lists international conventions and protocols signed by Canada. Canada is a signatory to International Maritime Organization (IMO) International Convention for the Prevention of Pollution from Ships (MARPOL) and International Convention for the Safety of Life at Sea (SOLAS). As such, Canadian marine laws, regulations and guidelines rules are a reflection of these international conventions, protocols and agreements.

At this time, Agnico Eagle has contracted NSSI and Petro-Nav to be used in Project shipping to Baker Lake. However, the shipping companies could change over the construction, operations and closure phases of the Project. It is required that the shipping contractors to be used by Agnico Eagle abide by Canadian laws and regulations, applicable MARPOL 73/70 annexes, and international conventions. This is also a requirement of NIRB Project Certificate 008 Condition 43. Inspections carried by federal inspectors will ensure that all applicable statutes are followed. This could include the review of required plans (SOPEP), an audit of the emergency response equipment carried by the vessel, and the means to prevent the discharge of any oil, oily water or other hazardous waste in Arctic waters.

All vessels transiting through and operating in Canadian Arctic waters are required to comply with the *Arctic Waters Pollution Prevention Act* (AWPPA), the *Canada Shipping Act* 2001 (CSA 2001), the *Marine Liability Act* (MLA) and their associated regulations, including requirements for vessel construction and operations (see Table 3-1). While the provisions of the CSA 2001 apply in all Canadian waters, vessels in Arctic waters north of 60°N and out to the 200 nautical mile limit of Canada's Exclusive Economic Zone are also subject to the provisions of the AWPPA. The AWPPA prohibits discharges of oil, chemicals, garbage and other wastes generated onboard vessels. It does allow for the discharge of untreated sewage[2]. The MLA sets out a regime that requires vessels operating in Canadian jurisdiction, including Arctic waters, to carry insurance to pay for damages from oil spills.

Two vessel control systems are established under the *Arctic Shipping Pollution Prevention Regulations* – the Zone/Date System and the Arctic Ice Regime Shipping System, which provide for operational safety by taking into account the vessel's capability to operate safely by virtue of ice strengthening, and the ice conditions it will encounter[3].

[2] Ships are to only discharge gray water and treated sewage when the ship is at least 50 km from Chesterfield Inlet.

[3] Agnico Eagle will only ship dry goods and fuel during the open water season.

Vessels servicing the Project will be required to comply with the AWPPA and regulations while in a Shipping Safety Control Zone.

The various shipping companies contracted by Agnico Eagle must have an approved SOPEP, and verify that equipment and operating procedures are consistent with Canadian Marine laws, regulations and guidelines, and with IMO agreements to which Canada is a signatory. It is the responsibility of the Master of the ship to ensure safe passage through Canadian waters and to maintain up-to-date charts and publications[4].

Agnico Eagle will provide the necessary human, material, and financial resources to meet or exceed the legal requirements attributable to the company that arise from shipping. Shipping contractors will be encouraged to do the same.

SECTION 4 • MARINE WILDLIFE

> Marine mammals have been the basis of the Inuit economy for over 4,000 years. They provide meat, fat, oil, leather, tools and materials for fabrication of arts and crafts. The top layers of the skin yield "muktuk", which is still highly prized as a food rich in vitamin C and high in energy content. *(Fisheries and Oceans Canada http://www.dfo-mpo.gc.ca/Science/publications/uww-msm/articles/beluga-eng.htm)*

The reaction of marine wildlife to vessel traffic is predicted to not be significant and, providing mitigation measures are employed, marine vessel traffic associated with the Project should not lead to any residual effects to marine wildlife (see Volume 3, Appendix 3-A). Agnico Eagle will include in its contracts that ships must remain mindful of marine areas having a high density of marine mammals and birds. Agnico Eagle request ships provide their ship track data for inclusion in annual reporting.

4.1 Interactions and Potential Effects

Vessel discharges (sewage, solid wastes, ballast water), the sight of the vessels and their movement, vessel noise, as well as accidental spills and releases have the potential to interact with and disturb marine wildlife and affect life cycle activities. Possible interactions between shipping and marine wildlife can have the following potential effects:

- marine mammals may retreat to the water should a vessel pass too close to an island or reef where they have pulled themselves out of the water;
- the foraging of marine birds and mammals may be interrupted when vessels approach and pass them in the shipping lanes;
- the improper treatment and release of ballast water, grey water and bilge water could alter the water quality and contaminate the food supply;
- mammal mortalities may result from collisions with the ship; and
- fuel and/or oil spills could result in mortalities and, for marine birds, could lead to the loss of foraging and brood rearing habitat.

4.2 Mitigation Measures

As part of shipping companies' standard operating procedures, ship crews will monitor for marine mammals from Hudson Strait to the lightering point near Helicopter Island. Since 2010, the Meadowbank division has implemented a vessel-based Marine Mammal and Seabird Observer (MMSO) program which will continue to be implemented during all routine project shipping activities along the shipping route (Volume 3, Appendix 3-A), in accordance with Meadowbank Mine NIRB Project Certificate Condition 36 (NIRB 2006). The ship's Master will be notified if there is a concern of the ship striking a marine mammal. Ship personnel will make a decision if actions are required to avoid

a possible collision. This may include, if safe to do so, slowing the ship until the animal has travelled clear of the ship's course. Subject to vessel and human safety considerations, ship personnel shall take every precaution to avoid disturbance, harassment, injury or mortality of marine wildlife by implementation of the following mitigation measures:

- adherence to monitoring requirements as outlined in the vessel-based MMSO program (Appendix B);
- ships will, when possible, maintain a straight course and constant speed, and avoid erratic behaviour;
- use a routing south of Coats Island as the primary shipping route (Figure 1-1)[5];
- marine mammals will be given right of way as safe navigation allows; under no circumstances, other than in the case of an emergency, will ships approach within 300 m of a walrus or polar bear observed on sea ice[6];
- ships will maintain a setback distance of at least 500 metres from colonies and aggregations of seabirds and marine mammals during Project shipping transiting through Hudson Strait, Hudson Bay, and Chesterfield Inlet[7];
- if marine mammals approach within 500 m of a ship, the vessel will reduce its speed and, if possible, cautiously move away from the animal;
- if it is not possible for the ship to move away from or detour around a stationary marine mammal or group of marine mammals, the ship will reduce its speed and wait until the animal(s) move to the side and remain at least 500 m from the ship prior to resuming speed;
- when marine mammals appear to be trapped or disturbed by ship movements, the ship will implement appropriate measures to mitigate disturbance, including stoppage of movement until the marine mammal has moved away from the immediate area;
- the ship will not be operated in such a way as to separate an individual member(s) of a group of marine mammals from other members of the group;
- when weather conditions require, such as when visibility decreases, the ship will adjust its speed accordingly to avoid the likelihood of the ship striking an animal;
- barge-tug or shipping vessels would only travel through the near shore islands and reefs when there is good visibility or adjust their speed according to the conditions;
- monitoring and reporting procedures for ship-bird collisions will be implemented, and any incidents of bird mortalities associated with ship operations will be recorded and reported to Environment and Climate Change Canada (Canadian Wildlife Services);
- ballast water will only be released in designated areas and if there is no marine wildlife in the area; and

5 In accordance with Condition 38 of NIRB Project Certificate 008

6 As all shipping will occur during the open water season, collision with young seals in liars will not happen.

7 In accordance with Condition 39 of NIRB Project Certificate 008

- bilge water, grey water and sewage will be properly treated and only released in areas where no marine wildlife is present.

Marine wildlife could be negatively affected by coming in contact with any petroleum product spilled from ships in transit. In the event of a spill, the ship personnel will discourage marine wildlife from coming in contact with the spilled material. The product most likely to be spilled from Project related shipping would be diesel fuel, which floats on the water surface and has a high rate of evaporation. However, these occurrences are expected to be rare and the activation of the SOPEP would significantly reduce their impact. Preventive and contingency measures already in place substantially reduce the risk to marine wildlife from spills.

Adaptive management will allow mitigation measures to be modified in response to new information arising from monitoring carried out by the vessel crews and from traditional knowledge.

4.3 Monitoring and Reporting

As in the past, monitoring will continue using Inuit Marine Wildlife Monitoring aboard the vessels between Helicopter Island and Baker Lake, in accordance with Meadowbank Mine NIRB Project Certificate 004 Condition 36 and Whale Tail Pit NIRB Project Certificate 008 Condition 42. In addition, as per Condition 40 of Project Certificate 008, a vessel-based MMSO program will be implemented during all Project routine shipping activities in the shipping route. This program, described in further details in Appendix B, will be executed by assigned observers stationed on-board Project vessel(s). Agnico Eagle will continue to report the observations annually to the Nunavut Impact Review Board (NIRB).

SECTION 5 • NAVIGATIONAL SAFETY

The most likely areas where interactions may occur between small boats and barges-tugs and/or ships or vessels are:

1. Chesterfield Inlet;
2. the passage between Chesterfield Inlet and Baker Lake; and
3. where the ship is transiting through the near shore islands and reefs offshore of Chesterfield Inlet.

Mitigation measures to safeguard the safety of those in small boats will include the following:

- Agnico Eagle and/or the shipping operator will consult with the community members mooring or beaching their boats in Chesterfield Inlet regarding scheduled ship transits throughout the Regional Study Area, including Hudson Bay and Chesterfield Inlet[8]; protocols will be developed to minimize the interaction between barge-tug or ship and small boats;
- vessels would only travel through the near shore islands and reefs when there is good visibility or adjust their speed according to the conditions, which would allow the ship and the small boats to be in visual contact;
- vessels will restrict themselves to the recommended shipping routes thereby not surprising any small boat travelling outside the shipping lanes; and
- vessels will sound its horn if a small boat seems unaware of its presence and hasn't responded to communication attemps.

[8] In accordance with Condition 41 of NIRB Project Certificate 008

SECTION 6 • ON BOARD WASTE MANAGEMENT

The six annexes of MARPOL promote the elimination of deliberate, negligent or accidental discharge of ship-source pollutants into the marine environment (see also Transport Canada 2009). The list of harmful ship-source discharges includes: oil, noxious liquid substances and dangerous chemicals, sewage, garbage and air pollution. Canadian laws and regulations mirror the MARPOL annexes and conventions.

Agnico Eagle will contract vessels that meet applicable environmental requirements in addition to being reliable and having a superior safety record.

6.1 Sewage

Vessels are to have an approved sewage treatment plant meeting Canadian standards[9]. Holding tanks with the capacity for all grey and treated sewage while in port are expected to be part of the ship's infrastructure. Agnico Eagle will advise ships that disposal of waste water into the environment is to be avoided within 50 km of Chesterfield Inlet.

Sewage sludge from the sewage treatment plant can be incinerated in the on-board incinerator.

6.2 Solid Waste

If deemed necessary by the carrier, solid waste materials are to be incinerated on board, disposed of in an approved landfill or shipped south for safe disposal to a certified waste management facility. No solid waste materials will be disposed of in the marine environment.

The design and operation of shipboard incinerators in Canada are specified under the International Marine Organization, Marine Environmental Pollution Committee 76 (40), Annex V. Standard specifications for shipboard incinerators allow for the incineration of solid wastes approximating in composition to household waste and liquid wastes arising from the operation of the ship, e.g., domestic waste, cargo-associated waste, maintenance waste, operational waste, cargo residues, and fishing gear. Operating temperatures are similar to those for the incinerator at the Project, and flue gases are cooled rapidly to limit the *in vivo* formation of dioxins.

Tugs will remain in Baker Lake for the duration of the shipping season. Their waste will be incinerated with the ash stored in containers, which will be shipped south at the end of the shipping season for treatment, recycling and/or disposal in a certified waste management facility.

Hazardous waste will not be incinerated but returned south for treatment, recycling and/or disposal in a certified waste management facility.

[9] If all sewage is to be incinerated, there will not be any need for sewage treatment.

SECTION 7 • BALLAST WATER MANAGEMENT

Ballast water is essential to control trim, list, draught, stability, and/or stresses on a vessel. Ballast water control and management regulations protect waters under Canadian jurisdiction from non-indigenous aquatic organisms and pathogens that can be harmful to ecosystems. The *Ballast Management Control and Management Regulations* are intended to minimize the probability of introduction of harmful aquatic organisms and pathogens from vessels' ballast water while also protecting the safety of vessels (Transport Canada 2007).

While an exemption exists in the regulations for vessels operating exclusively in waters under Canadian jurisdiction or certain adjacent waters, any Canadian vessel that has operated outside these waters may carry harmful aquatic organisms or pathogens in their residual ballast and, as such, is not eligible to exemption.

Agnico Eagle expects to use vessels largely active in the coastal trade that operate almost exclusively in waters under Canadian jurisdiction. However, these vessels do on occasion venture into waters outside Canadian jurisdiction and, as such, will require a Ballast Water Management Plan (BWMP). The regulations require the preparation and carriage of a BWMP for each vessel, and for copies to be submitted to Transport Canada. The BWMP will be specific to the vessel and will be a requirement of the carrier.

If Agnico Eagle were to contract vessels originating from waters outside the jurisdiction of Canada, a BWMP would be required. All BWMP (reviewed by the National Administration) carried on ships of foreign origin would be based on the following international guidelines and guiding principles:

- IMO Resolution A.868(20): *Guidelines for the Control and Management of Ships Ballast Water to Minimize the Transfer of Harmful Aquatic Organisms and Pathogens*, in particular Section 7.1;
- The *Model Ballast Water Management Plan* developed by the International Chamber of Shipping and the International Association of Independent Tanker Owners;
- Regulation B-1 of the IMO's *Regulations for the Control and Management of Ships' Ballast Water and Sediments*; and
- Part B of the Annex to Resolution MEPC.127 (53): *Guidelines for Ballast Water Management and Development of Ballast Water Management Plans*.

Agnico Eagle will require contracted vessels not eligible for exemption to provide Agnico Eagle with a copy of their BWMP.

7.1 Ballast Water Exchange

It is recognised by the IMO that the exchange of ballast water in deep ocean areas or open seas offers a means of limiting the probability of harmful aquatic organisms and pathogens being transferred to the marine environment via vessel ballast water. If it is necessary to take on and discharge ballast water in the same port to facilitate safe cargo operations, care will be taken to avoid unnecessary discharge of ballast water that has been taken up in another port as this could introduce harmful aquatic organisms. In particular, sediment found in the vessel's ballast tanks should be disposed of at sea in areas outside 200 nautical miles (370 km) from land and in water depths exceeding 2,000 m.

Vessels take on ballast water in segregated chambers for the main purpose of stabilizing the vessels by adding the weight of the water and maintaining a specified draught. Vessels laden with dry cargo or fuel will take on less ballast water than empty vessels. As all ships on the inward voyage to Chesterfield Inlet will be laden, they will have a minimum of ballast water. However, on the outward journey, these vessels will take on ballast water.

In the event that a ship is contracted from waters outside jurisdiction of Canada, ballast exchange is to occur at least 200 nautical miles from shore where the water is at least 2,000 m deep. If the foreign vessel undertakes this ballast exchange outside Canadian waters, it can undertake further ballast water exchanges within Canadian waters. If safety or other reasons dictates that the ballast exchange cannot occur outside waters under Canadian jurisdiction, an alternate designated area is available in Hudson Strait, east of 70°west longitude, where the water is over 300 m deep.

In the case of non-transoceanic navigation, and where ballast water is taken on-board outside waters of Canadian jurisdiction, the water is to be exchanged before entering Canadian waters at a location at least 50 nautical miles offshore, in water at least 500 m deep. If this is not possible due to safety or other reasons, the ballast water exchange can occur in the alternate designated area in Hudson Strait, east of 70°west longitude, where the water is over 300 m deep.

All coastal trade vessels will in all likelihood not venture more than 200 nautical miles from shore and will not exchange ballast water outside waters of Canadian jurisdiction. All the same, ballast water exchanges for all vessels operating in waters under Canadian jurisdiction are expected to meet the provisions of the Regulations, and to follow Part A of the IMO *Guidelines for Ballast Water Management and Development of Ballast Water Management Plans*, and the IMO *Guidelines for Ballast Water Exchange*.

SECTION 8 • SAFETY

Safety is a top priority for Agnico Eagle. It begins with all personnel (Agnico Eagle, contracted employees and contractors) wearing the appropriate personal protection equipment suitable for the task at hand and for the weather conditions at the time. Secondly, personnel must understand the hazards associated with the task, the safe procedures in carrying it out, and how not to place oneself in harm's way. Accident prevention will be supported by a proactive program to identify and correct potential hazards before an accident occurs.

Agnico Eagle or contracted supervisors will ensure that the interactions between ship and shore are carried out with the safety and the health of the employees first in mind.

SECTION 9 • HAZARD IDENTIFICATION ANALYSIS OF MARINE ROUTES

Hazard: Anything that has the potential to cause harm.

Likelihood: The probability/chance of harm occurring as a result of exposure to a hazard.

Severity: The level of harm that may occur as a result of exposure to or contact with a hazard.

Risk: The likelihood of harm occurring combined with the potential severity to produce a level of risk or risk rating.

Navigation through the Labrador Sea, Hudson Strait and Hudson Bay is not challenging during the open water season. Navigation through Chesterfield Inlet also does not represent a major risk with the exception of two locations; at Deer Island and Target Rock where passages are narrow and have strong current. No major hazards were identified along the shipping and tug-barge routes under normal conditions. Electronic charts combined with electronic navigation aids for the recommended shipping routes ensure the vessel remains on course where bathymetry and physical hazards are known.

Subject to ship and human safety considerations, the average speed of the vessels in open waters is expected to be less than 14 knots (26 km/h). Shipping can be carried out without pilotage as the shipping lanes entail minor hazards that do not significantly reduce ship safety. Any actions required by the crews of the ships and tugs are expected to be well within their capabilities.

At the anchor point, cargo will be lightered from the ships onto barges and be delivered to Meadowbank Mine barge unloading facilities in Baker Lake via the access passage (Chesterfield Narrows). The tugs-barges will be highly manoeuvrable and capable of transiting the access passage with its changing currents and will not require pilotage. Navigation will proceed with extra caution in periods of low visibility. Traffic through the access passage will be coordinated to avoid shipping conflicts and to ensure safety.

However, the following out of the ordinary events have been identified that could increase the level of hazard and necessitate associated mitigation measures:

- mechanical failure occurring on the ship or tug thereby placing it in jeopardy in the shipping lane;
- vessel running aground due to a navigational error or mechanical failure;
- loss or damage to sea cans in heavy seas;
- barge tow line breaking in heavy seas;

- collision of a vessel carrying dry cargo and fuel to Baker Lake through the access passage;
- vessel sinking upon hitting ice; and
- vessel colliding with a small boat.

The access passage between Chesterfield Inlet and Baker Lake deserves special attention as it contains a series of narrow passages and, although two-way traffic is theoretically possible, it raises the risk of collisions and groundings.

SECTION 10 • RISK ANALYSIS OF MARINE ROUTES

All ships, tugs, and tankers use electronic charts and other electronic navigational aids to provide safety in transit, reduce the risk of accidents, and remain within recommended sea routes. Also, shipping companies likely to be employed by Agnico Eagle commonly sail in Hudson Bay and to Chesterfield Inlet, are aware of its marine hazards, and have their own navigation manuals and guides (e.g., Navigation Arctic Guide).

Risk is defined as the likelihood of harm posed by a hazard combined with its potential severity. The potential severity of shipping hazards[10] cannot be changed in most circumstances; what can be reduced is their likelihood. This is possible through the application of mitigation measures. The objective is, through the use of mitigation measures, to reduce the risk as low as practically possible. Residual risk is what remains after mitigation measures have been applied; those having the highest potential residual risk would be aggressively managed. The following mitigation/safety measures will be implemented:

- where available, electronic navigation aids will be used in all instances;
- subject to ship and human safety considerations ship speeds in open water are to remain less than 14 knots in the absence of marine mammals;
- shipping will only carried out during the ice free season; should ice be encountered, the vessel will either sail around it at a reduced speed or proceed slowly through the ice;
- vessels will remain within recommended shipping routes;
- vessels will be double hulled;
- weather warnings will be consulted when updates are provided;
- traffic through the access passage will be coordinated to avoid conflicts and ensure safety;
- communication between tugs will coordinate movement through the access passage;
- Agnico Eagle will provide emergency response equipment and materials as outlined in the OPEP if necessary; tug or ship will also provide their own emergency response equipment;
- crews will follow standard operating procedures and adherence to these will be monitored;
- tug-barge or ship crews are to be trained for responses to hazards that can normally be expected in northern waters;
- before entering Chesterfield Inlet the Master of the ship is to make a careful assessment of the conditions (wind, waves, tides, currents, visibility, ship characteristics, crew experience and etc.);
- after the assessment, the ship is to proceed in the safest way according to the assessment and surrounding conditions;
- the ship's speed will be adjusted according to the current;
- the tug-barges will always proceed in good visibility conditions; and

[10] One hazard that can be reduced is shipping when ice is present. Agnico Eagle has opted to only ship during the ice-free season thereby greatly reducing this hazard.

- the vessel Master will make up-bound travel with tidal flood (starting at low water at the entrance to Chesterfield Inlet) whenever possible. This allows to take advantage of tidal current and weaker freshwater discharge current at narrow passages at Deer Island and Target Rock.

SECTION 11 • SOCIO-ECONOMIC IMPACT OF SHIPPING

Agnico Eagle does not believe that Project related shipping activities will result in an increased demand on local public service providers (i.e., fire, police, ambulance, medical, and maintenance) in Chesterfield Inlet. In most circumstances, any emergency response will be undertaken by Agnico Eagle personnel and/or the ship's crew. Agnico Eagle personnel and the Master of the ship will be responsible for security matters related to the shipping-related activities.

Shipping may impact socio-economic activities in Chesterfield Inlet and Baker Lake. The following mitigation measures will be employed to minimize negative socio-economic effects:

- communication between tugs will coordinate movement through the access passage to avoid conflicts and ensure safety;
- Agnico Eagle has a separate laydown and storage area from the community in Baker Lake; and
- Agnico Eagle and the shipping contractor will work alongside to ensure security procedures are followed. This includes restricting the transport of prohibitive substances.

Positive socio-economic effects will continue as a result of the extension of the Meadowbank Mine and the associated number of dry cargo and fuel tankers coming to the communities. The crews of these ships could come ashore when the boat is anchored and contribute to the local economy through the:

- use of restaurants, hotels and stores in the community;
- purchase of local Inuit art; and
- guided tours to the barrens for fishing and wildlife experiences.

SECTION 12 • PUBLIC AND MEDIA COMMUNICATIONS

When an environmental emergency occurs, the public will be provided with timely and accurate information as to the nature of the incident, the steps being taken to correct the problem, and, if necessary, what citizens should do to protect themselves. This information is intended to protect the overall community wellbeing, including human health; to provide timely information amongst the public,; to ensure cooperation from all interested parties; and to reduce the spread of concern or alarm through the dissemination of inaccurate information.

Each agency involved in a major spill event may provide its own media communications, and may designate spokespersons for such; however, from the Arctic REET's (Regional Environmental Emergencies Team) perspective, a coordinated response is preferable. To that end, the government lead Agency is expected to act as the official spokesperson for the response, with support provided by personnel within the Arctic REET, as required.

In the unlikely event of an environmental emergency relating to Project shipping, Transport Canada guidelines will be followed to ensure proper authorities are informed without delay so that appropriate action may be taken when:

- any incident occurs involving the loss, or likely loss, of dangerous goods into the marine environment; or
- any incident occurs giving rise to pollution or threat of pollution to the marine environment; or
- any oil pollution incident occurs involving the loading or unloading of fuel to or from tanker-to-tanker and from tanker to the Oil Handling Facility.

DEPTHS are in metres and are reduced to Chart Datum (Lowest Normal Tide), which at Chesterfield Inlet is 2.5 metres below Mean Water Level (MWL).

ELEVATIONS and spot elevations are in metres above Higher High Water, Large Tide. Underlined figures on drying areas or in brackets against drying features are in metres above Chart Datum.

HORIZONTAL DATUM: North American Datum 1983 (NAD 83), which is equivalent to WGS 84.

SOURCES: Surveyed by the Canadian Hydrographic Service, 1952-1997.

For Symbols and Abbreviations, see Chart No. 1.

LES PROFONDEURS sont en mètres et sont réduites au zéro des cartes (la marée normale la plus basse), lequel à Chesterfield Inlet est de 2.5 mètres au-dessous du niveau moyen de l'eau (NME).

LES ALTITUDES et les points cotés sont en mètres au-dessus de la pleine mer supérieure, grande marée. Les chiffres soulignés sur les zones asséchantes ou entre parenthèses contre les entités découvrantes sont en mètres au-dessus du zéro des cartes.

SYSTÈME GÉODÉSIQUE : Système de référence géodésique de l'Amérique du Nord 1983 (NAD 83), qui correspond au WGS 84.

SOURCES : Levé par le Service hydrographique du Canada, 1952-1997.

Pour les signes conventionnels et les abréviations, consulter la carte nº 1.

SOURCE CLASSIFICATION DIAGRAM
DIAGRAMME DE CLASSIFICATION DES SOURCES

Date of Survey / Date du levé	Sources	Line Spacing / Espacement des lignes
* a- 1949-50	CHS/SHC	150 m
* b- 1949	CHS/SHC	200 m
c- 1974	CHS/SHC	100 m
d- 1974	CHS/SHC	200 m
e- 1978	CHS/SHC	100 m
f- 1978	CHS/SHC	250 m

*The shoals have not been examined in this area.
*Les hauts-fonds n'ont pas été examinés dans ces zones.

CAUTION
Depths shown in areas a and b of the SOURCE CLASSIFICATION DIAGRAM are not reduced to the presently adopted chart datum. Extreme caution should be exercised when navigating in these waters.

ATTENTION
Les profondeurs indiquées dans les zones a et b du DIAGRAMME DE CLASSIFICATION DES SOURCES ne sont pas réduites au zéro des cartes présentement adopté. Soyez très prudents en naviguant dans ces eaux.

CANADA

NORTHWEST TERRITORIES/TERRITOIRES DU NORD-OUEST

CHESTERFIELD INLET

SCHOONER HARBOUR TO/À BAKER LAKE

Scale 1:40 000 (63°30'N) Échelle

Projection : Mercator

DEPTHS are in metres and from Schooner Harbour to Baker Lake are reduced to Lowest Normal Tide which at Norton Island is 1.4 metres below Mean Water Level. In Baker Lake depths are reduced to a Low Water Datum which at the hamlet of Baker Lake is 5.3 metres below Topographical Bench Mark No. 45.

ELEVATIONS and spot elevations are in metres above Higher High Water, Large Tide. Underlined figures on drying banks or in brackets against drying rocks are in metres above chart datum.

HORIZONTAL DATUM: North American Datum 1927 (NAD 27). Positions on NAD 83 must be moved 1.24 seconds southward and 0.41 seconds eastward to agree with this chart.

SOURCES: The hydrographic data are shown in the SOURCE CLASSIFICATION DIAGRAM.

For Symbols and Abbreviations, see Chart No. 1.

LES PROFONDEURS sont en mètres et de Schooner Harbour jusqu'à Baker Lake sont réduites à la marée normale la plus basse, laquelle à Norton Island est de 1.4 mètre au-dessous du niveau moyen de l'eau. Dans le lac Baker les profondeurs sont réduites à un niveau de basses eaux, lequel au hameau de Baker Lake est de 5.3 mètres au-dessous du repère de nivellement topographique No. 45.

LES ALTITUDES et les points cotés sont en mètres au-dessus de la pleine mer supérieure, grande marée. Les chiffres soulignés sur les bancs asséchants ou entre parenthèses contre les rochers qui découvrent sont en mètres au-dessus du zéro des cartes.

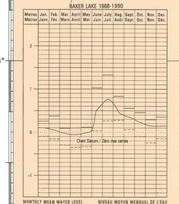
SYSTÈME GÉODÉSIQUE: Système de référence géodésique de l'Amérique du Nord 1927 (NAD 27). Les positions basées sur NAD 83 doivent être corrigées de 1.24 seconde vers le sud et de 0.41 seconde vers l'est pour être en accord avec cette carte.

SOURCES: Les données hydrographiques sont indiquées dans le DIAGRAMME DE CLASSIFICATION DES SOURCES.

Pour les signes conventionnels et les abréviations, consulter la carte No. 1.

TIDAL INFORMATION/RENSEIGNEMENTS SUR LES MARÉES

LOCATION / LOCALITÉ	Elevation above Chart Datum/Altitude au-dessus du zéro des cartes				
	Large Tide/Grande marée		Mean Tide/Marée moyenne		Mean Water Level/Niveau moyen de l'eau
	HHW/PMVE	LLW/BMI	HHW/PMVE	LLW/BMI	
Norton Island	mètres/mètres 2.7	mètres/mètres 0.2	mètres/mètres 2.4	mètres/mètres 0.3	mètres/mètres 1.4



CURRENTS
The arrows indicate the approximate main flood and ebb directions. Rates given are for mean tide. The direction and rate of the tidal currents can vary substantially with the stage and range of the tide.

COURANTS
Les flèches indiquent les directions principales approximatives du flot et du jusant. Les vitesses indiquées sont pour la marée moyenne. La direction et la vitesse des courants de marées peuvent varier considérablement dépendant du marnage et du stade de la marée.

BLUE TINT
On this chart unsurveyed water areas and areas with depths of 9 metres or less are tinted full blue.

TEINTE BLEUE
Les zones non hydrographiées et les zones de profondeurs de 9 mètres ou moins sont teintées en bleu plein.

BAKER LAKE 1988-1990

MONTHLY MEAN WATER LEVEL NIVEAU MOYEN MENSUEL DE L'EAU
Higher ——— la plus élevé
Average ——— Moyen
Lower ——— la plus bas

WATER LEVEL
The average seasonal fluctuations of the water levels at the hamlet of Baker Lake on Baker Lake are as shown in the hydrograph on this chart. When the water level is above chart datum, elevations and clearances must be reduced accordingly.

NIVEAU DE L'EAU
Les fluctuations saisonnières moyennes du niveau de l'eau au hameau de Baker Lake sur Baker Lake sont celles démontrées dans l'hydrogramme sur cette carte. Lorsque le niveau de l'eau est au-dessus du zéro des cartes, les altitudes et les hauteurs libres doivent être réduites en conséquence.

SECTION 1 • INTRODUCTION

The Marine Mammal Management and Monitoring Plan (MMMMP) has been developed for the Project to meet commitments made during the Nunavut Impact Review Board (NIRB) hearings related to Marine Shipping. It should be considered a living document that can be updated throughout the Project lifecycle in order to implement adaptive management techniques.

The MMMMP has been designed to provide protocols for conducting a vessel-based Marine Mammal and Seabird Observer (MMSO) program during all routine shipping activities along the shipping route. During routine shipping operations, Project-specific mitigation measures designed to minimize Project impacts on marine mammals and seabirds will be initiated by vessel-based MMSOs and implemented by the ship's crew.

Data collected by the MMSOs will provide information annually to the Government of Nunavut and other applicable regulators (e.g., Environment and Climate Change Canada (ECCC) - Canadian Wildlife Service (CWS)) regarding the location, behaviour, abundance, and species observed as well as any interactions with Project vessels during shipping activities along the shipping route.

SECTION 2 • MARINE MAMMAL AND SEABIRD OBSERVER PROGRAM

2.1 Routine Shipping Operations

This section outlines the protocol for undertaking a vessel-based Marine Mammal and Seabird Observer (MMSO) program involving marine wildlife monitoring during all routine shipping activities in the shipping route in accordance with Project Certificate Condition 40, which states the following:

" The Proponent shall develop and implement a ship-based marine mammal monitoring program, as part of a Marine Mammal Management and Monitoring Plan, in consultation with Fisheries and Oceans Canada, communities, and other interested parties. The Proponent shall report any accidental contact by project vessels with marine mammals or seabird colonies to applicable responsible authorities including Fisheries and Oceans Canada and Environment and Climate Change Canada. "

The MMSOs will record marine mammal and seabird observations based on the protocols along the shipping routes presented in Figure 1. Datasheets outlined in Attachment A and Attachment B and daily reports outlined in Attachment C will be completed throughout the transit and provided to Agnico Eagle.

2.1.1 Program Protocol

Mitigation measures outlined in Section 4.2 of the Shipping Management Plan will be implemented during all Project shipping activities by the shipping contractor(s). MMSOs will not be directly responsible for implementing mitigation measures. The role of the MMSO is to record and report on marine mammals and seabird sightings during shipping activities, and to advise the ship's crew on the location of observed marine mammals and if any action is recommended based on mitigation measures outlined in the Shipping Management Plan.

The following protocol will be implemented during the MMSO program:

- A minimum of one assigned MMSO will be present on-board the Project shipping vessels[1] during all transits;
- The MMSO will conduct marine mammal and seabirds observations along the shipping route from the bridge during daylight hours;
- The MMSO will observe and record sightings of marine mammals and birds during vessel movements in the shipping routes (including sea birds, coastal waterfowls, and sea ducks[2]) as well as environmental conditions;

[1] Contractor is responsible to assign a crew member or contractor the task of marine mammal observations (MMSO).

[2] In accordance with Project Certificate No 008 Condition 39 and 40.

- The shipping contractor will initiate mitigation measures designed to minimize Project impacts on marine mammals and seabirds, as identified in the Shipping Management Plan.

The MMSO program will allow for the opportunity of adaptive management techniques to be implemented if monitoring identifies potential for adverse effects on marine wildlife along the shipping route. This may include modification of mitigation measures in response to new information arising from the monitoring carried out by the MMSO. Adaptive management will be conducted in consultation with the Kivalliq Inuit Association, the Hunters and Trappers Organizations of the Kivalliq communities, and the relevant regulators.

AGNICO EAGLE

2.1.3 Marine Mammal Observing Protocol

General environmental and marine mammal sightings information is to be collected and recorded by filling out form in Attachment A.

The protocol outlined in this section are best conducted along a transect line, therefore, it is best to start a marine mammal observation period when the vessel is and will be moving in a straight line for an extended period of time.

Observer Position

Observations will be done from a high location on the vessel and ideally outdoors if possible and will be conducted at the same location each time. For marine mammal observations with a single observer, depending on the weather conditions and safety requirements for the crew the MMSO will position themselves in the middle of the ship at the front (bow) to observe marine mammal on both the starboard and the port side (Figure 2).

Observation Period

MMSO observation periods (marine mammal and seabird observations) should not last longer than 2 hours to mitigate observer fatigue and eye strain.

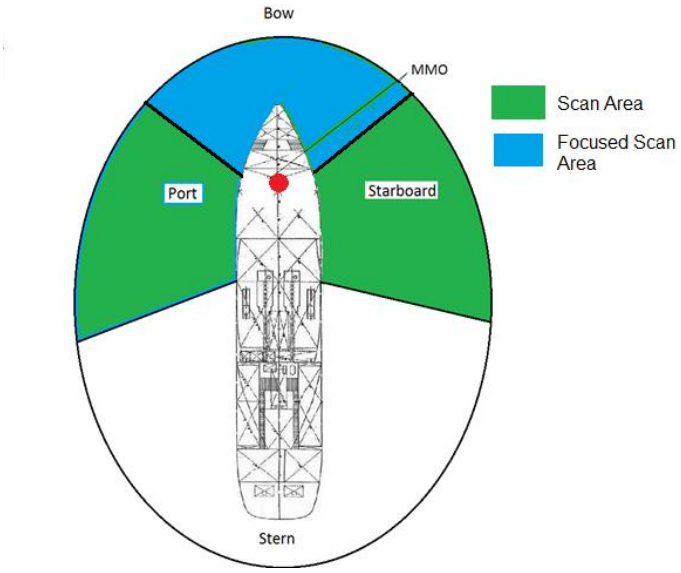

Figure 2. MMSO position and respective observation field on a hypothetical ship

2.1.3.1 Scan Routine

The following scan routine should be conducted throughout the marine mammal observation period. Scan the water with the naked eye and use binoculars only to focus on possible sightings. Perform S and U scans of the observation field about every 20 seconds (Figure 3). The most important aspect of marine mammal observing is to constantly scan the observation field to capture animals that could be located in the peripheral view for brief moments (e.g., surfacing). Scans should be made from the middle of the vessel (for one MMSO) and cover the scan area shown in Figure 2 with a focus on the water ahead and to the side to the moving vessel (e.g., focused scan area in Figure 2). If the vessel is stationary (e.g., anchored) scans should be conducted over the entire scan area (e.g., blue and green in Figure 2) in a uniform fashion. When the vessel is stationary, less priority can be attributed to marine mammal observations.

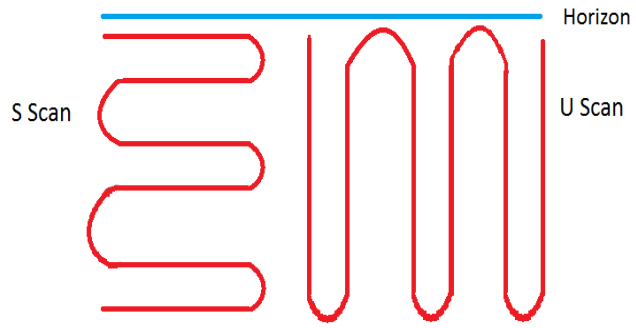

Figure 3: S & U scanning techniques

All marine mammals observed during the dedicated marine mammal observational periods as well as incidental sightings will be recorded including GPS location, distance to animal, angle to animal, number of individuals, species, behaviour etc. If a species is unknown or if a blow is the only detection of the animal observed, then mark the sighting as unknown. Marine mammals in large groups that are close together should be marked as a single sighting. When possible, photographs of marine mammal sightings will be taken and recorded alongside sightings records.

Angle to a marine mammal or group of marine mammal can be calculated using a Pelorus or by estimating the angle with an angle board. Figure 4 shows how an angle to a marine mammal from the vessel should be estimated.

On-effort sightings should be recorded by the MMSO only, with no assistance permitted by other crew members. Sightings of pinnipeds hauled-out on land will be recorded as off-effort sightings. Bow-riding dolphins or porpoises are also not recorded as on-effort sightings unless they are observed prior to their initial approach to the vessel (as it was assumed that the sighting of a bow-riding cetacean was not random but rather influenced by the presence of the vessel). Bow-riding dolphins or porpoises are recorded as incidental (off-effort) sightings.

All efforts will be made to avoid double counting individuals or groups of individuals. If a marine mammal is counted twice in the sightings record, then a note of a re-sighting should be marked.

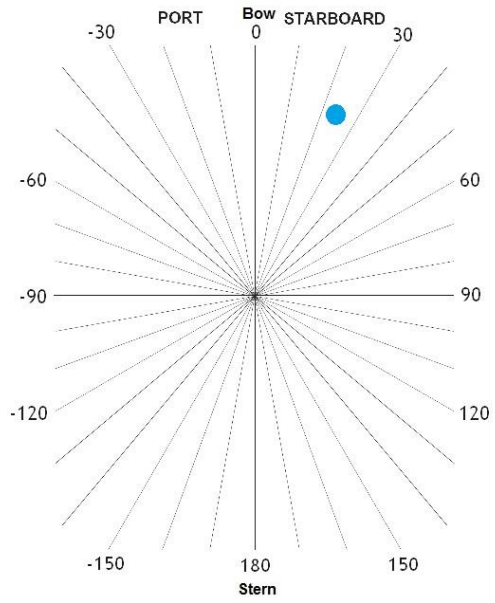

Figure 4. Angle to Marine Mammal (blue dot) is approximately 22º

2.1.3.2 Scan Routine

Record the distance to each marine mammal or group of marine mammal (to the centre of the group). For all marine mammals, estimate the angular distance between the marine mammal(s) and the observer.

Using Reticle binoculars

Reticle binoculars have a built in scale called a reticle. Estimating distances to marine mammals using reticles is based upon the distance to the horizon which is dependent on:

- the height of the observer eye above sea level in meters; and
- radians per reticle mark for the type of binoculars.

The height of the eye includes the height of the platform above the surface of the water. The number of radians (usually milliradians[3]) will depend on the type of reticles binoculars that are used. The number of radians per reticle mark can be used to produce a distance table based on an equation provided by the binocular manufacture. An example of an equation provided by Fujinon 2006 is:

Distance = (eye height + height above sea level in meters) x 1000 / # of milliradians

Reticle binoculars cannot be used to estimate distance if the horizon is obscured (by fog or land), or if they are used from a different height above sea level. Their use becomes minimal in nearshore waters.

[3] unit of angular measurement

2.1.4 Seabird Survey Protocol

Seabird survey will be conducted in the shipping route. The protocols laid out below were extracted and adapted from the CWS standardized protocol for pelagic seabird surveys from moving and stationary platforms (Gjerdrum et al. 2012).

Observer Position

Observations should be done from a high location on the vessel, when possible, at a location as close to the edge of the platform as possible to increase the detection of seabirds, especially for individuals that use the waters at the base of the vessel. All surveys should be conducted at the same location each time.

2.1.4.1 Survey Protocol – Moving Vessel

General environmental and bird sightings information is to be collected and recorded by filling out the form in Attachment B.

Transect Methods

During transect surveys, the observer is to look forward from the vessel, scanning at a 90° angle from either the port (left) or starboard (right) side depending where he or she is located. The transect width within seabirds are recorded is 300 m from the side of the vessel (see Figure 5). Scan ahead regularly (e.g., every minute) to spot birds that may dive as the vessel approaches.

All birds observed within this 300 m transect, whether flying or on the water, are recorded and are considered in-transect sightings. The methods for recording birds on the water verses birds in flight are outlined below. All five minute surveys should begin with a snapshot survey to capture flying birds. The perpendicular distance from the line to the seabirds detected on the water or in flight is estimated for each sighting. Birds observed outside the 300 m transect are also recorded if this does not affect observations within the 300 m transect. Distance categories “E” and “T” in Figure 5 are both considered not in transect. Binoculars and spotting scopes can be used to confirm species identification and other details as necessary.

Observation Period

Each seabird survey period will be conducted during six consecutive five-minute periods which is repeated three times a day to capture morning, afternoon and evening periods when possible. These five minute surveys should be dedicated to surveying for seabirds only. These surveys should be completed regardless if birds are present or not. If the vessel is not moving (stationary), use the method for stationary vessel described in Section 2.1.4.2 below.

Short breaks should be taken at the end of each five minute period to record the vessel’s position and any conditions that may have changed since the last five minute survey period. If ship speed or direction changes significantly during the survey period, record the time and location (GPS), cease the current survey and begin a new five minute survey period.

The frequency of the seabird surveys has been selected to provide time for the MMSO to:

- have dedicated seabird and marine mammal observation periods (as described above);
- conduct daily shipping-related activities if the MMSO is part of the ship's crew;
- take necessary breaks to avoid observer fatigue; and
- conduct daily reporting.

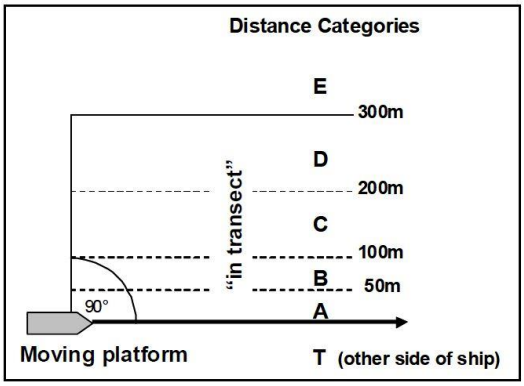

Figure 5. Illustration of a survey using a 90° scan, covering a 300 m transect from a moving platform (extracted from Gjerdrum et al. 2012)

Birds on the Water

All birds observed on the water are continuously recorded throughout the five minute survey period. If birds in the transect fly off the surface of the water as the vessel approaches, use binoculars to help count them, and record these birds as being on the water as outlined in the seabird survey sighting form (Attachment B). These birds are not subsequently counted as a flying bird during a snapshot survey (described below for flying bird).

Birds on the water may be observed up ahead of the platform, perhaps as far as 400 m or 500 m, but still within the 300 m transect (Figure 5). Because these individuals may dive or fly away as a result of the approaching ship, they should be counted as in transect and their perpendicular distance recorded when they are first observed. If the five minute survey will end before the ship reaches them they should be recorded in the next five minute survey period.

Birds in Flight – Snapshot method

All five min surveys should begin with a snapshot of flying birds. Flying birds are not recorded continuously throughout the five minute survey period as with birds on the water, as this would overestimate bird density. Create a routine of snapshot counts to record flying birds during the survey period. Only use the snapshot method when there are many birds observed flying in the area. The number of snapshots done will depend on the speed of the vessel (Table 1).

During each snapshot, record flying birds as in transect if they are flying above the 300 m transect. Record all other flying birds that are seen outside of the 300 m transect or between snapshot intervals as not in transect.

Some species may fly in long lines across the 300 m survey transect. At the time of the snapshot, the number of birds in the flock is recorded and the distance class is assigned according to the location of the centre of the flock. All the birds in the flock are recorded as in transect if the centre is within the 300 m transect. If the centre of the flock is outside the 300 m transect, all birds are recorded as not in transect.

Large Groups of Birds

When very large numbers of birds are encountered that overwhelm the observer's ability to count the number of birds and measure the distance to flocks the snapshot method can be used to count all birds in flight and on the water. If this protocol is used, note the change in protocol on the seabird survey sighting form (Attachment B). If it is not practical to estimate distance to each bird or flock of birds, the observer should at least indicate whether the birds were observed in or out of transect. If it is not practical to note which birds are on the water and which are in flight use the following guidelines:

- If the majority of the birds are in the air, they can be recorded as flying.
- If birds appear first on the water and then fly away as the vessel approached, or they continuously move between the water and air, recorded them being as on the water.

Birds that follow the Vessel

To avoid double counting birds, once a bird is recorded in-flight it is not subsequently recorded again if it follows the ship and it is not recorded on subsequent snapshots. If many birds are following the vessel and it becomes difficult to determine which individuals have already been recorded, the number of birds following the ship can be estimated and recorded at regular intervals (i.e., in between each five minute survey or as possible).

Table 1: Intervals at Which Instantaneous or "Snapshot" Counts of Flying Birds Should be conducted during a Moving Vessel Survey

Platform Speed (knots)	Interval Between Counts (minutes)
<4.5	2.5
4.5 – 5.5	2.0
5.5 – 8.5	1.5
8.5 – 12.5	1.0
12.5 - 19	0.5

Poor Visibility

When a survey period cannot be done because of poor visibility (i.e., when the entire width of the 300 m transect is not visible), the extent of visibility should be noted on the seabird survey information form.

Observation Periods with no birds

If no birds are observed during a five minute survey period, "no seabirds observed" must be noted on the seabird survey information form.

2.1.4.1 Survey Protocol – Stationary Vessel

Scan Method

Surveys while the vessel is stationary (e.g., on standby or anchored) are done using instantaneous counts, or "snapshots" of birds within a 300 m "semi-circle" area from the vessel. These surveys are conducted by scanning through a 180° arc, limiting observations to a semi-circle around the observer (Figure 6).

The area should be scanned from one side to the other, and all seabirds on water and in flight that are observed within 300 m are systematically recorded. Birds visible beyond 300 m are also, if possible. The distance to seabirds (inside and outside the 300 m area) from the observer is estimated and recorded for all birds. Birds observed outside the 300 m semi-circle are recorded as not in semi-circle on the seabird survey information form. Binoculars and spotting scopes can be used to confirm species identification and other details as necessary.

Observation Period

When the vessel is stationary, less priority can be attributed to marine mammal observations. The length of each scan will depend on the number of birds present at the time of the scan (e.g., it may only last a few seconds if there are no birds present).

Poor Visibility

When an observation period cannot be done because of poor visibility (i.e., when the entire width of the 300 m transect is not visible), the extent of visibility should be noted on the seabird survey information form.

Observation Periods with no birds

If no birds are observed during a five minute survey period, "no seabirds observed" must be noted on the seabird survey information form.

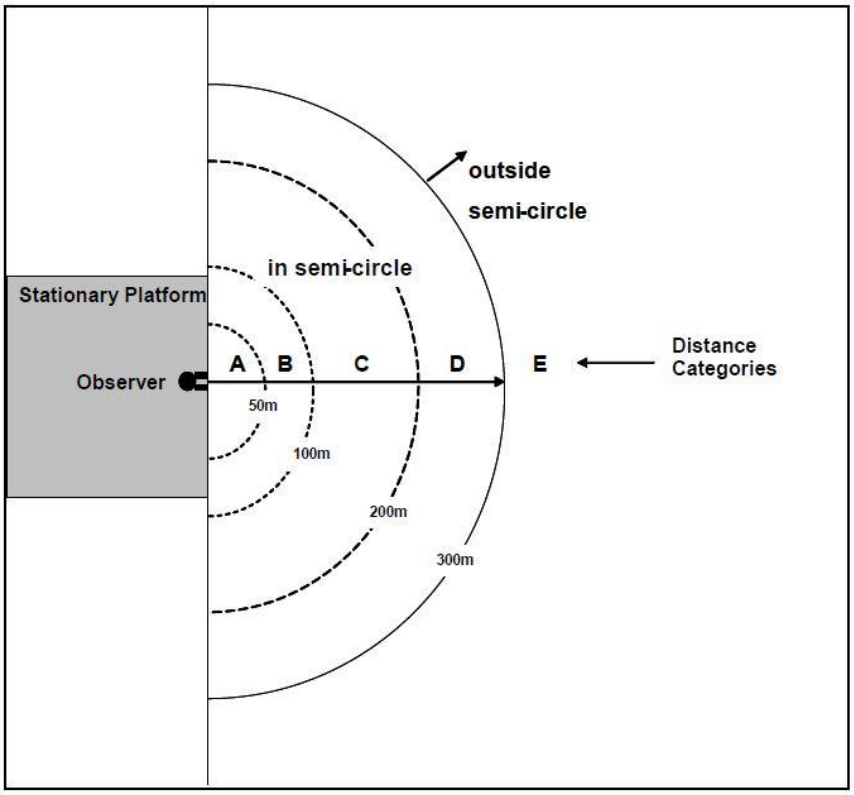

Figure 6. Survey using an 180o scan, surveying an area 300 m from a stationary observer (Extracted from Gjerdrum et al. 2012)

2.1.4.1 Estimating Distance

Record the distance to each bird or flock of birds (to the centre of the flock). For all birds, estimate the perpendicular distance between the bird(s) and the observer (Figure 6). If a group of birds is straddling the 300 m boundary with the flock centre located in D (some individuals inside and some individuals outside the transect) record the entire flock as being in D. If the flock centre is outside the transect, record the entire flock as distance class E. It is very important to record distance to birds within the 300 m strip, but if this is not possible (i.e., too busy), you may use the code 3 = within 300 m but no distance recorded. Distance T is used to indicate that the bird or flock was observed on the opposite side of the vessel.

2.1.5 Recording Observations

General environmental and marine mammal sightings information is to be collected and recorded by filling out forms in Attachments A & B.

MMSO's will record any responsive actions undertaken by the vessel crew in response to sightings. This will be recorded on a daily basis as outlined in the MMSO daily reporting template provided in Attachment C. All records of vessel strikes on marine mammals and bird collisions will be provided to Fisheries and Oceans Canada (DFO) and CWS on a weekly basis, as vessel communications allow (i.e., as internet connections allow). Immediate reporting will be required in the event that a ship strike occurs on a marine

mammal, or multiple bird collisions occur (involving more than five individuals) and the incidents appear related (i.e., similar time period, location, and weather conditions). In this instance, the regional Environment and Climate Change Canada (ECCC) Wildlife Enforcement Officer (contact information provided below) will be contacted to provide advice on the implementation of adaptive management techniques to attempt to reduce the likelihood of collisions occurring in the future.

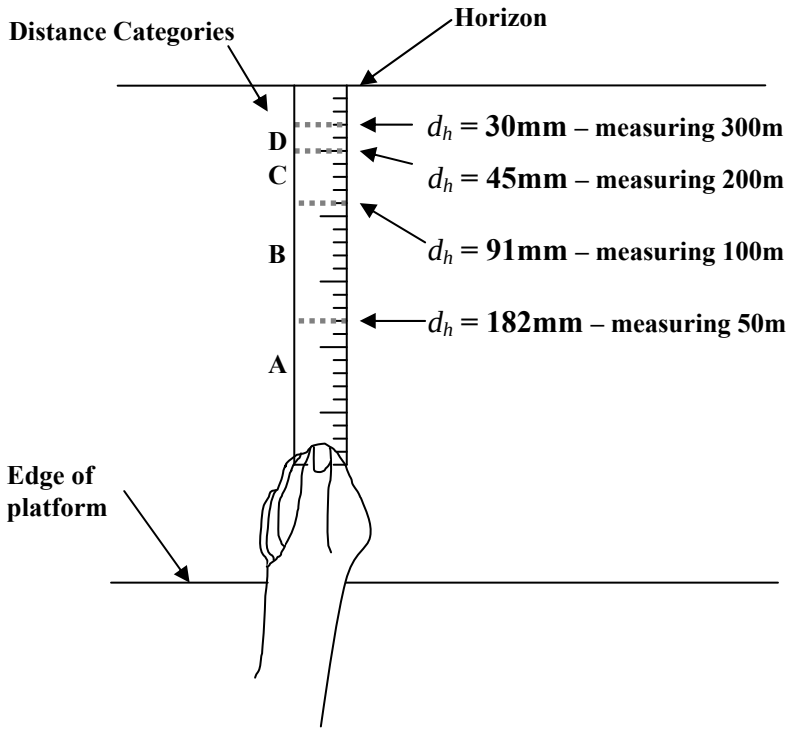
APPENDIX I. Estimating distance categories

The various distance categories can be estimated using the following equation[1]:

$$d_h = 1000\frac{(ah3838\sqrt{h}) - ahd}{h^2 + 3838d\sqrt{h}}$$

e.g. if a = 0.730 m, h = 12.5 m, and d = 300 m



then d_h = 30.0 mm

where:

d_h = distance below horizon (mm)
a = distance between the observer's eye and the ruler when observer's arm is fully out-stretched (m)
h = height of the observer's eye above the water at the observation point (m)
d = distance to be estimated (m; a separate calculation is required for each of 50, 100, 200, 300)

Distances are easily estimated using a gauge made from a transparent plastic ruler. A different ruler will be required for each combination of observer arm length (a) and platform height (h). Calculate d_h for the boundary of each distance class (A, B, C, D) and mark them on the ruler (dashed lines in figure). To use the gauge, extend the arm fully and keep the top end of the ruler aligned with the horizon. The dashed lines now demark the distance class boundaries on the ocean surface. Keep the gauge nearby during surveys to quickly verify bird distances.

Measurements for an observer with a = 73 cm and h = 12.5 m:

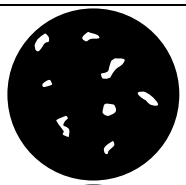
[1] Formula derived by J. Chardine, based on Heinemann 1981. A spreadsheet is available from the corresponding author to perform this calculation.

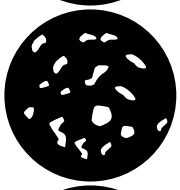
APPENDIX II. Codes for general weather conditions and glare

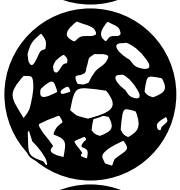
Code	Description	Explanation
	Weather conditions	
0		< 50% cloud cover (with no fog, rain, or snow)
1		> 50% cloud cover (with no fog, rain, or snow)
2		patchy fog
3		solid fog
4		mist/light rain
5		medium to heavy rain
6		fog and rain
7		snow
	Glare conditions	
0		none
1		slight/grey
2		bright on the observer's side of vessel
3		bright and forward of vessel

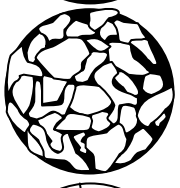
APPENDIX III. Codes for sea state and Beaufort wind force

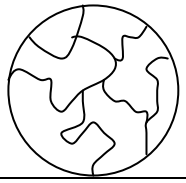
Wind Speed (knots)	Sea state code and description	Beaufort wind force and description
0	**0** Calm, mirror-like	**0** calm
01 – 03	**0** Ripples with appearance of scales but crests do not foam	**1** light air
04 – 06	**1** Small wavelets, short but pronounced; crests do not break	**2** light breeze
07 – 10	**2** Large wavelets, crests begin to break; foam of glassy appearance; perhaps scattered white caps	**3** gentle breeze
11 – 16	**3** Small waves, becoming longer; fairly frequent white caps	**4** moderate breeze
17 – 21	**4** Moderate waves with more pronounced form; many white caps; chance of some spray	**5** fresh breeze
22 – 27	**5** Large waves formed; white foam crests more extensive; probably some spray	**6** strong breeze
28 – 33	**6** Sea heaps up; white foam from breaking waves blows in streaks in direction of wind	**7** near gale
34 – 40	**6** Moderately high long waves; edge crests break into spindrift; foam blown in well-marked streaks in direction of wind	**8** gale
41 – 47	**6** High waves; dense streaks of foam in direction of wind; crests of waves topple and roll over; spray may affect visibility	**9** strong gale
48 – 55	**7** Very high waves with long overhanging crests; dense foam streaks blown in direction of wind; surface of sea has a white appearance; tumbling of sea is heavy; visibility affected	**10** storm
56 - 63	**8** Exceptionally high waves; sea is completely covered with white patches of foam blown in direction of wind; edges blown into froth; visibility affected	**11** violent storm
64 +	**9** Air filled with foam and spray; sea completely white with driving spray; visibility seriously affected	**12** hurricane











APPENDIX IV. Codes for ice conditions

Adapted from NOAA: Observers Guide to Sea Ice

Sea Ice Forms

Code	Name	Description
0	New	small, thin, newly formed, dinner plate-sized pieces
1	Pancake	rounded floes 30 cm - 3 m across with ridged rims
2	Brash	broken pieces < 2 m across
3	Ice Cake	level piece 2 - 20 m across
4	Small Floe	level piece 20 - 100 m across
5	Medium Floe	level piece 100 -500 m across
6	Big Floe	level, continuous piece 500 m - 2 km across
7	Vast Floe	level, continuous piece 2 - 10 km across
8	Giant Floe	level, continuous piece > 10 km across
9	Strip	a linear accumulation of sea ice < 1 km wide
10	Belt	a linear accumulation of sea ice from 1 km to over 100 km wide
11	Beach Ice or Stamakhas	irregular, sediment-laden blocks that are grounded on tidelands, repeatedly submerged, and floated free by spring tides
12	Fast Ice	ice formed and remaining attached to shore

Sea Ice Concentration

Code	Concentration	Description	
0	< one tenth	"open water"	
1	two-three tenths	"very open drift"	
2	four tenths	"open drift"	
3	five tenths	"open drift"	
4	six tenths	"open drift"	
5	seven to eight tenths	"close pack"	
6	nine tenths	"very close pack"	
7	ten tenths	"compact"	

APPENDIX V. Species codes for birds seen in Eastern Canada

Common name	Species code	Latin name
COMMON, REGULAR OR FREQUENTLY SEEN SPECIES		
Northern Fulmar	NOFU	*Fulmarus glacialis*
Great Shearwater	GRSH	*Puffinus gravis*
Manx Shearwater	MASH	*Puffinus puffinus*
Sooty Shearwater	SOSH	*Puffinus griseus*
Wilson's Storm-Petrel	WISP	*Oceanites oceanicus*
Leach's Storm-Petrel	LESP	*Oceanodroma leucorhoa*
Northern Gannet	NOGA	*Morus bassanus*
Red Phalarope	REPH	*Phalaropus fulicaria*
Red-necked Phalarope	RNPH	*Phalaropus lobatus*
Long-tailed Jaeger	LTJA	*Stercorarius longicaudus*
Parasitic Jaeger	PAJA	*Stercorarius parasiticus*
Pomarine Jaeger	POJA	*Stercorarius pomarinus*
Great Skua	GRSK	*Stercorarius skua*
Herring Gull	HERG	*Larus argentatus*
Iceland Gull	ICGU	*Larus glaucoides*
Glaucous Gull	GLGU	*Larus hyperboreus*
Great Black-backed Gull	GBBG	*Larus marinus*
Black-legged Kittiwake	BLKI	*Rissa tridactyla*
Common Murre	COMU	*Uria aalge*
Thick-billed Murre	TBMU	*Uria lomvia*
Razorbill	RAZO	*Alca torda*
Dovekie	DOVE	*Alle alle*
Atlantic Puffin	ATPU	*Fratercula arctica*
SPECIES MORE COMMONLY SEEN INSHORE		
Common Loon	COLO	*Gavia immer*
Red-throated Loon	RTLO	*Gavia stellata*
Red-necked Grebe	RNGR	*Podiceps grisegena*
Horned Grebe	HOGR	*Podiceps auritus*
Great Cormorant	GRCO	*Phalacrocorax carbo*
Double-crested Cormorant	DCCO	*Phalacrocorax auritus*
Greater Scaup	GRSC	*Aytha marila*
Common Eider	COEI	*Somateria mollissima*
Harlequin Duck	HARD	*Histrionicus histrionicus*
Long-tailed Duck	LTDU	*Clangula hyemalis*
Surf Scoter	SUSC	*Melanitta perspicillata*
Black Scoter	BLSC	*Melanitta nigra*
White-winged Scoter	WWSC	*Melanitta fusca*
Red-breasted Merganser	RBME	*Mergus serrator*
Black Guillemot	BLGU	*Cepphus grylle*

Common name	Species code	Latin name
INFREQUENTLY OR RARELY SEEN SPECIES		
Cory's Shearwater	COSH	*Calonectris diomedea*
Audubon's Shearwater	AUSH	*Puffinus lherminieri*
Lesser Scaup	LESC	*Aythya affinis*
King Eider	KIEI	*Somateria spectabilis*
South Polar Skua	SPSK	*Stercorarius maccormicki*
Bonaparte's Gull	BOGU	*Larus philadelphia*
Ivory Gull	IVGU	*Pagophila eburnea*
Black-headed Gull	BHGU	*Larus ridibundus*
Laughing Gull	LAGU	*Larus articilla*
Ring-billed Gull	RBGU	*Larus delawarensis*
Lesser Black-backed Gull	LBBG	*Larus fuscus*
Sabine's Gull	SAGU	*Xema sabini*
Common Tern	COTE	*Sterna hirundo*
Arctic Tern	ARTE	*Sterna paradisaea*
Roseate Tern	ROTE	*Sterna dougallii*
CODES FOR BIRDS IDENTIFIED TO FAMILY OR GENUS		
Unknown Bird	UNKN	
Unknown Shearwater	UNSH	*Puffinus* or *Calonectris*
Unknown Storm-Petrel	UNSP	Hydrobatidae
Unknown Duck	UNDU	Anatidae
Unknown Eider	UNEI	*Somateria*
Unknown Phalarope	UNPH	*Phalaropus*
Unknown Jaeger	UNJA	*Stercorarius*
Unknown Skua	UNSK	*Stercorarius*
Unknown Gull	UNGU	Laridae
Unknown Tern	UNTE	*Sternidae*
Unknown Alcid	ALCI	Alcidae
Unknown Murre or Razorbill	MURA	*Uria* or *Alca*
Unknown Murre	UNMU	*Uria*

APPENDIX VI. Codes for associations and behaviours

From Camphuysen and Garthe (2004). Choose one or more as applicable.

Code	Description
Association	
10	Associated with fish shoal
11	Associated with cetaceans
13	Associated with front (often indicated by distinct lines separating two water masses or concentrations of flotsam)
14	Sitting on or near floating wood
15	Associated with floating litter (includes plastic bags, balloons, or any garbage from human source)
16	Associated with oil slick
17	Associated with sea weed
18	Associated with observation platform
19	Sitting on observation platform
20	Approaching observation platform
21	Associated with other vessel (excluding fishing vessel; see code 26)
22	Associated with or on a buoy
23	Associated with offshore platform
24	Sitting on offshore platform
26	Associated with fishing vessel
27	Associated with or on sea ice
28	Associated with land (e.g., colony)
50	Associated with other species feeding in same location

Code	Description	Explanation
Foraging behaviour		
30	Holding or carrying fish	carrying fish towards colony
32	Feeding young at sea	adult presenting prey to attended chicks (e.g., auks) or juveniles (e.g., terns)
33	Feeding	method unspecified (see behaviour codes 39,40,41,45)
36	Aerial pursuit	kleptoparisitizing in the air
39	Pattering	low flight over the water, tapping the surface with feet while still airborne (e.g., storm-petrels)
40	Scavenging	swimming at the surface, handling carrion
41	Scavenging at fishing vessel	foraging at fishing vessel, deploying any method to obtain discarded fish and offal; storm-petrels in the wake of trawlers picking up small morsels should be excluded
44	Surface pecking	swimming birds pecking at small prey (e.g., fulmar, phalaropes, skuas, gulls)
45	Deep plunging	aerial seabirds diving under water (e.g., gannets, terns, shearwaters)
49	Actively searching	persistently circling aerial seairds (usually peering down), or swimming birds frequently peering (and undisturbed by observation platform) underwater for prey
General behaviour		
60	Resting or apparently sleeping	reserved for sleeping seabirds at sea
64	Carrying nest material	flying with seaweed or other material; not to be confused with entangled birds
65	Guarding chick	reserved for auks attending recently fledged chicks at sea
66	Preening or bathing	birds actively preening feathers or bathing
Distress or mortality		
71	Escape from ship (by flying)	escaping from approaching observation platform
90	Under attack by kleptoparasite	bird under attack by kleptoparasite in an aerial pursuit, or when handling prey at the surface
93	Escape from ship (by diving)	escaping from approaching observation platform
95	Injured	birds with clear injuries such as broken wings or bleeding wounds
96	Entangled in fishing gear or rope	birds entangled with rope, line, netting or other material (even if still able to fly or swim)
97	Oiled	birds contaminated with oil
98	Sick/unwell	weakened individuals not behaving as normal, healthy birds, but without obvious injuries
99	Dead	bird is dead

Thermal Monitoring Plan, Version 2

AGNICO EAGLE

WHALE TAIL PIT PROJECT

Thermal Monitoring Plan

In Accordance with
Project Certificate No. 008, T&C 14

Prepared by:
Agnico Eagle Mines Limited – Meadowbank Division

Version 2
March 2019

EXECUTIVE SUMMARY

Agnico Eagle Mines Limited – Meadowbank Division (Agnico Eagle) received a Project Certificate No.008 from the Nunavut Impact Review Board for the development of the Whale Tail Pit, a satellite deposit located on the Amaruq Exploration property.

The deposit will be mined as an open pit (i.e., Whale Tail Pit), and ore will be hauled by truck to the approved infrastructure at Meadowbank Mine for milling. Approximately 8.3 million tonnes (Mt) of ore will be mined from the open pit and processed over a three to four-year mine life. Ore from Whale Tail Pit will be crushed on site after which it will be transported to Meadowbank Mine for milling. The mill rate will be approximately 9,000 to 12,000 tonnes per day.

This document presents the Thermal Monitoring Plan for the Whale Tail Pit in accordance with Terms and Conditions No. 14 included in the Project Certificate.

1 INTRODUCTION

Agnico Eagle Mines Limited – Meadowbank Division (Agnico Eagle) is developing the Whale Tail Pit Project (Project), a satellite deposit located on the Amaruq property, to continue mine operations and milling at Meadowbank Mine.

The Amaruq property is a 408 km^2 site located on Inuit Owned Land approximately 150 km north of the hamlet of Baker Lake and approximately 50 km northwest of Meadowbank Mine in the Kivalliq Region of Nunavut. The deposit will be mined as an open pit (i.e., Whale Tail Pit), and ore will be hauled to the approved infrastructure at Meadowbank Mine for milling. The planned project involves: one year of construction, three years of mine operation, eight years of closure-related activities, and the post-closure period.

This document presents a Thermal Monitoring Plan prepared for the following mine facilities and natural locations:

- Waste rock storage facility (WRSF)
- Water management facilities including Whale Tail Dike, Mammoth Dike, North-East Dike, WRSF Dike, and Attenuation Pond
- Whale Tail Pit
- Whale Tail Lake shore

The Thermal Monitoring Plan provides general descriptions of the different facilities, describes the anticipated impact of operation of the facilities on the permafrost and presents general guidelines that are used to define instrumentation needs for each facility. This document is not intended to provide detailed specifications for the instrumentation program, which will be defined as mining progresses and infrastructures are built. The Thermal Monitoring Plan will be reviewed periodically to adjust to the dynamics of mine construction and operation and adapt the monitoring strategy defined for each facility as needed.

1.1 CONCORDANCE

Meadowbank Mine is an approved mining operation and Agnico Eagle is planning to extend the life of the mine by constructing and operating the Project. The Project was subject to an environmental review established by Article 12, Part 5 of the Nunavut Agreement. In June 2016, Agnico Eagle submitted a Final Environmental Impact Statement (FEIS) seeking a reconsideration of the Meadowbank Mine Project Certificate (No. 004/File No. 03MN107) and Type A Water Licence Amendment (No. 2AM-MEA1526) from the NIRB.

On July 2016, the NIRB determined that the proposed Project required a separate screening assessment under the Nunavut Agreement and the *Nunavut Planning and Project Assessment Act* (NuPPAA). A separate Project Certificate (NIRB Project Certificate No. 008) was issued for the Project on March 15, 2018 by the NIRB. This Thermal Monitoring Plan reflects the commitments made with respect to submissions provided during the technical review of the FEIS, to comply with Terms and Condition No. 14 included in the Project Certificate.

1.2 OBJECTIVES

The primary objective of the Thermal Monitoring Plan is to document and monitor ground thermal conditions at site and identify impacts to the permafrost, if any, that could be associated with development, operation and closure of the different mine facilities. This is done through the implementation of a monitoring program designed to assess variations in the ground thermal conditions and a data analysis program that will compare results obtained to baseline conditions prior to mine developments.

The monitoring program will allow for identification of affected permafrost zones and for the comparison between the anticipated and observed effects of the mine facilities on the permafrost. The results of the monitoring program will also be used to guide activities that might be required in future to document the development and/or evolution of permafrost at site.

In certain areas, effects of mine operations on the permafrost are anticipated to be temporary and normal conditions are expected to be restored progressively upon closure of the mine. The monitoring plan will constitute a means to assess and validate this assumption, and monitoring results will be used to determine if mitigation actions are required and define what these will be at specific locations, as needed.

2 BACKGROUND

2.1 CLIMATE ENVIRONMENT

The Project site has the following mean climate characteristics (Agnico Eagle 2016):

- Mean annual air temperature of -11.3 °C
- In summer months from June through September, the mean monthly air temperature ranges from 4.9 to 11.6 °C. In winter months from October to May, the mean monthly air temperature ranges from -6.4 to -31.3 °C
- Mean annual total rainfall of 168 mm
- Mean annual total snowfall (water equivalent) of 160 mm

2.2 REGIONAL PERMAFROST

The Project is located in the zone of continuous permafrost. Permafrost refers to subsurface soil or rock where temperatures remain at or below 0ºC for at least two consecutive years. This is synonymous to perennially cryotic ground, which may be frozen, partially frozen, or non-frozen depending on the ice/water content of the ground, and the salinity of the groundwater. The base of the permafrost is expected to be an undulating surface and the actual depth to permafrost is variable.

The Project footprint is underlain by permafrost except under portions of Whale Tail Lake where water is too deep to freeze to the bottom during winter. Taliks (areas of unfrozen ground) are expected beneath a water body where the water depth is greater than the ice thickness. Closed talik formations show a depression in the permafrost table below relatively shallow and small lakes. Open talik formations that penetrate through the permafrost and connect the lake waterbody with the sub-permafrost regime are to be expected for relatively deeper and larger lakes in the project area.

2.3 SITE SUBSURFACE GEOLOGY

The Whale Tail deposit is located in the northern portion of the Whale Tail Lake. Based on previous site investigation data, soils in the project area are typically medium to coarse grained glacial till and colluvium with high coarse fragment content overlying bedrock at shallow depths. Saturated soil layers overlying frozen layers have been observed on site. A review of the records of the six thermistor boreholes indicates soil thicknesses varying from 6.1 to 12.4 m. Underlying the soil, bedrock in the area generally consists of a stratigraphic sequence of greywacke, iron formation and komatiite, with varying thicknesses.

2.4 BASELINE FIELD INVESTIGATIONS

The Project site permafrost conditions were initially assessed by Knight Piésold (2015) between June and October of 2015 which included the installation of six thermistors in the vicinity of the proposed development of Whale Tail Lake to collect ground temperature data.

Golder Associates completed an additional thermal assessment for the Whale Tail Lake in 2017 (Golder 2017a) and installed four thermistors within the vicinity of Whale Tail Lake.

A Westbay well was installed on-site between March and April in 2016 where groundwater samples were collected from multiple intervals (Golder 2016a). A first estimation of the thickness of the permanently frozen permafrost was made based on information collected from the Westbay well.

Additional investigations and thermistor installations were carried out by SNC-Lavalin in 2016 and 2017 for the purpose of dike design.

2.4.1 Existing Instrumentation on-Site

A total of 14 thermistors have been installed at Whale Tail Site project area between 2015 and 2018. Data from these thermistors have been used to estimate the site permafrost and talik conditions (Golder 2017a, 2018a). Ten of the 14 thermistors are currently active.

The location and installation summary of the 10 active thermistors within the Project site are presented in Table 1. Figure 1 shows locations of active and inactive thermistors. Data are collected from the thermistor by data loggers or using manual readout units.

Results of each of these active and inactive thermistors are presented in Appendix A.

Figure 1. Location of Thermistors

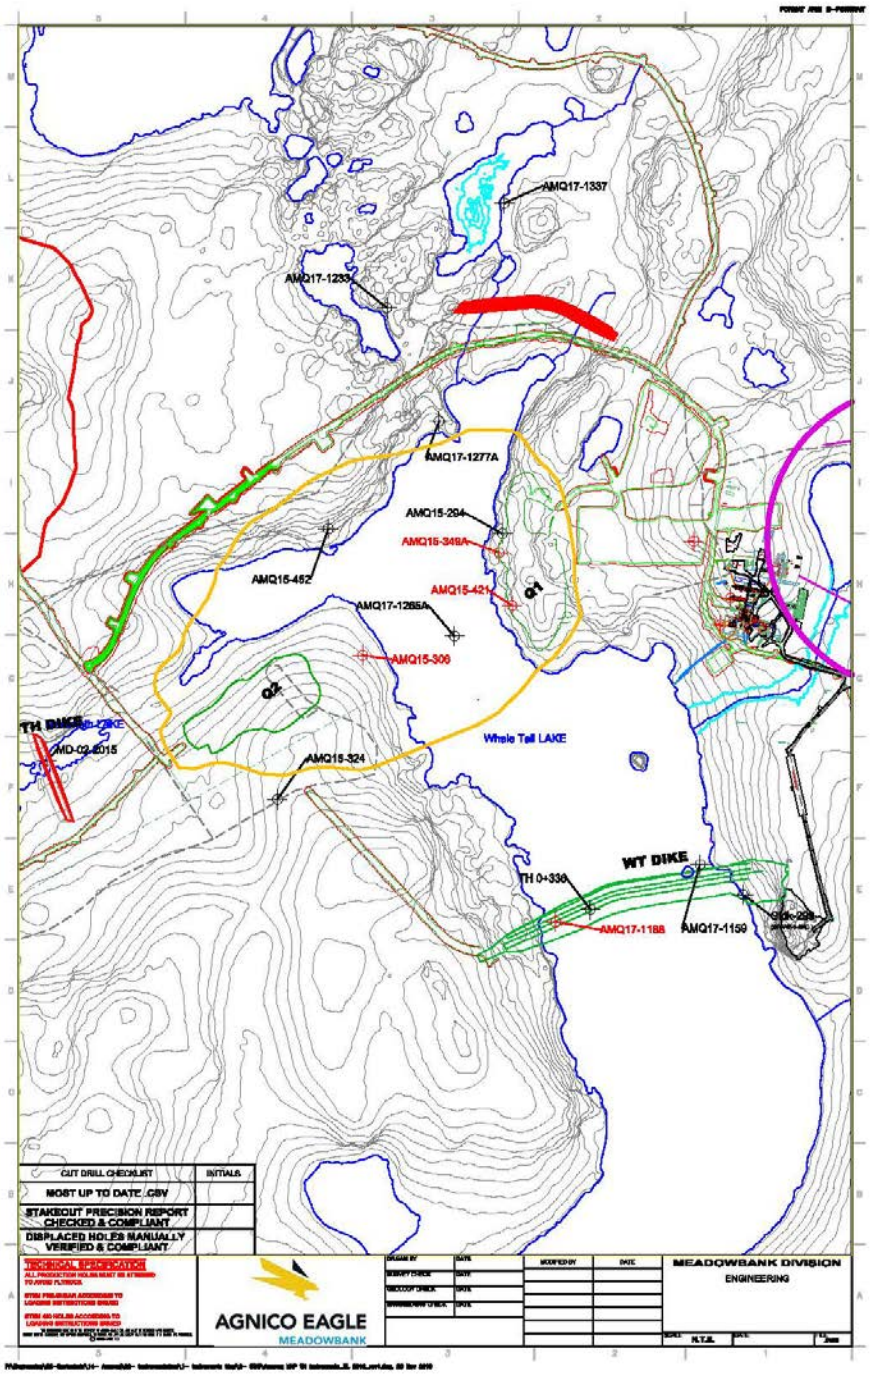

Table 1: Summary of Active Thermistors within the Project Site

Borehole	Location	Collar Coordinates					Thermistor Depth Below Ground Surface (m)	Reading Mode
		Northing	Easting	Elevation	Inclination (deg)	Azimuth (deg)		
AMQ15-294	Whale Tail Pit, at East Lake Shore	607,073.2	7,255,676.1	155.9	-45.18	322.7	144.4	Data Logger

2.5 BASELINE THERMAL MODELLING

Thermal modelling has been conducted to predict variations in the thermal regime of the permafrost. Modelling results are presented in the following reports:

- 2015 Site Permafrost Characterization by Knight Piésold (2015).
- 2017 Whale Tail Lake Thermal Assessment by Golder (2017a).
- 2017 and 2018 Golder Waste Rock Storage Facility thermal analysis for cover design by Golder (2017b, 2018b).
- 2018 Pit Lake Post-closure Thermal Assessment by Golder (2018a, In-progress).
- 2018 Dike Thermal Assessment by SNC-Lavalin (2018).

General results obtained from these studies are used to define the permafrost baseline conditions summarized in Section 2.6.

2.6 SUMMARY OF CURRENT PERMAFROST CONDITIONS

Current permafrost conditions on the Project site were estimated as follows based on thermistor data up to October 2017 and previous works. This information describes the baseline permafrost condition at the site.

- The depth of permafrost in the project site is estimated to be in the order of 427 to 495 m.
- The extrapolated mean annual ground surface temperature is estimated to be in the range of -3.4 to -9.9 °C.
- The estimated depths of zero amplitude from temperature profiles measured by the existing thermistors range from 18 m to 35 m.
- The temperatures at the depths of zero amplitude are in the range of -3.0 °C to -8.4 °C.
- The geothermal gradient is in the range of 0.005 °C/m to 0.025 °C/m.
- Based on the measured salinity concentration of 0.3% to 0.4% from groundwater samples collected on site, a freezing point depression of about 0.2 °C is estimated, which may reduce the frozen ground depth by approximately 20 m.

Ground thermal conditions under Whale Tail Lake were estimated by both thermal assessment and thermistor data. Results indicate the following:

- Under the northern portion of the lake including under the proposed pit location and along the proposed ramp area, there is likely a closed talik formation.
- An open talik is expected in the southern portion of the lake where it becomes wider and deeper
- Data from the thermistor AMQ17-1265A installed within the lake (near southeast side of the Pit) suggests the talik depth at this location is about 112 m from the lake water level. Permafrost is present beneath the talik at that location to a depth of about 343 m.

3 THERMAL MONITORING PLAN

This section presents a general description of each facility, the expected thermal effects on the permafrost, planned thermal monitoring and results documentation. The monitoring program will allow for evaluation of the actual impacts on the permafrost thermal regime during construction, operations, and closure of the facilities, and post-closure.

The information presented herein will be reviewed periodically during operations to reflect the actual site conditions.

3.1 WASTE ROCK STORAGE FACILITY

3.1.1 Facility Description

The WRSF is located north-west of the open pit, and consists of West WRSF and East WRSF. Waste rock and overburden will be trucked to the WRSF throughout mine operations, with distribution between the East and West portions based on the pile operation schedule. Agnico Eagle plans to deposit a total of 68.2 million dry tonnes (Mt) of waste rock and overburden material between 2018 and 2022.

The final height of the WRSF is anticipated to be 95 m. The construction process incorporates 20-m high benches composed of four 5-m thick layers. Each bench toe will start at a setback distance of 20 m from the crest of the previous bench to form an overall side slope of 2.5H:1V.

The diorite and south greywacke material, which are both non-acid generating and non-metal leaching, represent approximately 17% (10.5 Mt) of the waste rock to be mined from the open pit and can be used as cover material for the Whale Tail WRSF.Closure of the WRSF will begin when practical as part of the progressive reclamation program. As part of the Whale Tail Pit – Waste Rock Management Plan (Agnico Eagle 2017), the Whale Tail WRSF will be covered with non-potentially acid generating and non-metal leaching (NPAG/NML) waste rock to promote freezing of the pile as a control strategy to prevent acid generation and transport of contaminants.

3.1.2 Expected Thermal Effects on Permafrost

Construction of the WRSF on the permafrost is expected to result in aggradation of permafrost into the pile. The permafrost under the pile would remain, but temperatures in the upper permafrost zone are expected to increase gradually until a thermal equilibrium is established with the active zone and zero-amplitude zone moving upward and being located within the waste rock pile. Convective cooling conditions often occur in waste piles and would potentially offset some of the temperature increase in the permafrost.

The waste rock pile itself is expected to freeze back with time and have an active layer formed on the upper portion (Golder 2018b). Climate change in the long-term is expected to extend the depth of the active layer in the pile, but the thick waste rock pile will constitute a protection to the underlying permafrost. If heat generation occurs associated with the oxidation of sulphide-bearing minerals within the pile, the process of freeze-back would be delayed and, depending on the location of the heat generation source, the upper portion of the permafrost foundation could be impacted.

3.1.3 Thermal Monitoring

Currently there are no thermistors installed in the WRSF area.

Vertical thermistors will be installed through the waste rock and underlying permafrost during construction of the pile to monitor the evolution of temperature profiles with time and to evaluate if the process of permafrost aggradation and pile freeze-back is developing as anticipated. Thermistors installed during construction of the pile will be located in completed benches, and additional thermistors will be installed on top of the pile upon end of operations and installation of the cover system for closure of the facility. Thermistors installed after placement of the thermal cap on top of the facility will be used to assess whether the defined cover thickness of 4 m (Golder 2018b) is effective to maintain the top of the pile away from the active zone subject to seasonal freezing and thawing.

The thermistor strings will be connected to data loggers for automatic data collection and storage. Data will be reviewed periodically or as-needed, and results will be summarized in monitoring reports in a yearly basis during operation and for five years after closure. The frequency of reporting will be reviewed after that and might be reduced.

3.2 WATER MANAGEMENT FACILITIES

3.2.1 Facility Description

Water management infrastructure includes contact water collection ponds, freshwater collection ponds, diversion channels, retention dikes, dams, culverts, water treatment plant for effluent, potable water treatment plant, sewage treatment plant, and a discharge diffuser. All contact water on-site will be directed to an Attenuation Pond. Contact water will be treated and then released to Mammoth Lake through a discharge diffuser.

The Whale Tail Dike was constructed before operations to allow mining of the open pit. After dewatering of the lake area downstream of the dike the operational lake water level upstream of the dike is predicted to be at El. 156 masl, about 3.5 m higher than the current average lake level. The dike will be breached during closure to restore the lake, and will form a permanent pit lake as the open pit is flooded.

The Mammoth Dike is also a dewatering structure constructed at west side of the pit, and east side of Mammoth Lake to limit flow from Mammoth Lake into the pit. Similarly, the North East Dike will be constructed to limit inflow from lakes A46, A47 and AP68.

The Attenuation Pond will be located between the Whale Tail Dike and the Whale Tail Pit to collect mine water, runoff and seepage from the dike. The pond operational water level is expected to be at El. 146 masl.

The WRSF Dike is planned to be a water retaining dam to store contact water from the waste rock pile. The facility will be emptied annually and water will be pumped to the Attenuation Pond.

3.2.2 Expected Thermal Effects on Permafrost

The Whale Tail Dike will be constructed within the lake where talik is anticipated to exist, therefore there will be no direct negative impact on the permafrost zone underneath the talik. The construction of the Whale Tail Dike is expected to have a cooling effect on the lake ground

underneath the dike due to exposure to lower dike temperature than lake water. Minimal effects to the permafrost at the abutment areas are expected.

Upon lake dewatering and beginning of operations, areas downstream of the Whale Tail Dike are expected to freeze back progressively, and the upstream area of the dike is expected to remain unfrozen.

After the dike is breached in the final stages of closure, the Whale Tail lake will be restored, causing frozen zones located downstream of the dike to thaw and progressively restoring the original lake talik.

The other dewatering dike areas are expected to have similar thermal impacts on the permafrost associated with construction, operation and closure of the dikes.

The WRSF Dike may contain a pond formed from water flowing out of the waste rock facility. Depending on pond depth and operational conditions there would be impact with possible thawing of a shallow upper permafrost zone underlying the pond.

The talik zone under the Attenuation Pond would remain, but depth of the talik could be reduced as the Attenuation Pond will likely be shallower than the existing lake at that location. The surrounding areas to the pond would freeze back progressively after dewatering, but would restore to talik condition after breaching of the dewatering dikes and flooding of the area.

3.2.3 Thermal Monitoring

There are thermistors currently installed in the Whale Tail Dike and Mammoth Dike areas. No thermistors are present in North-East Dike nor WRSF Dike areas. Additional thermistors will be installed after construction of the dikes along the dike alignments, dike abutments, and adjacent lake shore areas to monitor changes in the thermal regimes, monitor performance of the dikes and confirm/validate the expected effects as described above. The exact location, quantity and specifications of new thermistor lines will be defined in future based on the final lay-out of site facilities.

Thermistors have not been installed within the footprint of the proposed Attenuation Pond. Considering that the Attenuation Pond is not anticipated to have any negative effects on permafrost due to its planned location within an existing talik area, the need for installation of thermistors will be evaluated upon completion of the detailed engineering design of the pond.

At the location of the WRSF Dike, thermistors will be installed within the dike footprint to monitor variations in the underlying permafrost condition.

All new thermistors will be connected to data loggers for automatic data collection and data storage. Existing thermistors that are not connected to a logger will be read manually in at least monthly basis, or be further connected to data loggers. Data will be reviewed periodically or as-needed. Results will be presented in annual reports during operation and closure of until dike decommissioning.

3.3 OPEN PIT

3.3.1 Facility Description

The proposed Whale Tail Pit will extend across the northern edge of Whale Tail Lake. Approximately 8.3 Mt of ore will be mined from the Whale Tail Pit and processed over a three to four-year mine life. The base of the pit is designed to be at El. 37 masl, about 115.5 m below the existing average lake water level of 152.5 masl.

Construction of the Whale Tail Pit site started in 2018. The operational phase will span from Year 1 (2019) to Year 4 (2022). Mining activities are currently expected to end in Year 3 (2021) and ore processing is expected to end during Year 4 (2022). Pit flooding is anticipated to commence in 2022 marking the beginning of the closure period, and is expected to reach the top of the pit / base of Whale Tail Lake (138 masl) in 2025 and the initial lake in 2028.

3.3.2 Expected Effects on Permafrost

The pit will be excavated through an upper closed talik zone and underlying permafrost. During operations of the pit the talik zone is expected to freeze back progressively and the lower permafrost zone surrounding the pit walls will, in general, experience reduction in temperature other than at a shallow active zone adjacent to the pit walls subjected to seasonal thawing during summer.

Upon closure and subsequent flooding of the pit, permafrost areas underneath the pit lake are expected to gradually thaw. Thermal assessments have indicated this process would take hundreds of years (Golder 2018a). The pit lake would eventually reduce the permafrost depth in the pit surrounding ground, but this process could take significantly longer time (in the order of 10,000 years) to complete.

3.3.3 Thermal Monitoring

A total of eight thermistors are currently active in the area of the future pit. Some of the existing thermistors may be destroyed during pit mining. Additional thermal investigations around the pit at shallow depth may be undertaken; the need for this will be defined during mining.

For/if any thermistors remain active or are installed in this area, they may be connected to data loggers for automatic data collection and data storage. Data will be reviewed periodically or as-needed, and results will be summarized in annual monitoring reports during operation and for five years after closure. The frequency of reporting may be modified in time as the thermal regime of the area stabilizes.

3.4 WHALE TAIL LAKE SHORE

The shore of Whale Tail Lake south basin will be affected by increased water levels upstream of the Whale Tail dike, while the shores of the Whale Tail Lake north basin will be affected by lake dewatering downstream of the dikes, mining of open pit, and re-flooding after breaching of dewatering dikes during closure of the facilities.

The design lake level of El. 156 m upstream of the Whale Tail Dike is about 3.5 m higher than the current average lake water level. This will result in flooding of part of the lake shore and shallow thawing of the upper portion of the permafrost during operations. Given the short mine operation period, the impact is anticipated to be small. Deeper portions of the permafrost in newly flooded

areas upstream of the dikes are not expected to be effected significantly. After the dewatering dikes are breached, the original lake level will be restored and permafrost conditions will recover gradually as the lake water level lowers.

There are thermistors currently installed on the lake shore of Whale Tail North Basin. These thermistors will monitor thermal conditions on the shore prior to, during and after operations into post-closure.

There are no thermistors installed on the lake shore of Whale Tail South Basin upstream of the dike. Given the short period of time (three to four years) during which the lake shore in the South Basin will be flooded, the effects on the permafrost will be temporary and limited to the shallow upper portion of the ground. It is not considered necessary to install additional thermistors in that area.

Thermistors on the shore of Whale Tail North Basin will be connected to data loggers for automatic data collection and storage. Data will be reviewed periodically or as-needed, and results will be summarized in annual monitoring reports during operations and for five years after closure.

4 CLOSURE

The Thermal Monitoring Plan presented in this document is intended to constitute a guide for instrumentation and monitoring of the Project facilities to evaluate the effects of mine developments on the thermal regime of the natural ground and relevant site infrastructures.

The instrumentation program at the different facilities will consist primarily of thermistor strings installed horizontally, vertically and at angles as needed. Data obtained from the thermistor strings will constitute the primary source of information for evaluation of changes in the thermal regime of the permafrost basin associated with construction, operations, and closure of the mine facilities.

The actual schedule of instrumentation and quantity, type of instrument, location, depth and length of the thermistor strings to be installed will be defined specifically for each facility based on the mining plan, construction schedule and accessibility to be defined during mine operation. The activities listed in this Plan will be periodically reviewed to reflect the dynamics of site development and operation. Decisions on thermistor installation will be based on the results of the monitoring program, as deemed required for a given area to assess effects on the thermal regime of the ground or facility.

Installation of different types of instrumentation such as vibrating-wire piezometers, monitoring wells and oxygen probes may be considered in the future in areas such as the WRSF if there is a need to better understand the process of water percolation, air-flow convection and heat generation within the pile.

APPENDIX A

Subject: Summary of Thermal monitoring at Whale Tail Site from 2015-2018

This document present a summary of the thermal monitoring at the Amaruq project from 2015 to 2018. During that period, thermistor strings were installed around the Amaruq site to support various studies for the construction of the different infrastructures of the project.

A total of 14 boreholes for thermistors were installed between May 2015 and December 2018. 10 of the installation are still functional and continue to be monitored on a bi-weekly basis, either manually or with Dataloggers.

Table 1 present the thermistors installation, their coordinate and their status.

Figure 1 show a plan view of the location of the thermistors installed between May 2015 and December 2018.

Figure 2 to 15 present the thermistors data with a description of the instrument and the thermal results highlights for the active instruments.

Table 1: Permanent and temporary thermistors installation coordinates and status

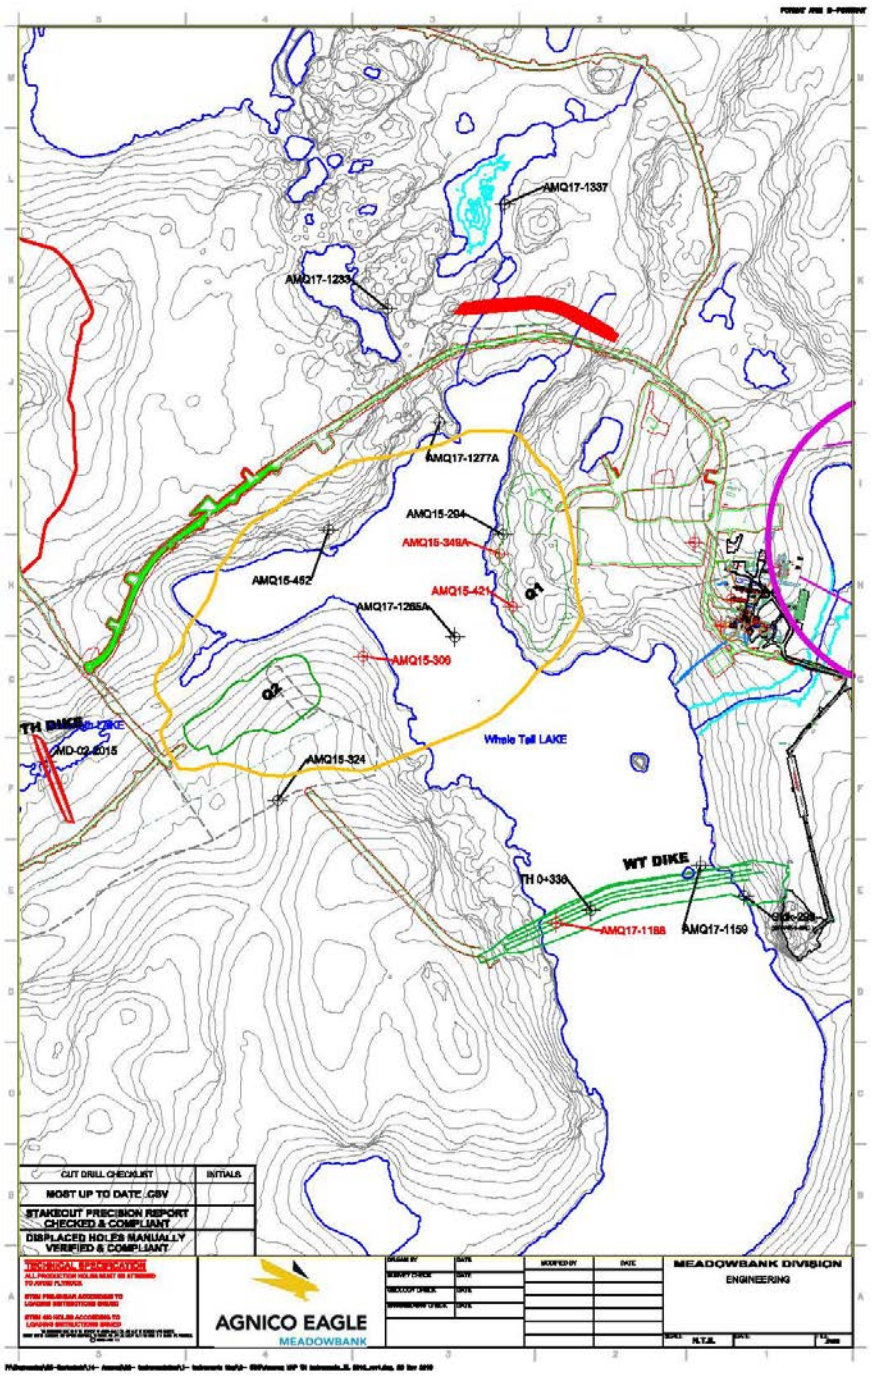

Figure 1: Amaruq Thermistor Location Plan View (active instrument in black)

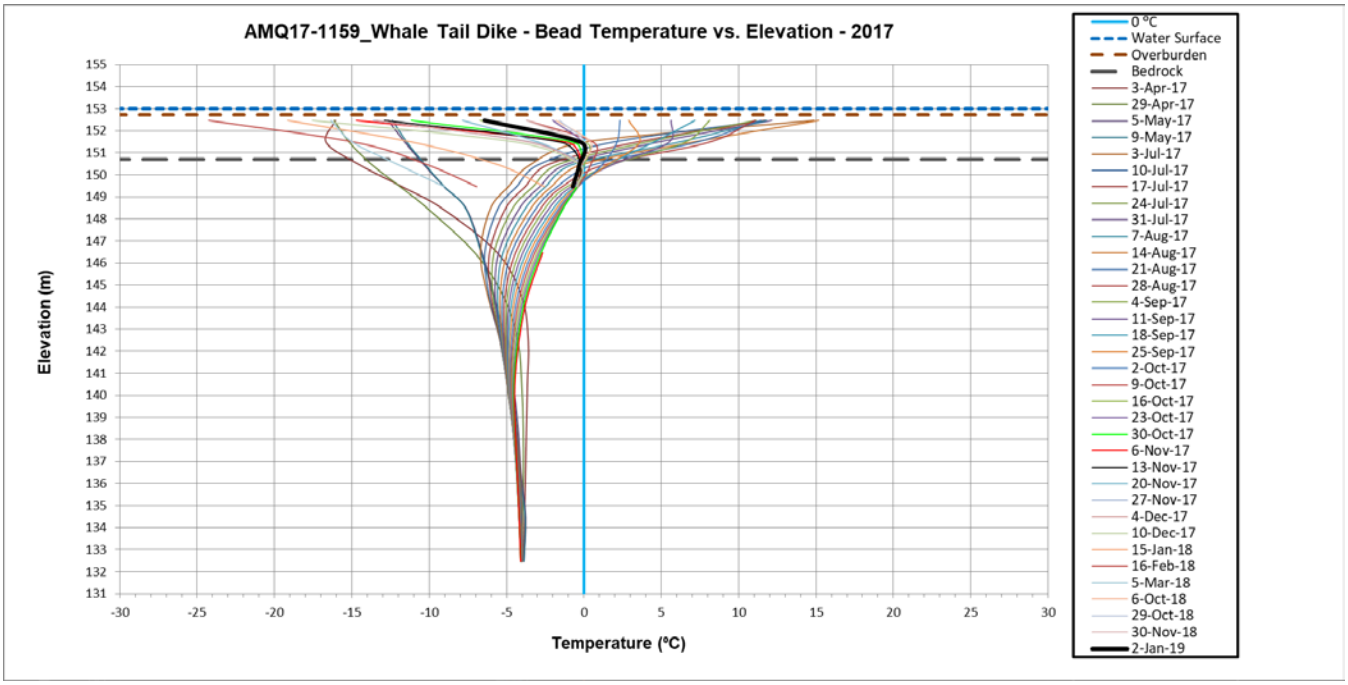

Figure 2: Temperature profile (Celsius) as a function of elevation (masl) from installation to January 2019 for thermistor AMQ17-1159

Location of the instrument:

- In proximity of the east abutment of Whale Tail dike; in shallow water (0.3m).
- Depth : 20.2m

Monitoring objective:

- Thermal condition of the surficial overburden under Whale Tail dike foundation

Thermal results highlights:

- Active layer: 3.2m (from elev. 152.7 to 149.5)
- Depth of zero annual amplitude: 13.7m (from elevation 152.7 to 139)
- Steady permafrost temperature of around -4ºC down to bottom of hole (elev 132.5)
- Geothermal gradient: Thermistor not deep enough to evaluate gradient
- Permafrost thickness: > 17m; Thermistor not deep enough to reach bottom of permafrost layer.

Annual variation in ground temperature: Similar from 2017 to 2018.\

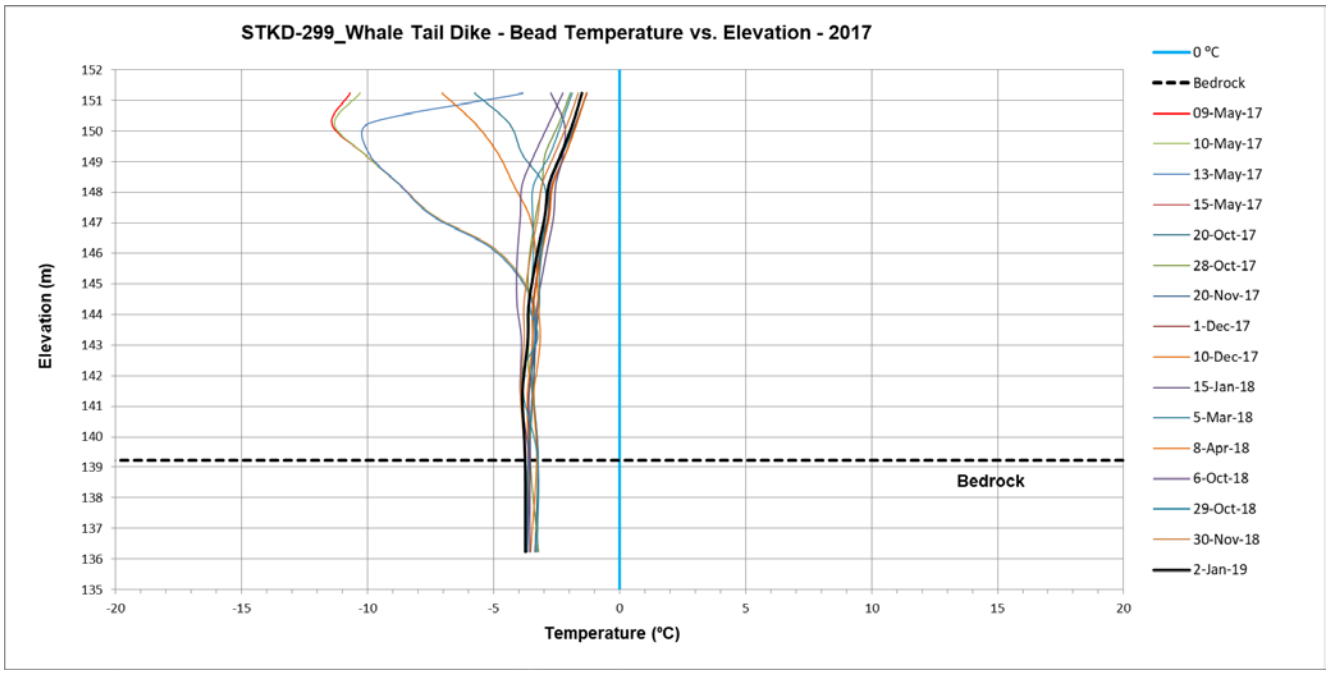

Figure 3: Temperature profile (Celsius) as a function of elevation (masl) from installation to January 2019 for thermistor STKD-299

Location of the instrument:

- In proximity of the east abutment of Whale Tail dike; on the shore.
- Depth : 16.0m

Monitoring objective:

- Thermal condition of the surficial overburden under Whale Tail dike foundation

Thermal results highlights:

- Active layer: Unknown ; Lack of surficial thermistor beads
- Depth of zero annual amplitude: 8.4m (from elevation 152.4 to 144)
- Steady permafrost temperature of around -3.7ºC down to bottom of hole (elev 136.2)
- Geothermal gradient: Thermistor not deep enough to evaluate gradient
- Permafrost thickness: > 15m; Thermistor not deep enough to reach bottom of permafrost layer.
- Annual variation in ground temperature: Similar from 2017 to 2018.

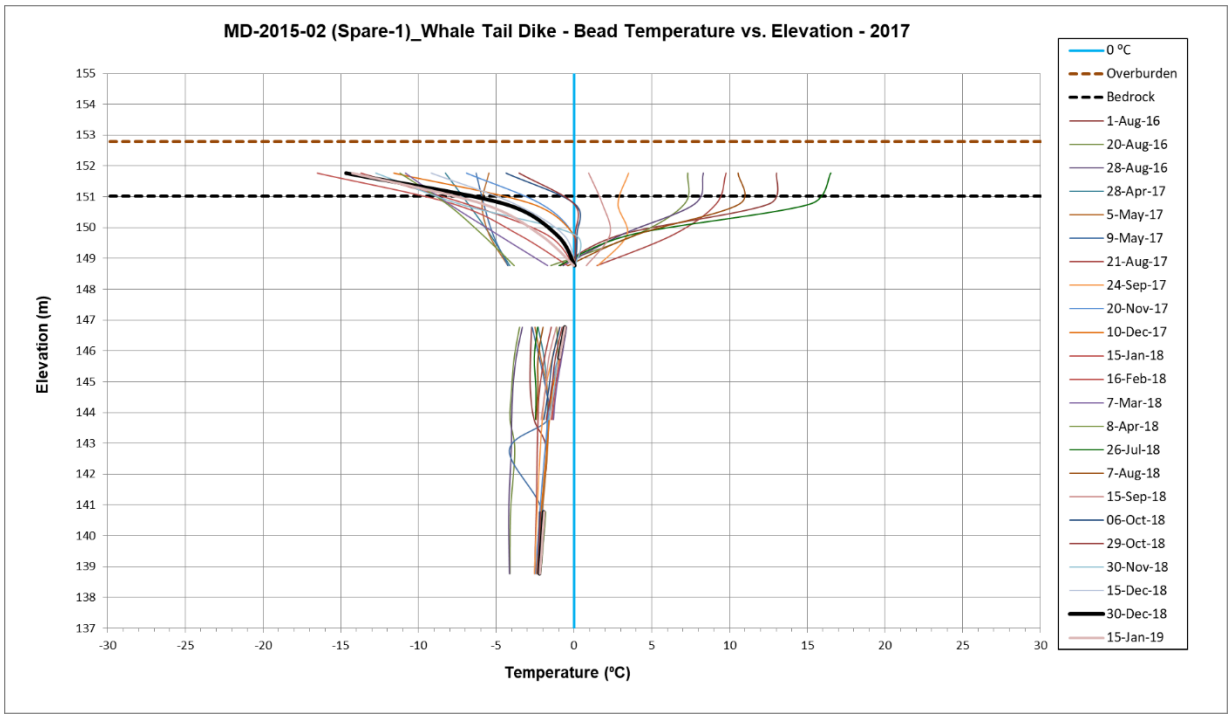

Figure 4: Temperature profile (Celsius) as a function of elevation (masl) from installation to January 2019 for thermistor MD-2015-02

Location of the instrument:

- In proximity of the deepest portion of Mammoth dike; in shallow water (<0.3m).
- Depth : 14.1m

Monitoring objective:

- Thermal condition of the surficial overburden under Mammoth dike foundation

Thermal results highlights:

- Active layer: 4.3m (from elev. 152.8 to 148.5)
- Depth of zero annual amplitude: 11.8m (from elevation 152.8 to 141)
- Steady permafrost temperature of around -2.1ºC down to bottom of hole (elev 138.7)
- Geothermal gradient: Thermistor not deep enough to evaluate gradient
- Permafrost thickness: > 9.8m; Thermistor not deep enough to reach bottom of permafrost layer.
- Annual variation in ground temperature: Similar from 2017 to 2018. 2016 data looks offset by -1 ºC

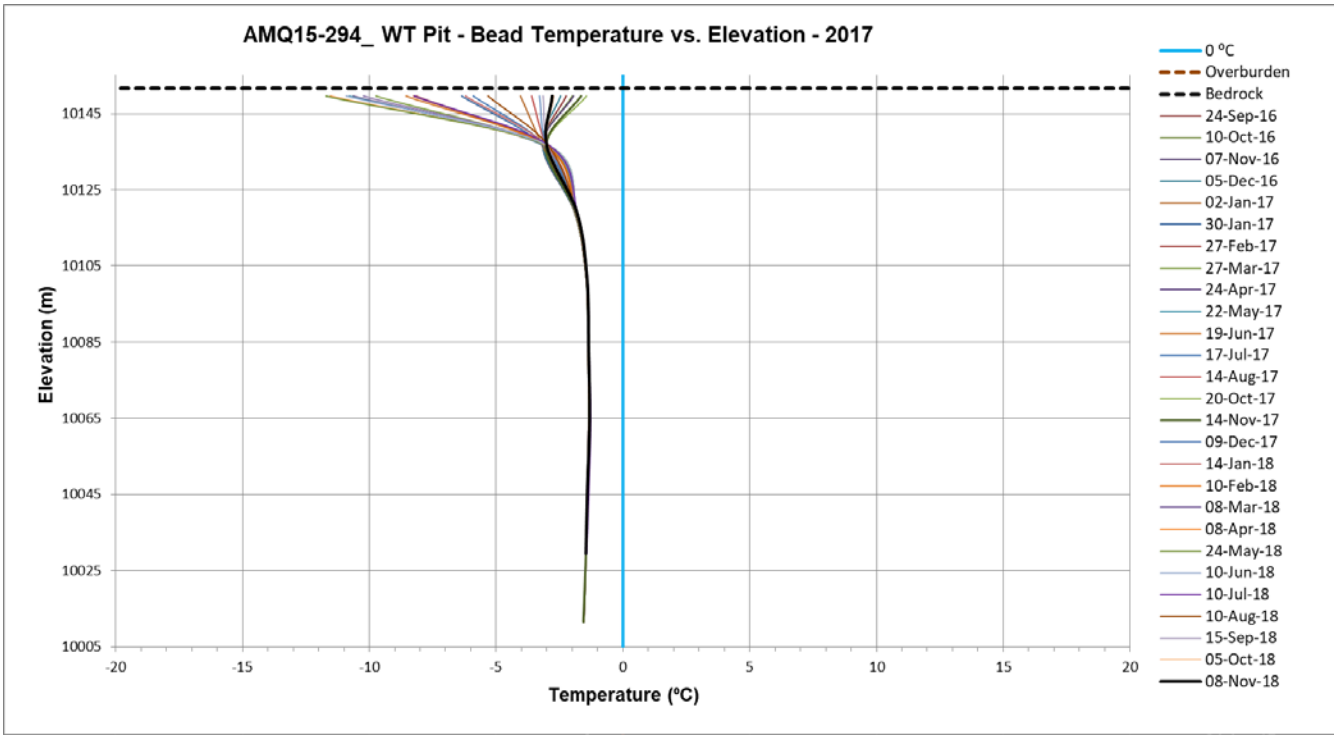

Figure 5: Temperature profile (Celsius) as a function of elevation (masl) from installation to November 2018 for thermistor AMQ15-294

Location of the instrument:

- Within the Whale Tail pit footprint (east wall). On the shore (not the lake).
- Depth : 144.4m

Monitoring objective:

- Thermal condition of the open pit walls (east). Calibration of the global thermal model.

Thermal results highlights:

- Active layer: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Depth of zero annual amplitude: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Steady permafrost temperature of around -1.4ºC down to bottom of hole (elev 011.5)
- Geothermal gradient: Thermistor not deep enough to evaluate gradient
- Permafrost thickness: > 140m; Thermistor not deep enough to reach bottom of permafrost layer.
- Annual variation in ground temperature: Similar from 2016 to 2018. Instrument broken as of nov 2018.

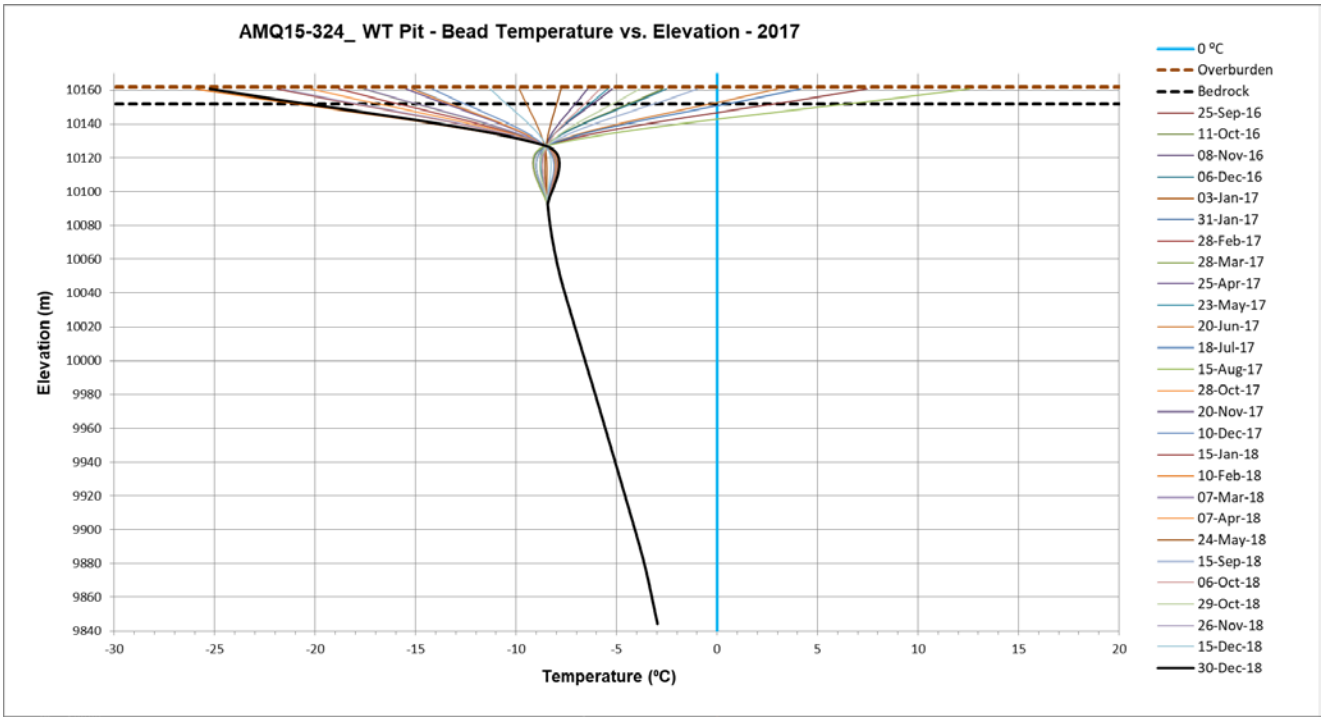

Figure 6: Temperature profile (Celsius) as a function of elevation (masl) from installation to December 2018 for thermistor AMQ15-324

Location of the instrument:

- West of Whale Tail Lake and Whale Tail pit.
- Depth : 317 m

Monitoring objective:

- Thermal condition of deep permafrost (far from talik influence). Calibration of the global thermal model.

Thermal results highlights:

- Active layer: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Depth of zero annual amplitude: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Variable permafrost temperature; from -8.0 ºC (ele 056) to -3 ºC (elev -155)
- Geothermal gradient: approximately +0.024ºC/m
- Permafrost thickness: > 315m; Thermistor not deep enough to reach bottom of permafrost layer.
- Annual variation in ground temperature: Similar from 2016 to 2018.

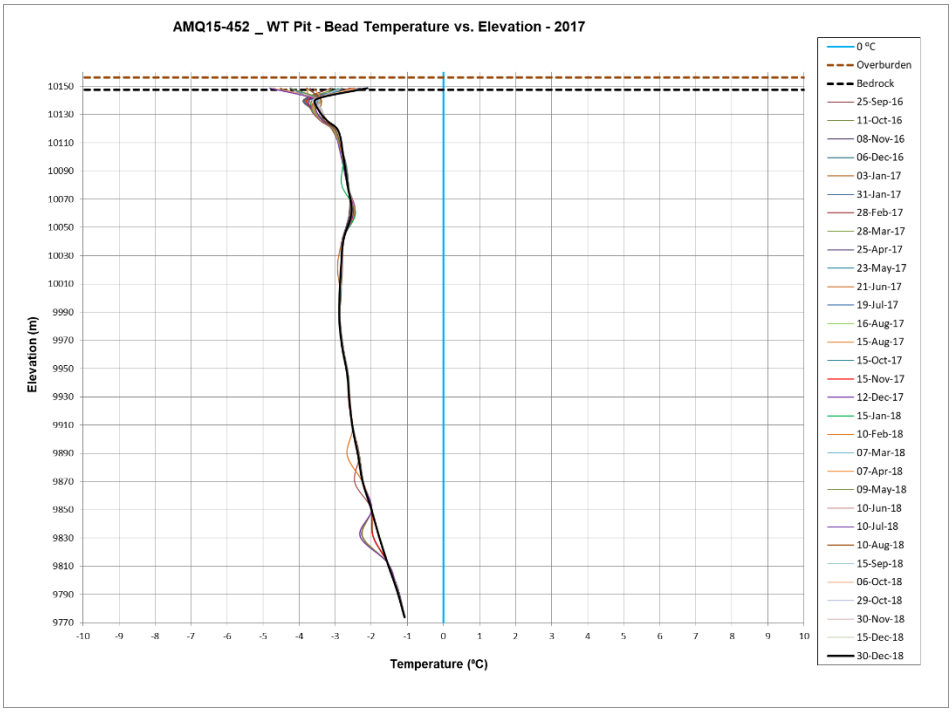

Figure 7: Temperature profile (Celsius) as a function of elevation (masl) from installation to December 2018 for thermistor AMQ15-452

Location of the instrument:

- North of Whale Tail Lake (on the shore); Within Whale Tail pit north walls.
- Depth : 382 m

Monitoring objective:

- Thermal condition of permafrost (near from talik influence). Calibration of the global thermal model.

Thermal results highlights:

- Active layer: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Depth of zero annual amplitude: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Variable permafrost temperature; from -2.9 ºC (ele -016) to -1.0 ºC (elev -226)
- Geothermal gradient: approximately +0.009ºC/m
- Permafrost thickness: > 380m; Thermistor not deep enough to reach bottom of permafrost layer.
- Annual variation in ground temperature: Similar from 2016 to 2018.

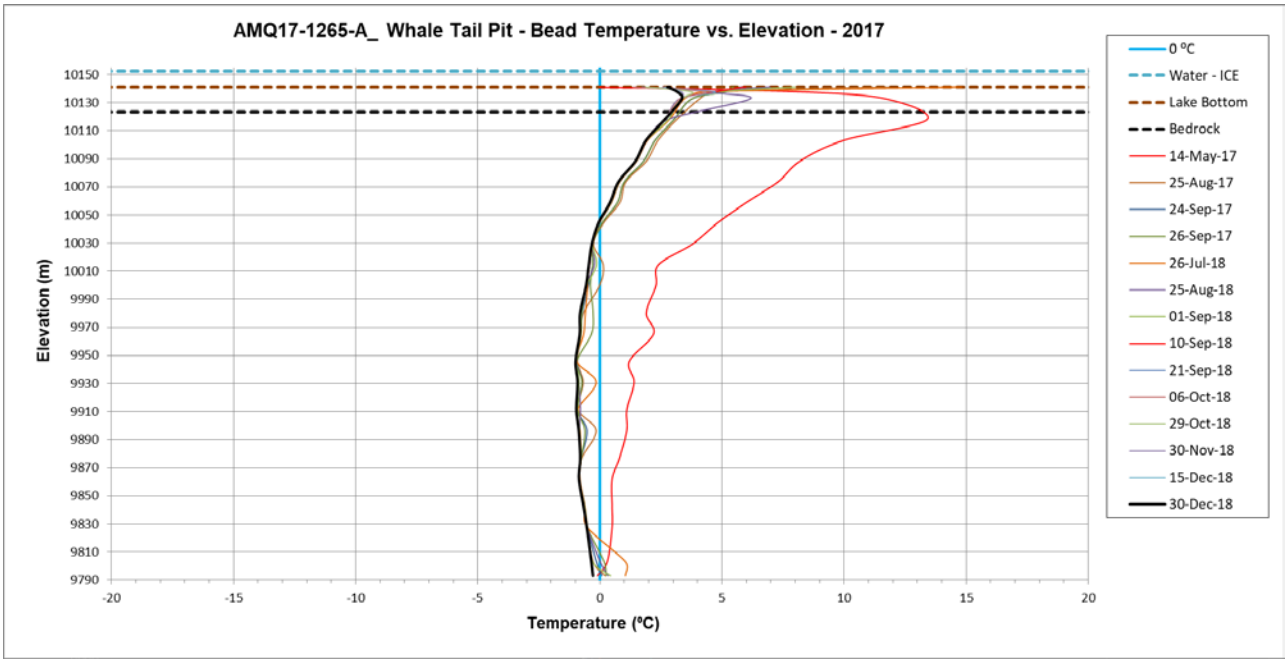

Figure 8: Temperature profile (Celsius) as a function of elevation (masl) from installation to December 2018 for thermistor AMQ17-1265A

Location of the instrument:

- In the middle of Whale Tail Lake (deep portion @ 11m of water);
- Depth : 348 m

Monitoring objective:

- Thermal condition of talik underneath the lake. Calibration of the global thermal model.

Thermal results highlights:

- Active layer: Not applicable – Talik area
- Depth of zero annual amplitude: Not applicable – Talik area
- Depth of talik: 97m (elev 141 to 044)
- Variable permafrost temperature; from -1.0 ºC (ele -055) to -0.3 ºC (elev -207)
- Geothermal gradient: approximately +0.00046ºC/m
- Permafrost thickness: approximately 250m (elev. 044 to -207)
- Annual variation in ground temperature: Similar from 2016 to 2018.

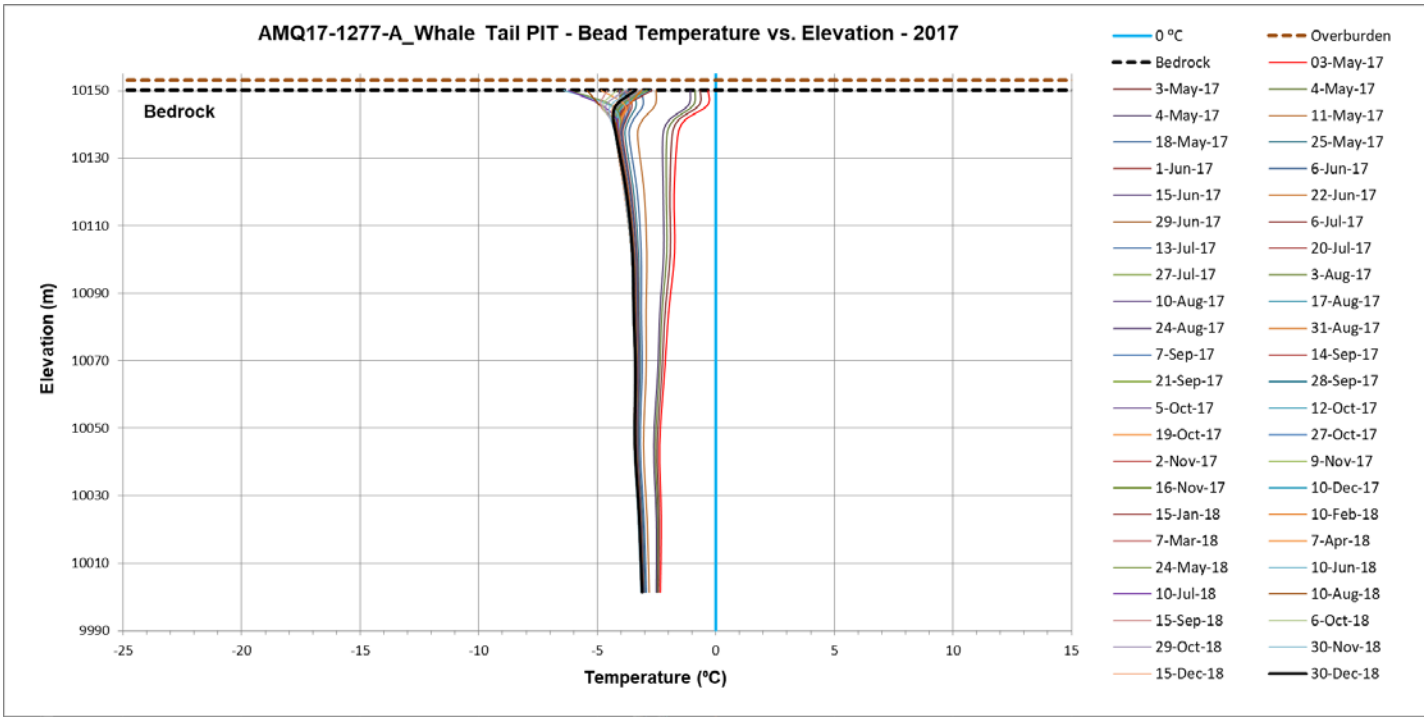

Figure 9: Temperature profile (Celsius) as a function of elevation (masl) from installation to December 2018 for thermistor AMQ17-1277A

Location of the instrument:

- North East of Whale Tail Lake (on the shore); Within the Whale Tail pit footprint
- Depth : 152 m

Monitoring objective:

- Thermal condition of talik underneath the lake. Calibration of the global thermal model.

Thermal results highlights:

- Active layer: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Depth of zero annual amplitude: Approximately 12m (elev 153 to 141)
- Variable permafrost temperature; from -4.3 ºC (elev 141) to -3.1 ºC (elev 001)
- Geothermal gradient: approximately +0.0086ºC/m
- Permafrost thickness: > 150m; Thermistor not deep enough to reach bottom of permafrost layer.
- Annual variation in ground temperature: Similar from 2017 to 2018. Early 2017 data were under stabilization (post-installation)

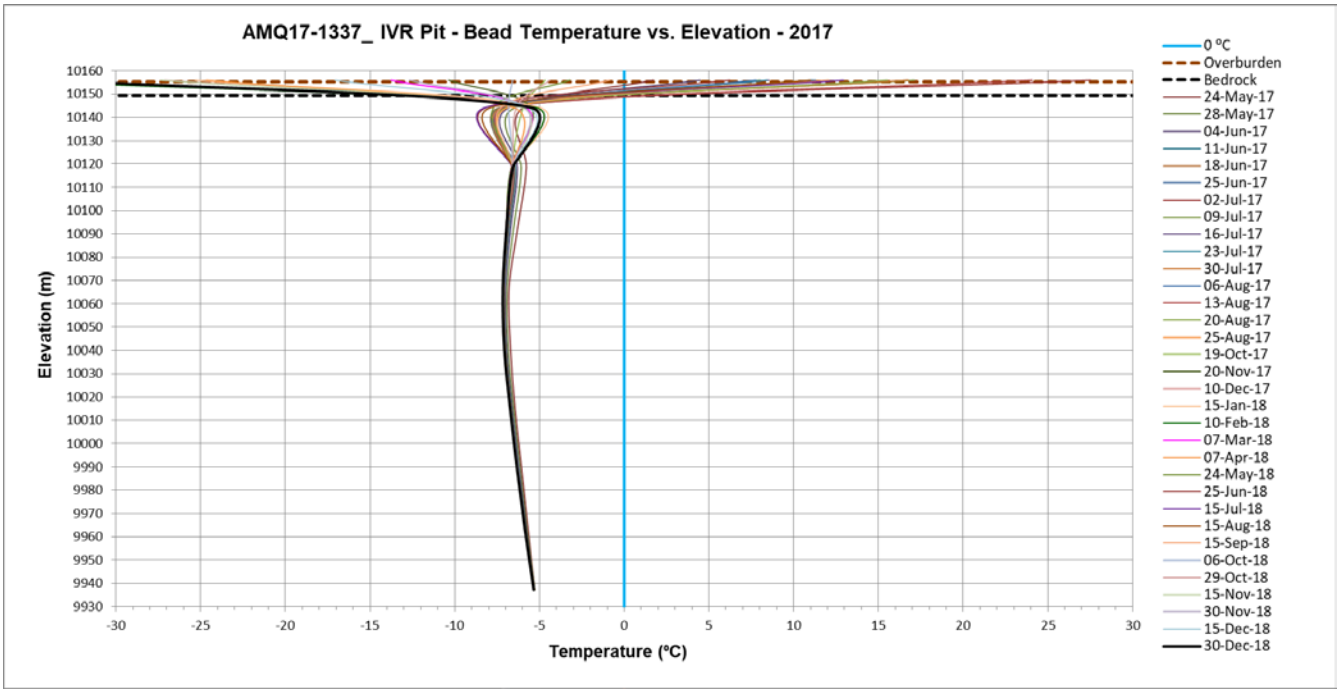

Figure 10: Temperature profile (Celsius) as a function of elevation (masl) from installation to December 2018 for thermistor AMQ17-1337

Location of the instrument:

- Within the IVR pit footprint
- Depth : 218 m

Monitoring objective:

- Thermal condition within the IVR pit area. Calibration of the global thermal model.

Thermal results highlights:

- Active layer: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Depth of zero annual amplitude: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Variable permafrost temperature; from -7.1 ºC (elev 040) to -5.3 ºC (elev -063)
- Geothermal gradient: approximately +0.017ºC/m
- Permafrost thickness: > 215m; Thermistor not deep enough to reach bottom of permafrost layer.
- Annual variation in ground temperature: Similar from 2017 to 2018.

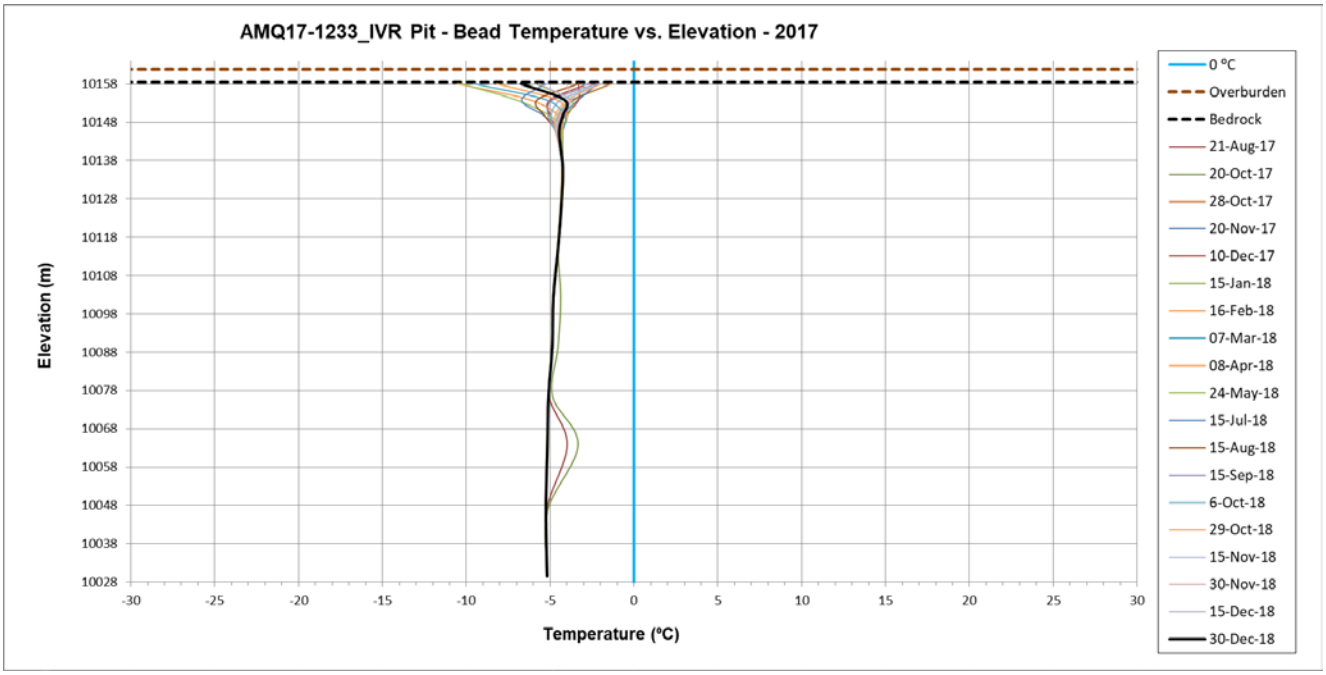

Figure 11: Temperature profile (Celsius) as a function of elevation (masl) from installation to December 2018 for thermistor AMQ17-1233

Location of the instrument:

- Within the IVR pit footprint
- Depth : 132 m

Monitoring objective:

- Thermal condition within the IVR pit area. Calibration of the global thermal model.

Thermal results highlights:

- Active layer: Unknown ; Lack of surficial thermistor beads (not the objective of the instrument)
- Depth of zero annual amplitude: Approximately 25m (from elev 161 to 136)
- Stable permafrost temperature around -5.3 ºC
- Geothermal gradient: Thermistor not deep enough to evaluate gradient
- Permafrost thickness: > 132m; Thermistor not deep enough to reach bottom of permafrost layer.
- Annual variation in ground temperature: Similar from 2017 to 2018.

Non Active thermistors:

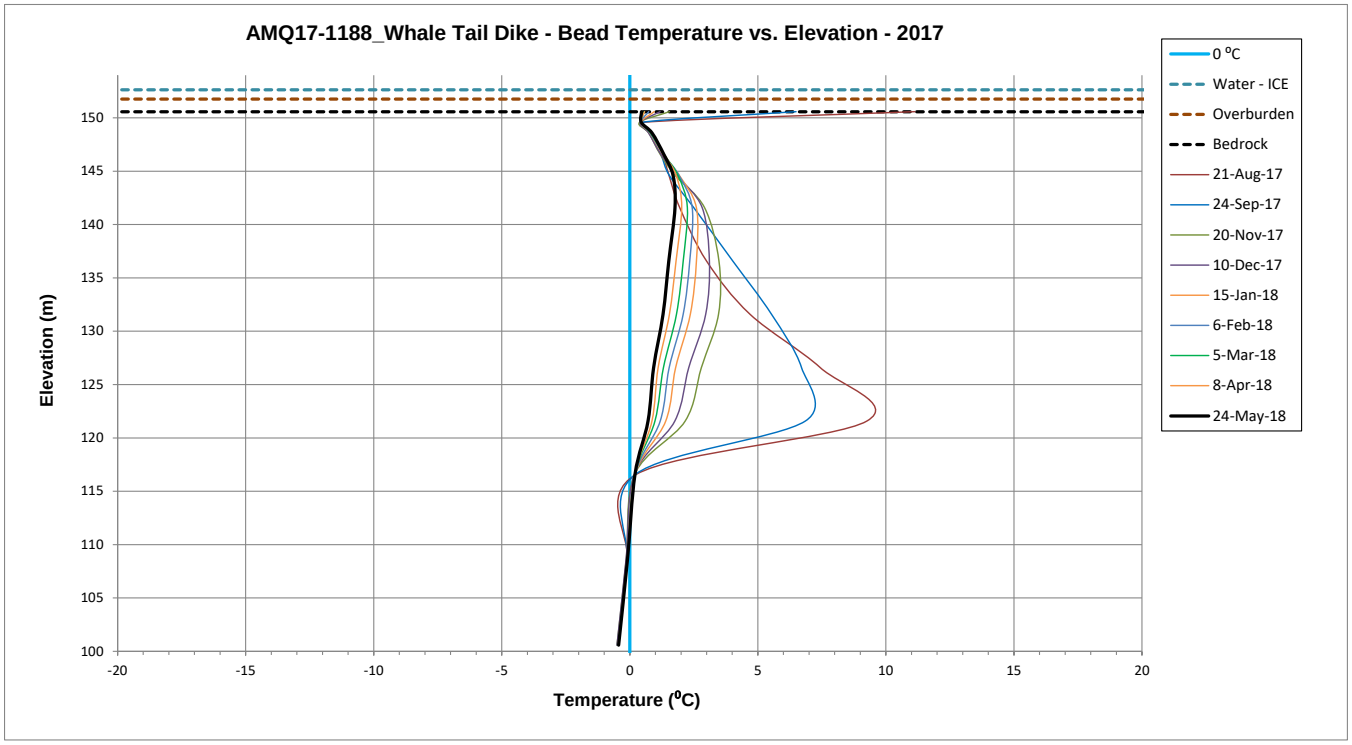

Figure 12: Temperature profile (Celsius) as a function of elevation (masl) from installation to May 2018 for thermistor AMQ17-1188

SECTION 1 • INTRODUCTION

1.1 OBJECTIVE OF THE OMS MANUAL

The objective of this manual is to define the technical aspect related to the operation, maintenance and surveillance (OMS) of the water management infrastructure at the Whale Tail Pit Project operated by Agnico Eagle Mines Limited (AEM), Meadowbank Division.

This manual is intended as a practical document used by the personnel involved in with the Whale Tail Project water management infrastructure. It incorporates operating, maintenance and surveillance procedures recommended by the Canadian Dam Association (CDA) “Dam Safety Guidelines” (CDA 2013 & 2014) and the Mining Association of Canada (MAC) “Developing an Operation, Maintenance and Surveillance Manual for Tailings and Water Management Facilities” (MAC, 2018). This manual was written by the Meadowbank Engineering team with the support of SNC-Lavalin and the Nunavut Engineer of Record.

The objectives of this OMS manual are to define and describe:

- Roles, responsibilities, and level of authority of personnel who perform activities related to the water management infrastructure
- The water management infrastructure covered in the scope of this OMS manual
- Plans, procedures and processes for :
    - The operation, maintenance and surveillance of the Whale Tail Project water management infrastructures to ensure that it functions in accordance with their design, meets performance objectives and link to emergency response planning
    - Evaluating performance of the structures, and report performance results
    - Managing change

This manual contains protocols and information that will assist AEM to operate, maintain, and monitor the water management infrastructure in a safe manner and identify early signs of malfunction.

Element related to design, construction and closure of water management infrastructures, infrastructures related to management of underground water and to water treatment are out of scope of this manual.

1.2 CONTROL OF DOCUMENTED INFORMATION

This OMS manual is a controlled document. The latest version of this document is available in Intelex.

The person responsible for the preparation, update and distribution of this manual is the Engineering Superintendent. Any change to this OMS manual must be submitted to and approved by the Engineering Superintendent who will be responsible to update the OMS manual in Intelex.

It is each user responsibility to ensure that they are using the latest version of this document. In case of issue with retrieving the electronic version of this document, the most up to date paper version of this document will always be kept in the Engineering Superintendent Office.

The Engineering Superintendent is responsible to communicate any change to this manual by e-mail to the distribution list in Table 1-1. The Engineering Superintendent is responsible for maintaining an up-to-date distribution list of this manual.

Table 1-1: OMS Manual Distribution List

Position	Name
General Mine Manager	Luc Chouinard
General Superintendant	Eric Côté / Jacques Proulx
Environment Superintendent	Nancy Duquet-Harvey
Mine Operations Superintendent	Yan Côté, Nicolas P. Deschamps (asst.)
Engineering Superintendent	Pierre McMullen, Miles Legault (asst.)
Maintenance Superintendant	Christian Quirion
Energy & Infrastructures Superintendent	Guillaume Gemme
Engineer of Record, Meadowbank Division	Thomas Lepine

1.3 MANAGEMENT OF CHANGE

This manual will be reviewed on an annual basis at the beginning of Q3 and revised as necessary to accommodate changes in the condition and operation of the facilities. The Engineering Superintendent will be responsible to coordinate this review process.

In conducting the review and update of the OMS manual the following must be taken into account:

- Performance of the structure
- Current life cycle of the structure
- Change since the last review (site condition, critical control, risk profile, personnel, methodology and technology for OMS activities)

In addition to the annually scheduled review, a review may be triggered by a significant event or may need to be updated in response to:

- Planned changes, such as change in surveillance instrumentation or methodologies, or introduction of new instrumentation methodology
- Changes in personnel or roles referred to in the OMS manual
- Other changes that may occur that need to be addressed prior to the next scheduled review of the OMS manual

The update need to be completed in a timely manner following the document control criteria specified in Section 1.2.

As a good practice the Engineering Superintendent should organise on a yearly basis a session to present the change in the OMS manual to the person in its distribution list.

1.4 REQUIRED LEVELS OF KNOWLEDGE

To preserve the integrity of the operation of these structures, the personnel must have a good comprehension of the factor that can impact the performance of the water management infrastructures. It must also be know that any deviation can signify the emergence of a problem and the role that each person must have in the operation, maintenance and surveillance of these infrastructures.

It is the responsibility of each person in the distribution list of this manual to be familiar with it and understand its whole content. They also need to ensure that everyone under their supervision who's duty involve task related to the operation, maintenance or surveillance of any component of the water management infrastructures have the appropriate level of knowledge and the resources to comply with the protocol presented in this document.

1.5 LINKAGE WITH EMERGENCY RESPONSE PLAN

An emergency is a situation that poses an impending or immediate risk to health, life, property, or the environment and which requires urgent intervention to prevent or limit the expected outcome.

This OMS manual address conditions related to operation under normal or upset conditions, as opposed to emergency situation. An Emergency Response Plan (ERP) describes measures the Owner and, in some cases, external parties will take to prepare for an emergency, and to respond if an emergency occurs.

An OMS and ERP manual must be aligned, as a result this OMS manual contains the following information (refer to Section 4 and 5):

- Performance, occurrences, or observation that would results in an emergency being declared
- Roles and responsibilities of key personnel in transition from normal or upset conditions to an emergency
- Actions to be taken to transition from normal or upset conditions to an emergency situation

Once an emergency has been declared reference must be made to the Emergency Response Plan (Reference included in Table 1-2). The most recent version of the ERP can be found on Intelex and in the Engineering Superintendent Office

Table 1-2 Emergency Response Reference Documents

Document	Current Revision
Emergency Response Plan	Updated by AEM. Version 12, January 2018. (Intelex)

SECTION 2 • ROLES AND RESPONSIBILITIES

A functional chart for the water management infrastructure at the Whale Tail project is shown in Figure 2-1.

The roles and responsibilities of the key personnel involved in the water management infrastructure of the Whale Tail Project are shown in Table 2-1. Contact information for each position is indicated in Table 2-2.

Personnel who have task directly related to the water management infrastructure need to receive training when they start in the position to ensure they understand their roles and responsibility related to this OMS manual.

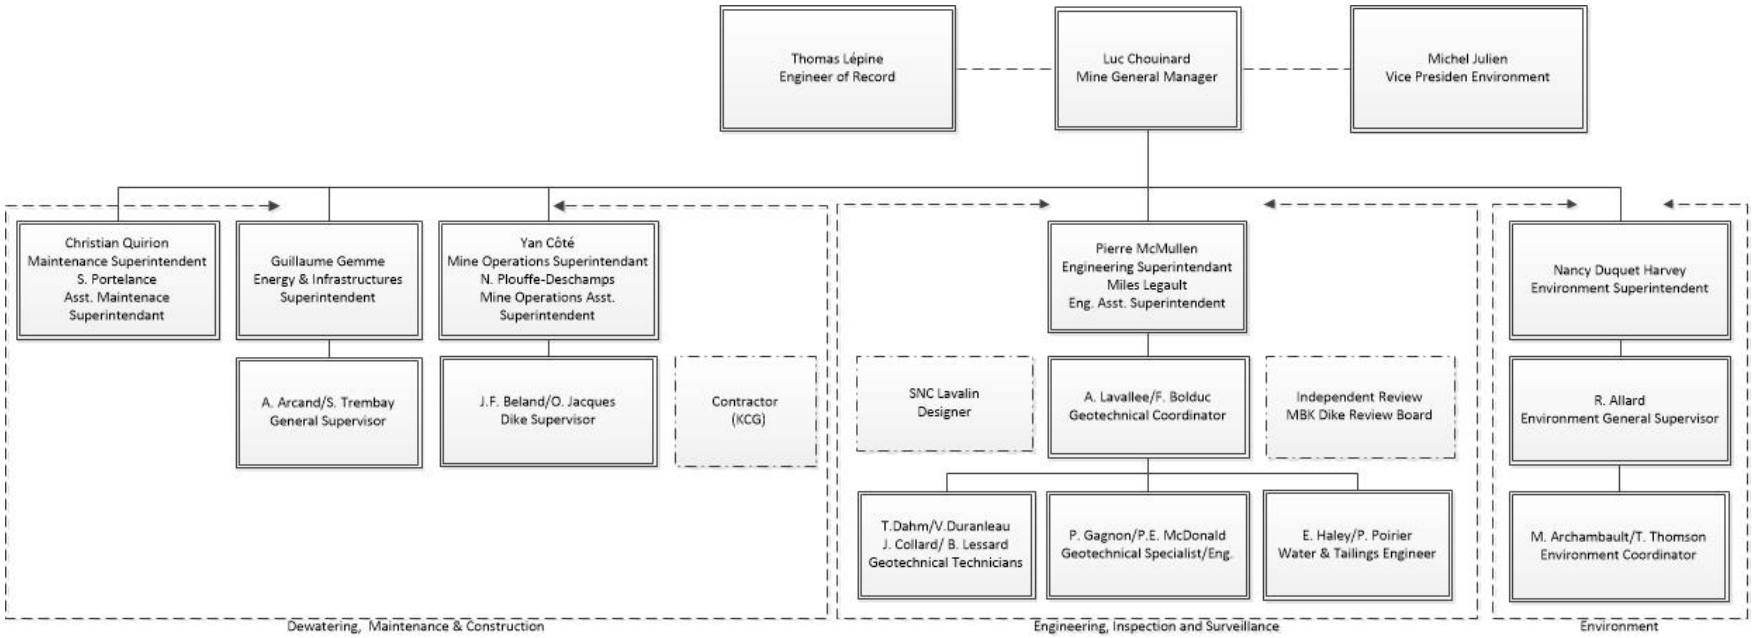

Figure 2-1: Organizational structure

Table 2-1: Responsibilities related to Whale Tail Water Management

Role	Responsibilities
Vice-President Environment	• Be aware of key outcome of water management risk assessment and how these risks are being managed • Has accountability and responsibility for putting in place appropriate management structure • Assign responsibility and appropriate budgetary authority for water management and defines the personnel duties, responsibility and reporting relationships, supported by job description and organisational charts to implements the water management system though all stages in the facility life cycles • Provide assurance to AEM and its Community of Interest that the water management infrastructure are managed responsibly
General Mine Manager	• Identifies the scope of work and budget requirement for all aspect of water management • Approve budget for OMS related activity • Establish an organisational structure with Roles and Responsibility that meets the operational needs • Delegate specific tasks and responsibilities for water management to qualified personnel • Liaise with independent reviewer (MDRB) as required
Engineer of Record (EoR)	• Input into the OMS activities in accordance with the design • Receive and review the OMS manual on a regular basis • Receive and review dewatering performance data at a frequency determined based on the risks • Either confirm operation is compliant or identify deviations from performance objectives and advise the Owner with recommendations • Advise on contemplated change on the structure operation • Maintain records relating to design construction and operation • Participate in inspection and independent review
Independent Reviewer – Meadowbank Dike Review Board (MDRB)	• Provide independent, objective, expert commentary, advice and recommendations, to assist in identifying, understanding, and managing risk associated with water management facilities
Engineering Superintendent	• Revise and update the OMS Manual to reflect as-built conditions and any other changes. • Review and update OMS manual into Intelex • Maintain up to date distribution list of the OMS Manual. • Establish a formal relationship with the EOR to ensure operation is compliant with design intent • Identify when/where contemplated operational changes are a potential deviation from the design intent and engage the EoR and Designer as part of processes to manage change

Role	Responsibilities
	• Coordinate work force as required for monitoring and maintenance.
Mine Operations Superintendent / Dike Supervisor	• Maintain access to the structure and seepage collection systems, including making road repairs, controlling dust and removing snow. • Carry out field maintenance related to earthwork as required, • Supervise Mine Contractor for aspect related to earthwork construction and maintenance
Geotechnical Coordinator	• Supervise the work of the geotechnical engineer, geotechnical technician and water and tailings engineer
Geotechnical Engineer	• Carry out inspections of the structures as required in the OMS Manual. • Carry out instrument monitoring as required in the OMS Manual. • Review and analyse surveillance data to evaluate dike performance with respect to design parameters. • Review and distribute surveillance reporting as required in the OMS Manual • Analyse geotechnical instrumentation monitoring data to evaluate dike performance with respect to design parameters
Geotechnical Technician	• Carry out inspections of the structures as required in the OMS Manual. • Monitor instrumentation as required in the OMS Manual. • Maintain instrumentation, readout units, data acquisition system and cabins • Responsible for data acquisition as required in the OMS manual • Prepare reports on instrumentation readings, dike performance, visual observations, etc. as required in the OMS Manual.
Water & Tailings Engineer	• Carry out inspections of the structures as required in the OMS Manual. • Carry out instrument monitoring as required in the OMS Manual. • Coordinate equipment, labour, materials and maintenance activities required for pumps and pipelines associated with dewatering, seepage collection systems and any runoff diversions. • Prepare reports on instrumentation readings, dike performance, visual observations, etc. as required in the OMS Manual.
Environment Department Superintendent / General Supervisor / Coordinator / Technician	• Ensure monitoring of water quality and total suspended solids as required in the water management plan • Review environmental monitoring data for compliance with Water License and regulations and to determine dike performance with respect to design parameters. • Liaise with external stakeholders including NIRB, Nunavut Water Board, NGO's, government agencies.

Role	Responsibilities
Energy & Infrastructures Superintendent / General Supervisor / Pump crew supervisor / electrical supervisor	• Installation and operation of pumps and pipeline (electrical, mechanical) • Maintain and service pumps and pipelines • Coordinate equipment, labour and materials for maintenance of electrical and mechanical equipment • Carry out field operations including pumping. • Carry out field maintenance on pumps and pipeline including electrical and mechanical repairs.
Mine Contractor	• Rent equipment and manpower for construction and maintenance of water management infrastructure
Design Engineer	• Advise on contemplated change to the structure design • Advisor on structure performance as required • Participate in inspection and independent review as required
Maintenance Superintendent/ Pump mechanics	• Ensure preventive maintenance is carried out regularly on each pumping equipment • Repair pumping equipment as required • Update and maintain a list of operational pumping equipment • Keep records of maintenance on pumping equipment

SECTION 3 • WATER MANAGEMENT INFRASTRUCTURES DESCRIPTION

The Whale Tail Project is a deposit on the Amaruq property which is a satellite operation to the Meadowbank Mine. The Amaruq property is a 408 km² site located on Inuit Owned Land, approximately 150 km north of the Hamlet of Baker Lake and approximately 50 km northwest of the Meadowbank Mine in the Kivalliq region of Nunavut. A description of the physical conditions of the site, as well as a geological and geotechnical conditions can be found in the design document of each structure referred to in this section.

The Whale Tail Project includes the construction and operation of a series of water management infrastructure as shown in Figure 3-1. Table 3-1 indicate the water management infrastructure of the Whale Tail Project

Table 3-1: Description of the water management infrastructure of the Whale Tail Project

Infrastructure	Function
Whale Tail Dike	Non-contact water retention and dewatering structure. WTD isolates the Whale Tail pit mining activities from Whale Tail Lake
Mammoth Dike	Non-contact water retentions structure. Isolates the Whale Tail pit mining activities from Mammoth Lake
WRSF Dike	Contact water retention structure. Prevents contact water from snow melt and runoff from direct precipitation on the waste rock stockpile from reporting into Mammoth Lake by storing it in the WRSF pond
WRSF Pond and pumping infrastructure	Pond formed by the WRSF Dike. It stores contact water which is pumped to the attenuation pond
North-East Dike (NE)	Non-contact water retention structure. Prevents runoff from the watershed behind it from reporting into the Whale Tail Pit by accumulating the water in the NE pond
NE Pond and pumping infrastructure	Pond formed by the NE dike. It stores non-contact water which is discharged to the environment or to the attenuation pond based on water quality
Attenuation Pond and pumping infrastructure	Pond formed by the dewatering of the Whale Tail North basin. It stores contact water which is pump to a water treatment plant (WTP) and then discharged through an approved diffuser

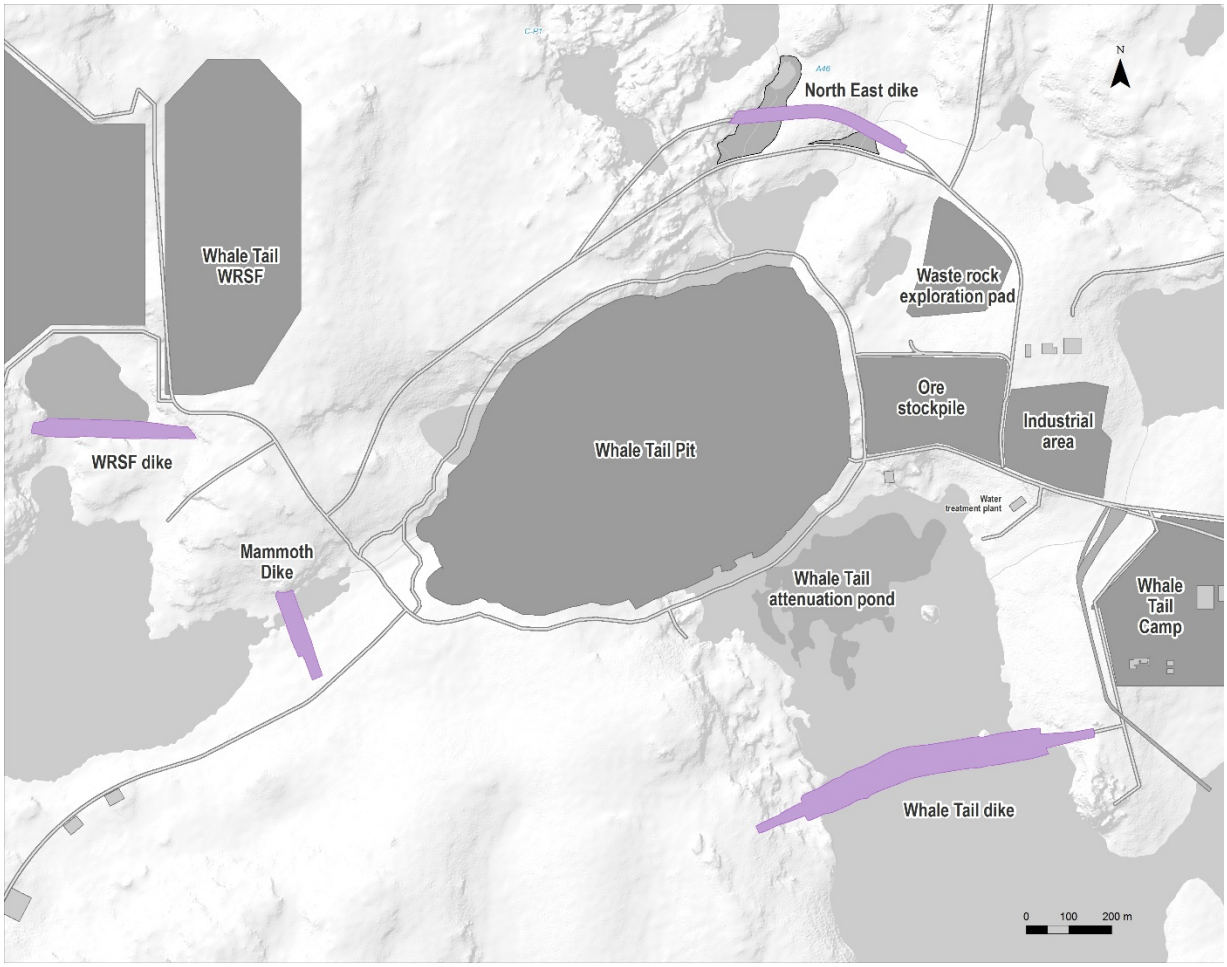

Figure 3-1: Site Plan and Water Management Infrastructure Location

3.1 WHALE TAIL DIKE

Whale Tail Dike (WTD) is a structure to isolate the Whale Tail Pit from Whale Tail Lake. WTD is located on a shallow plateau of the lake floor with an approximate 2 m depth of water. This plateau is located between deeper sections of the lake with water depths of about 12 m.

The downstream side of the dike will be dewatered and the upstream side of the dike will allow a 3.5 m raise of the water level at which time discharge will occur through the South Whale Tail Diversion Channel (SWTDC).

3.1.1 Whale Tail Dike - Design and Construction

Reference to key document for the design and construction of Whale Tail Dike are presented in Table 3-2. Table 3-3 summarise the main design criteria of WTD.

Table 3-2: Reference documents for Whale Tail Dike Design and Construction

	As-built (to come 90 days after end of construction)	NA	NA

Table 3-3 Design criteria for Whale Tail Dike

Use	Water type	Classification (CDA, 2013)	Inflow Design Flood	Water Level (m)		Crest Elevation (m)
				Normal	Design Flood	
Water Retention / Dewatering	Non-contact	High	1/3 between 1000-year and PMF[1]	156.0	157.0	159.0
Note 1: PMF means Probable Maximum Flood						

The construction of Whale Tail Dike started on July 2018 and ended on February 2019. This structure is a zoned rockfill dike with a core composed of a dynamically compacted fine filter. The low permeability element of this structure is a cement-bentonite (CB) cutoff wall consisting of secant piles drilled through the densified fine filter core.

The main highlight of the dike construction are summarised below:

- The South Whale Tail Diversion Channel will reroute the water accumulation on the upstream of the dike. This channel is designed with the same design flood as for Whale Tail Dike and will be built before freshet 2020;
- The dike is made of NPAG and NML material;
- The cutoff wall was constructed through a central zone of granular material referred to as the fine filter zone. A coarse filter zone is provided between the fine filter and the end dumped upstream and downstream rockfill zones;
- At the west abutment, the WTD alignment crosses an esker which extends well below lake level and contained a frozen core. The esker was excavated to about elevation 153 m. below that elevation, a key trench to the bedrock was progressively excavated in the thawed esker to expose its surface. At the east abutment, the strategy the active layer was removed during the summer season in order to reduce expected settlement and the impact of thaw settlement;
- The foundation preparation within the lake section of the key trench of WTD consisted of underwater excavation of the lakebed soils to the bedrock surface;
- A grout curtain was installed where the bedrock was in unfrozen condition. The grout holes were carried out from the crest at a 0.7 m upstream offset from the secant pile wall;

3.2 MAMMOTH DIKE

Mammoth Dike is a water retaining infrastructure built to isolate the Whale Tail Pit from Mammoth Lake. Mammoth Lake receives water from Whale Tail Lake through the SWTDC, treated water from the Attenuation Pond and from the North-East Sector. Mammoth dike is located across the northeast finger of the Mammoth Lake.

3.2.1 Mammoth Dike – Design and Construction

Reference to key document for the design and construction of Mammoth Dike are presented in Table 3-4. Table 3-5 summarise the main design criteria of Mammoth Dike.

Table 3-4: Reference documents for Mammoth Dike Design and Construction

	As-built (to come 90 after end of construction)	NA	NA

Table 3-5: Design Criteria for the Mammoth Dike

Use	Water Type	Classification (CDA, 2007/13)	Inflow Design Flood	Water Level (m)		Crest Elevation (m)
				Normal	Design Flood	
Water Retention	Non-Contact	High	1/3 (1,000-PMF)	Low or no water	153.5	155.0

The construction of Mammoth Dike occurred from February 2019 to March 2019 to maintain the frozen condition of the foundation. This structure is a zoned rockfill dike with a filter system. The low permeability element of the dike consist of a bituminous geomembrane (BGM) installed on the

upstream face anchored in a key trench with fine filter amended with bentonite (FFAB). The key trench is excavated in frozen glacial till or bedrock.

The main highlight of the dike construction are summarised below:

- The dike was constructed with NPAG and NL material
- Blasting activity was required for foundation excavation

3.3 WRSF DIKE

WRSF dike is a water retention infrastructure designed to prevent contact water from the Whale Tail waste rock storage facility (WRSF) accumulating in the WRSF pond from reporting to Mammoth Lake. The water collected in the WRSF pond located upstream of the dike is pumped to the Attenuation Pond and treated prior to being discharged. An area of approximately 109 ha drains towards the WRSF pond. The WRSF dike is located south of the Whale Tail WRSF.

3.3.1 WRSF Dike – Design and Construction

Reference to key document for the design and construction of WRSF Dike are presented in Table 3-6. Table 3-7 summarise the main design criteria of WRSF Dike.

	As-built (to come 90 days after end of construction)	NA	NA

Table 3-7: Design Criteria for the WRSF Dike

Use	Water Type	Classification (CDA, 2014)	Inflow Design Flood	Water Level (m)		Crest Elevation (m)
				Normal	Design Flood	
Runoff storage	Contact	Low	100	155.0	157.8	158.4

The construction of WRSF Dike occurred from January to February 2019 to maintain the frozen condition of the foundation. This structure is a zoned rockfill dike with a filter system. The low

permeability element of the dike consist of a bituminous geomembrane (BGM) installed on the upstream face anchored in a key trench with fine filter amended with bentonite (FFAB). The key trench is excavated in frozen glacial till or bedrock.

The main highlight of the dike construction are summarised below:

- The dike is constructed with NPAG and NL material
- Foundation excavation in the key trench area was done in the fall of 2018 to avoid blasting and aggrade frost penetration

3.4 NORTH-EAST DIKE

The North-East Dike (NE) dike is designed to prevent non-contact water from the Nemo Lake watershed from reporting into Whale Tail Pit. The NE Dike is located south of the Whale Tail Pit.

Water from the pond that will be created on the upstream side of the dike will be periodically pumped out and treated for suspended solids prior to being discharged to the environment.

3.4.1 North-East Dike– Design and Construction

Reference to key document for the design and construction of NE Dike are presented in Table 3-8. Table 3-9 summarise the main design criteria of NE Dike.

Table 3-8: Summary of key reference documents for the dikes

Table 3-9: Design criteria for NE Dike

Use	Water Type	Classification (CDA, 2014)	Inflow Design Flood	Water Level (m)		Crest Elevation (m)
				Normal	Design Flood	
Runoff storage	Non-contact	Significant	100 – 1000 yr	No water	156.7 (1)	157.5
Note 1: Above this elevation, water is discharged towards Nemo Lake. The integrity of the dike will not be at risk of failure.						

The construction of NE Dike occurred from January to February 2019 to maintain the frozen condition of the foundation. This structure is a zoned rockfill dike with a filter system. The low permeability

element of the dike consist of a bituminous geomembrane (BGM) installed on the upstream face anchored in a key trench with fine filter amended with bentonite (FFAB). The key trench is excavated in frozen glacial till or bedrock.

The main highlight of the dike construction are summarised below:

- The dike is constructed with NPAG and NL material
- Due to the presence of a hill in the middle of its alignment, the dike is divided into two legs ; the East and West Legs;
- Foundation excavation in the key trench area was done in the fall of 2018 to avoid blasting and aggrade frost penetration

3.5 ATTENUATION POND AND PUMPING INFRASTRUCTURE

The dewatered part of the North Whale Tail basin between the Whale Tail Dike and the Whale Tail Pit is referred as the Whale Tail attenuation pond. All surface contact water from the Whale Tail site are directed in this pond where they are stored prior to being send to the water treatment plant (WTP) and discharged in Mammoth Lake through an approved diffuser. An attenuation pond ramp will be built to allow pumping of the water from the attenuation pond to the WTP

The majority of the water movement on the Whale Tail Project will be done by pumping. Figure 3-2 indicates the position of the attenuation pond and of the pumping infrastructure of the Whale Tail Project.

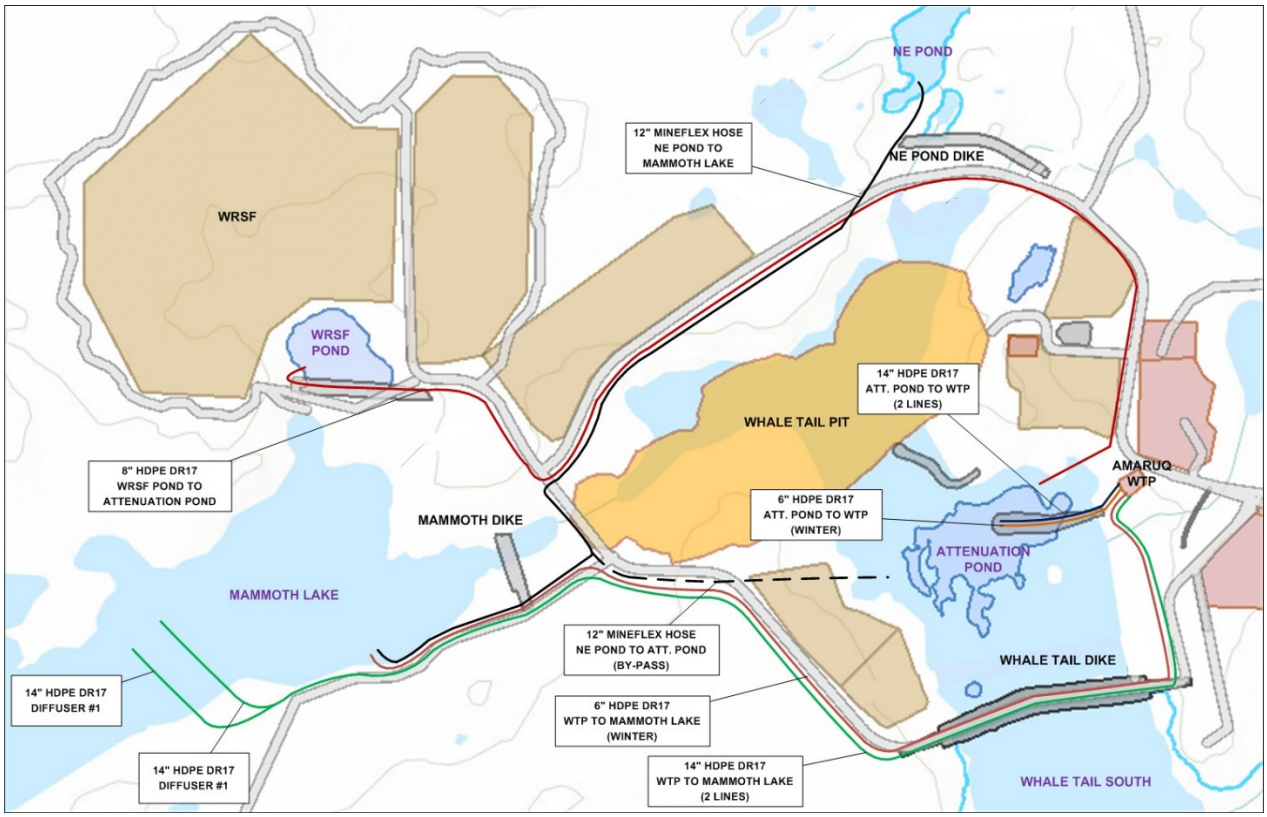

Figure 3-2 :Attenuation Pond and Pumping Infrastructure Layout

Reference to key document for the design and construction of the attenuation pond and pumping infrastructure of the Whale Tail Project are presented in Table 3-10. Reference is also given to the OMM manual of the WTP. A description of the permanent pumping setup installed is given in Table 3-11.

3.6 INSTRUMENTATION

The water management infrastructure will be instrumented to continuously monitor performance. In-situ instrumentation is installed within the structure and their foundation (piezometers, thermistors, and inclinometer).

Water levels in the ponds will be monitored by means of a visible staff gauge installed at a strategic location, piezometers and periodic water survey. The staff gauge will show the operational and design flood levels for ease of routine inspection.

Reference document for the instrumentation installed on the water management infrastructure is summarized in Table 3-12. The summary of the instrument installed is summarised in Table 3-13

SECTION 4 • DEWATERING

The following section outlines the key operational procedure that need to be observed and followed during dewatering in accordance with the performance objective of the dewatering structure. The dewatering phase begins once the pumps start in the whale Tail North and ends while the Whale Tail South seep into the South Whale Tail Diversion Channel.

This section only applies to Whale Tail Dike which separates the Whale Tail Lake into the South basin and the North Basin. The North Basin will be dewatered to allow mining of the Whale Tail pit.

Dewatering of the Whale Tail Basin will occur from February 2019 to May 2019.The approximate volume to be dewatered is 3 Mm³ (SNC, 2018a).

4.1 REFERENCES

Reference to key document for the dewatering of Whale Tail North is presented in Table 4-1.

4.2 SUMMARY OF PERFORMANCE OBJECTIVE AND OPERATION CONTROL DURING DEWATERING

The performance objective and the operational criteria and control for the Whale Tail North Basin dewatering and the performance of Whale Tail Dike during the dewatering are summarized in Table 4-2.

Table 4-2: Performance objectives and operational criteria during dewatering of Whale Tail North

Ensure that Whale Tail Dike commissioning criteria are met before starting dewatering
• All dike construction activity on WTD has been finished (except the thermal cover that may be constructed after the initiation of the dewatering) and construction deviation have been reconciled • All required instrumentation have been installed and stabilized (SNC, 2019) • Management gave the approvals to start dewatering
Water Management During dewatering
• Freeboard is respected in Whale Tail South • Discharge location is based on established water quality criteria (South Whale Tail Basin or Mammoth Lake) (refer to 60 days' notice document) • Water quality at discharge (TSS) met the approved criteria (refer to water quality management plan and 60 days' notice document) • Water discharge volume is recorded (refer to water movement tracking and 60 days' notice document) • The dewatering system (pump, pipes, dewatering ramp) is operated and maintained as per the defined operating procedure (refer to Whale Tail North Operation procedure) • The water level of Whale Tail North and South is recorded and follow prediction taking into account pumping rate
Surveillance
• Proper surveillance (inspection and data review) of Whale Tail Dike performance occur by a qualified person and is documented during dewatering (refer to section 7) • The performance of Whale Tail Dike during dewatering is reviewed against the threshold for performance criteria and trigger pre-defined actions (refer to Table 4-2)
Other
• Prohibit access to all personnel on Whale Tail North ice during dewatering • Restrict access to the dewatering ramp and Whale Tail Dike to trained personnel only during dewatering activity

4.3 OPERATING PROCEDURE DURING WHALE TAIL NORTH DEWATERING

Table 4-3 below present performance indicator and the pre-defined action (TARP) to be taken if the associated performance criteria deviate from defined range.

Table 4-3: Threshold Criteria and pre-defined action during Dewatering

		Threshold Criteria During Dewatering			
		Green **Normal Operating Range**	**Yellow** **Areas of concern**	**Orange** **High Risk Situation**	**Red** **Emergency Situation**
Criteria and specific action (SA)	Commissioning Criteria of WTD	Required commissioning criteria have been met before initiating dewatering	Dewatering ongoing while required commissioning criteria were partially met but management gave go ahead for dewatering following deviation reconciliation	Dewatering ongoing while required commissioning criteria not met or partially met and no formal go ahead from management to initiate dewatering	NA
	Whale Tail South Elevation	< 153 masl	> 153 and < 154 masl	> 154 and < 157 masl	> 157 masl Core overtopping
	Whale Tail North Elevation	Water level decrease of WT North correlate with estimate level base on pumping	Minor discrepancy between WT North level and estimate level from pumping rate before freshet (<15%)	Significant discrepancy between WT North level and estimate level from pumping rate before freshet (>30 %)	Major discrepancy between WT North level and estimate level from pumping rate before freshet (>50 %) Dike cutoff integrity is compromised
	Water Quality (turbidity)	TSS level below discharge criteria without treatment No sign of turbidity from WTD Dike	TSS level above discharge criteria without treatment Minor sign of turbidity from WTD Dike SA : Discharge to Mammoth through WTP	TSS level above discharge criteria with treatment (non-compliance with Env commitment)	NA
	Sloughing along downstream rockfill embankment face	None visible	Single event observed	More than one events observed	Continued event(s) Dike stability or cutoff integrity is compromised

5.2 SUMMARY OF PERFORMANCE OBJECTIVE AND OPERATION CONTROL

The performance objective and the operational criteria for the Whale Tail water management infrastructure during operation are summarized in Table 5-2.

Table 5-2: Performance objectives and operational criteria of Whale Tail water management infrastructure

Water Management
• Operational freeboard of each water retention structure must be respected during operation (refer to section 5.2.1) • Water movement must respect the water balance for intake and discharge location (refer to water balance) • Water movement must be tracked and recorded on a monthly basis (volume, origin, destination) • The water management system (pump, pipes, WTP) must be operated and maintained as per the defined operating procedure • Any seepage must be captured by sump and pumped back to allowed location (or naturally report to an approved location)
Water Quality
• All water discharged in the environment must be through an approved diffuser • Water quality at discharge met the approved criteria (refer to water management plan) • Water quality forecast data is used to make informed water management strategy decision • Water quality and quantity of seepage water is monitored
Surveillance
• Proper surveillance (inspection and data review) of Whale Tail Dike performance occur and is documented during dewatering (refer to section 7) • The performance of Whale Tail Dike during dewatering is reviewed against the threshold for performance criteria and trigger pre-defined actions (refer to Table 5-4 to 5-8)

5.2.1 Freeboard

The minimum freeboards for the Whale Tail water management infrastructure are contained within the design report of each infrastructure and are summarized in Tables 5-3.

Note that AP-5 is related to underground water management which is out of scope of this manual. However as long as the water quality of AP-5 met criteria for discharge it will be discharged on an annual basis to Mammoth Lake through an approved diffuser.

Table 5-3: Water Elevation During Operation

Location	Maximum Water Level		
	Normal Operating level	Design Flood Event	Related water retaining structure Dike Crest Elevation (m)
Whale Tail South	156	157	159
Mammoth Lake	152.5	153.5	155
WRSF Pond	155.4	157.8	158.4
NE Pond	155.5	156.7	157.5
Whale Tail Attenuation Pond	142	145.5	NA
AP-5	153.5	155	NA

5.2.2 Seepage Management

If seepage is observed through a water management structure, a system of collection ditch and sump will be constructed at the downstream toe of the structure to capture the seepage into a contact water retention pond. The water quality will be monitored and it will be directed to the attenuation pond or pump back on the upstream side of the structure base on its quality.

If seepage is observed through a structure but this seepage naturally report to a contact water retention pond (i.e. seepage from Whale Tail Dike reporting to the attenuation pond) then a seepage collection system would not be required.

The quantity and quality of each seepage from a water management infrastructure has to be monitored as per the requirement of section 7.

5.3 WATER MANAGEMENT

The water management strategy for the Whale Tail Project can be found in the water balance. A schematic version of the water movement strategy is summarised in Figure 5-1.

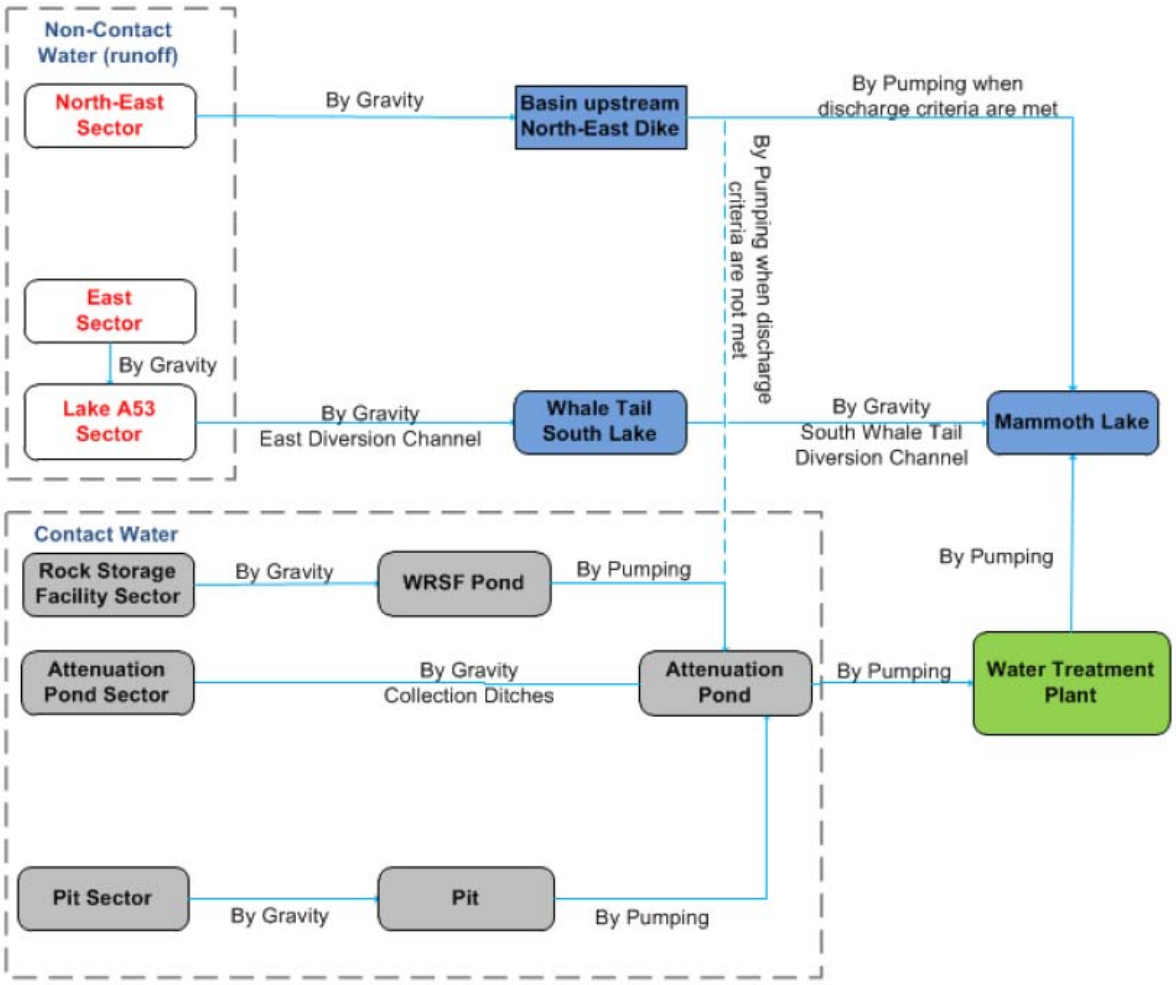

Figure 5-1: Flow Diagram of the Water Management Infrastructures (2019-2022)

5.4 OPERATING PROCEDURE DURING OPERATION OF WHALE TAIL WATER MANAGEMENT INFRASTRUCTURE

Table 5-4 to 5-8 below present performance indicator for each water management infrastructure and the Triger Action Response Plan (TARP) if the associated performance criteria deviate from defined range.

Table 5-4: Threshold Criteria and pre-defined action during operation of Whale Tail Dike

		Threshold Criteria During Operation			
		Green **Normal Operating Range**	**Yellow** **Areas of concern**	**Orange** **High Risk Situation**	**Red** **Emergency Situation**
Criteria and specific action (SA)	Whale Tail South Elevation (dike freeboard)	Normal operation range : < 156 masl	> 156 to < 156.5 m	> 156.5 to < 157 m	> 157 masl Core or crest overtopping
	Seepage to manage	Within design parameter < 2 000 m3 day and managed by pumping	Inflow higher than design parameter but manageable with a pumping capacity (FOS > 2) or Storage and discharge of this seepage is manageable without modifying water management strategy or Sudden or cumulative increase < 25 % in over 3 days	Inflow higher than design parameter and at the limit of the pumping capacity (FOS >1 and <2) or Storage and discharge of this seepage is manageable for the moment but cannot be sustained without modifying the water management strategy SA: increase pumping capacity & re-assess discharge and storage strategy	Inflow is unmanageable with pumping capacity (FOS < 1) or No more capacity on site for storage and discharge of this seepage water
	Seepage water quality (turbidity)	No observation of turbidity in seepage	Turbidity observed in seepage water (single TSS event of 30 mg/L)	Sustained high turbidity over 30 mg/l in seepage water	NA
	Sloughing along downstream rockfill embankment face and downstream toe	None visible	Single event observed	More than one events observed	Continued event(s) Dike stability or cutoff integrity is compromised
	Tension crack on the crest (outside cutoff area)	None visible	< 0.1 m wide & < 5 m length < 1.0 m deep	> 0.1 m and < 0.2 m wide & > 5 m and < 10 m length along the dike > 1.0 m deep	> 0.2 m wide > 10 m length along the dike > 2.0 m deep Dike stability is compromised
	Tension crack within 3 m each side of the cutoff wall at crest	None visible	or < 0.1 m wide < 0.1 m deep	> 0.1 m wide and < 0.2 m wide > 0.1 m and < 0.3 m deep	or > 0.2 m wide > 0.3 m deep Cutoff integrity is compromised
	Sinkhole on crest	None visible	Localised depression > 5 m outside from centreline	Sinkhole identified	Development of sinkhole Dike stability or cutoff integrity is compromised
	Cut-off wall lateral cumulative deformation (based on inclinometer)	< 50 mm	Between 50 mm and 100 mm SA: Refer to 7.5.1	> 100 mm	NA
	Cumulative vertical crest movement	None visible	< 1 m or Stable trend SA: Refer to 7.5.1	> 1 m with increasing rate of settlement	> 2 m with increasing rate of settlement Dike stability or cutoff integrity is compromised
	Pore water pressure (based on piezometers)	Pore water pressure correlate with water level trend during dewatering	Unexplained piezometric trend observed SA: Refer to 7.5.1	Piezometric trends are explained and demonstrate an upset in the structure condition	NA
	Temperature variation along centreline (based on thermistors and piezometers)	Temperature measurement stable, seasonal trend observed	Unexplained thermal trend observed SA: Apply step in case of instrument measurement outside normal range	Thermal trends are explained and demonstrate an upset in the structure condition	NA
	The surveillance program of the structure is followed	Inspection done and reviewed at the frequency mentioned in Ch 7 And Instrument monitoring and analysis of data is done, documented and reviewed at the frequency mentioned in Ch 7	Dike inspection is done but not reviewed and documented at the frequency mentioned in Ch 7 Or Monitoring and analysis of data is done, but not documented and reviewed per the frequency mentioned in Ch 7	Dike inspection not done at the frequency mentioned in the OMS Or Monitoring and analysis of data is not done at the frequency mentioned in the OMS	NA
Action Required (general)		• Continue operation, maintenance, surveillance and monitoring as per standard operating procedure	• Identify potential cause • Develop mitigation plan and implement specific action. Use as reference contingency measures for different scenarios proposed (See Appendix B) • Increase inspection and instrumentation monitoring frequency as per Ch 7 • Implement engineering review	• Restrict access to Whale Tail Dike crest • Take appropriate corrective action based on approved mitigation plan and specific action. • Increase inspection and instrumentation monitoring frequency as per Ch 7 • Reassess thresholds and conditions for red category (emergency situation) taking into account the changing conditions presently observed and interactions of various items.	• Evacuate Whale Tail Pit • Close access to Whale Tail Dike crest • Implement emergency response plan
		Take action and notify personnel as per decision framework of Figure 5-2

		Threshold Criteria During Operation			
		Green **Normal Operating Range**	**Yellow** **Areas of concern**	**Orange** **High Risk Situation**	**Red** **Emergency Situation**
Criteria and specific action (SA)	WRSF Pond elevation (dike freeboard)	Normal operation range : < 155.4 masl	Design flood range : > 155.4 and < 157.8 masl	> 157.8 masl without crest overtopping	Crest overtopping
	Seepage through dike	Within design parameter < 300 m3 day and managed by pumping	Inflow higher than design parameter but captured in sump and manageable with current pumping capacity (FOS > 2) or Storage and discharge of this seepage is manageable without modifying water management strategy or Sudden or cumulative increase < 25 % in over 3 days	Inflow higher than design parameter but captured in sump and managed with a limited pumping capacity (FOS >1 and <2) or Storage and discharge of this seepage is manageable for the moment but cannot be sustained without modifying the water management strategy SA: increase pumping capacity & re-assess discharge and storage strategy	Inflow is unmanageable with pumping capacity (FOS < 1) Or No more capacity on site for storage and discharge of this seepage water
	Seepage water quality (turbidity)	No observation of turbidity in seepage	Turbidity observed in seepage water (single TSS event of 30 mg/L)	Sustained high turbidity over 30 mg/l in seepage water	NA
	Sloughing along downstream rockfill embankment face and downstream toe	None visible	Single event observed	More than one events observed	Continued event(s) Dike stability is compromised
	Tension crack on the crest	None visible	< 0.1 m wide & < 5 m length < 1.0 m deep	> 0.1 m and < 0.2 m wide & > 5 m and < 10 m length along the dike > 1.0 m deep	> 0.2 m wide > 10 m length along the dike > 2.0 m deep Dike stability is compromised
	Sinkhole on crest	None visible	Localised depression	Sinkhole identified	Development of sinkhole Dike stability is compromised
	Cumulative vertical crest movement	None visible	< 1 m or Stable trend SA: Refer to 7.5.1	> 1 m with increasing rate of settlement	> 2 m with increasing rate of settlement Dike stability is compromised
	Temperature variation (based on thermistors)	Temperature measurement stable, seasonal trend observed	Unexplained thermal trend observed SA: Apply step in case of instrument measurement outside normal range	Thermal trends are explained and demonstrate an upset in the structure condition	NA
	The surveillance program of the structure is followed	Inspection done and reviewed at the frequency mentioned in Ch 7 And Instrument monitoring and analysis of data is done, documented and reviewed at the frequency mentioned in Ch 7	Dike inspection is done but not reviewed and documented at the frequency mentioned in Ch 7 Or Monitoring and analysis of data is done, but not documented and reviewed per the frequency mentioned in Ch 7	Dike inspection not done at the frequency mentioned in the OMS Or Monitoring and analysis of data is not done at the frequency mentioned in the OMS	NA
Action Required (general)		• Continue operation, maintenance, surveillance and monitoring as per standard operating procedure	• Identify potential cause • Develop mitigation plan and implement specific action. Use as reference contingency measures for different scenarios proposed (See Appendix B) • Increase inspection and instrumentation monitoring frequency as Ch 7 • Implement engineering review	• Restrict access to WRSF Dike crest • Take appropriate corrective action based on approved mitigation plan. • Increase inspection and instrumentation monitoring frequency as per Ch 7 • Reassess thresholds and conditions for red category (emergency situation) taking into account the changing conditions presently observed and interactions of various items.	• Implement emergency response plan
		Take action and notify personnel as per decision framework of Figure 5-2			

Table 5-7: Threshold Criteria and pre-defined action during operation of NE Dike

		Threshold Criteria During Operation			
		Green **Normal Operating Range**	**Yellow** **Areas of concern**	**Orange** **High Risk Situation**	**Red** **Emergency Situation**
Criteria and specific action (SA)	NE Pond elevation (dike freeboard)	Normal operation range : < 155.5	Design flood range :>155.5 and < 156.7 masl	> 156.7 masl without crest overtopping	Crest overtopping
	Seepage through dike	Within design parameter < 300 m3 day and managed by pumping	Inflow higher than design parameter but captured in sump and manageable with current pumping capacity (FOS > 2) or Storage and discharge of this seepage is manageable without modifying water management strategy or Sudden or cumulative increase < 25 % in over 3 days	Inflow higher than design parameter but captured in sump and managed with a limited pumping capacity (FOS >1 and <2) or Storage and discharge of this seepage is manageable for the moment but cannot be sustained without modifying the water management strategy SA: increase pumping capacity & re-assess discharge and storage strategy	Inflow is unmanageable with pumping capacity (FOS < 1) Or No more capacity on site for storage and discharge of this seepage water
	Seepage water quality (turbidity)	No observation of turbidity in seepage	Turbidity observed in seepage water (single TSS event of 30 mg/L)	Sustained high turbidity over 30 mg/l in seepage water	NA
	Sloughing along downstream rockfill embankment face and downstream toe	None visible	Single event observed	More than one events observed	Continued event(s) Dike stability is compromised
	Tension crack on the crest	None visible	< 0.1 m wide & < 5 m length < 1.0 m deep	> 0.1 m and < 0.2 m wide & > 5 m and < 10 m length along the dike > 1.0 m deep	> 0.2 m wide > 10 m length along the dike > 2.0 m deep Dike stability is compromised
	Sinkhole on crest	None visible	Localised depression	Sinkhole identified	Development of sinkhole Dike stability is compromised
	Cumulative vertical crest movement	None visible	< 1 m or Stable trend SA: Refer to 7.5.1	> 1 m with increasing rate of settlement	> 2 m with increasing rate of settlement Dike stability is compromised
	The surveillance program of the structure is followed	Inspection done and reviewed at the frequency mentioned in Ch 7 And Instrument monitoring and analysis of data is done, documented and reviewed at the frequency mentioned in Ch 7	Dike inspection is done but not reviewed and documented at the frequency mentioned in Ch 7 Or Monitoring and analysis of data is done, but not documented and reviewed per the frequency mentioned in Ch 7	Dike inspection not done at the frequency mentioned in the OMS Or Monitoring and analysis of data is not done at the frequency mentioned in the OMS	NA
Action Required (general)		• Continue operation, maintenance, surveillance and monitoring as per standard operating procedure	• Identify potential cause • Develop mitigation plan and implement specific action. Use as reference contingency measures for different scenarios proposed (See Appendix B) • Increase inspection and instrumentation monitoring frequency as Ch 7 • Implement engineering review	• Restrict access to NE Dike crest • Take appropriate corrective action based on approved mitigation plan. • Increase inspection and instrumentation monitoring frequency as per Ch 7 • Reassess thresholds and conditions for red category (emergency situation) taking into account the changing conditions presently observed and interactions of various items.	• Evacuate Whale Tail Pit • Implement emergency response plan
		Take action and notify personnel as per decision framework of Figure 5-2			

Table 5-8: Threshold Criteria and pre-defined action during operation of Attenuation Pond and Pumping Infrastructure

		Threshold Criteria During Operation			
		Green **Normal Operating Range**	**Yellow** **Areas of concern**	**Orange** **High Risk Situation**	**Red** **Emergency Situation**
Criteria and specific action (SA)	Attenuation Pond elevation (storage capacity)	Normal operation range : < 142	Maximum operating range :>142 and < 145 masl	> 145 masl without overflowing in pit	Pit crest overflow
	Tension cracks on the attenuation pond ramp	None visible	< 0.1 m wide & < 5 m length < 1.0 m deep	> 0.1 m and < 0.2 m wide & > 5 m and < 10 m length along the dike > 1.0 m deep	> 0.2 m wide > 10 m length along the dike > 2.0 m deep Ramp stability is compromised
	Cumulative vertical crest movement of attenuation pond ramp	None visible	< 0.2 m SA: Apply step in case of instrument measurement outside normal range	> 0.2 m and < 1 m increasing rate of settlement	> 1 m increasing rate of settlement Ramp stability is compromised
	Water movement (pumping) follow the Water Balance	Water movement (origin / destination) follow the current water balance and Elevation of each pumping point is within the predicted range of the water balance	The water management data show that the water balance strategy of the water balance is not sustainable from a storage / discharge point of view SA: Modify the water balance and re-assess water management strategy	Water movement (origin/destination) cannot follow water balance due to operational constraint (i.e. capacity, water quality, water treatment)	Water cannot be stored / discharge from the Whale Tail site. The water balance is not applicable SA : Flood underground ramp
	Water movement (pumping) are recorded for volume, origin and destination	Water movement data are read and recorded at the specified frequency of the OMS	Water movement data are read on a non-compliant frequency and there are gap in the data	Water movement data are not read or recorded at the specified frequency of the OMS	NA
	Water quality in the receiving environment and at discharge	Water quality at discharge met receiving environment criteria and Water quality of the receiving environment follow water quality forecast	Water quality at discharge met receiving environment criteria And Water quality of the receiving environment show a trend that water quality is deteriorating higher than the forecast SA : Review diffuser and WTP performance	Water quality at discharge does not met receiving environment criteria SA : stop discharge SA : Review WTP performance	Water quality of the receiving environment no longer allow discharge (no more discharge allowable) SA : Flood underground ramp
	Water quality data is used to make informed water management decision	Water quality data is integrated within the water balance to make informed water movement strategy	Water quality data is not taken into account while deciding water movement	NA	NA
Action Required (general)		• Continue operation, maintenance, surveillance and monitoring as per standard operating procedure	• Identify potential cause • Develop mitigation plan and implement specific action. Use as reference contingency measures for different scenarios proposed (See Appendix B) • Increase inspection and instrumentation monitoring frequency as Ch 7 • Implement engineering review	• Take appropriate corrective action based on approved mitigation plan. • Increase inspection and instrumentation monitoring frequency as per Ch 7 • Reassess thresholds and conditions for red category (emergency situation) taking into account the changing conditions presently observed and interactions of various items.	• Evacuate Whale Tail pit • Implement emergency response plan
		Take action and notify personnel as per decision framework of Figure 5-2			

5.5 COMMUNICATION AND DECISION MAKING

Figure 5-2 indicates the communication and decision process when the threshold criteria are met and when pre-defined action need to be implemented.

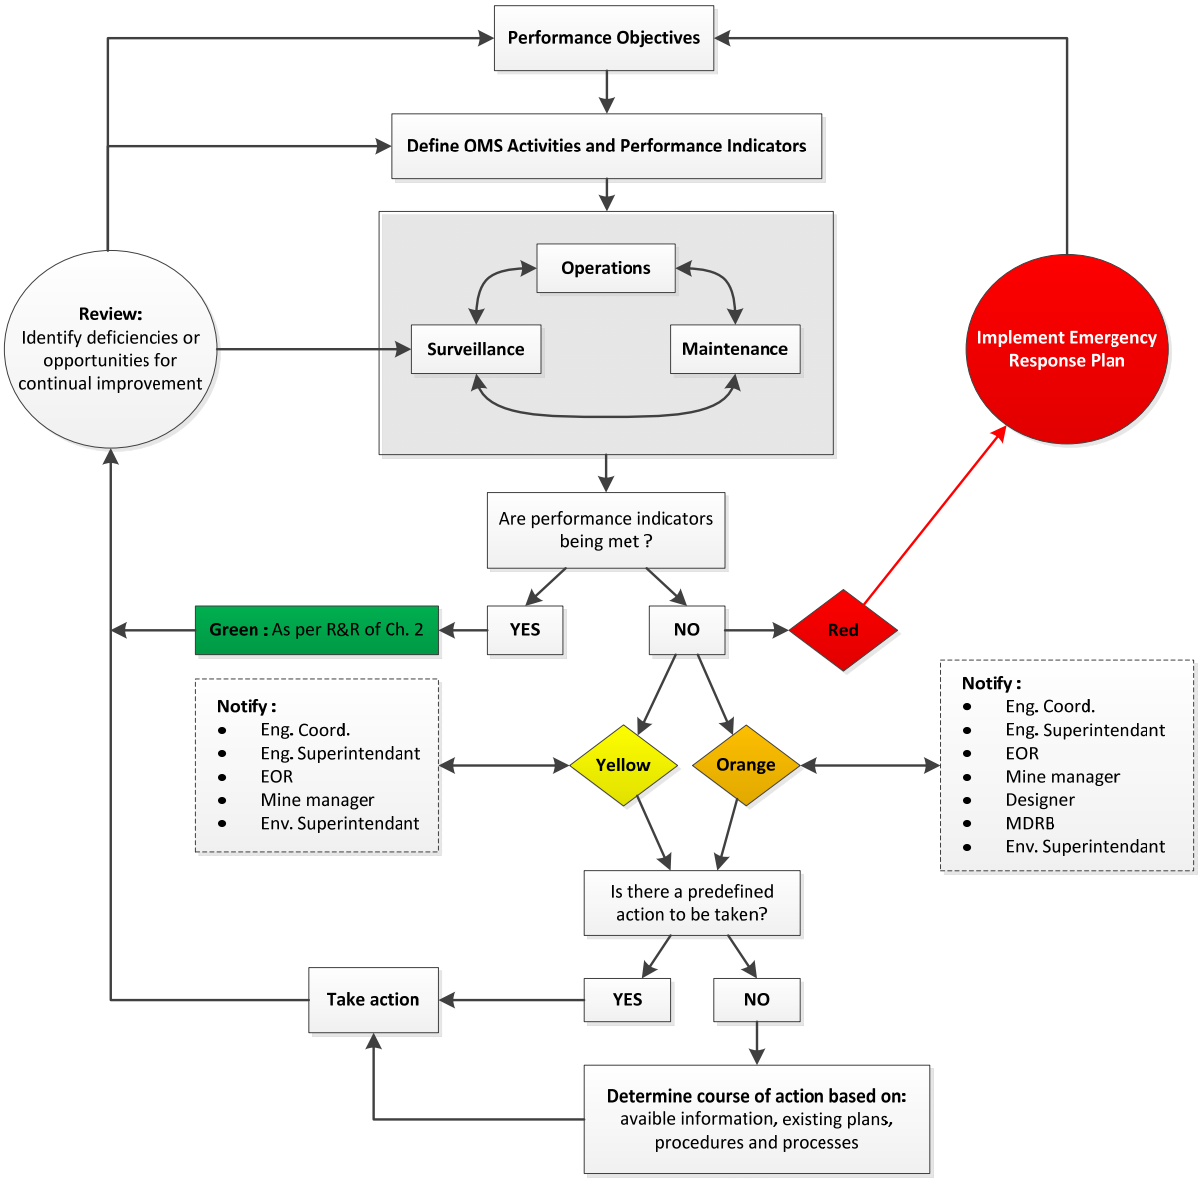

Figure 5-2: Communication and Decision Process for Water Management Infrastructure TARP

SECTION 6 • MAINTENANCE

This section identifies all infrastructures within the scope of this manual that has maintenance requirements and identifies all preventative, predictive and corrective maintenance activities.

6.1 PREVENTATIVE, PREDICTIVE AND CORRECTIVE MAINTENANCE

Maintenance is divided into preventative (planned), predictive and corrective.

Preventative maintenance is planned, recurring maintenance activities conducted at a fixed or approximate frequency and not typically arising from results of surveillance activities. Examples of such maintenance include calibration and maintenance of surveillance equipment or regularly changing oil on a pump as per manufacturer's requirement.

Predictive maintenance is pre-defined maintenance conducted in response to results of surveillance activities that measure the condition of a specific component against performance criteria.

Corrective maintenance of a component of the water management system is to prevent further deterioration and ensure their performance in conformance with performance objectives. The need for corrective maintenance is based on surveillance activities, with surveillance results identifying the need and urgency of maintenance.

6.2 REFERENCES

Reference to key document for the maintenance of the Whale Tail water management infrastructure is presented in Table 6-1.

6.3 COMPONENT OF THE WATER MANAGEMENT INFRASTRUCTURE REQUIRING MAINTENANCE

Table 6-2 indicates all the component of the Whale Tail water management infrastructure that requires maintenance.

Table 6-2: Component of the water management infrastructure requiring maintenance

Water Management Infrastructure
• Dike embankment (i.e. repair erosion) • Dike crest (i.e. fill inactive tension cracks) • Seepage collection sump (i.e., reprofile slope, increase sump volume) • Ditches and diversions (i.e. snow removal, repair erosion)
Pumping infrastructure
• Pumps (mechanical and electrical maintenance) • Pipes (steaming, drain line, repair leak)
Surveillance
• Geotechnical instruments (thermistors, piezometers, inclinometers, survey monument) • Data acquisition system • Flowmeter
Other
• Dike crest access road • Access to sump

6.3.1 Maintenance component that are outside the scope of this OMS manual

The following component maintenance activities are outside of the scope of this OMS manual. For more information the superintendent of the department responsible for these maintenance can be contacted

- Electrical systems and supply – E&I
- Maintenance of heavy equipment and light vehicles – Maintenance
- Communication infrastructures - IT
- Road used to access the infrastructures – Mine
- Water treatment plant – E&I

6.4 DESCRIPTION OF MAINTENANCE ACTIVITIES

Table 6-3 summarizes the description of maintenance activities for each component of the Whale Tail water management infrastructure. Each component possesses activities as well as a trigger for that maintenance and a person responsible for this activity. It is the person responsible for the maintenance activity to ensure that the person doing the maintenance has the qualifications and competency required to conduct the maintenance and is following the proper safety procedure. The responsible person must also ensure that the proper documentation and reporting requirement are followed.

Table 6-3 :Description of maintenance activity for component of water management infrastructure

Component	Type of maintenance	Nature of the activity	Frequency of maintenance (preventative) OR Trigger of maintenance (predictive and corrective)	Responsible for the activity	Documentation Required	Reporting Requirement
Water Management Infrastructure						
Dike embankment Attenuation pond ramp repair erosion	Corrective	Gullies and depression to be filled with rockfill and re-sloped	Following a demand from engineering superintendent following a visual inspection showing erosion	Mine Superintendent (can use a contractor alternatively)	Photo of remediation work	Engineering to update the maintenance log of the structure
Dike crest / Attenuation pond ramp – fill inactive tension cracks	Corrective	Inactive tension cracks to be filled with bentonite to prevent widening due to water infiltration	Following a demand from engineering superintendent following a visual inspection showing inactive tension cracks	Geotechnical technician	Photo of remediation work	Engineering to update the maintenance log of the structure
Dike crest / Attenuation pond ramp compensate settlement	Corrective	Add rockfill to increase the height of the dike following observation of settlement	Following a demand from engineering superintendent following a visual inspection showing settlement that need to be compensated (i.e. loss of freeboard)	Mine Superintendent (can use a contractor alternatively)	Photo of remediation work Surveying of remediation work	Engineering to update the maintenance log of the structure and provide surveying
Seepage collection sump– increase volume	Predictive	Excavate an additional sump or increase the capacity of an existing sump	Following a demand from engineering superintendent following a re-assessment of the sump capacity	Mine Superintendent (can use a contractor alternatively)	Photo of remediation work Surveying of remediation work	Engineering to update the maintenance log of the structure and provide surveying
Seepage collection sump – reprofile sump	Corrective	Excavate flatter slope for the sump or add material against the slope to reprofile them	Following a demand from engineering superintendent following a visual inspection showing instable sump slope	Mine Superintendent (can use a contractor alternatively)	Photo of remediation work	Engineering to update the maintenance log of the structure and provide surveying
Ditches – snow removal	Predictive	Use an excavator to remove snow in the ditch	Every year prior to freshet to ensure that ditch is clear of snow obstruction. Demand will be formulated by the Engineering Superintendent	Energy & Infrastructure Superintendent	Photo of remediation work	Engineering to update the maintenance log of the structure
Ditches – clean debris and sediment accumulation	Corrective	Remove any debris and accumulation of sediment that can hinder flow	Following a demand from engineering superintendent following a visual inspection showing accumulation of debris and sediment	Energy & Infrastructure Superintendent	Photo of remediation work	Engineering to update the maintenance log of the structure
Ditches – repair erosion of granular layer	Corrective	Add granular material to repair erosion of the ditches	Following a demand from engineering superintendent following a visual inspection showing erosion of the ditches	Energy & Infrastructure Superintendent	Photo of remediation work	Engineering to update the maintenance log of the structure
Ditches – release of TSS from the ditches	Corrective	Corrective action to mitigate release of TSS from ditches. Can include placement of sill curtain or temporary by-passing the ditches using pump	Following a demand from the environment superintendent following sampling of a high turbidity event from the diches	Environment Superintendent	Water sample results Photo of remediation work	Engineering to update the maintenance log of the structure
Pumping infrastructure						
Pumps and Genset – maintenance as per manufacturer specification	Preventative	Do PM on the pumping unit as per manufacturer recommendation	As per manufacturer specification	Pump mechanics	Equipment log Maintenance record	Maintenance to update the pump maintenance log or Genset maintenance log
Pumps and Genset – maintenance when deficiencies are observed (cavitation, breakdown, electrical trouble)	Corrective	Troubleshoot the pump problem so that it is once again operational	When the E&I Superintendent ask that a pump be fixed following a visual inspection of deficiencies	Pump mechanics	Equipment log Maintenance record	Maintenance to update the pump maintenance log or Genset maintenance log
Pumps – winterization of unit used in winter	Preventative	Ensure that pumps used in winter have been winterized	Once new pump is received on site that will be used in winter	Maintenance superintendent	Maintenance record	Maintenance to update the pump maintenance log
Pipe – drain the line	Preventative	Ensure that the line is empty of water when it is stopped in winter	Every time pumping is interrupted in winter	Energy & Infrastructure Superintendent	-	-
Pipe – unfreezing a line	Corrective	Steaming the line to unfreeze it in winter	When the E&I Superintendent ask that a line be unfroze following visual inspection of a frozen line	Energy & Infrastructure Superintendent	-	-
Pipe – maintenance when deficiencies are observed (leak, pipe burst)	Corrective	Replacing a deficient part of a line with new pipe	When the E&I Superintendent ask that a line be repaired following visual inspection of pipe deficiency	Energy & Infrastructure Superintendent	-	-
Surveillance						

Component	Type of maintenance	Nature of the activity	Frequency of maintenance (preventative) OR Trigger of maintenance (predictive and corrective)	Responsible for the activity	Documentation Required	Reporting Requirement
Geotechnical Instrument – loss of reading	Corrective	Investigate the status of an instrument who no longer gave data	When an instrument no longer gave data for an unknown reason	Geotechnical technician	Update status in instrument database	Update of the geotechnical instrument database by the geotechnical technician
Geotechnical instrument – unusual reading	Corrective	Investigate the status of an instrument who gave unusual data	When an instrument gave an unusual data	Geotechnical technician	Update status in instrument database	Update of the geotechnical instrument database by the geotechnical technician
Geotechnical instrument – replacement	Corrective	Replace an instrument that no longer work	When the engineering superintendent as for a geotechnical instrument to be replaced	Geotechnical technician	Instrument installation as-built report Update spare inventory Calibration sheet Initial instrument reading	Update of the geotechnical instrument database by the geotechnical technician
Geotechnical instrument –calibration of total station	Preventative	Send the total station to be calibrated	yearly	Geotechnical technician	Calibration sheet	Update of the geotechnical instrument database by the geotechnical technician
Geotechnical instrument –calibration of inclinometer probe	Preventative	Send the inclinometer probe to be calibrated	yearly	Geotechnical technician	Calibration sheet	Update of the geotechnical instrument database by the geotechnical technician
Datalogger – maintenance	Preventative	Do maintenance of datalogger as per manufacturer specification	yearly	Geotechnical technician	Maintenance report	Update of the geotechnical instrument maintenance log by the geotechnical technician
Datalogger – battery change	Predictive	Change battery when the battery level alarm get triggered	When the battery alarm is triggered in VDV	Geotechnical technician	Maintenance report	Update of the geotechnical instrument maintenance log by the geotechnical technician
Datalogger – troubleshooting	Corrective	Repair of a dataloger deficiency	When a dataloger is suspected of being deficient	Geotechnical technician	Update status in instrument database	Update of the geotechnical instrument maintenance log by the geotechnical technician
Flowmeter – calibration	Preventative	Send the flowmeter to be calibrated	yearly	Energy & Infrastructure Superintendent	Calibration sheet	Update of the geotechnical instrument maintenance log by the geotechnical technician
Flowmeter – deficient reading	Corrective	Repair of a flowmeter deficiency	When the Engineering Superintendent ask that a flowmeter be troubleshoot based on irregular data	Energy & Infrastructure Superintendent	Update status in instrument database	Update of the geotechnical instrument database by the geotechnical technician
Other						
Dike crest access	Predictive	Snow clearing, maintaining roadway, grading access	As required to maintain access	Mine Superintendent	-	-
Access to sump	Predictive	Snow clearing, maintaining roadway, grading access	As required to maintain access	Mine Superintendent	-	-

SECTION 7 • SURVEILLANCE

Surveillance Involves the inspection and monitoring (i.e. collection of qualitative and quantitative observation and data) of activities related to water management infrastructures. Surveillance also includes the timely documentation, analysis and communication of surveillance results, to inform decision making and verify whether performance objective including critical controls are being met.

There are two types of surveillances activities which are further discussed in this chapter:

- Site observation and inspection
- Instrument monitoring

7.1 REFERENCE

Reference to key document for site observation & inspection of the Whale Tail water management infrastructure is presented in Table 7-1. Reference to key document for instrument monitoring is presented in Table 7-2.

7.2 SITE OBSERVATIONS AND INSPECTIONS

The purpose of site observation and inspection is to identify warning signs for the development of potentially adverse conditions that could lead to a failure or some other form of loss of control. Site observation and inspection include the direct observations by personnel on or adjacent to the water management infrastructure and may also include observation from helicopter or photo taken from unmanned airborne vehicle (UAV, satellites).

Site observation and inspections are used to identify and track visible change in the condition of the water management infrastructure. Changes that may be observed throughout site observations and inspections are included in Table 7-3

Table 7-3: Changes that may be observed through site observation and inspection of Whale Tail water management infrastructure

Changes related to physical risk of dike, road, ramp
• Change in freeboard • Deformation or change in condition at the crest, slopes and toes (i.e. bulge, cracks, sinkhole, sloughing, settlement) • Newly form or expanding areas of erosion • Evidence of piping or unexpected water movement through water containment structures • Changes in the seepage quantity (pumping rate) and quality (turbidity)
Changes related to physical risk of ditch
• Newly form or expanding areas of erosion • Newly form of obstruction to flow (i.e. boulder, sediments, snow) • Newly form of slope instability
Changes related to water storage and transport
• Change in sump level • Verify using the staff gauge that the pond is operated within its normal operating condition • Changes in the seepage quantity (pumping rate) and quality (turbidity) • Condition of pipe for water transport • Sign of leaks from water line • Condition of pumps
Change related to surveillance instrumentation
• Condition of surveillance instruments and associate protection around instruments (i.e. cover, barriers to prevent vehicle damage) • Condition of power supplies for instruments (i.e. solar panel) • Condition of communication infrastructure associated with instruments (i.e. antenna, datalogger)

7.2.1 Site observation

Site observation is conducted by personnel working on or adjacent to water management infrastructure as part of their daily activities, maintaining awareness of the facility in the course of carrying their duties. Trained personnel such as geotechnical technician should be on the lookout for sign of changing condition as indicated in Table7-3 as adverse condition can develop rapidly between inspections. A simplified visual observation form can be used to document such observations but they do not need to be documented unless a new condition has been observed. Any new observation should be documented by photograph and reported to the geotechnical personnel or Engineering Superintendent.

7.2.2 Inspection program

Inspections are conducted by the engineering department or other personnel with appropriate training and competency and are more rigorous than site observations.

The inspection program consists of several types of inspections such as routine and special visual inspection, dike safety inspection and dam safety review. The following sub-section describe in more details the scope, frequency and responsible for each type of inspection.

7.2.2.1 Routine Visual Inspection

Routine visual inspections are conducted on a pre-defined schedule and may target specific activities. Their objective is to identify any conditions that might indicate change in the water management infrastructure performance and therefore require follow-up. The inspection need to cover the aspect described in Table 7-2. Of particular significance are new occurrences or noted changed in seepage, erosion, sinkholes, boils, slope slumping, settlement, displacement, or cracking of structure components. These inspections are held during dewatering and operation.

There are two approved inspection form for inspection; a simplified one and a detailed one. The detailed form should be used for monthly inspection while the simplified one can be used when inspection are required at an increased frequency. All area of the form must be filled.

The person responsible for the inspection must:

- Do the inspection as per the required frequency
- Fill all information on the proper inspection form
- Take picture to supplement the inspection. As much as possible, these are to be taken from the same vantage points during each inspection so that changes in conditions can be readily identified. Photos should be annotated or captioned and should include a date stamp.
- Store electronically all photo and inspection form
- Update the surveillance log
- Ensure that the reviewer is aware that the document is ready to be reviewed

During the review process, the reviewer must:

- Ensure that all require information is present
- Ensure that the observation does not trigger a change in alert level
- Sign the inspection form as a reviewer
- Update the surveillance log
- Distribute the inspection results

The frequency for inspection of a structure will vary based on its TARP level and need to be updated in the surveillance log.

Table 7-4 summarise the Routine & Special visual inspection R&R, suggested frequency and scope in function of the alert level of the structure

Table 7-4 : Summary of routine inspection requirements

Structure	TARP Level	Inspection Responsible	Scope of inspection	Inspection Frequency	Reporting	Inspection Reviewer	Distribution List
Whale Tail Dike – Dewatering	Green	Geotechnical Engineer	All of Table 7-2	Daily	Simplified inspection form	-	Engineering Geotechnical Team, EOR
			Physical risk and surveillance	Bi weekly	Detailed inspection form	Geotechnical Coordinator

	Yellow	Water & Tailings Engineer or Geotechnical Engineer	Water storage and transport + physical stability of ramp	Weekly in area of concern	Detailed Inspection	Geotechnical Coordinator	Engineering Geotechnical Team, E&I, EOR,
	Orange	Water & Tailings Engineer or Geotechnical Engineer	Water storage and transport + physical stability of ramp	Daily	Simplified inspection form	Geotechnical Coordinator	Engineering Geotechnical Team, EOR, designer, Management
				Weekly in area of concern	Detailed Inspection		

7.2.2.1 Special Visual Inspection

Special inspections are conducted during and after unusual or extreme events that may impact the facility. Special inspections are conducted by the geotechnical engineer or Engineer of Record using the detailed inspection form and using the same procedure for review and documentation. Special visual inspection must be done on each structure after each of these events:

- At the end of dewatering once downstream toe is exposed
- Following a blast that exceed the vibration limits of the structure
- After an earthquake
- After a high intensity rainfall event (higher than a 1:2 years recurrence)
- Immediately after a site observation notice a change in condition
- Prior or immediately after increasing or decreasing the TARP level of a structure

7.2.2.2 Dike Safety Inspection (annual geotechnical inspection)

A dike safety review is a more comprehensive technical inspection, integrating inspections and results of monitoring instrument. This type of inspection is conducted by an external geotechnical engineer and supported by the Engineer of Record to have a more complete understanding of the facility performance and identify deficiencies in performance or opportunity for improvement. This will provide information to be used to revise the OMS manual.

For Whale Tail water management infrastructure such inspection need to occur on an annual basis between the month of July and September. The following components need to be inspected during this review:

- Whale Tail Dike, Mammoth Dike, WRSF Dike, NE Dike
- Attenuation pond and pumping infrastructure
- Ditches and channel

In addition to field inspection done as part of the safety review the following point should be addressed during the review:

- Review of all inspections report performed since the last review
- Review of monitoring instruments data;
- Identify deficiencies in performance or opportunity for improvement
- Review OMS performance and operational criteria and confirm that these meet the performance objective of the design
- Review and provide recommendations regarding OMS for the following year.

After each safety inspection a report must be submitted to the Engineering Superintendent which includes the results of the inspection done and addressing all point above. These reports will be stored electronically

7.2.2.3 Independent Dam Safety Review

Independent dam safety review are carried out by an independent third party to review all aspects of the design, construction, operation, maintenance, processes and other systems affecting the dam's safety, including the dam safety management system. The review defines and encompasses all components of the "dam system" under evaluation including the dam, foundations, abutments, instrumentation and seepage collection works. The independent third party for the Whale Tail water management infrastructure is the Meadowbank Dike Review Board (MDRB).

Modification to the MDRB composition can only be made by the Engineer of Record.

The Meadowbank Dike Review Board (MDRB) is comprised of the following member.

- Anthony Rattue
- Don Haley

An annual MDRB meeting will be held every year at the Meadowbank site. Other events that could trigger a MDRB meeting are:

- Major modifications to the design or design criteria;
- Discovery of unusual conditions that can compromise the integrity the water management infrastructure;
- After extreme hydrological or seismic events; and
- Decommissioning.

During the annual MDRB meeting, a dam safety review will be carried out according to the recommendations laid out in the Dam Safety Guidelines (CDA, 2013).

This review will include, but is not limited to:

- Review of the dikes classification;
- Site inspection;
- Review of design and construction records;
- Review of monitoring practices and the instrumentation records
- Assessment of the operation of the facilities;
- Provide recommendation on operation, maintenance and surveillance based on the results of the instrumentation readings, construction records and site observations;

7.3 INSTRUMENT MONITORING PROGRAM – DATA ACQUISTION

Instrument monitoring provides information on parameters or characteristics that cannot be detected through site observation or inspections cannot be observed with sufficient precision and accuracy or need to be monitored at high frequency or continuously.

The objective of instrument monitoring is to collect data to be used to assess the performance of the infrastructure against the performance objectives and indicators and the critical controls (refer to table 4-2 and 5-2). Instrument monitoring and inspections work together as a comprehensive data set to enable assessment of the water management infrastructure performance and provide a basis for informed decision. All are essential, and none of these forms of surveillance can be neglected if performance objectives are to be met and risks are to be managed.

More information on the type of in-situ instruments installed on each structure, how they were installed and their location can be found in Section 3-6 of this OMS manual.

Table 7-5 indicate the type of information collected through instruments monitoring and how it is collected. Table 7-6 summarise the data acquisition program related to instrument monitoring

Table 7-5: Information collected using instrument monitoring

Direct collection of information
• In-situ thermistors to measure temperature profile within the structure and its foundation • In-situ piezometer to measure pore-water pressure providing information about flow of water through the structure and foundation stability • In-situ shape array inclinometer (SAA) to provide information on deformation within the cut-off wall • Survey monument to provide information on settlement and deformation • Staff gauge to inform about water level of a pond versus its operating level • Blast monitor to inform on potential impact of blasting vibration on the structure • Flow meters and seepage monitoring station to inform on volume of water movement • Surveys conducted to measure ice cover, water level, update height and slope of containment structure
Collection of information from remote sensing
• Data acquired from airborne survey to generate detailed topographic map
Collection of information based on laboratory analyses
• Water quality analysis of seepage and surface runoff • Water quality analysis of water discharged through diffuser to inform on Environmental compliance • Water quality analysis of water stored in the various pond on site to inform on water movement decision
Collection of information related to the conduct of OMS activities
• Automatic data collection and transmission system for in-situ instruments (datalogger, solar panel, antenna, battery)

Table 7-6: Summaries of data acquisition program related to instrument monitoring of Whale Tail water management infrastructure

Instrument monitoring	Location of monitoring (3)	Parameter measured	Acquisition Methodology	Standard Acquisition frequency	Acquisition Responsible	Documentation methodology	Documentation Responsible
Thermistors	Whale Tail Dike, WRSF Dike, Mammoth Dike	Temperature (C^0) point for each bead on the chain	In-situ instrument connected to automatic data acquisition and transmission system	New data are acquired and transmitted to VDV every 3 hrs	Geotechnical Technician	Data are exported from VDV into instrumentation report emitted at a predetermined frequency (1)(2)	Geotechnical Engineer
Piezometer	Whale Tail Dike, Whale Tail South, Attenuation Pond	Pressure (kpa) point for each instrument	In-situ instrument connected to automatic data acquisition and transmission system	New data are acquired and transmitted to VDV every 3 hrs	Geotechnical Technician	Data are exported from VDV into instrumentation report emitted at a predetermined frequency (1)(2)	Geotechnical Engineer
Shape array accelerometer (SAA)	Whale Tail Dike	Displacement in mm	In-situ instrument connected to automatic data acquisition and transmission system	New data are acquired and transmitted to VDV every 3 hrs	Geotechnical Technician	Data are exported from VDV into instrumentation report emitted at a predetermined frequency (1)(2)	Geotechnical Engineer
Survey monument (4)	-	Elevation of monument which is then converted into mm of displacement (minimum precision of 3 mm required)	Data are acquired using a total station	Monthly in winter and bi-weekly from May to September	Geotechnical Technician	Data are exported into geoexplorer. Instrumentation report are emitted at predetermined frequency (1)(2)	Geotechnical Technician
Staff Gauge	Attenuation pond, WRSF pond, NE pond	Water level in pond	Take picture of the gauge	During each inspection	Inspection officer	Within inspection report	Inspection officer
Blast Monitor	Whale Tail Dike, WRSF Dike, Mammoth Dike, NE Dike	Peak particle velocity (PPV) measured by the blast monitor (mm/s)	Placement of blast monitor at a predetermined area on the dike	Before each blast in the vicinity of the dike	Geotechnical Technician	Update the blast vibration log. Discussion on recorded vibration in instrumentation report	Geotechnical Technician
Flow meter	NE pond, WRSF pond,	Volume of water pump (m^3)	Pumpman operator will inscribe flowmeter value on a pumping sheet	Daily when pump is operating	E&I Pump crew supervisor	Data will be integrated in the water balance	Water & Tailings engineer
Seepage monitoring station (manual reading with a V notch)	Where umpumped seepage is observed	Seepage flow (m^3/s)	Using a bucket and a stopwatch	Weekly during period of flow	Geotechnical Technician	Documented within instrumentation	Geotechnical Engineer
Survey shot	Whale Tail South, Whale Tail North, WRSF Pond, NE Pond	Elevation of the water level (minimum precision of 3 mm required)	Surveyor will take a water/ice level at a predetermined area	Once per week	Surveyor Leader	Integrated in the water movement log	Water & Tailings engineer
Airborne survey	All water management infrastructure	Topographic aerial survey made using drone	Surveyor will take a drone survey	Once per year after freshet	Surveyor Leader	Within survey database	Surveyor Leader
Water quality	Mammoth Lake, WTP discharge, WRSF pond, NE pond, attenuation pond, sumps (5)	Parameter indicated within water management plan	Water quality sample taken and sent for laboratory analyses	Acquisition frequency within water management plan	Environment General Supervisor	Within Env water quality database	Environment General Supervisor

(1)Refer to section 7-5 for more information on reporting methodology and the frequency of reporting
(2) Refer to section 7-6 on how to present instrumentation data from VDV in a report
(3) Exact location of each instrument can be found in the instrumentation database
(4) Survey monument are planned to be installed in 2020
(5) Location of water quality sampling point can be found in water management plan

7.4 ADDING INSTRUMENT TO THE MONITORING PROGRAM

Any addition to the monitoring program must be validated by the Engineering Superintendent or by the Environment Superintendent for aspect relating to water quality. In-situ instrument installation must be recorded in an as-built report and added to the instrumentation database and map. After each installation of instrumentation the following must be done:

- Document the calibration sheet and initial data reading
- Document instrument specification (manufacturer sheet)
- Document Information to which datalogger the instrument is connected
- Survey instrument coordinate (x,y,z)
- If the instrument is drilled, a schematic view of the depth of the instrument versus the stratigraphy must be produced
- Photo of installation must be documented

7.5 ANALYSIS OF SURVEILLANCE RESULTS

For the effective use of surveillance results and decision making, results must be collated, examined, analysed and reported in a timely and effective manner.

For visual inspection the process of analysing the data and communicating the results is describe in section 7-4 and happen at the same time the inspection is done and the report is sent. The information gained from the analysis of these results is then compared during the inspection and review to the TARP criteria which will then inform the action to take if performance indicator is not met.

For the instrumentation monitoring to be effective the data must be reviewed, analysed and reported at the proper frequency. Table 7-7 summarise the requirement for review, analyses and reporting of instrumentation data.

The person responsible for instrumentation data review need to update the surveillance log each time an instruments results has been reviewed and analysed. The person responsible for review of reporting and distribution need to update the surveillance log once the report has been reviewed and distributed.

Instrumentation	TARP Level	Expected range of observation	Responsible for review & analyse	Frequency of review	Responsible for reporting	Reporting frequency	Responsible for review and distribution	Distribution List
Piezometer, thermistor, SAA, (**Dewatering**)	Green	Define in TARP for dewatering	Geotechnical Engineer	Daily	Geotechnical Engineer	Bi-weekly instrumentation report	Geotechnical Coordinator	Engineering geotechnical team, designer, EOR
	Yellow	Define in TARP for dewatering	Geotechnical Engineer	Twice a Day	Geotechnical Engineer	Weekly instrumentation report	Geotechnical Coordinator	Engineering geotechnical team, designer, EOR
	Orange	Define in TARP for dewatering	Geotechnical Engineer	Twice a Day	Geotechnical Engineer	Weekly instrumentation report	Geotechnical Coordinator	Engineering Geotechnical Team, EOR, designer, Management
Piezometer, thermistor, SAA, survey monument (**Operation**)	Green	Define in TARP of each structure	Geotechnical Engineer	Bi-Weekly	Geotechnical Technician	Quarterly instrumentation report	Geotechnical Engineer	Engineering geotechnical team, designer, EOR
			Geotechnical technician	Weekly				
	Yellow	Define in TARP of each structure	Geotechnical Engineer	Weekly	Geotechnical Technician	Instrumentation reporting included within monthly inspection report	Geotechnical Engineer	Engineering geotechnical team, designer, EOR
			Geotechnical technician	Every 3 days				
	Orange	Define in TARP of each structure	Geotechnical Engineer	Daily	Geotechnical Engineer	Instrumentation reporting included within weekly update report	Geotechnical Coordinator	Engineering Geotechnical Team, EOR, designer, Management
			Geotechnical technician	Daily				
Staff Gauge / Survey shot (freeboard)	Green	Define in TARP of each structure	Water & Tailings Engineer	Weekly	Water & Tailings Engineer	Within the monthly attenuation pond and pumping infrastructure inspection report	Geotechnical Coordinator	Engineering geotechnical team, designer, EOR
	Yellow	Define in TARP of each structure	Water & Tailings Engineer	Daily	Water & Tailings Engineer	Within the monthly attenuation pond and pumping infrastructure inspection report	Geotechnical Coordinator	Engineering geotechnical team, designer, EOR
	Orange	Define in TARP of each structure	Water & Tailings Engineer	Twice a day	Water & Tailings Engineer	Included within weekly update report	Geotechnical Coordinator	Engineering Geotechnical Team, EOR, designer, Management
Blast Monitor	-	PPV> 50 mm/s	Geotechnical Technician	After retrieving a blast monitor on a water management structure	Geotechnical Technician	In Quarterly instrumentation report	Geotechnical Engineer	Engineering geotechnical team, designer, EOR
Flow meter / Seepage monitoring	Green	Define in TARP of each structure	Water & Tailings Engineer	Weekly	Water & Tailings Engineer	During the monthly update of the water balance	Geotechnical Coordinator	Engineering geotechnical team, designer, EOR
	Yellow	Define in TARP of each structure	Water & Tailings Engineer	Daily	Water & Tailings Engineer	During the monthly update of the water balance	Geotechnical Coordinator	Engineering geotechnical team, designer, EOR
	Orange	Define in TARP of each structure	Water & Tailings Engineer	Twice a day	Water & Tailings Engineer	Included within weekly update report	Geotechnical Coordinator	Engineering Geotechnical Team, EOR, designer, Management
Water quality	Green	Define in TARP of each structure	Environment General Supervisor	As per water management plan	Environment General Supervisor	As per water management plan	Environment Superintendent	Engineering geotechnical team

	Yellow	Define in TARP of each structure	Environment General Supervisor	As per water management plan	Environment General Supervisor	As per water management plan	Environment Superintendent	Engineering geotechnical team
	Orange	Define in TARP of each structure	Environment General Supervisor	As per water management plan	Environment General Supervisor	As per water management plan	Environment Superintendent	Engineering geotechnical team

Table 7-7 :Requirement for review, analyses and reporting of instrument data

7.5.1 Procedure in case of data exceeding expected range of observation

If data exceeding the expected range of observation or anomalous data readings are observed, the following actions need to be taken:

- Re-read to check the reading (if the reading is from VDV, take a manual reading in the field);
- Check readout equipment to verify that it is functioning correctly;
- Verify calibration;
- If instrument has stopped functioning, notify the Engineering Superintendent immediately. If considered critical, a replacement instrument should be installed;
- If an anomalous reading is confirmed, a detailed review of the effects of the reading should be carried out and design or remedial actions should be implemented if determined necessary by the Engineering Superintendent. Any malfunctioning instrument or frozen piezometer must be documented.
- In the case of valid data that would exceed the TARP level do a special inspection if possible.

Before modifying the TARP level due to in-situ instrumentation reading that cannot be confirmed by other visual observation the EOR must be consulted for further guidance.

7.5.1.1 Blast Monitor

If a reading exceeding the PPV limit for a water management structure (50 mm/s) is observed this event must be communicated to the drill and blast engineer who will need to ensure that the blasting pattern is modified to avoid re-occurrence of this event. Afterward a special inspection will need to be done on the structure to look for changing condition.

If more than one occurrence of blast vibration exceeding the limit are observed within a 2 weeks period the Engineering Superintendent needs to be notified of the situation.

7.5.2 Anomalous Instrumentation Data

Anomalous instrumentation data includes the following as presented in Table 7-7. These anomalies could happen without triggering a TARP level change and need to be investigated and recorded:

Table 7-8: Example of anomalous data and some common cause

Thermistors
• Increase or decrease in measurements (over two or more readings) that cannot be explained by seasonal temperature variations; • Progressive loss of data (starting from the bottom and progressing). This is usually a sign of water infiltration • Observation of a spike in temperature in one bead. This is usually due to a capacitive effect • Loss of data (could be a transmission error, faulty hardware or a sheared cable)
Piezometer
• Increase or decrease in pore water pressure measurements that cannot be explained by seasonal lake level variations (verify that the instrument has not been installed in a casing); • Sharp increase in reading (verify that the instrument is not frozen) • Loss of data (could be a transmission error, faulty hardware or a sheared cable)
SAA
• Cumulative increases in displacement (greater than 3 cm); • Erratic movement. This is usually a sign of water infiltration
Survey Monument
• Accelerating displacement rate of the survey monuments (x, y, z directions) (over two or more readings) (could be due to a prism shooting error or problem with the total station)
Blast Monitor
• Vibrations during a blast are not observed (the blast was cancelled, the blast monitor was not properly installed or vibrations were too weak to be recorded)
Flowmeter, survey shot and staff gauge
• Sudden change in staff gauge reading. Or reading that seem to not reflect the probable water elevation. This could be due to a settlement or displacement of the staff gauge. • Increase or decrease in flowmeter reading that are inconsistent with pumping rate or rainfall or observed water level. • Survey elevation that has a sharp fluctuation from last reading. This can be caused by the reading not taken at the good location, wave actions or daily variances in GPS signal

7.6 SURVEILLANCE DOCUMENTATION & REPORTING

One visual inspection report per structure needs to be completed, reviewed and distributed per the frequency in Table 7-4.

An instrumentation report need to prepare at predetermined frequency to present all instrumentation monitoring data as described in Table 7-8.
Table 7-9 describe how instrumentation data should be reported.

Instrumentation reports need to include the following information:

- Table presenting all the instruments installed on each structure, their status and pertinent installation information
- Graph of all instruments for all structure covered by the report. The graph need to present data for a minimum period of 1 year. Higher recurrence should be presented if clarity of the presented information allows it. The graph need to be presented in a way that allow for data interpretation without referring to other document
- Analyses of all instruments data presented highlighting specific trend
- Discussion on anomalous trend

For the structure having a yellow Tarp level the instrumentation data relevant to the cause of the alert need to be included with each visual inspection report.

For the structure having an orange Tarp level the instrumentation data relevant to the alert level need to be included with each inspection report. In addition the weekly update reports need to be written with the following information:

- Context on why the structure is at the orange level
- Change in condition since the last weekly report
- What is the mitigation plan and what action have been taken since the last update report
- Discussion on the result of the instrumentation data

Table 7-9: How data should be presented in report for instrumentation monitoring

Thermistance
• Temperature vs. depth plots over time. • The plot should indicate the thermistor string reference number and date of each measurements presented • The plot need to indicate relevant stratigraphy and their depth • Plot need to be presented with a cross-section of the installation (if on a structure) as well as a plan view showing the instrument location
Piezometer
• Plots of total head as elevation versus time; and • Plot need to be presented with a cross-section of the installation showing lithology with depth as well as a plan view showing the instrument location • The plot need to indicate the instrument number, the dates of each measurement and a mention if the temperature read by the instrument is less than 0 degree
SAA
• Cumulative displacement plots (to view total displacement); • Incremental displacement plots (to present increasing or accelerating movements between readings); • Cumulative displacement at crest versus time; and • Time plots at zones of identified displacement. • The plot need to indicate the SAA number, what is considered positive and negative displacement and the dates of each measurement • Both elevations and depths should be presented together with the lithology. • A plan view need to be included showing the instrument location
Survey Monument
• Total net movement plots (to present total displacement); • Vertical displacement plots; and • Lateral displacement plots parallel and perpendicular to the dike axis • The plot need to indicate the survey monument number, what is considered positive and negative displacement and the dates of each measurement • A plan view need to be included showing the instrument location

7.7 DATA MANAGEMENT

An electronic library or database, which is easily accessible, shall be set up to catalogue and store inspection documents, maintenance reports and instrumentation measurements. The following will be stored in the hard copy and/or electronic format. Section 7.1 indicates where each of these items can be found electronically:

- Instrumentation report
- Visual inspection report
- Weekly report for structure in orange Tarp level
- Dike safety inspection (annual geotechnical inspection)
- Dam Safety Review report;
- Surveillance log
- Instruments database and map
- Maintenance log of geotechnical instrument
- Maintenance log of water management infrastructure
- Pump maintenance record

Detailed Inspection Forms Template

Simplified Surveillance Form

Structure :	Date :
Surveillance done by :	

	Item	Changing condition ? Yes	No	NA	Comments
1	Freeboard and pond level				
2	Tension Cracks				
3	Sinkhole				
4	Settlement				
5	Sloughing				
6	Erosion				
7	Debris & Obstruction (ditches, sump)				
8	Seepage				
9	Turbidity				
10	Instrumentation Condition				
11	Piezometric reading				
12	Thermistor reading				
13	SAA reading				
14	Flowmeter				
15	Condition of pipe and pump				

Recomendation

This simplified form is to be used as per the OMS manual instruction. The surveillance log must be updated after this surveillance report is filed. All condition deviating from normal operating threshold must be described in the comments section. Picture of changing condition should be attached to this document. Any changing condition must be reported to the geotechnical engineer. Any chaning condition trigering a change in threshold level must be communicated to the Engineering Coordinator or Superintendant

Potential Mitigation for Upset Condition

Potential Mitigation Plan for Upset Condition on Water Management Infrastructures

Upset Condition	Area / Cause		Comments/Monitoring	Contingency or Corrective Action
Overtopping and Subsidence	1a	Water level rise / storm event	Lake levels and crest elevations is monitored as part the water management infrastructure surveillance program Outflow channels are inspected during thaw, open water season and during ice break-up.	Add additional pumping unit If rise is caused by a channel obstruction, remove the obstruction
	1b	Dam crest settlement	This scenario requires extensive loss of support in the foundation since the rockfill of the dikes is essentially not settlement prone itself after construction and dewatering. For foundation settlement of this magnitude to occur, a piping event must develop or there is unexpected layer of compressible soil in the foundation. The situation would develop slowly with crest settlement evident at least several weeks before a run-away event develops. Easily observed cracks should be evident. Monitoring of the crest settlement is conducted routinely.	The crest is wide and comprises of coarse rockfill. Significant damage to the dike is not credible, based on performance of other rockfill structures subjected to overtopping or flow through events Rockfill from the mining operations can be placed to raise the dike crest and compensate settlement. Mining operations may need to be suspended, but there will be considerable warning time given the slow development of the scenario.
	1c	Wave action	Large freeboard and wide crest zone makes this a low concern	Rip-rap can be added and/or dam crest can be raised.
Internal Erosion	2a	Dike section: Cut-off wall/geomembrane is defective, allowing high water flow. This defect occurs at a location where the core allows high flows and where the fills/geomembrane is defective; the combination allows erosion of the cut-off and/or the Core Backfill.	The cut-off wall/geomembrane and/or core backfill will develop a progressively increasing void ratio, thereby increasing the rate of water flow through the dike. This is not a catastrophic failure mode but could lead to an inability to manage water on site	Monitor seepage from downstream face for rate of seepage and for presence of sediment in seepage. Identify zone of seepage and establish a seepage capture and monitoring station with sufficient pumping capacity Re-evaluate the impact of this water inflow on the site wide water balance
	2b	Dike section: geomembrane is defective.	Results in increasing the rate of water flow through the dike. This is not a catastrophic failure mode as the rockfill will be stable and at its worst would lead to temporary suspension of mining.	Monitor seepage from downstream face for rate of seepage and for presence of sediment in seepage. Identify zone of seepage and establish a seepage capture and monitoring station with sufficient pumping capacity Re-evaluate the impact of this water inflow on the site wide water balance
	2c	Foundation till is possibly non-uniform with more transmissive zones and not self-filtering. It is possible that one of these zones may align with defective construction of the cut-off wall allowing high flows. Seepage would lead to erosion of the cut-off into the downstream rockfill. Seepage could also erode the foundation tills at the downstream toe or into the downstream rockfill because of the lack of filtering.	Limited seepage at the toe or into the rockfill would accelerate in to a large inflow, and could lead to the undermining of the dike if no action was taken. This is a credible catastrophic mode if increased seepage is not detected in time. No particular instrumentation is needed as this failure mode will show itself as localized and increasing seepage. It could be detected by walk-over inspection by an experienced engineer or technician.	Remedial action could comprise a reverse filter and rockfill buttress depending on location of the flow and configuration of the foundation, freezing or grouting, if identified in time. In the worst case, the pit may be deliberately flooded in a controlled manner, the cut-off repaired and the pit dewatered. Build additional dike downstream increasing pumping.

Upset Condition	Area / Cause		Comments/Monitoring	Contingency or Corrective Action
Seepage	3a	Within the Embankment	Seepage on its own is not a credible failure scenario. The downstream rockfill shell has extremely high flow through capacity. The rockfill zone is both large and pervious, so that seepage will not daylight and lead to instability.	Monitor seepage from downstream face for rate of seepage and for presence of sediment in seepage. Identify zone of seepage and establish a seepage capture and monitoring station with sufficient pumping capacity Re-evaluate the impact of this water inflow on the site wide water balance
	3b	Within the Foundation	Defective construction of cut-off leading to transfer of unexpectedly high fraction of the reservoir head into the downstream part of the dike foundation, or leading to a piping event as described in internal erosion (2c). If this mechanism arises it should show itself during initial dewatering or very shortly thereafter.	Monitor seepage from downstream face for rate of seepage and for presence of sediment in seepage. Identify zone of seepage and establish a seepage capture and monitoring station with sufficient pumping capacity Re-evaluate the impact of this water inflow on the site wide water balance Re-assess stability (numerical modelling) and construct a stabilising berm
Structural - Slope Instability	4a	Normal Operation: Slope Failure	The rockfill shoulders of the dike are wide and have high shear strength Slope failure requires failure in the foundation and which would extend into the overlying dike. Sliding failure is considered unlikely given the low horizontal forces generated by the water and ice relative to the normal frictional force due to the weight of the dikes and the frictional angles of foundational materials. This mechanism should develop during construction or dewatering, due to the increase in load and associated pore water pressure development. Initial stages of failure should be observable as tension cracks in the dike crest. Walk-over inspection of the dike by trained inspector is an appropriate monitoring strategy in addition the instrumentation. Survey of crest face and toe is conducted.	Re-assess stability (numerical modelling) and construct a stabilising berm if required Fill inactive tension cracks with bentonite
	4b	Earthquake Induced: Slope Failure	Site is located in a low seismic zone. Dam consisting of massive rock zone has a low sensitivity to seismic motion.	Do an inspection and repair damage
	4c	Erosion; washout, ice scour	Crest – minimum 50 m section, Downstream – large quarry rock face.	Repair erosion by placing additional rockfill and material
Structural – Lateral Movement	5a	Failure of Cut-off Wall	Differential horizontal movement of the dike due to dewatering, water or ice loading or pit wall failure may create a breach in the cut-off wall. Ice and water forces are not credible due to the ratio of frictional forces generated by the self-weight of the dike versus ice loads and water pressure. Large inflows through the breach may occur as a consequence if the cut-off wall breached. Pit would flood requiring suspension of mining activities. Potential for loss of life of workers inside dikes. Inclinometer, settlement prism and monument monitoring is done routinely.	Repair the cutoff wall
Subsidence	6	Foundation Soils	Unexpected foundation soils consolidated during dike construction or dewatering. A significant quantity of clay would be required to generate settlement resulting in a water release event. Prism and monument monitoring is done routinely.	A 1 m core settlement would be required to allow water to flow through the rockfill and over the settled cut-off. This flow would not cause failure of the rockfill shells. It would also be readily repaired by excavating rockfill above the cut-off wall and placing more till. Soil conditions will be observed during dewatering to accommodate actual conditions.
Premature Closure	7	Corporate Bankruptcy or Early Resource Depletion	Bond is provided for this eventuality. Design of rehabilitation is the same as rehabilitation at closure of project.	This would trigger the closure plan

Upset Condition	Area / Cause		Comments/Monitoring	Contingency or Corrective Action
Pump and Pipeline Failure	8	Pumping infrastructures	Freezing protection is provided by heat tracing and insulation. Pipelines monitored pump pressures at plant and frequent site inspection.	Replace defect in pipeline Repair the pump and use another pump in the meantime

Water Quality and Flow Monitoring Plan, Version 6

AGNICO EAGLE

MEADOWBANK DIVISION

WHALE TAIL PIT

Water Quality and Flow Monitoring Plan

MARCH 2019

VERSION 6

EXECUTIVE SUMMARY

The purpose of this Water Quality and Flow Monitoring Plan is to establish the program to be implemented and followed by Agnico Eagle's environmental management team to monitor the performance of the waste and water management systems at the Whale Tail Pit Project.

The Plan is one component of the *Aquatic Effects Management Program* (AEMP) and is closely associated with the *Water Management Plan* and the *Core Receiving Environment Management Plan* (CREMP). The Water Quality and Flow Monitoring Plan summarizes the monitoring locations, sampling frequency, monitoring parameters, compliance discharge criteria and an adaptive management plan for water quality at the Whale Tail Pit.

Section 2 in this Plan includes an overview of the monitoring programs and mine development schedule. Section 3 provides specific details (including sampling locations and parameters to be measured) for the compliance monitoring program, along with general guidance for the event monitoring program. An adaptive management program is described for both regulated discharges and non-regulated discharges in Section 3 as well. Requirements of the flow monitoring program are described in Section 4, and an overview of the reporting requirements is described in Section 5.

This Plan has been updated to meet terms and conditions 17 and 18 in Project Certificate No. 008 and Type A Water License 2AM-WTP1826.

IMPLEMENTATION SCHEDULE

This Plan will be implemented immediately, subject to any modifications proposed by the NWB as a result of the review and approval process.

SECTION 1. INTRODUCTION

The Water Quality and Flow Monitoring Plan (the Plan) has been prepared to meet Type A water Licence requirements (Water Licence 2AM-WTP1826, including modified Schedule I as approved by the Nunavut Water Board (NWB) through Board Motion NO. 2018-A1-023, dated December 6, 2018, as required by Part G, Item 2 of the Licence), and Project Certificate No.008. This Plan is one component of the Aquatic Effects Management Program (AEMP) and is closely associated with the Water Management Plan and the Core Receiving Environment Management Plan (CREMP). The Plan summarizes the monitoring locations, sampling frequency, monitoring parameters, compliance discharge criteria and an adaptive management plan for water quality at the Whale Tail Pit.

The purpose of this Water Quality and Flow Monitoring Plan is to establish the program to be implemented and followed by Agnico Eagle's environmental management team to monitor the performance of the waste and water management systems for the Project. The program includes:

- A Plan to verify and validate the results of predictive water quality modelling with empirical measurements of the mine site water quality and flows;
- An assessment of the effects of project activities and infrastructure on surface water quality conditions;
- A comparison of measured water quality data to compliance requirements;
- A monitoring plan with documentation to track the quantity of water that contacts mine ore and wastes, management of contact water to protect aquatic resources, and water conservation and recycling; and
- A framework for adaptive management that allows the identification and rectification, where necessary, of unexpected trends or non-compliance in water quality and flows.

The Plan provides information on the locations of the monitoring stations at the various stages of mining. These monitoring locations are used to evaluate the performance of the mine waste and water management system.

The objectives of the monitoring program are:

1) to track the chemistry of the contact and non-contact water prior to and during discharge;
2) to assist in identifying if water treatment is required prior to discharge;
3) to minimize the potential impacts of mining activities on the surrounding environment;
4) to confirm that non-contact water is clean; and
5) to demonstrate contact water is being captured and managed accordingly.

Additional locations outside the footprint of the Amaruq property (and outside the scope of this Plan) are monitored under the Aquatic Effects Management Program and the Core Receiving Environmental Monitoring Plan (Azimuth 2015, 2016, 2018a, 2018b).

There are three main surface water quality monitoring programs designed for the monitoring and protection of the receiving environment:

- Water Quality Monitoring and Management Plan for Dike Construction Dewatering
- Water Quality and Flow Monitoring Plan

- Core Receiving Environment Monitoring Program

Through these combined programs, water quality will be monitored at various locations (including two reference lakes), at least annually, and during all phases of the project.

SECTION 2. BACKGROUND

2.1 OVERVIEW OF SITE WATER MANAGEMENT PLAN

Details of overall water management are discussed in the Whale Tail Pit Water Management Plan which is updated as needed to reflect changes in operation and/or technology or as otherwise required by a Water Licence. All contact water from the mine facilities including the waste rock storage facilities (WRSF), Whale Tail open pit, and other disturbed areas will be directed by pumping or berms and other surface diversions to either of the following:

- Sumps from which the water will be pumped to the Whale Tail Attenuation Pond; or
- The open pits during re-flooding and after mining activity has ceased.

As specified in the Water Management Plan: All contact water will be intercepted, contained, analyzed, treated, if required, and discharged to the receiving environment only when water quality meets the discharge criteria. The Water Management Plan is intended to ensure appropriate destination and treatment of contact water as well as water conservation and recycling to minimize the use of natural water.

2.2 MONITORING PROGRAMS

The Water Quality and Flow Monitoring Plan has been divided into two levels of monitoring to characterize the range of potential effects between the sources of contact water in the individual mine facilities and the point of discharge or release to the receiving environment. The two levels of monitoring include:

1) compliance monitoring; and
2) event monitoring.

2.2.1 Compliance Monitoring Program (CM)

The compliance monitoring (CM) sites are those stipulated in a water Licence; these sites vary from contact water collection ditches and attenuation ponds to sampling in areas prior to discharge to the receiving environment. The requirements of the Water Licence 2AM-WTP1826 including water quality limits will be applied at the applicable mine discharge points identified in the CM program.

The CM program provides a mechanism to assess water quality at specified sites, to confirm and to document compliance of discharge with regulatory requirements. As part of adaptive water management, these internal monitoring stations provide protection to the receiving water environment, provide data to predict pit re-flooding water quality and ensure exceedances of predicted or regulated levels are appropriately managed or mitigated to reduce impacts.

The water quality and flow monitoring program was designed as a complimentary plan to the Core Receiving Environment Monitoring Program – Whale Tail Pit Addendum (CREMP; Azimuth 2016), the Groundwater Monitoring Plan and the Water Quality Monitoring and Management Plan for Dike Construction Dewatering.

2.2.2 Event Monitoring Program (EM)

The EM sites result from unexpected events such as spills, accidents, and malfunctions. The response programs for such events are discussed in greater detail in the following documents:

- Spill Contingency Plan;
- Emergency Response Plan; and
- Whale Tail Pit Water Management Plan.

Each accidental release will require mobilization of site equipment to stabilize the release, procedures to contain, neutralize, and dispose of the discharge, and recommendations for monitoring the site following the incident.

2.3 OVERVIEW OF MINE DEVELOPMENT SCHEDULE

The Project is a satellite deposit located on the Amaruq property, to extend mine operation and milling at the Meadowbank Mine. The open pit mine, mined by truck-and-shovel operation, will produce 8.3 million tons (Mt) of ore, 68.2 Mt of waste rock and overburden material between 2018 and 2022. Figures 2-1, 2-2, 2-3 and 2-4 show the sequence of staged development of Whale Tail Pit, from the pre-development and construction, operations, closure, and post-closure phases, respectively. These figures show the water quality monitoring location by mine phase. The actual configuration of the pit may change as mining progresses. As a result, the monitoring program (Section 3.0) accommodates changes in the pit design.

The staged development of the mine facilities has been divided into four phases for monitoring purposes. The four phases include:

- Construction phase (illustrated on Figure 2-1);
- Operations phase (illustrated on Figure 2-2);
- Closure phase (illustrated on Figure 2-3); and
- Post-closure phase (illustrated on Figure 2-4).

A summary of site activities and water quality monitoring issues during these phases is provided below.

2.3.1 Pre-development and Construction Phase

The principal impacts resulting from construction activities may be the increase in turbidity and TSS from the release of particulates during dike construction, surface runoff, the disturbance of lake sediments and the dewatering of future mining zones. Management and monitoring of these impacts are discussed in the AEMP and the Water Quality Monitoring and Management Plan for Dike Construction and Dewatering. Construction of the Whale Tail Pit site has commenced.

2.3.2 Operations Phase

During the operations phase, mining will occur in the Whale Tail Pit. Most of the waste rock generated from the pit will be deposited in the waste rock storage facility (WRSF), however some NPAG waste rock may be used for construction of mine infrastructure (roads, dikes), and potentially some for fish habitat structures. Milling and tailings will be regulated under the 2AM-WTP1826 Type A Water Licence. During the early operations phase, mine water from the individual pit sumps including dike seepage will be pumped to the Attenuation Pond. Water from the Attenuation Pond will be discharged to Mammoth Lake during the open water period on an annual basis through a diffusor. This water will be treated as required (e.g., TSS arsenic, and phosphorus) prior to being discharged.

The operations phase will span three to four years, from Year 1 (2019) to Year 4 (2022).

2.3.3 Closure Phase

Mining activities are currently expected to end during Year 4 (2022). Closure will occur from Year 4 (2022) to Year 11 (2029) after the completion of mining and will include removal of the nonessential site infrastructure and flooding of the mined-out open pit, as well as reestablishment of the natural Whale Tail Lake water level.

The Dikes will be decommissioned once water quality within the pit lake meets discharge criteria. Activities during the late closure phase will be primarily monitoring of selected mine facilities including flooded pit lakes and the reclaimed WRSF areas.

Further details about closure is covered in the Interim Whale Tail Closure and Reclamation Plan.

2.3.4 Post-closure Phase

Activities during the post-closure phase will be primarily monitoring of selected mine facilities including flooded pit lakes and the reclaimed WRSF area. The Dikes will be breached once water quality within the pit lake meets discharge criteria – CCME guideline for the Protection of Aquatic Life and background levels for parameters not listed in the CCME guideline.

Post-closure monitoring to confirm physical and chemical stability is planned until 2046.

SECTION 3. MONITORING PROGRAM

The monitoring program is presented in three sections; requirements of the compliance monitoring (CM) program, an overview of the event monitoring program (i.e., monitoring that occurs after spills or emergencies), and details of the adaptive management program for monitoring results.

3.1 COMPLIANCE MONITORING PROGRAM

The CM program monitors the chemistry of mine contact water and diverted water at specified locations prior to the release into the receiving water environment in order to confirm and document compliance with regulatory requirements. The types of water and the timing of the CM program include:

- non-contact water discharged from diversion ditches during operations, and closure phases of the mine and eventually non-contact water from dike seepage;
- mine contact water directed to and discharged from the Attenuation Pond during the operations phase of the mine;
- monitoring points located within the pit lakes and the flooded Whale Tail Attenuation Pond before and after the dikes have been breached during the late-closure phase of the mine life; and
- runoff from Whale Tail WRSF prior to discharge to Mammoth Lake.

The CM sampling program has multiple monitoring stations across the project site, with sampling at different stages of the mine life. All of the CM stations, a description of their location, parameters to be monitored and sampling frequency are listed in Table 3-1. Specific details for the monitoring parameter groups are provided in Table 3-2 and are the same as presented in 2AM-WTP1826 Water Licence. In summary, 6 groups of parameters include:

- Group 1 – mine site monitoring parameters;
- Group 2 – receiving environment parameters consistent with the CREMP and applied to all AEMP stations (including ground water monitoring); includes dissolved metals for hydrogeological monitoring and to be protective of the aquatic environment;
- Group 3 – sampling prior to discharge; includes MDMER parameters plus sulphate, turbidity and Aluminum;
- Group 4 – sampling prior to discharge at secondary containment fuel storage areas;
- Group 5 – MDMER; and
- Group 6 – Field Measurements

Figures 2-1 and 2-4 show the approximate location of the sampling sites at the Whale Tail Pit area. The actual location of each sampling site is determined by access and safety considerations and will be marked by a stake (where appropriate) that defines the exact location of the collection point for sampling events with appropriate attached signage in English, Inuktitut, and French.

GPS coordinates for all compliance monitoring stations will be confirmed with the Water Resources Officer.

Table 3-1: Monitoring Program

Station	Description	Phase	Monitoring Parameters or Group	Frequency
ST-DC-1 to TBD	Monitoring stations during dike construction as defined in the Whale Tail Water Quality Monitoring and Management Plan for Dike Construction and Dewatering	Construction	As defined in Water Quality Monitoring and Management Plan for Dike Construction and Dewatering referred to in Part D, Item 5	As defined in Water Quality Monitoring and Management Plan for Dike Construction and Dewatering referred to in Part D, Item 5
ST-DD-1 to TBD	Monitoring Program stations during dike dewatering as defined in the Whale Tail Water Quality Monitoring and Management Plan for Dike Construction and Dewatering	Construction	As defined in Water Quality Monitoring and Management Plan for Dike Construction and Dewatering referred to in Part D, Item 5	As defined in Final Water Quality Monitoring and Management Plan for Dike Construction and Dewatering referred to in Part D, Item 5

		Operations	Group 2	Monthly during open-water
		Closure	Group 2	Monthly during open-water

Table 3-2: Monitoring Parameters

Group	Parameters
1	pH, turbidity, hardness, alkalinity, chloride, fluoride, sulphate, total dissolved solids (TDS), total suspended solids (TSS), ammonia nitrogen, nitrite, nitrate, orthophosphate, total phosphorus, total metals (aluminum, arsenic, barium, cadmium, chromium, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, thallium and zinc).
2	**Total and Dissolved metals:** aluminum, antimony, arsenic, boron, barium, beryllium, cadmium, copper, chromium, iron, lithium, manganese, mercury, molybdenum, nickel, lead, selenium, tin, strontium, titanium, thallium, uranium, vanadium and zinc. **Nutrients:** Ammonia-nitrogen, total Kjeldahl nitrogen, nitrate nitrogen, nitrite-nitrogen, orthophosphate, total phosphorous, total organic carbon, total dissolved organic carbon and reactive silica. **Conventional Parameters:** bicarbonate alkalinity, chloride, carbonate alkalinity, conductivity, hardness, calcium, potassium, magnesium, sodium, sulphate, pH, total alkalinity, TDS, TSS and turbidity.
3	MDMER parameters (arsenic, copper, lead, nickel, zinc, TSS, pH), sulphate, turbidity and total aluminum.
4	Total Arsenic, Total Copper, Total Lead, Total Nickel, TSS, Benzene, Toluene, Ethylbenzene, Xylene, TPH, pH.
MDMER	Arsenic, copper, lead, nickel, zinc, TSS, pH, effluent volumes and flow rate of discharge, acute lethality (Rainbow Trout and *Daphnia magna*) and environmental effects monitoring (EEM).
Field Measurements	pH, specific conductivity, dissolved oxygen (DO) and temperature

3.1.1 General Sampling and Analysis Program

Samples are collected in clean laboratory-supplied containers and preserved as directed by the analytical laboratory. During all phases, samples are analyzed offsite at an accredited commercial lab (e.g., ALS in Burnaby BC, Maxxam Analytics in Montreal or H2lab in Val d'Or).

Table 3-3 summarizes the minimum sample volumes, container, preservation, and holding times for each analyze. This information is from the *USEPA Methods for Chemical Analysis of Water and Waste Water* (*EPA-600/4-79-020, 1979*). Note, these bottle types and volumes may change if the laboratories make a change in procedure.

Table 3-3: Summary of Sampling Requirements for each Analyte

Parameter	Minimum Volume (mL)	Bottle Type	Preservation	Holding Time
pH	250	250 mL, glass or plastic, filled to the top	4˚C	Analyze immediately
Conductivity	125	250 mL, glass or plastic	4˚C	28 days

Ammonia-nitrogen	250	250 mL, glass or plastic, filled to the top	4˚C, H_2SO_4	28 days
Total kjeldahl nitrogen	250	250 mL, glass or plastic, filled to the top	4˚C, H_2SO_4	28 days
Nitrate nitrogen	125	250 mL, glass or plastic	4˚C	48 hours
Nitrite nitrogen	125	250 mL, glass or plastic	4˚C	48 hours
Ortho-phosphate	125	250 mL, glass or plastic	4˚C	14 days
Total phosphorous	125	250 mL, glass or plastic	4˚C, H_2SO_4	28 days
Total organic carbon	125	250 mL glass	4˚C, H_2SO_4	28 days
Dissolved organic carbon	125	250 mL glass	4˚C, H_2SO_4	28 days
Chloride	125	250 mL, glass or plastic	4˚C	28 days
Fluoride	125	250 mL plastic	4˚C	28 days
Sulphate	125	250 mL, glass or plastic	4˚C	28 days
Radium 226	500	1L plastic	4˚C, HNO_3	1 month
Reactive Silica	250	500 mL, plastic	4˚C	28 days

Note: The bottle types and preservation method may change at the discretion of the laboratory.

3.1.2 Compliance Monitoring Stations and Discharge Criteria

Consistent with similar mining operation (i.e., Meadowbank Mine) further details of the specific CM stations and discharge criteria are established for Whale Tail Pit Project according to the Nunavut Water Board Type A Water Licence 2AM-WTP1826.

3.1.2.1 *Construction and Dewatering Activities*

To mine the Whale Tail Pit, a series of dikes will be built to isolate the pit from the surrounding water bodies. The document "*Whale Tail Pit Project Water Quality Monitoring and Management Plan for Dike Construction and Dewatering"* (January 2016) will be followed for the Approved Project to specifically address the monitoring requirements for these activities (Refer to Section 3 of that plan).

3.1.2.2 *Visual Inspections and Seepage Monitoring*

The Plan includes visual inspections to be conducted regularly to monitor for potential issues such as erosion (see Section 3.1.2.3 for more details), spills and leaks (see Section 3.2 for more details), or unanticipated seepage (e.g., from the WRSF, haul road). Where seepage is observed, sampling will be conducted (Table 3-1 for details) and appropriate follow-up (e.g., collection and transport to the Attenuation Pond) will be conducted.

Regular inspections and seepage monitoring (where water is observed) is required to document that the seepage is appropriately contained, managed and will not enter the receiving environment. Inspections will be conducted on a monthly basis at the WRSF during open water season or after a major rain event occurs. Seepages identified at the Whale Tail WRSF will be pumped to the WRSF collection pond. . Results of the inspections and seepage monitoring data are also used for comparisons to the FEIS predictions (see Section 5.0 for more details).

3.1.2.3 *Water Collection System (Diversions and Effluent)*

A water collection system comprised of ditches, sumps, water management ponds, and open pits is proposed to control surface water for the Project. Water that may potentially come into contact with waste rock or contaminated material is segregated from non-contact water and collected in water management ponds and treated, if necessary, prior to discharge into the receiving environment.

Regular monitoring during freshet (the snowmelt, thawing) and during heavy or prolonged rainfall to identify any erosional or stability issues with regards to:

- The configuration or structure of channels, due to localized thawing, local ground instabilities, subsidence and transport of fine particles;
- The free flow of water, due to an accumulation of ice, sediments and other debris; and
- Potential damage to retention structures and monitoring of seepage.

Maintenance operations consist of cleaning accumulated sediments and debris from the ditches and culverts, and repairing damaged areas as soon as possible.

During pit flooding, samples will be taken in representative locations of the pit that is being re-flooded. It is likely that the sampling sites will change based on mine sequencing and as the water

level in the pits rise in response to flooding.

The following is a list of the various areas of the water collection system where samples for the internal compliance monitoring program will be collected:

- Whale Tail/ Pit area ditches, sumps, ponds, and pit lake (ST-WT-1, ST-WT-3, ST-WT-4, ST-WT-7, ST-WT-10).

Effluent discharged from the Attenuation Ponds at CM station ST-WT-2 is directed to Mammoth Lake through a diffuser. Discharge to the receiving environment shall not exceed effluent quality limits stipulated in Table 3-4 and based on criteria established in Whale Tail Pit Type A Water Licence 2AM-WTP1826.

Table 3-4: Effluent Criteria – Discharge from Mammoth Lake Diffuser

Parameter	Maximum Average Concentration	Maximum Allowable Grab Sample Concentration
Conventional Parameters		
pH	6.0 to 9.5	6.0 to 9.5
Total Suspended Solids (mg/L)	15	30
Total Dissolved Solids (mg/L)	1400	1400
Nutrients		
Total Ammonia (mg-N/L)	16	32
T-Phosphorus (mg-P/L)	0.3	0.6
Metals		
Total Aluminium (mg/L)	0.5	1.0
Total Arsenic (mg/L)	0.1	0.2
Total Cadmium (mg/L)	0.002	0.004
Total Chromium (mg/L)	0.02	0.04
Total Copper (mg/L)	0.1	0.2
Total Iron (mg/L)	1.0	2.0
Total Lead (mg/L)	0.05	0.10
Total Mercury (mg/L)	0.004	0.008
Total Nickel (mg/L)	0.25	0.5
Total Zinc (mg/L)	0.1	0.2
Other		
Total Petroleum Hydrocarbons (mg/L)	3.0	6.0

Effluent discharged from CM station ST-WT-2 shall be demonstrated to be acutely non-lethal, as stipulated in Water Licence 2AM-WTP1826 Modified Schedule 1. The following are the toxicity tests that are performed:

- Reference Method for Determining Acute lethality of Effluents to Rainbow Trout EPS 1/RM/13 Second Edition December 2000 (with May 2007 amendments); and
- Biological Test Method; Acute Lethality Test Using Daphnia spp. EPS 1/RM/11 July 1990 (with May 1996 amendments).

All water collected within the non-contact water diversion system during operations at CM stations ST-WT-7, ST-WT-13 and Whale Tail Seepage Monitoring Program Stations ST-S-1 to –TBB shall not exceed the effluent quality limits presented in Table 3-5.

Table 3-5: TSS Criteria at CM Stations ST-WT-7 and ST-WT-13

Parameter	Maximum Average Concentration (mg/L)	Maximum Allowable Grab Sample Concentration (mg/L)
TSS	15	30

3.1.2.4 *Waste Rock Storage Facility*

Waste rock from the open pits not used for site development purposes will be trucked to the Whale Tail WRSF. Samples will be collected at the WRSF Pond (ST-WT-3), and if seepage is observed, for the compliance monitoring program. Frequency of collection will be as described in Table 3-1.

In addition, there will be regular inspections of the WRSF to determine the presence of any seepage or uncontrolled runoff. Where seepage or runoff is observed, water quality samples will be collected and facilities will be constructed to divert water to a collection system. Results of these inspections are reported in the Agnico Eagle annual report.

Further details about waste rock monitoring is covered in the Acid Rock Drainage/Metal Leaching Plan.

3.1.2.5 *Support Facilities*

Whale Tail Pit Camp and Site

A sewage treatment plant will be in operation at the Whale Tail Camp. Discharge from the plant will be directed to the Whale Tail attenuation pond and then discharged through a diffuser to the receiving environment. Water quality monitoring for this facility is included in the CM water collection system.

Construction debris and domestic waste generated on-site to be disposed of to the on-site landfill located in the Whale Tail WRSF.

The Whale Tail Bulk Fuel Storage Facility will be located east of the Whale Tail Camp adjacent to the mine operations haul road. Water collected within the fuel containment facilities will be discharged to land, when necessary, in a controlled manner. It is proposed that Effluent from the fuel containment facilities being discharged to land (sampled as ST-WT-12) shall not exceed the effluent quality limits presented, as stipulated in the Whale Tail Type A Water Licence 2AM-WTP1826 (Table 3-6).

Table 3-6: Effluent Criteria – Whale Tail Bulk Fuel Storage Facility at Monitoring Station ST-WT-12

Parameter	Maximum Authorized Monthly Mean Concentration	Maximum Authorized Concentration in a Grab sample
Conventional Parameters		
pH	6.0 to 9.5	6.0 to 9.5
Total Suspended Solids (mg/L)	15*	30
Metals		
Total Arsenic (mg/L)	0.5*	1.0
Total Copper (mg/L)	0.3*	0.6
Total Nickel (mg/L)	0.5*	1.0
Total Zinc (mg/L)	0.5*	1.0
Lead (mg/L)	0.1	0.1
Other		
Oil and Grease (mg/L)	5 and no visible sheen	5 and no visible sheen
Ammonia (mg/L)	6.0	6.0
Benzene (µg/L)	370	370
Toluene(µg/L)	2	2
Ethylbenzene (µg/L)	90	90

*Metal and Diamond Mines Effluent Regulations (MDMER)

3.1.2.6 *Whale Tail Pit Haul Road and Quarries*

Whale Tail Pit Haul Road and Quarries

The 64.1 km long exploration access road from Vault to the Amaruq exploration camp site was expanded in width (from 6.5 m to 9.5 m) and upgraded to a haul road. Road surfacing was constructed using non-potentially acid generating (NPAG) Vault waste rock and aggregates from the quarry sites and esker material. Approved borrow sources was used for construction; some of these will remain open for the duration of the mine to service the road.

Monitoring procedures along the Whale Tail Pit Haul Road and quarries include visual inspections of infrastructure and water quality sampling.

As per the quarry leases requirements (Item 17 of Quarry Permit KVCA15Q02, Item 17 of Quarry Permit KVCA15Q01, Item 18 of Quarry Permit KVCA17Q01 and Item 18 of Quarry Permit KVCA18Q01), a water monitoring plan will be prepared for quarries in which explosives are in use. The water will be monthly sampled and analyzed for a full suite of water quality parameters[1]. Prior to the tenth day of each month, a report will be submitted to the KIA indicating the water quality results. Water results shall be tabulated and compared to applicable guidelines.

[1] Physical Parameters: pH (field and laboratory), temperature (field), alkalinity, bicarbonate, carbonate, electrical conductivity, hardness, hydroxide, ion balance, total dissolved solids, total suspended sediments
Nutrients: NH_4, NO_3, NO_2, PO_4
Major Ions: Ca, Cl, Mg, K, Na, SO_4
Trace Metals: Al, Sb, As, Ba, Be, B, Cd, Cr, Cu, Fe, Pb, Li, Mn, Hg, Mo, Ni, Se, Ag, Sr, Sn, Ti, U, V, Zn

Visual Inspections

The watercourse crossing visual inspection and maintenance program is designed to identify issues relating to watercourse crossings structural integrity and hydraulic function. It has two main objectives:

1) Visual inspection of its infrastructure to identify defects, cracks or any other risks to structural integrity. Particular attention will be paid to the inlet and outlet structures of culverts, and to bridge abutments and their foundations, as required. This inspection is conducted annually by a geotechnical engineer.

2) Visual inspection to identify sediment or other debris accumulation impeding the free flow of water through the crossings. Maintenance operations will consist of hand removal of accumulated debris and repairing damages as soon as possible. Visual inspection of upstream and downstream channels to identify bed erosion or scour around the watercourse crossing structure. Particular attention is to be paid to bridge abutments and abutment foundations as they are vulnerable to scour and erosion. This inspection is conducted weekly during freshet and post freshet season, by a member of the environmental team.

Results of these inspections are reported in the Agnico Eagle annual report.

Water Quality Monitoring

Geochemical characterization studies were carried out in 2015 to 2018 on esker and quarries material from potential borrow source locations between Vault and Whale Tail Pit, as well as NPAG waste rock from the Vault WRSF. The results indicate that the materials tested are suitable for construction use and are not expected to cause any adverse water quality issues.

If issues are observed or a spill occurred near a water course during the winter a full suite of water quality sampling is conducted along the Whale Tail Pit Haul Road at areas of concern. This includes:

- Any significant water seeps and/or water ponded in contact with the road. Other criteria for selecting a sampling location include: areas of evident rock staining (rust color particularly) and areas where an accidental spill has previously occurred.
- Upstream and downstream from the major road stream crossings in order to confirm there are no water quality issues resulting from these crossings or the adjacent road rock fill.

Should the results indicate a significant change in water quality from previous years or elevated risks to aquatic life, further water quality monitoring will be conducted at those specific locations to determine the cause and notification will be provided to regulatory authorities. An action plan will be developed and implemented should the results indicate issues. The results for all access road water quality monitoring are reported in the Agnico Eagle Annual Report to regulators.

3.1.2.7 *Groundwater*

The *Groundwater Monitoring Plan* describes the groundwater monitoring plan for the Project.

3.1.2.8 *Receiving Environment*

Receiving water quality monitoring is discussed in Section 1A of the A*quatic Effects Management Program (AEMP) (November 2015*). Within the AEMP are numerous monitoring programs: of greatest emphasis for the protection of the aquatic environment are the core receiving environment monitoring program (CREMP), Environmental Effects Monitoring studies and targeted monitoring programs (Azimuth 2015, 2016, 2018a, 2018b).

The core monitoring program includes three areas of sampling stations that surround each of the mine developments (near field, mid field and far field) for early detection of mine-related impacts, as well as two reference lake areas. The monitoring program is summarized in Table 2-2 of the CREMP and includes: water quality, sediment chemistry, benthos, periphyton, phytoplankton, and fish monitoring (as part of EEM and fish habitat compensation monitoring), the parameters to be measured, sampling locations, sampling frequency, sampling methods, and criteria for data evaluation. Targeted studies are limited in scope and intended to address "specific questions related to particular components of mine development during construction and operation."

Monitoring locations for the effluent diffuser in the receiving environment will be located at the edge of the diffuser mixing zone either within the CREMP core near-field sampling zones or as separate monitoring locations, depending upon the final location of the diffuser.

Lakes not sampled under the CREMP (ST-WT-13 and ST-WT-15) are included in this monitoring plan and are listed in Table 3-1. Data collected from these sampling stations during the operations phase will be compared to the water quality model predictions.

3.2 EVENT MONITORING

The Event Monitoring (EM) program addresses the site-specific monitoring that is required following any accidental release. A "release" may be caused by:

- Spills, including unidentified seepage (Spill Contingency Plan); and
- Emergencies (Emergency Response Plan).

The EM program is designed to verify whether contamination of the surface soil, nearby receiving environment and active zone has occurred as a result of an accidental release of a hazardous material or contaminated water, through monitoring of surface runoff and nearby receiving environment following remediation of any release. It is anticipated that owing to the presence of permafrost beneath most of the mine footprint, there will be minimum impact to groundwater. A complete list of hazardous materials use during operations of the mine is provided in the *Hazardous Materials Management Plan.*

The EM plan is developed on a site-specific basis subsequent to a spill or other incident, and considers the type of product spilled, the potential receptors and the potential for any remaining contamination after clean-up. The plan is done in coordination with the Environmental Superintendent as described in the *Spill Contingency Plan.*

In the event of an accidental release, the water quality of the downstream receptor and possibly upstream of the receiving point, if any, is to be sampled (during the ice-free season) and analyzed. Should the spill have happened over snow cover, water and possibly soil sampling is to take place at the earliest feasible time after thaw to verify if there has been any impact to the receiving water

or soil quality. The specific parameters monitored as part of the EM program will depend on the nature of the spill, and will be determined for the specific hazardous material released.

EM monitoring will occur following the clean-up of a release and the frequency of sampling will depend on the type of material spilled (wet or dry spill), the environment into which the chemical was released (surface water body or soil; frozen or thawed), the quantity of spill material and the status of remediation/clean up measures that were initiated. The EM program for a particular spill will cease upon obtaining satisfactory analytical results (within 20% of background level, to accommodate for analytical accuracy) from the potentially affected areas or as required by regulators.

3.3 ADAPTIVE MANAGEMENT PROGRAM

Results of the water quality monitoring are to be reviewed by the Environmental Department of the mine and chemical trends of constituents of interest are tracked for mine site monitoring and in the AEMP data (including the CREMP) to allow early detection of significant changes in water quality within the mine site prior to discharge, or if thresholds and triggers are exceeded in the receiving environment. Action plans are then to be implemented to ensure that environmental protection objectives are met.

Results of the annual monitoring are compared to the FEIS water quality predictions to determine if conditions are similar to predicted. If site data shows a negative trend that differs from predicted concentrations by a significant amount, the adaptive management program designed for the Project provides a framework for action, if necessary. This program is consistent with the program in use at the Meadowbank Mine. The program has two levels - a trigger level to compare the monitoring data, and an action plan of mitigative measures for identified exceedances to these triggers.

The adaptive management program is divided into two sections, one for parameters with regulated discharge criteria at specific monitoring locations, as specified in the Water Licence 2AM-WTP1826 and by the MDMER. The second section is for measured parameters for which no discharge limits have been identified in the water Licence (i.e. CREMP monitoring).

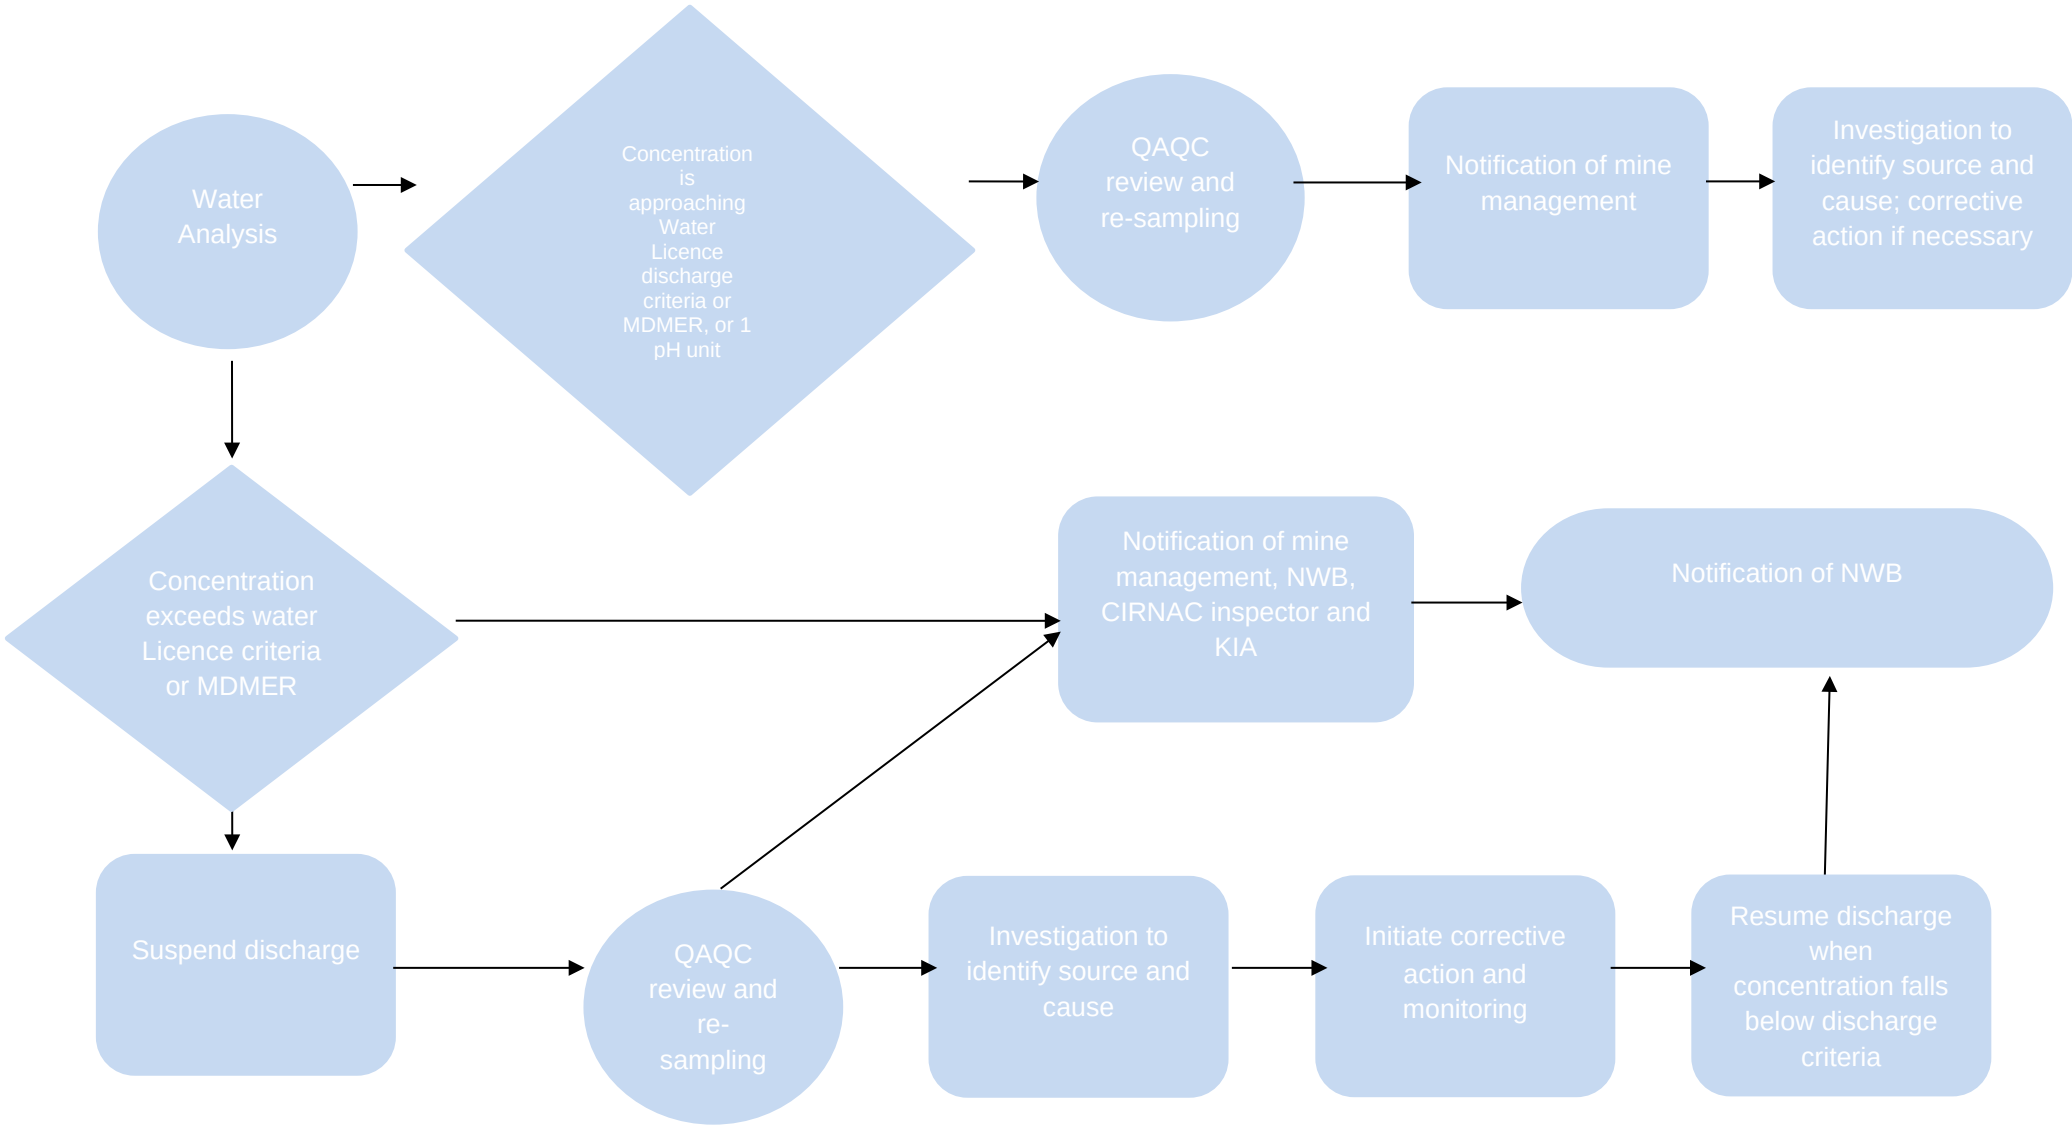
3.3.1 Adaptive Management Program for Regulated Discharge

3.3.1.1 *Action Plan*

In the case of an exceedance of a NWB Licence limit or MDMER discharge limit an action plan will be implemented. The adaptive management program requires that if one or more of the key monitored parameters exceed the respective limits, a staged sequence of responses will follow. Table 3-7 summarizes the staged adaptive action plan for the CM program for regulated discharge. Figure 3-1 is a logic diagram showing the decision path for evaluating analytical results for regulated discharge.

Should the TSS value (measured value or calculated from turbidity measurements) of non-contact water at any time during the construction, operation, or closure phases exceed regulatory guidelines, the water will be discharged to the Attenuation Pond until the cause of the exceedance can be identified and the situation rectified.

In addition to the mitigative measures listed above, a number of other possible alternatives are



available to reduce or treat contaminants. These mitigation measures include:

- Best management practices for sediment and erosion control would be employed to reduce TSS concentrations, i.e. flow control, sedimentation basin construction, etc.;
- Addition of a coagulant for the reduction of TSS in pond water;
- Use of geotextile or re-armoring of banks to filter and reduce TSS in pond/ditch water;
- Deployment of absorbent booms and/or barriers within ponds to isolate surface petroleum hydrocarbon films for removal and/or treatment;
- Adjustments to on-site sewage treatment for the reduction of BOD and E. coli concentrations;
- Injection of oxygen or aeration for the reduction of ammonia;
- Addition of lime to increase a low pH value or reduce metal concentrations; and/or
- Removal of the offending source rock or the prevention of surface waters coming into contact with the offending source rock.
- Development and Implementation of a Whale Tail Pit-specific *Freshet Action Plan* to proactively identify any additional seeps around areas of concern; conduct additional monitoring, and control and contain seepage on site.

Table 3-7: Action Plan for Regulated Discharge

Example	Action Plan
Exceeds water Licence discharge criteria or MDMER	- Suspension of discharge activities; - QA/QC review and analysis, and re-sample water at the particular location if necessary; - Notification of mine management (General Mine Manager and Environment Superintendent) and the Nunavut Water Board, the CIRNAC Water Resources water Licence inspector and the Kivalliq Inuit Association; - Investigation to identify possible source(s) and cause(s) of the exceedance; - Initiation of corrective actions or water treatment, and follow up monitoring; and - Resumption of discharge when concentrations are below the discharge criteria

Figure 3-1: Logic Diagram for Regulated Discharge

3.3.2 Adaptive Management Program for Non-Regulated Discharge

Aside from targeted monitoring studies (i.e. “Effects Assessment Studies”) such as those commissioned following dike construction, the CREMP is the main program aimed at measuring and assessing potential impacts of contaminants in the receiving aquatic environment that are not regulated under MDMER or NWB.

This program was designed to take an integrated, ecosystem-based approach that links mitigation and monitoring of physical/chemical effects on key ecological receptors in the receiving environment. It addresses key issues identified in the Environment Assessment (i.e., mining-related activities with the potential to affect water quality, fish habitat and fish populations). Monitoring results are intended to inform the “adaptive management” process, supporting the early identification of potential problems and development of mitigation options to address them by comparing results to established threshold and trigger levels.

3.3.2.1 *CREMP Threshold and Trigger Levels*

As described in the CREMP Design Document (Azimuth 2015, 2016) trigger levels were developed to facilitate adaptive management of potential water quality issues in the receiving environment. These criteria were developed with the assumption that action will be considered before certain monitored parameters reach levels that cause or have the potential to cause adverse effects to aquatic biota. The criteria for action provide an early warning framework under which management responses may be considered, taking into account findings from other AEMP component programs. Two types of criteria were developed:

- Thresholds are legal requirements, regulatory guidelines (e.g., CCME), or other discrete benchmarks, below which unacceptable adverse effects are not expected and above which adverse effects may occur. If effects-based thresholds do not exist or are not warranted for a particular variable, then early warning triggers (based on statistical criteria) will be developed without thresholds.
- Triggers are early warning criteria that may lead to action. Exceedance of a trigger value does not necessarily imply that an adverse effect may be expected. For variables with a threshold, the trigger was set as the maximum of either the value halfway between: the baseline median and the threshold, or the 95th centile of the baseline data. For variables without thresholds, triggers were set equal to the 95th centile of the baseline data except in cases where less than 5% of the data exceeded the current detection limit (DL), in which case the trigger was set to two times the DL.

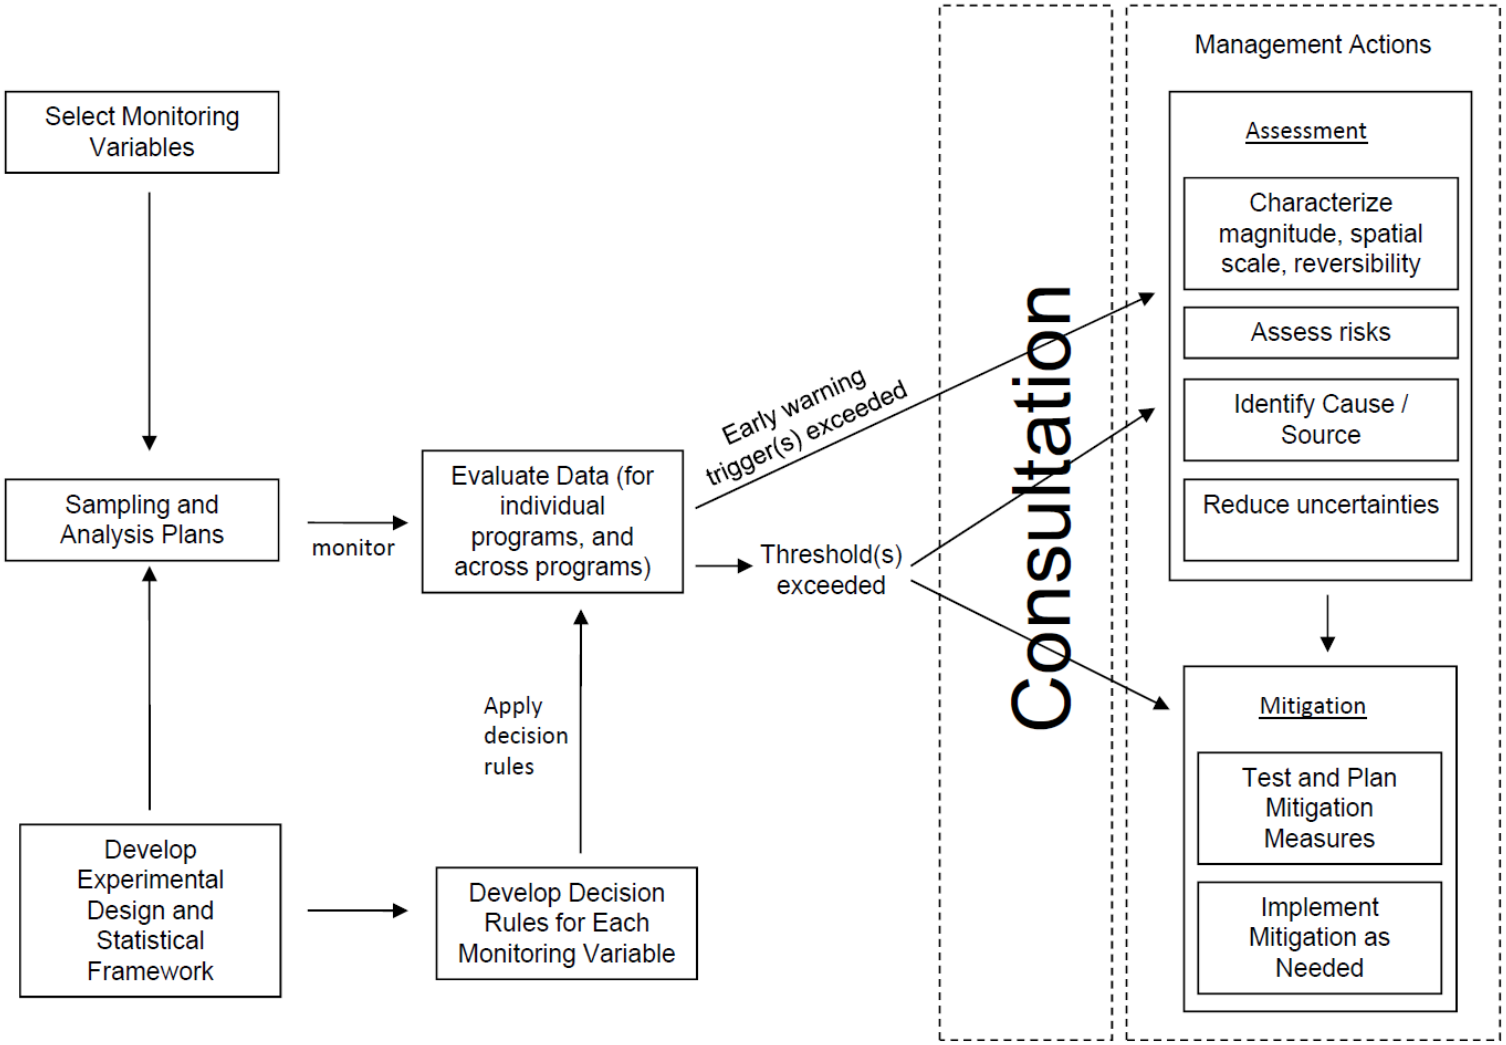
Water chemistry data is collected up to six months per year (March, May, July, August, September and November/December) for the annual period of paired sampling to support Before/After Control/Impact statistical analyses, recognizing that in any given year the actual number of samples collected may range from four to six depending on logistical constraints (e.g. snow and ice). Two randomly located subsamples are collected at each station each month and all samples are 3 m from the surface. In addition, basic water quality data is collected at key near-field areas at least once mid-winter to reduce uncertainty regarding the potential occurrence of change over winter.

Annual average concentrations (6-month mean) are compared to trigger values to determine need for action (rather than results from individual sampling events).

Further information on the development of thresholds and triggers is provided in the CREMP Design Document (Azimuth, 2016).

3.3.2.2 *Action Plan*

A management response plan (MRP) has been developed for the AEMP (Azimuth 2015, 2016), of which the CREMP is one component. The general MRP for the AEMP is shown in Figure 3.2. Following the integration of the results from each independent program, the response actions are based on the cumulative results of all programs. Therefore, while we expect management actions to be taken in cases where criteria for action are exceeded, the specific actions are not linked to outcomes of the CREMP alone because the CREMP is only one of the monitoring programs under the AEMP. In other words, it is not possible or appropriate to describe the specific management actions that will be taken when CREMP triggers or thresholds are exceeded.



Nevertheless, there are two general classes of management actions – those aimed at further assessment and those aimed at mitigation. In general, exceedance of early warning triggers will trigger further assessment, which may then lead to mitigation, whereas exceedances of thresholds could possibly lead directly to mitigation. It is expected that CREMP triggers will be exceeded occasionally due to chance (given the large number of variables that are monitored, particularly for water chemistry), therefore further assessment will almost always be important.

The specific management action that would be appropriate in a given case depends on the underlying cause. For example, if a metal becomes elevated in receiving water, the identification of options for further assessment and/or mitigation options would be different if the source of the metal is groundwater versus effluent versus dust. The timing of management actions is also case-specific. In cases where further assessment is warranted, that assessment should begin as soon as practically possible. In cases where mitigation is considered, mitigation should begin as soon as the weight of evidence indicates that mitigation is warranted, and the benefits of commencing mitigation immediately outweigh the disadvantages of waiting for further information. Consultation with regulators and stakeholders is important for determining management actions (see Azimuth, 2015).

Further details on the integrated aquatic effects action plan are provided in Azimuth, 2015.

The general staged sequence of responses for triggered parameters is summarized in Figure 3.2 below.

Figure 3-2: Logic Diagram for Non-Regulated Discharge

SECTION 4. FLOW VOLUMES

Flow volumes within the mine footprint will be measured daily during periods of discharge. Flow volume measurements will be conducted using volumetric flow meters attached to applicable pumps. For permanent pumping arrangements, these flows will be measured using permanent in-line flow meters, such as fresh and reclaim water pumping systems. For periodic batch discharges, such as secondary containment sumps, portable flow meters or calculated pump time and capacity methods will be used. If needed, seepage collection ditch flows may be measured using either flow measuring weirs or using stream gauging methods.

Detailed pump records are maintained including date, pond/sump number, receiving location of pumped water, pump ID, duration of pumping, and total volume pumped. The average flow rates, total discharge per event and total cumulative discharge will be reported annually. The flow volumes monitoring is intended to help in the water management by ensuring the appropriate destination for contact water and discharges, and to track water conservation and recycling.

In accordance with Water Licence 2AM-WTP1826, monitoring locations of the Whale Tail Pit area for water flow volumes include:

- The volume of fresh water obtained from any source for domestic, industrial, or re-flooding (ST-WT-5);
- The volume of effluent (ST-WT-11) and fresh water (Whale Tail Lake South Basin, ST-WT-8) transferred to the pit lake; and
- The volume of water discharged from the Attenuation Ponds to a diffuser (ST-WT-2).

Details on the intervals of pumping for contact water are provided in the Water Management Plan.

SECTION 5. REPORTING

5.1 Monthly Reporting

All water quality monitoring results and flow measures will be compiled into a brief monthly report, and sent to the NWB, Crown-Indigenous and Northern Affairs Canada (CIRNAC), Water Resource Inspector and to the Kivalliq Inuit Association (KIA). These reports are due within 30 days of the end of the month being reported on.

5.2 ANNUAL REPORTING

An annual report is to be submitted to the NWB, KIA, Department of Fisheries and Oceans, CIRNAC, NIRB, Government of Nunavut, and other interested parties by March 31st of the following year. The report is to summarize the following:

- Monitoring results for each sampling station during the year and for the life of mine (construction to end of closure); activities during the year at each station; and any exceedances at stations, the action plan applied to the exceedance, and the results of the action plan;
- Annual seep water chemistry results; including location of the samples, sources of the water collected, and results of chemical analyses of the samples;
- Annual groundwater monitoring results; activities during the year at each well site and record of well operations, well replacement, and proposed drilling for the next year; and installation details of new wells and identification of any abandoned or destroyed wells.
- Receiving water monitoring results;
- Spills and any accidental releases; event monitoring activities conducted following containment, remediation, and reclamation; and the results of EM program, any exceedance in EM results, and the action plan following the exceedance;
- Compare monitoring results to predictions in the Environmental Assessment (EA) and identify significant discrepancies;
- Measured flow volumes;
- Effluent flow rates, volumes and calculated chemical loadings following the requirements of MDMER; and
- Results of QA/QC analytical data.

5.3 EXCEEDANCE REPORTING

Any measured concentration at a CM station exceeding a regulated discharge criterion stipulated in the Water Licence 2AM-WTP1826 or MDMER will be reported to the NWB and Environment and Climate Change Canada upon receipt of the analysis. In addition, results of the action plan will be reported and, where necessary, mitigation options identified within 90 days after receipt of the analyses.

Exceedances in the concentration of a parameter in receiving water will be reported as specified in the AEMP and EEM – MDMER accordingly.

AGNICO EAGLE

Meadowbank Division

Whale Tail Pit – Waste Rock Management Plan

OCTOBER 2018

VERSION 4

EXECUTIVE SUMMARY

Agnico Eagle Mines Limited – Meadowbank Division (Agnico Eagle) will develop the Whale Tail Pit and Haul Road Project (Project), a satellite deposit located on the Amaruq property, to continue mine operations and milling at Meadowbank Mine.

The proposed open pit mine, mined by truck-and-shovel operation, will produce 8.3 million tonnes (Mt) of ore, 61.3Mt of waste rock, and 6.0 Mt of overburden waste. There are four phases to the development: 1 year of construction, 3 years of mine operations, 8 years of closure, and the post-closure period. According to the Whale Tail Pit Life of Mine (LOM) calculation, the addition of the Whale Tail Pit to the actual Meadowbank LOM (LOM 2015) will generate an addition of approximately 8.3 Mt (dry) of tailings to the Meadowbank Tailings Storage Facility (TSF) for a total of 35.4 Mt.

Project mining facilities include accommodation buildings; two ore stockpiles; one overburden stockpile; one waste rock storage facility (WRSF) area planned to receive waste rock and waste overburden; a water management system that includes collection ponds, water diversion channels, and retention dikes/berms; and a Water Treatment Plant.

One area, located north-west of the open pit, has been identified as the Whale Tail WRSF for waste rock placement. Waste rock and overburden will be trucked to the Whale Tail WRSF until the end of mine operations, with distribution according to the operations schedule. Waste rock and overburden will be co-disposed together in one of the two piles constituting the Whale Tail WRSF area. All waste rock material will be sampled and tested during operations to confirm their ARD and ML potential in support of waste segregation. Waste rock and overburden produced during mining will be used in the construction of the mine site infrastructure, while some of the non-potentially acid generator (NPAG) and non-metal leaching (NML) waste rock will be put aside for capping at closure. Because of the large material requirement for construction and NPAG/NML rock cover, as well as the importance for adequate disposal to meet closure objectives, waste rock management will be a key component of the mining planning for the Whale Tail Project.

Tailings from the Project will be stored in the Meadowbank TSF. The management operation and monitoring of the TSF is regulated under Agnico Eagles existing Type A Water Licence 2AM-MEA1526. Updates to the Meadowbank Mine Waste Rock and Tailings Management Plan have been provided in support of the application and amendment needed to the Type A Water Licence to reflect changes in the Meadowbank operations. In summary, the TSF consists of a North Cell and South Cell located within the basin of the former north-west arm of Second Portage Lake previously dewatered to allow mining in the Portage Pit. To store the full volume of tailings from processing of the Whale Tail Pit ore, Agnico Eagle will maximize storage in South cell through the deposition of approximately 5.3 Mt of tailings, and is proposing to construct internal dike structures to store the remaining 3 Mt within the current footprint of the North Cell.

The generation of metal leachate in acidic drainage is a concern for mining projects. Climate control strategies rely on cold temperatures to reduce the rate at which oxidation occurs. The low net precipitation in permafrost regions limits infiltration of water into waste rock and tailings disposal areas. Consequently, the climate of the Whale Tail Pit will act as a natural control to reduce the production of acid mine drainage and metal leachate. Climate control strategies are best applied to materials placed at a low moisture content to reduce the need for additional controls on seepage and infiltration. This strategy is considered to be effective for waste rock in arid climate such as the one of Whale Tail Pit.

The Whale Tail WRSF and the ore stockpiles were designed to minimize the impact on the environment and to consider geotechnical and geochemical stability. The surface runoff and seepage water from these facilities will be collected in water collection ponds as part of the water management strategy. If water quality does not meet the discharge criteria as per the Whale Tail Water Licence requirement, the collected water will be treated prior to being discharged to the outside environment during operation and closure.

Closure of the Whale Tail WRSF will begin when practical as part of the progressive reclamation program. The Whale Tail WRSF will be covered with non-potentially acid generating and non-metal leaching waste rock to promote freezing as a control strategy against acid generation and migration of contaminants. Thermistors will be installed within the Whale Tail WRSF to monitor permafrost development. Thermal and water quality monitoring will be carried out during all stages of the mine life to demonstrate geotechnical stability and the safe environmental performance of the facilities. If any non-compliant conditions are identified, then maintenance and planning for corrective measures will be completed in a timely manner to ensure successful completion of the Whale Tail Interim Closure and Reclamation Plan.

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited – Meadowbank Division (Agnico Eagle) will develop the Whale Tail Pit and Haul Road Project (Project), a satellite deposit located on the Amaruq property, to continue mine operations and milling at Meadowbank Mine.

The Amaruq property is a 408 square kilometre (km^2) site located on Inuit Owned Land approximately 150 kilometres (km) north of the hamlet of Baker Lake and approximately 50 km northwest of Meadowbank Mine in the Kivalliq Region of Nunavut. The deposit will be mined as an open pit (i.e., Whale Tail Pit), and ore will be hauled to the approved infrastructure at Meadowbank Mine for milling.

The proposed open pit mine, mined by truck-and-shovel operation, will produce 8.3 million tonnes (Mt) of ore, 61.3Mt of waste rock, and 6.0Mt of overburden waste. There are four phases to the development: 1 year of construction, 3 years of mine operations, 8 years of closure, and the post-closure period.

The general mine site location for the Project is shown in Figure 1.1. The mine development will include the following major infrastructure:

- industrial area (camp and garage);
- crusher;
- ore stockpiles;
- rock and overburden storage facilities;
- landfill;
- haul and access roads;
- open pit mine; and
- water dewatering dikes.

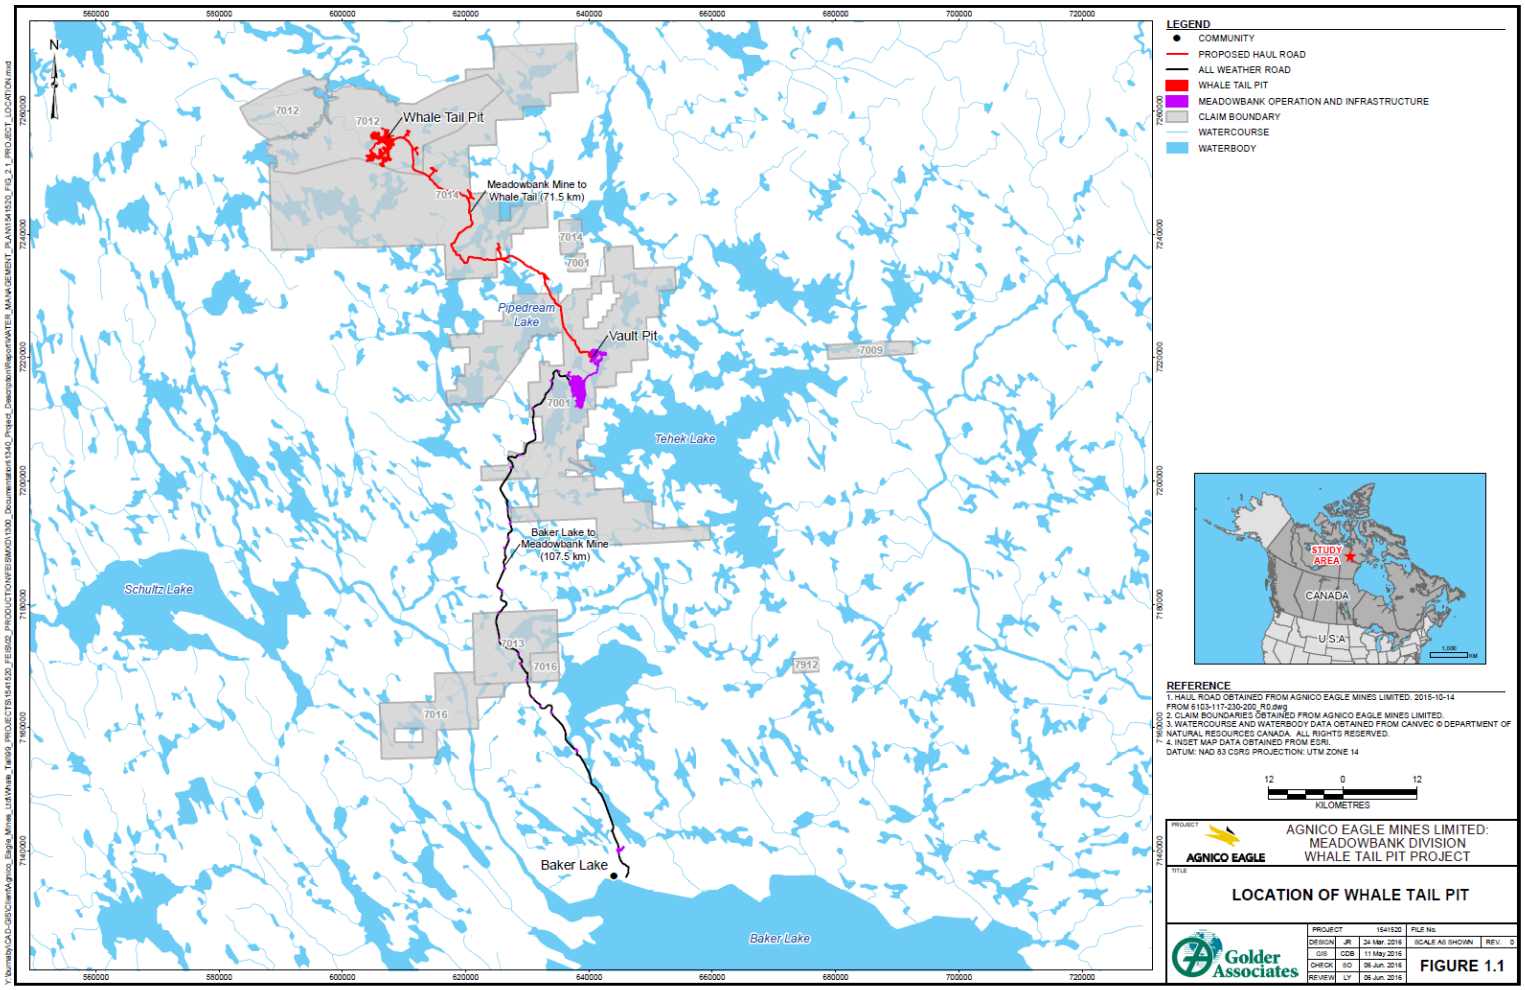

Figure 1.1 Location of Whale Tail Pit

This document presents the Waste Rock Management Plan (the Plan) and is submitted as per Part B, conditions 14 and 15 of the NWB Whale Tail Type A Water License 2AM-WTP1826. The purpose of the Plan is to provide consolidated information on the management ore stockpiled on site, waste rock and overburden, including strategies for runoff and dust control and monitoring programs for the storage facilities. The management operation and monitoring of the tailings storage facilities (TSF) (refer to Figure 1.2) is regulated under Agnico Eagles existing Type A Water Licence 2AM-MEA1526. Updates to the Meadowbank Mine Waste Rock and Tailings Management Plan have been provided in support of the application and amendment needed to the Type A Water Licence to reflect changes in the Meadowbank operations.

As per the Nunavut Impact Review Board (NIRB) Whale Tail Project Certificate No.008, term and condition 7, the Whale Tail Waste Rock Management Plan is submitted to the NIRB at least 60 days prior to the start of construction of the Waste Rock Storage Facility, with subsequent updates or revisions to the Plan submitted annually thereafter or as may otherwise be required by the NIRB for the life of the Project.

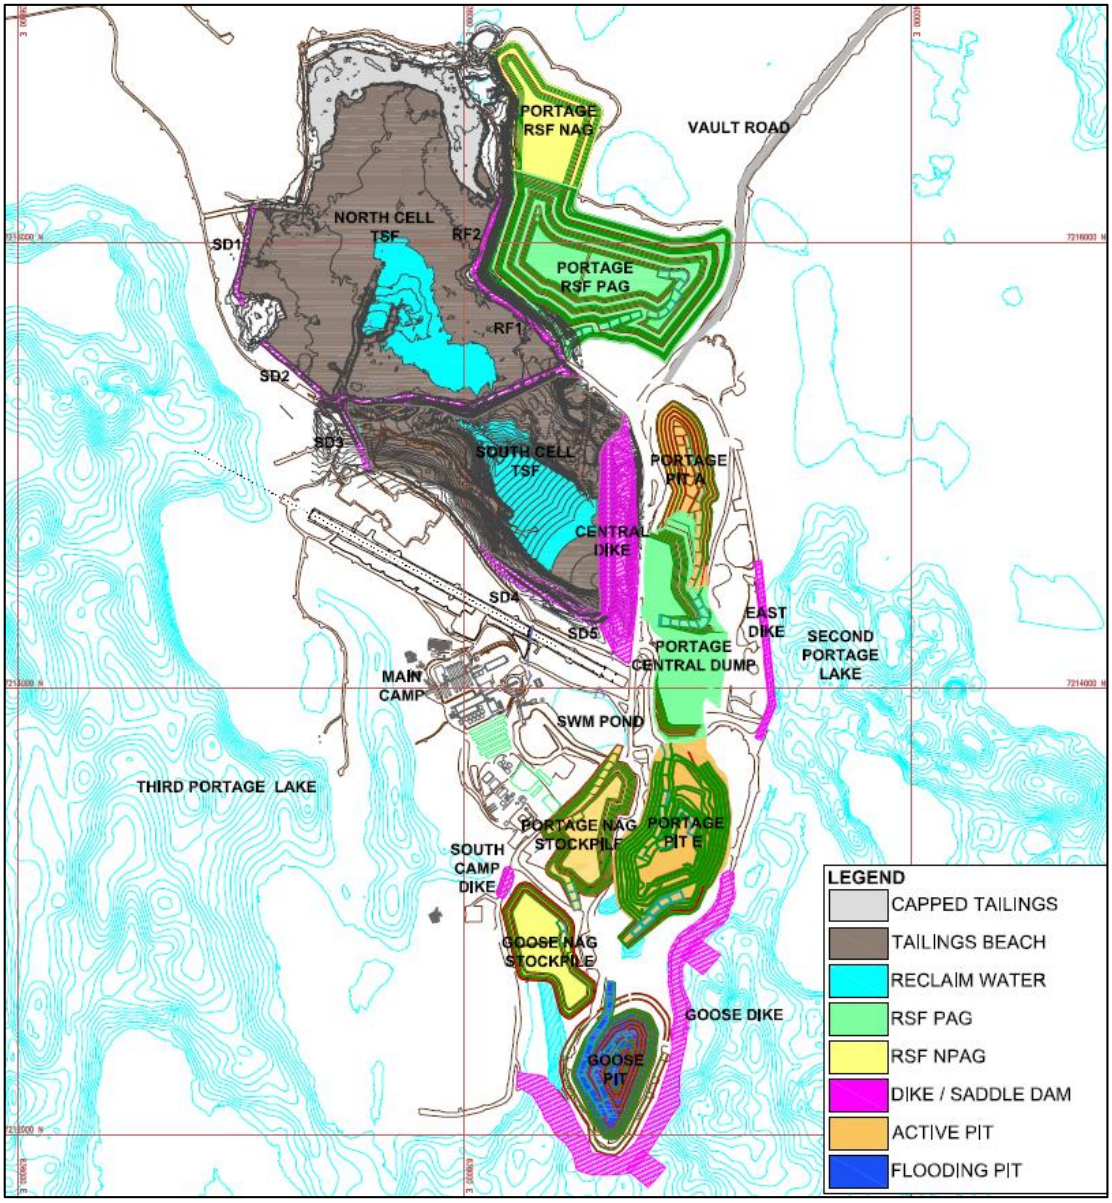

Figure 1.2 Meadowbank Tailings Storage Facility

SECTION 2 • BACKGROUND INFORMATION

2.1 Whale Tail Pit Mine Operations

The construction phase is anticipated to start in at the beginning of the third quarter of Year -1 (2018) and focus on site preparation and the construction of infrastructure, with the start of the open pit development to produce construction material. The operations (mining and ore processing) will continue approximately 3 years, from Year 1 (2019) to Year 4 (2022), with a rate of extraction targeted between 9,000 and 12,000 tonnes per day (t/day) of ore at an average stripping ratio of 8.1. Mining activities are expected to end in Year 3 (2021) and ore processing with stockpiled material is expected to end during the first quarter of Year 4 (2022). Closure will occur from Year 4 (2022) to Year 11 (2029) after the completion of mining and will include removal of the non-essential site infrastructure and flooding of the mined-out open pit, as well as reestablishment of the natural Whale Tail Lake level. Post-closure and monitoring phases will commence as closure is completed in Year 11 (2029) and will continue until approximately Year 28 (2047) or until it is shown that the site and water quality meets regulatory closure objectives. Table 2.1 summarizes the Project timeline and general activities.

Table 2.1 Overview of Timeline and General Activities

Phase	Year	General Activities
Construction	Year -1	• Construct site infrastructure • Develop open pit mine • Stockpile ore
Operations	Year 1 to 3	• Open pit operations • Transport ore to Meadowbank Mine • Stockpile ore • Discharge Tailings in Meadowbank TSF
	Year 4	• Complete transportation of ore to Meadowbank Mine • Complete discharge tailings in Meadowbank TSF
Closure	Year 4 to 11	• Remove non-essential site infrastructure • Flood mined-out open pit • Re-establish natural Whale Tail Lake level
Post-Closure	Year 11 forwards	• Site and surrounding environment monitoring

TSF = Tailings Storage Facility

2.2 Meadowbank Mine Operations

As a requirement of the Type A Water Licence, any modifications to the dewatering process, life of mine (LOM), tailings storage facilities (TSF), and any other aspect associated to the water management at Meadowbank are adhered to and updated in the annual submission of the Meadowbank Water Management Plan and associated water balance.

2.3 Whale Tail Pit Site Layout

Site layouts are presented in Appendix A.

2.4 Climate

Climate characteristics presented herein were extracted from the permitting level engineering report (SNC, 2015).

The Project is located in an arid arctic environment that experiences extreme winter conditions, with an annual mean temperature of -11.3 degrees Celsius (°C). The monthly mean temperature ranges from -31.3°C in January to 11.6°C in June, with above-freezing mean temperatures from June to September. The annual mean total precipitation at the Project is 249 millimetres (mm), with 59 percent (%) of precipitation falling as rain, and 41% falling as snow. Mean annual losses were estimated to be 248 mm for lake evaporation, 80 mm for evapotranspiration, and 72 mm for sublimation. Mean annual temperature, precipitation, and losses characteristics are presented in Table 2.2.

Short-duration rainfall events representative of the Project are presented in Table 2.3, based on intensity-duration-frequency curves available from the Baker Lake A meteorological station (Station ID 2300500) operated by the Government of Canada (2015).

2.5 Climate Change

Climate change information presented herein was extracted from the Final Environmental Impact Statement (FEIS) Amendment, Volume 4, Section 4.2 (Agnico Eagle, 2016).

The climate in the Arctic is changing faster than at mid-latitudes (IPCC, 2014). The most recent set of climate model projections (CMIP5) predict an Arctic-wide year 2100 multi-model mean temperature increase of +13°C in late fall and +5°C in late spring under the Intergovernmental Panel on Climate Change (IPCC)'s "business as usual scenario" (RCP8.5). IPCC climate change mitigation scenario RCP4.5 results in a year 2100 multi-model Arctic wide prediction of +7°C in late fall and +3°C in late spring (Overland et al., 2013). The effects of changes of this magnitude to terrestrial, aquatic and marine ecosystems, and social and economic systems of the Arctic are an active area of research. However, due to the short duration of the proposed Project, climate change related effects to the Project are likely negligible. The WRSF, which will be a permanent infrastructure, was design using the appropriate climate change model scenario to mitigate potential climate change related effects (Golder, 2018).

2.6 Permafrost

The mine site is located in an area of continuous permafrost, as shown on Figure 2.1. Based on measurements of ground temperatures (Knight Piésold, 2015), the depth of permafrost at the mine site is estimated to be in the order of 425 metres (m) outside of the influence of waterbodies. The depth of the permafrost and active layer will vary based on proximity to the lakes, overburden thickness, vegetation, climate conditions, and slope direction. The typical depth of the active layer is 2 m in this region of Canada. The typical permafrost ground temperatures at the depths of zero annual amplitude (typically at the depth of below 15 m) is approximately -8.0 °C in areas away from lakes and streams. The geothermal gradient measured is 0.02 degrees Celsius per metre (°C/m) (Knight Piésold, 2015). Late-winter ice thickness on freshwater lakes is approximately 2.0 m. Ice covers usually appear by the end of October and are completely formed in early November. The spring ice melt typically begins in mid-June and is complete by early July.

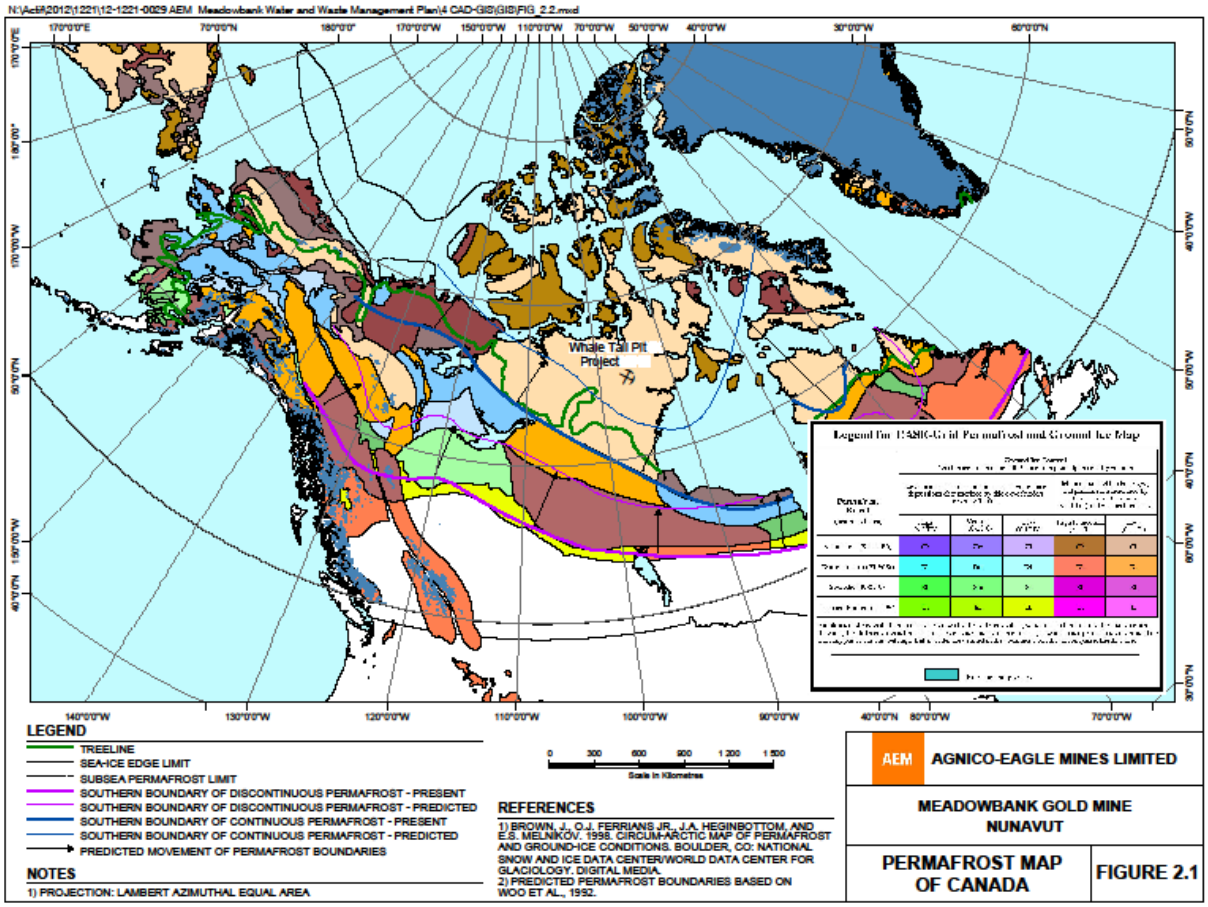

Figure 2.1 Permafrost Map of canada

2.7 Seismic Zone

The mine site is situated in an area of low seismic risk. The peak ground acceleration (PGA) for the area was estimated using the seismic hazard calculator from the 2010 National Building Code of Canada website (http://www.earthquakescanada.nrcan.gc.ca/hazard-alea/interpolat/index_2010-eng.php). The estimated PGA is 0.019 grams (g) for a 5% in 50-year probability of exceedance (0.001 per annum or 1 in 1,000 year return) and 0.036 g for a 2% in 50-year probability of exceedance (0.000404 per annum or 1 in 2,475 year return) for the area.

SECTION 3 • WHALE TAIL PIT DEVELOPMENT PLAN

3.1 Whale Tail Pit Life of Mine

Several LOM scenarios were analysed by Agnico Eagle, which ultimately retained the best one based on economic viability of the Project. The chosen scenario is not expected to change significantly from that existing at Meadowbank, and will remain on average 9,000 t/day and up to a peak mill throughput of 12,000 t/day (which is the current rate capacity at Meadowbank Mill). Milling will end as the maximum capacity of the current TSF at Meadowbank is reached (8.3 Mt). Table 3.1 summarizes the Whale Tail Pit LOM.

Table 3.1 Projected Whale Tail Pit Mined Tonnages

Year	Period	Ore Mined (t)	Ore Processed in Mill (t)	Production Days
2018		160,020	-	-
2019	Q1	366,229	-	184
	Q2	610,012	-	
	Q3	418,663	821,250

2021		2,476,834	3,285,000	365
2022		0	66,644	8
Total		**8,279,144**	**8,279,144**	**923**

t = tonne.

The Whale Tail Pit deposition plan is proposed to be a continuation of the current Meadowbank deposition plan according to the Whale Tail Pit production rates and mill feed presented in Table 3.1. Completion of the Meadowbank LOM milling activities will occur in Q3 2018.

For additional information, refer to the Mine Waste Rock and Tailings Management Plan submitted under Water Licence 2AM-MEA1526.

3.2 Mine Waste Production Sequence

Two mine waste streams will be produced at Whale Tail Pit, waste rock and overburden. A third mine waste stream, tailings, will be produced at Meadowbank Mine (Refer to the Mine Waste Rock and Tailings Management Plan, submitted under Water Licence 2AM-MEA1526). Approximately 61.3Mt of waste rock and 6.0Mt of overburden will be generated by the Project as presented in Tables 3.2 and 3.3. The operation management and monitoring of the TSF is regulated under Agnico Eagle Type A Water Licence 2AM-MEA1526.

The term "waste rock" designates all fragmented rock mass that has no economic value and needs to be stored separately. Waste rock is also commonly referred to as "mine rock" in the mining industry. Typically, waste rock is produced during the initial stripping phase and during the subsequent development of open pits and underground workings.

The term "overburden" designates all soils above the bedrock that needs to be stripped at surface prior to developing the open pits. Generally, the overburden at the site consists of a thin layer of organic material overlying a layer of non-cohesive soil with variable amounts of silt, sand, and gravel.

Table 3.2 Projected Mined Tonnages and Ore Stockpile Balance (2018 – 2022)

Year	Period	Ore Mined (t)	Waste Rock Excavated (t)	Overburden Excavated (t)	Total Material Excavated (t)	Total Material Excavated (t/day)	Strip ratio	Ore Stockpile Balance (t)

t = tonne; t/day = tonnes per day.

The proposed usage or destination of the two mine waste materials is presented in Table 3.3. Further details on the management of the mine waste materials are presented in Section 5 of this Plan.

The site layouts presented in Appendix A show the evolution of the site in 2018, 2019, 2022, and 2029. Most of the waste rock excavated in 2018 at the start of the open pit development will be used for the construction of the water management structures, the infrastructures pads, and the access roads (Table 3.4). During the Year 1 (2019) and the Year 2 (2020), the remaining required facilities for the operations will be completed.

Table 3.3 Summary of Mine Waste Tonnage and Destination

Mine Waste Stream	Estimated Quantities	Waste Destination
Overburden	6.0Mt	• Temporary storage West of Whale Tail Lake (~ 0.1 Mt for operations) • Co-disposed with waste rock in Whale Tail WRSF
Waste Rock	61.3Mt	• Construction material • Whale Tail WRSF • Closure and site reclamation

Mt = million tonnes; WRSF = Waste Rock Storage Facility.

t = tonne; WRSF = Waste Rock Storage Facility.

Over the LOM, non-potentially acid generating (NPAG)/non-metal leaching (NML) and potentially acid generating (PAG)/metal leaching (ML) waste rock will be segregated according to the requirement for construction (refer to the Operational Acid Rock Drainage (ARD)/Metal Leaching (ML) Testing and Sampling Plan) and capping of the Whale Tail WRSF (refer to Sections 5 and 9). The NPAG waste rock tonnage required for the construction of the Whale Tail WRSF for the 4.7 m thermal cover is 8,883,000 tonnes.

SECTION 4 • WHALE TAIL PIT OVERBURDEN MATERIALS

A detailed description of soils in the Project footprint is presented in FEIS Volume 5, Section 5.3 - Terrain, Permafrost, and Soils (Agnico Eagle, 2016). Soils in the Project footprint are predominantly coarse to moderately coarse-textured glacial till and colluvium with high coarse fragment content commonly overlying bedrock at shallow depths (less than 1 m). Soils are dominated by Cryosols which develop on till dominated landscapes. Saturated soil layers overlying frozen layers have been observed on site. Other soils identified include Brunisols which are most prevalent on glaciofluvial material (e.g., eskers), Gleysols which develop on till in transition areas between upland and depressional landscape positions, and Regosols which are poorly developed soils. Organic Cryosolic soils have been found in wetlands.

Field results suggest that the mineral soils are predominantly acidic to neutral, ranging from pH 5.14 to 6.96, with pH tending to increase with soil depth (FEIS Amendment Volume 5, Appendix 5-A, Appendix E). Due to their mineralogy, the mineral soils in the Project area are increasingly sensitive to adverse effects due to acid deposition with decreasing baseline pH. Soils in the Project footprint are generally not susceptible to compaction. Soils prone to compaction are limited to low-lying, imperfectly and poorly drained areas where the clay content of soils is slightly higher.

Most soils in the Project area are rated as having moderate erosion potential, with the exception of areas with morainal blankets or colluvial deposits on slopes greater than 60%, and areas containing glaciofluvial soils. In areas of gullied or dissected terrain, the erosion potential would increase.

There is a level of uncertainty associated with the location of ice-rich permafrost within the Project footprint as no detailed permafrost studies regarding the thickness of the active layer or the ice content of the soils were completed for this area. It is assumed that ground ice content is between 0 and 10% as suggested by Heginbottom et al. (1995). Conditions are considered to be similar to Meadowbank, with ice lenses and ice wedges present locally on land, as indicated by permafrost features such as frost mounds. These areas of local ground ice are generally associated with low-lying areas of poor drainage.

A chemical characterization program investigated the geo-environmental properties of surficial overburden and Whale Tail Lake sediments. Static geochemistry tests, mineralogy and kinetic leaching tests were carried out to investigate the reactivity of these materials with respect to their potential to generate ARD and to release metals (metal leaching or ML) to the receiving environment. The surficial overburden, as described in FEIS Amendment Volume 5, Appendix 5-E, is NPAG and has low leachability but the fines portion of the material could be amenable to erosion and transport as suspended solids in contact water.

The overburden expected to be excavated over the LOM is presented in the Table 3.2. According to Meadowbank Mine experience, lakebeds will consist of water saturated and soft soils. The remainder

of the overburden materials will consist of till excavated on land. Some of the till or till-like material (approximately 100,000 t) is expected to be used during operations and will be temporarily stockpiled on the Overburden Storage pad (having approximate footprint of 3.2 hectares (ha)) near Whale Tail Dike and where the contact runoff will naturally flow into the Whale Tail Attenuation Pond. The remaining 5.9 Mt of overburden will be piled at the base of the Whale Tail WRSF and surrounded with waste rock to stabilize the material (see Figure A.1 in Appendix A). All the overburden stockpiled in the Whale Tail WRSF will be eventually covered with NPAG/NML waste rock if deemed required. Further details on mine site closure and reclamation can be found in the Whale Tail Interim Closure and Reclamation Plan.

SECTION 5 • WHALE TAIL PIT WASTE ROCK

The location of the Whale Tail WRSF took into consideration the following environmental, social, economic, and technical aspects of waste rock management:

- minimize the overall footprint of the Whale Tail WRSF to the extent practicable while maintaining the short-term and long-term stability of the facilities;
- avoid or minimize impact to adjacent fish bearing lakes;
- minimize the haul distance from the open pit to the Whale Tail WRSF;
- minimize the number of the water catchment areas potentially affected by drainage from the Whale Tail WRSF;
- when feasible, divert upstream clean natural non-contact run-on water away from the Whale Tail WRSF; and
- facilitate the collection and management of the contact water from the Whale Tail WRSF during mine operations to avoid potentially negative impacts on the surrounding environment.

The area selected for the storage of waste rock and overburden materials is shown in Figures A.1 to A.4 of Appendix A. This area has an approximate footprint of 110 ha. Waste rock and overburden from the Whale Tail Pit not used for site development purposes will be trucked to the Whale Tail WRSF until the end of mine operations.

Waste rock will be managed in accordance with the Plan, as per Part F, condition 19 of the Water License 2AM-WTP1826.

5.1 Waste Rock Properties

A chemical characterization program investigated the geo-environmental properties of waste rock and ore at the Project (Golder, 2018b). Static geochemistry tests, mineralogy and kinetic leaching tests were carried out to investigate the reactivity of these materials with respect to their potential to generate ARD (potentially acid generating, or PAG) and to release metals (ML) to the receiving environment.

The Whale Tail deposit mineralization is low sulphur but the sulphur carries arsenic which is enriched in many waste rock types, while other rock types are PAG. Arsenic, sulphur, and carbonate-buffering capacity are the parameters of environmental interest present in mining wastes. Mine waste will be segregated during operations, such that all PAG and/or ML material will be managed within the Whale Tail WRSF, and all material that is NPAG and NML will be used for site construction and WRSF closure. Table 5.1 below summarizes the various waste rock types and their ARD/ML potential.

Table 5.1 Anticipated ARD/ML Potential of Waste Rock Types at Whale Tail (Golder, 2018b)

Waste Type	Rock Unit Code	ARD Potential	ML Potential[1]
Komatiite North	V4a – 0a	No	High
Komatiite South	V4a – 0b	No	Moderate
Greywacke Central	S3C – 3b	Yes	Variable
Greywacke South	S3S – 3b	No	Low
Greywacke North	S3N-3b	Variable	Variable
Chert	S10 – 3b	Yes	Variable
Iron Formation	S9E – 3b	No	High
Basalt	V3 – 1b	No	Moderate
Diorite	I2 – 8b	No	Low
Overburden	n.a.	No	Low[2]
Lake sediment	n.a.	Yes	High[2]

n.a. not applicable

[1] based on large column kinetic test results

[2] based on Shake Flask Extraction results

Most of the waste rock lithologies to be disturbed by mining are NPAG including komatiite, iron formation, basalt, southern greywacke and diorite units. Together, these lithologies comprise approximately 68% of the waste rock (41.8 Mt). These units will not require means to control ARD. Of these, however, the basalt, komatiite and iron formation units, which account for 51% of waste rock (31.3 Mt), as well as some of the lake sediments, leach arsenic in static and kinetic leaching tests at concentrations that exceed the Effluent Quality Criterion (EQC) developed for the site. The south greywacke and the diorite within the open pit have low leachability in addition to being NPAG and represent approximately 17% of the waste rock (10.5 Mt). The north greywacke has variable ARD and arsenic leaching potential and represents 11% of waste rock (6.8 Mt).

The ore and waste rock from the central greywacke and chert units are PAG. Chert and central greywacke represent 21% of waste rock to be generated by mining (19.1 Mt). They are silicified and, compared with the other greywacke waste rock, have a lower buffering capacity and/or a slightly higher sulphur content which results in a PAG classification of this material. The PAG waste rock also leaches arsenic but at concentrations that are well below the EQC. Kinetic leaching tests, mineral

depletion calculations and consideration of the scale and site differences between laboratory tests and field conditions suggest a time lag to possible ARD development at site of more than a decade. Upper tier ARD materials (high sulphur/low buffering capacity greywacke or chert waste rock) generated acidic drainage earlier under laboratory conditions but without the benefit of added buffering capacity from mixing with other NPAG rock piles. The delay to onset of ARD from the bulk of PAG waste rock and ore is expected to be substantially longer than the four years of mine construction and operations. Further, ARD control mechanisms for PAG materials will be implemented during operations as PAG/ML material will be in placed in the center of the WRSF and progressively covered with NPAG material.

All waste material will be sampled and tested during operations to confirm their ARD and ML potential in support of waste segregation. Based on results to date, a sulphur content of 0.1 wt% appears to be a suitable threshold to identify PAG material. Arsenic leaching material will be evaluated based on a strong correlation between total and leachable arsenic in the current results, which indicates that material below 75 mg/kg is not expected to result in waste rock contact water quality above the EQC. The diorite and south greywacke material, which are both NPAG/NML, as well as other material below these threshold values, can be used as construction materials on site, as cover material for the Whale Tail WRSF and as reclamation material. All material above these thresholds, as well as the lake sediments, will require long-term management and will be stored in the Whale Tail WRSF.

5.2 Waste Rock and Waste Rock Storage Facility Management

5.2.1 Waste Rock Storage Facility Water Management

Seepage and runoff water from the Whale Tail WRSF will be managed by a combination of water retention dikes and water collection ponds (Whale Tail WRSF Pond and Whale Tail Attenuation Pond). Water quality will be monitored as per the Whale Tail Water License requirements. If water quality does not meet discharge criteria, contact water in the water collection ponds will be treated at the Whale Tail water treatment plant (WTP) prior to discharge to the outside environment.

The Whale Tail WRSF was located considering advantageous topography in the form of a gentle valley presenting one low topographic point near Mammoth Lake where a contact water pond will be built. Only one low topographic point is observed north of the Whale Tail WRSF where potential runoff could escape from the Whale Tail WRSF footprint. As part of the surrounding road, a saddle dam will be constructed at this location to avoid contamination of the sub-watershed located northward of the Whale Tail WRSF.

As mentioned in the document Amaruq Stage 1 WRSF, Ore Stockpile 1 and Starter Pit Design Report and Drawings (Agnico Eagle, 2018), while awaiting the construction of the Whale Tail WRSF dike expected in winter 2019, a Stage 1 WRSF will be initiated. The Stage 1 WRSF, located within the footprint of the final location of the WRSF, will be positioned as to be able to control the watershed using the topography in combination with temporary water management structures in order to prevent potentially contaminated contact water from seeping into the environment. The duration of

this Stage 1 WRSF will be during the second half of 2018 until the aforementioned WRSF dike is constructed or when weather conditions are sufficiently cold that no thawing or water runoff can occur.

To avoid any potential contact water from entering the environment, a low-permability access road built of overburden will be established first to reach the Stage 1 WRSF location and will act as a barrier to any water not naturally diverted towards a containment sump that will be established once the access road is completed and prior to any placement of PAG / ML material. The location of the Stage 1 WRSF was chosen as to use the topography to control water runoff, in combination with the access road and collection sump designed to sustain a 1:100 year rain event. All water collected in the sump will be directed towards Quarry 1 in a closed circuit. Refer to Figure A.5 of Appendix A.

The construction of Whale Tail WRSF Pond (Whale Tail WRSF Dike) and Whale Tail Attenuation Pond (Whale Tail Dike) are among the most important water management infrastructure for the Project Construction of Whale Tail Dike will be initiated in the third quarter of 2018 and the construction of the Whale Tail WRSF Dike will start in 2019. The source of construction material for these facilities will be the first development of the open pit where NPAG/NML rocks are located. The overburden will be removed and stockpiled in the Whale Tail WRSF. During the construction, berms and sumps will be built inside the footprint of the Whale Tail WRSF area if required to limit seepage and runoff from overburden and waste rock. As soon as waste rock material will be available from the open pit, the overburden will be surrounded with waste rock material (see Figure A.1 in Appendix A) to control the stability of the pile. If deemed necessary, turbidity barriers in Mammoth Lake will also be installed.

During the operations of the mine, seepage and runoff from the Whale Tail WRSF will be captured by the Whale Tail WRSF Pond and pumped to the Whale Tail Attenuation Pond where the contact water will be treated in the Whale Tail WTP prior to discharge to the outside environment.

The Whale Tail WRSF water management infrastructure will remain in place until mine closure activities are completed and monitoring results demonstrate that the contact water quality from the Whale Tail WRSF meets discharge criteria (refer to Section 9.1).

Refer to the Whale Tail Pit Water Management Report for additional details on water management of the Whale Tail WRSF.

5.2.2 Waste Rock Management Planning

Waste rock and overburden produced during mining will be used in the construction of the mine site infrastructure, while some of the NPAG/NML waste rock will be put aside for capping at closure and for underwater structures for fish habitat compensation if required. The balance of the PAG or NPAG waste rock that will not be used will be placed in the Whale Tail WRSF and will remain in the dedicated rock storage facility areas for PAG or NPAG material.

As a first step in waste rock management planning, options are developed to define the main use and destination for each rock type based on the results of geochemical testing. The second step required accounting of the quantity and timing of extraction of each waste rock type on an annual basis. This included further refinement of the quantity, type and timing of construction material requirements for each infrastructure of the project. The lithology of waste rock is added to the geological block model for each deposit and a detailed account of construction requirements is made, based on the most advanced infrastructure designs available at the moment of planning. The Waste Rock Management Plan is updated annually with current production quantities and actual LOM, dictating the production and mining schedule. Planning of the placement of waste rock material is reviewed for each LOM exercise, considering the different waste rock facility locations and capacity, as well as the closure NPAG/NML cover requirements.

Waste rock management is also part of the day to day planning of the mine operation. Part of the mining planning includes the management of waste rock, to ensure the plan established with the LOM is followed, to ensure material required for construction or closure purposes are properly stored, and also to plan for adequate and permitted storage areas. Because of the material requirement for construction and NPAG/NML rock cover, as well as the importance for adequate disposal to meet closure objectives, waste rock management will be a key component of the mining planning for the Whale Tail Project.

5.2.3 Waste Rock Management Execution

Segregation of ore, waste rock as potentially acid generating (PAG) or non-potentially acid generating material (NPAG), as well as metal leaching (ML) and non-metal leaching material (NML), is based on operational testing during mining activity to differentiate waste rock type. Sampling and testing of waste materials for acid rock drainage (ARD) and metal leaching will be conducted during mine operation in order to segregate PAG/ML waste rock from NPAG/NML waste rock material, so that waste material can be assigned to specific locations or use. This practice has been ongoing since the beginning of the mining operations at Meadowbank, and will continue during the operation period at Whale Tail Pit.

Operational sampling and analysis will be completed at the laboratory on site, at specified frequency during mining activities, in order to identified and delineate the material type in the pits during mining. The results from these analyses will be used to differentiate the PAG/ML and NPAG/NML materials. Once characterized, the waste rock material will be segregated and placed in appropriate locations.

The geochemical properties of all Whale Tail mining wastes will also be confirmed by certified laboratory, through both static and kinetic testing on numerous representative samples, by various test methods and through multiple Project development stages. These data will be used to update the Waste Rock Management Plan and implement adaptive management strategies to adequately ensure the protection of the environment and meet regulatory requirements.

The dispatch system is a computer system used to manage and control surface mining equipment. This system has been implemented at Meadowbank and will be used also at the Whale Tail Pit. The system offers real time fleet management and machine guidance technology that records data related to mining equipment activity, location, time, production, and maintenance. This information is also displayed to machine operators and other mining personnel. The system connects with mobile computers on field equipment such as excavators and haul trucks. For example, operators of loading equipment in the pit have information on screens about the type of material they are excavating. The haul truck drivers also have access to information in their equipment, about what type of material they are hauling and where is the appropriate disposal destination for the material. Information regarding the waste rock characterization is also managed and recorded by the mine dispatch system, tracking in real time loads of material, including waste rock, and their respective destination. The system and the dispatcher in charge guide the operators and ensure the ore and waste rock material are transported to the appropriate destination.

As part of the planning and execution of the waste rock management strategy, waste rock presenting geological characteristics leading to metal leaching such as arsenic will be managed in the Whale Tail WRSF in order to ensure their encapsulation and geochemical stability. Certain type of waste rock material or lithology will be placed in specific locations within the WRSF in order to provide sufficient cover of NPAG/NML waste rock material to prevent metal leaching and ensure geochemical stability.

5.2.4 Waste Rock Facility Monitoring

Monitoring will be carried out during all stages of the operation to demonstrate geotechnical stability, safe environmental performance of the facility and efficiency of the waste management procedures. If any non-compliant conditions are identified, adaptive management including modification of waste management practices and planning for corrective measures will be completed in a timely manner to ensure the environmental performance of the Whale Tail WRSF, the protection of the environment and that regulatory requirements are met.

In order to assess and monitor the performance of the waste rock management procedure, a number of methods can be put in place during the operation, such as:

- QA/QC laboratory analysis program with an accredited commercial laboratory to validate the procedure and results of the onsite laboratory for determination of PAG/NPAG and ML/NML waste rock;
- Mine dispatch data base, ensuring tracking and location of all waste rock material at any locations on site. With the information in the system, recovery of waste rock material disposed in an inappropriate location will be possible in a timely manner;
- Clear indication and marking of the PAG/ML zones, NPAG/NML zones and NPAG/NML cover within the waste rock storage facility, to provide visual guidance for the operators and during environmental inspection;

- Survey of the WRSF to provide a record plan of the waste rock material placement within the facility;
- Thermal monitoring of the WRSF to observe freezeback with thermistors installed at strategic locations. The purpose of the thermistors is to monitor the temperature within the facility as freezing progresses. The thermistors will be monitored regularly throughout the operational period, as presented in the Thermal Monitoring Plan, to verify and validate the WRSF thermal model with operational data from site.
- Water quality monitoring will be completed as per the Water Quality Flow and Monitoring Plan and the Water License requirements.

A specific set of procedures for segregation and monitoring of the waste rock material at the Whale Tail Project is presented in the Operational Acid Rock Drainage (ARD)/ Metal Leaching (ML) Testing and Sampling Plan.

5.3 Whale Tail Waste Rock Storage Facility Dimensions

The evolution of the Whale Tail WRSF is shown in Figures A.1 to A.4 of Appendix A. At completion, the crest elevation of the Whale Tail WRSF will be approximately at 250 m (maximum height of approximately 95 m) in an environment where the adjacent topography elevation varies between 154 and 170 m.

The Whale Tail WRSF is designed to minimize the impact on the environment and consider both the physical and geochemical stability of the stored waste rock and overburden. The design criteria are presented in FEIS Amendment Volume 2, Appendix 2-J (Agnico Eagle, 2016). Final design details for the Whale Tail WRSF will be provided to the regulators for approval at least 60 days prior to construction. The Whale Tail WRSF is designed considering the placement of the waste rock and overburden in layers spread using a dozer to minimize the footprint and the dust. Each bench of 20 m maximum height is going to be composed of 4 layers of 5 m thickness, and where the bench toe will start at a setback distance of 20 m from the crest of the previous bench. The current design and overall sideslope angle of the Whale Tail WRSF will be 2.5V:1V, an angle generally considered stable for such a facility (see Figure 5.1 for a typical cross section). However, slope stability analyses will be performed during the next engineering phases to determine the final design so that it is consistent with approved Portage and Vault Waste Rock facilities at Meadowbank Mine. If needed, the Whale Tail WRSF could be expended for additional capacity, within the approved limits of the Project and upon regulatory approval.

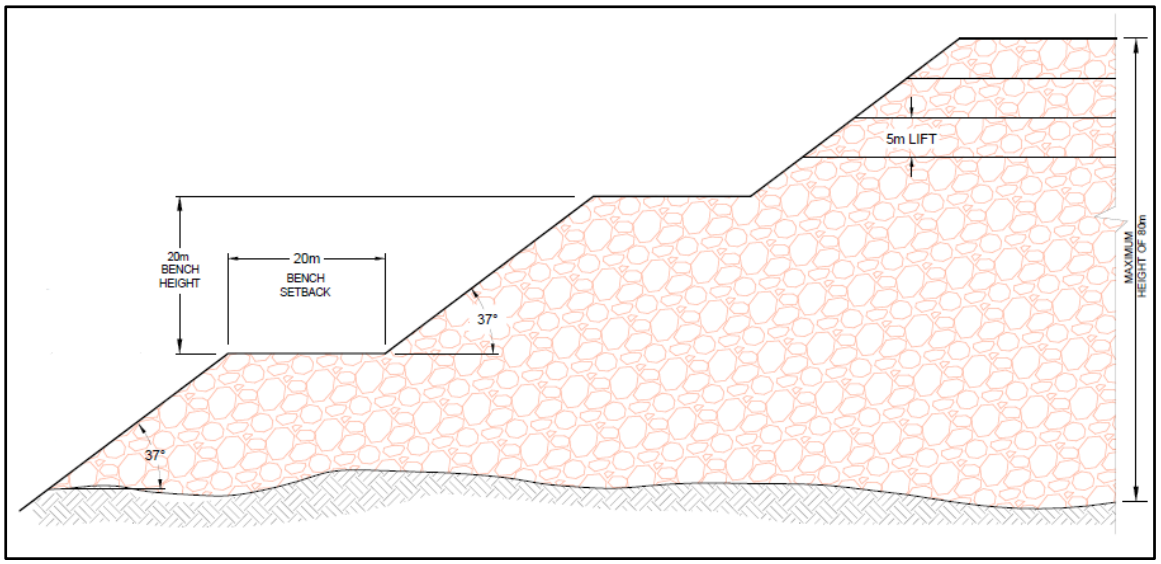

Figure 5.1 Typical Cross Section of the Whale Tail Waste Rock Storage Facility

Source: SNC (2015).

SECTION 6 • WHALE TAIL PIT ORE STOCKPILES

The three areas selected for stockpiling of ore are identified as Ore Stockpile 1, Ore Stockpile 2, and Ore Stockpile 3 on Figure A.2 of Appendix A. These ore stockpile pads have an approximate footprint of 5.7, 5.5, and 6.5 ha, respectively. As presented in Table 3.1, the maximum amount of ore stockpiled on the ore pads is 1,136,261 tonnes (t) in Q2 2019, from there the quantity of ore stockpiled stabilizes and then decreases until the end of operations in Q1 2022. No ore will remain on stockpile pads at the end of operations.

6.1 Ore Properties

A chemical characterization program investigated the geo-environmental properties of waste rock and ore report (FEIS Amendment Volume 5, Appendix 5-E). Static geochemistry tests, mineralogy and kinetic leaching tests were carried out to investigate the reactivity of these materials with respect to their potential to generate ARD and to release metals (ML) to the receiving environment.

The ore is PAG, and is enriched in arsenic, antimony, bismuth, chromium, selenium, silver and to a lesser extent, nickel. Some of the ore samples leached arsenic at concentrations that exceed the Portage effluent criterion in static (shake flask extraction) tests but exceedances were short-lived in the first cycles of kinetic leaching tests. The delay to onset of ARD from ore is expected to be substantially longer than the seven years of mine construction, operations, and closure.

6.2 Ore Stockpile Management

Seepage and runoff water from Ore Stockpiles 1, 2, and 3 will naturally flow to the Whale Tail Attenuation Pond; channels will be constructed if deemed required to direct the seepage and runoff to the pond. If the water quality does not meet discharge criteria, the contact water will be treated at the Whale Tail WTP prior to discharge to the outside environment.

The Ore Stockpile Pad 1, which constitute the first stage of the ore stockpile, was designed based on the following considerations. A minimum 1.0 m of overburden and/or waste rock will be placed over original ground to reduce any thaw-induced differential settlements. Waste rock will then be placed to follow the natural topography, thereby reducing the likelihood of water ponding on the surface of the pad requiring additional maintenance. A final grade of about 0.5% sloping towards the Whale Tail Attenuation Pond will be achieved. Any surface run off from the ore stockpile or the pad will therefore be directed to the Attenuation Pond containment area (Agnico Eagle, 2018).

6.3 Ore Stockpile Facility Dimensions

The three ore stockpiles will occupy an area of approximately 17.8 ha. A typical cross section of these facilities is presented in Appendix A (Drawing no. 6108-687-210-001). Currently, Ore Stockpiles 1, 2, and 3 are designed to stack three layers of 5 m maximum thickness for a total height of 15 m. The sideslope angle of these ore stockpiles will be 3V:1V, an angle generally considered stable for such

facility. Slope stability analyses will be performed during the next engineering phases and a final design will be presented prior to construction.

SECTION 7 • MEADOWBANK TAILINGS STORAGE FACILITY - TAILINGS MANAGEMENT FOR WHALE TAIL PIT

According to the Whale Tail Pit LOM calculation, the addition of the Whale Tail Pit to the Meadowbank LOM (LOM 2015 – completion Q3 2018) will generate an addition of approximately 8.3 Mt (dry) of tailings to the Meadowbank TSF for a total of 35.4 Mt.

Currently, Meadowbank tailings are stored within the TSF North and South Cells. The TSF includes dikes/dams, and is located within the basin of the former north-west arm of Second Portage Lake which has been dewatered to allow mining in the Portage Pit (refer to Figure 1.2). The TSF North and South cells are separated by the Stormwater Dike. Tailings were deposited into the North Cell from 2010 until November 2014, and again from June to September 2015. The South Cell (former Portage Attenuation Pond) is currently operating and receiving tailings.

Tailings from Whale Tail Pit will be stored within the approved Meadowbank TSF footprint. According to the approved Meadowbank TSF design and Meadowbank LOM 2015, there remains a capacity of 5.3 Mt in the South Cell after the completion of mining Goose Pit, Portage Pit, Vault Pit, BB Phaser, and Phaser Pit. To provide the additional 3 Mt of capacity required to store Whale Tail Pit tailings, Agnico Eagle is proposing to construct an internal structure raise over the outside perimeter of the existing and frozen North Cell. This concept will increase the tailings beach elevation to a maximum of 153.5 masl in the North Cell.

The management operation and monitoring of the TSF is regulated under Agnico Eagles existing Type A Water Licence 2AM-MEA1526. Updates to the Meadowbank Mine Waste Rock and Tailings Management Plan has been provided in support of the Whale Tail Pit application and amendment needed to the existing Type A Water Licence to reflect changes in the Meadowbank operations.

SECTION 8 • CONTROL STRATEGIES FOR ACID ROCK DRAINAGE AND METAL LEACHATE IN COLD REGIONS

The generation of metal leachate in acidic drainage is a concern for mining projects. In evaluating the potential control strategies for the disposal of the mine waste for the Whale Tail Pit, consideration was given to strategies that are effective in cold regions. A discussion of the alternative control strategies considered is summarized below.

Common control strategies for the prevention or reduction of acid mine drainage in cold regions are:

1. Control of acid generating reactions;
2. Control of migration of contaminants; and
3. Collection and treatment.

In assessing the overall control strategies for the Project, emphasis has been placed on methods that satisfy (1) and (2) in the above list, which then has an impact on (3) by potentially reducing the requirements for these activities. Table 8.1 presents various acid mine drainage control strategies.

Table 8.1 Acid Mine Drainage Control Strategies of the Arctic

Strategy	Description
Freeze Controlled	Requires considerable volumes of non-acid waste rock for insulation protection. Better understanding of air and water transport through waste rock required for reliable design.
Climate Controlled	Requires control of convective air flow through waste rock, infiltration control with modest measures and temperature controls. Better understanding of waste rock air, water, and heat transport for reliable design.
Engineered Cover	Special consideration for freeze-thaw effects. Availability and cost of cover materials are major impediments.
Subaqueous Disposal	Very difficult to dispose of waste rock beneath winter ice.
Collection and Treatment	Costly to maintain at remote locations Long-term maintenance cost.

Source: Dawson and Morin (1996).

The Whale Tail Pit site is located within the zone of continuous permafrost, and has a mean annual air temperature of about -11.3°C. Based on thermal data collected during baseline studies, the mine area is underlain by permafrost to the depth of 425 m below the ground surface. In developing this Plan, freeze control and climate control strategies have been adopted.

Freeze control strategies rely on the immobilization of pore fluids to control acid mine drainage reactions, and the potential migration of contaminated pore water outside of the storage facility. The climate conditions in the project area are amenable to freeze control strategies, and hence should be taken advantage of. In addition to immobilization of pore fluids, permafrost can reduce the hydraulic conductivity of materials by several orders of magnitude. Consequently, freeze control strategies are effective methods for reducing the migration of contaminants through materials. According to

Dawson and Morin (1996), freeze control strategies can only be effective if sufficient quantities of NPAG waste rock are available for use as a cover and insulation protection.

Climate control strategies rely on cold temperatures to reduce the rate at which oxidation occurs. The low net precipitation in permafrost regions limits infiltration of water into waste rock and tailings disposal areas. Consequently, the climate of the Whale Tail Pit will act as a natural control to reduce the production of acid mine drainage and metal leachate. Climate control strategies are best applied to materials placed at a low moisture content to reduce the need for additional controls on seepage and infiltration. This strategy is considered to be effective for waste rock in arid climate such as the one of Whale Tail Pit.

Meadowbank Mine uses the climate control strategy for the reclamation of the WRSF and TSF. Research activities are ongoing about the behaviour and the performance of the proposed cover systems for Meadowbank Mine with the participation of the Université du Québec en Abitibi-Témiscamingue and Polytechnique: Research Institute Mines and Environment since 2014. Experience and knowledge acquired at Meadowbank Mine regarding the design, the closure cover conception and the monitoring of the facility and the cover system will be applied to the Whale Tail Pit waste rock storage facility.

SECTION 9 • MONITORING AND CLOSURE

9.1 Whale Tail Waste Rock Storage Facility

Progressive reclamation includes closure activities that take place prior to permanent closure in areas or at facilities that are no longer actively required for current or future mining operations. Reclamation activities can be done during operations with the available equipment and resources to reduce future reclamation costs, minimize the duration of environmental exposure, and enhance environmental protection. Progressive reclamation may shorten the time for achieving reclamation objectives and may provide valuable experience on the effectiveness of certain measures that might be implemented during permanent closure. The Whale Tail WRSF will be operated to facilitate progressive reclamation; detailed mine closure and reclamation activities are provided in the Whale Tail Interim Closure and Reclamation Plan.

A closure cover system will be added on the slopes and top surface of the Whale Tail WRSF, to encapsulate the PAG/ML waste rock. As for the Meadowbank WRSF, the NPAG/NML cover to be placed over the PAG/ML waste rock will be constructed during operations with the available equipment and resources in areas safe to access for work. The cover design proposed is the similar as the Meadowbank Portage WRSF. Based on results calibrated to the Meadowbank WRSF thermal data to date and climate change predictions, the maximum predicted thickness of the WRSF active layer is 4.2 m and a contingency of 0.5 m will be added. Thus, the cover will consist of a 4.7 m thick NPAG/NML waste rock placement as a final surface cover. The intent of the cover is to contain the yearly active layer inside the thickness of the cover and maintain a temperature below 0°C for the underlying PAG/ML waste rock. The objective of the cover is the control of acid generating reactions and migration of contaminants.

The segregation of the PAG/NPAG and ML/NML waste rock will occur during operations (see the Operational ARD-ML Sampling and Testing Plan and Section 5.2), as will the progressive placement of the final cover on the WRSF slopes. The covering of the top of the Whale Tail WRSF will be completed during the closure period using the stockpiled NPAG and NML waste rock. There is sufficient NPAG/NML material for the 4.7 m cover, if needed (Golder, 2018b). It is anticipated that the native lichen community will naturally re-vegetate the surface of the Whale Tail WRSF over time.

During operation, thermal monitoring will be conducted in the cover and the facility. These results, along with thermal modelling, will assess the performance of the WRSF closure cover and identify if adjustments in the cover placement or thickness will be required.

Thermal and water quality monitoring will be carried out during all stages of the mine life to demonstrate geotechnical stability and the safe environmental performance of the facilities. If any non-compliant conditions are identified, then maintenance and planning for corrective measures will be completed in a timely manner to ensure successful completion of the Whale Tail Interim Closure and Reclamation Plan.

Mine closure and the reclamation of the Whale Tail WRSF will use currently accepted management practices and appropriate mine closure techniques that will comply with accepted protocols and standards.

Geochemical testing indicates that some waste rock material is NPAG/NML, but some waste rock is characterized as PAG and/or ML (refer to Section 5.1) and therefore, means to limit oxidation and water infiltration need to be put in place. By containing the yearly active layer inside the thickness of NPAG/NML waste rock cover and maintain a temperature below 0°C for the underlying PAG/ML waste rock, the cover will provide control of acid generating reactions and migration of contaminants. Increased active thaw depth/rock cover from 4.0 to 4.7 m is expected to have no effect on WRSF contact water quality during operations, and long-term post closure effects to water quality of a thicker active layer are expected to be within model accuracy where a clean (low leaching) waste rock cover present.

The contact water management system for the Whale Tail WRSF (WRSF Dike and WRSF Pond) will remain in place until mine closure activities are completed and monitoring results demonstrate that water quality conditions from the Whale Tail WRSF are acceptable for discharge with no further treatment required. Water quality will be monitored as per the Whale Tail Pit Water License requirements. Once water quality meets the discharge criteria established through the water licensing process, the contact water management system will be decommissioned to allow the surface runoff and seepage water from the Whale Tail WRSF to naturally flow to the outside environment. Water quality predictions for Whale Tail Pit are provided in Volume 6, Appendix 6-H of the FEIS (Agnico Eagle, 2016).

9.2 Ore Stockpiles

Ore Stockpiles 1, 2, and 3 will used over the operations to stockpile ore and will be freed during Q1 2022. During the following summer, if metal contamination of ore pads is measured, the pad section targeted by the contamination will be excavated and placed in the Whale Tail WRSF before its final covering with NPAG waste rock. If deemed required, the Ore Stockpiles 1, 2, and 3 will be covered with NPAG/NML waste rock or soils. In the event of a short-term temporary closure, the water and dust management strategies for the ore stockpiles will be kept the same as used during active mine operations. In the event of a long-term temporary closure, surface water control structures will be maintained as required. Further details on mine site closure and reclamation, including the ore stockpiles, can be found in the Whale Tail Interim Closure and Reclamation Plan.

9.3 Water Quality Forecast for Whale Tail Pit Operation and Closure

An updated water quality forecast report including Whale Tail Pit was completed in 2017 (Golder, 2017). The purpose of the updated modelling was to identify through a mass balance approach the contaminants of concern during the pit flooding process and determine if water treatment will be required on site for closure activities when comparing the final contaminant levels to the CCME

guidelines and/or site specific criteria for parameters that are not included in the CCME guidelines. In 2018, a hydrodynamic modelling of Whale Tail Pit Lake was conducted as additional analyses to determine the approximate fill time for the Whale Tail Pit at closure and to evaluate the potential for chemical stratification and the Pit Lake water quality profile post-closure. This hydrodynamic modelling study is addressing terms and conditions of NIRB project certificate, Condition 16 a), c). Results show that diffusion of arsenic from all pit walls has no significant effect on water quality in short and long-term. Arsenic transfer to the open pit by diffusion from the submerged pit walls is not significantly affected by the hydrogeological regime around the flooded open pit (Golder, 2018a).

By 2018, the pit lake is expected to be fully flooded by transfer from South Basin and natural inflows. Lake water is predicted to completely mix bi-annually in spring and fall and exhibit weak chemical stratification in summer and winter. Pit lake water quality meets SSWQO for arsenic, oligotrophic level of 0.01 mg/L phosphorous and receiving water quality guideline for and nitrate in 2028 and post-closure, allowing reconnection of North and South Basins and restore lake circulation (Golder, 2018a).

The hydrodynamic modelling indicated that the effluent discharge into Mammoth Lake will be well mixed (fully mixed conditions), which is representative of the closure conditions. The water quality forecast will be updated on an annual basis as new monitoring data is added at the site, as per the Whale Tail Water License requirements. Forecasted model values from prior years will be compared with the actual sample results from the following years for model calibration purposes.

9.4 Water Quality Forecast for Meadowbank Operation and Closure

Using Whale Tail Pit tailings geochemistry data, identified three contaminants of concern that could impact end Goose and Portage pits water quality at Meadowbank and therefore require treatment: copper, selenium and total nitrogen. These contaminants originate from the TSF reclaim water transferred to the pits in 2022 as outlined in Section 8.7 of the forecast (SNC, 2016). As the afore mentioned parameters may be of concern prior to dike breaching, treatment options for their removal during or after the pit flooding process will need to be examined and will be assessed in greater detail during the preparation of the Meadowbank Final Closure and Reclamation Plan to be submitted one year prior to the end of operations. The management operation and monitoring of the TSF and of the Portage and Goose pits water quality is regulated under Agnico Eagle existing Type A Water Licence 2AM-MEA1526.

9.5 Monitoring of Freezeback

9.5.1 Whale Tail Waste Rock Storage Facility

To observe the freezeback of Whale Tail WRSF, a series of subsurface thermistors will be installed at strategic locations. The purpose of the thermistors is to monitor the temperature within the facility as freezing progresses. The thermistors will be monitored regularly throughout the operational period as well as during closure and post-closure according to the Whale Tail Water Licence and as described

in the Thermal Monitoring Plan. The results will be used to evaluate the predicted thermal response of the facility, and will allow for revision of the thickness of the final cover if required.

Water Management Plan, Version 3

AGNICO EAGLE

Meadowbank Division

WHALE TAIL PIT

Water Management Plan

OCTOBER 2018
VERSION 3

EXECUTIVE SUMMARY

Agnico Eagle Mines Limited – Meadowbank Division (Agnico Eagle) is proposing to develop Whale Tail Pit and Haul Road Project (Project), a satellite deposit located on the Amaruq property, to extend mine operations and milling at Meadowbank Mine.

The open pit mine, mined by truck-and-shovel operation, will produce 8.3 million tonnes (Mt) of ore, 61.3 Mt of waste rock, and 6.0 Mt of overburden waste. There are four phases to the development: 1 year of construction, 3 years of mine operations, 8 years of closure, and the postclosure period. According to the Whale Tail Pit Life of Mine (LOM) calculation, the addition of the Whale Tail Pit to the actual Meadowbank LOM (LOM 2015) will generate an addition of approximately 8.3 Mt (dry) of tailings to the Meadowbank Tailings Storage Facility (TSF) for a total of 35.4 Mt.

The water management objectives are to minimize potential impacts to the quantity and quality of surface water at the mine site. Water management structures (water retention dikes/berms and diversion channels) will be constructed, dependent on the potential presence and volume of water, to contain and manage the contact water from the areas affected by the mine or mining activities. The major water management infrastructure includes: two contact water ponds, three water diversion channels, four water retention dikes, and two Water Treatment Plants (WTP).

This Water Management Plan for the Project describes the main objectives pertaining to water management, which are to limit and/or stop the flow of surface water runoff in the pit and to limit the impact on the local environment. In developing the water management plan, the following principles were followed:

- keep the different water types separated as much as possible;
- control and minimize contact water through diversion and containment;
- minimize freshwater consumption by recycling and reusing the contact and process water wherever feasible; and
- meet discharge criteria before any site contact water is released to the downstream environment.

During mine construction and operations, contact water originating from affected areas on surface will be intercepted, diverted and collected within the various collection ponds. The collected water on the mine site will be eventually pumped and stored in the Whale Tail Attenuation Pond, where the contact water will be treated by the WTP prior to discharge to the receiving environment or reused in the operations.

During operations, site contact water quality is predicted to exceed established effluent criteria (i.e. under the Meadowbank Water Licence for Portage Pit) for arsenic and total dissolved solids in Whale Tail Waste Rock Storage Facility (WRSF) Pond and in Whale Tail Pit sump. Therefore, this water will be

controlled by constructing the Whale Tail WRSF Dike and the Whale Tail Attenuation Pond. The Whale Tail WRSF Pond water will report with all other contact water and will be mixed in the Whale Tail Attenuation Pond and treated during operations. Through best management practices and mitigation, the predicted water quality of Whale Tail Lake (North Basin) meets aquatic life guidelines post-closure.

During operations when the mine is at its maximum footprint, the conservative predictions of future water quality indicate that most parameter concentrations in the downstream environment are below CEQG-AL except for arsenic. A site wide water balance will be updated on a regular basis and end pit water quality modelling will be conducted as needed to update predictions.

Dikes will not be breached until the water quality in the flooded area meets Canadian Council of Ministers of the Environment Water Quality Guidelines, baseline concentrations or appropriate site specific water quality objectives. During mine closure, no mine discharges will occur to the downstream receiving environment since all contact waters are diverted to the open pit and Whale Tail Lake (North Basin) for re-flooding. The water quality in open pit and Whale Tail Lake (North Basin) averaged over the closure period is predicted to be similar to that of the last year of operations, with similar maximum and average concentrations.

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited – Meadowbank Division (Agnico Eagle) is proposing to develop Whale Tail Pit and Haul Road Project (Project), a satellite deposit located on the Amaruq property, to continue mine operations and milling at Meadowbank Mine.

The Amaruq property is a 408 square kilometre (km^2) site located on Inuit Owned Land approximately 150 kilometres (km) north of the hamlet of Baker Lake and approximately 50 km northwest of Meadowbank Mine in the Kivalliq Region of Nunavut. The deposit will be mined as an open pit (i.e., Whale Tail Pit), and ore will be hauled to the approved infrastructure at Meadowbank Mine for milling.

The open pit mine, mined by truck-and-shovel operation, will produce 8.3 million tonnes (Mt) of ore, 61.3 Mt of waste rock, and 6.0 Mt of overburden waste. There are four phases to the development: 1 year of construction, 3 years of mine operations, 8 years of closure, and the postclosure period. According to the Whale Tail Pit Life of Mine (LOM) calculation, the addition of the Whale Tail Pit to the actual Meadowbank LOM (LOM 2015) will generate an addition of approximately 8.3 Mt (dry) of tailings to the Meadowbank Tailings Storage Facility (TSF) for a total of 35.4 Mt.

The construction and preparation of material started in summer 2018 after all permits and authorizations were received andconstruction of the dikes has started in the third quarter of Year -1 (2018). Focus on site preparation and construction of infrastructure, with the development of the open-pit to produce construction material will continue in 2018. During this first phase, waste rock and overburden will be piled in the Whale Tail Waste Rock Storage Facility (Whale Tail WRSF) and ore stockpiled on the ore pads. The operational phase will span approximately 3 years, from Year 1 (2019) to Year 4 (2022). Mining activities are expected to end in Year 3 (2021) and ore processing is expected to end during the first quarter of Year 4 (2022). Closure will occur from Year 4 (2022) to Year 11 (2029) after the completion of mining and will include removal of the non-essential site infrastructure and flooding of the mined-out open pit as well as reestablishment of the natural Lake A17 (Whale Tail Lake) level. Only essential infrastructure related to water treatment will remain on site during the closure and post-closure phases. Accordingly, in addition to the Water Treatment Plant (WTP), a part of the camp, including all infrastructure allowing camp autonomy and security, as well as site roads, will be maintained following the operational phase (see more information in Whale Tail Pit Interim Closure and Reclamation Plan). Post-closure is expected from Year 11 (2029) forwards. Site and surrounding environment monitoring will start from the beginning of the construction and be completed during the post-closure phase when it is shown that the site and water quality meets the regulatory closure objectives. Table 1.1 summarizes the overview of the timeline and general activities.

Table 1.1 Overview of Timeline and General Activities

Phase	Year	General Activities
Construction	Year -1	• Construct site infrastructure • Develop open pit mine • Stockpile ore
Operations	Year 1 to 3	• Open pit operations • Transport ore to Meadowbank Mine • Stockpile ore • Discharge Tailings in Meadowbank TSF
	Year 4	• Complete transportation of ore to Meadowbank Mine • Complete discharge tailings in Meadowbank TSF
Closure	Year 4 to 11	• Remove non-essential site infrastructure • Flood mined-out open pit • Re-establish natural Whale Tail Lake level
Post-Closure	Year 11 forwards	• Site and surrounding environment monitoring

TSF = Tailings Storage Facility

This document presents the Water Management Plan (Plan) for the Project in accordance with Part B, conditions 14 and 15, and Part E, condition 7, of the Nunavut Water Board (NWB) Water License 2AM – WTP1826. It is also addressing Term and Condition n. 6 of the Nunavut Impact Review Board (NIRB) project certificate. Agnico Eagle has applied the same water management and water balance approach in this document as used for the annual Meadowbank Mine Water management report (Agnico Eagle, 2015a and 2018). The purpose of this Plan is to provide consolidated information on water management, required water management infrastructure and water balance for the operations of Whale Tail Pit as a satellite pit for the Meadowbank Mine.

This Plan will be updated as required to reflect any changes in operations or economic feasibility occurs, and to incorporate new information and the latest technology, where appropriate.

SECTION 2 • BACKGROUND INFORMATION

2.1 Site Conditions

The general mine site location for the Project is presented in Figure 2-1.

2.1.1 Climate

Climate characteristics presented herein were extracted from the permitting level engineering report (SNC 2015).

The Project is located in an arid arctic environment that experiences extreme winter conditions, with an annual mean temperature of -11.3 degrees Celsius (°C). The monthly mean temperature ranges from -31.3°C in January to 11.6°C in June, with above-freezing mean temperatures from June to September. The annual mean total precipitation at the Project is 249 millimetres (mm), with 59 percent (%) of precipitation falling as rain, and 41% falling as snow. Mean annual losses were estimated to be 248 mm for lake evaporation, 80 mm for evapotranspiration, and 72 mm for sublimation. Mean annual temperature, precipitation, and losses characteristics are presented in Table 2.1.

Short-duration rainfall, representative of the Project are presented in

Table 2.2, based on intensity-duration-frequency curves available from the Baker Lake A meteorological station (Station ID 2300500) operated by the Government of Canada (2015).

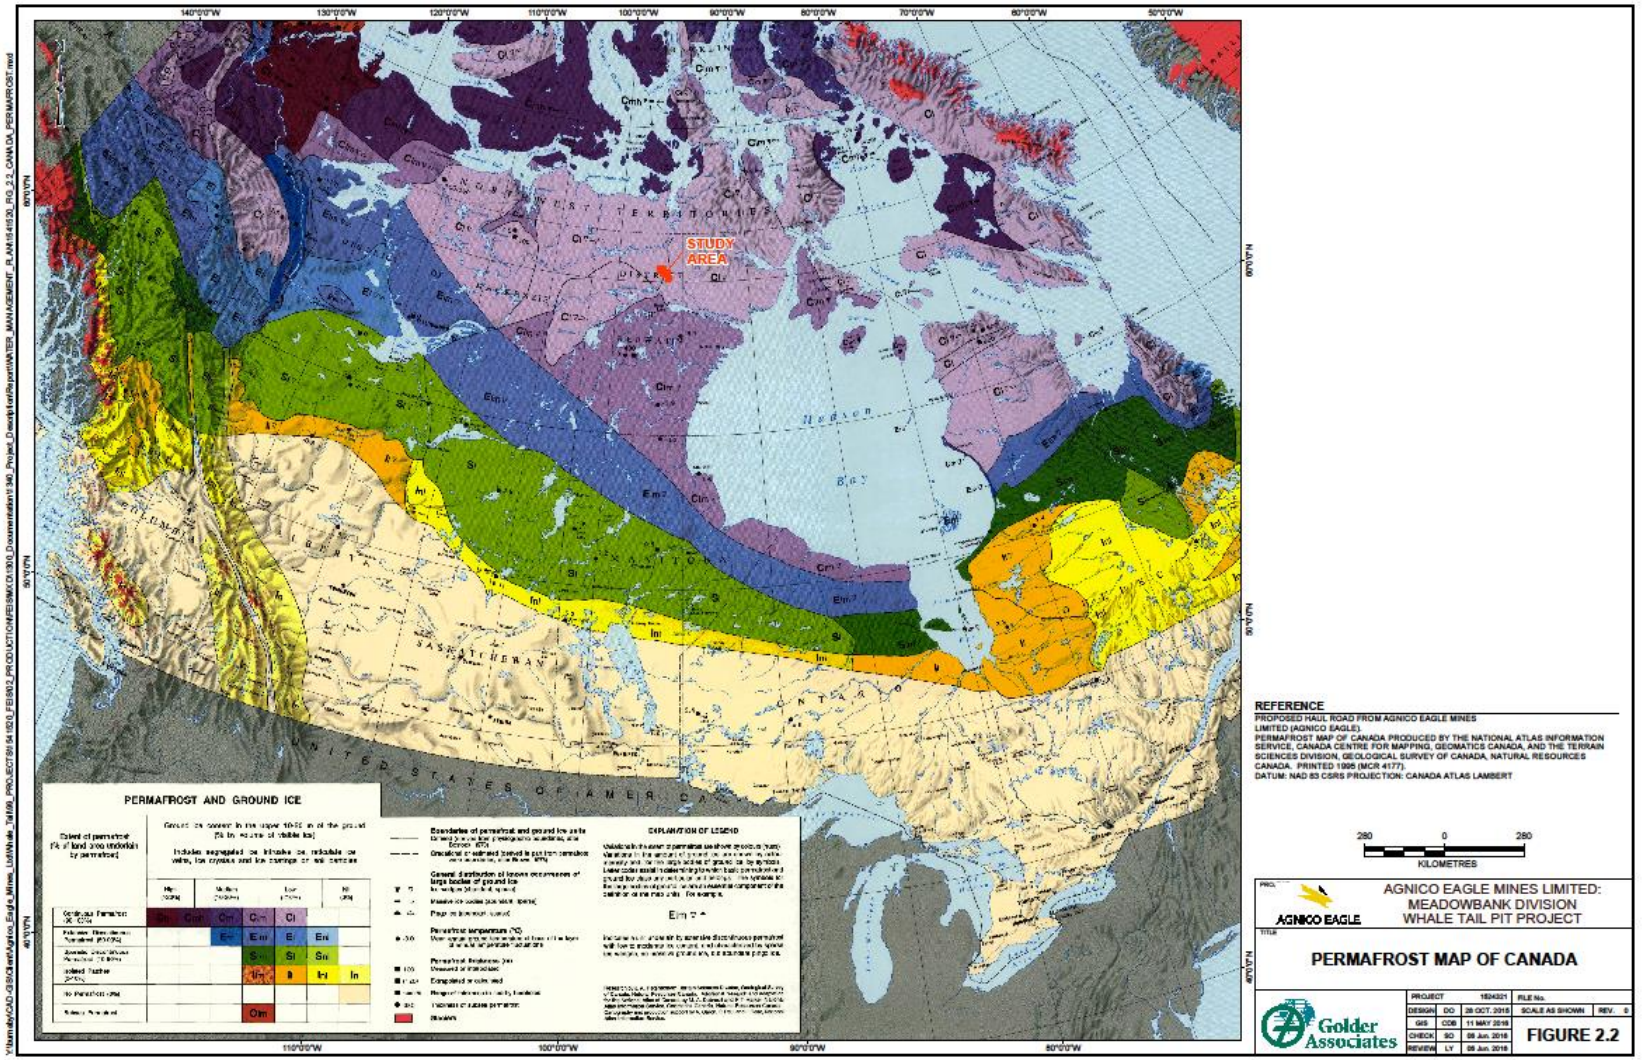
2.1.2 Permafrost

The mine site is located in an area of continuous permafrost, as shown on Figure 2.2. Based on measurements of ground temperatures (Knight Piésold 2015), the depth of permafrost at the mine site is estimated to be in the order of 425 metres (m) outside of the influence of waterbodies. The depth of the permafrost and active layer will vary based on proximity to the lakes, overburden thickness, vegetation, climate conditions, and slope direction. The typical depth of the active layer is 2 m in this region of Canada.The typical permafrost ground temperatures at the depths of zero annual amplitude (typically at the depth of below 15 m) is approximately -8.0 °C in the areas away from lakes and streams. The geothermal gradient measured is 0.02 degrees Celsius per meter (°C/m) (Knight Piésold 2015). Late-winter ice thickness on freshwater lakes is approximately 2.0 m. Ice covers usually appear by the end of October and are completely formed in early November. The spring ice melt typically begins in mid-June and is complete by early July.



Groundwater characteristics at the mine site are detailed in the Final Environmental Impact Statement (FEIS), Volume 6, Section 6.2 (Agnico Eagle, 2016) and are briefly summarized herein.

Two groundwater flow regimes in areas of continuous permafrost are generally present:

- a deep groundwater flow regime beneath the base of the permafrost; and
- a shallow flow regime located in an active (seasonally thawed) layer near the ground surface.

From late spring to early autumn, when temperatures are above 0˚C, the active layer thaws out. Within the active layer, the water table is expected to be a subdued replica of topography, and is expected to parallel the topographic surface. Project area groundwater in the active layer flows to local depressions and ponds that drain to larger lakes at velocities estimated to range from about 0.004 m/day to 0.08 m/day.

Figure 2.2 Permafrost Map of Canada

2.1.3 Hydrology

Hydrology characteristics were extracted from surface water quantity impact assessment section (FEIS, Volume 6, Section 6.3; Volume 6, Appendix 6-C, Agnico Eagle, 2016).

The proposed mine site is located in the A watershed (i.e., where Lake A17 [Whale Tail Lake] and Lake A16 [Mammoth Lake] are located), and water management activities are planned in the A watershed, and the C watershed (i.e., where Lake C38 [Nemo Lake] is located); these two watersheds drain into Lake DS1, which drains north to the Meadowbank River. These watersheds comprise an extensive network of lakes, ponds, and interconnecting streams, and have lake water surface fractions (i.e., the ratio of lake area to watershed area) of 16% (A watershed) and 23% (C watershed).

Shorelines in the mine site area exhibit a consistent terrain type related to shorelines that have developed in morainal material. These morainal shorelines were observed at all lakes visited during the 2015 field survey. Limited areas of bedrock and shallowly sloped sandy shorelines were also observed. As a general characteristic for the surveyed shorelines, the predominant materials are boulder gardens mixed with cobble with very limited soils or organic materials on top. The outlet channels are relatively short with a low sinuosity (i.e., close to 1.0) and exhibit the same characteristics for streambed materials, which results in interstitial flow through large boulders or below the surface likely close to the bedrock, making flow difficult to observe and measure.

Discharges of watercourses in the mine site area typically peak in late-May to mid-June from snowmelt, rapidly decline in July, and low discharges prevail until frozen conditions in October to November, with a secondary peak in September from rainfall events. Watercourses in the Project area are frozen over the winter.

Derived long-term mean annual water yield for selected lakes in the mine site area vary between 86 mm at Lake C38 (Nemo Lake) to 230 mm at Lake A69. These water yields are similar to regional water yields reported at the Meadowbank Mine.

2.1.4 Surface Water Quality

Water quality characteristics were extracted from the water quality baseline report (FEIS, Volume 6, Appendix 6-G, Agnico Eagle, 2016) and the water quality impact assessment section (FEIS, Volume 6, Section 6.4, Agnico Eagle, 2016). Baseline water quality sampling was conducted at lakes and tributaries in various watersheds in the study area during open-water conditions in 2014 and 2015.

Surface water collected from lakes during the open water season was characteristic of low productivity headwater lakes in the Arctic; soft water, with low alkalinity, low turbidity (and corresponding high Secchi depth) and low total suspended solids (TSS). There was minor thermal stratification evident at some deeper lake stations. The water columns of lakes are well oxygenated and pH was neutral to slightly acidic. The majority of water chemistry parameter concentrations were below the analytical detection limit and below the Canadian Council of Ministers of the Environment

water quality guidelines for the protection of aquatic life (CCME, 1999) and the Canadian drinking water guidelines (Health Canada, 2014).

Samples collected from the tributaries showed them to be well oxygenated, with low conductivity, and neutral to slightly alkaline pH. As with the lakes, the majority of the water chemistry parameter concentrations were below the aquatic life and drinking water quality guidelines.

2.1.5 Climate Change

Climate change information presented herein was extracted from the air quality impact assessment section (FEIS, Volume 4, Section 4.2, Agnico Eagle, 2016).

The climate in the Arctic is changing faster than at mid-latitudes (IPCC, 2014). The most recent set of climate model projections (CMIP5) predict an Arctic-wide year 2100 multi-model mean temperature increase of +13°C in late fall and +5°C in late spring under the IPCC's "business as usual scenario" (RCP8.5). IPCC climate change mitigation scenario RCP4.5 results in a year 2100 multi-model Arctic wide prediction of +7°C in late fall and +3°C in late spring (Overland et al., 2013). The effects of changes of this magnitude to terrestrial, aquatic and marine ecosystems, social and economic systems of the Arctic are an active area of research. However, the short duration of the proposed Project means that climate change related effects to the Project are likely negligible.

2.1.6 Seismic Zone

The mine site is located in an area of relatively low seismic risk. The peak ground acceleration (PGA) for the area was estimated using seismic hazard calculator from the 2010 National Building Code of Canada website (http://www.earthquakescanada.nrcan.gc.ca/hazard-alea/interpolat/index_2010-eng.php). The estimated PGA is 0.019 g for a 5% in 50-year probability of exceedance (0.001 per annum or 1 in 1,000 year return) and 0.036 g for a 2% in 50-year probability of exceedance (0.000404 per annum or 1 in 2,475 year return) for the area.

2.2 Mine Operations Description

2.2.1 Mine Development Plan

Whale Tail Pit will be mined using traditional open pit method, and the mining is planned from Q2 of Year -1 (2018) to the end of Year 3 (2021).

Two mine waste streams will be produced at Whale Tail Pit, waste rock and overburden. Approximately 61.3 Mt of waste rock and 6.0 Mt of overburden will be generated by the Project. As ore is transported to the Meadowbank Mine for processing, a third mine waste stream, tailings, will be produced at Meadowbank Mine (Refer to the Meadowbank Mine Waste Rock and Tailings Management Plan). The operation management and monitoring of the TSF is regulated under Agnico Eagle Type A water Licence 2AM-MEA1526.

The mine development will include the following major infrastructure:

- industrial area (camp and garage);
- crusher;
- ore stockpiles;
- rock and Overburden Storage facilities;
- landfill;
- haul and access roads; and
- open pit mine.

In addition, the mine development will include construction of water management facilities, listed in Section 3.1.2.

2.2.2 Summary of Mine Waste Management

This section describes a summary of the mine waste management plan. More detailed information on mine waste management is presented in the Whale Tail Pit Waste Rock Management Plan. Water management associated with mine waste management is described in Section 3.1.4 of this document. One area was identified as the Whale Tail WRSF to store waste rock and overburden material, as shown in Figure A.1 to Figure A.4 in Appendix A. Table 2.3 presents a summary of the total tonnage of mine waste materials and their proposed usage or destination.

Table 2.3 Summary of Mine Waste Tonnage and Destination

Mine Waste Stream	Estimated Quantities	Waste Destination
Overburden	6.0Mt	• Temporary storage West of Whale Tail Lake (~ 0.1 Mt for operations) • Co-disposed with waste rock in Whale Tail WRSF
Waste Rock	61.3Mt	• Construction material • Whale Tail WRSF • Closure and site reclamation
Tailings	8.3 Mt	• As slurry tailings placed in the approved Meadowbank Mine tailings storage facility

WRSF = Waste Rock Storage Facility; Mt = million tonne

SECTION 3 • WATER MANAGEMENT PLAN AND WATER BALANCE

3.1 General Water Management Strategy

3.1.1 Water Management Objectives and Strategies

The goal of water management is to minimize the impact of the mine activities on the aquatic ecosystem surrounding the mining area. The key objectives for water management are:

- keep the different water types (i.e., contact, non-contact, and freshwater) separated to the extent practical;
- control and minimize contact water through diversion and containment;
- minimize freshwater usage by recycling and reusing the contact water to the extent practical; and
- meet discharge criteria before any site contact water is released to the downstream environment.

To achieve the above water management objectives, the following key strategies were implemented to develop the Plan:

- Two levels of catchment disturbance have been defined for the area, namely undisturbed and disturbed. Areas that have been disturbed as part of the mine development are considered disturbed catchments, while the areas left unaffected are considered undisturbed catchments.
- For the purpose of mine water management, runoff from undisturbed areas is considered non-contact water, while runoff from disturbed catchment areas is considered contact water. Surface water that is diverted around the mine facilities, or groundwater that does not emerge into a mine facility, is considered non-contact water. Any non-contact water that mixes with contact water becomes contact water.
- Conveyance and storage of contact water will be controlled by channels and containment structures (i.e., sumps and ponds). Sumps will be installed in the open pit and in low points surrounding the open pit. Contact water will be diverted and collected in various sumps and water collection ponds and conveyed to the Whale Tail Attenuation Pond.
- The collected water will be treated if the water quality does not meet the discharge criteria established in the Water Licence 2AM-WTP1826.
- The treated water will be reused as much as possible to minimize the freshwater requirements. The excess treated water will be discharged into Lake A16 (Mammoth Lake) through a submerged diffuser.
- Non-contact water will be intercepted and directed away from disturbed areas by means of natural catchment boundaries and/or man-made diversion structures and will be allowed to flow to the neighbouring waterbodies.

3.1.2 Water Management System

The water management system includes the following components (identified on Figure A.1 to Figure A.5 in Appendix A):

- Turbidity Curtains;
- low-permeability access road to reach the Stage 1 WRSF and a collection sump;
- two contact water collection ponds (Whale Tail Attenuation and Whale Tail WRSF);
- two freshwater collection ponds (Whale Tail Lake (South Basin) and Northeast Sector);
- three proposed water diversion channels (Whale Tail, East, and North, if deemed necessary);
- four water retention dikes (Whale Tail, Mammoth, Whale Tail WRSF, and Northeast);
- two coffer/saddle dams;
- seven proposed culverts (Culverts 181, 182, 183, 184, 185, 186, and Mammoth Channel Culvert, if deemed necessary);
- a freshwater intake causeway and pump system;
- a WTP and associated intake causeway;
- a WTP for construction;
- a Sewage Treatment Plant (STP);
- pipeline and associated pump system;
- a Potable WTP; and
- a discharge diffuser located in Lake A16 (Mammoth Lake).

3.1.3 Waterbody Inventory

The A and C watersheds will potentially be impacted by mining activities, primarily by dewatering of Whale Tail Lake (North Basin) to Lake A16 (Mammoth Lake), the Northeast Diversion to the C watershed, and the Whale Tail Lake (South Basin) Diversion to Lake A16 (Mammoth Lake). Waterbodies directly impacted by mining activities are presented in Table 3.1 and shown in Figure A.2 in Appendix A.

Table 3.1 Inventory of Waterbodies Directly Impacted by Mining Activities

Watershed	Primary Disturbance	Waterbody	Note
A	Dewatering	Lake A16 (Mammoth Lake)	Receiving lake during dewatering activities
	Northeast Diversion	Lake A47	Flooded
		Lake A48	Flooded
		Lake A55	Flooded
		Lake A62	Flooded
		Lake A63	Flooded
		Lake A65	Flooded
		Lake A113	Flooded
		Pond A-P38	Flooded
		Pond A-P68	Flooded
	Whale Tail Lake (South Basin) Diversion	Lake A18	Flooded
		Lake A19	Flooded
		Lake A20	Flooded
		Lake A21	Flooded
		Lake A22	Flooded
		Lake A45	Part of diversion channel
		Lake A55	Flooded

		Lake A63	Flooded
		Lake A65	Flooded
		Pond A-P1	Flooded
		Pond A-P53	Flooded
	Various Water Management Activities	Lake A17 (Whale Tail Lake)	Water management activities include diversion of upper watershed and dewatering of Whale Tail Lake (North Basin)
C	Water Intake	Lake C38 (Nemo Lake)	

3.1.4 Water Management Plan during Construction and Operations

3.1.4.1 Infrastructure Required for Mine Site Water Management

During the mine construction, operational and closure phases, a network of collection and interceptor channels and sumps will be constructed and maintained to facilitate mine site water management. A list of the water management control structures and facilities is presented in Table 3.2 together with the proposed construction schedule. These structures were designed according to design criteria presented in the FEIS, Volume 2, Appendix 2-J (Agnico Eagle, 2016). Final design details of these structures will be provided to the regulators for approval at least 60 days prior to construction.

Appendix A, Figure A.1 to Figure A.5 shows the location of the respective structures at the different development stages of the mine life. Information on operation, maintenance, and surveillance (OMS) of Project dikes is provided in the following sub-sections.

Table 3.2 Water Management Facilities and Construction Schedule

Mine Year	Figure	Water Management Facilities Constructed or Installed
Year -1 (2018) Construction	A.1 and A.5	• Turbidity Curtains • Start Whale Tail Dike • Start Mammoth Dike • Start the contact water intake causeway in the Whale Tail Attenuation Pond • Construction of the low-permeability access road built of overburden and collection sump for Stage 1 WRSF • Freshwater intake causeway in Nemo Lake • Water Treatment Plant and Construction Water Treatment Plant • Pipelines and associated pump systems for water management and dewatering • Sewage Treatment Plant • Potable Water Treatment Plant • Discharge diffuser in Mammoth Lake • Culverts 184, 186, and Mammoth Channel
Year 1 (2019) Operations	A.2	• Complete Whale Tail Dike • Complete Mammoth Dike • Complete the contact water intake causeway in the Whale Tail Attenuation Pond • Whale Tail WRSF Dike • Northeast dike • Whale Tail Lake (South Basin) Diversion Channel • Whale Tail East Channel and Saddle/Coffer Dam • If deemed necessary, North Diversion Channel • Saddle/Coffer Dam #1 in Whale Tail WRSF

WRSF = Waste Rock Storage Facility.

3.1.4.2 Dike Construction

The Whale Tail Dike is intended to raise Whale Tail Lake (South Basin), Lake A18, Lake A19, Lake A20, Lake A21, Lake A22, Lake A55, Lake A62, Lake A63, Lake A65, Pond A-P1, and Pond A-P53, to an elevation of 156.0 metres above sea level (masl), and divert runoff downstream to the Lake A16 (Mammoth Lake) watershed through the Whale Tail Lake (South Basin) diversion channel. Whale Tail Dike will be constructed as a zoned rockfill dike on the lakebed foundation with a core composed of a fine filter dynamically compacted. A coarse filter will be placed between the rockfill and the fine filter.

A cement-bentonite cutoff wall consisting mainly of secant piles will be constructed through this dense core and will act as a seepage barrier. The construction technique will differ for the sections extending into the existing lake from those at the abutments. For the lake sections of the dike, construction will be initiated by advancing two single-line platforms built at elevation 154.0 masl. After cleaning out the central key trench by reaching the bedrock, backfill consisting of fine and coarse filters will be gently deposited up to elevation 154.0 masl. The WTD will then be constructed up to elevation 157.0 masl. From this level, the fine filter will be dynamically compacted by heavy tamping. The secant piles will then be installed from elevation 157.0 masl to 1.0 m below the bedrock surface. The type of material used for the cutoff wall will be a cement-bentonite mix. The maximum height of the secant pile cutoff wall is expected to be of 10.5 m.

At the west abutment, the footprint of WTD will cross an esker which extends well below lake level. The esker will be blasted to about elevation 153.0 masl at the west abutment. The bottom of the excavation would be 0.5 m above lake level and then the rockfill zones and fine filter would be placed. Above elevation 153.0 masl, a key trench to the bedrock will then be progressively excavated in the thawed esker to expose its surface. In addition, and to minimize the number of secant piles, it is proposed to place a cement-bentonite slurry cutoff wall where bedrock surface is above elevation 155.5 masl. The secant piles will overlap the cured CB slurry cutoff over 1.5 m in horizontal length.

The strategy for the east abutment will be different than for the west abutment. It would be beneficial to remove (in the core trench area) the layer that contains ice rich till prior to the placement of any material. Due to schedule and access constraints, the east abutment will be blasted in order to remove about 4 m of frozen soil (in the core trench area) that contains ice rich material.

The performance of Whale Tail Dike will be evaluated based on the quantity of seepage collected (compared to the design estimate). This structure will be highly instrumented with sections of piezometers and thermistor strings to understand the hydraulic and thermal behaviour during reservoir filling. The thermal regime will be monitored all along the dike to note the thermal impact of raising the lake water level. Monuments and inclinometers will be installed along the dike as well. Typical sections of Whale Tail Dike and of Whale Tail Dike abutment are shown in Figure 3.1. All design drawings and figures can be found in the Whale Tail Dike Detailed Design Report (SNC, 2018).

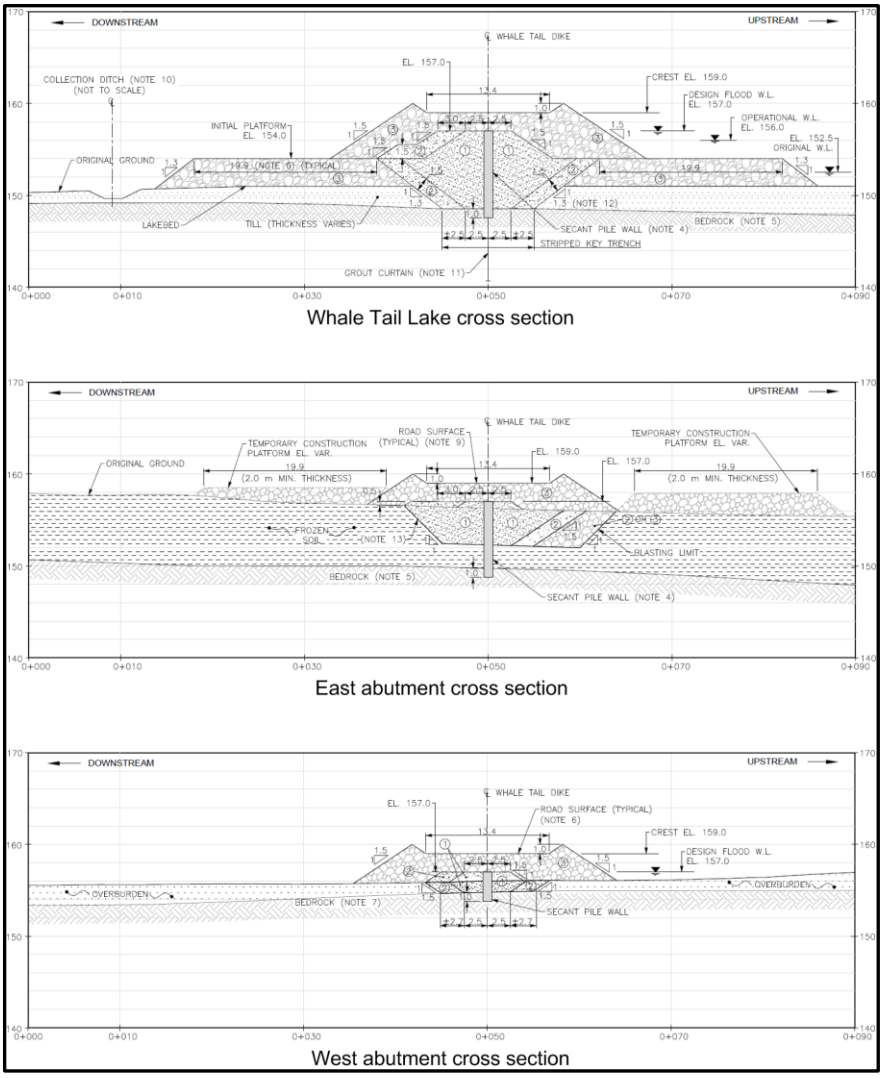

Figure 3.1 Typical Sections of Whale Tail Dike and Whale Tail Dike Abutment

The Mammoth Dike is intended to protect the mine site area from potential backwatering from Lake A16 (Mammoth Lake) during the operational and closure phases. The concept of this structure is similar to the other dikes in shallow water operated by Agnico Eagle (as Vault Dike). Mammoth dike has a length of about 300 m and a height of 2 m. It will be a rockfill dike lined with bituminous geomembrane on its upstream face encapsulated at the toe in a layer of fine filter amended with bentonite (FFAB) liner in turn constructed in a key trench. The key trench will extend down to the bedrock and all boulders along the alignment will be removed. A thermal cap of rockfill will be placed on top during the winter season to prevent the FFAB from thawing. The winter construction technique aims to reinforce the permafrost strength of the foundation. A typical section of the Mammoth Dike is shown in Figure 3.2.

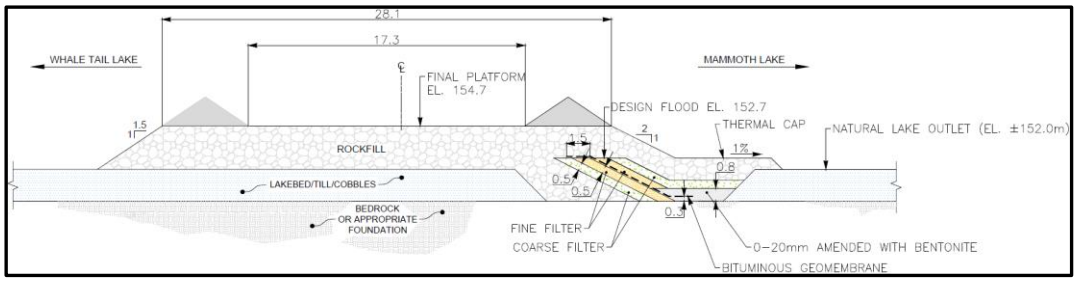

Figure 3.2 Typical Section of Mammoth Dike

Note: Adapted from SNC-Lavalin (2017).

The Whale Tail WRSF Dike confines contact water in the Whale Tail WRSF Pond before it is pumped to the Whale Tail Attenuation Pond. The WRSF dike is about 300 m and 5 m height and has been classified as a high based on CDA Guidelines. As the Mammoth Dike, the Whale Tail WRSF Dike will be a rockfill dike with a bituminous liner on its upstream face encapsulated at the toe in a layer of FFAB liner in turn constructed in a key trench anchored to the bedrock during the summer season. The liner will take advantage of frozen soil conditions to integrate the permafrost into its foundation (and key trench). The key trench will be stripped during the summer season. All ice-rich material sensitive to thawing will be removed below the liner. Once the bedrock is exposed, the bituminous liner will be sealed with FFAB. While the geomembrane in the key trench is buried, a thermal cap will be put in place to protect the foundation against sources of heat. If during the operation the degradation of the permafrost occurs, a grout curtain will be installed to enhance the performance of the dike. A typical section of the Whale Tail WRSF Dike is shown in Figure 3.3.

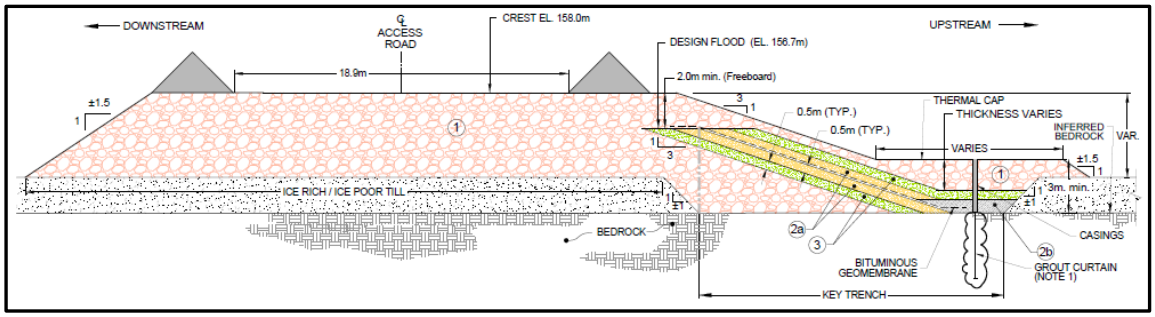

Figure 3.3 Typical Section of Whale Tail Waste Rock Storage Facility Dike

Note: Adapted from SNC (2015).

The Northeast (NE) Dike is a temporary structure with an estimated service life of about two (2) years and is designed to prevent runoff from the Northeast watershed reporting to the Whale Tail Pit As both Mammoth and WRSF Dikes, the upstream slope of the NE Dike will be lined with bituminous geomembrane encapsulated at the toe in a layer of FFAB liner in turn constructed in a key trench to the bedrock or to an appropriate foundation (ice-poor till). The construction will promote the extraction of heat to reinforce the permafrost of the key trench thus making it impervious. Dewatering should be completed prior to beginning of winter to promote development of permafrost in the

foundation. A thermal cap will be put in place to limit the penetration of heat into the foundation. A typical section of the Whale Tail WRSF Dike is shown in Figure 3.4.

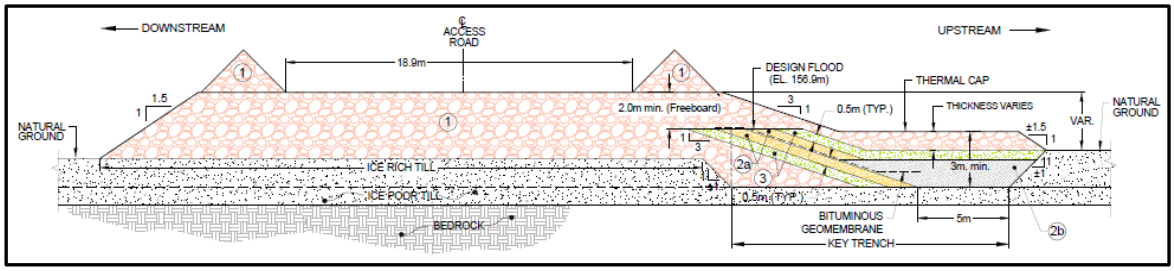

Figure 3.4 Typical Section of Northeast Dike

Note: Adapted from SNC (2015).

During dike construction, both the dike material itself as well as the disturbed material on the lake floor (particularly in the deep areas of the lakes) will contribute to increases in concentrations of suspended sediments in the water column. In the absence of sediment control measures, suspended sediment plumes would be expected to migrate with wind-driven currents. The key means for minimizing suspended sediment discharges from the dike construction zones during dike construction include the deployment of Turbidity Curtains and water treatment (if deemed necessary).

For the construction of Whale Tail Dike, a total of four (4) layers of turbidity curtains will be installed across Whale Tail Lake (two (2) on each side of the dike). These curtains will be deployed concurrently with the start of the dike construction to contain turbid water caused by the construction while the fishout is taking place. In addition, requirement for pumps installed in the water in front of the construction platform to neutralise the current created by the displacement of water from the deposition of rock in the lake will be evaluated at the beginning of the construction. If such mitigation measure is required, water will be pumped to the dewatering WTP and discharged into Lake A16 (Mammoth Lake) through the existing discharge diffuser system. The proposed location for the Turbidity Curtains is shown in Figure A.1.; however final location of the curtains will depend of the final dike design and site conditions.

For Northeast Dike, no specific TSS management plan is expected as the construction of this facility is planned when the open pit will be in operation and contact water will be managed as part of the current operations.

3.1.4.3 Dewatering

To allow the mining of the Whale Tail Pit, Lake A17 (Whale Tail Lake) will be partly dewatered once the Whale Tail Dike is constructed. The estimated total volume of Whale Tail Lake (Lake A17) is 8.5 million m^3 (Mm^3); the upper portion of Lake A17 (3.4 Mm^3) will be pumped to either Whale Tail Lake (South Basin) or to Lake A16 (Mammoth Lake) through the discharge diffuser. It is assumed that approximately 66% of the volume of water will be pumped directly to Whale Tail Lake (South Basin) if

it meets discharge criteria, and the remaining 34% of water will be pumped to the WTP first and then discharged to Lake A16 (Mammoth Lake) after treatment. The dewatering activity is planned from March to May 2019 to Whale Tail Lake (South Basin) and from June to September 2019 to Lake A16 (Mammoth Lake).

3.1.4.4 Key Water Management Activities during Construction and Operations

An inventory of waterbodies impacted by mining activities is provided in Table 3.1 (Section 3.1.3) and the water management facilities required for the Plan is provided in Table 3.2 (Section 3.1.4.1). These tables should be read in conjunction with Table 3.3, which presents the yearly major water management activities during the construction and operational phases. Water management activities during the closure phase are described in Section 3.2.

Table 3.3 Water Management Activities during Construction and Operations

Mine Year	Water Management Activities and Sequence
Year -1 (2018)	• Temporary pump contact water from the Stage 1 WRSF sump to quarry 1 • Temporary pump contact water from the starter pit to quarry 1 • Temporary pump contact water from open pit to the Whale Tail WRSF Pond • Treat turbid water from construction using the construction WTP and discharge in Lake A16 (Mammoth Lake) • Treat contact water from quarries using the construction WTP and discharge in Lake A16 (Mammoth Lake)
Year 1 (2019)	• Dewater Whale Tail Lake (North Basin) • Pump contact water from the open pit to the Whale Tail Attenuation Pond • Pump contact water from the Whale Tail WRSF Pond to the Whale Tail Attenuation Pond • Treat through the WTP the Whale Tail Attenuation Pond contact water and discharge in Lake A16 (Mammoth Lake) • Whale Tail East channel diverts non-contact water from Lake A53 to Whale Tail Lake (South Basin) • If deemed necessary, North channel diverts non-contact water from the north shore of the open pit to Lake A16 (Mammoth Lake)
Year 2 (2020)	• Continue to pump contact water from the open pit to the Whale Tail Attenuation Pond • Continue to pump contact water from the Whale Tail WRSF Pond to the Whale Tail Attenuation Pond • Treat through the WTP the Whale Tail Attenuation Pond contact water and discharge in Lake A16 (Mammoth Lake) • Northeast Pond flows towards the C watershed • Whale Tail Lake (South Basin) flows to Lake A16 (Mammoth Lake) through the Whale Tail Lake (South Basin) Diversion Channel

WRSF = Waste Rock Storage Facility; WTP = Water Treatment Plant.

A brief summary of the Plan during the construction and operational phases is presented as follows:

- Turbidity Curtains will be used during the construction of the Whale Tail Dike and, if deemed necessary for the construction of Mammoth Dike and Whale Tail WRSF Dike.
- During the construction, to the extent practical, turbid water originating from Lake A17 (Whale Tail Lake) and from the quarry 1 will be treated and discharged in Lake A16 (Mammoth Lake).
- The main contact water pond of the Project (i.e., Whale Tail Attenuation Pond) is located in a deep part of Whale Tail Lake (North Basin).
- Contact water from the major mine infrastructure will be diverted and/or collected in the Whale Tail Attenuation Pond.
- Contact water from the Whale Tail WRSF Pond will be pumped to the Whale Tail Attenuation Pond.
- Runoff water in the open pit will be collected by the sumps and then pumped to the Whale Tail Attenuation Pond.
- Water collected in the Whale Tail Attenuation Pond will be reused to the extent practical in the open pit and dust control operations, and the excess water will be treated by the WTP prior to discharge to the receiving environment via the diffuser into Lake A16 (Mammoth Lake). Water quality objectives for arsenic and phosphorous will be meet via the proposed diffusor design: 10 ports at 12.6 m spacing and 75mm, diameter diffusor ports, effluent mixing (mixing zone). Within Mammoth Lake, the required dilution of WRSF seepage is predicted to be met at 60 m from the discharge location in all scenarios. A rock fill weir at outlet will channelize seepage outflow into Mammoth Lake and facilitate dilution.
- Non-contact water is diverted away from the mine site infrastructure by reversing natural flows and/or using diversion channels.
- Freshwater usage on site will be supplied from Lake C38 (Nemo Lake) during operations, and from Whale Tail Lake (South Basin) during closure.

Table 3-4 summarizes the overall contact water management plan for the major mine infrastructure with the initial water collection location and final water destination. Detailed water management information for major mine infrastructure areas is described in the following sub-sections. Water management flowsheets for the construction and operations phase are provided in Appendix B.

Table 3.4 Overall Site Surface Contact Water Management Plan

Contact Water Source	Initial Contact Water Collection Location	Final Contact Water Collection Location
Industrial Sector	Whale Tail Attenuation Pond	Whale Tail Attenuation Pond
Whale Tail WRSF Sector	Whale Tail WRSF Pond (Quarry 1 for the temporary Stage 1 WRSF sump)	
Ore Stockpiles	Whale Tail Attenuation Pond	
Landfill	Whale Tail WRSF Pond	
Open Pit	Open pit sumps	

WRSF = Waste Rock Storage Facility.

3.1.4.5 Erosion and Sediment Control Plan

As described in the previous sections, Whale Tail Pit site infrastructure, channels, sumps and associated water management activities are designed with consideration of site wide erosion and sediment control. In addition to design controls, best management practices (BMPs) will furthermore ensure that activities, practices, devices or a combination thereof will prevent or reduce the release of sediments and will control erosion. The selection of permanent or temporary BMPs will be specific to the site and timing and may require regulatory approval prior to installation or construction.

Temporary BMPs Whale Tail Pit may include:

- Silt fences and fabric installation;
- Turbidity curtains;
- Sediment control basins to detain sediment-laden water; and
- Diversion of flows away from the construction area.

Permanent BMPs at the Whale Tail Pit may include:

- Infiltration basins and trenches;
- Sedimentation basins or ponds; and
- Construction of swales in ditches.

Monitoring of erosion and sedimentation associated with construction and operations are discussed in Section 3.2 of this plan and are detailed in the Whale Tail Pit Water Quality and Flow Monitoring Plan (FEIS Appendix 8 B.3, Agnico Eagle, 2016) and dike construction sediment control and monitoring is presented in Whale Tail Pit Dike Construction and Dewatering Management Plan (FEIS Appendix 8 – A.2, Agnico Eagle, 2016).

For specific details on sediment control guidelines and license requirements, on erosion monitoring and mitigation during freshet and the rise of water level in the South Basin of Whale Tail Lake, refer to the Whale Tail Project - Erosion Management Plan (Agnico Eagle, 2018b).

3.1.4.6 Water Management in Whale Tail Waste Rock Storage Facility

As mentioned in the document Amaruq Stage 1 WRSF, Ore Stockpile 1 and Starter Pit Design Report and Drawings (Agnico Eagle, 2018c), while awaiting the construction of the Whale Tail WRSF dike expected in winter 2019, a Stage 1 WRSF will be initiated. The Stage 1 WRSF, located within the footprint of the final location of the WRSF, will be positioned as to be able to control the watershed using the topography in combination with temporary water management structures in order to prevent potentially contaminated contact water from seeping into the environment. The duration of this Stage 1 WRSF will be during the second half of 2018 until the aforementioned WRSF dike is constructed or when weather conditions are sufficiently cold that no thawing or water runoff can occur.

To avoid any potential contact water from entering the environment, a low-permeability access road built of overburden will be established first to reach the Stage 1 WRSF location and will act as a barrier to any water not naturally diverted towards a containment sump that will be established once the access road is completed and prior to any placement of PAG / ML material. The location of the Stage 1 WRSF was chosen as to use the topography to control water runoff, in combination with the access road and collection sump designed to sustain a 1:100 year rain event. All water collected in the sump will be directed towards Quarry 1 in a closed circuit. Refer to Figure A.5 of Appendix A.

The Whale Tail WRSF will be used to permanently store all waste rock and overburden from mining activities. Seepage and runoff from the Whale Tail WRSF during the construction and operational phases will be managed via the Whale Tail WRSF Pond, isolated by the Whale Tail WRSF dike, where the contact water will be pumped to the Whale Tail Attenuation Pond for further treatment. During the construction phase or until the Whale Tail WRSF Dike is operational, runoff and especially water originating from thawed ice-rich soils will be managed with ditches and local sumps. All overburden soils will be stabilized with waste rock berms in order to limit spreading and soil water separation. More details about management of the Whale Tail WRSF are presented in the Mine Waste Rock and Tailings Management Plan.

3.1.4.7 Water Management for Ore Stockpile Areas

The ore stockpiles are located within the catchment of the Whale Tail Attenuation Pond as shown in Figure A.2, Figure A.3 and Figure A.5 (Appendix A). Based on the topographic information, contact water will naturally flow to the Whale Tail Attenuation Pond for further treatment. Channels will be constructed if deemed required to direct the seepage and runoff to the pond.

The Ore Stockpile Pad 1, which constitute the first stage of the ore stockpile, was designed based on the following considerations. A minimum 1.0 m of overburden and/or waste rock will be placed over original ground to reduce any thaw-induced differential settlements. Waste rock will then be placed to follow the natural topography, thereby reducing the likelihood of water ponding on the surface of the pad requiring additional maintenance. A final grade of about 0.5% sloping towards the Whale Tail

Attenuation Pond will be achieved. Any surface run off from the ore stockpile or the pad will therefore be directed to the Attenuation Pond containment area.

3.1.4.8 Water Management for the Pit Sector

The Whale Tail open pit is planned to extend to approximately 115 m below the ground surface. The open pit will be mined mostly within permafrost except for the north-central portion of the pit which will be within the closed talik at the northern end of Lake A17 (Whale Tail Lake). The pit does not extend through the bottom of the closed talik; however, the open pit acts as a sink for groundwater flow during operations, with water induced to flow up through the open talik beneath the central portion of Lake A17 (Whale Tail Lake) and into the open pit. Accordingly, groundwater inflows into open pit are expected, this water will be mixed with the open pit contact water and pumped the Whale Tail Attenuation Pond for further treatment.

3.1.4.9 Water Management for Haul Road

A network of access and haul roads will connect the ore body to the Whale Tail WRSF Sector and the Industrial Sector. The majority of the roadways servicing the mining area will drain directed towards the proposed contact water management infrastructure. Detailed information on roads is described in the Whale Tail Pit Haul Road Management Plan.

The approach to water management for these roads will involve the implementation of local best management practices during the construction, operational, and closure phases. The roads are constructed of non-potential for acid generating and non-leaching waste rock from mining operations. Other best management practices will strive to minimize the amount of runoff originating from the roadways and to prevent the migration of surfacing material from the roadways and crossings. Any areas identified as point sources of runoff originating from the roadways or crossings can be managed locally with silt fences, straw booms, turbidity curtains, interceptor channels, rock check dams, and/or small sedimentation ponds.

3.1.4.10 Water Management for Landfill

The landfill is located southeast of the Whale Tail WRSF, within the catchment of Whale Tail WRSF Pond, as shown in Figure A.2 to Figure A.4 (Appendix A). Based on the topographical information (PhotoSat 2015), runoff and any seepage from the landfill will naturally flow to the Whale Tail WRSF Pond and then pumped to the Whale Tail Attenuation Pond for further treatment before discharge.

Further information on the management of this facility is described in the Whale Tail Pit Landfill and Waste Management Plan.

3.1.4.11 Sludge Management from Water Treatment Plant

Sludge water from the Operation Water Treatment Plant (OWTP) will be dewatered with a centrifuge to produce a cake having a density with 20% of solid content. This cake will be stored in the Whale Tail WRSF. The maximum predicted annual volume of cake from the OWTP is approximately 5,760

cubic metres (m3). The OWTP, is designed to treat total suspended solids and arsenic during the Operations Phase.

3.1.5 Freshwater and Sewage Water Management

3.1.5.1 Freshwater Management

Freshwater for the Whale Tail Camp will be sourced from Lake A17 (Whale Tail Lake) and from Lake C38 (Nemo Lake), as per Part E, conditions 1, 2 and 3 of the Water License 2AM-WTP1826. Freshwater usage includes potable use, fire suppression, dust suppression, drilling water, if contact water is not available, and water for the truck shop. The freshwater source is Lake C38 (Nemo Lake) during construction and operations, and Lake A17 (Whale Tail Lake) during closure. For explosives mixing and associated use, the water will be pumped from the unnamed lake, as per Part E, condition 4 of the Water License 2AM-WTP1826. Freshwater will also be required to refill Whale Tail Lake (North Basin) at closure and will be sourced from the Whale Tail Lake (South Basin) and inflows to Whale Tail Lake (North Basin). Agnico Eagle will endeavour to minimize the amount of freshwater required for the Project, where possible.

Freshwater will be sourced through a freshwater intake and pump system. The intake will consist of vertical filtration wells fitted with vertical turbine pumps that supply water on demand. The intake will be connected to the pump house with piping buried under a rockfill causeway. The intake pipe will exit at the bottom of the causeway and will be fitted with a stainless steel screen, as per Part E, condition 6 of the Water License 2AM-WTP1826. The rockfill causeway will act as a secondary screen to prevent fish from becoming entrained. The stainless steel screens design for the water intake will be consistent the Fisheries and Oceans Canada (DFO) “Freshwater Intake End-Of-Pipe Fish Screen Guideline” (DFO 1995). As per the DFO policy intake screens will be cleaned every 2 years. The freshwater intake will be moved to Whale Tail Lake (North Basin) at closure.

Freshwater will be pumped to an insulated main storage tank located at the Whale Tail Camp. The freshwater pipeline will be a high density polyethylene pipe and insulated and heat traced. The Whale Tail Camp will have a WTP for potable (domestic) water. The design flow rate for the potable water for the Whale Tail Camp and accommodations (i.e., kitchen, laundry) is 84 cubic metres per day (m^3/day), based on a 350 people camp capacity, using both the existing Exploration Camp and additional 210 units and a nominal consumption of 240 litres per day per person (L/day/person). In the Potable WTP, the freshwater will first go through sand filters and then be pumped through ultraviolet units, and finally be treated with chlorine. The treated water will be stored within a potable water tank. Potable water will be monitored according to the Nunavut health regulations for total and residual chlorine and microbiological parameters. Treated potable water will be piped to other facilities requiring potable water.

Approximately 8,760 cubic metres per year (m^3/year) of freshwater will be required during the construction phase, 118,625 m^3/year during the operational phase, and 17,520 m^3/year during the

closure phase. The use of freshwater will respect the limits as per Part E, conditions 1 and 2 of the Water License 2AM-WTP1826 During closure, the Whale Tail Pit and Whale Tail Lake (North Basin) will be allowed to flood naturally with non-contact, treated, and freshwater from direct precipitation, runoff from adjacent land, and Whale Tail Lake (South Basin). It is anticipated that approximately 24,000,000 m^3 over 8 years is required to fill the mined-out Whale Tail Pit (i.e., approximately 17,000,000 m^3) and Whale Tail Lake (North Basin) (i.e., approximately 7,000,000 m^3) to its original level, including approximately 2,300,000 m^3/year from Whale Tail Lake (South Basin), 120,000 m^3/year from tributaries to Whale Tail Lake (North Basin), and 580,000 m^3/year from direct precipitation to Whale Tail Lake (North Basin). As per part E, condition 5 of the Water License 2AM-WTP1826, the use of water from Whale Tail Lake shall not exceed a total of 10,655,000 m^3/year commencing when notification of closure is received by the NWB through to the expiry of the Licence.

3.1.5.2 Sewage Water Management

Sewage will be collected from the camp and change-room facilities and pumped to a STP. The objective of the STP is to treat sewage to an acceptable level for discharge to the Whale Tail Attenuation Pond via a sewage water discharge pipeline. The STP will be housed in a prefabricated (modular) structure located in the Whale Tail Camp. The sewage treatment system will be designed based on a flow rate of 200 L per day per room for a peak load of 210 rooms, for an average daily flow rate of 42 m^3 (1.75 cubic metres per hour [m^3/hour]). As already installed on site for the Exploration Camp, additional Bionest Kodiak biological reactor units are envisioned to be installed to treat camp waste water and accommodate for a total of 350 rooms.

The STP for the camp facilities will be designed to meet appropriate guidelines for wastewater discharge (for example, NWT Water Board 1992). Wastewater System Effluent Regulations (WSER) criteria are not currently applicable to systems located in Nunavut, and is unlikely to apply to the Project effluent quality.
Table 3.5 provides the anticipated performance of the system compared to the WSER criteria.
Further information on the management of this facility is described in the Whale Tail Sewage Treatment Plant Operation and Maintenance Manual.

Table 3.5 Effluent Quality and Wastewater Characteristics

Parameter	Units	Regulatory Limit	Design Value
Wastewater			
• Biochemical Oxygen Demand	mg/L	-	952
• Total Suspended Solids	mg/L	-	300
• Total Kjeldahl Nitrogen	mg/L	-	130
• Ammonia nitrogen	mg/L	-	130
• Fat, Oil and Grease	mg/L	-	30
• pH	-	-	6 to 9.5
• Water Temperature	°C	-	10 to 25
• Alkalinity	mg/L as $CaCO_3$	-	471.1
• Prohibited Chemicals/Compounds	Not present		
• Grinder Pumps	Not present Upstream of MBR		
Effluent			
• pH	-	6-9.5	6.5 to 8.5
• Carbonaceous Biochemical Oxygen Demand	mg/L	<25	<5
• Total Suspended Solids	mg/L	<25	<1
• Un-ionized ammonia	mg/L	<1.25	<0.08
• $N0_3$-N	mg/L	<5	4
• TP	mg/L	<0.5	0.5
• Fat, Oil and Grease	mg/L	<5	<1
• Fecal Coliform	CFU/100mL	<200	Non-Detect
• Total Residual Chlorine	mg/L	<0.02	0

1. Noted values are assumed blend between kitchen and dormitory wastewater after the grease trap.
2. A complete list of prohibited chemicals is included in the membrane maintenance manual.

3.2 Operation, Maintenance, and Surveillance of Project Dikes

3.2.1 Consequence of Failure

The consequence of failure classification is presented in SNC (2018b) based on the guidelines provided in the Canadian Dam Association Dam Safety Guidelines (CDA, 2014). The Whale Tail Dike and the Mammoth Dike are rated as “High” consequence of failure structures, Northeast Dike is rated as “Significant” consequence of failure structure, and Whale Tail WRSF Dike is classified as “Low” consequence of failure structure.

No flooding or inundation mapping has been completed.

It is assumed that failure of Whale Tail Dike and Mammoth Dike could flood the Whale Tail Pit, resulting in associated threat to the safety of mine personnel, equipment, and other workings within

the dewatered area. Flooding would likely cause cessation of mining operations within the pit, either temporarily or permanently.

Finally, as the Whale Tail WRSF Pond will have a small volume and will continue to be pumped to the Whale Tail Attenuation Pond over the summer season, a low probability of failure is attributed to the Whale Tail WRSF Dike and then to the consequence of failure.

3.2.2 Operation, Maintenance, and Surveillance Manual

The Meadowbank Mine OMS manual (Whale Tail Addendum) will be updated by Agnico Eagle before the operations of the dikes, reviewed on an annual basis and revised as necessary to accommodate changes in the condition and operations of the facilities or in management structure as per Part B, condition 13 of the Water License 2AM-WTP1826 . The OMS Manual will be an extension of the existing Meadowbank OMS Manual (Agnico Eagle, 2017).

3.2.3 Role and Manual Holders

The Meadowbank Mine Engineering Superintendent will be responsible for delivering the first release of the OMS Manual as well as issue all revisions and addenda to the registered holders: General Mine Manager, Environment Superintendent, Mine Operations Superintendent, Engineering Superintendent, General Services Manager, Site Services Superintendent, Corporate Environment Director, Health and Safety Superintendent, and Dike Design Engineer. The role and responsibilities of holders will be revised when issuing the OMS Manual.

3.2.4 Dewatering

Based on SNC (2018c), the design criteria for minimum freeboard for the dikes are presented in Table 3.6. The freeboard may change due to fluctuations in Whale Tail Lake and Ponds, or due to settlement in the dikes. Maintenance may be required to restore loss of freeboard due to settlement. The freeboard may also change during further advanced engineering phases.

Table 3.6 Design Minimum Freeboard

Structure	Minimum Freeboard		
	Normal operation (m)	Design flood conditions (m)	Actual minimum freeboard (m)
Whale Tail Dike	2.0	1.8	2.0
Mammoth Dike	No water	1.3	1.5
Whale Tail WRSF Dike	No water	0.6	0.7
Northeast Dike	No water	0.7	0.8

m = metre; WRSF = Waste Rock Storage Facility.

Based on past experience at dewatering operations (i.e. Vault Lake for Meadowbank operations), a WTP was not required because the regulatory criteria limit was reached without treatment or a WTP was used only during the latter stages when TSS from bottom sediments were present. It is expected for the Project that approximately 2/3 of the dewatered water from the Whale Tail Lake (North Basin) will be pumped and directly discharged to Whale Tail Lake (South Basin) while the remaining 1/3 of the water will be processed through the WTP to reduce TSS and discharged to Lake A16 (Mammoth Lake) thru a diffuser. During new dike construction, Agnico Eagle will abide by limits established by the NWB in the Water License 2AM-WTP1826. .

Pore water pressures in the foundation of the dewatering dikes will be monitored during dewatering as a predictor of possible slope instability. Both pore water pressures and temperature measurements will be monitored during dewatering as one method of detecting potential zones of seepage. The quantity of water pumped out during dewatering will be monitored with flow meters in addition to monitoring the water level downstream of the Lake A17 (Whale Tail Lake) watershed.

3.2.5 Operations

Water from the seepage collection systems of the dikes is to flow naturally to the Whale Tail Attenuation Pond or to the Open-Pit and the Collection Ponds and be pumped to the Whale Tail Attenuation Pond. The quantity of seepage through the dikes will be estimated on further advanced engineering phases. Seepage rates, volumes and the condition of the seepage water (i.e. turbidity, temperature, etc.) will be monitored as per Part I, conditions 15 and 16 of the Water License 2AM-WTP1826, and incorporated in the Water Balance.

Water quality of the seepage and runoff collected in the sumps and ditches at the toe of the dikes is to be monitored during operations according to the Water License 2AM-WTP1826requirements. Weekly inspections will be performed as an indicator of dike performance to note whether seepage water is clear, cloudy or if fine material is present.

3.2.6 Surveillance

A program of regular surveillance is required to ensure that the dikes, instrumentation and seepage collection systems are performing adequately and that problems are detected so that the necessary corrective actions can be implemented in a timely manner. A surveillance program will be implemented based on the International Commission on Large Dams (ICOLD 1998) for detection of potential failure mechanisms applicable to the dikes, primarily Whale Tail Dike, Northeast Dike and Whale Tail WRSF Dike. The surveillance program for the Project will be implemented in the OMS Manual by Agnico Eagle before the operations of the dikes.

3.2.7 Monitoring and Instrumentation

Monitoring of the dikes will be carried out for the purpose of environmental monitoring, assessment of physical stability of the structures, assessment of overall performance of the dikes, and aiding in future design. Monitoring complements the surveillance and is divided into the following aspects: drawdown rate and water quality during dewatering, geotechnical instrumentation including piezometers, thermistors, inclinometers, survey prisms, etc., and seepage rates and water quality during operations. The monitoring program for the Project will be implemented by the OMS Manual issued by Agnico Eagle before the operations of the dikes.

3.2.8 Reporting Procedures and Data Management

Emergency, inspection, and instrumentation measurements will be reported according to the role and responsibility of individuals and as per the OMS Manual requirements. An electronic library or database will be set up to catalogue and store inspection documents, maintenance reports and instrumentation measurements. Hard copies will also be catalogued and stored on site.

3.2.9 Decommissioning

The decommissioning of the dikes will take place progressively as the dikes are decommissioned and opened to reconnect lakes.

The Whale Tail Dike and the Mammoth Dike will remain intact during the controlled flooding of the Whale Tail Pit and Whale Tail Lake (North Basin). These are flooded gradually over the course of several years. Once the water levels have stabilized within Whale Tail Lake (South Basin) and Whale Tail Lake (North Basin) and water quality is considered acceptable for mixing with neighbouring lakes, these two dikes will be decommissioned to allow circulation of lake water.

The Northeast Pond will be draw-down into the open-pit before the dike be decommissioned.

The Whale Tail WRSF Dike will remain in place during closure and post-closure period or until the water quality monitoring results meet discharge criteria to allow water to naturally flow to the receiving environment. Following confirmation the water quality monitoring results meet discharge criteria the Whale Tail WRSF Dike will be decommissioned.

Long-term inspection will be carried out to ensure the adequate performance of maintained closure and post-closure facilities.

3.2.10 Emergency Preparedness Plan

The purpose of an Emergency Preparedness Plan is to present a basic procedure for responding to potential failure mechanisms for dikes. The procedure identifies various measurable or observable effects or causes of the failure mechanisms, identifies the appropriate people to notify, presents the procedure to put in place according to the level of emergency and lists the response reference. The Emergency Preparedness Plan for the Project will be implemented in the OMS Manual by Agnico Eagle before the operations of the dikes.

3.3 Water Management during Closure

Mine closure is integral to the mine design and will be modified during operations. Planning for permanent closure is an active and iterative process. The intent of the process is to develop a final closure plan including specific water management components using adaptive management. This begins during the mine design phase and continues through to closure implementation. Adaptive management enables the plan to evolve as new information becomes available through analysis, testing, monitoring, and progressive reclamation. The detailed mine closure and reclamation activities are provided in the Whale Tail Pit Interim Closure and Reclamation Plan (FEIS, Volume 8, Agnico Eagle Mine, 2016).

Water management during closure and reclamation will involve maintaining contact water management systems on site until monitoring results demonstrate that water quality is acceptable for discharge of all contact water to the environment without further treatment. Once water quality meets the discharge criteria, the water management systems will be decommissioned to allow the water to naturally flow to the receiving environment. In 2018, a WRSF seepage analysis and Hydrodynamic modelling of Mammoth Lake were conducted to address NIRB project certificate Term and Condition no. 6 a). The objectives were to assess Mammoth Lake near-field water quality at WRSF seepage outlet post-closure and to evaluate seasonal water circulation patterns in Mammoth Lake resulting from effluent discharge. This analysis also aimed to predict and evaluate the water quality within Mammoth lake during operations and post-closure (Golder, 2018a). Results show that no modification to the water management strategy are needed concerning closure activities and sequence.

The key water management activities during mine closure are summarized in Table 3.7. Figure B.2 to Figure B.4 in Appendix B show the water management flowsheets during mine closure phases.

Table 3.7 Key Water Management Activities during Mine Closure

Mine Year	Figure	Key Water Management Activities and Sequence
Year 4 (2022) to Year 7 (2025)	A.3	• Fill the mined-out open pit with active pumping of water from Whale Tail Lake (South Basin) and treated Whale Tail WRSF pond water • Draw-down of the raised Northeast Sector and breaching of the Northeast Dike. The Northeast Pond water flows in the open pit and Lake A47, Lake A48, Lake A113, Pond A-P38, and A-P68 return to their natural water level and drainage patterns • Water from the A watershed stops to flow in the C watershed • Water from Whale Tail Lake (South Basin) stops flow through Whale Tail Lake (South Basin) Diversion Channel and to Lake A16 (Mammoth Lake) • Draw-down of the raised Whale Tail Lake (South Basin) to natural water level by pumping to Whale Tail Lake (North Basin). Lake A55, Lake A65, Lake A62, Lake A63, Lake A18, Pond A-P23, Lake A20, Lake A21, Lake A22, and Lake A45 return to their natural water level and drainage patterns. • The freshwater intake is moved in Whale Tail Lake (South Basin) • The monitoring of the site water quality starts • If necessary, the WTP is moved in the Whale Tail WRSF sector
Year 8 (2026) to Year 11 (2029)	A.4	• Fill Whale Tail Lake (North Basin) with active pumping water from Whale Tail Lake (South Basin). The pumping rate will be equivalent to the natural inflow to Whale Tail Lake (South Basin) to keep a constant and natural water level in Whale Tail Lake (South Basin) • The Whale Tail Attenuation Pond as well as the Industrial Sector and the Whale Tail Camp are no longer considered as contact water and now contribute to the re-establishment of the natural water level of the Whale Tail Lake (North Basin) • Whale Tail Dike and Mammoth Dike are breached when i) the South side and the North side of the Whale Tail Dike are at the same water level (i.e., at natural water level) and ii) the water quality monitoring results meet discharge criteria to allow water to naturally flow to the receiving environment Remove non-essential site infrastructure
Post-Closure	N/A	• Treated contact water from the Whale Tail WRSF Sector is discharged in Lake A16 (Mammoth Lake) through the existing diffuser system. This water is treated until water quality meet direct discharge criteria, following which the water management system is decommissioned • Breach the Whale Tail WRSF Dike once water quality monitoring results meet discharge criteria to allow water to naturally flow to the receiving environment • Remove non-essential site infrastructure

WRSF = Waste Rock Storage Facility; N/A = not applicable.

3.3.1 Open Pit and Refilling of Whale Tail Lake (North Basin)

Following completion of mining, the open pit will be filled with natural runoff and water pumped from Whale Tail Lake (South Basin) and treated water from the Whale Tail WRSF. During the summer of the

Year 4 (2022), the water accumulated in Whale Tail Lake (South Basin) over the years of operations will be pumped in the open pit. It will take approximately 4 years to refilling the pit with an assumed pumping rate of 45,000 m^3/day. Following this first pumping summer, the water elevation in Whale Tail Lake (South Basin) will be back to the baseline value (152.5 masl) and no outlets will be available for this basin as the Whale Tail Lake (South Basin) Diversion Channel is at the elevation 156 masl and the Whale Tail Dike is maintained in place. During the following years and until Whale Tail Lake (North Basin) reaches the same water elevation as Whale Tail Lake (South Basin) (i.e., baseline water surface elevation of 152.5 masl), the yearly accumulated water in Whale Tail Lake (South Basin) (i.e., over the baseline water surface elevation of 152.5 masl) is pumped to Whale Tail Lake (North Basin). At an assumed pumping rate of 45,000 m^3/day, the north and south parts of the Lake A17 (Whale Tail Lake) will be at the same elevation 8 years after the end of the operational phase and then the Whale Tail Dike and the Mammoth Dike will be reconnected when the water quality monitoring results meet discharge criteria to allow water to naturally flow to the receiving environment. Results from the 2018 modelling (Golder, 2018a) show that effluent discharge into Mammoth Lake will be well mixed. Steady-state untreated WRSF contact water released is predicted to meet SSWQO for arsenic at the edge of the mixing zone in the long-term, under the anticipated cover performance scenario (from the 4.7 meters cover of low arsenic leaching waste rock). The mixing zone in the Lake is predicted to range from 5 meters (under calm conditions in July when 6% of the seasonal seepage flow occurs), to 60 meters (under medium current conditions in June when 65% of the seasonal flow is predicted to occur at a more dilute arsenic concentration) from the entry point of this seepage into the Lake and along the plume centre line. Mammoth Lake is sensitive to cover material seepage quality, in turn sensitive to cover composition and WRSF pile contact water volume. Observational data at Meadowbank WRSF suggest that pile contact water volumes are substantially lower than originally predicted (Portage is 20 to 40% lower, Vault WRSF contact water is minimal compared to 178,000m^3 predicted at maximum footprint year) using similar modelling assumptions. Modelling results reflect a conservative chemical load estimate to Mammoth Lake in WRSF seepage that will be verified with monitoring.As per Type A Water Licence 2AM-WTP1826 Part E, conditions 7 and 8 , Agnico Eagle anticipates a site wide water balance and end pit water quality model update will be required for the Whale Tail Pit Site as part of the annual water management plan.

3.3.2 Contact Water Collection System

The complete contact water collection system will remain in place to collect surface runoff water and seepage from the mine site until the open pit is flooded. During this period of 4 years, the Industrial Sector and the Whale Tail Camp will be reclaimed and the non-essential site infrastructure will be removed. Thereafter, water in these sectors will no longer be collected and will contribute to the reestablishment of the natural elevation of Whale Tail Lake (North Basin). Although water might not meet the discharge criteria after 4 years, water will be controlled as the Whale Tail Dike and the Mammoth Dike will remain in place until Year 11 of the Project.

In the Whale Tail WRSF Sector, the contact water collection system will remain in place. Dikes will not be reconnected until the water quality in the flooded area meets Canadian Council of Ministers of the Environment (CCME) Water Quality Guidelines, baseline concentrations or appropriate site specific water quality objectives. Contingency for water treatment if required in closure is also accounted for in the closure plan.

Dike breaching will involve the removal of a portion of the dike to original ground levels. Consideration will be given to breach staging, with the above water portions of the dike/berm in the breach area removed during winter periods, when there will be little surface water flow, thereby minimizing the potential release of sediments to the neighbouring waterbodies. The remainder of the breach would be completed during the open water season following freshet so as to allow for the deployment of turbidity curtains to control potential releases of sediment.

Channel and sump closure involve the infrastructure will be re-contoured and/or surface treated according to site-specific conditions to minimize wind-blown dust and erosion from surface runoff, if required. This closure activity is intended to enhance site area development for re-colonization by native plants and wildlife habitat.

3.4 Water Balance

A water balance model was developed to assist in the evaluation of the proposed water management infrastructure, and estimation of the pumping requirements over the life of the mine (SNC, 2015) and under closure conditions (Whale Tail Interim Closure and Reclamation Plan).

The water balance was computed on a monthly time step based on mean annual climate conditions (Section 2.1.1) and the following conservative assumptions:

- snow sublimation is subtracted from snowfall on a monthly basis. If snow sublimation is greater than snowfall for a particular month, net snow value us zero for that month;
- snowfall between October and May, net of snow sublimation and rainfall, accumulates as snow and ice, and melts entirely in June;
- runoff is composed of precipitation and snow melt during the summer months (June to September);
- net inflow for a lake or pond is computed as runoff minus evapotranspiration (computed based on the watershed area minus lake or pond area) and lake evaporation (computed based on the lake or pond area); and
- change in storage was not accounted for, and net inflow is equal to net outflow.

The water management flow sheets are presented in Appendix B, and water balance results are presented in Appendix C for mean annual climate conditions during operations.

The estimated mean annual water input/output from each of various water management facilities under mean annual climate conditions during operations are summarized in Table 3.8.

Table 3.8 Estimated Mean Annual Volumes from Mine Site Water Balance

Item	Mean Annual Water Volume (m^3)[1]
Whale Tail Attenuation Pond	455,000
Whale Tail WRSF Contact water to Pond	112,000
Open Pit inflows	111,000
Freshwater Pumped from Lake C38 (Nemo Lake)	74,000
Treated Water from WTP to be Discharged to the Receiving environment	420,000
Freshwater Diverted from Watershed A to Watershed C	207,000
Freshwater from Whale Tail Lake (South Basin) to Lake A16 (Mammoth Lake)	1,873,000

[1] Volume rounded to the nearest thousand.

WRSF = Waste Rock Storage Facility.

Blasting Activities – Whale Tail Dike construction, Version 1

AGNICO EAGLE

TECHNICAL MEMORANDUM

To: Department of Fisheries and Ocean (DFO)

Cc: Amaruq Permitting team

From: Pier-Eric McDonald, Patrice Gagnon

Date: Friday, June 15, 2018

Subject: Blasting Activities – Whale Tail Dike construction

---

1. Introduction

After the reception of Licence A, Agnico Eagle (AEM) plans to build the Whale Tail Dike that will allow for the mining of the Whale Tail pit. One of the construction activities consists of drill & blasting (D&B) the East and West abutments of the Whale Tail dike. Those abutments are located on the shoreline of Whale Tail Lake and this activity is critical for assuring the performance of the dike. Since this activity is close to a water body, AEM aims to comply with the DFO's Guidelines for Use of Explosives in or Near Canadian Fisheries Waters. This memo presents the proposed monitoring and mitigation measures in order to respect the above guidelines that are summarized in section 3.

2. Description of Blasting Activities

Drill and Blast of the Whale Tail Dike abutment is required as per the Design to minimize the risk of deformation of cut-off wall of the structure due to thaw settlement. Following the dike construction, thawing of the abutment is expected due the rise of the Whale Tail lake level which will change the thermal regime of the foundation. Removing the ice-rich till material and unsuitable foundation material under the cut-off wall on the abutments will remove this risk by ensuring that the cut-off of the dike is on a foundation not prone to thaw settlement. Due to the expected thickness of frozen material to remove, blasting is required for this activity. Drill and blast will be undertaken on each abutment and near the lake shore while respecting the distance allowed per the DFO's guideline. The blasting activities are planned to occur in the months of July to August 2018. The extent of the blasting area for both abutments are presented in Appendix A. These extents might change due to field observations and design adjustments.

3. Review of existing DFO guidelines

AEM intends to comply with the nine (9) guidelines of the document "Guidelines for Use of Explosives in or Near Canadian Fisheries Waters" summarize below:

> *1. Proponents considering the use of explosives are encouraged to consult the appropriate DFO Regional/Area authorities (Appendix I) as early as possible in their planning process to identify possible alternatives to the use of explosives, the biological resources and their habitats at risk, and/or effective mitigation measures.*
>
> *2. Where provincial or territorial resource management agencies, or aboriginal resource management boards undertake the administration of fisheries, the proponent is encouraged to consult with the relevant authorities.*

3. The use of confined or, in particular, unconfined explosives in or near Canadian fisheries waters is discouraged, and proponents are encouraged to utilize other potentially less destructive methods wherever possible.

4. No use of ammonium nitrate-fuel oil mixtures occurs in or near water due to the production of toxic by-products (ammonia).

5. After loading a charge in a hole, the hole is to be back-filled (stemmed) with angular gravel to the level of the substrate/water interface or the hole collapsed to confine the force of the explosion to the formation being fractured. The angular gravel is to have a particle size of approximately 1/12th the diameter of the borehole.

6. All "shock-tubes" and detonation wires are to be recovered and removed after each blast.

7. No explosive is to be knowingly detonated within 500 m of any marine mammal (or no visual contact from an observer using 7x35-power binocular).

8. No explosive is to be detonated in or near fish habitat that produces, or is likely to produce, an instantaneous pressure change (i.e., overpressure) greater than 100 kPa (14.5 psi) in the swimbladder of a fish.

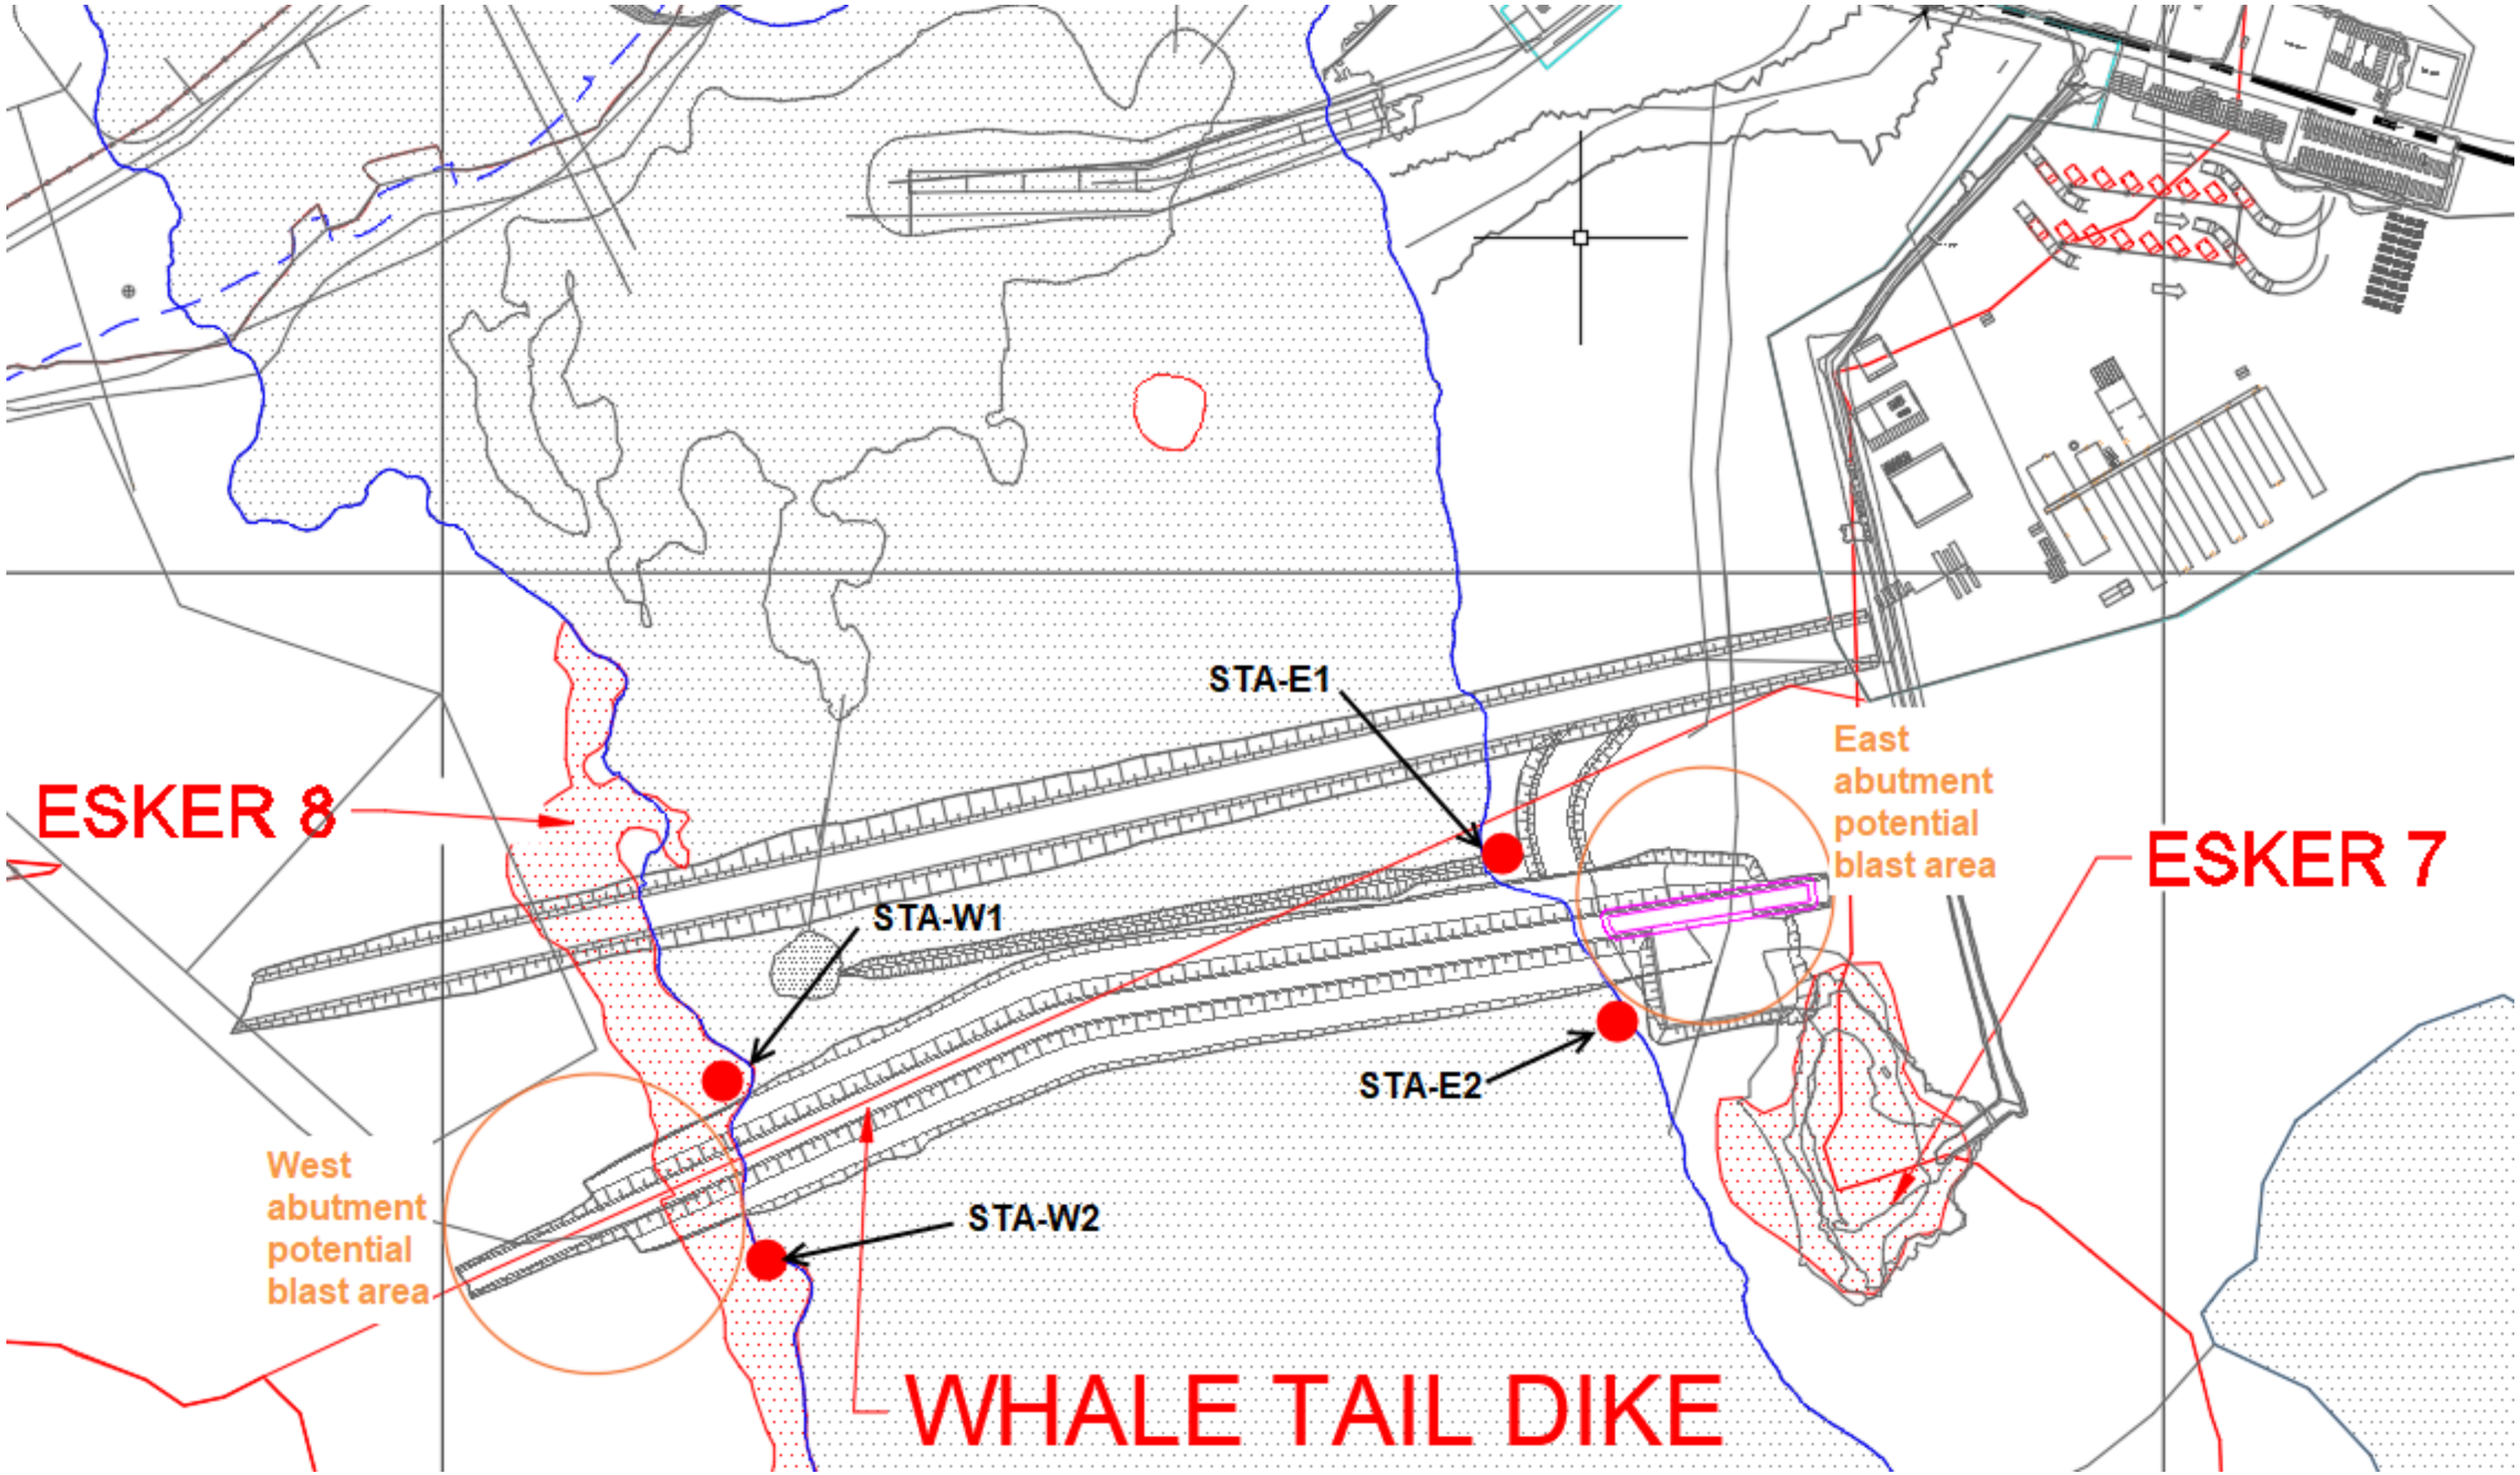
9. No explosive is to be detonated that produces, or is likely to produce, a peak particle velocity greater than 13 mm•s-1 in a spawning bed during the period of egg incubation.

4. Proposed Monitoring Plan

AEM is committed to monitor blast vibrations with Instantel seismograph monitoring devices to be installed as indicated by the manufacturer at the same location every blast. Note that 2 stations per abutment are suggested depending on which side of the centerline the blast are occurring. Those locations are to be in a representative area on the shoreline and outside the footprint of dike construction . Refer to appendix A for proposed locations of STA-W1, STA-W2, STA-E1 and STA-E2. Such practices are consistent with the current application of the license at Meadowbank.

After each blast, the recorded values shall be analyzed and documented by competent personal and adjustments on the next blasting sequences shall be brought forward should the vibration limits exceed the guidelines presented in section 3.

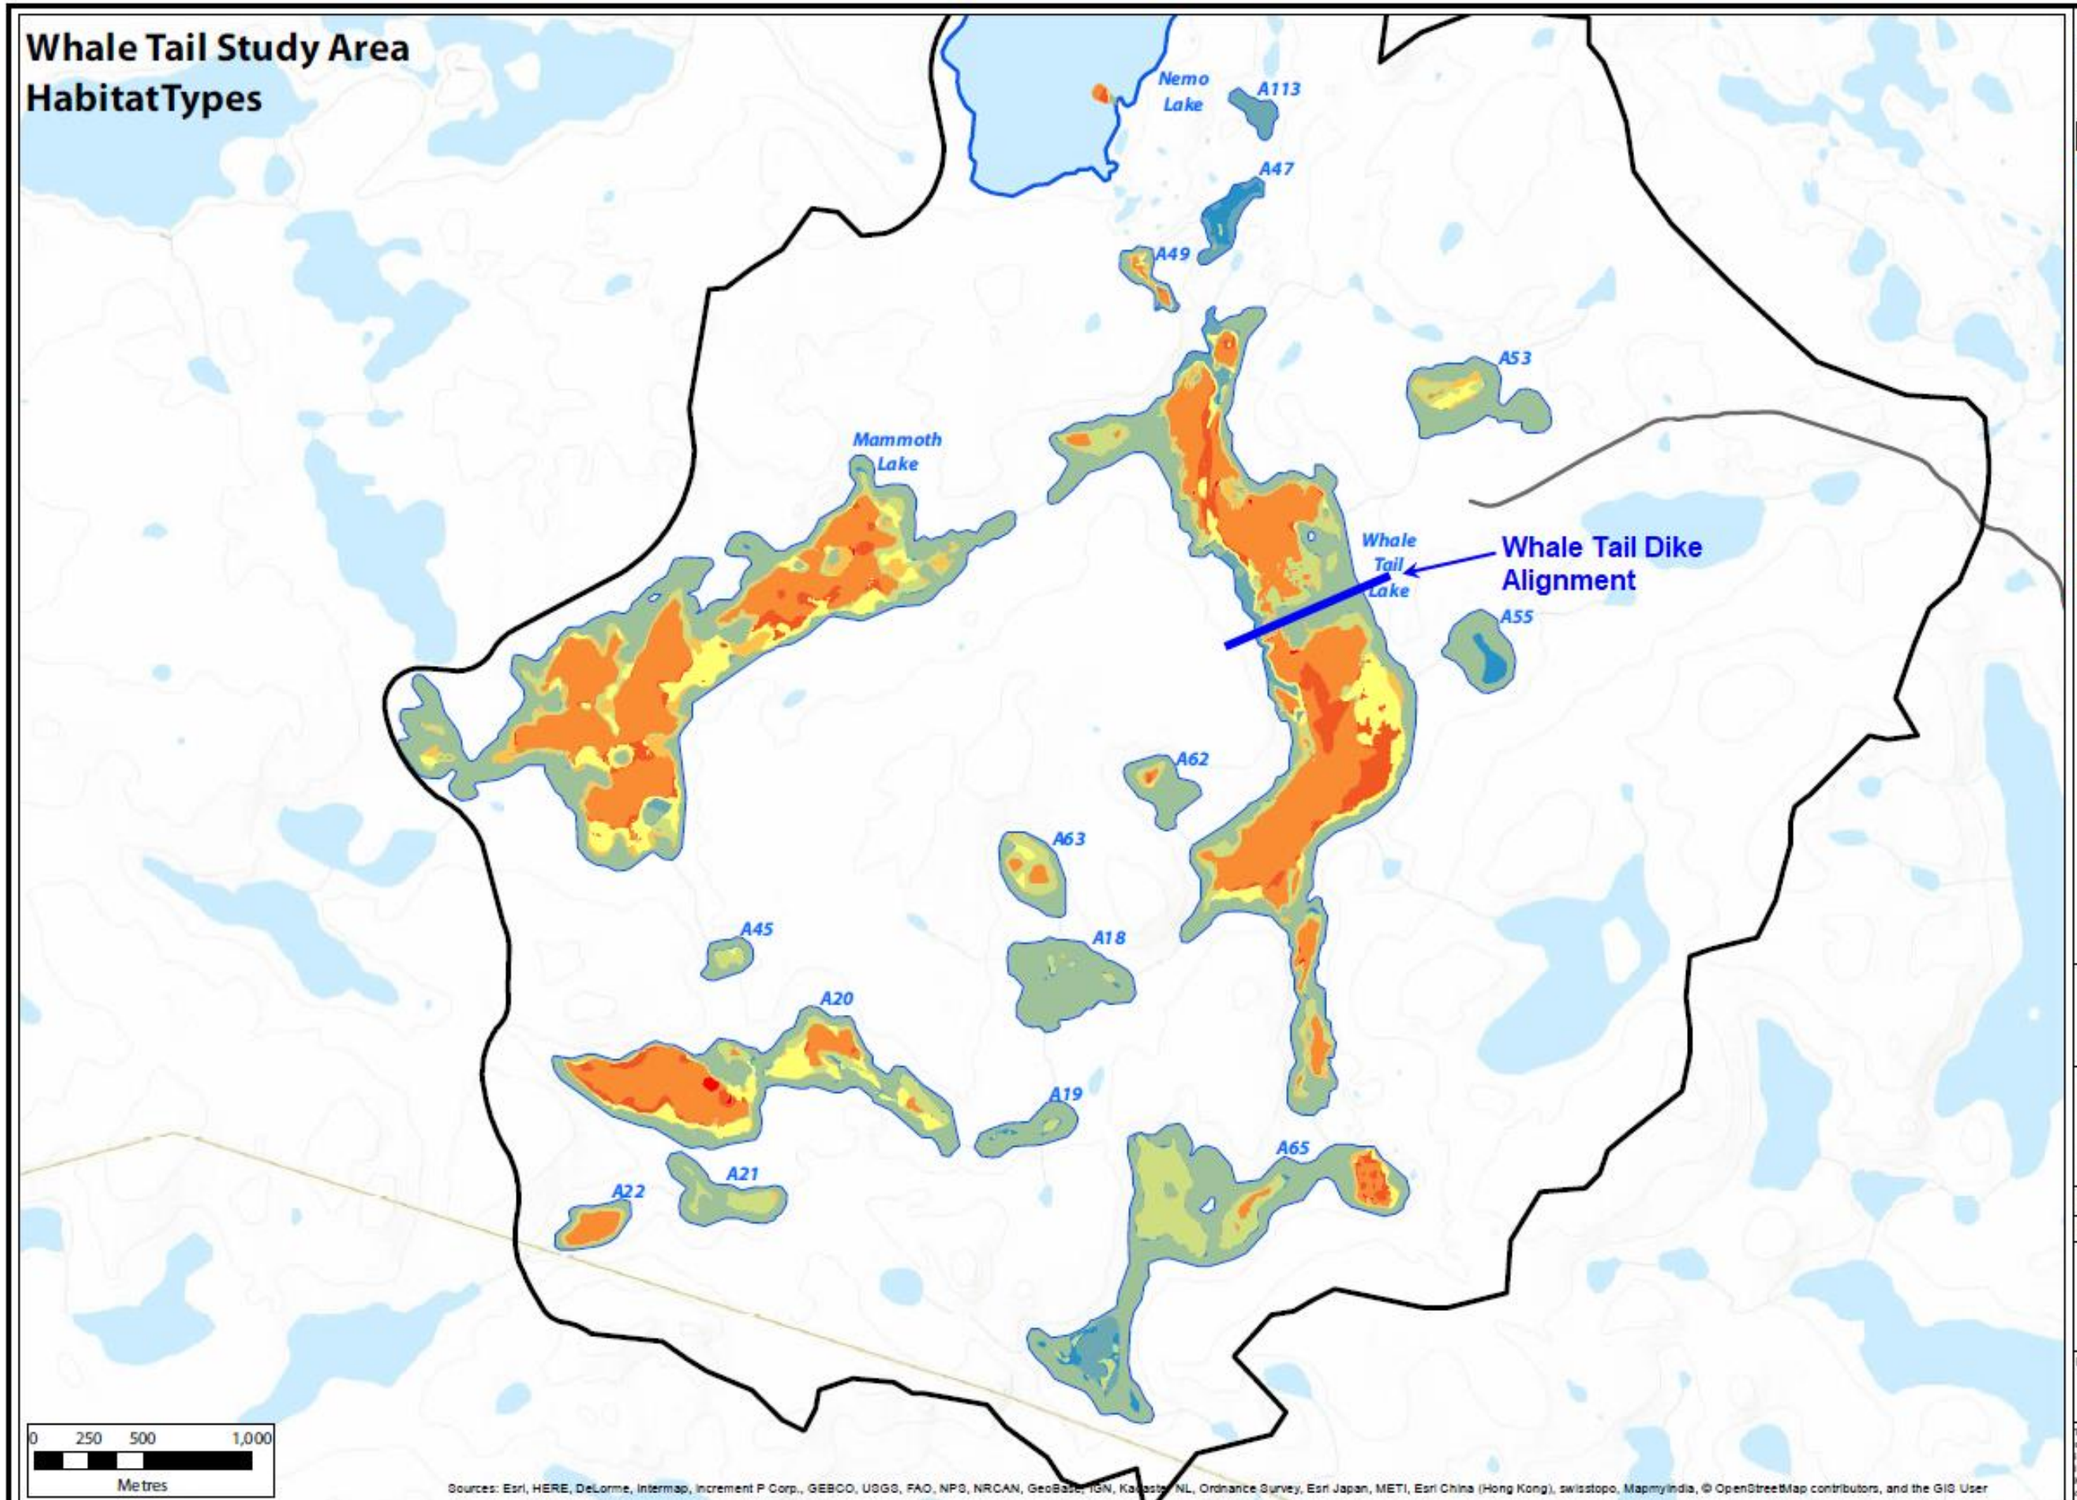
5. Potential mitigation measures



AEM has identified a handful of potential mitigation measures that could be applied in Drill & Blast practices in order to comply with the above mentioned DFO guidelines. Those are developped from a combination of literature and past experiences at Meadowbank that have proven to be successful, namely:

- This document will be reviewed by all parties involved in the D&B activities ;
- Drill on small diameters hole as low as 3" to limit vibrations ;
- The explosive charge in each hole (powder factor) shall be reduced to the minimum judged practical in the design phase of the blast ;

- Number of holes blasting per delay shall be reduced to a minimum as much as practical in the tying plan produced by the D&B engineer to limit vibrations ;
- The blasting area will be broken down to small blast patterns to be blasted in a sequential manner.
- The blaster will perform a visual inspection of the area around the blast after each blast and remove any shock tubes or detonators close to the shoreline. If visual inspection reseals blasting accessories in the water, the blaster will advice the Geotechnical engineer so that the material is removed by boat via appropriate procedures ;
- Every hole will be backfilled with angular gravel as per current AEM practices ;
- The explosive used will be emulsion which is not water soluble.
- In the event where projections are judged problematic, blasting mats or geotextile could be applied over the whole blasting sequence with an appropriate amount of aggregates over it in such a way that the energy is kept in the rock mass as opposed to sending projections and deleterious blasting material in the air.



Additionally, AEM's D&B engineers have performed calculations as presented in Appendix II & III of the DFO's guidelines document to find the maximum setback distance from the shoreline to avoid a pressure on fish bladders exceeding 100kpa as per criteria number 8 and to have vibrations limit not exceeding 13 $mm*s^{-1}$ in spawning beds for criteria number 9. Furthermore, appendix B below presents the fish habitats type and it can be seen that the Whale Tail Dike's alignment and proposed blasting areas on the East and West abutments are in a low risk zone and more than 100m away from the critical areas. Nevertheless, AEM is committed to respect the criteria directed by DFO's Guidelines for Use of Explosives in or Near Canadian Fisheries Waters.

Freshet Action Plan, Version 1

AGNICO EAGLE

MEADOWBANK GOLD MINE

FRESHET ACTION AND INCIDENT RESPONSE PLAN

WHALE TAIL PROJECT

MARCH 2019

VERSION 1

EXECUTIVE SUMMARY

The purpose of this Action and Response Plan is to identify areas of concern around the Whale Tail Pit mine site and the associated Hauling road that need to be managed in an organized and timely manner during the annual freshet period to prevent adverse environmental and operational impacts. The Incident Response section of the Plan outlines any future incidents that have the potential to affect off site water or land will be added and would include any specific mitigation and monitoring actions.

The freshet period typically occurs during the annual snow and ice melt sometime around mid-May and extends until the end of July. During this period excess water is created and must be managed through additional pumping and management practices at vulnerable areas around the site. Mitigation techniques, timeframes and specified roles and responsibilities are outlined in this document for each area of concern.

The main areas of concern are the mining pit and pit wall.

It is important that all dewatering and associated infrastructure be in good working order and adequate to manage the expected water flows associated with the freshet period; this includes but is not limited to pumps, ditch, culvert and sump maintenance, critical piping system installation and inspection, adequate resource allocation for preparative work and establishing a viable monitoring program for the areas of concern and incident response locations. A summary of the 2019 preparation works and roles and responsibilities is presented in the attached Appendix 1 (2019 Freshet Action Plan Procedures). Appendix 1 will be updated yearly to reflect changes in conditions at the Whale Tail site. .

Appendix 1 - 2019 Freshet Action Plan Procedure

1 INTRODUCTION

The purpose of this Whale Tail (WT) Freshet Action and Incident Response Plan is to ensure that Agnico can address and manage excess water associated with the freshet season at the Whale Tail site and to ensure Agnico has implemented specific management and mitigation measures in response to environmental incidents with potential for off site impacts to water or land.

The freshet season is loosely defined as being a period of time from approximately May 15 – July 30; in some cases this period of time can extend up to early fall when freezing re-occurs (October 15). There are many areas around the site that are vulnerable to this excess water; the goal is to identify these areas and develop a clear plan with defined roles and responsibilities (among Agnico Departments), and to manage the freshet flows.

In addition, several guiding principles are applicable to the formation of this plan. The highest priority principles are:

1) to ensure that mine contact water from runoff or seepage is managed to prevent adverse environmental impacts;
2) to ensure that the health and safety of Agnico employees is protected, especially with respect to mining operations when excess water is present; and
3) to make sure the site is in compliance with the Nunavut Water Board (NWB) License, Part D, Item 21 and Part E, Item 11.

The plan will identify the areas of concern and discuss the potential risks as well as mitigation measures necessary to address the identified issues. An adaptive strategy had been designed at the Whale Tail site to ensure sufficient mitigation measured are in place to prevent potential issues. The overall site footprint has increased and experience needs to be gained in indenfying key location; lessons learned from the Meadowbank site will provide the necessary guidance. Appendix 1 contains the defined 2019 procedures, the roles and responsibilities and associated timelines. Agnico's intent is to update the Procedural Appendix on a yearly basis. For example, there may be additional mitigation measures for a defined problem area or in some cases a previously defined issue may be permanently rectified.

The main areas of concern are:

- Mining pits and pit walls;
- WRF pond;
- A53 pond;
- East channel;;
- North-East dike;
- Attenuation pond;
- WT Tank farm;
- Haul road culverts and bridges.

Each area identified above will be discussed in detail below. All areas of concern are considered priorities based on the guiding principles.

2 AREAS OF CONCERN

2.1 SITE MAPS

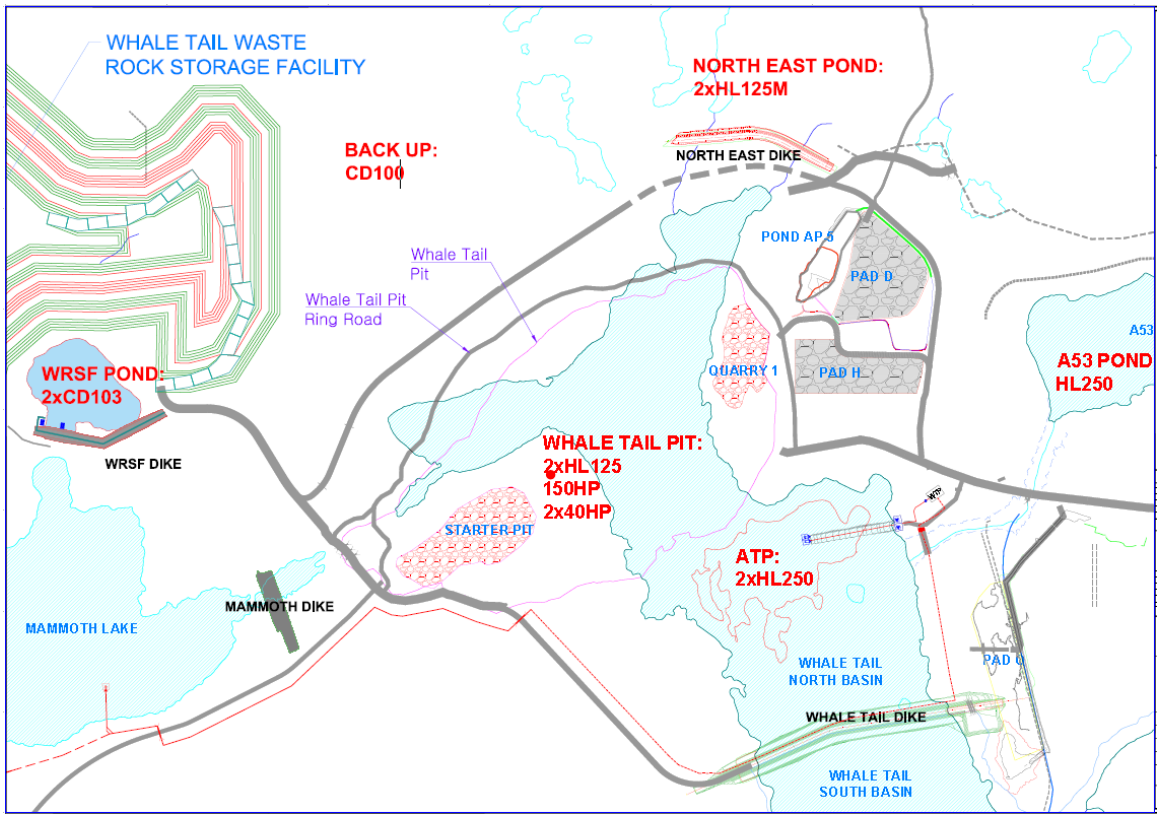

Figure 2-1: View of Whale Tail area with the associated pumps and trenches

2.2 MINING PITS AND PIT WALLS

All permanent ramps, jump ramps, ditches and sumps must be cleaned of all ice and snow before May in order to contain any water resulting from the snow melt. All pumps must be checked and serviced before the month of May. In addition, a check must be completed confirming that all piping systems starting from the different pits leading to the Whale Tail attenuation pond are free of ice by validating pumping values (if pumping systems are active) and/or performing an air test in the pipe with a compressor.

Water management in the Whale Tail pit has been simplified since the mining is it's early sequences of operation.

- A pond and ditch system is planned in the pit. Runoff water accumulated in this pond will be pumped into the attenuation pond. Infrastructures might be modified or added within the actual trench and sumps footprint in such a way to prevent water from ponding against the pit crest;

2.3 WHALE TAIL ROCK STORAGE FACILITY

The Whale Tail Rock Storage Facility (RSF) will require weekly inspections around the perimeter beginning as soon as the freshet starts (May) until freeze up to identify any seepage. In the event that seepage is observed from the RSF, it must be reported to the Engineering and Environment Departments and samples must be taken to determine the water quality and source. A mitigation plan will be prepared and implemented if necessary. A sump is located at the toe of the RSF and water will be pumped to the WT Attenuation pond when required.

2.4 A53 LAKE

Water management around A53 will required regular inspection to ensure impacts are limited, to maintain integrity of structure and to prevent any adverse environmental impacts. Inlfows of water will be monitored for the lake immediate watershed to ensure, erosion and sediments are not impacting the waterbody.

2.5 EAST CHANNEL

The east channel structure is planned to be built subsequently to the 2019 freshet season and therefore water will be management by maintaining a pumping strategy from it's planned source (lake A53), ensuring that water from upstream won't impact surrounding water bodies by erosion and TSS.

2.6 NORTH-EAST DIKE

Water collecting at North-East Dike will be managed according by letting water raise behind the dike thus redirecting the non-contact water naturally towards Nemo lake. A pumping strategy could also be used to ensure no impacts are directed towards Nemo Lake if erosion and dike stability are affected depending on water quality and quantities observed around the area.

2.7 ATTENUATION POND

Water from the WT Attenuation pond will be management as contact water and treated, if necessary, through the AsWTP and the water discharged towards Mammoth Lake. Representing the main water collection structure in 2019, the attenuation water levels will be managed closely and be inspected regularly at freshet.

Discharge from the WT attenuation pond to Mammoth Lake may require treatment at the AsWTP if the water quality did not meet discharge criteria, Water License and MDMER criteria, for the Attenuation Pond discharge. The Actiflo treatment plant was designed to remove TSS and arsenic. All piping and the discharge diffuser must be inspected in April in order to have all installations in place to proceed with pumping and/or treatment activities during freshet.

2.8 WHALE TAIL FUEL TANK FARMS

The main fuel fuel farm constainment is in the process of being built and will be monitored at freshet. Snow and ice accumulation within the fuel tank farm must be adequately managed to prevent overflow to the environment and/or damage to the fuel handling systems. The Energy and Infrastructure Department will advise the Environmental Department of their intent to pump the containment area once ice/snow begins to melt. Water samples will be taken in accordance with the Water License to ensure compliance prior to its release. A notice must be provided to the Inspector 10 days prior to this pumping activity. Once sample results have been obtained, the Environmental Department will advise the Energy and Infrastructure Department if pumping can begin. If sample results permit, the pumping may begin; to direct water to the tundra/ground in a way to prevent erosion. In the event that the water sample results do not meet discharge criteria the water could be trucked in a tanker and transported to the Meadowbank site to be disposed of in the TSF or placed in containers for shipment south as hazmat.

2.9 HAUL ROAD CULVERTS AND BRIDGES

Daily and Weekly inspections will be undertaken starting in May at all culverts along the Haul road to ensure that water during freshet is flowing freely and no erosion is occurring. If elevated TSS/Turbidity levels are observed sampling will occur and the results assessed. Turbidity barrier will be installed if required. The Energy and Infrastructure department will also be advised if severe erosion/scouring is observed. In addition snow and ice removal may be required to allow the water to flow as per design specifications. Daily inspections will be performed during the freshet period by the Environment department.

3 INCIDENT RESPONSE

No incidents require a specific response plan to be impleted for the Whale Tail site at this moment.

4 SNOW MANAGEMENT

Similarly to the Meadowbank site, a snow management procedure has been developed internally in 2018 and will be updated annually. Temporary snow storage dumps and snow accumulation areas of concern were identified on a map. Removal will be managed accordingly.

APPENDIX 1

2019 Freshet Action Plan Procedure

Section	Area of Concern	Role/Action	Responsbilities	Dates
2.1	**Mining Pits and Pit Walls**			
2.1	Mining Pit and Pit walls - General	1) Clean all ice, mud and snow on all permanent ramps, jump ramps, etc.	Mine Operations	Before May
		2) Check and service all pumps.	E&I (Energy and Infrastructure) and Maintenance	Before May
		3) Check that all piping systems starting from the pit leading to the Attenuation pond are free of ice by validating pumping values (if pumping systems is active) and/or performing an air test in the pipe with a compressor.	E&I	Before May
2.2	**WASTE ROCK STORAGE FACILITY**			
2.2.	WT RSF Inspection	1) Weekly inspection around the RSF perimeter to identify any seepage.	Env. Department	May - as soon as freshet starts until freeze up
		2) If seepage observed notify Eng and Env Department AND sample for Water License Parameters.	Env. Department	May - as soon as freshet starts until freeze up

2.3	**A53**			
2.3	A53	1) Daily inspection - keep record	Env. Department	May - until Freshet complete and after rain events
		2) Install turbidity barriers, if needed (elevated TSS observed), and maintain	Env. Department	May - until freshet complete and after rain events
		3) Sample monitoring for TSS, if excess turbidity observed - use external lab.	Env. Department	May - until freshet complete and after rain events
		4) Report any discharge of TSS to ECCC/NWB (if grab > 30 mg/L).	Env. Department	May - until freshet complete and after rain events
2.4	**East Channel**			
2.4	A53 to East channel	1) Daily inspection - keep record	Env. Department	May - until Freshet complete and after rain events
		2) Install turbidity barriers, if needed (elevated TSS observed), and maintain	Env. Department	May - until freshet complete and after rain events

		3) Sample monitoring for TSS, if excess turbidity observed - use external lab.	Env. Department	May - until freshet complete and after rain events
		4) Report any discharge of TSS to A56 to ECCC/NWB (if grab > 30 mg/L).	Env. Department	May - until freshet complete and after rain events
2.5	**North-East dike**			
2.5	North-East dike flow to Nemo	1) Daily inspection - keep record	Env. Department	May - until Freshet complete and after rain events
		2) Install turbidity barriers, if needed (elevated TSS observed), and maintain	Env. Department	May - until freshet complete and after rain events
		3) Sample monitoring for TSS, if excess turbidity observed - use external lab.	Env. Department	May - until freshet complete and after rain events
		4) Report any discharge of TSS to Nemo Tail to ECCC/NWB (if grab > 30 mg/L).	Env. Department	May - until freshet complete and after rain events

2.6	**WT Attenuation pond**		
2.6 WT Attenuation Pond	1) During the freshet period water management consists of making sure all sumps are pumped to the Attenuation Pond.	Mine Operations	May to Sept
	2) Set-up pumping Attenuation Pond to prevent water from flowing into the pit area.	Mine Operations	May
	3) Notify Environmental Department before discharging any water to Mammoth Lake. **NOTE: Any discharge of contact water must be through the Diffuser.**	Engineering	Freshet/Summer 2019
	4) Inspect all piping and discharge diffuser	E&I	May
2.7	**FUEL TANK FARMS**		
2.7 WT Tank Farm	1) E&I Dept to advise Env Dept in advance of intent to pump once ice melts in containment area.	E&I and Env. Department	Probably mid-June and September
	2) Sample water in accordance with Water License to ensure compliance with limits prior to release.	Env. Department	Probably mid-June and September
	3) Provide notice to Inspector 10 days prior to pumping.	Env. Department	Probably mid-June and September

		4) Advise Energy and Infrastructure Dept if pumping can begin based on sample results.	Env. Department	Probably mid-June and September
		5) Pump to tundra/ground or Meadowbank TSF. **NOTE: The water cannot be pumped out to the tundra if it does not meet the Water License criteria.**	E&I	Probably mid-June and September
2.8	**HAUL ROAD CULVERTS AND BRIDGES**			
2.8	Culverts and bridges	1) Weekly inspection of culverts along the haul road.	Env. Department	May
		2) Sample for TSS and Turbidity if elevated TSS observed.	Env. Department	May - until freeze up
		3) Notify E&I Dept if severe erosion/scouring observed - for repair action.	Env. Department	May - until freeze up
		4) Install turbidity barriers if required.	Env. Department	May - until freeze up
2.9	**INCIDENT RESPONSE**			
	To be determined			

MEADOWBANK GOLD PROJECT & WHALE TAIL PROJECT (COMBINED)

Air Quality and Dustfall Monitoring Plan, Version 4

MEADOWBANK OPERATIONS
(Meadowbank Gold Project & Whale Tail Pit Project)

Air Quality and Dustfall Monitoring Plan

In Accordance with:
NIRB Project Certificate Terms and Conditions No.004 and No. 008

Prepared by:
Agnico Eagle Mines Limited – Meadowbank Division

Version 4
March 2019

EXECUTIVE SUMMARY

General Information

The Air Quality and Dustfall Monitoring Plan (AQDMP) describes the design features and operational procedures for the monitoring of air quality and dustfall at the Meadowbank Gold Project and Whale Tail Pit Project sites.

Annual Review

The AQDMP will be reviewed and updated regularly if necessary. Completion of the review of the AQDMP will be documented through signatures of the personnel responsible for reviewing, updating and approving the AQDMP.

Record of Changes

A record will document all significant changes that have been incorporated in the AQDMP subsequent to the latest review. The record will include the names of the persons who made and approved the change, as well as the date of the approval.

Distribution List

Agnico Eagle Mines Limited (Agnico Eagle) will maintain a distribution list for the AQDMP providing information about all parties that receive the plan.

IMPLEMENTATION SCHEDULE

The proposed implementation schedule for this Plan is effective immediately (March 2019) subject to any modifications proposed by the NIRB as a result of the review and approval process.

DISTRIBUTION LIST

Agnico Eagle - Environmental Superintendent

Agnico Eagle – Environmental General Supervisor

Agnico Eagle – Environmental Coordinator (s)

DOCUMENT CONTROL

1 INTRODUCTION

1.1 OBJECTIVES

In accordance with Nunavut Impact Review Board Project Certificates No.004 and No.008, the objective of this program is to monitor ambient air quality and dustfall at the Meadowbank and Whale Tail Pit mine site perimeters and roads, with the goals of verifying compliance with applicable standards, and mitigating potential environmental effects. The parameters to be measured are suspended particulates (TSP, PM_{10}, $PM_{2.5}$), NO_2 and dustfall (settleable particulate matter).

1.2 MONITORING LOCATIONS

The initial monitoring locations were determined in consultation with Environment Canada in 2011. One station (DF-4) was moved in 2012 due to changes in the location of the Vault Road (see Section 1.2.4).

In 2012, dustfall transects were added at kilometer's 18 and 78 along the All-Weather Access Road (AWAR) between Baker Lake and the Meadowbank Mine.

Station DF-5 was installed in 2018 but the monitoring at this station will begin only in 2019. Dustfall transects at approximately kilometers 18, 36, and 54 along the WTHR was added in 2018.. The new monitoring locations were selected in consultation with Environment and Climate Change Canada, and in accordance with terms and conditions associated with the development of the Whale Tail Pit Project.

UTM coordinates are provided in Table 1, and locations are shown in relation to Baker Lake, the Meadowbank Mine, and the Whale Tail Pit in Figure 1.

1.2.1 DF-1

Station DF-1 is located next to the explosive storage area (emulsion plant), and approximately 500 m north of the all-weather access road. TSP, PM_{10}, $PM_{2.5}$, NO_2 and dustfall are monitored at this location.

1.2.2 DF-2

Station DF-2 is located at the northern corner of South Camp Island, near the TCG contractor area. TSP, PM_{10}, $PM_{2.5}$, NO_2 and dustfall are monitored at this location.

1.2.3 DF-3

Station DF-3 is approximately 1,800 m east of the East Dike. Second Portage Lake is to the west and east. Dustfall only is monitored at this location.

1.2.4 DF-4

Station DF-4 was approximately 1,500 m southwest of the future location of Vault Pit. This monitoring station was installed before the construction of the Vault Road. Realignment of the road during

construction placed the station within 10 feet of the road. Therefore, Agnico Eagle re-positioned Station DF-4 approximately 480 m to the north-west on February 29, 2012 to be representative of the originally intended location relative to the road. Dustfall only is monitored at this location.

1.2.5 AWAR: KM-18 and KM-78

Dustfall transects were established in 2012 at kilometers 18 and 78 along the Baker Lake to Meadowbank Mine AWAR. Dustfall samples are collected annually from mid-August to mid-September. Transects include stations at 25 m, 100 m, 300 m and 1000 m from the road on both sides (east/downwind and west/upwind). The purpose of these temporary monitoring stations were to evaluate dust mitigation measures (AEM 2017) and to validate recent model predictions of fugitive dust in support of the Whale Tail Pit and Haul Road (AEM 2016).

In 2019, Agnico will conduct a study to put in application the recommendation from ECCC saying that the installation of canisters at ground level and not on 1.5-2m poles is not a common practice. The study will first consist of the review of the following documents of reference cited by ECCC:

1. Standard test method for collection and measurement of dustfall (settleable particulate matter) - ASTM 2017

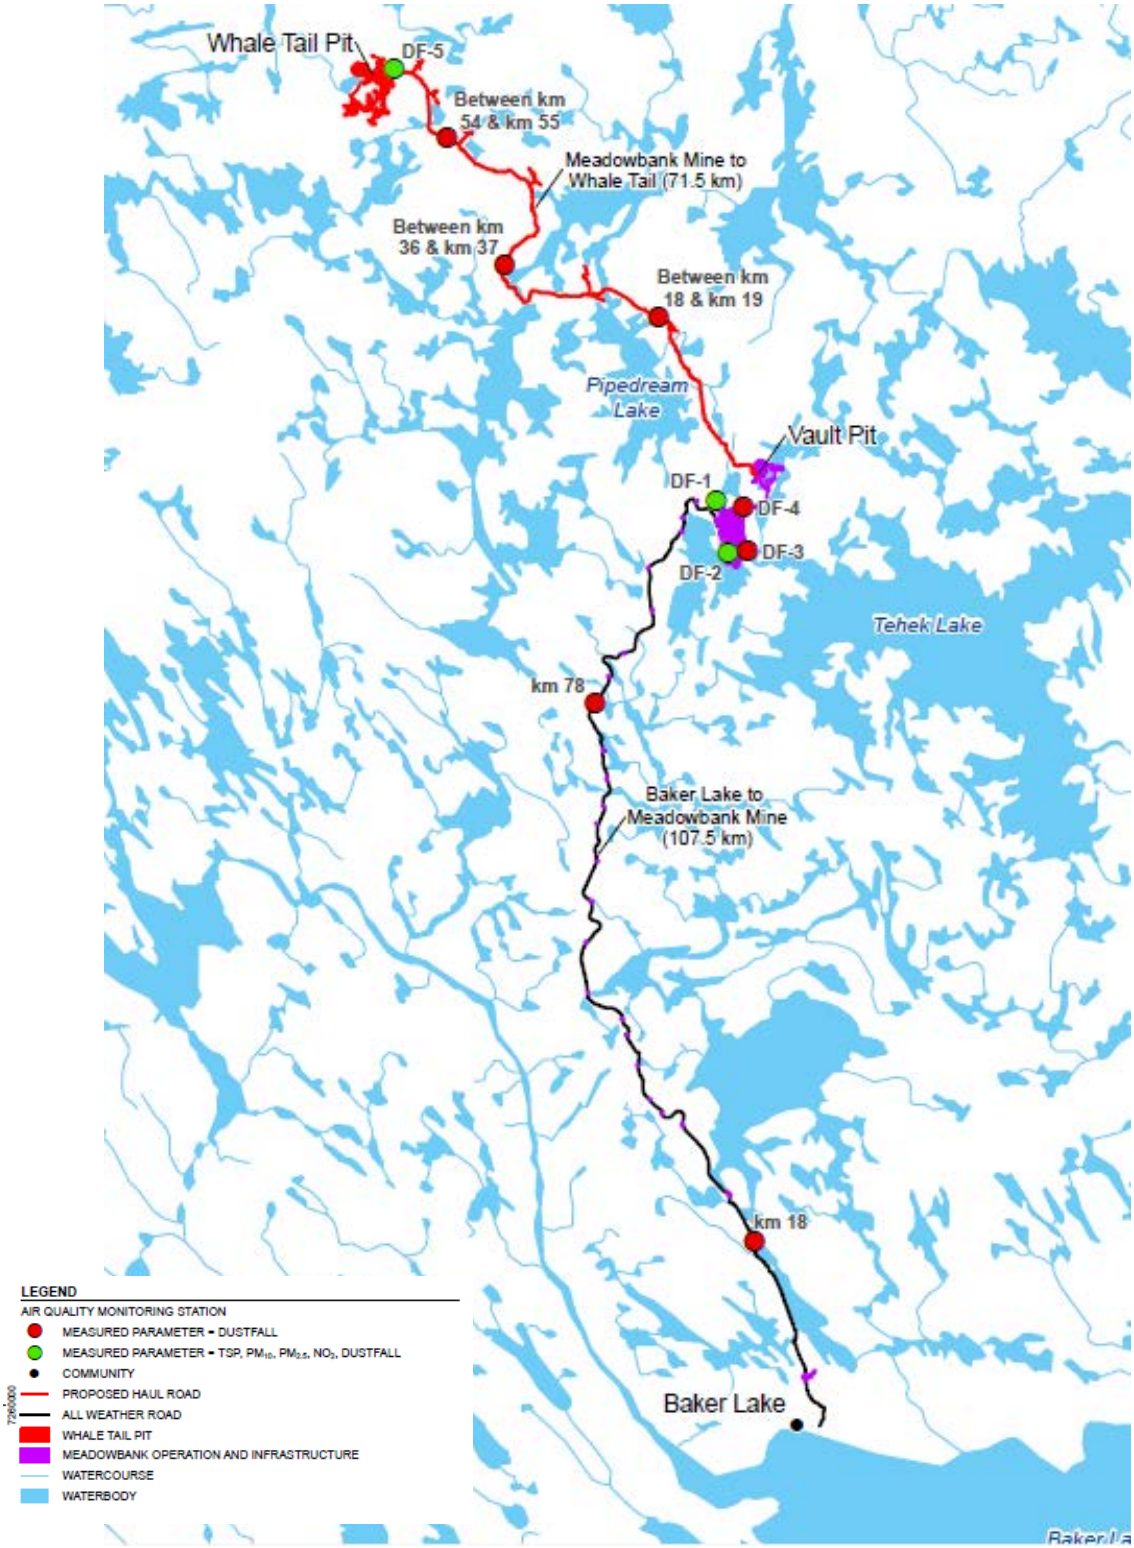
2. Ontario's manual for air quality monitoring: https://dr6j45jk9xcmk.cloudfront.net/documents/1466/3-7-32-manual-for-air-quality-monitoring-en.pdf

3. US EPA Quality Assurance Handbook for Air Pollution Measurement Systems Volume II: Ambient Air Quality Monitoring Program: https://nepis.epa.gov/Exe/ZyPDF.cgi/P100FUYK.PDF?Dockey=P100FUYK.PDF

Agnico will then determine the best method to comply with these reference documents to confirm confirm that dustfall rates measured at ground level continue to align with those measured on stands. The study will probably consist of the installation of canisters on elevated poles in one of the established transect along the AWAR. Canisters will also be installed on the ground at the same location, as in previous years, and a comparison on both methods will be assessed. Result of the study will be provided in subsequent annual report along with sampling method and mitigation measure that will be adopted.

1.2.6 DF-5

Station DF-5 (Figure 1) will be sited with the communications tower on the eastern boundary of the Whale Tail Pit in an area predicted to receive elevated concentrations of particulate matter (TSP, PM_{10} and $PM_{2.5}$) and NO_2 relative to concentrations predicted further from the project footprint. Monitoring at DF-5 will include TSP, PM_{10}, $PM_{2.5}$, passive NO_2, and dustfall.



1.2.7 WTHR: KM-18, KM-36 and KM-54

Dustfall transects will be established between kilometers 18 & 19, 36 & 37, and 54 & 55 along the Whale Tail Haul Road (WTHR). Dustfall samples will be collected annually from mid-August to mid-September. The transects will include stations at 25 m (upwind east/north), 100 m, 300 m and 1000 m (downwind west/south) of the haul road.

Table 1: UTM Coordinates for the Meadowbank and Whale Tail Air Quality and Dustfall Monitoring Locations

Monitoring Locations	Measured Preferences	Easting	Northing
DF-1	TSP, PM_{10}, $PM_{2.5}$, NO_2, dustfall	636850	7217663
DF-2	TSP, PM_{10}, $PM_{2.5}$, NO_2, dustfall	637895	7213049
DF-3	Dustfall	639599	7213198
DF-4	Dustfall	639233	7217074
AWAR KM-18	Dustfall	640208	7152082
AWAR KM-78	Dustfall	626155	7199739
DF-5	TSP, PM_{10}, $PM_{2.5}$, passive NO_2, dustfall	608301	7255973
WTHR KM-18	Dustfall	630941	7234375
WTHR KM-36	Dustfall	618132	7238621
WTHR KM-54	Dustfall	613782	7249508

Figure 1: Meadowbank and Whale Tail Air Quality and Dustfall Monitoring Locations

2 METHODS

2.1 TSP, PM_{10}, $PM_{2.5}$

Suspended particulate matter will be generated by wind erosion of local landscapes, movement of vehicles/equipment, airstrip activities, construction activities, the combustion of diesel fuel, and solid waste incineration.

The monitoring program for suspended particulates will utilize Partisol Model 2025 sequential air samplers (single and dichotomous units) installed at two locations to measure:

- Total suspended particulates (TSP) – particulate matter less than 100 µm;
- PM_{10} – particulate matter less than 10 µm; and
- $PM_{2.5}$ – particulate matter less than 2.5 µm.

Partisol samplers operate on the principle that a stream of ambient air at a controlled flow rate is drawn through a size-selective inlet and then through a pre-weighed filter for a pre-determined time period. The exposed filter is shipped to a laboratory where it is re-weighed. The concentrations can be determined using the measured volume of air and the weight difference between the pre-weighed and exposed filter. The U.S. EPA has described standard methods for collection of PM air samples in section 40 CFR part 53 and 58 of the U.S. Code of federal Regulations (U.S. CFR, 1997a, 1997b, 1997c,).

The monitoring of TSP, PM_{10}, and $PM_{2.5}$ concentrations will be carried out according to the National Air Pollution Surveillance (NAPS) schedule. This schedule follows a monitoring cycle where a single 24-hour sample is collected every sixth day. Sampling in accordance with the NAPS schedule will provide consistency between the Meadowbank particulate monitoring stations and stations at the other facilities across the country. In addition, by operating stations on a six-day cycle, different days are sampled each week, which allows for the monitoring of differing production intensities or other variations. Monitoring of TSP and fine particulate matter will continue throughout the operations and closure phases of the Project.

Particulate sampling will be conducted year-round using the Partisol instruments' automated sampling function. However, sampling during extreme winter conditions (-20 degrees Celsius [°C] and colder with the potential for blowing snow) which frequently occur during winter months, allows the possibility for snow to be drawn through the inlet, resulting in a void sample and possible damage to the electronic components of the sampler. A small amount of data loss is expected during the winter as ambient conditions exceed the normal operating range expected for the equipment being used. Climate-controlled shelters are used to minimize those issues.

The collection of TSP provides a measure of airborne dust or dirt, which may present environmental issues such as reduced visibility, while $PM_{2.5}$ and PM_{10} (fine and coarse particulates) are regulated based on health-related concerns. TSP and $PM_{2.5}$ are subject to GN ambient air quality standards (GN, 2011). No standard is provided for PM_{10} in Nunavut, so these results will be compared to the BC air quality objective (BC, 2013) – see Section 3.

For comparison to Government of Nunavut Ambient Air Quality Standards (GN, 2011), concentrations of particulates must be calculated as:

$$C = M/V_{STD}$$

Where:

C = mass concentration of particulates ($\mu g/m^3$)

M = final mass of filter – initial mass of filter (μg)

V_{STD} = volume of air drawn in during the sampling period, normalized to 25°C and 101.3kPA (standard temperature and pressure; STP)

The Partisol instrument will be set to calculate and store the V_{STD} value for each filter.

2.2 DUSTFALL

Dustfall collection is a passive program that provides a measure of particulate deposition in the vicinity of the Project. The main dust generation processes at Meadowbank and Whale Tail are wind erosion of site structures (e.g. the Rock Storage Facility), and fugitive sources from open pit mining, rock crushing and movement of vehicles/equipment/air traffic on site.

Dustfall is collected over monthly periods in open vessels containing a purified liquid matrix, supplied by an external accredited laboratory. Particles are deposited and retained in the liquid, which is then analyzed by the accredited laboratory for total and fixed (non-combustible) dustfall. Calculated dustfall rates are normalized to 30 days (mg/cm^2/30 days). Sampling is conducted over this period to allow for a sufficient sample size for analysis, and as a result it provides an indication of longer-term air quality trends.

The analysis of the fixed dustfall sampling results will include comparison with Alberta Environment's objectives since neither Nunavut nor the NWT have dustfall standards or guidelines (see Section 3).

2.3 NO_2

Concentrations of NO_2 by volume (ppb) are analyzed at two locations over monthly periods using a passive sampling device provided by an external accredited laboratory. No continuous monitoring is proposed for other gaseous pollutants because of low concentrations predicted by air quality dispersion modeling for Meadowbank (Cumberland, 2005) and the Whale Tail Pit (Agnico Eagle 2016).

The passive NO_2 monitoring stations are co-located with dustfall stations to allow for the efficient collection of samples and the calculation of ambient secondary particulate (nitrate) concentrations (should this information be required at a later date).

The annual average NO_2 concentration by volume is calculated from the monthly data for comparison against the relevant standard.

2.4 WEATHER DATA

Weather data for the dustfall and air quality monitoring plan is collected using the Meadowbank and Whale Tail Pit permanent climate station. Daily averages for wind speed, wind direction and temperature are available from this station (see Meteorological Monitoring Plan).

2.5 GREENHOUSE GAS EMISSIONS

Agnico Eagle is required by the Greenhouse Gas Emissions Reporting Program (GHGRP) to track greenhouse gas emissions based on annual fuel consumption, composition and the US EPA's AP-42 emission factors. Please see the Meadowbank and Whale Tail Greenhouse Gas Reduction Plan.

2.6 QUALITY ASSURANCE/QUALITY CONTROL PROCEDURES

Agnico Eagle will ensure that monitoring is conducted in accordance with the sampling reference methodology. In addition to standardized quality assurance/quality control requirements, such as instrument calibration, leak checks, review of data, and proper labeling of all sampling containers, field audits of Partisol samplers will be performed in accordance, where possible, with the Partisol Sampler Operating Manual, "Section 6 – Operations". See Section 4 for a detailed description of instrument management. Filters and dustfall samplers will be supplied and analyzed by a CALA-accredited external laboratory.

3 DATA ANALYSIS

3.1 REGULATORY STANDARDS

Data collected from the air quality and dustfall monitoring program at Meadowbank and Whale Tail are compared to the applicable Government of Nunavut Environmental Standards for Ambient Air Quality (October, 2011). Standards for the measured parameters are provided in Table 2.

Table 2: Government of Nunavut Environmental Standards for Ambient Air Quality (October, 2011) for the parameters of concern at Meadowbank and Whale Tail

Parameter	Time Frame	Standard	
		µg/m^3	ppb
Fine Particulate Matter ($PM_{2.5}$)	24-h average	30	
Total Suspended Particulate (TSP)	24-h average	120	
	Annual geometric mean	60	
Nitrogen Dioxide (NO_2)	1-h average	400	213
	24-h average	200	106
	Annual arithmetic mean	60	32

Note: All values are for data normalized to standard conditions of 25°C and 101.3 kPa.

No PM_{10} standard is yet available for coarse particulate matter (PM_{10}), so results will be compared to the BC Air Quality Objective (August, 2013) of 50 µg/m^3.

Comparison to Canadian Ambient Air Quality Standards (CAAQS) for Fine Particulate Matter (PM2.5) is also done (28 µg/m^3 for the 24-h)

Likewise, no standards for dustfall are available for Nunavut. Results of the dustfall analysis will be compared to the Alberta Environment Department recreational area guideline of 0.53mg/cm^2/30d, to provide context.

3.2 ANNUAL TRENDS

In addition, annual and year-over-year trends will be assessed, and results will be discussed in the context of mine site activity.

3.3 REPORTING

Agnico Eagle will provide an annual air quality and dustfall monitoring report that summarizes the collected data. In addition, Agnico Eagle will report annual emission estimates to the NPRI and GHG emissions to the appropriate federal program.

Annual monitoring reports will include the following:

- Description of the monitoring programs;

- Description of mitigation efforts undertaken in the previous year;
- Monitoring locations;
- Instrumentation;
- Weather conditions during sample collection;
- Time and duration of monitoring, including dates;
- Partisol sampler inspection reports;
- Relevant standards/guidelines;
- Results of monitoring (raw and averaged as appropriate for comparison to standards);Comparison of results to FEIS;
- Emission tracking data for greenhouse gases based on annual fuel consumption, composition, and AP-42 emission factors;
- Comparison of results to relevant standards, analysis of annual and year-over-year trends, and comparison to estimates in EIA dispersion modeling;
- Discussion of results, including possible reasons for non-compliance with standards; and
- Mitigation measures for reducing non-compliance incidents in the future.

4 OPERATION AND MAINTENANCE

4.1 MANAGEMENT RESPONSIBILITY

Agnico Eagle will be responsible for managing and operating the stations. Operation and monitoring of the stations will come under the responsibility of the Environment Superintendent. Designation of training requirements is the responsibility of Meadowbank Environment Department.

4.2 OPERATION

The Environment Department will be responsible to ensure that the Partisol samplers are operated in accordance with the equipment operating manual and that samples will be collected by appropriately trained personnel consistent with detailed written operating instructions from qualified personnel (i.e. air quality specialist familiar with the equipment). An SOP will be kept up to date and communicated to personnel. It will also ensure that proper QAQC practices are followed.

4.3 MAINTENANCE

As recommended by the manufacturer and to ensure results are in compliance with good practices, the following items will be part of the regular maintenance and care of the Partisol sequential air samplers. This will allow flow values and temperature compensation to be constant with time.

Maintenance Procedures	**Interval**
Exchanging particle trap filter	6 months
Testing batteries–exchange if necessary	6 months
Exchanging fuses	As needed
Cleaning Air Intake Filters	6 months
Inspect “V” Seals and O-rings	3 months
Rebuilding piston pump(s)	18 months

Audit Procedures	**Interval**
Ambient Air Temperature audit	4 weeks
Filter Temperature(s) audit	4 weeks
Ambient Pressure audit	4 weeks
External Leak Check	4 weeks
Flow controller audit	4 weeks

Calibration Procedures	**Interval**
Analog I/O calibration	Automatic
Ambient Air Temperature calibration	1 year
Filter Compartment Temperature calibration	1 year
Filter Temperature(s) calibration	1 year
Ambient Pressure calibration	1 year
Ambient Relative humidity calibration	1 year
External Leak Check	1 year
Flow controller calibration	1 year

5 DUST MANAGEMENT

Daily road watering and, if necessary, the application of chemical dust suppressants will be employed at the Meadowbank Project and the Whale Tail Pit Project to mitigate emissions of fugitive road dust during the frost-free summer season. Dust suppression along the Meadowbank AWAR will consist of the application of Tetraflake ($CaCl_2$) twice a year during summer time on five sections of the AWAR, as well as two locations in the hamlet of Baker Lake, and one area onsite. Locations are described in Table 3. Effectiveness of dust suppression will continue to be reported annually to NIRB. Dust suppression on mine site will consist of water and Tetraflake.

As well, Agnico will also continue to investigate alternatives dust mitigation measures in its Nunavut sites.

Table 3: AWAR dust suppression location

Location Type	Dust Suppression Location	Rationale
Hamlet	Agnico Eagle spud barge area	High traffic area near hamlet
Hamlet	Agnico Eagle tank farm to Arctic Fuel site	High traffic area near hamlet
AWAR	km 10 - 12	High traffic area near hamlet & area of concern to HTO – proximity to lake
AWAR	km 24 - 26	Area of concern to HTO – proximity to lake
AWAR	km 48 - 50	Area of concern to HTO – water crossing
AWAR	km 68 - 70	Location identified by Agnico Eagle – water crossing
AWAR	km 80 - 84	Location identified by Agnico Eagle – proximity to water & crossing
Onsite	Emulsion plant turn off to Meadowbank site (km 103 – 110)	High traffic area onsite

Based on the modelling of the dust emissions on the road, and the experience and monitoring data of the Meadowbank AWAR from Baker Lake to the mine site, use of chemical dust suppressants is not expected for the Whale Tail Pit Haul Road. Chemical dust suppressants may be only used as a last resort and only in accordance with the Environmental Guidance for Dust Suppression published by the Government of Nunavut Department of Environment (GN 2014).

The Whale Tail Haul Road (WTHR) Management Plan discusses mitigation measures that will be employed by Agnico Eagle to suppress the production of fugitive dust along the Whale Tail Pit Haul Road (see Section 8.3; WTHR Management Plan; Agnico Eagle 2019). These strategies include:

- enforcing speed limits;
- grading of road surfaces;
- placement of new coarser material onto the road surface; and
- if necessary, road watering or application of dust suppressants.

The Agnico Eagle road supervisor may employ dust mitigation measures where road visibility is impaired, or in areas where dust deposition is potentially impacting traditional land use, fish habitat and/or water quality (WTHR Management Plant; Agnico Eagle; 2019).

Thresholds (Table 3) will be used to determine when mitigation measures need to be initiated. Dustfall measurements will be regularly collected (along the roads and other parts of the Meadowbank and Whale Tail Mine site) using passive sampling methods to record the quantity of dust collected over time and to quantify the success of mitigation measures. The monitoring data will be used to adjust mitigation measures and improve dust management strategies.

In Q2 2019, Agnico Eagle will hold a discussion with ECCC during the technical meeting of the Whale Tail Expansion Project and will determine in collaboration, the threshold that will trigger adaptive management responses and actions. The Air Quality and Dustfall Monitoring Plan will then be updated.

Table 4: Thresholds and Mitigation Measures

Location	Frequency	Indicator	Threshold	Mitigation Measure
Haul road and site access roads	Regular weekly or more frequency inspection by road supervisor during the late spring and summer periods	• Measured dustfall • Deterioration of visibility along road	• Deterioration of visibility • Safety concern • High dust levels evident near significant waterbodies	• Use of water and/or dust suppressant in areas requiring attention • Grade the road surface • Add new granular material to the road surface • Temporarily lower the speed limit on the road
Mine site, including travel areas	Regular weekly or more frequent inspection by the site supervisor during the late spring and summer periods.	• Measured dustfall	• Deterioration of visibility • Safety concern • Dust reaching Whale Tail Lake or Mammoth Lake	• Use of water and/or dust suppressant on exposed surfaces such as parking areas, pads, haul, access and service roads • Review mitigation measures in place • Add new granular material to surface • If applicable, grade the surface • Temporarily lower the speed limit on site
Ramps in the open pits	Regular inspection by pit supervisor during summer period	• Deterioration of visibility	• Deterioration of visibility • Safety concern	• Use water as a dust suppressant

6 PLAN REVIEW

The Air Quality and Dustfall Monitoring Plan will be reviewed regularly by the Meadowbank Environmental Superintendent and be updated if any changes to the equipment or the program occur.

Blast Monitoring Plan, Version 3

AGNICO EAGLE

Meadowbank & Whale Tail Project

Blast Monitoring Program

Prepared by:
Agnico-Eagle Mines Limited – Meadowbank Division

Version 3

March 2019

1. EXECUTIVE SUMMARY

The Guidelines for the Use of Explosives In or Near Canadian Waters (Wright and Hopky, 1998) as modified by the DFO for use in the North mention the following requirements that are applicable to the Meadowbank Mine:

- No explosive is to be detonated in or near fish habitat that produces, or is likely to produce, an instantaneous pressure change (i.e. overpressure) greater than 100 kPa in the swim bladder of a fish.
- No explosive is to be detonated that produces, or is likely to produce, a peak particle velocity greater than 13 mm/sec in a spawning bed during the period of egg incubation.

As a result of testing and monitoring in the NWT that indicates the limit of 100 kPa was not protective to fish, DFO has recommended to Agnico to use 50 kPa as the threshold for instantaneous pressure change.

Every blast is monitored with an Instantel Minimate Blaster to ensure that vibrations generated by blasting are less than 13 mm/sec and the overpressure is under 50 KPa. The blasts are monitored from three locations at the Meadowbank site; one station is located near the northern end of Portage Pit, the second near the south end of Portage Pit and the other one at the north of Vault Pit. For Whale Tail, the blasts are monitored from two locations; one on Whale Tail Lake before the fish out is completed and another one on Mammoth Lake for the open pit operations. Independent blast monitoring plans will be established for blasts that are outside of the Whale Tail Pit area; for example: the Whale Tail Dike and the Mammoth Dike Construction MEMO that was submitted to the DFO. The results of blast monitoring are systematically analyzed by the Engineering department within the 24 hours following the blasting operation. The blast monitoring results are interpreted and a blast mitigation plan is implemented immediately if the vibrations or the overpressure exceed the guidelines. A retro analysis is conducted to determine what caused the higher than expected results.

The following factors are considered in controlling vibration intensity:

- The confinement of the charges
- The coupling of the explosives charges to the rock affects how much energy is transferred to the rock

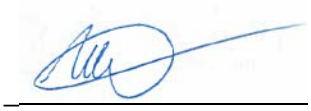
- The spatial (geometric) distribution of the explosives affects the character and intensity of the ground vibrations
- The charge weight per delay (8ms intervals)
- The blast direction

The following factors are considered in controlling overpressure:

- Depth of burial
- Insufficient burden on the first row of holes, this can cause air blast and generate fly rocks
- Charges placed in open seams, clay filled seams, and highly fractured zones where gases could be vented
- The charge weight per delay (8ms intervals), especially for pre-shear blasting

The blast monitoring reports are systematically archived and relevant information entered into a database. The blast monitoring data will be submitted for regulatory review annually in the Meadowbank Annual Report.

IMPLEMENTATION SCHEDULE



This Plan is implemented immediately (March 2019)

1. Introduction

Agnico-Eagle Mines Limited – Meadowbank Division has developed this Blasting Monitoring Program for the control of blasting vibrations at the Portage, Goose and Vault Pit in accordance with Condition 85 of Project Certificate No.004 issued by the Nunavut Impact Review Board (NIRB). This monitoring program was also updated to include blasting activities at Whale Tail Project in accordance with Condition 22 of NIRB Project Certificate No.008.

Agnico had developed a detailed blasting program to minimize the effects of blasting on fish and fish habitat, water quality, and wildlife and terrestrial VECs. The Blasting Program has been developed in consultation with the Department Of Fisheries and Oceans (DFO) and the Government of Nunavut (GN), and shall:

a) Comply with the Guidelines for the Use of Explosives In or Near Canadian Fisheries Waters (Wright and Hopky, 1998) as modified by the DFO for use in the north;
b) adhere to the guidance provided in the Monitoring Explosive-Based Winter Seismic Exploration in Waterbodies, NWT 2000-2002 (Cott and Hanna, 2005);
c) Include a monitoring and mitigation plan to be developed in consultation with the DFO, and obtain DFO approval of the blasting program prior to the commencement of blasting;
d) Restrict blasting when migrating caribou, or sensitive local carnivores or birds may be negatively affected; and
e) Minimize the use of ammonium nitrate to reduce the effects of blasting on receiving water quality

The Blasting Monitoring Program will continue to be implemented during the operation phases of the Meadowbank and Whale Tail Projects.

2. Blasting standard and criteria

The effects of blasting are typically assessed in terms of Peak Particle Velocity (PPV). The US Bureau of Mines has established that the peak particle velocity is related to the scaled distance by the following relationship:

$$PPV = k * (R/W^{0.5})^{-b}$$

Where:

PPV = Peak Particle Velocity, mm/s

R = Distance from blast to point of concern, m

W = Charge weight per delay, kg

k = confinement factor – specific to site

b = site factor

This formula can be used to estimate PPV and determine if the PPV will surpass the given limits before the blast occurs.

The Guidelines for the Use of Explosives In or Near Canadian Waters (Wright and Hopky, 1998) as modified by the DFO for use in the North mention the following requirements that are applicable to the Meadowbank Project:

> "8. No explosive is to be detonated in or near fish habitat that produces, or is likely to produce, an instantaneous pressure change (i.e. overpressure) greater than 100 kPa (14.5 psi) in the swim bladder of a fish.
>
> 9. No explosive is to be detonated that produces, or is likely to produce, a peak particle velocity greater than 13 mm/sec in a spawning bed during the period of egg incubation."

As a result of testing and monitoring in the NWT that indicates the limit of 100kpa was not protective to fish, DFO has recommended to Agnico to use 50 kPA as the threshold for instantaneous pressure change.

To keep PPV under the 13 mm/sec guideline Wright and Hopky (1998) suggests the setback distances shown in table 1.

Table 1 : Set back distance (m) from center of detonation of a confined explosive to spawning habitat to achieve 13mm/sec guideline criteria for all types of substrate (Wright and Hopkins, 1998)

	Weight of Explosive Charges (kg)						
	0.5	1	5	10	25	50	100
Setback distance (m)	10.7	15.1	33.7	47.8	75.5	106.7	150.9

Concerning the instantaneous pressure change (i.e. overpressure), Wright and Hopky (1998) suggest the following setback distances to keep it under the 100 kPa guideline.

Table 2 : Set back distance (m) from center of detonation of a confined explosive to fish habitat to achieve 100 KPa guideline criteria for various substrate.

	Weight of Explosive Charges (kg)							
Substrate Type	0.5	1	2	5	10	25	50	100
Rock	3.6	5.0	7.1	11.0	15.9	25.0	35.6	50.3
Sfrozen Soil	3.3	4.7	6.5	10.4	14.7	23.2	32.9	46.5
Ice	3.0	4.2	5.9	9.3	13.2	20.9	29.5	41.8
Saturated Soil	3.0	4.2	5.9	9.3	13.2	20.9	29.5	41.8
Rock	2.0	2.9	4.1	6.5	9.2	14.5	20.5	29.0

The Meadowbank Engineering team is also referring to the vibration and overpressure historical data to assess certain blast pattern closer to lakes. Nine (9) years of historical data are archived in the Meadowbank database and they are often used as case study for delicate blasting operations.

3. Blast monitoring plan

3.1. Blast monitoring equipment

Every blast is monitored to ensure that vibrations generated by blasting are less than 13 mm/sec and the overpressure is under 50 KPa. The instrument used for blast monitoring is an Instantel Minimate Blaster which is fully compliant with the international Society of Explosives and Engineers performance specification for blasting seismographs (Instantel, 2005).

The Minimate Blaster has three main parts: a monitor, a standard transducer (geophone) and a microphone (figure 1). The monitor contains the battery and electronic components of the instrument. It also checks the two sensors to be sure that they work properly. The transducer measures ground vibration with a mechanism called a geophone.

Figure 1: Instantel Minimate Blaster Unit

The transducer has three geophones that measure the ground vibrations in terms of particle velocity. They measure transverse, vertical and longitudinal ground vibrations (figure 2). Transverse ground vibrations agitate particles in a side to side motion. Vertical ground vibrations agitate particles in an up and down motion. Longitudinal ground vibrations agitate particles in a back and forth motion progressing outward from the event site (Instantel, 2016).

The microphone measures the PSP (Peak Sound Pressure) also referred as to the PAO (Peak Air Overpressure). The instrument checks the entire event waveform and displays the largest sound pressure in Pa unit.

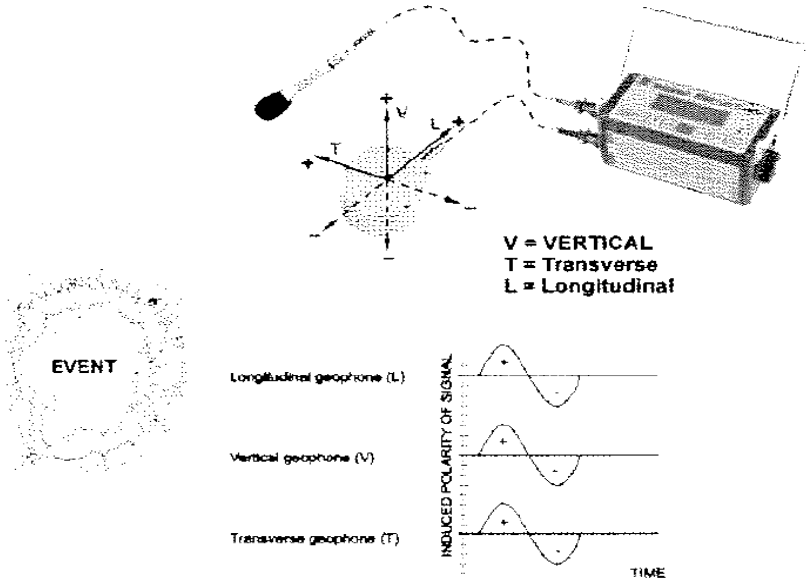

Figure 2: Sensor Orientation (Instantel, 2016)

The Minimate Blaster (Instantel) calculates the PPV for each geophone and calculates the vector sum of the three axes.

The final result is the PVS (Peak Vector Sum) and it is the resultant particle velocity magnitude of the event:

$$PVS = \sqrt{(T^2 + V^2 + L^2)}$$

Where:

T = particle velocity along the transverse plane

V = particle velocity along the vertical plane

L = particle velocity along the longitudinal plane

3.2. Equipment installation

The transducer is installed on a hard surface, which in this case is rock. A 3/8 inch bolt is anchored in the rock (figure 3) and the transducer is tightened with a nut (figure 4). The arrow on the top of the standard transducer must be pointed in the direction of the event to ensure the geophone sensors, located inside the standard transducer, remains in their natural axis (Instantel, 2016). The trigger level of the instrument is set to 1 mm/s and the transducer will start recording an event automatically when the ground vibrations are greater than or equal to 1 mm/s. The recording time is 4 seconds, which is sufficient considering that the blast timing is rarely more than 2 seconds at Meadowbank. The instrument is protected with a box and the microphone is oriented in the direction of the blast.

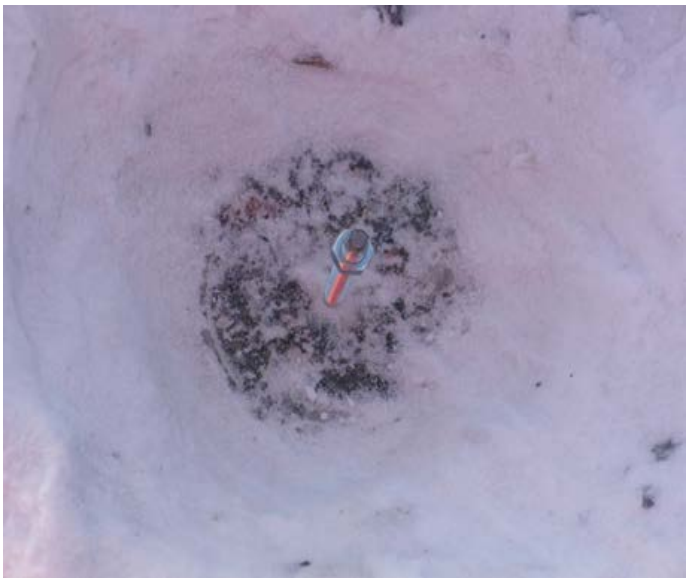

Figure 3: 3/8 inch bolt anchored in the rock

Figure 4: Transducer tightened with a nut

Figure 5: Final Set-up with the Microphone in the direction of the blast

Figure 6: General view of the Portage South monitoring station

3.3. Blast monitoring stations at Meadowbank

The blasts are monitored from three different locations. The locations were chosen to have the optimal distance between the blasts and the water (fish habitat). One station is located near the northern end of Portage pit and the other near the south end of Portage pit (figure 7). The third station is located at the complete northern of the Vault Pit (Figure 8).

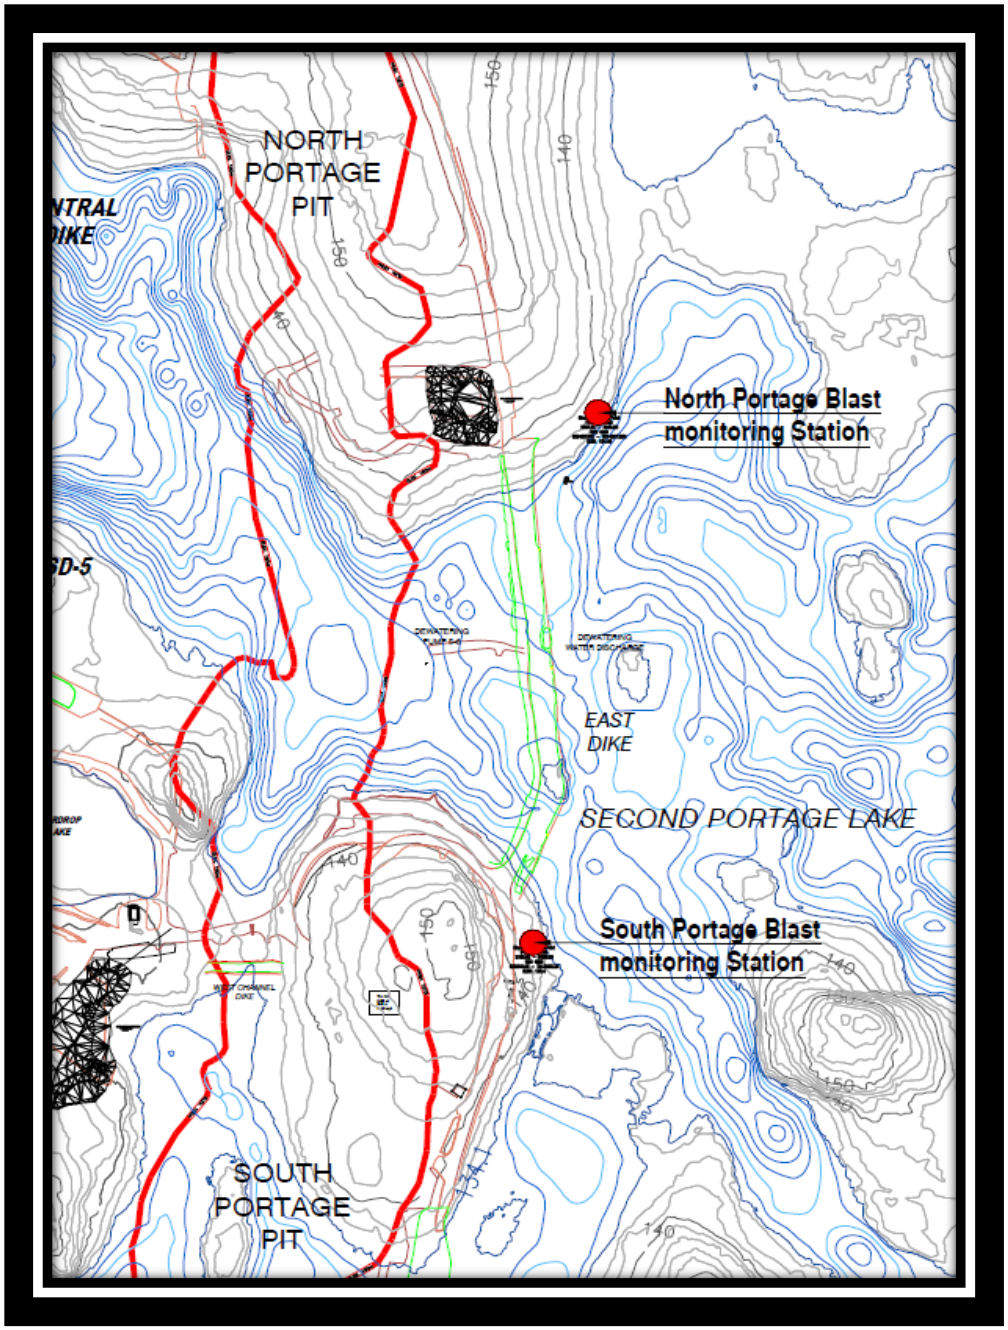

Figure 7: Localizations of the two blast monitoring stations at Portage Pit

.

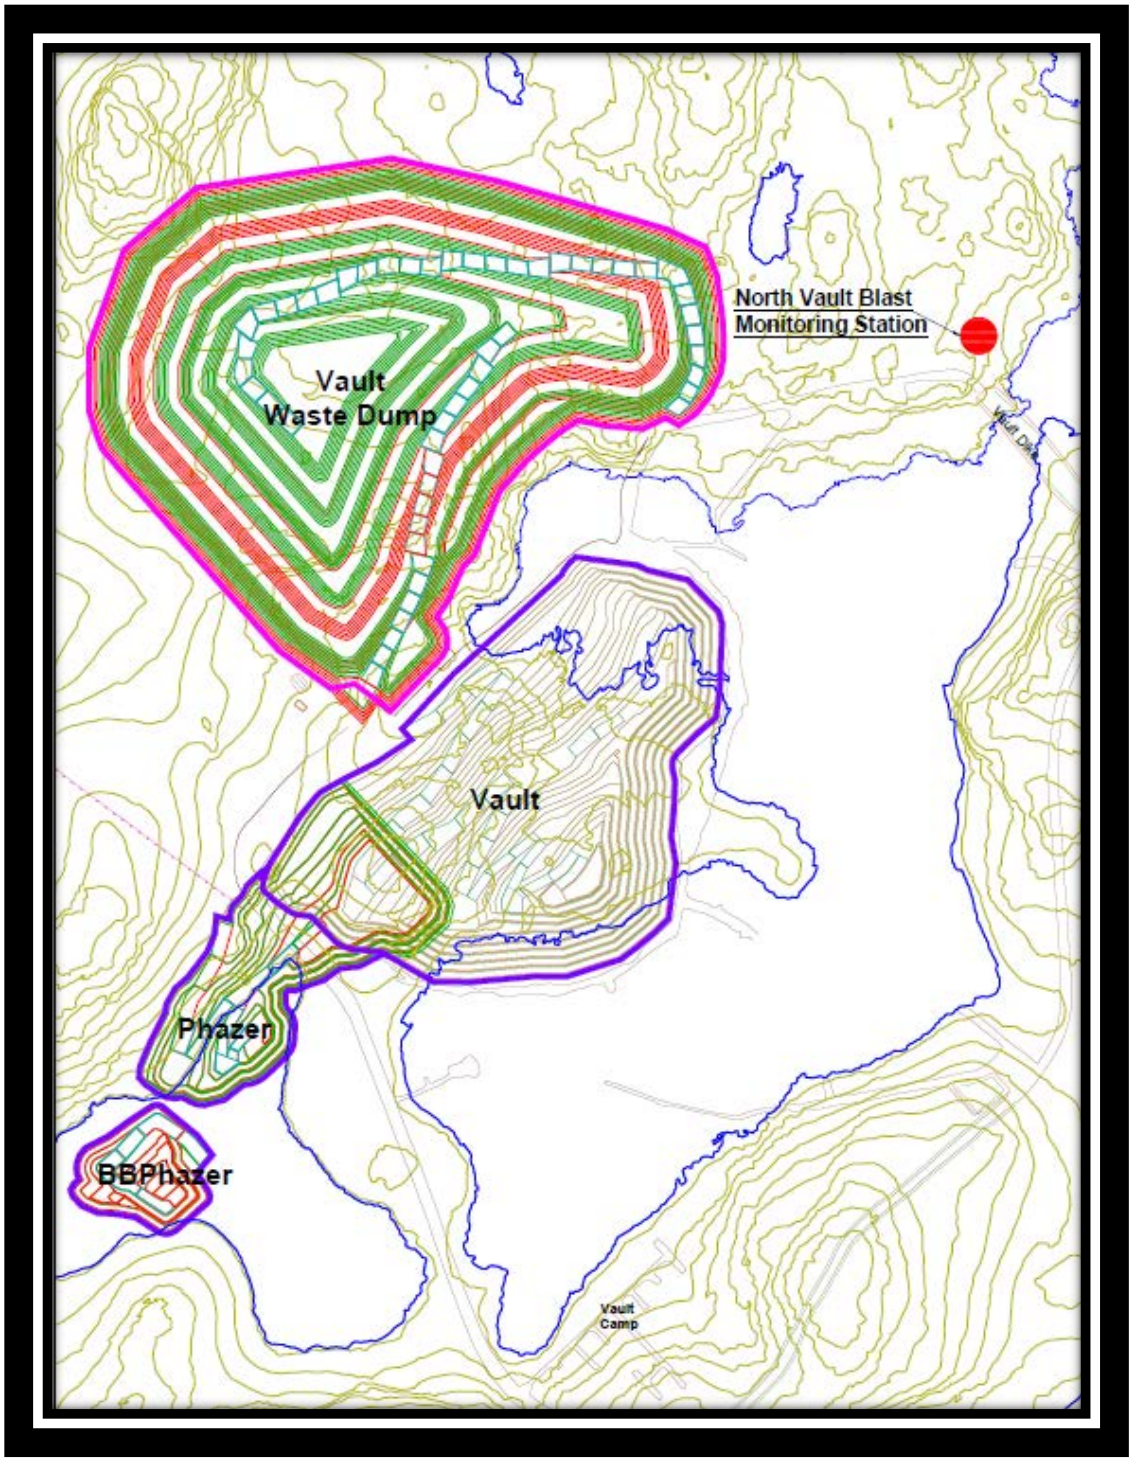

Figure 8: Localization of the blast monitoring station at Vault pit

3.4 Whale Tail monitoring stations

The blasts were monitored from Whale Tail Station 1 when mining in Quarry 1 and Ap-5. For Quarry 2 and Phase 1 of Whale Tail Pit; monitoring is done from Mammoth Station 1 only since the fish out of Whale Tail Lake has been completed. Depending on the location of the blast inside Whale Tail Pit, Whale Tail Station 2 will be used as well. Additionally, monitoring will be done on both Mammoth Dike and Whale Tail Dike which will provide redundancy and mitigation if ever the Instatel monitoring devices were to not record.

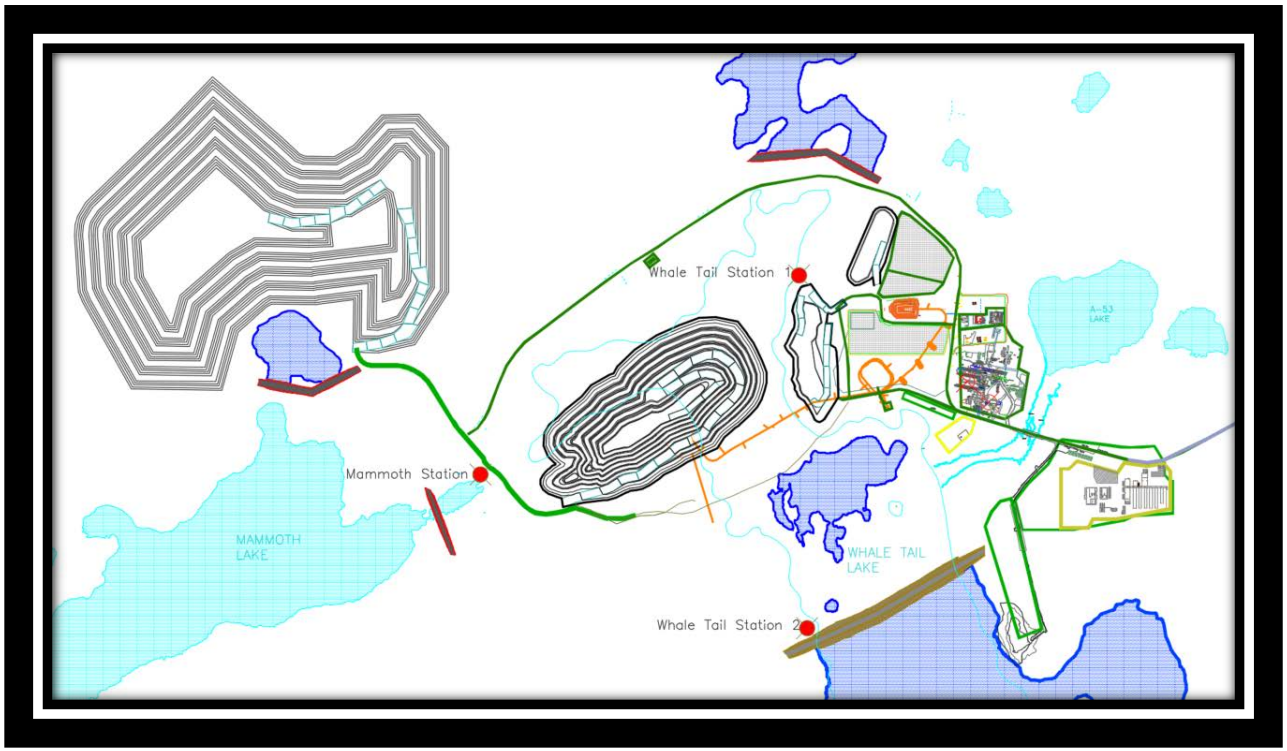

Figure 9: Localization of the blast monitoring stations at Amaruq

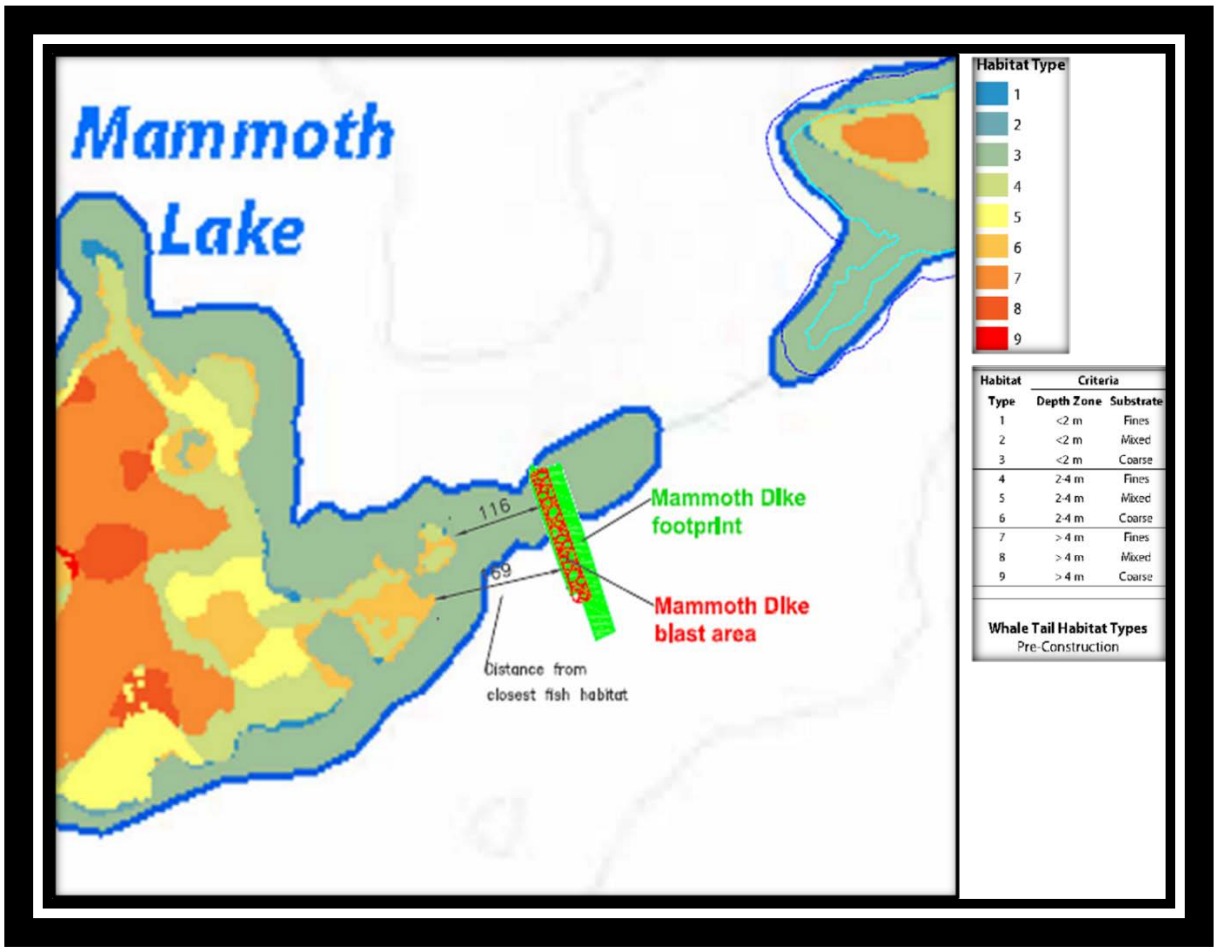
As demonstrated on Figure 10, the possible fish spawning areas are located West of Mammoth Dike while Mammoth Station is located East of the Dike. Therefore, it is safe to say, according to the formula for calculating PPV in Section 2, that if we record PPVs under the 13mm/s threshold, that the PPVs will be lower at the fish spawning areas.



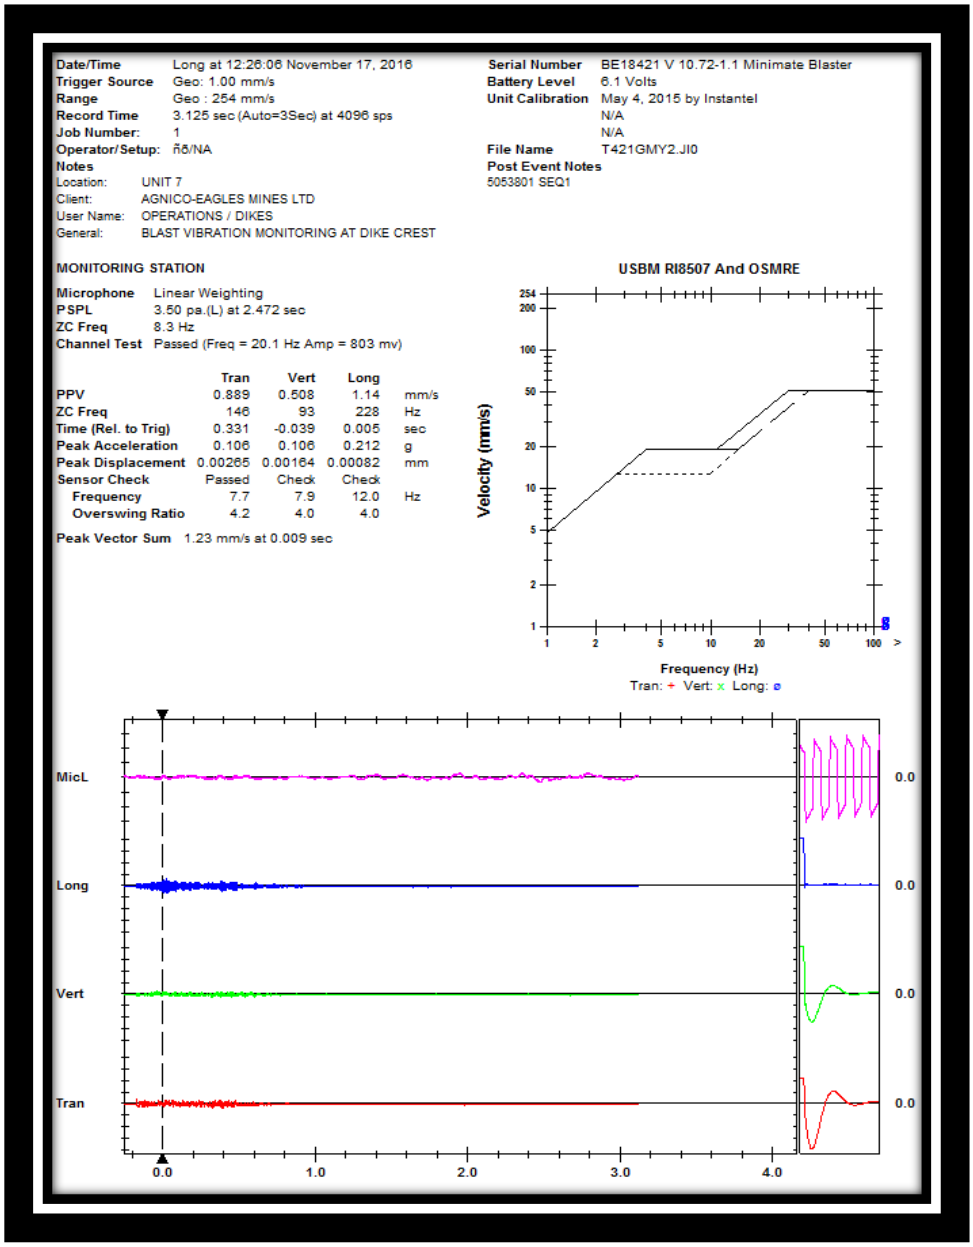


Figure 10: Fish Habitat Types for Mammoth Lake

3.5 Blast monitoring report

After each blast, the results are stored in a database and the report saved in the library for future reference. The blast monitoring results are interpreted and a blast mitigation plan is implemented immediately if the vibrations or the overpressure exceed the permitted limit (see section 4). The data will be submitted to DFO, GN, NIRB, Environment and Climate Change Canada, and the Nunavut Water Board annually in the Meadowbank Annual Report.

4. Blast mitigation plan

This mitigation plan is specific to blasts in the open pits (Portage Pit, Vault Pit, BB Phaser Pit, Phaser Pit and Whale Tail Pit. A Memo has been sent to the Fisheries and Oceans with its own specific mitigation plan relative to blasts for Whale Tail Dike and Mammoth Dike excavation.

If the vibrations or the overpressure approach or exceed the permitted limit, it is possible to conduct a retro analysis and find the factors that may have caused higher than desired results. It is important to consider the main factors influencing blast vibration intensity (table 3) or overpressure (table 4) in order to prevent such results (ISEE, 1998).

Table 3: Main Factors Influencing Blast Vibration Intensity (ISEE, 1998)

Main Factors Influencing Blast Vibration Intensity
Maximum charge weight detonating at one time
True distance (distance the waves must travel)
Geological conditions
Confinement
Physical properties of the rock
Coupling
Spatial distribution
Detonator timing scatter
Time of energy release
Type of Explosive

Table 4: Main Factors Influencing Overpressure (ISEE, 1998)

Main Factors Influencing Overpressure
Maximum charge weight per delay
Depth of burial of charges
Exposed surface detonation material
Atmospheric conditions
Wind
Temperature gradients
Topography

Volume of displaced rock
Delay interval and orientation
Type of Explosive

Geological conditions and rock properties are site specific and cannot be changed but there are several controllable factors that may reduce blast vibration intensity. Agnico takes the following factors into consideration at Meadowbank to reduce vibration intensity:

I. The confinement of the charges affects the vibration intensity. If a charge is deeply buried with no free face nearby, the rock is not displaced and more of the energy goes into seismic waves (ISEE, 1998). The engineering department carefully plans pre-shear blasting that may have excessive burden in the first row of holes.

II. The coupling of the explosives charges to the rock affects how much energy is transferred to the rock and hence the intensity of the vibrations. If smaller-diameter charges are placed in large-diameter holes, the charges are decoupled and less energy is transferred (ISEE, 1998). Using bulk products increases the coupling. In specific cases, like pre-splitting blast, it is a better idea to use packaged products that have a small diameter.

III. The spatial (geometric) distribution of the explosives affects the character and intensity of the ground vibrations. A reduction in vibration is often found when there are many small charges per delay, widely distributed. There is a practical limit to the number of small charges that can reinforce each other, and the more there are, the less effective their reinforcement. A charge per delay composed of 100 charges of 1lb each will not generate the same intensity of vibration as a single charge of 100 lbs. (ISEE, 1998).

IV. The main factor that is used to prevent high intensity vibration is the charge weight per delay. The 8-ms criterion is applied to prevent short delay times from overlapping or causing constructive reinforcement (addition) of two or more pulses (ISEE, 1998), which could cause higher vibrations. In every blast connection plan designed by the engineering department, this fact is taken into consideration. Timing is designed to minimize the number of holes that overlap in an 8 ms delay.

V. The blasting direction of a blast pattern is another key element to minimize vibration once blasting besides areas close to lakes.

Mitigation techniques used to reduce overpressures are as follows:

I. Depth of burial affects the overpressure. Improperly stemmed or insufficient collar will allow blast holes energy to be vented upwards. The quality of the stemming is also important: angular, coarse stemming material (3/4'') is necessary to be efficient.

II. Avoid having insufficient burden on the first row of holes. This can cause air blast and generate fly rocks. Leaving muck piles from the previous blast in front of the free face (choke blasting) can reduce the amount of air blast generated and minimize the chance fly rocks.

III. Avoid placing charges in open seams, clay filled seams, and highly fractured zones where gases could be vented.

IV. Controlling the charge weight per delay especially for the pre-shear drilling. A limited number of kg per delay is in effect at Portage pit to avoid overpressure.

5. Conclusion

Blast monitoring process will continue to ensure that blast vibrations do not cause harm to aquatic life at Meadowbank and Whale Tail. The results are used to find a more accurate confinement factor of the site. The data collected helps to correlate different factors that could influenced vibration intensity and will be taken into consideration in the future to guarantee a constant improvement in controlling blast vibrations.

We have overall successfully managed to keep our vibrations below the limit authorized. Agnico is committed to monitoring all blasts in order to fully comply with the regulation.

Meadowbank and Whale Tail Bulk Fuel Storage Facility:

Environmental Performance Monitoring Plan

MARCH 2019

VERSION 4

EXECUTIVE SUMMARY

Agnico Eagle Mines Limited – Meadowbank Division (Agnico Eagle) is currently operating the Meadowbank Gold Project approximately 70 km north of the Hamlet of Baker Lake. As part of the project, one - 5.6 million litres bulk fuel storage tank was constructed to store diesel fuel for routine operations at the mine site, and one - 1.5 million liters bulk fuel storage tank will be built at the Whale Tail Pit site. The former bulk fuel tank facility was commissioned in January 2009 while the one at Whale Tail is to be commissioned in 2019. This document provides the details for the Meadowbank and Whale Tail Pit Bulk Fuel Storage Facility Environmental Performance Monitoring Plan required by Water License 2AM-MEA1526 Part B, Item 13(l) and 2AM-WTP1826 Part B, Item 14 (b).

To adequately assess the environmental performance of the bulk fuel storage tank at Meadowbank and Whale Tail Pit, this report provides: a summary of the design, installation, operation and maintenance that follows the CCME (2003) Environmental Code of Practice for Aboveground Storage Tank Systems Containing Petroleum and Allied Petroleum Products; a summary of the location and environmental setting; a summary of the NWB Type A water license requirements; and an environmental assessment to support the recommended environmental monitoring for the ongoing evaluation of the secondary containment.

IMPLEMENTATION SCHEDULE

As required by Water Licence 2AM-MEA1526 and 2AM-WTP1826, , the proposed implementation schedule for this Plan is effective upon approval and subject to any modifications proposed by the NIRB and NWB as a result of the review and approval process.

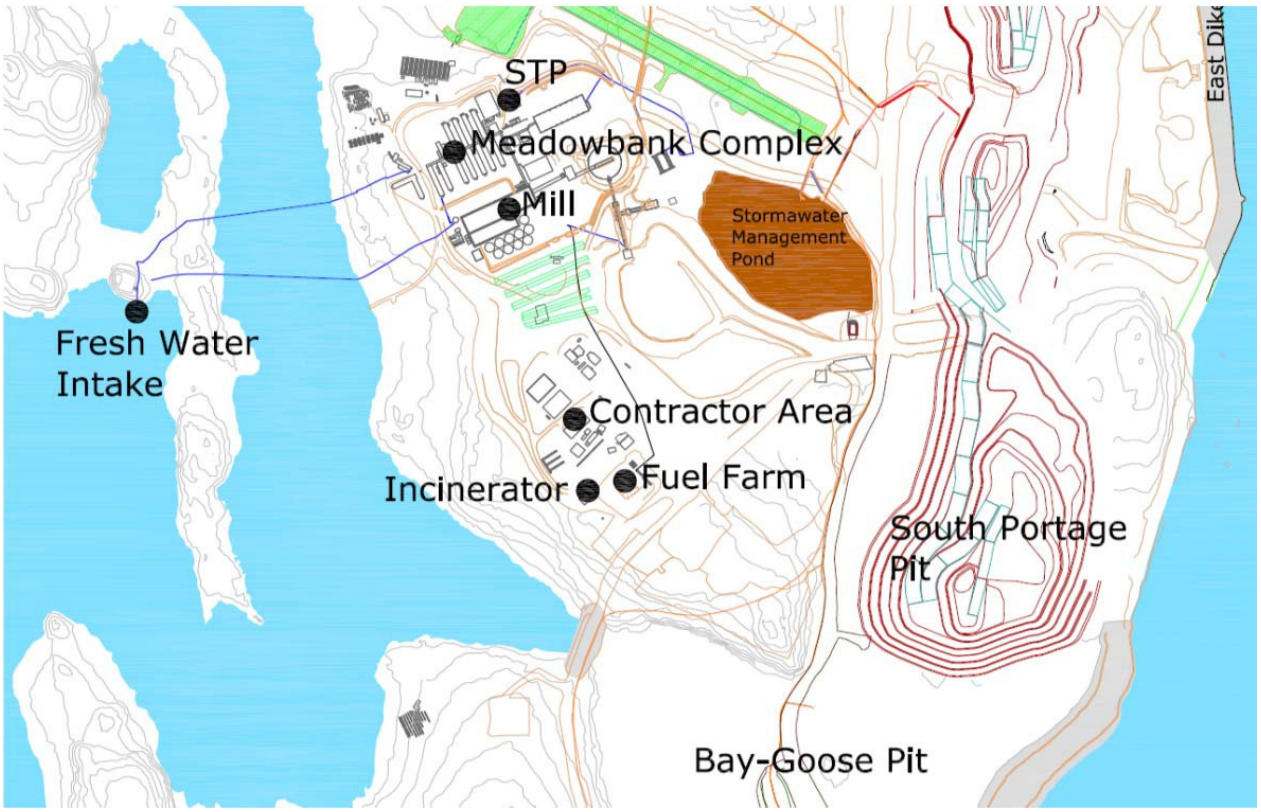
Section 1 INTRODUCTION

Agnico Eagle Mines Limited – Meadowbank Division (Agnico Eagle) is operating the Meadowbank Gold Project and Whale Tail Pit (a Meadowbank satellite deposit located on the Amaruq property). The Meadowbank Project includes the Baker Lake Marshalling Area, the All-weather Access Road (AWAR), the Meadowbank Mine site, the Whale Tail pit, and the Whale Tail Haul Road.

One 5.6 million liter bulk fuel storage tank was constructed to provide diesel fuel for routine operations at the Meadowbank mine site, and one 1.5 ML tank will be built at the Whale Tail Pit Project.

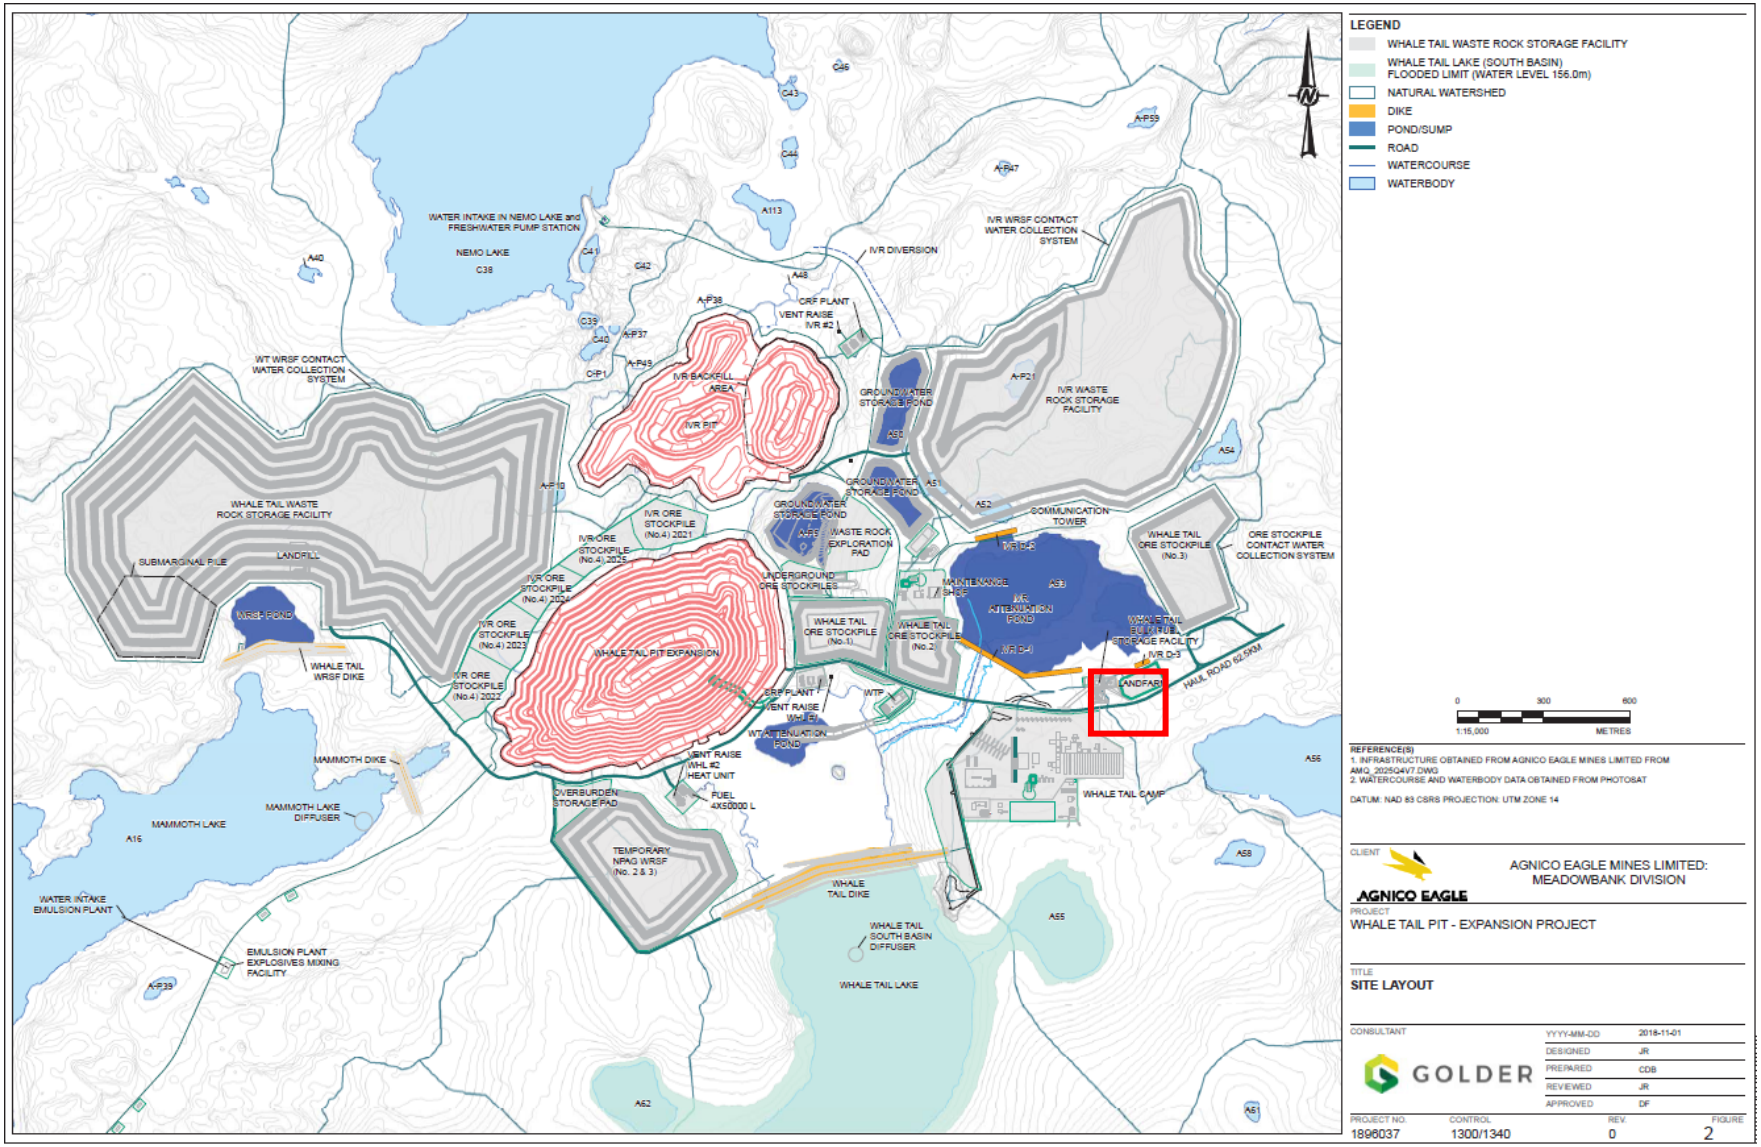
To adequately assess the environmental performance of the bulk fuel storage tanks at Meadowbank and Whale Tail this report provides:



- a summary of the design, installation, operation and maintenance that follows the CCME (2003) Environmental Code of Practice for Aboveground Storage Tank Systems Containing Petroleum and Allied Petroleum Products;
- a summary of the location and environmental setting;
- a summary of the NWB Type A water license 2AM-MEA1526 and 2AM-WTP1826 requirements; and
- an environmental assessment to support the recommended environmental monitoring for the ongoing evaluation of the secondary containment.

Section 2 SITE LOCATION, CONSTRUCTION AND OPERATION

2.1 SITE LOCATION



The Meadowbank Bulk Fuel Storage Facility is located at Meadowbank, east of the main camp facilities adjacent to the mine operations haul road. There is one (1) above ground storage tank with approximately 5.6 million liters capacity. The GPS coordinates of the facility is NAD83 14W E 0638083 N 7214288. The general location of the tank farm is provided in Figure 2-1 below.

Figure 2-1. Location Meadowbank Tank Farm

The Whale Tail Fuel Storage Facility is located at the Whale Tail satellite open pit, approximately 50 km west of the Meadowbank site. One 1.5 ML tank will be built. The tank will be in a berm and lined area and its location is shown in Figure 2-2.

Figure 2-2. Location of Whale Tail Fuel Storage

2.2 DESIGN AND INSTALLATION SUMMARY

Following regulatory approval, during the summer of 2008 Agnico Eagle built the bulk fuel tank and respective secondary containment with a capacity of 5.6 million liters (AEM, 2009). The secondary containment enclosure and HDPE liner was installed in accordance with CCME (2003) specifications. The aboveground storage tanks were field erected. Construction activity was supervised by Hatch Engineering and Stavibel Engineering and included qualified steel fabricators and membrane installers. The diesel fuel tank is single-walled and constructed of welded steel. In addition, aviation fuel is stored in two 50,000 L double-walled steel tanks adjacent to the airstrip. Additionally, in the summer of 2015, an aboveground pipe was installed in accordance with CEPA (2008) specifications to supply fuel from the bulk fuel tank to the main Meadowbank power plant.

Similarly, for the Whale Tail Pit site, diesel fuel originating from the Baker Lake Tank Farm is stored in one 1,500,000 L tank with secondary containment. The Whale Tail Bulk Fuel Storage Facility is shown in Figure 2-2.

2.3 OPERATION AND MAINTENANCE SUMMARY

Inventory control of transfer and monthly volume inspections using manual or electronic dip reconciliation are conducted at Meadowbank and at the Whale Tail Pit by operations staff at the respective sites. Weekly inspections are logged and reported by Agnico Eagle. Weekly visual inspections and inventory reconciliation are used to evaluate and determine bulk fuel tank leakage at Meadowbank and Whale Tail.

The bulk fuel storage facilities are maintained in accordance with best management practices. The bulk fuel tanks at Meadowbank and Whale Tail Pit are re-filled by a fuel truck on a regular basis throughout the year. During the period of re-filling, there is the greatest risk of over-filling. Through regular visual inspections, inventory control and monitoring fuel transfer, the risk of over-filling is significantly reduced. In the case of a spill, the Spill Contingency Plan will be implemented.

Section 3 ENVIRONMENTAL SETTING

3.1 TOPOGRAPHY

The surrounding area of the Meadowbank site and Whale Tail site consists of low, rolling hills with many small lakes; Third Portage Lake is located to the south and Second Portage Lake to the north. The bulk fuel storage tank at Meadowbank is bound to the north by the mine site, a haul road to the east, and the incinerator and waste management area to the south. The surface water drainage at the bulk fuel storage facility is towards the storm water management pond to the north.

The topography of the Whale Tail area differs a little from that of Meadowbank. The tank farm is located northeast of the camp as shown in Figure 2-2. The water drainage at the Whale Tail Pit bulk fuel storage facility is towards pond A53, which during operations drains through the east channel and into Whale Tail Lake (South Basin).

3.2 GEOLOGY

The two fuel storage sites have a thin, discontinuous cover of top soil with minimal organic material. Soil thickness is typically between 1 and 5 m below which bedrock is encountered. In the area near the Meadowbank and Whale Tail Pit bulk fuel farm, bedrock is encountered within 2m of existing ground surface or is exposed with weathered fractures extending 1 to 2 m into the rock.

3.3 FLORA AND FAUNA

There are no trees and few shrubs in the area surrounding the Meadowbank and Whale Tail sites. The sites are covered by low-lying vegetation; predominated by grassy hummocks, dwarf willow, sedge, green moss, and lichen.

Arctic ground squirrels, ptarmigan and songbirds are inhabitants in the area surrounding the fuel storage areas. Lake trout, arctic char, lake whitefish, round whitefish, slimy sculpin and stickleback are predominant fish species found in local lakes.

3.4 SUBSURFACE CONDITIONS

At the two sites, soil is characterized by lateral deposits of glacial till. Bedrock is exposed at shallow depths throughout the sites. There is high site drainage due to limited soil depth, high presence of fractured bedrock and glacial till.

3.5 WATER QUALITY

Water quality closely resembles distilled water as many conventional water chemistry parameters are at or below detection limits. The water column is generally well mixed and the water chemistry homogenous. During the open water season there is limited vertical stratification in temperature and dissolved oxygen.

Section 4 NWB TYPE A WATER LICENSE CONDITIONS

Agnico Eagle will continue to adhere and will apply the conditions of the Nunavut Water Board (NWB) Type A water license 2AM-MEA1526 and 2AM-WTP1826 requirements, related to the Meadowbank mine site bulk fuel storage facility and the Whale Tail Pit Bulk Fuel Storage Facility. Agnico Eagle is committed to achieving all of these requirements at Meadowbank, and at Whale Tail.

Section 5 ENVIRONMENTAL PERFORMANCE ASSESSMENT

To adequately assess the environmental performance of the Meadowbank bulk fuel storage tanks and facilities, a desktop review of the Meadowbank Fuel Storage Installations: Final Report (Agnico Eagle, 2009) was completed. In addition, on October 26, 2009 Agnico Eagle environmental personnel completed a site inspection to visually evaluate the site drainage, tank construction, and secondary containment and performed an environmental assessment of the bulk fuel storage facility. A geotechnical inspection is also conducted annually by an external qualified engineer. The report included observations, photos and recommendations.

A similar level of assessment was carried out at Whale Tail Pit once the fuel storage facilities are in place.

5.1 DESK-TOP REPORT REVIEW OF THE MEADOWBANK BULK FUEL STORAGE FACILITY

The Meadowbank bulk fuel storage facility was commissioned in January 2009. The installation report (Agnico Eagle, 2009; attached in Appendix A) indicated the use of best management practices during the installation of the aboveground fuel storage tank. Following the tank construction, X- Ray testing of horizontal and vertical welds was completed. All of the welds met the specifications outlined in the API Standard 650 (Agnico Eagle, 2009). A similar approach was used at the Whale Tail tank farm.

Under the supervision of Hatch Engineering and Stavibel Engineering, the construction of the secondary containment berm was completed for the tank. Enviroline Services Inc. was hired in October 2008 to install the HDPE membrane liner in accordance with CCME (2003) specifications; this liner was subsequently covered with a surface layer of crushed stone.

A secondary containment volume calculation using AutoCAD Civil 3D was completed to provide verification on the liquid storage capacity of the storage tank system. The CCME Environmental Code of Practice for Aboveground Storage Tanks (2003) states:

> *a storage tank system that consists of more than one storage tank which should have a volumetric capacity of not less than the sum of the capacity of the largest storage tank located in the contained space and 10% of the capacity of the largest tank or the aggregate capacity of all other storage tanks located in the contained space.*

In accordance with the CCME (2003) code of practice, the Meadowbank bulk fuel storage tank meets the volumetric requirements for a storage tank system (Agnico Eagle, 2009). The Whale Tail bulk fuel storage tanks will also be constructed to meet CCME (2003) code of practice.

In the summer of 2009, a 4-inch below-ground pipe was installed to supply fuel from the Bulk Fuel storage tank to the Meadowbank main power plant. The pipe was installed according to the CEPA (2008) regulations.

5.2 SECONDARY CONTAINMENT VISUAL INSPECTIONS

A consultant performs a geotechnical inspection annually and inspects the bulk fuel secondary containment structures at the Meadowbank Bulk Fuel Storage Facility, the report is sent to NWB annually. The same inspections and reporting are carried out at Whale Tail Pit.

5.3 ENVIRONMENTAL ASSESSMENT

The management at the site drainage, surface water collection, and water/fuel removal within the secondary containment area is an important measure in the protection of the terrestrial environment, surface water, and ground water from potential sources of contamination. The environmental protection objectives, strategy, and an evaluation of the potential of leaks or seepage that could contaminate the terrestrial environment, surface water and ground water are provided in the following sections. Much of the environmental protection strategies focus on the control of contact water. In this report contact water is defined as any water that may be physically or chemically affected by the nearby operational activities.

At Meadowbank and Whale Tail Pit, the bermed and lined tank farm provides secondary containment. If fuel escapes from the tanks holding the fuel, the bermed and lined area will not allow the fuel to escape to the receiving terrestrial and aquatic environment. As there is expected to be a high volume of fuel transfer and activity around the modular fuel dispenser and refueling station, inadvertent fuel spills during refueling are expected but will be retained on the impermeable, lined pad. The liner is sloped such that any fuel spilled on the pad would flow to a sump where it collects and can be recovered.

5.3.1 Terrestrial Environment

The primary objective of the terrestrial management plan is to minimize any adverse impacts to the terrestrial (soil, flora and fauna) environment. To meet this objective, the Meadowbank and Whale Tail Pit bulk fuel storage facility structures have been constructed, to minimize the operational footprint and control contact run-off water within the secondary containment area. Due to the site grading, all water that comes into contact with the bulk fuel storage facility (including the modular fuel dispenser) is intercepted and directed into the impermeable HDPE lined secondary containment area.

The ground beneath the secondary containment area has been graded to ensure berm stability.

5.3.2 Surface Water

The objective of water management around the Meadowbank and Whale Tail bulk fuel storage facilities is to minimize impacts on the quantity and quality of surface water and groundwater. To meet this objective, the bulk fuel storage facility structures have been constructed to intercept and direct contact run-off water to the impermeable HDPE lined secondary containment area. As there is a high volume of fuel transfer and activity around the modular fuel dispenser, the pad below the modular fuel dispenser and refueling station is lined and sloped toward the secondary containment berm.

Due to the high compaction of the surrounding mine site pad, natural topography of the site, shallow top soil and predominate bedrock, should contact water reach the natural environment at Meadowbank, the ultimate fate of the contaminants is to the stormwater management pond.

5.3.3 Groundwater

It is not expected that groundwater would be impacted as there is no direct pathway for contaminated water to seep from the Meadowbank and Whale Tail bulk fuel storage facilities. Due to the site grading, all contact water from the bulk fuel storage facility is directed inside the HDPE lined secondary containment area. Should the integrity of the liner become compromised, there could be leakage into the below grade soil, which is within a zone of continuous permafrost.

Section 6 PERFORMANCE MONITORING PLAN

The environmental performance monitoring plan is a tiered approach with an emphasis on visual and operational inspections; routine surface water sampling to control and monitor the quality of the contact water; and event monitoring (in the case of a spill emergency or occurrence). Management of the Meadowbank and Whale Tail fuel storage facilities will be guided by the monitoring results.

6.1 VISUAL AND OPERATIONAL INSPECTIONS

Visual and operational inspections are a central component of the environmental performance monitoring plan. Visual inspections of the Meadowbank and Whale Tail secondary containment structures are important because if the integrity of the berm walls or liner is compromised, this presents the greatest potential for leaks or seepage.

Visual inspections are conducted by the environmental department once per week and monthly manual or electronic dip tests are conducted for inventory reconciliation by Procurement Department. Staff will inspect the bulk fuel storage facilities pad for: tank and piping condition, secondary containment berm structure and integrity, indicators of liner damage, precipitation/ run-off accumulation, evidence of tampering or misuse, any structural abnormalities and visible sheens on contact water pools and crush material inside the secondary containment.

The Environment staff will follow-up with the Energy and Infrastructures (E&I) Department if any non-compliances are observed. A weekly written inspection sheet will continue to be completed and signed by the E&I supervisor and available upon request.

6.2 ROUTINE CONTACT WATER MONITORING

Due to snow accumulation, melting and precipitation, contact water is unavoidably collected inside the secondary containment area. Contact water from inside the secondary containment area is sampled as described below before being discharged. The water accumulated in the Meadowbank and Whale Tail secondary containment will be released in accordance with the Type A Water License 2AM-MEA1526 and 2AM-WTP1826, Part F Item 7 to 11 conditions.

During visual inspections the quantity of contact water collected inside the secondary containment area and sump will be evaluated. If there is a visible sheen on the contact water or if water withdrawal to the environment is deemed necessary, water samples will be collected and analyzed as per Water License 2AM-MEA1526 Part F Item 8 and 2AM-WTP1826 Part F Item 7. If the contact water exceeds the licensed limits, a portable oil-water separator can be used to treat the water. Prior to withdrawal, samples will be analyzed at a certified laboratory and the 10-day notice will be sent to the inspector (as per 2AM-MEA1526 Part F Item 12 and 2AM-WTP1826 Part F, Item 13).

In addition, water samples from lakes near the Meadowbank and Whale Tail Pit site are collected as part of the Core Receiving Environmental Monitoring Plan (CREMP) and Aquatic Environmental Management Plan. The results of these analyzes will continue to be included in the annual report.

These samples are used to evaluate the performance of the overall water management plan for the Meadowbank and Whale Tail sites.

6.3 EVENT MONITORING

In the event of a spill occurrence at fuel storage facilities, the Spill Contingency Plan will be followed. As a follow-up to the spill response, the environmental staff will conduct an environmental assessment to determine the extent of impacts of the spill occurrence on the nearby environment. This will include the identification of the potential environmental pathways of concern that may result in impacts to surface water (i.e. Third Portage Lake near-shore surface water or east channel that drains into Whale Tail Lake (South Basin)), soil or groundwater.

6.3.1 Soil Sampling

Following the unlikely event where a spill is not contained within the secondary containment area or on the lined pad, soil sampling may be required to locate and prevent further impact to the terrestrial and aquatic receiving environment. Depending on the quantity of the spill, the organic surface soils and shallow till are a likely sink for hydrocarbons, thus soil samples will be taken at selected locations to horizontally and vertically delineate the impacted areas. Furthermore, the soil samples will provide valuable information used to determine the necessity of installing groundwater wells (see Section 6.3.3 below).

6.3.2 Water Sampling

Following a spill event escaping secondary containment, an environmental assessment will be conducted. Similar to routine contact water sampling (inside the secondary containment area or on the lined pad), water samples will be collected and analyzed as per Water License 2AM-MEA1526 Part F Item 8 and 2AM-WTP1826 Part F Item 7. If the contact water exceeds the licensed limits, a portable oil-water separator can be used to treat the water before it was disposed to the stormwater management ponds. Prior to withdrawal, samples will be analyzed at a certified laboratory. As part of the CREMP, receiving environment surface and at-depth water samples will be taken from Third Portage Lake or Whale Tail Lake, and analyzed for the same parameters as listed above.

6.3.3 Assessment of the Need for Groundwater Well Installation

Following a spill event escaping secondary containment, if soil sample results identify elevated concentrations of contaminants (i.e. exceeding the CCME Canada-Wide Standard (CWS) for Petroleum Hydrocarbons (PHC) in Soil) and/or if water samples identify elevated receiving environment water samples (i.e. exceeding licensed limits caused as a result of the spill event), an assessment of the need for groundwater wells will be conducted. The assessment, and if required, design for installation, monitoring and maintenance of vertical ground water monitoring wells will be in accordance with CCME (2003) procedures.

APPENDIX 2

SAFE FILL LEVEL FOR FUEL TANK 680-TK-042

DESCRIPTION OF THE MANDATE

Agnico-Eagle Mines has given a mandate to the undersigned in order to verify the compliance with applicable regulations of its fuel storage installations at the Meadowbank gold mining site, in Nunavut.

According to the terms of reference, the mandate consists summarily in the following activities.

A. Review and compilation of the available documentation ;

B. Collection of any information that may be missing ;

C. Preparation of an *AS BUILT* version of the construction drawings ;

D. Verifications to the storage capacity within the containment berms in regards to the applicable regulations.

A. DOCUMENTATION READILY AVAILABLE

HATCH - Vancouver Office

Only one (1) layout drawing showing the berm enclosure was issued from Hatch. No detailed design or cross-sections of containment berms was available prior to the construction phase. The original design of the fuel containment area is shown on revision 0B of drawing 325174-600-C-0135, which was issued **for information**.

NISHI-KHON / SNC-LAVALIN LTD - Vancouver Office

This firm was responsible for issuing the piping layout drawings and P&ID's for the Baker Lake fuel storage installations, which is a similar project located 100 km further South. During the construction and installation of piping for the Meadowbank bulk fuel storage tank, the *Process and Instrumentation Diagram* issued for construction was not readily available to the pipefitters.

GEM STEEL EDMONTON LTD

This vendor has submitted a set of drawings issued **for review**, consisting in three (3) structural drawings showing the details of a fuel tank of 5.6 million liters nominal capacity. The original design of this fuel tank is shown on revision A0 of drawings BL-2008-80-1, BL-2008-80-2, and BL-2008-80-3.

CHAMCO INDUSTRIES LTD

This vendor has submitted a set of preliminary drawings issued **for approval**, consisting in twenty-five (25) documents showing details of a fuel dispensing module. These documents have been reviewed by HATCH, and bear the following identification, which has been assigned by HATCH Document Control.

DRAWING NUMBER	H325174-M268-VD-0040	H325174-M268-VD-0041	H325174-M268-VD-0010

B. ADDITIONAL COLLECTION OF INFORMATION

HATCH - Vancouver Office

Role during construction phase : Design & Field Supervision during construction of berms.

Mr. Marlon Coakley and Jim Bonia, both of which were HATCH employees at the time, have supervised the construction of the fuel containment area. They have also hired a specialized crew from Saskatoon (Enviroline Service inc.) in October 2008 to install the HDPE membrane covering the berms. This HDPE membrane has since been covered with a layer of about 100 mm thickness of crushed stone.

NISHI-KHON / SNC-LAVALIN LTD - Vancouver Office

Role during construction phase : So far, I have never communicated with these people.

A research of all files provided by HATCH Document Control has permitted to find **Revision 0** of drawing 017202-2000-46D6-2001 from SNC-LAVALIN.

This document was not readily available to the construction team at the time when the crew from Mosher Engineering Ltd were installing the piping and commissioning the fuel dispensing module.

AGNICO-EAGLE MINES LTD, Meadowbank Surveying Team

Role during construction phase : Surveying of quantities & grades for berms, HDPE liner.

A surveying crew from AEM has monitored the quantities of granular materials and required berm elevations, as well as the installation of the HDPE membrane and grounding wire around the fuel tank. All of this work was done with the same specifications which were observed during the construction of the berms around the AEM bulk fuel storage tanks, which are located in Baker Lake.

GEM STEEL EDMONTON LTD

Role during construction phase : Fabrication and field assembly of the 5.6 M liters tank

A crew of ten (10) workers has started the construction of fuel tank 680-TK-042 on August 25, 2008 and the field erection was completed over a period of 16 days. Following this field work, a crew from ACUREN has proceeded to X-RAY testing of horizontal and vertical welds according to specifications described in the latest edition of API Standard 650. According to the report made by ACUREN, no repairs of defective welds were required, either on the tank shell or nozzles.

MOSHER ENGINEERING LTD

Role during construction phase : Welding of pipelines and support brackets between the 5.6 M liters tank and the fuel dispensing module.

In early November 2008, a crew of two (2) workers has welded the pipelines and installed the flanged connections and gate valves between fuel tank 680-TK-042 and the fuel dispensing module manufactured by CHAMCO INDUSTRIES LTD.

They have also installed check valves on the 100 mm diameter inlet and outlet nozzles on this tank, as well as a pressure relief valve set at 75 psi to bypass the check valve on the pipeline between the tank outlet and the fuel dispensing module. The grade of material that was used for this pipeline was A333 cold temperature rated steel.

CHAMCO INDUSTRIES LTD

Role during construction phase : Manufacturing of the fuel dispensing module.

This fuel dispensing module was manufactured in the summer of 2007 and sent to the Meadowbank site. No representatives of CHAMCO were present during the commissioning. Possibly due to vibrations during transport, there were many flanged connections that needed tightening, and it was found that this was not a turn-key installation. The air eliminator unit on the fuel tanker unloading area leaked fuel extensively during operation, as it was often locked in open position.

C. REVISION OF CONSTRUCTION DRAWINGS

AEM has hired STAVIBEL Engineering Services, a firm based in Val-d'Or, in order to complete the drawings that were used in producing this report.

Those four (4) drawings are enclosed in **Appendix 1** of this report.

Drawing VD2259-MDB-001 shows the general layout of the fuel tank 680-TK-042 and containment area. It has been compiled using surveying data collected by a crew from AEM. It also shows the location of pipelines, fuel dispensing module, and some three (3) additional fuel tanks.

Drawing VD2259-MDB-002 shows the cross-sections on both sides of the containment area. These cross-sections are derived from surfaces that were generated using the *Autocad Civil 3D* software, and are also based on information collected from AEM Construction Supervisors. This drawing file was also used to verify containment volumes, as it is described further in section D.

Drawing VD2259-MDB-003 is an as-built version of Vendor drawing BL-2008-80-1 which has been updated to reflect nozzle orientations that were noted during a site visit. No changes were noted except those made to the nozzle schedule.

The enclosed **Revision 1** of drawing 017202-2000-46D6-2001 from SNC-LAVALIN is also an as-built drawing. It shows a few items from the proposed piping layout for the Meadowbank bulk fuel storage that have not yet been put in place. These missing items consists in three (3) pressure relief loops around gate valves, and a 300 US gallon floor sump, which was to be located inside the fuel dispensing module. This floor sump has not been supplied by CHAMCO INDUSTRIES LTD.

Also enclosed is a vendor drawing from CHAMCO INDUSTRIES LTD, which shows the piping details inside the fuel dispensing module.

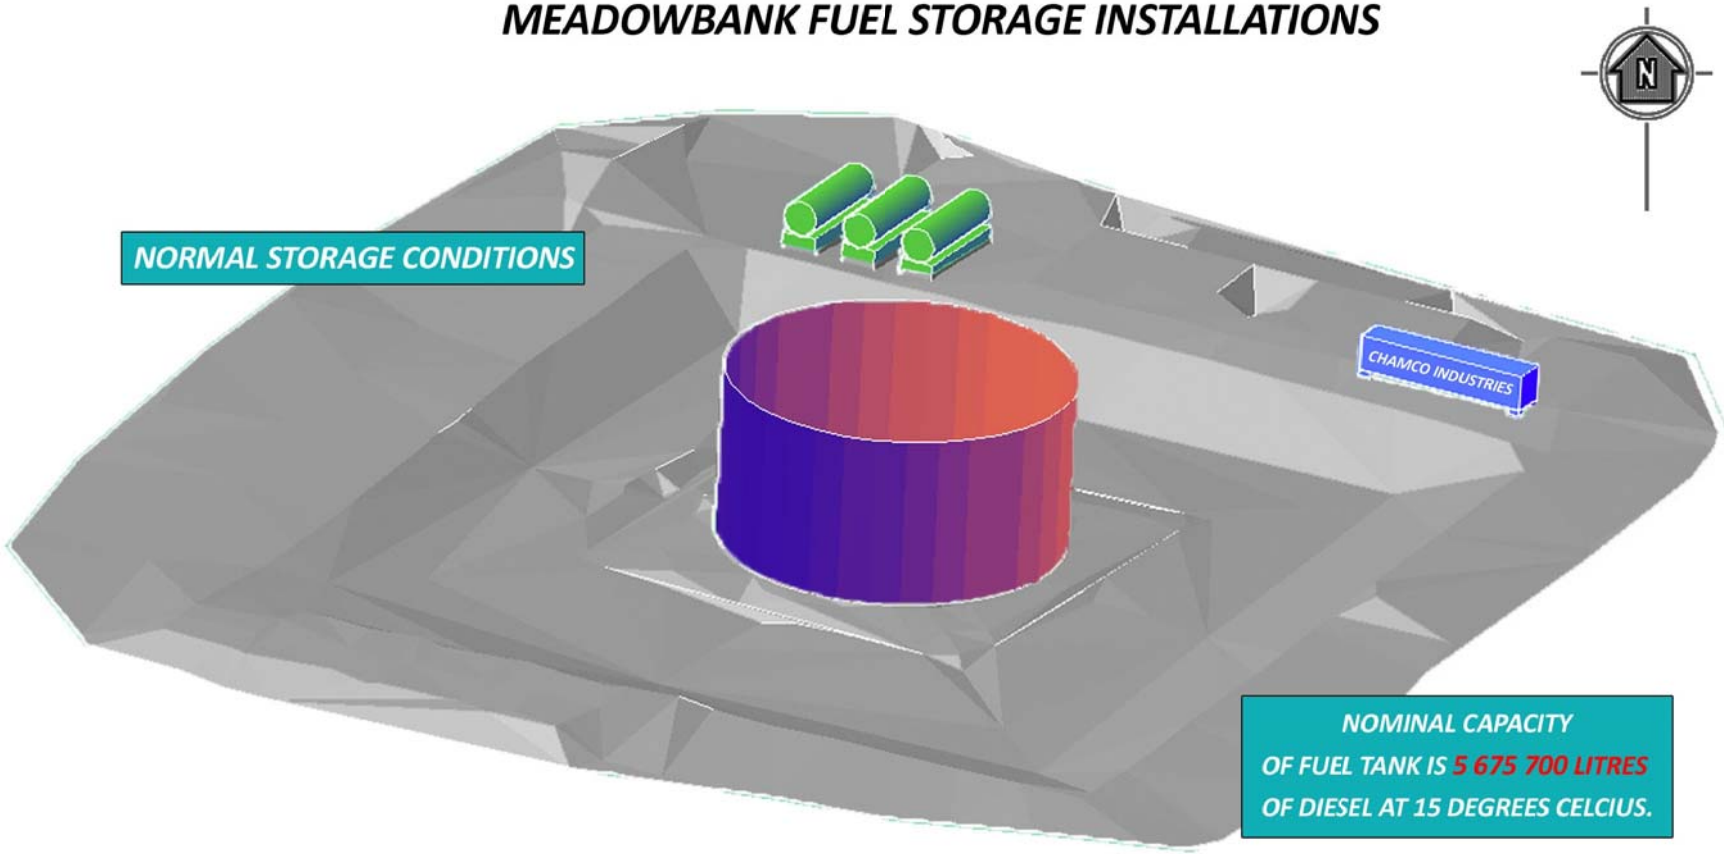
D. VERIFICATIONS TO STORAGE CAPACITY WITHIN BERMS

STAVIBEL Engineering Services has completed verifications on the liquid storage capacity inside the containment berms, which create an impermeable enclosure around tank 680-TK-042.

The method used was a volume calculation using *Autocad CIVIL 3D* software.

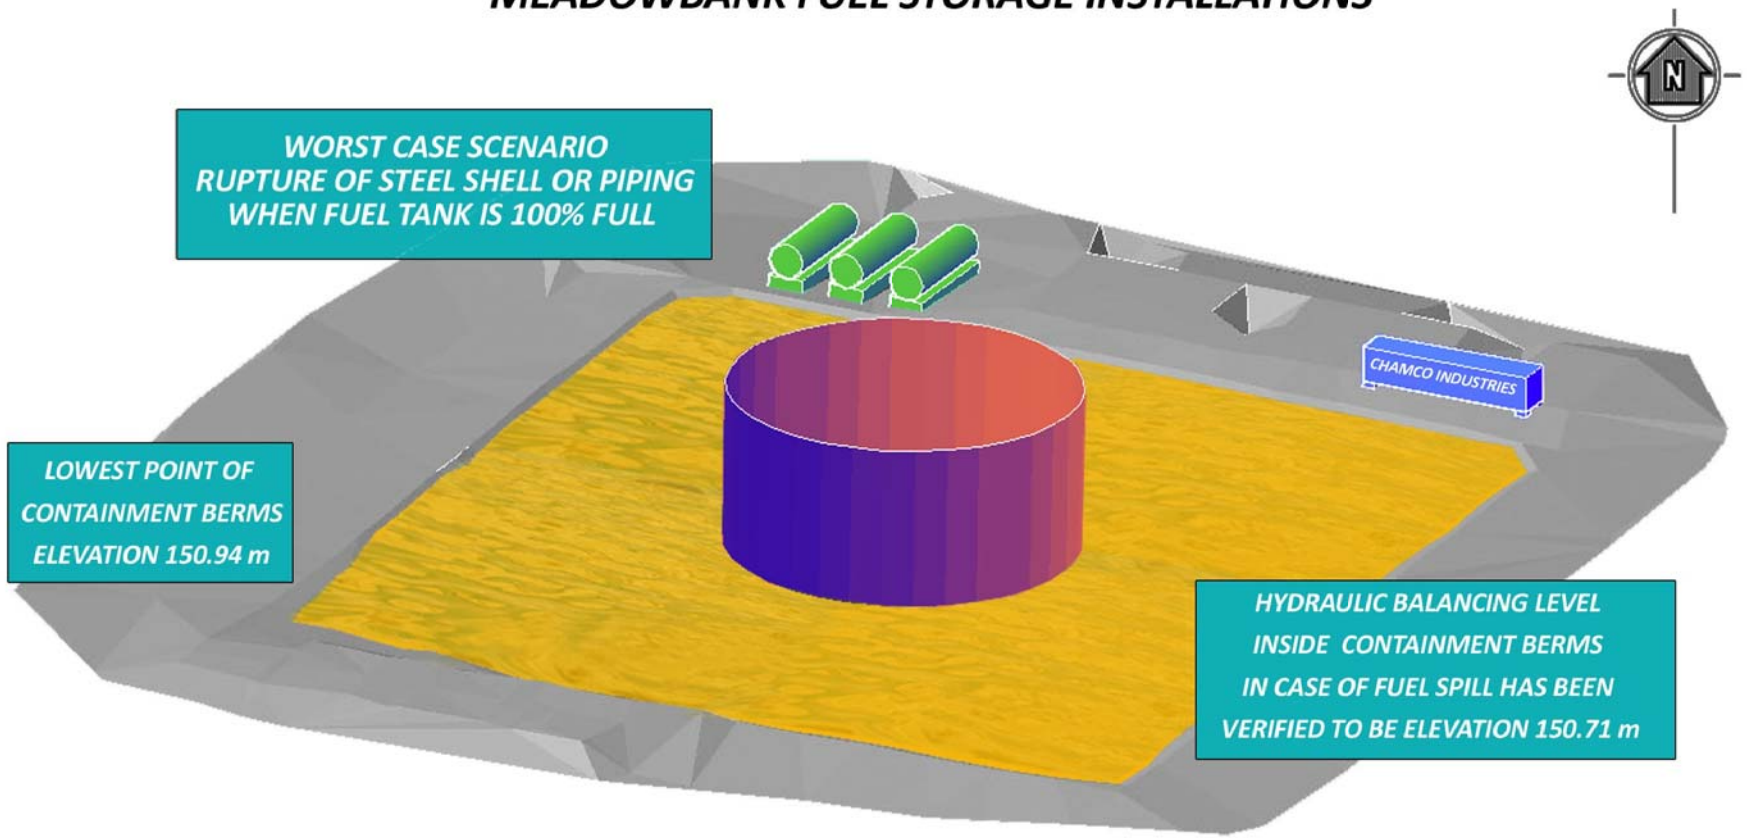
The maximum storage capacity of fuel tank 680-TK-042 is 5 675 700 litres of diesel fuel at a standard temperature of fifteen degrees Celcius (15 °C).

It has been verified using the above software that the impermeable enclosure around this fuel tank will effectively hold one hundred and ten percent (110 %) of its maximum storage capacity. This theoretical calculation does not include the volume inside the tank itself, as if the fuel was pumped outside the tank.



Thus, the lowest point of the HDPE membrane that sits atop the containment area is sufficiently high (at elevation 150.94 m) to meet the above criteria.

On the following pages are the results of a software simulation, which are showing a 3D view of the containment area in normal storage conditions, as well as another view showing the worst case scenario.



This worst case scenario would consist in either a rupture of the first course of side plates in the tank shell, or a failure in the outlet piping, when the tank is 100% full.

This simulation shows that, in such a worst case scenario, the hydraulic balancing level inside the containment area would not exceed the point with the lowest elevation on the surrounding berms. There is a safety margin of about 200 mm.

SAFE FILL LEVEL FOR FUEL TANK 680-TK-042

The safe fill level of fuel tank 680-TK-042 depends on the temperature of the fuel inside the tanker, as well as outside temperature. In order to allow room for thermal expansion of diesel fuel, some care must be taken not to exceed the safe fill levels stated hereunder. The VAREC float gives imperial readings.

safe fill for fuel tank 680-TK-042

Hazardous Materials Management Plan

Meadowbank Mine Site

Whale Tail Pit Site

Baker Lake Facilities

In Accordance with Water License 2AM-MEA1526 & 2AM-WTP1826

Prepared by:

Agnico Eagle Mines Limited – Meadowbank Division

Version 4
March 2019

EXECUTIVE SUMMARY

General Information

The Hazardous Materials Management Plan (HMMP) will be executed within the scope of normal operations. The Meadowbank Mine and Whale Tail Project requires that the transportation, storage, handling and use of hydrocarbon products, ammonium nitrate and associated explosive materials, and all other chemicals be conducted in a safe and efficient manner. Ore and material (including various hazmat products and waste) will be shipped along the Whale Tail Pit Haul Road (WTHR) an All-Weather access road (AWAR).

Annual Review

The HMMP will be reviewed annually and updated as required. Completion of the annual review of the HMMP will be documented through signatures of the personnel responsible for reviewing, updating and approving the HMMP.

IMPLEMENTATION SCHEDULE

As required by Water License 2AM-MEA1526 and 2AM-WTP1826, the proposed implementation schedule for this plan is effective immediately and subject to any modification proposed by the Nunavut Water Board as a result of the review and approval process.

1 INTRODUCTION

1.1 PURPOSE & SCOPE OF THE PLAN

The purpose of this plan is to provide a consolidated source of information on the safe and environmentally sound transportation, storage, and handling of the major hazardous products that are used at the Meadowbank Mine and Whale Tail Pit. A hazardous material is one that, as a result of its physical, chemical, or other properties, poses a hazard to human health or the environment when it is improperly handled, used, stored, disposed of, or otherwise managed. In combination with Agnico Eagle's Emergency Response Plan (ERP) and Spill Contingency Plan (SCP), this Hazardous Materials Management Plan (HMMP) provides instruction on the prevention, detection, containment, response, and mitigation of accidents that could result from handling hazardous materials.

The plan is based on the following principles of best practice management for hazardous materials:

- Identify and prepare materials and waste inventories;
- Characterize potential environmental hazards posed by those materials;
- Allocate clear responsibility for managing hazardous materials;
- Describe methods for transport, storage, handling, and use;
- Identify means of long-term storage and disposal;
- Prepare contingency and emergency response plans;
- Ensure training for management, workers, and contractors whose responsibilities include handling hazardous materials; and
- Maintain and review records of hazardous material consumption and incidents in order to anticipate and avoid impacts on personal health and the environment.

All hazardous materials to be used at the Meadowbank and Whale Tail Projects operations will be manufactured, delivered, stored, and handled in compliance with all applicable federal and territorial laws and regulations. Agnico Eagle is committed to preventing, to the greatest extent possible, both inadvertent release of these substances to the environment and accidents resulting from mishandling or mishap. Agnico Eagle has instituted programs for employee training, facility inspection, periodic drills to test systems, and procedural review to address deficiencies, accountability, and continuous improvement objectives.

Agnico Eagle actively works towards minimizing the generation of hazardous wastes by investigating alternatives to the use of hazardous materials, by recycling products and containers wherever feasible, and by treating wastes using state-of-the-art technologies before any release to the environment.

As with all other aspects of health and safety policy at the Meadowbank mine, all employees will be expected to comply with all applicable precautions and handling procedures with regard to hazardous materials. Employees are also expected to report any concerns to their supervisors, the Occupational Health & Safety Committee (OH&SC), or senior site management. All staff are encouraged to bring forward suggestions for improvements that can be incorporated into procedure revisions as appropriate.

1.2 APPLICABLE LEGISLATION

Both federal and territorial legislation regulate the management of hazardous materials in Nunavut. Copies of relevant legal documents are kept on file at the mine site. Agnico Eagle will regularly update the HMMP with respect to applicable legislation, and ensure that current legislation documents are available at the mine site.

Management and safety personnel provide an overview of the applicable regulations to all employees as part of their initiation and ongoing training. The acts, regulations, and guidelines pertinent to the hazardous products that are used at the Meadowbank Gold Project[1] are listed in Appendix A.

The *Transportation of Dangerous Goods Act* classifies hazardous materials into nine (9) main classes according to an internationally recognized system, as follows:

- Class 1 – Explosives;
- Class 2 – Gases;
- Class 3 – Flammable liquids;
- Class 4 – Flammable solids;
- Class 5 – Oxidizing substances and organic products;
- Class 6 – Poisonous (toxic) and infectious substances;
- Class 7 – Nuclear substances, within the meaning of the Nuclear Safety and Control Act, which are radioactive;
- Class 8 – Corrosives; and
- Class 9 – Miscellaneous products or substances.

Fuel products hazard classes and potential impacts are presented in Table 1.

[1] The Meadowbank Gold Project includes the Meadowbank mine site, the Baker Lake facilities All-weather Private Access Road, the Whale Tail open pit and the haul road between Meadowbank and Whale Tail Pit.

2 OVERVIEW OF HAZARDOUS MATERIALS

2.1 HAZARDOUS MATERIALS AND FUEL STORAGE LOCATIONS

The primary storage locations for hazardous materials, hazardous wastes and fuel are shown on Figures 1 to 6. Figure 1 and 2 are respectively a general layout of the Meadowbank mine site and Vault open pit. Figure 3 identifies hazardous material storage areas at Meadowbank mine site. Figure 4 shows the Diesel Fuel Tank Farm and Figure 5 show the Jet-A Fuel Tank Farm at the Baker Lake Marshalling Area. Figure 6 provides a general layout of camp infrastructure at the Whale Tail Project, including a Hazardous Material Storage Area. Hazardous materials are to be located in all work areas such as the warehouse, mine maintenance shop and bulk fuel storage facility. Comprehensive lists of all hazardous materials and the estimated quantities that are and will be stored at the mine site and the satellite open pit are provided in Appendix B. Hazardous materials used in the process plant will only be located at the Meadowbank site.

Petroleum products, explosives, sodium cyanide and miscellaneous hazardous materials are stored in facilities that contain no open drains, utilize concrete berms, and incorporate lined areas or secure sea-cans. Storage tanks on site are regularly inspected and maintained.

Meadowbank's permanent storage facilities are clearly identified as storage facilities for hazardous materials with proper labelling. These are ventilated in order to prevent the build-up of toxic fumes or dust, which could harm both the personnel present and the environment. The facilities are secured and only authorized personnel have access to the area. The same will hold true for the Whale Tail storage facilities. Additionally, the Whale Tail site includes a hazardous material storage area next to the tank farm where products and wastes will be held until they are either consumed or transported to Meadowbank for treatment or sent south to a certified waste management company for disposal or recycling.

2.2 TYPES OF HAZARDOUS MATERIALS

The Meadowbank Gold Project requires the use of the following types of classified hazardous materials:

- Petroleum products and lubricants – diesel fuel, Jet-A, oils, greases, anti-freeze, and solvents used for equipment operation and maintenance;
- Meadowbank Process plant consumables – sodium cyanide, caustic soda (sodium hydroxide), sulphur prills, carbon sodium metabisulphite, nitric acid , calcine lime, flocculants, calcium chloride, borax, silica, lead nitrate, and anti-scalants used in mineral extraction;
- Water treatment chemicals - silica sand and flocculants polymers;

Explosives – emulsion, caps, and high explosives used for blasting in the mine; and

- Meadowbank Laboratory chemicals and wastes – various by-products classified as hazardous waste and chemicals such as nitric acid used in the assay laboratory.

Sections 5 and 7 contain general information and safe handling procedures for the first four categories above. Laboratory wastes are generally very limited in quantity and will be handled only by specialist laboratory technicians. These wastes will be pumped to the grinding circuit in the process plant for recycling and eventually become part of the tailings disposal stream. As such, they are not addressed separately in this document.

2.3 GENERAL HAZARDOUS MATERIAL STORAGE GUIDELINES

Agnico Eagle is committed to the safe and appropriate storage of fuels, hazardous materials and hazardous wastes. The following sections outline Agnico Eagle's general guidelines for storing fuels, hazardous materials and hazardous wastes.

2.3.1 General Guidelines for Storage Drums/Containers

Hazardous materials/waste shall be stored in super sacs/drums/sea containers according to the following guidelines:

- In the original containers, where possible, or in containers compatible with the material being stored to prevent corrosion or chemical interaction that could lead to leaks or fires;
- Storage containers shall be in good condition, sealable and not damaged or leaking;
- Drums containing hazardous materials/wastes expected to be in storage for more than six months shall be placed on pallets or on a well-drained storage area to prevent rusting;
- Each container shall be clearly labelled to identify the substance being stored according to the requirements of the *Workplace Hazardous Materials Information System* (WHMIS) and as specified in the MSDS;
- Containers shall be kept closed except when adding or removing product;
- Containers with product shall be kept in the upright position, empty drums can be placed horizontally;
- Containers shall be arranged to prevent damage from falling or dislodging; and
- Containers shall be arranged to allow for easy access and inspections.

2.3.2 General Guidelines for Storage Areas

To assist in the safe and secure storage of fuels, hazardous materials and hazardous wastes, the following general guidelines for storage areas/facilities are followed:

- Design of storage areas are in compliance with the *National Fire Code*, where appropriate;
- Compliance with the Canadian Council of Ministers of the Environment (CCME) publication, *"Environmental Code of Good Practice for Above Ground Storage Tank Systems Containing Petroleum Products"*. This CCME code deals with inventory control, inspections, corrosion protection, records and monitoring. Environment Canada's *Storage Tank Systems for Petroleum Products and Allied Petroleum Products Regulations* outline registration and documentation requirements for storage tanks;
- Storage areas are adequately signed indicating that hazardous materials/wastes are stored therein;
- Storage locations are clearly defined and marked to prevent damage of storage drums and containers in the event they are covered by snow;
- Incompatible materials are segregated by chemical compatibility within the storage area to prevent contact between materials in the event of a release;
- Storage areas are located at least 30 metres from surface water and on a low-permeability area;
- Storage areas are readily accessible for firefighting and other emergency procedures;
- Storage areas are adequately ventilated to prevent the build-up of noxious or toxic vapours;
- Where necessary secondary containment is installed to allow for the containment of at least 110% of the largest container or tank volume within the contained area;
- Storage areas are constructed, or provided with barriers, to protect containers from physical damage;
- Adequate spill and emergency response equipment has been installed at large volume storage areas – i.e.; bulk fuel tank facilities (i.e. spill control, fire protection, etc.). A list of spill control equipment is provided in the Spill Contingency Plan.

3 HAZARDOUS MATERIALS LIFE CYCLE MANAGEMENT

3.1 LIFE CYCLE MANAGEMENT

"Life cycle management" implies the assessment of a particular product over its entire life — from the time where a material need is identified to the time the product is fully consumed or disposed of as waste. It covers product supply, transportation, storage, handling, recycling, and waste disposal. Agnico Eagle is committed to ensuring proper life cycle management of all products used at the Meadowbank and Whale Tail sites, including hazardous materials. Agnico Eagle and its contractors will deal only with reputable, certified suppliers, transporters, and expediters.

3.1.1 Delivery

All hazardous materials are delivered to site by commercial carriers in accordance with the requirements of the *Canadian Transportation of Dangerous Goods Act* (TDGA). Carriers are licensed and inspected as required by the Department of Transportation. All required permits, licences, and certificates of compliance are the responsibility of the carrier. All shipments are properly identified and labelled. Shipping papers must be accessible and include information describing the substance, immediate health hazards, fire and explosion risks, immediate precautions, firefighting information, procedures for handling leaks or spills, first aid measures, and emergency response telephone numbers.

Each transportation company is required to develop a spill prevention, control, and countermeasures plan to address the materials they are importing. In the event of a release during transport, the commercial transportation company is responsible for first response and cleanup. Agnico Eagle intends to periodically verify the qualifications of transport companies, their personnel and the existence of their spill prevention, control and countermeasures plan.

3.1.2 On-Site Handling

Once dangerous goods are received at the workplace, additional regulations apply. The federal *Workplace Hazardous Materials Information System* (WHMIS) calls for the proper labelling of products, the availability of product information in the form of MSDS, and employee education on how to identify and handle hazardous products. Agnico Eagle has established procedures for obtaining MSDS with new product deliveries; maintaining MSDS current (i.e. no older than three years), and maintaining a system of hardcopy or electronic MSDS that are readily accessible by all employees. A chemical tracking system is also established and all news hazardous material used on site are reviewed by Health and Safety and Environmental Department before the first use.

All hazardous materials are stored in secured areas to prevent access by unauthorized personnel or any tampering. All tanks used for the storage of diesel and aviation fuel have been installed in secondary containment areas sized to hold at least 110% of the volume of the largest tank or in double walled storage tanks. Tanks and vessels in the process plant are installed on concrete surfaces sloping

to interior sumps that will route spilled solutions to lined collection areas. Additional guidelines for the storage of hazardous materials are provided in Section 2.3.2.

In support of pollution prevention, Agnico Eagle has established procedures for the regular inspection of storage containers and facilities. If deficient conditions are identified, appropriate corrective actions are taken and documented. Additional details for inspection of storage areas are provided in Section 9.

Emergency response procedures for spilled chemical substances are provided in the Spill Contingency Plan (SCP) (see also the Emergency Response Plan (ERP). These procedures outline the response to accidental spills or releases of hazardous materials to minimize health risks and environmental effects. Included are procedures for evacuating personnel, maintaining safety, cleanup and neutralization activities, emergency contacts, internal and external notifications to regulatory authorities, and incident documentation.

3.1.3 Wastes

On becoming wastes, materials are stored and/or disposed of in accordance with specific government regulations and guidelines. Agnico Eagle stores most waste materials on the Meadowbank site in secure facilities until they can be transported to a provincial jurisdiction for recycling or disposal. Wastes materials originating from the Whale Tail site are to be sorted at Whale Tail sites, packaged at the source and delivered to Meadowbank for management, shipment to Baker Lake and ultimately sent on the barge. The waste will be stored in a seacan on a lined pad. The length of time the wastes will be stored at Whale Tail Pit will depend on the product and the time it takes to fill a seacan for safe shipment along the Haul Road.

Process plant tailings pass through a treatment plant for cyanide destruction using the standard Inco SO_2/air process or through chemical destruction with Sodium Metabisulphite before being disposed of in the tailings pond. The cyanide content of the tailings material is reduced to 15 ppm (parts per million). Cyanide further degrades naturally with exposure to air and sunlight (UV) in the Tailings Storage Facility. The current regulatory requirement for cyanide content in liquids released to the environment is 1 mg/L for a single grab sample or no greater than 0.5 mg/L average for the month (Nunavut Water Board Water License).

The Nunavut Department of Environment and Environment Protection Service (EPS) monitor the movement of hazardous waste from the generator to final disposal, through use of a tracking document known as a Waste Manifest. Accordingly, a Waste Manifest accompanies movements of hazardous wastes for the Meadowbank Project. Agnico Eagle is registered with the EPS as a waste generator, and employs only registered waste carriers to transport waste to registered/approved waste receivers. A copy of the completed manifest will be maintained for a period of two years after the hazardous waste is received by the authorized waste disposal facility.

3.1.4 Empty Product Containers

Many empty chemical containers are not safe to dispose of directly and require handling precautions identical to those for full containers. Chemical users must be familiar with safe waste handling and storage procedures supplied by manufacturers in MSDS. The containers are backhauled to the Baker Lake Marshalling Area for disposal at an approved facility. These containers are stored and hauled south via sealift.

4 SODIUM CYANIDE

4.1 INTRODUCTION

Large quantities of sodium cyanide are used at the Meadowbank Gold Project to optimize gold recovery from the ore. Due to transportation restrictions, normally a full year's supply of sodium cyanide will be transported and stored on site. This product will be transported, stored, handled, transferred and used in compliance with appropriate legislation and applicable Best Management Practices. Agnico Eagle became a signatory to the International Cyanide Management Code in 2011.

4.1.1 Physical Properties

Cyanide is one of only a few chemical reagents that will dissolve in water. Gold mining operations use very dilute solutions of sodium cyanide, typically in the range of 0.01% to 0.05% cyanide (100 to 500 ppm). Unlike many synthetic chemicals, cyanide oxidizes and decomposes when exposed to air or other oxidants (UV sunlight rays), and does not persist in the environment. As such, it does not give rise to chronic health or environmental problems when present in low concentrations.

4.1.2 Cyanide Production

Cyanide production and handling are highly regulated. Both the manufacturer and Agnico Eagle employ stringent risk management systems to prevent injury or damage from the use of cyanide.

Sodium cyanide for the Meadowbank project is in briquette form, and packaged in water-resistant super sac and 4mm bags inside an intermediate bulk container (IBC). The IBC holds 1,000 kg of cyanide, and have the following approximate dimensions: 44" x 44" x 44". For shipment, there are normally 20 IBCs in a sea can container.

4.1.3 Cyanide Transport

Cyanide producers audit purchasers and transportation systems. They design special packaging for the transport of cyanide and inventory all shipments against delivery records to ensure proper surveillance at all times. All shipments are accompanied by MSDS that provide the chemistry and toxicity of sodium cyanide, instructions in case of accidents, and emergency telephone numbers for assistance.

Truck, rail, and barge transporters screen their employees, carefully inventory shipments and, establish and maintain systems for loading and unloading cyanide products. Product handling and transportation are in accordance with protocols set by the industries and in compliance with national and international regulations.

For the Meadowbank Project, the IBCs are properly stacked in sea containers and transported by ship from Becancour, QC to Baker Lake, NU. At Baker Lake, the containers are transferred from barge to truck for transport to the Meadowbank mine site. At no point during transport the sea container or IBCs will be opened. From the point of cyanide packaging and onwards, the bags will only be opened on site, when and at the location (mill) where the use of cyanide is required.

This method of cyanide transport provides three levels of containment. The cyanide is contained within plastic bags. In the event one of the bags ruptures, the cyanide is contained within the IBC. In the event the IBC container breaks, the cyanide is contained within the sea container, which provides a tertiary precautionary measure for minimizing the impact of the spilled material.

4.1.4 On-Site Storage & Handling

The cyanide is stored on site in a dark, cool, dry, location. Cyanide is stored in sealed sea cans until the time it is needed for processing. Only as much as needed is removed from storage at any one time. The cyanide storage area is located close to the processing plant. Only authorized personnel have access to the cyanide storage.

When cyanide is required, only the quantity required for immediate use will be removed from storage. The cyanide bag will be lifted by its straps (the straps are provided by the manufacturer as part of packaging; see Appendix C for an illustration) using a forklift, and then using an overhead crane to lower onto a specially designed knife slitter that cuts the bag. The contents of the bag will drop into a mixing tank. At no time does the cyanide need to be physically handled by Meadowbank personnel.

The IBC materials are properly decontaminated and disposed of according to all applicable regulations to prevent environmental impact. Before disposal, the bags are visually inspected to ensure they are empty, and triple rinsed and drained to dissolve any residual cyanide left in the bag. Rinse water from the flushing process is recovered and reused in the cyanide mix tank and used in the gold recovery plant.

All personnel potentially exposed to cyanide, including contractors and visitors, receive appropriate training (see Section 10).

4.1.5 Spills

In the event a spill occurs, the cyanide will be promptly cleaned up to minimize its exposure to humans and the environment. A dry spill will be swept up and disposed of in a drum or other suitable container. In the event of a wet spill, the spill procedures will be carried out to prevent environmental contamination and the appropriate authorities will be contacted. For more information on spills handling and containment, see the SCP and ERP.

After cleaning up as much cyanide as possible, the area will be decontaminated using a small amount of caustic solution (i.e., 1 oz. /5 gal hypochlorite solution). This will help keep the pH in the 10 to 11 range and suppress the formation of lethal HCN gas.

4.1.6 International Cyanide Management Code

Agnico Eagle is a signatory to the International Cyanide Management Code (the Code) for the manufacture, transport and use of cyanide in the production of gold. The Code is administered by a non-profit institute consisting of participants from the gold mining industry, governments, nongovernmental organizations, labour, cyanide producers, and other interested parties.

The Code represents a voluntary commitment on the part of all signatories to identify and follow basic principles and guidelines for safe cyanide use at gold mining operations. This is the first such generic international code in the history of the mining industry. Under the Code, gold mines are required to manage their cyanide from source to site, thus assuming "cradle to grave" responsibility for all cyanide used at their operation.

5 PETROLEUM PRODUCTS

5.1 PRODUCT DESCRIPTION

The Meadowbank and Whale Tail Project operations use large amounts of fuel and lubricants (petroleum products). These products are transported, stored, handled, transferred and used in compliance with the appropriate legislation and Best Management Practices.

5.2 DELIVERY TO SITE

With the exception of diesel and aviation fuel, most petroleum fuel and lubricant products are delivered to the two sites and stored in the original packing container from the manufacturer. These types of containers include a variety of sealed drums, pails, 1 tonne super sac, bulk cubes, cans, and tubes.

Due to transportation restrictions, i.e. climate, a full year's supply of fuel and lubricants is transported and stored on-site, in order to meet the demand of the upcoming year. During the summer months, diesel and aviation fuel are shipped from Becancour, QC to Baker Lake, NU where it is transferred into storage tanks. From the Baker Lake storage tanks, fuel is transported daily on the AWAR to Meadowbank and in the near future on the Whale Tail haul road to Whale Tail Pit bulk fuel storage sites via contracted tanker trucks.

Diesel fuel coming from the Baker Lake Tank Farm is stored onsite at the Meadowbank site in a single 5.6 million litre tank within secondary containment, and the aviation fuel into two (2) – 50,000L double walled tanks at the airstrip. Similarly for the Whale Tail site, diesel fuel originating from the Baker Lake Tank Farm will be stored in one 1,500,000 L tank within secondary containment. From there, the diesel at both sites is delivered directly to the power plants by above ground pipes or redistributed into different storage tanks by an on-site tanker. Table 2 provides the varieties and volumes of petroleum products stored on site and their storage locations at Meadowbank.

Exploration will have up to 37 envirotanks of diesel for use in their underground and regional exploration programs.

The Baker Lake fuel farm consists of six (6), ten (10) million litre (L) tanks for diesel fuel and eighteen (18), 100,000L double walled tanks, within secondary containment, for aviation fuel. Agnico Eagle is currently working to permit the addition of two (2) ten (10) million L tanks for diesel fuel to the Baker Lake fuel farm. The diesel fuel tanks are single-walled and constructed of welded steel. The aviation fuel tanks are double-walled and constructed of steel. Both Baker Lake Fuel Farm and storage locations have been designed and constructed to meet the CCME guidelines for *Aboveground Storage Tank Systems Containing Petroleum and Allied Petroleum Products*. The fuel unloading facility in each area includes a sloped lined pad to prevent contamination of the receiving environment. A continuous 60 mm high-density, polyethylene liner sheet is installed under the tanks and the internal sides of the berm. The containment area is sized to hold 110% of the volume of the largest tank.

All fuel transfer and storage facilities have been designed in accordance with the Canadian Council of Ministers for the Environment (CCME, 1994) *Environmental Code of Practice for Above Ground Storage Tank Systems Containing Petroleum Products*, and the *National Fire Code*.

Appropriate measures are in place to minimize impacts to surface water, groundwater and soils from potential vehicle accidents when transporting petroleum products to the site. Details of petroleum product safe handling procedures and proper PPE can be found in Tables 3 and 4. Details of spill response measures are presented in the SCP. The following general precautions will be taken:

- A maximum speed on the All-Weather Private Access Road and the Whale Tail haul road for loaded and empty vehicles has been established based on the road design which considers safety and the protection of wildlife. This speed limit is 50 km/hr;
- All trucks will carry a spill kit;
- Trucks are equipped with a reliable radio and/or satellite phone; and
- Agnico Eagle commits to being prepared to respond to spills resulting from vehicle accidents on both roads in a timely and efficient manner. Refer to the Spill Contingency Plan.

5.3 FUEL TRUCK TRANSFER PROCEDURES

A contract supplier fills the storage tanks in the main tank farms at both sites. General procedures to be followed are listed below. Similar procedures would be followed for fuelling remote station tanks.

Before fuel transfer, verify that:

- All fuel transfer hoses are connected properly and couplings are tight;
- Transfer hoses are not obviously damaged;
- Fuel transfer personnel are familiar with procedures;
- Personnel are located at both the fuel delivery truck and fuel transfer tank(s) and can manually shut off the flow of fuel;
- If a high liquid level shutoff device is installed at the delivery tank, verify that the shutoff is operating correctly each time it is used; and
- Fuel transfer will then proceed per the established procedures of the contract supplier.

Any accidents or spills must be reported immediately to the Environmental Department representatives at the Meadowbank or Whale Tail sites. Notification and response procedures are detailed in the Spill Contingency Plan.

5.4 CONTAMINATED SOILS AND SPILLS

All contaminated spill pads, and booms resulting from the storage and handling of fuels and lubricants will be salvaged at the time such impacts are identified, and put into Quatrex bags, labelled and shipped off-site to an approved disposal facility or incinerated (small quantities) on site. All the petroleum hydrocarbon contaminated soil from the Meadowbank and Whale Tail sites is placed into the Meadowbank landfarm for treatment. At this time, a landfarm will not be established at the Whale Tail Pit site. Refer to the *Landfarm Design and Management Plan* for more details regarding the Meadowbank landfarm.

5.5 USED PETROLEUM PRODUCTS

Used oil that is no longer suitable for its intended use is classified as a liquid waste. The discharge of used oil into the environment, including but not limited to landfills, sewers and water bodies, is prohibited.

Used oil is used as auxiliary fuel at the secondary chamber at the Meadowbank incinerator or in designated on site waste oil heaters. This used oil burner at the incinerator has the capacity to handle approximately 200,000 litres of used oil per year. Refer to the *Incinerator Waste Management Plan* for more information. Similarly, at the Whale Tail site, waste oil will be used in the incinerator or waste oil heaters. Failing this, the waste oil will be sent to Meadowbank where it will be consumed or shipped to an accredited recycling facility.

All used oil products that are not burned in the incinerators or waste oil heaters are collected in tanks or drums marked “Waste Oil” and disposed of at an approved facility in the south. Empty petroleum containers are stored on site in a designated area and returned to the supplier on backhauls or disposed at approved facilities in the south. Oil filters are punctured and/or crushed and drained of their contents for 24 hours prior to disposal.

A random sample of used oil incinerated at both sites will continue to be analysed twice a year to ensure that it does not contain unacceptable levels of impurities, including cadmium, chromium, lead, total organic halogens (such as chlorine compounds), polychlorinated biphenyls (PCB) and ash content. Samples will be sent to an accredited laboratory (H2Lab) for analysis. Concentrations of parameters listed above will be compared to the criteria set out in Schedule A of the *Used Oil and Waste Fuel Management Regulations*. Alternate arrangements will be made for the off-site disposal, treatment or recycling of used oil that does not meet this criteria.

The following information is recorded in association with the incineration of used oil:

- Volume of used oil generated at each site;
- Volume of used oil incinerated at each site;
- Name and address of the person in charge, management or control of the used oil, and the place where the used oil was produced;

- Analysis of any representative sample of used oil;
- Summary of maintenance performed on the incinerators or processing equipment;
- Volume and nature of the products produced from the used oil; and
- Destination of the used oil products shipped from the Meadowbank Mine (including Whale Tail Pit facilities).

Table 1 - Fuel Products – Hazardous Classes & Potential Impacts

Material	TDGA Class[a]	Potential Environmental Impact
Diesel	3	Water & soil contamination
Motor oil	Not regulated	Water & soil contamination
Aviation fuel	3	Water & soil contamination
Hydraulic fluid	Not regulated	Low risk to water & soil with proper handling
Varsol	3	Water & Soil contamination
Automotive grease	Not regulated	Low risk to water & soil with proper handling
Ethylene glycol	Not regulated	Toxic by ingestion, could potentially be consumed by wildlife.

Table 2 - Fuel Products – Meadowbank and Whale Tail Site Storage Locations

Product	Total Quantity On-Site	Storage Location	Container	Presently used
Diesel	6.1 ML (potentially 66.1 ML including Baker Lake) and 1.5 ML at Whale Tail Site	Meadowbank Fuel farm	1 x 5.6 ML tank in berm area	Yes
		Whale Tail Fuel Farm	1 x 1.5 ML tank in berm area	Yes
		Meadowbank Powerhouse	2 x 25,000 L tank	Yes
		Exploration camp	1 x 10,000 L tank	Not in use but contains diesel
			1 x 75,000 L tank	Not in use but contains diesel
		Meadowbank Emulsion Plan	1 x 25,000 L tank	Yes

		Meadowbank Camp Emergency Genset	2 x 55,000 L tank	Yes
		Meadowbank Incinerator	1 x 2,200 L tank	Yes
		Meadowbank Fueling station	1 x 50,000 L tank	No
		Vault	4 x 50,000 L tank	Yes
			1 x 25,000 L tank	Yes
			1 x 10,000 L tank	Yes
		Baker Lake	6 x 10 ML tank in bermed area	Yes
Gasoline	60,000 L	Fueling Station	1 x 50,000 L tank	Yes
			1 x 10,000 L tank	Yes
Waste oil	50,000 L	Incinerator	1 x 50,000 L tank	Yes
Motor oils	*refer to Appendix B	Mechanical shop	Cubes or Barrels	Yes
		Powerhouse	Cubes or Barrels	Yes
		Exploration camp	Cubes or Barrels	No
Aviation fuel	100,000 L (potentially 2.1ML including Baker Lake)	Airstrip	2 x 50,000 L tank	Yes
		Exploration Camp	1 x 75,000 L tank	Not in use but contain aviation fuel
		Baker Lake	20 x 100,000 L tank in berm area	Yes
Hydraulic fluid	*refer to Appendix B	Mechanical shop	Cubes or Barrels	Yes
		Powerhouse	Cubes or Barrels	Yes
		Plant	Cubes or Barrels	Yes

Ethylene glycol	*refer to Appendix B	Mechanical shop	Cubes	Yes

Note: L = litre; ML = Mega-litre (1X10^6 litres).

Table 3 - Fuel Products – Safe Handling Procedures

Product	Handling Procedures
Diesel	Do not get in eyes, on skin, or on clothing. Avoid breathing vapours, mist, fume, or dust. Do not swallow. May be aspirated into lungs. Wear PPE and/or garments if exposure conditions warrant. Wash thoroughly after handling. Launder contaminated clothing before reuse. Use with adequate ventilation. Keep away from heat, sparks, and flames. Store in a well-ventilated area. Store in a closed container. Bond and ground during transfer.
Motor oil	Wear protective clothing and impervious gloves when working with used motor oils. To be handled generally consistent with other petroleum hydrocarbons.
Aviation fuel	See diesel procedures above.
Hydraulic fluid	Keep container closed until ready for use.
Ethylene glycol	Ensure adequate ventilation. Wear protective gloves and chemical safety goggles. Keep in tightly closed container, stored in a cool, dry, ventilated area. Separate from acids and oxidizing materials. Empty containers of this product retain product residues and may be hazardous.

Table 4 - Fuel Products – Personal Protective Equipment

Product	Personal Protective Equipment		
	Eyes	**Skin**	**Respiration**
Diesel	Chemical goggles	Neoprene or nitrile gloves; protective garments	None usually required
Motor oil	Chemical goggles	Neoprene or nitrile gloves; protective garments	None usually required
Aviation fuel	Chemical goggles	Neoprene or nitrile gloves; protective garments	None usually required; ensure adequate ventilation
Hydraulic fluid	Chemical goggles	None usually required	None usually required
Ethylene glycol	Chemical goggles	Neoprene or nitrile gloves; protective garments	None usually required; ensure adequate ventilation

6 EXPLOSIVES

6.1 PRODUCT DESCRIPTION

Explosives are required for blasting waste rock and ore in the mine. Transportation, storage, use, and handling of blasting materials are strictly regulated by the Federal *Explosives Act* and *Transportation of Dangerous Goods Act* (Class 1 – Explosives), as well as the following territorial Acts:

- Explosives Use Act and Regulations; and
- Mine Health and Safety Act and Regulations.

6.2 EXPLOSIVES STORAGE

Manufacturing, handling, and storage of explosives are carried out by QAAQTUQ – Dyno Nobel Canada Inc. However, a small amount of explosive materials are shipped to Meadowbank in the form of blasting caps and Agnico handles them. The bulk of the explosives used at site are Emulsion (XL-1000), which is a mixture of nitrites and emulsifier. Emulsion is mixed by Dyno Nobel in an on-site plant (Emulsion Plant shown on Figure 1), located near the Meadowbank Mine site.

The estimated annual explosives requirement for the Whale Tail satellite open pit is expected to vary from 6,000 to 11,000 tonnes per year, this being the same as presently used at Meadowbank. The use of explosives at Portage Pit, Goose Pit, Vault Pit, Phaser Pit and BB Phaser Pit, located on or near the Meadowbank Mine site, will cease upon completion of mining.

The existing emulsion plant at Meadowbank Mine will continue to operate with deliveries on an as needed basis to Whale Tail. The haul road will be used to truck explosives between Meadowbank and the Whale Tail sites, with a minimum amount of explosives to be stored at the Whale Tail Pit site in the remote emulsion storage located adjacent to the Whale Tail Pit operations. Explosives truck(s) will be based at the Emulsion Plant at the Meadowbank Mine.

The Whale Tail site will primarily use emulsion based explosives during construction and operations. Presplit explosives will also be used to control the final pit walls, where required.

Sea cans of emulsion and nitrite prills are stored on the Meadowbank Emulsion Plant site. They are stored within sea cans in quantities of approximately 20,000 kg's per sea can. These items are stored in separate locations so as to prevent the mixing of the two products. These products are also stored away from any other products, >40m away from the emulsion plant, and >25m from the fuel tanks.

The high explosive detonators and blasting caps are stored in an enclosed magazines located near the Meadowbank emulsion plant and will be stored at a safe location and distance from the Whale Tail Pit operations. It is estimated that approximately twelve magazines will be required on site, each being approximately 4 m x 14 m (i.e., not much bigger than a sea can).

The explosive mixing plant, product storage, and magazines are safely located away from vulnerable facilities, as stipulated by the federal and territorial *Explosives Use Act* and Regulations. The mixing plant is also used for the washing and minor repair of trucks and equipment used to handle the explosives.

6.3 USE OF EXPLOSIVES

The primary blasthole drills are diesel-powered rigs capable of drilling 152.4 mm diameter holes. Drilling requirements were calculated for ore and waste. A pre-shear and buffer blasting followed by mechanical wall cleanup is used for the final wall. Blasting operations are affected by several factors, including wall control and weather. A number of modified operating procedures will be implemented during the winter season. These may include minimizing the sleep time for loaded holes; ensuring that cuttings are mounded around the hole collars after loading to prevent snow drifting into the holes, and utilizing blasthole covers.

The responsibility for blasting is split between appropriately trained mine personnel and the explosives supplier, Dyno Nobel. Dyno Nobel is responsible for supplying and delivering blasting agents to the site, manufacturing the blasting product on site, delivering blasting agents to the blastholes and filling the holes. Agnico Eagle Blasters are responsible for charging the holes, placing the detonators and boosters, and tying-in the patterns. The AN and emulsion components are loaded on barges and transported to the Baker Lake Marshalling Area for temporary storage, if necessary, prior to transport to site. Dyno Nobel provide mixing and delivery trucks. Agnico Eagle provides diesel fuel and accommodations.

Blasting will be approximately daily and will average, in size, the daily production requirement of 50-90,000 tonnes per blast. Blasting will likely be by electric initiation and will feature current technology with down-the-hole delays to minimize the energy per delay to single hole loads. This will minimize backbreak, fly rock, vibration levels and will optimize fragmentation and minimize digging problems.

Blasting is carried out by certified blasters following blasting regulations and safe practices. All pit activities are under the supervision of certified mine supervisors, knowledgeable in mine operating regulations and best practices.

The manufacture and distribution of explosives is carried out by suppliers under Federal license to conduct such work. They provide and operate the explosives manufacturing plant under such license and authority.

Details on explosives inventory and inspections are provided in Section 9.2. Information on Explosives Handlers is available in Section 10.3.

6.4 DISPOSAL

Disposal of regular waste will follow the *Agnico Eagle Meadowbank Mine Waste Management Plan*.

Wash water that is created at the Emulsion plant is sucked out via vacuum truck and taken to the tailings storage facility for disposal.

Any unusable Emulsion waste is taken to the mines blast pattern for disposal down the bore holes.

7 PROCESS PLANT & WATER TREATMENT REAGENTS & CONSUMABLES

7.1 PRODUCT DESCRIPTION

The Process Plant (mill) uses a number of chemicals and reagents to treat the ore, recover entrained gold and to destroy cyanide. The Water Treatment Plant also uses a number of chemicals and reagents to treat water for TSS removal. Water Treatment chemicals would be used over a 3 to 4 month period during frost-free months only for dewatering and the discharge of the attenuation pond water to Mammoth Lake. The range in annual quantities used would reflect the different dosages that may be used during different mining stages (early operations, late operations, closure treatment of tailings water and polishing of pit lake water quality on a contingency basis). Material categories, site handling and storage requirements, and PPE recommended by manufacturers are summarized in Tables 5 to 8.

Table 5 - Process Plant & Water Treatment Reagents – Use, Consumption & Storage

Reagent	Use	Approximate Consumption		Phase	Normal Delivery Format	On-Site Storage
		Daily	Annual			
Acetylene	Welding	1-2	600	gas	gas cylinders	secured upright
Activated carbon (granular)	Gold recovery	340 kg	140 t	solid	500 kg bags	Pallet
Anti-scalant	Water treatment	25 kg	10 t	liquid	650 kg tote tank	Pallet drums
Borax	Refinery	60 kg	22 t	solid	40 kg bags	Pallet
Silica	Refinery	30 kg	11 t	solid	22.7 kg bags	Pallet
Calcium oxide (Quicklime) (CaO)	pH control	7,814 kg	3150 t	solid	1 t supersacs	Pallet
Calcium peroxide (alternative to hydrogen peroxide)	Potential use: Water treatment	minimal*	minimal*	solid	45 kg drum	Pallet drums
Copper sulphate ($CuSO_4$)	Cyanide destruction	1450 kg	585 t	solid	1 t supersacs	Pallet

Flocculant (Magnafloc 338 or Magnafloc 10)	Settling aid	300 kg	120 t	solid	25 kg bags	Pallet
Hydrochloric acid (HCl)	Refining/stripping	200 kg	75 t	liquid	20 gal drums	Pallet drums
Hydrofluoric acid	Laboratory	5 gallons	1 825 gallons	liquid	20 gal drums	Pallet drums
Hydrogen peroxide (alternative to calcium hydroxide)	Potential use: Water treatment	minimal*	minimal*	liquid	1 m^3 HDPE tote	Pallet
Lead acid batteries	Vehicles	-	24	liquid	-	Pallet
Nitric acid	Stripping	50 kg	18 t	liquid	34 kg bottle	Pallet
Paints	Maintenance	-	100 gallons	liquid	gallon	Pallet
Sodium cyanide (NaCN)	Leaching	3825 kg	1 540 t	solid	1 t box bags	Pallet
Sodium hydroxide (caustic soda) (NaOH)	Refining/stripping	20 kg	8 t	solid	25 kg bags	Pallet
	Refining/stripping	786 kg	320 t	solid	1000 kg	Pallet
Sodium metabisulphite ($Na_2S_2O_5$)	Cyanide destruction	7710 kg	3100 t	solid	1 t supersacs	Pallet
Sodium nitrate	Refinery	40 kg	15 t	solid	50 kg bags	Pallet
Sulphur	Cyanide destruction	745 kg	300 t	solid	1 t bags	Pallet

Note: kg = kilogram; t = ton; gal = gallon; m^3 = cubic metre.

Table 6 - Process Plant & Water Treatment Reagents – Hazard Classes & Potential Environmental Impacts

Material	Class	Potential Impact
Acetylene	2.1	Generally not hazardous for water.
Activated carbon	4.2	No information available.
Anti-scalant	Not regulated	Negligible with proper handling
Borax	Not regulated	Presents no health hazards.
Calcium oxide	Not regulated	No information available.
Calcium peroxide	5.1	Releases oxygen into environment when dissolved in water.
Copper sulphate	9	Harmful to aquatic life.
Flocculant	Not regulated	Acute fish, invertebrate, algae and bacteria toxicity.
Hydrochloric acid	8	Extremely toxic to aquatic life by lowering the pH below 5.5. When released into the soil, this material may leach into groundwater.
Hydrofluoric acid	8.6.1	No information available.
Hydrogen peroxide	5.1	Aquatic Toxicity 96-hour LC50.
Lead acid batteries	8	No information available.
Nitric acid	8	No information available.
Paints	Not regulated	No information available.
Silica	Not regulated	Generally not hazardous for water.
Sodium cyanide	6.1	Expected to be very toxic to aquatic life and to terrestrial life.

Sodium hydroxide	8	No information available.
Sodium metabisulphite	Not regulated	No information available.
Sodium nitrate	5.1	Possibly hazardous short-term degradation products are not likely. However, long term degradation products may arise. The products of degradation are less toxic than the product itself.
Sulphur	9	No info available (insoluble in water).

Table 7 - Process Plant & Water Treatment Reagents – Safe Handling Procedures

Product	Handling Procedure
Acetylene	Do not mix with air or oxygen above atmospheric pressure. Store away from oxidizing agents. Open and handle cylinder with care. Keep ignition sources away - Do not smoke. Protect from heat. Protect against electrostatic charges. Pressurized container: protect from sunlight, store in a cool location and do not expose to temperatures exceeding 50°C. Do not pierce or burn, even after use. Prevent impact and friction. Store in accordance with local fire code and/or building code or any pertaining regulations.
Activated carbon	Wash thoroughly after handling. Use with adequate ventilation. Minimize dust generation and accumulation. Avoid contact with eyes, skin, and clothing. Avoid ingestion and inhalation. Activated Carbon, especially when wet, can deplete oxygen from air in enclosed spaces, and dangerously low levels of oxygen may result. Store in a tightly closed container. Keep from contact with oxidizing materials. Store in a cool, dry, well-ventilated area away from incompatible substances.
Anti-scalant	Used in extremely small quantities. Can cause mild to moderate irritation of eyes, skin, and upper respiratory tract. Wash thoroughly after handling. Use sensible industrial hygiene and housekeeping products. Not flammable. Keep containers tightly closed
Borax	No special steps required.

Calcium oxide	Store in closed containers in a controlled drainage area under cover. Use in a well ventilated area. Empty containers retain product residues and may be hazardous.
Calcium peroxide	Wash thoroughly after handling. Avoid all situations that could lead to harmful exposure. Store in a cool, dry, well-ventilated place. Keep container tightly closed and away from incompatible materials and sources of heat.
Copper sulphate	Avoid contact with skin and eyes. DO NOT breathe dust. Always wash hands thoroughly after contact. Store and use only in dry, well-ventilated areas. Keep container tightly closed.
Flocculant	Dust generated in handling of this product can be explosive if sufficient quantities are mixed in air, in which case ignition sources should be avoided. Employ grounding, venting and explosion relief provisions in accord with accepted engineering practices in process operations capable of generating dust/or static electricity. Handle in accordance with good industrial practice, handle with care and avoid unnecessary personal contact. Avoid contact with eyes and prolonged or repeated skin contact. Avoid continuous or repetitive breathing of dust. Use only with adequate ventilation. Remove contaminated clothing; launder or dry-clean before reuse. Wash thoroughly with soap and water after using. For industrial use only. Slip hazard when wet. Material is slippery when wet. Store in the original container, securely closed, in a cool and dry location. Avoid extremes of temperature and ignition sources.
Hydrochloric acid	Do not get in eyes, on skin, or on clothing. Wear protective clothing. Avoid breathing vapours or fumes. Store in cool, dry, ventilated area with acid-resistant floors. Keep container closed, out of direct sunlight, and away from heat, water, and incompatible materials. When diluting, add acid slowly to water and in small amounts. Never use hot water and never add water to acid. When opening metal drum, use non-sparking tools because hydrogen gas may be present. Do not wash out container and use for other purposes. Empty containers retain product residues and may be hazardous.

Hydrofluoric acid	Wash thoroughly after handling. Remove contaminated clothing and wash before reuse. Use with adequate ventilation. Do not get on skin, in eyes or on clothing. Do not ingest or inhale. Store in a cool, dry, well-ventilated area away from incompatible substances. Do not store in metal or glass containers. Do not store in direct sunlight. Keep tightly closed. Empty container may contain hazardous residue. Do not add any other material to the container. Do not wash down the drain. Do not allow smoking or food consumption while handling. Store in approved containers only. Do not add water to acids.
Hydrogen peroxide	Use extreme care when attempting any reactions because of fire and explosion potential (immediate or delayed). Conduct all initial experiments on a small scale and protect personnel with adequate shielding as the reactions are unpredictable, and may be delayed, and may be affected by impurities, contaminants, temperature, etc. Do not get in eyes. Avoid contact with skin and clothing. Wash thoroughly after handling. Avoid contact with flammable or combustible materials. Avoid contamination from any source including metals, dust, and organic materials. In the event of an accident where large volumes of hydrogen peroxide might come into contact with external fires or with incompatible chemicals, a one-half mile area from the incident should be evacuated. Store in a properly vented container or in approved bulk storage facilities. Do not block vent. Do not store on wooden pallets. Do not store where contact with incompatible materials could occur, even with a spill (see "Hazardous Reactivity" on MSDS). Have water source available for diluting. Do not add any other product to container. Never return used or unused peroxide to container, instead dilute with plenty of water and discard. Rinse empty containers thoroughly with clean water before discarding. (See "Waste Disposal" on MSDS).
Lead Acid Batteries	Store batteries in a well-ventilated cool area. Handle carefully to avoid damaging or turning batteries over.
Nitric acid	Class 8 products are not to be loaded with class 1, 4.3, 5, 6, 7 or foodstuffs or foodstuff empties. Store in a well-ventilated area and out of direct sunlight. Keep containers closed at all times. Store away from oxidisable, caustic and combustible materials. Vapours heavier than air; prevent concentration in sumps and hollows. DO NOT enter confined spaces where vapour may have collected. Strong oxidising agent; can lead to fire or explosion with organic and/or combustible materials.
Paints	No special steps required.

Silica	Prevent formation of dust. This product is not flammable. When pouring into a container of flammable liquid, ground both containers electrically to prevent static electric spark. Keep containers tightly sealed.
Sodium cyanide	Highly toxic, corrosive to eyes, skin, and respiratory tract. Can be fatal if swallowed, inhaled, or absorbed through skin. Keep cyanide antidote kit available in any cyanide work area. Wear personal protective clothing at all times. Keep in tightly closed container in cool, dry, ventilated area. Protect against physical damage to containers. Do not store under sprinkler systems. Do not wash out container and use for other purposes. Empty containers retain product residues and may be hazardous.
Sodium hydroxide (caustic soda)	Can cause severe injury to eyes, skin, and respiratory tract. Use PPE at all times and DO NOT contact product directly. Wash thoroughly after handling. Store in dry, well ventilated area. Keep in original container, tightly closed. Empty containers retain product residues and may be hazardous.
Sodium	May cause irritation to eyes, skin, and respiratory tract with prolonged exposure.
metabisulphite	Sulphite-sensitive individuals may experience severe allergic reaction to dust. Releases sulphur dioxide gas when mixed with water. Wear PPE and wash thoroughly after handling. Store in dry, well-ventilated area away from heat, acids, and oxidizers. Keep container tightly closed. Use vacuum to clean up dust.
Sodium nitrate	Keep away from heat. Keep away from sources of ignition. Keep away from combustible materials. Empty containers pose a fire risk; evaporate the residue under a fume hood. Ground all equipment containing material. Do not ingest. Do not breathe dust. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as reducing agents, combustible materials, acids. Keep container dry. Keep in a cool place. Keep container tightly closed. Keep in a cool and well-ventilated area. Highly toxic or infectious materials should be stored in a separate locked safety storage cabinet or room.

Sulphur	Wash thoroughly after handling. Remove contaminated clothing and wash before reuse. Minimize dust generation and accumulation. May form flammable dust-air mixtures. Avoid contact with skin, eyes and clothing. Empty containers contain product residue, (liquid and/or vapour), and can be dangerous. Keep containers tightly closed. Avoid contact with heat, sparks, and flame. Use with adequate ventilation. Do not pressurize, cut, weld, braze, solder, drill, grind, or expose empty containers to heat spark, or open flames. Store away from heat, sparks, and flame. Keep away from sources of ignition. Store in a tightly closed container. Store in a cool, dry, well-ventilated area away from incompatible substances (oxidizing agents).

Table 8 - Process Plant & Water Treatment Reagents – Personal Protective Equipment

Product	Personal Eyes	Protective Skin	Equipment Respiration
Acetylene	Tightly sealed goggles	Protective gloves	Use atmosphere supplying respirators (e.g. supplied-air: demand, pressure demand, or continuous flow or self-contained breathing apparatus: demand or pressure demand or combination supplied-air with auxiliary self-contained air supply atmosphere supplying respirator in case of insufficient ventilation).
Activated carbon	None required	None required	None required
Anti-scalant	For splash protection use chemical goggles or full face shield	Rubber or neoprene gloves; impervious apron or coveralls and boots	Not normally needed

Borax	Avoid eye contact	None required	None required
Calcium oxide	For splash protection use chemical goggles or full face shield.	Rubber, neoprene, or nitrile gloves; impervious apron or coveralls and boots.	NIOSH/MSHA approved respirator, if required.
Calcium peroxide	Chemical goggles, full-face shield, or a full-face respirator is to be worn at all times when product is handled. Contact lenses should not be worn; they may contribute to severe eye injury.	Impervious gloves of chemically resistant material (rubber or neoprene) should be worn at all times. Wash contaminated gloves and dry thoroughly before reuse. Body suits, aprons, and/or coveralls of chemical resistant material should be worn at all times. Wash contaminated clothing and dry thoroughly before reuse. Impervious boots of chemically resistant material should be worn.	NIOSH-approved respirator for dust should be worn if needed.
Copper sulphate	Chemical goggles or full face shield.	Rubber or neoprene gloves; impervious apron or coveralls and boots.	Dust mask; NIOSH/MSHA approved respirator, if required.
Flocculant	For splash protection use chemical goggles or full face shield	Rubber or neoprene gloves; impervious apron or coveralls and boots	Dust mask
Hydrochloric acid	For splash protection use chemical goggles or full face shield	Rubber or neoprene gloves; impervious apron or coveralls and boots	NIOSH/MSHA approved respirator

Hydrofluoric acid	Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133. Wear face shield.	Wear appropriate protective neoprene gloves to prevent skin exposure. Wear acid resistant jacket, trousers and boots sufficient to protect skin.	Wear appropriate OSHA/MSHA approved chemical cartridge respirator regulations found in 29CFR 1910.134. If more than TLV, do not breathe vapour. Wear self contained breathing apparatus. Always use an NIOSH-approved respirator when necessary.
Hydrogen peroxide	Wear coverall chemical splash goggles. In addition, where the possibility exists for eye or faces contact due to splashing or spraying of material, wear chemical splash goggles/full-length face shield combination.	Where there is potential for skin contact, have available and wear as appropriate: impervious gloves, apron, pants, jacket, hood, and boots; or totally encapsulating chemical suit with breathing air supply. Permeation data supplied by vendors indicate that impervious materials such as natural rubber, natural rubber plus neoprene, nitrile, or polyvinylchloride afford adequate protection. Do not wear leather gloves or leather shoes (uppers or soles) because they can ignite following contact with peroxide. Cotton clothing can also ignite. This effect may be within minutes, or delayed. Clothing fires and skin damage occur less quickly with 50% or lower hydrogen peroxide than with 70% material, but adequate personal protection is essential for all industrial concentrations. Protective skin creams offer no	Where there is potential for airborne exposure in excess of applicable limits, wear NIOSH approved respiratory protection.

		protection from hydrogen peroxide and should not be used.	
Lead Acid Batteries	Safety glasses must be worn when moving, connecting, disconnecting, or maintaining batteries, or cleaning up acid spills; as well as, when brushing battery posts or handling solids from inside a battery.	When moving, connecting, disconnecting or maintaining batteries, or cleaning up acid spills acid resistant gloves and full coverage acid resistant clothing must be worn. When brushing battery posts or handling solids from inside a battery gloves and apron must be worn.	When brushing battery posts or handling solids from inside a battery, dust masks must be worn.
Nitric acid	Chemical safety goggles. A face shield may also be necessary.	Impervious gloves, coveralls, boots, and/or other resistant protective clothing. An impervious full-body encapsulating suit and respiratory protection may be required in some operations.	NIOSH/MSHA approved respirator, if required
Paints	None required.	None required.	None required.

Silica	Safety goggles	Wear impervious gloves, shoes and protective clothing to prevent skin contact.	NIOSH/MSHA approved respirator, if required
Sodium cyanide	For dust and splash protection use chemical goggles or full face shield	Rubber or neoprene gloves; impervious lab coat, apron, or coveralls and boots	NIOSH/MSHA approved respirator, if required
Sodium hydroxide (caustic soda)	Tight-fitting goggles if dust is generated. For splash protection use chemical goggles or full face shield	Gauntlet type rubber or neoprene gloves; impervious apron or coveralls and boots	NIOSH/MSHA approved respirator
Sodium metabisulphite	Chemical safety goggles	Cotton gloves adequate for handling dry product. For solutions, use rubber or neoprene gloves; impervious apron or overalls and boots	NIOSH/MSHA approved respirator
Sodium nitrate	Contact lenses should not be worn; they may contribute to severe eye injury.	Impervious gloves of chemically resistant material (rubber or PVC), body suits, aprons, and/or coveralls of chemical resistant material and impervious boots of chemically resistant material should be worn at all times	For dusty or misty conditions, wear NIOSH-approved dust or mist respirator. In case of spill or leak resulting in unknown concentration, use NIOSH approved supplied air respirator.
Sulphur	Chemical safety goggles	Wear impervious gloves, shoes and protective clothing to prevent skin contact.	NIOSH/MSHA approved respirator, if required

8 MISCELLANEOUS HAZARDOUS/TOXIC MATERIALS

8.1 PRODUCT DESCRIPTION

Acids such as nitric acid, as well as emulsifiers and ammonium nitrate are used at the mine site. Gases such as propane, oxygen, acetylene; solvents; water/effluent treatment chemicals and various additives are also utilized.

The release or spillage of any of these substances would possibly result in environmental impacts and pose a potentially hazardous situation for those personnel exposed to some of these materials. It is essential that materials deemed to be potentially hazardous be dealt with in a cautious manner, in strict adherence to laws and regulations outlined in the legislation, whether the substance is provided in large or smaller quantities as this will prevent serious repercussions should an accidental release of material happen.

8.2 STORAGE FACILITIES OF HAZARDOUS/TOXIC CHEMICALS

All explosive related chemicals will be stored as discussed in Section 6 of this Plan.

All other chemicals and gases will be stored in appropriate locations.

These storage facilities ensure that chemicals that could interact and cause a serious incident will be kept segregated.

9 INVENTORY, INSPECTION & RECORDS

A contract expediting company, Arctic Fuels, arranges all deliveries from the Baker Lake Marshalling Area to the Meadowbank and Whale Tail sites. This includes the hazardous materials discussed in this plan. The General Mine Manager has ultimate responsibility for supervising the receipt, inspection, and recording of all material inventories at site. The division managers reconcile total amounts received against amounts ordered.

9.1 PETROLEUM PRODUCTS

9.1.1 Inventory Management

Diesel fuel use is metered automatically when it is pumped from the Meadowbank and Whale Tail bulk tanks. The metered volumes are summarized weekly and reconciled against tank levels determined manually with a dipstick from the top of the tanks. Diesel fuel consumption for the power generators is recorded weekly at Meadowbank and will be recorded weekly at Whale Tail.

Aviation fuel is dispensed as required under the supervision of aircraft personnel and site services. Helicopters may be stationed at the Whale Tail site for Amaruq exploration activities with periodic use of a fixed wing aircraft at the Amaruq Exploration site. Fixed wing aircrafts and helicopters will continue to use the Meadowbank airstrip. Consumption and on-site volumes are reconciled monthly at both locations. Lubricants and other petroleum products are inventoried monthly.

9.1.2 Inspection

The Environmental Department performs regularly scheduled inspections of all fuel and lubricant storage areas at both sites. The inspection schedule and procedures to be followed are summarized in Table 9. All inspections are logged with the date and time of inspection, facility inspected, and name of the person making the inspection. See Appendix D for the inspection report of any hazardous material storage area.

The condition of hazardous materials storage areas, containers, tanks, connectors and associated plumbing will be checked on a regular basis. Observations on their condition will be logged, dated and kept near the corresponding storage area. Drums/containers will be inspected for the presence and legibility of symbols, words or other marks identifying the contents, signs of deterioration or damage such as corrosion, rust, leaks at seams or signs that the drum/container is under pressure such as bulging and swelling, spillage or discoloration on the top or sides of the drum/container. If leaks or deterioration is encountered it will be noted and addressed in a timely manner.

The hazardous materials area's secondary containment will be inspected and the condition of the secondary containment will be noted. Arrangements will be made for repairs if necessary.

Table 9 - Inspection of Petroleum Storage Sites

Fuel Tanks	*Schedule* – Daily by Site Services Supervisor, Weekly by Environmental Technician, Quarterly by Environmental Coordinator. *Procedure* – Repair leaks and report promptly. Inspections will be reported annually and filed with the General Mine Manager or Site Services Superintendent and Environmental Superintendent.
Electrical Generating Plant (diesel)	*Schedule* – Daily by powerhouse operator, weekly by Environmental Technician as part of internal environmental inspections. *Procedure* – Inspections will be reported annually and filed as above.
Other Fuelling Stations	*Schedule* – Daily by Site Services Supervisor, Weekly by Environmental Technician as part of regular inspections. *Procedure* – Inspections will be reported annually and filed as above.
Spill Kits	*Schedule* – Monthly by Environmental Technician, Quarterly by Environmental Coordinator. *Procedure* – Inspections will be reported annually and filed as above.
Other Hazardous Material Storage	*Schedule* – Daily by Site Services Supervisor, Mill Supervisor, Weekly by Environmental Technician when materials are on site. *Procedure* – Inspections will be reported annually and filed as above.

Any accidental damage to containment structures will be inspected immediately and appropriate repairs undertaken. The extent of damage will be reported in writing to the General Mine Manager and Environmental Superintendent. The report will note any remedial repairs that may be made, the date of any repairs, and the need for any follow-up inspection.

9.1.3 Records

Records pertaining to storage, use, and loss of fuels and lubricants are required by CCME and the Fire Marshal (under the *National Fire Code).* The following records are prepared by the Procurement and Logistics and Site Services departments:

- Reconciliation of bulk inventory from resupply logs;
- Weekly use summaries;
- Weekly reconciliation for each storage tank;

- Overfill alarm tests;
- Pressure tests (if applicable);
- Inspections and maintenance checks of the storage tank, piping, and delivery systems;
- Any alteration to the systems;
- Reports of leaks or losses;
- Reports of spill responses; and
- Records of training.

9.2 EXPLOSIVES

9.2.1 Inventory Management

See Figure 1 for location of the Meadowbank Explosives Mixing Plant or Emulsion Plant. Once mining ends at Meadowbank, the emulsion manufactured on-site will continue to be stored in a tank located at the Emulsion Plant and delivered via the haul road to the Whale Tail site on an as needed basis. Refer to the Ammonia Management Plan for more details on emulsion storage. Agnico Eagle's explosive contractor, Dyno Nobel Inc., performs daily and weekly inspections on the Emulsion Plant to ensure that inventory used is documented. Agnico Eagle conducts daily inspections of the sea can's storing the boosters, delays and detonator cords and provides an inventory to the Mine Manager.

9.2.2 Inspection

Access to and use of explosives will be under the exclusive control of Agnico Eagle. Agnico Eagle will be responsible for inspection of all explosives equipment and facilities, including the ammonium nitrate storage areas and the magazines for high explosive detonators and blasting caps. The explosives manufacturing plant is inspected by Dyno Nobel Inc. and reports this to Agnico Eagle Management.

9.2.3 Records

The *Federal Explosives Act* requires that the following records be kept with regard to explosives products:

- Quantity and strength of each explosive manufactured; and
- Quantity of each explosive issued to the mine site from the factory, including the dates of shipments and quantity of each explosive on site.

Agnico Eagle staff will provide weekly reports to the General Mine Manager that will include:

- Staffing;
- Safety concerns or incidents;

- Total explosives consumption;
- Amount of ammonium nitrate remaining on site; and
- Inventory of other explosives and accessories to be audited for fiscal month-end balances.

9.3 MISCELLANEOUS HAZARDOUS/TOXIC MATERIALS

9.3.1 Inventory Management

Adequate quantities of all hazardous chemicals are reconciled against orders on receipt. The appropriate department responsible for the miscellaneous chemicals at each site is responsible for reconciling the resupply inventory.

9.3.2 Inspection

During operations, the appropriate department responsible for storage and handling of the miscellaneous chemicals are to regularly inspect all areas where such hazardous materials are used and stored. Any problems will be noted and reported to the Department Manager. The Department Manager is responsible for weekly or monthly inspections of miscellaneous hazardous materials and storage areas.

9.3.3 Records

The quantity of hazardous materials received, used, and in possession of personnel are recorded by appropriate Departments. The departments are to comply with the environmental regulations.

10 TRAINING

10.1 GENERAL

All staff and contractors at the Meadowbank and Whale Tail sites will receive the following training:

- WHMIS;
- Emergency and spill response (see also the SCP and ERP);
- Operations overview; and
- Mine Standard Operating Procedures.

Mine employees will receive additional training in mine safety as specified by the *Mine Health and Safety Act* and regulations. Agnico Eagle will ensure compliance with the training requirements specified in the Act and regulations.

Process plant employees will receive additional training specific to their area of work and duties, including safe operating practices, safe handling and storage of chemicals, and use of PPE. Other training includes cyanide and chemical awareness, specific chemical training for specific tasks, and a mill induction training. This training will be the responsibility of Agnico Eagle.

A record of training received will be maintained for each employee and also from contractors.

In Appendix E you will find a procedure poster that is placed at the applicable hazardous material storage location. This poster will also be used during toolbox meetings with all departments to ensure that hazardous material is being segregated and placed in the appropriate containers for storage.

10.2 PETROLEUM PRODUCTS HANDLERS

Personnel who handle petroleum products will be expected to be conversant with relevant MSDS information. As well, these personnel will be given training in the following:

- Transportation of dangerous goods (TDG);
- Agnico Eagle's fuel handling procedures (outlined in Section 5);
- Spill response and cleanup procedures for petroleum (see the SCP); and
- Emergency response, especially firefighting procedures (see the ERP).

10.3 EXPLOSIVES HANDLERS

Only trained and certified persons will work with explosives. The explosives personnel will undertake formal training and on-the-job training to ensure compliance with legislation. The Mine Inspector will check the adequacy of training. Training requirements will include (but not necessarily be limited to):

- Specific fire procedures as per the *Federal Explosives Act*;

- First aid;
- Transportation of dangerous goods (TDG); and
- WCB Blasting Certificate.

10.4 PLANT EMPLOYEES

Process plant operators may receive TDG training, if appropriate. All plant employees will be trained in spill and emergency response procedures. Emergency response procedures for spilled chemical substances are provided in the SCP.

10.5 THIRD PARTY CONTRACTORS

It is expected that third party contractors receive adequate and comprehensive training to conduct their work tasks from their employer. Agnico Eagle intends to review the general qualifications of third party contractors prior to having them work at the site. In addition, the contractor companies may also be requested to confirm the qualifications of specific individuals that they may have working at the site.

Third party contractors working on the site are required to participate in, and complete a site specific health and safety training session. The training session is envisioned to be valid for a period of 3 years, after which time the contractor may be required to complete the training again, or attend a refresher. The training session will outline site specific hazardous and response procedures that they should be aware of in the course of conducting their work on site. The training session will cover hazardous materials management.

11 PLAN EVALUATION, AUDIT & IMPROVEMENT

As part of Agnico Eagle's commitment under the International Cyanide Management Code, it will sponsor regular (every three years) audits by Institute-approved, third-party professionals to verify its compliance with the Code's principles and standards of practice with regard to cyanide handling

Appendix A

List of Applicable Legislation

The following is a list of federal and territorial legislation and guidelines that regulate the management of hazardous materials in Nunavut, and which are considered potentially applicable to the Meadowbank Gold Mine. As part of Meadowbank Mining Corp's overall environmental management system for the mine site, this list is updated at least annually to ensure it represents current and relevant information.

Federal Legislation

- **CANADIAN ENVIRONMENTAL PROTECTION ACT, 1999 S.C. 1999, c. 33**

  Code of Practice for the Reduction of Chlorofluorocarbon Emissions from Refrigeration and Air Conditioning Systems.

  Environmental Code of Practice for Elimination of Fluorocarbon Emissions from Refrigeration and Air Conditioning Systems.

  Environmental Code of Practice on Halons Code of Practice EPS 1/RA/3E.

  Environmental Emergency Regulations SOR/2003-307.

  Environmental Guidelines for Controlling Emissions of Volatile Organic Compounds from Aboveground Storage Tanks, CCME-EPC-87-E, as amended.

  Export and Import of Hazardous Waste and Hazardous Recyclable Material Regulations SOR/2005-149.

  Federal Halocarbon Regulations, 2003 SOR/2003-289.

  Interprovincial Movement of Hazardous Waste Regulations SOR/2002-301.

  Ozone-Depleting Substances Regulations, 1998 SOR/99-7.

- **EXPLOSIVES ACT R.S.C 1985, c. E-17**

  Ammonium Nitrate and Fuel Oil Order C.R.C. 1978, c. 598.

  Explosives Regulations C.R.C. 1978, c. 599.

 TRANSPORTATION OF DANGEROUS GOODS ACT, 1992 S.C. 1992, c. 34
Transportation of Dangerous Goods Regulations SOR/2001-286.

Transportation of Dangerous Goods Regulations - Schedules SOR/2001-286.

Federal Codes and Other Guidance Documents

- National Fire Code.
- Indian and Northern Affairs Canada. 2005. DEW Line Cleanup Barrel Protocol.
- Canadian Council of Ministers for the Environment (CCME) - Environmental Code of Practice for Above-Ground and Underground Storage Tanks Systems containing Petroleum Products and Allied Petroleum Products (2003).
- CCME - Canadian Wide Standards for Petroleum Hydrocarbons in Soil.
- CCME - Canadian Environmental Quality Guidelines.
- Environment Canada (Tilden & Westerman). 1990. Guidelines for the Preparation of Hazardous Material Spill Contingency Plans.
- Department of Fisheries and Oceans. 1998. Guidelines for the Use of Explosives in or Near Canadian Fisheries Water.

Territorial Legislation

- **ENVIRONMENTAL PROTECTION ACT R.S.N.W.T. 1988, c. E-7**

  A Guide to the Spill Contingency Planning and Reporting Regulations January 2002.

  Environmental Guideline for Contaminated Site Remediation November 2003.

  Environmental Guideline for Waste Lead and Lead Paint.

  Guideline for Ozone Depleting Substances.

  Guideline for the General Management of Hazardous Waste in the NWT.

  Guideline for the Management of Waste Antifreeze.

  Guideline for the Management of Waste Batteries.

  Guideline for the Management of Waste Paint.

  Guideline for the Management of Waste Solvents.

  Guideline for Dust Suppression, February 1998.

  Spill Contingency Planning and Reporting Regulations R-068-93.

  Used Oil and Waste Fuel Management Regulations R-064-2003.

  Plain Language Guide to the Used Oil and Waste Fuel Management Regulations.

- **TRANSPORTATION OF DANGEROUS GOODS ACT, 1990 S.N.W.T. 1990, c. 36**
  Transportation of Dangerous Goods Regulations R-049-2002.

- **EXPLOSIVES USE ACT R.S.N.W.T. 1988, c. E-10**
- *Explosives Regulations R.R.N.W.T. 1990, c. E-27.*

The miracles of science™

Notice:

Sodium cyanide may be fatal if swallowed, inhaled, or with prolonged skin contact. Contact with acids, water, or weak alkalies liberates poisonous gas. Causes eye burns and may irritate skin. See "Personal Safety and First Aid." See DuPont's Sodium Cyanide Material Safety Data Sheet (MSDS) for more detailed safety and health information.

For Emergency Assistance, Call DuPont at

(901) 357-1546

(This is a transportation emergency Cyanide Hotline to our Memphis, TN plant.
Do not use for routine technical or commercial information.)

For Transportation Emergencies,

Call DuPont at (901) 357-1546, Then Call

CHEMTREC at (800) 424-9300

(See "Transportation Emergencies")

For commercial or technical information, call your DuPont marketing representative or a sales office listed on the back cover.

Sodium Cyanide: UN 1689

DO NOT USE AS A PESTICIDE.

See DuPont's MSDS for detailed instructions for treatment of cyanide poisoning.

Product Information

Introduction

DuPont sodium cyanide (NaCN) is a white crystalline solid, available in a briquette or granular form. The briquettes are uniform in size, average 18 g (about ⅔ oz) in weight, and have overall dimensions of approximately 3.5 × 3.5 × 1.3 cm (1⅜ × 1⅜ × ½ in). They are resistant to breakage and dusting, easy to scoop up, and readily soluble in water. The granules are irregularly shaped particles, typically sized to generate a minimum of dust, and pass 90–100% through a ⅜-in screen and 3% maximum through a USS Sieve No. 50. Cyanobrik® and Cyanogran® are DuPont trade names (see **Figures 1** and **2**).

The Chemical Abstract Service Registry Number for NaCN is 143-33-9.

* Typical analyses based on historical production performance. DuPont does not make any express or implied warranty that future production will demonstrate or continue to possess these analyses.

** **CAUTION:** Sodium hydroxide (NaOH) content can be below 0.1% versus 0.3%, typical. NaOH should be added as outlined on page 3 to suppress hydrogen cyanide formation when making a water solution.

Figure 1. Cyanobrik®

Figure 2. Cyanogran®

Uses and Applications

The mining, metal, and chemical industries are the principal consumers of sodium cyanide. Typical uses include:

Ore Extraction and Ore Flotation

The cyanide process for extracting gold and silver from low-grade ores uses aqueous solutions of sodium cyanide with oxygen (air) to convert the noble metal (M) to soluble $NaM(CN)_2$, from which M can be recovered either by precipitation with zinc dust or aluminum powder, carbon absorption, or electrowinning.

In the flotation of galena (lead sulfide) to separate it from mixed ores containing sphalerite (zinc sulfide) and pyrite (iron sulfide), sodium cyanide acts as a depressor; that is, it reduces the tendency of gangue materials to travel along on the froth and so impair the separation. Sodium cyanide finds similar use in the separation of pentlandite from pyrrhotite and molybdenite from copper concentrates by flotation. It is also used to purify the molybdenite by extraction of copper impurities.

Electroplating

Cyanide brass, cadmium, copper, gold, silver, and zinc baths deposit decorative and/or functional metal coatings on a variety of substrates. The good throwing power of the electrolyte causes relatively uniform deposition of the metal on intricately shaped parts. Small amounts of special additives in the baths give bright metal deposits, even on recessed surfaces of the work. Cyanide electroplating baths are versatile and capable of high production rates, whether plating large or small parts.

Case Hardening Steel

Molten salt baths containing 10–30% sodium cyanide find extensive use for case hardening steels at temperatures below 870°C (1600°F). The molten bath process is fast, easy to operate, and yields mixed carbon-nitrogen cases that have excellent wear resistance and uniformity. The addition of activators or accelerators to the bath results in deeper cases than those obtained with plain cyanide baths, but nitrogen pickup is usually less.

The life of keen-edged tools improves when the high-speed steel is cyanide-nitrided in molten cyanide baths at about 565°C (1050°F).

Metal Cleaning

Aqueous solutions of sodium cyanide are effective metal cleaners, especially for smut removal after acid pickling.

Chemical Manufacture

Sodium cyanide is used to make other chemicals that lead to such diverse products as pharmaceuticals, vitamins, animal food supplements, dyes and pigments, insecticides, sequestrants, polymers, and catalysts (see "Chemical Reactions" section).

In any synthesis or formulation involving sodium cyanide, no cyanide compound should survive in the final product as an impurity. This is especially important with regard to consumer products.

Chemical Reactions

The most hazardous reaction of sodium cyanide is with acids to form lethal hydrogen cyanide (HCN) gas, which is invisible and has a very weak odor. Smaller amounts of HCN gas can develop from contact with water and weak alkalies. When working with sodium cyanide, special provisions are needed to address HCN and cyanide toxicity.

Sodium cyanide deliquesces in moist air. Crystals of the dihydrate, $NaCN{\cdot}2H_2O$, form when saturated solutions of sodium cyanide cool at temperatures below 35°C (95°F) (see **Figure 3**). Sodium cyanide dissolves in methanol (6.05 g/100 mL saturated solution at 15°C [59°F]). It also dissolves in liquid ammonia (3.7 g/100 mL NH_3 at –33°C [–27°F]).

Sodium Cyanide Reactions in Water

Sodium cyanide dissolved in water forms an equilibrium between ionized sodium cyanide and highly volatile HCN. In sodium cyanide solutions, HCN concentrations must be kept low and/or contained to avoid toxic fumes. HCN formation varies with pH, cyanide concentration, and temperature. HCN in the air around a sodium cyanide solution will also be influenced by the amount of solution surface area and ventilation. At pH 8 or less, essentially all of the cyanide will be in the HCN form in dilute solutions (see **Figure 5**). To suppress HCN formation in typical concentrated sodium cyanide make-up solutions, a pH of 12 minimum (preferably 12.5–13) should normally be used. In operating tanks, HCN in the vapor space above a 23% solution at room temperature typically will be about 250 ppm (without pH adjustment). With the pH raised to 12–12.5, HCN levels drop to around 125 ppm and below 50 ppm, around pH 13. Higher temperatures and solution concentrations increase HCN fumes. The following recommendation is made to minimize HCN formation with a modest pH increase.

When making a concentrated (e.g., 10–30%) cyanide solution, the proper procedure is to add about 0.5% sodium hydroxide (caustic) (about 50 lb [22.7 kg] sodium hydroxide/1000 gal [3785 L] water) before adding the cyanide. More sodium hydroxide will not be chemically harmful to the cyanide and will further reduce HCN levels; however, increased alkalinity increases eye hazards from splashes. For most operations, pH 12.5–13.0 is a good compromise to reduce HCN without excessively high alkalinity. If process chemistry prevents adding caustic, adequate precautions in design and operation must be taken to protect against HCN fumes, HCN polymerization, and cyanide hydrolysis.

pH is a log scale measurement, which means it takes about ten times as much sodium hydroxide to raise the pH each subsequent unit than the previous. For example, if it took 1 lb (0.45 kg) of sodium hydroxide to go from pH 9 to 10, it would take 10 lb (4.5 kg) to raise the pH from 10 to 11 and 100 lb (45.4 kg) from 11 to 12, etc. Therefore, even pH 11 water will need

Figure 3. Solubility of Sodium Cyanide in Water

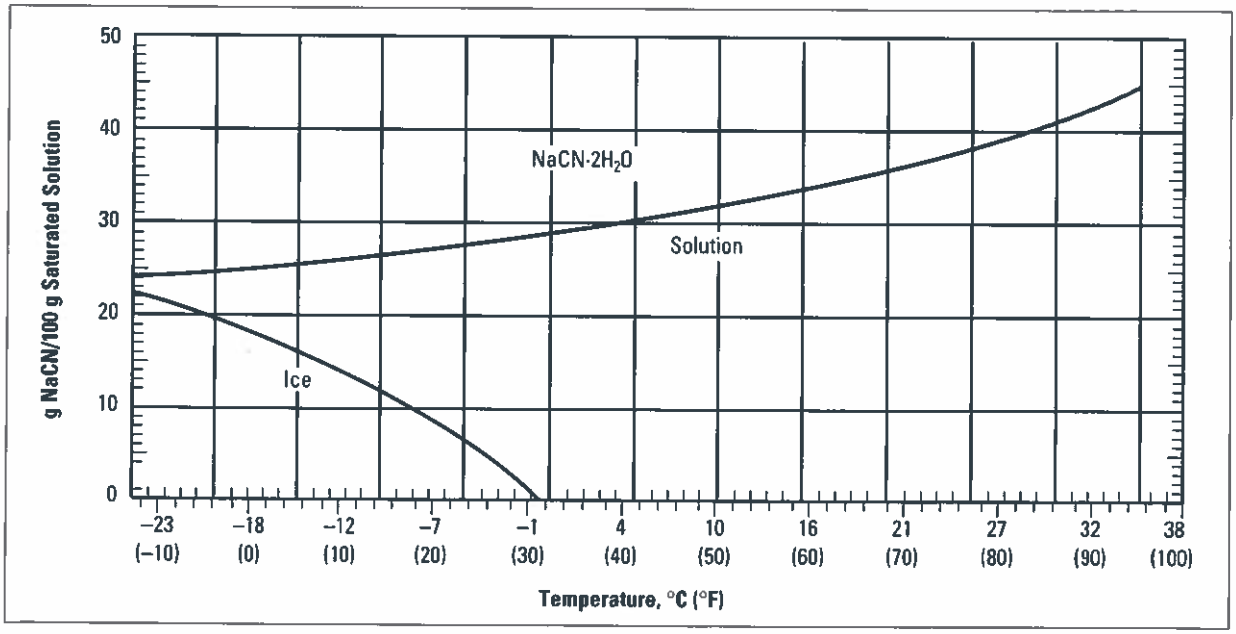

Figure 4. Densities of NaCN Solutions

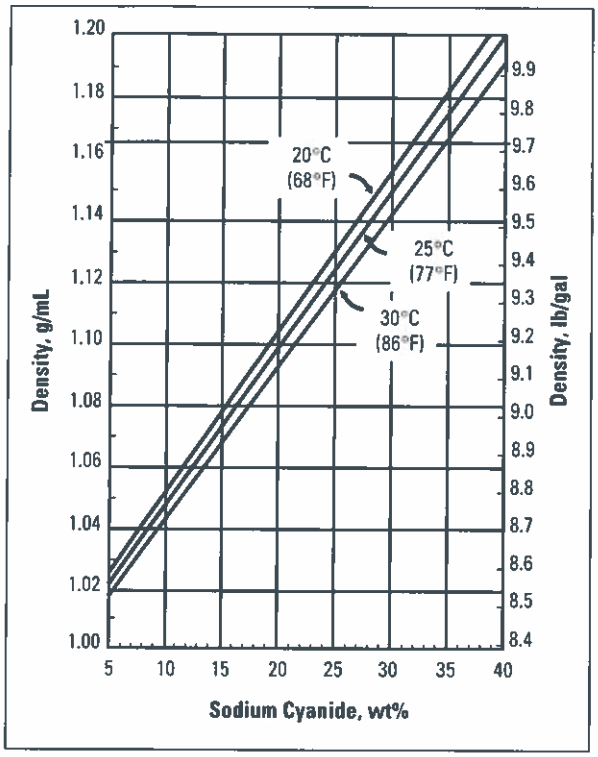

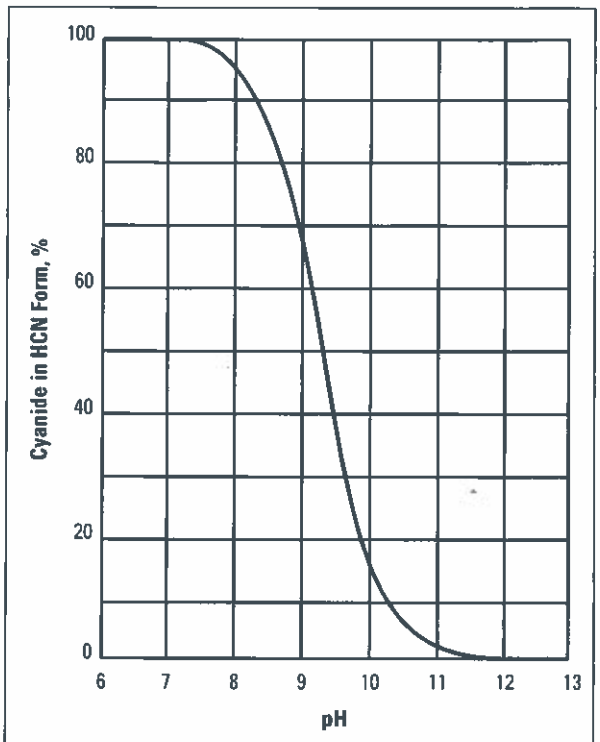

Figure 5. Effect of pH on Cyanide Ionization

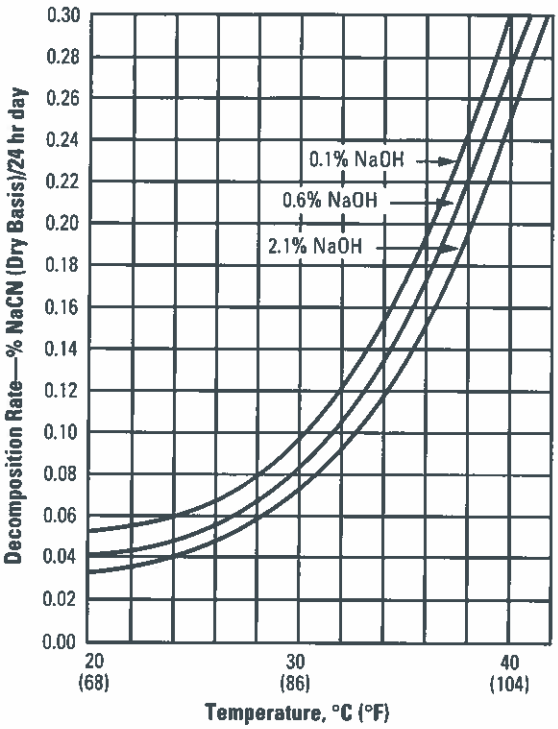
Data based on work by D. Milne, 1950, for dilute sodium cyanide solutions at ambient temperature. Toxic HCN fumes increase as temperature and solution concentrations increase, requiring higher pH for safe operation.

nearly as much sodium hydroxide added to it as would the same amount of water with pH 6 to 11. Water at pH 10 or 11 does not eliminate the need to add sodium hydroxide to reduce HCN.



NOTE: Lime (calcium hydroxide) is not as effective as sodium hydroxide because of limited solubility, but it can be substituted to raise the pH to around 12.

Hydrogen cyanide molecules will polymerize to form the extremely inert HCN polymer. It is not unusual for HCN polymerization to occur in sodium cyanide solutions made without additional alkali, particularly if stored at elevated temperatures. In dilute solutions, HCN polymer will generate colors ranging from pale yellow to dark reddish brown. In stronger solutions, a dark brown precipitate resembling iron rust can form, which will interfere with heat transfer, plug pumps, orifices, etc., and may cause significant cyanide loss. HCN polymer will discolor chemical products. Again, high pH values give low HCN concentrations, which reduces the tendency for polymer formation.

Cyanide also reacts with water to form ammonia and formate ions. In the acid pH range, hydrolysis products are formic acid and ammonium salts. Alkaline solutions produce formate salts and volatile ammonia. With strong solutions, the volume of ammonia evolved can cause dangerous pressure buildup. One gallon of 30% sodium cyanide solution can produce more than 25 ft^3. For this reason, extra vent capacity is recommended for large, heated storage tanks.

Ordinarily, the reaction between cyanide and water proceeds slowly. However, the reaction rate increases exponentially with an increase in temperature. The critical range is around 60–70°C (140–158°F). At temperatures below this range, the reaction can be controlled by cooling and, where practical, by dilution. At higher temperatures, however, the reaction can be uncontrollable in large tanks for highly concentrated solutions and may proceed until substantially all the cyanide has been consumed, unless temperature control and adequate cooling and venting capacity exist (see **Figure 6**).

Figure 6. Decomposition Rate of NaCN Solutions

NOTE: The % NaOH shown above is the concentration in the final solution. The NaCN (as shipped–containing 0.1% NaOH), when diluted to a 30% solution, will have only 0.03% NaOH in the final solution, unless additional NaOH is added. (Decomposition rates based on DuPont experimental data using 35% NaCN solution.)

Heated sodium cyanide solution storage tanks should be equipped with facilities to measure and control solution temperature (see "Equipment" section). Heating may be needed to assist in dissolving the NaCN and to prevent freezing (see **Figures 3** and **7**). Cooling could be critically important, if the hydrolysis reaction begins to generate heat faster than it can be dissipated to the surroundings.

All the reactions discussed above consume a portion of the stored cyanide, and all are inhibited by maintaining low solution temperature and high pH.

If special precautions are taken, acidification of sodium cyanide to produce HCN gas for a chemical reaction is an acceptable procedure, but only when handled in special equipment by technically qualified people after detailed planning. HCN operations require much more stringent plans, procedures, and standards for safe operation.

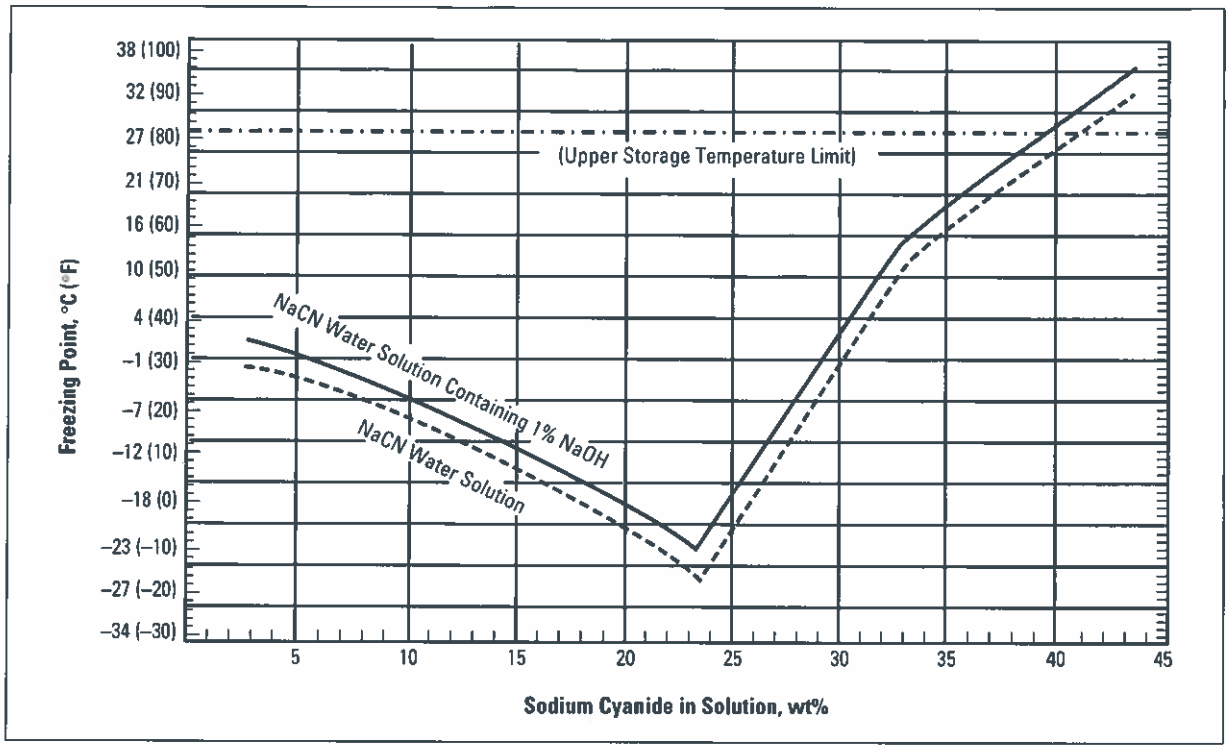
CAUTION

Even in laboratory quantities, the accumulation and storage of liquid or gaseous HCN should not be considered until its properties and the required safety precautions for handling it have been studied carefully. In addition to toxicity considerations, violent exothermic polymerization reactions can occur with liquid HCN, even in the absence of air or oxygen.

Other Reactions

Oxidants, such as alkaline hypochlorite solutions, hydrogen peroxide solutions, and permanganate solutions can oxidize cyanide to sodium cyanate. These oxidation reactions find wide use in the control of cyanides in effluents. They must be done in dilute solutions at proper pH to avoid formation of highly toxic gases (see "Cyanide Destruction" section).

Strong oxidants, such as nitrites and chlorates, react violently when added to molten sodium cyanide (or vice versa).



With the exception of lead and platinum, most metals (when finely divided) dissolve in aqueous sodium cyanide in the presence of oxygen.

Alkaline solutions of sodium cyanide dissolve water-insoluble cuprous and zinc cyanide with formation of sodium tricyanocuprate and tetracyanozincate, respectively.

Reacting an alkyl halide, sulfate, or toluene-sulfonate (p-$CH_3C_6H_4SO_2OR$) with sodium cyanide in aqueous alcohol, dimethylformamide (DMF), or similar aprotic solvent, leads to an alkyl cyanide (nitrile). Fusing a sodium aryl sulfonate with sodium cyanide yields the aryl nitrile; for example, sodium benzene-sulfonate (sodium phenyl sulfonate) gives benzonitrile (phenyl cyanide).

Hydrogen cyanide, generated by reacting an acid with sodium cyanide, is capable of adding to isolated double bonds and to the carbonyl group of an aldehyde or ketone. In the case of acetophenone, for example, the corresponding cyanohydrin forms, which hydrolyzes to atrolactic acid (a-phenylacetic acid, $C_6H_5[CH_3]C[OH]COOH$). Similarly, when preparing an alpha-amino acid from an aldehyde or ketone by Strecker synthesis, the hydrogen cyanide and ammonia needed can come from ammonium cyanide formed in the reaction of sodium cyanide with ammonium chloride.

Figure 7. Freezing Points of Sodium Cyanide Solutions

One method of synthesizing the sodium salt of ethylen ediaminetetraacetic acid (tetrasodium EDTA, a chelating agent) combines ethylenediamine with formaldehyde and sodium cyanide in hot (80°C [175°F]) alkaline solution.

Personal Safety and First Aid

Health and Safety Hazards

See DuPont's MSDS for detailed instructions for treatment of cyanide poisoning.

Because of the toxicity of sodium cyanide, all persons working with it should be completely familiar with and observe the established safety practices.

Sodium cyanide is a fast-acting poison that can cause death quickly at low levels of exposure. Its toxic effect results from the inhibition of specific processes in body cells by restricting oxygen use in cellular respiration, particularly cells in the brain and heart. Poisoning can result from breathing cyanide gas, dust, or solution; absorption through the skin, particularly the eyes and other membranes and feet; and from ingestion. Contact with the skin may cause irritation and poisoning, particularly with prolonged contact, or if open wounds, skin abrasions, or mucous membranes are involved. Sodium cyanide is alkaline and causes eye burns. Because of the possibility of skin absorption of hydrogen cyanide fumes, air monitoring for HCN is required, even for someone wearing an air mask.

Cyanide is not a cumulative poison, and it is not a carcinogen. It is believed that there are no chronic effects of cyanide poisoning, unless repeated, prolonged exposures, well above the established limits, were to occur. With prompt treatment, recovery from overexposure is normally quick and complete.

CAUTION

Sodium cyanide in contact with acids liberates highly toxic and flammable hydrocyanic acid gas. Also, toxic amounts of HCN can be liberated from water solutions of sodium cyanide or from contact with weak alkalies, if ventilation is inadequate (see "Sodium Cyanide Reactions in Water").

Safety Precautions

The basic safety precautions are:

- Do not breathe sodium cyanide dust, solution mist, or HCN gas. Wear an approved toxic dust and mist respirator when there is danger of inhaling cyanide dust or mist. Additional protection is required for HCN gas. The respirator should be one approved by the Mine Safety and Health Administration (MSHA) or by the National Institute for Occupational Safety and Health (NIOSH).
- Avoid skin contact with cyanides, particularly contact with open wounds or skin abrasions. Wash skin promptly and thoroughly if contact occurs. Wear protective gloves when handling solid cyanides. Wear rubber gloves when handling cyanide solutions (butyl rubber has very low permeability; neoprene is more rugged with low HCN permeability and is best for many jobs involving sodium cyanide).
- Do not get in eyes. Wear approved chemical splash goggles when handling cyanide solutions and when there is danger of splashing.
- Have available and wear other protective clothing as needed for job safety. Develop clothing change procedures to ensure cyanide is not scattered around the site or inadvertently carried home.
- Immediately sweep up any spilled cyanide and place in a suitable container. Wash area and/or treat contaminated area with dilute hypochlorite solution to destroy the cyanide. Comply with federal, state, or local regulations. If approved, drain to neutral chemical waste sewer.
- Take every precaution to keep acids from contacting sodium cyanide. Do not store with acids or weak alkalies.
- Do not eat, drink, or smoke in areas where cyanide is present. Do not handle or store food or beverages in cyanide areas.
- Store sodium cyanide in a ventilated, locked area. Containers should be kept closed and their contents dry. Do not store under sprinklers; sodium cyanide will not burn, but sprinkler activation could cause an environmental problem. Local fire regulations may require sprinklers. Always check and follow local regulations. If sprinkling is required, the area must be diked to contain the runoff.
- Have antidote, emergency plans, and training in place before using cyanide. See DuPont's Sodium Cyanide MSDS for detailed instructions.

Sodium Cyanide Exposure Limits

The U.S. Department of Labor (OSHA) has ruled that an employee's exposure to sodium cyanide in any 8-hr work shift of a 40-hr week shall not exceed a time-weighted average (TWA) of 5 mg of cyanide per cubic meter of air.[2,3] It also cautions that because cyanide may penetrate the skin, control of vapor or dust inhalation alone may not be sufficient to prevent absorption of an excessive dose.

HCN Exposure Limits

The current OSHA workplace exposure limit for HCN is 11 mg/m^3 (10 ppm), ***8-hr average***. A 1989 revision of the HCN limit (along with several hundred other chemicals) to 5 mg/m^3 (4.7 ppm), ***15-min average***, was vacated by court order, and the pre-1989 limit has been reinstated. OSHA (and others) also cautions that because hydrogen cyanide may penetrate the skin, control of vapor inhalation alone may not be sufficient to prevent absorption of an excessive dose.[2,3] During all of this, the U.S. Mine Safety and Health Administration (MSHA) limit stayed at 10 ppm for HCN. The American Conference of Governmental Industrial Hygienists (ACGIH) recommends a 4.7 ppm limit instantaneous ceiling value with a similar skin notation.[4] DuPont's experience supports the current OSHA and MSHA regulatory levels. However, as a matter of practice, DuPont does not have people working for prolonged periods under conditions approaching our upper limits, because we can design/operate to avoid prolonged exposure.

In summary, HCN air quality requirements will vary from jurisdiction to jurisdiction, and it is incumbent on each user to be aware of and comply with the rules regulating exposure to HCN in their regulatory jurisdiction. The specific OSHA and MSHA exposure limit for HCN is currently 11 mg/m^3 (10 ppm) for an 8-hr TWA. The ACGIH Threshold Limit Value (TLV) is 5 mg/m^3 (4.7 ppm), 15-min TWA. This is also a ceiling value. The DuPont Acceptable Exposure Limit (AEL) is 4.7 ppm, 15-min TWA with current regulatory ceiling limitations. All of these exposure limits carry a "skin" notation indicating that HCN may penetrate the skin; therefore, control of vapor inhalation alone may not be sufficient to prevent cyanide poisoning. Also, exposure limits are subject to change, and users should stay current with regulatory changes.

Symptoms of Cyanide Poisoning

Personnel should be constantly alert for symptoms of cyanide poisoning in themselves and others. The following poison symptoms can result from other causes, but should be investigated promptly when they occur around cyanide:

Reddening of the eyes*	Nausea*
Irritation of the throat	Headache*
Palpitation	Weakness of arms and legs
Difficulty in breathing	Giddiness
Salivation	Collapse
Numbness	Convulsions

Effects of Exposure to HCN Vapor

The following toxicity data show the "Reported Human Response to Various Concentrations of HCN Vapor"[5]:

2–5 ppm	Odor threshold
10 ppm	OSHA and MSHA exposure limit, 8-hr TWA[2]
20–40 ppm	Slight symptoms after several hours
45–54 ppm	Tolerated for ½ to 1 hr without significant immediate or delayed effects
100–200 ppm	Fatal within ½ to 1 hr
300 ppm	Rapidly fatal (if no treatment)

These numbers should be considered reasonable estimates only, because data are not exact and effects vary for different people. Also, *heavy breathing from physical work will increase cyanide intake and reduce the time for symptoms to show.* The "rapidly fatal" exposure level of 300 ppm assumes no first aid or medical treatment; either is very effective if used quickly.

* Reddening of the eyes (and skin) is one of the earliest symptoms, with nausea and/or headache common in low level exposure. These three are the most readily identifiable symptoms of low level cyanide overexposure.

Prompt administration of the recovery techniques has proven very effective, but emphasis must be placed on quick action. Seconds count, and treatment should be provided within about 200 sec (3–4 min). In case of overexposure to cyanide, quick action is required to sound the alarm, remove the patient from the contaminated area, and provide treatment. With prompt treatment as prescribed, recovery is normally quick and complete with no serious aftereffects. Treatment after 3–4 min can still be effective, but chances of recovery are reduced without prompt treatment. Unlike many poisons, cyanide is not cumulative. While cyanide poisoning can be rapidly fatal, no case should be considered hopeless. Treatment should be continued until a physician certifies death.

First Aid and Medical Treatment

See DuPont's MSDS for detailed instructions for treatment of cyanide poisoning.

Ordering Cyanide Poisoning Antidote Kits and Amyl Nitrite

To obtain cyanide poisoning antidote kits and/or amyl nitrite ampules:

1. Obtain a prescription from your local physician (required because amyl nitrite is a prescription product).
2. Purchase the cyanide antidote kit from your pharmacy. The pharmacy can obtain the kit from Akorn Pharmaceuticals at (800) 932-5676.
3. Amyl nitrite can also be purchased from your local pharmacy or from Save-A-Life Systems in Ft. Wayne, IN at (800) 933-5885.

Shipping

Containers

DuPont produces sodium cyanide in briquette and granular forms.

A variety of containers are used as follows:

Nonreturnable Drums

Net weight 50-kg (110.2-lb) steel drums stacked 9–27 to a pallet.

Net weight 100-kg (220.4-lb) steel drums stacked eight to a pallet (see **Figure 8**).

Note: Drums can be stored three pallets high in a warehouse.

Figure 8. Palletized 100-kg (220-lb) Drums Being Loaded into a Truck

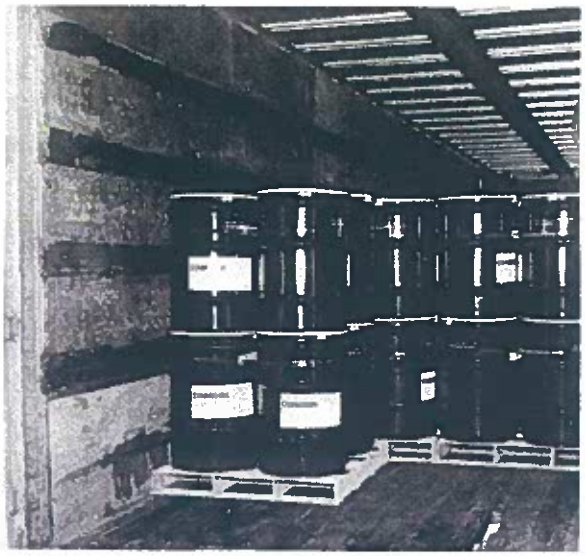


Figure 9. A Tuff-Pak Box Full of Bags

Tuff-Pak

- 48 20-kg (44-lb) pinch-bottom, multiwall composite bags that are hermetically sealed and water-resistant. The bags are packaged in a wooden box on a self-contained pallet. Net weight 960 kg (2116 lb). Individual bags are not to be sold separately (see **Figure 9**).

Figure 10. Partially Loaded Container of IBCs

Nonreturnable Intermediate Bulk Container (IBC)

- Water-resistant package holding 1000 kg (2205 lb). Box dimensions are 44¾ × 44¾ × 44⅜ in high (see **Figure 10**). For shipment, there are normally 20 IBCs in a container.

Returnable FLO-BIN® Containers (Briquettes Only)

- 1361- and 1497-kg (3000- and 3300-lb) net returnable FLO-BIN® containers, 12–14 bins per truck (see **Figures 11** and **14**).

Bulk Trucks

- 30% solution tank trailers (18,000 lb, 100% basis—8180 kg) are available from the Carlin, NV terminal. They can be unloaded using the customer's pump or by plant or truck air (see **Figure 13**).
- Excel I tank trucks (6804–9526 kg [15,000–21,000 lb]). These trucks are equipped with circulation pumps that will permit water addition, dissolving by circulation, and then pumping off into the customer's tank (see **Figure 15**).
- Excel II tank trucks (15,876–18,144 kg [35,000–40,000 lb]) are unloaded by circulating premeasured water from a storage tank by a driver/technician (see **Figures 12** and **16**).

Figure 11. Bins corded two abreast on a flatbed trailer. The bins are strapped to the trailer to prevent movement during transportation.

Transportation

Sodium cyanide must not be shipped by U.S. mail. The U.S. Department of Transportation (DOT)[3,6] hazard classification is Class 6.1 (Toxic) with an ID number of UN1689. A DOT toxic label is required. Transportation equipment must also be placarded with toxic placards in accordance with DOT requirements.

Sodium cyanide drums, Tuff-Paks, and IBCs should be shipped in vehicles that have secondary containment, such as vans. Pickup trucks, etc., should not be used. In case of an accident, secondary containment will minimize the impact of spilled material. Also, the driver must be in a separate compartment isolated from the cyanide.

Sodium cyanide must not be shipped with any acids (dry or liquid), food (human or animal), or ingredients for products used for human or animal consumption, including food, pharmaceuticals, food supplements, etc. Shipment with flammables and strong oxidizers should be avoided, as these mixed shipments can cause fire fighting complications, including cyanide runoff, in case of an accident and subsequent fire.

Storage and Handling

Storage and use areas should be designed so that accidental spillage can be contained and disposed of safely.

Storage Security

When sodium cyanide is stored, security should be maintained so only authorized people have access to it. Locked rooms or locked fenced areas can be used. Only the quantity required for immediate use should be removed from storage.

Figure 12. Excel II Truck

Drums

Drums of sodium cyanide should be stored inside and segregated from acids, weak alkalies, and strong oxidizing materials such as nitrates. It is also recommended that sodium cyanide be stored away from flammables and combustibles to minimize the chance of cyanide-water runoff as a result of fire fighting. Where local regulations permit, sodium cyanide drums should not be stored under sprinklers, because sodium cyanide will not burn in ordinary fires and cyanide runoff must be avoided. Storage with food or intermediates for human or animal products must be avoided. Observe all the precautions given under "Safety Precautions."

Figure 13. NaCN Solution Truck

If possible, open cyanide containers in the areas in which the cyanide is to be used. Remove the cover from the container, and remove the cyanide with a metal scoop or dump the cyanide from the container as required. Replace the cover on the container if the drum still contains cyanide. Store appropriately. Immediately pick up any spillage.

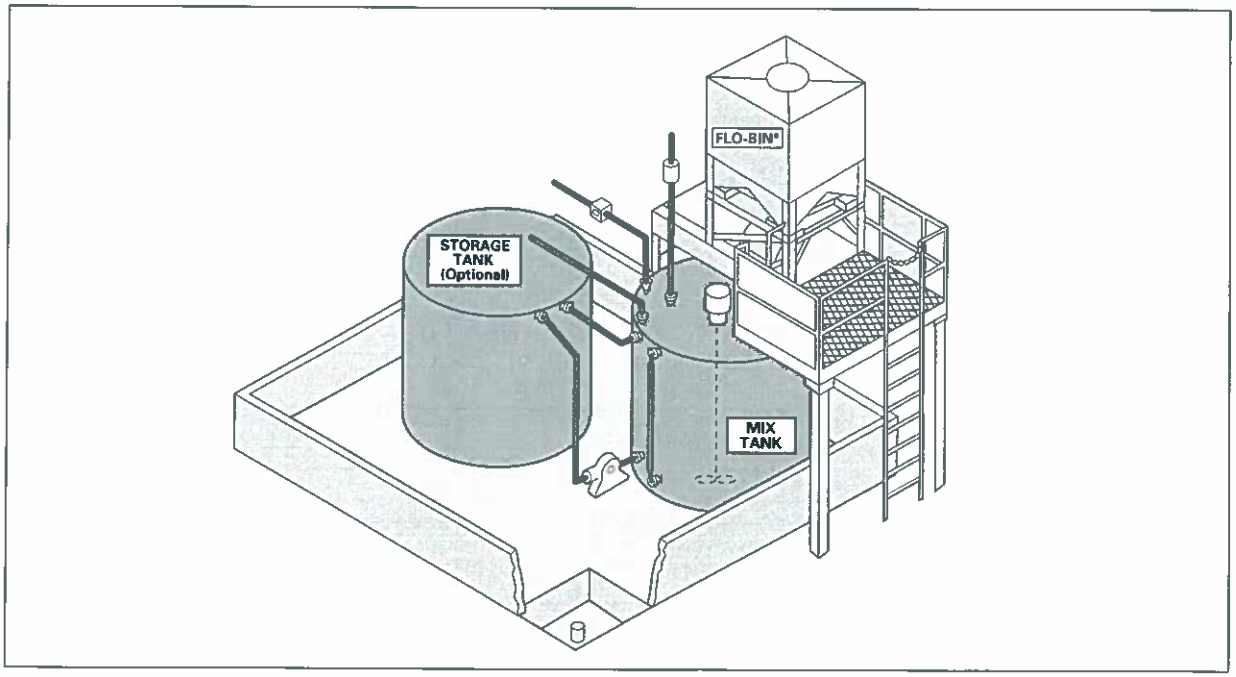
Drum Disposal

Sodium cyanide drums are nonreturnable, and it is against U.S. DOT regulations to reship or recoup the drum, except when approved for disposal of waste materials. Empty drums should be visually inspected for cyanide removal, flushed with large volumes of water, and then drained. This flush and drain cycle should be repeated three times to comply with federal regulations. Rinse water should be collected, treated, and disposed of according to local regulations (see "Cyanide Destruction" section). After cleaning, drum labels should be removed or obliterated to confirm cleaning, and the drum destroyed to prevent reuse. After the above, recycling as scrap metal is appropriate.

FLO-BIN®

A typical FLO-BIN® unloading and storage system is shown in **Figure 14**. A special design manual is available from DuPont. Contact DuPont's sales representative to discuss package and delivery options to meet specific needs.

Sodium cyanide is shipped in returnable FLO-BIN® containers (600 lb tare weight) to customers by truck or rail. In trailers, bins are shipped two abreast. Road weight limitations restrict the truck load to 12–14 bins. The advantages of FLO-BIN® deliveries are:



Economics—Customers using about 100,000 kg (200,000 lb) or more per year of sodium cya-nide can effect direct cost savings versus other smaller packages.

FLO-BIN® Customer Shipping Responsibility

When returning bins, the customer becomes the shipper and bears the responsibility for seeing that all safety precautions are carried out. DOT regulation 49 CFR 173.29 requires that a returnable container offered for transportation must meet the same standards as when the container previously held a greater quantity of a hazardous material. Returning bins do not have to be cleaned internally. Internal water washing is discouraged, because cyanide solution rundown is likely to create spillage, unless the bins are dried. External cleaning and inspection of each bin is required to ensure no cyanide is left on the outside and that the camlocks are locked closed with locking pins or wires.

When returning bins, secure bins with equipment provided. DO NOT reverse the poison placards (four) on car or truck. DO NOT remove or deface product label on bin.

Figure 14. Typical FLO-BIN® Unloading System

Intermediate Bulk Container (IBC)

IBCs are the ideal package for most large consumers of NaCN who are not near a manufacturing facility. IBCs are readily handled with forklift trucks. DuPont recommends stacking IBCs two high for storage. The DuPont IBC holds 1000 kg (2205 lb) of NaCN. When diluted to 23% (the minimum freezing point of a NaCN/water solution) with pH at 12 or above, the IBC will make about 3900 L (1030 gal).

The IBC is emptied by lifting the bag by the straps using a forklift or hoist and then positioning and lowering the bag onto the specially designed knife slitter that cuts the bag, allowing the contents to drop into the dissolving tank.

IBC Decontamination and Disposal

Decontamination and disposal of used IBC materials must be properly handled to prevent environmental contamination and meet regulations. The bags should be empty—this should be confirmed visually or by weight before they are sent to a disposal facility. Then, a flush and drain cycle, repeated three times, will dissolve any residual cyanide left in the bag. Care must be taken to ensure the bag material does not overlap and prevent water contact—interfering with the dissolving process. Rinse water should be collected and recycled or treated and disposed of according to local regulations. As part of the cleaning process, labels should be removed or obliterated. If burning is the method of disposal, keep in mind that all of the NaCN will probably not be destroyed during the burning process, and the ashes must be properly contained.

30% NaCN Solution

The DuPont terminal in Carlin, NV ships 30% NaCN solution as far away as 300 miles. The specially designed trailers hold 6300 gal—equivalent to 18,000 lb of dry NaCN. DuPont 30% NaCN solution is often the most convenient way to receive NaCN. The drivers are specially trained to make these deliveries and have a safety record envied in the trucking industry. DuPont offers technical assistance and support to assist with the design or modification of an existing system.

Excel Trucks

Excel trucks combine transportation and unloading safety by permitting shipment of solid sodium cyanide and unloading by dissolving the cyanide in place and then pumping the solution into appropriate storage. Excel I (see **Figure 15**) is ideal for customers with annual usage of ½ to 1 million lb, where 30% solution may not be desirable, but Excel I is only available in limited geographical areas. Excel II delivery systems (see **Figure 16**) are ideal for many large sodium cyanide users and usually require an annual NaCN usage of about 1 million lb per year to justify the larger investment compared to handling FLO-BIN® containers. Cost factors such as location (transportation), expected operating life, available space, inventory requirements, etc., should be evaluated with DuPont to determine the best system for each specific situation. Design manuals are available for Excel systems.

When dissolving the sodium cyanide in Excel systems, position the tank truck so that the hose connection can be made between the truck pipe headers and the storage tank and pump piping.

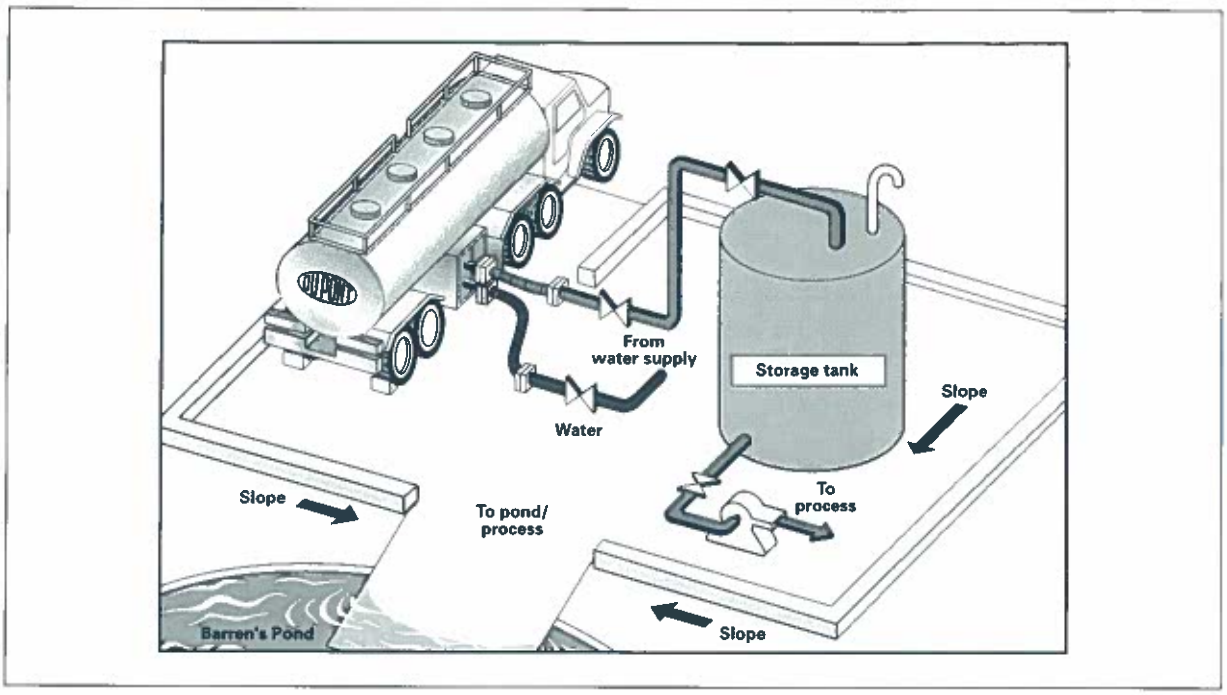
For Excel II, meter into the storage tank the amount of water and sodium hydroxide (NaOH) needed to make the desired concentration of sodium cyanide solution (about 363 kg [800 lb] NaOH for 18,144 kg [40,000 lb] NaCN). The water temperature needed for dissolving the NaCN depends on the solution concentration needed, the circulation rate, and weather conditions. The water can be preheated up to about 38°C (100°F) to speed the dissolving, but heated water is frequently not needed, unless cold weather and cold water are involved (see "Chemical Reactions" section).

Cyanide decomposition rates increase with higher temperatures, with sodium formate and ammonia being formed. Because the decomposition reaction is exothermic, provision must be made for temperature monitoring and emergency cooling, if heating is used (see "Temperature Indicators, Insulation, Heating, and Cooling").

Excel II Unloading Procedures

Position valves. Start the pump. Check the system for leaks. Circulate the water continuously from the storage tank through the tank truck from the bottom to top to flood the truck and overflow back to the storage tank. Listen to the rattling briquettes by placing your ear near the bottom of the tank trailer. Dissolving should be complete about 30 min after the rattling stops, but system experience will provide the best guide. Then, pump the sodium cyanide solution from the tank truck into the storage tank. The dissolving time varies with circulation rate, water temperature, and final concentration, but dissolving can be complete in about 1½ hr under best conditions. Typically, 3–4 hr are needed in winter, without heat, for a 20–25% concentration.

Figure 15. Typical Excel I Unloading System



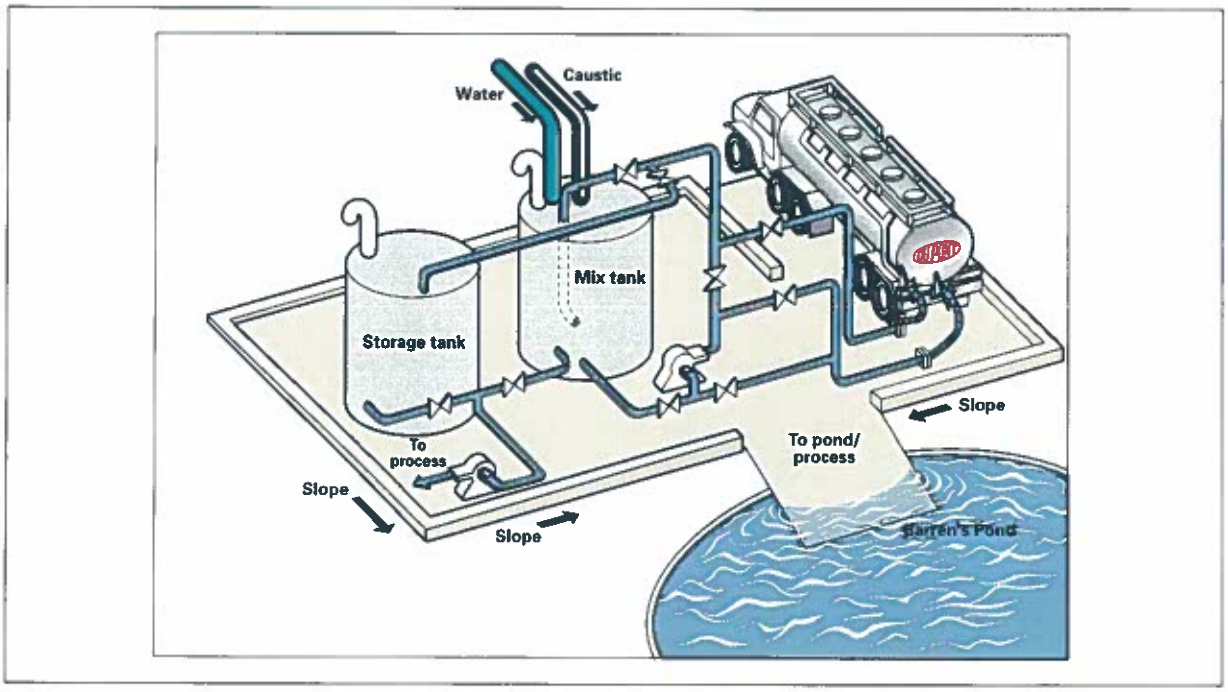


Figure 16. Typical Excel II Unloading/Storage System

Equipment

Materials of Construction

Carbon steel equipment is usually satisfactory for sodium cyanide solutions where velocities are not over 1.2–1.5 m/sec (4–5 ft/sec). At higher velocity, 304 or 316 stainless steel is sometimes recommended, because an erosion-corrosion effect occurs on steel. Carbon steel with a corrosion allowance may be acceptable instead of stainless to reduce cost, particularly if flow is frequently shut off so no erosion-corrosion is occurring. Even at very low velocities, welded, not threaded, piping should be used for all pipe materials to avoid leaks. To avoid leaks, no threaded connections should be used for piping instruments, drains, or any other connection. For pumps and instruments, 316 stainless is recommended. Valve operating conditions will determine whether carbon steel versus stainless can be used. Gaskets of Teflon® or nitrile-butadiene rubber (NBR), with Kevlar® filler, are recommended for sodium cyanide solutions.

Solution Storage Tank

Sodium cyanide solution is stored in a tank typically fabricated from ¼-in carbon steel plate. For bulk installations, top nozzles are recommended for a 15.2- to 20.3-cm (6- to 8-in) pipe vent, a 10-cm (4-in) fill and circulating line, level indicator, high-level alarm, provision for water, and caustic additions and manway. A top 4-in nozzle with a physical break in the water line will prevent backflow. Bottom openings must also be provided for a 15-cm (6-in) pump suction line, temperature control-alarm, and (optional) heating/cooling coils. The size of the storage tank depends upon the sodium cyanide shipment size and concentration of solution required. For example, 18,150 kg (40,000 lb) of sodium cyanide makes 71,000 L (18,750 gal) of 23% solution. A vertical tank 4.9 m (16 ft) in diameter by 5.0 m (16½ ft) high has a nominal 95,000-L (25,000-gal) capacity, which is sufficient to allow some outage and/or solution inventory (see **Figure 17**). The tank may be lined with neoprene to prevent buildup of iron content, if this is critical to the process. All pipe nozzles should be schedule 40 pipe minimum.

To provide mixing, a properly aligned dip tube/mixer with a siphon vent must be installed.

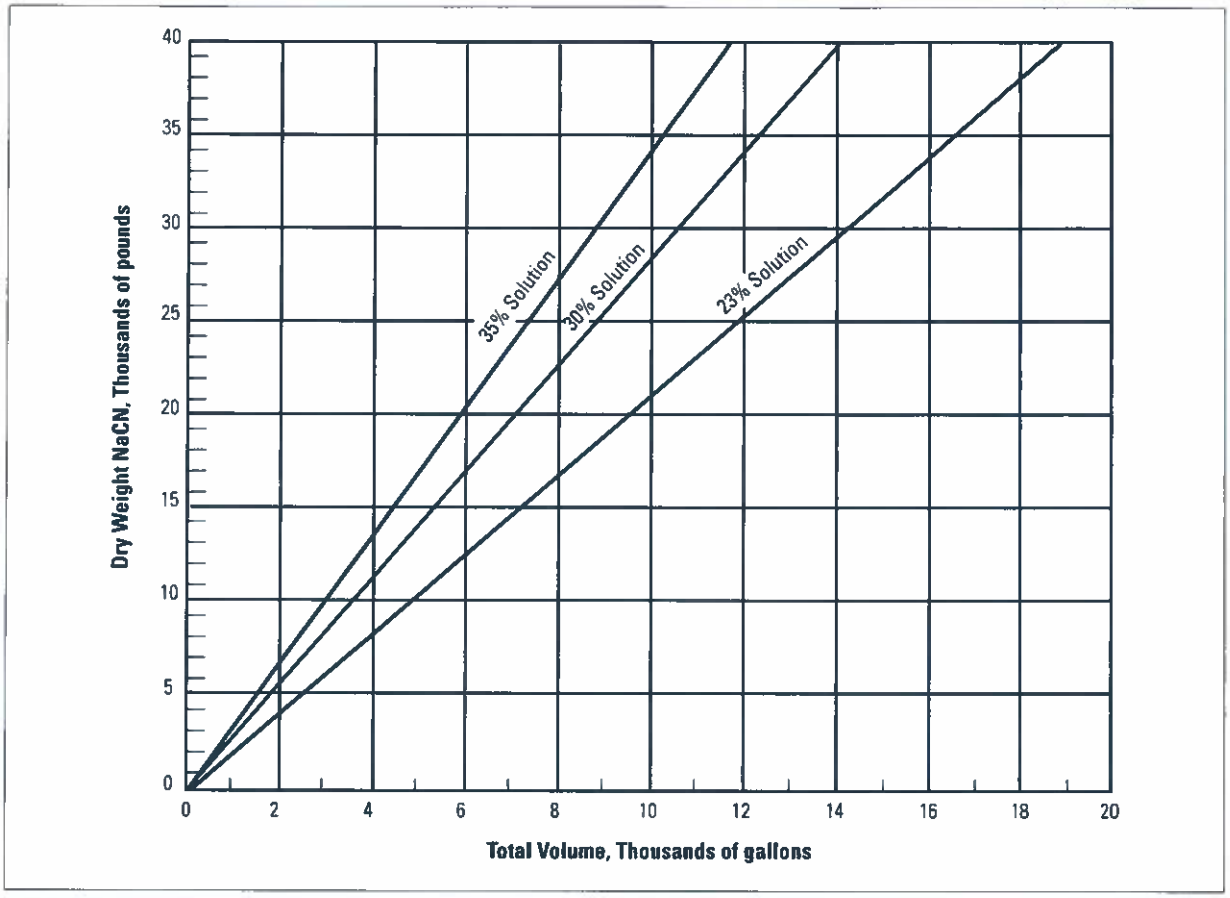
If the storage tank is located inside a building, all tank openings must be sealed and the tank vent routed outside the building to a safe location. This will prevent the discharge of hydrogen cyanide inside the building when the tank is being filled (see "Caustic Addition" on page 15).

Pump

For Excel II, a 316 stainless steel pump with a 10.2-cm (4-in) suction and a 7.6-cm (3-in) discharge is needed. It should be capable of delivering 2271–2650 L (600–700 gal) per minute at 18.3–21.3 m (60–70 ft) head. Small pumps will not provide sufficient agitation for tank car cyanide dissolving. Totally enclosed, fan-cooled, 25-HP motors are recommended.

Water Meter and Supply

A 7.6-cm (3-in) water meter with a preset totalizer and an automatic cutoff is recommended in the storage tank water addition line. There should be a physical disconnection in the water supply line to prevent cyanide from backing up into the water system.



Pipe and Hoses

Welded, not threaded, carbon steel (or 304 or 316 stainless steel) pipe with minimum flanges can be used (see "Materials of Construction" for piping and gaskets). Excel II circulation piping of 10.2-cm (4-in) is recommended (except for the line from the tank to the pump inlet, which should be 6 in, to minimize NPSH losses) with all valves, pumps, etc., located inside the dike and minimum flanges outside the dike. Tank car and truck hoses should be overdesigned to ensure against failure. Hose pressure rating should be 225 psi minimum with burst pressure (including end connections) at least twice the rated pressure. Contact DuPont for hose design and vendor recommendations. Circulation piping system, including hoses, should be inspected before each use to protect against failure and a major spill. Hoses should be long enough to permit hookup, regardless of the direction the vehicle comes into the facility. Sodium cyanide solution trailer connections are located at the rear (bumper level) and middle (on top) of the trailer; Excel II trailer connections are located at the rear (bumper level); and Excel I connections are in the box located in the middle of the trailer (ground level). All connections are quick connects, except for the top solution connection, which may be either bolted or quick connect.

Drainage Control

The storage tank should be diked and have a sealed concrete bottom. No dike drain should be installed, because it might leak or be left open. The unloading area should be curbed and drainage control provided that will prevent spilled cyanide solution from draining into public water courses (see "Pipe and Hoses"). Specific spill control requirements depend on surroundings and local regulations. Impounded sodium cyanide can be reclaimed or chemically destroyed.

Figure 17. Solution Volume Curves—Gallons of Solution from Dry Weight at 35°C (95°F)

Filter

To obtain a clear solution, a filter can be used. It should be located so that it filters the solution between the tank car and the storage tank and, also, between the storage tank and process. Filters are not needed if a clear solution is not required.

Level Indicator and Alarm

A sonic liquid level indicator is preferred over a float-type instrument, as it is more reliable, easier to read, and can be installed at a convenient location. It is recommended that a high-level alarm system, equipped to shut off the pump, be installed to prevent overflowing the storage tank.

Temperature Indicators, Insulation, Heating, and Cooling

Sodium cyanide solution should be stored above the crystallization point (see **Figure 3**), but normally below 38°C (100°F), when possible, to reduce decomposition (see **Figure 6**). A temperature control system may be needed for high concentrations. Tank insulation can be fiberglass with a sheet aluminum cover, if climate and solution concentration warrant. Low pressure steam can be used to reduce localized overheating. The same coils can be used for circulating cold water when necessary. Alternately, live steam can be injected, if small concentration changes from condensation are acceptable.

CAUTION

Read the "Chemical Reactions" section carefully and note the dangers at high temperatures.

Caustic Addition

To minimize highly toxic HCN formation and prevent color formation from HCN polymerization in the stored sodium cyanide solution, sufficient caustic (sodium hydroxide) is added to give a pH 12, preferably 12.5–13. Caustic addition to provide a 0.3–0.5% solution (about 50 lb NaOH per 1000 gal water) is usually sufficient. A 50% caustic solution can be used during the summer, but 25% solution is recommended for winter to avoid freezing. Use of 22.7-kg (50-lb) bags of bead caustic may be convenient. Additions can be made directly to the tank. Caustic should be added before sodium cyanide is added. Where process chemistry prevents caustic addition, HCN formation will increase, which must be controlled by ventilation and/or other means.

Transportation Emergencies

How to Get Help

DuPont wants to be called about any transportation incident involving DuPont cyanide, regardless of whether a spill occurred. In the event of a transportation incident or other problem involving DuPont cyanide that requires immediate help, call the DuPont Cyanide Hotline at our Memphis, Tennessee plant:

Call Collect, Day or Night

(901) 357-1546

NOTE: Do not use this number for non-emergencies. Contact the sales office listed on the back cover for routine commercial or technical information.

Calling the DuPont Cyanide Hotline is the fastest way DuPont can provide guidance to assist in handling an emergency. DuPont will evaluate whether a team of specialists should be sent to the scene.

In the United States and Canada, CHEMTREC can also be called at:

(800) 424-9300

In the rest of the world, call CHEMTREC at:

001-703-527-3887

CHEMTREC uses Language Services for non-English speakers.

The DuPont or CHEMTREC information specialist on duty will ask the name and location of the caller, the name of the shipper, the product, the shipping point and destination as well as what happened, nature of any injuries, weather conditions, proximity to populated areas, etc. If you call CHEMTREC, the information specialist will then contact the manufacturer (DuPont) for further assistance.

In Canada, CANUTEC can also be called in Ottawa, Ontario, at:

(613) 996-6666

Action at the Scene

The following is intended to provide guidance to first responders to a DuPont sodium cyanide transportation emergency incident.

1. For any transportation incident involving DuPont sodium cyanide, call DuPont for assistance as soon as possible, regardless of whether there is a spill.
2. Avoid overreaction that can occur because "cyanide" is involved. Remember, in most cases, you are dealing with a dry, solid, nonvolatile material that is normally easy to clean up, unless the cyanide has contacted acid or some other incompatible chemical or is spilled into a water system. If sodium cyanide solution is spilled, the amount of HCN gas evolved will probably be greater than if dry sodium cyanide was spilled, but because of the amount of caustic contained in sodium cyanide solution, the amount of HCN will probably still be well below lethal limits (see "Effects of Exposure to HCN Vapor" on page 8)—unless the HCN vapors are somehow contained or the solution is in contact with an acid. Gasoline, diesel, or other motor oils do not generally cause large amounts of cyanide gas.
   a. The need for evacuation is highly unlikely. Unless acid and cyanide are mixed, hydrogen cyanide gas formation is limited.
   b. While rain or any water contact with sodium cyanide can produce hydrogen cyanide gas, the amount of gas is small and would not require evacuation. While dangerous levels of gas can develop in enclosed spaces, wet sodium cyanide in the open can be shoveled up by standing upwind during cleanup.
3. Shovel the cyanide into drums, plastic bags, or any suitable container.
4. If sodium cyanide solution is spilled, contain the spill as soon and as much as possible. Keep sodium cyanide out of lakes, streams, or any other water. Block off sewer system, drainage, or any other water access. Even small concentrations of cyanide can be fatal to aquatic life. As soon as is practical, place the spilled material into a container suitable for movement to a proper disposal area.
5. As with all chemical spills, approach the scene from upwind to determine what chemicals are involved. With sodium cyanide spillage, check for battery acid spillage.
6. Keep people (nonresponders) away.
7. Halt or divert traffic to prevent spreading the cyanide.
8. If raining, cover any spilled sodium cyanide with a tarp, plastic, or anything available to minimize water contact and subsequent cyanide-water runoff. Divert any water streams around the cyanide.
9. To repeat, call the DuPont Cyanide Hotline at:

(901) 357-1546

Cyanide Destruction

The entire process in which by-products are generated should be reviewed for possible recycle of sodium cyanide, instead of disposal. If recycle is not feasible, ion exchange and reverse osmosis may be useful for concentrating cyanides, but destruction is usually easier and more economical.

The most effective and widely used chemical methods to destroy cyanide are oxidizing it to cyanate (CNO^-) with hypochlorite or hydrogen peroxide. Both methods are effective for oxidizing free and weak acid-dissociable cyanide.

For concentrated cyanide solutions, long-term high-temperature heating will destroy much of the cyanide with associated ammonia release.

Chlorination

CAUTION

Concentrated hypochlorite should not be mixed with concentrated cyanide solutions or solid cyanide, because highly toxic cyanogen chloride gas will be released. Very dilute solutions, in the correct pH range, should be used.

Chlorination of dilute sodium cyanide solutions can be accomplished by treatment with diluted solutions of sodium hypochlorite, calcium hypochlorite, or by generating hypochlorite from NaOH and Cl_2 gas. The choice of hypochlorite is an economic and safety decision. Solution concentrations of 1% sodium cyanide and 1% hypochlorite can be reacted if mixed slowly (over, say, 10 min) and with proper pH control.

Hypochlorite reacts with cyanide ions (CN^-) to produce highly toxic cyanogen chloride, which, at pH 10–11, hydrolyzes promptly to form cyanate ions (CNO^-). Because cyanogen chloride is a poisonous gas with little water solubility, the treatment process must be designed and operated to prevent cyanogen chloride fumes. Fumes are best controlled by limiting the cyanide concentration to a few thousand parts per million and controlling pH. Below pH 10, cyanogen chloride release increases; above pH 11, cyanide destruction slows, particularly above pH 11.5.

Further chlorination to destroy cyanate, sometimes referred to as "complete" chlorination, can be accomplished with additional chlorine. After reaction at pH 10.5 for 10 min or more, the pH must be reduced to 7.5–9, preferably 8–8.5, and maintained at that pH until the reaction is complete. Completion of both reactions typically requires at least 2 hr and can use eight or more parts of Cl_2 per part of CN^- (versus about three parts of Cl_2 for oxidation to CNO^-), while producing CO_2 and N_2 as reaction products. Chlorination is effective for cyanide destruction and can be automated for continuous systems. However, other waste stream components are often chlorinated, which increases chlorine consumption and may produce undesirable by-products in the effluent.

pH 10–11

Normally fastest reaction rate. Reduced HCN release and pH drop during treatment favor starting around pH 11. Higher pH will slow reaction, particularly above 11.5.

CAUTION

Adequate ventilation and HCN monitoring are important and more so as cyanide concentrations increase and pH decreases, particularly below pH 11.

pH Below 10

Causes slower reaction and release of HCN and/or cyanogen chloride gas (highly toxic, like HCN, and a powerful lachrymator, causing tearing of the eyes). Also, there is greatly increased concern about HCN release.

Acid pH

CAUTION

In addition to toxic gas release, acidic conditions can result in nitrogen trichloride formation that can separate as an insoluble oil-like material and explode violently, even in small amounts.

Hydrogen Peroxide Oxidation

CAUTION

Concentrated hydrogen peroxide should not be mixed with concentrated cyanide solutions or solid sodium cyanide, because highly toxic HCN or ammonia gas could be released. Also, high heat and oxygen gas release may cause foaming or eruption and splash workers. Dilution minimizes these problems.

Depending on the composition of the waste, additions of copper or formaldehyde may be required to destroy cyanide. The waste liquor is adjusted to pH 11 (10.5–11.5), formaldehyde or copper ions (typically with copper sulfate) added if needed, and hydrogen peroxide mixed with the solution. The solution must be agitated mechanically or with air. The reaction rate is dependent on temperature. Dilute wastes can be warmed to 38–54°C (100–130°F), but temperature elevation is usually less economical than adding 10–20% excess peroxide to shorten reaction time (which is normally about ½–1 hr at ambient temperature). Dilution and/or controlled addition rate may be needed when treating more concentrated wastes.

Chlorination is faster than peroxide oxidation and is frequently more adaptable to continuous destruction systems. Where speed is not critical, such as in batch tanks, hydrogen peroxide has several advantages including:

- Cyanogen chloride and chlorinated by-products are not produced.
- More concentrated cyanide wastes can be treated safely.
- The hazards of handling chlorine are avoided.
- Chlorine/chloride in water discharges are prohibited in some locations and can be avoided with peroxide.
- Sulfur compounds will react with hypochlorite, but not peroxide, and can increase hypochlorite costs substantially.
- Peroxide may destroy other objectionable organics.

By-products from peroxide treatment are cyanate, ammonia, and glycolic acid amide. Cyanate does not revert to cyanide in surface waters or sewage treatment systems, according to a U.S. Public Health Service study. Both the cyanate and glycolic acid amide are biodegradable. The cyanate can be readily hydrolyzed in acid solutions to ammonia.

Hydrolysis

Hydrolysis is sometimes a practical treatment for strong sodium cyanide solutions. Simply heating a 10% sodium cyanide solution for about 36 hr to 95–100°C (about 210°F) should reduce the cyanide content well below 1%, where chemical oxidation can be used more effectively. Provisions should be made to accommodate the ammonia that will be generated (see "Sodium Cyanide Reactions in Water").

Metal Complexes

Strongly bonded metal cyanides, especially iron cyanides (ferrocyanide and ferricyanide), are apt to be found in cyanide waste streams. These will not be detected by simple analytical procedures, such as titration with silver nitrate, which are normally used for measuring "free" or "weak acid-dissociable" cyanides. However, they will be included in the "total cyanide" analyses using acid distillation procedures. These complexes are not effectively destroyed by the commonly used waste treatment processes. If regulations require removal of these generally stable complexes of low toxicity, other treatment methods such as precipitation to produce a solid waste may be required.

Handling Spills

Sodium cyanide spills should be cleaned up promptly to minimize exposure of people and the environment. Shovel and sweep dry spilled material into a drum or suitable container. Keep dry spilled material dry. If solutions are spilled, immediately contain them to prevent contaminating nearby water. Contact DuPont for additional actions at a spill scene. If raining, covering the spill will reduce sodium cyanide dissolving and runoff. Decontamination of an area, after cleaning up as much cyanide as possible, can be accomplished with hypochlorite solution. A small amount of caustic (1 oz/5 gal hypochlorite solution) will help keep the pH in the 10–11 range.

C.2 Material Safety Data Sheets – Sodium Cyanide

Material Safety Data Sheet
Sodium Cyanide MSDS

Section 1: Chemical Product and Company Identification

Product Name: Sodium Cyanide

Catalog Codes: SLS2314, SLS3736

CAS#: 143-33-9

RTECS: VZ7525000

TSCA: TSCA 8(b) inventory: Sodium Cyanide

CI#: Not available.

Synonym:

Chemical Name: Sodium Cyanide

Chemical Formula: NaCN

Contact Information:

Sciencelab.com, Inc.
14025 Smith Rd.
Houston, Texas 77396

US Sales: **1-800-901-7247**
International Sales: **1-281-441-4400**

Order Online: ScienceLab.com

CHEMTREC (24HR Emergency Telephone), call:
1-800-424-9300

International CHEMTREC, call: 1-703-527-3887

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Sodium Cyanide	143-33-9	100

Toxicological Data on Ingredients: Sodium Cyanide: ORAL (LD50): Acute: 6.44 mg/kg [Rat]. DERMAL (LD50): Acute: 10.4 mg/kg [Rabbit].

Section 3: Hazards Identification

Potential Acute Health Effects:
Very hazardous in case of skin contact (irritant), of eye contact (irritant), of ingestion, of inhalation. Hazardous in case of skin contact (permeator). Corrosive to eyes and skin. The amount of tissue damage depends on length of contact. Eye contact can result in corneal damage or blindness. Skin contact can produce inflammation and blistering. Inhalation of dust will produce irritation to gastro-intestinal or respiratory tract, characterized by burning, sneezing and coughing. Severe over-exposure can produce lung damage, choking, unconsciousness or death. Inflammation of the eye is characterized by redness, watering, and itching. Skin inflammation is characterized by itching, scaling, reddening, or, occasionally, blistering.

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: Not available. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance may be toxic to skin, eyes, central nervous system (CNS). Repeated or prolonged exposure to the substance can produce target organs damage. Repeated exposure of the eyes to a low level of dust can produce eye irritation. Repeated skin exposure can produce local skin destruction, or dermatitis. Repeated inhalation of dust can produce varying degree of respiratory irritation or lung damage. Repeated exposure to a highly toxic material may produce general deterioration of health by an accumulation in one or many human organs.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Cold water may be used. Get medical attention immediately.

Skin Contact:
In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cover the irritated skin with an emollient. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention immediately.

Serious Skin Contact:
Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:
If swallowed, do not induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. Loosen tight clothing such as a collar, tie, belt or waistband. Get medical attention immediately.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: May be combustible at high temperature.

Auto-Ignition Temperature: Not available.

Flash Points: Not available.

Flammable Limits: Not available.

Products of Combustion: Some metallic oxides.

Fire Hazards in Presence of Various Substances: Slightly flammable to flammable in presence of acids, of moisture.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions:
SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use water spray, fog or foam. Do not use water jet.

Special Remarks on Fire Hazards:
Dangerous on contact with acids, acid fumes, water or stream. It will produce toxic and flammable vapors of CN-H and sodium oxide. Contact with acids and acid salts causes immediate formation of toxic and flammable hydrogen cyanide gas. When heated to decomposition it emits toxic fumes hydgrogen cyanide and oxides of nitrogen

Special Remarks on Explosion Hazards: Fusion mixtures of metal cyanides with metal chlorates, perchlorated or nitrates causes a violent explosion

Section 6: Accidental Release Measures

Small Spill: Use appropriate tools to put the spilled solid in a convenient waste disposal container.

Large Spill:
Corrosive solid. Poisonous solid. Stop leak if without risk. Do not get water inside container. Do not touch spilled material. Use water spray to reduce vapors. Prevent entry into sewers, basements or confined areas; dike if needed. Eliminate all ignition sources. Call for assistance on disposal. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up.. Keep container dry. Keep away from heat. Keep away from sources of ignition. Empty containers pose a fire risk, evaporate the residue under a fume hood. Ground all equipment containing material. Do not ingest. Do not breathe dust. Never add water to this product. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, acids, moisture.

Storage: Keep container tightly closed. Keep container in a cool, well-ventilated area. Do not store above 24°C (75.2°F).

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.

Personal Protection:
Splash goggles. Synthetic apron. Vapor and dust respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Vapor and dust respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
STEL: 5 (mg/m3) from ACGIH (TLV) [United States] SKIN CEIL: 4.7 from NIOSH CEIL: 5 (mg/m3) from NIOSHConsult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Solid. (Granular solid. Flakes solid.)

Odor:
Faint almond-like odor. Odorless when perfectly dry. Emits odor of hydrogen cyanide when damp.

Taste: Not available.

Molecular Weight: 49.01 g/mole

Color: White.

pH (1% soln/water): Not available.

Boiling Point: 1496°C (2724.8°F)

Melting Point: 563°C (1045.4°F)

Critical Temperature: Not available.

Specific Gravity: 1.595 (Water = 1)

Vapor Pressure: Not applicable.

Vapor Density: Vapor Density of Hydrogen Cyanide gas: 0.941

Volatility: Not available.

Odor Threshold: Not available.

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water.

Solubility:
Soluble in cold water. Slightly soluble in Ethanol

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Excess heat, moisture, incompatibles.

Incompatibility with various substances: Reactive with oxidizing agents, acids, moisture.

Corrosivity:
Corrosive in presence of aluminum. Non-corrosive in presence of glass.

Special Remarks on Reactivity:
Violent reaction with fluorine gas, magnesium, nitrates, nitric acid. Dangerous on contact with acids, acid fumes, water or stream. It wil produce toxic and flammable vapors of CN-H and sodium oxide. Cyanide may react with CO2 in ordinary air to form toxic hydrogen cyanide gas. Strong oxidizers such as acids, acid salts, chlorates, and nitrates. Contact with acids and acid salts causes immediate formation of toxic and flammable hydrogen cyanide gas.

Special Remarks on Corrosivity: Corrosive to aluminum

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation. Ingestion.

Toxicity to Animals:
Acute oral toxicity (LD50): 6.44 mg/kg [Rat]. Acute dermal toxicity (LD50): 10.4 mg/kg [Rabbit].

Chronic Effects on Humans: May cause damage to the following organs: skin, eyes, central nervous system (CNS).

Other Toxic Effects on Humans:
Very hazardous in case of skin contact (irritant), of ingestion, of inhalation. Hazardous in case of skin contact (permeator).

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans: May cause adverse reproductive effects (maternal and paternal fertility) based on animal data.

Special Remarks on other Toxic Effects on Humans:
Acute Potential Health effects: Skin: May cause itching and irritation. May be fatal if absorbed through injured skin with symtpoms similar to those noted for inhalation and ingestion. Eyes: May cause eye irritation and eye damage. Inhalation: May cause respiratory tract irritation. May be fatal if inhaled. The substance inhibits cellular respiration causing metabolic asphyxiation. May cause headache, weakness, dizziness, labored breathing, nausea, vomiting. May be followed by cardiovascular effects, unconciousness, convulsions, coma, and death Ingestion: May be fatal if swallowed. May cause

gastrointestinal tract irritation with nausea, vomiting. May affect behavior and nervous systems(seizures, convulsions, change in motor activity, headache, dizziness, confusion, weakness stupor, aniexity, agitation, tremors), cardiovascular system, respiration (hyperventilation, pulmonary edema, breathing difficulty, respiratory failure), cardiovascular system (palpitations, rapid heart beat, hypertension, hypotension). Massive doses by produce sudden loss of conciousness and prompt death from respiratory arrest. Smaller but still lethal doses on the breath or vomitus. Chronic Potential Health Effects: Central Nervous system effects (headaches, vertigo, insomnia, memory loss, tremors, fatigue), fatigue, metabolic effects (poor appetite), cardiovascular effects (chest discomfort, palpitations), nerve damage to the eyes, or dermatitis, respiratory tract irritation, eye irritation, or death can occur. may prolong the illness for 1 or more hours. A bitter almond odor may be noted

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:
Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: CLASS 6.1: Poisonous material.

Identification: : Sodium cyanide UNNA: 1689 PG: I

Special Provisions for Transport: Marine Pollutant

Section 15: Other Regulatory Information

Federal and State Regulations:
Connecticut carcinogen reporting list.: Sodium Cyanide Illinois chemical safety act: Sodium Cyanide New York release reporting list: Sodium Cyanide Rhode Island RTK hazardous substances: Sodium Cyanide Pennsylvania RTK: Sodium Cyanide Minnesota: Sodium Cyanide Massachusetts RTK: Sodium Cyanide Massachusetts spill list: Sodium Cyanide New Jersey: Sodium Cyanide New Jersey spill list: Sodium Cyanide Louisiana RTK reporting list: Sodium Cyanide Louisiana spill reporting: Sodium Cyanide California Director's List of Hazardous Substances: Sodium Cyanide TSCA 8(b) inventory: Sodium Cyanide TSCA 4(a) final test rules: Sodium Cyanide TSCA 8(a) PAIR: Sodium Cyanide TSCA 8(d) H and S data reporting: Sodium Cyanide TSCA 12(b) one time export: Sodium Cyanide SARA 302/304/311/312 extremely hazardous substances: Sodium Cyanide CERCLA: Hazardous substances.: Sodium Cyanide: 10 lbs. (4.536 kg)

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200). EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):
CLASS B-6: Reactive and very flammable material. CLASS D-1A: Material causing immediate and serious toxic effects (VERY TOXIC). CLASS E: Corrosive solid.

DSCL (EEC):
R27/28- Very toxic in contact with skin and if swallowed. R41- Risk of serious damage to eyes. S1/2- Keep locked up and out of the reach of children. S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. S28- After contact with skin, wash immediately with plenty of water S36/37- Wear suitable protective clothing and gloves. S39- Wear eye/face protection. S45- In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible). S46- If swallowed, seek medical advice immediately and show this container or label.

HMIS (U.S.A.):

Health Hazard: 3

Fire Hazard: 1

Reactivity: 0

Personal Protection: j

National Fire Protection Association (U.S.A.):

Health: 3

Flammability: 0

Reactivity: 0

Specific hazard:

Protective Equipment:
Gloves. Synthetic apron. Vapor and dust respirator. Be sure to use an approved/certified respirator or equivalent. Wear appropriate respirator when ventilation is inadequate. Splash goggles.

Section 16: Other Information

Procedure Poster Hazardous Material Storage

Agnico-Eagle Mines: Meadowbank Division Environment Department

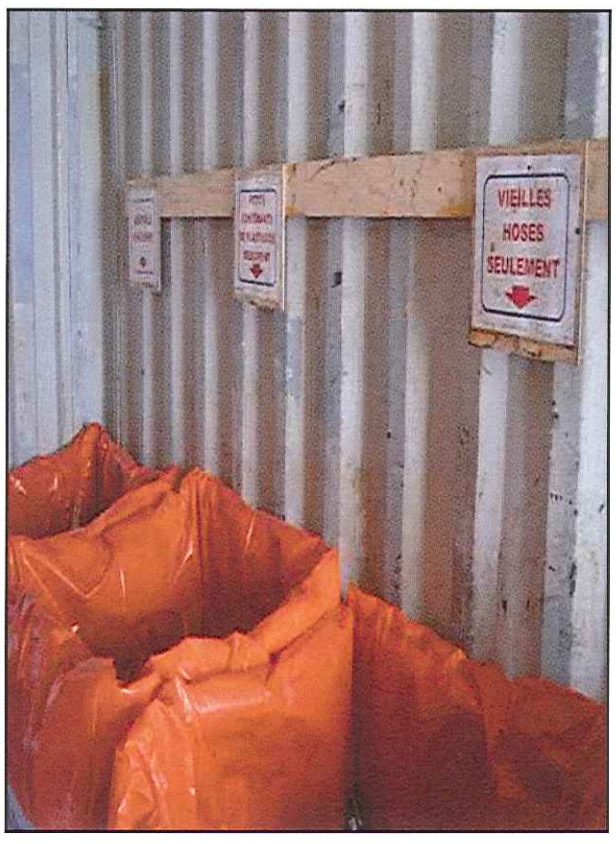
AGNICO EAGLE
MEADOWBANK

HAZARDOUS Materials/Waste Management and Storage Procedures

- AEM is committed to the safe and appropriate storage of fuels, hazardous materials, and hazardous wastes.
- AEM Environmental Department will be conducting routine inspections on each departments HAZMAT area to ensure proper procedures and storage are being met. This not only meets the requirements of our license, but is also a cost-savings initiative.
- When Hazardous Materials are not properly segregated, additional handling costs are added to the total cost of shipping our Hazardous Material down south.
- AEM's general guidelines for storing fuels, hazardous materials and hazardous wastes are listed below.

Hazardous Materials/Waste includes:

Waste Oil, Grease, Filters & Hoses, Spray Cans, Rags with Oil, Grease or Chemical Product, Paints, Batteries, Fluorescent Lights



HAZARDOUS MATERIALS/WASTE MUST BE SEPARATED (See Example Below)

The Hazardous Materials/Waste Storage Area is located near the Fuel Farm and Incinerator

When your HAZMAT is ready to transport to the Hazardous Materials/Waste Storage area, we ask that you follow these steps:

- HAZARDOUS MATERIALS MUST BE SEGREGATED AND STORED IN PROPER DRUMS, QUATREX, OR CONTAINER TO ALLOW ACCESS FOR INSPECTION AND EMERGENCY RESPONSE IN THE EVENT OF A SPILL OR RELEASE
- ALL OF THE CONTAINERS IN THE HAZMAT STORAGE AREA ARE CLEARLY LABELED. IDENTIFY THE STORAGE CONTAINER THAT MATCHES THE HAZMAT THAT YOUR TRANSPORTING (FOR EXAMPLE—SEE BELOW)

AEROSOL CANS **INTO** **AEROSOL CONTAINER**

- WHEN PLACING HAZMAT PRODUCT INTO THE STORAGE AREA CONTAINERS, GENERAL HOUSE KEEPING RULES APPLY. CONTAINERS WITH PRODUCT SHALL BE KEPT IN AN UPRIGHT POSITION AND MATERIAL SHALL BE ARRANGED TO PREVENT DAMAGE FROM FALLING OR DISLODGING

Hazardous Materials/Waste Management requires the commitment and participation of all site personal. If you have questions or are unsure of where to dispose of your Hazardous Material/Waste please call:

Site Services at extension 6902, Environment Department at extension 6747

THANK YOU FOR YOUR CO-OPERATION

NIRB Project Certificates No. 004 and No.008

Prepared by: Agnico Eagle Mines Limited

Version 3

June 2018

EXECUTIVE SUMMARY

GENERAL INFORMATION

This Noise Monitoring and Abatement Plan (NMAP) describe the operational procedures for noise abatement and monitoring at the Meadowbank Gold Project site and Whale Tail Pit Project, with respect to wildlife disturbance and potential offsite human receptors. This plan is an updated version of the Noise Management and Abatement Plan (Version 2) –January 2014.

ANNUAL REVIEW

The NMAP will be reviewed regularly and updated as necessary. Completion of the review of the NMAP will be documented through signatures of the personnel responsible for reviewing, updating and approving the NMAP.

RECORD OF CHANGES

A record will document all significant changes that have been incorporated in the NMAP subsequent to the latest review.

DISTRIBUTION LIST

Agnico Eagle Mines Limited (AEM) will maintain a distribution list for the NMAP, providing information about all parties that receive the plan.

IMPLEMENTATION SCHEDULE

The proposed implementation schedule for this Plan is effective immediately (June 2018) subject to any modifications proposed by the NIRB as a result of the review and approval process.

DISTRIBUTION LIST

SECTION 1 • INTRODUCTION

The following document presents Meadowbank and Whale Tail Pit Noise Monitoring and Abatement Plan (the Plan) in support of Meadowbank Nunavut Impact Review Board (NIRB) Project Certificate No.004 Condition 62 and Whale Tail NIRB Project Certificate No.008 Conditions 4 and 5. This plan outlines Agnico Eagle's strategy for reducing noise disturbance on and near the Meadowbank and Whale Tail mine sites, with particular regard to wildlife and potential offsite human receptors.

Section 2 of this Plan describes the site's target sound levels based on Environment and Climate Change Canada (2009) guidelines.

Section 3 describes the onsite noise monitoring program that will be conducted to track typical noise levels in the local study area and to assist in the continual improvement of noise mitigation whenever possible.

Finally, Section 4 describes the onsite noise abatement plan for anticipated common noise sources and intense noise occurrences.

SECTION 2 •TARGET SOUND LEVELS

2.1 WILDLIFE

As no specific noise guidelines were found for the Meadowbank and Whale Tail project area, recommendations made by Environment and Climate Change Canada's "Environmental Code of Practice for Metal Mines" (2009) were adopted. This document states that:

> *"In residential areas adjacent to mine sites, the equilibrium sound pressure level (L_{eq}) from mining activities should not exceed 55 dBA during the day and 45 dBA at night. Ambient noise can also affect wildlife, so sites in remote locations should also work to meet these objectives for off-site ambient noise levels."*

Therefore, target sound levels at the perimeter of the Meadowbank and Whale Tail sites are:

Daytime (0700 – 2300 h) L_{eq} (1hr) = 55 dBA

Nighttime (2300 – 0700 h) L_{eq} (1hr) = 45 dBA

Results from noise monitoring stations located at the perimeter of the Meadowbank and Whale Tail sites (including the noise monitoring stations located near the Amaruq Exploration/Haul Road) are compared to these guidelines to assist in ongoing noise management (see Section 3).

To further ensure that mine site activities are not impacting wildlife more than predicted, Agnico Eagle maintains a Terrestrial Ecosystem Management Plan (Agnico Eagle, 2018), as per Condition 54 of the Meadowbank NIRB Project Certificate and Condition 28 of the Whale Tail NIRB Project Certificate.

2.2 OFFSITE HUMAN RECEPTORS

Although no offsite impacts to human receptors were identified in the FEIS due to the remote location of the mine site, a Permissible Sound Level (PSL) may be developed in the event of construction of a dwelling in an impacted location. Based on the Alberta Energy and Utilities Board (EUB)'s "Noise Control Directive User Guide" (1999, 2007) this value will be the existing noise level at the new dwelling, when constructed.

SECTION 3 • NOISE MONITORING

3.1 OBJECTIVE

The objective of noise monitoring at the Meadowbank and Whale Tail sites is to measure representative noise levels at the perimeter of the mines and roads, and to assist in the implementation of noise mitigation measures, wherever feasible (see Section 4).

3.2 MONITORING LOCATIONS

Agnico Eagle will continue to monitor noise levels around the Meadowbank mine site at five locations previously determined in consultation with Golder Associates Ltd. UTM coordinates for the base noise monitoring stations are provided in Table 1, and are shown in relation to the mine site features in Figure 1. All sites are located at a distance from noise sources to be representative of sound levels in locations where wildlife may be expected to occur, and where noise-related PPE is not required. These locations may be adjusted as mine site operations change, to target specific activities or receptors.

Table 1 – Meadowbank Site Base Noise Monitoring Locations

Location Name	Easting	Northing
R1	636018	7217101
R2	636795	7214435
R3	641121	7214417
R4	639441	7218750
R5	633779	7214494

Agnico Eagle will also monitor noise levels around the Whale Tail mine site and Whale Tail Pit Haul road at six locations. As per the Condition 5 of NIRB Project Certificate No.008, for noise monitoring, four (4) monitoring stations are located in the vicinity of the Whale Tail Pit and two (2) are along the Haul road. Four (4) of the chosen locations (R6, R7, R8 and R9) are the same receptor locations used for baseline monitoring (refer to Volume 4, Whale Tail FEIS, Agnico Eagle, 2016). Two (2) additional locations (R10 and R11) were selected close to Whale Tail Pit. UTM coordinates for the base noise monitoring stations are provided in Table 2, and are shown in relation to the mine site features in Figure 2.

Table 2 –Whale Tail Site Base Noise Monitoring Locations

Location Name	Easting	Northing
R6	640708	7221964
R7	620194	7239038
R8	610725	7256677
R9	602488	7255946
R10	609516	7254055
R11	608 786	7257008

3.2.1 R1

Location R1 is approximately 700 m south of the explosive storage area, 400 m north of the all-weather access road, and 3,500 m north of the Meadowbank camp. Third Portage Lake is nearby to the south, and surrounding terrain is rocky tundra with some vegetation.

3.2.2 R2

Location R2 is approximately 600 m southwest of the airstrip, and 1,600 m northwest of the Meadowbank camp. Third Portage Lake is to the west and southwest and surrounding terrain is vegetated tundra with rocky outcrops.

3.2.3 R3

Location R3 is approximately 1,800 m east of the East Dike, and 3000 m east of the Meadowbank camp. Second Portage Lake is to the west and east, and surrounding terrain is vegetated tundra with rocky outcrops.

3.2.4 R4

Location R4 is approximately 1,100 m southwest of Phaser Pit, and 5,350 m north of the Meadowbank camp. Turn Lake is to the west, and surrounding terrain is vegetated tundra with rocky outcrops.

3.2.5 R5

Location R5 is in the exploration camp area, near the all-weather access road, approximately 3,500 m west of the airstrip and 4,500 m west of the Meadowbank camp. Third Portage Lake is immediately to the east, and surrounding terrain away from the shoreline is vegetated tundra with rocky outcrops. This location is situated on a known caribou migration route.

3.2.6 R6

Location R6 is located approximately 1,500 m east from the proposed Whale Tail Pit Haul road and approximately 1,500 m north from the centre of the Vault Pit. The terrain is relatively flat and covered by vegetation typical of tundra (i.e., low vegetation). In addition, the ground surface near

the receptor is covered by scattered rocks. The waste rock storage area of the Vault Pit is located approximately 750 m south from the monitoring site.

3.2.7 R7

Location R7 is located approximately 1,500 m east from the proposed Whale Tail Pit Haul Road. The ground surface around the monitoring site is generally covered by vegetation typical of tundra (i.e., low vegetation). In addition, the ground surface is covered with scattered rocks.

3.2.8 R8

Location R8 is located on an elevated plateau approximately 1,500 m northeast from the Whale Tail Pit site. The ground surface is covered by vegetation typical of tundra (i.e., low vegetation) and covered by scattered rocks.

3.2.9 R9

Location R9 is located approximately 1,500 m northwest from the proposed Whale Tail Pit. The ground surface is covered by vegetation typical of tundra (i.e., low vegetation) and covered by scattered rocks.

3.2.10 R10

Location R10 is located approximately 1,000 m southeast from the Whale Tail Pit site, on the east side of Whale Tail Lake.

3.2.11 R11

Location R11 is located approximately 1,000 m north from the Whale Tail Pit site, on the east side of Nemo Lake.

June 11, 2018 | **Fig.2**

3.3 MONITORING FREQUENCY

Agnico Eagle field staff will aim to conduct a minimum of two noise surveys per year at each of the locations described in Section 3.2. Each survey will be for a 2-4 days period to ensure significant data is collected. These surveys provide data on average noise levels during a typical day, as well as variability of noise levels within the day.

3.4 SOUND LEVEL METER

A Bruel and Kjaer Model 2250 integrating sound level meter will be used to conduct the noise surveys at the locations described in Section 3.2. The noise level logging rate will be set at one-minute intervals, and sound will be recorded in 10 minute intervals.

The parameters logged each minute will be:

- Integrated average sound level, in dBA – L_{eq}
- Absolute maximum sound level, in dBA – L_{max}
- Absolute minimum sound level, in dBA – L_{min}

3.5 WEATHER DATA

Weather data for the noise monitoring periods is collected using onsite weather stations. Hourly data for wind, temperature and relative humidity is available from this station. This data is used to screen out sound levels collected under inappropriate conditions (see Section 3.7).

3.6 FIELD NOTES

A pocket weather meter (Kestrel 3000) will be used by field staff to record wind speed, direction and temperature at the beginning and end of each monitoring period. Other records include precipitation, cloud cover and observed noises during instrument set-up and take-down. See Appendix A for an example field monitoring sheet.

3.7 QUALITY CONTROL

Calibration of the sound level instrument will be performed before and after each monitoring period using a Bruel and Kjaer Type 4231 Calibrator, to ensure variance is within 0.5 dB. Calibration results are recorded in field notes. Estimated uncertainty of the calibrator is ± 0.12 dB at a 99% confidence level. Professional calibration of the instrument will be performed as described in Section 5.

3.8 DATA ANALYSIS

Since noise levels vary over time, the monitoring instrument used measures near-continuously and reports a single-number value for each minute, representing the “equivalent sound level” (L_{eq}). This value is the average sound level occurring over the specified time period (i.e.one minute). Alternatively, it is the sound level that would produce the same total amount of acoustical energy in the specified time period as the measured sound levels did.

Data downloaded from the instrument will be filtered to remove measurements collected outside of acceptable weather conditions (wind speed > 4.17 m/s; relative humidity > 90%). All data points associated with the first and last 30 min of measurement will be filtered out to remove noise from technicians, and more than 30 min of data will contribute to hourly averages.

One-minute L_{eq} values produced by the instrument will be used to calculate hourly, day-time (7am-11pm), night-time (11pm-7am) and 24 hr L_{eq} values. These time periods are based on Health Canada recommendations, as described in Golder (2012). L_{eq} values for each time period are calculated as the geometric mean of filtered one-minute L_{eq} values.

3.9 REPORT

Results of the noise monitoring program will be compiled annually and reported to NIRB and Environment and Climate Change Canada. Reports will include, for each station:

- Visual display of one-minute L_{eq}, one-minute maximum and one-minute minimum values;
- Hourly, daytime, nighttime and 24 hr L_{eq} values, including number of hours of valid data contributing to each;
- Weather data for each monitoring period (temperature, wind speed and direction);
- Audible noises noted on field logs and in sound files, especially those corresponding with intense noise occurrences (see Section 4.3);
- Comparison of daytime and nighttime L_{eq} values to target sound levels, for applicable stations (those located at the site perimeter);
- A historical comparison of daytime, nighttime and 24-hr L_{eq} values, and comparison to predicted noise levels for the Projects;
- Recommendations for additional monitoring or for implementation of additional abatement measures, if possible, when sources of intense noise occurrence are confirmed.

SECTION 4 • NOISE ABATEMENT

4.1 GENERAL PRACTICES

The Meadowbank and Whale Tail Pit mine sites infrastructure are laid out to concentrate all activities within a small footprint (see Figures 1 and 2). As a result, the common noise sources at site are in close proximity to one another and for the most part are contained within separate buildings (i.e. facilities such as the crusher, SAG mill are indoors to reduce noise intensity). Personnel office spaces and accommodations are separate from these operational buildings. The Meadowbank and Whale Tail site infrastructure are oriented to reduce intense noise occurrences that may impact wildlife or personnel. These attenuation measures taken during the design and construction of the infrastructure are an important component of noise abatement on the mine sites.

In general, all departments will strive to ensure that equipment manufacturers have incorporated noise attenuation into their design as much as possible, will maintain equipment in good working condition, and will position stationary equipment away from potential receptors of concern or in enclosed areas.

4.2 DAILY NOISE OCCURRENCES

Common noise sources that are daily occurrences may include road traffic, air traffic, impact equipment, stationary equipment (such as generators, compressors or pumps), construction activities, blasting, material handling (i.e. crushers, cranes), earth movers (i.e. truck loaders and dozers) and the Meadowbank primary plant facilities (i.e. SAG mill, ball mill and power plant).

Table 3 describes the project-related noise sources that have been identified as well as proposed mitigation/management measures to be implemented whenever possible during operation of the facility.

Table 3 - Standard mitigation measures for daily noise occurrences.

Noise Source	Noise Mitigation Measures
Whale Tail Haul Road Construction	• Operate construction equipment within specification and capacity (i.e., don't overload machines) • Adequate equipment maintenance • Avoid operating numerous pneumatic tools at the same time, and spread operation throughout working periods • Avoid prolonged idling • If blasting is required, preference for daytime blasting
Road traffic (mine site, AWAR) and Haul Roads operation	• During maintenance, check that noise abatement devices are in good order (e.g., brakes, exhaust mufflers, engine hoods) • Enforce speed limits • Use shallow slopes for haul road

Noise Source	Noise Mitigation Measures
	• Educate truck drivers about the characteristics of diesel engines (i.e., that the flat torque characteristic allows ascending an incline in a higher gear, which is a less noisy operation) • Keep road surfaces in good repair to reduce tire noise • Avoid prolonged idling • Avoid trucking operation during night time on access road, when possible
Air traffic (Meadowbank)	• Avoid low altitude flights (not lower than 610 m in sensitive bird/wildlife areas), except on take-off and landing • Restrict air traffic to daytime hours except for emergencies
Impact equipment (pile drivers, jack hammers, drills, pneumatic tools)	• Avoid operating numerous pneumatic tools at the same time, and spread operation throughout working periods
Stationary equipment (compressors, generators, pumps)	• Keep equipment in good condition
Blasting	• Use delays, both surface and down hole • Preference for daytime blasting • Blasting in depressed pits (normal production practice)
Outdoor material handling equipment (crushers, concrete mixers, cranes)	• Place crushers in sheltered/enclosed locations if possible • Maintain equipment in good working condition • Turn equipment off when not in use if practicable
Earth moving equipment (trucks, loaders, dozers, scrapers)	• Aim to restrict equipment age so only newer, more efficient machinery will operate onsite • Operate equipment within specification and capacity (i.e., don't overload machines) • Use noise abatement accessories such as sound hood and mufflers
Primary plant facilities (gyratory primary crusher, SAG mill, ball mill, power plant)	• Provide building with walls absorbing noise • Maintain equipment on a regular basis, replace worn parts, lubricate as required • Provide diesel plant units with efficient intakes and exhaust silencers • Use conveyor system with low noise output, paying particular attention to rollers • Enclose conveyors where necessary
Utilities and services	• Ensure that a rotating biological contactor treatment system operates quietly • Dump solid waste behind barriers

4.3 INTENSE NOISE OCCURRENCES

4.3.1 Strategy

It has been found that people (and therefore, potentially, wildlife) are more tolerant of louder continuous background noise than a quieter baseline punctuated by high-level peaks. Therefore, the intense noise abatement strategy acknowledges the common continuous noise sources, and aims to reduce the occurrence of intense noise peaks. For the purposes of this Plan, intense noise occurrences are considered to be those that exceed the target sound levels described in Section 2. Examples of these may be low flying air traffic, exceedingly loud blasting or nearby impact equipment. Since noise monitoring stations may be located away from the site perimeter, the target sound levels are only used as a conservative benchmark to filter audio files for closer analysis and adaptive noise management.

4.3.2 Identification

Through the annual monitoring program, 24-h sound profiles for each monitoring station will be developed, and the daytime equivalent sound level (L_{eq}) identified (see Section 3.7). Recorded sound files will then be reviewed in conjunction with field notes to attempt to determine the sources of intense noises (> target sound levels).

4.3.3 Abatement

When sources of intense noises are confirmed, the Environment Department staff will work with the responsible party to determine whether further abatement of the noise is possible. At a minimum, this will include ensuring the previously identified mitigation measures (Table 3) are being applied. If all abatement practices are in use and the source continues to contribute to intense noise occurrences in subsequent monitoring events, the implementation of additional appropriate measures will be investigated. This method of intense noise identification means that there will be a continual effort to reduce the sounds contributing to the loudest, most disruptive noise peaks onsite, even as site operations evolve and average noise levels change.

SECTION 5 • MANAGEMENT AND OPERATION

The following presents the plan's management responsibility, and operational procedures for the Bruel and Kjaer Model 2250 integrating sound level meter.

5.1 MANAGEMENT RESPONSIBILITY

Operation and monitoring of the noise stations will come under the responsibility of the Environment Superintendent. Designation of training requirements is the responsibility of the Environment Department.

5.2 EQUIPMENT OPERATION

The Environment Department will be responsible for the operation of equipment and collection of samples by appropriately trained personnel consistent with detailed written operating instructions (SOP – Appendix B) from qualified personnel. The SOP will be kept up-to-date and any changes will be communicated to relevant personnel.

5.3 EQUIPMENT MAINTENANCE

As recommended by the manufacturer and to make sure results are in compliance with good practices, the meter will be factory calibrated and certified per the schedule outlined below.

Calibration	Interval
Microphone	2 years
Meter	2 years
Calibrator	1 year

SECTION 6 • PLAN REVIEW

The Noise Monitoring and Abatement Plan will be reviewed regularly by the Environmental Superintendent and be updated if any changes to the equipment or the program occur.

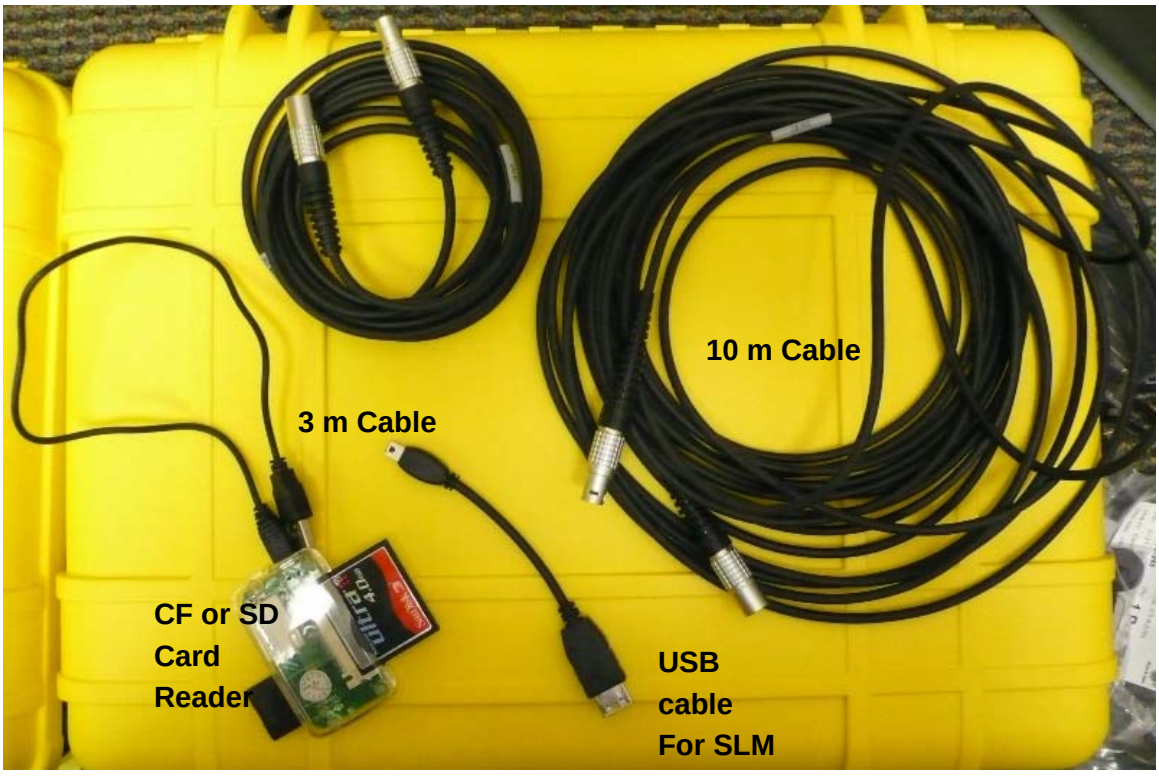
1.0 LONG-TERM MONITORING CONFIGURATION

The Bruel and Kjaer 2250 sound level meter (2250 SLM) can be configured for short or long term noise monitoring. The photo below shows the long-term monitoring setup including the weather protective case. In long-term monitoring, the following components are required:

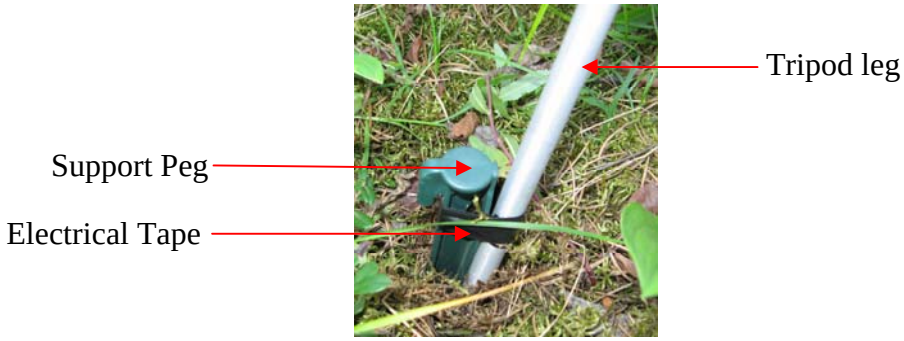


- 2250 SLM;
- Microphone and Preamp Assembly;
- Outdoor Microphone Kit;
- Microphone Extension Cable;
- Tripod;
- External 12 Volt DC Power Supply;
- Power Supply Cable Connector;
- External Memory Card (CF-Card or SD-Card);
- Support Pegs; and
- Electrical Tape.

1.1 Storage Case Setup

The monitoring components and setup for the equipment storage case are shown below.

1.2 Outdoor Microphone Assembly



The procedure for assembling the outdoor microphone is summarized below:

1.3 Hardware Setup Procedure

1.3.1 Tripod

Extend the tripod to its maximum extension. Secure a support peg to end of each tripod leg, making sure that the pegs are parallel to the leg. Using electrical tape (note electrical tape is ideal as it is durable and can be easily removed) to secure the tripod legs to the support pegs such that little to no swaying or tipping is possible. Insert the support pegs into the ground far enough to provide ample support of the legs of the tripod.

1.3.2 Outdoor Microphone Kit

Remove the outdoor microphone kit windscreen and extension cable and attach it to the top of the extension pole. Run the microphone extension cable down one of the tripod legs securing it with electrical tape approximately every 2 feet along the leg as shown below.

1.3.3 Extension Cable Connection

Connect the microphone extension cable to the input of the B&K 2250 Analyzer making sure that the dot on the extension cable is lined up with the dot on the input of the Analyzer (see left figure below).

Note, when dismantling the meter it may be difficult to remove the microphone extension cable from the B&K 2250 Analyzer. If difficulties do arise, place a cloth over the sleeve and use pliers to gently grip and pull back the sleeve to release the connection as shown below.

Sleeve

Place cloth over sleeve.

Use pliers to gently pull back sleeve.

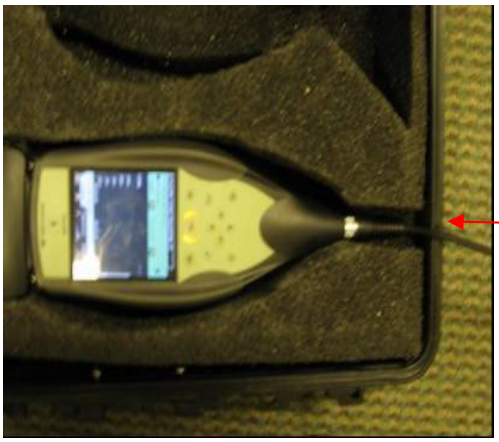
1.3.4 Long Term Power Supply (12V DC)

Connect the power supply cable from the 12V Panasonic battery to the external power supply located at the base of 2250 SLM. There are two indicators to confirm that 12V DC power supply is connected successfully to the 2250 SLM:

- The green LED which is located at the bottom of the B&K 2250 Analyzer should be on; and

Check 2250 Analyzer LED for power.

- The battery symbol on the B&K 2250 Analyzer screen display changes from a battery to a power plug symbol - as shown in the figure below.



External power symbol indicating that external power is connected.

A flashing green LED light indicates the internal battery of the Sound Level Meter is fully charged (100%).

1.3.5 Extension Cable Arrangement

There are two data cable available (3 m and 10 m). Use the 3 m when connect to the handheld microphone pre-amp and use the 10 m extension cable when using the outdoor microphone kit. The microphone extension cable must extend across the notched portion of the sound level meter case as shown below.

Extend microphone extension cord over notched portion of protective case.

After securing the cables of the sound level meter, the case should be placed underneath the three legs of the tripod as shown below. Coil the excess cable length and store it inside the case. Tape the microphone extension cord along the tripod to avoid tripping and noise contamination (wind).

Tape microphone extension cord along tripod.

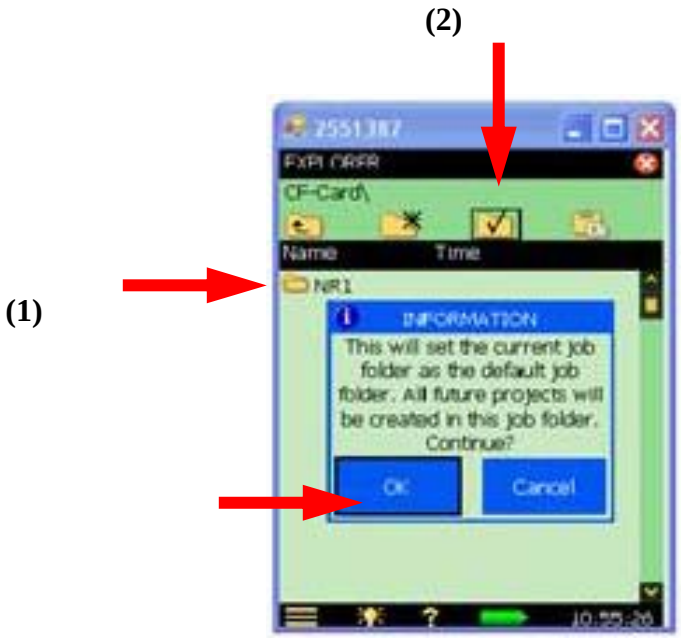
1.4 SLM Setup Procedure

1.4.1 Data Storage Card - 4.0 GB Memory (CF/SD) Card

1. Insert an empty 4 Gigabyte memory card into the B&K 2250 Analyzer. Upon inserting the CF/SD card, the B&K 2250 Analyzer should acknowledge the card and display the prompt to accept the card. Click "Yes" to this.

2. Select the "Main Menu" which is shown by three bars to the lower right on the B&K 2250 Analyzer screen as shown above left. Then select the "Explorer" (see below) option so that a folder can be created on the CF/SD card.

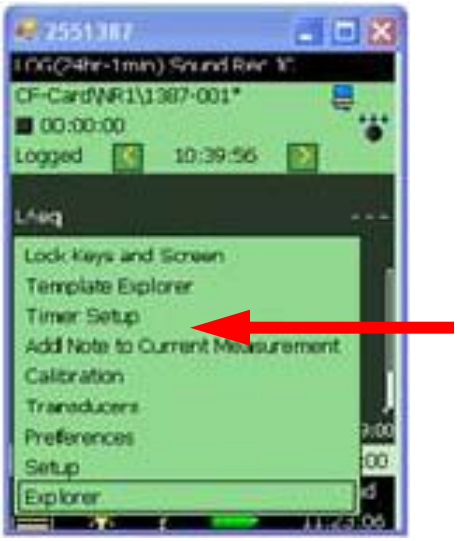
3. The next step involves creating a folder on the CF/SD card in which to store the noise data. Creating a new folder is done by selecting the folder icon with a star as shown in the figure below left. A prompt will display that a new job folder will be created. Select "Ok".



4. Renaming the folder is the next step. Select the folder, right click mouse button, and then select the "Rename" option. Choose the name of the folder appropriately to help with identification of noise monitoring location during data analysis and processing later (*e.g.*, MEADOWBANK030308).

5. Once the folder has been renamed, the folder must be identified as the default for data storage. This is done by selecting the folder itself and selecting the "Open" option (1 below). Now select the folder icon with the check mark (2 below) on it to set the current job folder (NR1 in photo below) as the default job folder, *i.e.*, all measurements will be stored within this folder.

6. Observe the file path that is shown at the top of the display screen, it should display that the CF/SD card is at the top level and that the folder (NR1 in photo below) is one level below, *i.e.*, "CR-Card\NR1" as is shown in the below left screen.



7. Exit the “Explorer” screen by selecting the red “x” at the top left of the display screen.

1.4.2 Monitoring Template

The 2250 SLM is loaded with 10 standard monitoring templates. Each of the 10 standard templates performs a different type of measurement. The standard templates can be modified and saved as a Project Template to retain specific display settings and measurement setups. The template itself does not store any measurements. A Project Template named “MEADOWBANK 24hr LOGGING” has been designed to conduct the 24 hr noise monitoring. Use the following procedures to load the template.

1. Select the “Main Menu” and select the “Template Explorer” option as shown below. All the available templates will be shown on the screen.

2. Choose the “MEADOWBANK 24hr LOGGING” and then select “Open”.

3. The common measurement settings selected in this template are shown in the following table:

MEADOWBANK 24hr LOGGING SETTING

Input		
Input	Top Socket	
Trans. Used	4152_0 (########) Check serial # on mic	Outdoor kit
Sound Field Correction	Free-field

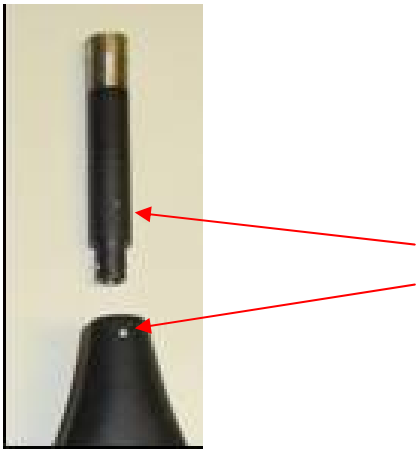
2.0 SHORT TERM MONITORING CONFIGURATION

The following components are for short term monitoring:

- 2250 SLM;
- Microphone and Preamp assembly;
- Windscreen;
- External Compact Flash Memory Card (CF/SD-Card);
- Tripod; and
- Tripod mounting bracket.

Since short term measurements rarely require an external power source. The B&K 2250 internal battery is typically used as the power source which can supply the meter for approximately 7 hours of operating time. The battery icon will display the estimate battery life remain in the internal battery. The photo on the left shows the hand-held configuration assembly.

2.1 B&K 2250 Hand-held Configuration



1. Connect the microphone to the pre-amplifier.

Option:
3 m extension cable can be inserted here for extension purposes.
(*e.g.*, ventilation fans on building wall)

2. Insert the microphone and pre-amplifier component into the B&K Analyzer making sure to line up the dot on the preamplifier with the dot on the B&K Analyzer.

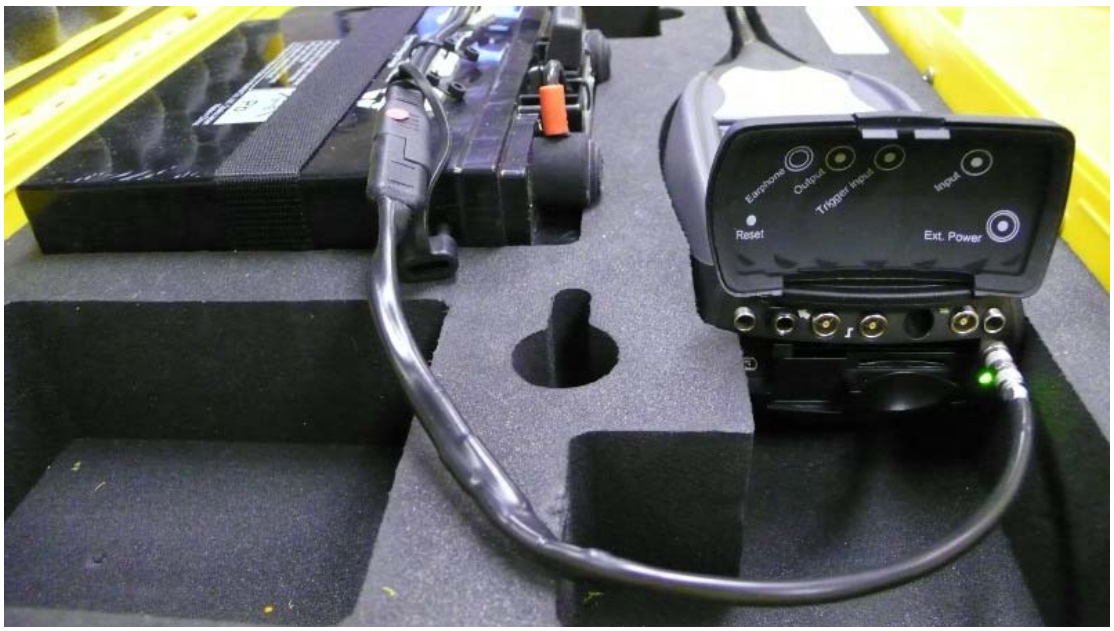
3. Connect the windscreen to the microphone-preamplifier.

4. Mount the SLM on the tripod with the tripod adaptor.

2.2 Frequency Analyzer Template

Select the "Main Menu" and select the "Template Explorer" option as shown in Section 1.4.2 above. All the templates available will be shown on the screen. Choose the Project template named "MEADOWBANK SHORT-TERM FREQ ANALYZER", and then select "Open". This template is setup so that the B&K 2250 Analyzer records the frequency content in 1/3-octave measurements and broadband sound level measurements simultaneously. The measurement settings selected in this template are shown in the following table:

MEADOWBANK SHORT-TERM FREQUENCY ANALYZER SETTING



Input		
Input	Top Socket	
Trans. Used	4189 (#######) Check serial # on mic	mic with preamp
Sound Field Correction	Free field

Sound Recording (Off)		

3.0 POWER SUPPLY

3.1 Panasonic 12 Volt External Battery Charging

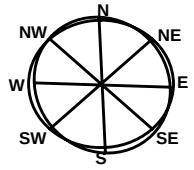
A long term measurement duration can be anywhere between 7 to 36 hours. When an external batter supply is used, the 2250 m draws first from it until it is depleted. When the fully charged external battery is depleted (roughly 3 days) then the meter begins to draw from the internal power supply (roughly 7 hours). To recharge the 12 Volt Panasonic batteries used for long term measurements do the following:

- Connect the battery power supply cord to the battery charge cord;

- NOTE: The battery charger input rating is 120V, connecting it directly to a 220-230V AC supply will DESTROY IT!

- Connect the battery charger to the power outlet and observe the colour of the battery chargers LED.

    - GREEN - battery is being charged, NOT READY
    - YELLOW - battery is being charged, READY FOR USE
    - RED - battery malfunction or bad connection



3.2 2250 SLM Internal Battery Charging

Connect AC/DC power supply adaptor to 2250 SLM power inlet as shown in the photo below. The 2250 internal battery will take up to 10 hours to charge. The battery will typically last 7 to 8 hours in warm temperature.

4.0 FIELD MEASUREMENT RECORDS

Important information such as field observation, measurement location, weather, acoustic environment must be recorded prior to any measurement period. The following field record sheets shows example for the record entries in Long Term and Short Term Measurements:

MONITORING STARTS		
Operator:

5.0 CALIBRATION

5.1 Calibrator

The 2250 SLM requires regular calibration to confirm the meter meets the precision requirement. It is mandatory to perform a calibration before and after each measurement program. Calibration is carried out via the B&K 4231 Calibrator shown in following photos.

Without case

With case

5.2 Calibration Procedure

The following steps are to be taken for proper calibration:

1. Choose the Main Menu to access the “Calibration” option as shown below.

2. Insert the B&K 4231 Calibrator on to the microphone; pushing it until it becomes flush (bottoms out). Press the start button. The way in which the calibrator is installed for the hand-held and outdoor kit configuration is shown below. There are two ways of checking that the calibrator is working. The first is by simply turning it on prior to inserting it onto the microphone and listening. Alternatively, confirming that the LED light on the calibrator is lit.

Outdoor Calibration Configuration

Hand-held Calibration Configuration

3. On the display screen the "Start Calibration" should appear. Select this and let the calibration begin.

4. It is important to conduct the calibration in a quiet environment (*e.g.*, no car engine idling or conversation). High ambient noise will disrupt calibration.

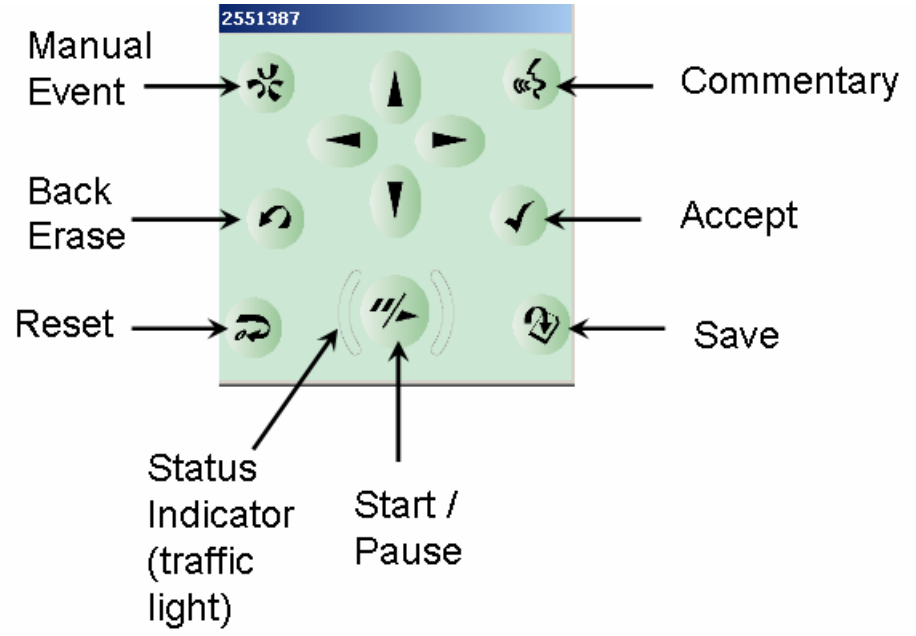
5. Observe the dB level in the 2250 SLM display measuring the calibration signal. This level should be at or very close to 94 dB.

6. Just before the end of the calibration, the meter will display "New Sensitivity" information. This information should be documented on the "Noise Field Sheet" for later use (see Noise Field Sheet form in Section 4 above). Note that the value "Deviation from last" should be no more than ±0.1 dB. Repeat the calibration if the deviation exceeds the ±0.1 dB limit.

7. Select yes to "Accept calibration?" and then "Exit Calibration".

5.3 High Deviation Level

The following may be reasons for the deviation value being consistently outside the acceptable limit of ±0.1 dB during calibration:



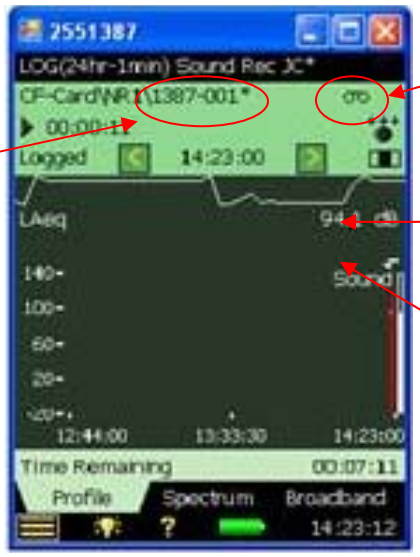
- High humidity levels;
- High ambient noise level surrounding the calibration environment; and/or
- Poor connection between the preamplifier and the B&K outdoor kit body. The preamplifier should be firmly screwed into B&K outdoor kit body; however, not so tight as to damage the fine threads of the preamplifier, or not to be able to unscrew the amplifier after use.

6.0 START NOISE MONITORING

After completing the setup and calibration, the following steps are to be carried out to begin noise measurements during long-term monitoring:

1. Press the “Reset Measurement” button.

2. Press the “Start” button.



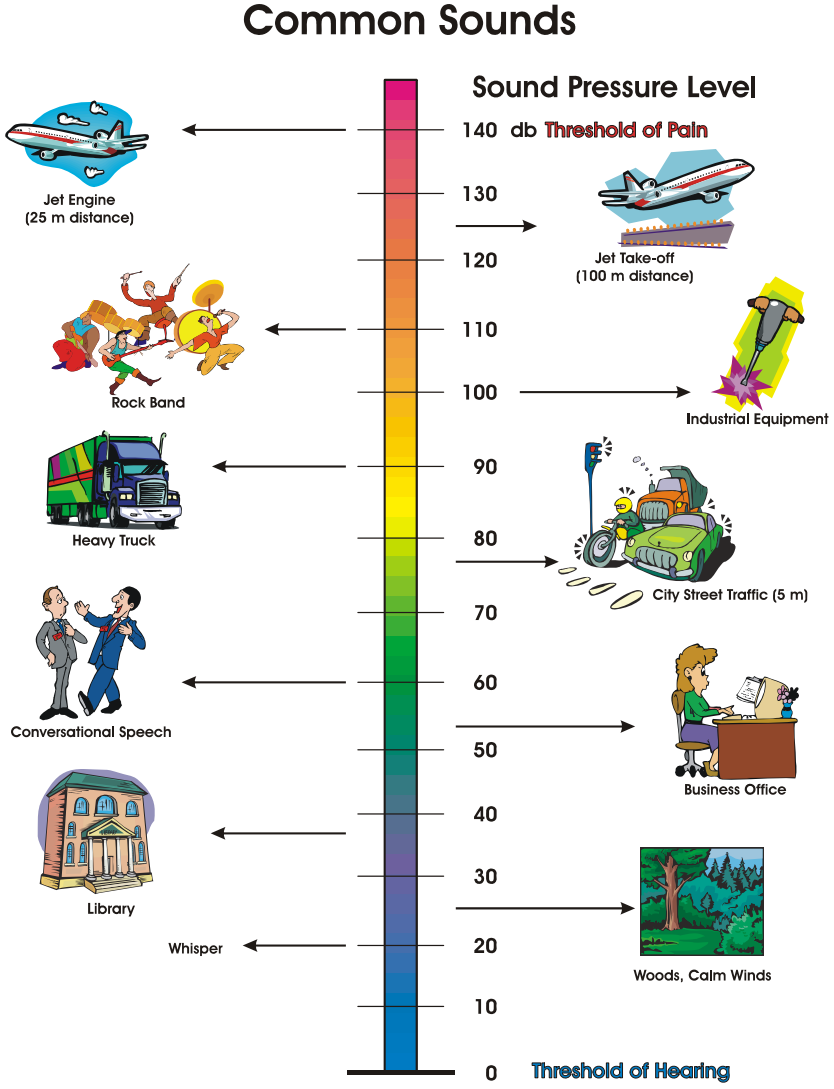
Because the measurement control setup is manual during short-term monitoring, you will have to repeat the following steps for each measurement:

- Reset
- Start
- Stop/Pause
- Save

The following information should be recorded on the Noise Field Sheet shown in Section 4:

- Save file number
- Location of measurement
- Overall level

Upon starting a measurement, one will see a time history forming which fluctuates with time as shown in the below figure.



Sound recording

File name for data storage, asterisk * indicates file has not been saved

"Real Time" Time History Plot

Instantaneous Noise Level

It is recommended to remain silent for a minute after starting a measurement so as to let the meter "settle-down" and to determine whether the noise levels being recorded are representative for the study area. The following figure lists some typical noise level ranges for different environments. It should be used as a rough guide when on site taking noise measurements.

Common Sounds
Sound Pressure Level
140 db Threshold of Pain
130
120
110
100
90

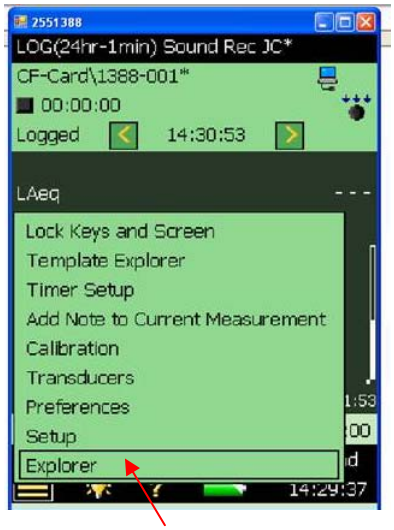
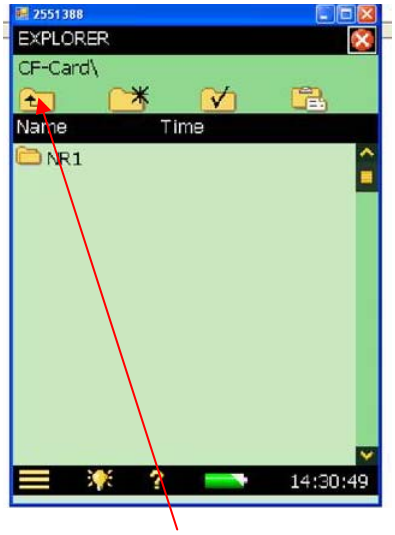
Business Office
Library
Whisper
Woods, Calm Winds

7.0 POST MEASUREMENT PROCEDURES



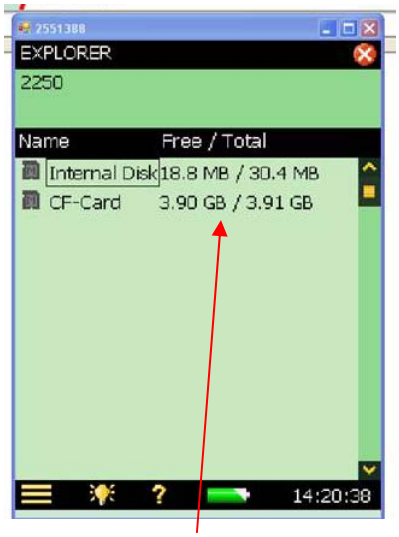
After completing a long-term noise measurement (*i.e.*, after 24 hours has passed), it is time to retrieve the equipment from the field to set it up at some other desired location.

7.1 Data Check



Prior to completely dismantling the equipment, the quantity of the data that has been recorded should be verified.

A series of checks can be performed to confirm that the noise data has been collected. Prior to removing the CF/SD card from the B&K 2250 Analyzer, the amount of data recorded on the CF/SD card should be checked on the 2250 Explorer display. As a general rule of thumb, a 24 hour noise measurement should represent approximately 2.4-2.7 Gigabytes of data (or thereabouts). This leaves about 1.6 Gigabytes of storage space remaining on the card.

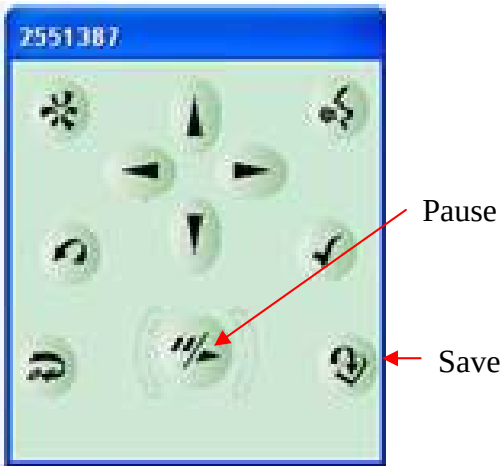


Select the Main Menu to access Explorer. Select the up one folder icon (folder with up arrow on it) to view both the "Internal Disk" and the "CF/SD card" as shown below.

Choose Explorer

Choose Up one level

View "Free/Total" of each storage device



In the example above, it can be seen that there is 3.90 Gigabytes of free data storage space available on the CF/SD card. Note Explorer displays "Free" space on the storage medium and not used space. This means that 0.01 Gigabytes has been used; not enough for a 24 hour monitoring period. Again, approximately 1.6 Gigabytes of free data storage space should be available following a 24-hour monitoring period.

7.2 Save

The recorded data will be saved automatically into the specified file upon completion of the specified measurement period (24 hours). However, if the measurement period is terminated before the specified period, the data must be saved manually.

Only save the file if the specified measurement period has not been exceeded.

In such case, the SLM is still recording upon arrival. The data record file display on the top will show an asterisk '*' at the end of the filename (*e.g.*, CF-card\Project001*****). Press the Pause button and then the Save button.

7.3 Calibration

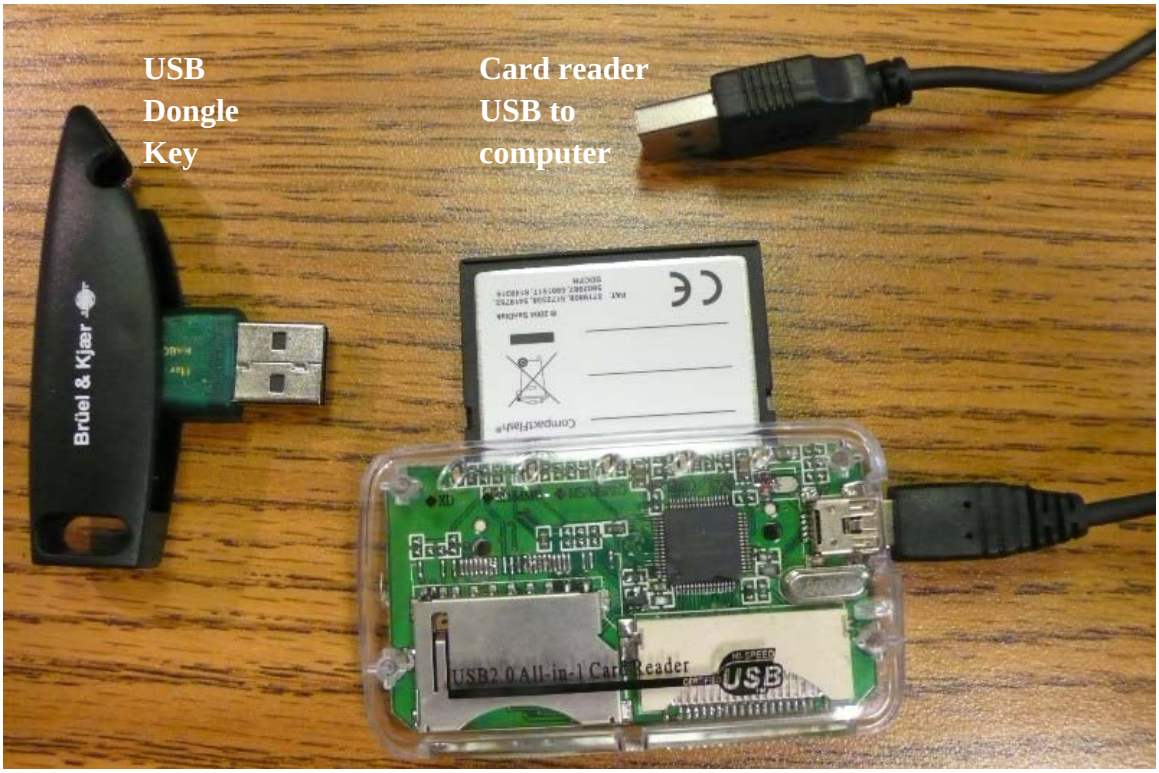
Before powering down the B&K 2250 Analyzer, the sound level meter needs to be recalibrated. Following procedure outlined in Section 5 for post measurement calibration.

8.0 DATA DOWNLOAD

The data download requires the following steps:

1. Connect CF/SD card to the card reader;

2. Activate the B&K BZ5503 software to copy data files from CF/SD card into archive files on a computer;



3. Export the archive file to a format for the Evaluator 7820-7821 Software; and

4. View recorded data in Evaluator 7820-7821 Software.

The following equipment is required to complete the data download:

- Computer with USB port;
- CF/SD card reader; and
- B&K USB dongle key for the use of the B&K Evaluator software.

Refer to the document “BZ – 5503 Data Download Procedure” provided with the noise monitoring equipment for further details.

8.1 CF/SD Card Reader and USB Dongle Key

After connecting the dongle key to the computer, start/run the B&K BZ 5503 software and connect the card reader using the computer USB connection as shown in the figures below:

Insert B&K Dongle

Remove CF/SD card from 2250 Analyzer and insert into card reader

Connect USB connection to USB port

8.2 Data Archive

The data from each 24-monitoring location should be archived and the entire archive directory should be burnt to a DVD. A typical 24 hour monitoring program will occupy one 4GB DVD.

9.0 EQUIPMENT TROUBLESHOOTING CASE STUDY

The following are examples of potential equipment malfunctions and possible reasons for those malfunctions.

9.1 Failed Power Connection

The following reasons can result in external power supply failure:

- Loose power supply connecting cable;
- Uncharged battery; and
- Bad fuse.

9.2 Invalid Data Collection

Invalid data collection is typically found when analyzing the time history of the sound file. The data ends up having either higher or lower sound levels (dBA) than would be representative of the area. Regular field visits during the monitoring period to check on the measurement levels will reduce the potential for invalid data being recorded. The following are common causes of invalid data:

- Power failure;
- Poor weather – heavy rainfall, high wind gust;
- Tampering with sound level meters;
- No calibration check; and
- Incorrect setup.

9.2.1 Poor Weather: Wind Speed and Precipitation

Poor weather conditions are probably the biggest reason for invalid data. Poor weather conditions include rain and high winds. Long-term noise measurements are rarely if ever done during winter months. Ideal noise monitoring conditions require that wind be no more than 20 km/hr (5.6 m/s) and that there be no precipitation during the measurement period. High wind has the effect of masking the true noise at a distance from different sources. Flutter noise is a type of noise due to velocity gusts impacting the microphone. In both cases the data collected during these non ideal conditions must be removed in order to have valid noise data set. The Energy Resources Conservation Board (ERCB) has established guidelines, namely, Directive 0038, for “Favourable summertime weather conditions” as shown in the below table:

Parameter	Preferred Condition
Ground Cover	No snow, water, or ice (frozen) ground cover.
Precipitation	No steady precipitation, monitoring invalid.

Wind Speed	Wind speed limits (noise data may be invalid if limits are exceeded):
	• Less than 500 m from noise source
	  • Upwind: 10 km/hr limit
	  • Crosswind: 15 km/hr limit
	  • Downwind: 15 km/hr limit
	• 500–1000 m from noise source
	  • Upwind: 5 km/hr limit
	  • Crosswind: 10 km/hr limit
	  • Downwind: 10 km/hr limit
	• Greater than 1000 m from noise source
	  • Upwind: less than 5 km/hr limit
	  • Crosswind: 10 km/hr limit
	  • Downwind: 10 km/hr limit
	24-hour noise sampling period: there should be at least 3 hours of wind blowing directly to the noise receptor in the nighttime sampling period (22:00 to 7:00) and 3 hours in the daytime sampling period (7:00 to 22:00).

When doing a long-term noise measurement, it is not always possible to determine whether rain has occurred over the entire 24 hours of the study. The possibility of rain should be investigated prior to the noise field trip. The following website is useful for determining weather conditions across Canada: www.theweathernetwork.com or http://www.weatheroffice.gc.ca/canada_e.html.

In addition, a couple of indicators may help determine whether rain has occurred including:

- Visible signs of water on the protective sound level meter case and the surrounding ground.

- Cross referencing the B&K Evaluator sound file with the weather data obtained from the site weather station. If rain can be heard upon listening to the sound file, and the humidity is close to 100 %, then there is good reason to believe that rain occurred during that time period.

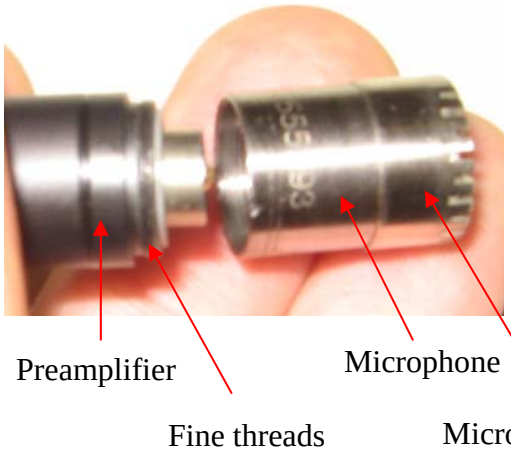
9.2.2 B&K 2250 Analyzer Calibration Fault

Calibrating the sound level meter before and after each measurement is a necessary part of the noise monitoring process. Not carrying out this necessary step can result in invalid data. Calibrating the noise level meter essentially tests the B&K 2250 Analyzer's ability to sense correct noise levels. The B&K 4231 calibrator itself must have new or fully charged batteries so that it too outputs the correct test signal (94 dBA at 1000 Hz). As an example during one noise field study, the microphone on the B&K 2250 Analyzer was found to become wet from the rain. Upon performing a post measurement calibration, the B&K 2250 Analyzer was found to be observing larger than normal values. Typically, the B&K 2250 Analyzer outputs a reading in the range between 49-52 mV/Pa (millivolts per Pascal). With the moisture in the microphone, the values were found to be much higher than this. After the water evaporated, the calibration was again found to be in normal range.

10.0 EQUIPMENT MAINTENANCE

10.1 Microphone Maintenance

The following maintenance procedures are recommended keeping order to maintain the microphone in good working order:



- When not in use, keep the microphone in an environmentally controlled area with moderate to low humidity levels, as humidity will alter the sensitivity of the microphone. Condensation of water vapour within the microphone can cause significant negative effects, the worse of which is electrical continuity between the diaphragm and the back plate. Thus, it is necessary to prevent the microphone from coming into contact with any liquid whatsoever. Keep the microphone and preamplifier assembly in the designated case when not in use for long periods of time as shown in the figure below:

- When connecting the microphone to the preamplifier or the outdoor kit body, thread the microphone VERY CAREFULLY to avoid damaging the threads. Do not remove the microphone shield as the microphone drum can fall out and become damaged or lost (see photos below).

- The Microphone and SLM should be calibrated every two years.

10.2 B&K 2250 Analyzer Maintenance

The following maintenance procedures are recommended to keep the B&K 2250 Analyzer in good working order:

- Keep the Analyzer in the protective case when not in use.
- Be careful not to drop the meter as the touch display screen can be damaged.
- Avoid using solvents when cleaning the touch display screen. Instead use a damp cloth as recommended by B&K.
- To remove the microphone extension cable, make sure to pull back the spring loaded sleeve gently before pulling the connection from the meter. If difficultly arises in removing the connection, put a cloth over the sleeve and use pliers to gently grip the cloth while pulling back to release the connection.
- The B&K 2250 Analyzer should be sent to the B&K North America service department every two years for maintenance. This facility is located at:

  Bruel & Kjaer North America
  2815-A colonnades Court
  Norcross, GA 30071-1588
  Phone: 800-332-2040
  Fax: 770-447-4033
  www.bkhome.com

10.3 B&K 4231 Calibrator Maintenance

The following maintenance procedures are recommended to keep the B&K 4231 Calibrator in good working order:

- Keep the calibrator in its case at all times. There is no need for the leather case to be removed except for when the batteries need to be changed.

- The B&K 4231 Calibrator should be sent to the B&K North America service department every year for maintenance. This facility is located at the same address as that given above.

10.4 Outdoor Microphone Assembly Maintenance

- Keep the windscreen on the outdoor microphone body, as this protects the microphone.

- Clean the windscreen from any debris that may accumulate on it after field work, as any build up of debris will serve to impede sound from being transmitted to the microphone.

Occupational Health and Safety Plan, Version 2

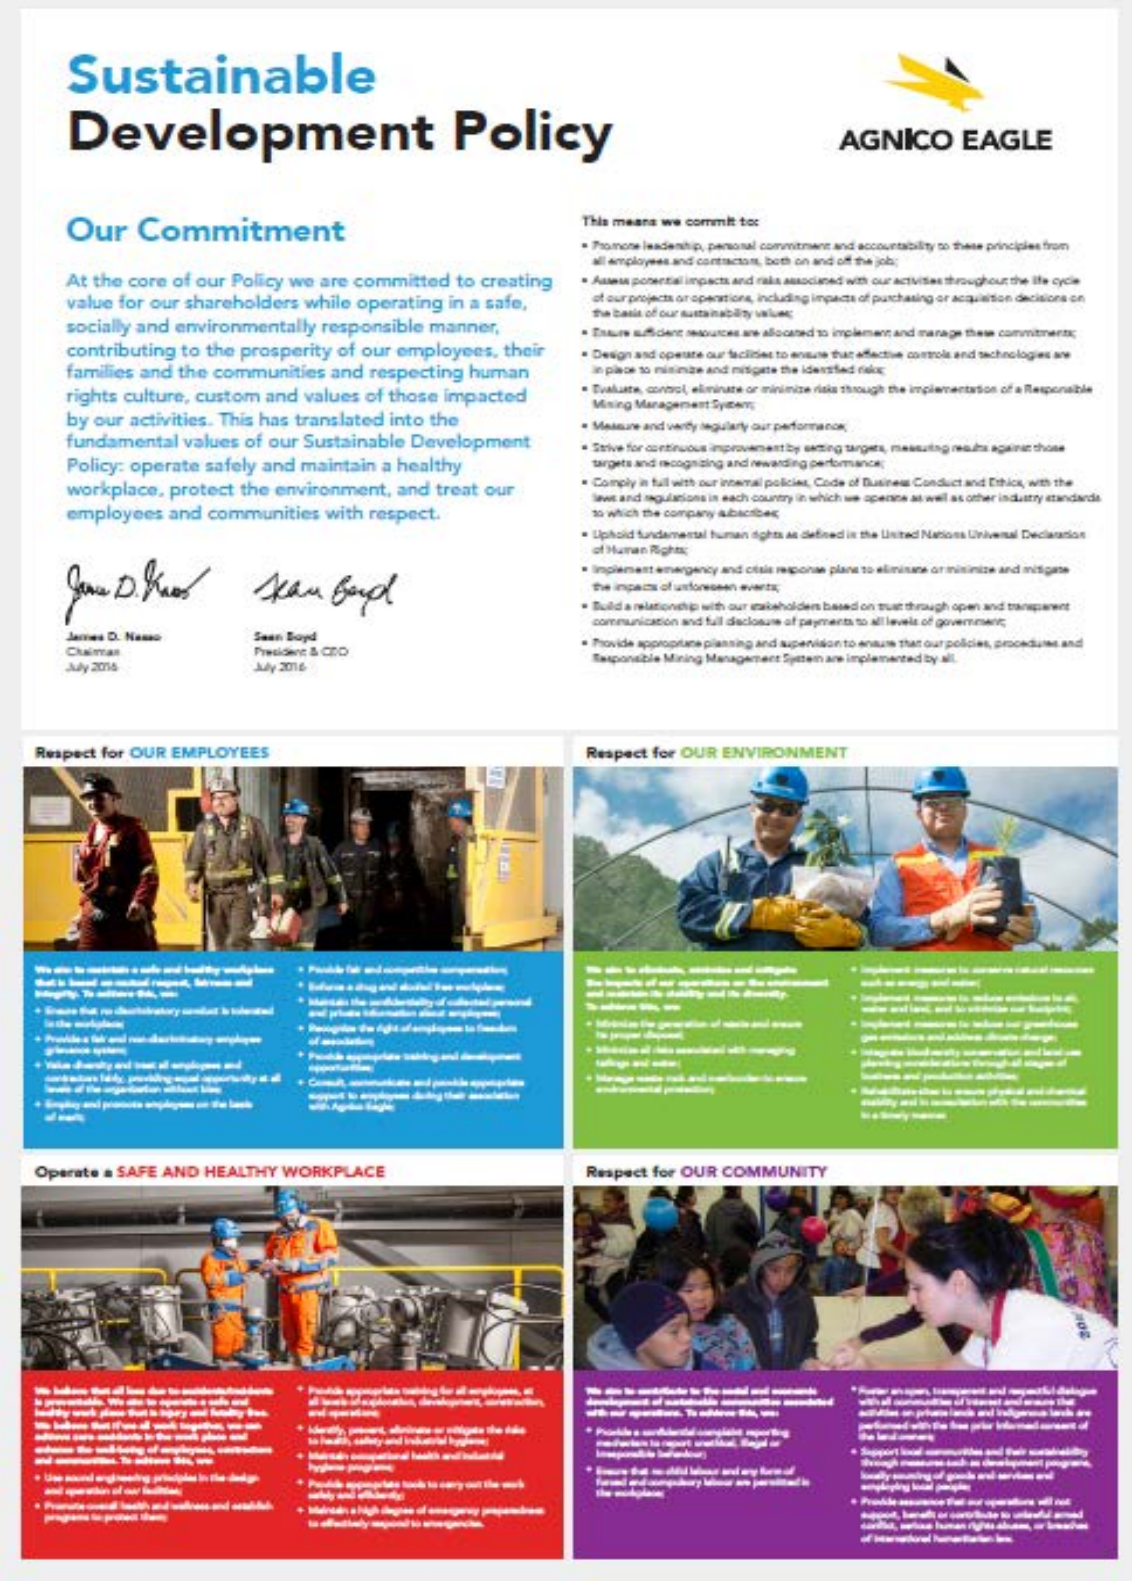
Occupational Health & Safety Plan

	PROGRAM NUMBER:MBK-HSS-PLN – Occupational Health and Safety Plan		
People concerned	• All employees, contractors and visitors	**Prepared by**	Health and safety
		Authorized by	Markus Uchtenhagen Health and Safety Superintendent
Effective **Revised**	April 24, 2013 December 6, 2018	***"Safety First, Safety Last … Safety Always!"*** ***"No Repeats" – Our Stepping Stone to ZERO HARM***	
This program corresponds to the required minimum standard. Each and every one also has to comply with the rules and regulations of the Nunavut Government in terms of health and safety at work.			

Objective:

- To establish the framework, rules and procedures for ensuring the health and safety of all employees, contractors and visitors at Meadowbank and Amaruq sites.

Concerned departments:



All departments

Required equipment:

- Knowledge

Risks /Impacts legend

Health & Safety	Process/Quality	Costs	Environment

Sustainable Development Policy

AGNICO EAGLE

Our Commitment

At the core of our Policy we are committed to creating value for our shareholders while operating in a safe, socially and environmentally responsible manner, contributing to the prosperity of our employees, their families and the communities and respecting human rights culture, custom and values of those impacted by our activities. This has translated into the fundamental values of our Sustainable Development Policy: operate safely and maintain a healthy workplace, protect the environment, and treat our employees and communities with respect.

James D. Nasso
Chairman
July 2016

Sean Boyd
President & CEO
July 2016

This means we commit to:

- Promote leadership, personal commitment and accountability to these principles from all employees and contractors, both on and off the job;
- Assess potential impacts and risks associated with our activities throughout the life cycle of our projects or operations, including impacts of purchasing or acquisition decisions on the basis of our sustainability values;
- Ensure sufficient resources are allocated to implement and manage these commitments;
- Design and operate our facilities to ensure that effective controls and technologies are in place to minimize and mitigate the identified risks;
- Evaluate, control, eliminate or minimize risks through the implementation of a Responsible Mining Management System;
- Measure and verify regularly our performance;
- Strive for continuous improvement by setting targets, measuring results against those targets and recognizing and rewarding performance;
- Comply in full with our internal policies, Code of Business Conduct and Ethics, with the laws and regulations in each country in which we operate as well as other industry standards to which the company subscribes;
- Uphold fundamental human rights as defined in the United Nations Universal Declaration of Human Rights;
- Implement emergency and crisis response plans to eliminate or minimize and mitigate the impacts of unforeseen events;
- Build a relationship with our stakeholders based on trust through open and transparent communication and full disclosure of payments to all levels of government;
- Provide appropriate planning and supervision to ensure that our policies, procedures and Responsible Mining Management System are implemented by all.

Respect for OUR EMPLOYEES

Respect for OUR ENVIRONMENT

Operate a SAFE AND HEALTHY WORKPLACE

Respect for OUR COMMUNITY

5.4.6.3 Removing locks from a lock out situation 34
5.4.6.4 Cut padlock security 35
5.4.6.5 Training on the lockout and ensuring zero-energy It is important to note that the implementation of such a procedure must be accompanied by specific training. Training on lockout and ensuring zero energy aims particularly the employees working on equipment that may be started by others during the repairs. 35
The training includes the following: 35
5.4.6.6 Review 35
5.4.7 Respiratory Protection Program 35
5.4.7.1 Risk Assessment 35
5.4.7.2 Means of Risk Control 35
5.4.7.3 Criteria for selecting respirators 36
5.4.7.4 Training on respiratory protection 38
5.4.7.5 Revision of the respiratory protection program 38
5.4.8 Hearing Conservation Program 38
5.4.8.1 Exposure assessment of workers 38
5.4.8.2 Identification of noise zones 39
5.4.8.3 Potential Risks to health associated with exposure to noise 39
5.4.8.4 Methods used to reduce noise exposure 39
5.4.8.5 Training Information 41
5.4.8.6 Hearing Conservation Program 42
5.4.9 Confined Space Management Program 42
5.4.9.2 Assessment of potential hazards in confined spaces 42
5.4.9.3 Preventive measures 42
5.4.9.4 Entry Permit Confined Space 43
5.4.9.5 Opening an confined space at high risk 43
5.4.9.6 Confined Space Training 43
5.4.9.7 Review of Confined Space Management Program 44
5.4.10 Fall Protection 44
5.4.10.1 The safety measures against falls from height 44
5.4.10.2 Personal Protective Equipment 45
5.4.10.3 Training on Fall Protection 47
5.4.10.5 Site Management 48
5.4.11 Management of Sulphur Dioxide (SO2) 48
5.4.11.1 Means of Control 48
5.4.11.2 Training Information 49
5.4.12 Cyanide Management 49
5.4.12.1 Means of Control **Preventive maintenance** 49
5.4.12.2 Training 50
6. Review of Health & Safety Plan 55

AGNICO EAGLE

The following document presents Meadowbank and Whale Tail Pit Occupational Health and Safety Plan (the Plan) in support of Meadowbank Nunavut Impact Review Board (NIRB) Project Certificate No.004 and Whale Tail NIRB Project Certificate No.008, condition 57. This plan outlines Agnico Eagle's strategy for Health and Safety.

1. Goals for the Occupational Health and Safety Plan

The prevention program focuses on eliminating dangers to health, safety and protects the physical integrity of all workers (this includes all Agnico-Eagle Mines employees, Contractors and visitors).

Specific objectives:

- Identify and assess the risks in the process and the work environment;
- Propose effective and sustainable technical controls to ensure the health and safety of employees/contractors;
- Adequately protect workers exposed to specific risks by setting health and safety standards;
- Adequately protect all personnel and contractors working on sites against specific risks, by setting health and safety standards, for every risk encountered;
- Ensure the preventive maintenance of personal and collective protective equipment;
- Train the employees and contractors on the risks related to their work and their environment.

2. Policy

Agnico Eagle Mines – Meadowbank Division recognizes the importance of eliminating as much as possible the risks of an accident and/or occupational disease. To achieve this goal, Agnico Eagle Mines - Meadowbank Division established a policy for these objectives, and, always maintains harmonious relations with their employees.

3. Application

The prevention program is for all employees of the Meadowbank Mine, Agnico and contractors. All contractors, suppliers and visitors working at the Meadowbank Division site must comply with the content of this program.

Accident prevention necessitates the involvement of everyone. Every employee and contractor has a specific role to play and is responsible for their health and safety. In other words, we can say that, at Agnico Eagle Mines, Meadowbank Division, we have as many safety specialists as we have employees, contractors at the site.

4. Responsibilities of the parties

4.1 Management team

- Provide material, financial and human resources to implement, maintain, update and improve the prevention program;
- Maintain the prevention programs to provide workers and contractors a safe and healthy work environment;
- Participate actively in the assessment, review and monitoring of the program activities;
- Ensure the implementation, improvement and monitoring of the Supervisors' Formula and the work card;
- Ensure that the employees and contractors have the training and the necessary information to avoid endangering their health or safety and / or their colleagues;
- Correct with immediacy, a known situation that might endanger the health or safety of someone; and
- Collaborate with the occupational health and safety committee and with any public health and safety institution or regulator.

4.2 Health and Safety/Training Officers/Emergency Response Coordinators/Security

- Coordinate the implementation, application and improvement of the prevention program;
- Coordinate all activities by managing health and safety and security;
- Support and coach employees, Supervisors and Management in performing their duties;
- Collaborate in the identification, evaluation and controlling risks in their respective workplaces;
- Ensure compliance with Act and Regulations, Standards and Site policies/procedures;
- Inform members of the management team of any suspicious circumstances that may affect the health or safety or security;
- Ensure the implementation, improvement and the follow-up of the Supervision Formula and the work card;

- Ensure that workers have the necessary training and information to minimize the possibility of endangering their health, safety or security and / or their colleague;
- Correct with immediacy, a known situation that might endanger the health or safety or security of someone;
- Collaborate with the safety representatives in the various mandates entrusted to them;
- Collaborate with the (Workers Safety and Compensation Commission) WSCC inspectors or other regulators during their visits;
- Collaborate with health team on site or mandated by the WSCC; and
- Ensure an effective and properly trained Emergency Response Team. Ensure an adequate number of trained personnel for both Surface and Underground settings.

4.3 Supervisors

- Correct immediately any potential hazard in the workplace;
- Collaborate in the identification, evaluation and control of any hazardous situation in the workplaces;
- Inform the Health and Safety Department of any situation that could affect the health or safety of the workers;
- Provide individual and/or collective protective equipment for workers;
- Ensure that workers have the training and the necessary information to avoid endangering their health and safety and / or their colleague;
- Follow the Act/Regulations, rules, standards, procedures and site Policies/Protocols;
- Ensure the implementation, improvement and follow-up of the Supervision Formula and the work card with an emphasis on "immediacy" for the corrective actions to be taken;
- Ensure that all incidents are properly reported in a timely manner to the Health and Safety Department, and Department, using the appropriate forms;
- Investigate all incidents/accidents and document findings and recommend corrective measures on appropriate forms; and
- Work with the Occupational Health and Safety Committee and the safety representative in the various mandates that were given to them.

4.4 Worker

- Protect their health, safety and physical integrity or that of others in the workplace;
- Respect the preventive measures established in the Health and Safety plan;
- Respect the information given during the induction program, postings, and safety meetings;
- Participate in the identification, evaluation and control of hazards in the workplace;
- Wear personal protective equipment and/or collective protective equipment required for specific jobs to protect their health and safety;
- Participate in identifying and quantifying of the contaminants in the workplace;
- Respect the Act/Regulations, safety rules, standards, procedures and policies/protocols at all times;
- Inform the supervisor of any doubtful situations that may affect the health or safety;
- Report all accidents, incidents or close calls (near misses) to the supervisor immediately (within the working shift);
- Participate in training or/and health and safety information sessions; and
- Work with the Joint Occupational Health and Safety Committee on different health and safety issues that were mandated to the committee.

4.5 Nurse (Health Care Provider)

- Coordinate the health program for the site;
- Inform managers, supervisors and workers on contaminants potentially present in their workplace;
- Propose to the management team methods to control risks that could affect the health or safety of workers;
- Initiate screening biological tests on contaminants potentially present in the workplace;
- Provide immediate care to injured personnel and follow-up;
- Training as required;
- Participate in the identification of Health hazards in the workplace;

- Provide information on sexual health and well-being; and
- Work with the Occupational Health and Safety Committee on the various mandates given to the committee.

4.6 Industrial Hygiene Technician

- Identify all the contaminants in the workplace that could pose a health and safety hazard to workers;
- Determine the potential exposure of workers to the identified contaminants with good sampling and analysis strategy;
- Inform supervisors and workers on the results of exposure present in their workplace and how to protect themselves;
- Provide managers with methods to control risks that could affect the health and/or safety;
- Perform maintenance and monitor the calibration of measuring instruments used in industrial hygiene;
- Develop and maintain an Industrial Hygiene Program;
- Develop and maintain an Asbestos Management Plan;
- Provide training in Industrial Hygiene subjects with all concerned; and
- Work with the Occupational Health and Safety Committee on the various mandates given to the committee.

4.7 Contractors

- Transmit to Agnico Eagle Mines– Meadowbank Division a Health and Safety program specific to their activities on the site. Agnico Eagle Mines- Meadowbank Division reserves the right to request changes that they consider important;

  Note: Any contractor on site for a period of less than fifteen (15) days does not have to submit a Health and Safety program. However, they must comply with the Health and Safety program of the site and made available to workers.

- Transmit (before the job starts) all plans certified, signed and sealed by an engineer recognized in the Nunavut Territory for construction on surface;
- Provide Agnico Eagle Mines – Meadowbank Division with a current letter indicating that they are in good standing with WSCC in Nunavut;

- Transmit the Health and Safety program specific to their activities on the site, which must contain a list of risks in regards to construction work and, indicate the controls put in place in regards to those risks;

- Submit in writing to Agnico Eagle Mines– Meadowbank Division all changes that were made to the work procedures and have them available for the workers and their supervisors;

- Take measures to ensure that all workers under their supervision are informed of the risks they are exposed to;

- Inform, immediately, Agnico Eagle Mines– Meadowbank Division of any accident/incident in the execution of various contracts;

- Inform in writing Agnico Eagle Mines– Meadowbank Division of any writing or report issued by the WSCC to the contractor;

- Update a bulletin board dedicated exclusively to health and safety at work inside the trailer or any other location easily accessible to workers;

- Hold a weekly safety meeting for each crew. Send a copy of the minutes of the meeting with the names of participants to Agnico Eagle Mines – Meadowbank Division Health and Safety Department;

- Provide a written document stating that your enterprise as a contractor on the site will abide to Agnico Eagle Mines– Meadowbank health and safety programs;

- Provide monthly hours worked by their employees and sub-contractors (if applicable) as well as its accident/incidents statistics;

- Provide workers with personal protective equipment determined by legislation or by the Occupational Health and Safety Committee according to the tasks they must accomplish;

- Ensure that the employees wear their personal protective equipment at all times while at work and that they use the proper tools to accomplish their tasks;

- Ensure that the corrective measures requested by Agnico Eagle Mines– Meadowbank Division be completed in the time frame prescribed;

- Submit a list of workers who have a valid or current first aid certificate;

- Ensure that all equipment complies with Agnico Eagle Mines – Meadowbank Division and Nunavut Regulations;

- Provide a list of all current MSDS sheets for products that you as a contractor are bringing on site;

- Ensure that all temporary structures and / or permanent are safe and that they comply with legislation or site specifics ex. (railings, guarded openings, etc.).

If the contractor or any person within its jurisdiction fails to comply with the terms of the program, Agnico Eagle Mines– Meadowbank Division can then take any necessary action to correct the situation, and that at the expense of Contractor.

4.8 Suppliers

- Comply with the Health and Safety program of Agnico Eagle Mines– Meadowbank Division, standards and procedures applicable to them (especially when they perform delivery or assemble their products or equipment on site).

4.9 Joint Occupational Health and Safety Committee

- Approve the Health and Safety Plan;
- Make periodic follow-up of the Health and Safety plan by actively participating in various activities to identify, assess and control;
- Cooperate with the WSCC representatives;
- Encourage the participation of managers, supervisors and workers in various elements of the program; work within the “Terms of Reference” guidelines;
- Receive suggestions and complaints from employees, employee representatives on health and safety issues at work;
- Receive and review the planned inspection reports, accident investigations, safety meetings and the WSCC mine inspector reports;
- Receive and analyze the accidents and incidents statistics;
- Receive and analyze the accidents / incidents investigations reports;
- Participate in accidents/incidents investigations and analysis and risk assessments for all job tasks on site;
- Hold a meeting with the Joint Occupational Health and Safety Committee members at least once a month;
- Provide recommendations to Management to resolve Health and Safety issues; and
- Actively and positively promote Health and Safety for all workers, contractors on site.

5. Elements of the program

5.1 Risk identification

Identify all potential hazards from different health and safety activities in place within the Meadowbank and Amaruq site. Among these activities, we find the planned inspections, investigations and analysis of accidents/incidents, close calls, task observations, monthly safety meetings, job hazard analysis (JHA), and the workers comments on their work card.

In addition, periodic meetings are held with all the personnel to complete the list of possible hazards. This process requires the participation of every department and requires an effort from everyone. A listing of possible risks is presented at these meetings to guide workers in selecting potential hazards in their work place. The potential risks are then stored in a tabloid format. Once the list of potential risks is developed, a selection process is started to prioritize the hazards. This prioritization step consists of a consultation process with officials from each department and each committee member of risk management program.

5.2 Prioritization of risks

Prioritizing risks is mathematically based on a prioritization grid containing different risk parameters and control:

Legal requirement

- Site specific
- Extent of risk
- Probability of risk
- Severity of risk
- Risk of fire
- Effect on health as a function of exposure
- Administrative control
- Operational Control
- HR Dimension

Once the list is completed, every department will develop an action plan to address the most significant risks determined in the prioritizing process. In addition, the departments will also have created a list of training needs, a list of critical tasks to be observed and a list of hazards. Job Hazard Analysis will be completed when and where required.

5.3 Revision

The process of identification, assessment and risk control will be revised every three (3) years.

5.4 Activities and Specific Management Programs

5.4.1 Supervision Formula and work card

The Supervision Formula is a philosophy and is the basis for our entire Health and Safety Program, here at Meadowbank.

To meet due diligence, the supervisor must take immediate action on all situations that could endanger the health or safety of the employees. In other words, he must use the "immediacy" to correct outstanding situations and involve the employees.

5.4.1.1 Summary of Supervision Formula

The Supervision Formula is divided into six (6) phases which are:

- Greeting
- Inspection
- Planning
- Decision
- Execution
- Worker's comments

The **Greeting** phase allows the supervisor to discuss with workers on the tasks to be done during the day, list the equipment and tools they may need, check the understanding and above all, arousing all workers to have "a safety minded attitude all the time", followed by a talk about known abnormal conditions reported by the previous shift and the hazards they may encounter during the day.

The **Inspection** phase enables workers and supervisors to inspect the access to the work place, workplaces, tools, equipment to detect any anomalies that could lead to an incident or accident in the short, medium and long term. It also eliminates these deficiencies "immediately" when discovered. The inspection is the most important phase of the Supervision Formula, because at this stage, if we take the time to inspect and correct the deficiencies found, the risks will be minimized or even eliminated.

The **Planning** phase is the logical extension of the inspection, because when anomalies are found, we must define how to correct them. Then the planning of the day's tasks to be accomplished is revised with the employee on how it will be done, what tool and/or equipment to use and the most important part is to identify the specific risks that could be generated and how to control the risks identified.

The **Decision** phase is when the supervisor gives his/her agreement to do the task as planned. Before giving the agreement he/she must make certain that the employee understood him and agrees with the planning, the workplace is up to standard, the tools and equipment are good, the hazards have been identified and controlled, the employee has the training to accomplish the task, and then the supervisor will give the authorization to continue the work.

The **Execution** phase is to accomplish the work as agreed in the planning phase. However, we must remember at this stage to be vigilant at all times, because during the execution of work, we may have to repeat all the phases of the **Supervision Formula** that is: inspection, planning, decision and

execution.

Reviewing the **Worker's Comments** on the work card (at end of shift) is an extremely important part of communication for the incoming shift. This part allows workers to report any anomalies/deficiencies observed during their shift which could affect the health and safety of other workers. Workers also reports broken equipment, missing material etc.

The ideal tool for conveying the supervision formula is:

"The work card"

5.4.1.2 Using the work card

Every day, the employees/contractors receive a work card that they must complete at the workplace before the work begins. Workers notes on the work card the state of the access to the workplace, the work place, material to be used and equipment with special attention to sub-standard conditions. During his/her tour while applying the Supervision Formula, the supervisor approves the continuation of work by comparing the information written on the card to his own observations. Exchanges are done between the employees/contractors at the workplace and the supervisor.

At the end of the shift, the cards are handed by the employees to the supervisor so that he can read the comments and the situation of the work place. The supervisors will leave instruction to the incoming shift.

The work cards are kept in files for a period of one (1) year.

An evaluation on the quality of the work cards used by the employees and supervisors is done on a quarterly basis by the 2nd level supervisors. The evaluation results are then presented to the follow-up Committee of the Supervision Formula.

5.4.1.3 Follow-up Committee of the Supervision Formula

A follow-up committee meets periodically to evaluate the application of the supervision formula and the results of the work card. The follow-up team is composed of members of management and two (2) representatives of the Health and safety department.

5.4.2 The Health Program

The health program is part of the health and safety plan. It identifies some hazards associated with physical or mental health of workers and recommends a series of actions to protect all employees against the hazards in their work tasks or their environment.

5.4.2.1 The Medical Staff (Health Care Providers)

Two (2) registered nurses are present at the Meadowbank mine site, and (1) one nurse is present at Amaruq 24 hours a day, 365 days a year. They are registered in Nunavut territories and have accredited training in trauma (ACLS/TNCC).

To complement the health and safety team, a medical director conducts periodic visits to the mine site. During these visits, the medical director will do the medical examinations required by the legislation.

5.4.2.2 First Aid Emergency

First aid is provided by anyone who is qualified to give first aid. In addition our Health Care Providers provide higher level of treatment when necessary. They can direct the patient to specialized care if necessary. However, several people have been trained and can give first aid. The injured employee if/when transported must be accompanied by a nurse or paramedic in the ambulance or airplane.

5.4.2.3 Trained First aid personnel

First aid training is provided to a sufficient number of workers who are able to respond at all times. To ensure the continuous presence of rescuers/first aiders on all shifts, all supervisors are trained from all areas of the mine site. Furthermore, all Emergency Response team members received first aid training. A minimum of twenty (20) emergency response team members are on site all the time and trained to face every type of emergency.

In addition, some Emergency Response team members are trained to the advanced first aid level.

5.4.2.4 Emergency First Aid Kits

Emergency first aid kits are available in all AEM vehicles and workplaces at different locations on the site. The contents respect legislation requirements. We have MASS Casualty First Aid Supply is in place by entrance to Gymnasium. Our ERT teams are equipped to handle most Emergencies that can occur on site.

5.4.2.5 Registers and accident reports

In case of accident, an initial report is completed by the supervisor with the employee. The original report is then forwarded to the Health and Safety department. When the accident causes bodily harm that requires medical assistance, the Health Care Providers will open a file on the accident and if needed, they will fill out the necessary WSCC claim reports. All medical files are kept at the clinic under lock.

A weekly report is communicated to the management and the accident statistics are tabulated and communicated on a monthly basis to site and WSCC.

5.4.2.6 Clinic

(At Meadowbank site) The clinic is located on the ground floor of the service building adjacent to the Maintenance team offices and shop. (At Amaruq site), the clinic is located in the Exploration camp at far end – West adjacent to the fire hall.

The following equipment is available at the clinic:

- Oxygen and defibrillators
- Examination table

- Eye wash station
- Scale, Bandages
- Medications
- Burn Kits
- I.V. solution
- Material Safety Data Sheets (MSDS)
- First Aid Equipment
- Heart monitoring equipment
- Trauma Supplies
- Multiple Casualty equipment

5.4.2.7 Medical Examinations

Medical pre-employment

Prior to employment with Agnico-Eagle Mines, Meadowbank Division, each candidate must have a full medical examination and a hearing test. The pre-employment medical ensures that the candidate is fit for the job for which he/she is hired.

When hired, the new employee/contractor completes an induction session (e-learning) with different modules. A Health Care Provider explains their programs such as what to do in case of an accident or sickness. Each worker will have a confidential medical record kept under lock in the clinic. Only nurses and physicians will have access to the medical files. In addition, the physician will meet with workers upon their request.

5.4.2.8 Monitoring during an illness or accident

During a prolonged absence from work, the Health Care Provider is responsible for systematically monitoring the health of the worker. If the absence lasts more than three (3) days, the procedures for insurance is undertaken jointly with the worker and Human Resources Department. For absences due to an accident at work, the case is managed with the WSCC.

During a medical visit following an accident, the worker must contact the nurse or his supervisor to transmit the doctor's decision if he has allowed the injured worker to be assigned to light duty work as soon as possible.

To facilitate rehabilitation, the worker is assigned to light duty work until his/her injury is healed. The supervisor is notified of employees' work limitations/restrictions as well as the probable date of return

to regular work. At the clinic, each employee has a separate file for personal sickness and for work related accidents.

5.4.2.9 Medical exam when leaving the company

Every employee leaving the company shall, before his/her departure, pass a hearing test if his last test exceeds six (6) months and be referred to a specialist if required.

5.4.2.10 Health and Well-Being

Our Health Care Providers have included health and well-being information in our employee orientation program and our “Site Readiness” program. When any new employee arrives on site, they will be informed of topics such as sexual health, well-being, mental health, fatigue management, addictions, being “fit for duty” etc.

They will communicate and share with all workers the range of health services available onsite and update it as necessary as new services are available.

Periodic crew meetings with the different departments to inform our employees of our health and well-being services on site.

Brochures are developed and made available to all employees on subject matter.

We have also made available condoms on our site to promote sexual health.

We endeavor to ensure that all brochures are available in English and Inuktitut.

5.4.2.11 Review of Health Program

To audit the health program, an annual evaluation of the program is made by the Health Care Providers.

Any request for modification, addition and revision should be made to the Health Care Providers.

5.4.3 Investigation and analysis program

The investigation program and accident analysis aim to ensure and maintain a process of investigation and clear analysis so that it will:

- Clarify the responsibilities of all concerned parties;
- Ensure the quality of investigation reports and analysis based on criteria established and recognized;
- Identify the immediate and root cause of accidents or incidents;
- Recommend preventive and corrective measures following related events;

- Follow-up preventive and corrective measures;
- Eliminate the hazards and threat to health and safety of workers.

Important Information:

Under the NU – Mines Safety Health Act and Regulations, the employer must inform a WSCC Mines Inspector, as soon as possible (without delay) (ex. by telephone), and, within (72) hours, make a written report with the information required by regulations, regarding the events that have caused:

- Fatal injury to an employee;
- Serious injury to a worker; (as defined by Section 16.01 and 16.02 of NU Mines Safety Health Act and Regulations (Reportable Incident).

Furthermore, the NU Mine Safety Health Act and Regulations states that the inspector must be advised as soon as possible for any Dangerous Occurrence incident as defined by Section 16.01 (within 24 hours). The Dangerous Occurrence final investigation report must be submitted to the Mines Inspector within (72) hours.

At Agnico Eagle Mines – Meadowbank Division, the WSCC mine inspector will be informed by the General Manager, or by the Health and Safety Superintendent or Designate.

5.4.3.1 Procedure for investigation and accident analysis

At Agnico Eagle Mines - Meadowbank Division, accidents are divided into the following categories: fatality, lost time accidents, accidents resulting in modified/light duty assignment, medical aid, first aid, reported incidents, fire incidents, incidents (but no injury) and near miss or close calls.

Depending on the frequency and severity of the situation, some accidents/incidents must be investigated, in order to collect all the information and evidence or facts that cause the accident/incident. This information is used to determine the root causes of the accident/incident and finally, to recommend corrective and preventive measures to prevent its recurrence. The following chart summarizes the accidents that should be investigated.

Fact PARTICIPANTS

Guidelines for assembling persons for the investigation process: always keep in mind the "potential" severity and not the result.

Worker;
Supervisor;
JOHSC Representative
General Foreman;
Dept. Superintendent/Designate
Health and Safety Dept. Rep.
General Manager /Designate (if required)

Worker;
Supervisor;
JOHSC Representative
General Foreman;
Dept. Superintendent/Designate (if required)
Health and Safety Dept. Rep.

Worker;
Supervisor;
JOHSC Representative to review;
General Foreman to review
Health and Safety Department Rep.;

Worker;
Supervisor;
JOHSC Representative to review;
General Foreman (if required);
Health and Safety Department Rep (if required);

** If an investigation is requested*
Worker;
Supervisor;
JOHSC Representative to review
Health & Safety Dept. (if required);
General Foreman to review

Note: All accident/incident reports are to be forwarded to Meadowbank Health and Safety Department!!!

5.4.3.2 Accident report

Steps:

1. Any employee/contractor involved or that witnesses an accident must immediately notify their immediate supervisor or designate of the situation and keep the scene intact or undisturbed to allow time for the investigation, except to prevent further accidents.

2. Any worker involved or witnesses an accident must complete with the supervisor the initial incident report form, as soon as possible after the event but at the very least before the end of the shift.

   Note: The official accident with bodily harm log book is located in the clinic.

3. The immediate supervisor or his designate must immediately notify the general foreman who will notify the health and safety department of the accident. Depending on the severity and/or potential of the accident/incident, the OHSC representative will also be notified by the Health and Safety department or by the Department Management in which the event occurred.

Note: Reportable incidents – (Any incident listed in the "Serious Injury" portion and as described in Section 16.01 of the Regulations must be reported without delay to a Nunavut Mines Inspector and OHSC Co-chairs, by the Manager and/or his designate.
Dangerous Occurrences – (Any incident listed in the "Dangerous Occurrence" portion and as described in Section 16.01 of the Regulations must be reported within 24 hours to a Nunavut Mines Inspector by the Manager and/or his designate and OHSC Co-chairs.
Within 72 hours after a "Dangerous Occurrence" or "Reportable Incident", the Manager and/or designate shall send a report to the Mines Inspector and OHS Committee Co-chairs.

The investigation:

1. When an accident happens, the supervisor shall, if possible, go immediately to the scene of the accident to control the scene and collect the facts of the accident. The scene shall be secured pending investigation and only released after all facts have been gathered. In the case of a "Dangerous Occurrence" and/or "Reportable Incident", the scene shall not be released until the Mine Manager and/or his designate release it and only after consultation with Mines Inspector and OHSC Co-Chairs.

2. The supervisor will evaluate the loss and he will contact the appropriate officials.

A Supervisor or Health and Safety Department representative may demand an investigation for an accident without injury or even a first aid accident in the case if the consequences could have been worst (potential severity).

3. The immediate supervisor or designate will immediately initiate, if necessary, the process of the investigation, if possible, with the injured worker or workers who witnessed the accident. The investigation will be done whenever possible at the scene of the accident.

4. The supervisor fills out the investigation report with, if possible, the injured worker or/and the worker/s that witnessed the accident.

5. The investigation report must be signed and a copy must be sent to the Health and Safety Department as soon as possible. The Health and Safety Department is responsible for forwarding a copy of the investigation to the Manager (as needed) and to the Occupational Health and Safety Committee without delay. A copy of the investigation report must also be reviewed by the OHSC safety representative.

Accident analysis:

An analysis must accompany every accident investigation. This analysis is essential to determine the root causes of the accident and to recommend corrective and preventive measures necessary to prevent the accident from recurring. The analysis includes three (3) major steps:

- Initial analysis of all the information gathered in the investigation to keep only the contributing factors;
- Identification of all the causes and factors that contributed to the accident;
- Separation of contributing factors into two (2) categories:
  - Immediate causes
  - Root causes

The method of analysis:

This method involves taking the consequences as a starting point and looking for causes by asking "Why?" At each step, ask the following question: "Why did it happen this way?"

Each answer must be complete and sufficient to explain the reason the accident happened. If they do not explain it completely, there is/are another cause/s to be determined.

Please find enclosed the steps in completing an accident/incident investigation:

The accident/Incident

Need a complete description of the event, location and who was involved.

↓

Immediate causes

Immediate Causes categories:
- Work practices, behaviors
- Environmental conditions, equipment/material
- Use of protective equipment
- Conditions of protective equipment

↓

Fundamental Root Causes

Fundamental (Root) Causes categories:
- Personal factors
- Organizational factors

↓

Consequences

Results in Injury, Damage to Equipment, Fires, Damage or Spills to Environment, Loss to Process

↓

Corrective Measures

Ensuring good corrective measures will prevent Re-occurrence of accident/incident
Communication of incident/accident is very important as well

↓

Follow-Up

Ensuring that corrective measures are in place, in force and doing what they were designed to do
Sharing corrective measures within the Department and site wide to prevent similar accidents/incidents from occurring again

To do this, the immediate supervisor or his designate must initiate the review process once the investigation is completed. The analysis may be conducted away from the scene of the accident by completing the investigation and analysis formula of the accidents.

Furthermore, it is essential that recommendations and remedial measures following the investigation and analysis of the accident are followed-up for the immediacy of corrective actions.

5.4.3.3 Training in investigation and analysis

Training in investigation and analysis of accident is a must for all supervisors, general supervisors and occupational health and safety committee members. This training aims to provide supervisors and members of the occupational health and safety committee good knowledge, techniques and skills to effectively fulfill their responsibilities outlined by the management team. A refresher course will be given when needed.

5.4.3.4 Review the program of investigation and analysis of accidents, incidents

The accident investigation and analysis program is revised as needed.

Any request for modification, addition and/or revision must be made to the Health and Safety Department.

5.4.3.5 Entry into Intelex – tracking system

All incidents / accidents will be logged into Intelex in a timely manner and incidents will be closed out on a monthly basis.

5.4.4 Inspection of workplace

Objectives of the inspection of the workplaces:

- Eliminate accidents, improve the quality of life, increase productivity and efficiency;
- Protect the health, safety and integrity of workers;
- Identify and correct the situations and conditions that may cause loss;
- Identify non-compliances with the standards in the work areas;
- Develop appropriate remedial action following non-compliances and ensure follow-up.

5.4.4.1 Description of the different types of inspections

General planned inspection:

Systematically inspect one or more areas to check compliance of area, equipment and work environment. Pay attention to the working methods to detect dangerous actions or methods. Good housekeeping is a must.

Specific inspection:

Check one specific aspect following an investigation and analysis of accident/incident, a specific request of the JOHSC, an evaluation of the accident log book or any other situation with a potential of loss.

Daily inspection (work card):

Daily inspection of access, work places, tools, equipment listed on the work card to detect and correct with immediacy sub-standard conditions. This inspection is to be done by worker/Supervisor.

Daily pre-use inspection of equipment:

All users of mobile equipment must check compliance of their mobile equipment and complete inspection card associated with the equipment at the beginning of each shift to ensure that equipment is compliant and it creates no risk to the safety and health for operator and others. Once completed, the cards are stored and kept for a period of one (1) year.

5.4.4.2 Frequencies of the inspections

- **Site General Manager** will plan and participate in general inspections to cover the surface operations as needed (2) times per year.
- **Department Superintendent/Assistant:** must attend a minimum of four (4) planned, general inspections with the supervisors, or general foremen of his department, or area of responsibility.
- **General Foreman** must attend a minimum of four (4) inspections with the supervisors via Supervision Formula and (1) planned inspection per month in area of responsibility.
- **Supervisor** will conduct daily inspections planned in his sector with his workers (as per work card) and occasionally with a member of the Health and Safety Department. Monthly, he and an OHSC rep. will conduct (1) planned inspection in his/her working area.

- **Health and Safety Department personnel: (Health and Safety Superintendent/Assistant and H & S Advisors)** will conduct minimum of (2) inspections per rotation in different areas of the site.

- **JOHSC Representatives** will be invited to participate in monthly inspections with each level of the management team named above in their area of responsibility. Note: JOHSC must conduct one inspection per month as legislated in the Mine Regulations Section 3.19 – 3.22.

- **Worker** will conduct a daily inspection of access, work places, tools, equipment listed on the work card to detect and correct with immediacy sub-standard conditions.

5.4.4.3 Methodology of Inspection

To be effective, the people responsible for the inspection must be prepared, organized and have the right tools. Four (4) steps are necessary to ensure an inspection of quality:

- Planning
- Inspection
- Report
- Corrective actions and follow-ups

Objectives of the inspection report:

- Identify all items inspected (compliant or non-compliant); **(Note: non-compliance must be based and in reference to Mine Regulations, Company Policies/Procedures etc.)**
- Identify the sector and / or equipment inspected;
- Classify risks for each observed deviation;
- Determine corrective action;
- Identify a person responsible for each corrective action;
- Determine a timeframe;
- Indicate the number of the work order and/or completed formulas to apply corrective measures.

Note: the report must be written legibly or typed, saved electronically

Distribution of the inspection reports:

Once the report is completed, participants in the inspection must send the original to the health and safety department. A copy of the report must be sent to the department heads concerned by the inspection and to the manager.

The participants keep a copy of the inspection report and when the sub-standard anomalies have been corrected, they will send a copy of the report with the corrective actions completed to the department heads concerned by the inspection and the safety and health department.

Follow-up of the corrective action:

The responsibility to follow-up the corrective action should be incumbent to those who conducted the inspection. The department head will make certain that the follow-up is completed.

The Health and Safety Department will produce an update on the frequency of inspections and the amount of corrective actions that were completed every month. The report will be sent to the JOHS Committee for review.

Classification and time frame for the corrective measures

Severity	Time frame for temporary corrective actions	Time frame for permanent corrective actions
A) Action or condition that could have resulted in permanent disability, fatality, loss of a limb; damages that created a loss of production and/or material exceeding $50,000	Immediately	Started Immediately and corrections completed within (24) hours following the report Note: if corrections cannot be completed within (24) hours – a plan must be put in place to ensure the health and safety of all concerned.
B) Action or condition that could cause a temporary disability with a duration of more than the day of the accident; damages that created a loss of production and/or material exceeding $10,000 but less than $50,000	Immediately	Started Immediately and repairs completed within (3) days (72 hours) following the report
C) Action or condition that could cause a minor accident necessitating first aid treatment and or a medical assistance without a loss of time; damages that created a loss of production and/or material less than $10,000	Within (24) hours	Started Immediately and repairs completed within (7) days following the report
H) Action or condition that is considered a housekeeping item and if left unattended or not taken care of could result in trip and fall or other injury or damage to equipment or environment.	Within (24) hours	Started immediately and maintained continuously. No time limit to fix, repair or clean up. An on-going effort is required to maintain good housekeeping.

5.4.5 Objectives of management of cutting and welding activities

- **I**dentify the contaminants in the welders' workplace;
- Assess the physical and chemical contaminants in the cutting and welding activities;
- Provide effective lasting controls to ensure health and safety of employees;
- Train and inform employees about the contaminants in their asks and their environment;
- Prevent fire hazards;
- Follow up on these activities;

The risk assessment will be done through field inspection, task analysis and sampling of contaminants on/with the personnel. The sampling methods used are consistent with those proposed by the Institute of research for Health and Safety (IRSST), OSHA and A.C.G.I.H.

5.4.5.1 Information on contaminants potentially released with the activities of cutting and welding

Health effects of certain metals may be present in fumes from welding and cutting

Contaminants	Source or process	Possible effects on the health
Aluminum oxide	Composition of welding rods or aluminum alloy.	Aluminosis: particle deposition forming of fibroids in the lungs.
Cadmium oxide	Silver electrode surface in some alloys and rustproof of the steel.	Highly toxic substance that can cause lung and kidney lesions. Carcinogen.
Chrome	Alloy in stainless steel, rust-proof paint or covering chromed parts	May cause lung damage and asthma. Carcinogen.
Copper	Copper concentrate and copper welding electrodes (brass or bronze).	May cause metal fume fever (fever welders) similar to that of zinc.
Tin	Welding electric wires and copper pipe.	Lungs irritation
Iron Oxide	Ferrous metals and steel, welding electrode, may represent 50 to 60% of welding fumes.	Respiratory irritation, low toxicity dusts of iron oxide, may be due to siderosis.
Manganese	Alloy steel rods and composition of capital.	Irritation of upper respiratory tract attacks the nervous tissue and causes weakness and poor coordination.

Molybdenum	Composition of some steel alloys.	Irritation of eyes and lungs.
Nickel	Metals nickel, stainless steel.	Carcinogen.
Lead	Metals coated with paint containing lead present in certain alloys and metals, coatings and tank armor, welding tin.	Toxic substances that affect blood, nervous tissue, gastrointestinal tract and brain.
Silica	Embedding electrode can be found in welding fumes.	May cause lung damage.
Titanium	Coating of electrodes and in some alloys (ferrovanadium).	Respiratory irritant that can cause fibrosis.

Health effects of certain gases may be present in fumes from welding and cutting

Gas	Source or process	Possible effects on the health
Ozone	Gas with a characteristic odor formed during arc welding resulting from the action of UV on oxygen.	Low concentration: irritation of nose, throat and respiratory tract. Elevated: headache, dizziness, nausea, vomiting, fainting
Carbon Monoxide	Produced by the incomplete combustion of organic matter in the form of plaster, paint or coating electrodes, welding under protective gas (CO2).	Low concentration: headache, dizziness. Elevated: nausea, vomiting, unconsciousness, asphyxia resulting in death.
Nitrogen oxides	Suffocating gas and highly flammable formed during the process of arc welding or welding in shielding gases especially when welding stainless steel.	Low concentration: irritation of eyes, nose and lungs. Elevated: irritation of the eyes, coughing, chest pain, and pulmonary edema.
Phosgene	Irritating gas formed when a flame or heated surface at high temperatures or UV rays of the arc are in contact with chlorinated solvents.	Low concentration: sensation of dryness and burning throat, numbness, vomiting, difficulty breathing. Elevated irritation leading to pulmonary edema, chronic bronchitis, pulmonary emphysema .
Hydrogen fluoride	Formed by heat flux, decomposition coatings (applied on stainless steel), coated electrodes	Low concentration: irritation of nose, throat, nose bleeds. Elevated pain in the eyes and nose, pulmonary edema, burning the skin. Chronic Exposure: disease = bone fluorosis (increased bone density).

5.4.5.2 Reduction at the source

The reduction at the emission point is the most effective way to protect the health of workers potentially exposed to contaminants in the air. It is to prevent the emission of contaminants into the air.

Variants of the welding process must be adjusted to produce maximum performance while reducing emissions of contaminants into the air.

Parameters affecting production of contaminants

Parameters	Consequences
The power intensity	In general, the higher the amperage, the higher the emission of smoke.
The diameter of the electrode	With/when equal current is used: the small diameter electrodes produce more smoke than those with larger diameter.
The tension	The amount of smoke rises in direct proportion to the tension.
The polarity of the electrodes	The welding direct current positive at up to 30% more smoke than welding in direct current negative.
The length of the arc	The longer the arc, the more smoke is produced.
The shielding gas	The type of shielding gas used helps determine the volume of emissions. For example, the volume of emissions can be reduced by 15% to 25% by the addition of argon to carbon dioxide instead of using it in its purest form. Ozone concentrations are reduced significantly when adding nitric oxide gas protection in welding of aluminum MIG.
Substitution	Is characterized by the fact of replacing certain ingredients in the welding electrode by others with similar metallurgical characteristics, but emitting less smoke (ex. replacing an electrode lead with an electrode containing lead and tin).
The cleaning of the surfaces	The surface cleaning (grease, dust, paint, etc.) reduces the emission of contaminants into the air.

5.4.5.3 Means of technical control

Ventilation is the primary means of technical control to reduce the exposure to welders from fumes produced by welding and cutting.

General ventilation:

General ventilation can dilute contaminants dispersing in the work area. General ventilation can be mechanical (fans) or natural (open door). It can be very effective if used in order to remove the contaminants from the breathing zone of the welder.

Local ventilation:

The local exhaust ventilation will capture pollutants as close as possible to their emission sources and remove them from the workplace. Since most emissions occur near the arc, the local exhaust ventilation is more effective than general ventilation. The system of local exhaust ventilation is designed to capture fumes and gases before the welder breathes it. However, the performance of the local exhaust systems may be greatly affected by air currents and the distance between the contaminant source and the sensor arm (90% efficiency at 22 inches).

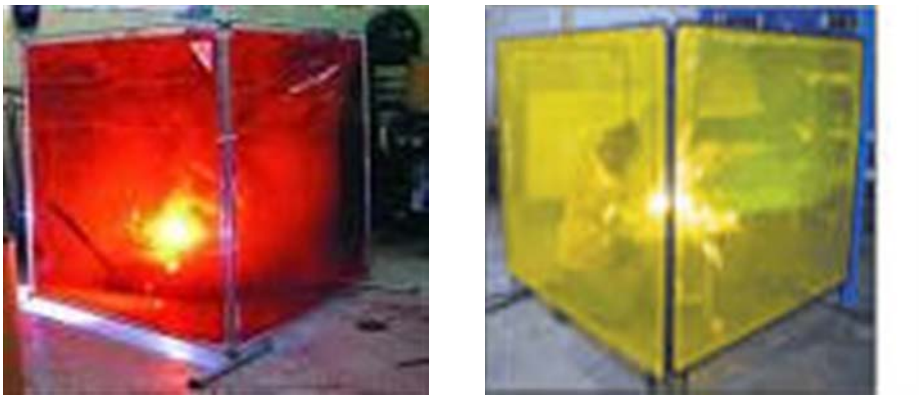
The extension arms are inspected periodically to determine the system performance. This assessment takes place every six (6) months and is made by the industrial hygienist. The data collected is stored in the log book.

Example of a “smoke eater” as used by welders

Example of an extension arm with a fume captor

5.4.5.4 Respiratory Protective Equipment

The personal protective equipment for respiratory system should be used as a last resort when other means of control are not possible. These personal protection devices must be used according to specifications of the Respiratory Protection Program of the establishment (next section).



5.4.5.5 Other risks related to activities of cutting and welding

Other risks associated with welding, apart from the fumes and gases, are radiation, noise, electricity, sparks, heat and explosions.

Protection against radiation:

The ultraviolet radiation emitted by the welding process can cause eye problems ranging from simple irritation to conjunctivitis. Therefore, eye protection devices (properly shielded safety eyewear) must be worn by the entire welder group and those assisting them in their work, unless protective screens are used and in place.

The presence of shield against radiation is necessary for places where bystanders are likely to be exposed to radiation.

Example of shields against radiation

Tinted goggles (grade 5) may be used for small amount of cutting or brazing with torch (flame cutting) while the face shield should be used for all other types of welding and cutting. Different degrees of protection for the lenses are necessary depending on the type of welding.

The welder must change the protective lenses when they are damaged.

Protection against sparks:

Sparks projected during the cutting or welding can cause burns, fire or explosion. Welders must wear protective clothing (flame retardant) such as Indura soft (like coveralls) at all times while performing

work of cutting and welding. Long non-flammable gloves should also be used. This equipment, gloves and clothing must be changed when they are damaged.

5.4.5.6 Hot Work Permit

Welding and cutting are not permitted without obtaining a Hot Work Permit. Hot Work permits are required whenever welding, cutting or any task where open flames are required such as torch use, tiger torch, whether working inside or outside (except in designated areas such as a welding bay).

On the permit is a list of precautions to be taken. This must be completed by the welder himself/herself before commencing work. It is important that all safety precautions listed on the permit are followed as they are subject to rigorous inspection by the worker. During his inspection, the supervisor approves the continuation of work by signing the permit on the back. When the work is completed, workers must clean up their workplace and conduct a continuous check for fire for 30 minutes and monitor and check the area for a minimum of 2 hours after the welding, cutting or burning activities are finished. The employee that does the final check for fire ultimately signs the permit and gives it to the supervisor. It is kept in a register for a period of one (1) year.

To ensure the strict enforcement of permits for cutting welding, Agnico-Eagle has established an audit program with the following objectives:

- Maintain good standards of application in terms of how to safely perform hot work;
- Ensure compliance of hot work performed;
- Promote the importance of fire protection on the site.

The audits will be held every four (4) months and the results will be compiled in a register.

Fire Extinguishers:

In addition to fire extinguishers located at strategic locations and near building EXIT doors on the site and in buildings, every oxy/acetylene cutting torch set up (fixed) or (dolly) mobile is equipped with a fire extinguisher. Fire extinguishers must always be in working order. An inspection must be made before commencing work. Note: this is part of the “work card” inspection process.

All extinguishers are checked on a monthly basis. Extinguishers on equipment are checked daily as part of the pre-operational vehicle check.

Stop Work:

When welding and cutting are suspended even for a short period of time, welding machines and cutting torches must be turned off, the electrodes must be removed from their rack, valves and equipment for the cylinder compressed gas must be closed and / or stored in a safe place (as defined in the procedure for hot work).

5.4.6 Lock out and tag out

Repairs, installation and verification of equipment powered by electricity or any other energy are always a risk. Each employee must take some responsibility and ensure his/her own safety and that of fellow employees respecting the lock out tag out procedure and ensure “zero energy” state.

The lockout procedure and making a “zero energy” state is part of the prevention program at the Meadowbank Division.

5.4.6.1 Tools

The tools for the lock out tag out have several components. These various types of locks, multiple lock link, lock-boxes, keys, covers valves, chains and labels.

Personal Padlocks and departmental padlock:

Each worker exposed to a hazard that necessitates to lockout tag out must have a “brass” padlock with a single key and identification tag. This “brass” lock will have the owner’s identity on it. Locks for service department cannot be used in a personal way. It is forbidden to lend your personal lock to another person.

5.4.6.2 Zero-energy Procedure

No piece of equipment can be de-energized and locked to zero energy until the workers in the area where the work is to be performed have been told. The supervisor will then allow the employee to stop the equipment. The supervisor involved must make sure to inform all the other employees on the work to be done by the crew.

All contractors must follow the lockout procedure of Agnico-Eagle.

Note: In many areas, there are specific procedures related to certain equipment. Before you lockout inform the supervisor.

Examples: mobile equipment, radioactive devices, overhead crane, etc.

Application of the procedure:

- **Locking out equipment of 750 volts or less**

  When repairs or check-ups requiring a simple lockout, the worker shall, lockout the equipment and check to see if the equipment can start after being locked out to make sure that the equipment is not operational. Lock the master switch on equipment in the off position. It is important that other workers working on this equipment affix their padlocks by using a multiple lockout system. The last hole of the multiple lockout system must be kept to add another multiple lockout devise if ever we must add more padlocks.

- **Multiple lockout equipment of 750 volts or less**

  To accomplish a checkup or repair on equipment, it is required to use multiple lockout system (multiple padlock devices). The qualified person responsible for checking the deactivation or lockout of the equipment must take the necessary amount of locks to ensure through testing by startup of the equipment. He must lockout the master switch on the equipment in the off position and put the keys in the red lockout box by ensuring that the identification numbers of the locks are visible. The lockout box should be locked with a multiple lockout system and locked with padlocks. A lockout tag must be installed and a final start-up of the equipment must be made to make certain that the equipment will not start. All other employees who work on such equipment must affix their locks on the lockbox.

- **Lockout equipment at high voltage (over 750 volts) equipped with knives switch (inside a closed box)**

  All equipment of high voltage with knives switches are identified and require the presence of an electrician to cut the power. He ensures that there is no more energy or power on the line. Then the lockout procedure applies.

- **Lockout equipment of high voltage (over 750 volts) with motorized switches (medium voltage circuit breaker) or aerial disconnect breakers**

  All equipment with high voltage motorized switch (medium voltage circuit breaker) or aerial disconnect breakers requires the presence of an electrician to cut off the power. He must use the specific procedure to accomplish the cutoff of power. Then the lockout single or multiple lockout procedures must be applied.

- **Ensuring zero energy on piping or pressure vessels**:

  Use the single or multiple lockout procedure considering that the energy source is compressed air or steam. Beware of secondary or residual energy that may remain under pressure. Leave the drain valve in case of a leak in the isolation valve.

  Various mechanisms are available to lock the valves of different types: handles, chains, etc. We must ensure that the mechanism is reliable. If in doubt, check with your supervisor.

5.4.6.3 Removing locks from a lock out situation

When an employee must leave, he/she must remove his/her lock. After the work is completed, the equipment must be unlocked in order to verify proper operation. Notify the responsible supervisor that repairs are completed and the equipment is functional.

During a shift change or when an employee must leave before the work is completed and the person replacing him/her has not placed his personal lock, he/she must ensure that equipment is locked by a Departmental padlock with a tag-out informing his replacement to put his padlock on. He/she must also notify his/her supervisor or the job leader. When work resumes, a start test should be performed.

5.4.6.4 Cut padlock security

If an employee forgets to remove his/her lock and that employee is no longer on site or at work, the supervisor or his/her delegate has the authority to cut the lock. This must be done with great care and a good judgment. Firstly, we must try to reach the employee. If he/she can't be reached, we must make certain that the employee is no longer on the site. The **"Lock Removal Form"** must be completed and the procedure in place before cutting the lock. Return the form to the general supervisor of the lockout.

5.4.6.5 Training on the lockout and ensuring zero-energy

It is important to note that the implementation of such a procedure must be accompanied by specific training. Training on lockout and ensuring zero energy aims particularly the employees working on equipment that may be started by others during the repairs.

The training includes the following:

- Legal aspects of standards and regulations lockout;
- Effects on safety;
- Tools;
- Lockout procedure and ensuring zero energy;
- Practical exercises.

5.4.6.6 Review

The lockout procedure and ensuring zero energy is revised annually by the Health and Safety Department and Training Department.

Any request for modification, addition and revision should be made to the Health and Safety Department and Training Department.

5.4.7 Respiratory Protection Program

The objective of the Respiratory Protection Program is to effectively protect personnel working in workplaces where technology controls do not permit or are not sufficient to eliminate the source of contaminants in the air.

This program also aims to help managers to identify ways to control the selection, use, and maintenance of respiratory protection.

5.4.7.1 Risk Assessment

The risk assessment is done by sampling personnel in the workplace. These assessments help to determine the type of respiratory protection and appropriate filters to be used.

5.4.7.2 Means of Risk Control

- **Reduction at the source**

Reduction at the source is the objective of the establishment and is the most effective way to protect the health of workers potentially exposed to contaminants in the air. It is to prevent the emission of contaminants into the air.

- **Control techniques**

  Control techniques are used to vacuum, abate or dilute the contaminant emissions in air. Among these, we find the air ducks, hoods, primary and secondary fan systems to induce the fresh air, dust collectors and sprinklers.

- **Personal Protective Equipment**

  The personal protective equipment for the protection of the respiratory system must be used as a last resort when other means of control are impossible. For respiratory protection, there are several types of equipment. The apparatus of respiratory protection used in Agnico-Eagle Meadowbank Division includes: filter type respirators, cartridge type, air powered (PAPR) and self-contained breathing apparatus (SCBA). According to protective factors established by NIOSH and CSA, these appliances offer different levels of protection ranging from 10 to 10,000 depending on the equipment.

  Information on respirators:

  ✓ **Appliances Air Purification**

  This category includes all half-masks and full face using chemical cartridges or as a particulate filters contaminants. These masks are negative pressure, which is to say that the lungs of the user are the generators of the circulation of air. To meet the requirements, different types of respirators are available in three (3) sizes: small, medium and large.

  ✓ **Appliances Air purification Air powered**

  This category includes mainly helmets or masks complete type of manufacturer 3M RACAL engine which propels the air inside a helmet then filters through chemical cartridges and particulate. Currently, the agencies give this product a protective factor that varies from 25 to 1000.

  ✓ **SCBA:**

  This category includes all full-face respirators equipped with a cylinder of compressed air breathing unrelated to an external airline. In setting, only mine rescue teams, firefighters and some specially trained workers are allowed to wear such equipment. This equipment provides a minimum protection factor of 10 000.

5.4.7.3 Criteria for selecting respirators

The choice of a proper respiratory protection is essential to protect the worker. We must therefore evaluate the following parameters when choosing a type of respirator:

- **Level of oxygen in the air**

  The NIOSH states that "the percentage of oxygen by volume in air at any workstation of an establishment must not be less than 19.5% at normal atmospheric pressure". All respirators Air-purifying approved by the National Institute for Occupational Safety and Health (NIOSH) should be used in workplaces only when the oxygen concentration exceeds 19.5%. Otherwise, the worker must wear respiratory protection equipment independently.

- **Types of contaminants present or potentially present**

  The industrial hygiene department established the physical, chemical and toxicological properties of contaminants, including their concentration, toxicity, nature, condition, the detection characteristics of each and their potential for eye irritation and skin absorption.

- **Intended use of the respirator**

  To make the best choice, workers and supervisors must take into account various environmental parameters and conditions to use a respirator, for example:

  - ✓ workplace;
  - ✓ task;
  - ✓ duration of use;
  - ✓ frequency of use;
  - ✓ effort to the task;
  - ✓ industrial process used;
  - ✓ comfort of the user;
  - ✓ need for mobility;
  - ✓ need for communication;
  - ✓ extreme temperature conditions (very cold or very hot).

FIT test:

Users of respiratory protection must be tested for sealing quality with the respirator. This fit test is required prior to issuing of a respirator.

The fit testing is conducted by the Training Department, Health and safety department or industrial hygiene technician. This training shows the user how to use proper respiratory protection.

Once the initial fit test done (when issuing the respirator), additional fit testing is required only when one has suffered of a facial morphology (ex. scarring, loss of weight, acne, etc.). He/she must be fit

tested again for leakage before using respiratory protection. Those who pass the fit test are logged in a log book.

Example of a quality fit test

5.4.7.4 Training on respiratory protection

It is important to note that the implementation of such a program must be supported by training. At Agnico-Eagle Mines– Meadowbank Division, we have training on respiratory protection. The training aims particularly the users of masks to purify air using chemical cartridges and / or particulate and users of helmet air-purifying (positive pressure). This course covers the selection, use and checking of disposable masks and chemical cartridge.

The training covers the following:

- ✓ Legal aspects of regulations and standards in respiratory protection;
- ✓ Inventory of contaminants and basic rules of industrial hygiene;
- ✓ Health effects of contaminants;
- ✓ Fit Tests;
- ✓ Technical knowledge on the function of all models of respirators;
- ✓ Inspection, maintenance, cleaning and storage of respirators;
- ✓ Practical exercise.
- ✓ Refresher training is also needed each year for workers, supervisors, responsible for the fit testing and the person responsible for checking and cleaning of respirators.

5.4.7.5 Revision of the respiratory protection program

The respiratory protection program is reviewed annually by the Health and Safety Department and Training Department.

Any request for modification, addition and revision should be made to these departments.

5.4.8 Hearing Conservation Program

5.4.8.1 Exposure assessment of workers

In order to identify work areas where noise exceeds 85 decibels (83 dBA or workers, working 12 hour shifts), the exposure of workers by job or workplace, is measured in accordance with CSA Standard Z.107.2-1973 entitled "Methods for measuring sound levels".

Employees with exposure to noise exceeding 85 decibels (A) are included in this program. Wearing hearing protection is mandatory for workers unless the means of source reduction of technical and administrative controls are in place.

The assessment strategy for the noise levels are in the "Industrial Hygiene Program" as well as legal requirements. Assessments must be made when purchasing new equipment or changes in processes or equipment.

5.4.8.2 Identification of noise zones

The areas likely to exceed 83 decibels must be identified with a poster at the entrance area or where there is noisy equipment. The sign identifies the requirement to wear hearing protection.

5.4.8.3 Potential Risks to health associated with exposure to noise

The main physiological risks associated with working in noisy environments are a loss of hearing (temporary or permanent) when exposed to noise without hearing protection. Hearing loss associated with exposure in industrial work will affect the high frequencies. The loss is recognized as an occupational disease when it reaches the thresholds listed in the Regulation on the scale of industrial injuries.

5.4.8.4 Methods used to reduce noise exposure

Management and workers must take steps to protect their health, their safety and physical integrity as required by the Occupational Health and Safety. The reduction at the source and engineering controls are the best means to reduce exposure of workers to noise. If these means do not reduce noise to an acceptable level, then use the personal protective equipment. Any reduction in noise, even a few decibels, reduces hearing loss, improves communication and improves concentration. All sources of noise must be evaluated to determine the appropriate method of protection.

Reduction at the source:

The reduction at the source involves a reduction of noise from equipment:

- ✓ Replacement of equipment;
- ✓ Relocation of noisy equipment.

Technical Means of control:

The technical means of control are expected to reduce workers' exposure to noise by changing the environment in which they work:

- ✓ Modification of vector transmission noise (acoustic insulation);
- ✓ Reduction of the reverberation (absorbent materials for walls and ceilings);
- ✓ Reduced vibration equipment (carpets, preventive maintenance);
- ✓ Changing a method of work;

- ✓ Mufflers.

Means of Administrative Control:

The administrative control is to reduce the duration of worker exposure to noise:

- ✓ Modify the hours of work;
- ✓ Rotate tasks to high and low exposure;
- ✓ Start-up of noisy machines when few workers left the area.

Personal and collective protective equipment:

This is the last possible alternative when the noise reduction is less than the permissible exposure limit after implementing technical and administrative controls. The hearing protectors designed to reduce transmission of the wave to the ear.

The effectiveness of hearing protection varies from one worker to another, it depends on proper protective equipment, fitted and worn during the entire period of exposure to noise.

Types of hearing protectors:

Earplugs: plastic foam Max TaperFit 2 UltraFit, Décidamp2, Ear Caps Caboflex) (category preformed caps);

Shells: passive type deductions with a headband (PELTOR H6b, Peltor H7B) or attached on each side of the safety helmet with headphones (PELTOR HTM7P3E) or without headset (PELTOR H7P3E, PELTOR H9P3E).

Noise abatement related to the hearing protector:

The sealing and acoustical properties of the materials determine the level of protection provided by the hearing protector. The shells form a seal around the ear while the ear plugs are against the wall of the canal. The index of noise reduction from the manufacturer (IAB or NRR (English word is: "Noise Reduction Ratio") is set in ideal laboratory conditions.

It is recommended by NIOSH 1996 (Summary of Appendix B, Methods for Estimating the Adequacy of Hearing Protector Attenuation, in the Occupational Noise Standard 29 CFR 1910.95) in calculating the exposure of a worker on its protection hearing, to deduct a percentage for each specific type of hearing protector. This percentage reduction prepared by NIOSH takes into account the performance offered by each type of hearing protector.

Type of hearing protection	***Reduction percentage***
1. For the shell type	75 % of the manufacture IAB
2. Earplugs	50 % of the manufacture IAB

Taking into account the criteria set by NIOSH, the factor of noise reduction for each type of hearing protector has been calculated.

Indices noise abatement set by the manufacturer for each hearing protector available to Agnico-Eagle to the mitigating factors under criteria modified NIOSH 1996.

Type of hearing protection	IAB (dBA)	(dBA) IAB Modified
Plastic foam plug Taper Fit 2	32	16
Plastic foam plug Ultra Fit	25	13
Plastic foam plug Decidamp	29	15
Plastic foam plug Max	33	16
Plastic foam plug Ear Caps	17	9
Plastic foam plug Caboflex	20	10
Shell *PELTOR H9P3E (yellow)*	23	17
Shell *PELTOR H7P3E (green)*	24	18
Shell *PELPOR H10PE3* (*black*)	27	20
Shell *PELTOR H7B (green for helmet)*	22	17

Note: The attenuation factor (IAB) proposed by type of protector is conditional to constant wearing of the protectors during exposure.

Medical Surveillance:

An audiogram is conducted for all employees as follows:

- ✓ Every employee working where the noise levels exceed 83 dB is required to pass an audiometric test every three (3) years;
- ✓ Employees and the clerical employees are required to pass an audiometric test every five (5) years or as needed;
- ✓ All employees leaving the company shall, before departure, have an audiometric test completed;
- ✓ In the hiring process, a person must pass an audiometric test.

5.4.8.5 Training Information

Training is mandatory for all workers likely to work near a source of noise. This training consists of the following:

- Regulations;
- Responsibilities of employees;
- Effects on health over the hearing capacity and the body: short and long term;
- Source reduction;
- Control methods: technical and administrative;
- Hearing protection equipment selection, maintenance and use;
- Meaning of posters;
- Audiogram.

5.4.8.6 Hearing Conservation Program

The program for hearing protection is revised as needed by the Health and Safety Department.

5.4.9 Confined Space Management Program

The program management to work in confined space remains an important reference tool for all supervisors and workers involved in supervising and working in confined spaces area. Depending on the nature of work and the nature of the confined spaces, the risks will vary. It is the responsibility of the supervisors and workers to ensure that all preventive measures are taken when there is work to be done inside a confined space area.

5.4.9.1 Definition of a Confined Space:

“Confined Space” means a tank, process vessel, underground vault, tunnel or other enclosure that is not designed or intended for human occupancy and that a person would only enter if there were work to be done.

5.4.9.2 Assessment of potential hazards in confined spaces

Atmospheric Risk:

Confined spaces are regular atmospheric hazards that make the air unsafe to breathe for the worker. Whether a lack of oxygen, super oxygenation, the presence of flammable or toxic gases, all of these conditions pose a significant risk to the worker and should be considered before entering inside a confined space.

Physical hazards:

Physical hazards potentially present in a confined space are numerous: there is a restraint entry or exit, a dangerous work area, a risk of engulfment, mechanical parts in motion, the presence of electricity, heat or cold, noise or poor visibility.

5.4.9.3 Preventive measures

Ventilation:

For some cleaning, welding, cutting, fabrication of fiber glass, sandblasting abrasive and solvent use, ventilation must be provided before and / or during the task is being done. The duration of this ventilation vary depending on the nature of work, the size of confined space and movement of natural air flow inside the confined space.

The natural or mechanical ventilation of the confined space must be done to avoid exposing other workers to contaminants. Therefore, the breathing of the air should be prioritized in certain activities (ex: welding and cutting activities).

Lock-out and tag-out the energy:

The lockout procedures and ensuring zero energy must be followed. In addition, some confined spaces, must be completely isolated by disconnecting, purging and sealing of all supply lines.

5.4.9.4 Entry Permit Confined Space

The entry permit for confined space is a written authorization indicating the location, staff involvement, hazard identification and control for a given enclosure. This is only valid for a period of 12 hours of uninterrupted work.

The permit must be completed before the start of work by a qualified person and it applies only to a single workstation. The permit must remain in the workplace so that work is ongoing and when the job is completed, the permit must be return to the Health and Safety Department.

If environmental conditions change in the environment or the execution of work, the permit must be corrected and the testing methods must be reassessed.

5.4.9.5 Opening an confined space at high risk

The opening of the confined space must be performed with appropriate respiratory protection. The specific list of confined space for each department indicates adequate protection for the contaminant found in the enclosed space.

However, when the concentration of contaminants inside the confined space is unknown, it is considered highly dangerous to life and health. The opening of the enclosure must be done with maximum care and if necessary, with a self-contained breathing apparatus.

Evaluation of the air inside the confined space:

To evaluate the quality of air we must:

- ✓ Check the quality of air with an appropriate instrument that measures gas and of oxygen, and this even before opening the enclosed space;
- ✓ Assess the quality of air near the opening by inserting the sampling probe inside the confined space. This step is essential when you suspect the presence of toxic or flammable gases;
- ✓ Assess the entire volume of air inside the enclosure to verify the presence of heavy gas, light gas and neutral gas.

5.4.9.6 Confined Space Training

It is important to note that the implementation of such a program must be accompanied by a sustained training.

It is prepared primarily for workers, supervisors and project leaders who are likely to work in confined spaces.

The training Recognition of confined spaces:

- ✓ Responsibility of all parties;
- ✓ Risks associated with confined spaces;

- ✓ Risk assessment;
- ✓ Preventive measures put in place for every task in confined spaces;
- ✓ Entry permit;
- ✓ Emergency procedures;
- ✓ Tools;
- ✓ Assessment of air quality.

A refresher training course will last approximately two (2) hours and will be given if required to the workers, supervisors that were previously trained on confined spaces.

5.4.9.7 Review of Confined Space Management Program

The management program for confined space work is revised as needed by the Health and Safety Department.

Any request for modification, addition and revision must be made to the Health and Safety Department.

5.4.10 Fall Protection

5.4.10.1 The safety measures against falls from height

Falls from heights or in dangerous openings account for (40% of injury cases); they can and usually cause serious injuries.

The legislation states that all workers must be protected against falling when exposed to a fall of more than 3 meters from a working position;

- when he may fall into a liquid or a hazardous substance, on moving parts, on equipment or materials presenting a danger;
- if exposed to a fall of over 1.2 meters using a vehicle.

Agnico-Eagle Mines – Meadowbank Division endeavors to reduce at the source instead of using other means. But, if this is impossible, here are other preventive measures that are used to ensure the safety of workers:

Guard Rails:

Guard Rails is the means of protection most appropriate for protecting workers against the risk of falling. There is a fence along the opening that restricts the movement of workers and ensures that he/she will not be exposed to a free fall. The guardrail must be placed alongside of an elevated floor, roof, a platform of a scaffold, stairway or ramp, around an excavation or any other place where a worker may fall:

- in water;
- from a height of 1.2 meters or more if he is using a vehicle;
- from a height of 5 meters or more of a perimeter roof and 3 meters in other cases.

They are made of various materials and must meet minimum strength and built as stipulated in the safety Code for construction work. On the site, the majority of the railings are fixed permanently. They are inspected periodically.

Warning: The installation of guardrail must always be made with a full body harness

Fixed ladders:

Fixed ladders are used to replace the stairs. They must be strong enough to withstand a weight of 90 kg in middle of a rung and exceed the upper tier of at least 900 mm. Finally, fixed ladders must be equipped with guardrails surrounding the floor opening with a removable rigid barrier (not chain) giving access to it.

Ladder Safety Training:

All persons working at Meadowbank must have ladder safety training as delivered by the Training Department.

3-Point contact should be practiced and followed at all times when ascending and descending any equipment, staircases, ladders, basically any place where handrails are provided – use them.

- All ladders are to be inspected before use
- Always use the 4:1 rule when setting up a ladder – i.e.: 4' rise X 1' from the wall or structure that you are putting the ladder against
- Always secure extension ladders
- Always have a minimum of three rungs extending past the landing or exit point off of ladder at top
- Never use a conductive type ladder near electrical installations

There are many types of ladders in use at our operation. Extension ladders, folding ladders, straight ladders, and they come in assorted sizes and lengths.

5.4.10.2 Personal Protective Equipment

Safety Miners' Belts

When a safety belt is made available to a worker, it can be used in combination with a lanyard to limit the movement of the worker or to keep him/her in his/her working position and this for all workers working near an opening where a (3) meter or greater fall can occur.

Caution: The miners' belt cannot be used as personal protective equipment to stop the fall of a worker. In other words, the safety belt is used to prevent workers from reaching the point of fall (ex. Dangerous openings or shafts).

Safety Full Body Harness

Wearing a Full Body safety harness is mandatory for workers exposed to a fall of more than three (3) meters (9.8 feet) from his working position.

The full body safety harness is used with an energy absorber which is connected to a lanyard not

allowing a free fall of more than 1.2 meters (3.9 feet) or a retractable lifeline (also known as SALA BLOCK name) which includes the energy absorber.

Safety harness

Wearing a safety harness is mandatory for workers exposed to a fall of more than three (3) meters (9.8 feet) from his working position.

The safety harness is used with an energy absorber which is connected to a lanyard not allowing a free fall of more than 1.2 meters (3.9 feet) or a retractable lifeline (also known as SALA BLOCK name) which includes the energy absorber.

All persons required to use Fall Arrest Equipment – must have training in good standing.

Only harnesses classified class A (according to CSA-Z259.10) with straps for shoulders and thighs are used on the site.

Warning: *It is strictly forbidden for a worker to reuse a safety harness and energy absorber which was used in a fall. It is the responsibility of the worker involved in the fall to discard the equipment and send it to garbage.*

Energy absorber:

The shock absorber is actually a breaking device which must always be part of a safety harness, and this, in order to absorb the shock that the employee would have in cases of a free fall.

We have (2) types of dampers. The conventional damper comprising a pouch containing various types of energy absorbers and terminal loops and the lanyard shock absorber provided with an outer envelope longer than the inner part.

Lanyard:

We use two (2) types of lanyards made of synthetic fiber with or without shock absorbers built.

The lanyard without damper is always accompanied by a miner's belt and can be used as equipment used to arrest a fall. The lanyard with integrated shock is always accompanied by a safety harness and shall not permit a free fall of over 1.2 meters.

Furthermore, all lanyards shall be provided with a hook with a safety self-latching latch.

Anchor points:

The attachment point for the lanyard to a safety harness or safety belt shall be:

- Anchored to an element having a rupture capacity of a least 18 kilo Newton (4046.6 pounds);
- Attached to an approved slide line;
- Attached to a system of horizontal lifeline and anchorage, designed an certified by an engineer, certificate available on the mine site

Inspection before use of anchorage systems fall arrest is essential for the safety of the worker.

Every anchor point that was involved in a fall arrest must be re-checked and certified by an engineer.

Horizontal lifeline:

The horizontal cable is a steel cable with a diameter of 12 mm released at an angle less than 5 degrees from the horizontal and the distance between anchors points shall not be greater than 12 meters. The anchors points of a horizontal lifeline shall have a rupture capacity of a minimum 90 kilo Newton (20,000 lbs.) and cannot be used by more than two (2) workers simultaneously. The cable clamps must be tensioned using a torque wrench as specified by the manufacturer.

Any lifeline involved in a fall must be changed or re-certified by an engineer.

5.4.10.3 Training on Fall Protection

Training sessions and information are conducted periodically by training department with the collaboration of the health and safety department. The objective of this training is to train and inform about collective and personal protection in place to protect the health and safety of workers working at heights.

Workers participating to this training are documented stating the type of training, names of participants, name of contact person and the duration of the meeting. Monitoring of these meetings is to periodically respond to demands for improvement from participants. This monitoring is the responsibility of the training department.

5.4.10.4 Revision

The fall protection program is revised as required by the Health and Safety department in collaboration with all departments.

Requests for amendments, additions and revisions should be made to the Health and safety Department.

5.4.10.5 Site Management

Good housekeeping can eliminate some hazard related to the workplace and minimize the tripping hazards. In fact, if we tolerate the presence of debris and spills, it becomes easy to overlook serious risks.

In addition to basic cleanliness, good housekeeping requires that work areas are clean of debris and that the floors and hallways do not pose a risk of slipping or tripping. We must include demarcation areas, demarcation of travel ways and pedestrian crossings. The lack of storage space could be critical to maintain good housekeeping. Good housekeeping of the premises must be maintained all the time.

To achieve this, Agnico-Eagle Mines– Meadowbank division will have the resources to improve and maintain housekeeping on its site, and this, through the Supervision Formula and the work card. Furthermore, planned inspections under the theme "Hazard and Housekeeping" occur systematically in each department and this on an ongoing basis.

Waste Disposal:

The waste must be collected regularly to ensure good housekeeping of the site and to facilitate the recycling program in the waste management program. Leaving waste materials accumulate, becomes a waste of time and energy because we must go back and take the time to do the cleaning. In order to encourage and facilitate the removal of debris, containers are placed near the working areas. All waste containers are clearly identified (ex. glass, plastic, metal, etc.). To ensure compliance to this element, the environment department makes regular inspections, writes reports to the department that was inspected and makes a follow-up for the corrective actions.

5.4.11 Management of Sulphur Dioxide (SO2)

5.4.11.1 Means of Control

Preventive maintenance
In order to minimize the risk of dispersion of SO2 in the environment in the workplace, facilities are thoroughly inspected and all employees assigned to maintenance of the system receive specific training.

Several stationary SO2 gas monitors are strategically placed throughout the process plant and SO2 Plant to ensure everyone's safety.

Personal Protective Equipment
In accordance with the respiratory protection program for the selection, testing, maintenance and inspection of respirators, the following provisions apply in the presence of sulfur dioxide gas:

Sulphur dioxide in the AIR	Types of respirators	Comments
0-2 ppm	*No protection needed.*	*Concentration is lower than the prescribed threshold limit for 8 hours*
2 –20 ppm	*A cartridge half mask with sulphur dioxide filters*	

20-100 ppm	*Full-face mask with sulphur dioxide cartridge.*	*Eye irritation at 20 ppm and over*
100 ppm et plus	*A self-contained breathing apparatus*	
Emergency entrance with unknown values	*A self-contained breathing apparatus.*	

5.4.11.2 Training Information

Each year, a reminder is provided to all workers and supervisors who may perform work in the presence of sulfur dioxide.

5.4.12 Cyanide Management

In case of leakage, it evaporates rapidly producing a toxic gas lighter than air, hydrogen cyanide (HCN), a colorless gas smelling of bitter almonds.

5.4.12.1 Means of Control

Preventive maintenance

To minimize the risk of spreading the cyanide into the environment and in the workplace, facilities are thoroughly inspected and all employees assigned to maintenance of the system receive specific training.

Personal Protective Equipment

As explained in the respiratory protection program for the selection, testing, maintenance and inspection of respirators, the following provisions apply in the presence of cyanide

HCN Concentration in the air	Type of respirators	Comments
0-10 ppm	*Do not need a respirator.*	*Concentration is lower than the permissible maximum for 8 hours*
10 ppm et plus	*SCBA needs a self-contained breathing apparatus*	*Maximum value permissible for 8 hours*
Emergency entrance with unknown values	*Must enter with a self-contained breathing apparatus*	

HCN detection and alarms:

Gas sensors positioned at strategic locations to ensure plant reliability. These are calibrated periodically with standard gases of known concentration and the results of these calibrations are recorded in the register provided for that purpose and kept at the mill.

5.4.12.2 Training

All persons working with Sodium Cyanide must have received the mandatory Cyanide Awareness Training. This training will cover such topics as: what PPE is required, how to use and manipulate sodium cyanide totes, first aid procedures in the event of exposure, proper hygiene and cleaning practices that should be followed to prevent exposure etc.

Each year, a refresher course is given to all workers and supervisors that may have to work on the cyanide system. They must be able to easily recognize the warning signals and be fully aware of procedures to follow in case of alarms. They must also know the emergency plan and have conducted drills with their crew.

Under WHMIS, workers, supervisors and guardians officers are also informed about the use of cyanide (and hydrogen cyanide) and first aid measures in case of overexposure.

Finally, employers and workers concerned are trained for respiratory protection.

5.4.12.3 Dealing with Ammonia

Ammonia is a by-product gas produced by the Electro winning of Gold in the carbon stripping process in the Plant. There are stationary Ammonia gas monitors strategically located in the process plant to ensure everyone's safety.

Stationary gas monitors are in place for all gases that may be produced in the process plant. The control room operator monitors the gas readings on a 24/7 basis. If there is a release of gas in any area of the process plant, the gas monitor will alarm and the control room operator will proceed with the safe procedures for evacuating the mill and/or have the area checked out by competent trained persons.

Proper PPE such as SCBA's, portable gas monitors are provided for trained persons to do so.

5.4.13 WHMIS Review and Training

5.4.13.1 WHMIS 2015 training

All new employees and contractors will receive Workplace Hazardous Materials Information System (WHMIS 2015) training during their induction at Meadowbank site.

WHMIS 2015 training is mandatory for all employees and contractors no matter if the employee and contractor have received it in the past.

Refresher training is available on a yearly basis in the form of a safety meeting huddle and/or as requested.

5.4.13.2 SDS sheets

A "product review form" is used for all new products coming to site. This form is filled out by the Department requesting the new product.

The SDS sheet is then attached to the "product review form" and is sent to Health and Safety Department.

The "product review form" and SDS sheets are reviewed and signed off by:

- Health and Safety Department
- Environmental Department
- JOHS Committee Representative, and
- Purchasing Department

Once the "product review form" and SDS has been reviewed and signed by all concerned, the SDS sheet is then entered into the Maetrix Electronic Binder Online service by the Health and Safety Department?. From this point on, the SDS Online service is responsible in ensuring that the most up to date SDS sheets for products are kept on file.

This is the icon that is on all AEM computers which when used will access all of our SDS sheets.

Hard copies of SDS sheets are kept on file in the clinic (First Aid room) and the Warehouse.

5.4.14 Induction to Site

5.4.14.1 Emergency Measures Induction

All new employees, contractors, and visitors arriving at site for the first time receive an Emergency Measures Induction. This induction occurs on the same day as the persons arrive @ 5:00 p.m. and is delivered by a Health and Safety Department Representative.

Topics covered during the Emergency Measures Induction:

- Fire Alarm and Evacuation Route
- Muster Stations and how to access – physically shown locations
- How to initiate a "Code 1" Emergency on radio and/or telephone
- What to do if you get injured – how to access Medical help (location of clinic)
- Wearing of slippers to keep camp clean
- Kitchen/cafeteria hours
- Confectionary store – access and hours
- Mandatory Induction Training to site (Saturdays and Sundays)
- Agnico-Eagle Mines – Meadowbank Division – Emergency Response Capabilities
- How to access Security on site – (lost keys etc.)
- Working language @ Meadowbank is English
- Blasting in Open Pit mine – Noise and shaking – Blasting info etc.
- Noise and Respect for neighbors in Camp dorm room and wings
- Smoking Policy – where smoking is permitted – legislation

- Dry camp – No drugs or alcohol permitted on site
- Food and wildlife issues – no food outside and in domestic garbage
- Safety items such as using Man doors and not large garage doors to access buildings
- Danger / Caution Tape rules and respect for such
- Tagging in or signing in to access the Mill – Mill Evacuation procedures
- Respirator mandatory use in Mill, Crusher Buildings, Some areas of Assay Lab
- PPE zones and requirements for site
- Recreational walking/running on site
- Use and location of telephone booths
- Wireless Internet services
- Laundry facilities
- Use of gymnasium – physically shown location and equipment
- Review use of Fire Extinguisher
- Luggage – Tags – Check Out Time
- Health Services that are available on site such as sexual health, well-being (The clinic discusses these topics at the end of the induction, where the employees fill their medical forms.)

5.4.14.2 Mandatory Induction Training

The following topics are covered in great detail during the mandatory induction (e-learning) here @ Meadowbank. All employees, contractors (who will be at site for longer than 15 days) will receive this training prior to arriving at the site.
General Induction – (includes the following: Human Resources, Camp, Security, Environment, Health and Safety, Clinic – Health Care Providers) Each of these groups give an overview of what persons can expect from them, rules to follow, expectations etc.)

- Fire Extinguisher safety and use
- Workplace Hazardous Materials Information System – WHMIS
- SOP Surface – Driving anywhere on surface but not in the Pit or Mine
- Stairs and Ladder Safety
- Job Hazard Analysis
- Work Card (as per Supervision Formula philosophy)

5.4.14.3 Other Training provided

The following training is provided by our Training Department on an on-going basis and/or upon request. This list is not all inclusive but rather a general breakdown on some of the more common type of training that occurs at our site.

- SOP Mine – Driving in Pit and/or Mine – a person requires SOP Surface before he/she is eligible to be trained in SOP Mine.
- Aerial Work Platform
- Backhoe Operation
- Forklift Operation
- Telehandler Operation
- Over Head Crane Operation
- Lock Out / Tag Out Safety
- Fall Protection

- Confined Space
- Skid Steer
- Respiratory Protection
- Standard First aid – CPR – Oxygen Therapy
- Mill Induction

5.4.15 Emergency Response Program

5.4.15.1 Selection of Candidates

Person(s) wanting to become part of Meadowbank's Emergency Response Team may do so by filling out the application form and submitting it to the Health and Safety Department. Person(s) with previous experience in Emergency Response, Mine Rescue, Fire Fighting, Ambulance, First Aid, etc. are encouraged to apply.

5.4.15.2 Medical Evaluation

All person(s) wanting to be an active member of the Emergency Response Team must undergo and pass a Medical Evaluation. This medical is conducted by our Health Care Providers and results are sent down to our Medical Director who will review and advise accordingly.

5.4.15.3 Basic Mine Rescue Training

All person(s) who have completed and passed their medical evaluation will receive Basic Mine Rescue training. Training is of 40 hour duration and involves:

- Introduction: Principles, Requirements and Certification
- Mine Rescue Operations: Emotional Stress, Personal Safety and PPE, Team Procedures
- Mine Gases: Recognition, Effects and Treatment, TLV's, Hazards, Gases and Chart
- Gas Detection and Equipment: Introduction, Gas detection pumps and tubes, Electronic Devices
- Oxygen Therapy: When, The oxygen unit, Safe Practices, Storage and Handling
- Electrical Safety: Basic Facts and Hazards, Potential Injuries, Safe Approach and Lock Out / Tag Out
- Rescue Rigging: Introduction, Webbing and Rope, Equipment, Knots.
- Fire: Safety, Ignition Temperatures, Combustion, Fire Phases, Ventilation, Fire Habits, Fire Extinguisher. Fire-Fighting and PPE
- Respiratory Protective Equipment: Introduction, Hazards, SCBA, Donning, Doffing
- Rescue Rigging: Harnesses, Lowering, Anchoring, Packaging Systems and Shallow, Slope Rescue
- Special Hazards of Winter Conditions.
- Rescue Operations: Tools, Airbags, Winching, Vehicles, Buildings and Cave Ins
- Scene Assessment and Incident Command: ICS, Activation, Team, Classifications, Scene / Hazard Size Up / Zones
- Team Practical: Fire Drill Exercise, Equipment Donning, Searching
- Team Practical: Rescue Rigging, Repelling
- Final Evaluation and Written Exam

Upon successful completion of the Mine Rescue course – the individual will receive a Certificate from WSCC.

At the present time, we have three qualified Mine Rescue Instructors at site.

5.4.16 Critical Procedures

5.4.16.1 The Critical Procedures

- The Fundamental Critical Procedure
- Fit For Work
- Lifting and Mechanical Handling
- Working at Heights
- Permit to Work
- Energy and Machinery Isolation
- Confined Spaces
- Water Bodies and Liquid Storage
- Chemicals and Hazardous Substances
- Surface Mining
- Mobile Equipment and Light Vehicle
- Equipment Guarding

The Critical Procedures are designed to explain how we the Meadowbank Division will operate safely while conducting tasks associated with these rules.

Each Critical Procedure will have policies, procedures, standards and training associated with them, which helps our workforce to safely conduct work related to the rule.

5.4.17 Environmental Spills / Wildlife

5.4.17.1 How to Handle Spills

Any person noticing or causing a spill shall:

1. Stop the activity causing the spill
2. Contain (avoid spreading)
3. Decontaminate
4. Segregate – soil/snow – use pads, or booms
5. If larger than 100 liters – Call the Environmental Dept.: ext. 6747, 6728, or Radio channel 9.
6. Complete an Environmental Spill Report and give to Environment Department

5.4.17.2 How to Handle Wildlife

1. Make no sudden moves
2. Find a Safe shelter
3. Call Environmental or Security Department – Environmental (6747, 6728 or Radio channel 9), (Security 6748, 6817 or channel 9)
4. Do not provoke animals
5. Do not feed animals
6. Do not liter

7. Properly dispose of your food waste
8. Beware of animals while driving
9. Report all animal sightings – date, time, specific area, number of animals etc.

6. Review of Health & Safety Plan

On a yearly basis, the Health and Safety Department will produce a Health and Safety report. The purpose of this report and analysis is, among others, to reveal a tendency on the type of accidents that occur most often and to reveal the root causes behind these events, and this, in order to establish action plans for the coming months.

The results are presented to the Joint Occupational Health and Safety committee and the management team to assist them in their future goals. It must contain the following aspects:

Health Section:

- number of injuries and incidents;
- frequency of events
- severity of events;
- part of the body injured:
- type of injury;
- nature of injury;

Safety Section:

- root causes behind the events;
- main immediate causes behind the events;
- equipment involved in the events;
- time of day when events occur;
- sequence of work where events occur;
- trade affected;
- seniority workers to the task when an event occurs;
- event involving a fire hazard;
- comparison to previous years;

To be reviewed by Management and the OHSC on yearly basis.

Quality Assurance / Quality Control (QA/QC) Plan, Version 4

AGNICO EAGLE

MEADOWBANK GOLD PROJECT

Quality Assurance / Quality Control (QA/QC) Plan

In Accordance with Water License 2AM-MEA1526 and 2AM-WTP1826

Prepared by:
Agnico Eagle Mines Limited – Meadowbank Division

Version 4
March 2019

EXECUTIVE SUMMARY

This document presents the Meadowbank and Whale Tail Sites Quality Assurance / Quality Control (QA/QC) Plan, a requirement of the Meadowbank Type A Water License No. 2AM-MEA1526 Part I Item 16 and 2AM-WTP1826 Part I Item 19. This Plan also supports the following conditions of the Meadowbank Project Certificate No. 004 Condition 6 and 23, issued by the Nunavut Impact Review Board (NIRB). The plan has been developed in accordance with the current standard method and with the Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC) 1996 '*Guidelines for Use by Class "A" Licensees in Meeting SNP Requirements and for Submission of a QA/QC Plan'*

The objective of quality assurance and quality control (QA/QC) program is to assure that the chemical data collected are representative of the material being sampled, are of known quality, are properly documented, and are scientifically defensible. Data quality was assured throughout the collection and analysis of samples using specified standardized procedures, by the employment of accredited laboratories, and by staffing the program with experienced technicians.

IMPLEMENTATION SCHEDULE

As required by Water License 2AM-MEA1526 and 2AM-WTP1826 Part B, Item 11, the proposed implementation schedule for this Plan is outlined below.

This Plan will be immediately implemented (March 2019) subject to any modifications proposed by the Analyst or the NWB as a result of the review and approval process**.**

SECTION 1. INTRODUCTION

The objective of quality assurance and quality control (QA/QC) program is to assure that the chemical data collected are representative of the material being sampled, are of known quality, are properly documented, and are scientifically defensible. Data quality was assured throughout the collection and analysis of samples using specified standardized procedures, by the employment of accredited laboratories, and by staffing the program with experienced technicians.

This Plan documents the QA/QC program for the Meadowbank Project required by Type A Water License 2AM-MEA1526 and 2AM-WTP1826. It has been developed in accordance with the current standard method and with the Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC) 1996 '*Guidelines for Use by Class "A" Licensees in Meeting SNP Requirements and for Submission of a QA/QC Plan',* which includes the following definitions:

Quality Assurance: the system of activities designed to better ensure that quality control is done effectively; and

Quality Control: the use of established procedures to achieve standards of measurement for the three principal components of quality – precision, accuracy and reliability.

This QA/QC Plan sets out standard procedures for sample and data collection with respect to surface water and groundwater sampling in support of monitoring programs outlined in the *Water Quality and Flow Monitoring Plan*, *Groundwater Monitoring Plan* and *Core Receiving Environment Monitoring Program (CREMP)*. The QA/QC plan will be reviewed as needed and updated as required by the Environment General Supervisor.

Section 2 includes procedures for field sample collection and handling, Section 3 outlines external and internal laboratory requirements and Section 4 sets out data verification procedures and regulatory reporting requirements.

SECTION 2. FIELD SAMPLING

Sampling stations, frequency and parameters are set out in Type A Water License 2AM-MEA1526 and 2AM-WTP1826 Schedule I – Conditions Applying to General and Aquatic Effects Monitoring[1] and Metal and Diamond Mining Effluent Regulations (MDMER). All sampling stations have a GPS location and are landmarked. All stations are used repeatedly with the same qualified personnel and techniques to reduce operational error. The following sections outline the standard procedures for collection and handling of all surface water and groundwater samples.

2.1 SAMPLING EQUIPMENT

New laboratory supplied containers are used for sample collection. The bottles are either polyethylene plastic or glass, dependent on the specific parameter being analyzed.

Different handheld instruments are used to collect, as required, field parameters such as turbidity, temperature, pH, conductivity and dissolved oxygen. Instruments are calibrated before each sample event to ensure optimal performance and calibration results are recorded for future reference, if needed. Calibration and maintenance procedures are followed as set out by the supplier's operation manual. Equipment and bottles are selected so that they do not contaminate or alter the concentrations of parameters of interest according to laboratory standards.

For the groundwater sampling, CREMP sampling and to collect water samples at depth from the surrounding lake receiving and references environments, a pump with tubing is used. Low Density Poly Ethylene (LDPE) tubing (groundwater only), filter apparatus, manual pump and tubing, ash less filter paper are used to filter water for chlorophyll and inline filter for dissolved metal and/or for depth integrated sampling (i.e. chlorophyll a, phytoplankton or biological oxygen demand).

2.2 SAMPLING METHODS AND HANDLING

2.2.1 Sample Identification

All samples have a unique sample identification name based on a station identifier, date and time of collection. For duplicate, field blank and trip blank, the sample identification are still based on the station identifier, date and time but followed by DUP (duplicate), FB (field blank) or TB (trip blank).

All sample bottles are identified with the sample identification and date of collection. This information is marked on a label with a water resistant pen and affixed to the sample bottle. Additional information like time of sampling and parameters to analyses are included in the analysis request that will be sent to the accredited laboratory.

[1] Refer to Meadowbank Water Quality Flow and Monitoring Plan Section 2.3 and Whale Tail Water Quality and Flow Monitoring Plan Section 2.3 for more detailed description of station locations and both Meadowbank and Whale Tail Type A License Schedule I – Tables 1 and 2. The actual location of each sampling site will be marked with a highly visible stake with appropriate signage attached that will define the exact location of the collection point

2.2.2 Surface Water Sampling

The bottles are pre-labelled with the required sample identification before going on the field. Surface grab samples are collected by submerging the sample bottle to half depth of the stream/lake. For sumps, diversion ditches and piped discharge points, sample are collected below the surface of the water.

Samples bottles are provided by the accredited laboratory. Bottles are received pre-rinsed and pre-preserved or pre-rinsed with vials of preservative that are added in the field by qualified technicians or biologists. In the case that bottles are not pre-preserved, bottles are rinsed three times with sample water before filling. When sampling bottle contains preservative, the bottle is filled by using another clean bottle to avoid any release of preservative. Sometimes, a preservative is added after filling as directed by the laboratory; see Section 2.2.4 for more detail on preservation. The bottles are filled properly to allow mixing, preservative addition and thermal expansion.

Samples analyzed for dissolved metals are filtered through ash less filter paper at the time of collection when the delay before analysis is long. However, when the delay before analyses is fast the accredited laboratory will filter the sample before analyses. For chlorophyll A analysis, the sample is filtered through the ash less filter paper. In some case, when the analysis delay is long, the sample is frozen to prevent parameter degradation.

2.2.3 Groundwater Well Sampling

Well Preparation for Sampling

At the time of purging and sampling the heat trace cables are activated to warm the well pipe. Once the well has been thawed the well is purged.

Well Purging

Depending on the depth of the well, purging is performed by inserting a ¾'' Low Density Polyethylene (LDPE) Waterra tube to approximately 20 meters below the water surface and to use a compressor to push the water out. The wells are purged to remove standing water inside the well and to induce the flow of fresh groundwater from the rock formation. The Waterra tube is lowered to 20 meters below the remaining water and a compressor is used to completely dry the well. The quality of the purged water is monitored for pH, conductivity, temperature, water clarity and color (visual observation) during this activity. Three (3) well volumes of water between the in-well packer and bottom of screened interval) are removed prior to sampling or until the monitored parameters stabilize (values remaining within 10% for three consecutive readings).

Groundwater Sampling

Groundwater is sampled immediately after purging by lowering the intake of the DVP tubing to 3 to 5 meters above the screened interval.

A groundwater sample is collected in clean, laboratory-supplied containers as per the instructions in the previous section. Samples analyzed for dissolved metals are filtered through a 45 µm inline filter.

Samples are collected in duplicate (see Section 2.2.5) and submitted to the analytical accredited laboratory. Duplicate samples are collected.

Measurements of groundwater temperature, pH, electrical conductivity, turbidity and salinity are obtained in the field during purging and sampling. Measurements are recorded for future reference and to check against laboratory data.

The following procedures are followed to provide data quality control on the samples:

- Measurement of field parameters at selected intervals until stable readings (within 10% of each other);
- Minimization of the exposure of the sampled water to the atmosphere;
- Use of compressed, inert gas (nitrogen) to evacuate water for sample collection;
- In-situ measurement of sensitive chemical parameters (pH, conductivity, where applicable); and
- Abiding by sample preservation methods (refrigeration and use of preservatives where needed); and specified holding times.

Bottles are labelled with required information.

2.2.4 Preservation

Preservatives, if required, are added to sample bottles by the laboratory or added by the technician after filling, as directed by the analytical laboratory. Table 2.1 summarizes the minimum sample volumes, preservation and holding times for each analyte. This information was provided by the accredited laboratory H2Lab and revised with them in compliance with their protocol. It should be noted that pH, conductivity, turbidity, dissolved oxygen are parameters analyses on the field.

Table 2-1: Summary of Sampling Requirements

Parameter	Minimum Volume (mL)	Bottle Type	Preservation	Holding Time
pH	250	250 mL, glass or plastic, filled to the top	4˚C	Analyze immediately
Conductivity	125	250 mL, glass or plastic	4˚C	28 days
Hardness	250	250 mL plastic, filled to the top	4˚C, HNO_3	6 months
Oil and Grease (total)	1000	1 L amber glass	4˚C, H_2SO_4	28 days
Turbidity	125	250 mL, glass or plastic	4˚C	48 hours
Total Dissolved Solids (TDS)	125	250 mL glass	4˚C	7 days
Total Suspended Solids (TSS)	125	250 mL glass	4˚C	7 days
Total Alkalinity	250	250 mL, glass or plastic, filled to the top	4˚C	14 days
Bicarbonate Alkalinity	250	250 mL, glass or plastic, filled to the top	4˚C	14 days
Carbonate Alkalinity	250	250 mL, glass or plastic, filled to the top	4˚C	14 days
Total Cyanide	125	250 mL, glass or plastic	4˚C, NaOH	14 days
Free Cyanide	125	250 mL, glass or plastic	4˚C, NaOH	14 days
Benzene, Toluene, Ethylbenzene & Xylene	40 (per vial)	3 X 40 mL, glass, filled to the	4˚C	7 days

Parameter	Minimum Volume (mL)	Bottle Type	Preservation	Holding Time
(BTEX)		top		
Total Petroleum Hydrocarbons(TPH)	1000	1L, glass	4˚C, H_2SO_4	28 days
Total Metals (ICP-MS) (Aluminum, Antimony, Arsenic, Boron, Barium, Beryllium, Cadmium, Cobalt, Copper, Chromium, Iron, Lithium, Manganese, Mercury, Molybdenum, Nickel, Lead, Selenium, Tin, Strontium, Titanium, Thallium, Uranium, Vanadium, Zinc, Potassium, Magnesium, Sodium)	125	250 mL plastic	4˚C, HNO_3	6 months
Dissolved Metals (Aluminum, Antimony, Arsenic, Boron, Barium, Beryllium, Cadmium, Cobalt, Copper, Chromium, Iron, Lithium, Manganese, Mercury, Molybdenum, Nickel, Lead, Selenium, Tin, Strontium, Titanium, Thallium, Uranium, Vanadium, Zinc)	125	250 mL plastic	4˚C, Filtered on-site, HNO_3	6 months
Ammonia-nitrogen	250	250 mL, glass or plastic, filled to the top	4˚C, H_2SO_4	28 days
Total kjeldahl nitrogen	250	250 mL, glass or plastic, filled to the top	4˚C, H_2SO_4	28 days
Nitrate nitrogen	125	250 mL, glass or plastic	4˚C	48 hours
Nitrite nitrogen	125	250 mL, glass or plastic	4˚C	48 hours
Ortho-phosphate	125	250 mL, glass or plastic	4˚C	14 days
Total phosphorous	125	250 mL, glass or plastic	4˚C, H_2SO_4	28 days
Total organic carbon	125	250 mL glass	4˚C, H_2SO_4	28 days
Dissolved organic carbon	125	250 mL glass	4˚C, H_2SO_4	28 days
Chloride	125	250 mL, glass or plastic	4˚C	28 days
Fluoride	125	250 mL plastic	4˚C	28 days
Sulphate	125	250 mL, glass or plastic	4˚C	28 days
Radium 226	500	1L plastic	4˚C, HNO_3	1 month
Reactive Silica	250	500 mL, plastic	4˚C	28 days

2.2.5 Field Duplicates, Field Blanks and Trip Blanks

One field duplicate, one filter blank, and one field blank are collected for a) every 10 samples (i.e. randomness duplicate samples are taken for 10% of the samples), b) each sampling event or c) once per year as shown in Table 2.2. Field duplicates and filter blanks are collected and handled in the same manner as the other samples in the field. Field blanks are samples of deionized (DI) water handled concurrently and in the same manner as the other samples in the field. Trip blank, laboratory pre-filed bottles with DI water are carried to the sampling location and are left unopened, will be collected for a total of 10% annually.

Table 2-2: Quality Control Sample Frequency

Sampling Site	QA/QC Sampling Frequency
Compliance Monitoring Program	
Attenuation and reclaim ponds	1 field duplicate and 1 field blank per 10 samples
Mine facilities - operations	1 field duplicate and 1 field blank per year

Mine facilities - closure	1 field duplicate and 1 field blank per year
Mine facilities - post-closure	1 field duplicate and 1 field blank per year
Seep water chemistry	1 field duplicate and 1 field blank per 10 samples
Groundwater chemistry	1 field duplicate per groundwater sampling event. One field blank and 1 trip blank per year
Receiving water chemistry	Blind field duplicates, laboratory and field blanks, sediment cleaning swipes, laboratory matrix spike duplicates per 10 samples (CREMP)
Event Monitoring Program	
Each event	1 field duplicate and 1 field blank per 10 samples

2.2.6 SAMPLE TRANSPORT

All water samples are stored upright in coolers with ice packs and preserved as specified by the laboratory. Samples are shipped to the external laboratory as soon as possible via chartered aircraft and dedicated ground transportation to ensure arrival in a safe and timely manner. If sample can't be shipped the same day, there are conserved in a refrigerator at 4°C until shipping.

A Chain of Custody form with the following information is completed for every shipment of samples:

- Company name and sampler's name;
- Sample identification name;
- Time and date of sampling;
- Presence and type of preservative and whether the sample was filtered or not;
- Requested analytical parameters for each bottle;
- Time and date of shipping; and
- Analytical laboratory address and contact person.

One electronic or PDF copy is send by email to the laboratory and one electronically copy is kept at the mine site for reference.

SECTION 3. LABORATORY ANALYSIS

3.1 EXTERNAL LABORATORY

All analytical chemistry analyses are performed by an accredited laboratory.

In many cases these analyses are performed by H2Lab, an accredited facility (see Appendix A) that is located in Val D'Or, Quebec. This ensures that samples collected meet holding time requirements for all regulatory sampling. All data from H2Lab undergoes a rigorous internal QA/QC process, including the use of spiked samples and duplicate samples. All QA/QC data passed the laboratories acceptable limits.

All toxicity tests were performed by an accredited laboratory, generally Maxxam Analytique in Quebec City and/or Aquatox in Guelph, ON. Testing was conducted as stipulated in the corresponding Environment Canada Biological Test Methods.

Agnico also require the services of laboratory as Maxxam in Edmonton, Alberta, and SGS in Lake Field, Ontario for some parameters that H2Lab is not accredited for. Agnico also uses the services of ALS for many of the CREMP and AEMP water quality analysis.

3.2 INTERNAL LABORATORY

The assay lab at the Meadowbank site is not an accredited laboratory but is periodically used for "real-time" results for some parameters like TSS, Copper and WAD Cyanide. These results are for observational purposes and do not meet the standards of an accredited laboratory.

SECTION 4. DATA REQUIREMENTS

4.1 DATA COLLECTION

Starting in 2018, Agnico implemented the use of an environmental database named EQuiS. All historical data and future sampling result of all water sampling data is maintained at the Meadowbank and Whale Tail sites. The database has been designed based on the sample stations in the compliance monitoring program of 2AM-MEA1526 and 2AM-WTP1826 Schedule I, the various discharge limits designated in the license, the MDMER regulation and CCME guideline. The database functionality includes trend analysis and flagging out of compliance samples, all to enhance the effectiveness of the QA/QC program. All of this information is presented to regulators in the annual report.

The following data is collected for each sample in the field and will be entered into the database by the sampler for the corresponding sampling station:

a) Sample identification name;
b) Name of sampler;
c) Date and time of sampling or measurement; and
d) Physical characteristics (pH, temperature etc.), if required.

Upon receipt of sample results from the laboratory, the data will be input to the database and matched on sample identification name.

The analysis certificate for each sample from the accredited laboratory will include but not limited to:

a) Analytical methods or techniques used;
b) Date of analysis;
c) Name of the person(s) / laboratory that approved the certificate; and
d) Results of any analysis.

4.2 DATA VERIFICATION

Upon reception of analytical results, the field blank and duplicate analyses will be verified for potential contamination and accuracy, respectively. Results will be interpreted and recommended actions will be taken if results are not accurate.

4.3 EXCEEDENCE REPORTING

Any measured concentration at a sample station exceeding a regulated discharge criterion stipulated in Water License 2AM-MEA1526, 2AM-WTP1826 or the Metal and Diamond Mining Effluent Regulations (MDMER) will be reported to the NWB, ECCC and CIRNAC water inspector as soon as the analysis result is received. In addition, results of the action plan will be reported and, where necessary, mitigation options identified within 90 days after receipt of the analyses.

Spill Contingency Plan, Version 7

MEADOWBANK MINE

Spill Contingency Plan

Meadowbank Mine Site
All Weather Access Road (AWAR)
Whale Tail Pit
Whale Tail Haul Road
Baker Lake Facilities

In Accordance with Water License 2AM-WTP1826 & 2AM-MEA1526

Prepared by:
Agnico Eagle Mines Limited – Meadowbank Division

Version 7
February 2019

EXECUTIVE SUMMARY

This document presents the Spill Contingency Plan for Agnico Eagle Mines Limited (Agnico Eagle) Meadowbank Mine Site, All Weather Access Road (AWAR), Whale Tail Mine Site, Whale Tail Haul Road, and Baker Lake Marshalling Facilities, which is a requirement of the Meadowbank Gold Project Type A Water License No. 2AM-MEA1526 issued on July 23, 2015 and 2AM-WTP1826 issued on July 11, 2018.

The Spill Contingency Plan (SCP) designates lines of authority, responsibility, establishes proper reporting and details plans of action in the event of a spill. This plan applies to the operational phase of the Project and is applicable to all Agnico Eagle employees and any contractors associated with the project located at latitude 65°01'52"N and longitude 96°04'22"W approximately 70 km north of Baker Lake in Nunavut including the Baker Lake Marshalling Facilities located at latitude 64°18'36"N and longitude 95°58'04"W, Whale Tail Project located at latitude 64°24’14” and 96°40’50”, the All-Weather Access Road (AWAR), and the Whale Tail Haul Road between Meadowbank and Whale Tail sites.

IMPLEMENTATION SCHEDULE

As required by Water License 2AM-WTP1826 Part B, Item 13 & 2AM-MEA1526 Part B Item 11, the implementation schedule for this Plan is effective immediately (February 2019) subject to any modification proposed by the NIRB and NWB as a result of the review and approval process.

DISTRIBUTION LIST

1. INTRODUCTION

1.1 PURPOSE AND SCOPE OF THE SPILL CONTINGENCY PLAN

The overall purpose of creating a spill contingency plan is to minimize the impacts of spills by the establishment of predetermined lines of response and plans of action. This plan has been designed to facilitate effective communication and the efficient clean-up of potentially hazardous materials spills. These materials include:

- Hydrocarbon liquids such as diesel fuel, aviation fuel (Jet-A), gasoline, hydraulic oil;
- Soluble solids such as ammonium nitrate prills;
- Soluble liquids, such as glycols, acids, paints;
- Corrosive liquids such as sulphuric acid and corrosive solids such as sodium cyanide; and
- Any deleterious substances such as suspended solids, arsenic, copper, lead, nickel, zinc etc.

More specifically the objectives of this Spill Contingency Plan (SCP) are to:

- Identify roles, responsibilities, and reporting procedures;
- Provide readily accessible emergency information to the cleanup crews, management, and government agencies;
- Comply with federal and territorial regulations and guidelines pertaining to the preparation of contingency plans and notification requirements;
- Promote the safe and effective recovery of spilled materials; and
- Minimize the environmental impacts of spills to water or land.

This plan has been prepared in accordance with the following reference documents:

- Crown-Indigenous Relations and Northern Affair Canada (CIRNAC) 2007. *Guidelines for Spill Contingency Planning*;
- Government of Canada, Department of Fisheries and Ocean (DFO) 2016, *Fisheries Act*;
- Government of Canada, Environment and Climate Change Canada (ECCC) 1999, *Canadian Environmental Protection Act (CEPA) Environmental Emergency Regulations*;
- Government of Canada, Environment and Climate Change Canada (ECCC) 2017, *Migratory Birds Convention Act 1994*;

2 PROJECT DESCRIPTION

The Meadowbank Gold Project, operated by Agnico Eagle Mines Limited, is located approximately 70 km north of the Hamlet of Baker Lake in Nunavut. The project is located on Inuit Owned surface lands (IOL BL-14) and has the following coordinates:

Latitude: 65°01'52"N
Longitude: 96°04'22"W
NTS map sheet 66H/1

Meadowbank Project components include marshalling facilities in Baker Lake, the 110 kilometer All-Weather Access Road (AWAR) from Baker Lake, the Meadowbank mine site (Figure 9), the Whale Tail Project and the Whale Tail Pit Haul Road between Meadowbank and Whale Tail sites (Figure 10). The Meadowbank mine site consists of the process plant, landfarm, sewage treatment plant, water intake, accommodation buildings, power plant, tank farm, warehouse, truck shop, emulsion plant, open pit (Figure 1) and Vault area (Figure 2). The Baker Lake Marshalling Area consists of a laydown transfer area to temporarily store materials prior to the delivery to the Meadowbank mine site. The Baker Lake fuel farm consists of six (6), ten (10) million litre tanks for diesel fuel, within secondary containment (Figure 3) and eighteen (18) 100,000L double walled tanks, within secondary containment, for aviation fuel (Figure 4). Agnico Eagle is in the permitting process to add two 10,000,000 L tanks in Bake Lake. The Whale Tail camp (Figure 5) consists of sewage treatment plant, water intake, accommodation buildings, power plant, 1,500,000 bulk fuel storage area, warehouse, maintenance shop, and open pit. The Whale Tail Haul Road has one diesel tank of 1,915L installed at Km 132.

The fuel is delivered in bulk by sealift to the Baker Lake fuel farm. From there, fuel is hauled to the Meadowbank and Whale Tail sites by contractor tanker trucks on the AWAR and on the Whale Tail Pit Haul Road, respectively. Diesel fuel coming from the Baker Lake Tank Farm is stored at the Meadowbank site into a single 5.6 million litre tank, within secondary containment, and the aviation fuel into eight (8) – 50,000L double walled tanks in proximity of the airstrip. Fuel at the Whale Tail site will be stored in one 1,500,000 L tank. From there, the diesel is redistributed around site by an onsite fuel truck to site fuel tanks. Fuel storage locations have been designed to meet the CCME guidelines for Aboveground Storage Tank Systems Containing Petroleum and Allied Petroleum Products.

Emergency spill response equipment (i.e. spill kits) is installed at each fuel storage location. Spill kits contain the appropriate type, size and quantity of equipment for the volume and type of product present at the storage location. Transport trucks, heavy equipment and light vehicles are all equipped with spill kits.

Construction at the Meadowbank mine site began with the issuance of the Type A Water License and other relevant authorizations in July 2008 with operations commencing in January 2010. Mining of ore at Meadowbank is expected to cease in Q3 2019. The Meadowbank site is expected to be extended through the operation of the Whale Tail Project which will supply ore to the Meadowbank process plant. Construction of the Whale Tail open pit has started in July 2018.

2.1 PREVENTION AND INSPECTIONS

The first step in spill contingency planning is to take actions to prevent spills from occurring.

Transport, transfer and storage of materials are performed by trained personnel using secondary containment, with well- maintained equipment and containers. Refueling stations in Baker Lake, at the mine site, and at the Whale Tail site are equipped with a lined area to contain any minor leaks or spills while refueling. Transfer of fuel from tanks to tanker trucks are performed with the aid of fuel pumps. A Product Transfer Area Assessment were conducted for the Baker Lake Oil Handling Facility and can be found in Appendix M. Good housekeeping practices are adopted especially in areas such as storage facilities, loading and unloading zones. Site orientations are conducted with all employees and spill prevention and response is discussed in detail. Regular worksite inspections are conducted to identify measures to minimize the risk of spills. All personnel are trained to be aware of the potential hazards associated with the fuel/chemicals with which they are assigned to work. In addition to work site inspections conducted by area specific employees, the Environmental Department conducts weekly inspections to audit facilities handling or storing hazardous materials (Appendix A).

Agnico Eagle supports the following general principles for spill prevention:

- Provide up-to-date and accessible Material Safety Data Sheets (MSDS) for all hazardous materials;
- Regular inspections of fuel/chemical storage areas for leaks (including flex connectors and plumbing) and platform shifting;
- Regular inspections of hazardous materials storage areas;
- Train workers in the use of safe work procedures for hazardous materials, and procedures to clean up spills;
- Encourage workers to take reasonable measures to prevent spills;
- Keep drums/containers sealed or closed when not in use;
- Place drums/containers within a suitable form of secondary or spill containment;
- Keep “overpack” or “salvage” drums nearby to contain leaking drums;
- Keep storage areas secure from unauthorized access;
- Segregate incompatible materials;
- Ensure chemical storage areas are adequately protected from weather and physical damage; and
- Provide adequate spill response materials at storage areas (details of spill response equipment are outlined in Section 8).

3 DEFINITIONS

3.1 WHAT IS A SPILL?

For the purposes of this plan, a major spill is defined as an accidental release of product into the environment that has the potential for adverse impacts to the receiving environment, Agnico Eagle property or human health. This can include potential impacts to water, surface and groundwater, land, equipment, buildings, local communities, human health and the atmosphere.

A minor spill is defined as any spill that does not involve a toxic, reactive, or explosive material in a situation that does not pose a significant risk to the environment, human health or Agnico Eagle property. Minor spills are generally contained within Agnico Eagle facilities.

3.2 MATERIALS AND REPORTABLE (TO REGULATORY AUTHORITIES) SPILLS ON SITE

As a precaution, if there is any doubt as to whether the quantity spilled meets the minimum thresholds for reporting to regulatory authorities listed in Table 1, the spill incident will be reported. Furthermore, Agnico Eagle maintain a detailed log of all spills reportable to authorities and those non-reportable for all materials listed in Section 1.1. As part of Agnico Eagle's overall environmental management system and in the spirit of a continuous improvement of environmental performance, procedures will be implemented to ensure **all** spills irrespective of location are reported to the Meadowbank Environment Department.

To ensure compliance with Section 36(3) and 38(5) of the Fisheries Act, Section 5(1) of the Migratory Birds Convention Act, the CEPA Environmental Emergency Regulations, Nunavut Spill Regulation and the Metal and Diamond Mining Effluent Regulations all spills of fuel or hazardous/deleterious materials, regardless of quantity, into a water body (including frozen), shall be reported immediately to the NT-NU 24-HOUR SPILL REPORT LINE (at 867.920.8130 or online at spills@gov.nt.ca). All spills on land that reach the reportable quantity listed in Table 1 need to be report to the NT-NU 24-HOUR SPILL REPORT LINE within 24 hours of the spill occurrence.

Table 1 - Spill quantities that must be reported to the NT-NU 24-HOUR SPILL REPORT LINE

Transportation Class	Type of Substance	Compulsory Reporting Amount
1	Explosives	Any amount
2.1	Compressed gas (flammable)	Any amount of gas from containers with a capacity exceeding 100 L
2.2	Compressed gas (non-corrosive, non- flammable)	Any amount from containers with a capacity exceeding 100 L
2.3	Compressed gas	Any amount
2.4	Compressed gas (corrosive)	Any amount
3.1, 3.2, 3.3	Flammable liquid	100 L
4.1	Flammable solid	25 kg
4.2	Spontaneously combustible solid	25 kg
4.3	Water reactant solids	25 kg
5.1	Oxidizing substances	50 L or 50 kg
5.2	Organic peroxides	1 L or 1 kg
6.1	Poisonous substances	5 L or 5 kg
7	Radioactive substances	Any amount
8	Corrosive substances	5 L or 5 kg
9.1 (in part)	Miscellaneous substances	50 L or 50 kg
9.2	Environmentally hazardous	1 L or 1 kg

Transportation Class	Type of Substance	Compulsory Reporting Amount
9.3	Dangerous wastes	5L or 5 kg
9.1 (in part)	PCB mixtures of 5 ppm or more	0.5 L or 0.5 kg
None	Other contaminants	100 L or 100 kg
None	Deleterious substances, Seepage	Any amount

Note: L = litre; kg = kilogram; PCB = polychlorinated biphenyls; ppm = parts per million

4 RESPONSE ORGANIZATION

This section addresses the response organization and the responsibilities of each individual during response to an incident.

Figure 6 and 7 illustrates Agnico Eagle's Spill Reporting Procedure Steps in the event of a spill and Sections 4.1 -4.9 list the major responsibilities of site staff that will be participating in the emergency response management.

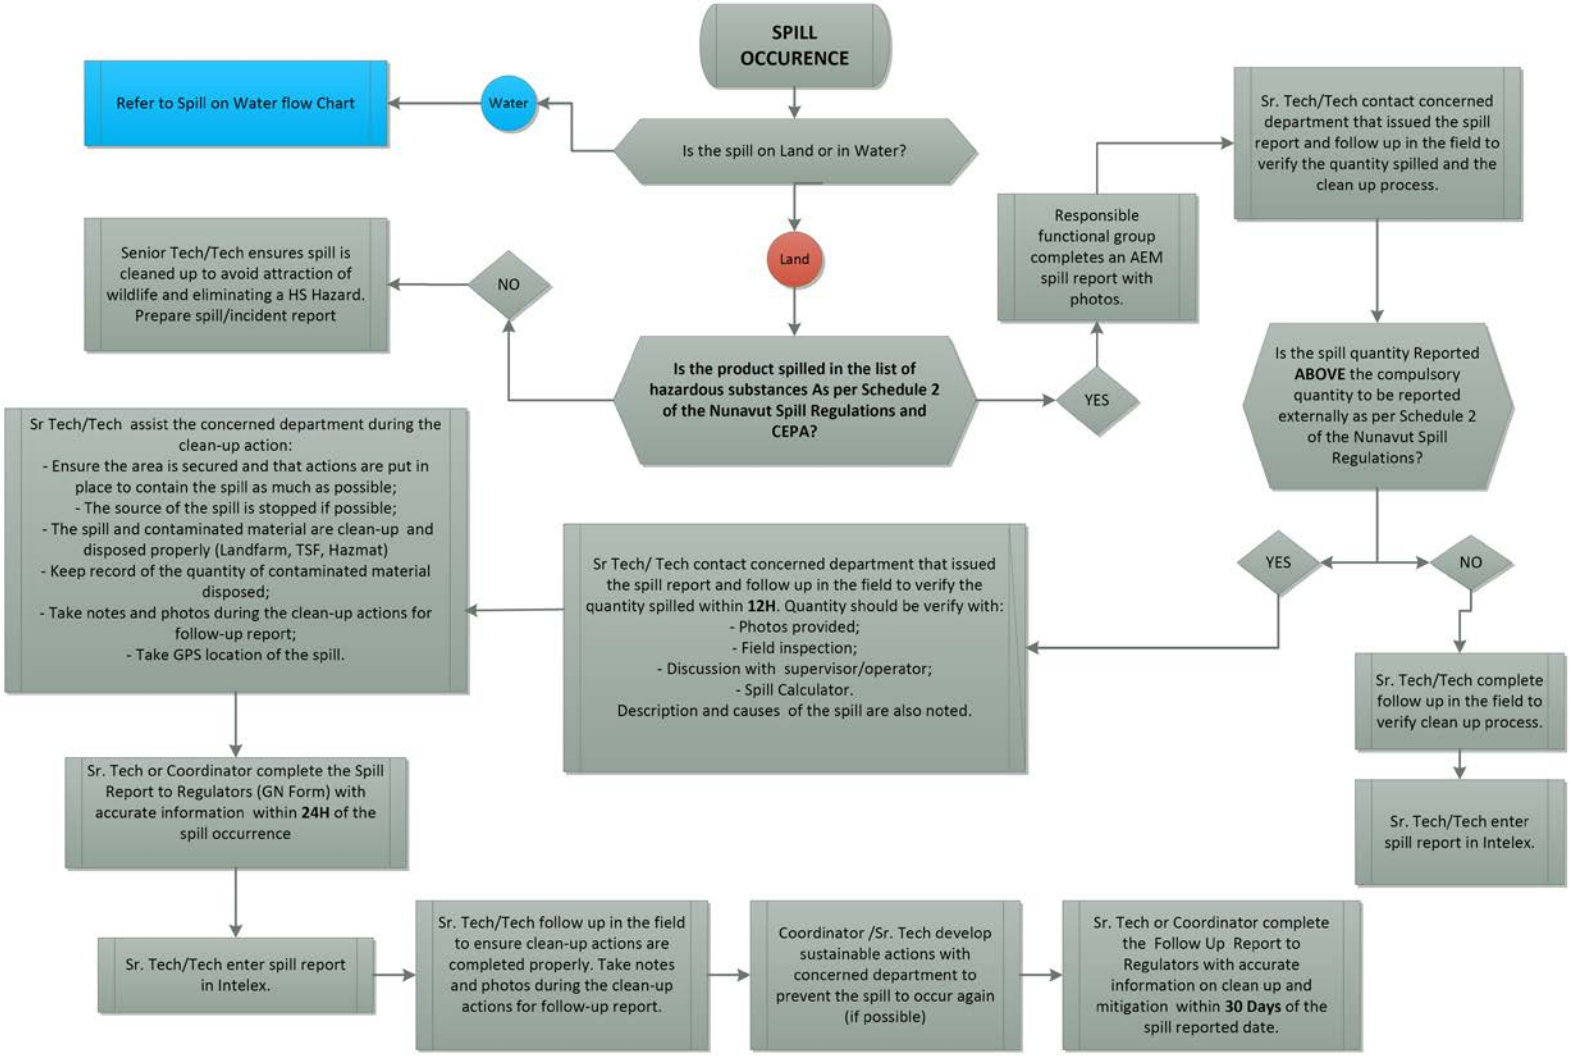
The first person (first responder) to notice, or come in contact with, any spill situation either initiates a Code 1 (i.e. If a tanker truck overturns on the AWAR/Whale Tail Haul Road) or reports to his/her immediate supervisor (i.e. All other spills on land or water). The supervisor is responsible to report the incident to the designated Incident Commander for a major spill or to the environmental department for a minor spill. If a Code 1 is initiated, the Incident Commander will respond in conjunction with the Emergency Response Team (ERT). Major responsibilities such as initial coordination, spill clean-up and mobilizing the ERT are part of the Incident Commander's duties.

The Incident Commander will contact the Environmental Superintendent and/or General Mine Manager or alternate, who in turn will inform the Senior Vice President, Environment and Sustainable Development. After all information has been collected, the Environmental Superintendent or alternate will submit a spill report and follow up spill report to the NWT/NU Spill Line, Nunavut Water Board, Kivalliq Inuit Association, Environment and Climate Change Canada (ECCC) and Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC). Incidents that require media communications will be the responsibility of Agnico Eagle General Mine Manager or alternate.

In the event of a major spill during a ship-to-ship transfer or due to unforeseen circumstances, the shipping company will be solely responsible for responding to the spill. The containment and clean-up of inadvertent spills resulting from the tankers in transporting the fuel is the responsibility of the shipping company. In the unlikely event where a major fuel spill becomes unmanageable, the shipping company could call on external resources such as the Canadian Coast Guard for assistance. In these situations, Agnico Eagle would provide whatever assistance it can to the shipping company[1]. Due to the lack of resources Agnico Eagle possess to counter act such a large scale marine spill, Agnico Eagle's assistance would be limited to providing support to preserve the shoreline environment. Agnico Eagle would put its resources to the best use possible during such an event, and assist as much as possible with the resources at hand. The Shipboard Oil Pollution Emergency Plan (SOPEP) is the responsibility of the shipping company; it covers the ship-to- ship transfer of fuel near Helicopter Island. Please refer to the Oil Pollution Emergency Plan for more details. Please refer to the certificate of entry and acceptance boats of shipping company, communication protocol, safety management system for entry into confined water and monthly safety meeting forms found in the Oil Pollution Emergency Plan.

[1] The Emergency Response Team will not be equipped or trained to respond to spills offshore in the Marine environment. They will however be able to respond to spills in the near shore area

Figure 6: Spill/incident reporting procedure



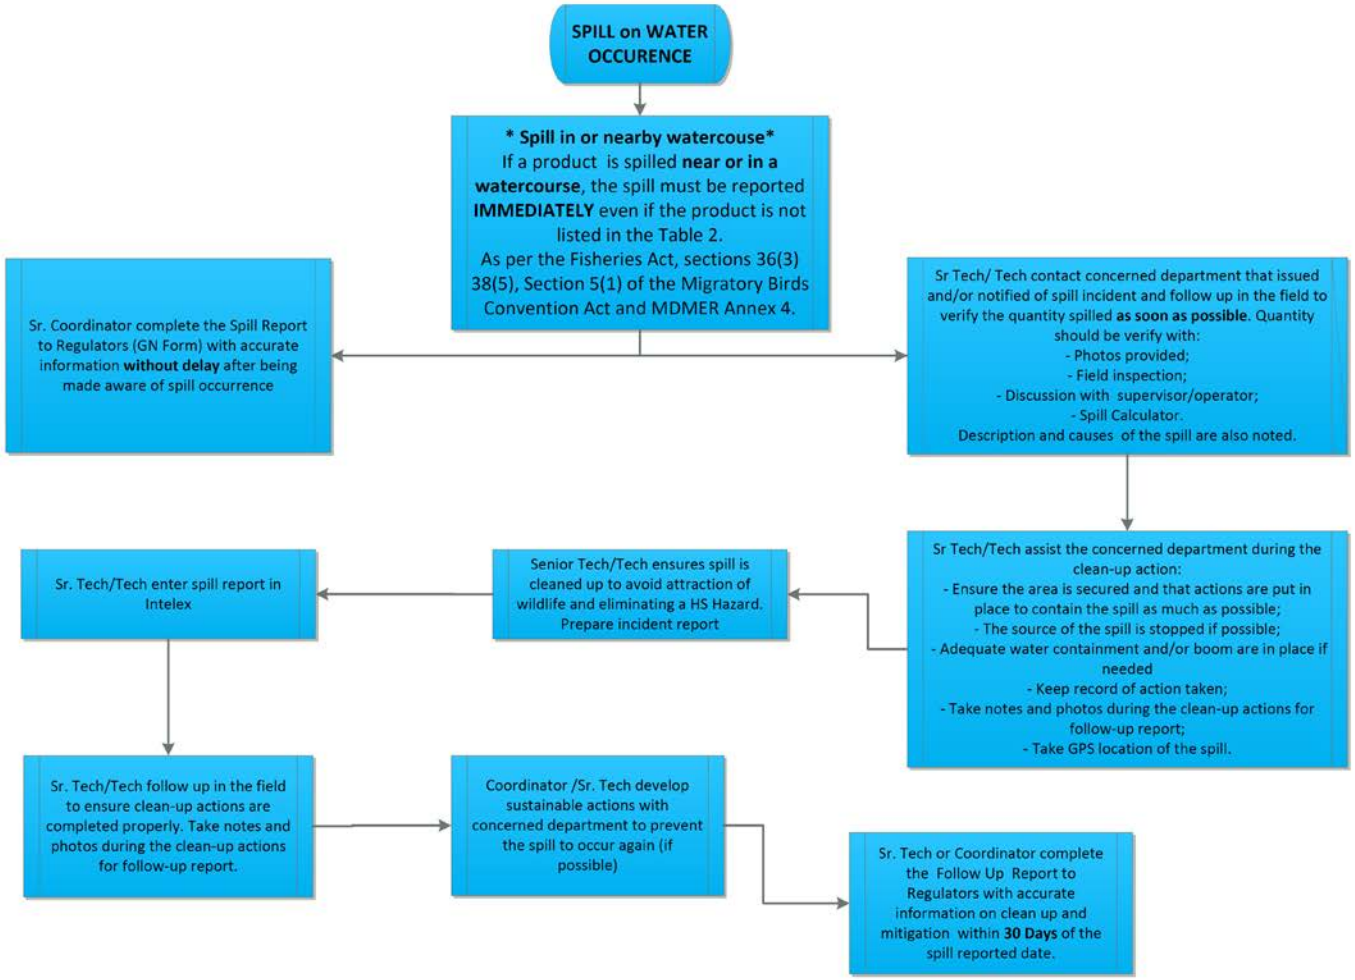


Figure 7: Spill/incident on Water Reporting Procedure

4.1 FIRST RESPONDER

The person who has caused a spill or the first to observe the spill is the first responder. The responsibilities of the first responder are as follows:

- In case of major incident (example: tanker truck overturn) and/or spill in or nearby watercourse, initiate a Code 1. Remain on radio to provide guidance to the ERT;
- In case of spill to land or water, contact the supervisor to report the incident;
- Immediately identify and contain the spill, IF SAFE TO DO SO; and
- Participate in spill response as a member of the clean-up crew.

4.2 SUPERVISOR

The responsibilities of the Supervisor are as follows:

- Initial assessment of the severity of the incident;
- Contacts the Incident Commander or Environmental Department;
- Gathers facts about the spill; and
- Participate in spill response as a member of the clean-up crew.

4.3 INCIDENT COMMANDER

Responsibilities of the Incident Commander are as follows:

- Assume complete authority over cleanup personnel and the spill scene, as well as assume responsibility for all mitigation efforts;
- Evaluate the initial situation and assess the magnitude of the problem;
- Activates the initial response plan;
- Alert and assemble key personnel in the response team, as deemed appropriate, to handle the situation;
- In consultation with the Environmental Superintendent or designate, develop the overall plan of action for containment and cleanup of the specific incident, as well as direct and implement the plan;
- Ensure assigned responsibilities are carried out and the activities of team members are coordinated;
- Assess the requirements for people, equipment, materials, and tools to contain the spill in light of what resources are immediately available; urgency will depend on the nature of the spill; and
- In consultation with the Environmental Superintendent or designate mobilize any additional resources that may be required and arrange for the transportation of necessary personnel and/or materials to the site.

4.4 EMERGENCY RESPONSE TEAM

Agnico Eagle has an Emergency Response Team (ERT) that is trained and responsible for controlling major spills, including those that could occur should a tanker truck overturn along the AWAR or on the Whale Tail Haul Road, and assisting with medical and other emergencies that may occur at the Meadowbank Mine, wherever the location. ERT team members attend regular training sessions.

4.5 EMERGENCY RESPONSE TEAM COORDINATOR

The responsibilities of the Emergency Response Team Coordinator (ERTC) are as follows:

- Mobilize all ERT personnel, equipment, personal protective equipment and supplies as

required to the site of the spill;
- Assist Incident Commander in obtaining any additional resources not available on site;
- Ensure that appropriate PPE is worn properly;
- Assist in developing and implementing emergency response training programs and exercises; and
- Ensure that all spill response personnel receive adequate training to fulfill their responsibilities as part of the ERT.

4.6 ENIVRONMENTAL SUPERINTENDENT OR DESIGNATE

The Environmental Superintendent or designate is responsible for implementing and maintaining the SCP. In addition, the Environmental Superintendent's or designates responsibilities in the case of a spill are to:

- Liaise with the Incident Commander;
- Provide technical advice on the anticipated environmental impacts of the spill;
- Advise on the effectiveness of various containment, recoveries, and disposal options, and suggest the most appropriate approach;
- Prepare and submit any formal reports (see Appendix B for NWT/NU Spill Report Form) to regulators and Agnico Eagle management detailing the occurrence of a spill;
- Contact the Senior Vice President Environment and Sustainable Development immediately for a major spill;
- Act as the spokesperson with regulatory and government agencies;
- If authorized by the General Mine Manager, act as a spokesperson with the public and media, as required;
- Implement a sampling protocol for the collection and analysis of samples to identify and monitor possible contaminant levels resulting from the spill;
- Ensure on-site resources for spill response and cleanup are available;
- Monitor the effectiveness of the cleanup operation and recommend further work, if necessary;
- Reviews incident occurrences and recommends preventative measures; and
- Assists in implementing training and simulation requirements for spill response personnel.

4.7 GENERAL MINE MANAGER ON DUTY

The General Mine Manager/designate is required to inform team members of the detailed nature of the operations to be performed in the event of a major spill during the operations phase. The responsibilities of the General Mine Manager/designate are as follows:

- Liaise with Agnico Eagle personnel resources and keep them informed of cleanup activities;
- Incidents that require media communications will be the responsibility of Agnico Eagle General Mine Manager or alternate; and
- Assist the Incident Commander and ERT as needed, particularly in obtaining any additional resources not available onsite for spill response and cleanup.

4.8 HEALTH AND SAFETY SUPERINTENDENT OR DESIGNATE

The following are the responsibilities of the Health and Safety Superintendent or designate in conjunction with the Training Department:

- Maintain emergency and health and safety records;
- Assist in conducting emergency spill response exercises;
- Track all emergency and health and safety training that on-site staff have received, and

when retraining will be required;
- Notify the Incident Commander (related to ERT) when retraining is required;
- Ensure that employees are retrained in appropriate emergency response skills, Workplace Hazardous Materials Information System (WHMIS) training, Hazard Communication (HAZCOM), Occupational Health and Safety Administration (OHSA) training, first aid, and respirator fit-testing prior to expiry of existing training certification; and
- Consult with appropriate organizations regarding retraining requirements and schedules.

4.9 ON-SITE HEALTH CARE PROVIDERS

On-site medics are responsible for the following:

- Providing on-site first aid and other medical support; and
- Providing additional training for ERT members.

In addition to the health care providers on site, the Baker Lake Hamlet health professionals will be called first on the scene, if required.

4.10 SPILL RESPONSE TEAM CONTACT INFORMATION

Internal contact information is contained in Table 2 for all Agnico Eagle personnel involved in spill recovery and subsequent reporting. Table 3 provides contact information for Agnico Eagle contractors present at the mine site and transportation contractors. Important external contacts such as regulatory agencies and health organizations are listed in Table 4. Table 5 provides contact information for external contractors should incident warrant assistance from outside sources.

5 ACTION PLAN

Spills may be the result of any of the following occurrences:

- Tanks, drums or containers may develop leaks or rupture;
- Failure of equipment such as valves, piping or containment structures;
- Overfilling;
- Improper storage;
- Spills during transfer of fuel, chemicals or waste products;
- Spills resulting from accidents during transportation; and
- Seepage that may migrate off site to receiving water or land; and
- Discharge to receiving environment of a deleterious substance exceeding the MDMER and/or NWB Water License and/or any other regulation.

5.1 INITIAL ACTION

For all spill emergencies, it is required that priority actions be undertaken. These are:

- Respond Quickly;
- Ensure Safety; and
- Report the Spill;

5.1.1 Respond Quickly

- Identify the spilled material;
- Be alert – ensure safety of yourself and others by notifying them of the incident;
- Shut off ignition sources such as vehicles and unplug electrical equipment – NO SMOKING;
- Attend to the injured;
- Assess the severity of the spill; and
- Contact the Incident Commander, identify the location and request assistance as required. If required the Incident Commander will mobilize the Emergency Response Team.

The primary form of ensuring safety is by using preventative measures. All personnel who deal with chemicals must have training in first aid and safe materials handling, including the Workplace Hazardous Materials Information System (WHMIS). In addition, regular training updates and site-specific exercises/drills are integral to preventing incidents.

5.1.2 Ensure safety

- Consult the MSDS and Product Guides for further information on the substance;
- Keep people away from spill site;
- Wear appropriate PPE such as impervious clothing, goggles, and gloves when containing the spill;
- Approach spill from upwind IF IT IS SAFE TO DO SO;
- Assess whether the spill, leak, or system failure can be readily stopped or brought under control;
- Stop product flow or leak if possible and IF IT IS SAFE TO DO SO;
- Do not contain compounds (e.g. gasoline, aviation fuel) if vapors might ignite – allow them to evaporate; and
- Depending on the type of compound spilled and IF IT IS SAFE TO DO SO, contain product using booms, berms, absorbent pads, earthen dike, trenches or improvise with materials at hand.

5.1.3 Report Spill

- Spill reporting will follow Spill Reporting procedure MBK-ENV-0016. This procedure can be found in Appendix K

- Obtain all necessary information to complete the spill report form (reportable or not) and provide to Environment Staff within 12 hours. Spills that meet regulatory reporting criteria must be reported to the NWT-NU 24 Hour Spill Line/CIRNAC/ECCC/Kivalliq Inuit Association and the NWB by Agnico Environment Staff within 24 hours. Any spills near and/or in water must be reported immediately to NWT-NU 24 Hour Spill Line/CIRNAC/ECCC/Kivalliq Inuit Association and the NWB by Agnico Environment Staff even if not meeting regulatory criteria describe in Table 1; and

- For spills that meet regulatory reporting criteria, a detailed spill report will be submitted to the CIRNAC Water License Inspector, ECCC inspector and the KIA Land's Inspector by Agnico Eagle Environment Staff no later than 30 days after the initial reporting of the spill. This report will contain the amount and type of spilled product, the GPS location of the spill and the measures taken to contain, cleanup and restore the spill site.

Procedures will vary depending on the season and materials spilled. The MSDS for spilled materials and/or Transport Canada's "Emergency Response Guidebook" must be consulted to ensure that safety procedures are followed. Response procedures specific to spills on land, water, snow and ice are presented in the following sections as general guidelines.

5.2 SPILLS ON LAND

Response to spills on land will include control techniques involving the use of two types of barriers: dikes and trenches. Barriers should be placed down-gradient (down-slope) from the source of the spill, and as close as possible to the source of the spill. Barriers will slow the progression of the material spilled and will also serve as containment to allow for recovery.

Depending on the volume spilled, the site of the spill as well as available material, a dike may be built with soil, booms, lumber, snow, etc. A plastic liner, if necessary, can be placed at the toe of and over the dykes to protect the underlying soil or other material and to facilitate recovery of the material. Dikes will be constructed in such a way as to accumulate a thick layer of free product in a single area (V-shaped or U-shaped).

Trenches are useful in the presence of permeable soil and when the spilled material is migrating below the ground surface. A plastic liner should be placed on the down-gradient edge of the trench to protect the underlying soil. Liners should not be placed at the bottom of the trench to allow water to continue flowing underneath the layer floating oil.

The use of absorbent materials to recover a large volume of spilled liquids such as petroleum based material should be avoided. Large volumes of free-product should be recovered, as much as possible, by using vacuums and pumps, and containerized. Mixtures of water and fuel may be processed through an oil-water separator. However absorbent materials work well for smaller volumes of spilled hydrocarbon based materials such as fuel. Absorbent sheets should be used to soak up residual fuel on water, on the ground (soil and rock), and on vegetation. Peat moss may also be sprinkled on vegetation to absorb films of petroleum products.

5.3 SPILLS ON WATER

Response to spills on water will include procedures that include containment, diversion and recovery techniques. The following elements must be taken into consideration when conducting response operations:

- To ensure compliance with Section 36(3) and 38(5) of the *Fisheries Act* and Section 5(1) of the Migratory Birds Convention Act all spills of fuel or hazardous materials, regardless of quantity, into a water body (including frozen), shall be reported immediately to the NT-NU 24-HOUR SPILL REPORT LINE (at 867.920.8130).
- Type of water body or water course (lake, stream, river);
- Water depth and surface area;
- Wind speed and direction;
- Type of shoreline; and
- Seasonal considerations (open-water, freeze-up, break-up, frozen).

The most common type of spill that could be anticipated is a petroleum hydrocarbon (diesel) spill during fuel transfers/transport. Containment of an oil slick in water will require the deployment of mobile floating booms to intercept, control, contain and concentrate (i.e., increase thickness) the floating oil. One end of the boom will be anchored to shore while the other will be towed by a boat and used to circle the oil slick and return it close to shore for recovery using a skimmer. Reducing the surface area of the slick will increase its thickness and thereby improve recovery. Mechanical recovery equipment (i.e., skimmers and oil/water separators) will be mobilized to site if required.

Measures will be taken to protect sensitive and accessible shoreline. The oil slick will be monitored to determine the direction of migration. In the absence of strong winds the oil will likely flow towards the discharge of the lake. Measures will be taken to block and concentrate the oil slick at the lake discharge using booms where it will subsequently be recovered using a portable skimmer, vacuum, or sorbent materials.

In small slowly-flowing rivers, streams, channels, inlets or ditches, inverted weirs (i.e., siphon dams) will be used to stop and concentrate moving oil for collection while allowing water to continue to flow unimpeded. In the case of floating oil, in a stream, heading for a culvert (i.e., at a road crossing) a culvert block will be used to stop and concentrate moving oil for collection while allowing water to continue to flow unimpeded. In both cases oil will then be recovered using a portable skimmer or sorbent materials.

In the case of spills in larger rivers, with fast moving currents, diversion booming will be used to direct the oil slick ashore for recovery. Single or multiple booms (i.e., cascading) may be used for diversion. Typically, the booms are anchored across the river at an angle. The angle will depend on the current velocity. Choosing a section of a river that is both wider and shallower will make boom deployment easier. Diversion booming may also be used to direct an oil slick away from a sensitive area to be protected.

5.4 SPILLS ON SNOW AND ICE

In general, snow and ice will slow the movement of hydrocarbons. The presence of snow may also hide the oil slick and make it more difficult to follow its progression. Snow is generally a good natural sorbent, as hydrocarbons will have a tendency to be soaked up by snow through capillary action. However, the use of snow as a sorbent material will be limited as much as possible. Snow and frozen ground will also prevent hydrocarbons from migrating down into soil or at least slow the migration process. Ice will prevent seepage of fuel into the water.

Most response procedures for spills on land discussed previously may be used for spills on snow and ice. The use of dykes (i.e., compacted snow berms lined with plastic sheeting) or trenches (dug in ice) will slow the progression of the fuel and will also serve as containment to allow recovery of the fuel.

Free-product will be recovered by using a vacuum, a pump, or sorbent materials. Contaminated snow and ice will be scraped up manually or using heavy equipment depending on volumes. The contaminated snow and ice will be placed in containers or within plastic lined berms on land.

5.5 DISPOSAL OF SPILLED MATERIAL

All contaminated spill pads, and booms are placed within Quatrex bags for shipment to an approved disposal facility. All the petroleum hydrocarbon contaminated soil is placed into the Meadowbank landfarm for treatment, this includes contaminated soil from the Baker Lake and Whale Tail facilities. Spills over 100 L of non-petroleum hydrocarbon material (e.g. solvents, glycol) will be placed in drums and stored in the on-site hazardous material area for shipment south to approve facilities during barge season. Spills of non-petroleum hydrocarbon material fewer than 100 L will be placed in the Tailings Storage Facility (TSF).

Spills under 100 L of petroleum hydrocarbon contaminated snow will be placed in a designated area of the landfarm and treated as contact water after snowmelt. Spills over 100 L of petroleum hydrocarbon contaminated snow will be excavated and stored in labeled drums or at the TSF. After snow melt, the contaminated water will be pumped through the site's oil-water separator (carbon filter) to remove petroleum hydrocarbon residue. The treated water will be sampled per Part F, Item 6 of the NWB 2AM-MEA1526 Water License, and discharged to the respective Stormwater Management Pond at Meadowbank and Whale Tail if criteria are met. If criteria are not met, water will be treated as hazardous material and shipped south. Also, after snowmelt, visible product will be cleaned up with absorbent pads or booms.

For more information refer to the Meadowbank Landfarm Design and Management Plan.

5.6 EVENT MONITORING

The Event Monitoring (EM) program addresses the site specific monitoring that is required following any accidental release. A "release" may be caused by a spill or an emergency (Emergency Response Plan; January 2018).

The EM program is designed to verify whether contamination of the surface soil, nearby receiving environment and active zone has occurred as a result of an accidental release of a hazardous material or contaminated water, through monitoring of surface runoff and nearby receiving environment following remediation of any release. It is anticipated that owing to the presence of permafrost beneath most of the mine footprint, there will be minimum impact to groundwater. A complete list of hazardous materials in use during operations at all sites is provided in the Hazardous Materials Management Plan (June 2016).

The EM plan is developed on a site-specific basis subsequent to a spill or accidental release, and considers the type of product spilled, the potential receptors, and the potential for any remaining contamination after clean up. The plan is done in coordination with the Environmental Superintendent.

In the event of an accidental release, the water quality of the downstream receptor and possibly upstream of the receiving point, if any, is to be sampled (during the ice-free season) and analyzed. Should the spill have happened over snow cover, water and possibly soil sampling is to take place at the earliest feasible time after thaw to verify if there has been any impact to the receiving water or soil quality. The specific parameters monitored as part of the EM program will depend on the nature of the spill, and will be determined for the specific hazardous material released.

EM sampling is to occur following the clean-up of a release and the frequency of sampling will depend on the type of material spilled (wet or dry spill), the environment into which the chemical was released (surface water body or soil; frozen or thawed), and the quantity of spill material. The EM program for a particular spill will cease upon obtaining satisfactory analytical results (within 20% of background level, to accommodate for analytical accuracy) from the potentially affected areas or as required by regulators.

In the event of a seepage from the TSF and/or rock storage facility (RSF), water will be pumped back to the North Cell TSF (or South Cell if necessary). Visual inspections will be conducted regularly to confirm that the seepage is appropriately contained and will not enter into the receiving environment.

6 HAZARDOUS MATERIALS STORED ON SITE

A variety of petroleum products and other hazardous materials will be used as part of mining operations. Large quantities of petroleum products will be stored at various sites at the Meadowbank Mine and at Whale Tail Project. Explosives will also be stored on site. Other hazardous materials will be used but in smaller quantities. Nonetheless, all these products are considered as potential environmental and safety hazards.

Material Safety Data Sheets (MSDS) of all materials transported, stored and used on-site will be made available at strategic locations near to where hazardous materials or toxic substances are stored or utilized. Appendices C to H provide General Response Procedures for Spilled Chemical Substances.

Table 5 identifies the predominant hazardous materials transported, stored and generated at the sites. Those destined for use in the process plant will only be stored at Meadowbank. Refer to the *Hazardous Materials Management Plan* for more details.

Table 5 - Materials stored at site during operations

Material	Maximum Anticipated on - site	Maximum Amount transported per unit	Storage Location
Acetylene	500 cylinders	300 cylinders per sea can	Inventory Lay down
Acid Hydrochloric	120 L	NA	Inventory Lay down, Laboratory
Activated Carbon	350 Mt	10 Mt per sea can	Inventory Lay down and Process Plant lay down
Ammonium Nitrate	10,000 Mt	20 Mt per sea can	Emulsion plant
Ammonium Nitrate Fuel Oil (ANFO)	Manufactured on demand	20,000 kg per truck	Emulsion plant
Anionic Flocculent	99,000 Kg	750 kg/bag	Inventory Lay down
Motor Oil	Estimated at 800,000L	20,800L per sea can	Inventory Lay down, garage
Trojan Boosters (Blasting Systems)	34,000 kg	15 Mt per sea can	Emulsion plant
Borax, Anhydrous	7,500 kg	3,375 kg per sea can	Inventory Lay down and Process Plant lay down
Calcium Chloride	600,000L	10,000L per sea can	Inventory Lay down
Carbon Dioxide	10 cylinders	10 cylinders per sea can	Inventory Lay down
Caustic Soda	138,000 Kg	1,000kg/Bag	Inventory Lay down
Copper Sulphate	500 Mt	20 Mt per sea can	Inventory Lay down and Process Plant lay down
Diesel Fuel	5.6 million Litres	40,000L per tanker	Meadowbank Tank farm
Diesel Fuel	1.5 million Litres	40,000L per tanker	Whale Tail Tank farm
Diesel Fuel	60 million Litres	NA	Baker Lake Tank farm
Dyno Split (Detagel)	135,000 kg	15 Mt per sea can	Emulsion plant
Lead nitrate	350,000 kg	1,000kg/bag	Inventory Lay down
Nonel EZTL	1,400 kg	15 Mt per sea can	Emulsion plant

Material	Maximum Anticipated on - site	Maximum Amount transported per unit	Storage Location
Nonel MS	1,800 kg	15 Mt per sea can	Emulsion plant
Ethylene Glycol	60,000L	10,000L per sea can	Inventory Lay down
Jet A Fuel	400,000L	11,000L Tanker	Meadowbank Tank, tarmac
Jet A Fuel	1,800,000L	NA	Baker Lake Tank Farm
Lead Acid Batteries	500L	500L per sea can	Warehouse
Magnafloc 10 (Flocculant)	300 Mt	15 Mt per sea can	Inventory Lay down
Metabisulfite	22,000,000kg	1,000kg/bag	Inventory Lay down
Nitric Acid	120,000L	8,000L per sea can	Inventory Lay down
Portland Cement	3,500 Mt	20 Mt per sea can	Dyke and Construction lay down
Sodium Cyanide	1,550,000kg Mt	19 Mt per sea can	Inventory Lay down and Process Plant lay down
Sodium Hydroxide	10 kg	10 kg in sea can	Warehouse
Sodium Nitrate	10.2 Mt	5.1 Mt per sea can	Inventory Lay down
Sulfur	4,600 Mt	20 Mt per sea can	Inventory Lay down Process Plant lay down
Quick Lime	600,000,000kg	1,700kg/bag	Inventory Lay down
Unleaded Gasoline	50,000L	40,000L tanker	Meadowbank and Baker Lake Tank
Varsol	4,000L	2,000 L per sea can	Inventory Lay down

7 POTENTIAL SPILL ANALYSIS

To prepare for emergency spill response, potential spill analyses were conducted using various worst case scenarios. These exercises serves to identify potential risk areas, as well as to determine the fate of spilled products and their environmental effects. One such potential scenario was identified for the Meadowbank Gold Project, this being a tanker truck spilling its contents into a waterbody somewhere between Baker Lake and Meadowbank alongside the AWAR. Such a scenario could also be applied to a tanker truck going off the Whale Tail haul road and spilling its contents.

Scenario #1: Road Accident Tanker Truck Spill on AWAR

Description of incident: Spill of the contents of a fuel tanker to the ground or water during transport from Baker Lake to the Meadowbank site.

Potential causes: Vehicle accident, human error, mechanical failure

Hazardous products spilled: Diesel fuel, aviation fuel

Maximum volume spilled: 40,000 litres

Immediate receiving medium: Stream, river or lake

Distance and direction to nearest receiving body of water: N/A

Resources to protect: Streams, rivers and lakes

Estimated emergency response time: Maximum time is 90 minutes depending on location of spill (assuming truck driver is injured and cannot commence spill response procedures). Minimum time to respond to a spill on the AWAR is 15 minutes.

Spill response procedures: Contain and recover oil slick downriver as described in Section 5.3, protect shorelines using sorbent booms. Collect free-product for temporary storage. Clean-up soiled shorelines. If the response crew arrives before the complete loss of fuel from the tanker truck seal the leak if feasible, contain and recover oil spill on ground using dykes, sumps or trenches as described in Section 5.2. Also, if the truck driver is not injured, he will act as a first responder and immediately initiate the spill contingency plan as defined in Section 5 using the spill kit kept in fuel trucks.

8 RESPONSE EQUIPMENT

8.1 GENERAL EQUIPMENT

This section addresses the emergency response machinery, equipment, tools and other resources that will be made available on-site for spill counter measures.

Mobile Equipment available to Agnico Eagle that will be used for spill contingency includes:

- Graders
- Cranes
- Snowmobiles
- Vacuum Truck
- Loaders
- Backhoe
- Bulldozer
- Forklift
- Water Trucks
- Excavators
- Winch Trucks
- Pickup Trucks
- Generator Sets
- Fire Truck
- Aluminum Boats
- Fuel Trucks
- Bobcat
- Haul Trucks
- Snow Cat

If required, additional equipment on site will be made available to assist with spill recovery. Temporary containment systems are also available on site and include:

- Booms
- Drums
- Tanks
- Tailings Pond
- Spill absorbent material packages/pads
- Silt fencing
- Maritime Barrier

Emergency transportations that will be used under an emergency situation are:

- Aircraft (fixed wing or helicopter)
- 4-wheel drive vehicles
- Snowmobiles
- Boats
- Tundra Buggy

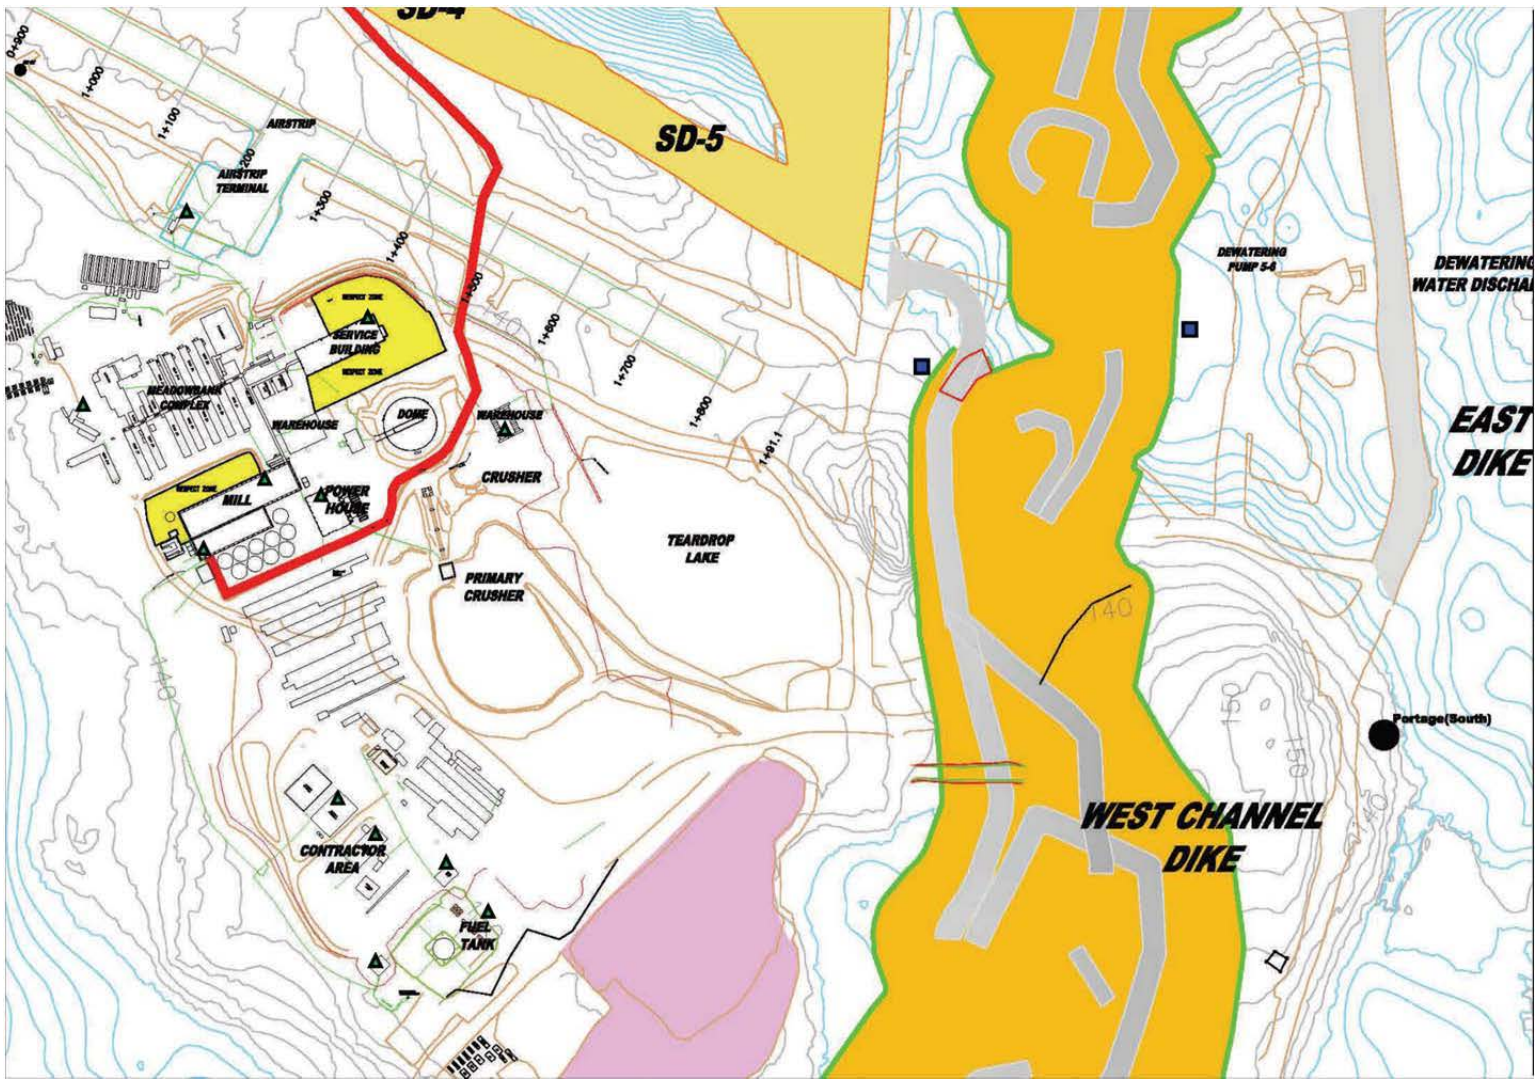
Communication equipment at Meadowbank and Whale Tail includes radios, telephones, faxes and other wireless communication systems that will be used in the event of an emergency situation.

Spill Response kits are strategically located where required around the Meadowbank (Figure 8) and Whale Tail (TBD) sites. Each department and work area is responsible for providing sufficient spill response kits in their respective work areas. The kits are kept in marked and accessible locations. The locations include all fuel storage areas, chemical storage areas and so on.

All of the mobile equipment on all sites (heavy equipment) contains an emergency spill kit.

An Environmental Emergency Trailer, which is easily accessible and mobile, is located on site at Meadowbank and contains the following items:

- Pump Elastec
- Pump accessories
- Vacuum ends
- 45 gallons top
- Tubing 2 inches diameter
- Tubing 3 or 4 inches diameter
- Diesel Fuel jerry can (place on a miniberm)
- Spill kit accessory (red box)
- Drums opener
- Wescot (to open empty drum screw)
- Empty drums
- 2 drums berm
- 4 drums berm 4x8
- Tarp 20x30
- Tarp 30x50
- Oil white spill pads
- Universal boom 5x10
- Universal boom 8x10
- ABS pipe: 10' (4")
- ABS pipe: 10' (6")
- Cell U-Sorb
- Sphagsorb
- 3 Size of Wedge wood
- Plug pattie
- Quattrex bags
- Hand shovel
- Ice braker chisel
- Sledge hammer
- Rod bar (4')



Along the AWAR there are 9 environmental emergency sea cans (Figure 9). Currently, there is two (2) environmental emergency sea cans installed along the Whale Tail Haul Road at Km 125.5 and Km 147, between Whale Tail Pit and Meadowbank. More environmental sea can are planned to be installed. Approximate location are detailed on Figure 10 below. These sea cans are, or will be placed, strategically placed along the roads at water crossings. Each environmental emergency sea can contains the following material:

- Empty drums (Sealed)
- Mini berm 36"x36" x4'
- 4 drum spill berm 4x8
- Tarp 20'x30'
- Tarp 30'x50'
- Oil white spill pads
- Universal boom 5"x10' (Chemical)
- Universal boom 8"x10' (Chemical)
- Oil only booms 5"x10' (Hydro-carbons)
- Maritime barrier (Baffle)
- ABS pipe: 10' (4")
- Cell U-Sorb
- Amerisorb peat moss
- Oil gator absorbent
- Plug pattie
- Quattrex bags

- Fork lift crate (pallets)
- Long handle round point shovel
- Chisel point crow bar 16 lbs 57"
- Ice braker chisel
- Sledge hammer 12 lbs 36"
- Rod bar (4')

If required, external resources are available in the Hamlet of Baker Lake and those contacts are found in Table 5.

9 TRAINING & EMERGENCY SPILL/EXERCISE

A designated Emergency Response Team (ERT) consisting of on-site personnel has been established at Meadowbank and another team will be established at Whale Tail. Agnico Eagle will ensure that the ERTs are trained and present for major spill response at all times. All members of the teams are trained and familiar with emergency and spill response resources, including their location and access, the SCP, and appropriate emergency spill response methodologies. The ERT has up to 40 members, each of whom train 8 hours per month.

The following training is included:

- A review of the spill response plan and responsibilities of the ERT members;
- The nature, status, and location of fuel and chemical storage facilities;
- The on-site and off-site spill response equipment and how to use it;
- Emergency contact lists;
- Desktop exercises of “worst case” scenarios;
- The likely causes and possible effects of spills; and
- On-site personnel.

Every employee at Agnico Eagle receives spill and waste management training during their initial site orientation so they are able to respond to small spills and raise the alarm if a larger response is required. ERT members receive more extensive HAZMAT training and learn how to respond while wearing personal protective equipment (PPE).

A training program is being developed to provide more complete training to all personnel (Agnico and contractors) that will cover safe spill response and intervention as well as awareness to different guidelines pertaining to spills. This training would be mandatory for all staff and renewable yearly.

The road crews between Baker Lake and Meadowbank, and Meadowbank and Whale Tail also received or will receive training regarding the actions that they have to carry out during an emergency or major spill on the road. You can find records of different trainings that Agnico Eagle personnel have attended in Appendix I. Agnico also performed each year a Mock Spill Scenario in Baker Lake. You can find the detailed of the 2018 Mock Spill in Appendix L. A Product Transfer Area Assessment for Baker Lake Oil handling Facility was also completed and can be found in Appendix M. The Environmental Department regularly attends tool-box sessions to provide information on spill response, spill prevention and spill reporting procedures.

Environmental Department weekly inspection template

Environmental Inspection report for MBK Refuelling Station, Jet-A tank and fueling area, Tank farm, and Camp Gensets

---

Date: _____ **Inspected By: _____**

Time: _____ **Weekly Inspection**

Compliance with	Subject	Conform	Non-conform	N/A	Comments
NIRB Condition 26	Ensure that spills, if any, are cleaned up immediately and that the site is kept clean of debris, including wind-blown debris.				
NIRB Condition 25	Management and control waste in a manner that reduces or eliminates the attraction to carnivores and/or raptors.				
NWB Part D Item 29 MBK - SCP	Spills on the ground				
NWB Part H Item 4 NIRB Condition 27	Secondary containment for fuel, Jet-A, and chemical storage in place				
NWB Part D Item 29	Refuelling procedures followed (secondary containment at every connection and 3 persons)				
MBK Bulk Fuel Storage Monitoring Plan Section 6.1	Precipitation or runoff accumulation in secondary containment				
MBK Bulk Fuel Storage Monitoring Plan Section 6.1	Any visible sheen on water.				

NWB Part F Item 23	Water in secondary containment of MBK Bulk Fuel Storage Facility and Jet-A storage being measured and recorded in m^3.				
NWB Part F Item 9 NIRB Condition 12	Discharge of water not causing erosion				
MBK Bulk Fuel Storage Monitoring Plan Section 6.1	Any visual structural issues with containment berms				
NWB Part F Item 8	10 days' notice given to inspector prior to discharge?				
NWB Part F Item 6	Water being discharged to land meets water quality limits				
MBK Bulk Fuel Storage Monitoring Plan Section 6.1	Any indicators that would suggest damage to liner for secondary containments				
NWB Part F Item 9	Discharge of water >30m from ordinary high water mark				
NWB Part F Item 5	Discharge from MBK Fuel Storage Facility being directed to Stormwater Management Pond				
NWB Part I Item 10(e)	Is the discharge volume being tracked?				
NWB Part F Item 9	Discharge of water not directly flowing to water body				
NWB Part H Item 3 NIRB Condition 27	Prevention in place to disallow chemicals, petroleum products and waste from entering Water				
NWB Part H Item 5	Date of last Env. visual inspection (weekly)				

MBK Bulk Fuel Storage Monitoring Plan Section 6.1	Weekly manual or electronic dip tests were conducted for inventory reconciliation. Date of last test				
CCME - Above Ground Storage Tank Guidelines	Non-smoking sign, Extinguisher, and tank identification present				
MBK - SCP	Spill Kits Present				
NWB Part D Item 22 NWB Part D Item 33	Erosion present / Erosion control in Place				
NWB Part D Item 36 NIRB Condition 27	All tanks and piping are not altered from approved construction.				
NWB Part I Item 9	Are signs identifying monitoring stations in place and posted in English, Inuktitut and French				
NWB Part I Item 12 (l)	Annual Geotechnical inspection completed				
MBK Wildlife Management Plan	Any nesting taking place on tanks or stairways of tank farm				
BMP	Are there any additional environmental hazards/potential impacts that require attention?				
MINE ACT	Are there any Health and Safety issues that should be addressed to prevent injury to workers?

General Response Procedures for Spilled Chemical Substances

Explosives

C.1 Ammonium Nitrate
C.2 Ammonium Nitrate Fuel Oil (ANFO)

C.1 Ammonium Nitrate

Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for use at the Meadowbank and Whale Tail sites.

The first step against prevention of potential spills and association hazards is the application of proper storage procedures for bulk Ammonium Nitrate, including the following:

- Good housekeeping of the storage facility will prevent spilling and or contamination of materials;
- Ammonium nitrate should be stored away from combustible materials and fuels, as well as other blasting accessories (i.e. boosters, delays, detonating cords and detonators);
- The storage facility should be well ventilated;
- Proper signage restricting the use/exposure of ammonium nitrate to ignition sources should be posted (e.g. no hot work, smoking or vehicle maintenance); and
- The storage facility should be locked at all times with only authorized personnel allowed access.

The following is a general spill response procedure for ammonium nitrate. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required. Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For an ammonium nitrate spill (solid):

1. Isolate and evacuate the spill area;
2. Contact your Supervisor who will then contact the On-Scene Coordinator and coordinate appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical-specific hazards and to identify any special precautions that must be taken;
3. Put on appropriate personal protective equipment. For an ammonium nitrate spill this includes:
    a) Gloves **as recommended by the MSDS or glove manufacturer**;
    b) Protective eyeglasses or chemical safety goggles or face shield **as recommended by the MSDS**;
    c) Lab coat, coveralls or TyvekTM coveralls **as recommended by the MSDS**; and
    d) Half mask air-purifying respirator with cartridges and/filters **as recommended by the MSDS or respirator manufacturer**;
4. Ventilate (open windows/doors to outdoors) closed spaces before entering;
5. Remove all sources of heat and ignition (no smoking, flares, sparks or flames in immediate area) and remove uncontaminated combustible materials and organic compounds (wood,

paper, oil, etc.,) from spill area;

6. For spills to land, protect the spill area from storm water runoff by constructing a ditch or dike using suitable absorbent materials, soil or other appropriate barrier;

7. Vacuum or sweep the spill residue using non-metal, non-sparking tools and place the residue in a labelled, plastic, container (plastic pail with lid or double heavy duty plastic bags) for re-use or off-site disposal at a licensed disposal facility;

   Note: Recovered solid, if generally free from impurities, may be suitable for its intended use. In this case, place solid in suitable container with lid, and ***clearly label the container per WHMIS Guidelines****.*

   Note: Minimize dust generation during the operation.

8. Remove and bag personal protective equipment for cleaning and disposal at a licensed facility. Thoroughly wash potential skin contact locations after handling.

C.2 Ammonium Nitrate Fuel Oil (ANFO)

Currently no ANFO is stored at the Meadowbank or Whale Tail sites. ANFO is fabricated on demand using ammonium nitrate and fuel oil. In the event that ANFO would be stored at the sites, Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for use at the Meadowbank Gold Project. Proper handling and disposal of ANFO is an important first step in mitigating against spills and associated hazards.

The proper storage procedures are as follows:

- ANFO should only be used under the supervision of authorized trained personnel;
- ANFO should be kept away from heat, sparks, and flames, as well as initiating explosives, oxidizing agents, combustibles, and other sources of heat;
- Containers should be protected from physical damage and in dry, well ventilated conditions;
- Transportation to the Mine site will be in accordance with Section 14 of the *Mines Act* and Regulations and the *Transportation of Dangerous Goods Act*. Transport vehicles will be in sound mechanical condition and equipped with proper safety equipment. Loaded vehicles will not be left unattended and only authorized personnel will be responsible for the security of the explosives under their control; and
- Explosives that have been identified as deteriorated or damaged will need to be disposed of or destroyed. The appropriate method of disposal or destruction and subsequent course of action will be determined by authorized personnel or the explosive supplier.

The following is a general spill response procedure for ammonium nitrate fuel oil – ANFO. The following procedure does not apply to emulsions or other explosives. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required. Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For an ANFO spill (solid):

1. Isolate and evacuate the spill area;
2. Immediately extinguish any open flames and remove ignition sources (no smoking, flares, sparks in immediate area) IF SAFE TO DO SO. **Fires involving large quantities of ANFO should not be fought;**
3. Contact the On-Scene Coordinator who will assemble ERT members and the appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical- specific hazards and to identify any special precautions that must be taken;
4. Put on appropriate personal protective equipment. For an ANFO spill this includes:
    a. Gloves **as recommended by the MSDS or glove manufacturer**;
    b) Protective eyeglasses or chemical safety goggles or face shield **as recommended by the MSDS**;
    c) Lab coat, coveralls or TyvekTM coveralls **as recommended by the MSDS**;
    d) Shoe covers or rubber boots;
    e) Half mask air-purifying respirator with cartridges and/filters **as recommended by**

the MSDS or respirator manufacturer;

5. If the spill has occurred outdoors, stay upwind and avoid low lying areas. Ventilate (open windows/doors to outdoors) closed spaces before entering. Ensure adequate explosion proof ventilation for clean-up;

6. Remove all sources of heat and ignition (no smoking, flares, sparks or flames in immediate area) and remove uncontaminated combustible materials and organic compounds (wood, paper, oil, etc.) from spill area;

7. Do not operate radio transmitters within 100 m of electric detonators;

8. For spill on land, protect the spill area from storm water runoff by constructing a ditch or dike using suitable absorbent materials, soil or other appropriate barrier. For spill to water, utilize damming, and/or water diversion to minimize the spread of contamination;

9. Collect, sweep or shovel spilled material and the other contaminated material/soil using non- metallic, spark- proof tools and place residue into a labelled, plastic, waste container (plastic pail with lid or double heavy duty plastic bags) for off-site disposal at a licensed disposal facility;

   Note: Recovered solid, if generally free from impurities, may be suitable for its intended use. In this case, place solid in suitable container with lid, and ***clearly label the container per WHMIS Guidelines.***

   Note: The drums/containers/residues are to be stored in ventilated areas away from incompatible materials for eventual off-site disposal at a licensed disposal facility.

10. Remove and bag personal protective equipment for cleaning or disposal at a licensed disposal facility. Thoroughly wash with soap potential skin contact locations after handling. Properly dispose of contaminated leather articles including shoes that cannot be decontaminated.

Appendix D

General Response Procedures for Spilled Chemical Substances

D.1 Compressed Gases

D.1 Compressed Gases

Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for Meadowbank Gold Project.

The following is a general spill response procedure for compressed gases. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required.

Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For a compressed (inert and flammable) gas leak:

1. IF SAFE TO DO SO and it will stop the gas leak, turn off cylinder valve;

2. If the leak cannot be stopped by closing the cylinder valve, and it is an inert atmospheric gas (e.g. nitrogen, carbon dioxide, etc.) isolate and evacuate the affected area. If the leak is a flammable gas and the leak is outside of a ventilated building enclosure that will contain the gas, immediately activate the fire alarm system and evacuate the area/building;

3. Contact the On-Scene Coordinator who will assemble spill response team members and the appropriate spill response materials outside the spill area. Obtain and read the MSDS for the substance to determine the chemical-specific hazards and to identify any special precautions that must be taken;

4. If possible and safety permits, adjust leaking cylinder so that gas escapes rather than liquid;

5. If possible and safety permits, eliminate all ignition sources (no smoking, flares, sparks or flames in immediate area) and turn off electrical equipment;

6. If the spilled has occurred outdoors, stay upwind and avoid low lying areas. If the spill has occurred inside a building, prevent spread of vapour throughout the building by closing doors to other rooms and hallways. If the room's air exchange system distributes air throughout the building, then it may also be necessary to have it shut-down. Allow vapours to ventilate outdoors by opening windows and doors to the exterior; and

7. Isolate area until gas has dispersed. On-Scene Coordinator to verify safe conditions.

Appendix E

General Response Procedures for Spilled Chemical Substances

E.1 Flammable and Combustible Liquids

E.1 Flammable and Combustible Liquids

Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for use at the Meadowbank Gold Project. The following is a general spill response procedure for flammable or combustible liquids, particularly petroleum hydrocarbon products. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required.

Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For a spill of flammable or combustible petroleum hydrocarbon product (liquid):

1. Isolate and evacuate the spill area;

2. Immediately extinguish any open flames and remove ignition sources (no smoking, flares, sparks in immediate area) IF SAFE TO DO SO;

3. Stop leak and contain spill (**see Step 9**) IF SAFE TO DO SO;

4. Contact the On-Scene Coordinator who will assemble ERT members if required and the appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical-specific hazards and to identify any special precautions that must be taken;

5. Put on appropriate personal protective equipment. Depending on the scale of the spill and properties of the spilled substance, this can include:

    a) Gloves **as recommended by the MSDS or glove manufacturer**;

    b) Splash goggles or face shield;

    c) Shoe covers or rubber boots;

    d) Lab coat or TyvekTM coveralls; and

    e) Half mask air-purifying respirator with **organic vapour or combination** cartridges, or **as otherwise recommended by the MSDS or respirator manufacturer**.

6. If the spilled has occurred outdoors, stay upwind and avoid low lying areas. If the spill has occurred inside a building, prevent spread of vapour throughout the building by closing doors to other rooms and hallways. If the room's air exchange system distributes air throughout the building, then it may also be necessary to have it shut-down;

7. Ventilate (open windows/doors to outdoors) closed spaces before entering. Ensure adequate explosion- proof ventilation for clean-up. A vapour suppressing foam or water spray may be used to reduce vapours;

8. Remove all sources of ignition (no smoking, flares, sparks or flames in immediate area) and combustible materials (wood, paper, oil, etc.) within the spilled area;

9. Contain spill by using spill absorbent, spill pads or pillows, soil or snow to construct a dike that limits flow and prevents entry to sewer, waterways or onto ice. For spills to land,

excavation of trenches/pits to capture spill flow may also be appropriate. If possible, compact soil or snow dikes, and place plastic tarps over the dike and at its foot to allow the product to pool on the plastic for easy recovery;

Note: Do not use paper towels to absorb spill as this increases the rate of evaporation and vapour concentration in the air.

Note: Do not flush with water into drainage areas or ditches as this will spread spill.

Note: Snow works well as a natural absorbent to collect and contain spilled petroleum hydrocarbons. However, its use in containing a spill will result in a water-contaminant mixture that may be more difficult to manage. It is important to scrape up the contaminated snow and ice as soon as possible.

10. Carefully cover the spill area with spill absorbent, spill pads, soil or snow, starting at the outside and working inward. Do not touch or walk through spilled material;

11. Sweep up or shovel the residue using non-metallic, spark-proof tools and place the residue into a labelled, plastic, waste container (plastic pail with lid or double heavy duty plastic bags). For larger spills to land, excavate impacted absorbent material and soil, place in lined and bermed temporary storage area or directly into sealed drums/containers;

    Note: The drums/containers/residues are to be stored in ventilated areas away from incompatible materials for eventual treatment at on-site landfarm or off-site disposal at a licensed disposal facility. Electrically ground all containers and transporting equipment.

    Note: Larger pools of product may be pumped into empty storage tanks or drums.

12. If spill is indoors, mop the affected area using detergent and water. Dispose of this water to drums for eventual off-site disposal at a licensed disposal facility. Spills to land may require further excavation or remediation of contaminated soil until acceptable soil quality is achieved. The On- Scene Coordinator and/or Environmental Superintendent will assess this requirement;

13. For spills to water, immediately limit the area of the spill on water using absorbent pads and booms and similar materials to capture small spills on water. Deploy and slowly draw in absorbent booms to encircle and absorb the spilled product. Recover larger spills on water with floating skimmers and pumps, as required, and discharge recovered product to drums or tanks;

    Note: Petroleum hydrocarbons are generally hydrophobic, and as such, do not readily dissolves in water. They typically tend to float on the water's surface. Absorbent booms are often relied on to recover hydrocarbons that escape land containment and enter water.

    Note: Antifreeze sinks and mixes with water. If released to water, attempt to isolate/confine the spill by damming or diverting the spill. Pump contaminated water to tanks or drums.

14. Remove and bag personal protective equipment for cleaning, informing laundry personnel of contaminant hazards, or disposal at a licensed disposal facility. Thoroughly wash with soap potential skin contact locations after handling. Properly dispose of contaminated leather articles, (including shoes) that cannot be decontaminated.

Appendix F

General Response Procedures for Spilled Chemical Substances

Oxidizing Substances

F.1 Liquids
F.2 Solids

F.1 Liquids

Agnico Eagle commits to review, modify and approve as required and to establish this procedure as appropriate for use at the Meadowbank Gold Project. The following is a general spill response procedure for liquid oxidizer compounds. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required.

Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For a liquid oxidizer spill:

1. Isolate and evacuate the spill area;

2. Stop leak and contain spill (**see Step 8**) IF SAFE TO DO SO;

3. Contact the On-Scene Coordinator who will assemble ERT members if required and the appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical-specific hazards and to identify any special precautions that must be taken;

4. Put on the appropriate personal protective equipment. Depending on the scale of the spill and properties of the spilled substance, this can include:

   a) Gloves **as recommended by the MSDS or glove manufacturer**;
   b) Splash goggles or face shield;
   c) Shoe covers or rubber boots;
   d) Lab coat, coveralls or TyvekTM coveralls **as recommended by the MSDS**; and
   e) Half mask air-purifying respirator with cartridges and/or filters **as recommended by the MSDS or respirator manufacturer**.

5. Ventilate closed spaces before entering. Ensure adequate explosion-proof ventilation for clean-up;

6. Remove and/or moisten with water any combustible material (wood, paper, oil, etc.) affected by the spill;

7. Use water spray to reduce vapours or divert vapour cloud drift, if required;

8. Contain spill by using non-combustible spill absorbent, soil or snow to construct a dike that limits flow and prevents entry to sewer, waterways or onto ice. For spills to land, excavation of trenches/pits to capture spill flow may also be appropriate;

   *Note: Flushing area with flooding quantities of water may also be appropriate assuming this does not make clean up and waste management more difficult– **refer to the MSDS**.*

9. Carefully cover the spill area with spill absorbent, soil or snow, starting at the outside and working inward. Use non-combustible absorbent. Do not touch or walk though spilled material.

10. Sweep up or shovel the spill residue using non-metal, non-sparking tools and place the residue into a labelled, plastic, waste container (plastic pail with lid or double heavy duty plastic bags) for off- site disposal at a licensed disposal facility;

11. For indoor spills, mop the affected area using detergent and water. Flushing area with

flooding quantities of water may also be appropriate – **refer to the MSDS**. Dispose of this water to the sanitary sewer, process stream or waste drums as appropriate. Spills to land may require further excavation or remediation of contaminated soil until acceptable soil quality is achieved. The On- Scene Coordinator and/or Environmental Superintendent will assess this requirement; and

12. Remove and bag personal protective equipment for cleaning, informing laundry personnel of contaminant hazards, or disposal at a licensed disposal facility. Thoroughly wash with soap potential skin contact locations after handling. Properly dispose of contaminated clothing that cannot be decontaminated.

F.2 Solids

Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for use at the Meadowbank Gold Project.

The following is a general spill response procedure for solid oxidizer compounds. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required.

Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For a solid oxidizer spill:

1. Isolate and evacuate the spill area;

2. Contact the On-Scene Coordinator who will assemble ERT members if required and the appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical-specific hazards and to identify any special precautions that must be taken;

3. Put on the appropriate personal protective equipment. Depending on the scale of the spill and properties of the spilled substance, this can include:

   a) Gloves **as recommended by the MSDS or glove manufacturer**;
   b) Safety glasses or goggles;
   c) Lab coat; and
   d) Half mask air-purifying respirator with **N95 or greater protection** particulate filter or **as recommended by the MSDS or respirator manufacturer**.

4. Remove all sources of heat and ignition (no smoking, flares, sparks or flames in immediate area) and remove uncontaminated combustible materials and organic compounds (wood, paper, oil, etc.,) from spill area;

5. For spills to land, protect the spill area from storm water runoff by constructing a ditch or dike using suitable non-combustible absorbent materials, soil or other appropriate barrier. For spill to water, utilize damming, and/or water diversion to minimize the spread of contamination;

6. Vacuum, sweep or shovel the spill residue using non-metal, non-sparking tools and place the residue into a labelled, plastic, container (plastic pail with lid or double heavy duty plastic bags) for re- use or off-site disposal at a licensed disposal facility;

   *Note: Recovered solid, if generally free from impurities, may be suitable for its intended use. In this case, place solid in suitable container with lid, and **clearly label the container per WHMIS Guidelines**.*

   Note: Minimize dust generation.

7. If there is still oxidizer residue left in the spill area, neutralize with appropriate agent **as recommended by the MSDS**, or for spills to land continue to excavate until no visible spilled solid remains. Use non- combustible spill absorbent or soil to absorb the neutralized residue. Place in suitable drums/containers for disposal to a licensed facility;

8. For indoor spills, mop the affected area using detergent and water. Dispose of this water to the sanitary sewer, process stream or waste drums as appropriate; and

9. Remove and bag personal protective equipment for cleaning, informing laundry personnel of contaminant hazards, or disposal at a licensed disposal facility. Thoroughly wash with soap potential skin contact locations after handling. Properly dispose of contaminated clothing that cannot be decontaminated.

Appendix G

General Response Procedures for Spilled Chemical Substances

Poisonous and Toxic Substances

G.1 Sodium Cyanide

G.1 Sodium Cyanide

Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for use at the Meadowbank Gold Project. The following is a general spill response procedure for solid Sodium Cyanide.

Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For a Sodium Cyanide (solid) spill:

1. Isolate and evacuate the spill area;

2. Contact the On-Scene Coordinator who will assemble ERT members and the appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical- specific hazards and to identify any special precautions that must be taken;

3. Put on the appropriate personal protective equipment. Depending on the scale of the spill and properties of the spilled substance, this can include:

   a) Impermeable Gloves **as recommended by the MSDS or glove manufacturer;**
   b) TyChem; and
   c) SCBA – Self Contained Breathing Apparatus
   d) Rubber Boots

   Note: For worker safety, maintain readily accessible supply of cyanide response kits on site.

4. Ventilate area of spill or leak;

5. Avoid exposure to acids, water or weak alkalis which can react to form toxic hydrogen cyanide (HCN) gas.

6. Contain spill to prevent release to sewer, waterway or onto ice. For spills to land, protect the spill area from storm water runoff by constructing a ditch or dike using absorbent materials, soil or other appropriate barrier. If raining, cover spill area with tarp or plastic to minimize contact with water and prevent subsequent runoff. For spill to water, utilize damming, and/or water diversion to minimize the spread of contamination;

7. Shovel the spilled material into labelled drums, containers or plastic bags for re-use or off-site disposal at a licensed disposal facility.

   *Note: Recovered solid, if generally free from impurities, may be suitable for its intended use. In this case, place solid in suitable container with lid, and **clearly label the container per WHMIS Guidelines**.*

   Note: Minimize dust generation.

8. If there is still spilled sodium cyanide residue left in the spill area, neutralize with appropriate agent **as recommended by the MSDS** (sodium or calcium hypochlorite solution), or for

spills to land continue to excavate until no visible spilled solid remains. Use suitable spill absorbent or soil to absorb the neutralized residue. Place in suitable drums/containers for disposal to a licensed facility. Collect material and place in a closed container for recovery or disposal.

IMPORTANT: ***It is strictly prohibited to add any chemicals or neutralizing solutions to a Sodium Cyanide Spill near a drainage system, or near or in a water body.***

9. For indoor spills, mop the affected area using detergent and water. Dispose of this water to waste drums/containers for disposal to a licensed facility; and

10. Remove and bag personal protective equipment for disposal at a licensed disposal facility. Thoroughly wash with soap potential skin contact locations after handling. Properly dispose of contaminated clothing that cannot be decontaminated.

Appendix H

General Response Procedures for Spilled Chemical Substances

Corrosive Substances

H.1 Acids, Liquids
H.2 Acids, Solids
H.3 Bases/Alkali, Liquids
H.4 Bases/Alkali, Solids

Response to Spilled Chemicals

IMPORTANT: ***It is strictly prohibited to add any chemicals or neutralizing solutions to a Spilled Chemicals near a drainage system, or near or in a water body.***

H.1 Acids, Liquids

Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for use at the Meadowbank Gold Project.

The following is a general spill response procedure for liquid acid compounds. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required.

Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For a liquid acid spill:

1. Isolate & evacuate the spill area;

2. Stop leak and contain spill (**see Step 8 below**) IF SAFE TO DO SO;

3. Contact the On-Scene Coordinator who will assemble ERT members if required and the appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical-specific hazards and to identify any special precautions that must be taken;

4. Put on appropriate personal protective equipment. Depending on the scale of the spill and properties of the spilled substance, this can include:

    a) Gloves **as recommended by the MSDS or glove manufacturer**;

    b) Splash goggles or face shield;

    c) Shoe covers or rubber boots;

    d) Lab coat or TyvekTM coveralls; and

    e) Half mask air-purifying respirator with **acid gas or combination** cartridges, or **as otherwise recommended by the MSDS or respirator manufacturer**.

5. If the spill has occurred outdoors, stay upwind and stay out of low areas. If the spill has occurred inside a building, prevent spread of vapour throughout the building by closing doors to other rooms and hallways. If the room's air exchange system distributes air throughout the building, then it may also be necessary to have it shut-down;

6. Ventilate (open windows/doors to outdoors) closed spaces before entering;

7. Remove all sources of ignition (no smoking, flares, sparks or flames in immediate area);

8. Contain spill by using spill absorbent, spill pads or pillows, or dry soil to construct a dike

that limits flow and prevents entry to sewer, waterways or onto ice. For spills to land, excavation of trenches/pits to capture spill flow may also be appropriate. Ideally, use spill absorbent that contains a mild neutralizing agent **as recommended by the MSDS;**

*Note: Many acids, particularly concentrated acids react violently in the presence of water. Do not flush spill area with water unless the **MSDS** indicates acceptable.*

Note: Nitric Acid reacts violently and explosively with organic chemicals and organic material such as wood, cotton and paper; therefore, do not use organic absorbent material on Nitric acid.

Note: Hydrofluoric acid will fume during neutralization. Provide adequate ventilation and approach from upwind. Neutralize carefully with sodium bicarbonate, soda ash or lime. Use water spray to disperse the gas/vapour if required. Remove all sources of ignition.

9. Carefully cover the spill area with spill absorbent, spill pads or dry soil, starting at the outside and working inward. If practical, neutralize spill using **MSDS-recommended** or commercially available neutralizers. Use pH indicator paper to determine if spill is neutralized (pH 7);

   Note: Use caution as neutralization reactions generate heat.

10. Sweep or shovel the neutralized spill residue using non-metal, non-sparking tools and place the residue into a labelled, plastic, waste container (plastic pail with lid or double heavy duty plastic bags) for off-site disposal at a licensed disposal facility;

11. Check the pH of the spill area. If it is less than pH 6, then further neutralize with a dilute solution of a suitable reagent **as identified on the MSDS** or for spill to land continue to excavate contaminated soil;

12. For indoor spills, mop the affected area using detergent and water. Dispose of this water to the sanitary sewer, process stream or waste drums as appropriate;

13. Remove and bag personal protective equipment for cleaning, informing laundry personnel of contaminant hazards, or disposal at a licensed disposal facility. Thoroughly wash with soap potential skin contact locations after handling. Properly dispose of contaminated clothing that cannot be decontaminated; and

14. After the spill has been cleaned up, the area should be free of vapours. However, if personnel note odours or irritation, isolate the spill area; re-clean the area as per **Steps 11 and 12** or wait at least **1 hour** before re-entering or until considered safe by the On-Scene Coordinator or Environmental Superintendent.

H.2 Acids, Solids

Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for use on the Meadowbank Gold Project.

The following is a general spill response procedure for solid acid compounds. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required.

Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For a solid acid spill;

1. Isolate and evacuate the spill area;

2. Contact the On-Scene Coordinator who will assemble ERT members if required and the appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical-specific hazards and to identify any special precautions that must be taken;

3. Put on the appropriate personal protective equipment. Depending on the scale of the spill and properties of the spilled substance, this can include:

   a) Gloves **as recommended by the MSDS or glove manufacturer**;

   b) Safety glasses or goggles;

   c) Lab coat; and

   d) Half mask air-purifying respirator with **N95 or greater protection** particulate filter, or **as otherwise recommended by the MSDS or respirator manufacturer**.

4. Contain spill to prevent release to sewer, waterway or onto ice. For spills to land, protect the spill area from storm water runoff by constructing a ditch or dike using absorbent materials, dry soil or other appropriate barrier. If raining, cover spill area with tarp or plastic to minimize contact with water and prevent reaction and/or subsequent runoff. For spill to water, utilize damming, and/or water diversion to minimize the spread of contamination;

5. If necessary to minimize dust production, slightly moisten the solid. Use water, or if the material is water reactive, another inert liquid **as recommended by the MSDS;**

6. Sweep up or shovel the residue using non-metallic, spark-proof tools and place the residue into a labelled, plastic, waste container (plastic pail with lid or double heavy duty plastic bags) for reuse or off-site disposal at a licensed disposal facility;

   *Note: Recovered solid, if generally free from impurities, may be suitable for its intended use. In this case, place solid in suitable container with lid, and **clearly label the container per WHMIS Guidelines**.*

7. Remaining solid acid residue may be neutralized using a dilute solution of appropriate agent **as recommended by the MSDS** (e.g. sodium bicarbonate - baking soda), or for spills to land continue to excavate until no visible spilled solid remains. Check the pH of the spill area; the final pH should be between pH 6 and 10. Use spill absorbent, spill pads or

dry soil to absorb the neutralized residue;

Note: Use caution as neutralization reactions generate heat.

8. For indoor spills, mop the affected area using detergent and water. Dispose of this water to the sanitary sewer, process stream or waste drums as appropriate; and

9. Remove and bag personal protective equipment for cleaning, informing laundry personnel of contaminant hazards, or disposal at a licensed disposal facility. Thoroughly wash with soap potential skin contact locations after handling. Properly dispose of contaminated clothing that cannot be decontaminated.

H.3 Bases/Alkali, Liquids

Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for use at the Meadowbank exploration camp.

The following is a general spill response procedure for liquid alkali or base compounds. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required.

Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For a liquid alkali or base spill:

1. Isolate & evacuate the spill area;

2. Stop leak and contain spill (**see Step 8**) IF SAFE TO DO SO;

3. Contact the On-Scene Coordinator who will assemble ERT members and the appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical- specific hazards and to identify any special precautions that must be taken;

4. Put on the appropriate personal protective equipment. Depending on the scale of the spill and properties of the spilled substance, this can include:

   a) Gloves **as recommended by the MSDS or glove manufacturer**;

   b) Splash goggles or face shield;

   c) Shoe covers or rubber boots;

   d) Lab coat or TyvekTM coveralls; and

   e) Half mask air-purifying respirator with cartridges/filters **as recommended by the MSDS or respirator manufacturer**.

5. If the spill has occurred outdoors, stay upwind and stay out of low areas. If the spill has occurred inside a building, prevent spread of vapour throughout the building by closing doors to other rooms and hallways. If the room's air exchange system distributes air throughout the building, then it may also be necessary to have it shut-down;

6. Ventilate (open/windows to outdoors) closed spaces before entering;

7. Remove all sources of ignition (no smoking, flares, sparks or flames in immediate area) and combustible materials (wood, paper, oil, etc.);

8. Contain spill by using spill absorbent, spill pads or pillows, or dry soil to construct a dike that limits flow and prevents entry to sewer, waterways or onto ice. For spills to land, excavation of trenches/pits to capture spill flow may also be appropriate. Ideally, use spill absorbent that contains a mild neutralizing agent **as recommended by MSDS;**

   Note: Use caution as neutralization reactions generate heat.

9. Carefully cover the spill area with spill absorbent, spill pads or dry soil, starting at the outside and working inward. If practical, neutralize spill using MSDS-recommended or commercially available neutralizers. Use pH indicator paper to determine if spill is neutralized (pH 7);

   Note: Use caution as neutralization reactions generate heat.

10. Sweep or shovel the neutralized spill residue using non-metal, non-sparking tools and place the residue into a labelled, plastic, waste container (plastic pail with lid or double heavy duty plastic bags) for off-site disposal at a licensed disposal facility;

11. Check the pH of the spill area. If it is greater than pH 10, then further neutralize with a dilute solution of a suitable reagent **as identified on the MSDS**, or for spill to land continue to excavate contaminated soil;

12. For indoor spills, mop the affected area using detergent and water. Dispose of this water to the sanitary sewer, process stream or waste drums as appropriate;

13. Remove and bag personal protective equipment for cleaning, informing laundry personnel of contaminant hazards, or disposal at a licensed disposal facility. Thoroughly wash with soap potential skin contact locations after handling. Properly dispose of contaminated clothing that cannot be decontaminated; and

14. After the spill has been cleaned up, the area should be free of vapours. However, if personnel note odours or irritation, isolate the spill area; re-clean as per **Steps 11 and 12** or wait at least **1 hour** before re- entering or until it is considered to be safe by the On-Scene Coordinator or Environmental Superintendent.

H.4 Bases/Alkali, Solids

Agnico Eagle commits to review, modify and approve as required to establish this procedure as appropriate for use at the Meadowbank Gold Project.

The following is a general spill response procedure for solid alkali or base compounds. Consult the MSDS for the specific spilled compound to determine whether deviations from the general guidance are required.

Agnico Eagle commits to review and test, and if necessary, modify and update this spill response procedure on an annual basis.

For a solid alkali or base spill;

1. Isolate and evacuate the spill area;

2. Contact the On-Scene Coordinator who will assemble ERT members if required and the appropriate spill response materials outside the spill area. **Obtain and read the MSDS** for the substance to determine the chemical-specific hazards and to identify any special precautions that must be taken;

3. Put on the appropriate personal protective equipment. Depending on the scale of the spill and properties of the spilled substance, this can include:

    a) Gloves **as recommended by the MSDS or glove manufacturer**;

    b) Safety glasses or goggles;

    c) Lab coat; and

    d) Half mask air-purifying respirator with **N95 or greater protection** particulate filter or **as recommended by the MSDS or respirator manufacturer**.

4. Contain spill to prevent release to sewer, waterway or onto ice. For spills to land, protect the spill area from storm water runoff by constructing a ditch or dike using absorbent materials, dry soil or other appropriate barrier. If raining, cover spill area with tarp or plastic to minimize contact with water and prevent reaction and/or subsequent runoff. For spill to water, utilize damming, and/or water diversion to minimize the spread of contamination;

5. If necessary to minimize dust production, slightly moisten the solid. Use water, or if the material is water reactive, another inert liquid **as recommended by the MSDS**;

    Note: Do not use water to flush bases in powdered form, such as calcium oxide (lime), as this material is not very soluble.

6. Sweep or shovel the residue using non-metallic, spark-proof tools and place the residue into a labelled, plastic, waste container (plastic pail with lid or double heavy duty plastic bags) for offsite disposal at a licensed disposal facility;

    *Note: Recovered solid, if generally free from impurities, may be suitable for its intended use. In this case, place solid in suitable container with lid, and **clearly label the container per WHMIS Guidelines**.*

7. Remaining solid alkali or base residue may be neutralized using a dilute solution of

appropriate acid. Check the pH of the spill area; the final pH should be between pH 6 and 10. Use spill absorbent, spill pads or dry soil to absorb the neutralized residue;

8. For indoor spills, mop the affected area using detergent and water. Dispose of this water to the sanitary sewer, process stream or waste drums as appropriate; and

9. Remove and bag personal protective equipment for cleaning, informing laundry personnel of contaminant hazards, or disposal at a licensed disposal facility. Thoroughly wash with soap potential skin contact locations after handling. Properly dispose of contaminated clothing that cannot be decontaminated.

Appendix I

Agnico Eagle Spill Response Training Records

Group Training Report

Course Name: Emergency Planning and Spill Response Awareness

Trainer's Name: Trever Miller

Date: Jan. 15/2013

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident** - 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on March 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

Km 23 - Bridge 3

1. List the **issues** linked to this scenario:

Response Time + Moving Equipment / Resources to the Area
Light + Temperature
Fish Bearing Stream
Speed of Containment / Cut off Point
Vast Contaminated area - Type of Contaminate

* Safety of Personel, Communications, Environment, Equipment

2. What **resources** are required?

Baker Lake Contractor / Peters Exp.
Baker Lake Command Center, Camp, at Spill Location
Ert Personal + Relieve
Emergency Trailer - Environmental
Emergency C-Cans / Roll offs
Lighting / Generators
Transportation
Safety officer(s)
AEM Personal from Baker Lake
Mapping of Area

3. What are the **initial spill response steps and what does your ICS look like**?

3rd Control / Crisis Centre
On Site Commander
Baker Lake
Logistic, Planning, Finance

1) Review ERP + Spill Contingency Plan
Prepare J.H.A on Spill

Establish Safety Zones - Hot, Warm, Cold

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

Shut off/Stop Spill - Identify Source
Contain Spill - Trench - Bell or (POE)
Maritime Booms & Absorbants
Estimate Direction of spill & find a cut off points
By Using 10-30-4 - Protect Shoreline and diverting flow

* Pre plan - Plan it now

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

Vacuum Pump, Absorbants, Oil/water Separater
- Excavate cont Soil
- Vegatated/Rocky Shorelines
-
- Sample & Monitored until we have clearances from DFO, ENV Canada

- Do a quick wash & leave it for Bio remediation

SWAT Consulting Inc.

6. What are some **safety** issues?

[redacted], Drinking Water - Baker Lake

Temperature + H2S of Response Team
LEL's
water + ice

7. How do you manage your **waste**?

Quatrex, 45 Gallons, oil/water separator

Contaminated Soil pad

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

Same as #3 - Notify Proper Personal / Authorities Additional
DFO, EC, Baker Lake Res.

SWAT Consulting Inc.

Fanny Laporde.

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

45 000 Litres KM 23

- **Incident -** 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on March 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

KM 23.

1. List the **issues** linked to this scenario:

Communication issu

- Contamination Back to land / Water contamination / Wildlife. To White ~~Hills~~ lake. (Fishing major site for invit)
- Time of day and distance from Camp.
- March → Still snow – could be cold
- Accident → Health & Safety (Driver) and the Responder
- Acid → add another safety issue ↓ less.
- Baker Lake water intake
- Public relation case / inform the Lobby appropriate person Community

SWAT Consulting Inc.

2. What **resources** are required? * 60 people ✓

- Labour → with incident Command Plan / everybody has a task in the organization / ERT Team.
- Commandement Trailer & facilities close to site ✓
  ↳ could be a container, heated
- decontamination area.
- Machinery → loader → TRUCK → ~~shovel~~ shovel. ✓
- Disposal and containing material DRUMS/45gall (berm - secondary material) Vacum - emergency trailer with supply.
- Towerlight → because it is night ✓ zodiak empty tanker.
  helicopter for next morning.

3. What are the **initial spill response steps and what does your ICS look like**?

Command ICS:

INFO. ①
- MSDS Sheets - Planning - Logistic
- JHA
- S.R.P spill response plan. / ERP. / SRP /

② Find ressources / General Briefing.

③ Logistic and reassess at all change (F.L.R.A)
  ↳ operations.
  - Isolation
  - Contain
  - Recovery - Remediate
  - wild life
  - Waste management
  - Sampling.

Level 3 ~~SPILL~~ emergency

Because it is night and impact can be desastrous

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

0A → Make the environment safe for me and my team - Gaz det for - PPE
1 Stop the leak
2 dig a ~~ditch~~ trench to protect the water (shore)
3 evalwate where the contaminent are → wind → slope → current.
4 Instal maritime bariere to contain (or) the biggest part of the oil.
5 Snow barrier if needed.
6 cut all entries to other ponds and rivers
7 Vaccum the containment and dispose the waste adequatly.
8 transpos what is still in the taken to another contaiter

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

Tundra / Rock
→ Inspect the shore / contain with ~~snow~~ maritime barrier. trenches / hell hole.
→ Monitoring often and sample
→ When melting / sample and Vaccum if needed Quick wash.
→ let nature take over.
→ if too much → excavate the shore and remove contaminent. and dispose

SWAT Consulting Inc.

6. What are some **safety** issues? Under the ice. → leave it.

→ LEL / Fire / toxic Gazes.

→ Water / ice / cold for response team and equipment.

→ darkness → uneven Ground / strain ankle

7. How do you manage your **waste**? 45 Gall.

Used Fuel → sent back south to appropriate place

used absorbant supply → ship down south in Quadrex

material → Land farm brought to

Clean and rinse - PPE

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

see # 4 ~~Exercise~~ answer. ✓

→ cut the Hamlet Water intake. ✓

inform additional Authorities.

Skimmers Vessels

Boats. V V J

Jeff Pratt

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident** - 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on March 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:

- 90km From mine
- Dark out
- Very Cold
- Vacinity to lake
- low tide will suck out

2. What **resources** are required?

- Personnel
- Command center both on site & Baker Lake
- Lightening
- Amenities for personnel
- Spill Response Equipment
- Transportation

3. What are the **initial spill response steps and what does your ICS look like**?

- Alert ERT and immobilize
- Alert ICS

ICS - Review of Spill Contingency - Planning for mobilization

- ERT Captain would assess situation and report incident command

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

~~Goal~~

- Stop the release - Plug hole or build berm.
- Contain release - Do Not Let Enter Lake
  - Place boom along ~~mouth~~ deltas From the tributaries.
  - Have to create ice road to down stream collection point.
  - ~~Use~~ Extract contaminent from down stream boom point*

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

- Create Hot, Warm, Cold Zones
- Rocky Sandy Substate
- Leave to summer Valatilize

6. What are some **safety** issues?

- No light
- Cold Weather
- PPE for Chemicals

7. How do you manage your **waste**?

- Quatrex bags
- Totes for liquid Contaminants

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

SWAT Consulting Inc.

M. Theriault

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident -** 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on March 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:

- BL water intake
- impact to the land / to the water
- Going towards white hills lake (fishing lake)
- Distance from camp / time of event / Weather
- H/S for the driver and responder + possible acid reaction
- Spalding of cont.
- Wildlife (fish)
- Public relationship (Must have the appropriate person)
- Dispersion
- Communication, Road Access

2. What **resources** are required?

- Equipment : Boat, Maritime Barrier, Shovel, truck, Quadrex waste disposal, secondary containment, Spot (toward light) Vaccum (Emergency trailer)

Decontamination unit, Commandement unit

- Personnal : Labour, ERT, IC, public relationship

Helicopter

3. What are the **initial spill response steps and what does your ICS look like**?

Planning { MSDS sheet, JHA, ERP, SRP,

Logist. { General Briefing
Find ressource and equipment and make them available

Operation → Field Level Risk Assessment
↳ Isolation - contain - Recovery ~~ect~~. Wildlife - Waste Management
Sampling

Reassess between field and Management by IC.

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

Make sure everything is safe, gaz detector, PPE ect.

Plug the hole / Stop the leak

Dig a ditch (trench) close to the shore

Evaluate the location of the contaminate in the watere

Install maritime barrier to enclose (isolate) the leaking shore

Cut all entries to other channels

Vaccum the accumulate diesel / transfert the diesel left in the tanker

Adequately dispose the waste

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

inspect the shore, keep the maritime barrier containing the fuel close to shore, monitore and sample if needed, vaccuum, let nature take over

WASH IT

If too much contaminant keep coming from the underground, dig everything

SWAT Consulting Inc.

6. What are some **safety** issues?

- LEL / fire / toxic gasses
- WATER / ICE
- cold weather
- Heavy equipment
- Uneven soil, darkness (strain ankle)

7. How do you manage your **waste**?

- used fuel send back south to appropriate location
- Absorbant stuff used (quadrex) burned or ship down south
- Contaminated soil send to landfarm
- Rinse all the PPE

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

See question #4

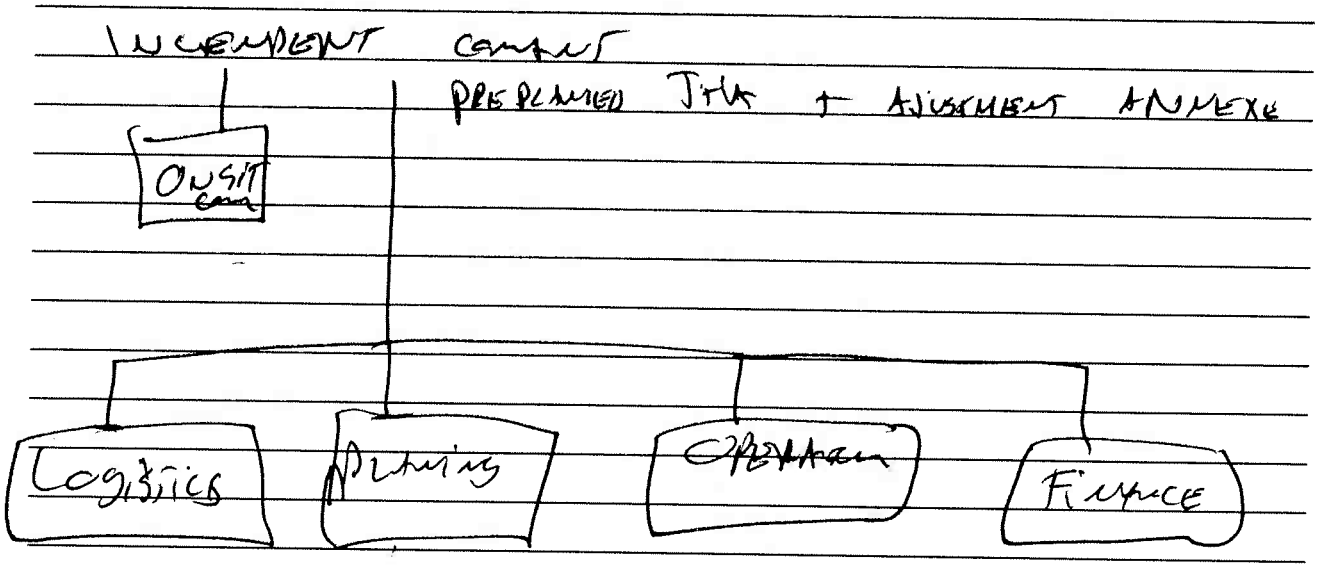
R-Jackson

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

23 24

- **Incident** - 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on March 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.



1. List the **issues** linked to this scenario:

- RESPONSE TIMES
- MOVING RESOURCES + EQUIP
- LIGHT FACTOR
- FISH BEARING
- SPEED OF CONTAINMENT
- VAST CONTAMINATED AREA
-

2. What **resources** are required?

- BLCS + PETER EXPEDITING HEAVY EQUIPMENT
- ERT PERSONEL + RELIEF PERSONEL
- COMMAND CENTER ON SITE + AT CAMP
- EMERGENCY SEAT CANS ROLLOFF BIN
- LIGHTING + GENERATORS
- INFORMATION + SAFETY OFFICER
- MAPPING OF THE AREA
-

3. What are the **initial spill response steps and what does your ICS look like**?

RL

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

CONTAIN SPILL (STOP SPILL AT THE SOURCE
PREVENT FURTHER ENTRY/ TRENCH BELL HOLE
ESTIMATE DIRECTION OF SPILL MARITIME BOOMING
FIND CUT OFF POINTS
BY USING 10/30 @ 4 KNOTS DIRECT FLOW TO AND
PROTECT SHORE LINE

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

- VACU PUMP
- PADS
- SORBANTS
-

6. What are some **safety** issues?

LEL
COLD T°
~~SOUR~~ INHALATION
CONTAMINATION
FIRE
WATER OVER RUN

7. How do you manage your **waste**?

QUANTUM TANKS
45 Gal DRUMS
OIL WAT SEPERATOR
CAN TRANSFER SAIC PUMP

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

SWAT Consulting Inc.

D. ALEXANDER

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident -** 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on March 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:

WATER INFILTRATION 90KM away
Sound alarm Pitch DARK
Extreme cold
Set-up block before RIVER ~~EMPTIES~~ EMPTIES INTO BAKER LAKE
Low tide when it comes will make it worse

2. What **resources** are required?

~~ERT RESPONSE~~ - ~~ALERT~~ BAKER LAKE FIRE DEPT.
COMMAND CENTRE AT MEADOW + BAKER
LIGHTING
WARM-UP ~~FOR~~ STAFF
SPILL RESPONSE EQUIP.
TRANSPORT FROM MINE
50-60 people fly/bus off at MB

3. What are the **initial spill response steps and what does your ICS look like**?

~~ALERT ERT~~ ALERT ERT, INCL. ENVIRO, MINE SUPER, ~~H+S~~ SUPER, SITE SERVICES HR
REVIEW CONTINGENCY PLAN, PLANNING FOR MOBILIZATION
ERT CAPTAIN - WITH ENVIRO, WOULD ASSES REPORT BACK TO the ICS

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

STOP ~~CONTAIN~~ SPILL CONTAIN FROM entry into LAKE.
PLUG THE HOLE IN TRUCK OR BUILD BERM
↳ CREW ASSIGNED.
- INSTALL BOOM ALONG THE DELTA MOUTH OF THE RIVER JUST BEFORE IN ENTERS THE LAKE
- MAKE ICE ROAD TO DOWNSTREAM COLLECTION POINT
= WITH VACUUM TRUCK
-ESTABLISH ZONES

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

ROCKY, SANDY SUBSTRATE. WAIT TIL SUMMER
VALITISE.
ZONE OFF.

6. What are some **safety** issues?

PITCH DARK - NEED
Cold Weather
PROPER PPE

7. How do you manage your **waste**?

VACUUM TRUCK

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

CELLULOSE BOOMS

SWAT Consulting Inc.

M. BARIBEAU

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident -** 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on March 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:

- 90 kms From Site
- Patch dark, Very cold.
- Safety to Lake.
=> Set up on site operational Post.
=> Low tide will clean water away.
=>

SWAT Consulting Inc.

2. What **resources** are required?

=> Manpower - 6 ppl
=> Boat, Light Tower, ammunity.
=> Bobcat, Lake Fire flight.
=> Personnel transportation.
=> Mean of communication.
=> Small Loader, Vacuum Truck. -

3. What are the **initial spill response steps and what does your ICS look like**?

- Set up ICS
- H&S, Env/Regulat, HR, Site Service, General Service. spill.
- Review Emergency contingency Plan.
- Plan mobilization. => ERT Captain. assess situation and Report, =>

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

Stop the Release, prevent further entry
- shut off flows, Build Berms,
→ Block off.

Make use Boat to collection Pond,

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

Rocky Sand wants clean till Summer.

SWAT Consulting Inc.

6. What are some **safety** issues?

- Measuring ice thickness
- Wear Proper PPE, ++
- Lighting
- cold weather
- acid
- 2 ashers Zones

7. How do you manage your **waste**?

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

STÉPHANE LACOSE

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident** - 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on ~~March~~ June 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:

→ 45 m^3 diesel / oil / acid flowing to the river heading to Baker lake. (15 km away)
→ Give less than 3 hours to react.
→ Contain the spill before the lake (Before to 2 rivers)
→ Secure and take care of the driver.

2. What **resources** are required?

- Helicopter to have look on the scene (Speed of the spill)
- 1 team at the scene (accident) to contained the spill at the source
- 1 team further down to stop the flow before the lake.
- Boats / maritime barrier / boom, etc... light plan
- ERT TEAM in case of fire.
- empty tanker to pump in.
- Good communication
- MSDS → Proper PPE

3. What are the **initial spill response steps and what does your ICS look like**?

- Scene survey (analyse) (inspection)
- Make the plan (planning)
- Decision (delegatee people)
- Execution
- Call proper authority

command

PLANNING OPERATION logistique cost

Safety first!!!

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

→ Install barrier before the rivers (less contamination)
→ Recover the fuel/oil (Skimmer)

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

→ Assess the shoreline situation and ask trained people to evaluate if we need to clean and what we have to do.
→ Flush
→ Is it transferable?

SWAT Consulting Inc.

6. What are some **safety** issues?

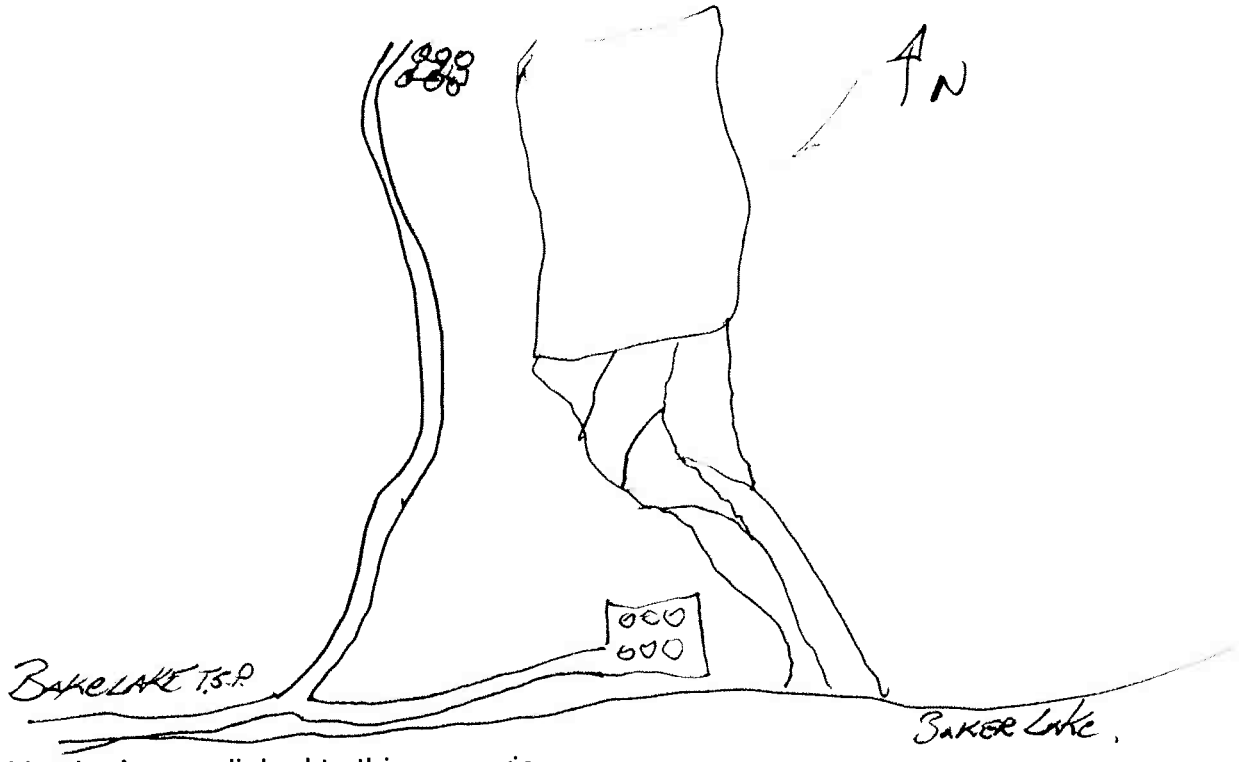
- Risk of fire
- Falling into water / ice
- Poor visibility at night.
- Hypothermia
- Cold water.
- PPE (:

7. How do you manage your **waste**?

- Bring to the proper facility disposal (ENV. DEPT.) (QUATREX BAG)

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

- Protect the water intake of the town.
- Do whatever it takes at all cost.
- Inform community



SWAT Consulting Inc.

Dave Holmstrom.

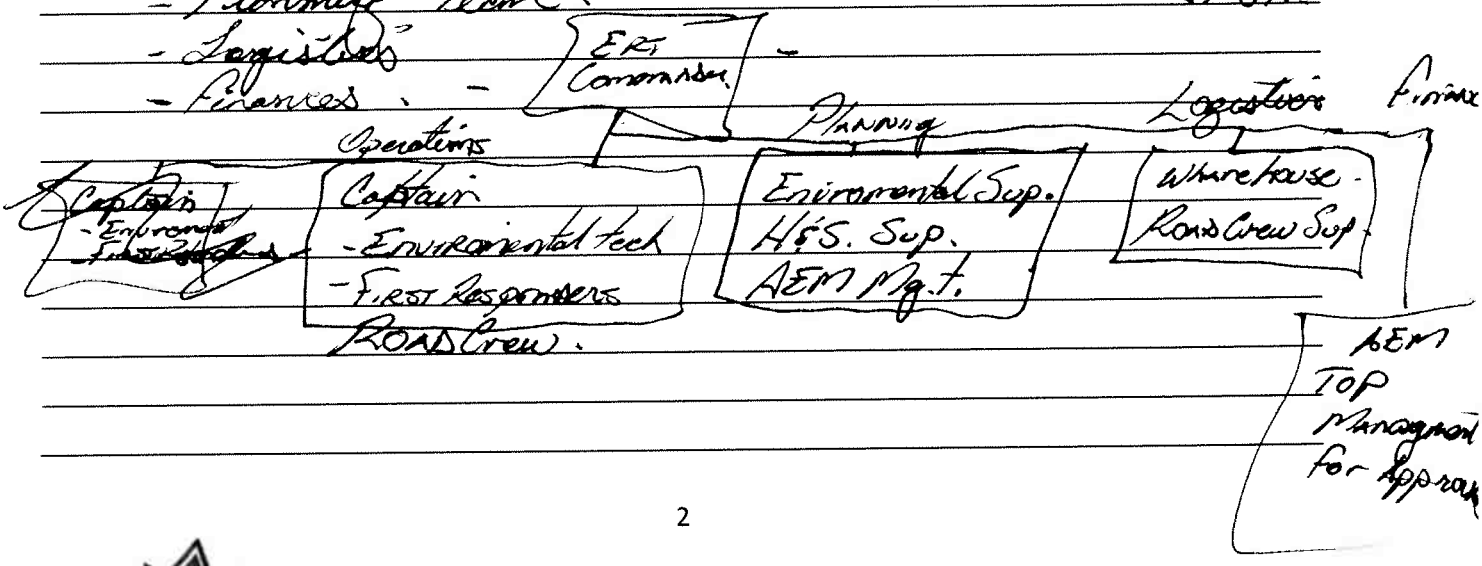
SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident -** 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on ~~March~~ June 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:

- POTENTIAL RISK TO Baker Lake portable drinking water.
- FAST moving water (FRESHET). High travel rate / ICE,
- POTENTIAL Impact to spawning grounds.
- IS IT STOPPED? - Truck Rollover ??? Contained
- what are the sensitive areas.
- Time Frame / Braided channel extended shoreline
- LEL.
- Road traffic / Security



2. What **resources** are required?

- pump trucks - helicopter, - boat
- personal facilities - food, PPE, Bathroom - ~~B~~
- personal - clean up, communication, H&S, Environmental.
- ~~D~~ stop & containment resources - booms, pumps, coil
- ~~stop~~ - ~~stop pockets~~, C-Cuts for ~~Ditch~~, earth movers, storage -
- ERP, ~~Ed~~ Spill contingency Plan, OPEP, JHA.
- WHMIS,
- Level C, for first 6 hours. Level D After.
- TIER 3 response. initially

3. What are the **initial spill response steps and what does your ICS look like**?

- Call appropriate personal.
- Evaluate Spill - Immediate danger threat level.
- ~~Check~~ Identify Incident Command, team - with ERP
  - Operations personal.
  - Planning Team.
  - Logistics
  - Finances.

- Spill response plan
- JHSA

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

- STOP Source.
- Based on Evaluation = ~~contain~~ Establish Booms for River Containment
  - Recover land based spills using
  - haul truck, Hoe, Loader. ~~Front~~
  - create ditch pump oil - from there.
  - Water containment - skimmer cleanup.
  - pump from bottom of V, U, J Boom.
  - Install booms at 30° of J.
  - Install ~~pumps~~ bell hole. pump from there.

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

~~Shoreline~~ Shoreline types.
- Rock
- Konsrd Organics.

Using SCAT.
Identified shoreline types - rock - nothing
- Tundra - Absorbants
+ and natural recovery.
- is it transferable.

SWAT Consulting Inc.

6. What are some **safety** issues?

- LEL, Benzine,
- Tired personel.
- recovery of truck
- water / ice operation - PPE's / Assesment.
- other road traffic.
- Possibility of Community water supplys
- Wild Animals.

7. How do you manage your **waste**?

Hazmat / Quadrex / Totes / Drums / Soil Pads.
Soil farms, Incinerate

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

- U-Boom
- V-Boom.
- 5-Boom.
- Corral it.
- Tostall Booms @ POE.

Robin Allard

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident** - 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on ~~March~~ June 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:

Flow in River
→ close Baker Lake - Potential
→ Ice → Flow Forecast
→ Potential Impact to wildlife
Stop possible a spot
Sensitive area
TIME FRAME
+ Surface for Braided.
Road usus.

Safety Driver
LOL ISSUE.

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident -** 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on ~~March~~ June 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:

- POSSIBLE CONTAMINATION OF COMMUNITIES WATER SUPPLY
- FRESHET WILL MAKE IT HARDER TO COLLECT CONTAMINANTS.
- BRAIDED CHANNELS INCREASE THE CHANCES OF MORE CONTAMINATED AREA
- MAY DISTURB SPAWNING AREAS → FISH
- TIDES WILL INCREASE THE CONTAMINATION OF SOIL.
- SHORT TIME FRAME
- SAFETY OF THE DRIVER
- LEL'S
- OTHER ROAD USERS.

SWAT Consulting Inc.

2. What **resources** are required?

- HEAVY EQUIPMENTS TO BUILD TRENCHES
- ENOUGH MATERIAL TO DO ENTIRE CLEANUP. (LAND & RIVER)
- PROPER PPE TO PROVIDE TO ALL PERSONEL
- ENOUGH MATERIAL TO DISPOSE CONTAMINATED MATERIAL (TOTES, SEALED DRUMS
- ADEQUATE MATERIAL TO BRING CONTAMINATED MATERIAL TO MINE SITE.
- SAFETY MONITORING DEVICE BEFORE STARTING ANY CLEANUP.
- PROPER COMMUNICATION.
- MSDS.
- MATERIAL TO MOVE THE TRUCK.
- H&S AND ENVIRONNEMENT PERSONNEL.
-

3. What are the **initial spill response steps and what does your ICS look like**?

- CODE 1 RADIO CALLED
- IC INFORMS TEAM OF SITUATION AND DOES HEADCOUNT BEFORE DEPLOYING TEAM
- COMMAND CENTRE SET UP - INCLUDE MANAGEMENT TO ASSISTS IN DECISION
- MONITOR AND DEVELOPPE A SAFETY ZONE IN THE SPILL AREA.
- IDENTIFY HAZARDS.
-

COMMAND

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

- PREVENT FURTHER ENTRY.
- BUILD TRENCHES OF BARRIERS TO AVOID THE SPREADING OF THE SPILL.
- PLACE BOOMS INSIDE BARRIERS TO PICK UP CONTAMINANTS
- ONCE BOOMS ARE FULL - REPLACE WITH NEW ONES. PLACE CONTAMINATED BOOMS IN PROPER CONTAINERS.
- SEND QUADREX BAGS TO MINE SITE AND PLACED INSIDE SEACANS, PROPERLY LABELLED
- WATER → PLACE MARITIME BARRIER INSIDE LAKE. PLACE BOOMS OR ABSORBS ON SHORE TO PROTECT SOIL ALSO ALONG MARITIME BARRIERS.

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

- ASSES THE SHORELINE.
- FLUSH THE SHORELINE
- STOP THE CLEANING WHEN CONTAMINANTS IS NOT TRANSFERABLE.

6. What are some **safety** issues?

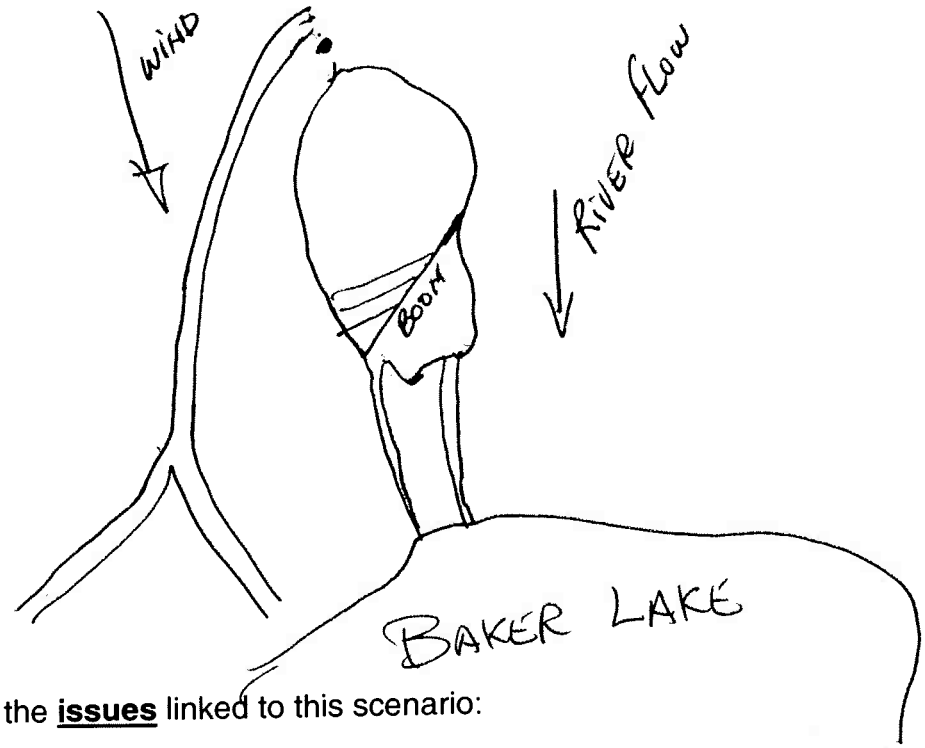
- TIRENESS OF THE CREW
- LELS
- REMOVAL OF THE TRUCK
- WORK ON ICE AND NEAR EAST WATER.
- WILDLIFE

7. How do you manage your **waste**?

- PUT IT INTO DRUMS OR TOTES TO BURN IT OR STORE IT → MINE SITE.
- ~~IF IT HITS THE WATER, SET UP A V, J OR U BOOM.~~

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

SET UP A V, J OR U BOOM.



SWAT Consulting Inc.

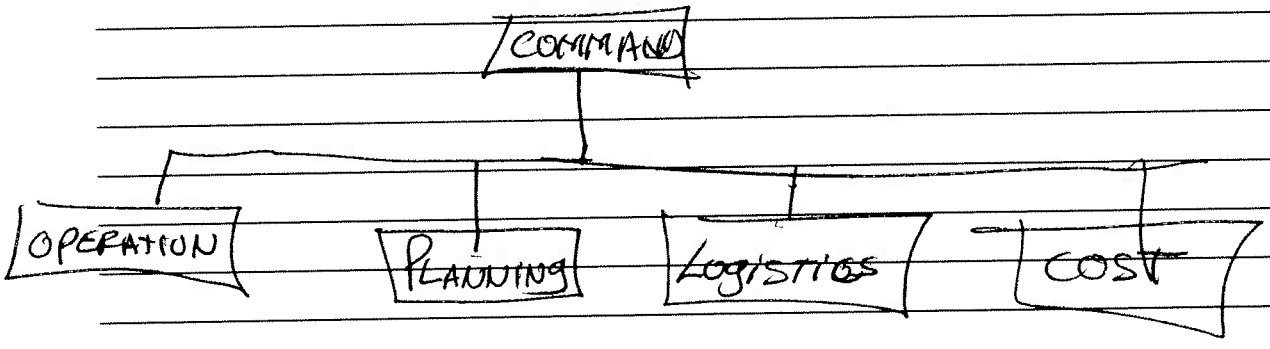
SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover

- **Incident** - 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on ~~March~~ June 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:



- DIESEL FLOWING INTO THE RIVER, HEADING TO BAKERLAKE (15 KM AWAY) GIVING US LESS THAN 3 HRS TO CONTAIN THE SPILL BEFORE IT GETS TO THE LAKE.
- ISOLATE THE VEHICULE.
- MAKE SURE THE DRIVER IS OK.

2. What **resources** are required?

- HELICOPTER TO ASSESS THE SPILL ON THE RIVER AND THE ACTUAL SPEED OF THE SPILL.
- A TEAM OF RESPONDERS AT THE ACCIDENT TO CONTAIND THE SPILL AT THE SOURCE.
- ANOTHER TEAM FURTHER DOWN STREAM BEFORE THE LAKE TO PREVENT ANY SPILL INTO THE LAKE
- NEED BOATS, MARITIME BARRIERS, SKIMERS, LIGHT PLANTS
- E.R.T. TEAM IN CASE OF FIRE
- M/T TANKER TRUCK TO PUMP THE REST OF THE LOAD
- M.S.D.S. - P.P.E.

3. What are the **initial spill response steps and what does your ICS look like**?

- ANALIZE THE SCENE, DELEGATE PEOPLE
- MAKE A PLAN, MAKE A DECISION, TAKE ACTION
- CALL PROPER AUTHORITY
- SAFETY

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

- INSTALL BOOM ACROSS THE RIVER (POUND) BEFORE IT GETS INTO THE 2 RIVERS (CREEK) AND THE Big LAKE

FABRICATE A BERM

10-30-4 BARRIER

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

- ASSESS THE SHORELINE SITUATION, ASK TRAINNED PEOPLE TO EVALUATE IF WE NEED TO CLEAN, IF YES WHAT IS THE BEST WAY TO DO IT. (ANY FRAGILE SYSTEM)

- IS IT TRANSFERABLE? YES OR NO

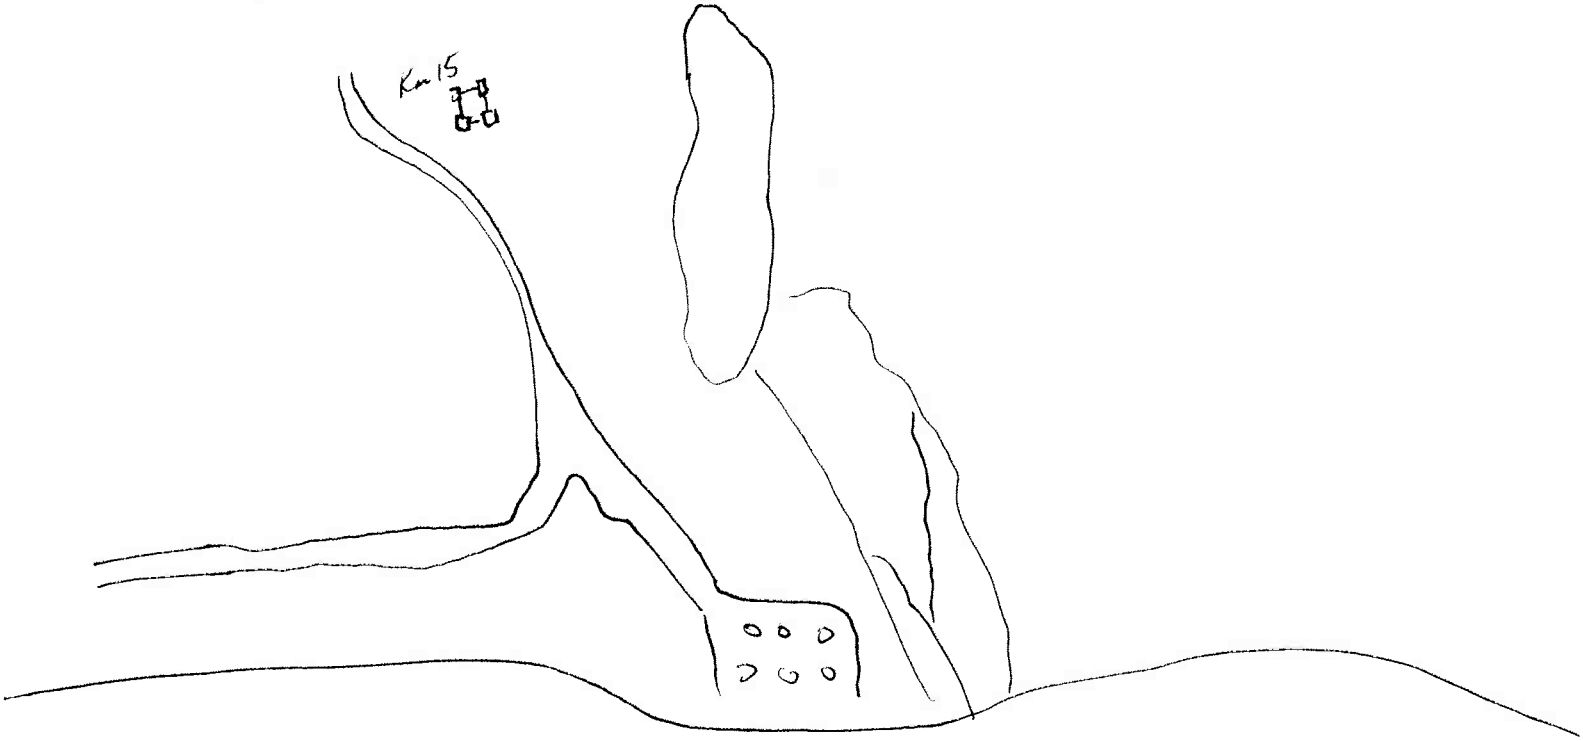
6. What are some **safety** issues?

- RISK OF FIRE
- FALLING INTO WATER
- DEALING WITH POOR VISIBILITY (DARK AT NIGHT)
- WATER & ICE
- POTABILITY

7. How do you manage your **waste**?

- BRING TO THE PROPER DISPOSAL FACILITY.

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?



- PROTECT THE WATER INTAKE FOR THE TOWN
- DO WHATEVER IT TAKES AT ALL COST.
- INFORM THE COMMUNITY.
- U-BOOM, V-BOOM, J-BOOM

Janie Katalnik

SWAT OILSPILL ISSUES WORKSHOP

Situation Analysis – Truck Rollover considered Tier 3 incident

- **Incident -** 45 m^3 diesel spills/plus oil/acid – Originates on Land, flows into the River
- **Spill** - occurred 22:00 hrs on ~~March~~ June 20, 2013
- **River** – water flow, 5 km/hr, braided channels; approx 15 km to Baker Lake
- **Lake** – winds from the North West at 20 km/hr. Tide is high.

1. List the **issues** linked to this scenario:

possible contamination of communitys water supply
freshet will make it harder to collect contaminants
braided channels - increases chances of more contamination area
may disturb spawning areas - fish
tides will increase contamination of soil
response time
other road users

2. What **resources** are required?

heavy equipment to build trenches (COMMS) ERP
enough material to do entire clean up
proper PPE for all ~~personell~~ personnel
enough material to dispose contaminated material - totes, sealed drums
adequate equipment to bring contaminated material to mine site
safety monitoring devices before starting any clean up

3. What are the **initial spill response steps and what does your ICS look like**?

- Code 1 on radio called - safety
- IC informs team of situation and does a head count before deploying team
- command centre setup - include management to assist in decisions
- ~~location~~ develop a safety zone in spill area

SWAT Consulting Inc.

4. What is your oil spill containment and recovery **strategy**?

land - build bell holes or barriers to avoid spreading of contaminants
- place booms inside barriers to pick up contaminants
- once booms are full, replace with new ones - place contaminated booms into Quattrex bags
- send Quattrex bags to mine site and placed inside seacans - properly labelled

water - place maritime barrier inside lake
place booms along shore to protect soil - also along maritime barrier
collect

5. What is your strategy for shoreline **cleanup** operations; if using SCAT what are the forecasted shoreline types, what is your treatment options for each type and what is your end point criteria

SWAT Consulting Inc.

6. What are some **safety** issues?

LEL
fatigue
water and ice
removal of truck
other road users
fast water
wildlife

7. How do you manage your **waste**?

place contaminated material - rags, booms - inside Quatrex bags
send bags to mine site - placed into seacans

8. If it were to make it to the lake what is your containment, recovery, cleanup and general overall response?

Dyno Nobel Emergency Response Plan

Please refer to the approved Meadowbank Spill Contingency Plan Version 4 (November 2013)

EMERGENCY RESPONSE PLAN

Meadowbank Mine Site.

Magazine, Plant and Work Sites

This Emergency Response Plan (ERP) addresses incidents and potential incidents involving the manufacturing, handling and storage of explosives and related products in Dyno Nobel Canada Inc.' magazines, plants and worksites. This ERP has been developed for Dyno Nobel Canada Inc. and all of it's wholly-owned subsidiaries (DNX Drilling). Actions detailed within this plan are compulsory, under the approval and authorization of DNCI's Regional Operations Managers.

"This document, as presented on Dyno Nobel's database, is a controlled document and represents the version currently in effect. All printed copies are uncontrolled documents and may not be current".

Note: Information provided within this document may be privileged and is not intended for general distribution.

Publication/Amendment

Date	Changes To Prior Edition	Pg.
15 Oct 03	**New document**	All
26 Apr 04	**Amendment # 1**	
	Renumbering of Appendices 6 – 13	App. 7 – 14
	Miscellaneous Typos & Amendment Dates	All
17 March 08	Amendment #2	
	Updated Contact information	
	Addition of definitions	
	Included Calling and responding emergency procedures	
	Addition Duties of Key personnel	
	Addition of response to Natural disasters	
	Addition of visitor and contractors access control -	
	Replaced the Appendices and renumbering	
	Included a Emergency Report form	
	Addition of Nitric acid, Aluminum and Diethylene glycol and CFE	
	Addition of alternate methods of communication	
	Addition of Reportable Substance list	
	Miscellaneous Typos & Amendment Dates	All
August 18, 2010	Amendment #3	
	Updated Scope and ERP Outline	
	Added Sign-off sheet for Annual Fire Department Review	
	Added Appendix for Employee Training sign-off	
	Updated Reporting Incidents Flowchart	
	Updated procedure for Raw Material Truck Spills	
	Updated Bomb Threat Checklist	
February 14, 2011	Amendment #4	
	Updated site contacts	
	Updated site evacuation & Muster locations	
July 14, 2011	Amendment #5	
	Updated site contacts	
	Updated site evacuation & muster loaction (Map drawn)	
	Site specific emergency procedures

1.0 SCOPE

This document provides a Work Site Emergency Response Plan covering fire/explosion, spills, security breach, bomb threat, evacuation and prescribed actions that employees must take to ensure employee and public safety in the event of an emergency. The general reference to DNCI's "Work Sites" throughout this document includes magazines, plants and miscellaneous work locations.

The Emergency Response Plan appearing on Dyno Nobel Canada Inc.' database is a controlled document. Uncontrolled copies of this ERP are provided to customers and associates who own the land on which DNCI's worksite is located, plus applicable municipal and regulatory authorities. As well, uncontrolled copies are issued to all Company employees and are placed in all central offices and Company delivery vehicles.

2.0 RELATED DOCUMENTS

The following documents also relate to emergency situations that can arise and should be held at each Work Site:

- Federal, Provincial and Municipal regulations, standards and guidelines
- Corporate Policies plus HSE Management System Standards & Procedures
- Standard Operating Procedures (SOP's)
- Dyno Nobel General and Specialized Work Rules
- Material Safety Data Sheets
- Prime Contractor's / Customer's ERP
- Transportation ERAP #2-1037
- Crisis Communication Plan

3.0 ERP OUTLINE

3.1 The following materials are covered by this ERP:

Fuel Oil
ATF Hydraulic Fluid
Ammonium Nitrate Prills and Solution
Sodium Nitrite
Sodium Thiocyanate
ANFO
Emulsion
Packaged Explosives
Detonators
Diethylene glycol

3.2 The following situations are addressed in this ERP:

- Fire / Explosion
- Storage Tank Failure
- Spills from Product Delivery Trucks
- Spills from Raw Material Delivery Trucks
- Process Spills
- Shut down due to weather, floods, lightning, fires, explosions and other threats to the security and operation of DNCI's facilities, equipment and material.
- Bomb Threats
- Quantities of spills and reportable to Dyno Nobel and authorities

3.3 This ERP covers:

Preparation	Reporting
Training	Waste Disposal Permits
Lines of Authority	Containment
Notification	Inspection
Decontamination	Maintenance

3.4 The following definitions apply to this plan:

DNCI Corporate contact : A DNCI corporate employee who is assigned to receive Emergency Calls at all times from the answering service.

ER Advisor: Emergency Response Advisor (ERA), who will normally be the applicable General Manager, Area Manager, or Technical Advisor who will liaise with First Responders.

OSC: (DNCI) On Scene Coordinator, the Senior DNCI employee at an incident site who manages and controls DNCI resources in support of First Responders and incident recovery.

ERT: Emergency Response Team, DNCI personnel dispatched to an incident site to assist First Responders and conduct incident recovery under the direction of the OSC.

4.0 PREPARATION AND PLANNING

4.1 In order to provide competent emergency response at Dyno Nobel Canada Inc. magazines, plants and worksites, first responders (local fire departments and mine rescue personnel) must be thoroughly briefed on an annual basis of the potential hazards involved in a Dyno Nobel Canada Inc. worksite fire. To this end, Work Site Supervisors must take fire department plus mine safety and security representatives on an annual magazine/plant tour to view:

Explosives Storage Areas	Evacuation (Meeting) Area
Bulk Emulsion Equipment	Communications Equipment
ANFO Blending Area	Facility Layout
Fire Fighting Equipment Sites	(Waste) Burn Facilities

A record of each explosives worksite tour and the names of the first responder representatives attending are to be documented and kept on file.

Annual Fire Department Review Form (Appendix 9)

4.2 All DNCI employees shall review this ERP on an annual basis and participate in ERP drills / exercises when scheduled.

4.3 All worksite accidents involving fire, explosion, reportable spills/emissions, breaches of security and bomb threats are to be reported to applicable authorities and senior management. As per incident reporting procedure

4. 4 Spill procedures for each of the materials listed in section 3.1 are outlined in Table 6-3. All procedures specify: Method of Cleanup, Method of Disposal and Protective Clothing. Based on the procedures presented in Table 6-3, worksite supervisors must ensure that adequate clean-up equipment and materials are readily available and in good condition.

4.5 Worksite information for each of DNCI's facilities is contained in the attached appendices. The ERP is revised whenever significant changes are made.

4.6 Current Material Safety Data Sheets (MSDS) are to be kept at each Work Site for all hazardous materials that are stored and handled at the Work Site. Copies of current product MSDS' are also made available to customers and landowners. Obsolete MSDS' will be replaced as new ones are issued.

4.7 Each Work Site will hold and maintain in good repair, appropriate fire fighting and spill control equipment for potential emergencies. Fire extinguishers, hoses and other fire fighting equipment are to be visually inspected on a monthly basis to ensure Magazine, Plant, Work Site and delivery vehicle readiness.

5.0 TRAINING

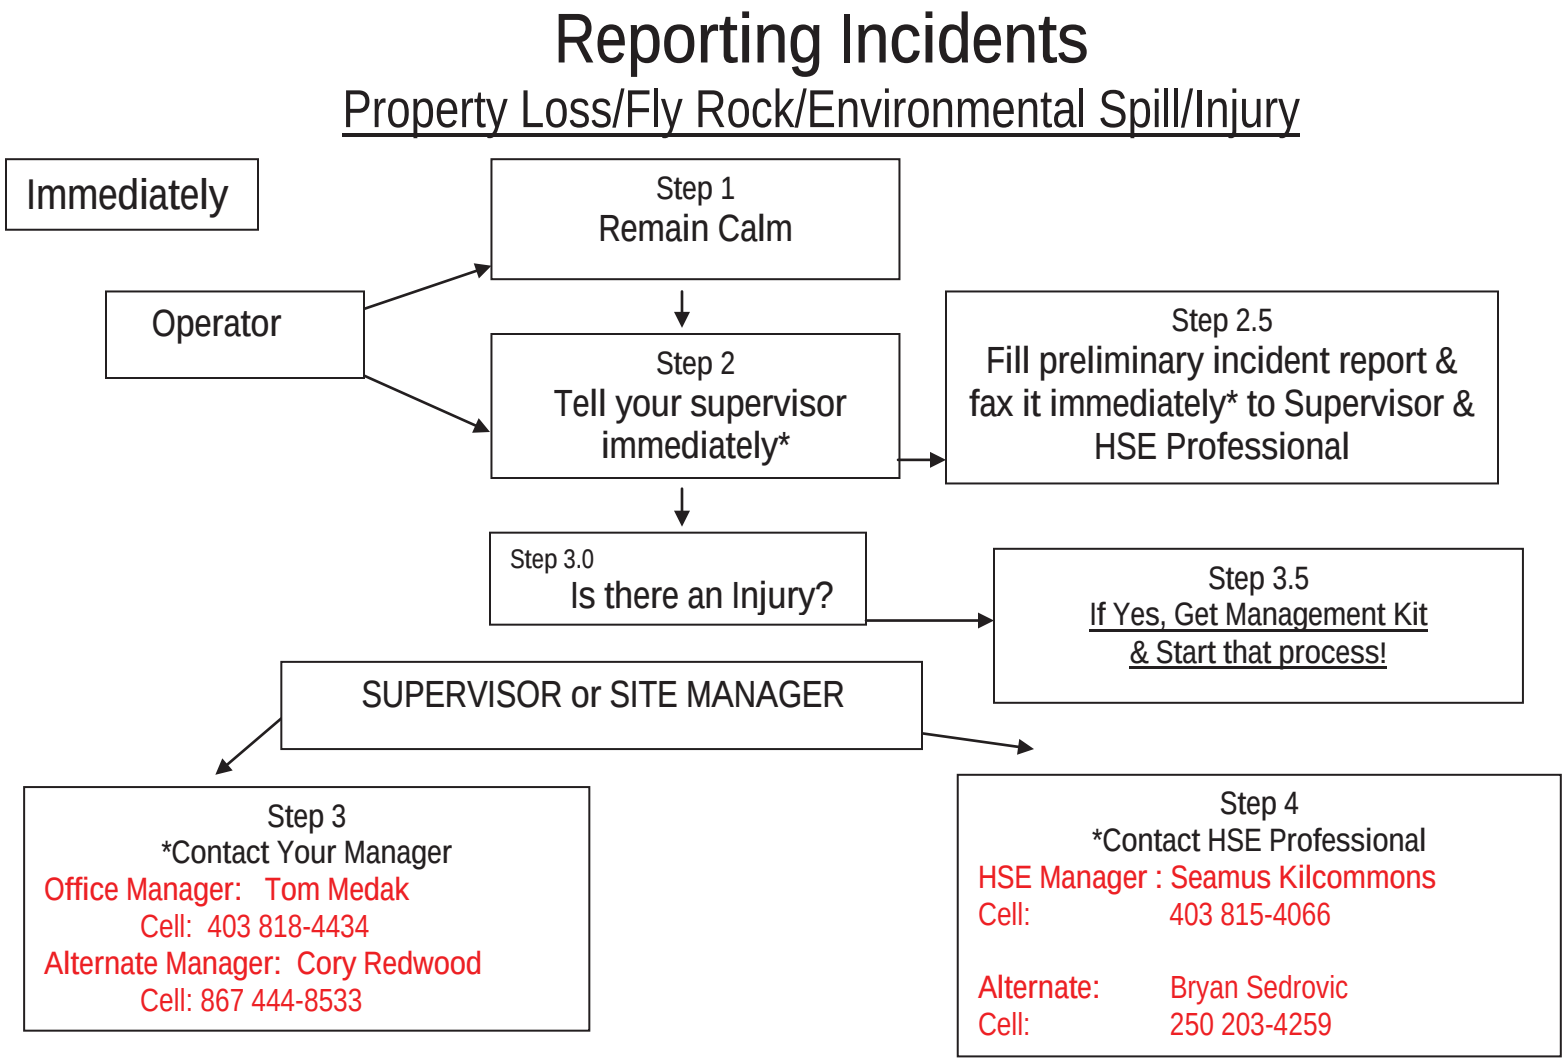
5.1 All employees will complete training on the contents of this Plan during their "new hire" orientation and review the plan annually.

5.2 A trained person is considered to have reviewed all related documents (Section 2.0), to have been instructed on the use of related equipment and procedures, and to have discussed with their Supervisor or trainer, questions and issues of concern.

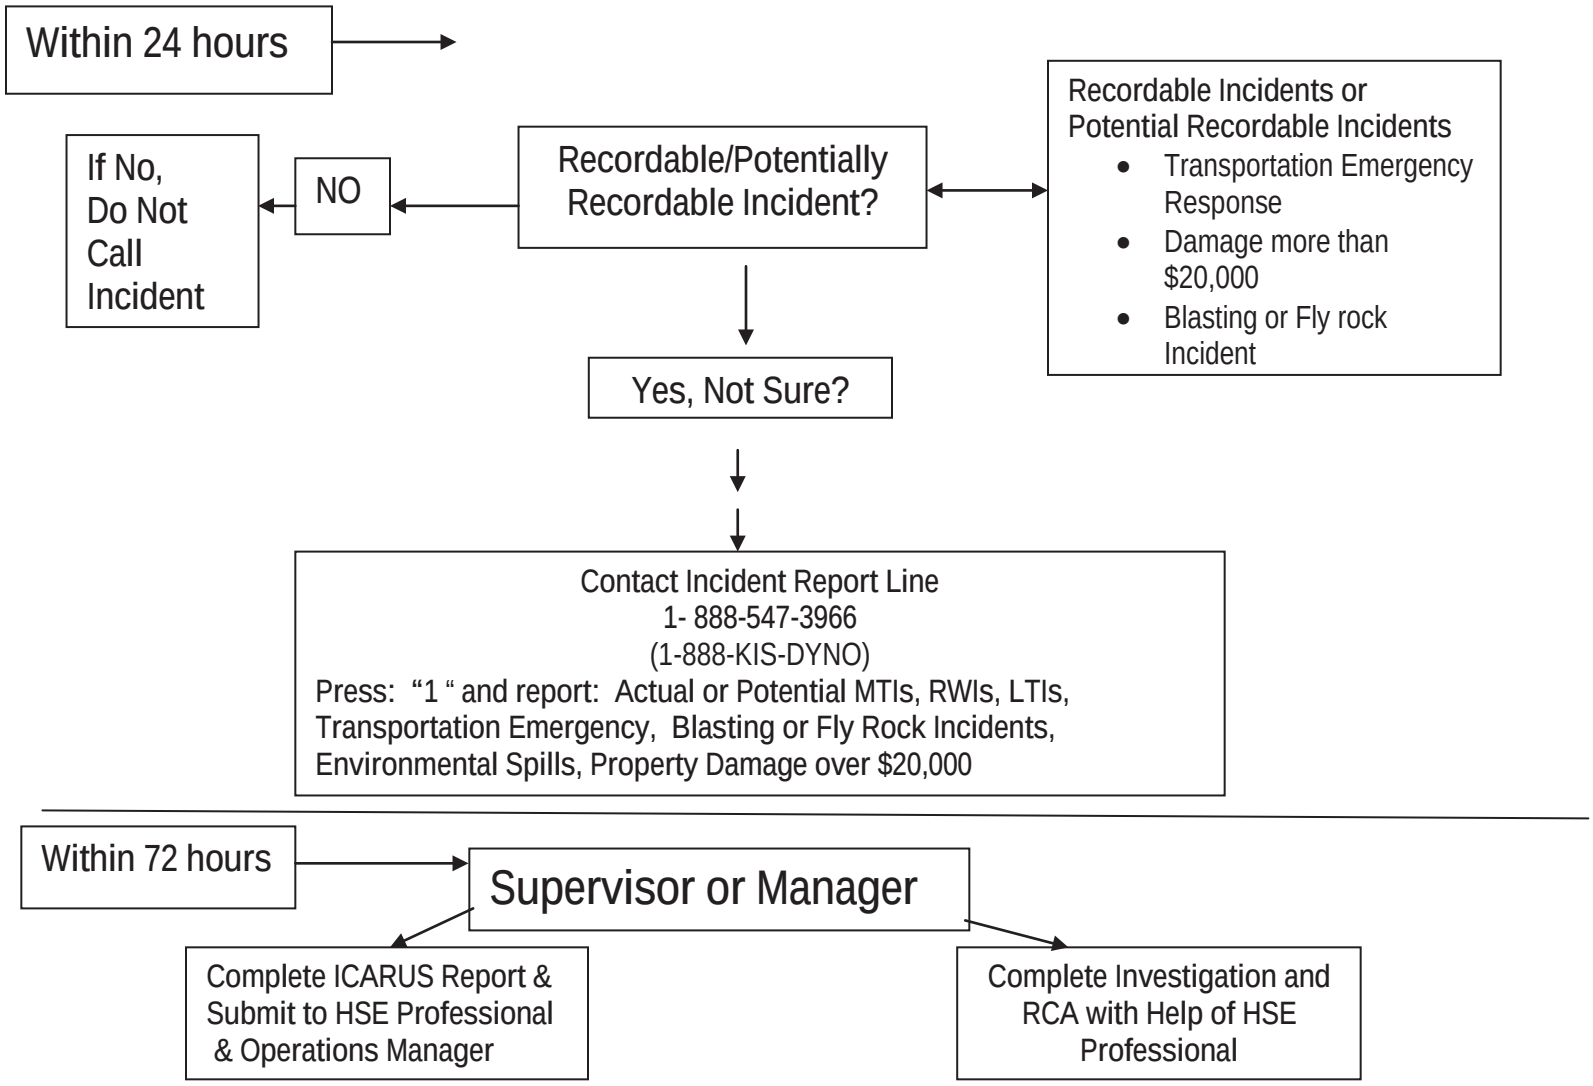
5.3 Training records, including certificates for training completed, are to be kept onsite in the Employee's Training Record.

5.4 The Magazine, Plant or Work Site Supervisor/Manager will certify their employees as having received training by signing the training form. In signing the training form, the Supervisor / Manager will have satisfied themselves that trained employees are able to:

- Recognize fire and explosive hazards for the materials and processes to which they are exposed /involved with;
- Competently use Fire Fighting / Fire Protection Equipment (Note: employees should receive refresher training in the use of fire extinguishers at least every three years)
- Competently use applicable personal protective equipment (PPE) when handling hazardous substances;
- Recognize and be familiar with substances which become hazardous wastes when spilled; and
- Follow SOP's and use established work practices to minimize the potential for fires, explosions, environmental releases and other accidents.
- Worksite Managers / Supervisors will ensure that all contractors receive a worksite orientation before commencing work or being left unaccompanied in the worksite. Following the orientation process, the contractors will be required to sign off on the Contractor Checklist acknowledging training in the applicable areas including the site emergency response plan.



- All Plant & Magazine sites will have in place, a continuous (24 hour) access control system to control the entrance, presence and exit of visitor and contractors and their equipment and materials
- Employees must be trained on Reportable Quantities to the Government in the unlikely event of a spill.
- All employees are aware of evacuation routes, muster point location, and all-clear notice procedure.
- New/Transferred employee or Annual Refresher sign-off form located in Appendix 8



6.0 EMERGENCY PROCEDURES AND LINES OF AUTHORITY

6.1 GENERAL

Reporting Incidents Flow Chart (Following page)

Within 72 hours
Supervisor or Manager
Complete ICARUS Report & Submit to HSE Professional & Operations Manager
Complete Investigation and RCA with Help of HSE Professional

SITE SUPERVISOR/DELAGATE
EXPERIENCING EMERGENCY / POTENTIAL EMERGENCY

- **CALL FOR EMERGENCY ASSISTANCE**
  In the event of an emergency, accidental release or imminent accidental release involving explosives, eliminate potential sources of detonation where possible (eg. turn off the ignition of a vehicle), call **6911** (or the local emergency number) for immediate assistance, **call the site Supervisor/Area Manager** and initiate the site's Emergency Response Plan. If normal phone systems are down other methods of communication can include two way radios, satellite phones, pager, e mail and vehicle satellite tracking systems.

- **WARN PUBLIC WITHIN EVACUATION DISTANCES IF RISK OF DETONATION**
  Should there be explosive detonations, or the risk of detonations due to the presence of fire or other detonating factors, advise the First Responders (or anyone within the immediate vicinity if First Responders are not at the scene) of the risk and applicable safety distances per Table 6-4, page 17 (liaise with Emergency Response Advisor (ERA) if time permits). Help organize perimeter guards to prevent people from entering the evacuation zone.
  Note: See ERP, page 17 Table 6-4 for Evacuation Procedures.

- **ASSIST LOCAL AUTHORITIES**
  Assist First Responders and Local Authorities in eliminating the emergency situation, and liaise with DNCI's On-Call Employee / ERA until relieved by the Company's Emergency Response Team (ERT).

TO RESPOND TO AN EMERGENCY CALL

DNCI Corporate contact instructions:

Upon receiving a call for emergency response assistance, keep a log of all subsequent communications and actions, and do the following:

1. Immediately obtain the name and callback number of the caller, in case the telephone line is lost.

2. Obtain information as fully and accurately as possible following the emergency report form (see appendix 1).

3. Call an ER Advisor for the applicable Region (see appendix 2) and report the emergency situation. In turn, the ER Advisor will phone the emergency scene caller, establish ongoing contact, assess the emergency, determine what Company resources and/or contracted emergency response services are required and organize an Emergency Response Team – ERT to proceed to the emergency scene if required.

4. Assist the Emergency Response Advisor (ERA).

5. Liaise with Company Executive / Senior Managers.

Emergency Response Advisor (ERA) instructions:

1.Call the Branch/Plant Supervisor nearest the emergency scene plus territorial & federal authorities (see applicable appendix to Annex D) to advise them of the situation and the need for an emergency response.

2. Designate, assemble and dispatch an Emergency Response Team (ERT), made up of Groups 1 & 2 personnel (see ERAP pg. 16 and Annex D) under the leadership of an On Scene Coordinator (OSC), if required.

3. Authorize the dispatching of additional resources, communications, transportation and contracted services as necessary.

4. Contact and instruct the designated Emergency Response Team (ERT) to proceed to the emergency scene with the required vehicles and equipment.

5. Liaise with the Person in Charge of the Emergency) and/or Local Authorities to obtain a situation update.

6.Advise Local Authorities as appropriate, regarding the properties, hazards and handling procedures for the explosives involved in the emergency. In particular, advise the Local Authorities of appropriate evacuation distances per Table 6-4 pg. 17.

7. Continue to consult with the Local Authorities as appropriate, plus the Company's On-Scene Coordinator (OSC), to stabilize and eliminate the emergency.

8. Refer to **Regional Manager** *(Tom Medak, Willard Pierce, Dale Bodnarchuk or Francois Lambert)* for any media requests in accordance to the Crisis Communication Plan (CCP). Media contacts shall be through Regional Manager designated for the area.

9. Contact the explosives supplier and / or transporter (if other than DNCI) to advise them of the emergency and to request their assistance if/as required.

ON-SCENE CO-ORDINATOR (OSC)

- The On-Scene Coordinator (OSC) is the Company's representative and local authority in charge of all company actions and resources at the emergency scene. Once the OSC arrives at the emergency scene, the ERA will transfer communication with First Responders/Local Authorities to the OSC. In turn, the OSC will liaise with the ER Advisor as required. Throughout the Company's emergency response, the OSC will ensure that First Responders and Company personnel (employees and contractors) observe all safety and regulatory standards and procedures.
- The OSC may revise / adjust the composition of the Emergency Response Team (ERT) and supporting resources as required. The OSC may, in consultation with the ER Advisor, contract commercial services to assist in addressing and resolving the emergency situation.

- The OSC will oversee the Company's local involvement with emergency services, government (municipal & provincial) and public interests until the emergency is fully resolved. Post-emergency activities (clean-up, restoration, etc.) under the direction of the Environment Manager may be delegated to an appropriate Branch, Plant or Area Manager. **EMERGENCY RESPONSE TEAM (ERT)**

- Selected emergency response personnel will take their direction to assemble and proceed to the emergency scene from the ERA or their representative. Team members will immediately report to the On-Scene-Coordinator.

- The primary role of the ERT is to provide a competent and trained / certified workforce plus specialized equipment and material to assist First Responders / Local Authorities in the stabilizing and elimination of an 'explosives emergency', and to retrieve / recover, repackage and remove to safe and secure storage, non-detonated explosives.

- While at the emergency scene, ERT members will take their direction from the Company's OSC and remain available until released by the OSC.

NOTE:

ONLY INDIVIDUALS WHO HAVE RECEIVED TRAINING AS REQUIRED UNDER THE TRANSPORTATION OF DANGEROUS GOODS (CLEAR LANGUAGE) REGULATIONS, OR WHO ARE WORKING UNDER THE DIRECT AND CONTINUOUS SUPERVISION OF AN EMPLOYEE WHO HAS BEEN TRAINED FOR CLASS 1 DANGEROUS GOODS UNDER TDG, MAY PARTICIPATE IN SITE CLEAN-UP ACTIVITIES SUCH AS PICKING UP, REPACKAGING AND TRANSPORTING EXPLOSIVE MATERIAL.

6.1.1 In any emergency the Work Site Supervisor/Manager or their delegate must take certain actions, including the following:

- Call local fire/emergency authorities (at mine sites, also call Mine Fire, Safety and Security if different and give relevant information).
- Account for all employees and visitors. Arrange for Rescue of anyone who may be trapped, without endangering oneself or others.
- Notify Dyno Nobel Canada Inc. ERA's so that necessary arrangements can be made for technical / administrative support, including accident reporting and investigation plus continued/alternate production. The following information should be provided and refer to appendix 1:

What Occurred	Time of Occurrence
Action Taken	People Contacted
Status of Situation	Anticipated Follow-up

6.2 FIRE & EXPLOSIVES

6.2.1. There are three categories of fire that may involve explosives:

I. Fires Directly Involving Class 1 Explosives and Blasting Agents

- **DO NOT FIGHT THE FIRE.** Instruct all fire fighters on the scene not to fight fire with explosives.
- Shut off power at main breakers if possible. At mine sites, call Mine Security or Fire/Rescue. At all other DNCI locations call local Fire/Rescue personnel.
- Evacuate all personnel from the Work Site to the safe meeting place as outlined in the Work Site Appendix.
- Set up a communications base at the meeting place and guard
- against anyone entering the area.

II. Fires Involving Components For Manufacture of Blasting Agents

Bulk blasting agents may be in the form of emulsion or ANFO. ANFO is a mixture of prilled ammonium nitrate and fuel oil.

Under conditions of large mass, intense heat, confined dust / vapor buildup, and the right mixture combination of the basic ingredients, emulsion and ANFO will explode. The probability of explosion with

ammonium nitrate (AN) alone is very small, but increases when under intense heat and confinement. Table 6-1 includes recommended fire fighting procedures for each of these substances.

III. <u>Fires Involving Dyno Nobel Canada Inc. Trucks</u>

In cases where the Dyno Nobel Canada Inc. delivery trucks are in a building that is on fire, if there is no explosives and safe to do so, may be moved provided access to the truck and exit from the building is not barred by flames or smoke, with available fire extinguishers with caution only if the fire is small and not in the storage compartment.

Fires on re-pump or other bulk explosive delivery vehicles shall not be fought if the fire involves the explosives compartment. Fire fighting measures should be taken immediately to prevent any fire such as a tire, electrical or cab fire from reaching the explosives compartment.

Fires on other transport vehicles may be fought with caution. Fires that cannot be controlled sufficiently to avoid involvement of the vehicle's fuel compartment shall be left and personnel evacuated to a safe distance.

6.2.2. When a fire is small and does not involve any explosive agents, it may be fought with plant extinguishing equipment. If the fire is widespread and intense, all personnel, including visitors and contractors should be evacuated to the meeting area outside the main gate.

Table 6 - 2
FIRE FIGHTING INFORMATION

MATERIAL	RECOMMENDED FIRE-FIGHTING METHODS	SPECIAL CONSIDERATION
Ammonium Nitrate Prill – Odorless white to light tan crystaline solid	Use flooding amounts of water in early stages of fire. Keep upwind. AN is an oxidizing agent which supports combustion and is an explosive hazard if heated under confinement that allows high-pressure buildup. Ensure good ventilation and remove combustible materials if it can be safely done. Evacuate to designated area if fire cannot be controlled.	Toxic oxides of nitrogen are given off during combustion. Fire fighters require self-contained positive pressure breathing apparatus. Avoid contaminating with organic materials. Many powdered metals such as Al, Sb, Si, Cd, Cr, Co, Cu, Fe, Pb, Mg, Mn, Ni, Sn, Zn and brass react violently and explosively with fused AN below 200˚C Sensitivity to detonation increases when heated.
Ammonium Nitrate Solution- Colorless/Odourless Liquid – white paste like solid when cooled	Use flooding amounts of water in early stages of fire. Cool containing vessels with flooding quantities of water until after fire is out	Material will not burn, but thermal decomposition may result in flammable/toxic gases being formed. These products are nitrogen oxides and ammonia. (NO,NO_2 NH_3). Product may form explosive mixtures when contaminated and comes in contact with organic materials. Explosive when exposed to heat or flame under confinement. Avoid temperatures over 210°C (410°F) A self contained breathing apparatus should be used to avoid inhalation of toxic fumes
Sodium Thiocyanate – White solid - odourless	Use extinguishing media most appropriate for the surrounding fire	Wear self contained breathing apparatus – MSHA/NIOSH approved or equivalent, and full protective gear. During a fire, irritating or highly toxic gases may be generated by thermal decomposition or combustion.
Sodium Nitrite – Oxydizing agent - white to light yellow crystals- faint odour	Flammability class – not regulated. Flood with water only – Isolate materials not involved in the fire and cool containers with flooding quantities of water until well after the fire is out.	Self contained apparatus should be worn in a fire involving Sodium Nitite.Thermal decomposition will cause reddish brown nitrogen oxides to be released.
Fuel Oil (No. 2 diesel) Dyed or pale yellow liquid with petroleum odor; and/or ATF Fluid	Use water spray to cool fire-exposed surfaces and to protect personnel. Shut off fuel from fire. Use foam, dry chemical or water spray to extinguish fire. Avoid spraying water directly into storage container due to danger of boil-over.	Avoid strong oxidizing agents.

Explosive emulsions, ANFO, packaged explosives and firing devices.	**Fire involving explosive materials must never be fought. Evacuate the incident scene. Do not confine (ventilate to prevent / reduce pressure build-up if safe to do so).**	Explosion hazard.
Enviro CFE	Dry chemical, foam, water spray (fog). Use water spray to cool exposed surfaces and containers	OIL FLOATS ON WATER. Do not use direct or heavy water stream to fight fire. Use organic vapour respirator or self-contained breathing apparatus to fight fire.

Table 6 - 3
CONTROL MEASURES FOR FIRE

MATERIAL	RECOMMENDED FIRE-FIGHTING METHODS	SPECIAL CONSIDERATION
Diethylene glycol	Small fire: type ABC dry chemical or CO_2 fire extinguisher. Large fire: water fog.	Keep away from oxidizers (nitrates and perchlorate). Explosion hazard if heated under confinement.

EVACUATION PROCEDURES

Advise the first emergency responders at the scene (police or fire) of the need to evacuate using the guidance in the Emergency Response Plan. Employees at the scene should assist local emergency services to the best of their ability to accomplish this. For incidents within a worksite such as a mine, quarry or construction operation, in most cases access is radio controlled. The quickest way of alerting people, therefore, is by site radio. Clearly state your location, situation and call for assistance in evacuating the area.

DO NOT FIGHT EXPLOSIVES FIRES. EVACUATE THE AREA AND LET THE FIRE BURN ITSELF OUT.

THE MINIMUM EVACUATION DISTANCE IS AS OUTLINED IN TABLE 6-4 (Pg. 17) FOR ALL DIRECTIONS (which is based on a higher traffic / risk / population density within the area, without benefit of protective features such as berms and hills. (**Transport Canada requires 1,600 meters for situations that involve high-risk surroundings**) upon determining actual quantity of explosives refer to Table 6-4 as per ERD quantity of distances.

Table 6 - 4
EVACUATION DISTANCES
Based On Amount of Explosives Present

Explosive Quantity		Metric Distance		English Distance
250 kg		70 Meters		230 Feet
500 kg		100 Meters		320 Feet
1,000 kg		150 Meters		500 Feet
2,000 kg		240 Meters		800 Feet
5,000 kg		400 Meters		1,300 Feet
7,000 kg		450 Meters		1,450 Feet
10,000 kg		480 Meters		1,550 Feet
20,000 kg		700 Meters		2,300 Feet
40,000 kg		800 Meters		2,640 Feet
60,000 kg		870 Meters		2,860 Feet
80,000 kg		960 Meters		3,150 Feet
100,000 kg		1040 Meters		3,420 Feet
120,000 kg		1100 Meters		3,610 Feet
>120,000 kg		1600 Meters		5,250 Feet

6.3 ENVIRONMENTAL RELEASES

6.3.1 Procedure For Fuel Oil Storage Tank Failure

- Assess the magnitude of the leak.
- If the leak is slow and the source can be determined, take the appropriate action to prevent further leakage.
- Transfer fuel from storage tank into drums if necessary.
- Collect spilled material, including contaminated soil, with absorbent pads or inert solid absorbent and store in drums labeled for disposal.
- If the leak is large and further leakage cannot be prevented, allow the dyke to fill. Transfer to drums, label for reuse or disposal, and store.
- Inspect empty tank to identify failure/cause of leak and repair tank.

6.3.2 **Procedure For Raw Material Truck Spills**

- Identify the material involved, assess the magnitude of the spill or leak and assist the driver to take appropriate action to stop the leak, taking care to prevent run off and/or entry into any water course or drainage system near the spill site.
- For AN prill, shovel spilled material into drums, label for reuse or disposal, and store. Use a non-sparking shovel to transfer spilled material into lined drums.
- For spilled fuel, contain by dyking with earth. Collect spilled fuel with absorbent pads or solid inert absorbent, transfer into drums, label and store for disposal.
- Remove contaminated soil for disposal in conformance with Environment Canada standards.

6.3.3 **Procedure For Process Spills**

- Identify the material involved and assess the magnitude of the spill or leak, taking care to prevent run off and/or entry into any watercourse or drainage system near the spill site.
- For AN prill, shovel spilled material into drums, label for reuse or disposal, and store.
- For spilled fuel, contain by dyking with earth. Collect with absorbent pads or solid inert absorbent, transfer into drums, label, and store for disposal.
- In the case of leaking bags of ANFO, sweep or shovel the spilled material into a clean drum or other suitable container, label for reuse or disposal, and store.
- Remove contaminated soil for disposal in conformance with Environment Canada standards.
- Have any process equipment (pumps, process lines, parts, gauges, etc.) involved in a leak or spill inspected and repaired or replaced. Re-inspect and test if necessary after repair is affected.

6.3.4 **Procedure For Emulsion Tank Failure**

- Assess the magnitude of the leak.
- If the leak is slow and the source can be determined, take the appropriate action to prevent further leakage.
- Transfer remaining emulsion from leaking storage tank into another storage tank, a tanker trailer if available, or into drums as necessary.
- Collect spilled material using double diaphragm pump(s) and store in labeled drums for reuse or disposal at the mine.
- If the leak is large and further leakage cannot be prevented, allow the room to fill. Transfer to drums, label for reuse or disposal, and store.
- Inspect empty tank to identify failure/cause of leak and repair or replace the tank

6.3.5 **Procedure For Fire**

- In the event of a raw material or product fire, take care to protect all persons from exposure to smoke and gaseous emissions from the fire.
- Potential toxic gaseous emissions from fires involving explosive materials include:

  Oxides of Nitrogen
  Carbon Monoxide
  Cyanide Gas

- All fires must be reported to local authorities and Mine Site Security as soon as possible.
- Self contained breathing apparatus is required for fighting a fire in the plant.
- Follow procedures outlined above for any spills and leaks resulting from fire when it is safe to do so

Table 6 – 5
ENVIRONMENTAL RELEASE PROCEDURES

MATERIAL	SPILL AND LEAK PROCEDURES	WASTE DISPOSAL
Ammonium Nitrate Prill (odorless white to light tan crystalline solid)	Remove source of heat and ignition. Sweep or shovel spill into a clean, non-combustible container. Wash remaining trace residues with water. Wear rubber gloves and safety glasses to minimize contact with skin and eyes.	Re-use if possible or give it to a farmer as a fertilizer. If not possible, dispose of as-is in approved. Remove as much as possible the spilled material as a solid.
Ammonium Nitrate Solution-Colorless/Odourless Liquid – white paste like solid when cooled	Small spill - Dike and contain spilled material. Ensure spilled material does not enter sewers, wells or water courses. Allow to solidify. Use appropriate tools to place in container for disposal. Larger spill - Dike and contain spilled material. Ensure spilled material does not enter sewers, wells or water courses. Notify downstream water users. Allow to solidify. Use appropriate tools to place in container for disposal.	Call for assistance for disposal. Ensure disposal complies with regulatory requirements and regulations.
Fuel Oil (dyed or pale yellow liquid with petroleum odor)	Eliminate any source of ignition. Prevent spills from entering watercourses or drainage systems. Contain with sand or earth. Recover with pump or inert absorbent material into clean container. Wear safety glasses and rubber gloves to prevent contact with the eyes and skin.	Dispose of recovered material in approved landfill or other waste disposal facility.
ANFO (Ammonium Nitrate Fuel Oil)	This material is an explosive. Remove all sources of heat and ignition. Transfer into clean plastic container with a plastic shovel. Label drums. Wear rubber gloves.	Recycle product, if possible. If not practical, explode it inside a borehole or burn it in an authorized burning ground.
Emulsion	This product is a blasting agent. Remove all sources of heat and ignition. Prevent spills from entering watercourses or drainage systems. If large amount of emulsion is involved, contain spill with earth or sand found locally. Recover spilled material with a diaphragm pump. Use of a diaphragm pump also requires an air compressor. Limitation of the pump suction is approximately 2.5 meters, pump discharge is approximately 8 meters. Use a screening device on pump suction hose. Out of area spills will require taking two pumps and extra hose. Transfer the product into a tanker trailer or clean 200 liter drums. If small amount of emulsion is involved, transfer material into a clean plastic container with a plastic shovel. Label tanker trailer or drums. Wear rubber gloves and rubber boots.	Recycle product, if possible. If not practical, explode it inside a borehole or if large amount is involved, demulsify it with liquid detergent.

Enviro CFE	Eliminate any source of ignition. Prevent spills from entering watercourses or drainage systems. Contain with sand or earth. Recover with pump or inert absorbent material into clean container. Wear safety glasses and rubber gloves to prevent contact with the eyes and skin.	Dispose of recovered material in approved landfill or other waste disposal facility.
Sodium Thiocyanate – White solid - odourless	Ensure adequate ventilation whe handling Sodium Thiocyanate. Keep containers closed when not in use. Wear appropriate PPE – eye protection, gloves and appropriate clothing to prevent skin exposure.	Vacuum or sweep up material and place into a suitable disposal container. Avoid run off into storm sewers and ditches which lead to waterways. Not regulated as a hazardous material. Chemical waste generators must consult appropriate hazardous waste regulations to ensure complete and accurate classification.
Sodium Nitrite – Oxydizing agent - white to light yellow crystals- faint odour	In the event of a spill or leak, contact the vendor (403-263-8660) for advice. Wear respirator, protective clothing and gloves. Vacuuming is the recommended method to clean up spills. Do **not** sweep or use compressed air for clean up. Recover spilled material on non-combustible material, such as vermiculite. Use non-sparking tools and place in covered containers for disposal. Any recovered material mau be used for it's intended purpose , depending on contamination.	Dispose of the waste material at an approved hazardous waste treatment/disposal facility.
Acetic Acid – Colourless liquid with a pungent odour	Wear appropriate PPE – evacuate downind areas as required to prevent exposure and to allow fumes and vapours to dissipate. Prevent entry into sewers or streams. Dike if needed. Eliminate all sources of ignition. Neutralize the residue with sodium carbonate or crushed limestone. Absorb win an inert dry material and place in an appropriate container for disposal. Flush area with water to remove trace residue.	Waste disposal must be done in accordance with provincial and federal regulations. Empty containers must be recycled or disposed of through an approved waste management facility.

6.4 SECURITY

6.4.1. In the event of a breach of security at a Dyno Nobel Canada Inc. Work Site, a call is to be made to the RCMP / local Police Department at the discretion of the Supervisor/Manager, or their delegate. In the case of a breach of security, Dyno Nobel Canada Inc.' HSE, Regulatory Affairs and Executive / Senior Management shall also be informed immediately and provided with the same information as outlined in Section 6.1

6.4.2. Any person(s) apprehended during the course of a serious security breach shall be detained until the Police arrive (note: employees are not to put themselves at undue risk by attempting to apprehend or restrain a potentially violent person).

6.5 BOMB THREAT

6.5.1. The safety of employees and the public is of primary concern. A person receiving a bomb threat over the telephone should attempt to remain calm and keep the caller talking by asking the questions listed in Table 6-6 (ERP pg. 20). Recording (writing) as much information about the caller and their comments is also very important for future reference. If possible, alert a co-worker to the situation while talking to the caller.

6.5.2. The police / mine security should be advised of the bomb threat as soon as possible. Unless there is good reason to the contrary, all personnel should evacuate the Work Site and await the arrival of the police / first responders at the designated meeting area. Suspicious objects should be reported but not tampered with and other people should be prevented from entering the Work Site until the local authority has authorized a return to the Work Site. Employees should be prepared to assist local authorities in their search / inspection of the Work Site as necessary.

Table 6 - 6
CONVERSATION GUIDELINES IN THE EVENT OF RECEIVING A BOMB THREAT

See Appendix 7

6.6 LINES OF AUTHORITY

6.6.1 Based upon the information available at the time of the incident, the Work Site Supervisor/Manager, in consultation with others (such as DNCI Senior Management, Mine/local authorities and/or Dyno Nobel advisors), will evaluate the incident and proceed with appropriate steps to implement this ERP. A decision on when to return to the scene of a serious incident will be made in like fashion, subject to approval by public authorities overseeing the incident.

6.6.2 The Work Site Supervisor/Manager will have overall responsibility for the implementation of this ERP and the supervision of all Company activities. Public authorities and the site owner have ultimate authority regarding the resumption of normal production activities.

7.0 NOTIFICATION AND REPORTING

7.1 Any incident that activates this ERP shall be documented on the DYNO Incident (Cintellate) Report. The Corporate Emergency Response Advisor must also be notified and in turn will advise the:

HSE Manager Vice President Operations
Area Manager

It is the responsibility of the HSE Manager or his delegate to report the incident to DYNO's HSE Management Team. A major incident involving a fire with emissions and/or a hazardous material spill shall be reported to a provincial Environment Officer under the direction of the Environmental Manager. Major incidents shall also be reported to the Chief Inspector, Explosives Branch, Natural Resources Canada; a Provincial/Territorial Safety Officer; and as applicable, an Emergency Measures Official.

Any incident which involves a spill at a Mine Site shall be immediately reported to the Mine Site Environmental Representative, and followed up with a copy of the incident report when complete.

7.2 Spills and Releases – Reportable and Significant Classifications

1) Determine if the spill/release is reportable

All environmental incidents are to be input into Cintellate. Reportable spills/releases are not only input into Cintellate, but the investigation and corrective action sections of Cintellate must be completed. To assist in determining if a spill/release is reportable, a listing of common materials with assigned reportable quantities is referenced (see Appendix 5, Reportable Substance List). The reportable quantities utilize the most stringent "reportable quantity" in Canada. Even if the spill/released material is recovered, the media impacted by the spill/release may be reportable to authorities (e.g., a portion of a spill reaching a source of drinking water or wetland). In addition, a spill/release is reportable if the amount equals or exceeds the Dyno Nobel Default Threshold.

2) Determine if the spill/release is significant

- Significant spills/releases are disclosed in the company's annual report. Significant spills/releases trigger time-critical internal actions as required by the company's procedures (crisis communication, internal investigation, etc)

The following table is provided to assist in making these determinations:

Reporting of Environmental Spills

Is the spill reportable?

- Yes if above a Reportable Quantity
- Yes if oil sheen is visible or sludge/emulsion is deposited beneath water surface
- Yes if water quality standards are exceeded
- Yes if from a UST exceeding 25 gallons or result in a sheen

Is the spill significant?

- Yes if authorities implement a national contingency plan
- Yes if "sensitive" environmental features have been impacted
- Yes if neighbors are evacuated
- Yes if authorities and/or neighbors file complaints and/or demand response activities
- Yes if financial impact is >US$100K
- Yes if media coverage is adverse.

7.3 Internal investigation reports will include:

- Name, work address, and phone number of the investigating (reporting) individual
- Identification and quantity of the released substance
- Time, duration, and location of the release
- Nature and quantity of injuries, property damage, production loss, administrative penalty and/or legal liability
- Precautions taken during the incident
- Relevant environmental conditions
- Corrective actions taken at the time of the incident
- Recommended corrective actions to prevent future occurrence

7.4 Senior Management shall be immediately informed by telephone of any major incident that requires Government notification as per Dyno Nobel's reporting procedures.

7.5 Major incidents involving explosive material shall also be reported to the Chief Inspector, Explosives Branch, and Natural Resources Canada by the applicable Regulatory Affairs Coordinator.

Table 7 – 1
REPORTABLE SUBSTANCE QUANTITY LIST

Material Released	Reportable to Authorities		Dyno Nobel Default Threshold (Proposed)
	If Recovered	If Unrecoverable/ Abandoned / Disposed	
AN Solution	Not Reportable if it can be used as a product	45 Kg (100 lbs) as released oxidizer (not media specific)	225 Kg (500 lbs)
	44 Kg (100 lbs) for ammonia if released into water	45 Kg (100 lbs) for ammonia if released into water	
	Report if released to Drinking Water (DW std at 10mg/L-N)	Report if released to Drinking Water (DW std at 10mg/L-N)	
	Report if released to aquatic ecosystem (NH3 toxic to fish)	Report if released to aquatic ecosystem (NH3 toxic to fish)	
AN Prill	Not Reportable if it can be used as a product	45 Kg (100 lbs) as released oxidizer (not media specific)	225 Kg (500 lbs)
	45 Kg (100 lbs) for ammonia if released into water	45 Kg (100 lbs) for ammonia if released into water	
	Report if released to Drinking Water (DW std at 10mg/L-N)	Report if released to Drinking Water (DW std at 10mg/L-N)	
	Report if released to aquatic ecosystem (NH3 toxic to fish)	Report if released to aquatic ecosystem (NH3 toxic to fish)	
	Report if released to Drinking Water (DW std at 10mg/L-N)	Report if released to Drinking Water (DW std at 10mg/L-N)	
	Report if released to Drinking Water (DW std at 10mg/L-N)	Report if released to Drinking Water (DW std at 10mg/L-N)	
Sodium Nitrite	45 Kg (100 lbs)	45 Kg (100 lbs)	225 Kg (500 lbs)
	Report if released to Drinking Water (DW std at 1mg/L-N)	Report if released to Drinking Water (DW std at 1mg/L-N)	
Fuel Oil	Reportable if sheen on surface of pond, stream, etc. or sludge within such	Reportable if sheen on surface of pond, stream, etc. or sludge within such	225 Kg (500 lbs); 261 L (69 gallons)
	State Regulations - Varies from Any Amount to specific Trigger Amounts	State Regulations - Varies from All Spills to specific Trigger Amounts	
	95 L (25 gallons) from UST	96 L (25 gallons) from UST	
Mineral Oil	Reportable if sheen on surface of pond, stream, etc. or sludge within such	Reportable if sheen on surface of pond, stream, etc. or sludge within such	225 Kg (500 lbs); 261 L (69 gallons)
	State Regulations - Varies from Any Amount to specific Trigger Amounts	State Regulations - Varies from All Spills to specific Trigger Amounts	
	95 L (25 gallons) from UST	96 L (25 gallons) from UST	

Emulsifier Agents	Reportable if sheen on surface of pond, stream, etc. or sludge within such	Reportable if sheen on surface of pond, stream, etc. or sludge within such	225 Kg (500 lbs); 261 L (69 gallons)
	State Regulations - Varies from Any Amount to specific Trigger Amounts	State Regulations - Varies from All Spills to specific Trigger Amounts	
ANFO	Not Reportable if it can be used as a product	45 Kg (100 lbs) as released oxidizer (not media specific)	225 Kg (500 lbs)
	45 Kg (100 lbs) for ammonia if released into water	45 Kg (100 lbs) for ammonia if released into water	
	Report if released to Drinking Water (DW std at 10mg/L-N)	Report if released to Drinking Water (DW std at 10mg/L-N)	
	Report if released to aquatic ecosystem (NH3 toxic to fish)	Report if released to aquatic ecosystem (NH3 toxic to fish)	
	Reportable if sheen on surface of pond, stream, etc.	Reportable if sheen on surface of pond, stream, etc.	
Emulsion	Not Reportable if it can be used as a product	45 Kg (100 lbs) as released oxidizer (not media specific)	225 Kg (500 lbs)
	44 Kg (100 lbs) for ammonia if released into water	45 Kg (100 lbs) for ammonia if released into water	
	Report if released to Drinking Water (DW std at 10mg/L-N)	Report if released to Drinking Water (DW std at 10mg/L-N)	
	Report if released to aquatic ecosystem (NH3 toxic to fish)	Report if released to aquatic ecosystem (NH3 toxic to fish)	
	Reportable if sheen on surface of pond, stream, etc. or sludge within such	Reportable if sheen on surface of pond, stream, etc. or sludge within such	
Ethylene Glycol	2250 Kg (5000 lbs)	2250 Kg (5000 lbs)	225 Kg (500 lbs)
Sodium Thiocyanate	45 Kg (100 lbs)	45 Kg (100 lbs)	225 Kg (500 lbs)
	Report if released to Drinking Water (DW std at 1mg/L-N)	Report if released to Drinking Water (DW std at 1mg/L-N)	

8.0 DECONTAMINATION

8.1 DNCI's Standard Operating Procedures and safety rules establish work practices that minimize employees' direct and indirect contact with hazardous substances.

8.2 Equipment, rubber boots, gloves and clothes that have been contaminated can be washed with soap and water. Wash water should be collected and disposed of in an approved manner with other contaminated material.

9.0 WORKSITE CLOSURE / SHUT DOWN

9.1 **Plant Shutdown (use appropriate lock-out/tag-out procedures)**

- In the event that a plant is shut down due to weather, flood, or other adverse situation, the Plant Manager / Supervisor or his delegate will ensure that all non-essential power is shut off. The Plant Manager / Supervisor will secure all valves and flow devices so as to prevent accidental opening.
- The Plant Manager / Supervisor shall determine if any raw material or raw material storage will be contaminated or at risk of fire/explosion, and take steps to move the material or isolate it from the contamination / hazard source.
- If the power and/or gas will create a dangerous situation the Plant Manager / Supervisor will cut the outside supply of power, thereby isolating all plant equipment.
- The Plant Manager /Supervisor will advise local Mine authorities of the plant shutdown and preventative actions taken.
- All sensitive documents must be secured.

9.2 **Magazine Closure (use appropriate lock-out/tag-out procedures)**

- In the event that a magazine is closed due to weather, flood, or other adverse situation, the Supervisor/Manager or his delegate will ensure that all non-essential power is shut off. Also, the Supervisor/Manager will ensure that all magazines and compound gates are locked before leaving the site.
- The Supervisor/Manager shall determine if any products or raw materials will be contaminated and take steps to move the material or isolate it from the contamination source.
- If power and/or gas will create a dangerous situation the Supervisor/Manager will cut the outside supply of power, thereby isolating all magazine equipment.

10. RESPONSE TO NATURAL DISASTER

Hurricanes, tornadoes, floods, slides, forest fires, and earthquakes, have the ability to damage or destroy everything in their path. Yet much of the

damage or destruction associated with such phenomena is the result of some secondary event, e.g. fallen power lines, ruptured tanks valves, pipes etc. If reasonable warning of an approaching disaster is received, efforts can be made to minimize damage by taking specific preventative measures. These measures are outlined in the following procedures.

1.Consult the Site Supervisor for guidance and proceed according to his direction.
2. If so directed, notify key personnel regarding the action being taken.
3. Collect important files, records and papers for safekeeping.
4. Open main electrical breaker to cut off all power to the site. (The main breaker is marked for easy identification).
5. Secure all buildings and equipment and lock the site gate.
6. Evacuate the site taking mobile equipment to safety.
7. Post Guards on site access routes to monitor the activities of unauthorized personnel.
8. A report of the incident must be submitted to the Area Manager within 24 hours.

10.1 PREVENTIVE MEASURES

10.2 **Waste Disposal Permits**

If nitrate waste is generated, a disposal permit must be obtained and kept up to date if the product will be disposed of off-site, or in mine tailings. Permits to dispose of other collected waste in the event of spills or leaks (such as described in Section 6.3) must also be obtained in consultation with mine / provincial environmental representatives

10.3 **Liquid Containment**

All fuel / oil storage tanks must be dyked according to the provisions of Federal and/or Provincial regulations (eg. National Fire Code, Environmental Protection Act), or have a double-walled tank.

A plan must be in place and materials on hand to create a dyke in the event of a large fuel or solution leak or spill or other emergency spill situation.

10.4 **Inspection**

All site emergency storage areas and equipment must be inspected monthly by qualified personnel, monthly for physical condition and serviceability, and the results recorded according to quality and safety standard operating procedures.

All recommendations/orders made by NRC Explosives Branch inspectors, Fire Marshals and insurance inspectors must be responded to and acted upon accordingly. Copies of their reports are to be forwarded to DNCI's HSE representative for the region.

10.5 **Maintenance**

All preventive and breakdown maintenance must be carried out and recorded in accordance with standard operating procedures.

11.0 WORK SITE START UP (Restoration of Business)

11.1 Before startup, the condition prompting the shutdown / closure must be over / corrected (i.e. flood, fire, explosion or blizzard).

11.2 All decontamination procedures must be followed and the site cleared and cleaned of any environmental waste hazards.

11.3 All repairs to plant equipment involving safety shutdowns and essential operating machinery must be completed.

11.4 All electrical circuits, plumbing and piping must be tested.

11.5 The Work Site Supervisor / Manager will ensure that all lockout and tag-out procedures have been followed and signed off.

11.6 The Work Site Supervisor / Manager will start up the facility by turning on individual switches to the components that have been shutdown.

11.7 Operational checks will be done to ensure that all equipment is functioning at safe working pressures and voltage.

11.8 The Work Site Supervisor / Manager will give the verbal "all clear" before workers will be allowed to return to work.

11.9 The Work Site Supervisor / Manager or one of their delegates will cancel / remove all roadblocks, terminate evacuation activities, and notify employees to return to normal activities.

APPENDIX 1

DNCI'S EMERGENCY REPORT FORM FOR INCIDENTS INVOLVING EXPLOSIVES

WHO IS CALLING? NAME:_____

PHONE #: _____ TIME:_____DATE:_____

CALLER'S ORGANIZATION:_____

LOCATION OF INCIDENT: _____

WHAT IS THE EMERGENCY?
PROBLEM**:** (Motor Vehicle Accident, Fire, Scattered Product, Disabled Truck, etc.)

_____

PRODUCTS INVOLVED : VISIBLE PLACARDS ? YES_____ NO_____

SHIPPING NAME(S)_____

UN NUMBER(S)_____

HAZARD CLASSIFICATION (ex: 1.1 D) :_____

QUANTITY: _____

INJURIES: _____

PROPERTY DAMAGE:_____

APPENDIX 5

Area Office Address:
Meadowbank site
Baker Lake, NU

Type of Facility:
Emulsion Plant
AN Tote storage

Emergency Meeting Place Upon Evacuation:
As identified on site orientation forms, employees and visitors are to meet at muster point for head count. Once all persons are accounted for, all will proceed to the Muster Point located at Security Gate #1, located at junction of All Weather Road. (see map)

Emergency Equipment On Hand:
Fire Extinguishers, First Aid Kits, Fire alarm system, video monitoring,

FY 2011 drill conducted

APPENDIX 6

BOMB THREAT CHECKLIST

Exact time of call:			
Exact words of caller:			
QUESTIONS TO ASK			
1- When is bomb going to explode?			
2- Where is the bomb?			
3- What does it look like?			
4- What kind of bomb is it?			
5-What will cause it to explode?			
6- Did you place the bomb?			
7- Why?			
8- Where are you calling from?			
9- What is your address?			
10- What is your name?			
CALLER'S VOICE (circle)			
Calm	Slow	Crying	Slurred
Stutter	Deep	Loud	Broken
Giggling	Accent	Angry	Rapid
Stressed	Nasal	Lisp	Excited
Disguised	Sincere	Squeaky	Normal
If voice is familiar, whom did it sound like?			
Were there any background noises?			
Remarks:			
Person receiving call:		Telephone number call received at:	
Date:		Report call immediately to:

MBK-ENV-0016 Spill Reporting Procedure

Spill Reporting Procedure

		PROCEDURE NUMBER:	**MBK-ENV-0016**
People concerned	• **All Departments**	**Prepared by**	**Jeff Pratt** **Erika Voyer** **Environment Coordinator**
		Authorized by	**Kevin Buck** **Assistant Environmental Superintendent**
Effective :	**January 18, 2015**	***"Safety First, Safety Last … Safety Always!"*** ***"No Repeats" – Our Stepping Stone to ZERO HARM***	
This procedure corresponds to the required minimum standard. Each and everyone also have to comply with the rules and regulations of the Nunavut Government in terms of health and safety at work.			

Objective:

- As per Meadowbank's Water License we must have and employ a Spill Contingency Plan. The overall purpose of creating a spill contingency plan is to minimize the impacts of spills by the establishment of predetermined lines of response and plans of action. The plan has been designed to facilitate effective communication and the efficient clean-up of spills from potentially hazardous materials. The Plan also specifies the reporting of all spills on site to the Environment Department. The Plan details which spills will be reported to regulators.

Concerned departments:

ALL DEPARTMENTS

Risks/ Impacts Legend

Health & Safety | Process/quality | Costs | Environment

Spill Reporting Procedure

Definitions:

A) A **Major spill** is defined as an accidental release of product into the environment that has the potential for adverse impacts to the receiving environment, AEM property or human health. This can include potential impacts to water, surface and groundwater, land, equipment, buildings, human health and the atmosphere.

B) A **Minor spill** is defined as any spill that does not involve a toxic, reactive, or explosive material in a situation that does not pose a significant risk to the environment, is not human health or AEM property.

Procedure	Risks/ Impacts
1. ***All Spills*** on the Meadowbank site regardless of size, quantity, location, or time of spill are to be reported to the Environment department.	
2. Spills must be immediately reported to the Supervisor.	
3. The supervisor will determine if the spill is a major or minor spill. A) If the spill is *Major*, supervisor will call CODE 1 to dispatch (Mine, AWAR, or Control room). B) If the spill is *Minor* the supervisor will contact the Environment Department (**Channel 9** or extension 6747 or 6759 Techs / 6980 or 6728 Coordinators)	
4. Whether the spill is Major or Minor the following must be verbally reported: a) Product description (diesel, hydraulic oil, sodium cyanide) b) Estimated quantity of the product c) Location of Spill d) Area contaminated (#meters x # meters) e) Cause of spill – If this is not yet know best assumption ** if photos can be taken of the spill, please submit to the environment department with spill report	
5. For a *Major Spill* the Supervisor will ensure the area stays safe until the ERT team arrives to intervene. The environment department will assist the ERT team.	

6. For a minor spill the supervisor and the Environment department will then determine the clean-up method and the location in which the contaminated material will be taken too. **Environment department may want to investigate the spill prior to clean up.	
7. A spill report will need to be completed, ***In Full***, and submitted to the environment department within ***12 hrs.*** of the spill occurring. Thus allowing time for the environment department to determine if it needs to be reportable to the Governing bodies. ********Spill report is attached below or can be found here:* http://mymeadowbank/documentcentre/Documents/Health%20and%20Safety/2014%20-%20AEM%20Internal%20Spill%20Report%20Form_V03.pdf	
8. Spills found on site that have not been reported to the environment department will be deemed as Non-Reported spills.

2018 Mock Spill

Mock Spill Baker Lake

September 8th, 2018

Karen Yip, AEM Community Liaison Coordinator in Baker Lake sent a Facebook message to advise the community of the scenario, in case that we use the radios and call a code one or that information is spread on this simulation event.

Scope/event : During the Jet A discharge, simulation of a breaking valve in the secondary containment and overflow of the secondary containment;

Environment technician on site; Fanny Laporte & Jonathan Pameolik

Event:

16:04 the Intertek crew discovered the leaking valve and advised ship captain to stop the fuel discharge

16:05 communication from Intertek to AEM staff at the spud barge, Freddy Riveron and Jean-Noel Vigneault explaining the emergency

16:05 Guillotine activated on the fuel line by the labor in charge of the inspection of the line /Employee of PetroNav Desgagnés

AEM employee left right away to the Environment spill response sea cans and grabbed the necessary supplies to contain the spill, absorbent booms, pads, PPEs, ½ cut drum, yellow secondary containment

16:07 confirmation from the vessel captain that the discharge has stopped- AEM spud barge team arrive at the location of spill Jet A.

Action taken to stop the spreading of the spill, installation of absorbent, etc.

16:12- call from the crew to AEM environment team- AEM E&I supervisors for extra resources, if not available- Arctic Fuel services will be called.

- Shovel to make a trench

- Vacuum truck
- Emergency pump and drums
- Truck for transportation, etc.

Emergency document and phone list was available at the spud barge office.

16:20 Debriefing; review of the ***General Spill Procedure, section 10*** of the OPEP, *Oil Pollution Emergency Plan*

Proper PPEs were worn- rubber gloves for the worker in contact with Jet A and safety glasses.

Good communication between the Intertek and AEM crew,

<u>Recommendation from Environment;</u>

Secure the perimeter: block access to the spill site with a pickup, a ribbon or/and message on the radio

Call dispatch for CODE 1, if the spill is significant or uncontrolled or the environment impact is major, e.i running to the lake.

Pick up at the spud barge need to have a hitch to put the boat in the water in case of emergency, it was not the case at the moment of the mock scenario.

Some documents related to OPEP and Emergency Spill response plan are outdated in the binder at the spud barge office; they need to be updated with the new documents. (as for example Woodward is now replaced by PetroNav Desgagnés, etc.)

<u>Recommendation from the **Intertek** crew for H&S and environment;</u>

To have a dock or a bridge section for pedestrian, they have to walk on the dock around the heavy equipment and they often have glass fuel jars that can break while they try to jump from the boat to the dock (they mention that the access is not easy and unsafe)

While doing the scenario, the Intertek employee recommended that they have a spill kit ready in a box in their pick up at all time during the discharge. This plastic box or cut drum can contain the minimum required to react to an eventual spill without having to drive down to the emergency sea-can, putty, absorbent, PPE- gloves, etc.

<u>Recommendation/question from the **spud barge** personnel;</u>

Why isn't there a permanent pipe & manifold with valve for the Jet A as well as the fuel tank, as of right now, there is probably 5000 feet of hoses which increase the risk of a spill while assembling/dismantling, connections, etc.

Varia;

Sulfur was removed from the Jet A fuel as per new regulation, therefore, the Jet A does not have a strong odor anymore and a spill may not be detected by the smell.

Camera, radio, electronic devices are not allowed around the discharge to prevent the risk of explosion

Low pressure alarm will go off in case of any loss of pressure, therefore, spill will or leak can easily be taken in charge early.

Employee of AEM getting supplies for spill response

Guillotine was pre-installed as per discharge protocol and it was closed right after the call of the leak

Scene where the mock spill occurred

Intertek and AEM crew installing the secondary containment and spill supplies

Drums, spills kits, quattrex and totes were available

Boat, gasoline, safety items were also available- the boat works, we went on the lake

Debriefing

2					

Prepared by: Environmental Department

Approved By: 

Robin Allard
Meadowbank General Supervisor Environment

1 Introduction

The purpose of this document is to satisfy the requirement of Section 15 of the Storage Tank Systems for Petroleum Products and Allied Petroleum Products Regulations (STSPPR) (SOR/2008-197) made pursuant to Canadian Environmental Protection Act, 1999 which states:

> ***15 (1)*** *The owner or operator of a storage tank system must ensure that petroleum product and allied petroleum product transfer areas are designed to contain any releases in liquid form in the environment that occur during the transfer process.*

In accordance to the STSPPR, a ‘’transfer area” means:

> *the area around the connection point between a delivery truck, railcar, aircraft or vessel and a storage tank system in which the tanks have an aggregate capacity of more than 2,500 L.*

Furthermore, Subparagraph 2.1(2) of the STSPPR states:

> *a person must not release - or permit or cause any release of - a petroleum product or allied petroleum product, in liquid form in the environment, during the transfer of the product to or from a storage tank system if, in the case of a system that has a transfer area, the release during transfer reaches outside the transfer area.*

In accordance with the above requirement, the following information intents to be the Product Transfer Area Assessment –for the Baker Lake Oil Handling Facility for both the Jet-A and the Diesel Tanks.

2 Fuel Transfer Area Description

2.1 Baker Lake Oil Handling Facility

The Baker Lake Oil Handling Facility (OHF) consists of six (6), ten (10) million liter tanks for diesel fuel, within secondary containment (Figure 1). The steel fuel tanks have been field-erected and built to API-650 standards with each bermed area holding two tanks. This area is capable of containing 110% of the volume of one ten (10) million liter tanks storage tank. Agnico Eagle is currently in the permitting process to add two (2) 10 ML diesel tanks in Baker Lake. The additional diesel tank will not change the current Product Transfer Area Assessment, as the process for fuel transfer will remain the same, i.e. no additional transfer area will be created.

The OHF also consist of eighteen (18), 100,000L double walled tanks, within secondary containment, for aviation fuel (Jet-A) (Figure 1). The steel fuel tanks have been field-erected and built to API-650 standards with the bermed area holding eighteen tanks. This area is capable of containing >110% of the volume of one 100,000L storage tank. Both Jet-A and Diesel storage area were designed by qualified engineering firm.

The Diesel and Jet-A tanks are refilled during the barge season on an annual basis, generally from July to October.

2.2 Ship to shore transfer area

The Diesel fuel transfer area from ship to tank farm consists of a permanent 6 inches steel pipe, 266m long. Two (2) shipper certified transfer hoses, 4 inches and 178m long, are connected to the shore permanent based pipeline manifold for the transfer of diesel fuel to the diesel tank farm (Photo 2). The diesel transfer rate is 200 m^3/hr. At the connection of the ship's transfer hose to the OHF manifold a portable containment pool is erected and in place during the transfer of product. This pool is capable of holding ~250L of liquid in the case that there is a leak at the flange or residual drips out of the conduit or hard wall pipe. Spill "pop-up" pools are also place under each joint for the transfer hose used to fill the Fuel tanks. These popup pools are only capable of holding 20-50 L of fuel and are in place to catch residual and be a first line of defense in the case of a leak. There is also a permanent watcher at the fuel manifold to detect any leak.

For Jet-A fuel, separate shipper certified hoses are laid out from the vessel to the Jet-A manifold located in the Jet-A Secondary Containment (Photo 3). As detailed in Section 2.1 above, this area is capable of containing >110% of the volume of one 100,000L storage tank. A total of 582m of 4'' certified hose are required to reach the Jet-A transfer area. The Jet-A transfer rate is 100 m^3/hr. Spill "pop-up" pools are place under each joint for the transfer hose used to fill the Fuel tanks. These popup pools are only capable of holding 20-50 L of fuel and are in place to catch residual and be a first line of defense in the case of a leak.

2.3 Refueling station to truck transfer area

For both the Diesel and Jet-A transfer area, there is one loading arm with dry quick connect coupling for tank truck filling operation (Photo 4). Loading arm is connected to an insulated pumping station (Photo 5) and consist of a single continuous 4m x 3 ½ inches pipe from the loading arm to the fuel truck. Both refueling system are equipped of a Scully System. These systems are capable of controlling fills and eliminating spills of tanker trucks. All fuel truck are equipped of a sensor that connected directly with the fuel dispenser. When the volume reach 90% of the truck tank capacity, the sensor stopped the refueling. The flow rate is approximately 715 L/min for both the Jet-A and Diesel. During refueling activities, a portable containment is place under the dry quick connect coupling to capture small spills that may result during disengagement of the loading arm. At the Diesel refueling station, a secondary containment area of 5,000L was constructed.

Location: 64°18’22.76” N, 95°57’33.99” W. Baker Lake, Nunavut
Diesel Tank System ID: EC# 00025772
Jet-A Tank System ID: EC# 00026142

Photo 1: Agnico Eagle Ltd.’s Baker Lake Oil Handling Facility

Figure 2: Diesel Transfer - Connection between shipper transfer hoses and Agnico permanent pipeline

Photo 4: Agnico Eagle Ltd.'s Refueling Station – Loading arm and Scully System

Photo 5: Agnico Eagle Ltd.'s Refueling Station – general view

3 Legislation

3.1 Ship to shore transfer area

Transfer of from ship to shore is performed in conformance with procedures outlined in:

- Canada Shipping Act;
- Response Organizations and Oil Handling Facilities Regulations;
- Vessel Pollution and Dangerous Chemical Regulation;
- Environmental Response Arrangements Regulations;
- Oil Handling Facilities Standards (TP 12402E);
- Response Organization Standards (TP 12401);
- Arctic Waters Oil Transfer Guidelines (TP 10783);
- Environmental Prevention and Response National Preparedness Plan (TP 13585);
- Release and Environmental Emergency Notification Regulations;
- Guidelines for reporting Incidents Involving Dangerous Goods, Harmful Substances and/or Marine Pollutants;
- Requirements of the Central & Arctic Regional Response Plan;
- National Fire Code of Canada (NFCC);
- Storage Tank Systems for Petroleum Products and Allied Petroleum Products Regulations – 2008; and
- Canadian Council of Ministers of the Environment, "Environmental Code of Practice of Aboveground and Underground Storage Tank Systems Containing Petroleum Products and Allied Petroleum Products – 2003 (Updated in 2013).

3.2 Refueling station to truck transfer area

Transfer of fuel into trucks is performed in conformance with procedures outlined in:

- National Fire Code of Canada (NFCC);
- American Petroleum Institute (API) Standard: 2610-94: *"Design, Construction, Operation, Maintenance and Inspection of Terminal and Tank Facilities"*;
- Canadian Petroleum Products Institute (CPPI, 1992*): "Professional Driver's Manual"*;
- Canadian Council of Ministers of Environment (CCME) – Code of Practice (COP) 2003; and
- Agnico Eagle fuel transfer procedure.

4 Analysis of Product Transfer Area Risks

The diesel and Jet-A storage tank system owned by Agnico Eagle Mines, located in Baker Lake, Nunavut, was evaluated in accordance with Environment and Climate Change Canada's (ECCC) approach to transfer area protection. A number of potential incidents, risk and related receiving environments were identified for this product transfer area.

The table below lists potential incidents, outcomes, description of PTA and receiving environments that have been identified for the storage tank system on site. The table also provides an evaluation of identified risks and an assessment on whether further action is required, and a list of mitigation measures.

Table 1: Product Transfer Risk Assessment – Ship to shore

Potential Incident	Outcome	PTA and Receiving Environment	Spill Consequence	Probability	Potential Impact	Evaluation	Mitigation Measures
Leakage if fuel remains in line after offloading and leakage at all couplings in the line (by the boat and outside the connections)	Maximum of ~7,900L of diesel and ~4,800L of Jet-A is released to Baker Lake	Secondary containment Adjacent soil/gravel area within ~10m Baker Lake	Low: the product is confined secondary containment. Moderate: the product reaches bare ground. High: the product reaches a water body.	Moderate	High	No Action Required	Trained Intertek Personal oversee product transfer at all time Line is cleared of fuel following transfer Portable containment used under each transfer hose connection
Coupling/equipment fails at onshore coupling	Maximum of ~7,900L of diesel and ~4,800L of Jet-A is released to Baker Lake			Moderate	High	No Action Required	Ships pumping system shuts off if hose pressure is lost. Trained Intertek Personal oversee product transfer at all time Transfer point is up gradient of pumping point so line does not completely drain if uncoupled Emergency Response Plan and Spill Contingency Plan Oil Pollution Emergency Plan Shipboard Oil Pollution Emergency Plan Marine spill response equipment adjacent to transfer point
Coupling/equipment fails at offshore coupling	Maximum of ~7,900L of diesel and ~4,800L of Jet-A is released to Baker Lake			Moderate	High	No Action Required	Spill contained onboard at pumping area Shipboard Oil Pollution Emergency Plan
Public interference	Transfer hose is damaged by passing boat or			Low	High	No Action Required	Community awareness conducted by Agnico

	transfer impacted by public protest						Boat traffic monitored by Desgagnes and Intertek
Operator spills small amount of fuel while uncoupling hose	~1 L of fuel is captured in secondary containment			High	Low	No Action Required	Portable containment used under each transfer hose connection
Vehicle contact with piping between transfer point and tank	Broken piping releases ~5,000L of fuel to adjacent gravel area, potentially reaching Baker Lake			Low	High	No Action Required	No road where pipes are installed for the transfer Trained Intertek Personal oversee product transfer at all time Fuel lines connected to tank farm can only release contents of the line.

Table 2: Product Transfer Risk Assessment - refueling station to fuel truck

Potential Incident	Outcome	PTA and Receiving Environment	Spill Consequence	Probability	Potential Impact	Evaluation	Mitigation Measures
Overfill during loading of fuel truck	Approximately 95L product is captured in secondary containment	Secondary containment Adjacent soil/gravel area within ~10m Bake Lake	Low: the product is confined secondary containment. Moderate: the product reaches bare ground. High: the product reaches a water body.	Moderate	Low	No Action Required	Secondary containment Scully fitted with optic overfill prevention system Permanent indoor structure with visual display for operator in cold weather Live cameras to Agnico Security Officer office
Overfill device fails	Product flows into secondary containment			Moderate	Low	No Action Required	Shut off button and tanker overfill pipe Scully System Permanent visual contact while refueling
Coupling/equipment fails at pump	Broken piping/hose			Moderate	Moderate	No Action Required	Shut off button, drainage to low point on roadside

station-hose connection.	releases ~121L of fuel to adjacent gravel area.						Emergency Response Plan and Spill Contingency Plan Trained spill response staff and equipment for large spills on site Spill kit
Absence of inspection (pre-op, checklist)	Faulty component or leak is not detected resulting in slow release of ~1L of product			Moderate	Moderate	No Action Required	Pre-op inspection (daily) Standard Operating Procedure (SOP)
Public access	Member of the public attempts to take or release fuel			Low	Low	No Action Required	Signage and surveillance cameras Fuel system security coded Community awareness conducted by Agnico
Vehicle contact with building/equipment	Broken piping releases ~1,000L of fuel to adjacent gravel area.			Low	Moderate	No Action Required	Secondary containment structure protects fuel station from collision by forming a barrier. Fuel lines connected to tank farm can only release contents of the line.
Inappropriate equipment for arctic conditions (arm/valve)	Valves and components fail in arctic conditions releasing ~121L of product			Moderate	Moderate	No Action Required	Valves and hoses suitable for arctic conditions installed. Pre-op inspection (daily)
Operator spills small amount of fuel while uncoupling hose	~1L of fuel is captured in secondary containment			High	Low	No Action Required	Portable containment used under dry quick connection

Please see Appendix A for the calculations relating to the product transfer areas. In summary, potential product spillage, volume has been calculated as follows:

Fueling station: a maximum delivery rate of 715 L/min and an emergency shut off time of 8 seconds would result in a product spillage volume of approximately 95.36L. Based on 8.9 cm hose at 4.06 m in length, a maximum potential spill at the tank / hose connection would result in an additional volume of 25.24 L, for a total 120.6 L of fuel spilled.

Ship to shore: a diesel maximum delivery rate of 3,333 L/min and an emergency shut off time of 8 seconds would result in a product spillage volume of approximately 444.4 L. Based on shipper transfer hose (10 cm diameter/178m in length * 2 hoses) and permanent pipeline (15 cm diameter/266 m in length), a maximum potential spill at the tank / hose connection would result in an additional volume of 7,492.65 L, for a total 7,937 L of diesel spilled.

Ship to shore: a Jet-A maximum delivery rate of 1,667 L/min and an emergency shut off time of 8 seconds would result in a product spillage volume of approximately 222.24 L. Based on 10 cm hose at 582 m in length, a maximum potential spill at the tank / hose connection would result in an additional volume of 4,568.70 L, for a total 4,790.94 L of Jet-A spilled.

5 Mitigation of Risks

5.1 Ship to shore transfer area

In the event of a spill, three (3) potential receiving environments have been identified for the fuel transfer system: the soil/gravel area partially surrounding the transfer area secondary containment and extending a distance of approximately 10 meters, the adjacent soil/ground surface, and the adjacent water body Baker Lake.

Any product amount of 100L or less that spills onto the gravel area can be recovered using the spill kit and shovels/equipment available on site. For spills of over 100 L, the product will likely reach the adjacent soil/ground surface and/or Baker Lake directly via overland surface flow (depending on the season). The following mitigation measures include:

- 250L secondary containment pool at onshore connection point;
- 20-50L spill 'pop-up' pools are also place under each joint for the transfer hose used;
- Pump and 1,000L portable containments on standby during transfer;
- Trained Intertek Personnel oversee product transfer at all time;
- Emergency Response Plan and Spill Contingency Plan on site;
- Oil Pollution Emergency Plan updated annually and review with all personnel involved in the ship to shore fuel transfer;
- Marine spill response equipment on site;
- As the ship to shore transfer only occurred during open water season, there is no potential spill risk during winter;
- Shipboard Oil Pollution Emergency Plan;
- The ship's pumping system is fitted with an emergency shut off system which is activated when pumping pressure is lost; and
- Annual MOCK spill and result analysis;

5.2 Refueling station to truck transfer area

In the event of a spill three (3) potential receiving environments have been identified for the refueling system: the gravel area surrounding the refueling station and extending a distance of approximately 10 meters, the adjacent soil/ground surface, and the adjacent water body Baker Lake.

Any product amount of 1,000L or less that spills onto the gravel area can be recovered using the spill kit and heavy equipment on site. For spills of over 1,000L, the product will likely reach the adjacent soil/ground surface and/or the Baker Lake directly via overland surface flow (depending on the season). During winter, the likely hood of product flowing to the shoreline increases; however, snow berms can be quickly installed. Mitigation measures include;

- Secondary containment for hose storage;
- Secondary containment for refueling of fuel trucks;
- Standard Operating Procedure (SOP);
- Inspection to determine if SOP are followed;
- Trained operators;
- Spill kit at refueling area containing absorbent pads;
- Marine spill response equipment on site;

- Personnel monitor transfer from viewing window in pump station; and
- Scully system - wire optic transfer system to prevent overfill.

6 Standard Operating Procedure (SOP)

6.1 Refueling station to truck transfer area

The Agnico procedure for diesel and Jet-A refueling fuel trucks in summarized as follows;

1. Perform an inspection of the vehicle.
2. Park the vehicle in the vicinity of the refueling tank and shut off your ignition.
3. Install wheel chocks on either side of the tanker tire.
4. Inspect the entire working area including the steps up to the HMI and the area in front of the loading arm and scully system; call your supervisor if there are problems.
5. Install the portable spill containment underneath the connection point.
6. Check the maximum capacity for the tanker being used. Ensure to only fill the tanker at 90% of the capacity to have room for fuel expansion at different temperatures, and a safe level for haulage. Fill the tanker to maximum 40,000L.
7. At the valve control panel, lift all the levers up, and make sure the valves are open.
8. Remove the cap of the scully plug and push and twist it onto the receiving end on the truck. Make sure the green light is on before continuing.
9. Connect the loading arm to the tanker.
10. Make sure the valves are open on each side.
11. Open the valve on the building.
12. Enter the control room and begin to program the fuel loading on the HMI.
13. Enter the applicable Microload identification and load sequence.
14. Enter the volume measure with the pop-up keypad.
15. Select the start button to activate the pump.
16. Once the fueling begins, the operator must monitor the situation diligently; this includes checking for leaks or monitoring any other unusual situations. The operator must be at the connection point at all times during fueling.
17. When finished pumping, close the valve on the building.
18. Disconnect the loading arm first, and then the truck level control.
19. Put the arm back and the truck level control in place. Close the valve.
20. Put the protection bag over the scully and the hose. Verify if the caps are put back on the truck.
21. Put back the portable spill containment.
22. At the valve control panel, pull down all the lever to close valve, and make sure they are closed.
23. Complete the mechanical verification in the pump station. Make sure they have no leaks on the equipment.
24. Before you leave, make sure the three doors are close at the fuel station.
25. Remove the wheel chocks and fully inspect the vehicle before beginning to bring the fuel to the Meadowbank Fuel Tank Farm.
26. If you encounter any emergency or a spill occurs, call your supervisor immediately and the Road supervisor of Agnico Eagle Mine Meadowbank.

6.2 Ship to shore transfer area

For a completed review of procedure during fuel transfer, refer to the Oil Pollution Emergency Plan. The fuel transfer is overseen by Intertek (contracted first responder). The Agnico procedure for refueling diesel and Jet-A tanks in summarized as follows:

1. The Oil Pollution Emergency Plan (OPEP) must be reviewed on an annual basis and updated prior to the first annual discharge. This will include but not limited to:
   a) Reviewing the phone numbers for emergencies
   b) Updating maps
   c) Review and if necessary update equipment lists
   d) Review roles and responsibilities
   e) Update Declaration
2. Contact Canadian Coast Guard and Transport Canada Pollution Prevention and make them aware of plans for transferring of fuel into our Oil Handling Facility (OHF) for that season
3. Complete Inventory report for Spill Response Sea Can at Agnico's Oil Handling Facility in Baker Lake
4. Ensure Shipping Company has provided Hose Testing Annual certification
5. All personnel who will be a part of the fuel transfer (including Baker Lake Supervisor and third part contractor Intertek) must review the OPEP and be familiar with preventive measures to take and with the steps to take in the case of a spill event while fueling
6. Install and monitor secondary containment underneath each connection of conduit on land
7. Ensure there is two-way functional communications between the OHF and the off-loading vessel
8. Ensure there is lighting in place at the transfer flange to provide illumination during any transfers taking place during the low to no light hours
9. Prior to any discharge, Agnico Eagle must receive a copy of the ship/shore checklist completed by the shipping company. Agnico Eagle should also verify this has been completed (as much as realistically possibly without boarding the ship)
10. The Pre-discharge Checklist for Agnico's Oil Handling Facility in Baker Lake must be completed, signed and provided to the Environment Department prior to discharge
11. During the ship-to-shore transfer, Agnico Eagle will have competent personnel on location at all times to monitor the fuel transfer and maintain contact with the tanker's crew
12. Monitor the fuel transfer at the beginning of each transfer and after that on an hourly basis checking the manifold, conduit, tank, and any connection points on land for spills and/or leaks. Communication between shore and ship should take place on an hourly basis
13. Have a fuel spill scenario annually

7 Conclusion

Agnico Eagle have the ability to respond and prevent spill to the fuel transfer area in Baker Lake according to the following management plan and refer the reader to those plan for more details:

- Oil Pollution Emergency Plan
- Spill Contingency Plan
- Shipboard Oil Pollution Emergency Plan
- Product Transfer Area Assessment – Baker Lake Oil Handling Facility

Furthermore, in the event of a spill reaching Baker Lake, a dedicated boat (open water season), containment booms, anchors, trench shovels, absorbent pads, pumps and are accessible year-round, and

regular spill response training is conducted with members of the Meadowbank Emergency Response Team and Environment Department. Meadowbank Environmental Technicians also conduct regular inspections of the Baker Lake OHF in order to ensure proper spill prevention and containment equipment is available, and that proper fuel transfer protocols are followed. All of the measures noted above are in place in order to contain, mitigate and prevent spills during the process of transferring fuel.

Appendix A - Potential Spill Quantities

1- Diesel Ship to shore

Flow rate = 200 m^3/hr (3,333 L/min) maximum rate
Transfer hose length: 17,800 cm, 10 cm diameter
Permanent pipeline: 26,600 cm, 15 cm diameter

Volume of Spill (from time it takes operator to shut off pumping)

3,333L/60s = 55.55 L/s
8s = time it takes for operator to turn off the pump should the tank start to overflow

Volume = 55.55L/s * 8s
= **444.4L**

Volume of the Shipper Transfer Hose

1. Radius = (diameter of the pipe / 2)
   Radius = (10/2)
   = 5

   Volume of a cylinder: V = πr2h
   Volume = 3.14 * 5^2 * 17,800
   = 1,397,300 cm^3

2. 1 Liter = 1,000m^3
   Volume in Liters = (volume in cm^3) * (1L/1,000cm^3)
   Volume = (1,397,300 / 1,000 L)
   = 1,397.3 L

3. Two (2) shipper transfer hose use to connect the permanent pipeline manifold
   = 1,397.3 * 2
   = **2,794.6 L**

Volume of the permanent pipeline

1. Radius = (diameter of the pipe / 2)
   Radius = (15/2)
   = 7.5

2. Volume of a cylinder: V = πr2h
   Volume = 3.14 * 7.5^2 * 26,600
   = 4,698,225 cm^3

3. 1 Liter = 1,000m^3
   Volume in Liters = (volume in cm^3) * (1L/1,000cm^3)
   Volume = (4,698,225 / 1,000 L)
   = 4,698 L

The maximum amount of a potential spill at the site would be **7,937L**.

2- Jet-A Ship to shore

Flow rate = 100 m^3/h (1,667 L/min) maximum rate
Transfer hose length: 58,200 cm, 10 cm diameter

Volume of Spill (from time it takes operator to shut off pumping)

1,667L/60s = 27.78 L/s
8s = time it takes for operator to turn off the pump should the tank start to overflow

Volume = 27.78L/s * 8s
= **222.24L**

Volume of Transfer Hose

1. Radius = (diameter of the pipe / 2)
   Radius = (10/2)
   = 5

   Volume of a cylinder: V = πr2h
   Volume = 3.14 * 5^2 * 58,200
   = 4,568,700 cm^3

2. 1 Liter = 1,000m^3
   Volume in Liters = (volume in cm^3) * (1L/1,000cm^3)
   Volume = (4,568,700 / 1,000 L)
   = **4,568.7 L**

The maximum amount of a potential spill at the site would be **4,790.94 L**.

3- Diesel and Jet-A Fuel Station to Fuel Truck

Flow rate = 715 L/min
Scully arm and hose length: 406cm, 8.9cm diameter

Volume of Spill (from time it takes operator to shut off pumping)

715L/min = 715L/60s = 11.92 L/s
8s = time it takes for operator to turn off the pump should the tank start to overflow

Volume = 11.92L/s * 8s
= **95.36 L**

Volume of Loading Arm

1. Radius = (diameter of the pipe / 2)
   Radius = (8.9/2)

= 4.45

Volume of a cylinder: V = πr2h

Volume = 3.14 * 4.45^2 * 406
= 25,245.02 cm^3

2. 1 Liter = 1,000m^3
   Volume in Liters = (volume in cm^3) * (1L/1,000cm^3)
   Volume = (25,245.02 / 1,000 L)
   = **25.24 L**

The maximum amount of a potential spill at the site would be **120.6L**.

Terrestrial Ecosystem Management Plan (TEMP), Version 6

AGNICO EAGLE

MEADOWBANK DIVISION

Terrestrial Ecosystem Management Plan

Prepared by:
Agnico Eagle Mines Limited – Meadowbank Division

Version 6
December 2018

EXECUTIVE SUMMARY

As a requirement of the Whale Tail Pit Project Certificate No.008, Condition 28, and Meadowbank Project Certificate No.004, Condition 54, this report provides an updated Terrestrial Ecosystem Management Plan (TEMP) for Agnico Eagle Mines Ltd. (Agnico Eagle) Meadowbank Gold Mine, which includes the All-Weather Access Road (AWAR) from Baker Lake to the Mine, the Vault Pit Haul Road, and the extension of the Meadowbank Mine through the Whale Tail Pit and Haul Road (inclusively the Project). In addition, the TEMP also applies to the proposed Whale Tail Expansion Project that includes a small expansion to the previous LSA to accommodate an additional pit (IVR Pit), underground mining and a vertical and minor horizontal expansion of the existing waste rock storage facility (WRSF). All other infrastructure related to processing (e.g., mill and tailings), camps, and airstrip, among others, remain unchanged. The Project is located approximately 90 to 150 km north of Baker Lake and 300 km inland from the northwest coast of Hudson Bay.

This revised TEMP has been written as a requirement of Project Certificate No.004 and No.008 in association with the Meadowbank Terrestrial Ecosystem Impact Assessment and the Whale Tail Pit Final Environmental Impact Statement, which identify potential residual effects of the Project to wildlife and wildlife habitat. For each potential effect, mitigation measures are proposed. To confirm that residual effects (i.e., after mitigation) are acceptable, a comprehensive monitoring plan is presented that evaluates the response of wildlife habitat and wildlife populations to the effects of the Project and Project-related activities, and measures effects against thresholds.

Adaptive management is used to assess the effectiveness of the mitigation. Ongoing review of the TEMP through the Whale Tail Pit regulatory process and annual Wildlife Monitoring Summary Reports by regulatory agencies, technical reviewers, Terrestrial Advisory Group, and stakeholders will further ensure that local and regional concerns have been adequately addressed.

This revised comprehensive TEMP builds on the successes of the original TEMP (October 2005) and incorporates the extension of the Meadowbank Mine through the Whale Tail Pit operations. To date, the TEMP has been effective in identifying, monitoring, and managing residual effects of the Project on wildlife and wildlife habitat. This revised TEMP has incorporated detailed decision trees outlining monitoring and adaptive management for varying scenarios of wildlife occurrence, and should enhance the ability of operations managers to respond to changes in wildlife distribution, abundance, and movement. This method provides transparency based on agreed upon approaches, thereby minimizing and mitigating potential Project/wildlife interactions.

IMPLEMENTATION SCHEDULE

This Plan will be implemented immediately subject to any modifications proposed by the Nunavut Water Board and Nunavut Impact Review Board as a result of the review and approval process.

DISTRIBUTION LIST

Agnico Eagle – General Manager

Agnico Eagle – Engineering Superintendent

Agnico Eagle – Geotechnical Engineer

Agnico Eagle – Environment Superintendent

Agnico Eagle – Environmental Coordinator

Agnico Eagle – Environmental Technician

DOCUMENT CONTROL

Version	Date (YMD)	Section	Revision
1	October 2005		Comprehensive plan for Meadowbank Project
2	May 2016	All	Update to include Whale Tail Pit and Haul Road
3	February 2017	All	Update in response to Whale Tail environmental assessment information requests
3.1	May 2017	All	Further revisions following meetings with GN, KivIA, HTO in Ottawa, February 22 and 23, 2017
3.2	June 2017	2.2, 3.4 and 4.0	Following EIS Technical Session and Community Roundtable in Baker Lake, April 28 – May 2, 2017
4	July 2017	All	Further revisions following meetings with GN, KivIA, HTO in Winnipeg, June 20 and 21, 2017
5	June 2018	All	Final revisions following final hearings, receipt of NIRB Project Certificate No.008 and comments from the TAG meeting.
6	December 2018	All	Revisions following receipt of NIRB Project Certificate No.008, TAG meeting and for review of the proposed Whale Tail Expansion Project.

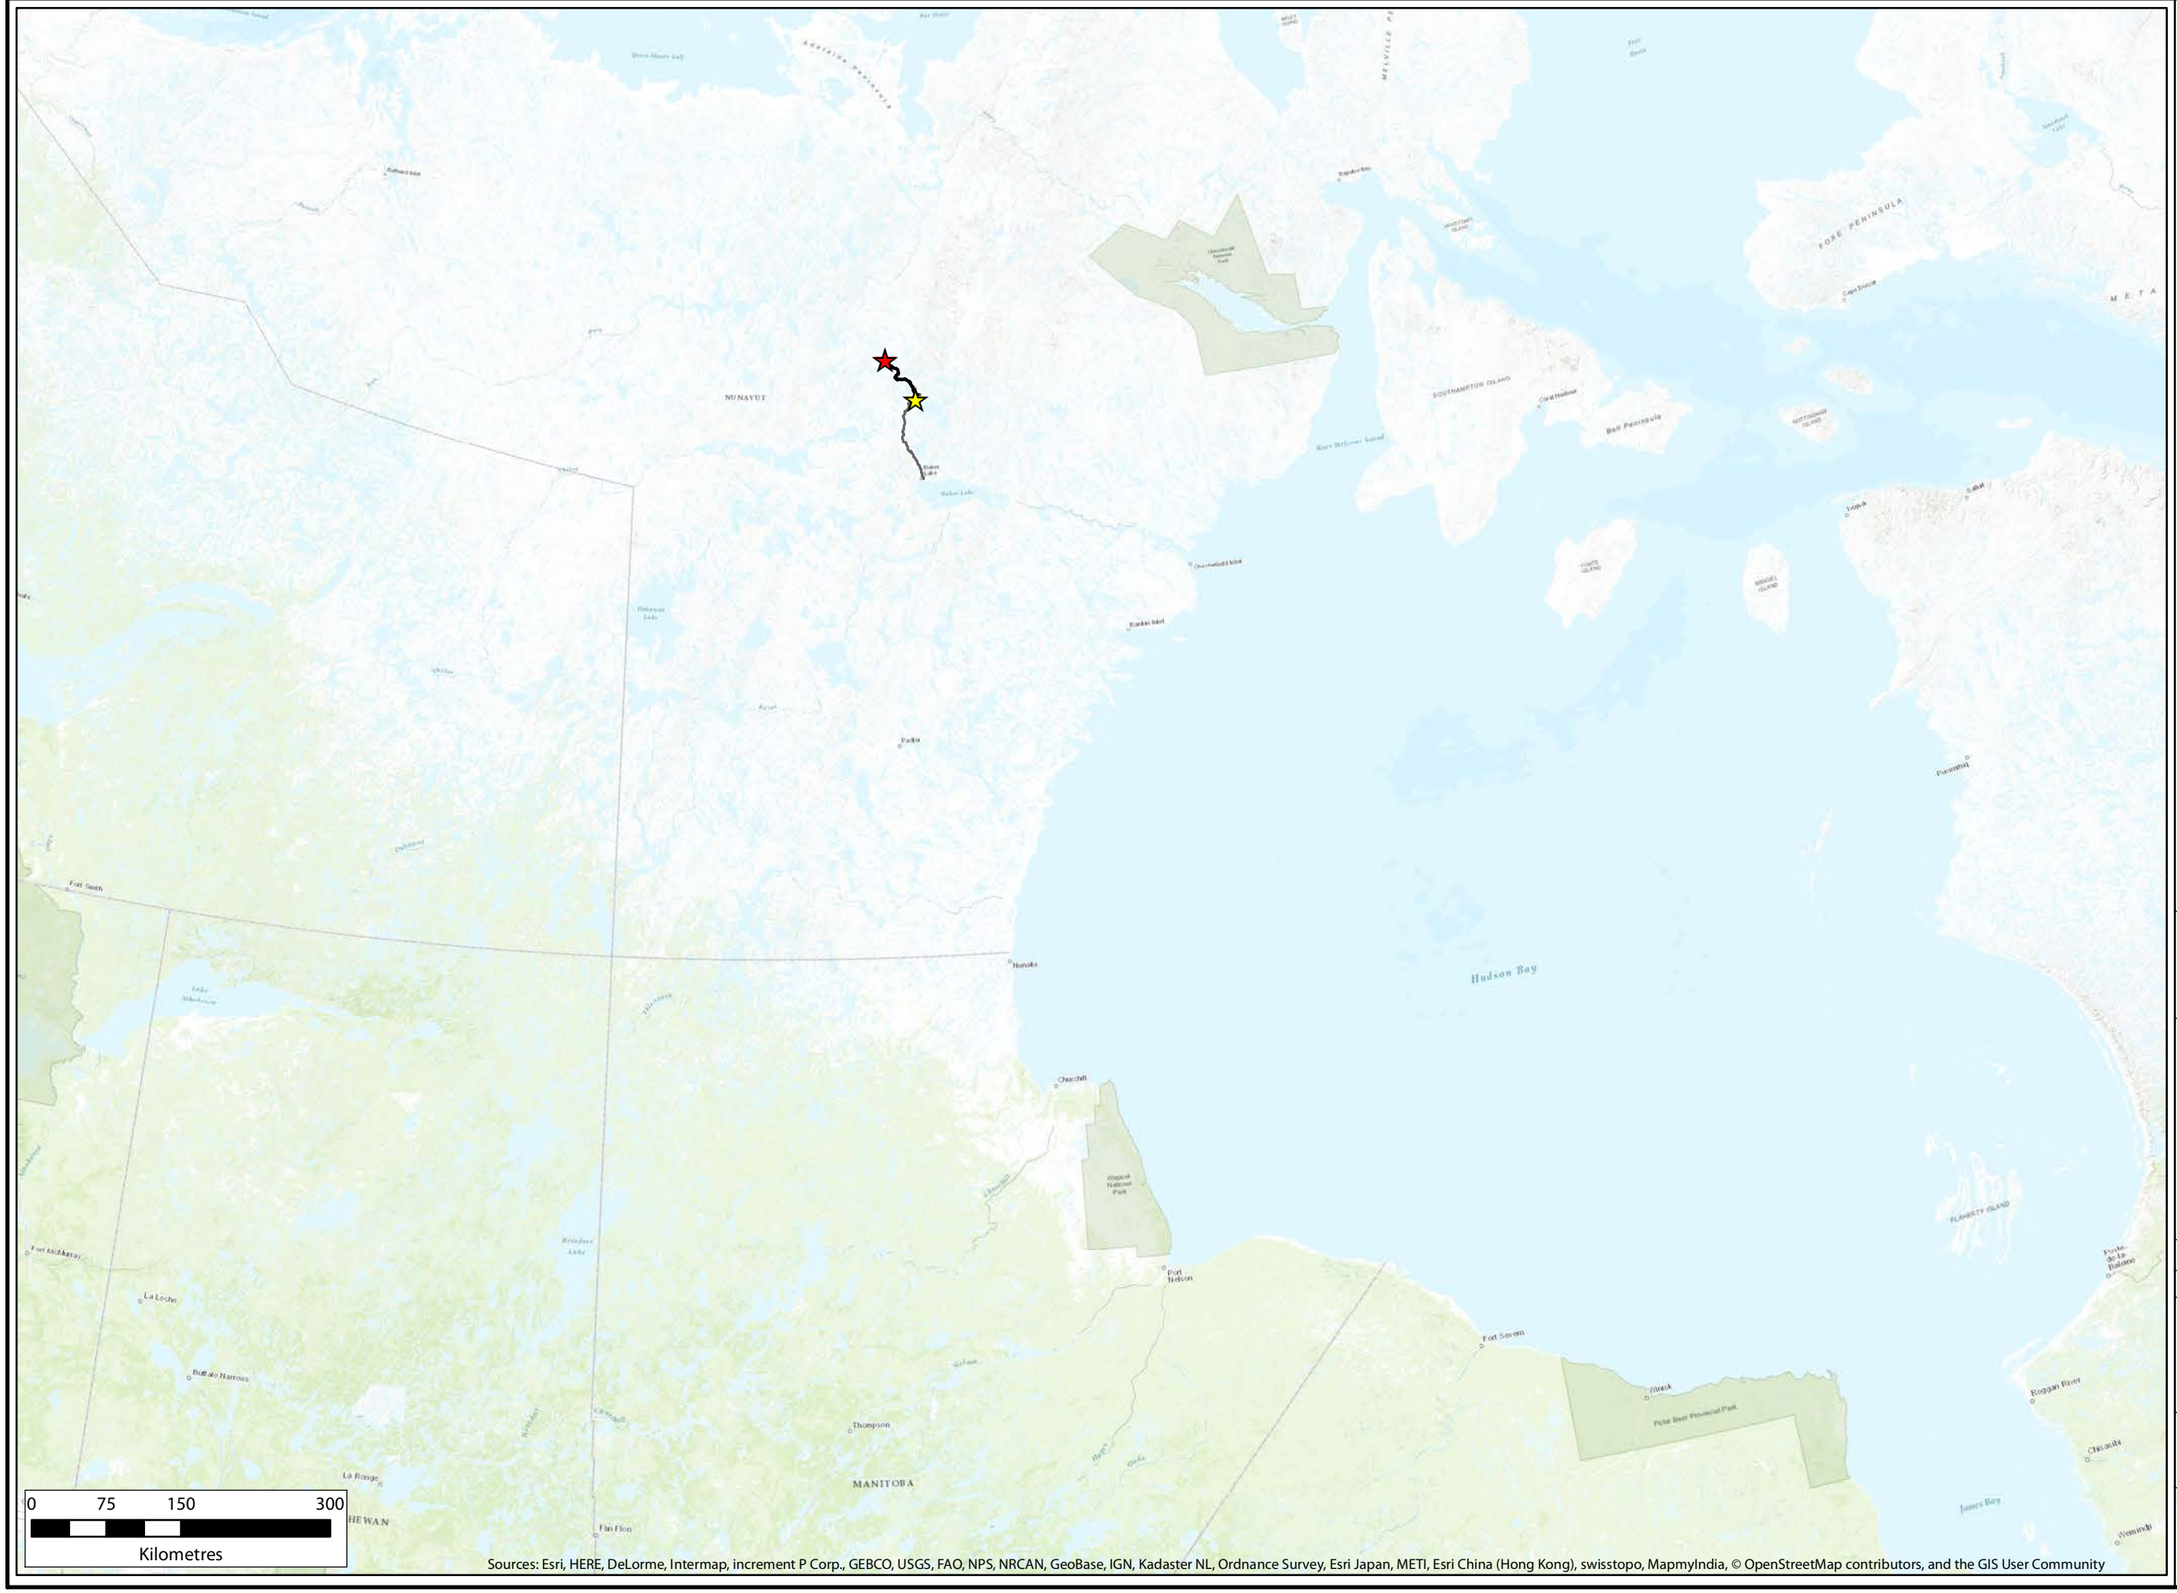
1. INTRODUCTION AND APPROACH



1.1 BACKGROUND

This report provides the Terrestrial Ecosystem Management Plan (TEMP) for Agnico Eagle Mines Ltd. (Agnico Eagle) Meadowbank Gold Mine, which includes the All-Weather Access Road (AWAR) from Baker Lake to the Mine, the Vault Pit Haul Road, and the Whale Tail Pit and Haul Road extension (inclusively the Project; see **Figures 1** and **2**). In addition, the TEMP also applies to the proposed Whale Tail Expansion Project that includes a small expansion to the previous Local Study Area (LSA) to accommodate an additional pit (IVR Pit), underground mining and a vertical and minor horizontal expansion of the existing waste rock storage facility (WRSF). All other infrastructure related to processing (e.g., mill and tailings), haul road, camps, and airstrip, among others, remain unchanged. The Project is located from approximately 90 to 150 km north of Baker Lake and 300 km inland from the northwest coast of Hudson Bay. The Project area is above the tree line near the Arctic Circle. The local physiography is characterized by numerous lakes and low, rolling hills covered mainly by lichen/rock complexes, and heath tundra.

This TEMP has been written to ensure consistency in association with the Meadowbank Terrestrial Ecosystem Impact Assessment (EIA; Cumberland 2005a), the Whale Tail Pit Final Environmental Impact Statement Addendum (EIS; Golder 2016) and proposed Whale Tail Expansion activities, which identify potential residual effects of the Project to vegetation and wildlife. The EIAs are based on an analysis of Project components and their effects on terrestrial Valued Ecosystem Components (VECs). In addition to being a revision of the original TEMP (Cumberland 2005a) and building on the monitoring experience at Meadowbank, this TEMP has also benefitted from collaborative input from the Government of Nunavut Department of Environment (GN), the Kivalliq Inuit Association (KivIA), and the Hunters and Trappers Organization (HTO) of Baker Lake through annual report reviews, technical reviews, workshops, and discussions through the Terrestrial Advisory Group (TAG).

A summary of environmental effects and a description of mitigation measures that have already been implemented during the design, construction, and operations phases of the Project, and those that will be implemented, are provided in this document. A detailed description of potential environmental effects is provided in the Project's EIA documents.

For each potential effect (described in detail in the EIAs), mitigation measures are proposed. To measure residual effects (i.e., after mitigation), a monitoring plan is presented that evaluates the response of vegetation communities and wildlife to the effects of the Project and Project-related activities, and measures effects against thresholds (see **Figure 3**).

Figure 3: Relationship between Effects, Mitigation, and Monitoring

Where monitoring determines that unacceptable residual effects exist, an adaptive management approach will be taken to assess the monitoring and mitigation. Additional mitigation will be the most likely means by which this will be accomplished. Adaptive management is an ongoing process that evolves throughout the life of the Project as better and more effective ideas are introduced in a process that is designed to be continually improving. Ongoing review of the TEMP and annual Wildlife Monitoring Summary Reports (which provide results of TEMP monitoring programs) by regulatory agencies, technical reviewers, and stakeholders will further ensure that local and regional concerns have been adequately addressed. All of these approaches or plans have been previously reviewed by Nunavut Impact Review Board (NIRB). For example, due to concerns raised by local stakeholders, Agnico Eagle has updated the Air Quality and Dustfall Monitoring Plan (Agnico Eagle 2018) to continue to measure dustfall along the Baker Lake to Meadowbank AWAR and Whale Tail Haul Road, and a Screening Level Risk Assessment Plan (**Appendix A**). In addition, response procedures have been developed for when Ungulates, Predatory Mammal dens, and Raptor nests are in close proximity to Project facilities.

The mitigation and monitoring procedures identified in this TEMP will be integrated into all stages of the Project to ensure that mine operation and future mine development can proceed as scheduled while accommodating wildlife management needs. The TEMP also outlines strategies for identifying how natural changes in the environment can be distinguished from Project-related

effects. Reporting of natural versus Project-related effects will be in the annual Wildlife Monitoring Summary Report.

This TEMP builds on the success of the original TEMP (October 2005) and subsequent meetings and feedback from the Kivalliq Inuit Association (KivIA), the Baker Lake Hunter and Trapper Organization (HTO), the Kivalliq Wildlife Board (KWB), and the Government of Nunavut (GN). The revised TEMP includes monitoring of the extension of the Meadowbank Mine through the operation of Whale Tail Pit and proposed Whale Tail Expansion, and additions (e.g., decision trees for wildlife monitoring and management) will increase the transparency of the monitoring and mitigation, and enhance the ability of operation managers to protect wildlife occurring in the area.

1.2 PURPOSE AND OBJECTIVES

While specific monitoring objectives for each VEC are provided in later sections, the TEMP should meet the following global objectives:

- Provide information to test the predicted wildlife-related effects of the Project
- Estimate the effectiveness of environmental design and mitigation efforts
- Incorporate local and traditional ecological knowledge (Inuit Qaujimajatuqangit)
- Monitor for action levels or thresholds that could be used to initiate additional mitigation or studies
- Reduce uncertainties and provide information that increases confidence in environmental assessment predictions of future developments
- Consider regional and collaborative environmental monitoring programs, and contributions to regional or national monitoring initiatives
- Reduce Project related effects to wildlife

1.3 RELEVANT ENVIRONMENTAL MANAGEMENT PLANS

This document includes overlap with other environmental management plans for the Meadowbank Mine, Whale Tail Project, and proposed Whale Tail Expansion. The following other plans contain elements of mitigation and monitoring that are relevant to the terrestrial environment.

- Air Quality and Dustfall Monitoring Plan
- Hazardous Materials Management Plan
- Landfarm Design and Management Plan
- Landfill Design and Management Plan
- Noise Monitoring and Abatement Plan

- Spill Contingency Plan
- Traffic Monitoring Plan
- Transportation Management Plan All-weather Private Access Road
- Wildlife Protection and Response Plan
- Predatory Mammal Den Management and Protection Plan
- Migratory Bird Mitigation Plan

1.4 VALUED ECOSYSTEM COMPONENTS SELECTION

Valued Ecosystem Components were selected through consultation with regulatory and governmental authorities and members of the local community (e.g., Hamlet of Baker Lake, Baker Lake HTO), and a review of VECs identified in other northern mines. Selection of VECs was further refined through the consideration of one or more of the following criteria: conservation status, relative abundance within the Project study area, importance in subsistence lifestyle and economy, importance in predator-prey systems, habitat requirement size and sensitivity, and contribution to local area concerns.

Based on this selection process, the key terrestrial VECs were determined to be: Wildlife Habitat, Ungulates, Predatory Mammals, Raptors, Waterbirds, and Upland Breeding Birds. Key species associated with these VECs are shown in **Table 1.**

Table 1: Valued Ecosystem Components in the Meadowbank and Whale Tail Study Areas

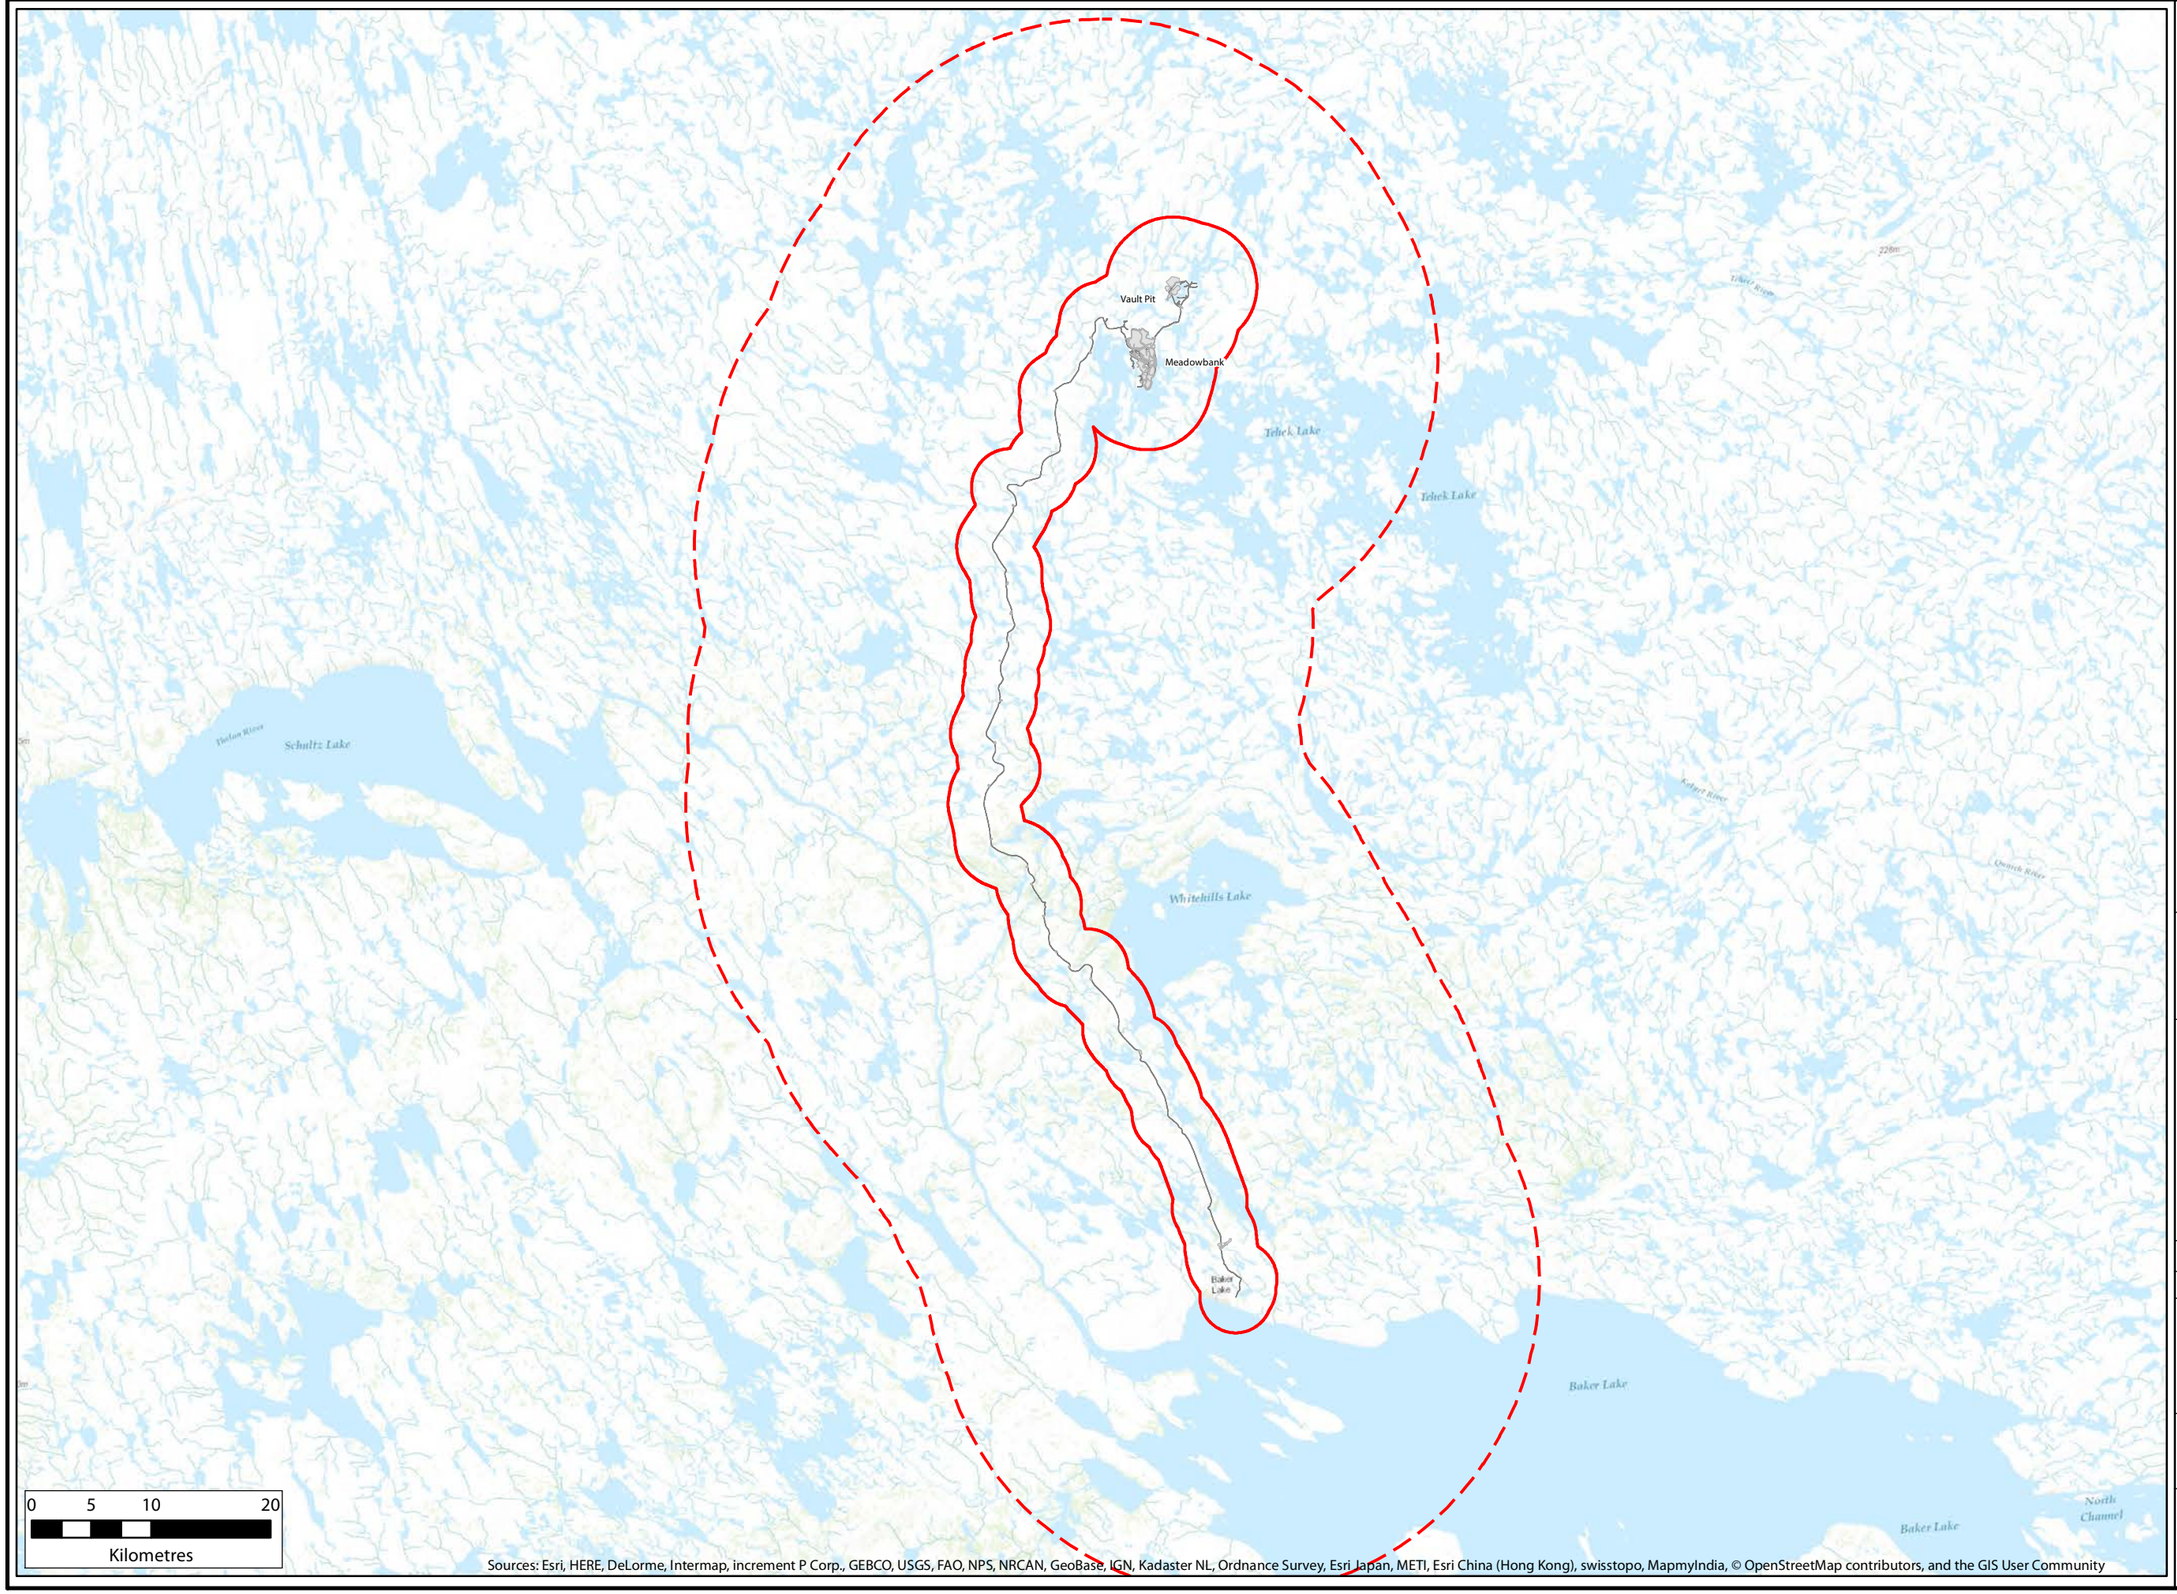
VEC	Common Name	Scientific Name
Vegetation	N/A	N/A
Ungulates	barren-ground caribou muskox	*Rangifer tarandus* ssp. *groenlandicus* *Ovibos moschatus*
Predatory Mammals	grizzly bear wolverine gray (Arctic) wolf Arctic fox	*Ursus arctos* *Gulo* *Canis lupus* *Vulpes lagopus*
Raptors	peregrine falcon gyrfalcon rough-legged hawk snowy owl	*Falco peregrinus* ssp. *tundrius* *Falco rusticolus* *Buteo lagopus* *Nyctea scandiaca*
Waterbirds	Canada goose long-tailed duck loons waterfowl[(a)]	*Branta canadensis* *Clangula hyemalis* *Gavia* spp.
Upland Breeding Birds	rock ptarmigan lapland longspur horned lark semipalmated sandpiper sandhill crane	*Lagopus mutus* *Calcarius lapponicus* *Eremophila alpestris* *Calidris pusilla* *Grus canadensis*

a) Waterfowl, in general, are included based on concerns related to potential for bycatch of diving birds during fish-outs, see Section 2.3.5

1.5 SPECIES OF CONCERN

Species of concern include those species identified by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) as being At Risk or Threatened, and may be impacted by the Project. Species of concern for the Project are listed in **Table 2**.

Table 2: Species of Concern Meadowbank and Whale Tail Study Areas



Species	COSEWIC Status	SARA Status	Effects Pathways
Barren-ground caribou	Threatened	No schedule	• mortality due to vehicle collisions • habitat loss • change in harvest due to improved access • barriers to movement and changes in behaviour
Grizzly bear	Special Concern	No schedule	• habitat loss • mortality due to attraction or vehicle collisions
Polar Bear	Special Concern	Schedule 1	• None anticipated
Wolverine	Special Concern	No schedule	• habitat loss • mortality due to attraction or vehicle collisions
Short-eared Owl	Special Concern	Schedule 1	• habitat loss
Peregrine Falcon	Special Concern	Schedule 1	• physical hazards to nests on mine infrastructure or in quarries
Red-Necked Phalarope	Special Concern	No schedule	• habitat loss

As per Project Certificate No.008, Condition 35, Agnico Eagle will ensure that the mitigation and monitoring strategies developed for Species at Risk (SARA) are updated as necessary to maintain consistency with any applicable status reports, recovery strategies, action plans, and management plans that may become available through the duration of the Project. Updates to the SARA will be considered during annual review and with each new revision of the TEMP. **Appendix B** highlights the Project Certificate No.008 Term or Condition related to the TEMP.

1.6 SPATIAL BOUNDARIES

The Meadowbank Mine local study area (LSA) includes a 5 km radius area centred on the Mine site and a 5 km radius around the Vault Site creating an elliptical shape with a total area of 154 km^2. The AWAR LSA consists of a 3 km wide corridor centred on the AWAR between Baker Lake and the Meadowbank Mine (**Figure 4**). The regional study area (RSA) encompasses an area that includes a 25 km radius area around the Main and Vault sites and a 50 km wide corridor along the AWAR for a total area of 5,077 km^2 (**Figure 4**).

The Whale Tail LSA is a 3 km corridor centered on the Whale Tail Haul Road and borrow site access roads (i.e., 1.5 km on either side of the road and 1.5 km around borrow areas) and includes an approximate 1.5 km buffer around development areas at the Whale Tail Pit area, for a total area of 282 km^2. The Whale Tail RSA is a 50 km corridor centred on the Haul Road alignment (i.e., 25 km on either side of the Haul Road and borrow site access roads, and 25 km around borrow areas), with a total area of 5,017 km^2 (**Figure 5**).

1.7 RESIDUAL EFFECTS

Residual effects are Project effects that remain after implementation of all mitigation. A comprehensive assessment of the expected residual effects on vegetation and wildlife has been provided in the Meadowbank Terrestrial Ecosystem Impact Assessment (Cumberland 2005a), the Whale Tail Pit Environmental Impact Statement (Golder 2016) and the proposed Whale Tail Pit Expansion Addendum (Golder 2018). The effectiveness of mitigation (described in **Section 2.0**) and magnitude of residual effects will be determined via monitoring programs outlined in this document, and compared against thresholds described in **Section 3.0**. Where monitoring determines that residual effects are outside established thresholds of acceptability, adaptive management will lead to more intensive monitoring or additional mitigation.

2. MITIGATION

2.1 GENERAL MITIGATION

General mitigation applicable to most wildlife are provided in **Table 3** below, while **Section 2.2** summarizes the anticipated environmental effects and mitigation specific to each VEC.

Table 3: General Mitigation for the Meadowbank Mine, and Whale Tail Pit and Haul Road

Environmental Education
Employees will participate in a wildlife awareness program during their induction, including bear safety procedures, instructions on wildlife rights-of-way, and other wildlife protection measures (see Wildlife Response and Protection Plan in **Appendix C**).
Feeding of wildlife is prohibited.
Wildlife on Site
A wildlife reporting system (e.g., wildlife log) will be maintained by environmental staff. Where human safety or wildlife well-being is an issue, employees will be notified regarding procedures (up to an including stopping work in the affected area). The Wildlife Protection and Response plan includes a staff organizational chart indicating who has responsibility for predatory mammal-human interactions, and procedures to be followed (see **Appendix C**).
Road Access and Restrictions
Public use of the AWAR is monitored by the Safety Department. For mine safety reasons, Baker Lake residents will be prohibited from travelling beyond the 85 km mark of the AWAR (see **Figure 2**). Because the Vault and Whale Tail Haul Roads begin within existing mine facilities and are beyond km 85, public access to these roads will be limited (see **Figure 2**). Voluntary hunting use data will be collected by Agnico Eagle at the gatehouse, and further action regarding acquiring this information is being considered to evaluate the presence of ATVs and hunting (i.e., shooting) as a mechanism affecting caribou interactions with the AWAR and as a component of the Hunter Harvest Survey (HHS).
The *Wildlife Act* prohibits discharging firearms along or across roads or within 1 km of dwellings (see **Figure 2** for no shooting zone). Upon notification by Agnico Eagle or this public, this is to be enforced by the Government of Nunavut (GN). Marker posts will be placed periodically to delineate the 1 km buffer along the road.
To avoid unnecessary degradation of wildlife habitats, Project vehicles will be restricted to existing roads.
Wildlife have the right-of-way on roads.
Maximum speed limits of 50 km/hr will be enforced, including periods of reduced speed limits when caribou, and/or other wildlife, are on or adjacent to the road.
All road-killed wildlife will be reported immediately to Meadowbank Mine environmental staff and removed to avoid attracting scavengers. If necessary, animals will be examined by the Environment Department to determine cause of death; ungulate and predatory mammal mortalities will be reported to the GN wildlife conservation officer. If approved by the GN officer, disposal of ungulates and predatory mammals will be through incineration at the mine or as directed by the GN. In the case of an ungulate and predatory mammal collision, drivers must fill out a vehicle/animal collision report to document the conditions and circumstances surrounding the incident. All such incidents will be reported using the Incident Report Form **(Appendix D)**.
Hunting
Hunting and harassment of any wildlife species by mine employees while on shift will be prohibited.
Access by way of All Terrain Vehicle (ATV) from Baker Lake to km 85 on the AWAR for hunting, is permissible according to NIRB Project Certificate No.004, Condition 32. See **Figure 2**

Table 3: General Mitigation for the Meadowbank Mine, and Whale Tail Pit and Haul Road

Agnico Eagle will enforce the policy of a "no-hunting zone" from km 85 to Whale Tail Pit, to reduce road-related effects on wildlife and to protect employee safety. A 1 km marker at the gatehouse will be used to ensure all hunters are aware of these restrictions. Periodic markers will be used along the AWAR to delineate the 1 km no-hunting zone between the Baker Lake gatehouse and km 85. See **Figure 2**.
Except for designated persons (e.g., wildlife monitors, environmental technicians), employees will not be permitted to carry firearms.
Spills and Contamination
All spills will be immediately cleaned up or isolated to minimize the potential for exposure to wildlife or degradation of the surrounding environment (see the Spill Contingency Plan).
Water that has the potential to come into contact with the mining activities will be intercepted, contained, and will meet license limits prior to discharge.

2.2 CARIBOU PROTECTION MEASURES

Caribou Protection measures employed by the project will be evaluated, in collaboration with, and through data sharing among Terrestrial Advisory Group (TAG) members, including the components outlined in **Table 4**.

Table 4: Caribou Protection Measure Components to be Evaluated

Caribou Protection Measures
Caribou protection measures employed the project will evaluated, including the following components
Tests of the monitoring methods that are used to detect caribou near the Project in order to quantify: (i) the probability of detecting groups; (ii) the effective range of detection; and (iii) the spatial extent of detection capacity relative to the mitigation distance buffers;
The collection of additional data on caribou group sizes to confirm the relevance of group size thresholds used in mitigation;
Collection and analyses of collar data to quantify the Zone-of-Influence (ZOI) associated with the Whale Tail Project, its haul road and the existing Meadowbank mine (and all-weather-access-road [AWAR]);
Collection and analyses of collar data to quantify the effects of the Whale Tail Project, its haul road and the existing Meadowbank mine (and AWAR) on the movements of caribou, in particular during migratory periods;
Collection of accurate records documenting the detection of caribou and the subsequent implementation of mitigation measures;
Analyses of collar Government of Nunavut (September 21, 2017) Construction and Active Phases To be completed within 5 years of commencement If active mining life span extended, the evaluation should be updated every 5 years NIRB Final Hearing Decision for the Whale Tail Pit Project NIRB File No. 16MN056 Page B-2 No. Subject Commitment Issue Raised by (Date of Commitment) Project Phase/Timing data comparing the movements of individuals that were and were not subject to the implementation of mitigation measures.
Evaluation of Caribou Protection Measures
The scope of this evaluation will include the following:
A study area or areas that encompass the Whale Tail mine site, haul road, Meadowbank mine and all-weather-access-road (including all activities utilizing this infrastructure including on-going exploration), all of which are integral components of the Project;
The use of accepted scientific methods and experimental designs to provide quantitative information;

The engagement of recognized subject matter experts in each area of the evaluation;
Collection of data with sufficient statistical power to detect potential impacts;
Guidance on study designs, analyses and interpretation from the Project's TAG;
The collection of data during both the construction and active mining phases of the Project;
Completion of the evaluation within 5 years of Project commencement (beginning with construction) to ensure that any adverse effects or deficiencies in caribou protection measures are revealed prior to potential extensions in the use of Project infrastructure;
A technical report, as noted above in (g), for the evaluation to be submitted to NIRB; and if the Project's active mining life span is extended beyond that currently proposed (i.e. 2022), including extended use of the haul road to support other projects, the evaluation should be updated every 5 years.

2.3 VEC-SPECIFIC MITIGATION

2.3.1 Wildlife Habitat

2.3.1.1 Summary of Potential Environmental Effects

Permanent habitat loss will occur due to the construction footprint of mine facilities, including mine buildings, haul roads, and access roads to quarry and borrow sites. Dewatering of Whale Tail Lake at the end of the construction phase, will result in the flooding of a number of tributary lakes upstream of the Whale Tail Dike to the Mammoth Lake Watershed, thereby altering flows to Mammoth Lake and downstream lakes. This change in water regime can strongly influence plant species composition, community structure, and biological diversity (Vale et al. 2015). These temporary changes in water levels will affect soil moisture, and may result in localized effects to vegetation quality through decreased species abundance and flooding. All terrestrial habitats provide some value to wildlife VECs. Consequently, loss or degradation of any of these habitats may result in localized negative effects on wildlife.

Another potential effect on Wildlife Habitat is degradation from dust and exhaust. Bryophytes and lichens may experience the largest effects close to roads where the greatest amount of deposition frequently occurs. Consistent with current dustfall monitoring and terrestrial monitoring along the AWAR, the EIA and EIS predicted that the primary effects of dust are generally confined to the immediate area next to roadways (Cumberland 2005a; Golder 2016; Everett 1980; Walker and Everett 1987). A recent study found that dust on plant leaves from diamond mine haul roads was significantly higher in a zone of up to 1000 m from the road (Chen et al. 2017).

2.3.1.2 Mitigation for Wildlife Habitat

Proposed mitigation for Wildlife Habitat are summarized in **Table 5**.

Table 5: Mitigation to Minimize Effects to Wildlife Habitat at the Meadowbank Mine, and Whale Tail Pit and Haul Road and proposed Whale Tail Expansion

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Minimizing Wildlife Habitat Loss				
Avoid high value habitats (e.g., eskers)	X	X		
Cluster facilities and minimize footprints	X			
Minimize haul and access road width and length	X	X		
Minimize borrow area size	X	X	X	
Construct boardwalks and helicopter pads		X	X	X
Stay on roads		X	X	X
Clearly mark road edges		X	X	X
Restore and revegetate disturbed habitats			X	X
Scarify roads, remove facilities, restore drainage patterns, and stabilize slopes			X	X
Minimizing Wildlife Habitat Degradation				
Minimize vehicle traffic and speeds to reduce dust		X	X	X
Contain (berms) fuel storage areas	X	X	X	X
Follow hazmat and spill contingency guidelines	X	X	X	X
Implement dust control measures (including dust suppressants) on mine roads and airstrip		X	X	X
Use landfill area to dispose of inorganic waste (e.g., concrete, plastic). All other materials shipped and disposed off-site		X	X	X
Maintain natural drainage patterns	X	X	X	X
During water diversion, pump discharge using natural drainage patterns when possible		X	X	X
Remove and dispose of contaminated soil (see 'Environmental Guidelines for Site Remediation', GN-DOE 2009		X	X	X

2.3.2 Ungulates

2.3.2.1 Summary of Potential Environmental Effects

Caribou and muskox are susceptible to habitat loss and sensory disturbance associated with Project facilities and activities. The potential for direct effects such as vehicle-animal collisions and increased hunting pressure are concerns, as are indirect effects related to contaminated water and vegetation. Although caribou may be present during any season, movements of collared caribou through the Meadowbank RSA are most common during the spring (April 1 to May 25) and fall (October 15 to November 7) migratory periods, (Agnico Eagle 2016; Golder 2016 Appendix 5-D). Likewise, while there are areas of the AWAR with more frequent observations of caribou, caribou may be observed along the entire length of the AWAR (Agnico Eagle 2016). Roadside observations of caribou from 2007 to 2016 show that caribou within and adjacent to the Meadowbank RSA are most common during the winter (44% of caribou observed), rut and fall

migration (34% of caribou observed) and spring (16% of caribou observed) (see **Table 6**). Data from collared caribou also closely follow the seasonal pattern of caribou observations observed from the AWAR and the Meadowbank Mine.

Table 6: Summary of AWAR Caribou Observations from 2007 to 2016 by Season and Collar Data from the Ahiak/Beverly, Lorillard, and Wager Bay Herds (2000 to 2016)

Season	Total Number of Caribou Observed from AWAR (% of Total)	Range of AWAR Count Observations (min-max)	Collar Days in Whale Tail RSA (% of Total in RSA)
Spring Migration (April 1 to May 25)	15,510 (16%)	230 to 6042	224.01 (23%)
Calving (May 26 to June 25)	4,213 (4%)	33 to 1,163	3.34 (0.3%)
Post-Calving (June 26 to July 31)	220 (0.2%)	0 to 135	18.42 (2%)
Summer Dispersal (August 1 to September 15)	1,815 (2%)	2 to 1,815	139.31 (14%)
Rut and Fall Migration (September 16 to November 7)	32,934 (34%)	44 to 9,856	155.15 (16%)
Early and Late Winter (November 8 to March 31)	43,500 (44%)	152 to 13,568	438.22 (44%)
Total	**98,192**	**0 to 13,568**	**978.45**

Monitoring at other mines suggests that caribou herds change their distribution around diamond mine developments, where probability of occurrence increases with distance from the mine (Boulanger et al. 2012; Johnson et al. 2005; Rescan 2007; Golder 2011a). This area is termed the zone of influence (ZOI), and likely results from sensory disturbance that may be related to smell, noise, taste and sight. A study using aerial survey and satellite-collar data collected around the Diavik, Ekati, and Snap Lake mines estimated that caribou relative abundance was reduced near the mine, and reached expected levels at up to 14 km (Boulanger et al. 2012). Golder (2011a) detected ZOI ranging from 12 to 40 km around the Diavik mine and Lac de Gras, although the estimates may be confounded by the presence of Lac de Gras, which affects caribou distribution. Ground-based monitoring at Ekati suggested that caribou groups with calves spend less time feeding within 5 km of the footprint (BHPB 2004). At the smaller Snap Lake Mine, a ZOI of 6.5 to 28 km was detected (Golder 2008; Boulanger et al. 2009), which increased with the level of mining activity (Golder 2008). Adding to the uncertainty, interviews with hunters in Kulguktuk familiar with mining reported that caribou are often observed at active mines; appearing undisturbed and staying for days at a time. Caribou are even attracted to mine infrastructure for mosquito relief (Golder 2011b). To date, although ZOI have been demonstrated to varying degrees around mine sites, they are poorly understood in terms of their mechanism, their extent, and the effects to individual caribou and populations. Agnico Eagle completed a preliminary ZOI study for the Lorillard and Wager Bay herds and found no ZOI effect with the exception of a weak effect during the winter months at a distance of 35 km. As part of the ZOI study, the Ahiak/Beverly herds were considered; however, there were too few collar locations within the RSA to include these data in the analysis. Through further discussions with the TAG and potentially additional workshops, additional studies are being considered in collaboration with the GN and other interested and qualified parties to better understand the presence of a ZOI, and potential barrier effects from mine infrastructure and the AWAR.

Road-related mortality may be a source of residual effects if not carefully managed. Although muskox are not considered a species at risk, their low reproductive rate, sedentary nature, and tendency to stand their ground when threatened make them vulnerable to disturbance and over-hunting.

A minor concern is the potential for caribou or muskox to drink potentially contaminated water from the tailings impoundments or possibly runoff from the waste rock piles; however this has not been documented. Approved deterrent methods have been implemented at Meadowbank Mine when necessary to remove caribou from areas of risk. On-site environmental staff will monitor the tailings facilities daily.

2.3.2.2 Mitigation for Ungulates

Proposed mitigation for Ungulates are summarized in **Table 7**. See also General Mitigation in **Table 3** and the Wildlife Protection and Response Plan.

Table 7: Mitigation to Minimize Effects to Ungulates at the Meadowbank Mine and Whale Tail Pit and Haul Road and proposed Whale Tail Expansion

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Minimizing Wildlife Habitat Loss (see Table 5 for Wildlife Habitat)				
Minimizing Wildlife Habitat Degradation (see Table 5 for Wildlife Habitat)				
Reducing Sensory Disturbance (see also General Measures, Table 3)				
Site-wide notifications of caribou presence (see **Figure 6** and **Figure 7**)		X	X	
Caribou on or crossing the road are given right-of-way		X	X	X
Construct the Whale Tail Haul Road during the winter to avoid effects to caribou during potentially sensitive periods (e.g., spring and fall migration)	X	X		
Minimize engine noises, as per the Noise Abatement and Monitoring Plan		X	X	X
Limit blasting when caribou are near (**Figure 9**); Maintain blasting windows (see Transportation Management Plan: All Weather Private Access Road and Whale Tail Haul Road Management Plan)		X	X	
Enforce speed limits on the AWAR and haul roads (Transportation Management Plan: All Weather Private Access Road and Whale Tail Haul Road Management Plan)		X	X	X
Aircraft pilots are instructed to avoid caribou, and will receive site-wide notifications of caribou movements. Recommended minimum distance is 300 m altitude and 1 km horizontal		X	X	X
Report Ungulates in the vicinity of the road to environmental staff and road dispatcher		X	X	X
Reduce speed to 30 km/h when caribou are observed from the haul road and Level 3 caribou mitigation is triggered (**Figure 7**)		X	X	

Table 7: Mitigation to Minimize Effects to Ungulates at the Meadowbank Mine and Whale Tail Pit and Haul Road and proposed Whale Tail Expansion

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Other mitigative action as determined by the Environmental Supervisor, possibly including: grouping haul trucks into convoys (e.g., 2X2 or groups of 4 or more vehicles), imposing additional speed limits, using pilot vehicles, stopping traffic near caribou attempting to cross haul roads, complete closure of haul roads, suspending blasting in accordance with **Figures 6** through **9**		X	X	X
Reducing Ungulate Project-related Mortality (see also General Measures, Section 2.2)				
Along pits, graduate slope angles to diminish likelihood of slippage	X	X	X	
Herd ungulates off airstrip only prior to arrivals and departures (see Access and Air Traffic Management Plan) if air traffic could not be delayed		X	X	X
Avoiding Exposure to Potentially Contaminated Water and Wildlife Habitat				
Deter ungulates attracted to potentially contaminated water in tailings ponds or runoff, documented using the Incident Report Form (**Appendix D**)		X	X	X
Avoiding Disruption of Movement or Migration Patterns				
Road shoulders are designed with a low profile and are sloped to ground level to accommodate haul trucks. Roads will be top dressed with esker-sourced. Consequently, roads are not perceived to be a physical barrier to caribou movement	X	X	X	
Implement special measures if Ungulates are in close proximity to Project facilities and roads (see **Section 3.5**)		X	X	
Contour snow banks to avoid creating barriers		X	X	X
Post updated maps of known migration corridors and report to GN, KivIA, and HTO personnel		X	X	
During road decommissioning, flatten and scarify road edges			X	X

2.3.3 Predatory Mammals

2.3.3.1 Summary of Potential Environmental Effects

Predatory Mammals are susceptible to animal/vehicle collisions, loss of denning habitat, and sensory disturbance associated with Project construction and operation. Grizzly bears and wolverines may be particularly vulnerable to road development. Due to their wide-ranging and scavenging natures, they are drawn to road edges where road kills may be readily available. Once they have been attracted, habituated or food-conditioned to a site, they may be difficult to avert and may eventually become a human safety concern. One wolverine and three wolves have been killed along the Meadowbank AWAR between 2007 and 2015 (Gebauer et al. 2016).

The potential for direct loss of denning habitat for some predatory mammals, especially wolves, is also a concern during road construction and borrow pit development. Wolves use unconsolidated materials (e.g., eskers), to excavate den sites, and the same den sites may be used from year to year (Cluff et al. 2002). Occasionally, adults with pups have been sighted along the AWAR area in summer denning months, and most recently, an active den and nursery site was identified within the borrow area at Esker #3 in the Whale Tail Haul Road study area (Dougan & Associates and Nunavut Environmental 2015). Wolf denning occurs between early May and late September (May et al. 2012).

Grizzly Bears are also known to use habitats such as eskers for denning (Mueller 1995), wolverines have been linked to areas of persistent snow cover and boulders because of their reliance on cached food as they litter during late winter (Inman et al. 2012). Sensory disturbance from road construction and operation could result in an indirect loss of nearby functional denning habitat (May et al. 2012).

Other potential effects to Predatory Mammals, such as changes in prey abundance, distribution, or health, are of lesser concern. Mitigation to ensure that the viability and integrity of prey populations are maintained (e.g., Ungulates) will also mitigate the potential effects to Predatory Mammals.

2.3.3.2 Mitigation for Predatory Mammals

Proposed mitigation for Predatory Mammals are summarized in **Table 8**. See also General Measures in **Table 3** and the Wildlife Protection and Response Plan.

Table 8: Mitigation to Minimize Effects to Predatory Mammals at the Meadowbank Mine and Whale Tail Pit and Haul Road and proposed Whale Tail Expansion

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Reducing Project-related Mortality (see also General Measures, Table 3)				
Apply response plan (see **Appendix C**) when individuals are near		X	X	X
Manage mine food wastes and odors (**Appendix C**)		X	X	X
Instruct mine workers to keep lunches inside vehicle cabs or buildings		X	X	X
Remove or incinerate all wildlife carcasses to avoid attracting predators to facilities		X	X	X
Continue to improve waste segregation techniques and procedures	X	X	X	X
Incinerate all kitchen waste, wood/paper products daily		X	X	X
Seal and store all aromatic products (e.g., paint) in bear-proof containers		X	X	X
Construct skirts or sheathing along all facilities with potential to attract Predatory Mammals	X	X	X	
Use deterrents if necessary for human and wildlife safety (**Appendix C**)		X	X	X
Avoiding Disturbance of Den Sites				

Table 8: Mitigation to Minimize Effects to Predatory Mammals at the Meadowbank Mine and Whale Tail Pit and Haul Road and proposed Whale Tail Expansion

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Initiate a den-specific response plan when a wolverine, grizzly bear or wolf den site is detected within 1 km of activities (see **Section 3.6**)		X	X	X
Restrict human and vehicle activity in the vicinity of den sites		X	X	X

2.3.4 Raptors

2.3.4.1 Summary of Potential Environmental Effects

Available survey data indicate that few Raptors nest in the vicinity of the Project area, and possibly also in old quarries and open pits. However, direct effects to breeding Raptors are expected to be very low (Cumberland 2005b; Dougan & Associates and Nunavut Environmental 2015). Ongoing monitoring (see **Section 3.7)** will document active nests if they are near mine facilities, or along the AWAR, Whale Tail Haul Road, and access roads to quarry/borrow sites.

Other potential effects to Raptors may result from changes in abundance, distribution, and health of prey populations due to road activities. Mitigation to minimize Wildlife Habitat removal (see **Section 2.3.1)** will reduce effects to prey populations.

2.3.4.2 Mitigation for Raptors

Proposed mitigation for Raptors are summarized in **Table 9**. See also General Measures in **Table 3**.

Table 9: Mitigation to Minimize Effects to Raptors at the Meadowbank Mine and Whale Tail Pit and Haul Road and proposed Whale Tail Expansion

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Minimizing Wildlife Habitat Loss (see Table 5 for Wildlife Habitat)				
Minimizing Wildlife Habitat Degradation (see Table 5 for Wildlife Habitat)				
Avoiding Disturbance to Nesting Raptors				
Develop a nest-specific response plan for identified raptor nests within areas of concern to ensure that nesting success is not affected by development activities (see **Section 3.7**)		X	X	X
Follow GN-DoE guidelines (GN-DOE 2005) for avoiding disturbance to raptor nests		X	X	X
Consult with GN (with respect to obligations under the *Wildlife Act*, SNU 2003, c.26) as per Project Certificate No.008, Condition 36. If deemed appropriate, discourage raptors from establishing nests on artificial structures, pit walls, or other facilities (see **Appendix E**)			X	

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Limit ferrying flight altitudes to a minimum height of 300 m above ground level where possible		X	X	X

2.3.5 Waterbird

2.3.5.1 Summary of Potential Environmental Effects

During baseline data collection and operational monitoring, only a small number of nesting Waterbirds were documented within the Meadowbank Mine and along the AWAR (see annual Wildlife Monitoring Summary Reports). Given these low densities of nests identified within the Project area since 2005 (i.e., too low to determine whether changes in nest abundance or success have occurred), and the absence of data suggesting that road-related effects were occurring, the Waterfowl nest survey program at Meadowbank was discontinued in 2012 (Gebauer et al. 2013). Initial waterfowl surveys for the Whale Tail study area have also documented low numbers of nesting waterfowl (Dougan & Associates and Nunavut Environmental 2015).

Waterbirds that use flooded portions of the tailings impoundment areas for resting or roosting purposes during the summer and migratory periods may be exposed to contaminants; however, residence times are not expected to be long due to the lack of wetland vegetation, and the absence of fish or invertebrates in the tailings impoundment and water management areas. There is a possibility that Waterbirds (e.g., geese) may forage on potentially contaminated graminoid vegetation (e.g., vegetation that may have been contaminated by fugitive dust fall from vehicles); however, results of recent risk assessments for the Meadowbank Mine have indicated no excess risk to Waterbirds as a result of Project activities (Agnico Eagle 2014).

The proposed expansion at Whale Tail will require a fish-out, which may lead to mortality of diving birds that can get caught in nets. Further, possible flooding during the nesting season may lead to loss of nests.

2.3.5.2 Mitigation for Waterbirds

Proposed mitigation for Waterbirds are summarized in **Table 10**. See also General Measures in **Table 3**.

Table 10: Mitigation to Minimize Effects to Waterbirds at the Meadowbank Mine and Whale Tail Pit and Haul Road and proposed Whale Tail Expansion

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Minimizing Wildlife Habitat Loss (see Table 5 for Wildlife Habitat)				
Stay 30 m away from shoreline areas during design except where necessary for constructing road crossings and pit development	X	X	X	
Provide foraging opportunities for Waterbirds, particularly geese, over the long term in revegetated areas and flooded mine pits			X	X

Table 10: Mitigation to Minimize Effects to Waterbirds at the Meadowbank Mine and Whale Tail Pit and Haul Road and proposed Whale Tail Expansion

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Minimizing Wildlife Habitat Degradation (see Table 5 for Wildlife Habitat)				
Where high levels of contaminants have been identified in water or vegetation, undertake reclamation activities to manage risks to Waterbirds		X	X	X
Avoiding Disturbance to Nesting Waterbird				
Clear land outside the breeding season (mid-May to mid-August) unless a nest survey by a qualified wildlife biologist has determined that no Waterbird nests are present		X	X	X
Helicopter ferrying flight altitudes should remain above 300 m, where possible		X	X	X
Where important bird areas (e.g., moulting areas, goose breeding colonies etc.) are identified, observe a 1,000 m vertical and 1,500 m horizontal distance whenever possible (Hines and Wiebe 1997). Make all pilots aware of these flight restrictions		X	X	X
Reducing Waterbird Project-related Mortality (see also General Measures, Table 3)				
Monitor tailings, reclaim ponds, and storm water retention ponds daily to ensure that Waterbird have not landed on these waterbodies. Where Waterbird have landed on ponds, use aversive tactics to scare them away		X	X	X
Implement mitigation for nests in flooding zones at the Whale Tail Project (**Appendix F**)		X		
Implement mitigation for diving bird mortality during Whale Tail Lake fish-out (see the Fishout Diving Waterbird Protection Plan)		X		

2.3.6 Upland Breeding Birds

2.3.6.1 Summary of Potential Environmental Effects

The greatest effect to Upland Breeding Birds (e.g., songbirds) is the removal, flooding, or degradation of nesting habitat. Virtually all terrestrial habitat within the study area provides foraging or nesting habitats for one or more species. Some species prefer shrubby terrain (e.g., Savannah Sparrow), others are found primarily in open tundra (e.g., lapland longspur), whereas some are restricted to wet meadows (e.g., semipalmated sandpiper).

Another potential environmental effect is the reduced habitat effectiveness due to human activity, although passerines appear to readily habituate to these activities compared to larger species such as Raptors and Waterbird. Studies have documented avoidance effects and reduced bird densities within 1 km of human infrastructure (Reijnen et al. 1997; Benitez-Lopez et al. 2010). Conversely, a study of lapland longspurs by Male and Nol (2005) showed no difference in nest success between sites with high and low levels of human noise at the Ekati Diamond Mine.

In addition, no decrease in upland bird species richness or abundance from mine activity has been observed at the Meadowbank Mine (Gebauer et al. 2012, 2013) or at the Ekati Diamond Mine (Smith et al. 2005; Rescan 2010).

Buildings, pits, and other facilities will provide new perching opportunities and possibly nesting opportunities for Raptors. The potentially higher densities of Raptors in the area, and potentially increased depredation rates on passerines, are possible negative effects of the Project on songbirds.

2.3.6.2 Mitigation for Upland Breeding Birds

Proposed mitigation for Upland Breeding Birds are summarized in **Table 11**. See also General Measures in **Table 3**.

Table 11: Mitigation to Minimize Effects to Upland Breeding Birds at the Meadowbank Mine and Whale Tail Pit and Haul Road and Proposed Whale Tail Expansion

Mitigation	Design	Construction	Operations	Closure/ Post-Closure
Minimizing Wildlife Habitat Loss (see Table 5 for Wildlife Habitat)				
Minimizing Wildlife Habitat Degradation (see Table 5 for Wildlife Habitat)				
Where high levels of contaminants have been identified in water or vegetation, undertake reclamation activities to manage risks to Upland Breeding Birds		X	X	X
Avoiding Disturbance to Nesting Upland Breeding Birds				
Clear land outside the breeding season (mid-May to mid-August) unless a nest survey by a qualified wildlife biologist or technician has determined that no Upland Breeding Bird nests are present		X	X	X
If nest found within Project facilities, set up buffer zone if possible		X	X	X
Avoid human activity around nest sites to avoid attracting predators to site		X	X	X
Reducing Upland Breeding Bird Project-related Mortality (see also General Measures, Table 3)				
Deter Raptors from nesting or roosting on mine facilities (see **Appendix E**). Locally breeding Raptors will increase predation rates on songbirds		X	X	X
Deter Upland Breeding Bird nesting attempts on equipment and facilities		X	X	X
Implement mitigation for nests in flooding zones at the Whale Tail Project (**Appendix F**)		X		

3. MONITORINGOVERVIEW

A comprehensive suite of monitoring activities are being undertaken for the Project facilities, haul roads and AWAR. **Table 12** summarizes all of the monitoring activities, their frequency, and the VEC each activity targets.

Table 12: Monitoring Activities Being Undertaken for the Project Facilities, Haul Roads, and All-Weather Access Road

Monitoring Activity	Frequency	VECs					
		Wildlife Habitat	Ungulates	Predatory Mammals	Raptors	Waterbird	Upland Breeding Birds
Traffic Monitoring for AWAR and Haul Roads	Currently completed and will be provided in the annual summary report		X	X	X	X	X
Public Use of Roads	Tracked at security gate and incidental observations, and will be provided in the annual summary report		X	X	X	X	X
Habitat monitoring	Every three years post-construction, or if greater than 25% of the overall mine footprint changes	X					
Dustfall monitoring	Monthly around Meadowbank Mine and Whale Tail Pit; detailed study conducted annually along the AWAR and the Whale Tail Haul Road	X					
Habitat reclamation monitoring	At Year 2 post-closure and every 3 years until Year 12 post-closure	X					
Caribou satellite-collaring program	Data provided to Agnico Eagle from GN at least 1x/week		X				
Zone of Influence or other Mechanistic Investigation Studies	As necessary and identified through the TAG		X				
Haul Roads, Pits and mine site ground surveys	At least 1x/week, includes inspections of waste streams for scavenger attractants		X	X	X	X	
Road surveys (AWAR and Haul Roads)	At least 1x/week		X	X	X	X	X
Height-of-Land surveys	At least 1x/week		X	X			
Vehicle encounter reports	Ongoing		X	X	X	X	X
Incident reports	Ongoing (when incidents with wildlife occur)						
Hunter Harvest Survey	Will be redeveloped and implemented in collaboration with the GN, KivIA and HTO (see **Section 3.5.2.8**)		X	X			
Active den site surveys	Initiated by the detection of an active den (grizzly bear, wolf or wolverine) within the active footprint or vicinity of Project facilities (see **Figure 12**)			X			

Table 12: Monitoring Activities Being Undertaken for the Project Facilities, Haul Roads, and All-Weather Access Road

Monitoring Activity	Frequency	VECs					
		Wildlife Habitat	Ungulates	Predatory Mammals	Raptors	Waterbird	Upland Breeding Birds
Active Raptor nest monitoring	During nesting season (May 1 to Sept 15) if active nest is within the active footprint and vicinity of Project facilities: within area of concern – 1x/day; not within area of concern – 1x/week (see **Figure 13**)				X		
Waterbird nest surveys	Active nests identified within 100 m of Project facilities and all roads monitored, if deemed necessary Additional monitoring may be required during fish-out or flooding					X	
PRISM plot surveys	Once every three years in collaboration with ECCC						X
North American Breeding Bird Survey (BBS)	Once every three years during closure and post closure complete a North American Breeding Bird Survey (NABBS) route and contribute to the NABBS						X

3.2 GENERAL MONITORING

3.2.1 Road Surveys

Meadowbank AWAR and Vault/Whale Tail Haul Road

Methods: Systematic ground surveys will be conducted along the AWAR and Whale Tail Haul Road by two observers (one can be the driver) in a vehicle. Survey vehicles will travel no more than 30 km/h to maximize observations of all wildlife along the route. All wildlife observations recorded incidentally as part of regular traffic along the haul roads and AWAR will be known at the start of ground surveys so that observers are aware of the location of wildlife observations and can focus attention in these areas. For each sighting, a UTM coordinate will be taken along the route along with distance of the animal from the haul road or AWAR, nearest road marker, and a variety of other information (see field data form in **Appendix D**). Behavior of Ungulates will also be recorded for each encounter and comments on disturbance related to a particular behavior (e.g., running) will be made (see field form in **Appendix D**). Raw data (i.e., field forms) will be included in the annual Wildlife Monitoring Summary Report. Further information on these surveys as they relate to caribou interaction are described below in Section 3.5.2.3. Timed observation scans (i.e., roadside observation locations) are also currently being considered, in addition to driving scans, where locations offer a unique vantage point for farfield detection of caribou and other wildlife (e.g., muskox).

Height of Land Surveys

Methods: While conducting the ground surveys, two observers will stop at the Height-of-Land (HOL) survey locations (see **Appendix G**) for 20 minutes to survey the area, focusing on furtherfield areas (i.e., likely up to 4 to 5 km). Raw data (i.e., field forms) will be included in the annual Wildlife Monitoring Summary Report. Further information on these surveys as they relate to caribou are described below in Section 3.5.2.3.

Frequency (haul roads and AWAR): January to April and July to August, once per week; May to June and September to December (frequency will increase when caribou are present, see **Figure 6, Figure 7,** and **Figure 9**; **Table 12**).

3.2.2 Pits and Mine Site Ground Surveys

Methods: Within the Meadowbank Mine and Vault sites (e.g., tailings pond, haul road to Vault Site) and the Whale Tail Pit site, systematic ground observations of Ungulates will be conducted by on-site environmental technicians/monitors who record details on species, numbers, sex, habitat type, and location. Behavior of Ungulates will also be recorded for each encounter and comments on disturbance related to a particular behavior (e.g., running) will be made (see field form in **Appendix D**).

Frequency: Once per week (frequency will increase if caribou are present, **Figure 6, Figure 7,** and **Figure 9; Table 12).**

3.3 WILDLIFE HABITAT

3.3.1 Objectives

The objectives of monitoring Wildlife Habitat will be to ensure that measures to minimize the amount (or area) of Wildlife Habitat lost to Project construction and operation are effective, and that concentrations of contaminants in vegetation do not exceed acceptable levels for wildlife health. Residual effects will be assessed, and opportunities for reclamation or habitat creation will be identified (e.g., recontouring, stabilization, and restoration of drainage patterns). Monitoring will also ensure that potentially contaminated vegetation is removed (or isolated from wildlife), and that the site is restored to its natural state. **Table 13** describes the framework that has been established for monitoring effects to Wildlife Habitat.

Table 13: Monitoring Approach for Wildlife Habitat for the Meadowbank, Whale Tail Project and proposed Whale Tail Expansion

Potential Effect	Impact Prediction	Quantitative Monitoring Variable	Thresholds	Monitoring Activity	Frequency
Habitat Loss **Meadowbank Mine and Vault Pit and Haul Road (Mine Site)**	Loss <EIA prediction and subsequent approvals (see Gebauer et al., 2015)	Area of altered habitat	5% above predicted EIA values of 867 ha for the Mine site	Habitat monitoring	Every three years post-construction, or if greater than 25% of the overall mine footprint changes.
Habitat Loss **Meadowbank AWAR**	Loss <EIA prediction and subsequent approvals (see Gebauer et al., 2015)	Area altered habitat	5% above predicted EIA values 281 ha for AWAR	Habitat monitoring	Every three years post-construction, or if greater than 25% of the overall mine footprint changes.
Habitat Loss **Whale Tail Pit and Haul Road**	Loss < EIS prediction (see Golder 2016)	Area of altered habitat	5% above predicted EIs values of 820 ha for the Pit and Haul Road	Habitat monitoring	Every three years post-construction, or if greater than 25% of the overall mine footprint changes.
Habitat Degradation by Contamination **Meadowbank Mine site and Haul Roads**	Dust and emissions will not result in unacceptable levels of contaminants in vegetation	Concentrations of contaminants	See Screening Level Risk Assessment Plan, **Appendix A** and Air Quality and Dustfall Monitoring Plan (Agnico Eagle 2018)	Screening Level Risk Assessment Dust fall monitoring	SLRA: Every three years Dust fall monitoring : annually
Habitat Reclamation following Project Closure	Vegetation will be naturally established on reclaimed sites	Proportion of disturbed areas revegetated	Up to 80% of the reclamation will be completed by year 12. Refer to the reclamation and closure plan for more details	Habitat reclamation monitoring	At Year 2 post-closure and every 3 years until Year 12 post-closure

3.3.2 Monitoring Approach

As per Project Certificate No.008, Condition 33, Agnico Eagle will continue to document and map sensitive wildlife features such as denning sites, caribou crossing sites, raptor nests and other nesting sites (representative figures are provided in **Appendix H**; from Dougan & Associates 2017). Initial documentation and mapping has been completed for the Whale Tail Pit and Haul Road (Dougan & Associates 2017) and information related to other development areas will be compiled into a single spatial dataset to guide monitoring activities. There are no caribou calving areas within the regional study area.

Monitoring activities for Wildlife Habitat will be carried out post-construction and post-closure. The following are the methods and frequency for the monitoring efforts for each measurable parameter.

3.3.2.1 Habitat Loss

Methods: Total area of habitat disturbance will be determined following Project construction using a combination of ground and aerial surveys, photography, ground-truthing (with the aid of GPS), as-built reports, and possibly satellite imagery. Monitoring of habitat loss will occur at three

primary locations: Meadowbank Mine (includes Vault Pit and Haul Road), AWAR (including quarry sites), and Whale Tail Pit and Haul Road (includes borrow sites and access roads). Reporting will describe the overall area of different ELC units lost due to Project development. For the Meadowbank Mine and AWAR locations, thresholds are disturbance of 5% above predicted EIA values of 867 and 281 ha (includes approved changes), respectively. For the Whale Tail and Haul Road location, the threshold is disturbance of 5% above a predicted EIS value of 820 ha.

Frequency: Every three years post-construction or if changes are greater than 25% of the overall mine site footprint from the previous year ELC was evaluated. This frequency may be reduced during the operation phase if the amount of new disturbance and reclamation areas is relatively unchanged.

3.3.2.2 Habitat Degradation by Contamination

Methods: A comprehensive environmental health monitoring program has been initiated that compares contaminant levels in soil and vegetation (i.e., lichen, berries, and sedges) before and after Project activities. Samples taken from the Project area are also compared to reference sites that are not influenced by Project activities. This Screening Level Risk Assessment program is described in **Appendix A** of this document. Additional information is provided through dustfall monitoring along the AWAR and Whale Tail Haul Road, as described in Air Quality and Dust Monitoring Plan (Agnico Eagle 2018).

3.3.2.3 Habitat Reclamation Post-Closure

Methods: Reclamation efforts will focus on providing conditions conducive to natural re-colonization of the site by surrounding native vegetation. There is a lack of available soils in the Project area that, in conjunction with the harsh climatic conditions (short cold and dry growing season), makes it difficult to establish vegetation over large areas. Reclamation activities and natural re-vegetation of disturbed areas during the closure and post-closure phases will reduce overall residual effects within the LSA.

Frequency: Vegetation plots and mapping will be conducted during the second growing season following closure and every three years thereafter up to Year 12 post-closure (considered to be a reasonable period of time within which to expect revegetation of most disturbed areas) to ensure effort is made to re-vegetate and that re-vegetation of previously disturbed areas is progressing.

3.3.3 Thresholds

Should the thresholds outlined in **Table 13** be exceeded, the following actions will be undertaken.

3.3.3.1 Habitat Loss

Where mapping indicates a loss of habitat area beyond that predicted, discussions will be held with construction contractors and Project personnel to resolve the concern. Additional mitigation may include clearer delineation of work space, road areas, and designated no-disturbance areas. Where unauthorized off-road vehicle activity is noted, more stringent off-road access control measures will be implemented. Habitat reclamation and restoration of natural drainage patterns and contours may be ordered depending on the scale of the disturbance.

3.3.3.2 Habitat Degradation by Contamination

See **Appendix A -** Screening Level Risk Assessment Program

3.3.3.3 Habitat Reclamation Post-Closure

If progress of revegetation is not occurring, further reclamation activity will be undertaken and may involve reseeding (e.g., native-grass cultivars and forbs such as nitrogen-fixing legumes).

3.4 INVASIVE PLANT MONITORING

The invasive plant monitoring component outlines the means by which Agnico Eagle plans to reduce Project-related effects to plant populations and communities, primarily through the mitigation and management of invasive species, and includes both environmental and follow-up monitoring (Project Certificate No.008, Condition 25). Proactive measures and monitoring programs are used to track conditions and implement further mitigation as required, while follow-up monitoring is used to verify the accuracy of impact predictions and adaptively manage and implement further mitigation as required.

3.4.1 Objectives and Thresholds

The objectives of the vegetation monitoring and management component are as follows:

- measure distribution and abundance of non-native invasive plant species
- using industry standards and best practices, equipment and bulk supplies must arrive to Project site free of soil or plant debris to minimize the risk of invasive plant introduction

Specific thresholds for invasive plant monitoring include the following:

- no non-native invasive species will occur as a result of mining operations (i.e., new equipment or materials arrival).

3.4.2 Monitoring Approach

Monitoring programs for non-native invasive plant species will be completed during the construction and operations phase of the Project. Surveys for non-native invasive plant species will be undertaken in disturbed areas (e.g., active mine site, borrow pits) to identify and document the extent of any non-native invasive plant species that may occur during construction and operations. Additionally, invasive plant inspection surveys will be completed on cargo in Becancour, prior to being loaded onto shipping vessel(s).

The early detection of non-native invasive plant species is important, as preventing these species from becoming established is the most effective mitigation that can be employed. If non-native invasive plant species are identified in the Project area, they will be reported to Government of Nunavut Department of Environment (GN DoE), as per DoE guidelines. As part of the reporting process, the following information will collected and sent to DoE:

- location of the species (i.e., GPS coordinates);
- species identification and population extent;
- photographs of the species in question to confirm identification; and
- species-specific management and eradication recommendations.

3.4.3 Mitigation

Terrestrial Pathways

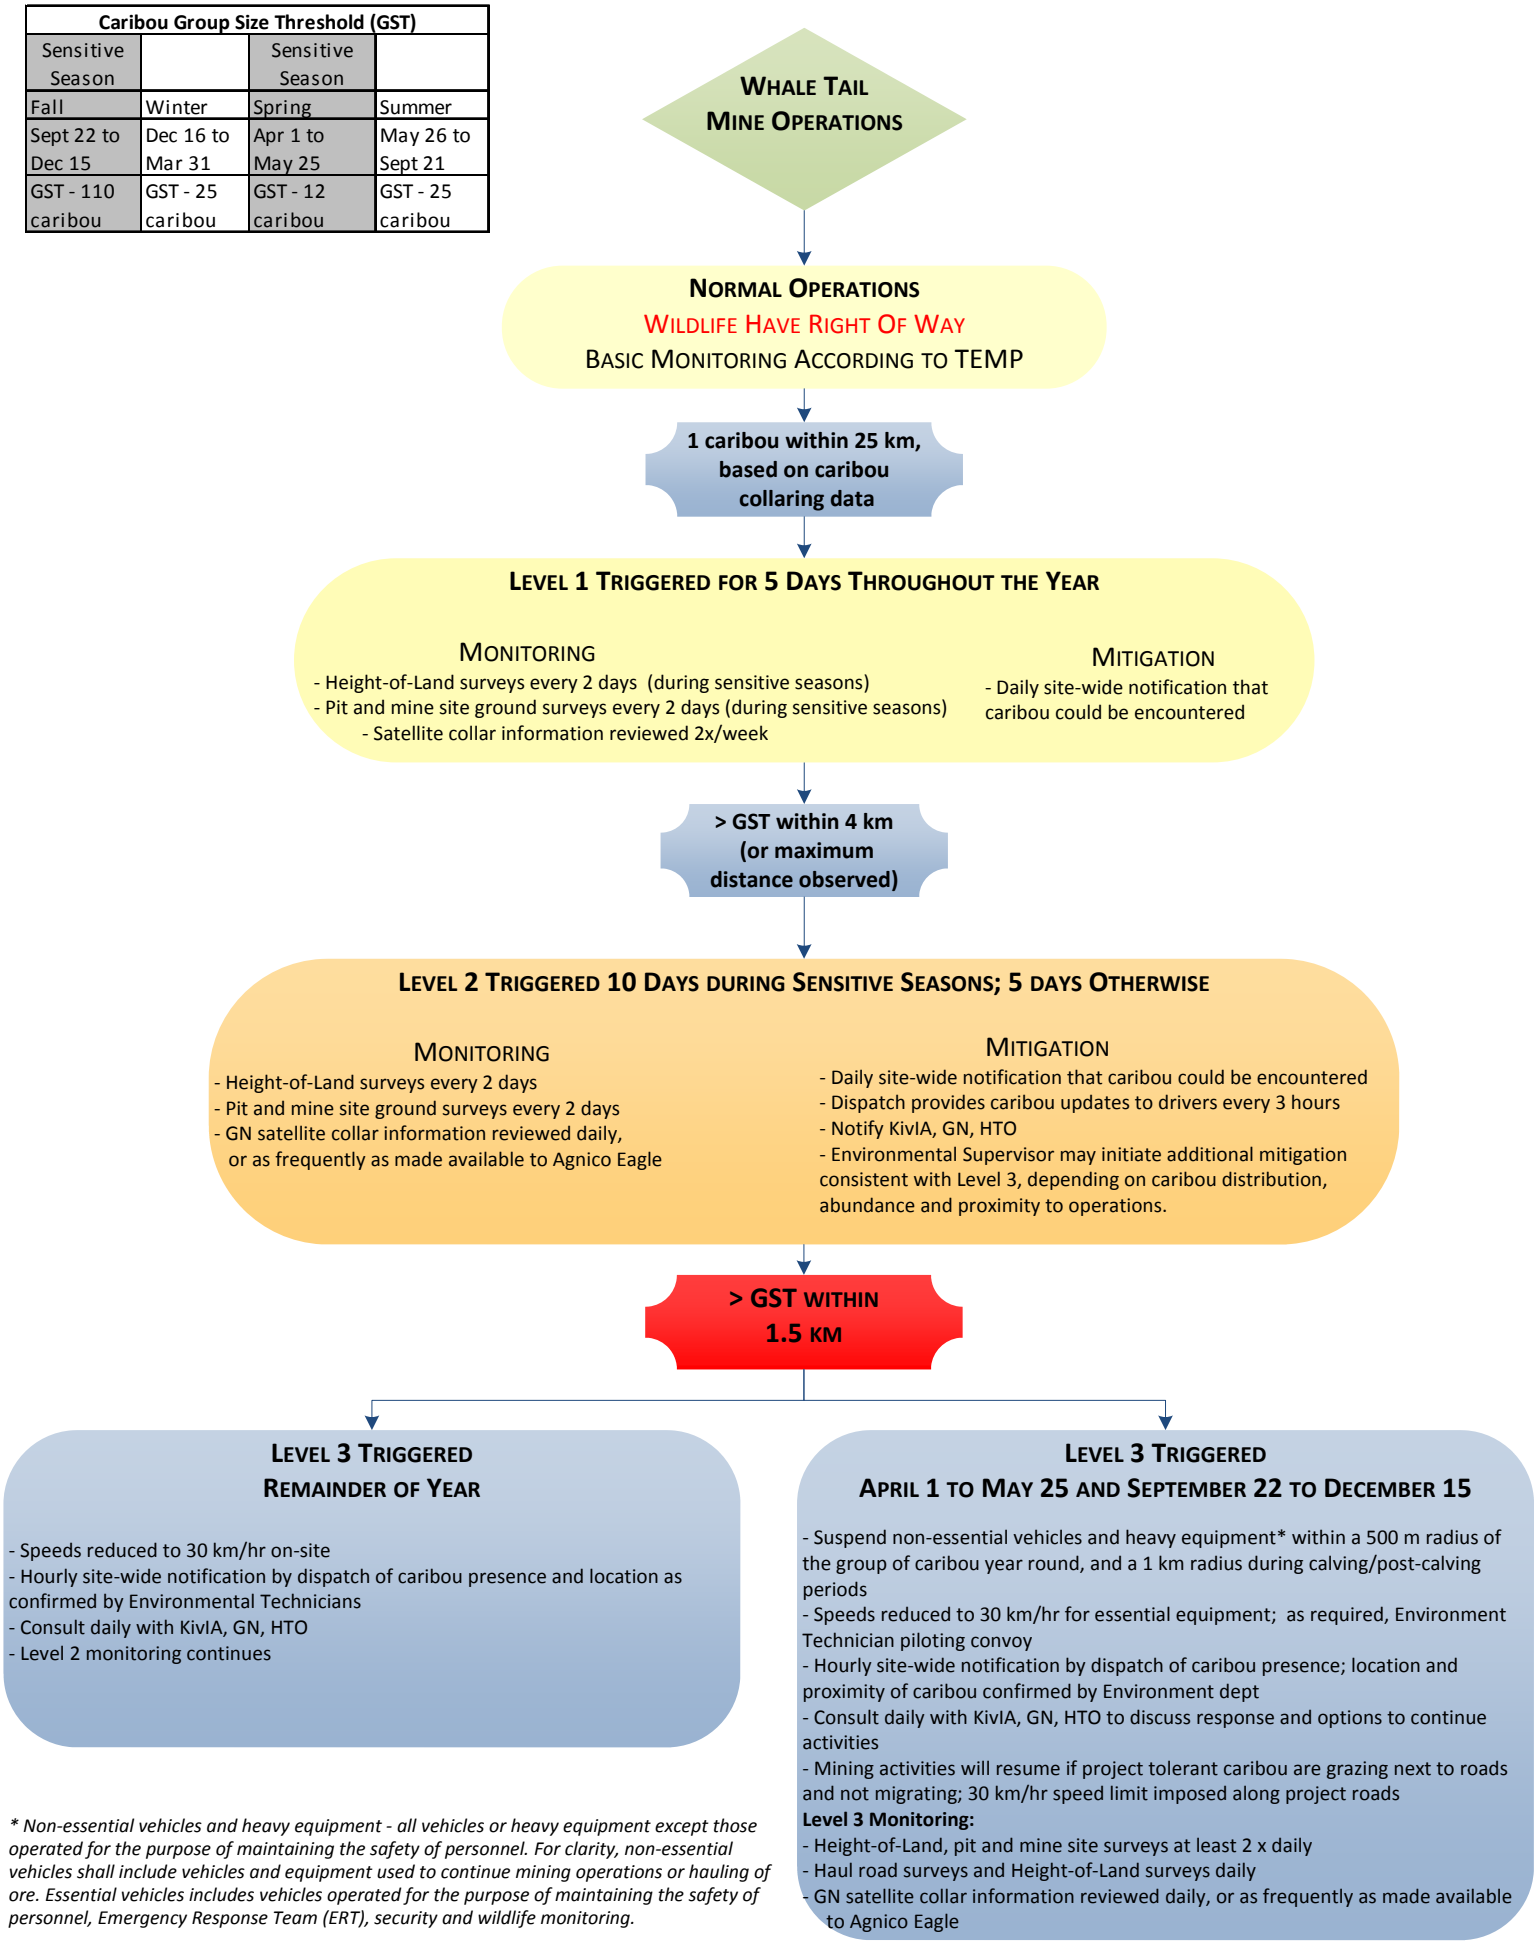
- All Equipment and supplies brought to the project sites are clean and free of soils that could contain plant seeds or organic matter not naturally occurring in the area
- Vehicle tires and treads are inspected prior to initial use in project areas

Specific Cleaning Measures

- Equipment and bulk supplies will be cleaned using brooms, brushes, shovels, water, or compressed air. Areas of particular concern include tires, tracks, skids, buckets, scoops, and packing materials.
- Accumulated soil, plant material or crop debris from openings, tracks, skids, wheels, buckets, scoops, and packing materials using a hand scraper, shovel, broom, or other methods.
- Additional focus should be made to areas where soil or plant debris can accumulate (i.e., tires or undercarriage).

3.5 UNGULATES

As previously mentioned, decision charts (**Figures 6** through **10**) outlining monitoring and mitigation (adaptive management) measures for ungulates have been developed for each phase as follows:

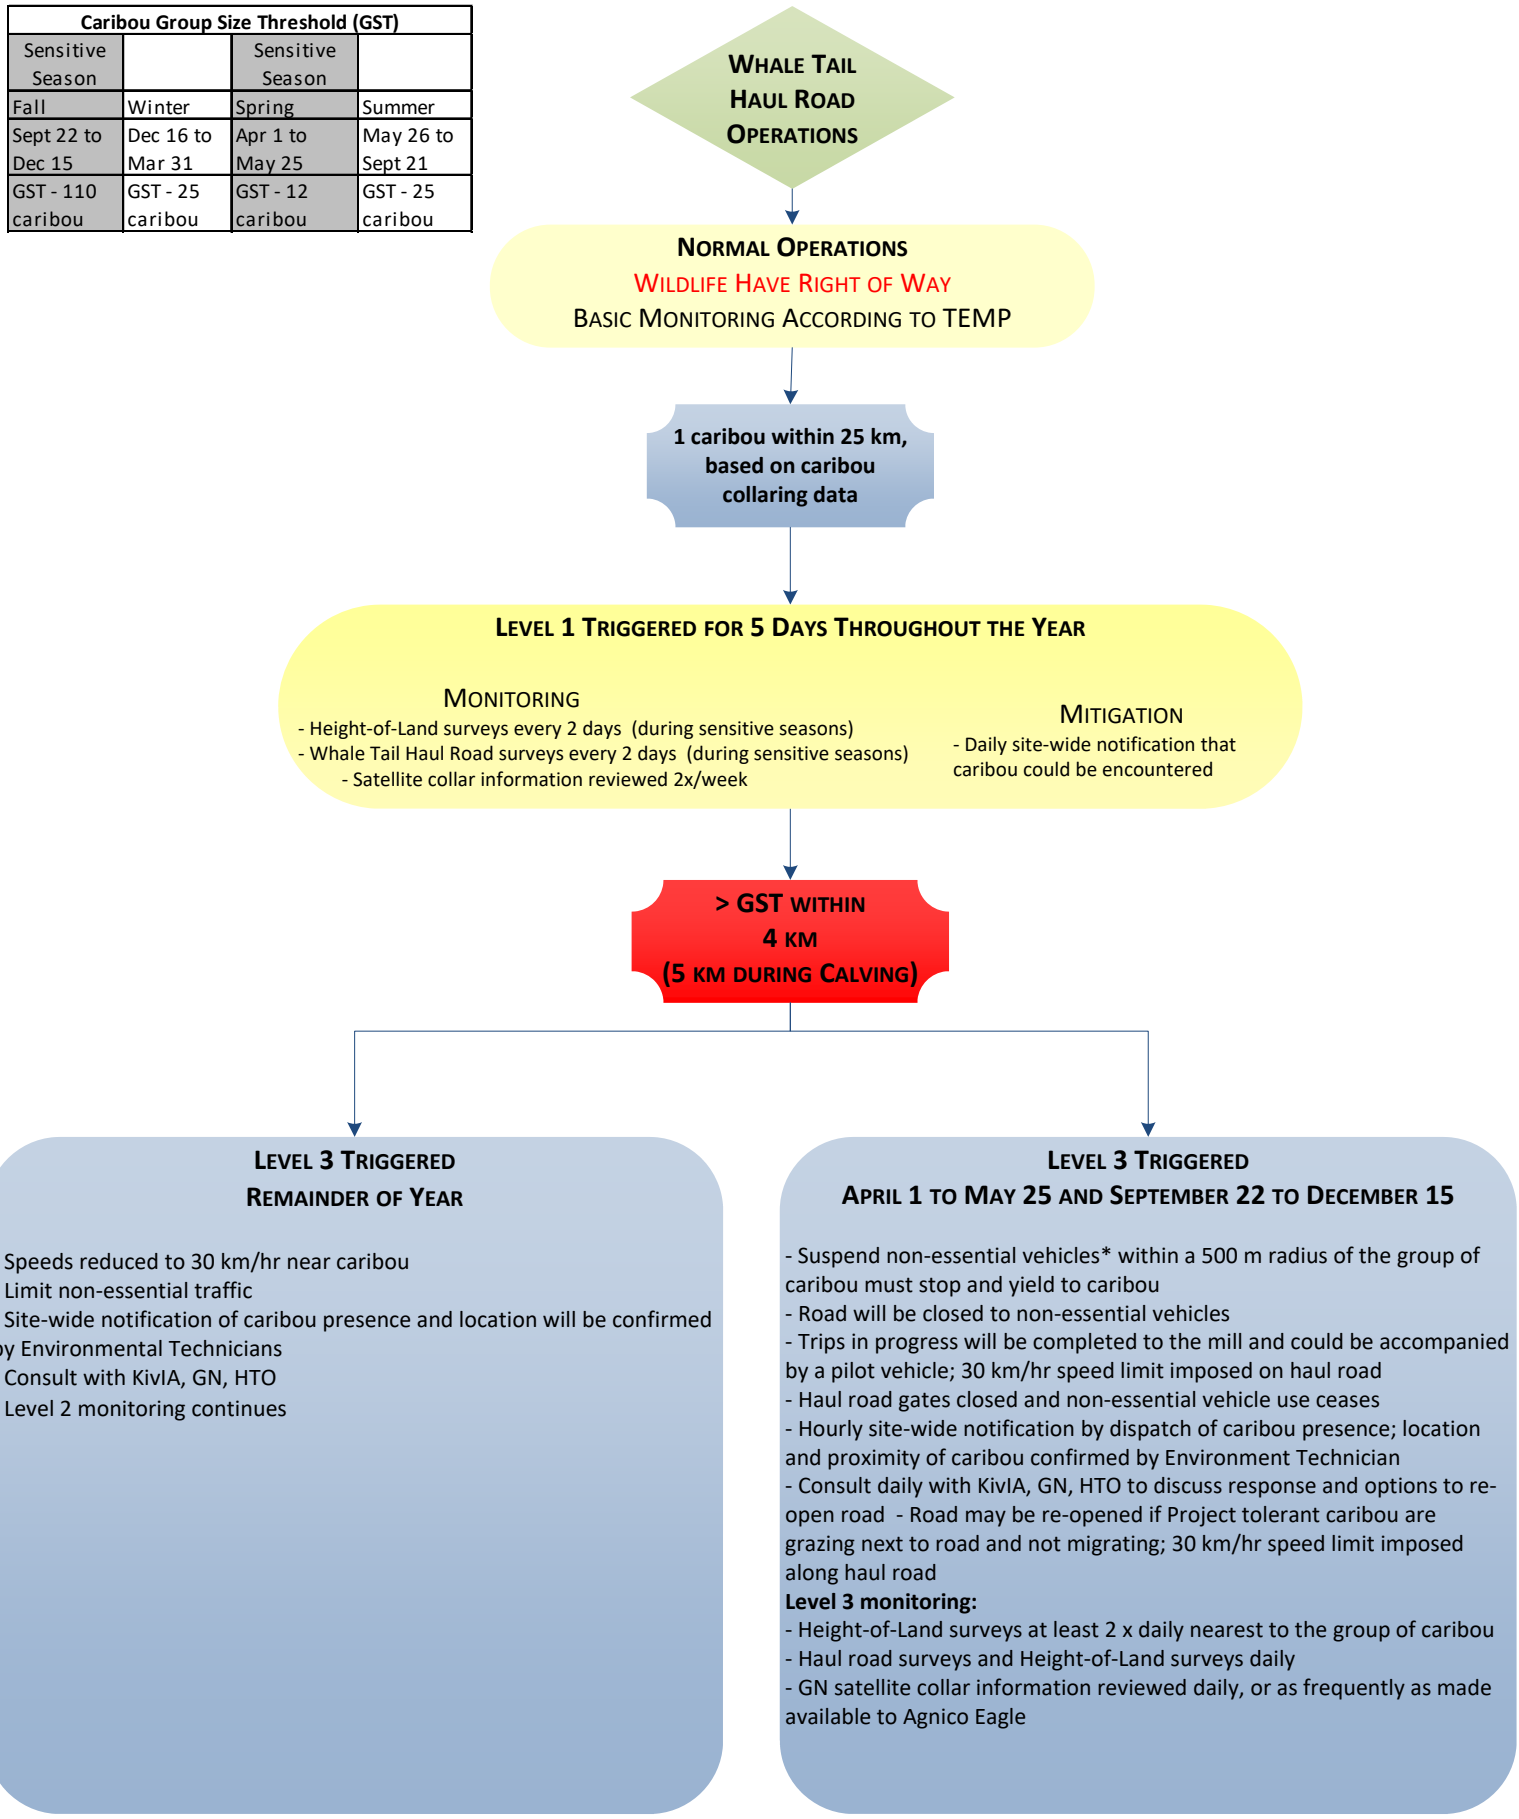


- Figure 6 – caribou and mining operations;
- Figure 7 – caribou and haul roads;
- Figure 8 – caribou and the All Weather Access Road (AWAR);
- Figure 9 – caribou and blasting; and
- Figure 10 – muskox and operations.

3.5.1 Objectives

The monitoring objectives are to detect if effect thresholds have been exceeded, to test the efficacy of mitigation, and understand Project-related effects to Ungulates. For Ungulates, it is also an objective to manage sensory disturbance to caribou approaching the Project, leading to monitoring to detect caribou approaching the project and mitigation to reduce sources of sensory disturbance. Due to the collar data sharing agreement, extensive range, large numbers of caribou and muskox, and history of analysis, this evaluation is done in collaboration with the GN.

Figure 6: Thresholds for Monitoring and Mitigation of Caribou in Proximity to Mine Operations



Caribou Group Size Threshold (GST)			
Sensitive Season		Sensitive Season	
Fall	Winter	Spring	Summer
Sept 22 to Dec 15	Dec 16 to Mar 31	Apr 1 to May 25	May 26 to Sept 21
GST - 110 caribou	GST - 25 caribou	GST - 12 caribou	GST - 25 caribou

** Non-essential vehicles and heavy equipment - all vehicles or heavy equipment except those operated for the purpose of maintaining the safety of personnel. For clarity, non-essential vehicles shall include vehicles and equipment used to continue mining operations or hauling of ore. Essential vehicles includes vehicles operated for the purpose of maintaining the safety of personnel, Emergency Response Team (ERT), security and wildlife monitoring.*

Sept 22 to Dec 15	Dec 16 to Mar 31	Apr 1 to May 25	May 26 to Sept 21
GST - 110 caribou	GST - 25 caribou	GST - 12 caribou	GST - 25 caribou

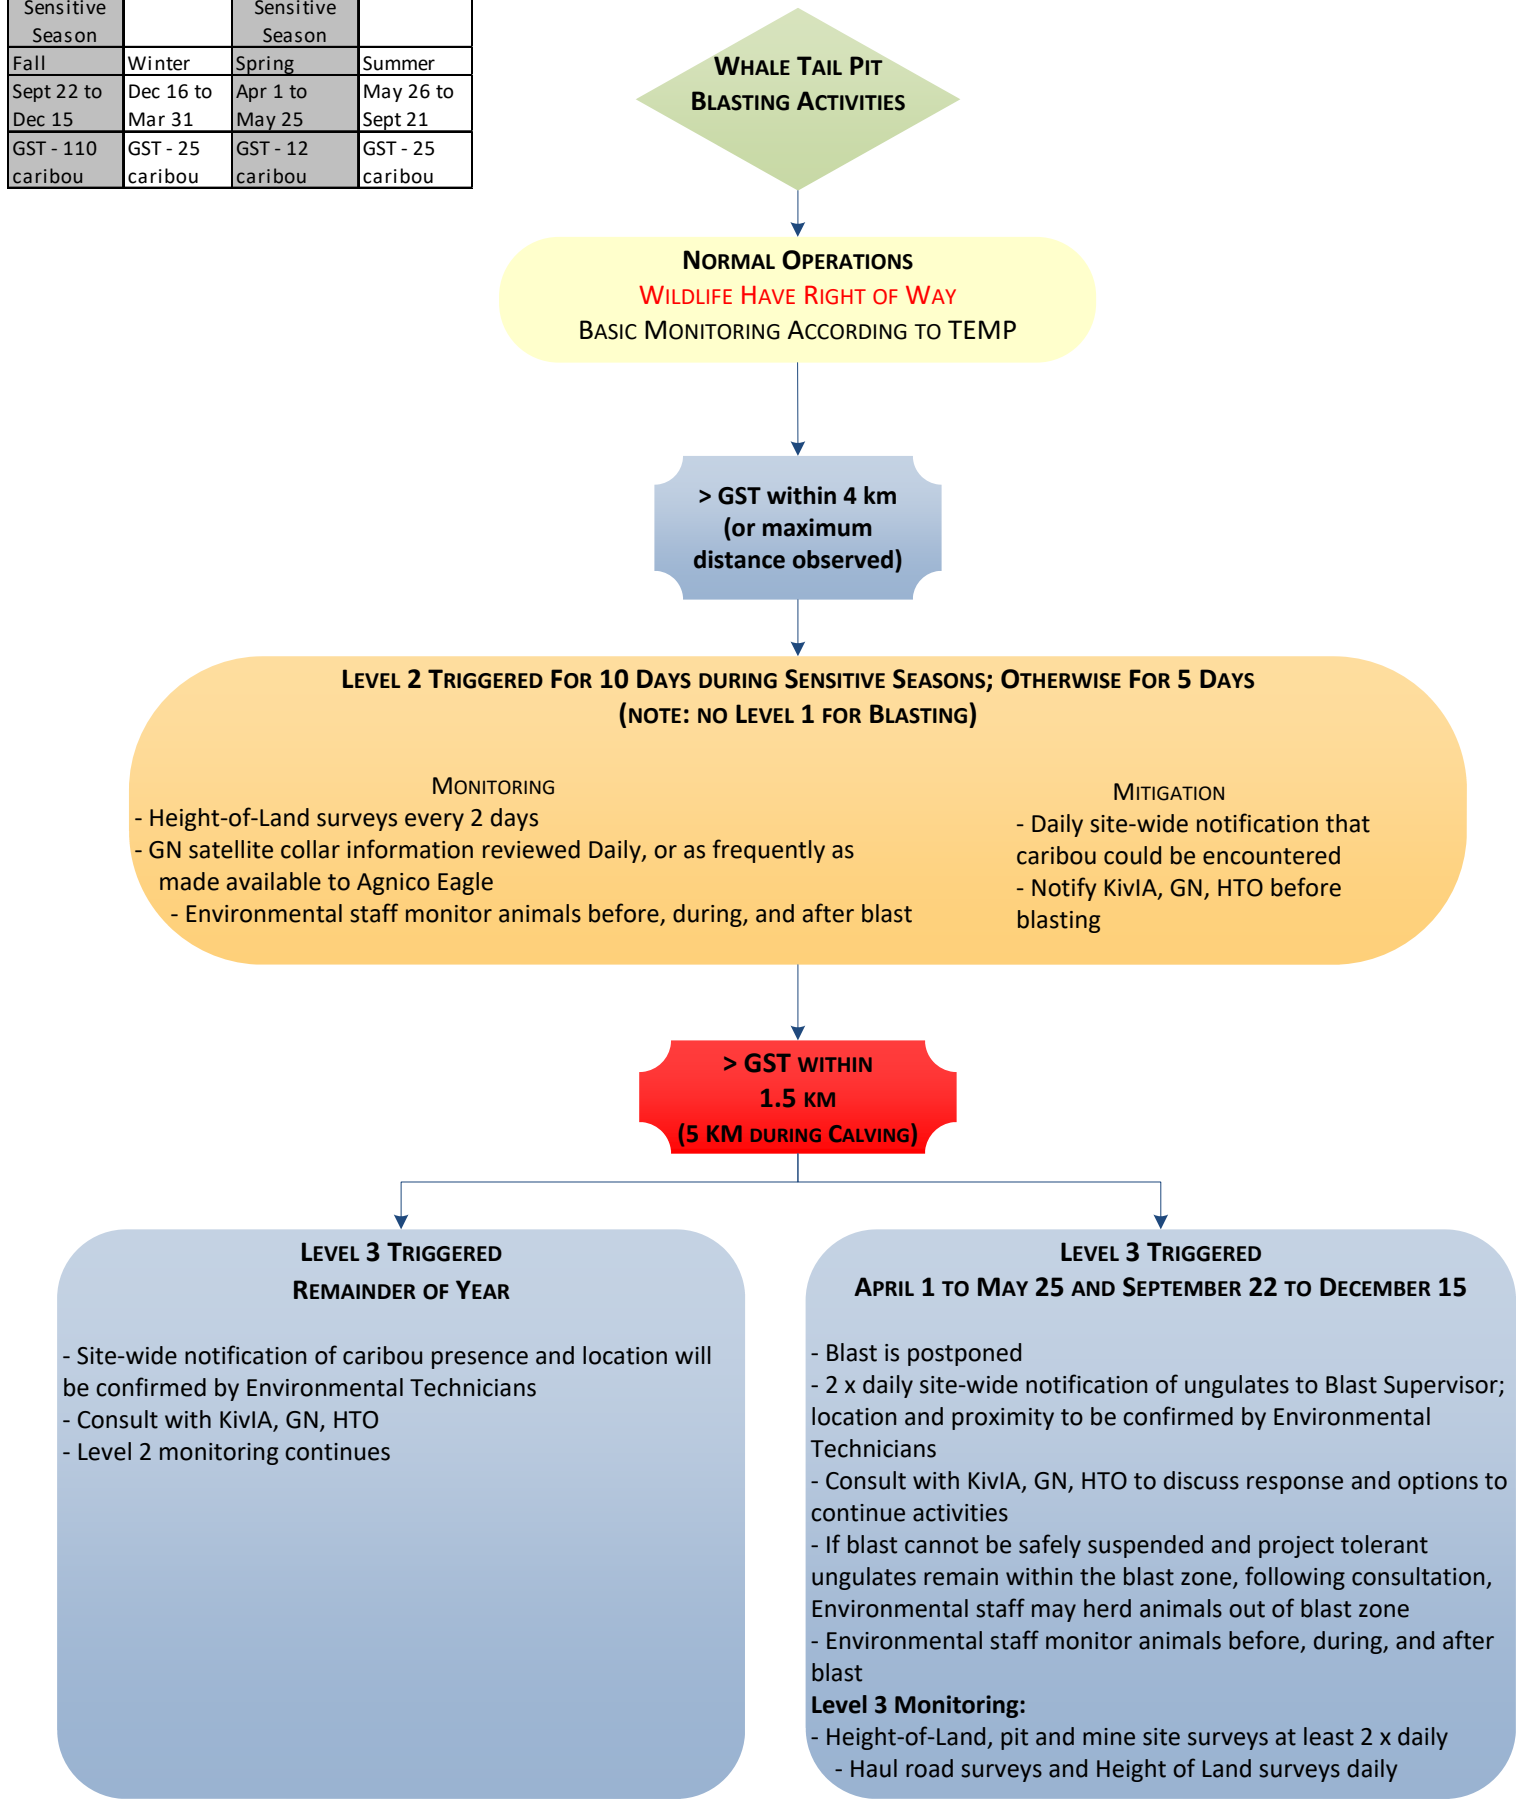

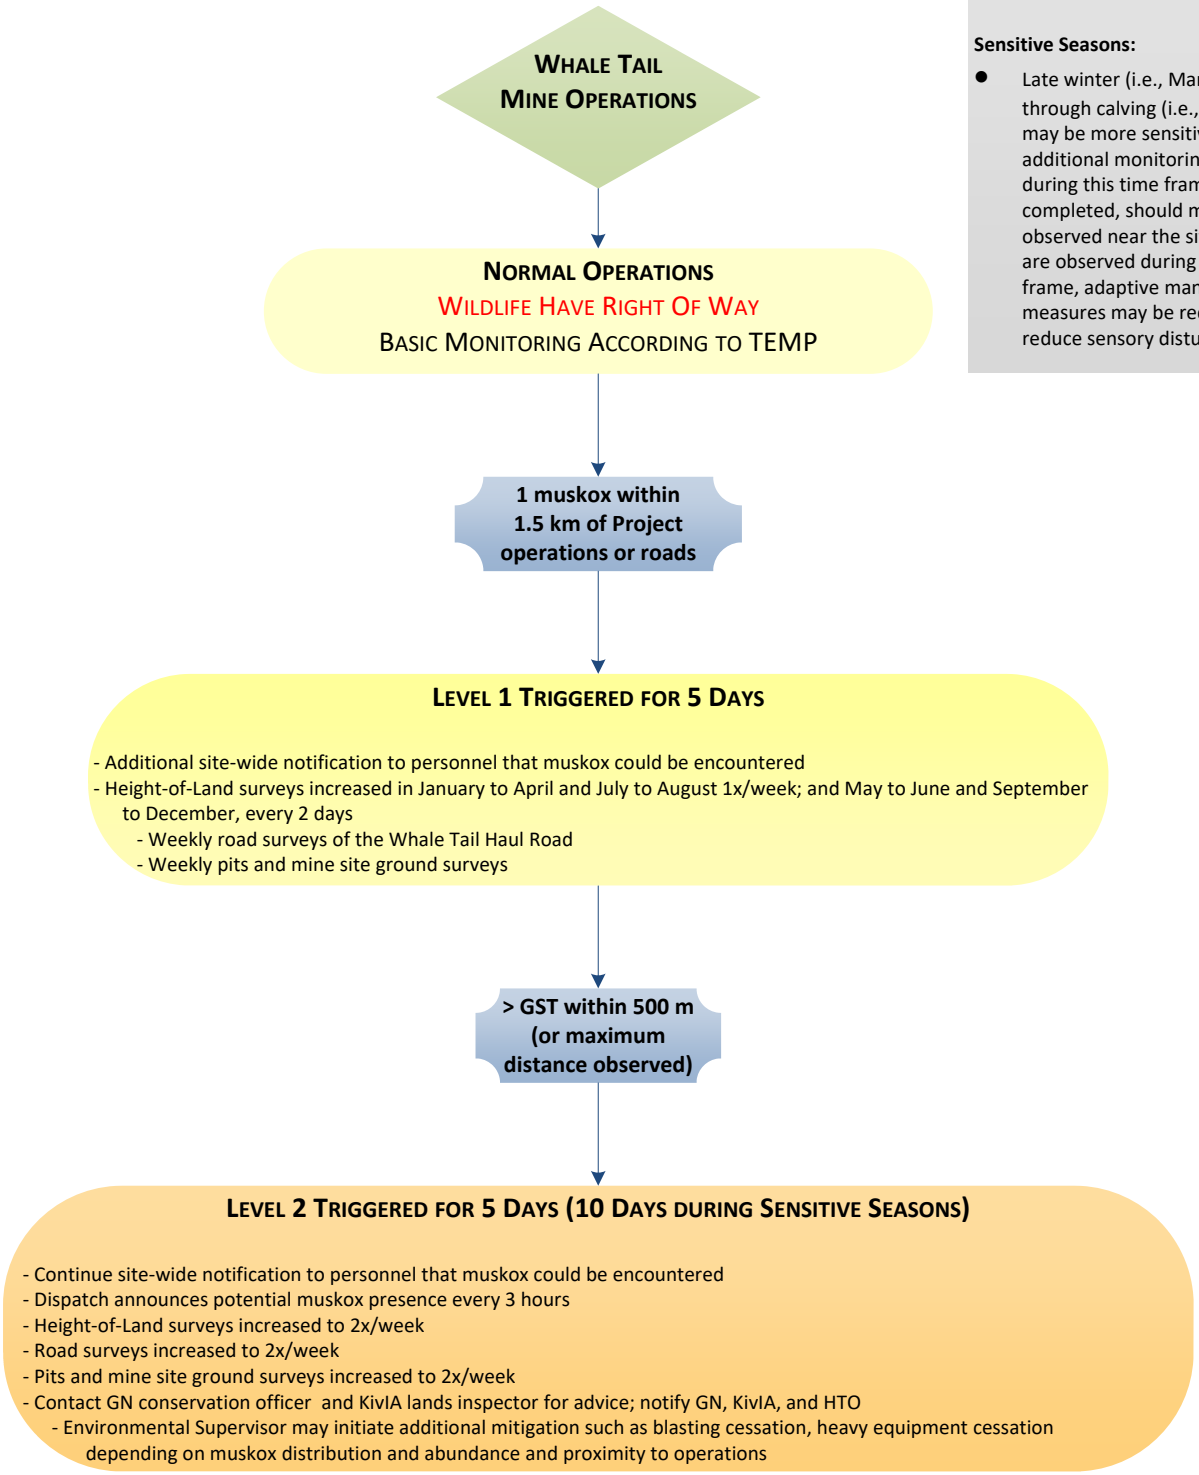

Figure 10: Thresholds for Monitoring and Mitigation of Muskox in Proximity to the Project

Muskox Group Size Threshold (GST):

- 13 muskox year round

Sensitive Seasons:

- Late winter (i.e., March 1st) through calving (i.e., mid-June) may be more sensitive and additional monitoring of muskox during this time frame will be completed, should muskox be observed near the site. If muskox are observed during this time frame, adaptive management measures may be required to reduce sensory disturbance.

3.5.2 Monitoring Approach

Monitoring activities for Ungulates will be carried out prior to, during, and following construction. Following are the methods and frequency for the monitoring efforts for each measurable parameter.

Table 14 describes the framework which has been established for monitoring effects to Ungulates. As described above, an objective is to reduce sensory disturbance to caribou approaching the Project. This objective is not linked to an impact prediction, as the monitoring is to trigger mitigation rather than to test a threshold. **Figure 6** through **Figure 10** describe monitoring and mitigation for caribou/muskox approaching the Project site for all aspects of the operations. Documents reviewed to develop monitoring and mitigation strategies included:

- Caribou Road Mitigation Plan for the Jay Project (Golder 2017)
- Wildlife Mitigation and Monitoring Program Plan for the Back River Project (ERM 2017)
- Management of Caribou Post-Calving Areas in the Kivalliq Region, Nunavut (Poole and Gunn 2016)

Distance thresholds for caribou monitoring have the ultimate objective of detecting caribou group size triggers up to a distance of 4 km (or maximum distance observed); however, not all caribou will be able to be observed at this distance in all circumstances and areas associated with the Project. During the spring and fall migration period, alongside HTO and KivIA representatives, additional personnel will be on-site to determine the best and most logistically feasible methods of recording data to document caribou detection thresholds from roads (e.g., AWAR and Haul Road) and for HOL survey locations. On-site environmental supervisors may use discretionary mitigation measures at level 2 of caribou and initiate adaptive management in collaboration with KIA and HTOP. This could include the addition of specific automatic measures intended to prepare for an operational shutdown if caribou move closer to mine operations or roads. In addition, a retrospective analysis using presence/absence data and wildlife features to determine “hot spots” near infrastructure to focus monitoring and mitigation. Data during field surveys and through strategically placed motion sensing cameras, will provide an understanding of caribou behaviour when approaching infrastructure (e.g., within 500 m of AWAR) and when interacting with infrastructure (e.g., caribou on road with no traffic vs caribou on road with traffic vs caribou near road with ATV and hunters). These data will be analyzed, discussed with the TAG and reported annually or on a relevant frequency commensurate with data volume.

Although the monitoring and mitigation is focused on caribou, muskox are also observed along the AWAR, with approximately 2500 animals from 299 observation records, of which nearly 2/3 of observations consist of 5 animals or less. A specific monitoring and mitigation decision chart for muskox has also been developed (**Figure 10**).

To provide additional clarity and support to the decision trees, the following definitions are provided:

‘Project tolerant’ as: an animal or group of animals (i) observed within a mitigation distance buffer for greater than 72 hours during the winter or 48 hours during other seasons; and (ii) not visibly disturbed by the Project.

‘Non-Essential Vehicles’: include vehicles and equipment used to continue mining operations or hauling of ore.

‘Essential Vehicles’: include vehicles operated for the purpose of maintaining the safety of personnel, Emergency Response Team (ERT), security and wildlife monitoring.

Table 14: Monitoring Approach for Ungulates for the Project

Potential Effect	Impact Prediction	Quantitative Monitoring Variable	Thresholds	Monitoring Activity	Frequency
Habitat Loss **Meadowbank Mine, and Vault Pit and Haul Road**	Loss <EIA prediction and subsequent approvals (see Gebauer et al., 2015)	area of altered habitat	10% above total loss of high suitability habitat (for ungulates) predicted in EIA **Meadowbank Mine and Vault Site** - 240 and 191 ha for the growing and winter seasons, respectively	Habitat monitoring	Every three years post-construction or based on TAG meeting outcomes
Habitat Loss **Meadowbank AWAR**	Loss <EIA prediction and subsequent approvals (see Gebauer et al., 2015)	area of altered habitat	10% above total loss of high suitability habitat (for Ungulates) predicted in EIA **Meadowbank AWAR** - 63 and 188 ha for the growing and winter seasons, respectively	Habitat monitoring	Every three years post-construction or based on TAG meeting outcomes
Habitat Loss **Whale Tail Pit and Haul Road**	Loss <EIS prediction (see Golder 2016)	area of altered habitat	10% above total loss of high suitability habitat (for Caribou)[(a)] predicted in EIA **Whale Tail Site** – 30 and 342 ha for the growing and winter seasons, respectively	Habitat monitoring	Every three years post-construction or based on TAG meeting outcomes
Sensory Disturbance to Caribou	N/A	Caribou presence	Monitoring is continuous, but with increasing intensity as caribou approach the Project (see **Figures 6** through **9**)	Pits and mine site ground surveys	Weekly increased up to every two days as per triggers (see **Figure 6**)
				Whale Tail Haul Road surveys	Weekly increased up to every two days as per triggers (see **Figure 7**)
				Caribou satellite-monitoring program	Data provided to Agnico Eagle from GN weekly, requested daily as per triggers(see **Figure 6** through **Figure 9**)
				ZOI and Mechanistic Studies	Through discussions/workshops with TAG members, determine new analysis requirements to better understand the indirect effects of mining on caribou as new data is acquired (Project Certificate No.008, Condition 29)
				Incident reports	As occurring

Table 14: Monitoring Approach for Ungulates for the Project

Potential Effect	Impact Prediction	Quantitative Monitoring Variable	Thresholds	Monitoring Activity	Frequency
				Height-of-land surveys	Weekly increased up to every two days as per triggers (see **Figure 6** through **Figure 9)**
Sensory Disturbance to Caribou from Blasting	N/A	Intensity of blast	NPC-119 criteria Monitoring is continuous, but with increasing intensity as caribou approach the blasting site (see **Figure 9**)	Monitoring of blast frequency, noise, and vibration	Blast is postponed. 2 x daily site-wide notification of ungulates to Blast supervisor; location and proximity to be confirmed by Environmental Technicians (see **Figure 9**)
Sensory Disturbance to Muskox	N/A	Muskox presence	Monitoring is continuous, but with increasing intensity as muskox approach the Project (see **Figure 10**)	Pits and mine site ground surveys	Weekly increased up to 2x/week as per triggers (see **Figure 10**)
				Whale Tail Haul Road surveys	Weekly increased up to 2x/week as per triggers (see **Figure 10**)
				Incident reports	As occurring
				Height-of-land surveys	Weekly increased up to 2x/week as per triggers (see **Figure 10**)
Vehicle Collisions	Ungulates will not be killed by vehicles	Numbers of Ungulates killed by vehicles	2 individuals	Pits and mine site ground surveys	See above
				Whale Tail Haul Road and All Weather Access Road surveys	See above
				Incident reports	As occurring
Hunting by Baker Lake Residents	Harvest intensity in the Meadowbank RSA will increase <20%	Correlation between spatial distribution of Ungulate harvest and road development Monitor trend in harvest from Hunter Harvest Study	>20% adjustment in harvest distribution Meadowbank AWAR use. This metric will further be refined as part of the revised HHS design and implementation	Baker Lake Hunter Harvest Study	Initiated in 2007 and active until 2015. Re-initiated in September 2017 with quarterly data collection; Yearly reporting

Table 14: Monitoring Approach for Ungulates for the Project

Potential Effect	Impact Prediction	Quantitative Monitoring Variable	Thresholds	Monitoring Activity	Frequency
	No increase in harvest from Whale Tail Haul Road RSA	Monitor trend in harvest distribution or total harvest from Hunter Harvest Study	No change in harvest	Baker Lake Hunter Harvest Study Satellite-collaring program	Initiated in 2007 and active until 2015. Re-initiated in September 2017 with quarterly data collection; Yearly reporting Data provided to Agnico Eagle from GN weekly, requested up to 2x/week as per triggers (see **Figure 6** through **Figure 9**)

Note: Frequency for some activities may change, see **Figure 6** through **Figure 9**

(a) For Whale Tail extension, effects on muskox were screened out during the EA process; therefore, they are not included in habitat loss calculations for the Whale Tail Site

3.5.2.1 Caribou Group Size

The environment department representative or observer (i.e., biologist, technician, and local hunter conducting caribou surveys) responsible for determining exceedance of triggers will monitor and document a "group of caribou" defined as:

> An aggregation of caribou that are sufficiently close together that they can see and react to another animal's behaviour, and have the potential of responding should one or more animal in the aggregation become startled.

At the discretion of the observer, if an aggregate of caribou are separated by approximately 500 m, this may be considered 2 groups of caribou depending on level of interaction and behaviour of groups. Agnico Eagle observes will work with GN, KivIA, and HTO representatives to ensure consistency in the application of this definition.

3.5.2.2 Group Size Thresholds

Group size numbers of caribou collected from observation monitoring along the AWAR are shown in **Table 15**. A group size of 50, which has been used to trigger adaptive management for caribou to date at the Meadowbank Mine, has been shown to encompass almost 2/3 (i.e., 64%) of all caribou observed from roadside surveys from 2007 to 2016 (**Table 15**). In addition, the majority of caribou groups greater than or equal to 50 are observed in the rut and fall migration and winter seasons (i.e., 91%).

Table 15: Summary of Caribou Numbers by Group Size Thresholds along the All-Weather Access Road (AWAR) from 2007 to 2016

Group Size	Total Number of Observations	Total Number of Caribou Represented in Group Size	% Total Caribou Observed
≥500	30	24,204	24.6%
≥100	181	52,513	53.4%
≥50	346	62,503	63.7%
≥40	423	65,772	67.0%
≥30	572	70,666	72.0%
Total	**3,961**	**98,192[(a)]**	

(a) Represents the total number of caribou observed from AWAR surveys between 2007 and 2016, consequently it will not be the sum of the Total Number of Caribou.

Through discussions with the GN and the KivIA, a desired minimum protection level of 75% of all caribou observed will be used as the foundation for group size thresholds (GST). Consequently, GSTs have been developed for the three main periods when caribou are observed on-site: early and late winter, fall rut and migration, and spring migration (**Table 16**). These data are also presented in **Appendix I** as graphs for each season. To be further conservative of caribou protection, the lower Confidence Interval value was used for the GST to trigger adaptive management (**Table 16**).

Table 16: Seasonal Caribou Group Size Thresholds Representing the Protection of 75% of All Caribou Observed, with 95% Confidence Intervals

Season	Group Size Threshold	Average Group Size	Upper/Lower 95% Confidence Intervals (CI)
Spring Migration	14	14.6	14.9/14.3
Early and Late Winter	35	35.3	35.7/34.9
Fall Rut/Fall Migration	140	175.0	209.6/140.4

Agnico Eagle reviewed GSTs to protect 75% of the caribou interacting with the Project. Agnico Eagle is committed to caribou conservation through the implementation of adaptive management based on group size and distance thresholds, but these measures have to be done in a manner that balances mining operations, and at this point it is uncertain how operations will be affected using a GST of 75%. Although Agnico Eagle suggests using the 75% GST and revisiting this number during the TAG meeting provided that this percentage balances operations and caribou conservation, as per Project Certificate No.008, Condition 30, Agnico Eagle will continue to collect additional data on caribou group sizes in proximity to the project and will work with the TAG to refine appropriate caribou GSTs. As mentioned earlier, the indirect effects of sensory disturbance on wildlife populations is poorly understood in terms of affecting the distribution and abundance of wildlife in relation to a mining development, even less is known of how these effects can translate to population level effects. Resource management objectives are typically devised around direct effects to wildlife populations such as hunting and habitat conservation, among others. Nevertheless, as per Project Certificate No.008, Condition 30, Agnico Eagle will initially adopt GSTs presented in **Table 17**.

Table 17: Initial Seasonal Caribou Group Size's as per Project Certificate No.008, Condition 30

Sensitive Season		Sensitive Season	
Fall	Winter	Spring	Summer
Sept 22 to Dec 15	Dec 16 to Mar 31	April 1 to May 25	May 26 to Sept 21
GST - 110 Caribou	GST - 25 Caribou	GST - 12 Caribou	GST - 25 Caribou

Based on the seasonal group size that will be used in the field, to implement heightened mitigation measures, more emphasis will be placed on understanding group size and the variation of group sizes within each biological season. In addition, whenever possible, the presence of collars will also be noted so that a linkage between collar presence and overall herd numbers can begin to be developed for each season[1]. As GSTs are the main trigger for mitigation and management, it is critical to understand the efficacy of these GSTs for overall herd protection.

[1] Collars can be challenging to see and observed at distances <300 m; all effort will be made to locate collars.

3.5.2.3 Zone of Influence and Mechanistic Studies

As per Project Certificate No.008, Condition 29, Agnico Eagle will work in collaboration with the GN and other relevantly interested parties, to collect additional caribou data and conduct analysis of this data to address questions about the direct and indirect effects of mining on caribou distribution and abundance. To date, Agnico Eagle completed a preliminary ZOI study. Agnico Eagle will continue to collaborate with the GN so that additional caribou data relevant to Agnico Eagle's operations can be collected to further explore a ZOI and/or other effects on caribou. For example, there appears to be an interaction between caribou and the road during seasonal movements, whereby caribou movements may be delayed at the local scale (i.e., not necessarily a delay to the ultimate destination of the calving grounds) when they encounter the road. Ground-based studies as part of the Whale Tail Pit Haul Road (referred to as the Haul Road) monitoring are being considered to determine the mechanisms that may be responsible for this delay. The Haul Road monitoring would specifically look at collecting the following information:

- Surveys inform of caribou distribution and relative abundance, and the AWAR datasheet has been the means for collecting information using the following parameters: date, time, species, number (group size), behavior, habitat, location coordinates, direction from road, distance from road, and general comments.
- Suggested changes to the objectives, methods, and data collection parameters are as follows and will be implemented in 2018:
    - Agnico Eagle developed GSTs to guide mitigation/management; these GSTs are seasonal and based on a protection measure of 75% of the herd (i.e., 75% of the total caribou numbers are represented by group sizes of the seasonal threshold or higher);
    - When caribou are near the Roads, monitoring intensity goes up through a phased approach to daily monitoring;
    - To improve data collection, Agnico Eagle is suggesting to better understand detection distance thresholds from the roads (AWAR/Haul Road) and we can do this by testing detection and measuring using range finders, people on the landscape, and installing visual markers at 1 km perpendicular distances from the road;
    - Observers will also record the maximum observable distance even when caribou observations are 0 and can retrospectively use collar data to try and determine detectability;
    - Agnico Eagle is now employing a consistent definition of groups but it is likely still important to note the distance of one group from another and record that behavior on the data sheet (i.e., are they separate groups?) to determine if they are interacting (exchanging individuals or responding to one another). The alternative

approach is to only record data for group you know is unique (i.e., if they are close spatially assume it's the same group[2]).

- Haul Road surveys are drive and scan, with un-controlled stops to confirm caribou numbers or to let caribou pass. However, Agnico Eagle is going to implement some trials of time-limited scans in certain locations along the Haul Road (i.e., where there's trails, elevation advantages, etc.) to help with detectability. Depending on how many surveys are completed in each season and based on caribou numbers, there may be enough data to generate an occupancy map of the Haul Road by breaking it into segments with presence-absence data (observed or not). The result wold be a heat map of the Haul Road, which could then be used to focus mitigation and monitoring. We would also consider other co-variates such as elevation (i.e., a DEM), caribou trail presence, or survey-specific covariates (e.g., distance to observation, weather).

These minor modifications are intended to better facilitate the determination of detection distance thresholds (i.e., how far out can we detect caribou from these areas when we know the caribou are coming based on collar data), caribou distribution, how many caribou, group size, and ideally even caribou behaviour at various distances from the road and qualified based on road activity level.

TAG meetings specific to caribou analysis to understand the direct and indirect effects of mining on caribou distribution and abundance will be established. Agnico Eagle wishes to work collaboratively with the GN, the KivIA, and other interested relevant and qualified parties to help understand the key effects and the optimal mitigation and management. Studies and reports will be completed on an as-needed basis throughout the operations of the mine as determined through the TAG and as additional data is acquired.

3.5.2.4 Blasting Thresholds

Nunavut does not have any regulations or guidelines related to potential environmental noise and vibration effects from blasting and the NIRB does not endorse or recommend any specific regulation or guideline as being appropriate for assessing potential environmental effects from blasting. As such, the approach used here is that safety procedures for the protection of caribou due to blasting should follow the standards and procedures for humans.

The Ontario Ministry of Environment Noise Pollution Control (NPC) Publication 119 (OMOE 1978) represents best practices with respect to the assessment of potential noise and vibration effects from blasting. As such, NPC-119 assessment methods and criteria were used in the Project Noise Impact Assessment. The EIS estimates that blasting noise during haul road construction will reach the NCP-119 limit of 120 dBZ at 300 m from the blast, and at 1,000 m for Whale Tail Pit operations. Noise is also reduced when receptors are not within the line-of-sight of the blast (such as when the blast is in a deep open pit or when receptors are behind a hill). For vibration, the EIS estimates that blasting vibration from haul road construction will reach the NCP-119 limit of

[2] Based on field observations, animals can be considered a single group if they are 500 to 1,000 m apart.

10 mm/s at 165 m from the blast, and at 1,150 m for Whale Tail Pit operations. Blasting vibrations from the Whale Tail Pit operations decay quickly from the source and are 504 mm/s at 100 m from the source, 38 mm/s at 500 m from the source, and down to 4 mm/s 2 km from the source.

Caribou Response to Noise and Vibration

Research into the range of caribou frequency sensitivity has found that caribou are less sensitive to low frequency noise than humans (Flydal et al. 2001). For example, the caribou hearing threshold at 63 Hz is approximately 30 decibels (dB) higher than the human hearing threshold at 63 Hz. Put another way, a human could be expected to detect a low frequency noise approximately 30 dB quieter than could be detected by a caribou.

Because human hearing is more sensitive to low frequencies than caribou hearing, using human-centric thresholds for effects to caribou can be considered conservative – i.e., tending to overestimate the magnitude of the effect.

Blasting noise and vibration are measured by two parameters:

- Peak Particle Velocity (PPV) expressed in millimetres per second (mm/s)
- Peak Pressure Level (PPL) expressed in unweighted or linear decibels (dBZ)

Caribou hearing is less sensitive at low frequencies than human hearing (Flydal et al. 2001); therefore, it is likely that humans will be able to detect airborne PPL associated with blasting at larger distances than will caribou. In contrast, Inuit Qaujimajatuqangit (IQ) indicates that caribou feet are sensitive; therefore, it is likely that caribou will be able to detect ground-borne PPV associated with blasting at larger distances than humans. In the absence of research identifying specific vibration detection thresholds for caribou feet, it is not possible to estimate specific distances over which caribou will be able to detect ground vibration from Project blasting, although Reimers and Coleman (2001) noted that aerial bombing in military exercises did not typically elicit a visible behavioural response from reindeer at distances between 1.8 and 3.0 km. The EIS indicates that PPV from blasting at the Whale Tail Pit is predicted to drop to effectively 0 mm/s for distances of 4.0 km from the blasting site. As such, it seems reasonable to conclude that PPV associated with blasting would not be detectible by even the most sensitive caribou feet at distances beyond 4.0 km from the blasting site. Conversely, PPV is predicted to be at 13 mm/s at 1,000 m from the source and 7 mm/s at 1.5 km from the site.

Agnico Eagle will implement a field-based study to understand and document the visual and physical parameters of the blast and quantify the response of caribou to the blast.

The Study design will be implemented during the 2018/2019 winter period and followed up again during snow free conditions. The objective of the proposed program is to first characterize blasting and vibration levels on the landscape as a result of operational blasting activities. The measurement data will be used to characterize the relationship between noise/vibration levels and blasting parameters (e.g., charge mass, burden depth), and the relationship between noise/vibration levels and propagation conditions (e.g., air temperature, wind speed/direction).
The study will achieve the following:

- The measurement program will consist of long-term blast monitoring over two different time windows. The first-time window will cover nominal summertime conditions (i.e., unfrozen ground, temperatures above 0°C). The second time window will cover nominal wintertime conditions (i.e., frozen ground, temperatures below 0°C).
- The monitoring program will characterize ground vibration from blasting using the Peak Particle Velocity (PPV) parameter. The monitoring program will characterize noise from blasting (also known as airblast overpressure) using the Peak Pressure Level (PPL) parameter.
- Based on blasting schedule and knowledge of caribou distribution and group sizes, opportunistically capture caribou behavioural response to blasting.
- Existing blast monitoring program is in place to measure noise and vibration, will use this data to extrapolate vibration measurements across the landscape.
- Characterize each blast in the field based on sound (develop a relative scale similar to the Beaufort scale for wind), visibility of dust plume (Y/N), if so describe it (i.e., height, width, visual longevity, etc.).
- Characterize caribou response to blast – basic behavioural parameters including the initial startle or not. Group and focal behaviour scans will help to quantify the behavioural response and to understand how many individuals respond versus how long. In addition, behavioural monitoring has been scrutinized and requires several hours of effort to determine meaningful results. Consequently, observations from Inuit hunters will be made and incorporated and video of caribou responses will also be used to gather a weight of evidence approach to answering the question.
- The logistical challenge will be to get an accurate distance of caribou groups from the blast, right now Agnico Eagle is considering 250 to 500 m increments. Agnico Eagle is also considering the use of laser range finders that can measure the distance from observer to caribou and distance from observer to blast and the angle to triangulate.
- The objective is to demonstrate the response of caribou to blasting at varying distances.

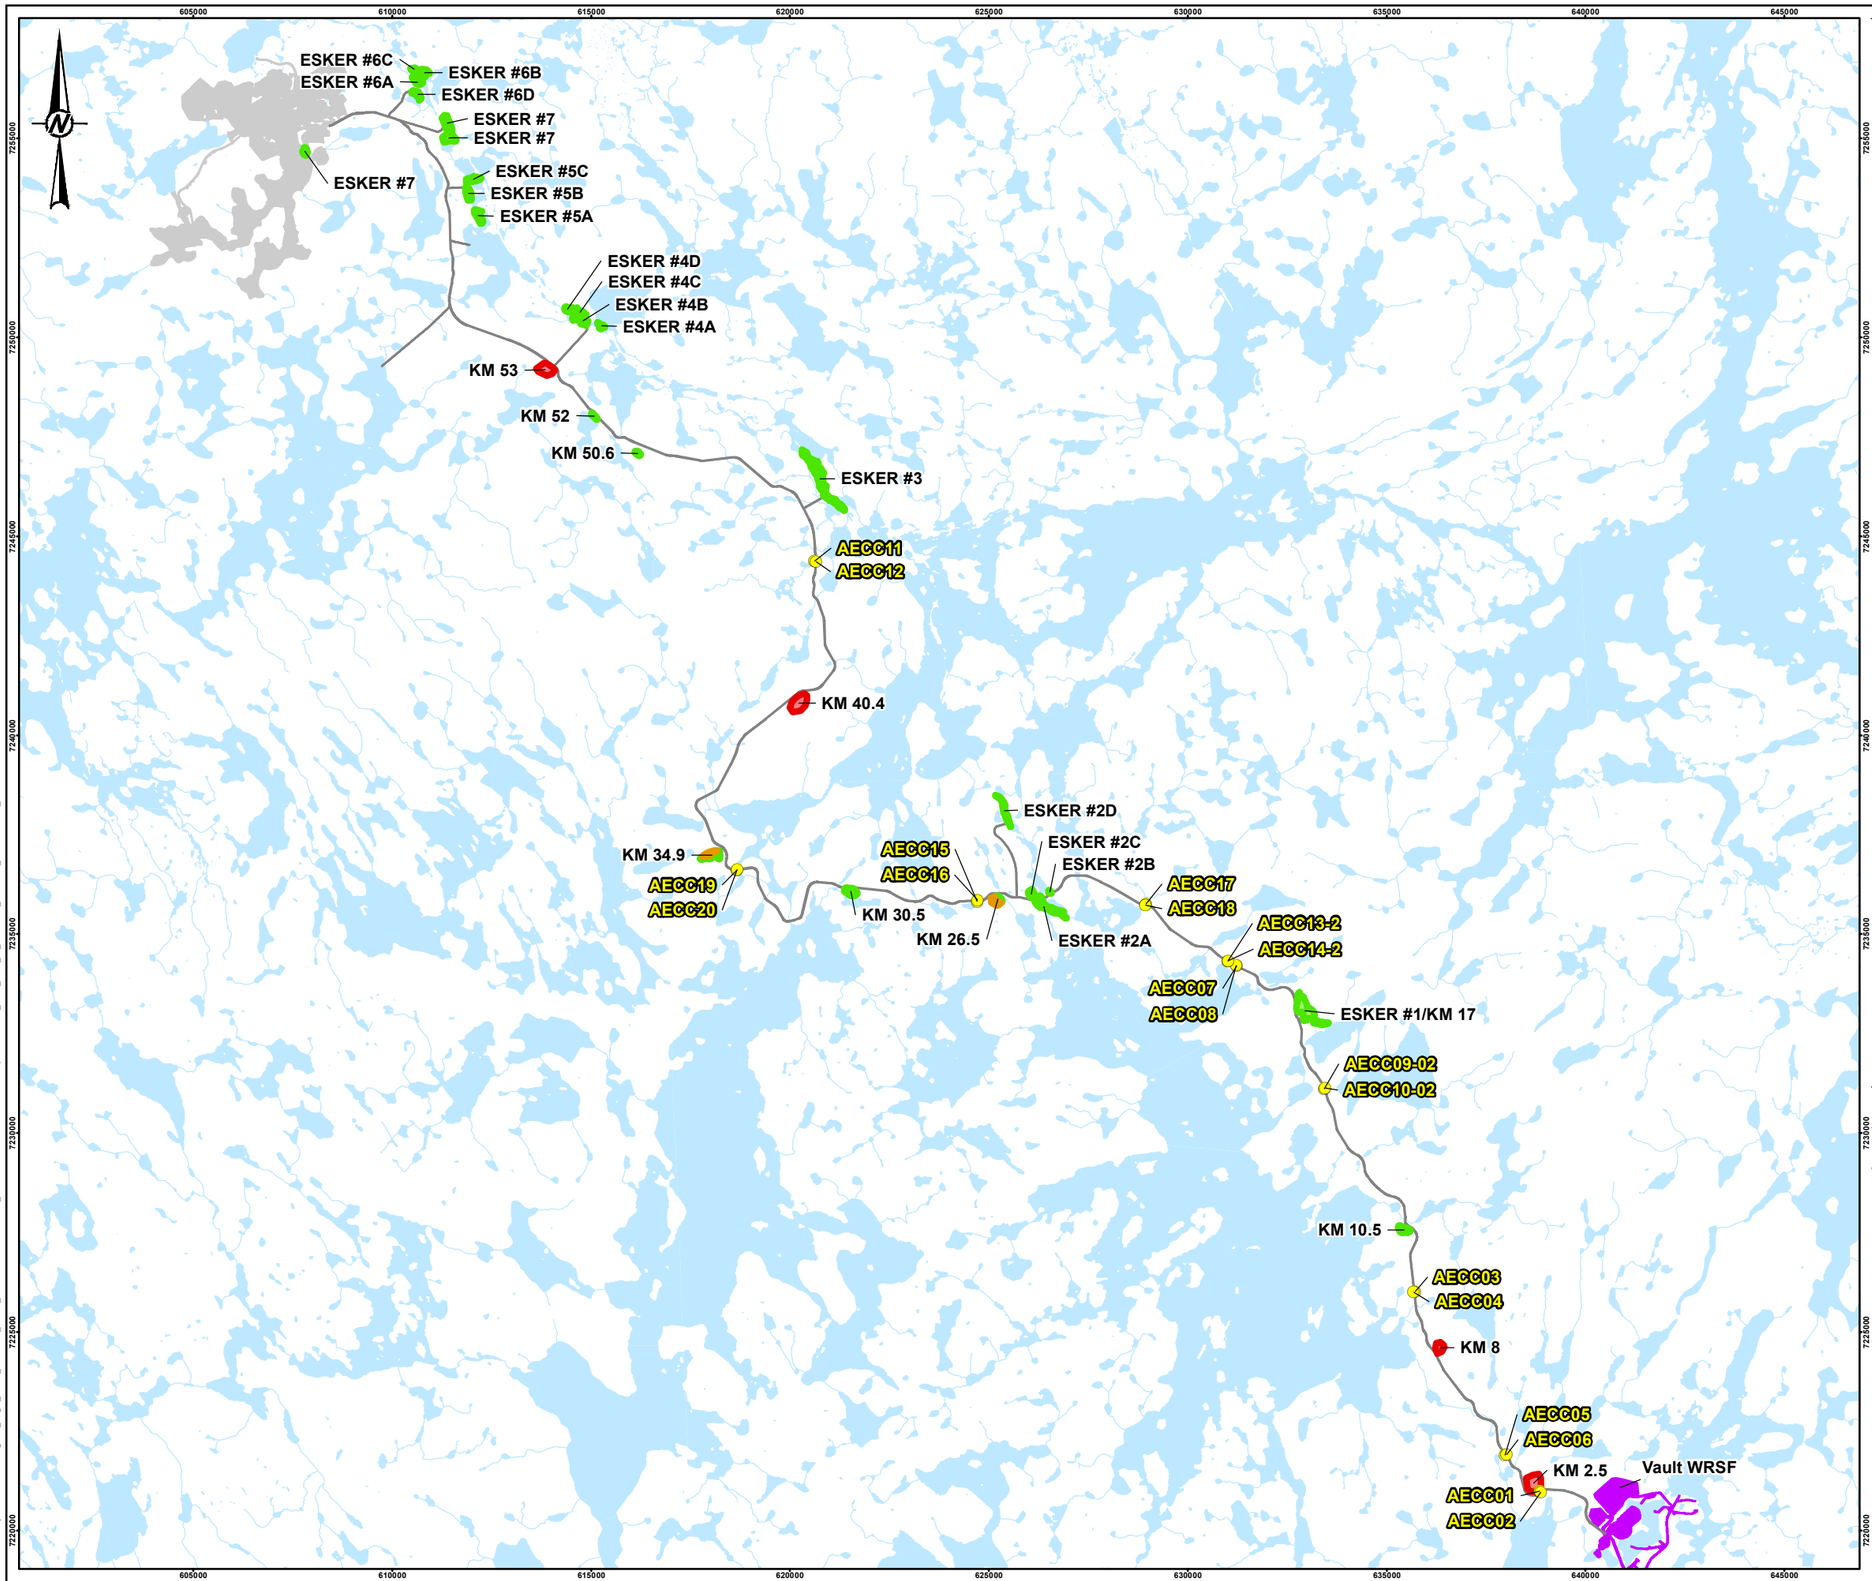
The approach outlined in **Figure 9**, will be followed. In addition, following threshold to delay a blast will be used:

- If caribou or other wildlife are observed within the danger zone for humans surrounding the blast, where there may potentially be fly rock or debris, as determined by the Blast Supervisor – typically 600 m radius from blast centre
- If the caribou Level 3 mitigation is triggered, when the caribou seasonal GST are observed within 1.5 km of the Project facilities (**Figure 9**)

3.5.2.5 Habitat Loss & Degradation

Methods: Habitat loss and degradation will be monitored and assessed through habitat monitoring (see **Section 3.3.2** for details). An analysis of the loss of High suitability habitats will be conducted and compared to thresholds (see **Table 13**).

Frequency: See **Section 3.3.2**.



3.5.2.6 Sensory Disturbance and Disruption of Movements

The primary goal of monitoring for sensory disturbance and disruption of movements of Ungulates is to provide an early detection of animals approaching a project (Poole and Gunn 2015). Once animals are detected, operational activities will be adjusted, as described in **Figure 6** through **Figure 10**, to reduce sensory disturbance. When the caribou seasonal GST are observed within 1.5 km of the Whale Tail Haul Road, additional mitigation will be implemented of reducing speeds to 30 km/h and any caribou crossing the Whale Tail Haul Road will be given the right-of-way. The following monitoring will be used to detect caribou.

- Caribou Satellite-Collaring Program
- Height-of-Land Surveys (see **Section 3.2.1**)
- Road Surveys (see **Section 3.2.1**)
- Pit and Mine Ground Surveys (see **Section 3.2.2**)

Monitoring and mitigation triggers for caribou include one collared caribou within 25 km of the Project (i.e., Level 1), which initiates more intensive monitoring and heightened awareness for Project staff that caribou are in the area. See **Table 17** for seasonal specific GSTs.

During the June, 2018 TAG meeting, several topics were evaluated regarding sensory effects to caribou related to general monitoring to examine group size, distribution, seasonality and implement mitigation, blasting (see Section 3.5.2.4 for a study to be immediately implemented) and road interactions, particularly along the haul road in relation to traffic. To gather additional information on caribou interactions with the Whale Tail Haul Road, 20 remote cameras were placed along the haul road (**Figure 11**). This initial monitoring is to determine any trends related to distribution of caribou road crossing, effects of traffic/activity to caribou road monitoring, which can then guide more fine-scale mitigation of traffic, road activity and potentially roadside marker design.

Caribou Satellite-Collaring Program

Methods: As part of its ongoing monitoring program for the Project, Agnico Eagle is collaborating with the GN in a caribou satellite-collaring program in the Meadowbank RSA. The joint satellite-collaring program will provide seasonal and regional information on caribou distribution within the Meadowbank and Whale Tail RSAs, and data collected during spring and fall migration periods will inform mitigation and management activities. In collaboration with the GN, data are formally analyzed for caribou migration trends and analyzed annually.

To determine whether caribou not observed from the Project are being disturbed (e.g., if their movement is deflected to avoid the Project), a one-time comprehensive analysis of satellite-collaring data since 2008 will be undertaken collaboratively by the GN and Agnico Eagle, but will be led by the GN. Results of the analysis will be included in the annual Wildlife Monitoring Summary Report. In addition, Agnico Eagle has initiated an initial analysis to explore the extent of a potential ZOI from the Project and will provide this information as it is available.

Frequency: Initiated in 2008 with four subsequent deployments. Data provided to Agnico Eagle from GN weekly, requested up to twice per week (see **Figure 6** through **Figure 9**).

Height-of-Land Surveys

Methods: Five, easily accessible, HOL survey locations are established along the Whale Tail Haul Road, one of which is near the Whale Tail Pit and another near the Vault Pit. The locations are within 500 m of the Whale Tail Pit Haul Road, and provide an unobstructed view (up to 360^0) of the surrounding terrain. **Appendix G** shows a viewshed analysis showing the amount of land available within a 4 km viewshed from each HOL survey location and a 1.5 km viewshed from the AWAR and Whale Tail Haul Road and includes available collar data. The HOL locations also show where caribou observations, signs, and trails were observed, which were used to guide these survey locations. The HOL surveys provide an 'early warning' system of the presence of caribou in proximity to the Whale Tail Pit and Haul Road after the collar data has shown that caribou may be moving towards the Project area and/or collars are within 25 km of the Project area. The surveys can be easily accessed from the Haul Road and will be conducted by environmental technicians or trained wildlife monitors. A minimum of 20 minutes will be spent surveying at each of the locations using a combination of naked eye, binoculars, and scopes. The surveyors will independently view the landscape for caribou starting at opposite cardinal directions and will scan 180° for 5 minutes at a time, but move 90° every 5 minutes. Results will then be compared to determine if GST is triggered, but consensus on numbers is not necessary as each survey will generate a separate result for each observer so that variability can be incorporated into detection rates. Further, where possible, this will also be tested with collar data. If feasible, a representative photo of the herd will be taken if GSTs (refer to decision trees) are exceeded; the environmental supervisor will be contacted immediately.

Information collected will be similar to that collected during systematic pits and mine site ground surveys (see **Table 13**, field data form in **Appendix D,** and **Appendix G**). Behavior of Ungulates will also be recorded for each encounter and comments on disturbance related to a particular behavior (e.g., running) will be made (see field form in **Appendix D**).

A summary of field confirmation details regarding the viewscape analysis at HOL locations includes the following (M. Young, Dougan Associates, 2017, pers. comm.):

HOL Survey Point	Average Maximum Observable Distance	Comments
1	9.2 km	This site was slightly relocated to improve the visibility of the road. Small blind spots (50 to 100 m wide) facing S and NW
2	7.2 km	Small blind spots facing S, SW, and W
3	9.1 km	Small blind spots facing S, SE, NW, and E
4	8.9 km	Lars Qaqqaq identified this location as a movement corridor for Barren Ground Caribou Small blind spots facing SE, W
5	5.5 km	Road at this section is not currently built. Small blind spots facing SW, NW, NE. SW, and NE blinds spots to be opened up when eskers removed for road construction.

The viewshed analysis is an important component of the overall monitoring program as it provides direction for monitoring locations that best capture caribou movements through the Project area during the spring and fall migration periods. Consequently, the survey locations chosen based on the results of the viewshed analysis will be continually reviewed and updated with the TAG. Additional tasks remaining related to the viewshed and survey locations still need to be completed prior to construction of the Whale Tail Pit and Haul Road, which include the following:

- Additional HOL survey location is to be added on the west side of the Whale Tail Pit to capture areas not currently covered by survey locations as revealed in the viewshed analysis. Suitable locations will be determined in 2018 field season and tested.
- Selected points along the road may fill in monitoring gaps in the viewshed, these sites have not yet been selected but an initial set of locations will be determined in 2018.
- Determine the amount of the landscape covered by HOL survey locations and roadside surveys within an area that buffers the HOL locations by 4 km and the road by 1.5 km to determine if there is sufficient monitoring coverage from the existing surveys.

Frequency: Surveys will be conducted weekly from January to April and July to August, twice per week from May to June and September to December. Increased up to every two days as per triggers (see **Figures 6, 7, 9,** and **10**).

3.5.2.7 Project-Related Mortality – Vehicle Collisions

Methods: Monitoring will be conducted during ground surveys at pits and the mine site, and along roads. Incident report (**Appendix D**) to be submitted following every vehicle collision with an Ungulate. The thresholds level of mortality beyond which further mitigation will be required is two mortalities per year (see **Table 14**).

Frequency: Incident reports (**Appendix D**) submitted when road-related mortalities occur. Ungulate mortality will be reviewed on an annual basis.

3.5.2.8 Project-Related Mortality – Hunting by Baker Lake Residents

Methods: As stated in the TEMP (Cumberland 2006), the Hunter Harvest Study (HHS) was established to monitor the spatial distribution, seasonal patterns, and harvest rates prior to and following construction of the AWAR. A survey of hunter harvests was conducted among Baker Lake residents from 2007 through 2015; however, declining participant rates has led to revaluation of the HHS approach.

Agnico Eagle has discussed and met with stakeholders (GN, KivIA, and HTO in November 2016 [Winnipeg], January and June 2017 [Ottawa]) to broaden the scope of the HHS and facilitate greater involvement of the local community in future years of the study.

The primary objectives of the HHS are to monitor potential Project related effects on harvesting of wildlife by residents of Baker Lake. This objective is achieved by estimating the following key metrics:

1. The distribution of caribou, muskox, and wolverine harvest by residents of Baker Lake; and

2. The total level (or an index of) caribou, muskox, and wolverine harvest by residents of Baker Lake.

Other objectives of the HHS may be established in consultation with TAG or other participants and may include:

1. Supporting creel surveys by gathering information on Arctic Char (*Salvelinus alpinus*), Lake Trout (*Salvelinus namaycush*), Lake Whitefish (*Coregonus clupeaformis*), and Arctic Grayling (*Thymallus arcticus*) catch rates and Inuit-use patterns in the Baker Lake area;

2. Understanding regional distribution of hunting and fishing activity;

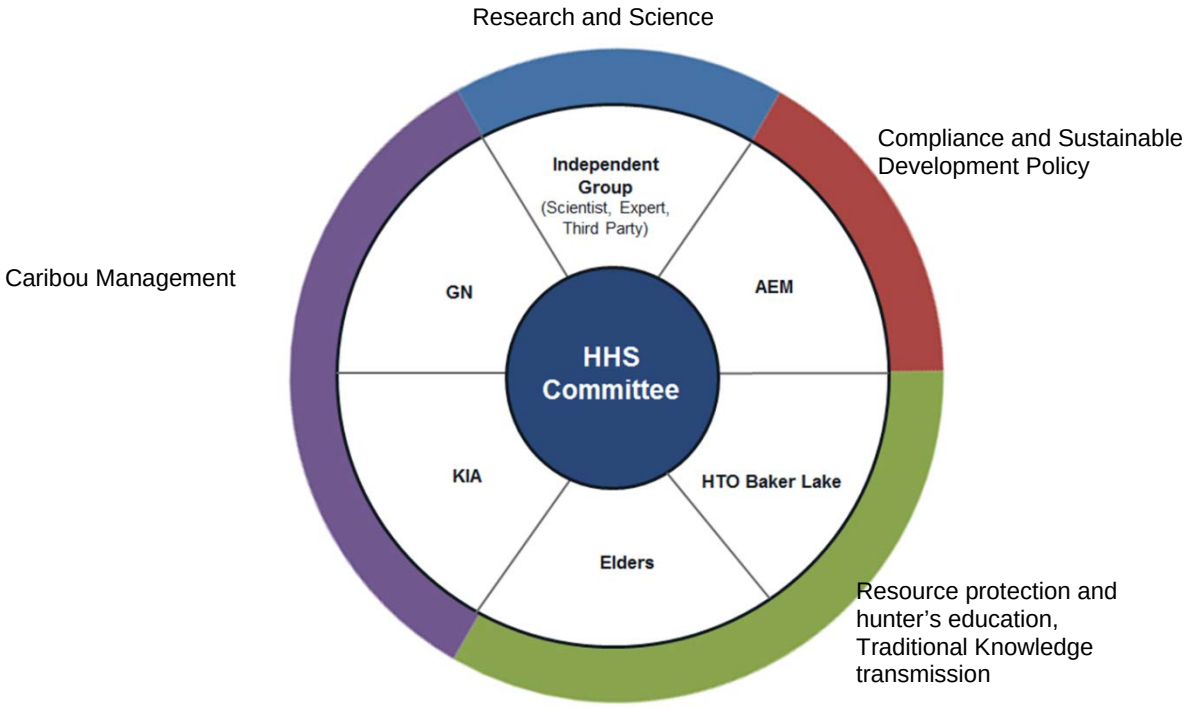
3. Investigating seasonal timing of hunting and fishing activity; and

4. Determining whether increased harvest and catch rates are associated with the AWAR.

As discussed during consultation with stakeholders, HHS will further seek to:

- increase and maintain the hunter participant rate in the future of the program;

- improve resource protection,



- improve hunter awareness and education;

- increase the integration of Inuit Qaujimajatuqangit and Traditional Knowledge; and

- increase availability of data collected for a collective approach to understanding wildlife harvest, assist Agnico Eagle in mitigative actions and the GN in management decisions.

The HHS will promote involvement/partnership of the local stakeholders; including the HTO, Elders, GN officer, and KivIA in a collaborative format conceptually illustrated in **Figure 12.** Detailed survey methods, survey timing, and promotional strategies will tentatively include HHS Committee members visit hunter harvest study participants on a regular basis to document harvests and discuss general hunting trends and observations. The members will also conduct communication actions and post promotional material around the Hamlet of Baker Lake. The use of social media will also be assessed and potentially used to increase awareness within the community and especially towards a younger generation of hunters.

Figure 12: Conceptual Hunter Harvest Study Partnership, Participants, and Relevant Objectives

The use of a third-party group was suggested and intended to facilitate the collection, preservation, exchange, and use of local observations and knowledge of the community. The emphasis would be targeted on supporting community-based efforts to direct research and monitoring based on priorities and information needs. It would also link between stakeholders and provide expertise towards community led initiatives in the HHS.

Frequency: Data will continue to be collected at least quarterly and analyzed at the end of each calendar year and provided within the annual Wildlife Monitoring Summary Report.

3.5.3 Thresholds

Should the thresholds outlined in **Table 14** exceeded, the following actions will be undertaken.

3.5.3.1 Habitat Loss & Degradation

See **Section 3.3.3**.

3.5.3.2 Sensory Disturbance and Disruption of Movements

Agnico Eagle has developed a tiered caribou monitoring procedure to increase levels of monitoring and mitigation if caribou are found to be in the vicinity of the site. **Figure 6** through **Figure 9** describes the tiers and triggers of this procedure and the appropriate actions to be undertaken.

3.5.3.3 Project-Related Mortality – Vehicle Collisions

If an Ungulate mortality occurs (i.e., threshold of two mortalities exceeded), an investigation into the circumstances and factors leading up to the incident will be conducted by the on-site Environmental Supervisor (see also the Incident Report Form, **Appendix D**). Where an incident has resulted from operator negligence, disciplinary action may be considered.

3.5.3.4 Project-Related Mortality – Hunting by Baker Lake Residents

If harvest rates are determined to be increasing significantly (as determined by the GN) as a result of Project infrastructure, Agnico Eagle, will request the Baker Lake HTO and GN investigate additional access control measures.

3.6 Predatory Mammals

3.6.1 Objectives

The primary objective of the Predatory Mammal monitoring program in the Project area will be to evaluate the success of preventative programs designed to proactively avoid the occurrence of problem animals and detect thresholds, as opposed to reactively trying to manage them by relocation or destruction.

3.6.2 Monitoring Approach

Table 18 describes the framework that has been established for monitoring effects to Predatory Mammals.

Table 18: Monitoring Approach for Predatory Mammals at the Meadowbank, Whale Tail Project and proposed Whale Tail Expansion

Potential Effect	Impact Prediction	Quantitative Monitoring Variable	Thresholds	Monitoring Activity	Frequency
Project-related mortality	Predatory Mammals will not be killed as a result of Project activities	Number of grizzly bears, wolves and wolverines killed	Two individuals of the same species in a year	Pits and mine site ground surveys	Weekly, at least. Includes inspections of waste streams to ensure no attractants for Predatory Mammals
				Road surveys	Weekly, at least
				Incident and vehicle encounter reports	Ongoing (when incidents with wildlife occur)
				Baker Lake Hunter Harvest Study (for wolverines)	Initiated in 2007, stopped in 2015 and scheduled for re-implementation in 2017 Quarterly data collection; Yearly reporting
Disturbance of Den Sites	Active Predatory Mammal dens will not be destroyed or disturbed to the point of den abandonment	Number of active grizzly bear, wolf or wolverine dens destroyed or abandoned due to sensory disturbances	One active den	Den-specific management plan, active den site surveys	Initiated by the detection of an active Predatory Mammal den (grizzly bear, wolf or wolverine) within the active footprint or vicinity of Project facilities. See **Figure 12**. Frequency of den monitoring will be determined by season, species and location. See **Appendix J**

3.6.2.1 Project-Related Mortality

Methods: Methods are the same as those described for Ungulates (**Section 3.5.2**). The threshold level of mortality beyond which further mitigation will be required is two individuals per year (see **Table 14**). The pits and mine site ground surveys will include inspections of waste streams to ensure no attractants for Predatory Mammals. In addition, the hunter harvest study (see **Section 3.3.2**) will investigate potential increases in wolverine mortality related to the road.

Frequency: The number of grizzly bear, wolf, and wolverine mortalities will be analyzed on an annual basis with findings presented in the annual Wildlife Monitoring Summary Report (see **Table 18**).

3.6.2.2 Disturbance of Den Sites

Methods: For existing operations, data will be collected on Arctic wolf abundance and behaviour during ground surveys, vehicle surveys, and HOL surveys. Should the wildlife technician suspect or confirm that a den is present within the active footprint and vicinity of Project facilities or roads, a den management plan will be prepared (see **Appendix J** for required components of den management plans). For new development sites, suitable habitat within 1 km of new development site will be investigated on foot for active wolf dens. In the event that wolverine or grizzly bear dens are discovered, den management strategies with appropriate timing windows will be developed for these species. The thresholds beyond which further mitigation will be required is discovery of one active den (see **Figure 13** and **Table 18**).

Frequency: See **Table 14** for frequency of ground, road, and HOL surveys, see **Figure 13, Section 3.5.3** for further mitigation strategy to be undertaken upon discovery of an active Predatory Mammal den.

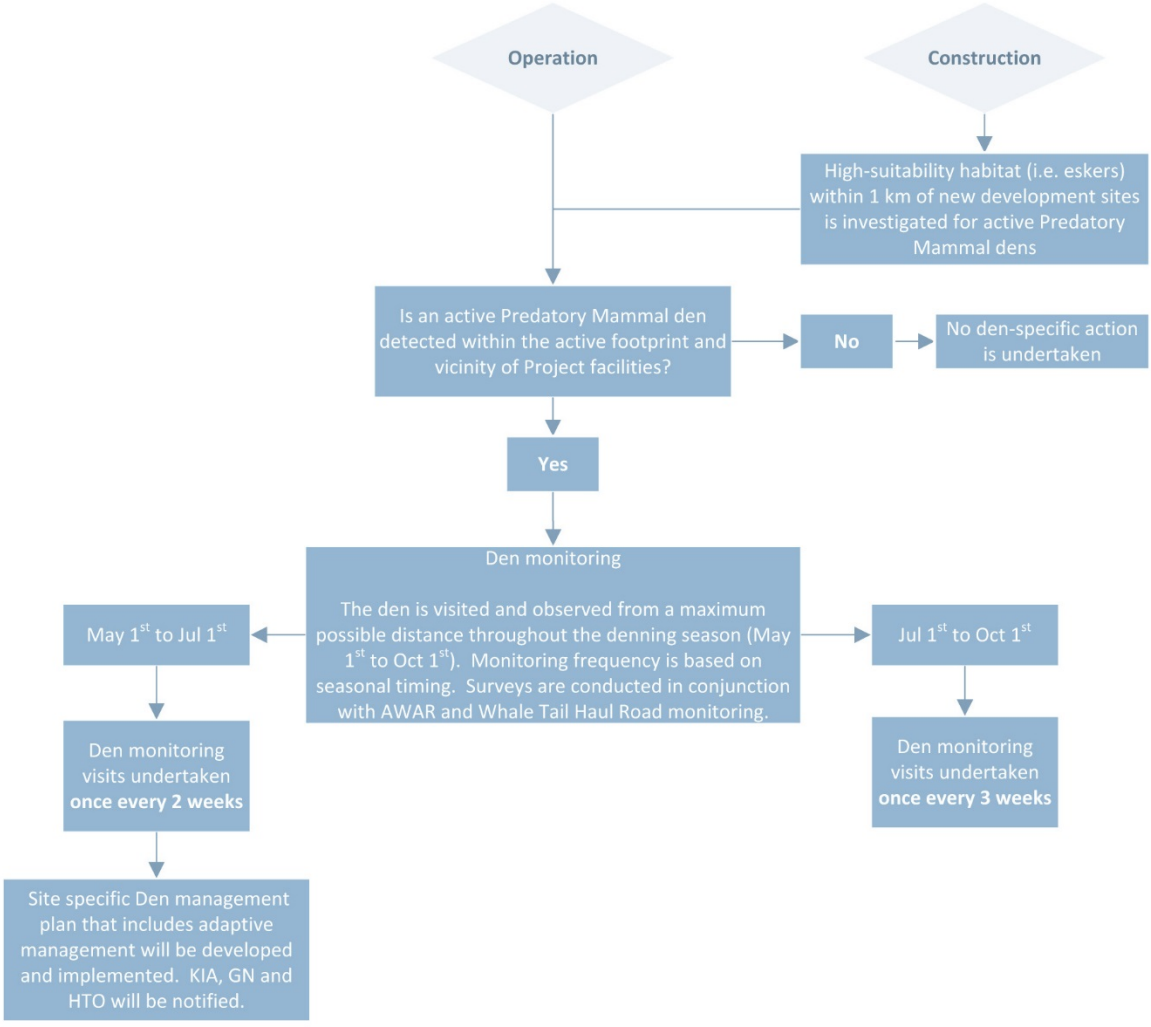
3.6.3 Thresholds

Should the thresholds outlined in **Table 18** be exceeded, the following actions will be undertaken.

3.6.3.1 Project-Related Mortality

The basic course of action is to contact the appropriate conservation officer with the Hamlet of Baker Lake and the GN, and to discuss additional mitigation options. At the discretion of the Agnico Eagle Environment Supervisor, GN conservation officer and the KivIA land inspector, if grizzly bears, wolverines, or wolves become problems and need to be dispatched or get killed in vehicle collisions (i.e., thus exceeding the threshold mortality of two despite efforts to avoid habituation and/or food conditioning), alternative mitigation action may be required. Regular inspections of waste streams will identify possible attractants and respond immediately with improved waste management approaches. Detailed reports for dealing with problem wildlife will be issued and are provided as an example in **Appendix C**.

3.6.3.2 Disturbance of Den Sites



If an active Predatory Mammal den is detected within the active footprint or in the vicinity of Project facilities, a den management plan will be developed (see **Figure 13** and **Appendix J** for details). The plan will include consultation with the GN with respect to obligations under *The Wildlife Act*, SNU 2003, c. 26. Ground personnel and vehicle access will be restricted in the vicinity of the den as needed to minimize disturbances at the den. The den management plan outlines a monitoring schedule (dependent on seasonal timing) and will inform further mitigation strategies as required. See **Appendix J** for Den Management and Protection Plan components.

Based on the findings from den monitoring, disturbance mitigation may be required, including increased frequency of den site monitoring, vehicle access restrictions, alterations to Project operation, or work stoppage in the vicinity of the den. Dens will be observed from a distance of at least 300 m with a spotting scope, and information on location, behaviour and number of juveniles will be determined, where possible. **Figure 13** below outlines the steps to be taken if a den is found during monitoring activities.

Example of mitigation and monitoring in action: if construction is proposed within 1 km of high-suitability denning habitat (i.e., eskers), these areas will be investigated for signs of denning (wolf pack, defensive behaviour, pups). If a den is confirmed within the active footprint or in the vicinity of Project facilities, monitoring will be undertaken from the maximum possible distance to determine if Project activities are inducing stress responses. See **Figure 13** for monitoring frequencies. If Wolves are showing signs of stress, further restrictions on vehicle access or other adaptive mitigation options may need to be considered.

See **Appendix J** for recommended Den Management and Protection Plan components.

Figure 13: Thresholds for Monitoring and Mitigation of Predatory Mammal Dens in Proximity to the Project

3.7 RAPTORS

3.7.1 Objectives

The primary objective of ongoing monitoring surveys for nesting Raptors evaluate the success of mitigation to prevent disturbance to raptors or raptor nests, to test for thresholds, and to determine the level of Project-related effects. Nest-specific management plans for nesting birds will reduce the potential for birds to abandon nests due to high noise or activity levels.

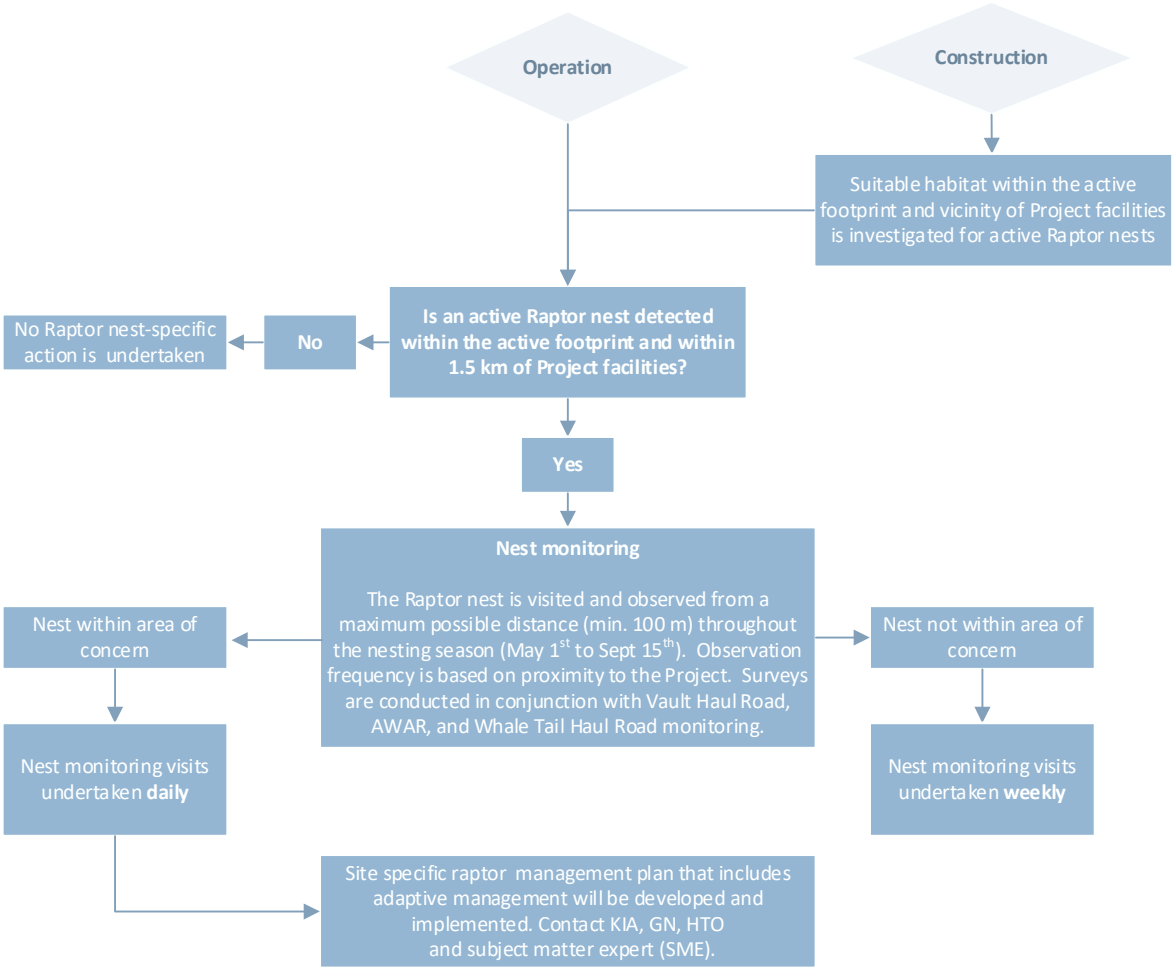
3.7.2 Monitoring Approach

Table 19: describes the framework that has been established for monitoring effects to Raptors.

Table 19: Monitoring Approach for Raptors at the Meadowbank, Whale Tail Project and proposed Whale Tail Expansion

Potential Effect	Impact Prediction	Quantitative Monitoring Variable	Thresholds	Monitoring Activity	Frequency
Disturbance of Nesting Raptors	Nest failures are not Project-related	Nest success	Failure of nest monitored through a Nest Protection Plan	Active Raptor nest monitoring	Daily during nesting season (May 1 to September 15) if active nest on Project facilities or within 500 m of activity Weekly if not within area of concern (see **Figure 13)**
Project-related Mortality	Raptors will not be killed at the Project site or along roads	Number of raptors killed	1 individual	Pits and mine site ground surveys	Weekly, at least
				Road surveys	Weekly, at least
				Incident and vehicle encounter reports	Ongoing (when incidents with wildlife occur)

3.7.2.1 Nest Monitoring



Methods: For existing operations, data will be collected on Raptor abundance and behaviour during ground, road, and height-of-land surveys. For active nests within the active footprint and within 1.5 km (AANDC 2011) of Project facilities, daily surveys will be conducted for nests within area of concern while weekly surveys will be conducted for nests outside the area of concern. For nests within the area of concern, a site-specific raptor response plan will be developed and implemented.

In accordance with Project Certificate No.008, Condition 36, Agnico Eagle will consult and review the raptor mitigation plan with the GN, prior to undertaking discouragement and in accordance with obligations under the *Wildlife Act* (SNU 2003, c. 26). Furthermore, the GN will be contacted prior to removal or deterrence of raptors to obtain a permit if required. To discourage raptors from nesting on pit walls and Project facilities, protocols outlined in the 'Peregrine Falcon Management and Protection Plan on the Meadowbank Gold Project Site' will be followed (see **Appendix E).** The plan also outlines management and mitigation around nests that have become established on Project facilities.

For new development sites, suitable habitat within 1.5 km of the sites will surveyed on foot for active Raptor nests. Active nests will be monitored from a distance of at least 100 m with a spotting scope, and information on location, behaviour, number of eggs, number of chicks, and number of fledged young will be determined, if possible. A raptor researcher or subject matter expert will be consulted as needed. The threshold beyond which further mitigation will be required is disturbance of one active Raptor nest (**Table 19**).

Frequency: During the nesting season (May 1 to September 15), if an active nest is within the active footprint and vicinity of Project facilities and within an area of concern, surveys will be conducted as per **Figure 14**. If disturbance to an active raptor nest is detected, mitigation and monitoring will be initiated (see **Figure 14**).

Figure 14: Thresholds for Monitoring and Mitigation of Raptor Nests in Proximity to the Project

3.7.2.2 Project-Related Mortality

Methods: Methods are the same as for the ground surveys, road surveys, and Incident reports described for Ungulates (**Section 3.5.2**). The threshold level of mortality beyond which further mitigation will be required is one (1) Raptor per year (see **Table 19** and **Appendix E** for details).

Frequency: Incident reports are filed when a Raptor mortality occurs. The number of Raptor mortalities will be analyzed on an annual basis with findings presented in the annual Wildlife Monitoring Summary Report.

3.7.3 Thresholds

Should the thresholds outlined in **Table 19** be exceeded, the following actions will be undertaken.

3.7.3.1 Nesting Monitoring

In consultation with the subject matter expert, a nest management plan will be developed for active nests established within an area of concern (e.g., within active footprint or in close vicinity of Project facilities) and will include a monitoring schedule based on the proximity of the nest to the Project. The management plan will also review disturbance levels at the nest to inform active management requirements (see **Figure 14**). Where recommended mitigation are not considered adequate for reducing disturbance to nesting raptors (determined through the nest management plan monitoring), more stringent mitigation, such work stoppage for nearby operations, may be implemented.

3.7.3.2 Project-Related Mortality

If the threshold mortality level for Raptors is exceeded, further mitigation will be implemented as described for Ungulates (**Section 3.5.3**).

3.8 Waterbirds

3.8.1 Objectives

The primary objective will be to determine the effectiveness of mitigation efforts to prevent or reduce effects from the Project, to test for thresholds, and to describe Project-related effects to Waterbirds.

3.8.2 Monitoring Approach

Table 20 describes the framework that has been established for monitoring effects to Waterbirds.

Table 20: Monitoring Approach for Waterbirds at the Meadowbank, Whale Tail Project and proposed Whale Tail Expansion

Potential Effect	Impact Prediction	Quantitative Monitoring Variable	Thresholds	Monitoring Activity	Frequency
Habitat Loss and Degradation **Meadowbank Mine and Vault Site**	Loss <EIA prediction and subsequent approvals (see Gebauer et al., 2015)	Area of altered habitat	10% above predicted EIA High suitability values. **Meadowbank Mine and Vault** – 518 ha	Habitat monitoring	Every three years post-construction
Habitat Loss and Degradation **Meadowbank AWAR**	Loss <EIA prediction and subsequent approvals (see Gebauer et al., 2015)	Area of altered habitat	10% above predicted EIA High suitability values. **Meadowbank AWAR** – 22 ha	Habitat monitoring	Every three years post-construction
Habitat Loss and Degradation **Whale Tail Pit and Haul Road**	Given the minimal effects associated with the Meadowbank project, habitat loss effects on Waterbird were not considered an issue and were screened out during the EA (Golder 2016)				
Loss of nests due to flooding **Whale Tail Pit**	Nests will be lost due to flooding during nesting season	See the Migratory Bird Protection Plan (**Appendix F**)			
Project-related Mortality	Waterbird will not be killed at the Project	Number of Waterbird killed	1 individual	Pits and mine site ground surveys	Weekly, at least
				Road surveys	Weekly, at least
				Incident and vehicle encounter reports	Ongoing (when incidents with wildlife occur)

3.8.2.1 Habitat Loss & Degradation

Methods: Habitat loss and degradation will be monitored and assessed through the Wildlife Habitat monitoring program (see **Section 3.3.2** for details). An analysis of the loss of High suitability habitats will be conducted and compared to thresholds (see **Table 20 and Appendix F**).

Frequency: See **Section 3.3.2**.

3.8.2.2 Project-Related Mortality

Methods: Methods are the same as for the ground and road surveys, and Incident reports described for Ungulates (**Section 3.5**). The threshold level of mortality beyond which further mitigation will be required is one (1) Waterbird per year (see **Table 20**).

Frequency: See **Table 20**. The number of Waterbird mortalities will be analyzed on an annual basis with findings presented in the annual Wildlife Monitoring Summary Report.

3.8.3 Thresholds

Should the thresholds outlined in **Table 20** be exceeded, the following actions will be undertaken.

3.8.3.1 Habitat Loss & Degradation

See **Section 3.3.2.**

3.8.3.2 Disturbance of Nesting Waterbird

Where disturbances to nesting Waterbirds are observed beyond the acceptable threshold (see **Table 20**), further mitigation will be implemented to minimize effects. As per Project Certificate No.008, Condition 34, Agnico Eagle will maintain a Migratory Bird Protection Plan (**Appendix F**), which will be updated as needed in consultation with Environment and Climate Change Canada (ECCC). Studies will be undertaken in collaboration with Trent University beginning in 2018 and through the flooding phases of the Whale Tail Pit and proposed Expansion Project. As per condition 34, results will be presented to NIRB on an annual basis.

3.8.3.3 Project-Related Mortality

If the threshold mortality level for Waterbirds is exceeded, further mitigation will be implemented (e.g., slower vehicle speeds, driver education).

3.9 UPLAND BREEDING BIRDS

3.9.1 Objectives

The primary objective of the monitoring program for ptarmigan, shorebirds, passerines, and other upland breeding birds is to collect information that contributes to national monitoring databases by undertaking the Protocol for Regional and International Shorebird Monitoring (PRISM) and complete a North American Breeding Bird Survey Route every three years, or as agreed upon by ECCC, for contribution to this program. While these protocols will contribute data to national databases, they will be unsuited to detecting Project-related effects. Previous studies at other similar developments have found that effects to upland birds are either undetectable or not biologically significant (see **Section 2.3.6**).

3.9.2 Monitoring Approach

The PRISM and North American BBS surveys are intended to contribute to national databases administered by ECCC (2012), and are not linked to an impact prediction or threshold. PRISM plots and North American BBS surveys will be conducted every three years; stations locations and methods will be developed in consultation with ECCC.

3.9.2.1 Habitat Loss & Degradation (monitored via habitat monitoring)

Methods: Habitat loss and degradation will be monitored and assessed through the Wildlife Habitat monitoring program (see **Section 3.3.2** for details). An analysis of the loss of High suitability habitats will be conducted and compared to thresholds (see **Table 20**).

Frequency: See **Section 3.3.2**.

4. REPORTING

A Wildlife Monitoring Summary Report will be provided annually summarizing the terrestrial ecosystem monitoring activities and results of the previous calendar year. The summary report will discuss the accuracy of predictions of the effect of the Project on the various wildlife VECs, the success of mitigation (i.e., whether any thresholds are exceeded), briefly describe new measures taken through the adaptive management approach, visually present results of all monitoring activities, and recommendations for mitigation and monitoring activities in the current year. An attempt will be made to distinguish between Project-related changes and natural variations in wildlife populations.

The annual Wildlife Monitoring Summary Report will allow regulators and other stakeholders to review and contribute insight, expertise, and suggestions for improving wildlife management activities within the Project area. To ensure the reported information is accessible for all stakeholders, the summary report will be concise, visual and simple in format.

As per Project Certificate No.008, Condition 33, Agnico will provide wildlife incident reports to the appropriate authorities in a timely fashion. These reports will provide the following information: location coordinates (i.e., latitude and longitude or UTM), species, number of animals, sex, age class (if possible), and a description of the animal activity.

Further, a comprehensive data analysis report will be prepared at three-year intervals (in addition to the annual Wildlife Monitoring Summary Report). The comprehensive report will consider questions such as the ZOI, deflection of caribou by the road, the efficacy of mitigation, or other such questions depending on the availability of data. The comprehensive reports should focus on specific areas of concern and specific VCs, as the Wildlife Monitoring Summary Report provides this overview.

Agnico Eagle will have the full responsibility for all aspects of the monitoring program (implementation, monitoring, reporting) and the plan will be reviewed and updated as deemed necessary.

4.1 MITIGATION AUDIT

The mitigation described in this document stems from current practices at existing mines, or was suggested during the environmental assessment process. However, an auditing system is required to evaluate the use and effectiveness of the mitigation, following the principals of adaptive management. In other words, it should be confirmed that the mitigation proposed here is used and that it works. Further, new mitigation should be documented. As an example, per Project Certificate No.008, Condition 32, Agnico Eagle will engage with the Baker Lake Hunters and Trappers Organization and other relevant parties to ensure that safety barriers, berms, and designed crossings associated with project infrastructure, including the haul road are constructed and operated as necessary to allow for the safe passage of caribou and other terrestrial wildlife. The audit will be undertaken annually, specific to audit the mitigation listed in Section 2, which requires Agnico Eagle to evaluate:

- if all mitigation has been implemented
- which mitigation is perceived to be or shown to be successful
- if new mitigation has been implemented in response to new issues
- if some mitigation is redundant

This audit is implemented annually, as part of the annual report.

4.2 TERRESTRIAL ADVISORY GROUP

As per Project Certificate No.008, Condition 27 Agnico Eagle is committed to the establishment of a TAG consisting of representatives, at a minimum, from the following organizations:

- Agnico Eagle
- the Government of Nunavut Department of Environment (GN-DoE)
- the Kivalliq Inuit Association (KivIA)
- the Hunters and Trappers Organization (HTO) of Baker Lake

Other organizations that may participate in the TAG include ECCC, Nunavut Tunngavik Inc (NTI), and others.

The terms of reference for this TAG will be discussed and completed by Q4 2018. Items that will be identified as part of the TAG terms of reference will include the following:

- Reporting frequency for annual and comprehensive analysis (e.g., every 3 years)
- Monitoring outcomes
- Mitigation summary (i.e., operation cessation, shutdowns, etc.)
- Mitigation improvements
- Learnings from other mines
- Opportunity for all parties to contribute for continuous improvement of the TEMP

Agnico Eagle will provide a summary of the outcomes from the TAG meetings to the NIRB on an annual basis in the annual report.

1 INTRODUCTION

1.1 BACKGROUND

In 2006, Azimuth Consulting Group Inc. conducted a pre-construction wildlife screening level risk assessment (WSLRA) for the Meadowbank site to assess potential risks to wildlife via dietary uptake of mine-related contaminants (Azimuth, 2006). Specifically, the pre-construction SLRA focused on determining the contaminants of potential concern (COPCs) from predicted minesite activities, evaluating potential risks to wildlife from exposure to contaminants under baseline conditions, and determining the magnitude of increase in contaminant exposure required to cause concern for wildlife populations. Preliminary estimates of post-development contaminant concentrations were then obtained from models, and based on those potential future changes, expected potential risks to local wildlife were evaluated.

Under baseline conditions, negligible risks were found for all COPCs except chromium, which was determined to pose an improbable but potential risk for songbirds at baseline concentrations. COPC exposure concentrations were not expected to increase during operation, so potential risks were not expected to change from baseline conditions.

As required under the Nunavut Impact Review Board Project Certificate - Condition 67, the WSLRA is completed every 3 years during mine operation. Results to date indicate that the Meadowbank mine does not appear to be contributing significant incremental risk to wildlife from consumption of chemical contaminants.

In 2016, AEM submitted an Environmental Impact Statement (EIS) to NIRB for the Whale Tail Pit satellite deposit, located approximately 50 km north of the main Meadowbank mine site. The EIS includes an assessment of risk for wildlife in the Whale Tail Pit area under baseline conditions and the post-development scenario. Results indicated that:

> "All concentrations in soil met their respective screening values and/or baseline plus 10%; as a result, no COPCs were retained in soil and no residual impacts due to changes to soil quality were identified. Furthermore, given that no COPCs were identified for soil, no residual impacts to vegetation quality were identified. This result is consistent with the results of the conclusions of the previous risk assessments conducted at the Meadowbank Mine."
>
> "Given that no COPCs were identified in soil (Section 4.3), concentrations of chemicals in prey items (i.e., plants and animals consumed as prey) were not anticipated to change. As a result, prey items were not assessed further with respect to potential wildlife health effects and no residual health impacts due to changes to prey item quality were identified."

Nevertheless, due to stakeholder concerns with contaminant loadings due to dust, this plan presents the assessment approach and methodology that will continue to be used to assess potential risk to wildlife from chemical contaminants as a result of operations at the Meadowbank site as well as the Whale Tail Pit satellite deposit.

1.2 GENERAL APPROACH

The goal of the WSLRA is to determine whether there are potential risks to wildlife from the identified contaminants of potential concern (COPCs) under operational conditions. The general approach includes the common risk assessment components of problem formulation, exposure assessment, hazard assessment and risk characterization. In particular, assessments will aim to distinguish risk

due to operation of the mine from risk due to background conditions by taking soil and vegetation samples at on-site, near-site, AWAR, Whale Tail site, Whale Tail haul road, and reference locations.

Risk assessments will follow a hazard quotient approach, and are based on food-chain modeling developed by Azimuth Consulting Group Inc. for the baseline wildlife screening level risk assessment at the Meadowbank site (Azimuth, 2006). The risk assessment framework used by Azimuth was taken from various Canadian and American sources (Environment Canada, 1994; CCME, 1996; BCE, 1998; US EPA, 1992, 1998). The exposure assessment stage will be updated with field data collected in each assessment year. Toxicity reference values (TRVs) will be continually compared to those used in similar risk assessments in the Kiggavik region and published databases.

2 PROBLEM FORMULATION

2.1 LOCATION DESCRIPTION

The main Meadowbank site is located 70 km north of the hamlet of Baker Lake, Nunavut, near the border of the Northern and Southern Arctic ecozones. Terrain in the Meadowbank area is typical barren-ground subarctic, with low-growing vegetation in poorly developed soil with continuous permafrost. The landscape is dominated by many interconnected lakes and isolated ponds with indistinct drainage patterns. Topography consists of rolling hills, boulder fields and bedrock outcrops. The main mine site is located at the headwaters of the Quioch River system, which flows southeast through Chesterfield Inlet into Hudson Bay. Lakes in this region are ultra-oligotrophic, with low productivity levels. This region supports few terrestrial mammals (15 species) and birds (62 species) (Azimuth, 2006). Migratory species (primarily caribou and Canada geese) are present.

2.2 SITE FACILITIES

The Meadowbank project consists of several gold-bearing open-pit deposits (Portage, Goose, Vault, and Whale Tail). Much of the infrastructure is located in close proximity to the mill and mine facilities, with the exception for the Vault Pit which is approximately 10 km northeast of the site, and the Whale Tail Pit which is approximately 50 km northwest of the site.

Waste rock from the pits are stored in the Portage Waste Rock Storage Facility, Vault Waste Rock Storage Facility, and Whale Tail Waste Rock Storage Facility (RSFs). Rock Storage Facilities are constructed to minimize the disturbed area and will be capped with a layer of non-potentially acid-generating rock (NPAG). During the construction period, NPAG is also used for construction of dikes and roads. Mined ore is either processed in the mill or stockpiled for eventual processing.

Tailings are stored in the Tailings Storage Facility (TFS) adjacent to the main minesite. The TSF is defined by the series of dikes built around and across the basin of the dewatered northwest arm of Second Portage Lake. Tailings water is reclaimed for use in ore processing.

An onsite airstrip supports transportation of goods and personnel to and from the Meadowbank site by jet. A 110-km All Weather Access Road (AWAR) runs between the main minesite and the hamlet of Baker Lake, where AEM maintains a bulk fuel storage and barge facility. The Vault Pit is connected to the main minesite by a 10-km haul road, and the Whale Tail Pit satellite deposit will be connected by a 62-km haul road.

2.3 SOURCES OF CONTAMINANTS

Major mine site operations and their potential to contribute to COPCs (based on Azimuth, 2006) are summarized here.

Open pits – Along with ore, pits produce waste rock, which may contribute to COPCs through dust emissions.

Rock storage facilities – Waste rock (not containing ore) is moved to these areas. Dust may be blown from the rock piles during dumping and vehicle traffic during transport of material. Seepage from rock storage facilities is controlled in sumps and pumped back to attenuation ponds or the TSF.

Borrow pits and quarries – Borrow pits and quarries are used as necessary for the construction of mine site roads and the airstrip. The COPCs for borrow pits and quarries are similar to open pits.

Tailings Storage Facilities (TSF) – The northwest arm of Second Portage Lake was partitioned off by the East Dike and de-watered from 2009 to 2012. The northwestern portion of this area was further partitioned by the Stormwater Dike to create the North and South Cell TSF. Although permafrost is expected to freeze the tailings, the material is fine-grained and could be a source of dust emissions during dry periods.

Roads and airstrip – Frequently used gravel haul roads run throughout the mine site to connect pits, waste rock storage and processing facilities. An airstrip, receiving approximately 4 planes per week, was built at the mine site to receive deliveries and personnel. Dust from these sources could be a potential source of contaminants. A 110 km long all weather access road (AWAR) was constructed between the mine and the Hamlet of Baker Lake, using gravel from quarries along the road.

Effluent discharge – De-watering of lakes for pit development or TSF construction is considered effluent discharge and is regulated under the current NWB Water License. Lake water is treated for suspended solids removal before discharge, and since it is an existing surface water source, it is not likely to be a source of contaminants in the receiving water. Effluent is also periodically discharged from attenuation ponds into adjacent lakes, under NWB Water License and MMER requirements. As a result, metals regulated under MMER are considered as COPCs.

Diesel generating plant, mine mill plant and associated facilities – Three diesel generating plants provide power for the mine. The Air Quality Impact Assessment (2005) determined emission of PAHs was “very low” and did not require modeling. The milling of rock in the processing plant takes place under wet conditions, and is not a source of particulate emissions. All health and safety-related requirements to reduce particulate emissions during handling of the ore at the mine plant before processing are met, so these are not expected to be a significant source of contaminants.

Overall, roads, waste rock and tailings were determined to be the main sources potentially contributing to COPCs through dust emissions. Dewatering effluent discharge may potentially contribute to COPCs in water sources.

2.4 CONTAMINANTS OF POTENTIAL CONCERN (COPCS)

In the baseline WSLRA, Azimuth (2006) identified COPCs for the main minesite area based on the chemical composition of the identified dust sources, the predicted effects of effluent on water quality in Third Portage Lake (from Golder, 2005), and a review of metals regulated under MMER (see Azimuth, 2006, Section 2.5 for details). No terrestrial wildlife COPCs were identified in the Whale Tail Pit FEIS (Golder, 2016).

Projected concentrations of metals in four dust sources (roads, waste rock and tailings) that exceeded the 90th centile of baseline soil concentrations or the CCME guidelines (CCME 1999, 2001) were included as COPCs for the main minesite. Five metals regulated under MMER (arsenic, copper, lead, nickel and zinc) were also included in the assessment. Although mercury was not predicted to exceed baseline soil concentrations or CCME criteria, it was included because it was found to be of concern to the general public in the Arctic.

Methods for Whale Tail COPC determination

The COPCs for this assessment are therefore comprised of:

Antimony	Lead	Tin
Arsenic	Manganese	Uranium
Barium	Mercury	Vanadium
Beryllium	Molybdenum	Zinc
Cadmium	Nickel	
Chromium	Selenium	
Cobalt	Strontium*	
Copper	Thallium	

Certain chemicals which are controlled through best management practices and which were not addressed in the baseline SLRA include petroleum hydrocarbons, process chemicals, dioxins, nitrates, ammonia and PAHs. For each source of these chemicals, best management practices are in place and environmental exposures are not expected to occur.

2.5 RECEPTORS OF CONCERN

The WSLRA considers four Receptors of Concern (ROCs): ungulates, small mammals, waterfowl and songbirds. These choices were determined from the project's initial EIA, which included discussions with stakeholders, public meetings, traditional knowledge and experience from other mines. In addition, semi-palmated sandpiper has been added as a ROC based on a commitment made during the Whale Tail Final Hearing through discussions with Environment and Climate Change Canada (ECCC). Specifically, the WSLRA focuses on caribou, Canada goose, Lapland longspur, semi-palmated sandpiper and northern red-backed vole as representative species. An ecological description of the area and detailed descriptions of the biology of each of these receptors can be found in Azimuth (2006). Receptor-specific values such as dietary preferences that are used in this assessment are further discussed in Section 3.1 (Table 3-1).

Separate characterizations are conducted for the main minesite, near-site, AWAR, Whale Tail pit, Whale Tail haul road, and external reference locations for northern red-backed vole, Lapland longspur and Canada goose because these species have small territories when not migrating and would not be expected to move between the sampling areas. Main minesite and near-site samples are combined for the caribou risk characterization, because it is assumed that when caribou are present they can readily move between these sampling locations. See Section 3.4 for a discussion of how residence time in each area is handled as a dose-adjustment factor.

2.6 PROTECTION GOALS AND ENDPOINTS

Since the ROCs identified are not rare or endangered species, protection at the population level was determined to be appropriate (Azimuth, 2006). The assessment endpoint is no adverse effect of COPCs on populations of caribou, Canada goose, Lapland longspur and northern red-backed vole.

The measurement endpoints will be calculated as exposure to the COPCs through ingestion of soil, water and food items. Ingested concentrations will be compared to literature-based ecotoxicological benchmarks equivalent to maximum acceptable exposure levels for each ROC. Specifically, the ecotoxicological benchmarks will be lowest observable adverse effect levels (LOAELs), which are generally considered to be appropriate for determining risk at the population level (Azimuth, 2006). Sample et al. (1996) provided TRVs for most of the COPCs, but values for antimony, cobalt, and thallium were obtained from other sources (see Appendix B).

2.7 EXPOSURE PATHWAYS

The following exposure pathways will be investigated:

Small mammals – ingestion of plants, insects, water, soil

Ungulates – ingestion of plants, water, soil

Songbirds – ingestion of plants, insects, water, soil

Waterfowl - ingestion of plants, insects, water, soil

Inhalation and dermal absorption of metals are generally considered to be insignificant in comparison to exposures through ingestion (USEPA, 2005), so they are not considered here.

3 EXPOSURE ASSESSMENT

Exposure assessment is used to calculate the dose of each COPC received by each ROC. The exposure assessment uses the food chain model developed by Azimuth (2006), and provided in Excel format. The model was developed to include the influence of COPC concentrations in exposure pathways, dietary preferences, ingestion rates and dose-adjustment factors. Estimated daily intake of each COPCs is calculated for each study area (main minesite, near-site, AWAR, Whale Tail site, Whale Tail haul road, external reference) as:

$$EDI = [\sum (I_{w,s,f} \times C_{w,s,f}) \times BF \times T]_{study} + [\sum (I_{w,s,f} \times C_{w,s,f}) \times BF \times T]_{ext\ ref}$$

Where:

EDI = estimated daily intake (mg/kg body weight/day)

$I_{w,s,f}$ = intake of water, soil and food items (L/kg ww/d; kg dw/kg ww/d; kg dw/kg ww/d)

$C_{w,s,f}$ = concentration of COPC in water, soil and food items (L/kg ww/d; kg dw/kg ww/d; kg dw/kg ww/d)

BF = biotransfer factor (absorption factor)

T = proportion of time in area

Each component is described below, and an example calculation is provided in Appendix A.

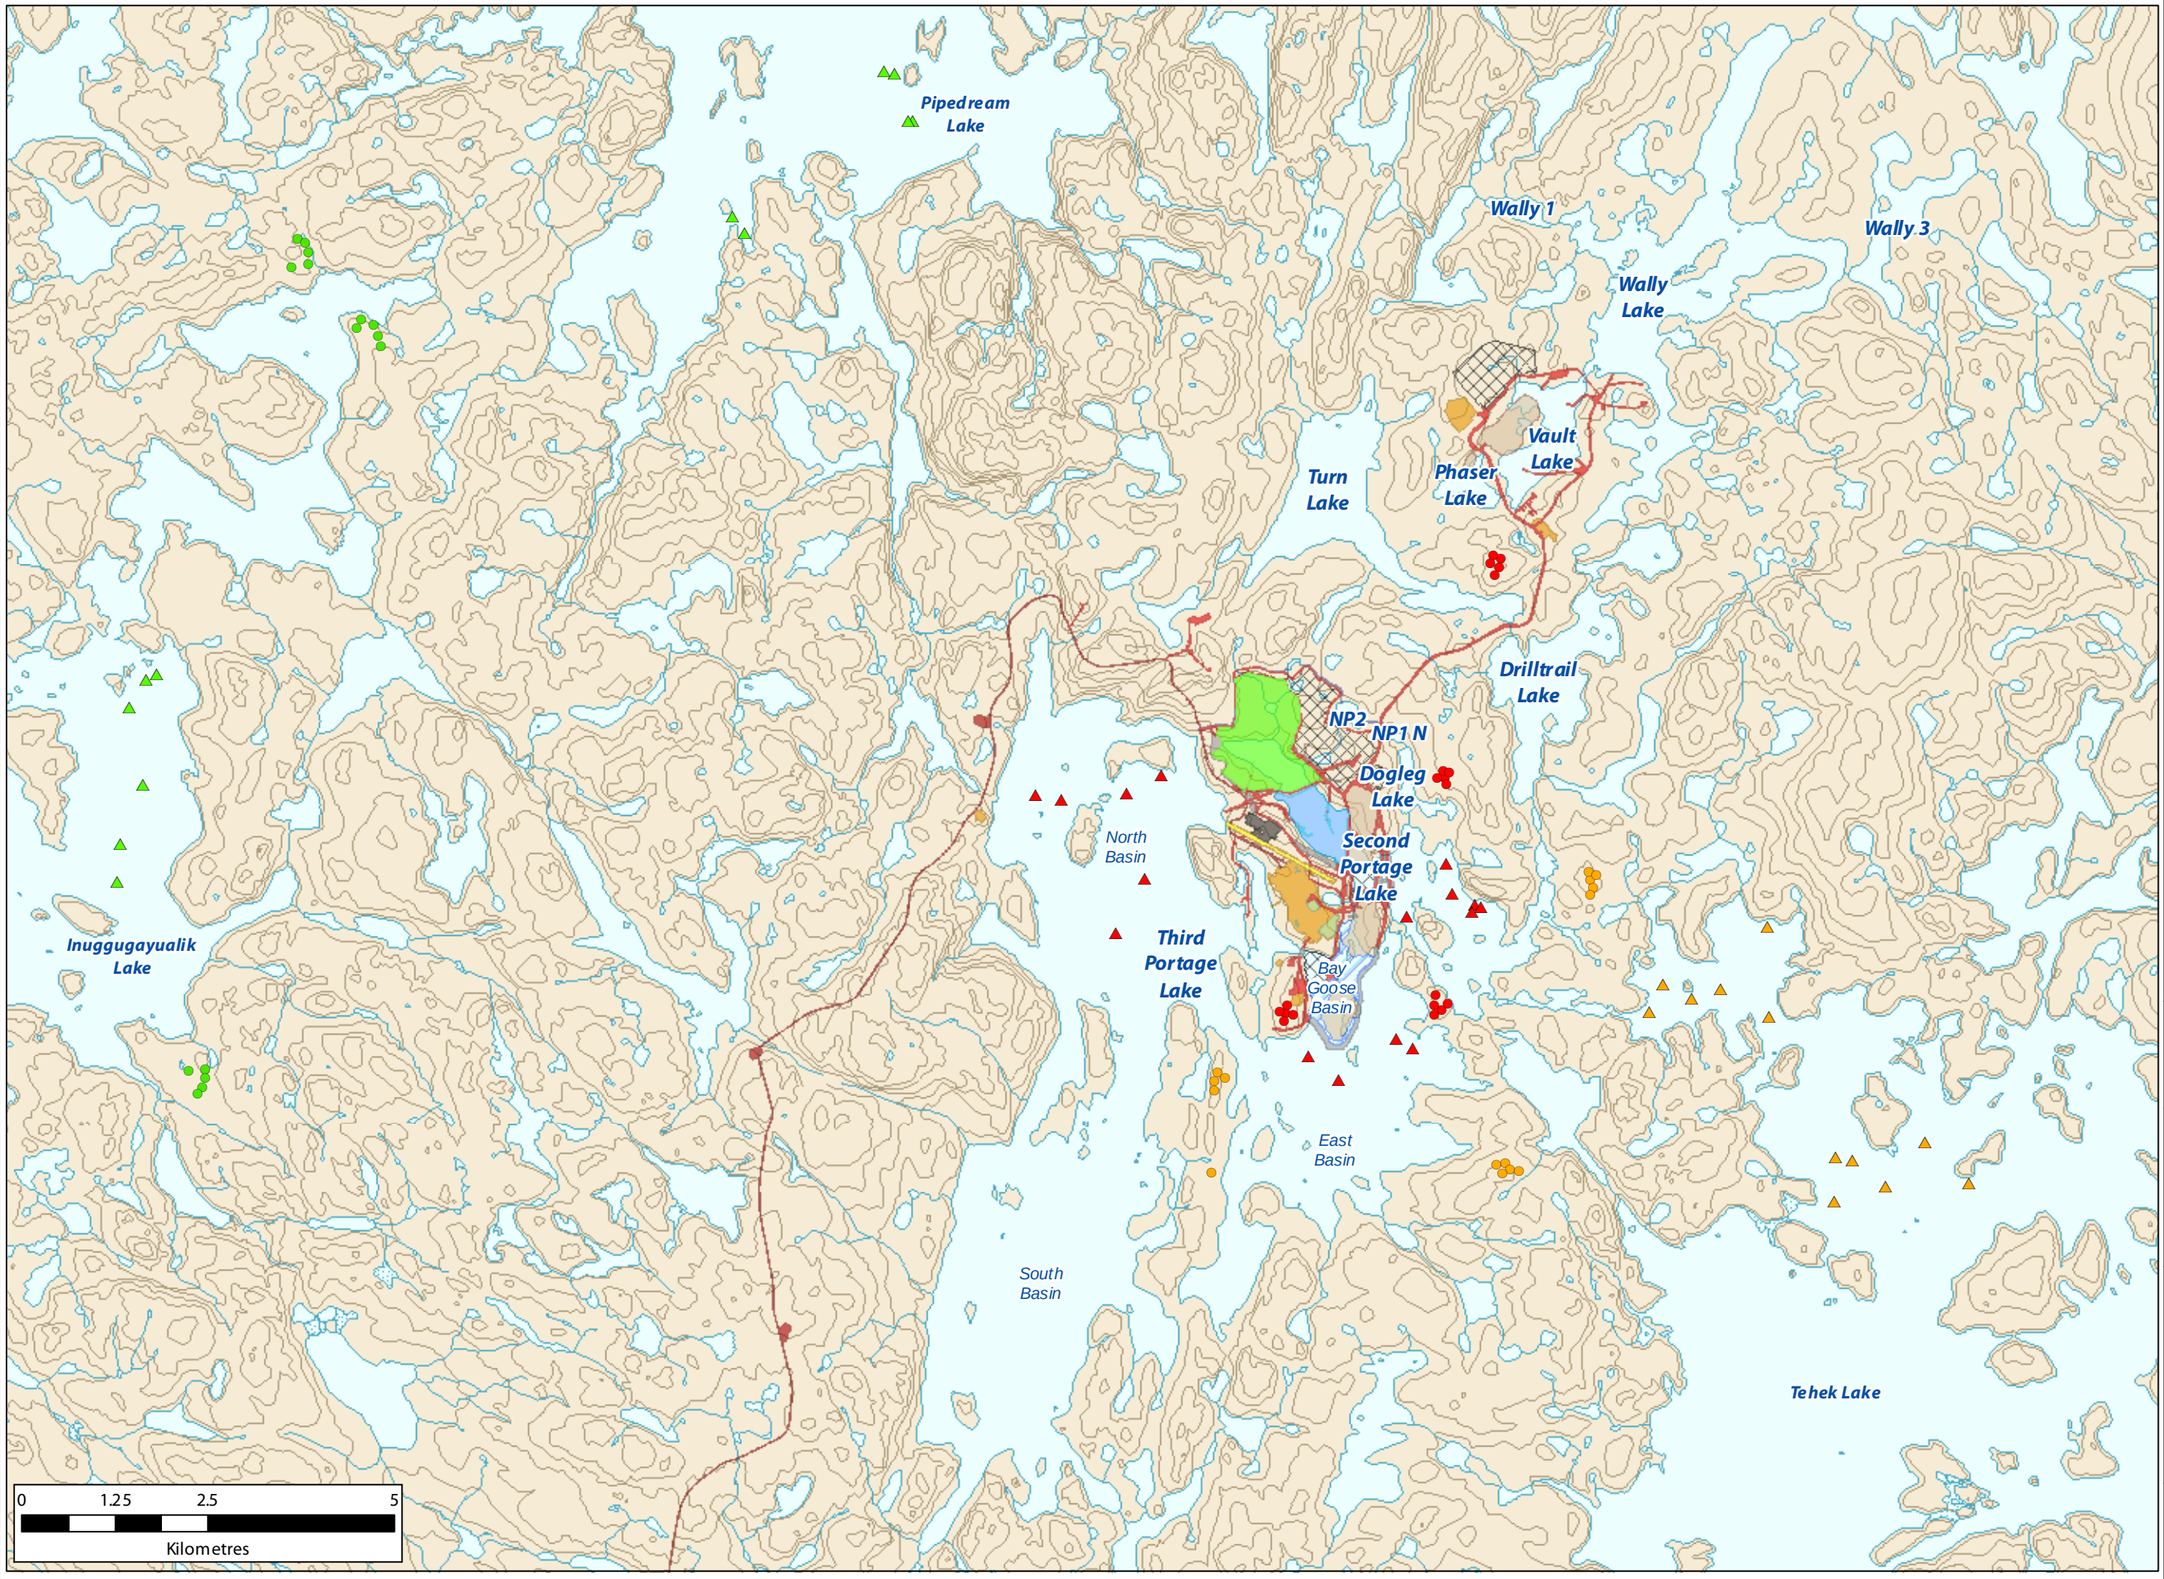
3.1 INTAKE OF WATER, SOIL AND FOOD

Water, food and soil ingestion rates used in the assessments are shown in Table 3-1. All intake parameters are considered to be conservative. Water and food ingestion rates were derived from USEPA (1993). Soil ingestion rates for Canada goose and Northern red-backed vole are also from USEPA (1993). Although Beyer et al. (1994) was referenced as the source of most soil ingestion rates in the Meadowbank baseline assessment, the species chosen to represent caribou and Lapland longspur were not indicated. The soil consumption rate for caribou was increased in subsequent Meadowbank assessments and here from 2% of dry food consumption to 5%, which is the general rate for mammals in Beyer et al. (1994), as used in (Senes, 2008). The soil ingestion rate for Lapland longspur was increased from 2% to 7%, based on Hansen et al. (2011). This study identified a rate of 0.7% for Swainson's thrush, a ground-dwelling songbird that primarily feeds on flying insects and berries. A 10x safety factor was applied because Swainson's thrush is a foliage-gleaner, while Lapland longspur is considered a ground-forager (Cornell University, 2011). This factor is considered to be conservative however, because Lapland longspur does not scratch the ground to uncover food items as other ground foragers do (Harrison 1967, Greenslaw 1977).

Table 3-1. Body weight (BW), water intake (I_{water}), soil intake (I_{soil}), and wet and dry (I_{food}; FI) food intake for the identified ROCs.

Parameter	Units	Value	Reference	Notes
Northern Red-backed Vole				
BW	kg wet	0.02	Nagorsen (2005)	Smallest body weight used
I_{water}	L/kg wet/day	0.253	USEPA (1993)	Species profile data for the Prairie Vole
I_{soil}	kg dry/kg wet/day	0.0008	USEPA (1993)	Assumed 2.4% of dry food ingestion rate (similar to Meadow Vole)
I_{food}	kg wet/kg wet/day	0.135	USEPA (1993)	Species profile data for the Prairie Vole
FI	kg dry/kg wet/day	0.049	Not available	Moisture in food assumed to be 64% as per diet moisture calculation
Caribou				
BW	kg wet	75	Dauphine (1976)	Smallest body weight used
I_{water}	L/kg wet/day	0.064	USEPA (1993)	Based on allometric equation for all mammals (L/day) $(0.099*(BW)^{0.90})$
I_{soil}	kg dry/kg wet/day	0.0013	Beyer et al. (1994)	Assumed 5% of dry food ingestion rate (general rate for mammals)
I_{food}	kg wet/kg wet/day	0.047	Not available	Moisture in food assumed to be 43% as per diet moisture calculation
FI	kg dry/kg wet/day	0.027	USEPA (1993)	Based on total dry food intake for herbivorous mammals (g/day) $(0.577*(BW)^{0.727})$
Lapland Longspur				
BW	kg wet	0.023	Cornell University (2011)	Smallest body weight used
I_{water}	L/kg wet/day	0.205	USEPA (1993)	Based on allometric equation for all birds (L/day) $(0.059*(BW)^{0.67})$
I_{soil}	kg dry/kg wet/day	0.0174	Hansen et al. (2011)	Assumed 7% of dry food ingestion rate (rate of Swainson's thrush +10x safety factor)
I_{food}	kg wet/kg wet/day	0.656	USEPA (1993)	Moisture in food of insectivorous birds; assumed 62% as per diet moisture calculation
FI	kg dry/kg wet/day	0.249	USEPA (1993)	Based on total dry food intake for passerine birds (g/day) $(0.398*(BW)^{0.850})$
Canada Goose				
BW	kg wet	2.000	Mowbray et al. (2002)	Smallest body weight used
I_{water}	L/kg wet/day	0.044	USEPA (1993)	Species profile data for Canada Goose
I_{soil}	kg dry/kg wet/day	0.0006	USEPA (1993)	Assumed 8.2% of dry food ingestion rate
I_{food}	kg wet/kg wet/day	0.032	USEPA (1993)	Species profile data for Canada Goose
FI	kg dry/kg wet/day	0.011	Not available	Moisture in food assumed to be 66% as per diet moisture calculation

3.2 DIETARY CONCENTRATIONS OF COPCS



Concentrations of COPCs will be measured in and around the Meadowbank site in water, soil and plant tissue (food items: sedges, lichens, berries) in assessment years. This includes five samples of each media type from four onsite locations, three near-site locations, one AWAR location, two Whale Tail Pit locations, one Whale Tail Haul Road location, and three external reference locations. An SOP for methods of collection along with UTM coordinates is provided in Appendix C.

Water samples from the Core Receiving Environment Monitoring Program (CREMP) data collection will be used in the WSLRA analyses. Main minesite concentrations will be from samples collected in Second Portage Lake (SPL) and the east and north basins of Third Portage Lake (TPE, TPN). Near-site concentrations will be from samples collected in Tehek Lake (TE). Whale Tail concentrations will be from samples collected in Whale Tail Lake (South basin) and Mammoth Lake. External reference samples are from Inuggugayualik Lake (INUG) and Pipedream Lake (PDL). Exact coordinates are subject to slight changes each year – see CREMP Plan (Azimuth, 2015) for details.

All locations for the main Meadowbank site are shown on Figure 3-1 and coordinates for soil and vegetation samples are provided in Appendix C. Specific locations for the Whale Tail site and along the haul road will be determined following ground-truthing, but will target locations up to 5 km downwind (to the south/southeast) of site activity, and will include one location on the downwind side of the haul road. The general approach for selecting these sites will be consistent with a near-field/ far-field approach used for the main Meadowbank Mine site since 2008 and illustrated in Figure 3-1.

Concentrations in soil and plant tissue used for food chain modeling will be the upper 95% confidence limit of the mean (UCLM). If values are below the detection limit, a value of ½ the detection limit will be used. Based on published literature, methyl mercury is assumed to comprise 1% of total mercury in water and soil, and 34% of total mercury in plant tissue, and inorganic mercury = total – methyl mercury (Azimuth, 2006).

Concentrations of COPCs in insects are not planned to be measured, but will be modeled from soil concentrations using published bioaccumulation models (see Azimuth, 2006). This method is particularly conservative, because the modeled factors are for ground insects whereas the songbird population in this assessment consumes primarily flying insects.

CHECKED BY:MAY

FIGURE:

3-1

The information displayed on this map has been compiled from various sources. While every effort has been made to accurately depict the information, this map should not be relied on as being a precise indicator of locations, features, or roads, nor as a guide to navigation. MNR data provided by Queen's Printer of Ontario. Use of the data in any derivative product does not constitute an endorsement by the MNR or the Ontario Government of such products.

3.2.1 Dietary Preferences

The proportions of food items (sedge, lichen, berries, insects) that comprise each diet were determined by Azimuth (2006) using the literature reviews referred to in Section 2.6. Similar values have been used in another recent risk assessment (Senes, 2008) and all dietary preferences presented in Azimuth (2006) will be used in subsequent assessments (Table 3-2). Consistent with Azimuth (2006), sedges, lichens and berries will be considered surrogates for all plant matter ingested by the ROCs.

Table 3-2. Estimated dietary preferences for the receptors of concern at the Meadowbank site. From Azimuth, 2006.

Dietary Item	Northern red-backed vole	Caribou	Lapland longspur	Canada goose
Sedges	55%	30%	25%	50%
Lichens	0%	65%	0%	0%
Berries	40%	5%	5%	45%
Insects	5%	0%	70%	5%
Total	100%	100%	100%	100%

3.3 BIOTRANSFER FACTOR

The uptake efficiency factor (biotransfer or absorption factor) describes the proportion of the COPC that is absorbed into the animal from any ingested sources. Uptake efficiency was conservatively assumed to be 100% for all COPC/receptor combinations. This is likely an extremely conservative assumption; for example, chromium compounds were found to have a maximum absorption efficiency of 10% in the GI tract (Outridge and Scheuhammer, 1993).

3.4 TIME IN AREA

Territory size (foraging range) affects the proportion of an animal's diet that could be affected by mine-related contaminants. In the baseline assessment for Meadowbank (Azimuth, 2006), an adjustment factor for foraging range was not applied (animals were assumed to spend 100% of time in the study area). For subsequent assessments, the only ROC assumed to spend 100% of its time in any study area will be the northern red-backed vole, because of its small territory size. Caribou, Canada geese and Lapland longspur are migratory species, and the fraction of time spent in each study area (main minesite, near-site, AWAR, Whale Tail site, Whale Tail Haul Road) is estimated at 33%, based on a recent risk assessment completed in the Kivalliq region (Senes, 2008). The remaining fraction of exposure dose (67%) will be calculated based on external reference samples. An examination of collared caribou from the Meadowbank region found that any one animal spent no more than a maximum of 12% of the year within 25 km of the minesite (Martin Gebauer and Jason Shaw, personal communication, March 2012), so the assumption of 33% is expected to be conservative. Risk will be characterized for small-territory ROCs Northern red-backed vole, Canada

geese and Lapland longspur for main minesite, near-site, AWAR, Whale Tail Pit, Whale Tail Haul Road, and external reference locations separately, in order to determine whether those animals choosing territories on the mine-site are at increased risk compared to those choosing territories at nearby locations. Exposure data for main minesite and near-site locations will be combined for caribou because caribou can readily roam between the onsite and near-site locations in the course of a day.

4 TOXICITY ASSESSMENT

The toxicity reference values (TRVs) used in the Meadowbank assessments were collated from a review of the literature; mainly from Sample et al. (1996). This represents one of the most comprehensive and commonly used sources available for wildlife toxicity reference values and has been used in other recent similar assessments (e.g. Senes, 2008). In order to ensure the selected TRVs were relevant to the Meadowbank site and the conditions of that risk assessment, several criteria were used in the baseline assessment in screening toxicity studies. These included selecting values from studies conducted on species of similar phylogeny (i.e. bird or mammal), and selecting studies that examined individual or population-level effects over chronic time periods. The following describes TRV selection, as performed by Azimuth (2006):

> The TRVs chosen for use in the risk characterization include both no observable adverse effect levels (NOAELs) and lowest observable adverse effect levels (LOAELs) when available. If effects concentrations were reported in terms of food concentrations, these were converted to dose. If a LOAEL was reported but no NOAEL could be determined, it was estimated as 1% of the LOAEL (as in Sample et al. 1996, Chapman et al. 1998). LOAELs cannot be estimated if only a NOAEL is available. Since the protection goal of this risk assessment no adverse effect of COPCs on populations of the ROCs, LOAELs are the most relevant TRV, and are used in the final risk estimate.
>
> Instead of species-to-species uncertainty factors, the baseline assessment used allometric scaling factors (Sample et al. 1996) to adjust mammalian TRVs from the test species (typically mouse or rat) to the ROC. A scaling factor of 1 was used for birds (Mineau et al. 1996).
>
> Where toxicity information was found for multiple forms of a contaminant, the one with the greatest toxic potency was chosen. TRVs for chromium-VI were available for mammals, but only chromium-III was available for birds. No NOAELs or LOAELs were available for total mercury. Mammalian LOAELs were not available for inorganic mercury or beryllium. Avian LOAELs were not available for uranium or vanadium. Avian NOAELs were not available for antimony and beryllium and were extrapolated from the mammalian values. The avian LOAEL for antimony was extrapolated from the mammalian value.

5 RISK CHARACTERIZATION

5.1 HAZARD QUOTIENTS

Risk characterization compares predicted exposure concentrations with the toxicity reference values from the literature, using the hazard quotient approach. Hazard quotients for all locations (main minesite, near-site, AWAR, Whale Tail Pit, Whale Tail Haul Road, and external reference) will be calculated as:

$$HQ = EDI / TRV$$

Where:

EDI = estimated daily intake (ug/kg body weight/day)

TRV = toxicity reference value (ug/kg body weight/day)

See Appendix A for an example calculation and Appendix B for all TRVs to be used in assessments for Meadowbank. As discussed above, the TRV to be used is represented by the LOAEL, unless only a NOAEL was available (indicated).

Because of the conservative assumptions included at this level of assessment, there is generally considered to be a high degree of certainty associated with results indicating negligible risk. A hazard quotient > 1 indicates the possible need for more in-depth assessment, including analysis of assumptions used. However, when HQ values exceed 1 for both the baseline (or external reference) and the study areas, and are of similar magnitude, it may be assumed that the receptor is adapted to the measured exposure level, or that the assumptions used in calculating the HQ have resulted in an over-estimation of risk (Dominion Diamond, 2015).

HQ values and a characterization of risk for each ROC will be provided in the assessment report.

5.2 UNCERTAINTY ASSESSMENT

The assumptions included in each section of the assessment are discussed here, along with implications for over- or under-estimating risk.

5.2.1 Uncertainty in Exposure Assessment

ROCs used in the assessment are assumed to represent categories of species (e.g. ungulates, small mammals, waterfowl, song birds) that are found around the Meadowbank site. Exposure is assumed to be similar for other species in these categories. Compared to other Arctic animals, the exposure for the species chosen is expected to be realistic to conservative, because they all are assumed to forage in or on the soil.

Exposure concentrations in environmental media are assumed to be represented by the 95$^{\%}$ UCLM of the measured concentrations. Since animals would be more likely to ingest food sources with a range of COPC concentrations, this is a conservative assumption.

Ingestion rates are applied using published values for similar but not identical species. Based on biological factors, these rates were chosen to be conservative.

Dietary preferences are from studies on the same or similar species, but are not from populations specifically inhabiting the study region.

It is assumed that flying insects accumulate the same proportion of metals from soil as ground-dwelling insects, because no flying insect BAFs were available. This assumption likely results in an over-estimation of risk for ROCs who primarily consume flying insects (Lapland longspur).

Absorption of COPCs in the gastrointestinal tract was assumed to be 100%. This assumption likely results in an over-estimation of risk for all COPCs/ROC combinations.

Methyl mercury proportions of total mercury concentrations are estimated from the available literature using the UCLM from two studies (Azimuth, 2006). While there is an unknown degree of uncertainty in the extrapolation of this data for use at the Meadowbank site, the fractions chosen were at the highest end of the published range, and are therefore designed to be conservative. Furthermore, mercury was included as a COPC because it was found to be of concern to the general public in the Arctic, and no source of elevated mercury was identified at the mine.

Ingestion of COPCs was the only route of exposure considered in this assessment. While this assumption may slightly under-estimate actual exposure, inhalation and dermal absorption of metals are generally considered to be insignificant in comparison to exposures through ingestion (USEPA, 2005).

5.2.2 Uncertainty in Toxicity Assessment

TRVs are not available for the ROCs considered in this assessment and species-to-species extrapolations are necessary. This includes allometric scaling for mammals, 1:1 scaling for birds, and the application of uncertainty factors in mammal-to-avian extrapolation. Food intake-to-body weight ratios are well studied and uncertainty factors are designed to be protective, so these extrapolations are likely to be realistic or conservative.

As is common in screening level risk assessments, the estimation of risk is for each COPC in isolation, and does not consider potential additive, synergistic or antagonistic reactions. Models for determining mixture toxicity of a large suite of metals are not yet widely available, and guideline values are for single compounds only. This factor may lead to under-estimation of actual risk from metals overall, but the otherwise conservative nature of an SLRA is assumed to compensate for this issue.

6 REPORTING AND ADAPTIVE MANAGEMENT

The SLRA for the Meadowbank Mine (including the Whale Tail Pit) will evaluate risks to wildlife from contaminant exposure in and around the mine site every three years during operation, and results will be reported to NIRB in the context of AEM's Annual Report for the Meadowbank site.

Because of the conservative assumptions included at this level of assessment, there is generally considered to be a high degree of certainty associated with results indicating negligible risk (HQ <1). In the case that hazard quotients exceed 1 and differ substantially (generally, by more than an order of magnitude) between mine-related and reference and/or baseline sites for a certain COPC, incremental risk due to mine operation will be classified as potentially unacceptable and more detailed investigations will be initiated. This may include a desk-top review and refining of the assessment parameters, and/or additional sampling in the subsequent year to confirm results. In the case that results of refined assessments continue to indicate unacceptable risk, adaptive management may include such interventions as capping of dust sources, increased road watering, delineation of contaminated areas, and deterrence methods pending reclamation.

Appendix A

Example Calculation

Exposure of Lapland longspur to Pb (main minesite area)

Exposure Assessment

$$EDI = T_{onsite}(DS_{onsite} + DW_{onsite} + DF_{onsite}) + T_{ref}(DS_{ref} + DW_{ref} + DF_{ref})$$

Where:

EDI = estimated daily intake of COPC

T_{onsite} = fraction of time in study area (i.e. onsite) = 33%

T_{ref} = remaining fraction of time = 67% (remainder of exposure based on external reference concentrations)

DS = dose from incidental soil ingestion

I_{soil} = intake of soil

DW = dose from drinking water

I_{water} = intake of water

DF = dose from food

I_{food} = intake of food

$Pb_{(media)}$ = measured concentration of lead in media (95% UCLM of onsite or external reference values, accordingly)

Example:

DS_{onsite} (mg/kg ww/d) = Pb_{soil}* (mg/kg dw) * I_{soil} (mg dw/kg ww/d)

= 11.23 * 0.0174

= 0.195

Notes:

Based on Sample et al. (1996), the following allometric equation was used for interspecies extrapolations among mammals: $NOAEL_w = NOAEL_{ts} * (BW_{ts}/BW_w)^{0.25}$; the equation also applies to the LOAEL

Based on Sample et al. (1996), an allometric scaling factor of 1 was considered appropriate for interspecies extrapolations among birds

underline corresponds to an unbounded LOAEL (10X safety factor used to derive the NOAEL) (see text for details)

na indicates that there was no TRV (NOAEL or LOAEL) available

Standard Operation Procedure for Soil and Vegetation Sampling Based on Azimuth (2006)

Meadowbank Project - Standard Operating Procedure

Collection of soil and vegetation samples for the Screening Level Risk Assessment program (from Azimuth, 2006)

March, 2016

---

1. Sample Locations

Three external reference (control) areas and eleven treatment areas are to be sampled. Control areas were selected northwest and west of the project area, upwind from mine related activities (C-1 to C-3). Treatment areas (main minesite, near-field, AWAR, Whale Tail Pit, Whale Tail Haul Road) were selected to represent wind distribution of contaminants from mining related activities (T-1 to T-11). Within each control and treatment area, five sample sites (S1 to S5) were selected within a 200 to 300 m radius, at least 150 m apart from one another. Within each sample site, composite tissue and soil samples are collected within a 10 to 30 m radius, depending on tissue (particularly berry) availability. UTM coordinates for each sample site are presented in Table 1.

Table 1. UTM coordinates for soil and vegetation sampling locations (NAD 83).

Sampling Area	Site #1	Site #2	Site #3	Site #4	Site #5

2. Soil Sample Collection

Soil samples will be collected using a composite sampling method at each sample site. Representative grab samples will be collected from five separate test pits per sample site (generally no greater than a 5.0 m^2 area) using a stainless steel ladle. First, the organic layer (which ranges from 0 to 5 cm below the surface) will be removed and discarded. Second, two small scoops of soil, approximately 5-10 cm below surface, will be placed in a pre-labeled Ziploc bag and homogenized. Decontamination (i.e., cleaning to prevent cross-contamination) of soil sampling equipment (i.e. stainless steel spoons) will be conducted at the beginning of each day, between treatment and control areas and between sample site locations. The cleaning procedures will include:

- Rinsing with site water to remove any remaining sediment or organic matter
- Scrubbing with brushes using Liquinox detergent
- A final rinse with site water

3. Tissue Sample Collection

Sedges and lichen samples will be collected in close proximity to the composite soil samples. Sedges will be collected from an approximate 5.0 m^2 area, near the center of the sample site, by randomly selecting and simply grabbing/ pulling representative sedge, periodically including the roots. Samples will be placed in a pre-labeled Ziploc bag. Similarly, lichen tissue samples will be collected by hand and placed in a pre-labeled Ziploc bag. Collection of lichen and sedge should continue until the Ziploc bag is full. Berry collection sites were selected along moderately dry, rolling hills where berries are the most abundant. Approximately 2 cups of berries should be collected per site. No species of berries, sedges and lichen should be sampled preferentially, as each treatment and control area has a different variety and abundance of vegetation.

4. Sample Handling, Documentation and Analyses

4.1 Field Book

During the field-sampling program a field book will be used to maintain a record of sample collection and observations, including:

- field staff
- descriptions of photos taken
- date and time
- weather conditions
- sample identifications
- tissue and soil sample characteristics
- # of samples taken
- sample locations, including GPS coordinates
- sample time
- notes and general observations

The field logbook is intended to provide sufficient information such that personnel may reconstruct events that occurred during the sampling period, without having to rely on field personnel or memory of the individuals.

4.2 Containers and Labeling

Samples will be collected in Ziploc bags for ease of sample collection and prevention of sample destruction and mixing during shipping:

- Soil samples – one (1) 950 mL (18cm x 20cm) Ziploc® bag per soil composite
- Tissue samples – one (1) 950 mL (18cm x 20cm) Ziploc® bag, per berries, sedge, and lichen sample
- Samples will be labeled with the following:
    - Site ID
    - Sample Date and Time
    - Sample ID
    - GPS Coordinates
    - Sample Type
    - Initials of Field Staff

Sample Identification (ID) will be coordinated to accommodate ease of organization and interpretation of analytical results. As an example, the ID for a Treatment Area 1, Site No. 2, Lichen tissue sample could be: T1 S2 Li.

4.3 Tracking, Preservation, Storage and Transportation

Tissue and soil samples will be recorded in the field book following sample collection at each sample site within each area. Chain-of-custody forms will be filled out for transport. Care will be taken to ensure that the sample identification is clearly marked on each bag. A small piece of paper with the sample ID, date and sample type may be placed in the sample bag. Samples will be placed on ice in coolers and shipped, along with the chain of custody records, to an accredited laboratory (typically ALS Laboratories in Vancouver, BC).

4.4 Laboratory Analysis

All soil and tissue analyses will be conducted by a CALA-accredited laboratory (typically ALS Environmental Laboratories in Vancouver, BC). The following laboratory analyses will be requested:

Soil – soil pH and total metals; and

Plant Tissue – Moisture content and total metals.

5. Quality Assurance/Quality Control (QA/QC)

The following recommended sample collection and handling techniques will be employed during collection of vegetation tissue and soil samples:

- Sampling by qualified personnel
- Prevention of foreign material in samples or loss of sample material
- Minimization of sample handling and use of new nitrile or latex gloves during sample collection
- Use of appropriate clean containers and proper storage of samples
- Collection of sufficient sample volumes as specified by the data quality objectives
- Adequate decontamination
- Use of appropriate packaging, ice and shipping methods to ensure that holding times and storage conditions are met.

APPENDIX B

**Meadowbank Mine Project Certificate No.004,
Whale Tail Pit Project Certificate No.008 Terms and Conditions, and
Government of Nunavut Commitments**

P.C.	T&C No.	Term or Condition	Location in TEMP Document
Meadowbank Project Certificate			
No. 004	32	AEM shall operate the all-weather road as a private access road, and implement all such measures necessary to limit non-mine use of the road to authorized, safe and controlled use by all-terrain-vehicles for the purpose of carrying out traditional Inuit activities. The measures AEM shall undertake include, but are not limited to: a. Maintaining a gate and manned gatehouse at kilometre 5 of the Private Access Road; b. In consultation with the Hamlet of Baker Lake, the local HTO, and the KivIA, update the All-weather Private Access Road Management Plan to set out the criteria and processes to authorize and ensure safe and controlled non-mine use of the road by all-terrain vehicles for the purpose of carrying out traditional Inuit activities, and measure to limit all other non-mine use of the road. The updated Plan is to be submitted to the GN, INAC, and KivIA for approval no later than one (1) month after the approval of revised Condition 32. c. The posting of signs in English and Inuktitut at the gate, each major bridge crossing, and each 10 kilometres of road, stating that unauthorized public use of the road is prohibited; d. The posting of signs in English and Inuktitut along the road route to identify when entering or leaving crown land; e. Prior to opening of the road, and annually thereafter, advertise and hold at least one community meeting in the Hamlet of Baker Lake to explain to the community that the road is a private road with non-mine use of the road limited to approved, safe and controlled use by all-terrain-vehicles for the purpose of carrying out traditional Inuit activities. f. Place notices at least quarterly on the radio and television to explain to the community that the road is a private road with non-mine use of road limited to authorized, safe and controlled use by all-terrain-vehicles for the purpose of carrying out traditional Inuit activities. g. Record all authorized non-mine use of the road, and require all mine personnel using the road to monitor and report unauthorized non-mine use of the road, and collect and report this data to NIRB one (1) year after the road is opened and annually thereafter; and h. Report all accidents or other safety incidents on the road, to the GN, KivIA, and the Hamlet immediately, and to NIRB annually.	Section 2; Table 3; Annual Reporting
No. 004	51	Cumberland shall engage the HTOs in the development, implementation and reporting of creel surveys within waterbodies affected by the Project to the GN, DFO and local HTO.	Section 3.5.2.8
No. 004	54	Cumberland shall provide an updated Terrestrial Ecosystem Management Plan, to the GN, EC and INAC, within three (3) months of the issuance of the Project Certificate including: a. Updated terrestrial ecosystem baseline data; b. Details of the method and rationale for conducting monitoring surveys prior to the commencement of construction; c. Statistical validation to support the conclusions drawn from monitoring impacts of the mine and infrastructure on wildlife; d. A detailed analysis of the method of distinguishing between cow/calf groups from other caribou group observations; e. Details of a comprehensive hunter harvest survey to determine the effect on ungulate populations resulting from increased human access caused by the all-weather private access road, including establishing preconstruction baseline harvesting data, to be developed in consultation with local HTOs, the GN-DOE and the Nunavut Wildlife Management Board; f. Details of annual aerial surveys to be conducted to assess waterfowl densities in the regional study area during the construction phase and for at least the first three (3) years of operation, with the data analyzed and compared to baseline data to determine if significant effects are occurring and require mitigation. g. Details of an annual breeding bird plot surveys and transects along the all-weather road to be conducted during the construction phase and for at least the first three (3) years of operation. h. Details of a monitoring program, including recording the locations and frequency of observing caribou and carnivores and any actions taken to avoid contact with or disturbance, and a specific mitigation plan for Shortearred owls and any other species of special concern pursuant to Schedule 3 of the Species at Risk Act located in the local study area or along the all-weather private access road	Section 2.2 (methods of analysis); Section 3 (monitoring and impact prediction); Section 4 (TEMP annual report)
No. 004	55	Cumberland shall provide the following analysis in the March 2007 Wildlife Summary Monitoring Report: a. Further review and analysis of the size of the regional study area; b. A summary of the involvement of Inuit in the monitoring program; c. A detailed report of the natural variability of VECs in the region; d. A detailed analysis on distribution and abundance of cows, bulls, and calves; e. Results of the 2006 monitoring program, including field methodologies and statistical approaches used to support conclusions drawn;	TEMP Annual Report

P.C.	T&C No.	Term or Condition	Location in TEMP Document
		f. Any proposed changes to the TEMP survey methodologies, statistical approaches or proposed adaptive management stemming from the results of the monitoring program.	
No. 004	56	Cumberland shall plan, construct, and operate the mine in such a way that caribou migration paths through the Project, including in the narrows west of Helicopter Island, are protected. Maps of caribou migration corridors shall be developed in consultation with Elders and local HTOs, including Chesterfield Inlet and placed in site offices and upgraded as new information on corridors becomes available. Information on caribou migration corridors shall be reported to the GN, KivIA and NIRB's Monitoring Officer annually.	TEMP Annual Report
No. 004	57	Cumberland shall participate in a caribou collaring program as directed by the GN-DOE.	TEMP Annual Report
Whale Tail Pit Project			
No. 008	27	The Proponent shall participate in a Terrestrial Advisory Group with the Government of Nunavut, the Baker Lake Hunters and Trappers Organization, the Kivalliq Inuit Association, and other parties as appropriate to continually review and refine mitigation and monitoring details within the Terrestrial Ecosystem Management Plan. Additional caribou collar data, results from associated studies, and other monitoring data as available should be considered for incorporation as appropriate.	Section 4.2
No. 008	28	The Proponent shall maintain a Terrestrial Ecosystem Management Plan (TEMP) throughout all phases of the Project. The Plan shall include detailed monitoring, mitigation, and adaptive management measures for wildlife, with consideration for each Project activity predicted to affect wildlife, and with inclusion of specific triggers for mitigation and adaptive management intervention. The TEMP shall demonstrate consideration for all relevant commitments made by the Proponent throughout the Nunavut Impact Review Board's review of the Project. Updates to the TEMP may be required when there are significant changes in project development plans, monitoring results indicating biologically-meaningful changes, significant updates to the scientific understanding of management methods relevant to wildlife at the project site, Inuit Qaujimajatuqangit, Traditional Knowledge, changes in climatic conditions that might subject wildlife to unexpected impacts, or as otherwise necessary.	Entire Document
No. 008	29	The Proponent shall, in collaboration with the Government of Nunavut, collect additional caribou collar data and conduct analyses of this data to quantify the zone of influence and associated effects of project components on caribou movement for a study area that includes the Whale Tail mine site, the haul road, the Meadowbank Gold Mine and its All-Weather Access Road	Outside of TEMP, but related
No. 008	30	The Proponent shall collect additional data on caribou group sizes in proximity to the Project, and shall work with the Terrestrial Advisory Group to refine appropriate caribou group size thresholds that trigger additional mitigation. Initially, the group size thresholds should be set at 110 (fall), 25 (winter and summer), and 12 (spring).	Section 3.5
No. 008	31	The Proponent shall develop and implement a Road Access Management Plan and maintain traffic monitoring logs along the haul road between the Whale Tail Pit project and the Meadowbank mine. Where traffic exceeds levels predicted within the Environmental Impact Statement, the Proponent shall develop and implement appropriate modifications to its wildlife protection measures.	Outside of TEMP, but will be reported within annual TEMP reports
No. 008	32	The Proponent shall engage with the Baker Lake Hunters and Trappers Organization and other relevant parties to ensure that safety barriers, berms, and designed crossings associated with project infrastructure, including the haul road, are constructed and operated as necessary to allow for the safe passage of caribou and other terrestrial wildlife.	TEMP Annual Report
No. 008	33	The Proponent shall provide wildlife incident reports to the appropriate authorities in a timely fashion. Wildlife incident reports should include the following information: a) Locations (i.e., latitude and longitude), species, number of animals, a description of the animal activity, and a description of the gender and age of animals if possible; b) Prior to conducting project activities, the Proponent should map the location of any sensitive wildlife sites such as denning sites, calving areas, caribou crossing sites, and raptor nests in the project area, and identify the timing of critical life history events (i.e., calving, mating, denning and nesting); and c) Additionally, the Proponent should indicate potential impacts from the project, and ensure that operational activities are managed and modified to avoid impacts on wildlife and sensitive sites ***Commentary:*** *Items (b) and (c) are not typically included in the wildlife incidents reports, but rather are expected to be included in the Terrestrial Ecosystem Management Plan and will be provided in accordance with the requirements of term and condition #28.*	TEMP Annual Report

P.C.	T&C No.	Term or Condition	Location in TEMP Document
No. 008	34	The Proponent will maintain a Migratory Birds Protection Plan for the Project in consultation with Environment and Climate Change Canada and other interested parties. The plan should include and/or demonstrate that the Proponent give consideration to the following: • Information obtained from baseline characterization of migratory bird and vegetation communities within the predicted flood area; • Results of field tests and/or the thorough literature review of the effectiveness of preferred deterrence prior to actual flooding; and • Details regarding monitoring the effectiveness of mitigation measures during flooding.	Appendix I and TEMP Annual Report
No. 008	35	The Proponent shall ensure that the mitigation and monitoring strategies developed for Species at Risk are updated as necessary to maintain consistency with any applicable status reports, recovery strategies, action plans, and management plans that may become available through the duration of the Project.	TEMP Annual Report
No. 008	36	Prior to removal or deterrence of raptors, the Proponent will contact the Government of Nunavut – Department of Environment to discuss proposed mitigation options and, if required, will obtain the necessary permits.	Section 3.7 and Appendix G

No.	Subject	Commitment	Issue Raised by (Date of Commitment)	Project Phase/Timing	Location in TEMP
Terrestrial Environment Commitments					
1	Caribou Protection Measures	The Proponent shall conduct an evaluation of caribou protection measures employed by the Project. The components of this evaluation shall include the following: (a) Tests of the monitoring methods that are used to detect caribou near the Project in order to quantify: (i) the probability of detecting groups; (ii) the effective range of detection; and (iii) the spatial extent of detection capacity relative to the mitigation distance buffers; (b) The collection of additional data on caribou group sizes to confirm the relevance of group size thresholds used in mitigation; (c) Collection and analyses of collar data to quantify the Zone-of-Influence (ZOI) associated with the Whale Tail Project, its haul road and the existing Meadowbank mine (and all-weather-access-road [AWAR]); (d) Collection and analyses of collar data to quantify the effects of the Whale Tail Project, its haul road and the existing Meadowbank mine (and AWAR) on the movements of caribou, in particular during migratory periods; (e) Collection of accurate records documenting the detection of caribou and the subsequent implementation of mitigation measures; and (f) Analyses of collar data comparing the movements of individuals that were and were not subject to the implementation of mitigation measures. The scope of this evaluation shall include the following: (a) A study area or areas that encompass the Whale Tail mine site, haul road, Meadowbank mine and all-weather-access-road (including all activities utilizing this infrastructure including on-going exploration), all of which are integral components of the Project; (b) The use of accepted scientific methods and experimental designs to provide quantitative information; (c) The engagement of recognized subject matter experts in each area of the evaluation; (d) Collection of data with sufficient statistical power to detect potential impacts; (e) Guidance on study designs, analyses and interpretation from the Project's Terrestrial Advisory Group (TAG); (f) The collection of data during both the construction and active mining phases of the Project; (g) Completion of the evaluation within 5 years of Project commencement (beginning with construction) to ensure that any adverse effects or deficiencies in caribou protection measures are revealed prior to potential extensions in the use of Project infrastructure; (h) A technical report, as noted above in (g), for the evaluation to be submitted to NIRB; and If the Project's active mining life span is extended beyond that currently proposed (i.e. 2022), including extended use of the haul road to support other projects, the evaluation should be updated every 5 years.	Government of Nunavut (September 21, 2017)	■ Construction and Active Phases ■ To be completed within 5 years of commencement ■ If active mining life span extended, the evaluation should be updated every 5 years	■ Included in TEMP Section 2.2 (in mitigation section)
2	Seasonal Windows	The Proponent shall revise the Terrestrial Ecosystem Management Plan (TEMP) to define the fall caribou migration season as the period from September 22 to December 15 for the purposes of applying caribou protection measures, as detailed in the Project's TEMP. All caribou protection measures that are applied to the period from September 22 to November 7 in the current version of the TEMP (figures 6 to 9 of version 4) shall be applied to this revised period.	Government of Nunavut (September 21, 2017)	■ September 22 – December 15 for the duration of the Terrestrial Ecosystem Management Plan	■ Table 17 ■ Figures 6-9
4	Caribou Group	The Proponent shall collect additional data on caribou group-sizes in proximity to the	Government of	■ Within five years of	■ Ongoing from May

No.	Subject	Commitment	Issue Raised by (Date of Commitment)	Project Phase/Timing	Location in TEMP
	Size Thresholds – data collection	Project (including the haul road) to assess the relevance of the proposed group size thresholds. These data shall be collected using the same definition of caribou 'group' used to trigger caribou protection measures in the TEMP. The TAG shall be directly involved in this assessment. This shall occur within five years of the Project's start.	Nunavut (September 21, 2017)	the project's start	2018 and Section 3.5.2.2
5	Monitoring for CPM - Frequencies	Within 1 year of Project certification, the Proponent shall revise the TEMP to increase the frequencies of height-of-land, road and ground surveys for caribou compared to the current levels in the TEMP (v.4.0). Thereafter, further revisions may be made annually within the TEMP, taking into account ongoing project monitoring. The revisions shall adhere to advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	■ Within 1 year of project certification ■ Annually thereafter	■ In development /ongoing assessment and adaptation of monitoring methods
6	Monitoring for CPM – Height of Land and Road Surveys coverage	Within 1 year of Project certification, the Proponent shall revise the number of proposed height-of-land and road-side survey points to provide sufficient line-of-sight coverage to detect caribou within 4 km of the Project (including haul road and pit) with greatest coverage at known road crossing points (as determined from IQ, collar data and other observations, and reviewed by the TAG). Thereafter, further revisions may be made annually within the TEMP, taking into account ongoing project monitoring. The revisions shall adhere to advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	■ Within 1 year of project certification ■ Annually thereafter	■ Section 3.5.2.6 – HOL and ideal observation locations to be further refined
7	Monitoring for CPM – Caribou GST	Within 1 year of Project certification, the Proponent shall revise caribou group-size thresholds for adaptive management, taking into account the frequency of monitoring effort, spatial coverage of monitoring and likelihood of detecting groups of caribou, in order to ensure a majority (75%) of caribou are subject to enhanced mitigation (i.e. levels 1 through 3 of mitigation and monitoring as illustrated in figures 6 through 9 of the Terrestrial Ecosystem Monitoring Plan (TEMP), v4.0). Thereafter, further revisions may be made annually within the TEMP, taking into account ongoing project monitoring. The revisions shall adhere to advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	■ Within 1 year of project certification ■ Annually thereafter	■ Section 3.5.2.2 ■ Table 16
8	Monitoring for CPM – alternatives research	The Proponent shall actively engage in research to develop alternative monitoring methods that may revise monitoring range, spatial coverage, frequency and detection probabilities.	Government of Nunavut (September 21, 2017)	■ All phases	■ Ongoing – to be included in General monitoring section
9	Caribou Monitor – Level 2	The Project's TEMP shall be revised to clarify that the definition of "non-essential vehicles and heavy equipment", as referenced in caribou mitigation procedures, includes vehicles and equipment used to continue mining operations or hauling of ore. "Essential vehicles" includes vehicles operated for the purpose of maintaining the safety of personnel, Emergency Response Team (ERT), security and wildlife monitoring.	Government of Nunavut (September 21, 2017)	■ All phases	■ Section 3.5.2 ■ Figure 6, 7 8 Footnote
10	Caribou Monitor – Level 2	Within 1 year of Project certification, the Project's TEMP shall be revised to reduce reliance on the use of discretionary mitigation measures at level 2 of caribou adaptive management and shall include the addition of specific automatic measures intended to prepare for an operational shutdown if caribou move closer to mine operations or roads. Thereafter, further revisions may be made annually within the	Government of Nunavut (September 21, 2017)	■ Within 1 year of project certification ■ Annually thereafter	■ Figures 6, 7, 8 updated based on operational implementation

No.	Subject	Commitment	Issue Raised by (Date of Commitment)	Project Phase/Timing	Location in TEMP
		TEMP, taking into account ongoing project monitoring. The revisions shall be consistent with advice provided by the TAG, as per the terms of reference.			
11	Caribou Monitor – suspension of vehicles, Heavy Equip.	With respect to monitoring and mitigation of caribou in proximity to mine operations, the Project's TEMP shall be revised such that the provision for suspension of non-essential vehicles and heavy equipment operation (Level 3 in Figure 6, TEMP, v.4.0), when seasonal caribou group size thresholds are exceeded within a 500 m radius of the vehicle, is applied year-round and increased to 1 km during the calving and post-calving periods. This distance buffer may be revised periodically throughout the life of the Project whenever relevant information becomes available. The revisions shall be consistent with advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	▪ All phases ▪ Year-round	▪ Figure 6
12	Caribou Monitor – non essential vehicle	The Project's TEMP shall be revised to clarify that the definition of "non-essential vehicles and heavy equipment", as referenced in caribou mitigation procedures, includes vehicles and equipment used to continue mining operations or hauling of ore. "Essential vehicles" includes vehicles operated for the purpose of maintaining the safety of personnel, Emergency Response Team (ERT), security and wildlife monitoring.	Government of Nunavut (September 21, 2017)	▪ All phases	▪ Section 3.5.2 ▪ Figure 6, 7 8 Footnote
13	Caribou Monitor – Level 2	Within 1 year of Project certification (and again thereafter whenever relevant information becomes available), the Project's TEMP shall be revised to reduce reliance on the use of discretionary mitigation measures at level 2 of caribou adaptive management and shall include the addition of specific automatic measures intended to prepare for an operational shutdown if caribou move closer to mine operations or roads. Thereafter, further revisions may be made annually within the TEMP, taking into account ongoing project monitoring. The revisions shall be consistent with advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	▪ Within 1 year of project certification ▪ Annually thereafter	▪ Refine decision trees based on implementation
14	Caribou Monitor – Level 3	Within 1 year of Project certification, the Project's TEMP shall be revised to further specify the provision for limitation of non- essential vehicles on the Whale tail haul and Meadowbank all- weather access roads when caribou are in proximity to these roads (i.e. level 3 responses, Figs. 7 & 8, TEMP v4.0) outside sensitive seasons. Thereafter, further revisions may be made annually within the TEMP, taking into account ongoing project monitoring. The revisions shall be consistent with advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	▪ Within 1 year of project certification ▪ Annually thereafter	▪ Figure 7 ▪ Figure 8

No.	Subject	Commitment	Issue Raised by (Date of Commitment)	Project Phase/Timing	Location in TEMP
15	4km and 5km Buffer	The TEMP shall be revised such that blasting activities at the Whale Tail site are suspended when caribou above the specified seasonal group size threshold are present within 4 km of the blast site. This provision shall apply year-round except during calving season when the buffer shall be increased to 5 km when cows with calves are present. These buffer thresholds are preliminary pending the results of further studies. These no-blasting buffers may be reviewed periodically throughout the life of the Project whenever relevant information becomes available taking into account ongoing project monitoring. Any revisions shall adhere to advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	▪ All Phases	▪ Section 3.5.2.4
16	Blasting - Study	A noise, vibration and visual cues study shall be conducted that: (1) will validate blasting noise and vibration predictions in the Project's EIS; (2) will document the scale and range of visual cues generated by blasting activities (i.e. the distance and duration over which dust plumes can be observed by the naked eye); and (3) may be used to revise the Project's no-blasting buffers for caribou. Notwithstanding the no blasting buffers, Agnico Eagle may conduct studies on caribou within the buffer distance for the purposes of determining whether the buffer distance can be modified. The design and conduct of the study shall be consistent with advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	▪ No timeline provided	▪ Section 3.5.2.4
17	Blasting – Surveys	Prior to each blast, surveys shall be conducted to detect caribou and other wildlife within the no-blasting buffers specified in the Terrestrial Ecosystem Monitoring Plan (TEMP).	Government of Nunavut (September 21, 2017)	▪ All Phases	▪ Section 3.5.2.4
18	Helicopter – Distance buffers for caribou	The Proponent shall apply mandatory, minimum distance buffers of 300m vertically and 1000m horizontally for the operation of all helicopters and fixed winged aircraft in proximity to caribou, subject to exception for safety considerations or the fulfillment of regulatory compliance activities only.	Government of Nunavut (September 21, 2017)	▪ All Phases	▪ Table 7, + general monitoring section
19	Helicopter – Distance buffers for landing and take-offs	The Proponent shall apply the mandatory, minimum distance buffers to landings and take-offs of helicopters, such that engine starts and takeoffs are suspended when caribou are observed within the buffer distance.	Government of Nunavut (September 21, 2017)	▪ All Phases	▪ To be addressed to in General monitoring section
20	Helicopter –Monitor traffic	The Proponent shall revise the Project's TEMP to include a program to monitor and report helicopter traffic associated with the Whale Tail project (including existing Meadowbank infrastructure) and all associated exploration activities so that the spatial scale and intensity of this activity can be documented. This should include the collection and analysis of GPS track logs for all helicopter flights contracted by the Proponent.	Government of Nunavut (September 21, 2017)	▪ All Phases	▪ To be addressed to in General monitoring section
21	Traffic Monitoring – Program through TAG	Prior to Project commencement, the Proponent shall develop a traffic-monitoring program. This program shall be designed to collect data on vehicle type, time, date, location (i.e. specific road segment utilized), point of origin and destination for all vehicles (Proponent-owned or contracted) using the Project's roads including the Whale Tail haul road and Meadowbank all-weather-access road. The design of this	Government of Nunavut (September 21, 2017)	▪ Prior to Project Commencement	▪ To be developed – will be included in General monitoring section

No.	Subject	Commitment	Issue Raised by (Date of Commitment)	Project Phase/Timing	Location in TEMP
		program shall be consistent with advice provided by the TAG, as per the terms of reference.			
22	Traffic Monitoring – Traffic Data Accuracy	The Proponent shall verify annually traffic data to ensure its accuracy and shall summarize traffic data for each road segment including the Whale Tail haul road and Meadowbank all-weather- access road. In addition to daily rates, any seasonal or monthly variation in traffic shall be reported. The observed rates and composition of traffic shall be compared to predictions in the EIS.	Government of Nunavut (September 21, 2017)	▪ Annually	▪ Traffic/road monitoring plan to be included in general monitoring section or as Appendix
23	Traffic Monitoring Exceed traffic predictions	Where traffic rates or composition exceed predictions in the EIS, based on a 3-year average, the Proponent shall produce a revised assessment to examine the potential impacts of this excess traffic on wildlife. This revised assessment shall be submitted to NIRB for consideration.	Government of Nunavut (September 21, 2017)	▪ All phases	▪ Traffic/road monitoring plan to be included in general monitoring section or as Appendix
24	Traffic Monitoring – Recording use	The Proponent shall expand monitoring efforts for recording public use of roads to include the collection of data by staff conducting wildlife road surveys.	Government of Nunavut (September 21, 2017)	▪ All phases	▪ Traffic/road monitoring plan to be included in general monitoring section or as Appendix
25	Project tolerant animals - definition	Within 1 year of Project certification, the Project's TEMP shall be revised to further define 'Project tolerant' animals as applied to wildlife mitigation and monitoring activities. Thereafter, further revisions may be made annually within the TEMP, taking into account ongoing project monitoring. The revisions shall be consistent with advice provided by the TAG, as per the terms of reference	Government of Nunavut (September 21, 2017)	▪ Within 1 year of Project certification ▪ Annually thereafter	▪ Section 3.5.2.1
26	Project tolerant animals – consulting	Where mitigation measures are to be relaxed for project tolerant animals, the Proponent shall consult with the TAG prior to reducing/removing mitigation.	Government of Nunavut (September 21, 2017)	▪ All phases	▪ Section 3.5.2.1
27	Project tolerant animals - reporting	The Proponent shall document all cases where mitigation measures are relaxed for project tolerant animals and shall report these cases in the annual project monitoring report.	Government of Nunavut (September 21, 2017)	▪ All phases	▪ Figures 6 and 7 (definition included 3.5.2)
28	Muskox - Group size thresholds	Within 1 year of Project certification, the Project's TEMP shall be revised to specify and justify the group-size threshold for triggering adaptive management for muskox. Justification of the group-size threshold should be based on available muskox group size data. Thereafter, further revisions may be made annually within the TEMP, taking into account ongoing project monitoring. The revisions shall be consistent with advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	▪ Within 1 year of Project certification ▪ Annually thereafter	▪ To be developed
29	Muskox - Blasting Suspension	The Project's TEMP shall be revised to include a provision for mandatory suspension of blasting when groups of muskox above the specified group size threshold are observed within 1km of blasting activities. The suspension of blasting shall be maintained until the animals have moved away. The no-blasting buffer may be reviewed periodically throughout the life of the Project whenever relevant information becomes available. The revisions shall be completed annually within the	Government of Nunavut (September 21, 2017)	▪ Annually	▪ Section 3.5.2.4

No.	Subject	Commitment	Issue Raised by (Date of Commitment)	Project Phase/Timing	Location in TEMP
		TEMP, taking into account ongoing project monitoring, and will be consistent with advice provided by the TAG, as per the term of reference.			
30	Muskox - Roads, vehicle speeds	The Project's TEMP shall be revised to include a requirement for vehicles to slow to 30 km/hr when passing within 500m of a group of muskox above a specified group size threshold. This mitigation measure may be reviewed periodically throughout the life of the Project taking into account ongoing project monitoring. The revisions shall be consistent with advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	▪ All phases	▪ Section 3.5
31	Muskox- Aircraft Buffers	The Project's TEMP shall be revised to include a mandatory requirement for aircraft to maintain a distance of at least 300 m vertically and 1000 m horizontally from groups of muskox; subject to exception for flight safety purposes. This mitigation measure may be reviewed periodically throughout the life of the Project taking into account ongoing project monitoring. The revisions shall be consistent with advice provided by the TAG, as per the terms of reference.	Government of Nunavut (September 21, 2017)	▪ All phases	▪ Table 7
32	Raptor Nests – Buffers	The proponent shall establish automatic minimum no-disturbance buffers around all raptor nests located in proximity to the Project. Project activities, including the operation of vehicles, heavy equipment, aircraft and blasting, shall be prohibited within these buffers unless an exception is specified within a nest-specific management plan that has been reviewed and approved by the GN, subject matter experts and other relevant parties. The size of minimum, no-disturbance buffers shall be based on the BC Guidelines for Raptor Conservation or similar guidelines as recommended by the Project's TAG.	Government of Nunavut (September 21, 2017)	▪ All phases	▪ Section 3.7.2.1
33	Uncertainty in caribou responses to Whale Tail haul road	Within 1 year of Project certification, Proponent shall: a. Complete movement analyses for collared caribou to measure behavioral responses to the All Weather Access Road including the annual rate of deflections to north of Meadowbank. The analyses should use all available information including harvesting patterns along the All Weather Access Road and annual variation in weather; b. Integrate caribou collar movements with Height of Land and All Weather Access Road survey monitoring data to describe the current representation of the collared caribou relative to the herds; and c. Revise thresholds using the results of the analyses of caribou speed, turning rates and direction of travel from the movement analyses for mitigation along the Whale Tail haul road in the TEMP.	Kivalliq Inuit Association (Sept. 21, 2017)	▪ Within 1 year of project certification	▪ Section 3.5.2
34	Terrestrial Ecosystem Management Plan	Within 1 year of Project certification, the Proponent shall revise the TEMP to include details on: a. Thresholds for when to implement convoying and duration of the gaps in traffic for all three project segments (mine operations, haul road and All Weather Access Road); b. How convoying will be tested for effectiveness (e.g., cameras, track surveys); and	Kivalliq Inuit Association Sept. 21, 2017	▪ Within 1 year of project certification	▪ Convoying included as part of decision trees (Figures, and Table 7) ▪ Update section 3.5.2-3.5.3 linking field observations to

No.	Subject	Commitment	Issue Raised by (Date of Commitment)	Project Phase/Timing	Location in TEMP
		c. Information on the effectiveness of convoying as mitigation shall be presented in annual reporting with the TAG.			convoy effectiveness
37	Uncertainty in effects of Whale Tail pit and haul road activities on caribou disturbance	Within 1 year of Project certification, the Proponent shall complete a review of statistical design, statistical power and sample size for caribou collaring applicable for environmental assessment and adaptive monitoring.	Kivalliq Inuit Association Sept. 21, 2017	▪ Within 1 year of project certification	▪ ongoing

APPENDIX C

Wildlife Protection and Response Plan: Meadowbank Division

1. SECTION 1 – INTRODUCTION

As part of this Terrestrial Ecosystem Management Plan (TEMP; 2017), mitigation measures and monitoring initiatives have been proposed to lessen the likelihood that wildlife will become habituated to the Meadowbank Mine, which includes Vault Pit, the All-Weather Access Road, Whale Tail Pit, and the Whale Tail Haul Road, and all associated infrastructure. The TEMP identified measures to deter wildlife from obtaining food rewards, finding shelter around the Project site, gaining access to harmful substances present on the site, being injured as a result of vehicle collisions, and damaging mine property.

Despite these mitigation measures, personnel may occasionally come into contact with wildlife that inhabits the Project area. To manage these incidents, a specific Wildlife Protection and Response Plan has been developed. Incidents must be managed to keep both humans and wildlife safe, using only humane control methods.

Furthermore, all staff must be familiar with the standard operating procedures and best practices aimed at ensuring human-wildlife conflicts are minimized during the life of the Project. All personnel, including contractors, on site have a role to play in ensuring human safety, conservation of wildlife and documenting wildlife activities in the Project area.

The following Wildlife Protection and Response Plan provides information on general human-wildlife conflicts policies and regulations, species-specific response plans for Ungulates and Predatory Mammals, and wildlife awareness.

2. SECTION 2 – HUMAN-WILDLIFE CONFLICTS

2.1 OVERVIEW

Wildlife encounters can take many forms. A conflict occurs when either human or wildlife health, and/or safety are put at risk. Human health and safety can be affected by contact or conflict with wildlife in several ways, including direct or indirect physical injury, and exposure to animal diseases that can infect humans (i.e., known as zoonotic diseases).

The most common conflict faced by wildlife is the increased risk of mortality from human encounters, which most often occurs when wildlife become habituated to human activity and lose their natural fear of people. The most serious form of habituation is directly correlated to the animal obtaining food, which is known as food conditioning. Food-conditioned animals become dependent on humans as sources of food. Because these human-induced habits become engrained in the animal, attempts to deter the habituated behavior generally fail with the end result usually the death of the animal. Loss of habitat effectiveness (how the animal uses its available habitat), and effects to wildlife movement (how the animal travels through its available habitat) can also result from wildlife in conflict with human development. Ultimately, this will affect both the health and safety of the wildlife species involved. While it is impossible to remove all risk to human and wildlife health and safety, approaches to minimize the risk do exist. Reactive measures do have their place in stopping the conflicts when they occur, but proactive strategies are the most effective means of preventing potential conflicts.

2.2 MINE POLICIES AND REGULATIONS

The following summarizes the general rules regarding wildlife on the site and will form the basis of the Wildlife Awareness Orientation and Courses (see below).

Employees and contractors are advised to report all incidents of unauthorized activities on or in the vicinity of the mine site to the Environment Department.

2.2.1 General Restrictions for Wildlife Protection

The following are general restrictions for Project workers and contractors, intended to minimize the potential for negative Project-related effects (e.g., increased mortality risk) on wildlife in and around the site.

- Wildlife shall have the right-of-way except where it is judged to be unsafe to do so. All species of wildlife (i.e., from small mammals to large carnivores, songbirds to raptors) when encountered by personnel on foot or in vehicles will be given the right-of way.
- Non-mine-registered firearms are not permitted on site (i.e., carrying of firearms in private vehicles to and from the project site on workdays).
- Feeding wildlife is prohibited at all times on or in the vicinity of the Project, including during travel to and from the site.

- Harassment (defined as to kill, injure, seize, capture or trap, pursue and includes to stalk, track, search for, lie in wait for, or shoot at - for any of those purposes not authorized by the Environment Department) of wildlife is prohibited at all times on or in the vicinity of the Project, including during travel to and from the site.
- The deliberate destruction or disruption of wildlife nests, eggs, dens, burrows, and the like, is prohibited at all times on or in the vicinity of the Project, including during travel to and from the site.
- Hunting and fishing is prohibited at all times on or in the vicinity of the Project, including during travel to and from the site on workdays.
- Pets are prohibited at all times on or in the vicinity of the Project, including during travel to and from the site on workdays.
- Maximum speed limit on all access roads is 50 km/h (30 mph).
- Traffic (including ATVs and snowmobiles) is restricted to designated access roads and trails.

The mine site refers to any mine facility present during the operations phase of the Project, including but not limited to, outbuildings (e.g., machine shop, offices), pits, parking areas, tailings storage facilities, and waste piles.

2.2.2 Wildlife Attractants

A list of potential wildlife attractants is provided below. The list is intended as a general summary of attractants but may not be comprehensive of all potential attractants.

- Food wastes and garbage.
- Chemicals (e.g., road salt) and their refuse (e.g., empty fuel containers).
- Wildlife carcasses (e.g., road kills, hunter kills).
- Movement and human activity (e.g., movement of people and equipment outdoors).
- Roads, which may create preferential travel corridors for wildlife, can lead to vehicle collisions and increased exposure to wildlife encounters at the Project site.

General recommendations directed at minimizing wildlife concerns related to food wastes and garbage is presented under **Section 2.2.3** (Garbage Management).

Protocols for dealing with chemical storage, disposal, and spills are presented in Meadowbank's Hazardous Materials Management Plan and Spill Contingency Plan. These protocols will minimize the potential for adverse wildlife effects, and are referenced under **Section 2.2.3** (Garbage Management) and **Section 2.2.4** (Wildlife Health).

Requirements related to the reporting and removal of wildlife carcasses are presented under **Section 2.2.7** (Reporting Wildlife Observations and Incidents).

2.2.3 Garbage Management

General recommendations directed at minimizing wildlife concerns related to food wastes and garbage are provided below.

- Littering is prohibited on and in the vicinity of the Project site, which includes all access roads. All garbage (e.g., lunch bags) must be returned to temporary storage containers. Note: organic wastes (e.g., orange peels, apple cores) are included.
- Food-related waste (including packaging) will be incinerated on a daily basis and general waste will be sent to the landfill and then buried.
- Wastes associated with mechanical maintenance and repairs (e.g., motor oil and antifreeze) will be disposed of as per the Hazardous Materials Management Plan.
- All temporary (small) storage containers for food waste garbage (yellow bin) will be wildlife protective (i.e., have bear proof lids).
- No open top buckets or anything similar will be tolerated outside buildings.
- Feeding wildlife is prohibited at all times on or in the vicinity of the Project, including during travel to and from the site on workdays.
- Wildlife incidents related to garbage or human food attractants will be reported as soon as possible. See **Section 2.2.7** (Reporting Wildlife Observations and Incidents) for more information.
- Improperly disposed of garbage, particularly food wastes will be reported as soon as possible.

See **Section 2.2.7** (Reporting Wildlife Observations and Incidents) for more information.

While Arctic Fox tend to be the greatest concern with respect to access to garbage, other animals (e.g., Wolverines, Wolves and Grizzly Bears) may be attracted to uncontained garbage sources. Problem wildlife data at the Meadowbank Mine to date indicate that Arctic Fox and Wolves are the most likely species to be attracted to the site.

2.2.4 Wildlife Health

The following recommendations are intended to reduce potential Project-related effects on wildlife health (including non-vehicle related accidents and consumption of toxic substances).

- Feeding wildlife is prohibited at all times on or in the vicinity of the Project, including during travel to and from the site. If caught feeding wildlife, an employee can be suspended and/or dismissed.
- Company procedures on the safe and prompt clean-up of any chemical spills will be followed. See Spill Contingency Plan for a more detailed protocol.
- Any observations of wildlife in and around potential sources of contaminants (e.g., fuelling sites) will be reported. See **Section 2.2.7** (Reporting Wildlife Observations and Incidents) for details.

2.2.5 Wildlife and Vehicles

The following recommendations are intended to reduce the incidence of wildlife-vehicle collisions and near misses.

- Wildlife has the right-of-way except where it is judged to be unsafe to do so.
- Obey all traffics signs.
- Maximum speed limit on all access roads is 50 km/h (30 mph).
- Verbally report wildlife carcasses observed on and in the vicinity of the Project, including along all access roads, as soon as possible. See **Section 2.2.7** (Reporting Wildlife Observations and Incidents) for more information.
- Restrict traffic (including ATVs and snowmobiles) to designated access roads and trails.
- Push and spread out the snow with a dozer when clearing the road to avoid build-up snow banks on the side of the road.
- Report all wildlife-vehicle collisions that results in the death or injury of wildlife as soon as possible. See **Section 2.2.7** (Reporting Wildlife Observations and Incidents) for details.
- A near miss between a vehicle and an animal should be reported as a wildlife 'incident'. See **Section 2.2.7** (Reporting Wildlife Observations and Incidents) for details.

2.2.6 Wildlife and Buildings

The following recommendations are intended to reduce the risk of close encountering situations between wildlife and people.

- Skirting will be added around the building to avoid having wildlife under the buildings.
- Under building access ways must be closed at all time.
- Keep c-can doors close at all time to avoid wildlife using them as shelter.
- Open top bins and containers for food waste will not be permitted outside buildings. If needs be, a bear-resistant container shall be used.

2.2.7 Reporting Wildlife Observations and Incidents

2.2.7.1 Reporting Requirements of Project Workers and Contractors

Project workers and contractors are required to verbally notify the Environment Department of the following wildlife observations or incidents as soon as possible.

- Signs of animal presence (e.g., tracks, scat, nests, burrows) in close proximity (visible to the eye from within the mine site footprint) to site facilities, vehicles, equipment, or areas frequented by workers.
- Sightings of animals in close proximity (visible to the eye from within the mine site

footprint) to site facilities, vehicles, equipment, or areas frequented by workers.

- Aggressive or unusual wildlife behavior in and around Project facilities.
- Instances of workers feeding wildlife.
- Instances of improper disposal of garbage or other waste materials.
- Observed maintenance issues (e.g., improper placement or maintenance of garbage containers).
- Instances of workers not following vehicle use guidelines (e.g., speed limits).
- Vehicle collisions with wildlife or near misses.
- Observations and locations of dead (e.g., road kill) or injured animals.

Following the verbal report of a wildlife incident or observation, completion of a Wildlife Incident Report Form may be requested at the discretion of the Environmental Coordinator or designate (s).

2.2.7.2 Reporting Requirements of Wildlife Occurrences

Wildlife Incident Reports (found in Appendix B to the TEMP) provide essential information that may identify: 1) potentially dangerous situations requiring intervention (e.g., problem wildlife); 2) situations that require notification of the Department of Environment; 3) weaknesses in garbage-handling and problem wildlife prevention measures; and 4) areas that may require warning signs (e.g., poor visibility road corners). The Environmental Coordinator or designate(s) should ensure that records of wildlife observations and incidents are thoroughly documented. Reports should attempt to include the following information wherever possible.

- Identification and number of wildlife observed.
- Specific timing and location of the observation(s).
- Details regarding the animal behavior, including direction of approach and departure, what it was doing, any aggressive behavior, etc.
- Assessment of local attractants, such as garbage, odors, movement of people, other wildlife, etc.
- If local attractants are identified as a factor, determination of what steps were or will be taken to address/remove potential attractants.
- Identification of any potential mitigation measures available to deter wildlife or limit access and how they will be implemented (refer to **Section 2.2.7** for additional information on dealing with problem wildlife).
- If an animal is destroyed, a description of the lethal measures deployed (e.g., rifle), statement of the rationale for use of lethal measures (e.g., proximity to workers, repeated incidents, observed condition of the animal, etc.), and indication of what previous non-lethal measures were employed (e.g., deterrents, hazing, trapping, and relocating [with permission from GN] etc.).

2.2.8 Protocols for Dealing with Problem Wildlife

A problem wildlife situation may arise where animal acts in an aggressive manner and/or is a repetitive nuisance or threat to worker safety. The following protocols should be used to deal with problem wildlife.

- Immediately notify the Environmental Coordinator or designate(s) of any problem wildlife issue. Reporting wildlife incidents as they occur will ensure that proactive rather than reactive measures can be taken to prevent a serious outcome (e.g., human injury, destruction of the problem animal). See **Section 2.2.7** (Reporting Wildlife Observations and Incidents) for details.
- If deemed necessary by the Environmental Coordinator, notify the Conservation Officer in the Hamlet of Baker Lake or other designated Government of Nunavut representative, inform them of the problem wildlife encountered on site, discuss appropriate aversive and mitigation actions, and determine timing when lethal methods should be implemented, if necessary.
- The Environmental Coordinator or designate(s) will initiate the appropriate actions in response to a problem wildlife issue, Recommended actions include:
    - Assess potential local attractants and address or remove all those identified, where practical;
    - Utilize non-lethal deterrents (e.g., aversive conditioning, hazing, trapping and relocating), projectiles (e.g., rubber bullets) or consider trapping and relocation of animals (e.g., Arctic Fox), where it is considered appropriate and safe to do so (refer to **Sections 3 and 4** for species-specific deterrents); and
    - Use lethal measures. Lethal measures should only be considered as a last resort in the event of aggressive animal behavior and/or repeated nuisance animals that pose a threat to worker safety and/or site facilities.
- Only authorized personnel (Environment Department) are permitted to use lethal and non-lethal projectiles (e.g., rubber bullets) or deploy traps for problem wildlife interventions.
- Do not attempt to deal with a problem wildlife issue on your own. Problem wildlife can be dangerous.
- Conform to recommendations regarding predator safety. All staff should have received a predatory mammal (i.e., Grizzly Bear, Wolverine, Wolf, and Arctic Fox) awareness training orientation. See **Section 5**.

3. SECTION 3 – SPECIES-SPECIFIC RESPONSE PLANS

3.1 PURPOSE

Response plans specific to species groups (i.e., ungulates and predatory mammals) are required to ensure that all personnel working for the Project are provided guidance on how to respond in a manner that is safe to both humans and wildlife should they encounter wildlife on or around the Project site.

3.2 SPECIES GROUPS ADDRESSED

Ungulates (Caribou and Muskoxen) and predatory mammals (Grizzly Bear, Wolverine, Wolf, and Arctic Fox) have the highest potential for interactions with humans during the life of the Project, and thus require specific response plans. If other wildlife are encountered, adaptive management strategies will be implemented if mitigation techniques and the policies and regulations mentioned in this document are not effective for these species. The proposed wildlife monitoring program will be the preferred measure of identifying potential areas in need of new mitigation strategies, or changes in policies or regulations.

For each of the species groups described below, the seasonal activity in the Project area is discussed, as well as the protocol in the event of an encounter.

3.2.1 Ungulates (Caribou and Muskoxen)

3.2.1.1 Seasonal Activity in the Project Area

Results from baseline surveys indicate that Caribou and Muskoxen are present in the Project area in all four seasons, but are observed in greatest abundance in the fall (e.g., October) when thousands of animals may be present in the vicinity of the Project, and in lowest abundance in the summer (see the baseline reports for Meadowbank [Cumberland Resources 2005a] and Whale Tail [Dougan and Nunavut Environmental 2015], and annual Wildlife Monitoring Reports for more details). Calving or post-calving aggregations or movements of Caribou have not been observed within the Project study areas since baseline studies were initiated in 1999.

3.2.1.2 Response to Encounters

Humans rarely have physical altercations with Caribou. Caribou do rut in the fall when they are at relatively high numbers on the Project site and the levels of aggression displayed, particularly by males, increases substantially. There is some anecdotal information suggesting that a bull Caribou may attack a person or vehicle during the rut; therefore, a close encounter with Caribou (during the fall) could be dangerous. Although considered rare, Muskoxen will charge humans if they are threatened (especially lone bulls). Being a sedentary species, Muskoxen will have the tendency to stand their ground when threatened, defending their territory or their young.

If you encounter a single or herds of Caribou or Muskoxen, the following actions should be taken.

- Back away slowly.
- Ensure animal(s) have an escape route.
- Do not make sudden movements.
- Do not make loud noises or attempt to scare the animal(s).
- Use radio/satellite phone to report presence of the animal(s) to the Environment Department.
- Stay in radio/phone contact until the animal(s) moves away or you have returned to a safe area (e.g., inside vehicle or building).
- Wait for the animal(s) to pass before continuing work in the area.

3.2.2 Predatory Mammals

3.2.2.1 Seasonal Activity in the Project Area

Grizzly Bear

Baseline surveys indicated limited use of the Project area by Grizzly Bears, which is consistent with what would be expected for Grizzly Bears in the north, given their wide-ranging habits and low densities. In the fall, when Caribou (a prey item) are more abundant, the Project area may have higher value for Grizzly Bears (see annual Wildlife Monitoring Reports, and Meadowbank and Whale Tail baseline reports for more details). Furthermore, increasing hunting and food caches along the Meadowbank access road in all seasons may also attract Grizzly Bears to the area.

Wolverine

Wolverines occur in the Project area on a year-round basis. Records of Wolverine sightings or their sign were infrequent in the Project area during baseline and monitoring studies beginning in 1999. Similar to Grizzly Bears, the limited evidence for Wolverine in the area is not surprising given their wide-ranging movements and characteristically low population densities (see annual Wildlife Monitoring Reports, and Meadowbank and Whale Tail baseline reports for more details). Only two occurrences (i.e., in 2011 and 2014) of a habituated Wolverine has reported at the Project site since baseline studies began in 1999.

Wolf

Although they do occur year-round in the Project area, Wolves were observed infrequently during all survey sessions, but were most common in the fall, perhaps in response to the increased Caribou abundance at that time of the year (see annual Wildlife Monitoring Reports, and Meadowbank and Whale Tail baseline reports for more details). Wolves have been one of the most frequent problem wildlife species encountered since the Meadowbank Mine became operational in 2009. Most problem Wolves were single and emaciated.

Arctic Fox

Camp personnel have regularly observed Arctic Foxes close to camp and in and around camp buildings during most months of operation, including winter (see annual Wildlife Monitoring

Reports, and Meadowbank and Whale Tail baseline reports for more details). Arctic Foxes are the most common predatory mammal species to be encountered at the Project site.

3.2.2.2 Responses to Different Levels of Encounters

Predatory mammals (such as Wolves, Wolverine, Arctic Fox, and Grizzly Bears) rarely attack people; however, they are extremely strong and vicious, and should be given respect. Members of the dog family (such as wolves and foxes) are more at risk of carrying rabies, and other zoonotic diseases, and therefore should be avoided. Arctic Fox in particular is easily tamed, quickly losing their fear of humans, and often approaching very close. Sick or injured animals may no longer be able to feed themselves and could be in a state of starvation. Often they show few physical signs that something may be wrong, but typically act more aggressively or even 'friendly' towards humans; therefore, a close encounter with a predatory mammal could be dangerous. All bites and scratches from wildlife should be reported immediately to Health & Safety department since animals can be vectors for rabies.

If you encounter a predatory mammal, your response will depend on the situation at hand. There are different levels of sightings and predatory wildlife alerts that will affect the immediate decisions you make in the field (i.e. General Sighting, or a Green, Yellow, and Red Wildlife Alert). This system allows for workers to quickly determine if predatory wildlife on or near the Project footprint/personnel needs to be left alone to pass through the size, or moved away from hazards or if the animal presents a risk to humans.

General Wildlife Sighting

Definition: When a bear or other predatory mammal is sighted >1000 m away from human activity and/or Project footprint.

Action:

- Immediately inform the Environment Department of situation using a radio/phone. A general notice will be broadcasted by the Environment Coordinator via radio to all other departments;
- Workers on the ground or helicopters in the vicinity will monitor the wildlife's trajectory non-invasively;
- Follow up notifications will be issued if the sighting changes to an Alert status, which will be dependent on the worker's location and exposure; and
- Stay in radio/phone contact until the animal(s) moves away or you have returned to a safe area (e.g., inside vehicle or building).

Green Wildlife Alert

Definition: When a bear or other predatory mammal is sighted <1000 m away from human activity and/or Project footprint.

Action:

- Immediately inform the Environment Department of situation using a radio/phone. A Green Wildlife Alert will be broadcasted by the Environment Coordinator via radio to all other departments;

- Workers on the ground or helicopters in the vicinity will monitor the wildlife's trajectory non-invasively and report the animals location regularly so that a trajectory of movement can be estimated;
- Follow up notifications will be issued if the sighting changes to a higher Alert status, which will be dependent on the worker's location and exposure;
- Workers in the affected area should be ready in case the situation escalates to a Yellow Alert Status by having a safe area (e.g., inside a building or vehicle) in the immediate vicinity that they can access quickly; and
- Stay in radio/phone contact until the animal(s) moves away or you have returned to a safe area (e.g., inside vehicle or building).

Yellow Wildlife Alert

Definition: When a bear or other predatory mammal is sighted <500 m away from human activity or Project footprint where an encounter, near miss, incident, or injury to a person or animal may be possible. If the wildlife's trajectory is aimed at human activity and/or Project footprint, or if the wildlife demonstrates abnormal behavior (such as interest or fixation), the following actions must be taken.

Action:

- Avoidance and distancing measures between workers and the animal should take place first by moving all workers away from the predicted trajectory of the animal, which may lead to a temporary closure of activities in that area. Preparation of personal deterrents should take place. Actively move personnel away from the work area, cease activities in the area and the predicted trajectory of the animal and go to a safe place (e.g., inside a building or vehicle);
- Immediately inform the Environment Department of the situation using a radio/phone. A Yellow Wildlife Alert will be broadcasted by the Environment Coordinator via radio to all other departments;
- Should avoidance and distancing measures not be possible for wildlife deterrence, possible mobilization of helicopters and the Environment Department Response Team may occur; and
- Stay in radio/phone contact until the animal(s) moves away or you have returned to a safe area (e.g., inside vehicle or building).

Red Wildlife Alert

Definition: When a bear or other predatory mammal is sighted <250 m away from human activity and/or Project footprint where an encounter, near miss, incident, or injury to a person or animal may be imminent if the animal does not change their trajectory. Wildlife deterrence must be placed into action immediately by trained wildlife responders and the following actions must be taken.

Action:

- Sound air horn with two long blasts. This will help deter the bear/predatory animal and inform all other workers of dangerous wildlife in close proximity;

- Avoidance and distancing measures between workers and the animal should take place first by moving all workers away from the predicted trajectory of the animal, which will lead to a temporary closure of activities in that area. Preparation of personal deterrents should take place. Actively move personnel away from the work area and cease activities in the immediate area of the animal and the predicted trajectory of the animal and go to a safe place (e.g., inside a building or vehicle);
- Immediately inform the Environment Department of the situation using a radio/phone. A Red Wildlife Alert will be broadcasted by the Environment Coordinator via radio to all other departments;
- ***If the predatory mammal does not back away, or shows interest in you:***
    - Continue to back away slowly and ensure a 10 m distance between yourself and the animal;
    - Make sure the animal has a safe route of escape;
    - Make noise to alert the animal of your presence or to scare it off;
    - Avoid provoking it;
    - Return to a safe area as soon as possible (e.g., inside a building or vehicle);
    - Keep the Environment Department informed of situation using the radio/phone;
- Immediate mobilization of helicopters (if available) and the Environment Department Response Team will occur to remove personnel from the area and/or deter the animal; and
- Stay in radio/phone contact until the animal(s) moves away or you have returned to a safe area (e.g., inside vehicle or building).

Table A-1 Summary of Predatory Wildlife Sightings and Alerts

General Wildlife Sighting **If wildlife is more than 1 km away:** 1. Inform Environment Department of location, distance, and number of animals. 2. Continue to monitor the bear and notify is sighting changes to Alert status. 3. Stay in radio/phone contact 4. Helicopters and Environment Department Team prepared to remove personnel or deter bear if needed.
Green Wildlife Alert **If wildlife is less than 1 km away:** 1. Inform Environment Department of location, distance, and number of animals. 2. Continue to monitor the bear and notify if Alert status changes. 3. Stay in radio/phone contact. 4. Workers are ready to go to safe area if needed. 5. Helicopters and Environment Department Response Team prepared to remove personnel or deter bear if needed.
Yellow Wildlife Alert **If wildlife if less than 500 m away:** 1. Inform Environment Department of location, distance, and number of animals. 2. Temporary work area closures for areas in vicinity of the animal and along its trajectory. Workers to prepare their personal deterrents and to go to a safe area immediately. 3. Stay in radio/phone contact. 4. Helicopter and Environment Department Response Team may be deployed to remove personnel or deter bear. 5. All personnel to stay in safe area until an all clear is given.
Red Wildlife Alert **If wildlife is less than 250 m away:** 1. Sound air horn with two long blasts. 2. Temporary work area closures for areas in vicinity of the animal and along its trajectory. Workers to immediately go to a safe area and use personal deterrents if needed. 3. Inform Environment Department of location, distance, and number of animals. 4. Stay in radio/phone contact. 5. Helicopter and armed Environment Department Response Team are deployed immediately to remove personnel or deter bear. 6. All personnel to stay in safe area until an all clear is given.

The Environment Department is to treat all predatory mammals that are threatening or aggressive as they would treat a Grizzly Bear, which is perceived to be the most dangerous. All predatory mammals that are showing interest in a person or Project facilities must be aggressively deterred to prevent habituation to the Project site. Detailed response recommendations are provided in **Section 3.2.2.3** below. If an animal is not of an immediate safety concern, the Wildlife Response team should discuss options to deter or remove the animal with Government of Nunavut Department of Environment (DOE) conservation personnel.

3.2.2.3 Environment Department Protocols for Managing Problem Predatory Mammals

As part of the detailed response plan, the Environment Department will follow the procedures included here when responding to predatory mammal sightings and encounters. It is assumed that the reporting person(s) has followed procedures for predatory mammal incidents, and has requested the Environment Department Response Team to be dispatched due to the failure of human presence to deter the predatory mammal. If an animal is not of an immediate safety concern, the Environment Department should discuss options to deter or remove the animal with Government of Nunavut DOE conservation personnel. All wildlife problems are to be recorded in the wildlife database.

In case of a General Wildlife Sighting or a Green Wildlife Alert, the Environment Department will:

- Conduct on-going monitoring and radio communication will continue in case the situation escalates and Alert status increases.

In the case of a Yellow Wildlife Alert:

- Environmental Coordinator or delegate will respond to the initial radio/call to confirm they have received the Alert message and that action is being taken;
- Environmental Coordinator or delegate will commence temporary area closures and collect all deterrent equipment and give a briefing to the Environment Department Response Team on location and circumstance of the call;
- The Environmental Coordinator will contact the helicopter dispatch and request immediate deployment (if required). Helicopter will prepare for deployment of Environment Department Response Team in to the field for emergency pick-up of field crews or a bear deterrence using the helicopter; and
- The Environmental Coordinator (or designate) should proceed to the security office to provision a firearm if needed and the site Medic should be on alert and monitor Alert updates.

In the case of a Red Wildlife Alert:

- The Environmental Coordinator or delegate will respond to the initial radio/call to confirm they have received the Alert message and that action is being taken;
- Environmental Coordinator or delegate will commence temporary area closures and collect all deterrent equipment and give a briefing to the Environment Department Response Team on location and circumstance of the call;
- The Environmental Coordinator will contact the helicopter dispatch and request immediate deployment (if required). Helicopter will prepare for deployment of Environment Department Response Team in to the field for emergency pick-up of field crews, or a bear deterrence using the helicopter;
- The Environmental Coordinator (or designate) should proceed to the security office to provision a firearm if needed and the site Medic and ERT should be on standby in the

unlikely event of a wildlife attack; and

- Updates on the situation will be broadcast if the situation or affected areas change, the Alert status changes, or when the hazard no longer exists and work may resume.

Once the Environment Department Response Team is deployed in the field:

- Prior to implementing any deterrence measures ensure the bear has a clear avenue of escape, and all workers have vacated the area;
- Depending on location, slowly drive or walk towards the animal staying a safe distance from the animal (minimum of 10 m);
- No firearms or deterrents should be discharged in a work area until all personnel are removed or are safely inside structures;
- When firearms are to be used there will always be two individuals, one person with a firearm (12 gauge) for deterrent use, the other as back up with lethal force. No lethal force will be taken without consent from the Environmental Superintendent / Coordinator in conjunction with the consultation of the Government of Nunavut DOE Wildlife Officer unless the situation is deemed to be life threatening;
- The appropriate less than lethal deterrent will be chosen and used in an effort to scare the predatory mammal away; and
- If the deterrent is successful, the incident will be recorded in the wildlife database and will detail the type and level of deterrent used, information on the predatory mammal involved, and all information on the circumstances leading up to the incident.

If the deterrent is not effective and the predatory mammal continues to approach or doesn't move away from the area of human activity or Project footprint.

- Increase deterrent efforts to less than lethal projectile (rubber bullet) if not already being employed;
- Ensure the animal has an open escape route; and
- Continue aggressive use of less than lethal projectile deterrents to try and chase the animal away.

All but the most aggressive animals should have been deterred at this point. The situation is now extremely dangerous and the Environment Department must be ready to use lethal force.

The risk to human life or property is imminent since the predatory mammal has not* responded *to non-lethal deterrent options and the safety of the team or mine property is now compromised.

- Shoot with the intention of stopping the threat, using the buckshot or 1-ounce lead slugs, as appropriate, to kill the animal;
- Shots should be aimed at the chest area, not the head or hind quarters;
- If lethal force has been used, the Environment Department must complete a full report

detailing the event immediately;

- The Government of Nunavut DOE conservation officers will be notified by phone. Direction will then be given to properly dispose of the carcass; and
- Any wildlife showing signs of rabies will be killed (never shot in the head) and reported.

Helicopter Deterrence:

- This method of deterrence is to be considered as a last resort depending on the circumstances (i.e., location of work);
- At least one member of the Environment Department must be onboard the helicopter to monitor the deterrence. The helicopter pilot is in charge of the safety of the aircraft and the passengers. The pilot will have the final say regarding where and how the aircraft is flown with regards to safety;
- To reduce stress on the animal, the helicopter must stay at least 100 m back and 30 m up from the animal during a helicopter deterrence;
- Animals cannot be pushed for more than ten minutes or 3 km (2.2 miles);
- The Environment Department passenger will notify the helicopter pilot once they are satisfied that the animal has been pushed a sufficient distance and that it is moving away from the site. They will then instruct the pilot to go up in altitude to continue monitoring the location of the animal and ensure that it is not returning;
- In the event that a firearm will need to be transported to a site via helicopter for deterrence (e.g., remote drill site), the firearm must be placed in a secure gun case and be unloaded; and
- A detailed record of all bear/wildlife activities and deterrence actions must be presented to the Environment Coordinator in a timely manner. This forms part of the reporting requirements for Wildlife Incident Tracking for regulatory authorities.

4. SECTION 4 – WILDLIFE AWARENESS INFORMATION AND ENCOUNTER STRATEGIES

This section deals with general predatory mammal (i.e., Wolves, Wolverines, and Grizzly Bears) awareness information and encounter strategies. It does not replace the need for all personnel to take a recognized wildlife awareness course.

4.1 FACTORS THAT INFLUENCE A PREDATORY MAMMAL'S REACTION

Wolverines, Wolves, and Grizzly Bears will react differently to chance encounters with humans, depending upon many factors, including each animal's past experience with humans. Their reaction is difficult to predict because of the variability of factors with each encounter.

- Female mammals may aggressively defend her young ones (for example: Female bears with cubs are more likely to attack than to flee).
- Wolverines or bears may defend a food cache (for example: a bear's main objective is to eat from the time it leaves its den to the time it returns to a winter den. Hunting bears will cache food after eating part of it by covering the food with dirt, branches or leaves. They will often establish a daybed nearby and return later for another meal). Animals will aggressively defend their food cache.
- Individual Space: All predatory mammals have a minimum distance surrounding them within which any intrusion is considered a threat. A cornered or surprised predatory mammal may be dangerous. If there is no cover to retreat to, their usual response to danger is to attack or to stand its ground.
- Old, wounded or predatory mammals with teeth malformations can be dangerous because they are very hungry or starving (e.g., Wolves observed on-site in 2009).
- Wolverines, Wolves, Arctic Fox, and Grizzly Bears are easily attracted to human food sources and may become aggressive to obtain it. Predatory mammals that have obtained food from humans become "human food habituated`. These mammals are accustomed to humans and link people as sources for obtaining food.
- Young animals which are inexperienced hunters and/or recently weaned are also at a greater risk to take advantage of human food source opportunities.

4.2 ANIMAL ENCOUNTERS

Most of animal safety is prevention – avoiding an encounter is the best way to stay safe while working in the home ranges of Wolverines, Wolves, Arctic Fox, and Grizzly Bears.

4.3. HOW TO REACT TO ANIMAL ENCOUNTERS

Your reaction should depend on circumstances and the behavior of the mammal.

- Stop and assess the situation before you act.

- Does the predatory mammal know you are there?
- How is the animal reacting to the nearby activity?
- Remain calm.
- Do not turn your back on the animal.

DO NOT RUN – You will trigger the animal's natural response to chase you. Wolverines, Wolves and Grizzly Bears are extremely fast and you cannot outrun them.

Some Simple Rules

- Respect them – they can kill you.
- Be alert at all times.
- Watch for sign.
- Make noise – don't surprise animals.
- Travel in groups when possible.
- Be cautious in noisy areas (streams).
- Know the types of areas animals use during the year.
- Do not approach them.
- Never feed them.
- Get trained and carry deterrents.
- Remember carcass equals danger – look for ravens, strong odours.
- Mentally rehearse encounters.

4.3.1 Specific Situations: Animal Encounters

Wolverine, wolf, or bear is not aware of you.

- Leave the area quietly in the same direction that you came from.
- Move while the predatory mammal is not aware of you and stop moving when the mammal lifts its head to check its surroundings.
- Stay downwind so the predatory mammal will not pick up your scent.
- When you have moved a safe distance away and preferably to your truck or shop where you can watch and wait until the predatory mammal leaves.
- Report event to Environment Department immediately.

If the wolverine, wolf or bear is unaware of you and approaching.

- Allow the mammal the right-of-way. Make sure there is a safe escape route and that you

are not in the way.

- Return to vehicle or building when available or allow animal a wide birth.
- Report event to Environment Department immediately.

If you cannot leave undetected

- Move upwind so animal can pick up your scent; this will help them identify you as human.
- If it is possible, try to keep the predatory mammal in your sight.
- Watch to see if the predatory mammal leaves when it smells that a person is nearby.
- Report event to Environment Department immediately.

If the wolverine, wolf or bear is aware of you but in the distance.

- Continue walking at the same general pace and towards a safe area (vehicle or building).
- DO NOT RUN.

The wolverine, wolf or bear is aware of you and close.

- A predatory mammal will feel threatened in a close confrontation. Generally their natural tendency will be to reduce or to remove the threat. Assist the animal by acting as non-threatening as possible.
- Do not make direct eye contact.
- Do not make any sudden moves.
- DO NOT RUN.
- In the case of a bear, they need to identify you as a person, so talk in low tones and slowly wave your arms over your head.
- Attempt to give the predatory mammal an opportunity to leave. Be sure they have an open escape route.
- Try to back away slowly.
    - If the predatory mammal begins to follow you, drop your jacket, or pack or some other article (not food) to distract it. This may distract the animal long enough for you to escape.
    - Report to Environment Department immediately.

The wolverine, wolf or bear is close and threatening.

- If you have a deterrent such as a bear banger or bear spray, be prepared to use it depending on how close the predatory mammal is.

- If you do not have a deterrent, or if using the deterrent is not successful, act as non-threatening as possible.
- Talk to the predatory mammal in a calm authoritative tone of voice.
- Do not startle or provoke the predatory mammal by making sudden moves.
- Back slowly away from the animal and drop a pack, jacket, or some other article in order to distract it momentarily.
- Remember that the predatory mammals may be defending their cubs that you have not yet seen or they may have a food cache nearby. Attempt to look as non-threatening as possible.
- Report to Environment Department immediately.

The wolverine, wolf or bear is very close and approaching.

A distance of less than 50 m in an open area is considered very close.

- If the predatory mammal continues to approach, use your deterrent when in range.
- If the predatory mammal does not respond to the deterrent you must now STAND YOUR GROUND!
- Report to Environment Department immediately.

The wolverine, wolf or bear charges.

In this case you have done something that has provoked the Wolverine, Wolf or Grizzly Bear into showing signs of aggression towards you. It is often not clear to the person what they have done to provoke the mammal until after the attack. It is important that you act passively, humble your posture, and do not look directly at the animal. Always keep the animal in sight. Never yell or throw things as these are obvious signs of aggression

When faced with a charging wolverine, wolf or bear.

- First use your deterrent, either a banger or pepper spray. If authorized (only Environment Department representatives or local security personnel) to carry a firearm, shoot the predatory mammal.
- **DO NOT PLAY DEAD IF THE PREDATORY MAMMAL CONSIDERS YOU FOOD.**
- You must defend yourself with whatever means are available, act aggressively towards the bear.
- Stand up on something high and try to make yourself look bigger. Try to appear dominant. Try to frighten it. Yell, scream, shout, and wave your arms. Jump up and down and fight back.
- Hold your jacket or backpack over your head to make yourself look bigger.
- If being aggressively attacked in a predatory attack, fight back. Concentrate your efforts on the face, eyes, and nose of the bear. Use whatever means you have, rocks, sticks,

tools, hardhat, or simply kick and punch with all the strength you can muster.

- Report to Environment Department immediately.

4.3.2 Types of Bear Attacks

Provoked Attacks

- You have done something that has provoked the bear into showing signs of aggression towards you. It is often not clear to the person what they have done to provoke the bear until after the attack.
- It is important that you act passively, humble your posture and do not look directly at the bear. Always keep the bear in sight.
- Lie down on the ground in the prone position (i.e., play dead as this is a sign of submission to the bear and shows the bear that you are no longer a threat to them).
- Never yell at the bear or throw things at the bear, these are obvious signs of aggression towards the bear.
- Report to Environment Department immediately.

Predatory Attacks

- The bear is hunting or stalking you! You are being treated as potential food. DO NOT PLAY DEAD IF THE BEAR CONSIDERS YOU FOOD.
- You must defend yourself with whatever means are available, act aggressively towards the bear. Stand up on something high and try to make yourself look bigger.
- Try to appear dominant. Try to frighten the bear. Yell, scream, shout and wave your arms. Jump up and down and fight back. Hold your jacket or backpack over your head to make yourself look bigger.
- Use your deterrent; either a banger or pepper spray. If authorized to carry a firearm, shoot the bear.
- Report to Environment Department immediately.

4.4 WILDLIFE DETERRENTS

4.4.1 Noise

- Pencil Flare Guns are highly portable but many people have received injuries from this type of deterrent as the pen explodes while they are holding it. This deterrent is still sold and is not recommended. Canadian Conservation Officers no longer using pencil flares.
- Pyrotechnics, including bangers, screamers, whistlers, and flares. Requires a magazine launcher. These launchers look like a small handgun. There are different types available, some carry only a single shot, and some will carry multiple cartridges. The bangers, screamers and whistlers are charges that will explode and emit a variety of different noises. The name of the device indicates the noise it will make.

4.4.2 Wildlife Chemical Deterrents

Bear Sprays are highly effective but they must be used correctly to be effective. As with all deterrents they have their good points and their bad points.

- The main ingredient in bear spray is Capsicum an extract from hot peppers.
- Capsicum needs to strike the eyes, nose or mouth of the mammal, (open membranes) to be effective.
- These sprays can only be used at very close range, 3 to 8 m or 10 to 25 ft.
- You cannot discharge the bear spray too early – or it will be completely ineffective.
- If the predatory mammal comes within the range of the bear spray – aim directly into their face and spray.
- You must be aware of the wind direction. If you the wind is blowing towards you, the spray will be carried by the wind into your face.
- Bear spray may not be effective in sub-zero weather (Spray cans do not fire well in very cold temperatures.) In colder weather, you need to keep the can of bear spray warm in order for it to fire effectively.
- Bear spray will not be effective in the rain. When you fire a can of bear spray, the spray will create a billowing cloud of capsicum and propellant. Rain can/will wash the spray right out of the air before it strikes the bear in the face.
- If you have used your can of bear spray to deter a mammal, wash the nozzle off with soap and water to remove the scent. Replace your can of spray as soon as possible. You do not want to have another bear encounter with a half a can of spray left.
- Bear sprays have a shelf life. Always replace your bear spray when you are nearing the end of the shelf life. The Capsicum does not deteriorate over time; it is the canister seals that deteriorate over time.
- Do not test your can of spray before going out into the field. You need to take a full can of spray into the field, not a partially used one.
- Wildlife chemical deterrents are only to be used for the purpose they are intended for. Misuse of wildlife deterrents such as chemical sprays, bangers, and pyrotechnics is considered a criminal offence.

5. SECTION 5 – TRAINING PROTOCOL

5.1 SCOPE

The Wildlife Training Protocol outlines recommended levels of training that specific groups of people at the Project site should receive. It is important that human activity at the site does not result in wildlife encounters that put people or wildlife at risk. All personnel on site have a role to play in ensuring human safety, conservation of wildlife, and documenting wildlife activities in the Project area.

5.2 ASSUMPTIONS AND KEY CONSIDERATIONS

Agnico Eagle, Meadowbank Division must assign overall accountability, recording and reporting responsibility to the Environmental Coordinator or designate(s) if the various wildlife response plans and training initiatives are to be effective.

The Environmental Coordinator or designates(s) will be responsible for ensuring that all employees, contractors, and visitors at the Project site receive wildlife training appropriate to their roles and responsibilities.

The Environment Department will be responsible for all deterrent action whenever it is necessary to deter wildlife from mine infrastructure or personnel. All members of the Environment Department will receive specialized training in various levels of deterrent use. Security personnel and the Environment Department will be the only onsite personnel to have access to a firearm.

5.3 TRAINING

Mandatory wildlife awareness orientation for all staff will include the following components.

5.3.1 Wildlife-Human Conflict

- General restrictions for wildlife protection.
- Wildlife Attractants.
- Garbage Management.
- Wildlife Health.
- Wildlife and Vehicles.
- Preventing Problem Wildlife.
- Dealing with Problem Wildlife.
- Reporting Wildlife Observations and Incidents.

5.3.2 Wildlife Awareness

The Wildlife Awareness and Working in the Wild brochure has been developed to provide Agnico Eagle staff and contractors with awareness of potential wildlife encounters that may occur at the Project site. This brochure discusses the following:

- Wildlife that commonly occur near the Project site;
- Behavior of wildlife that may be encountered near the Project site;
- Wildlife encounters; and
- Wildlife Deterrents.

5.3.3 Environment Department

In addition to the required Project site orientation, the Environment Department may require additional training. The following training is recommended, especially for those without experience in situations where wildlife occurrences are common.

Bear Safety Training

Provided by qualified contractor or territorial, provincial or federal Wildlife Officer, this course will provide:

- Instruction on the use of lethal and non-lethal deterrents for emergency response to bear incidents;
- Techniques for euthanizing bears during an emergency response;
- Other types of deterrent options available in non-emergency situations;
- In depth aversive conditioning techniques;
- Live trapping techniques and protocols;
- Necropsy techniques, and biological sampling; and
- Practicum.

Carnivore Safety Training

Provided by qualified contractor or territorial, provincial or federal Wildlife Officer to include:

- Biology, ecology, and behavior of Wolverine, Wolf, Arctic Fox, and Grizzly Bear;
- Rabies and other zoonotic diseases;
- Detailed deterrent and aversive conditioning techniques;
- Live trapping techniques;
- Instruction on the use of lethal and non-lethal deterrents for emergency response to incidents involving large carnivores;
- Necropsy techniques and biological sampling; and
- Practicum.

APPENDIX D

Field Data Forms and UTM Coordinates for Monitoring Programs

MEADOWBANK WILDLIFE INCIDENT PROCEDURES

Wildlife incidents refer to a range of possible occurrences at the Mine, including:

- human-wildlife interactions that present a risk to either people or animals
- wildlife-caused damage to property or delay in operations
- wildlife deterrent actions
- wildlife injury or mortality

The objective of wildlife incident reporting is to document and mitigate impacts to wildlife, reduce risks to people, and identify new mitigation.

Natural processes should be left alone, unless intervention is required to reduce risk to either wildlife or staff from Project activities. Each incident requires unique responses, but each incident should be assessed to reduce or eliminate the chance that it will recur.

GN should be contacted in the case of problem wildlife, and prior to disturbing nests. Detailed wildlife incident reporting is critical for implementing adaptive management. As part of the TEMP, all wildlife incidents are reported and reviewed to determine patterns in incident occurrences and to develop management procedures.

All wildlife incidents should be documented by Meadowbank Environment Department staff using the attached form, and reported immediately to the Environmental Superintendent. The report should include photographs and conversations with the individuals involved. Please attached additional pages or information that may be useful to understand what occurred and what can be learnt from the incident.

Wildlife Incident Report Form

Date:		**Time:**	
Individuals involved:			
Species:			
Number, gender, age:			
Location (description):			
Location (UTM):			
Digital photo numbers:			
Describe the incident or accident that occurred. Was there a threat to wildlife or human safety? What was the situation that caused it?			
Describe any use of wildlife deterrents: Describe any wildlife mortality:			
Describe any communication with GN-DOE:			
What immediate measures were taken to reduce risk or harm?			
What measures are recommended to prevent future occurrences?			
Report prepared by:		**Reviewed by:**

APPENDIX E

Peregrine Falcon Management and Protection Plan

Peregrine Falcon Management

and Protection Plan on the Meadowbank Gold Project Site

Version 2 - Updated June 18, 2012

Background and Purpose:

Since 2009, peregrine falcons have been observed along the All Weather Access Road occurring in three to five quarries. In June 2012, for the first time, falcon activity was observed in the Portage Pit. Subsequently a falcon nest site was observed in the South Portage Pit. In response a general mine site peregrine falcon management and protection plan was developed in accordance with the Terrestrial Ecosystem Management Plan (TEMP).

The purpose of this plan is to protect peregrine falcons from mine activities by firstly preventing them from nesting within the perimeter of active mining Pits (Portage, Goose, or Vault pits) during operation. If falcons nest in the mine pits, operations will be adapted according to the management plan and monitoring will increase to ensure protection of the falcons and their nest(s). The peregrine falcon is listed as "may be at risk" by the Canadian Endangered Species Conservation Council (2001) and the Nunavut Government (Government of Nunavut, 2001). *Falco peregrinus tundrius*, the subspecies that breeds north of the treeline, is listed as being of special concern in Canada (COSEWIC, 2002). Therefore we must ensure all activities protect these species.

Throughout the year Meadowbank environment department staffs routinely monitor the pit and other areas on site for birds to ensure their protection and that the management plan is being implemented. The following document outlines specific management and mitigative measures to protect peregrine falcons in accordance with the Meadowbank TEMP.

Deterrence and Protection Plan Prior to Nesting in Portage, Goose and Vault Pit:

Level 1) Prior to and during nesting season (May 25 – July 1) an inspection of the pit walls will be conducted daily. These inspections will include a visual assessment from the bottom of the pit looking up at the wall faces, and also from the top looking down the wall faces. Records shall be kept of the dates, times, and which individual(s) carried out the inspection.

Level 2) If falcons are reported to have been seen in the vicinity of the pit or are observed by environment department staff, inspections will increase to 3 times daily; once in early morning, once at mid-day, and once again in the later evening. All sightings shall be documented as to the date, time, location, and individual(s) spotting the falcons. Owl decoys will be erected in the

area where the falcons have been seen to attempt to deter the falcons from nesting in the pit areas. Noise cannons may also be utilized.

Level 3) If sightings become regular, inspections will increase to every 3 hours including incorporating a night shift to perform inspections.

Level 4) If perching is observed or if nests are being created within the pit, the following management measures will be under taken.

A. Shoot off a pistol banger (non-pyro technique) to ease them away from their location of perching. At no time will a banger be shot in the direction of the falcon, all bangers will be shot from a safe distance away to avoid any physical harm to the bird, i.e. hearing impairment.
B. When the bird flies away it will be observed. The reason for this is that Agnico-Eagle does not want any falcon to leave one active pit, ie., South Portage and move to North Portage or from either Portage pit to Bay Goose Pit. We must ensure the falcon is deterred from the active pit areas. If the falcon re-lands within one of the pit perimeters repeat step A.
C. If a nest is being constructed, each nest will be treated on a case by case basis depending on its location. One option at this level would be to roll or place wire mesh fencing over the nesting area to prevent the return of the falcon to the nesting area.

With protective measures in place, our goal is to never have to get beyond *Level 4:A*.

Portage, Goose and Vault Pit Nest Monitoring and Protection Plan

If a nest is established and/or eggs are observed blasts will be minimized within a protective zone of the nest. It is likely that the nest will occur near the top of the pit wall. Blast vibration and noise has not appeared to have deterred the falcons from nesting near pits at this time; therefore the greatest risk to the eggs and young would be from blast fly rock. To prevent falcon disruption, the frequency of blasts will be reduced, vehicle traffic and most importantly human traffic will be reduced within a radius of ~150m from the nest. Fly rock will be monitored by video to ensure no impacts. Through controlled blasts and video monitoring of fly rock in June and July AEM will ensure that fly rock is kept to a minimum height that does not exceed the height of the nests.

In accordance with the TEMP, daily monitoring by environmental staff will be conducted with binoculars or a scope from the west side of the pit and recorded. After all blasts, environmental staff will check on the nests and record observations. Portable motion sensor automatic cameras may also be installed to record movements in the nest on regular intervals.

Based on past monitoring results of the nests along the All Weather Road (2009-2011), there is no pattern that has indicated that some young have survived while others have not due to road or quarry operations. The activities in the pit need to continue to be protective of the nests and the environmental staff will continue to monitor the activity and nests daily between June and September if a nest is observed.

Portage, Goose and Vault Pit Mine Operation Mitigation

Blasting

As a protective measure, blasting in the south pit east wall will become less frequent with smaller controlled blasts. Over the past 6 months, blasting has been optimized to reduce dilution and control fly rock by modifying blast material density, timing and patterns.

Blasts should occur less frequently and should be minimized within 150m of the nest in June and July, operations will prevent blast fly rock from disturbing the nests and video record all blasts within a 150m radius. The blast vibration and noise does not appear to have deterred the falcons from nesting nearby. Through controlled blasts and video monitoring, fly rock will be monitored to ensure it has not flown towards the nests. If blasts occur within the radius, fly rock will not exceed 60m or the height of the nest in June and July.

Mine Operations and Reduced Vehicle Traffic

Traffic should be reduced within 150m radius of the nest to protect it from dust; if traffic cannot be reduced, dust suppressant should be used.

If all above mentioned measures have failed and AEM environment are not able to conform to the TEMP, the Government of Nunavut Department of Environment will be contacted by the Environment Superintendent, Environment Biologist, or Environment Coordinator.

APPENDIX F

Migratory Bird Mitigation Plan

TECHNICAL MEMORANDUM

DATE June 2018 **PROJECT No.** 1658927.3100_Rev2

TO Ryan Vanengen
Agnico Eagle Mines Limited

CC Lasha Young, Jen Range, Dionne Filiatrault

FROM Corey De La Mare, Damian Panayi **EMAIL** corey_delamare@golder.com

MIGRATORY BIRDS PROTECTION PLAN

1.0 INTRODUCTION

Agnico Eagle has planned two water diversions as part of water management activities for the proposed Whale Tail Project (the Project) and the proposed Whale Tail Expansion Project (Expansion Project). The purpose of this Plan is to present the anticipated flooding area and schedule during the Whale Tail Lake (South Basin) and Northeast diversions and present appropriate mitigation measures to reduce impacts to nesting migratory birds.

The Whale Tail Lake (South Basin) diversion consists of construction of the Whale Tail Dike, from June 2018 to February 2019, to divert Whale Tail Lake (South Basin) and tributary lakes through Lake A45, just south of Lake A16 (Mammoth Lake). Flooded tributary lakes (light blue shading in Figure 1) include Lake A18, Lake A19, Lake A20, Lake A21, Lake A22, Lake A55, Lake A62, Lake A63, Lake A65, Pond A-P1, and Pond A-P53 (Figure 1). Active flooding from elevation 152.5 to 156.00 masl of the area will occur from 2019 until 2020 causing approximately 157 ha of flooding; this will active require migratory bird mitigation. The flooded area will remain at elevation 156.00 masl from July 2020 until 2023, during operations.

The Northeast diversion consists of construction of the Northeast dike, from February to March 2019, to divert Lake A46 and tributary lakes through Lake C44 in the Lake C38 (Nemo Lake) watershed. Flooded tributary lakes (light blue shading in Figure 2) include Lake A47, Lake A48, Lake A113, Pond A-P38, and Pond A-P68 (Figure 2). Flooding of this area will occur between February 2019 to July 2020, and during operations (July 2020 to 2023).

The flooding has the potential for incidental disturbance and destruction of migratory birds and their nests. As per Nunavut Impact Review Board (NIRB) Project Certificate No.008 Condition 34, this Migratory Bird Nest Mitigation Plan (the Plan) describes how these impacts will be mitigated; the mitigation will be focused between 2018 to July 2020, or until water levels reach their maximum flood plain.

The *Migratory Birds Convention Act* (1994) (*MBCA*) prohibits the harm of migratory birds and the disturbance or destruction of nests and eggs. The original aim of this legislation in the early 1900s was to conserve migratory bird populations from overharvest (CWS 2007). Inadvertent disturbance or destruction of migratory birds has been termed “Incidental Take” and Environment and Climate Change Canada (ECCC) currently lacks legal mechanisms to regulate Incidental Take (CWS 2007).

This Plan describes the likely effects pathways that may harm migratory birds (based on the Whale Tail FEIS, Agnico Eagle 2016), the mitigation options to reduce these impacts, and Agnico Eagle’s preferred option for proceeding.

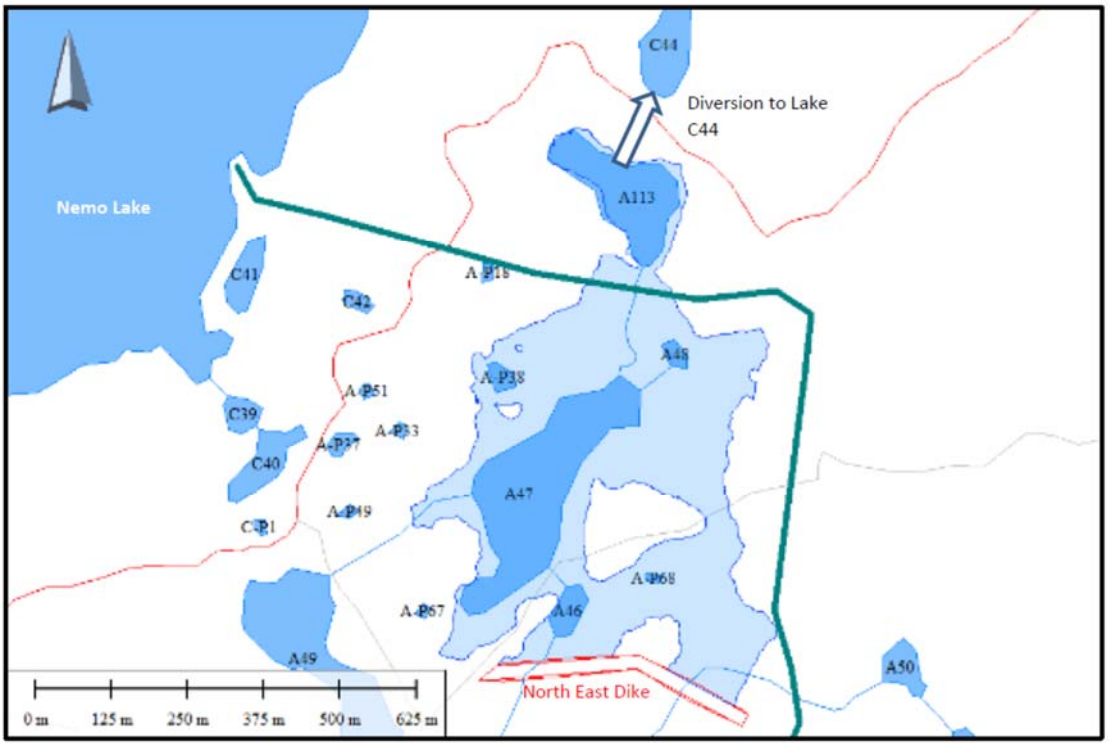

Figure 2: Northeast Diversion Flooding occurring between June 2019 to July 2020, and during operation (July 2020 to 2023)

2.0 EFFECTS PATHWAYS AND MITIGATION

The flooding resulting from the Whale Tail Project and proposed Whale Tail Expansion Project water diversions will lead to incidental disturbance and destruction of migratory birds and their nests.

2.1 Effects Pathway

Flooding at the Project and proposed Expansion Project site is anticipated due to the construction of new dikes in Whale Tail Lake (South Basin) and downstream of Lake A46 and Lake A50. Some of the flooding will occur during the nesting season and may lead to the loss of nests near the shoreline of the lake.

Shoreline surveys during the Project baseline field work examined 62.8 km of shoreline along lakes and streams (Agnico Eagle 2016, Volume 5, Appendix 5-C). In total, 24 species of birds and eight nests were observed including three semipalmated sandpiper nests, two semipalmated plover nests, one dunlin nest, one herring gull nest, and one cackling goose nest. Assuming that observers recorded nests that were observed within a 20 m swath surveyed by two people, the nest density for the Project is 0.06 nests per ha. Given the area of flooding expected to occur at the Project and proposed Expansion Project, and assuming densities are the same as that observed during baseline studies, approximately seven nests in 2019 and three nests in 2020 of the shorebirds, gulls and waterfowl groups may be displaced by flooding if no mitigation is undertaken (Table 1).

Upland birds have been surveyed at Meadowbank from 2003 to 2015 using PRISM protocols. PRISM surveys found 3.8 pairs of breeding birds per plot during 2015. As PRISM plots are 16 ha in size this indicates a density of 0.24 pairs per ha. The average nests observed per PRISM plot was 0.6 nests, or 0.04 nests per ha. It is assumed that not all the nests or breeding pairs were detected during the 2015 baseline studies so a nest density of 0.5 nests per ha was used to calculate the number of nests displaced due to flooding. It is predicted that approximately 61 upland bird nests will be displaced in 2019 and approximately 27 nests in 2020 if no mitigation is undertaken at the Project and proposed Expansion Project (Table 1).

Table 1: Predicted Number of Bird Nests Displaced from Flooding

Nesting Period Year[a]	Whale Tail Lake (South Basin) Diversion			Northeast Diversion		
	Change in Flooded Terrestrial Area (ha)	Predicted Number of Nests Displaced		Change in Flooded Terrestrial Area (ha)	Predicted Number of Nests Displaced	
		Shoreline Survey	PRISM Survey		Shoreline Survey	PRISM Survey
2018	0.21	0.01	0.10	0	0	0
2019	115.96	6.96	57.98	6.58	0.42	3.29
2020	41.38	2.48	20.69	11.86	0.75	5.93
2021	0	0	0	0	0	0
2022	-64.94[b]	0	0	-18.45[b]	0	0

[a] The nesting period used included the months of May, June, July, and August.

[b] Between May and August 2020 the total flooded habitat area and the flooded terrestrial area is expected to decrease in size.

PRISM = Program for Regional and International Shorebird Monitoring; ha = hectare.

2.2 Mitigation

The following options have been considered to reduce the risk that flooding poses to migratory birds. The options fall under the general categories of deterrents, and habitat modification or exclusion.

- Deploying visual and audio bird deterrents

- Reducing habitat quality
- Covering key nesting habitat within the flood zones of tributary lakes
- Disturbing the soil and vegetation

Each of these mitigation options is discuss in greater detail below. Field studies planned for the summer of 2017 will provide information on the species and densities found in the flooded area to further develop and refine the mitigation proposed below. Results will be reported in the annual Terrestrial Ecosystem Monitoring Report, and evaluation of mitigation options will be completed in consultation with ECCC in early 2018.

2.2.1 Bird Deterrents

Agnico Eagle would consider hiring additional local staff from May to August 2019 and 2020 to actively deter by use of walking, rope drags, ATVs or boats in nesting areas.

Additionally, will investigate commercially available visual deterrents and noise makers, deployed parallel to and facing the shoreline of tributary lakes prior to nesting season and remain operational during the nesting season. A variety of predator type calls could be broadcast to prevent habituation for a variety of upland bird species. Noise makers can be equipped with a solar panel to provide power for continuous operation. Visual deterrents may include scare balloons, human, and predator effigies and other visual deterrents. Scare balloons have large predator eye designs that look threatening to the birds and reflective flash tape rustles in the breeze, preventing habituation in the area. Snow melt, ice melt and arrival of migratory birds will be documented in 2017 and 2018, prior to the flooding activities, to inform mitigation. The location and distribution of visual deterrents will be rearranged occasionally to maintain their effectiveness, and will be deployed prior to migratory bird nesting period (i.e., the beginning of May, or prior to 50% snow melt).

A list of possible deterrents and their effectiveness relevant to marine oil spills is under development by ECCC, to be considered prior to final selection of bird deterrents. In addition to deterrents, Agnico Eagle staff should regularly survey the flooding area to provide further disturbance and to maintain and relocate the deterrents.

Surveys to investigate the effectiveness of fox effigies used at the Gahcho Kué Project (De Beers 2016) where inconclusive. Transects terminating in a fox effigy were surveyed for bird activity in May 2015. The surveys indicated Sparrows were more commonly observed in the control transects (11 individuals on control transects versus 3 on deterrent transects). Statistical analysis could not be conducted due to study design and low sample size.

2.2.2 Reducing Habitat Quality

Efforts could be made to reduce habitat quality, either through standing vegetation removal or a controlled burn during construction in 2018 and 2019 to remove disturbed vegetation and reduce the quality of nesting habitat in specific areas scheduled for flooding. The areas subject to flooding are primarily tundra and exposed rock, with little standing vegetation. However, standing vegetation (including a few willows) provide preferred nesting habitat for migratory birds, and can be cleared by ground crews using hand tools. Additionally, low lying vegetation could also be removed through a controlled burn along the shores of tributary lakes could be undertaken prior to flooding in high priority nesting areas identified in 2016 and 2017. A controlled burn would be carried out by fire experts under specified weather conditions with appropriate permits and regulations. Although the existing tundra is not particularly flammable this could be considered a suitable option, as burns could be controlled in designated areas.

2.2.3 Covering

If vegetation removal and/or burning of potential nesting areas were unsuccessful in 2018, key habitats with high potential for nesting birds within the flood zones could be covered with tarps or other material to reduce access by birds in 2019. Although this will be logistically challenging as the total area of predicted flooding in 2019 is over 120 ha, and most of this area is without access for vehicles or heavy equipment to deploy the cover material. If cover material could be deployed by hand, Agnico Eagle will prioritize areas identified in 2017 as high nesting suitable areas to be candidate target sites for covering. This mitigation technique will require frequent maintenance to prevent the cover from blowing away and continual adjustments will be required as water levels rise.

2.2.4 Disturbing Vegetation and Soil

Disturbing vegetation and soil (grubbing) could be conducted to reduce the attractiveness of the area to ground nesting birds in the areas adjacent to the tributary lakes. This option is not considered to be feasible due to a lack of access for the required earth moving equipment. The area will not have the required road access for heavy equipment and support vehicles (e.g., fuel and lubricant trucks). Winter grubbing is not feasible as the ground would be too frozen to disturb. Further, grubbing would lead to soil erosion when flooding begins, likely triggering the *Fisheries Act* for the deposition of deleterious substances.

3.0 PREFERRED OPTIONS

The following section describes Agnico Eagle's preferred mitigation for the two pathways described.

3.1 Preferred Mitigation for Loss of Migratory Bird Nests during Flooding

Upon review of the available mitigation options, Agnico Eagle has selected the following list of mitigation options for implementation, contingent upon field investigations in 2017.

- Deploying visual and audio bird deterrents
- Regular sweeps by Agnico Eagle staff to discourage nesting through human activity, and to move the visual and audio deterrents

Furthermore, the feasibility of the following option will be considered in consultation with ECCC and academic institutions, and completion of a thorough literature review, field tests of the deterrents, and monitoring the effectiveness of mitigation measures. If deemed appropriate Agnico Eagle will also implement the following options:

- Habitat modification or exclusion the habitat in the flood zone, which may include vegetation removal, controlled burn, or covering key nesting habitat

As per Project Certificate No.008 Condition 34, Agnico Eagle will report the results of the Migratory Birds Protection Plan to NIRB on an annual basis.

Viewshed Analysis

MEMORANDUM

TO Ryan Vanengen, Agnico Eagle Mines Ltd. **DATE** July 14, 2017

CC Dionne Filiatrault, Jen Range, Damian Panayi

FROM Corey De La Mare, P.Biol. **PROJECT No.** Doc 110-1658927.3200_Rev1

WHALE TAIL VIEWSHED ANALYSIS

Introduction

During the development and revisions of the Terrestrial Ecosystem Management Plan (TEMP) for the Whale Tail Project (the Project), which is an expansion of the existing Meadowbank Mine, several discussions revolved around caribou detection within and around the mine site, along the All Weather Access Road (AWAR) and the associated triggering mitigation actions. It became apparent that although caribou are regularly observed from roadside surveys along the existing Meadowbank AWAR, the sightability limit (i.e., maximum distance at which caribou could be observed based on topography) is largely unknown. This sightability distance is required to understand how much time Agnico Eagle Mines Limited (Agnico Eagle) may have to respond to caribou encountering the Project based on receiving GPS collar data and the lag time between receiving that data and caribou approaching the Project. The notion is that a greater distance of visible detection will allow for better caribou mitigation preparedness by Agnico Eagle.

The proposed Whale Tail Haul Road is a 65 km all weather haul road between the existing Meadowbank Operations (i.e., Vault Pit) and Whale Tail Pit. As part of the caribou monitoring component for this haul road, five height of land (HOL) survey locations are proposed in areas where caribou have been observed based on collar data, presence of caribou trails, caribou sign, and where topographic relief is greatest. The main methods for collecting caribou observation data are through roadside surveys along the existing Meadowbank AWAR and the proposed Whale Tail Haul Road, and at the five HOL survey locations.

To determine the extent of visibility from these locations, a viewshed analysis was completed within a GIS platform. The results of this memo are intended to validate the distance of visible detection using road surveys and HOLs will provide adequate caribou mitigation preparedness by Agnico Eagle.

Methods

The viewshed analysis shows the area where there is a line of sight based evaluation from elevations within the landscape, the observer height and the height of the target, in this case caribou. Visual aids, such as binoculars and spotting scopes, aid the observer to see at the extreme ends of the lines of sight so that caribou can be detected but the line of sight is not changed based on visual aids. The following assumptions were included in this viewshed analysis:

- An observer height of 2.0 m was added to each of the HOL locations, it is recognized that observers may not actually be 2.0 m but this is a standard observer measurement for viewshed analysis.
- A surface offset to simulate the height of caribou was added at 1.5 m.
- The observer height is set as: 2 m for the points and 1 m (default value) for the road; however, for the Whale Tail Haul Road the proposed road elevations based on the CAD profile was used.

The viewshed was required for the Regional Study Area; however, the availability of datasets was not consistent for the entire Regional Study Area in terms of data format and data resolution. Consequently, the datasets used and methods for harmonization are as follows:

- Road centerlines: Whale Tail Haul Road centerline and elevations (profile) provided by CAD, all weather road centerline generated semi-automatically using its footprint and linking its northern extremity to the Whale Tail Haul Road.
- 2016 HOL survey locations are only general and may have a high error range in their location precision, more specific coordinates will be acquired in 2017.
- Digital Elevation Model (DEM) for the haul road and the HOL survey points used a high resolution DEM (1 m). The DEM was down-sampled to 3 m resolution and merged with CDEM that has a 20 m resolution and then re-sampled back to 3 m resolution, but this is only to keep the 3 m precision where it exists and id does not make the CDEM more precise. Using a merging process avoiding edge effects and creates a smooth transition from one DEM source to the other.
- The high resolution DEM only covers the haul road (approximatively 500 m on each side) and a large portion of the Whale Tail Pit and development area.
- For the AWAR, no high resolution DEM coverage exists, consequently we only used the CDEM (20 m resolution) for this.

The viewshed analysis was run on an ESRI ArcGIS 10.4.1 platform using the 3D analyst tool – Viewshed. The visibility analysis does not take into account any potential vegetation or any other obstructions (natural/human) that are not part of the bare ground. A viewshed was developed for the existing Meadowbank AWAR, the proposed Whale Tail Haul Road, and the five HOL survey locations.

Results

The results of the viewshed analysis can be found in Figures 1 to 3, which each show the viewshed from the five HOL survey locations (Figure 1), the proposed Whale Tail Haul Road (Figure 2), and the existing Meadowbank AWAR (Figure 3). All three figures illustrate that with the naked eye, the sightlines from all three sources (HOL, Whale Tail Haul Road, AWAR) range from less than 1 km to greater than 8 km with a range of 3 to 5 km in several different directions from each location. When HOL locations are combined with the Whale Tail Haul Road as a point of observation, the visibility in general for all locations is around 5 km, with several vantage points of greater than 5 km.

A summary of field confirmation details regarding the viewscape analysis at HOL locations includes the following (M. Young, Dougan Associates, 2017, pers. comm.):

HOL Survey Point	Average Maximum Observable Distance	Comments
1	9.2 km	This site was slightly relocated to improve the visibility of the road. Small blind spots (50 to 100 m wide) facing S and NW
2	7.2 km	Small blind spots facing S, SW, and W
3	9.1 km	Small blind spots facing S, SE, NW, and E
4	8.9 km	Lars Qaqqaq identified this location as a movement corridor for Barren Ground Caribou Small blind spots facing SE, W
5	5.5 km	Road at this section is not currently built. Small blind spots facing SW, NW, NE. SW, and NE blinds spots to be opened up when eskers removed for road construction.

The viewshed analysis is an important component of the overall monitoring program as it provides direction for monitoring locations that best capture caribou movements through the Project area during the spring and fall migration periods. Consequently, the survey locations chosen based on the results of the viewshed analysis will be continually reviewed and updated with the Terrestrial Advisory Group. Additional tasks remaining prior to construction of the Whale Tail Pit and Haul Road include the following:

- Field crews are identifying ideal HOL survey locations and maximum line of sight distances during the summer of 2017, some of this information is incorporated in the table above and some will be compiled into this document at the end of the field season.
- Additional HOL survey location to be added on the west side of the Whale Tail Pit to capture areas not currently covered by survey locations as revealed in the viewshed analysis.
- Selected points along the road may fill in monitoring gaps in the viewshed, these sites have not yet been selected.
- Determine the amount of the landscape covered by height of land survey locations and roadside surveys within an area that buffers the height of land locations by 4 km and the road by 1.5 km to determine if there is sufficient monitoring coverage from the existing surveys.

Closure

We trust this meets your needs, if you have any questions or concerns, feel free to contact the undersigned.

Representative Figure from Baseline Characterization Report

Sources: Esri, HERE, DeLorme, Intermap, increment P Corp., GEBCO, USGS, FAO, NPS, NRCAN, GeoBase, IGN, Kadaster NL, Ordnance Survey, Esri Japan, METI, Esri China (Hong Kong), swisstopo, MapmyIndia, © OpenStreetMap contributors, and the GIS User Community

Significant Wildlife
(D&A; NEC, Franke et al, 2015-2017)

Occupied Raptor Nests
- Gyrfalcon Nest
- Rough-legged Hawk Nest
- Peregrine Falcon Nest
- Peregrine Falcon & Rough-legged Hawk Nest
- Gyrfalcon & Rough-legged Hawk Nest

High Suitability Waterbird Habitat
- Graminoid or Wet Graminoid Shorelines (Field confirmed 2017)

Map Base
- Esker or Esker Access Road
- Proposed Haul Road (AEM, Nov. 2015)
- Significant Wildlife Observations Figure Extent
- Mine Site
- Road
- Whale Tail Study Area
- LSA Boundary
- RSA Boundary

Notes:

1. Caribou trails, a significant wildlife feature, are displayed on Figure 7.12, Barren-Caribou Observations & Collaring Movements.
2. Franke et al occupied raptor nests & incidental wildlife observations are displayed to record the approximate location of VECs; these observations are not included in the abundance data due to insufficient associated metadata.

Significant Wildlife
(D&A; NEC, Franke et al, 2015-2017)

Predatory Mammals
- Arctic Fox Pups
- Arctic Fox Den
- Arctic Fox Sign
- Arctic Fox Observation
- Arctic Wolf Nursery
- Arctic Wolf Den
- Arctic Wolf Sign
- Arctic Wolf Observation
- Wolverine Sign
- Wolverine Observation
- Barren-ground Grizzly Bear Den
- Barren-ground Grizzly Bear Sign
- Barren-ground Grizzly Bear Observation

Ungulates
- Barren-ground Caribou Sign
- Barren-ground Caribou Observation
- Muskox Sign
- Muskox Observation

Raptors
- Bald Eagle Observation
- Gyrfalcon Observation
- Peregrine Falcon Observation
- Rough-legged Hawk Observation
- Short-eared Owl Observation

Observed Waterbirds

Species Code - (# in 2015, 2016, 2017)

AGPL - American Golden-Plover (2,1,4)
CACG - Cackling Goose (15,3,1)
CANG - Canada Goose (4,127,67)
COLO - Common Loon (3,8,0)
COME - Common Merganser (.0.0.2)
DUNL - Dunlin (1,2,1)
GLGU - Glaucous Gull (2,0,0)
GRWF - Greater White-fronted Goose (1,6,0)
HERG - Herring Gull (7,21,9)
LESA - Least Sandpiper (1,4,2)
LTDU - Long-tailed Duck (21,23,7)
PALO - Pacific Loon (0,1,0)
PESA - Pectoral Sandpiper (0,3,0)
PEEP - Sandpiper species (0,0,1)
RBME - Red-breasted Merganser (4,7,0)
RNPH - Red-necked Phalarope (0,0,2)
RTLO - Red-throated Loon (1,4,2)
SACR - Sandhill Crane (0,5,0)
SEPL - Semipalmated Plover (8,26,2)
SESA - Semipalmated Sandpiper (38,53,26)
SNGO - Snow Goose (1,0,0)
YBLO - Yellow-billed Loon (0,5,0)

Confirmed Nests

Species Code - (# in 2015, 2016, 2017)

AGPL - American Golden-Plover (0,0,1)
AMPI - American Pipit (2,4,0)
CACG - Cackling Goose (1,0,0)
CANG - Canada Goose (0,2,0)
DUNL - Dunlin (1,1,0)
HERG - Herring Gull (0,1,1)
HOLA - Horned Lark (0,1,0)
HORE - Hoary Redpoll (1,1,1)
LALO - Lapland Longspur (11,14,6)
LESA - Least Sandpiper (0,1,0)
LTDU - Long-tailed Duck (0,0,1)
REDP - Redpoll Species (0,2,0)
ROPT - Rock Ptarmigan (0,1,0)
RTLO - Red-throated Loon (0,1,0)
SAVS - Savannah Sparrow (2,4,0)
SEPL - Semipalmated Plover (2,3,1)
SESA - Semipalmated Sandpiper (8,10,2)

*** Notes:**

1. Shoreline Surveys were carried out on all waterbodies within the Whale Tail Pit Study Area & within 100 m of the alignments of the Proposed Haul Road, Esker Borrow Areas, & Esker Access Roads at the time of the Shoreline Survey (June 2016). The Proposed Haul Road alignment changed between the 2015 & 2016 surveys.
2. Only the Whale Tail Study area surveyed in 2017. Shoreline surveys were not conducted along the Haul Road in 2017.
3. Lakes 200-203 were added to the 2017 shoreline surveys due to proposed flooding.
4. For Upland bird obersvations by Shoreline Survey Transect see Appendix F: Shoreline Survey Results 2015, 2016, 2017
5. Refer to Appendix G: D&A to AEM Lake Names for the conversation between D&A Shoreline Survey Transects & AEM Lake Names

The information displayed on this map has been compiled from various sources. While every effort has been made to accurately depict the information, this map should not be relied on as being a precise indicator of locations, features, or roads, nor as a guide to navigation.

Observed Waterbirds

Species Code - (# in 2015, 2016, 2017)

AGPL - American Golden-Plover (2,1,4)
CACG - Cackling Goose (15,3,1)
CANG - Canada Goose (4,127,67)
COLO - Common Loon (3,8,0)
COME - Common Merganser (.0.0.2)
DUNL - Dunlin (1,2,1)
GLGU - Glaucous Gull (2,0,0)
GRWF - Greater White-fronted Goose (1,6,0)
HERG - Herring Gull (7,21,9)
LESA - Least Sandpiper (1,4,2)
LTDU - Long-tailed Duck (21,23,7)
PALO - Pacific Loon (0,1,0)
PESA - Pectoral Sandpiper (0,3,0)
PEEP - Sandpiper species (0,0,1)
RBME - Red-breasted Merganser (4,7,0)
RNPH - Red-necked Phalarope (0,0,2)
RTLO - Red-throated Loon (1,4,2)
SACR - Sandhill Crane (0,5,0)
SEPL - Semipalmated Plover (8,26,2)
SESA - Semipalmated Sandpiper (38,53,26)
SNGO - Snow Goose (1,0,0)
YBLO - Yellow-billed Loon (0,5,0)

Confirmed Nests

Species Code - (# in 2015, 2016, 2017)

AGPL - American Golden-Plover (0,0,1)
AMPI - American Pipit (2,4,0)
CACG - Cackling Goose (1,0,0)
CANG - Canada Goose (0,2,0)
DUNL - Dunlin (1,1,0)
HERG - Herring Gull (0,1,1)
HOLA - Horned Lark (0,1,0)
HORE - Hoary Redpoll (1,1,1)
LALO - Lapland Longspur (11,14,6)
LESA - Least Sandpiper (0,1,0)
LTDU - Long-tailed Duck (0,0,1)
REDP - Redpoll Species (0,2,0)
ROPT - Rock Ptarmigan (0,1,0)
RTLO - Red-throated Loon (0,1,0)
SAVS - Savannah Sparrow (2,4,0)
SEPL - Semipalmated Plover (2,3,1)
SESA - Semipalmated Sandpiper (8,10,2)

*** Notes:**

1. Shoreline Surveys were carried out on all waterbodies within the Whale Tail Pit Study Area & within 100 m of the alignments of the Proposed Haul Road, Esker Borrow Areas, & Esker Access Roads at the time of the Shoreline Survey (June 2016). The Proposed Haul Road alignment changed between the 2015 & 2016 surveys.
2. Only the Whale Tail Study area surveyed in 2017. Shoreline surveys were not conducted along the Haul Road in 2017.
3. Lakes 200-203 were added to the 2017 shoreline surveys due to proposed flooding.
4. For Upland bird obersvations by Shoreline Survey Transect see Appendix F: Shoreline Survey Results 2015, 2016, 2017
5. Refer to Appendix G: D&A to AEM Lake Names for the conversation between D&A Shoreline Survey Transects & AEM Lake Names

APPENDIX J

Predatory Mammal Den Management and Protection Plan

BACKGROUND AND PURPOSE

Predatory mammals represent a valued ecosystem component (VEC), which occur and are known to den in the vicinity of the Meadowbank and Whale Tail Project facilities. Sensory disturbances near to active dens such as blasting, vehicles and, most significantly, ground personnel, may negatively impact denning success by inducing stress responses in the adult mammals, which can result in den abandonment.

This plan is applicable to four species:

- Arctic wolf (*Canis lupus*) natal dens
- Grizzly bear (*Ursus arctos*) natal/overwintering dens
- Arctic fox (*Vulpes lagopus*) natal dens
- Wolverine (*Gulo gulo*) natal dens

The purpose of this plan is to provide a framework for identification, characterization, and monitoring of predatory mammal dens in order to protect any detected dens from disturbance throughout exploration and operation activities in the vicinity of all Meadowbank and Whale Tail Project facilities. The plan will include consultation with the Government of Nunavut (GN) with respect to obligations under the *Wildlife Act*, SNU 2003, c. 26.

MANAGEMENT AND PROTECTION PLAN PROTOCOL

Overview

All observation visits to any active predatory den site must be undertaken with utmost care to avoid disturbing the den. Observations will take place from the greatest possible distance that allows for accurate observation and will employ binoculars and spotting scopes.

Stage 1 – Detection

Detection of predatory mammal dens will be completed using a combination of targeted surveys prior to new construction and ongoing wildlife monitoring during operation.

OPTION A – DURING OPERATION	OPTION B – PRIOR TO CONSTRUCTION
During project facilities operation; Predatory mammal observations, including any indication of denning, will be recorded at any point during operation of project facilities. This detection will be supported by ongoing monitoring activities: road surveys and height-of-land surveys in conjunction with incidental observations by AEM personnel.	**Prior to construction of any new project facilities;** High-suitability denning habitat (i.e. eskers) within 1 km of the project footprint will be investigated for active predatory mammal dens.

If active predatory mammal dens are detected during Option A or Option B of Stage 1 (listed above) then proceed to Stage 2 of the protocol. If no active dens are detected then continue with Stage 1: Option A is ongoing and Option B is to be utilized as needed.

Stage 2 – Identification and Characterization

If an active predatory mammal den has been detected, Stage 2 of the protocol will be undertaken. In the table below, a list of the identification questions and examples of characterization answers are provided. This process will involve the completion of the following questions as well as dates, timing, identification information about the observer(s), and any additional comments. A blank version of this table, which can be used as a field data collection sheet, is provided at the end of this Appendix.

	Identification Questions to be Answered	**Characterization Answer Examples**
1	Unique ID?	e.g Wolf Den 01
2	What predatory mammal species is occupying the active den?	e.g. Arctic wolf; Grizzly bear; Arctic fox; Wolverine
3	Coordinates of the active den?	UTM Coordinates of den
4	Site description?	e.g. Arctic fox denning under trailer near Whale Tail helipad e.g. Arctic wolf den located approximately 800 meters from Whale Tail haul road on the south facing side of an ~8m tall esker.
5	Juveniles Observed?	e.g. Yes; 3 fox pups observed in the entering the den. e.g. No; wolf pups have not been observed directly. However, the behaviour of the adult wolves, the repeated observations of wolves at the site, the sandy ridge location of the site and the observations of wolf burrows at the site indicate that an active den with juveniles is highly probable.
6	Disturbance and impact considerations?	e.g. The wolf den occurs within 800 m of the Whale Tail haul road. As such vehicle noise, including helicopters, is frequently present within 1 km of the den site.
7	Adaptive management considerations?	e.g. Ground personnel access will be restricted within 1km of the den and, as much as possible, vehicles will not stop on the roadway at km 35. Helicopter routing will be advised and flybys of the esker at this location will be minimized.
8	Recommended monitoring program?	e.g. Weekly checks by the den monitoring survey team will be undertaken to monitor the progress of den development (i.e. age of pups), investigate for signs of adult stress responses and inform any additional adaptive management requirements. Checks will be undertaken from a height-of-land at (coordinates), approximately 300 m NW of the suspected den location.

Stage 3 – Monitoring

Monitoring visits will be undertaken at the frequency, distance and location recommended by the identification and characterization stage (Stage 2). In addition to the information in the table below, dates, timing, identification information about the observer(s), and any additional comments will be recorded. A blank version of this table is provided at the end of this appendix.

	Monitoring Questions to be Answered	Monitoring Characterization Answer Examples
1	Unique ID?	Wolf Den 01
2	Changes to disturbance and impact considerations?	e.g. frequency of helicopter flybys within 1 km have increased in conjunction with construction activities at the Whale Tail site.
3	Development stage of den?	e.g. Pups are now more active outside of the den.
4	Changes to site location?	e.g. Adult wolves still display territorial behaviours, but the specific den has likely been relocated ~200m to the NE.
5	Recommended changes to monitoring program?	e.g. Weekly monitoring is considered sufficient. e.g. Recommendation to reduce monitoring to bi-weekly visits: wolf den establishment appears stable, so reduction of personnel presence in the area is advisable
6	Recommended adaptive management considerations?	e.g. Continue restricting access to ground personnel within 1 km of the den. e.g. Develop new flight path instructions with helicopter teams. Avoid flybys over the den by at least 1 km.

Monitoring (Stage 3) continues at the rate recommended by Stage 2 assessment and all subsequent monitoring visits. Monitoring of an active den will be discontinued once the pups have left the den, the den has been relocated to a distance greater than 1 km from operating facilities, or the potential impacts to the den are considered negligible.

ADAPTIVE MANAGEMENT

Based on findings from Stage 3 monitoring, new adaptive management solutions may be required to prevent negative impacts to the active predatory mammal den. This may include the restriction of movements or activities by certain vehicles or work teams to minimize disturbances. It may also include alterations to monitoring activities to reduce disturbances or increase the amount of information available to inform management decisions. See Chart 3 in 2016 TEMP for adaptive management timing and work flow.

Data Sheet for Stage 2 – Identification and Characterization

Date: **Observer:**

	Identification Questions to be Answered	**Characterization Data**
1	Unique ID?	
2	What is the predatory mammal species is occupying the active den?
