EXECUTIVE SUMMARY

In July 2022, Agnico Eagle Mines Limited (Agnico Eagle) submitted to the Nunavut Impact Review Board the Final Environmental Impact Statement Addendum of the Meliadine Extension, which is currently under review. This document presents an updated version of the Water Management Plan, being submitted to the Nunavut Water Board (NWB) as part of the Water Licence Amendment of the Meliadine Extension.

Agnico Eagle is operating the Meliadine Mine, located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut.

Since its approval in 2015 by the Nunavut Impact Review Board (NIRB), and to extend the life of the mine, Agnico Eagle has continued to extend its knowledge and validation of the gold deposits around the Meliadine Mine by way of additional exploration. As a result, an improved project, collectively referred to as Meliadine Extension, is being proposed. Meliadine Extension will extend the life of the mine from 2032 to 2043 and will add underground mining activities at the already approved Wesmeg, Pump, F Zone, and Discovery deposits.

The water management objectives are to minimize potential impacts to the quantity and quality of surface water at the Meliadine Mine. Water management structures (surface ponds, water retention dikes, thermal berms, water diversion channels and culverts) are in place and will be constructed as needed to contain and manage the contact water from the areas affected by Meliadine Extension or mining activities. The major water management infrastructure includes contact water and saline contact water collection ponds (CPs and SPs), water retention dikes, thermal berms, channels, a Water Treatment Complex (WTC) housing the Effluent Water Treatment Plant (EWTP) and the Saline Effluent Treatment Plant (SETP); a Sewage Treatment Plant (STP), and a Saline Effluent Waterline.

During mine operations of Meliadine Extension, contact water originating from affected areas on surface will be intercepted, diverted, and collected within the various collection ponds and eventually pumped to and stored in Collection Pond 1 (CP1). From CP1, contact water is routed through the EWTP and discharged to the receiving environment. Discharge to Itivia Harbour is prioritized, with the remainder discharged to Meliadine Lake according to the approved Meliadine Mine Adaptive Management Plan (Agnico Eagle 2022). At the Discovery site, contact and saline contact water will be managed in the Discovery Saline Pond (SPD1) and routed to SP6 for discharge to Itivia Harbour.

Saline contact water originating from the underground mines will be pumped to different SPs on the surface, and then routed to either Tiriganiaq Pit 02 (TIR02) prior to 2025 and to Saline Pond 6 (SP6) from 2025 onwards. All saline contact water will be eventually conveyed from TIR02 or SP6 to the SETP-WTC prior to discharge to Itivia Harbour via the waterline.

The last year of mining in the Meliadine Extension will occur in 2043. The Closure phase commences in 2044. The pits will be filled with all collected site contact water routed from CP1, gravity drainage from the catchments surrounding the pits, and supplementary flows pumped from Meliadine Lake. Pit flooding will proceed over 7-years (2044-2050). All of the operational phase water management infrastructure remains in place for this period, however, no discharges to Meliadine Lake or Itivia Harbour are planned during active closure.

All remaining saline contact water is pumped from SP6 to the underground void spaces from October 2043 onwards. SP6 is actively refilled by pumping water from Meliadine Lake during the open water season of 2044. Pit flooding will be completed by end of 2050.

During Meliadine Extension closure, the water management infrastructure on site will remain in place until monitoring demonstrates that the water quality is acceptable for environmental discharge without treatment. The post-closure phase begins in 2051. All water management infrastructure (i.e., channels, dikes, thermal berms, ponds) will be decommissioned and pre-existing drainage patterns restored to the extent practical once contact water meets the relevant water quality criteria.

The long-term, post-closure water quality in the collection ponds and in the flooded open pit lakes will meet closure objectives developed for Meliadine Extension as presented in the Site Wide Water Balance and Water Quality Model (Appendix E).

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) is operating the Meliadine Gold Mine (the Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut Figure 1.

Since its approval in 2015 by the Nunavut Impact Review Board (NIRB), and to extend the life of the mine, Agnico Eagle has continued to extend its knowledge and validation of the gold deposits around the Meliadine Mine by way of additional exploration. As a result, an improved project, collectively referred to as Meliadine Extension, is being proposed (Figure 2 and

Figure 3). Meliadine Extension will extend the life of the mine from 2032 to 2043 and will add underground mining activities at the already approved Wesmeg, Pump, F Zone, and Discovery deposits. The Meliadine Mine is subject to the terms and conditions of both the amendments to Project Certificate No.006 issued by the Nunavut Impact Review Board (NIRB 2019, 2022) and Amended Water Licence No. 2AM-MEL1631 (the Licence), issued by the Nunavut Water Board (NWB) on May 13, 2021 (NWB 2021).

In July 2022, Agnico Eagle submitted to the NIRB the Final Environmental Impact Statement (FEIS) Addendum of the Meliadine Extension, which is currently under review. This document presents an updated version of the Water Management Plan (WMP), being submitted to the NWB as part of the Water Licence Amendment of the Meliadine Extension.

1.1 Water Management Objectives

The water management objectives are to minimize potential impacts to the quantity and quality of surface water at the Meliadine Mine and surrounding waterbodies. The purpose of the WMP is to provide information to applicable mine departments (Environment, Engineering, Mine, Energy and Infrastructure, etc.) for sound water management practices, proposed and existing infrastructure, the water balance model, water quality predictions, and for the water quality monitoring plan for the Meliadine Extension.

Water management structures (culverts, sumps, pipelines, water diversion channels and water retention dikes/thermal berms) are utilized to contain and manage contact water from areas affected by mining activities.

1.2 Management and Execution of the Water Management Plan

Revisions of the WMP can be initiated by changes in the Mine Development Plan (Mine Plan), operational performance, personnel or organizational structure, regulatory or social considerations, and/ or design philosophy. The WMP is reviewed annually by Agnico Eagle and updated as necessary as part of the Annual Report.

1.3 Background

The Meliadine Extension site conditions, local hydrology, hydrogeology, and mine development plan are presented in the Environmental Management Protection Plan.

1.4 Water Management Guiding Principles

The Meliadine Extension water management plan is based upon two guiding principles; diverting clean (non-contact) water away from mine infrastructure where possible, and separating surface contact water and saline surface water, as described below:

- **Surface Contact Water**: Surface contact water originating from developed areas will be intercepted and conveyed to the various collection ponds for temporary storage. The primary mine sources of contact water are the WRSFs, open pits dewatering, a portion of the TSF, laydown areas and facilities areas. All contact water is eventually conveyed from local CPs to Collection Pond 8 (CP8) and then to CP1. From CP1, contact water is routed through the Effluent Water Treatment Plant (EWTP) as necessary and discharged to the receiving environment. Discharge to Itivia Harbour is prioritized, with the remainder discharged to Meliadine Lake. At the Discovery site, contact and saline contact water will be combined managed in the Discovery saline pond (SPD1) and routed to SP6 for discharge to Itivia Harbour. At the Tiriganiaq-Wolf site, contact and saline contact water will be combined and managed in the Wolf saline pond (SP5) and routed to SP6 for eventual discharge to Itivia Harbour.
- **Saline Contact Water**: Saline contact water originating from the underground mines will be pumped to SPs on the surface, and then routed to either TIR02 (prior to 2025) or (SP6 from 2025 onwards). In addition to underground dewatering flows, saline contact water (which has higher salinity content) is generated by the ore pads, saline WRSFs, and a portion of the TSF. All saline contact water will be eventually conveyed from TIR02 or SP6 to the SETP-WTC (where feasible), where it will be treated for total suspended solids (TSS) and ammonia (NH_3) prior to discharge to the receiving environment (Itivia Harbour).

The guiding principles of water management for Meliadine Extension are discussed in more detail in the Meliadine Mine Adaptive Management Plan, as follows:

1. Water discharges to Meliadine Lake will be minimized or eliminated (per commitment made during the waterline amendment application and reflected in Project Certificate No.006 Amendment 002 Term and Condition 25a).
2. Water will be discharged to Meliadine Lake only if there is insufficient residual capacity in the waterline system and stored surface contact water volumes are outside of normal operating levels set in place in consideration of D-CP1 design or that are judged to be detrimental to the performance or safety of the dike.
3. Agnico Eagle will proactively assess the feasibility of all potential adaptive management actions.
4. Design criteria of infrastructure will be respected at all times.

5. Operate treatment plants at stable rates to reduce risk of process upset.
6. Discharge rates throughout the year will be modulated based on the water balance.

The Adaptive Management Plan also presents specific management actions and mitigation measures to be taken when specified thresholds are exceeded. Mitigation measures may include special studies, operational changes, revised or new water and waste management systems, new or expanded conveyance systems, structures and/or facilities, or implementing mitigation activities to prevent, stabilize or reverse a change in environmental conditions or to otherwise protect the receiving environment.

There are no anticipated changes to the guiding principles and normal operating conditions as a result of Meliadine Extension.

Figure 4 summarizes the overall water management plan of Meliadine Extension for key infrastructure and presents the initial water collection locations and final water destinations. Appendix A presents the Groundwater Management Plan. Appendix B presents the Freshet Action Plan, which includes the Freshet Action Procedure and the Snow Management Procedure for Meliadine Extension. Appendix C presents the Sediment and Erosion Management Plan. Appendix D presents the Water Quality and Flow Monitoring Plan, and Appendix E the Water Balance and Water Quality Forecast for Meliadine Extension.

1.5 Meliadine Extension Phases

The operational phase for the Meliadine Extension is expected to commence in 2024 upon reception of permits and approvals. The mine development sequence and life of mine summary for all deposits are presented in Table 1. The approved Meliadine Mine was scheduled to be completed in 2032. With the Meliadine Extension, it is proposed to extend the LOM (i.e., operation phase) until 2043. Agnico Eagle will continue exploration activities with the objective to extend mine life beyond 2043.

Closure will extend for 7 years as pits are being flooded, from 2044 to 2050. The flooding of open pits with water would extend until the end of the closure phase. During closure, all saline contact water will be pumped to the underground and surface contact water, as well as local runoff and precipitation will be stored in the pits to enhance reflooding activities. Active reflooding will be conducted with water to be pumped from Meliadine Lake. There will be no discharge into Meliadine Lake or to Itivia Harbour during the active closure phase.

Post-closure will be initiated when flooded pits are reconnected to the surrounding environment and will last approximately 10 years, from 2051 to 2060.

SECTION 2 • WATER MANAGEMENT OVERVIEW

The water management structures of Meliadine Mine consist of a network of berms, dikes, CPs, SPs channels, culverts and sumps with approved designs and that are maintained to facilitate water management of the ongoing approved mining operations.

The proposed water management structures of Meliadine Extension discussed in this section have been designed to a level appropriate for inclusion in the FEIS Addendum to be submitted to the NIRB. The conceptual water management controls and structures described herein, will be reviewed, and updated as part of the NWB Type-A Water Licence regulatory process.

2.1 Surface Contact Water Management

This section presents the CPs of Meliadine Extension. It is assumed that the CPs of the approved Meliadine Mine and Water Licence Amendment (i.e., CP1, CP2, CP5, and CP6) will remain in place with exception of CP3 and CP4, which will be overprinted by the footprint of the TSF and WRSF 1, respectively. CP2 is operational since 2022. For Meliadine Extension it is assumed that surface contact water stored in CP3, CP4 and CP5 is routed to SP6 for discharge to Itivia Harbour. More details about surface water management of the approved Meliadine Mine can be found in the Meliadine Mine Annual Report, and corresponding approved Water Management Plan.

The following section focuses on surface contact water management for Meliadine Extension.

2.1.1 CP1

The CP1 is the primary surface contact water CP, with all excess water routed to the EWTP prior to discharge to Itivia Harbour or Meliadine Lake. Inflows to CP1 average 482,000 m^3/year, rising to an average of 2.5 Mm^3/year once the mine footprint expands in 2026. The maximum pond design volume is 855,245 m^3 and 742,075 m3 for the Maximum Operating Water Level (MOWL) of 66.2 m. During the Active Closure phase, the mine site is managed as a zero-discharge facility, with all CP1 inflows routed to the open pits. Beginning in the Post-Closure phase, volumes in the CP1 pond are allowed to fluctuate naturally, with outflows reporting via pre-mine drainage pathways to Meliadine Lake.

2.1.2 CP8

Once Lake B4 is dewatered in 2025, it will become CP8, an additional surface water CP for the remainder of the operations phase of Meliadine Extension. The maximum predicted pond volume of CP8 is 2,366,729m^3. Contact water will be routed from CP8 to CP1 for treatment via the EWTP, and subsequent discharge to Itivia Harbour and Meliadine Lake. Inflows to CP8 average 680,000 m^3/year, rising to an average of 2.1 Mm^3/year once pumping to CP8 commences in 2026. CP8 will have year-round operation, brought to minimum operating water level at the end of each fall. The water stored in CP8 will be transferred to CP1 from where water will be routed through either the Effluent Water Treatment Plant (EWTP) or the Saline Effluent Treatment Plant (SETP-WTC) as necessary and

discharged to the receiving environment. Discharge to Itivia Harbour via the waterline is prioritized, with the remainder discharged to Meliadine Lake, per the Adaptive Management Plan. CP8 will continue to serve as a surface contact water CP throughout the active closure phase (2044-2050); for post-closure, once water quality meets objectives, it will be reconnected to the environment.

2.1.3 Runoff Storage Areas

Natural and non-contact runoff storage areas (i.e., A6, B5 North B5 South and A8 West) will be located within dewatered lakes. These areas will operate by temporarily storing the spring freshet water in June. The runoff storage areas will be periodically pumped to manage the collected summer runoff water after the freshet. They will be brought to "dry" condition by the end of each fall to provide the storage capacity for the next freshet.

Table 2 presents key Information and design parameters for the main CPs and runoff storage areas for Meliadine Extension.

Table 2: Key Information and Design Parameters for CP8, A6, B5North, B5South and A8 West

Pond	CP8	A6	B5North	B5South	A8West
Original Lake Elevation (m)	56.55	59.59	58.25	58.25	62.16
Pond Volume for Water Elevation at Original Lake Elevation (m^3)	743,716	780,951	380,537	82,053	1,188,000
Projected Maximum Pond Operating Water Elevation under Normal Operating Conditions and Mean Precipitation Years (m)	58.17	59.5	57.96	57.30	60.45
Pond Volume for Water Elevation at Projected Maximum Pond Operating Water Elevation under Normal Operating Conditions and Mean Precipitation Years (m^3)	2,366,729	737,359	307,350	30,000	226,679
Estimated Maximum Water Elevation during IDF (m)	58.60	60.19	58.39	58.72	60.84
Pond Volume for Water Elevation at Estimated Maximum Water Elevation during IDF (m^3)	2,843,673	1,120,458	417,732	134,598	382,235

2.1.4 Local Contact Water CPs and Sumps

Local smaller collection ponds (i.e., CP7, CP9, CPD1, and CPD2) will be used for temporary water storage during freshet and after a summer precipitation event. In general, contact water from local smaller collection ponds will be pumped to the larger collection ponds.

Table 3 presents key information and design parameters for local CPs and Table 4 presents the maximum storage capacities of local CPs, sumps for Meliadine Extension.

Table 3: Key Information and Design Parameters for CP7, CPD1 and CPD2

Pond	CP7	CPD1	CPD2
Excavated Pond Bottom Elevation (m)	40.0	61.0	59.0
Excavated Pond Outlet Elevation (m)	58.0	71.0	66.7
Pond Volume for Water Elevation at Pond Outlet Elevation (m^3)	217,000	52,600	35,400
Pond Volume for Water Elevation at Projected Maximum Pond Operating Water Elevation under Normal Operating Conditions and Mean Precipitation Years (m^3)	130,000	30,800	18,400
Pond Volume for Water Elevation at Estimated Maximum Water Elevation during IDF (m^3)	156,000	36,300	22,900
Thermal Protection Berm for Pond	Berm-CP7	N/A	Berm-CPD2
Average Excavation Depth (m)	13.0	11.0	9.5

Table 4: Local CPs and Sumps Maximum Design Capacity

CP/Sump	Function	Maximum Storage Capacity at MOWL (m^3)	Notes
CP9	Collect contact water from WRSF5 and WRSF6.	100,000	To store three days 1 in 100 wet year freshet runoff with assumed pumping rate during freshet.
CP7	Collect contact water from WRSF7 and pit water.	140,000	
CPD1	Collect natural runoff water and contact water from WRSF9 at Discovery and pit water.	33,000	
CPD2	Collect natural runoff water and contact water from WRSF10 at Discovery.	22,000	
Sump P1	Collect contact water from WRSF6.	7,000	To store three days 1 in 100 wet year freshet runoff with assumed pumping rate during freshet.
Sump P2	Collect contact water from WRSF6.	7,000	
Sump P5	Collect contact water from WRSF6 diverted by Channel 13.	44,000	To store three days 1 in 100 wet year freshet runoff with assumed pumping rate during freshet.

2.2 Groundwater and Saline Contact Water Management

The approved Meliadine Mine consist of the development of the Tiriganiaq gold deposit, with two open pits (TIR01 and TIR02) and one underground mine. Meliadine Extension proposes to include underground mining and associated saline contact water management infrastructures at the Pump, F Zone, and Discovery deposits, development of a new portal and associated infrastructures in the Tiriganiaq-Wolf mining area.

The underground mines will be operated below the base of continuous permafrost. The underground excavations act as a sink for groundwater flow during mining, with water induced to flow through the bedrock to the Underground Mine workings below the base of the permafrost.

The underground water management system is designed to prevent water from affecting the workings or production. The system contains a series of sumps (generally one at the access of each level) designed to capture groundwater inflows and runoff from mining operations (i.e., drilling), a clarification system, and a pumping system to redistribute the clarified saline contact water. More details about ground water management of the approved Meliadine Mine can be found in the Meliadine Mine 2021 Annual Report, and corresponding approved GWMP.

The following section focuses on groundwater management and saline contact water for Meliadine Extension.

Consistent with the Approved Meliadine Mine Water Management Plan, groundwater from the Meliadine Extension underground mines will be collected in underground sumps, transported to a clarification system, and subsequently recirculated for use in various underground operations. Temporarily inactive underground developments (similar to the water stope) are used for additional storage of excess underground water as required and as feasible. Further details on the underground water management system are provided in Appendix A.

Saline contact water will be managed in various saline ponds on the surface and then routed to either TIR02 open pit (prior to 2025) or SP6 (2025 onwards). The primary sources of mine related saline contact water include underground mine dewatering, ore pads, saline WRSFs, and a portion of the TSF.

From 2025 onwards, SP6 will be used as the main saline water collection pond from where the water will be transferred to the SETP-WTC and treated for total suspended solids and ammonia prior to discharge to Itivia Harbour. Several local saline ponds such as at Discovery (SPD1), Tiriganiaq-Wolf (SP5), Sumps P3 and P4 at Pump, and Sump F2 at F Zone will be used to temporarily store saline contact water before it is transferred to TIR02 open pit or SP6 depending on the operation year.

2.2.1 TIR02 Open Pit

In Q3 2021, mining in TIR02 open pit (TIR02) was stopped and the pit was subsequently converted to a saline contact water storage facility. TIR02 has a total saline contact water capacity of 1,616,554 m^3 and is currently used to store surface runoff to the pit and the saline contact water contained in both SP4 and SP1 in addition to on-going groundwater infiltration to the underground mine (Figure 5). Dewatering of both SP4 and SP1 to TIR02 took place in Q3 and Q4 2021. Starting in Q3 2021, groundwater from the underground mine is pumped to TIR02. For Meliadine Extension TIR02 will continue to serve as the primary SP until 2025 when SP6 becomes operational.

2.2.2 SP6

Once Lake B7 is dewatered during freshet of 2025, it will become SP6, the main SP of Meliadine Extension. Under Normal Operating Conditions and Mean Precipitation, SP6 has a total saline contact water capacity of 1,092,748 m3 at projected Maximum Operating Water Elevation (MOWL). SP6 volume for Water Elevation at Estimated Maximum Water Elevation during IDF is 1,366,764 m^3 (Tetra Tech 2023a).

The saline contact water stored in TIR02 pit will be transferred to SP6 to allow mining of TIR02 pit to resume during the winter of 2025/26. For Meliadine Extension it is assumed that surface contact water stored in CP3, CP4 and CP5 is routed to SP6. All saline contact water collected in SP6 will be routed to the SETP-WTC where it will be treated for total suspended solids (TSS) and ammonia (NH_3) prior to discharge to Itivia Harbour.

Treated effluent from the SETP-WTC is discharged into SP3. From SP3, the saline contact water is pumped into trucks which transport the water to Itivia Harbour, Rankin Inlet. For the Meliadine Extension it is assumed that trucking is stopped and saline water is stored in TIR02 open pit until the approved waterline becomes operational in June 2025.

It is assumed that, from June 2025 onwards, the waterline will be used to deliver effluent to Itivia Harbour via a diffuser. The effluent treatment and discharge rates via the waterline are as follows:

- 2020 – 2021 (July 15 – Sept 30) – discharge by truck to Itivia Harbour diffuser at a rate of up to 1,600 m^3/day
- 2022 – 2024 - no discharge by truck to Itivia Harbour. Saline water stored in TIR02 open pit.
- From 2025 – onwards (approx. June 20 to September 29) – discharge Itivia Harbour via the waterline at a rate of up to 20,000 m^3/day.

Further details pertaining the short, medium, and long-term groundwater management strategies are presented in the GWMP, Appendix A.

2.2.3 Local Saline Contact Water SPs and Sumps

From 2025 onwards, saline contact water originating from the underground mines will be managed in local SPs and sumps to temporarily store water from underground mining. Excess saline contact water from Discovery and Tiriganiaq-Wolf underground mining will be pumped to surface and collected into SPD1 and SP5. The runoff from the ore pads and saline WRSFs at from Discovery and Tiriganiaq-Wolf will also be collected into SPD1 and SP5, respectively. Water from SPD1 and SP5 will then be transferred to SP6.

As shown in Figure 4, saline contact water generated by the Saline WRSF 1, will be collected in sumps P3, sump P4, and saline contact water generated by Saline WRSF 2 will be collected by sump F2. Saline contact water from sumps P3, sump P4 and Sump F2 will be eventually conveyed to SP6. Table 5 and Table 6 present key information and design parameters for SP6 and SPD1 and SP5, respectively. Table 7 presents the storage capacities of saline water sumps for Meliadine Extension.

Table 5: Key Information and Design Parameters for SP6

Pond	SP6
Original Lake Elevation (m)	62.72
Pond Volume for Water Elevation at Original Lake Elevation (m^3)	843,558
Projected Maximum Pond Operating Water Elevation under Normal Operating Conditions and Mean Precipitation Years (m)	63.1

2.3 Water Management Infrastructure

Additional to the CP, SPs, and sumps described in Sections 2.1 and 2.2, water management infrastructure from the approved Meliadine Mine (2014 FEIS, and 2018 FEIS Saline Effluent to Marine Environment, and 2020 FEIS Saline Effluent to Marine Environment by the Waterline) will continue to be used in addition to the Meliadine Extension water management infrastructures presented herein.

The required water management infrastructure (i.e., dikes, berms, sumps, diversion channels, pumps/pipelines etc.) for the Meliadine Extension were assessed and sized based on the overall site water and waste management plans and the results of the water balance and water quality modelling (Appendix E). The required water management infrastructure for the Meliadine Extension include the following:

- Eleven water retention dikes including Dikes D-SP6North, D-SP6West, D-B5North, D-B5South, D-CP8North, DCP8West, D-CP8South, D-CP8East, D-A8North, D-A8South, and D-A6;
- Eight water collection ponds including contact water ponds CP7, CP8, CP9, CPD1, CPD2, and saline ponds SP5, SP6, and SPD1;
- Twelve water diversion channels including Channels 11 to Channel 22;
- Seven sumps including Sump P1, Sump P2, Sump P3, Sump P4, Sump P5, Sump F1, and Sump F2;
- Two water diversion berms including Berm-D1 and Berm-D2;
- Five thermal protection berms including Berm-P5, Berm-CP7, Berm-F2, Berm-CPD2, and Berm-SP5;
- Various pump and pipelines; and
- Culverts as required.

2.4 Dikes, Thermal Berms and Water Diversion Channels

2.4.1 Water Retention Dikes and Thermal Berms

Consistent with the approved design, the dikes and thermal berms of Meliadine Extension were designed in accordance with the recommendations provided in the CDA Dam Safety Guidelines (CDA 2013 and 2014) and with the following guiding principles and objectives:

- In accordance with Canadian Dam Safety Guidelines (CDA 2007/2013) and Application of Dam Safety Guidelines to Mining Dams (CDA 2014/2019).
- In accordance with Global Industry Standard on Tailings Management (2021), if applicable;
- In accordance with Agnico Eagle's Corporate Standard – Risk Management and Monitoring System – Water Management (2021);
- Meet requirements in the Meliadine Mine Water Licence 2AM-MEL1631
- Minimize seepage through dike and its foundation while optimizing the construction efficiency;
- Maximize the use of available construction materials produced at the site;
- Minimize overall environmental footprints and effects; and
- Consider site specific geotechnical and climatic conditions, and water storage pond operation requirements.

2.4.2 Diversion Channels

Consistent with the approved design, Meliadine Extension diversion channels were designed to divert the natural run-off and contact water towards collection ponds and sumps that will be subsequently pumped to the main CPs and SPs. The diversion channels were designed to pass extreme intensity flow and rain events.

Table 8 presents a summary of the proposed water management infrastructures for Meliadine Extension and Table 9 presents their proposed construction schedule.

Table 8. Proposed Meliadine Extension Water Management Infrastructure

Water Management Infrastructure Type	Nomenclature	Location and Operational Function
Dike	Dike D-SP6North	Located north of SP6. D-SP6North will be used to contain saline water from the TSF and prevent the saline water from flowing to the downstream receiving environment.
	Dike D-SP6West	Located in the narrow between SP6 and Lake B6. D-SP6West will be used to contain saline water from the TSF and prevent the saline water from flowing into downstream dewatered Lake B6.
	Dike D-B5North	Located north of WN01 open pit within dewatered Lake B5. D-B5North will be used to divert runoff from flowing into WN01 pit.
	Dike D-B5South	Located south of WN01 open pit within dewatered Lake B5. D-B5South will be used to collect runoff from B5 south catchment and portion of runoff from WRSF5.
	Dike D-CP8North	Located in the narrow between CP8 and Lake B5. D-CP8North will be used to contain contact water stored within CP8 and prevent the contact from flowing to the dewatered Lake B5.
	Dike D-CP8South	Located within the narrow of CP8 and B45. D-CP8South will be used to contain contact water stored within CP8 and prevent the contact from flowing to the downstream receiving environment.
	Dike D-CP8West	Located in the narrow between CP8 and B3. D-CP8West will be used to contain contact water stored within CP8 and prevent the contact from flowing to the downstream receiving environment.
	Dike D-CP8East	Located west of PUM01 open pit. D-CP8East will be used to contain contact water stored within CP8 and prevent the contact from flowing into PUM01 open pit.
	Dike D-A8North	Located south of WES03 open pit. D-A8South will be used to divert runoff from flowing into WES03 open pit.
	Dike D-A8South	Located north of PUM02 and PUM04 open pits. D-A8South will be used to divert runoff from flowing into PUM02 and PUM04 open pits.
	Dike D-A6	Located southwest of FZO01 open pit. D-A6 will be used to divert contact water from Lake A6 from flowing into FZO01 open pit.
Berm	Berm-D1	Located west of Saline WRSF3 and industrial pad. Berm-D1 will be used to divert contact water from Saline WRSF3, industrial pad, and saline water from Saline WRSF3 and prevent the contact from flowing to the downstream receiving environment.
	Berm-D2	Located downstream of WRFS8 to divert the runoff water from WRSF8 to CPD1 during operation.
Thermal Berm	Berm-P5	Located in the narrow between Sump P5 and Lake B46. Berm-P5 will be used as thermal protection berm for Sump P5.
	Berm-CP7	Berm-CP7 will be used as a thermal protection berm for CP7 to reduce seepage to F Zone open pits from CP7.
	Berm-F2	Located between Lake A6 and Sump F2. Berm-F2 will be used as thermal protection berm for Sump F2.
	Berm-CPD2	Located north of CPD2. Berm-CPD2 will serve as a thermal protection berm to control the seepage flow from CPD2 to downstream (CH6).
	Berm-SP5	Berm-SP5 will serve as a thermal protection berm to control the seepage flow from SP5 to Lake D4.
Channel	Channels 11, 12 and 13	Channels 11 and 12 to divert contact water from WRSF6 towards Sumps P1 and P2. Channel 13 to divert contact water from WRSF6 towards Sump P5.

Water Management Infrastructure Type	Nomenclature	Location and Operational Function
	Channels 14,15, and 16	Channel 14 and Channel 15 to divert contact water from WRSF7 towards Sump F1. Channel 16 to divert contact water from F Zone Ore Pad and Saline WRSF2 towards Sump F2.
	Channels 17,18	Channels 17 and 18 to divert contact water from Saline WRSF3, ore pad, industrial pad, and fuel pad towards the downstream SPD1.
	Channels 19, 20, and 21	Channels 19 is to divert contact water from WRSF8 towards CPD1. Channels 19 and 20 to divert contact water from WRSF9 towards CPD2.
	Channel 22	Located east side of WRSF5 to divert the runoff water from east slope of WRSF5 to CP9 or PUM01 open pit and prevent the runoff water from flowing to the dewatered Lake A8 area.
Sump	Sumps P3 and P4	Sumps P3 and P4 to collect saline contact water from Saline WRSF2 at Pump.
	Sump P1, Sump P2, and Sump P5	Sumps P1 and P2 to collect contact water from WRSF6 that has been diverted by Channels 11 to 12. Sump P5 will be used to contain contact water from the Pump Ore Pad and WRSF6 and prevent the contact from flowing to the downstream receiving environment.
	Sump F1	Sump F1 to collect contact water from WRSF7 that has been diverted by Channel 14 and Channel 15.
	Sump F2	Sump F2 to collect saline water from F Zone Ore Pad and Saline WRSF2 that has been diverted by Channel 16 and saline water from F Zone Underground mining.
Culverts	To be determined	For water conveyance through haul roads and access roads.

Other water management systems of Meliadine Extension include the following components:

- A water treatment complex (WTC) building – hosting the EWTP and SETP-WTC
- A sewage treatment plant (STP)
- A potable water treatment plant (WTP)
- A network of surface pumps and pipelines

- A freshwater intake
- Jetties and pumping infrastructure at selected collection ponds
- An effluent diffuser located in Meliadine Lake
- A waterline to convey saline contact water to Itivia Harbour
- An effluent diffuser located in Itivia Harbour

Meliadine Extension water management infrastructures have been included FEIS Addendum submitted to the NIRB have been updated as part of the NWB Type-A Water Licence amendment application process.

2.5 Water Management for Haul Road

A network of roads will provide access to infrastructure at Meliadine Extension. Most of the roadways servicing the mining area are located so that drainage is directed by berms, channels and culverts towards designated collection ponds or sumps. Detailed information about water management on roads is described in the Roads Management Plan updated in support of the Meliadine Extension application.

2.6 Water Management for Landfarm and Landfill

Any water that accumulates at the onsite landfarm is pumped through an oil-water separator prior to discharge into CP1. Additional details for landfarm water management are described in the Landfarm Management Plan updated in support of the Meliadine Extension application. Leachate from the landfill is anticipated to be non-hazardous and non-toxic due to the controls put in place on the materials accepted for deposition in the landfill.

Annual landfill operations involve clearing of snow prior to spring melt. In the event there is leachate from the Landfill due to periods of heavy rainfall or spring freshet, the runoff will be collected, controlled and treated, if necessary, and sent to CP1. Additional details for landfill water management are described in the Landfill and Waste Management Plan updated in support of the Meliadine Extension application.

2.7 Water Management for Emulsion Plant Area

Freshwater is trucked to the emulsion plant and used for manufacturing emulsion as well as for washing vehicles. Water within the emulsion plant is re-used when feasible, and excess water is collected and disposed of on site (i.e., STP) or stored and shipped south as hazmat.

2.7.1 Water Management for the Wash Bay

Water used in the Wash Bay is re-used when feasible and excess water is treated with an oil-water separator to reduce or remove hydrocarbons. Treated water is moved to CP1 or the surface saline ponds, depending on *in situ* specific conductivity applied to approximate TDS concentration. Solid

waste from the treatment process is removed and disposed of appropriately (landfarm, hazmat, or waste rock facilities).

2.8 Freshwater and Sewage Management

Additional freshwater usage and sewage management is described in the following sections.

2.8.1 Freshwater Management

Major freshwater usages on site include potable use, fire suppression, make-up water for the mill, and other operational needs, such as drilling and paste production for backfill. Freshwater is sourced from Meliadine Lake through a freshwater intake and pump system. For dust suppression, water is sourced from the freshwater intake system, ponded water located along the AWAR, or small ponds proximal to the road. Surface contact water from CP1 is applied as dust suppression within the site surface contact water system catchment. Freshwater is pumped through an overland pipeline to potable water storage tanks and a fire water suppression tank. The maximum design flow rate for the potable water for the main camp and accommodations (kitchen, laundry) is 226 m^3 per day. There is an onsite Potable Water Treatment System. Treated potable water is piped to areas in the service complex and other facilities requiring potable water. Due to increased tonnage and increased camp capacity more freshwater consumption than originally planned is required. Agnico Eagle is requesting an increase to a total of 1,116,112 m^3/year for operations of freshwater consumption.

Approximately 17 Mm^3/year over a period of 10 years of freshwater was assessed under the 2014 FEIS (Section 7.3.3.10, 2014 FEIS), to fill the mined-out open pits during the mine closure. These quantities were inclusive of water needs for dust suppression. For Meliadine Extension, the updated model indicates that 55.2 Mm^3 of water from Meliadine Lake is required to fill the pits during the mine closure, with a lower pumping rate over the 7-year period.

2.8.2 Sewage Management

Sewage collected from the camp and MSB facilities is pumped to the STP. The objective of the STP is to treat sewage to an acceptable level for discharge. Treated Effluent from the STP is primarily pumped to SP6, however, per adaptive management plan, treated effluent from the STP could also be pumped to CP1. The STP is housed in a prefabricated (modular) structure, located at south-east of the service complex at the Industrial Pad. For Meliadine Extension, the system is designed to treat a maximum daily flow of 299 m^3/day. The STP for the camp facilities is designed to meet appropriate guidelines for wastewater discharge (Agnico Eagle 2020b). Details regarding STP specifications and operation can be found in the Operation & Maintenance Manual Sewage Treatment Plant (Agnico Eagle 2021a).

2.8.3 Process Water Management

Process water is required in the mill for ore processing and is primarily sourced from Meliadine Lake through the freshwater intake system. Freshwater required for milling is not expected to exceed the freshwater consumption assessed in the 2014 FEIS when combined with other sources of

consumption. As per the Licence, reclaim of surface contact water for use at the Mill is maximized to the greatest practical extent.

2.9 Meliadine Lake Diffuser Effluent Flow Rates

The EWTP is currently configured to discharge effluent to Meliadine Lake via a diffuser at a rate of 22,000 m^3/day. The pump does not operate continuously at the maximum rate. The anticipated amount of effluent requiring discharge over each month per year is presented in the Water Balance and Water Quality Model (Appendix E).

2.10 Freshwater Intake

Freshwater usage at the Meliadine Mine includes potable uses, fire suppression, make-up water for the mill, and other operational requirements, such as drilling water, dust suppression, paste backfill production, and use at the washbay. The main freshwater intake is located northeast of the industrial pad in Meliadine Lake. The intakes consist of vertical filtration wells fitted with vertical turbine pumps that supply water on demand. Both intake pipes are fitted with a screen of an appropriate mesh size to ensure that fish will not be entrained and shall withdraw water at a rate such that fish do not become impinged on the screen (NWB 2016). No update to the freshwater intake is required for the Meliadine Extension.

2.11 Water Treatment

Contact water will be treated (if necessary) to meet Licence requirements prior to being discharged to the environment. TSS mitigation techniques (i.e., attenuation ponds, silt screens, etc.), oil separation treatment, the STP, the SETP-WTC, and the EWTP are used accordingly at various locations at Meliadine Extension prior to water being transferred to containment ponds and/or as effluent discharge to Meliadine Lake or Itivia Harbour. Water quality criteria are discussed in the Water Quality and Flow Monitoring Management Plan (Appendix D).

No changes in water treatment processes or parameters are proposed for Meliadine Extension.

2.11.1 Freshwater Treatment Plant (WTP)

Freshwater from Meliadine Lake is treated in the WTP before being directed to the camp areas for potable (domestic) water uses. The design flow rate for freshwater for the main camp and accommodations is 226 m^3/day. In the WTP, freshwater is pumped through cartridge filters, then pumped through ultraviolet units, and finally treated with sodium hypochlorite (chlorine). The treated water is stored within a potable water tank. Potable water is monitored according to the Nunavut Health Regulations for total and residual chlorine and microbiological parameters. Operation and maintenance details for the WTP can be reviewed in the Operational & Maintenance Manual – Water Treatment Plant (Agnico Eagle 2020a).

2.11.2 Sewage Treatment Plant (STP)

The STP for Meliadine Extension is rated for a treatment rate of 299 m^3/day. The water use per person is 250 L/day, and camp capacity will be 905 persons. During the active closure phase, the STP will operate for 6 months of the year (May to October), with a camp capacity of 75 persons. Wastewater from the accommodation complex and from satellite sewage tanks will be treated in the STP using a membrane bioreactor process before being directed to SP6, per the Adaptive Management Plan, treated effluent from the STP could also be pumped to CP1 for discharge to Meliadine Lake. Operation and maintenance details for the STP can be reviewed in the Operational & Maintenance Manual – Sewage Treatment Plant (Agnico Eagle 2021a). Sludge is pressed using a volute dewatering unit and stored in the active deposition zone of WRSF1 to ensure coverage with waste rock. After the WRSF1 is completed, sludge will be stored in other WRSFs.

2.11.3 Saline Water Treatment Plant (SWTP)

The SWTP is decommissioned and not currently a component of the groundwater management strategy of Meliadine Extension.

2.11.4 Water Treatment Complex (WTC)

The WTC is a building designed to house both the EWTP and SETP-WTC. The WTC provides a centralized building for surface contact water and saline contact water treatment, allowing for improved operational synergy. Construction of the WTC commenced in Q3 2020. The installation of the EWTP within the WTC was completed Q2 2021 to allow for discharge to Meliadine Lake during the open water season. Further information regarding the WTC can be found the As-Built Report (Agnico Eagle 2021b).

Effluent Water Treatment Plant (EWTP)

The purpose of the EWTP (Actiflo® model ACP-700R) is to reduce Total Suspended Solids (TSS) to a target maximum concentration of 15 mg/L from the influent surface contact water pumped from CP1 prior to its discharge through the diffuser into Meliadine Lake. Throughout operation of the EWTP in 2018 and 2019, the maximum capacity (nominal flow) of the discharge system was 520 m^3/h. In Q2 2020, the system underwent upgrades to improve discharge capacity to 916 m^3/h. Further information regarding EWTP operation can be found in the EWTP Operation and Maintenance Manual (Agnico Eagle 2021c). Forecasted monthly averages requiring treatment at the EWTP are provided in Appendix E.

Trigger limits for stopping discharge are in place at the EWTP as a component of TSS and TDS exceedance mitigation during periods of discharge. These trigger limits are derived from a regression analysis of TSS concentration as a function of turbidity, and TDS as a function of specific conductivity. The regressions are developed using MEL-14 grab sample laboratory measured specific conductivity and turbidity readings paired with corresponding TDS and TSS results. Rating curves are then applied to continuous *in situ* specific conductivity and turbidity readings taken from internal probes within the EWTP prior to discharge to approximate TDS and TSS, respectively. When a trigger limit is reached, the EWTP stops discharge immediately and begins recirculating treated water to CP1.

Agnico Eagle will continue to gather calibration/confirmatory paired samples in the future to actively increase the number of data points and strengthen the turbidity-TSS and conductivity-TDS correlations.

Saline Effluent Treatment Plant-Water Treatment Complex (SETP-WTC)

As discussed in Section 2.2, saline water stored in SP6 will be conveyed to the SETP-WTC where it will be treated (as required) prior to discharge to the Itivia Harbour via the approved waterline. Treated saline contact water will meet MDMER end-of-pipe discharge criteria. The Raw water feeding the SETP-WTC will be pumped to two parallel treatment lines. One line is used for ammonia and TSS removal through a break point chlorination process and TSS clarification. A Reverse Osmosis Plant is also in place to treat TDS from CP5.

This line is composed of the following steps:

- Oxidation of ammonia in nitrogen gas in a mixed reactor using calcium hypochlorite solution. In this step, pH is controlled by caustic and sulphuric acid addition.
- Dechlorination using powder activated carbon to remove the excess of chlorine, followed by an addition of sodium thiosulfate for chlorine removal polishing.
- TSS removal using a sand ballasted clarifier (Actiflo®). Addition of coagulant, flocculent and microsand is required to achieve high removal rates of TSS
- The second line is composed of the following step: TSS removal using a sand ballasted clarifier (Actiflo®). Addition of coagulant, flocculent and microsand is required to achieve high removal rates of TSS

Both lines are then conveyed in a polishing filtration step using a disk filtration system prior to being pumped in the water line pumping station, where pH can be adjusted with sulphuric acid if needed. The design flow rate of the SETP-WTC is as follow:

- Design flow for the breakpoint chlorination line (limited by Actiflo® hydraulic) - 12 000 m^3/d.
- Design flow for the TSS removal line only (bypassed water): 12 000 m^3/d.
- Maximum flow for the global water treatment plant (limited by the polishing filtration and the waterline): 20 000 m^3/d.

Waterline

Meliadine Extension includes the used of the approved waterline for conveyance of saline water to Itivia Harbour. The waterline will deliver effluent to Itivia Harbour via a diffuser, assumed to occur in 2025. The effluent treatment and discharge rates are as follows:

- 2020 - 2022 (July 15 – Sept 30) – discharge by truck to Itivia Harbour diffuser at a rate of up to 1,600 m^3/day.

- From 2025 – onwards (approx. June 20 to September 29) – discharge by waterline to Itivia Harbour at a rate of up to 20,000 m^3/day.

The guiding principle for discharge of site water (both surface contact water and saline contact water) is to limit the volumes discharged to Meliadine Lake to the extent practicable and maximize the discharge of surface contact water to Itivia Harbour via the Waterline, while still effectively managing the site saline water balance as outlined in the Adaptive Management Plan.

Agnico Eagle will measure the following parameters of the effluent to advise discharge operations and help ensure discharge parameters are met prior to discharge to Itivia Harbour: pH, turbidity, specific conductivity, temperature, chlorine, and ammonia. Ammonia will be analyzed periodically in the treated effluent with a manual method to assess the treatment. Total chlorine will be measured continuously. Final discharge point (FDP) samples will be analyzed at an accredited laboratory as per MDMER requirements, as discussed within the Water Quality and Flow Monitoring Management Plan (Appendix D).

Sludge Management

Sludge produced as part of the TSS removal process at the EWTP and SETP-WTC is discharged into saline water storage. The sludge is sampled monthly for metal content, hydrocarbons (C10-C50) and organic carbon to determine potential impact on the receiving saline ponds. Agnico Eagle invested in a screw press technology in 2019 to remove approximately 85% of the water from the STP. The remaining semi-solid product (referred to as cake) will be placed and covered with overburden/waste rock in the WRSFs. During planned and unplanned maintenance on the STP screw press, liquid sludge will be produced. This material will also be placed within the WRSFs.

2.11.5 Oil Separators

An oil-water separator is installed at the Landfarm. The oil-water separator located at the Landfarm is used to treat both direct precipitation to the landfarm footprint and melt from snow containing hydrocarbons (i.e., snow on which spills occur) that is stored in the landfarm and contaminated snow cell over winter.

Treated water is analyzed for benzene, toluene, ethylbenzene and xylene (BTEX), lead, and oil and grease prior to discharge to CP1 or used on the windrows to increase moisture content, as required. Hydrocarbons removed from water are stored and managed as hazmat. A second oil water separator is applied to treat water from the maintenance shop wash bay, in which mining equipment from both surface and underground operations undergo cleaning. Treated water is analyzed for BTEX, lead, and oil and grease prior to discharge to CP1 or saline ponds depending on *in situ* specific conductivity applied to approximate TDS concentrations. Hydrocarbons removed from water are stored and managed as hazmat. No update to the oil separators is required for the Meliadine Extension.

2.12 Meliadine Lake Discharge Diffuser

The discharge diffuser is the final surface contact water effluent discharge location for the Mine. The overall purpose of the diffuser is to discharge water from CP1 (at sampling station MEL-14) to Meliadine Lake while providing minimal environmental impacts to the Lake. The effluent mixing will be dependent on ambient currents in Meliadine Lake, driven by wind during the open water period. The diffuser modelling was initially conducted by Golder Associates Ltd. Further updates to the diffuser model were completed by Tetra Tech in support of the Water Licence Amendment (Tetra Tech 2020). No update to the Meliadine Lake diffuser is required for the Meliadine Extension.

SECTION 3 • WATER BALANCE AND WATER QUALITY

3.1 Water Balance

The site-wide water balance model is set-up to represent the interaction of the local climatic regime with the mine plan and water management plan, and based on these interactions, to predict the volumes of various water types (i.e., non-contact, surface contact and saline contact) requiring management, treatment and discharge to the receiving environment (Lorax 2023), as shown in Figure 6. The most recent update to the water balance was carried out by Lorax (2023) in support of the Meliadine Extension Water Licence Amendment application. The Meliadine Extension water balance results are provided in Appendix E. All future water balance model updates will be provided in Annual Reports. The water balance model will be updated once per year, as per the Water Licence.

3.2 Water Quality

Water quality predictions for Meliadine Extension were conducted by Lorax (2023) using the GoldSim database management and simulations code (Version 14) where mine surface contact water and saline contact water flows derived from the Meliadine Extension water balance were combined with chemistry data from materials exposed in mine infrastructure (i.e., TSF, WRSFs, ore pads), and site baseline information. Water quality estimates were generated for the operational, closure and post-closure periods for effluent to Meliadine Lake, each CP, SPs, sumps, and all the open pits and for the fully flooded open pit lakes at post-closure (Figure 7 and Figure 8). These results are included in Appendix E.

As per the amended Licence, the water quality forecast will be updated annually. Future updates to the water quality forecast will be provided via the Annual Reports.

SECTION 4 • MONITORING

4.1 Water Quality Monitoring

Water quality monitoring results of the Meliadine Mine are compared to MDMER criteria and effluent quality limits listed in the Licence. Water quality pertaining to MEL-14 will be compliant to Part F, Item 3 of the Licence prior to discharging to Meliadine Lake. All surface runoff and/or discharge from drainage management systems associated with the Mine, including laydown areas and All-Weather Access Road, where flow may directly or indirectly enter a water body, shall not exceed the Effluent quality limits listed in Part D, Item 18 of the Licence. Furthermore, all waters from natural water body dewatering activities shall be directed to Meliadine Lake and shall not exceed the Effluent quality limits listed in Part D, Item 12. Further details on water quality monitoring are presented in Appendix D, including the proposed sampling locations for Meliadine Extension.

4.2 Water Management Structure Monitoring

Pursuant to Part E, Item 16 of the Amended Water Licence, Agnico Eagle will carry out weekly inspections of all water management structures during periods of flow and monthly thereafter. The records will be maintained for review upon request of an Inspector. More frequent inspections may be required at the request of an Inspector.

4.3 Culvert and Water Crossing Inspections

Culverts and water crossings along the site access roads, All-Weather Access Road, Discovery Road, Bypass Road, other roads (e.g., roads to Tiriganiaq-Wolf), and at the Itivia site will be inspected for the following conditions. These inspections also satisfy the monitoring procedures outlined in the Sediment and Erosion Management Plan (Appendix C):

- Damage to the inlet or outlet of the culvert which may impede flow capacity;
- Bed erosion upstream and downstream of watercourse crossing structures;
- Scour under bridge abutments and abutment foundations;
- Erosion along cutslopes and fillslopes of embankments (rill and gully erosion);
- Blockages within the culvert including snow, ice, debris; and
- Snow cover or snow piles which would prevent routing of water towards the inlet of the culvert (only applicable prior to freshet).

In the case that any of the above conditions are observed, corrective actions will be taken to optimize culvert/water crossing function and integrity.

4.4 Thermal Monitoring

Vertical Ground Temperature Cables (GTCs) will be installed along the key trenches and below the crest of selected dikes to monitor the thermal performance of the foundation materials. Thermal

monitoring will also be conducted in the permafrost as described in the GWMP (Appendix A). Thermal records collected from these sensors will provide temporal analysis of temperature profiles to assess whether the structures are performing as intended. The details of the thermal monitoring plan of water management structures of Meliadine Extension will follow the same principles of the approved Meliadine Mine and updated as part of the NWB Type-A Water Licence application process. In addition to thermal monitoring, visual geotechnical inspections of water management structures will be performed per the Water Licence requirements.

4.5 Collection Pond Inspections

Water collection ponds will be inspected for the following conditions:

- Water quality results as a trigger to implement mitigation actions;
- Unplanned inputs via surface runoff which are not part of the water management system; and
- Water level elevation above the operating manual maximum.

In the case that any of the above conditions are observed, corrective actions will be taken to prevent loss of available water capacity or potential degradation to the thermal berms and/or dikes and consistent with the approved Adaptive Management Plan.

4.6 Dike and Thermal Berm Inspections

Dikes and thermal berms will be inspected to monitor the performance of the structure. Pertaining to dikes, a ‘master” sketch of all the observed surface features that were documented in the past is maintained to monitor any changes/new features. Inspections focus on the upstream slope, crest, downstream slope, and downstream toe. Observations include the following:

- New areas of movement/deterioration not previously documented;
- Changes to previously documented areas of movement/deterioration;
- Evidence of seepage along the downstream slope of toe;
- The presence of water in downstream channel/sump; and
- Areas of movement/deterioration of downstream channel/sump (where present).

Any issues or potential problems identified will be addressed accordingly by the Responsible Person to mitigate risks and maintain integrity of the structures.

4.7 Water Diversion Channel and Berm Inspections

In addition to the water management structures requiring inspections under the Water Licence, Agnico Eagle will carry out inspections of all channels for the following conditions:

- Obstructions to flow (ice, debris);
- Inflows not part of the water management system;

- Degradation of channel banks;
- Seepage through water diversion berms resulting in water movement to areas not planned within the water management system; and
- Erosion of diversion berms (i.e., undercutting, slope failure, etc.).

In the case that any of the above conditions are observed, corrective actions as directed by the Responsible Person will be taken if there is potential for compromise effectiveness of the channel function or potential for unplanned impact to water quality or quantity in associated containment ponds.

AGNICO EAGLE

EXECUTIVE SUMMARY

In July 2022, Agnico Eagle submitted to the Nunavut Impact Review Board the Final Environmental Impact Statement Addendum of the Meliadine Extension, which is currently under review. This document presents an updated version of the Groundwater Management Plan for the collection, treatment, storage, and discharge of saline groundwater, being submitted to the Nunavut Water Board (NWB) as part of the Water Licence Amendment of the Meliadine Extension.

Agnico Eagle Mines Limited (Agnico Eagle) is operating the Meliadine Gold Mine (Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut.

Since its approval in 2015 by the Nunavut Impact Review Board (NIRB), and to extend the life of the mine, Agnico Eagle has continued to extend its knowledge and validation of the gold deposits around the Meliadine Mine by way of additional exploration. As a result, an improved project, collectively referred to as Meliadine Extension, is being proposed. Meliadine Extension will extend the life of the mine from 2032 to 2043 and will add underground mining activities at the already approved Wesmeg, Pump, F Zone, and Discovery deposits. The Meliadine Mine is subject to the terms and conditions of both the amended Project Certificate 006 issued by the Nunavut Impact Review Board (NIRB) in accordance with the Nunavut Land Claims Agreement Article 12.5.12 on February 26, 2019 (NIRB, 2019) and Amended Water Licence No. 2AM-MEL1631 (the Licence), issued by the NWB on May 13, 2021 (NWB 2021).

Meliadine Extension proposes to include underground mining and associated saline water management infrastructures at the Pump, F Zone, and Discovery deposits, and development of a new portal and associated infrastructures in the Tiriganiaq-Wolf mining area. Saline water from the Meliadine Extension underground mines will be collected in underground sumps, transported to a clarification system, and subsequently recirculated for use in various underground operations such as make-up water for underground drilling. The remaining underground saline contact water will be pumped to surface to be managed and stored in TIR02 open pit until 2025 for treatment by the Saline Effluent Treatment Plant in the Water Treatment Complex (SETP-WTC) for discharge to sea. Meliadine Extension includes the used of the Approved Waterline for conveyance of saline water to Itivia Harbour. The waterline will deliver effluent to Itivia Harbour via a diffuser, beginning in 2025.

Lake B7, located west of the Tailings Storage Facility (TSF), will be dewatered during freshet of 2025, becoming Saline Pond B7 (SP6), the main Saline Pond (SP) of Meliadine Extension. From 2025 onwards, the saline contact water stored in TIR02 will be transferred to SP6 to allow mining of TIR02 pit to resume during the winter of 2025/26. In addition, underground saline water will be pumped from local saline ponds and sumps to SP6 and then to the SETP-WTC.

SECTION 1. INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) is operating the Meliadine Gold Mine (Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut.

Since its approval in 2015 by the Nunavut Impact Review Board (NIRB), and to extend the life of the mine, Agnico Eagle has continued to extend its knowledge and validation of the gold deposits around the Meliadine Mine by way of additional exploration. As a result, an improved project, collectively referred to as Meliadine Extension, is being proposed. Meliadine Extension will extend the life of the mine from 2032 to 2043 and will add underground mining activities at the already approved Wesmeg, Pump, F Zone, and Discovery deposits. The Meliadine Mine is subject to the terms and conditions of both the amended Project Certificate 006 issued by the Nunavut Impact Review Board (NIRB) in accordance with the Nunavut Agreement Article 12.5.12 on February 26, 2019 (NIRB 2019) and March 2, 2022 and Amended Water Licence No. 2AM-MEL1631 (the Licence), issued by the Nunavut Water Board (NWB) on May 13, 2021 (NWB 2021).

In July 2022, Agnico Eagle submitted to the NIRB the Final Environmental Impact Statement (FEIS) Addendum of the Meliadine Extension, which is currently under review. This document presents an updated version of the Groundwater Management Plan (GWMP) for the collection, treatment, storage and discharge of saline groundwater, being submitted to NWB as part of the Water Licence Amendment of the Meliadine Extension. The overall water management plan for the life of the Mine and post-closure is described in the Agnico Eagle Meliadine Gold Mine Water Management Plan (WMP; Agnico Eagle 2022).

1.1 Objectives

The objective of the GWMP is to provide consolidated information on groundwater management for the Meliadine Gold Mine. The GWMP is divided into the following components:

- Introductory section (Section 1);
- Description of groundwater inflow forecasts and management strategies (Section 2); and
- Description of the groundwater monitoring program (Section 3).

The GWMP will be updated as required to reflect any changes in operations or economic feasibility that occurs, and to incorporate new information and latest technology, where appropriate.

1.2 Background

The Meliadine site conditions, local hydrology and hydrogeology, as well as the mine development plan are presented in the Environmental Management Protection Plan.

SECTION 2. GROUNDWATER MANAGEMENT

2.1 Predicted Groundwater Volumes

Planning and mitigations for management of groundwater relies upon predictions of groundwater that may report to the underground workings and then require further storage and management on surface. This section provides a summary of modelling work that has been completed to predict groundwater volumes.

In 2020, an environmental and socio-economic assessment was completed for a proposed increase of the discharge of treated groundwater effluent from the underground mine of the Tiriganiaq deposit into the marine environment near Rankin Inlet, by routing the treated groundwater effluent through waterlines. As a requirement of the Project Certificate No.006 T&C 25, Agnico Eagle provided a saline water management plan to address the potential for higher-than-predicted volumes of saline water inflows into the underground mine. The Groundwater Management Plan (Version 5) was issued on April 2020 using the 2019 groundwater inflow predictions and submitted under the 2020 FEIS Addendum for the "Saline Effluent Discharge to Marine Environment" project. The addendum was approved on January 31, 2022. Versions 6 and 7 of the Groundwater Management Plan were then submitted in compliance with Commitment #5 from the Technical Meeting held on November 30, 2020 for the Amendment Application to the Water Licence No: 2AM-MEL1631, and as per Part B, Item 13 of the Amended Water Licence, respectively. Nonetheless, the 2019 groundwater predicted inflows were still presented in these two versions.

Since 2019, additional data has been collected in support of the environmental review to document existing conditions and to provide the foundation for a qualitative and quantitative assessment of the operations and mine development of the Meliadine Extension. This additional data, documented in the Summary of Hydrogeology Existing Conditions Report (Golder 2021a), was used to update the numerical groundwater model in support of the 2022 FEIS Addendum for Meliadine Extension. The updated model, presented in the Hydrogeology Modelling Report (Golder 2021b), incorporates the new underground developments proposed as part of the Meliadine Extension and an updated conceptual model.

In 2021, supplemental hydrogeological data has been collected to enhance the understanding of hydrogeological conditions. This additional data, documented in the Updated Summary of Hydrogeology Existing Conditions Report (Golder 2022b), was used to update once again the numerical groundwater model in support of the 2022 Water Licence Amendment for Meliadine Extension. The updated model is presented in the Updated Hydrogeology Modelling Report (Golder 2022c).

A summary of the predicted groundwater inflow to the underground developments during operations is presented in Table 2.1-1. Groundwater inflow to the Tiriganiaq Underground were predicted to increase from 375 m^3/day in 2022 to a peak inflow of 1,500 m^3/day in 2027. Inflows then decrease as

aquifer storage effects diminish from 2027 to 2037, where the predicted inflow to the underground is 1,100 m^3/day. The lateral expansion of the underground includes a drift to the north of the underground development, which causes the increase in the predicted inflows in 2025. Groundwater inflows to the other underground developments are lower than Tiriganiaq, reflecting the shallower planned mine depth, greater proportion of the development in permafrost, and overall smaller footprint of these developments. Peak inflows at the other developments range from 25 m^3/day at Wesmeg-North, up to 200 m^3/day at Tiriganiaq-Wolf and Discovery. Flows to Wesmeg, Wesmeg-North and Pump are mitigated by dewatering of Lakes B5 and A8 West. In the absence of this dewatering, higher inflows to the underground would be expected as the mine development extends below these lakes. Inflow to Wesmeg and Wesmeg-North are also affected by depressurization from the adjacent mining at Tiriganiaq, which acts as a stronger hydraulic sink given its greater depth of mining (maximum base elevation of -845 masl versus -590 at Wesmeg and -395 at Wesmeg-North) (Golder 2022c).

The predictions presented in Table 2.1-1 represent the best estimate of groundwater inflow and groundwater TDS based on the measured data and the results of the model calibration. Since the groundwater inflows are being mitigated by active grouting, the predicted groundwater inflows incorporate the effects of grouting as grouting of the underground development is assumed to continue as part of future inflow predictions.

Table 2.1-1: Predicted Base Case Scenario Groundwater Inflows – Groundwater Inflow, TDS Quality and Fresh Lake Water Contributions

Base Case Predictions

Source: Table 8 from (Golder 2022c)

2.1.1 Groundwater Inflow Predictions – Assumptions and Uncertainties

The shallow bedrock at the site is primarily within the frozen permafrost except in areas of taliks underlying lakes. The deeper competent bedrock has been subdivided into two separate units: Mafic Volcanic Rock formations and Sedimentary Rock formations. The Mafic Volcanic Rock formations are present between the Lower Fault and Pyke Fault and are inferred to transition to Sedimentary Rock formations to the east. Sedimentary Rock formations are present to the North of the Lower Fault, and South of Pyke Fault. Synthesis of the hydraulic testing results up to the end of 2021, indicates that the Mafic Volcanic Rocks have lower hydraulic conductivity Rocks at depth. The supplemental data, however, show that the shallow and intermediate bedrock zones may be more permeable than the deeper bedrock (Golder 2021c).

In crystalline rocks, fault zones may act as groundwater flow conduits, barriers, or a combination of the two in different regions of the fault depending on the direction of groundwater flow and the fault zone architecture (Gleeson and Novakowski 2009). Within the mine area, three regional faults (North, Lower and Pyke) are present. In addition, ongoing monitoring of geological structures has led to the identification of 17 faults (i.e., KMS corridor, RM-175) that have been incorporated into the conceptual hydostratigraphy near the underground developments. Each of these faults have been assumed to have enhanced permeability relative to the surrounding competent bedrock. The additional structures are generally located between the Lower Fault and Pyke Fault within the Mafic Volcanic Rock formations and range in thickness from 2 to 6 m. An exception is the KMS Fault corridor, located in the sedimentary rock formations to the north of the Lower Fault at the Tiriganiaq Underground. This corridor is a wider zone of rock located between the KMS Fault and Lower Fault that is associated with poor rock quality (Golder 2022c).

The hydraulic conductivity of the competent bedrock and faults is assumed to be linearly reduced by an order of magnitude between the top of the cryopeg and base of permafrost (zero-degree isotherm). This assumption reflects that this portion of the permafrost, which will contain partially unfrozen groundwater due to freezing point depression, is expected to have reduced hydraulic conductivity relative to the unfrozen bedrock reflecting the presence of isolated pockets of frozen groundwater within this zone. These frozen zones will result in a decrease in the hydraulic conductivity of the rock compared to that of the entirely unfrozen rock (Golder 2022c).

In support of the Meliadine Extension, 2D thermal modelling was completed to update the predicted depth to the base of permafrost in the study area, to assess the extent of lake taliks and to determine whether the proposed open pits and additional underground developments will remain within the permafrost limits (Golder 2022a). This approach was adopted given the number of proposed undergrounds and proximity of these undergrounds to lakes with potential open taliks. Results of the thermal modelling indicated:

- Open taliks were interpreted to be present beneath portions of each of the following lakes near the proposed open pits and undergrounds: Lake B4, Lake B5, Lake B7, Lake A6, Lake A8, and Lake CH6.
- Closed talik was interpreted below Lake D4 based on the 0-degree isotherm, however the lake is interpreted to potentially be connected to the regional groundwater flow system through the cryopeg zone.
- The depth of the base of permafrost was interpreted to be between 320 and 490 m depth, with the interpreted depth dependent on the proximity to nearby lakes. Shallower depths are from locations near to lakes both with and without open taliks.

It was conservatively assumed that the surface water/groundwater interaction at all lakes is not impeded by lower-permeability lakebed sediments that may exist on the bottom of some of these lakes (Golder 2022c).

Combined, the assumptions discussed above result in the following sources of uncertainty in the groundwater inflow model:

1. The properties of the faults assumed in the model are considered to be conservative based on supplemental testing in 2021 and their lateral extents and depths. The faults were also assumed to have enhanced permeability up to 2.5 kms away from the underground developments, and the width of the Lower Fault was increased to between 15 to 20 m to account for potential additional low RQD corridors along its length. These assumptions are considered conservative since the permeability and width of a fault zone can be heterogeneous along strike (Gleeson and Novakowski 2009) resulting potentially in zones of greater hydraulic conductivity along strike over short distances; whereas over longer distances the presence of zones infilled with fault gouge will act to decrease hydraulic connectivity along strike(Golder 2022c).
2. An increase in bedrock hydraulic conductivity by a factor of 2 can result in an increase of total saline groundwater inflow by approximately 54%. Overall, groundwater inflow for Tiriganiaq is the largest contributor of saline groundwater inflow to the Meliadine Extension, and uncertainty in these inflows will have the largest effect on water management planning (Golder 2022c).

2.2 Groundwater Management Control Structures

The approved Meliadine Mine consist of the development of the Tiriganiaq gold deposit, with two open pits (TIR01 and TIR02) and one underground mine. As described in the WMP, Meliadine Extension proposes to include underground mining and associated saline water management infrastructures at the Pump, F Zone, and Discovery deposits, and development of a new portal and associated infrastructures in the Tiriganiaq-Wolf mining area.

The underground mines of Meliadine underground workings will be operated below the base of continuous permafrost. The underground excavations act as a sink for groundwater flow during mining, with water induced to flow through the bedrock to the Underground Mine workings below the base of the permafrost and within the cryopeg.

The underground water management system is designed to prevent water from affecting the workings or production. The system contains a series of sumps (generally one at the access of each level) designed to capture groundwater inflows and runoff from mining operations (i.e., drilling), a clarification system, and a pumping system to redistribute the clarified saline contact water.

Consistent with the Approved Meliadine Mine GWMP, saline water from the Meliadine Extension underground mines will be collected in underground sumps, transported to a clarification system, and subsequently recirculated for use in various underground operations such as make-up water for underground drilling. The remaining underground saline contact water will be pumped to surface to be managed and stored in TIR02 open pit until 2025 for treatment by the Saline Effluent Treatment Plant in the Water Treatment Complex (SETP-WTC) for discharge to sea.

Lake B7, located west of the Tailings Storage Facility (TSF), will be dewatered during freshet of 2025, becoming Saline Pond 6 (SP6), the main Saline Pond (SP) of Meliadine Extension. From 2025 onwards, the saline water stored in TIR02 will be transferred to SP6 to allow mining of TIR02 pit to resume during the winter of 2025/26. In addition, underground saline water will be pumped from local saline ponds and sumps to SP6 and then to the SETP-WTC, where it will be treated for Total Suspended Solids (TSS) and ammonia (NH3) prior to discharge to Itivia Harbour.

From 2025 onwards, saline water originating from the underground mines will be managed in local SPs and sumps to temporarily store water from underground mining. Excess saline contact water from Discovery and Tiriganiaq-Wolf underground mining will be pumped to surface and collected into Saline Pond at Discovery (SPD1) and Saline Pond at Tiriganiaq-Wolf (SP5). The runoff from the ore pads and saline WRSFs at Discovery and Tiriganiaq-Wolf will also be collected into SPD1 and SP5, respectively. Water from SPD1 and SP5 will then be pumped back to SP6.

Saline contact water generated by the ore pads and saline WRSFs near Pump and F Zone deposits will drain by gravity into Sumps P3 and P4 (Pump), and Sump F2 (F Zone) and will then be pumped to SP6.

Temporarily inactive underground developments (similar to the water stope) will continue to be used for additional storage of excess groundwater inflows as required and as feasible.

Currently, treated effluent from the Saline Effluent Treatment Plant (SETP) is discharged into Saline Pond SP3 (SP3). From SP3, the saline water is pumped into trucks which transport the water to Itivia Harbour, Rankin Inlet. Meliadine Extension includes the used of the Approved Waterline for conveyance of saline water to Itivia Harbour. The waterline will deliver effluent to Itivia Harbour via a diffuser, beginning in 2025.

A schematic of the underground dewatering system is provided in Appendix A. Pond capacities for storage of saline water and year of available storage are presented in Table 2.2-1.

Table 2.2-1: SP and Sumps Storage Capacity at the Mine

SP/Sump	Maximum Water Capacity (m^3)	Storage Available (year)
TIR02	1,616,554	Up to 2025

2.3 Groundwater Management Strategies and Mitigations

Based on the modelled groundwater inflow volume, the following strategies and mitigation options were considered and form part of the short-, medium- and long-term management of groundwater inflows to the Underground Mine:

- Short-term Strategy: Store saline contact water on site (in TIR02) and treat it for discharge to receiving environment in Itivia Harbour via trucking (up to 2024) and waterline (2025 and onwards) (Section 2.3.1).
- Medium-term Strategy: Store saline contact water on site in SP6 and treat it for discharge to receiving environment in Itivia Harbour via waterline (2025 and onwards) (Section 2.3.2).
- Long-term Strategy: Implementation of the Adaptive Management Plan (Section 2.3.3).

Discussion regarding thresholds for adaptive management and expected timeline to reach thresholds are presented in the AMP.

2.3.1 Short-Term Management Strategy

The objective of the short-term strategy is to continue storing saline water on site, as per the Approved Mine GWMP, with continued discharge by truck to Itivia Harbour (as required and following treatment through the SETP) until the approved Waterline (Agnico Eagle received Ministerial approval on January 31, 2022) is operational. From 2025onwards, the waterline will be used to deliver effluent to Itivia Harbour via a diffuser.

The effluent treatment and discharge rates are as follows:

- 2020 - 2024 (July 15 – Sept 30) – discharge by truck to Itivia Harbour diffuser at a rate of up to 1,600 m^3/day
- From 2025– onwards (approx. mid-June – mid-Sept) – discharge by Waterline to Itivia Harbour at a rate of up to 20,000 m^3/day

2.3.2 Medium-Term Management Strategy

The objective of the medium-term strategy is to remove the need for permanent storage of water on site as a management strategy by providing discharge capacity to empty the saline ponds, including SP6 each year. Storage under the medium-term strategy would only be required on a temporary basis to store winter accumulation of groundwater inflows to the Underground Mine.

As discussed in Section 2.2, additional saline ponds will be added as part of Meliadine Extension, and the same operating conditions will be adopted. SP6 will be the primary pond to feed the waterline (following treatment through the SETP) and other saline ponds and sumps that contain saline water will report to SP6.

2.3.3 Long-Term Management Strategy

Based on the current inventory of saline water ponds and sumps on site (Table 2.2-1), plus current and forecasted groundwater inflows (Section 2.1), the proposed long-term strategy of implementing the Adaptive Management Plan (AMP) will be required to ensure all obligations are met and to create a robust and flexible groundwater management system. Within the AMP, temporary storage of saline water into pits is presented in the case additional water needs to be stored. Current open pits that have been assessed for temporary storage of saline water are TIR02, WES04, and WES05 (refer to the Project Description for the Meliadine Extension).

2.3.4 Groundwater Management Mitigations

The following mitigation options form part of the management of groundwater inflows to the Underground Mine and the storage of saline contact water at surface.

Fractured Bedrock Grouting

As discussed in the Approved Mine GWMP, a refined grouting approach began in 2019 based on the premise of preventative grouting (cementing) having greater effectiveness over reactionary grouting, which in previous years would be triggered by intersecting water bearing fractures when carrying out drilling (production and exploratory) and blasting activities.

In developing underground workings, exploratory Diamond Drill Holes (DDH) in areas of planned development are and will continue to be cemented prior to the advancement of the development. Furthermore, “Jumbo” holes (holes drilled by a Jumbo Drill) are drilled ahead of development and cemented specifically for the purpose of pre-development grouting. Combined, these grouting efforts act to reduce the potential for intersecting inflows with the increased surface area of the excavated heading. Where possible, residual inflows are then plugged on an as-needed basis in these areas. Inflows in blasted stopes and diffuse seeps are generally not able to be grouted and thus remain as active inflows to the underground workings.

The potential for intersecting water-bearing fractures is increased in production long holes (stopes), due to the increased surface area of the excavation and the proximity of the excavation to known water bearing structures. As such, during the drilling phase of stope production, a “grout curtain” is set in and around the stope to minimize the potential for inflows after blasting.

Storage increase

Upon the occurrence of greater than expected groundwater inflows to the underground mine, or delay in the construction of the waterline or the implementation of the medium-term management strategy (SP6 storage; Section 2.3.2), Agnico Eagle will consider expanding saline pond storage capacity until inflows can be reduced or treatment/discharge is capable of managing the inflows. Specifically, the mine plan as it relates to open pits can be adapted to provide additional storage.

Storage thresholds to trigger this adaptive management strategy have been set to allow ample time to make adjustments to the mine plan and to proceed through any applicable regulatory processes, if required. These storage thresholds are presented in the AMP.

It will be the goal of Agnico Eagle to reduce the amount of saline contact water stored in the saline ponds as much as possible during the open water season through discharge to sea to maximize storage potential.

2.3.5 Viability of Short-, Medium-, and Long-Term Management Strategies

The short-, medium-, and long-term strategy viability relates to balance of the rate at which saline water accumulates on site and the rate at which saline water is removed from the system. Annual maximums in saline contact water volumes requiring storage on site to the available storage capacity are provided in Appendix E of the WMP.

2.4 Groundwater Quality

The salinity of deep groundwater samples collected to date from the Meliadine Mine area are at the high end of what has been observed at other sites in the Canadian Shield at corresponding depths (Frape and Fritz 1987; Holden et al. 2009; Dominion 2014b). Water quality in deep groundwater samplings suggest the salinity remains consistent with depth following the transition from near surface freshwater. Salinity concentrations in deep groundwater at Meliadine are approximately 1.5 times that of sea water (35 g/L) (Golder, 2022b).

Data collected from the underground diamond drill holes at Tiriganiaq are collected from depths between 230 and 475 mbgs, which are inferred to be located above the zero-degree isotherm (base of permafrost) based on thermal modelling, and therefore within the cryopeg. TDS within the cryopeg may be elevated relative to groundwater in unfrozen rock at similar elevations due the preferential freezing of ‘fresher’ water and is similar to the assumed TDS below the regional permafrost (approximately 55 g/L) (Golder, 2022b).

SECTION 3. GROUNDWATER MONITORING PROGRAM

3.1 Water Quality and Quantity Monitoring

Water quantity and quality monitoring is an important part of the groundwater management strategy to verify the predicted water quantity and quality trends and conduct adaptive management should differing trends be observed.

The groundwater monitoring plan, summarized in Table 3.1-1, will be further defined as the Mine advances and will be conducted in agreement with the WMP for the Meliadine Mine.

Table 3.1-1: Groundwater Quantity and Quality Monitoring Plan

Monitoring Type	Monitoring Location	Purpose	Frequency
Verification	Underground Seeps	Quantity – Underground water balance approach to calculate groundwater inflow rate	Weekly
Verification	Underground to surface pipe	Quality – Monitor quality of saline contact water entering saline storage	Monthly
Verification	SP1, SP4, Tiriganiaq Pit 02, SPD1, SP5, SP6	Quality – Monitor quality of surface saline storage ponds	Monthly during open water
Verification	Underground seeps/DDHs	Quality – Verify quality of groundwater flowing into underground mine	Quarterly

3.1.1 Water Quantity

Groundwater inflow rates to the Underground Mine are estimated by balancing flowmeter measured volumes of water pumped out of the underground mine with changes in total water storage underground. Additionally, estimations for smaller inflows and outflows such as rock haulage moisture content, backfill paste water bleed, and surface to underground inflows are applied to improve calculated inflow accuracy.

Excess underground saline contact water volumes transferred from the Underground Mine to storage ponds on surface are recorded at a flow meter located after the main pumping station from underground to surface. Furthermore, water volumes in storage ponds are tracked via water elevation surveys applied to volume-elevation curves.

Observed groundwater inflow rates are compared to model predictions (Table 2.1-1) on a quarterly basis. If significant variations from model predictions are observed, revision of the assumptions/inputs behind the model will be considered and the model updated, if required. Variations that would be considered significant and would indicate the need to consider recalibrating the model and updating the inflow analysis would correspond to when groundwater inflows to the mine, based on a monthly average of inflow over six consecutive months, is 30% higher than the predicted groundwater inflows.

In addition, updates to the groundwater model may be required based on operational changes as the Underground Mine advances.

3.1.2 Water Quality

Underground Contact Water

Underground saline contact water is sampled on a monthly basis at the locations identified in Table 3.1-1. All underground saline contact water sampling locations are analyzed for the following parameters: conventional parameters (specific conductivity, TDS, TSS, pH, hardness, alkalinity, total and dissolved organic carbon, turbidity), oil and grease, major ions, total and free cyanide, radium 226, dissolved and total metals (including mercury), nutrients (nitrate and nitrite, ammonia, Kjeldahl nitrogen, total phosphorus, orthophosphate) and volatile organic compounds (i.e., benzene, xylene, ethylbenzene, toluene, F2-F4 petroleum hydrocarbons). Additional sampling locations are expected to be installed for the Meliadine Extension, located on surface and in-line of the underground to surface pumping line, providing final representative water quality of underground saline contact water entering surface saline storage before it interacts with previously existing saline contact water on surface and any precipitation runoff inflows.

Underground saline contact water monitoring is carried out for operational and water management purposes by Agnico Eagle. This monitoring data will not be reported to the Regulators in the Annual Water License Report but can be provided upon request by the Regulators.

Non-contact Groundwater

Non-contact groundwater quality is monitored at mine seeps and/or DDH water intersects to verify the quality of groundwater flowing into the mine prior to contact. Flushing and sampling techniques used to ensure samples are taken without contamination are described in Section 2.2.3 of the Quality Assurance/Quality Control Plan. Samples are collected quarterly at a minimum but actual sampling frequency may be greater depending on rate of progress, frequency of water intersects, and observed trends in groundwater quality with time. DDH intersect water samples are analyzed for the following parameters: conventional parameters (specific conductivity, TDS, TSS, pH, hardness, alkalinity, total and dissolved organic carbon, turbidity), major ions, nutrients (nitrate and nitrite, ammonia, Kjeldahl nitrogen, total phosphorus, orthophosphate), radium 226, dissolved and total metals (including mercury). Non-contact groundwater quality data collected for Meliadine Extension will be provided in the Annual Report.

Non-contact groundwater samples as part of the groundwater monitoring program are used to identify trends and improve predictions regarding groundwater inflow chemistry. If non-contact groundwater samples collected indicate that TDS concentrations are greater or less than 20% than the estimated 55 g/L (Section 2.4), then water quality predictions for underground will be reviewed and updated, if required.

3.2 Hydraulic Monitoring

As a strategy to support groundwater inflow modelling and monitor groundwater responses to mining, vibrating wire piezometers are currently installed in the rock mass surrounding the Underground Mine. These piezometers are currently and will continue to be applied to assess response of the groundwater pressure (pressure head) to groundwater inflows, and as calibration data for the groundwater inflow model (Section 2.1).

3.3 Permafrost Terrain Monitoring

Agnico Eagle considers that existing T&C 12 of Project Certificate No.006 is sufficient to protect, mitigate, and monitor the permafrost terrain for the Meliadine Extension. Nonetheless, as the primary source of data for calibration and verification of thermal model results for permafrost characterization are temperature measurement from thermistor strings, the following monitoring activities will continue:

- Thermistors will continue to be installed when possible in exploration boreholes, especially boreholes close to planned underground developments or beneath large lakes to confirm permafrost depth and talik characteristics.
- Data from a deep thermistor recently installed in an area farther away from lakes (to provide information about regional permafrost depth in areas not influenced by lakes) will continue to be collected and analyzed to assess thermal stability.
- Data from existing thermistors will continue to be collected and analyzed to assess thermal stability of the permafrost terrain.

Existing monitoring and follow-ups that have been implemented during construction and operation will continue to be carried forward through the Meliadine Extension.

SECTION 1 • INTRODUCTION

The purpose of the Freshet Action Plan (Plan) is to provide Agnico Eagle with specific management and mitigation measures to address and manage water associated with the freshet season (Freshet), a response plan, and procedures to prevent and to minimize potential negative impacts to the surrounding environment at the Meliadine Site (Site).

The term freshet refers to spring thaw, which can result in inundation of floodplains. Freshet at Meliadine typically takes place between May 15 and July 30. In some years, Freshet can also happen in early fall, when freezing re-occurs (mid-October) and then thaws. There are areas at the Site that are vulnerable to excess water produced during Freshet; the objective of this document is to identify those areas, and to develop a plan with defined roles and responsibilities to manage excess water produced on site.

The following guiding principles are applicable to the Plan:

- To ensure that mine contact water from runoff or seepage is managed to prevent adverse environmental impacts;
- To ensure the health and safety of Agnico Eagle employees and contractors; and
- To ensure the Site is in compliance with the Nunavut Water Board (NWB) Type A Water Licence No.: 2AM-MEL1631 (Type A Licence).

The Plan identifies areas of risk during Freshet, risk management and the procedures necessary to address potential concerns. Best practices will be used to ensure appropriate freshet management in the design process of the infrastructure.

SECTION 2 • AREAS OF RISK DURING FRESHET

The key areas of risk during Freshet at the Site include the following:

- P-Area
- Portal 1 Sump 1 (Sump LV50)
- Portal 2 Sump 1 (Sump LV50)
- Landfarm A and Landfarm B
- Landfill
- All Weather Access Road (AWAR) and Quarries along the road
- Infrastructure Areas; including the Exploration Camp area, Portal 1 & 2 and the Industrial Pad Areas
- Containment Pond 1 (CP1), Containment Pond 3 (CP3), Containment Pond 4 (CP4), Containment Pond 5 (CP5) and Containment Pond 6 (CP6)
- D-CP1 and D-CP5
- Meliadine Esker Quarry
- Bypass Road
- Itivia laydown and fuel handling facility (Itivia)
- Tailings Storage Facility

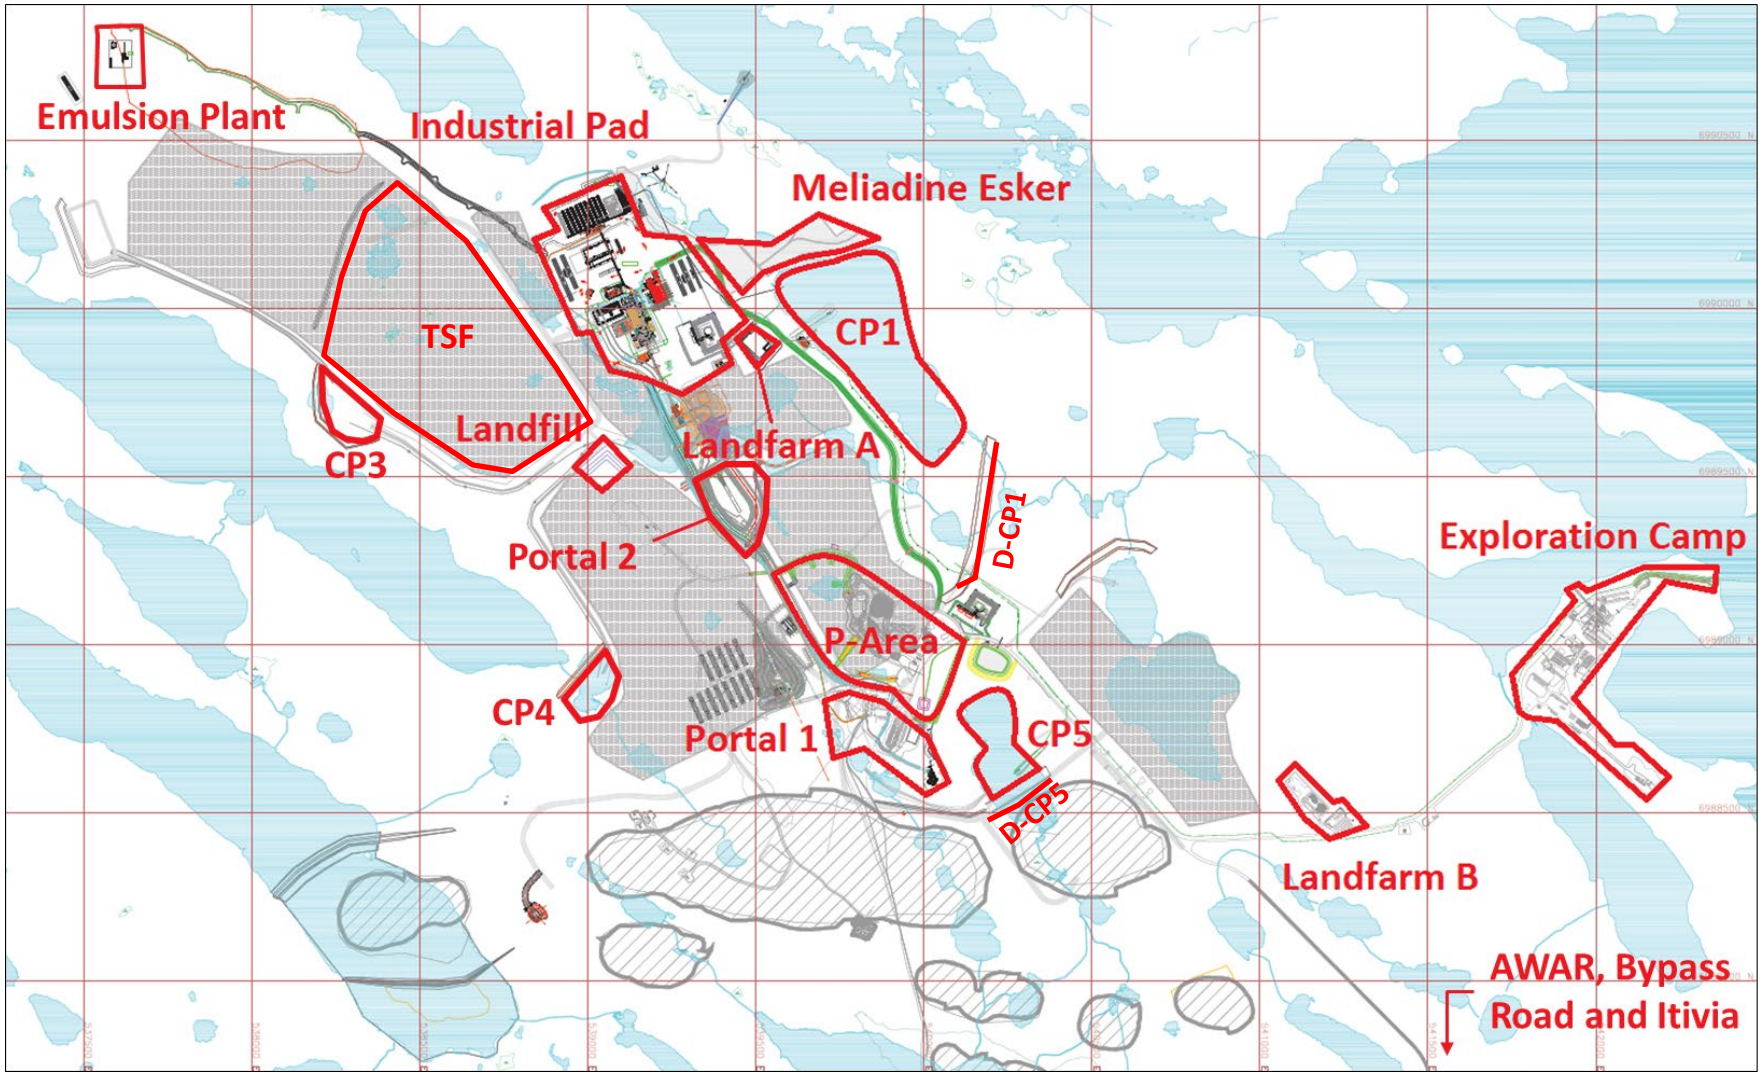
Identified areas of risk at Site are shown in Figure 1, and are described in the following section.

For the Meliadine Extension, new infrastructure for operational and water management purposes are going to be built, following the development sequence of the project. Some of the key infrastructure during freshet include:

- Collection Ponds
- Berms
- Dikes
- Access roads, including the Discovery road;
- Waterline
- A-chain pipeline;
- Channels
- Sumps
- Fuel farms
- Industrial Pads
- Laydown Areas
- Tiriganiaq-Wolf Area

Figure 2 shows a more detailed view of infrastructure that can be affected by freshet for the Meliadine Extension.

Figure 1: Site Plan View with Areas of Risk at Site during Freshet – Meliadine Mine



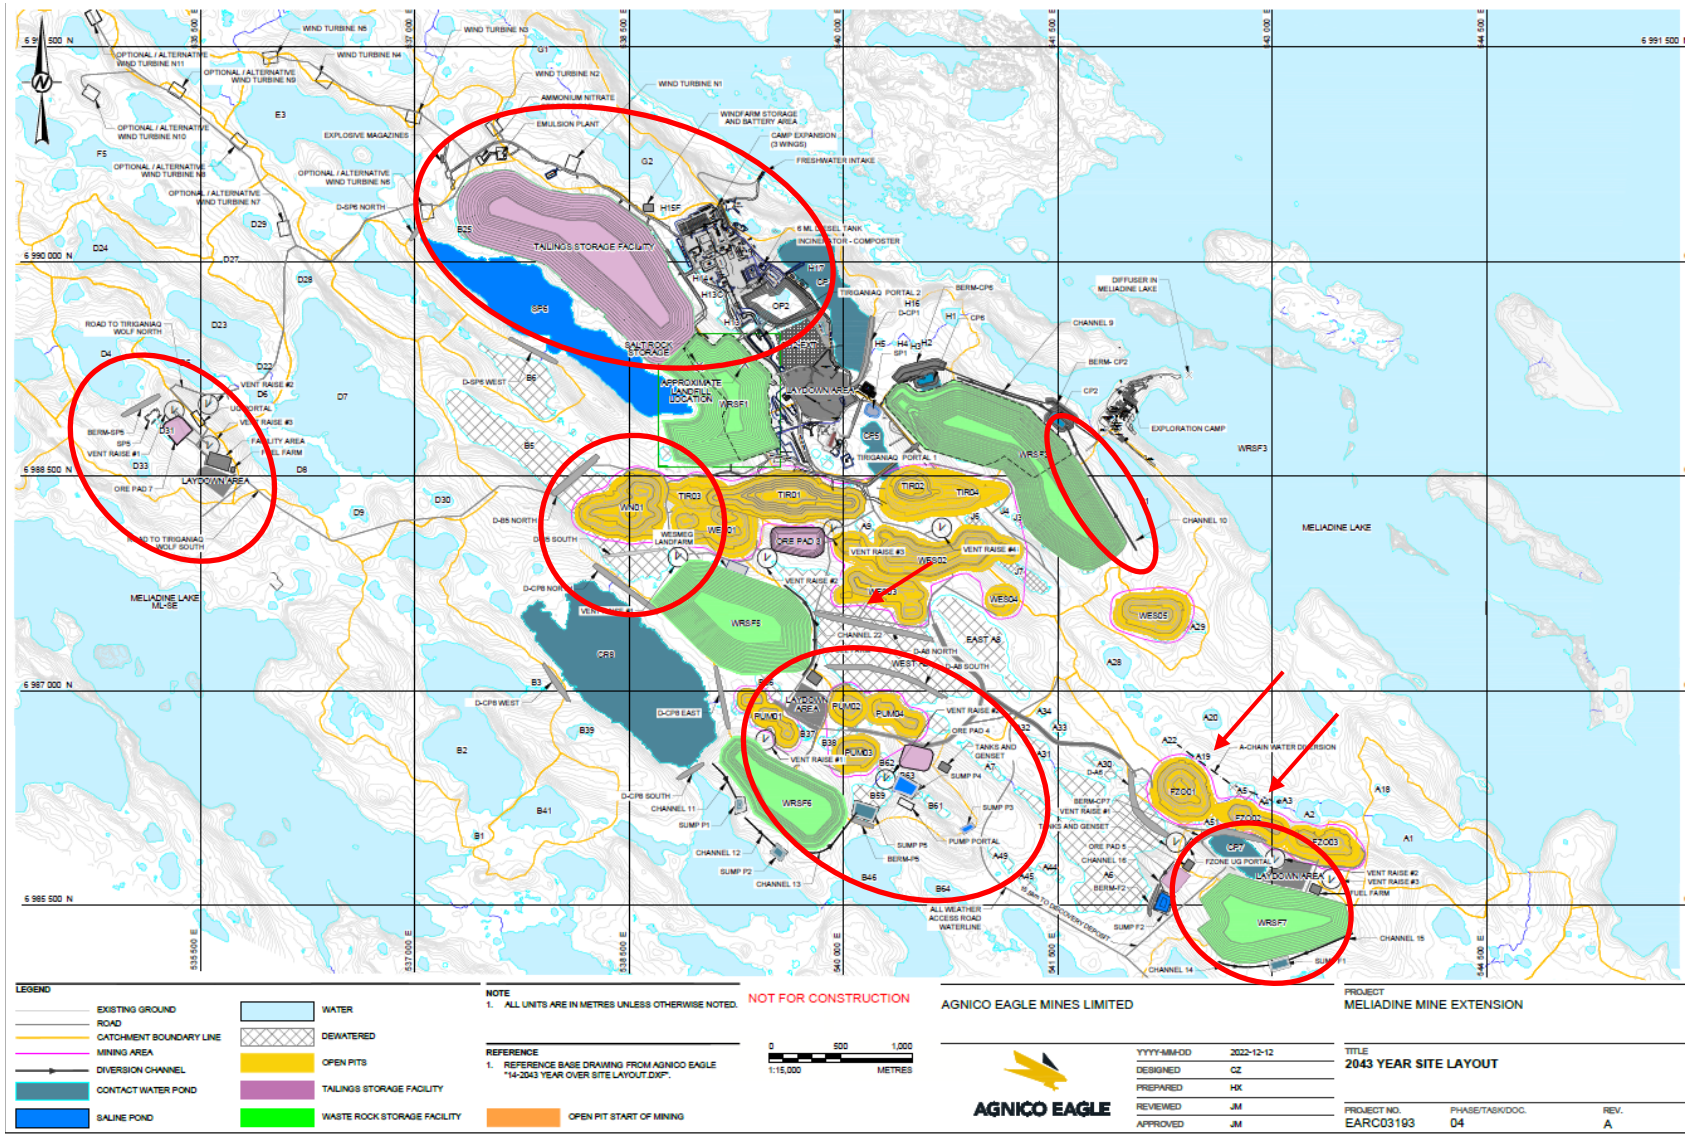


Figure 2: Site Plan View with Areas of Risk at Site during Freshet – Meliadine Extension

2.1 P-Area

Surface runoff that has come in contact with the southern portion of the future Waste Rock Storage Facility 2 (WRSF2) and surface works in the area of Portal 1 flows preferentially to the P-Area containment.

The P-Area includes three containment areas (Figure 2); P1 Containment Area (P1), P2 Containment Area (P2), and P3 Containment Area (P3) and has a cumulative capacity of 30,521 m^3. Periodic pumping to P1, from P2 and P3, is planned to manage water levels in P2 and P3. In past years active evaporation has been applied. In 2020, alternatives to active evaporation were assessed and transportation of water through a waterline was assessed and approved as the preferred alternative.

2.1.2 P1

P1 has a capacity of 20,781 m^3 and is the largest of the three ponds that make up the P-Area. Water contained in P1 includes direct precipitation, surface runoff in the P1 catchment area and any water accumulated in P2 or P3. Five evaporators are installed at P1. As mentioned above, alternatives to the evaporators are being assessed.

2.1.3 P2

P2 has a capacity of 6,828 m^3 and is located directly adjacent to and down-gradient from P1. In addition to direct precipitation, P2 captures surface runoff from the surrounding catchment area. Water captured in P2 is pumped to P1, as required.

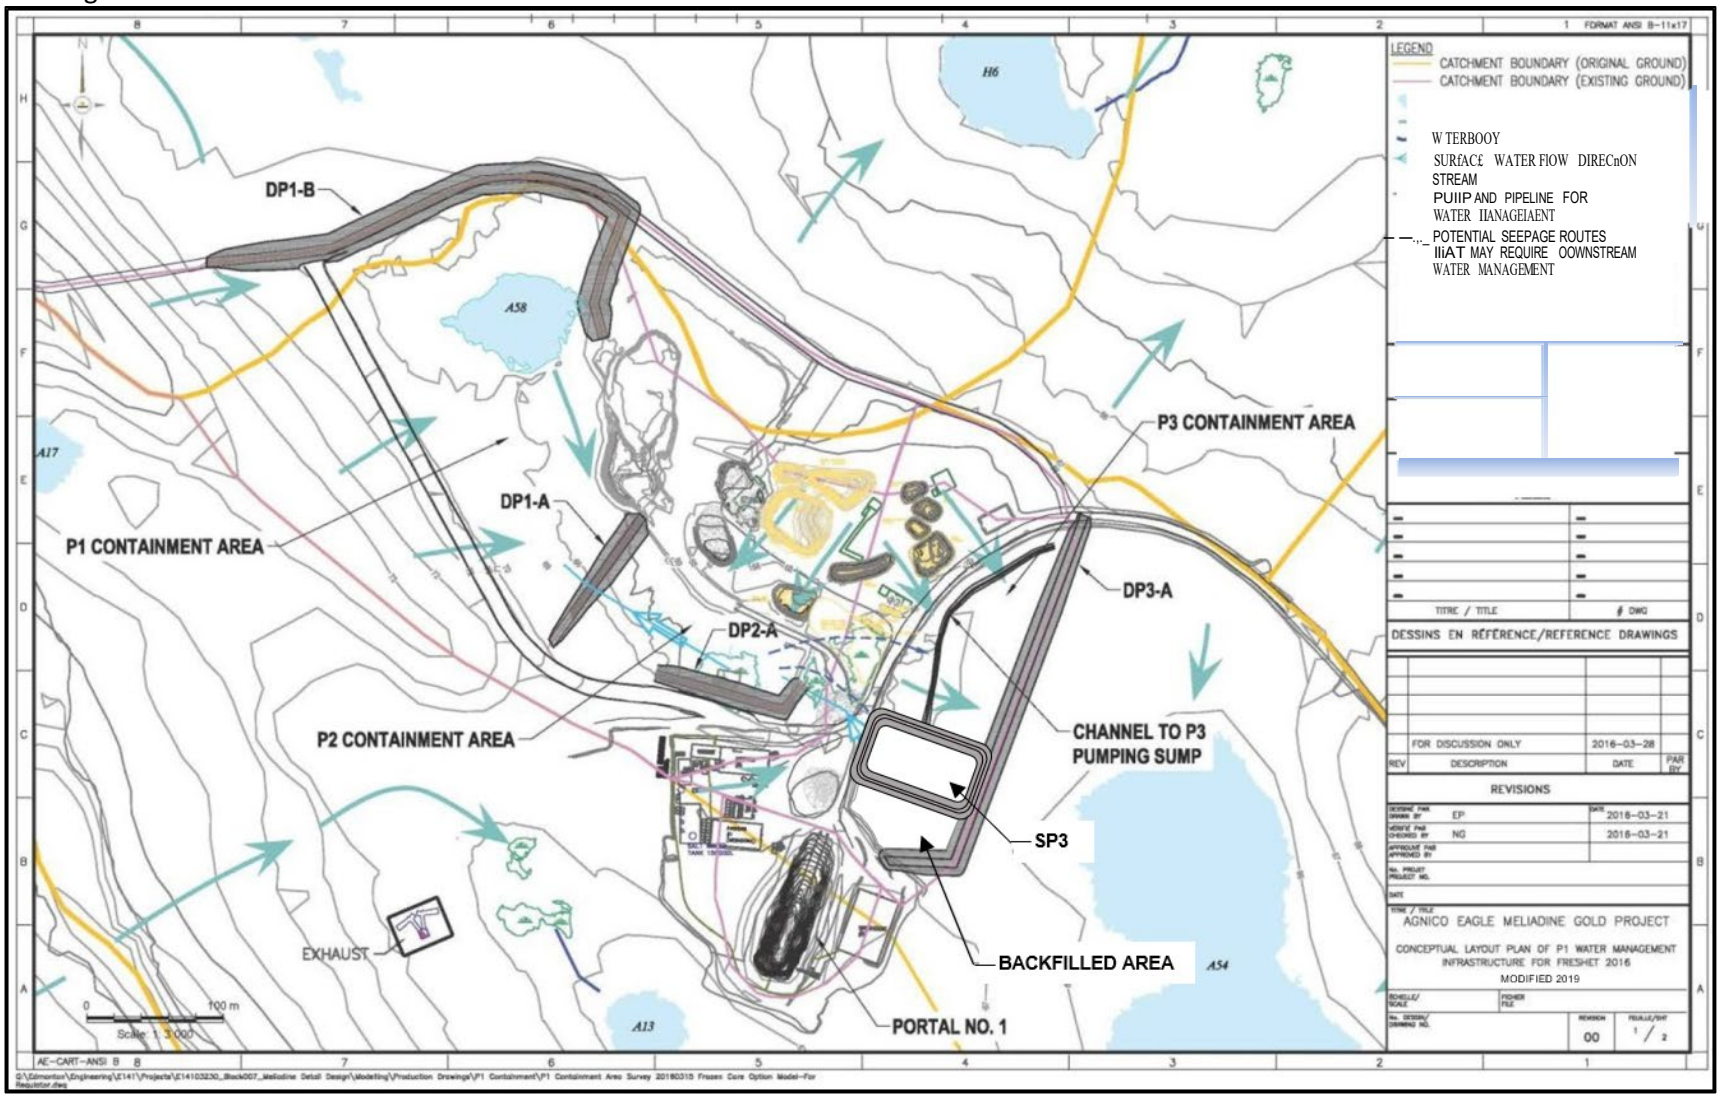
2.1.4 P3

P3 has a capacity of 2,912 m^3 and is down-gradient of P1 and P2. P3 contains surface runoff from the surrounding catchment, including the portal entrance area. Water from P3 is pumped to P1, as required. Furthermore, for the 2020 freshet, a back-up pump from P3 to CP5 is planned to manage greater than expected inflows to the P-Area and to ensure management of P3 water levels and protection of the SP3 liner (Section 3.1).

2.1.5 Saline Pond 3

Saline Pond 3 (SP3) is located south of P3 and has a maximum water storage capacity of 7,985 m^3. The design of the containment structure uses an elevated dike approximately 2 m higher than the adjacent road surface. As such, runoff water in this area does not flow into SP3.

Figure 3: P-Area Plan View



2.2 Portal 1 Sump 1 (LV50 SUMP)

LV50 is located 50 meters below grade (mbg) and is the first sump located down the Portal 1 ramp. Snowmelt and surface run-off that flows down the portal entrance is directed to sump LV50 where it is then pumped to CP5. The overall capacity for Portal 1 Sump 1 is 29 m^3. Water pumped from Portal 1 Sump 1 to CP5 is measured with a volumetric flow meter and recorded daily.

2.3 Portal 2 Sump 1 (LV50 SUMP)

LV50 is located 50 meters below grade (mbg) and is the first sump located down the Portal 2 ramp. Snowmelt and surface run-off that flows to the portal entrance to sump LV50 is pumped from LV50 to Channel 1. The overall capacity for Portal 2 Sump 1 is 55 m^3. Water pumped from Portal 2 Sump 1 to Channel 1 is measured with a volumetric flow meter and recorded daily.

2.4 Landfarm

The Type A License Landfarm is located adjacent and east of the Industrial Site Pad and is designed to receive soils, rock, snow, and ice contaminated with petroleum hydrocarbons. This includes light hydrocarbons such as diesel and gasoline (Agnico Eagle 2019). It was assumed that an annual volume of 500 m^3 of contaminated ice and snow would require management and the Landfarm has been designed to account for this volume.

The Landfarm has geotextile liners and is filled with soil. Water that pools, collects or flows from the Landfarm is collected for monitoring and treated before it is discharged to CP1.

2.5 All Weather Access Road (AWAR)

The All-Weather Access Road (AWAR) was built in 2013 to connect the Site to the hamlet of Rankin Inlet. The road is approximately 23.8 km long with twenty-two water crossings; three bridge crossings and nineteen culverts installed (Figure 3).

2.6 Infrastructure Areas

Infrastructure Areas represent buildings, pads and towers installed at the Site and include the Industrial Pad, Exploration Camp, and Emulsion Plant (Figure 1).

2.7 CP1, CP3, CP4, CP5, and CP6

Engineered water containment dikes constructed in 2017 at lakes A54 and H17 were developed as D-CP5 and D-CP1, respectively. The dikes are designed to contain contact water within the footprint of the Site and prevent pollution provisions of the *Fisheries Act*. Both CP1 and CP5 are used for Site contact water and snow and ice collection prior to Freshet. CP1 and CP5 are illustrated in Figure 1 and discussed in Section 3 of this plan.

CP3 and CP4 are containment ponds designed to collect runoff from the Tailings Storage Facility (TSF) area and Waste Rock Storage Facility 1 (WRSF1) area, respectively. CP3 construction was completed in Q4 of 2018 and CP4 construction was completed in Q2 2019. CP3 and CP4 design plans implement engineered thermal protection berms. Maximum operating levels within CP3 and CP4 are such that Berm-CP3 and Berm-CP4 will not be required to retain water (see Water Management Plan).

Construction of CP6 is on-going and the facility will be commissioned prior to Freshet of 2020. CP6 is designed to collect runoff from Waste Rock Storage Facility 3 (WRSF3) where the water will then be pumped to CP1 for containment prior to discharge. CP6 design implements an engineered thermal protection berm. Maximum operating level within CP6 is such that Berm-CP6 will not be required to retain water (see Water Management Plan).

2.8 Bypass road

The Bypass Road is a 5.9 km access road that provides a means to divert site-related traffic around the community of Rankin Inlet. The Bypass Road spans from the northwest margin of Itivia to km 2.9 on the AWAR (Figure 4) and has 19 culverts installed at 13 locations along the road.

2.9 Itivia

Itivia is located in Rankin Inlet and is accessed by the Site from the AWAR and Bypass Road. In combination with the Bypass Road, Itivia is intended to support the Site as a staging point for incoming and outgoing fuel and material handling for barge shipments. Itivia is also the location of the final discharge point for saline effluent generated by the mine. The location of Itivia is shown on Figure 3 and the plan view of the Itivia Site is presented as Figure 6. A culvert is installed to divert runoff around the Itivia Site and to allow passage of run-off from the Itivia laydown area (Figure 6).

2.10 Tailings Storage Facility

The Tailings Storage Facility (TSF) is a dry stack tailings storage facility. The TSF dry stack is located west of the Industrial Pad as shown in Figure 1. The facility stores compacted tailings that are transported from the process plant by haul truck. The tailings are spread and compacted in the facility. The tailings are deposited within a rockfill bermed area. The rockfill berm will ultimately form the cover for the placed tailings. Culvert 1 is in place to allow passage of water through the TSF haul road.

2.11 Meliadine Extension Water Management Infrastructure

Over the course of the Meliadine Extension, several water management infrastructures will be commissioned and decommissioned in a phased approach. Prior to construction, the Freshet Management Plan will be updated to include the operational risks and impact of the added infrastructure during freshet.

The design will follow best practices on hydrological risk management. Updates to the management plan will be done through the annual reporting process or otherwise as necessary.

After decommissioning and reclamation of a given infrastructure, the freshet management plan will no longer be applicable as the water management strategy will be then defined by the Interim Closure and Reclamation Plan.

Figure 4: AWAR Map Showing Water Crossing Location Section

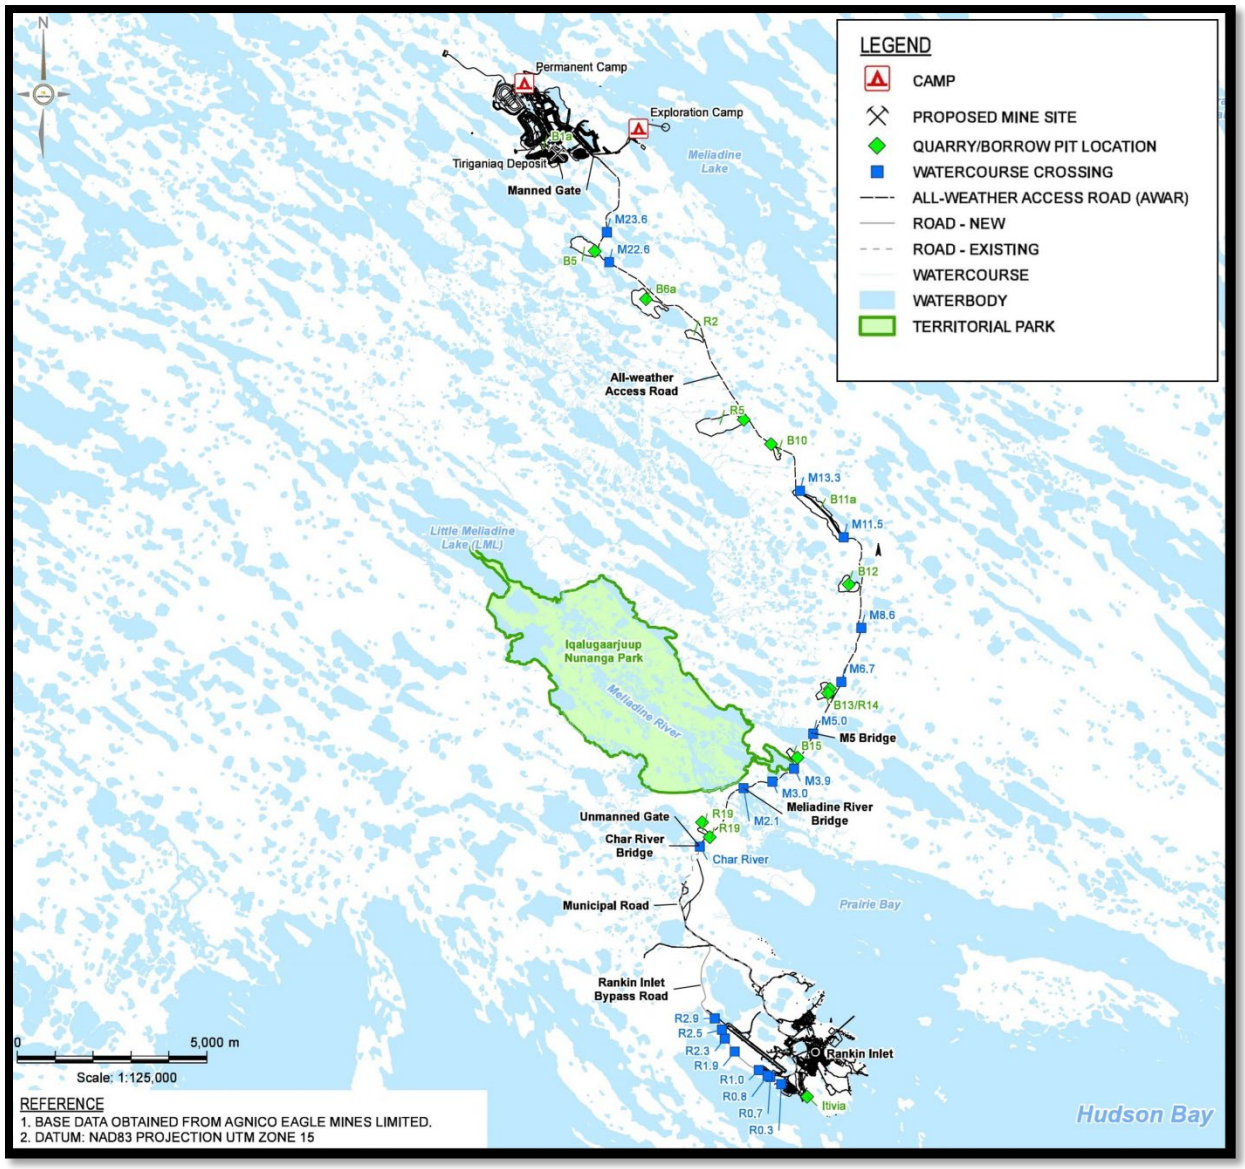


Figure 5: Bypass Road and Culvert Location

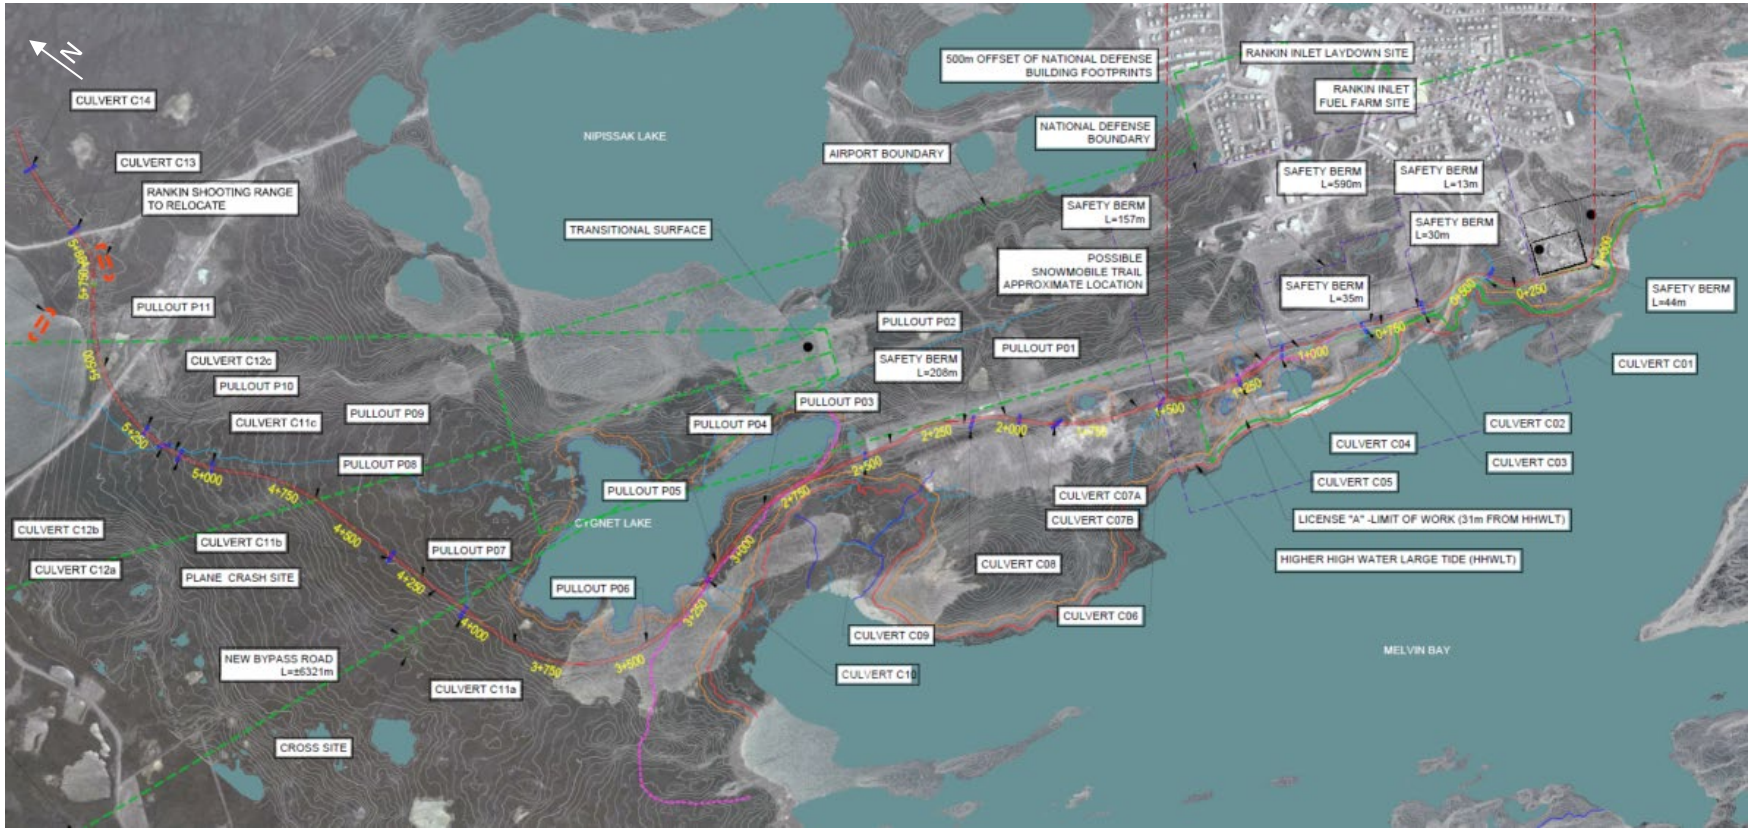

SECTION 3 • FRESHET RISK MANAGEMENT

Managing the risks prior to Freshet is a primary objective at Site. Planning and preparing before Freshet alleviates some of the risk from excess water that may suddenly occur, and helps to ensure compliance with applicable regulations. This is managed by removing water (pumping) at containment pond areas prior to winter freeze (fall) to allow for increased capacity from precipitation, snow and ice removal on roads, road water crossings, culverts, ditches, and select containment ponds after winter freeze and before Freshet (winter and spring).

Risk management practices for the Site areas during Freshet are described below and Appendix A presents the Freshet Action Plan Procedure for preparation prior to, during and after Freshet. Section 4 describes snow management at Site and Appendix B presents the Snow Management procedure.

3.1 P-Area Risk Management

The following management practices are maintained at the P-Area during Freshet and are described in more detail in Appendix A:

- Water levels will be monitored. The water level will not exceed the maximum design elevation in any of the three containment ponds (P1, P2 or P3). P3 water levels will be kept as minimal as possible to keep water from affecting the base of Saline Pond 3 (SP3), which is located immediately adjacent to (southwest of) P3, prior to Freshet (see Water Management Plan for details). To ensure maintenance of P3 water levels under scenarios of pump failure or greater than expected runoff volumes, installation of a back-up pump from P3 to CP5 is planned.
- Runoff water contained in the downstream sumps of DP1-B and DP3-A will be pumped into P1-B and P3, respectively.
- Agnico Eagle will conduct weekly freshet structural inspections of the dikes and note any observed seepage. Inspections will also include monitoring the base of SP3 for settling, slumping and cracking.
- Active evaporation from use of the evaporators may be used to contribute to managing the quantity of water contained at P-Area. However, alternatives to active evaporation as a means to manage P-Area water are being explored by AEM.
- Weekly water sampling during Freshet.

In the event that emergency removal of water contained within one or more cells comprising the P-Area is necessary, the most recent water quality data available will be used to determine an appropriate location for the water to be pumped to. The receiving location will also be assessed for sufficient capacity to receive the P-Area water.

3.2 Portal 1 Sump 1 Risk Management

If CP5 becomes filled to capacity and LV50 sump needs to be pumped, the water from LV50 will flow down gradient to the Underground Water Stope.

3.3 Landfarm Risk Management

If there is any excess water collected at the Landfarm during Freshet and treatment is not immediately possible, the excess volume will be transferred to the contaminated snow cell located in the Northwest extent of P1. If the snow cell is at capacity and the Landfarm contains excess water, the water will be sampled and, pending acceptable results, the water will be moved to CP1. If results do not allow transfer to CP1, water will be stored in totes until treatment is possible.

In the event that the water sample results do not allow transfer to CP1, potential treatment methods are as follows:

- Oil/water Separator
- CI Agent E-VAC Waste Water Filter System
- Carbon Filter System

If a suitable treatment cannot be completed, the water will be shipped south in totes or bladders for disposal in a certified disposal facility.

3.4 AWAR, Bypass Road and CP3/CP4 access road Risk Management

The following management practices are maintained to ensure the integrity of the AWAR, Bypass Road and CP3/CP4 access roads before and during Freshet and are described in further detail in Appendix A:

- Large culverts will be heated/steamed as necessary to allow the free flow of Freshet water.
- Prior to Freshet, water crossings and culverts will have snow removed from ice surface on the up and downstream side of the crossing to allow free flow of water.
- Visual inspections of AWAR and Bypass Road will be undertaken as to the structural integrity of the abutments and road integrity by the E&I Supervisor.
- Weekly (minimum) written inspections throughout Freshet and daily during excessive rainfall response including TSS transport, culvert/crossing function, flow rates, and integrity of roads will be completed by the Environment Department in conjunction with the E&I Department.

If erosion or ground surface scouring are observed, the E&I Department will be notified for repairs. TSS barriers, silt fences, straw logs or other sediment control methods will be implemented as required.

3.5 Infrastructure Areas

Risk management practices for the main Infrastructure Areas at the Site during Freshet are described in the following sections.

3.5.1 Camp Pads and Surroundings

Risk management practices are maintained at the Exploration Camp, Main Camp and surrounding camp areas as follows:

- Clearing off ice and debris from culverts prior to and during Freshet;
- Visual inspections for excessive water pooling. If pooled water is observed to flow into a water body, a water sample will be collected and monitored for TSS. Follow-up samples will be collected on a weekly basis thereafter;
- Visual inspections for snowmelt runoff. If runoff is observed to flow into a water body, a water sample will be collected and monitored for TSS. Follow-up samples will be collected on a weekly basis thereafter;
- Visual inspections to ensure flow through culverts and along channels is not impeded; and
- TSS transport will also be monitored at the culvert beside the garage that flows straight to Meliadine Lake. This area will be monitored for TSS, and preventative measures (install straw wattles and/or booms) will be installed to prevent deleterious substances from entering Meliadine Lake.

3.5.2 Industrial Pad and Access Road

The following management practices are maintained to ensure the integrity of the industrial pad and access road:

- This area will be monitored for turbidity and preventative measures (install straw wattles and/or booms) will be implemented to prevent deleterious substances from entering Meliadine Lake.

3.6 CP1, CP3, CP4, CP5, CP6, and Quarries

Risk management practices for CP1, CP3, CP4, CP5, CP6, and the Meliadine Esker and Quarries include discharging/pumping the water prior to winter freeze to be treated and/or discharged as per the Type A Water Licence and the Water Management Plan. If water is observed to be flowing or ponding, it will be sampled to ensure deleterious substances and TSS is not released to surrounding water bodies (Part I, Item 11 of the Type A Water Licence). Inspections of CP1, CP3, CP4, CP5, CP6, and associated water management structures or thermal protection berms, will be conducted following Part E Item 15 of the Type A Water Licence and the Water Management Plan.

3.7 Itivia

The following management practices are maintained to ensure the integrity of Itivia and the Bypass Road:

- The culvert installed between the Itivia laydown and the existing laydown areas (Figure 4) will be cleared of snow and ice prior to Freshet and will be monitored closely for TSS transport;
- Rip rap was installed around the culvert to control erosion and a decantation sump will be maintained downstream to collect suspended sediment;
- Two rock check dams were installed in 2019 upstream of the culvert to mitigate TSS transport through the Itivia site (Figure 6; Tetra Tech 2019);

- The upstream and downstream extents of the culvert area will be monitored for turbidity and preventative measures (install straw wattles and/or booms) will be implemented to prevent deleterious substances from entering Hudson's Bay; and
- Weekly water sampling at locations of runoff.

3.8 Tailings Storage Facility

The following management practices are maintained to ensure the integrity of the Tailings Storage Facility (TSF) and its associated structures:

- Culvert 1 (access road to TSF) will be cleared of snow and ice prior to Freshet and will be monitored closely for TSS transport;
- Snow that has accumulated on the TSF deposition surface will be removed prior to Freshet to reduce snowmelt runoff and pooling (Section 4);
- Daily visual inspections for ponding and areas of elevated sediment transport;
- Weekly inspections carried out to identify areas of concern including issues of seepage, cracking, and ponding on the TSF and associated structures.

3.9 Temporary Water Management Structures

Based on anticipated areas of ponding and/or impediment to flow on Site, or in reaction to unexpected ponding and/or impediment to flow on Site, temporary water management structures may be implemented to protect infrastructure by encouraging water movement through the water management system. Temporary water management structures will be constructed as needed and decommissioned when the event invoking the requirement (i.e., ponding) comes to an end. Such structures will be built in such a way that they maintain the overall flow direction of waters on site and do not affect the discharge to the receiving environment. No temporary measures would be placed outside the project footprint, nor alter the way water enters into the receiving environment. Temporary water management structures may include:

- Trenching in snow and/or ice;
- Excavation into ice to allow the immediate installation of pumps, avoiding the necessity to wait for ice to thaw; or
- Trenching/spillways across roads on Site at areas of ponding where pumping rates are unable to match accumulation rates.

3.9 Meliadine Extension Water Management Infrastructure

Based on the development sequence of the life of mine of Meliadine Extension, mining will occur until 2043. New infrastructure will be progressively added as it is commissioned and mitigation measures for the risks identified with each one will be added in section 3. It is anticipated that the management strategy (visual inspections, monitoring) will be similar throughout the entire life of the mine as there is little to no change in the infrastructure type. Particular field conditions could require enhanced risk management practices.

SECTION 4 • SNOW MANAGEMENT

Proper snow management during the winter contributes to risk mitigation from excess water during Freshet and prevents possible environmental impacts. *The Snow Management Procedure* (Procedure Number MEL-ENV-0017) (Appendix B) presents the plan to efficiently manage snow at the Site.

Snow that is removed from the Main Camp, Industrial Pad, Ore Pad, 6 Million Liter Fuel Farm, Portal 2 Pad, and Crusher Pad will be transported to a snow dump in the north end of CP1. Snow removed from the Tailing Storage Facility (TSF) will be transported to the north end of the TSF depositional footprint which is currently not occupied by tailings. Snow removed from the Paste Plant, Batch Plant, and surrounding laydowns will be transported immediately north of the Batch Plant and maintained as a level snow pad. Snow removed from the 3 Million Liter Fuel Farm, Portal 1 Pad, Vent Raise, SWTP/SETP Pad, and associated laydowns will be transported to CP5 and maintained as a level snow pad.

Snow and ice from the other areas at the Site are removed from roadways with a snow blower or plow and/or transported to CP1 or CP5, depending on the catchment of origin. Snow removal outside of the designated zones is generally maintained as a clean, level snow pad. Figure 5 illustrates the locations for snow collection during the winter and prior to Freshet. Figure 6 illustrates the snow management and storage areas for Itivia.

For the Meliadine Extension, snow will be removed and transported to a dedicated snow dump area where the snowmelt during freshet will not create critical volumes of water for the water management system and where the contact water can be captured treated prior to discharge.

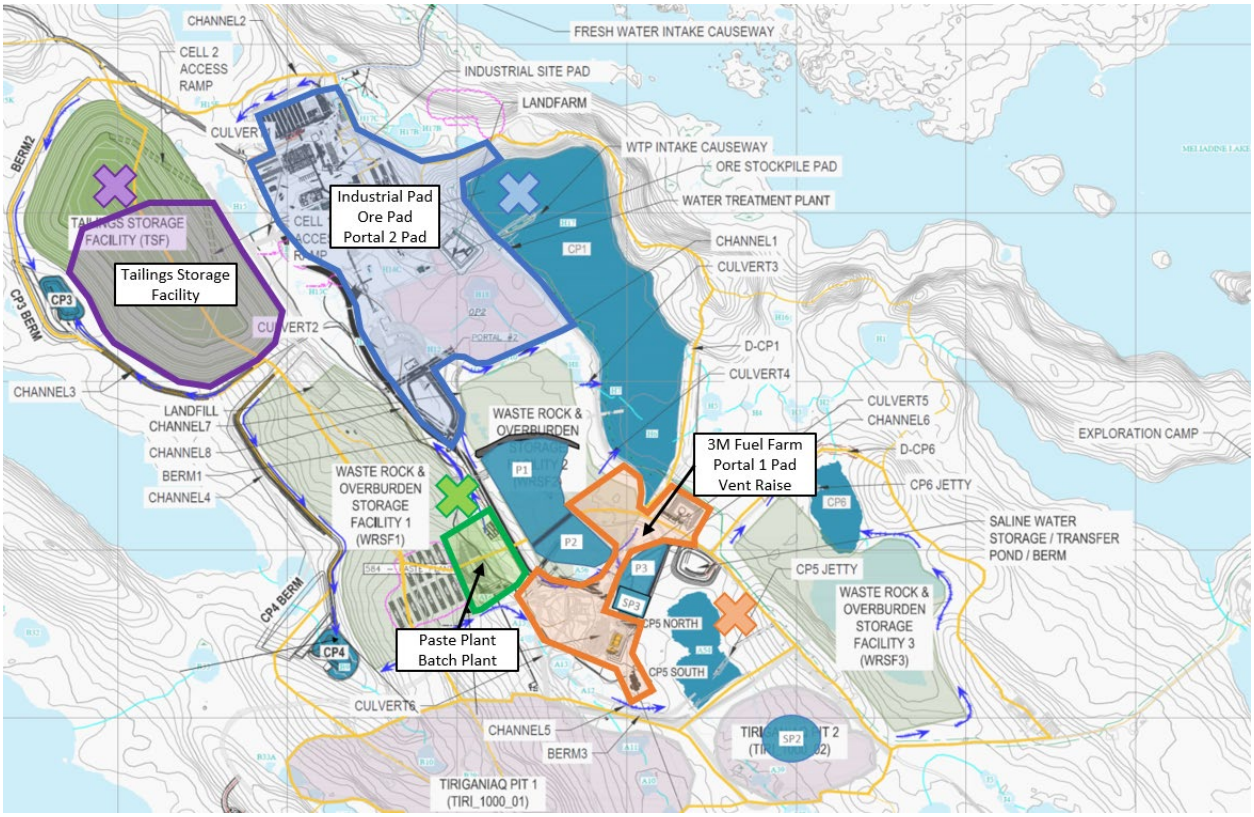

Figure 6: Snow Management Plan on Site.

Note: The locations identified by "x" are snow deposition areas for respective snow clearing areas (coloured polygon areas). Each snow clearing area and "x" are colour coded to identify where snow cleared from each area is deposited.

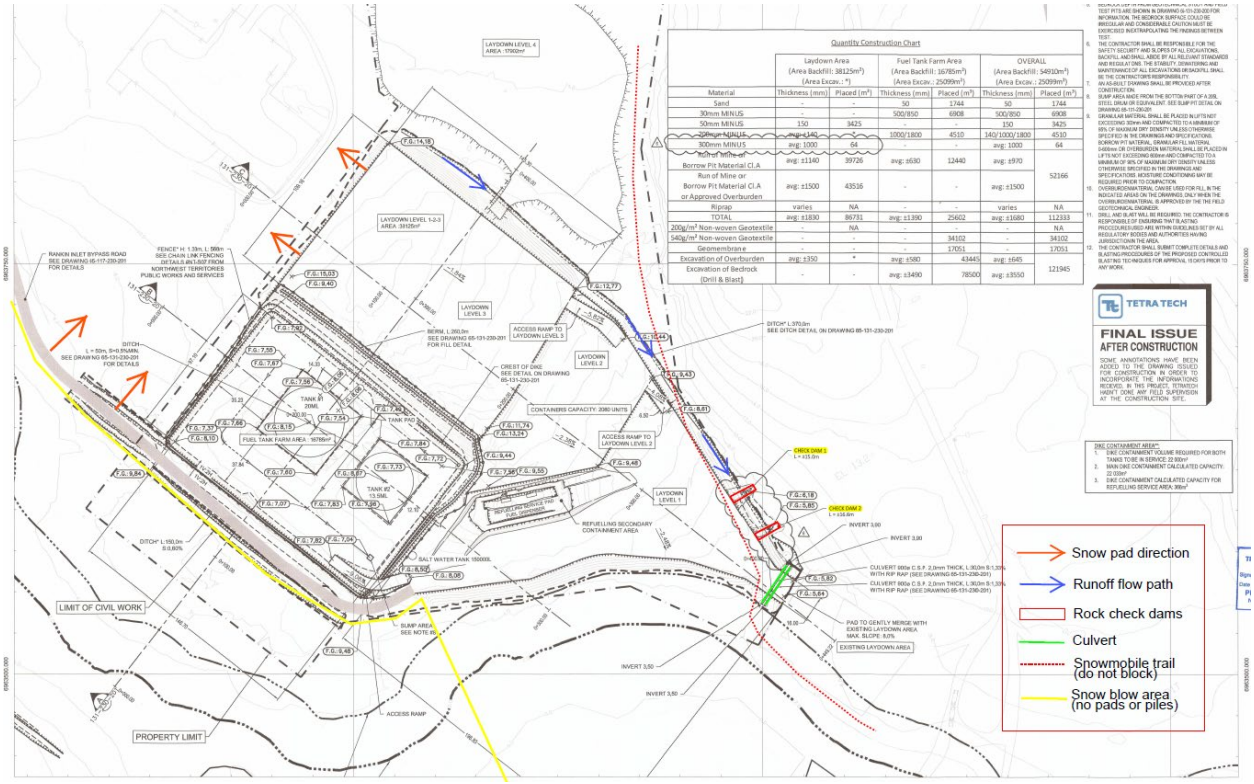

Figure 7: Itivia Snow Management Areas

APPENDIX A: FRESHET ACTION PLAN PROCEDURE

DOCUMENT ID: MEL-ENV-Freshet Management Plan Procedure	
People concerned: Agnico Eagle employees, contractors, visitors on the Meliadine site	**Effective Date: March 28, 2018**
This procedure corresponds to the required minimum standard. Each and everyone also have to comply with the rules and regulations of the Nunavut Government in terms of health and safety at work.	

Rev #	Date	Description	Initiator
1	2018-03-28	Change to Intelex Format	Matt Gillman
2	2018-12-14	Updated for 2019 Season	Matt Gillman
3	2019-03-12	Updated for 2019 Season, updated snow procedure spreadsheet to include D-CP5 and SP2	Matt Gillman
4	2020-03-17	Updated for 2020 Season, updated snow procedure to reflect current infrastructure, updated inspection frequencies	John Baechler Matt Gillman

Objective:

- To provide a plan to prevent potential environmental incidents at the Meliadine Site (Site) caused by the freshet season (Freshet) by recognizing specific areas for risk at the Site, possible actions to be undertaken and the departmental responsibilities to address the required actions.

Definitions (If applicable):

Tool/Equipment Required	PPE Required

Procedure					
Winter and Spring – Preparation Prior to Freshet[1]					***Risks/ Impacts***
Area for Risk		**Action**	**Responsible Department**	**Approximate Dates**	
P-Area	P1, P2 & P3	• Snow must not be stockpiled in any of the P-Area containment ponds	Environment to coordinate with Energy & Infrastructure, Engineering and Construction	All times	
AWAR, Bypass Road & CP3/CP4 Service Roads	Culverts	• Weekly Inspections	Environment	April - May	
	Major Crossings	• Snow and ice clearing[1], including ice and snow that may impede free water flow through culverts (including the culvert at Itivia) and at major water crossings • Effort is to be made to ensure road surface material is not removed during snow clearing. • Ensure snow is not stockpiled along roadside • Repairs (mark culvert locations, add armouring around downstream culverts and bridges, replace pipe as needed, and document maintenance and repairs) • Monitor signs of erosion (especially downstream at culverts 14.9 and 16 Km on AWAR) • Notify the Environmental Department about any areas for concern[2, 3]	Energy & Infrastructure	Winter Freeze to May (start of thaw)	
	Overall Roads				
Industrial Pad & Emulsion Pad	Culverts	• Inspection as needed and weekly from April - May	Environment		
	Channels and ditches	• Snow and ice clearing[1], including ice and snow that may impede free water flow through culverts and at major water crossings • Repair any erosion • Notify the Environmental Department about any areas for concern[2, 3]	Energy & Infrastructure		
	Access Road				
Quarries		• Snow and ice clearing[1], including ice and snow that may impede free water flow through culverts and at major water crossings • Re-grade disturbed areas to provide appropriate drainage	Construction Environment (for Sampling)	Winter Freeze to May (start of thaw)	

Tailings Storage Facility	• Culvert 1 (access road to TSF) will be cleared of snow and ice prior to freshet and will be monitored closely for TSS transport; • Snow that has accumulated on the TSF deposition surface will be removed prior to freshet to reduce snowmelt runoff and pooling (Section 4);	Energy & Infrastructure	Winter Freeze to May	

Note:
[1] See the *Snow Management Procedure* (Procedure No.: MEL-ENV-0017) for additional information for snow removal at the Site.
[2] The Environmental Department will assess the area of concern and action will be undertaken to comply with the Nunavut Water Board (NWB) Water Licence No.: 2AM-MEL1631 (Licence)(i.e. collect field parameters or water samples for analysis of total suspended solids, turbidity, or any deleterious substance).
[3] Areas of concern are defined as high water areas on roads, near the up gradient opening of a culvert, flowing water with sediment, spills, wildlife, etc.

Spring and Summer – During Freshet or During Heavy Rainfall				*Risks/ Impacts*
Area for Risk	**Action**	**Responsible Department**	**Approximate Dates**	
P-Area				
P1, P2, and P3	• Weekly visual inspection at minimum (daily as needed) • Daily monitor and record water levels • Weekly written inspection • Water sampling	Environment	May - October	
	• If water levels or structural integrity of berms are observed to be compromised, immediate action is required. Notify Supervisor	Engineering		
	• P2 and P3 water volume should be kept as minimal as possible. Pumping of this water should occur regularly (daily) • Measure and record pumping volumes daily and report to Environment weekly	Energy & Infrastructure		
Evaporators	• Commission after sub-zero temperatures no longer occur • Operate as efficient as possible	Energy & Infrastructure		
DP1 and DP3 Trenches /Seep	• Install pump and flow meter at trench to collect seep • Pump water to respective containment area (P1 or P3) • Measure and record pumping volumes daily and report to Environment weekly	Energy & Infrastructure		
AWAR, Itivia, Bypass Road, CP3/CP4 Access Roads				
Culverts	• Inspections for free flow water through culverts and major crossings, pooling water on road, and integrity of road and abutments (Weekly (minumum) or after heavy rainfall between May and October and daily during peak flow) • Sample as required[2]	Environment	May - October	
AWAR Major Crossings	• Snow and ice clearing[1], including ice and snow that may impede free water flow through culverts and at major water crossings • Repairs and erosion/sediment control implementation • Notify the Environmental Department about any areas for concern [2, 3]	Energy & Infrastructure Environment (for Sampling)		
Overall Roads and Itivia				
Quarries	• Repairs and erosion/sediment control implementation • Re-grade disturbed areas to provide appropriate drainage	Construction Environment (for Sampling)		

	• Notify the Environmental Department about any areas for concern [2, 3]		
Spring and Summer – During Freshet or During Heavy Rainfall			
Main Camp Pad/Industrial Pad			
Culverts	• Weekly inspections (at minimum; daily as needed) for free flow water through culverts and major crossings, pooling water on road, and integrity of road and abutments	Construction Environment (for Sampling)	May - October
Channels and Ditches	• Snow and ice clearing[1], including ice and snow that may impede free water flow through culverts and at major water crossings • Repairs and erosion/sediment control implementation • Notify the Environmental Department about any areas for concern [2, 3]	Construction Environment (for Sampling)	May - October
Access Road			
Infrastructure Pads			
Exploration Camp and Laydown	• Weekly visual inspection at minimum (daily as needed) • Water sampling as required • Installation of TSS mitigations as needed	Environment	May - June
Landfarm Structure	• Daily inspection of the landfarm retaining wall • Daily visual inspection for seepage • Collect a seepage water sample for hydrocarbon analysis. If seepage is present it should be immediately sampled and the seep be controlled. Whether by creating a sump and pumping back the water or by other methods.	Environment	
Landfarm	• Visually monitor excess water in containment area • Monitor seep (weekly) and collect water sample • Sample water according to the Licence	Environment	Mid-June and September
	• If excess water is present and cannot be treated immediately, sample in preparation for discharge to CP1		10 days prior to pumping
	• Once sample results have received, and if water is acceptable to be pumped to CP1 meets, water can be pumped to CP1 at a low flow to avoid erosion • Measure and record pumped volume	Energy & Infrastructure	Mid-June and September
Core Box Cemetery and Culvert	• Install straw wattles for sediment control on the other side of the road	Energy & Infrastructure	May
	• Weekly (at minimum; daily as needed) monitoring of TSS and turbidity and possible contaminant runoff	Environment	May - June
Emulsion Plant Pad	• Weekly Inspections • Water sampling of runoff as required for ammonia, nitrates, turbidity and TSS	Environment	May - June
	• Daily visual inspection for pooling water and water run off form pad to tundra, if noticed immediately contact environment department	Dyno Nobel	
Tailings Storage Facility	• Daily visual inspection for ponding and areas of elevated sediment transport;	Environment & Engineering	May - June

	• Weekly inspections carried out to identify areas of concern including issues of seepage, cracking, and ponding on the TSF and associated structures.			

Note:

[1] See the *Snow Management Procedure* (Procedure No.: MEL-ENV-0017) for additional information for snow removal at the Site.

[2] The Environmental Department will assess the area of concern and action will be undertaken to comply with the Nunavut Water Board (NWB) Water Licence No.: 2AM-MEL1631 (Licence)(i.e. collect field parameters or water samples for analysis of total suspended solids, turbidity, or any deleterious substance).

[3] Areas of concern are defined as high water areas on roads, near the up gradient opening of a culvert, flowing water with sediment, spills, wildlife, etc.

Fall – Preparation Prior to Winter Freeze					*Risks/ Impacts*
Area for Risk		**Action**	**Responsible Department**	**Approximate Dates**	
LV50		• Survey water level and calculate water volume and provide to Environment, and/or • Measure and record flow meter volume prior to pumping and after pumping and provide to Environment • Remove pumps and prepare equipment for maintenance and winter storage	Mining	Prior to pumping to P2 (Late September)	
		• Pump to P2		Late September/Early October	
Lv75/Water Stope		• Pump to SP1, SP2 (pending approval), or SWTP		June - September	
P-Area	P2 and P3	• Pump water to P1 for active evaporation	Energy & Infrastructure	June - September	
	P1, P2 & P3	• Remove pumps and prepare equipment for maintenance and winter storage		At beginning of winter freeze	
	Evaporators	• Decommission for winter and prepare equipment for maintenance and winter storage		Prior to any sub-zero temperatures	
A8		• Move pump house/pump closer to Site		Late September	
CP1		• Water sampling	Environment	June - September	
		• Pump water to discharge at Meliadine Lake	Process Plant		
		• Remove pumps and prepare equipment for maintenance and winter storage		Late September/Early October	
Downstream D-CP1		• Pump water to CP1	Energy & Infrastructure	June - September	
		• Remove pumps and prepare equipment for maintenance and winter storage		Late September/Early October	
CP5/D-CP5		• Restrict vehicle access on D-CP5 to prevent instrument damage • Pump water to CP1/SWTP		Late September	
Downstream D-CP5		• Pump water to CP5		June - September	

	• Remove pumps and prepare equipment for maintenance and winter storage		Late September/Early October	
Saline Ponds	• Remove pumps and prepare equipment for maintenance and winter storage		First week of October	
Tailings Storage Facility	• Daily visual inspections for ponding and areas of elevated sediment transport; • Weekly inspections carried out to identify areas of concern including issues of seepage, cracking, and ponding on the TSF and associated structures.	Environment & Engineering	June - September

APPENDIX B: SNOW MANAGEMENT PROCEDURE

This document is void 24 hours after printing

	DOCUMENT ID: MEL-ENV-PRO Snow Management
People concerned: Meliadine employees and contractors	**Effective Date: 21 December 2019**
This procedure corresponds to the required minimum standard. Each and every person must comply with the rules and regulations of the Nunavut Government in terms of health and safety at work.	

Rev #	Date	Description	Initiator
1	2018-03-28	Change to Intelex Format	Matt Gillman
2	2018-09-30	Updated for next season	John Baechler Matt Gillman
3	2018-10-11	Updated to include changes to snow management methods at Itivia, bypass road, CP3 and CP4 access roads, and Itivia Gas Boy.	Dan Gorton John Baechler
4	2019-12-17	Revised definitions, updated snow dump/pad location descriptions (table) and figure, removed P-Area snow dump, incorporated dust mitigation with TSF snow removal, updated Itivia snow managent figure with flow paths and check dams.	John Baechler

Objective:

The overall purpose of the snow management procedure (SMP) is to provide an outline for snow management that will assist with preventing adverse environmental impacts to the Meliadine Project (Site) and to mitigate risks from excess water during the freshet season (Freshet).

Definitions

Snow pad – A snow storage area where snow is flattened and compacted to promote sublimation, control runoff, reduce the formation of snowdrifts, and reduce the negative impact of snow melt.

Snow pile – A stockpile of snow that has not been further manipulated into a snow pad.

Negative impact of snow melt– High velocity runoff resulting in the transport of fine sediments or deleterious substances.

Tool/Equipment Required	PPE Required
• Snow blower • Shovel and haul truck • Grader	• Standard site PPE

Specific Training Requirements
• Equipment operator training

Procedure

Snow Removal at Meliadine Site

1. Prior to starting any snow removal, supervisors and equipment operators must discuss a removal plan based on the criteria outlined in this procedure.
2. If uncertain, supervisors or equipment operators must receive authorization from the Environment Department prior to moving snow to a non-designated area.
3. If snow is contaminated with a deleterious substance, snow removal should stop immediately to avoid the spread of contamination, and the steps outlined in the Spill Contingency Plan for Spills on Snow and Ice must be followed.
4. Supervisors must determine if the snow receiving location is:
   - Safe for the equipment operators;
   - Outside of a 31 m buffer zone around any water body;
   - A designated snow storage area;
   - A safety sensitive area.
5. Designated snow storage areas are as follows (see Figure 1 in the Appendices):

Snow Removal Area	Designated Snow Storage Area
Main Camp, Industrial Pad, Ore Pad, 6 Million Fuel Farm, Portal 2 Pad, Crusher Pad	Snow to be transported and dumped into a snow pile in the north end of CP1, not requiring further manipulation into a snow pad.
Tailing Storage Facility	Snow to be transported to the north end of the TSF and formed into wind breaking berms, running east-west, for TSF dust mitigation.
Paste Plant, Batch Plant	Snow to be transported immediately north of the Batch Plant and maintained as a snow pad.
3 Million Fuel Farm, Portal 1 Pad, Vent Raise, SWTP/SETP Pad	Snow to be transported to CP5 and maintained as a snow pad.

6. Snow piles are not authorized on the sides of any roadways, including the East Access Road, West Haul Road, CP3 Road, CP4 Road, All Weather Access Road (AWAR), Exploration Camp Road, or Bypass Road. Snow removed from roadways must be blown, or maintained as a snow pad next to the road.
7. The Fuel Farms, Gas Boy, Landfarm, and Itivia Diesel Tanks are safety sensitive areas. The valves and piping/hosing must be protected and available for inspection at all times. Snow must not be removed with a snow plow or heavy equipment.
8. Snow accumulated in Channels 1, 2, 3, 4, and 5 must be left to melt at freshet, as the use of snow removal or plow equipment can damage the synthetic channel liners.
9. A level snow pad may be created over the tundra provided that:
    - Clean snow is used for the pad construction;
    - The surface is cleaned after use;
    - Is not obstructing existing culverts, structures, or roadways.
10. Snow piles areas are not authorized at the Exploration Camp. Snow must be maintained as a snow pad to reduce the formation of snowdrifts and the negative impact of snowmelt at freshet (Figure 2).
11. Snow between the Main Camp dormitory wings must be removed to mitigate drifting against

the wings, which creates confined space under the camp and wildlife habitats (Figure 3).

12. Snow removed by Contractors at their designated worksite will be stockpiled at the worksite and subsequently removed by the Site Services department.

Snow Removal at Itivia Site

1. Snow piles are not authorized at the Itivia Laydown. Snow at the Laydown must be maintained as a snow pad. The existing ATV/snowmobile trail must not be blocked by snow removal (Figure 4).
2. Snow along the bypass road must be removed by blowing. Sand will not be used along the Bypass road as the blown snow must be clean and free of debris.
3. Snow removal from the Itivia Diesel Tank Farm secondary contaminant area must not be done using heavy equipment as to not damage the installed synthetic liner.
4. Snow accumulated in the Gas Boy secondary containment is to be removed using suitable equipment, to maintain capacity for fuel spill mitigation. Diesel contaminated snow will be disposed of appropriately at the snow cell or landfarm.

EXECUTIVE SUMMARY

This document presents the Sediment and Erosion management plan (the Plan) at the Meliadine Gold Mine. The purpose of this Plan is to provide consolidated information on the management and monitoring of potential areas subjected to erosion. This is accomplished by reviewing the potential effects of total suspended solids (TSS) and turbidity, the Federal guidelines and the license requirements, followed by the periods and types of activities subjected to erosion, and the specific monitoring and mitigating measures.

General findings on the effects of TSS on fish and fish habitat have been listed, such as sublethal and lethal effects on fish and their eggs. Federal TSS Guidelines have been cited, distinguishing the short-term and long-term exposure thresholds. Turbidity guidelines are also discussed in the present document. The Plan presents the monitoring and mitigating actions related to three (3) specific periods of activity: Periods of construction near water – during construction and operation; periods of freshet or significant runoff events – during construction, operation and closure; periods of potential impact to waterbodies – during operation. The proposed monitoring and mitigating measures are discussed for those periods of activity.

DOCUMENT CONTROL

Version	Date (YM)	Section	Page	Revision

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) is operating the Meliadine Gold Mine, located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut.

Agnico Eagle is currently proposing the Meliadine Extension to include several other pits and underground mining operations. This would extend the life of mine until the year 2043, followed by closure and post-closure phases. The same management strategy for sediment and erosion control would be used as per the conditions of the Project Certificate and Water Licence.

This document presents the Sediment and Erosion Management Plan (the Plan). The purpose of this Plan is to provide consolidated information on the management and monitoring of potential areas subjected to erosion. This is accomplished by presenting first a review of the potential effects of total suspended solids (TSS) and turbidity, the Federal guidelines and the license requirements, followed by the periods and type of activities subjected to erosion, and the specific monitoring and mitigating measures.

As per Nunavut Impact Review Board (NIRB) Meliadine Project Certificate No.006 Condition 28, the Sediment and Erosion Management Plan should be developed to prevent or minimize the effects of destabilization and erosion that may occur due to Project activities. The plan should also detail sediment control plans to prevent and/or mitigate sediment loading into surface water within the Project area.

The objectives of the plan are:

- To prevent the release of sediment into streams and waterbodies during construction activities;
- To reduce and mitigate erosion and the release of sediment during operations activities;
- To specify erosion and sediment control measures that, if implemented and maintained, will help Agnico Eagle maintain compliance with the Federal *Fisheries Act*, specifically with Section 36(3) of the Act, which prohibits the deposition of deleterious substances into waterbodies frequented by fish; and
- To provide references to approvals, relevant standards, control plans and procedures for training, communications, investigation and corrective action, and audits that are required under the Project Agreement.

SECTION 2 • TOTAL SUSPENDED SOLIDS/TURBIDITY EFFECTS, FEDERAL GUIDELINES AND LICENSE REQUIREMENTS

2.1 Effects of Total Suspended Sediments on Fish Habitat

Suspended sediments, and associated effects on water clarity, have the potential to affect fish and fish habitat in a variety of ways, including but not limited to:

- Smothering of deposited eggs or siltation of spawning habitats;
- Smothering of benthic invertebrate communities;
- Decreased primary productivity caused by reduced light penetration;
- Reduced visibility, which may decrease feeding efficiency and/or increase predator avoidance; and
- Clogging and abrasion of gills.

Moreover, the general findings for effects of TSS on fish and fish habitat indicate the following:

- Effects of TSS depend on both the concentration of TSS and duration of exposure;
- Effects of TSS can also be influenced by the size and shape of suspended particles;
- Lethal concentration of TSS on fish over acute exposure ranges from hundreds to hundreds of thousands of mg/L;
- Sublethal effects on fish (reduced growth, changes in blood chemistry, histological changes) associated with chronic exposures tend to be exhibited at TSS concentrations ranging from the tens to hundreds of mg/L;
- There is considerable uncertainty about potential effects of low TSS concentrations over long time periods;
- Overall, the most sensitive group of aquatic organisms to TSS appears to be salmonids, and guidelines are developed to protect this group;
- Adult salmonids are generally more sensitive to short durations of high concentrations of suspended sediments than juvenile salmonids; and
- Low suspended sediment levels are known to cause egg mortality (40 %) to rainbow trout at long durations (7 mg/L at 48 days). Guidelines for long-term exposure reflect these findings.

More details can be found in the report from Fisheries and Oceans Canada (DFO) on the effects of sediments on fish and their habitat (Fisheries and Oceans Canada, 1999).

2.2 Federal Guidelines

2.2.1 TSS Guidelines

The Canadian Council of Ministers of the Environment (CCME) specifies separate guidelines for TSS for clear and high flow periods. The guidelines are derived primarily from Caux *et al*. (1997), with application intended mainly for British Columbia streams. In the case of the application to the Meliadine Project lakes, the clear flow guidelines would be most relevant; even during freshet. The

lakes would not expect to see large natural fluctuations in TSS except in localized areas for short periods.

The guidelines put forth by the CCME recognize that the severity of effects of suspended sediments is a function of both the concentration of suspended sediments and the duration of exposure. Guidelines are intended to protect the most sensitive taxonomic group and the most sensitive life history stages.

Table 2.1 CCME National Guidelines and MDMER Legislated Standards for TSS

Source	Short-Term Exposure	Long-Term Exposure
CCME (1999, updated 2002)	Anthropogenic activities should not increase suspended sediment concentrations by more than 25 mg/L over background levels during any short-term exposure period (e.g., 24-h).	For longer term exposure (e.g., inputs lasting between 24h and 30 days), average suspended sediment concentrations should not be increased by more than 5 mg/L over background levels.
MDMER 2002, last amended December 2021	Maximum authorized concentration in a composite effluent sample = 22.5 mg/L. Maximum authorized concentration in a grab sample of effluent = 30 mg/L.	Maximum authorized monthly mean effluent concentration = 15 mg/L.

2.2.2 Turbidity Guidelines

Turbidity guidelines put forth by the CCME (1999) are based on extrapolation from the TSS guidance above, adjusted by a factor of about 3:1 (a typical average ratio for TSS: turbidity). In the case of turbidity for clear water, CCME (1999) recommends a maximum increase of 8 Nephelometric Turbidity Units (NTU) from background levels for a short-term exposure (e.g., 24-hour period), and a maximum average increase of 2 NTU from background levels for a longer term exposure (e.g., 30-day period).

CCME (1999) notes that in some cases short-term resuspension of sediments and nutrients in the water column can augment primary productivity, and in other cases, changes in light penetration may be inconsequential if a system is limited by other factors such as nutrients. The Caux *et al*. (1997) study considered effects of suspended sediment not only on fish but also on algae and zooplankton. In summary, the recommendations put forth by Caux *et al*. (1997) are based mainly on the most sensitive taxonomic group, which is salmonids.

However, research has shown that widespread, chronic turbidity can result in reduced light penetration and subsequent reductions of primary productivity (Fisheries and Oceans Canada, 1999; Canadian Council of Ministers of the Environment, 1999; Lloyd, Koenings, & Laperriere, 1987). Consequently, water clarity is of concern at broader spatial scales and longer time frames. It should be noted that DFO's report on effects of sediment on fish and their habitat (DFO, 1999) endorses the guidelines for TSS put forth by the CCME (1999), but does not recommend following guidelines for turbidity. Rather, turbidity may be used as a surrogate for suspended sediment only when the relationship between the two parameters is established for a particular waterbody.

2.3 Licence Requirements for the Protection of Fish and Fish Habitat at Meliadine

The Nunavut Water Board (NWB) Type A Water Licence for the Meliadine Project includes:

All surface runoff and/or discharge from drainage management systems, at the Monitoring Program Stations MEL-SR-1 to MEL-SR-TBD referred to in Part I, Item 11, during the Construction/Operation of any facilities and infrastructure associated with this project, including laydown areas and All Weather Access Road, where flow may directly or indirectly enter a water body, shall not exceed the Surface Runoff and Discharge from Drainage Management Systems quality limits in Table 2.2.

Table 2.2 Surface Runoff and Discharge from Drainage Management Systems Quality Limits

Parameter	Maximum Average Concentration	Maximum Concentration of Any Grab Sample
Total Suspended Solids (TSS) (mg/L)	50.0	100.0
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

Additionally, the discharge of effluent from the Final Discharge Point at Monitoring Program Station MEL-14 directed to Meliadine Lake through the Meliadine Lake Diffuser shall not exceed the following TSS concentrations, in accordance with the requirements of the Type A Water License (Part F, Item 3) and MDMER (see Table 2.1 above):

- Maximum monthly mean effluent concentration: 15 mg/L;
- Maximum concentration of any grab sample of effluent: 30 mg/L.

SECTION 3 • SEDIMENT AND EROSION MONITORING AND MITIGATION

3.1 Sediment and Erosion during Specific Periods

The purpose of the Plan is to ensure that Agnico Eagle will successfully monitor signs of sedimentation and erosion and minimize its resulting effects. This plan presents the monitoring and mitigating actions related to three (3) specific periods of activity for Meliadine:

- Periods of construction near water – during construction and operation;
- Periods of freshet or significant runoff events – during construction, operation and closure; and
- Periods of potential impact to waterbodies – during operation.

The construction of water management infrastructure could potentially lead to excess TSS. Therefore, erosion control methods must be considered during construction of water management infrastructure. In addition, erosion control must be considered during any dewatering activity.

The freshet season at Meliadine occurs approximately from mid-May until the end of June. In addition, there can be periods of high water flow due to rainfall events from late May – early October. As most site construction has been completed at the Meliadine site there are new areas and infrastructure that have become potentially vulnerable to excess water during the freshet season and in response to rainfall, such as, but not limited to:

- Culverts and other water management infrastructures;
- Newly constructed embankments, such as roads and berms;
- Water channels; and
- Surface runoff.

Water transfer and water discharge during operation can also lead to erosion and sedimentation.

3.2 Erosion and Sediment Monitoring

To monitor potential erosion and sedimentation, smaller water management infrastructure such as culverts, cross drains, surface runoff and ditches are inspected up to daily during freshet (minimum of weekly), on a monthly basis thereafter and daily after significant rain events. Larger culverts and bridges are inspected more often if they represent a risk for daily operations, for the receiving environment or for the health and safety of workers. More specifically, the following aspects are monitored during visual inspections:

- Accumulation of debris near the inlet of the crossings, impeding the free flow of water at those locations;
- Bed erosion upstream and downstream of watercourse crossing structures;
- Scour under bridge abutments and abutment foundations; and
- Erosion along cutslopes and fillslopes of embankments (rill and gully erosion), etc.

Newly excavated channels are inspected on a regular basis and after significant rain events. Erosion signs along the channel flow are monitored and documented. Inspections are carried out during the spring when surficial ice moves towards the inlet of the diversion channels to ensure that no ice

blockage causes water buildup upstream of the channel, which could lead to subsequent erosion problems. It is important to develop a database to determine if adverse trends are occurring. If adverse trends are observed, then mitigation will be undertaken to prevent a major incident.

The frequency of water and turbidity sampling are in accordance with the requirements of the Type A Water License and MDMER. The frequency will be increased if required during the freshet season or during heavy rainfall events. Procedures for turbidity monitoring include:

- Collection of water at the site of sediment entrance (exposure), and at a reference site (i.e., in the same watercourse/waterbody in an area unaffected by the sedimentation [upstream, at least 50 m away where water does not appear to be impacted]).
- Analyze samples for turbidity using a field turbidity meter and compare the exposure sample to the reference sample.
- If the exposure sample results are higher than the reference then mitigation will be undertaken (i.e., installation of silt fencing, silt barrier booms, etc.) to prevent any impact to watercourses.

If Agnico Eagle is actively working in an area with elevated turbidity – the work will stop until the level of clarity returns to an acceptable level.

Monitoring will be documented with site photographs and inspection forms.

3.3 Mitigation Measures

The following mitigation measures could be used, if required, to reduce risks associated with erosion and sedimentation.

- Riprap or clean non-acid generating/non-metal leaching rockfill could be used to armor shorelines, bridge abutments, culverts inlets and outlets and toe berms;
- Ditches managing high volumes of water could be armored for erosion control and reduce the speed of water flow;
- Sedimentation basins could be constructed at sensitive locations to allow settlement of finer sediments;
- Check dams could be constructed in areas of sustained high levels of TSS to mitigate transport of TSS downstream;
- Ditches, culverts and other water crossing structures should be maintained free of debris to allow free flow of runoff water;
- Installation of erosion control material such as turbidity barriers, silt curtains or straw booms;
- Site-specific erosion issues may arise during the mine operation that require specific local corrective actions;
- In-stream construction during periods when streams are expected to be dry or frozen to the bottom (i.e., during winter or fall). Isolation methods will be used for work below the high water mark for streams with flowing water at the time of construction;

- Materials installed below the high water mark (i.e., riprap) will be cleaned prior to installation to avoid adding deleterious substances to watercourses. Where concrete is installed, it will be allowed to cure fully prior to installation;
- Riparian areas will be maintained whenever possible to minimize erosion and impacts to fish habitat, with vegetation removal limited to the width of the workspace footprint. Disturbed areas along the streambanks will be stabilized and allowed to re-vegetate upon completion of work to minimize future erosion;
- Debris and excess materials resulting from construction will be removed from the work site to prevent them reaching water bodies; and
- When using equipment that creates tracks on the surface, run the equipment slowly to create grooves running perpendicular the slope and not parallel to the slope. This type of texture on slopes can slow the speed of runoff and reduce the amount of erosion and sediment transported downhill. This method must also be combined with an additional method of catching sediment at the base of the slope, such as a silt fence, straw log, etc.

EXECUTIVE SUMMARY

In July 2022, Agnico Eagle Mines Limited submitted to the Nunavut Impact Review Board the Final Environmental Impact Statement Addendum of the Meliadine Extension, which is currently under review. This document presents an updated version of the Water Quality and Flow Monitoring Plan, being submitted to the Nunavut Water Board as part of the Water Licence Amendment of the Meliadine Extension.

Since NIRB approval in 2015 and to extend the life of the mine, Agnico Eagle has continued to extend its knowledge of the gold deposits around the Meliadine Mine by way of additional exploration. As a result, an improved mine plan, collectively referred to as Meliadine Extension, is being proposed. Meliadine Extension will extend the life of the mine from 2032 to 2043 and will add underground mining activities at the already approved Wesmeg, Pump, F Zone, Discovery, and Tiriganiaq-Wolf areas.

Mine site development of the Meliadine Extension will include expansion of the tailings storage facility (TSF), waste rock storage facilities (WRSFs), water treatment complex, and sewage treatment plant to support the open-pit and underground mining activities over a 20-year mine life.

The Water Quality and Flow Monitoring Plan (the Plan) has been prepared in accordance with the requirements of the Approved Type A Amended Water Licence 2AM-MEL1631 (the Licence). The Plan complements the *Aquatic Effects Management Program* (AEMP) and is closely associated with the *Water Management Plan* and the *Metal and Diamond Mining Effluent Regulations (MDMER)*.

Section 2 of this Plan includes an overview of the monitoring programs and mine development schedule. Section 3 provides specific details (including sampling locations and parameters to be measured) for the compliance monitoring program, along with general guidance for the event monitoring program. An adaptive management program is described for regulated discharge and non-regulated discharges in Section 3. Requirements of the flow monitoring program are described in Section 4, and an overview of the reporting requirements in Section 5. Section 6 provides overview of Quality Assurance / Quality Control practices.

SECTION 1 • INTRODUCTION

The Water Quality and Flow Monitoring Plan (the Plan) has been updated in accordance with the requirements of the Nunavut Water Board (NWB) for the Type A Amendment of the Water Licence 2AM-MEL1631 (the Licence). The Plan is one component of the *Aquatic Effects Management Program* (AEMP) and is closely associated with the *Water Management Plan* and the *Metal and Diamond Mining Effluent Regulations (MDMER)*.

The Plan summarizes the monitoring locations, sampling frequency, monitoring parameters, compliance discharge criteria and an adaptive management plan for water quality at the Meliadine Extension.

The purpose of this Water Quality and Flow Monitoring Plan is to establish the program that is to be implemented and followed by Agnico Eagle's Meliadine environmental management team to monitor the performance of the waste and water management systems at the Meliadine Extension. The program includes:

- Verifying and validating the predicted water quality values with empirical measurements of the mine site water quality and flows;
- A comparison of measured water quality data to compliance requirements stipulated in the Licence; and
- A framework for adaptive management that allows the identification and rectification, where necessary, of unexpected trends or non-compliance in water quality and flows.

The Plan provides information on the locations of the monitoring stations at the various stages of mining. These monitoring locations are used to evaluate the performance of the mine waste and water management system.

The objectives of the monitoring program are:

1. To track the chemistry of the contact and non-contact water prior to and during discharge;
2. To assist in identifying if water treatment is required prior to discharge; and
3. To minimize the potential impacts of mining activities on the surrounding environment.

Additional locations outside the footprint of the mine (and outside the scope of this Plan) will be monitored under the *Meliadine Gold Project Aquatic Effects Management Program* (see Azimuth [2022] for the current detailed plan for operations). The Water Quality and Flow Monitoring Plan has been developed according to the approved Water Management Plan. The Water Management Plan has been updated to address Meliadine Extension application submission to the NWB.

SECTION 2 • OVERVIEW OF MONITORING PROGRAMS

This Plan has been divided into two levels of monitoring to characterize the range of impacts between the sources of contact water in the individual mine facilities and the point of discharge or release to the receiving environment. The two levels of monitoring include:

1. Compliance Monitoring (CM); and
2. Event Monitoring (EM).

2.1 Compliance Monitoring Program (CM)

The CM sites are those stipulated in the Licence; these sites vary from contact water collection ponds, structures such as ditches, culverts prior to discharge to the receiving environment and local lakes surrounding the mine site. The requirements of the Licence, including water quality limits, will be applied at the applicable mine discharge points identified in the CM program.

The CM program provides a mechanism to assess water quality at specified sites, and to confirm and document compliance of discharge with regulatory requirements. As part of adaptive water management, these internal monitoring stations provide protection to the receiving water environment, provide data to predict pit re-flooding water quality and ensure exceedances of predicted or regulated levels are appropriately managed or mitigated to reduce impacts.

2.2 Event Monitoring Program (EM)

The EM sites result from unexpected events such as spills, accidents, and malfunctions. The response programs for such events are discussed in greater detail in the following four documents:

- Spill Contingency Plan
- Risk Management and Emergency Response Plan
- Freshet Action Plan
- Water Management Plan

Each accidental release will require mobilization of site equipment to stabilize the release, procedures to contain, neutralize, and dispose of the discharge, and recommendations for monitoring the site following the incident.

SECTION 3 • MONITORING PROGRAMS

The monitoring program is presented in three sections; requirements of the compliance monitoring program, an overview of the event monitoring program, and then details of the adaptive management program for monitoring results.

Monitoring stations will be adjusted as mining progresses.

3.1 Compliance Monitoring Program

The CM program monitors the chemistry of four local lake surrounding the mine site (E3, G2, H1 and B5) as well as mine contact water collected and diverted at specified locations prior to release into the receiving water environment. The sampling is conducted to confirm and document compliance with regulatory requirements. The nature of water monitored within the CM program include:

- Non-contact water from local lakes;
- Mine surface contact water collected from drainage of different structures;
- Monitoring points located within the water management system prior to release into the receiving water environment; and
- Effluent released to Meliadine Lake and water within Meliadine Lake at the diffuser.

The CM sampling program has multiple monitoring stations across the project site, with sampling at different stages of the mine life. Table 3.1 provides a list of all CM stations for the Approved Mine. Table 3.2 provides a list of all the CM stations proposed for Meliadine Extension with the assumption that these stations would become active once the infrastructure is on surface. A description of the monitoring station location, parameters to be monitored and sampling frequency are provided in the tables. Specific details for the monitoring parameter groups are provided in Table 3.3. Agnico Eagle follows 5 groups of parameters as identified in Schedule I, Table 1 of the Licence. Additionally, Agnico Eagle follows the analytical requirements and authorized limits of deleterious substances as identified in Schedule 3 and Schedule 4 of the MDMER (Government of Canada, 2002).

Figure 3.1 shows the approximate location of each of the sampling sites for the Approved Mine. Figures 3.2 and figure 3.3 show the approximate location of the proposed sampling sites for Meliadine Extension. The actual location of each sampling site is determined by access and safety considerations and are marked by a stake that defines the exact location of the collection point for sampling events with appropriate attached signage in English, Inuktitut and French.

GPS coordinates for all compliance monitoring stations of the Meliadine Extension will be confirmed as the project advances in the regulatory process.

3.1.1 General Sampling and Analysis Program

Samples are collected in clean laboratory-supplied containers and preserved as directed by the analytical laboratory. During all phases, samples are analyzed offsite at a CALA accredited commercial lab (e.g., ALS in Burnaby, BV Labs in Nepean, AquaTox in Puslinch, H2Lab in Val d'Or, or Nautilus Environmental in Burnaby). Samples sent to commercial laboratories may change as the site matures and additional requirements occur. Sampling procedures are further detailed in Section 6 (Quality Assurance/Quality Control Procedures) and in the Quality Assurance/Quality Control Plan.

Table 3.4 summarizes the minimum sample volumes, container, preservation, and holding times for each analyte (note these criteria may change depending on the laboratory or changes in analytical methods). This information is from the *USEPA Methods for Chemical Analysis of Water and Waste Water* (*EPA-600/4-79-020, 1983*).

Table 3.1: Monitoring Program Approved Mine

Station	Description	Phase	Monitoring Parameters	Frequency
Mine Site				
MEL-D-1	Dewatering: Water transferred from lakes to Meliadine Lake during dewatering of lakes	Construction	As defined in the Water Management Plan referred to in Part D, Item 12	Prior to discharge and Weekly during discharge
			Volume (m3)	Daily during periods of discharge
MEL-SR-1 to TBD	Surface Runoff: runoff downstream of Construction areas at Meliadine Site and Itivia Site, Seeps in contact with the roads, earthworks and any Runoff and/or discharge from borrow pits and quarries	Construction, and Operation	As defined in the Water Management Plan referred to in Part D, Item 18	Prior to Construction, Weekly during Construction
			Group 1	Monthly during open water or when water is present upon completion
MEL-11	Water Intake from Meliadine Lake	Construction, Operation, and Closure	Full Suite	Monthly during periods of intake
			Volume (m^3)	Daily during periods of intake
MEL-12	Contact Water Treatment Plant (pre-treatment) coming from CP1, off the pipe and not in the pond	Construction (prior to release), Operations, and Closure	Group 1	Monthly during periods of discharge
MEL-13-01-MEL-13-07-MEL-13-10[(a)]	Mixing zone in Meliadine Lake and MDMER exposure stations for final discharge point within mixing zone	Construction (prior to release), Operations, and Closure	Full Suite, Group 3 (MDMER)	Monthly during periods of discharge
MEL-14	Contact Water Treatment Plant from CP1 (post-treatment): end of pipe in the plant before offsite release	Construction (upon effluent release), Operations, and Closure	Full Suite, Group 3	Prior to discharge and Weekly during discharge
			Volume (m3)	Daily during periods of discharge
			Acute Lethality	Once prior to discharge and monthly thereafter
MEl-15	Local lake E-3	Operations, and Closure	Group 2	Bi-annually during open water
MEL-16	Local Lake G2	Construction, Operations, and Closure	Group 2	Bi-annually during open water

Station	Description	Phase	Monitoring Parameters	Frequency
MEL-17	Local Pond H1	Construction, Operations, and Closure	Group 2	Bi-annually during open water
MEL-18	Local Lake B5	Construction, Operations, and Closure	Group 2	Bi-annually during open water
MEL-19	CP2, Collection of drainage from WRSF3	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-20	CP3 Collection of drainage from dry stacked tailings	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-21	CP4 Collection of drainage from WRSF1	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-22	CP5 Collection of drainage from WRSF1 and WRSF2	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-23	CP6 Collection of drainage from WRSF3	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-24	Seepage from the Landfill between the landfill and Pond H3	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-25	Secondary containment area at the Itivia Site Fuel Storage and Containment Facility	Construction, Operation, Closure	Group 4, Volume (m3)	Prior to discharge or transfer of Effluent
MEL-26	Itivia Harbour end of pipe (before offsite release) for treated saline effluent	Operations, and Closure	MDMER	As per MDMER requirements

Table 3.2: Proposed Monitoring Program Meliadine Extension

Station Id[(a)]	Description	Phase[(b)]	Monitoring Parameters	Frequency
Mine Site				
MEL-27	SP6 Collects Saline Water from underground and other saline ponds and sumps as well as runoff from the TSF	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-28	CP7 Collects water from WRSF7 and prevents contact water from flowing into F Zone open pits.	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-29	CP8 Collects surface contact water from open pits and mine operations	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-30	CPD1 Collects contact water from WRSF8 and DIS01 open pit.	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-31	CPD2 Collects contact water from WRSF9 and DIS01 open pit.	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-32	SPD1 Collects contact water from CPD1, CPD2, the ore pad, industrial pad, Saline WRSF 3 and fuel pad. It will also serve as a saline water storage pond for underground mining.	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-33	SP5 Collects contact water from ore pad, industrial pad, saline WRSF 4, and store the ground water from Tiriganiaq - Wolf underground.	Operations, and Closure	Group 1	Monthly during open water or when Water is present

a) New proposed stations. The final monitoring stations for Meliadine Extension need to be approved by the NWB during the draft Water Licence Amendment process.

b) Monitoring at the new stations would start once construction of the new infrastructure has been completed

Table 3.3: Approved Monitoring Parameters

Group	Parameters
1	pH, turbidity, hardness, total alkalinity, sodium, magnesium, potassium, calcium, chloride, fluoride, silicate, sulphate, total dissolved solids (TDS; calculated[a,b]), total suspended solids (TSS), total cyanide, ammonia nitrogen, nitrate, nitrite, phosphorus, orthophosphate, Total Metals (aluminum, arsenic, barium, cadmium, chromium, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, thallium, and zinc).
2	**Total and Dissolved Metals**: aluminum, antimony, arsenic, barium, beryllium, boron, cadmium, chromium, copper, iron, lead, lithium, manganese, mercury, molybdenum, nickel, selenium, silver, strontium, thallium, tin, titanium, uranium, vanadium, and zinc. **Nutrients**: ammonia-nitrogen, total Kjeldahl nitrogen, nitrate-nitrogen, nitrite-nitrogen, orthophosphate, total phosphorus, total organic carbon, dissolved organic carbon, and reactive silica. **Conventional Parameters**: bicarbonate alkalinity, chloride, carbonate alkalinity, turbidity, conductivity, hardness, calcium, potassium, magnesium, sodium, sulphate, pH, total alkalinity, TDS (calculated[a,b]), TSS, total cyanide, free cyanide, and weak acid dissociable (WAD) cyanide.
3	**MDMER parameters**: total cyanide, arsenic, copper, lead, nickel, zinc, radium-226, TSS, pH, total ammonia and temperature. **MDMER toxicity for the freshwater discharge**: Effluent volumes and flow rate of discharge, Acutely Lethality tests (Rainbow Trout and Daphnia magna) **MDMER toxicity for the marine discharge:** acute lethality three-spine stickleback.
4	Total arsenic, total copper, total lead, total nickel, TSS, ammonia, benzene, toluene, ethylbenzene, xylene, total petroleum hydrocarbons (TPH), and pH
Full Suite	Group 2, Total Petroleum Hydrocarbons, Turbidity. Non Acutely-lethal (Rainbow Trout and Daphnia magna) for discharge only.
Flow	Flow data-logger
Field measurements	Field pH, specific conductivity, dissolved oxygen, and temperature.

[a] Standard Methods (Method 1030E, American Public Health Association (APHA) 2012. Standard Methods for the Examination of Water and Wastewater, 22nd Edition, with updates to 2015.)
[b] TDSCalc (mg/L) = (0.6 x Total Alkalinity as CaCO3) + Sodium + Magnesium + Potassium + Calcium + Sulfate + Chloride + Nitrate + Fluoride + Silicate

VOC (MAH, CAH, THM, BTEX) (3)	28d	28d	28d	28d	2 Vial+1 blank	TSS	2/40ml

Type of bottle:
P.S.V.T.: plastic bottle, bag or glass bottle with Teflon cap
P, T: Plastic bottle or plastic bottle with Teflon cap
P.T.V.: Plastic bottle or glass bottle with plastic or Teflon cap
PPS: Sterile propyl ethylene bottle
VA: Clear or amber glass with aluminium or Teflon seal
VB: Amber glass (or clear glass covered with aluminium paper) aluminium seal of Teflon
VT: Clear or amber glass bottle with Teflon seal
Preservative:
AC: 0.1ml (100µl) of HCl per 100ml of sample
AcZn: 0.2ml zinc acetate 2N per 100ml of sample and NaOH 10N to pH >9
AN: HNO3 to pH <2
AS: H2SO4 to pH <2
E: 2.5ml EDTA 1.5% (p/v) per 100ml of sample if heavy metals are suspected
ED: 0.1ml diamine ethylene 45 mg/l per 100 ml of sample
EDTA: 1ml EDTA 0.25M per 100ml of sample
N: No preservative
NaOH: NaOH 10N to >12
TS: Sodium thiosulfate final concentration in the sample of 0.1% (p/v)

3.1.2 Compliance Monitoring Stations and Discharge Criteria

Further details of the specific CM stations and discharge criteria stipulated under the Licence are provided below. The compliance monitoring stations and discharge criteria for Meliadine Extension is to be discussed and approved by the NWB during the Water Licence Amendment process.

Dewatering Activities

All Waters from dewatering activities at Monitoring Program Stations MEL-D-1 through MEL-D-TBD shall be directed to Meliadine Lake or as other described in the Adaptive Management Plan and shall not exceed the quality limits presented in Table 3.5 as stipulated in Part D, Item 12 of the Licence.

Table 3.5: TSS and pH Criteria at CM Stations MEL-D-1 through MEL-D-TBD

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of Any Grab Sample
Total Suspended Solids (TSS) (mg/L)	15.0	30.0
pH	6.0 to 9.5	6.0 to 9.5

All surface runoff and/or discharge from drainage management systems, at the Monitoring Program Stations MEL-SR-1 to MEL-SR-TBD during the Construction/Operation of any facilities and infrastructure associated with the Meliadine Mine, including laydown areas and All-weather Access Road, where flow may directly or indirectly enter a Water body, shall not exceed the Effluent quality limits presented in Table 3.6, as stipulated in Part D, Item 18 of the Licence.

Table 3.6: Effluent Criteria at CM Station MEL-SR-1 to MEL-SR-TBD

Parameter	Maximum Average Concentration	Maximum Concentration of Any Grab Sample
Total Suspended Solids (TSS) (mg/L)	50.0	100.0
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	6.0 to 9.5	6.0 to 9.5

Site Water Collection System

Effluent discharged from CP1 at CM station MEL-14 shall be directed to Meliadine Lake through the Meliadine Lake Outfall Diffuser and shall not exceed the effluent quality limits presented in Table 3.7, as stipulated in Part F, Item 3 of the Licence and within MDMER.

Table 3.7: Effluent Criteria at CM Station MEL-14

Parameter	Unit	Maximum Authorized Monthly Mean Concentration	Maximum Authorized Concentration in a Grab Sample
Conventional Constituents			
pH		6.0 to 9.5[(a)]	6.0 to 9.5[(a)]
Total Dissolved Solids (TDS) (calculated)	mg/L	3,500	4,500
Total Suspended Solids (TSS)	mg/L	15[(a)]	30[(a)]
Nutrients			
Total Ammonia (NH_3-N)	mg-N/L	14	18
Total Phosphorous (P)	mg-P/L	2.0	4.0
Total Metals			
Aluminum (Al)	mg/L	2.0	3.0
Arsenic (As)	mg/L	0.3	0.6
Cyanide (CN)	mg/L	0.5	1.0
Copper (Cu)	mg/L	0.2	0.4
Lead (Pb)	mg/L	0.1[(a)]	0.2[(a)]
Nickel (Ni)	mg/L	0.5[(a)]	1.0[(a)]
Zinc (Zn)	mg/L	0.4	0.8
Others			
Total Petroleum Hydrocarbons (TPH) (mg/L)	mg/L	5.0	5.0
Radium 226[(a)]	Bq/L	0.37	1.11

[(a)] (MDMER, 2002)

The Discharge of Effluent from the Final Discharge Point at Monitoring Program Station MEL-14 shall be demonstrated to be non-Acutely Lethal as per test methods in the MDMER (GC 2002).

Saline effluent discharged at CM station MEL-26 shall be directed to Itivia Harbour through a submarine Pipeline and Diffuser and shall not exceed the effluent quality limits presented in Table 3.8, as stipulated in MDMER Schedule 4 (GC, 2002). The Discharge of Effluent from the Final Discharge Point at Monitoring Program Station MEL-26 shall be demonstrated to be non-Acutely Lethal as per test methods in the MDMER (GC, 2002).

Table 3.8: Effluent Criteria at CM Station MEL-26

Parameter	Unit	Maximum Authorized Monthly Mean Concentration	Maximum Authorized Concentration in a Grab Sample
Arsenic (As)	mg/L	0.3	0.6
Copper (Cu)	mg/L	0.3	0.6
Cyanide (CN)	mg/L	1.0	2.0
Lead (Pb)	mg/L	0.2	0.4
Nickel (Ni)	mg/L	0.5	1.0
Zinc (Zn)	mg/L	0.5	1.0
Total Suspended Solids (TSS)	mg/L	15.0	30.0
Radium-226	Bq/L	0.37	1.11
Un-ionized ammonia	mg-N/L	0.50	1.00

Itivia Marshalling Area

Surface water runoff from the bulk fuel tank storage areas is collected within the tank's secondary containment enclosures that are equipped with an HDPE liner; these are designed to contain petroleum products released due to spill events. Water collected in the secondary containment enclosures at CM station MEL-25 is discharged to land in a controlled manner according to the Licence.

All effluent being discharged from the secondary containment enclosures at the Itivia marshalling facility shall not exceed the effluent quality limits presented in Table 3.9, as stipulated in Part F, Item 5 of the Licence.

Receiving Environment

Receiving water quality monitoring is discussed in the Aquatic Effects Management Program (AEMP) (Azimuth 2022) and the Ocean Discharge Monitoring Plan (ODMP) (Agnico Eagle 2021). Within the AEMP and ODMP are numerous monitoring programs: water quality, sediment quality, benthic invertebrate communities, and fish health and fish tissue chemistry.

Table 3.9: Effluent Criteria at CM Station MEL-25

Parameter	Unit	Maximum Authorized Monthly Mean Concentration	Maximum Authorized Concentration in a Grab Sample
pH		6.0 to 9.5	6.0 to 9.5
Total Suspended Solids (TSS)	mg/L	15.0	30.0
Benzene	µg/L	370	370
Toluene	µg/L	2	2
Ethylbenzene	µg/L	90	90
Lead (mg/L)	mg/L	0.1	0.1
Oil and Grease (mg/L)	mg/L	5 and no visible sheen	5 and no visible sheen

3.2 Event Monitoring

The Event Monitoring (EM) program addresses the site-specific monitoring that is required following any accidental release. A "release" may be caused by:

- Spills, including unidentified seepage (Spill Contingency Plan); or
- Emergencies (Risk Management and Emergency Response Plan).

The EM program is designed to verify whether contamination of the surface soil and/or any nearby receiving environment and active zone has occurred as a result of an accidental release of a hazardous material or contaminated water. Verification is done through monitoring of surface runoff and nearby receiving environment during and following remedial activity. It is anticipated that due to the presence of permafrost beneath most of the mine footprint (active layer app 1.5m in depth), there will be minimal impact to groundwater from surface spills or accidental releases.

The EM plan is developed on a site-specific basis subsequent to a spill or other incident, and considers the type of product spilled, the potential receptors and the potential for any remaining contamination after clean-up. The plan is coordinated by the Environment Department.

In the event of an accidental release, the water quality of any downstream receptor as well as an upstream reference (background) is sampled to determine severity of impact. Should the spill have happened over snow cover, as much contaminated snow will be removed as possible. Verification sampling would occur in the area after thaw to determine if the clean-up is complete or if further remediation is necessary. The specific parameters monitored as part of the EM program will depend on the nature of the spill and will be determined for the specific material released.

The EM program for a particular spill will cease upon obtaining satisfactory analytical results from the potentially affected areas or as required by regulators.

3.3 Adaptive Response Approach

Results of the water quality monitoring are reviewed by the Meliadine Environment Department. Chemical trends of constituents of interest are tracked for mine site monitoring and for the AEMP program. This allows for early detection of significant changes in water quality within the mine site prior to discharge. If triggers and thresholds, such as in the AEMP program, are exceeded in the receiving environment action plans are then implemented to ensure that environmental protection objectives are met.

An adaptive management program has been designed for the Meliadine Gold Mine to evaluate the monitoring data and provide a framework for action, if necessary. The program has two levels - a trigger level to compare the monitoring data against, and an action plan of mitigative measures for identified exceedances.

The adaptive management program is divided into two sections, one for parameters with regulated discharge criteria at specific monitoring locations, as specified in the Licence and by the Metal Diamond Mining Effluent Regulations (MDMER). The second section is for measured parameters for which no discharge limits have been identified in the Licence such as those in the AEMP or Environmental Effects Monitoring (EEM).

3.3.1 Adaptive Management Program for Regulated Discharge

Action Plan

In the case of an exceedance of a Licence limit or MDMER discharge limit, an action plan will be implemented. The adaptive management program requires that if one or more of the key monitored parameters exceed the respective limits, a staged sequence of responses will follow. Table 3.10 summarizes the staged adaptive action plan for the CM program for regulated discharge. Figure 3.3 is a logic diagram showing the decision path for evaluating analytical results for regulated discharges.

In addition to the mitigative measures listed above, a number of other possible alternatives are available to reduce or treat contaminants. These mitigation measures include:

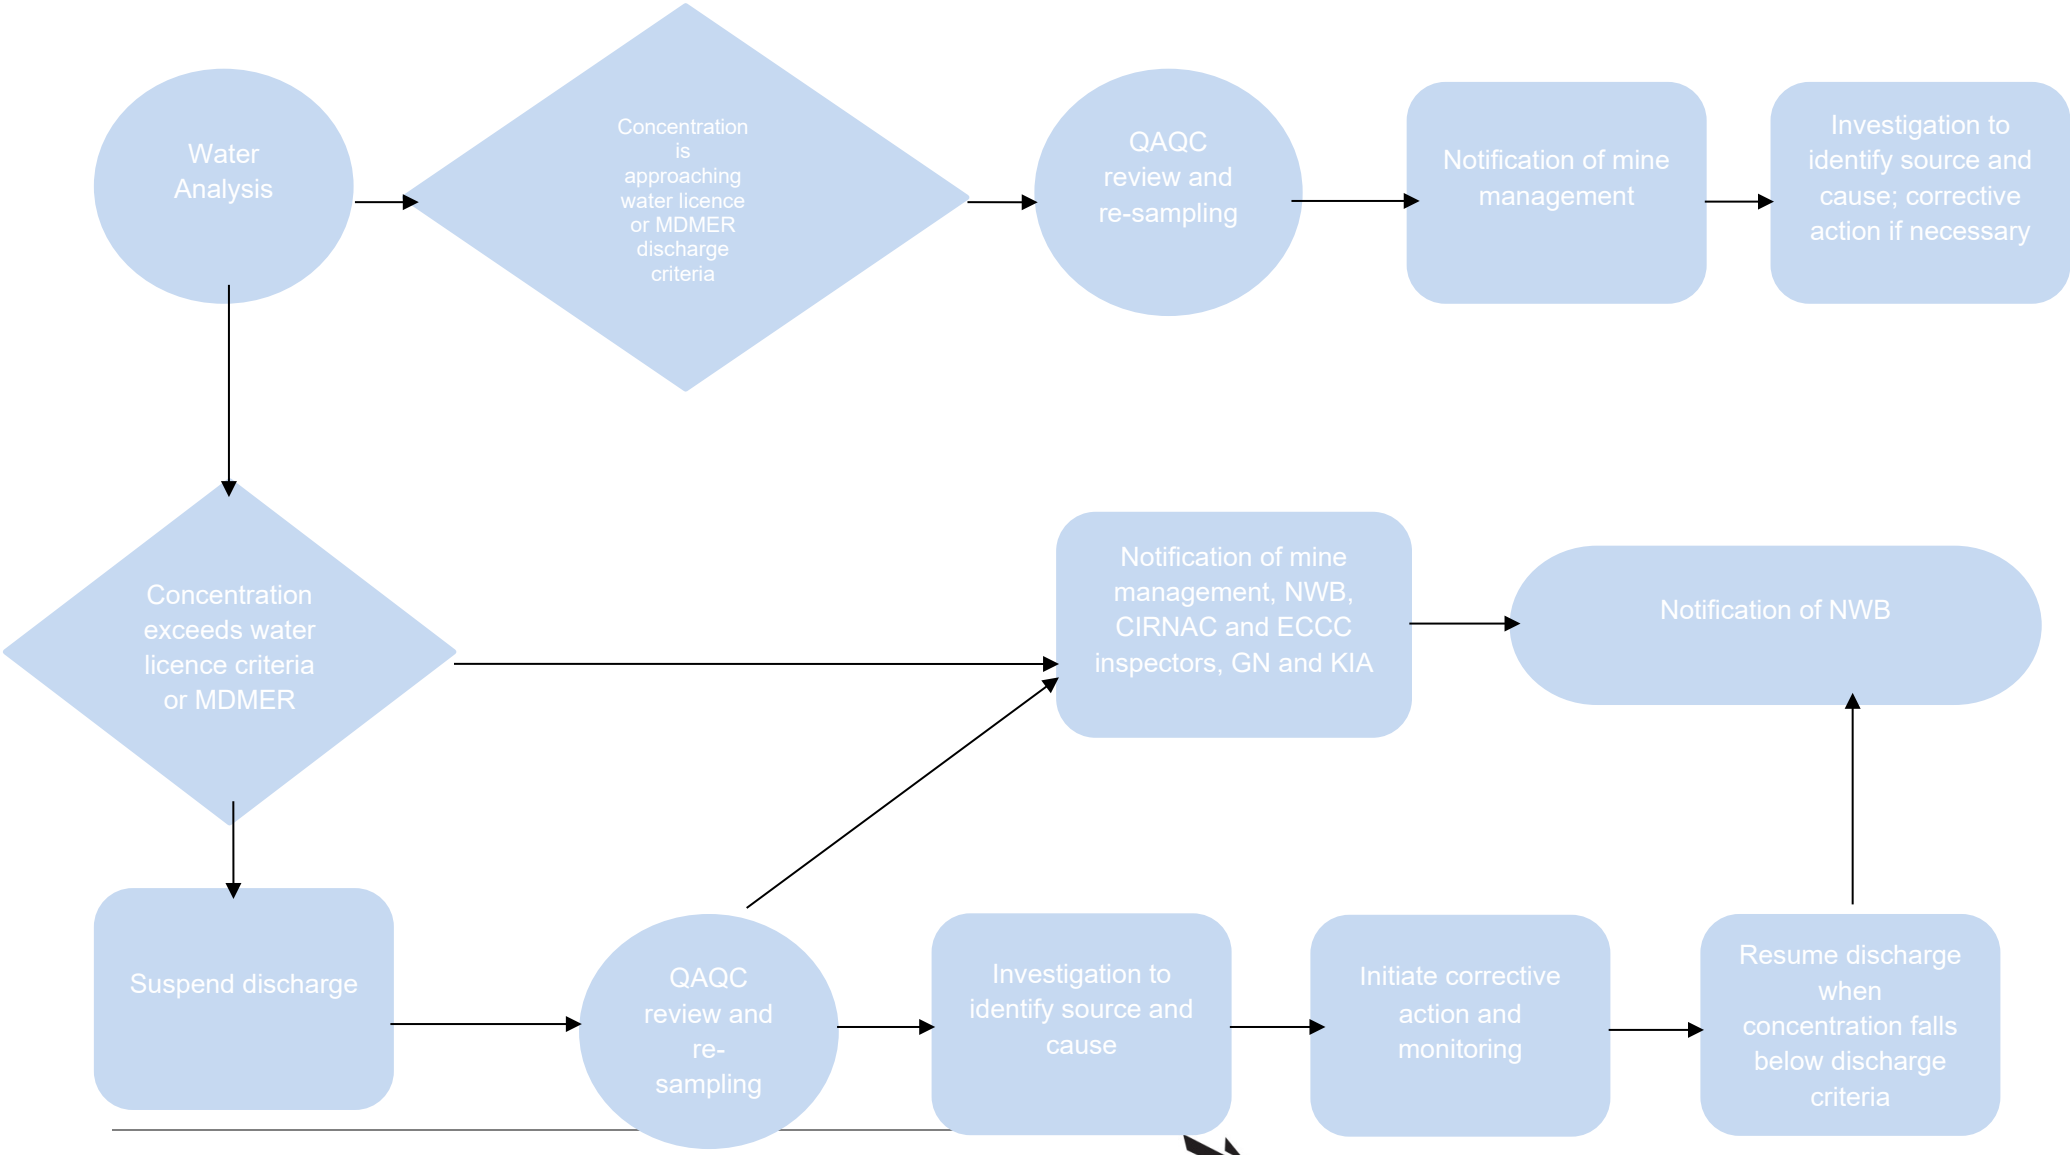
- Best management practices for sediment and erosion control would be employed to reduce TSS concentrations (i.e., flow control, sedimentation basin construction silt fencing, etc.; see Sediment and Erosion Management Plan);
- Addition of a coagulant for the reduction of TSS in pond water;
- Use of geotextile or re-armoring of banks to filter and reduce TSS in pond/ditch water;
- Deployment of absorbent booms and/or barriers within ponds to isolate surface petroleum hydrocarbon films for removal and/or treatment;
- Adjustments to on-site sewage treatment for the reduction of BOD and E. coli concentrations;
- Addition of lime to increase a low pH value or reduce metal concentrations;
- Removal of the offending source rock or the prevention of surface waters coming into contact with the offending source rock in the case of ARD; and/or

- Implementation of the Freshet Action Plan to proactively identify any issues around areas of concern; conduct additional monitoring, and control and contain seepage or movement of TSS on site.

Table 3.10: Action Plan for Regulated Discharge

Example	Action Plan
Exceeds water licence discharge criteria or MDMER	1. Suspension of discharge activities; 2. QA/QC review and analysis, and re-sample water at the particular location if necessary; 3. Notification of mine management (General Mine Manager or designate and Environment Superintendent, or designate) and the regulators: Nunavut Water Board, CIRNAC and ECCC inspectors, GN and the Kivalliq Inuit Association; 4. Investigation to identify possible source(s) and cause(s) of the exceedance; 5. Initiation of corrective actions or water treatment, and follow up monitoring; and 6. Resumption of discharge when concentrations are below the discharge criteria

Figure 3.3: Logic Diagram for Regulated Discharge



3.3.2 Adaptive Management Program for Non-Regulated Discharge

Aside from targeted monitoring studies (i.e., "Effects Assessment Studies") such as those following construction, the AEMP is the main program aimed at measuring and assessing potential impacts of contaminants in the receiving aquatic environment that are not regulated under MDMER or NWB. This program combines with the EEM required under MDMER.

The program is designed to take an integrated, ecosystem-based approach that links mitigation and monitoring of physical/chemical effects to key ecological receptors in the receiving environment. It addresses key issues identified in the Meliadine EA (i.e., mining-related activities with the potential to affect water quality, fish habitat and fish populations). Monitoring results are intended to inform the "adaptive management" process, supporting the early identification of potential problems and development of mitigation options to address them by comparing results to established threshold and trigger levels.

AEMP Action Level and Significance Threshold

The AEMP Response Framework links monitoring results to management actions, with the purpose of maintaining the assessment endpoints within acceptable ranges. It is a systematic approach for evaluating AEMP results and responding appropriately, such that potential unexpected effects are identified and mitigation is undertaken to reduce or reverse them, thereby preventing the occurrence of a significant adverse effect. This is accomplished by continually evaluating monitoring data and implementing follow-up actions (e.g., confirmation, further study, mitigation) at pre-defined levels of change in measurement endpoints (i.e., Action Levels). For purposes of this Response Framework, the following terms are used: effect, normal range, benchmark, Action Level, and Significance Threshold.

Action Level – Action Levels (Low, Moderate, and High) are pre-defined levels of environmental change that exceeds normal ranges or benchmarks, or results of statistical tests, or a combination of these. For example, exceedance of the normal range and approach of a benchmark by a water quality parameter in the near-field exposure area may be defined as the Low Action Level. A change that falls within the normal range of variability for the study area would not trigger an Action Level.

Significance Threshold – The Significance Threshold, for the purposes of an AEMP Response Framework, is a magnitude of change that would result in significant adverse effects. It is a clear statement of environmental change that must never be reached. The AEMP Response Framework is designed to prevent reaching the significance threshold for all assessment endpoints.

Action Levels

The proposed Action Levels are designed to provide an early warning indication of potential adverse effects to plankton and benthos (i.e., food for fish), to fish health, and to the assurance of normal ecological function (including water quality and sediment quality). The proposed Low Action Levels (Table 8-2 and 8-3) are designed such that changes of sufficient magnitude to trigger a Low Action Level response are reported, documented, investigated, and ultimately addressed (i.e., mitigation measures or operation

changes are implemented) before Significance Thresholds would ever be reached; if a Low Action Level is reached, Medium and High Action Levels (with response actions) are developed to provide further adaptive management guidance to the Mine to avoid reaching the Significance Thresholds. The type of management response taken after reaching an Action Level will depend on the type and magnitude of effect observed.

Further details on AEMP action levels and significance thresholds are provided in Azimuth (2022).

SECTION 4 • QUALITY ASSURANCE/QUALITY CONTROL PROCEDURES

Quality Assurance (QA) refers to plans or programs that encompass a wide range of internal and external management and technical practices designed to ensure the collection of data of known quality that matches the intended use of the data. Quality Control (QC) is a specific aspect of QA that refers to the internal techniques used to measure and assess data quality. Specific QA and QC procedures that will be followed during compliance-related sampling are described in Section 4.1 and 4.2 and are further detailed in the Quality Assurance/Quality Control Plan.

4.1 Quality Assurance

Quality assurance protocols are diligently followed so data are of known, acceptable, and defensible quality. There are three areas of internal and external management, which are described in the following three sections.

4.1.1 Field Staff Training and Operations

To make certain that field data collected are of known, acceptable, and defensible quality, field staff are trained to be proficient in standardized field sampling procedures, data recording, and equipment operations applicable to the monitoring program. All field work will be completed according to specified instructions and established technical procedures for standard sample collection, preservation, handling, storage, and shipping protocols. Thus, minimizing risk of operational errors.

4.1.2 Laboratory

To make sure that high quality data are generated, external CALA accredited laboratories have been selected for sample analysis. Accreditation programs are utilized by the laboratories so that performance evaluation assessments are conducted routinely for laboratory procedures, methods, and internal quality control.

The assay lab at the Mine site is not an accredited laboratory but will be used periodically for “real-time” results for some parameters like pH, total suspended solids, and Weak Acid Dissociable Cyanide. These results are for observational purposes and do not meet the standards of an accredited laboratory.

4.1.3 Office Operations

A data management system is utilized so that an organized consistent system of data control, data analysis, and filing will be applied to the monitoring program. Relevant elements will include, but are not limited to the following:

- All required samples are collected;
- sampling stations are clearly identified, and GPS coordinates collected and stored;
- chain-of-custody and analytical request forms are completed correctly (as per the Quality Assurance/Quality Control Plan);

- proper labelling and documentation procedures are followed, and samples will be delivered to the appropriate locations in a timely manner;
- laboratory data will be promptly reviewed once they are received to validate data quality;
- appropriate logic checks will be completed to ensure the accuracy of the calculations.

4.2 Quality Control

The QC component consists of applicable field and sample handling procedures, and the preparation and submission of two types of QC samples to the various laboratories involved in the program. The QC samples include blanks (e.g., travel, field, equipment) and duplicate/split samples.

Sample bottle preparation, field measurement and sampling handling QC procedures include the following:

- New laboratory supplied containers are used for sample collection. The bottles are either polyethylene plastic or glass, dependent on the specific parameter being analyzed.
- Sample bottles are kept in a clean environment, capped at all times, and stored in clean shipping containers. Samplers keep their hands clean, wear gloves, and refrain from eating or smoking while sampling.
- All bottles are identified with station number and date of collection.
- Where sampling equipment must be reused at multiple sampling locations, sampling equipment is cleaned appropriately between locations.
- Temperature, pH, and specific conductivity are measured in the field using hand held meters such as HACH test kit – 2100 Q Portal Turbidimeter (turbidity), Oakton PCS35 Meter (pH and conductivity), and Eureka Manta II (pH, dissolved oxygen and conductivity). The instruments are calibrated before each sample event to ensure optimal performance and record of the calibration are kept in a Calibration log. Maintenance procedures will be followed as set out by the supplier's operation manual.
- Samples are cooled to between 4 °C and 10˚C as soon as possible after collection and maintained at approximately 4 °C in a refrigerator until shipping. Care is taken when packaging samples for transport to the laboratory to maintain the appropriate temperature (between 4°C and 10˚C) and minimize the possibility of rupture. Where appropriate, samples are treated with laboratory-provided preservatives to minimize physical, chemical, biological processes that may alter the chemistry of the sample between sample collection and analysis.
- Samples are shipped to the laboratory as soon as reasonably possible to minimize sample hold times. If for any reason, samples do not reach the laboratory within the maximum sample hold time for individual parameters, the results of the specific parameters will be qualified, or the samples will not be analysed for the specific parameters.
- Chain of custody sample submission forms are completed by field sampling staff and submitted with the samples to the laboratory. Furthermore, an electronic copy is emailed to the laboratory upon shipping and a second electronic copy is maintained at the Mine Site for reference.

- Only staff with the appropriate training in the applicable sampling techniques conduct water sampling.

Quality control procedures implemented consist of the preparation and submission of QA/QC samples, such as field blanks, trip blanks, and duplicate water samples. These are defined as follows:

- Field Blank: A sample prepared in the field using laboratory-provided deionized water to fill a set of sample containers, which is then submitted to the laboratory for the same analysis as the field water samples. Field blanks are used to detect potential sample contamination during collection, shipping and analysis.
- Travel Blank: A sample prepared and preserved at the analytical laboratory prior to the sampling trip using laboratory-provided deionized water. The sample remains unopened throughout the duration of the sampling trip. Travel blanks are used to detect potential sample contamination during transport and storage.
- Duplicate Sample: Two samples collected from a sampling location using identical sampling procedures. They are labelled, preserved individually and submitted for identical analyses. Duplicate samples are used to assess variability in water quality at the sampling site. Duplicates are collected and submitted for analyses at approximately 10% of sampling locations. For smaller batches of samples (less than 10), at least one duplicate will be collected and submitted for analysis. Upon receipt of analytical results, the field/trip blank and duplicate analyses are verified for potential contamination and accuracy, respectively. Results are interpreted, and recommended actions are taken if necessary.

SECTION 5 • FLOW VOLUMES

Where applicable, flow volumes within the mine footprint will be tracked daily during periods of discharge. Flow volume measurements will be conducted using volumetric flow meters attached to applicable pumps or by applying pump time and capacity methods when flow meters are not possible (e.g., when a power source is not available). For applicable permanent pumping arrangements, such as fresh water pumping systems, flows will be measured using permanent in line flow meters. For periodic batch discharges, such as secondary containment sumps, portable flow meters or calculated pump time and capacity methods will be used.

The monitoring locations for water flow volumes, in accordance with Part I, Item 8, and Table 2 of the Licence, include:

- The volume of fresh Water obtained from Meliadine Lake at Monitoring Program Station MEL-11;
- The volume of fresh Water transferred to the Meliadine Lake during lakes' dewatering activities;
- The volume of fresh Water obtained along the road and Meliadine River for dust suppression activities;
- The volume of Effluent discharged from Final Discharge Point at Monitoring Program Station MEL-14;
- The volume of reclaim Water obtained from CP1;
- The volume of Effluent discharged onto tundra at Monitoring Program Station MEL-25 or transferred to CP1 from the Itivia Site Fuel Storage and Containment Facility; and
- The volume of Effluent and Fresh Water transferred to the pits during pits' flooding.

Flow volume measurements will be conducted to and from key containment ponds such as CP8 and SP6. The monitoring locations for water flow volumes will be defined during the Water Licence Amendment process for Meliadine Extension.

SECTION 6 • REPORTING

Reporting of water quality results is to be conducted on two levels a) monthly and annually with the results of the monitoring program and per MDMER requirements and b) in response to exceedances.

6.1 Annual Reporting

An annual report is to be submitted to the NWB, Kivalliq Inuit Association, Fisheries and Oceans, Crown-Indigenous Relations and Northern Affairs Canada, Nunavut Impact Review Board, Government of Nunavut, and other interested parties by March 31st of the following year. The report is to summarize the following:

- Monitoring results for each sampling station during the year and for the life of mine (construction to end of closure); activities during the year at each station; and any exceedances at stations, the action plan applied to the exceedance, and the results of the action plan;
- Annual seep water chemistry results; including location of the samples, sources of the water collected, and results of chemical analyses of the samples;
- Receiving water monitoring results;
- Spills and any accidental releases; event monitoring activities conducted following containment, remediation, and reclamation; and the results of EM program, any exceedance in EM results, and the action plan following the exceedance;
- Measured flow volumes;
- Effluent flow rates, volumes and calculated chemical loadings following the requirements of MDMER; and
- Results of QA/QC analytical data.

6.2 Exceedance Reporting

Any measured concentration at a CM station exceeding a regulated discharge criterion stipulated in the Licence or MDMER will be reported to the NWB and Environment Canada and Climate Change upon receipt of the analysis. In addition, results of the action plan will be reported and, where necessary, mitigation options identified within 90 days after receipt of the analyses.

Exceedances in the concentration of a parameter in receiving water will be reported as specified in the AEMP and EEM – MDMER accordingly.

APPENDIX E • WATER BALANCE AND WATER QUALITY FORECAST

TECHNICAL MEMORANDUM

To:	**Jenyfer Mosquera and Colleen Prather (Agnico Eagle Mines Limited)**	**Date:**	**January 12, 2023**
From:	**Lorax Environmental Services Ltd.**	**Project:**	**A667-1**
Subject:	**Meliadine Extension Water Balance and Water Quality Model Update**		

1. Introduction

Agnico Eagle Mines Limited (Agnico Eagle) operates the Meliadine Mine, located 25 km north of Rankin Inlet in the Kivalliq region of Nunavut (Figure 1-1). The Project Certificate issued in 2015 included approval of a multi-phase approach to development, including mining of the Tiriganiaq deposit using open pit and underground mining methods and mining of the Pump, F Zone, Discovery and Wesmeg deposits using open pit methods. Meliadine Extension proposes to extend the life of the mine from 2032 to 2043 and the addition of underground mining activities at the already approved Wesmeg, Pump, F Zone, and Discovery deposits. Meliadine Extension includes the development of six gold deposits located within the previously approved footprint (F Zone, Pump, Wesmeg, Wesmeg North, Tiriganiaq-Wolf and Discovery) and associated infrastructure.

Lorax Environmental Services Ltd. (Lorax) was retained by Agnico Eagle to update the site-wide water balance and water quality model (WBWQM) to represent the annual progression of the Meliadine Extension mine layout, in support of the Water Licence Amendment process with the Nunavut Water Board. The modelling effort described in this memo supersedes several previous water balance and water quality models, described in the following technical reports:

- Lorax Environmental Services Ltd. (2022a). *Meliadine Extension Water Balance and Water Quality Model – Technical Report*. Prepared by Lorax Environmental Services Ltd. for Agnico Eagle Mines Ltd. February 2022. 1471 pp.
- Golder Associates Ltd. (2020). *Meliadine Site Water Balance and Water Quality Model. Type a 2AM-MEL 1631 Water Licence Amendment*. Prepared by Golder Associates Ltd. for Agnico Eagle Mines Ltd. August 2020. 146 pp.
- Golder (Golder Associates Ltd.). (2014). *Volume 7.0 Freshwater Environment. Final Environmental Impact Statement (FEIS) – Meliadine Gold Project*. Prepared for Agnico Eagle Mines Ltd. by Golder Associates Ltd. April 2014.

The purpose of this memo is to provide WBWQM results for the Meliadine Extension in support of the Water Licence Amendment Regulatory process with the Nunavut Water Board. This model iteration builds upon the WBWQM developed for the 2022 FEIS application (Base Case) using the GoldSim modelling platform (Lorax, 2022a), with certain modifications to incorporate additional information and refinements to the mine plan.

A summary of model updates and water management assumptions are provided in Chapter 2. Results for Operations discharge water volumes to Itivia Harbour and Meliadine Lake as well as annual water balances for all ponds, sumps and open pits are provided in Chapter 3, while water quality results for Operations, Active Closure and Post Closure are provided in Chapter 4. Supporting information is provided in the following Appendices:

- Appendix A. Mine Site Layout
  - A.1 Site layout with sub-catchment delineation
  - A.2 Sub-catchment surface areas
- Appendix B. Water Management Wire diagrams
- Appendix C. Source Terms and Geochemical Reports
  - C1. ACLC Kinetic Testing Report
  - C2. Tailings Kinetic Testing Report
  - C3. Source Term Update
- Appendix D. Water Quality Model Results
  - D.1 End of Pipe Results
  - D.2 Open Pits, Natural Lakes and Collection Pond Results
  - D.3 Conjoined Pit Lake Results

2. Model Setup

This section provides a summary of the updated site-wide WBWQM inputs and assumptions. The WBWQM is built in the GoldSim v14 software platform and is set-up to run on a daily time-step. The primary modelling objective is the prediction of water and solute load transfers within the mine site, and to the receiving environment during all phases of the proposed Meliadine Extension. The GoldSim WBWQM is configured to predict the transfer of water and solute mass (loadings) from mined and non-contact areas into the relevant water management facilities. All mixing is assumed to occur instantly, and all mass is conserved throughout the model (*i.e.*, no attenuation is applied to any of the parameters that are tracked).

All model inputs and assumptions, including the approach to water balance model calibration and underlying water balance processes remains consistent with what was presented in the 2022 FEIS WBWQM (Lorax, 2022a). Any departures from the assumptions or inputs to the 2022 FEIS WBWQM are summarized in the following section.

2.1 Model Inputs and Data Sources

The following section provides references for model inputs used for the WBWQM update. Many of these inputs have been updated from the 2022 FEIS WBWQM (Lorax, 2022a). A summary of updates between the 2022 FEIS and NWB WBQMs are provided in Table 2-1.

Mine Site Layout and Physical Features

- Meliadine Extension semi-annual mine plan site layouts (Tetra Tech 2022a). The end of mine life (2043) mine site layout is shown in Figure 2-1.
- Pond nomenclature updated (Tetra Tech, 2022a).
- The delineation of both the natural and mine-altered watershed areas was updated to reflect the optimized annual Extension layouts (Appendices A and B).

Water Management

- Waterline management strategy for the Waterline as defined in Agnico Eagle (2022a) based on the adaptive management plan and to meet Term and Condition 25.
- The 2022 FEIS WBWQM has been refined to integrate the comments from intervenors (KivIA), particularly with respect to optimizing the discharges to Itivia Harbour via the Waterline to reduce operational discharges to Meliadine Lake. Most water management was unchanged from what was assumed in the 2022 FEIS WBWQM with few notable exceptions related to refinements in infrastructure and water management strategies to

address technical comments arising from the NIRB review process (Agnico Eagle 2022b). The updates are summarized in Table 2-1.

- Annual mine layouts and sub-catchment areas are presented in Appendix A.
- Water management infrastructure and design specifications are defined by the Water Management Design Basis Report (Tetra Tech, 2022a).
- Managed and passive flows are summarized by wire diagrams used in the NWB WBWQM model and provided in Appendix B.

Water Balance

- Daily climate data prepared by Okane Consulting (OKC, 2022a-c) (with precipitation updated by Tetra Tech; 2022b).
- Watershed model sub-module generated runoff series, including pond ice growth and melt formulations (Lorax, 2022a).
- Estimates of runoff and net percolation based on OKC's landform modelling for the TSF and WRSFs (OKC, 2022a-b);

Groundwater

- Modelled base case groundwater inflows to underground workings and TDS predictions (WSP Golder, 2022). These modelled underground inflows were adjusted to reflect moisture entrained in ore and drilling brine re-circulation, based on operational monitoring data (Agnico Eagle, 2022c).

Source Terms and Water Quality

- Non-contact water quality developed from baseline monitoring data (Lorax, 2022a).
- Source terms developed for the 2022 FEIS WBWQM described in the Geochemical Characterization and Source Term Report (Lorax, 2022b) are applied herein with few notable updates. Updates are generally related to changes to the mine site layout, mine facility water balance, thermal modelling profiles, and final kinetic testing results. Source term updates are described in Appendix C.3.

Many of the above listed model inputs have been updated since the 2022 FEIS WBWQM as presented in Lorax (2022a). Model updates completed in support of the Meliadine Extension submission to the Nunavut Water Board are summarized in Table 2-1.

Table 2-1:
Meliadine Extension water balance and water quality model updates for Nunavut Water Board submission

Category	Component	Updates
Water Treatment and Discharge	Itivia Harbour Discharge	• Discharge window of June 20th to September 29th at 20,000m^3/day beginning in 2025 when the Waterline becomes operational, to reflect current operational management. This discharge window has been extended from the 2022 FEIS WBWQM model which assumed July 15th to September 30th, and Waterline completion has been delayed from 2023 to 2025. • No trucking of saline water to Itivia Harbour is assumed, instead, saline water is stored in TIRI02 Pit prior to the Waterline becoming operational in late-June 2025. The 2022 FEIS WBWQM assumed a trucking rate of 1,600 m^3/day for July 15 to September 30 prior to Waterline completion. • Waterline remains available for first two years of Active Closure (2044 and 2045). The 2022 FEIS WBWQM assumed that the Waterline was closed at the end of Operations. • The saline effluent treatment plant (SETP) treats TSS to ≤ 15mg/L and will treat NH_3 as necessary to meet end-of-pipe water discharge limits although no treatment efficiency is incorporated into the GoldSim model. The 2022 FEIS WBWQM assumed treatment of TSS to ≤ 15 mg/L and treatment of NH_3 to ≤ 10mg/L. • Waterline model logic has been modified in several ways to minimize discharge to Meliadine Lake. o Saline water stored in TIRI02 was prioritized for discharge in 2025 once the Waterline is available. o SP6 discharges via the Waterline are prioritized over discharges from CP1 but the amount of Waterline capacity reserved for SP6 varies from 25%-100% depending on time of year and pond level. Any unused capacity in the Waterline is utilized by water from CP1. o CP1 volume is targeted to remain below the maximum operating water level (MOWL) volume (742,075 m^3). When water levels need to be drawn down, water is first directed to the Waterline (if available capacity) or to the EWTP (and Meliadine Lake).
	Meliadine Lake Discharge	• Discharges from CP1 to Itivia Harbour via the Waterline are prioritized and maximized over discharges to Meliadine Lake. • The EWTP has a discharge window of June 1st to October 7th at 22,000 m^3/day for the duration of mine Operations. • Both the 2022 FEIS and NWB WBWQM assumed the EWTP treats TSS to ≤ 15 mg/L.
Physical Mine Features	Open Pits	• Pit shell volume-elevation-curves (VECs) and spill points refined to more accurately capture interaction with surrounding topography. • Pit wall runoff coefficient reduced to 0.50 (from 0.70 used in 2022 FEIS WBWQM) based on monitoring data from Whale Tail
	WRSFs	• Update sub-catchment areas in model to reflect updated mine site layouts (Tetra Tech, 2022a) o Minor changes to WRSF footprints to respect setbacks with adjacent water bodies o Discovery WRSFs repositioned to avoid gravity drainage to Lake W1 in Post Closure, and Discovery waste rock placed into two facilities (WRSF8 and WRSF9). • Passive flow pathway between WRSF5 and A8-West removed – WRSF drainage now collected by Channel 22 and routed to PUMP01
	TSF	• Minor changes to TSF footprint (refer to annual layouts; Appendix A1) • No changes to modelled TSF runoff and interflow depths
Geochemical Source Terms	Operations and Closure	• Source terms were updated to incorporate the following additional information and mine plan updates: o Water balance update for generic WRSF and Discovery WRSF (OKC, 2022b) o Thermal modelling update for Discovery WRSF (OKC, 2022c) o Additional WRSF at Discovery (WRSF8) (Tetra Tech, 2022b) o Groundwater inflow rates and TDS (WSP Golder, 2022) o Kinetic testing program final results incorporated into source term calculations (OKC, 2022d)
Water Management	Operations	• STP discharges (299 m^3/day) and surface contact water collected in CP3, CP4, and CP5 routed to TIRI02 until SP6 is online in 2025, then routed to SP6 • SP6 MOWL increased to 63.1 m from 62.7 m, resulting in an increase in total storage volume to 1.09 Mm^3 from 0.867 Mm^3 assumed in the 2022 FEIS WBWQM and pond design. • Modelled underground inflows predicted in WSP Golder (2022) adjusted to reflect moisture entrained in ore and drilling brine re-circulation, based on operational monitoring data (Agnico Eagle, 2022c). This results in reduced underground mine dewatering rates compared to the 2022 FEIS WBWQM which assumed dewatering rates would be equal to predicted groundwater inflow to underground mines. • Lake dewatering removed from mine water management system. This water will be managed through a separate TSS treatment system if required and discharged directly to Meliadine Lake. • Mine pits will passively flood once mining is complete in the pit and in any underlying underground mine workings with hydrogeologic connections (Section 2.2.1). The 2022 FEIS WBWQM assumed that all pits were dewatered for the duration of Operations.
	Closure	• Revised Post Closure routing for PUMP pits to maintain height of land between watershed A and watershed B o PUMP04 to West-A8, PUMP03, PUMP02 and PUMP01 route to B4 • Modified Post Closure routing for WN01-B5 Lake Complex to maintain height of land between watershed A and watershed B o WN01-B5 Lake to routes to B4 • TIRI04 directed to TIRI Pit Lake in Post Closure instead of WES01 pit complex • WES04 (1 month) and PUMP01 (3 months) are dewatered to Itivia Harbour via the Waterline at beginning of Active Closure then flooded with Meliadine Lake water • CP7 to be flooded with Meliadine Lake water during Active Closure • CP1 water routed to TIRI04 during Active Closure (beginning in 2044) at the same rate as it was routed to the EWTP during Operations. Once full, additional spillover flows routed to TIRI01 which merges with the larger TIRI lake complex after 2051

2.2 Water Management Assumptions

The mine water management plan is based upon two guiding principles: diverting clean (non-contact) water away from mine infrastructure where possible, and separating the two mine affected water types, as below and as shown in Figure 2-2. The WBM replicates the Normal Operating Conditions as defined in the *Adaptive Management Plan for Water Management* (Agnico Eagle, 2022a).

2.2.1 Operations Water Management and Flow Paths

Surface Contact Water: Surface contact water originating from developed areas will be intercepted and conveyed to the various collection ponds for temporary storage. The primary mine sources of surface contact water are the WRSFs, open pit dewatering, a portion of the TSF, laydown areas and facilities areas. All surface contact water is eventually conveyed to CP1. From CP1, surface contact water is routed through the Effluent Water Treatment Plant (EWTP) and discharged to the receiving environment. Discharge to Itivia Harbour is prioritized, with the remainder discharged to Meliadine Lake (Agnico Eagle, 2022a). At the Discovery site, surface contact and saline contact water will be managed in the Discovery saline pond (SPD1) and routed to SP6 for discharge to Itivia Harbour.

Saline Contact Water: Saline contact water originating from the underground mines will be pumped to saline contact water ponds (SPs) on the surface, and then routed to either TIRI02 (prior to 2025) or SP6 (2025 onwards). In addition to underground dewatering flows, saline contact water is generated by the ore pads, saline WRSFs, and the TSF (2025 onwards). All saline contact water will be eventually conveyed from TIRI02 or SP6 to the SETP, where it will be treated for total suspended solids (TSS) and potentially ammonia (NH_3) prior to discharge to the receiving environment (Itivia Harbour).

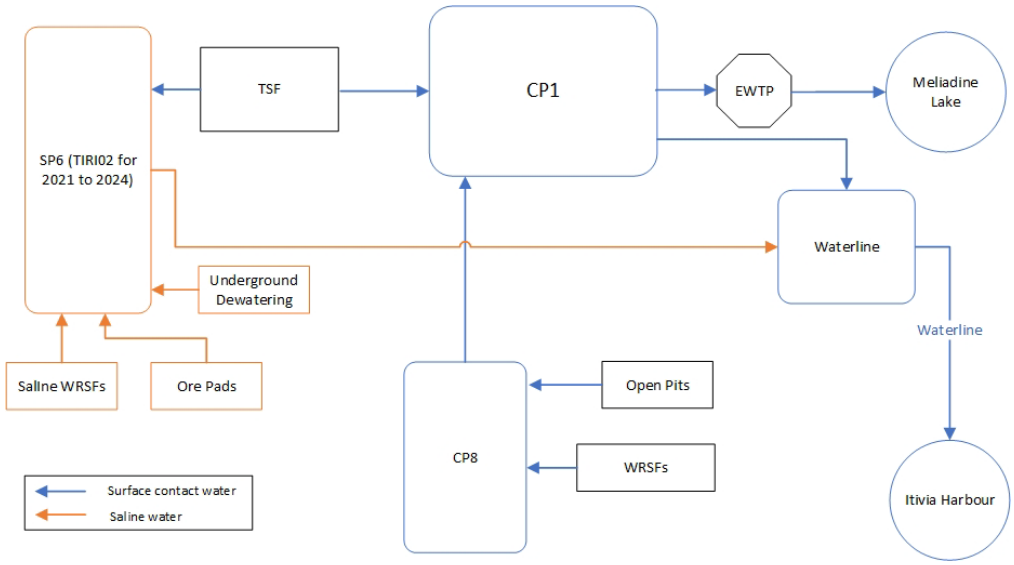

Figure 2-2: Conceptual site water management flow diagram for the Operations phase (simplified)

2.2.1.1 Collection Ponds and Pump Rates

Surface contact water is collected and routed through a series of collection ponds, with the Meliadine Extension mine infrastructure surface contact water routed to CP8, which is then transferred to CP1 prior to treatment and discharge. Saline contact water from the underground workings and saline WRSFs is collected by saline ponds (SPs). The key surface water and saline collection pond areas and berms are summarized in Table 2-1, along with a summary of pond and sump design volumes and routing (Table 2-2 and Table 2-3), followed by the design pump rates associated with each pond/sump (Table 2-4). Pond volumes, operating criteria and pumping rates were provided by Tetra Tech and approved by Agnico Eagle.

Surface contact water generated by the Pump mine area is collected in CP9 (located in the footprint of the PUMP01 pit), before being routed to CP8. Runoff and interflow from WRSF6 are collected by SUMPP1 and SUMPP2, which also route to CP8 (Figure 2-3).

The primary surface contact water collection pond for the F Zone mine area is CP7, which collects pit dewatering flows, as well as runoff and interflow from WRSF7 via SUMPF1. CP7 is routed to CP8 (Figure 2-3).

At the Discovery mine area, pit dewatering is directed to CPD1, and runoff and interflow from WRSF8 and WRSF9 is collected by CPD1 and CPD2, respectively, which route to SPD1 (Discovery Saline Pond), along with underground dewatering flows, prior to being pumped to SP6 (Figure 2-3). The full Extension Operations annual pit and underground mining and water management schedule is provided for reference in Table 2-5.

Table 2-2:
Existing (end of 2022) collection ponds for Meliadine Mine

Mine Plan	Pond/Treatment	Source Water	Design Volume (m^3)	Operation Period	Receives Water From	Routes Water To
2020 Water Licence Amendment (Existing Mine Layout)	CP1	Contact Water	742,075	2017 to Mine Closure	Landfill and Landfarm	EWTP and SP1

x = finished mining (UG or OP), no dewatering
- = Pre-mining

2.2.1.2 Underground Flows

Dewatering began in June 2018 as the Tiriganiaq underground was advanced, with dewatered volumes increasing steadily over time. Timing of peak dewatering does not appear to be consistent from year-to-year, however the highest dewatering rates typically occur between April and July. Underground dewatering is monitored using in-line totalizers with the monthly volumes is summarized in Table 2-6.

Table 2-6:
Monthly underground dewatering volumes (2018-2022)

Month	2018	2019	2020	2021	2022
January	0	2,718	534	9,021	8,928
February	0	1,629	2,906	8,148	8,064

Total	**37,770**	**37,031**	**103,484**	**106,215**	**87,552**

Underground dewatering volumes and salinity concentrations associated with future mine development were predicted using a 3D groundwater model (WSP Golder, 2022). The base case predicted inflows were subsequently adjusted to account for the calculated difference between the predicted and measured underground inflows over the 2020-2022 period in Agnico Eagle, (2022c). This is equivalent to an approximate ratio of 0.74 (measured: modelled). Further losses to ore moisture (assumed to equal 2% of ore mass are also applied, resulting in the adjusted values in Table 2-7. Owing to the elevated TDS of the groundwater system (Table 2-8) dewatering of all underground mines will be managed to SP6 and the saline water management system.

2.2.2 Closure and Post-closure flow paths

Several modifications to the pre-mining flow paths are proposed for the Post Closure period. Many of the pit complexes will develop into conjoined lakes, and in some cases, these will join with surrounding lakes (Figure 2-4).

The summary of these conjoined lakes is as follows:

- WN01-B5 (NORWES Pit Lake)
- TIRI01-03-WES01 (Tiri Pit Lake)

- WES02-03 (WES Pit Lake)
- FZONE01-02-03 (F ZONE Pit Lake)

In Post-closure, the water management objective is to ensure that pit lake water balances are maintained in a neutral or positive state (*i.e.*, only fluctuating in response to climate with no active management), and to route the majority of the remaining surface contact water emanating from the TSF and WRSFs to the 'A' watershed (Figure 2-4 and

Figure 2-6). The general flow path (from NW to SE) is as follows:

- The NORWES Pit Lake drains westward to the WN01/B5 Pit Lake;
- The PUMP02 Pit Lake drains to the PUMP03 Pit Lake, which in turn drains to the PUMP01 Pit Lake, with final routing to Lake B4;
- SP6 will drain into the Tiri Pit Lake;
- This water then reports to A8-West Lake via the WES Pit Lake, along with the TIR02/04 Pit Lake and the WES04 Pit Lake (via Lake A8-East);
- These combined flows then report to Lake A7 via an engineered channel, and then into Lake A6;
- Lake A6 flows into the F ZONE Pit Lake, then to A1 and finally to Meliadine Lake;
- CP1 reports to Meliadine Lake, and Lake B4 receives minimal amounts of contact runoff from the PUMP01, 02 and 03 Pit Lakes, WRSF5 and WRSF6 before flowing into B2, and finally Meliadine Lake;
- The reclaimed Tiriganiaq-Wolf Mine area will drain to Lake D4 with a natural catchment flow and water quality signature; and,
- At Discovery, WRSF8 and WRSF9 drain passively to the Discovery Pit Lake, which in turn overflows to Lake CH6 (Figure 2-5 and Figure 2-6).

3. Water Balance Results

Water balance model results are presented in this section, with a focus on the annual operational discharges to Itivia Harbour and Meliadine Lake (Section 3.1), along with a comparison to the results previously presented in Lorax (2022a; Section 3.2). Operations phase water balance time-series are provided for the key saline (SP6) and surface contact water collection (CP8 and CP1) ponds, as well as tabular summaries of annual water balances for the remaining sumps, ponds and open pits (Section 3.3). Active Closure water management is presented in Section 3.3.3, with a focus on the filling of open pit voids with surrounding catchment runoff and water pumped from Meliadine Lake.

3.1 Operational Mine Water Discharge to Itivia Harbour and Meliadine Lake

All surface contact water collected in the CP1 Pond is routed to the EWTP for treatment, targeting removal of TSS, before discharge to the receiving environment. Throughout Extension Operations, discharge priority for surface contact water is via the Waterline to Itivia Harbour, with the objective of minimizing operational discharges to Meliadine Lake as outlined in the Adaptive Management Plan for Water Management (Agnico Eagle, 2022a). Under the Base Case RCP4.5 climate scenario, discharges to Itivia Harbour average 1.9 Mm^3, with 0.94 Mm^3 routed from SP6 and 0.9 Mm^3 routed from CP1 (Figure 3-1).

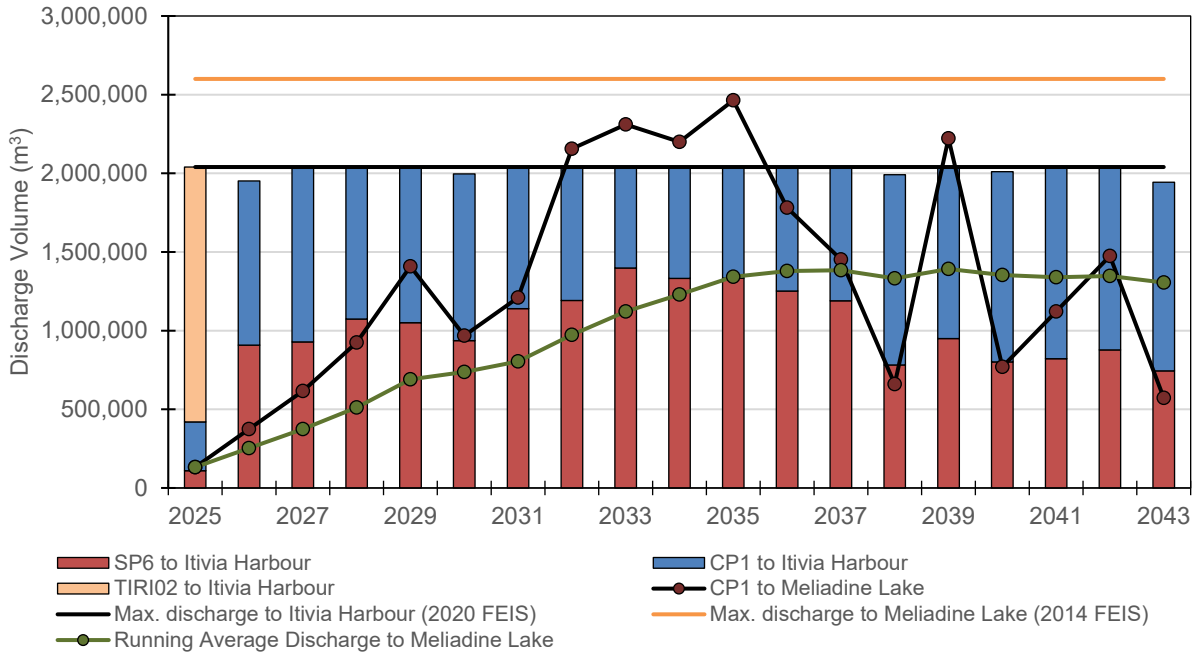

Figure 3-1: Annual discharges to Itivia Harbour from SP6 and CP1, and Meliadine Lake from CP1

Discharges to Meliadine Lake average 1.3 Mm^3/year, with the peak annual discharge of 2.5 Mm^3 occurring in 2035. Surface contact water discharges via the Waterline average 0.9 Mm^3/year, for a total average surface contact water discharge volume of 2.2 Mm^3/year (Figure 3-1).

The Meliadine Extension Operations period (2025-2043) can be separated into three periods, based on the mining sequence and associated dewatering requirements (Table 2-5).

Early Meliadine Extension (2025-2031);

- Saline water stored in TIRI02 pit is discharged as soon as the Waterline becomes available, dominating Waterline capacity in 2025;
- Mining of the TIRI01, WES04, WES01, WN01, PUMP01, and PUMP03 pits is completed, and mining begins at FZONE01 pit; and,
- Mining of the TIRI, PUMP, and Discovery undergrounds proceeds, with the latter reaching completion in 2031;

During the Early Meliadine Extension period, the mine area footprint is still limited relative to the full Extension area, with relatively limited pit dewatering required, but underground dewatering activities are near their predicted maxima, averaging 1,014 m^3/day. This permits a greater proportion of surface contact water to be discharged to Itivia Harbour than to Meliadine Lake. During this period, approximately equal amounts of surface contact water and saline water are discharged to Itivia Harbour, with approximately a 50/50 split in surface contact water routed to Itivia Harbour and Meliadine Lake (Table 3-1 and Figure 3-2). This period will allow further refinement of water balance predictions based on monitoring data, and optimization of water management practices at site, prior to the larger volumes requiring management that are anticipated during the 2032 to 2038 period.

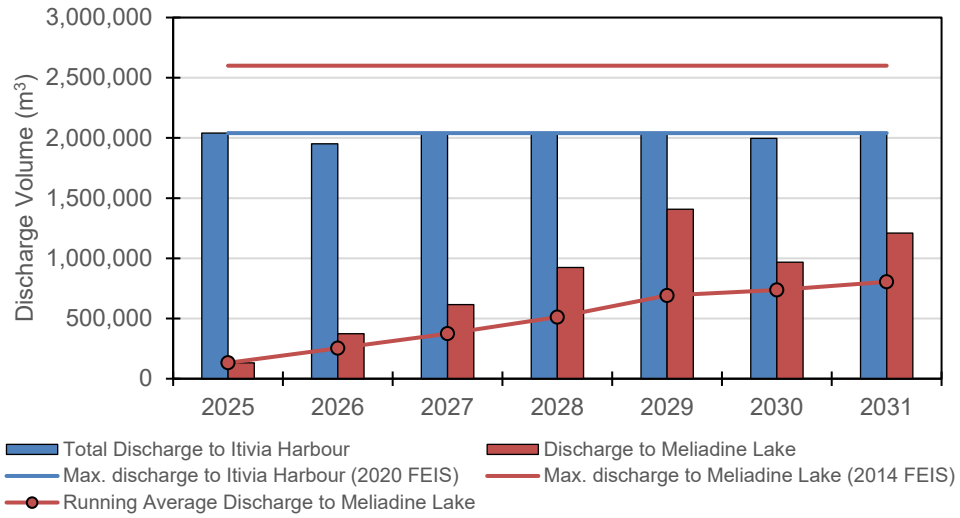

Figure 3-2: Annual discharges to Itivia Harbour and Meliadine Lake for the Early Meliadine Extension Operations Phase (2025-2031)

Mid-Meliadine Extension (2032-2038);

- Mining of PUMP02 and PUMP04, Discovery and all FZONE pits proceeds;
- Dewatering of TIRI01, TIRI02, TIRI03, WES01, WN01, PUMP03 pits required, in addition to those being actively mined;
- PUMP, FZONE, TIRI, and TIRI-Wolf underground mining proceeds, with the former completed in 2035.

From 2031 to 2039, underground dewatering rates are reduced slightly from the previous period average of 1,014 m^3/day to 891 m^3/day while the mine footprint has expanded to its full extent, along with multiple pits requiring ongoing dewatering. Dewatering will continue at inactive pits with connections to active underground mines (*i.e.*, TIRI01, TIRI02, TIRI03, WES01, WN01, PUMP03). Surface water contact volumes are at their predicted maxima, coincident with elevated saline water flows from the underground workings. This combination of factors limits the available capacity in the Waterline to discharge surface contact water from CP1, and so higher volumes of treated water must be discharged to Meliadine Lake to maintain the ponds within their operational water levels. During this period, approximately 60% of the Waterline discharge is comprised of saline water from SP6, and discharge of treated contact water from CP1 is split 70/30 between Meliadine Lake and the Waterline, respectively (Table 3-1 and Figure 3-3).

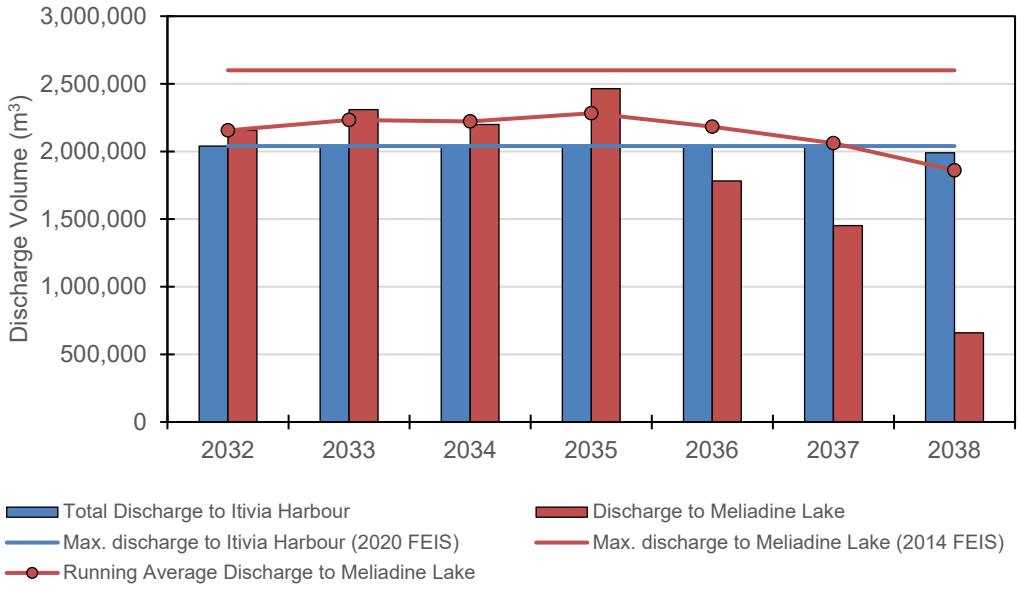

Figure 3-3: Annual discharges to Itivia and Meliadine Lake for the Mid-Meliadine Extension Operations Phase (2032-2038)

Late Meliadine Extension (2039-2043);

- TIRI03, TIRI04, WES02, WES03, WES05 pits are mined;
- Mining continues in TIRI-Wolf and FZONE undergrounds continues, with the latter complete in 2039;
- Dewatering of inactive pits no longer required, with the exception of the FZONE pits in 2039 only.

In the Late Meliadine Extension period, underground dewatering flows are predicted to be substantially reduced, averaging 140 m^3/day. Dewatering volumes from actively mined pits are also reduced, and the FZONE pits are only dewatered in 2039 during the last year of underground operations in this mine area. As a result, discharges to Meliadine Lake are reduced by approximately 30% relative to the 2032-2038 period. Approximately 42% of the Waterline discharge is comprised of saline water from SP6, and discharge of treated contact water from CP1 is split 50/50 between Meliadine Lake and the Waterline, respectively (Table 3-1 and Figure 3-4).

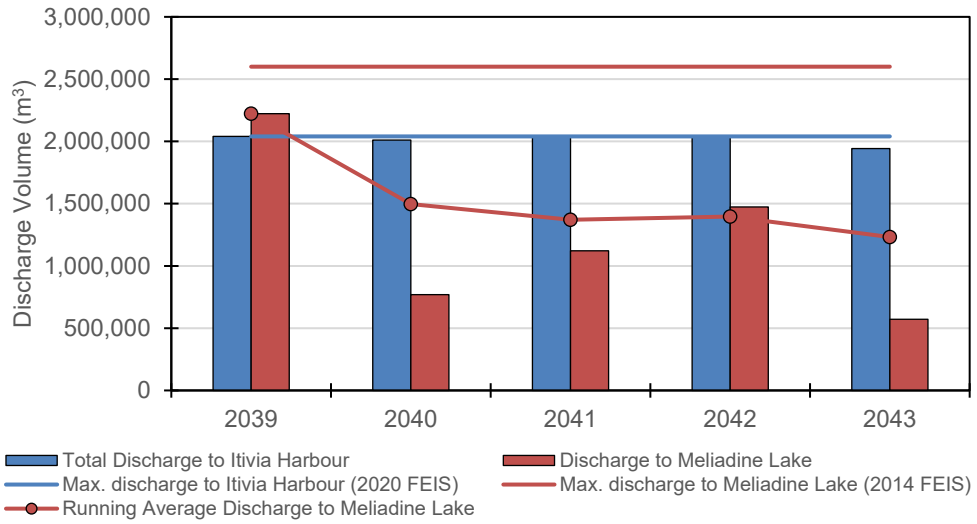

Figure 3-4: Annual discharges to Itivia Harbour and Meliadine Lake for the Late Meliadine Extension Operations Phase (2039-2043)

The model logic employed to manage discharges of saline and surface contact water Itivia Harbour seeks to maximize the Waterline capacity on a daily basis (see Table 3-1). The predicted peak discharge volume to Meliadine Lake occurs in 2035, and notably, is below that predicted in both the 2014 and 2022 FEIS submissions.

Total site discharge volumes (saline plus surface contact water) over the 2025 to 2043 Extension Operations period average 3.2 Mm^3 on an annual basis, with 40% of this volume routed to Meliadine Lake and 60% routed to Itivia Harbour.

Table 3-1:
Annual discharge volumes to Itivia Harbour and Meliadine Lake during Early, Mid and Late Operations phase.

Year	SP6 to Itivia Harbour	CP1 to Itivia Harbour	Total Discharge to Itivia Harbour	Discharge to Meliadine Lake
	m^3	m^3	m^3	m^3

3.2 Annual Discharge Comparison with 2022 FEIS

The mine plan adjustments and water management optimization undertaken during the updates described in this memo resulted in a 6% increase in discharge to Itivia Harbour (Figure 3-5), a 19% reduction in total discharge volumes to Meliadine Lake relative to the 2022 FEIS application

(Figure 3-6), and a 7% overall reduction in site discharges to Meliadine Lake and Itivia Harbour. This reduction in discharges to Meliadine Lake is the result of several factors, listed in order of importance:

1. Optimization of Waterline management;
2. Reduction in predicted underground dewatering rates, based on site monitoring data;
3. Increase in storage capacity of SP6; and,
4. Reduction in pit wall runoff coefficients.

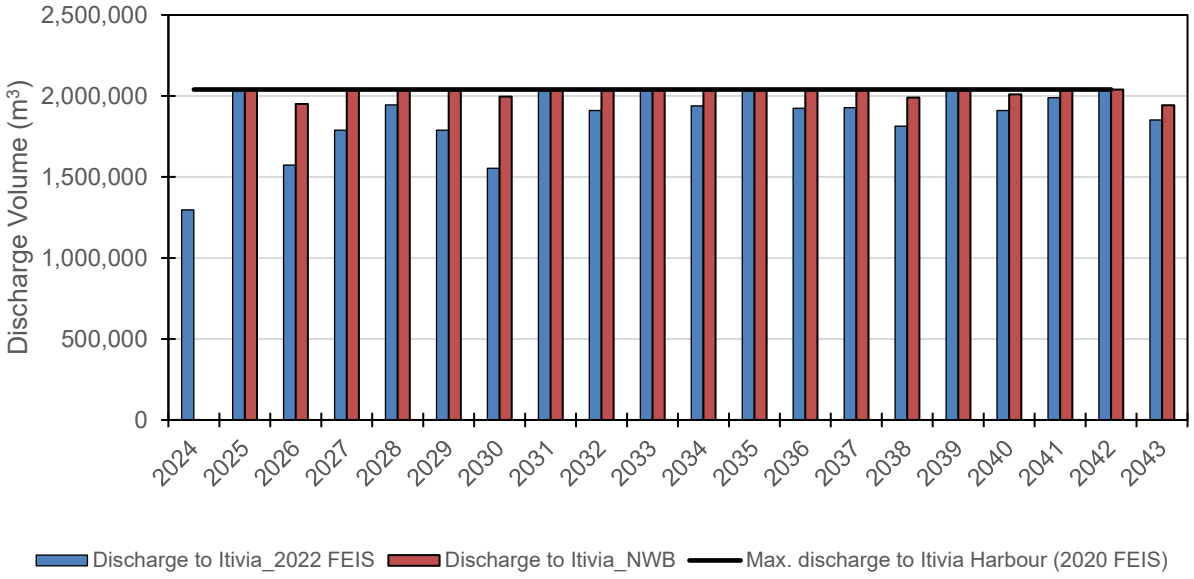

Figure 3-5: Annual discharges to Itivia Harbour for the 2022 FEIS submission, and the current NWB model

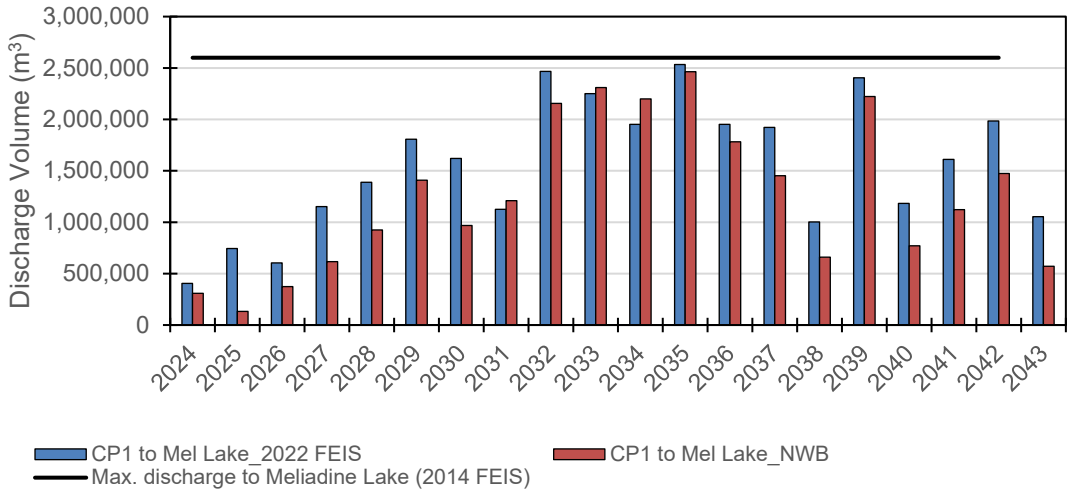

Figure 3-6: Annual discharges to Meliadine Lake for the 2022 FEIS WBWQM, and the current NWB model

3.3 Pond and Sump Water Balances

The water balance model results for the primary surface contact water and saline collection ponds are summarized in Sections 3.3.1 and 3.3.2, respectively. Section 3.3.3 presents the annual inflow/outflow water balances for the secondary collection ponds and sumps, and the annual open pit water balances are presented in Section 3.3.4.

3.3.1 Surface Water Collection Ponds

This section summarizes the water balances for the key surface water collection ponds (CP8 and CP1) for the Operations phase.

3.3.1.1 Collection Pond CP8

Lake B4 is dewatered in 2025 and converted to CP8 which serves as is the primary surface water collection pond for the remainder of the Operations phase. Excess surface contact water is routed to the CP1 collection pond for treatment via the EWTP, and subsequent discharge (in order of priority) to Itivia Harbour and Meliadine Lake. Pre-mining inflows to Lake B4 average 680,000 m^3/year, rising to an average of 2.1 Mm^3/year once pumping to CP8 is online in 2026 (Figure 3-7). The maximum predicted pond volume of 1.5 Mm^3, occurs in 2033 in response to a wetter than average year (473 mm of precipitation; 111% of the Operations phase average) and an expanded mine footprint. CP8 continues to serve as a surface contact water collection pond throughout the Active Closure phase (2044-2050), with water pumped to TIRI02/04, and is returned to its pre-mine condition and water balance prior to freshet 2051.

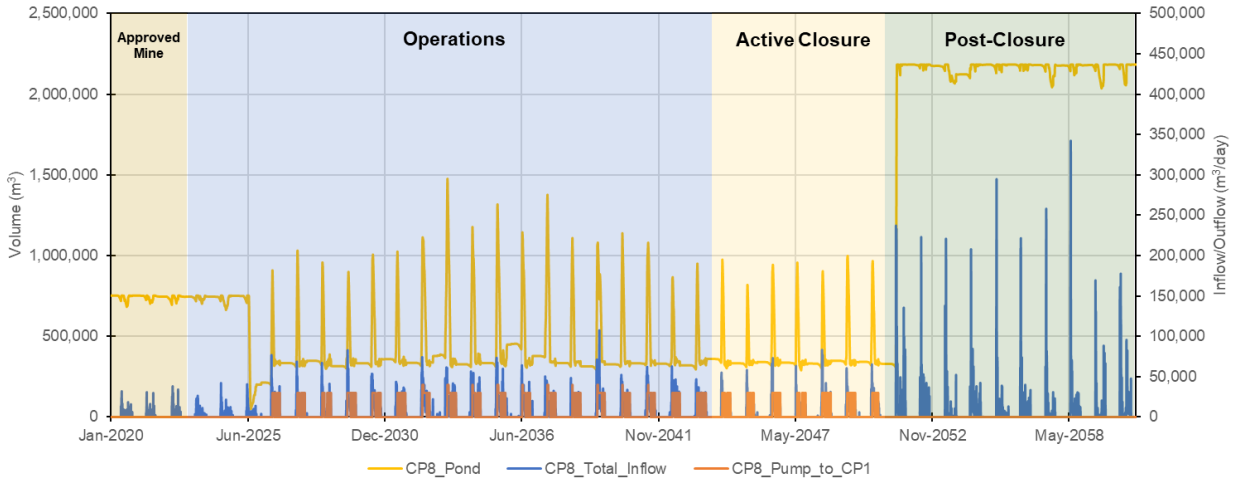

Figure 3-7: Volumes, inflows and outflows to CP8 for the Operations, Active Closure and early post-Closure phases

3.3.1.2 Collection Pond CP1

CP1 is currently the primary surface contact water collection pond, with all excess water routed to the EWTP prior to discharge to Itivia Harbour and Meliadine Lake. Inflows to CP1 average 482,000 m^3/year, rising to an average of 2.5 Mm^3/year once the mine footprint expands in 2026 (Figure 3-8). The maximum predicted pond volume of 762,335 Mm^3 occurs in 2032. During the Active Closure phase, the mine site is managed as a zero-discharge facility, with all CP1 inflows routed to TIRI02/04 open pit. Beginning in the Post-Closure phase, volumes in the CP1 pond are allowed to fluctuate naturally, with outflows reporting via pre-mine drainage pathways to Meliadine Lake.

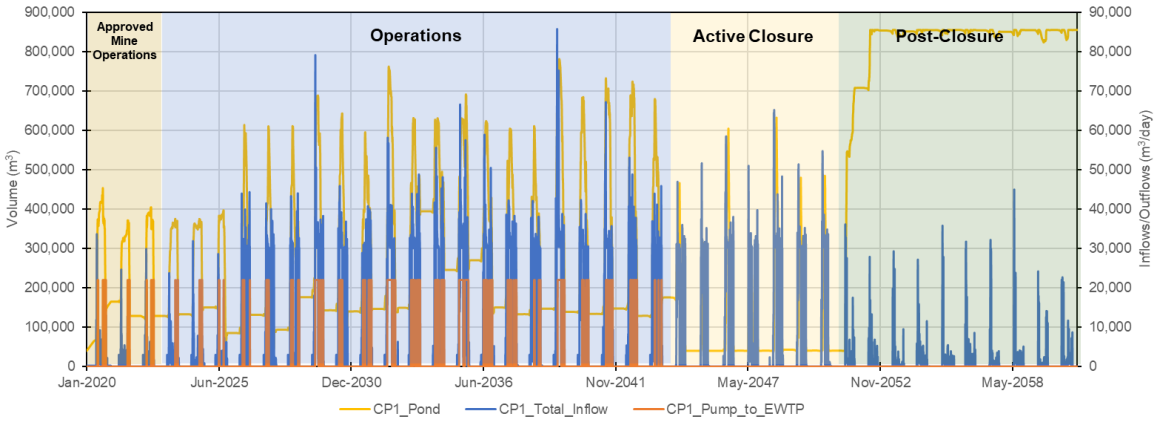

Figure 3-8: Volumes, inflows and outflows to the CP1 Pond for the Operations, Active Closure and early post-Closure phases

3.3.2 Saline Water Collection Ponds

This section summarizes the water balances for key saline contact water collection ponds (TIRI02 and SP6) over the Operations phase.

3.3.2.1 TIRI02

The saline contact water management system collects dewatering flows from all underground operations, Saline WRSFs and ore pads. Early in the Operations phase (up to end-2024), the Waterline is not in place, and SP6, the primary saline contact water storage pond (SP6) is not operational until the end of 2025. The TIRI02 pit serves as the primary saline contact water storage pond for this period, with a maximum predicted pond volume of 1.5 Mm^3 in June 2025 (Figure 3-9). Once Lake B7 is dewatered during freshet of 2025, it becomes the primary saline pond (SP6), and the saline contact water stored in TIRI02 is discharged via the Waterline to Itivia Harbour to allow mining of TIRI02 pit to progress during the winter of 2025/26 (Figure 3-10).

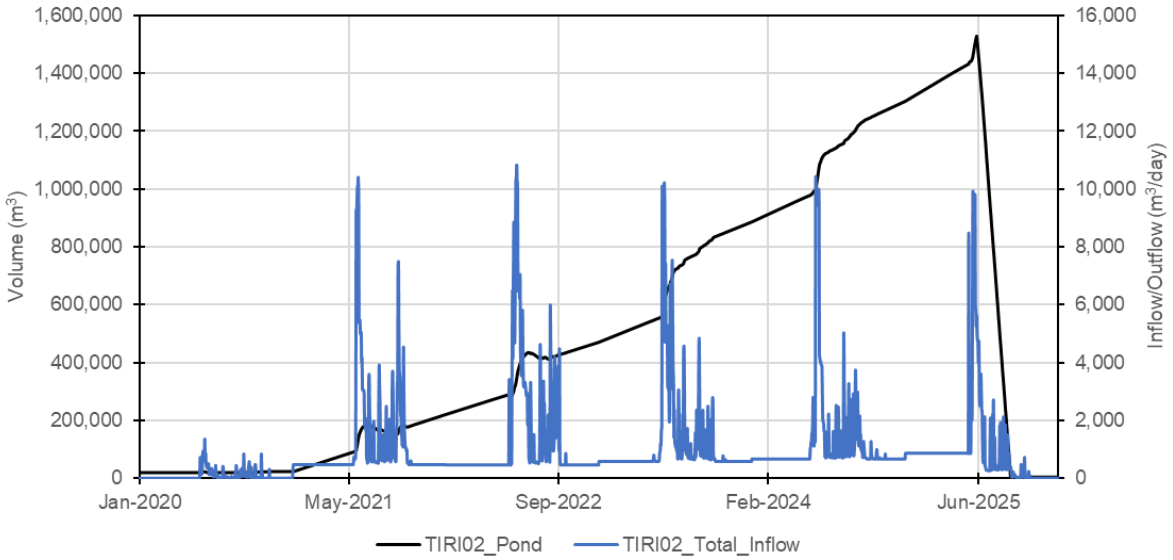

Figure 3-9: Time series of pond volume and inflows for the TIRI02 Pond during early Operations period

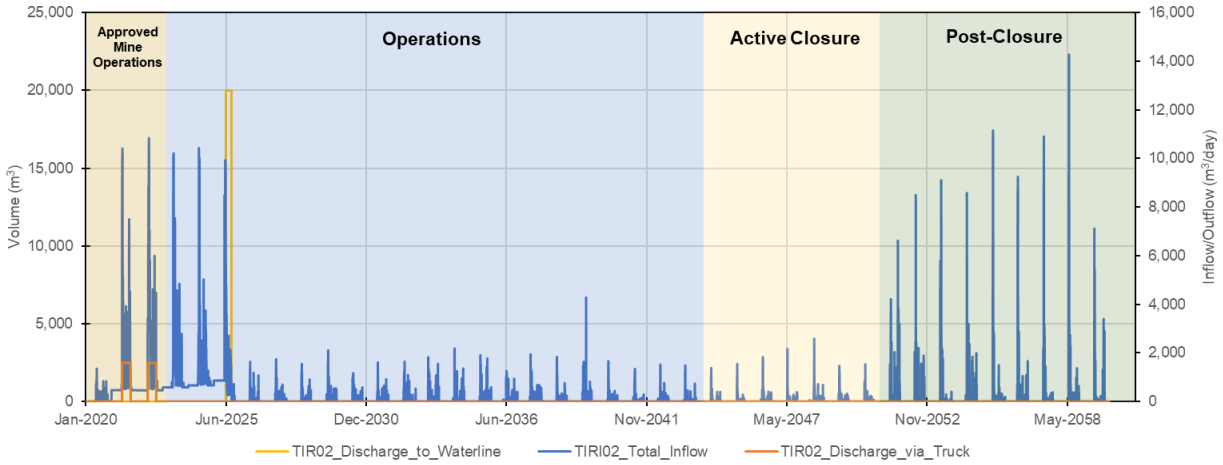

Figure 3-10: Inflows and outflows to the TIRI02 Pit for the Operations, Active Closure and early post-Closure phases

3.3.2.2 SP6

The Saline Pond SP6 is the primary saline contact water storage pond for the majority of the Operations phase once it is dewatered in 2025. All saline contact water collected in SP6 is routed to the Waterline for discharge to Itivia Harbour up to end-2043, along with surface contact water from the treated STP discharges, CP3, CP4 and CP5. After this point, any remaining saline contact water will be routed to the remaining underground voids before SP6 is allowed to fill with runoff from the surrounding catchments, including the small volumes of contact water from the TSF and WRSF1. The maximum predicted pond volume for SP6 is 1.07 Mm^3, coinciding with a wetter than average year and high underground dewatering rates (Figure 3-11).

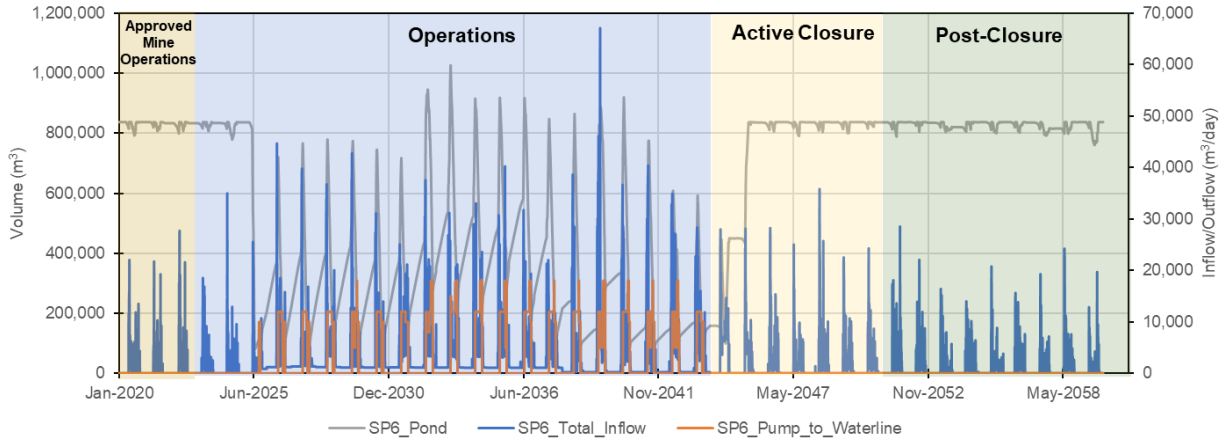

Figure 3-11: Volumes, inflows and outflows to SP6 for the Operations, Active Closure and early post-Closure phases

3.3.3 Secondary Ponds and Sumps

The annual total volumes of surface contact water and saline water pumped to CP1 and SP6 are presented in Table 3-2, along with the proportion of the total volume pumped to each pond. Pit dewatering to CP1 is not included and is presented in Section 3.3.4. While the proportion of total pumped flow to CP1 varies from year to year for each pond, overall, CP2 and CP7 comprise 30% and 32% of the total collection pond volumes pumped to CP1, respectively. For SP6, the sewage treatment plant (STP) discharge, CP5 and SPD1 comprise 21%, 24% and 29% of the total pumped inflow volumes.

3.3.4 Open Pits

The annual total pit dewatering volumes are presented in Table 3-3, along with the dewatering period averages. The PUMP01 pit has the highest average dewatering rate due to its use as a contact water collection pond for the PUMP mine area. The WES02 pit has the next highest dewatering rates, followed by the Discovery Pit.

Table 3-2:
Annual discharge volumes for secondary ponds and sumps, with percent of total pumped inputs to CP1 and SP6 (exclusive of open pits)

Notes:
[1] TIRI02 pit water (not saline) is discharged to CP8 once mining resumes in 2025
[2] Averages are calculated for the active dewatering periods only

3.4 Active Closure Pit Water Management

During the Active Closure phase, the site is maintained with zero discharge to Meliadine Lake, and only 3 months of predicted discharge to Itivia Harbour via the Waterline to drain the accumulated water in PUMP01 and WES04. Of key interest is the pumping duration and water volumes required to fill the pits to their spill points during the Active Closure phase.

Updated pit shells showed lower volumes than those presented in the 2022 FEIS WBWQM and resulted in a reduced pumping requirements of Meliadine Lake water to mine pits during Active Closure. The 2022 FEIS WBWQM determined that a pumping rate of 13.4 Mm^3/year would be required to fill the pits. It was assumed that Meliadine Lake pumping would proceed at this rate until each pit was fully flooded. The updated mine plan results in lower volumes of water required to fill the pits in Active Closure, with a lower pumping rate over the 7-year Active Closure period. Pumping of Meliadine Lake water remains at a maximum of 8.9 Mm^3/year over the first four years, reducing each year thereafter, to 3.6 Mm^3 in the last year of Active Closure (2050; Table 3-4). The 2022 FEIS WBWQM required 90.7 Mm^3 over 7 years of pumping, while the updated model indicates that 55.2 Mm^3 of water from Meliadine Lake is required, along with 13.9 Mm^3 reporting to the pits via gravity drainage from the surrounding catchments, and meteoric inputs (Table 3-4). This equates to a 39% reduction in Meliadine Lake water use for pit filling during Active Closure. Individual pit filling metrics are provided in Table 3-5.

Table 3-4:
Open pit water balances in Active Closure phase

Year	Meliadine Lake Pumped (m^3)	% Total	Surface Contact Water (m^3)	% Total

Notes:
[1] TIRI01, TIRI03 and WES01 form the TIRI pit lake complex once full
[2] TIRI02/04 is also filled via pumping from CP1, which comprises the majority of the volume shown here.
[3] WN01 joins with Lake B5 to form the WN complex once full
[4]TIRI01 receives overflow from TIRI02/04 at approximately 2,000 m^3/day, so Meliadine Lake water is not required to fill this pit.

4. Water Quality Results

This section presents water quality model results for the Meliadine Extension NWB WBWQM. Model predictions are compared against applicable guidelines as a screening tool to identify parameters of potential concern (POPCs), specifically:

- During Operations, model predictions at the end-of-pipe (EOP) to Meliadine Lake (EWTP) and Itivia Harbour (Waterline) are screened against effluent discharge limits as outlined in the Type A Water Licence (2AM-MEL1631) for the Meliadine Mine, and MDMER.
- During Post Closure, model predictions for all collection ponds (except SP6), pit lakes, and natural waterbodies are screened against water quality guidelines adopted in the 2020 Aquatic Effects Management Plan (AEMP) (Agnico Eagle, 2021). Model predictions at SP6 are compared to CCME guidelines for the protection of terrestrial life, as this collection pond remains listed under MDMER Schedule 2.

The complete model outputs for all mine phases are presented in Appendix D.

4.1 Operations

During Operations, TSS in mine effluent will be controlled by the SETP and EWTP for saline and freshwater discharges, respectively. For the purposes of water quality predictions, it is assumed that treated effluent is at the MDMER maximum monthly mean concentration of 15 mg/L. The differences in total and dissolved concentrations generated by this assumption are shown in Table 4-1. These values are added to dissolved concentrations predicted for Meliadine Lake and Itivia Bay discharges.

Summary statistics are presented herein for EWTP and Waterline, with comparison to EOP guidelines. During Operations, model predictions at EWTP remain below MDMER/Water Licence limits (Table 4-2), while model predictions of untreated water for the Waterline remain below MDMER with the exception of maximum and P90 for ammonia (Table 4-3). The ammonia guideline of 19 mg/L at the EOP to Itivia Harbour was determined conservatively by assuming a pH of 8 and a temperature of 15°C, and an un-ionized ammonia concentration of 0.5 mg/L. Options for treatment are being investigated. Monthly water quality predictions for the Waterline and EWTP are provided in Appendix D1. Water quality predictions for other model nodes present during mine Operations are provided in Appendix D2.

The model updates since the 2022 FEIS Addendum have resulted in changes to predictions for key mine-related POPCs, including total dissolved solids (TDS), ammonia, and arsenic. These changes are summarized as follows:

- Early Meliadine Extension (2025-2031):
    - Waterline: Compared to model predictions presented in the 2022 FEIS Addendum, there is an overall decrease in TDS concentrations due to a reduction in saline groundwater inflows, which dominate the TDS loading to the Waterline. Peak concentrations are now predicted in 2025 due to dewatering of saline water stored in TIRI02 through the Waterline. The maximum ammonia prediction without treatment (41 mg/L) is higher than the threshold value assumed in the 2022 FEIS Base Case model (10 mg/L), which assumed treatment.
    - EWTP: As part of water management optimization, collection ponds previously routed to CP1 (*e.g.,* CP3) are now routed to SP6, resulting in an overall reduction in ammonia concentrations at CP1 and in the discharge to Meliadine Lake (*i.e.,* EWTP). Under both the 2022 FEIS and current model iterations, peak concentrations of TDS and total arsenic at the EWTP are expected to decrease in relation to changes in surface water management during the early operational phase.

- Mid Meliadine Extension (2032-2038):
    - During this period, predictions for TDS and arsenic at the Waterline are lower compared to the 2022 FEIS Base Case model due to the reduction in saline groundwater inflows. In the years of 2036-2038, peak ammonia concentrations (without treatment) at the Waterline are predicted to increase above the MDMER limit, in relation to changes in underground mine water management (*e.g.,* pit dewatering) during this period.
    - At the EWTP, model predictions for TDS, ammonia, and total arsenic show small interannual variability, with concentrations remaining below MDMER/Water Licence limits and remaining within a similar range under the 2022 FEIS Base Case model and current model iteration.
- Late Meliadine Extension (2039-2043):
    - Model predictions at the Waterline and EWTP are expected to remain below their respective guidelines under both the 2022 FEIS and current model iterations. Most underground mine operations are complete in this time period and groundwater inflows to the Waterline are limited to flows from the TIRI-Wolf UG, resulting in gradual declines in the concentrations of TDS, ammonia, and total arsenic.

4.2 Active Closure

The Waterline remains available for the first two years of Active Closure (2044 and 2045), with discharges to Itivia Harbour planned in the months of June-August 2044, and no discharges in 2045. The 2022 FEIS Addendum assumed that the Waterline was not available during Active Closure, and no discharges were modelled. The additional two years that the waterline remains available is proposed as adaptive management piece to setup the site for the closure of the mine. However, these assumptions will be refined with site monitoring data and all details will be provided in the Final Closure Reclamation Plan. The monthly model predictions during this period are shown in Table 4-4. The predicted concentrations of POPCs at Waterline are below EOP guidelines during Active Closure.

Table 4-1:
Suspended Solids Composition and Contribution to Total Concentrations at End-of-Pipe during Operations.

Element	Particulate Composition	Particulate Fraction Concentration (mg/L) per 15 mg/L of Total Suspended Solids

Notes: "-" denotes not available.

1. The ammonia guideline was determined conservatively by assuming a pH of 8 and a temperature of 15°C, and an un-ionized ammonia concentration of 0.5 mg/L.

4.3 Post Closure

During Post Closure, mining activity will have ceased, and mine site waterbodies will begin to discharge passively. In the absence of mining activities, TSS is expected to return to relatively low baseline values of <3 mg/L. Due to the low TSS baseline conditions, total and dissolved concentrations are anticipated to be similar during Post Closure. Hence, model results are developed assuming that total concentrations are equal to dissolved concentrations.

Summary statistics are presented for key collection ponds and pit lakes during Post Closure, with comparison to terrestrial (SP6 only) and aquatic guidelines (Table 4-5 through Table 4-19). Parameters predicted to be above applicable guidelines include arsenic, copper, selenium, phosphorus, and ammonia. Of these parameters, phosphorus shows elevated concentrations in natural runoff and is not considered a mine related POPC in Post Closure (Lorax, 2022a). Among the 15 model nodes presented herein, the following 5 show Post Closure predictions above applicable guidelines for mine-related POPCs:

- SP6: flooded with Meliadine Lake water during Active Closure, with increasing concentrations of arsenic, copper, and selenium (to a lesser extent) predicted during Post Closure. The elevated concentrations in SP6 are due to the surrounding catchment being dominated (68% of total catchment area) by mine waste facilities (TSF and WRSF1). It is assumed that SP6 is not re-established as aquatic habitat but remains accessible to terrestrial life. In this regard, arsenic represents the only POPC with Post Closure predictions above the terrestrial/aquatic guideline of 0.025 mg/L. Additional monitoring data collected through the life of mine will be used to update model predictions during closure phases.
- CP7: flooded with Meliadine Lake water during Active Closure, with copper and selenium identified as POPCs during Post Closure. Loading of these POPCs originates from runoff and interflow from WRSF7 and show concentrations above guidelines periodically from 2058 onwards. Additional monitoring data collected through the life of mine will be used to update model predictions during closure phases.
- PUMP01: dewatered to Itivia Harbour via the Waterline at beginning of Active Closure then flooded with Meliadine Lake water, with ammonia identified as the only POPC. Changes in Active Closure water management could reduce initial ammonia prediction which are currently predicted to modestly exceed the 0.58 mg/L guideline at the beginning of Post Closure (2051 to 2055). Additional monitoring data collected through the life of mine will be used to update model predictions during closure phases.
- WES04: dewatered to Itivia Harbour via the Waterline at beginning of Active Closure then flooded with Meliadine Lake water. The WES04 pit lake is predicted to show an increasing

trend in most parameters due to evapo-concentration (*e.g.,* evaporation > runoff and precipitation). This trend leads to predicted copper concentrations increasing to above the guideline beginning in 2063. Additional monitoring data collected through the life of mine will be used to update model predictions during closure phases.

- TIRI Pit Lake: predicted to show an increasing trend in most parameters owing to drainage from SP6, with only selenium increasing to above the AEMP guideline starting in 2110 near the end of model horizon. Additional monitoring data collected through the life of mine will be used to update model predictions during closure phases.

In natural lakes located downstream of mine discharges (*e.g.,* Lake A8 West), phosphorus is the only parameter with concentrations above AEMP guideline. Similar to the 2022 FEIS Base Case model (Lorax, 2022a), the predicted phosphorus concentrations in these receiving lakes are similar to the baseline total phosphorus concentrations for non-contact areas. Monthly water quality predictions for pit lakes and natural lakes during Post Closure are provided in Appendix D2, predictions for conjoined pit lakes which form during Post Closure are provided in Appendix D3.

Table 4-5:
SP6 Post Closure Predictions Compared to Terrestrial Guidelines

Parameter	Unit	Summary Statistics for SP6					*Terrestrial Guideline*

Re:	**Meliadine ACLC Kinetic Testing Summary Memorandum**

Introduction

Okane Consultants (Okane) conducted a kinetic testing program for tailings and waste rock materials from the Meliadine Extension in Nunavut, Canada for Agnico Eagle Mines Ltd. (Agnico Eagle). Kinetic testing was performed using Okane's Advanced Customizable Leach Columns (ACLCs), which are engineered columns with automated monitoring systems that aim to approximate the simulation of field conditions in a laboratory setting while providing flexibility to control a range of variables. The program was initiated on December 1, 2020 and was completed on January 13, 2022. Objectives of the kinetic test work were to:

1) Assess the metal leaching trends and loading rates of the tailings and various waste rock materials;

2) Measure the intrinsic oxidation rates (IORs) of the tailings and waste rock materials;

3) Calculate the lag time for acid generation of the tailings and waste rock materials; and

4) Determine the salinity rinsing rates for rock containing saline connate water from underground workings.

This memorandum presents a summary of the methodology of the kinetic testing program as well as factual results for the metal leaching trends, loading rates, IORs, lag time to acid generation, and salinity rinsing rates for the waste rock columns. Results from kinetic testing were transferred to Lorax Environmental for further analysis and will be incorporated into the geochemical characterization of the Meliadine Extension.

Methods

One tailings sample and 10 waste rock samples were chosen for kinetic testing (Table 1). The tailings sample was sourced from the underground Tiriganiaq deposit and is characterized as non-potentially acid generating (NPAG). The waste rock lithologies tested consist of potentially acid generating (PAG) iron formation (IF-PAG), NPAG iron formation (IF-NPAG), PAG sedimentary rock (SED-PAG), NPAG sedimentary rock (SED-NPAG), NPAG gabbro (GAB-NPAG), and NPAG F-Zone (FZONE-NPAG). Two additional waste rock columns were filled with IF-PAG and SED-PAG with connate water from the underground mine workings used as influent. Two columns were filled with run of mine (ROM) low-grade ore from the underground Tiriganiaq deposit to determine the time at which residual salinity is rinsed from the rock under field conditions.

The ACLCs simulate unsaturated leaching conditions of mine waste materials. A representative photo of the ACLC columns is shown in Figure 1. The ACLCs were operated in two phases: Phase 1 was operated under closed conditions (no gas flow, closed to atmosphere) to determine the oxidation rates by O_2 consumption (Table 2) and Phase 2 was operated under atmospheric conditions to simulate mineral weathering under field conditions (Table 3). Weekly wetting events were performed to simulate leaching of waste rock and tailings. A second set of O_2 consumption measurements (described as Phase 1 Trial 2) was conducted at the end of the kinetic testing (Table 4). Influent water was added at a rate of 250 mL/week (equivalent to approximately 700 mm/year net percolation (NP)). Temperatures were controlled at 10 °C (the operational minimum of the ACLCs).

Table 1: Column lithologies and purposes.

Sample ID	Deposit	Lithology and ABA Class	Source	Purpose
01-TSF	Tiriganiaq	NPAG Tiriganiaq Paste Backfill	Tailings Storage Facility	Paste tailings loading rates
02-IF-PAG	Discovery	PAG Iron Formation	Underground	Determine lag time to ARD
03-SED-PAG	Discovery	PAG Sedimentary Rock	Open Pit	Determine lag time to ARD
04-GAB-NPAG	Discovery	NPAG Gabbro	Open Pit	Potential cover material
05-SED-NPAG	Discovery	NPAG Sedimentary Rock	Open Pit	Potential cover material
06-IF-NPAG	Discovery	NPAG Iron Formation	Open Pit	Potential cover material
07-IF-PAG-CW	Discovery	PAG Iron Formation	Underground	Impact of connate water on rock weathering
08-SED-PAG-CW	Discovery	PAG Sedimentary Rock	Open Pit	Impact of connate water on rock weathering
09-FZONE-NPAG	F Zone	NPAG F-Zone Rock	Open Pit	Potential cover material
10-ROM-SR1	Tiriganiaq	Low Grade Ore	Underground	Salt rinsing duration
11-ROM-SR2	Tiriganiaq	Low Grade Ore	Underground	Salt rinsing duration

Figure 1: Photograph of the ACLCs.

Table 2: Operational parameters for Phase 1 – Closed conditions

Parameter	Value
Temperature	10 °C
Gas Composition	Initially atmospheric prior to closing the column
Gas Flow Rate	0 L/min
Test Duration	4 to 6 weeks
Headspace Gas Sampling	5 samples/week for O_2 and CO_2
Influent Water Composition	• Connate water (07-IF-PAG-CW and 08-SED-PAG-CW) or sterilized deionized (DI) water (all other columns) • A pulse of bromide tracer (as KBr) was added to the influent at a concentration of 25 mg/L Br to test the homogeneity and assumption of plug flow of each column. Columns 7 and 8 had 2500 mg/L Br added
Wetting Event Frequency	Weekly
Wetting Event Volume	250 mL/week (equivalent to approximately 700 mm/year net percolation)
Weekly Leachate Sampling	• pH • Electrical conductivity (EC) • Oxidation-reduction potential (ORP) • SO_4^{2-} • Br^- (until breakthrough and return to baseline)
Monthly Leachate Sampling (in addition to weekly analytes)	• Alkalinity • Major ions • Trace metals • Nutrients (N species and phosphate) • Total cyanide (T-CN) and weak acid dissociable cyanide (WAD-CN) (01-TSF column only)
Other	Columns were sealed after the first wetting event. Water was recycled in a closed loop for the duration of Phase 1 to prevent the transfer of atmospheric gas into the column during wetting events

Table 3: Operational parameters for Phase 2 – Atmospheric conditions

Parameter	Value
Temperature	10 °C
Gas Composition	Atmospheric (21% O_2)
Gas Flow Rate	0.02 – 0.04 L/min
Test Duration	58 weeks for Column 1, 38 weeks for Columns 2 – 9, and 13 weeks for Columns 10 & 11.
Headspace Gas Sampling	Outlet gas (O_2 and CO_2) concentrations were monitored continuously by a Quantek 902D analyzer
Influent Water Composition	Connate water (07-IF-PAG-CW and 08-SED-PAG-CW) or sterilized deionized (DI) water (all other columns)
Wetting Event Frequency	Weekly
Wetting Event Volume	250 mL/week (equivalent to approximately 700 mm/year net percolation)
Weekly Leachate Sampling	• pH • Electrical conductivity (EC) • Oxidation-reduction potential (ORP) • SO_4^{2-} • Br^- (until breakthrough and return to baseline)
Monthly Leachate Sampling (in addition to weekly analytes)	• Alkalinity • Major ions • Dissolved trace metals • Nutrients (Nitrogen species and PO_4^{2-}) • Total cyanide (T-CN) and weak acid dissociable cyanide (WAD-CN) (01-TSF column only)
Other	Columns were free draining (water was not recycled)

Table 4: Timeline of kinetic testing.

Date	Columns Involved	Event
December 1, 2020	1	Column loaded
December 11, 2020	1	First wetting event
December 11, 2020	1	Phase 1 (trial 1) initiated
January 12, 2021	2 – 11	Columns loaded
January 15, 2021	1	Phase 1 (trial 1) finished; Phase 2 begins
January 15, 2021	2 – 11	First wetting event
January 15, 2021	2 – 9	Phase 1 (trial 1) initiated
February 18, 2021	2 – 9	Phase 1 (trial 1) finished; Phase 2 begins
February 25, 2021	1 – 9	Br^- tracer added to influent
October 10, 2021	1 – 9	Phase 1 (trial 2) initiated
November 1, 2021	2 – 9	Phase 1 (trial 2) finished
November 4, 2021	2 – 11	Columns deconstructed
December 23, 2021	1	Phase 1 (trial 2) finished
January 13, 2022	1	Column deconstructed

Tailings Kinetic Geochemistry

The leachate trends for key parameters and analytes are presented in this section. Complete leachate chemistry is provided in Appendix A. The leachate pH values for the tailings column (01-TSF) were circumneutral for the duration of the experiment, ranging from 6.7 to 7.5 and with a slow but gradual increase with time (Figure 2). Electrical conductivity (EC) values rapidly decreased from 98.5 mS/cm as the initial saline pore water was flushed from the material (Figure 3). The leachate EC temporarily increased between weeks 10 and 16. This increase in EC was attributed to either the presence of a low-permeability tailings mass within the column that took longer to wet-up and flush its initial constituents, or the development of a localized zone of positive pore water pressures created during pore-gas extraction during Phase 1 of testing, resulting in a delayed flushing of high EC water from near the mid-column sampling port. The EC approached a steady value around 3.0 mS/cm after week 30.

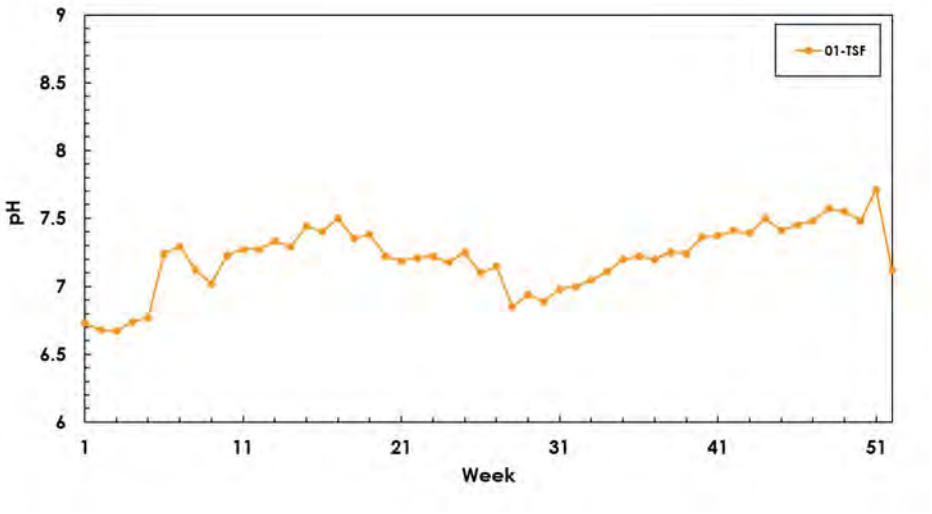

Figure 2: Column 01-TSF leachate pH values throughout the duration of kinetic testing.

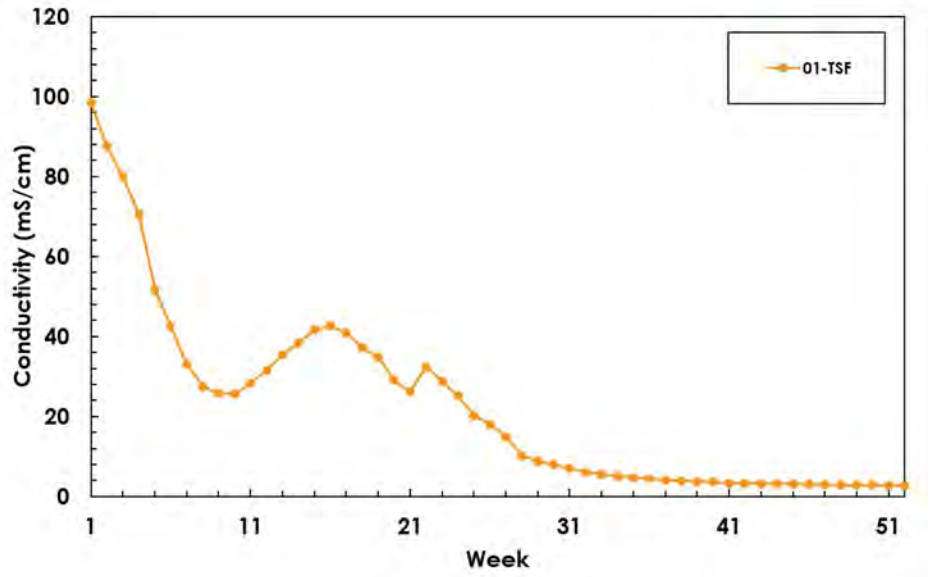

Figure 3: Column 01-TSF leachate EC values throughout the duration of kinetic testing.

Total alkalinity and SO_4 concentrations followed the EC trends and ranged between 135 and 376 mg/L (as $CaCO_3$) and 143 and 18,300 mg/L, respectively (Figure 4 and Figure 5). Two anomalously high SO_4 concentrations reported at weeks 23 and 25 are attributed to interferences in the analytical process resulting from the high salinity of the leachate. Chloride concentrations rapidly decreased from 16,900 mg/L at the beginning of testing, increased at the same time as EC, and gradually decreased to below the detection limit of 10 mg/L at week 48 as the initial salinity was completely flushed from the material (Figure 6). Arsenic concentrations rapidly decreased from 4.11 mg/L at the beginning of testing, slightly increased to 0.65 mg/L at week 24 and decreased to a final concentration of 0.10 mg/L (Figure 7).

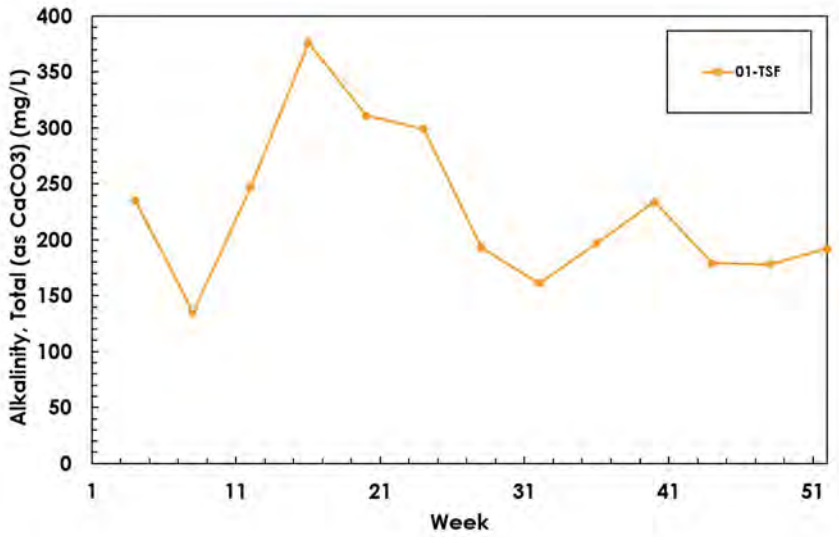

Figure 4: Column 01-TSF leachate total alkalinity concentrations throughout the duration of kinetic testing.

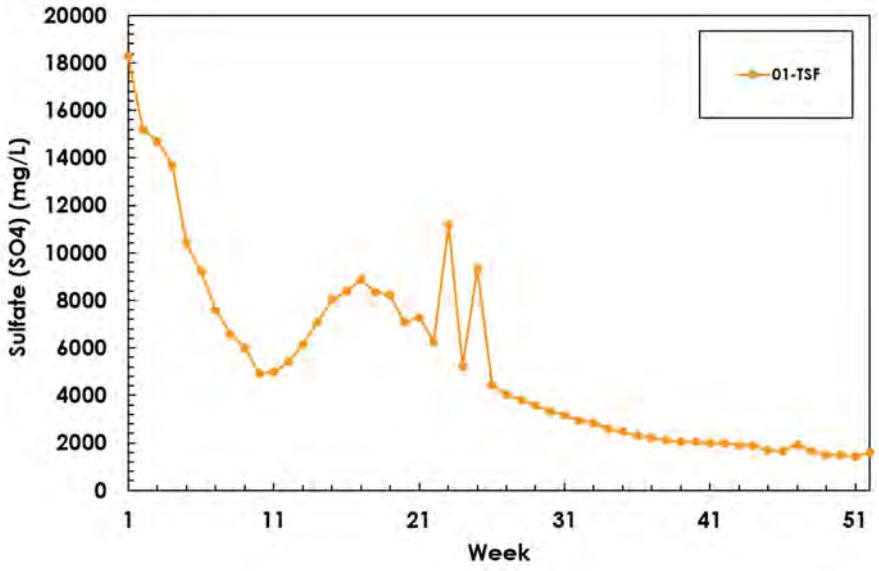

Figure 5: Column 01-TSF leachate SO4 concentrations throughout the duration of kinetic testing.

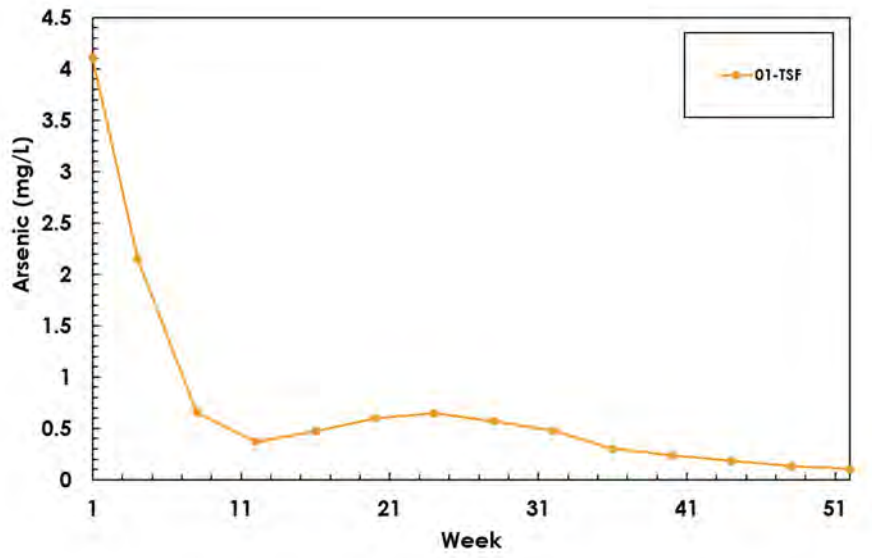

Figure 7: Column 01-TSF leachate As concentrations throughout the duration of kinetic testing

Waste Rock Kinetic Geochemistry

The leachate results for key parameters for waste rock columns 02-IF-PAG, 03-SED-PAG, 04-GAB-NPAG, 05-SED-NPAG, 06-IF-NPAG, and 09-FZONE-NPAG are presented here. Complete leachate chemistry is provided in Appendix A. Results for the salinity rinsing columns (10-ROM-SR1 and 11-ROM-SR2) are presented in a separate section, along with the columns using connate water as the influent (07-IF-PAG-

CW and 08-SED-PAG-CW), which are compared against columns with duplicate waste rock materials using DI water as influent (02-IF-PAG and 03-SED-PAG).

The leachate pH values for all waste rock columns leached by DI water was slightly alkaline (pH values between 7.4 and 8.7) throughout the duration of kinetic testing. The EC in all waste rock column leachate followed a similar trend of slightly increasing EC in the first few weeks of testing as soluble salts were flushed, followed by a gradual decrease to stable values (0.32 to 0.48 mS/cm) around week 23 (Figure 9). Column 04-GAB-NPAG had notably higher alkalinity compared to the other columns with a maximum concentration of 244 mg/L (as $CaCO_3$). Total alkalinity concentrations decreased throughout the experiment, but stabilized toward the end of testing (Figure 10).

Chloride concentrations rapidly decreased immediately after testing began; the final Cl concentrations of all waste rock columns converged to approximately 5 mg/L at week 36 (Figure 11), indicating that conservative constituents were completely flushed around this time.

Sulfate concentrations are an indicator of both flushing of soluble oxidation products and ongoing oxidation of sulfides. Sulfate concentrations were initially elevated as soluble salts were flushed. A second peak in sulfate concentrations occurred in several columns around week 30 as a result of enclosure temperature control issues during the summer months causing oxidation rates to increase. Temperatures peaked near 20 °C during weeks 24 and 27.

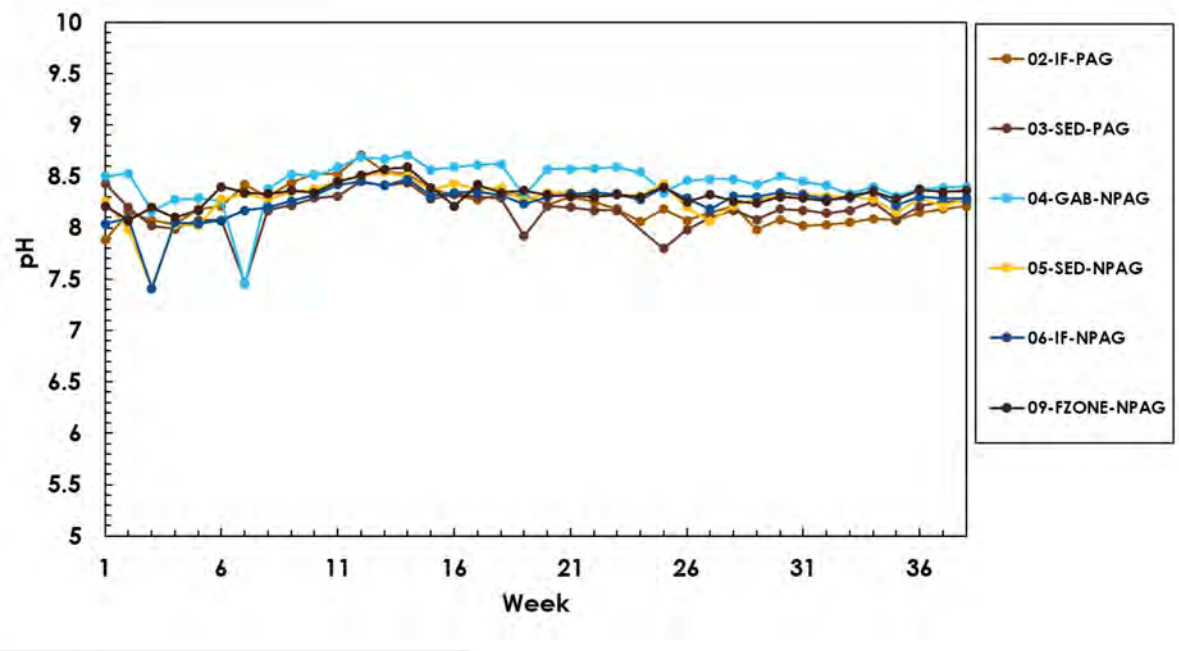

Figure 8: Leachate pH trends for waste rock Columns 02-IF-PAG, 03-SED-PAG, 04-GAB-NPAG, 05-SED-NPAG, 06-IF-NPAG, and 09-FZONE-NPAG throughout the duration of kinetic testing.

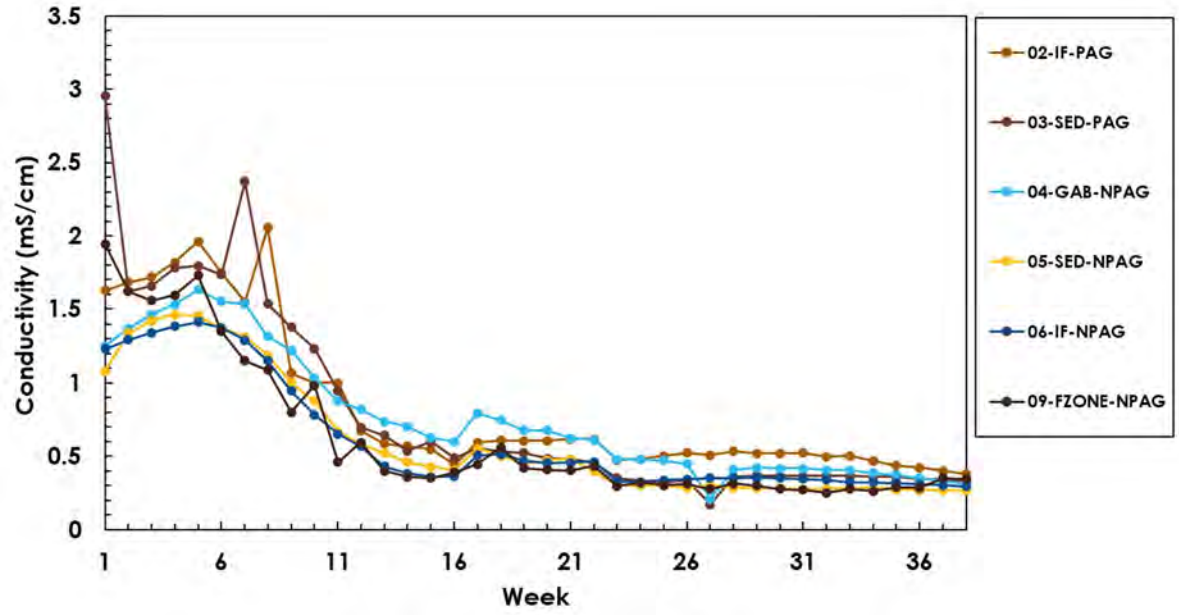

Figure 9: Leachate EC trends for waste rock Columns 02-IF-PAG, 03-SED-PAG, 04-GAB-NPAG, 05-SED-NPAG, 06-IF-NPAG, and 09-FZONE-NPAG throughout the duration of kinetic testing.

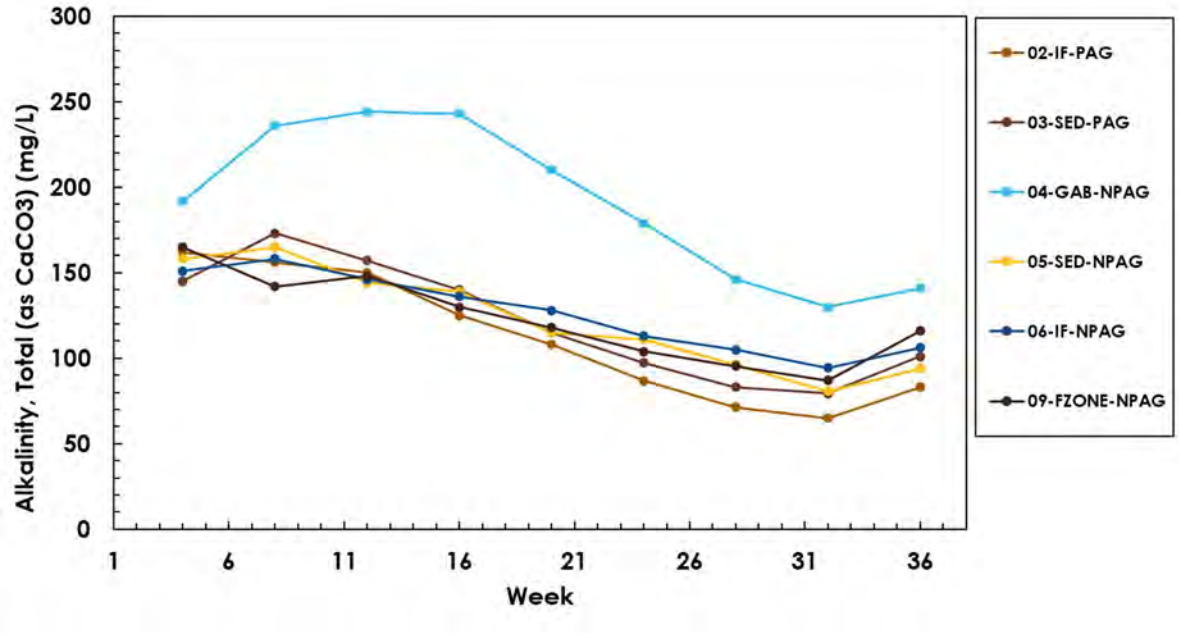

Figure 10: Leachate total alkalinity concentration trends for waste rock Columns 02-IF-PAG, 03-SED-PAG, 04-GAB-NPAG, 05-SED-NPAG, 06-IF-NPAG, and 09-FZONE-NPAG throughout the duration of kinetic testing.

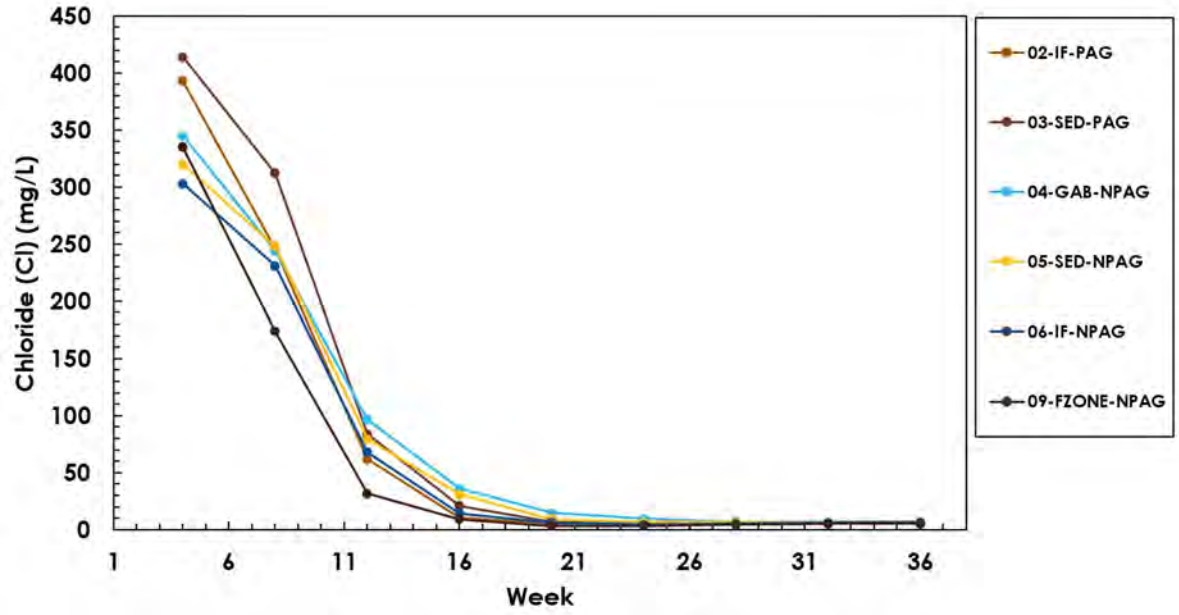

Figure 11: Leachate Cl^- concentration trends for waste rock Columns 02-IF-PAG, 03-SED-PAG, 04-GAB-NPAG, 05-SED-NPAG, 06-IF-NPAG, and 09-FZONE-NPAG throughout the duration of kinetic testing.

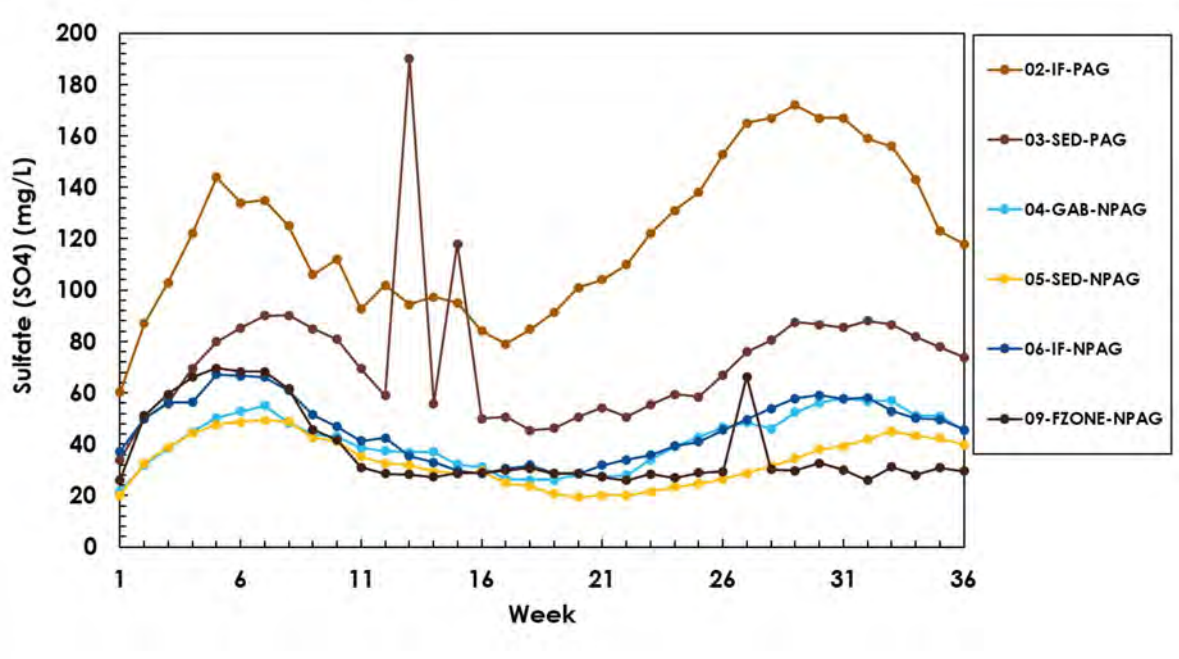

Figure 12: Leachate SO_4 concentration trends for waste rock Columns 02-IF-PAG, 03-SED-PAG, 04-GAB-NPAG, 05-SED-NPAG, 06-IF-NPAG, and 09-FZONE-NPAG throughout the duration of kinetic testing.

Leachate As concentrations increased from the initial flushing concentrations throughout kinetic testing for 04-GAB-NPAG and 05-SED-NPAG but were relatively stable for all other waste rock with concentrations between 0.0005 and 0.0043 mg/L (Figure 13).

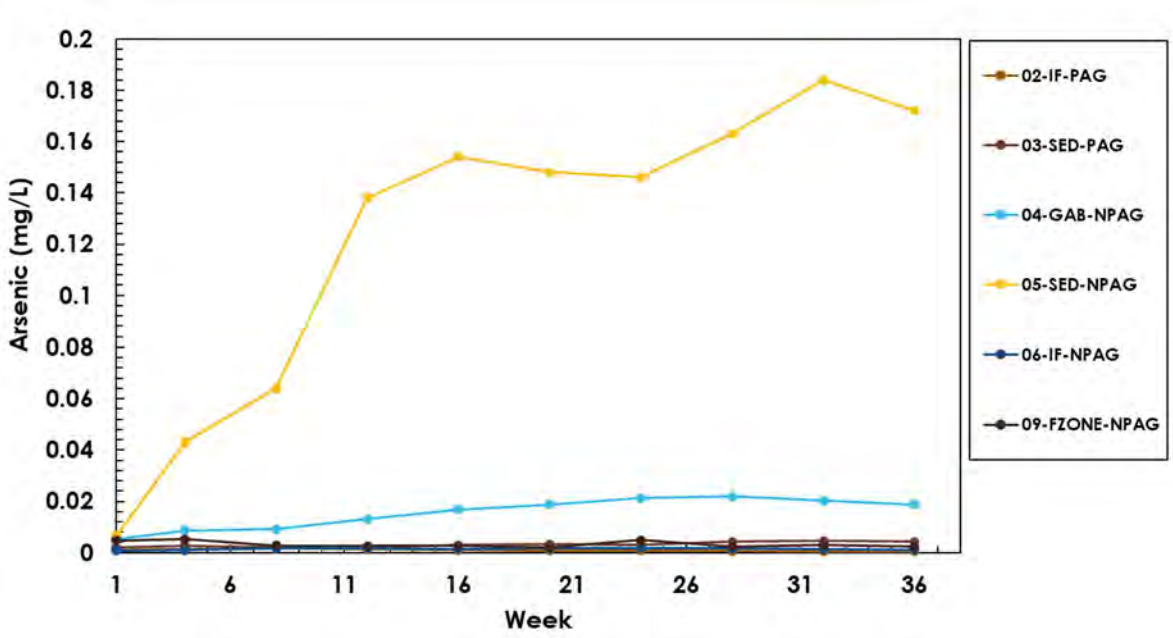

Figure 13: Leachate As concentration trends for waste rock Columns 02-IF-PAG, 03-SED-PAG, 04-GAB-NPAG, 05-SED-NPAG, 06-IF-NPAG, and 09-FZONE-NPAG throughout the duration of kinetic testing.

Column 05-SED-NPAG had the highest leachate As concentrations with a maximum concentration of 0.184 mg/L. The bulk chemistry of the 05-SED-NPAG waste rock material did not contain significantly greater As in the solid phase. It is expected that an anomalous As-bearing mineral that is not representative of the bulk NPAG Sediments material was included in the column material. Subsamples from several locations of the 05-SED-NPAG column were collected, homogenized, and submitted to Queen's University's Facility for Isotope Research for mineral liberation analysis (MLA). Arsenic-rich mineral phases were targeted in the analysis.

The majority of As in the 05-SED-NPAG sample was associated with arsenopyrite, which is a characteristic As-bearing phase in the waste rock. Several grains of gersdorffite (NiAsS) were identified, however, and could be the source of elevated As leaching. Additional MLA analysis of the NPAG Sediments material and other rock types to confirm the relative abundance of gersdorffite would provide additional support for attributing gersdorffite as the source of the non-representative As leaching rates from this material. The complete MLA data is provided in Appendix D.

Leaching Effects of Connate Water vs. DI Water

The purpose of 07-IF-PAG-CW and 08-SED-PAG-CW was to determine the effects that connate water from the underground mine workings has on mineral weathering within waste rock relative to DI water used in traditional kinetic tests. Here, the results from 02-IF-PAG and 03-SED-PAG (DI water used as influent) are compared against 07-IF-PAG-CW and 08-SED-PAG-CW (connate water influent), which have the same respective lithologies.

The connate water is characterized as being saline (EC = 74.2 mS/cm, TDS = 57,700 mg/L), circumneutral (pH = 7.2) with low alkalinity (37.7 mg/L as $CaCO_3$), high Ca and SO_4 concentrations (1,730 and 2,600 mg/L, respectively), and very high Na and Cl concentrations (17,400 and 33,100 mg/L, respectively). The concentrations of Cd, Ni, and As in the influent connate water were 0.00092 mg/L, <0.025 mg/L, and <0.005 mg/L, respectively.

The leachate pH values of 07-IF-PAG-CW and 08-SED-PAG-CW (pH = 7.0 to 7.5) were roughly one pH unit lower than 02-IF-PAG and 03-SED-PAG (pH = 7.8 to 8.7) were stable (Figure 14). The pH differences are potentially due to decreased carbonate dissolution resulting from the high Ca and Mg concentrations of the connate water. The range of leachate EC values of 07-IF-PAG-CW and 08-SED-PAG-CW (55.6 to 81.2 mS/cm) were nearly two orders of magnitude greater than the range of 02-IF-PAG and 03-SED-PAG EC values (2.95 to 0.17 mS/cm) and gradually increased throughout kinetic testing, whereas the leachate EC of 02-IF-PAG and 03-SED-PAG decreased (Figure 15).

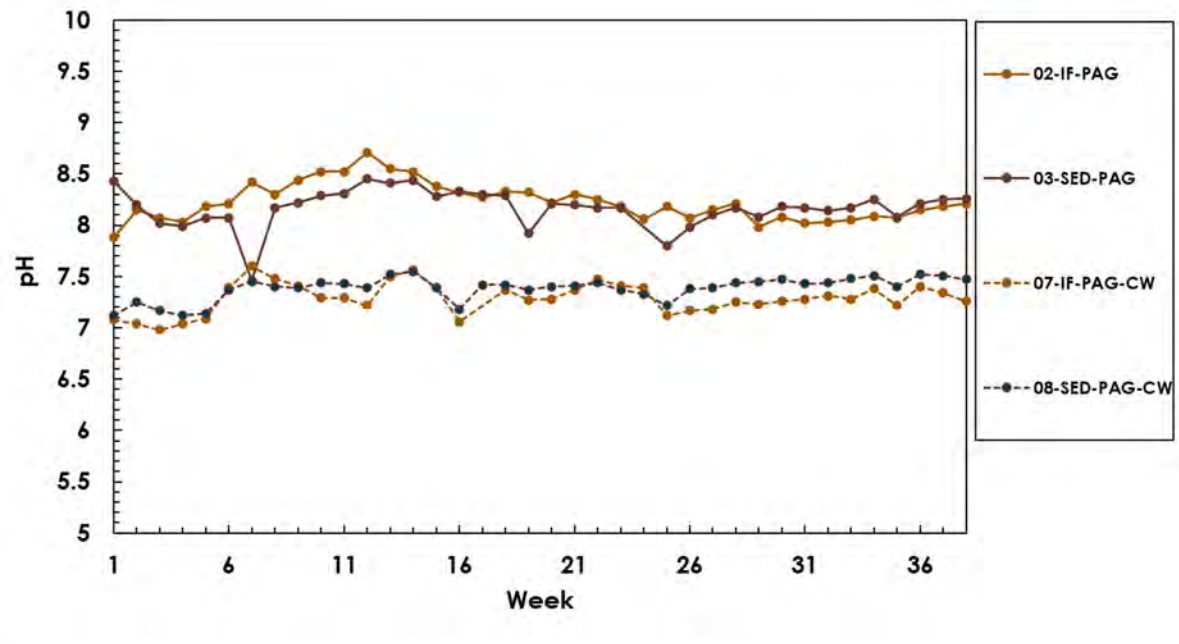

Figure 14: Leachate pH trends for waste rock 02-IF-PAG, 03-SED-PAG, 07-IF-PAG-CW, and 08-SED-PAG-CW throughout the duration of kinetic testing. CW = Connate Water.

Sulfate concentrations in 07-IF-PAG-CW and 08-SED-PAG-CW leachate increased throughout kinetic testing (2,600 to 3,600 mg/L; Figure 16) and were greater than SO_4 concentrations in the influent connate water (2,600 mg/L). Sulfate concentrations from 02-IF-PAG and 03-SED-PAG generally increased throughout testing ranging from 34 to 172 mg/L.

The mobility of divalent metals from the waste rock were affected by the connate water, whereas oxyanion species (e.g., As) were less affected. Both Ni and Cd concentrations from 07-IF-PAG-CW and 08-SED-PAG-CW were roughly 2 orders of magnitude greater than 02-IF-PAG and 03-SED-PAG and showed a stable trend, whereas Ni and Cd concentrations from 02-IF-PAG and 03-SED-PAG gradually decreased throughout kinetic testing (Figure 17 and Figure 18).

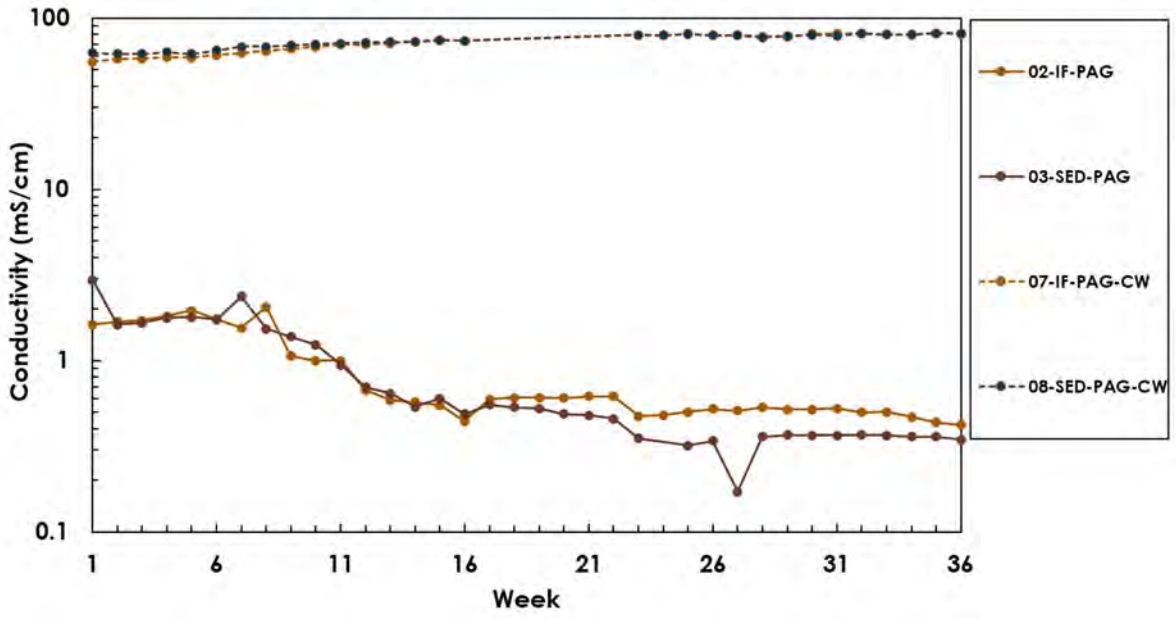

Figure 15: Leachate EC trends for waste rock 02-IF-PAG, 03-SED-PAG, 07-IF-PAG-CW, and 08-SED-PAG-CW throughout the duration of kinetic testing. CW = Connate Water.

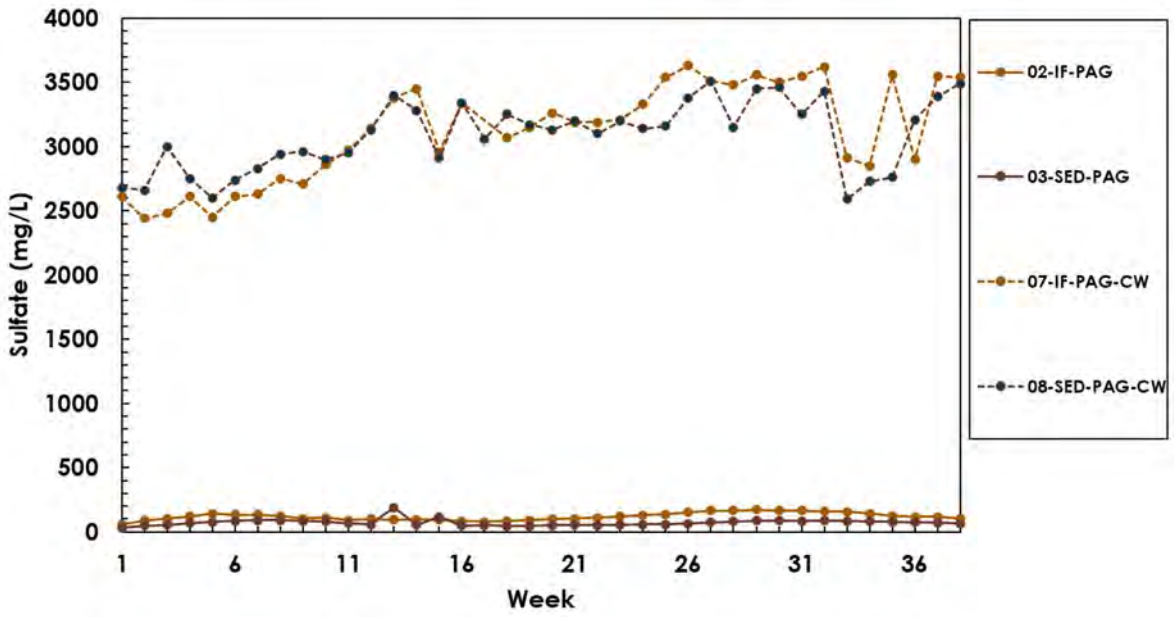

Figure 16: Leachate SO_4 concentration trends for waste rock 02-IF-PAG, 03-SED-PAG, 07-IF-PAG-CW, and 08-SED-PAG-CW throughout the duration of kinetic testing. CW = Connate Water.

Arsenic concentrations in leachate from 07-IF-PAG-CW and 08-SED-PAG-CW were generally below the detection limit of 0.005 and 0.01 mg/L for the entirety of kinetic testing, although the detection limits were raised because of the high TDS of the leachate. Arsenic concentrations in leachate from 03-SED-PAG gradually rose to a maximum of 0.0045 mg/L at week 32, whereas concentrations from 02-IF-PAG decreased to a minimum value of 0.0005 mg/L at the end of kinetic testing (Figure 19).

Cadmium and Ni had greater mobility in 07-IF-PAG-CW and 08-SED-PAG-CW than their DI water counterparts possibly due to decreased adsorption at the lower leachate pH, adsorption competition by SO_4, and complexation with SO_4 and other ligands present in the connate water. Arsenic was less affected at the leachate pH of the connate water columns because As forms oxyanion species that adsorb more strongly at lower pH.

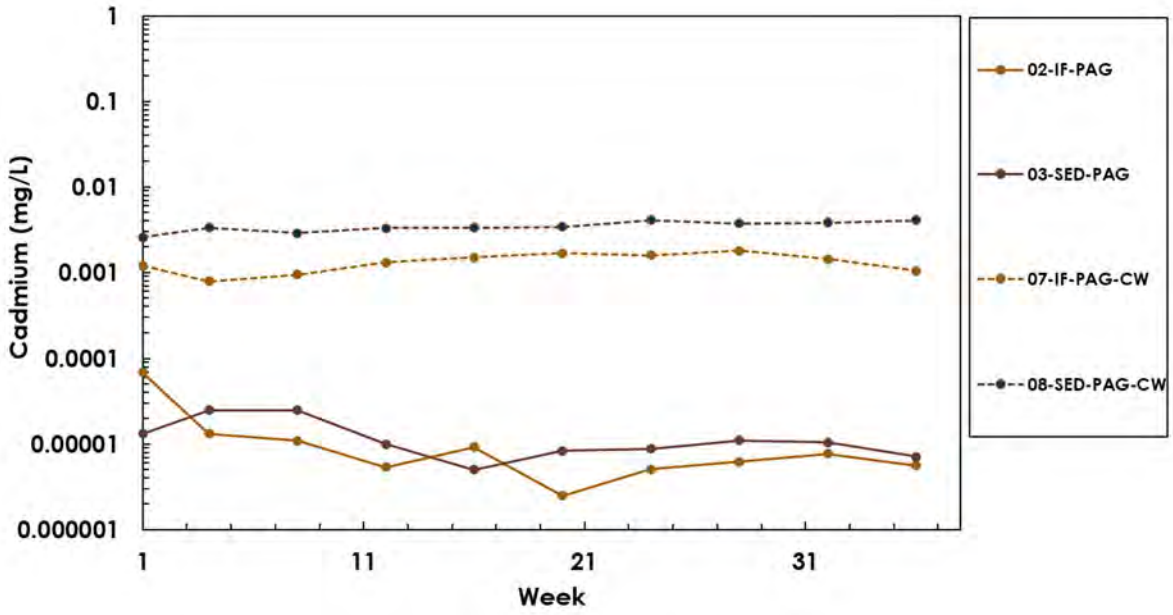

Figure 17: Leachate Cd concentration trends for waste rock 02-IF-PAG, 03-SED-PAG, 07-IF-PAG-CW, and 08-SED-PAG-CW throughout the duration of kinetic testing. CW = Connate Water.

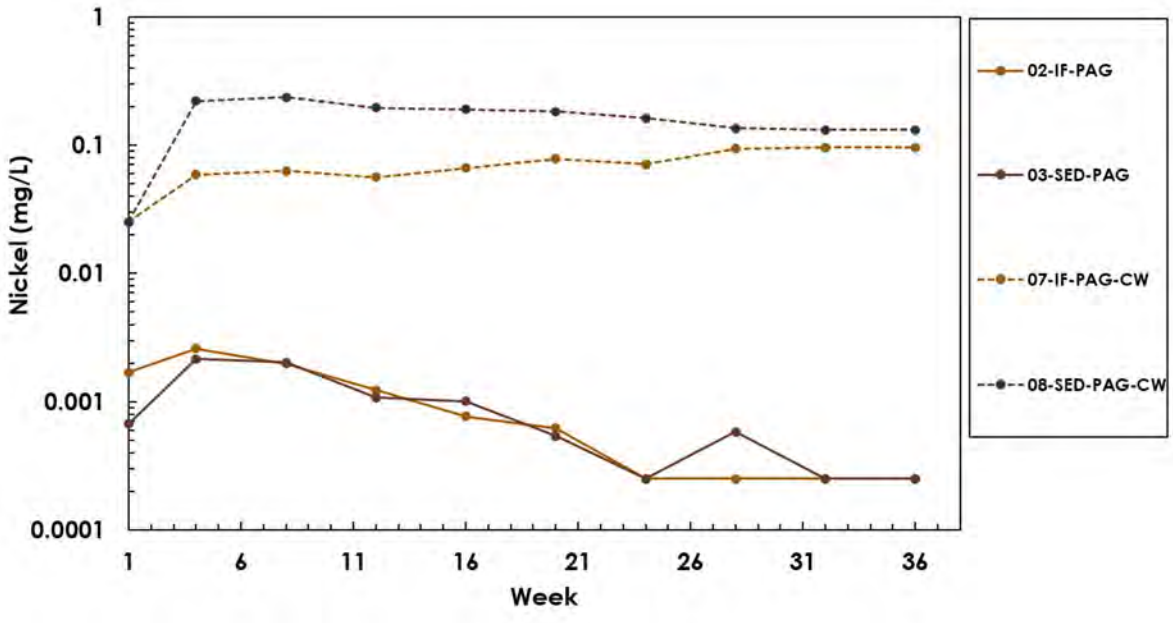

Figure 18: Leachate Ni concentration trends for waste rock 02-IF-PAG, 03-SED-PAG, 07-IF-PAG-CW, and 08-SED-PAG-CW throughout the duration of kinetic testing. CW = Connate Water.

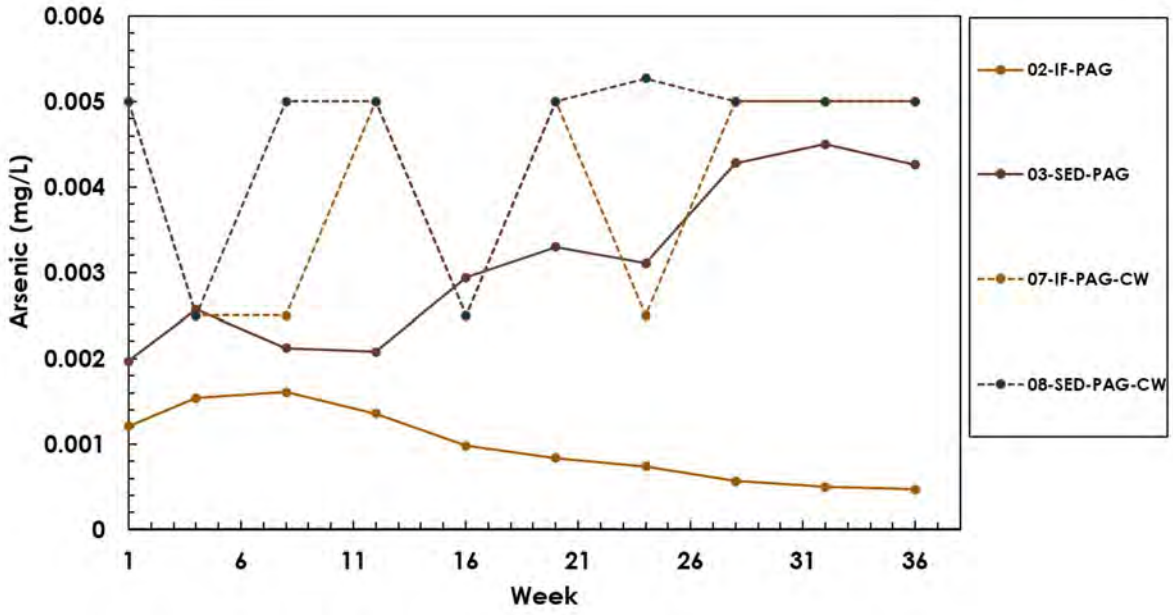

Figure 19: Leachate As concentration trends for waste rock 02-IF-PAG, 03-SED-PAG, 07-IF-PAG-CW, and 08-SED-PAG-CW throughout the duration of kinetic testing. CW = Connate Water.

Salinity Rinsing Columns

The purpose of the salinity rinsing columns (10-ROM-SR1 and 11-ROM-SR2) was to determine the rate that residual salinity is rinsed from the crushed ore under field conditions. Influent water was added at a higher rate than the other columns (0.6 L/week) to accelerate the flushing process. Electrical conductivity, Cl, and Na (proxies for salinity) were plotted against the total number of pore volumes flushed (Figure 20, Figure 21, and Figure 22).

The concentrations of EC, Cl, and Na decreased throughout testing for both 10-ROM-SR1 and 11-ROM-SR2, however each material type exhibited unique trends. Assuming plug flow conditions in the columns, the salinity rinsing rate of 11-ROM-SR2 was greater than 10-ROM-SR1, potentially due to the greater fines content (23% passing 0.15 mm for 11-ROM-SR2 compared to 15% for 10-ROM-SR1) and therefore a greater particle surface area requiring flushing. Leachate from 10-ROM-SR1 had initially high salinity concentrations that rapidly decreased during the first three pore volume flushes and began to stabilize after four flushes were achieved. Leachate salinity concentrations from 11-ROM-SR2 decreased more gradually during the first seven pore volume flushes. Concentrations began to stabilize around eight flushes. These results indicate that several pore volume flushes are required to flush stored salinity from ROM waste rock.

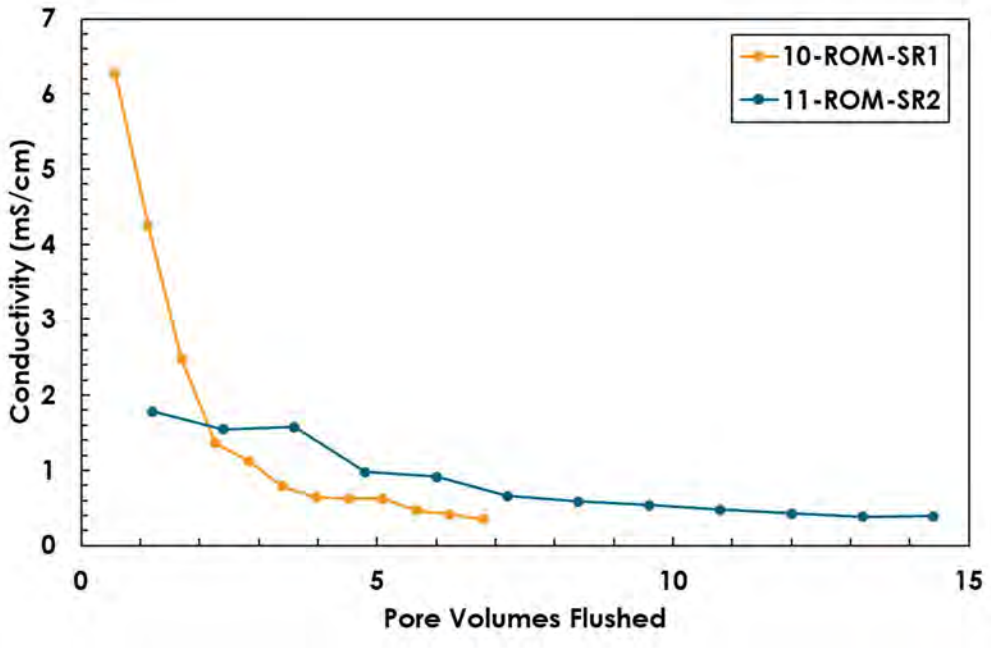

Figure 20: Leachate EC trends plotted against the number of pore volumes flushed for 10-ROM-SR1 and 11-ROM-SR2.

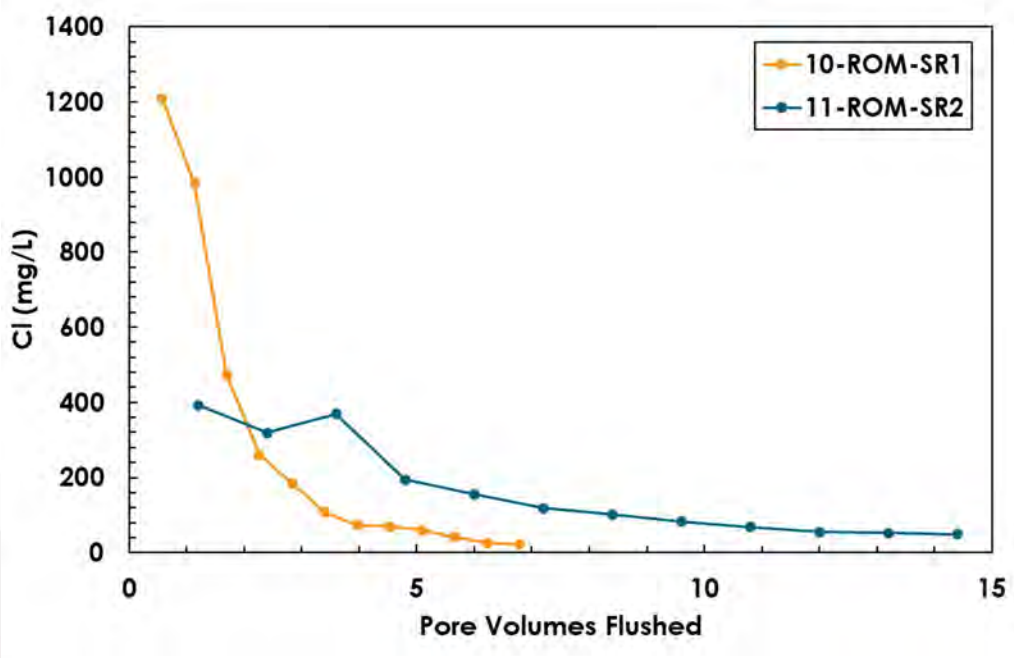

Figure 21: Leachate Cl^- concentration trends plotted against the number of pore volumes flushed for 10-ROM-SR1 and 11-ROM-SR2.

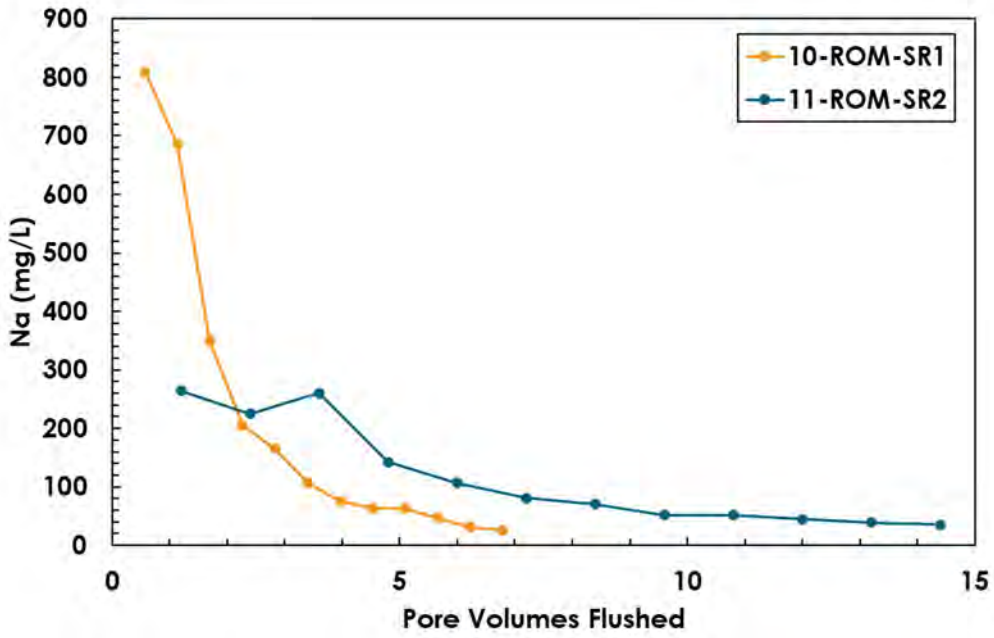

Figure 22: Leachate Na concentration trends plotted against the number of pore volumes flushed for 10-ROM-SR1 and 11-ROM-SR2.

Loading Rates

The loading rates for each analyte were calculated for the tailings and waste rock columns. Loading rates were calculated by dividing the cumulative load at the end of kinetic testing by the mass of material in the column and the total time elapsed (Table 5). The loading rates were not scaled up and represent the temperature (10 °C), equivalent net percolation (700 mm/year), and particle size distribution present in the columns. Scaling factors were not applied to these values because the loading rates may be applied under a range of physical conditions that require different scaling factors to be applied. Loading rates for the connate water columns were adjusted by subtracting the solute loads of the connate water itself from the leachate loads.

Sulfate, Cl, and F loading rates were greatest from 01-TSF. Additionally, metal release rates of As, Cd, Cr, Co, Cu, Pb, Mn, Ni, and Se were elevated from 01-TSF relative to waste rock samples, which is attributed to the combination of elevated sulfide content and finer-textured properties of the tailings.

Loading rates of several metals from the connate water columns were elevated compared to the duplicate columns leached by DI water, and included As, Cd, Co, Cu, Pb, Mn, Ni, and Zn. While As (any

oxyanion in solution) was elevated in the connate water leached columns, divalent metal loading rates were typically one to two orders of magnitude greater. The elevated loading rates of divalent metals was attributed to decreased pH causing less adsorption and increased aqueous complexation due to the high salinity of the connate water.

Table 5: Loading rates for selected analytes (mg/kg/wk).

Loads contributed by influent connate water were subtracted from load calculations of 07-IF-PAG-CW and 08-SED-PAG-CW.
N/A – Salinity of the connate water precluded measurement of a loading rate.

Acid and Neutralization Potential Consumption

Intrinsic Oxidation Rates

Two methods for deriving IORs for the waste rock and tailings samples were used: (1) O_2 consumption and (2) SO_4 loading rates. The complete calculations for the O_2 consumption method are provided in Appendix B. The O_2 consumption method measures the rate that O_2 is consumed in the column under sealed conditions. The SO_4 loading rate method estimates oxidation rates by the mass of SO_4 recovered in the leachate and assumes all SO_4 released results from pyrrhotite oxidation. The IORs (Table 6) can be used for modelling of oxidation processes in the waste rock and tailings.

Table 6: Intrinsic oxidation rates of tailings and waste rock materials calculated from headspace O_2 consumption and SO_4 load methods.

Column ID	Deposit	Intrinsic Oxidation Rate (kg O_2/tonne/s)

09-FZONE-NPAG	F Zone	1.1E-08	4.2E-09	1.1E-09

[1] Load of sulfate from influent connate water was subtracted from the sulfate load in the leachate for this calculation.
Trial 1 and Trial 2 of the O_2 consumption method measurements were performed before and after the atmospheric kinetic leaching testing, respectively.

The IORs were calculated based on the assumption that pyrrhotite and its reaction intermediates are the primary sources of O_2 consumption and SO_4 generation. The oxidation of pyrrhotite followed the reaction in Equation 1 and it was assumed x is equal to 0.125 (Equation 2). The resulting pyrrhotite oxidation produces Fe^{2+} and it was assumed that all Fe^{2+} oxidizes in the columns to Fe^{3+} and subsequently precipitates as $Fe(OH)_{3(s)}$ when pH > 3.5 (Equation 3). The net oxidation of pyrrhotite and its reaction intermediates consumes 2.15625 moles of O_2 and generates 1 mole of SO_4 and 2 moles of acid.

$$Fe_{1-x}S + \left(2 - \frac{x}{2}\right) O_2 + xH_2O \rightarrow (1-x)Fe^{2+} + SO_4^{2-} + 2xH^+ \quad (1)$$

$$Fe_{0.875}S + 1.9375O_2 + 0.125H_2O \rightarrow 0.875Fe^{2+} + SO_4^{2-} + 0.25H^+ \quad (2)$$

$$Fe_{0.875}S + 2.15625O_2 + 2.3125H_2O \rightarrow 0.875Fe(OH)_{3(s)} + SO_4^{2-} + 2H^+ \qquad (3)$$

The O_2 consumptions IORs calculated from Trial 1 were greater than those from Trial 2, likely due to freshly exposed surfaces created from crushing of the drill core. It is expected that IORs from Trial 2 are more representative of longer-term IORs than Trial 1. Trial 2 IORs are therefore used for further calculations and comparisons.

For waste rock samples, IORs measured using O_2 consumption were greater than IORs measured from the SO_4 load. This could be a result of O_2 being consumed by other processes or by attenuation of SO_4 within the columns (e.g., precipitation reactions). Waste rock flushed by connate water had greater IORs from the SO_4 load measurement despite the load from the influent connate water being subtracted from these calculations. The tailings IOR from the SO_4 load method was also greater than the O_2 consumption method, although this could be a result of an initially high load of stored SO_4 in the tailings material. Given the uncertainties of the SO_4 load, it is recommended that IORs from Trial 2 of the O_2 consumption method are used for all materials tested. Intrinsic oxidation rates were not measured for 10-ROM-SR1 and 11-ROM-SR2 as the purpose of these columns was to determine the salinity rinsing rate for ROM ore.

Neutralization Potential Depletion Time

Acid generation is assumed to occur when all available NP has been consumed, assuming that the acid potential of the sample has not been completely consumed. The depletion time of NP of the tested samples was calculated using both the IORs from the O_2 consumption method (Trial 2) and the SO_4 load method for comparison purposes.

To calculate the NP depletion time, acid generation rates and NP consumption rates (both as mg $CaCO_3$/t/s) were first calculated. Acid generation rates (Table 7) using the O_2 consumption IORs assumed that acid is generated following Equation 3. Alternatively, acid generation rates were also calculated using the SO_4 load in the leachate using the stoichiometry from Equation 3. Neutralization potential consumption rates were calculated using the carbonate molar ratio (CMR) method to relate the stoichiometric ratio of acid neutralization to carbonate consumption (Price, 2009)[1] by calculating the ratio of the cumulative Ca and Mg molar load to the SO_4 molar load of each material tested (Table 8).

* Values were assumed to be 1.00 because kinetic data contained interferences preventing calculation of the carbonate molar ratio.

‡Calculated values greater than 2 or less then 1 were limited to either 2 or 1 based on the expected stoichiometry of the carbonate neutralization reaction.

The mass of available NP in each column was calculated based on the modified neutralization potential (Mod-NP; Table 9) measured using the modified Sobek method[2] and the column-specific mass of material. The corresponding NP consumption rate and total Mod-NP in each column were used to estimate when Mod-NP would be completely consumed, and acid generation would begin (Table 10). Note that NP depletion times for NPAG materials do not mean that acid will be generated as, by definition, acid generation potential will be consumed before NP is consumed, and therefore acidic conditions will not form from NPAG materials.

Table 9: Acid base accounting characteristics of tested samples.

MAP – Maximum acid potential from Total-S content (Total-S wt.% × 31.25).
SAP – Sulfide acid potential is calculated from Sulphide-S (by difference) content (Sulphide-S wt.% × 31.25).
Mod-NP – Modified neutralization potential from Lorax (2022).
NPR – Net potential ratio, Mod-NP/SAP.

As with the IORs, the calculated NP depletion times were generally faster when calculated from the O2 consumption method. Calculated depletion times from the SO_4 load method were faster for the tailings and the waste rock flushed with connate water. It is suggested that NP depletion times from the O_2 consumption method be used, due to the possibility of SO_4 that is not a direct result of oxidation in the columns interfering with the measurements in the tailings and connate water columns.

The depletion times in Table 10 are based on the time to consume NP in the specific materials tested in the columns. A statistical range of the depletion times for each rock type tested was calculated based on Mod-NP statistics of the corresponding rock type ([1] Neutralization depletion is not expected to physically occur for NPAG materials, calculations are for theoretically purposes only.

Table 11; Lorax, 2022). The statistical NP depletion was calculated for each column by dividing the 10th, 25th, median, 75th, and 95th percentile Mod-NP for each rock type by the NP consumption rate (using the

[2] Lawrence, R.W. and Wang, Y. 1996. Determination of Neutralization Potential for Acid Rock Drainage Prediction. MEND Project 1.16.3. July 31, 1996.

O_2 consumption method values) measured in the columns for the respective rock type (Table 7). The measured NP depletion time for all columns lies within the statistical depletion time calculated from acid base accounting statistical ranges of Mod-NP (Table 12 and Figure 23). Note that these NP depletion times are based on unscaled kinetic test results; lower temperatures under field conditions would result in longer lag times until onset of acid generation.

Oxygen Consumption

Intrinsic oxidation rates (IORs) based on O_2 consumption

The IORs based on O_2 consumption were calculated using O_2 headspace measurements (Table 1 to Table 9), assumptions about the tailings and waste rock material properties (Table 10 and Table 11, respectively), and the calculated pore volume (Table 12).

The mass of oxygen consumed (kg O_2/t) was calculated using the atmospheric pressure (atm), estimated gas volume (L), gas constant (L · atm/mol · K), molar mass of oxygen (g/mol), measured headspace (%), and dry mass (kg). The IOR (kg O_2/t/s) was then calculated using the elapsed time (s) and the difference in the calculated mass of oxygen consumed.

Table 1: IOR Calculations for 01-TSF

Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2546323-4, -5, -6
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2546323-1
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2546323-4, -5, -6
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2546323-1
Matrix Spike	Thallium (Tl)-Dissolved	MS-B	L2546323-4, -5, -6
Matrix Spike	Uranium (U)-Dissolved	MS-B	L2546323-4, -5, -6
Matrix Spike	Uranium (U)-Dissolved	MS-B	L2546323-1
Matrix Spike	Nitrite (as N)	MS-B	L2546323-1, -2, -3, -4, -5, -6
Matrix Spike	Nitrate (as N)	MS-B	L2546323-1, -2, -3, -4, -5, -6
Matrix Spike	Sulfate (SO4)	MS-B	L2546323-1, -2, -3, -4, -5, -6

Qualifiers for Individual Parameters Listed:

Qualifier	Description
BL:INT	Balance Reviewed: Interference Or Non-Measured Component
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
K	Matrix Spike recovery outside ALS DQO due to sample matrix effects.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**

Reference Information

ALK-PCT-SK	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

BR-IC-N-SK	Water	Bromide in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CL-IC-N-SK	Water	Chloride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CN-T-CFA-VA	Water	Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-CFA-VA	Water	Weak Acid Diss. Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

EC-PCT-SK	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

F-IC-N-SK	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

IONBALANCE-OP03-SK	Water	Ion Balance Calculation	APHA 1030-E
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A

This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).

NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-CL	Water	Total P in Water by Colour	APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-SK	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-SK	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TKN-F-CL	Water	Total Kjeldahl Nitrogen by Fluorescence	APHA 4500-NORG (TKN)

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Reference Information

CL ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLHC	*Detection Limit Raised: Dilution required due to high concentration of test analyte(s).*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
HTA	*Analytical holding time was exceeded.*
IB:INT	*Ion Balance Reviewed: Imbalance is due to interference or non-measured component.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2100207**	Page	: 1 of 18
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 04-Feb-2021 14:45
PO	: ----	Issue Date	: 19-Feb-2021 18:04
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 34		
No. of samples analysed	: 34		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Cyanide by CFA	E333 Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

					Matrix Spike (MS) Report					
					Spike		Recovery (%)	Recovery Limits (%)

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY. By the use of this form the user acknowledges and agrees with the Terms and Conditions as specified on the back page of the white - report copy.

1. If any water samples are taken from a **Regulated Drinking Water (DW) System**, please submit using an **Authorized DW COC form**.

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **SK2100266**	Page	: 1 of 11
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon SK Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: ----	Date Samples Received	: 12-Feb-2021 11:45
PO	: ----	Date Analysis Commenced	: 12-Feb-2021
C-O-C number	: ----	Issue Date	: 22-Feb-2021 11:17
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 11		
No. of samples analysed	: 11		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Jorden Fanson	Analyst	Inorganics, Calgary, Alberta
Katrina Chudyk	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Melissa Houseman	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Melissa Houseman	Team Leader - Inorganics	Metals, Saskatoon, Saskatchewan
Naeun Kim	Analyst	Inorganics, Calgary, Alberta
Rebeccah Baker	Analyst	Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLCI	*Detection Limit Raised: Chromatographic interference due to co-elution.*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
IB:INT	*Ion Balance Reviewed: Imbalance is due to interference or non-measured component.*

Analytical Results

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2100266**	Page	: 1 of 20
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: ----	Date Samples Received	: 12-Feb-2021 11:45
PO	: ----	Issue Date	: 22-Feb-2021 11:17
C-O-C number	: ----		
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 11		
No. of samples analysed	: 11		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Melissa Houseman	Team Leader - Inorganics	Metals, Saskatoon, Saskatchewan
Naeun Kim	Analyst	Inorganics, Calgary, Alberta
Nancy Cruse	Laboratory _ Supervisor	Inorganics, Saskatoon, Saskatchewan
Rebeccah Baker	Analyst	Inorganics, Calgary, Alberta
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLHC	*Detection Limit Raised: Dilution required due to high concentration of test analyte(s).*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
SFP	*Sample was filtered and preserved at the laboratory.*

Project	: 948-021	Date Samples Received	: 11-Mar-2021 16:55
PO	: ----	Issue Date	: 19-Mar-2021 09:30
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 44		
No. of samples analysed	: 44		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- Duplicate outliers occur - please see following pages for full details.
- Matrix Spike outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Duplicate (DUP) RPDs								
Anions and Nutrients	SK2100585-003	01_TSF_W12	chloride	16887-00-6	E235.Cl	68.1 %	20%	Duplicate RPD does not meet the DQO for this test.
Anions and Nutrients	SK2100585-003	01_TSF_W12	nitrate (as N)	14797-55-8	E235.NO3	68.3 %	20%	Duplicate RPD does not meet the DQO for this test.
Anions and Nutrients	SK2100585-003	01_TSF_W12	sulfate (as SO4)	14808-79-8	E235.SO4	67.9 %	20%	Duplicate RPD does not meet the DQO for this test.
Matrix Spike (MS) Recoveries								
Anions and Nutrients	SK2100585-028	07-IF-PAG-CW_W8	fluoride	16984-48-8	E235.F	65.6 % K	75.0-125%	Recovery less than lower data quality objective

Result Qualifiers

Qualifier	Description
K	*Matrix Spike recovery outside ALS DQO due to sample matrix effects.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Water**

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	162513	1	18	5.5	5.0	✓
Ammonia by Fluorescence	E298	164684	1	13	7.6	5.0	✓
Bromide in Water by IC	E235.Br	162468	3	35	8.5	5.0	✓
Chloride in Water by IC	E235.Cl	162471	3	32	9.3	5.0	✓
Conductivity in Water	E100	162512	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Bromide in Water by IC	E235.Br Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Cyanide by CFA	E333 Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

Nancy Cruse	Laboratory _ Supervisor	Inorganics, Saskatoon, Saskatchewan
Rebeccah Baker	Analyst	Inorganics, Calgary, Alberta
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Are samples for human consumption/ use?

☐ YES ☑ NO

Special Instructions / Specify Criteria to add on report by clicking on the drop-down list below (electronic COC only)

Suspected hazards: elevated metals, potential for low levels of cyanide

SAMPLE CONDITION AS RECEIVED (lab use only)

Frozen ☐ | SIF Observations Yes ☐ No ☐

Ice Packs ☐ Ice Cubes ☐ | Custody seal intact Yes ☐ No ☐

Cooling Initiated ☐

INITIAL COOLER TEMPERATURES °C				FINAL COOLER TEMPERATURES °C			

SHIPMENT RELEASE (client use)

Released by: Jared Robertson	Date: March 11, 2021	Time:

INITIAL SHIPMENT RECEPTION (lab use only)

Received by:	Date:	Time:

FINAL SHIPMENT RECEPTION (lab use only)

Received by:	Date:	Time:

NOV 2018 FRONT

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY. By the use of this form the user acknowledges and agrees with the Terms and Conditions as specified on the back page of the white - report copy.

1. If any water samples are taken from a **Regulated Drinking Water (DW) System**, please submit using an **Authorized DW COC form**.

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **SK2100888**	Page	: 1 of 29
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon SK Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 08-Apr-2021 15:45
PO	: ----	Date Analysis Commenced	: 09-Apr-2021
C-O-C number	: ----	Issue Date	: 19-Apr-2021 10:13
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 44		
No. of samples analysed	: 44		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dwayne Bennett	Technical Specialist	Inorganics, Saskatoon, Saskatchewan
Harpreet Chawla	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Jorden Fanson	Analyst	Inorganics, Calgary, Alberta
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Melissa Houseman	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Melissa Houseman	Team Leader - Inorganics	Metals, Saskatoon, Saskatchewan
Naeun Kim	Analyst	Inorganics, Calgary, Alberta
Rebeccah Baker	Analyst	Inorganics, Calgary, Alberta
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sample Comments

Sample	Client Id	*Comment*
SK2100888-001	01_TSF_W14	Minimal sample provided for all samples, some past hold time

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
SFP	*Sample was filtered and preserved at the laboratory.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2100888**	Page	: 1 of 37
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 08-Apr-2021 15:45
PO	: ----	Issue Date	: 19-Apr-2021 10:13
C-O-C number	: ----		
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 44		
No. of samples analysed	: 44		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Bromide in Water by IC	E235.Br Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Cyanide by CFA	E333 Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Quality Systems Coordinator	Metals, Saskatoon, Saskatchewan
Dwayne Bennett	Technical Specialist	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Melissa Houseman	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Nancy Cruse	Laboratory _ Supervisor	Inorganics, Saskatoon, Saskatchewan
Parker Sgarbossa	Laboratory Analyst	Inorganics, Calgary, Alberta
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2101287**	Page	: 1 of 23
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 06-May-2021 16:45
PO	: ----	Issue Date	: 15-May-2021 18:10
C-O-C number	: ----		
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 38		
No. of samples analysed	: 36		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Bromide in Water by IC	E235.Br Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Cyanide by CFA	E333 Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO_3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 35		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Quality Systems Coordinator	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Inorganics, Burnaby, British Columbia
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Melissa Houseman	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Melissa Houseman	Team Leader - Inorganics	Metals, Saskatoon, Saskatchewan
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Naeun Kim	Analyst	Inorganics, Calgary, Alberta
Parker Sgarbossa	Laboratory Analyst	Inorganics, Calgary, Alberta
Sara Niroomand		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLHC	*Detection Limit Raised: Dilution required due to high concentration of test analyte(s).*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
RRV	*Reported result verified by repeat analysis.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2101741**	Page	: 1 of 26
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 03-Jun-2021 16:51
PO	: ----	Issue Date	: 28-Jun-2021 15:53
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 35		
No. of samples analysed	: 35		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	213503	1	16	6.2	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Bromide in Water by IC	E235.Br Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Cyanide by CFA	E333 Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

PO	: ----	Date Analysis Commenced	: 02-Jul-2021
C-O-C number	: ----	Issue Date	: 11-Jul-2021 18:51
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 36		
No. of samples analysed	: 36		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Quality Systems Coordinator	Metals, Saskatoon, Saskatchewan
Dwayne Bennett	Technical Specialist	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Jorden Fanson	Analyst	Inorganics, Calgary, Alberta
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Naeun Kim	Analyst	Inorganics, Calgary, Alberta
Parker Sgarbossa	Laboratory Analyst	Inorganics, Calgary, Alberta
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
IB:INT	*Ion Balance Reviewed: Imbalance is due to interference or non-measured component.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2102164**	Page	: 1 of 27
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 30-Jun-2021 16:30
PO	: ----	Issue Date	: 11-Jul-2021 18:51
C-O-C number	: ----		
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 36		
No. of samples analysed	: 36		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- Matrix Spike outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Matrix Spike (MS) Recoveries								
Anions and Nutrients	SK2102164-028	07-IF-PAG-CW_W24	fluoride	16984-48-8	E235.F	62.6 % K	75.0-125%	Recovery less than lower data quality objective
Anions and Nutrients	SK2102164-028	07-IF-PAG-CW_W24	nitrite (as N)	14797-65-0	E235.NO2	70.4 % K	75.0-125%	Recovery less than lower data quality objective

Result Qualifiers

Qualifier	Description
K	*Matrix Spike recovery outside ALS DQO due to sample matrix effects.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Bromide in Water by IC	E235.Br Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Cyanide by CFA	E333 Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Drinking Water (DW) Samples[1] (client use)

Are samples taken from a Regulated DW System?
☐ YES ☑ NO

Are samples for human consumption/ use?
☐ YES ☑ NO

Special Instructions / Specify Criteria to add on report by clicking on the drop-down list below (electronic COC only)

Suspected hazards: elevated metals, potential for low levels of cyanide

SAMPLE CONDITION AS RECEIVED (lab use only)

Frozen ☐ | SIF Observations Yes ☐ No ☐

Ice Packs ☐ Ice Cubes ☐ | Custody seal intact Yes ☐ No ☐

Cooling Initiated ☐

INITIAL COOLER TEMPERATURES °C				FINAL COOLER TEMPERATURES °C			

SHIPMENT RELEASE (client use)			INITIAL SHIPMENT RECEPTION (lab use only)			FINAL SHIPMENT RECEPTION (lab use only)

No. of samples analysed	: 36		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Quality Systems Coordinator	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Melissa Houseman	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Melissa Houseman	Team Leader - Inorganics	Metals, Saskatoon, Saskatchewan
Parker Sgarbossa	Laboratory Analyst	Inorganics, Calgary, Alberta
Ruifang Zheng	Analyst	Inorganics, Calgary, Alberta
Sara Niroomand		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sample Comments

Sample	Client Id	*Comment*
SK2102643-003	01_TSF_W32	sample 01_TSF_W33 is coded for multiple analysis but only received 1 125ml bottle for it. Sample 01_TSF_w32 is only coded for SO4 but received multiple containers matching those needed for 01_TSF_W33. Will assume client mislabelled and will process those bottles for sample 01_TSF_W33.
SK2102643-004	01_TSF_W33	sample 01_TSF_W33 is coded for multiple analysis but only received 1 125ml bottle for it. Sample 01_TSF_w32 is only coded for SO4 but received multiple containers matching those needed for 01_TSF_W33. Will assume client mislabelled and will process those bottles for sample 01_TSF_W33.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

IB:INT	*Ion Balance Reviewed: Imbalance is due to interference or non-measured component.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2102643**	Page	: 1 of 23
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 29-Jul-2021 13:30
PO	: ----	Issue Date	: 09-Aug-2021 17:34
C-O-C number	: ----		
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 36		
No. of samples analysed	: 36		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- Matrix Spike outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Matrix Spike (MS) Recoveries								
Anions and Nutrients	SK2102643-003	01_TSF_W32	fluoride	16984-48-8	E235.F	66.5 % K	75.0-125%	Recovery less than lower data quality objective

Result Qualifiers

Qualifier	Description
K	*Matrix Spike recovery outside ALS DQO due to sample matrix effects.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	255518	1	12	8.3	5.0	✓
Ammonia by Fluorescence	E298	257308	1	20	5.0	5.0	✓
Chloride in Water by IC	E235.Cl	255510	1	13	7.6	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Cyanide by CFA	E333 Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

C-O-C number	: ----	Issue Date	: 08-Sep-2021 16:17
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 36		
No. of samples analysed	: 36		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Cindy Tang	Team Leader - Inorganics	Inorganics, Burnaby, British Columbia
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Quality Systems Coordinator	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Melissa Houseman	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Nancy Cruse	Laboratory _ Supervisor	Inorganics, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
IB:INT	*Ion Balance Reviewed: Imbalance is due to interference or non-measured component.*
TKNI	*TKN result may be biased low due to Nitrate interference. Nitrate-N is > 10x TKN.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2103098**	Page	: 1 of 22
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 26-Aug-2021 16:51
PO	: ----	Issue Date	: 08-Sep-2021 16:17
C-O-C number	: ----		
Sampler	: Client		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 36		
No. of samples analysed	: 36		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	278023	1	20	5.0	5.0	✓
Ammonia by Fluorescence	E298	281828	1	15	6.6	5.0	✓
Chloride in Water by IC	E235.Cl	277992	2	26	7.6	5.0	✓

WAD Cyanide by CFA	E336	283304	1	5	20.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Cyanide by CFA	E333 Vancouver - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Vancouver - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

QUALITY CONTROL REPORT

Work Order	: **SK2103098**	Page	: 1 of 14
Client	: O'Kane Consultants Inc.	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5

Nancy Cruse	Laboratory _ Supervisor	Inorganics, Saskatoon, Saskatchewan

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Anthony Calero	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Dwayne Bennett	Technical Specialist	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Melissa Houseman	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Melissa Houseman	Team Leader - Inorganics	Metals, Saskatoon, Saskatchewan
Parker Sgarbossa	Laboratory Analyst	Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
IB:INT	*Ion Balance Reviewed: Imbalance is due to interference or non-measured component.*
RRV	*Reported result verified by repeat analysis.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2104022**	Page	: 1 of 20
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 23-Sep-2021 15:45
PO	: ----	Issue Date	: 15-Oct-2021 14:58
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 36		
No. of samples analysed	: 36		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	300985	1	19	5.2	5.0	✓
Ammonia by Fluorescence	E298	318005	1	19	5.2	5.0	✓
Chloride in Water by IC	E235.Cl	301832	2	34	5.8	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Cyanide by CFA	E333 Waterloo - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Waterloo - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO_3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 19		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Anthony Calero	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Quality Systems Coordinator	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Parker Sgarbossa	Laboratory Analyst	Inorganics, Calgary, Alberta
Ruifang Zheng	Analyst	Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

No. of samples received	: 19		
No. of samples analysed	: 19		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- Matrix Spike outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Matrix Spike (MS) Recoveries								
Anions and Nutrients	Anonymous	Anonymous	fluoride	16984-48-8	E235.F	58.8 % K	75.0-125%	Recovery less than lower data quality objective

Result Qualifiers

Qualifier	Description
K	*Matrix Spike recovery outside ALS DQO due to sample matrix effects.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Cyanide by CFA	E333 Waterloo - Environmental	Water	ISO 14403 (mod)	Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.
WAD Cyanide by CFA	E336 Waterloo - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in $CaCO_3$ equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

No. of samples analysed	: 19		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon SK Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 10-Nov-2021 16:08
PO	: ----	Date Analysis Commenced	: 10-Nov-2021
C-O-C number	: ----	Issue Date	: 18-Nov-2021 13:35
Sampler	: ----		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Quality Systems Coordinator	Metals, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLHC	*Detection Limit Raised: Dilution required due to high concentration of test analyte(s).*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

Quote number	: Q83455		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Saskatoon - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Chloride in Water by IC	E235.Cl Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC	E235.NO2 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC	E235.NO3 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Saskatoon - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Saskatoon - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Waterloo - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Waterloo - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Cyanide	E333 Waterloo - Environmental	Water	ISO 14403 (mod)	Total or Strong Acid Dissociable (SAD) Cyanide is determined by Continuous Flow Analyzer (CFA) with in-line UV digestion followed by colourmetric analysis. Method Limitation: High levels of thiocyanate (SCN) may cause positive interference (up to 0.5% of SCN concentration).
WAD Cyanide	E336 Waterloo - Environmental	Water	APHA 4500-CN I (mod)	Weak Acid Dissociable (WAD) cyanide is determined by Continuous Flow Analyzer (CFA) with in-line distillation followed by colourmetric analysis.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Waterloo - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Metals in Water by CRC ICPMS	E421 Saskatoon - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Hardness (Calculated)	EC100 Saskatoon - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Saskatoon - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Saskatoon - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Saskatoon - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Waterloo - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Waterloo - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Phosphorus in water	EP372 Waterloo - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Saskatoon - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Colby Bingham	Quality Systems Coordinator	Inorganics, Saskatoon, Saskatchewan
Colby Bingham	Quality Systems Coordinator	Metals, Saskatoon, Saskatchewan
Harpreet Chawla	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Lian Nesbitt	Laboratory Analyst	Metals, Saskatoon, Saskatchewan
Melissa Houseman	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Parker Sgarbossa	Laboratory Analyst	Inorganics, Calgary, Alberta
Sara Niroomand		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sample Comments

Sample	Client Id	*Comment*
SK2106353-002	01_TSF_W50	Received 2 samples marked 01_TSF_W51, missing W50. 1 container lists a time of 16:25, will assume this is the missing W50
SK2106353-003	01_TSF_W51	Received 2 samples marked 01_TSF_W51, missing W50. 1 container lists a time of 16:25, will assume this is the missing W50

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **SK2106353**	Page	: 1 of 9
Client	: **O'Kane Consultants Inc.**	Laboratory	: Saskatoon - Environmental
Contact	: Jared Robertson	Account Manager	: Brian Morgan
Address	: 112 - 112 Research Drive Saskatoon SK Canada S7N 3R3	Address	: 819 58 Street East Saskatoon, Saskatchewan Canada S7K 6X5
Telephone	: 250 420 7010	Telephone	: 1 306 221 7147
Project	: 948-021	Date Samples Received	: 10-Dec-2021 14:56
PO	: ----	Issue Date	: 20-Dec-2021 18:02
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: Q83455		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Saskatoon - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
