| | |
|---|---|
| Package 1 | 7.3°C |

Each temperature is the average of up to three cooler temperatures taken at receipt

**GENERAL COMMENTS**

Custody seal was not present on the cooler.

## QUALITY ASSURANCE REPORT

| | | | Matrix Spike | | Spiked Blank | | Method Blank | | RPD | | QC Standard | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| QC Batch | Parameter | Date | % Recovery | QC Limits | % Recovery | QC Limits | Value | Units | Value (%) | QC Limits | % Recovery | QC Limits |
| 2558764 | Dissolved Chloride (Cl) | 2011/07/22 | NC | 75 - 125 | 101 | 80 - 120 | <1 | mg/L | 0.4 | 20 | | |
| 2558765 | Dissolved Sulphate (SO4) | 2011/07/22 | NC | 75 - 125 | 100 | 80 - 120 | <1 | mg/L | 1.0 | 25 | | |

N/A = Not Applicable
RPD = Relative Percent Difference
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) - Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

## Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons. The extraction date for samples field preserved with methanol for F1 and Volatile Organic Compounds is considered to be the date sampled.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by Ontario Regulation 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
* Results relate only to the items tested.

(1) This test was performed by Maxxam Ottawa

(2) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.

| | |
|---|---|
| Package 1 | 4.0°C |

Each temperature is the average of up to three cooler temperatures taken at receipt

**GENERAL COMMENTS**

Cooler custody seal was present and intact.

Sample KW9637-01: Metal analysis:

RDL of Nickel was adjusted due to high concentration of Calcium.

## QUALITY ASSURANCE REPORT

| | | | Matrix Spike | | Spiked Blank | | Method Blank | | RPD | | QC Standard | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| QC Batch | Parameter | Date | % Recovery | QC Limits | % Recovery | QC Limits | Value | Units | Value (%) | QC Limits | % Recovery | QC Limits |
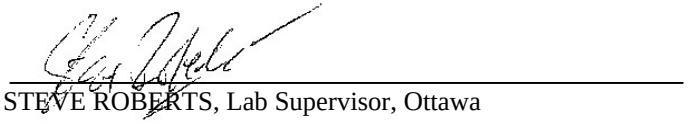
| 2618706 | Total Dissolved Solids | 2011/09/21 | | | | | <10 | mg/L | 3.7 | 25 | 98 | 90 - 110 |
| 2620069 | Total Phosphorus | 2011/09/20 | 103 | 80 - 120 | 102 | 85 - 115 | <0.002 | mg/L | 13.8 | 20 | 107 | 85 - 115 |
| 2620369 | Mercury (Hg) | 2011/09/21 | 112 | 75 - 125 | 112 | 80 - 120 | <0.1 | ug/L | NC | 25 | | |

N/A = Not Applicable
RDL = Reportable Detection Limit
RPD = Relative Percent Difference
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) - Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.



# Validation Signature Page

**Maxxam Job #: B1E1882**

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

CRISTINA CARRIERE, Scientific Services

STEVE ROBERTS, Lab Supervisor, Ottawa

==========

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
( 1 ) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Analytics Mississauga
(2) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

| | | | Total Zirconium (Zr) | 2012/08/03 | NC | | % | 20 |

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
QC Standard: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Spiked Blank: A blank matrix to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

*NP (Neutralization Potential)

$$= \frac{50 \times (N \text{ of HCL} \times \text{Total HCL added} - N \text{ NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.01 will be calculated using a 0.01 value.

Sulphur analysis performed following BC ARD Guidelines (Price 1997)

**LR Report :** **CA10273-SEP11**

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.01 will be calculated using a 0.01 value.

Sulphur analysis performed following BC ARD Guidelines (Price 1997)

**LR Report :** **CA10284-SEP11**

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.01 will be calculated using a 0.01 value.

Sulphur analysis performed following BC ARD Guidelines (Price 1997)

**LR Report :** **CA10516-SEP11**

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.01 will be calculated using a 0.01 value.

Sulphur analysis performed following BC ARD Guidelines (Price 1997)

**LR Report :** **CA11123-SEP11**

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.01 will be calculated using a 0.01 value.

Sulphur analysis performed following BC ARD Guidelines (Price 1997)

**LR Report :** **CA10417-JUN11**

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.01 will be calculated using a 0.01 value.

Sulphur analysis performed following BC ARD Guidelines (Price 1997)

# CERTIFICATE OF ANALYSIS
## Final Report

| Analysis | 3: Analysis Approval Date | 4: Analysis Approval Time | 5: CND-10 |
|---|---|---|---|
| Sample Date & Time | | | Date:N/A |
| Paste pH [units] | 19-Jul-11 | 15:59 | 8.18 |
| Fizz Rate [---] | 19-Jul-11 | 15:59 | 3 |
| Sample weight [g] | 19-Jul-11 | 15:59 | 2.03 |
| HCl added [mL] | 19-Jul-11 | 15:59 | 64.00 |
| HCl [Normality] | 19-Jul-11 | 15:59 | 0.10 |
| NaOH [Normality] | 19-Jul-11 | 15:59 | 0.10 |
| NaOH to pH=8.3 [mL] | 19-Jul-11 | 15:59 | 31.60 |
| Final pH [units] | 19-Jul-11 | 15:59 | 1.74 |
| NP [t CaCO3/1000 t] | 19-Jul-11 | 15:59 | 80 |
| AP [t CaCO3/1000 t] | 19-Jul-11 | 16:01 | 277 |
| Net NP [t CaCO3/1000 t] | 19-Jul-11 | 16:01 | -197.45 |
| NP/AP [ratio] | 19-Jul-11 | 16:02 | 0.29 |
| Sulphur (total) [%] | 14-Jul-11 | 16:00 | 10.5 |
| Acid Leachable SO4-S [%] | 19-Jul-11 | 15:59 | 1.59 |
| Sulphide [%] | 14-Jul-11 | 15:55 | 8.87 |
| Carbon (total) [%] | 14-Jul-11 | 16:00 | 1.62 |
| Carbonate [%] | 14-Jul-11 | 15:56 | 4.93 |

**LR Report :** **CA10195-JUL11**

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.01 will be calculated using a 0.01 value.

Sulphur analysis performed following BC ARD Guidelines (Price 1997)

## Final Report

| Analysis | 5: CND-10 |
|---|---|
| SiO2 [%] | 33.0 |
| Al2O3 [%] | 6.03 |
| Fe2O3 [%] | 36.2 |
| MgO [%] | 1.88 |
| CaO [%] | 3.73 |
| Na2O [%] | 0.76 |
| K2O [%] | 0.97 |
| TiO2 [%] | 0.21 |
| P2O5 [%] | 0.15 |
| MnO [%] | 0.11 |
| Cr2O3 [%] | < 0.01 |
| V2O5 [%] | 0.01 |
| LOI [%] | 13.6 |
| Sum [%] | < 98 |

**LR Report :** **CA11201-JUL11**

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.01 will be calculated using a 0.01 value.

Sulphur analysis performed following BC ARD Guidelines (Price 1997)

## EXPERIMENTAL METHOD

The eight samples of **Project Meliadine** were reduced into fine powder to the optimum grain-size range for X-ray analysis (<10µm) grinding under ethanol in a vibratory McCrone Micronising Mill for 7 minutes. Step-scan X-ray powder-diffraction data were collected over a range 3-80°2θ with CoKa radiation on a Bruker D8 Focus Bragg-Brentano diffractometer equipped with an Fe monochromator foil, 0.6 mm (0.3°) divergence slit, incident- and diffracted-beam Soller slits and a LynxEye detector. The long fine-focus Co X-ray tube was operated at 35 kV and 40 mA, using a take-off angle of 6°.

## RESULTS

The X-ray diffractograms were analyzed using the International Centre for Diffraction Database PDF-4 using Search-Match software by Siemens (Bruker). X-ray powder-diffraction data were refined with Rietveld program Topas 3 (Bruker AXS).

The results of quantitative phase analysis by Rietveld refinement are given in Table 1. These amounts represent the relative amounts of crystalline phases normalized to 100%. The Rietveld refinement plots for the samples are shown in Figures 1 – 8.

## EXPERIMENTAL METHOD

The thirty-three samples of **Project 11-1428-0011 Meliadine** were reduced to the optimum grain-size range for quantitative X-ray analysis (<10 μm) by grinding under ethanol in a vibratory McCrone Micronising Mill for 7 minutes. Fine grain-size is an important factor in reducing micro-absorption contrast between phases. Step-scan X-ray powder-diffraction data were collected over a range 3-80°2θ with CoKa radiation on a Bruker D8 Focus Bragg-Brentano diffractometer equipped with an Fe monochromator foil, 0.6 mm (0.3°) divergence slit, incident- and diffracted-beam Soller slits and a LynxEye detector. The long fine-focus Co X-ray tube was operated at 35 kV and 40 mA, using a take-off angle of 6°.

## RESULTS

The X-ray diffractograms were analyzed using the International Centre for Diffraction Database PDF-4 and Search-Match software by Siemens (Bruker). X-ray powder-diffraction data of the samples were refined with Rietveld program Topas 4.2 (Bruker AXS). The results of quantitative phase analysis by Rietveld refinements are given in Table 1 (separate file, ***Golder Associates Results Dec 22 2011 - Proj 11-1428-0011 Meliadine.xls*)**. These amounts represent the relative amounts of crystalline phases normalized to 100%. The Rietveld refinement plots are shown in Figures 1 – 33. The ideal formulae of phases present are given in Table 2.

Table 2.

| **Mineral** | **Ideal Formula** |
|---|---|
| Actinolite | $Ca_2(Mg,Fe)_5Si_8O_{22}(OH)_2$ |
| Ankerite – Dolomite | $Ca(Fe^{2+},Mg,Mn^{2+})(CO_3)_2$ - $CaMg(CO_3)_2$ |
| Arsenopyrite | FeAsS |
| Biotite | $K(Mg,Fe)_3(AlSi_3O_{10})(OH)_2$ |

Coloured lines are individual diffraction patterns of all phases.

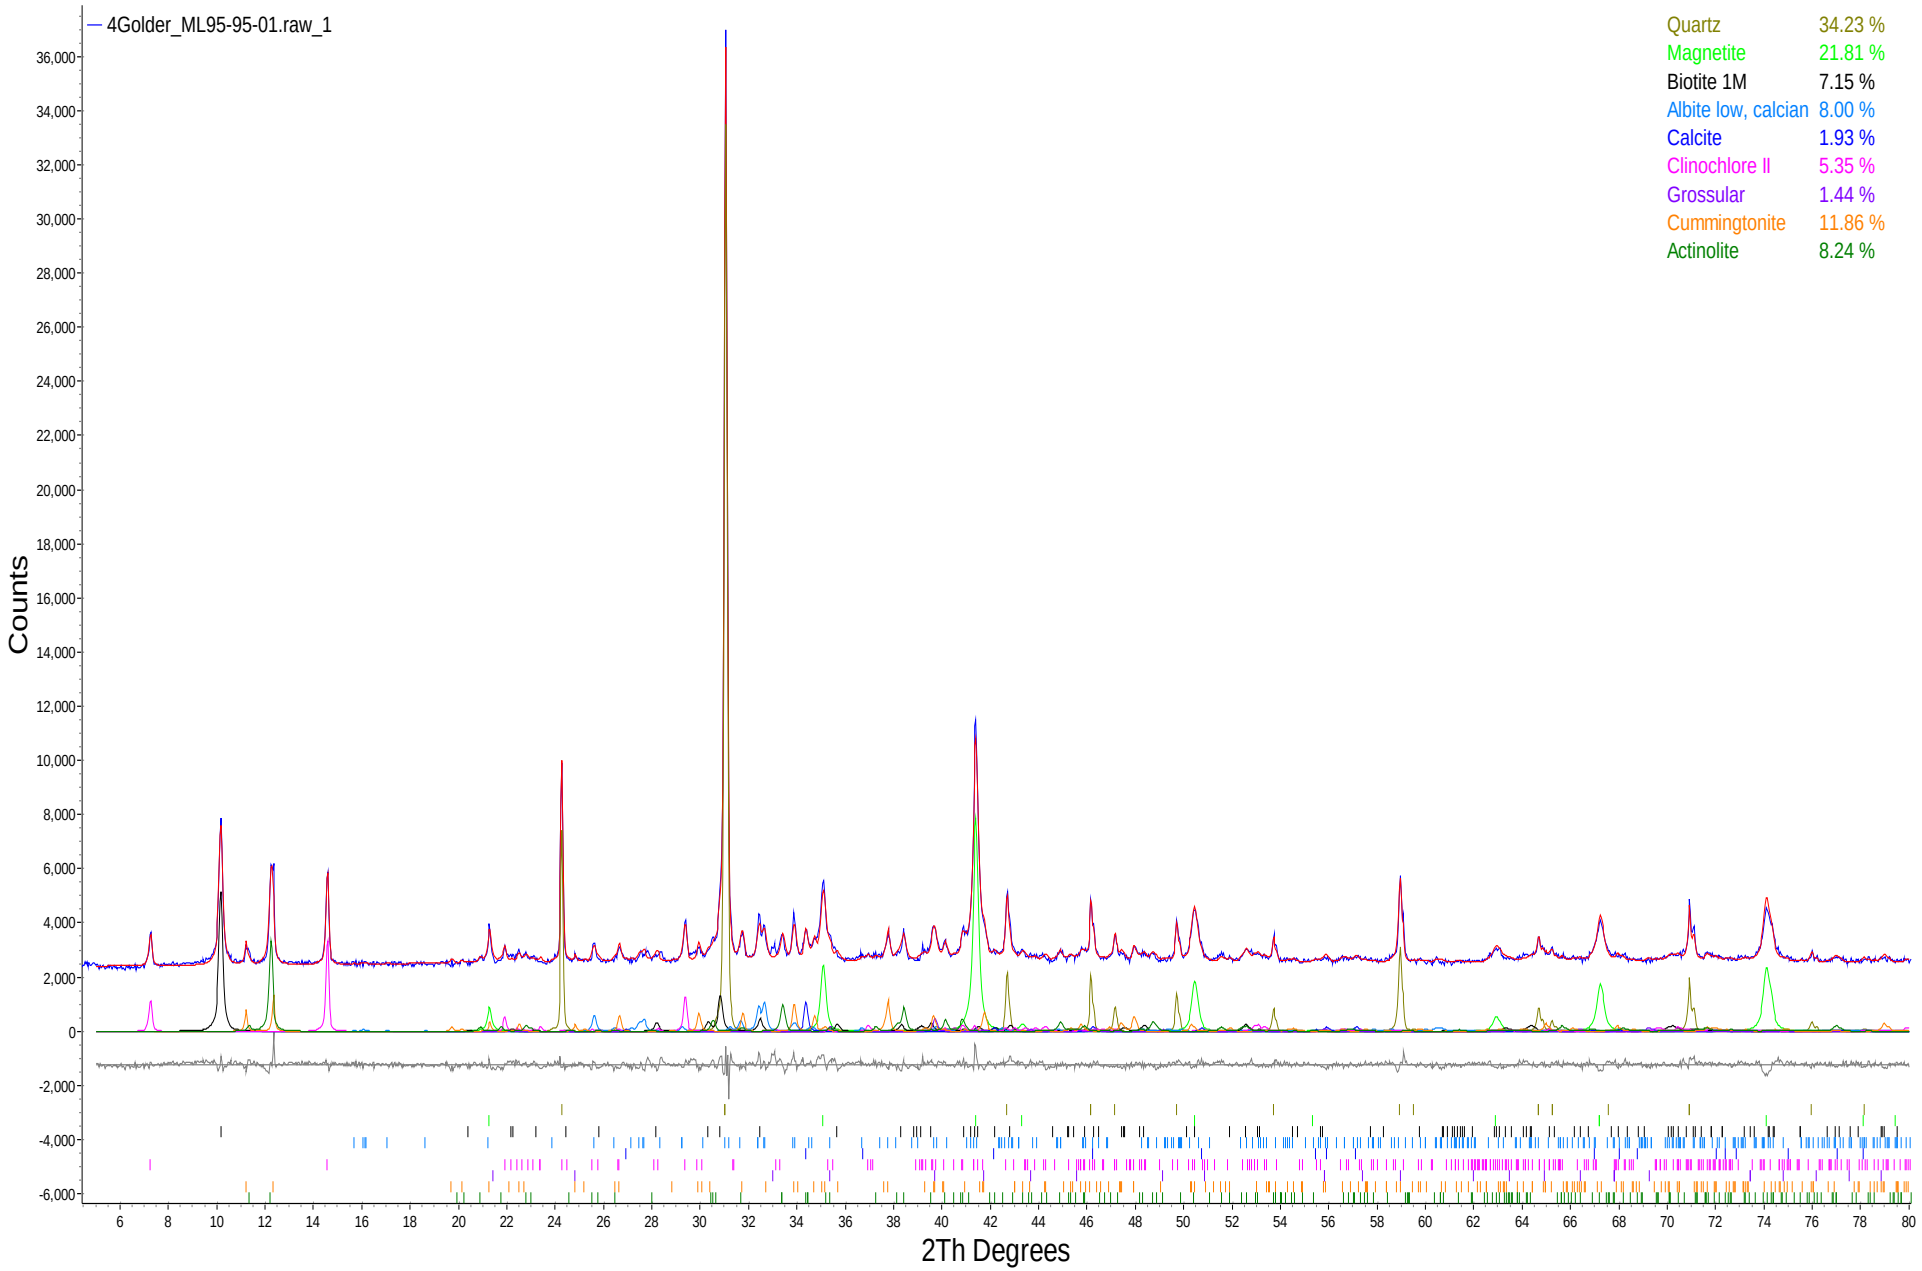

Figure 4. Rietveld refinement plot of sample **Golder Associates "ML95-95-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

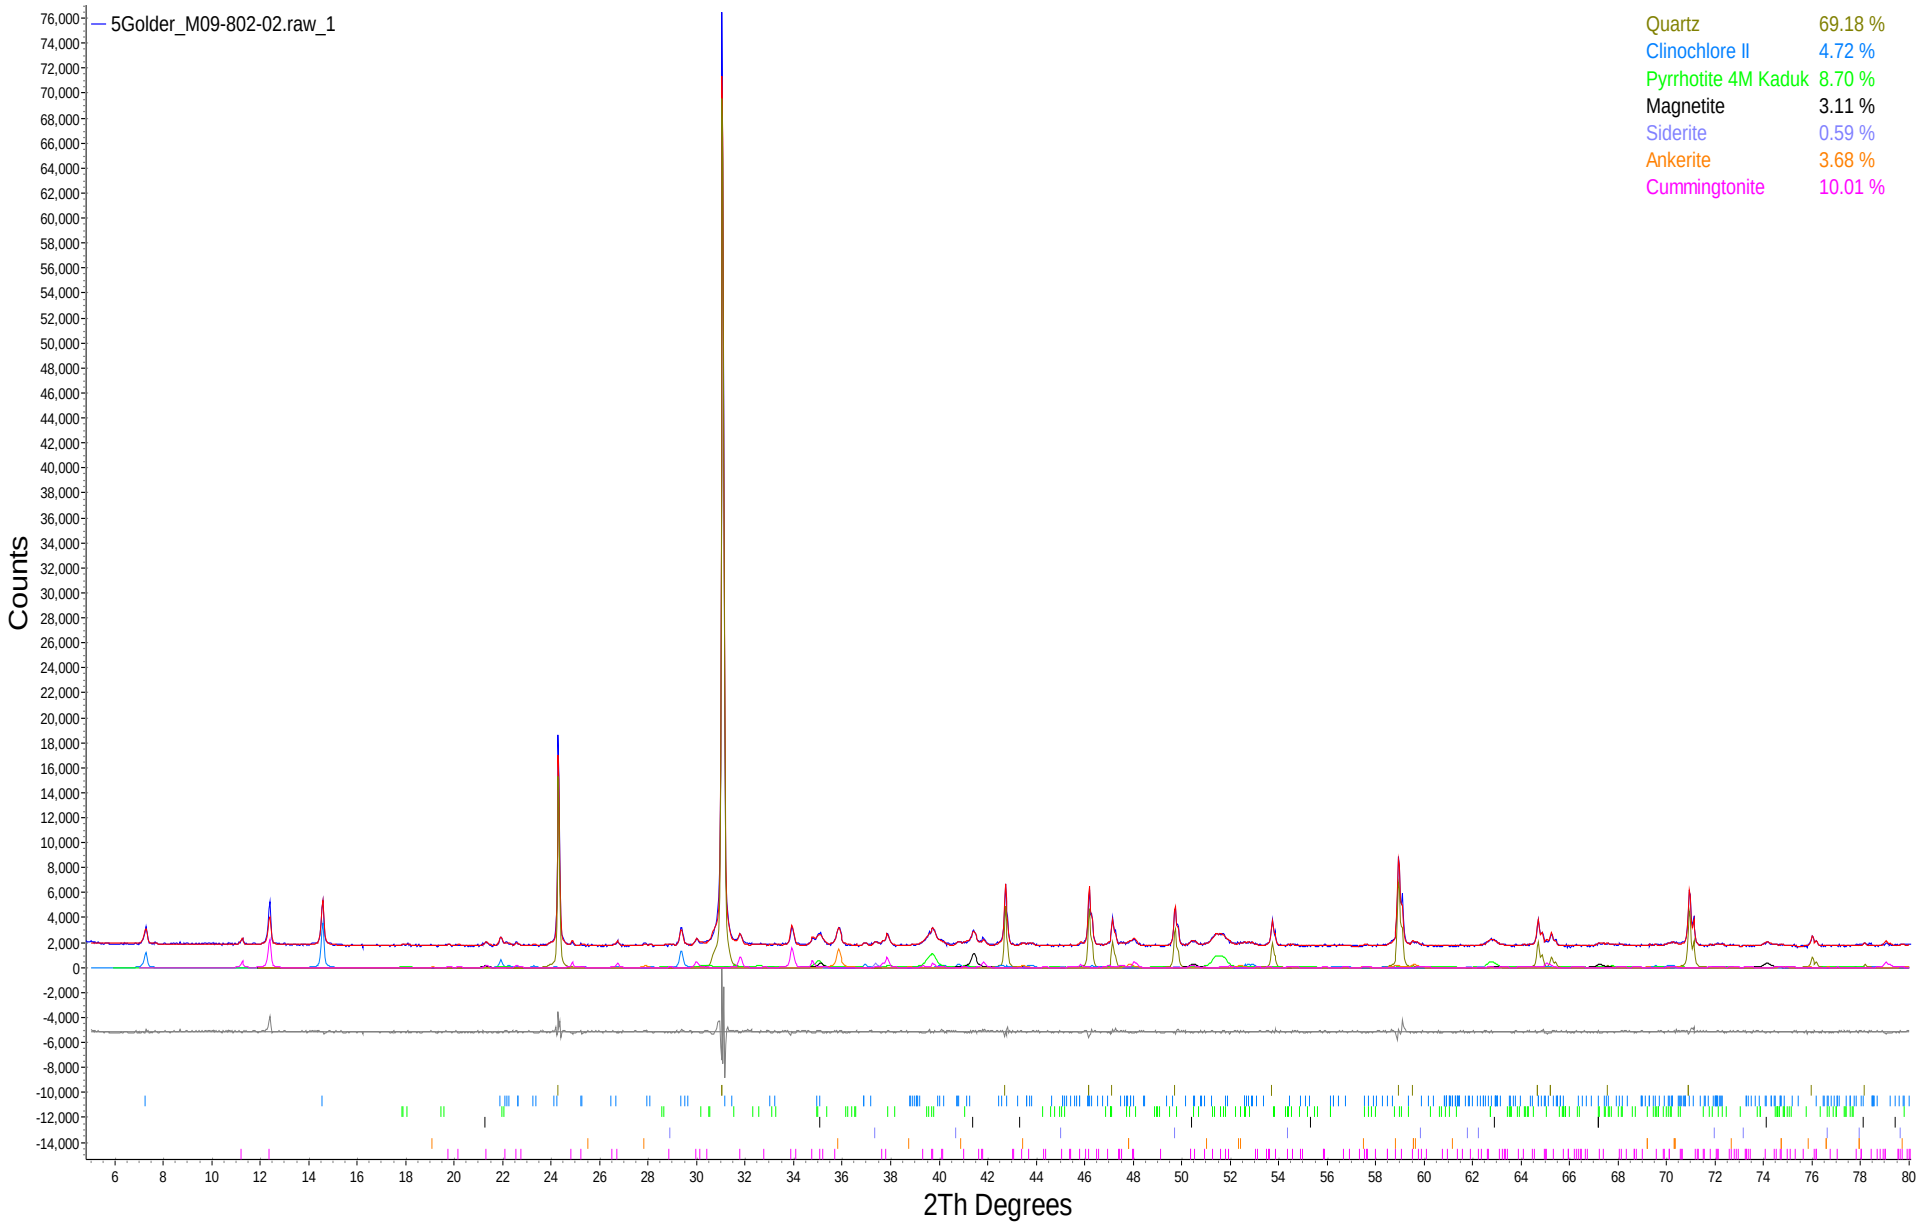

Figure 5. Rietveld refinement plot of sample **Golder Associates "M09-802-02"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

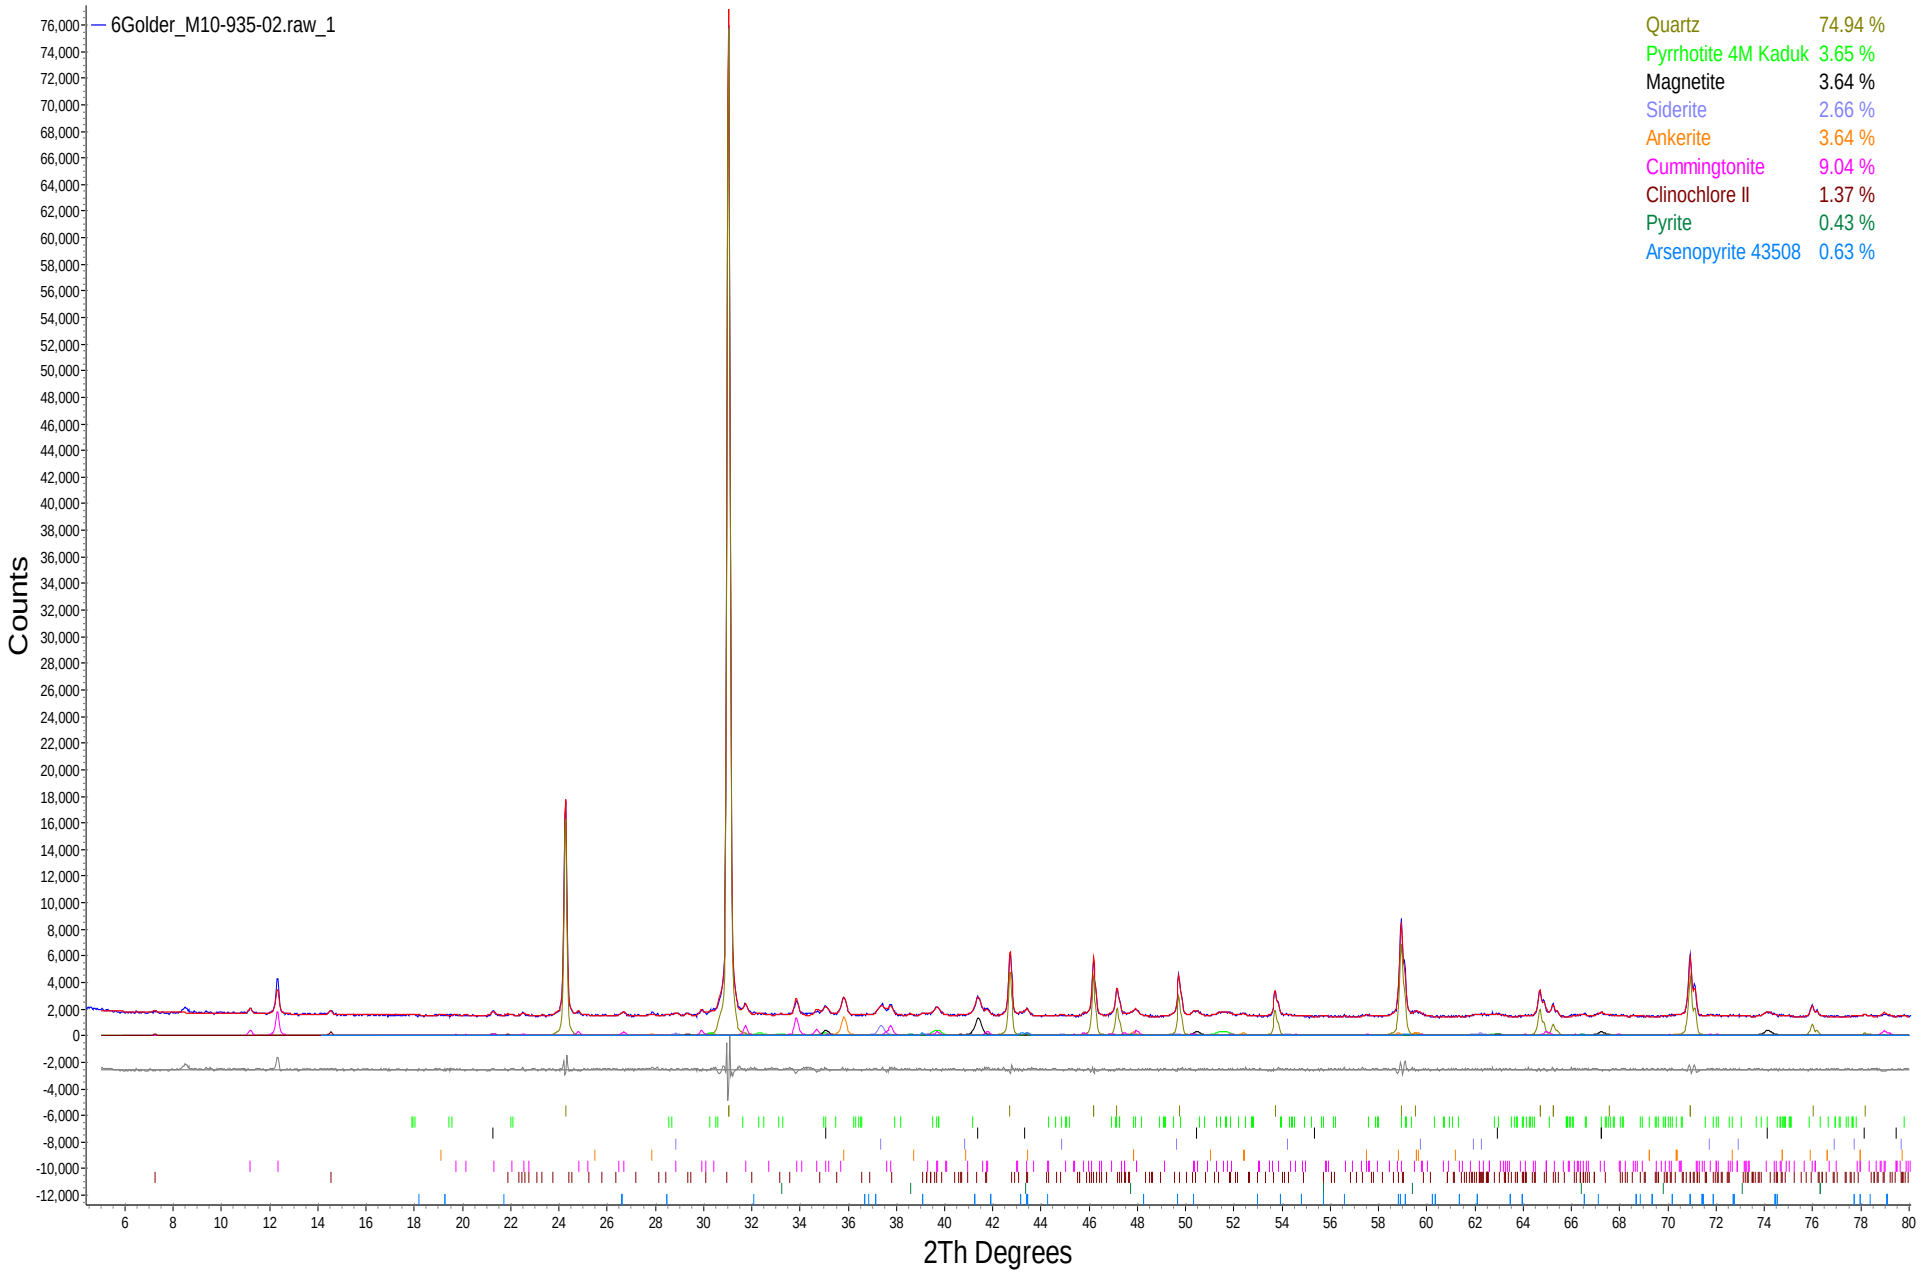

Figure 6. Rietveld refinement plot of sample **Golder Associates "M10-935-02"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

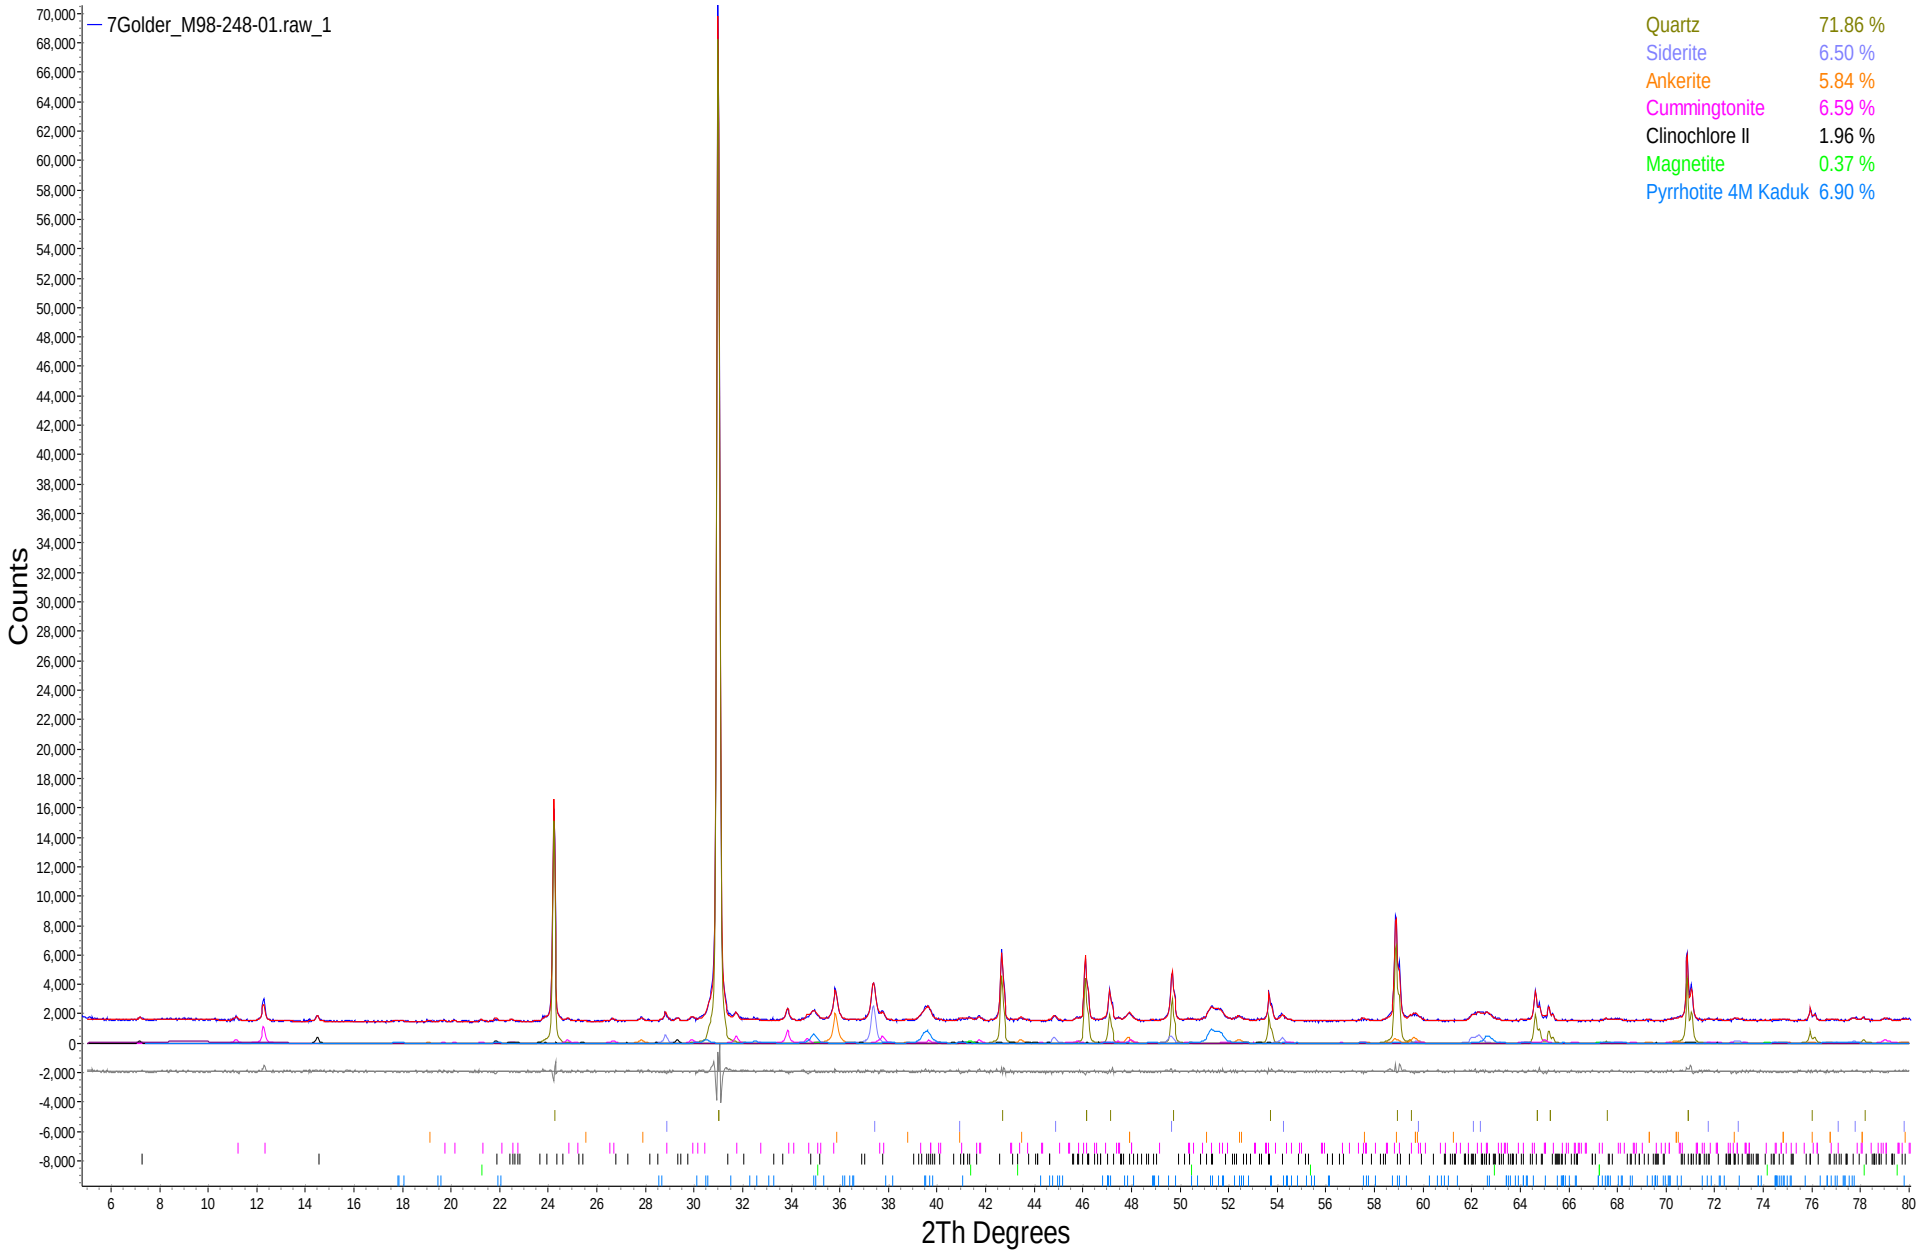

Figure 7. Rietveld refinement plot of sample **Golder Associates "M98-248-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

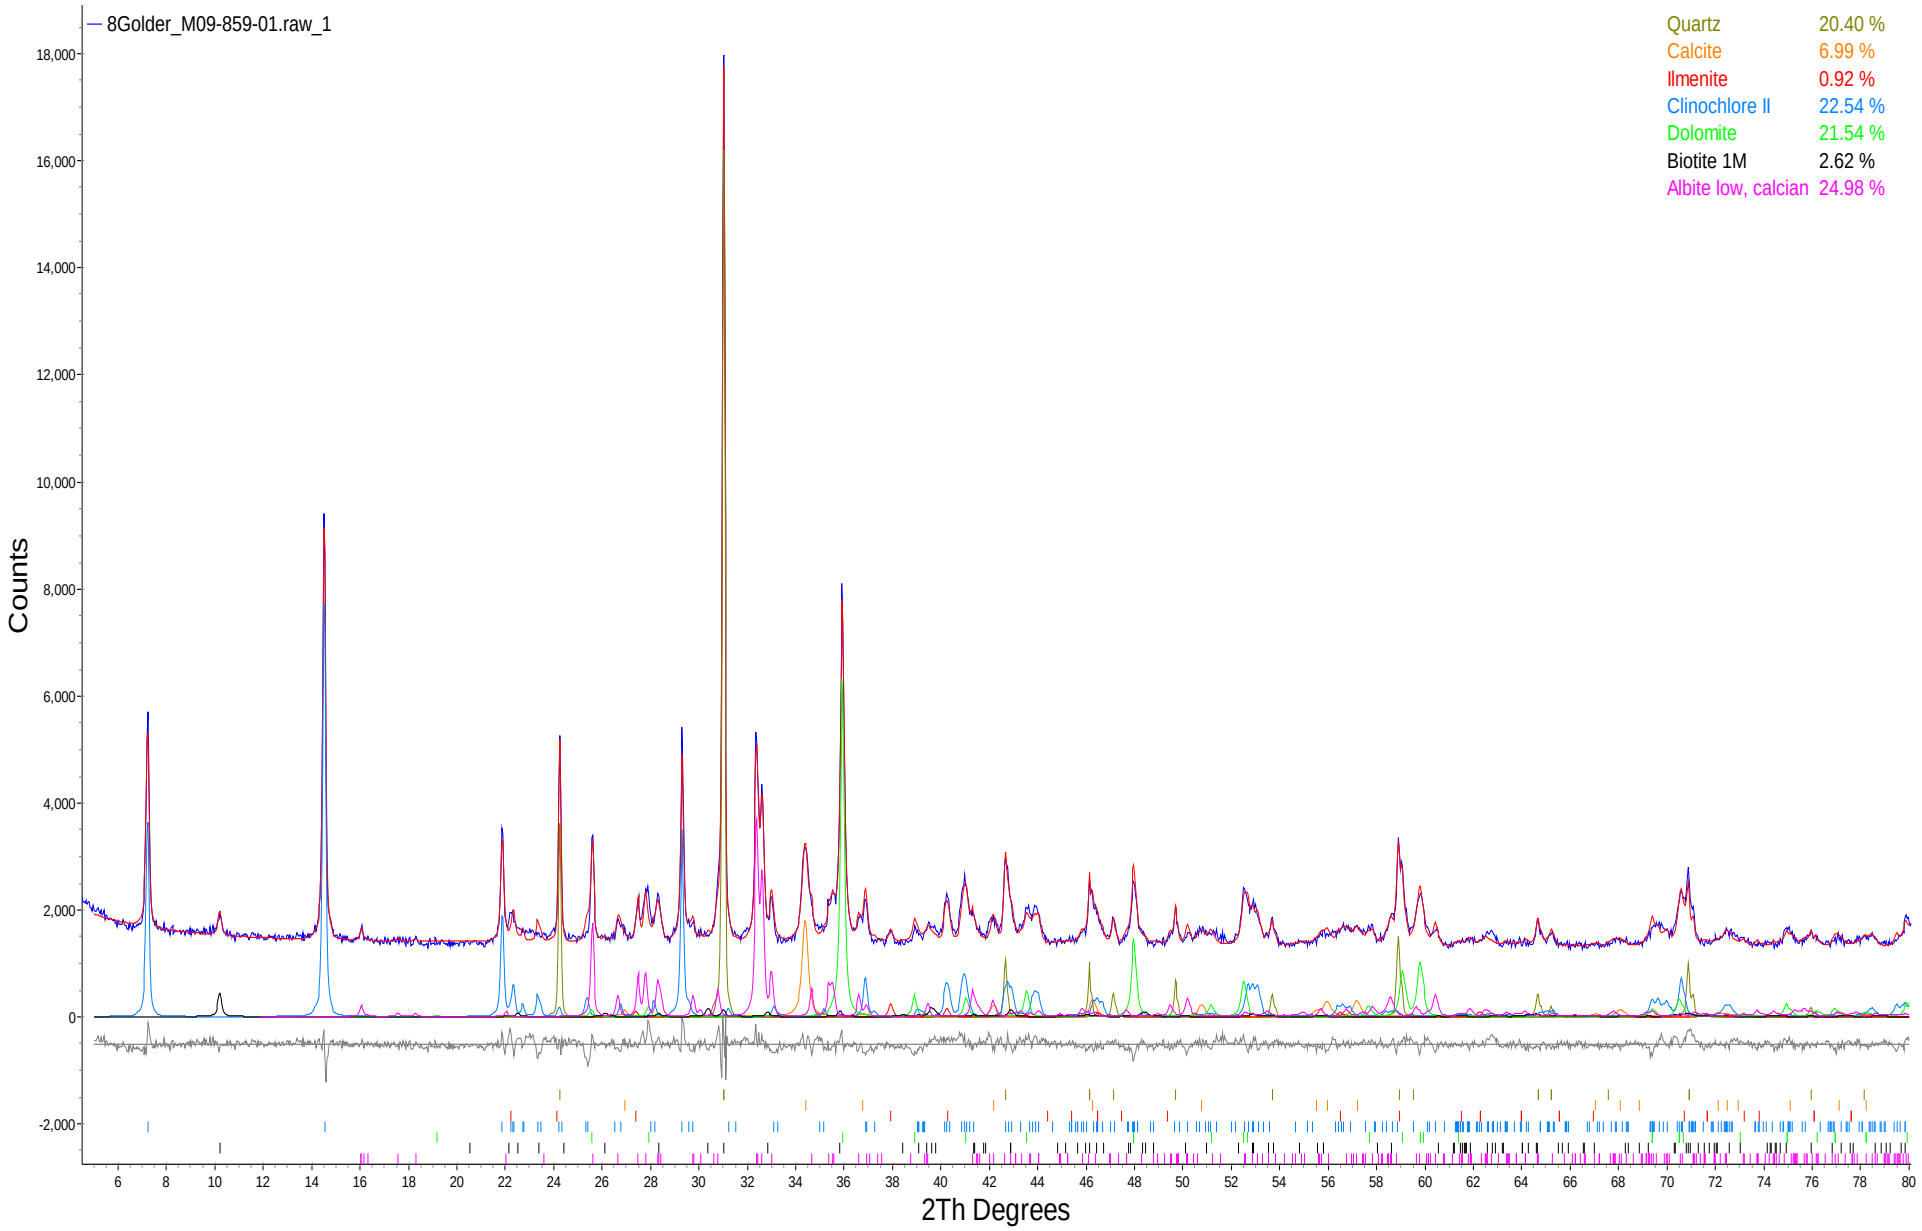

Figure 8. Rietveld refinement plot of sample **Golder Associates "M09-859-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

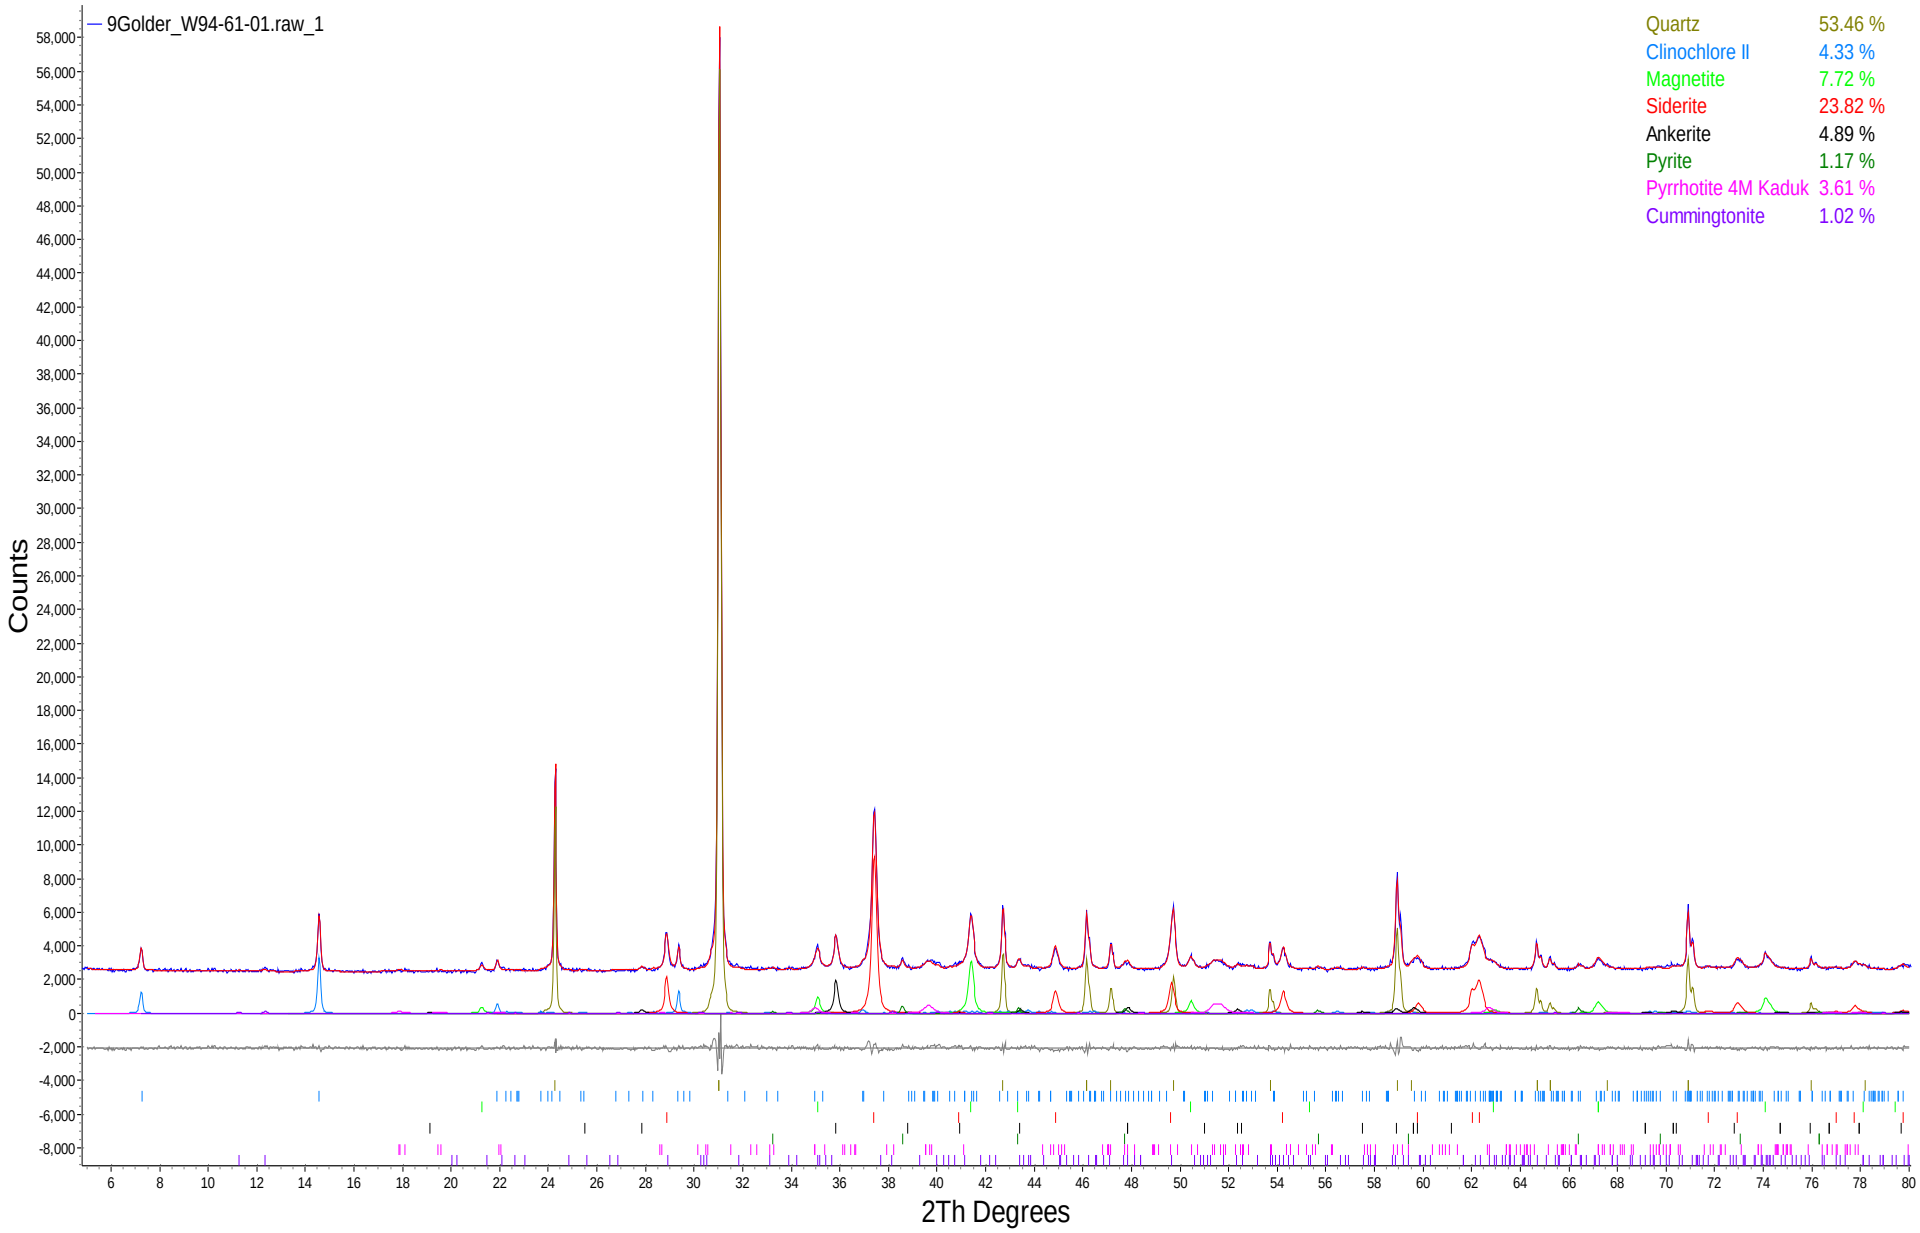

Figure 9. Rietveld refinement plot of sample **Golder Associates "W94-61-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

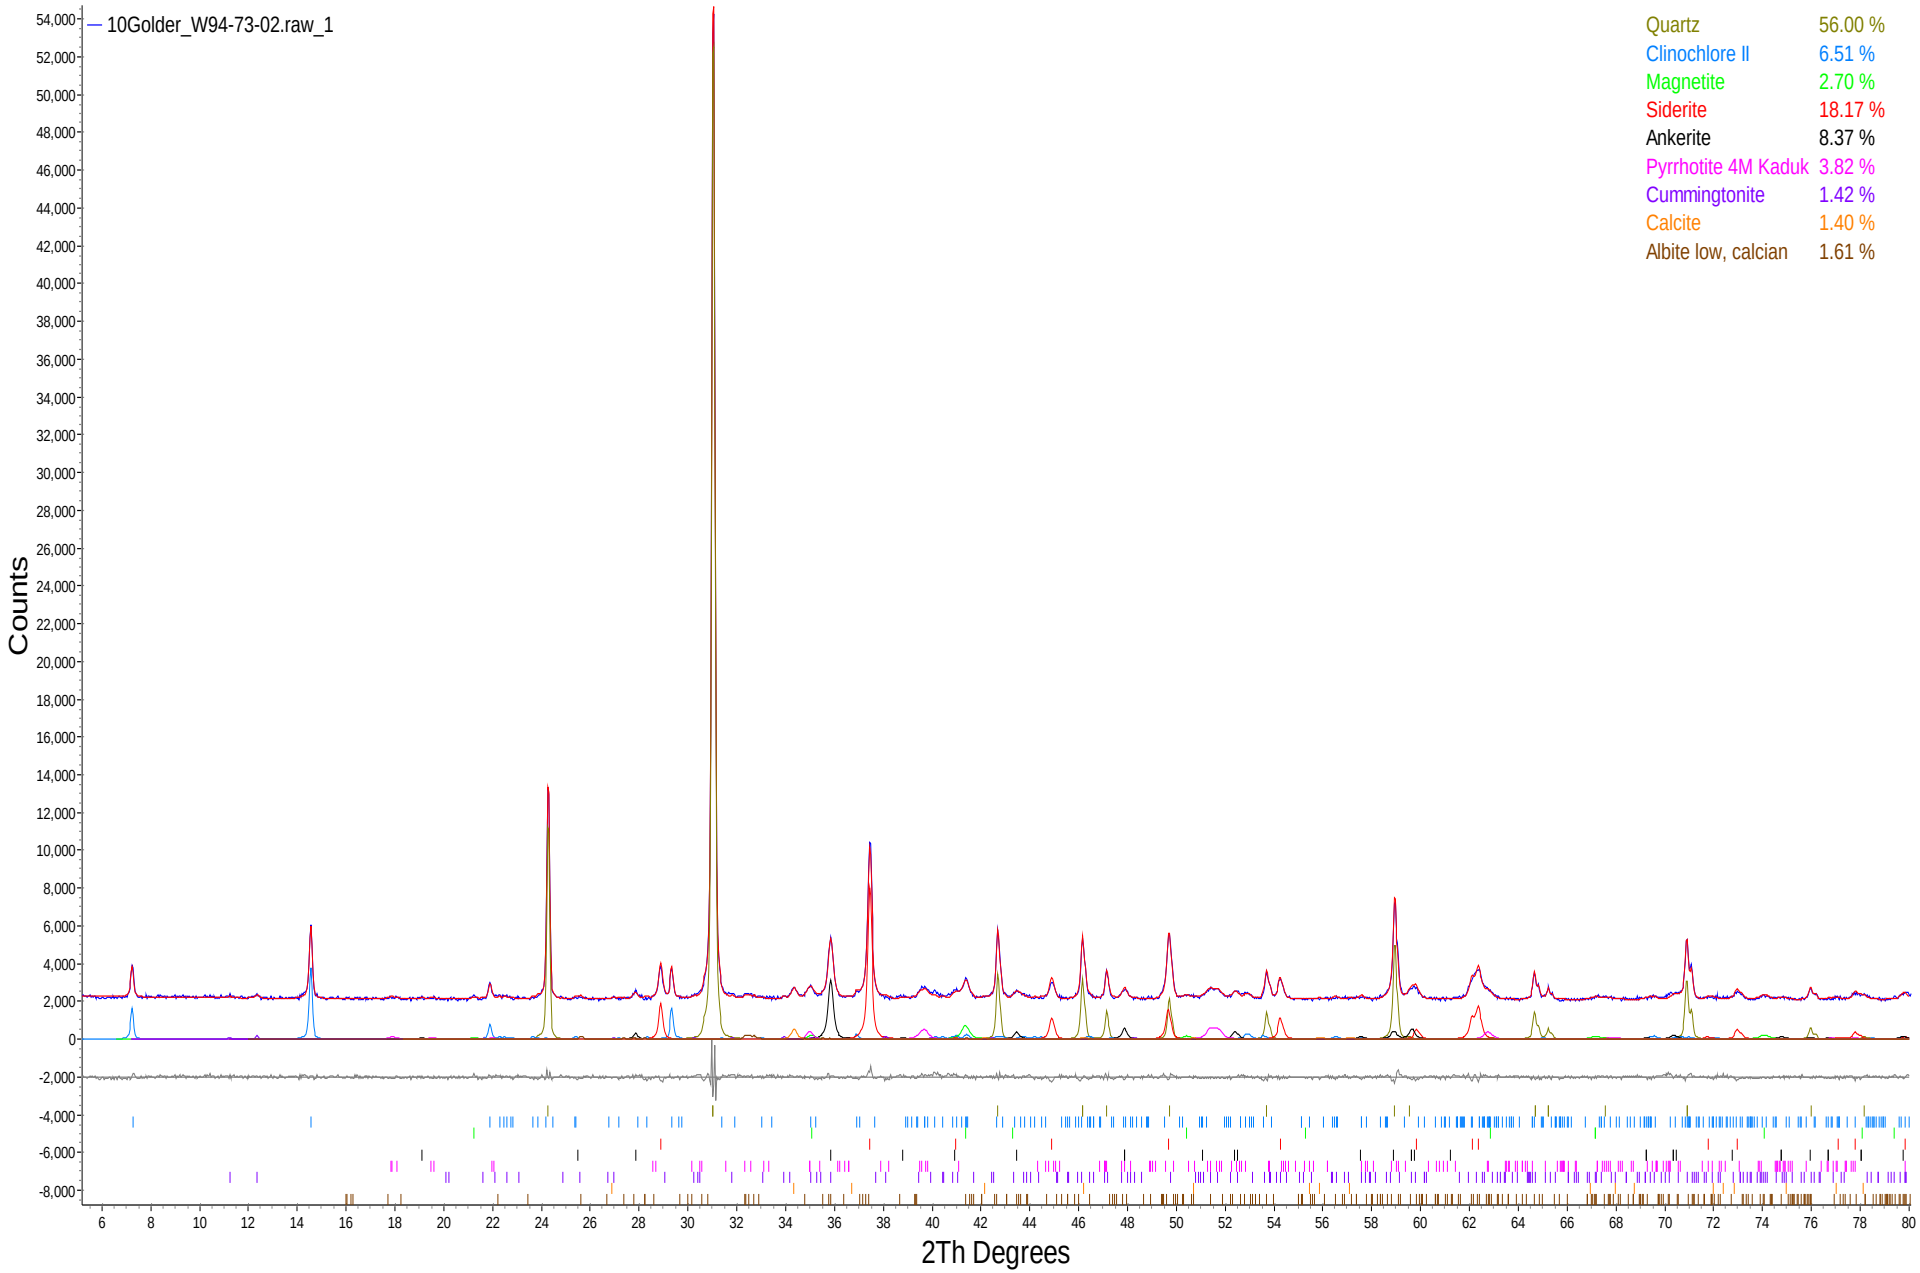

Figure 10. Rietveld refinement plot of sample **Golder Associates "W94-73-02"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

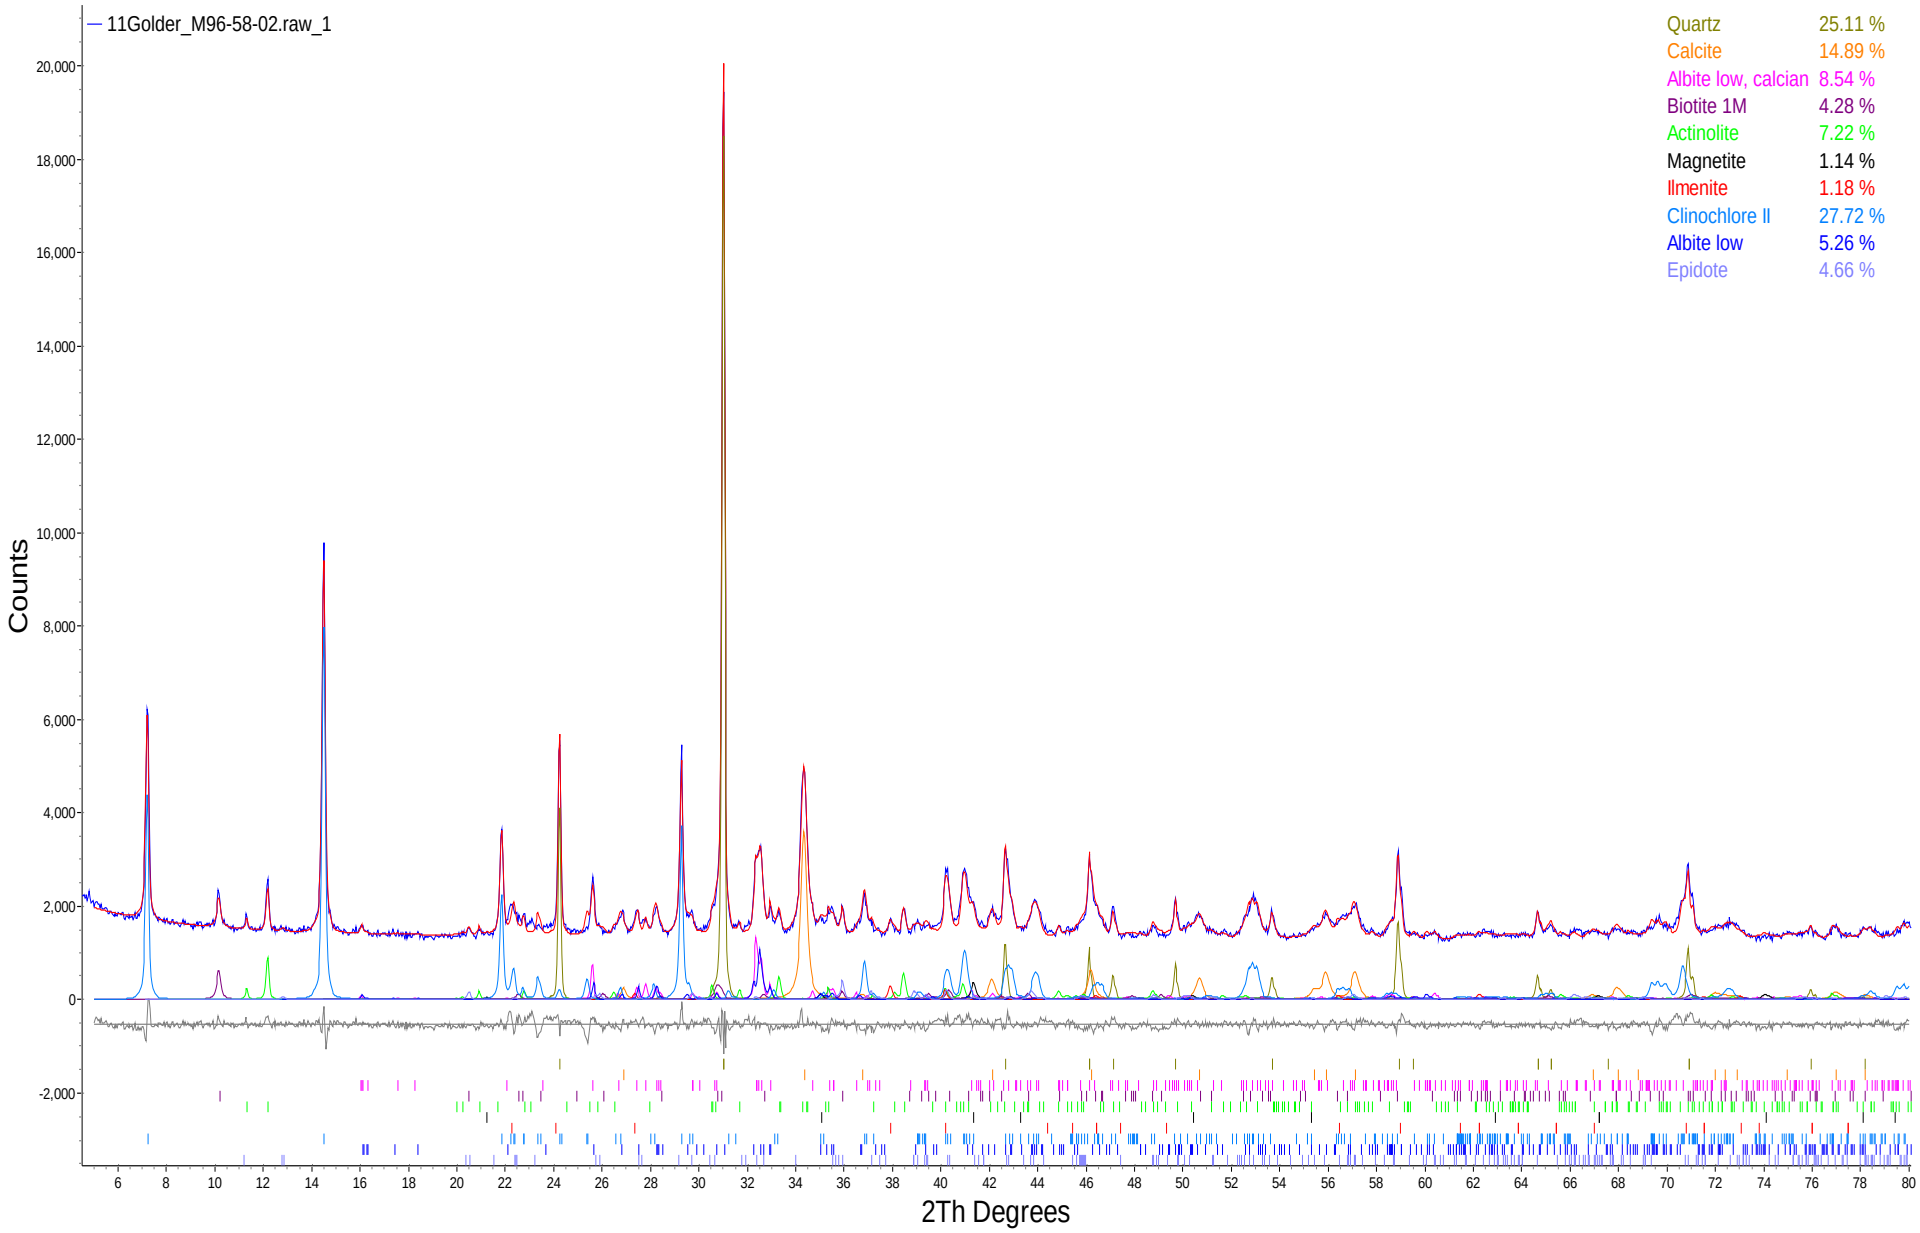

Figure 11. Rietveld refinement plot of sample **Golder Associates "M96-58-02"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

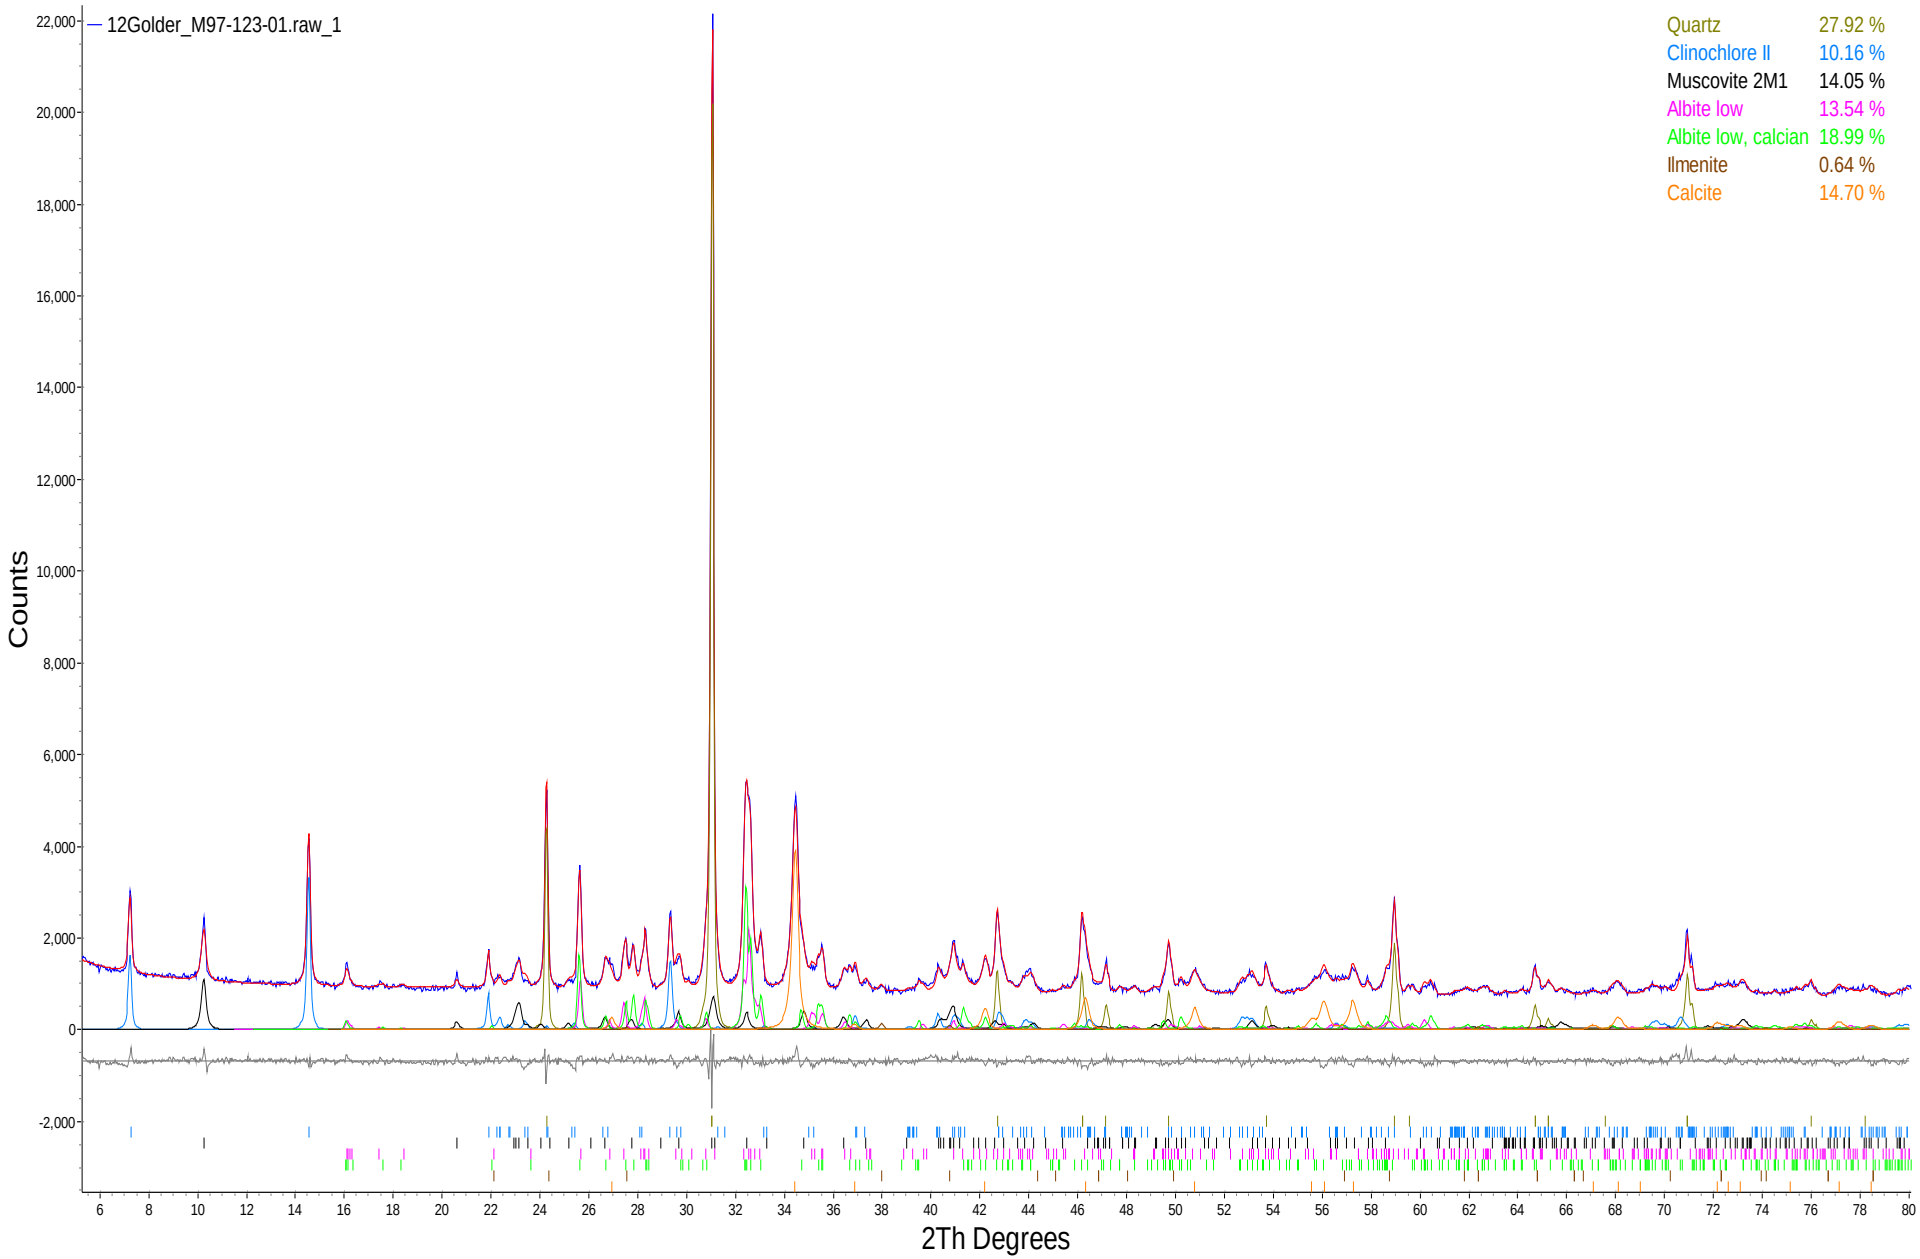

Figure 12. Rietveld refinement plot of sample **Golder Associates "M97-123-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

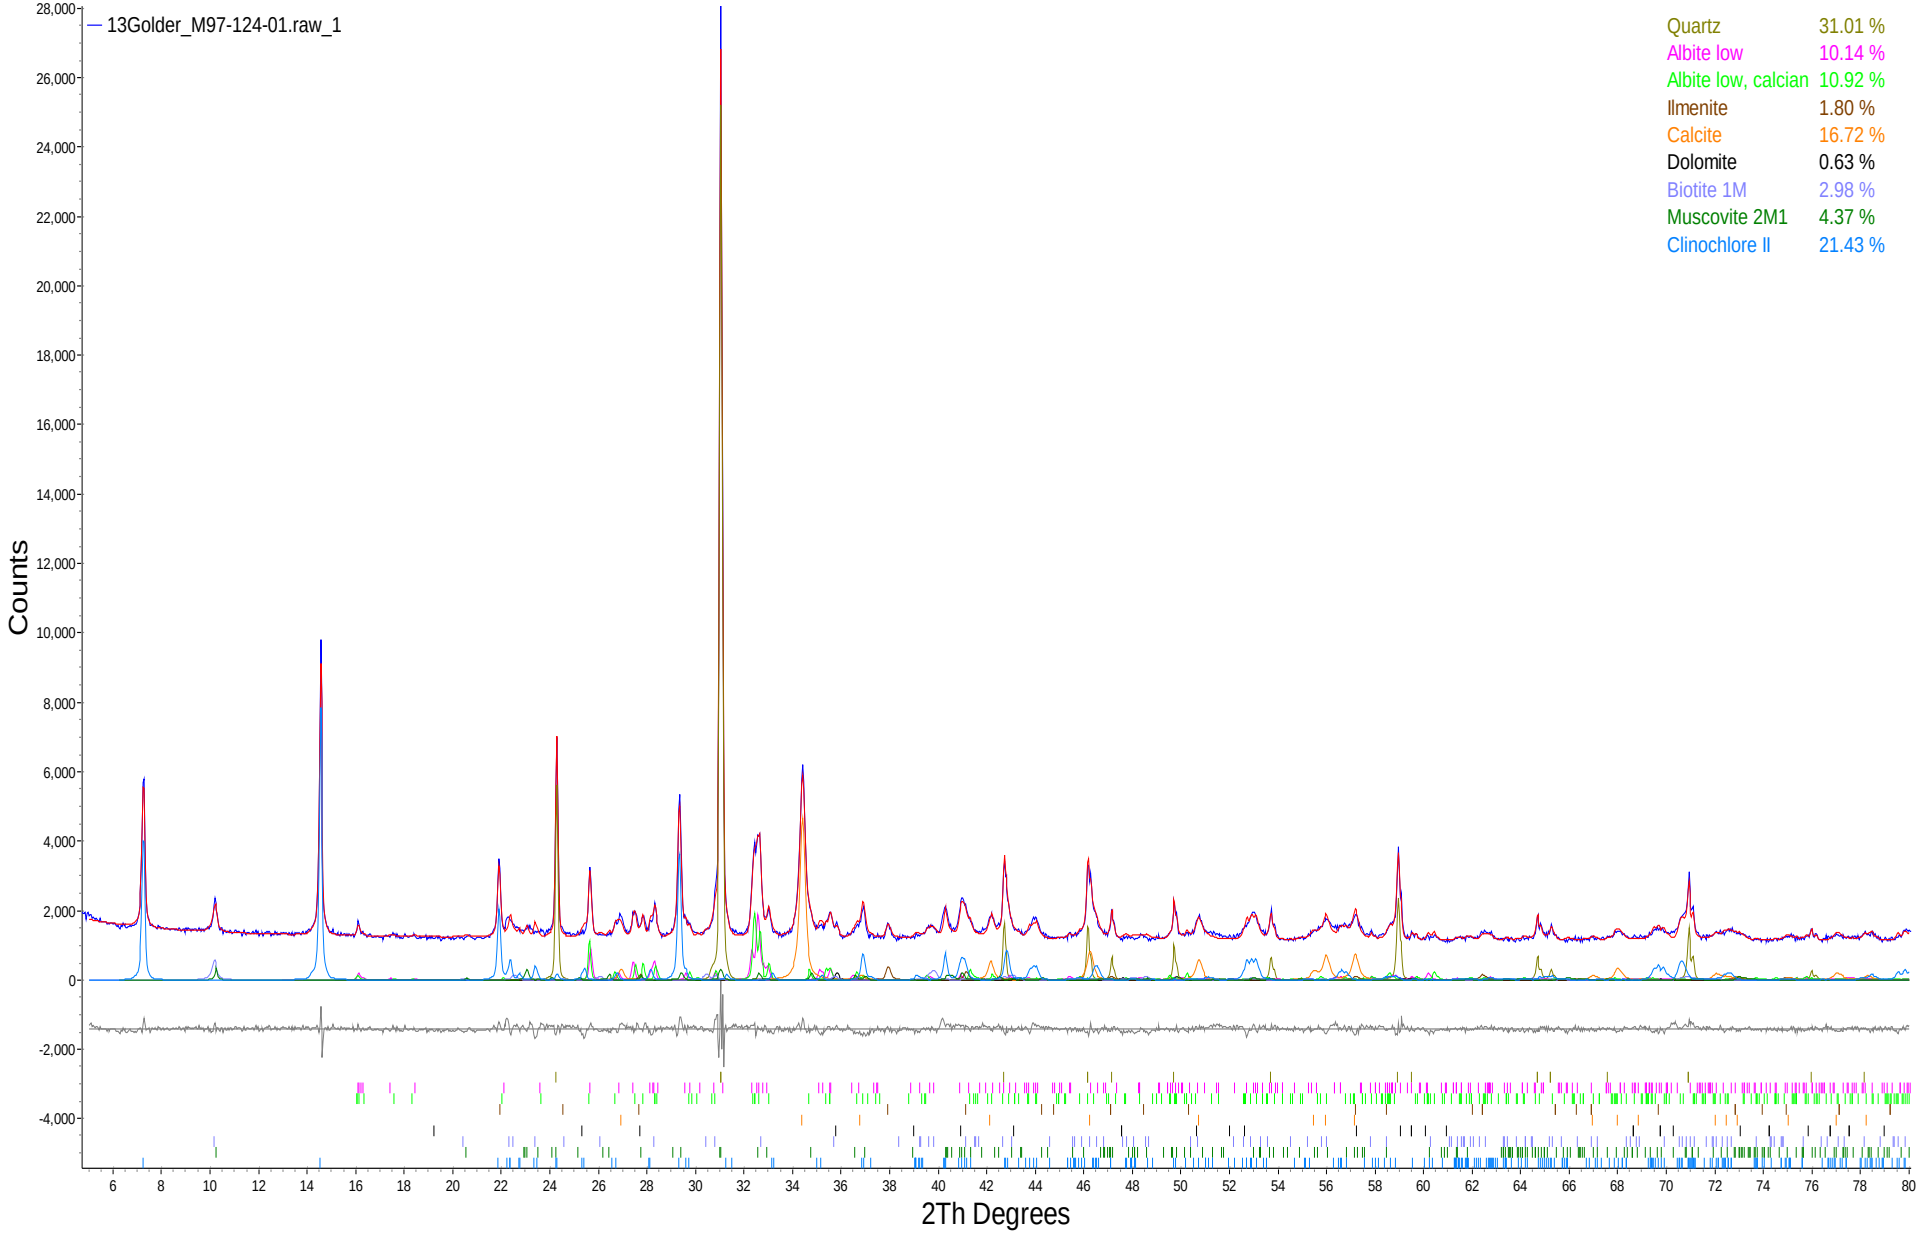

Figure 13. Rietveld refinement plot of sample **Golder Associates "M97-124-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

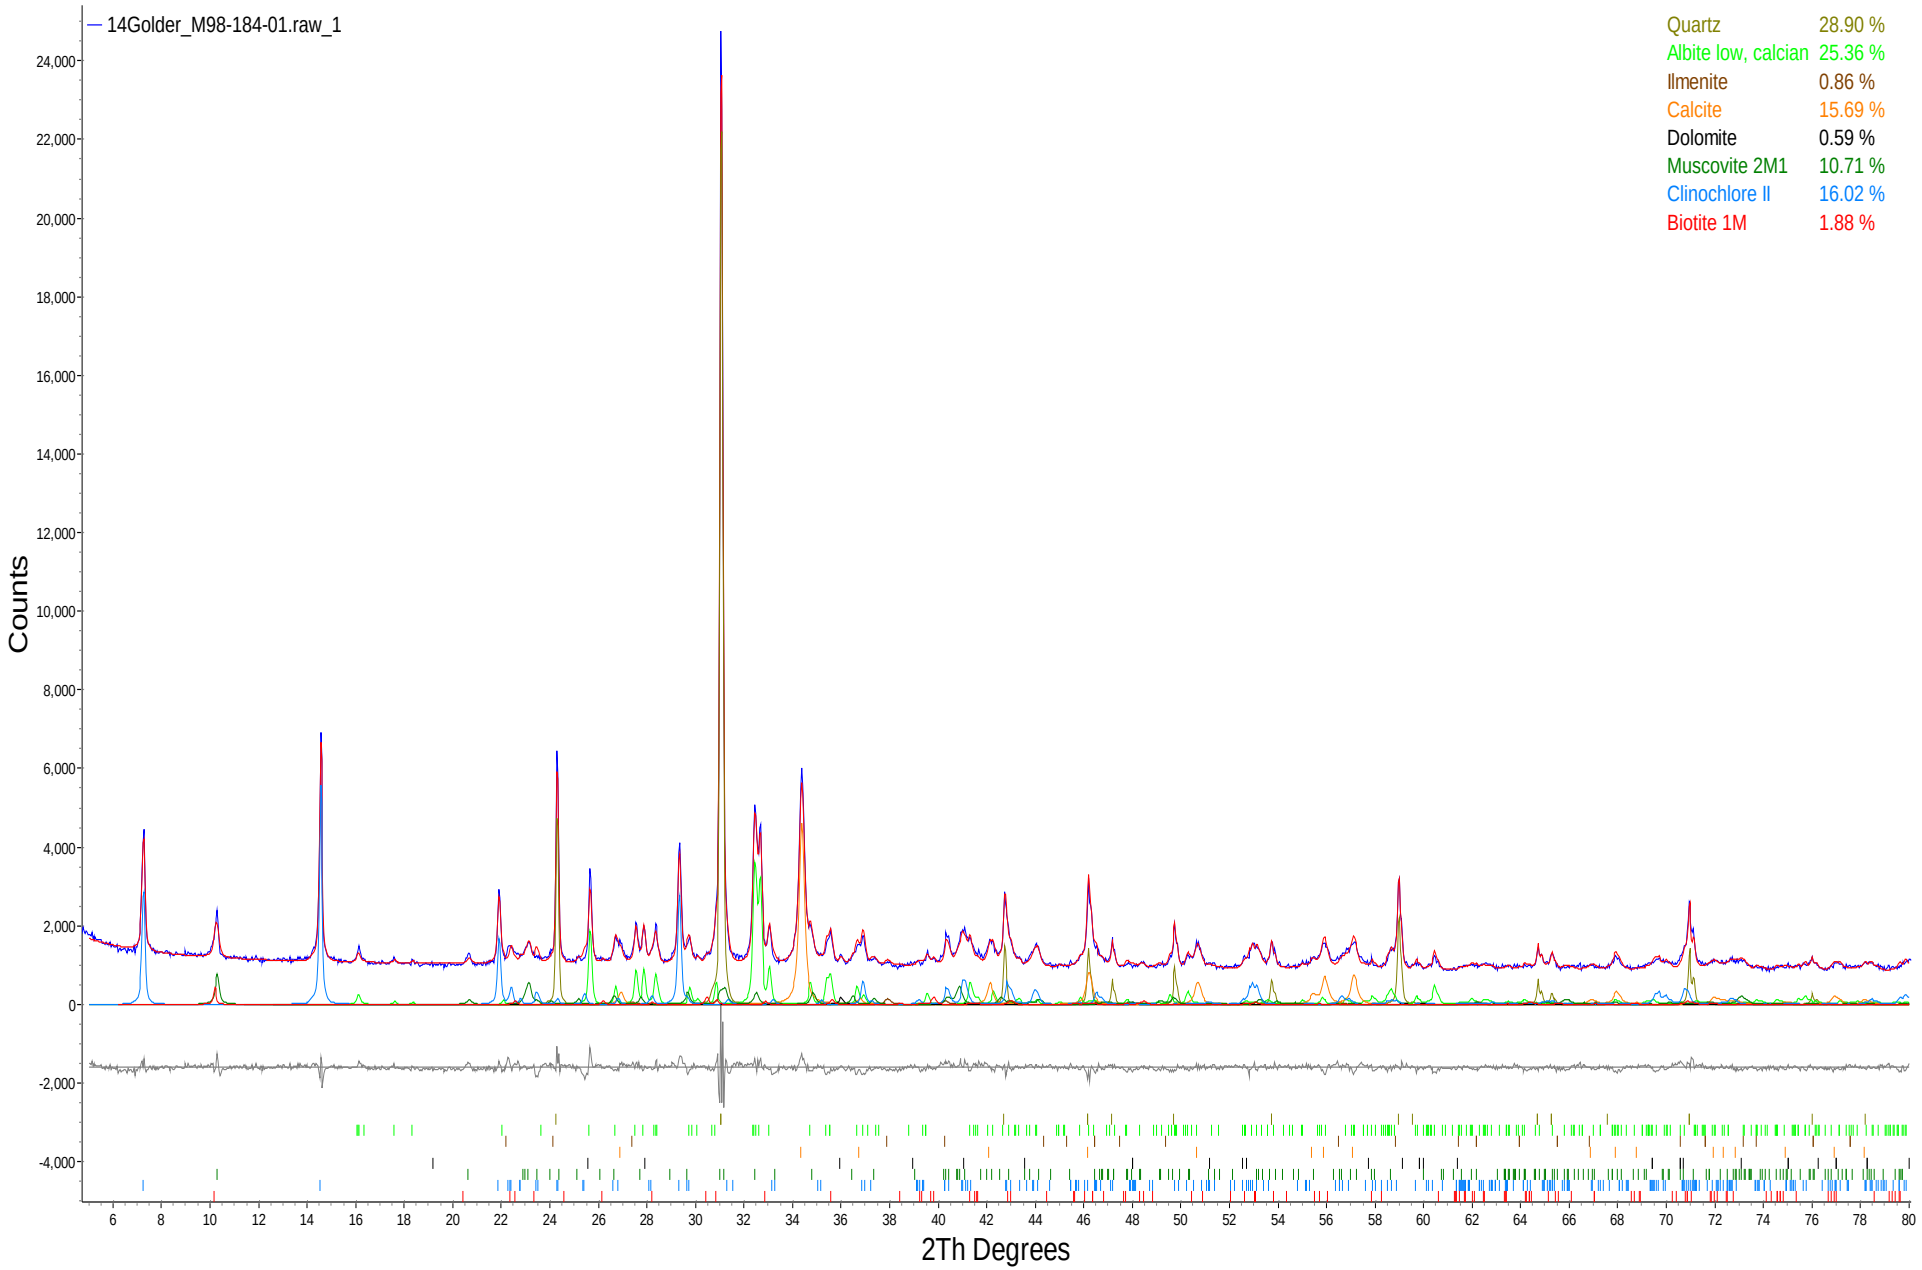

Figure 14. Rietveld refinement plot of sample **Golder Associates "M98-184-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

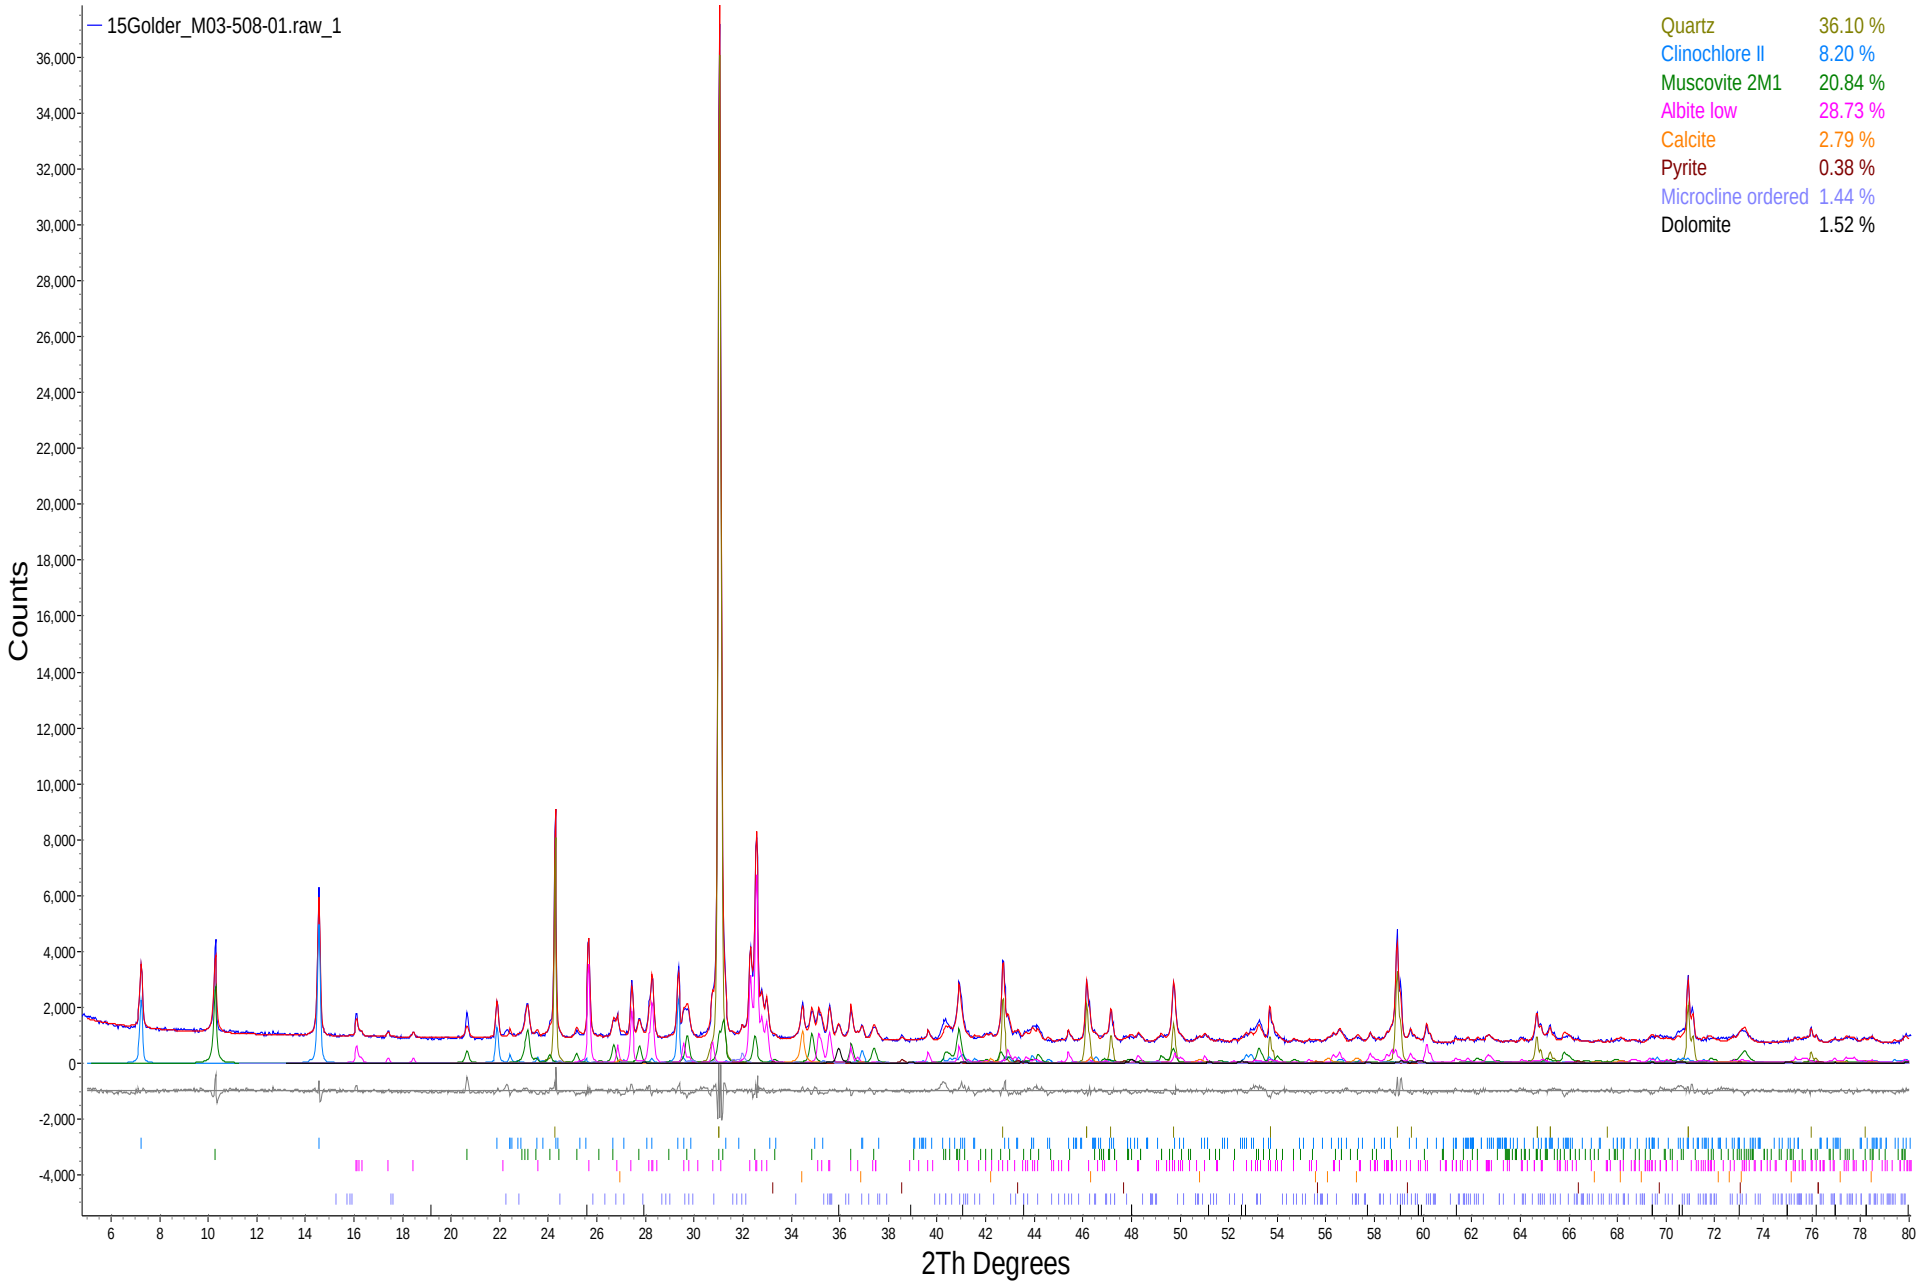

Figure 15. Rietveld refinement plot of sample **Golder Associates "M03-508-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

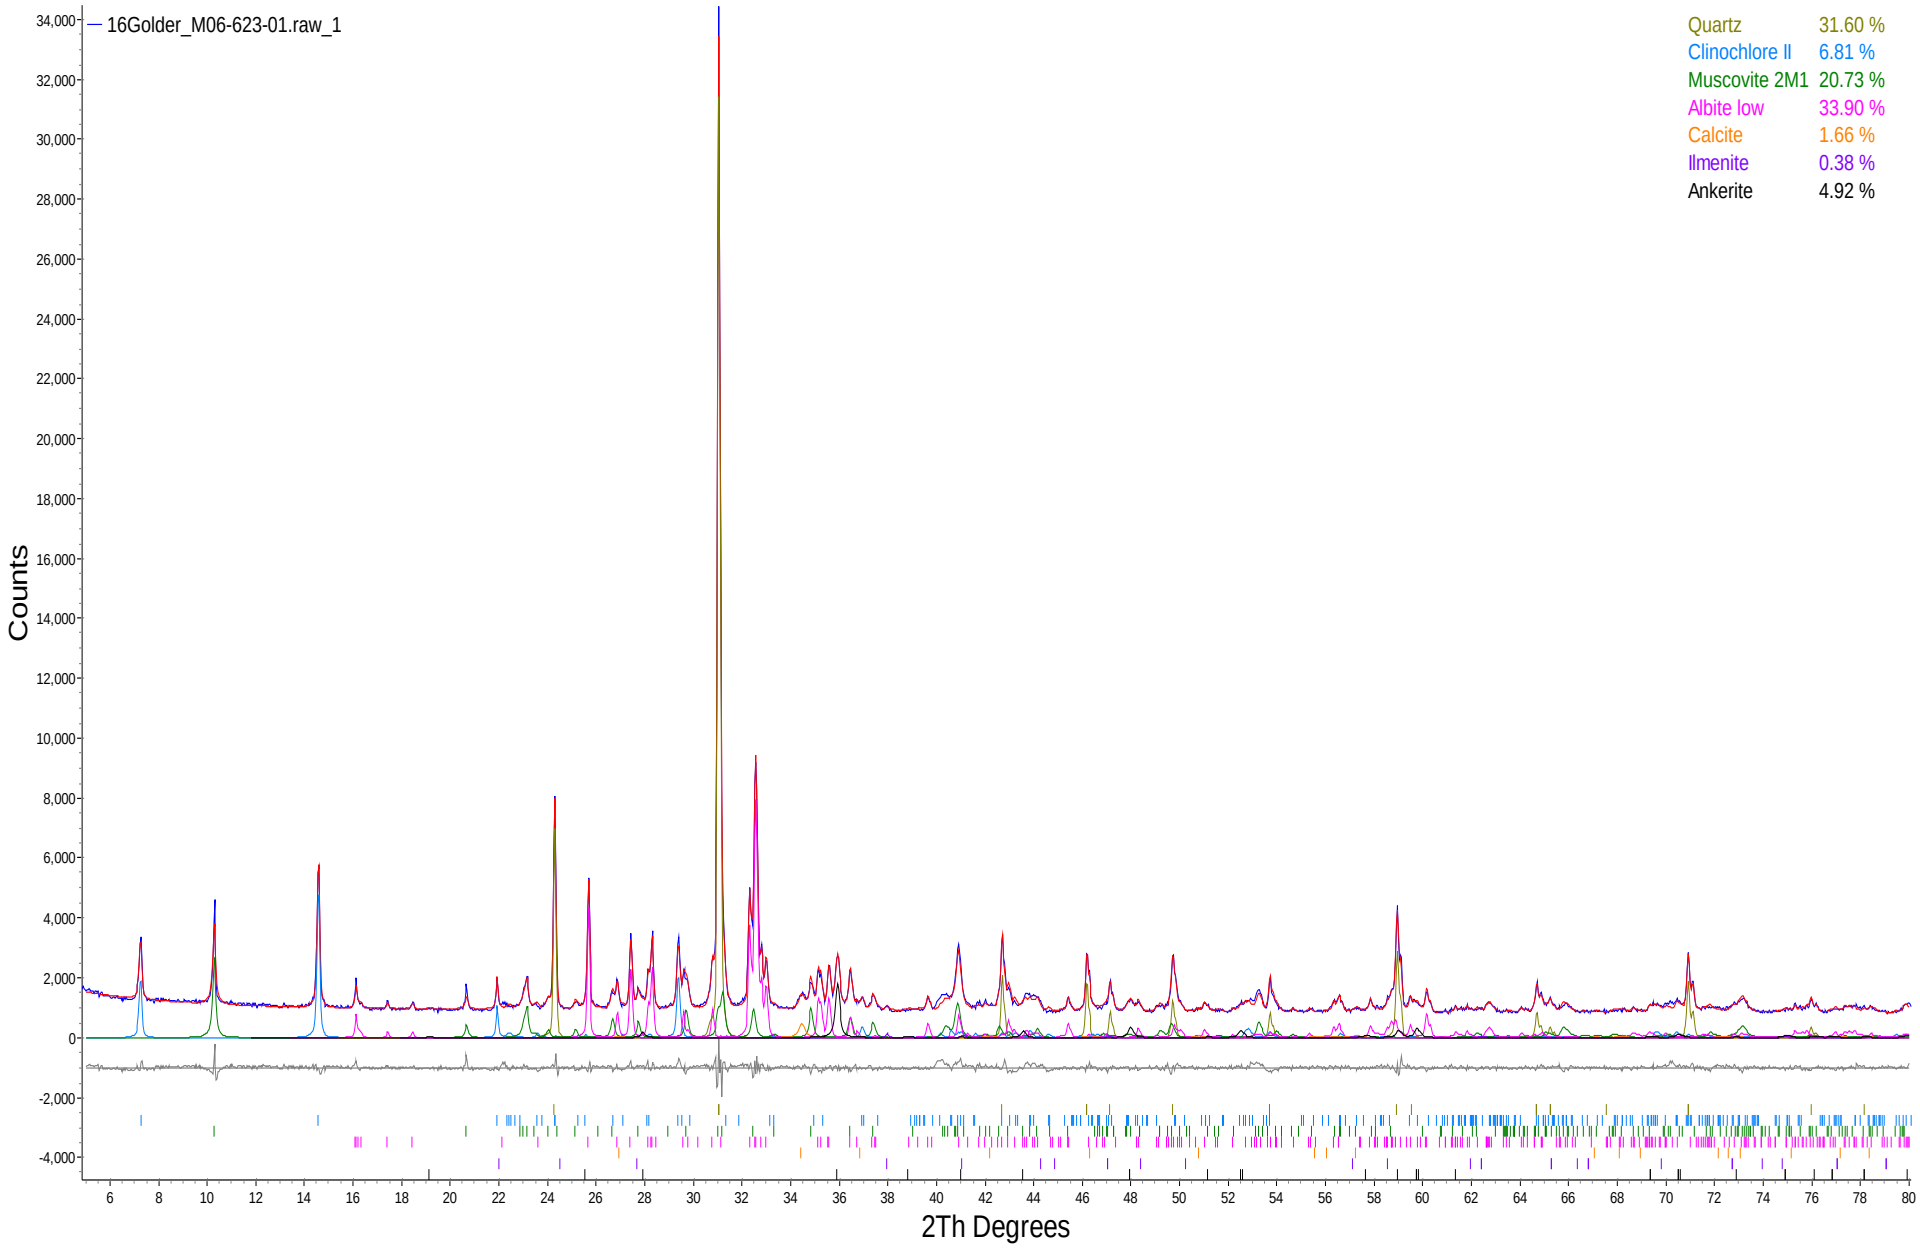

Figure 16. Rietveld refinement plot of sample **Golder Associates "M06-623-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

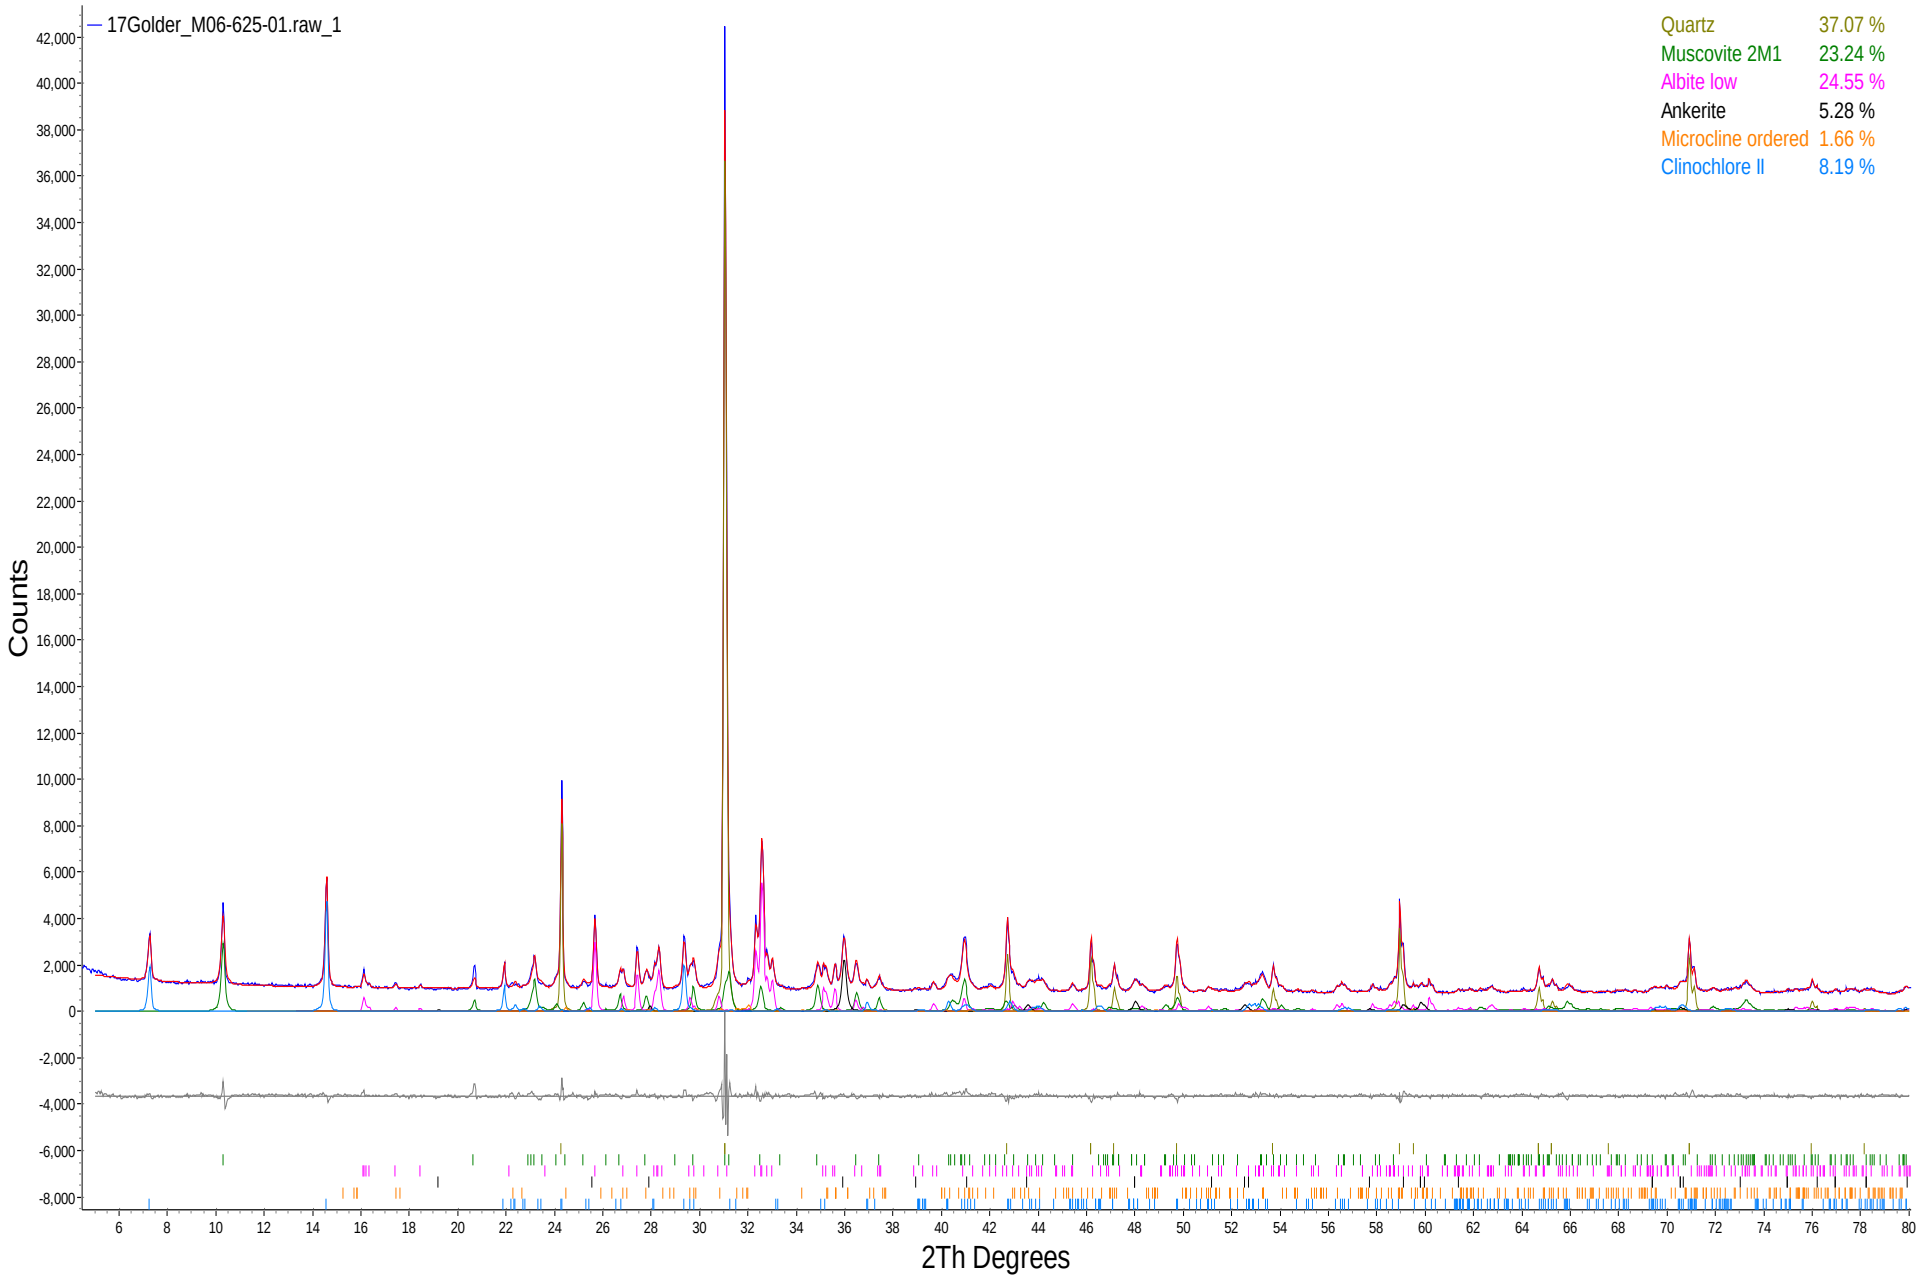

Figure 17. Rietveld refinement plot of sample **Golder Associates "M06-625-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

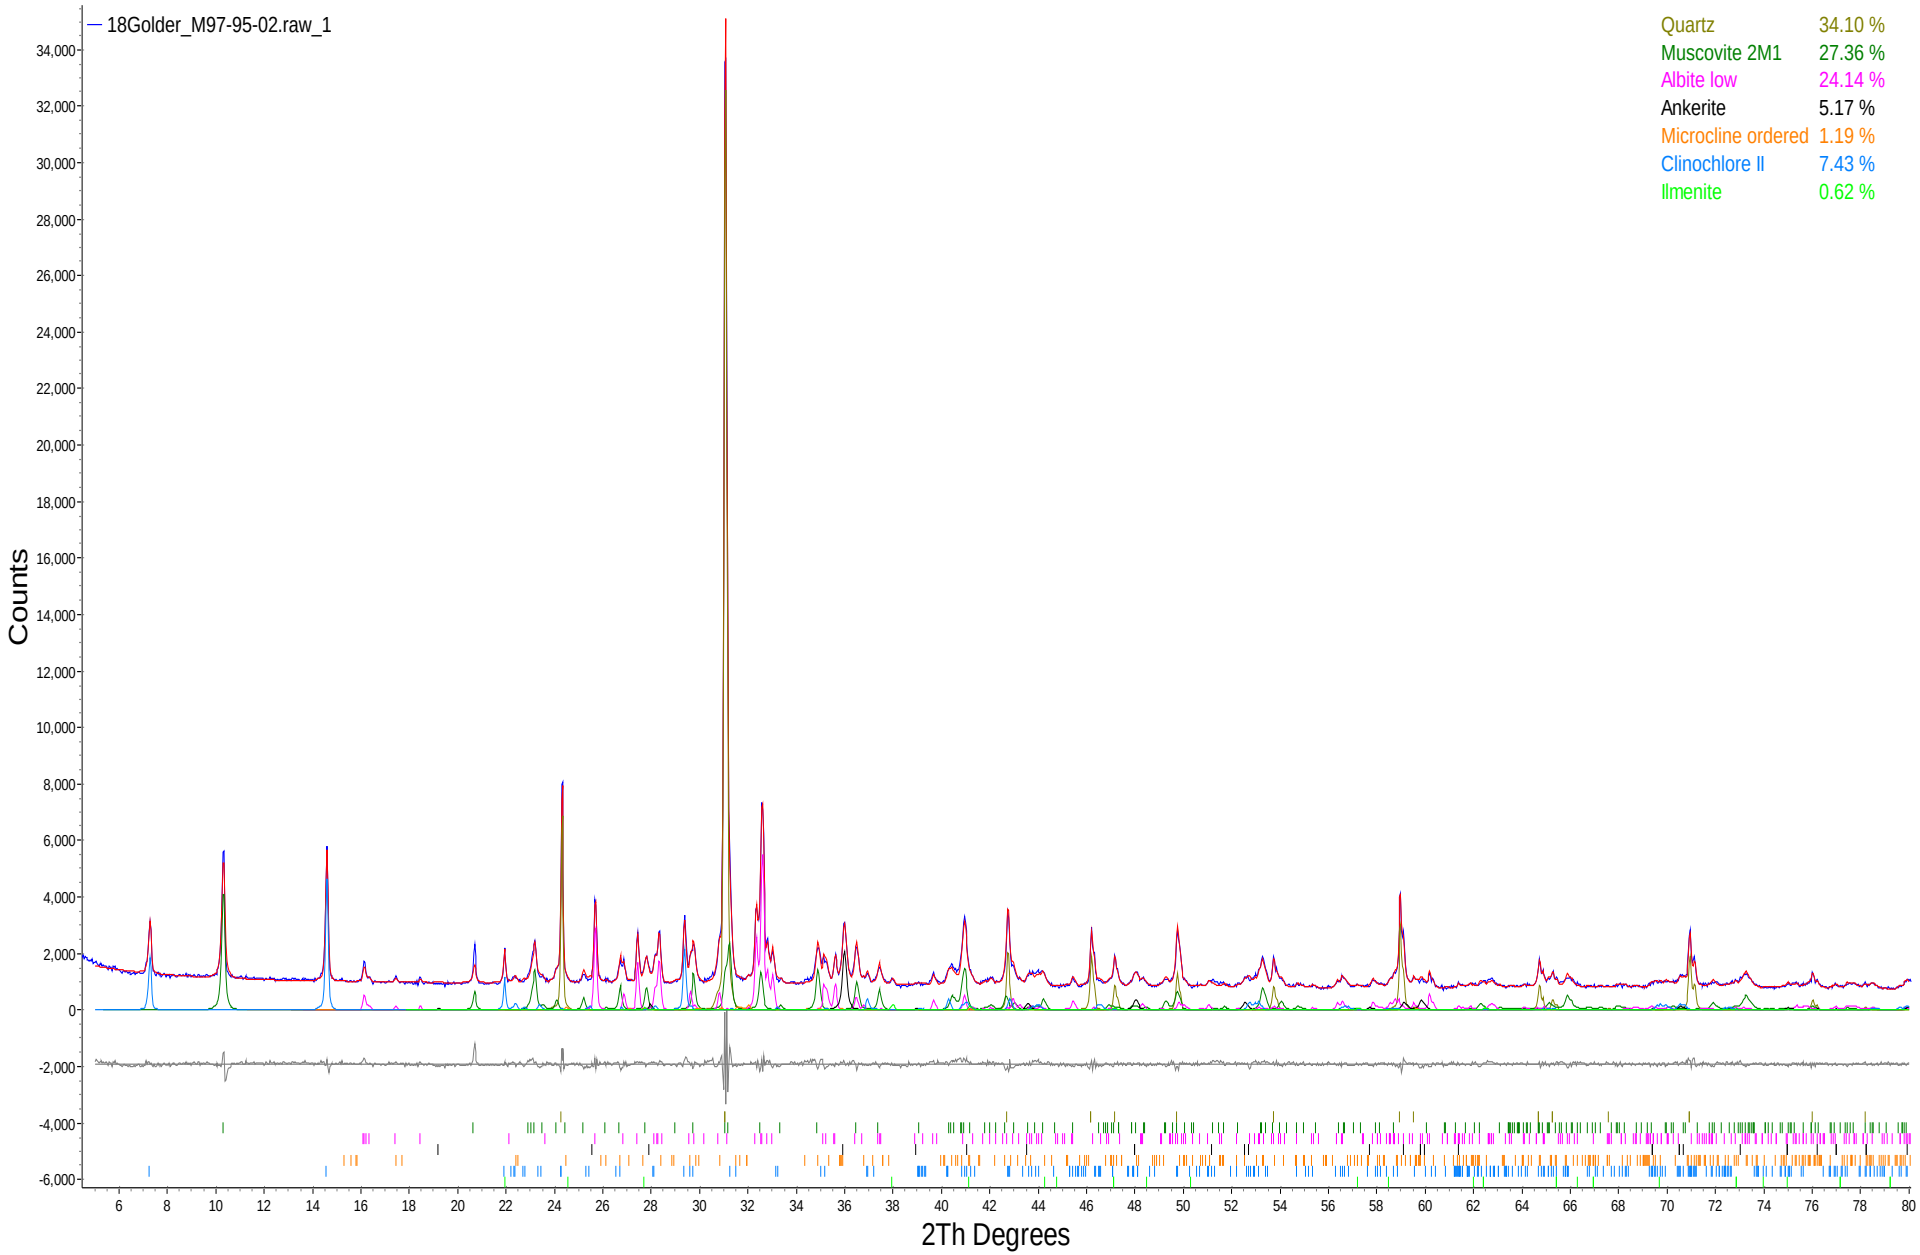

Figure 18. Rietveld refinement plot of sample **Golder Associates "M97-95-02"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

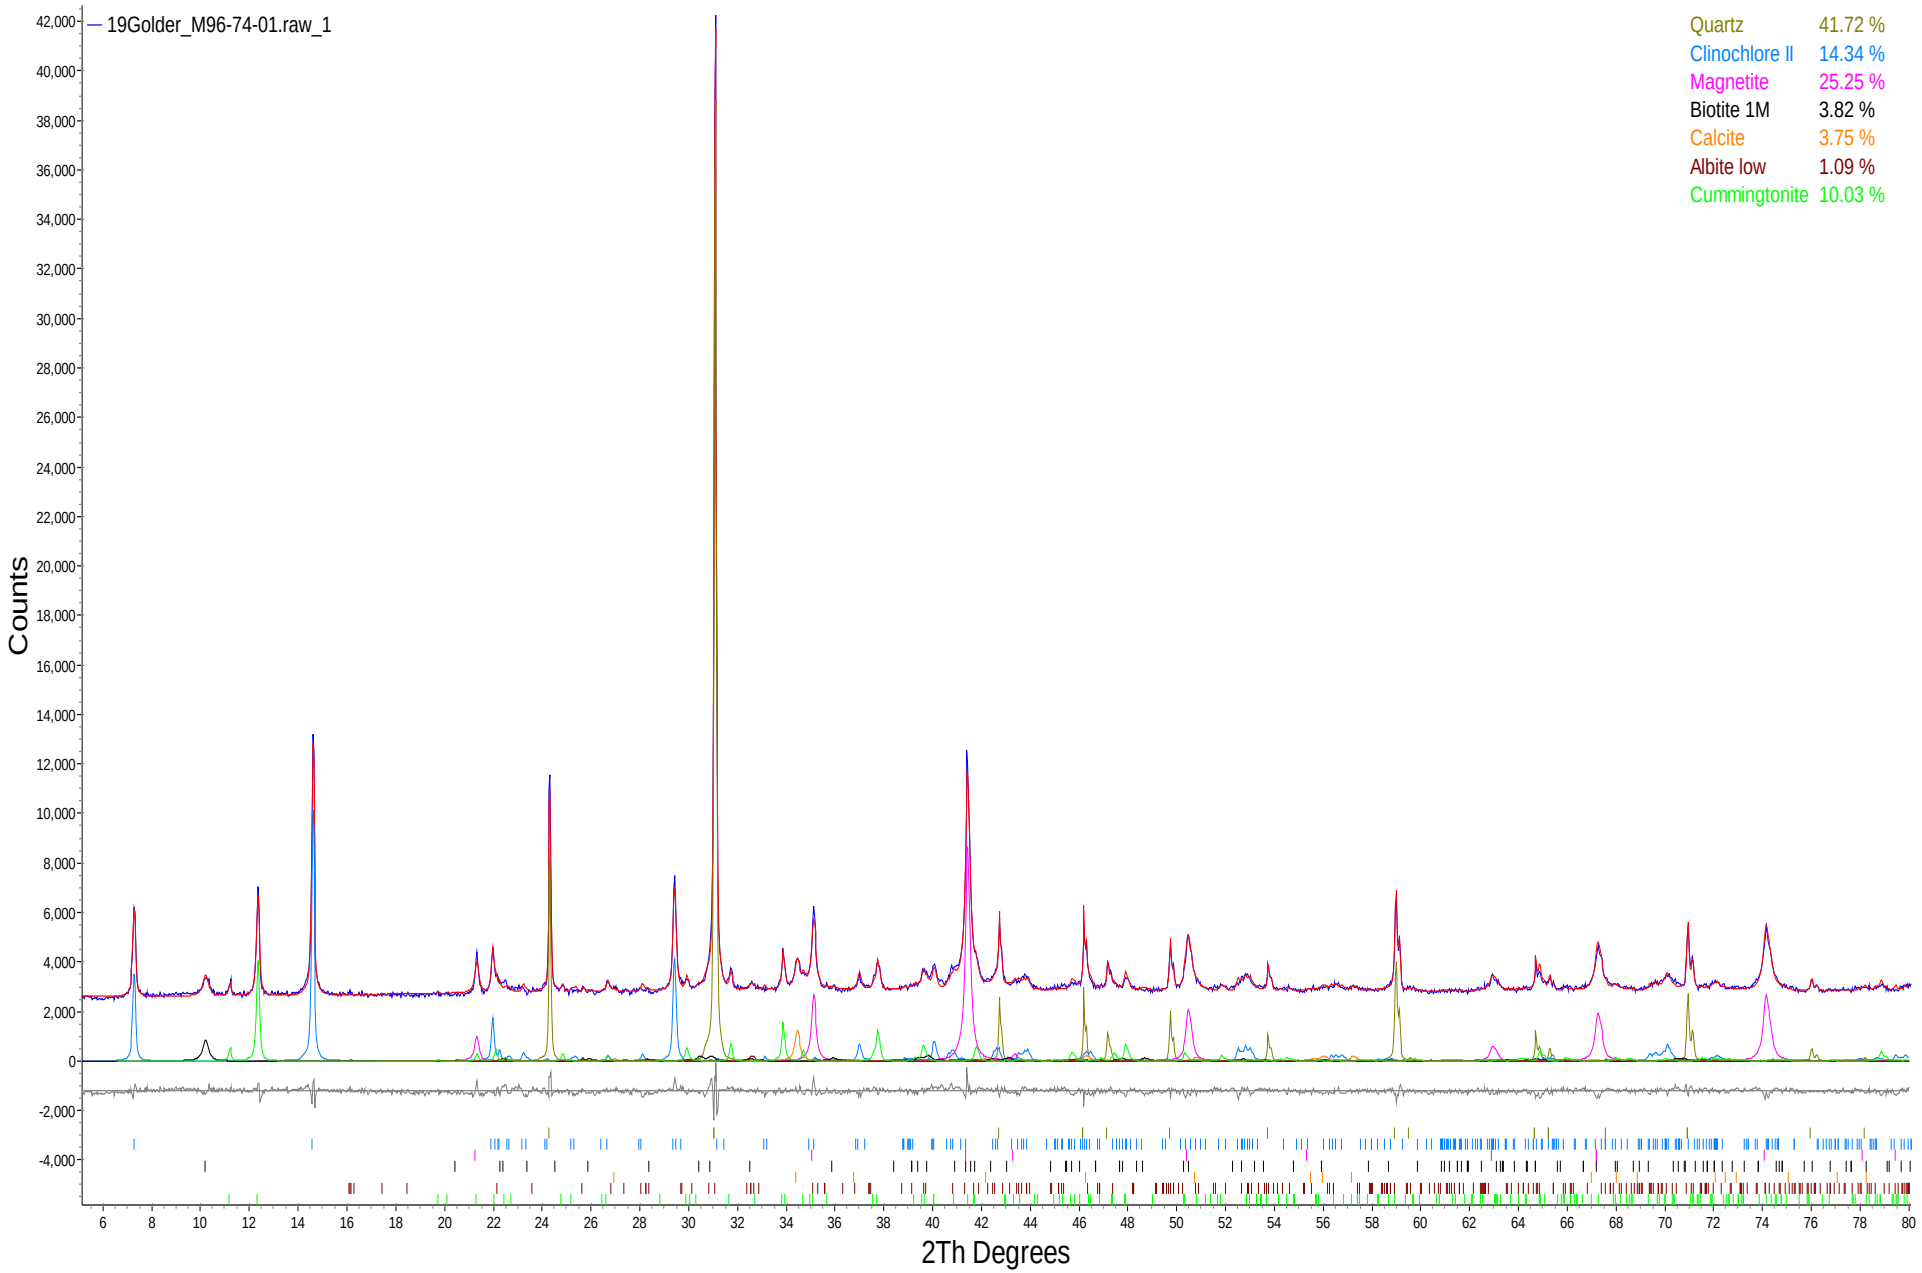

Figure 19. Rietveld refinement plot of sample **Golder Associates "M96-74-01"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

Member of the SGS Group (SGS SA)

## QEMSCAN Method Summary

***Mineral Identification and Interpretation:***

The QEM-ARMS, or Automated Rapid Mineral Scan by QEMSCAN, is a method designed to provide simple bulk mineralogy as well as basic liberation analysis of one or two minerals of interest which occur in significant quantities (>1% mineral mass) by using high definition mineralogical analyses; QEMSCAN (Quantitative Evaluation of Materials by Scanning Electron Microscopy) (METH# 8.11.1) and XRD (X-ray Diffraction, BRUKER AXS D8 Advance Diffractometer).

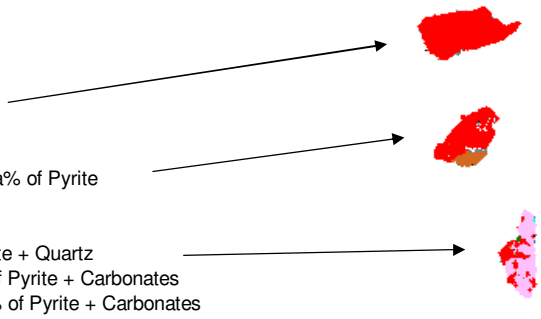
***Test Limitations:***

The reader should note that this is a semi-quantative study. Any data should be treated as approximations. The study is subject to the representativity of the sample selected, and its accuracy limited by the particle statistics.

---

## XRD Method Summary

***Mineral Identification and Interpretation:***



Mineral identification and interpretation involve matching the diffraction pattern of an unknown material to patterns of single-phase reference materials. The reference patterns are compiled by the Joint Committee on Powder Diffraction Standards - International Center for Diffraction Data (JCPDS-ICDD) database and released on software as Powder Diffraction Files (PDF).

Interpretations do not reflect the presence of non-crystalline and/or amorphous compounds. Mineral proportions are based on relative peak heights and may be strongly influenced by crystallinity, structural group or preferred orientations. Interpretations and relative proportions should be accompanied by supporting petrographic and geochemical data (Whole Rock Analysis, Inductively Coupled Plasma - Optical Emission Spectroscopy, etc.).

---

## Terminology for Association data

**Association classes were defined as the following;**

- **Free Pyrite** - A particle that has >=95% of Pyrite
- **Liberated Pyrite**: A particle that has ≥80 but <95 area% of Pyrite
- **Pyrite: Quartz** - A particle that has ≥95 area% of Pyrite + Quartz
- **Pyrite: Carbonates** - A particle that has ≥95 area% of Pyrite + Carbonates
- **Pyrite: Hard Silicates** - A particle that has ≥95 area% of Pyrite + Carbonates
- **Pyrite**: **Other Sulphides** - A particle that has ≥95 area% of Pyrite + Other Sulphides
- **Pyrite**: **Other** - A particle that has ≥95 area% of Pyrite + Any Other Minerals
- **Complex**: Any combination of the above definitions has been defined as a complex particle.

Note: similar associations have been created for Arsenopyrite

# THREE HEAD SAMPLES FROM MELIADINE PROJECT FOR RAPID ORE CHARACTERIZATION

Prepared for

## AGNICO-EAGLE MINES LTD.

**Project #** AUG2011-05
September 20, 2011

**NOTE:**
This report refers to the samples as received.

The practice of this Company in issuing reports of this nature is to require the recipient not to publish the report or any part thereof without the written consent of Process Mineralogical Consulting.

## Summary Results

Three samples of assay reject material identified as TOP, FZOP, and WMOP were submitted to Process Mineralogical Consulting Ltd for Rapid Ore Characterisation analysis. Representative portions of each sample were riffled and submitted for polished section preparation and quantitative X-ray diffraction analysis.

The results of the Rapid Ore Characterisation determined the following:

- TOP contains the most magnetite of the 3 samples containing ~8% by weight. ~2% magnetite is present the two other samples.
- The fine intergrowth texture of the magnetite in the TOP sample will make liberation difficult as a significant portion of the grains are <10µm.
- The sample identified as WMOP contains the highest amount of sulphide minerals being mainly composed of arsenopyrite with subordinate amounts of pyrite and trace amounts of pyrrhotite and chalcopyrite.
- The arsenopyrite present in all samples is relatively coarse and may achieve optimal liberation at standard primary grind sizes (~$K_{80}$ 150µm). Pyrite is not as coarse as arsenopyrite but may also liberate well at standard grind conditions.
- Elongated and fibrous non-opaque gangue minerals were observed within each sample. The aspect ratio of some grains measured 3:1 or greater with mineral chemistry of Fe, Mg, Al silicate. Semi-quantitative Energy Dispersive Spectrometry of select grains plotted into the Minident mineral database indicated that the chemistry of the grains was most similar to chamosite (chlorite), biotite and anthophyllite. It is strongly recommended that an accredited laboratory carry out appropriate asbestos evaluation. The following table details the mineral chemistry analysed by semi-quantitative Energy Dispersive Spectrometry (EDS).

**Table 1:** SEM-EDS analyses of selected elongated gangue minerals

| | WMOP | WMOP | | FZOP | FZOP | | TOP | TOP |
|---|---|---|---|---|---|---|---|---|

| | ***Biotite*** | ***Phlogopite*** | | ***Anthophyllite*** | ***Biotite*** | | ***Chamosite*** | ***Chamosite*** |

- Semi-Quantitative XRD results (Rietveld Refinement Method) determined the following non-opaque gangue mineral composition as detailed in Table 2. The presence of clinochlore and cummingtonite support the findings of the SEM-EDS where the fine elongated grains are a result of minor alteration sequences and are only present in trace amounts below the detection limits of XRD.

**Table 2:** Semi-quantitative XRD results

| Mineral | Ideal Formula | WMOP (WesMeg Open Pit) | TOP (Tiriganiaq Open Pit) | FZOP (F-Zone Open Pit) |
|---|---|---|---|---|
| Quartz | $SiO_2$ | 51.8 | 42.8 | 58.6 |

| Pyrrhotite | $Fe_{1-x}S$ | 2.9 | | 3.3 |
| Magnetite | $Fe^{2+}Fe^{3+}{}_2O_4$ | 0.9 | 5.5 | 2.1 |
| Ilmenite | $Fe^{2+}TiO_3$ | 0.4 | 0.6 | |
| Arsenopyrite | FeAsS | 0.8 | 2.1 | 1.2 |
| Sphalerite | (Zn,Fe)S | 0.1 | | |
| Grossular | $Ca_3Al_2(SiO_4)_3$ | | 0.5 | |
| **Total** | | **100.0** | **100.0** | **100.0** |

PMC Ltd. recommends a detailed size-by-size liberation analysis be carried out to better predict the optimal grind sizes for liberation and ultimate mineral textures that will influence concentration techniques. Further more a comprehensive gold deportment study, which would include SIMS analysis of the pyrite and arsenopyrite, will also provide valuable information with regard to gold-bearing mineral speciation, and association.

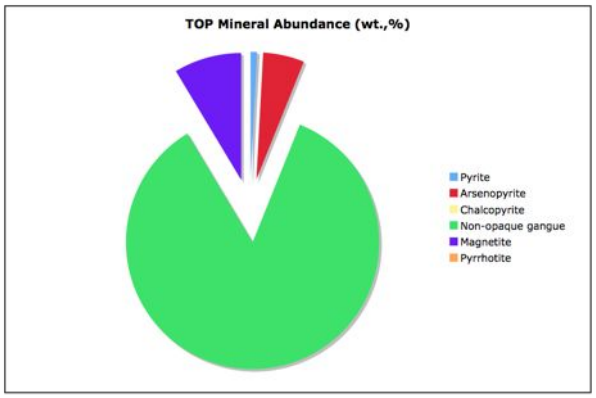
## RAPID ORE CHARACTERIZATION



### Sample: TOP

The sample is primarily composed of coarse granular non-opaque gangue minerals (see XRD results for mineral composition) having intergrowths of fine to coarse magnetite and to a lesser extent pyrite and arsenopyrite. Magnetite comprises a significant portion of the sample being present as fine and coarse intergrowths in NOG and as liberated grains. Arsenopyrite is present in moderate amounts mainly as liberated grains and ternary and complex particles mainly with NOG and magnetite. Pyrite is present as ternary and complex particles with moderate amounts occurring as liberated grains.

The NOG mineral population includes a minor amount of acicular (elongated) grains occasionally present as liberated grains or as disseminated grains within other NOG minerals. The aspect ratio of these grains is approximately 3:1 consistent with the definition of a fiber but may not necessarily be defined as asbestos. SEM-EDS semi-quantitative analysis indicates the composition of the grains is similar to chamosite (chlorite).

### TOP Mineral Abundance

| Mineral Component | Wt.,% |
|---|---|
| Pyrite | 0.91 |
| Arsenopyrite | 5.08 |
| Chalcopyrite | 0.02 |
| Non-opaque gangue | 85.5 |
| Magnetite | 8.53 |
| Pyrrhotite | 0.00 |
| **Total** | **100.0** |

### TOP Mineral Grain Size Frequency Distribution

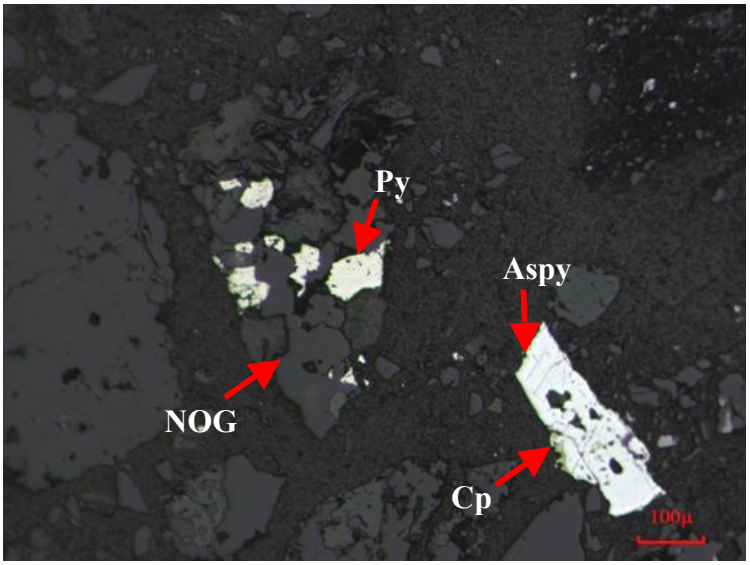

**Plate 1:**
Equi-granular pyrite (Py) intergrown with Non-opaque gangue (NOG). Mainly liberated arsenopyrite (Aspy) with minor attachment of chalcopyrite (Cp).

*Plane Polarized Reflected Light (PPRL) 100x Magnification*

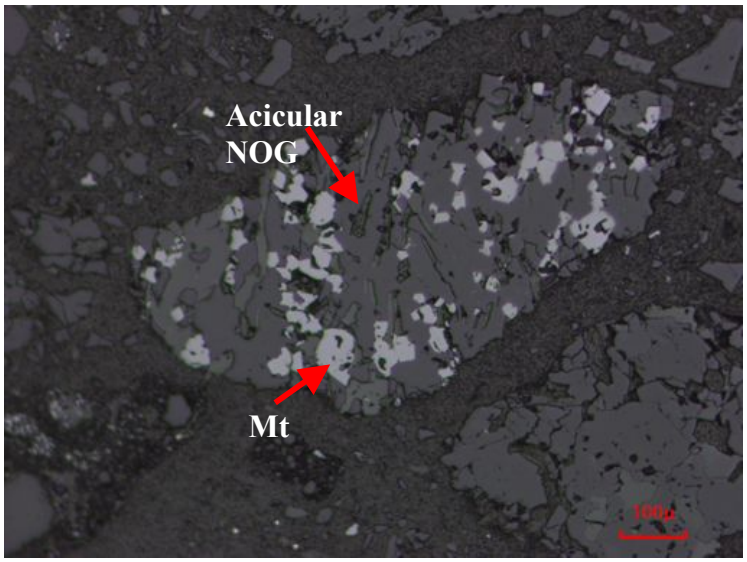

**Plate 2:**
Subhedral magnetite (Mt) evenly disseminated within Non-opaque gangue (NOG). Finely acicular NOG (possible amphibole) is also disseminated within the more massive NOG.

*Plane Polarized Reflected Light (PPRL) 100x Magnification*

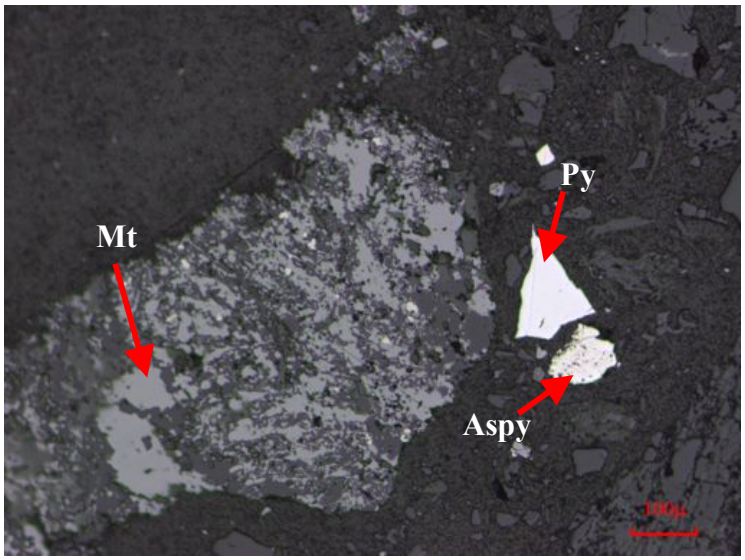

**Plate 3:**
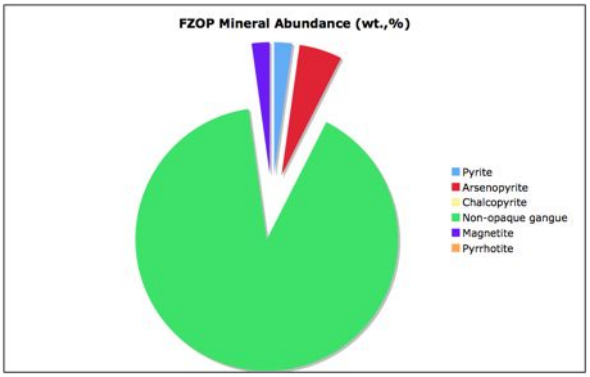
Complex anhedral magnetite disseminated within Non-opaque gangue (NOG). Fine inclusions of pyrite are present interstitial to magnetite and NOG grains. Liberated arsenopyrite and pyrite are also present in the photomicrograph.

*Plane Polarized Reflected Light (PPRL) 100x Magnification*



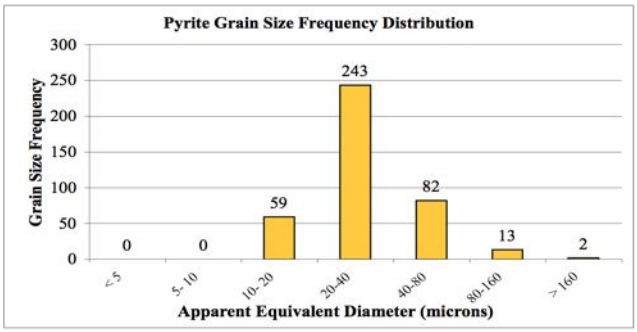
## RAPID ORE CHARACTERIZATION

### Sample: FZOP

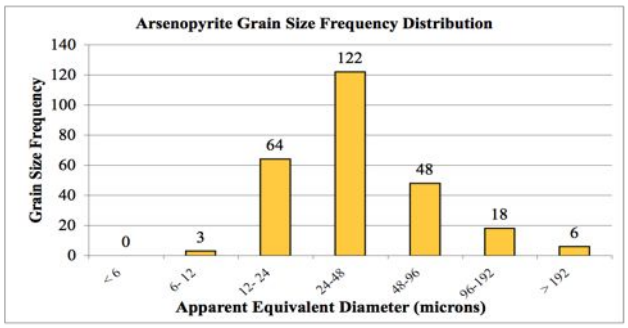
The sample is primarily composed of NOG minerals with lesser amounts of arsenopyrite, magnetite and pyrite in decreasing order. Pyrite, arsenopyrite, and magnetite occur as liberated grains and as composite particles within NOG minerals. Arsenopyrite is mainly present as associated grains with NOG and as ternary particles. Lesser amounts are present as liberated grains. Minor amounts of pyrite and magnetite are present as liberated grains with moderate amounts of pyrite associated with NOG minerals and as ternary particles. Major amounts of magnetite are associated with NOG minerals with moderate amounts associated as ternary particles.

### FZOP Mineral Abundance

| Mineral | Wt., % |
|---|---|
| Pyrite | 2.33 |
| Arsenopyrite | 5.26 |
| Chalcopyrite | 0.01 |
| Non-opaque gangue | 90.0 |
| Magnetite | 2.34 |
| Pyrrhotite | 0.00 |
| **Total** | 100.0 |



### FZOP Mineral Association



| Association | Pyrite | Arsenopyrite | Magnetite | Pyrrhotite |
|---|---|---|---|---|
| Liberated (100%) | 69.3 | 21.4 | 42.7 | 0.0 |

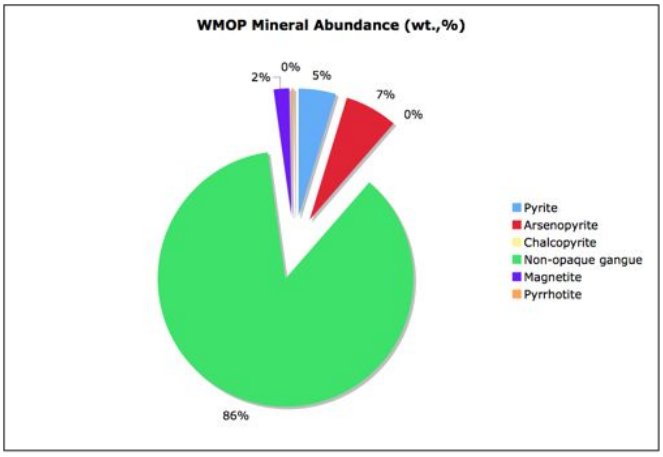
Complex NOG particle with inclusions of coarse anhedral arsenopyrite, pyrrhotite (Po) and chalcopyrite.

*Plane Polarized Reflected Light (PPRL) 200x Magnification*



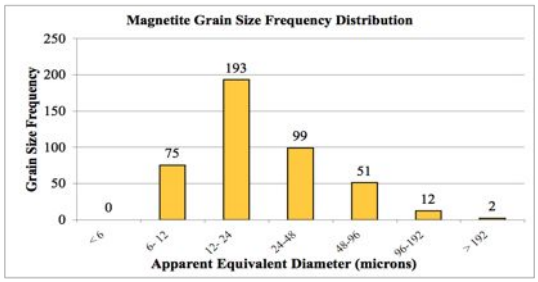
## RAPID ORE CHARACTERIZATION

### Sample: WMOP

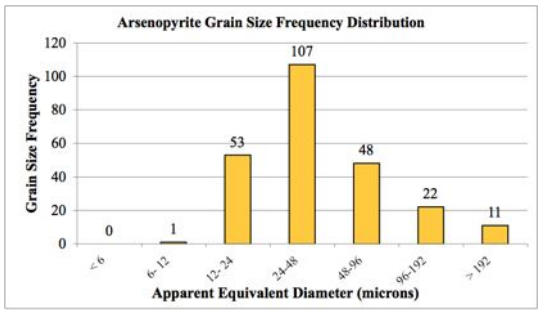
The sample is primarily composed of NOG minerals occurring as coarse particles intergrown with the sulphide minerals and oxide minerals. Sulphide minerals comprise a minor amount of the sample and include significant amounts of arsenopyrite, with lesser amounts of pyrite and trace amounts of pyrrhotite. Arsenopyrite is primarily present as associated grains with NOG minerals with lesser amounts present as liberated grains and subordinate amounts as ternary particles. Pyrite is present in similar amounts as liberated grains and as associated grains with NOG minerals. Pyrrhotite is present in trace amounts primarily as liberated grains and to a lesser extent as associated grains with NOG minerals. Magnetite is present in minor amounts in the sample mainly as liberated grains with subordinate amounts associated with NOG minerals and minor amounts as ternary particles. Elongated NOG minerals are present but SEM-EDS analysis determined these grains have the composition most similar to biotite / phlogopite. Muscovite was identified by XRD.

### WMOP Mineral Abundance

| Mineral | Wt.,% |
|---|---|
| Pyrite | 4.82 |
| Arsenopyrite | 6.53 |
| Chalcopyrite | 0.04 |
| Non-opaque gangue | 86.5 |
| Magnetite | 1.86 |
| Pyrrhotite | 0.30 |
| **Total** | **100.0** |



### WMOP Mineral Association



| Association | Pyrite | Pyrrhotite | Arsenopyrite | Magnetite |
|---|---|---|---|---|
| Liberated (100%) | 36.5 | 65.1 | 23.3 | 54.3 |
| Pyrite | --- | 1.34 | 2.31 | 1.82 |

**Experimental Method**

The three samples of **Project Aug2011-05** were reduced to the optimum grain-size range for quantitative X-ray analysis (<10 μm) by grinding under ethanol in a vibratory McCrone Micronising Mill for 7 minutes. Step-scan X-ray powder-diffraction data were collected over a range 3-80°2θ with CoKa radiation on a Bruker D8 Focus Bragg-Brentano diffractometer equipped with an Fe monochromator foil, 0.6 mm (0.3°) divergence slit, incident- and diffracted-beam Soller slits and a LynxEye detector. The long fine-focus Co X-ray tube was operated at 35 kV and 40 mA, using a take-off angle of 6°.

**Results**

The X-ray diffractograms were analyzed using the International Centre for Diffraction Database PDF-4 and Search-Match software by Siemens (Bruker). X-ray powder-diffraction data of the samples were refined with Rietveld program Topas 4.2 (Bruker AXS). The results of quantitative phase analysis by Rietveld refinements are given in Table 1. These amounts represent the relative amounts of crystalline phases normalized to 100%. The Rietveld refinement plots are shown in Figures 1 – 3.

Table 1. Results of quantitative phase analysis (wt.%)

| Magnetite | $Fe^{2+}Fe^{3+}{}_2O_4$ | 0.9 | 5.5 | 2.1 |
| Ilmenite | $Fe^{2+}TiO_3$ | 0.4 | 0.6 | |
| Arsenopyrite | FeAsS | 0.8 | 2.1 | 1.2 |
| Sphalerite | (Zn,Fe)S | 0.1 | | |
| Grossular | $Ca_3Al_2(SiO_4)_3$ | | 0.5 | |
| Total | | 100.0 | 100.0 | 100.0 |

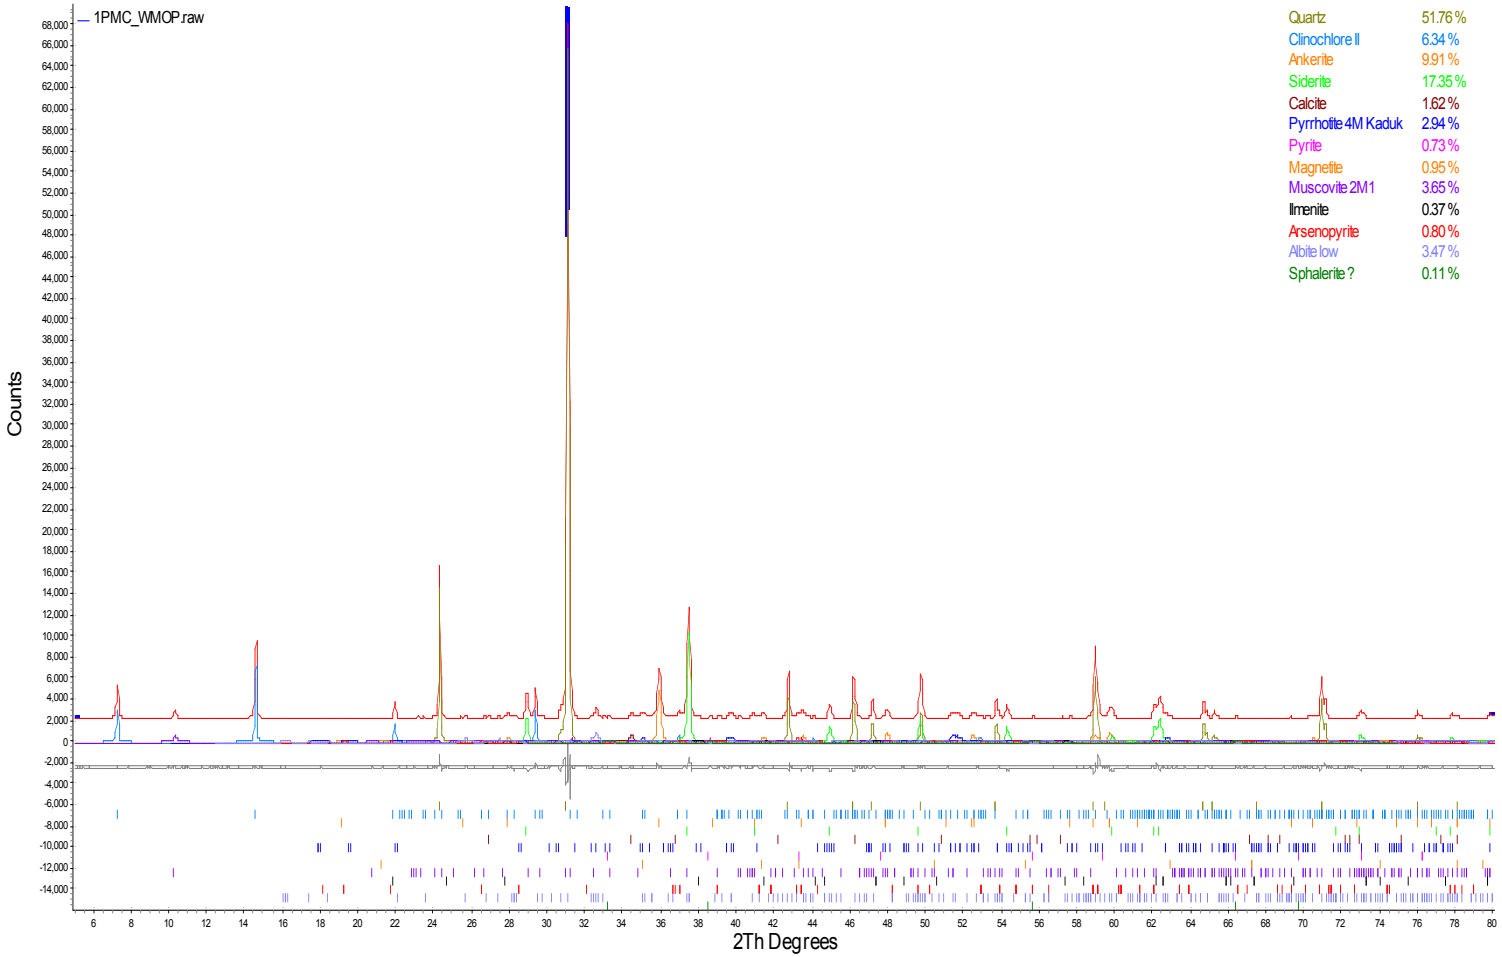

Figure 1. Rietveld refinement plot of sample **Process Mineralogical Consulting "WMOP (WesMeg Open Pit)"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

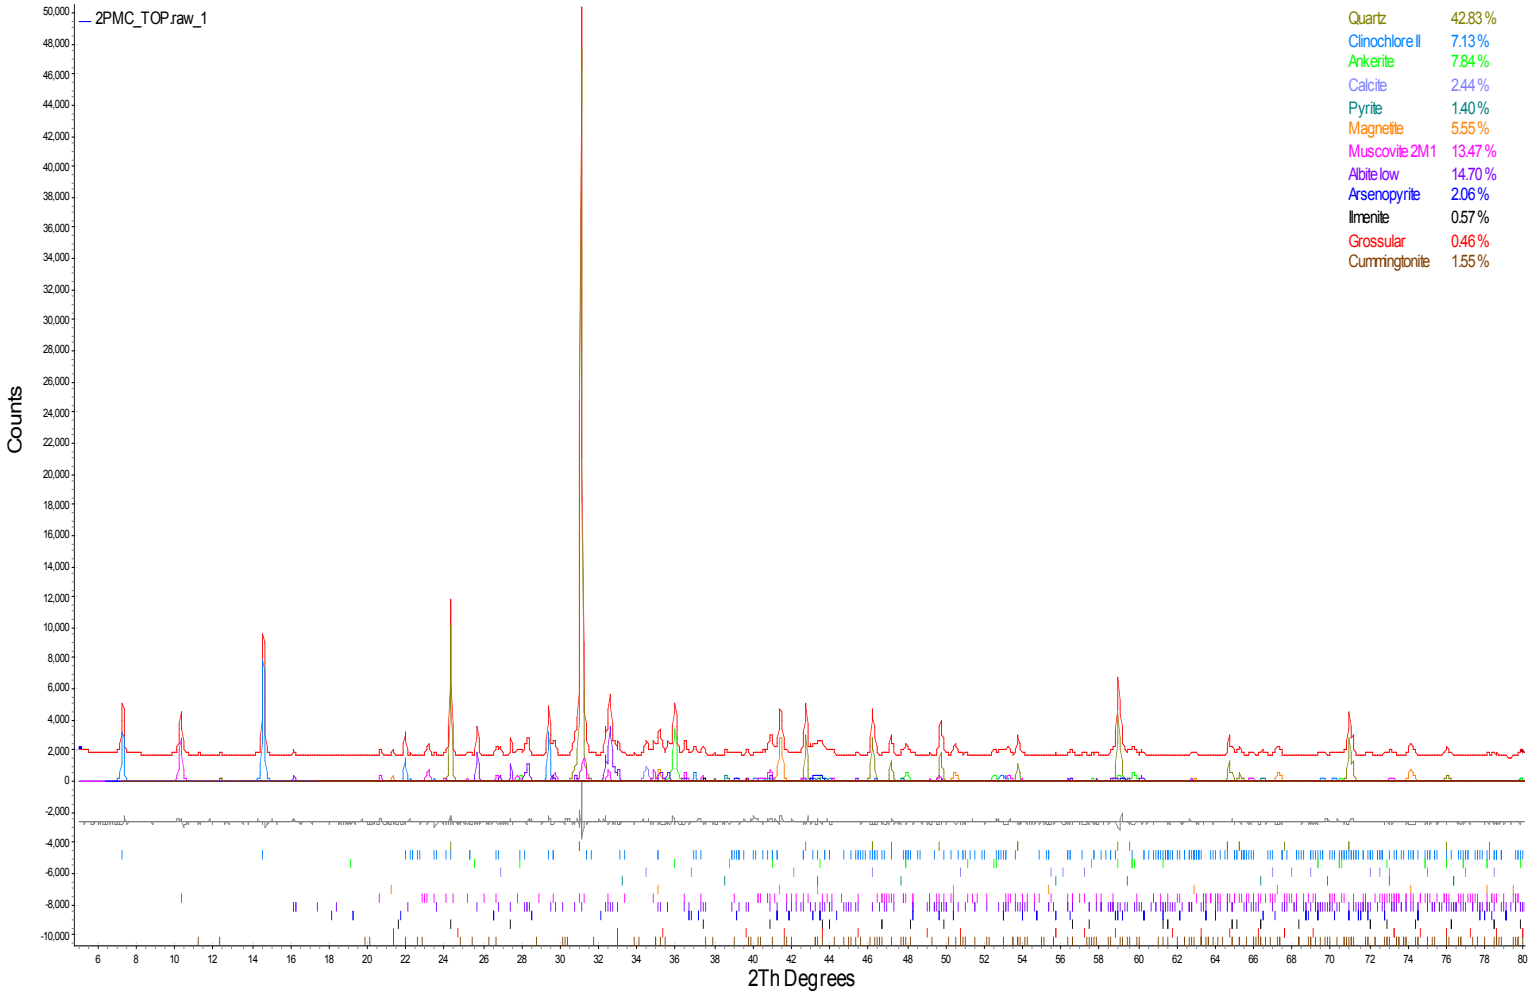

Figure 2. Rietveld refinement plot of sample **Process Mineralogical Consulting "TOP (Tiriganiaq Open Pit)"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

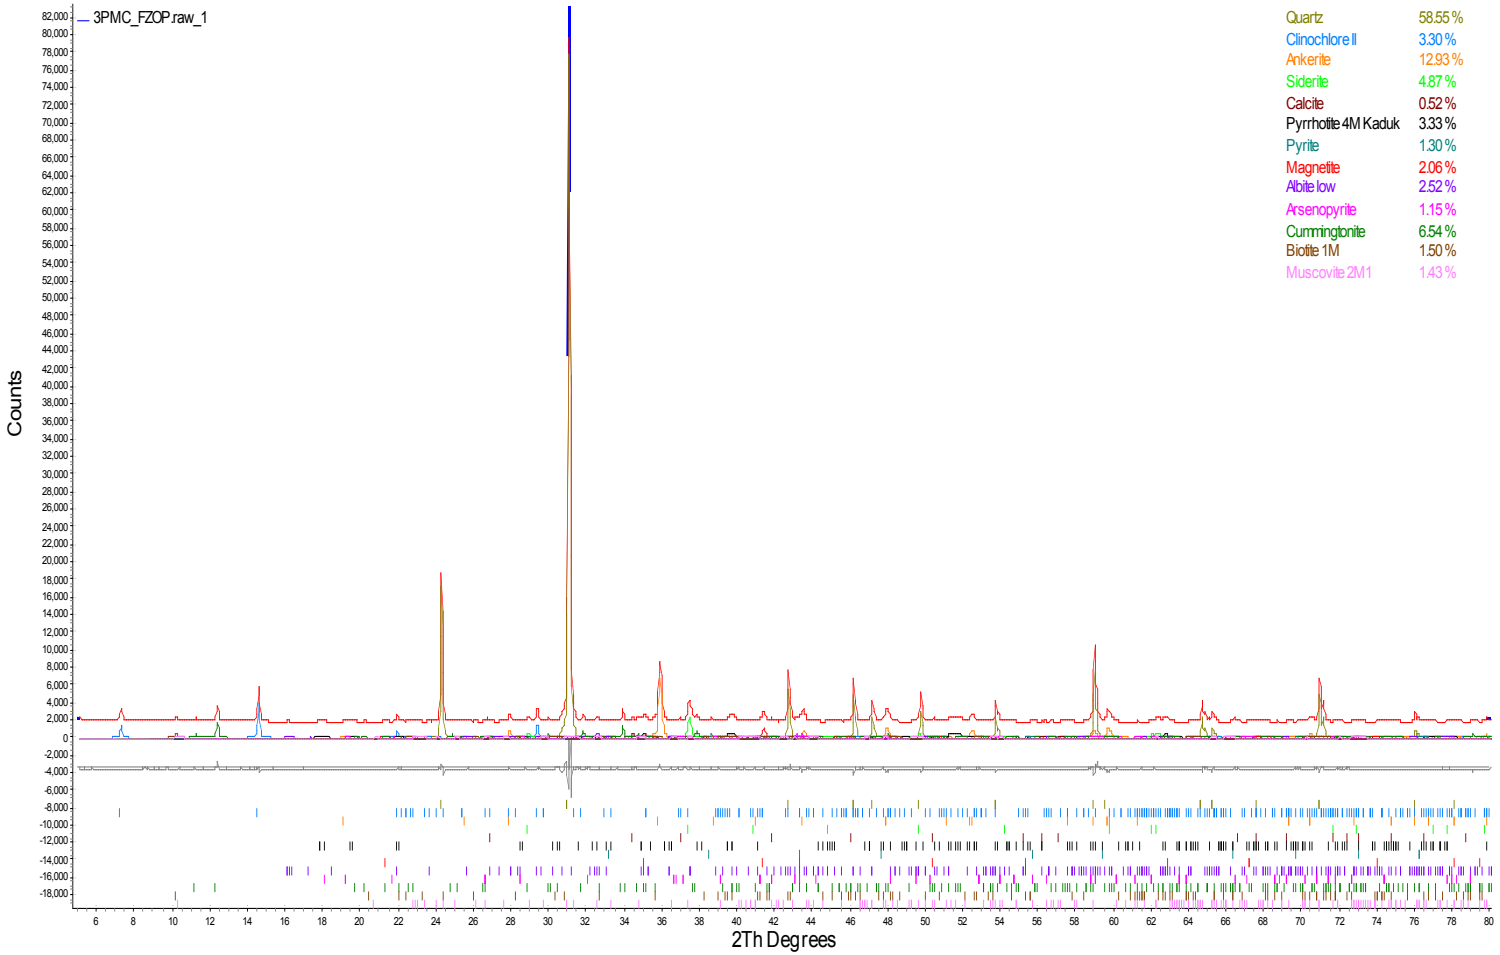

Figure 3. Rietveld refinement plot of sample **Process Mineralogical Consulting "FZOP (F-Zone Open Pit)"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

As a global, employee-owned organisation with over 50 years of experience, Golder Associates is driven by our purpose to engineer earth's development while preserving earth's integrity. We deliver solutions that help our clients achieve their sustainable development goals by providing a wide range of independent consulting, design and construction services in our specialist areas of earth, environment and energy.
