AGNICO EAGLE

MELIADINE GOLD MINE

Water Management Plan

JANUARY 2024
VERSION 14_NWB
6513-MPS-11

EXECUTIVE SUMMARY

Agnico Eagle Mines Limited (Agnico Eagle) is operating the Meliadine Gold Mine (Meliadine Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut.

The water management objectives are to minimize potential impacts to the quantity and quality of surface water at the Mine. Water management structures (surface ponds, water retention dikes/berms, water diversion channels and culverts) are in place and will be constructed as needed to contain and manage the contact water from the areas affected by the Mine or mining activities. The major water management infrastructure includes: contact water and saline contact water collection ponds (CPs and SPs), water retention dikes, berms, channels, a potable Water Treatment Plant (WTP), a Sewage Treatment Plant (STP), an Effluent Water Treatment Plant (EWTP), a Saline Effluent Treatment Plant (SETP), and a Saline Effluent Waterline.

During mine Construction and Operations, contact water originating from affected areas on surface will be intercepted, diverted and collected within the various collection ponds. The collected water at the Mine will be eventually pumped and stored in Collection Pond 1 (CP1), where the contact water will be treated by the EWTP for removal of Total Suspended Solids (TSS) prior to discharge to the receiving environment. Discharge to Itivia Harbour is prioritized, with the remainder discharged to Meliadine Lake according to the approved Meliadine Mine Adaptive Management Plan. At the Discovery site, contact water will be managed in the Discovery collection ponds (CP1 and CP2) and routed to SP6 for discharge to Itivia Harbour. Contact water from the Underground Mine will be collected in underground storage stopes and sumps. Some water from Underground will be reused for underground operations. Excess saline contact water will be pumped to different SPs on the surface, and then routed to either Tiriganiaq Pit 02 (TIR02) prior to 2025 and to Saline Pond 6 (SP6) from 2025 onwards. All saline contact water will be eventually conveyed from TIR02 or SP6 to the SETP-WTC prior to discharge to Itivia Harbour via the waterline.

The long-term, post-closure water quality in the collection ponds and in the flooded open pit lakes will meet Metal and Diamond Mining Effluent Regulations (MDMER), Canadian Council of Ministers of the Environment Water Quality Guidelines (CCME-WQG) for the protection of aquatic life and/or the Site-Specific Water Quality Objectives (SSWQOs) developed for the Mine.

During mine closure, the water management infrastructure on site will remain in place until mine closure activities are completed, and monitoring demonstrates that the water quality is acceptable for environmental discharge without treatment.

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Ltd. (Agnico Eagle) operates the Meliadine Gold Mine (Meliadine Mine) located approximately 25 kilometres (km) north of Rankin Inlet (Figure 1), Nunavut, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The existing Type A Water Licence (2AM-MEL1631) authorized the mining undertaking at Tiriganiaq open pits and underground. Agnico Eagle is applying for a Water Licence Amendment to support completion of licensing components approved under Project Certificate No. 006, which includes mining of the Wesmeg, Wesmeg North, Pump, F Zone, and Discovery deposits that were included in the 2014 Final Environmental Impact Statement (Agnico Eagle 2014) and Project Certificate No.006.

This document presents an updated version of the Water Management Plan (WMP), submitted as part of the Meliadine Mine Water License Amendment.

1.1 Water Management Objectives

The water management objectives are to minimize potential impacts to the quantity and quality of surface water at the Mine and surrounding waterbodies. The purpose of the WMP is to provide information to applicable mine departments (e.g., Environment, Engineering, Mine, Energy and Infrastructure, etc.) for sound water management practices, proposed and existing infrastructure, the water balance model, water quality predictions, and for the water quality monitoring plan for the Mine.

Water management structures (collection ponds, culverts, sumps, pipelines, water diversion channels and water retention dikes/berms) are utilized to contain and manage contact water from areas affected by mining activities. Measures have been implemented for the Mine Construction and Mine Operation phases.

1.2 Management and Execution of the Water Management Plan

Revisions of the WMP can be initiated by changes in the Mine Development Plan (Mine Plan), operational performance, personnel or organizational structure, regulatory or social considerations, and/or design philosophy. The WMP will be reviewed annually by Agnico Eagle and updated as necessary as part of the Annual Report. The Meliadine Mine Adaptive Management Plan is also used in combination with the Water Management Plan to provide management and mitigation actions.

SECTION 2 • BACKGROUND

2.1 Site Conditions

The Mine is located in an area of poorly drained lowlands near the northwest coast of Hudson Bay. The dominant terrain in the area consists of glacial landforms such as drumlins (glacial till), eskers (gravel and sand), and many small lakes. The topography is gently rolling with a mean elevation of 65 metres above sea level (m asl) and a maximum relief of 20 meters.

The local overburden consists of a thin layer of topsoil overlying silty gravelly sandy glacial till. Cobbles and boulders are present throughout the region at various depths. Bedrock at the Mine site area consists of a stratigraphic sequence of clastic sediments, oxide iron formation, siltstones, graphitic argillite, and mafic volcanic flows (Snowden, 2008; Golder, 2009).

The climate is extreme in the area, with long cold winters and short cool summers, and mean air temperatures of 12°C in July and -31°C in January. The mean annual air temperature at the Mine site is approximately -10.4 °C (Golder, 2012a). Strong winds blow from the north and north-northwest direction more than 30 percent of the time.

The mean annual precipitation in the area is approximately 412 mm and is typically equally split between rainfall and snowfall.

2.1.1 Local Hydrology

The Mine is located within the Meliadine Lake watershed. Meliadine Lake has a water surface area of approximately 107 square kilometres (km^2), a maximum length of 31 km, features a highly convoluted shoreline of 465 km, and has over 200 islands. Unlike most lakes, it has two outflows that drain into Hudson Bay through two separate river systems. It has a drainage area of 560 km^2 upstream of its two outflows. Most drainage occurs via the Meliadine River, which originates at the southwest end of the lake. The Meliadine River flows for a total stream distance of 39 km. The Meliadine River flows through a series of waterbodies, until it reaches Little Meliadine Lake and then continues into Hudson Bay. A second, smaller outflow from the west basin of Meliadine Lake drains into Peter Lake, which discharges into Hudson Bay through the Diana River system (a stream distance of 70 km). At its mouth, the Diana River has a drainage area of 1,460 km^2.

Watersheds in the Mine area are comprised of an extensive network of waterbodies, and interconnecting streams. The hydrology of these watersheds is dominated by lake storage and evaporation.

2.1.2 Ice and Winter Flows

Late-winter ice thicknesses on freshwater lakes in the Mine area range between 1.0 to 2.3 m with an average thickness of 1.7 m. Ice covers usually appear by the end of October and are completely formed in early November. The spring ice melt (freshet) typically begins in mid-June and is complete by early July (Golder, 2012b).

2.1.3 Spring Melt (freshet) and Freeze-up Conditions

With the exception of the main outlet of Meliadine Lake, which has been observed to flow continuously throughout the year, outlets of waterbodies near the Mine typically start flowing late May or early June, followed by freshet flows in mid-to-late-June. Flows steadily decrease in July and low flows are ongoing from August to the end of October, prior to winter freeze.

2.1.4 Permafrost

The Mine is located in an area of continuous permafrost. The depth of permafrost is estimated to be in the order of 360 to 495 m. The depth of the active layer ranges from about 1 m in areas with shallow overburden, up to 3 m adjacent to the lakes. The typical permafrost ground temperatures at the depths of zero annual amplitude (typically at the depth of below 15 m) are in the range of -5.0 to -7.5 °C in the areas away from lakes and streams. The geothermal gradient ranges from 0.012 to 0.02 °C/m (Golder, 2012b).

2.1.5 Local Hydrogeology

Continuous permafrost areas, in dominant presence in the Mine area, are subject to the following groundwater flow regimes characteristics:

- A shallow flow regime located in an active layer (seasonally thawed) near the ground surface and above permafrost, also called suprapermafrost groundwater; and,
- A deep groundwater flow regime beneath the base of the permafrost, also called subpermafrost groundwater.

From late spring to early autumn, when temperatures are above 0 ˚C, the shallow active layer thaws. Within the active layer, the water table is projected to be a subdued replica of topography. Groundwater within the active layer flows to local depressions and ponds that drain to larger waterbodies. The talik, or unfrozen ground, beneath large waterbodies will be open. Open talik define areas of connections between suprapermaforst groundwater and deep groundwater flow regime beneath the permafrost.

In a study investigating groundwater flow within the vicinity of the Meliadine site, Golder (2012a) identified that circular lakes with a minimum radius of 290 m or elongated lakes with minimum half width of 160 m, are subject to have underlying open taliks. Meliadine Lake and Lake B7 are likely to have open taliks connected to the deep groundwater flow regime.

2.2 Mine Development Plan

Agnico Eagle is currently mining the Tiriganiaq deposit with two open pits and one underground operation. The existing Type A Water Licence (2AM-MEL1631) authorized the mining undertaking at Tiriganiaq open pits and underground. Agnico Eagle is applying for a Water Licence Amendment to support completion of licensing components approved under Project Certificate No. 006, which includes mining of the Wesmeg, Wesmeg North, Pump, F Zone, and Discovery deposits that were included in the 2014 Final Environmental Impact Statement (Agnico Eagle 2014) and Project Certificate No.006. The mining schedule for the Meliadine Mine life of mine summary for all deposits are presented in Table 1.

The current Mine Plan is expected to produce approximately 37.5 million tonnes (Mt) of ore, 179.6 Mt of waste rock, 34.5 Mt of overburden waste, and 31.4 Mt of tailings. Agnico Eagle will continue exploration activities with the objective to extend mine life beyond 2031.

Mining facilities on surface include a plant site and accommodation buildings, ore stockpiles, a tailings storage facility (TSF), waste rock storage facilities (WRSFs), a water management system that includes collection ponds, water diversion channels, retention dikes/berms, and a series of water treatment plants. The general mine site layout plan is shown on Figure 2.

SECTION 3 • WATER MANAGEMENT CONTROLS AND STRUCTURES

There are three major sources of water at the Mine requiring management under the Mine water management system: freshwater pumped from Meliadine Lake, natural runoff from precipitation, and natural groundwater inflow to the Underground Mine. For the purpose of clarity and consistency, terminology and definitions are applied to these three main sources as follows below. These terms are applied throughout the remainder of the WMP.

- **Freshwater**: Water contained within natural water bodies (e.g., Meliadine Lake) which has not come into contact with the mine infrastructure.
- **Surface Contact Water**: Rain and snowmelt that has come into contact with the mine infrastructure and is collected within the collection ponds.
- **Saline Contact Water**: Saline groundwater which flows into the underground mine and comes into contact with the underground mine infrastructure.

A network of berms, dikes, collection ponds, channels, culverts, and sumps are in place and maintained to facilitate water management. Design Reports and As-Built Reports have been submitted and approved for the water management structures discussed in this section, as applicable. This section is included to summarize design and as-built information.

3.1 Water Management Systems

The water management systems, as shown in Figure 5, required to support the Meliadine Mine Plan include the following components:

- Eleven water retention dikes including Dikes D-SP6North, D-SP6West, D-B5North, D-B5South, D-CP8North, D-CP8West, D-CP8South, D-CP8East, D-A8North, D-A8South, and D-A6;
- Six water collection ponds including contact water ponds CP7, CP8, CP9, CPD1, CPD2, and saline pond SP6;
- Eight water diversion channels including Channel 11 to Channel 15 Channel 17 to Channel 19;
- Five sumps including Sump P1, Sump P2, Sump P5, Sump F1, and Sump F2;
- Three thermal protection berms including Berm-P5, Berm-CP7, and Berm-F2;
- Culverts as required;
- An effluent water treatment plant (EWTP);
- A saline effluent treatment plant (SETP);
- A water treatment complex (WTC) building – housing the EWTP and SETP;
- A sewage treatment plant (STP);
- A potable water treatment plant (WTP);
- A network of surface pumps and pipelines;
- A freshwater intake;
- Two jetties and pumping infrastructure (CP1 and CP5);

- An effluent diffuser located in Meliadine Lake; and
- An effluent diffuser located in Melvin Bay.

Surface contact water is intercepted, diverted, and collected within various collection ponds prior to passive evaporation, treatment and/or discharge. Surface contact water collected in CP3 and CP4 is discharged into Culvert 2 where it flows to CP1. Surface contact water collected in CP5 is discharged into CP1. Surface contact water from the WRSF 3 will be collected in CP2 and CP6 ponds and then pumped into CP1. Surface contact water collected in CP1 is treated for total suspended solids (TSS) at the EWTP (housed within the WTC) and discharged through the diffuser located in Meliadine Lake (Section 3.10).

Saline contact water from the Underground Mine is collected in underground sumps, transported to a clarification system, and subsequently recirculated for use in various underground operations. Excess saline contact water is pumped to surface where it is stored in Tiriganiaq Pit 2. Saline contact water that is not used for operations is treated at the Saline Effluent Treatment Plant (SETP). The treated water is then trucked to Itivia, as needed, and discharged through a diffuser in Melvin Bay (Section 3.11). Further details are found in Appendix A.

During the mine closure, the water management infrastructure will remain in place until closure activities are completed and monitoring demonstrates that water quality is acceptable for discharge to the environment without treatment.

A list of the water management control structures already constructed at Meliadine Mine is presented in Table 2. Table 3 (Tetra Tech 2024) summarizes future water infrastructures proposed to support mining of all deposits included in the Mine Plan. Figure 5 shows the location of the respective structures over the development stages of the mine life. Final design details of these structures will also be provided to the Regulators for approval at least 60 days prior to construction, as per the Water Licence.

Table 3: Water Management Control Structures to be Constructed

Infrastructure Type	Nomenclature	Location and Operational Function
Dike	Dike D-SP6North	Located north of SP6. D-SP6North will be used to contain saline water from the TSF and prevent the saline water from flowing to the downstream receiving environment.
	Dike D-SP6West	Located in the narrow between SP6 and Lake B6. D-SP6West will be used to contain saline water from the TSF and prevent the saline water from flowing into downstream dewatered Lake B6.
	Dike D-B5North	Located north of WN01 open pit within dewatered Lake B5. D-B5North will be used to divert runoff from flowing into WN01 pit.
	Dike D-B5South	Located south of WN01 open pit within dewatered Lake B5. D-B5South will be used to collect runoff from B5 south catchment.
	Dike D-CP8North	Located in the narrow between CP8 and Lake B5. D-CP8North will be used to contain contact water stored within CP8 and prevent the contact from flowing to the dewatered Lake B5.
	Dike D-CP8South	Located within the narrow of CP8 and B45. D-CP8South will be used to contain contact water stored within CP8 and prevent the contact from flowing to the downstream receiving environment.
	Dike D-CP8West	Located in the narrow between CP8 and B3. D-CP8West will be used to contain contact water stored within CP8 and prevent the contact from flowing to the downstream receiving environment.
	Dike D-CP8East	Located west of PUM01 open pit. D-CP8East will be used to contain contact water stored within CP8 and prevent the contact from flowing into PUM01 open pit.
	Dike D-A8North	Located south of WES03 open pit. D-A8South will be used to divert runoff from flowing into WES03 open pit.
	Dike D-A8South	Located north of PUM02 and PUM04 open pits. D-A8South will be used to divert runoff from flowing into PUM02 and PUM04 open pits.
	Dike D-A6	Located southwest of FZO01 open pit. D-A6 will be used to divert contact water from Lake A6 from flowing into FZO01 open pit.
Thermal Berm	Berm-P5	Located in the narrow between Sump P5 and Lake B46. Berm-P5 will be used as thermal protection berm for Sump P5.
	Berm-CP7	Berm-CP7 will be used as a thermal protection berm for CP7 to reduce seepage to F Zone open pits from CP7.
	Berm-F2	Located between Lake A6 and Sump F2. Berm-F2 will be used as thermal protection berm for Sump F2.
Channel	Channels 11, 12 and 13	Channels 11 and 12 to divert contact water from WRSF6 towards Sumps P1 and P2. Channel 13 to divert contact water from WRSF6 towards Sump P5.
	Channels 14 and 15	Channel 14 and Channel 15 to divert contact water from WRSF7 towards Sump F1.
	Channels 17, 19	Channels 17 and 19 to divert contact water from WRSF9 at discovery to CPD1, ore pad, industrial pad, and fuel pad towards the downstream SPD1.
	Channel 18	Channel 18 to divert contact water from industrial pad, and fuel pad at Discovery towards the downstream CPD2.
	Sump P1, Sump P2, and Sump P5	Sumps P1 and P2 to collect contact water from WRSF6 that has been diverted by Channels 11 to 12. Sump P5 will be used to contain contact water from the Pump Ore Pad and WRSF6 and prevent the contact from flowing to the downstream receiving environment.
	Sump F1	Sump F1 to collect contact water from WRSF7 that has been diverted by Channel 14 and Channel 15.
	Sump F2	Sump F2 to collect portion of contact water from WRSF7 and laydown pad at F Zone.
Culverts	To be determined	For water conveyance through haul roads and access roads.

3.2 Water Management Structures Design Criteria

The water management systems meet the following criteria:

- Treated surface contact water quality will meet regulatory criteria of the Licence and MDMER (described in Appendix D).
- Treated saline water quality will meet MDMER criteria (described in Appendix D).
- Design capacity of the EWTP is sufficient to ensure that D-CP1 and CP1 is able to manage the surface contact water from the entire site for a 1:100 wet year spring freshet, or a 1:2 mean year spring freshet in combination with a 1:1000 return 24-hour extreme rainfall.
- D-CP5 and CP5 are able to manage the surface contact water from its catchment area for 3/7 of a 1:100 wet year spring freshet or a 1:1000 return 24-hour extreme rainfall. This design is based on an allowable 3-day delay in initiation of pumping during a 7-day, 1:100 year freshet. Design capacity of pumping from CP5 to CP1 is sufficient to ensure that remaining freshet inflows to CP5 are managed via pumping to CP1.
- Storage capacity of each of the other water management ponds (CP2, CP3, CP4, CP6) is able to manage the surface contact water from their respective catchment area for 3/7 of a 1:100 wet year spring freshet or a 1:1000 return 24-hour extreme rainfall.
- The daily pumping rate for each of the ponds (CP2, CP3, CP4, CP5, CP6) is designed to have sufficient pumping capacity to handle the runoff surface contact water, which would result from one day (24.4 mm) of a 1:100 return wet spring freshet plus a 1:2 return one-hour rainfall (9.8 mm).

Channel 2 to Channel 4 are in place to pass an extreme intensity flow under a 5-minute 1:100 return rainfall of 9.2 mm. Channels 9 and 10 were designed to pass an extreme intensity flow under a 5-minute 1:100 return rainfall of 5.0 mm. Channel 1 and Channel 5 to Channel 8 are designed as internal channels where any surface contact water overflowing the channels will remain within the catchment areas of various collection ponds. Hydraulic analyses indicated that very wide channels are required to pass an extreme intensity flow under a 5-minute 1:100 return rainfall of 9.2 mm. As a result, these channels were designed to have a reasonable bottom width to pass a flow with lesser intensity, but the surface contact water overflowing the channels can be safely managed by berms or temporarily stored in a lower basin nearby. For example, surface contact water overflowing Channel 5 can be contained by Berm 3. Water overflowing Channel 7 and Channel 8 can be stored in the lower basin in the drained Pond H13, and Berm 1 combined with a mass till backfill protects the Portal No.2 entrance from flooding. Furthermore, the MULTI-PLATE at Portal No. 2 is protected by compacted, engineered structural fill. Surface contact water overflowing Channel 1 will flow through the flat ground between the Stage 1 pad and Stage 2 pad of Ore Storage Pad 2 (OP2) into CP1. Table 4 presents the design parameters for CP1 and CP5.

Table 4: As-Built Parameters for CP1 and CP5

Pond	CP1	CP5
Pond Volume at Maximum Operating Elevation under Normal Operating Conditions and Mean Precipitation Years (m^3)	742,075	46,674
Maximum Operating Water Elevation (m)	66.2	66.0
Maximum Water Elevation during IDF (m)	66.6	66.3
Estimated Pond Volume for Water Elevation at Maximum Operating Water Elevation during IDF (m^3)	855,245	70,000
Dike for Pond	D-CP1	D-CP5
As-Built Crest Elevation of Dike Collection Element (liner system) (m)	67.37	66.72

CP2, CP3, CP4 and CP6 are established through excavation of the original ground to increase water storage capacity and help ensure water levels do not reach the thermal protection berms. The as-built parameters for CP2, CP3, CP4 and CP6 are provided in Table 5 and are discussed in further detail within Tetra Tech (2022), Agnico Eagle (2019c), Agnico Eagle (2019d), and Tetra Tech (2020a).

Table 5: As-Built Parameters for CP2, CP3, CP4, and CP6

Pond	CP2	CP3	CP4	CP6
Elevated Pond Bottom Elevation (m)	41.4	53.3	51.0	51.1
Estimated Maximum Water Elevation during IDF (m)	52.0	63.0	63.0	62.0
Pond Volume at Estimated Maximum Water Elevation during IDF (m^3)	48,160	44,848	48,995	67,799
Thermal Berm for Pond	Berm-CP2	Berm-CP3	Berm-CP4	Berm-CP6

3.3 Water Collection Ponds

Six planned water collection ponds (CP1, CP2, CP3, CP4, CP5, and CP6) have been constructed to date as part of the water management infrastructure. Table 6 presents the locations and the required operational period of the collection ponds. The locations of the six water collection ponds are shown in Figure 2.

Table 6: Location of Collection Pond and Required Operation Periods

Collection Pond	Relative Location	Required Operation Period
CP1	Pond H17 and H6	Year 2017 to Mine closure
CP3	North of Lake B7 and southwest of TSF	2019 to 2026 (covered by TSF)
CP4	Southeast of Lake B7 and south of WRSF1	2019 to 2026 (covered by WRSF1)
CP5	North of Tiriganiaq Pit 2	2017 to Mine Closure
CP6	Pond H19 and north of WRSF3	Year 2020 to Mine closure
CP2	East of WRSF3	Year 2022 to Mine closure

3.4 P-Area Ponds

The P-area formerly consisted of three storage ponds as part of the saline contact water management system from 2016 to 2018.

In 2019, inputs to the P-Area were limited in an effort to begin the decommissioning process of the containment structures. In 2020, no saline contact water inputs to the P-Area took place, with the only planned inputs resulting from precipitation runoff. Backfilling of the P-Area cells (P1 and P2) began in Q3 of 2020 and finished in Q3 of 2021 using waste rock obtained form the underground mine and open pits to promote permafrost aggradation.

P3 remains active, as it is still required to capture surface contact water runoff from the areas adjacent to Portal 1 and former P2 footprint. Surface runoff to P3 was managed in 2020 by pumping water over the DP3 containment structure into CP5, where water quality was monitored and subsequently treated by the RO based on in situ water quality observations in CP5. In both 2021 and 2022, surface contact water captured by P3 was discharged to SP1 to eliminate any potential TDS loading generated by residual salt content that may be present in the pond or due to loading from the adjacent runoff areas. The same strategy will be used moving forward into 2023 open water season.

Table 7 presents the P3 capacity and maximum operating elevation. Figure 3 presents the layout of P3.

Table 7: As-Built Capacity for P-Area Ponds

Pond	P3
As-built Capacity (m^3)	2,912*
Maximum Design Water Elevation (m)	66.22*

*Former total as-built volume of P3 was 18,432 m^3, due to construction of SP3 and some filling within the P3 footprint, the volume corresponding to the maximum design water elevation is now reduced to 2,912 m^3.

Water monitoring protocols for P3 have been implemented to include water quality and transfer data, such as locations and flow volumes for water pumped to and from the collection ponds. This is discussed further in Appendix D.

3.5 Contaminated Snow Cell

A contaminated snow cell is used to store snow containing hydrocarbons (i.e., snow on which spills occur). The contaminated snow cell was constructed in 2017 (Agnico Eagle, 2017a) and is currently in place as a contingency measure for contaminated snow storage over the winter (Freshet Management Plan in Appendix B). Upon snowmelt, water within the contaminated snow cell is transferred to the Landfarm for treatment at the oil-water separator (Section 3.9.6).

The snow cell is lined with a polyethylene liner to avoid seepage of melting snow into the surrounding environment. The cell is designed to contain a volume of 1500 m^3 of snow and to contain 930 m^3 of water at a water surface elevation of 69.5 m.

3.6 Saline Ponds

3.6.1 Existing Saline Ponds

Saline Pond 1 (SP1) was constructed in Q3 2016 to accommodate excess saline contact water from the Underground Mine. SP1 is located north of CP5 (Figure 2). Table 8 summarizes the Saline Pond capacity for storage and maximum designed operating water levels.

Saline Pond 2 (SP2) was constructed within the footprint of Tiriganiaq Pit 2 in Q2 2019 as a temporary saline contact water storage pond on site, accommodating excess saline contact water from the Underground Mine. In Q2 2020 SP2 was decommissioned to allow mining of Tiriganiaq Pit 2. Saline contact water stored in SP2 was emptied into Saline Pond 4 (SP4) which was commissioned in March of 2020.

Saline Pond 3 (SP3) was constructed within the footprint of P-Area Pond 3 (P3). Construction of SP3 was completed in Q2 2019. SP3 is part of the medium-term groundwater management strategy, that consists of treating groundwater from the Meliadine Underground with respect to quality standards and discharge the treated water effluent into Melvin Bay. SP3 is used to store the treated water exiting the former Saline Effluent Treatment Plant (SETP) (i.e., the SETP not within the WTC) before being discharged to sea.

Saline Pond 4 (SP4) was temporary in nature and allowed for the dewatering of SP2 to facilitate construction of Tiriganiaq Pit 2 while providing additional storage for saline contact water from the underground mine. SP4 was constructed in bedrock within the footprint of Tiriganiaq Pit 1 (Figure 4). SP4 was dewatered to Tiriganiaq Pit 2 in 2021 to facilitate mining beneath the facility, and allow for mining to continue in Tiriganiaq Pit 1 in this area.

In Q3 2021, mining in Tiriganiaq Pit 2 was stopped and the pit was subsequently converted to a saline water storage facility. Tiriganiaq Pit 2 has a total saline water capacity of 1,616,554 m^3 and will be used to store the saline contact water pumped out of the underground mine. Further information on the saline contact water storage strategy is provided in Appendix A.

Groundwater from the underground mine is pumped to Tiriganiaq Pit 2 where it will remain in storage until it is treated at the SETP for discharge to sea (see Section 3.11 or Appendix A). In addition to saline contact water, to all saline ponds also include surface contact water runoff (rain and snow) from within the saline pond catchments.

Table 8: Storage Capacities for Saline Pond 1 and Tiriganiaq Pit 2

Item	Saline Pond 1	Tiriganiaq Pit 2
Maximum Operational Water Elevation (m)	62.9	62.0
Maximum Water Capacity (m^3)	32,686*	1,616,554

* Tetra Tech (2017) maximum operating capacity, not including IDF storage

Saline pond water capacity in relation to stored volumes can be found in the Meliadine Mine Groundwater Management Plan (Appendix A).

3.6.2 Saline Pond 6 (SP6) to be Constructed

Once Lake B7 is dewatered during freshet of 2025, it will become Saline Pond 6 (SP6). SP6 will serve as the main global saline water collection pond to store the saline water from the underground mining and the saline contact water transferred from other local saline ponds. Dikes D-SP6North and D-SP6West are associated perimeter dikes to form the SP6 and to prevent the saline water stored in SP6 from flowing to the downstream receiving environment. The saline contact water stored in TIR02 pit will be transferred to SP6 to allow mining of TIR02 pit to resume during the winter of 2025/26. All saline contact water collected in SP6 will be routed to the Saline Effluent Treatment Plant (SETP) where it will be treated for total suspended solids (TSS) and ammonia (NH3) prior to discharge to Itivia Harbour.

Treated effluent from the SETP is discharged into SP3. From SP3, the saline contact water is pumped into trucks which transport the water to Itivia Harbour, Rankin Inlet. It is assumed that trucking is stopped and saline water is stored in TIR02 open pit until the approved waterline becomes operational in June 2025. From that point on, the waterline will be used to deliver effluent to Itivia Harbour via a diffuser.

3.7 Water Diversion Channels, Dikes and Berms

The following sections provides details on existing water management infrastructures currently required for mining the Tiriganiaq deposit. Water management infrastructures to be constructed to

support the Mine Plan are summarized in Table 3. Details will be updated in the Water Management Plan as these structures progress into the detail design phase.

3.7.1 Water Diversion Channels

Nine water diversion channels (Channels 1 to 5, and 7 to 10) have been constructed and form part of the surface contact water management infrastructure. Construction of Channel 6 is tentative based on future water management strategies downstream of the P-area. Construction of Channels 9 and 10 was completed in Q2 2022. The as-built and design parameters for the water diversion channels are presented in Table 9.

Table 9: As-Built and Design Parameters for Channels

Channel	Approximate Total Length (m)	Bottom Width (m)	Side Slopes	Rip-rap Thickness (m)	Minimum Bottom Slope Gradient (%)	
1 (As-built)	528	3	3(H):1(V)**	0.3 to 0.5	0.2	
2 (As-built)	269.5	1.257	1.82(H):1(V)	0.277	0.30†	
3 (As-built)	656	1.2 to 2.4 or 0.8 to 3.3*	1.8(H):1.0(V) to 3.5(H):1.0(V)	0.3†	5.3 (upper)	0.4 (lower)
4 (As-built)	930	1.0 to 1.7 or 0.8 to 4.5*	1.8(H):1.0(V) to 5.0(H):1.0(V)	0.37	2.1 to 5.3 (upper)	0.1 to 4.2 (lower)
5 (As-built)	429†	2.3 to 2.9	1.9(H):1(V)	0.2	0.17†	
6	69	1	3(H):1(V)	0.3	0.44

* 1 m bottom width for first 100 m upstream section, and 2 m bottom wide for the remaining channel section

** Except from Sta. 0+050 to 0+130: 2(H):1(V)

† As-built parameter values not available; value displayed is from design

3.7.2 Water Retention Dikes and Berms

In general terms, “dikes” were constructed with impervious liner systems and “berms” are constructed with entirely till cores. At the end of Mine closure, when the water quality in the corresponding pond meets direct discharge criteria, each of the dikes and berms on site (except for Berm 2) will be breached to restore the original natural drainage paths. Berm 2 will remain in place to prevent non-contact water from off site from flowing into the TSF.

Water retention dikes D-CP1 and D-CP5 have been designed as a zoned earth fill dams with a geomembrane liner keyed into the permafrost foundation to limit the seepage through the dike and its foundation. The characteristics of the dikes and berms required for the WMP are summarized in Table 10.

Table 10: As-Built and Design Parameters for Water Retention Dike/Berm

Dike/Berm	Approximate Maximum Height (m)	Maximum Elevation (m)	Maximum Head of Water Retained (m)
D-CP1	6.6	68.5	3.6
Berm-CP2	5.07	58.6	0
Berm-CP3	4.9	69.9	0
Berm-CP4	5.0	69.1	0
D-CP5	3.3	67.3	1.4
Berm-CP6	6.0	68.0	0
DP1-A	3.7	70.5	68.5
DP1-B	3.4	70.7	68.7
DP2-A	4.0	69.5	67.5
DP3-A	3.4	69.0	67
Berm1	2.6	69.0	0
Berm2	1.5	varies	0
Berm3	2.76	67.37	0

3.7.2.1 Thermal Monitoring

Horizontal Ground Temperature Cables (GTCs) are installed along the key trenches of D-CP1 and D-CP5 at a depth of approximately 3 m below the original ground level. These installations are in place to verify that the foundations remain frozen and dike integrity is not compromised. D-CP1 and D-CP5 also contain vertical GTCs installed to an approximate depth of 15 m below the crest of each dike. Thermal berms of CP2, CP3, CP4 and CP6 contain vertical GTCs installed to approximately 8 m below original ground elevation to monitor the thermal performance of the foundation materials. Thermal records collected from these sensors provide temporal analysis of vertical temperature profiles to assess whether the structures are performing as designed.

D-CP1 and D-CP5 readings are obtained, recorded, and assessed weekly during open water season and monthly after freeze-up. Data loggers are set to record temperatures in the dikes every 12-hours. Reading frequency at the thermal berms is generally monthly during the first year following construction and quarterly thereafter. The measured readings are analyzed by an Agnico Eagle geotechnical engineer and are reported in the annual geotechnical inspection report.

In addition to thermal monitoring, visual geotechnical inspections of water management structures are currently performed, as described in Section 3.12 below.

3.8 Freshwater Intake

Freshwater usage at the Mine includes potable uses, fire suppression, make-up water for the mill, and other operational requirements, such as drilling water, dust suppression, paste backfill production, and use at the washbay. The main freshwater intake is located northeast of the industrial pad in Meliadine Lake, as shown on Figure 2. The intakes consist of vertical filtration wells fitted with vertical turbine pumps that supply water on demand. Both intake pipes are fitted with a screen of an appropriate mesh size to ensure that fish will not be entrained and shall withdraw water at a rate such that fish do not become impinged on the screen (NWB, 2021).

3.9 Water Treatment

Contact water will be treated (if necessary) to meet Licence requirements prior to being discharged to the environment. TSS mitigation techniques (i.e., attenuation ponds, silt screens, etc.), oil separation treatment, the STP, the SETP, the RO Plant, and the EWTP are used accordingly at various locations at the Mine prior to water being transferred to collection ponds and/or prior to effluent discharge to Meliadine Lake or Melvin Bay. Water quality criteria are discussed in Section 7 and Appendix D.

3.9.1 Freshwater Treatment Plant (WTP)

Freshwater from Meliadine Lake is treated in the WTP before being directed to the camp areas for potable (domestic) water uses. The design flow rate for freshwater for the main camp and accommodations is 216 m^3/day. In the WTP, freshwater is pumped through cartridge filters, then pumped through ultraviolet units, and finally treated with sodium hypochlorite (chlorine). The treated water is stored within a potable water tank. Potable water is monitored according to the Nunavut Health Regulations for total and residual chlorine and microbiological parameters. Operation and maintenance details for the WTP can be reviewed in the Operational & Maintenance Manual – Water Treatment Plant (Agnico Eagle, 2020a).

3.9.2 Sewage Treatment Plant (STP)

Wastewater from the accommodation complex and from satellite sewage tanks will be treated in the STP using a membrane bioreactor process before being directed to CP1. Operation and maintenance details for the STP can be reviewed in the Operational & Maintenance Manual – Sewage Treatment Plant (Agnico Eagle, 2021a). Sludge is pressed using a volute dewatering unit and stored in the active deposition zone WRSF1 or WRSF3 to ensure coverage with waste rock.

3.9.3 Saline Water Treatment Plant (SWTP)

In 2018, Agnico Eagle constructed and commissioned a Saline Water Treatment Plant (SWTP) consisting of two evaporator-crystallizers (SaltMakers) to treat saline contact water. The SWTP removes total suspended solids (TSS), calcium chloride ($CaCl_2$), sodium chloride (NaCl), metals, phosphorous (P), and nitrogen compounds from the influent saline contact water. Further specifications of the SWTP can be found within the SWTP Design Report (Agnico Eagle 2018) and the SWTP As-Built Report (Agnico Eagle 2019a).

In March 2020, operation of the plant was suspended due to poor performance coupled with high energy consumption and plant safety concerns. The SWTP is not currently a component of the groundwater management strategy. More information regarding the groundwater management strategy can be found in the Groundwater Management Plan (Appendix A).

3.9.4 Water Treatment Complex (WTC)

The WTC is a building designed to house both the EWTP and SETP. The design rationale for the WTC is to address concerns with the stability of the concrete slab at the previous EWTP building location. Additionally, the WTC provides a centralized building for contact water treatment, allowing for improved operational synergy.

Construction of the WTC commenced in Q3 2020. Further information regarding the WTC can be found the As-Built Report (Agnico Eagle 2021b).

3.9.4.1 Effluent Water Treatment Plant (EWTP)

The installation of the EWTP within the WTC (EWTP-WTC) was completed in Q2 2021 to allow for discharge to Meliadine Lake during the open water season.

The purpose of the EWTP-WTC (Actiflo® model ACP-700R) is to reduce Total Suspended Solids (TSS) to a target maximum concentration of 15 mg/L from the influent surface contact water pumped from CP1 prior to its discharge through the diffuser into Meliadine Lake. Throughout operation of the EWTP in 2018 and 2019, the maximum capacity (nominal flow) of the discharge system was 520 m^3/h. In Q2 2020, the system underwent upgrades to improve discharge capacity to 916 m^3/h. Further information regarding EWTP-WTC operation can be found in the EWTP-WTC Operation and

Maintenance Manual (Agnico Eagle 2021c). Forecasted monthly averages requiring treatment at the EWTP-WTC are provided in Table 13.

Trigger limits for stopping discharge are in place at the EWTP-WTC as a component of TSS and TDS exceedance mitigation during periods of discharge. These trigger limits are derived from a regression analysis of TSS concentration as a function of turbidity, and TDS as a function of specific conductivity. The regressions are developed using MEL-14 grab sample laboratory measured specific conductivity and turbidity readings paired with corresponding TDS and TSS results. Rating curves are then applied to continuous *in situ* specific conductivity and turbidity readings taken from internal probes within the EWTP-WTC prior to discharge to approximate TDS and TSS, respectively. When a trigger limit is reached, the EWTP-WTC stops discharge immediately and begins recirculating treated water to CP1.

Agnico Eagle will continue to gather calibration/confirmatory paired samples in the future to actively increase the number of data points and strengthen the turbidity-TSS and conductivity-TDS correlations.

3.9.4.2 Saline Effluent Treatment Plant (SETP)

Prior to discharge of saline effluent to sea at Melvin Bay (see Section 3.11 and Appendix A), saline contact water on site is stored in saline ponds (Section 3.6). Saline contact water as well as other contact water is pumped to the SETP for ammonia and total suspended solids treatment. Treated saline contact water will meet MDMER end-of-pipe discharge criteria. Initial treatment includes a clarification unit for TSS removal. Next, break-point chlorination treatment is applied as necessary to remove elevated ammonia levels, which are inferred to be the result of the use of explosives and washing of development faces/muck underground. Excess chlorine is removed with activated carbon filters. The SETP was designed to treat 1,600 m^3/day of saline water for TSS and ammonia. Further information on the SETP design can be found in Agnico Eagle (2020b).

Commissioning of the new SETP within the WTC (SETP-WTC) is expected to take place in Q3 2023. Operation of the SETP-WTC and subsequent discharge will occur following construction and commissioning of the waterline (more information can be found in Appendix A). Further information on the SETP-WTC design can be found in Agnico Eagle (2021d).

Once SP6 becomes operational, all saline contact water collected in SP6 will be routed to the SETP-WTC where it will be used to treat total suspended solids (TSS) and ammonia (NH_3) prior to discharge to Itivia Harbour.

Prior to movement of saline water from the Meliadine Site to Itivia for discharge to sea over the open water season, Agnico Eagle will measure pH, chlorine, ammonia, turbidity, specific conductivity, and temperature of the effluent as a means to continually advise discharge operations and help ensure discharge parameters are met. Final discharge point (FDP) samples will be analyzed at an accredited

laboratory as per MDMER requirements, as discussed within the Water Quality and Flow Monitoring Management Plan (Appendix D).

3.9.4.3 Sludge management

Sludge produced as part of the TSS removal processes at the WTC is discharged into saline water storage. The sludge is sampled monthly for metal content, hydrocarbons (C10-C50) and organic carbon to determine potential impact on the receiving saline ponds. Agnico Eagle may also explore other alternatives for sludge disposition in future years, such as dewatering using geotextile bags (e.g., Geotubes™), or mechanical dewatering. Mechanical dewatering could include technology such as filter press, centrifuge, or belt filters. The dewatered sludge could then be disposed of as a solid.

3.9.5 Oil Separators

An oil-water separator is installed at the Landfarm. The oil-water separator located at the Landfarm is used to treat both direct precipitation to the landfarm footprint and melt from snow containing hydrocarbons (i.e., snow on which spills occur) that is stored either in the landfarm or the contaminated snow cell over winter (Section 3.4). Treated water is analyzed for benzene, toluene, ethylbenzene and xylene (BTEX), lead, and oil and grease prior to discharge to CP1 or used on the windrows to increase moisture content, as required. Hydrocarbons removed from water are stored and managed as hazmat.

A second oil water separator is applied to treat water from the maintenance shop wash bay, in which mining equipment from both surface and underground operations undergo cleaning (Section 4.1.6). Treated water is analyzed for BTEX, lead, and oil and grease prior to discharge to CP1 or saline ponds depending on *in situ* specific conductivity applied to approximate TDS concentrations. Hydrocarbons removed from water are stored and managed as hazmat.

3.9.6 Reverse Osmosis Plant (RO)

A reverse osmosis (RO) treatment plant is used to treat marginally saline runoff water captured by site water management infrastructure that would otherwise be directed to saline water storage. The application of the RO through these means is intended to reduce storage requirements of saline water on site until the Waterline (see Appendix A) is operational (expected 2025). Permeate water produced by the RO – treated water of low salinity that passes through the semi-permeable membranes – is directed to CP1. Brine water – high salinity water rejected by the semi-permeable membranes – is directed to saline storage.

Efficacy of treatment is generally dependent on the quality and homogeneity of water being treated. As TDS of influent water increases, pressure against the semi-permeable membranes increases, resulting in a lower recovery of treated permeate and a greater volume of rejected brine. However, the treatment flow rate can be lowered to reduce pressure and improve permeate recovery in feed water with a high concentration of TDS. Other water quality constituents such as the concentrations

of TSS, organic content, and certain minerals in the feed water may also negatively affect performance of the RO. As size exclusion is the mechanism driving treatment, the concentration of TDS in the permeate generally remains below 1000 mg/L (average for 2022 was 447 mg/L), but can be influenced by feed water quality and treatment rates. Consequently, the TDS concentration in the brine by-product is primarily the difference in mass of feed water solutes and mass of permeate water solutes per unit of brine volume. Additionally, more stable quality conditions or homogeneity of the water source used to feed the RO allows a better adjustment of the treatment settings and thus an optimization of the recovery rate.

The treatment rate of the RO is primarily limited by the actual capacity and size of the plant, in addition to the influence of previously mentioned water quality factors. A rate of approximately 2000 m^3/day has been achieved with a recovery of 80% (i.e. 1600 m^3/d and 400 m^3/d of permeate and brine produced, respectively) where influent TDS was approximately 3500 mg/L. Depending on the objective of treatment (e.g. volume targets versus quality targets) a lower recovery rate may be used to ensure brine quality discharged to saline storage meets a desired TDS criteria, resulting in the allowance of feed water with much higher TDS while still treating water at an appreciable flow rate. For example, feed water with a TDS concentration of approximately 12,000 mg/L has been treated at a rate of approximately 1500 m^3/d with a permeate recovery rate of 53%.

In addition to the treatment of marginally saline runoff, the plant may also be used to treat stratified layers of low salinity water in the saline ponds. The cause of low salinity water in the saline ponds is assumed to be driven by the downward exclusion of TDS during ice formation in addition to poorly mixed runoff inflows. This results in a relatively homogeneous stratified layer of water with a lower concentration of TDS overlaying more saline water in storage. Removing the marginally saline water from saline storage increases storage capacity for saline contact water from the underground mine.

3.10 Meliadine Lake Discharge Diffuser

The discharge diffuser is the final surface contact water effluent discharge location for the Mine. The overall purpose of the diffuser is to discharge water from CP1 (at sampling station MEL-14) to Meliadine Lake while providing minimal environmental impacts to the Lake. The effluent mixing will be dependent on ambient currents in Meliadine Lake, driven by wind during the open water period. The diffuser modelling was initially conducted by Golder Associates Ltd. (Golder, 2015) and updated design progress was reported by Tetra Tech EBA (Tetra Tech EBA, 2016). Further updates to the diffuser model were completed by Tetra Tech in support of the Water Licence Amendment (Tetra Tech, 2020).

3.11 Saline Water Discharge to Sea

Currently due to sufficient forecasted storage capacity until 2026, saline water on site is managed through storage and treatment of marginally saline water. Punctual operations of hauling of saline water treated by the SETP to Melvin Bay are only conducted if necessary. The suspension of

continuous hauling operation followed the approval of the waterline to discharge to sea (section 3.3.3) under the Amendment 002 of the NIRB Project Certificate No. 006 issued on March 2nd. The waterline is currently under construction and is expected to me commissioning in 2025, once in operation, the waterline will be used in combination with the SETP-WTC to discharge treated saline water to Melvin Bay. Detailed information regarding treatment and discharge criteria are provided in the Groundwater Management Plan (Appendix A).

3.12 Water Management Structure Monitoring

Pursuant to Part E, Item 15 of the Licence, Agnico Eagle will carry out weekly inspections of all Water management structures during periods of flow and monthly thereafter. The records will be maintained for review upon request of an Inspector. More frequent inspections may be required at the request of an Inspector. Inspections will focus on structures and conditions detailed in Sections 3.12.1 to 3.12.5 to follow.

3.12.1 Culvert and Water Crossing Inspections

Culverts listed in Section 3.1, as well as culverts and water crossings along the All Weather Access Road (AWAR), Bypass Road, and at the Itivia site will be inspected for the following conditions. These inspections also satisfy the monitoring procedures outlined in the Sediment and Erosion Management Plan (Appendix C):

- Damage to the inlet or outlet of the culvert which may impede flow capacity;
- Bed erosion upstream and downstream of watercourse crossing structures;
- Scour under bridge abutments and abutment foundations;
- Erosion along cutslopes and fillslopes of embankments (rill and gully erosion);
- Blockages within the culvert including snow, ice, debris; and
- Snow cover or snow piles which would prevent routing of water towards the inlet of the culvert (only applicable prior to freshet).

In the case that any of the above conditions are observed, corrective actions will be taken to optimize culvert/water crossing function and integrity.

3.12.2 Collection Pond Inspections

Water collection ponds discussed in Section 3.3 and P3 pond discussed in Section 3.4 will be inspected for the following conditions:

- Laboratory water quality results as a trigger to implement mitigation actions;
- Unplanned inputs via surface runoff which are not part of the water management system; and
- Water level elevation above the operating manual maximum.

In the case that any of the above conditions are observed, corrective actions will be taken to prevent unaccounted for losses of available water capacity or potential compromise to dike integrity.

3.12.3 Dike and Thermal Berm Inspections

Dikes and thermal berms discussed in Section 3.6.2 are inspected to track natural (expected) movement of the structure. Pertaining to dikes, a “master” sketch of all the issues that were documented in the past is maintained as a means to spot any changes/new issues. Inspections focus on the upstream slope, the crest, the downstream slope, and downstream toe and observations include the following:

- New areas of movement/deterioration not previously documented;
- Changes to previously documented areas of movement/deterioration;
- Seepage through the downstream slope;
- Water presence in downstream channel/sump; and
- Areas of movement/deterioration of downstream channel/sump (where present).

Any issues or potential problems identified will be addressed accordingly by the Geotechnical Engineer in order to mitigate risks and maintain dike integrity.

3.12.4 Water Diversion Channel and Berm Inspections

In addition to the water management structures requiring inspections under the Water Licence, Agnico Eagle will carry out inspections of channels on site listed for the following conditions:

- Obstructions to flow (ice, debris);
- Inflows not part of the water management system;
- Structural failure of channel banks;
- Seepage through water diversion berms resulting in water movement to areas not planned within the water management system; and
- Erosion of diversion berms (i.e., undercutting, slope failure).

In the case that any of the above conditions are observed, corrective actions as directed by the Geotechnical Engineer will be taken if there is potential for compromise effectiveness of the channel function or potential for unplanned impact to water quality or quantity in associated collection ponds.

SECTION 4 • WATER MANAGEMENT STRATEGY

A brief summary of the water management strategy for the Mine is presented as follows:

- Surface contact water from key mine infrastructure is diverted and/or collected in collection ponds (CP1, CP2, CP3, CP4, CP5, CP6, the Saline Ponds and P3).
- The collected surface contact water in CP2, CP3, CP4, CP5 and CP6 is pumped to CP1. Surface contact water collected in CP1 may be reused for operational purposes and/or treated by the EWTP prior to discharge via the diffuser into Meliadine Lake.
- Surface contact water in Tiriganiaq Pit 1 will be collected in a sump and, depending on salinity, pumped to a collection pond or to a saline pond.
- Saline contact water from the Underground Mine (i.e., saline groundwater) will be contained in underground sumps and the water storage stope and reused for mining operations. Excess saline contact water volumes will be stored in Tiriganiaq Pit 2/SP6 until it can be treated and discharged to Melvin Bay.
- Natural flooding of the open pits at end of mining will be supplemented by using freshwater from Meliadine Lake.
- Upon the completion of underground mining, the Underground Mine workings will be allowed to naturally flood by groundwater seepage.

Appendix B presents the Meliadine Mine Freshet Action Plan, which includes the Freshet Action Procedure and the Snow Management Procedure for the Mine. Table 11 and Table 12 summarizes the overall contact water management plan for the existing and future key infrastructure respectively, with initial water collection locations and final water destinations. The plans for water management at key areas are described in the subsequent sections.

Table 11: Existing Water Management Infrastructures

Contact Water Source	Initial Contact Water Collection Location	Final Contact Water Collection Location
Industrial Site Pad Area (camp/process plant area)	CP1	CP1
WRSF1 Area	CP1, CP4 and CP5	
WRSF3 Area	CP2 and CP6	
Dry Stack TSF Area	CP1 and CP3	
Ore Storage Pad 2 (OP2)	CP1	
Landfill	CP1	
Landfarm (biopile)	Sump within Landfarm	To CP1 after oil separation
Maintenance Wash Bay	Retention Tank	CP1 or surface saline storage (based on effluent salinity) after oil separation
Tiriganiaq Pit 1	Open pit sumps	Salinity based - CP4, CP5, SP1, or Tiriganiaq Pit 2.
Tiriganiaq underground	Sumps in underground mine	Sumps in underground mine, Tiriganiaq Pit 2, then discharged to sea

4.1 Key Water Management Activities

Current activities required for the WMP are summarized in Table 13. Water management activities during closure are described in Section 7.

Table 13: Completed Key Water Management Activities

Mine Year	Major Water Management Activities and Sequence
Pre-Construction (2015)	• Started to re-use saline contact water • Dewatered top 0.5 to 1.0 m of fresh water in Pond H17 • Constructed Channel 2
Pre-Construction (2016)	• Dewatered H17 into Meliadine Lake • Started construction of D-CP1 to impound CP1 • Started construction of D-CP5 to impound CP5 • Dewatered Pond A54 in Q3 of Year -4 and pumped the water to CP1 • Constructed Saline Pond 1 (SP1) for additional saline contact water storage • Constructed and operated P-Area Containment Ponds • Started to store the excess saline contact water from the underground mine at surface • Implemented and tested evaporators at P-Area to reduce saline contact water volumes stored at surface • Constructed trenches down gradient from DP1-B and DP3-A to be able to pump collected water and pump back to P1 and P3, respectively • Constructed Channel 5 • Installed Culverts 3 and 4
Pre-Construction (2017)	• Completed construction of D-CP1, jetty and Pumping station CP1 • Completed construction of D-CP5, jetty and Pumping station CP5 • Started construction Channel 1 • Constructed Berm 3 • Constructed freshwater intake in Meliadine Lake and installed pumping station • Constructed Lv75 water stope for additional underground saline contact water storage • Installed Culvert 13 • Started to treat sewage from Sewage Treatment Plant (STP) and pump the treated sewage from STP to CP1 • Started to pump the surface contact water from CP5 to CP1 for treatment (solids removal) • Started to pump water collected in trenches, down gradient from D-CP1, D-CP5, DP1 and DP3 to the associated containment pond • Started to pump the water from the Type A Landfarm to CP1 after oil/water separator treatment • Started to pump water from washbay to underground for storage until a biological treatment unit for hydrocarbon reduction/removal arrives at the site
Pre-Construction (2018)	• Completed construction of Channel 1 • Started construction Channel 3, Berm-CP3 and Pond CP3 • Installed Culverts 1, 2, 15 and 16 • Constructed Berm 2 • Started to pump the surface contact water from CP1 to EWTP for treatment prior to discharge via the diffuser to Meliadine Lake • Pumped the solids sludge from EWTP to CP1. To limit recirculation of the sludge within CP1, the discharge of the sludge was located away from the EWTP intake

Mine Year	Major Water Management Activities and Sequence
	• Started diversion of surface contact water from industrial pad to CP1 via Channel 1 • Constructed and commissioned (in Q4) SWTP to discharge to CP1.
Pre-Construction (2019)	• Constructed Saline Pond 2 within footprint of Tiriganiaq Pit 2 and began storing excess saline contact water • Installed culverts 7, 8, 10, 11 and 20 • Constructed Channels 7 and 8 and Berm 1 • Completed construction of Channel 3, Berm-CP3 and Pond CP3 and started to collect surface contact water • Constructed Channel 4, Pond CP4 and Berm-CP4 and started to collect surface contact water • Started to pump the surface contact water in Ponds CP3 and CP4 to the partially drained Pond H13 where the water flows through Channel 1 into CP1 • Constructed, commissioned, and started discharge of saline water through the discharge to sea diffuser system • Partially dewatered Ponds H19 and H20 in Q3 of Year -1 by pumping water to the EWTP for discharge to Meliadine Lake • Started construction of Saline Pond 4 (SP4) within footprint of Tiriganiaq Pit 1
2020	• Completed construction of SP4 • Constructed Pond CP6 and Berm-CP6 • Transferred SP2 into SP4 • Decommissioning of evaporators • Started to pump surface contact water in CP6 to CP1 • Started to pump surface contact water collected in Tiriganiaq Pit 2 to CP5 • Started decommissioning of P1 and P2 (P-Area) by backfilling with waste rock • Decommissioning of SWTP
2021	• Start to pump surface contact water collected in Tiriganiaq Pit 1 to Tiriganiaq Pit 2 • Construct and commission EWTP within WTC (EWTP-WTC) • Complete conversion of Tiriganiaq Pit 2 to saline contact water storage facility • Dewater SP4 and SP1 into Tiriganiaq Pit 2 • Start pumping excess saline contact water from underground mine to Tiriganiaq Pit 2 • Finish decommissioning P1 and P2 (P-Area) by backfilling with waste rock • Pump EWTP and SETP sludge to saline contact water storage
2022	• Constructed Pond CP2 and Berm CP2 • Constructed Channels 9 and 10 • Store marginally saline water into SP1 • Pump water from Tiriganiaq Pit 1 to CPs, SP1, or Tiriganiaq Pit 2 • Operation of the RO plant for treatment of marginally saline water on site • Continued pumping saline contact water from underground mine to Tiriganiaq Pit 2 • SETP upgrade installation at the WTC
2023	• Water management plan similar to Year 3 • Construct Channel 2 Berm, pending required regulatory approval • SETP-WTC commissioning
2024	• Water management plan similar to Year 3 • Anticipated Waterline installation, pending required regulatory approval

Table 14 summarizes the planned construction schedule for water management infrastructures required in the future to support the Mine Plan.

Table 14: Estimated Pond Dewatering Schedule

4.1.1 Pond Dewatering and Displacement

The initial dewatering at Lake H17 and Lake A54 was conducted in 2016 prior to constructing CP1 and CP5, respectively. The water from these ponds was pumped to Meliadine Lake through a temporarily installed diffuser.

Preparation for construction of CP4 facility required dewatering of the two shallow ponds B8 and B9 into CP1. Preparation for CP3 did not require dewatering as B28 contained insufficient volumes to dewater.

In Q3 2019, partial dewatering of Ponds H19 and H20 to the EWTP took place, following the advanced timeline for the construction of CP6 and WRSF3. Specifically, H19 was partially dewatered to facilitate construction of Berm CP6, while H20 was partially dewatered to allow the placement of waste rock and overburden within the drained lake basin. Detailed information regarding the CP6 design and

subsurface thermal analysis can be found in the CP6 and Berm Design Report (Tetra Tech, 2020). Details for future pond dewatering will be provided in future versions of the Water Management Plan.

Table 15 summarizes the pond dimensions, dewatering date, and estimated dewatered volumes.

Table 15: Estimated Pond Dewatering Schedule

Pond	B8	B9	H20	H19
Maximum Pond Water Depth (m)	-	1.4	1.6	1.4
Existing Pond Surface Area (ha)	-	0.63	9.58	2.91
Dewatering Schedule	Q4 2018	Q4 2018	Q3 2019	Q3 2019
Estimated Total Volume of Water Dewatered (m^3)	2,993	6,840	90,307	16,431

4.1.2 Underground Water Management

The Underground Mine will extend approximately 650 m below the ground surface and part of the underground workings will be operated below the base of continuous permafrost. The underground excavations act as a sink for groundwater flow during mining, with water induced to flow through the bedrock to the Underground Mine workings below the base of the permafrost.

The underground water management system is designed to prevent water from affecting the workings or production. The system contains a series of sumps (generally one at the access of each level) designed to capture groundwater inflows and runoff from mining operations (i.e., drilling), a clarification system, and a pumping system to redistribute the clarified saline contact water. Excess saline contact water is pumped to surface to be managed in Tiriganiaq Pit 2. Temporarily inactive underground developments (similar to the water stope) are used for additional storage of excess underground water as required. Further details on the underground water management system are provided in Appendix A.

Beginning December 2018, the SWTP began treating groundwater to reduce stored saline contact water on site (See Section 3 for details). Furthermore, as part of the strategy to manage excess groundwater infiltration within the underground portion of the mine, Agnico Eagle received approval for marine discharge of saline water with the amended Project Certificate on February 26, 2019 (See Section 3.11 and Appendix A for details). A new amendment (Amendment 002 of the NIRB Project Certificate No. 006) was received March 2nd 2022 allowing the discharge of treated saline water through a waterline.

Table 16 presents the predicted groundwater inflow rates estimated for passive groundwater inflow to the Underground Mine (Lorax, 2024). Details pertaining to model inputs and assumptions are found in Appendix A. Details pertaining to groundwater monitoring are also provided in Appendix A. Values presented in Table 16 do not account for grouting efforts.

Table 16: Predicted Groundwater Inflow to the Underground Mine (2024 to 2031)

Year	Tiriganiaq Underground inflows Total (m^3/day)
2024	444
2025	639
2026	976
2027	1,098
2028	988
2029	921
2030	905
2031	925

Source: Lorax 2024

4.1.3 Water Management for Haul Road

A network of roads provide access to infrastructure at the Mine. The majority of the roadways servicing the mining area are located so that drainage is directed by berms, channels and culverts towards CP1, CP2, CP3, CP4, CP5, and CP6. Detailed information about water management on roads is described in the Meliadine Mine Roads Management Plan.

4.1.4 Water Management for Landfarm and Landfill

Any water that accumulates at the onsite Landfarm is pumped through an oil-water separator prior to discharge into CP1. Additional details for Landfarm water management are described in the Landfarm Management Plan.

Leachate from the Landfill is anticipated to be non-hazardous and non-toxic due to the controls put in place on the materials accepted for deposition in the Landfill. Annual Landfill operations involves clearing of snow prior to spring melt. In the event there is leachate from the Landfill due to periods of heavy rainfall or spring freshet, the runoff will be collected, controlled and treated, if necessary, and sent to CP1, as per the Landfill Management Plan.

Internal runoff and drainage from the Landfill will gradually seep through the northeast perimeter berm towards pond H13. In February 2022, the Landfill (Stage 4) Berm Raise design report was approved, including the addition of a small pumping station to help remove water present in the Landfill to pond H13. A section of perforated, corrugated metal pipe is proposed to be use as a “filter basket” around a small pump to prevent any waste material from being entrained by the pump suction. Pond H13 is located downstream of the natural drainage flow path for seeping through the landfill berm. H13 is immediately upstream of Culvert 2, which is upstream of Channel 1 and ultimately CP1. Water collected in CP1 is treated at the EWTP-WTC prior to being discharged to Meliadine Lake.

4.1.5 Water Management for Emulsion Plant Area

Freshwater is trucked to the emulsion plant and used for manufacturing emulsion as well as for washing vehicles. Water within the emulsion plant is re-used when feasible, and excess water is collected and disposed of on site (i.e., STP) or stored and shipped south as hazmat.

4.1.6 Water Management for the Wash Bay

Water used in the Wash Bay is re-used when feasible and excess water is treated with an oil-water separator to reduce or remove hydrocarbons. Treated water is moved to CP1 or the surface saline ponds, depending on *in situ* specific conductivity applied to approximate TDS concentration. Solid waste from the treatment process is removed and disposed of appropriately (Landfarm, hazmat, or underground).

4.2 Freshwater and Sewage Management

Additional freshwater usage and sewage management is described in the following sections.

4.2.1 Freshwater Management

Major freshwater usages on site include potable use, fire suppression, make-up water for the mill, and other operational needs, such as drilling and paste production for backfill. Freshwater is sourced from Meliadine Lake through a freshwater intake and pump system. For dust suppression, water is sourced from the freshwater intake system, ponded water located along the AWAR, or small ponds proximal to the road. Surface contact water from CP1 is applied as dust suppression within the site surface contact water system catchment.

Freshwater is pumped through an overland pipeline to potable water storage tanks and a fire water suppression tank. Under the Amended Licence, 742,000 m^3/year of freshwater is permitted during operation phase. Additionally, approximately 4,000,000 m^3 of freshwater is permitted per year to fill the mined-out open pits during the mine closure. These quantities are inclusive of water needs for dust suppression.

The maximum design flow rate for the potable water for the main camp and accommodations (kitchen, laundry) is 216 m^3 per day. There is an onsite Potable Water Treatment System (Section 3.9.1). Treated potable water is piped to areas in the service complex and other facilities requiring potable water.

Table 17 provides the updated freshwater consumption needs to support the Water License Amendment. Agnico Eagle is requesting an increase to a total of 1,100,296 m^3/year for operations of freshwater consumption. In the 2014 FEIS, the total freshwater needs was assessed at 2,168,100 m^3/year. Based on this, the additional freshwater volume requested for the Meliadine Water Licence Amendment is still below the range that was assessed in the 2014 FEIS.

Table 17: Freshwater Consumption for Meliadine Mine Water License Amendment

Items	2014 FEIS		Water Licence	Meliadine Mine Water Licence Amendment
	provided in m^3/h	converted to m^3/yr	m^3/yr	m^3/yr
Camp Use	5.67	49,669	50,000	73,000
Truck Shop-Washbay	8.5	74,460	9,636	365
Paste Plant	5.5	48,180	105,120	157,000
Mill	107.2	939,072	424,860	652,000
Drilling Water	N/A	N/A	1,460	730
Dust Control	18	45,000	24,168	24,168
Emulsion Plant	1.6	14,016	1,520	1,950
Underground Washbay	50	438,000	2,200	2,200
Discovery Installation				5,500
Pit Production	1.5	12,000	N/A	
Sub-total	198	1,620,397	618,964	916,913
Contingency	**25%**		**20%**	**20%**
Total	**247.5**	**2,168,100**	**742,757[(a)]**	**1,100,296**

4.2.2 Sewage Management

Sewage collected from the camp and MSB facilities is pumped to the STP. The objective of the STP is to treat sewage to an acceptable level for discharge to CP1 via a treated sewage water discharge pipeline. The STP is housed in a prefabricated (modular) structure, located at south-east of the service complex at the Industrial Pad, as shown in Figure 2. The system is designed to treat a maximum daily flow of 299 m^3 per day.

The STP for the camp facilities is designed to meet appropriate guidelines for wastewater discharge (Agnico Eagle, 2020c). Details regarding STP specifications and operation can be found in the Operation & Maintenance Manual Sewage Treatment Plant (Agnico Eagle, 2021a).

4.2.3 Process Water Management

Process water is required in the mill for ore processing and is primarily sourced from Meliadine Lake through the freshwater intake system. As per the License, reclaim of surface contact water for use at the Mill is maximized to the greatest practical extent.

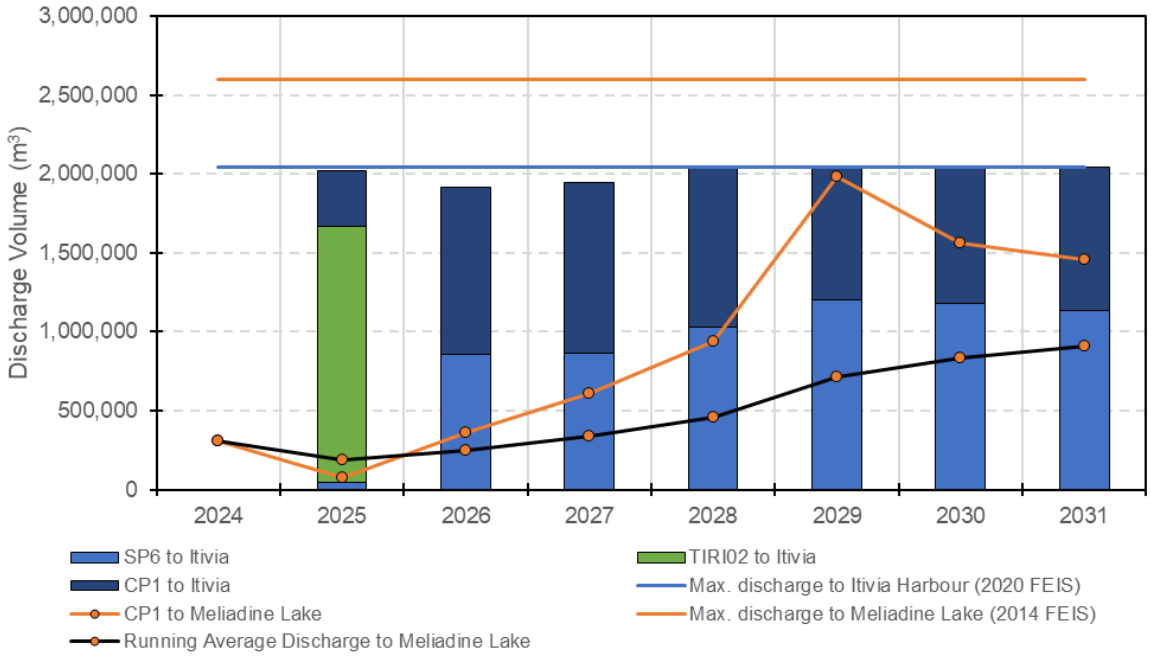
4.3 Meliadine Lake Diffuser Effluent Flow Rates

The EWTP is currently configured to discharge effluent to Meliadine Lake via a diffuser at a rate of 22,000 m^3/day. The pump does not operate continuously at the maximum rate. The anticipated amount of effluent requiring discharge over each month per year (Figure 18) is based on the Water

Balance and Water Quality Model (WBWQM). Details of the WBWQM can be found in the most recent submission of the Annual Report.

Forecasted effluent for Year 6 (2025) and onward are modeled to be 0 m^3 as it as anticipated that water discharges to Meliadine Lake will be minimized, with discharge of surface contact water to Itivia Harbour taking priority. Discharge to Meliadine Lake would only be required if there is insufficient residual capacity in the waterline system and stored surface contact water volumes are outside of normal operating levels set in place in consideration of D-CP1 design. Additional details can be found in Section 3.2 of the most recent submission of the Annual Report and in the Adaptive Management Plan for Water Management (Agnico Eagle, 2022).

Figure 18: Estimated Effluent Flow Rates over Mine Operating Life



SECTION 5 • WATER BALANCE

5.1 Site Water Balance Model

The site-wide water balance model is set-up to represent the interaction of the local climatic regime with the mine plan and water management plan, and based on these interactions, to predict the volumes of various water types (i.e., non-contact, surface contact and saline contact) requiring management, treatment and discharge to the receiving environment (Lorax 2024). The most recent update to the water balance was carried out by Lorax (2024) in support of the Meliadine Mine Water Licence Amendment (Appendix E).

All future water balance model updates will be provided in Annual Reports. The water balance model will be updated once per year, as per the License. Watersheds and waterbodies in proximity to the Mine location and waterbodies affected by Mine infrastructure are detailed in the Meliadine Mine Fish Offsetting Plan.

SECTION 6 • WATER QUALITY

Water quality monitoring is an important part of the Water Management Plan to verify the predicted water quality trends, conduct adaptive management should differing trends be observed, and to ensure all water quality limits at discharge points are met (i.e., effluent to Meliadine Lake and Melvin Bay). Water quality results and water transfers (i.e., origin, destination, rate) at the Mine are monitored and documented pursuant the Licence.

Water quality monitoring was initiated at the pre-development stage, continued through construction into operations, and will continue into closure and post-closure. Monitoring occurs at four levels:

1. Regulated discharge monitoring that occurs at monitoring points specified in the Licence or MDMER regulations.
2. Verification monitoring that is undertaken for operational and water management purposes by Agnico Eagle.
3. General monitoring that is commonly included in the Licence, specifying what is to be monitored according to a schedule. General monitoring is subject to change as directed by an Inspector, or by the Licensee, subject to approval by the NWB.
4. Event Monitoring that addresses the site-specific monitoring that is required following any accidental release. The EM program is designed to verify whether contamination of the surface soil and/or any nearby receiving environment and active zone has occurred as a result of an accidental release of a hazardous material or contaminated water. A “release” may be caused by spills, including unidentified seepage or emergencies.

Water quality monitoring include quality assurance/quality control procedures that are implemented as per current Quality Assurance/Quality Control Plan. Appendix D of the Meliadine Mine Water Quality and Flow Monitoring Plan provides details of the Monitoring Program Stations on Site and at Itivia.

6.1 Summary of Regulatory Guidelines

Water quality results are compared to MDMER criteria and effluent quality limits listed in the Licence. Water quality pertaining to MEL-14 will be compliant to Part F, Item 3 of the Licence prior to discharging to Meliadine Lake. All surface runoff and/or discharge from drainage management systems associated with the Mine, including laydown areas and All-Weather Access Road, where flow may directly or indirectly enter a Water body, shall not exceed the Effluent quality limits listed in Part D, Item 18 of the Licence. Furthermore, all waters from natural water body dewatering activities shall be directed to Meliadine Lake and shall not exceed the Effluent quality limits listed in Part D, Item 12.

Post-closure discharge water quality will be compared to Canadian Council of Ministers of the Environment Water Quality Guidelines (CCME-WQG) guidelines or the Meliadine SSWQO developed for aluminum, fluoride, and iron (Golder 2013a, 2013b, 2014). The Meliadine SSWQO criteria was developed as a conservative protection to the aquatic receiving environment and was developed by Golder (2013a, 2014) to assess whether waste rock consisted of a deleterious substance according to Environment Canada (2013). The outcome of the assessment was that Meliadine waste rock is not a deleterious substance (Environment Canada 2014).

6.2 Water Quality Monitoring - Licence Amendment

As a component of Amendment No. 1 (Emergency Amendment) and in support of the Water License Amendment Application for Amendment No. 2, additional regulated discharge monitoring was carried out in 2020, as described in the Meliadine Mine Water Quality Management and Optimization Plan (WQ-MOP). The purpose of the WQ-MOP sampling program was both to assess conditions experienced in Meliadine Lake during the 2020 discharge event and for the application as a science-based framework to support the determination of acceptable effluent quality conditions (EQCs) and Site-Specific Water Quality Objectives (SSWQOs). Further information regarding the WQ-MOP, including specifics of the 2020 sampling program, application of monitoring data, adaptive management measures and thresholds for the development of SSWQOs for chloride can be found in Meliadine Mine Water Quality Management and Optimization Plan Progress Update (Golder 2021).

6.3 Water Quality Modelling and Forecasts

Updated water quality predictions for Meliadine Mine were conducted by Lorax (2024) using the GoldSim database management and simulations code (Version 14) where mine surface contact water and saline contact water flows derived from the Meliadine Mine water balance were combined with chemistry data from materials exposed in mine infrastructure (i.e., TSF, WRSFs, ore pads), and site baseline information. Water quality estimates were generated for the operational, closure and post-closure periods for effluent to Meliadine Lake, each CP, SPs, sumps, and all the open pits and for the fully flooded open pit lakes at post-closure. Concentrations of water quality parameters required by Type A Water Licence 2AM-MEL1631 Part F, Item 3 are modelled for all mine water management ponds and sumps.

As per the amended License, the water quality forecast will be updated annually. Future updates to the water quality forecast will be provided via annual reports.

6.4 Post-Closure

As per the 2014 Final Environmental Impact Statement (FEIS) water quality model provided in Agnico Eagle (2015b), long-term, post-closure water quality in the collection ponds and in the flooded open pit lakes are anticipated to meet MDMER limits and CCME-WQG for the protection of aquatic life or the SSWQO developed for the Mine for aluminum, fluoride, and iron. Water quality is predicted to

improve in Closure when mining activities cease, and pit lakes are flooded with Meliadine Lake water. Detailed water quality predictions at Post-Closure are included in the Meliadine Mine Water Balance and Water Quality Model Technical Report (Lorax, 2024).

SECTION 7 • WATER MANAGEMENT DURING CLOSURE

The detailed Mine closure and reclamation activities are provided in the Meliadine Mine Interim Closure and Reclamation Plan. Water management during closure and reclamation will involve flooding the open pits using precipitation and freshwater from Meliadine Lake, flooding the Tiriganiaq Underground Mine workings with groundwater inflows (groundwater seepage), and maintaining contact water management systems on site until monitoring results demonstrate that water quality are acceptable for discharge of all contact water to the environment without further treatment. Once water quality meets the discharge criteria, the water management systems will be decommissioned to allow the water to naturally flow to the environment.

The key water management activities during Mine closure are summarized in Table 19. Figures 8 and 9 illustrate the WMP during and after Mine closure, respectively. Additional details for the activities are described in the following sections.

Table 19: Key Water Management Activities during Mine Closure

Phase	Figure	Key Water Management Activities and Sequence
Active Closure (2032 to 2038)	5	• Flooding of mined out pits • Continue to collect and manage the contact water in collection ponds • Continue to pump the contact water in CP1 to EWTP, if required, for treatment before being discharged to the outside environment • Remove non-essential site infrastructure • Pump the underflow sludge water from EWTP to CP1 • Continue natural flooding of Tiriganiaq Underground Mine with groundwater seepage • Remove Meliadine Lake pumping system
Post-Closure (2038+)	6	• Treat the contact water until water quality meet direct discharge criteria and then decommission the water management system • Continue natural flooding of Tiriganiaq Underground • Breach water retention dikes D-CP1, D-CP5, and thermal berms CP2, CP3, CP4, and CP6 once water quality monitoring results meet discharge criteria to allow water to naturally flow to outside environment • Remove culverts and breach remaining water retention berms (pending the demonstration of acceptable water quality)

7.1 Mine Flooding

During closure, all saline water will be pumped to the underground and surface contact water, as well as local runoff and precipitation will be stored in the mined out pits to enhance reflooding activities. Active reflooding will be conducted with water to be pumped from Meliadine Lake. Refilling of the mine out pits is anticipated to take seven years, with pumping of Meliadine Lake water at a maximum of 8.5 Mm^3/year over six years, reducing to 2.6 Mm^3 in the last year of Active Closure (Lorax, 2024). There will be no discharge into Meliadine Lake or to Itivia Harbour during this phase.

The water quality model results indicated that water quality in the flooded pits will meet the discharge criteria and post closure treatment will not be required. The water quality within the pits will be monitored during flooding to verify the prediction of the water quality model. The information will be used to develop a strategy to minimize contamination of the regional surface water system.

More details are provided in the Meliadine Mine Water Balance and Water Quality Model Technical Report (Lorax 2024).

7.3 Collection Ponds, Dikes and Berms

The collection ponds, dikes and berms will remain in place to collect the surface runoff water and seepage from the Mine until the water quality meets discharge criteria. Once the water quality meets discharge criteria, dikes/berms will be breached to allow runoff to follow natural (topographically induced) flow paths. Dikes/berms breaching will involve the removal of a portion of the dikes to a minimum depth of 1 m below average water level or back to original ground levels. Consideration will be given to breach staging, with the above water portions of the dike/berm in the breach area removed during winter periods, when there will be little surface water flow, thereby minimizing the potential release of sediments to the neighbouring waterbodies. The remainder of the breach would be conducted during the open water season following freshet. Turbidity curtains would be deployed to minimize any potential sediment release to surface water.

7.4 Channels and Sumps

Once monitoring results have indicated that contact water conveyed in channels and sumps meets acceptable water quality, the infrastructure will be graded and/or surface treated according to site-specific conditions to minimize wind-blown dust and erosion from surface runoff, if required. This closure activity is intended to enhance site area development for re-colonization by native plants and wildlife habitat.

AGNICO EAGLE

EXECUTIVE SUMMARY

This document presents an updated version of the Groundwater Management Plan for the collection, treatment, storage, and discharge of saline groundwater, being submitted to the Nunavut Water Board (NWB) as part of the Meliadine Mine Water Licence Amendment.

Agnico Eagle Mines Limited (Agnico Eagle) operates the Meliadine Gold Mine (Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The Meliadine Mine is subject to the terms and conditions of both the amended Project Certificate 006 issued by the Nunavut Impact Review Board (NIRB) in accordance with the Nunavut Agreement Article 12.5.12 on February 26, 2019 (NIRB, 2019) and Amended Water Licence No. 2AM-MEL1631 (the Licence), issued by the NWB on May 13, 2021 (NWB 2021).

Tiriganiaq Underground Mine is planned to extend to approximately 770 m below the ground surface; therefore, part of the Underground Mine will operate below the base of the continuous permafrost. The underground excavations will act as a sink for groundwater flow during operation, with water induced to flow through the bedrock to the Underground Mine workings once the Mine has advanced below the base of the permafrost.

Saline water from the Tiriganiaq underground mine will be collected in underground sumps, transported to a clarification system, and subsequently recirculated for use in various underground operations such as make-up water for underground drilling. The remaining underground saline contact water will be pumped to surface to be managed and stored in TIR02 open pit until 2025 for treatment by the Saline Effluent Treatment Plant in the Water Treatment Complex (SETP-WTC) for discharge to sea.

Lake B7, located west of the Tailings Storage Facility (TSF), will be dewatered during freshet of 2025, becoming Saline Pond B7 (SP6), the main Saline Pond (SP) of Meliadine Extension. From 2025 onwards, the saline contact water stored in TIR02 will be transferred to SP6 to allow mining of TIR02 pit to resume during the winter of 2025/26. In addition, underground saline water will be pumped to SP6 and then to the SETP-WTC. The approved Waterline will be used for conveyance of saline water to Itivia Harbour, beginning in 2025.

		3.1.1	7-8	Addition of inflow model assumptions/uncertainties	
		3.2	8-9	Updated with discharge to sea	
		3.3	9-10	Interpretation added and table Aug-18 results corrected	
		3.4	11-15	Addition of discharge to sea and update of SWTP performance	
		3.6	16-18	Addition of mitigation measures under greater than expected inflows	
		4.2	19	Addition of second pumping line from UG	

Version	Date	Section	Page	Revision	Author
		4.3	21-23	Addition of discharge to sea related sampling/monitoring	
5.	March 2020	All		In compliance with Agnico Eagle's amended No. 006 Project Certificate, Condition No. 25	Agnico Eagle Mines Ltd.
		Exec Summary		General update to reflect updated Plan	
		2.4	15	Update high level mine plan, schedule, addition of SETP and RO	
		3.1	16-17	General section update, and updated groundwater inflow rates included	
		3.2	18-19	Updated saline water control structures	
		3.3	19-20	General section update/revision; moved water quality table to Appendix C	
		3.4	20-24	Section update to reflect changes to saline water management strategy	
		3.5	24	Section revision/update to include SP4, timeline details	
		3.6	-	Former Section 3.6 was updated and moved into other sections	
		4.1	25-27	General section revision/update, QAQC portion moved to Water Quality and Flow Monitoring Plan and can be found in QAQC plan	
6.	January 2021	All		In compliance with Commitment #5 from Technical Meeting held on November 30, 2020 for Amendment Application to the Water Licence No: 2AM-MEL1631	Agnico Eagle Mines Ltd.
		Exec Summary		General update to reflect updated Plan	
		3.1	17-21	Updated with further details, and relocated data reporting to the 2020	
		3.2	21-22	Annual Report	
		3.3	23-31	Section update focussed on saline water control structures and pond storage capacities	
		3.5	32	Section update to reflect current saline water management strategy and to include grouting strategy and effectiveness, and viability discussion management strategies. Addresses Commitment 5 and 6 from the Type A Water Licence Amendment	
		4.1	34	Section revision/update to reflect current schedule	
		Appx B	-	Removed SWTP water quality monitoring	
		Appx C	-	Simplified Underground Water Management Flow Sheet Diagram	

Version	Date	Section	Page	Revision	Author
		Appx C	-	Removed groundwater quality data reporting appendix. This information will be provided in the 2020 Annual Report. Added Grouting and Groundwater Storage information as per 2AM-MEL1631 Technical Meeting Commitment 6	
7	August 2021	All		Updated as per Part B, Item 13 of the Amended Water Licence	Agnico Eagle Mines Ltd.
		2.4	16	Updated Mine Development Plan	
		3.2	20	Updated section to reflect P-Area decommissioning	
		3.3	20	Moved viability discussion on the management strategies to subsection 3.3.4, included Tiriganiaq Pit 2 as current storage	
		3.3.2.4	23	Updated section to include the definition of significant variations in inflow rates which would indicate the need to recalibrate the model	
		4.1.2	29	Updated section and Table 6 to include flowmeter driven inflow calculation, underground to surface pipe sampling point, Tiriganiaq Pit 2	
		Appendix C	-	Removed Appendix C (Grouting effectiveness)	
8_NIRB	February 2022	All		Submitted to NIRB as part of the Meliadine Extension Final Environmental Impact Statement	Agnico Eagle Mines Limited
8_NWB	December 2022	All		Submitted to NWB as part of the Meliadine Extension Water Licence Amendment	Agnico Eagle Mines Limited
9	March 2023	3.1		Text edits on the Predicted Groundwater Volumes section	Agnico Eagle Mines Limited
		3.2		Update of current levels in Table 2	
		3.3.2.2		Text edits on section Saline Effluent Treatment, Storage and Haulage	
		3.3.2.4		Text edits on the section Medium-Term Mitigation Measures – Groundwater Monitoring and Grouting	
		3.3.3		Rephrasing	
		3.3.4		Text edits and number updates to Table 3	
		3.5		Updates to Table 4 Discharge Schedule

SECTION 1. INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) operates the Meliadine Gold Mine (Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The Mine is subject to the terms and conditions of the amended Project Certificate (No. 006) issued on March 2nd, 2022 by the Nunavut Impact Review Board (NIRB) in accordance with the Nunavut Agreement Article 12.5.12 and Nunavut Water Board (NWB) Type A Amended Water Licence (No. 2AM-MEL1631, 2016) issued by the NWB on May 13, 2021 and approved by the Minister of Northern Affairs on June 23rd, 2021.

To support the completion of mining of all deposits permitted in 2015 by the Nunavut Impact Review Board (NIRB) at the Meliadine Mine, Agnico Eagle has identified components included in the 2014 Final Environmental Impact Statement and already approved under Project Certificate No. 006 which require licensing under the Type A Water Licence. This is collectively referred to as the Meliadine Mine Water Licence Amendment and includes open pit mining of F Zone, Wesmeg, Pump, and Discovery deposits; waste rock storage facilities at Pump, F Zone, and Discovery; an increase of fuel storage at Rankin Inlet fuel farm; an increase of operational water use; contact water infrastructure and dewatering of lakes and pond to support mining at Pump, F Zone, Wesmeg, and Discovery.

Tiriganiaq Underground Mine is planned to extend to approximately 770 m below the ground surface; therefore, part of the Underground Mine will operate below the base of the continuous permafrost. The underground excavations will act as a sink for groundwater flow during operation, with water induced to flow through the bedrock to the Underground Mine workings once the Mine has advanced below the base of the permafrost.

Saline water from the Tiriganiaq underground mine will be collected in underground sumps, transported to a clarification system, and subsequently recirculated for use in various underground operations such as make-up water for underground drilling. The remaining underground saline contact water will be pumped to surface to be managed and stored in TIR02 open pit until 2025 for treatment by the Saline Effluent Treatment Plant in the Water Treatment Complex (SETP-WTC) for discharge to sea. The approved Waterline will be used for conveyance of saline water to Itivia Harbour, beginning in 2025.

Lake B7, located west of the Tailings Storage Facility (TSF), will be dewatered during freshet of 2025, becoming Saline Pond B7 (SP6), the main Saline Pond (SP) at the Meliadine Mine. From 2025 onwards, the saline contact water stored in TIR02 will be transferred to SP6 to allow mining of TIR02 pit to resume during the winter of 2025/26. In addition, underground saline water will be pumped to SP6 and then to the SETP-WTC.

This document presents an updated version of the Groundwater Management Plan (GWMP) for the collection, treatment, storage and discharge of saline groundwater, being submitted to the NWB as part of the Meliadine Mine Water Licence Amendment. The overall water management plan for the life of the Mine and post-closure is described in the Agnico Eagle Meliadine Gold Mine Water Management Plan.

1.1 Objectives

The objective of the GWMP is to provide consolidated information on groundwater management for the Meliadine Gold Mine. The GWMP is divided into the following components:

- Introductory section (Section 1);
- Description of groundwater inflow forecasts and management strategies (Section 2); and
- Description of the groundwater monitoring program (Section 3).

The GWMP will be updated as required to reflect any changes in operations or economic feasibility that occurs, and to incorporate new information and latest technology, where appropriate.

1.2 Background

The Meliadine site conditions, local hydrology and hydrogeology, as well as the mine development plan are presented in the Environmental Management Protection Plan.

SECTION 2. GROUNDWATER MANAGEMENT

2.1 Predicted Groundwater Volumes

Planning and mitigations for management of groundwater relies upon predictions of groundwater that may report to the underground workings and then require further storage and management on surface. This section provides a summary of modelling work that has been completed to predict groundwater volumes.

In 2020, an environmental and socio-economic assessment was completed for a proposed increase of the discharge of treated groundwater effluent from the underground mine of the Tiriganiaq deposit into the marine environment near Rankin Inlet, by routing the treated groundwater effluent through waterlines. As a requirement of the Project Certificate No.006 T&C 25, Agnico Eagle provided a saline water management plan to address the potential for higher-than-predicted volumes of saline water inflows into the underground mine. The Groundwater Management Plan (Version 5) was issued on April 2020 using the 2019 groundwater inflow predictions and submitted under the 2020 FEIS Addendum for the "Saline Effluent Discharge to Marine Environment" project. The addendum was approved on January 31, 2022. Versions 6 and 7 of the Groundwater Management Plan were then submitted in compliance with Commitment #5 from the Technical Meeting held on November 30, 2020 for the Amendment Application to the Water Licence No: 2AM-MEL1631, and as per Part B, Item 13 of the Amended Water Licence, respectively. Nonetheless, the 2019 groundwater predicted inflows were still presented in these two versions.

Since 2019, additional data has been collected in support of the environmental review to document existing conditions and to provide the foundation for a qualitative and quantitative assessment of the operations and mine development. This additional data, documented in the Summary of Hydrogeology Existing Conditions Report (Golder 2021a), was used to update the numerical groundwater model.

Supplemental hydrogeological data was collected to enhance the understanding of hydrogeological conditions. This additional data, documented in the Updated Summary of Hydrogeology Existing Conditions Reports (WSP 2024b). The numerical groundwater model was updated to include a more current mine plan to generate predicted rates for the life of the Mine (WSP 2024b). This update included a limited calibration using historically measured groundwater inflow rates.

A summary of the predicted groundwater inflow to the Tiriganiaq underground developments during operations for the base case, along with predicted TDS is presented in Table 2.1-1. Groundwater inflow to the Tiriganiaq Underground were predicted to increase from 400 m^3/day in 2022 to a peak inflow of 1625 m^3/day in 2027. Inflows then decrease as aquifer storage effects diminish from 2027 to 2031, where the predicted inflow to the underground is 1,450 m^3/day. The lateral expansion of the underground includes a drift to the north of the underground development, which causes the increase in the predicted inflows in 2025. Flows to the Eastern and Western portion of Tiriganiaq underground

are mitigated by the dewatering of Lakes B5 and A8 West. In the absence of this dewatering, higher inflows to the underground would be expected as the mine development extends below these lakes. Inflow to the Eastern and Western portions of the underground are also affected by depressurization from the adjacent mining in the central portion, which acts as a stronger hydraulic sink given its greater depth of mining (WSP 2024b).

The predictions presented in Table 2.1-1 represent the best estimate of groundwater inflow and groundwater TDS based on the measured data and the results of the model calibration. Since the groundwater inflows are being mitigated by active grouting, the predicted groundwater inflows incorporate the effects of grouting as grouting of the underground development is assumed to continue as part of future inflow predictions.

Table 2.1-1: Predicted Base Case Scenario Groundwater Inflows – Tiriganiaq Underground

Year	Predicted Groundwater Inflow (m^3/day)	Predicted TDS (mg/L)
2022	400	58000
2023	575	58000
2024	700	56500
2025	975	53500
2026	1450	50500
2027	1625	50500
2028	1450	52500
2029	1400	54000
2030	1350	55000
2031	1450	54500

Source: Table 6 from (WSP 2024c)

2.1.1 Groundwater Inflow Predictions – Assumptions and Uncertainties

The shallow bedrock at the site is primarily within the frozen permafrost except in areas of taliks underlying lakes. The deeper competent bedrock has been subdivided into two separate units: Mafic Volcanic Rock formations and Sedimentary Rock formations. The Mafic Volcanic Rock formations are present between the Lower Fault and Pyke Fault and are inferred to transition to Sedimentary Rock formations to the east. Sedimentary Rock formations are present to the North of the Lower Fault, and South of Pyke Fault. Synthesis of the hydraulic testing results up to the end of 2021, indicates that the Mafic Volcanic Rocks have lower hydraulic conductivity at depth. The supplemental data, however, show that the shallow and intermediate bedrock zones may be more permeable than the deeper bedrock (WSP 2024c).

In crystalline rocks, fault zones may act as groundwater flow conduits, barriers, or a combination of the two in different regions of the fault depending on the direction of groundwater flow and the fault zone architecture (Gleeson and Novakowski 2009). Within the mine area, three regional faults (North, Lower and Pyke) are present. In addition, ongoing monitoring of geological structures has led to the identification of 17 faults (i.e., KMS corridor, RM-175) that have been incorporated into the conceptual hydostratigraphy near the underground development. Each of these faults have been assumed to have enhanced permeability relative to the surrounding competent bedrock. The additional structures are generally located between the Lower Fault and Pyke Fault within the Mafic Volcanic Rock formations and range in thickness from 2 to 6 m. An exception is the KMS Fault corridor, located in the sedimentary rock formations to the north of the Lower Fault at the Tiriganiaq Underground. This corridor is a wider zone of rock located between the KMS Fault and Lower Fault that is associated with poor rock quality (WSP 2024c).

The hydraulic conductivity of the competent bedrock and faults is assumed to be linearly reduced by an order of magnitude between the top of the cryopeg and base of permafrost (zero-degree isotherm). This assumption reflects that this portion of the permafrost, which will contain partially unfrozen groundwater due to freezing point depression, is expected to have reduced hydraulic conductivity relative to the unfrozen bedrock reflecting the presence of isolated pockets of frozen groundwater within this zone. These frozen zones will result in a decrease in the hydraulic conductivity of the rock compared to that of the entirely unfrozen rock (WSP 2024c).

In support of mine development, 2D thermal modelling was completed to update the predicted depth to the base of permafrost in the study area, to assess the extent of lake taliks and to determine whether continued mine development will remain within the permafrost limits (WSP 2024a). Results of the thermal modelling indicated:

- Open taliks were interpreted to be present beneath portions of each of the following lakes near the proposed open pits and undergrounds: Lake B4, Lake B5, Lake B7, Lake A6, Lake A8, and Lake CH6.
- Closed talik was interpreted below Lake D4 based on the 0-degree isotherm, however the lake is interpreted to potentially be connected to the regional groundwater flow system through the cryopeg zone. The depth of the base of permafrost was interpreted to be between 320 and 490 m depth, with the interpreted depth dependent on the proximity to nearby lakes. Shallower depths are from locations near to lakes both with and without open taliks.

It was conservatively assumed that the surface water/groundwater interaction at all lakes is not impeded by lower-permeability lakebed sediments that may exist on the bottom of some of these lakes (WSP 2024c).

Combined, the assumptions discussed above result in the following sources of uncertainty in the groundwater inflow model:

1. The properties of the faults assumed in the model are considered to be conservative based on supplemental testing in 2021 and their lateral extents and depths. The faults were also assumed to have enhanced permeability up to 2.5 kms away from the underground developments, and the width of the Lower Fault was increased to between 15 to 20 m to account for potential additional low RQD corridors along its length. These assumptions are considered conservative since the permeability and width of a fault zone can be heterogeneous along strike (Gleeson and Novakowski 2009) resulting potentially in zones of greater hydraulic conductivity along strike over short distances; whereas over longer distances the presence of zones infilled with fault gouge will act to decrease hydraulic connectivity along strike (WSP 2024c).
2. An increase in bedrock hydraulic conductivity by a factor of 2 can result in an increase of total saline groundwater inflow by approximately 54%. Overall, groundwater inflow for Tiriganiaq is the largest contributor of saline groundwater inflow to the underground, and uncertainty in these inflows will have the largest effect on water management planning (WSP 2024c).

2.2 Groundwater Management Control Structures

The Tiriganiaq underground workings will be operated below the base of continuous permafrost. The underground excavations act as a sink for groundwater flow during mining, with water induced to flow through the bedrock to the Underground Mine workings below the base of the permafrost and within the cryopeg.

The underground water management system is designed to prevent water from affecting the workings or production. The system contains a series of sumps (generally one at the access of each level) designed to capture groundwater inflows and runoff from mining operations (i.e., drilling), a clarification system, and a pumping system to redistribute the clarified saline contact water.

Consistent with the Approved Meliadine Mine GWMP, saline water from the Tiriganiaq underground mine will be collected in underground sumps, transported to a clarification system, and subsequently recirculated for use in various underground operations such as make-up water for underground drilling. The remaining underground saline contact water will be pumped to surface to be managed and stored in TIR02 open pit until 2025 for treatment by the Saline Effluent Treatment Plant in the Water Treatment Complex (SETP-WTC) for discharge to sea.

Lake B7, located west of the Tailings Storage Facility (TSF), will be dewatered during freshet of 2025, becoming Saline Pond 6 (SP6), the main Saline Pond (SP) of the Meliadine Mine. From 2025 onwards, the saline water stored in TIR02 will be transferred to SP6 to allow mining of TIR02 pit to resume during the winter of 2025/26. In addition, underground saline water will be pumped to SP6 and then to the SETP-WTC, where it will be treated prior to discharge to Itivia Harbour.

Temporarily inactive underground developments (similar to the water stope) will continue to be used for additional storage of excess groundwater inflows as required and as feasible.

A schematic of the underground dewatering system is provided in Appendix A. Pond capacities for storage of saline water and year of available storage are presented in Table 2.2-1.

Table 2.2-1: Saline Pond Storage Capacity at the Mine

SP/Sump	Maximum Water Capacity (m^3)	Storage Available (year)
TIR02	1,616,554	Up to 2025
SP1	32,686	To 2031
SP3	9,856	To 2031
SP6	1,092,748	2025 and onwards

Source: Lorax (2023)

2.3 Groundwater Management Strategies and Mitigations

Based on the modelled groundwater inflow volume, the following strategies and mitigation options were considered and form part of the short-, medium- and long-term management of groundwater inflows to the Underground Mine:

- Short-term Strategy: Store saline contact water on site (Section 2.3.1)
- Medium-term Strategy: Treat saline groundwater for discharge to receiving environment in Melvin Bay via trucking (Section 2.3.2)
- Long-term Strategy: Treat saline groundwater for discharge to receiving environment in Melvin Bay via waterline (Section 2.3.3).

2.3.1 Short-Term Management Strategy - Groundwater On-site Storage

This alternative was considered as part of the Type A Water Licence Application (2015) and has been implemented on site as part of the short-term management of groundwater inflows. It involves storing all excess groundwater in temporarily inactive underground developments and in dedicated surface saline water ponds at the Mine. Tiriganiaq Pit 2 is currently in use for storage of saline contact water on Site (Table 2.2-1).

Discussion regarding thresholds for adaptive management follows in Section 2.3.1.1.

2.3.1.1 Short-Term Mitigation Measures – Increased Storage

Upon the occurrence of greater than expected groundwater inflows to the underground mine, or delay in the implementation of the long-term management strategy (waterline discharge; Section 2.3.3), Agnico Eagle will consider expanding saline pond storage capacity until inflows can be reduced or treatment/discharge is capable of managing inflows. Specifically, the mine plan as it relates to open pits can be adapted to provide additional storage.

Storage thresholds to trigger this adaptive management strategy have been set in order to allow ample time to make adjustments to the mine plan and to proceed through any applicable regulatory

processes, if required. The following triggers are in place regarding increasing on-site storage as adaptive management:

- Occupied saline contact water storage capacity on site reaches 80% of total available saline contact water storage capacity; or
- Available saline contact water storage volume on site is expected to reach capacity within two (2) years.

When applying the collective short-, medium-, and long-term strategies together, it is not expected that either threshold will be reached.

2.3.2 Medium-Term Management Strategy

Saline Effluent Treatment, Storage and Haulage

In August 2019, Agnico Eagle began discharge of treated effluent from the Saline Effluent Treatment Plant (SETP) to sea at Melvin Bay as per the NIRB Project Certificate 006 Amendment 001, issued in February 2019. In September 2020, the daily rate of discharge to Melvin Bay was elevated from 800 m^3/day to 1600 m^3/day.

Saline contact water in the underground mine is first treated for total suspended solids (TSS) underground through a Mudwizard system including decanting basins. Saline contact water from underground is then pumped to surface and stored in the surface saline ponds. From there, the saline contact water as well as other contact water is pumped to the SETP for ammonia and TSS treatment. The SETP is designed to treat 1,600 m^3/day of saline water for TSS and ammonia. More details are available in Agnico Eagle (2020a). Following treatment, saline water is pumped to Saline Pond 3 (SP3) for storage prior to discharge.

Treated saline water stored in SP3 is hauled by tanker trucks to Itivia. Truck loads are up to 36 m^3 per truck and are unloaded using a flexible 4” HDPE suction pipe. The truck discharge pump transfers the treated effluent into the 6’’ discharge HDPE pipeline and through the diffuser. Further information on trucking can be found in the Roads Management Plan.

Hauling operations were suspended in 2022 following approval of the waterline (section 2.3.3) under the Amendment 002 of the NIRB Project Certificate No. 006 issued on March 2nd, 2022 and sufficient saline storage capacity on site forecasted until 2026 (Table 2.2-1). The cessation of hauling operations also aims to minimize traffic, reduce dust emissions alongside the AWAR and mitigate trucking impacts to community.

Water treated by the SETP and discharged to the environment through either the waterline or punctual hauling operations, if required, will meet MDMER end-of-pipe discharge criteria and be non-acutely and non-chronically toxic as per regulated toxicity testing per the MDMER.

Pumping and Diffusion Plan

The discharge facility includes a 778 m pipeline extending to an engineered diffuser located 20 m below surface in Melvin Bay to ensure proper mixing and prevent interference with traditional activities. The saline effluent will be discharged in a controlled manner through the diffuser to allow for maximum diffusion and minimum environmental impact to the marine environment. Environmental monitoring is discussed in the Ocean Discharge Monitoring Plan.

2.3.2.1 Medium-Term Mitigation Measures – Groundwater Monitoring and Grouting

Hydraulic Monitoring

As a strategy to support groundwater inflow modelling and monitor groundwater responses to mining, vibrating wire piezometers are currently installed in the rock mass surrounding the Underground Mine. These piezometers are currently and will continue to be applied to assess response of the groundwater pressure (pressure head) to groundwater inflows, and as calibration data for the groundwater inflow model (Section 2.1). The predictive capability of a groundwater inflow model enables additional mitigations measures to be implemented if predictions result in groundwater quantity or quality risks. The groundwater inflow model also allows for infrastructure to be adequately sized to manage future groundwater inflow to the underground mine.

Groundwater Quantity and Quality Monitoring

The groundwater monitoring program allows ongoing comparison of modelled water quantity/quality to realized trends. Details pertaining to the groundwater monitoring program are found in Section 3.

Non-contact groundwater samples as part of the groundwater monitoring program are used as tracers to identify trends and improve predictions regarding groundwater inflow chemistry. If non-contact groundwater samples collected indicate that TDS concentrations are more than 20% higher than the estimated 55,000 mg/L (Section 2.4), then water quality predictions for underground will be reviewed and updated, if required.

Similarly, observed groundwater inflow rates are compared to model predictions (Table 2.1-1) on a quarterly basis. If significant variations from model predictions are observed, revision of the assumptions/inputs behind the model will be considered and the model updated, if required.

Based on monthly averages over a window of six consecutive months, if observed variations between actual groundwater inflows and predicted values are 30% or higher, a recalibration of the model or an update of the inflow analysis will be performed. In addition, updates to the groundwater model may be required based on operational changes as the Underground Mine advances.

Fractured Bedrock Grouting

A refined grouting approach began in 2019 based on the premise of preventative grouting (cementing) having greater effectiveness over reactionary grouting, which in previous years would be triggered by

intersecting water bearing fractures when carrying out drilling (production and exploratory) and blasting activities.

In developing underground workings, exploratory DDHs in areas of planned development are cemented prior to the advancement of the development. Furthermore, “Jumbo” holes (holes drilled by a Jumbo Drill) are drilled ahead of development and cemented specifically for the purpose of pre-development grouting. Combined, these grouting efforts act to reduce the potential for intersecting inflows with the increased surface area of the excavated heading. Where possible, residual inflows are then plugged on an as-needed basis in these areas. Inflows in blasted stopes and diffuse seeps are generally not able to be grouted and thus remain as active inflows to the underground workings.

The potential for intersecting water-bearing fractures is increased in production long holes (stopes), due to the increased surface area of the excavation and the proximity of the excavation to known water bearing structures. As such, during the drilling phase of stope production, a “grout curtain” is set in and around the stope to minimize the potential for inflows after blasting.

2.3.3 Long-Term Management Strategy

Treated Groundwater Discharge to Melvin Bay at Itivia Harbour via a Waterline

Based on the current inventory of saline water storage capacity on site (Table 2.2-1), and forecasted groundwater inflows (Section 2.1), the proposed long-term strategy of discharging to Melvin Bay via a waterline will allow a more robust and flexible groundwater management system.

Specifically, the objective of the long-term strategy is to remove the need for permanent storage of water on site as a management strategy by providing discharge capacity to drain the saline ponds each year. Storage under the long-term strategy would only be required on a temporary basis to store winter accumulation of groundwater inflows to the Underground Mine. Application for the long-term strategy was submitted to the appropriate authorities in 2020 and approved under Project Certificate (No. 006) Amendment 002 issued on March 2nd, 2022 by the NIRB.

The discharge through the waterlines will follow the Adaptive Management Plan.

2.4 Groundwater Quality

The salinity of deep groundwater samples collected to date from the Meliadine Mine area are at the high end of what has been observed at other sites in the Canadian Shield at corresponding depths (Frape and Fritz 1987; Holden et al. 2009; Dominion 2014b). Water quality in deep groundwater samplings suggest the salinity remains consistent with depth following the transition from near surface freshwater. Salinity concentrations in deep groundwater at Meliadine are approximately 1.5 times that of sea water (35 g/L) (WSP 2024b).

Data collected from the underground diamond drill holes at Tiriganiaq are collected from depths between 230 and 475 mbgs, which are inferred to be located above the zero-degree isotherm (base of permafrost) based on thermal modelling, and therefore within the cryopeg. TDS within the cryopeg

may be elevated relative to groundwater in unfrozen rock at similar elevations due the preferential freezing of 'fresher' water and is similar to the assumed TDS below the regional permafrost (approximately 55 g/L) (WSP 2024b).

SECTION 3. GROUNDWATER MONITORING PROGRAM

3.1 Water Quality and Quantity Monitoring

Water quantity and quality monitoring is an important part of the groundwater management strategy to verify the predicted water quantity and quality trends and conduct adaptive management should differing trends be observed.

The groundwater monitoring plan, summarized in Table 3.1-1, will be further defined as the Mine advances and will be conducted in agreement with the WMP for the Meliadine Mine.

Table 3.1-1: Groundwater Quantity and Quality Monitoring Plan

Monitoring Type	Monitoring Location	Purpose	Frequency
Verification	Underground Seeps	Quantity – Underground water balance approach to calculate groundwater inflow rate	Daily
Verification	Underground to surface pipe	Quality – Monitor quality of saline contact water entering saline storage	Monthly
Verification	SP1, SP6, Tiriganiaq Pit 02	Quality – Monitor quality of surface saline storage ponds	Monthly during saline discharge
Verification	Underground seeps/DDHs	Quality – Verify quality of groundwater flowing into underground mine	Quarterly

3.1.1 Water Quantity

Groundwater inflow rates to the Underground Mine are estimated by balancing flowmeter measured volumes of water pumped out of the underground mine with changes in total water storage underground. Additionally, estimations for smaller inflows and outflows such as rock haulage moisture content, backfill paste water bleed, and surface to underground inflows are applied to improve calculated inflow accuracy.

Excess underground saline contact water volumes transferred from the Underground Mine to storage ponds on surface are recorded at a flow meter located after the main pumping station from underground to surface. Furthermore, water volumes in storage ponds are tracked via water elevation surveys applied to volume-elevation curves.

Observed groundwater inflow rates are compared to model predictions (Table 2.1-1) on a quarterly basis. If significant variations from model predictions are observed, revision of the assumptions/inputs behind the model will be considered and the model updated, if required. Variations that would be considered significant and would indicate the need to consider recalibrating the model and updating the inflow analysis would correspond to when groundwater inflows to the mine, based on a monthly average of inflow over six consecutive months, is 30% higher than the predicted groundwater inflows.

In addition, updates to the groundwater model may be required based on operational changes as the Underground Mine advances.

3.1.2 Water Quality

Underground Contact Water

Underground saline contact water is sampled on a monthly basis at the locations identified in Table 3.1-1. All underground saline contact water sampling locations are analyzed for the following parameters: conventional parameters (specific conductivity, TDS, TSS, pH, hardness, alkalinity, total and dissolved organic carbon, turbidity), oil and grease, major ions, total and free cyanide, radium 226, dissolved and total metals (including mercury), nutrients (nitrate and nitrite, ammonia, Kjeldahl nitrogen, total phosphorus, orthophosphate) and volatile organic compounds (i.e., benzene, xylene, ethylbenzene, toluene, F2-F4 petroleum hydrocarbons). Additional sampling locations are expected to be installed for continued operations located on surface and in-line of the underground to surface pumping line, providing final representative water quality of underground saline contact water entering surface saline storage before it interacts with previously existing saline contact water on surface and any precipitation runoff inflows.

Underground saline contact water monitoring is carried out for operational and water management purposes by Agnico Eagle. This monitoring data will not be reported to the Regulators in the Annual Water License Report but can be provided upon request by the Regulators.

Non-contact Groundwater

Non-contact groundwater quality is monitored at mine seeps and/or DDH water intersects to verify the quality of groundwater flowing into the mine prior to contact. Flushing and sampling techniques used to ensure samples are taken without contamination are described in Section 2.2.3 of the Quality Assurance/Quality Control Plan. Samples are collected quarterly at a minimum but actual sampling frequency may be greater depending on rate of progress, frequency of water intersects, and observed trends in groundwater quality with time. DDH intersect water samples are analyzed for the following parameters: conventional parameters (specific conductivity, TDS, TSS, pH, hardness, alkalinity, total and dissolved organic carbon, turbidity), major ions, nutrients (nitrate and nitrite, ammonia, Kjeldahl nitrogen, total phosphorus, orthophosphate), radium 226, dissolved and total metals (including mercury). Non-contact groundwater quality data collected for Meliadine Extension will be provided in the Annual Report.

Non-contact groundwater samples as part of the groundwater monitoring program are used to identify trends and improve predictions regarding groundwater inflow chemistry. If non-contact groundwater samples collected indicate that TDS concentrations are greater or less than 20% than the estimated 55 g/L (Section 2.4), then water quality predictions for underground will be reviewed and updated, if required.

3.2 Hydraulic Monitoring

As a strategy to support groundwater inflow modelling and monitor groundwater responses to mining, vibrating wire piezometers are currently installed in the rock mass surrounding the Underground Mine. These piezometers are currently and will continue to be applied to assess response of the groundwater pressure (pressure head) to groundwater inflows, and as calibration data for the groundwater inflow model (Section 2.1).

3.3 Permafrost Terrain Monitoring

Agnico Eagle considers that existing T&C 12 of Project Certificate No.006 is sufficient to protect, mitigate, and monitor the permafrost terrain for the Meliadine Extension. Nonetheless, as the primary source of data for calibration and verification of thermal model results for permafrost characterization are temperature measurement from thermistor strings, the following monitoring activities will continue:

- Thermistors will continue to be installed when possible in exploration boreholes, especially boreholes close to planned underground development or beneath large lakes to confirm permafrost depth and talik characteristics.
- Data from a deep thermistor recently installed in an area farther away from lakes (to provide information about regional permafrost depth in areas not influenced by lakes) will continue to be collected and analyzed to assess thermal stability.
- Data from existing thermistors will continue to be collected and analyzed to assess thermal stability of the permafrost terrain.

Existing monitoring and follow-ups that have been implemented during construction and operation will continue to be carried forward through the life of mine.

SECTION 1 • INTRODUCTION

The purpose of the Freshet Action Plan (Plan) is to provide Agnico Eagle Mines Limited (Agnico Eagle) with specific management and mitigation measures to address and manage water associated with the freshet season (Freshet), a response plan, and procedures to prevent and to minimize potential negative impacts to the surrounding environment at the Meliadine Mine (the Mine or Site).

The term freshet refers to spring snowmelt, that can also be overlapped by rainfall, which can result in inundation of floodplains. Freshet at Meliadine typically takes place between May 15 and July 30. In some years, Freshet can also happen in early fall, when freezing re-occurs (mid-October) and then thaws. There are areas at the Site that are vulnerable to excess water produced during Freshet; the objective of this document is to identify those areas, and to develop a plan with defined roles and responsibilities to manage excess water produced on site.

The following guiding principles are applicable to the Plan:

- To ensure that mine surface contact water from runoff or seepage is managed to prevent adverse environmental impacts;
- To ensure the health and safety of Agnico Eagle employees and contractors; and
- To ensure the Site is in compliance with the Nunavut Water Board (NWB) Type A Amended Water Licence 2AM-MEL1631 (Licence).

The Plan identifies areas of risk during Freshet, risk management and the procedures necessary to address potential concerns.

SECTION 2 • AREAS OF RISK DURING FRESHET

The key areas of risk during Freshet at the Site include the following:

- Pond P3 (remaining component of the P-Area)
- Portal 1 Sump 1 (Sump LV50)
- Portal 2 Sump 1 (Sump LV50)
- Landfarm A and Landfarm B
- Landfill
- All Weather Access Road (AWAR)
- Infrastructure Areas; including the Exploration Camp area, Portal 1 & 2 and the Industrial Pad Areas
- Collection Pond 1 (CP1), Collection Pond 2 (CP2), Collection Pond 3 (CP3), Collection Pond 4 (CP4), Collection Pond 5 (CP5) and Collection Pond 6 (CP6)
- D-CP1 and D-CP5
- Meliadine Esker Quarry
- Bypass Road
- Itivia laydown and fuel handling facility (Itivia)
- Tailings Storage Facility

Identified areas of risk at Site are shown in Figure 1 and are described in the following section.

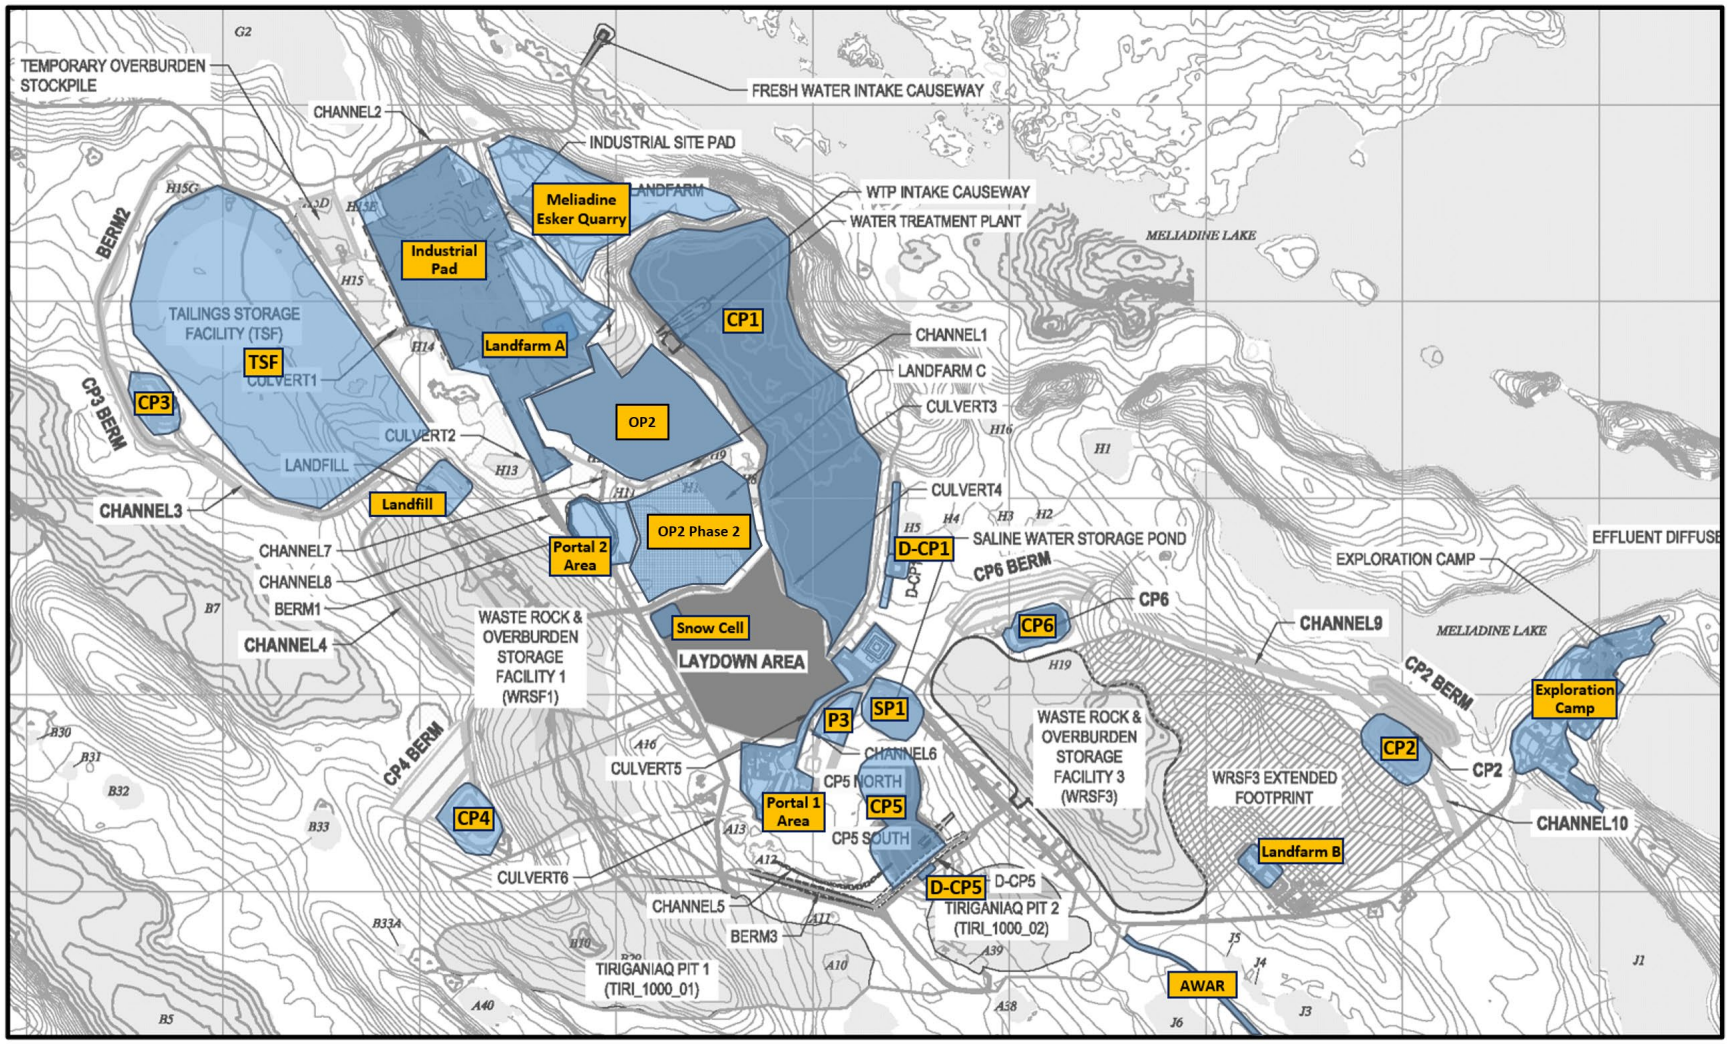

Figure 1: Site plan view with identified areas of risk at Site during freshet. (Existing Conditions)

AGNICO EAGLE

2.1 P-Area

The P-Area formerly consisted of three storage ponds as part of the saline contact water management system from 2016-2018. P3 is the remaining cell with a limited capacity of 2,912 m^3. More information on the decommissioning of the P-Area can be found in the most recent version of the Water Management Plan (WMP).

Surface contact water collected in P3 is monitored and managed as per the WMP to ensure the water level remains below the maximum design water elevation (66.22 m) and the protection of the Saline Pond 3 (SP3) liner. Information on SP3 can be found in the WMP.

2.2 Portal 1 Sump 1 (LV50 SUMP)

LV50 is located 50 meters below grade (mbg) and is the first sump located down the Portal 1 ramp. Snowmelt and surface run-off that flows down the portal entrance is directed to sump LV50 where it is then pumped to CP5. The overall capacity for Portal 1 Sump 1 is 29 m^3. Water pumped from Portal 1 Sump 1 to CP5 is measured with a volumetric flow meter and recorded daily.

2.3 Portal 2 Sump 1 (LV50 SUMP)

LV50 is located 50 meters below grade (mbg) and is the first sump located down the Portal 2 ramp. Snowmelt and surface run-off that flows to the portal entrance to sump LV50 is pumped from LV50 towards Channel 1. The overall capacity for Portal 2 Sump 1 is 55 m^3. Water pumped from Portal 2 Sump 1 to Channel 1 is measured with a volumetric flow meter and recorded daily.

2.4 Ore Pad 2

Ore Storage Pad 2 (OP2) and OP2 Stage 2 are located on either side of Channel 1 and are designed ore storage facilities. Freshet monitoring of OP2 and OP2 Stage 2 will include occurrences of seepage, and any observed seepages will be monitored for water quality.

2.5 Landfarm

The Type A Licence Landfarm is located adjacent and north of the OP2 and is designed to receive soils, rock, snow, and ice contaminated with petroleum hydrocarbons, as per the Landfarm Management Plan. This includes light hydrocarbons such as diesel and gasoline. It was assumed that an annual volume of 500 m^3 of contaminated ice and snow would require management and the Landfarm has been designed to account for this volume. Additional details for Landfarm water management are described in the Landfarm Management Plan.

2.6 Infrastructure Areas

Infrastructure Areas represent buildings, pads and towers installed at the Site and include the Industrial Pad, Exploration Camp, and Emulsion Plant (Figure 1).

2.7 CP1, CP2, CP3, CP4, CP5, and CP6

Engineered water containment dikes constructed in 2017 at lakes A54 and H17 were developed as D-CP5 and D-CP1, respectively. The dikes are designed to contain surface contact water within the footprint of the Site. Both CP1 and CP5 are used for Site surface contact water and snow and ice collection prior to Freshet. CP1 and CP5 are illustrated in Figure 1 and discussed in Section 3 of this plan.

CP3 and CP4 are collection ponds designed to collect runoff from the Tailings Storage Facility (TSF) area and Waste Rock Storage Facility 1 (WRSF1) area, respectively. CP3 construction was completed in Q4 of 2018 and CP4 construction was completed in Q2 2019. CP3 and CP4 design plans implement engineered thermal protection berms. Maximum operating levels within CP3 and CP4 are such that Berm-CP3 and Berm-CP4 will not be required to retain water (see Water Management Plan).

CP6 and CP2 are designed to collect runoff from Waste Rock Storage Facility 3 (WRSF3) where the water will then be pumped to CP1 for containment prior to treatment at the EWTP-WTC and discharge to the receiving environment (Meliadine Lake). CP2 and CP6 design implements an engineered thermal protection berm. Maximum operating level within the collection ponds is such that thermal berms will not be required to retain water (further details on these Pond as-built characteristics can be found in the Water Management Plan).

2.8 Tailings Storage Facility

The Tailings Storage Facility (TSF) is a dry stack tailings storage facility. The TSF dry stack is located west of the Industrial Pad as shown in Figure 1. The facility stores compacted tailings that are transported from the process plant by haul truck. The tailings are spread and compacted in the facility. The tailings are deposited within a rockfill berm that is continuously heightened to progressively cover the placed tailings. Culvert 1 is in place to allow passage of water through the TSF haul road and towards CP1 catchment.

2.9 All Weather Access Road (AWAR)

The All-Weather Access Road (AWAR) was built in 2013 to connect the Site to the hamlet of Rankin Inlet. The road is approximately 23.8 km long with twenty-two water crossings; three bridge crossings and nineteen culverts installed (Figure 2).

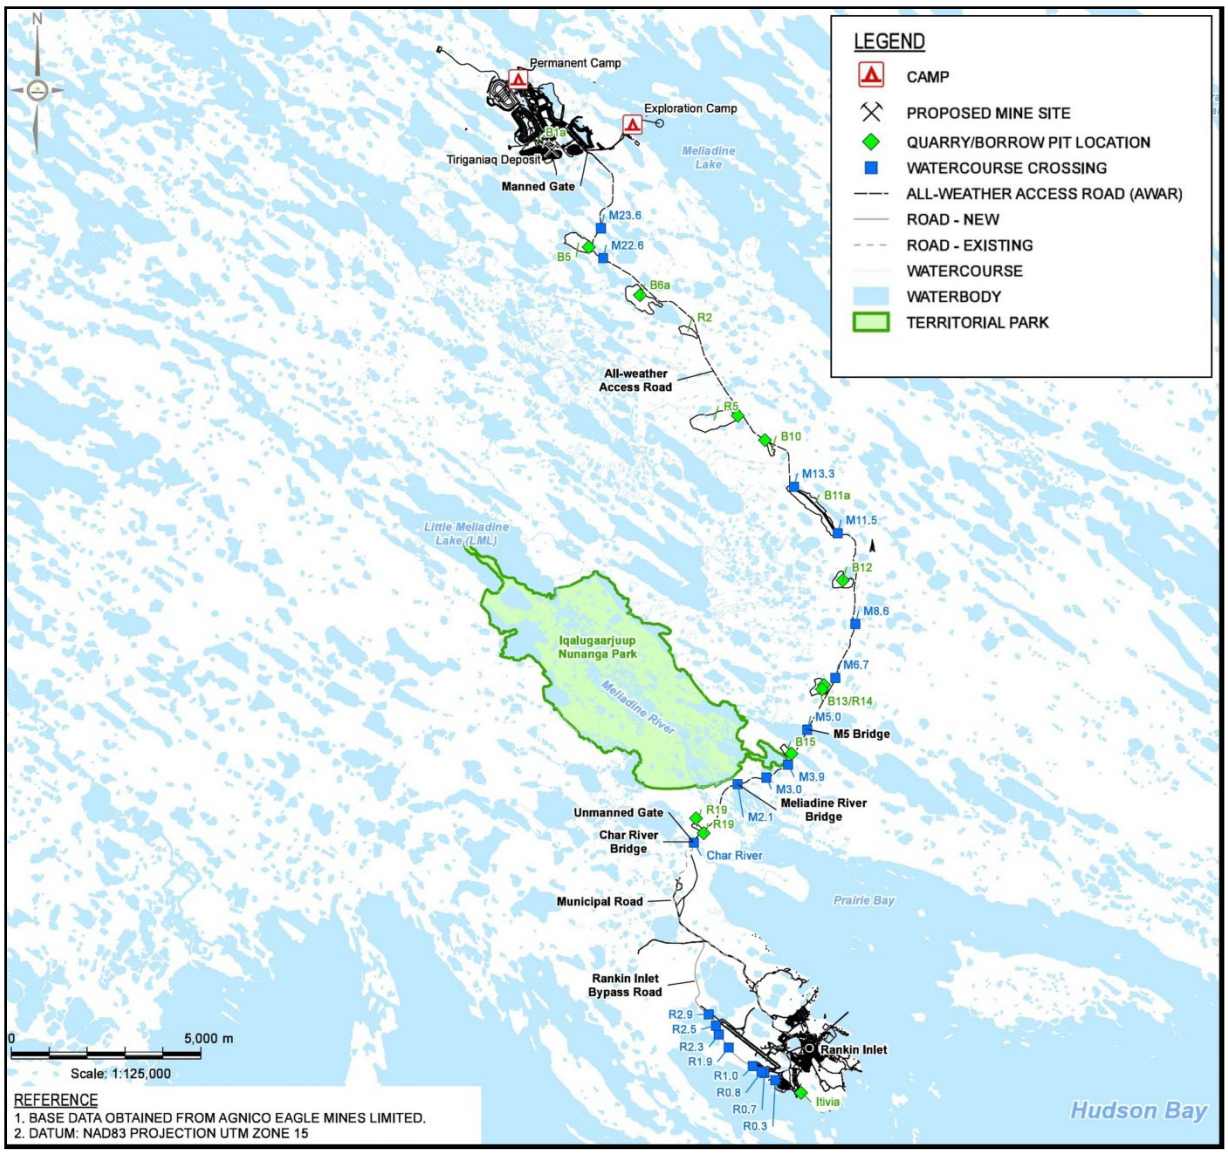

Figure 2: *AWAR Map Showing Water Crossing Location Section*

2.10 Bypass road

The Bypass Road is a 5.9 km access road that provides a means to divert site-related traffic around the community of Rankin Inlet. The Bypass Road spans from the northwest margin of Itivia to km 2.9 on the AWAR (Figure 3) and has 19 culverts installed at 13 locations along the road.

Figure 3: *Bypass Road and Culvert Location*

2.11 Itivia

Itivia is located in Rankin Inlet and is accessed by the Site from the AWAR and Bypass Road. In combination with the Bypass Road, Itivia is intended to support the Site as a staging point for incoming and outgoing fuel and material handling for barge shipments. Itivia is also the location of the final discharge point for saline effluent generated by the mine. The location of Itivia is shown on Figure 3 and the plan view of the Itivia Site is presented as Figure 5. A culvert is installed to divert upstream runoff around the Itivia Site and to allow passage of runoff from the Itivia laydown area (Figure 5).

SECTION 3 • FRESHET RISK MANAGEMENT

Managing the risks prior to Freshet is a primary objective at Site. Planning and preparing before Freshet alleviates some of the risk from excess water that may suddenly occur and helps to ensure compliance with applicable regulations.

This is managed by removing water (pumping) at collection pond areas prior to winter freeze (fall) to allow sufficient storage capacity from precipitation, snow and ice melt during freshet. For road water crossings, culverts, ditches, and select collection ponds, snow or ice removal after winter freeze and before Freshet (winter and spring) ensure these infrastructure function properly throughout freshet.

Risk management practices for the Site areas during Freshet are described below. Section 4 describes snow management at Site.

3.1 P-Area Risk Management

The following management practices are maintained at the P-Area (P3) during Freshet:

- P3 water levels are monitored daily during freshet. Runoff water collected in P3 will also be monitored for salinity and managed as described in the Water Management Plan.
- Agnico Eagle will conduct weekly freshet structural inspections of berm DP3 and note any observed seepage. Inspections will also include monitoring the base of SP3 for settling, slumping and cracking.
- Weekly water sampling during Freshet.

3.2 Portal 1 Sump 1 Risk Management

Overflow from the Portal 1 LV50 sump will flow down ramp where it will be managed by the underground mine water management system. If the water level against D-CP5 reaches the maximum operating level, any water in the Portal 1 LV50 sump requiring pumping will also be directed down ramp.

3.3 Portal 2 Sump 1 Risk Management

Overflow from the Portal 2 LV50 sump will flow down ramp where it will be managed by the underground mine water management system. In the unlikely situation where flooding conditions would be observed downstream of Culvert 1, water in the Portal 2 LV50 sump requiring pumping will also be directed down ramp.

3.4 Landfarm Risk Management

An oil-water separator is installed at the Landfarm A. The oil-water separator is used to treat both direct precipitation to the landfarm footprint and melt from snow containing hydrocarbons (i.e. snow on which spills occur) that is stored in the landfarm and contaminated snow cell over winter. Treated water is analyzed for benzene, toluene, ethylbenzene and xylene (BTEX), lead, and oil and grease prior to discharge to CP1 or used on the windrows to increase moisture content, as required. Hydrocarbons removed from water are stored and managed as hazmat.

A contaminated snow cell used to store snow containing hydrocarbons (i.e., snow on which spills occur) is located in the northwest corner of the laydown area (Figure 1). Upon snowmelt, water within the contaminated snow cell is transferred to the Landfarm for treatment at the oil-water separator.

If a suitable treatment cannot be completed, the water will be shipped south in totes or bladders for disposal in a certified disposal facility.

3.5 AWAR, Bypass Road and Site access roads Risk Management

The following management practices are maintained to ensure the integrity of the AWAR, Bypass Road and site access roads before and during Freshet:

- Large culverts will be heated/steamed as necessary to allow the free flow of Freshet water.
- Prior to Freshet, water crossings and culverts will have snow removed from ice surface on the upstream and downstream sides of the crossing to allow free flow of water as necessary.
- Visual inspections of AWAR and Bypass Road will be undertaken as to the structural integrity of the abutments and road integrity.
- Weekly (minimum) written inspections throughout Freshet and daily during excessive rainfall response will be completed. The following aspects are monitored during visual inspections: total suspended solids (TSS) transport and signs of erosion, culvert/crossing function, flow intensity, and integrity of roads.

If erosion or ground surface scouring are observed, the E&I Department will be notified for repairs. TSS barriers, silt fences, straw logs or other sediment control methods will be implemented as required. Sediment and erosion monitoring and mitigation will be conducted in accordance with the most recent version of the Sediment and Erosion Management Plan.

3.6 Infrastructure Areas

Risk management practices for the main Infrastructure Areas at the Site during Freshet are described in the following sections.

3.6.1 Camp Pads and Surroundings

Risk management practices are maintained at the Exploration Camp, Main Camp and surrounding camp areas as follows:

- Clearing off ice and debris from culverts prior to and during Freshet;
- Visual inspections to ensure flow through culverts and along channels is not impeded;
- Visual inspections for excessive water pooling. If pooled water is observed to flow into a water body, a water sample will be collected and monitored for TSS. Follow-up samples will be collected on a weekly basis thereafter;
- Visual inspections for snowmelt runoff. If runoff is observed to flow into a water body, a water sample will be collected and monitored for TSS in accordance with the Sediment and Erosion Management Plan. Follow-up samples will be collected on a weekly basis thereafter; and
- TSS transport will also be monitored at the culvert beside the garage at Exploration Camp that flows towards Meliadine Lake. This area will be monitored for TSS, and preventative measures (install straw wattles and/or booms) will be installed to prevent deleterious substances from entering Meliadine Lake. Sediment and erosion monitoring and mitigation will be conducted in accordance with the most recent version of the Sediment and Erosion Management Plan.

3.6.2 Industrial Pad and Access Road

The following management practices are maintained to ensure the integrity of the industrial pad and access road:

- This area will be monitored for turbidity and preventative measures (install straw wattles and/or booms) will be implemented to limit TSS in runoff to CP1.

3.6 CP1, CP2, CP3, CP4, CP5 and CP6

Risk management practices for CP1, CP2, CP3, CP4, CP5 and CP6 include discharging/pumping the water prior to winter freeze to be treated and/or discharged as per the Licence and the Water Management Plan. Inspections of CP1, CP2, CP3, CP4, CP5, CP6, and associated water management structures or thermal protection berms, will be conducted following Part E Item 16 of the Licence and as per the Water Management Plan.

3.7 Itivia

The following management practices are maintained to ensure the integrity of Itivia and the Bypass Road:

- The culvert installed between the Itivia laydown and the existing laydown areas (Figure 5) will be cleared of snow and ice prior to Freshet and the upstream and downstream monitored for TSS transport in accordance with the most recent version

of the Sediment and Erosion Management Plan. Preventative measures (installation of straw wattles and/or booms) will be implemented as needed;
- Rip rap was installed around the culvert to control erosion and a decantation sump will be maintained downstream to collect suspended sediment;
- Two rock check dams were installed in 2019 and two additional rock check dams were installed in the fall of 2021 upstream of the culvert to mitigate TSS transport through the Itivia site (Figure 5; Tetra Tech 2019);
- Monitoring at other locations of runoff during Freshet in accordance with the most recent version of the Sediment and Erosion Management Plan.

3.8 Tailings Storage Facility

The following management practices are maintained to ensure the integrity of the Tailings Storage Facility (TSF) and its associated structures:

- Culvert 1 (access road to TSF) will be cleared of snow and ice as applicable prior to Freshet and will be monitored closely for TSS transport;
- Snow that has accumulated on the TSF deposition surface will be removed prior to Freshet to reduce snowmelt runoff and pooling (Section 4);
- Daily visual inspections for ponding and areas of elevated sediment transport during Freshet;
- Weekly inspections carried out to identify areas of concern including issues of seepage, cracking, and ponding on the TSF and associated structures.

3.9 Temporary Water Management Structures

Based on anticipated areas of ponding and/or impediment to flow on Site, or in reaction to unexpected ponding and/or impediment to flow on Site, temporary water management structures may be implemented to protect infrastructure by encouraging water movement through the water management system. Temporary water management structures will be constructed as needed and decommissioned when the event invoking the requirement (i.e., ponding) comes to an end. Such structures will be built in such a way that they maintain the overall flow direction of waters on site and do not affect the discharge to the receiving environment. No temporary measures would be placed outside the project footprint, nor alter the way water enters into the receiving environment. Temporary water management structures may include:

- Trenching in snow and/or ice;
- Excavation into ice to allow the immediate installation of pumps, avoiding the necessity to wait for ice to thaw; or
- Trenching/spillways across roads on Site or on the AWAR at areas of ponding where pumping rates are unable to match accumulation rates.

SECTION 4 • SNOW MANAGEMENT

Proper snow management during the winter is a key component of the freshet action plan since it contributes to risk mitigation from excess water during Freshet and prevents possible environmental impacts. An internal Snow Management Procedure was developed to efficiently manage snow at the Site.

Snow that is removed from the Main Camp, Industrial Pad, Ore Pad, 6 Million Liter Fuel Farm, Portal 2 Pad, and Crusher Pad will be transported to a snow dump located at the north margin of CP1. Snow removed from the Tailing Storage Facility (TSF) will be transported to either the northeast side of the TSF or to the northwest side, just north of CP3. Snow removed from the Paste Plant, Batch Plant, and surrounding laydowns will be transported immediately north of the Batch Plant and maintained as a level snow pad. Snow removed from the 3 Million Liter Fuel Farm, Portal 1 Pad, Vent Raise, SWTP/SETP Pad, and associated laydowns will be transported north of the warehouse laydown pad, west of the main access road to the industrial pad (Lake H8 snow pad) and maintained as a level snow pad. Snow from Tiriganiaq Open Pit 1 will be transported to CP4 watershed and maintained as a snow pad.

Snow removed from roadways must be blown or maintained as a snow pad next to the road. Snow removal outside of the designated zones is maintained as a clean, level snow pad. Figure 4 illustrates the locations for snow collection during the winter and prior to Freshet. Figure 5 illustrates the snow management and storage areas for Itivia.

AGNICO EAGLE

EXECUTIVE SUMMARY

This document presents the Sediment and Erosion management plan (the Plan) at the Meliadine Gold Mine. The purpose of this Plan is to provide consolidated information on the management and monitoring of potential areas subjected to erosion. This is accomplished by reviewing the potential effects of total suspended solids (TSS) and turbidity, the Federal guidelines and the license requirements, followed by the periods and types of activities subjected to erosion, and the specific monitoring and mitigating measures.

General findings on the effects of TSS on fish and fish habitat have been listed, such as sublethal and lethal effects on fish and their eggs. Federal TSS Guidelines have been cited, distinguishing the short-term and long-term exposure thresholds. Turbidity guidelines are also discussed in the present document. The Plan presents the monitoring and mitigating actions related to three (3) specific periods of activity: Periods of construction near water – during construction and operation; periods of freshet or significant runoff events – during construction, operation and closure; periods of potential impact to waterbodies – during operation. The proposed monitoring and mitigating measures are discussed for those periods of activity.

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) operates the Meliadine Gold Mine, located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut.

This document presents the Sediment and Erosion Management Plan (the Plan). The purpose of this Plan is to provide consolidated information on the management and monitoring of potential areas subjected to erosion. This is accomplished by presenting first a review of the potential effects of total suspended solids (TSS) and turbidity, the Federal guidelines and the license requirements, followed by the periods and type of activities subjected to erosion, and the specific monitoring and mitigating measures.

As per Nunavut Impact Review Board (NIRB) Meliadine Project Certificate No.006 Condition 28, the Sediment and Erosion Management Plan should be developed to prevent or minimize the effects of destabilization and erosion that may occur due to Mine activities. The plan should also detail sediment control plans to prevent and/or mitigate sediment loading into surface water within the Mine area.

The objectives of the plan are:

- To prevent the release of sediment into streams and waterbodies during construction activities;
- To reduce and mitigate erosion and the release of sediment during operations activities;
- To specify erosion and sediment control measures that, if implemented and maintained, will help Agnico Eagle maintain compliance with the Federal *Fisheries Act*, specifically with Section 36(3) of the Act, which prohibits the deposition of deleterious substances into waterbodies frequented by fish; and
- To provide references to approvals, relevant standards, control plans and procedures for training, communications, investigation and corrective action, and audits that are required under the Project Agreement.

SECTION 2 • TOTAL SUSPENDED SOLIDS/TURBIDITY EFFECTS, FEDERAL GUIDELINES AND LICENSE REQUIREMENTS

2.1 Effects of Total Suspended Sediments on Fish Habitat

Suspended sediments, and associated effects on water clarity, have the potential to affect fish and fish habitat in a variety of ways, including but not limited to:

- Smothering of deposited eggs or siltation of spawning habitats;
- Smothering of benthic invertebrate communities;
- Decreased primary productivity caused by reduced light penetration;
- Reduced visibility, which may decrease feeding efficiency and/or increase predator avoidance; and
- Clogging and abrasion of gills.

Moreover, the general findings for effects of TSS on fish and fish habitat indicate the following:

- Effects of TSS depend on both the concentration of TSS and duration of exposure;
- Effects of TSS can also be influenced by the size and shape of suspended particles;
- Lethal concentration of TSS on fish over acute exposure ranges from hundreds to hundreds of thousands of mg/L;
- Sublethal effects on fish (reduced growth, changes in blood chemistry, histological changes) associated with chronic exposures tend to be exhibited at TSS concentrations ranging from the tens to hundreds of mg/L;
- There is considerable uncertainty about potential effects of low TSS concentrations over long time periods;
- Overall, the most sensitive group of aquatic organisms to TSS appears to be salmonids, and guidelines are developed to protect this group;
- Adult salmonids are generally more sensitive to short durations of high concentrations of suspended sediments than juvenile salmonids; and
- Low suspended sediment levels are known to cause egg mortality (40 %) to rainbow trout at long durations (7 mg/L at 48 days). Guidelines for long-term exposure reflect these findings.

More details can be found in the report from Fisheries and Oceans Canada (DFO) on the effects of sediments on fish and their habitat (Fisheries and Oceans Canada, 1999).

2.2 Federal Guidelines

2.2.1 TSS Guidelines

The Canadian Council of Ministers of the Environment (CCME) specifies separate guidelines for TSS for clear and high flow periods. The guidelines are derived primarily from Caux *et al*. (1997), with application intended mainly for British Columbia streams. In the case of the application to the Meliadine Project lakes, the clear flow guidelines would be most relevant; even during freshet. The lakes would not expect to see large natural fluctuations in TSS except in localized areas for short periods.

The guidelines put forth by the CCME recognize that the severity of effects of suspended sediments is a function of both the concentration of suspended sediments and the duration of exposure. Guidelines are intended to protect the most sensitive taxonomic group and the most sensitive life history stages.

Table 2.1 CCME National Guidelines and MDMER Legislated Standards for TSS

Source	Short-Term Exposure	Long-Term Exposure
CCME (1999, updated 2002)	Anthropogenic activities should not increase suspended sediment concentrations by more than 25 mg/L over background levels during any short-term exposure period (e.g., 24-h).	For longer term exposure (e.g., inputs lasting between 24h and 30 days), average suspended sediment concentrations should not be increased by more than 5 mg/L over background levels.
MDMER 2002, last amended December 2021	Maximum authorized concentration in a composite effluent sample = 22.5 mg/L. Maximum authorized concentration in a grab sample of effluent = 30 mg/L.	Maximum authorized monthly mean effluent concentration = 15 mg/L.

2.2.2 Turbidity Guidelines

Turbidity guidelines put forth by the CCME (1999) are based on extrapolation from the TSS guidance above, adjusted by a factor of about 3:1 (a typical average ratio for TSS: turbidity). In the case of turbidity for clear water, CCME (1999) recommends a maximum increase of 8 Nephelometric Turbidity Units (NTU) from background levels for a short-term exposure (e.g., 24-hour period), and a maximum average increase of 2 NTU from background levels for a longer term exposure (e.g., 30-day period).

CCME (1999) notes that in some cases short-term resuspension of sediments and nutrients in the water column can augment primary productivity, and in other cases, changes in light penetration may be inconsequential if a system is limited by other factors such as nutrients. The Caux *et al*. (1997) study considered effects of suspended sediment not only on fish but also on algae and zooplankton. In summary, the recommendations put forth by Caux *et al*. (1997) are based mainly on the most sensitive taxonomic group, which is salmonids.

However, research has shown that widespread, chronic turbidity can result in reduced light penetration and subsequent reductions of primary productivity (Fisheries and Oceans Canada, 1999; Canadian Council of Ministers of the Environment, 1999; Lloyd, Koenings, & Laperriere, 1987). Consequently, water clarity is of concern at broader spatial scales and longer time frames. It should be noted that DFO's report on effects of sediment on fish and their habitat (DFO, 1999) endorses the guidelines for TSS put forth by the CCME (1999), but does not recommend following guidelines for turbidity. Rather, turbidity may be used as a surrogate for suspended sediment only when the relationship between the two parameters is established for a particular waterbody.

2.3 Licence Requirements for the Protection of Fish and Fish Habitat at Meliadine

The Nunavut Water Board (NWB) Type A Water Licence for the Meliadine Mine includes:

All surface runoff and/or discharge from drainage management systems, at the Monitoring Program Stations MEL-SR-1 to MEL-SR-TBD referred to in Part I, Item 11, during the Construction/Operation of any facilities and infrastructure associated with this project, including laydown areas and All Weather Access Road, where flow may directly or indirectly enter a water body, shall not exceed the Surface Runoff and Discharge from Drainage Management Systems quality limits in Table 2.2.

Table 2.2 Surface Runoff and Discharge from Drainage Management Systems Quality Limits

Parameter	Maximum Average Concentration	Maximum Concentration of Any Grab Sample
Total Suspended Solids (TSS) (mg/L)	50.0	100.0
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

Additionally, the discharge of effluent from the Final Discharge Point at Monitoring Program Station MEL-14 directed to Meliadine Lake through the Meliadine Lake Diffuser shall not exceed the following TSS concentrations, in accordance with the requirements of the Type A Water License (Part F, Item 3) and MDMER (see Table 2.1 above):

- Maximum monthly mean effluent concentration: 15 mg/L;
- Maximum concentration of any grab sample of effluent: 30 mg/L.

SECTION 3 • SEDIMENT AND EROSION MONITORING AND MITIGATION

3.1 Sediment and Erosion during Specific Periods

The purpose of the Plan is to ensure that Agnico Eagle will successfully monitor signs of sedimentation and erosion and minimize its resulting effects. This plan presents the monitoring and mitigating actions related to three (3) specific periods of activity for Meliadine:

- Periods of construction near water – during construction and operation;
- Periods of freshet or significant runoff events – during construction, operation and closure; and
- Periods of potential impact to waterbodies – during operation.

The construction of water management infrastructure could potentially lead to excess TSS. Therefore, erosion control methods must be considered during construction of water management infrastructure. In addition, erosion control must be considered during any dewatering activity.

The freshet season at Meliadine occurs approximately from mid-May until the end of June. In addition, there can be periods of high water flow due to rainfall events from late May – early October. As most site construction has been completed at the Meliadine site there are new areas and infrastructure that have become potentially vulnerable to excess water during the freshet season and in response to rainfall, such as, but not limited to:

- Culverts and other water management infrastructures;
- Newly constructed embankments, such as roads and berms;
- Water channels; and
- Surface runoff.

Water transfer and water discharge during operation can also lead to erosion and sedimentation.

3.2 Erosion and Sediment Monitoring

To monitor potential erosion and sedimentation, smaller water management infrastructure such as culverts, cross drains, surface runoff and ditches are inspected up to daily during freshet (minimum of weekly), on a monthly basis thereafter and daily after significant rain events. Larger culverts and bridges are inspected more often if they represent a risk for daily operations, for the receiving environment or for the health and safety of workers. More specifically, the following aspects are monitored during visual inspections:

- Accumulation of debris near the inlet of the crossings, impeding the free flow of water at those locations;
- Bed erosion upstream and downstream of watercourse crossing structures;
- Scour under bridge abutments and abutment foundations; and

- Erosion along cutslopes and fillslopes of embankments (rill and gully erosion), etc.

Newly excavated channels are inspected on a regular basis and after significant rain events. Erosion signs along the channel flow are monitored and documented. Inspections are carried out during the spring when surficial ice moves towards the inlet of the diversion channels to ensure that no ice blockage causes water buildup upstream of the channel, which could lead to subsequent erosion problems. It is important to develop a database to determine if adverse trends are occurring. If adverse trends are observed, then mitigation will be undertaken to prevent a major incident.

The frequency of water and turbidity sampling are in accordance with the requirements of the Type A Water License and MDMER. The frequency will be increased if required during the freshet season or during heavy rainfall events. Procedures for turbidity monitoring include:

- Collection of water at the site of sediment entrance (exposure), and at a reference site (i.e., in the same watercourse/waterbody in an area unaffected by the sedimentation [upstream, at least 50 m away where water does not appear to be impacted]).
- Analyze samples for turbidity using a field turbidity meter and compare the exposure sample to the reference sample.
- If the exposure sample results are higher than the reference then mitigation will be undertaken (i.e., installation of silt fencing, silt barrier booms, etc.) to prevent any impact to watercourses.

If Agnico Eagle is actively working in an area with elevated turbidity – the work will stop until the level of clarity returns to an acceptable level.

Monitoring will be documented with site photographs and inspection forms.

3.3 Mitigation Measures

The following mitigation measures could be used, if required, to reduce risks associated with erosion and sedimentation.

- Riprap or clean non-acid generating/non-metal leaching rockfill could be used to armor shorelines, bridge abutments, culverts inlets and outlets and toe berms;
- Ditches managing high volumes of water could be armored for erosion control and reduce the speed of water flow;
- Sedimentation basins could be constructed at sensitive locations to allow settlement of finer sediments;
- Check dams could be constructed in areas of sustained high levels of TSS to mitigate transport of TSS downstream;
- Ditches, culverts and other water crossing structures should be maintained free of debris to allow free flow of runoff water;

- Installation of erosion control material such as turbidity barriers, silt curtains or straw booms;
- Site-specific erosion issues may arise during the mine operation that require specific local corrective actions;
- In-stream construction during periods when streams are expected to be dry or frozen to the bottom (i.e., during winter or fall). Isolation methods will be used for work below the high water mark for streams with flowing water at the time of construction;
- Materials installed below the high water mark (i.e., riprap) will be cleaned prior to installation to avoid adding deleterious substances to watercourses. Where concrete is installed, it will be allowed to cure fully prior to installation;
- Riparian areas will be maintained whenever possible to minimize erosion and impacts to fish habitat, with vegetation removal limited to the width of the workspace footprint. Disturbed areas along the streambanks will be stabilized and allowed to re-vegetate upon completion of work to minimize future erosion;
- Debris and excess materials resulting from construction will be removed from the work site to prevent them reaching water bodies; and
- When using equipment that creates tracks on the surface, run the equipment slowly to create grooves running perpendicular the slope and not parallel to the slope. This type of texture on slopes can slow the speed of runoff and reduce the amount of erosion and sediment transported downhill. This method must also be combined with an additional method of catching sediment at the base of the slope, such as a silt fence, straw log, etc.

EXECUTIVE SUMMARY

The Water Quality and Flow Monitoring Plan (the Plan) has been prepared in accordance with the requirements of the Approved Type A Amended Water Licence 2AM-MEL1631 (the Licence). The Plan complements the *Aquatic Effects Management Program* (AEMP) and is closely associated with the *Water Management Plan* and the *Metal and Diamond Mining Effluent Regulations (MDMER)*.

Section 2 of this Plan includes an overview of the monitoring programs and mine development schedule. Section 3 provides specific details (including sampling locations and parameters to be measured) for the compliance monitoring program, along with general guidance for the event monitoring program. An adaptive management program is described for regulated discharge and non-regulated discharges in Section 3. Requirements of the flow monitoring program are described in Section 4, and an overview of the reporting requirements in Section 5. Section 6 provides overview of Quality Assurance / Quality Control practices.

SECTION 1 • INTRODUCTION

The Water Quality and Flow Monitoring Plan (the Plan) has been updated in accordance with the requirements of the Nunavut Water Board (NWB) for the Type A Amendment of the Water Licence 2AM-MEL1631 (the Licence). The Plan is one component of the *Aquatic Effects Management Program* (AEMP) and is closely associated with the *Water Management Plan* and the *Metal and Diamond Mining Effluent Regulations (MDMER)*.

The Plan summarizes the monitoring locations, sampling frequency, monitoring parameters, compliance discharge criteria and an adaptive management plan for water quality at the Meliadine Mine.

The purpose of this Water Quality and Flow Monitoring Plan is to establish the program that is to be implemented and followed by Agnico Eagle's Meliadine environmental management team to monitor the performance of the waste and water management systems at the Meliadine Mine. The program includes:

- Verifying and validating the predicted water quality values with empirical measurements of the mine site water quality and flows;
- A comparison of measured water quality data to compliance requirements stipulated in the Licence; and
- A framework for adaptive management that allows the identification and rectification, where necessary, of unexpected trends or non-compliance in water quality and flows.

The Plan provides information on the locations of the monitoring stations for the mine. These monitoring locations are used to evaluate the performance of the mine waste and water management system.

The objectives of the monitoring program are:

1. To track the chemistry of the contact and non-contact water prior to and during discharge;
2. To assist in identifying if water treatment is required prior to discharge; and
3. To minimize the potential impacts of mining activities on the surrounding environment.

Additional locations outside the footprint of the mine (and outside the scope of this Plan) will be monitored under the *Meliadine Gold Mine* AEMP. The Water Quality and Flow Monitoring Plan has been developed according to the approved Water Management Plan. The Water Management Plan has been updated to address the Meliadine Mine Water Licence Amendment to the NWB.

SECTION 2 • OVERVIEW OF MONITORING PROGRAMS

This Plan has been divided into two levels of monitoring to characterize the range of impacts between the sources of contact water in the individual mine facilities and the point of discharge or release to the receiving environment. The two levels of monitoring include:

1. Compliance Monitoring (CM); and
2. Event Monitoring (EM).

2.1 Compliance Monitoring Program (CM)

The CM sites are those stipulated in the Licence; these sites vary from contact water collection ponds, structures such as ditches, culverts prior to discharge to the receiving environment and local lakes surrounding the mine site. The requirements of the Licence, including water quality limits, will be applied at the applicable mine discharge points identified in the CM program.

The CM program provides a mechanism to assess water quality at specified sites, and to confirm and document compliance of discharge with regulatory requirements. As part of adaptive water management, these internal monitoring stations provide protection to the receiving water environment, provide data to predict pit re-flooding water quality and ensure exceedances of predicted or regulated levels are appropriately managed or mitigated to reduce impacts.

2.2 Event Monitoring Program (EM)

The EM sites result from unexpected events such as spills, accidents, and malfunctions. The response programs for such events are discussed in greater detail in the following four documents:

- Spill Contingency Plan
- Risk Management and Emergency Response Plan
- Freshet Action Plan
- Water Management Plan

Each accidental release will require mobilization of site equipment to stabilize the release, procedures to contain, neutralize, and dispose of the discharge, and recommendations for monitoring the site following the incident.

SECTION 3 • MONITORING PROGRAMS

The monitoring program is presented in three sections; requirements of the compliance monitoring program, an overview of the event monitoring program, and then details of the adaptive management program for monitoring results.

Monitoring stations will be adjusted as mining progresses.

3.1 Compliance Monitoring Program

The CM program monitors the chemistry of four local lake surrounding the mine site (E3, G2, H1 and B5) as well as mine contact water collected and diverted at specified locations prior to release into the receiving water environment. The sampling is conducted to confirm and document compliance with regulatory requirements. The nature of water monitored within the CM program include:

- Non-contact water from local lakes;
- Mine surface contact water collected from drainage of different structures;
- Monitoring points located within the water management system prior to release into the receiving water environment; and
- Effluent released to Meliadine Lake and water within Meliadine Lake at the diffuser.

The CM sampling program has multiple monitoring stations across the project site, with sampling at different stages of the mine life. Table 3.1 provides a list of all CM stations for the Approved Mine. Table 3.2 provides a list of all the CM stations proposed for the full development of the permitted Meliadine Mine with the assumption that these stations would become active once the infrastructure is on surface. A description of the monitoring station location, parameters to be monitored and sampling frequency are provided in the tables. Specific details for the monitoring parameter groups are provided in Table 3.3. Agnico Eagle follows 5 groups of parameters as identified in Schedule I, Table 1 of the Licence. Additionally, Agnico Eagle follows the analytical requirements and authorized limits of deleterious substances as identified in Schedule 3 and Schedule 4 of the MDMER (Government of Canada, 2002).

Figure 3.1 shows the approximate location of each of the sampling sites for the Approved Mine. Figures 3.2 and Figure 3.3 show the approximate location of the proposed sampling sites for the full development of the approved Meliadine Mine. The actual location of each sampling site is determined by access and safety considerations and are marked by a stake that defines the exact location of the collection point for sampling events with appropriate attached signage in English, Inuktitut and French.

GPS coordinates for all new compliance monitoring stations of the Meliadine Mine will be confirmed as the project advances in the regulatory process.

3.4.1 General Sampling and Analysis Program

Samples are collected in clean laboratory-supplied containers and preserved as directed by the analytical laboratory. During all phases, samples are analyzed offsite at a CALA accredited commercial lab (e.g., ALS in Burnaby, BV Labs in Nepean, AquaTox in Puslinch, H2Lab in Val d'Or, or Nautilus Environmental in Burnaby). Samples sent to commercial laboratories may change as the site matures and additional requirements occur. Sampling procedures are further detailed in Section 6 (Quality Assurance/Quality Control Procedures) and in the Quality Assurance/Quality Control Plan.

Table 3.4 summarizes the minimum sample volumes, container, preservation, and holding times for each analyte (note these criteria may change depending on the laboratory or changes in analytical methods). This information is from the *USEPA Methods for Chemical Analysis of Water and Waste Water* (*EPA-600/4-79-020, 1983*).

Table 3.1: Approved Monitoring Program Meliadine Mine

Station	Description	Phase	Monitoring Parameters	Frequency
Mine Site				
MEL-D-1	Dewatering: Water transferred from lakes to Meliadine Lake during dewatering of lakes	Construction	As defined in the Water Management Plan referred to in Part D, Item 12	Prior to discharge and Weekly during discharge
			Volume (m3)	Daily during periods of discharge
MEL-SR-1 to TBD	Surface Runoff: runoff downstream of Construction areas at Meliadine Site and Itivia Site, Seeps in contact with the roads, earthworks and any Runoff and/or discharge from borrow pits and quarries	Construction, and Operation	As defined in the Water Management Plan referred to in Part D, Item 18	Prior to Construction, Weekly during Construction
			Group 1	Monthly during open water or when water is present upon completion
MEL-11	Water Intake from Meliadine Lake	Construction, Operation, and Closure	Full Suite	Monthly during periods of intake
			Volume (m^3)	Daily during periods of intake
MEL-12	Contact Water Treatment Plant (pre-treatment) coming from CP1, off the pipe and not in the pond	Construction (prior to release), Operations, and Closure	Group 1	Monthly during periods of discharge
MEL-13-01-MEL-13-07-MEL-13-10[(a)]	Mixing zone in Meliadine Lake and MDMER exposure stations for final discharge point within mixing zone	Construction (prior to release), Operations, and Closure	Full Suite, Group 3 (MDMER)	Monthly during periods of discharge
MEL-14	Contact Water Treatment Plant from CP1 (post-treatment): end of pipe in the plant before offsite release	Construction (upon effluent release), Operations, and Closure	Full Suite, Group 3	Prior to discharge and Weekly during discharge
			Volume (m3)	Daily during periods of discharge
			Acute Lethality	Once prior to discharge and monthly thereafter
MEl-15	Local lake E-3	Operations, and Closure	Group 2	Bi-annually during open water
MEL-16	Local Lake G2	Construction, Operations, and Closure	Group 2	Bi-annually during open water

Station	Description	Phase	Monitoring Parameters	Frequency
MEL-17	Local Pond H1	Construction, Operations, and Closure	Group 2	Bi-annually during open water
MEL-18	Local Lake B5	Construction, Operations, and Closure	Group 2	Bi-annually during open water
MEL-19	CP2, Collection of drainage from WRSF3	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-20	CP3 Collection of drainage from dry stacked tailings	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-21	CP4 Collection of drainage from WRSF1	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-22	CP5 Collection of drainage from WRSF1 and WRSF2	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-23	CP6 Collection of drainage from WRSF3	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-24	Seepage from the Landfill between the landfill and Pond H3	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-25	Secondary containment area at the Itivia Site Fuel Storage and Containment Facility	Construction, Operation, Closure	Group 4, Volume (m3)	Prior to discharge or transfer of Effluent
MEL-26	Itivia Harbour end of pipe (before offsite release) for treated saline effluent	Operations, and Closure	MDMER	As per MDMER requirements

Table 3.2: Proposed Monitoring Program Meliadine Mine

Station Id[(a)]	Description	Phase[(b)]	Monitoring Parameters	Frequency
Mine Site				
MEL-27	SP6 Collects Saline Water from underground and other saline ponds and sumps as well as runoff from the TSF	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-28	CP7 Collects water from WRSF7 and prevents contact water from flowing into F Zone open pits.	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-29	CP8 Collects surface contact water from open pits and mine operations	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-30	CPD1 Collects contact water from WRSF9 and DIS01 open pit.	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-31	CPD2 Collects contact water from Discovery laydown area	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEl-32	Local lake D-7	Operations, and Closure	Group 2	Bi-annually during open water

a) New proposed stations. The final monitoring stations need to be approved by the NWB during the draft Water Licence Amendment process.

b) Monitoring at the new stations would start once construction of the new infrastructure has been completed

Table 3.3: Approved Monitoring Parameters

Group	Parameters
1	pH, turbidity, hardness, total alkalinity, sodium, magnesium, potassium, calcium, chloride, fluoride, silicate, sulphate, total dissolved solids (TDS; calculated[a,b]), total suspended solids (TSS), total cyanide, ammonia nitrogen, nitrate, nitrite, phosphorus, orthophosphate, Total Metals (aluminum, arsenic, barium, cadmium, chromium, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, thallium, and zinc).
2	**Total and Dissolved Metals**: aluminum, antimony, arsenic, barium, beryllium, boron, cadmium, chromium, copper, iron, lead, lithium, manganese, mercury, molybdenum, nickel, selenium, silver, strontium, thallium, tin, titanium, uranium, vanadium, and zinc. **Nutrients**: ammonia-nitrogen, total Kjeldahl nitrogen, nitrate-nitrogen, nitrite-nitrogen, orthophosphate, total phosphorus, total organic carbon, dissolved organic carbon, and reactive silica. **Conventional Parameters**: bicarbonate alkalinity, chloride, carbonate alkalinity, turbidity, conductivity, hardness, calcium, potassium, magnesium, sodium, sulphate, pH, total alkalinity, TDS (calculated[a,b]), TSS, total cyanide, free cyanide, and weak acid dissociable (WAD) cyanide.
3	**MDMER parameters**: total cyanide, arsenic, copper, lead, nickel, zinc, radium-226, TSS, pH, total ammonia and temperature. **MDMER toxicity for the freshwater discharge**: Effluent volumes and flow rate of discharge, Acutely Lethality tests (Rainbow Trout and Daphnia magna) **MDMER toxicity for the marine discharge:** acute lethality three-spine stickleback.
4	Total arsenic, total copper, total lead, total nickel, TSS, ammonia, benzene, toluene, ethylbenzene, xylene, total petroleum hydrocarbons (TPH), and pH
Full Suite	Group 2, Total Petroleum Hydrocarbons, Turbidity. Non Acutely-lethal (Rainbow Trout and Daphnia magna) for discharge only.
Flow	Flow data-logger
Field measurements	Field pH, specific conductivity, dissolved oxygen, and temperature.

Type of bottle:
P.S.V.T.: plastic bottle, bag or glass bottle with Teflon cap
P, T: Plastic bottle or plastic bottle with Teflon cap
P.T.V.: Plastic bottle or glass bottle with plastic or Teflon cap
PPS: Sterile propyl ethylene bottle
VA: Clear or amber glass with aluminium or Teflon seal
VB: Amber glass (or clear glass covered with aluminium paper) aluminium seal of Teflon
VT: Clear or amber glass bottle with Teflon seal
Preservative:
AC: 0.1ml (100µl) of HCl per 100ml of sample
AcZn: 0.2ml zinc acetate 2N per 100ml of sample and NaOH 10N to pH >9
AN: HNO3 to pH <2
AS: H2SO4 to pH <2
E: 2.5ml EDTA 1.5% (p/v) per 100ml of sample if heavy metals are suspected
ED: 0.1ml diamine ethylene 45 mg/l per 100 ml of sample
EDTA: 1ml EDTA 0.25M per 100ml of sample
N: No preservative
NaOH: NaOH 10N to >12
TS: Sodium thiosulfate final concentration in the sample of 0.1% (p/v)

3.1.2 Compliance Monitoring Stations and Discharge Criteria

Further details of the specific CM stations and discharge criteria stipulated under the Licence are provided below. The compliance monitoring stations are to be discussed and approved by the NWB during the Water Licence Amendment process.

Dewatering Activities

All Waters from dewatering activities at Monitoring Program Stations MEL-D-1 through MEL-D-TBD shall be directed to Meliadine Lake or as other described in the Adaptive Management Plan and shall not exceed the quality limits presented in Table 3.5 as stipulated in Part D, Item 12 of the Licence.

Table 3.5: TSS and pH Criteria at CM Stations MEL-D-1 through MEL-D-TBD

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of Any Grab Sample
Total Suspended Solids (TSS) (mg/L)	15.0	30.0
pH	6.0 to 9.5	6.0 to 9.5

All surface runoff and/or discharge from drainage management systems, at the Monitoring Program Stations MEL-SR-1 to MEL-SR-TBD during the Construction/Operation of any facilities and infrastructure associated with the Meliadine Mine, including laydown areas and All-weather Access Road, where flow may directly or indirectly enter a Water body, shall not exceed the Effluent quality limits presented in Table 3.6, as stipulated in Part D, Item 18 of the Licence.

Table 3.6: Effluent Criteria at CM Station MEL-SR-1 to MEL-SR-TBD

Parameter	Maximum Average Concentration	Maximum Concentration of Any Grab Sample
Total Suspended Solids (TSS) (mg/L)	50.0	100.0
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	6.0 to 9.5	6.0 to 9.5

Site Water Collection System

Effluent discharged from CP1 at CM station MEL-14 shall be directed to Meliadine Lake through the Meliadine Lake Outfall Diffuser and shall not exceed the effluent quality limits presented in Table 3.7, as stipulated in Part F, Item 3 of the Licence and within MDMER.

Table 3.7: Effluent Criteria at CM Station MEL-14

Parameter	Unit	Maximum Authorized Monthly Mean Concentration	Maximum Authorized Concentration in a Grab Sample
Conventional Constituents			
pH		6.0 to 9.5[(a)]	6.0 to 9.5[(a)]
Total Dissolved Solids (TDS) (calculated)	mg/L	3,500	4,500
Total Suspended Solids (TSS)	mg/L	15[(a)]	30[(a)]
Nutrients			
Total Ammonia (NH_3-N)	mg-N/L	14	18
Total Phosphorous (P)	mg-P/L	2.0	4.0
Total Metals			
Aluminum (Al)	mg/L	2.0	3.0
Arsenic (As)	mg/L	0.3	0.6
Cyanide (CN)	mg/L	0.5	1.0
Copper (Cu)	mg/L	0.2	0.4
Lead (Pb)	mg/L	0.1[(a)]	0.2[(a)]
Nickel (Ni)	mg/L	0.5[(a)]	1.0[(a)]
Zinc (Zn)	mg/L	0.4	0.8
Others			
Total Petroleum Hydrocarbons (TPH) (mg/L)	mg/L	5.0	5.0
Radium 226[(a)]	Bq/L	0.37	1.11

[(a)] (MDMER, 2002)

The Discharge of Effluent from the Final Discharge Point at Monitoring Program Station MEL-14 shall be demonstrated to be non-Acutely Lethal as per test methods in the MDMER (GC 2002).

Saline effluent discharged at CM station MEL-26 shall be directed to Itivia Harbour through a submarine Pipeline and Diffuser and shall not exceed the effluent quality limits presented in Table 3.8, as stipulated in MDMER Schedule 4 (GC, 2002). The Discharge of Effluent from the Final Discharge Point at Monitoring Program Station MEL-26 shall be demonstrated to be non-Acutely Lethal as per test methods in the MDMER (GC, 2002).

Table 3.8: Effluent Criteria at CM Station MEL-26

Parameter	Unit	Maximum Authorized Monthly Mean Concentration	Maximum Authorized Concentration in a Grab Sample
Arsenic (As)	mg/L	0.3	0.6
Copper (Cu)	mg/L	0.3	0.6
Cyanide (CN)	mg/L	1.0	2.0
Lead (Pb)	mg/L	0.2	0.4
Nickel (Ni)	mg/L	0.5	1.0
Zinc (Zn)	mg/L	0.5	1.0
Total Suspended Solids (TSS)	mg/L	15.0	30.0
Radium-226	Bq/L	0.37	1.11
Un-ionized ammonia	mg-N/L	0.50	1.00

Itivia Marshalling Area

Surface water runoff from the bulk fuel tank storage areas is collected within the tank's secondary containment enclosures that are equipped with an HDPE liner; these are designed to contain petroleum products released due to spill events. Water collected in the secondary containment enclosures at CM station MEL-25 is discharged to land in a controlled manner according to the Licence.

All effluent being discharged from the secondary containment enclosures at the Itivia marshalling facility shall not exceed the effluent quality limits presented in Table 3.9, as stipulated in Part F, Item 5 of the Licence.

Receiving Environment

Receiving water quality monitoring is discussed in the Aquatic Effects Management Program (AEMP) and the Ocean Discharge Monitoring Plan (ODMP). Within the AEMP and ODMP are numerous monitoring programs: water quality, sediment quality, benthic invertebrate communities, and fish health and fish tissue chemistry.

Table 3.9: Effluent Criteria at CM Station MEL-25

Parameter	Unit	Maximum Authorized Monthly Mean Concentration	Maximum Authorized Concentration in a Grab Sample
pH		6.0 to 9.5	6.0 to 9.5
Total Suspended Solids (TSS)	mg/L	15.0	30.0
Benzene	µg/L	370	370
Toluene	µg/L	2	2
Ethylbenzene	µg/L	90	90
Lead (mg/L)	mg/L	0.1	0.1
Oil and Grease (mg/L)	mg/L	5 and no visible sheen	5 and no visible sheen

3.2 Event Monitoring

The Event Monitoring (EM) program addresses the site-specific monitoring that is required following any accidental release. A "release" may be caused by:

- Spills, including unidentified seepage (Spill Contingency Plan); or
- Emergencies (Risk Management and Emergency Response Plan).

The EM program is designed to verify whether contamination of the surface soil and/or any nearby receiving environment and active zone has occurred as a result of an accidental release of a hazardous material or contaminated water. Verification is done through monitoring of surface runoff and nearby receiving environment during and following remedial activity. It is anticipated that due to the presence of permafrost beneath most of the mine footprint (active layer app 1.5m in depth), there will be minimal impact to groundwater from surface spills or accidental releases.

The EM plan is developed on a site-specific basis subsequent to a spill or other incident, and considers the type of product spilled, the potential receptors and the potential for any remaining contamination after clean-up. The plan is coordinated by the Environment Department.

In the event of an accidental release, the water quality of any downstream receptor as well as an upstream reference (background) is sampled to determine severity of impact. Should the spill have happened over snow cover, as much contaminated snow will be removed as possible. Verification sampling would occur in the area after thaw to determine if the clean-up is complete or if further remediation is necessary. The specific parameters monitored as part of the EM program will depend on the nature of the spill and will be determined for the specific material released.

The EM program for a particular spill will cease upon obtaining satisfactory analytical results from the potentially affected areas or as required by regulators.

3.3 Adaptive Response Approach

Results of the water quality monitoring are reviewed by the Meliadine Environment Department. Chemical trends of constituents of interest are tracked for mine site monitoring and for the AEMP program. This allows for early detection of significant changes in water quality within the mine site prior to discharge. If triggers and thresholds, such as in the AEMP program, are exceeded in the receiving environment action plans are then implemented to ensure that environmental protection objectives are met.

An adaptive management program has been designed for the Meliadine Gold Mine to evaluate the monitoring data and provide a framework for action, if necessary. The program has two levels - a trigger level to compare the monitoring data against, and an action plan of mitigative measures for identified exceedances.

The adaptive management program is divided into two sections, one for parameters with regulated discharge criteria at specific monitoring locations, as specified in the Licence and by the Metal Diamond Mining Effluent Regulations (MDMER). The second section is for measured parameters for which no discharge limits have been identified in the Licence such as those in the AEMP or Environmental Effects Monitoring (EEM).

3.3.1 Adaptive Management Program for Regulated Discharge

Action Plan

In the case of an exceedance of a Licence limit or MDMER discharge limit, an action plan will be implemented. The adaptive management program requires that if one or more of the key monitored parameters exceed the respective limits, a staged sequence of responses will follow. Table 3.10 summarizes the staged adaptive action plan for the CM program for regulated discharge. Figure 3.4 is a logic diagram showing the decision path for evaluating analytical results for regulated discharges.

In addition to the mitigative measures listed above, a number of other possible alternatives are available to reduce or treat contaminants. These mitigation measures include:

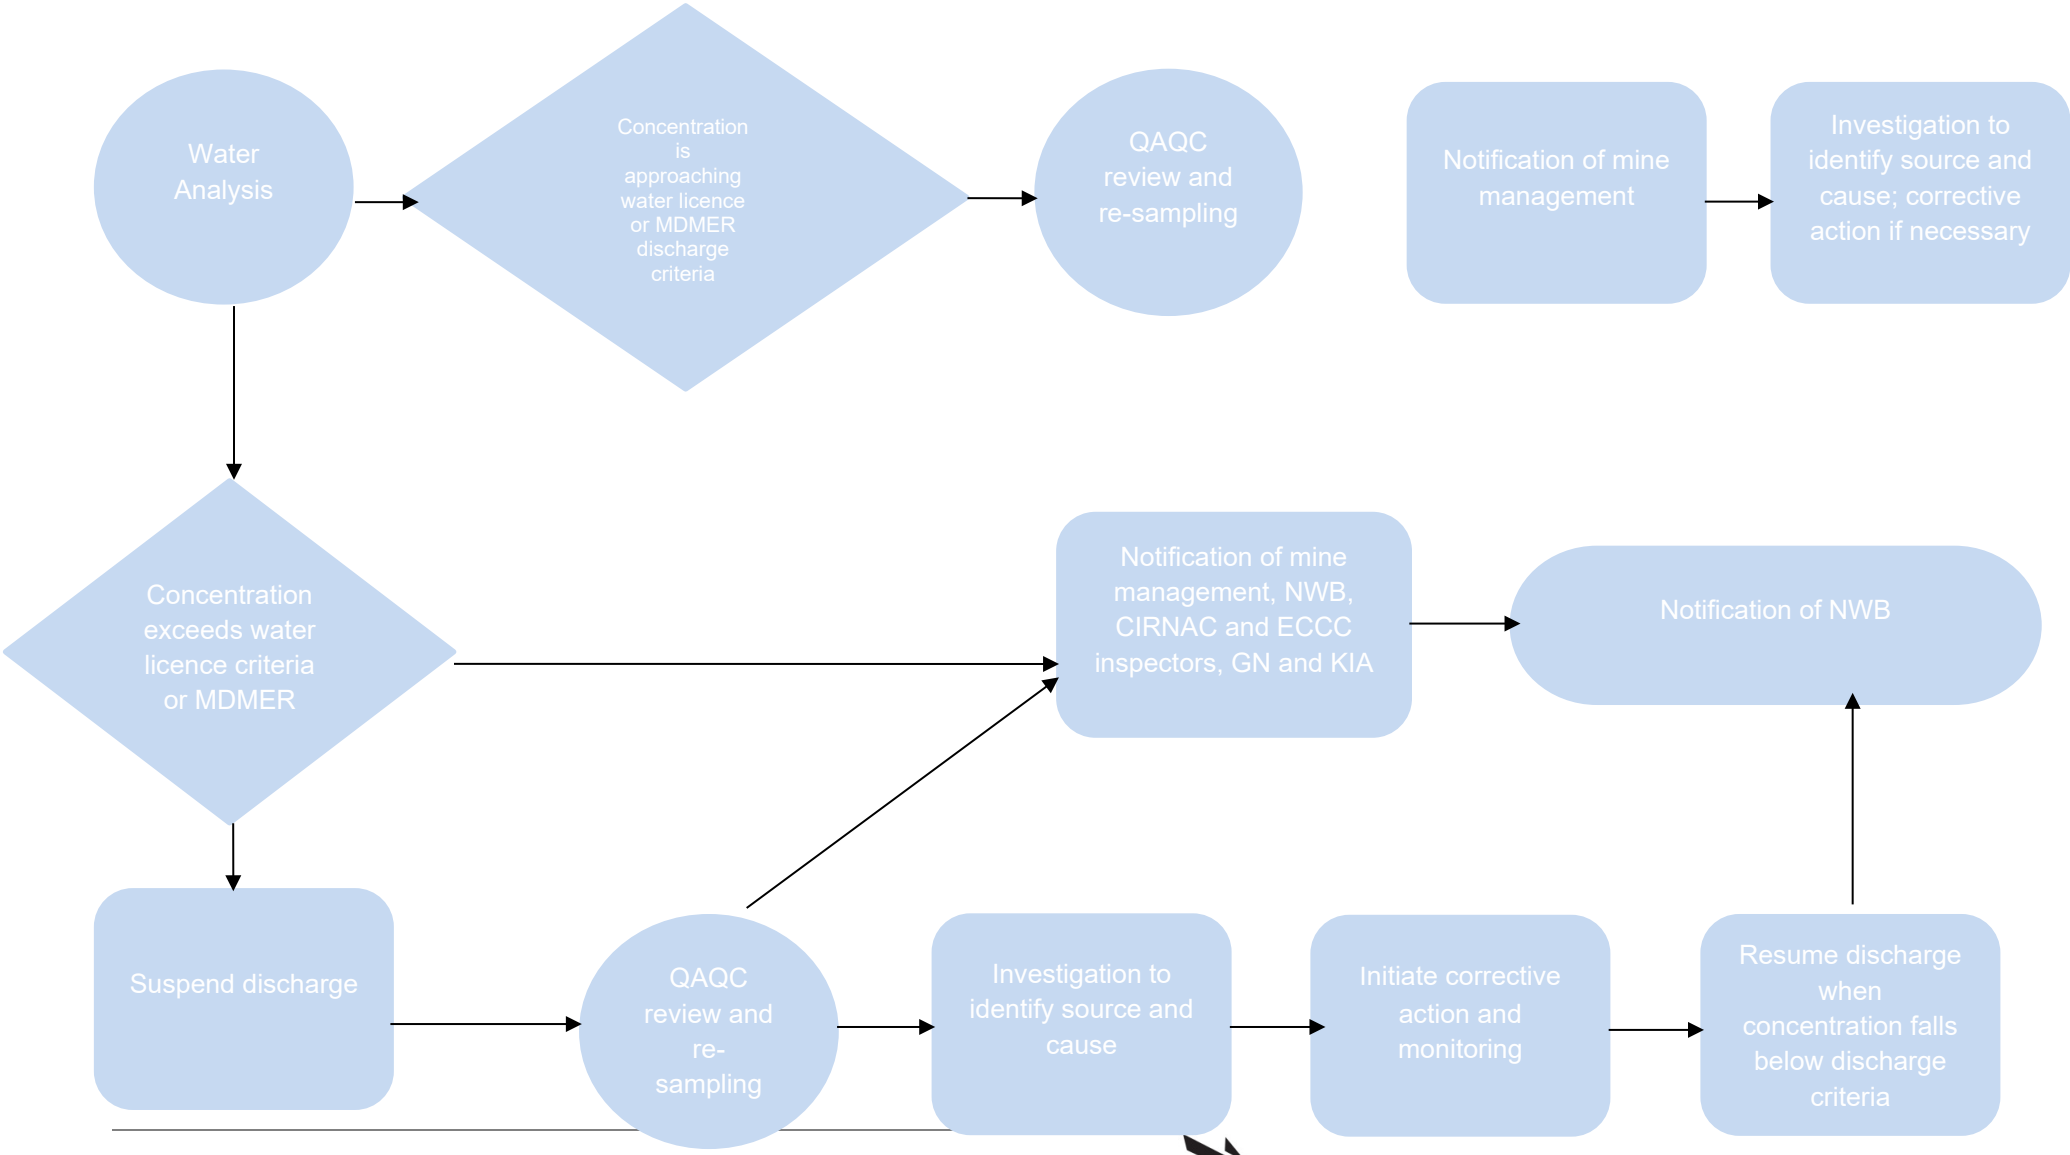
- Best management practices for sediment and erosion control would be employed to reduce TSS concentrations (i.e., flow control, sedimentation basin construction silt fencing, etc.; see Sediment and Erosion Management Plan);
- Addition of a coagulant for the reduction of TSS in pond water;
- Use of geotextile or re-armoring of banks to filter and reduce TSS in pond/ditch water;
- Deployment of absorbent booms and/or barriers within ponds to isolate surface petroleum hydrocarbon films for removal and/or treatment;
- Adjustments to on-site sewage treatment for the reduction of BOD and E. coli concentrations;
- Addition of lime to increase a low pH value or reduce metal concentrations;
- Removal of the offending source rock or the prevention of surface waters coming into contact with the offending source rock in the case of ARD; and/or

- Implementation of the Freshet Action Plan to proactively identify any issues around areas of concern; conduct additional monitoring, and control and contain seepage or movement of TSS on site.

Table 3.10: Action Plan for Regulated Discharge

Example	Action Plan
Exceeds water licence discharge criteria or MDMER	1. Suspension of discharge activities; 2. QA/QC review and analysis, and re-sample water at the particular location if necessary; 3. Notification of mine management (General Mine Manager or designate and Environment Superintendent, or designate) and the regulators: Nunavut Water Board, CIRNAC and ECCC inspectors, GN and the Kivalliq Inuit Association; 4. Investigation to identify possible source(s) and cause(s) of the exceedance; 5. Initiation of corrective actions or water treatment, and follow up monitoring; and 6. Resumption of discharge when concentrations are below the discharge criteria

Figure 3.4: Logic Diagram for Regulated Discharge



3.3.2 Adaptive Management Program for Non-Regulated Discharge

Aside from targeted monitoring studies (i.e., "Effects Assessment Studies") such as those following construction, the AEMP is the main program aimed at measuring and assessing potential impacts of contaminants in the receiving aquatic environment that are not regulated under MDMER or NWB. This program combines with the EEM required under MDMER.

The program is designed to take an integrated, ecosystem-based approach that links mitigation and monitoring of physical/chemical effects to key ecological receptors in the receiving environment. It addresses key issues identified in the Meliadine EA (i.e., mining-related activities with the potential to affect water quality, fish habitat and fish populations). Monitoring results are intended to inform the "adaptive management" process, supporting the early identification of potential problems and development of mitigation options to address them by comparing results to established threshold and trigger levels.

AEMP Action Level and Significance Threshold

The AEMP Response Framework links monitoring results to management actions, with the purpose of maintaining the assessment endpoints within acceptable ranges. It is a systematic approach for evaluating AEMP results and responding appropriately, such that potential unexpected effects are identified and mitigation is undertaken to reduce or reverse them, thereby preventing the occurrence of a significant adverse effect. This is accomplished by continually evaluating monitoring data and implementing follow-up actions (e.g., confirmation, further study, mitigation) at pre-defined levels of change in measurement endpoints (i.e., Action Levels). For purposes of this Response Framework, the following terms are used: effect, normal range, benchmark, Action Level, and Significance Threshold.

Action Level – Action Levels (Low, Moderate, and High) are pre-defined levels of environmental change that exceeds normal ranges or benchmarks, or results of statistical tests, or a combination of these. For example, exceedance of the normal range and approach of a benchmark by a water quality parameter in the near-field exposure area may be defined as the Low Action Level. A change that falls within the normal range of variability for the study area would not trigger an Action Level.

Significance Threshold – The Significance Threshold, for the purposes of an AEMP Response Framework, is a magnitude of change that would result in significant adverse effects. It is a clear statement of environmental change that must never be reached. The AEMP Response Framework is designed to prevent reaching the significance threshold for all assessment endpoints.

Action Levels

The proposed Action Levels are designed to provide an early warning indication of potential adverse effects to plankton and benthos (i.e., food for fish), to fish health, and to the assurance of normal ecological function (including water quality and sediment quality). The proposed Low Action Levels (Table 8-2 and 8-3) are designed such that changes of sufficient magnitude to trigger a Low Action Level response are reported, documented, investigated, and ultimately addressed (i.e., mitigation measures or operation

changes are implemented) before Significance Thresholds would ever be reached; if a Low Action Level is reached, Medium and High Action Levels (with response actions) are developed to provide further adaptive management guidance to the Mine to avoid reaching the Significance Thresholds. The type of management response taken after reaching an Action Level will depend on the type and magnitude of effect observed.

Further details on AEMP action levels and significance thresholds are provided in Azimuth (2022).

SECTION 4 • QUALITY ASSURANCE/QUALITY CONTROL PROCEDURES

Quality Assurance (QA) refers to plans or programs that encompass a wide range of internal and external management and technical practices designed to ensure the collection of data of known quality that matches the intended use of the data. Quality Control (QC) is a specific aspect of QA that refers to the internal techniques used to measure and assess data quality. Specific QA and QC procedures that will be followed during compliance-related sampling are described in Section 4.1 and 4.2 and are further detailed in the Quality Assurance/Quality Control Plan.

4.1 Quality Assurance

Quality assurance protocols are diligently followed so data are of known, acceptable, and defensible quality. There are three areas of internal and external management, which are described in the following three sections.

4.1.1 Field Staff Training and Operations

To make certain that field data collected are of known, acceptable, and defensible quality, field staff are trained to be proficient in standardized field sampling procedures, data recording, and equipment operations applicable to the monitoring program. All field work will be completed according to specified instructions and established technical procedures for standard sample collection, preservation, handling, storage, and shipping protocols. Thus, minimizing risk of operational errors.

4.1.2 Laboratory

To make sure that high quality data are generated, external CALA accredited laboratories have been selected for sample analysis. Accreditation programs are utilized by the laboratories so that performance evaluation assessments are conducted routinely for laboratory procedures, methods, and internal quality control.

The assay lab at the Mine site is not an accredited laboratory but will be used periodically for “real-time” results for some parameters like pH, total suspended solids, and Weak Acid Dissociable Cyanide. These results are for observational purposes and do not meet the standards of an accredited laboratory.

4.1.3 Office Operations

A data management system is utilized so that an organized consistent system of data control, data analysis, and filing will be applied to the monitoring program. Relevant elements will include, but are not limited to the following:

- All required samples are collected;
- sampling stations are clearly identified, and GPS coordinates collected and stored;
- chain-of-custody and analytical request forms are completed correctly (as per the Quality Assurance/Quality Control Plan);

- proper labelling and documentation procedures are followed, and samples will be delivered to the appropriate locations in a timely manner;
- laboratory data will be promptly reviewed once they are received to validate data quality;
- appropriate logic checks will be completed to ensure the accuracy of the calculations.

4.2 Quality Control

The QC component consists of applicable field and sample handling procedures, and the preparation and submission of two types of QC samples to the various laboratories involved in the program. The QC samples include blanks (e.g., travel, field, equipment) and duplicate/split samples.

Sample bottle preparation, field measurement and sampling handling QC procedures include the following:

- New laboratory supplied containers are used for sample collection. The bottles are either polyethylene plastic or glass, dependent on the specific parameter being analyzed.
- Sample bottles are kept in a clean environment, capped at all times, and stored in clean shipping containers. Samplers keep their hands clean, wear gloves, and refrain from eating or smoking while sampling.
- All bottles are identified with station number and date of collection.
- Where sampling equipment must be reused at multiple sampling locations, sampling equipment is cleaned appropriately between locations.
- Temperature, pH, and specific conductivity are measured in the field using hand held meters such as HACH test kit – 2100 Q Portal Turbidimeter (turbidity), Oakton PCS35 Meter (pH and conductivity), and Eureka Manta II (pH, dissolved oxygen and conductivity). The instruments are calibrated before each sample event to ensure optimal performance and record of the calibration are kept in a Calibration log. Maintenance procedures will be followed as set out by the supplier's operation manual.
- Samples are cooled to between 4 °C and 10˚C as soon as possible after collection and maintained at approximately 4 °C in a refrigerator until shipping. Care is taken when packaging samples for transport to the laboratory to maintain the appropriate temperature (between 4°C and 10˚C) and minimize the possibility of rupture. Where appropriate, samples are treated with laboratory-provided preservatives to minimize physical, chemical, biological processes that may alter the chemistry of the sample between sample collection and analysis.
- Samples are shipped to the laboratory as soon as reasonably possible to minimize sample hold times. If for any reason, samples do not reach the laboratory within the maximum sample hold time for individual parameters, the results of the specific parameters will be qualified, or the samples will not be analysed for the specific parameters.
- Chain of custody sample submission forms are completed by field sampling staff and submitted with the samples to the laboratory. Furthermore, an electronic copy is emailed to the laboratory upon shipping and a second electronic copy is maintained at the Mine Site for reference.

- Only staff with the appropriate training in the applicable sampling techniques conduct water sampling.

Quality control procedures implemented consist of the preparation and submission of QA/QC samples, such as field blanks, trip blanks, and duplicate water samples. These are defined as follows:

- Field Blank: A sample prepared in the field using laboratory-provided deionized water to fill a set of sample containers, which is then submitted to the laboratory for the same analysis as the field water samples. Field blanks are used to detect potential sample contamination during collection, shipping and analysis.
- Travel Blank: A sample prepared and preserved at the analytical laboratory prior to the sampling trip using laboratory-provided deionized water. The sample remains unopened throughout the duration of the sampling trip. Travel blanks are used to detect potential sample contamination during transport and storage.
- Duplicate Sample: Two samples collected from a sampling location using identical sampling procedures. They are labelled, preserved individually and submitted for identical analyses. Duplicate samples are used to assess variability in water quality at the sampling site. Duplicates are collected and submitted for analyses at approximately 10% of sampling locations. For smaller batches of samples (less than 10), at least one duplicate will be collected and submitted for analysis. Upon receipt of analytical results, the field/trip blank and duplicate analyses are verified for potential contamination and accuracy, respectively. Results are interpreted, and recommended actions are taken if necessary.

SECTION 5 • FLOW VOLUMES

Where applicable, flow volumes within the mine footprint will be tracked daily during periods of discharge. Flow volume measurements will be conducted using volumetric flow meters attached to applicable pumps or by applying pump time and capacity methods when flow meters are not possible (e.g., when a power source is not available). For applicable permanent pumping arrangements, such as fresh water pumping systems, flows will be measured using permanent in line flow meters. For periodic batch discharges, such as secondary containment sumps, portable flow meters or calculated pump time and capacity methods will be used.

The monitoring locations for water flow volumes, in accordance with Part I, Item 8, and Table 2 of the Licence, include:

- The volume of fresh Water obtained from Meliadine Lake at Monitoring Program Station MEL-11;
- The volume of fresh Water transferred to the Meliadine Lake during lakes' dewatering activities;
- The volume of fresh Water obtained along the road and Meliadine River for dust suppression activities;
- The volume of Effluent discharged from Final Discharge Point at Monitoring Program Station MEL-14;
- The volume of reclaim Water obtained from CP1;
- The volume of Effluent discharged onto tundra at Monitoring Program Station MEL-25 or transferred to CP1 from the Itivia Site Fuel Storage and Containment Facility; and
- The volume of Effluent and Fresh Water transferred to the pits during pits' flooding.

Flow volume measurements will be conducted to and from key containment ponds such as CP8 and SP6. The monitoring locations for water flow volumes will be defined during the Water Licence Amendment process.

SECTION 6 • REPORTING

Reporting of water quality results is to be conducted on two levels a) monthly and annually with the results of the monitoring program and per MDMER requirements and b) in response to exceedances.

6.1 Annual Reporting

An annual report is to be submitted to the NWB, Kivalliq Inuit Association, Fisheries and Oceans, Crown-Indigenous Relations and Northern Affairs Canada, Nunavut Impact Review Board, Government of Nunavut, and other interested parties by March 31st of the following year. The report is to summarize the following:

- Monitoring results for each sampling station during the year and for the life of mine (construction to end of closure); activities during the year at each station; and any exceedances at stations, the action plan applied to the exceedance, and the results of the action plan;
- Annual seep water chemistry results; including location of the samples, sources of the water collected, and results of chemical analyses of the samples;
- Receiving water monitoring results;
- Spills and any accidental releases; event monitoring activities conducted following containment, remediation, and reclamation; and the results of EM program, any exceedance in EM results, and the action plan following the exceedance;
- Measured flow volumes;
- Effluent flow rates, volumes and calculated chemical loadings following the requirements of MDMER; and
- Results of QA/QC analytical data.

6.2 Exceedance Reporting

Any measured concentration at a CM station exceeding a regulated discharge criterion stipulated in the Licence or MDMER will be reported to the NWB and Environment Canada and Climate Change upon receipt of the analysis. In addition, results of the action plan will be reported and, where necessary, mitigation options identified within 90 days after receipt of the analyses.

Exceedances in the concentration of a parameter in receiving water will be reported as specified in the AEMP and EEM – MDMER accordingly.

Plain Language Summary

AGNICO EAGLE

Plain Language Summary

The Meliadine Mine includes one underground mining area and open pits. While the complete Meliadine Mine plan was approved by Nunavut Impact Review Board (NIRB) with the issuance of Project Certificate No. 006, only certain mine components proceeded to the Type A Water Licence process at that time. This water balance and water quality model (WBWQM) has been updated to align with the Meliadine Mine Water Licence Amendment, which consists of supporting the completion of mining of all deposits permitted at the Meliadine Mine (Tiriganiaq, Wesmeg/Wesmeg North, Pump, F Zone, and Discovery).

The WBWQM fully incorporates the mine plan on a year-by-year basis, and includes annual changes to volume, area, and the characteristics of all mine infrastructure. In parallel, all water management infrastructure and activities are represented, with volumes and water quality predicted on a daily time-step. Two water 'types' are tracked in parallel within the model:

1. *Saline contact water* originating from underground dewatering and runoff from ore pads, saline waste rock storage facilities and a portion of the tailings storage facility; and
2. *Surface contact water* generated by the waste rock storage facilities, open pit walls, and other disturbed areas not related to underground mining operation.

The operation of ponds, pumps, water treatment systems and discharges to Meliadine Lake and Itivia Harbour are also represented within the model. Each mine component is assigned specific geochemical source terms and discharge concentrations to represent the predicted water quality for each component. These mine contact water flows are then transported within the model to collection sumps, and larger collection ponds where the various waters are mixed within the model prior to treatment and discharge. The model assumes that saline contact water is collected and treated to reduce ammonia and total suspended solids (TSS) concentrations and is subsequently discharged to Itivia Harbour. Surface contact water is treated for TSS, and discharged to Itivia Harbour, and then Meliadine Lake; discharge to Itivia Harbour is prioritized in the model, with the objective of minimizing discharge volumes to Meliadine Lake.

The model is run over a 100-year period to include the Operations, Active Closure, and post-Closure phases of the Meliadine Mine. The climate inputs used in the model reflect a variable climate condition, including the predicted climate change under the RCP4.5 scenario.

Under all conditions modeled, the mine water management infrastructure is shown to be capable of collecting, storing, and releasing the mine contact waters and saline waters in a controlled manner, according to the existing licenses and management plans. In addition, the WBWQM results indicate that the predicted Meliadine Mine volumes and water quality will remain within those presented in the 2014 Final Environmental Impact Statement (FEIS).

During the Operations phase, model predictions show that all parameters with the exception of ammonia are lower than their respective water quality guidelines in mine discharge and the main collection ponds. In the surface water collection ponds, elevated winter concentrations of ammonia are predicted at CP1 due to ice formation reducing the volume of water in the pond, while the loadings stay constant. In the saline contact water collection ponds, elevated concentrations of ammonia and arsenic are predicted during the Operations phase. Ammonia concentrations are predicted to be above discharge criteria to Itivia Harbour, and mitigation options (*e.g.*, treatment) are currently being investigated. No other exceedances of are expected in effluent discharged to Meliadine Lake and Itivia Harbour during mine Operations.

Water quality is predicted to improve when mining activities cease and site contact water and flows from Meliadine Lake are routed to the open pits, resulting in reductions in concentrations of parameters of potential concern. Loadings associated with the small volumes of contact water from the tailings storage facility and waste rock storage facility are predicted to maintain elevated concentrations of arsenic, ammonia, nitrate, and selenium in Saline Pond SP6 during post-Closure. Minor exceedances of chloride and ammonia are also predicted in one of the small pit lakes (WES04) and downgradient Lake J1, respectively. The above guideline prediction in Lake J1 occurs over a brief period (8 months) shortly after mine closure, and the above guideline prediction for min pit WES04 will not occur for several decades after mine closure if it is ever realized. In other mine pits and Lakes downstream of mine discharges, phosphorus is the only parameter with concentrations close to the water quality benchmark. The predicted phosphorus concentrations are similar to the baseline total phosphorus concentrations for non-contact areas and the elevated predictions are not related to mining activity.

1. Introduction

AGNICO EAGLE

1. Introduction

Agnico Eagle Mines Ltd. (Agnico Eagle) operates the Meliadine Gold Mine (Meliadine Mine), located 25 km North of Rankin Inlet in the Kivalliq region of Nunavut (Figure 1-1). The environmental assessment of the Meliadine Mine, resulting in the issuance of Project Certificate No.006 in 2015 by the Nunavut Impact Review Board (NIRB), included approval of a multi-phase approach to development, including mining of Tiriganiaq deposit using open pit and underground mining methods and mining of the Pump, F Zone, Discovery and Wesmeg deposits using open pit methods. Type A Water Licence 2AM-MEL1631 issued in 2016 was primarily for the Tiriganiaq deposit and associated infrastructure including, process plant, camp, tailings storage facility and waste rock storage facilities. It was always planned that the remaining approved 2014 mine components would be brought into the Type A Water Licence at a later date. This site-wide water balance and water quality model (WBWQM) has been updated to support the Meliadine Mine Water Licence Amendment, which consists of supporting the completion of mining of all deposits permitted at the Meliadine Mine (Tiriganiaq, Wesmeg/Wesmeg North, Pump, F Zone, and Discovery).

The mine plan represented in the updated WBWQM remains within the footprint and Meliadine Lake discharge volumes approved by NIRB in 2015.

Lorax Environmental Services Ltd. (Lorax) was retained by Agnico Eagle to update the WBWQM to represent the annual progression of the Meliadine Mine. The modelling effort described in this report supersedes several previous water balance and water quality models, described in the following technical reports:

- Golder Associates Ltd. (2020). *Meliadine Site Water Balance and Water Quality Model. Type a 2AM-MEL 1631 Water License Amendment*. Prepared by Golder Associates Ltd. for Agnico Eagle Mines Ltd. August 2020. 146 pp.
- SNC-Lavalin Inc. (2020). *Assessment of Water Balance and Water Quality Forecast around pond CP1 at Meliadine*. Prepared by SNC-Lavalin Inc. for Agnico Eagle Mines Ltd. 6 pp.
- AMEC (AMEC Earth & Environmental Limited). 2000. WMC International Ltd. *Meliadine West Gold Project. Water Balance Study 2000 Data Report*. Report Prepared for WMC International Ltd. December 2000.
- Golder (Golder Associates Ltd.). (2014). *Volume 7.0 Freshwater Environment. Final Environmental Impact Statement (FEIS) – Meliadine Gold Project*. Prepared for Agnico Eagle Mines Ltd. by Golder Associates Ltd. April 2014.

1.1 Model Objectives, Structure and Key Inputs

The site-wide water balance and water quality model (WBWQM) is built in the GoldSim v14 software platform and is set-up to run on a daily time-step. The primary modelling objective is the prediction of water and solute load transfers within the mine site, and to the receiving environment during all phases of the Meliadine Mine. The GoldSim WBWQM is configured to predict the transfer of water and solute mass (loadings) from mined and non-contact areas into the relevant water management facilities. Water volumes and loads are tracked on a daily time-step throughout the model, with all ponds, sumps, and open pits (and pit lakes) represented by 'pool' elements in GoldSim. The pool element allows the model to track multiple inflows and outflows simultaneously, without resulting in computational errors. All mixing is assumed to occur instantly, and all mass is conserved throughout the model (*i.e.*, no attenuation is applied to any of the parameters that are tracked).

Key model inputs are as follows:

- Meliadine Mine annual mine plan and associated sub-catchment areas;
- Daily climate data prepared by Okane Consulting (OKC) (with precipitation updated by Tetra Tech);
- Watershed model sub-module generated runoff series, including pond ice growth and melt formulations (described in Section 3.3);
- Estimates of runoff and net percolation based on OKC's landform modelling for the TSF and WRSFs (Section 3.6.1);
- Modelled base case groundwater inflows to underground workings (Section 3.7.3);
- Pump rates and treatment rates for water management infrastructure currently in place as of May 2021;
- Non-contact water quality (described in Section 4.3); and,
- Geochemical source terms (described in Section 4.4).

1.2 Report Structure

Following this introduction, the report is structured as follows:

- Section 2 describes the model input sources, including the mine plan, mine water management system and climate inputs;
- Section 3 summarizes the key inputs and assumptions for the site wide WBM and the modelling approach, including catchment delineation, the conceptual watershed

model, evaporation and ice algorithms, and mine component water balances (*e.g.,* pits, WRSFs, TSF, underground inflows), calibration exercise, and the active closure and post-Closure assumptions;

- Section 4 describes the water quality model, including key assumptions, model parameter list, background water quality, screening criteria and geochemical source terms;
- Section 5 summarizes the water balance model results;
- Section 6 summarizes the water quality model results; and,
- Section 7 provides a summary of key findings.

2. Model Input Source

2. Model Input Sources

2.1 Meliadine Mine Plan

The Meliadine Mine timeline is as follows:

- Meliadine Mine Operations: 2019 to 2031 (End-of-Mine [EOM]);
- Active Closure: 2032 to 2038; and,
- Post-Closure: 2039 onwards (modelled to calendar year 2119)

The EOM mine layout (2031), including all delineated sub-catchments (refer to Section 3.2) is presented in Figure 2-1. The full series of semi-annual layout maps are provided in Appendix B, and the annual water management wire diagrams are in Appendix C of this report.

2.2 Water Management Assumptions and Inputs

The mine water management plan is based upon two guiding principles: diverting clean (non-contact) water away from mine infrastructure where possible, and separating the two mine affected water types, as below and as shown in Figure 2-2 (Agnico 2020). The WBM replicates the Normal Operating Conditions as defined in the *Meliadine Mine Adaptive Management Plan for Water Management*.

Surface Contact Water: Surface contact water originating from developed areas will be intercepted and conveyed to the various collection ponds for temporary storage. The primary mine sources of surface contact water are the WRSFs, open pit dewatering, a portion of the TSF, laydown areas and facilities areas. All surface contact water is eventually conveyed to CP1. From CP1, surface contact water is routed through either the Effluent Water Treatment Plant (EWTP) or the Saline Effluent Treatment Plant (SETP) as necessary and discharged to the receiving environment. Discharge to Itivia Harbour is prioritized, with the remainder discharged to Meliadine Lake (Agnico Eagle, 2022). At the Discovery site, surface contact water will be managed in the Discovery contact water collection pond (CPD2) and routed to SP6 for discharge to Itivia Harbour.

PROJECT: **Meliadine Mine WB/WQM**

TITLE: Meliadine Mine Water Balance Layout - 2031

PROJECT #: A667-3

FIGURE: 2-1

P:\@Drafting\Meliadine\Drafting Figures\Autocad\Autocad Figures\NWB - Dec 2023\DWG\WBM\EOM WBM.dwg

Saline Contact Water: Saline contact water originating from the underground mine will be pumped to saline contact water ponds (SPs) on the surface, and then routed to either TIRI02 (prior to 2025) or SP6 (2025 onwards). In addition to underground dewatering flows, saline contact water is generated by the ore pad, saline WRSF, and a portion of the TSF. All saline contact water will be eventually conveyed from TIRI02 or SP6 to the SETP, where it will be treated for total suspended solids (TSS) and potentially ammonia (NH_3) prior to discharge to the receiving environment (Itivia Harbour).

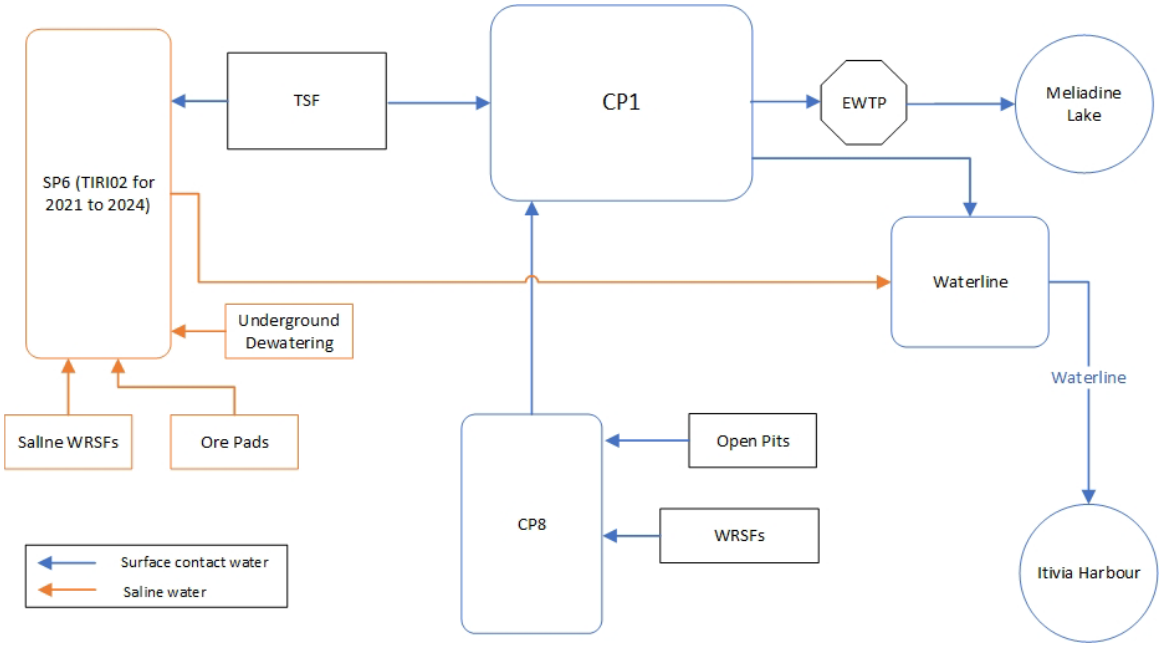

Figure 2-2: Conceptual site water management flow diagram for the Operations phase (simplified)

Additional water management assumptions are listed in bullet points below and in Table 2-1:

- Waterline management strategy for the Waterline as defined in Agnico Eagle (2023) is based on the adaptive management plan and to meet Term and Condition 25.
- The WBWQM has been refined to integrate feedback from key stakeholders, the KivIA in particular, with respect to optimizing the discharges to Itivia Harbour via the Waterline to reduce operational discharges to Meliadine Lake. The key assumptions related to treated effluent discharges are summarized in Table 2-1.
- Annual mine layouts and sub-catchment areas are presented in Appendix A.
- Water management infrastructure and design specifications are defined by the Water Management Design Basis Report (Tetra Tech, 2022a).
- Managed and passive flows are summarized by wire diagrams used in the WBWQM model and provided in Appendix B.

Table 2-1:
Meliadine Mine water balance and water quality model updates for Nunavut Water Board submission

Category	Component	Updates
Water Treatment and Discharge	Itivia Harbour Discharge	• Discharge window of June 20th to September 29th at 20,000 m^3/day beginning in 2025 when the Waterline becomes operational. • Saline water is stored in TIRI02 Pit prior to the Waterline becoming operational in late-June 2025. • Waterline remains available for first two years of Active Closure (2032 and 2033). • The saline effluent treatment plant (SETP) treats TSS to ≤ 15 mg/L and will treat NH_3 as necessary to meet end-of-pipe water discharge limits although no treatment efficiency is incorporated into the GoldSim model. • Waterline model logic has been modified in several ways to minimize discharge to Meliadine Lake. o Saline water stored in TIRI02 was prioritized for discharge in 2025 once the Waterline is available. o SP6 discharges via the Waterline are prioritized over discharges from CP1 but the amount of Waterline capacity reserved for SP6 varies from 25%-100% depending on time of year and pond level. Any unused capacity in the Waterline is utilized by water from CP1. o CP1 volume is targeted to remain below the maximum operating water level (MOWL) volume (742,075 m^3). When water levels need to be drawn down, water is first directed to the Waterline (if available capacity) or to the EWTP (and Meliadine Lake).
	Meliadine Lake Discharge	• Discharges from CP1 to Itivia Harbour via the Waterline are prioritized and maximized over discharges to Meliadine Lake. • The EWTP has a discharge window of June 1st to October 7th at 22,000 m^3/day for the duration of mine Operations. • EWTP assumed to treat TSS to ≤ 15 mg/L.
Physical Mine Features	Open Pits	• Pit shell volume-elevation-curves (VECs) and spill points refined to reflect interactions with surrounding topography. • Pit wall runoff coefficient set at 0.50 based on monitoring data from Whale Tail Mine.
	WRSFs	• Update sub-catchment areas in model to reflect updated mine site layouts (Tetra Tech, 2022a) o Minor changes to WRSF footprints to respect setbacks with adjacent water bodies o Discovery WRSF repositioned to avoid gravity drainage to Lake W1 in Post Closure.
Geochemical Source Terms	Operations and Closure	• Source terms were updated to incorporate the following additional information and mine plan updates: o Average composition of WRSFS and TSF applied to each year of mine life. o Maximum TDS and metals concentration for UG from Lorax (2023) and WSP (2022) applied to each year of mine life. o Diffusive flux source developed for SP6 lake sediments.
Water Management	Operations	• STP discharges (299 m^3/day) and surface contact water collected in CP3, CP4, and CP5 routed to TIRI02 until SP6 is online in 2025, then routed to SP6 • SP6 MOWL set at 63.1 m from 62.7 m, resulting in an increase in total storage volume to 1.09 Mm^3 from 0.867 Mm^3. • Modelled underground inflows predicted in WSP Golder (2022) adjusted to reflect moisture entrained in ore and drilling brine re-circulation, based on operational monitoring data (Agnico Eagle, 2022c). This results in reduced underground mine dewatering rates. • Lake dewatering is not routed to CP1. This water will be managed through a separate TSS treatment system if required and discharged directly to Meliadine Lake. • Mine pits will passively flood once mining is complete in the pit and in any underlying underground mine workings with hydrogeologic connections.
	Closure	• Revised Post Closure routing for PUMP pits to maintain height of land between watershed A and watershed B. o PUMP04 to West-A8, PUMP03, PUMP02 and PUMP01 route to B4 • Modified Post Closure routing for WN01-B5 Lake Complex to maintain height of land between watershed A and watershed B. o WN01-B5 Lake to routes to B4 • TIRI04 directed to TIRI Pit Lake in Post Closure instead of WES01 pit complex. • WES04 (1 month) and PUMP01 (3 months) are dewatered to Itivia Harbour via the Waterline at beginning of Active Closure then flooded with Meliadine Lake water. • CP7 to be flooded with Meliadine Lake water during Active Closure • CP1 water routed to TIRI04 during Active Closure (beginning in 2034) at the same rate as it was routed to the EWTP during Operations. Once full, additional spillover flows routed to TIRI01 which merges with the larger TIRI lake complex.

2.2.1 Collection Ponds and Pump Rates

Surface contact water is collected and routed through a series of collection ponds, with the Meliadine mine infrastructure surface contact water routed to CP8, which is then transferred to CP1 prior to treatment and discharge. Saline contact water from the underground workings and saline WRSF is collected by saline ponds (SPs). The key surface water and saline collection pond areas and berms are summarized in Table 2-1, along with a summary of pond and sump design volumes and routing (Table 2-2 and Table 2-3), followed by the design pump rates associated with each pond/sump (Table 2-4). Pond volumes, operating criteria and pumping rates were provided by Tetra Tech and approved by Agnico Eagle.

Surface contact water generated by the Pump mine area is collected in CP9 (located in the footprint of the PUMP01 pit), before being routed to CP8. Runoff and interflow from WRSF6 are collected by SUMPP1 and SUMPP2, which also route to CP8 (Figure 2-3).

The primary surface contact water collection pond for the F Zone mine area is CP7, which collects pit dewatering flows, as well as runoff and interflow from WRSF7 via SUMPF1. CP7 is routed to CP8 (Figure 2-3).

At the Discovery mine area, pit dewatering is directed to CPD2, and runoff and interflow from WRSF9 is collected by CPD1 and routed to CPD2, prior to being trucked to the main Meliadine Mine site for management (Figure 2-3). The full Operations phase annual pit and underground mining and water management schedule is provided for reference in Table 2-5.

- = Pre-mining

2.2.2 Waterline

Currently, effluent is discharged to Itivia Harbour via trucks. The proposed Waterline (*i.e.*, the installation of an effluent waterline discharging to Itivia Harbour) will deliver effluent to Itivia Harbour via a diffuser. This model assumes that the waterline will be operational beginning in 2025. Actual operational dates will be defined in later iterations of the model and in alignment with Agnico Eagle construction schedule. The effluent treatment and discharge rates are as follows:

- 2020 - 2024 – underground mine dewatering is routed to TIRI02; and,
- 2025 – EOM in 2031 – discharge by Waterline to Itivia Harbour at a rate of up to 20,000 m^3/day, during open-water conditions from June 20 to September 29, or until consistent sub-zero temperatures are observed.

The guiding principle for discharge of site contact water (saline and surface) is to minimize the volumes discharged to Meliadine Lake to the extent practicable and maximize the discharge of surface contact water to Itivia Harbour via the Waterline, while still effectively managing the site saline contact water balance as outlined in the *Adaptive Management Plan for Water Management* (Agnico Eagle, 2023).

2.2.3 Discharge to Meliadine Lake

Currently, treated effluent from the EWTP is discharged to Meliadine Lake via a diffuser at a maximum discharge rate of 22,000 m^3/day. The allowable discharge period is constrained by lake ice cover and pipeline operational restrictions related to temperature and is assumed in the WBM to span approximately June 1 to October 7 of each year.

2.2.4 Consumptive Freshwater Uses

Consumptive freshwater uses (*e.g.*, paste plant, potable water, mill makeup, dust control, *etc*.) are supplied by withdrawal from Meliadine Lake, and are not included as direct inputs to the water balance model, as this additional water is already incorporated in various components of the mine water balance, such as seepage from placed tailings and paste backfill bleed water reporting to underground workings.

2.2.5 Sewage Treatment Plant Discharge

The sewage treatment plant (STP) is rated for a treatment rate of 299 m^3/day, and discharges to CP1. Estimated water use per person is 250 L/day, and camp capacity will be 800 persons, which equates to a total inflow to (and thus treated discharge rate from) the STP of 200 m^3/day, routed to CP1. During the active closure phase, the STP will operate for 6 months of the year (May to October), with a camp capacity of 75 persons.

2.2.6 Lake Dewatering

To accommodate construction of mine infrastructure, it will be necessary to dewater multiple lakes located within the Meliadine Mine FEIS footprint. Lakes are dewatered in the year prior to the associated mine infrastructure coming online. The upper 50% of lake volume is expected to contain low levels of TSS, and thus will be discharged to the receiving environment without treatment. The lower 50% of each lake (by volume) is expected to contain higher levels of TSS that may potentially exceed discharge criteria, and therefore these volumes will be treated for TSS prior to discharge.

2.3 Climate Inputs

The climate input series spans a 100-year period from 2020 to 2119, and consists of daily minimum, mean and maximum air temperature and precipitation values derived from the Rankin Inlet climate station, and adjusted to reflect future climate projections under the RCP4.5 representative concentration pathway (OKC, 2022a; 2022b). This station was shown to be representative of climate conditions as measured by the Meliadine climate station and given the much longer and more complete record at Rankin Inlet, this dataset was used to represent climate conditions at the Meliadine site (OKC, 2022a; 2022b).

Mean annual precipitation in the RCP4.5 input series over the Operations period is 412.3 mm, and on a monthly average basis, precipitation ranges from lows of approximately 18 mm in January and February, to an annual maximum value of 59 mm in September. While typically snow falls in all months except July and August, the higher precipitation received during the summer months results in an average annual split of 64% snow/36% rain. The annual average air temperature is -10.4°C, with minimum and maximum mean temperatures of -34°C in January and 11°C in July, respectively (Table 2-6; Figure 2-4).

Table 2-6:
Average monthly climate conditions at Meliadine Mine for the Operations Phase

Parameter	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Min. Temp. (°C)	-33.9	-33.7	-29.2	-20.4	-8.9	0.7	6.4	6.4	1.4	-7.1	-20.7	-29.1	-33.9
Avg. Temp. (°C)	-30.3	-30.1	-24.9	-15.9	-5.6	4.4	10.8	9.8	3.9	-4.5	-16.9	-25.3	-10.4
Max. Temp. (°C)	-26.7	-26.4	-20.6	-11.4	-2.3	8.1	15.1	13.2	6.4	-1.8	-13	-21.6	15.1
Precipitation (mm)	17.5	17.1	24.3	27.0	25.8	30.0	46.8	46.0	58.8	53.0	36.4	29.5	412.3

% Rain	0%	0%	0%	1%	15%	84%	100%	100%	94%	32%	1%	1%	36%
Snow (mm)	17.7	16.8	24.6	27.0	21.3	4.8	0.0	0.0	3.6	34.6	36.3	29.7	216.4
% Snow	100%	100%	100%	99%	85%	16%	0%	0%	6%	68%	99%	99%	64%

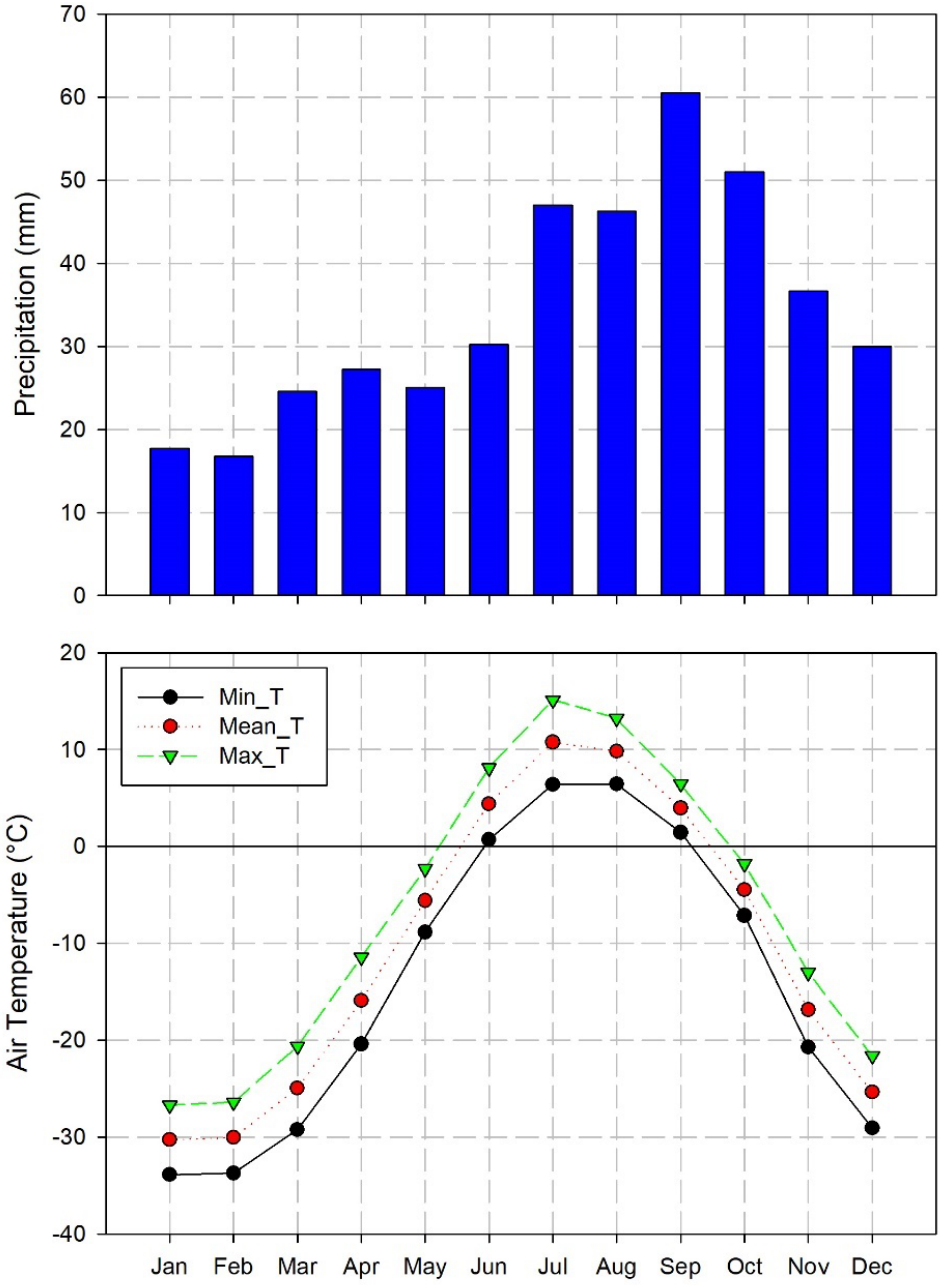

Figure 2-4: Mean monthly precipitation (top) and air temperature (bottom).

The Operations phase climate record contains a wide range of water-year (October to September) precipitation totals, ranging from a low of 348 mm in 2030 to a high of 517 mm in 2039, which coincides with near maximum mine site footprint (Figure 2-5). The Active Closure and post-Closure phase climate inputs show higher magnitude variability, ranging from a minimum water-year precipitation of 322 mm to a maximum of

639 mm, with a rising trend of approximately 10 mm/year, which is reflective of the climate change signal incorporated into the RCP4.5 series (OKC, 2022a; 2022b). While it is typical to run model sensitivities using dry- and wet-year recurrence interval estimates (*e.g.*, 1:100-year values) and to distribute the precipitation according to a predefined monthly distribution, this approach can obscure the more relevant processes that can lead to upset conditions in the mine water management system, such as multiple wetter than average years in a row. To highlight this point, while 2005 was the wettest year on record, a two-year running total indicates that 2013 and 2019 both presented two-year total precipitation values within 10% of the 2005-06 total.

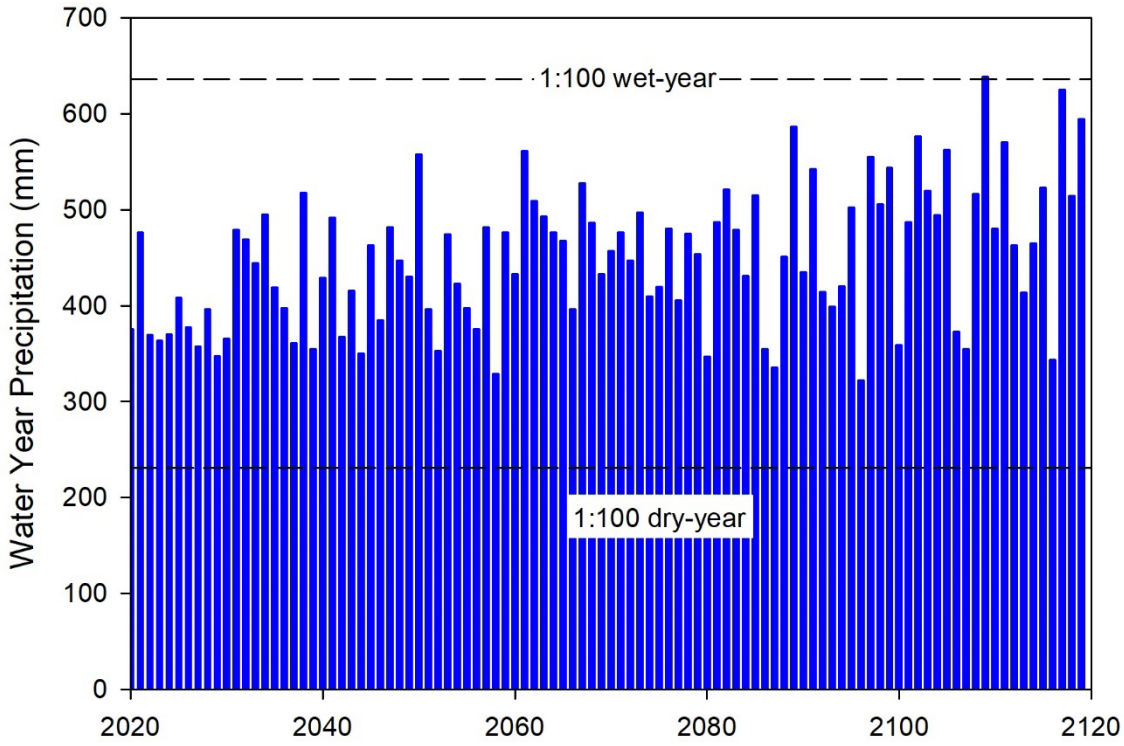

Figure 2-5: RCP4.5 water-year precipitation time-series, with 1:100 dry- and wet-year values indicated by dashed lines.

3. Water Balance Model Methods

3. Water Balance Model Methods

This section summarizes the approach, assumptions, conceptual model, and inputs used to construct the site-wide water balance model.

3.1 Approach and Assumptions

The site-wide water balance model (WBM) is set-up to represent the interaction of the local climatic regime with the mine plan and water management plan, and based on these interactions, to predict the volumes of various water types (*i.e.*, non-contact, surface contact and saline) requiring management, treatment, and discharge to the receiving environment. Given the potential for upset conditions to occur on sub-monthly time scales (*i.e.*, high magnitude rainfall events, rapid freshet), and the operational necessity of managing mine contact waters on a daily basis, the WBM is set-up to run on a daily time-step.

3.2 Sub-catchment Delineation

In order to generate water volume estimates ([volume (L^3)]/[time (T)]) from precipitation inputs ([depth (L)]/[time (T)]), the delineation of both the natural and mine-altered watershed areas (L^2) was necessary for modelling locations of interest in the Meliadine Mine plan. The annual mine plan time slices were provided by Agnico Eagle in .dxf file format, and the sub-catchment delineations for each mine component were completed in the AutoCAD2000 software package. The catchment areas by year are presented in Appendix B. Sub-catchment nomenclature was based on the water management feature that each mine component reports to via gravity drainage. For example, 'CP1-Natural' refers to the non-contact area drainage that reports to the CP1 pond. Given the large number of sub-catchments delineated (n>100), the sum of all sub-catchment areas were compared to the total mine footprint area by year to confirm that all areas were accurately represented within the WBM. This reconciliation exercise indicates that the total mine footprint area is within 0.7% of the total multiple sub-catchment areas incorporated into the WBM. This slight discrepancy is the result of rounding errors when reported to the nearest tenth of a hectare.

3.3 Conceptual Watershed Model

The streamflow regime at the Project site is strongly nival (snowmelt dominated), with freshet typically occurring between the end of May and mid-June. Additional peak flow events are currently common throughout the open water season (May through early October), driven by large rainfall events. Significant volumes of water may be delivered to the local watercourses in the span of 2 days yet may subsequently be followed by prolonged

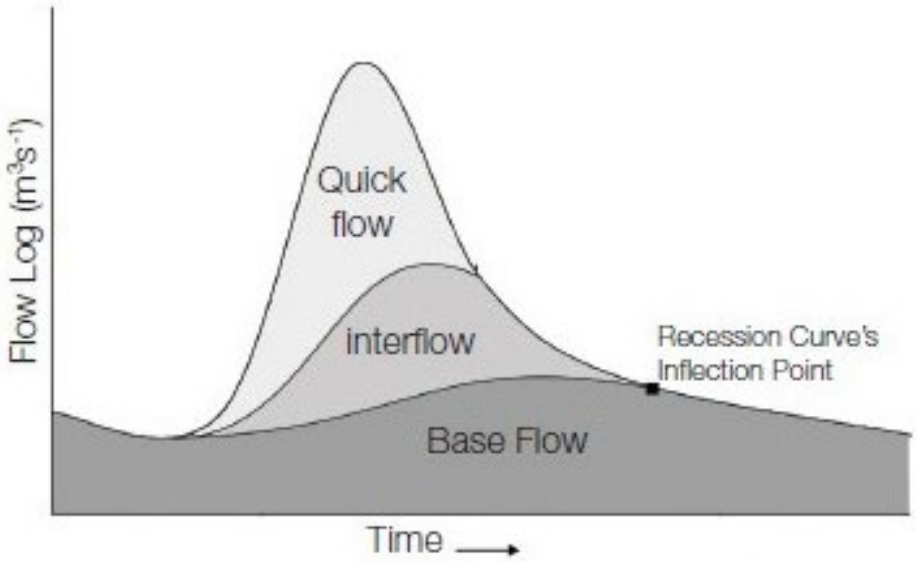
dry periods where surface flows diminish to the point where active layer discharge is the main determinant of streamflow (Golder, 2014).

As the open water season progresses, active layer melt can contribute increasing discharge volumes to local watersheds, expressed as an increasing baseflow signature throughout the summer. Finally, average winter temperatures are well below zero, and surface flow in all local watersheds is reduced to zero as lake outlets and stream channels freeze in during winter. A customized site-wide water balance model was constructed in the GoldSim modeling environment to allow the seasonally variable baseline conditions at the Project site to be accurately represented.

Figure 3-1 shows the commonly accepted components of streamflow in natural catchments with surface volumes of water reporting from with one of three signatures:

- *Quick flow* – generated by storm or snowmelt events and often resulting in peak flow events. For tributaries local to the Meliadine Mine, water contributed via this mechanism may report to creeks in less than 2 days' time;
- *Interflow* – this refers to the lateral movement of infiltrated meteoric water through the shallow overburden and active layer to the lakes and stream channels. Flow reporting to watercourses along this pathway is often referred to as vadose or unsaturated zone flow, and;
- *Baseflow* – the portion of surface flow derived from groundwater discharge. At the Project site, this flow component is understood to be negligible, and largely consists of water introduced via active layer melt.

The watershed model assembled to replicate the streamflow regime at the Project site incorporates this understanding of streamflow composition and response directly into the model architecture. Accordingly, surface runoff, interflow, active layer melt and baseflow, are all represented in the site wide WBM, which is a modified version of the Birkenes model. This model was developed as part of a research program to understand linkages between stream chemistry and flow in a small (< 1 km^2) catchment in southern Norway (*e.g.,* Christophersen and Seip, 1982; Seip *et al*., 1985). The modelling approach is depicted as a conceptual diagram in Figure 3-2.



Source: http://turmalina.igc.usp.br/img/revistas/guspsc/v13n1/a01fig07.jpg

Figure 3-1: Conceptual hydrograph showing runoff partitioning.

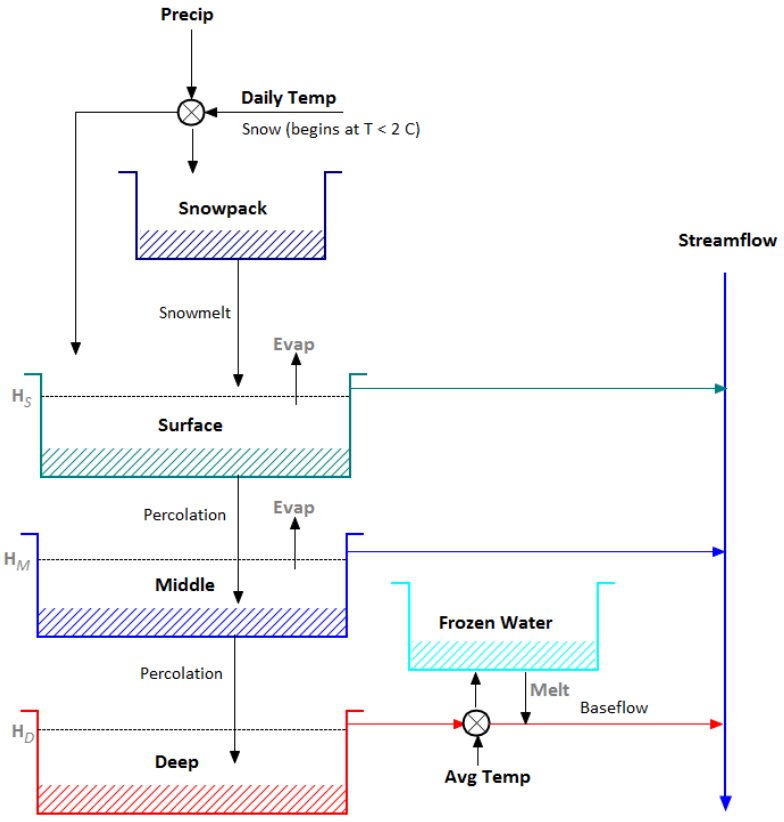


Figure 3-2: Schematic presenting an overview of the three-reservoir water balance model in conceptual format.

Conceptually, incoming precipitation is partitioned in the WBM watershed model between rain and snow based on air temperature thresholds. Incident precipitation is partitioned between snow and rainfall at the 0°C mean daily air temperature. Sublimation losses are set at a constant of 0.3 mm/day, which equals approximately 74 mm over the course of a winter season, or 32% of average annual snowfall. Rainfall is then directed into the Surface reservoir, which represents the quickflow runoff response shown in Figure 3-1. The volume of water routed from this reservoir to streamflow at each time-step is governed by a constant draindown parameter. As the reservoir volume decreases, the rate of outflow decreases, and thus the draindown curve approximates a negative exponential function.

Excess water contained within the Surface reservoir percolates at a rate proportionate to the Surface volume into the Middle reservoir, representative of the interflow runoff component in Figure 3-1. The proportions of Middle reservoir water routed to streamflow and to the Deep reservoir are governed by the same functions as for the Surface reservoir but have different parameter values to reflect the slower unsaturated flow response to infiltrating meteoric inputs. Figure 3-2 shows that when the Deep reservoir fills, slow recession flow from the reservoir reports to baseflow (and fractionally to channel ice formation in winter). Where channel ice has been modelled (based on air temperature) to freeze completely to bed during the winter months, streamflow is zero. In the model, evaporation is withdrawn from both surface reservoirs (Surface and Middle. The Deep reservoir is protected from evaporation (described in Section 3.4) and provides a source for winter baseflow and ice formation. Finally, snowmelt and melting of channel ice are indexed to the daily mean air temperature. Channel ice is assumed to melt at 20% of the snowmelt rate, due to its higher density and location in the shaded valley bottoms.

Additional information pertaining to the three-reservoir watershed model, including specific parameter values and assumptions are detailed in Section 3.7.1.

3.4 Potential Evapotranspiration

Most physically based evaporation models (*e.g.,* Penman-Monteith model, Priestley-Taylor formulation) used to estimate evaporation based on the site climate record require solar radiation, relative humidity, and wind speed as inputs – parameters that are difficult to generate synthetic estimates for due to topographical influences on wind speeds and data availability. To address this issue, the Hargreaves-Samani method (Hargreaves and Samani 1985) was used to develop estimates of potential evaporation, using the long-term daily record of minimum, average and maximum daily temperatures, as well as factors related to potential solar insolation (*e.g.*, latitude [63.08°] and day of year).

On an average annual basis, potential evapotranspiration is estimated to be 343.1 mm, varying from near zero in November through March, to an annual maximum of 98.5 mm in July (Figure 3-3).

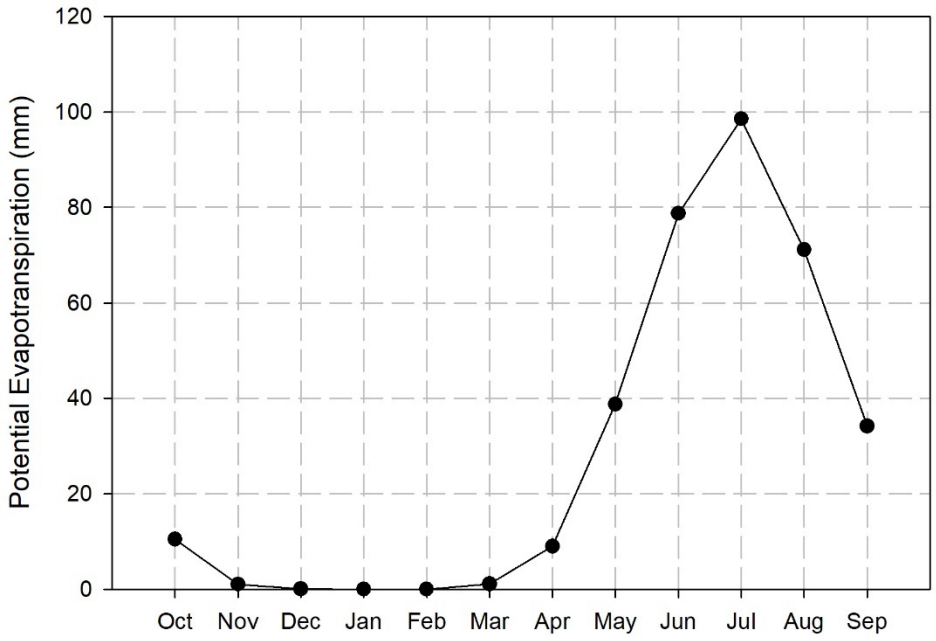

Figure 3-3: Monthly average potential evapotranspiration.

3.5 Lake Ice Growth

Lake ice in the Project area is extensive and drives cryo-concentration of parameters of potential concern (POPCs) within the collection ponds as the loadings remain constant while the effective free water volume is reduced in proportion to the volume consumed by ice growth. While the measured ice thickness at CP1 in 2020 (1.50 m in mid-February 2020) is relatively consistent with those measured during the baseline data collection period of 1998 to 2009 that returned average end-of-winter ice depths of 1.69 m ±0.27 m (Table 7.3-2; Golder, 2014a), the FEIS (2014; Vol. 7) notes that freshwater lakes in Nunavut are forming ice later, and ice thicknesses are decreasing over time. This is consistent with the projected warming due to anthropogenic climate change (Okane, 2021). As such, an assumption of constant end-of winter ice thicknesses would not allow the WBWQM to replicate the potential changes in ice thickness and therefore POPC concentrations in the collection ponds. To address this issue, air temperature-based ice growth and melt algorithms were incorporated into the WBM.

Ice growth is calculated using the Stefan equation, as described in Michel (1971) and Brooks *et al*. (2010; 2013).

$$h_i = \alpha D_f^{0.5}$$

Where:

h_i = peak winter ice thickness (mm)

D_f = sum of accumulated freezing days (air temperature < 0°C) over the water year

α = ice growth coefficient (mm °C$^{-1/2}$ d$^{-1/2}$)

Accumulated freezing days were calculated based on a running 31-day average air temperature following Brooks *et al*. (2013) to remove under-estimates due to periodic increases in air temperature during the spring. The value of α was set to 24.6, based on calibration to POPC concentrations in the CP1 pond in the winters of 2018/19 and 2019/20. This value is comparable to that suggested by Brooks (2010) of 23.7 for the Meliadine region, based on a cluster analysis of mean January temperature and precipitation for the Canadian arctic. The calibrated ice growth algorithm returned an average end-of-winter thickness of 1.68 m ±0.12 m over a 40-year test period based on the scaled Rankin Inlet historical climate record, displaying a decreasing trend over time of 3 cm/decade (Figure 3-4).

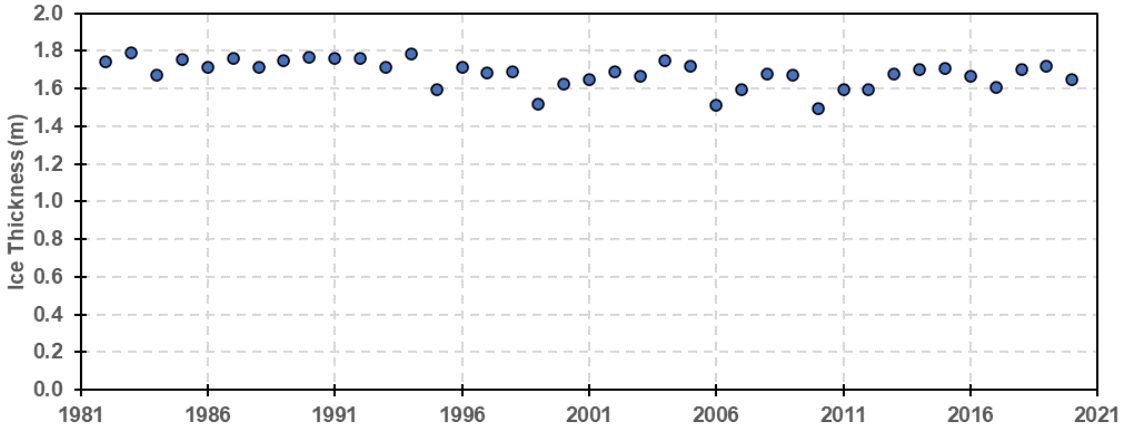

Figure 3-4: Modelled ice growth at the Meliadine Project

3.6 Lake Ice Melt

Lake ice melt is handled by the Bilello equation (Billelo 1980; Lotsari *et al*. 2019), which is based on the running 31-day average air temperature:

$$h_i = h_{max} - A * D_f$$

Where:

h_i = peak winter ice thickness (m)

h_{max} = maximum annual ice thickness (m)

A = ice melt coefficient (m/°C)

D_f = sum of accumulated melt degree days (air temperature > 0°C) over the water year

The value for A was set at 0.08 based on calibration to CP1 POPC concentrations in the spring of 2019 and 2020, resulting in melt durations of 8-12 days over the 40-year test model run.

3.6.1 Mine Component Water Balances

There are six categories of mine infrastructure responsible for the majority of POPC loadings:

- Open pits (Section 3.6.2);
- Waste Rock Storage Facilities (WRSFs; 3.6.3);
- Tailing Storage Facility (TSF; Section 3.6.4);
- Saline WRSFs (Section 3.6.5) and ore pads (Section 3.6.6); and,
- Underground dewatering (Section 3.6.7).

Underground dewatering rates were measured using pump totalizers for 2018-2022, and predictions of future underground inflow rates were generated using a 3D groundwater model (Golder, 2022). In addition to the above listed mine infrastructure, ore pads and saline WRSFs are also expected to contribute additional POPC loadings.

At the time of writing, limited information was available to constrain estimates of surface contact water volume generated by the TSF or WRSFs, so model calibration focused on replicating collection pond water balances and POPC concentrations as a proxy for the magnitude of source loadings from these landforms. The results of this calibration exercise (described in Section 3.7) were carried over to the predictive WBWQM to inform estimates of contact water generation from the TSF in particular.

Future estimates of surface runoff, infiltration, interflow, and basal seepage from the TSF and WRSFs were modelled by OKC (OKC 2022a; 2022b) for the RCP4.5 climate change scenario and provided at a daily time-step for direct input to the WBWQM. 2D thermal and water balance models were run for the TSF, ‘generic’ WRSFs and the Discovery WRSF. A summary of the key 2D model water balance outputs used as direct inputs to the WBWQM is provided in the following sections, and the reader is referred to the referenced reports for further detail on the conceptual models, inputs and assumptions used to generate these landform water balances.

3.6.2 Open Pits

Open pit runoff is represented by a constant runoff coefficient of 0.50 to reflect the limited potential for infiltration of meteoric inputs (Table 3-8). This runoff coefficient is based on pit sump pumping data from the Whale Tail Mine. With the exception of WN01, WES03 and PUMP04, none of the open pits are expected to advance into cryopeg, open taliks below lakes or the deep groundwater system beneath the permafrost. Groundwater inflows are assumed to be negligible, either due to the dewatering of the surrounding lakes and depressurization from the underground development (*e.g.*,); or, freeze-back of the pit slopes limiting seepage from closed taliks into the pits (Golder 2021a). Where pit development is expected to intersect shallow closed taliks, these will be dewatered prior to pit wall pushbacks.

All open pits are assumed to be completely dewatered for the duration of the Operations phase and filled over a 7-year period during the Closure phase with a combination of water pumped from Meliadine Lake, meteoric inputs to the pit footprint and surface contact water from CP1 (Table 2-5). The total pit void volume for all pits is approximately 73.5 Mm^3, with some variation between the Operations and post-Closure phases due to conjoined pit complexes forming a single pit lake once filled.

3.6.3 Waste Rock Storage Facilities

The following water balance components are tracked through the 2D models developed to predict the thermal and water balances of the WRSFs (OKC, 2022b; Figure 3-5):

- Runoff – the proportion of precipitation (*i.e.*, rainfall and snowmelt) that runs off the surface of the WRSF, with limited water: rock contact times;
- Infiltration – the proportion of meteoric water (minus runoff) that enters the landform through the surface;
- Interflow – lateral flow within the landform active layer. Ice lenses are predicted to form at the base of the active layer, limiting further infiltration into the landform, and interflow is expected to move along these ice layers and report to the toe of the landform.
- Basal Seepage – the basal layer of the WRSFs is expected to be permanently frozen from the time of material placement, therefore basal seepage is predicted to be negligible under all modelled scenarios.

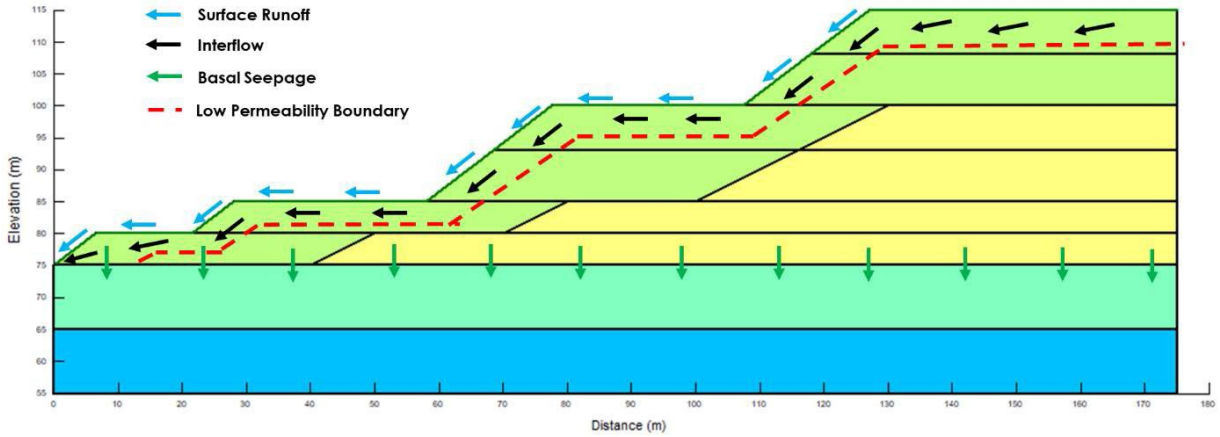

Figure 3-5: Conceptual cross-section showing water balance of Meliadine WRSFs (source: OKC, 2022b)

Due to the coarse-textured nature of the WRSFs, these landforms are expected to have high surface infiltration capacity. High infiltration rates are expected to lead to formation of ground ice at the boundary of the active layer over time. Over time, as this layer is established, infiltration will flow laterally along this interface within the active zone, resulting in interflow reporting to the toe of the WRSFs. The depth of this layer is influenced by the depth of the active zone, which in turn is influenced by the air temperature regime in the vicinity of the landform in question. Long-term (2090-2120), the active layer in the 'generic' WRSF is expected to be up to 5 m under the RCP4.5 scenario (OKC, 2022b).

Most waste rock that will be excavated as part of the Meliadine Mine is classified as NPAG outside of the Discovery deposit. The majority of the waste rock storage facilities associated with the Meliadine Project are NPAG (WRSF1, WRSF3, WRSF6 and WRSF7) and represented by the 'Generic WRSF' model outputs, summarized in OKC (2022b). The WRSF at Discovery (WRSF9) will contain PAG waste rock and is modelled separately to incorporate the impact of closure cover design Section 3.6.3.1.

Predicted surface runoff and interflow values were provided on a daily time-step, for the full 100-year model run period (2020-2120; Figure 3-6). By convention, fluxes into these landforms have a positive sign, and fluxes out of the landform are negative. On an average annual basis, 3% of mean annual precipitation (MAP) reports as runoff from the WRSFs (90^{th} percentile = 8%), and 13% reports as interflow (90^{th} percentile = 20%; Table 3-1). The RCP4.5 climate series displays a pronounced trend towards higher annual precipitation over time, with a long-term increase of 9.7 mm/decade. The coarse texture of the WRSF surface results in limited surface runoff (OKC, 2022b) and therefore the temporal trend in

runoff is insignificant. However, the trend towards higher interflow over time is similar to that of the precipitation inputs, at 7.1 mm/decade (Figure 3-6).

The detailed water balance model fluxes are input to the WBWQM on a daily time-step as depths, allowing these fluxes to be scaled by landform surface area as the WRSFs are built out.

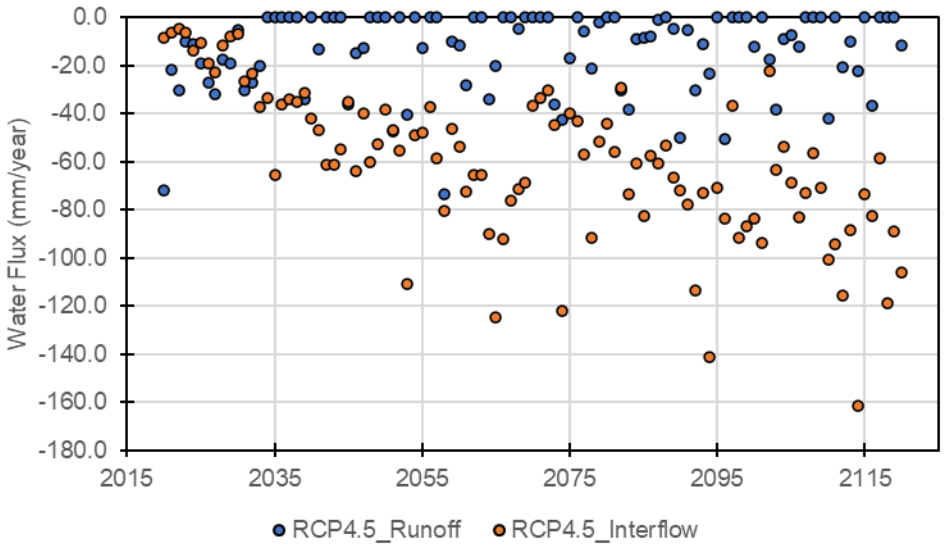

Figure 3-6: Generic WRSF annual runoff and interflow fluxes for the RCP4.5 climate scenario

Table 3-1:
Summary of generic WRSF water balance model results for the RCP4.5 climate scenario

Metric	Infiltration (mm/year)[1]	Runoff (mm/year)[2]	Interflow (mm/year)[2]	Runoff %MAP	Interflow %MAP
Average	59.7	-13.6	-59.9	3%	13%
Median	50.0	-8.5	-58.7	2%	13%
Mode	N/A	0.0	N/A	0%	N/A
90th Percentile	160.9	0.0	-22.3	8%	20%
Maximum	-89.5	-73.4	-161.2	19%	40%

[1]Fluxes into the landform are positive.
[2]Fluxes out of the landform are negative.

3.6.3.1 Discovery Waste Rock Storage Facility

In contrast to the other WRSFs, the Discovery WRSF (*i.e.,* WRSF9) will have a smaller proportion of its overall volume as overburden (Figure 3-7), and the majority of waste rock to be deposited in WRSF9 is classified as 'uncertain' or PAG (Section 4.4). Air

temperatures are predicted to rise at the Project site in all representative concentration pathway scenarios considered, including the base case RCP4.5 scenario. Rising air temperatures will drive the active layer deeper into the WRSF, and therefore the cover design must take the potential for future increases in active layer depth into account.

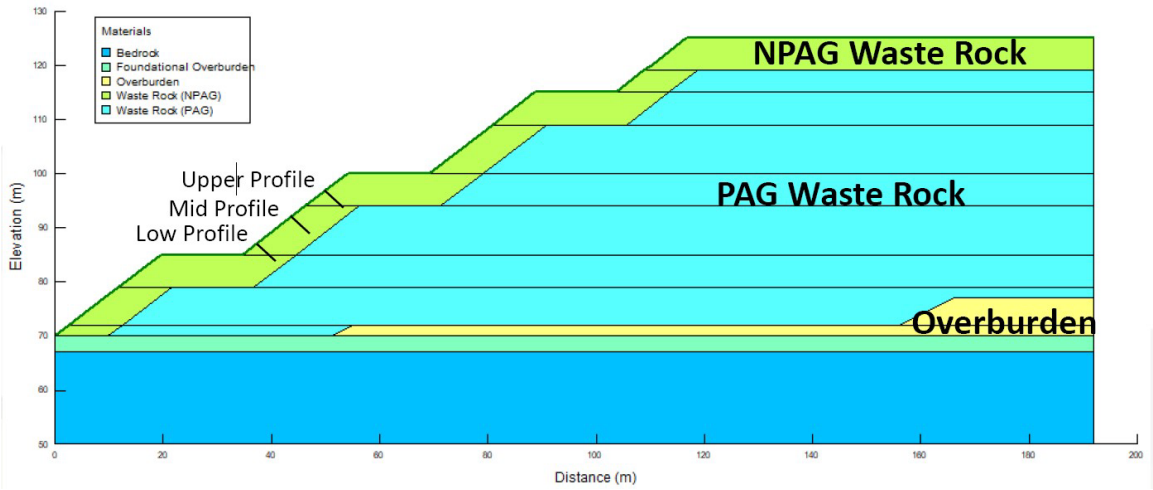

Figure 3-7: Discovery WRSF idealized cross-section (source: OKC, 2022c)

Given the higher potential for PAG/ML in WRSF9 relative to the other WRSFs, a 6 m NPAG/NML thermal cover has been proposed to maintain the bottom of the active layer above the material with PAG/ML potential (*i.e.*, maintain the WRSF core in a frozen state over the long-term).

The active layer at WRSF9 is expected to reach up to 6 m under the RCP4.5 scenario, reducing the likelihood of any interaction between infiltration beyond the proposed cover system.

On an average annual basis, 6% of MAP reports as runoff from WRSF9 (90th percentile = 14%), and 14% reports as interflow (90th percentile = 23%; Table 3-2).

The detailed water balance model fluxes are input to the WBWQM on a daily time-step as depths, allowing these fluxes to be scaled by landform surface area as the WRSFs are built out.

The RCP4.5 climate series displays a pronounced trend towards higher annual precipitation over time, with a long-term increase of 9.7 mm/decade. At WRSF9, both surface runoff and interflow are predicted to increase at a rate of 6.3 mm/decade and 8.0 mm/decade, respectively, over the full model run (Figure 3-8; OKC 2022c).

Table 3-2:
Statistical summary of Discovery WRSF (WRSF9) water balance model results for the RCP4.5 climate scenario

Metric	Infiltration (mm/year) [1]	Runoff (mm/year)[2]	Interflow (mm/year)[2]	Runoff %MAP	Interflow %MAP
Average	-27.0	62.7	-61.7	6%	14%

[2]Fluxes out of the landform are negative.

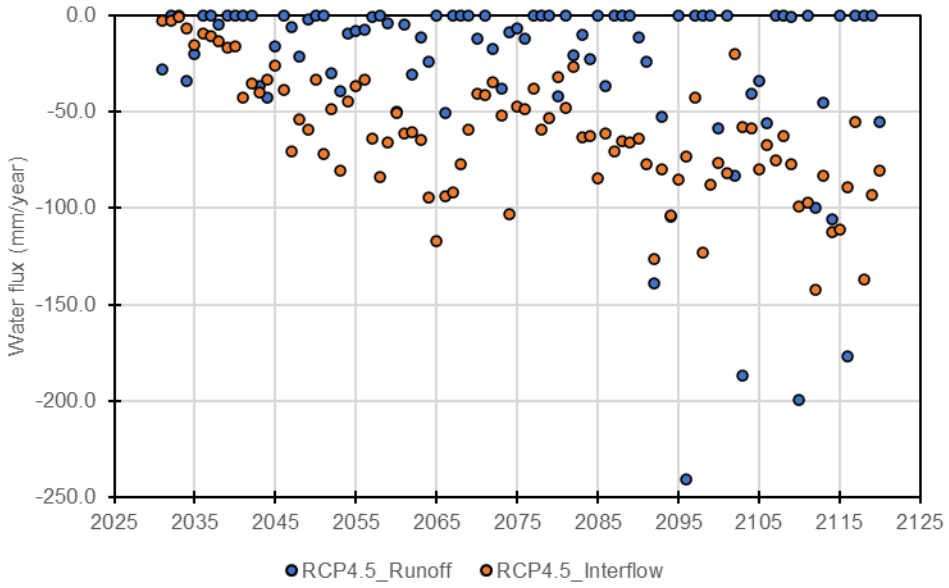

Figure 3-8: Discovery WRSF (WRSF9) annual runoff and interflow fluxes for the RCP4.5 climate scenario

3.6.4 Tailings Storage Facility

The Meliadine Mine tailings storage facility was modelled in a similar fashion to the WRSFs with the thermal and water balance represented by a 2D cross-section through the facility (OKC, 2022a), and the primary water balance components tracked separately (*i.e.*, infiltration, runoff, interflow, and basal seepage). A conceptual cross-section of the TSF with the key water balance components is provided in Figure 3-9, showing the placed tailings and the proposed waste rock thermal cover to be placed at the end of Operations. A majority of tailings generated as part of the Meliadine Mine are classified as NPAG. PAG tailings are limited to ore milled from the Discovery deposit. Outside of discovery,

approximately 18% of ore will be classified as Uncertain or PAG. Mitigation of ARD potential of tailings placed in the TSF will occur through encapsulation by non-PAG tailings and waste rock. Therefore, the design intent for this cover is similar to that for the cover proposed for the Discovery WRSF, in that the cover is intended to limit the depth of the active layer, and thus limit the degree to which meteoric water interacts with the tailings.

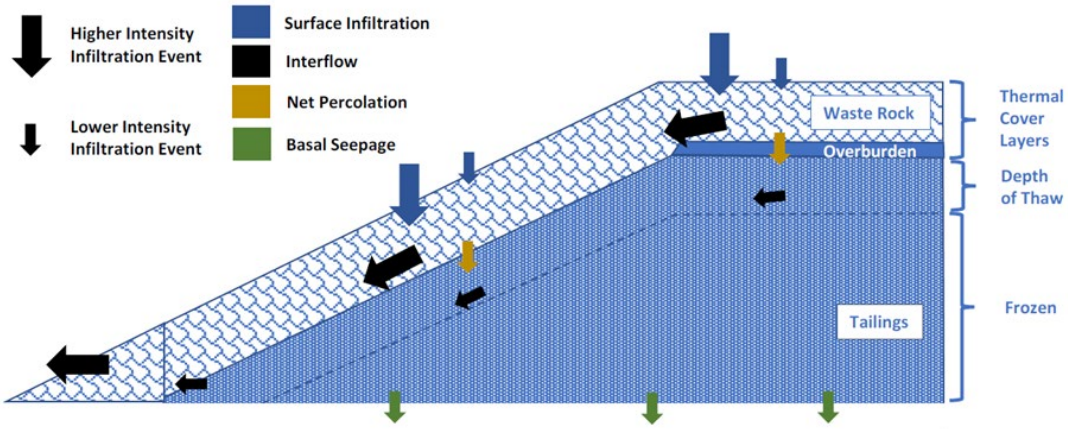

Figure 3-9: Conceptual cross-section showing key components of TSF water balance (source: OKC, 2022a)

The TSF cover will consist of an NPAG waste rock cover placed overtop of an overburden layer. It is expected that the high infiltration capacity of the waste rock, combined with the finer grained overburden, will result in a stark hydraulic break between the cover and the underlying fine-grained tailings. This break will promote lateral flow within the waste rock layer, limiting interaction with the underlying tailings, and resulting in the majority of unfrozen contact water reporting as interflow to the toe of the TSF.

Modelling results indicate that net percolation fluxes move vertically through the TSF during the Operations, Closure, and early post-Closure phases, eventually freezing back at depth. Similar to the WRSFs, the base layer of the TSF is expected to remain permanently frozen from the time of placement, resulting in negligible basal seepage fluxes.

TSF water balance model results were provided for the Closure condition (with cover), requiring that some simplifying and conservative assumptions be used for the Operations phase, prior to cover placement. Model outputs provided by OKC are representative of an uncovered condition at full TSF buildout, which results in conservative (*i.e.*, high) estimates of runoff and interflow for the early Operations phase prior to the TSF reaching the full thickness, and prior to progressive cover placement on the slopes during Operations. As for the WRSFs, all 2D model outputs were converted to depths (in mm)

and scaled by TSF area on an annual basis. The 90th percentile runoff coefficient of 0.05 was derived from these outputs and applied to meteoric inputs to generate surface runoff for the TSF (Table 3-8). Interflow was assumed to be equal to 20% of MAP. Snowmelt is assumed to be negligible during the Operations phase, as snow is removed from the TSF surface to allow geotechnical criteria for tailings placement to be met. Snow removed from the TSF surface is assumed to melt and be routed to CP1 via Channel 1. These Operations phase water balance assumptions were confirmed through the WBWQM calibration process, described in Section 3.7.

These Operations phase parameters are applied in the model until the end of 2031 (EOM), at which point the WBWQM switches over to using the 2D model daily output time-series as a direct input, representative of a covered Closure condition.

3.6.5 Saline Waste Rock Storage Facilities

Saline WRSF water balances are generated using the WRSF time-series of runoff and interflow as provided by OKC (2022b) and summarized in Section 3.6.2.

3.6.6 Ore Pads

Surface runoff from the ore pads is estimate using a simple runoff coefficient of 0.8 applied to the total rainfall plus snowmelt on a daily basis.

3.6.7 Underground Flows

Dewatering began in June 2018 as the Tiriganiaq underground was advanced, with dewatered volumes increasing steadily over time. Timing of peak dewatering does not appear to be consistent from year-to-year, however the highest dewatering rates typically occur between April and July. These volumes were input to the WBWQM during the calibration exercise. Underground dewatering is monitored using in-line totalizers with the monthly volumes is summarized in Table 3-3.

Table 3-3:
Monthly underground dewatering volumes (2018-2022)

Month	2018	2019	2020	2021	2022
January	0	2,718	534	9,021	8,928
February	0	1,629	2,906	8,148	8,064
March	0	1,297	10,393	9,021	8,928
April	0	2,697	29,313	8,730	8,640
May	0	4,063	16,773	9,021	8,928
June	2,417	5,737	11,628	8,730	8,640
July	10,337	8,064	7,909	9,021	8,928
August	7,711	5,417	5,255	9,021	8,928
September	9,615	4,304	5,446	8,730	8,640
October	3,453	47	4,002	9,021	8,928
November	3,346	245	3,093	8,730	-
December	891	814	6,233	9,021	-
Total	**37,770**	**37,031**	**103,484**	**106,215**	**87,552**

Underground dewatering volumes and TDS predictions associated with future mine development were predicted using a 3D groundwater model (Table 3-7; WSP Golder, 2022). The base case predicted inflows were subsequently adjusted to account for the calculated difference between the predicted and measured underground inflows over the 2020-2022 period in Agnico Eagle, (2022c). This is equivalent to an approximate ratio of 0.74 (measured: modelled). Further losses to ore moisture (assumed to equal 2% of ore mass are also applied, resulting in the adjusted values in Table 3-4. Owing to the elevated TDS of the groundwater system dewatering of all underground mines will be managed to SP6 and the saline water management system.

Table 3-4:
Predicted daily underground dewatering volumes for Meliadine Mine.
All values in m^3/day.

Year	Tiriganiaq	Wesmeg	Wesmeg North	Total
2024	373	53	18	444

3.7 Watershed Model Calibration

Calibration of the watershed model was conducted in two stages:

- To regional streamflow records collected by the Water Survey of Canada in representative small catchments; and,
- To measured water balance data from site collection ponds (water levels and volumes) over the 2018-2020 early operations period.

3.7.1 Regional Streamflow Calibration

The majority of flow data collected at the Project site reflects pumped transfers between collection ponds, with the runoff response from undisturbed areas contributing relatively lower flow volumes to the mine water collection system. Given the paucity of open channel flow data at the Project site, the watershed model described in Section 3.3 was calibrated to streamflow data collected in a small, lake dominated catchment located approximately 80 km north of the Project site. The majority of hydrometric records for the region represent large basins (> 1,000 km^2), which present a different streamflow response than would be expected of the small, lake dominated catchments of interest at the Project site. However, three seasonal hydrometric stations located on small (< 1 km^2) catchments were operated by the Water Survey of Canada (WSC) from 1978-1981 in the vicinity of Saqvaqjuac Inlet, located north of the entrance to Chesterfield Inlet (Table 3-5; Figure 3-10). The limited records available for these stations are reflective of the expected runoff response from undisturbed catchments in the Project area. These streamflow records are complimented by the long-term climate record from the Chesterfield station (2300700) operated by Environment Canada.

Table 3-5:
Representative regional hydrometric stations

Station ID	Station Name	Latitude (°)	Longitude (°)	Area (km^2)	Record Period
06OA002	Meadow Creek above Saqvaqjuac Inlet	63°38’45”	90°42’10”	0.16	1978 – 1981
06OA003	Far Creek at Far Lake Outlet	63°41’40”	90°40’30”	0.21	1978 – 1981
06OA004	P/N Lake Outlet	63°39’55”	90°40’00”	0.36	1978 – 1981

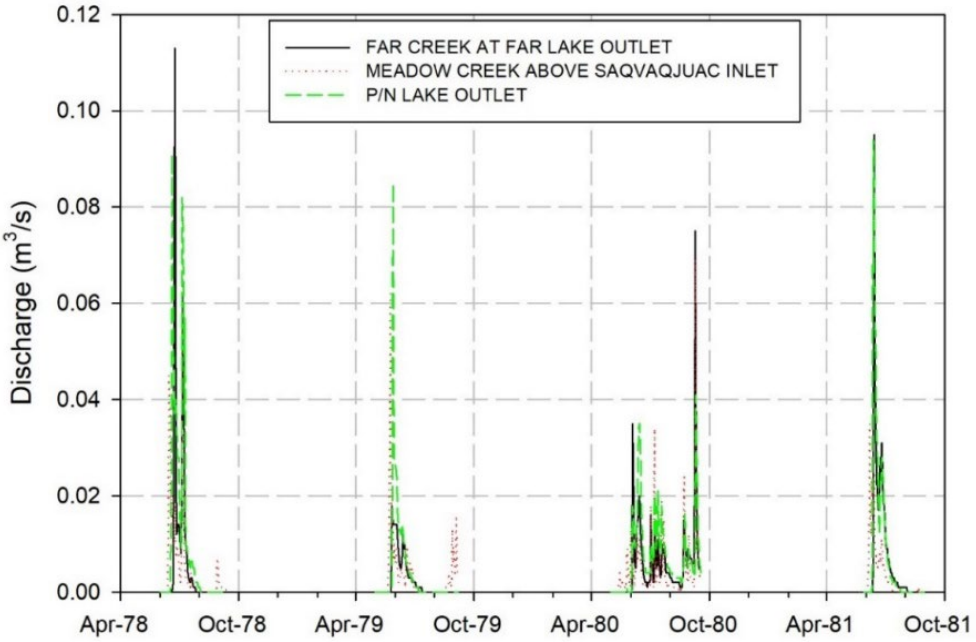

Figure 3-10: Regional streamflow data used to inform watershed model calibration.

The runoff response is consistent across all three catchments, with a strong and rapid freshet signature, followed by a rapid recession to low-flows, punctuated by periodic rainfall driven runoff events. Zero-flow conditions persist from late-September through to mid-May. Given the strong consistency between stations, the Meadow Creek above Saqvaqjuac Inlet station (06OA002; 0.16 km^2) was selected as the calibration target for the watershed model.

Calibration of the watershed model focused on replicating the timing and magnitude of peak flows in response to snowmelt and rainfall, as well as the shape of the draindown curve following these events, and the transition to zero surface flow conditions during the winter months. Model skill was evaluated by visual means, including streamflow time-series matching (Figure 3-11) and flow duration curves showing the probability of exceedance for a given flow value (Figure 3-12). This process was complicated by uncertain basin areas provided by the Water Survey of Canada, so for this stage of the calibration, the focus was placed on replicating the general regional discharge pattern. The tuned parameter set (Table 3-6) is reflective of the limited storage available in the active layer, and the rapid runoff response to snowmelt and rainfall that results. On an annual water year basis, the effective runoff coefficient (runoff depth/precipitation) averages 0.50, however this value ranges between 0.30 to 0.75 in response to the meteoric forcing.

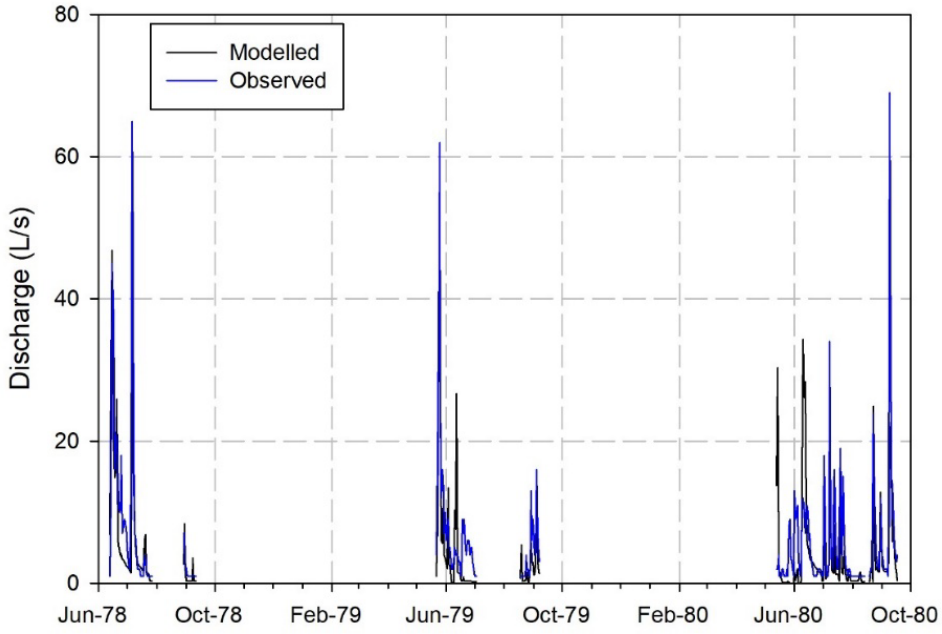

Figure 3-11: Modelled and measured streamflow at the Meadow Creek above Saqvaqjuac Inlet station (06OA002).

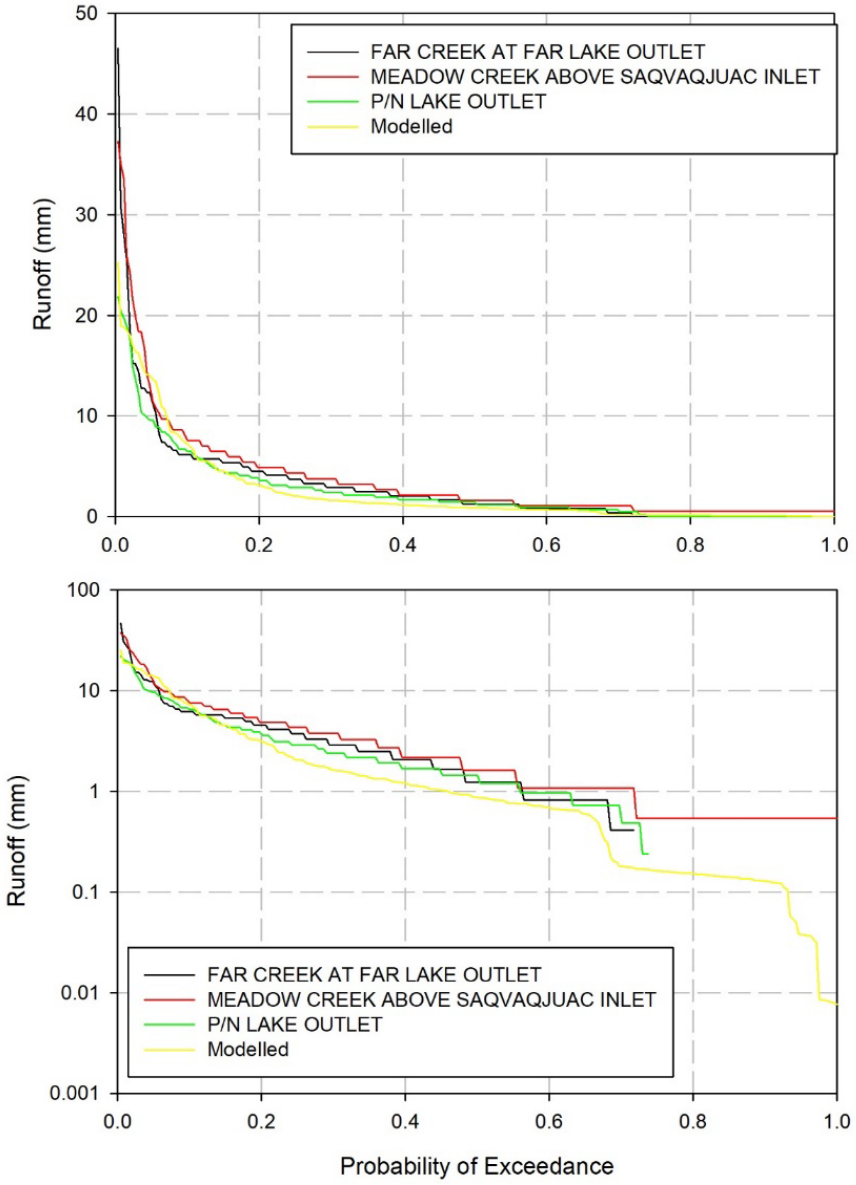

Figure 3-12: Modelled and measured regional runoff flow duration curves shown with linear (top) and logarithmic y-axis (bottom).

Table 3-6:
Watershed model calibrated parameter set

Bucket	Depth (mm)	Discharge (day^{-1})	Percolation (to next deepest bucket) (day^{-1})
Surface	1	0.46	50%
Middle	5	0.10	20%
Deep	9	0.07	-

3.7.2 Calibration to Collection Pond Water Balances

The second stage of the water balance model calibration focused on replicating the measured collection pond water balances over the early operations period of 2018-2020. As noted in Section 2.3, the early operation was characterized by large variability in annual precipitation, allowing the model to be calibrated to a wide range of water balance conditions over a short period.

Inputs to the calibration model included:

- Daily climate (min, mean and max daily air temperature and precipitation) scaled from the Rankin Inlet climate station and adjusted by Tetra Tech (OKC, 2022a);
- Incorporation of operational contact water routing, including pump rates, into the WBM (Table 3-10);
- Catchment and/or landform specific target runoff coefficients (Table 3-8);
- Annual sub-catchment delineations (Figure 3-13 and Figure 3-14);
- Calibrated watershed model described in Section 3.7.1;
- Measured water quality for key POPCs (described in Section 4.4); and,
- Measured monthly underground dewatering volumes (Table 3-3).

Of the three operating years, 2018 water year precipitation was close to the long-term median (415 mm and 420 mm, respectively), 2019 was the second wettest year on record (660 mm) and 2020 was the third driest year on record (264 mm). The maximum water year value is 4% higher than the 1:100 wet-year estimate of 636 mm, and the minimum water year value is 14% higher than the 1:100 dry-year estimate of 231 mm.

Pond volume measurements were provided by Agnico Eagle and were calculated from surveyed water levels and the pond specific storage-elevation curves. Pump rates between ponds (and to treatment plants) were also provided by Agnico Eagle, providing a control on inflows and outflows for each pond.

Table 3-7:
Surface contact water routing to CP1 – current conditions

Pond	Surface Contact Water Routing
CP1 – TSF	Culvert 1 → Culvert 18→ Culvert 2 → Channel 1 →Culvert 3→ CP1
CP3- TSF	Channel 3 → CP 3 (pumped) → H13 → Culvert 2 → Channel 1 → Culvert 3 → CP1
CP1-WRSF1	Channel 7→ Channel 8 → Channel 1 → Culvert 3 →CP1
CP5-WRSF1	Channel 5 → CP5 (pumped) → CP1
CP4-WRSF1	Channel 4 → Collection Pond 4 (pumped) → Collection Pond 1
CP6-WRSF3	Collection Pond 6 (pumped) → Collection Pond 1

Table 3-8:
Land Surface Types, Representative Runoff Type and Target Runoff Coefficients

Land Cover Type	Surface Runoff	Interflow	Baseflow	Target Runoff Coefficient
Disturbed[1]	x	x	x	0.50
Hard Surface (Ore Pads, Facilities Areas, Laydowns)[1]	x			0.80
Natural[1]	x	x	x	0.50
Tailings[2]	x	x		0.05 (Runoff); 0.20 (Interflow)
Open Water	x			1.0, minus evaporation
Waste Rock and Salt Rock Piles[2]	x			0.10 (Runoff); 0.0 (Interflow)
Open Pit Walls[3]	x			0.50

Notes:
[1]Average runoff coefficient provided, effective annual coefficients vary according to climate forcings.
[2]Upper bound of predicted values (90th percentile), reflective of years where runoff or interflow predicted to occur (mode is zero)
[3]Constant runoff coefficient

The CP1 collection pond is the primary surface contact water collection pond, and thus integrates all surface contact water managed at site (Table 3-10). Accordingly, the calibration focused primarily on first replicating the pond water balance over the 2019-2020 period, and secondarily on reproducing POPC concentrations for CP1. An initial QA/QC analysis was conducted to assess the degree to which site monitoring data were internally consistent. Specifically, a simple pond water balance was assembled in Excel to determine whether the recorded pump volumes, precipitation and evaporation fluxes could be used to reconstruct daily open water season fluctuations in pond volumes, as compared to the recorded pond volumes (calculated from water level surveys). The measured and reconstructed CP1 volumes match reasonably well in 2018, although monitoring data is sparse in the first portion of the open water season (Figure 3-15), and track very closely in 2019 (Figure 3-16) and 2020 (Figure 3-17), providing confidence in the pond volume monitoring data as a calibration target.

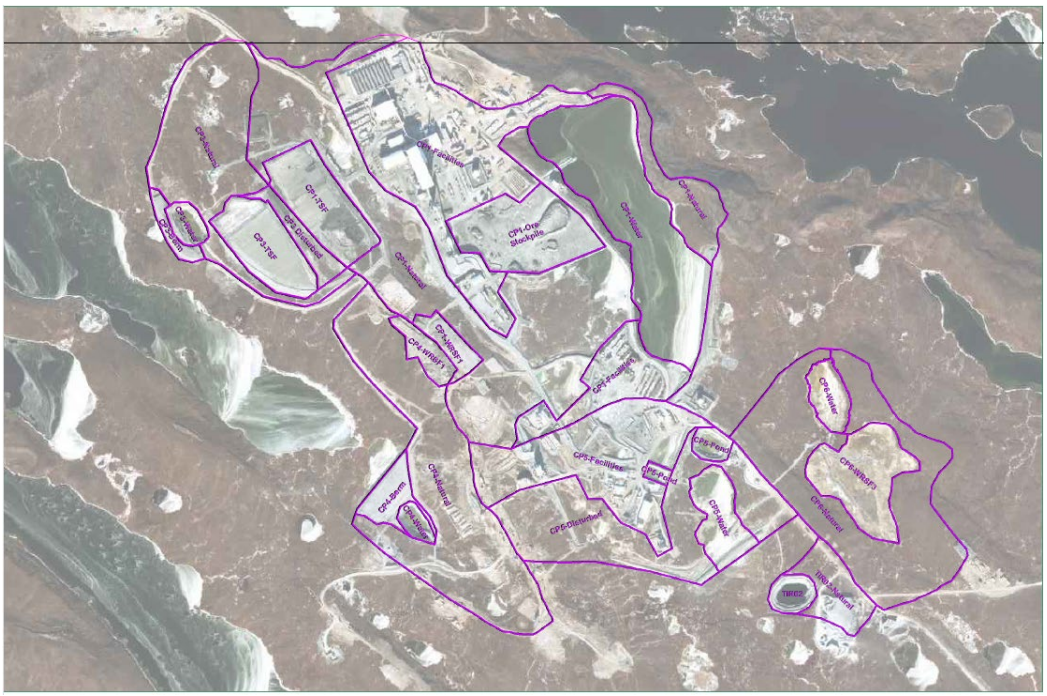

Figure 3-13: Mine site layout and catchment delineation for 2019 based on aerial photo from October 2019.

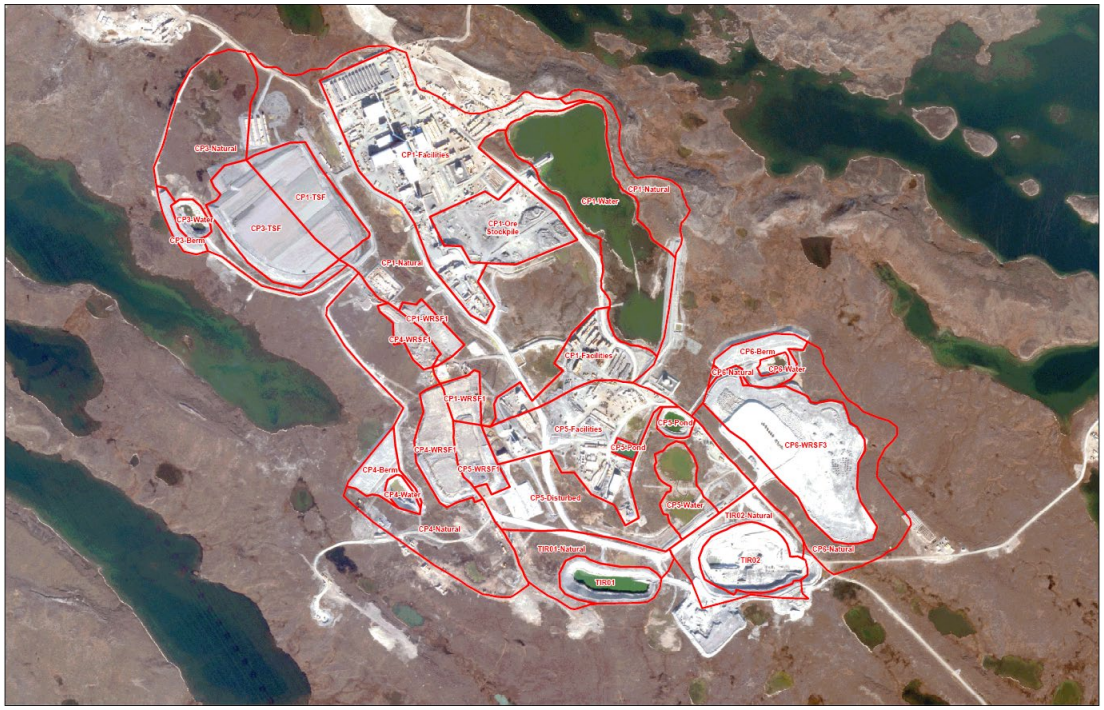

Figure 3-14: Mine site layout and catchment delineation for 2020 based on aerial photo from September 2020.

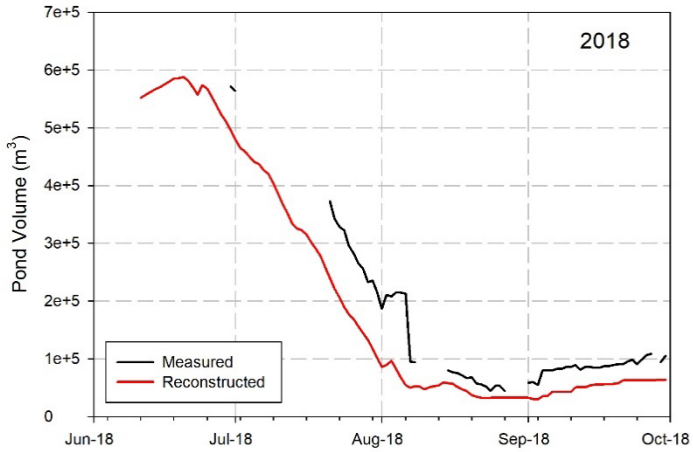

Figure 3-15: Measured and reconstructed CP1 pond water balance (2018).

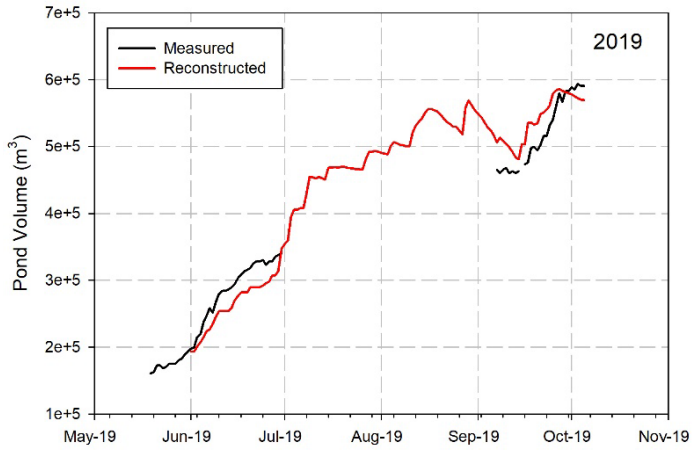

Figure 3-16: Measured and reconstructed CP1 pond water balance (2019).

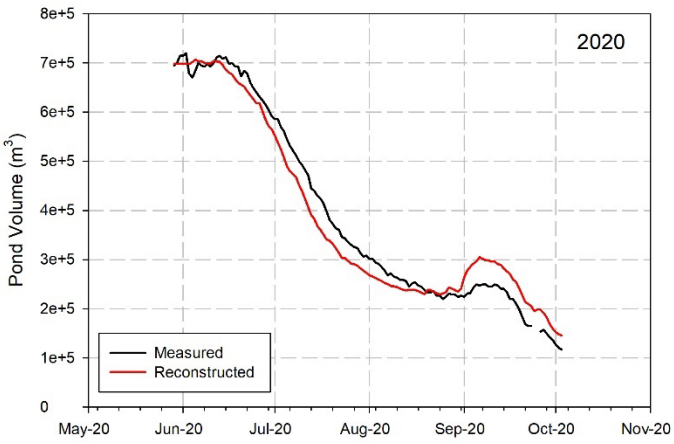

Figure 3-17: Measured and reconstructed CP1 pond water balance (2020).

In general, the calibrated water balance model replicates measured pond volumes well, accurately tracking the increase in volumes due to pumped inputs, freshet and rainfall generated runoff, as well as the effect of pumped withdrawals. The implementation of the ice formation and melt algorithm results in a divergence between modelled free water volume and surveyed volumes (based on water or ice level) over the winter of 2019-2020 (Figure 3-18). CP6 became operational in June 2020, and the modelled volume tracks measured volume with a high degree of accuracy (Figure 3-19), as it does for CP4 (Figure 3-21).

While the initial calibrated WBM replicated the variability in CP3 volume well, the magnitude diverged in June of 2019 and 2020, with the modelled values tracking significantly higher than the surveyed volumes. Due to uncertainty in the completeness of pumping records for this pond, adjustments were made to the assumed pumped outputs from CP3 in these two months to bring the modelled volumes in line with the measured values (Figure 3-20). Pump rates were increased in June 2019 and decreased in June 2020. The natural catchment runoff was also reduced by a factor of 0.5, which resulted in better water balance resolution, as well as reducing the modelled volumes in CP3, which resulted in a better fit to measured water quality (see Section 4.5).

The Meliadine Mine WBWQM predictions will be compared to site monitoring data on an annual basis per Water Licence condition Part E, Item 13. This will include comparisons to pond water level and volume monitoring data, effluent discharge volumes and water quality in the collection ponds. The model assumptions and calibrated parameter values will be revisited and updated as necessary on an ongoing basis to ensure that the model is providing accurate predictions.

3.8 Closure and Post-Closure Assumptions

The last year of mining in the Meliadine Mine will occur in 2031. The Closure phase commences the following year (2032), and include the following activities:

- Any saline waste rock from UG mine remaining at surface will be backfilled to underground workings;
- Ore pads, plant site, facilities areas and laydown areas will be reclaimed;
- Non-PAG waste rock covers will be progressively placed on the TSF and Discovery WRSF to limit the interaction of the active layer with the underlying tailings and waste rock, respectively;
- Pit filling proceeds over 7-years (2032-2038), consisting of all collected surface contact water routed from CP1, gravity drainage from the catchments surrounding the pits, and supplementary flows pumped from Meliadine Lake;
- All Operations phase water management infrastructure remains in place for this period (pumping, treatment, discharge pipelines to Meliadine Lake and Itivia Harbour), however, no discharges to Meliadine Lake are planned;
- The Waterline will be used to dewater the PUMP01 and WES04 pits in early Active Closure, expected to take 4 months and 1 month, respectively;
    - Once the WES04 pit is dewatered, it is filled with Meliadine Lake water by end-2032;
    - Once the WES04 and PUMP01 pits have been dewatered, CP1 will be dewatered for the remainder of 2032 and 2033, after which point CP1 water is routed to fill the TIRI02/04 pit.
- All remaining saline contact water is pumped from SP6 to the underground void spaces from October 2031 onwards.
    - SP6 is actively refilled by pumping water from Meliadine Lake during the open water season of 2032 (384,000 m^3).
    - It is assumed that once backfilled tailings and waste rock are accounted for, approximately 2.4 Mm^3 of void space will be available to store saline water. If additional saline contact water is present, it can be routed to an open pit, if necessary, where the higher density water would be expected to stratify. Note that the only remaining sources of saline contact water at EOM are limited volumes of salt rock encapsulated in the interior of WRSF1, WRSF-Ext1 and WRSF3, and elevated TDS interflow from the TSF.

- All contact water from WRSF7 is routed to the FZONE pit lake for the duration of Active Closure.

The active closure phase is expected to last for 7-years, with pit filling completed by end of 2038. The post-Closure phase begins in 2039, and is characterized by the following activities:

- All water management infrastructure (*i.e.*, channels, berms, ponds) will be decommissioned and pre-existing drainage patterns restored to the extent practical once surface contact water meets the relevant water quality criteria (expected to occur in winter of 2038/39);
- All contact flows revert to pre-mining drainage patterns where possible (Figure 3-22); and,
- Mine area discharges reporting to the nearest downstream lake are assumed to fully mix in that lake (Table 3-9).

Table 3-9:
Lakes receiving mine area drainage in post-Closure

Catchment	Lake Area (ha)	Volume (m^3)	Catchment Area (exclusive of Lake; ha)	Receives Mine Area Runoff From:
Lake CH6	135.6	2,324,000	553.6	Discovery Pit and WRSF9
Meliadine Lake[1]	12,618	116,900,000	42,250	CP1, CP2 and CP6
Lake A1	16.39	194,100	107.2	F Zone03

Note:
[1] Full mixing is assumed to occur at edge of IDZ (see Tetra Tech 2021a for details)

3.9 Post-closure flow paths

Several modifications to the pre-mining flow paths are proposed for the post-Closure period. Many of the pit complexes will develop into conjoined lakes, and in some cases, these will join with surrounding lakes (Figure 3-22).

The summary of these conjoined lakes is as follows:

- WN01-B5 (NORWES Pit Lake)
- TIRI01-TIRI03-WES01 (Tiri Pit Lake)
- WES02-WES03 (WES Pit Lake)
- FZONE01-FZONE02-FZONE03 (FZONE Pit Lake)

In addition to these combined pit lakes, it should be noted that TIRI02 is subsumed by TIRI04 during operations. This is not listed as a combined lake as the TIRI02 pit shell is

entirely contained within the TIRI04 footprint. In post-Closure, the water management objective is to ensure that pit lake water balances are maintained in a neutral or positive state (*i.e.*, only fluctuating in response to climate with no active management), and to route the majority of the remaining surface contact water emanating from the TSF and WRSFs to the 'A' watershed (Figure 2-4 and Figure 2-6). The general flow path (from NW to SE) is as follows:

- The NORWES Pit Lake flows into Lake B4;
- The PUMP02 Pit Lake drains to the PUMP03 Pit Lake, which in turn drains to the PUMP01 Pit Lake, with final routing to Lake B4;
- SP6 will drain into the Tiri Pit Lake;
- Tiri Pit Lake reports to A8-West Lake via the WES Pit Lake, along with the TIR02/04 Pit Lake and the WES04 Pit Lake (via Lake A8-East);
- These combined flows then report to Lake A7 via an engineered channel, and then into Lake A6;
- Lake A6 flows into the F ZONE Pit Lake, then to A1 and finally to Meliadine Lake;
- CP1 reports to Meliadine Lake, and Lake B4 receives minimal amounts of contact runoff from the PUMP01, 02 and 03 Pit Lakes, and WRSF6 before flowing into B2, and finally Meliadine Lake;

At Discovery, the DISC01 pit lake and WRSF9 will drain passively to Lake CH6 (Figure 3-23 and Figure 3-23).

4. Water Quality Model - Methods

AGNICO EAGLE

4. Water Quality Model – Methods

This section summarizes the approach, assumptions, conceptual model, and inputs used to construct the water quality model.

4.1 Approach and Assumptions

The water quality model is built upon the water balance model architecture described in Chapter 3, with water quality signatures assigned to non-contact (undisturbed) areas and mine infrastructure. Source term inputs to the WQM are based on either empirical observations from the operating mine site, data collected at analogue mine sites, or the results of various geochemical and metallurgical tests that have been undertaken to provide a basis for assigning likely future water quality associated with specific mine components.

Conceptually, modelled flows and associated source terms are combined in the GoldSim platform to derive predicted water quality estimates at key locations across the mine site (*e.g.*, ponds, pit lakes) and the two receiving environment nodes (Itivia Harbour and Meliadine Lake) throughout the phases of the Meliadine Mine. Concentrations of the POPCs listed in Table 4-1 are modelled for all mine water management ponds and sumps, open pit lakes and receiving environment nodes. WQM outputs are aggregated on a monthly time-step and Itivia Harbour discharges are screened against relevant water quality criteria described in Section 4.2.

Table 4-1:
Water quality model parameter list

Major Ions	Dissolved		Total	
TDS	D-Ag	D-K	T-Ag	T-K
NH_3-N	D-Al	D-Mg	T-Al	T-Mg
NO_3-N	D-As	D-Mn	T-As	T-Mn
NO_2-N	D-B	D-Mo	T-B	T-Mo
SO_4	D-Ba	D-Na	T-Ba	T-Na
T-CN	D-Be	D-Ni	T-Be	T-Ni
WAD-CN	D-Ca	D-P	T-Ca	T-P
	D-Cd	D-Pb	T-Cd	T-Pb
	D-Cl	D-Sb	T-Cl	T-Sb
	D-Co	D-Se	T-Co	T-Se
	D-Cr	D-Sr	T-Cr	T-Sr
	D-Cu	D-Tl	T-Cu	T-Tl
	D-F	D-U	T-F	T-U
	D-Fe	D-V	T-Fe	T-V
	D-Hg	D-Zn	T-Hg	T-Zn
		D-Ra226		T-Ra226

Both total and dissolved concentrations are predicted for end-of-pipe (EOP) discharges during operations. The total concentrations are calculated by assuming that mine discharge to Meliadine Lake and Itivia Harbour contains the maximum monthly mean concentration set by MDMER of 15 mg/L. In post-Closure, TSS levels in modelled waterbodies are expected to return to baseline concentrations. Owing to the minimal TSS present in the baseline environment, the model output assumes that total concentrations are equal to dissolved concentrations in this phase of mine life.

4.2 Parameter List and Screening Criteria

The parameters carried forward in the model consist of POPCs as defined by applicable guidelines and major ions that that contribute to TDS and hardness (Table 4-1). Both total and dissolved concentrations are tracked for certain model nodes (*i.e.,* EWTP, Waterline). Regulated parameters are defined in the following documents:

- 2020 Aquatic Effects Management Plan (AEMP) (Agnico Eagle, 2020a);
- Ocean Discharge Monitoring Plan (ODMP) (Agnico Eagle, 2020b); and,
- Type A Water License (2AM-MEL1631) for the Meliadine Mine.

The water quality model predictions are compared against applicable guidelines (Table 4-2) as a screening tool to identify POPCs. The specific screening criteria used for all mine phases are outlined below:

- During Operations, model predictions at the end-of-pipe (EOP) to Meliadine Lake (EWTP) are screened against effluent discharge limits outlined in the Type A Water Licence (2AM-MEL1631) for the Meliadine Mine and MDMER, while discharges to Itivia harbour are screened against MDMER only.
- During the Active Closure and post-Closure phases, model predictions at collection ponds, pit lakes, and natural waterbodies were screened as follows:
    - For waterbodies that are accessible to both aquatic and terrestrial life, generic water quality guidelines (CCME) and site-specific water quality objectives (SWQOs) adopted in the AEMP were used as the screening criteria.
    - For waterbodies listed under Schedule II as part of the Meliadine Mine Project (*e.g.,* B4, B7), model predictions were compared to both generic water quality guidelines for the protection of terrestrial life and aquatic life (CCME), although the listed waterbodies are not intended to support aquatic life given their Schedule II listing.

Table 4-2:
Water quality guidelines applied for comparison with model predictions during Operations, Active Closure, and post-Closure.

Parameter	**Unit**	**Operations**		**Active Closure and post-Closure**	
		NWB Water License	MDMER	[1]Water Quality Guidelines for the Protection of Aquatic Life	Water Quality Guidelines for the Protection of Terrestrial Life
		End-of-Pipe Discharge to Meliadine Lake	*End-of-Pipe Discharge to Itivia Harbour and Meliadine Lake*	*Collection Ponds, Pit Lakes, and Other Waterbodies (exclude those listed in the Schedule II application)*	*Collection Pond CP8 (Lake B4) and Saline Pond SP6 (Lake B7)*

Notes:
1. For waterbodies that are accessible to both aquatic and terrestrial life, generic water quality guidelines (CCME) and site-specific water quality objectives (SWQOs) adopted in the AEMP were used as the screening criteria. Site-specific hardness predicted at each node during Active Closure and post-Closure (2032-2119) was used to derive guidelines for parameters that are hardness dependent. The maximum pH (7.46) and lowest DOC (3.19 mg/L) measured at the MEL-01 monitoring station in 2020 were used to derive conservative guidelines for dissolved manganese and zinc.
2. The total ammonia (NH_3-N) guideline was determined conservatively by assuming a pH of 8 and a temperature of 15ºC.

4.3 Baseline (Non-contact) Water Quality Data

The baseline (unimpacted) POPC concentrations were calculated from the available monitoring data for the undisturbed non-contact areas. Median baseline concentrations are summarized in Table 4-3 to Table 4-8.

Table 4-3:
Median baseline major ions and nutrient concentrations for non-contact areas

4.4 Source Terms

4.4.1 Source Term Updates

The source terms developed for the 2023 NWB Application described in the *Meliadine Extension Water Balance and Water Quality Model Update* (Lorax, 2023) are applied to the current model scenario with minor updates as described below.

- The end-of-mine lithologic compositions presented in Lorax (2022) are used to calculate the geochemical source terms for the WRSFS and TSF. This source term is then applied to each year of Operations and Closure. Source term calculation is otherwise identical to that described in Lorax (2022 and 2023).
- The maximum Tiriganiaq UG source term calculated in Lorax (2023) are applied to each year of mine life in the current model. This highly conservative approach has been adopted due to uncertainties related to the backfill and excavation schedule.
- A diffusive flux term for SP6 lake sediments in post closure has been introduced. This source term represents upward diffusion of salinity trapped in sediment pore water into the overlying lake after saline water is replaced with fresh water in Closure. Calculations for this source term are described in Section 4.4.2.

All other source terms (*e.g.*, STP effluent, ore stockpiles, mine facilities area, *etc.*) are identical to those described in the Lorax (2023) WBWQM. The temporal trends for TDS and As are illustrated for WRSFs, the TSF, Open Pits, in Figure 4-1, Figure 4-2 and Figure 4-3, respectively. The complete set of source terms applied to the current WBWQM are provided in Appendix C.

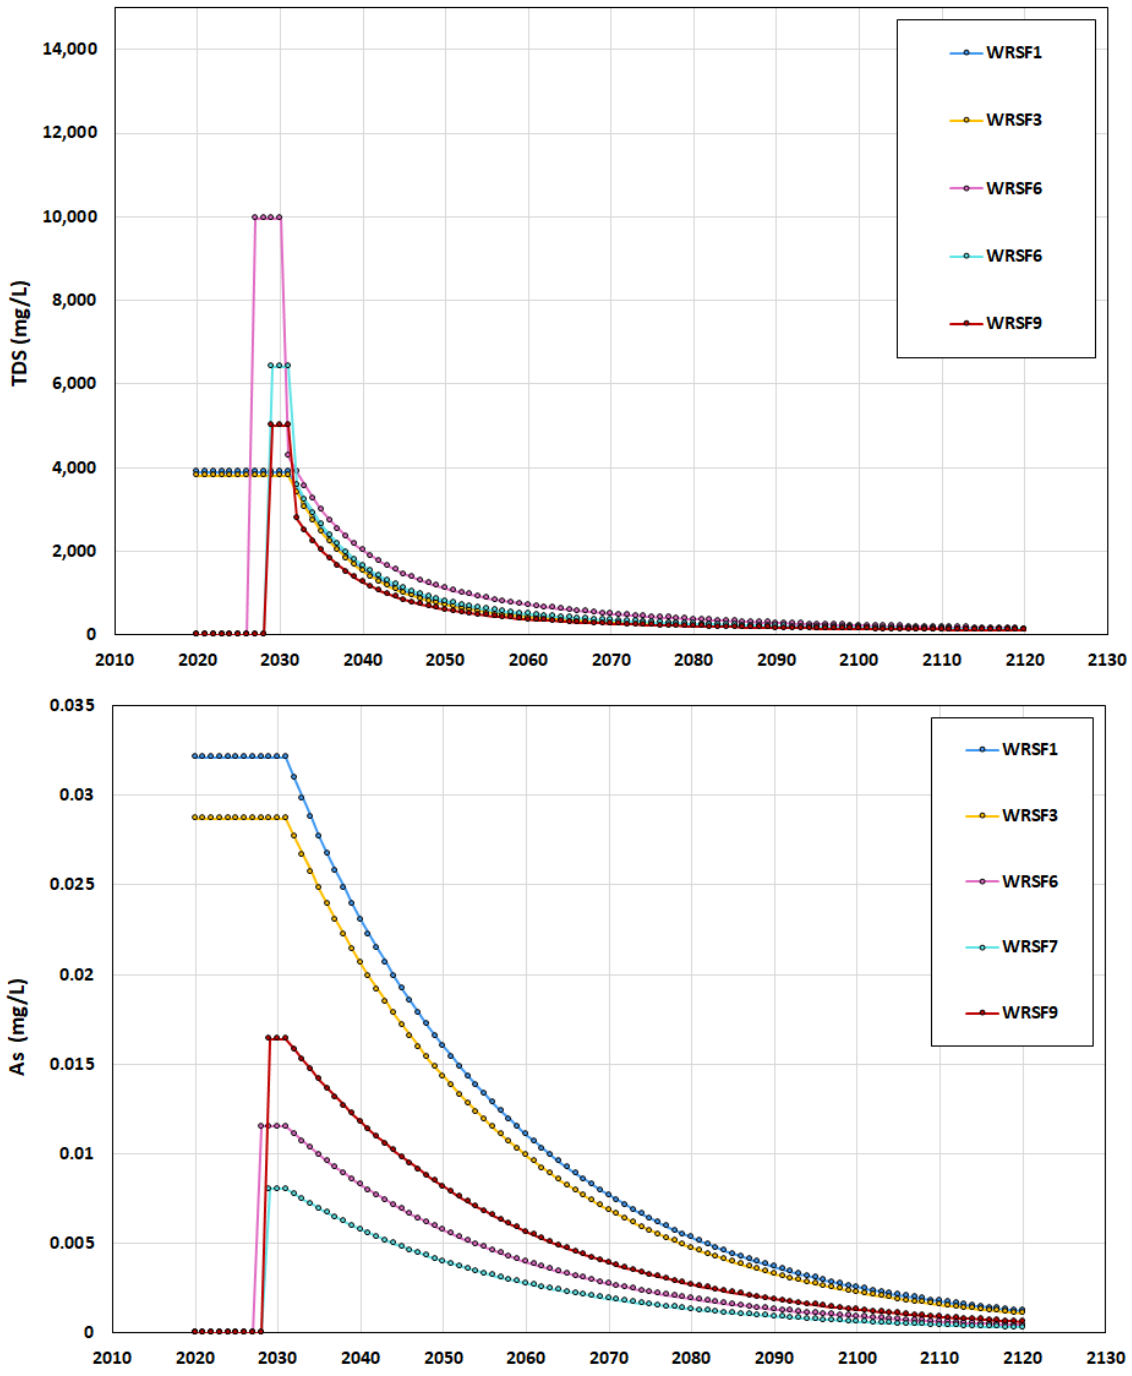

Figure 4-1: Waste rock storage facility annual source term for TDS (top) and As (bottom).

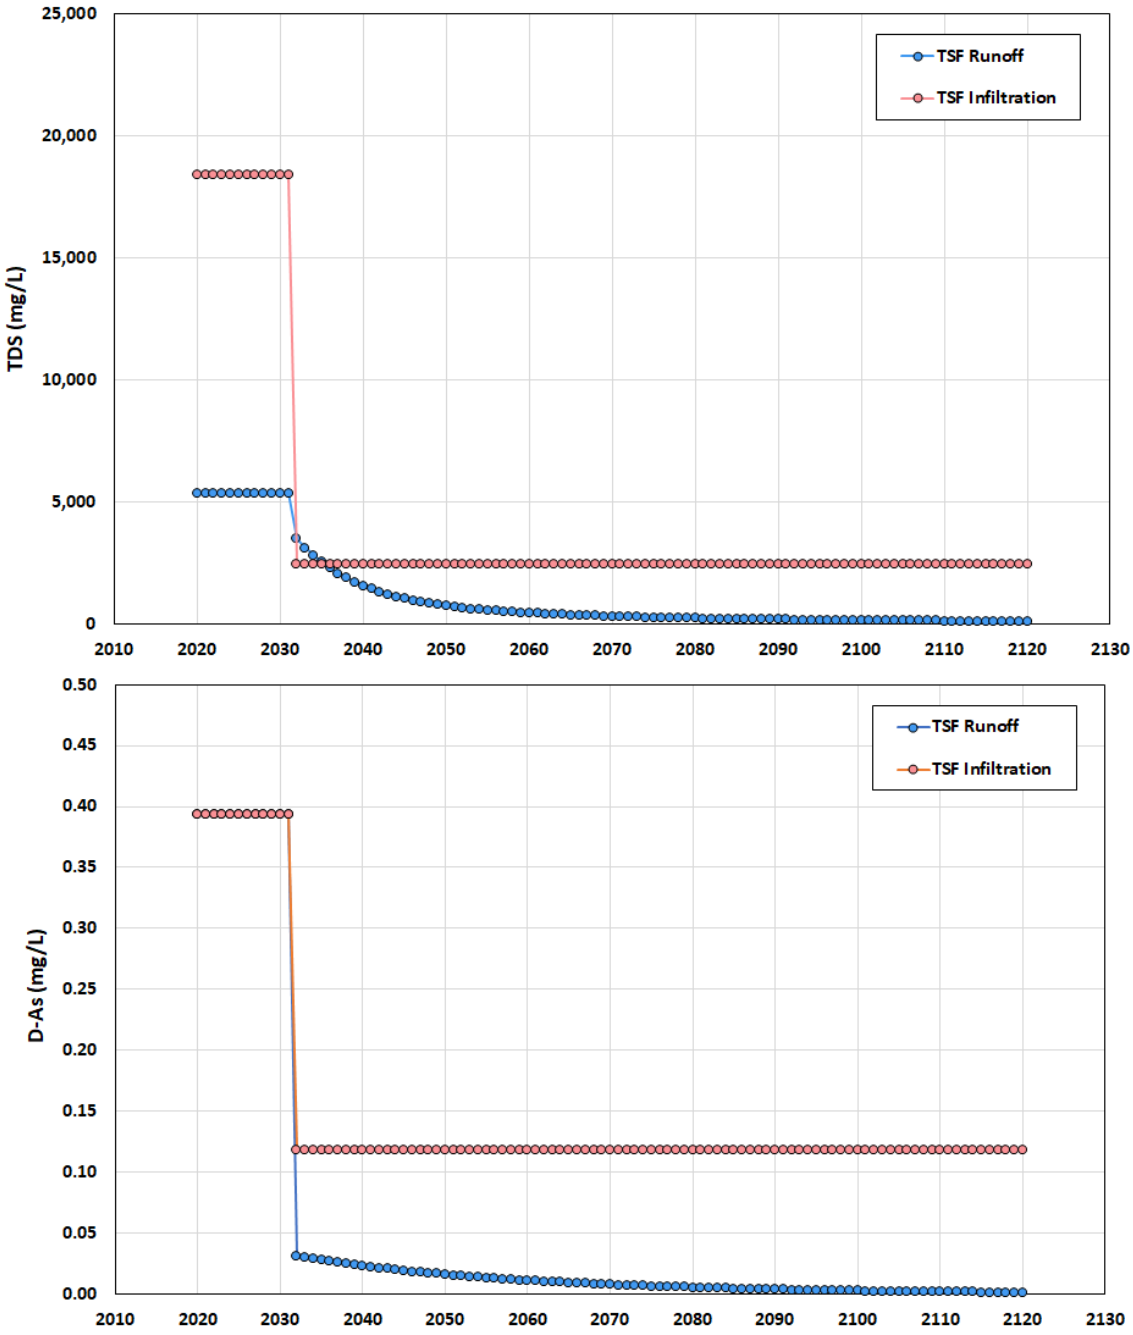

Figure 4-2: Tailings storage facility annual source terms for TDS (top) and As (bottom).

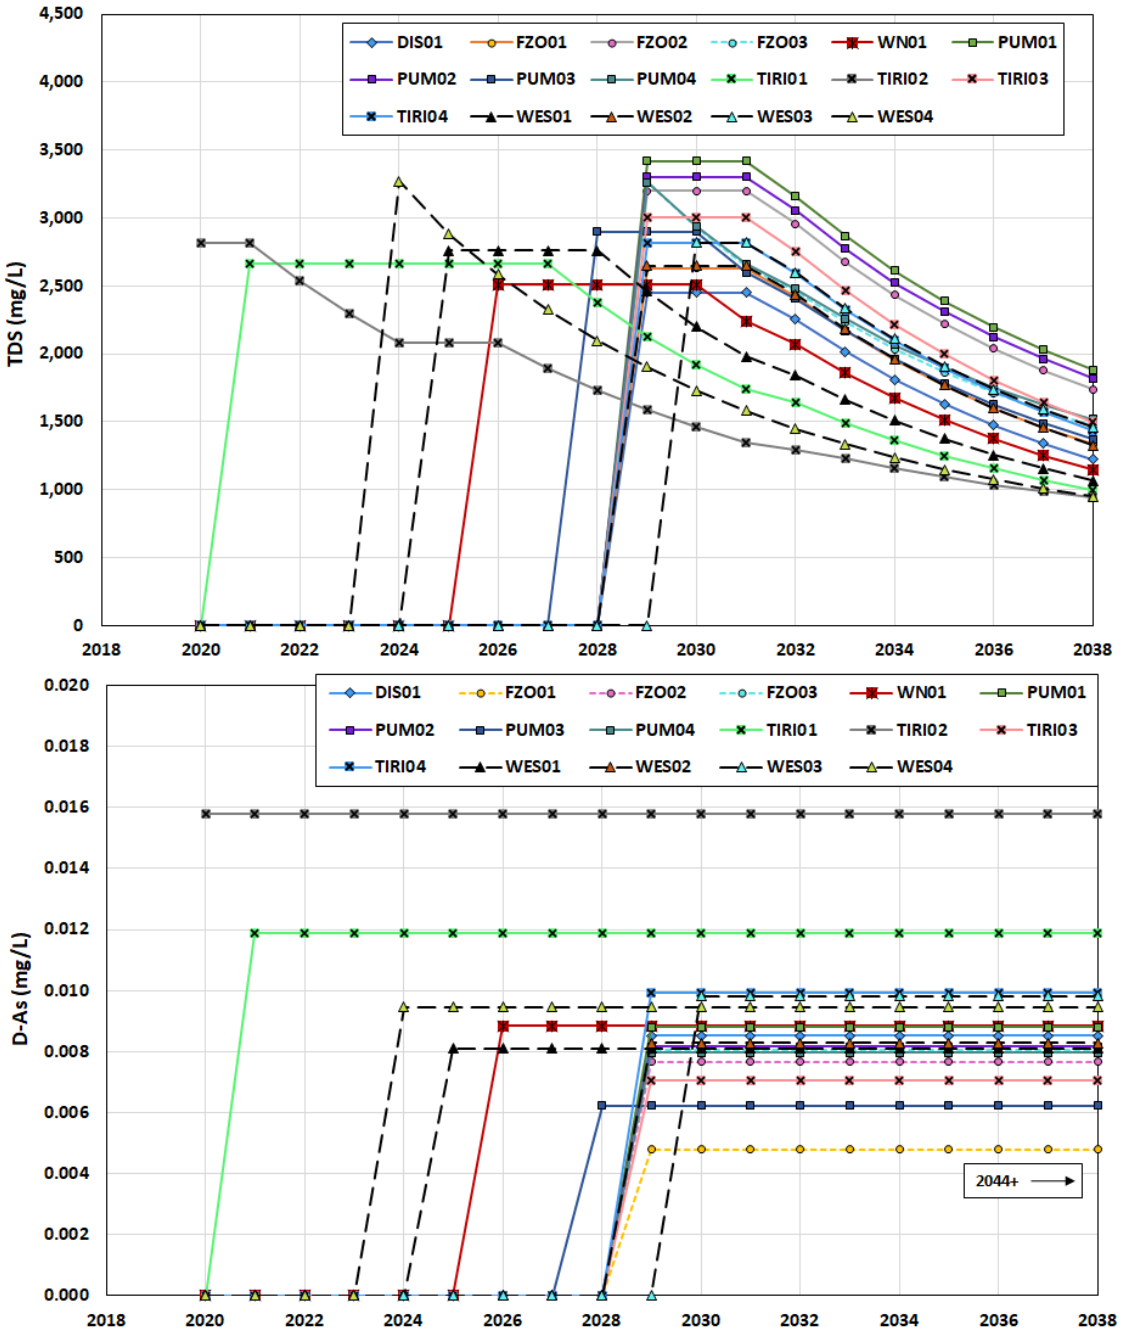

Figure 4-3: Pit wall annual results for TDS (top) and As (bottom).

4.4.2 Diffusive Flux from SP6 Lake Sediments

An upward diffusive flux of salinity and other parameters may occur from SP6 lake sediments in closure. Use SP6 for saline water management may result in saline water infiltrating into the underlying lake sediments. In closure, SP6 will be filled with Meliadine

lake water and runoff from the surrounding surface catchment; creating an upward diffusive gradient whereby salinity and other parameters retained within lake sediment may re-enter the SP6 water body.

The calculation of fluxes across the sediment-water interface are based on Fick's First Law of diffusion, as described in Martin et al., (2003a, b). This law defines the diffusive flux of solutes, describing their transfer along a concentration gradient from zones of high concentration to zones of low concentration. Fick's First Law describes the diffusive flux of solutes in $mg/m^2/yr$ according to the equation:

$$J_z = D°_J / F\varphi * (dc/dz)$$

where J_z = flux (mass/area/time); $D°_J$ = temperature-dependent diffusion coefficient; F= formation factor (Manheim, 1970); φ = porosity; and dc/dz = the concentration gradient across the sediment-water interface, which is defined as the change in concentration (dc) over the gradient distance at the sediment-water interface (dz). The $D°_J$ is an element specific *in situ* coefficient, with estimates provided at 0°C by Li and Gregory (1974).

SP6 pond sediment porosity is assumed to be 0.3, and a gradient distance of 30 cm at the beginning of post-Closure, reflecting ingression of the concentration gradient into the sediments during active closure (2032-2038). The formation factor is a measure of tortuosity which describes the convoluted (or "tortuous") path ions and molecules must follow to circumvent solid sediment particles (Boudreau, 1997), and can be calculated as follows:

$$F = \varphi^{-m}$$

Where m is the exponent of porosity, estimated to range from 1.5 for sand, and to 2 when in silty sand/clay (Taylor-Smith, 1971), resulting in an F value of 11.1 for pond sediments. The diffusive gradient (dc) was calculated based on operational and Post Closure NWB WBWQM predictions for SP6. The calculations assume average operations water quality represents pore water, while average post-Closure water quality represents the overlying pond. The resulting diffusive flux loading rates are then multiplied by the SP6 area (11.4 ha) to calculate the potential total load entering SP6.

The diffusive flux rates derived in the aforementioned calculations are shown in Table 4-9. Downward diffusive gradients, expressed as negative values, are assigned a zero value in the water quality model. This assumption is made to avoid loss of SP6 load through downward diffusion into lake sediments as a model conservatism.

Table 4-9:
Diffusive Flux in post-Closure from SP6 Lake Sediments

Parameter	Diffusive Flux per Area	Total Diffusive Flux
	mg/m2/yr	kg/yr
Total Dissolved Solids (TDS)	32605	3738
Ammonia (NH_3-N)	123	14.2
Chloride (Cl)	23586	2704
Sulfate (SO_4)	921	106
Arsenic (As)	0.13	0.015
Cadmium (Cd)	0.00010	0.000011
Cobalt (Co)	-0.00022	-0.000026
Copper (Cu)	0.00030	0.000034
Mercury (Hg)	-0.0000053	-0.00000061
Manganese (Mn)	0.051	0.0058
Nickel (Ni)	0.0097	0.0011
Phosphorus (P)	0.36	0.041
Lead (Pb)	0.00010	0.000011
Selenium (Se)	0.0057	0.00066
Uranium (U)	-0.00056	-0.000064
Zinc (Zn)	0.021	0.0024

4.5 Validation of Predicted Water Quality

Water quality predictions are validated against site monitoring data from 2019 to 2022 in order to confirm that the current model can conservatively reproduce observed water quality. The validation is conducted using the 2021 Annual Report (Agnico Eagle, 2022) WBWQM which incorporates the current site layout (Figure 4-4, Figure 4-5 and Figure 4-6), site pumping records and calibrated source terms (Lorax, 2023).

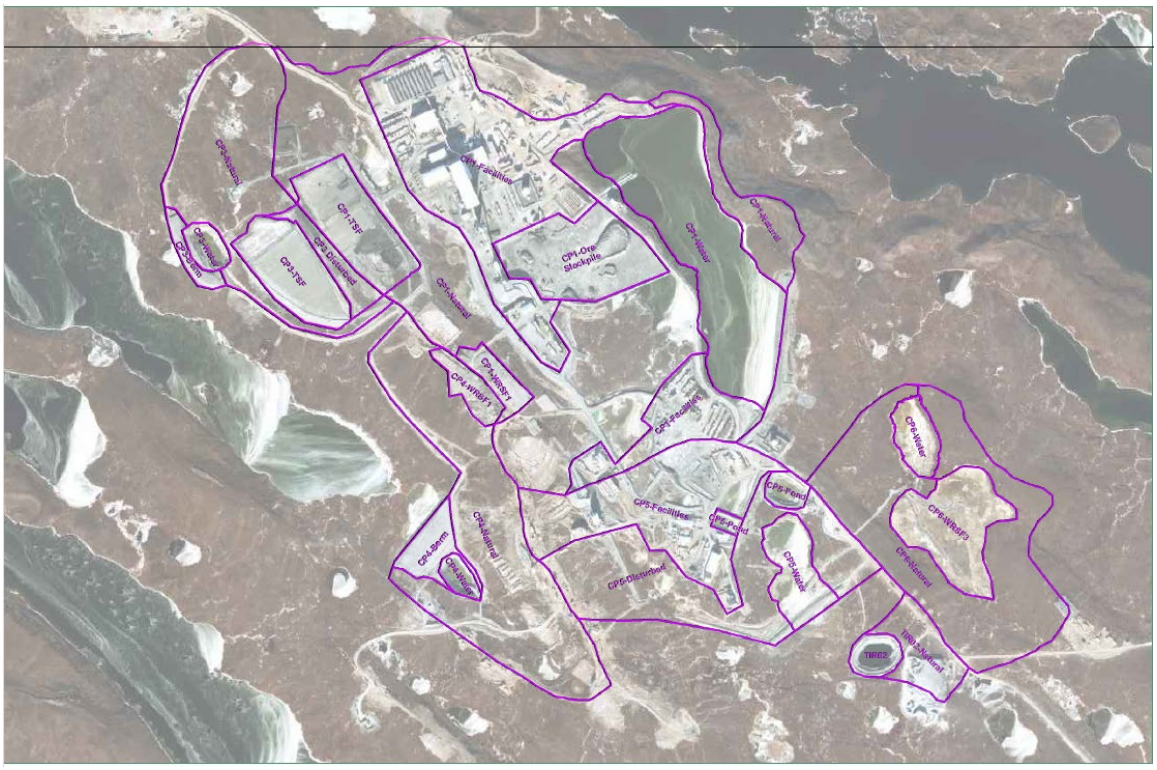

Figure 4-4: Meliadine Mine site layout and catchment delineation for 2019 based on aerial photo from October 2019.

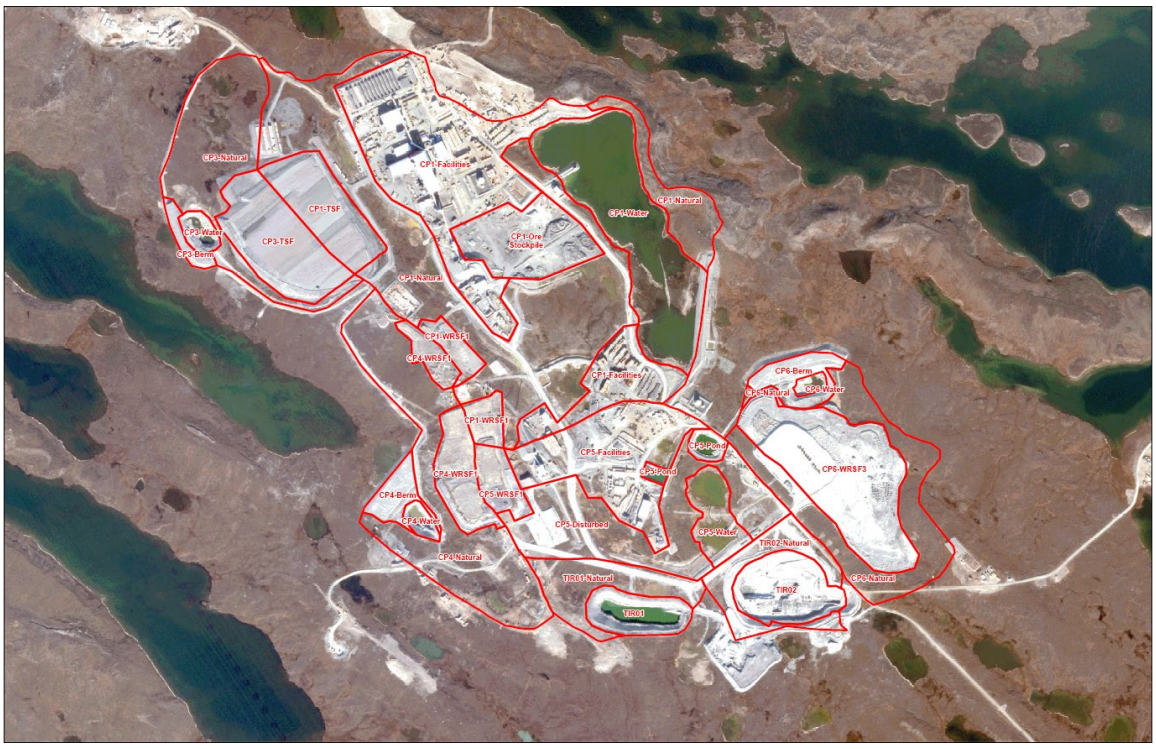

Figure 4-5: Meliadine Mine site layout and catchment delineation for 2020 based on aerial photo from September 2020.

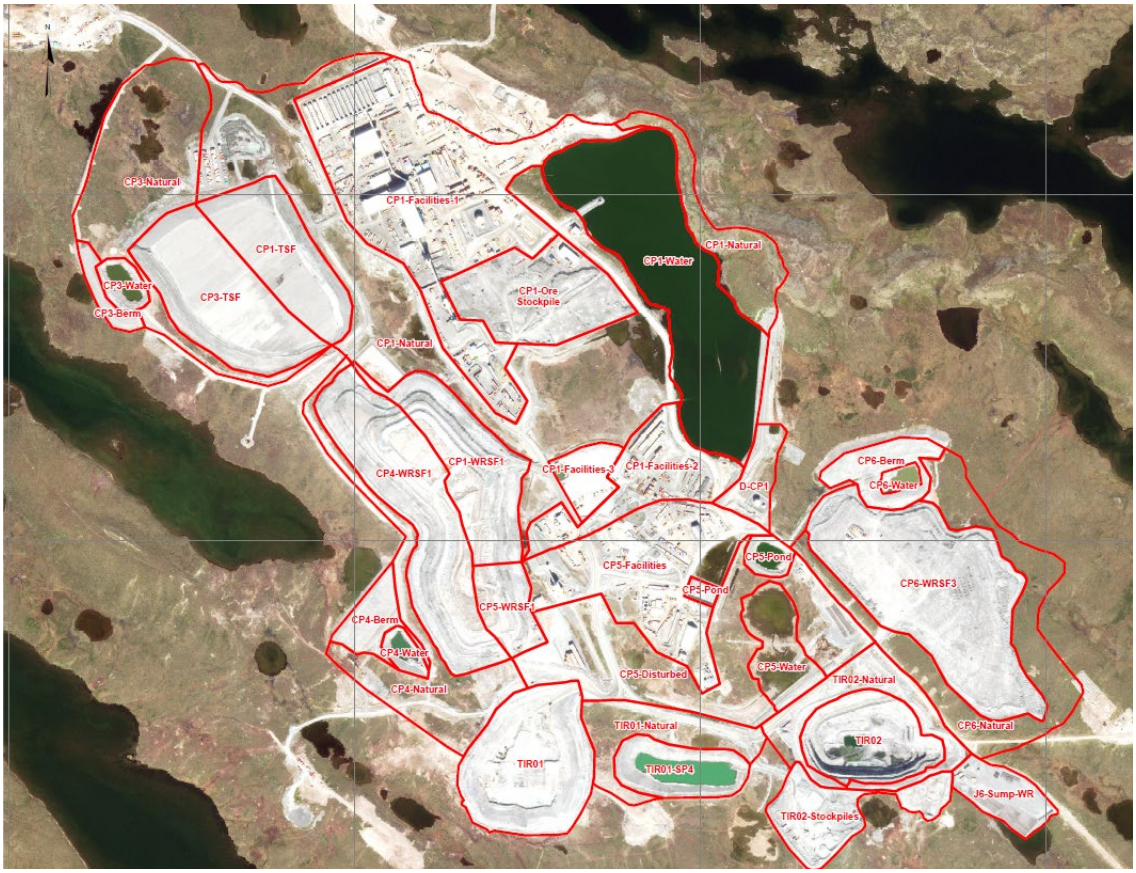

Figure 4-6: Meliadine Mine site layout and catchment delineation based on aerial photo from July 2021.

Model nodes Channel 1 and CP1 represent composite drainage chemistry from mine surface facilities. The CP1 collection pond has operated as the final collection point prior to discharge to Meliadine Lake via treatment at the effluent water treatment pond (EWTP). This collection pond receives drainage from all non-saline mine facilities (WRSF1, WRSF3, TSF, ore stockpiles, mine facilities areas, *etc.*) and upgradient mine catchments. Channel 1 is a constructed ditch that drains much of the mining area, including the TSF, a portion of WRSF1, the plant site area and ore pads, into CP1. Validation results for these model nodes are provided in Figure 4-7and Figure 4-8, respectively.

Overall, the validation model shows that calibrated source terms conservatively predict water quality at CP1, particularly for arsenic (As), Ammonia (NH_3), copper (Cu), selenium (Se) and nickel (Ni). The observed concentrations of these elements are significantly overestimated by the validation model in most months. Results for NH_3 are initially underestimated in 2019 shortly after model initiation but are then overestimated from 2020 onwards. Validation of this parameter in CP1 is complicated by attenuation processes

impacting NH_3 such as oxidation and biological uptake which are not incorporated into the model framework. A number of T-CN values are underestimated in 2019-2021, which could be impacted by model initialization and elevated T-CN method detection limit during this time period. Lower T-CN detection limits starting in 2022 show better validation and Channel 1 predictions capture the range of T-CN concentrations at this upstream monitoring point which is closer to the only known point source (TSF) of T-CN loading (Figure 4-8).

The validation results for Channel 1 generally reflect the range of observed concentrations (Figure 4-7). The validation model overestimates observed sulphate (SO_4) in the spring, indicating that the model runoff concentrations during the freshet may be more dilute than what is assumed in the model. The range of trace metal concentrations are generally conservatively captured, with the exception of a series of anomalously high Ni concentrations in 2019. The validation model conservatively estimates most Ni concentrations at Channel 1 in subsequent years (Figure 4-8), providing confidence that this parameter is conservatively captured.

Overall, the validation exercise shows that the water quality model assumptions can conservatively reproduce monitoring results.

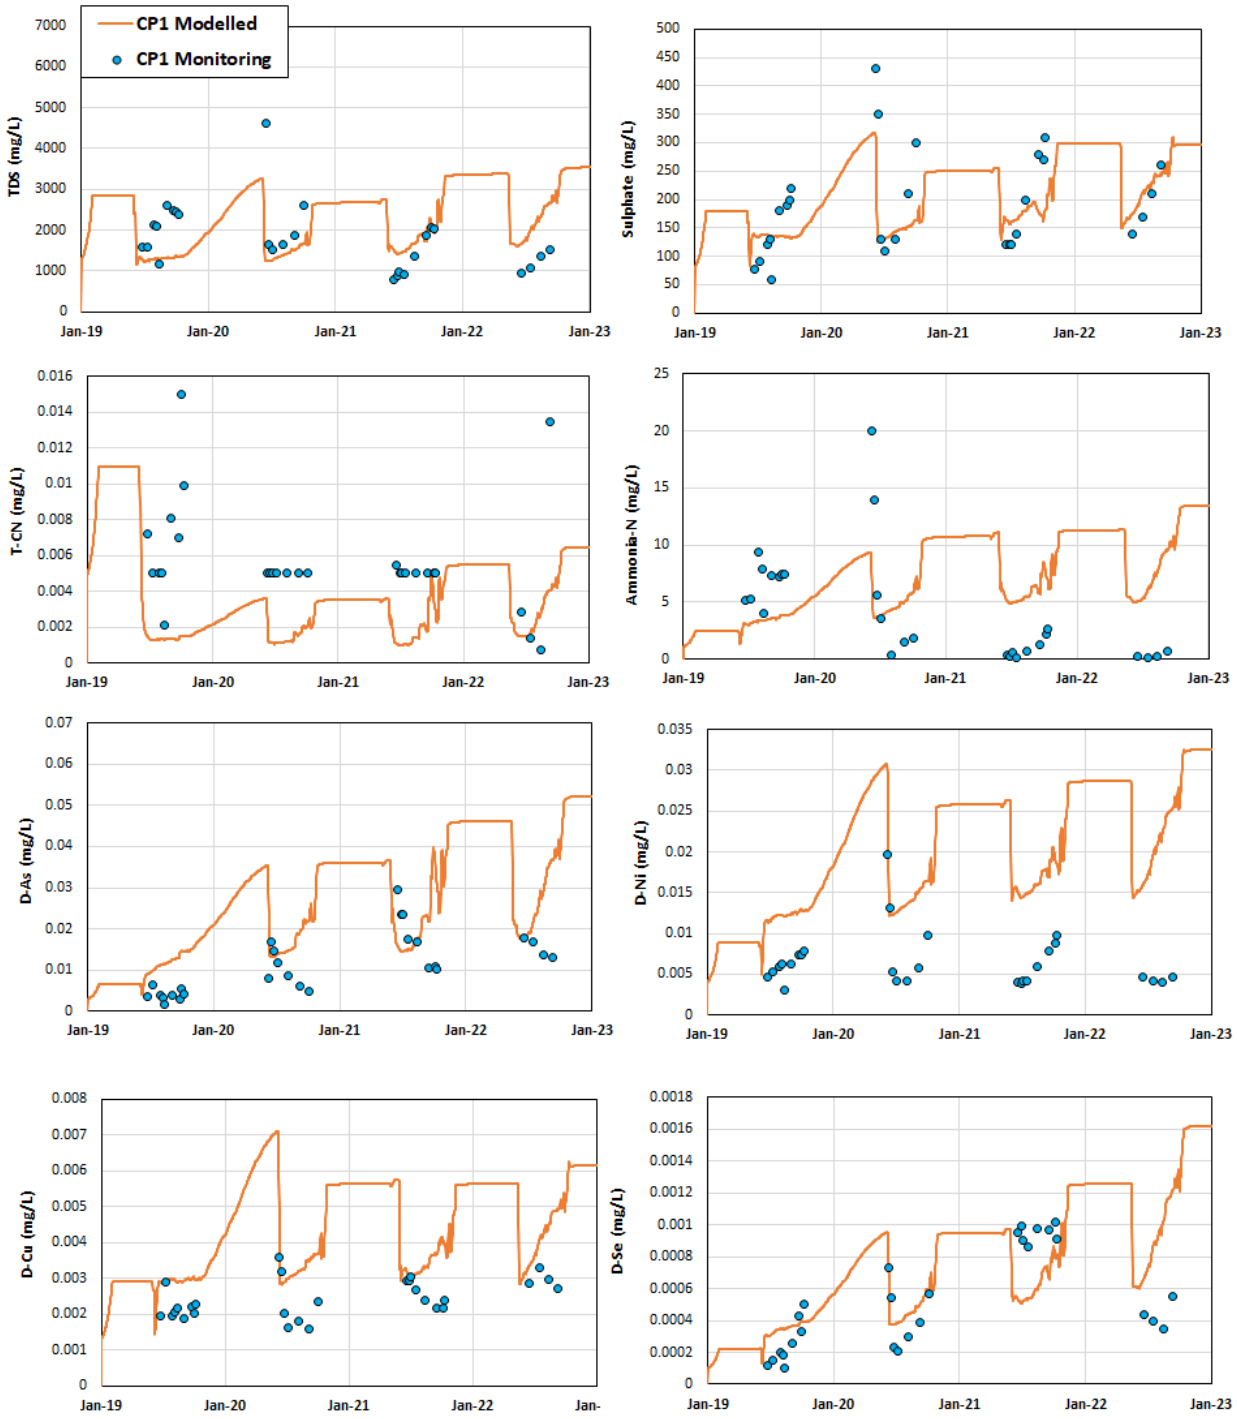

Figure 4-7: Water quality model validation results for CP1.

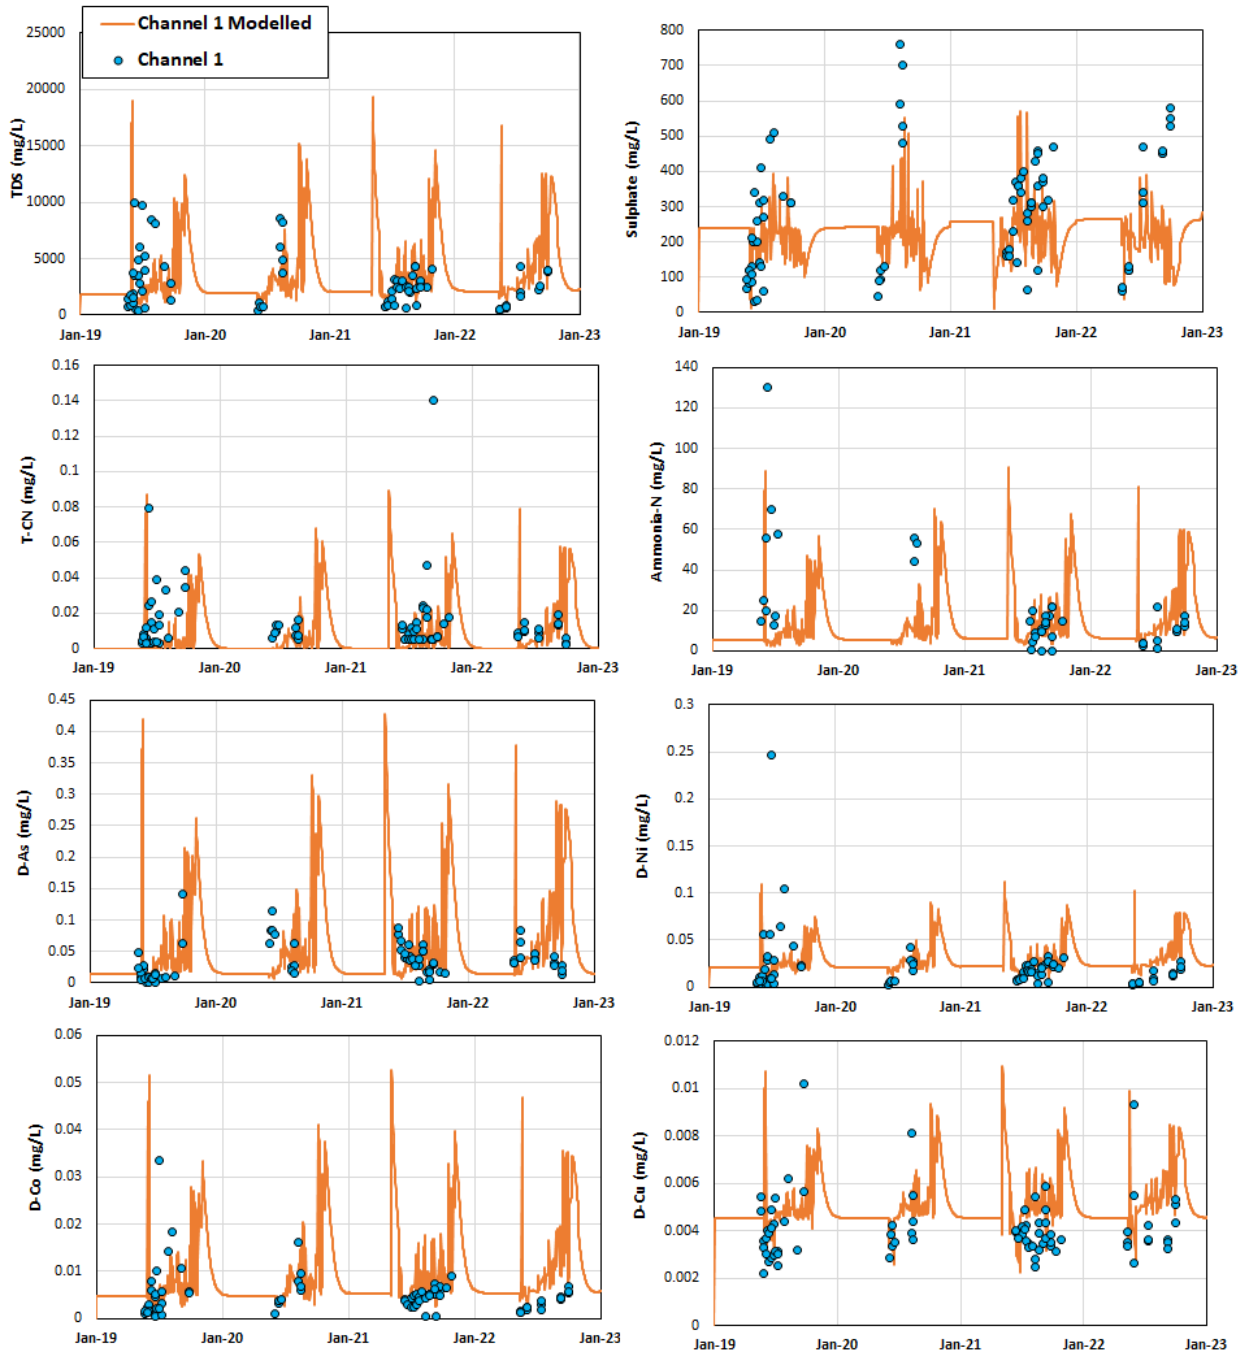

Figure 4-8: Water quality model validation results for Channel 1. Channel 1 monitoring data plotted in this figure includes sampling of upstream culverts (Culvert 2 and Culvert 3) as well as the Channel 2 tributary.

5. Water Balance Results

5. Water Balance Results

Water balance model results are presented in this section, with a focus on the annual operational discharges to Itivia Harbour and Meliadine Lake (Section 1). Operations phase water balance time-series are provided for the key saline (SP6) and surface contact water collection (CP8 and CP1) ponds, as well as tabular summaries of annual water balances for the remaining sumps, ponds, and open pits (Section 5.1). Active Closure water management is presented in Section 5.6, with a focus on the filling of open pit voids with surrounding catchment runoff and water pumped from Meliadine Lake.

5.1 Operational Mine Water Discharge to Itivia Harbour and Meliadine Lake

All surface contact water collected in the CP1 Pond is routed to the EWTP for treatment, targeting removal of TSS, before discharge to the receiving environment. Throughout Operations, discharge priority for surface contact water is via the Waterline to Itivia Harbour, with the objective of minimizing operational discharges to Meliadine Lake as outlined in the Adaptive Management Plan for Water Management (Agnico Eagle, 2023). Under the Base Case RCP4.5 climate scenario, discharges to Itivia Harbour average 2.0 Mm^3, with 0.91 Mm^3 routed from SP6 and 0.87 Mm^3 routed from CP1 (Figure 5-1).

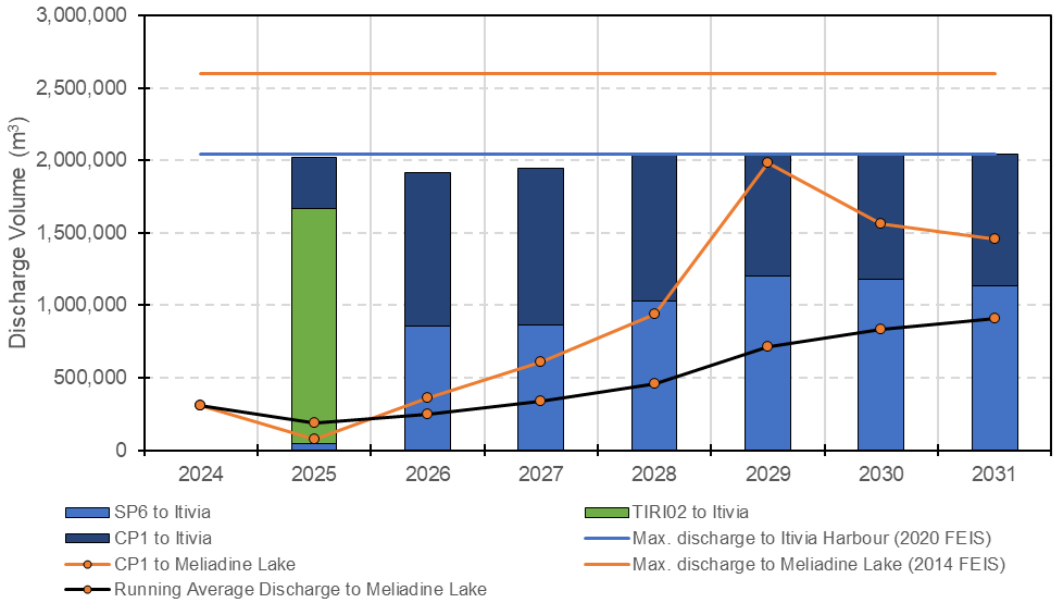

Figure 5-1: Annual discharges to Itivia Harbour from SP6 and CP1, and Meliadine Lake from CP1. The maximum predicted discharges to each receiver from the 2014 FEIS are presented for reference.

Discharges to Meliadine Lake average 0.91 Mm^3/year, with the peak annual discharge of 1.98 Mm^3 occurring in 2029 in response to an expanded mine footprint. Surface contact water discharges via the Waterline average 0.87 Mm^3/year, for a total average surface contact water discharge volume of 1.8 Mm^3/year (Figure 3-1).

5.2 Surface Water Collection Ponds

This section summarizes the water balances for the key surface water collection ponds (CP8 and CP1) for the Operations phase.

5.2.1 Collection Pond CP8

Lake B4 is dewatered in 2025 and converted to CP8 which serves as is the primary surface water collection pond for the remainder of the Operations phase. Excess surface contact water is routed to the CP1 collection pond for treatment via the EWTP, and subsequent discharge (in order of priority) to Itivia Harbour and Meliadine Lake. Pre-mining inflows to Lake B4 average 680,000 m^3/year, rising to an average of 2.16 Mm^3/year once pumping to CP8 is online in 2026 (Figure 5-2). The maximum predicted pond volume of 1.1 Mm^3, occurs in 2030 in response to an expanded mine footprint, despite receiving lower than average precipitation (81% of the Operations phase average of 380 mm). CP8 continues to serve as a surface contact water collection pond throughout the Active Closure phase (2032-2038), with water pumped to TIRI02/04, and is returned to its pre-mine condition and water balance prior to freshet 2040.

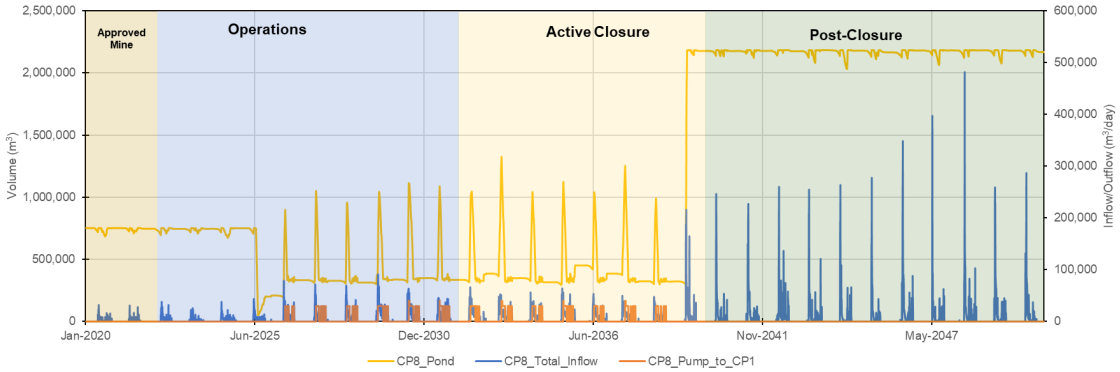

Figure 5-2: Volumes, inflows, and outflows to CP8 for the Operations, Active Closure, and early post-Closure phases

5.2.2 Collection Pond CP1

CP1 is currently the primary surface contact water collection pond, with all excess water routed to the EWTP prior to discharge to Itivia Harbour and Meliadine Lake. The maximum predicted storage volume (691,000 m^3; Figure 5-3) occurs in 2029 due to the expanded mine footprint. The corresponding predicted water level of 66.0 m remains lower than the Maximum Operating Water Level (MOWL) of 66.2 m (742,075 m^3; Table 2-2). During the Active Closure phase, the mine site is managed as a zero-discharge facility, with all CP1 inflows routed to TIRI02/04 open pit. Beginning in the post-Closure phase, volumes in the CP1 pond are allowed to fluctuate naturally, with outflows reporting via pre-mine drainage pathways to Meliadine Lake.

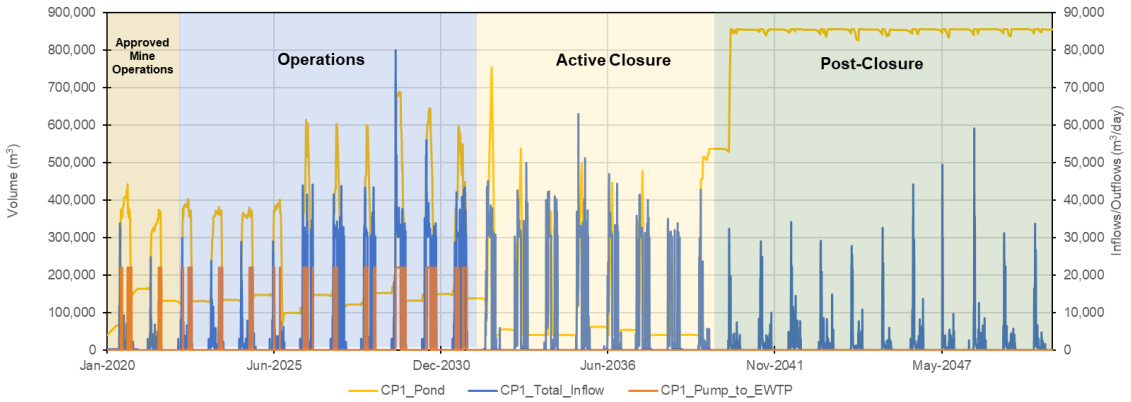

Figure 5-3: Volumes, inflows, and outflows to the CP1 Pond for the Operations, Active Closure, and early post-Closure phases

5.3 Saline Water Collection Ponds

This section summarizes the water balances for key saline contact water collection ponds (TIRI02 and SP6) over the Operations phase.

5.3.1 TIRI02

The saline contact water management system collects dewatering flows from the underground operation, Saline WRSF, and ore pad. Early in the Operations phase (up to end-2024), the Waterline is not in place, and SP6, the primary saline contact water storage pond (SP6) is not operational until the end of 2025. The TIRI02 pit serves as the primary saline contact water storage pond for this period, with a maximum predicted pond volume of 1.54 Mm^3 in June 2025 (Figure 5-4). Once Lake B7 is dewatered during freshet of 2025, it becomes the primary saline pond (SP6), and the saline contact water stored in TIRI02 is discharged via the Waterline to Itivia Harbor to allow mining of TIRI02 pit to progress during the winter of 2025/26 (Figure 5-5).

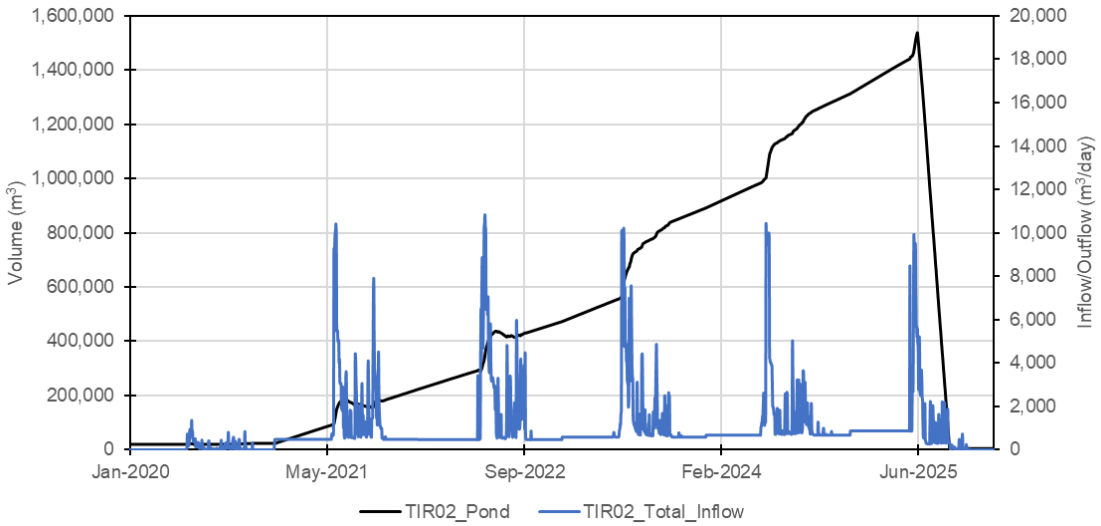

Figure 5-4: Time series of pond volume and inflows for the TIRI02 Pond during early Operations period

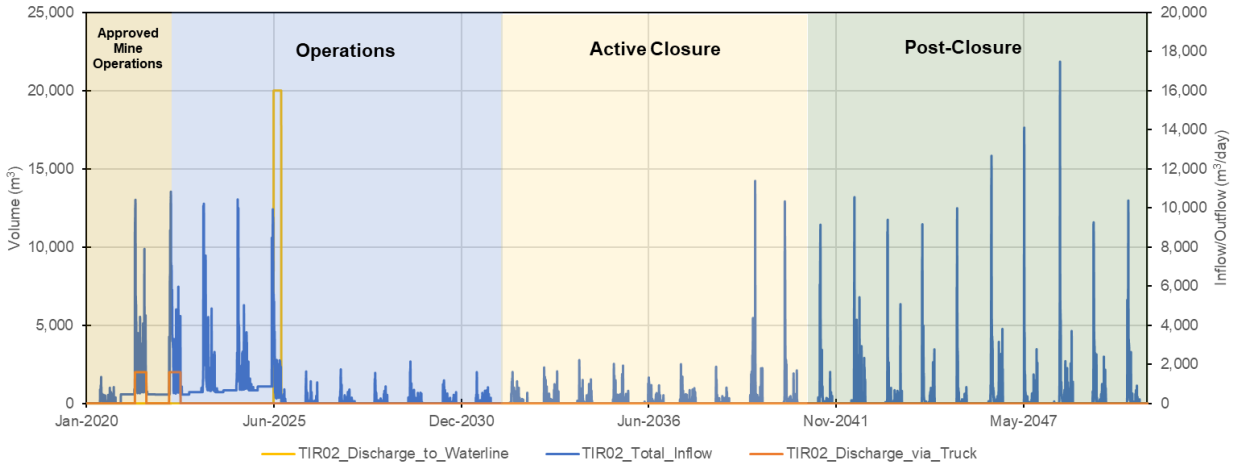

Figure 5-5: Inflows and outflows to the TIRI02 Pit for the Operations, Active Closure, and early post-Closure phases

5.3.2 SP6

The Saline Pond SP6 is the primary saline contact water storage pond for the majority of the Operations phase once it is dewatered in 2025. All saline contact water collected in SP6 is routed to the Waterline for discharge to Itivia Harbour up to end-2031, along with surface contact water from the treated STP discharges, CP3, CP4 and CP5. After this point, any remaining saline contact water will be routed to the remaining underground voids before SP6 is allowed to fill with runoff from the surrounding catchments, including the small volumes of contact water from the TSF and WRSF1. The maximum predicted pond volume

for SP6 is 783,000 m^3 in 2030, coinciding with high underground dewatering rates Figure 5-6).

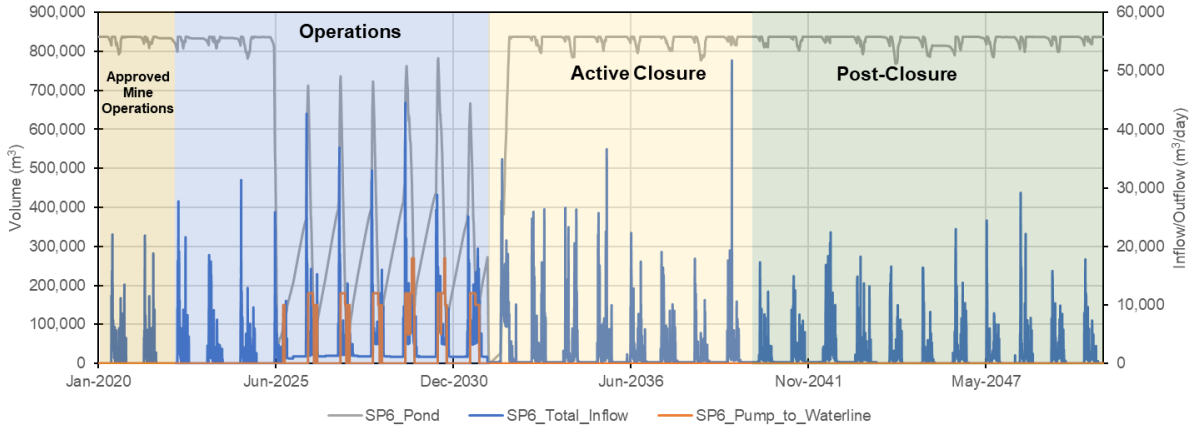

Figure 5-6: Volumes, inflows, and outflows to SP6 for the Operations, Active Closure, and early post-Closure phases

5.4 Secondary Ponds and Sumps

The annual total volumes of surface contact water and saline water pumped to CP1 and SP6 are presented in Table 5-1 and Table 5-2, respectively, along with the gravity drainage volumes from the surrounding catchments, TSF and WRSF1. Pit dewatering to CP1 is not included and is presented in Section 5.5. While the proportion of total pumped flow to CP1 varies from year to year for each pond, overall, CP8 comprises the majority (71%) of the total collection pond volumes pumped to CP1, followed by runoff (15%) from the surrounding catchments. Note that CP8 collects a large proportion of the surface contact water from the sumps at the PUMP and FZONE areas. For SP6, the surrounding catchment runoff is the dominant input (32%), followed by underground mine dewatering (29%).

5.5 Open Pits

The annual total pit dewatering volumes are presented in Table 5-3, along with the dewatering period averages. The PUMP01 pit has the highest average dewatering rate due to its use as a contact water collection pond for the PUMP mine area. The WES02 pit has the next highest dewatering rates, followed by the WN01 Pit.

Table 5-1:
Annual inputs to CP1

Year	Annual Volumes (m^3)					
	Routed to CP1

Notes:
[1] TIRI02 pit water (not saline) is discharged to CP8 once mining resumes in 2025.
[2] Averages are calculated for the active dewatering periods only.

5.6 Active Closure Pit Water Management

During the Active Closure phase, the site is maintained with zero discharge to Meliadine Lake, and only 3 months of predicted discharge to Itivia Harbour via the Waterline to drain the accumulated water in PUMP01 and WES04. Of key interest is the pumping duration and water volumes required to fill the pits to their spill points during the Active Closure phase.

Updated pit shells showed lower volumes than those presented in the 2014 FEIS WBWQM and resulted in a reduced pumping requirements of Meliadine Lake water to mine pits during Active Closure. The 2014 FEIS WBWQM determined that a pumping rate of 17.06 Mm^3/year would be required to fill the pits over a ten-year period. It was assumed that Meliadine Lake pumping would proceed at this rate until each pit was fully flooded. The updated mine plan results in lower volumes of water required to fill the pits in Active Closure, with a lower pumping rate over the 7-year Active Closure period. Pumping of Meliadine Lake water remains at a maximum of approximately 8.5 Mm^3/year over six years, reducing to 2.6 Mm^3 in the last year of Active Closure (2038; Table 5-4). The 2014 FEIS WBWQM required 170.6 Mm^3 over 10 years of pumping, while the updated model indicates that 52.8 Mm^3 of water from Meliadine Lake is required, along with 7.4 Mm^3 reporting to the pits via gravity drainage from the surrounding catchments, 15.4 Mm^3 pumped from CP1 to TIRI02/04, and meteoric inputs (Table 5-4). This equates to a 69% reduction in Meliadine Lake water use for pit filling during Active Closure relative to the 2014 FEIS. Individual pit filling metrics are provided in Table 5-4. Note that the modeled volume of Meliadine Lake water required to fill the pits is dependent on the prevailing climatic conditions during the Active Closure phase. Wetter than modeled conditions could reduce the required pumped volumes, and *vice versa*.

Table 5-4:
Open pit water balances in Active Closure phase

Year	Meliadine Lake Pumped (m^3)	% Total	Surface Contact Water Runoff (m^3)	% Total
2032	8,786,673	90%	984,794	10%

WN01[3]	9,873,505	12,000	9,353,693	789,362
Total	**73,455,858**	**74,200**	**52,787,087**	**7,436,227**

Notes:
[1] TIRI01, TIRI03 and WES01 form the TIRI pit lake complex once full.
[2] TIRI02/04 is also filled via pumping from CP1, which comprises the majority of the volume shown here (15.4 Mm^3).
[3] WN01 joins with Lake B5 to form the NORWES pit lake complex once full.
[4]TIRI01 receives overflow from TIRI02/04 at approximately 2,000 m^3/day, so Meliadine Lake water is not required to fill this pit.

6. Water Quality Model Results

6. Water Quality Model Results

This section presents water quality model results for the Meliadine Mine NWB WBWQM. Model predictions are compared against applicable guidelines shown in Table 4-2 as a screening tool to identify parameters of potential concern (POPCs). The complete model outputs for all mine phases are presented in Appendix D.

6.1 Operations

During Operations, TSS in mine effluent will be controlled by the SETP and EWTP for saline and freshwater discharges, respectively. For the purposes of water quality predictions, it is assumed that treated effluent is at the MDMER maximum monthly mean concentration of 15 mg/L. The differences in total and dissolved concentrations generated by this assumption were calculated in Lorax (2022) and are shown in Table 6-1. These values are added to dissolved concentrations predicted for Meliadine Lake and Itivia Harbour discharges. Dissolved and total predictions at EWTP and Waterline are provided in Appendix D1. Water quality predictions for other model nodes present during Operations are provided in Appendix D2.

Summary statistics are presented for EWTP and Waterline with comparison to EOP guidelines. During Operations, model predictions at EWTP remain below MDMER/Water License limits (Table 6-2), while model predictions of untreated water for the Waterline remain below MDMER with the exception of ammonia (Table 6-3). The ammonia guideline of 19 mg/L at the EOP to Itivia Harbour was determined conservatively by assuming a pH of 8 and a temperature of 15°C, and an un-ionized ammonia concentration of 0.5 mg/L. The maximum ammonia concentration without treatment (64 mg/L) is predicted in 2025 due to dewatering of saline water stored in TIRI02 through the Waterline. Options for treatment are being investigated.

6.2 Active Closure

The Waterline remains available for the first two years of Active Closure (2032 and 2033), with discharges to Itivia Harbour planned in the months of June to September. This additional Waterline operating window is proposed as an adaptive management measure to position the site for effective closure. In an effort to optimize post-Closure water quality, the WBWQM utilizes the Waterline to drain water from WES04, PUMP01 and CP1. These assumptions will continue to be refined with site monitoring data and all details will be provided in the Final Closure Reclamation Plan. The monthly model predictions during this period are shown in Table 6-4. The predicted concentrations of POPCs at Waterline

are below EOP guidelines during Active Closure. No discharge occurs via the EWTP during Active Closure.

Table 6-1:
Suspended Solids Composition and Contribution to Total Concentrations at End-of-Pipe

Element	Particulate Composition	Particulate Fraction Concentration (mg/L) per 15 mg/L of Total Suspended Solids
	ppm	*mg/L*
Silver (Ag)	0.057	0.000000855
Aluminum (Al)	62700	0.941
Arsenic (As)	65.7	0.000985
Barium (Ba)	261	0.00392
Beryllium (Be)	0.562	0.00000843

Notes: "-" denotes not available. *Calculation of min, P10, mean, and P90 excludes 0 values. Values shaded in grey are above the maximum monthly mean effluent concentrations specified in MDMER (Schedule 4, Table 2).

1. The ammonia guideline was determined conservatively by assuming a pH of 8 and a temperature of 15°C, and an un-ionized ammonia concentration of 0.5 mg/L.

6.3 Post Closure

During Post Closure, mining activity will have ceased, and mine site waterbodies will begin to discharge passively. In the absence of mining activities, TSS is expected to return to relatively low baseline values of <3 mg/L. Due to the low TSS baseline conditions, total and dissolved concentrations are anticipated to be similar during Post Closure. Hence, model results are developed assuming that total concentrations are equal to dissolved concentrations.

Summary statistics are presented for key collection ponds and pit lakes during Post Closure, with comparison to terrestrial (SP6 only) and aquatic guidelines (Table 6-5 through Table 6-19). Parameters predicted to be above applicable guidelines include arsenic, selenium, phosphorus, nitrate, and ammonia. Of these parameters, phosphorus shows elevated concentrations in natural runoff and is not considered a mine related POPC (Table 6-7). Among the model nodes presented herein, SP6, Lake J1 and WES04 show post-Closure predictions above applicable guidelines for mine-related POPCs:

- SP6: The SP6 catchment includes a portion of WRSF1 and the TSF, which generate small volumes of runoff that contribute to the SP6 post-Closure water balance. In addition to catchment runoff, SP6 receives a diffusive loading from lake sediments which are assumed to retain salinity from the Operations phase. Loadings from these sources are predicted to increase concentrations of ammonia, nitrate, chloride, arsenic, and selenium to values above their respective aquatic life guidelines in Post Closure. The only parameter to exceed the terrestrial life guideline is arsenic, which is above guidelines for 2.3 years from 2043 to 2046. The exceedances are temporary, with all parameters declining to below their respective guidelines by 2062.
- WES04: The WES04 pit lake is predicted to show an increasing trend in most parameters over the Post Closure period due to loadings from pit wall exposures and evapoconcentration (evaporation > precipitation) of the pit lake. This trend leads to chloride concentrations eventually exceeding generic aquatic life guidelines 65 years after mine closure (in 2104) and remaining elevated for the remainder of Post Closure.
- Lake J1: This lake does not receive mine contact water until the beginning of Active Closure when water management infrastructure around WRSF3 (*i.e.*, Channel 10) is removed. Small volumes of runoff from WRSF3 then enter Lake J1, resulting in slightly above guideline predictions for ammonia (max prediction of 0.59 mg/L vs. guideline of 0.58 mg/L) for a short duration (8 months) early in Post Closure.

Additional monitoring data collected through the life of mine will be used to update post-Closure model predictions. Monthly water quality predictions for pit lakes and natural lakes during Post Closure are provided in Appendix D2, predictions for conjoined pit lakes which form during Post Closure are provided in Appendix D3.

Table 6-5:

Notes: Values shaded in grey are above applicable guidelines. *Guideline assumes induced hardness. **The ammonia (NH_3-N) guideline was determined conservatively by assuming a pH of 8 and a temperature of 15ºC.

Duration of above guideline predictions during post-Closure (2039-2119) for Cl is 0.67 years.

7. Summary

AGNICO EAGLE

7. Summary

A linked water balance and water quality model was constructed to predict the movement of water and POPCs throughout the proposed Meliadine Mine. The model operates on a daily time-step and is driven by a climate forcing series representative of the RCP4.5 climate change scenario, for a 100-year period from 2020 to 2119. The mine plan is replicated on an annual basis, with subcatchment areas, tailings and waste rock volumes increasing over time. All mine site components, including open pits, underground operations, the tailings storage facility, waste rock storage facilities, ore pads and saline WRSFs are assigned runoff and interflow signatures, as well as geochemical source terms. All water management infrastructure is incorporated into the model and was tested in an iterative design approach using various configurations and climate inputs to ensure that the system is capable of effectively handling a wide range of potential conditions.

The water balance model incorporates daily changes in all key processes, including precipitation and air temperature, evapotranspiration, snow accumulation and melt, and water management (*i.e.*, pump rates, pond volumes and operating criteria). Natural catchment flows were calibrated using the streamflow record from a nearby representative catchment gauged by the Water Survey of Canada and replicate the unique hydrological conditions at the mine site, including rapid runoff response to snowmelt and rainfall. Mine site flows and source loadings were parameterized via a calibration exercise that utilized measured data from mine operations in 2019 and 2020. These calibrated parameter sets were then carried forward for use in the predictive model. The influence of ice formation and melt within the collection ponds on parameter concentrations (*i.e.*, cryo-concentration) was also calibrated using the CP1 water quality record and carried forward in the predictive model. The water balance model will continue to be verified against monitoring data on an annual basis, and the calibration updated as necessary to effectively replicate conditions at the mine site as development continues.

The water quality model generates monthly predictions for 30 metals (total and dissolved) and 7 major ions in all mine water management facilities and the discharges to Meliadine Lake and Itivia Harbour. Non-contact runoff is assigned background water quality, while all mine components are assigned geochemical source terms derived through a combination of lab analyses, site monitoring data and representative analogues.

The water balance model assembled for the Meliadine Mine tracks all water types (surface contact, saline and non-contact) across the site on a daily time-step. Lake, pit, and underground dewatering activities are represented, along with the balancing of discharges to Meliadine Lake and Itivia Harbour. Predicted inflows, outflows, and pond volumes for

key nodes (Collection Pond B4, CP1 and Saline Pond SP6) indicate that the water management infrastructure is capable of routing and storing the saline and surface contact water throughout Operations, under an annually variable RCP4.5 climate scenario. During the 7-year Active Closure phase, the total open pit void volume of 73.5 Mm^3 is filled with 15.4 Mm^3 (20% of the total) of surface contact water routed from CP1, 87.4 Mm^3 of surrounding catchment runoff and direct meteoric inputs (10%), and 52.8 Mm^3 of water (70% of the total) from Meliadine Lake. 2.4 Mm^3 are lost to evaporation from the pit lake surfaces over this period. These pit lakes merge with those in adjacent pits, and in some cases, with pre-existing lakes to form conjoined pit lake complexes that generally drain to the 'A' watershed.

During Operations, model predictions for key parameters (TDS, chloride, ammonia, and arsenic) at the main collection ponds and discharge points are generally lower than their respective water quality guidelines. No exceedances of any parameters are predicted in effluent discharged from EWTP during mine Operations. Above guideline concentrations of ammonia are predicted in Waterline discharge, and treatment options are being investigated to mitigate this potential exceedance.

Water quality is predicted to improve in Closure when mining activities cease, and pit lakes are flooded with Meliadine Lake water. Phosphorus is the only parameter with frequent above guideline predictions, owing to its presence in background runoff from non-contact areas. Above guideline concentrations of mine-related parameters are predicted at SP6, Lake J1 and WES04. At SP6, exceedances of ammonia, nitrate, arsenic, and selenium are predicted as a result of runoff from WRSF1, the TSF, and diffusive flux from lakebed sediments. Concentrations at SP6 are predicted to decline over time, with all parameters decreasing to below guideline concentrations by 2062. WES04 concentrations are predicted to gradually increase during post-Closure as a result of pit wall loading and evapoconcentration in the pit Lake. This trend eventually results in chloride exceeding guideline concentrations several decades after mine closure (2104). Lake J1 is predicted to have a short duration (8 month) exceedance in ammonia concentrations at the beginning of post-Closure, due to small quantifies of runoff from WRSF3 entering the lake. It should be noted that no consideration of non-conservative behaviour which may attenuate post-Closure concentrations has been incorporated into WQM predictions.
