Glossary and Abbreviations

AGNICO EAGLE

Glossary and Abbreviations

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

CP	Collection Pond
EOM	End of mining/end of Operations
EOP	End-of-pipe
EWTP	Effluent water treatment plant
FEIS	Final Environmental Impact Statement
MDMER	Metal and Diamond Mining Effluent Regulations
NWB	Nunavut Water Board
POPC	Parameter of potential concern
RCP4.5	Representative Concentration Pathway Scenario (4.5)
SETP	Saline effluent treatment plant
SP	Saline Contact Water Pond
STP	Sewage treatment plant
TDS	Total dissolved solids
TSF	Tailings storage facility
TSS	Total suspended solids
WBM	Site-wide water balance model
WBWQM	Site-side water balance and water quality model
WQM	Site-wide water quality model
WRSF	Waste rock storage facility

Plain Language Summary

AGNICO EAGLE

Plain Language Summary

Agnico Eagle Mines Limited (Agnico Eagle) is planning a Type A 2AM-MEL1631 Water Licence Amendment (the 2026 WL Amendment). The scope of activities remain within the assessed scope and disturbed footprint, thus not requiring further environmental assessment but necessitating amendments to the Water Licence.

In support of the Operational Update Water Licence Amendment, the Water Balance and Water Quality Model (WBWQM) has been updated to reflect updates in the mine plan.

The WBWQM incorporates the mine plan on a year-by-year basis, and includes annual changes to volume, area, and the characteristics of all mine infrastructure. In parallel, all water management infrastructure and activities are represented, with volumes and water quality predicted on a daily time-step. Two water 'types' are tracked in parallel within the model:

1. *Saline contact water* originating from underground dewatering and runoff from ore pads, saline waste rock storage facilities and a portion of the tailings storage facility; and
2. *Surface contact water* generated by the waste rock storage facilities, open pit walls, and other disturbed areas not related to underground mining operation.

The operation of ponds, pumps, water treatment systems and discharges to Meliadine Lake and Itivia Harbour are also represented within the model. Each mine component is assigned specific geochemical source terms and discharge concentrations to represent the predicted water quality for each component. These mine contact water flows and loads are then transported within the model to collection sumps, and larger collection ponds where the various waters are mixed within the model prior to treatment and discharge.

The model is run over a 100-year period to include the Operations, Active Closure, and post-Closure phases of the Meliadine Mine. The climate inputs used in the model reflect a variable climate condition, including the predicted climate change under the RCP4.5 scenario.

Under all conditions modeled, the mine water management infrastructure is shown to be capable of collecting, storing, and releasing the mine contact waters and saline waters in a controlled manner, according to the existing licenses and management plans. In addition, the WBWQM results indicate that the predicted Meliadine Mine volumes and water quality will remain within those presented in the 2014 Final Environmental Impact Statement (FEIS), and within the water license limits as prescribed in 2AM-MEL1631.

During the Operations phase, model predictions for the EWTP discharge to Meliadine Lake remain below the Metal and Diamond Mining Effluent Regulations (MDMER) and/or Water License limits. Ammonia-N concentrations are predicted to be above MDMER discharge criteria to Itivia Harbour, and mitigation options (*e.g.*, treatment) are currently being investigated.

1. Introduction

AGNICO EAGLE

1. Introduction

The updated Water Balance and Water Quality model (WBWQM) reflects revisions including changes to the mine plan, operating schedule, and water management infrastructure, underground mining below permafrost at PUMP, and commissioning of the waterline beginning in 2026 with full operation in 2027. This report presents only the information pertinent to the mine plan changes above, all other inputs and assumptions, as presented in Lorax (2024), remain applicable.

Lorax Environmental Services Ltd. (Lorax) was retained by Agnico Eagle to complete the WBWQM update. The modelling effort described in this report builds upon and supersedes that presented in Lorax (2025). The reader is referred to Lorax (2024) for technical details on model setup, assumptions, calibration and validation.

1.1 Report Structure

Following this introduction, the report is structured as follows:

- Section 2 describes the modifications to the mine plan included in the model update;
- Section 1 describes updates made to the water balance model calibration and assumptions;
- Section 4 describes updates made to the water quality model calibration and assumptions;
- Section 0 summarizes the water balance model results;
- Section 6 summarizes the water quality model results; and,
- Section 7 provides a summary of key findings.

2. Model Input Sources

2. Model Input Sources

Key model inputs and sources are described in this section, including the mine plan, water management schedule and assumptions for underground flows.

2.1 Meliadine Mine Plan

The proposed Meliadine Mine timeline is as follows:

- Meliadine Mine Operations: 2019 to 2036 (End-of-Mine [EOM]);
- Active Closure: 2037 to 2043; and,
- Post-Closure: 2044 onwards (modelled to calendar year 2119).

The EOM mine layout (2036), including all delineated sub-catchments is presented in Figure 2-1. The full series of annual layout maps are provided in Appendix A, and the annual water management wire diagrams are in Appendix B of this report.

Mine plan updates are focused on the continuation of mining operations to 2036, and the following specific changes to mine waste deposition and water management:

- Advancement of the PUMP underground mine below permafrost;
- Utilization of the underground mine voids for permanent storage of saline water at the beginning of Active Closure;
- Utilization of the Waterline for the first three years of Active Closure (2037-2039) to remove remaining surface contact water and saline water from storage at site; and,
- Routing of sewage treatment plant discharges to the underground mine void for the duration of the Active Closure phase (2037-2043).

M = Open pit mining and dewatering
D = Finished mining (OP), still dewatering
U = Underground mining
x = Finished mining (UG or OP), no dewatering
- = Pre-mining
S = Saline Contact Water Storage
CW = Contact Water Storage
T = In-pit Tailings Storage
WR = In-pit Waste Rock Storage

2.2 Closure Assumptions

In principle, the management of surface contact water and saline water follows the same logic as previously presented in the 2025 Modification application (Lorax, 2025). The primary objective of the Active Closure period is to remove all remaining saline water stored in surface reservoirs and to manage the remaining geochemical loads to meet the Closure water quality targets. The following updates noted for this submission:

- Remaining saline water in the WES02 pit is pumped underground mine voids at the beginning of Active Closure (2.6 Mm^3 to the Tiriganiaq (TIRI) UG and 0.3 Mm^3 to the PUMP UG);
- Any surface contact water remaining in CP7 and CP1 is pumped to TIRI04 via the EWTP to speed up pit flooding in early Active Closure; and,
- The Waterline is assumed to remain operational for the first three years of Active Closure (2037 through 2039), to allow any saline water remaining in WES02, and remaining contact water in WES03 to be pumped out to Itivia Harbour over this period, prior to flooding the pit with water pumped from Meliadine Lake.

3. Water Balance Model Updates

3. Water Balance Model Updates

The site-wide water balance model (WBM) is comprised of two components: the watershed model that generates flows for disturbed and undisturbed areas (including the Meliadine Lake water balance), and the mine site model that generates runoff and basal seepage for mine infrastructure, including the TSF, WRSFs and exposed pit walls. The mine infrastructure WBM also incorporates elements that represent collection ponds for saline and surface contact water, and the associated pump transfer rates, operational windows, water treatment plants, and pond operating levels. Dewatering of lakes to allow development of mine infrastructure is also incorporated.

3.1 Watershed Model

As part of the model calibration update described in Section 3.2, the foundational watershed model used to predict runoff from natural (undisturbed) and disturbed areas was updated. The watershed model was previously conceptualized as a three-reservoir system, comprised of quickflow (surface flow), shallow interflow, and baseflows (Lorax 2022). The availability of additional site monitoring data prompted a reassessment of the watershed model conceptualization and calibration. As part of this effort, the GR4J watershed model (Perrin *et al.*, 2003; Perrin *et al.*, 2007) was used to generate daily discharge volumes for natural and undisturbed areas. Snow accumulation and melt is calculated using the Cemaneige snowpack model (Valéry *et al.*, 2014), which has two adjustable parameters: the degree day factor, which converts heat energy as a function of air temperature into snowmelt in mm/day; and, the snowpack inertia factor, which tracks the amount of heat input required to initiate melt (*i.e.*, cold content).

The GR4J model tracks the daily water balance as a function of precipitation (P; snowmelt from Cemaneige + rainfall) inputs and evaporative (E) losses from a catchment (see Figure 3-1). The resultant infiltration is partitioned into the Production Store (SMA), which can lose additional water to evaporation on days where $SMA > 0$ and $P\text{-}E = 0$. The other loss from the Production Store is percolation. If the Production Store is full, then any additional infiltration is directed to the routing functions along with the percolation, with UH1 receiving 90% of total and UH2 receiving 10%.

In total, there are four adjustable parameters in the GR4J model, and two in the Cemaneige model (Table 3-1).

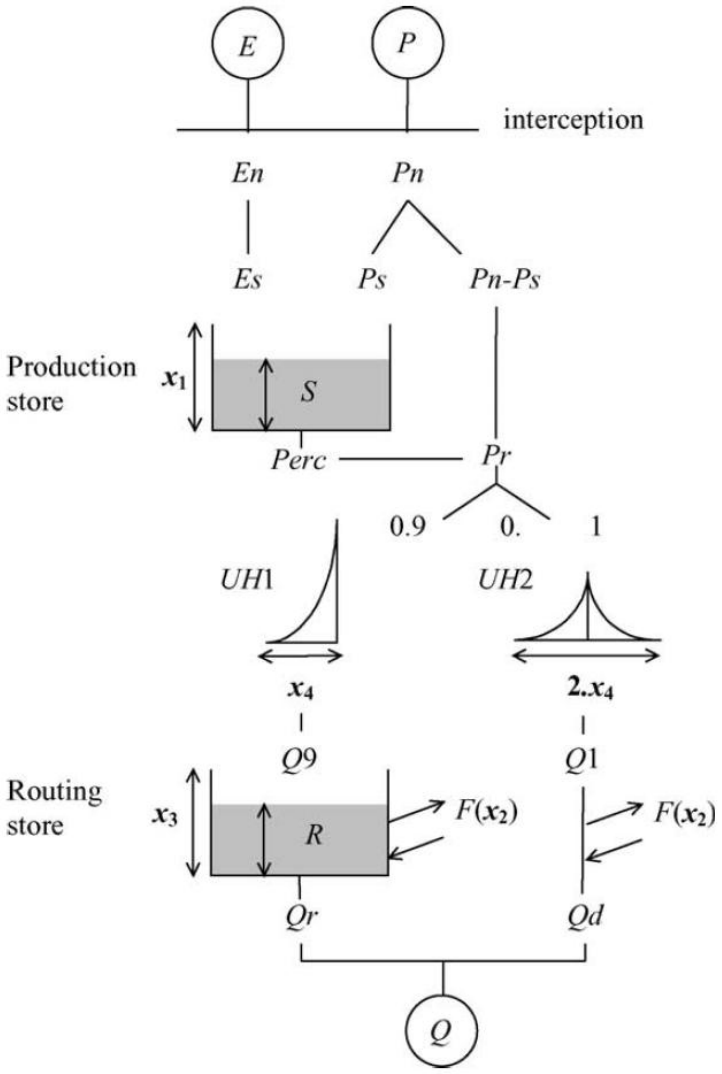

Figure 3-1: Conceptual Diagram of the GR4J Watershed Model

Table 3-1:
Calibrated Cemaneige and GR4J Parameters

Parameter	Value (Dimensionless)
Degree Day Factor	8
Snowpack Inertia Factor	0.61
Production Store (X_1)	9.79
Exchange Coefficient (X_2)	-3.28
Routing Store (X_3)	30
Lag Coefficient (X_4)	1.54

3.2 Model Calibration

Calibration of the watershed model was conducted in two stages:

- To a representative streamflow dataset from a Water Survey of Canada hydrometric station (Akkutuak Creek near Baker Lake; 06MA004; 18 km^2); and,
- To measured daily water level data from mine site collection ponds over the 2020-2025 period.

3.2.1 Regional Streamflow Calibration

The GR4J watershed model is considered well calibrated, with a Nash-Sutcliffe (NSE) value of 0.68, a log-NSE value of 0.59, and a good visual fit between measured and modelled streamflows (Figure 3-2). The calibrated parameter set carried over to represent runoff at the Meliadine mine site is provided in Table 3-1.

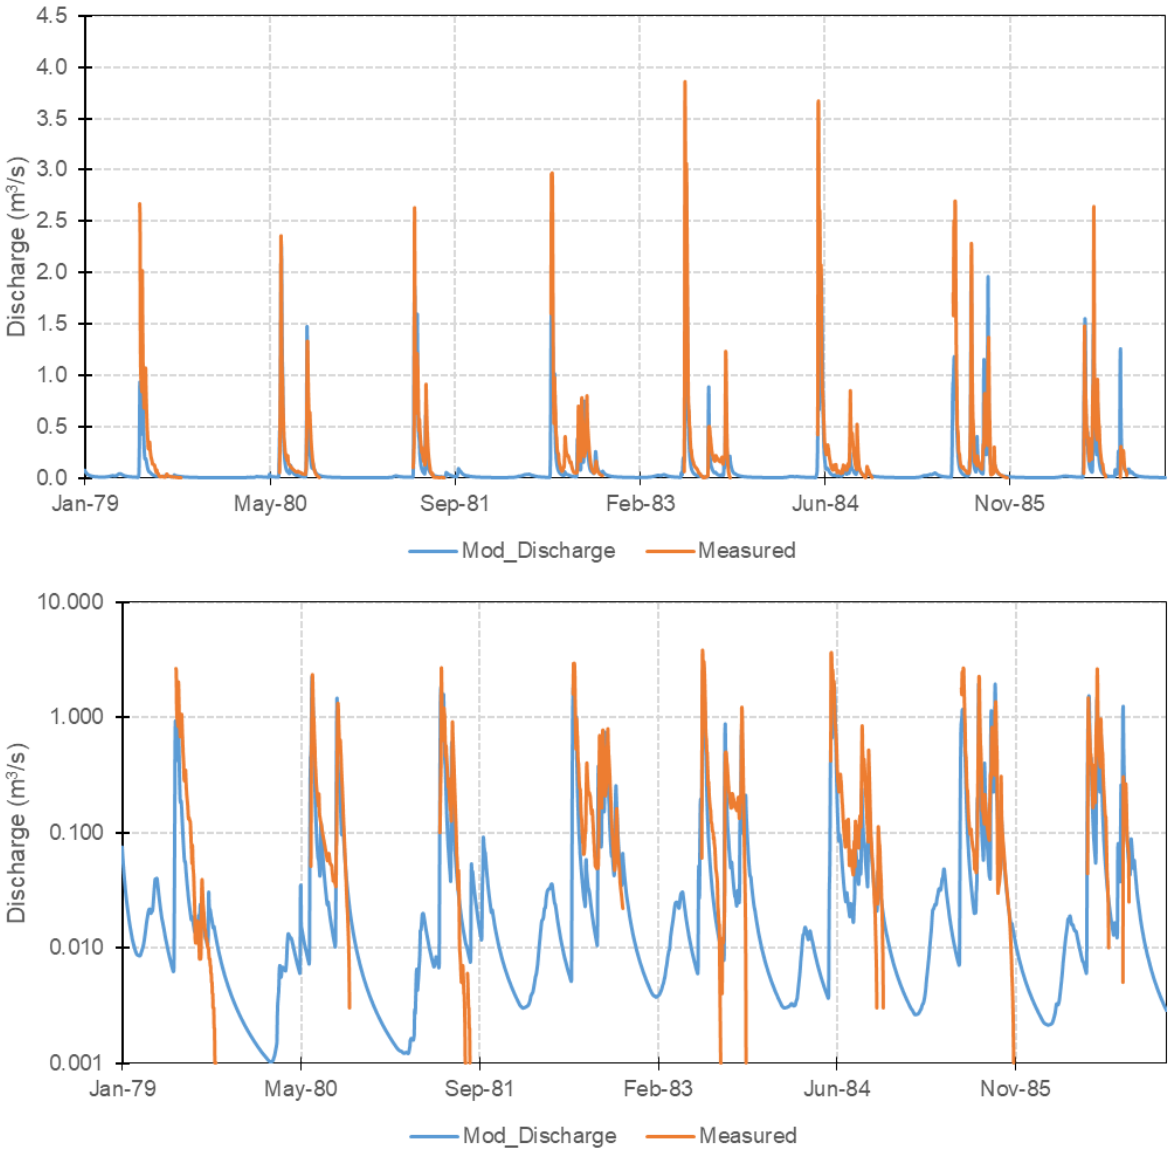

Figure 3-2: Measured and Modelled Streamflows for the Akkutuak Creek Near Baker Lake Hydrometric Station (1979-1986). Note bottom plot with log y-axis.

3.2.2 Meliadine Lake Outflow Calibration

Through previous license amendment applications, information requests were received from intervenors related to the potential changes to the Meliadine Lake water balance as a result of the withdrawals made to flood the open pits during the Active Closure period. For context, the licensed annual withdrawal maximum is 8,676,481 m^3/year, from a total lake volume of approximately 585 Mm^3 (Figure 3-3). This licensed maximum annual withdrawal volume equates to approximately 1.5% of the total lake volume per year.

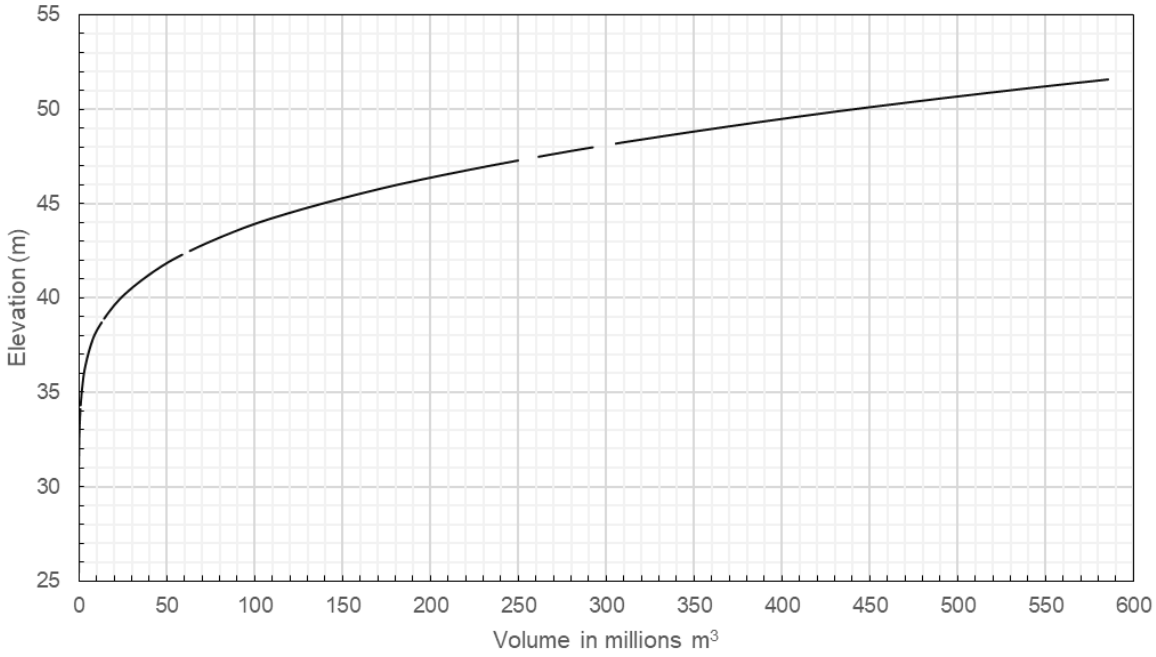

Figure 3-3: Volume-Elevation Curve for Meliadine Lake

Agnico Eagle re-installed two hydrometric stations at the main outlet and northwest outlets of Meliadine Lake in August 2024, and continuous discharge data from these stations to the end of September 2025 were used as a calibration target for a watershed model specific to Meliadine Lake.

Similar to the non-contact watershed model described in Section 3.2.1, a GR4J model was setup to generate inflows to Meliadine Lake, and the volume-elevation curve in Figure 3-3 was used to constrain lake storage changes, surface area and water level fluctuations, along with calculating evaporative losses from the lake surface and meteoric inputs to the lake water balance. Outflows are calculated as a function of lake water level using the rating curves for each of the outflow hydrometric stations.

This model was calibrated to the measured lake outflows and shows good agreement with the measured data (Figure 3-4). As more data is collected from the outflow hydrometric stations, the model will be validated, and the calibration updated if the model predictions drift appreciably from the measured data.

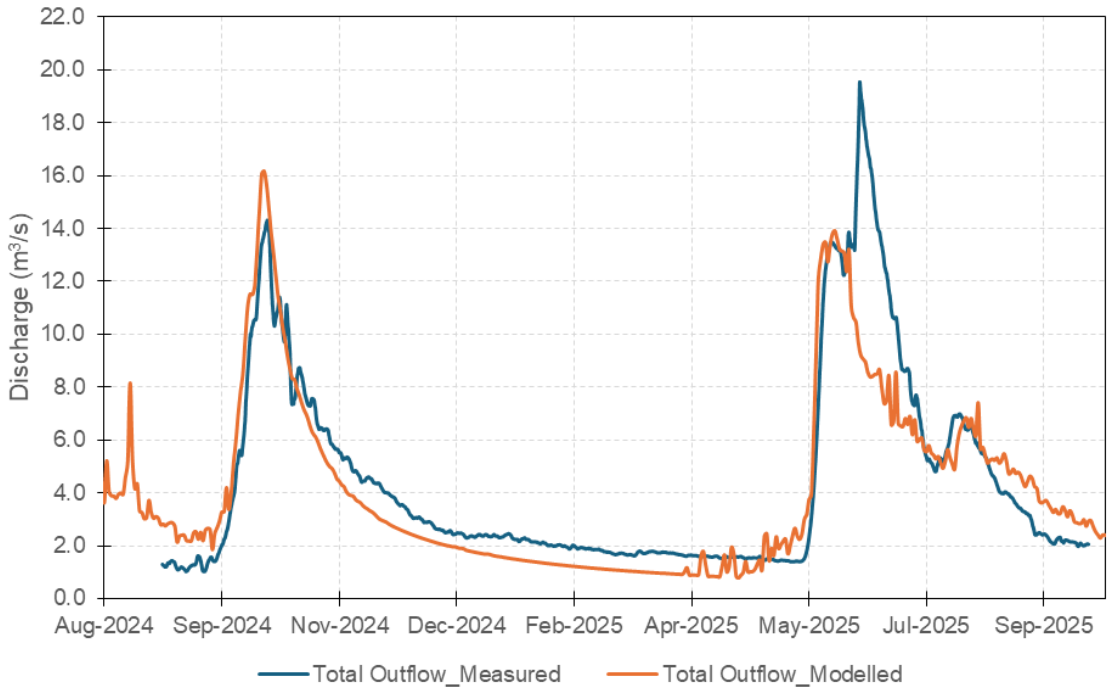

Figure 3-4: Modelled and Measured Outflows from Meliadine Lake

Modelled annual lake inflows and outflows (including evaporative losses) average 119 Mm^3/year (Figure 3-5), indicating a hydraulic residence time of Meliadine Lake of approximately 5 years. The licensed maximum annual withdrawal is equivalent to 7% of the annual average lake inflows on a volumetric basis.

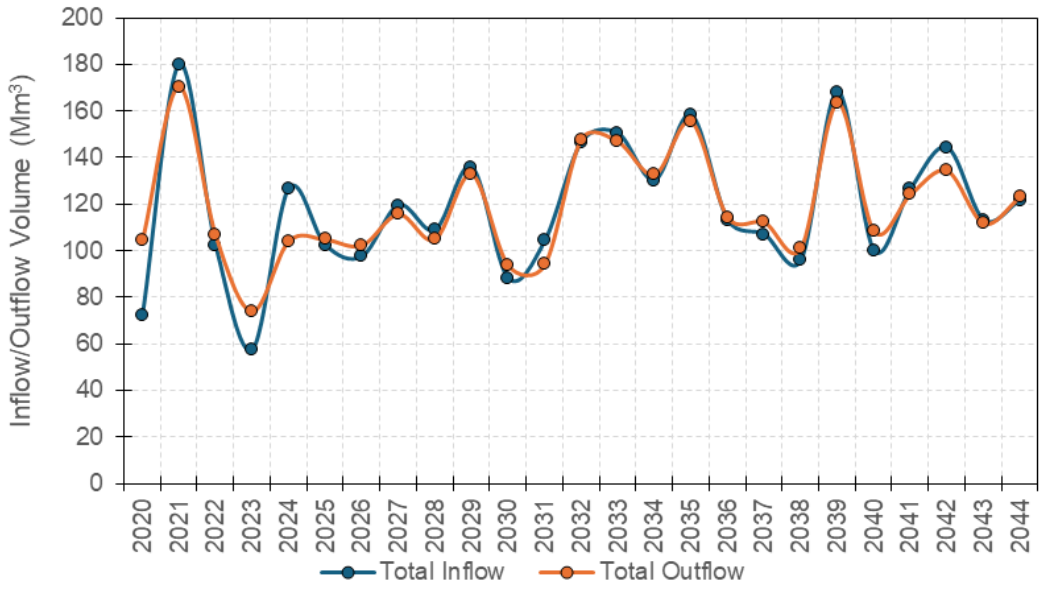

Figure 3-5: Modelled Total Annual Inflows and Outflows for Meliadine Lake

3.2.3 Collection Pond Water Balance Calibration

The second stage of the water balance model calibration focused on replicating the fluctuations in collection pond volumes as represented by continuous water level measurements made over the 2020-2025 period, and water routing as presented in Table 3-2.

Inputs to the calibration model included:

- Daily climate (minimum, mean and maximum daily air temperature and precipitation) scaled from the Rankin Inlet climate station;
- Incorporation of operational contact water routing, including pump rates, into the WBM;
- Catchment and/or landform specific target runoff coefficients (Table 3-3)
- Annual sub-catchment delineations (Figure 3-6 through Figure 3-10);
- Calibrated watershed model described in Section 3.2.1;
- Measured water quality for key POPCs (described in Section 4); and,
- Measured monthly underground dewatering volumes (Table 3-6).

Pond volume measurements were provided by Agnico Eagle and were calculated from measured water levels and the pond specific storage-elevation curves. Pump rates between ponds (and to treatment plants) were also provided by Agnico Eagle, providing a control on inflows and outflows for each pond.

Table 3-2:
Surface Contact Water Routing to CP1 – Current Conditions

Pond	Surface Contact Water Routing
CP1 – TSF	Culvert 1 → Culvert 18→ Culvert 2 → Channel 1 →Culvert 3→ CP1
CP3- TSF	Channel 3 → CP 3 (pumped) → CP1
CP1-WRSF1	Channel 7→ Channel 8 → Channel 1 → Culvert 3 → CP1
CP5-WRSF1	Channel 5 → CP5 (pumped) → CP1
CP4-WRSF1	Channel 4 → Collection Pond 4 (pumped) → Collection Pond 1
CP6-WRSF3	Collection Pond 6 (pumped) → Collection Pond 1

Table 3-3:
Land Surface Types, Representative Runoff Type and Target Runoff Coefficients

Land Cover Type	Surface Runoff	Interflow	Baseflow	Target Runoff Coefficient
Disturbed[1]	x	x	x	0.50
Hard Surface (Ore Pads, Facilities Areas, Laydowns)[1]	x			0.80
Natural[1]	x	x	x	0.50
Tailings[2]	x	x		0.05 (Runoff); 0.20 (Interflow)
Open Water	x			1.0, minus evaporation
Waste Rock and Salt Rock Piles[2]	x			0.10 (Runoff); 0.0 (Interflow)
Open Pit Walls[3]	x			0.40

Notes:
[1] Average runoff coefficient provided, effective annual coefficients vary according to climate forcings
[2] Upper bound of predicted values (90th percentile), reflective of years where runoff or interflow predicted to occur (mode is zero)
[3] Constant runoff coefficient

3.3 Mine Site Water Balance Model

This section describes the components of the mine site WBM that have been updated from those presented in Lorax (2024). The representation of contact water generation from the TSF, WRSF and pit walls remains unchanged.

3.3.1 Lake Dewatering

To accommodate construction of mine infrastructure, it will be necessary to dewater multiple lakes located within the Meliadine Mine footprint. The model assumes that lakes are dewatered in the year prior to the associated mine infrastructure coming online (Table 3-4). Previously, it was assumed that the upper 50% of lake volume contain low levels of TSS and thus would be discharged to the receiving environment without treatment. The lower 50% of each lake (by volume) was expected to contain higher levels of TSS that may potentially exceed discharge criteria, and therefore these volumes were routed to the EWTP for treatment prior to discharge.

Based on operational experience during the dewatering of Lake A8 in 2025, 90% of that volume met discharge criteria and was dewatered directly to Meliadine Lake, with the bottom 10% by volume sent to CP1 for treatment prior to discharge. Based on this outcome, a conservative assumption is made here for most lakes, such that 70% of the dewatered volume is discharged directly to Meliadine Lake, and 30% is pumped to CP1. For smaller lakes, 100% of the volume is assumed to be sent to CP1.

Table 3-4:
Lake Dewatering Schedule

Mine Area	Lake	Volume (m^3)	2026	2027	2028	2029

3.3.2 Groundwater Inflows to Pits

During mining of the WES03, WEN01 and PUMP04 pits, limited inflows of nearby shallow groundwater are predicted to occur. These inflows are expected to be limited in duration, as they result from draindown of remaining groundwater following dewatering of adjacent lakes. The inflows and associated TDS concentrations provided in Table 3-5 are also incorporated into the pit water and load balance model.

Table 3-5:
Predicted Daily Groundwater Inflows to Pits and Total Dissolved Solids Concentrations

Year	Predicted Groundwater Inflow (m^3/day)			Predicted Inflow TDS (mg/L)		
	WES03 Pit	WEN01 Pit	PUMP04 Pit	WES03 Pit	WEN01 Pit	PUMP04 Pit
2025	-	-	-	-	-	-
2026	200	-	-	1,500	-	-

2034	-	-	75	-	-	500
2035	-	-	-	-	-	-
2036	-	-	-	-	-	-

Source: WSP 2026

3.3.3 Underground Inflows

The predicted average daily inflows to the underground mine workings remain uncharged from the 2024 Water Licence Amendment for the TIRI UG (Lorax, 2024) and are expected to be slightly higher for the PUMP UG mine beginning in 2028 as mining moves below the permafrost (Table 3-7; WSP 2024).

Measured underground inflows are presented for the 2018-2025 period in Table 3-6. The base case predicted inflows for the TIRI UG mine consisting of the Tirganiaq, Wesmeg and Wesmeg-North underground operations, were subsequently adjusted to account for the calculated difference between the predicted and measured underground inflows over the 2020-2023 period. This is equivalent to an approximate *measured:predicted* ratio of 0.74. Further losses to ore moisture (assumed to equal 2%) of ore mass are also applied, resulting in the adjusted values in Table 3-7. The predicted PUMP UG inflow values were not adjusted prior to input to the model. The WBWQM assumes that dewatering of all underground mines will be managed to the saline water management system due to the elevated TDS of the groundwater system.

Table 3-6:
Monthly measured underground dewatering volumes (2018-2025).
All values in m^3/day.

Month	2018	2019	2020	2021	2022	2023	2024	2025
January	0	88	17	122	154	51	239	217
February	0	58	100	73	140	110	293	219
March	0	42	335	82	119	118	224	147
April	0	90	977	74	139	176	221	233
May	0	131	541	164	148	151	295	230
June	81	191	388	193	235	187	352	282
July	333	260	255	235	245	296	357	387
August	249	175	170	231	271	250	414	441
September	321	143	182	198	330	260	443	382
October	111	2	129	199	244	275	421	430
November	112	8	103	108	125	282	321	311
December	29	26	201	115	111	206	204	310
Average	**103**	**101**	**283**	**149**	**188**	**197**	**315**	**299**

In addition to the predicted underground mine inflow rates, WSP (2026) predicted that water storage in the WES03 pit over the 2028-2036 period would result in 90 m^3/day of seepage reporting to the underlying Tiriganiaq underground mine. These seepage rates are conservative estimations, as they assume maximum underground mine extents, the WES03 pit flooded to the spill point elevation, and maximum possible permafrost degradation (WSP 2026). This predicted seepage from the WES03 pit to the TIRI UG mine is included in the dewatering rates presented in Table 3-7.

Table 3-7:
Predicted Daily Underground Dewatering Volumes (m^3/day)

Year	Underground Inflows (m^3/day)	
	TIRI UG	PUMP UG
2026	792	-
2027	1,008	50
2028	1,163	100
2029	1,073	125
2030	1,019	175
2031	1,019	275
2032	1,037	325
2033	1,037	350
2034	1,037	350
2035	1,019	350
2036	1,019	350

Notes:
Source: WSP 2026
Estimated groundwater inflows to the TIRI UG include reductions due to brine recirculation and ore moisture losses (0.72x), and additional seepage from WES03 pit (90 m^3/day for 2028-2036).

4. Water Quality Model Updates

AGNICO EAGLE

4. Water Quality Model Updates

This section summarizes the approach, assumptions, conceptual model, and inputs used to construct the water quality model.

4.1 Approach and Assumptions

The water quality model is built upon the water balance model architecture described in Chapter 3, with water quality signatures assigned to non-contact (undisturbed) areas and mine infrastructure. Source term inputs to the WQM are based on either empirical observations from the operating mine site, data collected at analogue mine sites, or the results of various geochemical and metallurgical tests that have been undertaken to provide a basis for assigning likely future water quality associated with specific mine components.

Conceptually, modelled flows and associated source terms are combined in the GoldSim platform to derive predicted water quality estimates at key locations across the mine site (*e.g.*, ponds, pit lakes) and the two receiving environment nodes (Itivia Harbour and Meliadine Lake) throughout the phases of the Meliadine Mine. Concentrations of the POPCs listed in Table 4-1 are modelled for all mine water management ponds and sumps, open pit lakes and receiving environment nodes. WQM outputs are aggregated on a monthly time-step and Itivia Harbour discharges are screened against relevant water quality criteria described in Section 4.2.

Table 4-1:
Water Quality Model Parameter List

Major Ions	Dissolved		Total	
TDS	D-Ag	D-K	T-Ag	T-K
NH_3-N	D-Al	D-Mg	T-Al	T-Mg
NO_3-N	D-As	D-Mn	T-As	T-Mn
NO_2-N	D-B	D-Mo	T-B	T-Mo
SO_4	D-Ba	D-Na	T-Ba	T-Na
T-CN	D-Be	D-Ni	T-Be	T-Ni
WAD-CN	D-Ca	D-P	T-Ca	T-P
	D-Cd	D-Pb	T-Cd	T-Pb
	D-Cl	D-Sb	T-Cl	T-Sb
	D-Co	D-Se	T-Co	T-Se
	D-Cr	D-Sr	T-Cr	T-Sr
	D-Cu	D-Tl	T-Cu	T-Tl
	D-F	D-U	T-F	T-U
	D-Fe	D-V	T-Fe	T-V
	D-Hg	D-Zn	T-Hg	T-Zn
		D-Ra226		T-Ra226

Both total and dissolved concentrations are predicted for end-of-pipe (EOP) discharges during operations. The total concentrations are calculated by assuming that mine discharge to Meliadine Lake and Itivia Harbour contains the maximum monthly mean TSS concentration set by MDMER of 15 mg/L. In post-Closure, TSS levels in modelled waterbodies are expected to return to baseline concentrations. Owing to the minimal TSS present in the baseline environment, the model output assumes that total concentrations are equal to dissolved concentrations in this phase of mine life.

4.2 Parameter List and Screening Criteria

The parameters carried forward in the model consist of POPCs as defined by applicable guidelines and major ions that that contribute to TDS and hardness (Table 4-1). Both total and dissolved concentrations are tracked for certain model nodes (*i.e.,* EWTP, Waterline). Regulated parameters are defined in the following documents:

- 2020 Aquatic Effects Management Plan (AEMP) (Agnico Eagle, 2020a);
- Ocean Discharge Monitoring Plan (ODMP) (Agnico Eagle, 2020b); and,
- Type A Water License (2AM-MEL1631) for the Meliadine Mine.

The water quality model predictions are compared against applicable guidelines (Table 4-2) as a screening tool to identify POPCs. The specific screening criteria used for all mine phases are outlined below:

- During Operations, model predictions at the end-of-pipe (EOP) to Meliadine Lake (EWTP) are screened against effluent discharge limits outlined in the Type A Water Licence (2AM-MEL1631) for the Meliadine Mine and MDMER, while discharges to Itivia harbour are screened against MDMER.
- During the Active Closure and post-Closure phases, model predictions at collection ponds, pit lakes, and natural waterbodies were screened as follows:
    - For waterbodies that are accessible to both aquatic and terrestrial life, generic water quality guidelines (CCME) and site-specific water quality objectives (SWQOs) adopted in the AEMP were used as the screening criteria.
    - For waterbodies listed under Schedule II as part of the Meliadine Mine Project (*e.g.,* B4, B7), model predictions were compared to both generic water quality guidelines for the protection of terrestrial life and aquatic life (CCME), although the listed waterbodies are not intended to support aquatic life given their Schedule II listing.

Table 4-2:
Water quality guidelines applied for comparison with model predictions during Operations, Active Closure, and post-Closure.

Notes:
1. For waterbodies that are accessible to both aquatic and terrestrial life, generic water quality guidelines (CCME) and site-specific water quality objectives (SWQOs) adopted in the AEMP were used as the screening criteria. Site-specific hardness predicted at each node during Active Closure and post-Closure (2037-2119) was used to derive guidelines for parameters that are hardness dependent. The maximum pH (7.46) and lowest DOC (3.19 mg/L) measured at the MEL-01 monitoring station in 2020 were used to derive conservative guidelines for dissolved manganese and zinc.
2. The total ammonia (NH_3-N) guideline was determined conservatively by assuming a pH of 8 and a temperature of 15ºC.

4.3 Baseline (Non-contact) Water Quality Data

The baseline (unimpacted) concentrations were calculated from the available monitoring data for the undisturbed non-contact areas. Median baseline concentrations are summarized in Table 4-3 to Table 4-7.

Table 4-3:
Median Baseline Major Ions and Nutrient Concentrations for Non-contact Areas

4.4 Source Terms

4.4.1 Source Term Updates

The source terms developed for the Nunavut Water Board (NWB) 2024 Water Licence Amendment, described in Lorax, (2024) are applied to the current model scenario with updates as described below.

- Source terms were adjusted to reflect the current mine plan and waste schedule for WRSFs, the TSF, open pits, and the underground mine.
- Deposition of wind-blown particulates originating from the TSF has been incorporated into the water quality model. The addition of dust fall loads were calibrated based to water quality changes in Reference Lakes observed between 2019 and 2024, which are discussed in greater detail in Section 4.4.2.
- Updated calibration of WRSF and TSF source terms were completed for the period of 2020 to 2024 as informed by recent monitoring data at CP3, CP4 and CP6. The calibration calculates WRSF and TSF loading based on water quality monitoring and water balance of each collection pond. The updated calibration also incorporates estimates of dust fall impacts on each collection pond, described in Section 4.4.2.
- The end-of-mine lithologic compositions presented in Lorax (2022) are used to calculate the geochemical source terms for the WRSFs, pit walls, and TSF. This is a simplification from previous model versions, which used a transient dump composition for each year of mine life.
- Underground mine loading rates were updated to reflect the current mine schedule and monitoring data from 2020 to 2024. The loading rates derived for wall rock, rockfill and tailings backfill were adjusted from what was derived in Lorax (2022) to match annual median concentrations produced from TIRI UG between 2020 and 2021. The adjusted loading rates were then applied to the excavation and backfill schedule for TIRI and Pump UG mines. These loadings are combined with groundwater flows and TDS concentrations provided in Table 3-6 to produce source terms from UG mines.

All other source terms (*e.g.*, STP effluent, disturbed areas.) are identical to those described in the Lorax (2024) WBWQM. Complete source terms applied to the water quality model are provided in Appendix C.1.

4.4.2 Dustfall Loading Rate

Reference Lakes surrounding Meliadine Mine (A8, B7, D7, E3, G2 and H2; Figure 3-6) have shown changes in water quality since mining activities began in 2019. Monitoring data shows concentrations of As and Na have increased between 2019 and 2024, while concentrations of most other metals (e.g., Cd, Co, Cu) have remained relatively stable and near detection limits (Agnico Eagle, 2024).

The Reference Lakes do not directly receive mine site surface water, and the potential for groundwater seepage reaching these lakes is considered low due to pervasive permafrost surrounding mining areas. Potential sources of Na and As loadings to the Reference Lakes include melting of saline permafrost which is widespread in regions surrounding Hudson Bay (Skierszkan et al., 2024), or wind-blown dust from the mine area (e.g., TSF dry stack). Evidence for the source of As and Na can be found in seasonal water quality monitoring trends and observations from Snowcore data.

Different seasonal trends are observed for As and Na in Reference Lakes, with peak As concentrations typically observed during freshet while peak Na concentrations typically observed in the fall. This trend is most evident in smaller lakes (E3, G2 and H1) which are more sensitive to seasonal variations in runoff quality (Figure 4-1). The occurrence of peak As concentrations in the spring indicates that its release is associated with snowmelt. Snowcore monitoring data at station SNOCORE-Boundary near Lake G2 shows D-As concentrations ranging from 0.0036 to 0.047 mg/L, which is similar or greater than the range of peak As concentrations observed during freshet in Lake G2 (Figure 4-1). Conversely, snowcore data from this station shows Na concentrations ranging from 0.41 to 1.01 mg/L, which is below the range of concentrations observed in Lake G2 (Figure 4-1), indicating that snowmelt is not contributing to increasing Na concentrations.

The behaviour of As in Reference Lakes is consistent with release from wind-blown dust. That is, a majority of dust fall occurs during winter months when the strongest winds occur and dust suppression is more challenging. The relatively high As concentrations in the Snowcore, and peak concentrations associated with Snowmelt are consistent with this release mechanism. The behaviour of Na in Reference Lakes is more consistent with saline permafrost melt, as this parameter is not notably elevated in Snowcore, and it shows peak concentrations in the fall when the active zone melt reaches its seasonal depth maximum.

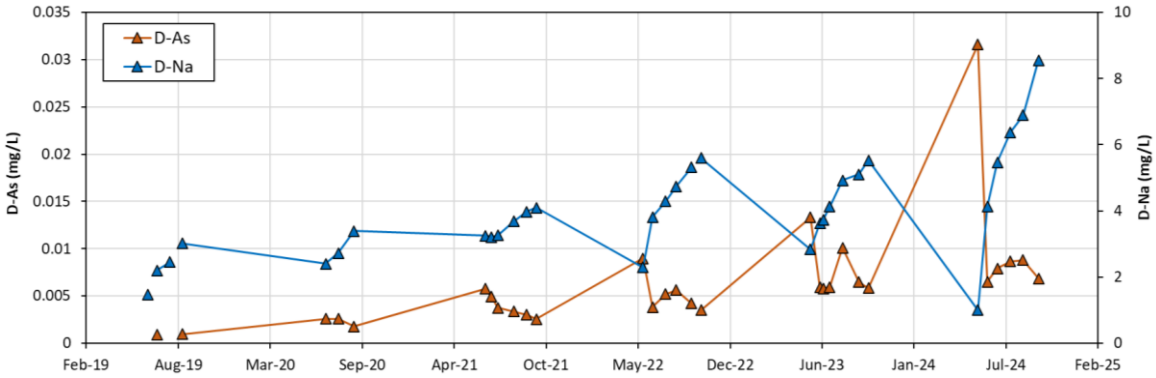

Figure 4-1: Time series for As and Na in Lake G2 for the period of February 2019 to December 2024.

In order to incorporate As loading associated with dust fall into the water quality model, a calibration exercise was completed using Reference Lake data. The calibration was designed to re-produce the water balance of each Reference Lake and calculate the As loading required to re-produce the 95th percentile As concentration observed in each Reference Lake between 2019 and 2024. The calibration results, along with water quality monitoring, estimated dust-impacted runoff concentrations, and Snowcore monitoring data adjacent to each Reference Lake are shown in Figure 4-2 and Figure 4-3. The calibrated As loading rates used to generate the concentrations shown in these figures are shown in Table 4-7.

Dust fall loading rates derived for Reference Lakes were applied to adjacent mine-impacted catchment areas. The two catchments immediately surrounding the TSF were assigned 2x the B7 catchment are loading to account for proximity to the TSF. The catchment surrounding the Fzone and Pump areas were assigned the dust fall loading calculated for Lake A8, which is the nearest calibration point (e.g., Reference Lake) to these mining areas.

The dust fall loading rates shown in Table 4-7 are applied to the operations phase of the water quality model. Dust fall loading is expected to be mitigated in active closure by TSF cover construction, removal of ROM ore stockpiles, and cessation of blasting in open pits. Therefore, no As dust fall loading was applied in the Active Closure or Post Closure period.

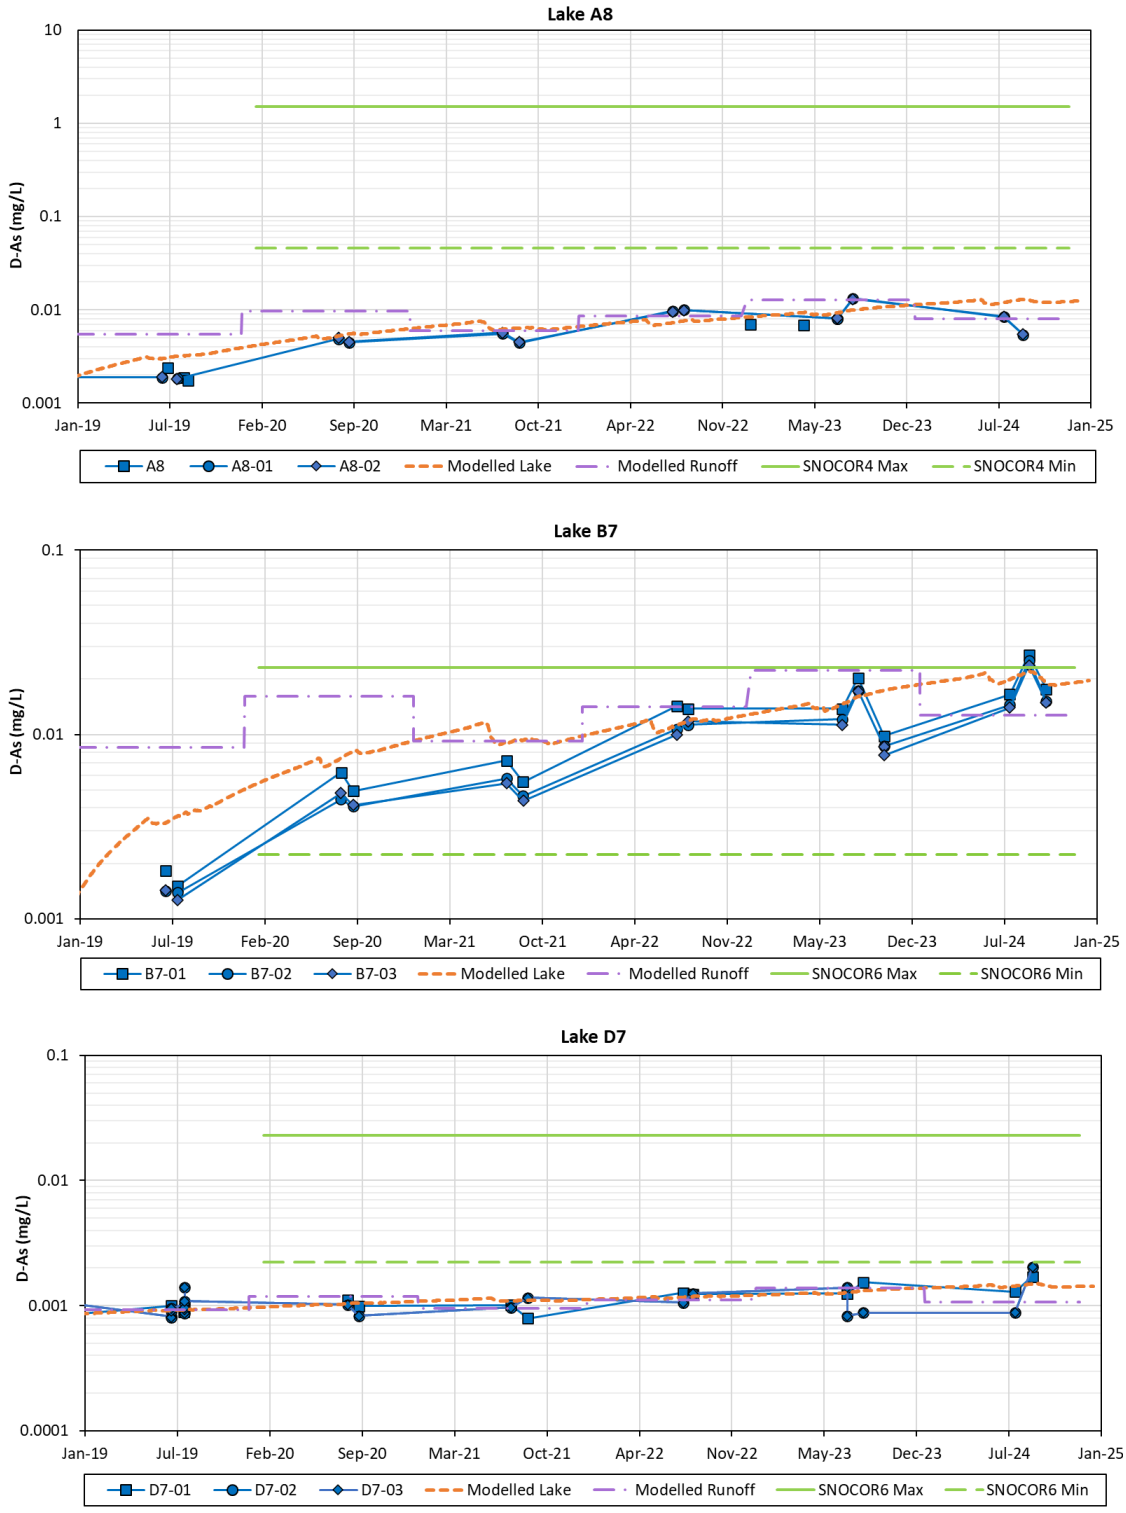

Figure 4-2: Arsenic monitoring and modelling results for Lakes A8, B7, and D7 and As snow core concentrations for the period of January 2019 to December 2024. Note that the y-axis is plotted on a logarithmic scale.

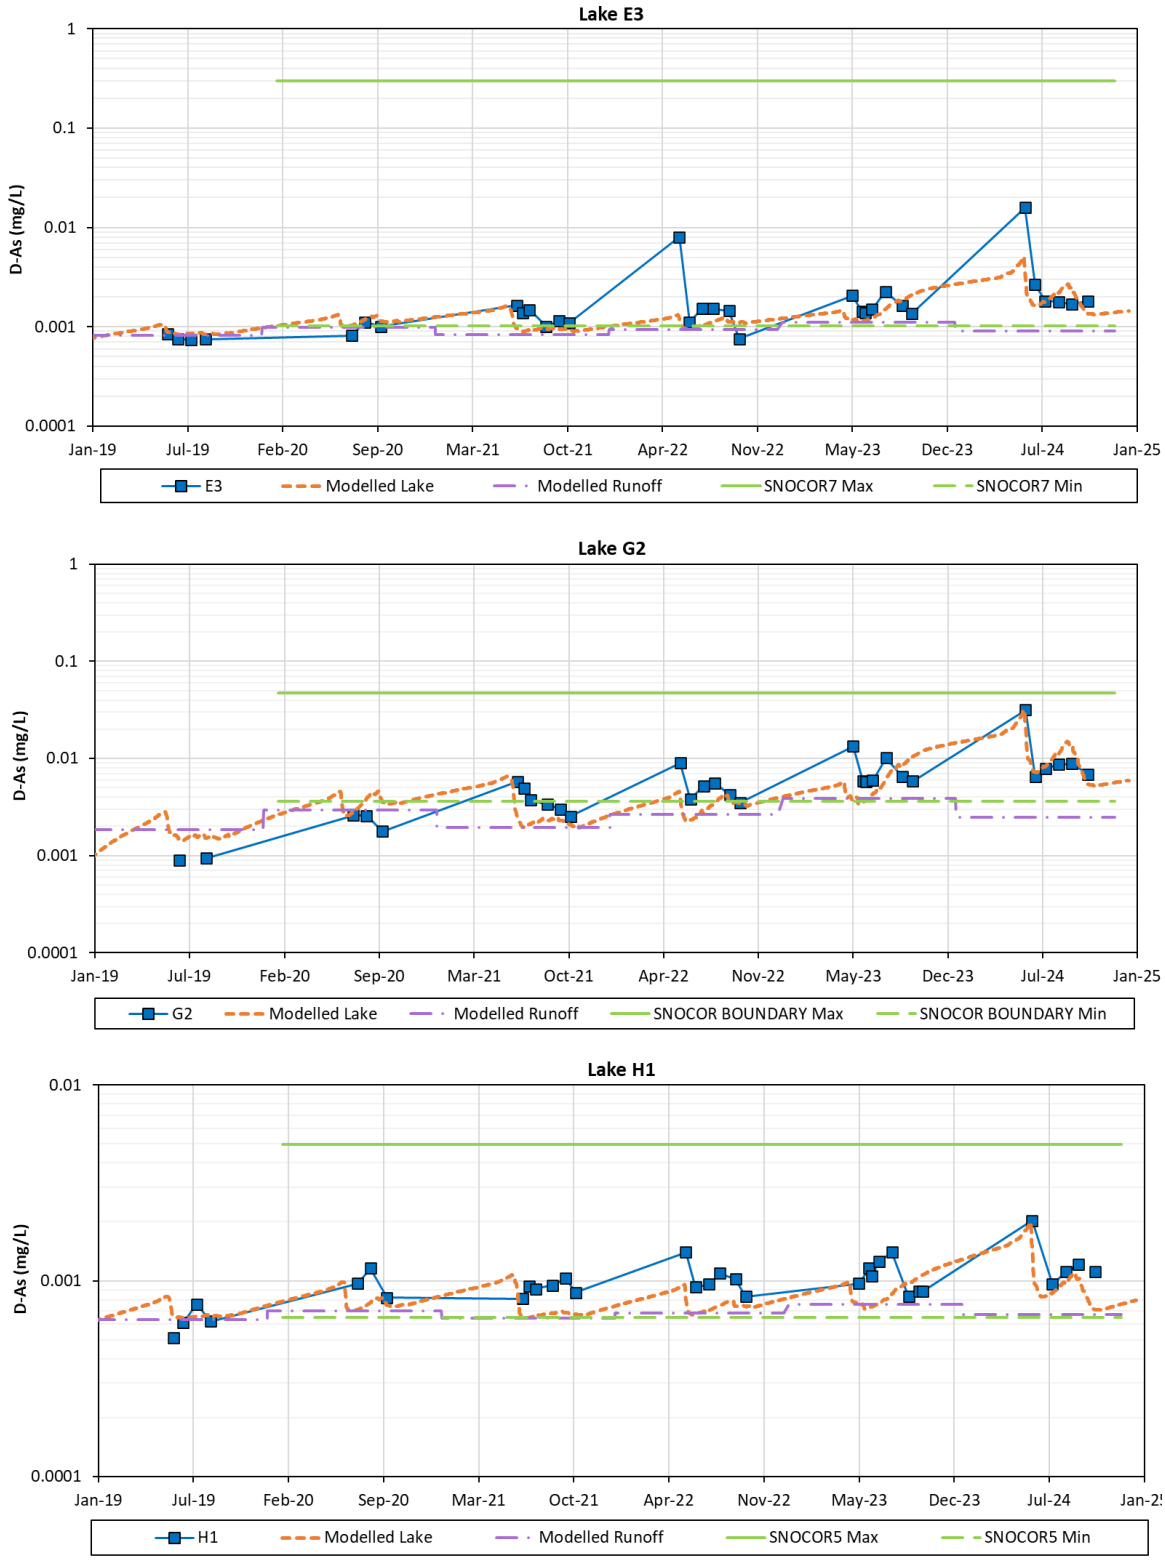

Figure 4-3: Arsenic monitoring and modelling results for Lakes E3, G2, and H1 and As snow core concentrations for the period of January 2019 to December 2024.

Table 4-7:
Dustfall Loading Rates

Catchment Area	Dustfall Loading Rate (As mg/m^2/day)	Data Source
A8	0.0035	Calibrated
B7	0.0065	Calibrated
D7	0.00022	Calibrated
E3	0.00014	Calibrated
G2	0.00094	Calibrated
H1	0.000057	Calibrated
CP3	0.013	2x B7 Catchment
CP4	0.013	2X B7 Catchment
CP6	0.000057	H1 Catchment
CP1	0.0065	B7 Catchment
FZone Area	0.0035	A8 Catchment
Pump Area	0.0035	A8 Catchment

4.4.3 Validation of Predicted Water Quality

Water quality predictions are validated against site monitoring data from 2020 to 2024 in order to confirm that the current model can conservatively reproduce observed water quality. The validation is conducted using the most up to date version of the WBWQM which incorporates the current site layout (Figure 3-6 to Figure 3-9), site pumping records, calibrated source terms and dustfall estimates.

Model node CP1 represents composite drainage chemistry from mine surface facilities. The CP1 collection pond has operated as the final collection point for surface contact water prior to treatment via the effluent water treatment plant (EWTP) and discharge to Meliadine Lake. This collection pond receives drainage from all non-saline mine facilities (*e.g.*, WRSF1, WRSF3, TSF, ore stockpiles, mine facilities areas, *etc.*) and upgradient mine catchments. Validation results for CP1 are provided in Figure 4-4. Additional validation results for calibrated nodes CP3, CP4, CP6 and the Tiriganiaq Underground are provided in Appendix C.2.

Overall, the validation model shows that calibrated source terms conservatively predict water quality at CP1 for TDS, sulphate, total cyanide (T-CN) ammonia (NH_3), arsenic (As), nickel (Ni), copper (Cu) and selenium (Se). Modelled concentrations during the winter months are under ice; therefore, validation focuses on model fit to monitoring results collected during the open water season (June to September). For NH_3-N, results are initially

below the range of monitoring results shortly after model initiation in 2020 but are then significantly overestimated from 2021 onwards. Validation of this parameter in CP1 is complicated by attenuation processes impacting NH_3 such as oxidation and algal assimilation not incorporated into the model framework. T-CN values are underestimated in 2020, which could be impacted by model initialization and the elevated T-CN method detection limit during this time period. Monitoring data collected with lower T-CN detection limits starting in 2022 show overall better validation.

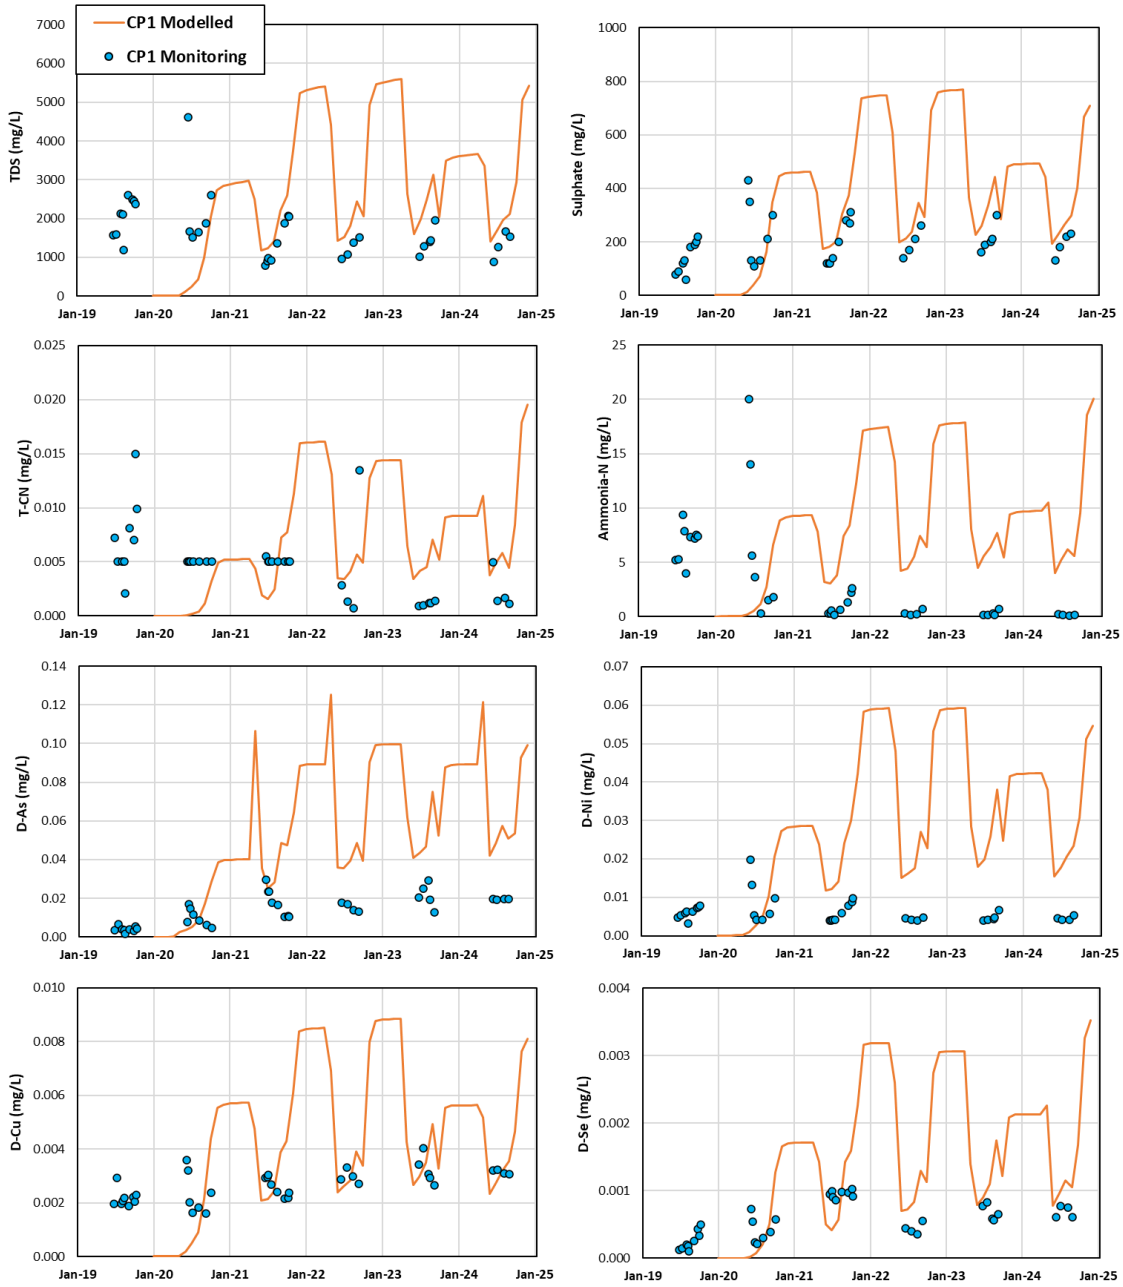

Figure 4-4: Water Quality Model Validation Results for CP1

The validation exercise shows that the water quality model assumptions can conservatively reproduce monitoring results.

4.4.4 Source Term Results

The temporal trends for TDS and As are illustrated for WRSFs, the TSF, Open Pits, in Figure 4-5, Figure 4-6 and Figure 4-7, respectively. The complete set of source terms applied to the current WBWQM are provided in Appendix C.2.

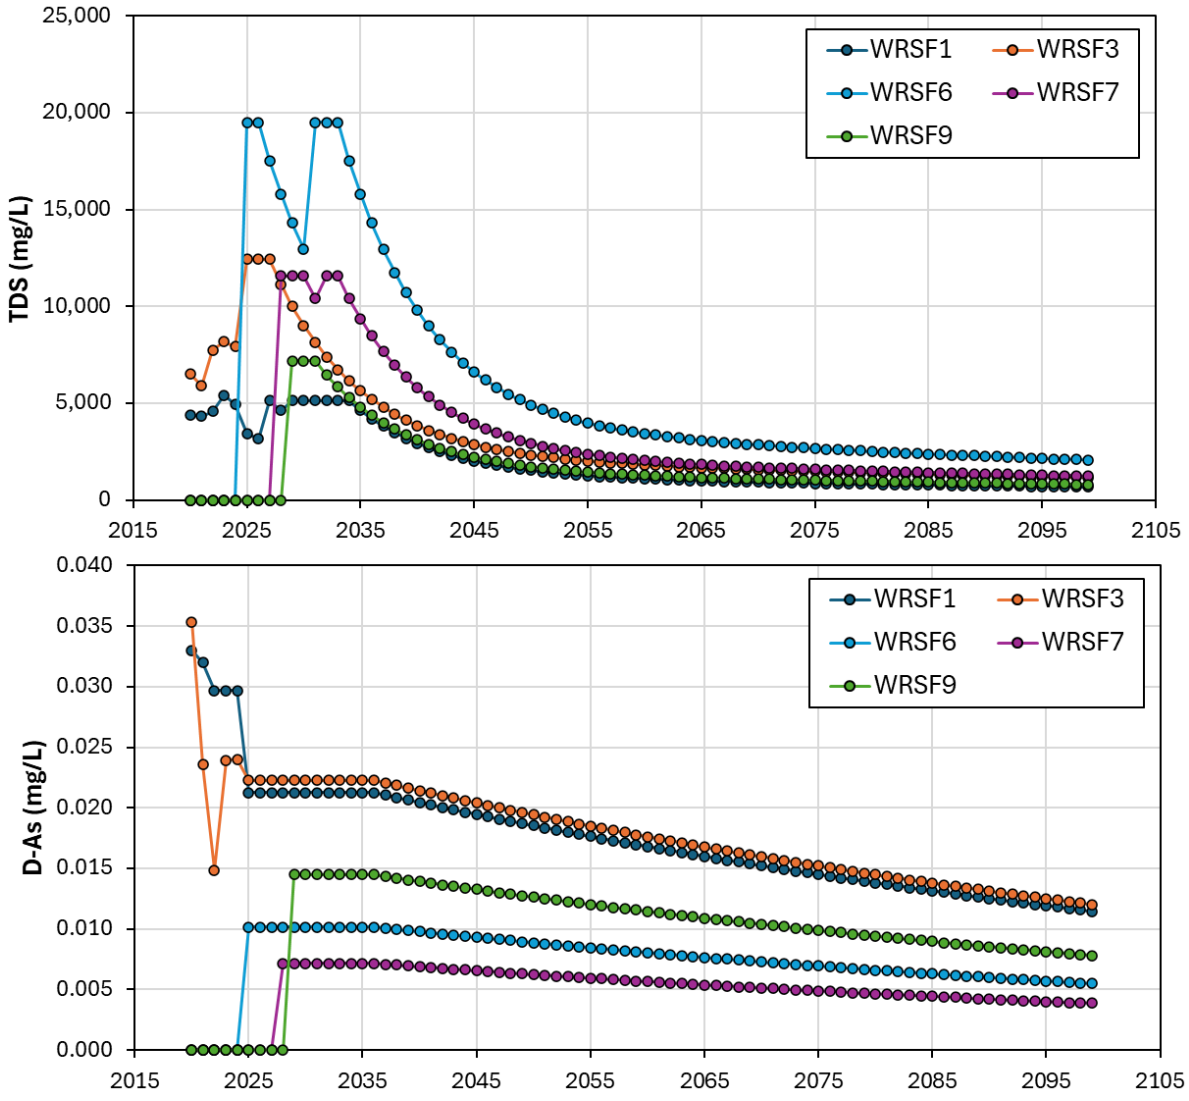

Figure 4-5: Waste Rock Storage Facility Annual Source Term for TDS (top) and As (bottom).

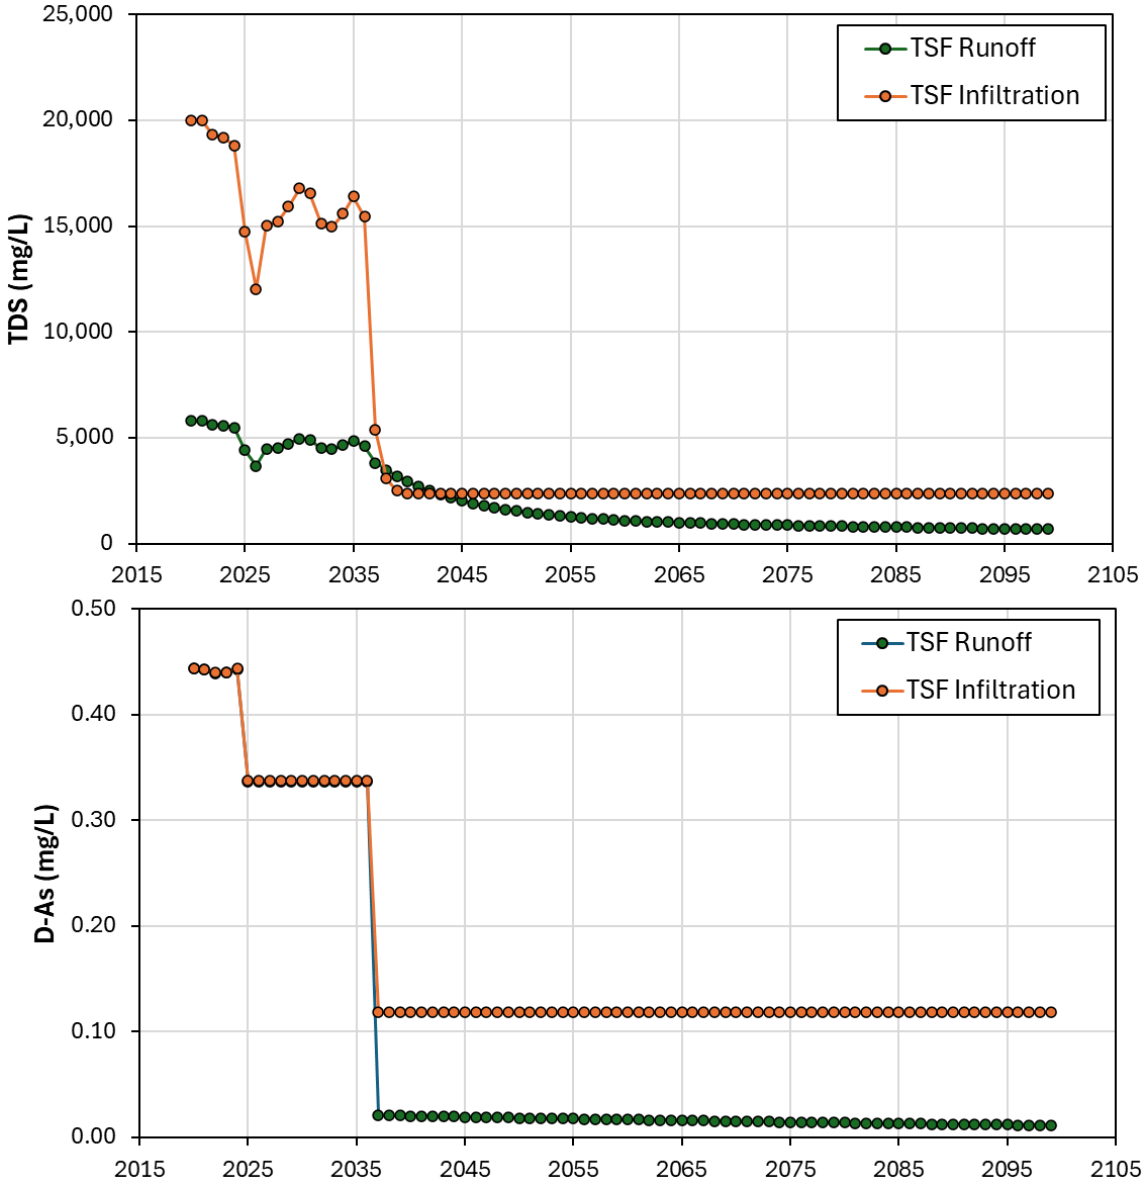

Figure 4-6: Tailings Storage Facility Annual Source Terms for TDS (top) and As (bottom).

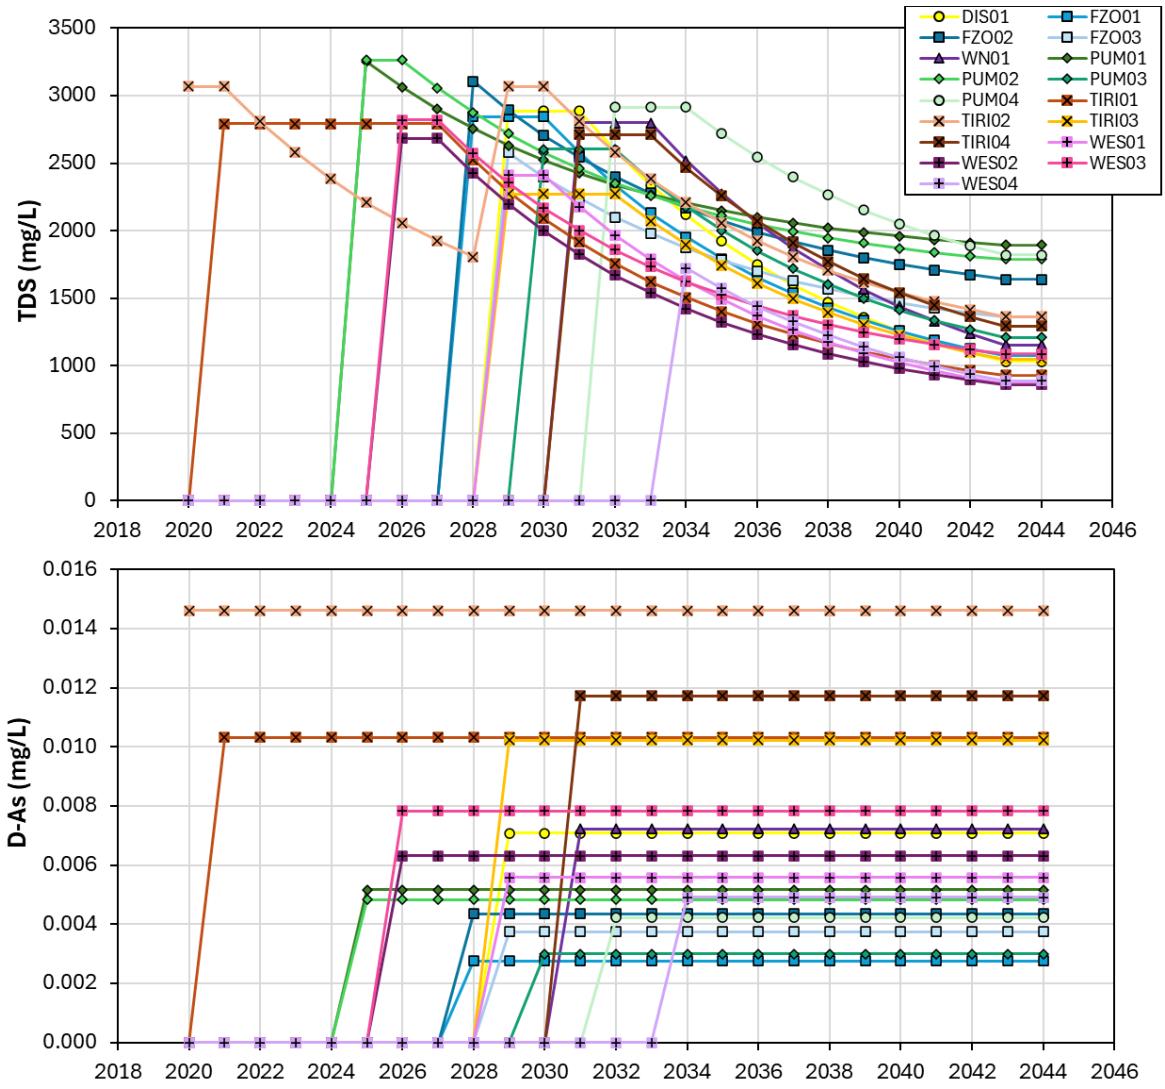

Figure 4-7: Pit Wall Annual Results for TDS (top) and As (bottom).

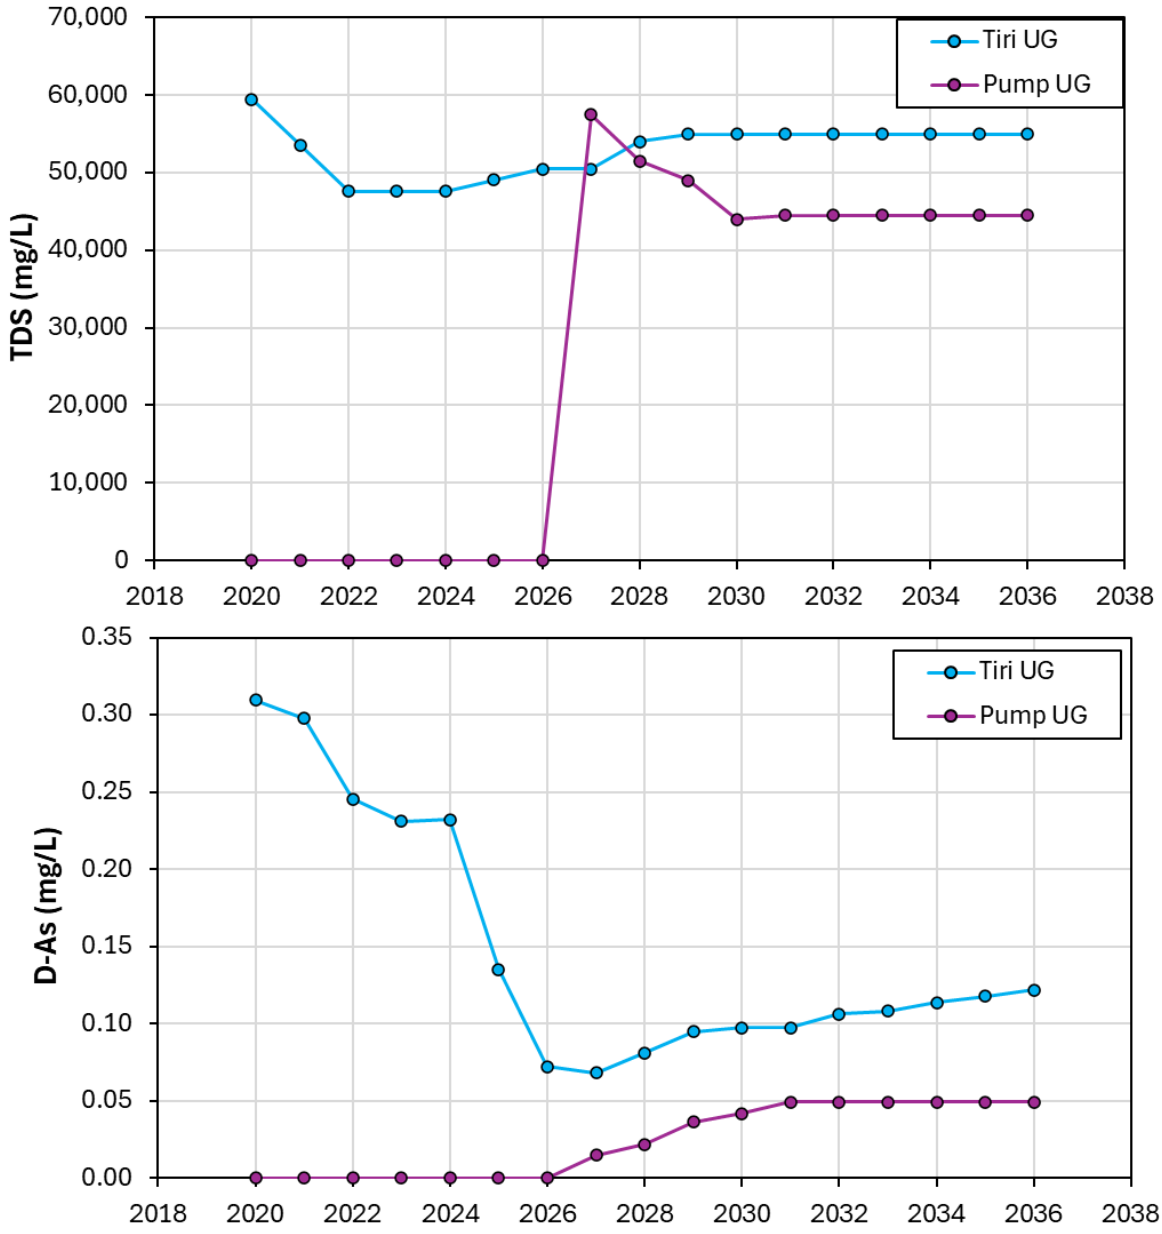

Figure 4-8: Underground Mine Annual Results for TDS (top) and As (bottom).

5. Water Balance Results

AGNICO EAGLE

5. Water Balance Results

Water balance model results are presented in this section, with a focus on the annual operational discharges to Itivia Harbour and Meliadine Lake (Section 1). Operations phase water balance time-series are provided for the key saline (TIRI02, PUMP02 and WES02) and surface contact water collection (CP1, CP7, WES03, and FZONE02) ponds, as well as tabular summaries of annual water balances for the remaining sumps, ponds, and open pits (Section 5.1).

As compared to the NWB approved 2025 Modification application, the following changes in the mine water management plan, and therefore the overall operational water balance and discharge volumes are highlighted:

- Waterline commissioning in June 2027 moves the discharge to Itivia Harbour one year later, resulting in increased discharges to Meliadine Lake in 2026 relative to the 2025 Modification application;
- Reduction in the proportion of lake dewatering volumes routed to CP1 from 50% to 30%, based on operational experience;
- Mining of PUMP UG beneath the permafrost beginning in 2031 increases the groundwater inflows to this mine void;
- Pumping of remaining saline water in the WES02 pit to the underground mine voids at the beginning of Active Closure; and,
- Operation of the Waterline to discharge any remaining surface contact water and saline water for the first three years of Active Closure.

5.1 Operational Mine Water Discharge to Itivia Harbour and Meliadine Lake

All surface contact water collected in the WES03 and CP1 Ponds is routed to the EWTP for treatment, targeting removal of TSS, before discharge to the receiving environment. Throughout Operations, discharge priority for surface contact water is via the Waterline to Itivia Harbour, with the objective of minimizing operational discharges to Meliadine Lake as outlined in the Adaptive Management Plan for Water Management. Under the Base Case RCP4.5 climate scenario, discharges to Itivia Harbour are predicted to be 1.97 Mm^3 per year while the Waterline is in operation with 0.45 Mm^3 per year on average comprised of saline water and 1.52 Mm^3 per year comprised of surface contact water (Figure 5-1 and Table 5-1).

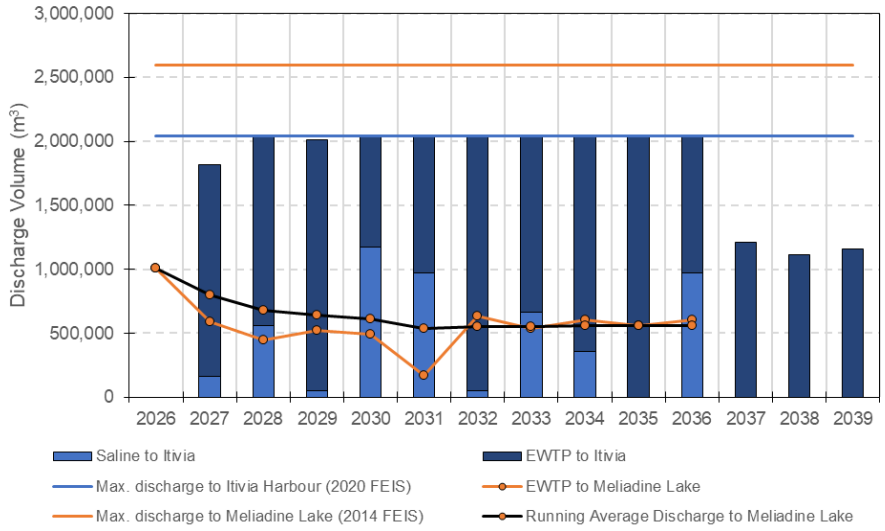

Figure 5-1: Annual discharges to Itivia Harbour and Meliadine Lake for Operations (2026-2036) and the first three years of Active Closure (2037-2039). The maximum predicted discharges to each receiver from the 2014 FEIS are presented for reference.

Table 5-1:
Annual discharge volumes and sources. Active closure phase discharges highlighted in grey.

Discharge	TIRI02 Dewatering	WES02 to Itivia Harbour	Surface Contact to Itivia Harbour	Total Discharge to Itivia Harbour	Discharge to Meliadine Lake
Year	**m³**				
2026	0	0	0	0	1,012,616
2027	204,736*	0	1,660,764	1,820,000	590,548
2028	1,688,376	612,000	1,479,000	2,040,000	446,503
2029	508,094	102,000	1,961,689	2,012,689	524,553
2030	0	1,224,000	867,000	2,040,000	493,144

2035	0	0	2,040,000	1,989,000	556,628
2036	0	1,020,000	1,071,000	2,040,000	602,516
2037	0	0	1,213,190	1,162,190	0
2038	0	0	1,115,441	1,064,441	0
2039	0	0	1,155,414	1,109,914	0
Operations Total	**2,401,206**	**5,202,000**	**15,199,453**	**20,101,689**	**6,181,028**
Active Closure Total	**0**	**0**	**3,484,045**	**3,336,545**	**0**

Notes:
* TIRI02 dewatering volume in 2027 discharged via Waterline as WES02 is not yet available for use as a saline storage reservoir.

Discharges to Meliadine Lake average 0.56 Mm^3/year over 2026-2036, with the peak annual discharge of 1.0 Mm^3 predicted to occur in 2026 prior to the Waterline becoming operational.

The updated model shows slight changes to the annual discharge volumes relative to those presented in Lorax (2025) and are summarized as follows:

- Reductions in saline water discharge to Itivia Harbour, with the exception of 2030, 2031, and 2033 (Figure 5-2);
- Comparable treated effluent discharge volumes from the EWTP to Itivia Harbour (Figure 5-3);
- Reduced discharges to Meliadine Lake via the EWTP (Figure 3-4; Table 5-2); and,
- Increased proportion of total Waterline discharge comprised of treated surface contact water (via the EWTP; Figure 5-4; Table 5-2).

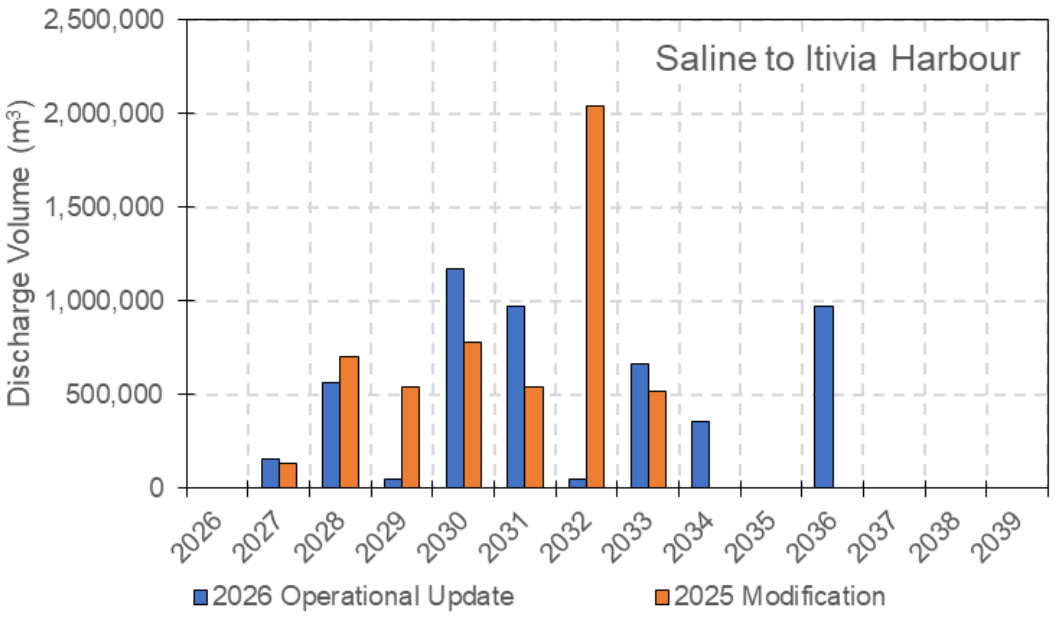

Figure 5-2: Annual Saline Water Discharges to Itivia Harbour

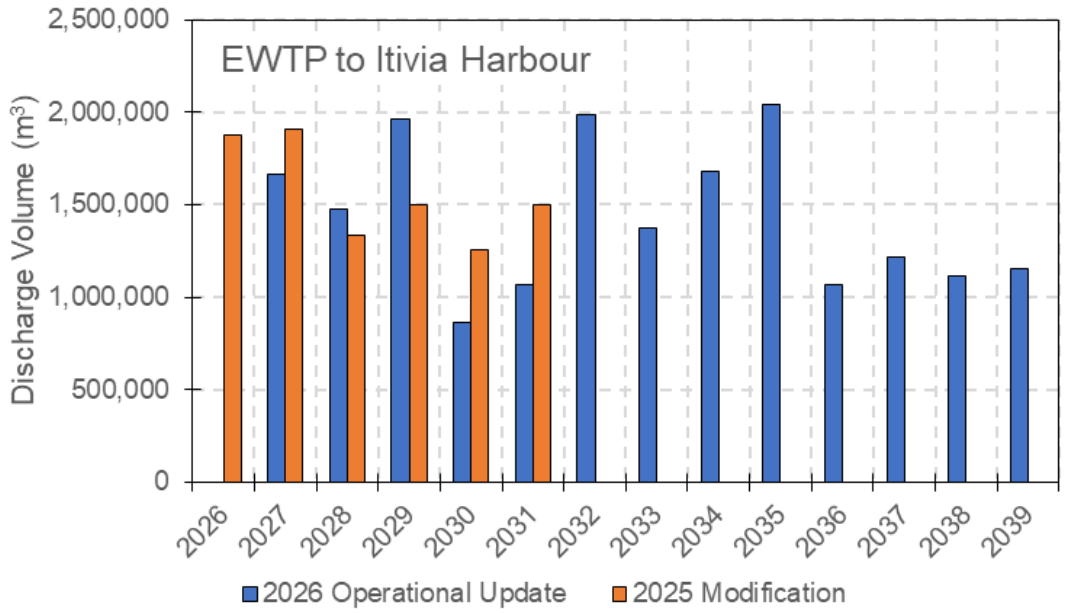

Figure 5-3: Annual Surface Contact Water (EWTP) Discharges to Itivia Harbour

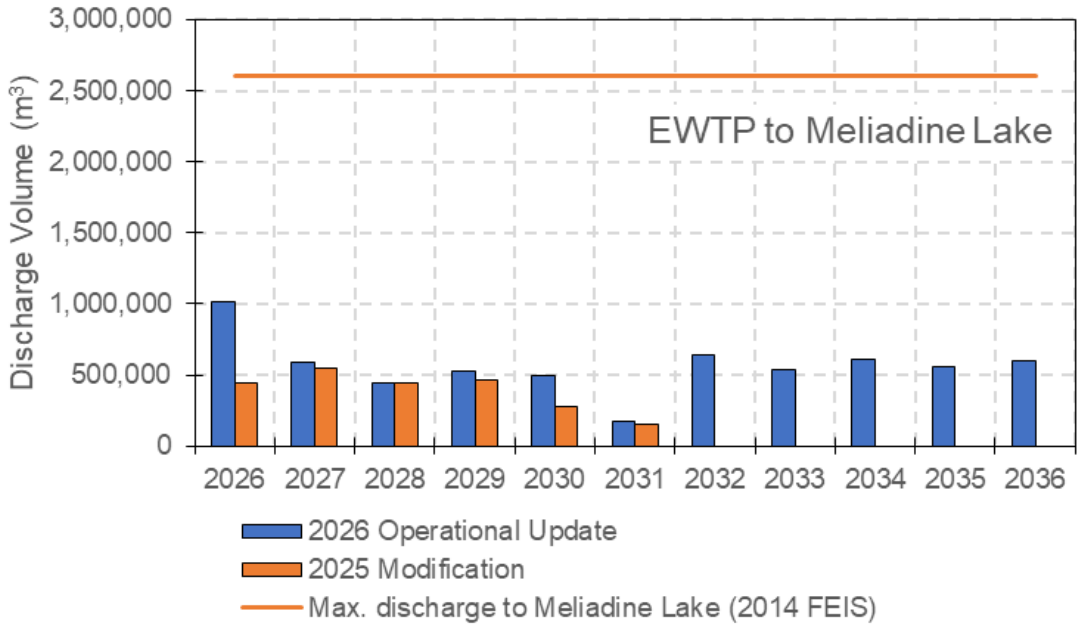

Figure 5-4: Annual EWTP discharges to Meliadine Lake. Maximum allowable annual discharge volume shown by orange line.

Table 5-2:
Annual Discharge Volumes and Sources

Discharge Metric	Phase	2025 Modification[1]	Current Prediction[2]	Percent Change
		m^3		
Saline Discharge to Itivia Harbour	Operations	5,301,984	4,953,236	-2%
EWTP (Contact Water) to Itivia Harbour	Operations	9,452,000	15,199,453	38%
Total Discharge to Itivia Harbour	Operations	12,024,097	20,152,689	40%
EWTP (Contact Water) to Meliadine Lake	Operations	3,736,372	6,181,028	41%
Total Discharge (Saline + Contact Water)	Operations	15,760,469	26,282,717	40%
Total Discharge (Saline + Contact Water)	Operations + Closure	19,972,715	26,196,098	24%

Note:
[1] Total discharge volumes calculated for the 2025-2031 period.
[2] Total discharge volumes calculated for the 2026-2036 period.

5.2 Surface Water Collection Ponds

This section summarizes the water balances for the key surface contact water collection ponds (WES03, PUMP01/CP9, FZONE02, CP1 and CP7) for the Operations phase.

5.2.1 WES03

The WES03 pit is mined in 2026 and 2027 and is dewatered to CP1 during this period. The WES03 pit will have an effective storage volume of 3.1 Mm^3 once mined out, and beginning in 2028, this pit will be utilized as a surface contact water storage reservoir. Discharges from the STP, CP3, CP4, and CP5 ponds (59% of total inflows) will be routed to this pit, which is pumped out to the SETP for treatment prior to discharge to Itivia Harbour via the Waterline. Note that the new CP8 sump that collects TSF contact water is routed to CP3 from 2026 onwards (Figure 2-2). In addition, minor groundwater inflows are predicted to enter the WES03 pit driven by draindown of the surrounding active layer during the years with active mining operations (Figure 5-5 and Table 5-3).

The predicted daily volume of surface contact water stored in WES03 pit shown in Figure 5-6, reaching a maximum of 2,830,000 m^3 in 2036 (Figure 5-6). In Active Closure, 2.95 Mm^3 of surface contact water is routed through WES03 to the Waterline for discharge to Itivia Harbour over the 2037-2039 period.

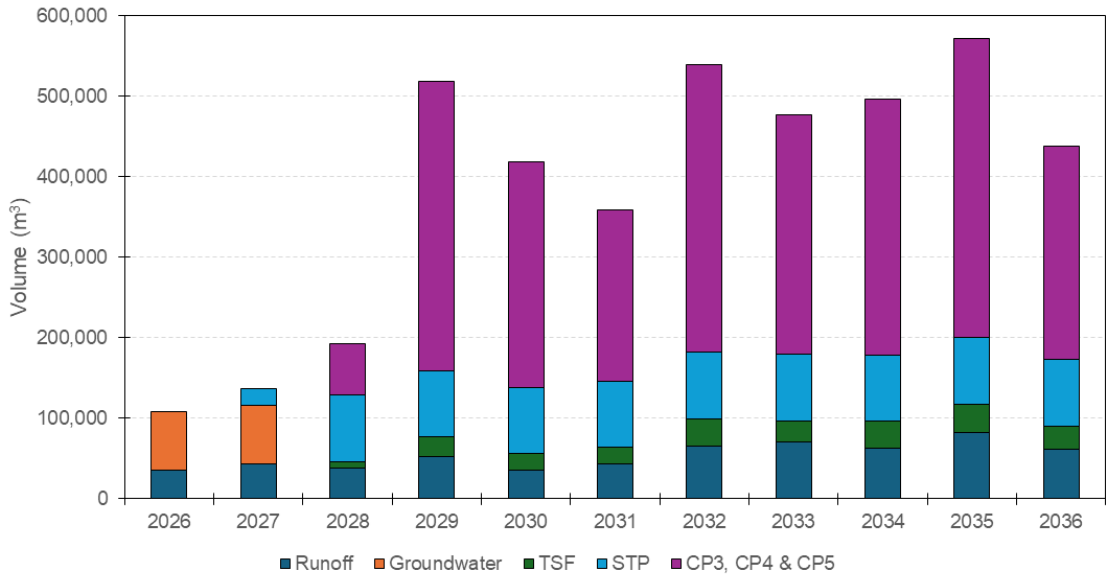

Figure 5-5: Annual Inflows to the WES03 Pit

Table 5-3:
Annual Operations Phase Water Balance for the WES03 Pit

Year	Inflows (m^3/year)					Outflows (m^3/year)		
	Runoff	Groundwater	TSF	STP	CP3, CP4 & CP5	Evaporation	To: CP1	To: SETP
2026	34,769	73,000	0	0	0	1,993	50,157	0
2027	43,115	73,000	0	20,815	0	2,883	57,661	1,129
2028	37,643	0	8,538	82,808	63,378	2,716	0	188,178
2029	52,151	0	24,127	82,581	359,821	8,141	0	84,600
2030	35,141	0	20,646	82,581	280,100	13,587	0	76,180
2031	43,066	0	20,621	82,581	212,396	19,060	0	62,767
2032	65,848	0	32,852	82,808	358,155	26,234	0	66,765
2033	70,627	0	26,196	82,581	297,349	32,186	0	59,129
2034	63,182	0	32,940	82,581	317,498	35,523	0	61,239
2035	82,235	0	35,091	82,581	371,394	43,574	0	65,182
2036	60,691	0	29,544	82,808	264,711	48,697	0	65,232
Average[1]	**53,497**	**13,273**	**20,959**	**69,520**	**229,527**	**21,327**	**9,802**	**66,400**
% Total Inflow[1]	**14%**	**3%**	**5%**	**18%**	**59%**

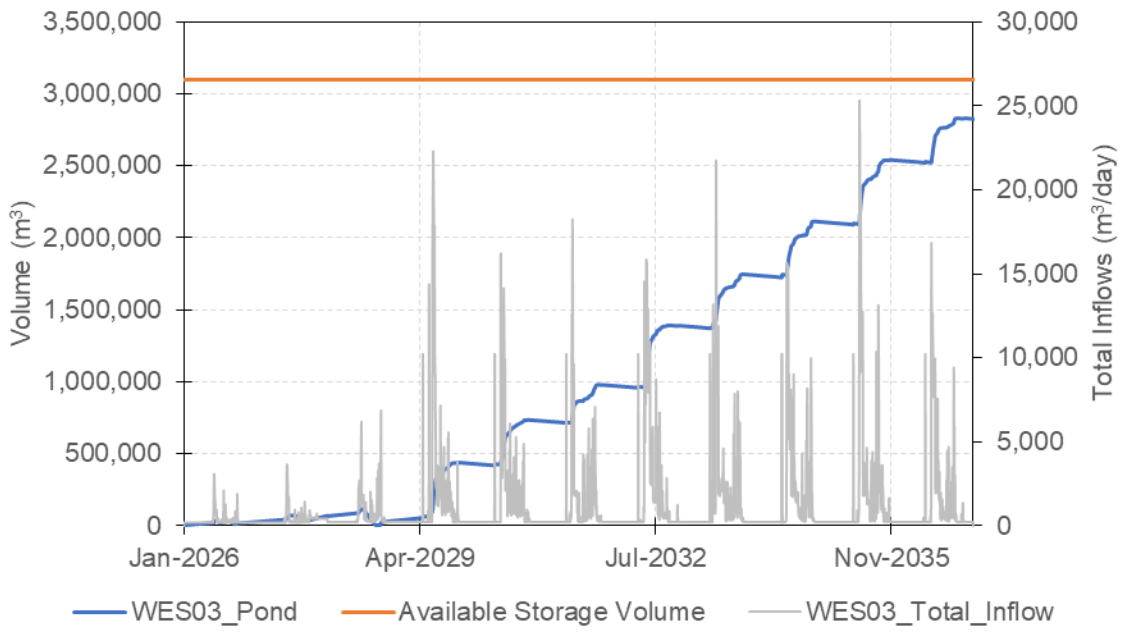

Figure 5-6: WES03 daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.2.2 PUMP01/CP9

Once mined out in Q3 2026, the PUMP01 pit is used as a local surface contact water pond (CP9), routing to CP1. The primary sources of inflow to this pond are passive runoff from the surrounding catchment and pitwalls (40%), followed by inputs from SUMPP5 (31%; Figure 5-7 and Table 5-4). On average, 284,400 m^3 is pumped from CP9 to CP1 over the 2027 to 2036 period (Table 5-4).

The predicted daily volume of surface contact water stored in PUMP01/CP9 reaches a maximum of 331,500 m^3 in 2027 (Figure 5-8).

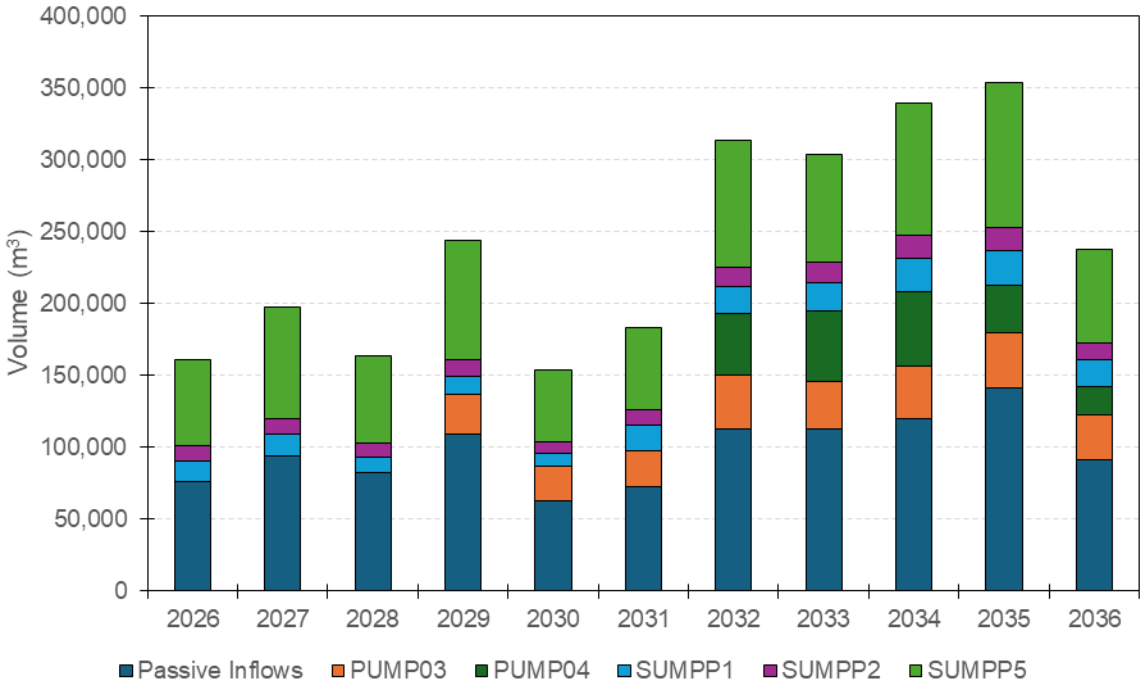

Figure 5-7: Annual Inflows to PUMP01/CP9

Table 5-4:
Annual Operations Phase Water Balance for PUMP01/CP9

Year	Inflows (m^3/year)						Outflows (m^3/year)	
	Passive Inflows	PUMP03	PUMP04	SUMPP1	SUMPP2	SUMPP5	Evaporation	To: CP1
2026	75,665	0	0	14,850	10,316	60,132	6,690	0
2027	93,803	0	0	15,076	11,111	77,576	9,714	345,967

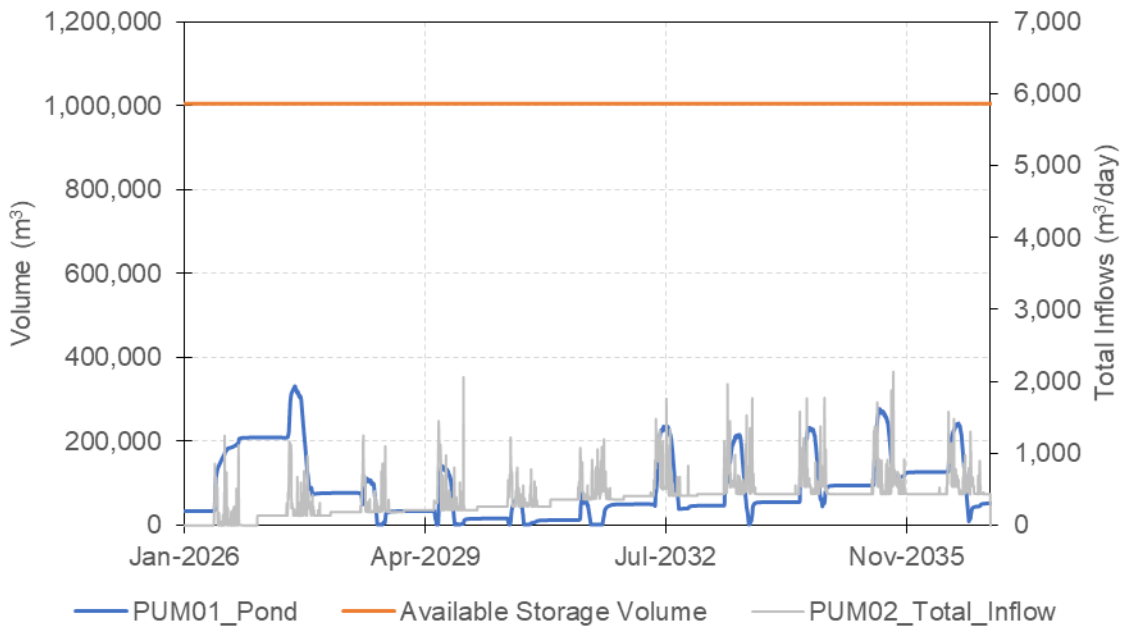

Figure 5-8: PUMP01/CP9 daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.2.3 FZONE02

Once mined out in Q3 2028, the FZONE02 pit is used as a local surface contact water pond, routing to CP1. The primary sources of inflow to this pond are passive runoff from the surrounding catchment and pitwalls (42%), followed by inputs from SUMPF2 (36%; Figure 5-9 and Table 5-5). On average, 144,900 m^3 is pumped annually from FZONE02 to CP1 over the 2028 to 2036 period (Table 5-5).

The predicted daily volume of surface contact water stored in FZONE02 reaches a maximum of 72,700 m^3 in 2035 (Figure 5-10).

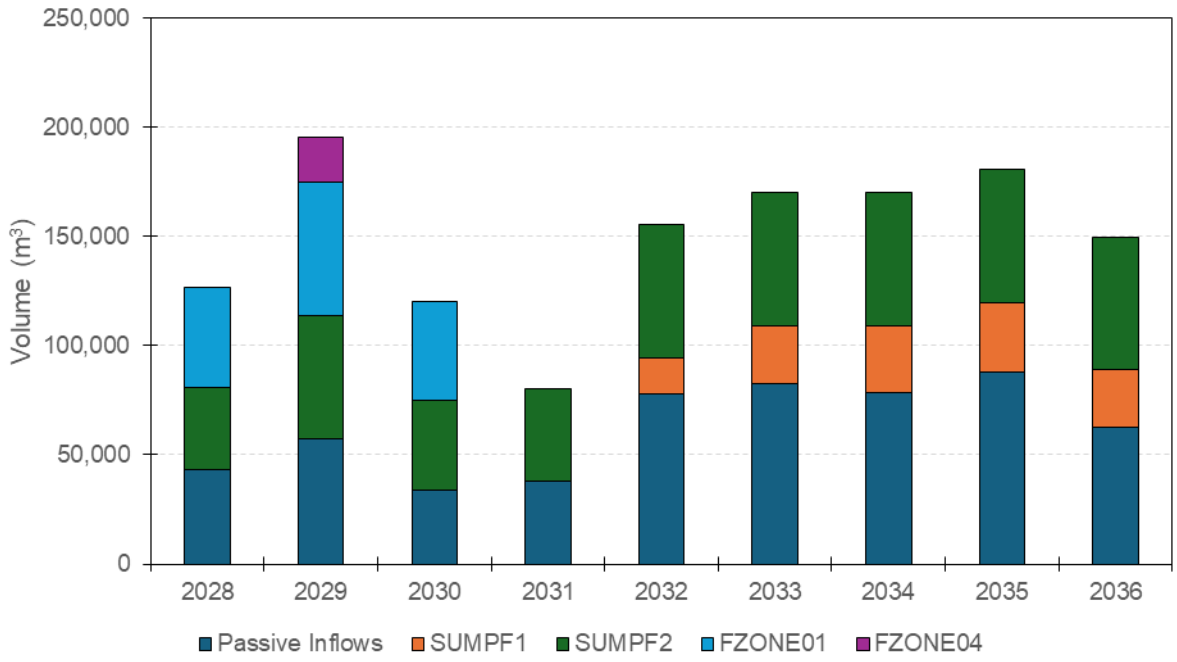

Figure 5-9: Annual Inflows to FZONE02 Pit

Table 5-5:
Annual Operations Phase Water Balance for the FZONE02 Pit

Year	Inflows (m³/year)					Outflows (m³/year)	
	Passive Inflows	SUMPF1	SUMPF2	FZONE01	FZONE04	Evaporation	To: CP1
2026	FZONE02 development begins in 2028

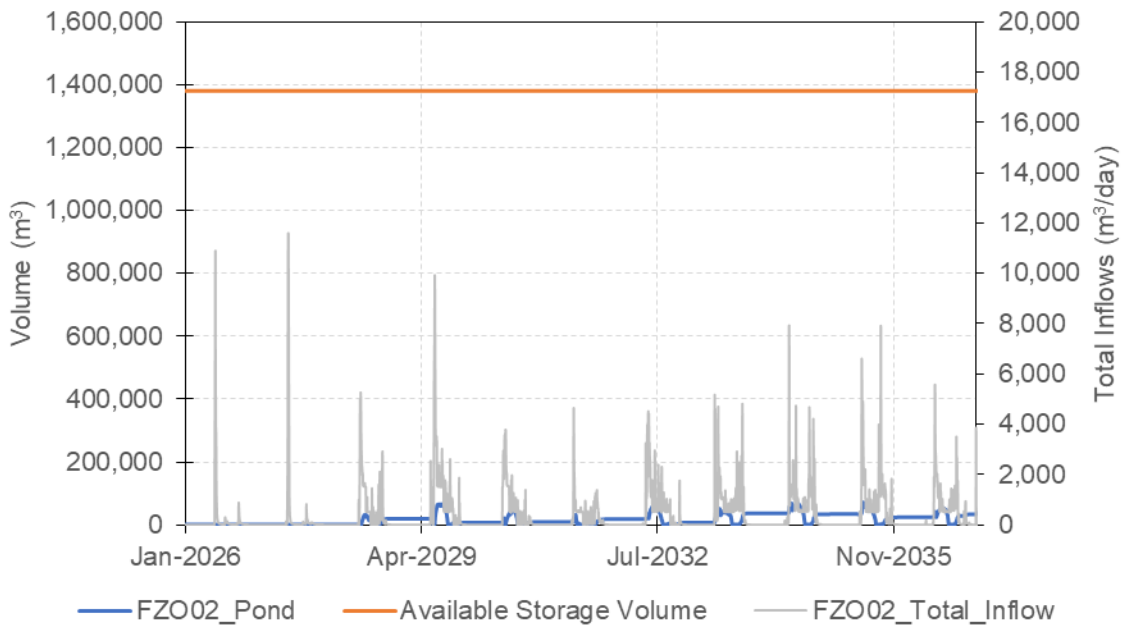

Figure 5-10: FZONE02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.2.4 Collection Pond CP1

CP1 is currently the primary surface contact water collection pond, with all excess water routed to the EWTP prior to discharge to Itivia Harbour and Meliadine Lake. The maximum predicted storage volume (740,000 m^3; Figure 5-12) occurs in 2032. The corresponding predicted water level of 66.18 m remains lower than the Maximum Operating Water Level (MOWL) of 66.2 m (870,800 m^3; Figure 5-12).

The primary sources of inflow to this pond are passive runoff from the dewatered lake beds and local sumps (79%), followed by inputs from nearby catchments and precipitation on the pond surface (13%; Figure 5-11 and Table 5-6). On average, 518,500 m^3 is discharged from CP1 to Meliadine Lake via the EWTP, and 1,525,000 m^3 is discharged to Itivia Harbour via the SETP over the 2027 to 2036 period (Table 5-5).

During the Active Closure phase, the mine site is managed as a zero-discharge facility, with all CP1 inflows routed to TIRI02/04 open pit. Beginning in the post-Closure phase, volumes in the CP1 pond are allowed to fluctuate naturally, with outflows reporting via pre-mine drainage pathways to Meliadine Lake.

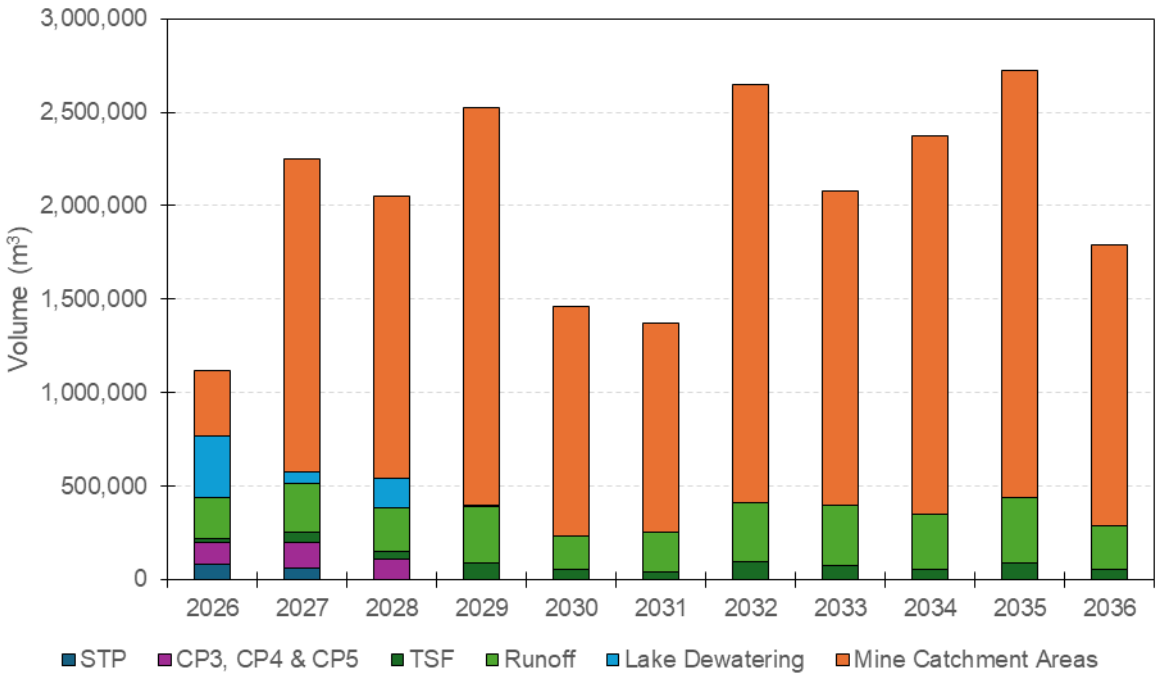

Figure 5-11: Annual Inflows to CP1

Table 5-6:
Annual Operations Phase Water Balance for CP1

Year	Inflows (m³/year)						Outflows (m³/year)		
	STP	Mine Catchment Areas	TSF	Runoff	Lake Dewatering	CP3, CP4 & CP5	Evaporation	To: EWTP	To: SETP

5.2.5 Collection Pond CP7

Lake B7 is dewatered in 2027 to serve as a backup surface contact water storage reservoir (CP7). The primary function of this reservoir is to serve as backup storage for CP1 during periods of high surface contact water production. Water collected in CP7 is routed to CP1 when the operating volume of CP1 allows it. The majority of the inputs to CP7 (96%) are comprised of passive runoff from the surrounding non-contact areas (Figure 5-13 and Table 5-7).

A total of 1.86 Mm^3 is pumped from CP7 to CP1 over the 2027 to 2036 period, and the maximum predicted volume stored in CP7 over the Operations phase is 286,000 m^3 in 2032 (Figure 5-14).

Beginning in the post-Closure phase, volumes in the CP7 pond are allowed to fluctuate naturally, with outflows reporting via pre-mine drainage pathways to Lake B6.

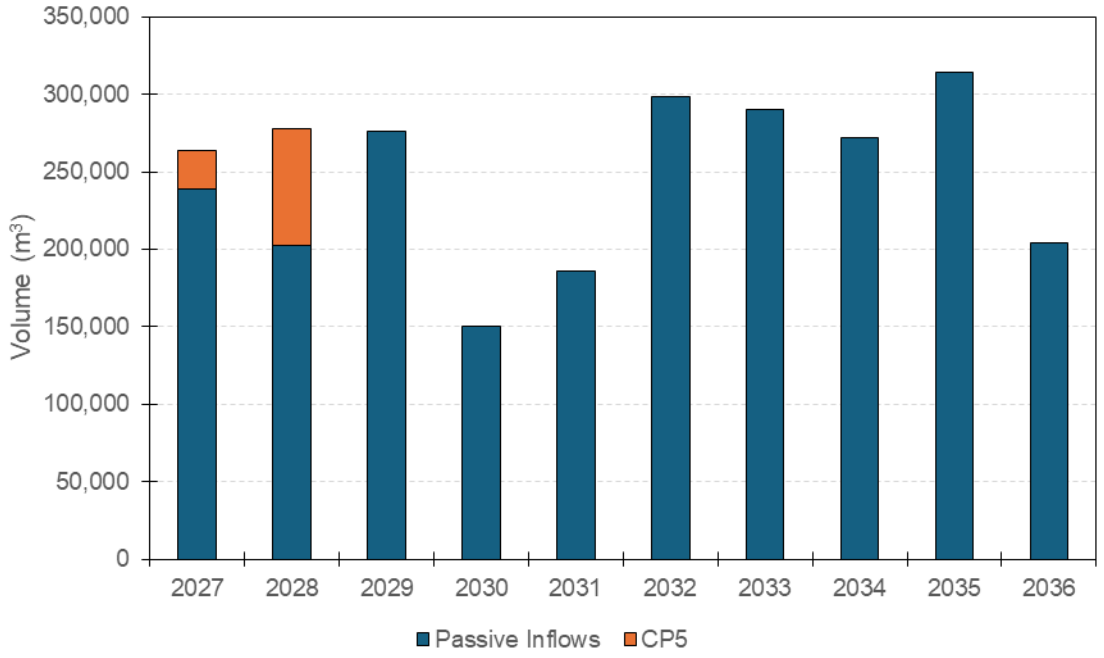

Figure 5-13: Annual Inflows to CP7

Table 5-7:
Annual Operations Phase Water Balance for CP7

Year	Inflows (m^3/year)		Outflows (m^3/year)			
	Passive Inflows	CP5	Evaporation	To: EWTP	To: Meliadine Lake	To: CP1

5.3 Saline Water Collection Ponds

This section summarizes the water balances for key saline contact water collection ponds (TIRI02, PUMP02 and WES02) over the Operations phase.

5.3.1 TIRI02

The saline contact water management system collects dewatering flows from the underground operation, PUMP underground WRSF, and ore pads. Early in the Operations phase (up to end-2026), the Waterline is not in place, and WES02, the primary saline contact water storage pond, is not available until 2028. The TIRI02 pit currently serves as the primary saline contact water storage pond until it is fully dewatered in 2029, with a maximum predicted pond volume of 1.56 Mm^3 in June 2028, below the available storage volume of 2.8 Mm^3 (Figure 5-16). The primary source of inflow to TIRI02 while it serves as a saline storage reservoir is dewatering of the underground mine workings (65%; Table 5-8 and Figure 5-15). The dewatering of TIRI02 proceeds over a 3-year period from 2027-2029, with a total of 2.4 Mm^3 pumped to storage in WES02 or discharged via the Waterline to Itivia Harbour. The dewatering of TIRI02 is extended in the updated water management plan to free up more capacity in the Waterline, allowing a larger proportion of treated surface contact water to be discharged to Itivia Harbour, thus reducing the overall discharge volumes to Meliadine Lake.

Mining of TIRI02 pit then resumes in 2029-2030, with all pit inflows routed to CP5, which in turn is routed to WES03.

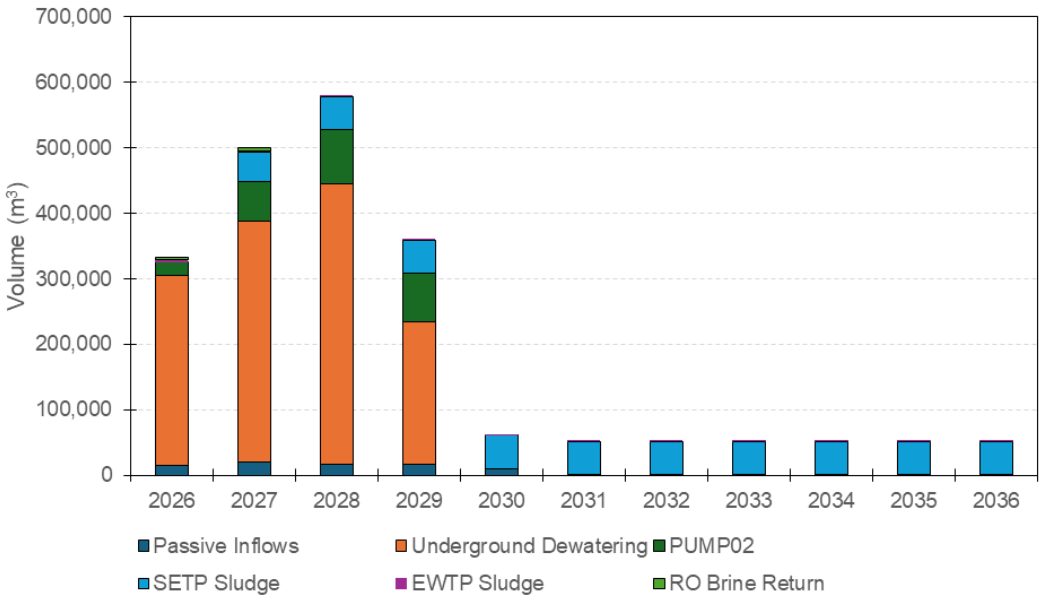

Figure 5-15: Annual Inflows to TIRI02 Pit

Table 5-8:
Annual Operations Phase Water Balance for TIRI02 Pit

Year	Inflows (m^3/year)						Outflows (m^3/year)			
	Passive Inflows	Underground Dewatering	PUMP02	SETP Sludge	EWTP Sludge	RO Brine Return	Evaporation	To: CP1	To: SETP	To: RO Plant

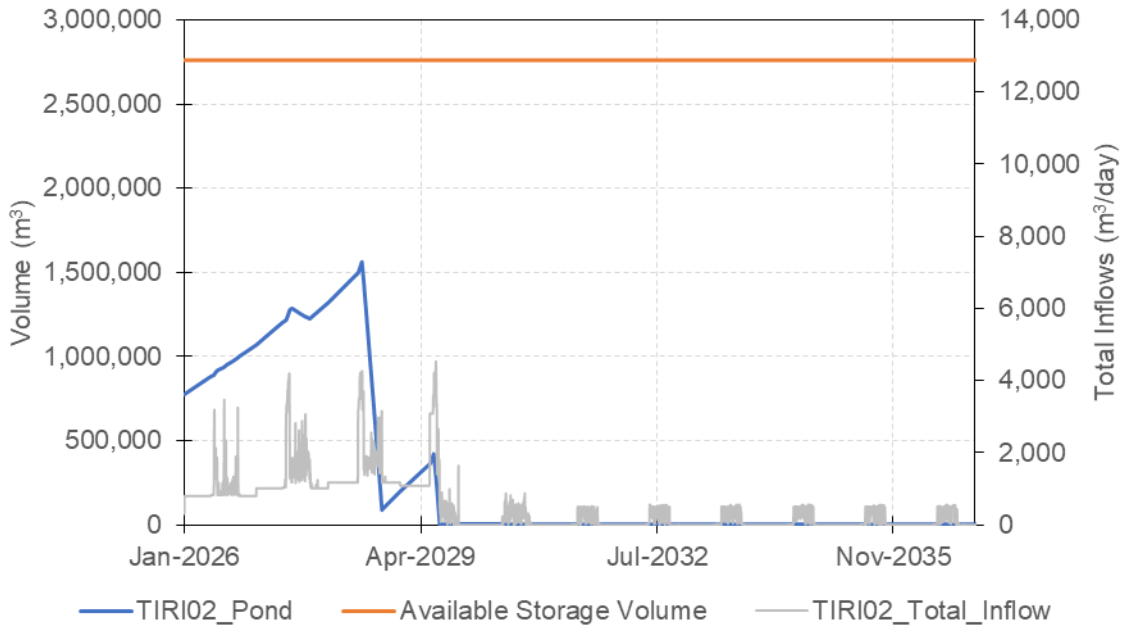

Figure 5-16: TIRI02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.3.2 PUMP02

Once mined out in 2026, the PUMP02 pit will have an effective storage volume of 962,000 m^3 and will also be utilized as a saline water reservoir, collecting runoff from the PUMP underground WRSF and excess saline water from the PUMP underground mine. The primary source of inflow to PUMP02 is dewatering of the PUMP UG mine workings (81%), followed by passive inflows from the surrounding catchment and pit walls (Figure 5-17 and Table 5-9).

The maximum predicted volume of saline water stored in PUMP02 is 115,000 m^3 in 2034 (Figure 5-18). All saline water collected in PUMP02 is routed to TIRI02 until the end of 2036. Once TIRI02 has been dewatered and mining of this pit has resumed, saline water stored in PUMP02 is routed to WES02 for the remainder of the Operations phase (Figure 2-2).

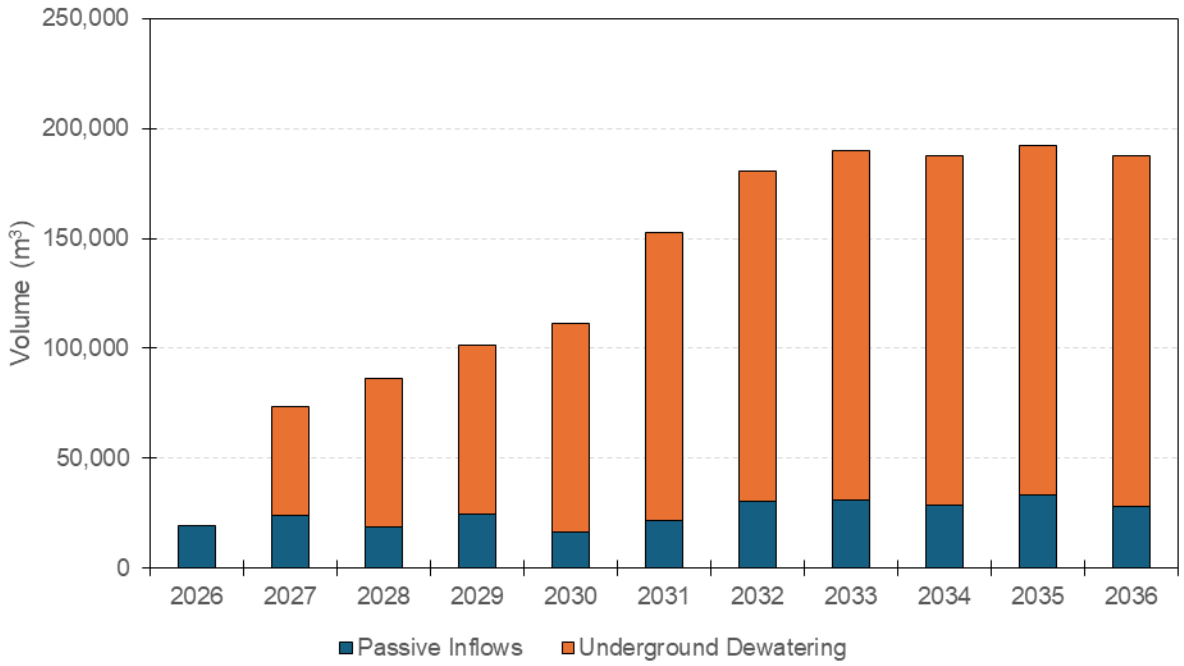

Figure 5-17: Annual Inflows to PUMP02 Pit

Table 5-9:
Annual Operations Phase Water Balance for PUMP02 Pit

Year	Inflows (m^3/year)		Outflows (m^3/year)

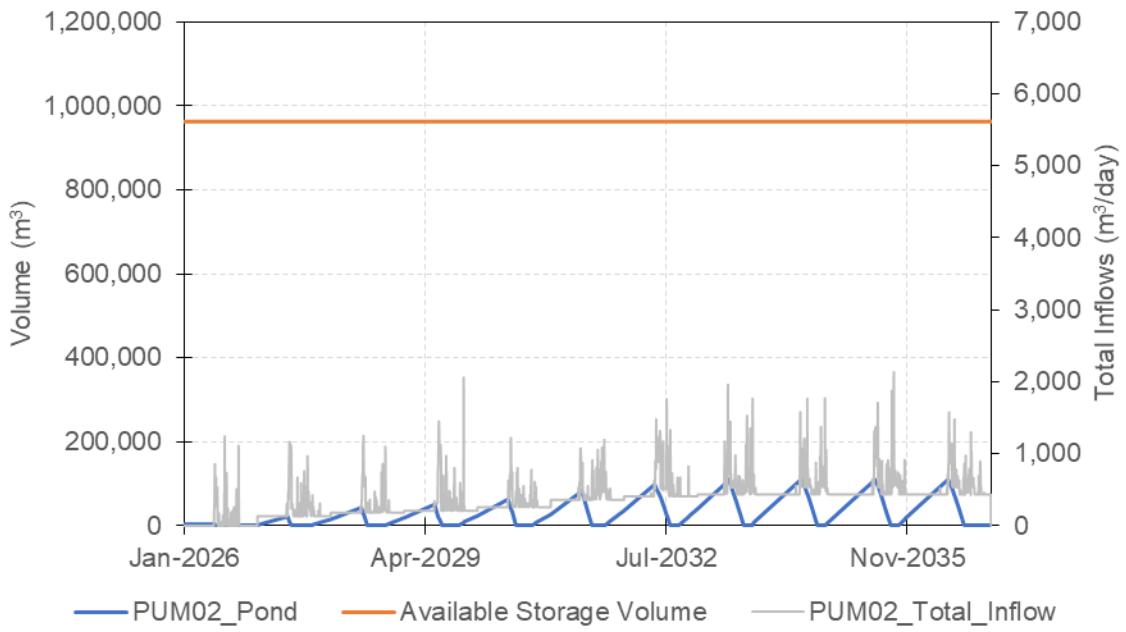

Figure 5-18: PUMP02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.3.3 WES02

The WES02 pit is mined out by end-2027, with 187,000 m^3 of pit inflows pumped to CP1 for treatment and discharge (Table 5-10). Once WES02 is mined out, it serves as a saline water storage reservoir, with 87% of inflows pumped from the other saline storage ponds (Figure 5-19 and Table 5-10). Over the remainder of the Operations phase (2028 to 2036), approximately 5.2 Mm^3 of saline water is transferred from WES02 to the SETP for treatment and discharge via the Waterline. The maximum predicted volume of water stored in WES02 is 3.3 Mm^3 at the end of the Operations phase in 2036 (Figure 5-20).

The remainder of the saline water stored in the WES02 pit at the end of Operations (2.91 Mm^3) is pumped to the underground mine voids in 2037 for permanent storage.

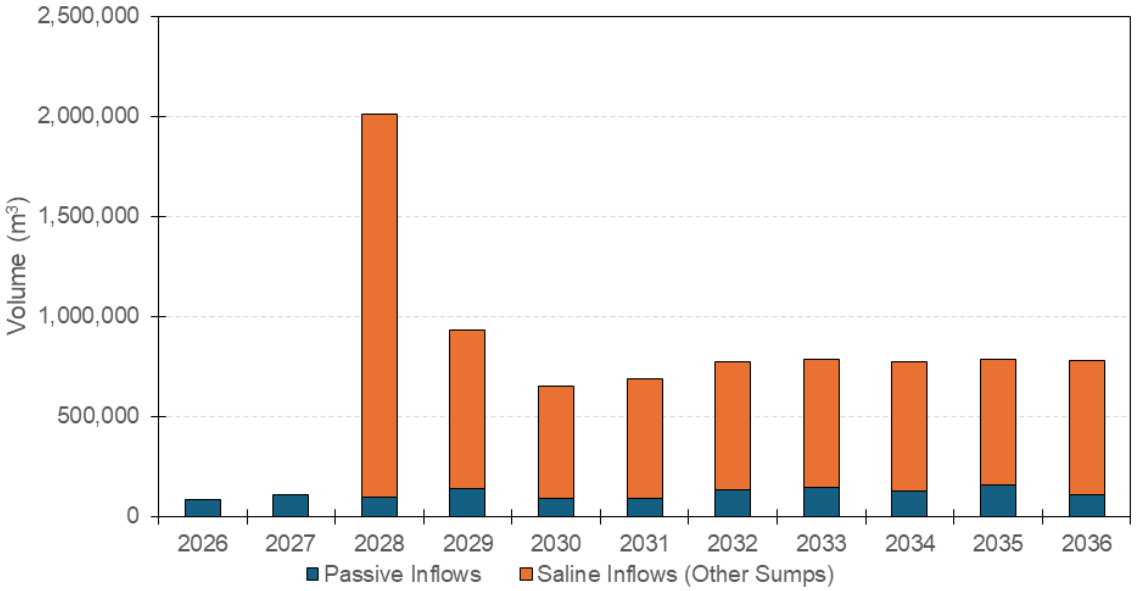

Figure 5-19: Annual Inflows to WES02 Pit

Table 5-10:
Annual Operations Phase Water Balance for WES02 Pit

Year	Inflows (m^3/year)		Outflows (m^3/year)

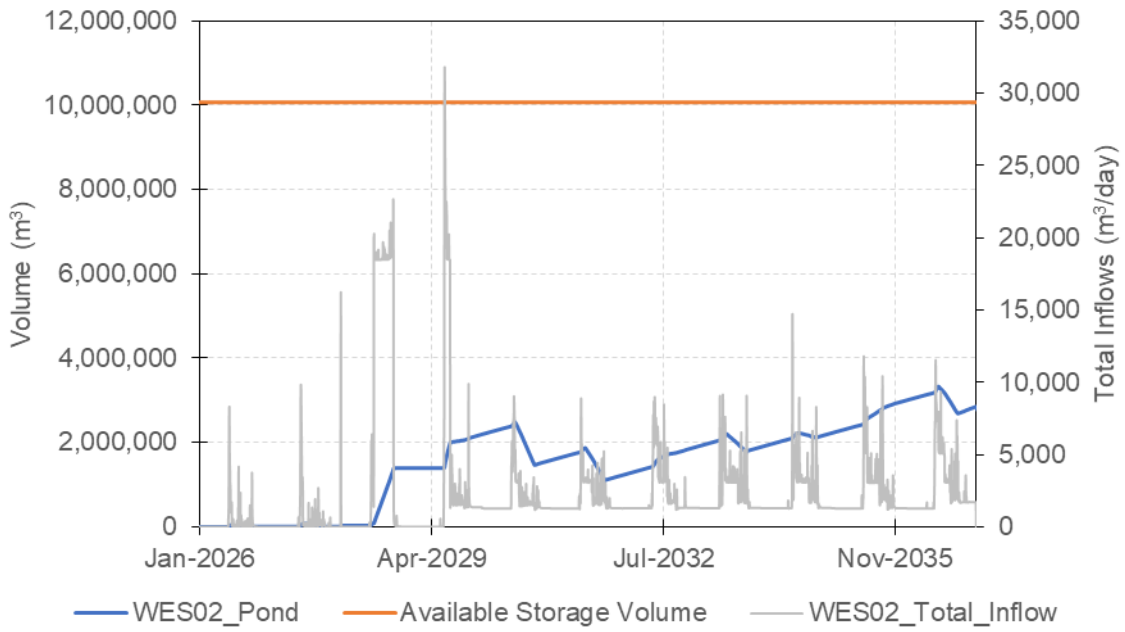

Figure 5-20: WES02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.4 Open Pit Dewatering During Mining

The annual total pit dewatering volumes during the mining phases of each pit are presented in Table 5-11, along with the dewatering period averages. For the pits that are used as storage reservoirs once mined out (*i.e.*, PUMP01, PUMP02, WES02 and WES03), the volumes shown are representative of only the active mining dewatering period. The annual water balances and daily time-series flows for these four pits are presented in separate sections above. For those pits mined over multiple years, the WN01 pit has the highest average dewatering rate, followed by TIRI02 and Discovery Pit. One and two-year average rates are higher for WES02, FZONE01 and FZONE02 pits.

Table 5-11:

Notes:
[1] TIRI02 pit water (not saline) is discharged to CP5 once mining resumes in 2029.
[2] Averages are calculated for the active dewatering periods only.

5.5 Active Closure Water Management

During the Active Closure phase, the site is maintained with zero discharge to Meliadine Lake, and 3 years of predicted discharge to Itivia Harbour via the Waterline to drain the accumulated water in WES03 (2.95 Mm^3). The remaining volume of saline water (2.9 Mm^3) in WES02 will be pumped into the underground mine voids for permanent storage. Surface contact water reporting to the CP3, CP4, and CP5, CP6, and CP8 sumps, and any TSF runoff reporting to Channel 1 are pumped to CP1. All remaining surface contact water from the PUMP and FZONE areas is pumped to CP1, which is routed to TIRI02/04 to speed the flooding process from 2037 to 2042. There is no discharge of treated surface contact water to Meliadine Lake over the Active Closure phase.

Given that there are no changes in pit volumes relative to those presented in Lorax (2024), the overall pit flooding strategy and timeline remains the same. Consistent with Lorax (2024), and Condition 2, Part E of Water License 2AM-MEL1631, pumping of Meliadine Lake water remains within the maximum prescribed limit of 8,676,481 m^3/year over the seven-year Active Closure period (Table 5-12).

Table 5-12:
Annual Pit Reflooding Volumes from Meliadine Lake

Year	Pumped Volume (m^3)
2037	6,791,000
2038	7,447,000
2039	7,518,000
2040	8,118,000
2041	8,118,000
2042	8,118,000
2043	7,634,994

The withdrawal of water from Meliadine Lake to flood the pits, along with no treated effluent discharge to Meliadine Lake during the Active Closure phase is predicted to result in minimal changes to the lake volume or minimum water levels. The minimum annual lake volume drops by 0.4% on average between the Operations phase and Active Closure, and minimum annual water levels are predicted to drop by an average of 2 cm (Figure 5-21).

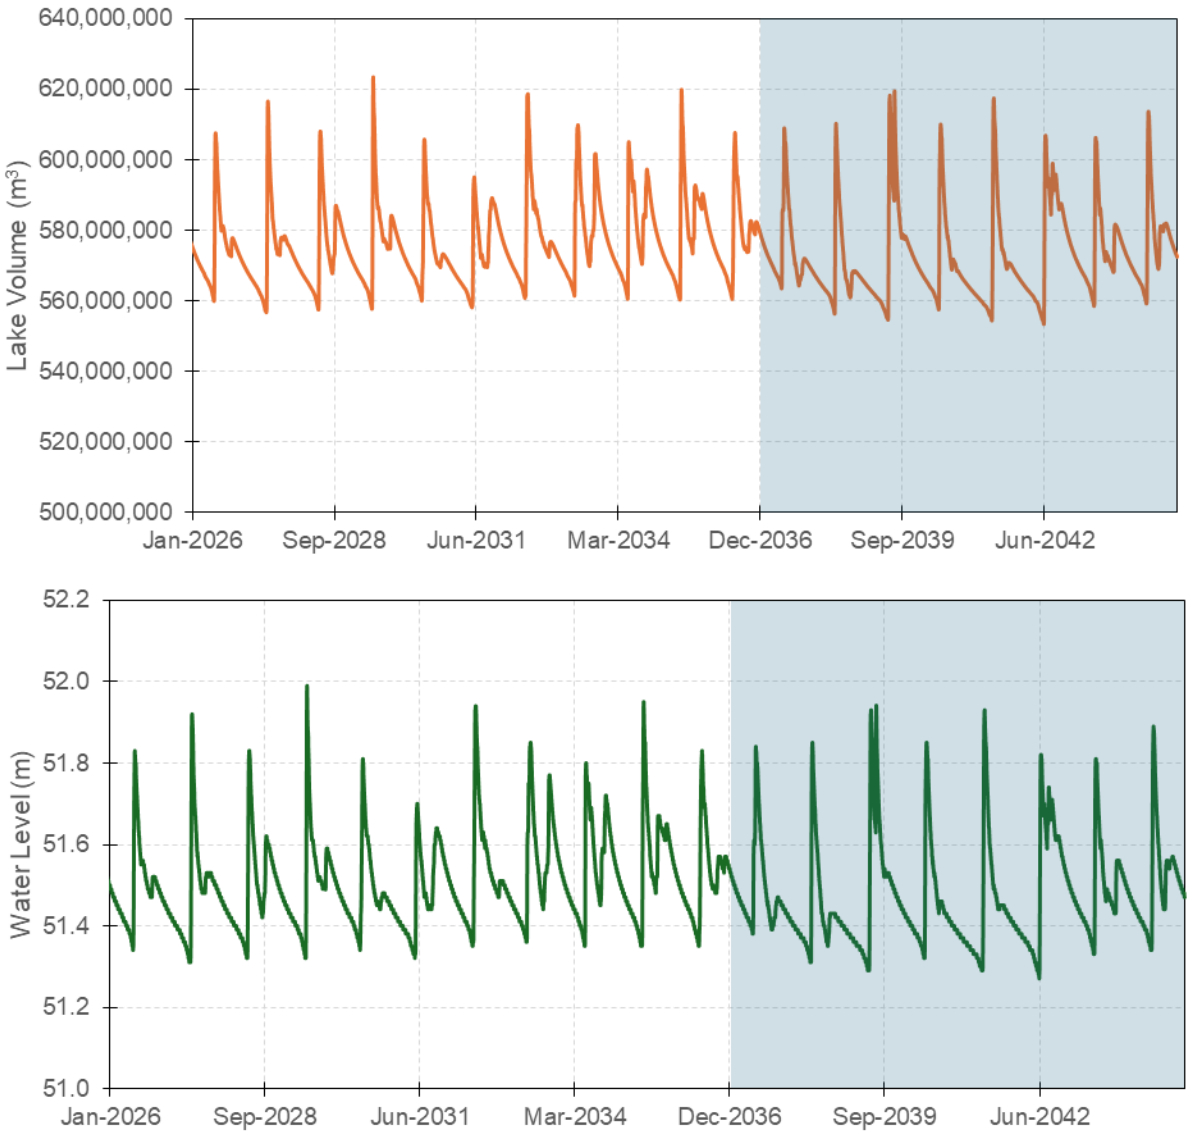

Figure 5-21: Modeled daily volume (top) and water level (bottom) of Meliadine Lake. The Active Closure phase is highlighted.

6. Water Quality Model Results

AGNICO EAGLE

6. Water Quality Model Results

This section presents water quality model results for the Meliadine Mine WBWQM. Model predictions are compared against applicable guidelines as a screening tool to identify parameters of potential concern (POPCs). During the Operations phase, model predictions at the end-of-pipe (EOP) to Meliadine Lake (EWTP) are screened against effluent discharge limits outlined in the Type A Water License (2AM-MEL1631) for the Meliadine Mine and MDMER, while discharges to Itivia Harbour are screened against MDMER only. The complete model outputs for all mine phases are presented in Appendix D.

6.1 Operations

During Operations, TSS in mine effluent will be controlled by the SETP and EWTP for saline and freshwater discharges, respectively. For the purposes of water quality predictions, it is assumed that treated effluent is at the MDMER maximum monthly mean concentration of 15 mg/L TSS. The differences in total and dissolved concentrations generated by this assumption were calculated in Lorax (2022) and are shown in Table 6-1. These values are added to dissolved concentrations predicted for Meliadine Lake and Itivia Harbour discharges. Dissolved and total predictions at EWTP and Waterline are provided in Appendix D.1. Water quality predictions for other model nodes present during Operations are provided in Appendix D.2.

Summary statistics are presented for EWTP and Waterline discharges with comparison to EOP guidelines. Consistent with 2025 Modification application Lorax (2025), model predictions for the EWTP remain below MDMER/Water License limits (Table 6-2), while model predictions of untreated water for the Waterline remain below MDMER with the exception of ammonia-N (Table 6-3). Options for treatment are being investigated.

6.2 Active Closure

The Waterline remains available for the first three years of Active Closure (2037 to 2039), with discharges of remaining contact and saline water stored in pits to Itivia Harbour planned in the months of June to September. This approach is proposed as a conservative contingency assumption to ensure closure water quality objectives are met. These assumptions will continue to be refined with site monitoring data and all details will be provided in the Final Closure Reclamation Plan. During Active Closure, the predicted concentrations of POPCs at the Waterline remain below EOP guidelines with the exception of ammonia-N (Table 6-4). It is noted that these results are distinct from the 2025 Modification, which show concentrations for all POPCs below EOP guidelines, due to the previous submission assuming that no saline underground water would be discharged in

Active Closure. Similar to the Operations phase Waterline predictions, the ammonia-N concentrations modelled are reflective of no treatment; however, Agnico Eagle is actively working on a treatment solution for these discharges. No discharge occurs via the EWTP to Meliadine Lake during the Active Closure phase.

Table 6-1:
Suspended Solids Composition and Contribution to Total Concentrations at End-of-Pipe

Element	Particulate Composition	Particulate Fraction Concentration (mg/L) per 15 mg/L of Total Suspended Solids

Notes: "-" denotes not available. *Calculation of min, P10, mean, and P90 excludes 0 values. Values shaded in grey are above the maximum monthly mean effluent concentrations specified in MDMER (Schedule 4, Table 2).

1. The ammonia guideline was determined conservatively by assuming a pH of 8 and a temperature of 15°C, and an un-ionized ammonia concentration of 0.5 .

Notes: "-" denotes not available. *Calculation of min, P10, mean, and P90 excludes 0 values. Values shaded in grey are above the maximum monthly mean effluent concentrations specified in MDMER (Schedule 4, Table 2).

1. The ammonia guideline was determined conservatively by assuming a pH of 8 and a temperature of 15°C, and an un-ionized ammonia concentration of 0.5 .

6.3 Post-Closure

During Post-Closure, mining activity will have ceased, open pits will have been flooded with Meliadine Lake water, and mine site waterbodies will begin to discharge passively. In the absence of mining activities, TSS is expected to return to relatively low baseline values of <3 mg/L. Due to the low TSS baseline conditions, total and dissolved concentrations are anticipated to be similar during Post-Closure. Hence, model results are developed assuming that total concentrations are equal to dissolved concentrations.

Summary statistics are presented for key collection ponds and flooded pits during Post-Closure, with comparison to terrestrial (CP7 only) and aquatic guidelines (Table 6-5 through Table 6-15).

Water quality predictions are summarized starting in January 2039 and extends to December 2119. The model nodes presented herein show predicted concentrations below the applicable guidelines throughout Post-Closure with the exception of phosphorus. Chloride concentrations are elevated only in PUMP01 early in Post-Closure and decrease to below the guideline value by June 2046. Elevated concentrations of phosphorus are associated with natural runoff and thus phosphorus is not considered a mine related POPC.

Additional monitoring data collected through the life of mine will be used to update Post-Closure model predictions. Monthly water quality predictions for flooded pits and natural lakes during Post-Closure are provided in Appendix D.2, predictions for conjoined flooded pits which form during Post-Closure are provided in Appendix D.3.

7. Summary

AGNICO EAGLE

7. Summary

The WBWQM assembled for the January 2024 Type A Water License 2AM-MEL1631 amendment (Lorax 2024), and subsequently updated for the 2025 Modification application, has been further revised to reflect slight changes to the mine plan to support the 2026 WL Amendment. These updates include:

- The mine plan is extended within the previously assessed footprint to the end of 2036;
- The Waterline is online as of June 2027;
- Advancement of the PUMP underground mine below permafrost;
- Utilization of the underground mine voids for permanent storage of saline water at the beginning of Active Closure;
- Sewage treatment plant discharges will be routed to the underground mine void for the duration of the Active Closure phase (2037-2043); and,
- Utilization of the Waterline for the first three years of Active Closure (2037-2039) to remove remaining surface contact water and saline water from storage at site.

The mine plan represented in the updated WBWQM remains within the footprint and Meliadine Lake discharge volumes approved by NIRB in 2015, and by the Nunavut Water Board in 2024.

The water balance model assembled for the Meliadine Mine tracks all water types (surface contact, saline and non-contact) across the site on a daily time-step, with water quality predictions aggregated to monthly time-steps for comparison to relevant criteria. Lake, pit, and underground dewatering activities are represented, along with the balancing of discharges to Meliadine Lake and Itivia Harbour. Predicted inflows, outflows, and pond volumes for key nodes (CP1, WES03, CP7, PUMP01/CP9, PUMP02, TIRI02 and WES02) indicate that the water management infrastructure is capable of routing and storing the saline and surface contact water throughout Operations, under an annually variable RCP4.5 climate scenario. The updated model shows slight changes to the annual discharge volumes relative to those presented in Lorax (2025), summarized as follows:

- Reductions in saline water discharge to Itivia Harbour, with the exception of 2030, 2031, and 2033;
- Comparable treated effluent discharge volumes from the EWTP to Itivia Harbour;
- Reduced discharges to Meliadine Lake via the EWTP; and,

- Increased proportion of total Waterline discharge comprised of treated (via the EWTP) surface contact water.

During Operations, model predictions for key parameters (TDS, chloride, ammonia-N, and arsenic) at the main collection ponds and discharge points are generally lower than their respective water quality guidelines. No exceedances of any parameters are predicted in effluent discharged from EWTP during mine Operations. Above guideline concentrations of ammonia are predicted in Waterline discharge, and treatment options are being investigated to mitigate this potential exceedance.
