Re: Response to Comments to 2AM-MEL1631 Water Licence Amendment – Operational Update – Technical Comments

Dear Mr. Shaikh,

Agnico Eagle thanks the Kivalliq Inuit Association, Crown-Indigenous Relations and Northern Affairs Canada, Environment and Climate Change Canada, and Fisheries and Oceans Canada for their comments and review on the Meliadine Mine Water Licence Amendment Application. Our responses are provided in the enclosed.

Agnico Eagle looks forward to a productive Technical Meeting and Pre-hearing Conference in Rankin Inlet November 17-18, 2026.

Should you have any questions or require further information, please contact the undersigned at your convenience.

Regards,

Colleen Prather, Ph.D., P.Biol.
Superintendent, Permitting & Regulatory Affairs
Agnico Eagle Mines Limited

Appendix B: Impact of Freshwater Withdrawals for Mine Operation and Mine Closure Scenarios on Lake Volume, Lake Level and Flow

KIVALLIQ INUIT ASSOCIATION (KivIA)

Interested Party:	**KivIA**	**Rec No.:**	**KivIA-IR-1**
Re:	**Security Modification**		

Request Made by Interested Party:
The KIA remains concerned that saline water storage on site during operations presents a significant liability that is currently unaccounted for in the existing security agreement.

To facilitate discussions on updating the security with the KIA and CIRNAC, the Proponent should prepare the following:

a) Current and annual inventories of saline water stored in pits on site
b) Current and annual inventories of underground volume that could be used to offset the volume of saline stored without requiring treatment

In addition, the KIA is of the view that any indices used to approximate inflation during this security update should remain consistent for future updates.

Agnico Eagle's Response to Request:
Agnico Eagle notes that the maximum predicted inventory of saline water stored on-site during operations is 2.9 Mm^3 (WES02), compared to an estimated 7.1 Mm^3 of available underground storage capacity (6.4 Mm^3 in the Tiriganiaq underground workings and 684,830 m^3 in the Pump underground workings). This demonstrates there is sufficient capacity for underground storage and that current security liabilities are appropriate. Specific details to the reviewer's comment is provided below.

As specifics to the reclamation security are discussed through a separate avenue, Agnico Eagle suggests that approximate inflation to future updates be discussed at the specific security meetings and reviews.

Response to bullet a):
The current observed annual inventories of saline water stored on-site is reported through the NWB Annual Report. The latest information is provided in Section 3.2.2 (Figure 9 extracted below, observed data shown in grey diamonds) of the 2025 Water Licence Annual Report (note that this is still reflective of the current approved operational mine life of 2031). TIRI02 is currently the only pit used saline storage pond.

The predicted annual inventories of saline water stored on-site under this Water Licence Amendment Application are presented in Section 5.3 of the WBWQM Report (Appendix 4-C of the Application). The figures for the saline contact water collection ponds (TIRI02, PUMP02, and WES02) have been extracted and are presented below (Figures 5-16, 5-18, and 5-20 from Appendix 4-C of the Application). These figures also show the total available storage in each of TIRI02, PUMP02, and WES02.

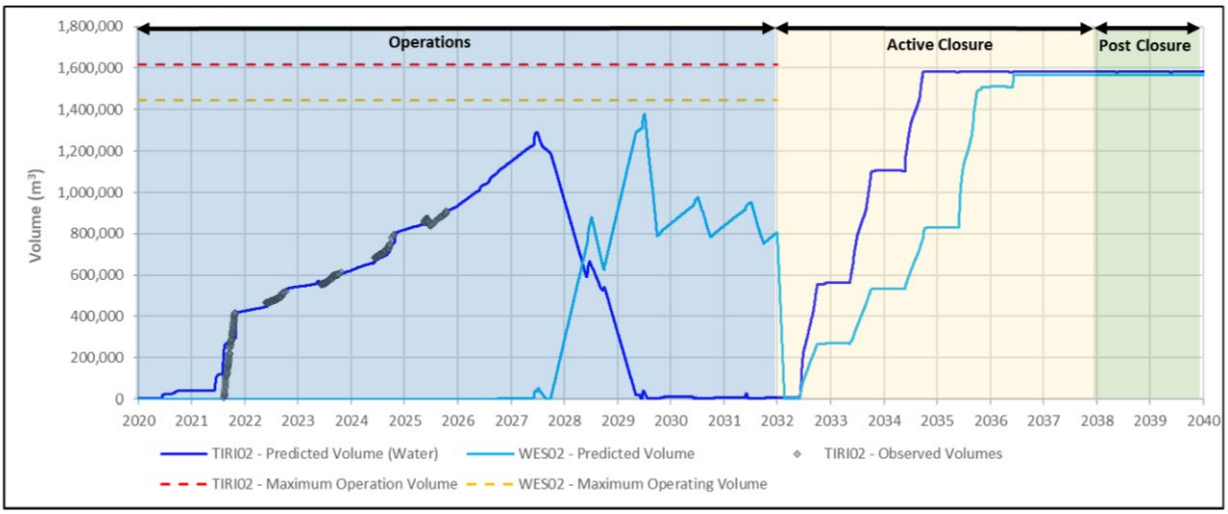

Figure 9: TIRI02 observed and WBWQM predicted volumes for both TIRI02 and WES02 during the Operations phase of the LOM and the Active and Post-Closure phases (measured and predicted values as reflected in the 2025 Annual Report)**

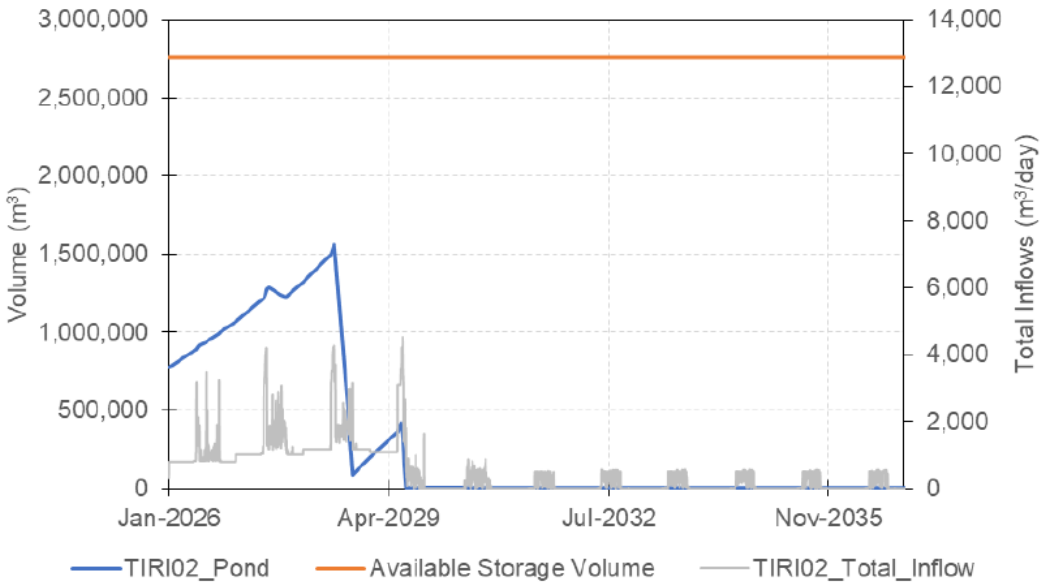

Figure 5-16: TIRI02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

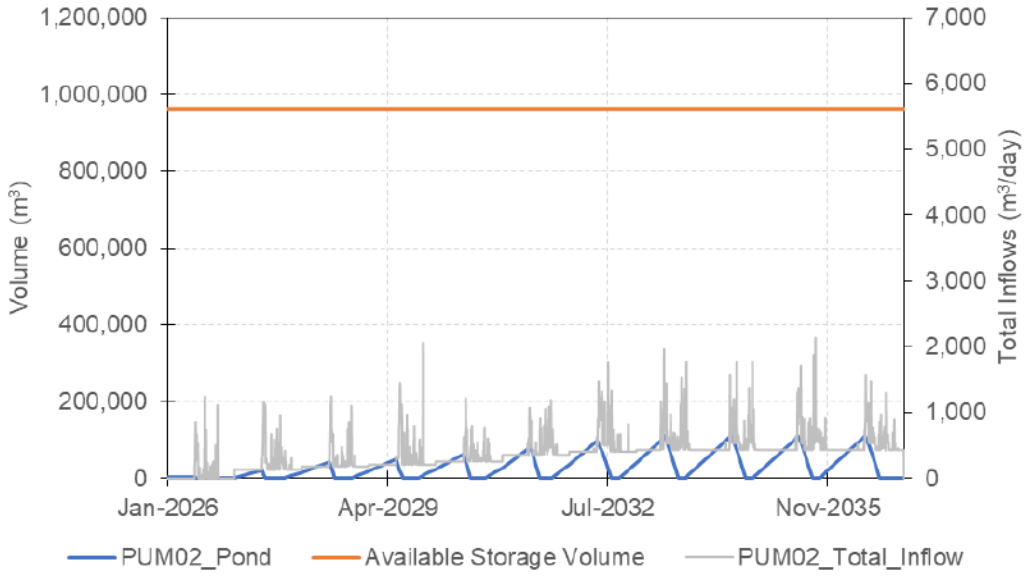

Figure 5-18: PUMP02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

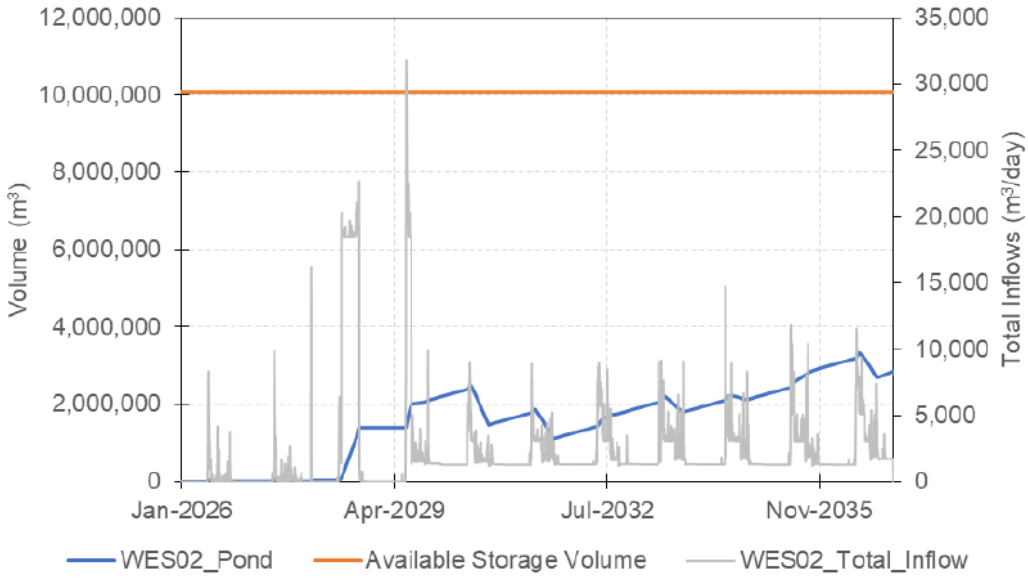

Figure 5-20: WES02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

Response to bullet b):

The current and annual inventories of underground volume that could be used to offset the volume of saline water stored without requiring treatment are summarized in Table KivIA-1, below. Current projections indicate sufficient underground capacity to store saline water without requiring treatment. Also note that TIRI02 stores all the underground contact water and RO brine discharge until 2028. Volumes of RO discharge will be dependant on the volume of marginally saline water diverted from CP1. In 2028, all water stored in TIRI02 is transferred to WES02.

Table KivIA-1: Annual Operations Phase Water Balance for WES02 including year end volume and underground maximum capacities

Year	Inflows to WES02 (m^3/year)*		Outflows from WES02 (m^3/year)*			Active Volumes (m^3)**		
	passive inflows	saline inflows	evaporation	to CP1	to SETP	WES02 year end volume	TIRIGANIAQ COMPLEX UG Maximum available volume	Pump UG Maximum available volume

Note: the available volume in the underground for water takes into account the backfilling of tailings (see CIRNAC-TC-03)

CROWN-INDIGENOUS RELATIONS AND NORTHERN AFFAIRS CANADA (CIRNAC)

Interested Party:	**CIRNAC**	**Rec No.:**	**CIRNAC-TC-01**
Re:	**Consistency of mine, milling and closure schedule**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle:

a) *Provide a reconciled annual life-of-mine production schedule that identifies ore mined, ore processed, year-end ore inventory, and tailings generated through depletion of the ore stockpiles; and*
b) *If the reconciled schedule indicates that milling may continue beyond 2036, identify the corresponding changes required to the mine operating period and demonstrate that the timing and assumptions used in the Water Management Plan, Mine Waste Management Plan, Water Balance and Water Quality Model, and Interim Closure and Reclamation Plan remain appropriate, or revise those documents as necessary.*

Agnico Eagle's Response to Request:
Response to bullet a):
The requested information is already reported in the NWB Annual Reports and will continue to be provided in future annual reports. The latest ore stockpile estimates (2019-2025) are presented in Table 10, and tailings estimates are presented in Table 12 of the 2025 Water Licence Annual Report (both tables extracted below). Annual changes in stockpile inventory reflect the difference between ore mined and ore processed, with stockpiles increasing when production exceeds processing capacity and decreasing when previously stockpiled ore is processed. The mine plan presented in the Application reflects a likely operating scenario at the time of submission. Actual mining and processing rates may vary over time, and updated ore inventory estimates will continue to be reported annually.

Response to bullet b):
Actual mining and processing rates may vary over time, and updated ore inventory estimates will continue to be reported annually. The Water Management Plan, Mine Waste Management Plan, Water Balance and Water Quality Model, and Interim Closure and Reclamation Plan are based on the most likely operating scenario at the time of submission and are considered appropriate for the current mine plan. Should future mine planning indicate that milling or operations are expected to continue beyond the currently projected mine life, Agnico Eagle would assess the implications of the revised schedule and update these plans, as necessary, through appropriate regulatory processes; however, milling beyond 2036 is not anticipated to require updates to plans as the management approach would continue.

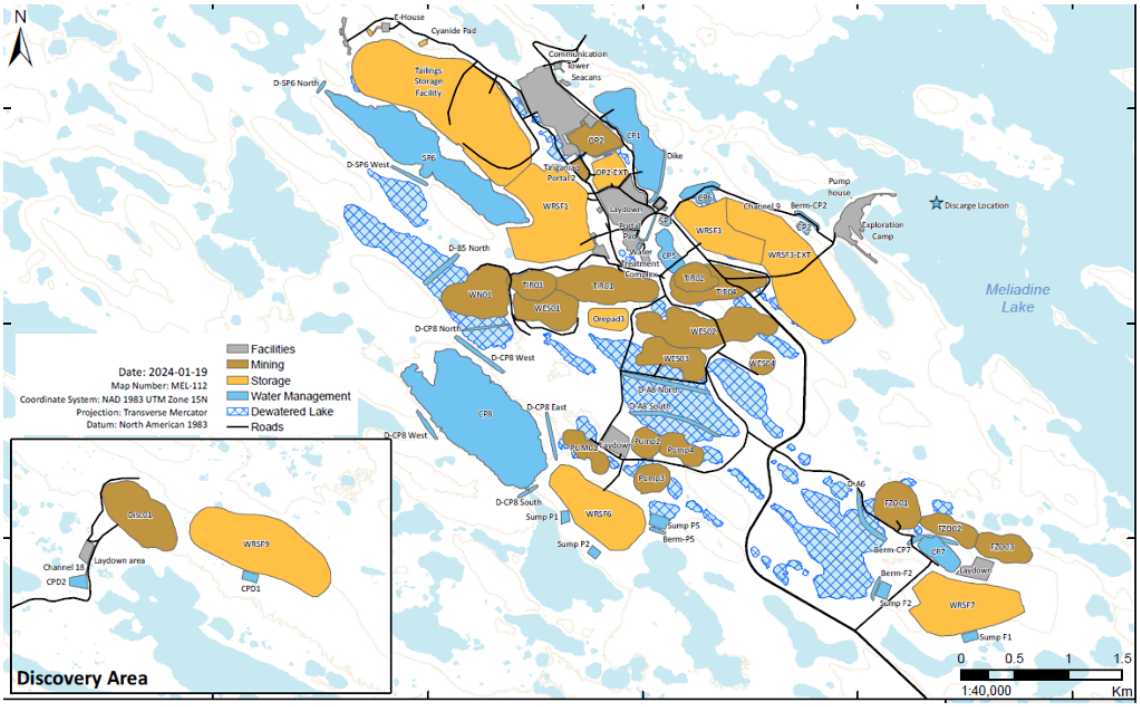
Re:	Ore storage capacity		

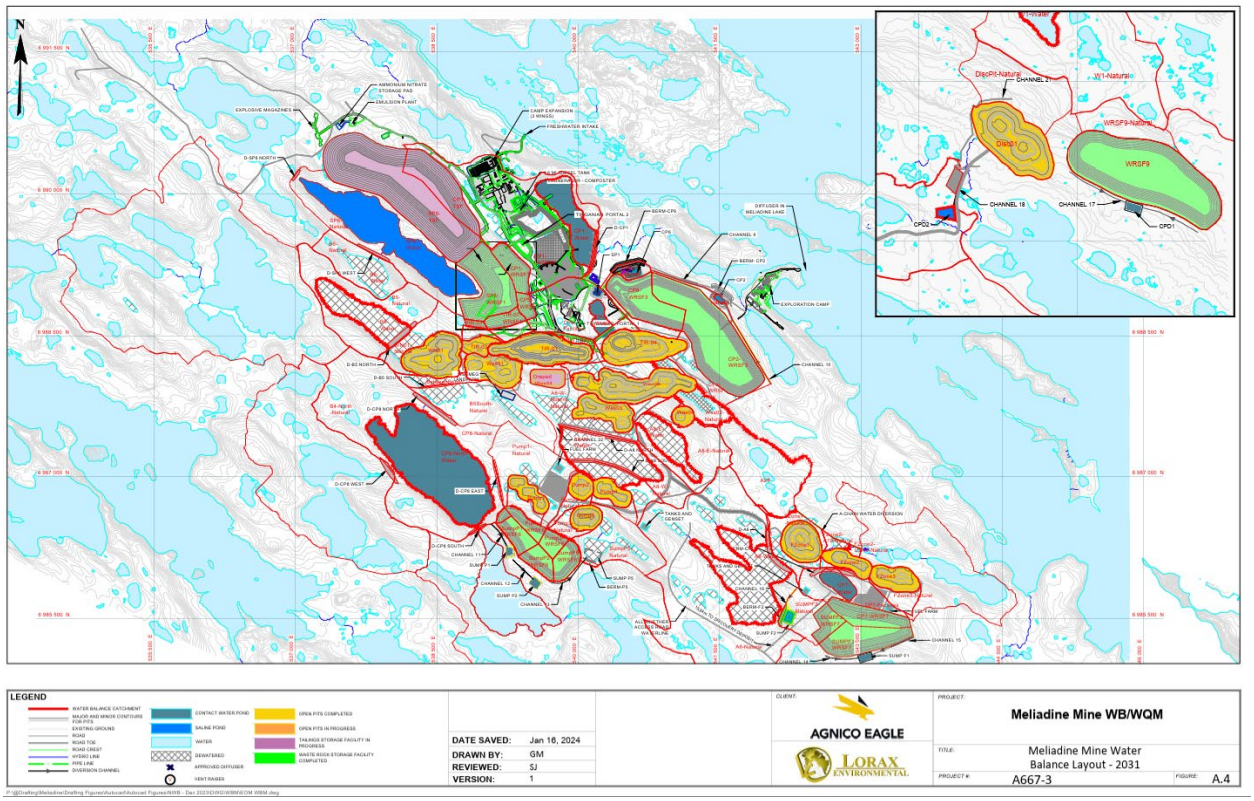
Request Made by Interested Party:



CIRNAC recommends that Agnico Eagle clarify in which documents ore storage pad OP3 is discussed and where it was approved.

Agnico Eagle's Response to Request:

As stated by the reviewer, details of Ore Pad 3 have not yet been integrated into the Ore Storage Management Plan because it has not yet been designed. This new pad would be designed and notification for construction would be submitted to the NWB prior to its use. This Ore Pad 3 was shown as a figure in the 2024 Water Licence Amendment Application Main Document, as well as in the relevant Management Plans that were part of that application. Ore Pad 3 is located south of the TIRI01 pit and between WES01 and WES02 pits. Runoff generated from the ore pad is captured by the existing site water management infrastructure and ultimately reports to CP1.



MELIADINE MINE WATER LICENCE AMENDMENT — MAIN APPLICATION DOCUMENT

Figure 1.2-1: Meliadine Mine Water Licence Amendment General Site Plan

January 2024 — 9 — AGNICO EAGLE

Furthermore, it was also accounted for the in the 2024 Water Balance Water Quality Model:

Interested Party:	CIRNAC	Rec No.:	CIRNAC-TC-03
Re:	Life-of-mine tailings mass balance		

Request Made by Interested Party:

CIRNAC recommends that Agnico Eagle provide the corrected annual life-of-mine tailings mass balance in which total tailings generated are accounted for, and confirm there is sufficient capacity for the increased underground backfill.

Agnico Eagle's Response to Request:

Agnico Eagle thanks CIRNAC for identifying the discrepancy. The corrected annual life-of-mine tailings mass balance, which fully accounts for total tailings generated, is provided below (corrected values highlighted). Agnico Eagle confirms that sufficient underground backfill capacity exists to accommodate the revised tailings volumes (see KivIA-TC-1). The Mine Waste Management Plan will be updated to reflect the corrected mass balance and submitted within 60 days from Minister approval of the Water Licence Amendment.

Re:	**Management of increased waste from increased camp size**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle confirm the next update to the Incineration and Composter Waste Management Plan will include an update to the waste volumes generated to reflect the increase camp capacity.

Agnico Eagle's Response to Request:
Agnico Eagle will update the Incineration and Composter Waste Management Plan (Appendix 5-H) to reflect the increase in camp capacity from 680 to 900 persons and submitted within 60 days from Minister approval of the Water Licence Amendment.

Interested Party:	CIRNAC	Rec No.:	CIRNAC-TC-05
Re:	Relocation of undergrounds in thermal model		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle:

a) Identify on illustrations which undergrounds were relocated and where they are actually located;
b) Explain the decision to model undergrounds deeper below the pits than their actual locations;
c) Describe the impact on model results of relocating undergrounds, including how the thickness of the layer colder than -3 °C below pits TIRI02 and PUMP02 might be altered; and
d) Discuss how the conclusions of the Thermal Assessment and Groundwater Modelling might change if the undergrounds had not be relocated in the thermal model.

Agnico Eagle's Response to Request:
Response to bullet a), b):
At the time the thermal model was created, the depth of the underground was conceptual. For that reason, a conservative 100 m crown pillar was chosen for modelling purposes which is the depth recommended by the Mine Health and Safety Regulations by the Worker's Safety and Compensation Commission (WSCC). Mining within the 100 m crown pillar requires a WSCC exemption which was not confirmed at the time of modelling. Following the exemption approval, the Tiriganiaq underground will be constructed 75 m below pits filled with water, and Pump underground will be constructed 100 m below pits filled with water, as modelled.

Response to bullet c, d):
Using conservative assumptions in the model offsets the minimal change from 100 m to 75 m crown pillar in the Tiriganiaq underground. The conservative model assumptions are described below:

- Pits were assumed to be instantaneously excavated and filled at the start of operations.
    - The model does not consider any freeze-back that would happen during excavation that could lead to colder initial temperatures beneath the pit at the time of flooding.
- The use of a two-dimensional model which does not capture the dynamics of three-dimensional heat transfer.
    - All heat generated from underground workings and flooded pits is dissipated over two dimensions. In reality, portions of the heat generated from operations would dissipate in three-dimensions perpendicular to the cross section.

Interested Party:	**CIRNAC**	**Rec No.:**	**CIRNAC-TC-06**
Re:	**Water quality of predicted inflows to PUMP04 Pit**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle clarify the predicted TDS concentration from groundwater inflowing into PUMP04 pit in 2032 and describe the impact of the discrepancy on predicted concentration results presented in the WBWQM.

Agnico Eagle's Response to Request:
The TDS value of 100 mg/L for PUMP04 groundwater inflows in 2032 originally presented in Table 3-5 of the WBWQM report was a typo in the reporting only. The correct value is 1,000 mg/L, consistent with the value in Table 2 of Groundwater Modelling Memo (Appendix 4-B), and this is the value that is used as input to the WBWQM.

For clarity, the correct value (1,000 mg/L) was used in the WBWQM.

The WBWQM report has been updated to fix this error and is submitted in Appendix A of this response package.

Interested Party:	**CIRNAC**	**Rec No.:**	**CIRNAC-TC-07**
Re:	**Water quality modelling predictions past 2099**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle share the post-closure water quality predictions of the WBWQM for the entire modelling period of 2039 to 2119.

Agnico Eagle's Response to Request:
The truncation of model results to end-2099 was the result of a formatting error. Appendix D of the WBWQM report (see Appendix A of this response package) has been updated to show predictions to December 2119 to address this error.

Interested Party:	**CIRNAC**	**Rec No.:**	**CIRNAC-TC-08**
Re:	**Modelled post-closure water quality**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle:

a) *Provide rationale for not presenting water quality model prediction results that do not meet applicable guidelines during post-closure in the main body of the report;*
b) *Explain the cause for increased post-closure predictions for cobalt concentrations between the 2025 and 2026 models;*
c) *Explain why the water chemistry at WES04 has increasing parameter concentration trends for TDS, Chloride, sulphate, ammonia and mercury, which differs from long-term forecasts in other pits; and*
d) *Discuss measures that could improve water quality outcomes in post-closure for the guideline exceedances identified above.*

Agnico Eagle's Response to Request:
The WBWQM report was revised to address this comment and is included as Appendix A of this response package. Please see details below:

Response to bullet a):
The water quality predictions for collection ponds presented in Appendix D3 of the WBWQM report for the post-closure period are artefacts of simulated mine component seepage entering the model immediately upstream of each pond. During Active Closure, water from these ponds will be routed to CP1 and the ponds will subsequently be dewatered and decommissioned to restore pre-development drainage patterns. While the pond nodes were retained in the model as prediction points, they are not expected to retain water following decommissioning and therefore do not represent receiving environment conditions.

These decommissioned pond nodes were inadvertently screened against receiving environment criteria. This error has been corrected in the revised report included with this response package. The exceptions are CP7, which is a Schedule 2 waterbody and is appropriately screened against terrestrial water quality guidelines, and CP1, which is screened against the applicable water quality objectives, consistent with the flooded conjoined pits and other downstream receiving waterbodies.

Following correction of the screening criteria, the only remaining receiving environment exceedance identified in the post-closure predictions outside of phosphorus and several parameters in WES04 (discussed below) is mercury (Hg) in Lake J1. The maximum predicted concentration in Lake J1 is 0.0000263 mg/L, which is marginally above the applicable guideline of 0.000026 mg/L. This negligible exceedance is considered an artefact of the mercury dataset, which contains a large proportion of results

reported at the method detection limit (MDL). Given the extremely small magnitude of the exceedance and the uncertainty associated with MDL-censored data, the predicted concentration is considered highly conservative.

Response to bullet b):
Cobalt concentrations have increased as a result of the updated WRSF and TSF source term calibration. This recalibration resulted in a 20% decrease in the TSF cobalt source term and a 90% increase in the waste rock facility source terms. These changes do not result in any operations or post-closure exceedances. The exceedances identified in the Appendix D screening tables were reported in error due to the application of incorrect screening criteria. This issue has been corrected in the revised report submitted with this response package.

Response to bullet c):
The ratio of exposed pit walls in WES04 (0.84 ha) to surrounding catchment area (0.2 ha) is approximately 4:1, which along with a large water surface area (4.17 ha) results in evapoconcentration of the pit wall loadings within this flooded pit. The predicted exceedances are largely a result of these physical characteristics of the pit.

Response to bullet d):
Potential measures that may improve post-closure water quality outcomes would focus on reducing the influence of the physical characteristics of the WES04 pit lake water quality. For example, connecting WES04 flooded pit with a nearby pit lake via a channel. The feasibility and effectiveness of any such measures would be evaluated through the closure planning process (e.g., Part J, 2: "*The Licensee shall submit to the Board for approval, at least twelve (12) months prior to the expected end of planned mining, a Final Closure and Reclamation Plan*") and/pr future updates to the WBWQM. As part of Part E, Item 11 of the Water Licence:

> *Part E, Item 11: The Licensee shall, at least ninety (90) days prior to starting of the next phase (Closure, Post-closure) of mine development, submit an updated Water Management Plan to the Board for approval in writing to reflect all changes in operations and/or technology. The Plan shall include updated Water Balance and Water Quality Forecast, and an action plan to be implemented, if predicted Water quality indicates that treatment is necessary.*

Interested Party:	**CIRNAC**	**Rec No.:**	**CIRNAC-TC-09**
Re:	**Water balance catchment areas**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle:

a) *Clarify in which instances which of the four sources of information on catchment areas in the WBWQM report were used as input to the water balance;*
b) *Explain the inconsistencies noted above to allow reviewers to confirm that all catchment areas are consistently accounted for in the WBWQM; and*
c) *Use consistent names for water catchment areas throughout the WBWQM report in future reports.*

Agnico Eagle's Response to Request:
The noted discrepancies were attributable to updates to the site water management plan nomenclature, which were incorporated into the WBWQM but not consistently reflected throughout the report. The discrepancies noted have been addressed in the updated WBWQM report (see Appendix A of this response package).

For clarity, there were discrepancies in the nomenclature used on the site maps which have been corrected in the updated report, but no revisions or updates to the models were required and therefore predictions have not changed between report versions.

Response to bullet a):
Catchment areas used in the model reflect the mine plan as stated in the main body of the WBWQM report. The table in Appendix A2 showing the Discovery area development has been updated to show development beginning in 2028 to match the model inputs.

Response to bullet b):
The collection pond formerly named SP6 (previously a saline collection pond) has been revised to CP7 to reflect its planned use for transient storage of excess surface contact water from CP1. CP7 was used previously to refer to a collection pond in the dewatered footprint of Lake A52, in the FZONE area. The water management plan for this area has been updated in the latest submission, and while Lake A52 is still dewatered, it is no longer used as a local contact water collection pond. All site maps, flow diagrams, and the catchment area table in Appendix A2 have been updated to reflect this change. As this logic was already coded in the WBWQM, no model updates or revisions to water quantity or quality predictions are necessary.

Response to bullet c):
The nomenclature for CP2.5 has been updated to CP8, and Appendix A2 and the maps in the main body of the report have been updated to match.

Interested Party:	CIRNAC	Rec No.:	CIRNAC-TC-10
Re:	Saline water treatment and site water management		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle:

a) *Discuss the predicted timeline for completing the ammonia-management approach for saline water, notice period, and treatment system construction/installation; and*
b) *Identify how material limitations or delays in implementation of ammonia treatment would be managed with respect to on-site saline-water storage and the allocation of waterline capacity between saline and surface contact water.*

Agnico Eagle's Response to Request:

Response to bullet a):

Agnico Eagle is currently advancing the design of the ammonia-treatment component of the Saline Effluent Treatment Plant (a component of the SETP-WTC). Construction of the ammonia-treatment is currently scheduled for 2027, with testing and commissioning targeted for 2028. Additional information on the SETP will be provided through the 60-day construction notice process as per Part D, Item 1 of the Water Licence.

Response to bullet b):

Should implementation of ammonia treatment be delayed beyond the current schedule, saline water can continue to be stored within existing site water management infrastructure (primarily WES02 pit) while available waterline capacity is prioritized for management of contact water during this period. As shown in Figure 5-18 of the WBWQM Report (Appendix 4-C), WES02 has sufficient capacity.

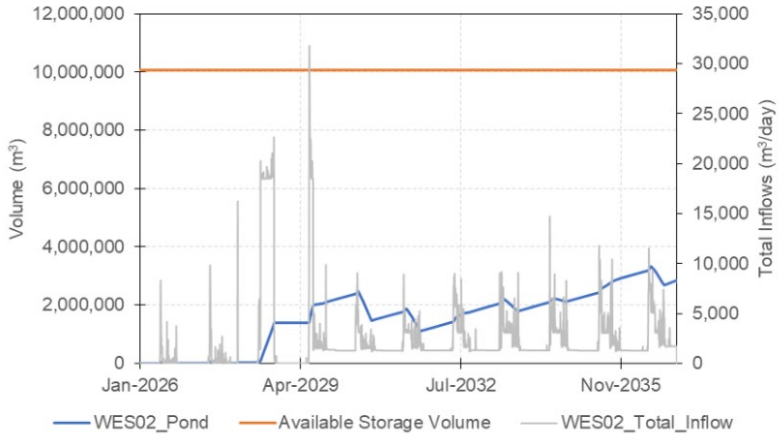

Figure 5-20: WES02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

Interested Party:	**CIRNAC**	**Rec No.:**	**CIRNAC-TC-11**
Re:	**Hydrodynamic model calibration**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle specify what in-situ water quality observations collected in Meliadine Lake were used to calibrate the Meliadine Lake hydrodynamic model or clarify in which document the calibration is described.

Agnico Eagle's Response to Request:
The Meliadine Lake model was calibrated predominantly using Supporting Documents of the 2014 FEIS (e.g., SD 7-1 and SD 7-2, Volume 7, Freshwater Environment), with water temperatures, Total dissolved solids (TDS) concentrations and water levels lake data ranging from the late 1990s to 2010.

The subsequent model validation against the AEMP data collected from 2018–2024 (Azimuth, 2025), confirmed the adequacy of the calibration.

This was supplemented by DHI's experience with similar northern lakes, particularly regarding freeze-up, ice melt, and overall seasonal water temperature ranges.

References:
Agnico Eagle. 2014. Meliadine Gold Project, Nunavut. Final Environmental Impact Statement (FEIS). Submitted to the Nunavut Impact Review Board. April 2014. Supporting Documents SD 7-1 and SD 7-2, Volume 7, Freshwater Environment, 2012.

Interested Party:	**CIRNAC**	**Rec No.:**	**CIRNAC-TC-12**
Re:	**Long-term fate of saline water placed in underground workings at closure**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle provide a timeline for development of an updated technical assessment of the long-term fate of saline water proposed for placement in the Tiriganiaq and Pump underground workings. The assessment should consider:

a) *The anticipated final underground configuration and the volume and chemistry of saline water proposed for placement underground;*
b) *Density-dependent groundwater flow, hydraulic recovery, and permafrost conditions; and*
c) *Potential hydraulic connections with flooded pits and surface-water receptors, with the results used to confirm or, if necessary, revise the proposed closure water management strategy and associated monitoring and contingency measures*

Agnico Eagle's Response to Request:
Response to bullet a) and b):
As per Part J, 2: "*The Licensee shall submit to the Board for approval, at least twelve (12) months prior to the expected end of planned mining, a Final Closure and Reclamation Plan*". The FCRP may include supporting documents such as a Hydrogeological Model (including groundwater flow connections), Thermal Evaluation, Water Balance and Water Quality Model, and Human Health and Ecological Risk Assessment (including surface water receptors), in addition to many more documents. These documents will confirm the closure water management strategy, associated monitoring, and mitigation or contingency as necessary.

Response to bullet c):
Furthermore, as stated in the WBWQM Report (Appendix 4-C), the potential hydraulic connections between flooded pits and surface-water receptors have already been considered. The WBWQM assumes that "*open pits will have been flooded with Meliadine Lake water, water management infrastructure will have been decommissioned, and mine site waterbodies will begin to discharge passively*" and "*additional monitoring data collected through the life of mine will be used to update Post-Closure model predictions*" (Section 6.3). This scenario forms the basis of the closure and post-closure water quality predictions.

Interested Party:	**CIRNAC**	**Rec No.:**	**CIRNAC-TC-13**
Re:	**Deficiencies in hydrological model**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle address the deficiencies noted above when they revisit the hydrological model once the hydrology monitoring program is complete.

Agnico Eagle's Response to Request:
As stated during the 2024 Water Licence Amendment NWB Public Hearing (241025_2AM-MEL1631 Reasons for Decision-OASE Final.pdf), Agnico Eagle committed to collecting streamflow and water-level data at both Meliadine Lake outlets over a three-year period (2024–2026) and it is the intention to incorporate all data collected through this program into future model updates. The updated model and supporting data are expected to be provided through the Annual Report process following completion of the initial three-year monitoring period.

The hydrological model submitted with the Operational Update application (Appendix 4-D) incorporates updated bathymetric data, lake-level observations collected in 2024–2025, and climate data. These inputs have supported effective model calibration, particularly under open-water (ice-free) conditions. The data deficiencies identified in the hydrology report relate to gaps in the historical baseline record that cannot be addressed retrospectively through field monitoring. Continued monitoring provides additional data to support model validation and refinement.

Interested Party:	**CIRNAC**	**Rec No.:**	**CIRNAC-TC-14**
Re:	**Closure freshwater withdrawal and pre-closure hydrological assessment**		

Request Made by Interested Party:
CIRNAC recommends that Agnico Eagle provide a timeline for development of an updated Meliadine Lake hydrological assessment. The updated assessment should:

a) *Incorporate the hydrometric record available at that time, include an appropriate baseline or no-withdrawal comparison, and evaluate the effects of the proposed closure withdrawals on Meliadine Lake levels and discharge through both lake outlets under relevant hydrological and climate conditions; and*
b) *Be used to establish an adaptive closure withdrawal strategy, including monitoring and response criteria for adjusting or suspending withdrawals if required.*

Agnico Eagle's Response to Request:
Response to bullet a):
Agnico Eagle has provided a sensitivity analysis evaluating the effects of proposed operational and closure water withdrawals from Meliadine Lake relative to baseline conditions (no mine withdrawals), including the associated effects on lake outflows. Details are provided in the response to DFO-TRC-01 and the DHI *Impact of Freshwater Withdrawals for Mine Operation and Mine Closure Scenarios on Lake Volume, Lake Level and Flow* (Appendix B of this response package). As noted in the response to CIRNAC-TC-13 (with reference to a commitment made during the 2024 Water Licence NWB Public Hearing; 241025 2AM-MEL1631 Reasons for Decision-OASE Final.pdf), an updated hydrological model will be provided through the Annual Report process following completion of the first three years of monitoring.

Response to bullet b):
In accordance with Part J, 2: "*The Licensee shall submit to the Board for approval, at least twelve (12) months prior to the expected end of planned mining, a Final Closure and Reclamation Plan*". The FCRP may include supporting documents such as a Meliadine Lake Hydrology Model, Human Health and Ecological Risk Assessment, and additional relevant documents. These documents will confirm the closure water withdrawal strategy, and if appropriate consider criteria to guide water withdrawal rates.

ENVIRONMENT AND CLIMATE CHANGE CANADA (ECCC)

Interested Party:	**ECCC**	**Rec No.:**	**ECCC-TRC-01**
Re:	**Guidelines for listed waterbodies**		

Request Made by Interested Party:
ECCC continues to recommend that the ICRP be updated to specify preliminary water quality criteria for closure that will be protective of aquatic life for all waterbodies, since, at closure, waterbodies will all be reconnected to the fish bearing regional surface water system regardless of their Schedule 2 status as tailings impoundment areas.

ECCC also recommends that the water balance and water quality model be updated to reflect these changes as the current model is still comparing predicted water quality in certain lakes against terrestrial protection guidelines.

Agnico Eagle's Response to Request:
This comment was previously raised as part of the 2024 Water Licence Amendment process and our position remains unchanged. When a waterbody is added to Schedule 2 of the MDMER this is based on an assumption that the waterbody is no longer fish habitat. This is one of the reasons a Fish Offsetting Plan is prepared to support such applications.

In accordance with Section 28 of the MDMER, water/effluent from the mine area must be deposited through a final discharge point (as defined in the MDMER), must not be acutely lethal (as defined in the MDMER), and it must be in compliance with the maximum authorized concentrations of prescribed deleterious substances described in Schedule 4 of the MDMER.

In other words, the MDMER:

- Do not prescribe <u>any</u> conditions related to the quality of water in an area listed on Schedule 2 of the MDMER.
- Do prescribe conditions related to discharge from the final discharge point.

The Type A Water Licence should not include any criteria for water quality within the water bodies that are added to Schedule 2 of the MDMER, because this would entirely contradict the MDMER.

Even if the Meliadine Mine becomes a recognized closed mine, unless and until these water bodies are removed from Schedule 2, it is Agnico Eagle's understanding that the legal status of these waterbodies would not change, and that ECCC would continue to have no legal authority to prescribe any conditions related to the quality of water in these waste deposition areas, since they would continue to be listed on Schedule 2.

That said, Agnico Eagle recognizes ECCC's underlying concern. If and when Agnico Eagle decides to seek authorization to reconnect these water bodies to the regional surface water system, it will engage with the appropriate authorities within the Government of Nunavut and the NWB.

FISHERIES AND OCEANS CANADA (DFO)

Interested Party:	**DFO**	**Rec No.:**	**DFO-TRC-01**
Re:	**Hydrology Modelling – Downstream Impacts**		

Request Made by Interested Party:
DFO recommends the Proponent provide modeled flow rates (m3/s) for the Meliadine River and Diane River, that conform to DFO's Framework for Assessing the Ecological Flow Requirements to Support Fisheries in Canada (2013) and includes the following:

- *modeled flows under operational water use volumes;*
- *modeled flows under closure water use volumes;*
- *comparison of modeled flows with 10% instantaneous flow;*
- *comparison of modeled flows with 30% MAD;*
- *open water and under-Ice discharge rating curves for both outlets; and*
- *a minimum of 20 years of river flow data (if available) to establish the "natural flow regime", for baseline comparison.*

Agnico Eagle's Response to Request:
Agnico Eagle conducted additional modelling exercises to address this DFO comment, with results presented in Appendix B of this response package. The model included use of an ice-free and ice-covered rating curve for both the Main Outlet (Meliadine River) and the West Outlet. Note: Diane River is the outflow of Peter Lake and not an outflow of Meliadine Lake. Three modelled scenarios were evaluated:

1. Mine Operation Scenario, with freshwater withdrawals of 1.1 Mm^3 per year
2. Mine Closure Scenario, with freshwater withdrawals of 8.7 Mm^3 per year, which used a constant daily extraction rate through the open-water season, from June 15 to September 30 (2037-2043)
3. Baseline Scenario, with no mine operation or closure withdrawals

Under the Mine Operation Scenario, changes in instantaneous streamflow at both the Main Outlet and West Outlet remain below 10% relative to the Baseline Scenario. Both outlets naturally experience flows below 30% of the Mean Annual Discharge (MAD) under frozen conditions: the Main Outlet flows only occasionally, while the West Outlet routinely ceases to flow during frozen conditions (2014 FEIS, Volume 7). Therefore, neither should be considered viable fish habitat under frozen conditions. In addition, to better reproduce observed winter changes in lake levels the model allows flow through the Main Outlet during frozen conditions. However, the outlet is shallow, with a maximum depth of less than 1 m, and ice routinely extends to the outlet bed. Any winter flow would therefore likely be subsurface.

Under the Mine Closure Scenario (withdrawals from June 15th to September 30th), both the Main Outlet and West Outlet experience changes in modelled instantaneous streamflow greater than 10% when compared to the Baseline Scenario during August, September, and October. No withdrawals occur during

periods of flow less than 30% of the MAD. Of note, the current modelling assessment uses a constant daily extraction rate (conservative) rather than an adaptive rate, which is appropriate at this time. The closure withdrawal volumes, timing, and duration remain subject to refinement as closure planning advances. The potential effects will be revisited through the interim and final closure planning process, and possible effects to fish and fish habitat, as well as any mitigations, will be further discussed with DFO, as required.

As noted in the response to CIRNAC-TC-13 (with reference to a commitment made during the 2024 Water Licence Amendment NWB Public Hearing; 241025 2AM-MEL1631 Reasons for Decision-OASE Final.pdf), an updated hydrological model will be provided through the Annual Report process following completion of the three years (2024-2026) of hydrological monitoring being conducted on Meliadine Lake and its outflows. The collected data in combination with Water Survey of Canda hydrometric records and watershed modelling can be used to generate the required 20-plus years of streamflow data and will be used in the further evaluation of closure-related effects on the Meliadine Lake hydrologic system.

Interested Party:	DFO	Rec No.:	DFO-TRC-02
Re:	Hydrology Modelling – Winter/Under-ice Considerations		

Request Made by Interested Party:

DFO recommends the Proponent provide information about water withdrawal volumes relative to total lake volume for the under-ice time period. This information should conform to the DFO Protocol for Winter Water Withdrawal from Ice-covered Waterbodies in the Northwest Territories and Nunavut (2010), including the percentage of the available water volume calculated using the appropriate maximum expected ice thickness for Meliadine Lake.

Agnico Eagle's Response to Request:

Agnico Eagle conducted additional modelling exercises to address this DFO comment, with results presented in Appendix B of this response package.

In summary, withdrawals during operations (to 1.1 Mm^3, annually) and closure (to 8.7 Mm^3, between June 15 to September 30 annually from 2037 to 2043) will have negligible effects on under-ice lake volumes, with modelled maximum reductions of 0.062% in May and 0.183% in November, respectively.

Withdrawals during both operations and closure conform to the DFO *Protocol for Winter Water Withdrawal from Ice-Covered Waterbodies in the Northwest Territories and Nunavut* (2010).

Interested Party:	**DFO**	**Rec No.:**	**DFO-TRC-03**
Re:	**Hydrology Monitoring Plan**		

Request Made by Interested Party:
DFO recommends that the Proponent develop a hydrology monitoring plan that includes:

- *details of the hydrology monitoring that was used to collect data for the Meliadine Lake Hydrology Model; and*
- *details on future monitoring throughout operation and closure.*

This plan should include:

- *how, when, and where data is collected;*
- *considerations of summer and winter conditions;*
- *information on how data will be collected to ensure that the project conforms to the DFO Protocol for Winter Water Withdrawal from Ice-covered Waterbodies in the Northwest Territories and Nunavut (2010) and DFO's Framework for Assessing the Ecological Flow Requirements to Support Fisheries in Canada (2013), in order to remain compliant with the Fisheries Act; and*
- *listed contingency measures should monitoring indicate impacts are exceeding that which is permitted (i.e., slowing or stopping withdrawal).*

Agnico Eagle's Response to Request:
As part of the 2024-2026 hydrology monitoring effort on the Meliadine hydrologic system, continuous monitoring stations were installed in Meliadine Lake to monitor lake levels at the outflows and the water intake, and streamflow was quantified at both outflow monitoring locations (Main and West Outflows). A summary update on the Meliadine Lake Outflow Monitoring completed through 2024 and 2025, including methodology, was provided to DFO in response to comments on the 2025 Annual Report.

As noted in the response to CIRNAC-TC-13 (with reference to a commitment made during the 2024 Water Licence Amendment NWB Public Hearing;241025 2AM-MEL1631 Reasons for Decision-OASE Final.pdf), an updated hydrological model will be provided through the Annual Report process following completion of the three years (2024-2026) of monitoring.

Agnico Eagle does not believe that development of a formal hydrology monitoring plan is necessary during the operations stage of the Meliadine mine because:

- Under the modelled Mine Operation scenario (Appendix B of this response package), the proposed freshwater withdrawals have negligible effects on the monthly lake volume (including under ice lake volumes), water level and discharge.

- Modelling results indicate conformity with both the DFO *Protocol for Winter Water Withdrawal from Ice-covered Waterbodies in the Northwest Territories and Nunavut* (2010), and the *Framework for Assessing the Ecological Flow Requirements to Support Fisheries in Canada* (2013).

Agnico Eagle will consider development of a formal hydrology monitoring plan in advance of closure, and to inform closure because the modelled Mine Closure scenario (Appendix B of this response package) indicates that proposed withdrawals may result in changes in instantaneous flows greater than 10%. At that time feasible adaptive management measures including adjustments to withdrawal rates, timing, duration, or prioritization of withdrawals during higher-flow periods, may be evaluated in consultation with DFO to avoid or mitigate adverse effects during closure.

Interested Party:	**DFO**	**Rec No.:**	**DFO-TRC-04**
Re:	**Closure Impacts – Pit Back-flooding**		

Request Made by Interested Party:
Prior to pit back-flooding, it is recommended that the Proponent consult with DFO regarding the need for a Fisheries Act Authorization.

Agnico Eagle's Response to Request:
Agnico Eagle will continue to consult as needed with DFO regarding the need for a *Fisheries Act* Authorization prior to commencing pit back-flooding activities at closure.

The closure withdrawal volumes, timing, and duration remain subject to refinement as closure planning advances. Once the proposed closure water requirements are better defined, the potential effects will be revisited through the interim and final closure planning process. Information associated with the closure withdrawals can be submitted through DFO's regulatory review process, if necessary.

APPENDIX A: WATER BALANCE & WATER QUALITY MODEL TECHNICAL REPORT REVISION 1 (OCTOBER 15, 2026)

AGNICO EAGLE

Meliadine Mine Operational Update: Water Balance and Water Quality Model Technical Report

Prepared for:

Revision Tracking Log

Revision Tracking Log

Section Updated	Description of Update
Rev0 – April 21,2026	
-	First submission of the Meliadine Mine Operational Update: Water Balance and Water Quality Model Technical Report
Rev1 – October 16, 2026	
Section 4.2:Post-Closure	• Minor revisions to text to clarify mine phases • Remove non-CCME/SSWQO parameters from Post-Closure screening table in Table 4-2
Section 6.3:Post-Closure	• Updated water quality model results screening tables to include model results to Dec. 2119 • Updates to text summarizing predictions, with additional context for WES04 pit and Lake J1 • Remove Aquatic Guidelines from Table 6-5 (CP7 screened against terrestrial guidelines) • Added screening table for DISC01 Pit
Section 7: Summary	• Additional text added to summarize Post-closure water quality results
Appendix A.1	• Corrected nomenclature for WN Pit, post-closure flooded pits, Lake A52 and CP7
Appendix A.2	• Corrected timing of Discovery area catchment development • Replaced CP2.5 with CP8 due to updated nomenclature
Appendix B	• Corrected WN Pit nomenclature • Added flow path from WRSF3 to Lake J1 in Post-closure
Appendix D.2 and D.3	• Extended model results to 2119 and updated screening • Removed screening of decommissioned collections ponds from post-closure model results

Glossary and Abbreviations

Glossary and Abbreviations

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

CP	Collection Pond
EOM	End of mining/end of Operations
EOP	End-of-pipe
EWTP	Effluent water treatment plant
FEIS	Final Environmental Impact Statement
MDMER	Metal and Diamond Mining Effluent Regulations
NWB	Nunavut Water Board
POPC	Parameter of potential concern
RCP4.5	Representative Concentration Pathway Scenario (4.5)
SETP	Saline effluent treatment plant
SP	Saline Contact Water Pond
STP	Sewage treatment plant
TDS	Total dissolved solids
TSF	Tailings storage facility
TSS	Total suspended solids
WBM	Site-wide water balance model
WBWQM	Site-side water balance and water quality model
WQM	Site-wide water quality model
WRSF	Waste rock storage facility

Plain Language Summary

AGNICO EAGLE

Plain Language Summary

Agnico Eagle Mines Limited (Agnico Eagle) is planning a Type A 2AM-MEL1631 Water Licence Amendment (the 2026 WL Amendment). The scope of activities remain within the assessed scope and disturbed footprint, thus not requiring further environmental assessment but necessitating amendments to the Water Licence.

In support of the Operational Update Water Licence Amendment, the Water Balance and Water Quality Model (WBWQM) has been updated to reflect updates in the mine plan.

The WBWQM incorporates the mine plan on a year-by-year basis, and includes annual changes to volume, area, and the characteristics of all mine infrastructure. In parallel, all water management infrastructure and activities are represented, with volumes and water quality predicted on a daily time-step. Two water 'types' are tracked in parallel within the model:

1. *Saline contact water* originating from underground dewatering and runoff from ore pads, saline waste rock storage facilities and a portion of the tailings storage facility; and
2. *Surface contact water* generated by the waste rock storage facilities, open pit walls, and other disturbed areas not related to underground mining operation.

The operation of ponds, pumps, water treatment systems and discharges to Meliadine Lake and Itivia Harbour are also represented within the model. Each mine component is assigned specific geochemical source terms and discharge concentrations to represent the predicted water quality for each component. These mine contact water flows and loads are then transported within the model to collection sumps, and larger collection ponds where the various waters are mixed within the model prior to treatment and discharge.

The model is run over a 100-year period to include the Operations, Active Closure, and post-Closure phases of the Meliadine Mine. The climate inputs used in the model reflect a variable climate condition, including the predicted climate change under the RCP4.5 scenario.

Under all conditions modeled, the mine water management infrastructure is shown to be capable of collecting, storing, and releasing the mine contact waters and saline waters in a controlled manner, according to the existing licenses and management plans. In addition, the WBWQM results indicate that the predicted Meliadine Mine volumes and water quality will remain within those presented in the 2014 Final Environmental Impact Statement (FEIS), and within the water license limits as prescribed in 2AM-MEL1631.

During the Operations phase, model predictions for the EWTP discharge to Meliadine Lake remain below the Metal and Diamond Mining Effluent Regulations (MDMER) and/or Water License limits. Ammonia-N concentrations are predicted to be above MDMER discharge criteria to Itivia Harbour, and mitigation options (*e.g.*, treatment) are currently being investigated.

1. Introduction

AGNICO EAGLE

1. Introduction

The updated Water Balance and Water Quality model (WBWQM) reflects revisions including changes to the mine plan, operating schedule, and water management infrastructure, underground mining below permafrost at PUMP, and commissioning of the waterline beginning in 2026 with full operation in 2027. This report presents only the information pertinent to the mine plan changes above, all other inputs and assumptions, as presented in Lorax (2024), remain applicable.

Lorax Environmental Services Ltd. (Lorax) was retained by Agnico Eagle to complete the WBWQM update. The modelling effort described in this report builds upon and supersedes that presented in Lorax (2025). The reader is referred to Lorax (2024) for technical details on model setup, assumptions, calibration and validation.

1.1 Report Structure

Following this introduction, the report is structured as follows:

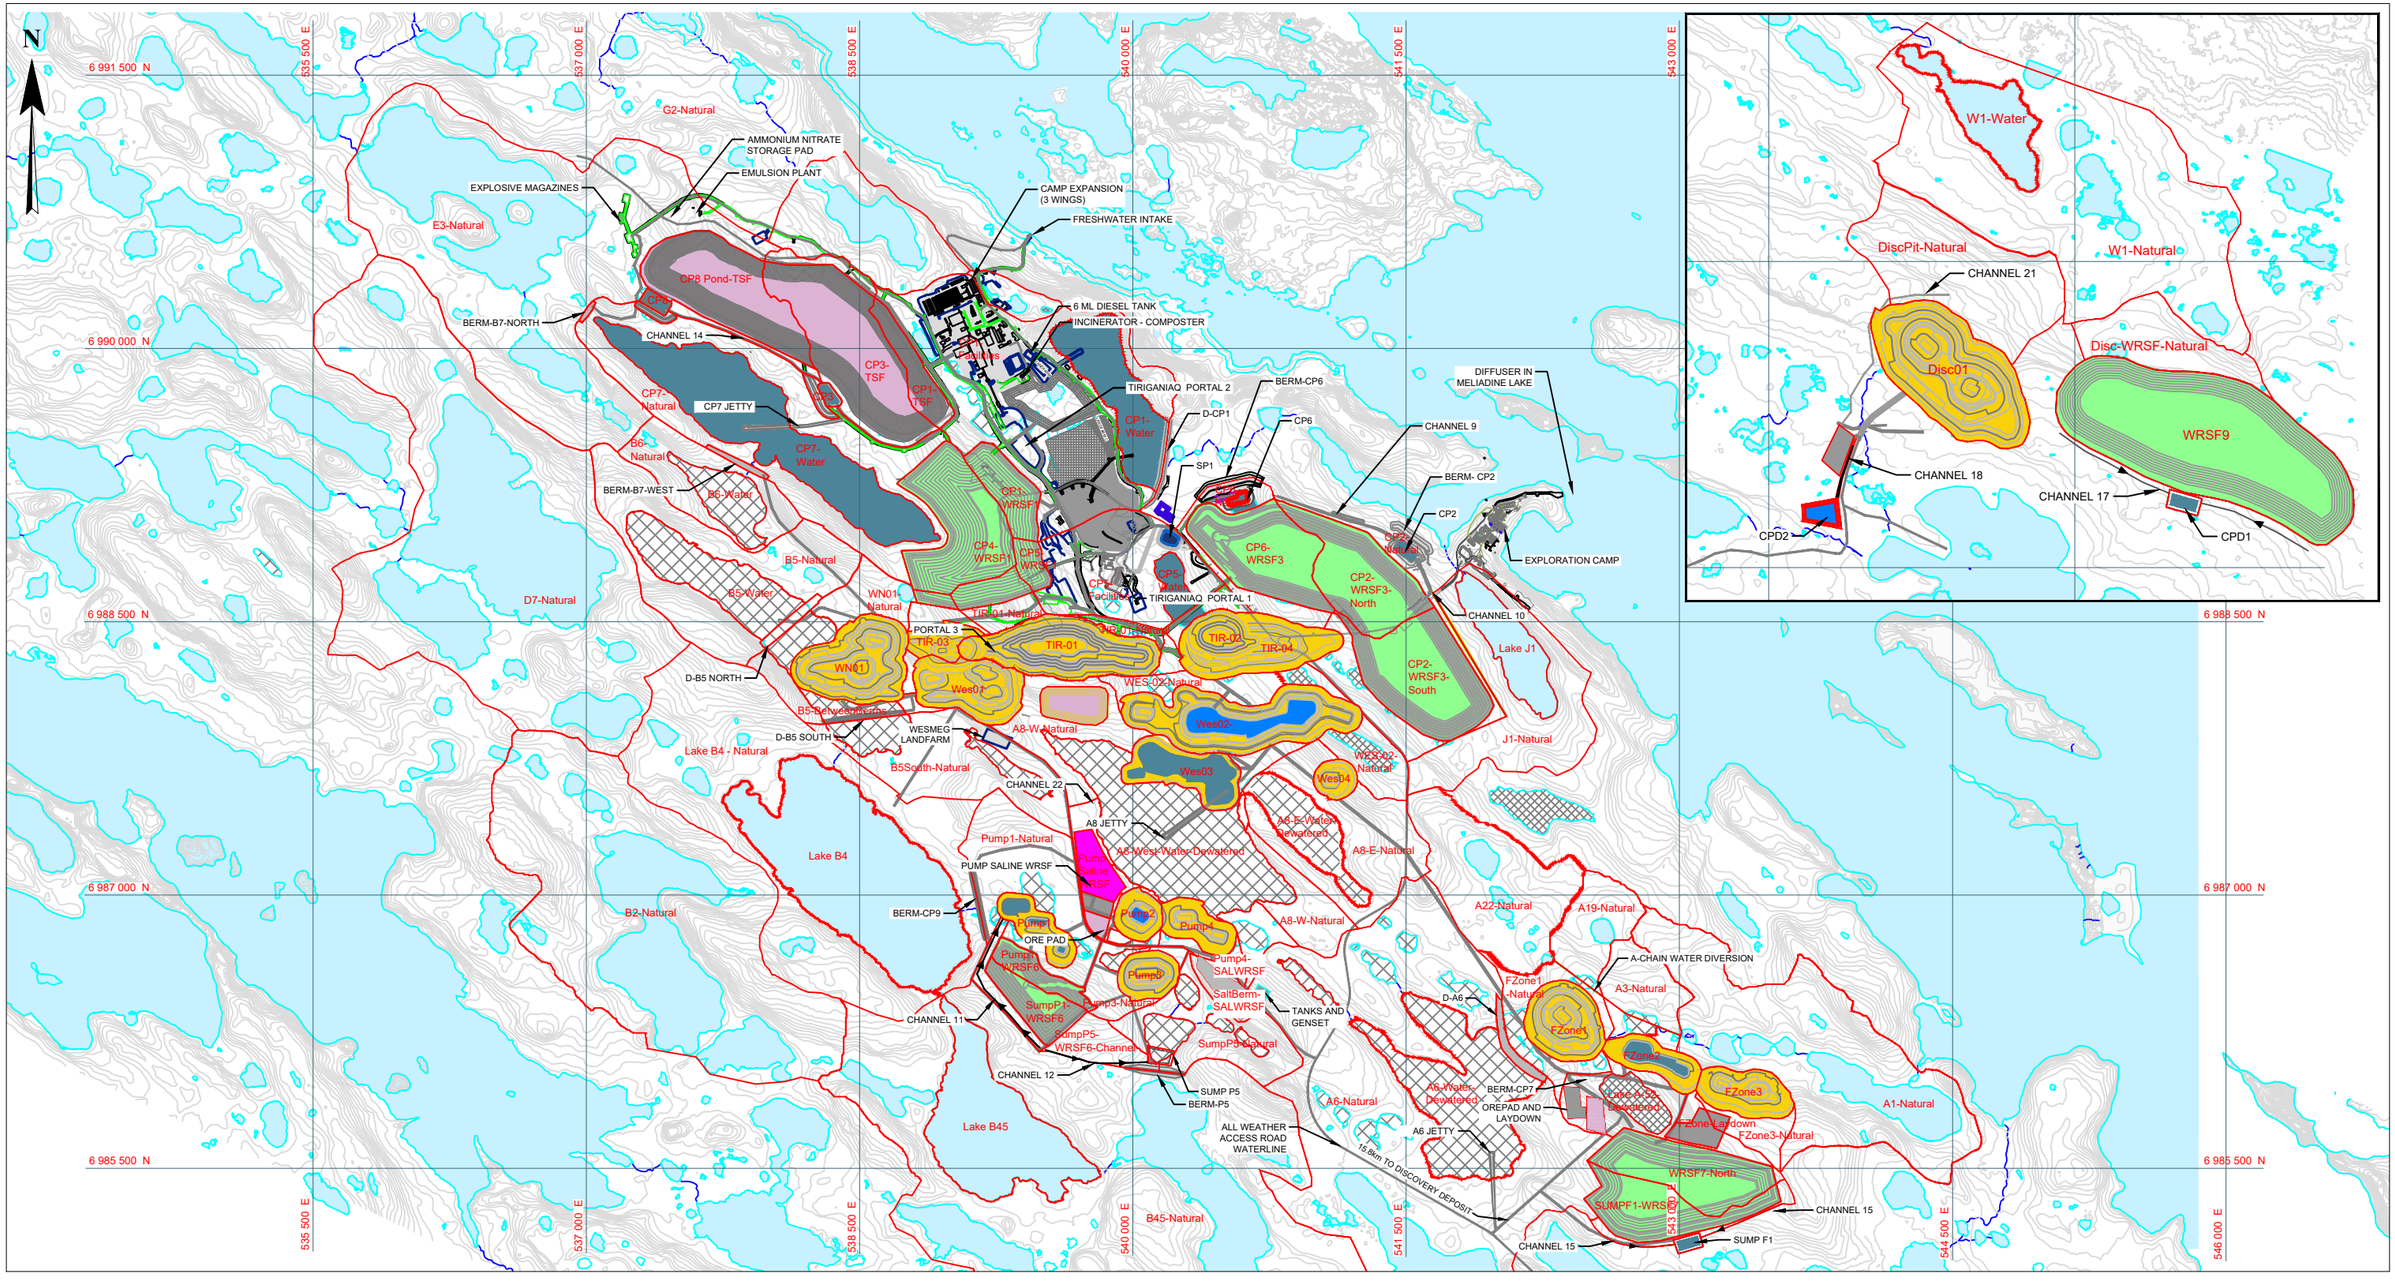
- Section 2 describes the modifications to the mine plan included in the model update;
- Section 1 describes updates made to the water balance model calibration and assumptions;
- Section 4 describes updates made to the water quality model calibration and assumptions;
- Section 1 summarizes the water balance model results;
- Section 6 summarizes the water quality model results; and,
- Section 7 provides a summary of key findings.

2. Model Input Sources

2. Model Input Sources

Key model inputs and sources are described in this section, including the mine plan, water management schedule and assumptions for underground flows.

2.1 Meliadine Mine Plan



The proposed Meliadine Mine timeline is as follows:

- Meliadine Mine Operations: 2019 to 2036 (End-of-Mine [EOM]);
- Active Closure: 2037 to 2043; and,
- Post-Closure: 2044 onwards (modelled to calendar year 2119).

The EOM mine layout (2036), including all delineated sub-catchments is presented in Figure 2-1. The full series of annual layout maps are provided in Appendix A, and the annual water management wire diagrams are in Appendix B of this report.

Mine plan updates are focused on the continuation of mining operations to 2036, and the following specific changes to mine waste deposition and water management:

- Advancement of the PUMP underground mine below permafrost;
- Utilization of the underground mine voids for permanent storage of saline water at the beginning of Active Closure;
- Utilization of the Waterline for the first three years of Active Closure (2037-2039) to remove remaining surface contact water and saline water from storage at site; and,
- Routing of sewage treatment plant discharges to the underground mine void for the duration of the Active Closure phase (2037-2043).

x = Finished mining (UG or OP), no dewatering
- = Pre-mining
S = Saline Contact Water Storage
CW = Contact Water Storage

2.2 Closure Assumptions

In principle, the management of surface contact water and saline water follows the same logic as previously presented in the 2025 Modification application (Lorax, 2025). The primary objective of the Active Closure period is to remove all remaining saline water stored in surface reservoirs and to manage the remaining geochemical loads to meet the Closure water quality targets. The following updates noted for this submission:

- Remaining saline water in the WES02 pit is pumped underground mine voids at the beginning of Active Closure (2.6 Mm^3 to the Tiriganiaq (TIRI) UG and 0.3 Mm^3 to the PUMP UG);
- Any surface contact water remaining in CP7 and CP1 is pumped to TIRI04 via the EWTP to speed up pit flooding in early Active Closure; and,
- The Waterline is assumed to remain operational for the first three years of Active Closure (2037 through 2039), to allow any saline water remaining in WES02, and remaining contact water in WES03 to be pumped out to Itivia Harbour over this period, prior to flooding the pit with water pumped from Meliadine Lake.

3. Water Balance Results

3. Water Balance Model Updates

The site-wide water balance model (WBM) is comprised of two components: the watershed model that generates flows for disturbed and undisturbed areas (including the Meliadine Lake water balance), and the mine site model that generates runoff and basal seepage for mine infrastructure, including the TSF, WRSFs and exposed pit walls. The mine infrastructure WBM also incorporates elements that represent collection ponds for saline and surface contact water, and the associated pump transfer rates, operational windows, water treatment plants, and pond operating levels. Dewatering of lakes to allow development of mine infrastructure is also incorporated.

3.1 Watershed Model

As part of the model calibration update described in Section 3.2, the foundational watershed model used to predict runoff from natural (undisturbed) and disturbed areas was updated. The watershed model was previously conceptualized as a three-reservoir system, comprised of quickflow (surface flow), shallow interflow, and baseflows (Lorax 2022). The availability of additional site monitoring data prompted a reassessment of the watershed model conceptualization and calibration. As part of this effort, the GR4J watershed model (Perrin *et al.*, 2003; Perrin *et al.*, 2007) was used to generate daily discharge volumes for natural and undisturbed areas. Snow accumulation and melt is calculated using the Cemaneige snowpack model (Valéry *et al.*, 2014), which has two adjustable parameters: the degree day factor, which converts heat energy as a function of air temperature into snowmelt in mm/day; and, the snowpack inertia factor, which tracks the amount of heat input required to initiate melt (*i.e.*, cold content).

The GR4J model tracks the daily water balance as a function of precipitation (P; snowmelt from Cemaneige + rainfall) inputs and evaporative (E) losses from a catchment (see Figure 3-1). The resultant infiltration is partitioned into the Production Store (SMA), which can lose additional water to evaporation on days where $SMA > 0$ and $P\text{-}E = 0$. The other loss from the Production Store is percolation. If the Production Store is full, then any additional infiltration is directed to the routing functions along with the percolation, with UH1 receiving 90% of total and UH2 receiving 10%.

In total, there are four adjustable parameters in the GR4J model, and two in the Cemaneige model (Table 3-1).

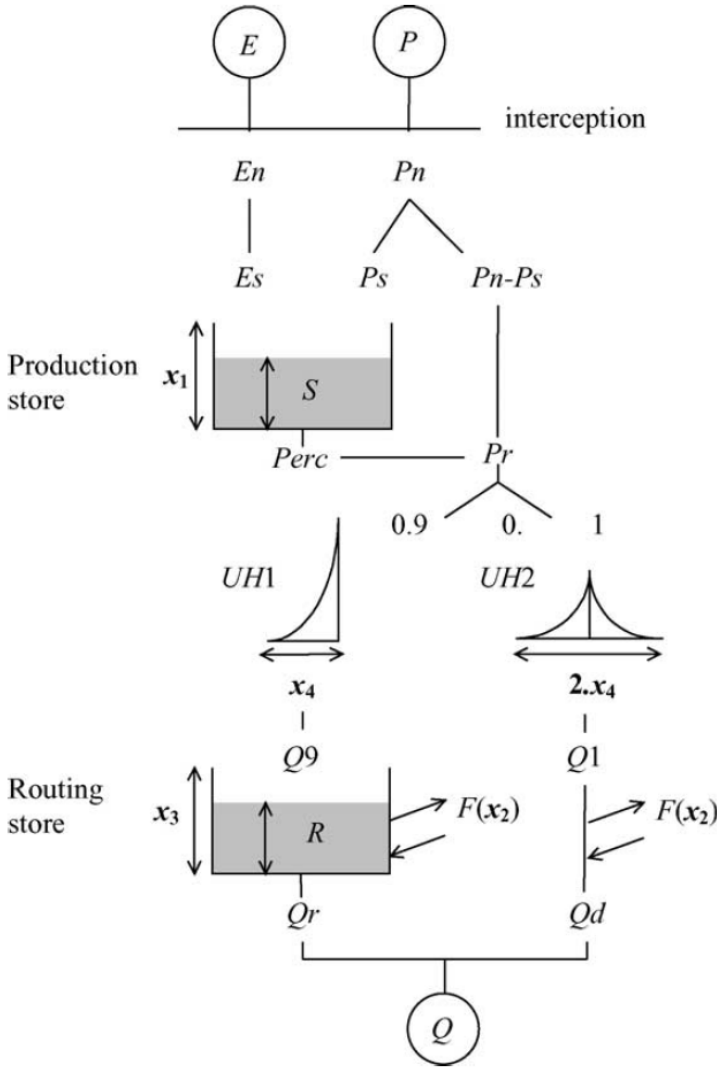

Figure 3-1: Conceptual Diagram of the GR4J Watershed Model

Table 3-1:
Calibrated Cemaneige and GR4J Parameters

Parameter	Value (Dimensionless)
Degree Day Factor	8
Snowpack Inertia Factor	0.61
Production Store (X_1)	9.79
Exchange Coefficient (X_2)	-3.28
Routing Store (X_3)	30
Lag Coefficient (X_4)	1.54

3.2 Model Calibration

Calibration of the watershed model was conducted in two stages:

- To a representative streamflow dataset from a Water Survey of Canada hydrometric station (Akkutuak Creek near Baker Lake; 06MA004; 18 km^2); and,
- To measured daily water level data from mine site collection ponds over the 2020-2025 period.

3.2.1 Regional Streamflow Calibration

The GR4J watershed model is considered well calibrated, with a Nash-Sutcliffe (NSE) value of 0.68, a log-NSE value of 0.59, and a good visual fit between measured and modelled streamflows (Figure 3-2). The calibrated parameter set carried over to represent runoff at the Meliadine mine site is provided in Table 3-1.

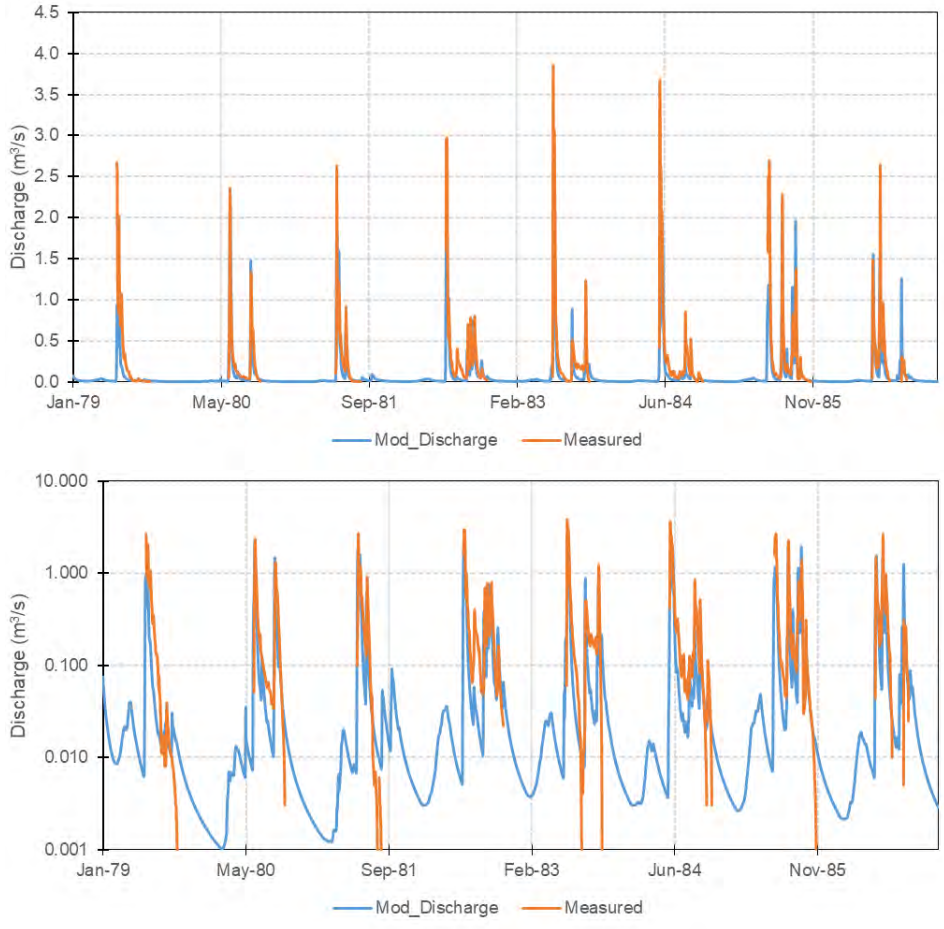

Figure 3-2: Measured and Modelled Streamflows for the Akkutuak Creek Near Baker Lake Hydrometric Station (1979-1986). Note bottom plot with log y-axis.

3.2.2 Meliadine Lake Outflow Calibration

Through previous license amendment applications, information requests were received from intervenors related to the potential changes to the Meliadine Lake water balance as a result of the withdrawals made to flood the open pits during the Active Closure period. For context, the licensed annual withdrawal maximum is 8,676,481 m^3/year, from a total lake volume of approximately 585 Mm^3 (Figure 3-3). This licensed maximum annual withdrawal volume equates to approximately 1.5% of the total lake volume per year.

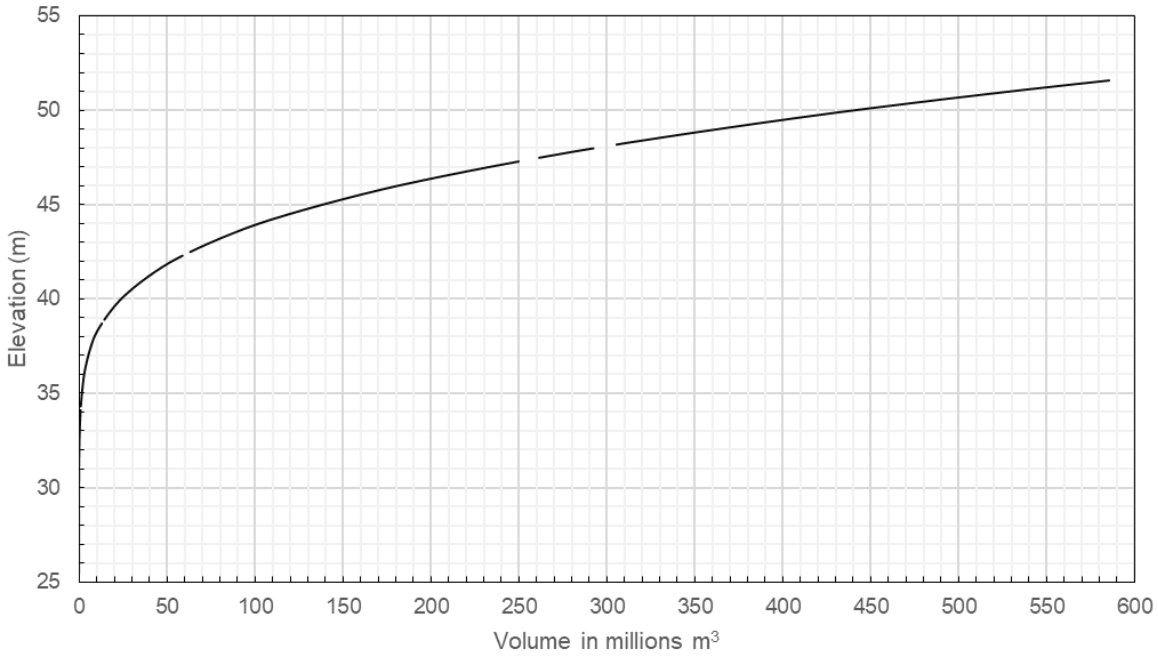

Figure 3-3: Volume-Elevation Curve for Meliadine Lake

Agnico Eagle re-installed two hydrometric stations at the main outlet and northwest outlets of Meliadine Lake in August 2024, and continuous discharge data from these stations to the end of September 2025 were used as a calibration target for a watershed model specific to Meliadine Lake.

Similar to the non-contact watershed model described in Section 3.2.1, a GR4J model was setup to generate inflows to Meliadine Lake, and the volume-elevation curve in Figure 3-3 was used to constrain lake storage changes, surface area and water level fluctuations, along with calculating evaporative losses from the lake surface and meteoric inputs to the lake water balance. Outflows are calculated as a function of lake water level using the rating curves for each of the outflow hydrometric stations.

This model was calibrated to the measured lake outflows and shows good agreement with the measured data (Figure 3-4). As more data is collected from the outflow hydrometric

stations, the model will be validated, and the calibration updated if the model predictions drift appreciably from the measured data.

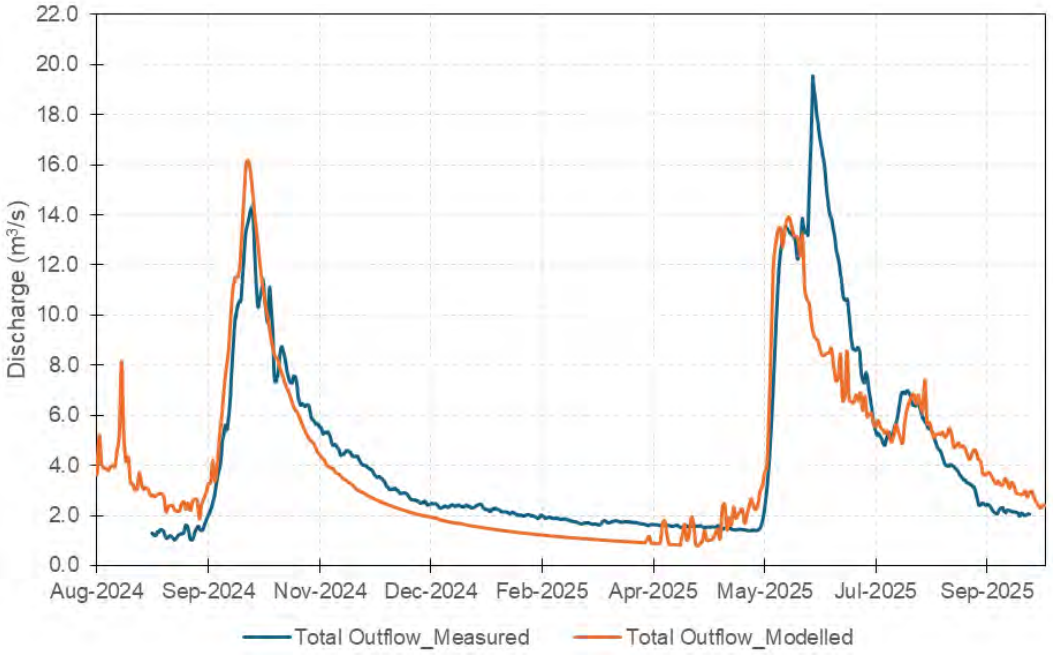

Figure 3-4: Modelled and Measured Outflows from Meliadine Lake

Modelled annual lake inflows and outflows (including evaporative losses) average 119 Mm^3/year (Figure 3-5), indicating a hydraulic residence time of Meliadine Lake of approximately 5 years. The licensed maximum annual withdrawal is equivalent to 7% of the annual average lake inflows on a volumetric basis.

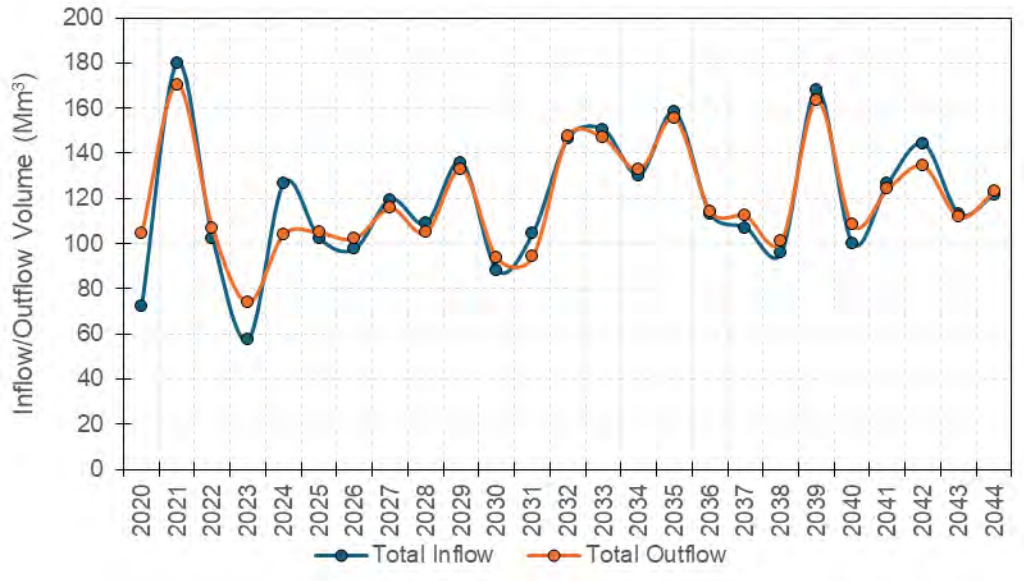

Figure 3-5: Modelled Total Annual Inflows and Outflows for Meliadine Lake

3.2.3 Collection Pond Water Balance Calibration

The second stage of the water balance model calibration focused on replicating the fluctuations in collection pond volumes as represented by continuous water level measurements made over the 2020-2025 period, and water routing as presented in Table 3-2.

Inputs to the calibration model included:

- Daily climate (minimum, mean and maximum daily air temperature and precipitation) scaled from the Rankin Inlet climate station;
- Incorporation of operational contact water routing, including pump rates, into the WBM;
- Catchment and/or landform specific target runoff coefficients (Table 3-3)
- Annual sub-catchment delineations (Figure 3-6 through Figure 3-10);
- Calibrated watershed model described in Section 3.2.1;
- Measured water quality for key POPCs (described in Section 4); and,
- Measured monthly underground dewatering volumes (Table 3-6).

Pond volume measurements were provided by Agnico Eagle and were calculated from measured water levels and the pond specific storage-elevation curves. Pump rates between ponds (and to treatment plants) were also provided by Agnico Eagle, providing a control on inflows and outflows for each pond.

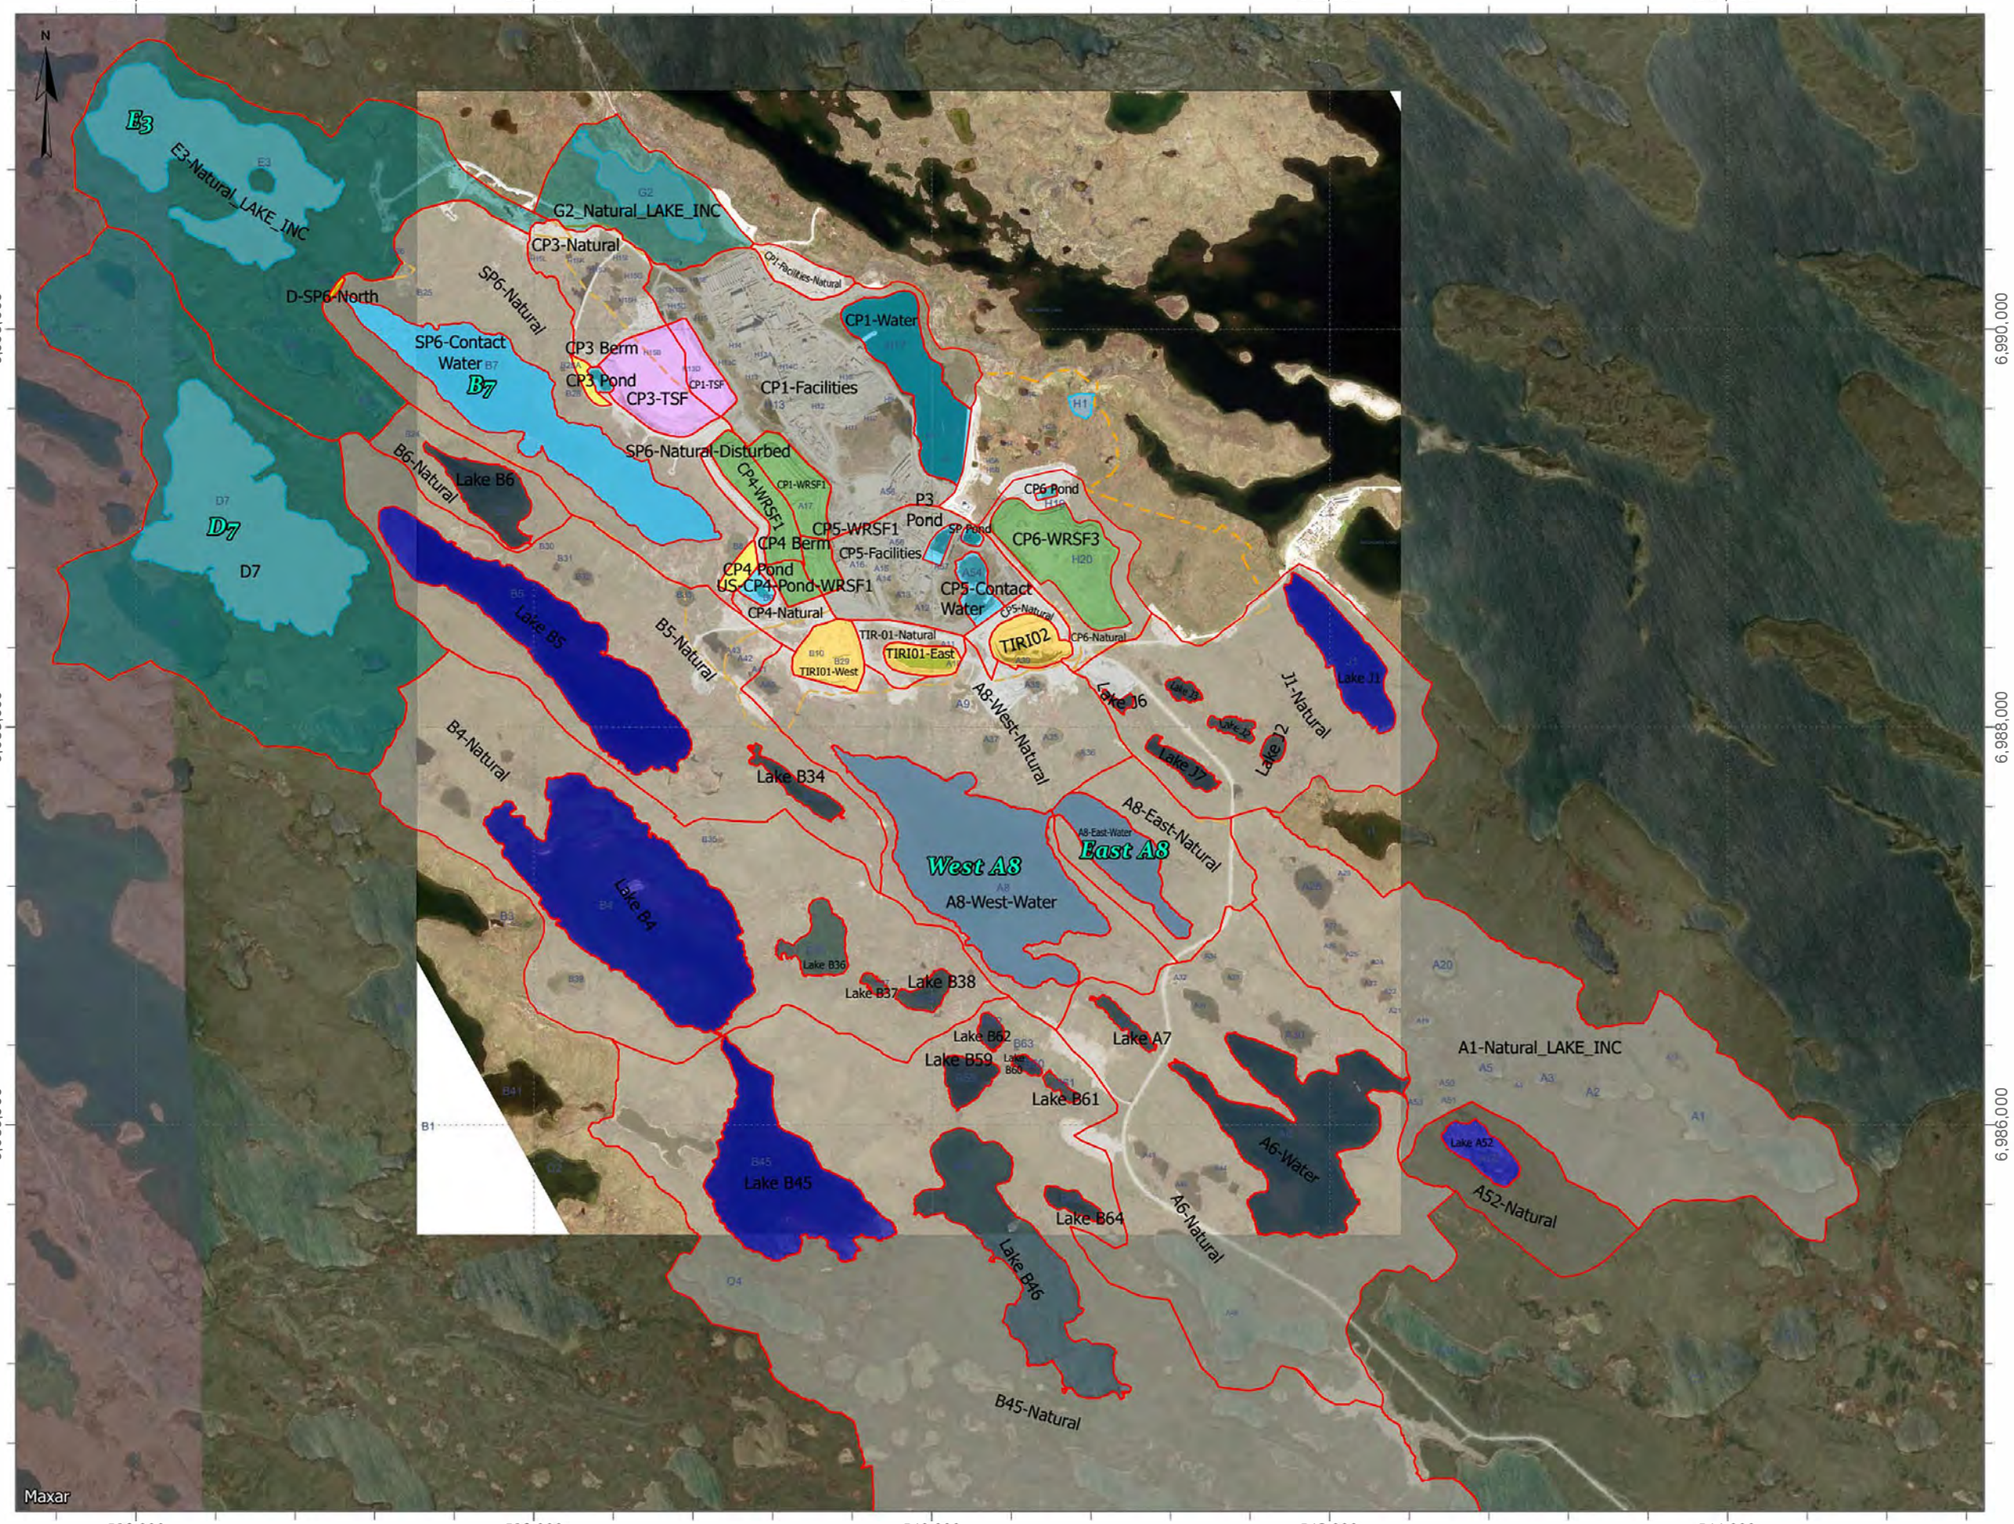

Table 3-2:
Surface Contact Water Routing to CP1 – Current Conditions

Pond	Surface Contact Water Routing
CP1 – TSF	Culvert 1 → Culvert 18→ Culvert 2 → Channel 1 →Culvert 3→ CP1
CP3- TSF	Channel 3 → CP 3 (pumped) → CP1
CP1-WRSF1	Channel 7→ Channel 8 → Channel 1 → Culvert 3 → CP1
CP5-WRSF1	Channel 5 → CP5 (pumped) → CP1
CP4-WRSF1	Channel 4 → Collection Pond 4 (pumped) → Collection Pond 1
CP6-WRSF3	Collection Pond 6 (pumped) → Collection Pond 1

Table 3-3:
Land Surface Types, Representative Runoff Type and Target Runoff Coefficients

Land Cover Type	Surface Runoff	Interflow	Baseflow	Target Runoff Coefficient
Disturbed[1]	x	x	x	0.50
Hard Surface (Ore Pads, Facilities Areas, Laydowns)[1]	x			0.80
Natural[1]	x	x	x	0.50
Tailings[2]	x	x		0.05 (Runoff); 0.20 (Interflow)
Open Water	x			1.0, minus evaporation
Waste Rock and Salt Rock Piles[2]	x			0.10 (Runoff); 0.0 (Interflow)
Open Pit Walls[3]	x			0.40

Notes:
[1] Average runoff coefficient provided, effective annual coefficients vary according to climate forcings
[2] Upper bound of predicted values (90th percentile), reflective of years where runoff or interflow predicted to occur (mode is zero)
[3] Constant runoff coefficient

3.3 Mine Site Water Balance Model

This section describes the components of the mine site WBM that have been updated from those presented in Lorax (2024). The representation of contact water generation from the TSF, WRSF and pit walls remains unchanged.

3.3.1 Lake Dewatering

To accommodate construction of mine infrastructure, it will be necessary to dewater multiple lakes located within the Meliadine Mine footprint. The model assumes that lakes are dewatered in the year prior to the associated mine infrastructure coming online (Table 3-4). Previously, it was assumed that the upper 50% of lake volume contain low levels of TSS and thus would be discharged to the receiving environment without treatment. The lower 50% of each lake (by volume) was expected to contain higher levels of TSS that may potentially exceed discharge criteria, and therefore these volumes were routed to the EWTP for treatment prior to discharge.

Based on operational experience during the dewatering of Lake A8 in 2025, 90% of that volume met discharge criteria and was dewatered directly to Meliadine Lake, with the bottom 10% by volume sent to CP1 for treatment prior to discharge. Based on this outcome, a conservative assumption is made here for most lakes, such that 70% of the dewatered volume is discharged directly to Meliadine Lake, and 30% is pumped to CP1. For smaller lakes, 100% of the volume is assumed to be sent to CP1.

Table 3-4:
Lake Dewatering Schedule

Mine Area	Lake	Volume (m^3)	2026	2027	2028	2029
FZONE	A5	3,041	30% to CP1	--	--	--

3.3.2 Groundwater Inflows to Pits

During mining of the WES03, WN01 and PUMP04 pits, limited inflows of nearby shallow groundwater are predicted to occur. These inflows are expected to be limited in duration, as they result from draindown of remaining groundwater following dewatering of adjacent lakes. The inflows and associated TDS concentrations provided in Table 3-5 are also incorporated into the pit water and load balance model.

Table 3-5:
Predicted Daily Groundwater Inflows to Pits and Total Dissolved Solids Concentrations

Year	Predicted Groundwater Inflow (m^3/day)			Predicted Inflow TDS (mg/L)		
	WES03 Pit	WN01 Pit	PUMP04 Pit	WES03 Pit	WN01 Pit	PUMP04 Pit
2025	-	-	-	-	-	-
2026	200	-	-	1,500	-	-
2027	200	-	-	500	-	-

2035	-	-	-	-	-	-
2036	-	-	-	-	-	-

Source: WSP 2026

3.3.3 Underground Inflows

The predicted average daily inflows to the underground mine workings remain uncharged from the 2024 Water Licence Amendment for the TIRI UG (Lorax, 2024) and are expected to be slightly higher for the PUMP UG mine beginning in 2028 as mining moves below the permafrost (Table 3-7; WSP 2024).

Measured underground inflows are presented for the 2018-2025 period in Table 3-6. The base case predicted inflows for the TIRI UG mine consisting of the Tirganiaq, Wesmeg and Wesmeg-North underground operations, were subsequently adjusted to account for the calculated difference between the predicted and measured underground inflows over the 2020-2023 period. This is equivalent to an approximate *measured:predicted* ratio of 0.74. Further losses to ore moisture (assumed to equal 2%) of ore mass are also applied, resulting in the adjusted values in Table 3-7. The predicted PUMP UG inflow values were not adjusted prior to input to the model. The WBWQM assumes that dewatering of all underground mines will be managed to the saline water management system due to the elevated TDS of the groundwater system.

Table 3-6:
Monthly measured underground dewatering volumes (2018-2025).
All values in m^3/day.

Month	2018	2019	2020	2021	2022	2023	2024	2025
January	0	88	17	122	154	51	239	217
February	0	58	100	73	140	110	293	219
March	0	42	335	82	119	118	224	147
April	0	90	977	74	139	176	221	233
May	0	131	541	164	148	151	295	230
June	81	191	388	193	235	187	352	282
July	333	260	255	235	245	296	357	387
August	249	175	170	231	271	250	414	441
September	321	143	182	198	330	260	443	382
October	111	2	129	199	244	275	421	430
November	112	8	103	108	125	282	321	311
December	29	26	201	115	111	206	204	310
Average	**103**	**101**	**283**	**149**	**188**	**197**	**315**	**299**

In addition to the predicted underground mine inflow rates, WSP (2026) predicted that water storage in the WES03 pit over the 2028-2036 period would result in 90 m^3/day of seepage reporting to the underlying Tiriganiaq underground mine. These seepage rates are conservative estimations, as they assume maximum underground mine extents, the WES03 pit flooded to the spill point elevation, and maximum possible permafrost degradation (WSP 2026). This predicted seepage from the WES03 pit to the TIRI UG mine is included in the dewatering rates presented in Table 3-7.

Table 3-7:
Predicted Daily Underground Dewatering Volumes (m^3/day)

Year	Underground Inflows (m^3/day)	
	TIRI UG	PUMP UG
2026	792	-
2027	1,008	50
2028	1,163	100
2029	1,073	125
2030	1,019	175
2031	1,019	275
2032	1,037	325
2033	1,037	350
2034	1,037	350
2035	1,019	350
2036	1,019	350

Notes:
Source: WSP 2026
Estimated groundwater inflows to the TIRI UG include reductions due to brine recirculation and ore moisture losses (0.72x), and additional seepage from WES03 pit (90 m^3/day for 2028-2036).

4. Water Quality Model Results

AGNICO EAGLE

4. Water Quality Model Updates

This section summarizes the approach, assumptions, conceptual model, and inputs used to construct the water quality model.

4.1 Approach and Assumptions

The water quality model is built upon the water balance model architecture described in Chapter 3, with water quality signatures assigned to non-contact (undisturbed) areas and mine infrastructure. Source term inputs to the WQM are based on either empirical observations from the operating mine site, data collected at analogue mine sites, or the results of various geochemical and metallurgical tests that have been undertaken to provide a basis for assigning likely future water quality associated with specific mine components.

Conceptually, modelled flows and associated source terms are combined in the GoldSim platform to derive predicted water quality estimates at key locations across the mine site (*e.g.*, ponds, pit lakes) and the two receiving environment nodes (Itivia Harbour and Meliadine Lake) throughout the phases of the Meliadine Mine. Concentrations of the POPCs listed in Table 4-1 are modelled for all mine water management ponds and sumps, open pit lakes and receiving environment nodes. WQM outputs are aggregated on a monthly time-step and Itivia Harbour discharges are screened against relevant water quality criteria described in Section 4.2.

Table 4-1:
Water Quality Model Parameter List

Major Ions	Dissolved		Total	
TDS	D-Ag	D-K	T-Ag	T-K
NH_3-N	D-Al	D-Mg	T-Al	T-Mg
NO_3-N	D-As	D-Mn	T-As	T-Mn
NO_2-N	D-B	D-Mo	T-B	T-Mo
SO_4	D-Ba	D-Na	T-Ba	T-Na
T-CN	D-Be	D-Ni	T-Be	T-Ni
WAD-CN	D-Ca	D-P	T-Ca	T-P
	D-Cd	D-Pb	T-Cd	T-Pb
	D-Cl	D-Sb	T-Cl	T-Sb
	D-Co	D-Se	T-Co	T-Se
	D-Cr	D-Sr	T-Cr	T-Sr
	D-Cu	D-Tl	T-Cu	T-Tl
	D-F	D-U	T-F	T-U
	D-Fe	D-V	T-Fe	T-V
	D-Hg	D-Zn	T-Hg	T-Zn
		D-Ra226		T-Ra226

Both total and dissolved concentrations are predicted for end-of-pipe (EOP) discharges during operations. The total concentrations are calculated by assuming that mine discharge to Meliadine Lake and Itivia Harbour contains the maximum monthly mean TSS concentration set by MDMER of 15 mg/L. In post-Closure, TSS levels in modelled waterbodies are expected to return to baseline concentrations. Owing to the minimal TSS present in the baseline environment, the model output assumes that total concentrations are equal to dissolved concentrations in this phase of mine life.

4.2 Parameter List and Screening Criteria

The parameters carried forward in the model consist of POPCs as defined by applicable guidelines and major ions that that contribute to TDS and hardness (Table 4-1). Both total and dissolved concentrations are tracked for certain model nodes (*i.e.*, EWTP, Waterline). Regulated parameters are defined in the following documents:

- 2020 Aquatic Effects Management Plan (AEMP) (Agnico Eagle, 2020a);
- Ocean Discharge Monitoring Plan (ODMP) (Agnico Eagle, 2020b); and,
- Type A Water License (2AM-MEL1631) for the Meliadine Mine.

The water quality model predictions are compared against applicable guidelines (Table 4-2) as a screening tool to identify POPCs. The specific screening criteria used for all mine phases are outlined below:

- During Operations and Active Closure, model predictions at the end-of-pipe (EOP) to Meliadine Lake (EWTP) are screened against effluent discharge limits outlined in the Type A Water Licence (2AM-MEL1631) for the Meliadine Mine and MDMER, while discharges to Itivia harbour are screened against MDMER.
- During the Post-Closure phase, model predictions at collection ponds, pit lakes, and natural waterbodies were screened as follows:
    - For waterbodies that are accessible to both aquatic and terrestrial life, generic water quality guidelines (CCME) and site-specific water quality objectives (SWQOs) adopted in the AEMP were used as the screening criteria.
    - For waterbodies listed under Schedule II as part of the Meliadine Mine Project (*e.g.*, Lake B7/CP7), model predictions were compared to both generic water quality guidelines for the protection of terrestrial life.

Table 4-2:
Water quality guidelines applied for comparison with model predictions during Operations, Active Closure, and post-Closure.

Parameter	Unit	Operations and Active Closure		Post-Closure	
		NWB Water License	MDMER	[1]Water Quality Guidelines for the Protection of Aquatic Life	Water Quality Guidelines for the Protection of Terrestrial Life
		End-of-Pipe Discharge to Meliadine Lake	*End-of-Pipe Discharge to Itivia Harbour and Meliadine Lake*	*Collection Ponds, Flooded Pits, and Other Waterbodies (exclude those listed in the Schedule II application)*	*Collection Pond CP7 (Lake B7)*

Zinc	mg/L	*0.4*	*0.5*	*variable*	*50*
Radium 226	Bq/L	-	*0.37*	-	-

Notes:
1. For waterbodies that are accessible to both aquatic and terrestrial life, generic water quality guidelines (CCME) and site-specific water quality objectives (SWQOs) adopted in the AEMP were used as the screening criteria. Site-specific hardness predicted at each node during Active Closure and post-Closure (2037-2119) was used to derive guidelines for parameters that are hardness dependent. The maximum pH (7.46) and lowest DOC (3.19 mg/L) measured at the MEL-01 monitoring station in 2020 were used to derive conservative guidelines for dissolved manganese and zinc.
2. The total ammonia (NH_3-N) guideline was determined conservatively by assuming a pH of 8 and a temperature of 15ºC.

4.3 Baseline (Non-contact) Water Quality Data

The baseline (unimpacted) concentrations were calculated from the available monitoring data for the undisturbed non-contact areas. Median baseline concentrations are summarized in Table 4-3 to Table 4-7.

Table 4-3:
Median Baseline Major Ions and Nutrient Concentrations for Non-contact Areas

4.4 Source Terms

4.4.1 Source Term Updates

The source terms developed for the Nunavut Water Board (NWB) 2024 Water Licence Amendment, described in Lorax, (2024) are applied to the current model scenario with updates as described below.

- Source terms were adjusted to reflect the current mine plan and waste schedule for WRSFs, the TSF, open pits, and the underground mine.
- Deposition of wind-blown particulates originating from the TSF has been incorporated into the water quality model. The addition of dust fall loads were calibrated based to water quality changes in Reference Lakes observed between 2019 and 2024, which are discussed in greater detail in Section 4.4.2.
- Updated calibration of WRSF and TSF source terms were completed for the period of 2020 to 2024 as informed by recent monitoring data at CP3, CP4 and CP6. The calibration calculates WRSF and TSF loading based on water quality monitoring and water balance of each collection pond. The updated calibration also incorporates estimates of dust fall impacts on each collection pond, described in Section 4.4.2.
- The end-of-mine lithologic compositions presented in Lorax (2022) are used to calculate the geochemical source terms for the WRSFs, pit walls, and TSF. This is a simplification from previous model versions, which used a transient dump composition for each year of mine life.
- Underground mine loading rates were updated to reflect the current mine schedule and monitoring data from 2020 to 2024. The loading rates derived for wall rock, rockfill and tailings backfill were adjusted from what was derived in Lorax (2022) to match annual median concentrations produced from TIRI UG between 2020 and 2021. The adjusted loading rates were then applied to the excavation and backfill schedule for TIRI and Pump UG mines. These loadings are combined with groundwater flows and TDS concentrations provided in Table 3-6 to produce source terms from UG mines.

All other source terms (*e.g.*, STP effluent, disturbed areas.) are identical to those described in the Lorax (2024) WBWQM. Complete source terms applied to the water quality model are provided in Appendix C.1.

4.4.2 Dustfall Loading Rate

Reference Lakes surrounding Meliadine Mine (A8, B7, D7, E3, G2 and H2; Figure 3-6) have shown changes in water quality since mining activities began in 2019. Monitoring data shows concentrations of As and Na have increased between 2019 and 2024, while concentrations of most other metals (e.g., Cd, Co, Cu) have remained relatively stable and near detection limits (Agnico Eagle, 2024).

The Reference Lakes do not directly receive mine site surface water, and the potential for groundwater seepage reaching these lakes is considered low due to pervasive permafrost surrounding mining areas. Potential sources of Na and As loadings to the Reference Lakes include melting of saline permafrost which is widespread in regions surrounding Hudson Bay (Skierszkan et al., 2024), or wind-blown dust from the mine area (e.g., TSF dry stack). Evidence for the source of As and Na can be found in seasonal water quality monitoring trends and observations from Snowcore data.

Different seasonal trends are observed for As and Na in Reference Lakes, with peak As concentrations typically observed during freshet while peak Na concentrations typically observed in the fall. This trend is most evident in smaller lakes (E3, G2 and H1) which are more sensitive to seasonal variations in runoff quality (Figure 3-4). The occurrence of peak As concentrations in the spring indicates that its release is associated with snowmelt. Snowcore monitoring data at station SNOCORE-Boundary near Lake G2 shows D-As concentrations ranging from 0.0036 to 0.047 mg/L, which is similar or greater than the range of peak As concentrations observed during freshet in Lake G2 (Figure 3-4). Conversely, snowcore data from this station shows Na concentrations ranging from 0.41 to 1.01 mg/L, which is below the range of concentrations observed in Lake G2 (Figure 3-4), indicating that snowmelt is not contributing to increasing Na concentrations.

The behaviour of As in Reference Lakes is consistent with release from wind-blown dust. That is, a majority of dust fall occurs during winter months when the strongest winds occur and dust suppression is more challenging. The relatively high As concentrations in the Snowcore, and peak concentrations associated with Snowmelt are consistent with this release mechanism. The behaviour of Na in Reference Lakes is more consistent with saline permafrost melt, as this parameter is not notably elevated in Snowcore, and it shows peak concentrations in the fall when the active zone melt reaches its seasonal depth maximum.

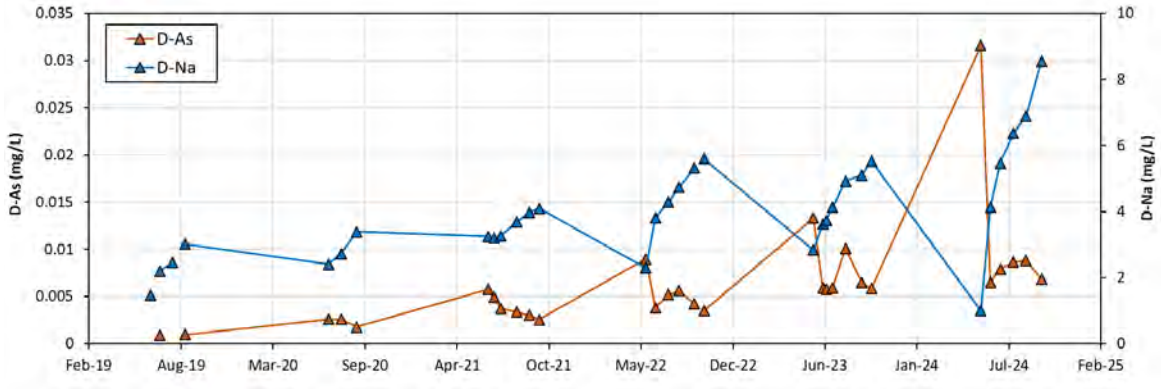

Figure 3-1: Time series for As and Na in Lake G2 for the period of February 2019 to December 2024.

In order to incorporate As loading associated with dust fall into the water quality model, a calibration exercise was completed using Reference Lake data. The calibration was designed to re-produce the water balance of each Reference Lake and calculate the As loading required to re-produce the 95th percentile As concentration observed in each Reference Lake between 2019 and 2024. The calibration results, along with water quality monitoring, estimated dust-impacted runoff concentrations, and Snowcore monitoring data adjacent to each Reference Lake are shown in Figure 4-1 and Figure 4-2. The calibrated As loading rates used to generate the concentrations shown in these figures are shown in Table 4-7.

Dust fall loading rates derived for Reference Lakes were applied to adjacent mine-impacted catchment areas. The two catchments immediately surrounding the TSF were assigned 2x the B7 catchment are loading to account for proximity to the TSF. The catchment surrounding the Fzone and Pump areas were assigned the dust fall loading calculated for Lake A8, which is the nearest calibration point (e.g., Reference Lake) to these mining areas.

The dust fall loading rates shown in Table 4-7 are applied to the operations phase of the water quality model. Dust fall loading is expected to be mitigated in active closure by TSF cover construction, removal of ROM ore stockpiles, and cessation of blasting in open pits. Therefore, no As dust fall loading was applied in the Active Closure or Post Closure period.

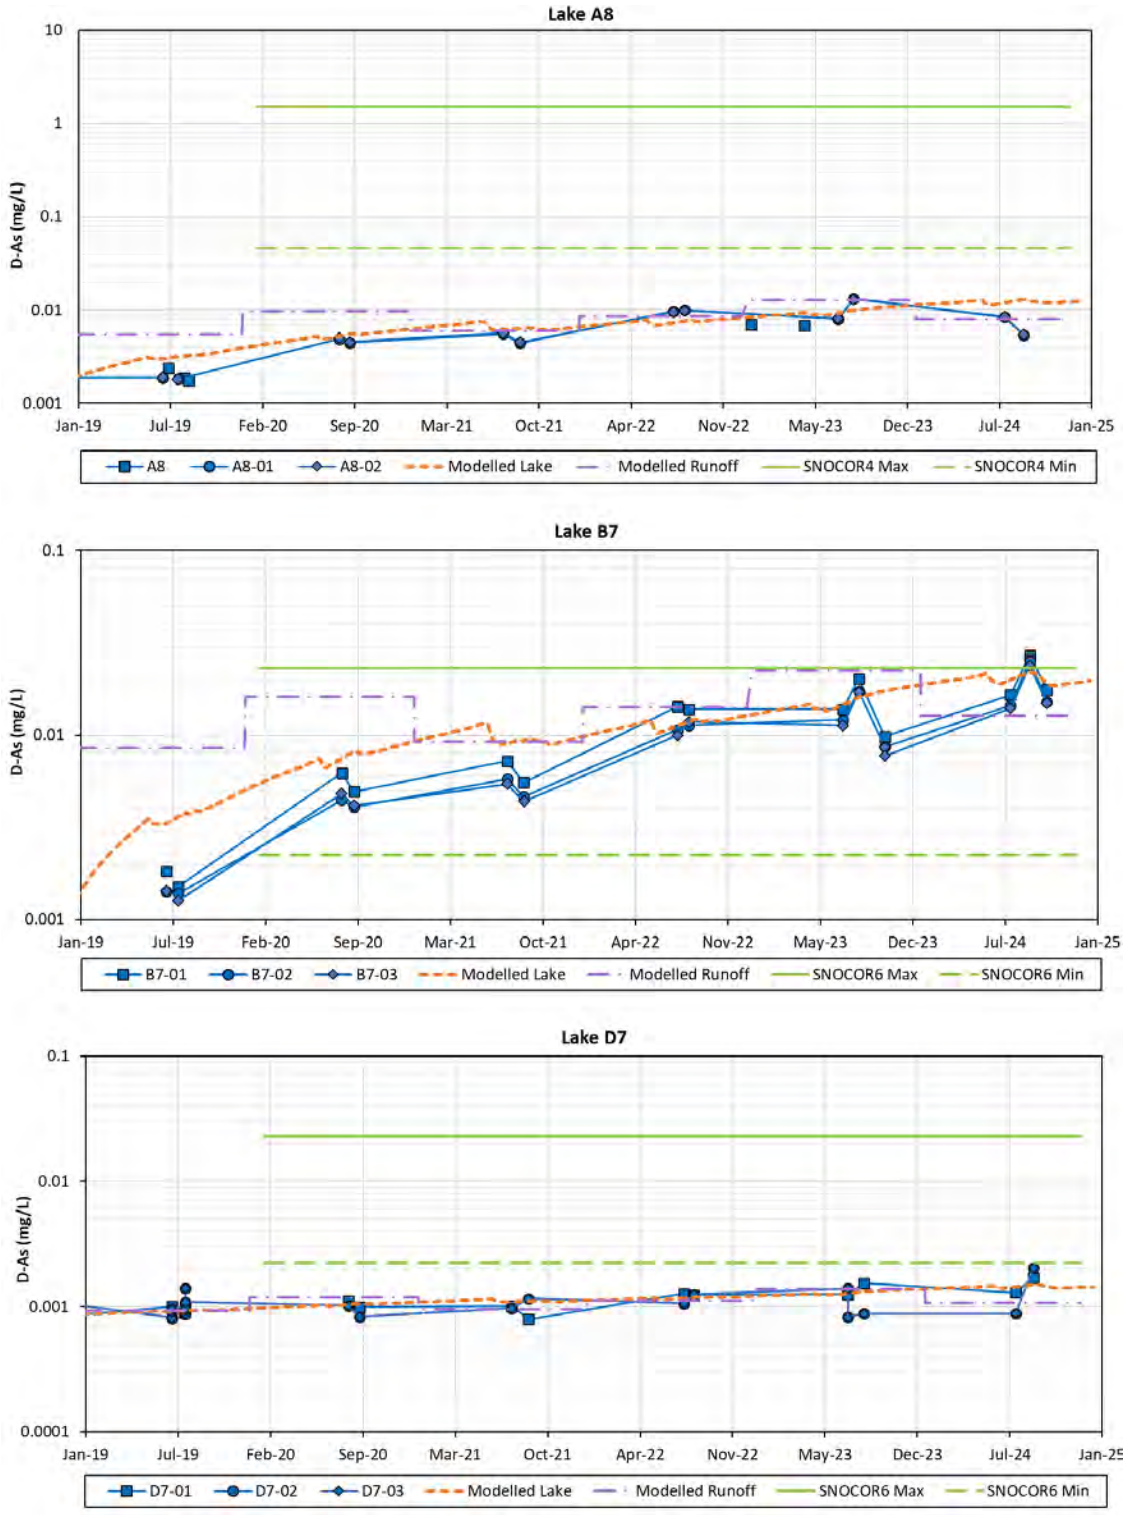

Figure 4-2: Arsenic monitoring and modelling results for Lakes A8, B7, and D7 and As snow core concentrations for the period of January 2019 to December 2024. Note that the y-axis is plotted on a logarithmic scale.

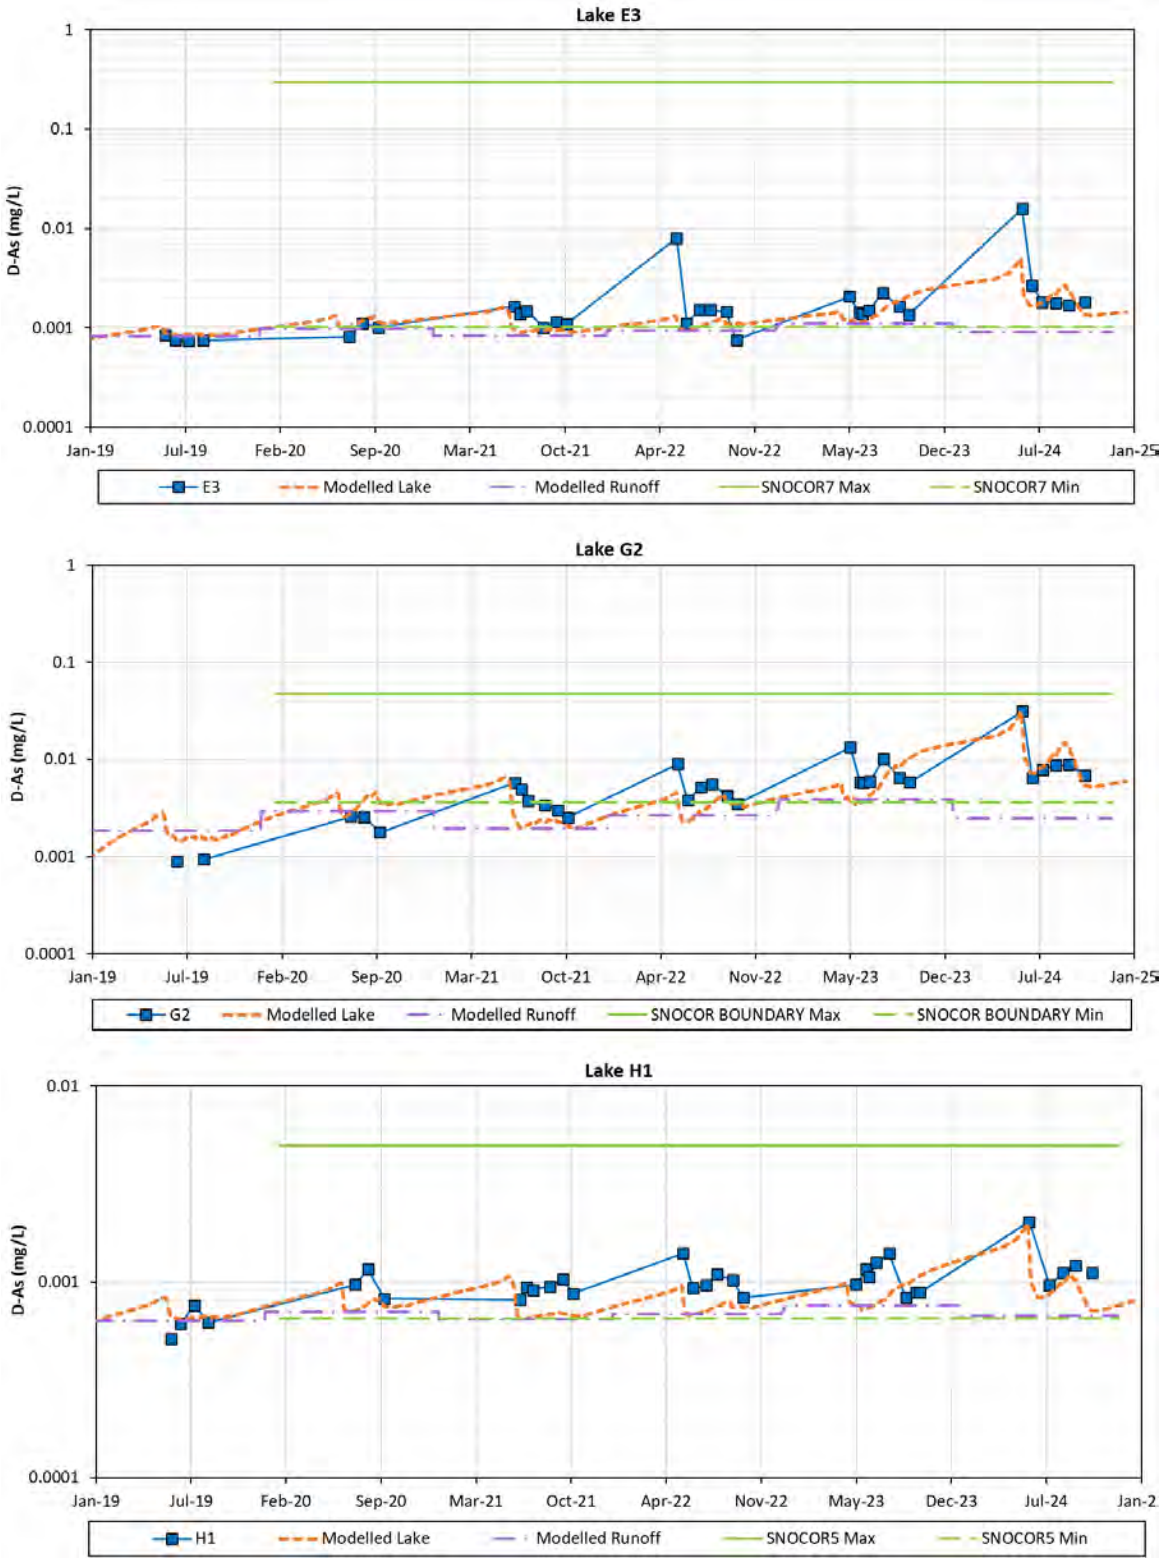

Figure 4-3: Arsenic monitoring and modelling results for Lakes E3, G2, and H1 and As snow core concentrations for the period of January 2019 to December 2024.

Table 4-7:
Dustfall Loading Rates

Catchment Area	Dustfall Loading Rate (As mg/m^2/day)	Data Source
A8	0.0035	Calibrated
B7	0.0065	Calibrated
D7	0.00022	Calibrated
E3	0.00014	Calibrated
G2	0.00094	Calibrated
H1	0.000057	Calibrated
CP3	0.013	2x B7 Catchment
CP4	0.013	2X B7 Catchment
CP6	0.000057	H1 Catchment
CP1	0.0065	B7 Catchment
FZone Area	0.0035	A8 Catchment
Pump Area	0.0035	A8 Catchment

4.4.3 Validation of Predicted Water Quality

Water quality predictions are validated against site monitoring data from 2020 to 2024 in order to confirm that the current model can conservatively reproduce observed water quality. The validation is conducted using the most up to date version of the WBWQM which incorporates the current site layout (Figure 3-6 to Figure 3-9), site pumping records, calibrated source terms and dustfall estimates.

Model node CP1 represents composite drainage chemistry from mine surface facilities. The CP1 collection pond has operated as the final collection point for surface contact water prior to treatment via the effluent water treatment plant (EWTP) and discharge to Meliadine Lake. This collection pond receives drainage from all non-saline mine facilities (*e.g.*, WRSF1, WRSF3, TSF, ore stockpiles, mine facilities areas, *etc.*) and upgradient mine catchments. Validation results for CP1 are provided in Figure 4-3. Additional validation results for calibrated nodes CP3, CP4, CP6 and the Tiriganiaq Underground are provided in Appendix C.2.

Overall, the validation model shows that calibrated source terms conservatively predict water quality at CP1 for TDS, sulphate, total cyanide (T-CN) ammonia (NH_3), arsenic (As), nickel (Ni), copper (Cu) and selenium (Se). Modelled concentrations during the winter months are under ice; therefore, validation focuses on model fit to monitoring results collected during the open water season (June to September). For NH_3-N, results are initially

below the range of monitoring results shortly after model initiation in 2020 but are then significantly overestimated from 2021 onwards. Validation of this parameter in CP1 is complicated by attenuation processes impacting NH_3 such as oxidation and algal assimilation not incorporated into the model framework. T-CN values are underestimated in 2020, which could be impacted by model initialization and the elevated T-CN method detection limit during this time period. Monitoring data collected with lower T-CN detection limits starting in 2022 show overall better validation.

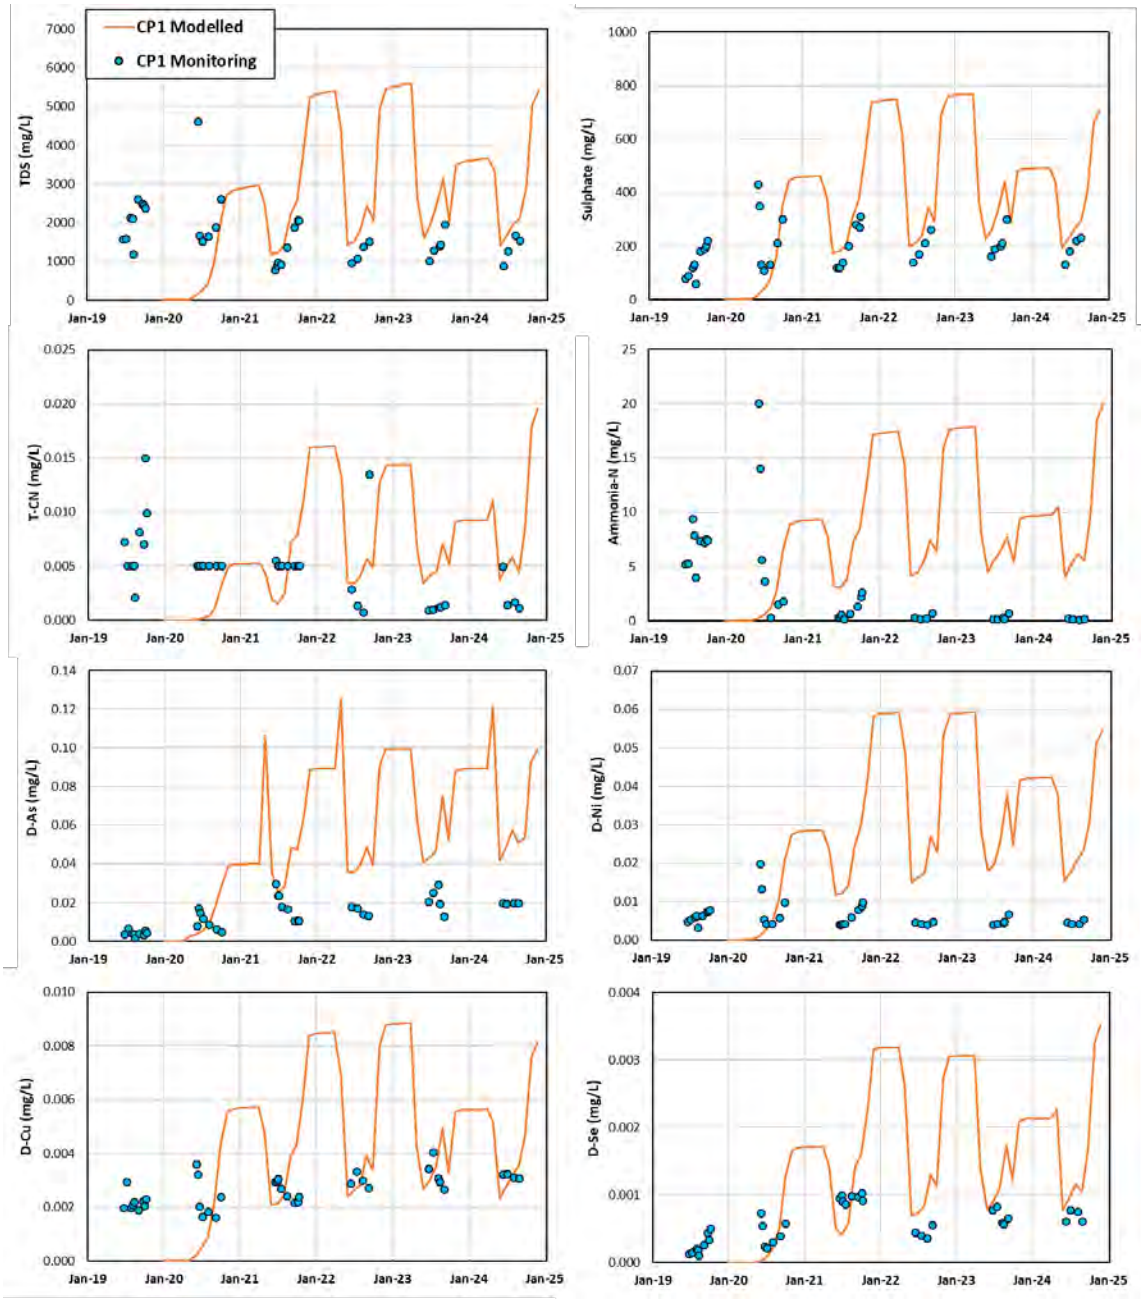

Figure 4-4: Water Quality Model Validation Results for CP1

The validation exercise shows that the water quality model assumptions can conservatively reproduce monitoring results.

4.4.4 Source Term Results

The temporal trends for TDS and As are illustrated for WRSFs, the TSF, Open Pits, in Figure 4-4, Figure 4-5 and Figure 4-6, respectively. The complete set of source terms applied to the current WBWQM are provided in Appendix C.2.

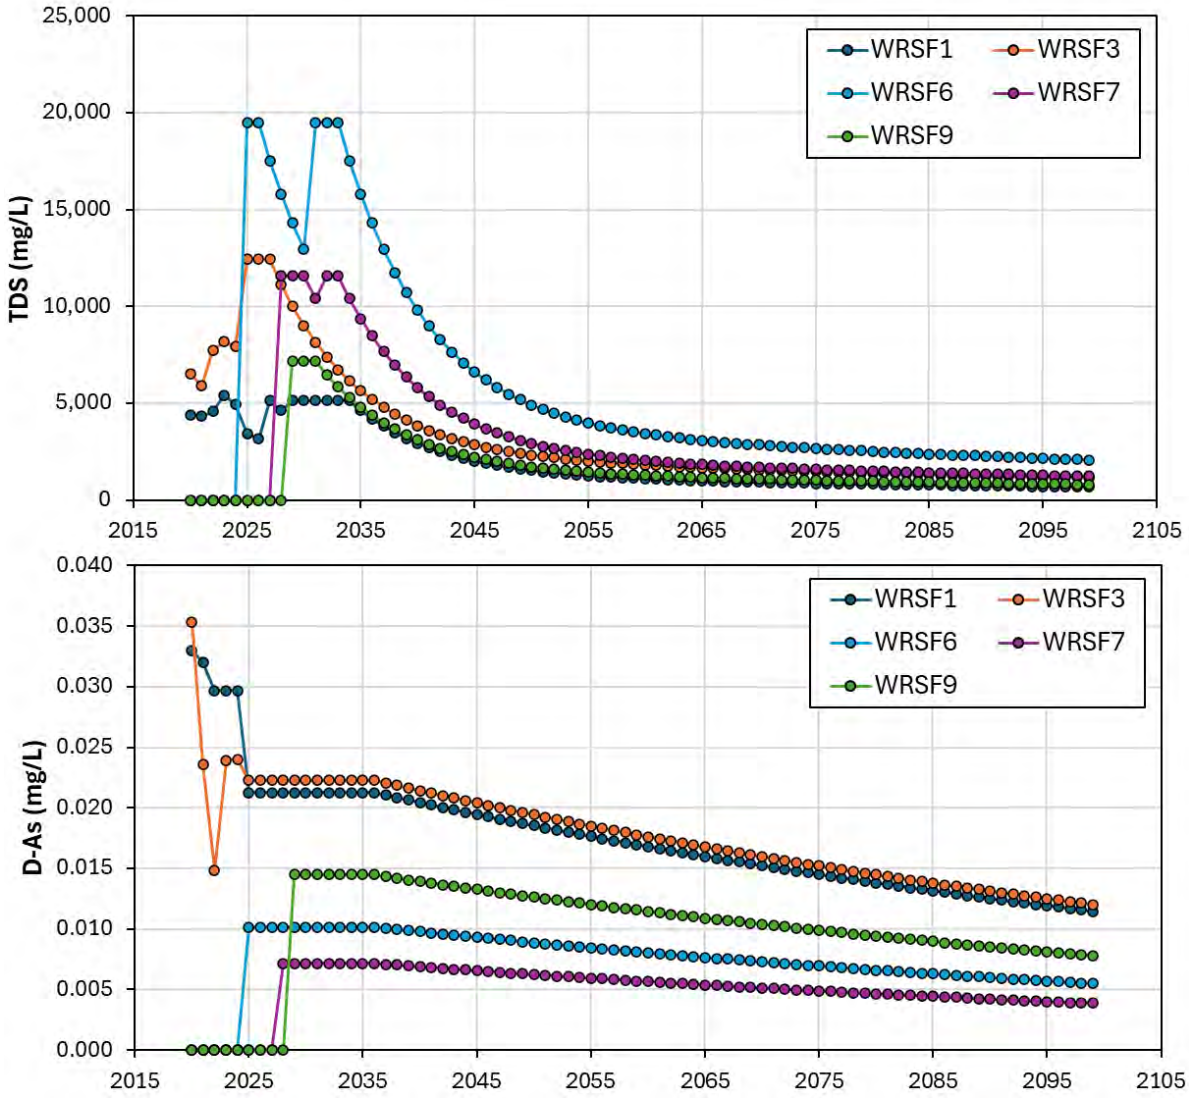

Figure 4-5: Waste Rock Storage Facility Annual Source Term for TDS (top) and As (bottom).

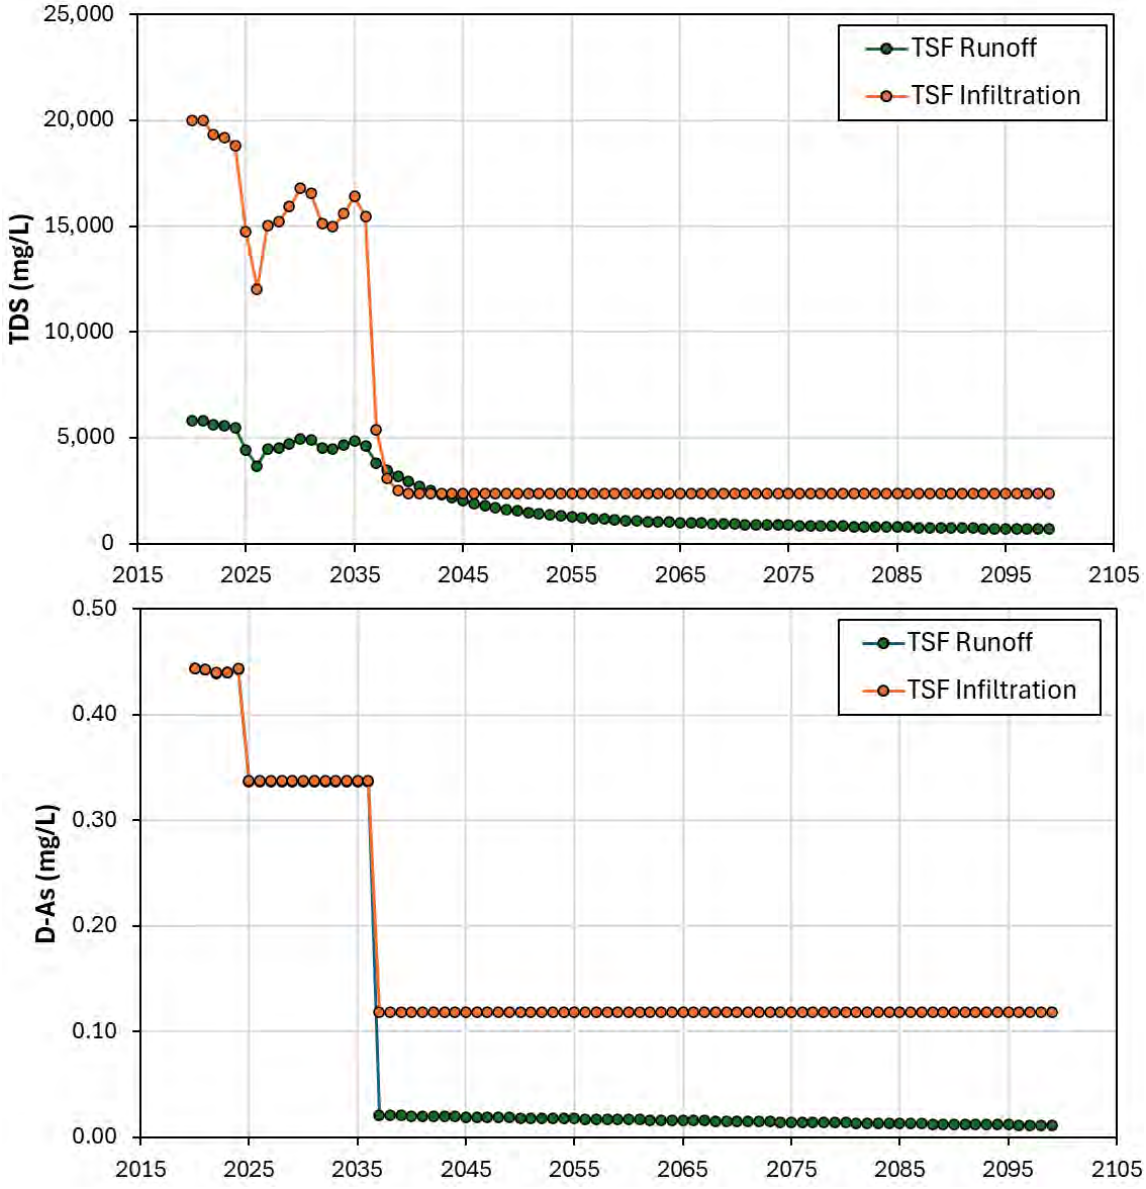

Figure 4-6: Tailings Storage Facility Annual Source Terms for TDS (top) and As (bottom).

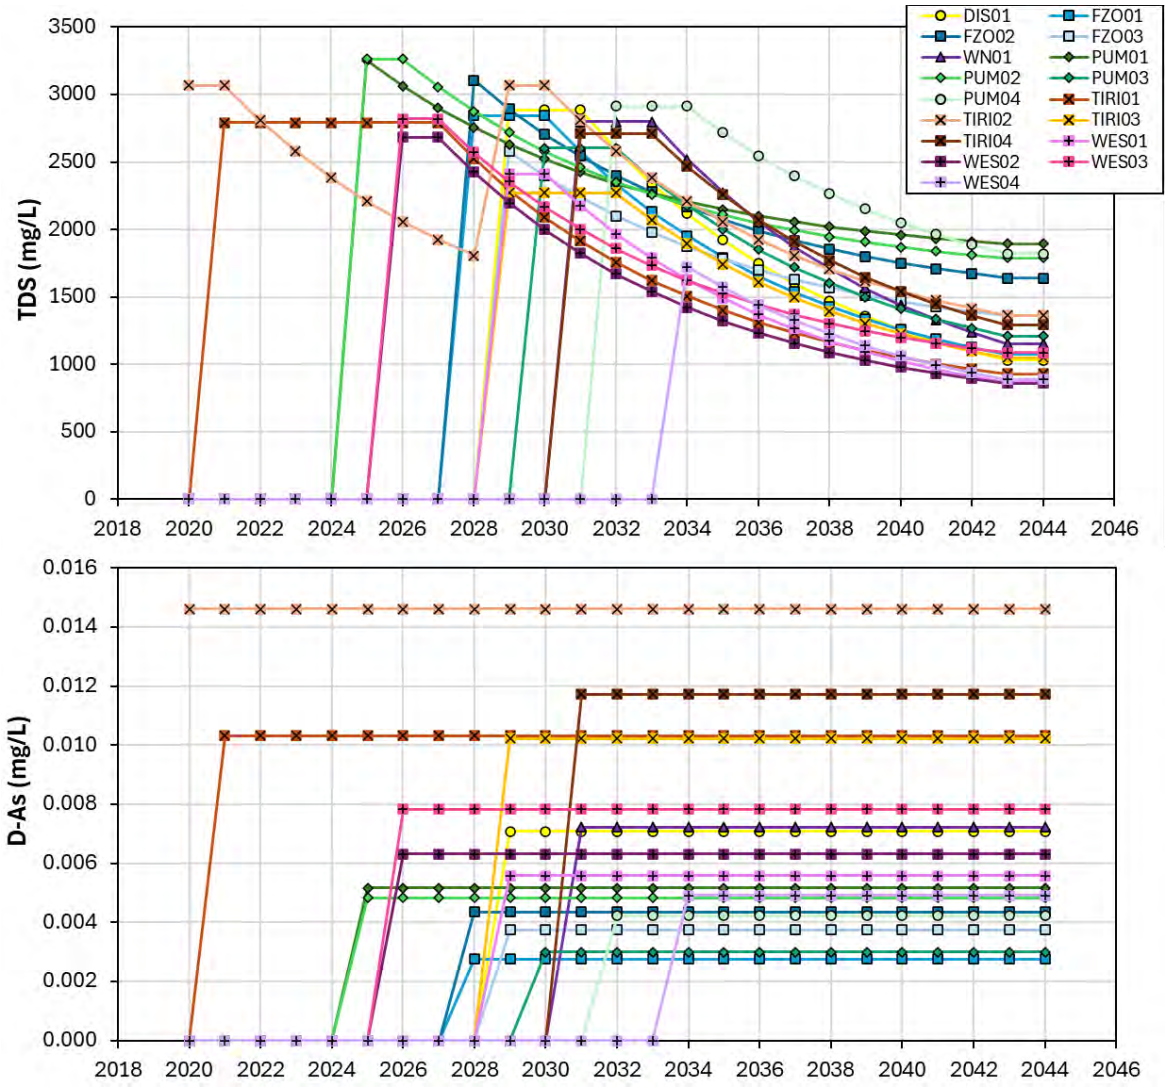

Figure 4-7: Pit Wall Annual Results for TDS (top) and As (bottom).

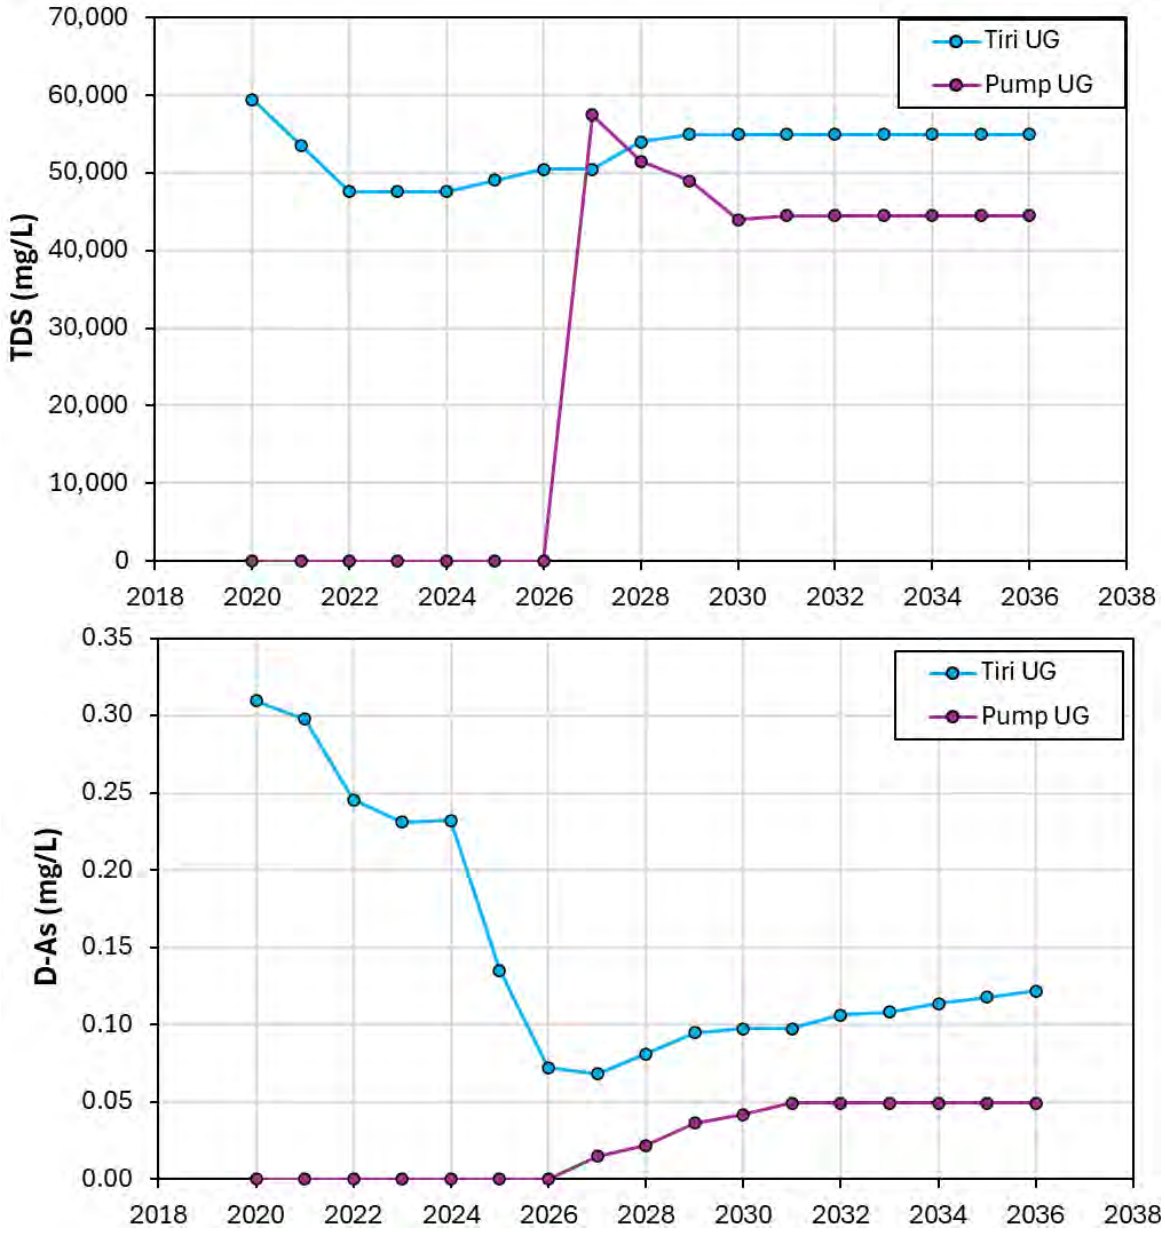

Figure 4-8: Underground Mine Annual Results for TDS (top) and As (bottom).

5. Water Balance Results

5. Water Balance Results

Water balance model results are presented in this section, with a focus on the annual operational discharges to Itivia Harbour and Meliadine Lake (Section 1). Operations phase water balance time-series are provided for the key saline (TIRI02, PUMP02 and WES02) and surface contact water collection (CP1, CP7, WES03, and FZONE02) ponds, as well as tabular summaries of annual water balances for the remaining sumps, ponds, and open pits (Section 5.1).

As compared to the NWB approved 2025 Modification application, the following changes in the mine water management plan, and therefore the overall operational water balance and discharge volumes are highlighted:

- Waterline commissioning in June 2027 moves the discharge to Itivia Harbour one year later, resulting in increased discharges to Meliadine Lake in 2026 relative to the 2025 Modification application;
- Reduction in the proportion of lake dewatering volumes routed to CP1 from 50% to 30%, based on operational experience;
- Mining of PUMP UG beneath the permafrost beginning in 2031 increases the groundwater inflows to this mine void;
- Pumping of remaining saline water in the WES02 pit to the underground mine voids at the beginning of Active Closure; and,
- Operation of the Waterline to discharge any remaining surface contact water and saline water for the first three years of Active Closure.

5.1 Operational Mine Water Discharge to Itivia Harbour and Meliadine Lake

All surface contact water collected in the WES03 and CP1 Ponds is routed to the EWTP for treatment, targeting removal of TSS, before discharge to the receiving environment. Throughout Operations, discharge priority for surface contact water is via the Waterline to Itivia Harbour, with the objective of minimizing operational discharges to Meliadine Lake as outlined in the Adaptive Management Plan for Water Management. Under the Base Case RCP4.5 climate scenario, discharges to Itivia Harbour are predicted to be 1.97 Mm^3 per year while the Waterline is in operation with 0.45 Mm^3 per year on average comprised of saline water and 1.52 Mm^3 per year comprised of surface contact water (Figure 5-1 and Table 5-1).

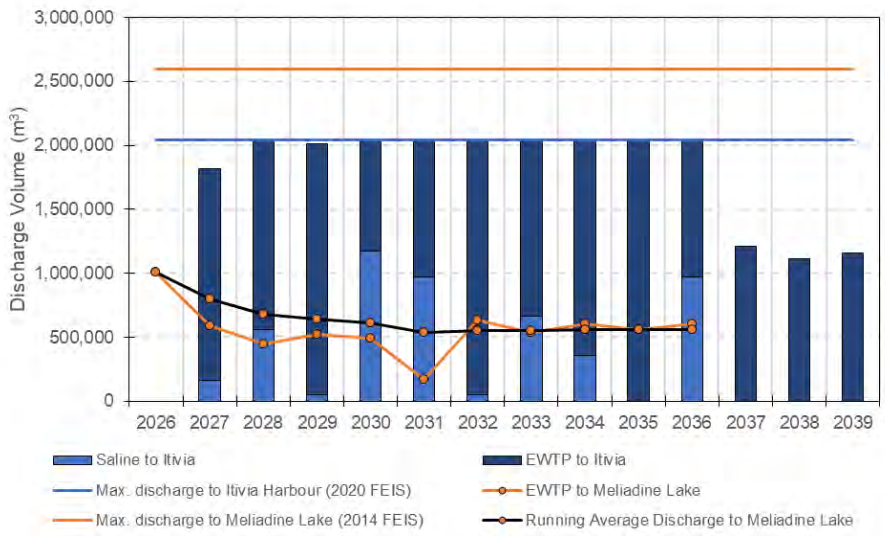

Figure 5-1: Annual discharges to Itivia Harbour and Meliadine Lake for Operations (2026-2036) and the first three years of Active Closure (2037-2039). The maximum predicted discharges to each receiver from the 2014 FEIS are presented for reference.

Table 5-1:
Annual discharge volumes and sources. Active closure phase discharges highlighted in grey.

Discharge	TIRI02 Dewatering	WES02 to Itivia Harbour	Surface Contact to Itivia Harbour	Total Discharge to Itivia Harbour	Discharge to Meliadine Lake
Year	**m³**				
2026	0	0	0	0	1,012,616
2027	204,736*	0	1,660,764	1,820,000	590,548
2028	1,688,376	612,000	1,479,000	2,040,000	446,503
2029	508,094	102,000	1,961,689	2,012,689	524,553
2030	0	1,224,000	867,000	2,040,000	493,144

Operations Total	**2,401,206**	**5,202,000**	**15,199,453**	**20,101,689**	**6,181,028**
Active Closure Total	**0**	**0**	**3,484,045**	**3,336,545**	**0**

Notes:
* TIRI02 dewatering volume in 2027 discharged via Waterline as WES02 is not yet available for use as a saline storage reservoir.

Discharges to Meliadine Lake average 0.56 Mm^3/year over 2026-2036, with the peak annual discharge of 1.0 Mm^3 predicted to occur in 2026 prior to the Waterline becoming operational.

The updated model shows slight changes to the annual discharge volumes relative to those presented in Lorax (2025) and are summarized as follows:

- Reductions in saline water discharge to Itivia Harbour, with the exception of 2030, 2031, and 2033 (Figure 5-2);
- Comparable treated effluent discharge volumes from the EWTP to Itivia Harbour (Figure 5-3);
- Reduced discharges to Meliadine Lake via the EWTP (Figure 3-4; Table 5-2); and,
- Increased proportion of total Waterline discharge comprised of treated surface contact water (via the EWTP; Figure 5-4; Table 5-2).

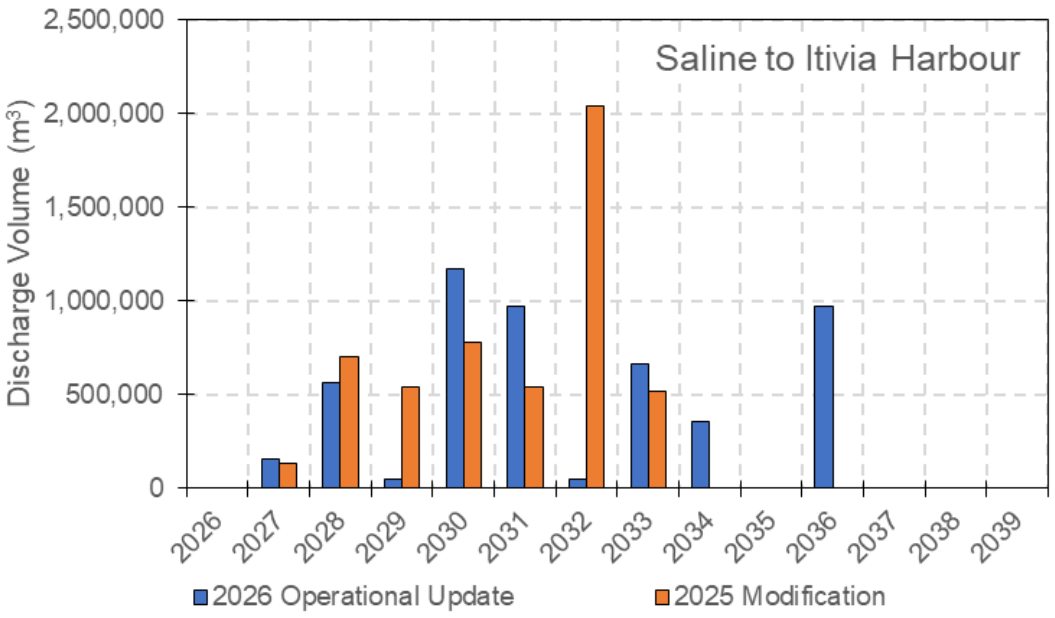

Figure 5-2: Annual Saline Water Discharges to Itivia Harbour

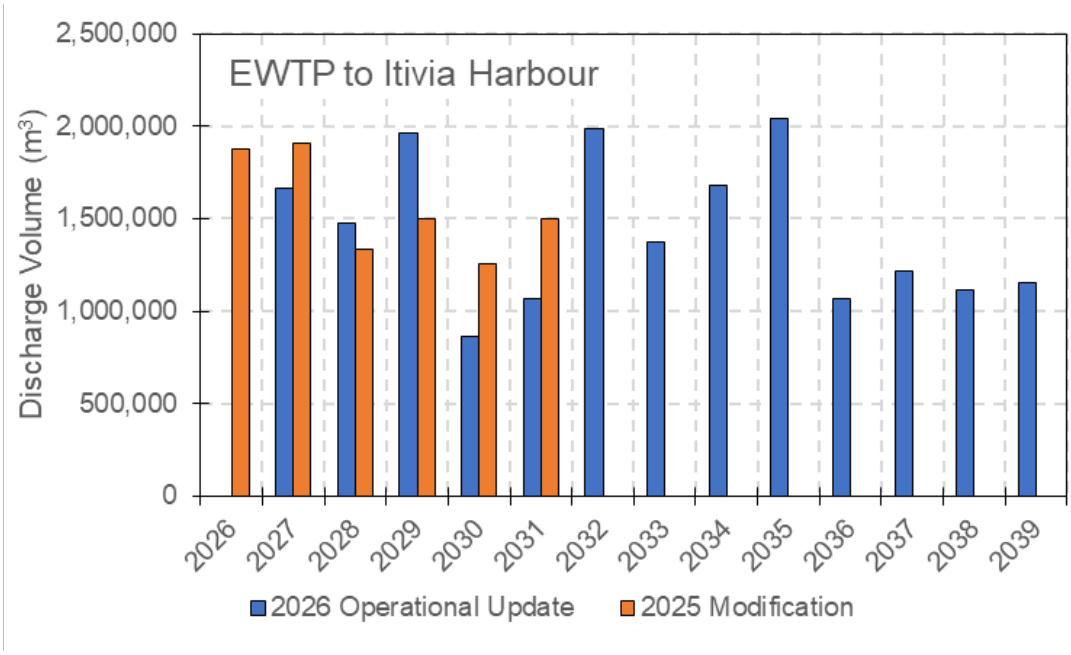

Figure 5-3: Annual Surface Contact Water (EWTP) Discharges to Itivia Harbour

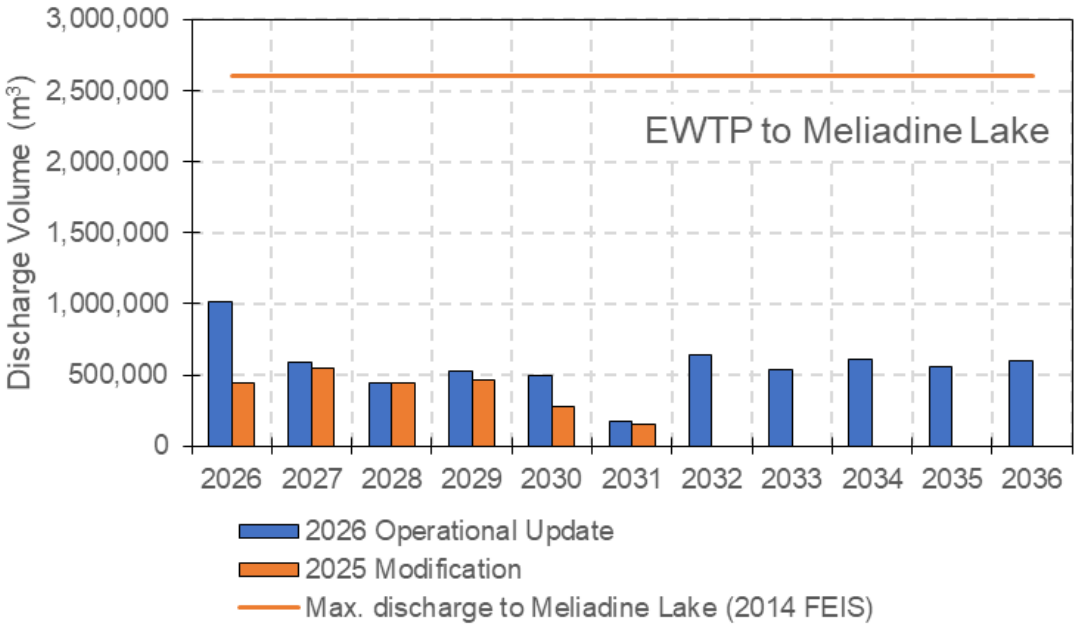

Figure 5-4: Annual EWTP discharges to Meliadine Lake. Maximum allowable annual discharge volume shown by orange line.

Table 5-2:
Annual Discharge Volumes and Sources

Discharge Metric	Phase	2025 Modification[1]	Current Prediction[2]	Percent Change
		m^3		
Saline Discharge to Itivia Harbour	Operations	5,301,984	4,953,236	-2%
EWTP (Contact Water) to Itivia Harbour	Operations	9,452,000	15,199,453	38%
Total Discharge to Itivia Harbour	Operations	12,024,097	20,152,689	40%
EWTP (Contact Water) to Meliadine Lake	Operations	3,736,372	6,181,028	41%
Total Discharge (Saline + Contact Water)	Operations	15,760,469	26,282,717	40%
Total Discharge (Saline + Contact Water)	Operations + Closure	19,972,715	26,196,098	24%

Note:

[2] Total discharge volumes calculated for the 2026-2036 period.

5.2 Surface Water Collection Ponds

This section summarizes the water balances for the key surface contact water collection ponds (WES03, PUMP01/CP9, FZONE02, CP1 and CP7) for the Operations phase.

5.2.1 WES03

The WES03 pit is mined in 2026 and 2027 and is dewatered to CP1 during this period. The WES03 pit will have an effective storage volume of 3.1 Mm^3 once mined out, and beginning in 2028, this pit will be utilized as a surface contact water storage reservoir. Discharges from the STP, CP3, CP4, and CP5 ponds (59% of total inflows) will be routed to this pit, which is pumped out to the SETP for treatment prior to discharge to Itivia Harbour via the Waterline. Note that the new CP8 sump that collects TSF contact water is routed to CP3 from 2026 onwards (Figure 2-2). In addition, minor groundwater inflows are predicted to enter the WES03 pit driven by draindown of the surrounding active layer during the years with active mining operations (Figure 5-5 and Table 5-3).

The predicted daily volume of surface contact water stored in WES03 pit shown in Figure 5-6, reaching a maximum of 2,830,000 m^3 in 2036 (Figure 5-6). In Active Closure, 2.95 Mm^3 of surface contact water is routed through WES03 to the Waterline for discharge to Itivia Harbour over the 2037-2039 period.

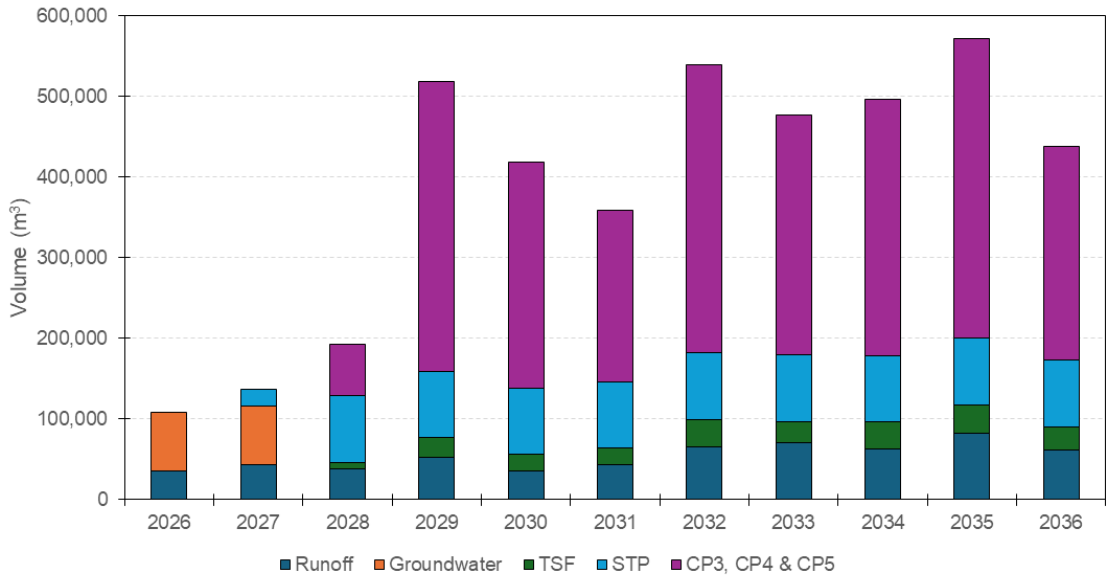

Figure 5-5: Annual Inflows to the WES03 Pit

Table 5-3:
Annual Operations Phase Water Balance for the WES03 Pit

Year	Inflows (m^3/year)					Outflows (m^3/year)		
	Runoff	Groundwater	TSF	STP	CP3, CP4 & CP5	Evaporation	To: CP1	To: SETP
2026	34,769	73,000	0	0	0	1,993	50,157	0
2027	43,115	73,000	0	20,815	0	2,883	57,661	1,129

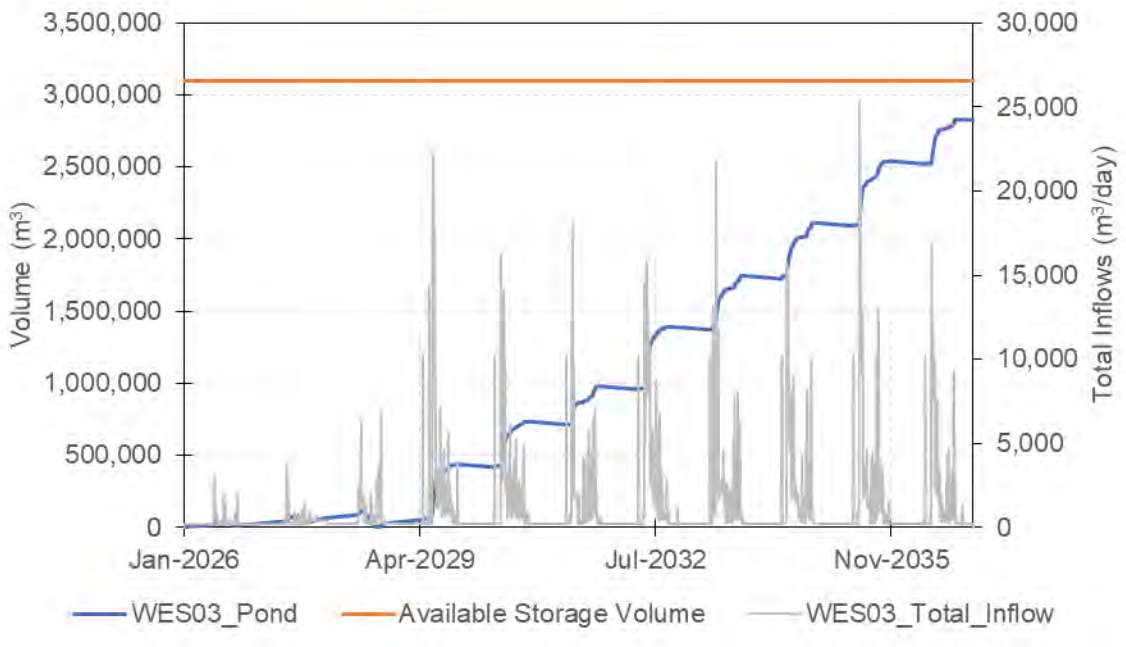

Figure 5-6: WES03 daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.2.2 PUMP01/CP9

Once mined out in Q3 2026, the PUMP01 pit is used as a local surface contact water pond (CP9), routing to CP1. The primary sources of inflow to this pond are passive runoff from the surrounding catchment and pitwalls (40%), followed by inputs from SUMPP5 (31%; Figure 5-7 and Table 5-4). On average, 284,400 m^3 is pumped from CP9 to CP1 over the 2027 to 2036 period (Table 5-4).

The predicted daily volume of surface contact water stored in PUMP01/CP9 reaches a maximum of 331,500 m^3 in 2027 (Figure 5-8).

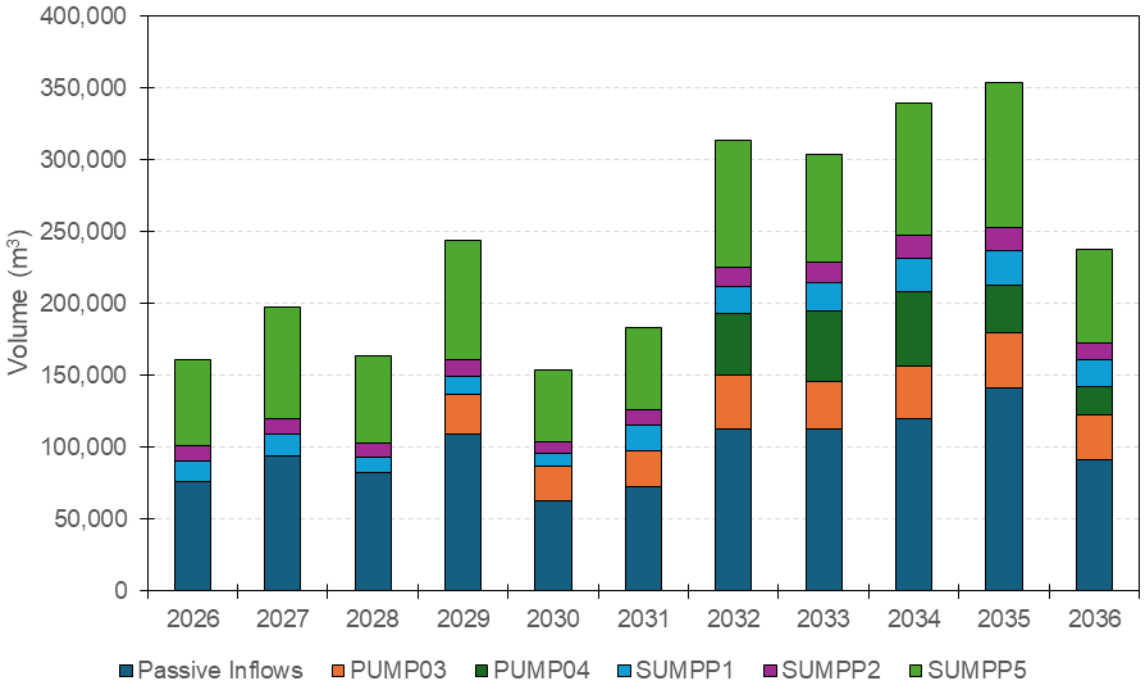

Figure 5-7: Annual Inflows to PUMP01/CP9

Table 5-4:
Annual Operations Phase Water Balance for PUMP01/CP9

Year	Inflows (m^3/year)						Outflows (m^3/year)	
	Passive Inflows	PUMP03	PUMP04	SUMPP1	SUMPP2	SUMPP5	Evaporation	To: CP1
2026	75,665	0	0	14,850	10,316	60,132	6,690	0

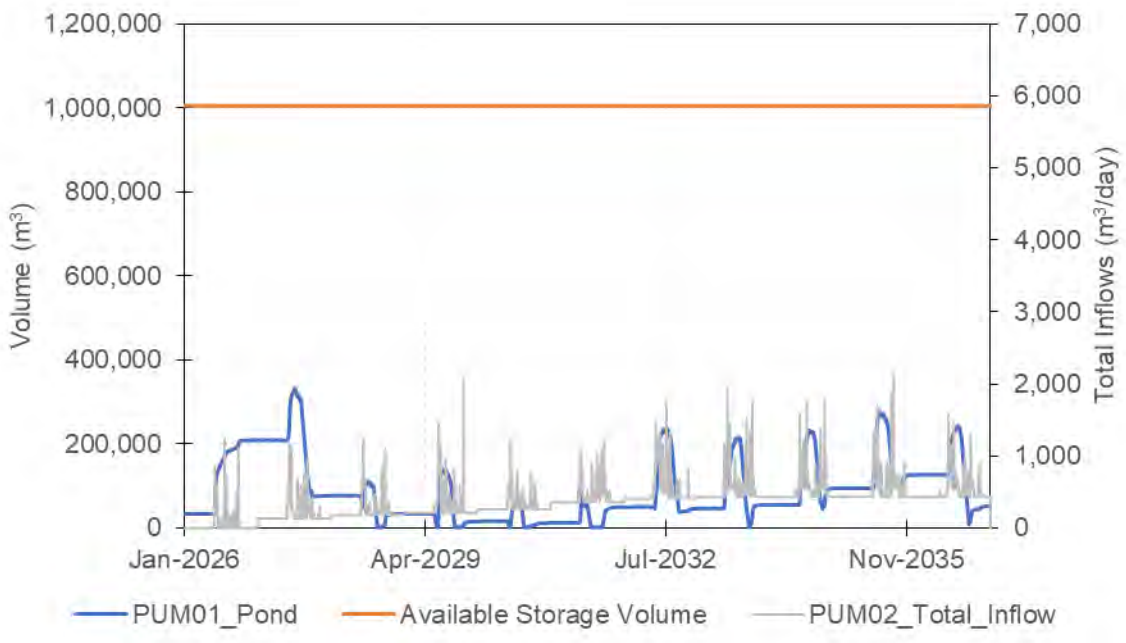

Figure 5-8: PUMP01/CP9 daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.2.3 FZONE02

Once mined out in Q3 2028, the FZONE02 pit is used as a local surface contact water pond, routing to CP1. The primary sources of inflow to this pond are passive runoff from the surrounding catchment and pitwalls (42%), followed by inputs from SUMPF2 (36%; Figure 5-9 and Table 5-5). On average, 144,900 m^3 is pumped annually from FZONE02 to CP1 over the 2028 to 2036 period (Table 5-5).

The predicted daily volume of surface contact water stored in FZONE02 reaches a maximum of 72,700 m^3 in 2035 (Figure 5-10).

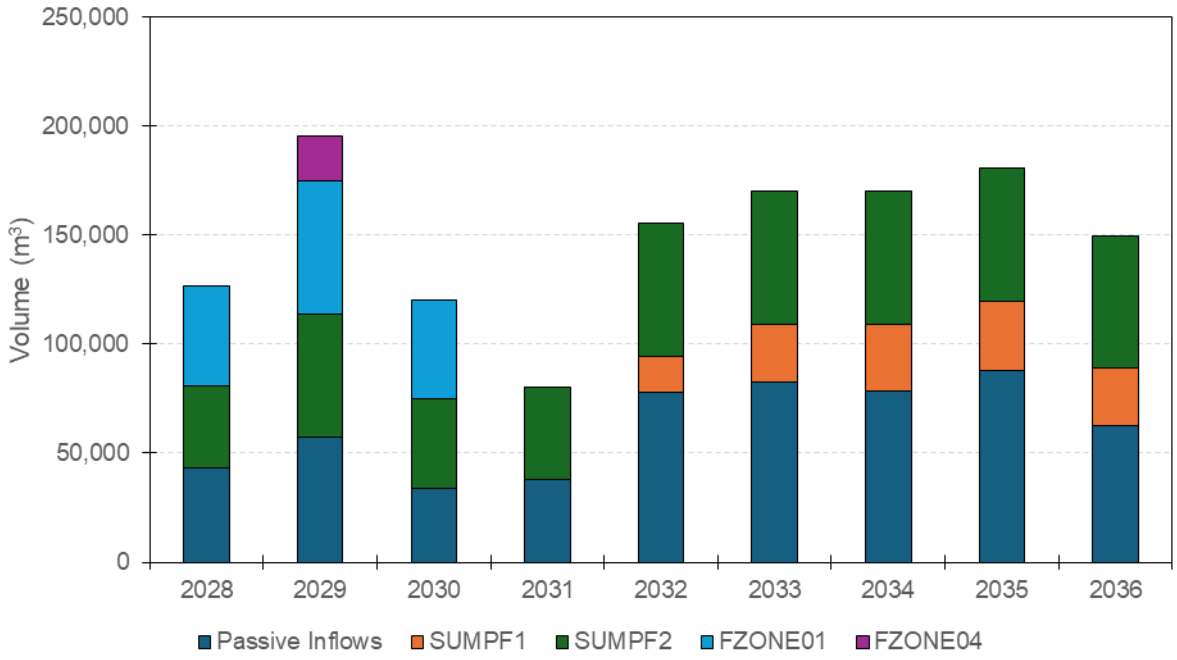

Figure 5-9: Annual Inflows to FZONE02 Pit

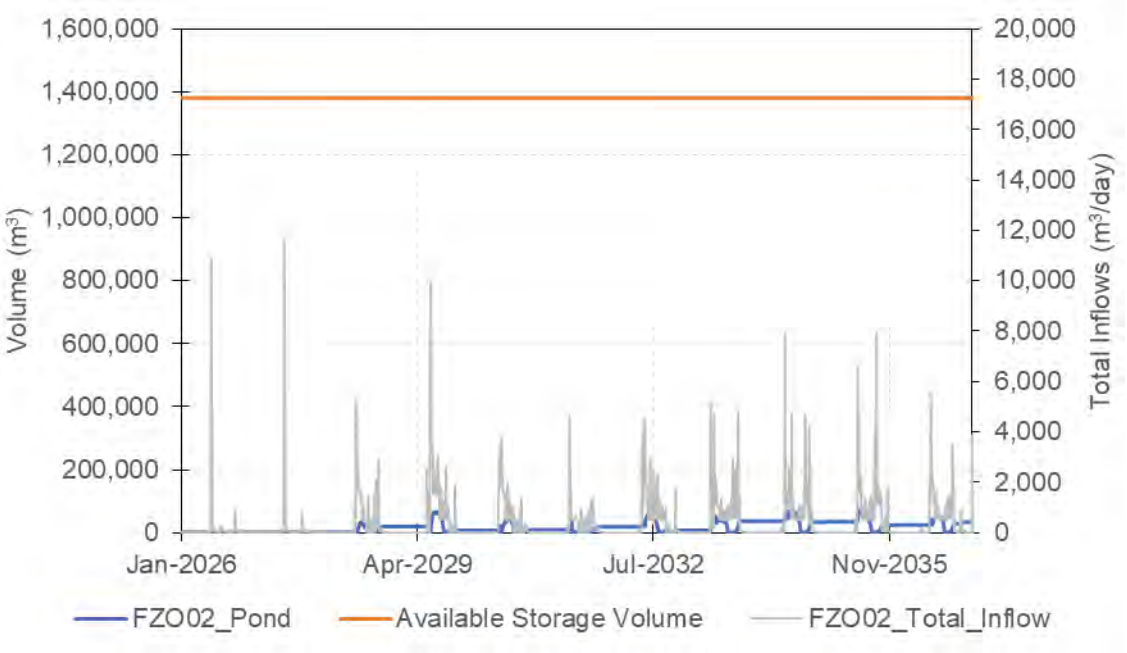

Figure 5-10: FZONE02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.2.4 Collection Pond CP1

CP1 is currently the primary surface contact water collection pond, with all excess water routed to the EWTP prior to discharge to Itivia Harbour and Meliadine Lake. The maximum predicted storage volume (740,000 m^3; Figure 5-12) occurs in 2032. The corresponding predicted water level of 66.18 m remains lower than the Maximum Operating Water Level (MOWL) of 66.2 m (870,800 m^3; Figure 5-12).

The primary sources of inflow to this pond are passive runoff from the dewatered lake beds and local sumps (79%), followed by inputs from nearby catchments and precipitation on the pond surface (13%; Figure 5-11 and Table 5-6). On average, 518,500 m^3 is discharged from CP1 to Meliadine Lake via the EWTP, and 1,525,000 m^3 is discharged to Itivia Harbour via the SETP over the 2027 to 2036 period (Table 5-5).

During the Active Closure phase, the mine site is managed as a zero-discharge facility, with all CP1 inflows routed to TIRI02/04 open pit. Beginning in the post-Closure phase, volumes in the CP1 pond are allowed to fluctuate naturally, with outflows reporting via pre-mine drainage pathways to Meliadine Lake.

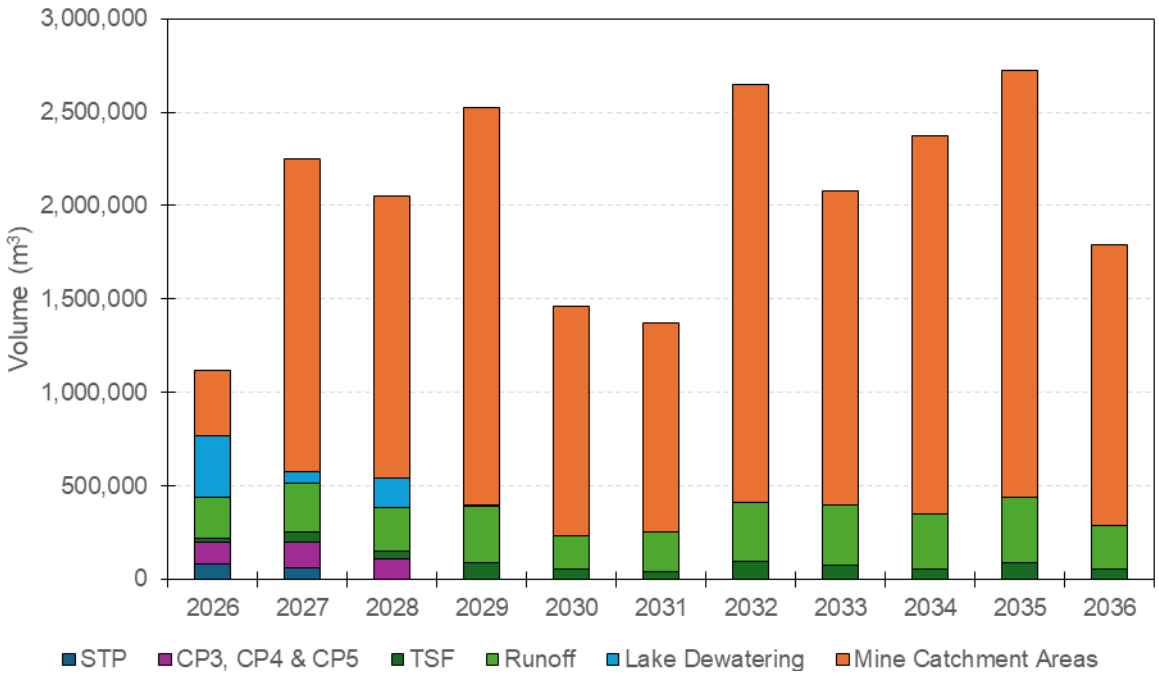

Figure 5-11: Annual Inflows to CP1

[1] Average inflows and percent of total inflow calculated as aggregate of all years with water pumped to CP1.

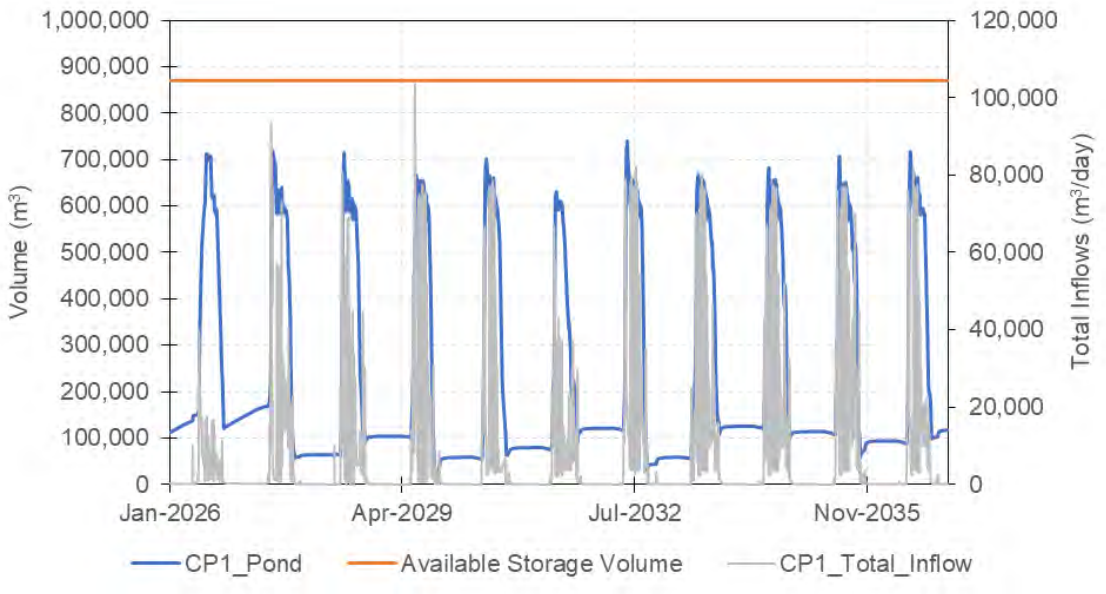

Figure 5-12: CP1 daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.2.5 Collection Pond CP7

Lake B7 is dewatered in 2027 to serve as a backup surface contact water storage reservoir (CP7). The primary function of this reservoir is to serve as backup storage for CP1 during periods of high surface contact water production. Water collected in CP7 is routed to CP1 when the operating volume of CP1 allows it. The majority of the inputs to CP7 (96%) are comprised of passive runoff from the surrounding non-contact areas (Figure 5-13 and Table 5-7).

A total of 1.86 Mm^3 is pumped from CP7 to CP1 over the 2027 to 2036 period, and the maximum predicted volume stored in CP7 over the Operations phase is 286,000 m^3 in 2032 (Figure 5-14).

Beginning in the post-Closure phase, volumes in the CP7 pond are allowed to fluctuate naturally, with outflows reporting via pre-mine drainage pathways to Lake B6.

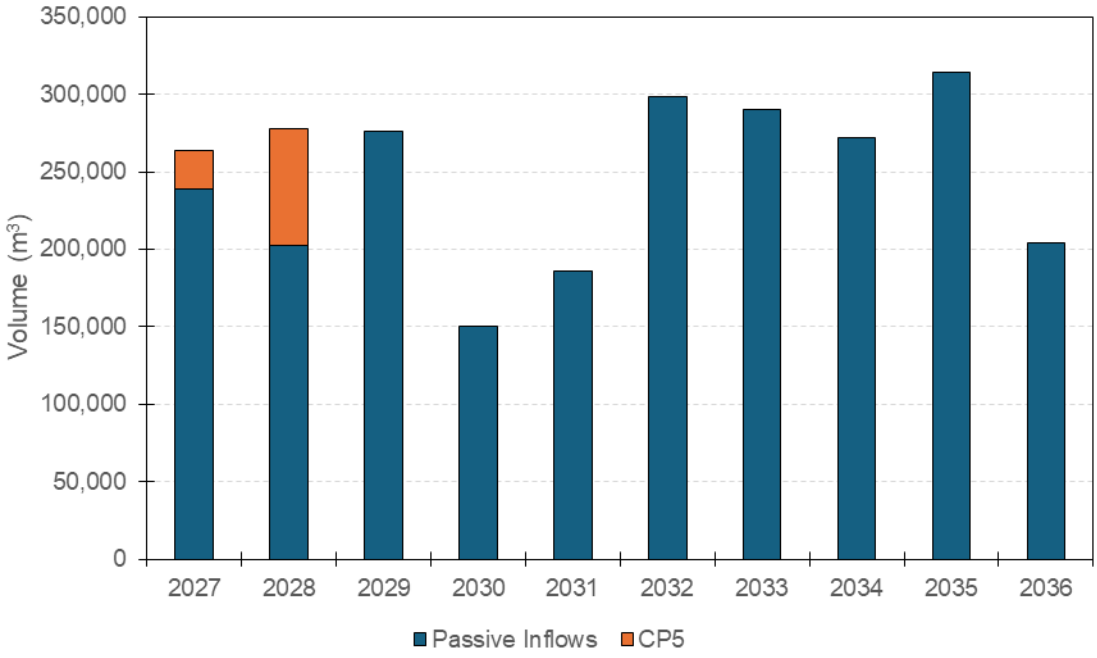

Figure 5-13: Annual Inflows to CP7

Table 5-7:
Annual Operations Phase Water Balance for CP7

Year	Inflows (m^3/year)		Outflows (m^3/year)			
	Passive Inflows	**CP5**	**Evaporation**	**To: EWTP**	**To: Meliadine Lake**	**To: CP1**

5.3 Saline Water Collection Ponds

This section summarizes the water balances for key saline contact water collection ponds (TIRI02, PUMP02 and WES02) over the Operations phase.

5.3.1 TIRI02

The saline contact water management system collects dewatering flows from the underground operation, PUMP underground WRSF, and ore pads. Early in the Operations phase (up to end-2026), the Waterline is not in place, and WES02, the primary saline contact water storage pond, is not available until 2028. The TIRI02 pit currently serves as the primary saline contact water storage pond until it is fully dewatered in 2029, with a maximum predicted pond volume of 1.56 Mm^3 in June 2028, below the available storage volume of 2.8 Mm^3 (Figure 5-16). The primary source of inflow to TIRI02 while it serves as a saline storage reservoir is dewatering of the underground mine workings (65%; Table 5-8 and Figure 5-15). The dewatering of TIRI02 proceeds over a 3-year period from 2027-2029, with a total of 2.4 Mm^3 pumped to storage in WES02 or discharged via the Waterline to Itivia Harbour. The dewatering of TIRI02 is extended in the updated water management plan to free up more capacity in the Waterline, allowing a larger proportion of treated surface contact water to be discharged to Itivia Harbour, thus reducing the overall discharge volumes to Meliadine Lake.

Mining of TIRI02 pit then resumes in 2029-2030, with all pit inflows routed to CP5, which in turn is routed to WES03.

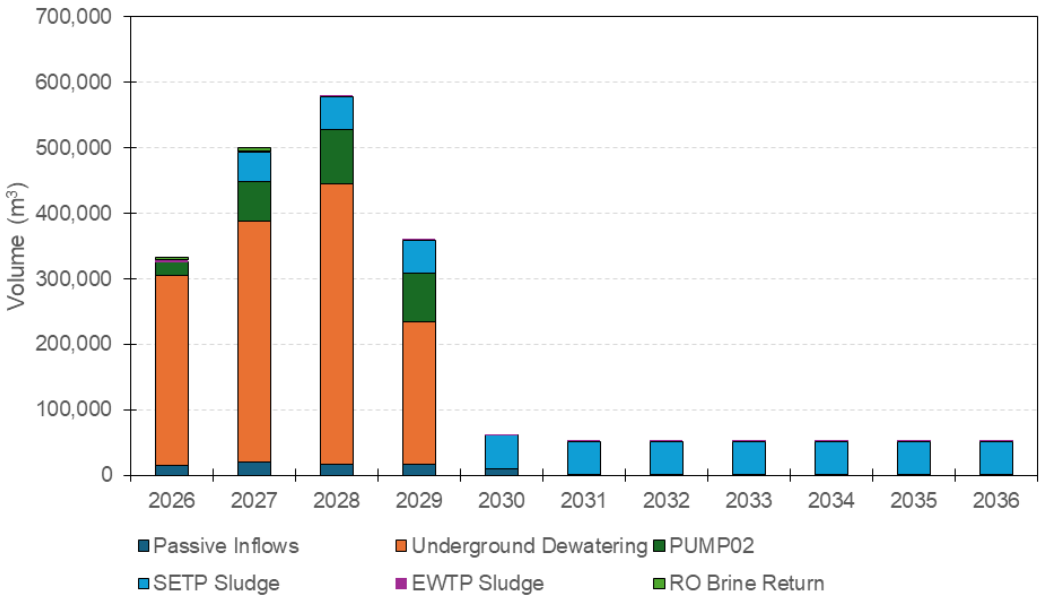

Figure 5-15: Annual Inflows to TIRI02 Pit

Table 5-8:
Annual Operations Phase Water Balance for TIRI02 Pit

Year	Inflows (m^3/year)						Outflows (m^3/year)			
	Passive Inflows	Underground Dewatering	PUMP02	SETP Sludge	EWTP Sludge	RO Brine Return	Evaporation	To: CP1	To: SETP	To: RO Plant
2026	15,611	289,080	21,047	0	3,320	4,244	11,809	0	0	28,290

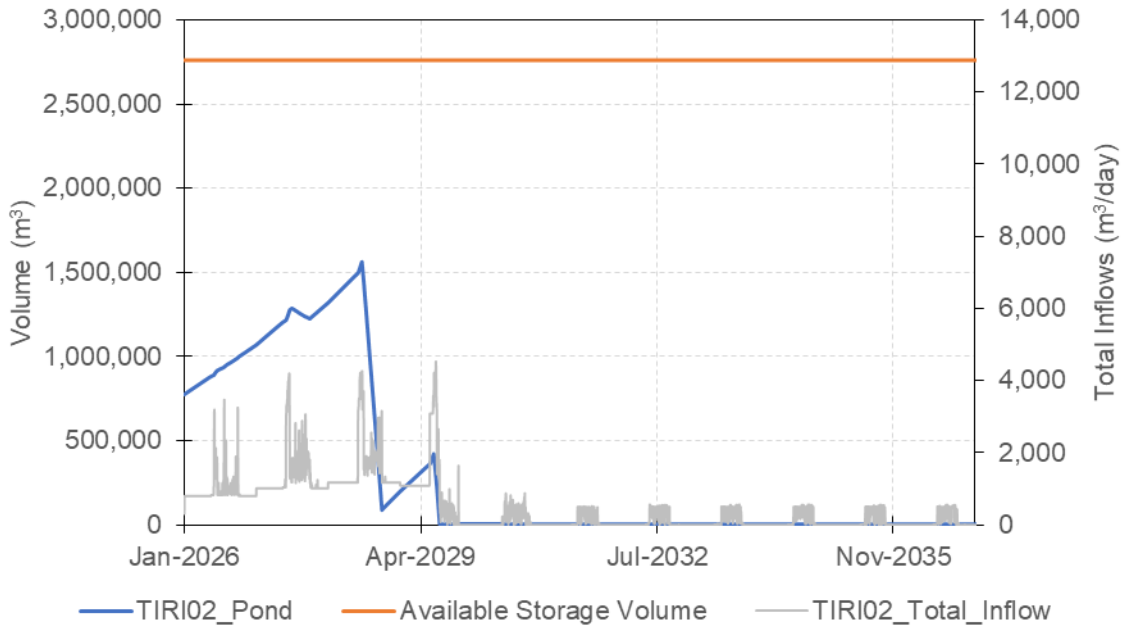

Figure 5-16: TIRI02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.3.2 PUMP02

Once mined out in 2026, the PUMP02 pit will have an effective storage volume of 962,000 m^3 and will also be utilized as a saline water reservoir, collecting runoff from the PUMP underground WRSF and excess saline water from the PUMP underground mine. The primary source of inflow to PUMP02 is dewatering of the PUMP UG mine workings (81%), followed by passive inflows from the surrounding catchment and pit walls (Figure 5-17 and Table 5-9).

The maximum predicted volume of saline water stored in PUMP02 is 115,000 m^3 in 2034 (Figure 5-18). All saline water collected in PUMP02 is routed to TIRI02 until the end of 2036. Once TIRI02 has been dewatered and mining of this pit has resumed, saline water stored in PUMP02 is routed to WES02 for the remainder of the Operations phase (Figure 2-2).

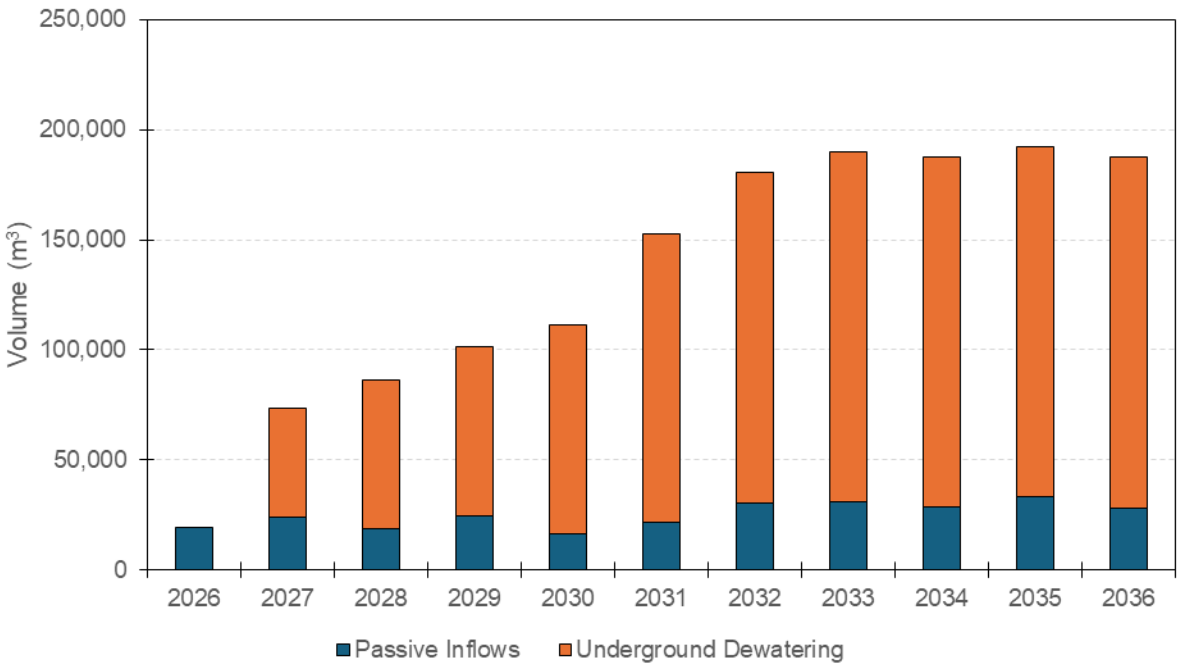

Figure 5-17: Annual Inflows to PUMP02 Pit

Table 5-9:
Annual Operations Phase Water Balance for PUMP02 Pit

Year	Inflows (m^3/year)		Outflows (m^3/year)		
	Passive Inflows	Underground Dewatering	Evaporation	To: TIRI02	To: WES02
2026	19,304	0	666	21,047	0
2027	24,112	49,275	873	59,547	0
2028	18,767	67,710	968	82,033	0
2029	24,611	76,650	945	74,775	21,332

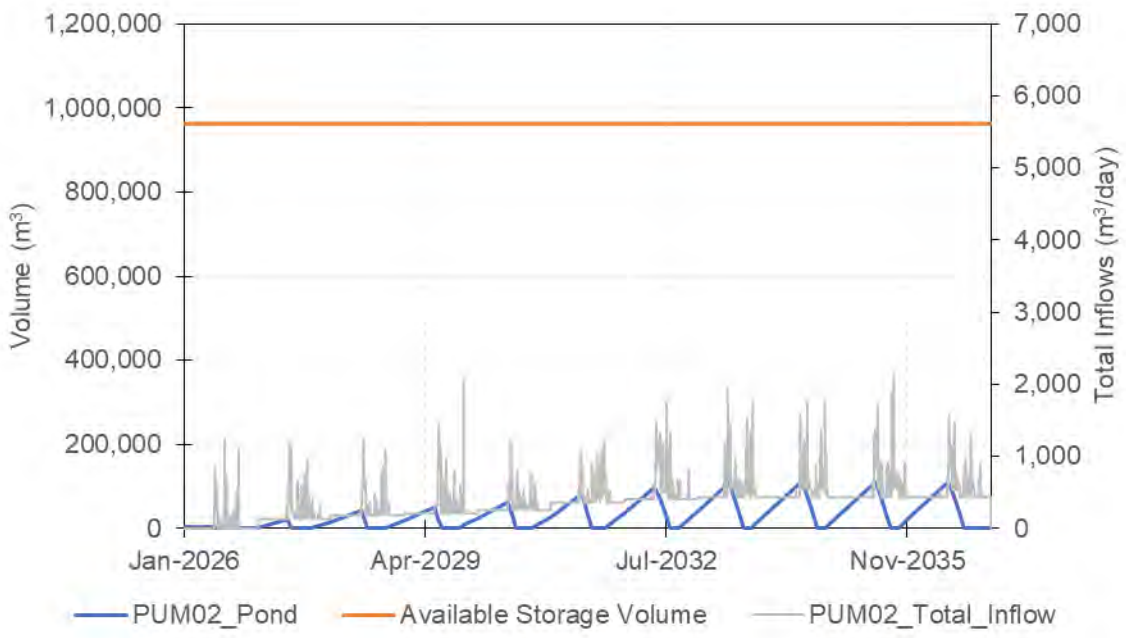

Figure 5-18: PUMP02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.3.3 WES02

The WES02 pit is mined out by end-2027, with 187,000 m^3 of pit inflows pumped to CP1 for treatment and discharge (Table 5-10). Once WES02 is mined out, it serves as a saline water storage reservoir, with 87% of inflows pumped from the other saline storage ponds (Figure 5-19 and Table 5-10). Over the remainder of the Operations phase (2028 to 2036), approximately 5.2 Mm^3 of saline water is transferred from WES02 to the SETP for treatment and discharge via the Waterline. The maximum predicted volume of water stored in WES02 is 3.3 Mm^3 at the end of the Operations phase in 2036 (Figure 5-20).

The remainder of the saline water stored in the WES02 pit at the end of Operations (2.91 Mm^3) is pumped to the underground mine voids in 2037 for permanent storage.

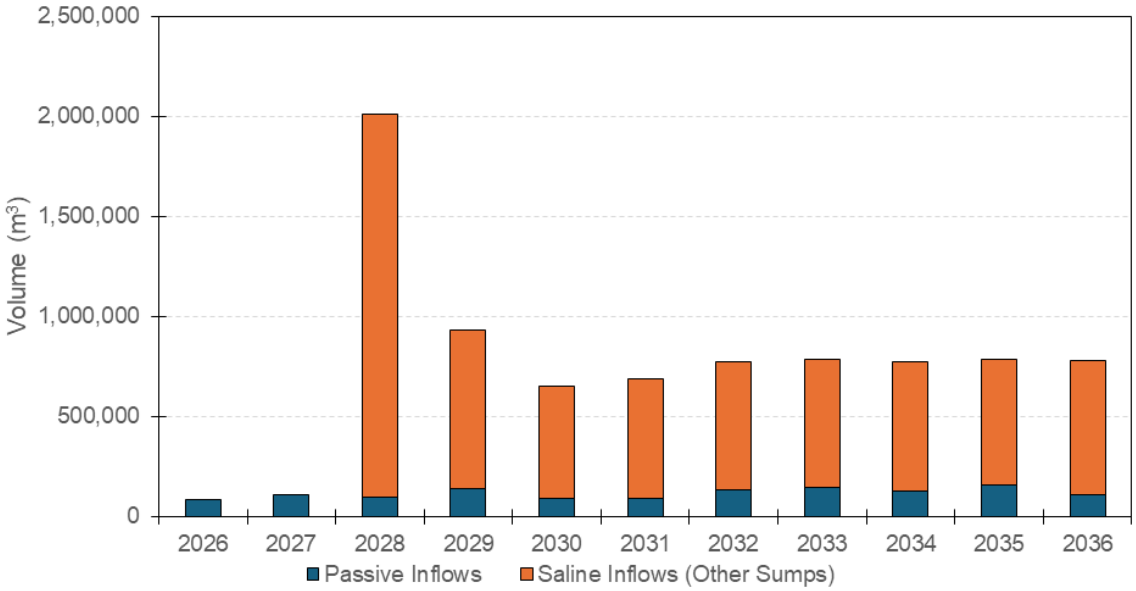

Figure 5-19: Annual Inflows to WES02 Pit

Table 5-10:
Annual Operations Phase Water Balance for WES02 Pit

Year	Inflows (m^3/year)		Outflows (m^3/year)		
	Passive Inflows	Saline Inflows (Other Sumps)	Evaporation	To: CP1	To: SETP

% Total Inflow[1]	**13%**	**87%**			

Notes:
[1] Average inflows and percent of total inflow calculated as aggregate of all years with water pumped to WES02 Pit.

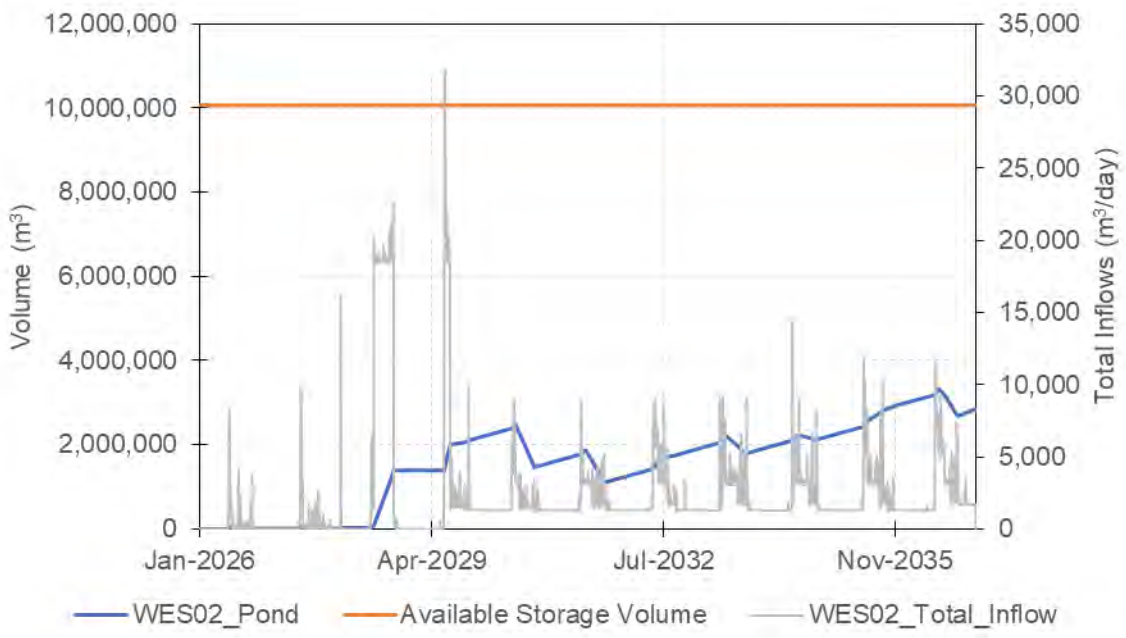

Figure 5-20: WES02 Pit daily predicted contact water storage volume in Operations phase (blue), with maximum available storage capacity shown in orange. Total daily inflows are shown in grey.

5.4 Open Pit Dewatering During Mining

The annual total pit dewatering volumes during the mining phases of each pit are presented in Table 5-11, along with the dewatering period averages. For the pits that are used as storage reservoirs once mined out (*i.e.*, PUMP01, PUMP02, WES02 and WES03), the volumes shown are representative of only the active mining dewatering period. The annual water balances and daily time-series flows for these four pits are presented in separate sections above. For those pits mined over multiple years, the WN01 pit has the highest average dewatering rate, followed by TIRI02 and Discovery Pit. One and two-year average rates are higher for WES02, FZONE01 and FZONE02 pits.

Table 5-11:
Annual dewatering volumes for open pits

Year	Annual Operational Pit Dewatering Volumes (m^3)

Notes:
[1] TIRI02 pit water (not saline) is discharged to CP5 once mining resumes in 2029.
[2] Averages are calculated for the active dewatering periods only.

5.5 Active Closure Water Management

During the Active Closure phase, the site is maintained with zero discharge to Meliadine Lake, and 3 years of predicted discharge to Itivia Harbour via the Waterline to drain the accumulated water in WES03 (2.95 Mm^3). The remaining volume of saline water (2.9 Mm^3) in WES02 will be pumped into the underground mine voids for permanent storage. Surface contact water reporting to the CP3, CP4, and CP5, CP6, and CP8 sumps, and any TSF runoff reporting to Channel 1 are pumped to CP1. All remaining surface contact water from the PUMP and FZONE areas is pumped to CP1, which is routed to TIRI02/04 to speed the flooding process from 2037 to 2042. There is no discharge of treated surface contact water to Meliadine Lake over the Active Closure phase.

Given that there are no changes in pit volumes relative to those presented in Lorax (2024), the overall pit flooding strategy and timeline remains the same. Consistent with Lorax (2024), and Condition 2, Part E of Water License 2AM-MEL1631, pumping of Meliadine Lake water remains within the maximum prescribed limit of 8,676,481 m^3/year over the seven-year Active Closure period (Table 5-12).

Table 5-12:
Annual Pit Reflooding Volumes from Meliadine Lake

Year	Pumped Volume (m^3)
2037	6,791,000
2038	7,447,000
2039	7,518,000
2040	8,118,000
2041	8,118,000
2042	8,118,000
2043	7,634,994

The withdrawal of water from Meliadine Lake to flood the pits, along with no treated effluent discharge to Meliadine Lake during the Active Closure phase is predicted to result in minimal changes to the lake volume or minimum water levels. The minimum annual lake volume drops by 0.4% on average between the Operations phase and Active Closure, and minimum annual water levels are predicted to drop by an average of 2 cm (Figure 5-21).

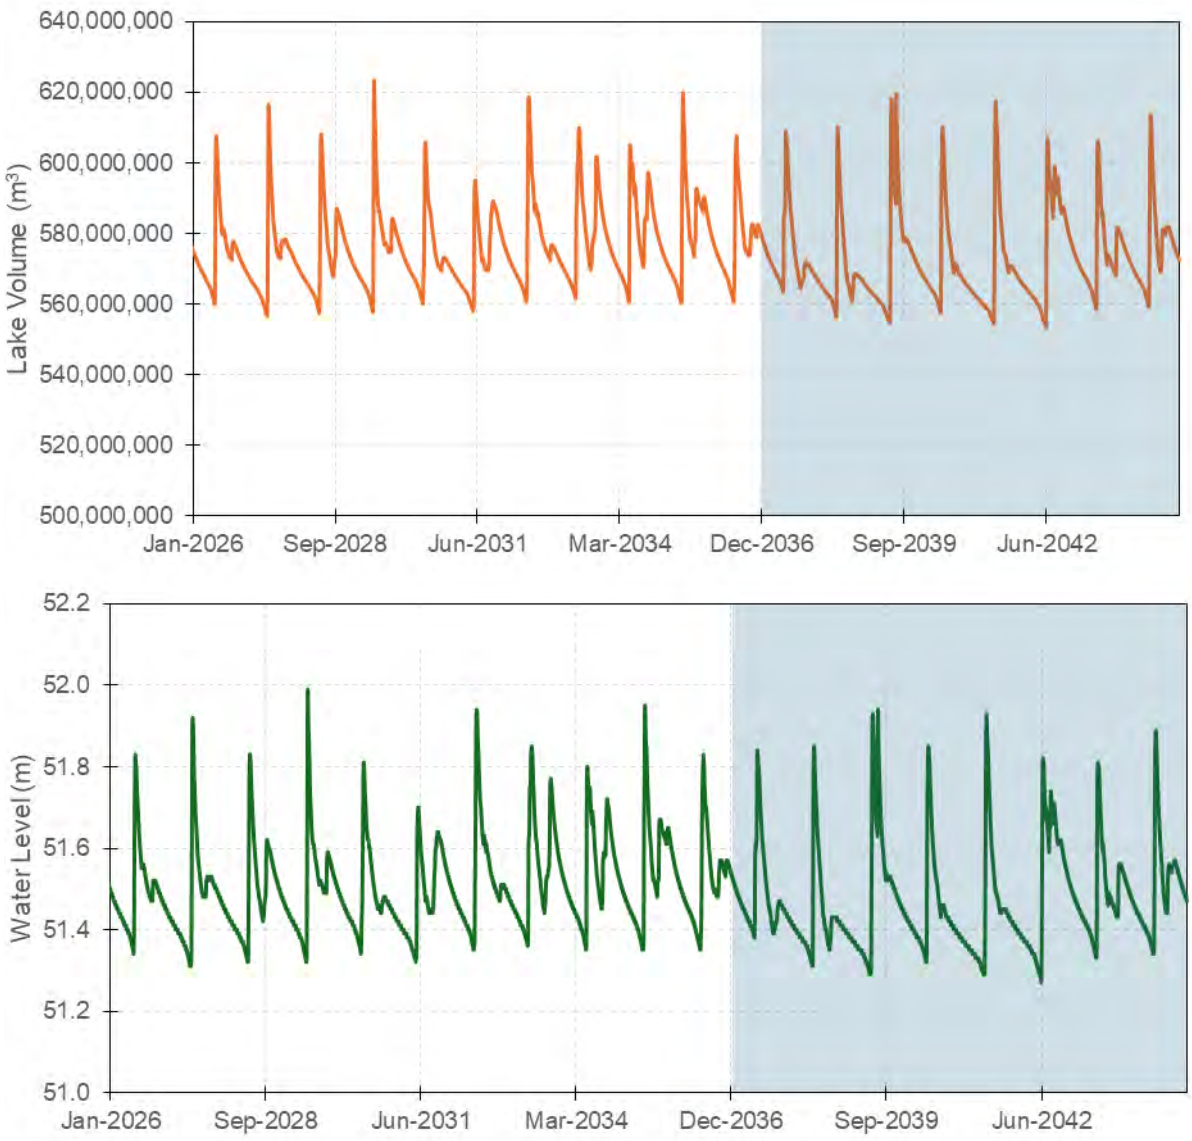

Figure 5-21: Modeled daily volume (top) and water level (bottom) of Meliadine Lake. The Active Closure phase is highlighted.

6. Water Quality Model Results

AGNICO EAGLE

6. Water Quality Model Results

This section presents water quality model results for the Meliadine Mine WBWQM. Model predictions are compared against applicable guidelines as a screening tool to identify parameters of potential concern (POPCs). During the Operations phase, model predictions at the end-of-pipe (EOP) to Meliadine Lake (EWTP) are screened against effluent discharge limits outlined in the Type A Water License (2AM-MEL1631) for the Meliadine Mine and MDMER, while discharges to Itivia Harbour are screened against MDMER only. The complete model outputs for all mine phases are presented in Appendix D.

6.1 Operations

During Operations, TSS in mine effluent will be controlled by the SETP and EWTP for saline and freshwater discharges, respectively. For the purposes of water quality predictions, it is assumed that treated effluent is at the MDMER maximum monthly mean concentration of 15 mg/L TSS. The differences in total and dissolved concentrations generated by this assumption were calculated in Lorax (2022) and are shown in Table 6-1. These values are added to dissolved concentrations predicted for Meliadine Lake and Itivia Harbour discharges. Dissolved and total predictions at EWTP and Waterline are provided in Appendix D.1. Water quality predictions for other model nodes present during Operations are provided in Appendix D.2.

Summary statistics are presented for EWTP and Waterline discharges with comparison to EOP guidelines. Consistent with 2025 Modification application Lorax (2025), model predictions for the EWTP remain below MDMER/Water License limits (Table 6-2), while model predictions of untreated water for the Waterline remain below MDMER with the exception of ammonia-N (Table 6-3). Options for treatment are being investigated.

6.2 Active Closure

The Waterline remains available for the first three years of Active Closure (2037 to 2039), with discharges of remaining contact and saline water stored in pits to Itivia Harbour planned in the months of June to September. This approach is proposed as a conservative contingency assumption to ensure closure water quality objectives are met. These assumptions will continue to be refined with site monitoring data and all details will be provided in the Final Closure Reclamation Plan. During Active Closure, the predicted concentrations of POPCs at the Waterline remain below EOP guidelines with the exception of ammonia-N (Table 6-4). It is noted that these results are distinct from the 2025 Modification, which show concentrations for all POPCs below EOP guidelines, due to the previous submission assuming that no saline underground water would be discharged in

Active Closure. Similar to the Operations phase Waterline predictions, the ammonia-N concentrations modelled are reflective of no treatment; however, Agnico Eagle is actively working on a treatment solution for these discharges. No discharge occurs via the EWTP to Meliadine Lake during the Active Closure phase.

Table 6-1:
Suspended Solids Composition and Contribution to Total Concentrations at End-of-Pipe

Element	Particulate Composition	Particulate Fraction Concentration (mg/L) per 15 mg/L of Total Suspended Solids

1. The ammonia guideline was determined conservatively by assuming a pH of 8 and a temperature of 15°C, and an un-ionized ammonia concentration of 0.5.

6.3 Post-Closure

During Post-Closure, mining activity will have ceased, open pits will have been flooded with Meliadine Lake water, water management infrastructure will have been decommissioned, and mine site waterbodies will begin to discharge passively. In the absence of mining activities, TSS is expected to return to relatively low baseline values of <3 mg/L. Due to the low TSS baseline conditions, total and dissolved concentrations are anticipated to be similar during Post-Closure. Hence, model results are developed assuming that total concentrations are equal to dissolved concentrations.

Summary statistics are presented for key collection ponds and flooded pits during Post-Closure, with comparison to terrestrial (CP7 only) and aquatic guidelines (Table 6-5 through Table 6-18).

Water quality predictions are summarized starting in January 2044 and extending to December 2119. Most model nodes presented herein show predicted concentrations below the applicable guidelines throughout Post-Closure with the exception of phosphorus. Elevated concentrations of phosphorus are associated with natural runoff and thus phosphorus is not considered a mine related POPC. Limited instances of elevated chloride and mercury concentrations are observed for discrete model nodes. Chloride concentrations are elevated in PUMP01 early in Post-Closure and decrease to below the guideline value by June 2047. Mercury concentrations are marginally elevated above the guideline value in Lake J1 only in May 2054 and September 2059. The mercury dataset largely contains results reported at the method detection limit, and thus, the exceedances are considered to be highly conservative. WES04 is the only model node with several exceedances above guideline values, including total dissolved solids, chloride, copper, and mercury. The occurrence of elevated concentrations is attributed to the physical characteristics of the WES04 pit, specifically a high ratio (4:1) of exposed pit walls to the surrounding catchment area and a large water surface area, which contribute to evapoconcentration of geochemical loadings within the flooded pit. As the predicted exceedances are largely a result of these physical characteristics of the pit. Additional monitoring data collected through the life of mine will be used to update Post-Closure model predictions. Monthly water quality predictions for flooded pits and natural lakes during Post-Closure are provided in Appendix D.2, predictions for conjoined flooded pits which form during Post-Closure are provided in Appendix D.3.

7. Summary

7. Summary

The WBWQM assembled for the January 2024 Type A Water License 2AM-MEL1631 amendment (Lorax 2024), and subsequently updated for the 2025 Modification application, has been further revised to reflect slight changes to the mine plan to support the 2026 WL Amendment. These updates include:

- The mine plan is extended within the previously assessed footprint to the end of 2036;
- The Waterline is online as of June 2027;
- Advancement of the PUMP underground mine below permafrost;
- Utilization of the underground mine voids for permanent storage of saline water at the beginning of Active Closure;
- Sewage treatment plant discharges will be routed to the underground mine void for the duration of the Active Closure phase (2037-2043); and,
- Utilization of the Waterline for the first three years of Active Closure (2037-2039) to remove remaining surface contact water and saline water from storage at site.

The mine plan represented in the updated WBWQM remains within the footprint and Meliadine Lake discharge volumes approved by NIRB in 2015, and by the Nunavut Water Board in 2024.

The water balance model assembled for the Meliadine Mine tracks all water types (surface contact, saline and non-contact) across the site on a daily time-step, with water quality predictions aggregated to monthly time-steps for comparison to relevant criteria. Lake, pit, and underground dewatering activities are represented, along with the balancing of discharges to Meliadine Lake and Itivia Harbour. Predicted inflows, outflows, and pond volumes for key nodes (CP1, WES03, CP7, PUMP01/CP9, PUMP02, TIRI02 and WES02) indicate that the water management infrastructure is capable of routing and storing the saline and surface contact water throughout Operations, under an annually variable RCP4.5 climate scenario. The updated model shows slight changes to the annual discharge volumes relative to those presented in Lorax (2025), summarized as follows:

- Reductions in saline water discharge to Itivia Harbour, with the exception of 2030, 2031, and 2033;
- Comparable treated effluent discharge volumes from the EWTP to Itivia Harbour;
- Reduced discharges to Meliadine Lake via the EWTP; and,

- Increased proportion of total Waterline discharge comprised of treated (via the EWTP) surface contact water.

During Operations and Active Closure, model predictions for key parameters (TDS, chloride, ammonia-N, and arsenic) at the main collection ponds and discharge points are generally lower than their respective water quality guidelines. No exceedances of any parameters are predicted in effluent discharged from EWTP during mine Operations. Above guideline concentrations of ammonia are predicted in Waterline discharge, and treatment options are being investigated to mitigate this potential exceedance.

During Post-Closure, mining activities will have ceased, open pits will have been flooded with Meliadine Lake water, water management infrastructure will have been decommissioned, and site waterbodies will begin to discharge passively. Predicted concentrations generally remain below applicable guideline values throughout the 2044 to 2119 simulation period. Phosphorus concentrations exceed aquatic guidelines at several model nodes; however, these elevated concentrations are associated with natural runoff and are not considered mine-related parameters of potential concern. The most notable exceedances are predicted for the WES04 flooded pit, where total dissolved solids, chloride, copper, and mercury exceed applicable guidelines as a result of the high ratio of exposed pit wall area to contributing catchment area and the resulting evapoconcentration of geochemical loadings. Overall, the post-closure modelling indicates that water quality is expected to remain protective of aquatic and terrestrial receptors at most site waterbodies, with WES04 identified as the primary location where future mitigation measures or design refinements may be warranted.
