Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Andy Lu, Ph.D., P.Chem., Scientific Specialist

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B8N2546
Received: 2018/09/06, 11:00

accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Maxxam Analytics Mississauga
(2) This test was performed by Maxxam Analytics Kitimat
(3) This test was performed by Campo to Burnaby Subcontract
(4) Dissolved Organic Carbon (DOC) present in the sample should be considered as non-purgeable DOC.
(5) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(6) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.
(7) Radium-226 results have not been corrected for blanks.
(8) Total Organic Carbon (TOC) present in the sample should be considered as non-purgeable TOC.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

QUALITY ASSURANCE REPORT

Agnico-Eagle
Site Location: MELIADINE
Your P.O. #: B8N2546

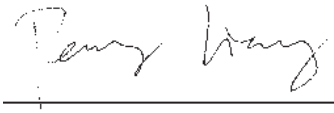
			Matrix Spike		Spiked Blank		Method Blank		RPD	
QC Batch	Parameter	Date	% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9146428	Reactive Silica	2018/09/17	104	80 - 120	100	80 - 120	<0.050	mg/L	2.4	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.



Maxxam Analytics International Corporation o/a Maxxam Analytics Calgary: 2021 - 41st Avenue N.E. T2E 6P2 Telephone (403) 291-3077 Fax (403) 291-9468

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B877821
Received: 2018/09/11, 09:53

Sample Matrix: Water
Samples Received: 1

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Silica (Reactive)	1	N/A	2018/09/17	AB SOP-00011	EPA 370.1 R1978 m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Andy Lu, Ph.D., P.Chem., Scientific Specialist

Melissa McIntosh, Project Manager

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B8N2551
Received: 2018/09/06, 11:00

accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Maxxam Analytics Mississauga
(2) This test was performed by Maxxam Analytics Kitimat
(3) This test was performed by Campo to Burnaby Subcontract
(4) Dissolved Organic Carbon (DOC) present in the sample should be considered as non-purgeable DOC.
(5) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(6) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.
(7) Radium-226 results have not been corrected for blanks.
(8) Total Organic Carbon (TOC) present in the sample should be considered as non-purgeable TOC.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	15.7°C

Revised Report (2018/12/18): Client sample ID changed to MEL-14 and GPS coordinates included per client request.

Sample HRK627 [MEL-14] : Total Cyanide < Free Cyanide: Both values fall within the method uncertainty for duplicates and are likely equivalent.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Received: 2018/09/11, 09:53

Sample Matrix: Water
Samples Received: 1

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Silica (Reactive)	1	N/A	2018/09/17	AB SOP-00011	EPA 370.1 R1978 m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Your P.O. #: B8N2551

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	3.7°C

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Andy Lu, Ph.D., P.Chem., Scientific Specialist

Melissa McIntosh, Project Manager

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Sampler Initials: SA

			Matrix Spike		Spiked Blank		Method Blank		RPD	
QC Batch	Parameter	Date	% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9146428	Reactive Silica	2018/09/17	104	80 - 120	100	80 - 120	<0.050	mg/L	2.4	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
CNI	Test result for Total Cyanide may be biased high due to interference from high nitrite in this sample. Nitrite can cause false positives for T-CN at up to ~ 0.8% of the nitrite concentration. Interpret result as a maximum possible value.
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
K	Matrix Spike recovery outside ALS DQO due to sample matrix effects.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRV	Reported Result Verified By Repeat Analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-CO3CO3-CALC-WP	Water	Alkalinity, Carbonate	CALCULATION
The Alkalinity of water is a measure of its acid neutralizing capacity.Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by carbonate is calculated and reported as mg CO3 2-/L.			
ALK-HCO3HCO3-CALC-WP	Water	Alkalinity, Bicarbonate	CALCULATION
The Alkalinity of water is a measure of its acid neutralizing capacity.Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by bicarbonate is calculated and reported as mg HCO3-/L			
ALK-OHOH-CALC-WP	Water	Alkalinity, Hydroxide	CALCULATION
The Alkalinity of water is a measure of its acid neutralizing capacity.Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by hydroxide is calculated and reported as mg OH-/L.			
ALK-TITR-WP	Water	Alkalinity, Total (as CaCO3)	APHA 2320B
The Alkalinity of water is a measure of its acid neutralizing capacity. Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. Total alkalinity is determined by titration with a strong standard mineral acid to the successive HCO3- and H2CO3 endpoints indicated electrometrically.			
C-DOC-HTC-WP	Water	Dissolved Organic Carbon by Combustion	APHA 5310 B-WP
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
C-TOC-HTC-WP	Water	Total Organic Carbon by Combustion	APHA 5310 B-WP
Sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
CL-L-IC-N-WP	Water	Chloride in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
CN-FREE-CFA-WP	Water	Free Cyanide in water by CFA	ASTM D7237
This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.			
CN-T-CFA-WP	Water	Total Cyanide in water by CFA	ISO 14403-2
This analysis is carried out using procedures adapted from ISO Method 14403-2:2012 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourmetric analysis.			
CN-WAD-CFA-WP	Water	Weak Acid Diss. Cyanide in water by CFA	APHA 4500-CN I
This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak acid dissociable (WAD) cyanide is determined by in-line sample distillation and final determination by colourmetric analysis.			
EC-WP	Water	Conductivity	APHA 2510B
Conductivity of an aqueous solution refers to its ability to carry an electric current. Conductance of a solution is measured between two spatially fixed and chemically inert electrodes.			

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ETL-HARDNESS-DIS-ED	Water	Hardness (from Dissolved Ca and Mg)	APHA 2340 B-Calculation
F-IC-N-WP	Water	Fluoride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
HG-D-L-CVAF-WP	Water	Mercury, Dissolved	EPA 1631 D (modified)
Mercury in filtered aqueous matrices is oxidized with bromine monochloride and analyzed by cold-vapor atomic fluorescence spectrometer.			
HG-T-L-CVAF-WP	Water	Mercury, Total	EPA 1631 T (modified)
Mercury in unfiltered aqueous matrices is oxidized with bromine monochloride and analyzed by cold-vapor atomic fluorescence spectrometer.			
IONBALANCE-CALC-WP	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.			
Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance (as % difference) cannot be calculated accurately for waters with very low electrical conductivity (EC), and is reported as "Low EC" where EC < 100 uS/cm (umhos/cm). Ion Balance is calculated as:			
Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-NP-U-CCMS-ED	Water	Diss. Metals in Water by CRC ICPMS (Ult)	APHA 3125-ICP-MS
Ultra trace metals in water are analyzed by ICPMS, based on US EPA Method 6020A (Jan 1998). This procedure is intended for pristine field-filtered acid-preserved water samples. ALS recommends that filtration blanks be submitted for this test to aid with interpretation of results.			
MET-T-NP-U-CCMS-ED	Water	Metals in Water by CRC ICPMS (No Digest)	APHA 3125-ICP-MS
Ultra trace metals in water are analyzed by ICPMS, based on US EPA Method 6020A (Jan 1998). The detection limits provided can only be met for undigested samples. This procedure is intended for pristine, non-turbid, acid-preserved water samples, where sample turbidity is < 1 NTU. Where turbidity exceeds 1 NTU, results may be biased low compared to true Total Metals concentrations. ALS recommends that turbidity analysis be requested on samples submitted for this test to aid with interpretation of results.			
NH3-L-CFA-ED	Water	Ammonia in Water by Colour	APHA 4500 NH3-NITROGEN (AMMONIA)
This analysis is carried out using procedures adapted from APHA Method 4500 NH3 "NITROGEN (AMMONIA)". Ammonia is determined using the automated phenate colourimetric method.			
NO2+NO3-CALC-L-WP	Water	Nitrate+Nitrite	CALCULATION
NO2-L-IC-N-WP	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WP	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
P-T-L-COL-WP	Water	Phosphorus, Total	APHA 4500 P PHOSPHORUS-L
This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.			
P-TD-L-COL-WP	Water	Phosphorus, Total Dissolved	APHA 4500 P PHOSPHORUS-L
This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Dissolved Phosphorous is determined colourimetrically after persulphate digestion of a sample that has been lab or field filtered through a 0.45 micron membrane filter.			
PH-WP	Water	pH	APHA 4500H
The pH of a sample is the determination of the activity of the hydrogen ions by potentiometric measurement using a standard hydrogen electrode and a reference electrode.			
PO4-DO-L-COL-WP	Water	Phosphate Ortho Dissolved in Water	APHA 4500 P PHOSPHORUS-L
This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.			
RA226-MMER-FC	Water	Ra226 by Alpha Scint, MDC=0.01 Bq/L	EPA 903.1
SIO2-L-COL-WP	Water	Reactive Silica by colour	APHA 4500 SIO2
This analysis is carried out using procedures adapted from APHA Method 4500-SiO2 "Silica". Molybdate Reactive Silica is determined by analysis of the sample using the heteropoly blue colourimetric method.			
SO4-IC-N-WP	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-WP	Water	Total Dissolved Solids (TDS)	APHA 2540 SOLIDS C,E
A well-mixed sample is filtered through a glass fiber filter paper. The filtrate is then evaportaed to dryness in a pre-weighed vial and dried at 180 – 2C. The increase in vial weight represents the total dissolved solids.			
TKN-L-CFA-ED	Water	TKN in Water by Colour	APHA 4500-NORG (TKN)
This analysis is carried out using procedures adapted from APHA Method 4500-Norg "Nitrogen (Organic)". Total Kjeldahl Nitrogen is determined by sample digestion at 380 celcius with analysis using an automated colourimetric finish.			
TSS-LOW-VA	Water	Total Suspended Solids by Grav. (1 mg/L)	APHA 2540D
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total suspended solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			
TURBIDITY-WP	Water	Turbidity	APHA 2130B (modified)
Turbidity in aqueous matrices is determined by the nephelometric method.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WP	ALS ENVIRONMENTAL - WINNIPEG, MANITOBA, CANADA
ED	ALS ENVIRONMENTAL - EDMONTON, ALBERTA, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA
FC	ALS ENVIRONMENTAL - FORT COLLINS, COLORADO, USA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Workorder: L2139293 Report Date: 21-FEB-19

Client: Agnico-Eagle - Meliadine Gold Project

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
J	Duplicate results and limits are expressed in terms of absolute difference.
K	Matrix Spike recovery outside ALS DQO due to sample matrix effects.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2139293 were received on 01-AUG-18 09:40.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Re: ALS Workorder: 1808031
Project Name:
Project Number: L2139293

Dear Ms. Dalmaijer:

Ten water samples were received from ALS Environmental, on 8/2/2018. The samples were scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental
Katie M. OBrien
Project Manager

ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

ALS Environmental – Fort Collins

1808031

Radium-226:
The samples were prepared and analyzed according to the current revision of SOP 783.

Sample 1808031-3 was originally prepped in batch RE180820-2 on 08/20/2018. Due to a laboratory incident, the sample was lost prior to analysis. A replacement was received from the client and the sample was analyzed on 09/11/2018 in batch RE180905-2. Please refer to NCR #14744 at the end of this report for further information.

All acceptance criteria were met.

Analyses	Result	Qual	Report Limit	Units	Dilution Factor	Date Analyzed

Explanation of Qualifiers

Radiochemistry:

- "Report Limit" is the MDC

U or ND - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.

- Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

G - Sample density differs by more than 15% of LCS density.

D - DER is greater than Control Limit

M - Requested MDC not met.

LT - Result is less than requested MDC but greater than achieved MDC.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).

U or ND - Indicates that the compound was analyzed for but not detected.

E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.

M - Duplicate injection precision was not met.

N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.

Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.

* - Duplicate analysis (relative percent difference) not within control limits.

S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

U or ND - Indicates that the compound was analyzed for but not detected.

B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.

E - Analyte concentration exceeds the upper level of the calibration range.

J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).

A - A tentatively identified compound is a suspected aldol-condensation product.

X - The analyte was diluted below an accurate quantitation level.

* - The spike recovery is equal to or outside the control criteria used.

+ - The relative percent difference (RPD) equals or exceeds the control criteria.

G - A pattern resembling gasoline was detected in this sample.

D - A pattern resembling diesel was detected in this sample.

M - A pattern resembling motor oil was detected in this sample.

C - A pattern resembling crude oil was detected in this sample.

4 - A pattern resembling JP-4 was detected in this sample.

5 - A pattern resembling JP-5 was detected in this sample.

H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.

L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.

Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
- gasoline
- JP-8
- diesel
- mineral spirits
- motor oil
- Stoddard solvent
- bunker C

Ft. Collins, Colorado

NCR #: 14744

CONTROLLED
NON-CONFORMANCE REPORT

Non-Conformance

Initiated By: Channing R. Weber on 9/4/2018

Event Type: Laboratory Incident/Error

Event Explanation: The lid to the vial on sample 1808301-3 fell apart while sample was ingrowing and all of sample leaked out before analysis could be completed.

Action To Prevent Reccurence: (isolated incident).(jfn)

Corrective Action

Corrective Action: Replacement volume received from client

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLB	Detection Limit Raised. Analyte detected at comparable level in Method Blank.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-CO3CO3-CALC-WP	Water	Alkalinity, Carbonate	CALCULATION
The Alkalinity of water is a measure of its acid neutralizing capacity.Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by carbonate is calculated and reported as mg CO3 2-/L.			
ALK-HCO3HCO3-CALC-WP	Water	Alkalinity, Bicarbonate	CALCULATION
The Alkalinity of water is a measure of its acid neutralizing capacity.Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by bicarbonate is calculated and reported as mg HCO3-/L			
ALK-OHOH-CALC-WP	Water	Alkalinity, Hydroxide	CALCULATION
The Alkalinity of water is a measure of its acid neutralizing capacity.Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by hydroxide is calculated and reported as mg OH-/L.			
ALK-TITR-WP	Water	Alkalinity, Total (as CaCO3)	APHA 2320B
The Alkalinity of water is a measure of its acid neutralizing capacity. Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. Total alkalinity is determined by titration with a strong standard mineral acid to the successive HCO3- and H2CO3 endpoints indicated electrometrically.			
C-DOC-HTC-WP	Water	Dissolved Organic Carbon by Combustion	APHA 5310 B-WP
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
C-TOC-HTC-WP	Water	Total Organic Carbon by Combustion	APHA 5310 B-WP
Sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
CL-L-IC-N-WP	Water	Chloride in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
CN-FREE-CFA-WP	Water	Free Cyanide in water by CFA	ASTM D7237
This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.			
CN-T-CFA-WP	Water	Total Cyanide in water by CFA	ISO 14403-2
This analysis is carried out using procedures adapted from ISO Method 14403-2:2012 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourmetric analysis.			
CN-WAD-CFA-WP	Water	Weak Acid Diss. Cyanide in water by CFA	APHA 4500-CN I
This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak acid dissociable (WAD) cyanide is determined by in-line sample distillation and final determination by colourmetric analysis.			
EC-WP	Water	Conductivity	APHA 2510B
Conductivity of an aqueous solution refers to its ability to carry an electric current. Conductance of a solution is measured between two spatially fixed and chemically inert electrodes.			
F-IC-N-WP	Water	Fluoride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
HARDNESS-CALC-WP	Water	Hardness Calculated	APHA 2340B
Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.			
HG-D-L-CVAF-WP	Water	Mercury, Dissolved	EPA 1631 D (modified)

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
Mercury in filtered aqueous matrices is oxidized with bromine monochloride and analyzed by cold-vapor atomic fluorescence spectrometer.			
HG-T-L-CVAF-WP	Water	Mercury, Total	EPA 1631 T (modified)
Mercury in unfiltered aqueous matrices is oxidized with bromine monochloride and analyzed by cold-vapor atomic fluorescence spectrometer.			
IONBALANCE-CALC-WP	Water	Ion Balance Calculation	APHA 1030E
Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance (as % difference) cannot be calculated accurately for waters with very low electrical conductivity (EC), and is reported as "Low EC" where EC < 100 uS/cm (umhos/cm). Ion Balance is calculated as: Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]			
MET-D-NP-U-CCMS-ED	Water	Diss. Metals in Water by CRC ICPMS (Ult)	APHA 3125-ICP-MS
Ultra trace metals in water are analyzed by ICPMS, based on US EPA Method 6020A (Jan 1998). This procedure is intended for pristine field-filtered acid-preserved water samples. ALS recommends that filtration blanks be submitted for this test to aid with interpretation of results.			
MET-T-NP-U-CCMS-ED	Water	Metals in Water by CRC ICPMS (No Digest)	APHA 3125-ICP-MS
Ultra trace metals in water are analyzed by ICPMS, based on US EPA Method 6020A (Jan 1998). The detection limits provided can only be met for undigested samples. This procedure is intended for pristine, non-turbid, acid-preserved water samples, where sample turbidity is < 1 NTU. Where turbidity exceeds 1 NTU, results may be biased low compared to true Total Metals concentrations. ALS recommends that turbidity analysis be requested on samples submitted for this test to aid with interpretation of results.			
NH3-L-CFA-ED	Water	Ammonia in Water by Colour	APHA 4500 NH3-NITROGEN (AMMONIA)
This analysis is carried out using procedures adapted from APHA Method 4500 NH3 "NITROGEN (AMMONIA)". Ammonia is determined using the automated phenate colourimetric method.			
NO2+NO3-CALC-L-WP	Water	Nitrate+Nitrite	CALCULATION
NO2-L-IC-N-WP	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-WP	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
P-T-L-COL-WP	Water	Phosphorus, Total	APHA 4500 P PHOSPHORUS-L
This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.			
P-TD-L-COL-WP	Water	Phosphorus, Total Dissolved	APHA 4500 P PHOSPHORUS-L
This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Dissolved Phosphorous is determined colourimetrically after persulphate digestion of a sample that has been lab or field filtered through a 0.45 micron membrane filter.			
PH-WP	Water	pH	APHA 4500H
The pH of a sample is the determination of the activity of the hydrogen ions by potentiometric measurement using a standard hydrogen electrode and a reference electrode.			
PO4-DO-L-COL-WP	Water	Phosphate Ortho Dissolved in Water	APHA 4500 P PHOSPHORUS-L
This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.			
RA226-MMER-FC	Water	Ra226 by Alpha Scint, MDC=0.01 Bq/L	EPA 903.1
SIO2-L-COL-WP	Water	Reactive Silica by colour	APHA 4500 SIO2
This analysis is carried out using procedures adapted from APHA Method 4500-SiO2 "Silica". Molybdate Reactive Silica is determined by analysis of the sample using the heteropoly blue colourimetric method.			
SO4-IC-N-WP	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TDS-WP	Water	Total Dissolved Solids (TDS)	APHA 2540 SOLIDS C,E
A well-mixed sample is filtered through a glass fiber filter paper. The filtrate is then evaportaed to dryness in a pre-weighed vial and dried at 180 – 2C. The increase in vial weight represents the total dissolved solids.			

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
TKN-L-CFA-ED	Water	TKN in Water by Colour	APHA 4500-NORG (TKN)

This analysis is carried out using procedures adapted from APHA Method 4500-Norg "Nitrogen (Organic)". Total Kjeldahl Nitrogen is determined by sample digestion at 380 celcius with analysis using an automated colourimetric finish.

TSS-LOW-VA	Water	Total Suspended Solids by Grav. (1 mg/L)	APHA 2540D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total suspended solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.
Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

TURBIDITY-WP	Water	Turbidity	APHA 2130B (modified)

Turbidity in aqueous matrices is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WP	ALS ENVIRONMENTAL - WINNIPEG, MANITOBA, CANADA
ED	ALS ENVIRONMENTAL - EDMONTON, ALBERTA, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA
FC	ALS ENVIRONMENTAL - FORT COLLINS, COLORADO, USA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

	2	20-AUG-18 08:45	04-SEP-18 12:00	14	15	days	EHT

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2153439 were received on 27-AUG-18 09:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Winnipeg, MB R2J 3T4

Re: ALS Workorder: 1808541
Project Name:
Project Number: L2153439

Dear Ms. Dalmaijer:

Two water samples were received from ALS Environmental, on 8/28/2018. The samples were scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental
Katie M. OBrien
Project Manager

ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

ALS Environmental – Fort Collins

Analyses	Result	Qual	Report Limit	Units	Dilution Factor	Date Analyzed

Explanation of Qualifiers

Radiochemistry:

- "Report Limit" is the MDC

U or ND - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.

- Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

G - Sample density differs by more than 15% of LCS density.

D - DER is greater than Control Limit

M - Requested MDC not met.

LT - Result is less than requested MDC but greater than achieved MDC.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).

U or ND - Indicates that the compound was analyzed for but not detected.

E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.

M - Duplicate injection precision was not met.

N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.

Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.

* - Duplicate analysis (relative percent difference) not within control limits.

S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

U or ND - Indicates that the compound was analyzed for but not detected.

B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.

E - Analyte concentration exceeds the upper level of the calibration range.

J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).

A - A tentatively identified compound is a suspected aldol-condensation product.

X - The analyte was diluted below an accurate quantitation level.

* - The spike recovery is equal to or outside the control criteria used.

+ - The relative percent difference (RPD) equals or exceeds the control criteria.

G - A pattern resembling gasoline was detected in this sample.

D - A pattern resembling diesel was detected in this sample.

M - A pattern resembling motor oil was detected in this sample.

C - A pattern resembling crude oil was detected in this sample.

4 - A pattern resembling JP-4 was detected in this sample.

5 - A pattern resembling JP-5 was detected in this sample.

H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.

L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.

Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
- gasoline
- JP-8
- diesel
- mineral spirits
- motor oil
- Stoddard solvent
- bunker C

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2168402-1
Matrix Spike	Calcium (Ca)-Total	MS-B	L2168402-1
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2168402-1
Matrix Spike	Strontium (Sr)-Total	MS-B	L2168402-1
Matrix Spike	Silica, Reactive (as SiO2)	MS-B	L2168402-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-CO3CO3-CALC-WP	Water	Alkalinity, Carbonate	CALCULATION

The Alkalinity of water is a measure of its acid neutralizing capacity.Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by carbonate is calculated and reported as mg CO3 2-/L.

ALK-HCO3HCO3-CALC-WP	Water	Alkalinity, Bicarbonate	CALCULATION

The Alkalinity of water is a measure of its acid neutralizing capacity.Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by bicarbonate is calculated and reported as mg HCO3-/L

ALK-OHOH-CALC-WP	Water	Alkalinity, Hydroxide	CALCULATION

The Alkalinity of water is a measure of its acid neutralizing capacity.Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by hydroxide is calculated and reported as mg OH-/L.

ALK-TITR-WP	Water	Alkalinity, Total (as CaCO3)	APHA 2320B

The Alkalinity of water is a measure of its acid neutralizing capacity. Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. Total alkalinity is determined by titration with a strong standard mineral acid to the successive HCO3- and H2CO3 endpoints indicated electrometrically.

C-DOC-HTC-WP	Water	Dissolved Organic Carbon by Combustion	APHA 5310 B-WP

Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.

C-TOC-HTC-WP	Water	Total Organic Carbon by Combustion	APHA 5310 B-WP

Sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.

CL-L-IC-N-WP	Water	Chloride in Water by IC (Low Level)	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CN-FREE-CFA-WP	Water	Free Cyanide in water by CFA	ASTM D7237

This analysis is carried out using procedures adapted from ASTM Method 7237 "Free Cyanide with Flow Injection Analysis (FIA) Utilizing Gas Diffusion Separation and Amperometric Detection". Free cyanide is determined by in-line gas diffusion at pH 6 with final determination by colourimetric analysis.

CN-T-CFA-WP	Water	Total Cyanide in water by CFA	ISO 14403-2

This analysis is carried out using procedures adapted from ISO Method 14403-2:2012 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourmetric analysis.

CN-WAD-CFA-WP	Water	Weak Acid Diss. Cyanide in water by CFA	APHA 4500-CN I

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak acid dissociable (WAD) cyanide is determined by in-line sample distillation and final determination by colourmetric analysis.

EC-WP	Water	Conductivity	APHA 2510B

Conductivity of an aqueous solution refers to its ability to carry an electric current. Conductance of a solution is measured between two spatially fixed and chemically inert electrodes.

F-IC-N-WP	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-WP	Water	Hardness Calculated	APHA 2340B

Reference Information

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-L-CVAF-WP Water Mercury, Dissolved EPA 1631 D (modified)

Mercury in filtered aqueous matrices is oxidized with bromine monochloride and analyzed by cold-vapor atomic fluorescence spectrometer.

HG-T-L-CVAF-WP Water Mercury, Total EPA 1631 T (modified)

Mercury in unfiltered aqueous matrices is oxidized with bromine monochloride and analyzed by cold-vapor atomic fluorescence spectrometer.

IONBALANCE-CALC-WP Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance (as % difference) cannot be calculated accurately for waters with very low electrical conductivity (EC), and is reported as "Low EC" where EC < 100 uS/cm (umhos/cm). Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-NP-U-CCMS-ED Water Diss. Metals in Water by CRC ICPMS (Ult) APHA 3125-ICP-MS

Ultra trace metals in water are analyzed by ICPMS, based on US EPA Method 6020A (Jan 1998). This procedure is intended for pristine field-filtered acid-preserved water samples. ALS recommends that filtration blanks be submitted for this test to aid with interpretation of results.

MET-T-NP-U-CCMS-ED Water Metals in Water by CRC ICPMS (No Digest) APHA 3125-ICP-MS

Ultra trace metals in water are analyzed by ICPMS, based on US EPA Method 6020A (Jan 1998). The detection limits provided can only be met for undigested samples. This procedure is intended for pristine, non-turbid, acid-preserved water samples, where sample turbidity is < 1 NTU. Where turbidity exceeds 1 NTU, results may be biased low compared to true Total Metals concentrations. ALS recommends that turbidity analysis be requested on samples submitted for this test to aid with interpretation of results.

NH3-L-CFA-ED Water Ammonia in Water by Colour APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out using procedures adapted from APHA Method 4500 NH3 "NITROGEN (AMMONIA)". Ammonia is determined using the automated phenate colourimetric method.

NO2+NO3-CALC-L-WP Water Nitrate+Nitrite CALCULATION

NO2-L-IC-N-WP Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WP Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-L-COL-WP Water Phosphorus, Total APHA 4500 P PHOSPHORUS-L

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

P-TD-L-COL-WP Water Phosphorus, Total Dissolved APHA 4500 P PHOSPHORUS-L

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Dissolved Phosphorous is determined colourimetrically after persulphate digestion of a sample that has been lab or field filtered through a 0.45 micron membrane filter.

PH-WP Water pH APHA 4500H

The pH of a sample is the determination of the activity of the hydrogen ions by potentiometric measurement using a standard hydrogen electrode and a reference electrode.

PO4-DO-L-COL-WP Water Phosphate Ortho Dissolved in Water APHA 4500 P PHOSPHORUS-L

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

RA226-MMER-FC Water Ra226 by Alpha Scint, MDC=0.01 Bq/L EPA 903.1

SIO2-L-COL-WP Water Reactive Silica by colour APHA 4500 SIO2

This analysis is carried out using procedures adapted from APHA Method 4500-SiO2 "Silica". Molybdate Reactive Silica is determined by analysis of the sample using the heteropoly blue colourimetric method.

SO4-IC-N-WP Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-WP Water Total Dissolved Solids (TDS) APHA 2540 SOLIDS C,E

Reference Information

A well-mixed sample is filtered through a glass fiber filter paper. The filtrate is then evaportaed to dryness in a pre-weighed vial and dried at 180 – 2C. The increase in vial weight represents the total dissolved solids.

TKN-L-CFA-ED Water TKN in Water by Colour APHA 4500-NORG (TKN)

This analysis is carried out using procedures adapted from APHA Method 4500-Norg "Nitrogen (Organic)". Total Kjeldahl Nitrogen is determined by sample digestion at 380 celcius with analysis using an automated colourimetric finish.

TSS-LOW-VA Water Total Suspended Solids by Grav. (1 mg/L) APHA 2540D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total suspended solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.
Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

TURBIDITY-WP Water Turbidity APHA 2130B (modified)

Turbidity in aqueous matrices is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
FC	ALS ENVIRONMENTAL - FORT COLLINS, COLORADO, USA
WP	ALS ENVIRONMENTAL - WINNIPEG, MANITOBA, CANADA
ED	ALS ENVIRONMENTAL - EDMONTON, ALBERTA, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2168402 were received on 21-SEP-18 09:20.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Re: ALS Workorder: 1809488
Project Name:
Project Number: L2168402

Dear Ms. Dalmaijer:

One water sample was received from ALS Environmental, on 9/24/2018. The sample was scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental
Katie M. OBrien
Project Manager

ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

CONDITIONS OF CARRIAGE

IMPORTANT - PLEASE READ: The consignor agrees that the act of tendering the shipment to the carrier for transportation shall be sufficient to constitute signature of this bill of lading by the consignor and shall bind the consignor to the conditions of carriage stated below.

RECEIPT Carrier acknowledges receiving from the shipper, at the point of origin and on the date specified, the shipment described in this bill of lading in apparent good order, except as noted (contents and conditions of contents of shipment unknown), and agrees to carry and deliver the shipment to the receiver at the destination set out in this bill of lading, subject to payment of all lawful charges. "Carrier" refers to Purolator Inc. and any connecting and/or successive carriers involved in the transportation of the shipment herein described, including any of their respective subsidiaries, controlled entities, and their respective employees, agents and independent contractors.

LIMITATION ON LIABILITY Carrier's liability in respect of the shipment described in this bill of lading (including for any loss, damage, delay, misdelivery, non-delivery or failure to deliver) is limited to $2.00 per pound ($4.41 per kilogram) computed on the total weight of the shipment, unless a higher value is declared in the specially marked Purolator Online Shipping user entry field, "Declared Value for Insurance ($)". Notwithstanding any disclosure of the nature or value of the goods carried or any special agreement to the contrary, carrier is not liable under any circumstances for the consequences of delay, or for any indirect or consequential damages (including lost profits) howsoever caused.

NOTICE OF CLAIM Carrier is not liable for any loss, damage or delay to any goods carried under this bill of lading unless notice of the claim setting out particulars of the origin, destination and date of shipment of the goods and the estimated amount claimed in respect of such loss, damage or delay is given in writing to the carrier within sixty (60) days after the delivery of the goods, or, in the case of failure to make delivery, within nine (9) months from the date of shipment. Subject to any overriding statutory provisions, the final statement of the claim must be filed within nine (9) months from the date of shipment, together with a copy of the paid freight bill. If the Convention applies, other notice periods may govern. No claim will be entertained until all transportation charges due in connection with this bill of lading have been paid in full. All claims are subject to proof of amount of loss.

TERMS INCORPORATED BY REFERENCE Every service to be performed under this bill of lading is subject to the conditions of carriage contained in this bill of lading, including the terms and conditions contained in Purolator Inc.'s published terms and conditions of carriage and the terms and conditions prescribed by the law of the jurisdiction where the goods originate (including the uniform conditions of carriage thereunder, if any). If the carriage involves an ultimate destination or a stop in a country other than the country of departure, the Convention (as defined below) may apply and limit the liability of the carrier in respect of loss of, damage to or delay of cargo. "Convention" means the Convention for the Unification of Certain Rules relating to International Carriage by Air, signed at Warsaw, Poland, 12 October, 1929, or the Convention for the Unification of Certain Rules for International Carriage by Air, signed at Montreal, Canada, 28 May, 1999, or those Conventions as amended or supplemented as may be applicable to the carriage hereunder.

MISCELLANEOUS Unless otherwise indicated, the consignor's name and address is the sender's name and address indicated on this bill of lading, and the latter is the place of execution and the place of departure; the consignee's name and address is the receiver's name and address indicated on this bill of lading, and the latter is the place of destination; and the date indicated on this bill of lading is the date of execution. There are no specific stopping places which are agreed to, and the carrier reserves the right to select the route and the mode of transportation that the carrier deems appropriate. The consignor warrants that the shipment is properly described on this bill of lading and on any accompanying documentation, and that the shipment is properly marked, addressed and packed to ensure safe transportation in accordance with the carrier's ordinary care in handling. Unless otherwise indicated on this bill of lading, the consignor waives its right to determine the volume or dimensions of the shipment, and to indicate same on this bill of lading. The consignor appoints the carrier as its agent for the performance of customs clearance and selecting a customs broker.

ENTIRE AGREEMENT The terms and conditions contained in this bill of lading, including those incorporated herein by reference, constitute the entire agreement relating to the carriage of the shipment described in this bill of lading, and no agent, servant or representative of the carrier or consignor has the authority to alter, waive or otherwise modify any provision of this agreement. In tendering the shipment described herein for carriage, the consignor agrees to these terms and conditions on his own behalf and on behalf of the consignee and any other party claiming an interest in this shipment.

Analyses	Result	Qual	Report Limit	Units	Dilution Factor	Date Analyzed

Explanation of Qualifiers

Radiochemistry:

- "Report Limit" is the MDC

U or ND - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.

- Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

G - Sample density differs by more than 15% of LCS density.

D - DER is greater than Control Limit

M - Requested MDC not met.

LT - Result is less than requested MDC but greater than achieved MDC.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).

U or ND - Indicates that the compound was analyzed for but not detected.

E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.

M - Duplicate injection precision was not met.

N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.

Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.

* - Duplicate analysis (relative percent difference) not within control limits.

S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

U or ND - Indicates that the compound was analyzed for but not detected.

B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.

E - Analyte concentration exceeds the upper level of the calibration range.

J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).

A - A tentatively identified compound is a suspected aldol-condensation product.

X - The analyte was diluted below an accurate quantitation level.

* - The spike recovery is equal to or outside the control criteria used.

+ - The relative percent difference (RPD) equals or exceeds the control criteria.

G - A pattern resembling gasoline was detected in this sample.

D - A pattern resembling diesel was detected in this sample.

M - A pattern resembling motor oil was detected in this sample.

C - A pattern resembling crude oil was detected in this sample.

4 - A pattern resembling JP-4 was detected in this sample.

5 - A pattern resembling JP-5 was detected in this sample.

H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.

L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.

Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
- gasoline
- JP-8
- diesel
- mineral spirits
- motor oil
- Stoddard solvent
- bunker C

Dear Jennifer,

Re: Report on Sublethal Toxicity Analysis of Wastewater for MMER - August 2018

Enclosed are the reports for sublethal testing conducted on the sample of MEL-14 collected 2018-08-07. Data are presented in electronic format.

As you are aware, submission of sublethal toxicity data via RISS is a requirement of the MMER regulation. We would be pleased to enter this information on your behalf, for a fee. Please review the attached reports, and in an e-mail to **reporter@aquatox.ca**, provide us with your RISS user name and password (supplied to you by ECCC), along with written permission for AquaTox to access RISS on your behalf. We will then enter your results. In the future, if you would prefer us to enter the data automatically at the time the reports are issued, please indicate this in writing.

If you have any questions about the results, do not hesitate to contact me.

Sincerely,

AQUATOX TESTING & CONSULTING INC.

Martina Rendas
Project Manager

TOXICITY TEST REPORT

Fathead minnow
EPS 1/RM/22

Work Order : 236864
Sample Number : 55841

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-07
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-09
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	23.0 °C
Sampled By :	J. Brown	Date Tested :	2018-08-09
Sample Description :	Clear, yellow, odourless.		

Test Method : Test of Larval Growth and Survival Using Fathead Minnows. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/22 , 2nd ed. (February 2011).

7-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth from Biomass)	>100%	–	–
LC50	>100%	–	–

The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

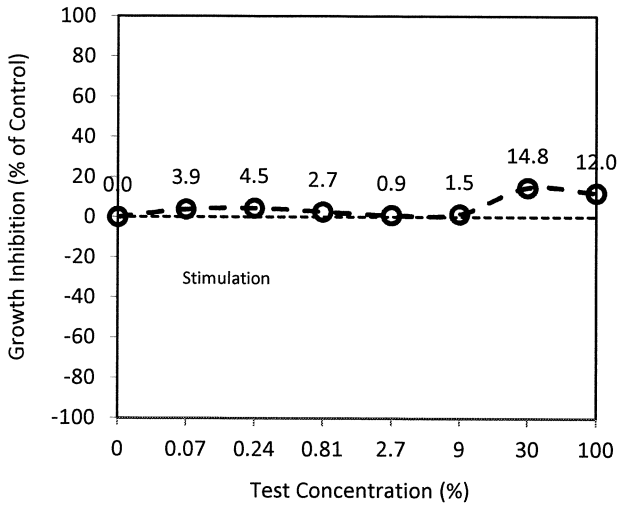
Date Tested :	2018-07-31		
Test Duration :	7 days	Analyst(s) :	MV, RD, MR
IC25 Growth (from Biomass) :	0.87 g/L	LC50 :	1.00 g/L
95% Confidence Limits :	0.78 - 0.93 g/L	95% Confidence Limits :	0.93 - 1.07 g/L
Statistical Method :	Non-Linear Regression (CETIS)[a]	Statistical Method :	Linear Regression (MLE) (CETIS)[a]
Historical Mean IC25 :	0.94 g/L	Historical Mean LC50 :	1.10 g/L
Warning Limits (± 2SD) :	0.71 - 1.24 g/L	Warning Limits (± 2SD) :	0.92 - 1.31 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS

Test Organism :	*Pimephales promelas*	Test Type :	Static Renewal
Organism Batch :	Fm18-08	Control/Dilution Water :	Well water (no additional chemicals)
Organism Age :	~07:00 - 21:15 h at start of test	Test Volume / Replicate :	300 mL
Source :	In-house culture	Test Vessel :	420 mL polystyrene beaker
Culture Mortality/Diseased :	0.38 % (previous 7 days)	Depth of Test Solution :	8 cm
pH Adjustment :	None	Organisms per Replicate :	10
Sample Filtration :	None	Number of Replicates :	3
Hardness Adjustment :	None	Daily Renewal Method :	80-85% syphoned and replaced
Test Aeration :	None	Test Method Deviation(s):	None

COMMENTS



•All test validity criteria as specified in the test method cited above were satisfied.

•No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.

•Inflated swim bladders were confirmed in all test organisms used in this test.

Work Order : 236864

TOXICITY TEST REPORT

Ceriodaphnia dubia
EPS 1/RM/21

Work Order : 236864
Sample Number : 55841

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-07
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-09
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	23.0 °C
Sampled By :	J. Brown	Date Tested :	2018-08-09
Sample Description :	Clear, yellow, odourless.		

Test Method : Test of Reproduction and Survival using the Cladoceran *Ceriodaphnia dubia*. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/21, 2nd ed. (February 2007).

6-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Reproduction)	>100 %	–	–
LC50	>100 %	–	–

The results reported relate only to the sample tested and as received.

SODIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-07-31		
Test Duration :	6 days	Analyst(s) :	MW, MR
IC25 Reproduction :	1.09 g/L	LC50 :	2.74 g/L[2]
95% Confidence Limits :	0.90 - 1.30 g/L	95% Confidence Limits :	2.17 - 3.68 g/L
Statistical Method :	Non-linear Regression[1] (CETIS)[a]	Statistical Method :	Linear Regression (MLE) (CETIS)[a]
Historical Mean IC25 :	1.31 g/L	Historical Mean LC50 :	2.21 g/L
Warning Limits (± 2SD) :	1.00 - 1.72 g/L	Warning Limits (± 2SD) :	1.87 - 2.61 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS

Sample Filtration :	None	Test Volume per Replicate :	15 mL
Test Aeration :	None	Test Vessel :	19 mL polystyrene vial
pH Adjustment :	None	Depth of Test Solution :	4.8 cm
Hardness Adjustment :	None	Number of Replicates :	10
Renewal Frequency :	Once daily (≤24 h)	Organisms per Replicate :	1
Renewal Method :	Transferred to fresh solutions	Number of Concentrations :	7 + 1 Control
Control/Dilution Water :	Well water (no chemicals added)	Test Method Deviation(s) :	None

COMMENTS

[1]Poisson weighting (CETIS)[a] was applied.

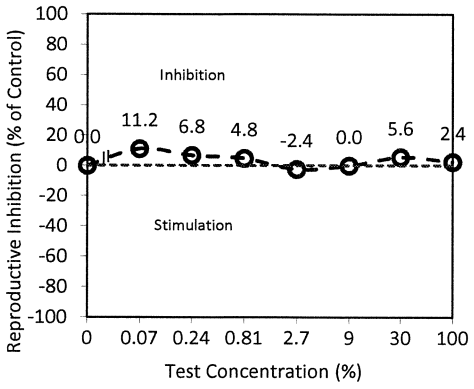
[2]Note: The reference toxicant LC50 test result exceeded the 95% warning limits for historical data. No other unusual circumstances were observed and therefore the test result is considered acceptable.

•All test validity criteria as specified in the test method cited above were satisfied.

Work Order : 236864
Sample Number : 55841

TEST ORGANISMS

Test Organism :	*Ceriodaphnia dubia*	Range of Age (at start of test) :	07:50 h - 19:50 h
Organism Batch :	Cd18-08	Mean Brood Organism Mortality :	0%
Organism Origin :	Single in-house mass culture	Ephippia in Culture :	No
Test Organism Origin :	Individual in-house cultures		



Brood Organism Neonate Production

Replicate :	1	2	3	4	5	6	7	8	9	10	Mean
Total (third or subsequent brood):	12	18	15	12	16	12	12	14	12	15	13.8
Total (first three broods):	25	28	27	25	23	26	27	23	26	25	25.5

No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.

NOTES : •All young produced by a test organism during its fourth and subsequent broods were discarded and not included in the above counts. The presence of two or more neonates in any test chamber, during any given day of the test, constitutes a brood.

•[3] Outlier according to Grubbs Test [b]. Outlying data points were not excluded from statistical analysis, since they could not be attributed to error.

"x"= test organism mortality
"*"= accidental test organism mortality
"–"=4th brood (see 'NOTES')

TOXICITY TEST REPORT

Lemna minor
EPS 1/RM/37

Work Order : 236864
Sample Number : 55841

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-07
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-09
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	23.0 °C
Sampled By :	J. Brown	Date Tested :	2018-08-09
Sample Description :	Clear, yellow, odourless.		

Test Method : Test for Measuring the Inhibition of Growth using the Freshwater Macrophyte, *Lemna minor*. Method Development and Application Section, Environmental Technology Centre, Environment Canada. Ottawa, Ontario. Report EPS 1/RM/37, 2nd ed. (January 2007).

7-DAY TEST RESULTS

Effect	Value (%)	95% Confidence Limits	Statistical Method
IC25 (Frond Yield)	72.3%	36.4 - 86.5	Linear Interpolation (CETIS)[a]
IC25 (Weight)	>97.0	–	–

The results reported relate only to the sample tested and as received.

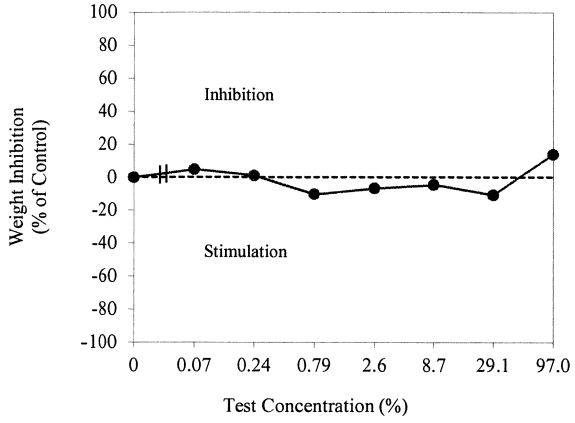
POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-08-15	Historical Geometric Mean IC25 :	2.04 g/L
Test Duration :	7 days	Warning Limits (± 2SD) :	1.52 - 2.74 g/L
IC25 (Frond Production) :	2.16 g/L	Growth Medium :	Modified APHA
95% Confidence Limits :	1.95 - 2.39 g/L	Analyst(s) :	MA, CZN
Statistical Method :	Non-Linear Regression (CETIS)[a]		

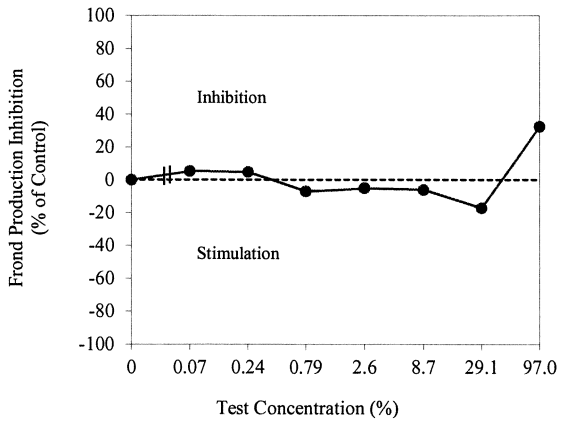
The reference toxicant test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS

Test Organism :	*Lemna minor* L., Strain 7730	Test Type :	Static (no sub-samples required)
Organism Batch :	Lm18-07	Control/Dilution Medium :	Modified APHA
Culture Origin :	UTCC 492	Medium Preparation Water :	Distilled Water
Test Organism Source :	Axenic in-house culture	Source of Water :	Morning Mist
Culture Medium :	Modified Hoaglands E+	Medium Preparation Chemicals :	Modified APHA stocks A, B, C (10 mL/L)
Age (on Test Day 0) :	10 days	Nutrient Spiking of Sample :	Modified APHA stocks A, B, C (10 mL/L)
Health Criteria (in APHA) :	13.33-fold frond increase in 7 days	Replicates per Concentration :	4
Organism Acclimation :	21:15 h in APHA medium	Test Volume per Replicate :	100 mL
Inoculum (Test Day 0) :	2 plants (3 fronds per plant)	Test Vessel :	250 mL glass Erlenmeyer flask
Sample Filtration :	1 µm (Whatman GF/C)	Depth of Test Solution :	4.0 cm
Sample Pre-aeration :	20 min. at ≤100 bubbles/min.	Photoperiod/Light Intensity :	Continuous, 4460 - 5250 lux
pH Adjustment :	None	Test Method Deviation(s) :	None
Hardness Adjustment :	None		



COMMENTS



•All test validity criteria as specified in the test method cited above were satisfied.

•Statistical analysis could not be performed using non linear regression, since a suitable model could not be found. Therefore, test results were calculated using Linear Interpolation (CETIS)[a]. In test concentrations where frond production/weights were stimulated (greater than the control), data were replaced with control values for the purposes of statistical analysis, as recommended by Environment Canada (2005).

TOXICITY TEST REPORT

Pseudokirchneriella subcapitata

EPS 1/RM/25

Work Order : 236864
Sample Number : 55841

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-07
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-09
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	23.0 °C
Sampled By :	J. Brown	Date Tested :	2018-08-09
Sample Description :	Clear, yellow, odourless.		

Test Method : Growth Inhibition Test Using a Freshwater Alga. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/25, 2nd ed. (March 2007).

72-h TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth)	>90.91 %	–	–

The results reported relate only to the sample tested.

ZINC (AS ZINC SULPHATE) REFERENCE TOXICANT DATA

Date Tested :	2018-08-21	Statistical Method :	Non-Linear Regression (CETIS)[a]
Organism Batch :	Ps18-08	Historical Mean IC25 :	10.4 µg/L
Test Duration :	72 hours	Warning Limits (± 2SD) :	4.9 - 22.3 µg/L
IC25 Growth :	8.8 µg/L	Analyst(s) :	AS, MDS, CZN
95% Confidence Limits :	7.5 - 10.2 µg/L		

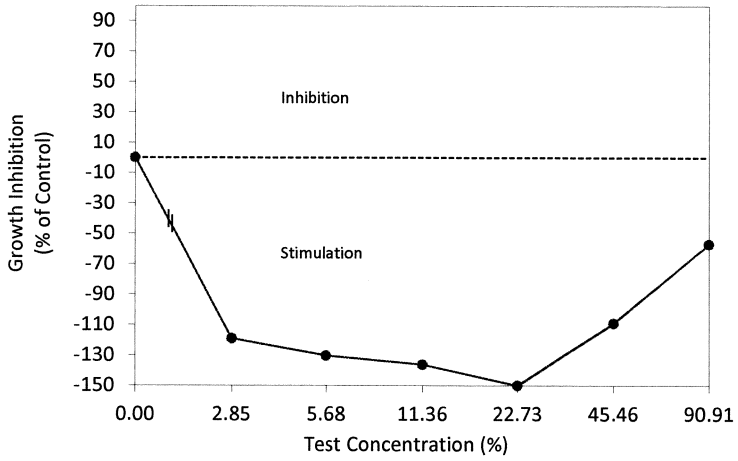
The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST ORGANISM

Test Organism :	*Pseudokirchneriella subcapitata*	Source :	In-house culture
Culture Origin :	University of Waterloo, Waterloo ON	Cell Density at 0-h :	9818 cells/mL
Strain Number :	CPCC 37	Inoculum Prepared :	00:05 h prior to test initiation
Organism Batch :	Ps18-08	Age (at start of test) :	3 days (in exponential growth)

•Algal growth curve is determined at least twice per year as required by the test method cited above.
•No unusual appearance or treatment of culture prior to testing.

TEST CONDITIONS



Test Type :	Static	Volume per Replicate :	220 µL
Test Duration :	72 hours	Control Replicates :	10
Mean Temperature (± SD):	24.3°C (± 0.3)	Test Replicates :	4
Sample Pre-aeration :	None	Concentrations Tested :	10 + Control
Sample Filtration :	0.45 µm preconditioned filter	Photoperiod :	Continuous light
Volume Filtered:	≥10 mL	Light Intensity :	3800-4320 lux
Control/Dilution Water :	Millipore Milli-Q (no chemicals added)	pH Adjustment :	None
Enrichment Medium :	Stock 2B: EDTA reduced to 25%	Hardness Adjustment :	None
Test Vessel :	U-shaped polystyrene microplate	Test Method Deviation(s) :	None

COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.

Work Order : 236864
Sample Number : 55841

Dear Jennifer,

Re: Report on Sublethal Toxicity Analysis of Wastewater for MMER - August 2018

Enclosed are the reports for sublethal testing conducted with Fathead Minnow, *Lemna minor*, and *Pseudokirchneriella subcapitata* on the sample of MEL-14 collected 2018-08-13. Data are presented in electronic format. The corresponding test with *Ceriodaphnia dubia* was unsuccessful, and requested submission of a sample to retest. Our understanding resampling was not possible at the time of notification.

As you are aware, submission of sublethal toxicity data via RISS is a requirement of the MMER regulation. We would be pleased to enter this information on your behalf, for a fee. Please review the attached reports, and in an e-mail to reporter@aquatox.ca, provide us with your RISS user name and password (supplied to you by ECCC), along with written permission for AquaTox to access RISS on your behalf. We will then enter your results. In the future, if you would prefer us to enter the data automatically at the time the reports are issued, please indicate this in writing.

If you have any questions about the results, do not hesitate to contact me.

Sincerely,

AQUATOX TESTING & CONSULTING INC.

Martina Rendas
Project Manager

TOXICITY TEST REPORT

Fathead minnow
EPS 1/RM/22

Work Order : 236923
Sample Number : 55913

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-13
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-15
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	21.0 °C
Sampled By :	D. Gorton	Date Tested :	2018-08-16
Sample Description :	Clear, light yellow, odourless.		

Test Method : Test of Larval Growth and Survival Using Fathead Minnows. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/22 , 2nd ed. (February 2011).

7-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth from Biomass)	>100%	–	–
LC50	>100%	–	–

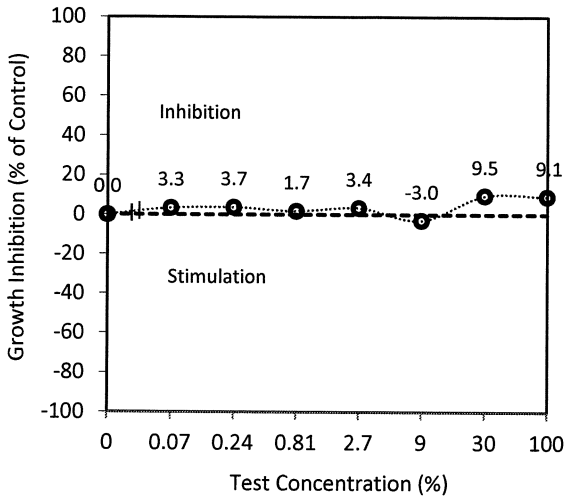
The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-08-28	Analyst(s) :	MV, RD, MA
Organism Batch :	Fm18-08	Test Duration :	7 days
IC25 Growth (from Biomass) :	0.90 g/L	LC50 :	1.03 g/L
95% Confidence Limits :	0.81 - 0.97 g/L	95% Confidence Limits :	0.96 - 1.11 g/L
Statistical Method :	Non-Linear Regression (CETIS)[a]	Statistical Method :	Linear Regression (MLE) (CETIS)[a]
Historical Mean IC25 :	0.93 g/L	Historical Mean LC50 :	1.09 g/L
Warning Limits (± 2SD) :	0.71 - 1.23 g/L	Warning Limits (± 2SD) :	0.91 - 1.30 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS



Test Organism :	*Pimephales promelas*	Test Type :	Static Renewal
Organism Batch :	Fm18-08	Control/Dilution Water :	Well water (no additional chemicals)
Organism Age :	~07:00 - 20:35 h at start of test	Test Volume / Replicate :	300 mL
Source :	In-house culture	Test Vessel :	420 mL polystyrene beaker
Culture Mortality/Diseased :	0.77 % (previous 7 days)	Depth of Test Solution :	8 cm
pH Adjustment :	None	Organisms per Replicate :	10
Sample Filtration :	None	Number of Replicates :	3
Hardness Adjustment :	None	Daily Renewal Method :	80-85% syphoned and replaced
Test Aeration :	None	Test Method Deviation(s):	None

COMMENTS

- All test validity criteria as specified in the test method cited above were satisfied.
- No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.
- Inflated swim bladders were confirmed in all test organisms used in this test.

TOXICITY TEST REPORT

Lemna minor
EPS 1/RM/37

Work Order : 236923
Sample Number : 55913

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-13
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-15
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	21.0 °C
Sampled By :	D. Gorton	Date Tested :	2018-08-16
Sample Description :	Clear, light yellow, odourless.		

Test Method : Test for Measuring the Inhibition of Growth using the Freshwater Macrophyte, *Lemna minor*. Method Development and Application Section, Environmental Technology Centre, Environment Canada. Ottawa, Ontario. Report EPS 1/RM/37, 2nd ed. (January 2007).

7-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Frond Yield)	38.2%	26.6 - 52.1	Non-Linear Regression* (CETIS)[a]
IC25 (Weight)	42.0%	26.5 - 63.2	Non-Linear Regression (CETIS)[a]

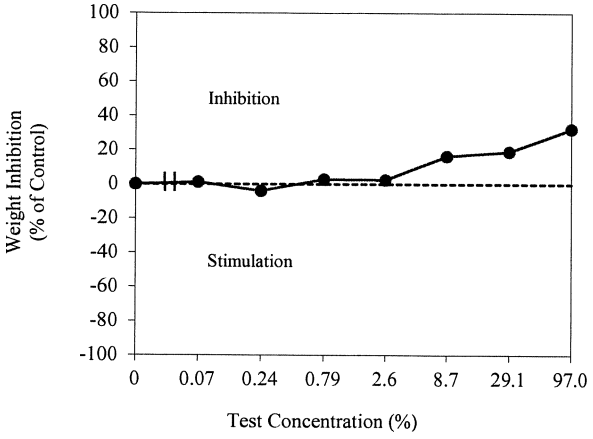
The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

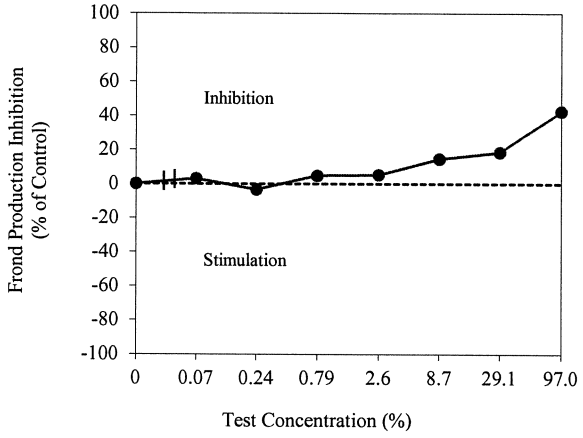
Date Tested :	2018-08-15	Statistical Method :	Non-Linear Regression (CETIS)[a]
Organism Batch :	Lm18-08	Historical Geometric Mean IC25 :	2.04 g/L
Test Duration :	7 days	Warning Limits (± 2SD) :	1.52 - 2.74 g/L
IC25 (Frond Production) :	2.16 g/L	Growth Medium :	Modified APHA
95% Confidence Limits :	1.95 - 2.39 g/L	Analyst(s) :	MA, CZN

The reference toxicant test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS



Test Organism :	*Lemna minor* L., Strain 7730	Test Type :	Static (no sub-samples required)
Organism Batch :	Lm18-08	Control/Dilution Medium :	Modified APHA
Culture Origin :	UTCC 492	Medium Preparation Water :	Distilled Water
Test Organism Source :	Axenic in-house culture	Source of Water :	Morning Mist
Culture Medium :	Modified Hoaglands E+	Medium Preparation Chemicals :	Modified APHA stocks A, B, C (10 mL/L)
Age (on Test Day 0) :	9 days	Nutrient Spiking of Sample :	Modified APHA stocks A, B, C (10 mL/L)
Health Criteria (in APHA) :	22.2-fold frond increase in 7 days	Replicates per Concentration :	4
Organism Acclimation :	23:20 h in APHA medium	Test Volume per Replicate :	100 mL
Inoculum (Test Day 0) :	2 plants (3 fronds per plant)	Test Vessel :	250 mL glass Erlenmeyer flask
Sample Filtration :	1 µm (Whatman GF/C)	Depth of Test Solution :	4.0 cm
Sample Pre-aeration :	20 min. at ≤100 bubbles/min.	Photoperiod/Light Intensity :	Continuous, 4100 - 5290 lux
pH Adjustment :	None	Test Method Deviation(s) :	None
Hardness Adjustment :	None		



COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.
*Box-Cox weighting (CETIS)[a] was applied.

Work Order : 236923
Sample Number : 55913

Dear Jennifer,

Re: Report on Sublethal Toxicity Analysis of Wastewater for MMER - September 2018

Enclosed are the reports for sublethal testing conducted on the sample of MEL-14 collected 2018-09-03. Data are presented in electronic format.

As you are aware, submission of sublethal toxicity data via RISS is a requirement of the MMER regulation. We would be pleased to enter this information on your behalf, for a fee. Please review the attached reports, and in an e-mail to **reporter@aquatox.ca**, provide us with your RISS user name and password (supplied to you by ECCC), along with written permission for AquaTox to access RISS on your behalf. We will then enter your results. In the future, if you would prefer us to enter the data automatically at the time the reports are issued, please indicate this in writing.

If you have any questions about the results, do not hesitate to contact me.

Sincerely,

AQUATOX TESTING & CONSULTING INC.

Martina Rendas

TOXICITY TEST REPORT

Fathead minnow
EPS 1/RM/22

Work Order : 237106
Sample Number : 56153

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project		
Location :	Rankin Inlet NU	Date Collected :	2018-09-03
Substance :	MEL-14	Time Collected :	07:00
Sampling Method :	Grab	Date Received :	2018-09-06
Sampled By :	J. Brown	Time Received :	09:45
Temp. on arrival :	22.0°C	Date Tested :	2018-09-06
Sample Description :	Clear, yellow, odourless		
Test Method :	Test of Larval Growth and Survival Using Fathead Minnows. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/22 , 2nd ed. (February 2011).		

TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth from Biomass)	>100%	-	-
LC50	>100%	-	-

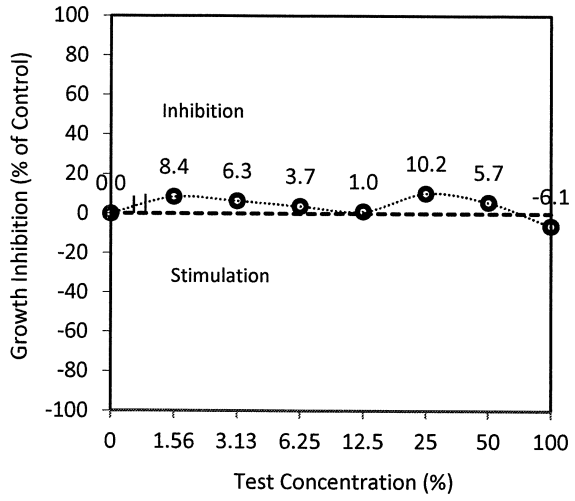
The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-08-28		
Test Duration :	7 days	Analyst(s) :	MV, RD, MA
IC25 Growth (from Biomass) :	0.90 g/L	LC50 :	1.03 g/L
95% Confidence Limits :	0.81 - 0.97 g/L	95% Confidence Limits :	0.96 - 1.11 g/L
Statistical Method :	Non-Linear Regression (CETIS)[a]	Statistical Method :	Linear Regression (MLE) (CETIS)[a]
Historical Mean IC25 :	0.93 g/L	Historical Mean LC50 :	1.09 g/L
Warning Limits (± 2SD) :	0.71 - 1.23 g/L	Warning Limits (± 2SD) :	0.91 - 1.30 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS



Test Organism :	*Pimephales promelas*	Test Type :	Static Renewal
Organism Batch :	Fm18-09	Control/Dilution Water :	Well water (no chemicals added)
Organism Age :	~07:00 - 23:35 h at start of test	Test Volume / Replicate :	300 mL
Source :	In-house culture	Test Vessel :	420 mL polystyrene beaker
Culture Mortality/Diseased :	1.54 % (previous 7 days)	Depth of Test Solution :	8 cm
pH Adjustment :	None	Organisms per Replicate :	10
Sample Filtration :	None	Number of Replicates :	3
Hardness Adjustment :	None	Daily Renewal Method :	80-85% syphoned and replaced
Test Aeration :	None	Test Method Deviation(s):	None

COMMENTS

- All test validity criteria as specified in the test method cited above were satisfied.
- No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.
- Inflated swim bladders were confirmed in all test organisms used in this test.

Work Order : 237106
Sample Number : 56153

Aberrant behaviour or swimming impairment : None

NOTES : *2018-09-13: Replicate 1.56-A was accidentally spilled. Two test organisms were lost from the test vessel, resulting in accidental mortalities (SD/RD). The test organisms that suffered accidental mortalities were excluded from statistical analysis. All test endpoints were calculated from a total of 8 test organisms exposed in replicate 1.56-A (VC).

TOXICITY TEST REPORT

Ceriodaphnia dubia
EPS 1/RM/21

Work Order : 237106
Sample Number : 56153

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project		
Location :	Rankin Inlet NU	Date Collected :	2018-09-03
Substance :	MEL-14	Time Collected :	07:00
Sampling Method :	Grab	Date Received :	2018-09-06
Sampled By :	J. Brown	Time Received :	09:45
Temp. on arrival :	22.0°C	Date Tested :	2018-09-06
Sample Description :	Clear, yellow, odourless		

Test Method : Test of Reproduction and Survival using the Cladoceran *Ceriodaphnia dubia*. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/21, 2nd ed. (February 2007).

TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
LC50	>100%	-	-
IC25 (Reproduction)	90.1%	23.3-96.3	Linear Interpolation (TOXSTAT) d

The results reported relate only to the sample tested and as received.

SODIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-08-28		
Test Duration :	6 days	Analyst(s) :	MW, MA
IC25 Reproduction :	1.46 g/L	LC50 :	2.32 g/L
95% Confidence Limits :	0.98 - 1.82 g/L	95% Confidence Limits :	1.80 - 3.00 g/L
Statistical Method :	Linear Interpolation (CETIS)[a]	Statistical Method :	Binomial (CETIS)[a]
Historical Mean IC25 :	1.30 g/L	Historical Mean LC50 :	2.23 g/L
Warning Limits (± 2SD) :	0.98 - 1.73 g/L	Warning Limits (± 2SD) :	1.84 - 2.70 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS

Sample Filtration :	None	Test Volume per Replicate :	15 mL
Test Aeration :	None	Test Vessel :	19 mL polystyrene vial
pH Adjustment :	None	Depth of Test Solution :	4.8 cm
Hardness Adjustment :	None	Organisms per Replicate :	1
Daily Renewal Method :	Transferred to fresh solutions	Number of Replicates :	10
Control/Dilution Water :	Well water (no chemicals added)	Test Method Deviation(s) :	None

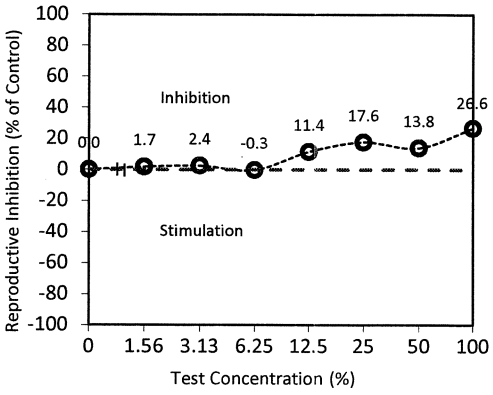
COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.
•Statistical analysis could not be performed using non linear regression, since a suitable model could not be found. Therefore, test results were calculated using Linear Interpolation (Toxstat)[d]. In test concentrations where reproduction was stimulated (greater than the control), data were replaced with control values for the purposes of statistical analysis, as recommended by Environment Canada (2005).

Work Order : 237106
Sample Number : 56153

TEST ORGANISMS

Test Organism :	*Ceriodaphnia dubia*	Range of Age (at start of test) :	19:40 h - 23:40 h
Organism Batch :	Cd18-09	Mean Brood Organism Mortality :	3.3%
Organism Origin :	Single in-house mass culture	Ephippia in Culture :	No
Test Organism Origin :	Individual in-house cultures		



Brood Organism Neonate Production

Replicate :	1	2	3	4	5	6	7	8	9	10	Mean
Total (third or subsequent brood):	16	9	15	15	15	17	12	17	16	15	14.7
Total (first three broods):	23	19	23	19	21	23	21	25	20	23	21.7

No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.

TOXICITY TEST REPORT

Lemna minor
EPS 1/RM/37

Work Order : 237106
Sample Number : 56153

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project		
Location :	Rankin Inlet NU	Date Collected :	2018-09-03
Substance :	MEL-14	Time Collected :	07:00
Sampling Method :	Grab	Date Received :	2018-09-06
Sampled By :	J. Brown	Time Received :	09:45
Temp. on arrival :	22.0°C	Date Tested :	2018-09-06
Sample Description :	Clear, yellow, odourless		

Test Method : Test for Measuring the Inhibition of Growth using the Freshwater Macrophyte, *Lemna minor.* Method Development and Application Section, Environmental Technology Centre, Environment Canada. Ottawa, Ontario. Report EPS 1/RM/37, 2nd ed. (January 2007).

TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Weight)	>97.0%	-	-
IC25 (Frond Production)	>97.0%	-	-

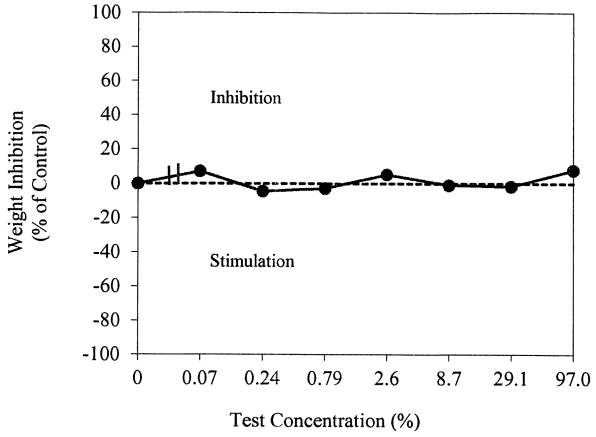
The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

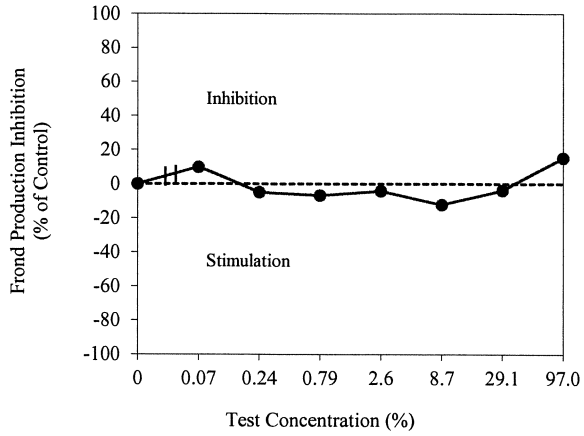
Date Tested :	2018-09-12	Statistical Method :	Non-Linear Regression (CETIS)[a]
Test Duration :	7 days	Historical Geometric Mean IC25 :	2.11 g/L
IC25 (Frond Production) :	2.45 g/L	Warning Limits (± 2SD) :	1.57 - 2.85 g/L
95% Confidence Limits :	1.99 - 2.90 g/L	Growth Medium :	Modified APHA
		Analyst(s) :	MDS

The reference toxicant test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS



Test Organism :	*Lemna minor* L., Strain 7730	Test Type :	Static (no sub-samples required)
Organism Batch :	Lm18-08	Control/Dilution Medium :	Modified APHA
Culture Origin :	UTCC 492	Medium Preparation Water :	Distilled Water
Test Organism Source :	Axenic in-house culture	Source of Water :	Morning Mist
Culture Medium :	Modified Hoaglands E+	Medium Preparation Chemicals :	Modified APHA stocks A, B, C (10 mL/L)
Age (on Test Day 0) :	9 days	Nutrient Spiking of Sample :	Modified APHA stocks A, B, C (10 mL/L)
Health Criteria (in APHA) :	16.16-fold frond increase in 7 days	Replicates per Concentration :	4
Organism Acclimation :	19:50 h in APHA medium	Test Volume per Replicate :	100 mL
Inoculum (Test Day 0) :	2 plants (3 fronds per plant)	Test Vessel :	250 mL glass Erlenmeyer flask
Sample Filtration :	1 µm (Whatman GF/C)	Depth of Test Solution :	4.0 cm
Sample Pre-aeration :	20 min. at ≤100 bubbles/min.	Photoperiod/Light Intensity :	Continuous, 4290 - 5440 lux
pH Adjustment :	None	Test Method Deviation(s) :	None
Hardness Adjustment :	None		



COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.

	D	6	54	48				

NOTES: *No unusual appearance or treatment of culture prior to testing. Test inoculated with healthy plants.

•No significant stimulation (α=0.05) of frond increase was detected by ANOVA-Dunnett Multiple Comparison Test (CETIS)[a] at any test level compared to the control.

•A 12.0-fold increase in frond number was observed in the control over the testing period.

•No outlying data points were detected according to Grubbs Test (CETIS)[a].

Sample Description :	Clear, yellow, odourless		
Test Method :	Growth Inhibition Test Using a Freshwater Alga. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/25, 2nd ed. (March 2007), with deviation(s) as noted below.		

72-h TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth)	>90.91%	-	-

The results reported relate only to the sample tested and as received.

ZINC (AS ZINC SULPHATE) REFERENCE TOXICANT DATA

Date Tested :	2018-09-24	Statistical Method :	Nonlinear Regression* (CETIS)[a]
Organism Batch :	Ps18-09	Historical Mean IC25 :	10.4 µg/L
Test Duration :	72 hours	Warning Limits (± 2SD) :	4.8 - 22.3 µg/L
IC25 Growth :	10.3 µg/L	Analyst(s) :	MA
95% Confidence Limits :	8.6 - 11.9 µg/L		

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST ORGANISM

Test Organism :	*Pseudokirchneriella subcapitata*	Source :	In-house culture
Culture Origin :	University of Waterloo, Waterloo ON	Cell Density at 0-h :	10409 cells/mL
Strain Number :	CPCC 37	Inoculum Prepared :	00:10 h prior to test initiation
Organism Batch :	Ps18-09	Age (at start of test) :	3 days (in exponential growth)

•Algal growth curve is determined at least twice per year as required by the test method cited above.

•No unusual appearance or treatment of culture prior to testing.

TEST CONDITIONS

Test Type :	Static	Volume per Replicate :	220 µL
Test Duration :	72 hours	Control Replicates:	10
Mean Temperature (± SD):	24.0°C (± 0.0)	Test Replicates :	4
Sample Pre-aeration :	None	Concentrations Tested :	10 + Control
Sample Filtration :	0.45 µm preconditioned filter	Photoperiod :	Continuous light
Volume Filtered:	≥10 mL	Light Intensity :	4160-4350 lux
Control/Dilution Water :	Millipore Milli-Q (no chemicals added)	pH Adjustment :	None
Enrichment Medium :	Stock 2B: EDTA reduced to 25%	Hardness Adjustment :	None
Test Vessel :	U-shaped polystyrene microplate	Test Method Deviation(s) :	None

COMMENTS

Noted Deviation(s) : A reference toxicant test was not started within 14 days of the toxicity test, as required by the test method.

•All test validity criteria as specified in the test method cited above were satisfied.

*Box Cox weighting (CETIS)[a] was applied.

CHAIN OF CUSTODY RECORD

AQUATOX

AquaTox Work Order No: 237106

Shipping Address: AquaTox Testing & Consulting Inc.
11B Nicholas Beaver Road, RR #3
Guelph, Ontario Canada N1H 6H9

Voice: (519) 763-4412 **Fax:** (519) 763-4419

P.O. Number:	580278
Field Sampler Name (print):	Jennifer Brown
Signature:	
Affiliation:	Agnico Eagle Mines Ltd. - Meliadine Division
Sample Storage (prior to shipping):	Shipped immediately after sampling
Custody Relinquished by:	Jennifer Brown
Date/Time Shipped:	2018-09-03 - 08:00

Client: Agnico Eagle Mines Limited
Meliadine Project
Rankin Inlet, Nunavut, Canada
X0C 0G0

Phone: (819) 759-3555

Fax:

Contact: Jennifer Brown

Sample Identification					Analyses Requested										Sample Method and Volume		
Date Collected (yyyy-mm-dd)	Time Collected (e.g. 14:30, 24 hr clock)	Sample Name	AquaTox Sample Number	Temp. on arrival	Rainbow Trout Single Concentration	Rainbow Trout LC50	*Daphnia magna* Single Concentration	*Daphnia magna* LC50	Fathead Minnow Survival & Growth	*Ceriodaphnia dubia* Survival & Reproduction	*Lemna minor* Growth	*Pseudokirchneriella subcapitata* Growth	RISS Data Entry	Other (please specify below)	Grab	Composite	# of Containers and Volume (eg. 2 x 1L, 3 x 10L, etc.)
2018-09-03	07:00	EWTP MEL-14b (Post-treatment)	56153	22.0					✓	✓	✓	✓			✓		3 x 20L

For Lab Use Only

Received By: EJS/MJT
Date: 2018-09-06
Time: 0945
Storage Location:
Storage Temp.(°C)

Please list any special requests or instructions:

Noise monitoring report

AGNICO EAGLE

MELIADINE GOLD PROJECT

2018 Noise Monitoring Report

In Accordance with NIRB Project Certificate No. 006

Prepared by Agnico Eagle Mines Limited –
Meliadine Division

MARCH 2019

EXECUTIVE SUMMARY

In accordance with NIRB Project Certificate No. 006, and as described in the Noise Abatement and Monitoring Plan (March, 2017), Agnico Eagle Mines Ltd. (Agnico Eagle) began outdoor noise monitoring at the Meliadine site near Rankin Inlet in 2016. The objective of the noise monitoring program is to measure noise levels at four previously determined monitoring locations (NPOR006, NPOR008, NPOR014, NPOR017) over at least two 24 h periods. Results are compared to FEIS predictions for the 24-h L_{eq}, and the $L_{eq\text{-}nighttime}$ design target of 40 dBA for reference. Note that according to conditions of the Project Certificate, NPOR014 was not required to be monitored in 2018, since activities related to the Discovery Pit were not occurring. However, maintaining this site as a reference station facilitates interpretation of the dataset, by providing a measure of the general background acoustic environment.

Since high winds in the area tend to significantly reduce the amount of available data, technicians aim to conduct two or more monitoring events for each station, of two to three days each. In 2018, two separate monitoring events were conducted for NPOR006 and NPOR017, while one event was conducted for NPOR008 and NPOR014. These stations are only accessible by boat, and high winds inhibited technician access.

Overall, a very limited dataset was available for calculation of 24-h and night-time L_{eq} values in 2018. This was generally due to sub-optimal weather conditions, near-continuous animal sound interference, and subsequent filtration of the data. For stations NPOR006 and NPOR017, insufficient data was available after filtering to calculate valid 24-h and night-time L_{eq} values for comparison to predictions. For remote stations NPOR008 and NPOR014, L_{eq} values were elevated so sound recordings were reviewed, and no human-associated activity was audible. Significant wind, wave, and animal sounds (bird calls) mainly contributed to the elevated background acoustic environment in these locations.

The data collected in 2018 suggests that background sound levels in this area may regularly exceed those assumed during the FEIS (35 dBA), likely due to predominant high winds and wave action on the shore of Meliadine Lake. Particular care will be taken to ensure future monitoring is conducted when wind speeds are at their lowest, to reduce the significant wind interference and wave noises contributing to background sounds. Timing monitoring events earlier in the season may also help reduce the frequency of bird calls which were especially dominant in recordings this year, and which consistently contributed to recorded sound peaks. In addition, due to frequent use of the cabin at NPOR006 and potential for interference with sound measurements, Agnico will conduct reconnaissance in 2019 to determine whether monitoring at NPOR005 would facilitate analysis of acoustic data in this area.

1 INTRODUCTION

In February, 2015, Agnico Eagle Mines Ltd. (Agnico Eagle) was issued NIRB Project Certificate No. 006 for the Meliadine Gold Project, near Rankin Inlet, NU. In accordance with this Project Certificate, and as described in the Noise Abatement and Monitoring Plan (March, 2017), Agnico Eagle began conducting outdoor noise monitoring at the Meliadine site in 2016. The objective of the Noise Abatement and Monitoring Plan is to validate predictions of noise levels made in the FEIS, confirm the findings of the noise impact assessment (Vol. 5 – Atmospheric Environment and Impact Assessment, April, 2014), and inform the implementation of noise mitigation measures. If noise monitoring confirms excessive Project-associated noise levels exist, the monitoring data will be used to determine where noise abatement requires improvement.

A summary of the noise monitoring program is shown in Table 1, according to the Noise Abatement and Monitoring Plan (2017).

Table 1. Noise monitoring objectives, frequency, duration, and locations.

Project Phase	Project Objectives	Frequency and Duration of Monitoring	Monitoring Locations
Construction and Operations	To verify that the noise emissions used in the FEIS noise assessment were reasonable, yet conservative. To verify that the mitigation measures considered integral to the Project are incorporated as planned, and are effective.	Yearly monitoring programs, twice per year. A duration of 24+ hours per station.	FEIS receptors NPOR006 NPOR008 NPOR014 NPOR017 Possibility to add NPOR005

2 METHODS

2.1 MONITORING LOCATIONS

In 2018, noise monitoring was conducted at four locations, as identified in the Noise Abatement and Monitoring Plan. These locations coincide with the identified points of reception (PORs) with the greatest predicted changes in noise levels from existing conditions, as determined through the noise impact assessment (FEIS Vol. 5, Section 5.5). The monitoring locations are identified in Figure 1, and summarized in Table 2. Photos of the noise monitoring locations are provided in Section 3. These

monitoring locations will be reviewed and may be adapted throughout the construction and/or operations phases of the Project, as necessary.

It should be noted that based on conditions for monitoring, NPOR014 was not required to be assessed in 2018, since activities associated with the Discovery Pit were not occurring. However, maintaining this station as a reference site facilitates interpretation of the noise data.

Table 2. Noise monitoring locations and conditions for monitoring.

POR	UTM	Project Area	Conditions for Monitoring
NPOR006	15V 538286 / 6991299	Mine	Monitor during the entire Construction and Operations Phases, and initial stages of Closure when extensive activities are occurring.
NPOR008	15V 543707 / 6987276	Mine	Monitor during the entire Construction and Operations Phases, and initial stages of Closure when extensive activities are occurring.
NPOR014	15V 549401 / 6982060	Mine	Monitor only if activities associated with the Discovery Pit are occurring.
NPOR017	15V 544203 / 6970537	AWAR	Monitor during the entire Construction and Operations Phases, and initial stages of Closure when extensive activities are occurring.

All noise monitoring stations are located in close proximity to seasonally occupied cabins, which were identified as being the most sensitive receptors in the noise impact assessment (FEIS Vol. 5, Section 5.5.4.4). However, it is noted that the frequent use of some of these cabins impedes efficient collection of valid noise data that is representative of mine activities.

NPOR006 is located approximately 1 km north of the mine site disturbance area, and approximately 200 m outside the FEIS site study area (SSA). The adjacent cabin was in use at the time of the 2018 noise surveys. The surrounding terrain is a mix of small rock and lichen. The slope is very minimal leaning SW. Meliadine Lake is ~150 m NE and an unnamed small lake is ~120 m SSW.

NPOR008 is located approximately 1.25 km from the SSA, on the east side of the site. The surrounding terrain is on the summit of a small vegetated hill with very little apparent rock. Meliadine Lake is ~ 51 m to the NNE. The mine camp is approximately 2 km to the northwest, and the all weather road is approximately 2.5 km to the southwest.

NPOR014 is located approximately 130 m from the traditionally used ATV trail. This station is at the southern end of Meliadine Lake and is approximately 10 km away from the Meliadine exploration camp and 5 km from the Discovery area. It is located within the SSA. Currently there is no development in this area, so measurements at NPOR014 in 2018 are expected to be indicative of background values.

NPOR017 is located at the southern end of the all-weather access road (AWAR). It is approximately 150 m SW of the road. No SSA was assessed for the AWAR.

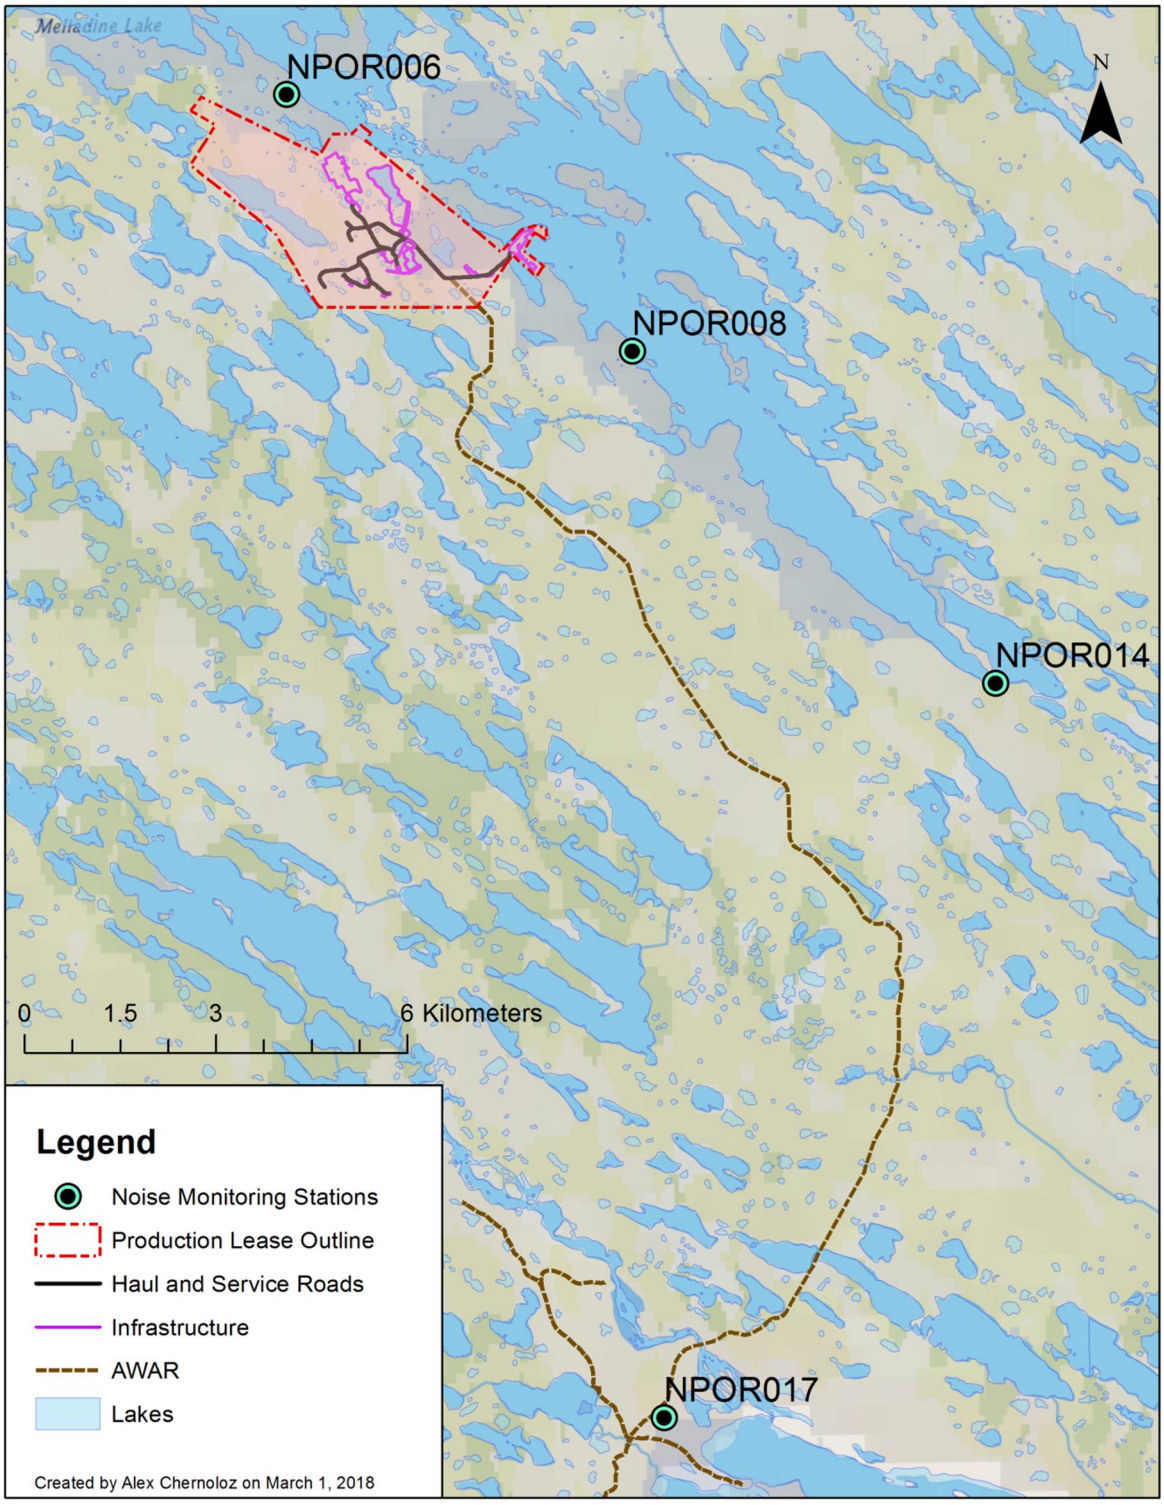

Figure 1. Noise receptors (points of reception - PORs) as identified in the noise impact assessment. Noise monitoring was conducted at NPOR006, NPOR008, NPOR014, and NPOR017 in 2018.

2.2 MONITORING DATES

In accordance with the Noise Abatement and Monitoring Plan, two 24-h+ noise surveys were planned to be conducted for each location. One survey was completed for NPOR008 and NPOR014 due to adverse weather conditions. These sites are accessible by boat only, and high winds prevented technicians from conducted a second monitoring event. Surveys were planned to last approximately 72 - 96 h in duration (extents of battery life), since a significant portion of data is typically filtered out due to sub-optimal weather conditions (see Section 2.4). Monitoring dates and times for each survey are provided in Table 3. Due to equipment malfunction, three surveys recorded less than 24 h of data.

Table 3. Noise monitoring dates in 2018.

Location	Monitoring Start Date (Time)	Monitoring Stop Date (Time)	Duration (h)
NPOR006	8/22/18 11:08	8/22/18 21:44	11
	9/04/18 11:38	9/07/18 16:37	78
NPOR008	8/28/18 17:42	8/29/18 5:52	13
NPOR014	8/25/18 16:26	8/28/18 16:27	73
NPOR017	8/10/18 12:07	8/12/18 23:59	60
	9/09/18 10:11	9/09/18 21:49	12

2.3 SOUND LEVEL METER

For all stations a Bruel and Kjaer Model 2250 integrating sound level meter with secondary wind screen was used to conduct the noise survey. The noise logging rate was set at one-minute intervals, and according to the Noise Abatement and Monitoring Plan, logged parameters included:

- Integrated equivalent A-weighted sound level (L_{Aeq})
- 1/3 octave band sound levels in decibels (dB)
- Statistical data (L_{10}, L_{90})
- Maximum sound level (L_{max}) in dBA
- Minimum sound level (L_{min}) in dBA

Calibration of the instrument was performed before and after each monitoring event using a Bruel and Kjaer Type 4231 Calibrator, to ensure variance was within 0.5 dB (see field notes, Appendix A). Estimated uncertainty, over a yearly time period for the calibrator is better than 0.05 dB at a 96% confidence level.

2.4 WEATHER DATA

Weather data for the noise monitoring periods was collected using the mine site's permanent weather station. Hourly data for wind, temperature, and relative humidity were available from this station.

The Alberta Energy Resource Conservation Board Directive 038 (Directive 038) requires noise data to be collected under appropriate weather conditions, which are represented by an absence of steady precipitation, snow, water, or ice ground cover, as well as restrictions on wind speed. To adhere to these conditions, noise data was filtered out from analyses when relative humidity exceeded 90% (assuming precipitation occurred) and/or wind speed exceeded 15 km/hr. Average hourly humidity and wind speed values were used, since filtering based on maximum values resulted in exclusion of nearly the entire noise dataset. This approach is considered conservative, since higher winds are likely to result in increased noise levels due to wind effects. Weather data (wind speed, wind direction, temperature, and humidity) are provided in Appendix B.

2.5 FIELD NOTES

A pocket weather meter (WeatherHawk® WindMate™, WM-300) was used by field staff to record wind speed, direction, and temperature at the beginning and end of each monitoring period. Other observations included precipitation, cloud cover, and observed noises during instrument set-up and takedown. All field notes are provided in Appendix A.

2.6 DATA ANALYSIS

Data recorded at the four monitoring sites were downloaded for assessment using the Bruel and Kjaer 5503 Measurement Suite software, with some calculations performed using Microsoft Excel. Recorded one-minute L_{Aeq} values were used to calculate hourly equivalent energy noise levels ($L_{eq, 1h}$).

2.6.1 INITIAL DATA FILTERING

All datapoints associated with the first hour of measurement were filtered out to remove noise from technician activity, and to ensure more than 30 min of data contributed to hourly averages. Data was also filtered on the basis of recorded weather conditions to comply with Directive 038 (see Section 2.4).

2.6.2 24-H AND NIGHT-TIME LEQ CALCULATIONS

After the initial filtration, valid hourly L_{eq} values for each monitoring period were used to calculate average 24-h equivalent energy noise levels ($L_{eq, 24\,h}$) for comparison to FEIS model predictions and the site's noise monitoring criteria (see Table 4) . When a data point ($L_{eq, 1\,h}$) was available from more than one day within a monitoring period, values were energy-averaged across calendar days to ensure time points contributed equally to 24-h L_{eq} values. As indicated in the Noise Abatement and Monitoring Plan, night-time (11pm – 7am) L_{eq} values were also calculated, and are compared with the design target of 40 dBA for reference only. It should be noted that this target was designed to apply at a distance of 1.5 km from the site study area (SSA) in remote areas. Since all of the monitoring stations are located closer to or within the SSA (except NPOR017, the AWAR location for which no

SSA was assessed), exceedances of this target value may occur, without an exceedance at the 1.5 km distance. In that case, one or more stations may be added or moved in future monitoring events to coincide with this design target location to more precisely assess FEIS predictions.

According to Directive 038, a noise monitoring survey is considered to be acceptable when there are a minimum of 180 valid minutes during the daytime period and 180 valid minutes during the nighttime period. When insufficient valid data was available from the appropriate time periods, 24-h and night-time L_{eq} values could not be calculated.

Table 4. FEIS predictions for 24-h equivalent sound levels, FEIS design targets for 1.5 km from the site study area perimeter, and proposed noise monitoring criteria from the 2017 Noise Abatement and Monitoring Plan.

Location	FEIS Prediction $L_{eq\text{-}24h}$ (dBA)	Design Target (1.5 km from SSA) $L_{eq\text{-}nighttime}$ (dBA)	Proposed Noise Monitoring Criteria $L_{eq\text{-}24h}$ (dBA)
NPOR006	39.8	40	45
NPOR008	41.7	40	45
NPOR014	44.7	40	45
NPOR017	43.4	40	45

2.6.3 SECONDARY DATA FILTERING

When calculated 24-h or night-time L_{eq} values exceeded the above criteria, sound recordings were reviewed to identify and if necessary, remove noise data containing recordings of abnormal noise sources unrelated to mine activity. In 2018 this was limited to prolonged wind-induced microphone noise, and animal interference in close proximity to the microphone (in particular, very loud bird calls). These noise sources were assumed to be minimal in the FEIS process, since a background sound level of 35 dBA was used. After this second data filtering, the final L_{eq} values were compared to FEIS predictions and the night-time design target.

3 RESULTS

All 1-h L_{eq} values are provided in Appendix B.

3.1 NPOR006

L_{eq} values calculated from 1-min measurements over each monitoring period at NPOR006 are shown in Figures 3 and 4. Invalid data points removed from analyses due to assumed technician interference and sub-optimal weather conditions (as described in Section 2.4) are indicated (LA_{eq}-unfiltered). For event 1 at station NPOR006, 11 h of monitoring were conducted, and 5 h of valid data were available after initial filtering. Since all valid data was from the daytime period (12 – 5 pm), there was insufficient representative data to calculate a 24 h L_{eq} or night-time L_{eq} for this event. For event 2 at NPOR006, 78 h of monitoring were conducted, and 20 h of valid data were available after initial filtering, including 14 daytime and 6 night-time hours.

Audible noises noted in the field log for this location include human activities from a nearby cabin (ATV traffic, construction work), site traffic (including helicopters) and site activities (gravel excavation nearby).

After the initial filtering, the calculated 24-h L_{eq} value for the valid monitoring event (September) was 56.5 dBA, which exceed the FEIS prediction of 39.8 dBA and FEIS impact assessment criteria for "non-significant impacts" (45 dBA). Sound recordings were therefore reviewed. Significant animal interference (bird calls) contributed to peaks, and strong wind induced microphone noise occurred throughout the recording. The dataset was further filtered on this basis. Approximately 6 h were removed due to dominant wind induced noise (evident from listening to sound files and observed elevated L_{min} values), and 24 min were removed due to very prominent bird noises in close proximity to the sound meter. After this secondary filtering, the available dataset consisted of 11 h of data from September 5 – 6, including 2 h from the night-time period, which is insufficient to calculate valid 24-h and night-time L_{eq} values.

Monitoring in 2019 will be conducted earlier in the season, prior to the fall goose migration and when wind speeds tend to be lower, in order to optimize chances of successful data collection.

In 2017, the FEIS impact assessment criteria of 45 dBA was marginally exceeded during one event, and continued monitoring was recommended to determine if elevated noise levels in this location are sustained, and in order to better distinguish mine-related noise from that of the cabin. Since occupancy of the nearby cabin is frequent, and construction works there appear to be ongoing (a second cabin appears to have been built since 2016), it has not been feasible to conduct monitoring during an unoccupied period. Furthermore, near-continuous noise from small mechanical equipment (potentially a generator) is audible on sound files. Agnico will conduct reconnaissance in 2019 to determine the feasibility of monitoring at NPOR005, as described in the Noise Abatement and Monitoring Plan. This station is in a similar location relative to site development, but may have lower occupancy rates.

To date, no noise-related complaints have been received in this area.

Figure 2. Noise monitoring location NPOR006 (September 4, 2018).

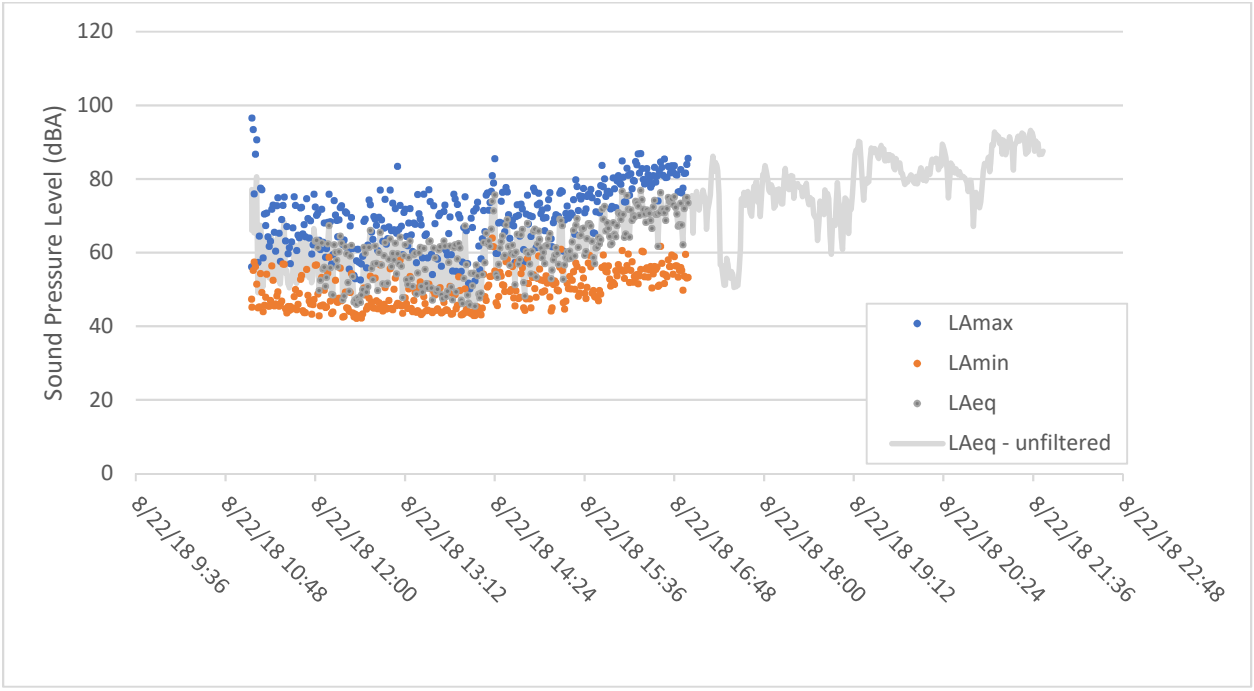

Figure 3. 1-min L_{max}, L_{min}, and L_{eq} values recorded at site NPOR006 during monitoring event 1.

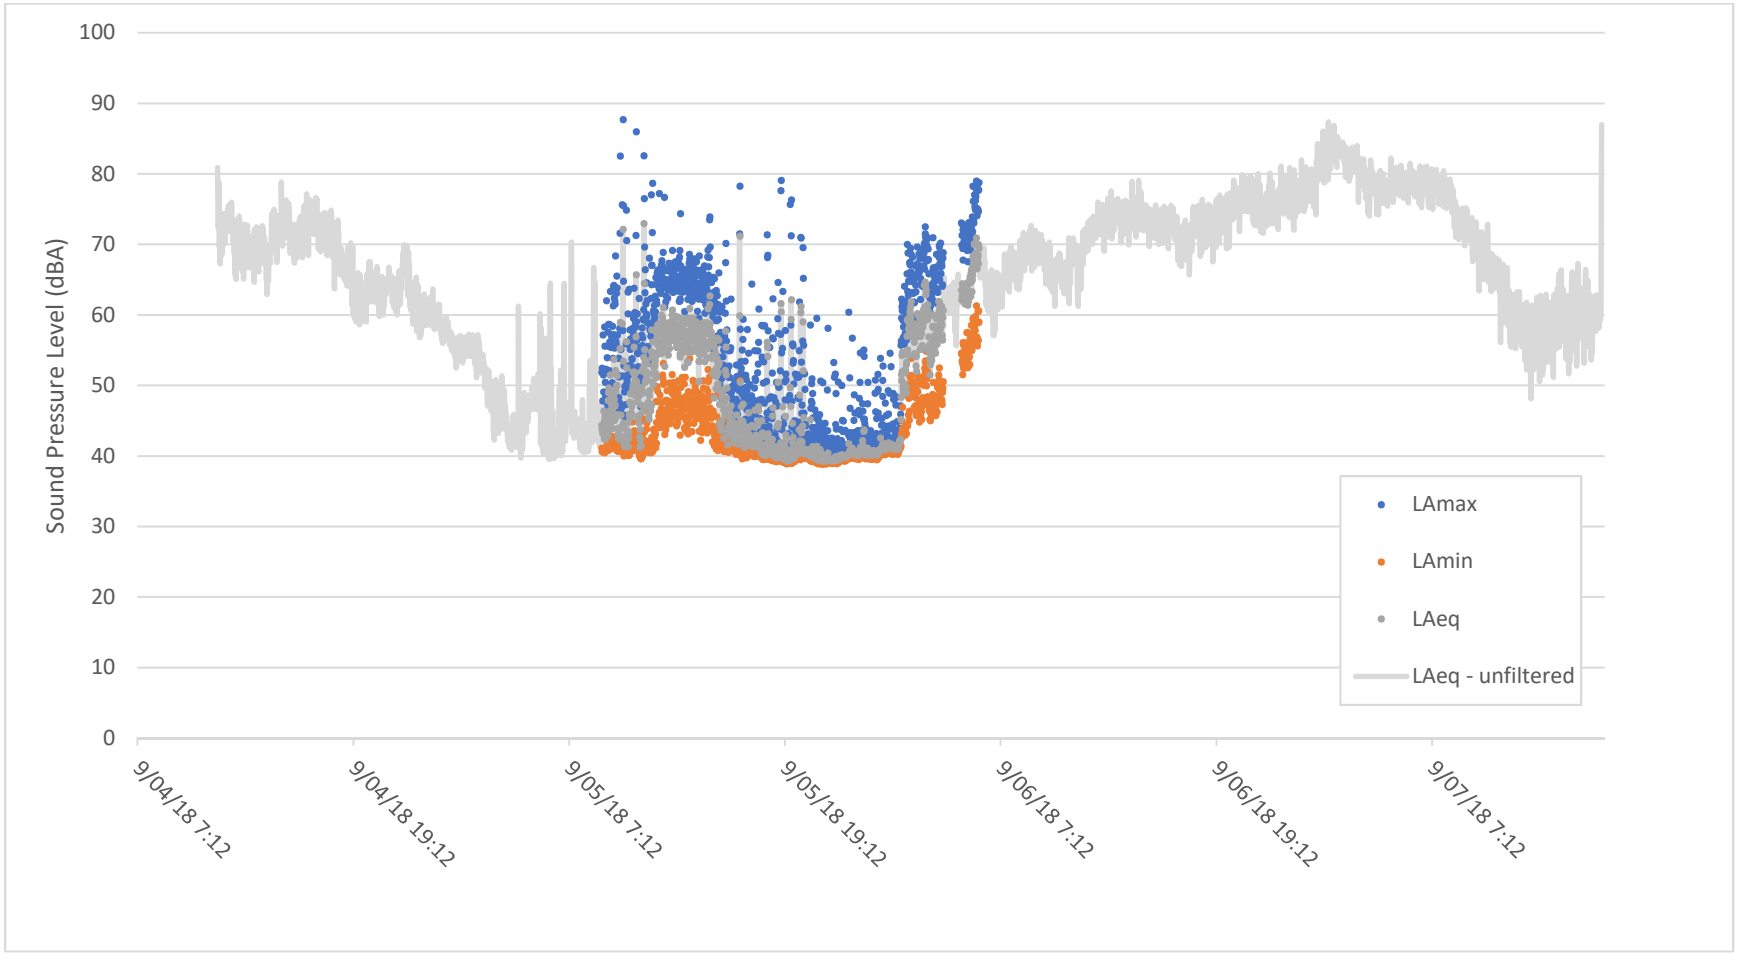

Figure 4. 1-min L_{max}, L_{min}, and L_{eq} values recorded at site NPOR006 during monitoring event 2.

3.2 NPOR008

L_{eq} values calculated from 1-min L_{eq} measurements over the monitoring period at NPOR008 are shown in Figure 6. Invalid data points removed from the analysis due to technician interference and sub-optimal weather conditions (as described in Section 2.4) are indicated. For the monitoring event at this station (August 28 – 29), 12 h of monitoring were successfully conducted, and 5 h of valid data were available after initial filtering. This included one hour from the daytime period, which is insufficient to calculate a valid 24-h L_{eq}s.

Audible noises noted in the field log at this location include occasional boats, helicopters, and wildlife (birds).

After the initial filtering, the $L_{eq\text{-}nighttime}$ for this station was 64.5 dBA, which is above the design target of 40 dBA for 1.5 km from the mine SSA. As a result, sound recordings were reviewed. From this review, no mine-related or other human-associated sounds were audible on the recordings. Wind, wave action, and occasional animal noises appear to be contributing to the recorded acoustic environment at this station. L_{min} values were elevated, further indicating significant background noise. Since no mine activity was audible, the dataset was not further filtered on the basis of the sound review, and the recorded Leq night-time is assumed to be representative of a naturally elevated acoustic environment in this location.

As indicated in Section 3.1, it is recommended for monitoring to be conducted earlier in the season, when wind speeds tend to be lower. It may also be noted that a background noise value of 35 dBA was assumed in the FEIS, which is typical in remote areas. However, in this location adjacent to Meliadine Lake, the combination of greater wind speeds and the nearby shoreline appears to result in an elevated background sound level which should be considered in data interpretation for this site.

Figure 5. Noise monitoring location NPOR008 (2018).

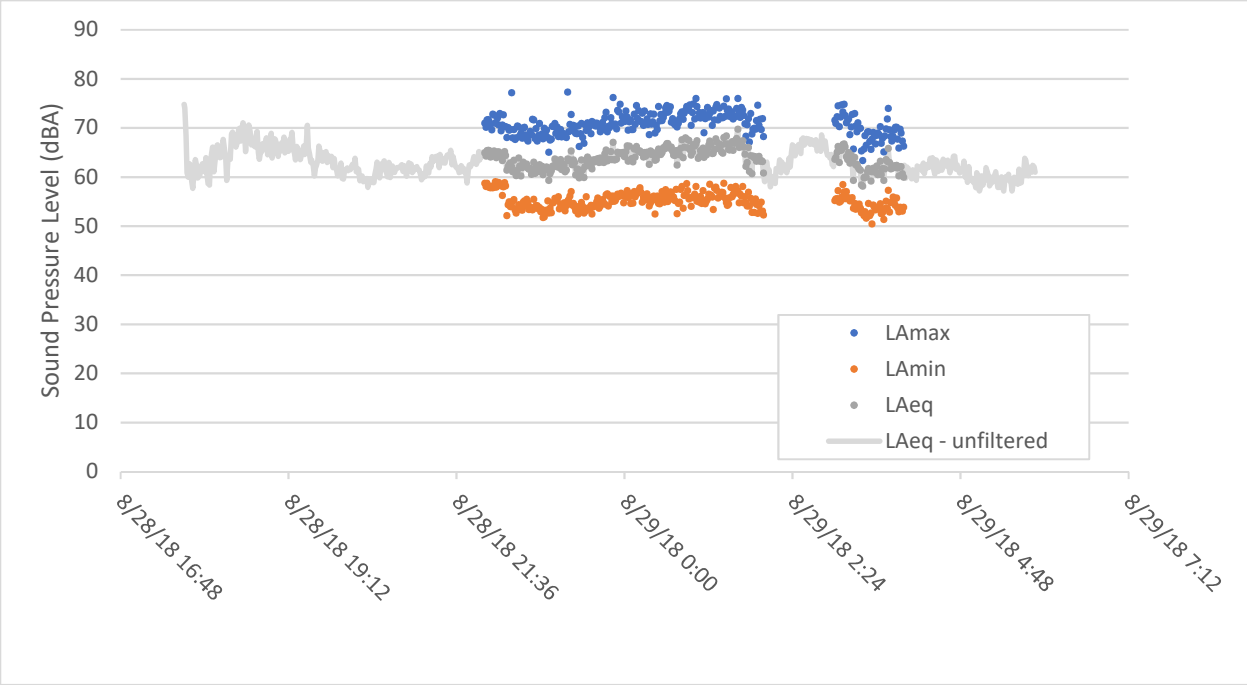

Figure 6. 1-min L_{max}, L_{min}, and L_{eq} values recorded at site NPOR008 during monitoring event 1.

3.3 NPOR014

No development activity is currently occurring in the area of NPOR014, so 2018 monitoring is considered to be representative of the background acoustic environment. L_{eq} values calculated from 1-min L_{eq} measurements over the August 25 - 28 monitoring period at NPOR014 are shown in Figure 8. Invalid data points removed from the analysis due to technician interference and sub-optimal weather conditions based on weather station data (as described in Section 2.4) are indicated. For station NPOR014, 73 h of monitoring were conducted, and 49 h of valid data were available after initial filtering.

Noise sources noted in the field log at this location include potential for boats and ATVs, bird sounds, and hunting sounds.

The calculated 24-h L_{eq} after initial filtering was 63.5 dBA. This is above the value of 44.7 dBA predicted in the FEIS for this location. The $L_{eq\text{-}nighttime}$ was 49.9, which is above the design target of 40 dBA for 1.5 km from the mine SSA. As a result, sound recordings were reviewed. No mine related activity was audible. Significant and frequent animal interference (bird sounds) in close proximity to the noise meter contributed to noise peaks, and background sounds were dominated by wind and wave action, and near-constant bird calls throughout sections of the recording. Insect sounds were also frequently audible. Since no development activity is currently occurring in this area, the recorded sound levels are indicative of the typically elevated acoustic environment near the shore of Meliadine Lake at this time of year.

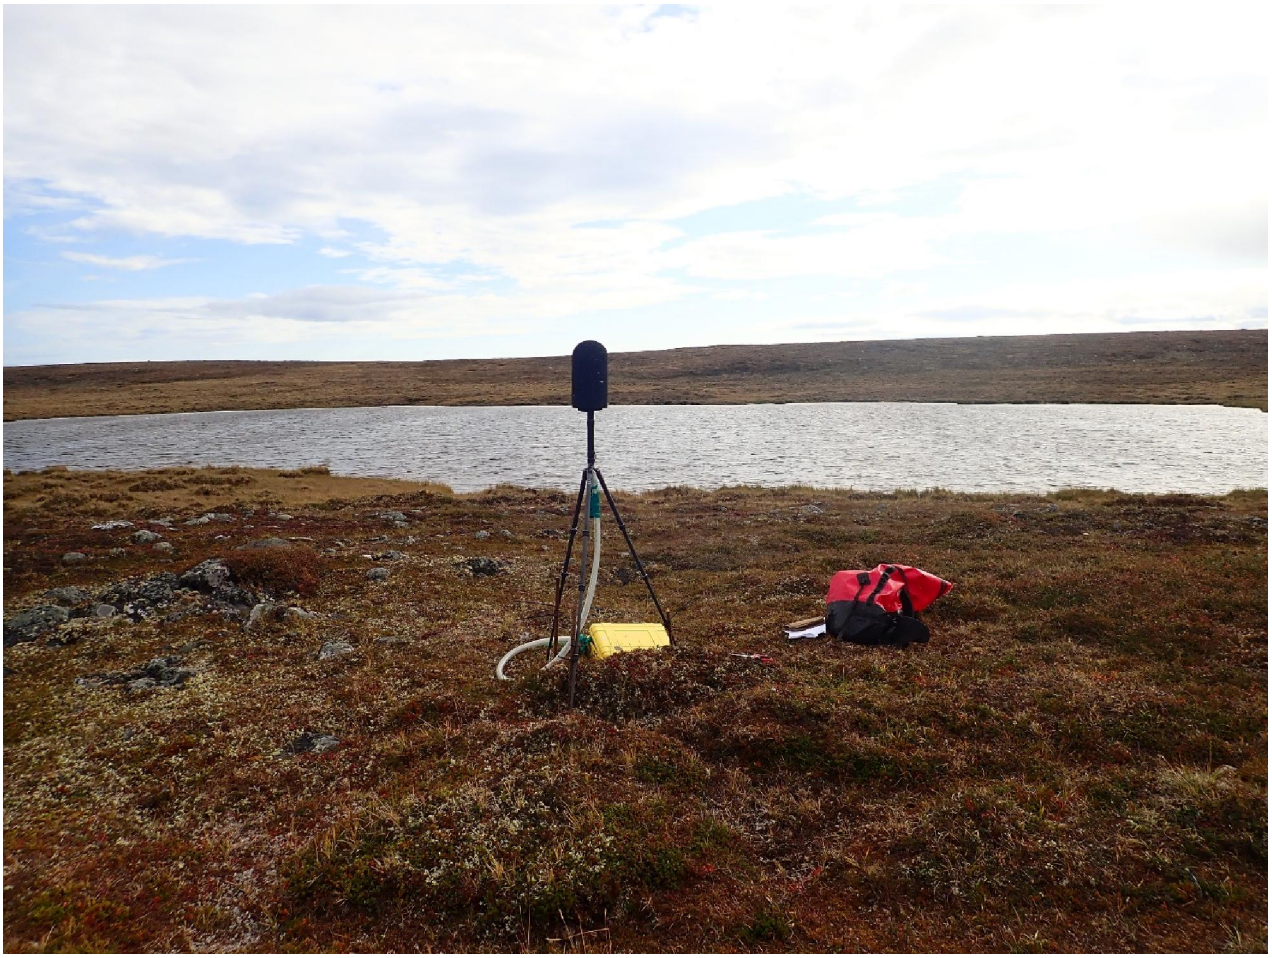

Figure 7. Noise monitoring station NPOR014 (August 28, 2018).

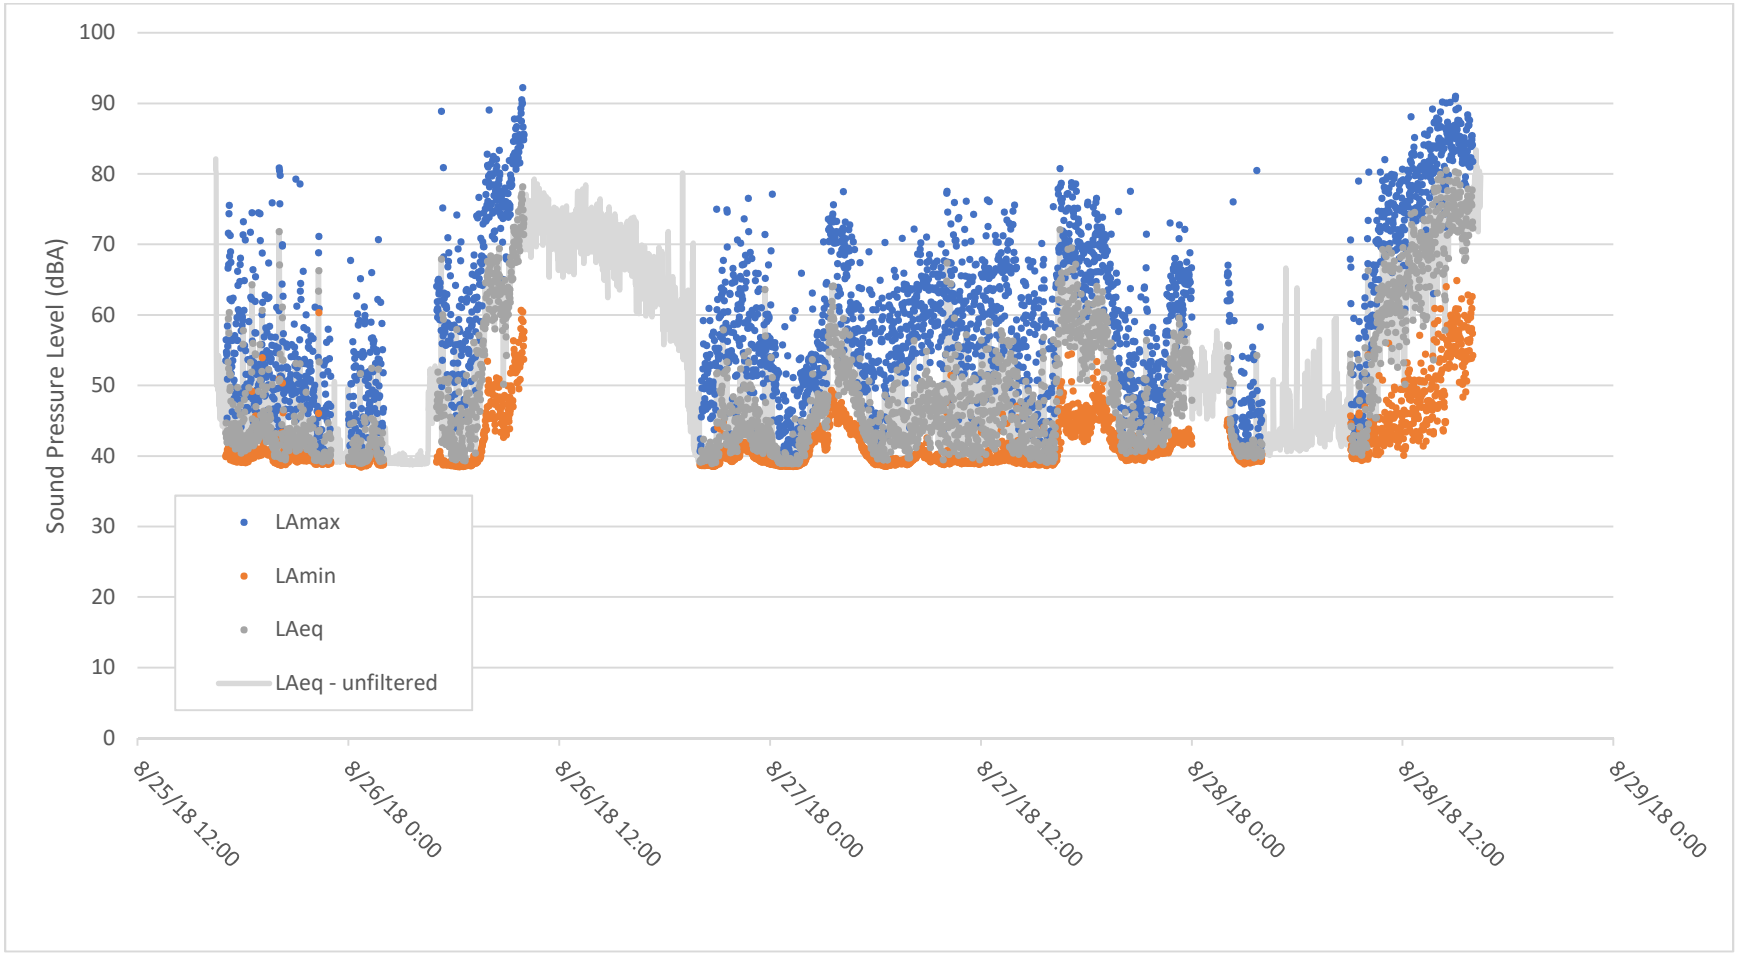

Figure 8. 1-min L_{max}, L_{min}, and L_{eq} values recorded at monitoring site NPOR014.

3.4 NPOR017

L_{eq} values calculated from 1-min L_{eq} measurements over the monitoring periods at NPOR017 are shown in Figure 10 and 11. Invalid data points removed from analysis due to technician interference and sub-optimal weather conditions based on weather station data (as described in Section 2.4) are indicated. For event 1 at station NPOR017 (August 10 - 12), 60 h of monitoring were conducted and 9 h of valid data were available after filtering. This did not include any night-time hours (11 pm – 7 am), so calculation of a valid 24-h L_{eq} or night-time L_{eq} was not possible. For event 2 at station NPOR017 (September 9), 12 h of monitoring were conducted, and 2 h of valid data were available after filtering. As a result it was not possible to calculate any valid day- or night-time measurements for event 2.

This station is located 140 m from the all weather road. Audible noises noted in the field log include light vehicles, transport trucks, ATVs, sounds from the nearby hunting cabin, and bird noises.

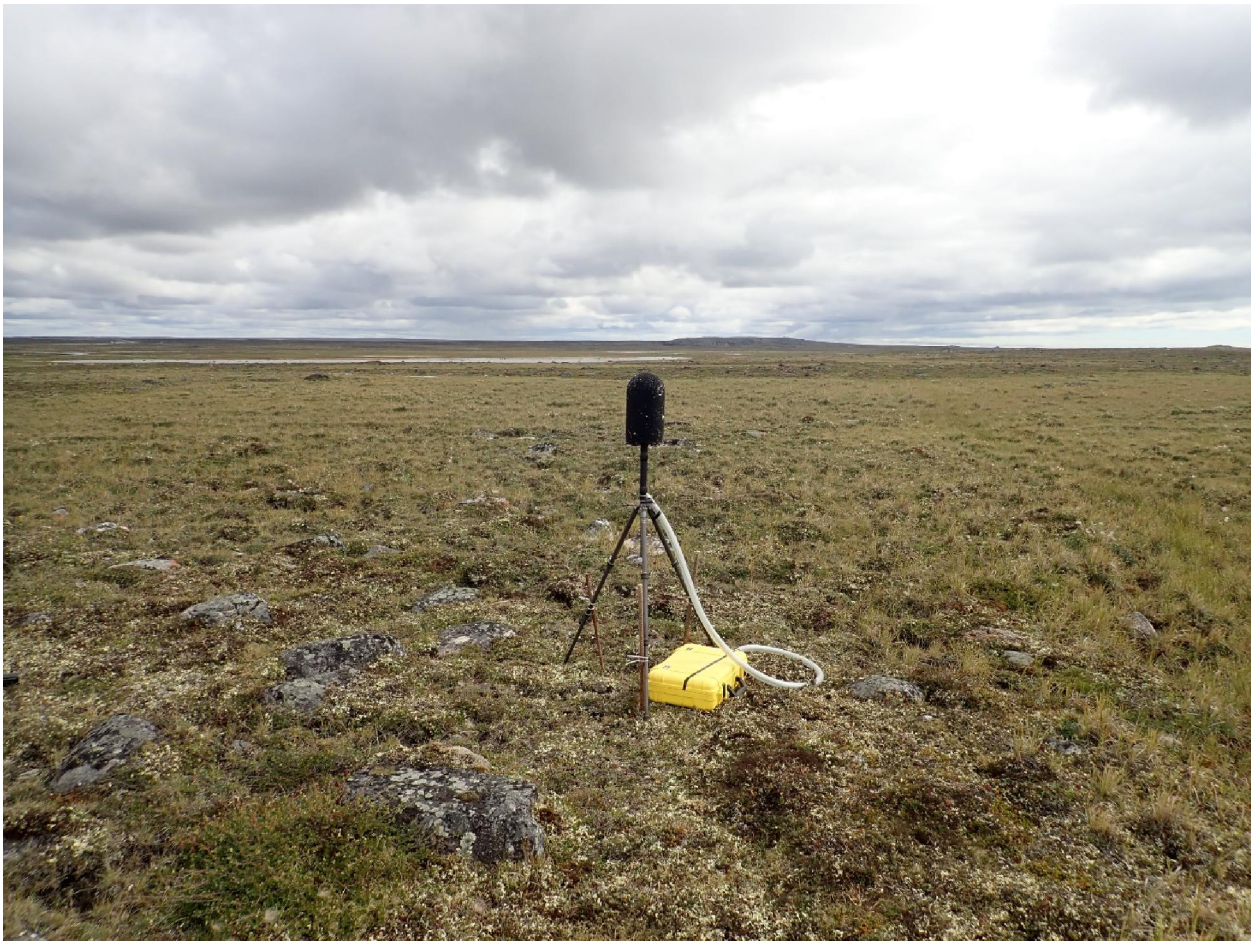

Figure 9. Noise monitoring location NPOR017 (August 10, 2018).

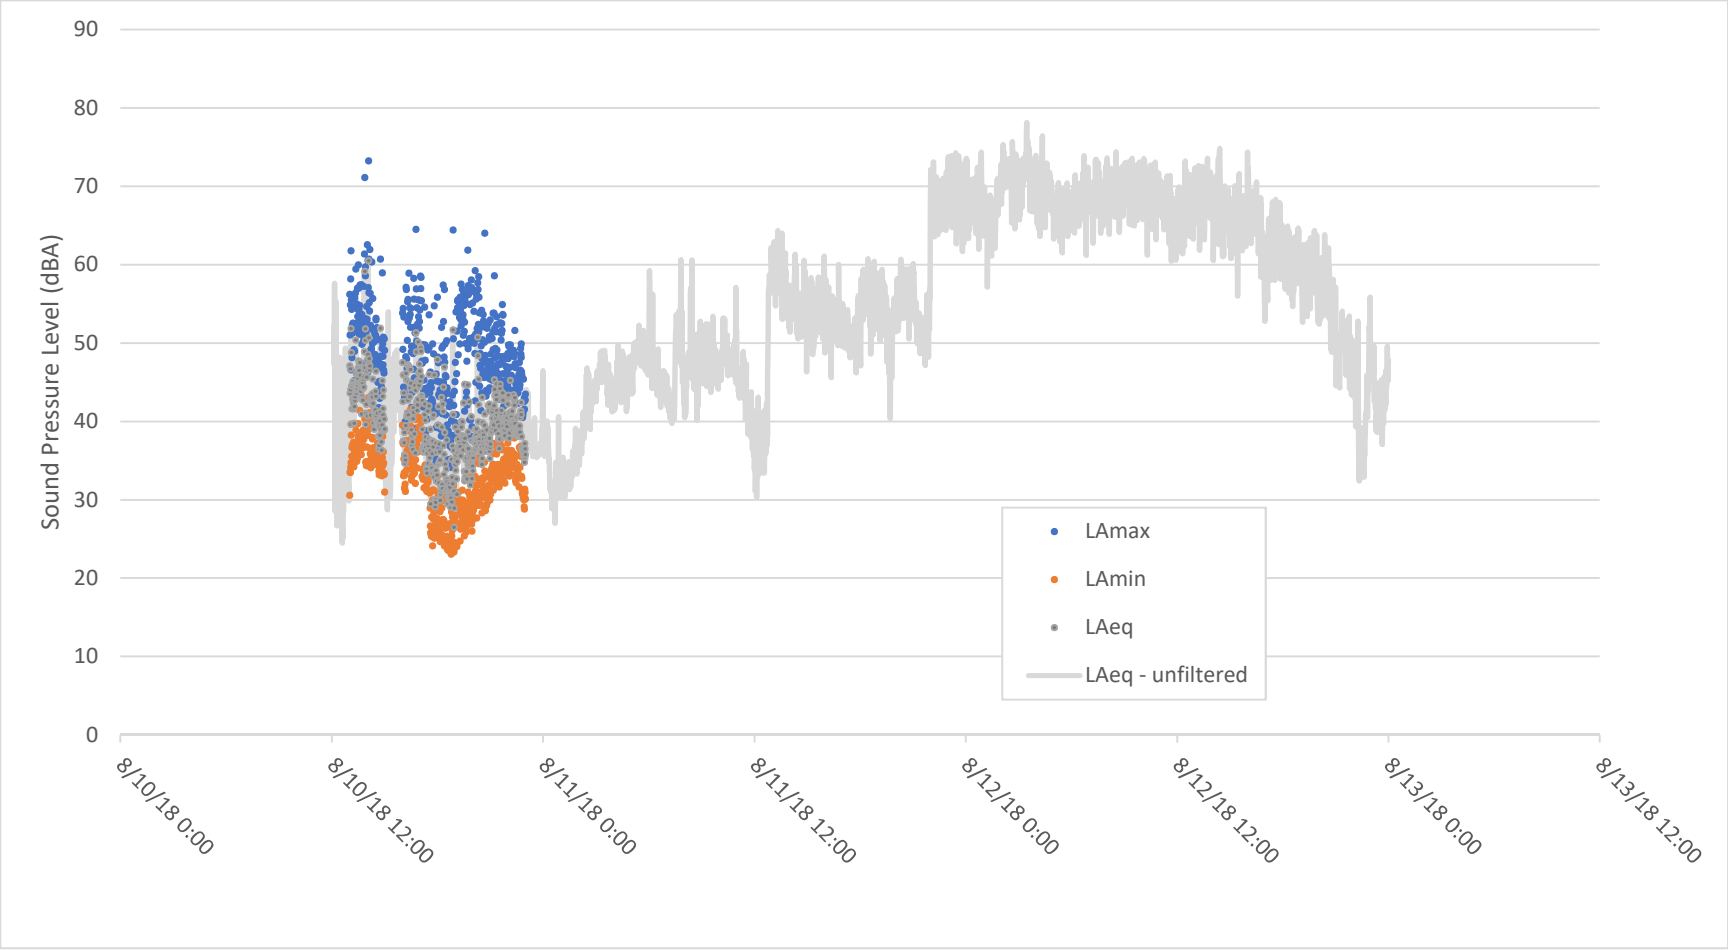

Figure 10. 1-min L_{max}, L_{min}, and L_{eq} values recorded at site NPOR017 during monitoring event 1.

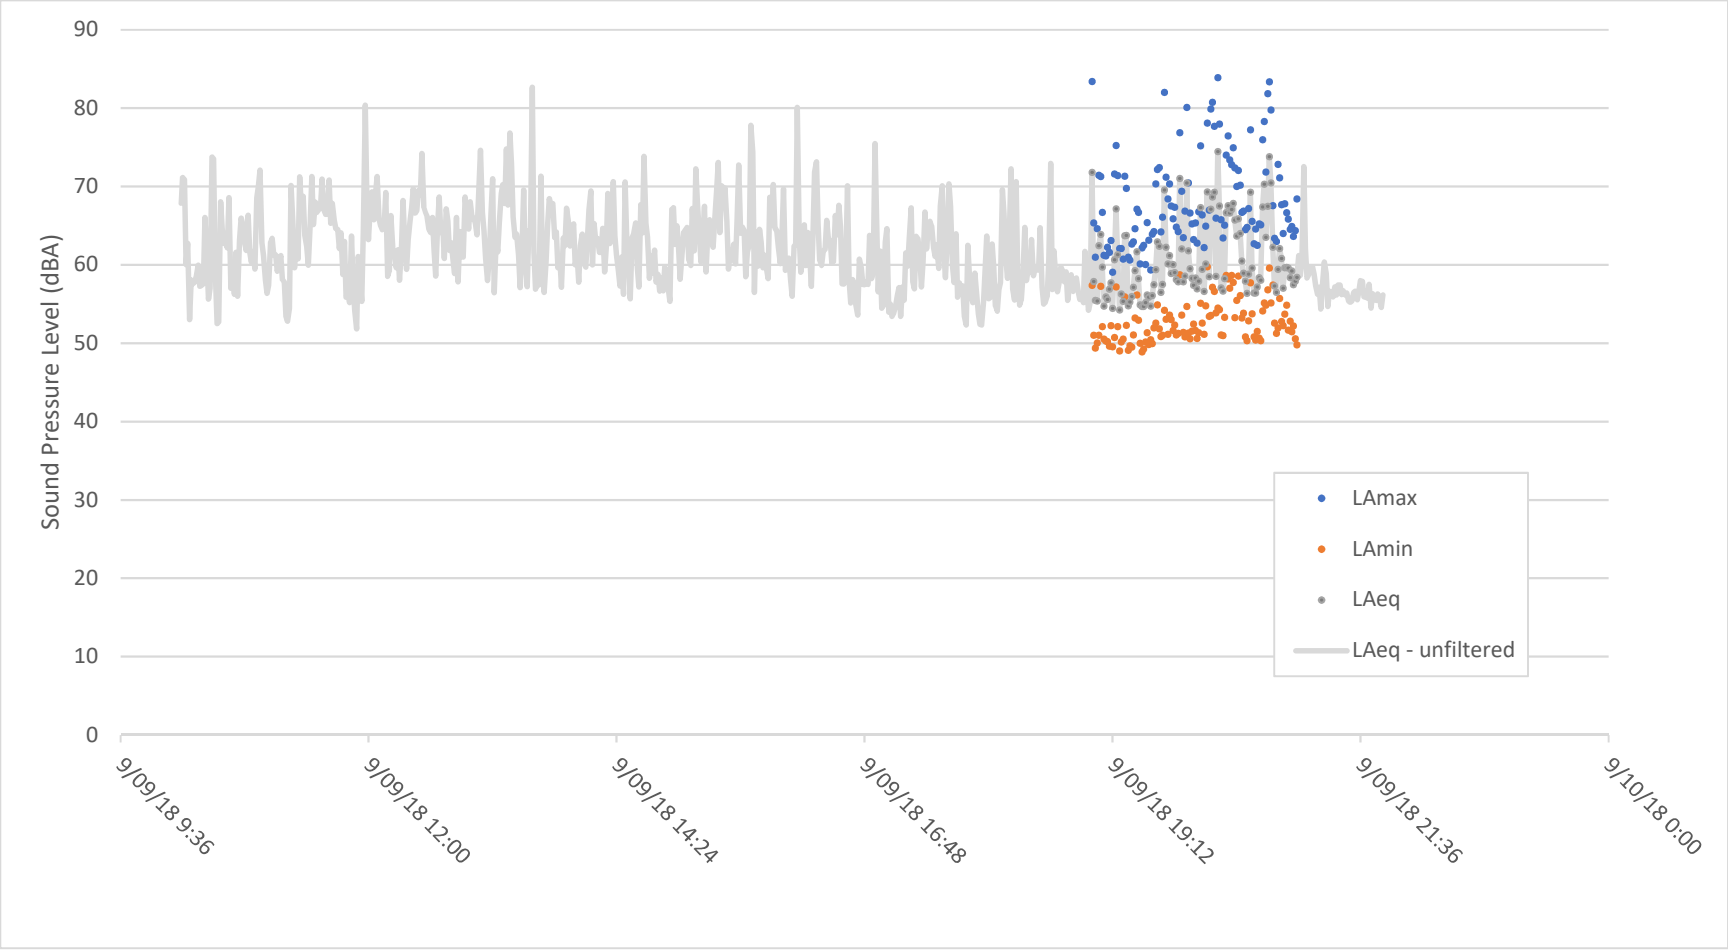

Figure 11. 1-min L_{max}, L_{min}, and L_{eq} values recorded at site NPOR017 during monitoring event 2.

4 SUMMARY AND CONCLUSION

The objective of the noise monitoring program at Meliadine is to measure noise levels at four previously determined monitoring locations over at least two 24 h periods. In 2018 Agnico Eagle conducted two successful rounds of monitoring for stations NPOR006 and NPOR017, and one successful round of monitoring for NPOR008 and NPOR014. However, high winds (both measured and audible) and frequent bird calls in close proximity to the noise meter substantially reduced the quality of the data for comparison to FEIS predictions.

A summary of the available noise monitoring results is provided in Table 5. For station NPOR006 and NPOR017, insufficient valid data was available after initial and/or secondary filtering to calculate 24-h or night-time L_{eq} values. For station NPOR008, only a night-time L_{eq} could be calculated after initial filtering, and that value exceeded the design target of 40 dBA. However, sound recordings were dominated by wind and wave action, and no human-associated activities were audible, so a secondary filtering was not performed. The calculated L_{eq} value is not considered comparable to FEIS predictions or design targets, which assume limited background noise. Similarly for NPOR014, the measured 24-h and night-time L_{eq} values exceeded noise monitoring criteria and the design target, respectively, but no mine-related activity is ongoing in this area, and sound recordings were dominated by wind, waves, and near-continous bird calls for significant portions of the dataset.

Table 5. Summary of noise monitoring results in 2018. "NA" indicates insufficient valid data was available after filtering. *No mine activity is audible at these remote sites, so measured values are assumed representative of baseline; no filtering on the basis of sound recordings was performed.

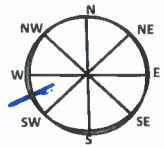
Location	Monitoring Start	Monitoring End	Noise Monitoring Criterion - $L_{eq(24\ h)}$ (dBA)	FEIS Prediction - $L_{eq(24\ h)}$ (dBA)	Measured $L_{eq(24\ h)}$ (dBA)	Measured L_{eq} (nighttime) (dBA)
NPOR006	08/22 11:08	08/22 21:44	45	39.8	NA	NA
	09/04 11:38	09/07 16:37	45	39.8	NA	NA
NPOR008	08/28 17:42	08/29 5:53	45	41.7	NA	*64.5**
NPOR014	08/25 16:26	08/28 16:27	45	44.7	*63.5**	*49.9**
NPOR017	08/10 12:07	08/12 23:59	45	43.4	NA	NA
	09/09 10:11	09/09 21:50	45	43.4	NA	NA

Overall, a very limited dataset was available for calculation of 24-h and night-time L_{eq} values in 2018. This was generally due to a tendency towards sub-optimal weather conditions, and subsequent

filtration of the data. The data collected in 2018 suggests that measured background sound levels in this area may regularly exceed those assumed during the FEIS (35 dBA), likely due to predominant high winds and wave action on the shore of Meliadine Lake. Particular care will be taken in the future to ensure monitoring is conducted when wind speeds are at their lowest, to reduce the significant wind and wave noises contributing to background sounds. Timing monitoring events earlier in the season may also help reduce the frequency of bird calls which were especially dominant in recordings this year, and which consistently contributed to recorded sound peaks. Continued use of a far-field reference station such as NPOR014 will be considered, in order to better define background noise levels in this area.

5 ACTIONS

The following actions were planned for 2018 and responses of Agnico are indicated:



- Additional efforts will be made to conduct monitoring at NPOR006 while the cabin is unoccupied.
    - Attempts were made to fulfill this objective, but the cabin at NPOR006 is regularly occupied and was in use at the time of noise surveys. Agnico will conduct reconnaissance at nearby station NPOR005 (according to the Noise Abatement and Monitoring Plan) in 2019 to determine occupancy rates, and will conduct monitoring at this station if feasible.

The following actions are planned for 2019:

- Noise monitoring surveys will be conducted earlier in the ice-free season when wind speeds and animal interference (bird calls) are minimized.
- Weather data will be reviewed during or immediately following noise monitoring events to estimate the proportion of usable data and the need for supplemental monitoring.
- Reconnaissance and monitoring (if feasible based on occupancy) will be conducted at NPOR005, since high occupancy rates at NPOR006 tend to interfere with assessments of mine-related noise in this location. Monitoring will also be conducted at NPOR006.
- Monitoring will focus on NPOR005, NPOR006, NPOR008 and NPOR017. Since activities at the Discovery Pit are not ongoing, monitoring is not required at NPOR014. However, data will be collected at this station if time and weather conditions permit.

Air monitoring report

AGNICO EAGLE

MELIADINE GOLD PROJECT

2018 AIR QUALITY MONITORING REPORT

In Accordance with NIRB Project Certificate No. 006

**Prepared by Agnico-Eagle Mines Limited –
Meliadine Division**

March 2019

EXECUTIVE SUMMARY

In accordance with NIRB Project Certificate No. 006, and as described in the Air Quality Monitoring Plan (November 2015), Agnico Eagle Mines Ltd. (Agnico Eagle) continued ambient air quality monitoring at the Meliadine site, near Rankin Inlet in 2018. Through this program, Agnico Eagle aims to measure airborne particulates, dustfall, and the gaseous compounds (NO_2 and SO_2) using a combination of active and passive sampling methods. In accordance with the Plan, monitoring in 2018 included analysis of dustfall in seven locations, as well as NO_2 and SO_2 in two locations, over one month averaging periods throughout the year. Active sampling of total suspended particulates (TSP), $PM_{2.5}$, and PM_{10} began in December 2018. Available results for all parameters were compared to regulatory guidelines and Final Environmental Impact Statement (FEIS) predictions, and spatial and temporal trends were assessed.

Dustfall results are compared to Alberta's Ambient Air Quality Guidelines (June, 2016) for recreational and industrial areas, for context. In 2018, 2 of 36 samples exceeded the recreational area guideline (DF-3, 25 m from the All Weather Access Road), but no samples exceeded the industrial area guideline. Results indicate very low rates of dustfall overall, despite elevated traffic compared to FEIS predictions. No quantitative predictions were made for dustfall in the FEIS.

Suspended particulates (TSP, $PM_{2.5}$, and PM_{10}) were analyzed in two locations using Partisol air samplers beginning in December, 2018. All available results were below regulatory guidelines (Government of Nunavut Ambient Air Quality Standards/CCME Canadian Ambient Air Quality Standards /BC Ambient Air Quality Objectives) and were below maximum concentrations predicted in the FEIS.

Calculated annual average concentrations of NO_2 and SO_2 were well below the Government of Nunavut Ambient Air Quality Standards, and were below FEIS maximum predicted values. This was the second full year of monitoring for gaseous compounds, and no clear spatial or temporal trends were observed.

As described in the Air Quality Monitoring Plan, a permanent weather station was installed at the Meliadine site, and daily averages for wind speed, direction, temperature, solar radiation, and rainfall are provided.

Incinerator stack testing was performed in September, 2018. All conditions for validity of the test were met, and concentrations of criteria contaminants (dioxins and furans, and mercury) were within relevant GN standards (Environmental Guideline for the Burning and Incineration of Solid Waste, 2012).

Agnico Eagle is required by Environment Canada's Greenhouse Gas Emissions Reporting Program (GHGRP) to track greenhouse gas emissions. Estimated emissions for the Meliadine site (including

Rankin Inlet operations) in 2018 were 62,051 tonnes CO_2 equivalent (e), which is lower than the FEIS maximum predicted emission rate of 304,000 tonnes/yr CO_2e.

Since monitoring results in 2018 were within applicable air quality criteria and FEIS predictions, no additional adaptive management measures are planned.

1 INTRODUCTION

1.1 BACKGROUND AND OBJECTIVES

In February 2015, Agnico Eagle Mines Ltd. (Agnico Eagle) was issued NIRB Project Certificate No. 006 for the Meliadine Gold Project, near Rankin Inlet, NU. In accordance with Conditions 1 and 2 of the Project Certificate, Agnico Eagle has developed the Meliadine Air Quality Monitoring Plan (November, 2015) to describe the program for onsite air quality monitoring.

Through this program, Agnico Eagle aims to measure concentrations of airborne particulate matter and gaseous compounds surrounding the major areas of Project activity, and the deposition of those particles over time, using a combination of active and passive sampling methods. The objective of the Air Quality Monitoring Plan is to compare ambient air quality to regulatory standards, confirm the findings of the air impact assessment in the FEIS (Vol. 5 – Atmospheric Environment and Impact Assessment, April, 2014), and thereby ensure the effectiveness of the planned mitigation measures.

In accordance with the Project Certificate and the Air Quality Monitoring Plan, air quality monitoring for the Meliadine site includes analysis of suspended particulates, dustfall, NO_2 and SO_2. In addition, as meteorological data are a critical input to air dispersion models and emissions estimation, a real time meteorological station has been installed at the site and recorded meteorological data is reported

A summary of the air quality monitoring program is shown in Table 1. Monitoring according to the pre-construction objectives has been ongoing since 2012. In 2017, the project entered the construction phase, which continued in 2018.

Table 1. Air quality monitoring objectives.

Project Phase	Program Objectives	Monitoring Equipment
Pre-construction	To obtain baseline data in order to be able to compare with construction and operation phases	• Three dustfall jars onsite • Three dustfall jars along the AWAR
Construction	To verify compliance with applicable standards. To apply mitigation measures if necessary.	• One continuous TSP/PM_{10} sampling unit (Partisol model 2025) • One passive NO_2-SO_2 monitor (laboratory-supplied) • Four dustfall jars onsite. • Three dustfall jars along the AWAR
Operations Phase	To verify that the TSP, PM_{10}, and $PM_{2.5}$ emission rates used in the assessment were reasonable. To verify the predicted concentrations of TSP, PM_{10}, and $PM_{2.5}$. To verify that the mitigation measures considered integral to the Project are being incorporated as planned, and are effective.	• Two continuous TSP/PM_{10}/$PM_{2.5}$ sampling units (Partisol model 2025) • Two passive NO_2-SO_2 monitors (laboratory-supplied) • Four dustfall jars onsite. • Three dustfall jars along the AWAR

1.2 Monitoring Locations and Dates

According to the construction-phase monitoring objectives, air quality monitoring in 2018 included dustfall sampling at three locations along the AWAR, and four locations onsite (DF-1 through DF-7, described below; Figure 1). Dustfall monitoring was conducted over approximately 30 day periods for all sampling stations from December 31, 2017 through December 12, 2018 (December 2018 - January 2019 samples will be included in the 2019 monitoring report).

Passive samplers for NO_2 and SO_2 were installed at two locations (DF-5 and DF-7). Passive monitoring of NO_2 and SO_2 was conducted over approximately 30 day periods from December 31, 2017 through December 12, 2018.

Active sampling for suspended particulates occurs at DF-5 (South unit) and DF-7 (North unit). Sampling at the South unit (DF-5) began on December 3, 2018 (TSP only), and sampling at the North unit (DF-7) began on December 21, 2018 ($PM_{2.5}$/PM_{10} only). Sampling did not commence until December as a result of delays in shipments of the Partisol units as well as availability of the service personnel to provide onsite set up and training. It is anticipated that both TSP and $PM_{2.5}$/PM_{10} units will be active at both locations in 2019.

Details of the monitoring locations in 2018 are summarized in Table 2. As described in the Air Quality Monitoring Plan, sampling locations will be reviewed and may be adapted throughout the construction and/or operations phases of the Project, as necessary.

Table 2. Air quality monitoring locations and parameters monitored in 2018. *Partisol sampler installed but not functioning properly – samples not collected.

Monitoring Station	UTM	Parameters	General Location	Location Description
DF-1	544073E 6970759N	Dustfall	AWAR	AWAR km 4 South of Iqalugaarjuup Nunanga Park 100 m from road (west/upwind side)
DF-2	546621E 6973334N	Dustfall	AWAR	AWAR km 10 East of Iqalugaarjuup Nunanga Park 100 m from road (west/upwind side)
DF-3	544899E 6981387N	Dustfall	AWAR	AWAR km 23 North of Iqalugaarjuup Nunanga Park 25 m from road (west/upwind side)
DF-4	540014E 6987836N	Dustfall	Onsite	Adjacent to freshwater pumphouse on Lake A8 Downwind of main mine site
DF-5	542226E 6988507N	Dustfall NO_2, SO_2 TSP (PM_{10}, $PM_{2.5}$)*	Onsite	500 m south-east of the exploration camp Downwind of main mine site
DF-6	537586E 6989096N	Dustfall	Onsite	Adjacent to Lake B5, approx. 600 m southwest of main mine site (direction perpendicular to dominant wind)
DF-7	537143E 6991176N	Dustfall NO_2, SO_2 (TSP)* PM_{10}, $PM_{2.5}$	Onsite	Adjacent to emulsion plant, approx. 2 km northwest (upwind) of the camp complex

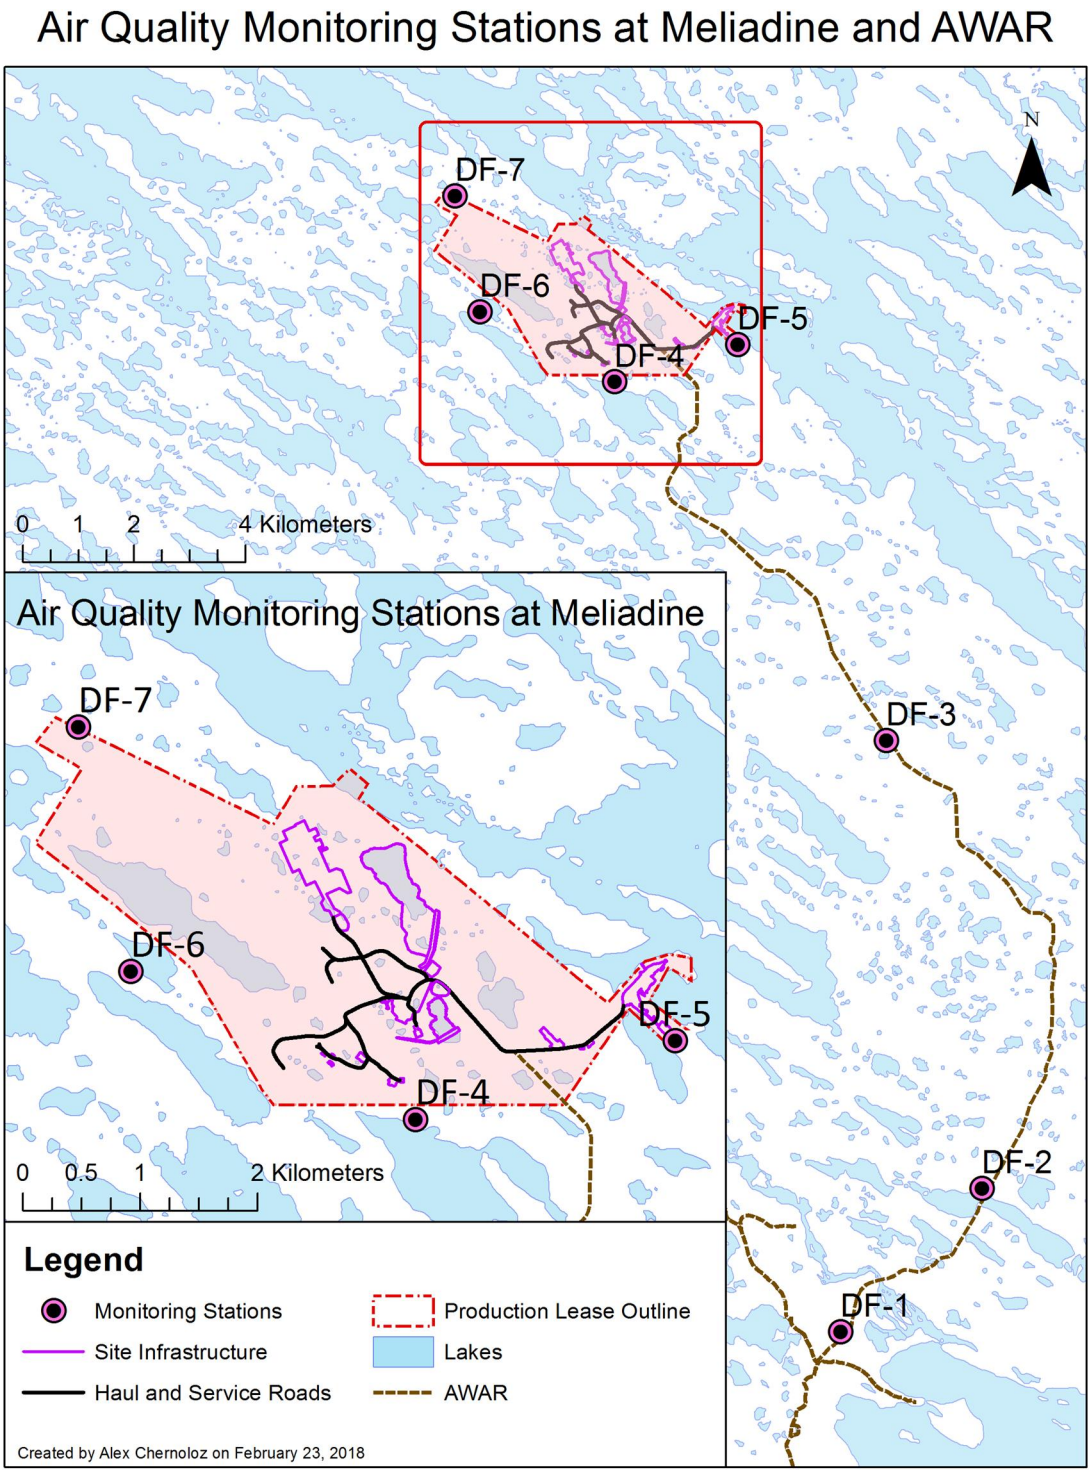

Figure 1. Air quality monitoring locations.

2 METHODS

2.1 SAMPLING METHODOLOGY

2.1.1 DUSTFALL

Dustfall was collected in open vessels containing a purified liquid matrix (de-ionized water and isopropanol), supplied by a commercial analytical laboratory. Particles are deposited and retained in the liquid, which is then analyzed for total and fixed (non-combustible) dustfall by the supplying laboratory. Vessels were deployed according to laboratory specifications for sequential one-month periods at each location, retrieved, re-sealed, and shipped back to the laboratory. Canisters were placed on a 2 m stand with an open bucket-style holder fitted with wires around the rim to deter birds (see Figure 2). Calculated dustfall rates were normalized to 30 days (mg/cm^2/30 days). Dustfall canisters were provided by and analyzed by Maxxam Analytics.

As required by Condition 1 of Project Certificate No. 006, and described in the Air Quality Monitoring Plan, an initial snowpack survey will be conducted in the winter season of 2018-2019 at each of the dustfall stations for analysis of dust content in the snow.

Figure 2. Dustfall sampling stand at the Meliadine site.

2.1.2 *SUSPENDED PARTICULATES*

Suspended particulates (TSP, PM_{10}, $PM_{2.5}$) are sampled over 24-h periods every six days using a Partisol Plus Model 2025i Sequential Air Sampler (TSP) and a Partisol Plus Model 2025-D Dichotomous Sequential Air Sampler ($PM_{2.5}$ and PM_{coarse}). Partisol samplers draw in a stream of ambient air at a controlled flow rate, and particulates are collected on a pre-weighed filter supplied by an accredited laboratory. The exposed filter is then shipped back to the laboratory and re-weighed to measure the total accumulated particulates. Calculations for TSP, PM_{10} and $PM_{2.5}$ were performed according to the Partisol operating manual, as follows.

TSP is calculated as:

$$TSP = M_{TSP}/V$$

Where: TSP = mass concentration of particulates (µg/m^3)

M_{TSP} = final mass of TSP filter – initial mass of filter (µg/filter)

V = volume of air drawn in during the sampling period (~24 m^3)

Since the dichotomous unit splits the intake air stream to determine $PM_{2.5}$ and PM_{coarse} ($PM_{10\text{-}2.5}$), the volume of air is different for each filter. Calculations are performed as follows:

$PM_{2.5}$ is calculated as:

$$PM_{2.5} = M_{2.5}/V_{2.5}$$

Where: $PM_{2.5}$ = mass concentration of particulates (µg/m^3)

$M_{2.5}$ = final mass of $PM_{2.5}$ filter – initial mass of filter (µg/filter)

$V_{2.5}$ = volume of air drawn through the $PM_{2.5}$ filter during the sampling period (~21.7 m^3)

And PM_{coarse} is calculated as:

$$PM_{coarse} = M_{coarse}/V_{total} - PM_{2.5}(V_{coarse}/V_{total})$$

Where: PM_{coarse} = mass concentration of particulates (µg/m^3)

M_{coarse} = final mass of PM_{coarse} filter – initial mass of filter (µg/filter)

V_{total} = total volume of air drawn into unit during sampling (~24m^3)

V_{coarse} = volume of air drawn through the PM_{coarse} filter during the sampling period (~2.4 m^3)

Concentration of PM_{10} is then calculated as PM_{coarse} + $PM_{2.5}$.

For comparison to Government of Nunavut Ambient Air Quality Guidelines (2011), concentrations of particulates need to be calculated using air volumes normalized to 25°C and 101.3kPA (standard temperature and pressure; STP). Standardized volumes were either recorded by the Partisol unit, or calculated from average temperature and pressure recorded by the Partisol unit during the sampling period, whenever possible. Estimates of suspended particulate concentrations using non-standardized volumes are expected to be slightly conservative (higher than actual), since air temperatures are almost always colder than 25°C. In addition, the air sampling unit is housed in an insulated container because winter temperatures inhibit operation. This is standard practice in northern climates. Since the unit's ambient temperature sensor is warmer than actual air temperature for much of the year, intake volumes are inflated compared to calculated volumes, resulting in conservative estimates of particulate concentrations.

In 2018, recorded standardized volumes were available for all sampling dates.

2.1.3 NO_2 AND SO_2

Concentrations of NO_2 and SO_2 by volume (ppb) were analyzed over one-month periods using a passive sampling device provided by Maxxam Analytics and deployed by Agnico Eagle technicians according to laboratory-identified procedures. Following each sampling period, the sampling device was retrieved and shipped to the commercial laboratory for analysis.

2.2 DATA ANALYSIS

2.2.1 DUSTFALL

No standards for dustfall are available for Nunavut or the Northwest Territories. Results of the dustfall analysis are therefore compared to the Alberta Ambient Air Quality Guideline for recreational areas for total dustfall (June, 2016) of 0.53 mg/cm^2/30d and commercial/industrial guideline of 1.58 mg/cm^2/30d, to provide context. These guidelines are based on aesthetic or nuisance concerns, and are to be used for airshed planning and management, as a general performance indicator, and to assess local concerns. Based on predictions for other mine-related roads in Nunavut (Meadowbank site), it is anticipated that guidelines for recreational areas may regularly be exceeded in close proximity to the AWAR or minesite, and that guidelines for industrial areas may occasionally be exceeded.

Dustfall rates were analyzed for indications of spatial and temporal trends (within and between years). Unusual results will trigger investigation, and potentially supplementary monitoring or mitigation measures.

Although modeling was conducted as a component of the Air Quality Impact Assessment (FEIS Volume 5) to determine deposition rates of particulate matter on a 1x1 km grid in the Project area,

quantitative results (isopleths) were not provided in the FEIS documents. Quantitative predictions regarding dustfall (i.e. deposition of TSP) in the FEIS are limited to percent change values based on distance from the centre of the AWAR, in no particular location. According to the Air Quality and Dustfall Monitoring Plan, samples were collected at the 25 m and 100 m distance, but not in the same location. Since deposition rates are strongly influenced by microclimate and topography, no comparisons to FEIS predictions for dustfall are performed. The AWAR dustfall sampling program may be adjusted in future years to facilitate such a comparison, if rates of dustfall appear elevated in comparison to guideline values.

2.2.2 SUSPENDED PARTICULATES

Results of suspended particulate monitoring are compared to Government of Nunavut Environmental Guidelines for Ambient Air Quality (October, 2011). Guidelines for the measured parameters are provided in Table 3.

In 2015, the Canadian Council of Ministers of the Environment adopted new Canadian Ambient Air Quality Standards for $PM_{2.5}$. Although these have not yet been incorporated into Nunavut's guidelines, the published 24-h value for $PM_{2.5}$ of 28 µg/m^3 and annual average of 10 µg/m^3 are addressed here for reference. These values represent voluntary objectives.

No GN standard is available for PM_{10}, therefore results are compared to the BC Air Quality Objective (August, 2013) of 50 µg/m^3.

Results will additionally be compared to FEIS predictions for maximum ground-level concentrations of particulates, which exceed regulatory guidelines in most cases. According to FEIS Volume 5 (Atmospheric Environment), Table 5.2-15, maximum predicted emissions of TSP, PM_{10}, and $PM_{2.5}$ for the Site Study Area where samplers are located are shown in Table 3. These model results assume no contribution from background concentrations, which were not available for remote sites in the North. However, it should be noted that monitoring results will include background contributions, so comparisons to these FEIS predictions are expected to be conservative. Comparisons to predicted peak concentrations (which include influence of meteorological anomalies) may be conducted if such a situation occurs.

Table 3. Government of Nunavut (GN) Environmental Guidelines for Ambient Air Quality (October, 2011), CCME Canadian Ambient Air Quality Standards, and BC Air Quality Objectives for the parameters of concern at Meliadine. All values are for data normalized to standard conditions of 25°C and 101.3 kPa. *Maximum predicted values according to Table 5.2-15 in Golder (2014).

Parameter		Regulatory Guidelines		FEIS Predictions*
	Averaging Time	Jurisdiction	Guideline (µg/m³)	
Fine Particulate Matter ($PM_{2.5}$)	24-h average	GN	30	55.3
		CCME	28	
	Annual average	CCME	10	-
Coarse Particulate Matter (PM_{10})	24-h average	BC	50	104.0
Total Suspended Particulate (TSP)	24-h average	GN	120	213.7
	Annual geometric mean	GN	60	16.8

2.2.3 NO_2 AND SO_2

The analysis of the NO_2 and SO_2 sampling results includes a comparison of results with the GN Environmental Guidelines for Ambient Air Quality (October, 2011), which are equivalent to the Canadian National Ambient Air Quality Objective for these compounds. Concentrations measured on a monthly basis were averaged, and compared to the annual average guidelines for NO_2 (60 µg/m³ or 32 ppb) and SO_2 (30 µg/m³ or 11 ppb).

In order to determine the accuracy of assumptions and predictions made during the Project assessment phase, a comparison to NO_2 and SO_2 concentrations described in the FEIS (Golder, 2014) is also included. For the current construction phase, results were compared to predicted concentrations for "Case 1", where no open-pit mining is occurring. For the site study area, where the sampling station DF-5 is located, the FEIS predicted a maximum annual average of 43.9 µg/m³ (23.3 ppb) for NO_2, and 0.3 µg/m³ (0.1 ppb) for SO_2 for the Case 1 scenario. For the local study area, where the sampling station DF-7 is located, the FEIS predicted a maximum annual average of 22.8 µg/m³ (12.3 ppb) for NO_2, and 0.0 µg/m³ (0.0 ppb) for SO_2 for the Case 1 scenario. It should be noted that model predictions were for emissions produced by mine site activity, so do not include background values, which are included in monitoring results. The background values assumed in the FEIS (Table 5.2-6) of 0.1 µg/m³ (0.05 ppb) for NO_2 and 0.5 µg/m³ (0.2 ppb) for SO_2, are from the Fortune Minerals NICO project. Therefore, results of the monitoring program at Meliadine are compared to the sum of these assumed background values and the predicted concentrations from site activity, as summarized in Table 4.

Table 4. Summary of GN guidelines and FEIS predictions (plus assumed background concentrations) for annual average concentrations of NO_2 and SO_2.

Compound	GN Guideline (Annual Average)	FEIS Prediction (Annual Average)	
		DF-5	DF-7
NO_2	32 ppb	23.4 ppb	12.4 ppb
SO_2	11 ppb	0.3 ppb	0.2 ppb

The measured ambient NO_2 and SO_2 concentrations were also analyzed for spatial and temporal trends.

2.3 QA/QC

According to the Air Quality Monitoring Plan, QA/QC procedures for the monitoring program included the following:

- An accredited laboratory was used for pre-sample preparation and analysis;
- Samples were collected by appropriately trained personnel; and
- An accredited laboratory calculated ambient dustfall deposition rates based on laboratory results;
- Results were interpreted by qualified personnel.

3 MONITORING RESULTS

Laboratory certificates for all analytical results are provided in Appendix A.

3.1 DUSTFALL

Results of the 2018 dustfall sampling program (30-day normalized rates of total dustfall) are provided in Figures 3 and 4. Values below the detection limit (0.001 or 0.002 mg/cm^2/30d) are reported as ½ the limit. Samples are plotted by the collection start date. To provide context, the Alberta Ambient Air Quality Guidelines for recreational/residential and industrial/commercial areas of 0.53 mg/cm^2/30 days and 1.58 mg/cm^2/30 days are indicated for total dustfall. In total, 2 of 36 samples collected in 2018 exceeded the recreational area guideline. These two samples were collected in very close proximity to the AWAR (25 m) at station DF-3. No samples exceeded the industrial area guideline.

Fixed dustfall results since 2012 are provided in Figures 5 (AWAR), 6 and 7 (mine site) for assessment of trends over time, since the non-combustible fraction is more representative of dust generated by mine site activity than total dustfall, which includes organic components (e.g. pollen, plants, animal particles). When results were greater than the detection limit, fixed dustfall accounted for 81% of total dustfall in each sample on average (range of 15 – 100%). In 2018, the greatest dustfall rates were observed at DF-3, which is located only 25 m from the AWAR. Generally, a slight increase

in measured dustfall has occurred since 2012 as site activity has increased, and rates tend to be highest during the summer months when conditions are the driest and traffic rates peak. In 2018, caribou migration in July resulted in road closures as well as decreased application of dust suppressant. However, relatively low dustfall values were measured overall, and no other significant trends are apparent.

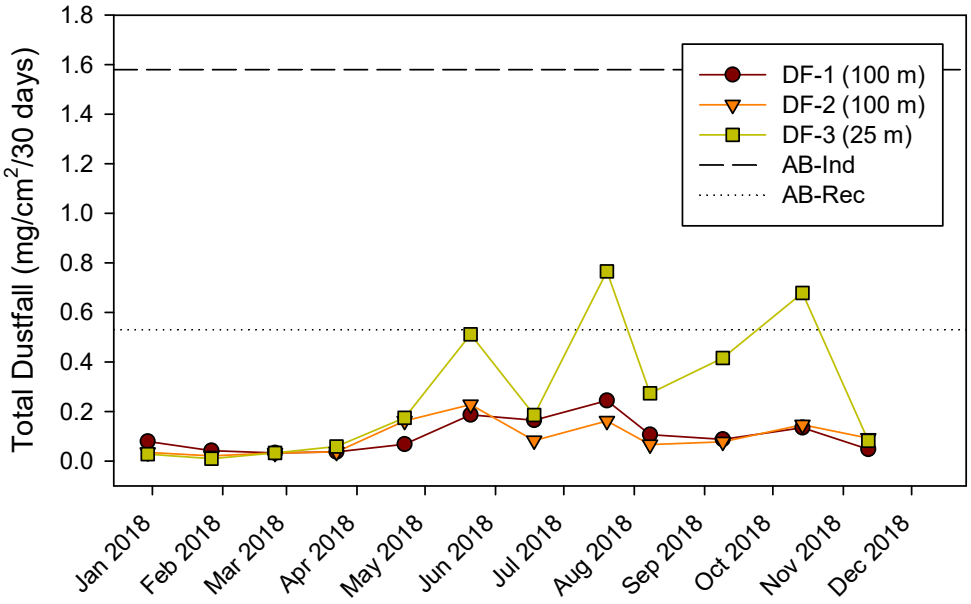

Figure 3. 30-day-normalized rates of total dustfall at AWAR sampling locations (DF-1 – 3) at the Meliadine site in 2018. Symbols represent start date of sample collection. For reference, the dotted line indicates the Alberta Ambient Air Quality Guideline for recreational areas of 0.53 mg/cm²/30d, and the dashed line indicates the industrial area guideline of 1.58 mg/cm²/30d.

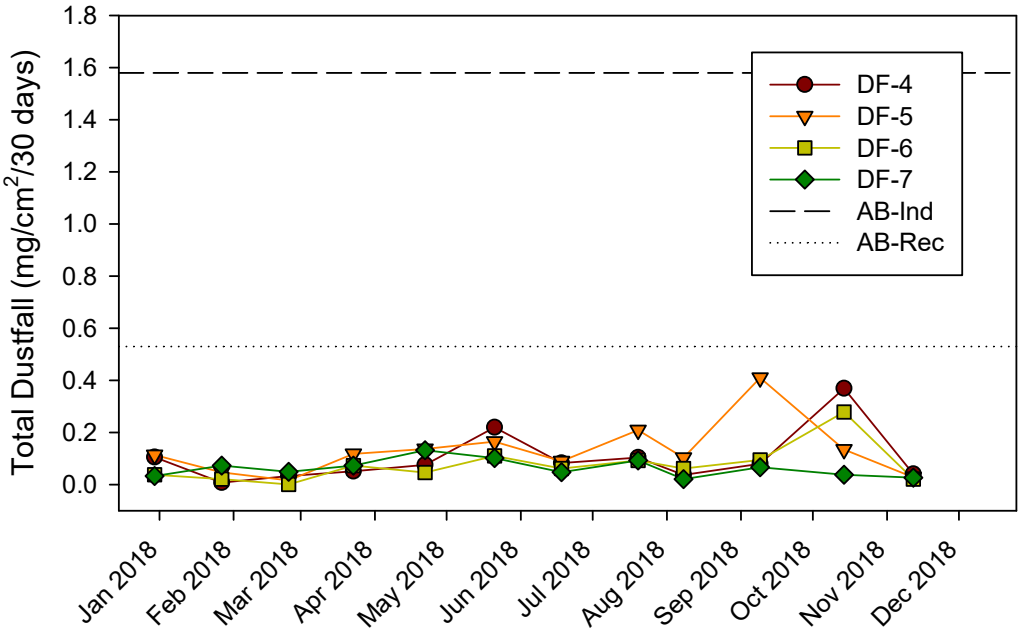

Figure 4. 30-day-normalized rates of fixed dustfall at minesite monitoring locations (DF-4 – 7) at the Meliadine site in 2018. Symbols represent start date of sample collection.

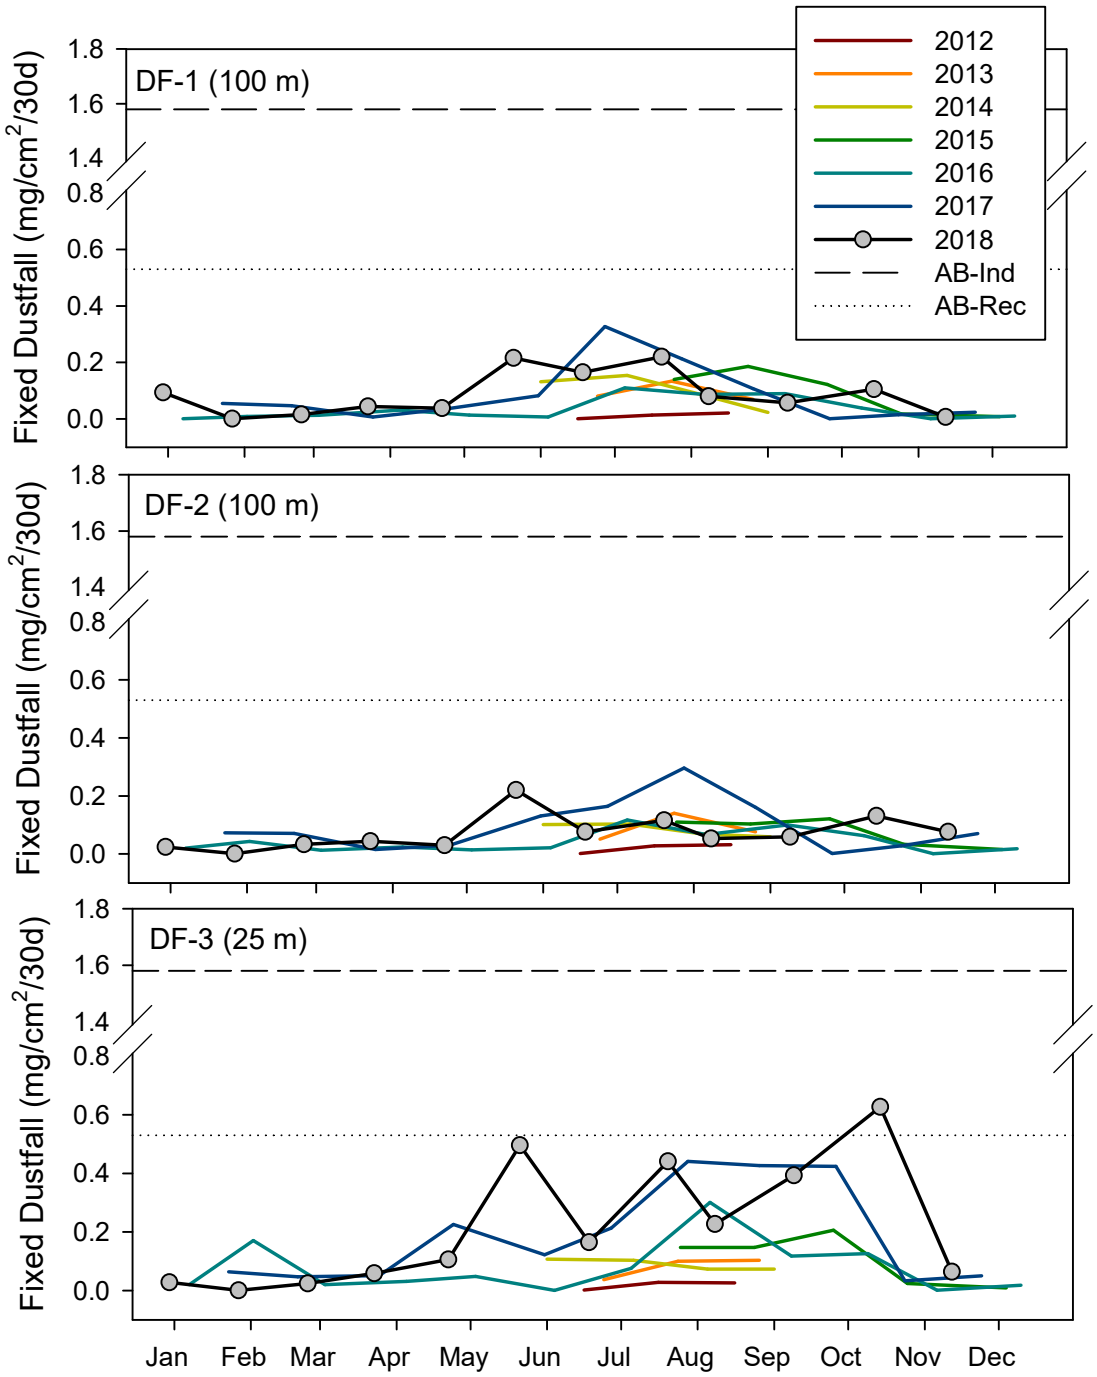

Figure 5. Fixed dustfall measurements for AWAR sampling locations a 25 m and 100 m from the road, since monitoring began in 2012. Alberta Ambient Air Quality Guidelines for total dustfall for recreational areas (AB – Rec.) and industrial areas (AB-Ind.) are indicated for context (fixed dustfall represents 81% of total dustfall, on average).

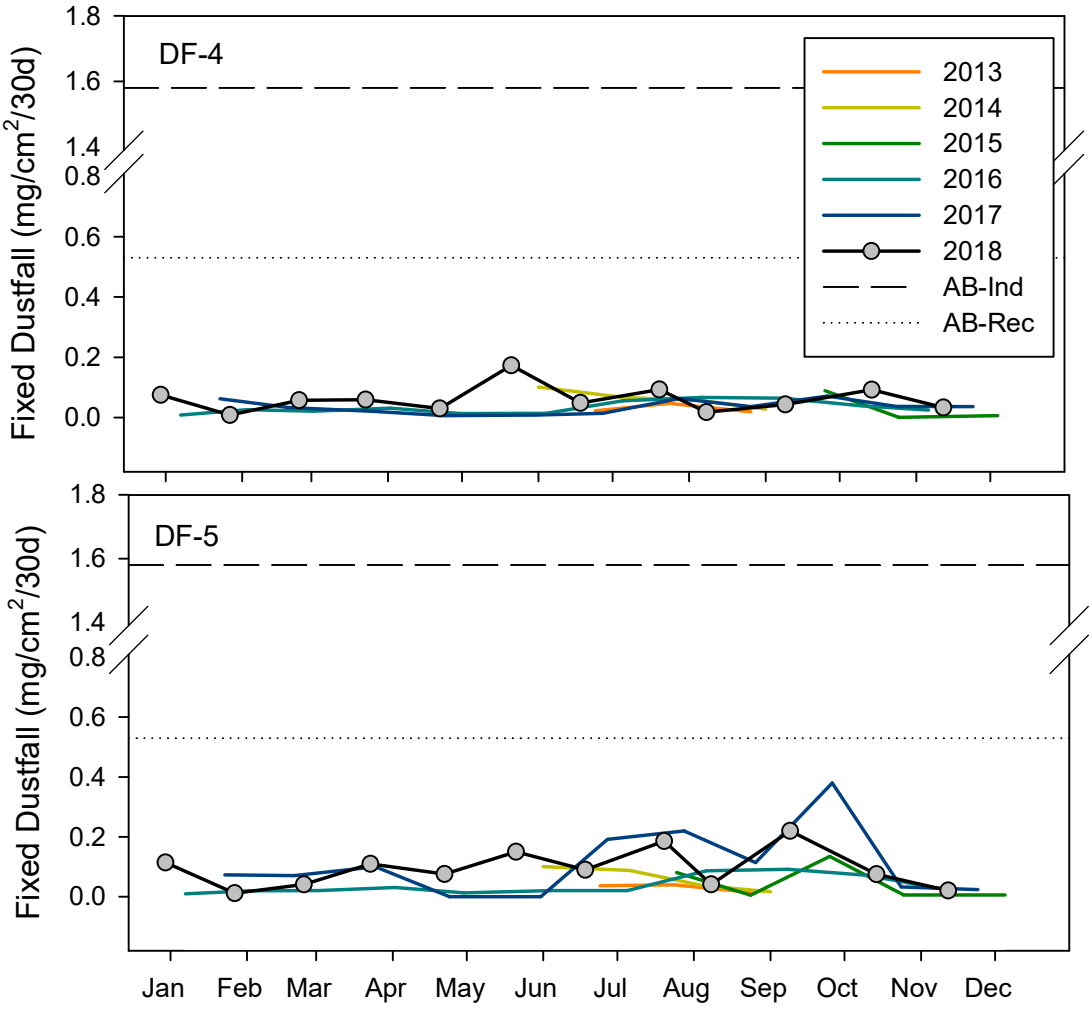

Figure 6. Fixed dustfall measurements for onsite sampling locations DF-4 and DF-5 since monitoring began in 2012. Alberta Ambient Air Quality Guidelines for total dustfall for recreational areas (AB – Rec.) and industrial areas (AB-Ind.) are indicated for context (fixed dustfall represents 81% of total dustfall, on average).

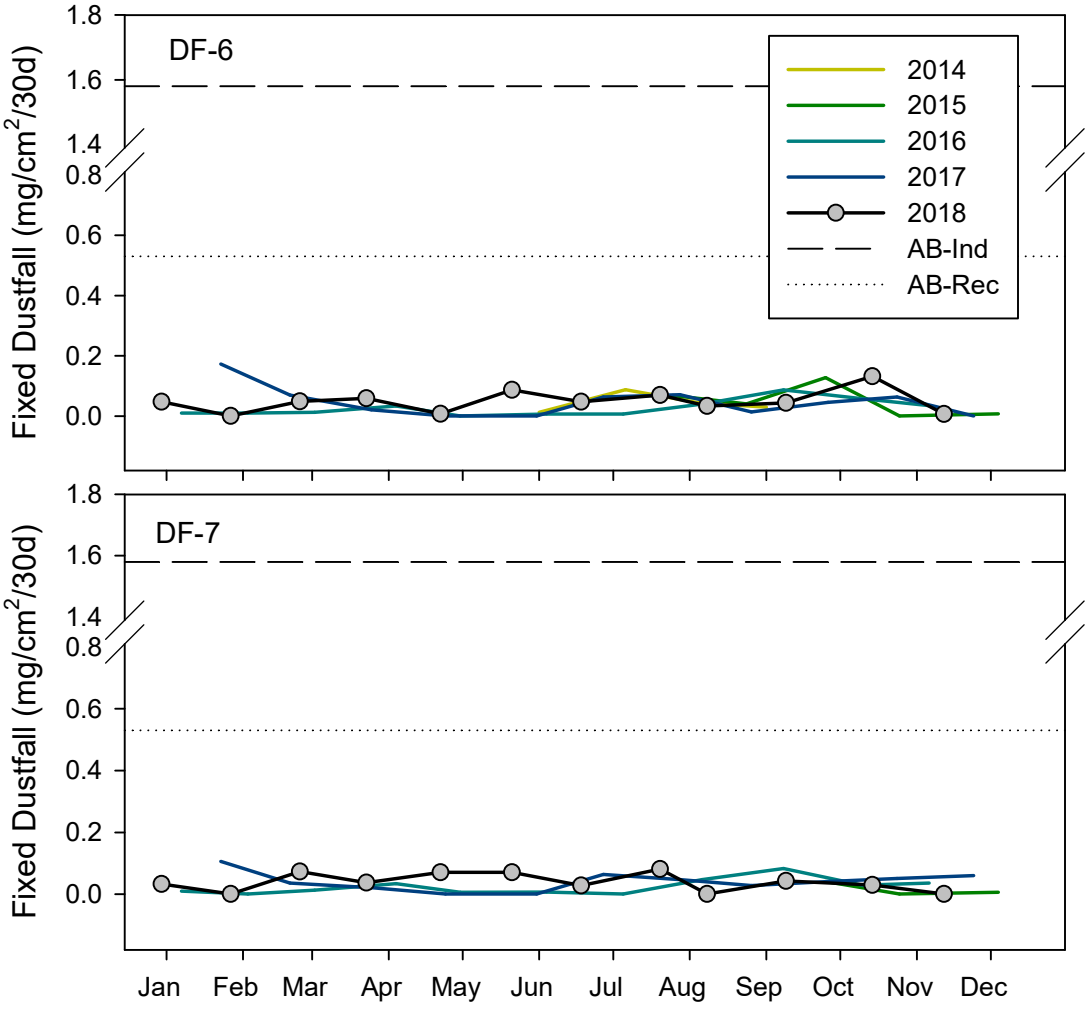

Figure 7. Fixed dustfall measurements for onsite sampling locations DF-6 and DF-7 since monitoring began in 2014. Alberta Ambient Air Quality Guidelines for total dustfall for recreational areas (AB – Rec.) and industrial areas (AB-Ind.) are indicated for context (fixed dustfall represents 81% of total dustfall, on average).

3.2 Suspended Particulates

In 2018, suspended particulate sampling began December 3 at DF-5. Only the TSP unit was functional at this location. Sampling began December 21 at DF-7, and only the $PM_{2.5}/PM_{10}$ unit was functional. Available results are shown in Table 5. All values are below the lowest available regulatory guideline or FEIS prediction for the 24-h average. Since only a maximum of five datapoints were available, the annual averages were not calculated.

Table 5. Concentrations of suspended particulates measured in 2018 at the Meliadine site. *For 24-h averaging time. See Table 3 for full list of regulatory guidelines and FEIS predictions.

Location	Parameter	Lowest Reference Value* (µg/m³)	Sample Start Date & Time	Result (µg/m³)
DF-5	TSP	120	12/03/18 0:00	24.0
			12/09/18 0:00	1.2
			12/15/18 0:00	6.0
			12/21/18 0:00	6.2
			12/27/18 0:00	1.5
DF-7	$PM_{2.5}$	28	12/21/18 0:00	1.6
			12/27/18 0:00	1.5
	PM_{10}	50	12/21/18 0:00	2.1

3.3 NO_2 AND SO_2

Monthly-average NO_2 trends in 2018 are provided in Figure 8. Samples are plotted by the collection start date. Concentrations of NO_2 vary between non-detect (<0.1) and 1.7 ppb.

Annual arithmetic mean concentrations were calculated for each station from the monthly average values. The annual mean concentrations of NO_2 were 0.83 and 0.52 ppb for DF-5 and DF-7, respectively (December 31, 2017 – December 12, 2018). These are both well below the Government of Nunavut Ambient Air Quality Standard of 32 ppb for the annual average. These values are also lower than maximum concentrations predicted in the FEIS, adjusted for assumed background concentrations (23.4 ppb and 12.4 ppb for DF-5 and DF-7, respectively).

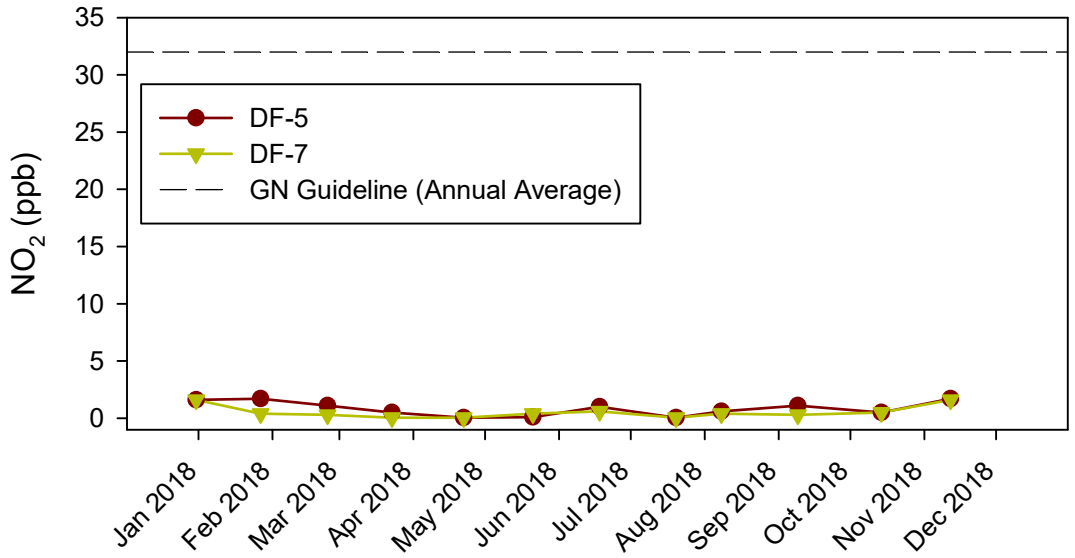

Figure 8. Monthly average concentration of NO_2 at DF-5 and DF-7. Symbols represent the collection start date. Dashed line indicates GN standard for the annual average.

No clear trends between sampling stations or over time are evident. Historical results are presented in Figure 9.

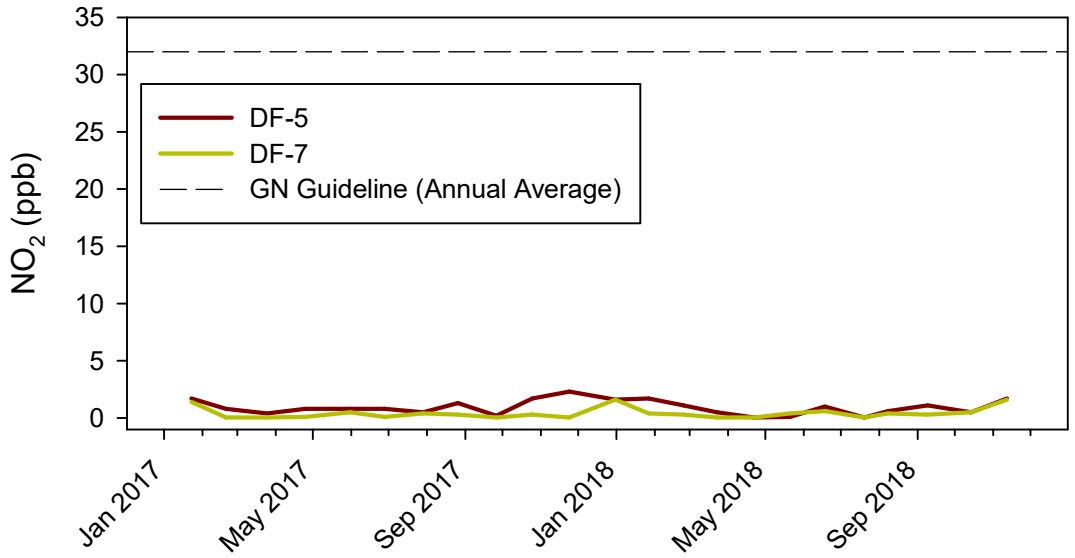

Figure 9. Historical measured monthly average concentration of NO_2 at DF-5 and DF-7. Dashed line indicates GN standard for the annual average, for reference.

Monthly-average SO_2 trends in 2018 are provided in Figure 10. Samples are referred to by the collection start date. Concentrations of SO_2 were non-detect (<0.1 ppb) in 16 of 24 samples, with a maximum of 0.3 ppb.

Annual arithmetic mean concentrations were calculated for each station from the monthly average values. A value of 0.05 ppb was used for samples below the detection limit (0.1 ppb). The annual mean concentrations of SO_2 were 0.07 and 0.10 ppb for DF-5 and DF-7, respectively (December 31. 2017 – December 12, 2018). These are both well below the Government of Nunavut Ambient Air Quality Standard of 11 ppb for the annual average, and FEIS maximum predicted values of 0.3 ppb and 0.2 ppb for DF-5 and DF-7, respectively.

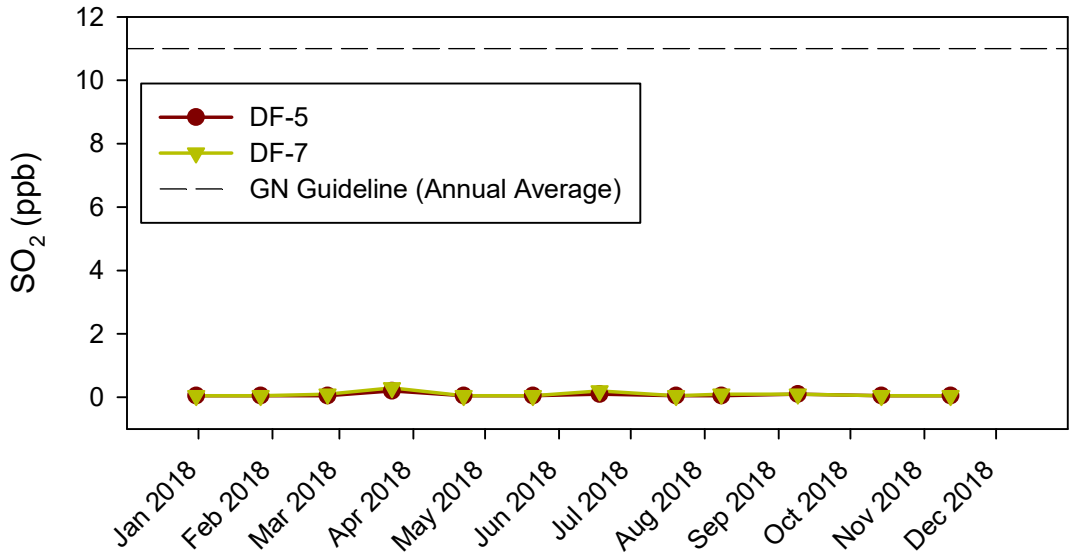

Figure 10. Monthly average concentration of SO_2 at DF-5 and DF-7. Symbols represent the collection start date. Dashed line indicates GN standard for the annual average.

No clear trends between sampling stations or over time are evident. Historical results are presented in Figure 11.

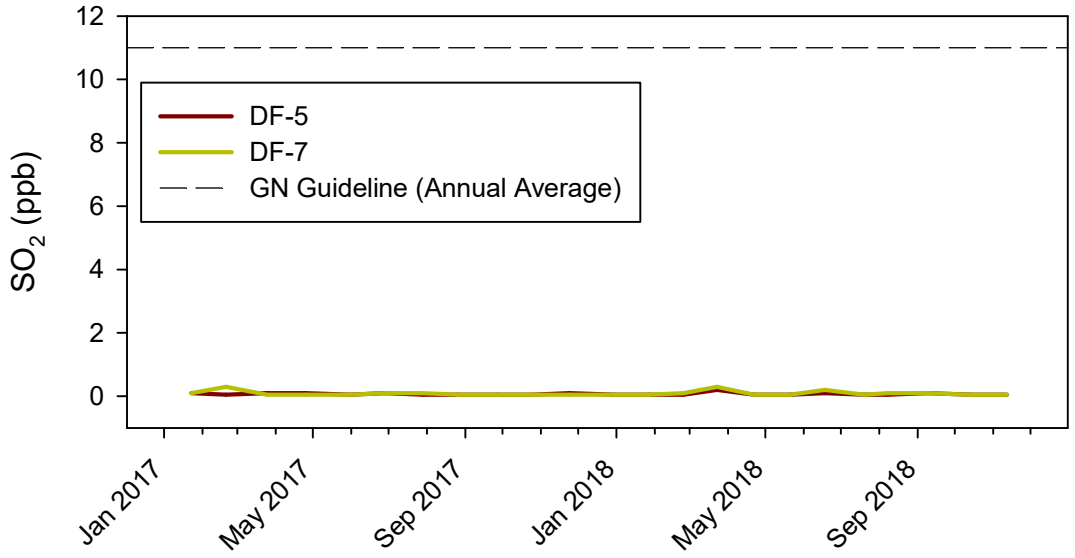

Figure 11. Historical measured monthly average concentration of SO_2 at DF-5 and DF-7. Dashed line indicates GN standard for the annual average, for reference.

4 METEOROLOGICAL MONITORING

As described in the Air Quality Monitoring Plan, a permanent weather station was installed at the Meliadine site, and daily averages for the following parameters in 2018 are provided in Appendix A:

- wind speed;
- wind direction;
- temperature;
- solar radiation;
- rainfall

Total precipitation was also recorded several times per week using two onsite rain gauges (Appendix B).

5 INCINERATOR STACK TESTING

Incinerator stack testing was performed in September, 2018 to ensure standards provided in the GN's Environmental Guideline for the Burning and Incineration of Solid Waste (2012) are not being exceeded. All conditions for validity of the test were met, and concentrations of criteria contaminants

(dioxins and furans, and mercury) were within the guideline values. The full report is provided in Appendix C.

Table 6. Summary of incinerator stack testing results for criteria contaminants (mercury, dioxins and furans).

Contaminant	Test Results	GN Standard
Mercury	0.23 µg/Rm^3 @ 11% v/v O_2	20 µg/Rm^3 @ 11% v/v O_2
Dioxins and Furans	0.042 ng /Rm^3 @ 11% v/v O_2	0.08 ng /Rm^3 @ 11% v/v O_2

6 GREENHOUSE GAS EMISSIONS

Agnico Eagle is required by Environment Canada's Greenhouse Gas Emissions Reporting Program (GHGRP) to track greenhouse gas emissions based on annual fuel consumption, composition and the US EPA's AP-42 emission factors.

Estimated greenhouse gas emissions for the Meliadine site including Rankin Inlet operations were 62,051 tonnes CO_2 equivalent (e) in 2018.

In the FEIS, total GHG emissions from the mine site were conservatively estimated to be not more than 304,000 tonnes/yr CO_2e. Estimated GHG emissions from the additional marine operations at Rankin Inlet were estimated at approximately 13,000 tonnes/yr CO_2e.

7 MITIGATIVE AND ADAPTIVE STRATEGIES

Fugitive dust abatement measures and pollution prevention strategies were identified in the FEIS for the construction phase as follows, and are being implemented. Since monitoring results in 2018 were within applicable air quality criteria and FEIS predictions, no additional mitigative measures are planned.

- Best management practices to control fugitive particulate emissions onsite and on the AWAR (see Road Management Plan for details).
- Exhaust emissions from non-road vehicles are managed through purchasing equipment that meet Tier 3 emission standards.
- Exhaust emissions from non-road vehicles are managed through regular and routine maintenance of vehicles.
- SO_2 emissions from non-road vehicles and stationary equipment are reduced through the use of diesel fuel with less than 15 ppm of sulfur.

In 2017, the following adjustments to the air quality and dustfall sampling program were planned, with Agnico's actions in 2018 indicated:

- Dustfall monitoring along the AWAR may be adjusted in order to assess declines in rates of deposition with distance. This is proposed to include an additional sampling jar for the DF-3 location at the 125 m distance during the peak dust generation period (July and August). Alternatively, modeled deposition rates will be obtained for the study area, as calculated in the FEIS Air Quality Impact Assessment.
    - Since dustfall samples along the AWAR only occasionally exceed guidelines for recreational areas, even in very close proximity to the road (25 m), Agnico determined that no changes to the sampling program were warranted at this time. However, trends will continue to be monitored to determine whether additional sampling is necessary.
- Adjustments to the monitoring program for metals in dustfall will also be made. Pending further discussion with NIRB and/or the commercial analytical laboratory, this may include analysis of dustfall on filters rather than collection liquid.
    - Through review of the Project Certificate and discussions with the analytical laboratory, Agnico has determined that analysis of metals on TSP filters will be conducted, rather than dustfall liquid. TSP sampling began in December, 2018, and results will be reported in 2020.
- Conduct sampling of dustfall in snowpack, as described in the Air Quality Monitoring Plan.
    - As described in the 2017 Air Quality and Dustfall Monitoring Report, a snowpack survey is planned to be conducted in the winter of 2018/2019.
- Repairs have been planned for to allow the stack testing in the fall of 2018.
    - Completed.

The following monitoring actions are planned for 2019 to improve the program:

- Maintenance and replacement parts will be obtained to ensure all Partisol units are operating, and minimal delays occur due to service requirements.
- Procedures will be developed for the collection of sampled filters, and deployment of new filters to reduce the potential for gaps in the data.
- A schedule of annual calibration of each unit, with bi-annual or quarterly system audits will be implemented.

Outside of these actions monitoring in 2019 will be conducted according to the construction phase schedule, as described in the Air Quality Monitoring Plan.

GLOSSARY

PM: Particulate matter

SVOC (PCDD/F): Dioxins and furans

ME: Metals

O_2: Oxygen

CO_2: Carbon dioxide

CO: Carbone monoxide

NO_X: Nitrogen oxide

ACFM: Actual cubic feet per minute

ECCC: Environment and Climate Change Canada

USEPA: United Stated Environmental Protection Agency

QA/QC: Quality Assurance / Quality Control

ΔP: Differential pressure read at the stack

ΔH: Differential pressure read at the control unit

DL: Detection Limit

SUMMARY

Consulair was mandated by Agnico Eagle Mines, Meliadine Division, to sample the atmospheric emissions at the outlet of an incinerator of its plant located near Rankin Inlet, Nunavut.

The objectives of the characterization of atmospheric emissions were to:

- Evaluate the physical characteristics of the gas flow in the stack;
- Evaluate the concentration and the emission rate of the particulate matter (P), Metals (ME) and Hydrogen chloride (HCl);
- Demonstrate the performance of the incinerator to meet the standards for mercury (Hg) and dioxins and furans (PCDD/F);
- Ensure that QA/QC of Consulair is respected throughout the stack sampling program.

For this project, the applicable standards are shown below with the tests results. The applicable standards for dioxins and furans (PCDD/F) were met for all tests, as well as the applicable standard for mercury (Hg). The standards come from the "Environmental Guideline for the Burning and Incineration of Solid Waste" emitted by the Department of Environment of the Government of Nunavut base on the Canadian Council of Ministers of the Environment (CCME) Canada - Wide Standards for Dioxins and Furans and Mercury Emissions.

The government of Nunavut presented a guideline document in October 2010, which was revised in January 2012, for the burning and incineration of solid waste. The document presented two criteria for air emissions which are applicable in the current project. A standard for Dioxins and Furans is stated at 80 pg I-TEQ/m^3 and another standard for mercury is stated at 20 µg/Rm^3. The reference conditions are stated at 101.3 kPa and 25°C and both standards are corrected to 11% O_2.

APPLICABLE STANDARDS		
CONTAMINANTS	**TEST RESULTS**	**STANDARDS**
MERCURY (Hg)	0.23 µg / Rm^3 @ 11 % v/v O_2	20 µg / Rm^3 @ 11 % v/v O_2
DIOXINS AND FURANS (PCDD/F)	0.042 ng / Rm^3 @ 11 % v/v O_2	0.08 ng TEQ / Rm^3 @ 11 % v/v O_2

R: Reference conditions 25 °C and 101.3 kPa on a dry basis.

SUMMARY

INORGANIC SAMPLING TRAIN

SO_2 (mg/Rm^3)	0.6
SO_2 (kg/h)	0.004
R: Reference conditions 25 °C, 101.3 kPa on a dry basis.	

The sampling was performed in compliance with the rules of the requirements of the Report No. EPS 3/UP/2, including methods recommended by "Environment and Climate Change Canada" (ECCC) of the Government of Canada inside "Environment Canada, The National Incinerator Testing and Evaluation Program: Air Pollution Control Technology". Report No. EPS 3/UP/2, Ottawa, 1986.

1 INTRODUCTION

Consulair was mandated by Agnico Eagle Mines, Meliadine Division (Nu), to demonstrate the performance of the incinerator to meet the standards for mercury (Hg) and dioxins and furans (PCDD/F).

1.1 Sampling scope

The objectives of the characterization of atmospheric emissions were to:

- Evaluate the physical characteristics of the gas flow in the stack;
- Evaluate the concentration and the emission rate of particulate matter (P), Metals (ME) and Hydrogen chloride (HCl);
- Demonstrate the performance of the incinerator to meet the standards for mercury (Hg) and dioxins and furans (PCDD/F);
- Ensure that QA/QC of Consulair is respected throughout the stack sampling program.

The study included sources and pollutants referred in the following table.

Table 1-1 – OVERALL TEST MATRIX

SOURCE	POLLUTANTS	SAMPLING METHODS
Incinerator outlet	Particulate matter (PM)	EPS 1/RM/8 EC
	Hydrogen chloride (HCl)	EPS 1/RM/1 EC
	Metals	USEPA 29
	SVOC (PCDD/F)	EPS 1/RM/2 EC

2 SAMPLING TEAM AND PARTICIPANT

The interveners of this testing program are listed in Table 2-1 and 2-2. The analysis laboratory used is defined in Table 2-3.

3 SAMPLING

3.1 Process operation

A representative of the Agnico Eagle mines company had the responsibility to monitor the operating conditions to ensure the representativeness of the sampling. In order to perform the sampling program under representative conditions, a tight liaison was maintained with the operators during testing.

Process operating conditions of the incinerator were under Agnico-Eagle's responsibility. The operating conditions were maintained stable throughout each days of the test program.

3.2 Source description

The number of measuring points in the stack was determined in accordance with the requirements of Environment Canada's EPS 1/RM/8 sampling method entitled: "Reference methods for source testing: measurement of releases of particulate from stationary sources".

Stacks characteristics are described in the following table.

Table 3-1 – SAMPLED SITE CHARACTERISTICS

SOURCE	DIMENSION(S) Stack (m)	DIAMETER NUMBER)		NUMBER OF SAMPLING POINTS	
		A_D	B_D	Number of port used and sampling points	Total
Incinerator outlet	0.826	5.0	2.0	2 x 6	12

3.3 Sampling methodology

Sampling methods used in this project are methods approved and recommended by known organisms such as the United States Environmental Protection Agency (US EPA) and Environment Canada (EC).

The following table shows the sampling methods that were used during testing.

Table 3-2 – SAMPLING METHODS

PARAMETERS	METHODS	SAMPLING DURATION (min)
Manual sampling methods		
Temperature	Thermometer or thermocouple	With isokinetic value
Gas flow	SPE 1/RM/8, method B – Environment Canada	With isokinetic value
O_2, CO_2, CO	SPE 1/RM/8, method C – Environment Canada	With isokinetic value
Moisture content	SPE 1/RM/8, method D – Environment Canada	With isokinetic value
Particulate matter (PM)	SPE 1/RM/8, method E – Environment Canada	120 / 170 / 180
HCl	SPE 1/RM/1 – Environment Canada	
Metals	USEPA, CFR 40, Part 60, Method 29	
SVOC (PCDD/F)	SPE 1/RM/2 – Environment Canada	240 / 150 / 180
Instrumental sampling method		
NO_X	USEPA, CFR 40, Part 60, Method 7E	60
SO_2	USEPA, CFR 40, Part 60, Method 6C	60

The distribution of parameters within the sampling train is presented in the following table.

Table 3-3 – DISTRIBUTION OF PARAMETERS FOR EACH SAMPLING SYSTEM

SAMPLING TRAIN	PARAMETERS
Metals & Particulate matter & HCl	PM & Metals & HCl
SVOC	PCDD/F

3.4 Temperature, moisture content and flowrate

Gas temperature, flowrate, velocity and moisture content will be measured at the sampling sites according to "Reference methods for source testing: measurement of releases of particulate from stationary sources". Methods B and D, Environment Canada, December 1993, EPS 1/RM/8.

3.5 Isokinetic sampling

Isokinetic sampling allows to collect particles in the sampling nozzle at the same velocity as the gas stack velocity. In non-isokinetic conditions, if the sampling velocity is inferior than the gas stack velocity, more large particles would be collected resulting in an overestimation of the true mass concentration. On the opposite, if the sampling velocity is superior than the gas stack velocity, less large particles would be collected resulting in underestimation of the true mass concentration. In either case, the sample collected would not be an accurate reflection of the gas stack stream.

The following table presents a test acceptance criteria according to the methods (sampling systems) used.

Table 3-4 – SAMPLING ACEPTANCE CRITERIA

PARAMETERS	METHOD	ACCEPTANCE CRITERIA
Particulate Matter	SPE 1/RM/8	• Isokinetic rate comprised between 90 % and 110 % • Less than 10% of the sampled points out of the 90 % to 110 % range
Metals	Method 29 from USEPA	
SVOC	SPE 1/RM/2	

3.5.1 Particulate matter (PM), metals & HCl

Particulate matter (PM) and metals (Al, Sb, Ag, As, Ba, Be, Bi, B, Cd, Ca, Cr, Co, Cu, Sn, Fe, Li, Mg, Mn, Mo, Ni, Pb, K, Se, Na, Ti, V, Zn, Sr, Tl, Si (Silicium soluble), Hg) were sampled in accordance with the requirements of Environment Canada EPS 1/RM/8 sampling method entitled: "Reference methods for source testing: measurement of releases of particulate from stationary sources". This method was combined with USEPA method 29 entitled “Metals emissions from stationary sources" in order to allow for metals sampling (including Hg). HCl was analyzed in the first impinger of that sampling train.

Table 3-5 – MAIN COMPONENTS OF THE PM/HCl/METALS SAMPLING SYSTEM

SAMPLING PROBE	SAMPLING TRAIN	CONTROL UNIT
• Quartz nozzle; • Quartz probe; • S type Pitot tube for the gas velocity attached to the sample probe; • Thermocouple for temperature attached to the sample probe.	• A 0.3 µm porosity pre-weighted quartz filter mounted in a Pyrex filter holder and placed in a heated oven to avoid moisture condensation; • Seven impingers placed in series and containing: ○ # 1: 100 mL H_2O; ○ # 2 and # 3: 100 mL HNO_3 (5%) / H_2O_2 (10%) solution; ○ # 4: empty; ○ # 5 and # 6: 100 mL $KMnO_4$ (4%) / H_2SO_4 (10%) solution; ○ # 7: silica gel; • Impingers placed in an ice bath to condense all the flue gas moisture.	• Sampling cord that connects the train to the sampling console; • Sampling console with oil manometer, a dry gas meter, an orifice, a temperature reader and temperature controllers; • Diaphragm vacuum pump.

3.5.2 Semivolatile organic compounds (SVOC) (PCDD/DF)

Semi Volatile Organic Compounds (SVOC) are defined as organic compounds with boiling points greater than 100 °C. This class of compounds includes PCDD (PolyChlorinated Dibenzo p Dioxins), PCDF (PolyChlorinated DibenzoFurans),

SVOCs (PCDD/F) were sampled in accordance with the requirements of Environment Canada EPS 1/RM/2 sampling method entitled: " Reference Method for Source Testing: Measurement of Releases of Selected Semi-Volatile Organic Compounds from Stationary Sources ". For this project, SVOCs included polychlorinated dibenzo-p-dioxins (PCDD) and polychlorinated dibenzofurans (PCDF). A minimal volume of at least 3.0 Rm^3 was sampled during each run.

For one series of three SVOC tests, a blank train was taken to the stack sampling site. A volume of ambient air equal to the sum of all leak check volumes during the SVOC test was pumped through the blank train, according to the requirements of reference method EPS 1/RM/2.

The following table shows the various components of the sampling system for PCDD/F.

Table 3-6 – MAIN COMPONENTS OF A SVOC SAMPLING SYSTEM

SAMPLING PROBE	SAMPLING TRAIN	CONTROL UNIT

• Glass nozzle of a precisely measured diameter to allow isokinetic sampling;
• Glass heated probe to avoid moisture condensation;
• Probe is fastened to an "S" type Pitot tube for gas velocity measurement and to a thermocouple for temperature measurement.
	• A 0.3 µm porosity pre-weighted fiber glass filter mounted on an accurate holder and placed in a heated oven to avoid moisture condensation;
	• Condenser;
	• XAD-2 resin cartridge;
	• Condensate trap;
	• Three impingers placed in series and containing:
	  ○ # 1: 100 mL ethylene glycol;
	  ○ # 2: empty;
	  ○ # 3: silica gel;
	• Impingers placed in an ice bath to condense all the flue gas moisture.
		• Sampling cord that connects the train to the sampling console;
		• Sampling console with oil manometer, a dry gas meter, an orifice, a temperature reader and temperature controllers;
		• Diaphragm vaccum pump.

3.6 Gaseous parameters (O_2, CO_2, CO, SO_2 & NO_X)

One CEM (Continuous Emission Monitoring) systems was used to determine the concentration of O_2, CO_2, CO, SO_2 & NO_X. The CEM system includes a gas extraction system, one analyzer and a data acquisition system. The moisture-free gas was analysed for O_2, CO_2, CO, SO_2 & NO_X with an analyzer as described in the following table.

Graphics of continuous measurements of gas are presented in Appendix 2 of the report.

Table 3-7 – GAS ANALYZER

ANALYZER	O_2/CO_2	CO	SO_2	NO_X
Method	USEPA 3A	USEPA 10	USEPA 6C	USEPA 7E

	2018-09-29	16:14-19:14	PM/Metal/HCl # 3

3.8 LAWS AND REGULATIONS

The government of Nunavut presented a guideline document in October 2010, which was revised in January 2012, for the burning and incineration of solid waste. The following emission standards apply to existing, new or expanding solid waste incinerators operating in Nunavut and have been adopted from the Canadian Council of Ministers of the Environment (CCME) Canada - Wide Standards for Dioxins and Furans and Mercury Emissions. The document presented two criteria for air emission which are applicable in the current project. A standard for Dioxins and Furans is stated at 80 pg I-TEQ/m^3 and another standard for mercury is stated at 20 µg/Rm^3. The R conditions are stated at 101.3 kPa and 25°C. Both standards are corrected to 11% O_2.

4 QUALITY CONTROL PROCEDURES (QA/QC)

The quality insurance program and control at Consulair has several elements to validate the methodologies used during sampling. The main points are detailed within this section.

4.1 QA/QC – PRE-TEST

4.1.1 Equipment, instruments and reagents

The sampling train glassware and sample containers were cleaned and checked according to the applicable reference methods.

The instruments used were subject of regular maintenance and are calibrated for less than a year. The calibration constants of the equipment used are shown in Tables 4-1 to 4-3. Calibration certificates of equipment are presented in Appendix 3 of the report.

The gas standards used for calibration of the analyzer were valid at the time of use considering the retention periods imposed by the supplier. The standard gases are certified to ± 2% by the supplier.

4.1.2 Field forms

The forms that present field data for the target parameters are shown in Appendix 5.

4.2 Sample tracking

A clean room inside the incinerator building was used for the assembly and the different stages of recovery of sampling trains. Recovery of samples was performed according to the procedures recommended by the methods.

The samples were collected in suitable containers as specified by the methods. All samples were kept cool during the sampling period and until the delivery of samples to analytical laboratories. Consulair used an identification system for the samples that allowed tracking the origin easily by a unique code coupled to a lookup table. Each sample number includes the date, test number, the precise location of the sampling, the nature and destination (analysis, archiving). This information is indicated on the chain of custody listing and the information is available on the analysis reports.

4.3 Validation criteria

Consulair ensured that each step of the air emission characterization program (including QA / QC program) will achieve the defined objectives, while respecting the deadline set by the customer.

4.3.1 Analytical laboratory

The particulate samples analysis was done in the laboratory of Consulair. This laboratory is accredited by the *Centre d'Expertise en Analyse Environnementale du Québec* (CEAEQ) for particulate matter (domain 400 of the air chemical section). The metals samples were analysed by Maxxam's laboratory, which is accredited by the *Centre d'Expertise en Analyse Environnementale du Québec* (CEAEQ) for metallic analysis (domain 404 of the air chemical section). The PCDD/F samples were analysed by AGAT's laboratory, which is accredited by the *Centre d'Expertise en Analyse Environnementale du Québec* (CEAEQ) for PCDD/F analysis (domain 510 of the air chemical section).

The analytical reports have been signed by a chemist and are presented in appendix 4. The laboratory also made available, in its report, the QA/QC program specific to the analysed contaminants.

4.3.2 Validation criteria – Particulate matter / Metals / HCl (PM/ME/HCl)

The following tables show the validation criteria of the methodology used.

Table 4-1 – QA/QC METHODOLOGY – PM/METALS/HCl

SPE 1/RM/8 METHODOLOGICAL INFORMATION

R: Reference conditions at 101.3 kPa et 25°C, and dry basis.				

The sampling time for the second run of SVOC is under the 180 minutes limit of the method because of a process malfunction and the sampling had to be stopped. However, since the sampling volume for this test run is higher than the 3.0 m^3 limit of the method, this should have no impact on the result.

5 RESULTS

The reference values are reported at a temperature of 25°C and an atmospheric pressure of 101.3 kPa, on a dry basis.

For the inorganic results, a laboratory analysis value preceded of "<" means that the laboratory result is less than the detection limit reported (LDR) and represents a maximum result. In this case, the detection limit reported (LDR) is the value used.

The PCDD / F result tables include all toxic congeners (17) calculated with TEF (Toxic Equivalency Factor). The term "toxic equivalency (TEQ)" is the sum of the 17 toxic congeners calculated according to the TEF and when a congener was not detected by the laboratory analysis, it was replaced by "zero".

Unless otherwise indicated, the averages indicated in the tables below are the average of all tests carried out to the same source for the same operating condition.

Computer compiled data is presented in Appendix 1.

6 CONCLUSION

According to the sampling methods and procedures combined with a rigorous quality control, the results of concentrations and / or emission rates presented in this report are valid and representative of the process operation conditions sampled for period test results.

The final results obtained are valid and representative of the operating conditions during the tests.

The sampling was made in compliance with the rules of the requirements of the Report No. EPS 3/UP/2, including methods recommended by “Environment and Climate Change Canada” (ECCC) of the Government of Canada inside “Environment Canada, The National Incinerator Testing and Evaluation Program: Air Pollution Control Technology”. Report No. EPS 3/UP/2, Ottawa, 1986.

Remarques:

Les laboratoires Maxxam sont certifiés ISO/IEC 17025:2005 pour certains paramètres précis des portées d'accréditation. Sauf indication contraire, les méthodes d'analyses utilisées par Maxxam s'inspirent des méthodes de référence d'organismes provinciaux, fédéraux et américains, tels que le CCME, le MDDELCC, l'EPA et l'APHA.

CERTIFICAT D'ANALYSES

 # DE DOSSIER MAXXAM: B847715
Reçu: 2018/10/19, 12:30

Toutes les analyses présentées ont été réalisées conformément aux procédures et aux pratiques relatives à la méthodologie, à l'assurance qualité et au contrôle de la qualité généralement appliqués par les employés de Maxxam (sauf s'il en a été convenu autrement par écrit entre le client et Maxxam). Toutes les données de laboratoire rencontrent les contrôles statistiques et respectent tous les critères de CQ et les critères de performance des méthodes, sauf s'il en a été signalé autrement. Tous les blancs de méthode sont rapportés, toutefois, les données des échantillons correspondants ne sont pas corrigées pour la valeur du blanc, sauf indication contraire. Le cas échéant, sauf indication contraire, l'incertitude de mesure n'a pas été prise en considération lors de la déclaration de la conformité à la norme de référence.

Les responsabilités de Maxxam sont restreintes au coût réel de l'analyse, sauf s'il en a été convenu autrement par écrit. Il n'existe aucune autre garantie, explicite ou implicite. Le client a fait appel à Maxxam pour l'analyse de ses échantillons conformément aux méthodes de référence mentionnées dans ce rapport. L'interprétation et l'utilisation des résultats sont sous l'entière responsabilité du client et ne font pas partie des services offerts par Maxxam, sauf si convenu autrement par écrit. Maxxam ne peut pas garantir l'exactitude des résultats qui dépendent des renseignements fournis par le client ou son représentant.

Les résultats des échantillons solides, sauf les biotes, sont rapportés en fonction de la masse sèche, sauf indication contraire. Les analyses organiques ne sont pas corrigées en fonction de la récupération, sauf pour les méthodes de dilution isotopique.
Les résultats s'appliquent seulement aux échantillons analysés. Si l'échantillonnage n'est pas effectué par Maxxam, les résultats se rapportent aux échantillons fournis pour analyse.
Le présent rapport ne doit pas être reproduit, sinon dans son intégralité, sans le consentement écrit du laboratoire.
Lorsque la méthode de référence comprend un suffixe « m », cela signifie que la méthode d'analyse du laboratoire contient des modifications validées et appliquées afin d'améliorer la performance de la méthode de référence.
Notez: Les données brutes sont utilisées pour le calcul du RPD (% d'écart relatif). L'arrondissement des résultats finaux peut expliquer la variation apparente.

Note : Les paramètres inclus dans le présent certificat sont accrédités par le MDDELCC, à moins d'indication contraire.

REMARQUES GÉNÉRALES

MÉTAUX (SOLUTION BARBOTEUR)

Les limites de détection indiquées sont modifiées en fonction du volume d'échantillon reçu.

MÉTAUX (TRAIN)

Les limites de détections indiquées sont multipliées par les facteurs de dilution utilisés pour l'analyse des échantillons.
Les limites de détection indiquées sont modifiées en fonction du volume d'échantillon reçu.

Les résultats ne se rapportent qu'aux échantillons soumis pour analyse

LDR = Limite de détection rapportée

MRC: Un échantillon de concentration connue préparé dans des conditions rigoureuses par un organisme externe. Utilisé pour vérifier la justesse de la méthode.

Blanc fortifié: Un blanc, d'une matrice exempte de contaminants, auquel a été ajouté une quantité connue d'analyte provenant généralement d'une deuxième source. Utilisé pour évaluer la précision de la méthode.

Blanc de méthode: Une partie aliquote de matrice pure soumise au même processus analytique que les échantillons, du prétraitement au dosage. Sert à évaluer toutes contaminations du laboratoire.

Réc = Récupération

(1) La récupération ou l'écart relatif (RPD) pour ce composé est en dehors des limites de contrôle, mais l'ensemble du contrôle qualité rencontre les critères d'acceptabilité pour cette analyse

Courriel: AFrangoulis@maxxam.ca

Objet : **Explications de la demande d'analyses pour le projet de Agnico Eagle (Meliadine).**
Notre no de projet : #18-5528

Bonjour Argyro,

Voici la demande d'analyse concernant le dossier mentionné précédemment. Les mesures ont été effectuées du 22 au 29 septembre 2018. Les échantillons se retrouvent dans une glacière. À cela suivra plus tard les échantillons des métaux particulaires et les échantillons d'eau (# 304, 312, 320 et 328).

DEMANDE D'ANALYSES / MÉTAUX

Les fractions filtres et buse-sonde acétone vous seront envoyées un peu plus tard afin de faire l'analyse pour les métaux particulaires. Pour chacun des essais, nous voulons un résultat combiné des 2 fractions Buse-Sonde (Acétone et HNO_3) et le Filtre (donc 3 échantillons à combiner ex. éch.# 301, 302 et 303 – 309, 310 et 311 etc. Aussi, pour le Mercure d'un même essai, les fractions de $KmnO_4$ (BB56) et de HCl 8N (BB56-HCL) doivent être combinées (ex. éch.# 307 et 308). Il est important de respecter ces combinaisons exigées.

Il y a aussi les échantillons d'eau, # 304, 312, 320 et 328 qui vont arriver plus tard. L'analyse des métaux et du Hg sera également à faire.

Les métaux à analyser sont les suivants : Al, Sb, Ag, As, Ba, Be, Bi, B, Cd, Ca, Cr, Co, Cu, Sn, Fe, Li, Mg, Mn, Mo, Ni, Pb, K, Se, Na, Ti, V, Zn, Sr, Tl, Si (Silicium soluble), Hg

Il est important de ne pas jeter les échantillons et de nous les retourner après l'analyse.

Pour des renseignements supplémentaires n'hésitez pas à communiquer avec nous.

Envoyer les résultats à eric.trepanier@consul-air.com.

Salutations.

Eric Trépanier

CONSULAIR GESTION GLOBALE AIR ET ENVIRONNEMENT

F_12_V9 (2/2)

August/2018

Récupération finale du dispositif de prélèvement MÉTAUX USEPA 29

Date de récupération :	23-09-2018	Heure de récupération:	8Lxx
Pesée des barboteurs pour l'humidité:	✓	Nettoyage de l'extérieur des différentes pièces :	✓
Conditionnement des contenants de récupération :	✓		

Contenant 1 - Récupération du filtre (Séparateur principal)

Mettre le filtre dans un pétri propre et scellé (pince en polyéthylène ou teflon)	✓

Contenants 2 et 3 - Récupération de la buse et de la sonde

Items	Remarques	Brosser 100 ml Acétone	Rincer 100 ml HNO_3 0,1N	Niveau
de la buse à la partie avant du porte-filtre		✓	✓	✓

Contenant 4 - Récupération de la partie arrière du porte-filtre aux barboteurs métaux (Barb. 1-2 & 3)

Items	Remarques	Rincer 100 mL HNO_3 0.1N	Niveau	Volume (mL)
de la partie arrière du porte-filtre aux barboteurs métaux (Barb. 1-2 & 3)	BB 1234	✓	✓	334

Contenant 5 - Récupération barboteurs 4 seul

Items	Remarques	Rincer 100 ml HNO_3 0.1N	Niveau	Volume (mL)
barboteur 4	Avec 123	✓	✓	✓

Contenant 6 - Récupération barboteurs 5 et 6 ($KMnO_4$)

Items	Remarques	Rincer 100 ml $KMnO_4/H_2SO_4$	Rincer 100 ml eau	Niveau	Volume (mL)
du barboteur 5 au barboteur 6 (pot de verre ambré)		✓	✓	✓	390

Contenant 7 - Récupération barboteurs 5 et 6 ($KMnO_4$) avec HCl 8N

Items	Remarques	200 mL H_2O dans bouteille récup. Rincer 25 mL HCl 8N	Niveau	Volume (mL)
du barboteur 5 au barboteur 6		✓	✓	225

Remarques:

BB1 → HCl 180 cc

BB4 → Rincé avec BB 123 parce qu'il était vide après les tests

Blancs :

100 mL Acétone		Pour la demande d'analyse, voici les échantillons:
300 mL 0.1 N HNO_3		1a- Métaux sur contenants 1 + 2 + 3
100 mL H_2O		1b- Hg sur contenants 1 + 2 + 3
200 mL Solution H_2O_2 10% / HNO_3 5%		2a- Métaux sur contenant 4
100 mL KMnO4 4% / H2SO4 10%		2b- Hg sur contenant 4
200 mL H_2O + 25 mL HCL 8N		3a- Hg sur contenant 5
Filtre Quartz (x3)		3b- Hg sur contenant 6
		3c- Hg sur contenant 7

Récupération finale du dispositif de prélèvement - COSV (SPE 1/RM/2)

Date de récupération :	28.06.2018	Heure de récupération:	15h00
Nettoyage de l'extérieur des différentes pièces :			
Conditionnement (HA) des contenants **(verre ambré)** de récupération :			

Contenant 1 - Buse-Sonde

Item	Remarques	Brosse HA	HA 3x Ch.	Niveau
Buse et Sonde				

Contenant 2 - Filtre

Filtre	Pétri scellé avec ruban de teflon - dans le papier d'aluminium	

Contenant 3 - Récupération de la partie arrière du Porte-filtre au Condenseur (avant trappe)

Item	Remarques	Tremp. H-A 5 min. Ch	HA 3x Ch.	Niveau
Avant trappe résine				

Contenant 4 - Récupération de la Trappe de résine XAD-2

Trappe de résine XAD-2	Sceller avec ruban de teflon - enveloppé papier d'aluminium	

Contenant 5 - Récupération de la Trappe à condensat au 1er Barboteur (eau)

Item (dans l'ordre)	Remarques	H_2O HPLC 3x	Niveau
Eau			

Contenant 6 - Rinçage final de la partie arrière du Porte-filtre au dernier Barboteur

Item	Remarques	HA 3x Ch.	Niveau
Rinçage final			

Les pots doivent être en verre ambré.

Remarques

Blancs:

Blanc de terrain (1x pour chaque 3 essais) - Faire aspirer volume d'air équivalent à tous les tests de fuite		
Résine XAD-2 (environ 40g, 1 tube)		
Eau HPLC		
Éthylène Glycol		
Acétone		
Hexane

Executive Summary

The Agnico Eagle Mines Limited (Agnico Eagle) Meliadine Gold Mine (the Project), received a Project Certificate (No. 006) from the Nunavut Impact Review Board (NIRB) in February 2015. A conceptual Terrestrial Environment Mitigation and Management Plan (TEMMP) for the Project was prepared for submission with the Project Final Environmental Impact Statement (FEIS) and forms a component of the documentation series produced in accordance with the Project. This report addresses requirements of the Project Certificate (No. 006) (Appendix A).

The objectives of the Terrestrial Effects Monitoring and Mitigation Plan (TEMMP) Report are to summarize annual data (2018) collected from wildlife and vegetation monitoring programs, and to describe natural variation and potential Project-related changes in wildlife populations within and adjacent to the Project. The data was collected according to procedures outlined in the Project's Standard Operating Procedures and the TEMMP. The 2018 annual report describes monitoring objectives and methodology, 2018 annual results, mitigation activities, and management recommendations based on 2018 monitoring results. The following report documents results collected for the 2018 TEMMP for the Meliadine Project located in the Kivalliq Region of Nunavut.

Incorporation of Inuit Quajimajatuquangit

- When possible, field programs in 2018 were guided by Inuit Qaujimajatuqangit (IQ), including the assistance of local field assistants. Annual contributions from Inuit to the monitoring programs are presented in Table 8.1-1.

Direct Habitat Loss

- In 2018, a total area of 484 ha has been altered due to Project construction, representing 29% of the Predicted Project footprint (1,682 ha). Table 1.2-1 summarizes the impacts by each vegetation community/habitat type. Of the total project impacted habitat, 343 ha is vegetated heath types (36% of the predicted impacts), 95 ha is wetland riparian types (22% of the predicted impacts) and 6 ha of un-vegetated sand community (75% of predicted impacts).
- The project has altered 46 ha of unvegetated areas, representing 16% of the Predicted Project footprint. Of these, 40 ha (14% of the predicted project footprint) are associated with waterbodies and watercourses.

Indirect Habitat Loss

- Indirect habitat loss for caribou and wildlife habitat (soils and vegetation) was not assessed in 2018.

Wildlife Observations

- Between 4 January and 27 November there were 214 incidental wildlife observations among 13 different species comprising approximately 7,187 individual animals.

Wildlife Track Surveys

- On-site wildlife track surveys were conducted on 3 and 23 November 2018 and 8, 15 and 25 of December 2018.
- All observations were limited to arctic fox hare tracks - no caribou tracks were observed.
- A predatory mammal observation report was completed for wolf tracks which were observed on the main camp site on April 10, 2018, and for two polar bears observed on November 10, 2018.

Nest Relocation

- In July 2018, an active Common Redpoll nest was observed within an active construction zone.
- A Damage or Danger Permit (the permit) was issued under the Environment Canada Migratory Birds Regulations (MBR), which authorized the relocation of the migratory birds, eggs (3) and nest.
- The nest and eggs were successfully relocated, allowing the birds to fledge.

Incidents and Mortalities

- A gosling was found deceased near the Meliadine Lake gen set area. It is believed to died on the lake of unknown causes and was brought to shore through wave action.
- A total of 22 arctic foxes were trapped and dispatched by on GN DoE officers in 2018. (Table 6.3-1). The mortality rate varies based on frequency of trapping by GN DoE officers.

Wildlife Deterrents

- Bird deterrent canons were initially deployed on P1 and P3 dykes on June 21, 2018. Shortly after deployment, a deterrent canon was moved to the landfarm at the request of the NIRB. Concerns were raised about the canons impacts on caribou and other wildlife at which point canons were removed on July 2, 2018 (D. Gorton, Agnico Eagle, Per. Comm. 2019). No wildlife deterrents were used to deter caribou in 2018.

Barren-ground Caribou

Caribou Advisory

- Mass migration through the Project and AWAR took place between 5 July and 22 July 2018. The caribou work suspension protocol (complete work stoppage) was in effect for periods from 8 July to 17 July 2018 (Table 8.2-1). Closure and restrictions on AWAR took place on 7-20 July (Table 8.2-1).
- There was a complete work stoppage for 191 hours and restricted duties for 93 hours in 2018 (Mine and AWAR).

Caribou Behavior

- Caribou behavior observations were completed on seven groups of caribou in 2018.

Hunter Harvest

- Agnico Eagle is currently in working on a Memorandum of Understanding (M.O.U.) with the Rankin Inlet Inlet Hunters and Trappers Organization (HTO).

Birds

Shoreline Surveys

- All waterbodies within 200 m of mining related infrastructure (excluding the AWAR) were surveyed on foot by trained biologists to locate and identify nesting waterbirds from 12 to 18 June 2018. (Figure 3.8-1).
- A total of eight different species were observed (Table 10.1-1). No fledglings were observed, all observations were nesting adults, and eggs observed in nests. In total, 56 adult birds were recorded with 27 eggs observed among eight different species. Waterbodies within 200 m of the AWAR were not completed due to time constraints.

Point Counts

- Avian point count locations were chosen to be within 1 km on either side of the AWAR (2 km in total) with the first point counts occurring at 50 m from the road on either side, with subsequent plots spaced 100 m from the preceding plot. In 2018, a total of 6 transects were completed for a total of 72 point count surveys. The survey method is described in more detail in the TEMMP (Golder 2015).
- In total, seven passerine (i.e. songbird) species were recorded on the point count surveys (Table 9). The most abundant species was horned lark (*Eremophila alpestris*) and the least abundant species was American robin (*Turdus migratorius*).

PRISM

- Agnico Eagle contributed to the Environment and Climate Change Canada (ECCC) PRISM surveys in 2018 and will continue to do so every three years. For the 2018 surveys, a representative from ECCC, Golder biologists, and two local assistants completed PRISM surveys at the Project at randomly chosen locations (by ECCC). Observers recorded the species encountered, estimated their breeding status, and recorded habitat conditions.
- A total of ten PRISM survey plots were surveyed with a total of thirteen bird species observed (Table 10.3.2). The most common bird species observed in the plots were Lapland longspur (*Calcarius lapponicus*), and savannah sparrow (*Passerculus sandwichensis*). No species-at-risk were observed on survey plots. Breeding evidence of three species of shorebirds was found during the surveys.
- Due to the late spring in 2018, and the relatively early timing of the field work, no actively nesting songbirds were found during PRISM surveys.

Raptors

- The 2018 annual report of the Arctic Raptors Research Program is included in Appendix B.

Soil and Vegetation Monitoring

- Invasive Plant surveys were completed along the AWAR and Project footprint. Two occurrences of common dandelion were recorded along the AWAR. Common dandelion was not observed in the Project footprint or ship loading areas.
- Soil and vegetation contamination (metals and dust) will be monitored in 2019.

Environmental Variables

- The max annual temperature of 27.5°C was recorded on July 11, 2018 and the minimum annual temperature -46.8°C was recorded on February 19, 2018. Snowmelt began June 9, 2018 when the average daily air temperature exceeded 0°C. Environmental variables will continue to be monitored on an on-going basis.

1.0 INTRODUCTION

1.1 Background

The Agnico Eagle Mines Limited (Agnico Eagle) Meliadine Gold Mine (the Project), located in the Kivalliq Region of Nunavut (Figure 1.1-1), received a Project Certificate (No. 006) from the Nunavut Impact Review Board (NIRB) in February 2015. The subsequent Water Licence and leases, allowed for the construction of a gold mine and ancillary facilities including an All-weather Access Road (AWAR), barge unloading facilities, lay-down area, and a fuel tank farm in Rankin Inlet. This report addresses requirements of the Project Certificate (No. 006) (Appendix A). A conceptual Terrestrial Environment Mitigation and Management Plan (TEMMP) for the Project was prepared for submission with the Project Final Environmental Impact Statement (FEIS) and forms a component of the documentation series produced in accordance with the Project. The TEMMP will be reviewed and updated on a regular basis as the Project proceeds into detailed design, construction, operations, closure and post-closure.

The 2018 annual report (this document) is the second of a series of annual TEMMP summary reports for the Project. The purpose of this report is to summarize the 2018 data collected from wildlife and vegetation monitoring programs, and to describe natural variation and potential Project-related changes in wildlife populations within and adjacent to the Project. The 2018 annual report describes monitoring objectives and methodology, 2018 annual results, mitigation activities, and management recommendations based on 2018 monitoring results. It should be noted however, that the Project is not currently active and is in the construction phase of development. The Project is anticipated to be operational from 2019 to 2037, where effects to wildlife may be more realized during open pit operations.

Figure 1.1-1: Project Location

1.2 Project Description

The Project, with an expected operating life of about eight years (until 2027), is located approximately 25 kilometers (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. Situated on the western shore of Hudson Bay, the Project site is located on a peninsula between the east, south, and west basins of Meliadine Lake (63°1’23.8’’ N, 92°13’6.42"W), on Inuit Owned Lands (IOL).

The scope of the TEMMP annual report is to report on monitoring of the Project during construction, operation, maintenance, reclamation, and closure. This report includes data collected in 2018, the second year of construction. Project site facilities include a plant site and accommodation buildings, a water management system that includes collection ponds, water diversion channels, retention dikes/berms, and a Water Treatment Plant. Project components include two ore stockpiles, a temporary overburden stockpile, a tailings storage facility, three waste rock storage facilities, a landfarm, incinerator, and landfill.

Environmental baseline studies were completed in the Project area prior to Project approval and integrated into the current project design according to the 2015 TEMMP (Golder 2015). Vegetation and wildlife Valued Ecosystem Components (VECs) were identified in consultation with regulatory agencies, the Kivalliq Inuit Association (KivIA) and the Rankin Inlet Hunters and Trappers Organization (HTO). Vegetation VECs include plant populations and communities, listed (rare) plant species, and traditional use plant species. Wildlife VECs include ungulates (caribou and muskox), carnivores (grey wolf and polar bear), raptors, waterbirds, and upland birds (including migratory birds). Further details on VEC selection can be found in the FEIS (Agnico Eagle 2014) and the TEMMP (Golder 2015).

1.2.1 Concordance with Terms of Reference

The initial purpose of this document was to address the Guidelines issued by the Nunavut Impact Review Board for the Mine (NIRB 2012), and specifically those relating to the presentation of a Wildlife Mitigation and Management Plan (Section 9.4.17 of the Guidelines). Specific requirements set out in the Guidelines relating to the preparation of a Wildlife Mitigation and Management Plan were used to guide this TEMMP and are provided in FEIS Volume 1, Appendix 1.0-A.

NIRB recommends the following related to standardization of data for monitoring programs:

> *“all monitoring plans should be designed so that results from these programs can be coordinated with ongoing regional initiatives or programs with relevant government organizations, or regional authorities.” NIRB guidelines, Section 9.3, page 78-79.*
>
> *“When designing data collection or baseline studies, it is recommended that the Proponent coordinate with ongoing programs with relevant developments, government organizations, regional authorities, and researchers. This recommendation applies to data collected for the Nunavut General Monitoring Program (NGMP), as per Article 12 of the NLCA, the Proponent’s project-specific monitoring programs, as well as any regional monitoring initiatives in which the Proponent will participate. The Proponent is expected to coordinate on any initiatives undertaken by government organizations in respect to the NGMP and to liaise with the NGMP Secretariat whenever possible.” NIRB guidelines, Section 7.7.1, page 40-41.*

Agnico Eagle will comply with these principles and has already established several programs that involve collaborations with regional initiatives and contribute to monitoring cumulative effects. These include:

- **Caribou Collar Program:** Supporting the GN's caribou satellite-collaring program for the Qamanirjuac herd (and other herds in the Kivalliq), facilitating monitoring of cumulative effects at the herd level (Golder (2015), Section 3.4, page 12).
- **Regional Muskoxen Surveys:** Agnico Eagle has provided the GN DoE with in-kind contributions and support for previous muskoxen surveys and will continue to do so when requested.
- **Hunter Harvest Program:** Agnico Eagle will establish a harvest study in association with the Rankin Inlet HTO to document harvest rates, harvesting distribution and seasonality, and monitor these data over time (Golder (2015), Section 3.5, page 13). This will contribute to an understanding of cumulative effects by increasing understanding of the regional distribution and seasonality of hunting.
- **Raptor Monitoring Program:** Agnico Eagle, in collaboration with the Arctic Raptor Project, has developed and implemented the raptor monitoring program (Golder (2015), Section 3.6, page 14). This will directly align monitoring efforts at Meliadine with this long-term regional research program which already involves government, non- government, Indigenous communities, and academic partnerships.
- **Waterfowl and Shorebird Monitoring:** Agnico Eagle, in collaboration with Environment and Climate Change Canada, have agreed to implement the Program for Regional and International Shorebird Monitoring (PRISM) (Golder (2015), Section 4.11, page 39) on a three-year schedule. This will directly align monitoring efforts at Meliadine with other Agnico Eagle properties for waterfowl and shorebirds.
- **Wildlife Surveys:** Agnico Eagle, in collaboration with the HTO, will conduct wildlife surveys twice weekly along the All- Weather Access Road (AWAR) and with environment technicians around the proposed mine site. This will contribute to an understanding of cumulative effects by collecting routine wildlife survey data (including caribou) and assist in anticipating large herd migrations, communicating with the HTO and managing mine activities during migration events. In addition, Agnico Eagle has contributed to regional muskoxen survey programs and will continue to do so in the future.

The Project Certificate (NIRB 006) for the Meliadine Gold Mine was issued on February 26, 2015. This third iteration of the TEMMP addresses the Terms and Conditions of that Project Certificate as they relate to Terrestrial and Wildlife Mitigation and Management.

Table 1.2-1 Concordance Table with Project Certificate Terms and Conditions

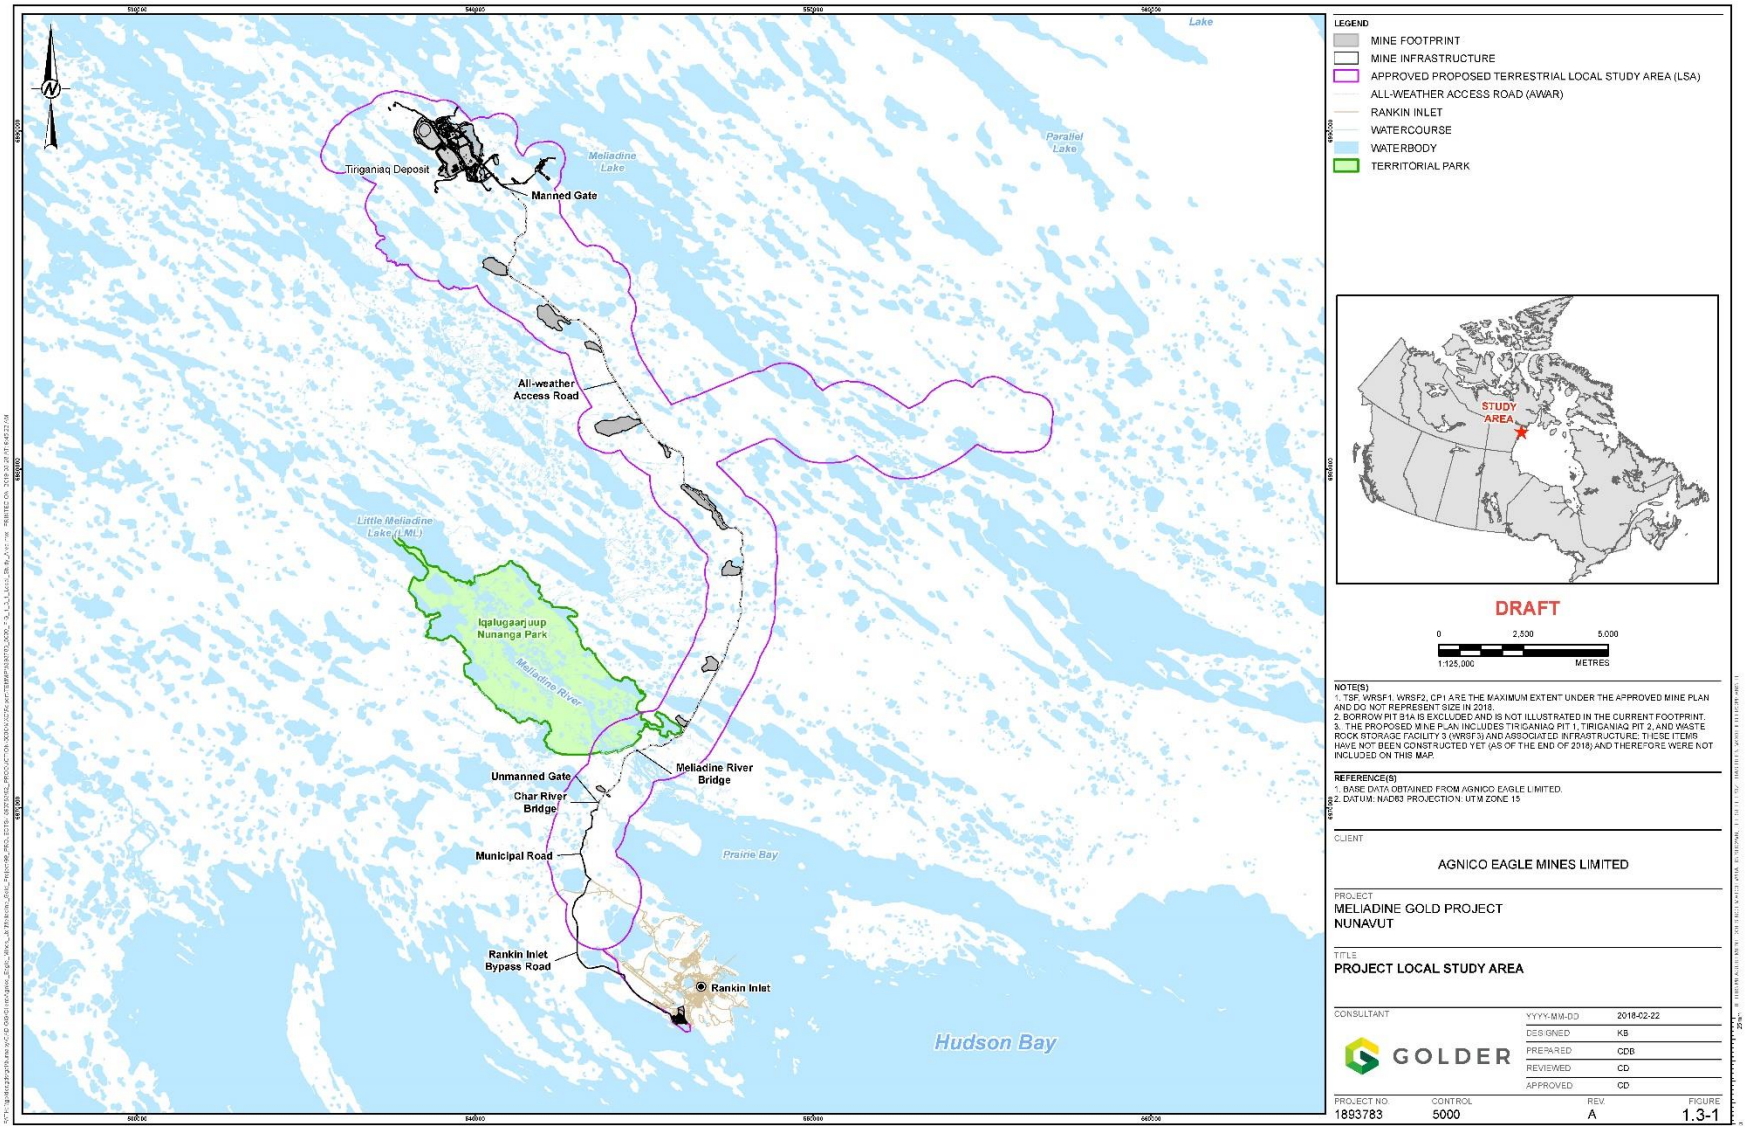
Term	Condition	Section
37	The Proponent shall incorporate protocols for monitoring for the potential introduction of invasive vegetation species (e.g. surveys of plant populations in previously disturbed areas) into its Terrestrial Environment and Monitoring Plan. Any introductions of non-indigenous plant species must be promptly reported to the Government of Nunavut Department of Environment.	12.1
38	The Proponent shall conduct sampling to determine baseline levels for metals in soils found in areas with berry-producing plants near the Project area and shall update relevant vegetation sections within the Terrestrial Management and Monitoring Plan to incorporate ongoing monitoring of these parameters prior to commencing operations.	12.0
39	The Proponent shall develop and establish an on-going monitoring program to determine the distribution, abundance, and health of vegetation species used as caribou forage (such as lichens) near Project areas, prior to commencing operations.	12.0
47	The Proponent shall share information with the Government of Nunavut (GN) relating to the migration of caribou and include the GN as a party respecting caribou monitoring and movement through Project development areas, including the all-weather access road and associated roads and trails.	6.1, 8.1.1, 8.2.1 and 8.2.2
52	The Proponent shall undertake periodic surveys and a habitat assessment for muskoxen in the regional study area by partnering with, or complementing, the existing regional muskox monitoring programs.	6.0
55	In consultation with the Government of Nunavut (GN) and other affected parties, the Proponent shall set thresholds for direct mortality of wolf, grizzly bear, polar bear, wolverine, and fox to ensure monitoring and mitigation for the Project is responsive to undesirable rates of mortality. The Proponent shall reach an agreement with the appropriate Designated Inuit Organization regarding compensation or any direct mortality of wildlife resulting from the Project.	6.5
56	The Proponent shall report annually to the NIRB regarding its terrestrial environment monitoring efforts, with inclusion of the following information: a. Description of all updates to terrestrial ecosystem baseline data; b. A description of the involvement of Inuit in its monitoring programs; c. A detailed presentation and analysis of the distribution relative to Project infrastructure and activities for caribou and other terrestrial mammals observed during surveys and incidental sightings; d. Results of the annual monitoring program, including field methodologies and statistical approaches used to support conclusions drawn; and e. An assessment and presentation of annual environmental conditions including timing of snowmelt, green-up, as well as standard weather summaries.	4.1.2 and 5.0
57	Within its annual report to the NIRB, the Proponent shall incorporate a review section which includes: a. An examination for trends in the measured natural variability of Valued Ecosystem Components in the region relative to the baseline reporting; b. A detailed analysis of wildlife responses to operations with emphasis on wildlife behaviour, mortalities and displacements (if any), and responses to operations of the all-weather access road and associated access roads/trails; c. A demonstration and description of how the monitoring results, including the all-weather access road and associated access roads/trails contribute to cumulative effects of the project; and d. Any proposed changes to the monitoring survey methodologies, statistical approaches or proposed adaptive management stemming from the results of the monitoring program.	6.3
59	If Species at Risk or their nests and eggs are encountered during Project activities or monitoring programs, the primary mitigation measure must be avoidance. The Proponent shall establish clear zones of avoidance based on the species-specific nest setback distances outlined in the Terrestrial Environment Management and Monitoring Plan.	6.2
61	Prior to bird breeding season, the Proponent shall either conduct clearing activities or identify and install nesting deterrents (e.g., flagging) to discourage birds from nesting in areas likely to be disturbed by construction/clearing activities. If clearing is to take place during the nesting season, a nest survey should take place to identify nests and any identified nests must remain undisturbed until the young have fledged or left the nest. Any nests identified shall be included as part of the annual reporting for the Terrestrial Environmental Mitigation and Monitoring Plan (TEMMP).	6.2, 10.1.2 and 10.3.2
62	The Proponent shall protect any nests found (or indicated nests) with a buffer zone determined by the setback distances outlined in its Terrestrial Environment Mitigation and Monitoring Plan (TEMMP), until the young have fledged. If it is determined that observance of these setbacks is not feasible, the Proponent will develop nest-specific guidelines and procedures to ensure bird's nests and their young are protected.	6.2, 10.1.2 and 10.3.2
71	The Proponent shall develop detailed and robust mitigation and monitoring plans for migratory birds, reflecting input from relevant agencies, the Kivalliq Inuit Association and communities.	10, 11
72	The Proponent shall continue to develop and update relevant monitoring and management plans for migratory birds under the Proponent's Environmental Protection Plan and Terrestrial Environment Mitigation and Monitoring Plan (TEMMP) prior to construction. The key indicators for follow up monitoring under this plan will include upland birds (including migratory birds), waterbirds, raptors, and seabirds including migration and wintering.	10, 11
73	The Proponent's monitoring program shall assess and report, on annual basis, the extent of terrestrial habitat loss due to the Project to verify impact predictions and provide updated estimates of the total Project footprint.	4.1
105	The Proponent is strongly encouraged to consider incorporating information obtained from local outfitting and guiding businesses into its Hunter Harvest Survey where possible, and to include these organizations as potential respondents to surveys undertaken.	9.0
118	The Proponent shall include in an updated Terrestrial Wildlife Management and Monitoring Plan (TEMMP), plans for increased caribou monitoring efforts including weekly winter track surveying and summer and fall surveys undertaken on foot twice per month. These results shall be reported to the NIRB with the Proponent's annual reporting requirements.	6.1, 8.1.1, 8.2.1 and 8.2.2
119	The Proponent shall include within its updated Terrestrial Wildlife Management and Monitoring Plan, a commitment to establishing deterrents along the AWAR at any areas where it is observed that caribou are attracted to the AWAR and their presence may present a risk of collisions with traffic along the AWAR (such as areas where caribou are utilizing the AWAR to facilitate movement, areas where caribou may be licking minerals/road salt from the road, areas where caribou are gathering to avoid insects, etc.).	TEMMP (Golder 2015) Appendix 3 – Wildlife Protection and Response Plan

1.3 Study Area Boundaries

The Local Study Area (LSA) includes a 500 meter (m) radius buffer centered on the Project footprint and includes 1000 m buffer on the AWAR, Discovery access road and the Rankin Inlet bypass road. The total area of the LSA is 10,598 hectares (ha) (Figure 1.3-1). The Regional Study Area (RSA) encompasses an area that includes a 28 km radius area around the Project, including Rankin Inlet for a total area of 246,300 ha (Figure 1.3-2).

Further details on the justification for study area sizes can be found in the Final Environmental Impact Statement (Agnico Eagle 2014) and the TEMMP (Golder 2015).

Figure 1.3-1: Project Local Study Area



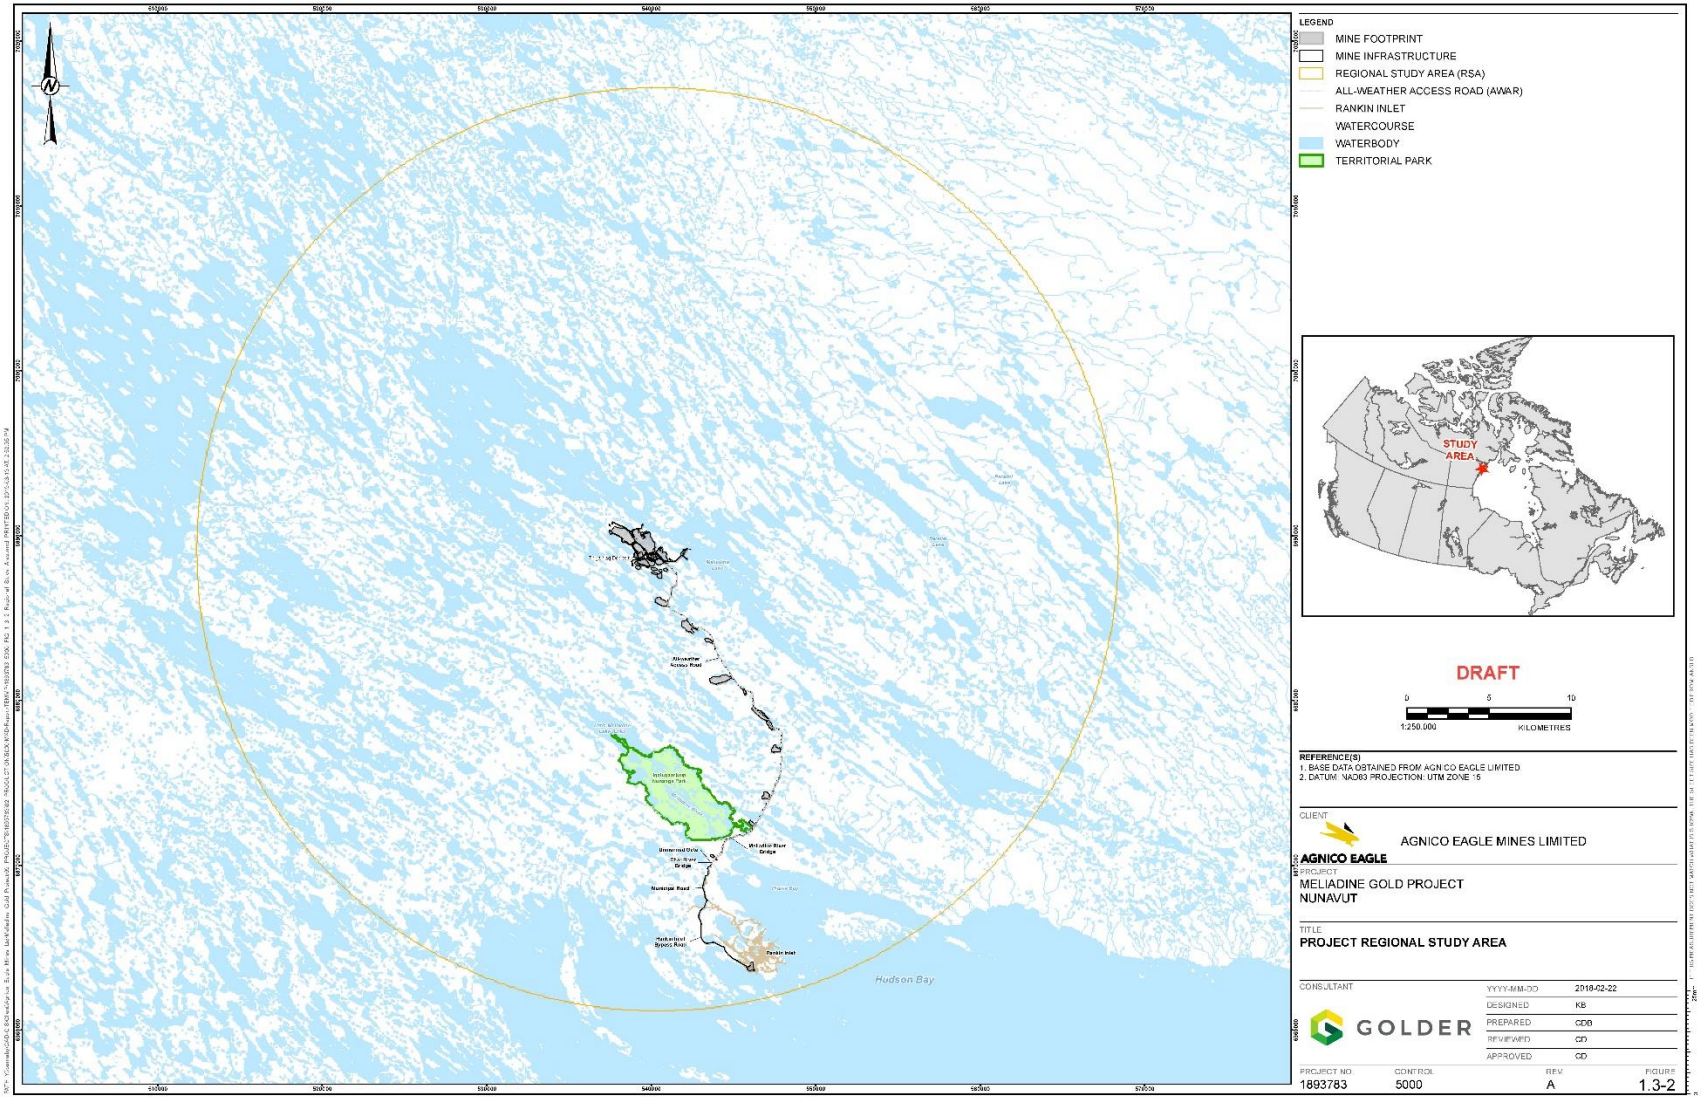


Figure 1.3-2: Project Regional Study Area

1.4 Monitoring Approach

Wildlife monitoring is an essential tool in protecting and maintaining wildlife in the vicinity of the Project. A comprehensive monitoring strategy has been implemented and, as required, is adapted to meet the objectives of the management strategy and methods set out in the TEMMP (Golder 2015). Monitoring programs evaluate the effectiveness of mitigation measures and assess Project-related impact predictions. For all wildlife monitoring programs there is a certain level of uncertainty or unpredictability; therefore, residual effects identified during monitoring may require implementation of adaptive management strategies.

To effectively evaluate the accuracy of impact predictions, a series of quantitative monitoring indicators, which are within the broad categories of habitat distribution, wildlife distribution, wildlife richness, wildlife diversity, wildlife abundance, and environmental health, have been developed. However, as stated earlier, the Project is currently in the construction phase of development and this is the second year of monitoring, consequently not all of the objectives below can be answered at this time.

1.5 Objectives

The primary objectives of the 2018 Annual Report include:

- Collect information that will assist Agnico Eagle to determine if there are effects on wildlife and if these effects were accurately predicted in the FEIS.
- Reporting the results of the 2018 wildlife monitoring programs.
- Summarizing the monitoring strategy implemented over the course of the year.
- Evaluating the function and validity of implemented monitoring strategies.
- Summarizing adaptive management strategies.
- Providing management recommendations for 2018.
- Allowing regulators to contribute advice for improving wildlife management.

1.6 Report Organization

Within each section of this report, data is presented that will be tracked over the life of the Project. Recommendations for enhancement to the TEMMP is presented at the end of each section for consideration and may be incorporated into the TEMMP for subsequent years. The TEMMP is an evolving program that will reflect recommendations during previous years, as well as advances in Project development. Changes will be captured in future revisions of the TEMMP as needed.

2.0 REVIEW OF IMPACT PREDICTIONS

A summary of the impact predictions proposed in the TEMMP (Golder 2015) is provided in Table 2.0-1. Adaptive management will be implemented if the Project impacts exceed the predictions. The corresponding section of this annual report, where monitoring indicators are discussed is also listed. Project related mortalities are defined as those caused as a direct result of project activities and exclude those resulting from trapping conducted by regulatory organizations.

Table 2.0-1: Summary of Predicted Effects, and accuracy of Impact Predictions, 2018

Monitoring Indicator	Proposed thresholds	Surveyed in 2018?	Exceeded in 2018?	Monitoring Methods	Frequency of Data Collection	Section Reference
Vegetation (Wildlife Habitat)						
Habitat Loss	Terrestrial – 2951 ha Aquatic – 515 ha	Yes	No	Ground Surveys, Mapping, GIS Analysis	Annually	4.1
Habitat Degradation by Contamination	No invasive plant species established	Yes	Yes	Invasive Plant Survey of AWAR and Project site	Annually	12.0
Habitat Degradation by Contamination	TBD – SLRA No effects to plant health from dust deposition	No	-	Vegetation and Soil Samples	Every 3 Years	6.0
Habitat Reclamation following Mine Closure	NA	No	-	Ground Surveys, Vegetation Plots, Mapping	Once pre - construction (this year) baseline and 3 times Post-Closure	12.0
Ungulates						
Habitat Loss and Degradation	No greater than 2951 ha of terrestrial habitat loss	Yes	-	Ground Surveys, Mapping, GIS Analysis	Annually	4.1
Sensory Disturbance	<10% caribou deflections from AWAR	No	-	Ground Surveys, Satellite-collaring	Daily/Weekly	4.2
Vehicle Collisions	1 individuals	Yes	No	Ground Surveys	Daily	6.1
Hunting by Rankin Inlet Residents	After 3 years of data collection, in collaboration with GN, establish a threshold level	No	-	Hunter Harvest Study	Collected throughout the year and reported annually	10.0
Other Project-related Mortality	1 Individual	Yes	Yes	Ground Surveys	Daily	6.1
Exposure to Contaminated Water or Vegetation	TBD – SLRA	No	-	Vegetation and Soil Samples	Every 3 Years	4.2
Predatory Mammals						
Project-related Mortality	1 Arctic Fox	Yes	Yes	Ground Surveys, Cameras in attractant areas	Daily	6.1
Raptors						
Disturbance of Nesting Raptors	To be determined in consultation with GN and Alastair Franke, related to occupancy and productivity.	Yes (Appendix B)	TBD	Active Nest Monitoring	Nests within 200 m – Daily Nests from 200-1000 m – Weekly	12.0
Project-related Mortality	To be determined in consultation with GN and Alastair Franke	Yes (Appendix B)	TBD	Ground Surveys, Collision Reporting System	Mine Site-Daily AWAR – 2x/Week	1.0
Waterbirds						
Habitat Loss and Degradation	515 ha of Aquatic Habitat	Yes	No	Ground Surveys, Mapping, GIS Analysis	Annually	4.1
Disturbance of Nesting Waterfowl	TBD once NRV is established through consultation with ECCC and GN	Yes	No	Shoreline Surveys	TBD	10.1
Exposure to Contaminated Water or Vegetation	TBD – SLRA	No	-	Vegetation and Soil Samples	Every 3 Years	4.2
Project-related Mortality	1 Individual	Yes	No	Ground Surveys, Collision Reporting System	Mine Site-Daily AWAR - 2x/Week	6.1
Other Breeding Birds						
Habitat Loss and Degradation	No greater than 2951 ha of terrestrial habitat loss	Yes	No	Ground Surveys, Mapping, GIS Analysis	Annually	4.1
Exposure to Contaminated Water or Vegetation	TBD – SLRA	No	-	Vegetation and Soil Samples	Every 3 Years	4.2
Changes in Breeding Bird Populations	TBD once NRV is established through consultation with ECCC	Yes	-	Breeding Bird Plots and Transects	Every 3 Years	9.0

SLRA = Screening Level Risk Assessment; NRV = Natural Range of Variability; ECCC = Environment and Climate Change Canada; GN = Government of Nunavut Department of Environment; AWAR = All-Weather Access Road; *TEMMP = Terrestrial Environment Management and Monitoring Plan (Golder 2015)

3.0 INCORPORATION OF INUIT QUAJIMAJATUQANGIT

Field programs were guided by Inuit Qaujimajatuqangit (IQ), including the assistance of local field assistants. Annual contributions from Inuit to the monitoring programs are presented below (Table 3.0-1).

Table 3.0-1: IQ Field Contributions from Inuit to Monitoring Programs

Name	Date(s) Worked on Site	Total Days	Programs Contributed To
Brenda Anderson	■ June 11 to June 24, 2018; ■ July 16 to July 20, 2018; and ■ July 26, 2018.	19	■ Breeding bird surveys ■ Shoreline surveys ■ PRISM surveys
John Papak	■ August 6 to August 19, 2018.	14	■ Fish Sampling
Matt Adams	■ June 1 to June 20, 2018; ■ June 22 to June 25, 2018; ■ July 17 to July 27, 2018; and ■ August 13 to August 19, 2018.	32	■ Breeding bird surveys ■ PRISM surveys ■ Shoreline surveys ■ Water/sediment quality sampling ■ Archaeology survey

4.0 HABITAT LOSS

4.1 Direct Habitat Loss

The vegetation component of the TEMMP (Golder 2015) outlines the means by which AEM plans to reduce Project-related effects to vegetation populations and communities, and consequently wildlife habitat. The monitoring plan includes both environmental and follow-up monitoring. Environmental monitoring programs are used to track conditions and implement further mitigation as required, and the follow-up monitoring used to verify the accuracy of impact predictions and adaptively manage. This section provides the results of the follow-up monitoring from Project construction initiation to 2018 and summarizes the current Project impacts to vegetation communities/habitat type.

Direct effects to wildlife populations includes the physical disturbance and loss of habitat (e.g., upland and riparian vegetation, wetlands, and water), which results in the direct displacement of wildlife. Direct habitat disturbance is expected to occur through the construction of the Project footprint, such as the creation of roads, Project rock piles, core Project facilities, and increased water levels in some local lakes and streams. Impacts to vegetation communities/habitat types are considered long-term as the recovery of vegetation is slow in arctic environments (Burt 1997).

The objective of this component of the annual report is to determine if direct vegetation/habitat loss due to Project footprint stays within impact predictions of 2,950 ha (Agnico Eagle 2014).

4.1.1 Methods

The Project development area was delineated through aerial photographs, satellite imagery, or ground surveys, and calculated using ArcGIS software. The actual area of the Project footprint will be compared to the permitted area and monitored over the life of the Project at key phases of development, or at 3 year intervals (Golder 2015).

A shapefile with the most current Project footprint from 2018 was obtained from Agnico Eagle and used to determine impacts to vegetation communities/habitat type due to the Project. The footprint layer was compared against 2017 GoogleEarth imagery and laid over the vegetation unit layer available for the Project and developed by Golder (2012). Each vegetation community/wildlife habitat disturbed by the Project was selected and calculations were made using ArcGIS to determine the area (ha) of each habitat type replaced by the Project footprint.

Changes to vegetation communities/habitat types were assessed for the maximum predicted Project footprint (Golder 2015), which should have the largest magnitude and geographic extent of effects to vegetation. The maximum predicted Project footprint includes Project site and associated infrastructure (e.g., tailings storage facility [TSF], open pits, waste rock storage facilities, and camp), the AWAR between the Project and Rankin Inlet and the proposed infrastructure within the boundary of the Hamlet of Rankin (associated roads, floating dock, laydown yard and tank farm).

A portion of the bypass road connecting Rankin Inlet and the AWAR (Figure 1.3-1) was not included in this assessment because this portion was developed outside the original Project LSA as per the Hamlet's instruction. This portion of the road is 4 km in length and 10 m wide.

4.1.2 Results

As of December 2018, a total area of 484 ha has been altered due to Project construction, representing 29% of the Predicted Project footprint (1,682 ha). Table 2.0-1 summarizes the impacts by each vegetation community/habitat type. A total of 343 ha of vegetated heath types have been impacted by the Project (35 % of the predicted impacts). The wetland riparian types have been impacted by Project by 95 ha (22% of the predicted impacts). In total 6 ha of un-vegetated sand community have been impacted due to the Project (75 % of predicted impacts) (Figure 4.1-1)

Figure 4.1-1: Project Footprint Comparison by Vegetation Community/Habitat Type

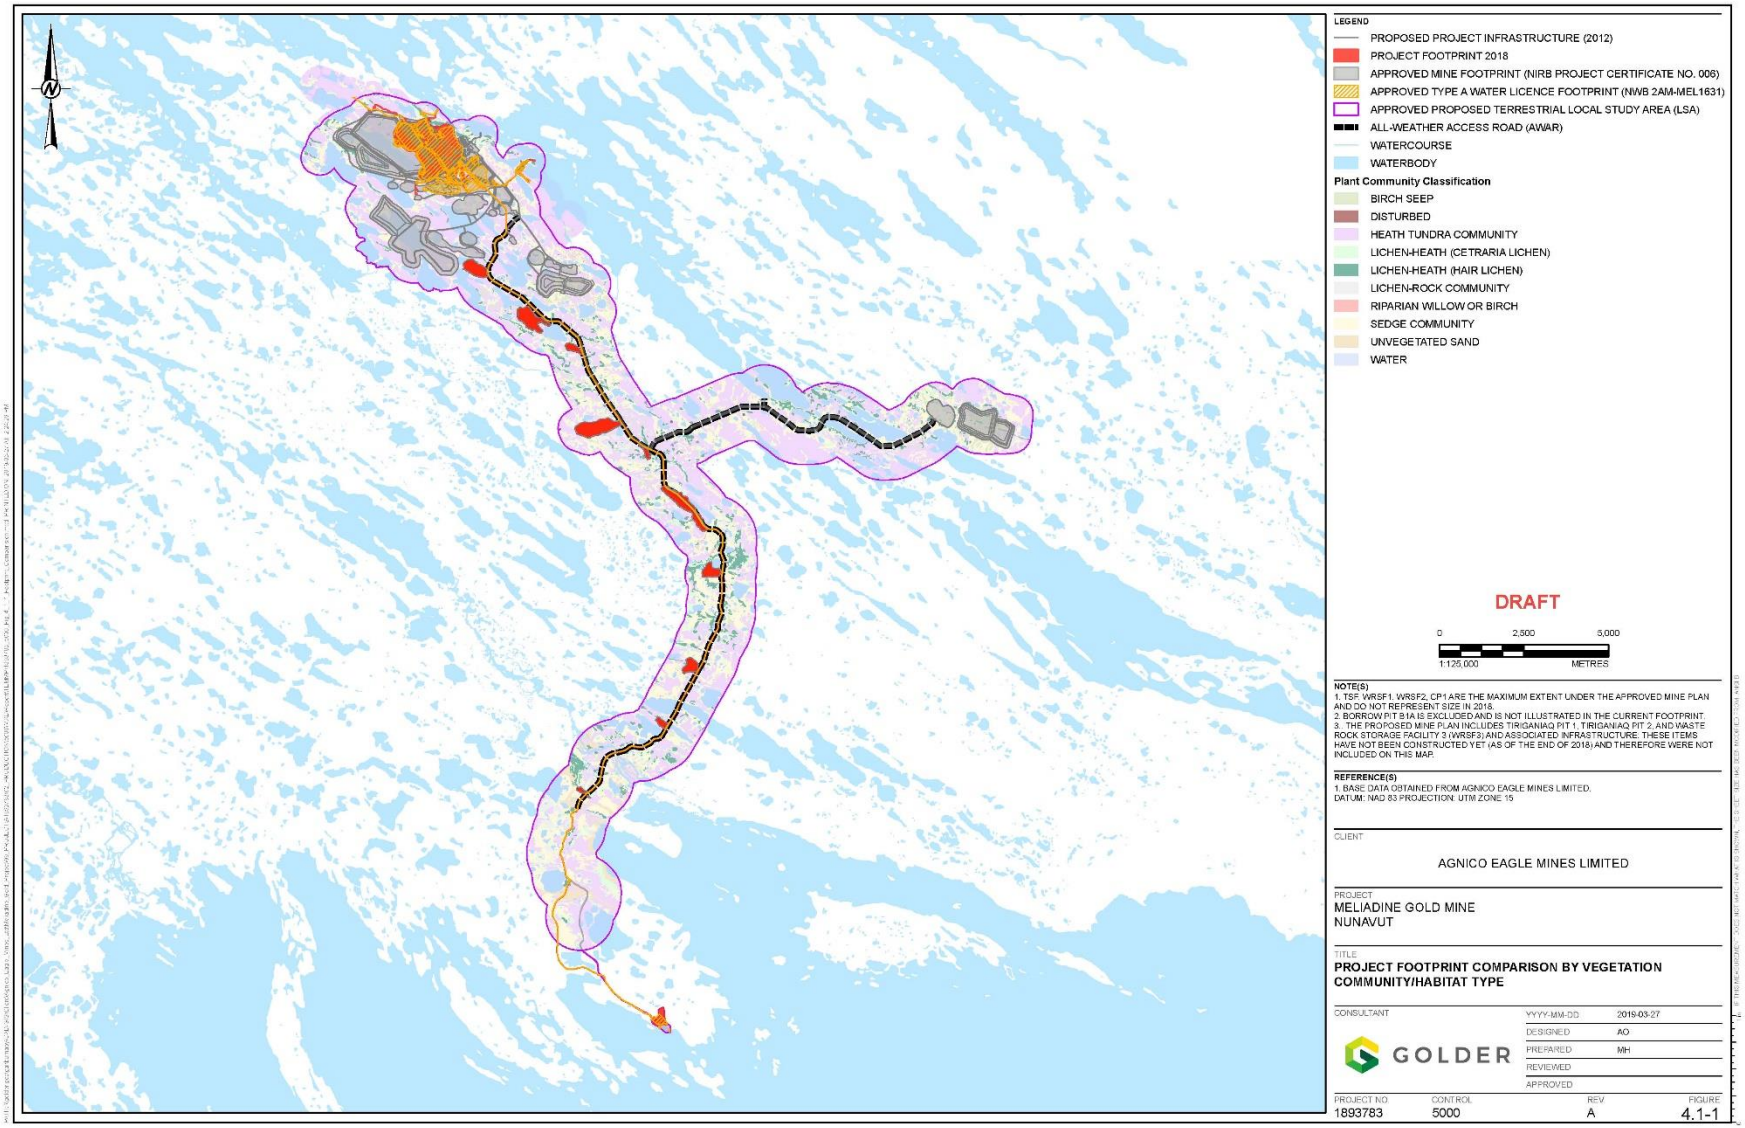

Table 4.1-1: Total and Predicted Vegetation Community/Habitat Type loss from Project approval to 2018

Vegetation Community Type	Vegetation Community Type Description	Total Area of LSA (ha)	Project Predicted Impacts [ha]	2018 Project Impacts [ha] [(a)]
Heath				
Lichen-Rock Community	characterized by crustose lichens growing on the boulders or rocks that predominate on eskers or rocky plateaus	233	37	28
Lichen-Heath (*Cetraria* Lichen)	occurs on lower slope positions, often below the lichen-health – hair lichen community, on more rapidly drained sandy substrates	560	86	35
Lichen-Heath (Hair Lichen)	occurs almost exclusively on the higher ridges of slopes and on drumlin and esker crests, where the ground cover consists of a high percentage of black and green hair lichens	601	110	59
Heath Tundra Community	occurs on uplands and slopes of most ridges characterized by gently rolling to undulating terrain with rapidly to well-drained soils	4,036	722	222
	Heath subtotal	***5,429***	***956***	***343***
Wetland/Riparian				
Birch Seep	occurs on imperfectly poor to poorly drained soils such as the edges of solifluction lobes, on the slopes of some eskers, in stream valleys and along transitions to some sedge associations	305	87	10
Sedge Community	occurs adjacent to lakes and streams on very poorly drained soils and in low-lying areas	2,449	1	85
Riparian Willow or Birch	typically occurs along the banks of stream courses; characterized by imperfectly drained, nutrient enriched soils	12	351	<1
	Wetland/Riparian subtotal	***2,767***	***440***	***95***
Un-vegetated				
Disturbed [(b)]	cleared areas and access roads associated with the Project as well as various natural disturbance features	<1	<1	<1
Un-vegetated (Sand)	associated with steep sandy slopes and the margins of rivers and lakes; limited to no vegetation cover	182	8	6
Water	associated with waterbodies and watercourses	2,221	278	40
	un-vegetated subtotal	***2,403***	***286***	***46***
	Total	**10,598**	**1,682**	**484**

(a) Impacts to vegetation communities/habitat types from Project approval to December 2018.
(b) Disturbance include areas that were already disturbed at baseline conditions when the vegetation community/habitat type mapping was developed.

Note: Some numbers are rounded for presentation purposes; totals may not equal the sum of the individual values.

4.2 Recommendations

Although, Project footprint is currently 29% of the total predicted footprint, follow up monitoring should continue at 3 year intervals, as monitoring studies are used to provide feedback to Project operations to determine if the goals and objectives are being met. Depending on the results, actions may be considered such as modifying and/or implementing additional mitigation.

4.3 Accuracy of Impact Predictions

Impact predictions related to habitat loss is summarized in Table 2.0-1. Terrestrial and aquatic habitat loss is currently below predictions. Effects to plant health from dust deposition were not scheduled for assessment in 2018. Plant health related to dust deposition is assessed every at three years intervals from baseline (2017) as per the TEMMP (Golder 2015), the next assessment was to be completed in 2020 but to align the assessment frequency with the first year of construction, the next assessment will happen in 2019.

5.0 INDIRECT HABITAT LOSS

Indirect effects to wildlife are associated with changes in habitat that can alter the movement and behavior of individuals in the vicinity of the Project as a result of sensory disturbance. Indirect Project effects such as dust deposition on vegetation communities and presence of heavy metals on vegetation tissue and soils were assessed in 2017 and presented in the 2017 Annual report (Golder 2018). Indirect Project effects are assessed every three years, with the next field assessment scheduled for summer 2019 to align sampling years with the first year of construction. The results will be compared against values from samples collected at Reference Areas (10 to 15 km from the site infrastructure).

Indirect habitat loss for caribou and wildlife was not assessed in 2018.

6.0 WILDLIFE OBSERVATIONS

Environmental technicians conduct site surveillance monitoring and road surveillance monitoring regularly of the AWAR and the Project. In addition to planned surveys, all supervisors ask their employees to report wildlife sightings; Wildlife logs are posted throughout the Project and easily accessible to employees to facilitate wildlife reporting before, during, and after work shifts.

In 2018, there were over 214 incidental wildlife observations among 13 different species and approximately 7,187 individual animals (Table 6.0-1). Observations were recorded between 4 January and 27 November 2018.

Table 6.0-1: Incidental Wildlife Observations, 4 January to 27 November 2018

Species	Observations	Individuals
Bald eagle	1	1
Canada goose	6	67
Common Raven	2	2
Duck sp.	2	20
Ptarmigan sp.	4	19
Sandhill crane	1	4
Snow goose	1	100
Snowy owl	2	2
Tundra swan	2	4
Arctic hare	28	31
Caribou	76	6839

Table 6.0-1: Incidental Wildlife Observations, 4 January to 27 November 2018

Species	Observations	Individuals
Arctic fox	97	105
Polar bear	1	2
Sik sik	1	1
Wolverine	1	1

Specific GPS locations were not recorded for incidental wildlife observations in 2018.

6.1 Wildlife Track Surveys

On-site wildlife track surveys were conducted on 3 and 23 November 2018 and 8, 15 and 25 of December 2018. All observations were limited to arctic fox hare tracks - no caribou tracks were observed. In addition to scheduled wildlife track surveys, a predatory mammal observation report was completed for wolf tracks observed on the main camp site on 10 April 2018, and for two polar bears observed on 10 November 2018. A wildlife inspection was completed on 11 April 2018 and no further signs of wolves in the area were observed. Wildlife track surveys will continue to be conducted in 2019.

6.2 Common Redpoll Nest Relocation

In July 2018 an active Common Redpoll nest was observed within an active construction zone within rebar installed for a concrete foundation of a building. A Damage or Danger Permit (the permit) was issued under the Environment Canada Migratory Birds Regulations (MBR) under subsection 4.(1) of the MBR on 27 July, 2018, which authorized the relocation of the migratory birds, eggs (3) and nest. The nest containing the eggs was relocated, and passively monitored daily until successfully fledging.

Summary of events

- Nest was observed at 63.026774N, -92.219641W.
- Prior to relocation, all four eggs hatched.
- The nest was moved a total of 31.5 m from the active construction zone.
- Successful with nestlings fledging from the nest on 7 August 2018.

6.3 Incidents and Mortalities

6.3.1 Methods

Project-related incidents and mortalities are reported to the Environment Department for documentation in a detailed incident investigation for immediate follow-up. All incidental wildlife mortalities are reported immediately to the Government of Nunavut Department of Environment (GN DoE), and the GN DoE is consulted for follow-up mitigation and disposal procedures. In addition, the KivIA will also immediately be notified of wildlife mortalities and the events and circumstances around that mortality. If wildlife had to be deterred to reduce the risk of a wildlife-human incident, then all efforts are made by the environmental technicians to start with the least intrusive method available, and all deterrent actions are recorded.

6.3.2 Results

The following wildlife incidents in Table 6.3-1 were reported at the Project in 2018:

Table 6.3-1: Wildlife Mortality Incidents Recorded at Meliadine (Including AWAR) in 2018

Date	Species	Number	Location	Comments
Jan. 22 – 28	arctic fox	1	n/s[(a)]	trapped and disposed in incinerator[(c)]
Jan. 29 – Feb. 5	arctic fox	1	n/s	trapped; unknown cause of death
Feb. 1	arctic fox	1	snow disposal area /industrial pad	unknown cause of death
Feb. 12 - 19	arctic fox	1	n/s	trapped and disposed in incinerator
Feb. 21	arctic fox	1	n/s	trapped and disposed in incinerator
Mar. 6	arctic fox	3	n/s	trapped and disposed in incinerator
Mar. 7	arctic fox	2	n/s	trapped and disposed in incinerator
Mar.8	arctic fox	1	n/s	trapped and sent to lab for rabies testing (bit employee)
Mar.8	arctic fox	2	n/s	trapped and disposed in incinerator
Mar. 9	arctic fox	1	process plant	aggressive fox chasing people, killed in self-defense and incinerated
Mar. 9	arctic fox	2	n/s	one of animals was aggressive and suggested by GN to have potential for rabies, both incinerated
Mar. 15	arctic fox	1	landfill	trapped - disposed in incinerator
Mar. 22	arctic fox	1	landfill	trapped - disposed in incinerator
Mar. 22	arctic fox	1	landfill	shot – disposed in incinerator
Mar. 23	arctic fox	1	landfill	trapped - disposed in incinerator
Mar.26	arctic fox	1	n/s	snared by fox monitor, and disposed of in incinerator – potential rabies
Jun. 17	arctic fox	1	under explo.kitchen	disposed of in incinerator – potential rabies
Jul. 6	arctic fox	1	Mel esker	found deceased, and disposed of in incinerator – potential rabies
Aug. 2	gosling	1	Mel Lake gen set area	found deceased – retrieved by GN
Aug. 2	arctic fox	1	n/s	trapped and disposed of by GN
Aug. 29	arctic hare	1	behind SWTP	unknown cause of death
Sep. 22	arctic fox	1	n/s	trapped and disposed of by GN
Oct. 3	arctic fox	1	n/s	trapped by GN and disposed of by GN in incinerator (on-site)
Nov. 29[(b)]	arctic fox	1	n/s	trapped and disposed of by GN

(a) n/s – location not specified
(b) no additional mortalities after November 29, 2018.
(c) all trapping and site mortalities were completed by GN

Mortalities were reported to the GN DoE, which collected the gosling and 4 arctic foxes for disposal. Other mortalities were disposed of in the incinerator.

Following initial guidance from the GN DoE, traps were placed around the Project starting 19 September 2017. A total of 22 arctic foxes were trapped and dispatched by on site staff and GN DoE officers from 1 January 2018, to 29 November 2018.

6.4 Recommendations

Mortalities can occur as fox and other wildlife become habituated to mining activities resulting from efforts to locate food or shelter (DDMI 1998). Diligent waste management, employee and environmental awareness, and immediate reporting of wildlife sightings in and around Project infrastructure can limit the mortality of wildlife. In response to incidents, employees of the Environment Department will continue to hold toolbox meetings with various departments and contractors, stressing that the harassment and feeding of wildlife are harmful, unacceptable and against company rules.

6.5 Accuracy of Impact Predictions

A summary of the impact predictions proposed in the TEMMP (Golder 2015) is provided in Table 2.0-1. Through systematically recording the presence of all wildlife within and around the Project footprint, Environmental staff will remain appraised of current and emerging issues and will be able to manage issues as they arise. To use a common example, surveillance monitoring may detect that wildlife has gained access and is taking shelter beneath a building.

Monitoring thresholds are not well established, however, Agnico Eagle will work with the GN DoE to better refine these thresholds and adapt their practices, nevertheless, the following thresholds in Table 6.5-1 are suggested as a starting point for adaptive management and TEMMP (Golder 2015) refinement. Impact predictions related to wildlife incidents are summarized in Table 6.5-1.

Table 6.5-1: Accuracy of Impact Predictions – Wildlife Incidents

Monitoring Indicator	Preliminary Threshold	Exceeded in 2018?	Adaptive Management	Monitoring Method	TEMMP[a] Section
Project Related Mortality[b]	No more than 1 ungulate/year	No	Not Currently Identified	Wildlife Sightings Log, Site Surveillance Monitoring	4.4.2
Project Related Mortality	No more than 1 Arctic fox/year	Yes	On-going waste management and, regular toolbox meetings reiterating that harassing and feeding wildlife are harmful, unacceptable and against company rules	Wildlife Sightings Log, Site Surveillance Monitoring, with particular emphasis around waste management areas	4.4.2
Vehicle Collisions	No more than 1 ungulate/year	No	Not Currently Identified	Wildlife Sightings Log, Site Surveillance Monitoring, AWAR Road Surveillance, Road Surveillance	4.4.2
Project Related Mortality	No more than 1 raptor/year	No	Not Currently Identified	Wildlife Sightings Log, Site Surveillance Monitoring	4.9
Project Related Mortality	No more than 1 waterbird/year	No	Not Currently Identified	Wildlife Sightings Log, Site Surveillance Monitoring	4.10

(a)TEMMP = Terrestrial Environment Management and Monitoring Plan (Golder 2015)
(b) Project related Mortality = A death that can be directly linked to the mine or mining activity.

7.0 WILDLIFE DETERRENTS

Bird deterrent canons were initially deployed on P1 and P3 dikes in accordance with Agnico Eagle licence requirements, project certificate TC #74 on June 21, 2018, which states that the Proponent's Terrestrial Management and Monitoring Plan (TEMMP) shall include mitigation measures implemented to prevent the use of water attenuation ponds by waterfowl and waterbirds and monitoring that assesses whether the mitigation measures are working or revised or further deterrent measures are required. Shortly after deployment, NIRB requested a deterrent canon be moved to the landfarm to prevent birds landing and nesting in the sump area. Inuit workers raised concerns (verbally) about the canons impacts on caribou and other wildlife at which point canons were removed on July 2, 2018 (D. Gorton, Agnico Eagle, Per. Comm. 2019). No caribou were deterred in 2018.

8.0 BARREN-GROUND CARIBOU

Barren-ground caribou (including Lorillard and Qamanirjuaq herds) currently have a federal status of 'Threatened' (COSEWIC 2018), but are not listed under the *Species at Risk Act (*SARA 2018) and are considered 'Apparently Secure' in Nunavut by the Canadian Endangered Species Conservation Council (CESCC 2016). Annual home ranges mapped by GN DoE show that the Project is within the annual home range of the Qamanirjuaq (Kaminuriak) Caribou Herd (Campbell et al. 2014; Campbell et al. 2012). However, the Lorillard caribou are migratory (Campbell et al. 2014) and generally distributed north of Chesterfield Inlet, based on radio-telemetry data collected by the GN DoE and the location of their historical calving grounds (Campbell et al. 2012). The likelihood of animals from the Lorillard Herd occurring in the RSA is very low. Baseline survey data documenting the distribution of barren-ground caribou during early winter, spring migration and calving, and post-calving through fall migration and rut periods suggest that the RSA is within the seasonal range of the Qamanirjuaq barren-ground caribou herd (Jalkotzy 1999, 2000a, 2000b).

The annual range of the Qamanirjuaq herd occupies an area from northern Manitoba and Saskatchewan in the south, to southwestern NU and southeastern NT (BQCMB 1999; Campbell et al. 2012). Barren-ground caribou are migratory, and movements and range use varies annually (Wakelyn 1999). The annual distribution and life history of this population has been previously documented (Banfield 1954; Kelsall 1968; Thomas 1969; Parker 1972; Heard 1983). A portion of the Qamanirjuaq herd may pass through the RSA in summer but in some years they may linger from late October through March (Hubert and Associates 2007). Thus, impacts to the Qamanirjuaq herd due to the Project have the potential for transboundary effects. For additional discussion on the Qamanirjuaq herd please refer to the FEIS (Agnico Eagle 2014).

8.1 Caribou Behavior

Concern has been raised regarding the effect of the Project AWAR and mining operations on caribou movement and behavior, particularly during the post-calving migration/aggregation which has occurred over the past 4 to 5 years. The Qamanirjuac herd calves approximately 57 km to the west-northwest of the Project and after calving the herd aggregates into a post-calving movement east towards the coast and then moves back to the west and southwest of the Project where their summer movement and distribution patterns commence. During the post-calving movements to the coast, thousands of caribou can come through the Meliadine Project site and reside within and around the Project area for approximately 5 to 10 days. Once 50 caribou are observed within 5 km of the Project footprint boundary (visual detection or based on collar data), a stop work procedure commences on site. Understanding how caribou interact with the Project infrastructure including roads (i.e., crossing, deflection, walking parallel) and other Project infrastructure, documenting behaviour through activity budgets may better inform appropriate adaptive management and distance triggers and thresholds in the future. Over time, a long-term dataset will be used to evaluate obvious response or lack of obvious response of caribou to mining based on behaviour.

Activity budgets (i.e., time spent feeding, resting, walking, running) of caribou exposed to disturbances from the Project and AWAR will be used to provide inputs for assessing the impact to the energy balance of caribou (Section 4.5.2 of the TEMMP (Golder 2015) for additional discussion). The immediate effect of specific stressors (e.g., aircraft, vehicles, other wildlife) on caribou behavior will also provide general insight into the relative effect of natural versus road stressors on caribou behavior. Essentially this data will contribute to a larger data set from information collected at other mine sites to help determine a weight of evidence of caribou behavioral response to stressors on the Project site and from the AWAR. Consequently, opportunistic surveys should be completed when appropriate to do so during the caribou post-calving migration, without causing additional stress to caribou (based on surveyor opinion).

The objectives of this component of the monitoring program are to:

- determine the effect of the Project AWAR on caribou activity budgets
- determine the effect of other mining activities (e.g., blasting, human presence, light truck traffic) that may elicit a response in caribou
- determine which stressors associated with the Project have the greatest influence on caribou behavior, and the variation in caribou behavior from these stressors

8.1.1 Methods

Ground-based behavioral observations, or scan sampling, are conducted to provide data on changes in caribou behavior as a function of distance from the Project. Two different, but complementary approaches have been used to record the activity budget of caribou around the Project and AWAR. See the TEMMP (Golder 2015) for additional details on the behavior scan method.

8.1.2 Results

Caribou behavior observations were completed on July 11, July 12, July 13, July 15 and July 21, 2018. A summary of caribou behavior observation in 2018 is present in Table 8.1-1. Observations showed no obvious behavioral response to mine activity.

Table 8.1-1: Caribou Behavior Observations (2018)

Date of Observation	Location	Approximate Number of Caribou	Behavior(s) Observed
11 July 2018	Between CP5 and Exploration Camp	8	Bedding, Feeding, Standing
12 July 2018	NW of Old Anfo. Plant	73	Feeding, Walking
13 July 2018	South of Landfarm B	604	Bedding, Feeding, Walking
13 July 2018	Western Edge of Project	520	Feeding, Swimming, Walking
15 July 2018	Between H15and MSB Pad	231	Feeding, Standing, Walking
21 July 2018	NW of Old Anfo. Plant	162	Bedding Feeding, Walking
21 July 2018	West of CP1	1	Feeding, Standing, Walking

8.2 Caribou Advisory

The objective of the Caribou Advisory Monitoring program is ensure workers are aware of the approximate numbers of caribou on and in close proximity the Project, which is related to the potential for interactions between caribou and mining activities. This raises general awareness so that employees are alert to the likelihood that mitigation could be triggered, and what mitigation entails. The number of animals near the Project and in specific areas dictates the type of mitigation practices that will be undertaken (e.g., haul road closure, closing specific areas on the Project site, speed reduction).

8.2.1 Methods

Agnico Eagle in collaboration with the GN and KIA undertook an extensive preparation for caribou migration at Meliadine, including the implementation of a caribou monitoring and work suspension protocol to minimize sensory disturbance at the Project site and along the AWAR. HTO and KIA members assist AEM staff conducting surveys during caribou migration. KIA members, assisted by Government of Nunavut (GN) staff worked with AEM staff to monitor caribou from July 5th to July 22nd, 2018 during the caribou migration period. Communication protocols built into the work suspensions are designed to be broadcast swiftly and broadly among all departments in real time. The environmental department monitored caribou presence as per the caribou migration protocol (Appendix IV; Golder 2015) including the use of collar data and regular surveys, and issued caribou advisories. Regular surveys for caribou, were completed by on site environmental technicians, and consisted of ground surveys at multiple locations, at regular intervals throughout the day (i.e., 06:00, 12:00, 18:00) during caribou migration.

8.2.2 Results

Mass migration through the Project and AWAR took place between 5 July and 22 July 2018. At the Project, the caribou work suspension protocol (complete work stoppage) was in effect for periods of 8 July to 17 July (Table 8.2-1). Closure and restrictions on AWAR took place on 7-20 July (Table 8.2-1). In total for both the Project and AWAR there was a complete work stoppage for 191 hours (~8 days) and restricted duties for 93 hours (~4 days).

Table 8.2-1: Caribou Advisories Meliadine, 2018

Date	Hours	Location	Mitigation
5 July	11.25	Mine[(a)]	Light duties permitted
6 July	14.5	Mine[(a)]	Light duties permitted
6 July	7.5	Mine[(a)]	Light duties at main site, full stoppage at exploration camp
7 July	5.5	Mine[(a)]	Light duties at main site, full stoppage at exploration camp
7 July	6.5	Mine[(a)]	Exploration camp restricted to light duties
7 July	6	Mine[(a)]	Light duties permitted
7 July	4	Mine[(a)]	Light duties at main site, full stoppage at exploration camp
7 July	2	Mine[(a)]	Complete work stoppage
7 July	12	AWAR	Speed limit restricted to 30 km/hr
8 July	24	Mine[(a)]	Complete work stoppage
8 July	18	AWAR	Complete work stoppage
9 July	24	Mine[(a)]	Complete work stoppage
9 July	24	AWAR	Complete work stoppage
10 July	12	Mine[(a)]	Complete work stoppage
10 July	24	AWAR	Complete work stoppage

Table 8.2-1: Caribou Advisories Meliadine, 2018

Date	Hours	Location	Mitigation
11 July	6	Mine[(a)]	Light duties permitted
11 July	12	AWAR	Speed limit restricted to 30 km/hr
12 July	9	AWAR	Speed limit restricted to 30 km/hr
12 July	15	AWAR	Complete work stoppage
13 July	17	Mine[(a)]	Complete work stoppage
13 July	24	AWAR	Complete work stoppage
14 July	6	Mine[(a)]	Complete work stoppage
14 July	12	AWAR	Complete work stoppage
14 July	12	AWAR	Speed limit restricted to 30 km/hr
15 July	20	Mine[(a)]	Complete work stoppage
15 July	24	AWAR	Complete work stoppage
16 July	5	Mine[(a)]	Complete work stoppage
16 July	4	Mine[(a)]	Portal 1 work stoppage
16 July	15	Mine[(a)]	Complete work stoppage
16 July	5	AWAR	Complete work stoppage
16 July	4	AWAR	Speed limit restricted to 30 km/hr
16 July	15	AWAR	Complete work stoppage
17 July	6	Mine[(a)]	Complete work stoppage
17 July	1	Mine[(a)]	Work stopped at industrial pad and portal 1
17 July	2	Mine[(a)]	Light duties at industrial pad and portal 1
17 July	6	AWAR	Complete work stoppage
18 July	16	AWAR	Complete work stoppage
19 July	5	AWAR	Complete work stoppage
19 July	13	AWAR	Speed limit restricted to 30 km/hr
20 July	3	AWAR	Speed limit restricted to 30 km/hr

(a) Mine includes Site vehicle traffic, UG operations, Exploration Camp and Industrial Pad.

8.3 Accuracy of Impact Predictions

A summary of the impact predictions proposed in the TEMMP (Golder 2015) is provided in Table 2.0-1. Though not fully developed, the following thresholds are suggested as a starting point for adaptive management and TEMMP (Golder 2015) refinement and is tested against the results of the 2018 observational data (Table 8.3-1).

Table 8.3-1: Accuracy of Impact Predictions - Caribou

Monitoring Indicator	Preliminary Threshold	Exceeded in 2018?	Adaptive Management	Monitoring Method	TEMMP* Section
Hunting by Rankin Inlet Residents	After 3 years of data collection in collaboration with GN, establish a threshold level	Not assessed in 2018	Not Currently Identified	Hunter Harvest Survey, Collected throughout the year and reported annually	4.8
Sensory Disturbance	<10% caribou deflections from AWAR	Not assessed in 2018	Not Currently Identified	Ground Surveys, Satellite-collaring	4.7

Table 8.3-1: Accuracy of Impact Predictions - Caribou

Monitoring Indicator	Preliminary Threshold	Exceeded in 2018?	Adaptive Management	Monitoring Method	TEMMP* Section
Vehicle Collisions	No more than 1 ungulate/year	No	Not Currently Identified	Wildlife Sightings Log, Site Surveillance Monitoring, AWAR Road Surveillance, Road Surveillance	4.4.2
Project Related Mortality	No more than 1 ungulate/year	No	Not Currently Identified	Wildlife Sightings Log, Site Surveillance Monitoring	4.4.2

AWAR = All-Weather Access Road; GN = Government of Nunavut Department of Environment; *TEMMP = Terrestrial Environment Management and Monitoring Plan (Golder 2015)

8.4 Recommendations

To harmonize methods with other Agnico Eagle projects in Nunavut, further discussions between Agnico Eagle and GN DoE should be initiated on establishing the best path forward for determining effects from mining development on caribou and the Zone of Influence and data collection measures to support these analyses.

Agnico Eagle will continue to focus monitoring on caribou activity near the Project and AWAR while continuing to support GN DoE led caribou monitoring and/or research where possible.

9.0 HUNTER HARVEST INFORMATION

Agnico Eagle is currently in working on an Memorandum of Understanding (M.O.U.) with the HTO (M. Theriault, Agnico Eagle, 2019, pers. comm).

10.0 BIRDS

Four types of surveys were completed in 2018 for waterfowl, waterbirds, upland birds and shorebirds including: shoreline surveys, point counts, avian use surveys, and Program for Regional and International Shorebird Monitoring (PRISM) surveys. These surveys are designed to measure mining-related effects on upland bird (i.e., songbirds and waterfowl) and shorebird species richness, diversity, and relative abundance. Specifically, the intent is to measure these parameters in response to mining development and increased traffic along the AWAR.

Shoreline surveys are designed to determine nesting distribution within 200 m of the shore, which is considered to be the approximate zone of influence from sensory disturbance in the FEIS, of mining and Project-related infrastructure (e.g., AWAR). The program will attempt to determine mated pair distribution and nesting success in ponds, wetlands, and lake shorelines within 200 m of Project infrastructure.

Point counts, avian use surveys, and PRISM surveys for upland birds and shorebirds were completed in 2018. The objectives of PRISM include estimating breeding population size; describing the distribution, abundance, and habitat relationships; and monitoring trends in breeding population size of shorebirds (Bart et al. 2005), can be expanded to include upland birds. The PRISM survey methods (CWS 2008), avian use survey and point count methods employed are used consistently across North America so data can be compiled and compared across the continent.

10.1 Shoreline Surveys

This program is designed to determine the nesting distribution of waterfowl and waterbirds on waterbodies within 200 m of mining related infrastructure including the AWAR. All waterbodies within this search area are surveyed on foot by trained biologists to locate and identify nesting waterbirds.

10.1.1 Methods

Survey methods are described in more detail in the TEMMP (Golder 2015). Due to limited survey time, the field crew deviated from described methods and worked separately on shorelines that were completely surveyed. All waterbodies within 200 m of the Project, excluding the AWAR, were surveyed on 12 to 18 June 2018 (Figure 10.1-1).

10.1.2 Results

A total of eight different species were observed (Table 10.1-1). No fledglings were observed, all observations were nesting adults, and eggs were observed in nests. Canada Goose were the most numerous species observed with 28 adults recorded. In total, 56 adult birds were recorded with 27 eggs observed among eight different species. A total of 27 nests were observed, eggs counts were confirmed in 14 nests, 6 nests contained no eggs, and eggs counts could be completed in the remaining 7 nests. Waterbodies within 200 m of the AWAR were not completed due to time constraints.

Figure 10.1-1: Breeding Bird Survey Plot Locations

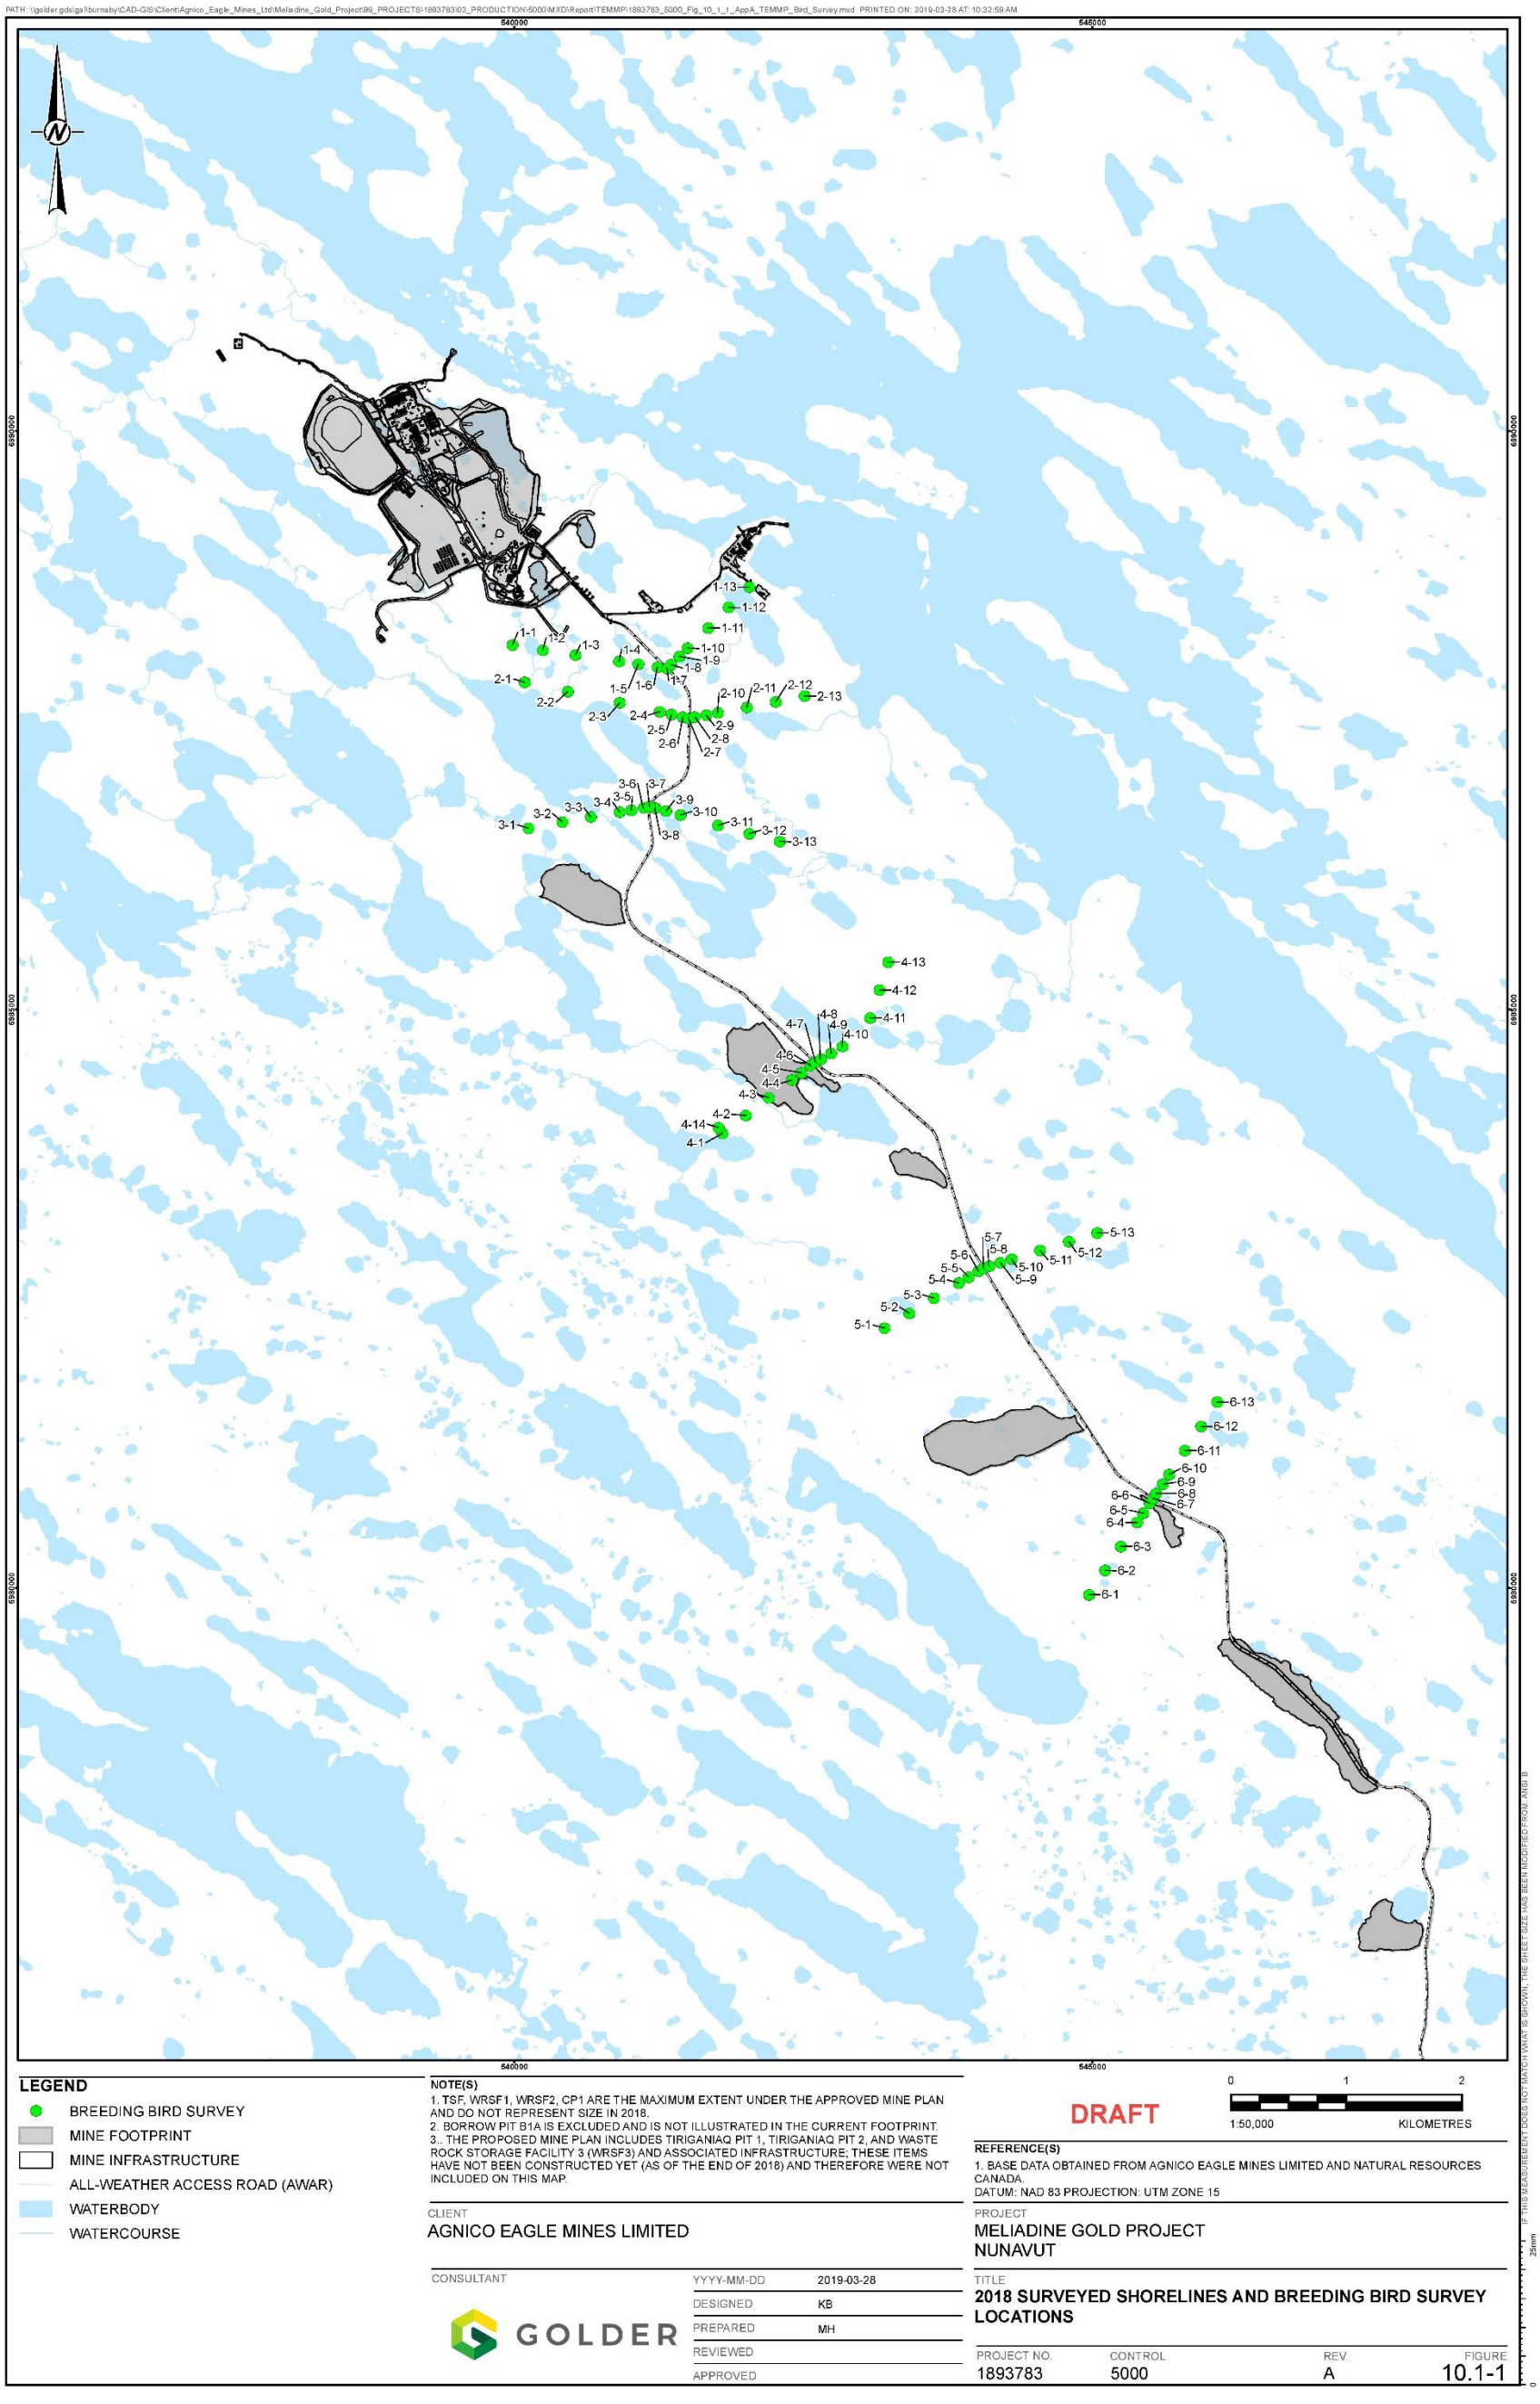

Table 10.1-1: Summary of Adult and EggsObserved during Shoreline Surveys, July 2018

Species	Adult	Eggs[(a)]	Total
Cackling Goose	2	2	4
Canada Goose	28	14	42
Horned Lark	4	1	5
Lapland Longspur	6	3	9
Least Sandpiper	4	2	6
Peregrine Falcon	2	1	3
Tundra Swan	2	1	3
Willow Ptarmigan	6	1	9
Grand Total	56	27	83

(a) Eggs were counted to observers best ability while minimizing disturbance to nests

10.2 Point Counts

In baseline studies, upland bird point count surveys were used to determine the composition and relative abundance of upland bird species and their habitat associations within the RSA (Agnico Eagle 2014). Upland bird point count surveys estimate population densities and species composition of bird communities (Robbins 1970; Kissling and Garton 2006). They provide habitat-specific density data and can be used to measure the effect of land-use practices on breeding bird populations.

10.2.1 Methods

Point count locations were determined to be within 1 km on either side of the AWAR (2 km in total) with the first point counts occurring at 50 m from the road on either side, with subsequent plots spaced 100 m from the preceding plot. Each transect consisted of 12 plots, and were completed with 6 transects in 2018 for a total of 72 point count surveys. Point counts were 5-minutes long and constrained to a radius distance of 100 m. The survey method is described in more detail in the TEMMP (Golder 2015).

10.2.2 Results

In total, just seven passerine (i.e. songbird) species were recorded on the point count surveys with a total of 177 individuals recorded (Table 10.2-1). The most abundant species was horned lark (*Eremophila alpestris*) with 68 total birds observed. The least abundant species was American robin (*Turdis migratorius*) with just 1 individual recorded. An additional 17 species were incidentally recorded during point count surveys, comprising the remaining 108 observations. The small number of observations was likely a result of late spring conditions and field staff being on site early.

Table 10.2-1: Summary table of point count survey results

Species	Total n = 72	Esker Complex n = 1	Gravel Pit n = 2	Heath/Bedrock n = 3	Heath/Boulders n = 17	Heath Tundra n = 22	Low Shrub n = 2	Sedge Wetland n = 7	Tussock/Hummock n = 18
American pipit	22	0	1	1	8	4	0	3	5
American robin	1	0	0	0	0	1	0	0	0
common redpoll	4	0	0	0	0	1	0	0	3

10.3 PRISM

Agnico Eagle contributed to the Environment and Climate Change Canada (ECCC) PRISM surveys in 2018 and will continue to do so every three years. These surveys are designed to document population numbers of Arctic breeding shorebirds and contribute to regional knowledge in an effort to set population targets and assist with management and conservation of these species (EC 2012). For each PRISM survey, plot locations are randomly chosen by ECCC. For the 2018 field program, a representative from ECCC joined Golder crews at the Project to conduct PRISM surveys in the area. This data will be submitted to ECCC for inclusion in their regional database.

10.3.1 Methods

Monitoring methods adhered to standard techniques for surveying shorebirds (CWS 2008). Ground-based rapid assessment surveys of 12 ha plots were completed from June 19 – 21, 2018. The field crew consisted of two Golder biologists, an ECCC biologist and two local assistants. Observers recorded the species encountered, estimated their breeding status, and recorded habitat conditions.

10.3.2 Results

A total of ten PRISM survey plots were surveyed with a total of eleven bird species observed. The most common bird species observed in the plots were Lapland longspur (*Calcarius lapponicus,*), and savannah sparrow (*Passerculus sandwichensis,*).

Table 10.3-1 Species Observed in 2018 PRISM Surveys

Species	Nests	Probable Nests	Pairs	Males	Females	Unknown Sex
Common redpoll						4
Dunlin		1				
Greater white-fronted goose		1				
Horned lark		2	2			1
Lapland longspur	6	1	4	13	4	
Least sandpiper				1		
Long-tailed duck			2	1		
Sandhill crane	1					2
Savannah sparrow		4	4	14	3	2
Semi-palmated plover		1				
Willow ptarmigan				2		
TOTAL	**7**	**10**	**12**	**31**	**7**	**9**

No species-at-risk were observed on survey plots. Breeding evidence of three species of shorebirds was found during the surveys, including dunlin (*Calidris alpina*), least sandpiper (*Calidris minutilla*), and semipalmated plover (*Charadrius semipalmatus*).

Due to the late spring in 2018, and the relatively early timing of the field work, no actively nesting songbirds were found during PRISM surveys; however, breeding evidence such as singing males and closely associating pairs provides evidence where birds are likely to nest. Only one nest was found overall, which was established by a pair of sandhill cranes (*Grus canadensis)*, and contained a single egg.

10.4 Accuracy of Impact Predictions

A summary of the impact predictions proposed in the TEMMP (Golder 2015) is provided in Table 2.0-1. The primary objective of the waterfowl and waterbird monitoring program is to determine the effects, if any, of sensory disturbance from mining activities, including access along the AWAR on breeding success or changes in distribution of mated pairs (Table 10.4-1).

Threshold triggers for additional mitigation or evaluation of mitigation will be determined through discussions with appropriate ECCC and GN DoE personnel. This thresholds may be difficult to initially establish due to low bird densities and high variability. However, thresholds will likely be based on habitat loss (i.e., 515 ha of aquatic habitat) with no additional habitat loss than FEIS predictions. After initial data collection (first 3 years of operations) and a range of natural variability is determined, breeding and productivity thresholds will be determined.

Table 10.4-1: Accuracy of Impact Predictions – Waterfowl, Waterbirds, Upland Birds and Shorebirds

Monitoring Indicator	Threshold	Exceeded in 2018?	Adaptive Management	Monitoring Method	TEMMP* Section
Habitat Loss and Degradation	515 ha of Aquatic Habitat	To be assessed after first 3 years of operations	Not Currently Identified	Shoreline Surveys, PRISM	4.10.2
Disturbance of Nesting Waterfowl	TBD once NRV is established through consultation with ECCC and GN	No	Not Currently Identified	Shoreline Surveys	4.10
Project-related Mortality	1 Individual Waterbird	No	Not Currently Identified	Wildlife Sightings Log, Site Surveillance Monitoring, AWAR Road Surveillance, Road Surveillance	4.10
Changes in Breeding Bird Populations	TBD once NRV is established through consultation with ECCC	No	Not Currently Identified	Point counts and transects	4.11

SLRA = Screening Level Risk Assessment; NRV = Natural Range of Variability; ECCC = Environment and Climate Change Canada; GN = Government of Nunavut Department of Environment; PRISM = Program for Regional and International Shorebird Monitoring; *TEMMP = Terrestrial Environment Management and Monitoring Plan (Golder 2015)

11.0 RECOMMENDATIONS

It is recommended that Agnico Eagle continue to monitor birds through shoreline surveys, breeding bird point counts and PRISM. The timing of the field programs occurred earlier 2018 to capture breeding activity and avoid overlap with the Qamanirjuaq herd migration through the area. Further discussions with ECCC and GN DoE is required to determine the locations and frequency of surveys.

Agnico Eagle has engaged the Arctic Raptors Research Program (http://www.arcticraptors.ca/) to develop and implement the raptor monitoring program (Franke 2012). The 2018 annual report of the Arctic Raptors Research Program is included in Appendix B.

11.1 Accuracy of Impact Predictions

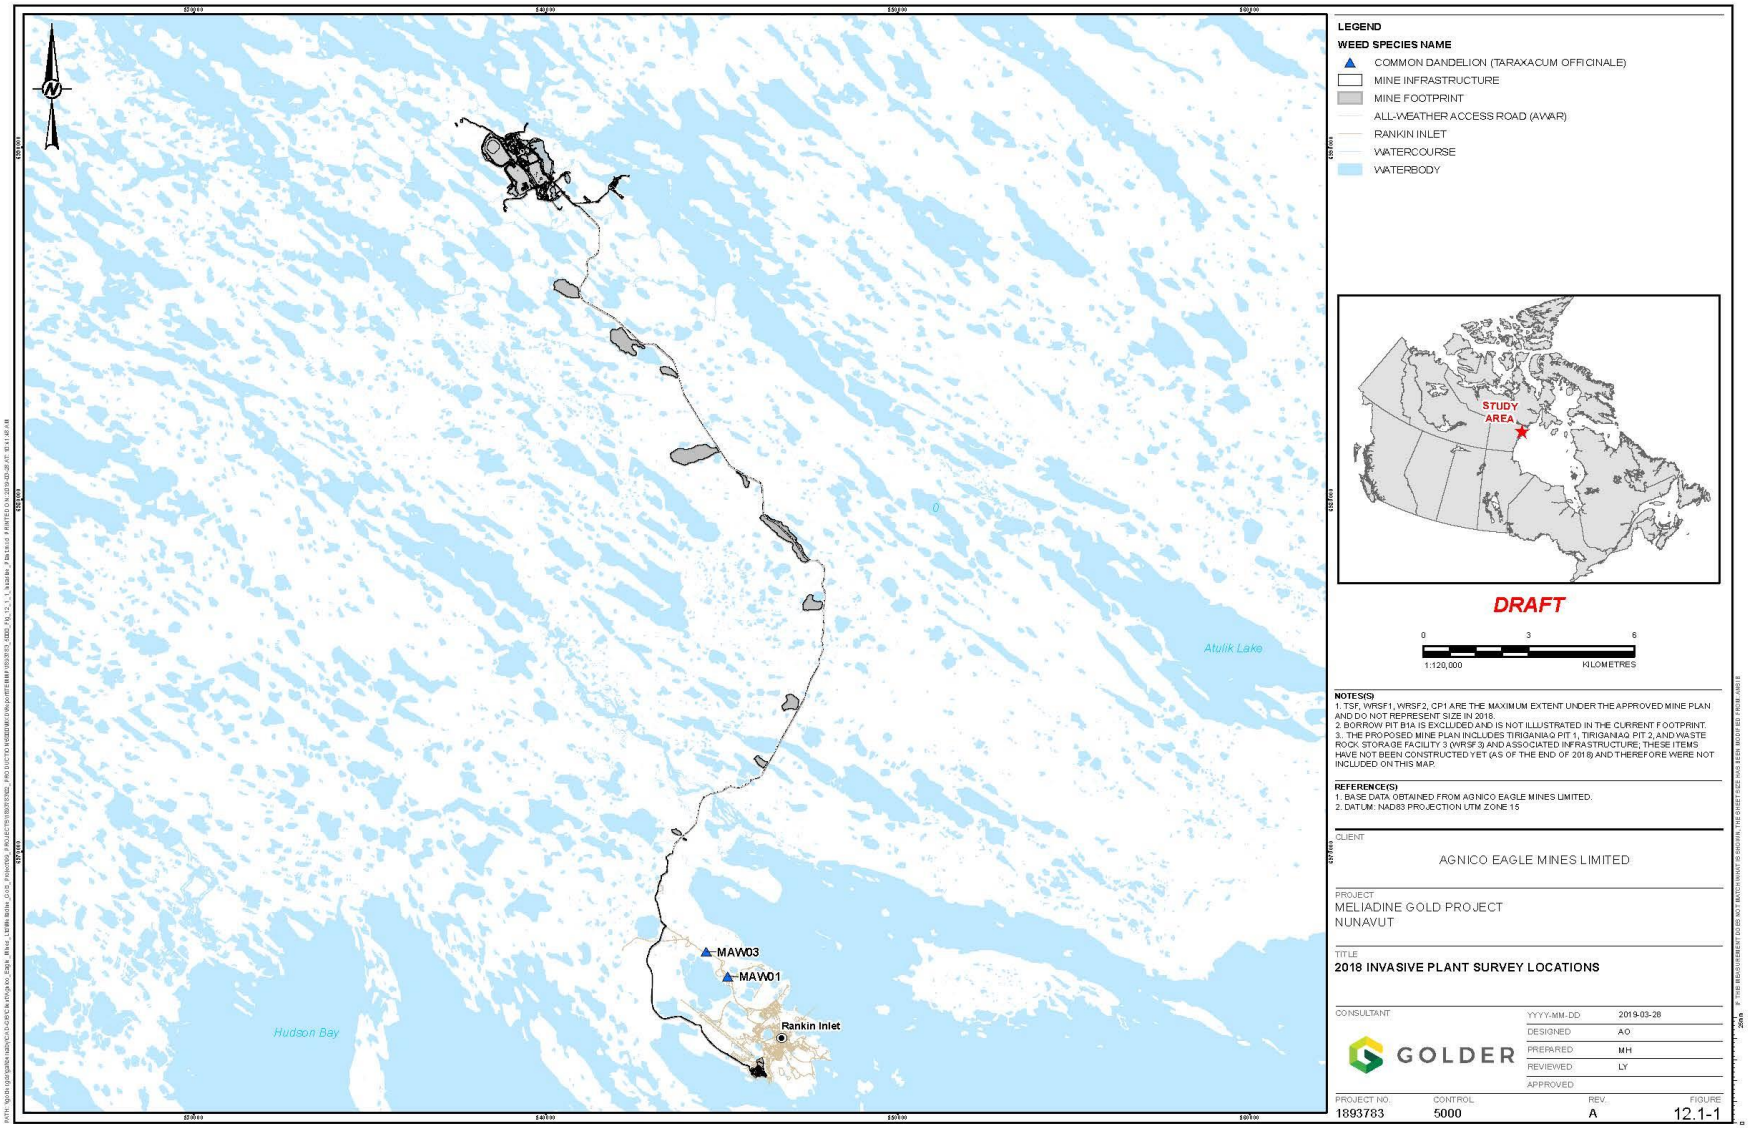
Thresholds for the raptor monitoring program will be developed in conjunction with the Artic Raptor Research Program and GN DoE personnel. However, a threshold of no more than a 20% difference in occupancy and productivity between nest sites near Project infrastructure (e.g., 1 km) and nest sites far from Project infrastructure (e.g., > 1 km) is proposed. In addition, site-specific monitoring opportunities (e.g., cameras) will be discussed with the Arctic Raptor Research Program to determine potential mechanisms for differences in productivity, which can then be incorporated into adaptive management strategies.

12.0 SOIL AND VEGETATION MONITORING

The 2017 TEMMP Annual Report (Golder 2018) presented the baseline levels of metals in berry producing plants, sedges, lichen, and soil chemistry potentially affected by the Project. To evaluate the potential for adverse health effects to terrestrial life associated with changes in environmental quality due to chemical releases from the Project, the existing (or baseline) conditions of the environment must first be understood. Vegetation (i.e., berries, sedges, and lichens) and soil sampling will occur again in 2019, when Mine production is expected to start. Soil characteristics will be compared to baseline conditions to determine whether there is an accumulation of metals or change in nutrient composition. If there are indications of vegetation stress, poor vigour, or plant die-back, soil sampling will be implemented (as required), to determine whether changes in the growth media is influencing plant health and/or establishment.

Annual monitoring was not conducted in 2018. Monitoring programs will be completed at three-year intervals starting in 2019.

12.1 Invasive plant surveys



The spread of invasive weed species across the landscape is a concern for the Inuit. Construction equipment and operation activities can result in the introduction of, or spread of, invasive vegetation species. Thus, the Project certificate No 006 (Appendix A) includes Term and Conditions 36 and 37 to prevent and minimize the introduction of invasive plants during pre-construction, construction, operations, temporary closure and maintenance, closure and post closure. Pre-construction surveys were completed during the baseline studies completed during 1998, 2008 and 2009 surveys (Golder 2012).

This section includes the methods and results and mitigation measures to minimize the spread of invasive plant species as a result of Project construction. The next invasive monitoring surveys will occur in 2019, when Project Operations are expected to start. Subsequent surveys will be completed annually.

12.1.1 Methods

A desktop search for invasive plants in Nunavut was completed prior to field surveys. A list of potential non-native and invasive plants was obtained from the Canadian Endangered Species Conservation Council List (CESCC 2010). Invasive plant surveys were completed on July 24, 2018 by a Golder Terrestrial Ecologist. Surveys targeted areas with a high potential of occurrence such as along the AWAR, Project footprint, and ship loading areas. Ten different locations were assessed at each side of the AWAR (Figure 12.1-1). In addition, the Project accommodations footprint was circumnavigated, and the AEM ship loading area in Rankin Inlet will be surveyed. Where invasive plant species were observed, a GPS point and photograph was taken and the size of occurrence was recorded.

Figure 12.1-1: 2018 Invasive Plant Survey Locations

12.1.2 Results

Two occurrences of common dandelion (*Taraxacum officinale*), a listed species under the Non-Native and Invasive species in Nunavut (CESCC 2010) (Appendix A) were recorded along the AWAR.Common dandelion was not observed in the Project footprint or ship loading areas. Figure 10.1-1 shows the location along the AWAR were this invasive species occurred.

12.1.3 Mitigation

The early detection of invasive plant species is important, as preventing these species from becoming established is the most effective mitigation that can be employed. Invasive plants identified as a concern by the GN DoE will be reported to the GN, including location of the species (i.e., GPS coordinated and map), species identification and photographs of the species in question.

In addition, to the early detection of non-native invasive species the following mitigation measures have been implement by AEM during Project operation:

- where possible, utilize existing access trails and roads;
- limit the width of access roads and the size of workspaces;
- inspect and clean new equipment arriving to site from the ship loading area prior to entering the Project Area;
- complete non-native invasive plant monitoring surveys every year during operations to identify problem areas. Surveys should be targeted for areas with a high potential of occurrence such as along the AWAR, Project footprint, and ship loading areas.

12.2 Accuracy of Impact Predictions

Invasive plant species were observed in disturbed area (i.e., along AWAR and around operations camp area). However, invasive plant encroachment was not observed in vegetation communities/habitat types. A summary of the impact predictions proposed in the TEMMP (Golder 2015) is provided in Table 2.0-1. Specific thresholds for vegetation and wildlife habitat monitoring are outlined in Table 12.2-1.

Table 12.2-1: Accuracy of impact Predictions - Vegetation

Monitoring Indicators	Threshold	Exceeded in 2018?	Adaptive Management	Monitoring Method	TEMMP* Section
Habitat Degradation by Contamination	No invasive plant species established	Yes	See Section 12.1.3	Invasive Plant Survey of AWAR and Project site	4.6
Habitat Reclamation following Project Closure	NA	No	Not Currently Identified	Ground Surveys, Vegetation Plots, Mapping	4.6

*TEMMP = Terrestrial Environment Management and Monitoring Plan (Golder 2015)

12.3 Recommendations

For the occurrences found during 2018 surveys, both individuals were hand pulled, and the plant material collected in bags to be disposed of at an offsite location. The CESCC (2010) (Appendix D) has developed posters that show Non-Native species and invasive species in Nunavut. These can easily be displayed at the Project site and incorporated into on-boarding materials. Chemical herbicide treatments are not recommended to be used at this point as the presence and extent of this invasive species is limited.

13.0 ENVIRONMENTAL VARIABLES

A summary of climate conditions collected on site in 2018 are presented in Table 12.3-1

Table 12.3-1: Climate Conditions Recorded in the Project Area

ENVIRONMENTAL VARIABLE	YEAR[(a)]
	2018
TEMPERATURE (°C)	
Mean Annual Temperature	-11.3
Max Annual Temperature	27.5
Min Annual Temperature	-46.8
PRECIPITATION	
Total Annual Rainfall (mm)	139.7
Total Annual Snowfall (mm)	111.8

(a) All values reported were collected via on site meteorological station, with the exception of snowfall which was collected by AE staff

The max annual temperature of 27.5°C was recorded on July 11, 2018 and the minimum annual temperature -46.8°C was recorded on February 19, 2018. Snowmelt began June 9, 2018 when the average daily air temperature exceeded 0°C. Environmental variables will continue to be monitored on an on-going basis.

NIRB PROJECT CERTIFICATE [NO.: 006]

February 26, 2019

Schedule of Amendments to the Nunavut Impact Review Board's Meliadine Gold Mine Project Certificate No. 006

AMENDMENT No.	DATE OF AMENDMENT	TYPE OF AMENDMENT
001	February 26, 2018	Amendments and additions to Terms and Conditions of Project Certificate to reflect significant modifications to the Meliadine Gold Mine Project as proposed in the Saline Effluent Discharge to the Marine Environment proposal and amendments to reflect implementation of project monitoring and reporting requirements: • Updates to the Project Certificate to reflect changes to legislation and references to regulatory agencies; • Update to Term and Condition 25 to specify the required management plans • New Terms and Conditions 128-131 related to development of the pipeline and on-shore infrastructure, and HTO involvement in developing a specific management plan

1.0 BACKGROUND

Whereas:

A. Pursuant to the *Agreement between the Inuit of the Nunavut Settlement Area and Her Majesty the Queen in right of Canada* (*Nunavut Agreement*), the Nunavut Impact Review Board (Board or NIRB) has completed a review of the potential ecosystemic and socio-economic effects of the Meliadine Gold Mine Project, NIRB No File. 11MN034 (the Project);

B. The Board has considered the list of commitments made by Agnico Eagle Mines Limited (Agnico Eagle or the Proponent) throughout the NIRB's review and during the NIRB Final Hearing for the Project and the Board has every expectation that the Proponent will fulfill the commitments made during the Final Hearing, within its Final Environmental Impact Statement and contained within supporting documentation submitted during the review of the Project, not just the commitments that are expressly included as terms and conditions in this Project Certificate;

C. The Board has determined, pursuant to Section 12.5.5 of Article 12 of the *Nunavut Agreement*, that, taking into account the implementation of the measures necessary to prevent or mitigate the potential adverse environmental and socio-economic effects associated with the Project and set out as terms and conditions in this Project Certificate, the Meliadine Gold Mine Project is not likely to cause significant adverse ecosystemic and socio-economic effects;

D. The Board has found, pursuant to Section 12.5.5 of Article 12 of the *Nunavut Agreement* and taking into account all matters relevant to its mandate including Section 12.2.5, that the Meliadine Gold Project will enhance and protect the existing and future well being of the residents and communities of the Nunavut Settlement Area;

E. The Minister of Aboriginal Affairs and Northern Development Canada has accepted the NIRB Final Hearing Report for the Meliadine Gold Mine Project (January 2015), and the recommended terms and conditions contained in the Report that are now included in the Project Certificate; and

F. Recognizing the importance of co-ordination, integration and avoiding duplication with other monitoring requirements in permits, licences and other authorizations, the project-specific monitoring program, provided as Appendix A to this Project Certificate, will be issued in final form after key regulatory authorizations, including land use permits, water licences and mineral leases, are issued.

Therefore, the Nunavut Impact Review Board pursuant to Section 12.5.12 of Article 12 of the *Nunavut Agreement*, and as applicable to the Saline Effluent Disposal Proposal, also pursuant to Section 12.8.2 of Article 12 of the *Nunavut Agreement*, s. 112 of the *Nunavut Project and Planning Assessment Act,* S.C. 2013, c 14, s.2 *(NuPPAA)*, issues this amended Project Certificate for the Meliadine Gold Mine Project to Agnico Eagle Mines Limited, subject to the terms and conditions contained herein.

2.0 PROJECT DESCRIPTION

The Meliadine Gold Mine Project (the Project) consists of mining at five gold deposits and processing of the ore at an on-site milling operation at a rate of 8,500 tonnes per day, as well as transportation of the gold bullion south for final refinement and sale. The Project includes the extended exploration, construction, operation, closure, and reclamation of both underground and open-pit mines and associated infrastructure for extraction, processing and transportation of gold. The mining of gold ore would occur at the five deposits through a phased approach, Tiriganiaq, Wesmeg, Pump, F Zone and Discovery, with Tiriganiaq being the only deposit where gold would be mined through both above ground and underground methods, with the other deposits being mined using open pit methods. There are three main Project areas: the Tiriganiaq mine site, the Discovery deposit and the Itivia Harbour. Phase 2 of all-weather access road (AWAR) would be an upgrade of the currently existing and previously approved Phase 1 of the AWAR which is approximately 24 kilometres (km) long and connects the Tiriganiaq exploration site to Rankin Inlet currently. As part of construction of Phase 2 of the AWAR, a spur road would be developed to connect the main road with the south end of Meliadine Lake to allow for public access to the Lake. Agnico Eagle has confirmed that Phase 2 of the AWAR would not be completed until it is ready to develop the Discovery deposit and would entail constructing a second road which would run parallel but separately from the public road, for mine traffic only.

Supplies and equipment required for construction and ongoing Project supply would be received during the open water season only, at the Itivia spud barge at Melvin Bay, near Rankin Inlet. The Itivia area would consist of eight one-million litre tanks for fuel and a laydown area to temporarily store materials received during the open water barging season. This area would be connected to the AWAR by a bypass road which would facilitate mine traffic avoiding the community of Rankin Inlet on route to the Project mine site.

In 2018 Agnico Eagle submitted the Saline Effluent Discharge proposal to the NIRB as required by the original Meliadine Final Hearing Report which directed that, should the preferred method of groundwater disposal change, further assessment would be required. Under the Saline Effluent Discharge proposal, Agnico Eagle sought to discharge saline effluent (salty or saline groundwater) from the Tiriganiaq Underground Mine into the marine environment at Melvin Bay near Rankin Inlet. Specifically, Agnico Eagle proposed to collect and truck the saline groundwater via the all-weather road from the mine site to a holding tank on the shore. The holding tank would be connected to an underwater pipeline and diffuser installed into Melvin Bay which would release the saline water into the ocean. Further, the Nunavut Water Board Type “A” Water Licence for the Project allows Agnico Eagle to manage the salty groundwater flowing into the underground workings by treating the water prior to discharge into collection ponds and Meliadine Lake. Even after the Saline Effluent Discharge proposal is approved to proceed, Agnico Eagle is expected to continue using the previously licensed water management practices but will add the option to discharge a portion of the salty groundwater into the ocean during the open water season, when all the required regulatory authorizations for this activity are in place.

3.0 IMPLEMENTATION

NIRB has the authority to reconsider the terms and conditions of the Project Certificate to ensure that the terms and conditions are achieving their purpose. Clearly the NIRB expects the Proponent to meet its obligations under this Certificate, however, the NIRB may revisit the Certificate if the NIRB determines that the terms and conditions are not achieving their purpose.

If the Kivalliq Inuit Association or other Designated Inuit Organization, or person or body that would normally have standing to seek this type of court determination, has concerns that any term or condition is not being implemented, these parties may seek a determination before the appropriate court regarding whether or not the terms and conditions in the project certificate have been implemented. This Project Certificate is implemented by authorizing agencies in accordance with the reviewability section of the *Nunavut Agreement* (Section 12.9.7):

> "A licence, permit, certificate or other governmental approval which implements or incorporates any term or condition of a NIRB project certificate may not be called into question in a court of law on the grounds that the issuing agency thereby fettered its discretion or otherwise acted without jurisdiction, when implementing any term or condition of a NIRB project certificate."

3.1 Overview of NIRB Monitoring Program

As set out in Sections 12.7.1 and 12.7.2 of Article 12 of the *Nunavut Agreement* and s. 135 of the *NuPPAA,* the NIRB has the jurisdiction to establish a project-specific monitoring program to: measure the ecosystemic and socioeconomic effects of a project; assess whether the project is in compliance with the prescribed project terms and conditions; share information with regulatory agencies to support the enforcement of land, water or resource use approvals and agreements; and to assess the accuracy of predictions contained in the environmental impact statements. Given the Board's application of the precautionary approach to several aspects of the assessment for this Project, in the Board's view project-specific monitoring will play a crucial role in addressing the uncertainty regarding project effects and enabling all parties to adapt mitigation measures on an ongoing basis to ensure the Project's negative effects are prevented or limited to the extent possible.

The role of the Board with respect to the establishment of monitoring programs is to focus the terms and conditions in relation to the Project. With respect to existing or future general regional and territorial monitoring programs that may include some of the same monitoring parameters/indicators as the project-specific monitoring program, the *Nunavut Agreement* and *NuPPAA* also directs the NIRB to avoid duplication but facilitate co-ordination and integration between the project-specific monitoring programs required by the NIRB and more general programs and initiatives such as the Nunavut General Monitoring Plan.[1] Where the requirements of regional or territorial programs are more extensive or substantively different than those established through the Project Certificate, at all times the Proponent must ensure compliance with the Project Certificate terms and conditions.

[1] See the discussion in Section 5.10.3 of the report and Sections 12.7.4 and 12.7.5 of the *Nunavut Agreement*.

In order to co-ordinate, integrate and avoid duplication with other monitoring programs, but also to ensure that the NIRB's project-specific monitoring program yields the information required to measure effects and adequately assess compliance with terms, conditions, regulatory instruments and agreements, the NIRB's monitoring program will continue to be developed through consultation with responsible authorities, the resource and land owners and the proponent as the remaining regulatory instruments for the Project are developed. Following the issuance of the Project Certificate by the NIRB, the framework for a project-specific monitoring program will be developed and will be provided in draft form as Appendix A to the Project Certificate. As noted in the Preamble, this framework cannot be issued in final form until key regulatory authorizations, including land use permits, water licences, mineral leases, etc. are issued so that the monitoring program supplements and supports but does not duplicate the monitoring requirements in regulatory and land use instruments. Prior to finalization, the Proponent will be required to comply with all aspects of the draft framework as directed by the NIRB.

3.2 General Principles of Interpretation Applicable to Terms and Conditions:

In order to view the project-specific terms and conditions set out within this Project Certificate in the appropriate context, the following general principles of interpretation apply to the Project Certificate in its entirety, with all terms and conditions being interpreted in accordance with:

a. The NIRB's Final Hearing Report (namely NIRB File No.: 11MN034, Final Hearing Report for the Meliadine Gold Project Proposal, October 10, 2014 available from the NIRB's registry) and Reconsideration Report and Recommendations for the Saline Effluent Discharge Proposal;

b. The rights, responsibilities, authorities and jurisdiction granted under the *Agreement between the Inuit of the Nunavut Settlement Area and Her Majesty the Queen in right of Canada* (*Nunavut Agreement*);

c. The limits and obligations imposed under laws of general application applicable to the Proponent or any party referred to in the term and condition, as those laws may be amended over time (e.g., privacy legislation, worker's health and safety, etc.);

d. The specific jurisdictional and policy limits applicable to authorizing agencies, Nunavut Tunngavik Incorporated, the Kivalliq Inuit Association, or other regulatory authority with jurisdiction in respect of the Project;

e. Where terms and conditions include specific references to items that must be taken into consideration or included in work plans, etc. these specific references are intended to establish minimum expectations but are not intended to limit the Proponent or prevent the Proponent from undertaking additional measures beyond those expressly prescribed in such terms and conditions; and

f. As noted in the Final Hearing Report, for those items where a more stringent version of the precautionary principle has been applied, it is the Board's expectation that the adaptive management strategies chosen will be highly responsive to early warning signs that risks may materialize, and that rather than waiting for impacts to be noted before mitigation measures are triggered, thresholds and triggers will be set to require responses long before adverse impacts are likely.

3.3 Format of Terms and Conditions:

Wherever possible, the NIRB has used the following format for the project-specific terms and conditions set out within this Project Certificate, so as to provide clear direction on the intended application, objectives and reporting requirements:

Category: Identifies the relevant environmental component or project activity to which the term and condition applies. Wherever possible categories have been labelled so as to directly associate back to the Final Environmental Impact Statement and Environmental Impact Statement Guidelines prepared for the Project.

Responsible Parties: Identifies the parties responsible for implementation of the term and condition. While this is generally the Proponent, at times other agencies have been implicated as appropriate.

Project Phase: Identifies the phase(s) of Project development to which the term and condition is applicable. Project phase may include any one or more of the following:

- Pre-Construction - includes site preparation and staging of materials and equipment in advance of construction
- Construction
- Operations
- Temporary Closure /Care and Maintenance
- Closure and Post-Closure Monitoring - includes abandonment, decommissioning and reclamation

Objective: Provides a short description of the impact or effect being mitigated. Where relevant, expectiations regarding the timing for when terms and conditions will be deemed to be satisifed (i.e., sunset clause), who has discretion for determining it is satisfied has been provided.

Term or Condition: Provides specific direction on the required action or follow up. In most instances the NIRB has endeavoured to use generalized wording to allow for maximum flexibility in achieving the stated objective, however more explicit direction has been provided where deemed necessary.

REVISED Term or Condition: Where, upon reconsideration, the Board has recommended an amendment to the Terms or Conditions in the Project Certificate and the Minister has accepted the Board's recommendation, the Board has included the Original Term and Condition, followed by the REVISED Term or Condition, with deletions to the Term or Condition identified by strike through text and additions to the text identified in bold and underlining. Upon issuance of an amendment to the Project Certificate, the Proponent is required to comply with the text of the REVISED Term or Condition.

NEW Term or Condition: Where, upon reconsideration, the Board has recommended that the Project Certificate be amended by adding a new Term and Condition and the Minister has accepted the Board's recommendation, the Board has added the Term or Condition to the relevant section, has identified the Term or Condition as NEW and has added an alphabetical listing to the existing numbered Term or Condition immediately preceding the NEW Term or Condition. Upon issuance of an amendment to the Project Certificate, the Proponent is also required to comply with any NEW Terms or Conditions added to the Project Certificate.

Reporting Requirements: Sets out any specific reporting parameters required to measure achievement of objectives or to demonstrate compliance, as well as the required frequency of reporting. Consideration will be given to coordination of Project Certificate reporting requirements with reporting requirements as established by other regulatory instruments associated with the Project.

It should be noted that, for some of the recommended terms and conditions, a non-binding **Commentary** section has also been added following the specific term and condition as an aid to interpretation. The Commentary section reflects clarification of the term and condition, recording the common understanding and interpretation resulting from discussions and guidance provided at the Project Certificate Workshop held by teleconference on February 23-24, 2015. The Commentary section is offered as a reference only and is not legally binding; in the event of a conflict between the wording in the Project Certificate and the clarification provided in the Commentary, the express wording of the Project Certificate prevails.

3.4 Flexibility

It is acknowledged that the NIRB's monitoring program will have varying requirements over the course of the Project lifecycle, and that monitoring requirements will apply from construction to eventual abandonment and reclamation. In areas where there may be a need for flexibility in relation to the terms and conditions of the Project Certificate or their application, the NIRB has endeavoured to reflect this in the associated language and/or acknowledge that objectives may be achieved through various means.

The NIRB retains the ability to give additional clarification or direction on an ongoing basis through its Monitoring Officer, with respect to compliance requirements for the Project. Upon request by the Proponent or other parties, the NIRB can provide additional clarification or direction regarding implementation of Project Certificate terms and conditions.

Where the objective of a Project Certificate term or condition can be achieved through more efficient alternate means, the Proponent is encouraged to consult with the NIRB (and other parties as required) to seek acceptance of proposed alternatives.

The NIRB has the authority to reconsider the terms and conditions of the Project Certificate to ensure that the terms and conditions are achieving their purpose. Clearly the NIRB expects the Proponent to meet its obligations under this Project Certificate, however, the NIRB may revisit the Project Certificate if the NIRB determines that the terms and conditions are not achieving their purpose. In the event that the monitoring program needs to be modified to better achieve its purpose, the Board, the Proponent, the Designated Inuit Organization or other interested parties may cause the Board, under Section 12.8.2 of the *Nunavut Agreement* to revisit the monitoring program, or any other terms and conditions in the Project Certificate.

3.5 Enforcement

As noted in Section 12.10.3, where the terms and conditions of the Project Certificate are implemented or incorporated by reference into permits, certificates, licences or other governmental approvals, the enforcement of the terms and conditions included in that authorization remains with the agency responsible for the authorization (i.e., Authorizing Agency). Under ss. 74(g) and 219 of the *NuPPAA*, the

Proponent is required to carry out the Project in accordance with the terms and conditions in this Project Certificate; failing to meet the requirements of the terms and conditions in this Project Certificate is an offence. In addition, under Part 8, Article 12 of the *Nunavut Agreement*, if the Board determines that these terms and conditions are not achieving their purpose for any reason, including instances of significant non-compliance, the NIRB may revisit the terms and conditions contained in the Project Certificate.

3.6 Proponent Commitments

The Board expects that Agnico Eagle Mines Ltd. will fulfill all commitments made during: both the original Final Hearing and the Hearing conducted in association with the Board's reconsideration of the Project Certificate associated with the assessment of the Saline Effluent Discharge into the Marine Environment proposal; within its Final Environmental Impact Statement (FEIS) and supporting documentation submitted during the Review; and commitments provided within the FEIS Addendum and associated documents as well, regardless of whether the commitments have been incorporated into the Terms and Conditions of this Project Certificate. The Board further notes that, as indicated in Agnico Eagle's Response to Final Written Submissions, filed in advance of the original Final Hearing and as noted by several intervenors during the Final Hearing, the Proponent had come to "agreement in principle" regarding many requests filed by agencies in final written submissions provided to the Board, and it is the NIRB's expectation that the Proponent will be in a position to demonstrate actions taken in finalizing these commitments in practice.

To support transparency and accountability associated with the Proponent's commitments, the Board encourages the Proponent to provide, in an annual report to the NIRB, a summary of the status of the Proponent's progress with respect to meeting any commitments which are intended to prevent or mitigate adverse ecosystemic or socio-economic effects of the Project and that are beyond the scope of ensuring compliance with Project Certificate terms and conditions.

4.0 PROJECT-SPECIFIC TERMS AND CONDITIONS

4.1 General

NIRB Monitoring Responsibilities

1. The NIRB will appoint Monitoring Officers as required to monitor the Project in accordance with the purpose of a monitoring program as set out in section 12.7.2 of the *Nunavut Agreement* for the full life of the Project, including closure and restoration. Subject to direction from the NIRB, the responsibilities of the NIRB Monitoring Officers will include:
    a. Providing direction to the Proponent, the Terrestrial and Marine Environment Working Groups, regulatory agencies, and the Kivalliq Socio-Economic Monitoring Committee to supply NIRB with reports and information respecting the Project's operations, impacts and the implementation of mitigative measures;
    b. Conducting a periodic evaluation of the monitoring program for the Project;
    c. Compiling a report on the adequacy of the monitoring program and on the ecosystemic and socio-economic impacts of the Project; and
    d. Where appropriate, recommending to the NIRB reconsideration of Project Certificate Terms and Conditions in accordance with section 12.8.2 of the *Nunavut Agreement*.
2. The NIRB will report annually (in English and Inuktitut) on the results of its Monitoring Program for the Project.
3. The NIRB will schedule periodic updates regarding its Monitoring Program for the communities most affected by the Project.
4. The NIRB Monitoring Officers will schedule periodic site inspections at the Project, coordinating with other regulatory agencies to the extent possible.

General Regulatory Requirements

5. The Proponent must obtain all required federal and territorial permits and other approvals, and shall comply with the requirements of such regulatory instruments.
6. The Proponent shall take prompt and appropriate action to remedy any occasion of non-compliance with environmental laws and regulations and/or regulatory instruments, and shall report any non-compliance as required by law immediately. A description of all instances of non-compliance and associated follow up is to be reported annually to the NIRB.
7. The Proponent shall meet with respective licensing authorities prior to the commencement of construction to discuss the posting of adequate performance bonding. Licensing authorities are encouraged to take every measure to require that sufficient security is posted before construction begins.

Monitoring Records

8. All monitoring information collected pursuant to the Project Certificate and various regulatory requirements for the Project shall contain the following information:

a. The name of the person(s) who performed the sampling or took the measurements including any relevant accreditations;

b. The date, time and place of sampling or measurement, and weather conditions;

c. The date of analysis;

d. The name of the person(s) who performed the analysis including any relevant accreditations;

e. A description of the analytical methods or techniques used; and

f. A discussion of the results of any analysis.

9. The Proponent shall make its monitoring results available, to the fullest extent possible, in English and Inuktitut.

10. The Proponent shall keep and maintain the records, including results, of all Project-related monitoring data and analysis for the life of the Project, including closure and post-closure monitoring.

11. The Proponent shall maintain the Final Environmental Impact Statement and the Environmental Effects Monitoring program developed for the Project, with predictions updated as new baseline data is collected. If the results of monitoring programs necessitate updates to effects predictions, the Proponent shall update the associated management programs and plans as required to address or reflect the updated assessment of effects.

12. The Proponent shall establish a Project-specific web portal or web page as a means of making all non-confidential monitoring and reporting information associated with the Project available to the general public. This does not limit what the Proponent may be required to submit to the NIRB or other regulatory authorities to meet reporting requirements.

On-going Engagement in Project Monitoring, Modelling, Management and Reporting

13. The Proponent is encouraged to provide on-going opportunities for consultation and comment on any substantive revisions to the Project-specific monitoring program, modelling, studies, management plans, management measures and reporting under the Project Certificate.

14. To the extent feasible, the NIRB will provide an opportunity for comment on any substantive revisions to the Project-specific monitoring, modelling, studies, management plans, management measures and reporting provided by the Proponent under the Project Certificate.

4.2 Terms and Conditions

Ecosystemic

Air Quality

Term and Condition No.	**1**
Category:	Air Quality – Updated Air Quality Monitoring Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure monitoring
Objective:	To define plans for the monitoring of data and mechanisms for response with regard to potential air quality impacts arising from the Project
Term or Condition:	Prior to commencing construction activities, the Proponent shall update its Air Quality Monitoring Plan, and shall consider installing two real-time air monitoring stations in advance of mining operations. The updated plan shall include, but is not limited to, details regarding the following: a. Description of real-time air monitoring stations including proposed timing of installation, location, and any factors considered with regards to planning for the installation; b. Plans for the collection of total suspended dust samples year round, including sampling for metals content relevant to the Project; c. Description of snowpack surveys and dustfall collectors; d. Description of lichen surveys; e. Identification of near field, far field and reference sites that are located with consideration of ambient wind conditions; f. Baseline data collected prior to significant construction activity; and g. A description of the proposed annual reporting mechanism and response framework.
Reporting Requirements:	The updated plan should be submitted to the NIRB at least 90 days prior to the start of construction, with results submitted annually thereafter or as may otherwise be required.

Term and Condition No.	**2**
Category:	Air Quality – Emissions monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure monitoring
Objective:	To provide feedback on Project-related specified emissions
Term or Condition:	The Proponent shall demonstrate through monitoring of air quality at the aboveground emissions points at the mine site and at the Tiriganiaq site that sulphur dioxide (SO_2) and nitrous dioxide (NO_2) emissions remain within predicted levels and, where applicable, within limits established by all applicable guidelines and regulations. In cases where exceedances

	occur, the Proponent shall provide an explanation for the exceedance, a description of planned mitigation, and shall conduct additional monitoring to evaluate the effectiveness of mitigative measures.
Reporting Requirements:	The Proponent shall report on the development and implementation of this Plan and associated monitoring results annually to the NIRB. The report must clearly identify the parameters being evaluated if the results are being compared to predicted levels set out in the Environmental Impact Statement or limits established by applicable guidelines and regulations.

Term and Condition No.	**3**
Category:	Air Quality – Dust management and monitoring plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction
Objective:	To define plans for the monitoring of air quality data, specifically dust deposition arising from the all-weather access road
Term or Condition:	Prior to commencing construction activities the Proponent shall update its dust management and monitoring plan to address and/or include the following additional items: a. Align plan requirements with commitments made in the FEIS and during the Final Hearing to monitor dust along the all-weather access road and associated roads and trails. b. Verify commitments to the utilization of dust suppressants along the all-weather access road including and associated roads and trails, including a description of the type of suppressant to be utilized, the frequency and timing of applications to be made throughout the various seasons of road use. c. Outline the specific adaptive management measures to be considered should monitoring indicate that dust deposition is higher than predicted, specifically where traffic along the all-weather access road is greater than initially predicted.
Reporting Requirements:	The updated plan should be submitted to the NIRB for review and comment at least 60 days prior to commencement of construction activities.

Term and Condition No.	**4**
Category:	Air Quality – Incineration management plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure monitoring
Objective:	To ensure incineration activities are designed in a manner that mitigates impacts to air quality
Term or Condition:	The Proponent shall develop and implement an Incineration Management Plan that takes into consideration the recommendations provided in Environment Canada's *Technical Document for Batch Waste Incineration* (2010).[2]

[2] Environment Canada, 2010. Technical Document for Batch Waste Incineration.

Reporting Requirements:	The plan should be submitted to the NIRB at least 60 days prior to the commencement of construction activities.

Commentary: *With the recognition that there may be a considerable gap between the commencement of general project related construction and the construction of the incinerator to be used by the Project, the timeline set out under the Reporting Requirements above is intended to require the submission of the Incineration Management Plan at least 60 days prior to the commencement of "construction activities" related to the construction of the incinerator, not general project construction activities.*

Term and Condition No.	**5**
Category:	Air Quality – Stack testing
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure monitoring
Objective:	To mitigate impacts to air quality from incineration activities
Term or Condition:	The Proponent shall provide all stack testing conducted on temporary or permanent incinerators operated for the Project to the NIRB in the annual report for that year.
Reporting Requirements:	Stack test results are to be reported to the NIRB and to Environment Canada annually, or as may otherwise be required.

Term and Condition No.	**6**
Category:	Air quality – Landfill dust suppression
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure
Objective:	To address potential air quality concerns arising from dust generated at the landfill
Term or Condition:	The Proponent shall employ appropriate dust suppression measures when conducting activities in the landfill such as topping or capping.
Reporting Requirements:	Implementation of these measures shall be reported and discussed in the Proponent's annual report to the NIRB.

Climate and Meteorology (including Climate Change)

Term and Condition No.	**7**
Category:	Climate and Meteorology, Climate Change – Greenhouse gas emissions
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure monitoring
Objective:	To provide feedback on Project-related emissions
Term or Condition:	The Proponent shall provide within its annual report to the NIRB, calculations of greenhouse gas emissions generated by activities at the Itivia port and other Project sources including mine-related road traffic and aircraft associated with the Project. Calculations shall take into

	consideration, fuel consumption as measured by the Proponent's purchase and use as well as the fuel use of its contractors and sub-contractors.
Reporting Requirements:	Implementation of these measures shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	**8**
Category:	Climate and Meteorology, Climate Change – Inuit participation
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure monitoring
Objective:	To promote public awareness and engagement of affected groups
Term or Condition:	To actively engage Inuit in initiatives related to climate change, where it is feasible, the Proponent shall endeavour to include the participation of Inuit from affected communities when undertaking climate-change related studies and research.
Reporting Requirements:	A summary of consultation and how the information was used to inform planning for the Project shall be provided in the Proponent's annual report to the NIRB.

Term and Condition No.	**9**
Category:	Climate and Meteorology, Climate Change – Greenhouse Gas Emissions Reduction Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction
Objective:	To develop a pro-active approach to limiting greenhouse gas emissions throughout the Project life
Term or Condition:	Prior to the commencement of operations, the Proponent shall develop a Greenhouse Gas Emissions (GHG) Reduction Plan which includes, but is not limited to: a. An estimate of the Project's GHG baseline emissions; b. A description of monitoring measures to be undertaken, including the methods, frequency, parameters, and a description of data analysis; and, c. A description of mitigative and adaptive strategies planned, and taken, toward reducing the Project-related emission of greenhouse gases over the Project's life.
Reporting Requirements:	The plan should be submitted to the NIRB at least 90 days prior to the commencement of operations, and unless otherwise determined within the Plan, the reporting of results requried by this Plan shall be provided in the Proponent's annual report to the NIRB.

Noise and Vibration

Term and Condition No.	**10**
Category:	Noise and Vibration – Noise and Vibration Abatement Plan

Responsible Parties:	The Proponent, Government of Nunavut, Environment Canada and Health Canada
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure monitoring
Objective:	To minimize the impact of noise and vibration
Term or Condition:	The Proponent shall further develop and implement its noise abatement plan to protect people and wildlife from mine activity noise, including, blasting, drilling, equipment, vehicles and aircraft. The noise abatement plan will be developed in consultation the Government of Nunavut, Environment Canada and Health Canada as appropriate, and at a minimum is to include: a. Restrictions on blasting and drilling when migrating caribou, birds or local carnivores may be affected; b. The establishment of strict standards for noise levels; use of equipment and vehicles with the best noise attenuation devices; c. When practical, the use of fences or berms around noisy machinery or sites; d. Flight corridor restrictions over sensitive areas with known concentrations of wildlife and birds whenever possible; e. Requiring with the exception of take off and approach for landing, a minimum flight altitude of 300 metres above ground level when flights to and from the mine site are passing near sensitive wildlife and bird areas; and, f. The incorporation of the use of sound metres to monitor sound levels at locations in and around the mine site and local study area. The location and design of the sound metres shall be selected in consultation with EC and set up immediately upon issuance of the Project Certificate for the purpose of obtaining baseline data, and shall be maintained for data collection during and after operations.
Reporting Requirements:	The finalized noise abatement plan should be submitted to the NIRB at least 90 days prior to the commencement of construction, and any subsequent monitoring results required within the Plan shall be provided in the Proponent's annual report to the NIRB.

Term and Condition No.	**11**
Category:	Noise and Vibration – Monitoring at accommodations sites
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure monitoring
Objective:	To minimize the impacts of vibration on employees
Term or Condition:	The Proponent shall conduct noise and vibration monitoring at Project accommodations sites located at the Tiraginiaq mine site. Sampling shall

	be undertaken during the summer and winter months during all phases of Project development, with reporting of results and implementation of associated mitigation measures as necessary reported to the NIRB.
Reporting Requirements:	Monitoring results and implementation of these measures shall be reported and discussed in the Proponent's annual report to the NIRB.

Terrestrial Environment

Term and Condition No.	**12**
Category:	Terrestrial Environment – Permafrost and permafrost terrain mapping
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction
Objective:	To further understanding of baseline conditions and to inform design of Project facilities and mitigate impacts to permafrost
Term or Condition:	The Proponent shall conduct further permafrost mapping to document permafrost temperature, thickness of seasonal thaw and amount of ground ice in the Project development area, with such information to be available to inform the detailed design of Project infrastructure (i.e., dikes and tailings storage facility designs and talik predictions for lakes that are to be dewatered or used for saline water storage).
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition as well as the results of mapping to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**13**
Category:	Terrestrial Environment – Terrain and soils, geotechnical investigations
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure
Objective:	To assist with design of Project facilities and mitigate impacts to sensitive landforms
Term or Condition:	The Proponent shall undertake additional geotechnical investigations as required to identify sensitive landforms, modify engineering design for Project infrastructure (i.e., dikes, tailings storage facility, waste rock pile and landfill), and develop and implement preventative and/or mitigation and monitoring measures to minimize the impacts of the Project's activities and infrastructure on sensitive landforms. Plans for the investigations, mitigative and monitoring measures are to be included within an updated Environmental Protection Plan.
Reporting Requirements:	The updated plan is to be submitted to the NIRB within 90 days of the issuance of a Project Certificate. Implementation of these measures, updates to the Plan, and monitoring results shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	14
Category:	Terrestrial Environment – Dike and tailings storage facility design
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction
Objective:	To ensure Project design features consider thermal analysis and stability
Term or Condition:	The Proponent is encouraged to conduct more detailed thermal analysis to support detailed design of the dikes and the tailings storage facility, including seepage and stability analysis, and shall incorporate the results of the analysis into Project design. Details of the thermal analyses undertaken are to be provided to the NIRB.
Reporting Requirements:	Details are to be provided to the NIRB at least 60 days prior to the commencement of construction, and the results of any required additional reporting shall be submitted to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	15
Category:	Terrestrial Environment – Tailings storage facility design and management
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure Project infrastructure integrity is considered and maintained post-closure
Term or Condition:	The Proponent shall assess the potential environmental effects of a post-closure failure of the geomembrane of the Tailings Storage Facility while tailings are in a thawed state. This assessment shall include, at a minimum: a. A description of the potential environmental effects of such a failure; b. Identification of the monitoring measures employed to detect environmental changes that could result; c. Identification of proposed mitigation measures to address any changes identified during monitoring; and d. Updated Risk Management Plan and Closure and Reclamation Plan reflecting changes which result from the post-closure failure assessment. A summary of the results from this assessment and implications to project infrastructure and operational plans shall be provided to the NIRB.
Reporting Requirements:	A summary of the assessment and updated plans should be submitted to the NIRB 6 months following issuance of the Project Certificate and the results of any required additional reporting shall be submitted to the NIRB through the Proponent's annual monitoring report.

Commentary: *The NIRB recognizes that as the initial submission of updated plans will be within 6 months of the issuance of the Project Certificate, it is expected that the level of detail of the Proponent's initial submission will be largely conceptual and will be supplemented and updated over time.*

Term and Condition No.	**16**
Category:	Terrestrial Environment – Erosion Management Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure appropriate measures for preventing destabilization and erosion of shorelines, stream edges and ensure that diversion channels are maintained
Term or Condition:	The Proponent shall finalize and implement a comprehensive erosion management plan to prevent or minimize the effects of destabilization and erosion resulting from Project activities.
Reporting Requirements:	Finalization of plan, implementation of these measures and monitoring results as well as any subsequent updates to the Plan, shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	**17**
Category:	Terrestrial Environment – Permafrost integrity
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure that impacts to permafrost and permafrost terrain are minimized through all phases of the Project
Term or Condition:	The Proponent shall monitor the effects of the Project on permafrost conditions relative to Project infrastructure, including along the all-weather access road and associated roads, waste rock stockpile, trails and quarries. Through its monitoring the Proponent must demonstrate that permafrost integrity is maintained with implementation of appropriate preventative measures should permafrost degredation be observed.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including the results of monitoring or adaptive management strategies, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**18**
Category:	Terrestrial Environment – As-built drawings and final design plans
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction
Objective:	To ensure the NIRB and public have information available on the Project components to assist in monitoring

Term or Condition:	The Proponent shall provide the NIRB with copies of as-built drawings and final design plans for Project infrastructure as they are developed/finalized to assist with the Board's ongoing monitoring efforts.
Reporting Requirements:	The Proponent shall submit copies of the drawings and final designs as they are completed as well as provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**19**
Category:	Terrestrial Environment – Tailings and waste rock monitoring program
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure, Post-Closure
Objective:	To ensure the integrity of Project infrastructure is maintained, and to establish rigorous safeguards to prevent structural failure
Term or Condition:	The Proponent shall develop and implement a monitoring program for its Tailings Storage Facility and Waste Rock Storage Facility (including dikes). The monitoring progam is to include, but shall not be limited to: a. Plans for monitoring the thermal condition and stability of storage facilities (including deformation of the cover) and dikes, includingthe use of thermistor cables, temperature loggers, and core sampling technology as required to monitor dike stability and tailings freezeback efficiency, including for example, factors such as ice content and stability; and, b. Measures proposed to ensure the safe containment and structural integrity of Project infrastructure, and to prevent contamination of waterbodies. Details of the monitoring program shall provided to the NIRB.
Reporting Requirements:	Details of the monitoring program should be submitted to the NIRB at least 90 days prior to the establishment of either facility, with subsequent plan revisions or updates submitted annually thereafter. Results of any required reporting shall be submitted to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**20**
Category:	Terrestrial Environment – Closure and Reclamation Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure/Care and Maintenance, and Closure
Objective:	To assist in the re-vegetation of reclaimed areas
Term or Condition:	The Proponent shall explore the the feasibility and practicality of topsoil/organic matter salvage as part of phased approach to Project development, with updates to its Closure and Reclamation Plan to reflect any changes based on this investigation. The Closure and Reclamation Plan

	should be updated on an on-going basis as more information becomes available from similar reclamation projects, including experience with implementing closure and reclamation plans at the Meadowbank mine site, as applicable.
Reporting Requirements:	The updated plan is to be submitted to the NIRB within 6 months of the issuance of the Project Certificate. Implementation of these measures and monitoring results as well as any subsequent updates to the Plan, shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	**21**
Category:	Terrestrial Environment – Waste Management Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure permafrost integrity is maintained and that soil contamination is minimized
Term or Condition:	The Proponent shall update its Waste Management Plan to include details which explain how the design employed for Project landfills is expected to protect the integrity of the local environment, including permafrost integrity, and water quality for adjacent waterbodies. The Proponent shall demonstrate its consideration for the use of liners at waste management facilities, where feasible.
Reporting Requirements:	The updated plan is to be submitted to the NIRB at least 90 days prior to operation of Project landfills. Implementation of these measures and monitoring results as well as any subsequent updates to the Plan, shall be reported and discussed in the Proponent's annual report to the NIRB.

Geology (including Geochemistry)

Term and Condition No.	**22**
Category:	Geology (including Geochemistry) – Mine Waste Management Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure
Objective:	To inform parties on the adaptive management progress made relating to mine waste management
Term or Condition:	The Proponent shall report annually to the NIRB on the adaptations it has had made to the Mine Waste Management Plan and practices based on results obtained through monitoring.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including the results of monitoring or adaptive management strategies, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	23
Category:	Geology (including Geochemistry) – Mine Waste Management Plan, Discovery Deposit
Responsible Parties:	The Proponent, Natural Resources Canada
Project Phase:	Construction, Operations
Objective:	To mitigate impacts of Acid Rock Generation and Metal Leaching
Term or Condition:	Prior to the commencement of excavation at the Discovery deposit, the Proponent, in consultation with Natural Resources Canada, shall update its Mine Waste Management Plan to assess the potential for acid rock drainage and to identify any monitoring and mitigation measures that may be required in this development area.
Reporting Requirements:	Details of the Plan should be submitted at least 90 days prior to construction at the Discovery deposit, with subsequent plan revisions submitted annually thereafter; if accompanying the Proponent's annual report to the NIRB the document must be separated so as to be directly retrievable via the NIRB's public registry. Results of any required reporting shall be submitted to the NIRB through the Proponent's annual monitoring report.

Hydrogeology and Groundwater Quantity and Quality

Term and Condition No.	24
Category:	Hydrogeology and Groundwater – Hydraulic data
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations
Objective:	To collect and analyze additional baseline data to use as baseline to monitor for groundwater quality
Term or Condition:	The Proponent shall, reflecting any direction from the Nunavut Water Board during water licensing, collect new hydraulic data (e.g., from new monitoring wells) in key areas during the pre-development, construction and operation phases to better define vertical and horizontal ground flow in the project development area.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

REVISED Term and Condition No.	25
Category:	Hydrogeology and Groundwater – Groundwater Management Plan
Responsible Parties REVISED:	The Proponent, Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC)
Project Phase:	Pre-construction, construction, Operations, temporary closure/care and maintenance, closure, post closure monitoring.

Objective:	To manage saline groundwater and minimize the impacts to permafrost, soil, surface water, vegetation and wildlife
Term or Condition REVISED:	**The Proponent shall submit a detailed Groundwater Management Plan to the NIRB which includes mitigation measures designed to address the potential for higher-than-predicted volumes of saline water inflows into the underground mine, treatment and disposal methods, and details of its plan to monitor saline water at site. The plan must identify uncertainties pertaining to predictions for groundwater quality and quantity and inform adaptive management strategies for the site. CIRNAC should be consulted with respect to the contents of the Plan and any required mitigation measures.**
Reporting Requirements:	An updated plan shall be submitted to the NIRB within 90 days of receipt of the amended Project Certificate. The Proponent shall provide a summary discussion of its implementation of this Term and Condition, including the results of monitoring or adaptive management strategies, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**26**
Category:	Hydrogeology and Groundwater – Pit refill rates
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, construction, Operations, temporary closure/care and maintenance, closure, post closure monitoring
Objective:	To assess the flow of groundwater into the lake
Term or Condition:	The Proponent shall carry out continued analyses over time to confirm and update, accordingly, the approximate fill time for the mine pits as identified in the FEIS.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Hydrology (including Surface Water Quantity) and Water and Sediment Quality

Term and Condition No.	**27**
Category:	Hydrology and Sediment Quality – Aquatics Effects Monitoring Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, construction, Operations, temporary closure/care and maintenance, closure, post closure monitoring
Objective:	To mitigate potential impacts to surface waters
Term or Condition:	The Proponent shall update its Aquatic Effects Monitoring Plan (AEMP) to include, at a minimum: a. Details regarding the monitoring of non-point sources of discharge, selection of appropriate reference sites, measures to ensure the collection of adequate baseline data at Meliadine Lake prior to and during construction activities, including information on chemical

	loading in the snowpack, and the mechanisms proposed to monitor for and treat runoff and sediment; b. A description of measures to be undertaken as relate to dustfall monitoring, designed in accordance with the following: i. To establish Phase 1 all-weather access road baseline data and a description of plans for data collection during Project operations for comparison; ii. To facilitate comparison with existing guidelines; iii. To assess the seasonal deposition (rates, quantities) and chemical composition of dust entering aquatic systems along representative distance transects of the all-weather access road and Rankin Inlet by-pass road; c. A description of water quality monitoring to be conducted at Little Meliadine Lake; and d. Details regarding comparisons of results to be run against predicted values and the analysis of data to be undertaken on an annual basis, or as may be required.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including the results of monitoring or adaptive management strategies, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**28**
Category:	Hydrology and Sediment Quality – Sediment and Erosion Management Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction
Objective:	To develop appropriate sediment and erosion controls to prevent impacts to surface waters and sediment quality
Term or Condition:	The Proponent shall develop and implement a sediment and erosion management plan to prevent or minimize the effects of destabilization and erosion that may occur due to Project activities. The plan should also detail sediment control plans to prevent and/or mitigate sediment loading into surface water within the Project area.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of the plan, including the results of monitoring or adaptive management strategies, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**29**
Category:	Hydrology and Sediment Quality – Water infrastructure monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, temporary closure/care and maintenance, closure, post closure monitoring.
Objective:	To mitigate impacts to natural water flow

Term or Condition:	The Proponent shall develop and implement adequate monitoring and maintenance procedures to ensure that the culverts and other conduits that may be prone to blockage do not significantly hinder or alter the natural flow of water from areas associated with the proposed mine. In addition, the Proponent shall monitor, document and report the withdrawal rates for water removed and utilized for all domestic and industrial purposes.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including the results of monitoring or adaptive management strategies, to the NIRB through the Proponent's annual monitoring report.

Freshwater Aquatic Environment

Term and Condition No.	**30**
Category:	Freshwater Aquatic Environment – Aquatic Effects Monitoring Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To monitor and mitigate potential effects to the freshwater aquatic environment
Term or Condition:	The Proponent shall update its Aquatic Effects Monitoring Plan (AEMP) to include, at a minimum: a. Provide details for additional reference lakes to be included within its sampling and monitoring programs; b. Updates to include sedimentation within relevant monitoring programs; and c. Results from additional testing for mercury in fish tissue, and include test results in updated baseline data.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including any updates to the Plan, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**31**
Category:	Freshwater Aquatic Environment – Setbacks
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To mitigate impacts of runoff/sedimentation into freshwater aquatic habitat.
Term or Condition:	The Proponent shall maintain an appropriate setback distance between project quarries and fish-bearing or permanent water bodies as required to prevent acid rock drainage or metal leaching into such water bodies.
Reporting Requirements:	Implementation of these measures shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	32
Category:	Freshwater Aquatic Environment – Site Drainage and Silt Control Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To mitigate impacts of the Project on natural drainage and minimize sedimentation
Term or Condition:	Prior to the commencement of construction, the Proponent shall submit to the NIRB, a Site Drainage and Silt Control Plan.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including any updates to the Plan, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	33
Category:	Freshwater Aquatic Environment – Blasting
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To mitigate impacts of explosives use on fish and fish habitat
Term or Condition:	The Proponent shall meet or exceed the guidelines set by Fisheries and Oceans Canada for blasting thresholds and implement practical and effective measures to ensure that residue and by-products of blasting do not negatively affect fish and fish habitat.
Reporting Requirements:	Implementation of these measures shall be reported and discussed in the Proponent's annual report to the NIRB.

Corrected Term and Condition No.	34
Category:	Freshwater Aquatic Environment – Watercourses
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction
Objective:	To prevent blockages or restrictions to fish passages
Term or Condition:	Unless otherwise approved by regulatory authorities, the Proponent shall ensure that all Project infrastructure in watercourses is designed and constructed in such a manner that it does not obstruct unduly prevent or limit the natural movement of water in fish bearing streams and rivers.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including any updates to the Plan, to the NIRB through the Proponent's annual monitoring report.

Vegetation

Term and Condition No.	35
Category:	Vegetation – Site footprint
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impacts of the Project on vegetation
Term or Condition:	The Proponent shall ensure that Project components and activities are planned and conducted in such a way as to minimize the Project footprint; this should include input from potentially affected communities where applicable.
Reporting Requirements:	A summary of consultation and how the information was used to inform planning for the Project shall be provided in the Proponent's annual report to the NIRB.

Term and Condition No.	36
Category:	Vegetation – Invasive species
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction
Objective:	To prevent the introduction of invasive species
Term or Condition:	The Proponent shall ensure that equipment and supplies brought to Project sites are clean and free of soils that could contain plant seeds not naturally occurring in the area. Vehicle tires and treads in particular must be inspected, and cleaned if required, prior to transport into Nunavut for use in Project areas.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	37
Category:	Vegetation – Monitoring for invasive species
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize introduction of invasive species
Term or Condition:	The Proponent shall incorporate protocols for monitoring for the potential introduction of invasive vegetation species (e.g. surveys of plant populations in previously disturbed areas) into its Terrestrial Environment and Monitoring Plan. Any introductions of non-indigenous plant species must be promptly reported to the Government of Nunavut Department of Environment.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including any updates to the Plan, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	38
Category:	Vegetation – Updated baseline and ongoing monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To assess the impact of the Project on berry-producing plants
Term or Condition:	The Proponent shall conduct sampling to determine baseline levels for metals in soils found in areas with berry-producing plants near the Project area, and shall update relevant vegetation sections within the Terrestrial Management and Monitoring Plan to incorporate ongoing monitoring of these parameters prior to commencing operations.
Reporting Requirements:	Monitoring results and implementation of these measures shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	39
Category:	Vegetation – Monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To monitor metal levels in vegetation
Term or Condition:	The Proponent shall develop and establish an on-going monitoring program to determine the distribution, abundance, and health of vegetation species used as caribou forage (such as lichens) near Project areas, prior to commencing operations.
Reporting Requirements:	Details for the program are to be submitted to the NIRB within 6 months of the issuance of the the Project Certificate. Implementation of these measures, updates to the Plan, and monitoring results shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	40
Category:	Vegetation – Adaptive management
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To mitigate impacts to vegetation abundance, diversity and health
Term or Condition:	The Proponent shall review, on an annual basis, all monitoring information and the vegetation mitigation and management plans developed under its Environmental Management Plan and Terrestrial Environment and Monitoring Plan (TEMMP) and adjust such plans as may be required to effectively prevent or reduce the potential for significant adverse project effects on vegetation abundance, diversity and health, taking into account lessons learned at other northern mining developments where appropriate.

Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including any updates to the Plan, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**41**
Category:	Vegetation – Reclamation and re-vegetation
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To maximize revegetation in reclaimed areas
Term or Condition:	Prior to the commencement of operations, the Proponent shall develop a progressive re-vegetation program for disturbed areas that are no longer required for operations, such program to incorporate measures for the use of test plots, reseeding and replanting of native plants as necessary. It is further recommended that this program be directly associated with the management plans for erosion control established for the Project and incorporate lessons learned at Meadowbank.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including any updates to the Plan, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**42**
Category:	Vegetation – Closure and Reclamation Plan
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To maintain an up to date re-vegetation plan for the Project
Term or Condition:	The Proponent shall include re-vegetation strategies in its Closure and Reclamation Plan that support progressive reclamation and that promote natural revegetation and recovery of disturbed areas compatible with the surrounding natural environment and incorporate lessons learned at Meadowbank
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Terrestrial Wildlife and Wildlife Habitat

Term and Condition No.	**43**
Category:	Terrestrial Wildlife and Wildlife Habitat – General
Responsible Parties:	The Proponent and other parties as appropriate
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure appropriate and responsive adaptive management

Term or Condition:	The Proponent shall continue to develop and implement Project-specific monitoring for the terrestrial environment through its Terrestrial Environment Management and Monitoring Plan (TEMMP), and will demonstrate appropriate refinements to design, incorporation of analytical methods and elaboration of methodologies. The TEMMP shall contain clear thresholds to allow for the assessment of long-term trends and cumulative effects where project interactions are identified. Coordination and cooperation will be required where data collection, analysis and interpretation, or responsibility for mitigation and management requires the efforts of multiple parties (e.g., government, Kivalliq Inuit Association, communities).
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including any updates to the Plan, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**44**
Category:	Terrestrial Wildlife and Wildlife Habitat – Caribou monitoring
Responsible Parties:	The Proponent, Government of Nunavut
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To further define details of monitoring programs
Term or Condition:	In consultation with the Government of Nunavut (GN) and other relevant parties, the Proponent shall further develop its Terrestrial Environment Management and Monitoring Plan (TEMMP) to include increased caribou monitoring across the regional study area and additional details on the scope and design of monitoring programs. The Proponent shall also demonstrate consideration for contributing to exisiting and planned regional monitoring initiatives associated with terrestrial wildlife and wildlife habitat as appropriate. Monitoring should be adequate to test impact predictions, monitor impact thresholds and trends over time, and to support implementation of mitigation measures as proposed in the Final Environmental Impact Statement.
Reporting Requirements:	Results of discussions, implementation of measures, updates to the Plan, and monitoring results shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	**45**
Category:	Terrestrial Wildlife and Wildlife Habitat – General monitoring
Responsible Parties:	The Proponent and other parties as appropriate
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To promote coordination of monitoring efforts
Term or Condition:	The Proponent shall demonstrate consideration for cooperating with exisiting and planned regional and/or community-based monitoring initiatives associated with terrestrial wildlife and wildlife habitat that

	produce information pertinent to mitigating project-induced impacts. The Proponent shall give special consideration for supporting regional studies of population health and harvest programs for Qamanirjuaq caribou which help address areas of uncertainty for Project impact predictions.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including the results of monitoring, adaptive management strategies, consultation, and contribution efforts undertaken, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**46**
Category:	Terrestrial Wildlife and Wildlife Habitat – Harvest study
Responsible Parties:	The Proponent, Government of Nunavut, Hunters and Trappers Organizations, other parties as appropriate
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure harvest study considers appropriate Project-specific factors
Term or Condition:	The Proponent shall update its Terrestrial Environment Management and Monitoring Plan (TEMMP) for the Project to include a detailed harvest study prepared in consultation with the Government of Nunavut (GN) and other affected parties. The design of the harvest study should demonstrate consideration for the following: a. Hiring of a dedicated local survey coordinator through local Hunters and Trappers Organizations (HTOs) and provision of adequate resources for the HTOs to run the program; b. The potential effects on caribou populations and on caribou behaviour resulting from increased human access caused by the all-weather access road and associated roads and trails; and, c. Increasing local knowledge of the project development areas, including establishing baseline harvesting levels prior to unrestricted public access on the all-weather access road.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring, adaptive management strategies, and contribution efforts undertaken) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**47**
Category:	Terrestrial Wildlife and Wildlife Habitat – Monitoring
Responsible Parties:	The Proponent, Government of Nunavut
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To promote coordination of monitoring efforts
Term or Condition:	The Proponent shall share information with the Government of Nunavut (GN) relating to the migration of caribou and include the GN as a party respecting caribou monitoring and movement through Project

	development areas, including the all-weather access road and associated roads and trails.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including any updates to the Plan, to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**48**
Category:	Terrestrial Wildlife and Wildlife Habitat – Management of road access
Responsible Parties:	The Proponent, Government of Nunavut, Kivalliq Inuit Association, Kivalliq Wildlife Board, and local HTOs
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure mitigation and monitoring consider increases to harvesting from improved access
Term or Condition:	In consultation with the Government of Nunavut, the Kivalliq Inuit Association, the Kivalliq Wildlife Board and local Hunters and Trappers Organizations, the Proponent shall develop appropriate monitoring and mitigation measures relating to the harvesting of caribou and improved harvesting access granted by the all-weather access road. These measures shall be included within a Road Access Management Agreement that must be in place prior to construction of phase 2 of the all-weather access road. The Road Management Agreement shall include the following specific measures: ▪ During periods when large aggregations of caribou (greater than 50 individuals) are detected within 1 km of the all-weather access road (AWAR), the road will be closed to public access via car and truck by means of a barrier at the southern gate. Public access using all-terrain vehicles (ATVs) will be allowed. ▪ During periods when large aggregations of caribou (greater than 50 individuals) are observed within 1 km of the AWAR, the road will be closed to public access via barriers at bridges on the AWAR to prevent all vehicle access, including ATVs. This will allow ATVs to enter areas previously accessible along existing trails while not facilitating access via bridges constructed specifically for the Project. ▪ Following consultation with the Nunavut Wildlife Management Board, as required under the *Nunavut Wildlife Act*, it is recommended that a no-shooting zone (1 km wide) on either side of the road should be established as a condition of public access to the AWAR and compliance with this Agnico Eagle policy should be monitored and reported by the Proponent. ▪ Dedicated 'road monitors' should patrol the road to ensure compliance with the provisions of the Road Management Plan (SD 2-9) relating to public safety and wildlife. Monitoring should be

	increased during periods of road closure when large aggregations of caribou are present. ▪ All incidents of hunting involving shooting along or across the AWAR should be reported by the Proponent to the GN. ▪ During periods when large aggregations of caribou are detected near the Project, harvest monitoring intensity should be increased to ensure that levels of caribou harvesting are properly documented.
Reporting Requirements:	Road Access Management Agreement to be submitted to the NIRB at least 60 days prior to the commencement of increased traffic related to the marine outflow activities, with implementation of these measures and monitoring results as well as any subsequent updates to the Plan, reported and discussed in the Proponent's annual report to the NIRB.

Commentary: T*he reference in Bullet 3 above to a no-shooting zone as a condition of public access to the AWAR is a reference to a policy of the Proponent and is not a reference to policy requirements of the Nunavut Wildlife Management Board or Nunavut Wildlife Act.*

Term and Condition No.	**49**
Category:	Terrestrial Wildlife and Wildlife Habitat – Research licensing
Responsible Parties:	The Proponent, Nunavut Research Institute
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To facilitate licensing review
Term or Condition:	The Proponent is encouraged to consult with the Nunavut Research Institute (NRI) on the research permitting process as it relates to the *Nunavut Scientists Act*. The Proponent is encouraged to share monitoring and research study design with the NRI four (4) months prior to the anticipated commencement of research activities to facilitate licensing review.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Commentary: *The NIRB recognizes that the Proponent would only consult with and share monitoring and research study design with the NRI for those research activities undertaken by the Proponent under the Project Certificate that would trigger the requirement for a scientific research licence under the Nunavut Scientists Act.*

Term and Condition No.	**50**
Category:	Terrestrial Wildlife and Wildlife Habitat – Wildlife habitat
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure progressive reclamation of disturbed wildlife habitat

Term or Condition:	The Proponent shall develop a strategy for the recovery of terrestrial wildlife habitat in a progressive manner that is consistent with the *Nunavut Wildlife Act*.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**51**
Category:	Terrestrial Wildlife and Wildlife Habitat – Territorial Park
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize disturbance from helicopter overflights
Term or Condition:	The Proponent shall not conduct routine helicopter flights over, or land in, Iqalugaarjuup Nunanga Territorial Park. The Proponent will communicate this commitment to all helicopter companies contracted by it to undertake work at the Meliadine Project site prior to the start of such contracted work. Emergency flights, specifically medical evacuation flights and/or search and rescue overflights are excepted from adherence to this requirement.
Reporting Requirements:	Information regarding the Proponent's consultation, coordination and other contribution efforts undertaken in fulfillment of this term and condition shall be provided in the Proponent's annual report to the NIRB.

Term and Condition No.	**52**
Category:	Terrestrial Wildlife and Wildlife Habitat – Muskoxen monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To promote coordination of monitoring efforts
Term or Condition:	The Proponent shall undertake periodic surveys and a habitat assessment for muskoxen in the regional study area by partnering with, or complementing, the existing regional muskox monitoring programs.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**53**
Category:	Terrestrial Wildlife and Wildlife Habitat – Furbearer surveying
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize disturbance to furbearers from Project activities

Term or Condition:	Prior to construction of Project infrastructure and Phase 2 of the all-weather access road, the Proponent shall conduct a survey that is sufficient to locate any dens of foxes, bears or wolverines that could be damaged or destroyed during construction or operation of the Project.
Reporting Requirements:	Survey results shall be submitted to the NIRB at least 60 days prior to the commencement of traffic associated with the transport of saline water on the all-weather access road. Implementation of these measures and monitoring results as well as any subsequent updates to the Plan, shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	**54**
Category:	Terrestrial Wildlife and Wildlife Habitat – Movement of wildlife
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure Project infrastructure does not prevent or unduly limit the movement of wildlife
Term or Condition:	The Proponent shall ensure that road safety barriers or berms associated with Project infrastructure, all-weather access road and associated roads/trails are constructed to allow for the safe passage of caribou and other terrestrial wildlife while achieving the objective of separating public road use with Project-related mine traffic.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**55**
Category:	Terrestrial Wildlife and Wildlife Habitat – Wildlife mortality
Responsible Parties:	The Proponent, Government of Nunavut, Designated Inuit Organization
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure clear thresholds exist for Project-related mortality of wildlife species, adequate adaptive management measures and compensation agreements are in place
Term or Condition:	In consultation with the Government of Nunavut (GN) and other affected parties, the Proponent shall set thresholds for direct mortality of wolf, grizzly bear, polar bear, wolverine, and fox to ensure monitoring and mitigation for the Project is responsive to undesirable rates of mortality. The Proponent shall reach an agreement with the appropriate Designated Inuit Organization regarding compensation or any direct mortality of wildlife resulting from the Project.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	56
Category:	Terrestrial Wildlife and Wildlife Habitat – Reporting
Responsible Parties:	The Proponent
Project Phase:	Construction, Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To mitigate and monitor for impacts to wildlife
Term or Condition:	The Proponent shall report annually to the NIRB regarding its terrestrial environment monitoring efforts, with inclusion of the following information: a. Description of all updates to terrestrial ecosystem baseline data; b. A description of the involvement of Inuit in its monitoring programs; c. A detailed presentation and analysis of the distribution relative to Project infrastructure and activities for caribou and other terrestrial mammals observed during surveys and incidental sightings; d. Results of the annual monitoring program, including field methodologies and statistical approaches used to support conclusions drawn; and e. An assessment and presentation of annual environmental conditions including timing of snowmelt, green-up, as well as standard weather summaries.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring, adaptive management strategies, consultation, and contribution efforts undertaken) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	57
Category:	Terrestrial Wildlife and Wildlife Habitat – Reporting
Responsible Parties:	The Proponent
Project Phase:	Construction, Operations, Temporary Closure /Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To mitigate and monitor for impacts to wildlife
Term or Condition:	Within its annual report to the NIRB, the Proponent shall incorporate a review section which includes: a. An examination for trends in the measured natural variability of Valued Ecosystem Components in the region relative to the baseline reporting; b. A detailed analysis of wildlife responses to operations with emphasis on wildlife behaviour, mortalities and displacements (if

	any), and responses to operations of the all-weather access road and associated access roads/trails; c. A demonstration and description of how the monitoring results, including the all-weather access road and associated access roads/trails contribute to cumulative effects of the project; and d. Any proposed changes to the monitoring survey methodologies, statistical approaches or proposed adaptive management stemming from the results of the monitoring program.
Reporting Requirements:	The Proponent shall provide its discussion of these factors to the NIRB through the Proponent's annual monitoring report.

Birds and Bird Habitat

Term and Condition No.	**58**
Category:	Birds and Bird Habitat – Awareness
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To prevent/minimize impacts on birds and bird habitat
Term or Condition:	The Proponent shall ensure all employees working at Project sites receive awareness training regarding the importance of avoiding known nests and nesting areas and avoiding large concentrations of foraging and moulting birds.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	**59**
Category:	Birds and Bird Habitat – Species at Risk
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize impacts on Species at Risk
Term or Condition:	If Species at Risk or their nests and eggs are encountered during Project activities or monitoring programs, the primary mitigation measure must be avoidance. The Proponent shall establish clear zones of avoidance based on the species-specific nest setback distances outlined in the Terrestrial Environment Management and Monitoring Plan.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	**60**
Category:	Birds and Bird Habitat – Species at Risk
Responsible Parties:	The Proponent

Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize impacts to Species at Risk
Term or Condition:	The Proponent shall ensure that the mitigation and monitoring strategies developed for Species at Risk are updated as necessary to maintain consistency with any applicable status reports, recovery strategies, action plans and management plans that may become available during the duration of the Project.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**61**
Category:	Birds and Bird Habitat – Construction/clearing activities
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations
Objective:	To minimize disturbance to birds during the breeding season
Term or Condition:	Prior to bird breeding season, the Proponent shall either conduct clearing activities or identify and install nesting deterrents (e.g., flagging) to discourage birds from nesting in areas likely to be disturbed by construction/clearing activities. If clearing is to take place during the nesting season, a nest survey should take place to identify nests and any identified nests must remain undisturbed until the young have fledged or left the nest. Any nests identified shall be included as part of the annual reporting for the Terrestrial Environmental Mitigation and Monitoring Plan (TEMMP).
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	**62**
Category:	Birds and Bird Habitat – Construction/clearing activities
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impacts on birds during the breeding season
Term or Condition:	The Proponent shall protect any nests found (or indicated nests) with a buffer zone determined by the setback distances outlined in its Terrestrial Environment Mitigation and Monitoring Plan (TEMMP), until the young have fledged. If it is determined that observance of these setbacks is not feasible, the Proponent will develop nest-specific guidelines and procedures to ensure bird's nests and their young are protected.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	63
Category:	Birds and Bird Habitat – Marine considerations
Responsible Parties:	The Proponent, Environment Canada
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impact of marine shipping on birds and bird habitat
Term or Condition:	Any incidents of bird mortalities associated with lighting infrastructure, construction activities, and Project vessel operations are to be recorded and reported to Environment Canada (Canadian Wildlife Services). The Proponent shall work with the Canadian Wildlife Services to determine appropriate recording and reporting format and timing.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	64
Category:	Birds and Bird Habitat – Marine considerations
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure appropriate monitoring measures are in place to address the potential impacts of marine fuel spills
Term or Condition:	The Proponent shall develop a framework for monitoring of marine bird species and their habitat in the event of a major marine fuel spill. Specific details regarding the scope of follow-up monitoring may be further refined if and when such an event were to occur.
Reporting Requirements:	The framework should be submitted to the NIRB at least 90 days prior to conducting any Project-related shipping. Implementation of these measures, updates to the Plan, and monitoring results shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	65
Category:	Birds and Bird Habitat – Marine considerations
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impact of marine shipping on birds and bird habitat
Term or Condition:	The Proponent shall maintain reduced speeds to sufficiently ensure that wakes are equal or less than the mean natural seasonal wave height to prevent wake action from negatively impacting migratory bird nests in low lying shoreline habitat.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	66
Category:	Birds and Bird Habitat – Marine considerations
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impact of marine shipping on birds and bird habitat
Term or Condition:	The Proponent shall ensure all Project vessels are checked for bird strikes after a suspected event and include details of its protocol to do so, as well as results, within its updated Terrestrial Environment Mitigation and Monitoring Plan.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	67
Category:	Birds and Bird Habitat – Marine considerations
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impact of marine shipping on birds and bird habitat
Term or Condition:	The Proponent shall submit an updated Oil Pollution Prevention Plan including measures to avoid adverse effects to species at risk and migratory birds from spills, as well as details regarding monitoring of effects of a spill on species at risk and migratory birds.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	68
Category:	Birds and Bird Habitat – Marine considerations
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impact of marine shipping on birds and bird habitat
Term or Condition:	The Proponent shall demonstrate consideration for the potential cumulative effects of other development projects and shipping activities (including community resupply) when assessing their cumulative effects on marine birds in the Hudson Strait, in its annual report.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Corrected Term and Condition No.	**69**
Category:	Birds and Bird Habitat – Flight altitude requirements
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impact of aircraft on birds and bird habitat
Term or Condition:	Subject to safety requirements, the Proponent shall require all Project related aircraft to maintain a cruising altitude of at least: a. 650 m during point to point travel when in areas likely to have migratory birds b. 1100 m vertical and 1500 m horizontal distance from observed concentrations of migratory birds c. 1100 m over the area identified as a key site for moulting snow geese during the moulting period (July-August), and if maintaining this altitude is not possible, maintain a lateral distance of at least 1500 m from key sites for moulting snow geese.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	**70**
Category:	Birds and Bird Habitat – Flight altitude requirements
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impact of aircraft on bird and bird habitat
Term or Condition:	The Proponent shall ensure that pilots are informed of minimum cruising altitude guidelines and that a daily log or record of flight paths and cruising altitudes of aircraft within all Project areas is maintained and made available for regulatory authorities such as Transport Canada to monitor adherence and to follow up on complaints.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	**71**
Category:	Birds and Bird Habitat – Monitoring
Responsible Parties:	The Proponent, Kivalliq Inuit Association, Kivalliq HTOs and communities
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To develop appropriate mitigation measures and monitoring plans related to birds

Term or Condition:	The Proponent shall develop detailed and robust mitigation and monitoring plans for migratory birds, reflecting input from relevant agencies, the Kivalliq Inuit Association and communities.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**72**
Category:	Birds and Bird Habitat – Monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impact to sensitive bird species
Term or Condition:	The Proponent shall continue to develop and update relevant monitoring and management plans for migratory birds under the Proponent's Environmental Protection Plan and Terrestrial Environment Mitigation and Monitoring Plan (TEMMP) prior to construction. The key indicators for follow up monitoring under this plan will include upland birds (including migratory birds), waterbirds, raptors, and seabirds including migration and wintering.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**73**
Category:	Birds and Bird Habitat – Monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To assess the extent of terrestrial habitat loss
Term or Condition:	The Proponent's monitoring program shall assess and report, on annual basis, the extent of terrestrial habitat loss due to the Project to verify impact predictions and provide updated estimates of the total Project footprint.
Reporting Requirements:	Monitoring results and implementation of these measures shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	**74**
Category:	Birds and Bird Habitat – Monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring

Objective:	To minimize the impact of Project activities on water birds
Term or Condition:	The Proponent's Terrestrial Management and Monitoring Plan (TEMMP) shall include mitigation measures implemented to prevent the use of water attenuation ponds by waterfowl and waterbirds and monitoring that assesses whether the mitigation measures are working or revised, or further deterrent measures are required.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**75**
Category:	Birds and Bird Habitat – Monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To minimize the impact of predatory species on nesting birds
Term or Condition:	The Proponent shall implement mitigation measures and monitoring programs to limit the attraction of predators and scavengers to Project facilities in the TEMMP and other plans such as the Landfill and Waste Management Plan as appropriate.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

Marine Environment

Term and Condition No.	**76**
Category:	Marine Environment – General
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure plans and Project design reflect the need to protect the ecosystemic integrity of the marine environment
Term or Condition:	The Proponent shall update all relevant plans including, but not limited to: the Shipping Management Plan, Wildlife Mitigation and Monitoring Plan, and Adaptive Management Plan, in order to address concerns and identify potential impacts of the Project and proposed mitigation measures designed to protect the integrity of the marine environment. The Shipping Management Plan shall also incorporate updates for all Project-related shipping.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition, including the results of monitoring or adaptive management strategies, and any updates to plans to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	77
Category:	Marine Environment – Spill prevention
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure appropriate response capacity for potential spill events
Term or Condition:	The Proponent shall ensure that it maintains the necessary equipment and trained personnel to respond to all sizes of potential spills associated with the Project in a self-sufficient manner.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	78
Category:	Marine Environment – Spill prevention
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure accurate and adequate spill response and emergency preparedness
Term or Condition:	Prior to the shipping of Project supplies, the Proponent shall conduct fuel spill dispersion modeling that will, at a minimum, consider: a. Modeling of oil spills in the following areas: i. Pinch points, including: Hudson Strait, Melvin Bay area including Itivia Harbour and Panorama Island; ii. Shallow water and shorelines; and, iii. Areas that have been identified as having high flows and/or high concentrations of marine mammals, marine fish or seabirds; b. Open water and ice-covered conditions; c. Spill volumes up to and including loss of a full tanker cargo; and, d. Differences in the quantity and properties of each type of bulk fuel transported by vessels when they are at, or in transit to, the port of Rankin Inlet.
Reporting Requirements:	Results of the spill dispersion modeling should be submitted to the NIRB at least 90 days prior to the commencement of construction. Implementation of these measures, updates to the Plan, and monitoring results shall be reported and discussed in the Proponent's annual report to the NIRB.

Commentary: *Modelling considerations related to item (b) should be inclusive of seasonal ice variability, i.e. ice formation and break up.*

Marine Wildlife

Term and Condition No.	79
Category:	Marine Wildlife – Updated baseline
Responsible Parties:	The Proponent, other parties as appropriate
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure updated and accurate marine baseline data is available prior to Project-related shipping
Term or Condition:	Prior to any Project-related shipping, the Proponent will update its marine baseline information to ensure that it includes the most recent information on marine wildlife abundance and distribution, carefully considers seasonal distribution patterns of marine wildlife, and incorporates western scientific and Inuit Qaujimajatuqangit knowledge sources. The updated marine baseline should be made available to appropriate authorities for feedback, then incorporated into the Proponent's Shipping Management Plan (SMP), with continued updates on a regular basis as new information becomes available.
Reporting Requirements:	Updated baseline should be provided to the NIRB and appropriate authorities prior to the commencement of Project-related shipping. The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	80
Category:	Marine Wildlife – Marine baseline
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure updated and accurate marine baseline data is available
Term or Condition:	The Proponent shall assess its available baseline information for Melvin Bay and for the area surrounding the fuel transhipment anchorage to ensure that both are adequate for the detection of Project-related impacts, particularly related to contaminants.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	81
Category:	Marine Wildlife – Wildlife plans
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure relevant plans incorporate mitigation and monitoring programming for marine wildlife

Term or Condition:	Prior to any Project-associated shipping, the Proponent shall revise and update the Terrestrial Environment Management Plan (TEMMP) and/or the Shipping Management Plan (SMP) to include following information: a. a plan for involvement of local hunters in wildlife baseline studies and monitoring program; b. a plan for coordinating wildlife studies/monitoring activities with other organizations, institutions, government departments and/or individual researchers conducting wildlife studies in the regional study area; and c. measures to be applied to avoid or reduce the disturbance, harassment, injury or mortality of marine mammals due to shipping activities.
Reporting Requirements:	Updates to the relevant plan(s) should be provided to the NIRB a minimum of 120 days prior to the commencement of Project-related shipping. Implementation of these measures, updates to the Plan, consultation records, and monitoring results shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	**82**
Category:	Marine Wildlife – Monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure monitoring of marine wildlife during Project-related ship voyages
Term or Condition:	The Proponent shall require all contracted shipping companies to provide full-time marine wildlife monitoring using trained observers and established data collection and recording protocols. Monitoring plans should include provisions for all *Species At Risk Act* (SARA) and for the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) listed species (birds and mammals).
Reporting Requirements:	Updated monitoring plans should be provided to the NIRB a minimum of 120 days prior to the commencement of Project-related shipping. Implementation of these measures, updates to the Plan, and monitoring results shall be reported and discussed in the Proponent's annual report to the NIRB.

Commentary: *The Proponent is encouraged to consult with the parties involved with marine wildlife management to develop standardized marine wildlife data collection and recording protocols.*

Term and Condition No.	**83**
Category:	Marine Wildlife – Marine mammal interactions
Responsible Parties:	The Proponent

Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To prevent impacts to marine mammals associated with Project shipping
Term or Condition:	The Proponent shall ensure that, subject to vessel and human safety considerations, all Project shipping adhere to the following mitigation procedures while in the vicinity of marine mammals (including polar bear) and birds: a. Marine mammals will be given right of way; b. Ships will when possible, maintain a straight course and constant speed, avoiding erratic behavior; and c. When marine mammals appear to be trapped or disturbed by vessel movements, the vessel will implement appropriate measures to mitigate disturbance, including stoppage of movement until wildlife have moved away from the immediate area.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Term and Condition No.	**84**
Category:	Marine Wildlife – Route planning
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To mitigate potential impacts terrestrial walrus haulouts
Term or Condition:	Prior to any Project-related shipping, the Proponent will prepare a map of terrestrial walrus haulouts (uglit) in the Project area, and use this information for route planning, fuel spill modeling, and sensitive area identification. The map should include all available sources of information on uglit locations, including scientific knowledge and Inuit Qaujimajatuqangit and shall be updated by the Proponent whenever new information becomes available.
Reporting Requirements:	Mapping and associated details should be provided to the NIRB a minimum of 180 days prior to the commencement of Project-related shipping. Implementation of these measures, updates to the Plan, and monitoring results shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	**85**
Category:	Marine Wildlife – Monitoring
Responsible Parties:	The Proponent
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To monitor potential impacts to walruses

Term or Condition:	The Proponent shall consider ways to monitor disturbance to walruses at terrestrial haulout sites, including but not limited to remote monitoring (e.g., time-lapse cameras) and community-based monitoring or Inuit Qaujimajatuqangit surveys.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**86**
Category:	Marine Wildlife – Cumulative effects
Responsible Parties:	The Proponent, other parties as appropriate
Project Phase:	Pre-construction, Construction, Operations, Temporary Closure/Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To promote coordinated understanding and mitigation of potential cumulative effects
Term or Condition:	The Proponent is encouraged to liase with relevant stakeholders, regulatory agencies and/or forums (e.g. the Marine Environmental Working Group associated with the Mary River Project), that might allow for participation in relevant research and management initiatives and increasing understanding and mitigation of potential cumulative effects associated with the Project's shipping activities through the Hudson Strait.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB.

Socio-Economic Terms and Conditions

Economic Development, Contracting, and Business Opportunities

Term and Condition No.	**87**
Category:	Economic Development, Contracting and Business Opportunities – Socio-Economic Monitoring, Kivalliq Socio-Economic Monitoring Committee
Responsible Parties:	The Proponent, members of the KSEMC
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Description of the general monitoring framework to be developed in consultation with the Kivalliq Socio-Economic Monitoring Committee.
Term or Condition:	The Proponent is strongly encouraged to participate in the work of the Kivalliq Socio-Economic Monitoring Committee along with other agencies and the communities of the Kivalliq region, and to identify areas of mutual interest and priority for inclusion into a collaborative monitoring framework that includes socio-economic priorities related to the Project, communities, and the Kivalliq region as a whole.

Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this Term and Condition (including the results of monitoring) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**88**
Category:	Economic Development, Contracting and Business Opportunities – Socio-Economic Monitoring
Responsible Parties:	The Proponent, KIA, GN, AANDC also known as Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC), Kivalliq communities
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Description of a socio-economic monitoring working group to oversee project-specific monitoring program
Term or Condition:	The Proponent is encouraged to work in collaboration with other socio-economic stakeholders including for example, the KIA, GN, AANDC, and communities of the Kivalliq region, to establish a socio-economic working group for the Project to develop and oversee the Meliadine Socio-economic Monitoring Program. The working group should develop a Terms of Reference which outlines each member's roles and responsibilities with regards to, where applicable, project-specific socio-economic monitoring throughout the life of the Project. The Terms of Reference are to be provided to the NIRB upon completion, and within one year of issuance of the Project Certificate.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB. All updates to the Terms of Reference should be submitted to the NIRB during annual socio-economic reporting.

Term and Condition No.	**89**
Category:	Economic Development, Contracting and Business Opportunities – Socio-Economic Monitoring
Responsible Parties:	The Proponent, KSEMC, KIA, GN, AANDC also known as Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC), Kivalliq communities
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Details regarding the establishment of Project-specific socio-economic monitoring program.
Term or Condition:	The Proponent shall develop the Meliadine Socio-economic Monitoring Program to monitor the predicted impacts outlined in the FEIS as well as regional concerns identified by the Kivalliq Socio-economic Monitoring Committee (SEMC). Where possible, the Proponent is encouraged to work in collaboration with all other socio-economic stakeholders such as the KIA, GN, AANDC and the communities of the Kivalliq region in developing this program, which should include a process for adaptive management and mitigation in the event unanticipated impacts are identified. Details of the

	Meliadine Socio-economic Monitoring Program are to be provided to the NIRB upon finalization, and within one year of issuance of the Project Certificate.
Reporting Requirements:	Details of the Meliadine Socio-economic Monitoring Program should be submitted to the NIRB within one (1) year of issuance of the amended Project Certificate. The Proponent shall produce annual Meliadine socio-economic monitoring reports throughout the life of the Project that are submitted to the NIRB and shared with the wider Socio-Economic Monitoring Committee.

Term and Condition No.	**90**
Category:	Economic Development, Contracting and Business Opportunities – Closure planning and monitoring
Responsible Parties:	The Proponent, KSEMC
Project Phase:	Pre-Construction, Construction
Objective:	To capture and provide analysis of Project-specific and regional data during Project closure(s), and to clarify mitigation measures related to closure
Term or Condition:	Prior to the commencement of operations, the Proponent is required to undertake an analysis of the risk of temporary mine closure, giving consideration to how communities in the Kivalliq region may be affected by temporary and permanent closure of the mine, including economic, social and cultural effects. The results of this analysis are to be provided to the NIRB upon completion.
Reporting Requirements:	This initial results of the Proponent's analysis should be provided to the NIRB within nine (9) months of the issuance of the amended Project Certificate. Any updates to the analyses should be provided to the NIRB as completed by the Proponent and include plans or details in respect of informing the regional socio-economic committee of these results.

Term and Condition No.	**91**
Category:	Economic Development, Contracting and Business Opportunities – Closure planning and monitoring
Responsible Parties:	The Proponent, KSEMC
Project Phase:	Pre-Construction, Construction
Objective:	To capture and provide analysis of Project-specific and regional data during Project closure(s), and to clarify mitigation measures related to closure
Term or Condition:	Within 3 months of the NIRB's acceptance of the Proponent's analysis of the risk of temporary mine closure referenced above, the proponent is expected to update its Socio-Economic Management Plan or to include within a newly developed plan or framework, a description of its plan to collect and analyze Project-specific and regional data at closure and post-closure phases, as well as its defined measures to help mitigate impacts which may result from Project closure(s), both temporary and final.
Reporting Requirements:	The required updates to the Socio-Economic Monitoring Program (and the Socio-Economic Management Plan included within the Program) should be

	provided to the NIRB within three (3) months of the completion of the analysis or updates to the analysis of the risk of temporary mine closure in the term and condition noted above. The Proponent shall reference any updates to its Socio-Economic Monitoring Program and associated management plan in the annual Meliadine socio-economic monitoring reports that are submitted to the NIRB and shared with the wider Socio-economic Monitoring Committee throughout the life of the Project.

Employment

Term and Condition No.	**92**
Category:	Employment – Employment schedule
Responsible Parties:	The Proponent
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	In the interest of producing accurate labour market information and reliable economic and employment forecasting for the current and future labour force, it is important to have up-to-date estimates of the types of employment available through the Project, and what skills are required for these jobs.
Term or Condition:	The Proponent shall submit a detailed staff schedule to the NIRB and to the Government of Nunavut in the first 6 months following the issuance of a Project Certificate. The schedule should, at a minimum, provide a description of: a. Title of positions required by department and division; b. Quantity of positions available by Project phase and year; c. Transferable skills, both certified and uncertified which may be required for, or gained during, employment within each position; and, d. The National Occupational Classification (NOC) code for each individual position. The Proponent is encouraged to consult the Government of Nunavut during development of the schedule. A new schedule should be submitted following any significant deviation from original predictions.
Reporting Requirements:	Within 6 months of Project Certificate issuance and as required thereafter.

Term and Condition No.	**93**
Category:	Employment – Registration of trades workers
Responsible Parties:	The Proponent
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring

Objective:	To ensure that the Government of Nunavut has accurate information to assist it in its role as overseer of the apprenticeship program in Nunavut and in its provision of access to training initiatives and programs.
Term or Condition:	The Proponent is encouraged to register all trades occupations, journeypersons and apprentices working with the Project and to register any trades occupations listed in its forecast, as well as to provide the Government of Nunavut with information regarding the number of registered apprentices and journeypersons from other jurisdictions employed at the Project during each year of the Project's life.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB and shared with the wider regional socio-economic monitoring committee throughout the life of the Project.

Term and Condition No.	**94**
Category:	Employment – Labour force analysis
Responsible Parties:	The Proponent
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To update information provided within the FEIS and monitor Project impacts on labour force characteristics throughout the life of the Project.
Term or Condition:	The Proponent shall update its labour force analysis utilizing current or the most recent baseline information as may be available from the Nunavut Bureau of Statistics or Statistics Canada. The updated labour force analysis is to be provided to the NIRB within 6 months of the Project Certificate being issued. The Proponent is encouraged to work collaboratively with other stakeholders to monitor any impacts the Project may have on the labour force characteristics of the Kivalliq region during all project phases.
Reporting Requirements:	The Proponent should summarize the results of these efforts in the annual Meliadine socio-economic monitoring reports submitted to the NIRB and shared with the wider Socio-Economic Monitoring Committee throughout the life of the Project.

Education and Training

Term and Condition No.	**95**
Category:	Education and Training – Transferable skills and training
Responsible Parties:	The Proponent, Kivalliq Inuit Association, Government of Nunavut, Municipal Training Organization
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Offering training which results in certification that is valid for employment at other sites or in other fields contributes to the long-term employability of Nunavummiut.
Term or Condition:	The Proponent is encouraged to work with training organizations and/or government departments offering mine-related or other training in order

	to provide additional opportunities for residents and employees to gain meaningful and transferable skills and certifications.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB. Updates to the list should be included in the annual Meliadine socio-economic monitoring reports submitted to the NIRB and shared with the wider Socio-Economic Monitoring Committee throughout the life of the Project.

Term and Condition No.	**96**
Category:	Education and Training – Transferable skills and training
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction
Objective:	Offering training which results in certifications that are valid for employment at more than one site or in different fields contributes to the long-term employability of Nunavummiut.
Term or Condition:	Prior to construction, the Proponent shall develop an easily referenced listing of formal certificates and licences that may be acquired via on-site training or training during Proejct employment. The listing shall indicate which of these certifications and licences would be transferable to a similar job site within Nunavut, and should be updated on an annual basis, and is to be provided to the NIRB upon completion and as may be revised.
Reporting Requirements:	The initial listing should be provided to the NIRB at least 60 days prior to the start of construction, and annually thereafter or as may otherwise be required.

Term and Condition No.	**97**
Category:	Education and Training – Monitoring impacts of closure
Responsible Parties:	The Proponent
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To further the understanding of the impacts that Project closure may have on education and training
Term or Condition:	The Proponent's project-specific socio-economic monitoring program should be updated to address the potential impacts to education and training which may arise from temporary, final and/or post-closure phases.
Reporting Requirements:	Information regarding the Proponent's fulfillment of this term and condition shall be included in the Proponent's annual report to the NIRB and shared with the wider regional socio-economic monitoring committee throughout the life of the Project.

Term and Condition No.	**98**
Category:	Education and Training – Monitoring impacts to education system
Responsible Parties:	The Proponent, KSEMC

Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To further the understanding of potential impacts from pressures to the education system in the Kivalliq region and individual communities throughout the life of the Project.
Term or Condition:	The Proponent is encouraged to work with the members identified as potential stakeholders in the socio-economic monitoring working group and with the Kivalliq Socio-Economic Monitoring Committee to review and monitor education utilization rate trends on an on-going basis to understand if the Project can be determined to be having an impact on the education system of the Kivalliq region and/or on any communities in particular.
Reporting Requirements:	The summary of this information should be included in the annual Meliadine socio-economic monitoring reports submitted to the NIRB and shared with the wider Socio-economic Monitoring Committee throughout the life of the Project.

Population Demographics

Term and Condition No.	**99**
Category:	Population Demographics – Monitoring demographic changes
Responsible Parties:	The Proponent, KSEMC
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Monitoring demographic changes affecting the Kivalliq communities is important to understanding trends which may be correlated with the Meliadine Project or other activities in the region.
Term or Condition:	The Kivalliq Socio-Economic Monitoring Committee and its membership are encouraged to engage in the monitoring of demographic changes including the movement of people into and out of the Kivalliq communities and the territory as a whole. This information may be used in conjunction with monitoring data obtained by the Proponent from recent hires and/or out-going employees in order to assess the potential effects of the Project on migration.
Reporting Requirements:	The summary of this information should be included in the annual Meliadine socio-economic monitoring reports submitted to the NIRB and shared with the wider Socio-economic Monitoring Committee throughout the life of the Project.

Term and Condition No.	**100**
Category:	Population Demographics – Survey of Nunavummiut employees
Responsible Parties:	The Proponent, KSEMC, GN
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring

Objective:	Monitoring changes in the circumstances of Nunavummiut employees may provide important information which could be used to evaluate predictions made and the potential impacts to Kivalliq communities.
Term or Condition:	The Proponent is encouraged to work with the Kivalliq Socio-Economic Monitoring Committee to design and implement a voluntary survey to be offered to its Nunavummiut employees on an annual basis in order to identify changes of address, housing status (i.e. public/social, privately owned/rented, government, etc.), and migration intentions, while respecting confidentiality of all persons involved. The survey should be designed in collaboration with the Government of Nunavut, the Nunavut Housing Corporation and other relevant stakeholders. Non-confidential results of the survey are to be reported to the Government of Nunavut and the NIRB.
Reporting Requirements:	The summary of this information should be included in the annual Meliadine socio-economic monitoring reports submitted to the NIRB and shared with the wider Socio-economic Monitoring Committee throughout the life of the Project.

Term and Condition No.	**101**
Category:	Population Demographics – Employee origin
Responsible Parties:	The Proponent
Project Phase:	Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Project-specific information regarding employee origin is important to comparing predictions of labour availability and employment opportunities with actual levels of employment from various demographic segments over different geographic areas.
Term or Condition:	The Proponent shall include with its annual reporting to the NIRB a summary of employee origin information as follows: a. The number of Inuit and non-Inuit employees hired from each of the Kivalliq communities, specifying the number from each; b. The number of Inuit and non-Inuit employees hired from each of the Kitikmeot and Qikiqtani regions, specifying the number from each; c. The number of Inuit and non-Inuit employees hired from a southern location or other province/territory outside of Nunavut, specifying the locations and the number from each; and d. The number of non-Canadian foreign employees hired, specifying the locations and number from each foreign point of hire.
Reporting Requirements:	The summary of this information should be included in the annual Meliadine socio-economic monitoring reports submitted to the NIRB and shared with the wider Socio-economic Monitoring Committee throughout the life of the Project.

Traditional Activity and Knowledge

Term and Condition No.	102
Category:	Traditional Activity and Knowledge – Meliadine Lake community boat launch
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Appropriate planning for and consideration of, mitigation in design features and further monitoring of usage is an important component of the public boat launch as proposed in order to ensure public and worker safety.
Term or Condition:	Prior to commencing construction of the Discovery spur road to pass Meliadine Lake, the Proponent shall provide to the NIRB, details regarding the design features for the Meliadine Lake community boat launch, including traffic turnoffs from the all-weather access road, relevant signage, parking areas, considerations for public safety around the boat launch, plans for garbage removal and treatment of other refuse including buildings and equipment which may be stored at the site, as well as plans to monitor and/or maintain the site, including frequency and timing. These details, once finalized, shall also be incorporated, as updates, to various mitigation, monitoring and/or management plans as applicable.
Reporting Requirements:	Initial details to be provided prior to commencement of construction of the Discovery spur road. The Proponent shall provide a summary discussion of its implementation of this term and condition, monitoring results, implementation of adaptive management strategies, and updates to relevant plans to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	103
Category:	Traditional Activity and Knowledge – Community input to monitoring
Responsible Parties:	The Proponent, KIA, KHTO, KSEMC
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Incorporating community input into monitoring plans, programs and mitigation measures is important to ensuring they consider traditional knowledge and activities.
Term or Condition:	The Proponent is encouraged to consult with the Kangiqliniq Hunters and Trappers Organization and the Kivalliq Socio-Economic Monitoring Committee and to make all reasonable efforts to engage Elders and community members of the Kivalliq communities in order to have community level input into updates to its monitoring plans, programs and mitigative measures. This type of engagement will ensure that these programs and measures have been informed by traditional activities, cultural resources, and land use as such may be implicated or impacted by ongoing Project activities. All plans are to include a feedback mechanism for consulting with residents of the Kivalliq, including the provision of

	results from the Proponent's wildlife monitoring programs to each community. The Proponent shall submit updated plans to the NIRB within 30 days of their revision and/or finalization.
Reporting Requirements:	Updated plans shall be submitted to the NIRB 30 days prior to their revision/finalization. Further, the Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring, adaptive management strategies, consultation, and contribution efforts undertaken) to the NIRB through the Proponent's annual monitoring report. Plans should explain specifically how the information will be shared with the wider regional socio-economic monitoring committee throughout the life of the Project.

Non-Traditional Land Use and Resource Use

Term and Condition No.	**104**
Category:	Non-Traditional Land Use and Resource Use – Consultation with outfitters and guides
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	It is important that the Proponent have an accurate understanding of land use patterns near Project activities in order to properly assess safety precautions that may be needed to protect human and environmental health, as well as to understand where these uses may be impacted by Project activities.
Term or Condition:	The Proponent is encouraged to consult with outfitting and guiding businesses that operate in the LSA and RSA regarding use of the area, specifically as it relates to hunting, fishing and guiding within proximity of the AWAR. Results of this consultation should be incorporated into updated plans where applicable.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including results of monitoring, adaptive management strategies, consultation, and contribution efforts) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	**105**
Category:	Non-Traditional Land Use and Resource Use – Hunter harvest survey
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Where possible, relevant information obtained from non-traditional land uses such as outfitting and guiding may help in improving the robustness of the hunter harvest survey to be carried out by the Proponent.
Term or Condition:	The Proponent is strongly encouraged to consider incorporating information obtained from local outfitting and guiding businesses into its

	Hunter Harvest Survey where possible, and to include these organizations as potential respondents to surveys undertaken.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including results of monitoring, adaptive management strategies, consultation, and contribution efforts) to the NIRB through the Proponent's annual monitoring report and shared with the wider regional Socio-Economic Monitoring Committee throughout the life of the Project.

Cultural, Archaeological and Paleontological Resources

Term and Condition No.	**106**
Category:	Cultural, Archaeological and Paleontological Resources – Inspection reporting
Responsible Parties:	The Proponent, GN
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	It is important that the Proponent and the GN determine a mutually agreeable schedule for the Proponent's reporting of inspection results, as this information may be needed for adjustments to mitigation and/or monitoring measures and programs.
Term or Condition:	The Proponent shall, in consultation with the Government of Nunavut's Territorial Archaeologist, determine a reporting frequency for the provision of inspection reports to the Government of Nunavut regarding the status of the Meliadine River Bridge, the Char River Bridge, and the M5 Bridge Crossing during the spring freshet period (mid-May to June) and during the remainder of the ice-free period to freeze-up (July to October).
Reporting Requirements:	Evidence of meeting the requirements of this term and condition shall be submitted as part of the Proponent's annual reporting to the NIRB.

Term and Condition No.	**107**
Category:	Cultural, Archaeological and Paleontological Resources – Mitigation of ice buildup
Responsible Parties:	The Proponent, GN
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	It is important that a plan be developed to address ice buildup at various Project bridge crossings in order to ensure the protection of archaeological resources.
Term or Condition:	The Proponent shall consult with the Government of Nunavut – Department of Culture and Heritage in developing a mitigation plan to address ice buildup at the Meliadine River Bridge, the Char River Bridge, and the Bridge Crossing at M5. The Proponent shall submit this mitigation plan to the NIRB once finalized.
Reporting Requirements:	Evidence of meeting the requirements of this term and condition shall be submitted as part of the Proponent's annual reporting to the NIRB.

Individual and Community Wellness

Term and Condition No.	108
Category:	Individual and Community Wellness – Counseling and treatment programs
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To make available, necessary treatment and counseling services for employee and family well-being.
Term or Condition:	The Proponent is encouraged to consider providing access to counseling and treatment programs for substance and gambling addictions, and programs which address domestic, parenting, and marital issues that could affect employees and/or their families.
Reporting Requirements:	Evidence of meeting the requirements of this term and condition shall be submitted as part of the Proponent's annual reporting to the NIRB.

Term and Condition No.	109
Category:	Individual and Community Wellness – Indirect impacts to health and well-being
Responsible Parties:	The Proponent, KSEMC
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To understand the indirect impacts of the Project upon health and well-being
Term or Condition:	The Proponent is encouraged to work with the Kivalliq Socio-Economic Monitoring Committee to monitor potential indirect effects of the Project, including indicators such as the prevalence of substance abuse, gambling issues, family violence, marital problems, rates of sexually transmitted infections and other communicable diseases and others as deemed appropriate.
Reporting Requirements:	Evidence of meeting the requirements of this term and condition shall be submitted as part of the Proponent's annual reporting to the NIRB.

Term and Condition No.	110
Category:	Individual and Community Wellness – Employee cohesion
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To encourage the on-site cohesion and wellbeing of employees through cultural awareness and wellness programs
Term or Condition:	The Proponent shall provide the NIRB with a description of wellness and cultural diversity/acceptance programming made available to employees and family or community members and shall report the following information with respect to each program to the NIRB annually: a. Language of instruction;

	b. Uptake by employees and/or family members where relevant, noting Inuit and non-Inuit participation rates; c. Completion rates for enrolled participants, noting Inuit and non-Inuit rates; and d. Issues as may relate to program content which may have been noted or present either on site or in the community and which affect Project employment or employee wellness.
Reporting Requirements:	Summaries of all cross-cultural training initiatives should be provided in the annual Meliadine Socio-Economic Monitoring Report.

Term and Condition No.	**111**
Category:	Individual and Community Wellness – Employee training opportunities
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To understand how the Proponent's employee training programs are delivered and received, including uptake and completion rates by Inuit and non-Inuit staff.
Term or Condition:	In its annual reporting to the NIRB, the Proponent is strongly encouraged to provide detailed descriptions of all employee programs and training including: a. Descriptions of the goals of each program offered; b. Language of instruction; c. Schedules and location(s) of when each program was offered; a. Uptake by employees and/or family members where relevant, noting Inuit and non-Inuit participation rates; and, b. Completion rates for enrolled participants, noting Inuit and non-Inuit rates.
Reporting Requirements:	Evidence of meeting the requirements of this term and condition shall be submitted as part of the Proponent's annual reporting to the NIRB.

Term and Condition No.	**112**
Category:	Individual and Community Wellness – Access to housing
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To investigate ways that economic development and self-reliance may improve access to housing by employees.
Term or Condition:	The Proponent is encouraged to investigate measures and programs designed to assist Project employees with pursuing home ownership or accessing affordable housing options.
Reporting Requirements:	Provided the sharing of such information is consistent with and not limited by the terms and conditions of any applicable Inuit Impact Benefit Agreement, these efforts should be reported to the NIRB within the annual Meliadine Socio-Economic Monitoring Report.

Community Infrastructure

Term and Condition No.	113
Category:	Community Infrastructure – Access to public housing
Responsible Parties:	The Proponent, KSEMC, GN-Nunavut Housing Corporation
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To inform the territory with respect to current housing rates, needs, and intentions to migrate may provide the GN with insight as to where additional resources may need to be devoted, based on trends that can be identified.
Term or Condition:	The Proponent is encouraged to collaborate with the Kivalliq Socio-Economic Monitoring Committee and the Government of Nunavut – Nunavut Housing Corporation, to design and implement a voluntary employee survey to be completed on an annual basis in order to to identify any changes of address, detailed occupancy status (i.e., public/social, privately owned/rented, government, number of people sharing the resident space, etc.), housing preferences, migration intentions, and reasons for migration while respecting confidentiality of all person involved. Non-confidential results of the survey are to be reported to the Government of Nunavut and the Nunavut Impact Review Board.
Reporting Requirements:	The frequency and content of the survey should be determined by the collaborating parties, but content may include changes to address, housing status (i.e., public/social, privately owned/rented, government, etc.) and migration intentions of Project employees. Non-confidential results of the survey should be reported to the GN and other members of the Socio-economic Monitoring Committee and summary information of these results should be reported to the NIRB within the annual Meliadine Socio-Economic Monitoring Report.

Term and Condition No.	114
Category:	Community Infrastructure – Financial literacy and planning programs
Responsible Parties:	The Proponent, GN-Nunavut Housing Corporation
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure accurate and helpful information is passed to Project employees relating to financial literacy and housing/homeownership.
Term or Condition:	The Proponent is encouraged to collaborate with the Government of Nunavut – Nunavut Housing Corporation prior to the development and inception of its programs relating to financial literacy and planning to ensure that relevant and accurate information about housing and home ownership is available and considered for inclusion.
Reporting Requirements:	Evidence of meeting the requirements of this term and condition shall be submitted as part of the Proponent's annual reporting to the NIRB.

Term and Condition No.	115
Category:	Community Infrastructure – Impacts to health services
Responsible Parties:	The Proponent, Government of Nunavut
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	It is important to understand potential Project-specific impacts to the local health services, as well as to ensure a clear procedure is developed for Project employee medical referrals.
Term or Condition:	The Proponent is encouraged to work collaboratively with the Government of Nunavut Department of Health to monitor the impacts of the Meliadine Gold Project on health services within the LSA communities and specifically, Rankin Inlet.
Reporting Requirements:	Evidence of meeting the requirements of this term and condition shall be submitted as part of the Proponent's annual reporting to the NIRB.

Public and Worker Health and Safety

Term and Condition No.	116
Category:	Public and Worker Health and Safety – Air quality monitoring
Responsible Parties:	The Proponent, Government of Nunavut
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	Adequate analysis of particulate matter is required in order to understand the potential impacts to human health.
Term or Condition:	The Proponent shall update the air quality monitoring aspect of its environmental and health risk monitoring program to include the following parameters for particulate matter: a. An analysis of the metals content of the dust collected in passive monitoring; and b. Discrete samples to be collected on a frequency to be determined in collaboration with the Government of Nunavut, from the camp, and analyzed for acrolein and aldehyde. Results are to be incorporated into the Proponent's annual reporting for submission to the NIRB.
Reporting Requirements:	If required, updated information regarding mitigation measures or management plans should be provided to the NIRB at least 90 days following issuance of the amended Project Certificate, and subsequent modifications to these plans should be identified and included in the Proponent's annual report to the NIRB.

Other Terms and Conditions

Accidents and Malfunctions

Term and Condition No.	117
Category:	Accidents and Malfunctions – All-weather access road
Responsible Parties:	The Proponent, Kivalliq Inuit Association, Hamlet of Rankin Inlet, community members
Project Phase:	Pre-Construction
Objective:	To ensure overall safety through design and operation of the road, in accordance with relevant legislation and regulatory requirements
Term or Condition:	Prior to construction Phase 2 of the all-weather access road and the Rankin Inlet bypass road, the Proponent shall consult applicable laws in Canada and Nunavut as well as meet with all regulatory agencies and the public as it finalizes its road operations plans.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring, adaptive management strategies, and consultation) to the NIRB through the Proponent's annual monitoring report.

Commentary: *The reference to meeting with "all regulatory agencies" is intended to be all "relevant" regulatory agencies with a mandate in relation to the all-weather access road.*

Term and Condition No.	118
Category:	Accidents and Malfunctions – All-weather access road
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure adequate monitoring of wildlife presence informs road management and operations
Term or Condition:	The Proponent shall include in an updated Terrestrial Wildlife Management and Monitoring Plan (TEMMP), plans for increased caribou monitoring efforts including weekly winter track surveying and summer and fall surveys undertaken on foot twice per month. These results shall be reported to the NIRB with the Proponent's annual reporting requirements.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including results of monitoring, adaptive management strategies, consultation, and contribution efforts) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	119
Category:	Accidents and Malfunctions – All-weather access road
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring

Objective:	To mitigate potential interactions of caribou with traffic along the AWAR
Term or Condition:	The Proponent shall include within its updated Terrestrial Wildlife Management and Monitoring Plan, a commitment to establishing deterrents along the AWAR at any areas where it is observed that caribou are attracted to the AWAR and their presence may present a risk of collisions with traffic along the AWAR (such as areas where caribou are utilizing the AWAR to facilitate movement, areas where caribou may be licking minerals/road salt from the road, areas where caribou are gathering to avoid insects, etc.).
Reporting Requirements:	The updated plan should be submitted to the NIRB at least 90 days prior to the start of construction. Implementation of these measures, updates to the Plan, and monitoring results shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	**120**
Category:	Accidents and Malfunctions – Marine shipping
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure protection of the marine environment
Term or Condition:	The Proponent shall contract only Transport Canada certified shippers to carry cargo for the Project, and will ensure shippers are aware of the requirements of the Shipping Management Plan, the Risk Management and Emergency Response Plan and the Oil Pollution Emergency Plan (OPEP).
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition to the NIRB through the Proponent's annual monitoring report.

Commentary: *As clarified by Transport Canada, Transport Canada certifies "vessels" or "ships" and not the "shippers" themselves. The Term and Condition should be implemented with the recognition that the Proponent intends to use Canadian-flagged ships or vessels only.*

Term and Condition No.	**121**
Category:	Accidents and Malfunctions – Marine shipping
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure protection of the marine environment
Term or Condition:	The Proponent shall monitor the ingress/egress of Project related ships at Rankin Inlet and report any accidents or spills immediately to the regulatory agencies as required by law and to NIRB's Monitoring Officer.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	122
Category:	Accidents and Malfunctions – Marine shipping
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure protection of the marine environment
Term or Condition:	The Proponent shall ensure that best practices are used at all times during ship to shore and other marine-based fuel transfer events, including implementing measures specifically designed to prevent leaks and spills resulting from ice forming on the hoses during fuel transfers.
Reporting Requirements:	The Proponent shall provide a summary discussion of its implementation of this term and condition (including the results of monitoring or adaptive management strategies) to the NIRB through the Proponent's annual monitoring report.

Term and Condition No.	123
Category:	Accidents and Malfunctions – Marine shipping
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure protection of the marine environment
Term or Condition:	The Proponent shall ensure that the necessary spill response equipment and training is available prior to commencing project shipping.
Reporting Requirements:	Evidence of meeting the requirements of this term and condition shall be submitted as part of the Proponent's annual reporting to the NIRB.

Term and Condition No.	124
Category:	Accidents and Malfunctions – Spill preparedness
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure protection of local water resources
Term or Condition:	Prior to construction, the Proponent shall update its Spill Contingency Plan specific to a major spill event occurring on the bypass road and within proximity to (and including potential spills into) Nipissar Lake.
Reporting Requirements:	The updated plan should be submitted to the NIRB at least 90 days prior to the start of construction. Implementation of these measures and monitoring results as well as any subsequent updates to the Plan, shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	125
Category:	Accidents and Malfunctions – All-weather access road
Responsible Parties:	The Proponent

Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure rules for use of the road are clearly communicated in the interest of providing for the health and safety of all users of the AWAR
Term or Condition:	The Proponent shall implement all such measures necessary to protect public and mine traffic on all Project roads. The measures undertaken shall include, but are not limited to: a. Prior to expansion of the AWAR, the Proponent shall update its Roads Management Plan to include a detailed consultation plan specifying the methods the Proponent will use to provide the Kivalliq Inuit Association, members of the Hunters and Trappers Organizations in the area, residents of Rankin Inlet and the Hamlet of Rankin Inlet with information regarding the safety requirements of AWAR use. The updated Plan is to be submitted to the Nunavut Impact Review Board, Kivalliq Inuit Association, Kangiqliniq Hunters and Trappers Organization, and the Government of Nunavut; b. Prior to the opening of the AWAR to the public, and annually thereafter, advertise and hold at least one community meeting in the Hamlet of Rankin Inlet and Chesterfield Inlet to explain to the community the rules for use of the road; c. Prior to the opening of the AWAR to the public, the Proponent shall address enforcement of health and safety rules for the operation of the road (i.e., no shooting zone) and implement necessary communications with the public (i.e., signage and public meetings), which includes, but is not limited to: i. Maintaining manned and unmanned gates as proposed along the all-weather access road; ii. The posting of signs in English and Inuktitut along the road at appropriate intervals (i.e., 10 km and bridge crossings); and iii. Place notices at least quarterly on the radio and television to explain to the community the rules for use of the road; d. Once the AWAR expansion is completed and the road is opened to the public, the Proponent shall conduct a vehicle survey four times annually (once during the weekdays during the winter season, once during the week end days during the winter season, once during the weekdays during the summer season and once during the week end days during the summer season) to record the number and types of mine vehicles and the number and type of public vehicles using the AWAR over a 12 hour period (8:00 am to 8:00 pm). The vehicle survey data shall be collated as indicated above and provided in the Proponent's Annual Report;

	e. Prior to the development of the Discovery deposit, the Proponent shall update its Road Management Plan for the planned operation of the twinned road which could include additional rules, Project infrastructure, or other measures designed to maintain safety for employees and the public; and f. Report all accidents or other safety incidents on the road, to the Government of Nunavut, Kivalliq Inuit Association, the Hamlet of Rankin Inlet and the NIRB immediately.
Reporting Requirements:	The updated plan should be submitted to the NIRB at least 90 days prior to the start of construction of Phase 2 of the AWAR. As noted in the Board's decision on the Saline Effluent Discharge to the Marine Environment proposal, updated plans shall be submitted to the NIRB prior to undertaking transport of saline groundwater from the Meliadine site to the temporary storage tank near Rankin Inlet. Implementation of these measures and monitoring results as well as any subsequent updates to the Plan, shall be reported and discussed in the Proponent's annual report to the NIRB.

Commentary: *The reference under the Reporting Requirements to "90 days prior to the start of construction" is not intended to be tied to general project construction, but rather is intended to be linked to 90 days prior to the construction associated with the expansion of the AWAR (referred to as "Phase 2 of the AWAR development" in the Proponent's Final Environmental Impact Statement).*

Alternatives Analysis

Term and Condition No.	**126**
Category:	Alternatives Analysis – All-weather access road
Responsible Parties:	The Proponent
Project Phase:	Pre-Construction
Objective:	To ensure clear and consistent communication of safety requirements and road use limitations to inform members of the public
Term or Condition:	Prior to expansion of the AWAR, the Proponent shall prepare and add to the finalized Roads Management Plan (SD 2-9), a detailed consultation plan specifying the methods the Proponent will use to provide the Kivalliq Inuit Association, members of the Hunters and Trappers Organizations in the area, residents of Rankin Inlet and the Hamlet of Rankin Inlet with information regarding the safety requirements and any limitations on public AWAR use (i.e. the "rules of the road") and to ensure that this information continues to be clearly communicated on an on-going basis while the public has access to the AWAR.
Reporting Requirements:	The updated plan should be submitted to the NIRB at least 90 days prior to the start of construction. Implementation of these measures and monitoring results as well as any subsequent updates to the Plan, shall be reported and discussed in the Proponent's annual report to the NIRB.

Term and Condition No.	127
Category:	Alternatives Analysis – Marine shipping
Responsible Parties:	The Proponent, Kivalliq Inuit Association, Kivalliq HTOs
Project Phase:	Pre-Construction, Construction, Operations, Temporary Closure / Care and Maintenance, Closure and Post-Closure Monitoring
Objective:	To ensure adaptive management measures are available to address impacts to marine mammals
Term or Condition:	The Proponent shall, in coordination and consultation with the Kivalliq Inuit Association and the Hunters and Trappers Organizations of the Kivalliq communities, provide updates to its Shipping Management Plan to identify adaptive management measures that will be employed if effects monitoring identifies potential for effects on marine mammal populations along the shipping route.
Reporting Requirements:	The updated plan should be submitted to the NIRB at least 90 days prior to the start of construction. Implementation of these measures and monitoring results as well as any subsequent updates to the Plan, shall be reported and discussed in the Proponent's annual report to the NIRB.

Saline Effluent Disposal New Terms and Conditions

NEW Term and Condition No.	128
Category:	Marine Environment
Responsible Parties:	The Proponent, Fisheries and Oceans Canada (DFO), Environment and Climate Change Canada (ECCC), Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC)
Project Phase:	Operations, Care and Maintenance, Closure
Objective:	To assess the environmental impact of the Project on the seabed and marine environment if the effluent discharge pipeline is abandoned in place or removed.
Term or Condition:	The Proponent shall provide the NIRB with a detailed design for the system that includes the location of the pipeline in relation to the saline effluent storage tank at Itivia, the location of submerged collars supporting the pipeline and the design of the diffuser.
Reporting Requirements:	To be provided to the Nunavut Impact Review Board at least 90 days prior to construction of the effluent pipeline and diffuser system.

NEW Term and Condition No.	129
Category:	Marine Environment
Responsible Parties:	The Proponent and Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC)
Project Phase:	Operations, care and maintenance, and closure

Objective:	To assess the environmental impact of the Project on the seabed and marine environment if the effluent discharge pipeline is abandoned in place or removed.
Term or Condition:	The Proponent shall conduct and submit to the Board a hazard and operability assessment of the pipeline and marine outfall system as part of the land authorization process.
Reporting Requirements:	To be provided to the Nunavut Impact Review Board at least 90 days prior to operation of the effluent pipeline and diffuser system.

NEW Term and Condition No.	**130**
Category:	Marine Environment
Responsible Parties:	The Proponent, Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC), Environment and Climate Change Canada (ECCC), and Fisheries and Oceans Canada (DFO)
Project Phase:	Operations, care and maintenance, and closure
Objective:	To assess the environmental impact of the Project on the seabed and marine environment if the effluent discharge pipeline is abandoned in place or removed.
Term or Condition:	The Proponent shall remove the subsea pipeline and diffuser in Melvin Bay when the pipeline is no longer in use unless it can be demonstrated to the satisfaction of the Nunavut Impact Review Board that this infrastructure will provide a net positive environmental effect to the local ecosystem.
Reporting Requirements:	Information necessary to support an application for removal of the subsea pipeline and diffuser must be provided to the Nunavut Impact Review Board for consideration at least 12 months prior to planned removal.

NEW Term and Condition No.	**131**
Category:	Marine Environment
Responsible Parties:	The Proponent
Project Phase:	Operations, care and maintenance, and closure
Objective:	To prevent adverse impacts to community travel and use of local marine areas.
Term or Condition:	The Proponent shall ensure its Marine Environment Management Plan addresses a procedure for engagement with the Kangiqliniq Hunters and Trappers Organization (HTO) to confirm the commencement and ending of the open water season for marine effluent discharge each year. The Proponent shall also engage with the HTO and the community of Rankin Inlet when developing a program for monitoring saline effluent temperature going into the subsea pipeline, ice thickness on Melvin Bay in the vicinity of the discharge and determining appropriate communication and safety protocols applicable for travel by community members through Itivia and Melvin Bay.

Reporting Requirements:	A summary of actions taken are to be included in the Proponent's annual reporting to the NIRB.

APPENDIX A – MONITORING PROGRAM

[To be developed]

APPENDIX B

Arctic Raptor Research Program, 2018

KIVALLIQ PEREGRINE FALCON MONITIRORING: 2017 REPORT TO GOVERNMENT OF NUNAVUT

Introduction

The peregrine falcon (*Falco peregrinus*) is one of the most intensively studied raptor species in the world (for example, Olsen and Olsen 1989, Ratcliffe 1993, Rosenfield et al. 1995, Quinn and Kokorev 2000, Ganusevich et al. 2004, Anctil et al. 2013a). In North America, interest was focused on this species due to well-established population declines associated with contamination from organochlorine pesticides (for example, Enderson et al. 1968, Peakall and Kiff 1979, Peakall et al. 1983, Risebrough and Peakall 1988, Ellis et al. 1989, Court et al. 1990, Franke et al. 2010). Wide-scale population declines in North America were first summarized at the 1965 Madison Peregrine Falcon Conference (Hickey 1969), and were found to be extensive in the United States (virtually total extirpation in the east and severe declines in the west) and throughout southern parts of Canada east of the Rocky Mountains. Of the 3 sub-species that exist in the North America, the American peregrine falcon (*F. p. anatum*) and Arctic peregrine (*F. p. tundrius*) were listed as "endangered" in the United States pursuant to the Endangered Species Act (ESA 1973, as amended) in 1970; the Peale's peregrine (*F. p. pealei*) was never listed in the United States. In Canada, the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) listed the American peregrine as "endangered", the Arctic peregrine as "threatened", and the Peale's peregrine as "special concern" pursuant to the Species at Risk Act (SARA 2002, as amended) in 1978. Historically, the northern portion (boreal, sub-arctic and arctic) of the peregrine falcon population was thought to be large, and potentially accounted for as much as 80% of the total population in North America (Kiff 1988). However, the spatial extent over which surveys can realistically occur constrains data collection over geographic spatial scales (Cade 2013). Northern-breeding American and Arctic peregrines are highly migratory (Yates et al. 1988, Schmutz et al. 1991, Fuller et al. 1998). In the United States, the Arctic peregrine and American peregrine were removed from the list of endangered species in 1994 (USFWS 1998) and in 1999 (USFWS 1999a), respectively. In Canada, the Arctic peregrine and American peregrine were evaluated together (rather than as separate sub-species) and down-listed by COSEWIC to Special Concern in 2007, and were legally listed as such on Schedule 1 of the Species at Risk Act in 2012.

There is one long-term study on Peregrine Falcons in Rankin Inlet, Nunavut. Population monitoring at Rankin Inlet was initially motivated by the need to understand the processes responsible for reproductive failure, and with the exception of one year (2001), has been conducted annually since 1980. Much of the information on the ecology and toxicology of Arctic peregrine falcons has resulted from the research conducted on this population (Court 1986, Court et al. 1988a, Court et al. 1988b, Bradley 1989, Court et al. 1989, Court et al. 1990, Bradley and Oliphant 1991, Johnstone et al. 1996, Bradley et al. 1997, Johnstone 1998, Franke et al. 2010, Franke et al. 2011b, Anctil and Franke 2013, Anctil et al. 2013a, Franke et al. 2013, L'Hérault et al. 2013, Franke et al. 2016, Lamarre et al. 2017). The objective of this work is part of a commitment to provide annual updates to the Government of Nunavut with regard to monitoring of the population of peregrine falcons breeding near Rankin Inlet, Nunavut.

Background

The Rankin Inlet Peregrine Falcon study population was discovered in the late 1970s, but its size and density was not appreciated until intensive surveys were conducted in 1980-81. Critical nesting habitat and an abundance of marine and terrestrial prey make the area ideal for Peregrine Falcons and other nesting predatory birds. The entire area is accessible by snowmobile, ATV, and boat, allowing a systematic search of nesting territories for banded and unbanded adult birds. Acccess to nesting sites for collecting productivity data and banding of young poses few problems.

A variety of research partners and the Government of Nunavut have been involved in the project since 1981. Up to 1996, graduate students from the Universities of Alberta and Saskatchewan conducted and managed the project and the government provided field equipment and logistical support. Research projects included detailed studies of life history, pesticide contamination, diet, and a series of investigations based on individually identified (banded) birds. These studies, and on-going monitoring by the government, have produced one of the longest continuous data sets on reproductive success and contaminant burdens for nesting Peregrine Falcons anywhere in the world. These data allow for an assessment of trends in pesticide residues from peregrines and their primary prey species over three decades. These data, combined with detailed information on Peregrine Falcon reproductive performance, have been referenced numerous times in research journals and status reports that provide management actions for falcons

throughout North America. Additionally, data collected at Rankin Inlet has allowed immediate assessment of factors that may impact falcon populations throughout Nunavut. As such, the falcon population at Rankin Inlet is widely recognized as one of the best "indicator" populations of Peregrine Falcons in North America. The unique, detailed, long-term data set includes demographic attributes such as the annual number of occupied territories, the number of pairs to produce young, and the total number of young fledged. Both the University of Alberta and the University of Saskatchewan were involved closely with graduate students until 1996. No monitoring was conducted in 2001. However, with funding from the Government of Nunavut (GN DoE), Department of Environment, monitoring of the population resumed in earnest in 2002 and 2003.

The GN DoE contributes approximately $20,000.00 per year to the project (or approximately 10% of the overall annual budget required to fund the project). The remaining funding is raised from external sources, primarily ArcticNet, Mitacs, Peregrine Fund, Agnico Eagle Mine, Baffinland Iron Mine, Northern Scientific Training Program, and NSERC.

Study area

The study population of Peregrine Falcons is encompassed within a 1000 km^2 study area (Figure 1) near the hamlet of Rankin Inlet, Nunavut, Canada. At its peak, the density of breeding Peregrine Falcons at Rankin Inlet included 26 territorial pairs at one pair per 17 square km, a density that is among the highest for the species in the world and the highest recorded in the tundra biome. Though relatively southern for Peregrine Falcons in Canadian Arctic, (62°49'N 92°05'W), environmental conditions are as, or more, severe than any encountered in the range of the species. Passerines and small mammals comprise the bulk of the diet and lemming consumption (at least 30% of the diet biomass in any given year) increases significantly during peak abundance; more pairs attempt to breed and more young are produced during peak lemming abundance (Court et al. l988a, l988b, Bradley and Oliphant 1991). Terminology used in describing nesting activities of Peregrine Falcons and a general description of vegetation, climate, and geology of the study area are reported elsewhere (Court 1986, Court et al. l988a, l988b, 1989).

Methods

Survey Methods

Accurate determination of site occupancy and productivity is challenging if effort is limited to a single, short-term survey, particularly if the survey is conducted late in the breeding season (e.g. at a period of time typically associated with brooding or chick rearing). For this reason, between 1982 and 2017, a full census of the entire study area was conducted a minimum of twice annually. Beginning in May of each year, as Peregrine Falcons arrived from their wintering grounds, territories were surveyed by snow machine to determine the presence or absence of territorial, breeding-aged, adults. All unoccupied sites were checked until occupancy by Peregrine Falcons was confirmed or the breeding season was sufficiently advanced to conclude that the site was vacant.

In cases where sites were occupied by individuals previously fitted with unique alphanumeric color-coded leg bands, bands were read using a Questar Field Model telescope, hand held digital camera or Reconyx trail camera. If territories were occupied by unmarked individuals, effort was made to trap and mark these birds with an alphanumeric color band on one leg and a US Fish and Wildlife band on the other. In addition, we measured un-flattened wing chord, body weight, tail length, tarsus width and length, for each bird; a subjective measure of body condition, sharpness of keel, was also recorded.

After breakup of the sea-ice, territories were surveyed by boat to determine occupancy and productivity at each site; inland sites were accessed by all-terrain vehicle for the same purpose. During summer, banded adult Peregrine Falcons were identified by either trapping or visually by telescope. Unmarked individuals were trapped and banded where possible. Once nestlings reached a minimum of 25 days of age (first week of August), they too were banded. Young were considered to be successfully raised after reaching banding age, and yearly productivity is therefore defined as the number of young produced per occupied territory (Steenhof and Newton 2007, Steenhof et al. 2017).

Statistical analysis

Data exploration was carried out following the protocol described in (Zuur et al. 2010). Specifically, histograms and kernel density plots to inspect raw occupancy and productivity values

for normality. In addition, the Shapiro-Wilk test (w) for normality was used to assess whether p-values were >0.05, and w = 1 (Shapiro and Wilk 1965). Boxplots were used to detect outliers; extreme values were removed only when they were considered to be outside of the range of natural variation.

General additive models (GAM) were used to estimate annual trends for each occupancy and productivity area. Each GAM was defined as follows:

$$Y_i = \partial + f(Year_i) + \varepsilon_i \quad (1)$$

where Y_i represents the i^{th} observation of the demographic of interest (occupancy or reproductive success), ∂ is the intercept, $f(Year_i)$ is the smoothing function, and ε_i represents a vector that contains the prediction residuals. Each GAM was estimated using the `mgcv` package in R (R Development Core Team 2017) where the amount of smoothing (effective degrees of freedom) was estimated using cross validation (Wood 2016). After fitting each GAM was validated using histograms and kernel density plots to inspect the residuals for normality. In addition, we applied the Shapiro-Wilk test (w) for normality to assess whether p-values were >0.05, and w = 1. Homogeneity of variance was assessed by plotting residual values against fitted values, and inspecting each plot to ensure that points were uniformly distributed.

Results

Model results (Figure 2, Table 1) indicated that occupancy has remained stable throughout the monitoring period. Productivity appears to have declined over the same period. Potential mechanisms for these patterns have been investigated in standalone studies (Franke et al. 2010, Franke et al. 2011a, Anctil et al. 2013b, Franke et al. 2013, Franke et al. 2016, Lamarre et al. 2017)

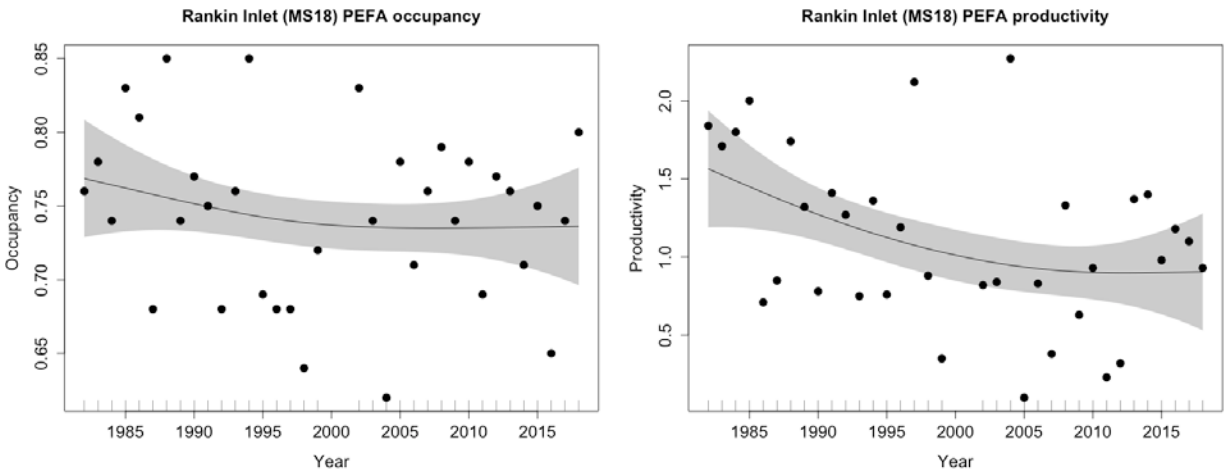

Figure 1. General additive model results for occupancy and productivity for peregrine falcons monitored near Rankin Inlet, Nunavut from 1982 – 2017.

Table 1. Model structure and smoothing terms for peregrine falcon occupancy and productivity at Rankin Inlet, NU. The intercept estimates the grand mean, we do not report a p-value as the intercept is expected to be significantly different from zero *a priori.* Effective degrees of freedom (edf) were estimated by generalized cross-validation, where higher values indicate less smoothing and lower values indicate more smoothing; significant p-values indicate improved model fit (%D, deviance explained) compared to a linear model. Non-significant *p*-values indicate highly variable data.

	Coefficient		smoothing terms				
Model	Intercept	SE	edf	p-value	D (%)	GCV	n
occupancy ~ s(year)	0.74	0.010	1.48	0.44	6.38	0.004	35
productivity ~ s(year)	1.01	0.085	1.67	0.043	19.7	0.27	35

Discussion and management considerations:

In Canada, the conservation status of the peregrine falcon has been down-graded to Special Concern (COSEWIC 2007), and in the United States, the species has been removed from the Federal list of threatened and endangered species (USFW 1999) resulting in legal harvest of wild-caught migratory Peregrine Falcons (which were used regularly for the practice of falconry (Ward and Berry 1972) from 1938 until 1970. Millsap and Allen (2006) recommended that falconry harvest rates for juvenile raptors not exceed one-half of the estimated maximum sustainable yield (MSY) up to a maximum of 5%, depending on species-specific estimates of

capacity to sustain harvest; the authors reported that passage Peregrine Falcons could withstand a harvest rate at MSY of 0.16 of annual production. The USFWS recently increased the harvest quota of passage peregrine falcons from 36 hatch year birds to 144 hatch year birds per year. On-going monitoring of the Rankin Inlet peregrine falcons population contributes to the national management plan goal to "maintain a self-sustaining population of the peregrine falcon anatum/tundrius throughout its Canadian range for the next 10 years" (Canada 2017). In addition, ongoing monitoring of this population fulfills one of Canada's obligation to the Arctic Council's Biodiversity Working Group pan-Arctic biodiversity monitoring plan to detect and report on long-term changes in Arctic biodiversity (Christensen et al. 2018). The plan recognizes a suite of focal ecosystem components (FECs) and multiple FEC attributes that are considered to be suitable indicators for ongoing ecological monitoring at the scale of the circumpolar Arctic. The Terrestrial Ecosystem Working Group (TEWG) of the Circumpolar Biodiversity Monitoring Programme (CBMP) identified the peregrine falcon (*Falco peregrinus*) and the gyrfalcon (*F. rusticolus)* as focal ecosystem components (Christensen et al. 2013), in part due to their role as top predators within Arctic food webs.

CESCC – Non-Native & Invasive Species In Nunavut

Non-Native & Invasive species *In Nunavut*

In 2010 the Canadian Endangered Species Conservation Council (CESCC) identified 17 species not normally found in Nunavut.

These are called "non-native species". Some of these plants and animals can become an "invasive species", which represents a potential major concern for the future health of the Arctic.

What is a non-native species?

A non-native species is defined as an organism that is not normally found in a region. They are introduced by human activities, which can be intentional (e.g. species introduced to control a pest species), accidental (e.g. shipping and ballast water exchange), or environmental (e.g. changes in climate leading to wildlife movements). An example of a non-native species in Nunavut is the European Starling *(Sturnus vulgaris)*, which was introduced to North America from Europe intentionally by humans.

What is an invasive species?

Not all non-native species are considered invasive. This term is reserved for species that do so well in their new habitat that they end up causing harm to the environment, other species, human health, or economic activity (ISAC, 2006). An example of an invasive species in southern Canada is the Zebra Mussel *(Dreissena polymorpha)*, which was introduced to North America by ships releasing their ballast water. The Zebra mussel reproduces quickly and establishes large colonies on any hard surface. In this way they take over habitat occupied by native species, reducing the availability of food for other species, and also attaching themselves in great numbers to boats and other infrastructure in the water. (Benson and Raikow, 2010).

Why should you be concerned about invasive species?

When invasive species are introduced and survive, their populations can increase rapidly because there are no natural predators. Invasive species may feed on native species, compete for food and space, as well as expose native species to new parasites and disease. Invasive species are now widely recognized as a leading cause of endangerment and/or extinction of native species (Lassuy and Lewis, 2010).

* *There are currently no known species in Nunavut that can be classified as aquatic or terrestrial invasive species.*

Schill, 2005

Species: Field Sow Thistle *(Sonchus arvensis)*

Impact: The Field Sow Thistle grows quickly, easily and when there are many of them they can reduce the water resources available to other plants. They have the potential to decrease native plant diversity by competing for space and water.

Introduction pathway: Accidently introduced from Europe into North America in a containment of agricultural crop seed. This plant has been able to spread long distances across Canada because the seeds can travel far in the wind.

Schill, 2005

Species: The European Starling *(Sturnus vulgaris)*

Impact: The European Starling can displace native bird species by taking over nesting sites and competing for food.

Introduction pathway: Introduced intentionally to North America from Europe. These birds then dispersed naturally into Canada through migration.

Non-Native Species in Nunavut

As of 2011, there are 17 species known to be non-native in Nunavut, these are listed below and are all terrestrial species. Please note that it is not currently known what the potential is for any of these species to become invasive and to what extent. Two species, the starling and the sow thistle are described in more detail below.

SCIENTIFIC NAME	COMMON NAME		ORGANISM TYPE
Carum carvi	**Wild Caraway**	Cliffe, 2003	Flowering Plant
Taraxacum officinale	**Common Dandelion**	Walker, Lyndon	Flowering Plant
Sonchus arvensis	**Field Sow Thistle**	Schill, 2005	Flowering Plant
Leucanthemum vulgare	**Oxeye Daisy**	Brouwer, Sjon	Flowering Plant
Thlaspi arvense	**Field Pennycress**	Brouwer, Sjon	Flowering Plant
Capsella bursa-pastoris	**Shepherd's Purse**	Gray-Wilson, Anne	Flowering Plant
Barbarea vulgaris	**Yellow Rocket**	Mitchell, Gregg	Flowering Plant
Amaranthus retroflexus	**Green Amaranth**	Pilney, 2003	Flowering Plant
Hordeum vulgare	**Common Barley**	Mitchell, Gregg	Flowering Plant
Puccinellia distans	**Spreading Alkali Grass**	Pilney, 2003	Flowering Plant
Vicia cracca	**Tufted Vetch**	Cliffe, 2003	Flowering Plant
Papaver somniferum	**Opium Poppy**	Anonymous, 2003	Flowering Plant
Plantago major	**Common Plantain**	Pilney, 2003	Flowering Plant
Polygonum aviculare	**Prostrate Knotweed**	Pilney, 2003	Flowering Plant
Pieris rapae	**Cabbage White**	Hall & Jason	Butterfly
Sturnus vulgaris	**European Starling**	Schill, 2005	Passerine Bird
Passer domesticus	**House Sparrow**	Mahaffey, 2003	Passerine Bird

How might invasive species get into Nunavut?

Species are transported throughout the world by human activities, like shipping, which allows species to move further distances and over barriers that they could not do on their own. Nunavut remains very remote compared to the rest of Canada and so the lack of major road systems, infrequent shipping and cold climate has limited their introduction and survival.

However, as climate change alters Arctic ecosystems, it creates conditions that are more favorable to the survival and reproduction of non-native species. It also enables greater human activity and development, which gives potential invasive species more opportunities to establish themselves. (Lassuy and Lewis, 2010).

Pathways of introduction for invasive species into Nunavut

MacGregor, 2003

Hull fouling occurs when organisms attach themselves to the outside of a ship's hull where they can then be transported around the world.

* Ballast water exchange and hull fouling have the greatest potential for introducing invasive species into the aquatic ecosystems of Nunavut. Ballast water is used to stabilize ships. It is pumped aboard ships from different ports around the world and often exchanged far from the region it was obtained. This water can contain species that are not native, and may establish themselves locally.

* Seeds, insects and even small mammals can be transported around the world through the shipping of grocery produce, lumber, construction supplies, and packing materials, even dirt from someone's footwear can contain plant seeds (IASC, 2010).

Dorchet, 2003

The Migratory Grasshopper *(Melanoplus sanguinipes)* is a winged insect that is widely distributed across Canada and is one example of a species that may expand its range into Nunavut.

* As climate continues to change in the Arctic, many terrestrial and aquatic plants and animals will move further north looking for the food and habitat they desire. These wildlife movements are not a threat when it comes to invasive species, but it is important to note that some species, (especially rare or threatened ones) may not survive the transition. Others may do well, like flying insects, which are already increasing in number in some areas of Nunavut. (IASC, 2010).

Wildlife movements are often referred to as "range extensions" where a species expands the area they can live in when the habitat and climate is favorable for them.

Potential Invasive Species in Nunavut

As trade and shipping continues to increase, some aquatic invasive species known to commonly foul ship hulls and ballast waters, like the Chinese Mitten Crab, are more likely to arrive at ports around Nunavut.

A recent report commissioned by Fisheries and Oceans Canada identified a number of potential aquatic invasive species, mainly for the Hudson Bay region. The table below lists only those species considered as "High Risk" to Nunavut and they are found in freshwater & marine environments.

SCIENTIFIC NAME	COMMON NAME		ORGANISM TYPE

How can you help?

Report

Have you seen a different plant, animal or insect in Nunavut?

You help identifying these species is important. Report the **location** where you observed the species (GPS Coordinates are very helpful) and provide a **detailed description** of the plant, animal, or insect. If possible **take a photo**.

Remember that not all non-native species are considered invasive. If you see an unknown plant or animal, it is very important to report it.

Do not take any extreme actions; the first step is reporting the species so that territorial and federal agencies can respond appropriately. We will report our findings back to you and information about the species you have observed.

Share

Keep yourself informed and educate others about non-native and invasive species. Let them know what to do if they see an unknown or uncommon species.

Report a species to your local Conservation Officer.

Executive Summary

Agnico Eagle Mines Limited ships approximately 40,000 tonnes of dry cargo (equipment and supplies) and 122 million litres of diesel fuel annually for the operations of the Meliadine Gold Mine in Rankin Inlet, Nunavut. The Mine's Shipping Management Plan outlines a Marine Mammal and Seabird Observer (MMSO) program that is to be implemented by Project shipping contractors. The purpose of the MMSO program is to mitigate interactions between marine mammals and seabirds and Project vessels and to collect information on marine wildlife presence. The objective of this report is to provide additional information regarding the 2017 and 2018 MMSO program as requested by the Nunavut Impact Review Board (NIRB) during their review of the Mines 2017 annual report. This report provides an interpretation and discussion of the MMSO data collected in 2017 and 2018 by the shipping contractor Transport Desgagnés.

In 2017 the marine mammal observations were conducted from the Acadia Desgagnés and the Claude A. Desgagnés and in 2018 from the Acadia Desgagnés. Marine mammal observations were reported between 22 July to 21 September 2017 and 26 June to 24 July 2018. Five species of marine mammals were observed in 2017 including the Atlantic walrus, hooded seal, ringed seal, humpback whale, and pilot whale. No marine mammals were observed in 2018.

A maximum of 4 and 12 seabird species were recorded during moving and stationary platform surveys in 2017 (June and July) and 2018 (June to October), respectively. The density of seabirds reported are generally low, although densities estimated from 2018 moving platform data were significantly higher than in 2017.

No marine mammal-vessel interactions or birds-vessel interactions (e.g., strikes) were recorded in 2017 or 2018.

Study Limitations

On behalf of Agnico Eagle Mines Limited (Agnico Eagle), Nuqsana Golder Engineering and Environmental Consulting Inc. (Nuqsana Golder) has prepared this Marine Mammal and Seabird Observer (MMSO) Report for the 2017 and 2018 Shipping Season for the Meliadine Gold Mine in Rankin Inlet, Nunavut. The scope of work for this report was undertaken under the Master Services Agreement (MSA) between Agnico Eagle and Nuqsana Golder, made effective as of 17 April 2018 and as outlined in Nuqsana Golder work plan titled “Proposal – Marine Mammal and Seabird Observer (MMSO) report” and dated 7 January 2019.

This report was prepared, based in part, on information obtained from Transport Desgagnés through Agnico Eagle and other historic information sources. In preparing the report, Nuqsana Golder has relied in good faith on information provided. We accept no responsibility for any deficiency or inaccuracy contained in this report because of our reliance on the aforementioned information.

The findings and conclusions documented in this report have been prepared for the specific application to this Project and have been developed in a manner consistent with that level of care normally exercised by environmental professionals currently practicing under similar conditions in the jurisdiction.

With respect to regulatory compliance issues, regulatory statutes are subject to interpretation. These interpretations may change over time and should be reviewed regularly.

If new information is discovered during future work, the conclusions of this report should be re-evaluated, and the report amended, as required, prior to any reliance upon the information presented herein.

Summary of Marine Mammal Sightings and Environmental Variables Recorded by Transport Desgagnés for the 2017 and 2018 Shipping Season

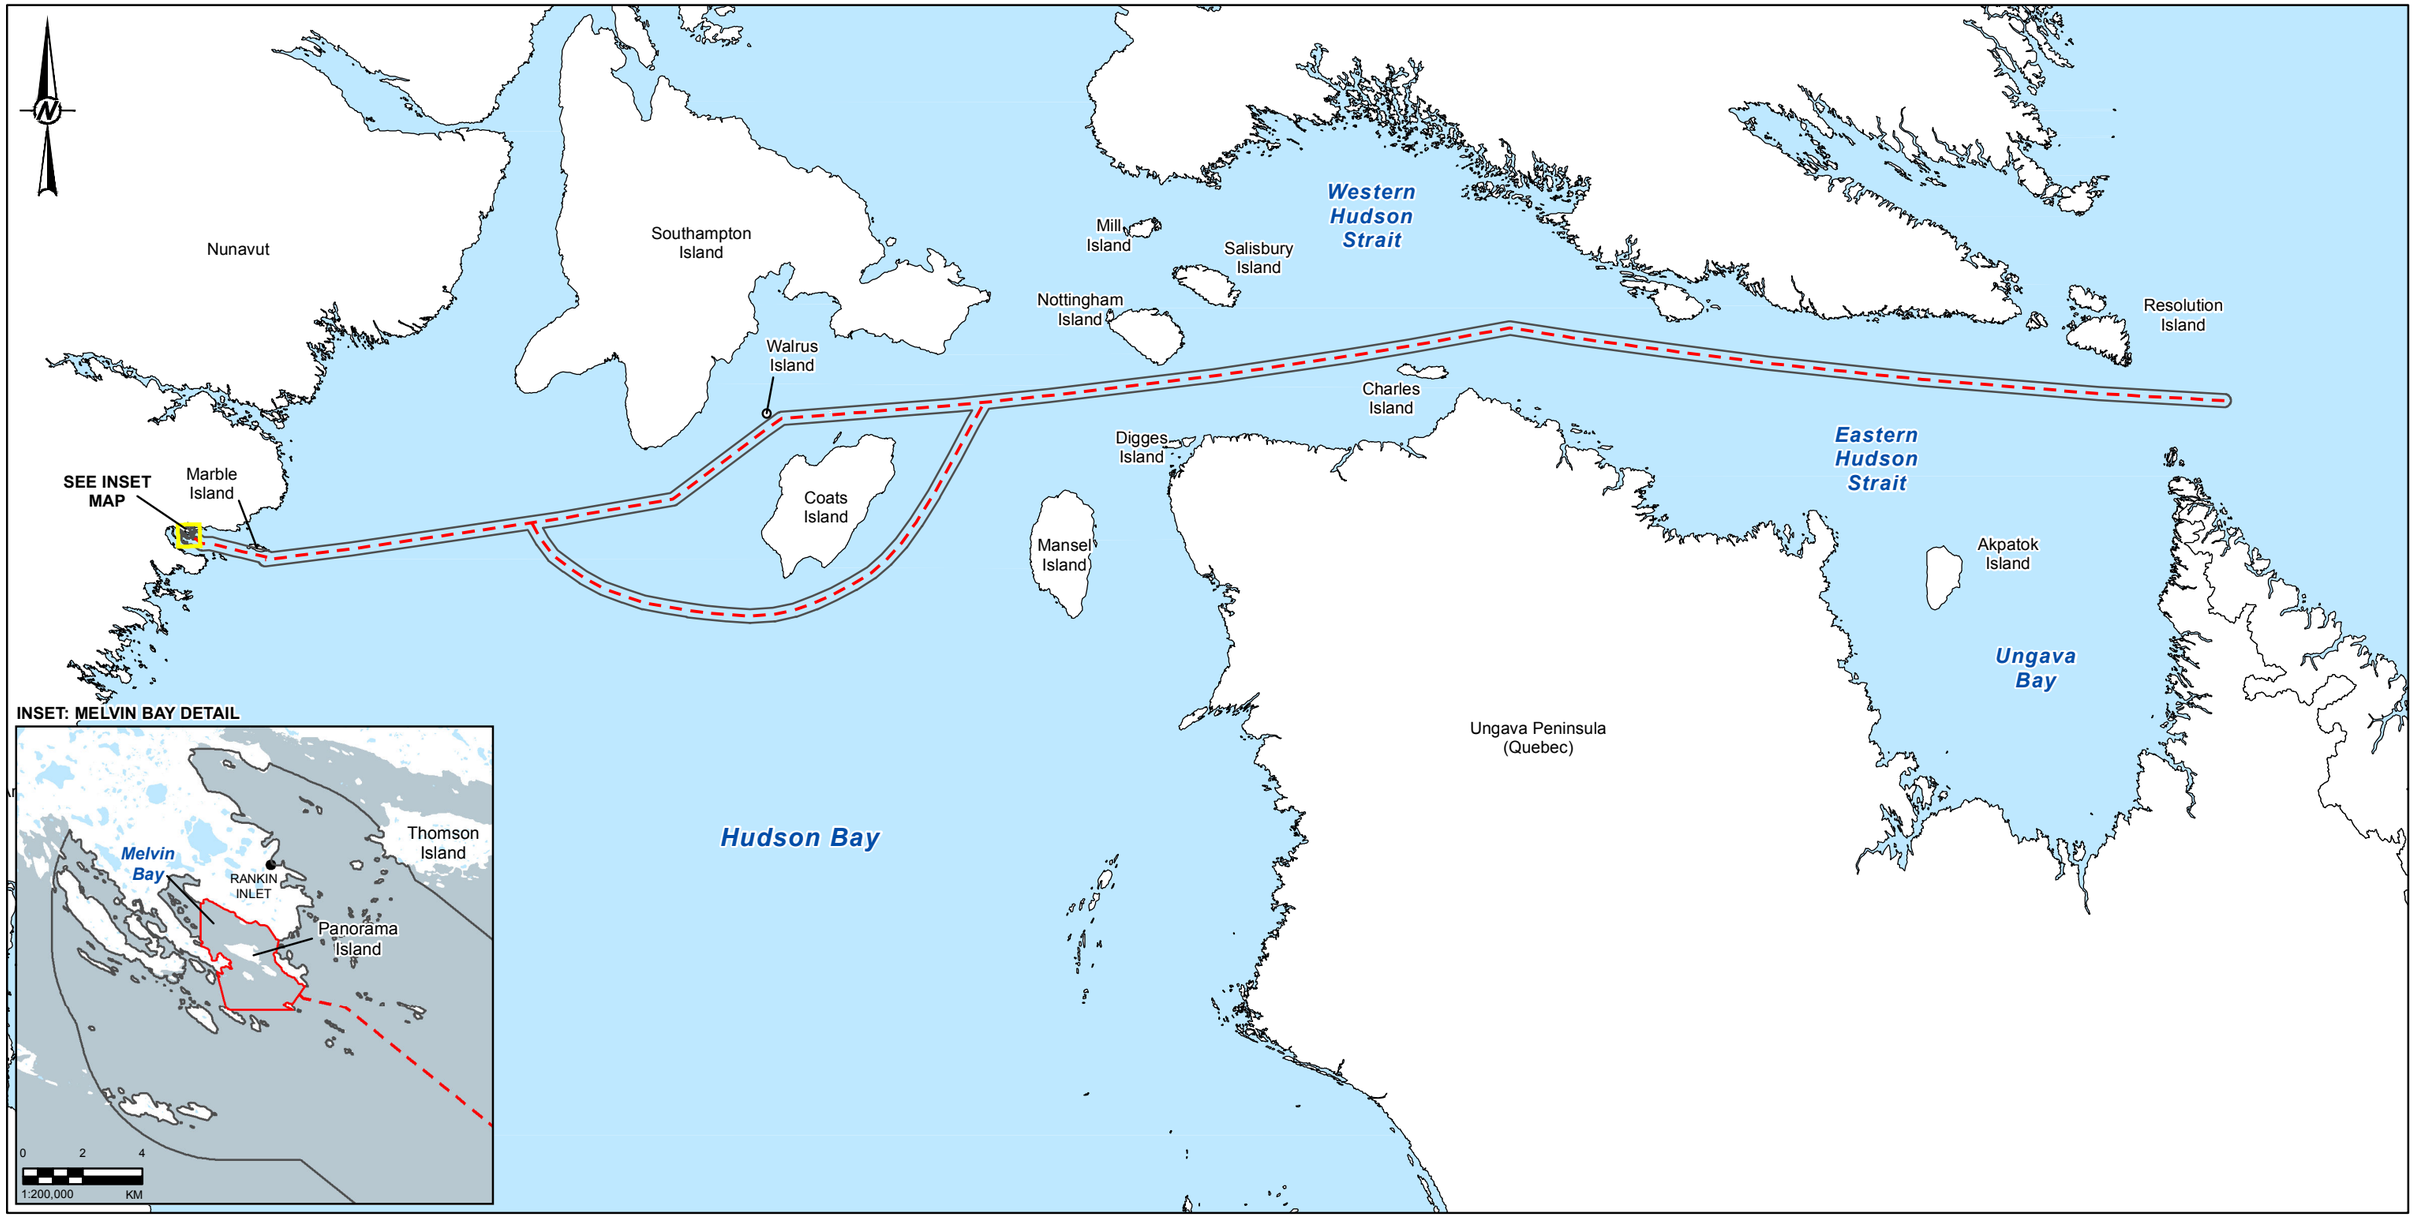
APPENDIX B
Data Sheets Recorded by Transport Desgagnés and Provided by Agnico Eagle Mines for Marine Mammal and Seabird Observations for the 2017 and 2018 Shipping Season

1.0 INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) ships approximately 40,000 tonnes of dry cargo (equipment and supplies) and 122 million litres of diesel fuel annually for the operations of the Meliadine Gold Mine (the Mine or the Project) in Rankin Inlet, Nunavut (Agnico Eagle 2018; Figure 1). To meet these needs, approximately eight ships per year are needed to deliver dry cargo and up to four additional ships per year to deliver fuel. Shipping is carried out during the open water season (typically from early July to late October; Agnico Eagle 2018). Shipping activities are carried out by Transport Desgagnés. To support the Terms and Conditions of the Mine Project Certificate, Transport Desgagnés is required to implement a Marine Mammal and Seabird Observer (MMSO) program during shipping activities in the marine Local and Regional Study Areas (Agnico Eagle (2018; Figure 2). The purpose of the MMSO program is to mitigate interactions between marine mammals, seabirds and Project vessels and to collect information on marine wildlife presence.

This report provides an interpretation and discussion of the 2017 and 2018 MMSO observations collected by Transport Desgagnés to support the Mines annual report to the Nunavut Impact Review Board (NIRB).

1.1 Objectives



The objective of this report is to present a summary of the MMSO data collected by Transport Desgagnés during the 2017 and 2018 MMSO programs including a summary of results, interpretation and discussion to support Agnico's 2018 annual report to NIRB. The comments related to the 2017 reporting of the MMSO program provided by NIRB are presented in Table 1.

Table 1: Project Certificate Terms and Conditions and Comments Provided by NIRB on the 2017 Mines Annual Report

Number	Project Certificate Terms and Conditions	Comments by NIRB
66	The Proponent shall ensure all Project vessels are checked for bird strikes after a suspected event and include details of its protocol to do so, as well as results, within its updated Terrestrial Environment Mitigation and Monitoring Plan.	While the raw data is provided in the appendix, the NIRB expects a summary of the results with interpretation and discussion to be provided within the main text of the annual report.
82	The Proponent shall require all contracted shipping companies to provide full-time marine wildlife monitoring using trained observers and established data collection and recording protocols. Monitoring plans should include provisions for all Species At Risk Act (SARA) and for the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) listed species (birds and mammals).	While the raw data is provided, the NIRB expects a summary of the results with interpretation and discussion to be provided within the main text of the annual report. In addition, the NIRB acknowledges Environment and Climate Change Canada's comments regarding standardized protocols and databases and encourages the Proponent to follow-up.

2.0 METHODS

Nuqsana Golder has assumed that the 2017 and 2018 MMSO programs were conducted by Transport Desgagnés in accordance with the methods outlined in the Shipping Management Plan (Agnico Eagle 2018). Appendix A summarizes the MMSO data recorded by Transport Desgagnés and Appendix B provides the raw datasheets used by Transport Desgagnés and provided by Agnico Eagle.

2.1 Marine Mammal Data Analysis

This section outlines the methods used to summarize the environmental conditions, observer effort, and marine mammal sightings related to the marine mammal information recorded by Transport Desgagnés. There were not enough marine mammal sightings recorded during the 2017 and 2018 MMSO programs to conduct a density analysis.

Temporal and Spatial Observation Effort

Temporal (hours) and spatial (km) marine mammal observation effort was defined as the effort dedicated to marine mammal observations as recorded by Transport Desgagnés on the MMSO datasheets (Appendix B). Marine mammal spatial effort was calculated as linear kilometres using GPS coordinates that were recorded by Transport Desgagnés at the start and end of each MWO shift. Start and end times were recorded by Transport Desgagnés on the datasheets (Appendix B) and were used to determine temporal effort (i.e., the time spent completing marine mammal observations).

Environmental Variables

The environmental variables of ice cover (percent), wind speed and direction, sea state (Beaufort scale), weather (e.g., precipitation and cloud conditions), visibility, sun glare and sightability (combination of weather, glare, and sea state, etc.) were recorded by Transport Desgagnés on the datasheets (Appendix B) and were summarized as a percentages of observation effort.

2.2 Seabirds

This section outlines the methods used to summarize the environmental conditions, observer effort, and to provide a density estimate for seabird sightings related to the seabird information recorded by Transport Desgagnés in 2017 and 2018. Additionally, Agnico Eagle requested a comparison of seabird monitoring results from 2017 to 2018 between years to determine if there were differences.

Temporal and Spatial Observation Effort

According to seabird protocols (Agnico Eagle 2018), surveys from moving and stationary platforms are completed in 5-minute intervals. Additionally and similar to marine mammals, the number of survey hours and km were recorded as indices of effort for seabird. Seabird spatial effort was calculated as linear kilometres using GPS coordinates that were recorded by Transport Desgagnés at the start and end of each 5-minute interval. Start and end times were recorded by Transport Desgagnés on the datasheets (Appendix B) and were used to determine temporal effort (i.e., the time spent completing seabird surveys).

Environmental Variables

The same environmental variables of ice cover (percent), wind speed and direction, sea state (Beaufort scale), weather (e.g., precipitation and cloud conditions), visibility, sun glare were recorded by Transport Desgagnés on the datasheets (Appendix B). Environmental conditions were not separately summarized for seabird monitoring but are anticipated to be similar since the MMSO protocol is to alternate these programs numerous times throughout daily monitoring (Agnico Eagle 2018).

2.2.1 Data Analysis

The monitoring records prepared by Transport Desgagnés and provided by Agnico Eagle included observations of seabird counts at varying distances from moving and stationary ships (Appendix B). Sightings data from a moving vessel are analogous to line-transect sampling while observations from stationary vessel are similar to point-counts. Both can be used to estimate the density of seabirds. When distances to seabirds are measured, the density estimate can be corrected for seabirds that are farther away from the ship and harder to detect (i.e., not observed or missed). This correction is employed through use of a distance-based detection function as outlined in Buckland et al. (2001). The analysis was focussed on estimating and then comparing seabird density by year. Densities for stationary and moving surveys are presented without regard for environmental variables because preliminary review of data indicated that low sample sizes were going to be limiting (Buckland et al. 2001) and inclusion of additional model variables would decrease the precision of estimates.

Analysis of stationary and moving platform seabird data was performed using the Conventional Distance Sampling analysis engine of the Distance 7.2 software program (Thomas et. al. 2009). The initial step is to fit a detection distribution that corresponds to the sightings data. The hazard-rate, half-normal, and uniform key functions, all with cosine, simple polynomial, and hermite polynomial series expansions, were tested for fitting the data. The observation data were transformed into intervals for the fitting of the models. There is a possibility that seabirds may actively avoid the ship during the moving platform surveys (e.g., birds may dive when they are close to the ship and resurface further from the ship where they are recorded by observers). To account for this, seabird observations from moving platform surveys that were recorded within 0 to 50 m and 51 to 100 m from observers were pooled together into one distance interval (i.e., 0 to 100 m) for the moving platform data analysis.

The standard analysis method of transect surveys assumes that on average, over multiple replications of the survey, each point within the survey area has an equal likelihood of being sampled (uniform coverage probability). Because the locations of the transect lines were considered random with respect to the location of seabirds, the average density of seabirds was considered to be the same irrespective of distance from the transect line. Thus, any observed change in seabird sightings with increasing distance from the transect line was considered a change in the probability of detection, rather than a true change in bird density. The change in detection probability with respect to sighting distance from the transect line was measured to provide an estimate of the average probability of detection of a bird, which was, in turn, used to estimate the density of seabirds in the survey area. Sample size for modelling detection function should generally be at least 60 to 80 sightings, although for some purposes, as few as 40 sightings may be adequate (Buckland et al. 2001).

Models were selected using the minimum Akaike's Information Criterion (AIC) as well as consideration for fit near zero distance, where fit is most critical and not accounted for in AIC values (Buckland et. al. 2001). For moving platform surveys, these detection functions all assume 100% detection on the trackline (g(0)=1).

Distance truncation of the data was performed to remove sightings past a selected distance (i.e., 300 m), which serves to remove outliers that would otherwise inflate density and abundance estimates (i.e., observation size-bias) as well as remove hard-to-fit portions of the dataset (e.g., obvious data heaping at certain distances).

Observation data used distance analyses included on-transect sightings only. Re-sightings were not used for the estimation of any variables. The sample sizes available for estimating detection functions and seabird densities are provided in Table 2. The sample sizes indicate that accurate species-level densities can not be estimated.

Table 2: Sample Size Available for Distance Analyses

Year	Survey Type	Number of Transects / Stationary Plots for Calculating Detection Function and Density Estimates
2017 – all species	Moving Platform	30
2018 – all species	Moving Platform	54
2017 and 2018 – all species	Moving Platform	84
2017 – all species	Stationary Platform	7
2018 – all species	Stationary Platform	2
2017 and 2018 – all species	Stationary Platform	9

3.0 RESULTS

3.1 Marine Mammals

Marine mammal observations were recorded by Transport Desgagnés and provided by Agnico Eagle during the 2017 and 2018 shipping season. In 2017 the marine mammal observations were conducted from the Acadia Desgagnés and the Claude A. Desgagnés and in 2018 from the Acadia Desgagnés. Surveys were completed between 22 July to 21 September 2017 and 26 June to 24 July 2018. Marine mammal sightings were only recorded in 2017; no marine mammal sightings were recorded in 2018. No record of marine mammal-vessel interactions (e.g., strikes) were recorded by Transport Desgagnés in 2017 or 2018.

A summary of the environmental variables and marine mammal sightings recorded by Transport Desgagnés and provided by Agnico Eagle is provided in Appendix A. Data sheets for marine mammal monitoring recorded by Transport Desgagnés and provided by Agnico Eagle are provided in Appendix B.

3.1.1 Survey Effort

According to the observation records prepared by Transport Desgagnés, marine mammal observer effort included a total of 22.7 hours and 543.45 km in 2017, with six hours of effort while anchored. In 2018, observer effort included a total of 21.5 hours and 1,514.2 km in 2018 and no hours of effort while anchored.

3.1.2 Environmental Variables and Sighting Conditions

Weather

Predominant weather conditions recorded by Transport Desgagnés during the 2017 marine mammal observation program were recorded as < 50% cloud cover with no fog, rain, or snow (62% of survey effort) followed by > 50% cloud cover with no fog, rain, or snow (25% of survey effort), and solid fog (13% of survey effort; Figure 3).

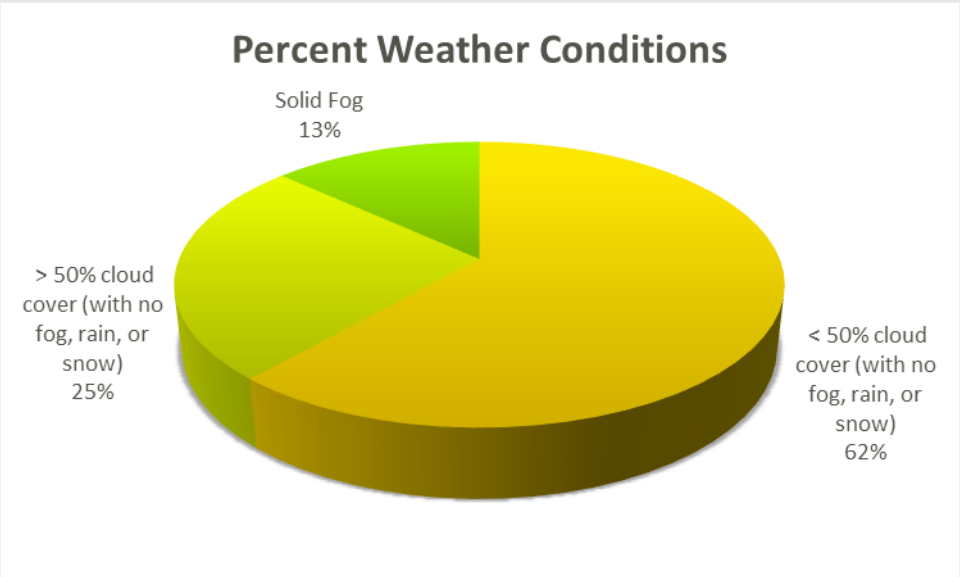

Figure 3: Percent Weather Conditions – 2017 Marine Mammal Observation Program

Predominant weather conditions during the 2018 marine mammal observation program were recorded as < 50% cloud cover with no fog, rain, or snow (44% of survey effort) and > 50% cloud cover with no fog, rain, or snow (44% of survey effort) followed by patchy fog (10% of survey effort) and fog/rain (2% of survey effort; Figure 4).

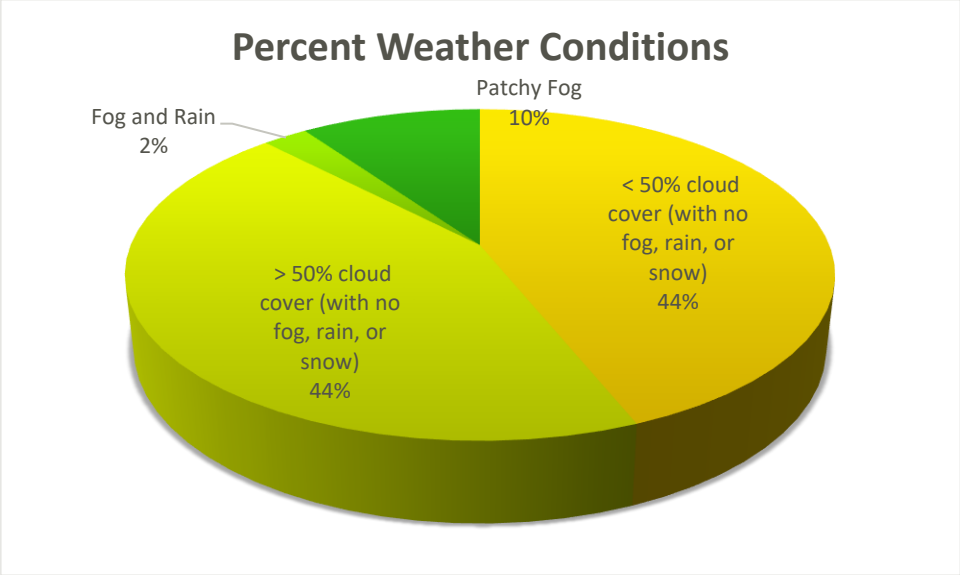

Figure 4: Percent Weather Conditions - 2018 Marine Mammal Observation Program

Visibility

Visibility recorded by Transport Desgagnés during the 2017 marine mammal observation program ranged from 1 to 10 km, on average visibility was recorded to be 9.2 km. In 2018, the marine mammal observation program recorded visibility ranging 8 to 75 km, on average visibility was recorded to be 21.93 km.

Sea State

Sea state recorded by Transport Desgagnés during the 2017 marine mammal observation program ranged from 0 (no waves, glassy) to 4 (1.2 to 2.4 m waves, Moderate Waves, Some Spray). The majority of sea state conditions were recorded as 0 (no waves, glassy; 38% of survey effort), followed by 2 (0.1 to 0.5 m waves, Smooth Wavelets; 27% of survey effort), 1 (0 to 0.1 m waves, small wavelets; 21% of survey effort), 3 (0.5 to 1.2 m waves, slight; small white caps; 9% of survey effort), and 4 (1.2 to 2.4 m waves, moderate waves, some spray; 5% of survey effort; Figure 5).

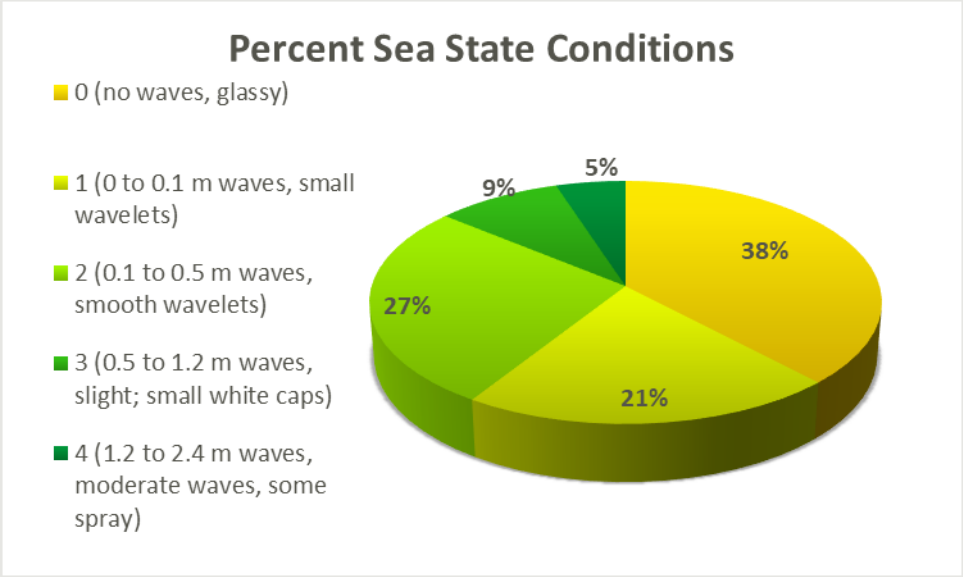

Figure 5: Percent Sea State Conditions – 2017 Marine Mammal Observation Program

In 2018, sea states recorded by Transport Desgagnés ranged from 0 (no waves, glassy) to 4 (1.2 to 2.4 m waves, moderate waves, some spray) during the marine mammal observation program. The majority of sea state conditions were recorded as 4 (1.2 to 2.4 m waves, moderate waves, some spray; 26 % of survey effort), followed by 3 (0.5 to 1.2 m waves, slight; small white caps; 23% of survey effort), 2 (0.1 to 0.5 m waves, smooth wavelets; 21% of survey effort), 1 (0 to 0.1 m waves, small wavelets; 16% of survey effort) and 0 (no waves, glassy; 14% of survey effort; Figure 6).

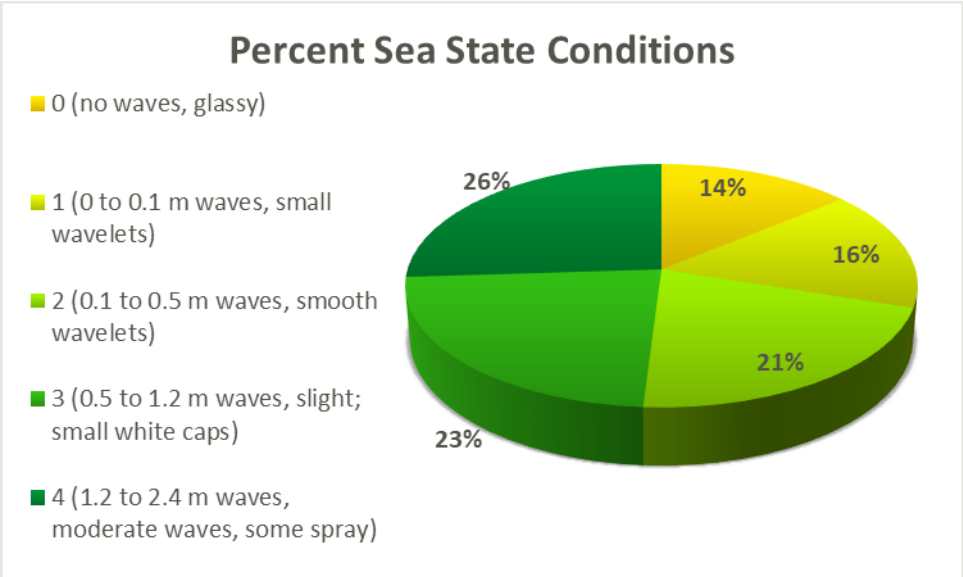

Figure 6: Sea State Conditions – 2018 Marine Mammal Observation Program

Glare Conditions

During the marine mammal observation program in 2017, glare conditions recorded by Transport Desgagnés ranged from 0 (none) to 3 (bright and forward of vessel). The majority of glare conditions were recorded as 0 (none; 41% of survey effort), followed by 2 (bright on the observer's side of the vessel; 24%), 3 (bright and forward of vessel; 24%, and 1(slight/grey) (Figure 7).

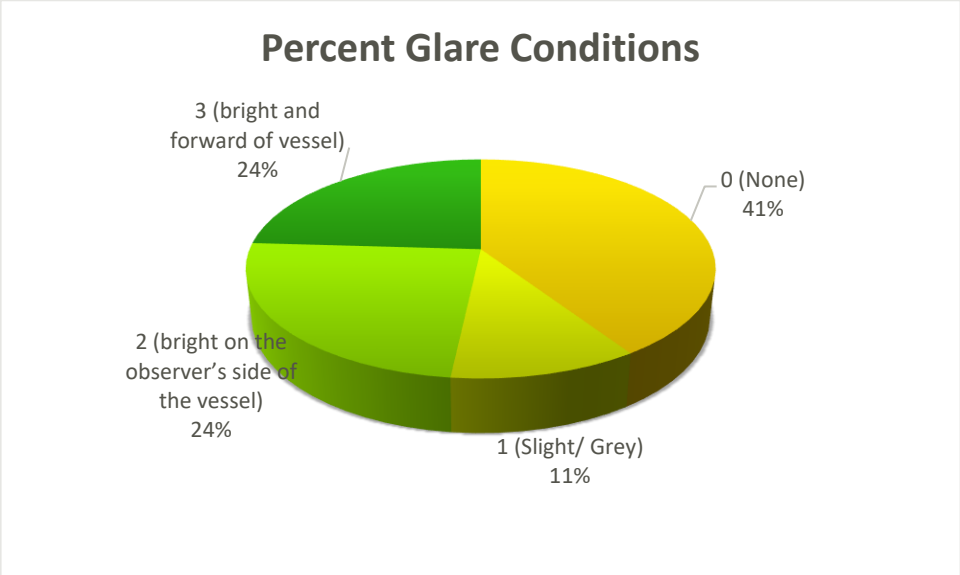

Figure 7: Glare Conditions – 2017 Marine Mammal Observation Program

During the marine mammal observation program in 2018, glare conditions recorded by Transport Desgagnés ranged from 0 (none) to 3 (bright and forward of vessel). The majority of glare conditions were recorded as 0 (none; 58% of survey effort), followed by 1 (slight/grey; 32%), 2 (bright on the observer's side of the vessel; 5%) and 3 (bright and forward of vessel; 5%) (Figure 8).

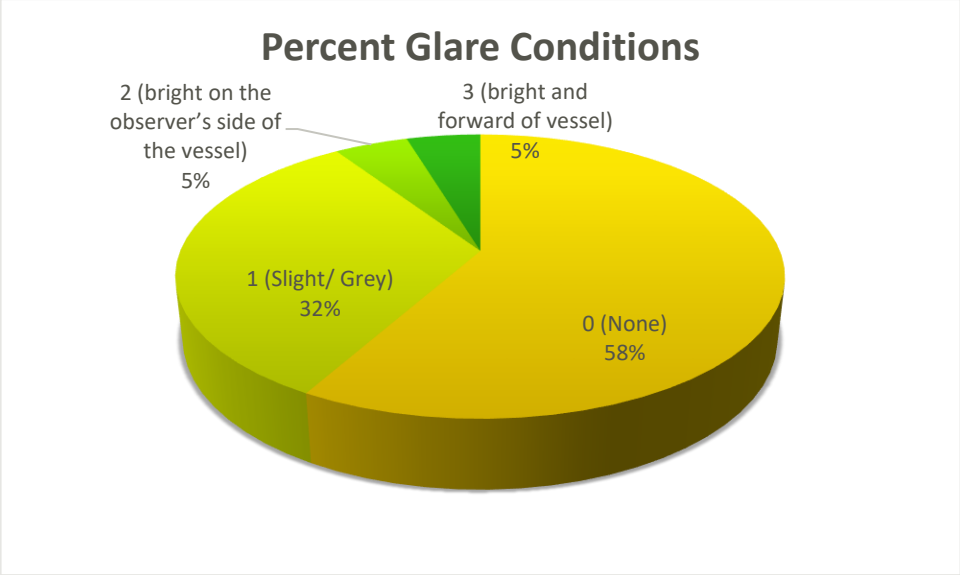

Figure 8: Glare Conditions – 2018 Marine Mammal Observation Program

Ice Concentration

Ice variables were not recorded by Transport Desgagnés during marine mammal observation program in 2017. In 2018, ice concentrations recorded by Transport Desgagnés ranged from 0 (less than one tenth cover, open water) and 5 (seven to eight tenths, close pack). Ice Conditions were predominantly recorded as 0 (none; 80% of survey effort) followed by 1 (two to three tenths, very open drift; 17%) and 5 (seven to eight tenths, close pack; 3%; Figure 9).

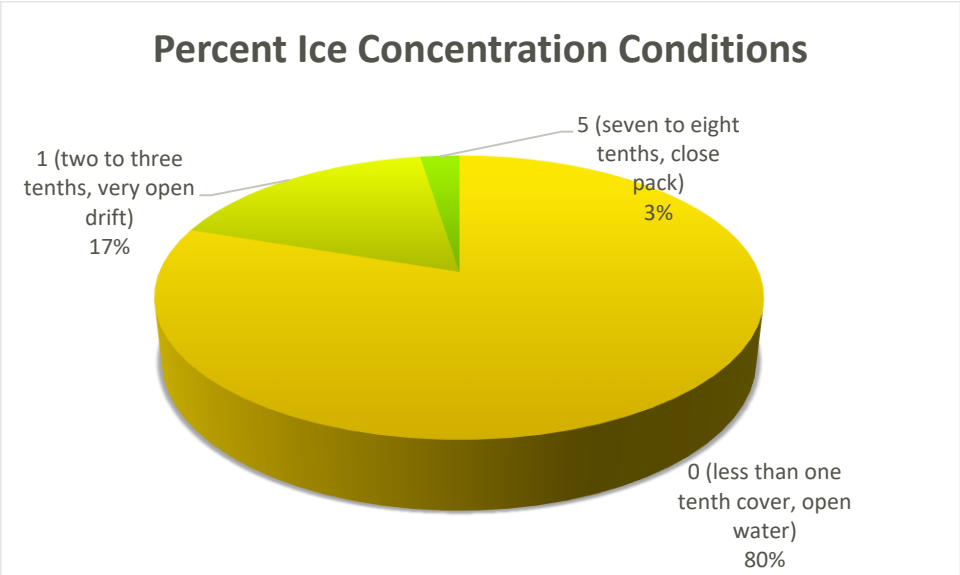

Figure 9: Ice Conditions – 2018 Marine Mammal Observation Program

3.1.3 Sightings

Five species of marine mammals were recorded by Transport Desgagnés during the MMSO Program in 2017: Atlantic walrus (*Odobenus rosmarus rosmarus*), hooded seal (*Cystophora cristata*), ringed seal (*Pusa hispida*), humpback whale (*Megaptera novaeangliae*), and pilot whale (*Globicephala melas* or *G. macrorhynchus*). Unidentified whales and seals were recorded on three occasions. Table 3 summarizes the number of marine mammal sightings recorded by Transport Desgagnés in 2017 and individuals recorded for each species. A total of 13 sightings of 48 individual marine mammals were recorded during MMSO program. All sightings recorded were observed in June and July. The most commonly identified species was Atlantic walrus (five sightings of 14 individuals), followed by ringed seal (three sightings of 12 individuals), pilot whale (one sighting of 10 individuals), and humpback whale (one sighting of five individuals).

Table 3: Marine Mammal Observations During the 2017 MMSO Program

Species	Number of Sightings	Number of Individuals
Atlantic Walrus	5	14
Hooded Seal	1	1
Humpback Whale	1	5
Pilot Whale	1	10
Ringed Seal	3	12
Unidentified Seal Species	2	2
Unidentified Marine Mammal Species	1	4

Hooded Seal

Hooded seals were recorded by Transport Desgagnés in the Eastern Hudson Strait (Figure 10). A total of one sighting of one individual hooded seal was recorded (Table 3).

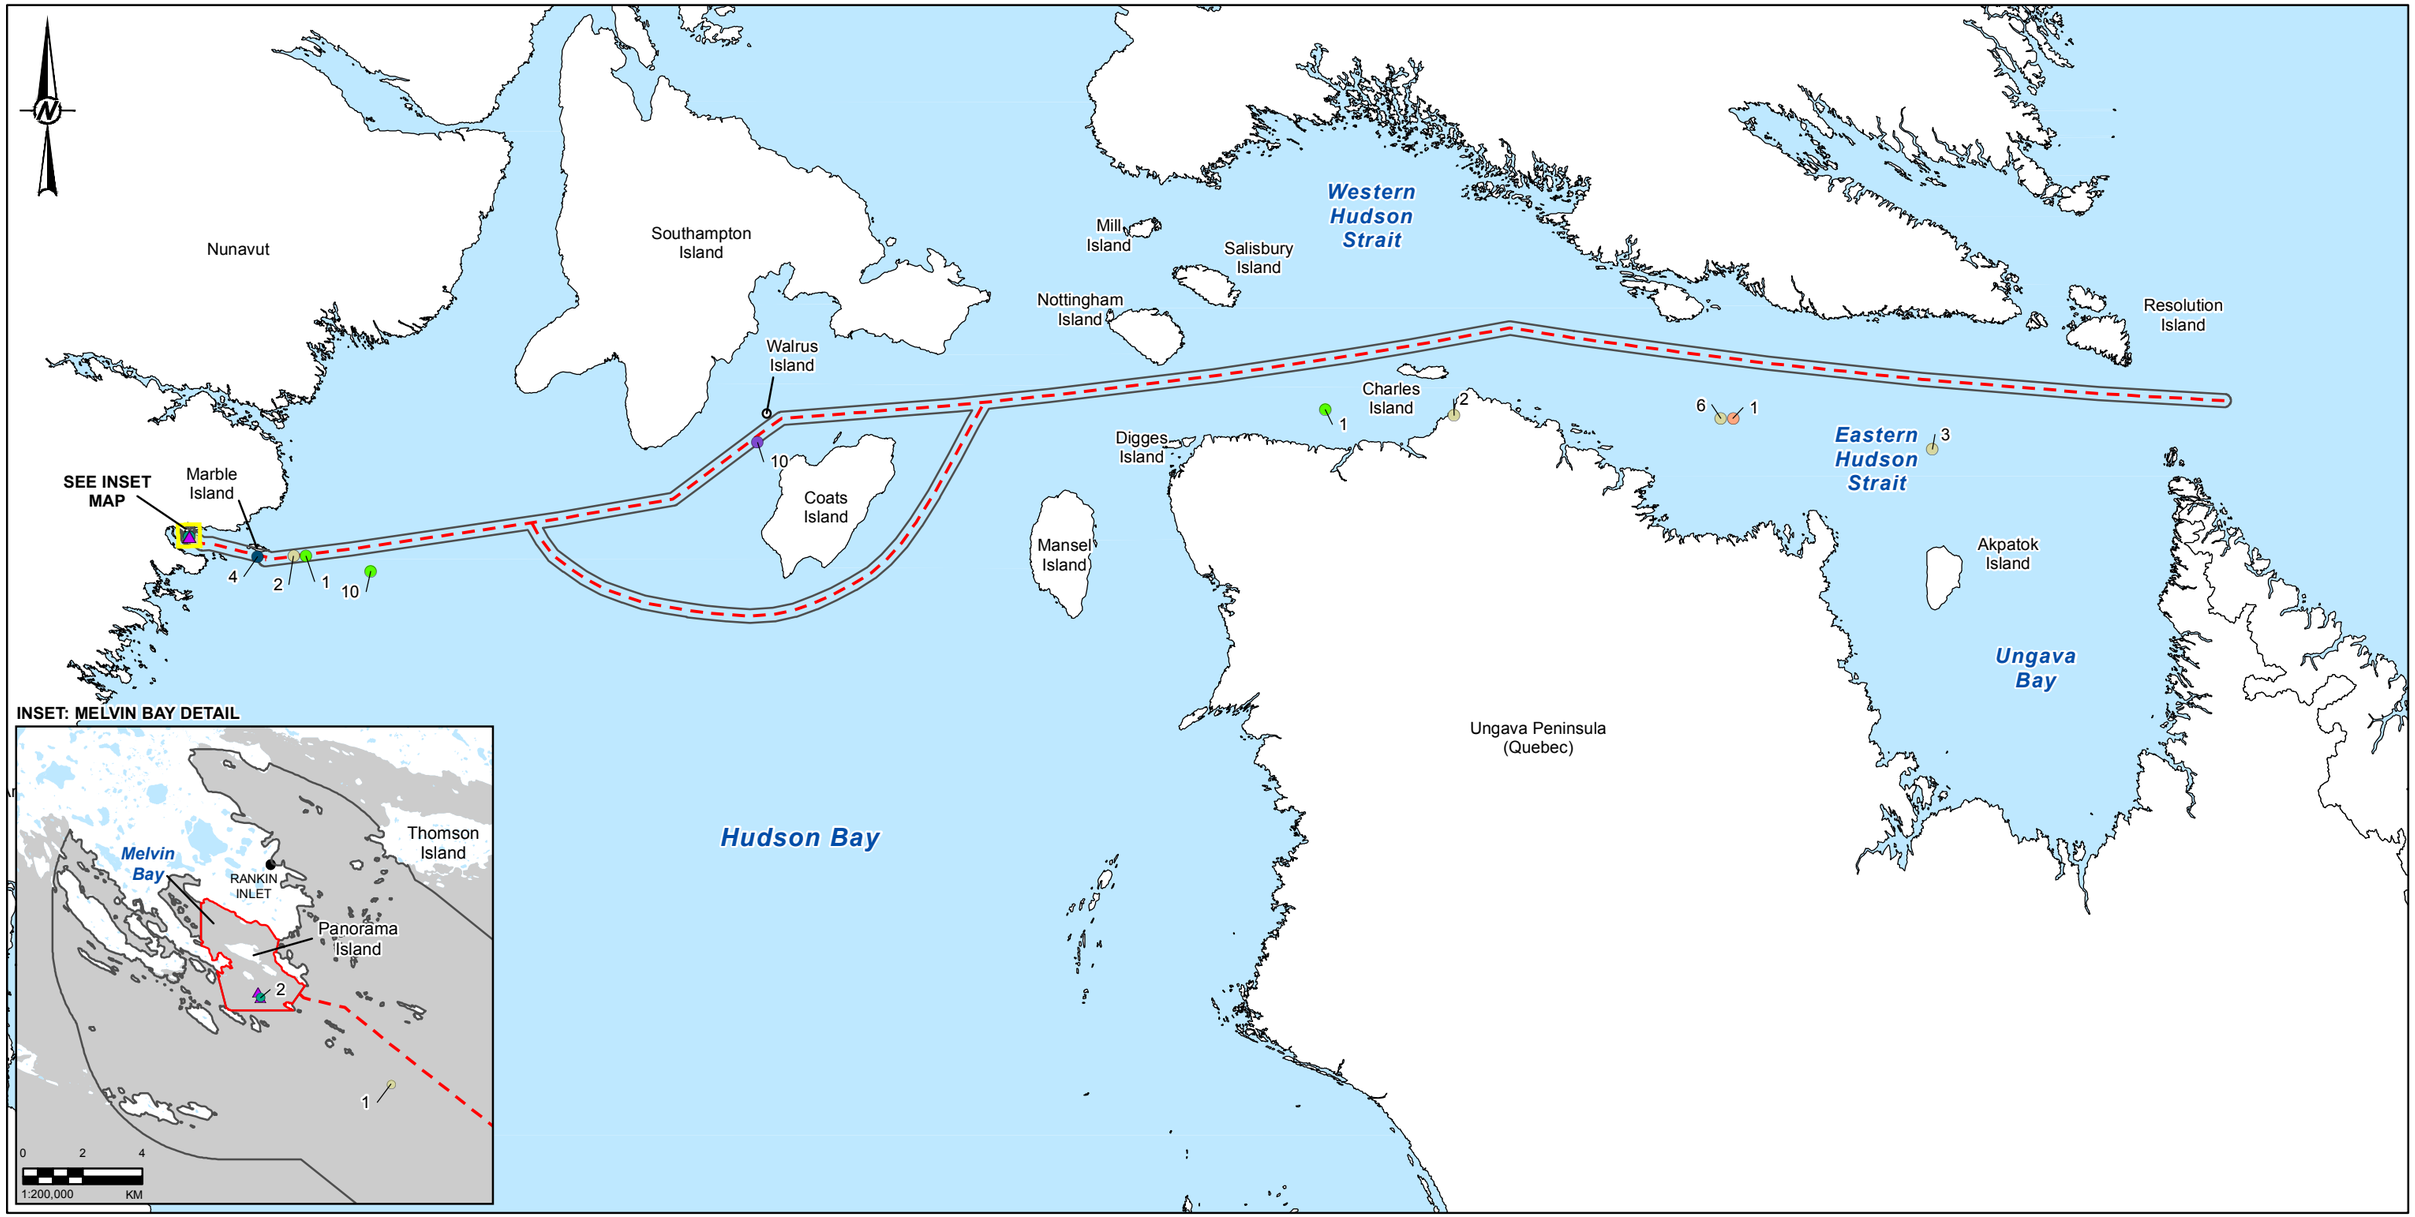
Ringed Seal

Ringed seals were predominately recorded by Transport Desgagnés near Marble Island (Figure 10). A total of three sightings of 12 individual ringed seals were recorded during observations (Table 3). Group sizes ranged from single animals to a group of 10 individuals.

Unidentified Seal

Unidentified seals were recorded near Melvin Bay by Transport Desgagnés (Figure 10). A total of two sightings of two individual unidentified seals were recorded during observations (Table 3). All unidentified seals recorded by Transport Desgagnés were observed in the water or diving.

Pilot Whale



A single sighting of a group of pilot whales was recorded by Transport Desgagnés between Walrus Island and Coats Island during marine mammal observations in 2017 (Figure 10). A total of one sighting of 10 individual pilot whales were recorded during observations (Table 3).

Humpback Whale

Humpback whales were recorded by Transport Desgagnés once during the MMSO program in 2017. Five individual humpback whales were recorded in one group (Table 3; Figure 10).

Atlantic Walrus

Atlantic walruses were recorded by Transport Desgagnés primarily in Eastern Hudson Strait (Figure 10). A total of five sightings of 14 individual Atlantic walruses were recorded (Table 3). Atlantic walruses were primarily observed in groups. Group sizes ranged from a single animal to groups of six individuals. Single walruses and groups of three were recorded as haul-out in 2017. No large walrus haul-outs were recorded during the 2017 or 2018 MMSO programs.

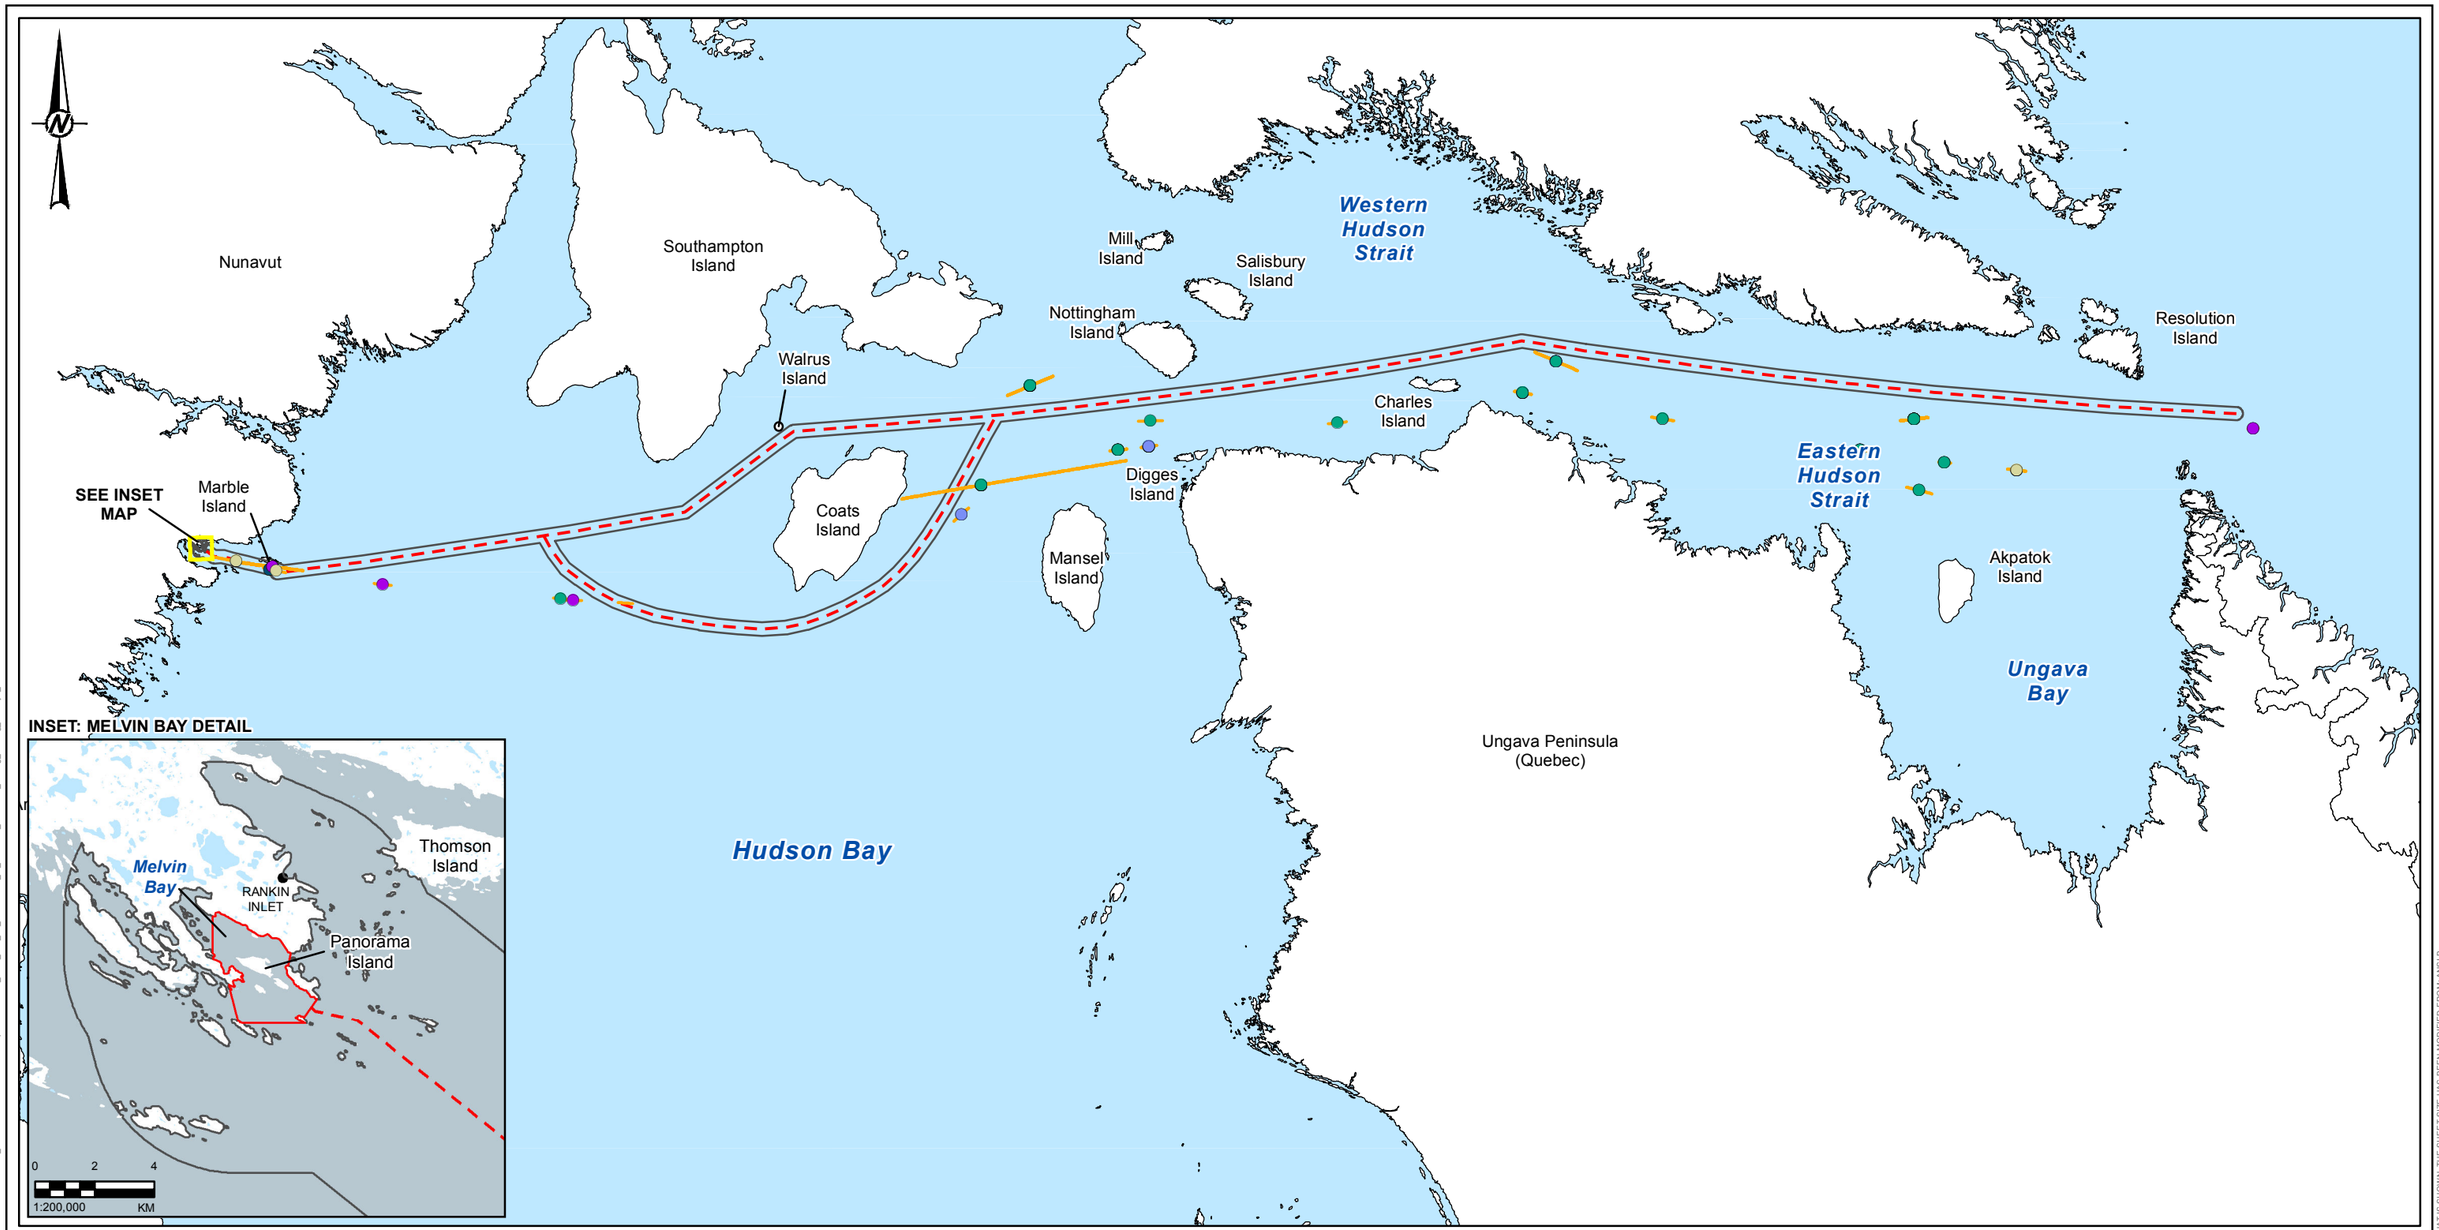
3.2 Seabirds

Seabird monitoring was completed by Transport Desgagnés daily on 26 June to 24 July 2017, 30 June 2018, 17 July to 4 August 2018, 11 to 21 September 2018, 20 October 2018, and 23 October 2018. No seabird interactions (e.g., strikes) with vessels were recorded by Transport Desgagnés during 2017 or 2018 MMSO programs. Data sheets for seabird monitoring recorded by Transport Desgagnés are provided in Appendix B.

3.2.1 Survey Effort

According to the observation records prepared by Transport Desgagnés, monitoring resulted in 227, 5-minute surveys on moving platforms and 65, 5-minute surveys on stationary platforms. In 2017, 443.3 km were surveyed over 15.9 hours for seabirds using moving platform surveys. In 2018, 389.8 km were surveyed over 17.5 hours for seabirds using moving platform surveys. During stationary platform surveys for seabirds, 7 hours and 1 hour were surveyed in 2017 and 2018, respectively.



3.2.2 Surveys from Moving Platforms

3.2.2.1 All Species

During all moving platform surveys reported, a total of 12 identified species and individuals in five unidentified species groups were observed (Table 4). Ivory gull, which is an endangered species in Nunavut (SARA 2019), was observed during the surveys in 2018 (Table 4). The most common identified species during the moving platform surveys in 2017 were thick-billed murre (*Uria lomvia*), dovekie (*Alle alle*), and Iceland gull (*Larus glaucoides*) (Table 4; Figure 11). The most common species identified during the surveys in 2018 were thick-billed murre, Iceland gull, glaucous gull (*Larus hyperboreus*), and black guillemot (*Cepphus grylle*) (Table 4; Figure 12).

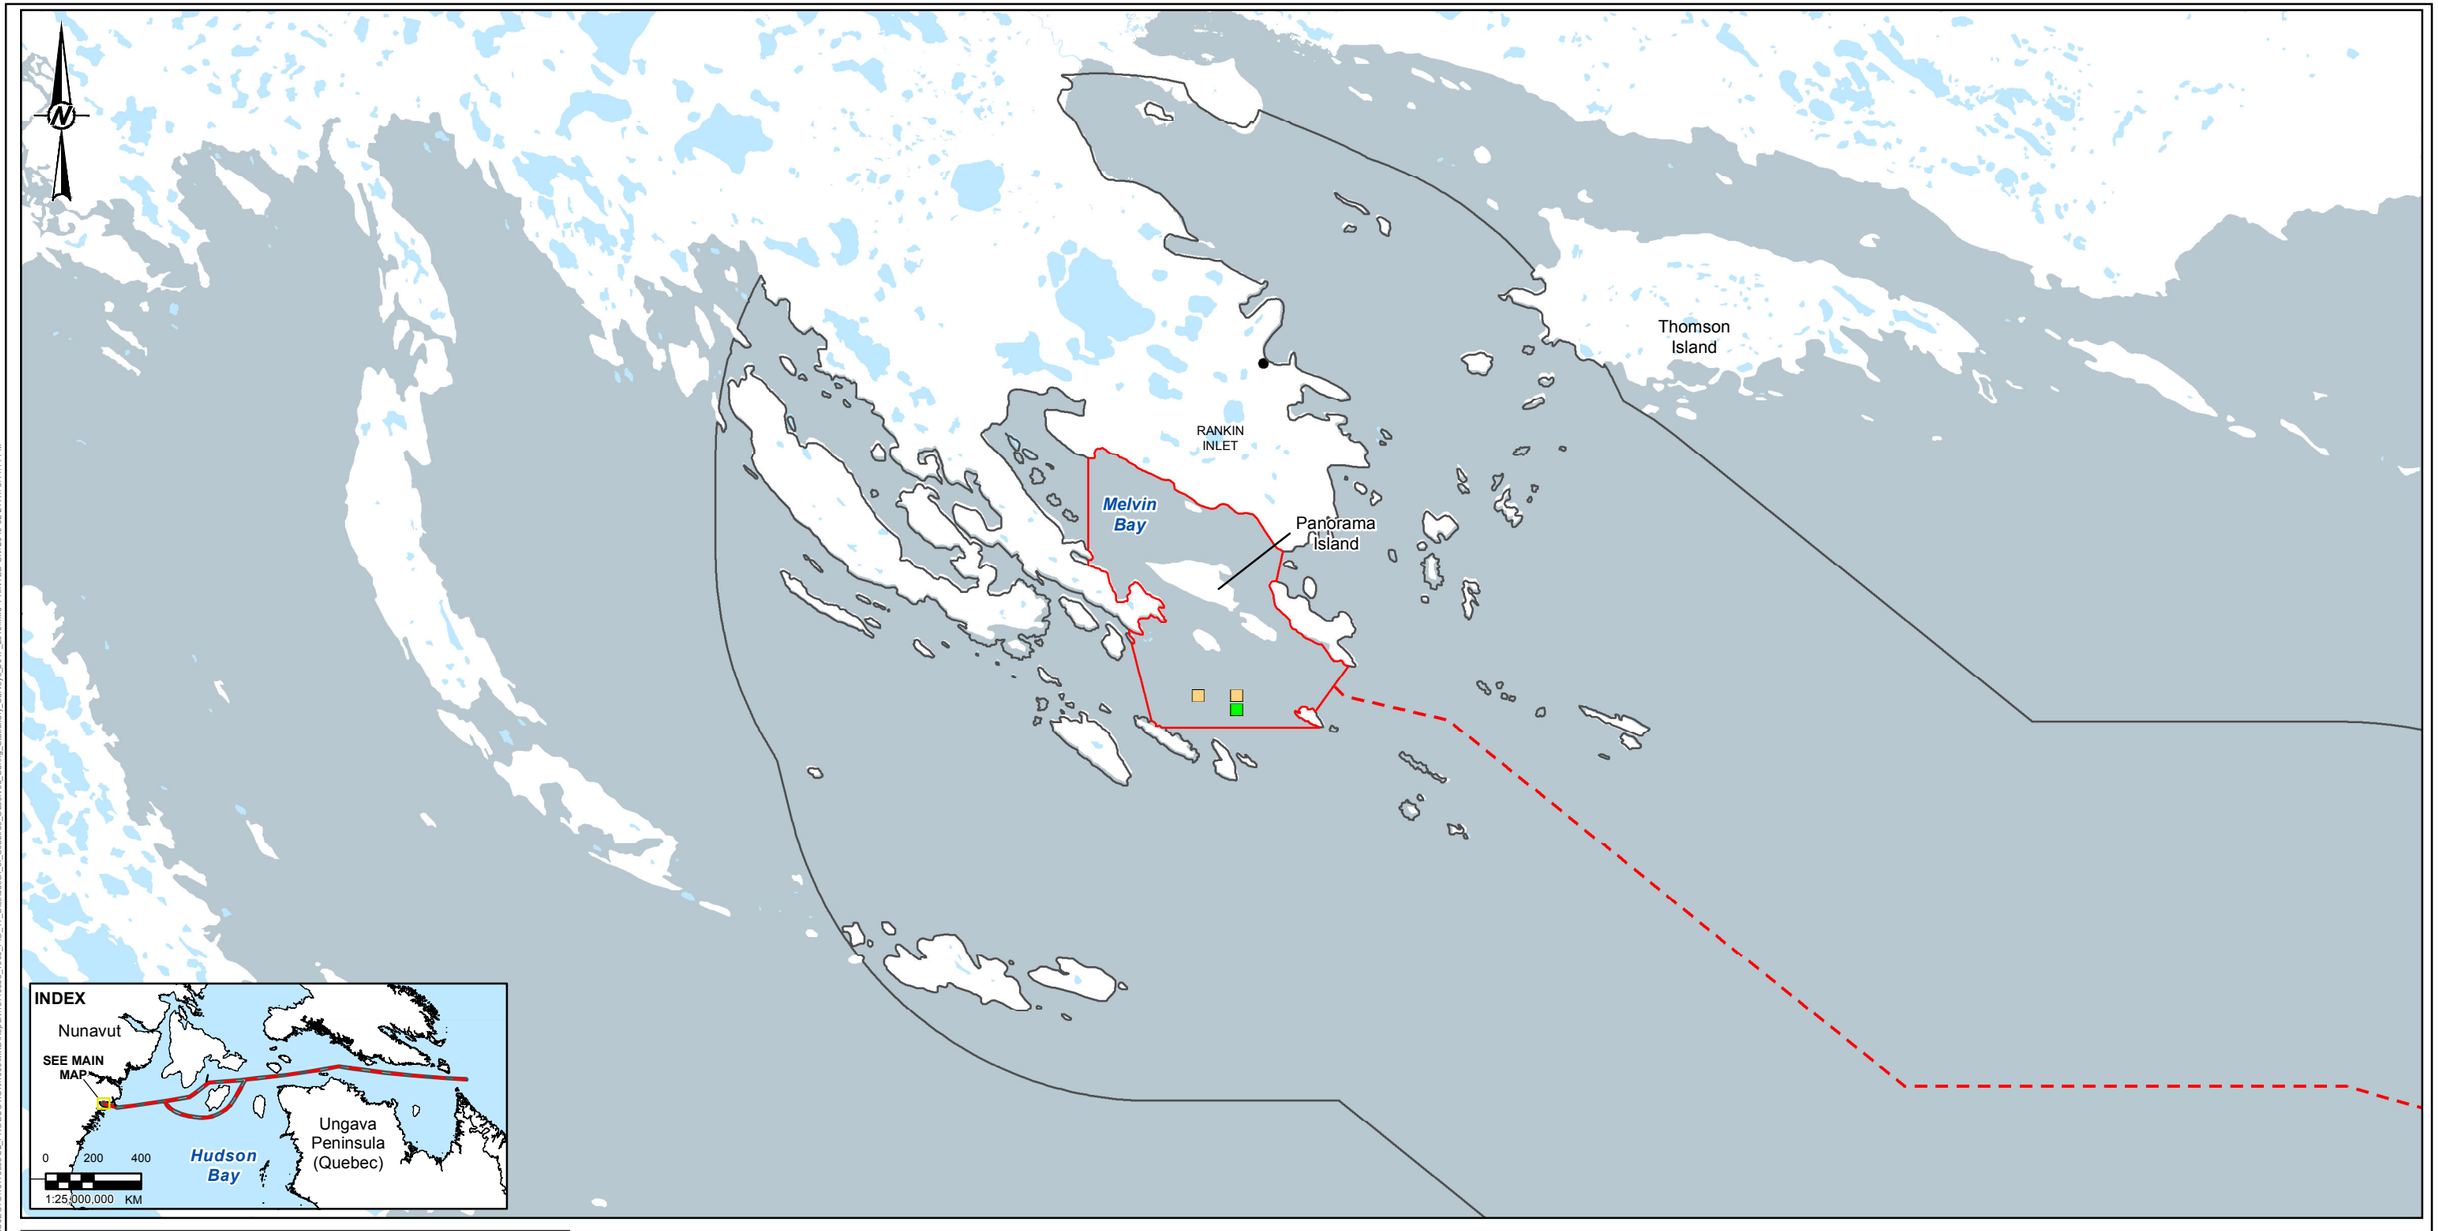
PATH: Y:\burnaby\CAD-GIS\Client\Agnico_Eagle_Mines_Ltd\Meliadine_Gold_Project\99_PROJECTS\18110868\02_PRODUCTION\1000\MXD\Report\18110868_1000_FIG_16_Distribution_of_Seabirds_Observed_During_Moving_Surveys_2018.mxd PRINTED ON: 2019-02-22 AT: 9:45:59 AM

For the initial step in determining density, the detection distribution with the best fit to the sightings data was determined. The half-normal models with simple polynomial expansions had the lowest AIC scores for the moving platform dataset. Having the lowest AIC score of all detection distributions evaluated meant it was the most appropriate to use. Based on this detection function, the overall probability of detecting seabirds during moving platform surveys in 2017 and 2018 was estimated to be 0.43 (95% Confidence Interval [CI]: 0.39 to 0.48). The density estimate of seabirds in 2017 was 1.2 birds/km^2 (Table 5). The density estimate of seabirds in 2018 was 3.6 birds/km^2 (Table 5). Based on non-overlapping 95% CIs, the density of seabirds was significantly higher in 2018 than in 2017 (Table 5). The analysis of the 2017 data may be inaccurate as the sample size for this year is small (Table 2; Buckland et al. 2001). Density estimates were not generated for individual seabird species because the low sample sizes would yield inaccurate results (Buckland et al. 2001).

Table 5: Density Estimates and 95% Confidence Intervals for Seabirds Observed Along Moving Platform Surveys in 2017 and 2018

Year	Model, AIC Score	Sample Size	Density Estimate (individuals/km^2)	95% Confidence Interval (individuals/km^2)
2017	Half-normal, 354.3	30	1.2	0.7 to 2.0
2018		54	3.6	2.7 to 4.9



km^2 = square kilometres; AIC = Akaike's Information Criteria.

3.2.3 Surveys from Stationary Platforms

Four identified species and individuals in three unidentified species groups were observed during stationary surveys in 2017 and 2018 (Table 6; Figure 13). Thick-billed murre was the most abundant species observed in 2017, while glaucous gull was the most abundant species observed in 2018.

Table 6: Seabirds Observed During Stationary Platform Surveys, 2017 and 2018

Species	Number of Individuals Observed	
	2017	2018
Common eider	5	4
Glaucous gull	9	14
Iceland gull	5	0
Thick-billed murre	17	0
Unidentified duck species	9	0
Unidentified gull species	12	7
Unidentified bird species	46	0
Total	**103**	**25**

As with moving platforms, the half-normal model with a cosine expansion had the lowest AIC score and so is the best model of detection for the 2017 and 2018 combined stationary platform data. Using this model, the overall probability of detecting seabirds during stationary platform surveys in 2017 and 2018 was 0.29 (95% CI: 0.16 to 0.54). The estimated density of seabirds in 2017 was 82.9 birds/km^2 (Table 13). The estimated density of seabirds in 2018 was 158.4 birds/km^2 (Table 7). Based on overlapping 95% CIs, the density of seabirds was not significantly different in each of the survey years (Table 7). The analysis of the stationary data may be inaccurate as the sample size for is small (Table 2; Buckland 2001). Density estimates were not generated for individual seabird species because the low sample sizes would yield inaccurate results (Buckland 2001).

Table 7: Density Estimates and 95% Confidence Intervals for Seabirds Observed During Stationary Platform Surveys in 2017 and 2018

Year	Model, AIC Score	Sample Size	Density Estimate (individuals/km^2)	95% Confidence Interval (individuals/km^2)
2017	Half-normal, 135.29	7	82.9	36.5 to 188.5
2018		2	158.4	29.4 to 851.1

km^2 = square kilometres; AIC = Akaike Information Criteria.

4.0 DISCUSSION

This report presents a summary of the MMSO data collected by Transport Desgagnés during the 2017 and 2018 MMSO programs and includes a summary of results, interpretation and discussion in support of the Mine's 2018 annual report. MMSO programs were conducted from the Acadia Desgagnés and the Claude A. Desgagnés in 2017 and from the Acadia Desgagnés in 2018.

Environmental variables of weather conditions, visibility, sea state, glare and ice conditions were recoded by Transport Desgagnés during the MMSO programs in 2017 and 2018. Summaries of the environmental conditions recorded during the marine mammal monitoring indicated annual variation for each of the variables recorded as might be expected. Environmental conditions were not separately summarized for seabird monitoring but are anticipated to be similar since the MMSO protocol is to alternate these programs numerous times throughout daily monitoring (Agnico Eagle 2018).

Marine mammal observations were completed by Transport Desgagnés between 22 July to 21 September 2017 and 26 June to 24 July 2018. Five species of marine mammals were recorded by Transport Desgagnés in 2017 including the Atlantic walrus, hooded seal, ringed seal, humpback whale, and pilot whale. No marine mammals were recorded by Transport Desgagnés in 2018. There were not enough marine mammal sightings recorded to provide a density analysis. No marine mammal-vessel interactions (e.g., strikes) were recorded by Transport Desgagnés in 2017 or 2018.

A total of 12 seabird species were recorded by Transport Desgagnés during June to July 2017 and during June to October 2018. Observations of seabirds from moving platform surveys were variable between years. Four (common eider, dovekie, Icelandic gull and thick-billed murre) of 12 species were seen in both years and the number of seabirds was considerably higher in 2018. Eight more seabird species were recorded by Transport Desgagnés in 2018 than in 2017. Thick-billed murre was recorded consistently as the most abundant (and in total numbers) seabird observed in both years. Overall, densities of seabirds (all species pooled) from moving platforms were low regardless of year. However, densities in 2018 were significantly higher than in 2017. Stationary platform monitoring recorded two (common eider and glaucous gull) of four species that were present in 2017 and 2018 and both were not numerous but relatively consistent across years. Densities of seabirds from stationary platforms were highly imprecise, so the differences are not considered significant. The higher densities observed in 2018 from moving platforms could be an artifact of the monitoring schedule. In 2018, monitoring included the months of September and October, which may capture migrants. In general, the monitoring to date has resulted in low numbers of observations and samples of seabirds, which limit the type of analyses that can be completed for seabirds (Buckland et al. 2001). No interactions between vessels and seabirds were recorded during the MMSO in either 2017 or 2018.

5.0 CLOSURE

We trust this information is sufficient for your needs at this time. Should you have any questions or concerns, please do not hesitate to contact the undersigned at 604-296-4200.

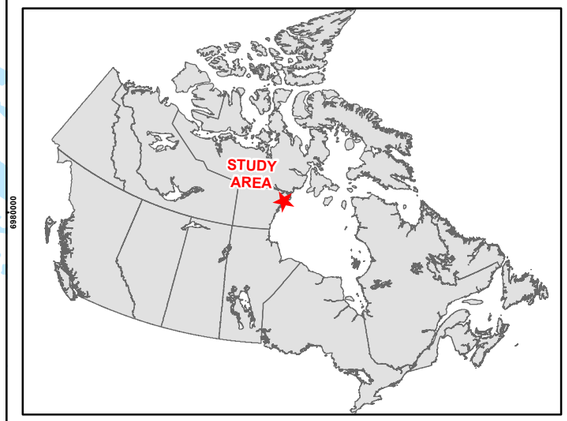
SITE STATUS

The Government of Nunavut has requested that Agnico Eagle Mines Limited (Agnico Eagle) submit a series of maps to help facilitate the management of the archaeological resources that occur within the Meliadine Project Local Study Area (Request GN-30 of the Joint Statement on Suggested Terms and Conditions respecting NIRB Final Hearing on Meliadine Gold Project, Nunavut Department of Justice File #7660-204, issued 20 August, 2014).

This document has been prepared to provide this updated information in years that changes have occurred to the Meliadine Gold Project (Project) footprint or an Archaeological Permit is taken out for work within the Local Study Area (LSA). The version presented here is redacted for public viewing, as it does not show the maps with plotted archaeological sites for their continued protection. Rather, a series of tables that summarize the current status of archaeological sites identified within the Project area and the mitigative measures that have been undertaken to date are presented.



In 2018, Nunavut Archaeologist Permit 2018-16A was issued to Golder Associates Ltd. The assessment focussed on examining the expansion to the Meliadine East Esker borrow pit located north of Lake H17, as well as baseline studies for potential infrastructure under consideration. Two new archaeological sites (KgJm-76 and 77) were identified during the course of the field program and 11 sites were revisited (KgJm-1, 2, 3, 4, 6,11, 37, 38, 39, 47, and 62). The KgJm-11 site area was further assessed through shovel testing, and a potential tent ring and hearth feature at KgJm-4 were mitigated through feature mapping and proportional test excavation. Both of these sites were examined in relation to the Meliadine East Esker borrow pit expansion.

The updated Project footprint and Cultural Resources LSA are shown in Figure 1. The LSA includes a 500 m buffer surrounding proposed project infrastructure/footprint. Table 1 provides an index to the sites associated with the mine infrastructure area, summarizing the site type and mitigative activities conducted to date. Table 2 provides an index to the sites associated with the All-Weather Access Road (AWAR). Table 3 provides an index to sites associated with the community of Rankin Inlet and the airport bypass road.

Table 1: Status of Archaeological Sites Located in the Mine Infrastructure Local Study Area

Borden Number	Cultural Affiliation	Site Type	Archaeological Significance	Distance from Development	Status of Site	Details of Status	Permit Reports Detailing Status	Recommendations
KgJm-1	Neoeskimo	Campsite (tent ring Cache)	low	850 m from emulsion road	Not Mitigated	Site location updated	2018-016A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-2	Neoeskimo	Campsite (pit and hearth)	low	950 m from emulsion road	Not Mitigated	Site location updated	2018-016A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-3	Palaeoeskimo	Campsite (hearth box mid-passage)	high	Database coordinates 710 m from emulsion road	Not Mitigated	Not located; original UTM coordinates appear in error; ATV trail may have impacted site	2018-016A	Continued avoidance by 30 m buffer; further efforts should be made to locate site
KgJm-4	Palaeoeskimo	Tent ring and hearth	high	0 m from esker borrow boundary	Mitigated	Site location updated; Detailed mapping, testing and photo documentation	2018-016A	No further work
KgJm-6/43	Palaeoeskimo (Reported)	Box hearth (Reported)	low	Reported location 0 m from esker borrow boundary	Mitigated	Site revisited on 3 occasions; no evidence of feature; may have been impacted by ATV trail; appears to be same site as KgJm-43; landform where site reported shovel tested, all negative.	2014-016A 2017-014A 2018-016A	No further work
KgJm-7	Neoeskimo	Campsite (Thule pit house)	high	0 m from Lake H17; 65 m from esker borrow pit	Partially Mitigated	Features F1 to F6, F8 mapped, tested and excavated in relation to Lake H17; Features F7 and F9 above high water and not mitigated	2014-016A; 2016-07A	No further concern in relation to lake H17; if F7 and F9 on esker crest to be impacted further work required.

Table 1: Status of Archaeological Sites Located in the Mine Infrastructure Local Study Area

Borden Number	Cultural Affiliation	Site Type	Archaeological Significance	Distance from Development	Status of Site	Details of Status	Permit Reports Detailing Status	Recommendations
KgJm-8	Neoeskimo	Campsite (Thule pit house)	high	410 m from infrastructure	Not Mitigated	Documented	2011-26A Site form update	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-9	Neoeskimo	Campsite (Thule pit house)	high	680 m from infrastructure	Not Mitigated	Documented	2011-26A Site form update	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-10	Neoeskimo	Campsite	low	40 m from Lake H17; 0 m from current esker borrow boundary	Mitigated	Feature completely excavated in 1976	Linnamae 1977; 2014-016A; 2016-07A	No further work
KgJm-11	Palaeoeskimo (Reported)	Semi-circle stone feature	low to moderate	0 m from esker borrow boundary	Mitigated	Located one feature; Photo documentation; feature mapping; proportional excavation (2017); shovel tested site area (2018); no evidence to suggest Palaeoeskimo	2014-016A; 2016-07A; 2017-014A 2018-016A	No further work
KgJm-12	Neoeskimo	Campsite	low to moderate	60 m from Lake H17; 10 to 40 m from current esker borrow boundary	Not Mitigated	Documented, staked 2014; Feature F8 within 10 m of borrow pit mapped and tested 2017; same site as KgJm-41	2014-016A; 2016-07A; 2017-014A	Continued avoidance of remaining features by 30 m buffer or additional mitigation required
KgJm-13	Palaeoeskimo	Campsite (Box hearth)	high	45 m from lake H17 - higher elevation; 55 m from current esker borrow boundary	Not Mitigated	Documented	2014-016A; 2016-07A; 2017-014A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-14	Neoeskimo	Cache	low	130 m from lake H17; 170 m from current esker borrow boundary	Not Mitigated	Documented	2014-016A; 2016-07A	Continued avoidance by 30 m buffer or additional mitigation required

Table 1: Status of Archaeological Sites Located in the Mine Infrastructure Local Study Area

Borden Number	Cultural Affiliation	Site Type	Archaeological Significance	Distance from Development	Status of Site	Details of Status	Permit Reports Detailing Status	Recommendations
KgJm-15/42	Neoeskimo	Campsite	low	0 m from current esker borrow boundary	Mitigated	Detailed mapping and excavation; Duplicate site number	2014-016A	No further work
KgJm-16	Neoeskimo	Campsite	low to moderate	75 m from Lake H17, higher elevation	Not Mitigated	Documented	2011-26A site form update	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-17	Neoeskimo	Hunting	low	20 m from lake H17, higher elevation	Not Mitigated	Documented: High accuracy UTM recording, staked 2012, 2016 for avoidance during Lake H17 works	2012-24A; 2014-016A	Continued avoidance/monitor or additional mitigation required
KgJm-18	Neoeskimo	Campsite	low	80 m from Lake H17; higher elevation	Mitigated	Photo documentation, feature mapping, proportional excavation	2012-024A	No further work
KgJm-19	Neoeskimo	Boat stand	high	60 m from Lake H17; higher elevation	Not Mitigated	Documented, staked 2012	2012-024A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-20	undetermined	Campsite	low	Reported location 280 m from infrastructure	Not Mitigated; Reported site location in error	Site location revisited and no evidence of features	2011-26A	Site not positively identified; Continued avoidance by 30 m buffer or additional mitigation required
KgJm-21	undetermined	Cache	low	Reported location 260 m from infrastructure	Not Mitigated; Reported site location in error	Site location revisited and no evidence of features	2011-26A	Site not positively identified; Continued avoidance by 30 m buffer or additional mitigation required

Table 1: Status of Archaeological Sites Located in the Mine Infrastructure Local Study Area

Borden Number	Cultural Affiliation	Site Type	Archaeological Significance	Distance from Development	Status of Site	Details of Status	Permit Reports Detailing Status	Recommendations
KgJm-22	Palaeoeskimo	Mid passage	high	123 m from infrastructure	Mitigated	Features completely excavated	Linnamae 1977, 2011-26A	No further work
KgJm-23	Neoeskimo	Hunting	low	110 m from infrastructure	Mitigated	Photo documentation, feature mapping proportional excavation	2011-26A; 2012-024A	No further work
KgJm-24	Neoeskimo	Boat stand	high	220 m from infrastructure	Mitigated	Photo documentation, feature mapping proportional excavation	2011-26A; 2012-024A	No further work
KgJm-25	Palaeoeskimo	Mid passage	high	235 m from infrastructure	Mitigated	Photo documentation, feature mapping proportional excavation	2011-26A; 2012-024A	No further work
KgJm-26	Neoeskimo	Campsite	low	300 m from infrastructure; 10 m from ATV trail	Mitigated	Photo documentation, feature mapping proportional excavation	2011-26A; 2012-024A; 2017-14A	No further work
KgJm-27	Neoeskimo	Hunting	low to moderate	355 m from infrastructure	Not Mitigated	Documented and staked	2011-26A; 2012-024A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-28	Neoeskimo	Campsite	low	420 m from infrastructure	Not Mitigated	Documented	2011-26A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-29	Neoeskimo	Campsite	low to moderate	440 m from infrastructure	Not Mitigated	Documented	2011-26A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-30	Neoeskimo	Campsite	Low to moderate	490 m from infrastructure	Mitigated	Photo documentation, feature mapping proportional excavation	2011-26A; 2012-024A	No further work

Table 1: Status of Archaeological Sites Located in the Mine Infrastructure Local Study Area

Borden Number	Cultural Affiliation	Site Type	Archaeological Significance	Distance from Development	Status of Site	Details of Status	Permit Reports Detailing Status	Recommendations
KgJm-31	Neoeskimo	Campsite	low to moderate	470 m from infrastructure	Not Mitigated	Documented and staked	2011-26A; 2012-024A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-32	Neoeskimo	Hunting blind	low	550 m from infrastructure	Not Mitigated	Documented	2011-26A Site form update	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-33	Neoeskimo	Campsite	low to moderate	625 m from infrastructure	Not Mitigated	Documented	2011-26A Site form update	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-34	Neoeskimo	Campsite	low to moderate	620 m from infrastructure	Not Mitigated	Documented	2011-26A Site form update	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-35	Neoeskimo	Hunting	low	410 m from infrastructure	Mitigated	Photo documentation, feature mapping proportional excavation	2011-26A; 2012-024A	No further work
KgJm-36	Neoeskimo	Campsite	low	0 m from sand quarry	Mitigated	4 features mitigated in 1998, 1 in 2011	1998-876; 2011-26A	No further work
KgJm-37	Neoeskimo	Cache	low	200 m from exploration camp infrastructure	Not Mitigated	Site location updated	1998-876; 2018-016A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-38	Neoeskimo	Marker (stone slab marker)	low	670 m from exploration camp infrastructure	Not Mitigated	Site location updated	1998-876; 2018-016A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-39	Neoeskimo	Campsite (tent ring and hearth)	low	580 m from exploration camp infrastructure	Not Mitigated	Site location updated	1998-876; 2018-016A	Continued avoidance by 30 m buffer or additional mitigation required

Table 1: Status of Archaeological Sites Located in the Mine Infrastructure Local Study Area

Borden Number	Cultural Affiliation	Site Type	Archaeological Significance	Distance from Development	Status of Site	Details of Status	Permit Reports Detailing Status	Recommendations
KgJm-40	Neoeskimo	Cache	low	335 m from infrastructure	Mitigated	Photographed, mapped	2011-026A	No further work
KgJm-41	Neoeskimo	Campsite	low to moderate	60 m from Lake H17	Not Mitigated	Documented, staked 2014; same site as KgJm-12	2014-016A; 2016-07A	Continued avoidance by 30 m buffer or additional mitigation required
KgJm-15/42	Neoeskimo	Campsite	low to moderate	0 m from infrastructure	Mitigated	Features mapped and proportional excavation; Same site as KgJm-15	2014-016A; 2016-07A	No further work
KgJm-43	Palaeoeskimo (Reported)	Stone paving (Reported)	low	Reported location 20 m from freshwater intake	Mitigated	Site revisited on 2 occasions; no evidence of feature; feature may have been impacted by ATV trail; suggested to be same site as KgJm-6; landform where site reported shovel tested, all negative.	1998-876; 2014-016A; 2017-014A	No further work
KgJm-44	Neoeskimo	Hunting	low to moderate	0 m from infrastructure	Mitigated	Photo documentation, feature mapping and surface artifacts sample collected	2014-016A	No further work
KgJm-45	Neoeskimo	Hunting	low to moderate	0 m from infrastructure	Mitigated	Photo documentation, mapping	1998-876; 2010-005A; 2011-026A	No further work
KgJm-46	Neoeskimo	Campsite (recent)	low	0 m from infrastructure	Mitigated	Photo documentation, mapping	1998-876	No further work
KgJm-47	Neoeskimo	Hunting	low	550 m from infrastructure	Mitigated	Photo documentation, mapping (2010)	2008-003A; 2010-005A; 2018-016A	No further work

Table 1: Status of Archaeological Sites Located in the Mine Infrastructure Local Study Area

Management plans updates

AGNICO EAGLE

MELIADINE GOLD PROJECT

Water Management Plan

MARCH 2019
VERSION 6
6513-MPS-11

EXECUTIVE SUMMARY (ENGLISH)

Agnico Eagle Mines Limited (Agnico Eagle) is developing the Meliadine Gold Project (the Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The Mine Plan proposes open pit and underground mining methods for the development of the Tiriganiaq gold deposit, with two open pits (Tiriganiaq Pit 1 and Tiriganiaq Pit 2) and one Underground Mine.

The water management objectives are to minimize potential impacts to the quantity and quality of surface water at the Mine. Water management structures (surface ponds, water retention dikes/berms, water diversion channels and culverts) are in place and will be constructed as needed to contain and manage the contact water from the areas affected by the Mine or mining activities. The major water management infrastructure includes: water containment ponds, water retention dikes, berms, channels, a potable Water Treatment Plant (WTP), a Sewage Treatment Plant (STP), a Saline Water Treatment Plant (SWTP), a Reverse Osmosis (RO) Plant, and an Effluent Water Treatment Plant (EWTP).

During mine Construction and Operations, contact water originating from affected areas on surface will be intercepted, diverted and collected within the various containment ponds. The collected water at the Mine will be eventually pumped and stored in Containment Pond 1 (CP1), where the contact water will be treated by the EWTP for removal of Total Suspended Solids (TSS) prior to discharge to the outside environment or as make-up water by the Process Plant. Contact water from the Underground Mine will be collected in underground storage stopes and sumps. Some water from Underground will be reused for underground operations. In addition, due to high saline content, some underground mine water will be stored for treatment at the SWTP or discharged to sea.

The long-term, post-closure water quality in the containment ponds and in the flooded open pit lakes will meet Metal and Diamond Mining Effluent Regulations (MDMER) , Canadian Council of Ministers of the Environment Water Quality Guidelines (CCME-WQG) for the protection of aquatic life and/or the Site Specific Water Quality Objectives (SSWQO's) developed for the Mine.

During mine closure, the water management infrastructure on site will remain in place until mine closure activities are completed and monitoring demonstrates that the water quality is acceptable for environmental discharge without treatment.

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Ltd. (Agnico Eagle) is developing the Meliadine Gold Project (the Mine) located approximately 25 kilometres (km) north of Rankin Inlet (Figure 1.1), Nunavut, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The Mine is subject to the terms and conditions of both the amended Project Certificate issued by the Nunavut Impact Review Board (NIRB) in accordance with the Nunavut Land Claims Agreement Article 12.5.12 on February 26, 2019 (NIRB, 2019) and Type A Water Licence No. 2AM-MEL1631 (the Licence), issued by the Nunavut Water Board (NWB) on April 1, 2016 (NWB, 2016). This report presents an updated version of the Water Management Plan (WMP). The purpose of this update is to incorporate changes related to comments received from Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC), and Environment and Climate Change Canada (ECCC), towards Version 5 of the Water Management Plan. Additionally, this update includes all changes related to the approval for discharge to sea that was received with the amended Project Certificate on February 26, 2019.

1.1 Water Management Objectives

The water management objectives are to minimize potential impacts to the quantity and quality of surface water at the Mine and surrounding waterbodies. The purpose of the WMP is to provide information to applicable mine departments (Environment, Engineering, Mine, Energy and Infrastructure, etc.) for sound water management practices, proposed and existing infrastructure, the water balance model, water quality predictions, and for the water quality monitoring plan for the Mine.

Water management structures (culverts, sumps, pipelines, water diversion channels and water retention dikes/berms) are utilized to contain and manage contact water from areas affected by mining activities. Measures have been implemented for the Mine Construction and are being implemented for Mine Operation phases.

1.2 Management and Execution of the Water Management Plan

Revisions of the WMP can be initiated by changes in the Mine Development Plan (Mine Plan), operational performance, personnel or organizational structure, regulatory or social considerations, and/ or design philosophy. The WMP will be reviewed annually by Agnico Eagle and updated as necessary.

SECTION 2 • BACKGROUND

2.1 Site Conditions

The Mine is located in an area of poorly drained lowlands near the northwest coast of Hudson Bay. The dominant terrain in the area consists of glacial landforms such as drumlins (glacial till), eskers (gravel and sand), and many small lakes. The topography is gently rolling with a mean elevation of 65 metres above sea level (masl) and a maximum relief of 20 meters.

The local overburden consists of a thin layer of topsoil overlying silty gravelly sandy glacial till. Cobbles and boulders are present throughout the region at various depths. Bedrock at the Mine site area consists of a stratigraphic sequence of clastic sediments, oxide iron formation, siltstones, graphitic argillite, and mafic volcanic flows (Snowden, 2008; Golder, 2009).

The climate is extreme in the area, with long cold winters and short cool summers, and mean air temperatures of 12°C in July and -31°C in January. The mean annual air temperature at the Mine site is approximately -10.4 °C (Golder, 2012a). Strong winds blow from the north and north-northwest direction more than 30 percent of the time.

The mean annual precipitation in the area is approximately 412 mm and is typically equally split between rainfall and snowfall.

2.1.1 Local Hydrology

The Mine is located within the Meliadine Lake watershed. Meliadine Lake has a water surface area of approximately 107 square kilometres (km^2), a maximum length of 31 km, features a highly convoluted shoreline of 465 km, and has over 200 islands. Unlike most lakes, it has two outflows that drain into Hudson Bay through two separate river systems. It has a drainage area of 560 km^2 upstream of its two outflows. Most drainage occurs via the Meliadine River, which originates at the southwest end of the lake. The Meliadine River flows for a total stream distance of 39 km. The Meliadine River flows through a series of waterbodies, until it reaches Little Meliadine Lake and then continues into Hudson Bay. A second, smaller outflow from the west basin of Meliadine Lake drains into Peter Lake, which discharges into Hudson Bay through the Diana River system (a stream distance of 70 km). At its mouth, the Diana River has a drainage area of 1,460 km^2.

Watersheds in the Mine area are comprised of an extensive network of waterbodies, and interconnecting streams. The hydrology of these watersheds is dominated by lake storage and evaporation.

2.1.2 Ice and Winter Flows

Late-winter ice thicknesses on freshwater lakes in the Mine area range between 1.0 to 2.3 m with an average thickness of 1.7 m. Ice covers usually appear by the end of October and are completely

formed in early November. The spring ice melt (freshet) typically begins in mid-June and is complete by early July (Golder, 2012b).

2.1.3 Spring Melt (freshet) and Freeze-up Conditions

With the exception of the main outlet of Meliadine Lake, which has been observed to flow continuously throughout the year, outlets of waterbodies near the Mine typically start flowing late May or early June, followed by freshet flows in mid-to-late-June. Flows steadily decrease in July and low flows are ongoing from August to the end of October, prior to winter freeze.

2.1.4 Permafrost

The Mine is located in an area of continuous permafrost. The depth of permafrost is estimated to be in the order of 360 to 495 m. The depth of the active layer ranges from about 1 m in areas with shallow overburden, up to 3 m adjacent to the lakes. The typical permafrost ground temperatures at the depths of zero annual amplitude (typically at the depth of below 15 m) are in the range of -5.0 to -7.5 °C in the areas away from lakes and streams. The geothermal gradient ranges from 0.012 to 0.02 °C/m (Golder, 2012b).

2.1.5 Local Hydrogeology

Groundwater characteristics at areas of continuous permafrost that are generally present in the Mine area include the following flow regimes:

- A shallow flow regime located in an active layer (seasonally thawed) near the ground surface and above permafrost; and,
- A deep groundwater flow regime beneath the base of the permafrost.

From late spring to early autumn, when temperatures are above 0 ˚C, the shallow active layer thaws. Within the active layer, the water table is projected to be a subdued replica of topography. Groundwater in the active layer flows to local depressions and ponds that drain to larger waterbodies. The talik beneath large waterbodies will be open. The open talik will connect to the deep groundwater flow regime beneath the permafrost.

Elongated waterbodies with terraces and a width of 340 to 460 m or greater are expected to have open taliks extending to the deep groundwater flow regime at the Mine. Meliadine Lake and Lake B7 are likely to have open taliks connected to the deep groundwater flow regime (Golder, 2012a). No impact is expected to Lake B7 by mine activities.

2.2 Mine Development Plan

The Mine Plan and key mine development activities, including mine waste management are currently used concurrently with the WMP.

The Mine Plan includes one underground mine (Tiriganiaq Underground Mine) and two open pits (Tiriganiaq Open Pit 1 and Tiriganiaq Open Pit 2) for the development of the Tiriganiaq gold deposit.

The Mine is expected to produce approximately 14.9 million tonnes (Mt) of ore, 31.8 Mt of waste rock, 7.4 Mt of overburden waste, and 14.9 Mt of tailings. The following phased approach is proposed for the development of the Tiriganiaq gold deposit;

- Phase 1: 3.5 years for Mine Construction (Q4 Year -5 to Q2 Year -1);
- Phase 2: 8.5 years for Mine Operations, beginning in 2019 (Q2 Year -1 to Year 8);
- Phase 3: 3 years Mine Closure (Year 9 to Year 11); and;
- Phase 4: Post-Closure (Year 11 forward).

Mining facilities on surface will include a plant site and accommodation buildings, two ore stockpiles, a temporary overburden stockpile, a tailings storage facility (TSF), three waste rock storage facilities (WRSFs), a water management system that includes containment ponds, water diversion channels, retention dikes/berms, and a series of water treatment plants. The general mine site layout plan is shown on Figure 1.2.

SECTION 3 • WATER MANAGEMENT CONTROLS AND STRUCTURES

A network of berms, dikes, containment ponds, channels, culverts and sumps are in place and maintained to facilitate water management. The following sections describe the water management design criteria for the infrastructure used at the Mine.

3.1 Water Management Systems

The water management systems, as shown in Figure 1.2, include the following components:

- Five water containment ponds (CP1, CP3, CP4, CP5, and CP6) and their associated dikes or thermal berms (D-CP1, Berm-CP3, Berm-CP4, D-CP5, and D-CP6)
- Three P-Area containment ponds (P1, P2, and P3) and four containment berms (DP1-A, DP1-B, DP2-A, and DP3-A)
- A surface Saline Pond (SP1) and a second saline storage pond (SP2; yet to be commissioned) to support Agnico Eagle's strategies to store, treat (SWTP) and discharge saline water to sea
- A third saline pond (SP3) for final treatment of saline water prior to discharging to sea
- Three diversion berms (Berm 1, Berm 2, and Berm 3)
- Eight water diversion channels (Channel 1 to Channel 8)
- Sixteen water passage culverts to convey water (Culverts 1 to 8, 10, 11, 13, 14 to 16, 18, 19)
- Five evaporators
- A reverse osmosis (RO) treatment plant
- An effluent water treatment plant (EWTP)
- A saline water treatment plant (SWTP)
- A sewage treatment plant (STP)
- A potable water treatment plant (WTP)
- A network of surface pumps and pipelines
- A freshwater intake causeway
- Three jetties and pumping infrastructure (CP1, CP5 and CP6)
- An effluent diffuser located in Meliadine Lake

The status of construction and planned construction dates of the above are listed in Table 1.

Surface contact water is intercepted, diverted and contained within various containment ponds prior to evaporation or treatment. Water contained in CP5 is treated by an RO treatment plant prior to discharging to CP1. Water collected in the P-area is temporarily stored and then actively evaporated. At CP1, the water is treated for total suspended solids (TSS) at the EWTP and discharged through the diffuser located in Meliadine Lake. Water treated through the RO treatment plant at CP5 is moved to CP1 prior to treatment through the EWTP.

Contact water from the Underground Mine is collected in underground sumps and stored in the underground water stope and the saline pond to be recirculated for use in various underground operations. The second saline pond will be used as additional underground water storage, pending commissioning (Section 3.5). Underground contact water that is not used for operations is treated for discharge.

Hatch (2013) investigated groundwater treatment options for the site and concluded that a combination chemical reverse osmosis (RO) and mechanical vapour compression evaporator plant would be the most efficient method of treating excess groundwater for discharge. Agnico Eagle has since acquired and constructed a Salt Water Treatment Plant (SWTP) consisting of two evaporator crystallizers (SaltMakers) and a chemical RO unit that will be used to treat groundwater. Treatment details are found in Section 3.9.3.

As part of the strategy to manage excess groundwater infiltration of saline water within the underground portion of the mine, Agnico Eagle applied to the Nunavut Impact Review Board for approval to discharge saline water to the sea (Melvin Bay, Rankin Inlet). Agnico Eagle received approval with the amended Project Certificate on February 26, 2019. An overview of management around discharge to sea is found in Section 3.11. Further details are found in Appendix A.

During the mine closure, the water management infrastructure will remain in place until closure activities are completed and monitoring demonstrates that water quality is acceptable for discharge to the environment without treatment.

A list of the water management control structures are presented in Table 1 with each respective construction status. Figure 1.2 shows the location of the respective structures over the development stages (Year – 5 to Year 8) of the mine life. Final design details of these structures will be provided to the Regulators for approval at least 30 days prior to construction, as per the Licence.

3.2 Water Management Structures Design Criteria

The design of the various water management systems in place will meet the following criteria:

- Water quality will meet regulatory criteria of the Licence (described in Appendix F).
- Design capacity of the EWTP is sufficient to ensure that D-CP1 and CP1 will be able to manage the surface contact water from the entire site for a 1:100 wet year spring freshet, or a 1:2 mean year spring freshet in combination with a 1:1000 return 24-hour extreme rainfall.
- D-CP5 and CP5 will be able to manage the water from its catchment area for 3/7 of a 1:100 wet year spring freshet or a 1:1000 return 24-hour extreme rainfall. This design is based on an allowable 3-day delay in initiation of pumping during a 7-day, 1:100 year freshet. Design capacity of pumping from CP5 to CP1 is sufficient to ensure that remaining freshet inflows to CP5 are managed via pumping to CP1.
- Design pumping capacity of each of the other water management ponds (CP3, CP4, and CP6,) will be able to manage the water from their respective catchment area for 3/7 of a 1:100 wet year spring freshet or a 1:1000 return 24-hour extreme rainfall.
- The daily pumping rate for each of the ponds (CP3 to CP6), Tiriganiaq Pit 1 sump, and Tiriganiaq Pit 2 sump will be designed to have sufficient pumping capacity to handle the runoff water, which would result from one day (24.4 mm) of a 1:100 return wet spring freshet plus a 1:2 return one-hour rainfall (9.8 mm).

Channel 2 to Channel 4 are designed to pass an extreme intensity flow under a 5-minute 1:100 return rainfall of 9.2 mm. Channel 1 and Channel 5 to Channel 8 are designed as internal channels where any water overflowing the channels will remain within the catchment areas of various containment ponds. Hydraulic analyses indicated that very wide channels are required to pass an extreme intensity flow under a 5-minute 1:100 return rainfall of 9.2 mm. As a result, these channels were designed to have a reasonable bottom width to pass a flow with lesser intensity, but the water overflowing the channels can be safely managed by berms or temporarily stored in a lower basin nearby. For example, water overflowing Channel 5 can be contained by Berm 3. Water overflowing Channel 7 and Channel 8 (once constructed) can be stored in the lower basin in the drained Pond H13, and Berm 1 (once constructed) will protect Portal No.2 from flooding. Currently, Portal No.2 is protected by compacted, engineered structural fill, and mass till backfill. Water overflowing Channel 1 will flow through the flat ground between Ore Pad 2 (OP2) and future WRSF2 into CP1. Table 2 presents the design parameters for CP1, CP5 and CP6.

Table 2: Design Parameters for CP1, CP5 and CP6

Pond	CP1	CP5	CP6
Pond Volume for Water Elevation at Projected Maximum Pond Operating Water Elevation under Normal Operating Conditions and Mean Precipitation Years (m^3)	742,075	46,674	19,154
Estimated Maximum Operating Water Elevation (m)	66.2	66.0	63.9

Pond	CP1	CP5	CP6
Dike for Pond	D-CP1	D-CP5	D-CP6
Design Crest Elevation of Dike Containment Element (liner system) (m)	66.50	66.30	64.30
Pond Volume for Water Elevation at Design Crest Elevation of Dike Containment Element (m^3)	778,502	66,231	49,627

CP3 and CP4 will be established through sub-excavation of the original ground to increase water storage capacity and help ensure water levels do not reach the thermal protection berms. The key design parameters for CP3 and CP4 are provided in Table 3 and are discussed in further detail within Tetra Tech (2018).

Table 3: Design Parameters for CP3 and CP4

Pond	CP3	CP4
Elevated Pond Bottom Elevation (m)	56.0	56.0
Estimated Maximum Water Elevation during IDF (m)	63.0	63.0
Pond Volume for Water Elevation at Estimated Maximum Water Elevation during IDF (m^3)	28,000	35,093
Pond Surface Area at Estimated Maximum Water Elevation during IDF (m^2)	6,583	8,805
Thermal Berm for Pond	Berm-CP3	Berm-CP4

3.3 Water Containment ponds

Three water containment ponds (CP1, CP3, and CP5) have been constructed to date as part of the water management infrastructure. Two more water containment ponds, CP4 and CP6, will be constructed in 2019 and 2023, respectively. Table 4 presents the locations and the required operational period of the containment ponds. The locations of the five water containment ponds are shown on Figure 1.2.

Table 4: Location of Containment Pond and Required Operation Periods

Containment Pond	Relative Location	Required Operation Period
CP1	Pond H17	Year 2017 to Mine closure
CP3	North of Lake B7 and southwest of TSF	Year 2019 to Mine closure
CP4	Southeast of Lake B7 and south of WRSF1	Year 2019 to Mine closure

CP5	North of Tiriganiaq Pit 2	Year 2017 to Mine closure
CP6	Pond H19 and north of WRSF3	Year 2023 to Mine closure

3.4 P-Area Containment Ponds

The P-area consists of three storage ponds, four water containment berms and five evaporators. This area contains surface runoff and is part of the surface water management system dedicated to saline water. The total storage capacity of the P-Area ponds is 46,041 m^3. P1 is divided by a berm and P1-A (6,131.8 m^3) is the southern section of P1 and P1-B (14,649 m^3) is the northern section. P2 is adjacent and located south of P1-A. P3 was constructed east of the existing south access road, with the primary purpose of collecting seepage originating from the P2 confining berm and its abutments. A pumping station was installed to collect and pump any collected water from P3 to P1.

P1, P2 and P3 are contained by berms DP1-A, DP1-B, DP2-A, and DP3-A. Five evaporators have been installed on DP1-B. Table 5 summarizes the as-built capacities for the P-Area ponds and Figure 3.1 illustrates the P-Area plan view. In Q2 of 2019, SP3 will be installed within southwestern portion of P3. SP3 will act as the final treatment pond for saline water that is to be discharged to sea. Thus, P3 volume will be decreased upon SP3 construction. SP3 will have a minimum storage capacity of 5000 m^3 and will be lined with polyethylene geomembrane to prevent seepage between SP3 and P3. Updated P-Area volumes will be included in the 2020 annual report.

A contaminated snow cell was engineered and installed within the northwest extent of P1 in reaction to the April 8th 2017, 30,000 L diesel spill on Site. The contaminated snow cell was used to store contaminated snow from this event. Since then, the snow cell has been used to store snow containing hydrocarbons (i.e., snow on which spills occur) over the 2017 early spring and 2017/2018 winter. Upon snowmelt an oil-water separator was used to treat the water and was moved to P1. The contaminated snow cell is currently in place as a contingency measure for contaminated snow storage over the 2018/2019 winter period (See Freshet Management Plan in Appendix B).

The snow cell is lined with a polyethylene liner to avoid transfer of melting snow into the other ponds part of the P-area. The cell is designed to contain a volume of 1500 m^3 of snow and to contain 930 m^3 of water at a water surface elevation of 69.5 m.

Table 5: As-Built Capacity for P-Area Ponds

Pond	P1	P2	P3
As-built Capacity (m^3)	20,781	6,828	18,432
Maximum Design Water Elevation (m)	68.5	67.5	67.0
Total P-Area Capacity (m^3)	46,041		

Water monitoring protocols for the P-Area have been implemented to include water quality and transfer data, such as locations and flow volumes for water pumped to and from the containment ponds. This is discussed further in Appendix F.

3.5 Saline Ponds

The Saline Pond (SP1) was constructed in Q3 2016 to accommodate excess saline water from the Underground Mine. The Saline Pond is located east of P3 and north of CP5 (Figure 1.2). Table 6 summarizes the Saline Pond capacity for storage and maximum designed operating water levels. The maximum saline water capacity is the volume that can be stored in the Saline Pond prior to winter freeze. Approximately 9,000 m^3 capacity should be available to accommodate precipitation that may accumulate throughout winter and at freshet.

Based on adaptive management strategies, the project requires a second saline water storage pond (SP2). SP2 will be temporary in nature and is being constructed in bedrock within the footprint of Tiriganiaq Pit 2 (Figure 3.2). Saline Pond 2 is designed to have a minimum storage volume of 75,000 m^3. Groundwater will be pumped to Saline Pond 2 where it may then be treated for TDS removal at the SWTP. Water stored in SP2 will also contribute to saline water being discharged to sea (Section 3.11; Appendix A). Inputs to the second saline pond will be similar in chemical nature to those input to the SP1, mainly originating from the underground water storage system.

Table 6: As-Built Storage Capacity for Saline Pond 1

Item	Water Balance Under Mean Precipitation Conditions
Maximum Design Water Elevation (m)	62.9
Maximum Saline Water Capacity (m^3)	23,686
Estimated Maximum Storage Capacity at Maximum Water Elevation (m^3)	32,686 *

* Includes the capacity for saline water to be pumped into Saline Pond 1 from Underground, a combined capacity for net precipitation, and potential seepage water into the pond.

3.6 Water Diversion Channels, Dikes and Berms

3.6.1 Water Diversion Channels

Four water diversion channels (Channels 1, 2, 3, and 5) have been constructed and form part of the water management infrastructure. Four remaining channels (Channels 4, 6, 7, and 8) have yet to be installed. As outlined in Table 1, Channels 4, 7, and 8 are planned to be constructed in Q2 of 2019, Q3 of 2019 and Q3 of 2019, respectively. Construction of Channel 6 is tentative based on future water management strategies downstream of WRSF2. The as-built and design parameters for the water diversion channels are presented in Table 7.

Table 7: As-Built and Design Parameters for Channels

Item	Channel							
	1 (As-Built)	**2 (As-Built)**	**3**	**4**	**5 (As-Built)**	**6**	**7**	**8**
Approximate Total Length (m)	528	269.5	619	710	429†	69	214	315
Bottom Width (m)	3	1.257	1 or 2*	1 or 2*	2.3 to 2.9	1	1	1
Side Slopes	3(H):1(V)**	1.82(H):1(V)	3(H):1(V)	3(H):1(V)	1.9(H):1(V)	3(H):1(V)	3(H):1(V)	3(H):1(V)
Rip-rap Thickness (m)	0.3 to 0.5	0.277	0.3	0.3	0.2	0.3	0.3	0.3
Minimum Bottom Slope Gradient (%)	0.2	0.30†	0.17	0.13	0.17†	0.44	0.42	0.38

* 1 m bottom width for first 100 m upstream section, and 2 m bottom wide for the remaining channel section

** Except from Sta. 0+050 to 0+130: 2(H):1(V)

† As-built parameter values not available; value displayed is from design

3.6.2 Water Retention Dikes and Berms

In general terms, “dikes” will retain continuous water during normal operations and “berms” may retain water during short-term high level water events. At the end of Mine closure, when the water quality in the corresponding pond meets direct discharge criteria, each of the dikes and berms on site (except for Berm 2) will be breached to restore the original natural drainage paths. Berm 2 will remain in place to prevent non-contact water from flowing into the TSF.

Water retention dikes D-CP1, D-CP5, and future D-CP6 have been designed as a zoned earth fill dam with a geomembrane liner keyed into the expected permafrost foundation to limit the seepage through the dike and its foundation. The characteristics of the dikes and berms required for the WMP are summarized in Table 8.

3.6.2.1 Thermal Monitoring

Horizontal Ground Temperature Cables (GTCs) are installed along the key trenches of D-CP1 and D-CP5 at a depth of approximately 3 m below the original ground level. These installations are in place to verify that the foundations remain frozen and dike integrity is not compromised. D-CP1, Berm-CP3 and D-CP5 contain vertical GTCs installed to a minimum depth of 15 m below the crest of each dike. Thermal records collected from these sensors provide temporal analysis of vertical temperature profiles to assess increasing (or decreasing) temperatures within the dike or berm structure.

During 2018, D-CP1 and D-CP5 readings were obtained, recorded, and assessed every 2 – 3 days during freshet and weekly following freshet until freeze-up. Following freeze-up, readings were then taken monthly. Data loggers set to log every 12-hours were installed in October 2018 at D-CP1 and D-CP5 to provide twice-daily records. Reading frequency at Berm-CP3 and Berm-CP4 (upon construction) will be monthly during the first year following construction and yearly thereafter. Reading frequency at D-CP6 will depend on the construction design provided with the D-CP6 design report. The measured readings are consistently analyzed by an Agnico Eagle geotechnical engineer and will be reported in the annual geotechnical inspection report. This will continue into 2019.

In addition to thermal monitoring, visual geotechnical inspections of water management structures are currently performed, as described in Section 3.12 below.

Table 8: Design Parameters for Water Retention Dike/Berm

Item	D-CP1	Berm-CP3	Berm-CP4	D-CP5	D-CP6	DP1-A	DP1-B	DP2-A	DP3-A	Berm1	Berm2	Berm3
Approximate Maximum Height (m)	5.6	2.0	2.0	3.3	1.8	3.7	3.4	4.0	3.4	1.6	2.5	2.76
Maximum Elevation (m)	67.5	66.1	65.4	67.3	65.3	70.5	70.7	69.5	69.0	68.5	varies	67.37
Maximum Head of Water Retained (m)	3.5	0.2	0.1	1.4	0.5	68.5	68.7	67.5	67.0	0	0	0

3.7 Evaporators

Five evaporators are installed on jetties constructed at DP1-B. The evaporator system is designed for vaporizing water contained at the P-Area. The evaporators are installed to accommodate the quantity of excess saline water before saline water treatment options and disposal plans have been implemented at the Mine. Based on data collected during 2016, the efficiency of one evaporator was estimated to be 22 m^3/hr.

3.8 Freshwater Intake

Freshwater usage at the Mine includes potable uses, fire suppression, make-up water for the mill, and other operational requirements, such as drilling water, dust suppression, batch plant use, and use at the washbay. The main freshwater intake is located northeast of the industrial pad in Meliadine Lake, as shown on Figure 1.2 and an additional freshwater intake pump is located at Lake A8. The intakes consist of vertical filtration wells fitted with vertical turbine pumps that supply water on demand. Both intake pipes are fitted with a screen of an appropriate mesh size to ensure that fish will not be

entrained and shall withdraw water at a rate such that fish do not become impinged on the screen (NWB, 2016).

3.9 Water Treatment

Contact water will be treated (if necessary) to meet Licence requirements prior to being discharged to the environment. TSS mitigation techniques (i.e., attenuation ponds, silt screens, etc.), oil separation treatment, the STP, the SWTP, the RO Plant and the EWTP are used accordingly at various locations at the Mine prior to water being transferred to containment ponds and/or as effluent discharge to Meliadine Lake. Water quality criteria is discussed in Section 7 and Appendix F.

3.9.1 Freshwater Treatment Plant (WTP)

Freshwater from Meliadine Lake will be treated in the WTP before being directed to the camp areas for potable (domestic) water uses. The design flow rate for freshwater for the main camp and accommodations is 216 m^3/day. In the WTP, freshwater will be pumped through cartridge filters, then pumped through ultraviolet units, and finally treated with sodium hypochlorite (chlorine). The treated water will be stored within a potable water tank. Potable water will be monitored according to the Nunavut Health Regulations for total and residual chlorine and microbiological parameters. Operation and maintenance details for the WTP can be reviewed in the Process and Control Narrative (H2O Innovation, 2016).

3.9.2 Sewage Treatment Plant (STP)

Wastewater from the accommodation complex and from satellite sewage tanks will be treated in the STP before being directed to CP1. Operation and maintenance details for the STP can be reviewed in the Operational & Maintenance Manual – Sewage Treatment Plant (Agnico Eagle, 2017c).

3.9.3 Saline Water Treatment Plant (SWTP)

Saline water generated from the Underground Mine is currently being stored underground and on surface at the P-Area and SP1. SP2 will be an addition to this saline water storage system upon completion of its construction. A Saline Water Treatment Plant (SWTP) was constructed in 2018 and is currently being commissioned. The system will be in full operation during Q2, 2019. The SWTP is located in a dome approximately 50 m to the southeast of Portal 1. The SWTP will be used to treat water from the Underground Mine, P-Area or from the saline ponds.

The SWTP will remove excessive total suspended solids (TSS), calcium chloride ($CaCl_2$), sodium chloride (NaCl), metals, phosphorous (P), and nitrogen compounds from the influent saline water. Effluent from the SWTP is intended to be discharged to CP1. In February 2019, the discharge point was moved, temporarily directing effluent to CP5 while a line extension is performed at the CP1 discharge point. This change will be reverted once the line extension is complete. Pre-treatment groundwater and effluent from the SWTP are monitored every 12 hours (night shift and day shift) for

pH and TDS, and weekly for chloride (Cl), ammonia (NH_4), nitrite (NO_2), nitrate (NO_3), TDS, TSS, total phosphorus (P), total cyanide (Cn), total metals and total mercury (Hg). The SWTP Design Report can be found in Appendix E.

The SWTP consists of two parallel units. Each unit can be operated to produce brine or solid by-product. Both units within the SWTP will be operated in Brine Mode for Q1 of 2019. Brine-mode of one unit within the SWTP is expected to operate to the following specs:

- Inlet capacity of 115 m^3/day with a 95% expected operation availability for a corrected average input capacity of 109 m^3/day.
- With an input capacity of 109 m^3/day the effluent and brine will be discharged as follows:
    - 68 m^3/day to CP1
    - 24 m^3/day to Saline Pond as Brine
    - The 17 m^3/day difference is due to evaporation loss through treatment.

Solid-mode of one unit within the SWTP is expected to operate to the following specs:

- Inlet capacity of 69 m^3/day with a 95% expected operation availability for a corrected average input capacity of 66 m^3/day. This full inlet capacity will be discharged to CP1 as effluent
- Decisions regarding the management of solid salt by-product are ongoing by Agnico Eagle. One possible option would be use as a dust suppressant on roads as the material is similar to Calcium Chloride currently approved for such use. Formal approval would be required from the Government of Nunavut Environment Department.

SWTP effluent is currently transferred to CP1 where it will be treated by the EWTP prior to discharge to Meliadine Lake. EWTP effluent discharge to Meliadine Lake was performed in 2018 in accordance with the conditions outlined in Part F, Item 3 of the Water Licence. Discharge to Meliadine Lake is expected to be carried out in 2019. Total discharge to Meliadine Lake, including the treated groundwater, will remain within the permitted daily volume and meet the discharge criteria defined in the License, as well as MDMER discharge limits. Additionally, SSWQO's for EWTP effluent (including treated groundwater) will be met at the edge of the mixing zone in Meliadine Lake. Further details regarding the EWTP are provided in Sections 3.9.4 and Section 4.3 of the WMP.

The saline effluent temperature from the SWTP is expected to be approximately 35 °C (however may be greater during winter months to prevent freezing of pipeline), with an approximate pH of 7.5 (Saltworks 2017). According to pilot testing, SWTP effluent meets the required Water Quality Output Requirements defined in Agnico Eagle's Desalination Water Treatment Plan Design Criteria with the exception of ammonia, nitrite, total cyanide, and selenium (Saltworks 2017). However, weekly sample results from the first months of sampling (December 13, 2018 to February 18, 2019) show the SWTP effluent consistently meets the aforementioned requirements for all constituents aside from ammonia and nitrite. Ammonia exceeded the Water Quality Output Requirement of 35 mg/L on three sampling dates (Jan-16, Jan-18, Feb-10), however the mean ammonia concentration over the

sampling period was 24 mg/L. Nitrite exceeded the Water Quality Output requirement of 0.2 mg/L on all (n=9) sampling dates with a mean concentration of 1.2 mg/L. The cause for these exceedances is that the SWTP system remains in the commissioning phase, specifically the chemical RO unit designed to remove constituents such as ammonia and nitrite has not yet been commissioned. Upon commissioning (expected by end of Q1 2019), the SWTP is expected to meet all Water Quality Output Requirements.

SWTP effluent and CP1 water quality will continue to be monitored according to the SWTP Design Report to identify future exceedances and potential impacts to CP1. Pilot testing predicted that TDS concentrations would be approximately 158 mg/L (condensed water after treatment; Saltworks 2017). During commissioning, mean TDS concentration has been 174 mg/L (n=9) to date. As commissioning continues (i.e., process is refined and RO treatment is commissioned), effluent quality will trend towards lower concentrations as the treatment process is refined for optimal treatment quantity and quality. With respect to toxicology, the SWTP effluent passed acute toxicity tests on Rainbow trout, Three-spined stickleback and Daphnia magna (Saltworks 2017).

3.9.4 Effluent Water Treatment Plant (EWTP)

Approximately 642,521m³ of contact water from CP1 was treated and discharged from the EWTP during 2018. The monthly and daily discharge averages are provided in Table 13 and Figure 7.2, respectively. Based on the anticipated water quality (Appendix F) and water quantity, the EWTP will be continue to be used to remove TSS at CP1 in 2019. The volume of water requiring treatment for TSS removal and discharge will increase to a maximum of 798,000 m³ in 2022 and then decrease to 673,000 m³ during the final year of the life of mine (2027). Based on the maximum flow rate of the Actiflo® system model ACP-600R, the EWTP has a maximum capacity of 520 m³/h (nominal flow). The system will have the capacity to treat the anticipated discharge from CP1 for the life of the mine.

TSS mitigation is ongoing with runoff water from ditch systems that have the potential to discharge directly to receiving waters and is described further in the Freshet Action Plan (Agnico Eagle, 2018b).

Beginning July 2018, water stored in pond CP5 was treated through a Reverse Osmosis (RO) system and then pumped through the EWTP for treatment (prior to discharge into Meliadine Lake). The resultant EWTP effluent was continually monitored for turbidity and electrical conductivity as a surrogate for TSS and TDS, respectively. In addition, Agnico Eagle conducted regular sample monitoring in accordance with the Type A Water License and the MDMER.

With respect to TSS monitoring during CP1 discharge events, Agnico has developed triggers for mitigation. Rating curves predicting TSS concentration as a function of turbidity and TDS as a function of conductivity were developed with simple linear regressions. The regressions applied *in situ* conductivity and turbidity readings and MEL-14 sample results. Rating curves are applied to continuous conductivity and turbidity readings taken from internal probes within the EWTP to predict TDS and TSS, respectively. Regarding conductivity, a trigger limit has been set to 1900 µS/cm which

corresponds to 1,244 mg/L TDS (See rating curve in Figure 3.3). When this trigger is reached, discharge to Meliadine Lake will be stopped. The correlation strength pertaining to the TDS-conductivity rating curve is R^2 = 0.85. Thus, the trigger limit was set below the maximum allowable concentration (1400 mg/L - TDS limit) to allow for uncertainty associated with the correlation.

Regarding turbidity, two trigger limits have been set. The first is set to 1.2 NTU which corresponds to approximately 15 mg/L TSS (See rating curve in Figure 3.4). When this first trigger is reached, sample frequency will be increased to twice per week for TSS at an accredited lab. The second trigger limit is set to 2.3 NTU which corresponds to approximately 25 mg/L TSS (Figure 3.4). When this second trigger is reached, discharge to Meliadine Lake will be stopped. The correlation strength pertaining to the TSS-turbidity rating curve is R2 = 0.79. Thus, the trigger limit was set below the maximum allowable concentration (15mg/L - TSS Max Ave Concentration and 30 mg/L - TSS Max Grab Concentration) to allow for associated uncertainty the correlation.

Agnico will continue to gather calibration/confirmatory paired samples in the future to increase the number of data points and thus to strengthen the turbidity-TSS and conductivity-TDS correlations.

3.9.6 Oil Separators

An oil separation treatment system was installed in 2018 at the Maintenance Shop to collect and separate oil from water used for washing mining equipment. A second oil-water separator is installed at Landfarm A. In the event of water accumulation at Landfarm A due to rainfall or snowmelt, the ponded water will be pumped through the oil-water separator to remove PHC residue and will be analyzed for BTEX, lead, and oil and grease prior to discharge to CP1 or used on the windrows to increase moisture content, as required. Water accumulating in the landfarm will not be discharged directly to the receiving environment.

3.10 Discharge Diffuser

The discharge diffuser is the final effluent discharge location for the Mine. The overall purpose of the diffuser is to discharge water from CP1 (at sampling station MEL-14) to Meliadine Lake while providing minimal environmental impacts to the Lake. The effluent mixing will be dependent on ambient currents in Meliadine Lake, driven by wind during the open water period. The diffuser modelling was initially conducted by Golder Associates Ltd. (Golder, 2015) and updated design progress was reported by Tetra Tech EBA (Tetra Tech, EBA 2016).

3.11 Saline Water Discharge to Sea

Based on the current standing of saline water stored on site, the rate at which the SWTP can treat saline water (Section 3.9.3), and the forecasted inflows (Appendix A), it was anticipated that a second discharge location was required for long-term groundwater management. Agnico Eagle proposed to treat groundwater and discharge the saline effluent to Melvin Bay at Itivia Harbour via a storage tank

and engineered marine outflow. In 2018, Agnico Eagle applied to the NIRB for approval to discharge saline water to the sea (Melvin Bay, Rankin Inlet). Agnico Eagle received approval for discharge of saline water to sea along with an amended Mine Project Certificate from NIRB on February 26, 2019. A maximum of 800 m^3/day of effluent at a TDS concentration no greater than 39,600 mg/L will be discharged to Melvin Bay at the Itivia Site during the open water seasons of 2019 – 2031. Further details are provided in Appendix A.

Saline effluent quality will meet the Canadian federal end-of-pipe discharge criteria (Metal and Diamond Mining Effluent Regulations – or MDMER [GC 2018]), and Site-Specific Water Quality Objectives, if applicable, at the edge of the mixing zone for the diffuser discharge into Melvin Bay. As per MDMER (GC 2018) Section 9 and Section 10, Agnico Eagle will submit information regarding the final discharge point 60 days before discharge. A preliminary sampling plan is discussed in Appendix A. Refer to section 2.1.3 of Golder's Report: Modelling Assessment of Groundwater Discharge into the Melvin Bay Marine Environment, Rev B for detailed information regarding simulations of the treated groundwater effluent mixing (Appendix A).

3.12 Water Management Structure Monitoring

Pursuant to Part E, Item 15 of the Licence, Agnico Eagle will carry out weekly inspections of all Water management structures during periods of flow and monthly thereafter. The records will be maintained for review upon request of an Inspector. More frequent inspections may be required at the request of an Inspector. Inspections will focus on structures and conditions in Sections 3.12.1 to 3.12.5 to follow. The associated inspection template can be found in Appendix G.

3.12.1 Culvert and Water Crossing Inspections

Culverts listed in Section 3.1, as well as culverts and water crossings along the AWAR, Bypass Road, and at the Itivia site will be inspected for the following conditions. These inspections also satisfy the monitoring procedures outlined in the Sediment and Erosion Management Plan (Appendix D):

- Damage to the inlet or outlet of the culvert which may impede flow capacity;
- Bed erosion upstream and downstream of watercourse crossing structures;
- Scour under bridge abutments and abutment foundations;
- Erosion along cutslopes and fillslopes of embankments (rill and gully erosion);
- Blockages within the culvert including snow, ice, debris; and
- Snow cover or snow piles which would prevent routing of water towards the inlet of the culvert (only applicable prior to freshet).

In the case that any of the above conditions are observed, corrective actions will be taken to optimize culvert/water crossing function and integrity.

3.12.2 Containment Pond Inspections

Water containment ponds discussed in Section 3.3 and P-Area containment ponds discussed in Section 3.4 will be inspected for the following conditions:

- Unplanned inputs via surface runoff which are not part of the water management system; and
- Water level elevation above the operating manual maximum (OMM).

In the case that any of the above conditions are observed, corrective actions will be taken to prevent unaccounted for losses of available water capacity or potential compromise to dike integrity.

3.12.3 Dike Inspections

Dikes discussed in Section 3.6.2 are inspected in order to track natural (expected) movement of the structure. Furthermore, a 'master" sketch of all the issues that were documented in the past is maintained as a means to spot any changes/new issues. Inspections will focus on the upstream slope, the crest, the downstream slope, and downstream toe and observations will include the following:

- New areas of movement/deterioration not previously documented;
- Changes to previously documented areas of movement/deterioration;
- Seepage through the downstream slope;
- Water presence in downstream channel/sump; and
- Areas of movement/deterioration of downstream channel/sump.

Any issues or potential problems identified will be addressed accordingly by a geotechnical engineer in order to mitigate risks and maintain dike integrity.

3.12.4 Water Diversion Channel and Berm Inspections

In addition to the water management structures requiring inspections under the Water Licence, Agnico Eagle will carry out inspections of all channels on site listed within Section 3.6.1 and Table 1 for the following conditions:

- Obstructions to flow (ice, debris);
- Inflows not part of the water management system;

- Structural failure of channel banks;
- Seepage through water diversion berms resulting in water movement to areas not planned within the water management system; and
- Erosion of diversion berms (i.e., undercutting, slope failure).

In the case that any of the above conditions are observed, corrective actions will be taken if there is potential for compromise effectiveness of the channel function or potential for unplanned impact to water quality or quantity in associated containment ponds.

SECTION 4 • WATER MANAGEMENT STRATEGY

There are four major sources of inflow water considered in the Mine water management system; freshwater pumped from Meliadine Lake and Lake A8, natural run off from precipitation, natural groundwater inflow to the Underground Mine and open pits, and water produced during freshet.

A brief summary of the water management strategy for the Mine is presented as follows:

- Contact water from key mine infrastructure will be diverted and/or collected in the containment ponds (CP1, CP3, CP4, CP5, CP6, the Saline Ponds and the P-Area).
- The collected water in CP3 to CP6 will be pumped to CP1. Water collected in CP1 may be reused by the process plant and the excess water will be treated by the EWTP prior to discharge via the diffuser into Meliadine Lake.
- Contact water from the Underground Mine will be contained in underground sumps and the water storage stope and reused for mining operations. Excess water volumes will be stored in the Saline Ponds, treated by the SWTP to be transported to CP1, or will be discharged to Melvin Bay.
- Runoff water in the open pits will be collected in sumps and then pumped to the designated water containment ponds (CP1, CP5).
- Natural flooding of the open pits at end of mining will be supplemented by using freshwater from Meliadine Lake.
- Upon the completion of underground mining, the Underground Mine workings will be allowed to naturally flood by groundwater seepage.

Appendix B presents the Freshet Action Plan, which includes the Freshet Action Procedure and the Snow Management Procedure for the Mine. Table 9 summarizes the overall contact water management plan for the key infrastructure and presents the initial water collection locations and final water destinations. The plans for water management at key areas are described in following sections.

Table 9: Overall Site Surface Contact Water Management Plan

Contact Water Source	Initial Contact Water Collection Location	Final Contact Water Collection Location
Industrial Site Pad Area (camp/process plant area)	CP1	CP1
WRSF1 Area	CP1, CP4 and CP5	
WRSF2 Area	CP1 and CP5	
WRSF3 Area	CP6	
Dry Stack TSF Area	CP1 and CP3	
Ore Stockpiles OP1 to OP2	CP1	
Landfill	CP1	
Landfarm (biopile)	Sump within Landfarm	To CP1 after oil separation
Tiriganiaq Pit 1 Tiriganiaq Pit 2	Open pit sumps	First to CP5 and then to CP1
Tiriganiaq underground	Sumps in underground mine	Sumps in underground mine, surface saline water storage ponds (Saline Pond, P-Area), SWTP to CP1 and/or discharge to sea

The following sections describe the strategy for water management at different areas for the Mine.

4.1 Key Water Management Activities

The activities required for the WMP are summarized in Table 10. Water management activities during closure are described in Section 6.

Table 10: Key Water Management Activities

Mine Year	Major Water Management Activities and Sequence
Q4 of Yr -5 (2015)	• Started to re-use the underground water • Dewatered top 0.5 to 1.0 m of fresh water in Pond H17
Yr -4 (2016)	• Dewatered H17 into Meliadine Lake. • Dewatered Pond A54 in Q3 of Year -4 and pumped the water to CP1. • Started to store the excess groundwater from the underground mine at surface. • Implemented and tested evaporators at P-Area to reduce water volumes stored at surface. • Constructed trenches down gradient from DP1-B and DP3-A to be able to pump collected water and pump back to P1 and P3, respectively.

Mine Year	Major Water Management Activities and Sequence
Yr -3 (2017)	• Started to treat sewage from STP and pump the treated sewage from STP to CP1. • Started to pump the contact water from CP5 to CP1 for treatment (solids removal) • Started to pump water collected in trenches, down gradient from D-CP1, D-CP5, DP1 and DP3 to CP1, CP5, P1 and P3, respectively. • Started to pump the water from the Type A Landfarm to CP1 after oil/water separator treatment. • Started to pump water from washbay to underground for storage until a biological treatment unit for hydrocarbon reduction/removal arrives at the site
Yr -2 (2018)	• Started to pump the water from CP1 to EWTP for treatment prior to discharge via the diffuser to Meliadine Lake. • Pumped the solids sludge from EWTP to CP1. To limit recirculation of the sludge within CP1, the discharge of the sludge was located away from the EWTP intake. • Started diversion of the contact water from industrial pad to CP1 via Channel1 • Constructed and commissioned (in Q4) SWTP to discharge to CP1.
Yr -1 (2019)	• Commission wash bay water treatment unit, monitor water quality monthly and transport treated water to CP1 • Start to pump the contact water in CP3 to the partially drained Pond H13 where the water will flow through Channel1 into CP1 • Discharge up to 800 m^3/day saline water to Melvin Bay at Itivia during the open water season • Start to pump the contact water in CP4 to the partially drained Pond H13 where the water will flow though Channel1 into CP1
Yr 1 (2020)	
Yr 2 (2021)	• Start to pump contact water collected in Tiriganiaq Pit 1 to CP5
Yr 3 (2022)	• Dewater Ponds H19 and H20 in Q3 of Year 3 and pump the water to CP1
Yr 4 (2023)	• Start to pump contact water collected in Tiriganiaq Pit 2 to CP5 • Start to pump contact water in CP6 to CP1
Yr 5 (2024)	• Water management plan similar to Year 4
Yr 6 (2025)	• Water management plan similar to Year 4
Yr 7 (2026)	• Water management plan similar to Year 4 • Stop pumping water from the open pits when the pits are mined-out at end of year • Stop pumping excess water from underground when underground mine is completed
Yr 8 (2027)	• Start to fill the mined-out Tiriganiaq Pits 1 and 2 with active pumping from Meliadine Lake • Start natural flooding of Tiriganiaq Underground mine with groundwater seepage • Stop pumping water to process plant when the processing is completed

4.1.1 Pond Dewatering and Displacement

The initial dewatering at Lake H17 and Lake A54 was conducted in 2016 prior to constructing CP1 and CP5, respectively. The water from these ponds was pumped to Meliadine Lake through a temporarily installed diffuser. Preparation for construction of CP4 facility required dewatering of two shallow ponds into CP1, namely B8 and B9 at CP4. Volumes pumped to CP1 from B8 and B9 occurred in Q4 2018 are approximately 2993 m^3 and 6840m^3, respectively. Preparation for CP3 did not require dewatering as B28 contained insufficient volumes to dewater. Regarding dewatering of Ponds H19 and H20 for CP6 and WRSF3, it is assumed that approximately half the volume of water in these ponds will be pumped to Meliadine Lake if it meets discharge criteria, and the remaining volume of water will be pumped to CP1 to be stored for open water discharge to Meliadine Lake or for use in the Process Plant. Table 11 summarizes the estimated dewatering plan and estimated volume of water to be dewatered for future construction.

Table 11: Estimated Pond Dewatering Plan

Pond	H20	H19
Maximum Pond Water Depth (m)	1.6	1.4
Existing Pond Surface Area (ha)	9.58	2.91
Dewatering Schedule	Sept. to Oct. of Year 3	Sept. to Oct. of Year 3
Estimated Total Volume of Water to be Dewatered (m^3)	90,307	16,431

4.1.2 Underground Water Management

The Underground Mine will extend approximately 650 m below the ground surface and part of the underground workings will be operated below the base of continuous permafrost. The underground excavations will act as a sink for groundwater flow during mining, with water induced to flow through the bedrock to the Underground Mine workings once the Mine has advanced below the base of the permafrost.

Underground contact water is contained within underground sumps and the underground water stope. Excess underground water is pumped to surface to be managed in Saline Pond 1 (SP1). A second Saline Pond (SP2) will be added to the storage system pending commissioning of the structure. Beginning December 2018, the SWTP began treating groundwater to reduce stored saline water on Site (See Section 3 for details). Furthermore, as part of the strategy to manage excess groundwater infiltration of saline water within the underground portion of the mine, Agnico Eagle applied to the Nunavut Impact Review Board for approval to discharge saline water to the sea (Melvin Bay, Rankin

Inlet). Agnico Eagle received approval with the amended Project Certificate on February 26, 2019 (See Section 3.11 and Appendix A for details).

The estimated volume of water to be managed is expected to range from a minimum of about 0.11 Mm^3/year to a maximum of 0.18 Mm^3/year depending on the production. Details of the underground dewatering system are provided in the Mine Plan (Agnico Eagle, 2017a).

Table 12 presents the predicted groundwater inflow rates estimated by Golder (2016) for passive groundwater inflow to the Underground Mine. Details pertaining to model inputs and assumptions are found in Appendix A. Values presented in Table 12 do not include grouting efforts or ventilation loss. Net inflow values to the Underground Mine, which included the impact of grouting, ventilation losses, loss of water in waste rock pore space, treatment by the SWTP, and loss due to re-use of water in mining operations, were estimated based on changes in water volumes stored in the underground water storage system. Changes in storage were calculated on a daily basis and used to produce monthly values of mean daily net inflow rate. Based on these monthly estimates of mean daily inflow, mean net inflow rate over 2018 was 51 m^3/day. This is not the groundwater inflow rate to the mine but rather the balance of inflows, the aforementioned water losses, and water used for operations. Thus, the 51 m^3/day estimate is the surplus of inflows that was placed in storage.

It should be noted that the net inflow rate generally increased over 2018. During Q4 of 2018 the mean daily net inflow rate was approximately 105 m^3/day. The increasing trend is the result of the progression of development, especially development approaching the lower fault (in the vicinity of the ore body), where hydraulic conductivities are expected to be relatively high (1x10-7 m/s). Going forward, daily net inflow rates will increase when stoping within the cryopeg begins (Q1 of 2019). This is because greater surface area of rock will be exposed and stoping will proceed within the ore body where water-bearing structures exist, and grouting of inflows will not be possible within stopes.

Table 12: Predicted Groundwater Inflow to the Underground Mine (2017 to 2032)

Period	Predicted Groundwater Inflow (m^3/day)
2017	230
2018	300
2019	280
2020	300
2021	340
2022	340
2023-2024	420
2025-2026	380
2027-2028	390
2029-2030	380
2031-2032	360

Source: Updated Predictions of Groundwater Inflow to Tiriganiaq Underground Mine (Golder 2016).

4.1.3 Water Management for Haul Road

A network of haul roads are to provide access to infrastructure at the Mine. The majority of the roadways servicing the mining area are located so that drainage is directed by berms, channels and culverts towards CP1, CP3 and CP5. As shown in Appendix C, water diverted to CP3, CP4, CP5 and CP6 will eventually be transferred to CP1. Detailed information about water management on roads is described in the Roads Management Plan (Agnico Eagle, 2019).

4.1.4 Water Management for Landfarm and Landfill

Any water that accumulates at the onsite Landfarm will be pumped through an oil/water separator prior to discharge into CP1. Additional details for Landfarm water management are described in the Landfarm Management Plan (Agnico Eagle, 2015b).

Leachate from the Landfill is anticipated to non- hazardous and non- toxic due to the controls placed on materials acceptable for the landfill. Drainage from the Landfill is expected to freeze within the WRSF with minimal amounts of leachate reporting to the water collection infrastructure placed around the WRSF. Annual Landfill operations will involve clearing of snow prior to spring melt. However, in the event there is leachate from the Landfill due to periods of heavy rainfall or spring freshet, the runoff will be collected, controlled and treated, if necessary (Agnico Eagle, 2015a), and sent to CP1.

4.1.5 Water Management for Emulsion Plant Area

Freshwater will be trucked to the emulsion plant and used for manufacturing emulsion as well as for washing vehicles. Water within the emulsion plant will be re-used when feasible, and excess water will be collected and disposed of either through the onsite STP or in the P-Area holding ponds.

4.1.6 Water Management for the Batch Plant

Freshwater is pumped from Lake A8 to the Batch Plant and used for concrete production. Water used in the Batch Plant will be re-used when feasible and excess used water will be collected and disposed of in the P-Area containment ponds.

4.1.7 Water Management for the Wash Bay

Water used in the Wash Bay is re-used when feasible and excess water is recycled through a biological treatment system designed to reduce or remove hydrocarbons. Waste from the treatment process is removed in the form of solids and disposed of appropriately (landfarm or landfill).

4.2 Freshwater and Sewage Management

Additional freshwater usage and sewage management is described in the following sections.

4.2.1 Freshwater Management

Major freshwater usages on site include potable use, fire suppression, a portion of make-up water for the mill, and other operational needs, such as drilling. Freshwater is sourced from Meliadine Lake through a freshwater intake and pump system. For dust suppression, water is sourced from any ponded water located along the All Weather Access Road (AWAR), small ponds proximal to the road and/or from the Meliadine River.

Freshwater is pumped through an overland pipeline to an insulated main storage tank located at the plant site. Under the Licence, up to 62,000 m^3/year of freshwater may be used during the construction phase. Approximately 318,000 m^3/year of freshwater is permitted during operation phase. Additionally, approximately 4,000,000 m^3 of freshwater is permitted per year to fill the mined-out open pits during the mine closure. These quantities are inclusive of water needs for dust suppression.

The design flow rate for the potable water for the main camp and accommodations (kitchen, laundry) is 136 m^3 per day (based on a 680-people camp capacity and a nominal consumption of 200 L/day/person). There is an onsite Potable Water Treatment System. Treated potable water is piped to areas in the process plant, service complex, and other facilities requiring potable water.

4.2.2 Sewage Management

Sewage is collected from the camp and change-room (dry) facilities and pumped to the STP. The objective of the STP is to treat sewage to an acceptable level for discharge to CP1 via a sewage water discharge pipeline. The STP is housed in a prefabricated (modular) structure, located at south-east of the service complex at the Industrial Pad, as shown in Figure 1.2. The sewage treatment system is designed based on a flow rate of 200 L per day per worker for a peak load of 680 people, for an average daily flow rate of 136 m^3 (5.67 m^3/h).

The STP for the camp facilities is designed to meet appropriate guidelines for wastewater discharge (Agnico Eagle, 2017c). Details regarding STP specifications and operation can be found in the Operation & Maintenance Manual Sewage Treatment Plant (Agnico Eagle, 2017c).

4.2.3 Process Water Management

Process water will be required in the mill for ore processing. Both contact water from CP1 and sludge water from the EWTP may be used as process water. When possible, water from CP1 will be the main source of water for the ore process. Additional water needs will be supplied by freshwater from Meliadine Lake. Approximately 600 m^3/day of process water will be required in Year 1 to Year 3 operations and approximately 770 m^3/day of process water will be required in Year 4 to Year 8.

4.3 Meliadine Lake Diffuser Effluent Flow Rates

Effluent is discharged from the EWTP into Meliadine lake via a diffuser at a design rate of 11,688 m^3/day (a water treatment rate of 12,000 m^3/day minus 312 m^3/day of sludge returned back to CP1).

The pump does not operate continuously. The amount of effluent flow released over each month and over each year was based on the overall water balance for the feasibility study (Tetra Tech EBA, 2016).

Table 13 shows the estimated total volume of effluent released per month per year along with effluent released per month in 2018. Daily effluent discharge rates are provided in Figure 7.2 and discussed in Section 7.

Table 13: Estimated Effluent Flow Rates over Mine Operating Life

Year	Effluent Released Over the Course of the Month (m^3)				
	June	July	August	September	October
Year -2: 2018	134,262	352,551	153,066	2,632	0
Year -1: 2019	175,320	303,888	105,192	93,504	35,064
Year 1: 2020	175,320	292,200	105,192	163,632	70,128
Year 2: 2021	175,320	350,640	128,568	105,192	35,064
Year 3: 2022	175,320	350,640	128,568	93,504	35,064
Year 4: 2023	175,320	350,640	128,568	93,504	35,064
Year 5: 2024	175,320	350,640	128,568	93,504	35,064
Year 6: 2025	175,320	280,512	105,192	81,816	35,064
Year 7: 2026	175,320	292,200	116,880	93,504	35,064
Year 8: 2027	175,320	292,200	116,880	93,504	35,064
Year 9: 2028	175,320	280,512	116,880	93,504	35,064
Year 10: 2029	-	-	-	-	-
Year 11: 2030	-	-	-	-	-

SECTION 5 • WATER BALANCE

5.1 Global Water Balance

A water balance model was developed to assist in the evaluation of the water management infrastructure and estimation of the pumping requirements over the life of the Mine and under closure conditions. The model includes a water balance conducted on both a monthly and yearly basis. The model focuses specifically on contact water management infrastructure and areas that are affected by mining activities.

A monthly site-wide water balance was conducted for CP1, CP3, CP4, CP5, CP6, Tiriganiaq Pit 1, Tiriganiaq Pit 2, water in the underground mine operation, make-up water for the mill, water for the WTPs, and freshwater during mine construction period to mine closure under mean precipitation years.

The following sections present the parameters and assumptions adopted in the water balance model as well as a 2019 model update along with a summary of the water balance results.

5.2 Water Balance Framework

The water balance framework developed for the site-wide water balance model was presented in Version 1 of the WMP (Agnico Eagle, 2015a). To simulate a range of conditions, the model was run for the proposed mine life and closure conditions.

5.3 Water Balance Assumptions

The water balance was based on the following:

- snow accumulates throughout the months of November to May, and thaws in June during the annual spring freshet period;
- average precipitation year climate conditions;
- the open pits and water containment ponds (CP3 to CP6) are not to be used for long-term storage of water during operations;
- the water collection sumps and ponds are empty in the autumn prior to the spring freshet each year; and,
- other water management assumptions described in Section 4 of this WMP.

A general water management flow sheet illustration is presented in Appendix C.

5.4 Water Balance Results

The estimated maximum annual water input/output from each of the various water management facilities under mean precipitation conditions are summarized in Table 14. Results were also provided

for 1:100 year wet and dry conditions, with corresponding basis and assumptions, in a separate technical memorandum (Tetra Tech EBA, 2015). Results of the 2019 water balance update are provided in Appendix H of the plan.

Table 14: Estimated Maximum Annual Volumes from Mine Site Water Balance

Item	Maximum Annual Water Volume (Mm^3)
Contact Water from CP1	0.800
Contact Water from CP3	0.088
Contact Water from CP4	0.087
Contact Water from CP5	0.240
Contact Water from CP6	0.076
Water Pumped from CP1 to EWTP for Treatment	0.798
Fresh Water Pumped from Meliadine Lake during Construction	0.062
Fresh Water Pumped from Meliadine Lake during Operation	0.318
Treated Water from EWTP to be Discharged to Outside Environment	0.730
Underground Water Pumped to Underground TSS Removal Plant	0.696
Excess Water from Underground Mine to be Stored on Surface	0.155
Fresh Water Pumped from Meliadine Lake to Fill Mined-out Tiriganiaq Pit 1	3.068
Fresh Water Pumped from Meliadine Lake to Fill Mined-out Tiriganiaq Pit 2	0.749

5.5 Waterbody Inventory

Three watersheds (Watershed A, Watershed B and Watershed H) will be impacted by the Mine activities. Table 15 presents the waterbodies that are impacted by mining activities. Watersheds and waterbodies in proximity to the Mine location and waterbodies affected by Mine infrastructure are shown on Figure 5.1.

5.6 2019 Water Balance Update

An update to the water balance model was generated to provide monthly water balance and water quality forecasts (Section 7.3) for the 2019 year. The purpose of this update is to identify potential changes to the site water balance as the mine transitions to commercial operation (Appendix H).

The 2019 water balance update is specific to waterbodies that will be affected by the commencement of operations and operational activities taking place throughout the remainder of the 2019 calendar year. The water containment facilities included in this update are CP1, CP3, CP5, Saline Pond,

underground mine operation, and P-Area. Results of the water balance update are provided in Appendix H.

The framework of the 2019 water balance update was designed with the following assumptions:

- Precipitation is based off an average climate scenario;
- The Mine will not discharge saline water to Melvin Bay;
- Additional saline water storage on surface (i.e. Saline Pond 2) is not included;
- The SWTP will be used to treat saline water from the underground mine;
- Winter inputs (snow dumping activities) to CP1 are not accounted for; and
- TSF runoff includes a component of waste rock runoff originating through the waste rock cover.

Table 15: Inventory of Waterbodies Impacted by Mining Activities

Watershed	Waterbody	Maximum Lake Water Depth, m	Total Area (ha)	Water Volume (m^3)	Notes
A	A9	N/A	0.18	-	Flow regimes impacted by the development of Tiriganiaq Pit 1
	A10	0.67	0.26	-	Ponds removed by development of Tiriganiaq Pit 1
	A11	0.45	0.40	-	
	A12	0.87	0.47	-	Pond drained due to construction of Channel 5
	A13	0.30	0.26	-	
	A17	0.30	0.16	-	Covered by WRSF 1
	A38	N/A	0.05	-	Flow regimes impacted by the development of Tiriganiaq Pit 2
	A39	0.48	0.12	-	Ponds removed by development of Tiriganiaq Pit 2
	A54	1.3	5.99	34,545	Dewatered for CP5
	A58	0.50	0.43	-	Covered by WRSF 2

SECTION 6 • WATER MANAGEMENT DURING CLOSURE

The detailed Mine closure and reclamation activities are provided in the Preliminary Closure and Reclamation Plan (Agnico Eagle, 2015d).

Water management during closure and reclamation will involve flooding the open pits using precipitation and freshwater from Meliadine Lake, flooding the Underground Mine workings with groundwater inflows (groundwater seepage), and maintaining contact water management systems on site until monitoring results demonstrate that water quality are acceptable for discharge of all contact water to the environment without further treatment. Once water quality meets the discharge criteria, the water management systems will be decommissioned to allow the water to naturally flow to the environment.

The key water management activities during Mine closure are summarized in Table 16. Figures 6.1 and 6.2 illustrate the WMP during and after Mine closure, respectively. Additional details for the activities are described in the following sections.

Table 16: Key Water Management Activities during Mine Closure

Mine Year	Figure	Key Water Management Activities and Sequence
Yr 9 to 11 (2028 to 2030)	6.1	• Finish flooding the mined-out Tiriganiaq Pit 1 and Tiriganiaq Pit 2 by Q4 of Year 10 • Continue to collect and manage the contact water in CP1, CP3, CP4, CP5 and CP6 • Continue to pump the contact water in CP1 to EWTP, if required, for treatment before being discharged to the outside environment • Remove non-essential site infrastructure • Pump the underflow sludge water from EWTP to CP1 • Continue natural flooding of Tiriganiaq Underground Mine with groundwater seepage • Remove Meliadine Lake pumping system
Post-Closure	6.2	• Treat the contact water until water quality meet direct discharge criteria and then decommission the water management system • Continue natural flooding of Tiriganiaq Underground (progressive reclamation since Year 8) • Breach water retention dikes D-CP1, D-CP3, D-CP4, D-CP5, and D- CP6 once water quality monitoring results meet discharge criteria to allow water to naturally flow to outside environment • Remove culverts and breach remaining water retention dikes/berms in Year 18

6.1 Open Pits Flooding

When flooding the open pits for closure, the maximum pumping rate from Meliadine Lake shall not exceed 4,000,000 m^3/year during closure of the Mine, as stated in Part E Item 2 of the Licence. The planned pumping period will occur during the open water season from mid-June to end of September

for each year. Table 17 summarizes the pit volume and expected water elevations at the completion of flooding activities. It will take approximately three years to fill the pits with an assumed pumping rate of 0.44 m^3/s (38,300 m^3/day). The assumed pumping rate of 0.44 m^3/s from Meliadine Lake during closure will have negligible effect to Meliadine Lake when compared to the average outflow rate at the outlet of Meliadine Lake. The pumping rate will be evaluated further to validate that any possible negative effects to Meliadine Lake do not occur.

Table 17: Pit and Underground Flooding

Pit	Volume (Mm^3)	Final Water Elevation (masl)	Water Source
Tiriganiaq Pit 1	9.20	64.14	Freshwater from Meliadine Lake
Tiriganiaq Pit 2	2.25	64.38	Freshwater from Meliadine Lake
Tiriganiaq Underground	1.4	Groundwater level	Groundwater seepage

The water quality model results indicated that water quality in the flooded pits will meet the discharge criteria and post closure treatment will not be required. The water quality within the pits will be monitored during flooding to verify the prediction of the water quality model. The information will be used to develop a strategy to minimize contamination of the regional surface water system.

6.2 Underground Mine Flooding

Passive flooding of the Tiriganiaq Underground Mine will occur following the completion of mining. The estimated total flooding volume of the underground workings is 1,372,000 m^3. Seepage water into the Underground Mine will be the main water source for flooding. At the predicted seepage rate it is estimated to take 6 years to flood the Underground Mine.

6.3 Containment Ponds, Dikes and Berms

The containment ponds, dikes and berms will remain in place to collect the surface runoff water and seepage from the Mine until the water quality meets discharge criteria. Once the water quality meets discharge criteria, dikes/berms will be breached to allow runoff to follow natural (topographically induced) flow paths. Dikes/berms breaching will involve the removal of a portion of the dikes to a minimum depth of 1 m below average water level or back to original ground levels. Consideration will be given to breach staging, with the above water portions of the dike/berm in the breach area removed during winter periods, when there will be little surface water flow, thereby minimizing the potential release of sediments to the neighbouring waterbodies. The remainder of the breach would be conducted during the open water season following freshet. Turbidity curtains would be deployed to minimize any potential sediment release to surface water.

6.3 Channels and Sumps

Once monitoring results have indicated that contact water conveyed in channels and sumps meets acceptable water quality, the infrastructure will be graded and/or surface treated according to site-specific conditions to minimize wind-blown dust and erosion from surface runoff, if required. This closure activity is intended to enhance site area development for re-colonization by native plants and wildlife habitat.

SECTION 7 • WATER QUALITY

Water quality monitoring is an important part of the Water Management Plan to verify the predicted water quality trends, conduct adaptive management should differing trends be observed, and to ensure all water quality limits at discharge points are met (i.e., effluent to Meliadine Lake and Melvin Bay). Water quality results and water transfers (i.e., origin, destination, rate) at the Mine are monitored and documented pursuant the Licence.

Water quality monitoring was initiated at the pre-development stage and continued through construction. Monitoring will continue into operations, closure, and post-closure. Monitoring occurs at three levels:

1. Regulated discharge monitoring that occurs at monitoring points specified in the Licence or MDMER regulations.
2. Verification monitoring that is undertaken for operational and water management purposes by Agnico Eagle.
3. General monitoring that is commonly included in the Licence, specifying what is to be monitored according to a schedule. This monitoring is subject to compliance assessment to confirm sampling was carried out using established protocols, included quality assurance/quality control provisions, and addressing identified issues. General monitoring is subject to change as directed by an Inspector, or by the Licensee, subject to approval by the NWB.

Appendix F details the Water Quality and Flow Monitoring Plan, which will be further defined as the Mine advances. Figure 7.1a and Figure 7.1b depict Monitoring Program Stations on Site and at Itivia.

Water quality predictions for the Mine were generated using the GoldSim database management and simulations code (Version 11.1.2) where Mine contact water flows derived from the Meliadine water balance are combined with chemistry data from materials exposed in mine infrastructure (tailings storage facility, waste rock piles, etc.), and site baseline information. Where site-specific information is not available, data collected at other mine sites in the north were used to supplement input data.

Water quality estimates were generated for the operational and post-closure periods for effluent to Meliadine Lake, each contact water containment pond (CP1, CP3, CP4, CP5, and CP6), for sumps in the two open pits and for the two fully flooded open pit lakes post-closure. These results were submitted with the 2015 Water Management Plan.

The sensitivity of water quality to an added TSS load was evaluated outside of the GoldSim mass balance model. Total parameter concentrations were evaluated at ponds that discharge to the receiving environment (i.e., CP1 during operations, and CP1, CP3, CP4, and CP6 post-closure) based on an addition of 15 mg/L TSS. Given the uncertainties associated with the modelling exercise (i.e., the development stage of the Mine, laboratory-based input values, assumptions where data do not

exist and consideration of an average climate year), the predicted concentrations are considered to be order-of-magnitude estimates. The estimates are sensitive to the assumptions and design elements considered.

Table 18 shows the various MEL-14 (effluent to Meliadine Lake) water quality limits listed under Part F, Item 3 of the Licence, the 2018 water quality results for MEL-14, and the predicted maximum values during operations with respect to end-of-pipe concentrations for MEL-14. As stated above, updated predictions of maximum MEL-14 values will be provided as an addendum to the Water Management Plan when completed.

7.1 Summary of Regulatory Guidelines

Water quality results are compared to MDMER criteria and effluent quality limits listed in the Licence. Water quality pertaining to MEL-14 will be compliant to Part F, Item 3 of the Licence prior to discharging to Meliadine Lake. All surface runoff and/or discharge from drainage management systems associated with the Mine, including laydown areas and All-Weather Access Road, where flow may directly or indirectly enter a Water body, shall not exceed the Effluent quality limits listed in Part D, Item 18 of the Licence. Furthermore, all waters from natural water body dewatering activities shall be directed to Meliadine Lake and shall not exceed the Effluent quality limits listed in Part D, Item 12.

Post-closure discharge water quality will be compared to Canadian Council of Ministers of the Environment Water Quality Guidelines (CCME-WQG) guidelines or the Meliadine SSWQO developed for aluminum, fluoride, and iron (Golder 2013a, 2013b, 2014). The Meliadine SSWQO criteria was developed as a conservative protection to the aquatic receiving environment and was developed by Golder (2013a, 2014) to assess whether waste rock consisted of a deleterious substance according to Environment Canada (2013). The outcome of the assessment was that Meliadine waste rock is not a deleterious substance (Environment Canada 2014).

7.2 Construction

7.2.1 2018 Discharge to Meliadine Lake (MEL-14) Results

With respect to discharge from CP1 to Meliadine Lake (MEL-14), there was one exceedance of the maximum grab sample total aluminum concentration in effluent under Part F, Item 3 of the Licence (3 mg/L; Table 18). This exceedance was reported to the GN. The sample was taken on July 23rd and produced total aluminum concentrations equal to 4.39 mg/L. Results of the adjacent sampling events, July 15th and July 29th, produced concentrations equal to 1.23 mg/L and 0.811 mg/L, respectively. On July 23rd, results showed a relatively high TSS concentration (21 mg/L) and total aluminum was made up of only 2.1% dissolved aluminum. Thus, the exceedance may be attributed to uncommonly high TSS on the sampling date or a lab error. A re-analysis could not be performed as there was no additional water left from this sample. There were no other exceedances under Part F, Item 3 of the Licence during Construction.

Daily MEL-14 discharge volumes over 2018 are shown in Figure 7.1 and monthly totals are provided in Table 13. Discharge began on June 21st and ended on September 3rd. Daily discharge ranged from 103 m^3/day during the late-season (late-August to early-September) to 18,998 m^3/day during peak discharge (mid- to late-July). Average discharge rate was 9,409 m^3/day between June 21st and September 3rd.

7.2.2 2018 Surface Runoff (MEL-SR-1 to MEL-SR-14) Results

With respect to surface runoff associated with the Mine, there were five TSS exceedances of maximum concentrations of any grab sample listed under Part D, Item 18 of the Licence (100 mg/L TSS). One of these occurred at MEL-SR-1 (500 mg/L TSS) and one at MEL-SR-9 (670 mg/L TSS) on May 27th, and on June 17th, respectively. The remaining three occurred at MEL-SR-11 (1200 mg/L TSS, 420 mg/L TSS, 160 mg/L TSS) on May 27th, June 3rd and June 10th. The high levels of TSS present during these sampling events caused the moving averages to fall above the maximum average TSS concentration limit listed under Part D, Item 18 of the Licence (50 mg/L). Thus, there were four exceedances of maximum average TSS concentration, one at MEL-SR-1 (143 mg/L TSS) and three at MEL-SR-11 (450 mg/L TSS, 154 mg/L TSS, 56 mg/L TSS). The maximum average TSS concentration exceedances were all the direct result of grab sample maximum concentrations exceedances, which were reported to the GN. Once the moving average calculations progressed beyond the inclusion of the grab sample exceedances, the moving average decreased well below the 50 mg/L limit. Thus, the exceedances of average TSS values were not the result of consistently high TSS values, but rather the result of temporally discrete instances of high TSS results.

Visual assessment and upstream sampling suggests the main TSS source to the MEL-SR-1 exceedance originated from infrastructure to the East and Northeast of the Itivia Site, outside of the site boundaries. Upon 2019 snowmelt, sediment control methods (i.e., silt fences, straw logs) will be strategically installed to prevent sediment transport into and through the Itivia site to MEL-SR-1. Agnico Eagle is currently planning permanent structures for sediment control at Itivia. With respect to MEL-SR-11, the cause for the exceedances and source of runoff was sediment-rich snow piles accumulated during construction of the Bypass Road. The snow piles were located to the Southwest of the Itivia fuel storage tanks. Construction of the Bypass Road is now complete and snow will not be placed in this area over the 2018/2019 winter. Furthermore, based on 2018 runoff patterns snow will be managed strategically to prevent sediment rich snow piles and runoff with the potential to entrain TSS (Refer to Snow Management Procedure within the Freshet Management Plan; Appendix B).

7.3 2019 Water Quality Forecast Update

Results from the 2019 model update (Section 5.4) include TDS concentrations for CP1, CP3, CP5, Saline Pond, underground mine operation, and P-Area. These results were calculated through a mass balance model developed in conjunction with the 2019 water balance model update. Pending the commissioning of additional treatment options, the water quality model will be updated to include all additional parameters outlined in Part F of the licence. The results of the mass balance model are provided alongside the water balance results in Appendix H.

Model predictions exhibit heightened instances of TDS loading across the containment ponds. These values can be attributed to several factors. In general, forecasted precipitation and runoff inflow volumes to all containment ponds is considered to be conservative. There is assumed to be a reduced accounting for freshwater inflows, as precipitation values through winter months is misrepresentative of the overall captured snow and ice melt within the catchment areas. This results in reduced TDS concentrations within all containment ponds and in particular, CP1, due to the size of the catchment area. There is also a lack of accounting for freshwater volumes received due to snow removal stockpiling within CP1. Additionally, CP3 TDS concentrations are assumed to be highly conservative due to the static TDS concentration applied to all runoff volumes within the TSF. As such, the results provide more relative concentrations compared to what has been observed in previous years and are better suited to reflect the magnitude of TDS concentrations that can be expected in 2019.

Table 18: Effluent Characteristics of MEL-14 (CP1 to Meliadine Lake)

	MDMER and Licence Part F, Item 3 Maximum Concentrations		2018 MEL-14 End-of-Pipe Concentrations		Maximum MEL-14 End-of-Pipe Concentrations Predictions based on Tiriganiaq Monthly Average

[a] Insufficient quantity of sample results to calculate an average as it is defined in the Licence (requires 4 sample dates for moving average).

*Exceeds effluent quality limit listed under Part F, Item 3 of the Licence (2AM-MEL1631).

7.2.3 Dewatering and Other Monitoring Program Stations

There were no dewatering activities applicable to Part D, Item 12 of the Licence. Dewatering of Lake B8 and Lake B9 produced modest volumes (Section 4.1.1) and was directed to CP1.

The remaining Monitoring Program Station results will be provided in the 2018 Annual Water Licence Report where the stations have sufficient data to report. These stations are not final discharge points and thus do not have effluent quality limits applied within the Licence. A discussion of these results and trends will be provided in the 2018 Annual Water Licence Report where applicable.

7.3 Operations

According to model predictions, CP3 arsenic concentration may exceed MDMER on occasion if precipitation events or the freshet flows generate drainage from the TSF (Golder, 2012c). The main source of arsenic in CP3 is predicted to be from residual process water that is assumed to be present in the filtered tailings. Arsenic transfer from process water to CP3 water will be minimized by effective dewatering of the tailings prior to placement into the TSF, and from freezing of the tailings in the TSF. Frozen tailings will act to limit infiltration and seepage. Water from CP3 will be pumped to CP1 where it will mix with other site waters before discharge. Dissolved arsenic concentration in CP1 is predicted to meet the MDMER monthly average maximum concentration. All other chemical parameters in CP3 and all chemical parameters in CP1, CP4, CP5, and CP6 are predicted to meet MDMER limits for chemical constituents.

7.4 Post-Closure

Long-term, post-closure water quality in the containment ponds (CP1, CP3, CP4, CP5, and CP6) and in the flooded open pit lakes are anticipated to meet MDMER limits and CCME-WQG for the protection of aquatic life or the SSWQO developed for the Mine for aluminum, fluoride, and iron. Arsenic concentrations in CP3 could slightly exceed the SSWQO post-closure, a criteria that is conservatively protective of the receiving aquatic environment (Golder, 2013a). Concentrations that exceed predictions are minor, much less than the mixing capacity in the receiving environment. These arsenic concentrations (Golder, 2013a) are within the tolerance levels that have been deemed non-deleterious by Environment Canada for the Mine (Environment Canada, 2014).

APPENDIX A • MELIADINE GROUNDWATER MANAGEMENT PLAN

AGNICO EAGLE

MELIADINE GOLD MINE

Groundwater Management Plan

MARCH 2019
VERSION 4

EXECUTIVE SUMMARY

Agnico Eagle Mines Limited (Agnico Eagle) is developing the Meliadine Gold Mine (the Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut.

The Mine Plan proposes mining methods for the development of the Tiriganiaq gold deposit, with two open pits (Tiriganiaq Pit 1 and Tiriganiaq Pit 2) and one Underground Mine. Based on the current Mine Plan, the Mine will produce approximately 14.9 million tonnes (Mt) of ore, 31.4 Mt of waste rock, 7.1 Mt of overburden waste, and 14.9 Mt of tailings (Agnico Eagle 2019). There are four phases to the development of the Mine; just over 4 years of construction (Q4 Year -5 to Q2 Year -1)), 8.5 years of Mine operation (Q2 Year 1 to Year 8), 3 years of closure (Year 9 to Year 11), and post-closure (Year 11 forwards).

Tiriganiaq Underground Mine is planned to extend to approximately 625 m below the ground surface; therefore, part of the Underground Mine will operate below the base of the continuous permafrost. The underground excavations will act as a sink for groundwater flow during operation, with water induced to flow through the bedrock to the Underground Mine workings once the Mine has advanced below the base of the permafrost. Over 2018, there was a net positive balance of stored underground water. The mean daily addition to underground water storage was estimated at 51 m^3/day. Groundwater quality data from samples taken underground 2017 through 2018 from diamond drillholes (DDHs) indicate TDS concentrations are less than predicted at an average concentration of 56,000 mg/L.

Saline water generated from the Underground Mine is currently stored underground and on surface at the P-Area and in Saline Pond 1 (SP1). A second containment pond, Saline Pond 2 (SP2), is being constructed in Q1 2019 and will be an addition to the surface saline water containment system. Saline groundwater stored on site is currently pumped to the Saline Water Treatment Plan (SWTP) for treatment and discharge to CP1. As part of the strategy to manage excess groundwater infiltration of saline water within the underground portion of the mine, Agnico Eagle received approval from the Nunavut Impact Review Board to discharge saline water to the sea (Melvin Bay, Rankin Inlet). Total dissolved solids of water discharged to sea and daily discharge volumes will not exceed 39,600 mg/L and 800 m^3/day, respectively.

This document presents the Groundwater Management Plan (GWMP) for the collection, treatment, storage and discharge of saline groundwater in accordance with Agnico Eagle's Type A Water Licence 2AM-MEL1631, Part E, Item 14.

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) is developing the Meliadine Gold Mine (Mine), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The Mine is subject to the terms and conditions of both the Mine Project Certificate (No. 006) issued by the Nunavut Impact Review Board in accordance with the Nunavut Agreement Article 12.5.12 on February 26, 2015 and Nunavut Water Board Type A Water Licence (No. 2AM-MEL1631, 2016) issued by the Nunavut Water Board (NWB) on April 1, 2016.

This document presents the Groundwater Management Plan (GWMP) for the collection, treatment, storage and discharge of saline groundwater in accordance with the Type A Water Licence 2AM-MEL1631 (Licence) and in accordance with Condition No. 25 of the amended Mine Project Certificate. The overall water management plan for the life of the Mine and post-closure is described in the Agnico Eagle Meliadine Gold Mine 2019 Water Management Plan (WMP) (Version 6). The WMP provides descriptions of the Mine water control structures and associated design criteria. The WMP was updated in March 2019 and reflects the groundwater management strategy presented in this document.

1.1 Concordance

The Mine is subject to the land and resource management processes established by the Nunavut Agreement and other Federal laws and regulations. Agnico Eagle submitted a Licence Application for a Mining and Milling Undertaking (Application) required to use water and to deposit waste in development of the Mine, in accordance with the *Nunavut Waters and Nunavut Surface Rights Tribunal Act* and Nunavut Water Regulations.

The Licence was issued on April 1, 2016 and signed by the Minister on May 19, 2016. The GWMP reflects the commitments made with respect to submissions provided during the technical review of the Application, as well as final submissions and issues raised during the Public Hearing Process, where applicable, to comply with Part B Section 13, and Part E Section 14 of the Licence.

In 2018, Agnico Eagle submitted a Saline Effluent Discharge proposal to the Nunavut Impact Review Board (NIRB). NIRB provided approval and issued the amended Mine Project Certificate for the Meliadine Gold Mine Project to Agnico Eagle on February 26, 2019. The GWMP reflects the revised Condition No. 25, which states the Proponent shall submit a detailed Groundwater Management Plan to the NIRB that includes mitigation measures under greater than expected groundwater inflow rates, treatment and disposal methods for discharge to sea, and details of its plan to monitor saline water at site.

1.2 Objectives

The objective of the GWMP is to provide consolidated information on groundwater management for the Meliadine Gold Mine. The GWMP is divided into the following components:

- Introductory section (Section 1);
- A brief summary of the physical setting at the mine site and the mine development plan (Section 2);
- A description of groundwater inflow forecasts and management strategies (Section 3); and
- A description of the groundwater monitoring program (Section 4);
- A description of the measures in place to ensure quality control and quality assurance is maintained in groundwater monitoring (Section 5).

The GWMP will be updated as required to reflect any changes in operations or economic feasibility that occurs, and to incorporate new information and latest technology, where appropriate, to comply with Part B Section 15 of the Licence.

SECTION 2 • BACKGROUND

2.1 Site Conditions

The Mine is located in an area of poorly drained lowlands near the northwest coast of Hudson Bay. The dominant terrain in the Mine area consists of glacial landforms such as drumlins (glacial till), eskers (gravel and sand), and many small lakes. The topography is gently rolling with a mean elevation of 65 metres above sea level (masl) and a maximum relief of 20 metres (m).

The local overburden consists of a thin layer of topsoil overlying silty gravelly sand glacial till. Cobbles and boulders are present throughout the region at various depths. Bedrock at the mine site area consists of a stratigraphic sequence of clastic sediments, oxide iron formation, siltstones, graphitic argillite and mafic volcanic flows (Snowden 2008; Golder 2009).

The climate is extreme in the area, with long cold winters and short cool summers, and mean air temperatures of 12 °C in July and -31 °C in January. The mean annual air temperature at the Mine site is approximately -10.4 °C (Golder 2012a). Strong winds blow from the north and north-northwest direction more than 30 percent of the time.

The mean annual precipitation in the area is approximately 412 mm and is typically equally split between rainfall and snowfall.

Late-winter ice thicknesses on freshwater lakes in the mine site area were recorded from 1998 to 2000. The measured data indicated that ice thickness ranges from 1.0 to 2.3 m with an average thickness of 1.7 m. Ice covers usually appear by the end of October and are completely formed in early November. The spring ice melt typically begins in mid-June and is complete by early July (Golder 2012b).

2.2 Local Hydrology

The Mine is located within the Meliadine Lake watershed. Meliadine Lake has a surface water area of approximately 107 square kilometres (km^2), a maximum length of 31 km, features a highly convoluted shoreline of 465 km and has over 200 islands. Unlike most lakes, it has two outflows that drain into Hudson Bay through two separate river systems. It has a drainage area of 560 km^2 from its two outflows. Most drainage occurs via the Meliadine River, which originates at the southwest end of the lake. The Meliadine River flows for a total stream distance of 39 km. The Meliadine River flows through a series of waterbodies, until it reaches Little Meliadine Lake and then continues into Hudson Bay. A second, smaller outflow from the west basin of Meliadine Lake drains into Peter Lake, which discharges into Hudson Bay through the Diana River system (a stream distance of 70 km). At its mouth, the Diana River has a drainage area of 1,460 km^2.

Watersheds in the Mine area are comprised of an extensive network of waterbodies, and interconnecting streams. The hydrology of these watersheds is dominated by lake storage and evaporation.

2.3 Hydrogeology

The Mine is located in an area of continuous permafrost. Based on thermal studies and measurements of ground temperatures, the depth of permafrost at the mine site is estimated to be in the order of 360 to 495 m. The depth of the active layer ranges from about 1 m in areas with shallow overburden, up to about 3 m adjacent to the lakes. The depth of the permafrost and active layer varies depending on proximity to the lakes, overburden thickness, vegetation, climate conditions, and slope direction (Golder 2012b). The typical permafrost ground temperatures at the depths of zero annual amplitude are in the range of -5.0 to -7.5 °C in the areas away from lakes and streams. The geothermal gradient ranges from 0.012 to 0.02 °C/m (Golder 2012c).

Groundwater characteristics at the Mine are detailed in Final Environmental Impact Statement (FEIS) Volume 7, Section 7.2 Hydrogeology and Groundwater, and in an updated hydrogeological assessment completed for the Mine (Golder 2016). The groundwater characteristics for the Mine are briefly summarized herein.

Two groundwater flow regimes in areas of continuous permafrost are generally present:

- a deep groundwater flow regime beneath the base of the permafrost; and
- a shallow flow regime located in an active (seasonally thawed) layer near the ground surface.

From late spring to early autumn, when temperatures are above 0 ˚C, the active layer thaws. Within the active layer, the water table is expected to be a subdued replica of topography, and is expected to parallel the topographic surface. Mine area groundwater in the active layer flows to local depressions and ponds that drain to larger lakes.

Taliks exist beneath waterbodies that have sufficient depth such that they do not freeze to the bottom over the winter. Beneath small waterbodies that do not freeze to the bottom over the winter, a talik bulb that is not connected to the deep groundwater flow regime will form (a closed talik). Elongated waterbodies with terraces (where the depth is within the range of winter ice thickness), a central pool(s) (where the depth is greater than the range of winter ice thickness), and a width of 340 to 460 m or greater are expected to have open taliks extending to the deep groundwater flow regime at the Mine site. A review of bathymetric data, ice thickness data, and results of thermal modelling suggests that Meliadine Lake and Lake B7 are likely to have open taliks connected to the deep groundwater flow regime (Golder 2012a).

Tiriganiaq Underground Mine is planned to extend to approximately 625 m below the ground surface; therefore, part of the underground mine will be operated below the base of the frozen permafrost (top of the cryopeg). The underground excavations will act as a sink for groundwater flow during

operation, with water induced to flow through the bedrock to the underground mine workings once the mine has advanced below the base of the frozen permafrost.

Both Tiriganiaq Pit 1 and Tiriganiaq Pit 2 will be mined within the frozen permafrost, therefore, groundwater inflows to the open pits is expected to be negligible and were not considered in the WMP.

2.4 Mine Development Plan

The Mine Plan proposes mining methods for the development of the Tiriganiaq gold deposit, with two open pits (Tiriganiaq Pit 1 and Tiriganiaq Pit 2) and one Underground Mine. Based on the current Mine Plan, the Mine will produce approximately 14.9 million tonnes (Mt) of ore, 31.4 Mt of waste rock, 7.1 Mt of overburden waste, and 14.9 Mt of tailings (Agnico Eagle 2019). The following phased approach is proposed for the development of the Tiriganiaq gold deposit:

- Tiriganiaq underground mine will be developed and operated from Year -5 to Year 7;
- Tiriganiaq Pit 1 will be mined from Year 2 to Year 7; and
- Tiriganiaq Pit 2 will be mined from Year 4 to Year 7.

Mine facilities on surface include a plant site and accommodation buildings, two ore stockpiles, a temporary overburden stockpile, a tailings storage facility, three waste rock storage facilities, a water management system that includes containment ponds, water diversion channels, retention dikes/berms, a final Effluent Water Treatment Plant (EWTP) and a Saline Water Treatment Plant (SWTP). An additional treatment plant to apply break-point chlorination, oil and grease, and total suspended solids (TSS) removal will be added by end of Q2, 2019 as part of the saline effluent discharge to sea management system.

SECTION 3 • GROUNDWATER MANAGEMENT STRATEGY

3.1 Groundwater Volumes

In the WMP of the water licence application (Agnico Eagle 2015a) it was stated that supplemental hydrogeological investigations were to be undertaken to provide additional information on potential volumes and quality of the saline groundwater to be managed. These investigations were undertaken in 2015 and 2016 and are summarized in Golder (2016). They included the completion of 24 packer tests, two pumping tests, two injection tests, 11 groundwater samples, and seven surface water samples. The work plan for the fieldwork was developed in consultation with two independent technical advisors, Dr. Shaun K. Frape and Dr. Walter A. Illman (both of the University of Waterloo).

The additional hydraulic conductivity measurements resulted in a refined interpretation on the variability of hydraulic conductivity between geological formations and data on the storage properties of the bedrock. A summary of predicted groundwater inflows between 2017 and 2032, based on this refined interpretation, are provided in Table 1. A revision of the modelled inflow volumes is currently being conducted and is scheduled to be completed by the end of April 2019. The purpose of this update is to provide more accurate estimates, thereby increasing informative capabilities regarding planning of management strategies. The results will be submitted in the 2020 WMP or as an addendum to the 2019 WMP.

Table 1: Predicted Groundwater Inflow to Underground Mine (2017 to 2032)

Period	Predicted Groundwater Inflow (m^3/day)
2017	230
2018	300
2019	280
2020	300
2021	340
2022	340
2023-2024	420
2025-2026	380
2027-2028	390
2029-2030	380
2031-2032	360

Source: Updated Predictions of Groundwater Inflow to Tiriganiaq Underground Mine (Golder 2016).

The groundwater inflow predictions presented in Table 1 do not account for grouting currently being conducted as a mitigation to reduce groundwater inflows to the underground development, water being removed in waste rock, or potential losses through the ventilation system. Both mechanisms

reduce the actual groundwater inflows to the Underground Mine relative to that which was predicted. As such, these predicted inflows to the underground development represent unmitigated estimates.

Actual inflow values to the Underground Mine, which included the impact of grouting, ventilation losses, loss of water in waste rock pore space, treatment by the SWTP, and loss due to re-use of water in mining operations were estimated based on changes in water volumes stored in the underground water storage system. Changes in storage were calculated on a daily basis and used to produce monthly values of mean daily net inflow rate. Based on these monthly estimates of mean daily inflow, mean net inflow rate over 2018 was 51 m^3/day. This is not the groundwater inflow rate to the mine but rather the balance of inflows, the aforementioned water losses, and water used for operations. Thus, the 51 m^3/day estimate is the surplus of inflows that was placed in storage.

It should be noted that the net inflow rate generally increased over 2018. During Q4 of 2018 the mean daily inflow rate was approximately 105 m^3/day. The increasing trend is the result of the progression of development, especially development approaching the lower fault (near the ore body), where hydraulic conductivities are expected to be relatively high ($1x10^{-7}$ m/s). Going forward, daily net inflow rates will increase when stoping within cryopeg begins (Q1 of 2019), as greater surface area of rock will be exposed, stoping will proceed within the ore body where water bearing structures exist, and grouting of inflows will not be possible within stopes.

3.1.1 Groundwater Inflow Predictions – Assumptions and Uncertainties

Hydraulic conductivities of both the Hanging Wall and Footwall units are assumed to be reduced by an order of magnitude between the top of the basal cryopeg and the bottom of the cryopeg. This assumption reflects that this portion of the permafrost, which will contain unfrozen groundwater due to freezing point depression (salinity and pressure induced), is expected to have reduced hydraulic conductivity relative to the unfrozen bedrock because of the presence of isolated pockets of frozen groundwater within this zone. Linearly decreasing hydraulic conductivity with temperature is assumed within this zone, with a full order of magnitude decrease assumed at the top of the basal cryopeg, and hydraulic conductivity equivalent to the unfrozen rock at the bottom of the cryopeg.

In crystalline rocks, fault zones may act as groundwater flow conduits, barriers, or a combination of the two in different regions of the fault depending on the direction of groundwater flow and the fault zone architecture. These zones, termed Enhanced Permeability Zones (EPZs), were assigned hydraulic conductivity values based on both field measurements and testing conducted at similar faulting in various locations within the Canadian Shield. Furthermore, EPZs were assumed not to be impacted by isolated freezing in the cryopeg and were therefore assigned similar hydraulic conductivity values within and below the cryopeg. The latter assumption along with the assumption that all faults are considered EPZs is considered conservative. For instance, observations made at other gold mines in the Canadian Shield indicate not all faults are EPZs (Golder, 2016).

Based on the geometry of water bodies, it was assumed that Lake B7, Lake D7, and Meliadine Lake possess open taliks connected to the deep groundwater flow regime. It was conservatively assumed that the surface water/groundwater interaction through open taliks is not impeded by lower-permeability lakebed sediments that may exist.

Combined, the assumptions discussed above result in the following sources of uncertainty in the groundwater inflow model:

- If there is a lack of reduction in hydraulic conductivity between the top of the basal cryopeg and the bottom of the cryopeg, it is likely that greater than expected inflows upon stoping will occur in the cryopeg (300 to 450 m below ground surface).
- If faults within the model do not act as EPZs, then it is expected that inflows resulting from development near these structures will be less than expected. The degree of deviation from expected inflows and timing will be dependent on the location of the structure in relation to development.
- If hydraulic conductivity of faults within the cryopeg are impacted by isolated freezing, then lower than expected inflows will be observed when development in the cryopeg progresses near the structures. The degree of deviation from expected inflows and timing will be dependent on the location of impacted EPZs in relation to development.
- If significant thicknesses of lakebed sediments with relatively low permeability exist within in the flow path connecting surface water to groundwater through open taliks, it is likely that mine-wide inflows will be less than expected due to a reduction in expected recharge to the groundwater flow regime.

Quantification of the uncertainty associated with the realization of the listed scenarios has not been conducted. As the invalidity of the above assumptions would result in less than expected inflows, the model is considered conservative and quantification of associated uncertainty is not required.

3.2 Existing Groundwater Management Control Structures

Contact water in the Underground Mine is contained within underground sumps and the Saline Pond. A proportion of the underground water is recirculated as make-up water for underground drilling. The remaining underground water is stored for treatment by the SWTP. During the open water season of 2019, saline water treated to remove TSS, oil and grease, and ammonia will be discharged to sea at Melvin Bay (Section 3.4.3).

Calcium chloride is currently not added to the underground water but has been used in the past to prevent freezing in drill holes when drilling in permafrost with low salinity drill water. The potential for use again in the future is low due to the existing calcium chloride levels in the groundwater that is used for drilling.

Groundwater inflows to the Underground Mine since 2015 have not been discharged to the environment and are being stored underground and in the surface storage pond, Saline Pond 1. Based

on adaptive management strategies, the project requires a second saline water storage pond, Saline Pond 2 (SP2). Saline Pond 2 is to be temporary in nature and is being constructed in bedrock within the footprint of Tiriganiaq Pit 2. Saline Pond 2 has an initial storage estimate of 78,862 m^3 which will be added to the saline water storage system in Q1 of 2019. Details of the underground dewatering system are provided in the Mine Plan (Agnico Eagle 2015a) and details of the ponds are provided in the WMP (Agnico Eagle 2019). The pond capacities and maximum water elevation for storage of the saline water are presented in Table 2.

Table 2: Salt Water Storage Capacity at the Mine for Groundwater and Water Primarily Influenced by Underground Workings

Surface Pond	Capacity (m^3)	Maximum Water Elevation (m)
Saline Pond	32,686	62.9
Saline Pond 2 (Q1, 2019)	78,862	62.5
P1	20,781	68.5
P2	6,828	66.5
P3	18,432*	67.0

Source: Agnico Eagle (2017).

* Volume excludes Saline Pond 3 capacity (Section 3.4.3.1).

3.3 Groundwater Quality

Groundwater investigations suggested that total dissolved solids (TDS) concentrations are relatively consistent below the permafrost at approximately 64,000 mg/L (Golder 2016). Groundwater quality data from samples taken underground 2017 through 2018 from diamond drillholes (DDHs) indicate mostly stable concentrations for several parameters (Table 3) and indicate that TDS concentrations are less than predicted at an average concentration of 56,000 mg/L. The discrepancy between expected and observed TDS levels is potentially due to the difference of sampling depth between pre-development testing and samples collected during development. Pre-development samples were collected below permafrost (>450 m below ground surface), whereas the bulk of samples collected to-date have been collected in the basal cryopeg (280 m to 450 m below ground surface). Samples and trends will continue to be assessed as development progresses below the cryopeg. It should also be noted that mining operations include drill-and-blast excavation for the development of the Underground Mine, which results in certain parameters in groundwater to be influenced by explosives (particularly ammonia and nitrate due to emulsion explosives).

With respect to high nitrate, nitrite and ammonia concentrations in February 2017, the anomaly is due to one sampling event (Feb. 24) believed to be conducted without proper flushing of the DDH. Thus, the results from this sampling event are similar to those observed in underground contact water (i.e., sump water). The February 24, 2017 DDH sample produced nitrate, nitrite and ammonia results of 344 mg/L, 23.5 mg/L and 300 mg/L, respectively. Whereas Sump 125 (contact water) results from February 12, 2017 show nitrate, nitrite and ammonia concentrations equal to 435 mg/L, 27.2 mg/L

and 400 mg/L, respectively. Considering the similarity, it can be assumed that the February 24, 2017 DDH sample was contaminated with drilling water.

Table 3: Average Saline Groundwater Quality

Source: Groundwater quality data from DDH sample location (Agnico Eagle, December 2018)

3.4 Groundwater Management Strategy and Associated Control Structures

Based on the Type A Water Licence 2AM-MEL1631 Terms and Conditions, Part E: Conditions Applying to Water Use and Management, No. 14, Agnico Eagle has reviewed the Mine alternatives to apply to the GWMP. Condition No. 14 specifically states:

> *"The Licensee shall submit a Groundwater Management Plan to the Board for approval in writing, at least six (6) months prior to the discharge of any Groundwater. The Plan shall take into consideration all comments raised and commitments made with respect to submissions received during the technical review of the Application as well as final submissions and issues raised during the Public Hearing Process, where applicable."*

Furthermore, based on the NIRB Project Certificate No. 006 Terms and Conditions: Hydrogeology and Groundwater Quantity and Quality, No. 25, Agnico Eagle has updated the groundwater management strategy sections for submission to NIRB within 90 days of receiving the amended Mine Project Certificate. Condition No. 25 specifically states:

> *"The Proponent shall submit a detailed Groundwater Management Plan to the NIRB which includes mitigation measures designed to address the potential for higher-than-predicted volumes of saline water inflows into the underground mine, treatment and disposal methods, and details of its plan to monitor saline water at site. The plan must identify uncertainties pertaining to predictions for groundwater quality and quantity and inform adaptive management strategies for the site. CIRNAC should be consulted with respect to the contents of the Plan and any required mitigation measures."*

Groundwater management strategies were considered for the Mine based on the potential range of groundwater flows and quality that could be generated (Agnico Eagle 2015a).

Based on the groundwater inflow volume, the following options were considered and form part of the short and long-term management of groundwater inflows to the Underground Mine:

- Short-term Strategy: treat saline groundwater and store/use the brine from the treatment process on-site (Section 3.4.1)
- Current Long-term Strategy: treated discharge to receiving environment in Meliadine Lake (Section 3.4.2) and Discharge to sea (see Section 3.4.3).

The short and long-term groundwater management strategies are described below.

3.4.1 Short-Term Management Strategy - Treat and Store/Use Groundwater On-site

This alternative was considered as part of the Type A Water Licence Application and is currently implemented on site as part of the short-term management of groundwater inflow. It involves storing all excess groundwater in underground sumps and in surface water ponds at the Mine. As outlined in the WMP (Agnico Eagle 2019), a total of ten water containment ponds are planned on Site at the Mine surface (CP1, CP3, CP4, CP5, CP6, the P-Area [P1, P2, and P3], SP1 and SP2), seven of which have been

constructed and are in use (CP1, CP3, CP5, P-Area [P1, P2, and P3], and SP1). SP2 is presently being constructed and will be commissioned by the end of Q1 2019. Additional to this are all associated water retention dykes, water diversion berms, channels, and culverts, to manage surface water and underground water (Appendix A).

Five saltwater evaporators have been in-use on site since mid-2017 at P1 to reduce saline groundwater volumes stored in surface water ponds. While evaporators have been used with some success, the combined volumes of realized groundwater inflows with anticipated surface water volumes influenced by underground waste rock to be managed is greater than the available long-term storage at the Mine, and therefore, discharge to environment is required.

3.4.2 Current Long-Term Management Strategy - Treated Groundwater Discharge to Meliadine Lake

Hatch (2013) investigated groundwater treatment options for the site and concluded that a combination chemical reverse osmosis (RO) and mechanical vapour compression evaporator plant would be the most efficient method of treating excess groundwater for discharge. Agnico Eagle has since acquired and constructed a Salt Water Treatment Plant (SWTP) consisting of two evaporator crystallizers (SaltMakers) that will be used to treat groundwater. The SWTP will remove excessive total suspended solids (TSS), calcium chloride ($CaCl_2$), sodium chloride (NaCl), metals, phosphorous (P), and nitrogen compounds from the influent saline water.

The SWTP consists of two parallel units. Each unit can be operated to produce brine or solid by-product. Brine-mode of one unit within the SWTP is expected to operate to the following specifications:

- Inlet capacity of 115 m^3/day with a 95% expected operation availability for a corrected average input capacity of 109 m^3/day.
- With an input capacity of 109 m^3/day the effluent and brine will be discharged as follows:
    - 68 m^3/day to CP1
    - 24 m^3/day to Saline Pond as Brine
    - The 17 m^3/day difference is due to evaporation loss through treatment

Solid-mode of one unit within the SWTP is expected to operate to the following specifications:

- Inlet capacity of 69 m3/day with a 95% expected operation availability for a corrected average input capacity of 66 m3/day. This full inlet capacity will be discharged to CP1 as effluent
- Decisions regarding the management of solid salt by-product are ongoing by Agnico Eagle. One possible option would be use as a dust suppressant on roads as the material is similar to calcium chloride currently approved for such use. Formal approval would be required from the Government of Nunavut Environment Department.

SWTP effluent is currently transferred to CP1 where it will be treated by the EWTP prior to discharge to Meliadine Lake. EWTP effluent discharge to Meliadine Lake was performed in 2018 in accordance with the conditions outlined in Part F, Item 3 of the Water Licence. Discharge to Meliadine Lake is expected to be carried out in 2019. Total discharge to Meliadine Lake, including the treated groundwater, will remain within the permitted daily volume and meet the discharge criteria defined in the License, as well as MDMER discharge limits. Additionally, SSWQOs for EWTP effluent (including treated groundwater) will be met at the edge of the mixing zone in Meliadine Lake. Further details regarding the EWTP are provided in Sections 3.9.4 and Section 4.3 of the WMP.

The saline effluent temperature from the SWTP is expected to be approximately 35 °C, with an approximate pH of 7.5 (Saltworks 2017). According to pilot testing, SWTP effluent meets the required Water Quality Output Requirements defined in Agnico Eagle's Desalination Water Treatment Plan Design Criteria with the exception of ammonia, nitrite, total cyanide, and selenium (Saltworks 2017). However, weekly sample results from the first months of sampling (December 13, 2018 to February 18, 2019) show the SWTP effluent consistently meets the aforementioned requirements for all constituents aside from ammonia and nitrite. Ammonia exceeded the Water Quality Output Requirement of 35 mg/L on three sampling dates (Jan-16, Jan-18, Feb-10), however the mean ammonia concentration over the sampling period is 24 mg/L. Nitrite exceeded the Water Quality Output requirement of 0.2 mg/L on all (n=9) sampling dates with a mean concentration of 1.2 mg/L. The cause for these exceedances is that the SWTP system remains in the commissioning phase, specifically, the chemical RO unit designed to remove constituents such as ammonia and nitrite has not yet been commissioned. Upon commissioning (expected by end of Q1 2019), the SWTP is expected to meet all Water Quality Output Requirements.

SWTP effluent and CP1 water quality will continue to be monitored according to the SWTP Design Report to identify future exceedances and potential impacts to CP1. Pilot testing predicted that TDS concentrations would be approximately 158 mg/L (condensed water after treatment; Saltworks 2017). During commissioning, mean TDS concentration has been 174 mg/L (n=9) to date. As commissioning continues (i.e., process is refined and RO treatment is commissioned), effluent quality will trend towards lower concentrations as the treatment process is refined for optimal treatment quantity and quality. With respect to toxicology, the SWTP effluent passed acute toxicity tests on Rainbow trout, Three-spined stickleback and Daphnia magna (Saltworks 2017).

3.4.3 Current Long-Term Management Strategy - Treated Groundwater Discharge to Melvin Bay at Itivia Harbour

Based on the current standing of saline water stored on site, the rate at which the SWTP can treat saline water (Section 3.4.2) and the forecasted inflows (Section 3.1), it is anticipated that a second discharge location will be required for long-term groundwater management. Agnico Eagle proposed to treat groundwater for TSS, oil and grease, and ammonia and discharge it as saline effluent to the ocean, either as a direct discharge and/or after temporary on-site storage in one or more of the water containment ponds at the Mine. In 2018, Agnico Eagle applied to the NIRB for approval to discharge saline water to the sea (Melvin Bay, Rankin Inlet). Agnico Eagle received approval for discharge of saline water to sea with an amended Mine Project Certificate from NIRB on February 26, 2019.

3.4.3.1 Discharge to Sea Methods for Disposal and Treatment

Treatment, storage and haulage

As discussed in Section 3.4.1, saline water will be stored on surface or underground. Saline water will then be transported to a treatment plant (to be named) for treatment. Initial treatment will be for oil and grease removal via an oil-water separator. The water will then enter a Multiflo system for TSS removal. Next, break-point chlorination treatment will be applied to remove elevated ammonia levels, which are inferred to be the result of the use of emulsion and washing of development faces/muck underground. Excess free chlorine will be removed with activated carbon filters. Following break-point chlorination, water will merge with EWTP effluent prior to entering Saline Pond 3 (SP3) for final settling and storage. Treatment rates and expected treatment performance are currently being assessed and will be provided 30 days prior to operation of the treatment plant.

Treated saline water stored in SP3 will hauled by tanker trucks to Itivia. Truck loads will be up to 50 m^3 per truck and will be unloaded using a flexible 4" HDPE suction pipe. The truck discharge pump will transfer the treated effluent into the 6'' discharge HDPE pipeline and through the diffuser. The truck discharge pump will also be used to transfer effluent into the storage tank until the next day, before it is pumped into sea when necessary.

Pumping and Diffusion Plan

The flow rate to be discharged to Melvin Bay will not exceed 800 m^3/d with a TDS of 39,600 mg/L (Appendix B). The discharge facility will include a 778 m pipeline extending to an engineered diffuser located 20 m below surface in Melvin Bay to ensure proper mixing and prevent interference with traditional activities (See Appendix X for design drawings). Pumping will occur during the open water season from 2019 to 2031. The saline effluent will be discharged in a controlled manner through the diffuser to allow for maximum dilution and minimum environmental impact to the marine environment. Environmental monitoring is discussed in Section 4.3.3.

Agnico Eagle intends to engage with the Kangiqliniq Hunters and Trappers Organization (HTO) and the community of Rankin Inlet to:

- confirm the commencement and end of the open water season for marine effluent discharge each year,
- develop a procedure for monitoring of saline effluent temperature going into the subsea pipeline,
- ice thickness on Melvin Bay in the vicinity of the discharge and determining appropriate communication and safety protocols applicable for travel by community members through Itivia and Melvin Bay.

The effluent discharge system will consist of a truck discharge pump, a back-up discharge truck pump, a 100 000-litre storage tank, as well as suction and discharge pipelines. The 100 000-litre

storage tank will only be used to contain the treated effluent until the next day, if the 800 m^3/d discharge limit is attained upon a truck's arrival. The storage tank will be installed on a containment area, built on a geomembrane with underlying and overlying granular materials and surrounded by berms. The construction drawings are shown in the Appendix B.

A pumping station including two pumps will be installed on the containment area. The truck discharge pump will be used to transfer the effluent from the trucks directly into the sea (or to storage tank). A by-pass pipeline will be installed parallel to the main discharge pipe in case the discharge truck pump malfunctions or maintenance is required. The back-up truck discharge pump will be used to pump the effluent into the by-pass pipe, though the 6'' discharge HDPE pipe and out the diffuser, if necessary.

Treated groundwater effluent quality is required to meet the Canadian federal end-of-pipe discharge criteria (per the amended MDMER; GC 2018) and to be non-acutely lethal. Treated groundwater will be discharge into Melvin Bay via an engineered diffuser (refer to Appendix D or Section 3.5 of the FEIS Addendum; Agnico Eagle 2018g) to meet Canadian Surface Water Quality Guidelines (WQG; CCME 2003), or background concentrations for parameters without guidelines, at the edge of the mixing zone. For information regarding background concentrations and expected mixing zone diffusion, refer to Appendix D (the Conceptual Ocean Discharge Monitoring Plan). Sampling will meet MDMER (GC 2018) requirements, and is outlined in Section 4.3.3, and detailed in Appendix D. A modelling assessment of groundwater discharge into the Melvin Bay marine environment was conducted by Golder (2019) and is included within Appendix B).

3.5 Discharge Schedule

Table 4 outlines the timeline for key activities on the Mine related to the management of saline groundwater, including tasks and facilities for the current short-term and long-term management strategies for discharge to Meliadine Lake (Section 3.4.1 and 3.4.2). A detailed Mine schedule for the overall Mine Water Management (e.g., building of culverts, berms and containment ponds) are presented in the 2019 WMP.

Table 4: High Level Mine Schedule

Activity	Timeline	Notes
On-site water storage	Ongoing	—
Update Groundwater Management Plan (Current Document)	Six months prior to discharge	Type A Water Licence 2AM-MEL1631 requirement
Commissioning of Salt Water Treatment Plants (SaltMaker #1 and #2)	Q4-2018 to Q1-2019	—
Discharge saline water to the sea (Melvin Bay, Rankin Inlet)	2019 open water season (Q2)	

Activity	Timeline	Notes
Active Discharge to Meliadine lake	Annually May thru October to 2031	—
Operation of Salt Water Treatment Plant	24 hr. a day / 7 days a week, year round	In-service as required
Inactive Discharge	Annually November thru April to 2031	Water will be stored underground and in surface containment ponds during the winter
Final Effluent Discharge to Meliadine Lake	End of Mine life 2031	—

Source: Agnico Eagle (2017).

3.6 Mitigation Measures regarding Greater than Expected Inflows

It is possible that realized groundwater inflow rates to the underground mine will be greater than modelled inflow rates. Specifically, this would arise from error in hydraulic conductivities assigned to geological units/structures and invalidity of assumptions listed in Section 3.1.1. Furthermore, it is possible that groundwater TDS levels will deviate from the past and current trends and produce greater than expected concentrations of TDS in groundwater to be managed. Considering both the Golder (2015) TDS forecasts agreeing with the realized groundwater TDS concentrations and the multitude (n = 133) of groundwater samples contributing to the to-date mean concentrations of TDS in groundwater surrounding the Mine, it is unlikely that groundwater TDS concentrations will increase as development and stoping progresses. In the unlikely case that TDS does increase, groundwater discharged to sea will be decreased as less raw groundwater will contribute to the saline water volumes being discharged to sea (due to TDS limit in effluent of 39,600 m^3; Section 3.4.3.1). Thus, greater than expected inflow rates and/or greater than expected TDS values would result in greater than expected groundwater volumes to manage. The following sections discuss mitigations under the occurrence of these scenarios.

3.6.1 Mitigation Measures – Contingency Storage Units

Upon the occurrence of greater than expected groundwater inflows to the underground mine, Agnico Eagle will utilize contingency saline water storage units until inflows can be reduced or SWTP treatment rates are increased to reduce required storage (Section 3.6.2). As of March 2019, the collective contingency saline water storage units produce a total potential storage of approximately 131,000 m^3. These storage units and corresponding capacities are listed below and will be filled in the following order, if required:

1. Level 350 West Block (5,766 m^3)
2. Ramp 1 extending from Level 425 to Level 450 (7,216 m^3)
3. Ramp 3 extending from Level 375 to Level 400 (17,298 m^3)
4. Ramp 3 extending from Level 350 to Level 375 (48,576 m^3)

5. Level 425 (50,530 m^3)

The contingency storage features listed above are not intended for long-term storage. The use of these will affect production, as portions of the mine will be unavailable to operations. Thus, if these units are required then adaptive management practices focused on increasing desalination rates will be implemented by Agnico Eagle in order to empty the features and allow production to continue optimally.

3.6.2 Mitigation Measures – Increased Storage and SWTP Treatment Rate

With respect to volumes of infiltrated groundwater to be managed, Agnico Eagle will apply adaptive management practices focused on increasing desalination rates. Prior to implementation of any changes to groundwater management, Agnico Eagle will submit a proposal for an amendment to the Mine Project Certificate or Water License, as applicable. The following are preliminary plans concerning the ability for Agnico Eagle to manage greater than expected saline water volumes stored on site.

In a scenario when modest increases above expected inflows (< 100 m^3/day) occur and are anticipated to persist, Agnico Eagle will assess the feasibility of running the SWTP in brine-mode (Section 3.4.2). Operating the SWTP in brine-mode rather than solid mode would provide an increase in treatment rate of approximately 86 m^3/day. As discussed in Section 3.4.2, brine would be added to the saline water storage system on site and freshwater effluent would be discharged to CP1 to be further treated to removed TSS prior to discharge to Meliadine Lake.

The addition of SP2 (approximately 75,000 m^3) to the saline water storage system provides further mitigation to greater than expected inflows by providing storage for saline water until inflows can be reduced or treatment can be increased. It will be the goal of Agnico Eagle to reduce the amount of saline water stored in SP1, SP2 and underground as much as possible during the open water season (through discharge to sea) in order to maximize storage potential.

3.6.1 Mitigation Measures – Hydraulic monitoring

As a strategy to increase the confidence of groundwater inflow modelling and decrease uncertainty, seven (7) vibrating wire piezometers are currently installed in the rock mass surrounding the underground mine. These piezometers are currently, and will continue to be applied to, assess response of the groundwater pressure (pressure head) to groundwater inflows. The data records produced by these piezometers will be used to approximate recharge rates and changes thereof, which may then be applied to the groundwater inflow model. Going forward, several additional piezometers will be installed in the rock mass (targeting major water bearing structures) to provide further insight into recharge rates and better inform modelling efforts. Agnico Eagle anticipates installing at least three (3) more piezometers over 2019.

3.6.2 Mitigation Measures – Groundwater Quality Monitoring

Raw groundwater and underground mine water in the underground storage system are sampled monthly. The sample analysis results are used to identify trends and improve predictions regarding

groundwater inflow chemistry. This information is used to improve operational performance at the SWTP and act as a trigger for revision of the groundwater quality predictions. If raw groundwater samples (i.e., from flushed drillholes) collected indicate that the TDS is more than 20% higher than the estimated 64,000 mg/L (Section 3.3), the water quality predictions for underground will be reviewed and results considered as part of the adaptive management of the groundwater quantity contribution to the WMP.

SECTION 4 • GROUNDWATER MONITORING PROGRAM

4.1 Water Quality and Quantity Monitoring

Water quality monitoring is an important part of the Mine water management to verify the predicted water quality and quantity trends and conduct adaptive management should differing trends be observed. Water quality and quantity monitoring has been initiated and will continue during construction, operations, closure and post-closure. Monitoring will occur at three levels:

- Regulated discharge monitoring that occurs at monitoring points specified in the Licence or regulations.
- Verification monitoring that is carried out for operational and water management purposes by Agnico Eagle. This monitoring data will not be reported to the Regulators in the Annual Water License Report, but can be provided upon request by the Regulators.
- General monitoring that is included in the Licence requirements and is subject to compliance assessment to confirm sampling was carried out using established protocols, including quality assurance/quality control provisions, and addressing identified issues. General monitoring is subject to change as directed by an Inspector, or by the Licensee, subject to approval by the NWB.

All three types of monitoring is used at the Mine. The WMP and Water Quality and Flow Monitoring Plan present the conceptual water quality monitoring plan during construction, operations and closures and more detailed information on monitoring programs.

The groundwater quality monitoring plan summarized in Section 4.4, will be further defined as the Mine advances and will be conducted in agreement with the WMP for the Mine (Agnico Eagle 2019). Required monitoring and frequency for pre- and post- treatment (i.e., monitoring above ground) is presented in the WMP (Agnico Eagle 2019).

4.2 Water Quantity

The volume of groundwater inflow being collected and transferred to surface water management systems is measured using a flow meter installed at the Portal 1 entrance and is fed by Water Stope 75. A second pumping system was commissioned in 2019 to pump directly from Level 300 to surface. Currently this line is used to pump to the SWTP where inflow volumes are tracked via a water level sensor. A flow meter will be installed within this line prior to discharging directly to surface (expected Q2 2019). This data is supplemented by monthly seepage surveys in which visually observed groundwater inflows in the Underground Mine are recorded.

Observed groundwater inflow rates are compared to model predictions (Table 1) on an annual basis. If significant variations from model predictions are observed, the assumptions behind the analysis will

be reviewed and the analysis updated if required. In addition, updates to the groundwater model may be required based on operational changes as the Underground Mine advances.

Variations that would be considered significant and would indicate the need to consider recalibrating the model and updating the inflow analysis include:

- Groundwater inflows to the mine, based on a monthly average of inflow over six consecutive months, is 80% of the model predictions while active grouting is being utilized to mitigate groundwater inflows.
- Groundwater inflows to the mine, based on a monthly average of inflow over six consecutive months, is 30% higher than the predicted groundwater inflows once grouting is ceased.

Changes in underground storage were calculated on a daily basis and used to produce monthly net inflow rate estimates. Based on these monthly averages, mean net inflow rate over 2018 was 51 m^3/day. Golder (2016) predicted a gross inflow rate of 300 m^3/day (Table 1).

Identification of a potential long-term effect associated with the groundwater flow is to be conducted and based on a detailed examination of the groundwater data to assess the potential causes of greater than expected groundwater quantity. If the greater than predicted flows could be correlated to a short term effect such as freshet or transient drainage of a high storage feature, then no further action would be required. However, if the greater than predicted flows could not be correlated to a short term effect, than the effect would be considered to be potentially long term. The duration of six months is based on observed seasonal variations in inflow quantities in mines situated permafrost regions.

If model re-calibration is deemed necessary, future groundwater inflow quantity would be predicted using this re-calibrated model and results considered as part of the adaptive management of the groundwater quantity contribution to the WMP. Currently, an update to the numerical model is underway. The update is not the result of either of the two conditions listed above, but rather is intended to provide more accurate estimates to better inform planning of management strategies.

4.2.1 Underground Water Management System

The underground water management system is designed to prevent water from affecting the workings or production. The system contains a series of sumps (generally one at the access of each level) designed to capture groundwater inflows and runoff from mining operations (i.e., drilling). Presently, underground water is managed by pumping from sump to sump from the lower levels to Level 125. Water collected in Level 125 sump is then moved to the Water Stope to be distributed for mining operation requirements or moved to surface (Section 4.2).

Beginning in approximately Q2 2019, a new pumping system will be implemented underground as follows:

- All groundwater inflows and water used for operations from Level 300 to the bottom of the mine will be pumped to storage containers on Level 300.
- All groundwater inflows and water used for operations on Level 275 to surface will be transported to storage tanks on Level 300. Movement will be directed by gravity from sump to sump via boreholes connecting the sumps.
- Water that is stored on Level 300 will be clarified using a Mudwizard (flocculation) system as a means to ensure pumping efficiency and prevent damage to the system.
- Following clarification, water will be fed by gravity to Level 350, where a main pumping station will move the water to Level 200.
- A second main pumping station on Level 200 will move the water to the SWTP or Saline Ponds on surface (Section 4.2).

4.3 Water Quality

4.3.1 Underground Mine Sump Water and Groundwater Inflows

Water accumulating in sumps underground is sampled on a monthly basis at Sump 125, which is the main collection sump prior to recirculation for underground use. Sump water samples are analyzed for the following parameters: conductivity, TDS, pH, temperature, oil and grease, major anions, radium 226, dissolved and total metals, nitrate and nitrite, ammonia, volatile organic compounds (i.e., benzene, xylene, ethylene, and toluene).

Groundwater quality is also monitored at mine seeps and/or diamond drill holes (DDHs) to verify the quality of formation water flowing into the mine prior to contact and potential contamination by mining and drilling fluids. The DDHs consist of underground holes drilled in advance of mining for ore body delineation purposes. These DDHs are sampled if there is sufficient flow to flush the borehole prior to initiation of grouting. Flushing and sampling techniques used to ensure samples are taken without contamination are described in Section 2.2.3 of the Quality Assurance/Quality Control Plan. Samples are collected quarterly at a minimum but actual sampling frequency may be greater depending on rate of progress, frequency of water intersects, and observed trends in groundwater quality with time. Water samples are analyzed for the following parameters: conductivity, TDS, pH, temperature, major anions, radium 226, dissolved and total metals and toxicity testing.

If water samples are collected that indicate that the TDS is more than 20% higher than the estimated 64,000 mg/L, the water quality predictions for underground will be reviewed and results considered as part of the adaptive management of the groundwater quantity contribution to the WMP.

4.3.2 Saline Water Treatment Plant Influent and Effluent

Water samples are currently collected weekly at both the inlet and outlet of the SWTP. The results of the sample analysis are used by SWTP operators to fine-tune the treatment process and ensure its optimal performance. Samples taken at the outlet of the SWTP are analyzed to provide the quality of treated water produced by the SWTP that is transferred to CP1.

Water samples are analyzed for the following parameters: pH, electrical conductivity, temperature, Total Suspended Solids (TSS), Total Dissolved Solids (TDS), chloride, ammonia, nitrite, nitrate, total phosphorus, total metals, total cyanide, and total mercury.

4.3.3 Discharge to Sea

Prior to haulage of saline water from the Meliadine Site to Itivia for discharge to sea, Agnico Eagle will measure pH, electrical conductivity, and temperature of the effluent as a means to continually advise discharge operations and help ensure discharge parameters are met. Agnico Eagle will also collect weekly samples to be analyzed by an accredited laboratory. Samples will be analyzed for the full suite and Group 3 (MDMER) parameters as listed in the Water License and the Water Quality and Flow Monitoring Management Plan appended to the WMP.

Effluent water at the final discharge point (end-of-pipe) will be measured for pH and analyzed for concentrations of deleterious substances listed in MDMER Schedule 4 (GC 2018). End-of-pipe brine effluent will be sampled once per month for acute lethality testing per MDMER requirements. Acute lethality testing will be conducted on Three-spine stickleback in accordance with the procedures set out in sections 5 or 6 of Reference Method EPS 1/RM/10 (ECCC 2018). Effluent characterization samples (Section 4.1.3) will be collected at the same time to aid in interpretation of acute lethality test results.

Effluent characterization will be conducted once per calendar quarter at least one month apart. Effluent will be sampled and analyzed for the following parameters:

- General parameters, including pH, TDS, TSS, hardness, alkalinity, electrical conductivity, salinity, and temperature;
- Anions including sulphate and chloride; and
- Nutrients, including ammonia and nitrate.
- Total metals and dissolved metals including those listed in MDMER Schedule 4 and Schedule 5 paragraph s. 4.

Sublethal toxicity testing of brine effluent will be conducted twice a year at least one month apart, at the beginning and at the end of discharge for three years, and once a year after the third year. The following tests will be conducted:

- Fish early life stage development test on inland silverside (Menidia beryllina) or topsmelt (Atherinops affinis) (US EPA 2002)
- Invertebrate reproduction test on echinoids (sea urchins or sand dollars) (Environment Canada 1992)
- Algae toxicity test on barrel weed (Champia parvula) (US EPA 2002)

These tests will be conducted on aliquots of the same sample collected for effluent characterization.

Agnico Eagle will adhere to MDMER EEM requirements for fish population surveys, water and sediment quality, and benthic invertebrate community assessments. The sampling plan is conceptually outlined in Table 5. Fish tissue monitoring will be conducted if triggered by MDMER conditions. A study design will be provided to ECCC according to the MDMER requirements (GC 2018), which includes all proposed monitoring locations.

Starting March 2019, a monthly under-ice sampling program was initiated in the area anticipated to be influenced by Agnico Eagle discharge to sea. The sampling program will extend to May 2019. The program included three sampling locations selected to correspond with the location of potential exposure to diffuser discharge In Melvin Bay. The purpose of the sampling program is to develop a baseline for water quality parameters within the potential exposure area prior to initiation of discharge. Details are found in Appendix D.

Further information regarding sampling locations, QA/QC, water quality benchmarks, sediment quality benchmarks, and environmental effect thresholds is provided in the Conceptual Ocean Discharge Monitoring Plan (Appendix D).

Table 5: Conceptual Ocean Discharge Monitoring Program Sampling Summary

Monitoring Component	Sampling Frequency	Monitoring Location	Sample Replication and Number of Samples
Deleterious Substances (MDMER Schedule 4)	Every week	FDP (end-of-pipe)	One grab sample
Acute lethality	Every month (sampled concurrently with effluent characterization)	FDP (end-of-pipe)	One grab sample
Effluent characterization	Four times a year, one month apart during discharge	FDP (end-of-pipe)	One grab sample
Sublethal toxicity	Twice a year, one month apart at the start and finish of the discharge	FDP (end-of-pipe)	One grab sample
In situ Water Column Measurements	Four times a year, once a month during discharge	Exposure and reference areas	7 stations in the Exposure Area, 3 stations in each reference area. One vertical profile per station
Water Quality	Four times a year, once a month during discharge	Exposure and reference areas	7 stations in the Exposure Area, 3 stations in each reference area. One sample @1m below the surface and one sample @5 m above the bottom at each station.
Benthic Invertebrate Communities, and sediment quality	Every 3 years in August if triggered by MDMER	Exposure and reference areas	6 stations in the Exposure area and 5 stations in each reference area. Three subsamples per station
Fish population	Every 3 years in August if triggered by MDMER	Exposure and reference areas	20 sexually mature males and 20 sexually mature females of two fish species in each sampling area

Monitoring Component	Sampling Frequency	Monitoring Location	Sample Replication and Number of Samples
Fish tissue	Every 3 years in August if triggered by MDMER	Exposure and reference areas	8 samples of a single species from each sampling area

Notes:

Amended Metal and Diamond Mining Effluent Regulations (MDMER; GC 2018) will be adhered to. Metal Mining Effluent Regulations (MMER) will be adhered to as a minimum while MDMER come into effect.

FDP = Final Discharge Point

4.4 Groundwater Monitoring Plan

Table 6 presents a summary of the underground monitoring plan presented in Sections 4.2 and 4.3. Additional sampling at the surface will be conducted, including pre- and post- SWTP sampling as outlined in the WMP and the Water Quality and Flow Monitoring Plan.

Table 6: Groundwater Monitoring Plan

Monitoring Type	Monitoring Location	Purpose	Frequency
Verification	Portal Water Stope L75	Quantity - Monitor underground water quantity pumped to surface.	Totalized Flow Tabulated Monthly
Verification	Underground Seeps	Quantity - Seepage survey to verify underground flow estimates.	Monthly
Verification	Sump 125	Quality - Monitor underground water quality prior to recirculation for underground use.	Monthly
Verification	Underground seeps/DDHs	Quality – Verify quality of groundwater flowing into underground	Quarterly
Verification	SWTP Inlet and Outlet	Quality – Verify quality of groundwater being treated and monitor final treated effluent prior to continued transfer to CP1	Weekly

SECTION 5 • QUALITY ASSURANCE/QUALITY CONTROL PROCEDURES

Quality Assurance (QA) refers to plans or programs that encompass a wide range of internal and external management and technical practices designed to ensure the collection of data of known quality that matches the intended use of the data. Quality Control (QC) is a specific aspect of QA that refers to the internal techniques used to measure and assess data quality. Specific QA and QC procedures that will be followed during sampling performed for the Groundwater Monitoring Program are described in Section 5.1 and 5.2.

5.1 Quality Assurance

Quality assurance protocols are diligently followed so data are of known, acceptable, and defensible quality. There are three areas of internal and external management, which are described in the following three sections.

5.1.1 Field Staff Training and Operations

To make certain that field data collected are of known, acceptable, and defensible quality, field staff are trained to be proficient in standardized field groundwater sampling procedures, data recording, and equipment operations applicable to the Groundwater Monitoring Program. All field work will be completed according to specified instructions and established technical procedures for standard sample collection, preservation, handling, storage, and shipping protocols.

5.1.2 Laboratory

To make sure that high quality data are generated, accredited laboratories have been selected for sample analysis. Accreditation programs are utilized by the laboratories so that performance evaluation assessments are conducted routinely for laboratory procedures, methods, and internal quality control.

5.1.3 Office Operations

A data management system is utilized so that an organized consistent system of data control, data analysis, and filing will be applied to the Groundwater Monitoring Program. Relevant elements will include, but are not limited to the following:

- all required samples are collected;
- chain-of-custody and analytical request forms are completed and correct;
- proper labelling and documentation procedures are followed, and samples will be delivered to the appropriate locations in a timely manner;
- laboratory data will be promptly reviewed once they are received to validate data quality;
- sample data entered into a Mine-specific groundwater quality database will be compared to final laboratory reports to confirm data accuracy; and

- appropriate logic checks will be completed to ensure the accuracy of the calculations.

5.2 Quality Control

The QC component consists of applicable field and sample handling procedures, and the preparation and submission of two types of QC samples to the various laboratories involved in the program. The QC samples include blanks (e.g., travel, field, equipment) and duplicate/split samples.

Sample bottle preparation, field measurement and sampling handling QC procedures include the following:

- Sample bottles are kept in a clean environment, capped at all times, and stored in clean shipping containers. Samplers keep their hands clean, wear gloves, and refrain from eating or smoking while sampling.
- Where sampling equipment must be reused at multiple sampling locations, sampling equipment is cleaned appropriately between locations.
- Temperature, pH, and specific conductivity are measured in the field using hand held meters. Samples are cooled to between 4 °C and 10˚C as soon as possible after collection. Care is taken when packaging samples for transport to the laboratory to maintain the appropriate temperature (between 4°C and 10˚C) and minimize the possibility of rupture. Where appropriate, samples are treated with preservatives to minimize physical, chemical, biological processes that may alter the chemistry of the sample between sample collection and analysis.
- Samples are shipped to the laboratory as soon as reasonably possible to minimize sample hold times. If for any reason, samples do not reach the laboratory within the maximum sample hold time for individual parameters, the results of the specific parameters will be qualified, or the samples will not be analysed for the specific parameters.
- Chain of custody sample submission forms are completed by field sampling staff and submitted with the samples to the laboratory.
- Only staff with the appropriate training in the applicable sampling techniques conduct water sampling.

Quality control procedures implemented consist of the preparation and submission of QA/QC samples, such as field blanks, trip blanks, and duplicate water samples. These are defined as follows:

- Field Blank: A sample prepared in the field using laboratory-provided deionized water to fill a set of sample containers, which is then submitted to the laboratory for the same analysis as the field water samples. Field blanks are used to detect potential sample contamination during collection, shipping and analysis.
- Travel Blank: A sample prepared and preserved at the analytical laboratory prior to the sampling trip using laboratory-provided deionized water. The sample remains unopened

throughout the duration of the sampling trip. Travel blanks are used to detect potential sample contamination during transport and storage.

- Duplicate Sample: Two samples collected from a sampling location using identical sampling procedures. They are labelled, preserved individually and submitted for identical analyses. Duplicate samples are used to assess variability in water quality at the sampling site. Duplicates are collected and submitted for analyses at approximately, 10% of sampling locations. For smaller batches of samples (less than 10), at least one duplicate will be collected and submitted for analysis.

1 INTRODUCTION

1.1 SITE LOCATION AND ACCESS

WSP Canada Inc. (WSP) was retained by Agnico Eagle Mines Limited (Agnico Eagle) to prepare the Design Report of the proposed saline effluent discharge to the marine environment near Rankin Inlet, Nunavut. As part of their long-term groundwater management strategy, Agnico Eagle is planning to collect groundwater from the Meliadine underground mine, treat the influent with respect to quality standards and discharge the treated groundwater effluent into Melvin Bay.

The Meliadine Mine is located approximately 25 km North of Rankin Inlet (63°1'23.8'' N, 92°13'6.42'' W), Nunavut.

The proposed discharge point for the saline groundwater effluent is in Melvin Bay just west of Rankin Inlet. Agnico Eagle will access the area using a bypass road. The area is also accessible by Itivia Street, a gravel road linking the Agnico Eagle Fuel Storage Facility at the Itivia Harbour and Rankin Inlet.

1.2 EXISTING AND FUTURE SITE FACILITIES

Agnico Eagle owns and operates the existing Fuel Storage Facility and plans to use this property to install the saline effluent discharge system. This projected effluent discharge system consists of truck discharge pump, a back-up discharge truck pump, a 100 000-litre storage tank, as well as suction and discharge pipelines. The 100 000-litre storage tank will only be used to contain the treated effluent until the next day, if the 800 m^3/d discharge limit is attained upon a truck's arrival. The storage tank will be installed on a containment area, built on a geomembrane with underlying and overlying granular materials and surrounded by berms. The construction drawings are shown in the Appendix A.

A pumping station including two pumps will be installed on the containment area. The truck discharge pump will be used to transfer the effluent from the trucks directly into the sea (or to storage tank). A back-up truck discharge pump will be installed to by-pass the first pump, if necessary. The truck-discharge pump is connected to a 778 m long HDPE pipeline to pump the effluent from the trucks to 20m below sea level in Melvin Bay. A diffuser is connected at the end of the pipe to ensure effective dilution of the saline effluent into the marine environment. The ballast weights will be attached to the pipe to sink and hold it onto the seabed.

For more detailed information, refer to the construction drawings shown in the Appendix A.

1.3 PURPOSE OF THE DOCUMENT

The purpose of the report is to outline the final design and construction drawings for the saline effluent discharge system which includes the storage tank, the pumping station, the discharge pipe as well as the diffuser that will release the treated groundwater effluent into Melvin Bay.

This report has been prepared in accordance with Condition 128 of NIRB Project Certificate No.006:

‘‘The Proponent shall provide the NIRB with a detailed design for the system that includes the location of the pipeline in relation to the saline effluent storage tank at Itivia, the location of submerged collars supporting the pipeline and the design of the diffuser.’’

The final design was presented to the local stakeholders including the Kangiqliniq Hunters and Trappers Organization (KHTO), the Hamlet of Rankin Inlet and the Government of Nunavut - Nunavut Airports Division and Community and Government Services Department on January 24th, 2019 for final review.

This design report refers to Golder’s Report which assessed the environmental guidelines characterizing Melvin Bay at the location of the proposed diffuser and conducted the numerical modelling to design the diffuser. Golder’s Report was published in February 2019 and is shown in Appendix D.

1.4 SCOPE OF WORK

WSP was retained by Agnico Eagle to design the pumping station and pipeline while Golder was responsible for the assessment of the groundwater effluent plume with respect to environmental guidelines. This report describes the design of the pumping station, the pipeline and the diffuser.

2 GENERAL SITE CONDITIONS AND OTHER DATA INPUT FOR DESIGN

2.1 MODELLING FOR DIFFUSER DESIGN

The model calculates numerical simulations of the treated groundwater effluent mixing in the proposed marine environment. The modelling of the groundwater effluent plume dispersion allows the user to assess the dilution behaviour.

The ambient environmental conditions (e.g. winds, currents, etc.) and treated groundwater effluent characteristics are necessary to calculate numerical simulations of the mixing.

The proposed diffuser pipeline is to extend from the storage tank to be located south of the Aginco Eagle’s Fuel Storage Facility, to south-south-west in Melvin Bay. The diffuser port will be installed on the seabed at a depth of 20 m, to ensure proper mixing and prevent interference with traditional activities.

Refer to section 2.1.3 of Golder’s Report: Modelling Assessment of Groundwater Discharge into the Melvin Bay Marine Environment, Rev B, for detailed information (Golder, 2019).

2.2 ENVIRONMENTAL DATA

For detailed information on the environmental data used, refer to section 2.1.1 of Golder’s Report.

2.3 CHARACTERISTICS OF THE EFFLUENT

For detailed information on the characteristics of the effluent, refer to Appendix B of Golder's Report.

3 DESIGN OF THE STORAGE AND PUMPING STATIONS

3.1 GENERAL

After treatment, the excess groundwater will be stored on site at the Meliadine Mine, before being hauled by tanker trucks to Itivia Harbour. Trucks will unload their treated groundwater effluent by connecting on a flexible 4'' HDPE suction pipe. The truck discharge pump will transfer the treated effluent into the 6'' discharge HDPE pipeline and through the diffuser. The truck discharge pump will also be used to transfer effluent into the storage tank until the next day, before it is pumped into sea when necessary.

A by-pass pipeline will be installed parallel to the main discharge pipe in case the discharge truck pump malfunctions or maintenance is required. The back-up truck discharge pump (spare) will be used to pump the effluent into by-pass pipe, though the 6'' discharge HDPE pipe and out the diffuser, if necessary.

3.2 PUMP NARRATIVE

The flow rate to be discharged to Melvin Bay will not exceed 800 m^3/d with a TDS of 39 600 mg/L (Golder, 2019). The discharge will only occur during open water season. For more detailed information on the modelling scenarios and the input parameters, refer to section 2.1.2 of Golder's Report.

3.3 PUMPING STATION ENCLOSURES

The pumping station will be enclosed inside a heated container to protect the mechanical and electrical equipment from cold temperatures before Winter and at freshet. This precaution will decrease the risks of malfunctions in the system.

3.4 STORAGE TANKS

A 100 000-litre horizontal double wall storage tank will only be used to store the treated groundwater effluent until the next day if the daily discharge limit is attained upon a truck's arrival.

3.5 PIPING

The piping manifold for pumping stations within the container will be made of chlorinated polyvinyl chloride (CPVC) with Victaulic connections to facilitate the dismantlement during maintenance operations.

The 4'' suction and 6'' discharge pipelines outside of the heated container will be made of HDPE DR-9 pipe.

3.6 CONTROLS

The pumping station was designed to control the high and low water levels in the storage tank. The water level in the storage tank will be regulated with an ultrasonic transmitter located in the storage tank. When the water reaches the high level, the pump will automatically start to discharge the treated effluent to Melvin Bay.

A flow meter will be installed downstream of the pumping station to measure the flow rate before discharging into the marine environment. The pH, conductivity and the temperature levels of the effluent will be measured at the Chlorination Treatment Plant before arrival to Agnico Eagle Fuel Storage Facility. This equipment will allow Agnico Eagle to control the discharge operations and to respect the base parameters. This is in accordance with the commitments during the Final Environmental Impact Statement (FEIS) process.

A valve will be installed downstream of the storage tank to allow the sampling according to the Metal and Diamond Effluent Regulation.

The pumping station is designed to facilitate the user's operations and maintenance. The design allows a local control at the pumping station.

4 DESIGN OF THE HDPE PIPELINES

4.1 GENERAL

The present section of the report describes the main components of the effluent discharge pipeline and provides the reader with further details on its design and functionalities.

The groundwater effluent pipeline was designed to prevent interference with local transportation including snowmobiling, boating and ATV's. Our design proposes an ATV and snowmobile crossing constructed over a section of the onshore pipeline and parallel to the laydown area fence line. Furthermore, drawing 65-100-210-200 illustrates the location of the proposed ATV and snowmobile crossing.

The design will not affect the use of traditional land during construction and operation.

4.2 ABOVE-GROUND PIPELINE

4.2.1 ONSHORE

The onshore pipe will be installed permanently on the undisturbed natural ground. Signage will be installed in both directions of the traffic near the onshore pipe to indicate the obstacle and the crossing to motorized vehicles.

4.2.2 SUBMARINE PIPELINE

Unlike the conceptual design presented during the FEIS process, Agnico Eagle is proposing not to bury the pipeline located in the intertidal zone. This proposed design will result in reducing the impacts on the environment and community (i.e. eliminate need to re-open the Itivia quarry, reduce risk of erosion and sedimentation into Melvin Bay during pipe installation and reduce risk of pipe being moved by ice during winter).

The submarine pipeline is segmented into two sections, a temporary (removable) and a permanent section. The first 150 m long section located south of the crossing must be removed from the Melvin Bay before Winter since the formation of ice could damage the pipe. The temporary section will be re-installed at freshet once the ice has broken up. The temporary pipe is removable by its flanges located at the extremities of the 150 m section.

On the other hand, the permanent section of the submarine pipeline will be at least 6 m below sea level and will stay in place year-round. A diffuser is connected at the end of the pipe.

4.3 MATERIAL

4.3.1 PIPELINES

The effluent discharge pipeline will be made of Sclairpipe HDPE DR-9 PE4710. Also, the pipeline will be welded using a fusion welding machine except at it's flanges. The pipe's dimension ratio was selected based on the need for high rigidity. The chemical properties of HDPE pipes make it highly resistant to saline water. Finally, HDPE pipelines are easier to install in a marine environment compared to other materials (e.g. steel).

4.3.2 FLANGES, VALVES AND ACCESSORIES

The pipeline's temporary section has two HDPE flanges at its extremities to enable it to be removed and installed again, when necessary. A back-up ring will be inserted in-between each flange connections and then mechanically fastened to ensure tightness. The ring will be designed to resist low water temperatures as well as salinity.

4.3.3 BALLAST WEIGHTS

The ballast weights will be installed at a 1.52 m interval along the submarine pipeline. The ballast weights must weigh 67.6 pounds to keep the pipeline floating when filled with air, until it is in the projected alignment. Once the pipeline is filled with water, the ballast weights will sink and hold the pipeline onto the seabed. The ballast weight will allow the installation of the pipeline underwater.

4.4 EQUIPMENT

4.4.1 FLOWMETER

As mentioned in section 3.6, a flowmeter will be installed downstream of the pumping station to measure the flow rate before discharge into the marine environment.

5 DESIGN OF DIFFUSER AND MODELLING RESULTS

5.1 DIFFUSER CONFIGURATION

The optimized diffuser has the following configuration:

- Diffuser connection with outfall through a 6'' five-way cross;
- Length of the diffuser: 0.9 m;
- Diameter of the diffuser: 150 mm, DR-9 (nominal);
- Diffuser depth: 20 m (based in 2017 bathymetry survey of Melvin Bay);
- Discharge type: single port;
- Horizontal angle of discharge: Perpendicular to bathymetric contours;
- Vertical angle of discharge: 90°;
- Port diameter: 75 mm, DR-9 (nominal);
- Port height from seabed: 1 m.

For more detailed information, refer to construction drawing 65-100-210-200 in Appendix A.

6 CONSTRUCTION

6.1 GENERAL

Construction is expected to begin in May 2019 and end in August 2019.

6.1.1 PIPELINE

The pipeline sections will be welded on shore into three major segments; the onshore segment as well as the temporary and permanent submarine segments.

The ballast weights will be installed onshore only when the submarine segments are welded together. Initially, the ballast weights will be stockpiled adjacent to the work station. Then, a ramp or skid way, including railroad tracks or steel beams, will be placed to facilitate moving the weights along with the pipe.

The pipeline is ready for launching when all the ballast weights are fixed to the pipeline. To keep the pipeline floating until the sinking operation, the pipe ends are blocked to prevent water from entering the pipe. This will be accomplished by installing a flange assembly with a blind flange at each end.

Before the launch, the ramp of the skidway will extend deep enough into the water so that the weights can be supported by the floating pipe. In case of high currents, an anchorage system will be installed to hold the pipe while it is being launched. A boat with a winch and cable system will be used to move the pipeline into the water. It may be necessary to install guide cables and shore anchors to hold the system over the alignment when it is being sunk.

The sinking process consists of filling the pipe with water at one end and evacuating the air out of the other end.

The construction of the pipeline onshore and under water will not interfere with the local community activities. During construction, vertical lighting signs will be installed onshore to alert incoming traffic at Itivia Harbor. The lighting will be oriented with caution, towards the working area and away from the airstrip take off and landing area.

6.1.2 STORAGE TANK

The installation of the storage tank will require the use of a lifting mobile equipment. The storage tank measures 12.2 m long x 3.3 m wide and weighs 15 m.t. It will be set in place with the M & T KoneCrane ReachStacker Model SMV 4531. Its maximum vertical extension is 18.2 m but just to lift the storage tank off a flat bed and set in place, it would be extended about two thirds that height.

6.1.3 CONTAINMENT PAD (NEAR ITIVIA FUEL STORAGE FACILITY)

The Containment pad will be built to minimize land disturbance and environmental risks. Therefore, the pad is to be built 31 m away from the Highest High Water Large Tide (HHWLT).

Once the subgrade is prepared, an HDPE geomembrane is installed with underlying and overlying granular material. Also, berms are to be constructed around and higher than the containment pad. This gives the pad the capacity to contain the volume of effluent inside the storage tank in case of spillage.

The pad will facilitate daily operations such as maneuvering the tanker trucks to unload the groundwater effluent into the storage tank.

The construction of the containment pad will require an excavator, tandem trucks, a spread dozer and a compactor. The tallest heavy equipment on site will be the CAT 330 excavator. It has a maximum vertical reach of 10.7 m but will not be deployed to this height since the work will occur at ground level only.

6.2 MATERIAL SPECIFICATIONS

All the materials used to fabricate the facility are non-potentially acid generating (NPAG) materials. The granular materials that will be used for building the containment pad will be sourced from a nearby borrow pit.

6.3 CONSTRUCTION QUALITY CONTROL AND SURVEY

Agnico Eagle is responsible for conducting quality control and surveying during construction.

6.4 TESTING AND INSPECTION

Agnico Eagle is responsible for testing and inspecting the saline discharge effluent system according to the manufacturer's recommendations before its start-up. After the pipeline installation, diver's will verify that the ballasts holding the pipeline are all properly sitting on the bottom contours and that the pipeline is not resting on any rocks, debris or material that could cause damage.

7 OPERATIONS

7.1 REMOVABLE AND PERMANENT PIPE

As stated in section 4.2.2, operation of the saline effluent discharge requires installing and removing a temporary segment of the pipeline at freshet and Winter, respectively. The temporary segment will be removed and stored away before the bay freezes up.

The temporary section of pipe can be disconnected from the system at its flanges and will have to be pulled out using heavy equipment. Agnico Eagle is responsible for storing this pipeline segment on their property during Winter.

7.2 MAINTENANCE PROGRAM

Agnico Eagle will have in place a maintenance program based on manufacturer's recommendations. The system will be inspected according to the manufacturer's recommendations and repaired when needed to keep the system in good working condition.

NOTES:

1) FOR THE INSTALLATION, THE CONTRACTOR NEED TO REFER TO THE HANDBOOK OF PE PIPE CHAPTER 10, MARINE INSTALLATION. EACH SECTION OF PIPE MUST BE JOINT BY FUSION, EXCEPT FOR THE TEMPORATY PIPE REMOVABLE FOR WINTER THEY ARE CONNECTING TO THE PERMANENT PIPES WITH FLANGE FUSED AT EACH END BACK-UP RING.

2) POST-INSTALLATION SURVEY

UPON COMPLETION OF THE INSTALLATION OF A SUBMERGED PIPELINE, IT IS ADVISABLE TO HAVE THE COMPLETE LINE SURVEYED BY A COMPETENT DIVER TO ENSURE THAT:

- THE PIPELINE IS LOCATED WITHIN THE PRESCRIBED RIGHT-OF-WAY;
- THE BALLASTS HOLDING THE PIPELINE ARE ALL PROPERLY SITTING ON THE BOTTOM CONTOUR AND THAT THE LINE IS NOT FORCED TO BRIDGE ANY CHANGES IN ELEVATION;
- THE PIPE IS NOT RESTING ON ANY ROCKS, DEBRIS OR MATERIAL THAT COULD CAUSE DAMAGE;
- ANY AUXILIARY LINES, SUCH AS HOSES, ROPES, BUOYANCY BLOCKS OR ANY OTHER EQUIPMENT USED DURING THE INSTALLATION HAS BEEN REMOVED;
- WHERE REQUIRED, THE PIPE HAS BEEN BACKFILLED AND THE BACKFILLING WAS DONE PROPERLY;
- ALL OTHER INSTALLATION REQUIREMENTS ESTABLISED BY THE DESIGNER FOR THE SUBJECT APPLCATION HAVE BEEN COMPLIED WITH.

Table of Contents

1. Document objective 1

2. Description 1

2.1 System description – Saline water truck unloading, storage and discharge at sea 1
2.2 Control description – Saline water truck unloading pump 1

1. Document objective

This document describes the programming of the control logic to be implemented for the control system of the discharging at sea of the treated saline effluent water coming from Meliadine site. The system will be installed close to the existing fuel deposit in Rankin Inlet, near the shore of Melvin Bay. The project is for Agnico Eagle's Meliadine mine.

2. Description

2.1 System description – Saline water truck unloading, storage and discharge at sea

Truck loaded with up to 50 000 liters of treated water ready to discharge at the sea will connect their load to a flexible pipe 150mm in diameter. Once connected, the operator will turn on the pump for about 15 to 30 minutes to transfer the water into a 100 000 liters storage tank or by changing the manual valves, directly to the diffuser in the sea. Overflow of the tank will be prevented by a float valve on the filling port. A mechanical level indicator will be installed on the tank. A flowmeter/totalizer will be installed on the sea discharge line in order to double check the volume of water discharged in sea.

The system will be powered by the existing electrical room at the fuel deposit.

2.2 Control description – Saline water truck unloading pump

Start/Emergency Stop button stations will be installed near the pumps.

Operator will open and close the valves in order to choose:

1. Main Pump or Back up Pump
2. Unload truck to tank, unload truck to sea or unload tank to sea

END OF SECTION

Appendix C: Sclairpipe Technical Specification

uponor

Sclairpipe®

VERSATILE HIGH DENSITY POLYETHYLENE PIPE

Sclairpipe

Sclairpipe® high density polyethylene (HDPE) pipe represents the latest advances in both material and manufacturing techniques. Since 1968, Sclairpipe has been proven in a wide range of municipal and industrial piping applications. It has been used extensively in the municipal market for gravity sewers, sewage forcemains, and pressure water systems. Uponor Infra has special expertise in marine installations of Sclairpipe, including river and lake crossings; and river, lake and deep ocean intakes and outfalls.

Lighter. Stronger. Chemical Resistant.

Sclairpipe is a tough, lightweight, solid wall pipe with a smooth internal surface. Available in various diameters from 4″ to 48″ it can handle internal pressures of up to 380 psi (PE 4710). It is a well suited alternative to copper, PVC, ductile iron and concrete pipe in a variety of applications.

Sclairpipe weighs approximately 1/10 that of a similar sized concrete pipe. Handling requires a minimum of heavy equipment and Sclairpipe can easily be assembled on ice or through wet marshy areas. It will not corrode, tuberculate or support biological growth, making it the material of choice in harsh environments. Sclairpipe is inert to salt water and to chemicals likely to be present in sanitary sewage effluent.

Sclairpipe has a smooth ID and maintains its flow capability over time - Hazen Williams C Factor remains 150, even after years of use.

Easier to Transport and Install. Leak Proof.

Sclairpipe is much easier to handle and install than heavier, rigid concrete pipe, offering potential cost savings during the construction process. It is structurally designed to withstand impact, especially in cold weather installations when other pipes are prone to cracks and breaks. Sclairpipe will float even when full of water. For marine applications long lengths of pipe can be assembled on shore and then floated into position.

Thermal butt fusion provides an economical and fast method of delivering a complete, long, continuous length of pipe. Thermal fusion eliminates potential leak points every 8-20 feet commonly found with gasketed (or bell or spigot) pipe materials. The fused joints provide a continuous leak proof system that eliminates the risk of joint leakage due to ground shifting. Fused joints are fully restrained and as such may reduce or eliminate the need for expensive thrust blocks. With Sclairpipe infiltration and exfiltration problems are eliminated.

Sclairpipe Advantages

- Leak Proof
- Corrosion Resistant
- Chemical Resistant
- Long Life
- Fatigue Resistant
- Impact Resistant
- Lightweight
- Flexible
- UV Resistant
- Environmentally Friendly

Cost Effective. Permanent.

Sclairpipe offers distinct advantages. It can be cold bent to a radius as small as 25 times the pipe's nominal pipe diameter, and the installed bend radius can be as small as 50 times the nominal pipe diameter. Scalirpipe, installed on a radius, eliminates many of the fittings that would be required for directional changes when using other pipe materials. In addition, the flexibility of Sclairpipe allows it to adapt to uneven ground, unconsolidated river bottoms and excavated underwater trenches without the need for expensive foundations or minor degree elbows. It is well suited for dynamic soils and areas prone to earthquake.

Sclairpipe is cost effective in both the short and long term. The fact that it is lightweight makes it easier to transport and install. It is leak proof and fatigue resistant means there will be years of maintenance free use. The Plastics Pipe Institute estimates the service life for HDPE pipe to conservatively be 50-100 years.

Proven performance in a wide range of applications

Since its development in 1955, large diameter HDPE pipe has been successfully used in many installations worldwide. In North America, Sclairpipe high density polyethylene pipe was first introduced in 1968. Since then it has been installed for river, lake and salt water crossings, municipal and industrial fresh and salt water intakes and effluent outfalls. Sclairpipe has also been used extensively for pipeline repair and rehabilitation.

Some popular applications of Sclairpipe include:

- Potable Water Distribution
- Pressure Water Systems
- Sewage Systems
- Water Mains
- Sliplining
- Fire Mains
- Directional Drilling
- Trenchless Technologies
- Slurry Pipe
- Mining
- Marine Pipelines & Crossings
- Deep Water Intakes
- Deep Water Outfalls
- Irrigation Lines
- Biofilters
- Gas Gathering

Potable Water

Sclairpipe is used for both new water main installations and to rehabilitate deteriorated piping systems made from other materials. It can accept repetitive pressure surges that far exceed the static pressure rating of the pipe. Sclairpipe is easy to handle and is available in long lengths that cut down on jointing time. Thermal fusion on site reduces installation time and ensures leakproof joints that eliminate infiltration and exfiltration problems. Sclairpipe is well suited for dynamic soils and areas prone to earthquake.

Sewage Systems

After more than 35 years of use in municipal and industrial sewer applications, Sclairpipe has proven to be a reliable, cost effective, long-term solution for sewer and wastewater systems. It offers resistance to corrosion and chemicals with durability and strength that rigid concrete, PVC or ductile iron pipes can't duplicate. Lightweight Sclairpipe is easy-to-install, extremely flexible and does not corrode or tuberculate over time.

Industry

Long-term reliable piping solutions are always in demand by industry. Sclairpipe offers resistance to corrosion, abrasion and chemicals resulting in a durable, strong and cost-effective installation.

Mining

Sclairpipe solid wall HDPE pipe is commonly used in mining applications for tailings disposal and water management including: river water diversion, reclamation lines, culvert, sewer and sub-drainage systems and slurry pipe. It is lightweight, flexible, durable and abrasion resistant. It is virtually leak proof, and can withstand corrosive chemicals, acids or salts commonly found in mines. Sclairpipe combines strength and durability in above ground applications and is UV resistant.

Irrigation

Sclairpipe is a cost effective solution for irrigation and agricultural drainage applications such as river and canal diversion, agricultural irrigation systems and pipelines, and water conservation. It is lightweight, flexible and leak proof, resistant to corrosion and salt water, and joints can be heat-fused on site for ease of installation. A Sclairpipe irrigation system will withstand the test of time.

Heating & Cooling

Sclairpipe has proven to be a strong, leak proof and chemically inert solution for district cooling applications including dual-purpose projects providing cooling and potable water. It can be assembled on shore in a continuous flexible length, floated on the water's surface and then sunk by a controlled process. The pipe can also be manufactured in specific lengths and connected on site by flanges with the aid of marine divers. Sclairpipe's resistance to both corrosion and zebra mussel fouling makes it an ideal solution.

Choose the size that's right for you

Sclairpipe is available in standard Dimensional Ratio's (DR's), in sizes ranging from 4" to 48" in diameter. Sclairpipe is available in PE 3608 and PE 4710. With the higher allowable stress rating of PE 4710, the pipe wall can be thinner for the same pressure rating (higher DR).

The Dimensional Ratio relates the minimum wall thickness of the pipe to its outside diameter, and is important to define the pressure rating of a particular pipe. The maximum continuous operating pressure stated is based on the allowable hydrostatic design stress of each specific material (per ASTM D3350 and PPI's TR-3), and the pipe wall thickness (DR), at a service temperature of 73.4°F.

Pipe dimensions are in accordance with ASTM F714 and AWWA C906
Pressure Ratings are for water at 73.4 deg F.
Some of the pipe sizes and DR's above are available only on request. Check with your representative for availability.
Other dimensions and DR's not listed may be available upon special request.
All dimensions are in inches unless otherwise noted.
Weights are calculated by the methodology established in PPI's TR-7 and are applicable to PE 3608.

The standard stocked length of Sclairpipe pipe is 50 feet, in sizes above 4″ in diameter with longer lengths available on request.

Please visit our web site (www.uponor.ca) and use our online design tools to determine the pipe size best suited to your specific application.

Sclair IPS Cut Sheet_PE3608_r201407

- All dimensions are in inches unless otherwise specified.
- Pressure ratings are based on load durations of 50 years at a service temperature of 73.4F. The HDS (pipe wall allowable stress) for PE 3608 and PE 4710 are 800 psi and 1,000 psi respectively.
- Dimensions and tolerances per ASTM F714. Pipe weights calculated using PPI TR-7 using PE3608 density of 0.953 gm/cc and 0.958 gm/cc for PE4710 materials.
- The ASTM D3350 cell classifications conform to the requirements of the applicable pipe specification (ASTM F714, AWWA C906, etc.).
- Contact Uponor Infra for sizes, DR's and DIPS offering not shown.

Pipe dimensions are in accordance with ASTM F714 and AWWA C906
Pressure Ratings are for water at 73.4 deg F.
Some of the pipe sizes and DR's above are available only on request. Check with your representative for availability.
Other dimensions and DR's not listed may be available upon special request.
All dimensions are in inches unless otherwise noted.
Weights are calculated by the methodology established in PPI's TR-7 and are applicable to PE4710

Product innovation and quality assurance

For 50 years Uponor Infra has been a leader in the design, development, manufacture and support of polyethylene piping systems. Uponor Infra's experienced engineers can offer design and engineering assistance, assuring you of a dependable piping system designed to meet your needs. Visit our website (www.uponor.ca) and see how our innovative online calculator can assist you. Extensive R&D in the early 1960's led us to produce 16" diameter polyethylene pipe at a time when many considered large diameter polyethylene pipes a technical impossibility. Today Uponor Infra produces solid wall Sclairpipe in sizes up to 48".

All Uponor Infra products are manufactured from special, high strength resins with complete quality control maintained from raw material to finished pipe product. Uponor Infra was the first North American manufacturer of polyethylene pipe and fittings to have its Quality Management System registered to the ISO 9001:2008 level.

Our strict manufacturing specifications are verified daily, using precise dimensional controls and accelerated long term hydrostatic testing. A continuous quality control process assures you of long-term pipe performance. We certify that the pipe resin used to extrude Sclairpipe has a minimum cell classification of PE 345464C or PE445474C respectively, when classified in accordance with ASTM D3350. Sclairpipe's material classification is based on PPI's (Plastic Pipe Institute) method of determining and validating the Long-Term Hydrostatic Stress (LTHS) of polyethylene pipe.

Innovative joining methods and equipment

Sclairpipe piping systems can be assembled by heat fusion (butt, electrofusion, socket and saddle fusion), flanged connections, compression couplings and various mechanical couplings. The superior performance of Sclairpipe results from the combination of pipe and fittings designed to work together as a complete system. A full range of pressure rated fittings is available to suit any application.

The most popular method of joining Sclairpipe is thermal butt fusion. This fast and economical technique permits the quick assembly of long continuous lengths and the joining of fittings to the pipe. The fused joints are as reliable and strong as the pipe itself, fully restrained, providing continuous leak proof systems.

Ordering & shipping information

Uponor Infra welcomes your inquiries for non-standard sizes, lengths and pressure ratings of Sclairpipe pipe.

We can meet most special packaging requirements and provide custom pipe fittings. Please contact your local Uponor Infra representative or visit our web site.

The charts below outline standard shipment sizes for straight length and coiled pipe.

Pipe lengths range from 40 to 50 feet in size

Sclairpipe general specifications & material standards

Pipe and Fittings

REFERENCE SPECIFICATIONS

ASTM F714: Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR). Based on outside diameter.
CSA B137.1: Polyethylene Pipe, Tubing and Fittings for Cold Water Pressure Services.
ASTM D3350: Standard Specification for Polyethylene Plastics Pipe and Fittings Materials.
AWWA C901: Polyethylene (PE) Pressure Pipe and Tubing, 1/2 in. Through 3 in. for Water Service.
ASTM D3035: Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR). Based on Controlled Outside Diameter
ISO 9001:2008: Model for Quality Assurance in Production and Installation.
AWWA C906: Standard for Polyethylene (PE) Pressure Pipe and Fittings 4 in. Through 63 in., for Water Distribution.NSF 14, 61

MATERIAL

The pipe shall be made from polyethylene resin compound with a minimum cell classification of PE 345464C for PE 3608 materials and PE445474C for PE 4710 materials in accordance with ASTM D3350. This material shall have a Long Term Hydrostatic Strength of 1600 psi when tested and analyzed by ASTM D2837, and shall be a Plastic Pipe Institute (PPI) TR4 listed compound. The raw materialshall contain a minimum of 2%, well dispersed, carbon black. Additives, which can be conclusively proven not to be detrimental to the pipe may also be used, provided that the pipe produced meets the requirements of this standard. The pipe shall contain no recycled compound except that generated in the manufacturer's own plant from resin of the same specification and from the same raw material supplier. Compliance with the requirements of this paragraph shall be certified in writing by the pipe supplier, upon request. Manufacturer's Quality System shall be certified by an appropriate independent body to meet the requirements of the ISO 9001:2008 Quality Management Program.

PIPE DESIGN

The pipe shall be designed in accordance with the relationships of the ISO-modified formula (see ASTM F714).

$$P = \frac{2S}{(D°/t) - 1}$$

where, S = Hydrostatic Design Stress (psi)
P = Design Pressure Rating (psi)
D° = ODavg for IPS Pipe
ODmin for ISO Pipe
t = Minimum Wall Thickness
D°/t = Dimension Ratio

The design pressure rating P shall be derived using the formula above, expressed in pounds per square inch.
The Hydrostatic Design Stress for PE 3608 materials is 800 psi and for the PE4710 materials is 1000 psi.
The pipe dimensions shall be as specified in manufacturer's literature.

MARKING

The following shall be continuously printed on the pipe or spaced at intervals not exceeding 5 feet:
Name and/or trademark of the pipe manufacturer.
Nominal pipe size.
Dimension ratio.
The letters PE followed by the polyethylene grade per ASTM D3350, followed by the Hydrostatic Design stress in 100's of psi e.g. PE 3608.
Manufacturing Standard Reference e.g. ASTM F 714
A production code from which the date and place of manufacture can be determined.

JOINING METHODS

Whenever possible, polyethylene pipe should be joined by the method of thermal butt fusion as outlined in ASTM F2620, Standard Practice for Heat Fusion Joining of PE Pipe and Fittings. Butt fusion joining of pipe and fittings shall be performed in accordance with the procedures recommended by the manufacturer. The temperature of the heater plate should be between 400°F and 450°F. Follow the recommendations of ASTM F2620 regarding interfacial pressures for pipe wall thickness less than or equal to 1.5". Follow the manufacturer's recommendations regarding interfacial pressures for pipe walls thicker than 1.5".

Polyethylene pipe may be connected to fittings or other piping systems by means of a flanged assembly consisting of a polyethylene flange adapter or stub end, and a metal backup ring that has a bolting pattern meeting the dimensional requirements of Class 150, ANSI B16.1/B16.5 in sizes up through 24", and meeting Class 150 Series A, ANSI B16.47 or AWWA C207 Class B for larger sizes. Follow the manufacturer's recommendations regarding bolting techniques and the use of gaskets. Pipe or fittings may be joined by butt fusion only by technicians who have been trained and qualified in the use of the equipment.

GENERAL REQUIREMENTS

The pipe manufacturer shall provide, upon request, an outline of quality control procedures performed on polyethylene system components.

Appendix D: Modelling Assessment of Groundwater Discharge into Melvin Bay Marine Environment, Rev B (Golder, 2019)

GOLDER

TECHNICAL MEMORANDUM

DATE February 1, 2019 **Project No.** Doc718_1773384 _Rev0

TO Manon Turmel
Agnico Eagle Mines Ltd.

CC Ryan Vanengen, Carolina Leseigneur Torres

FROM Shouhong Wu and Bruce Dean, Golder Associates Ltd. **EMAIL bruce_dean@golder.com**

MODELLING ASSESSMENT OF GROUNDWATER DISCHARGE INTO THE MELVIN BAY MARINE ENVIRONMENT, REV B

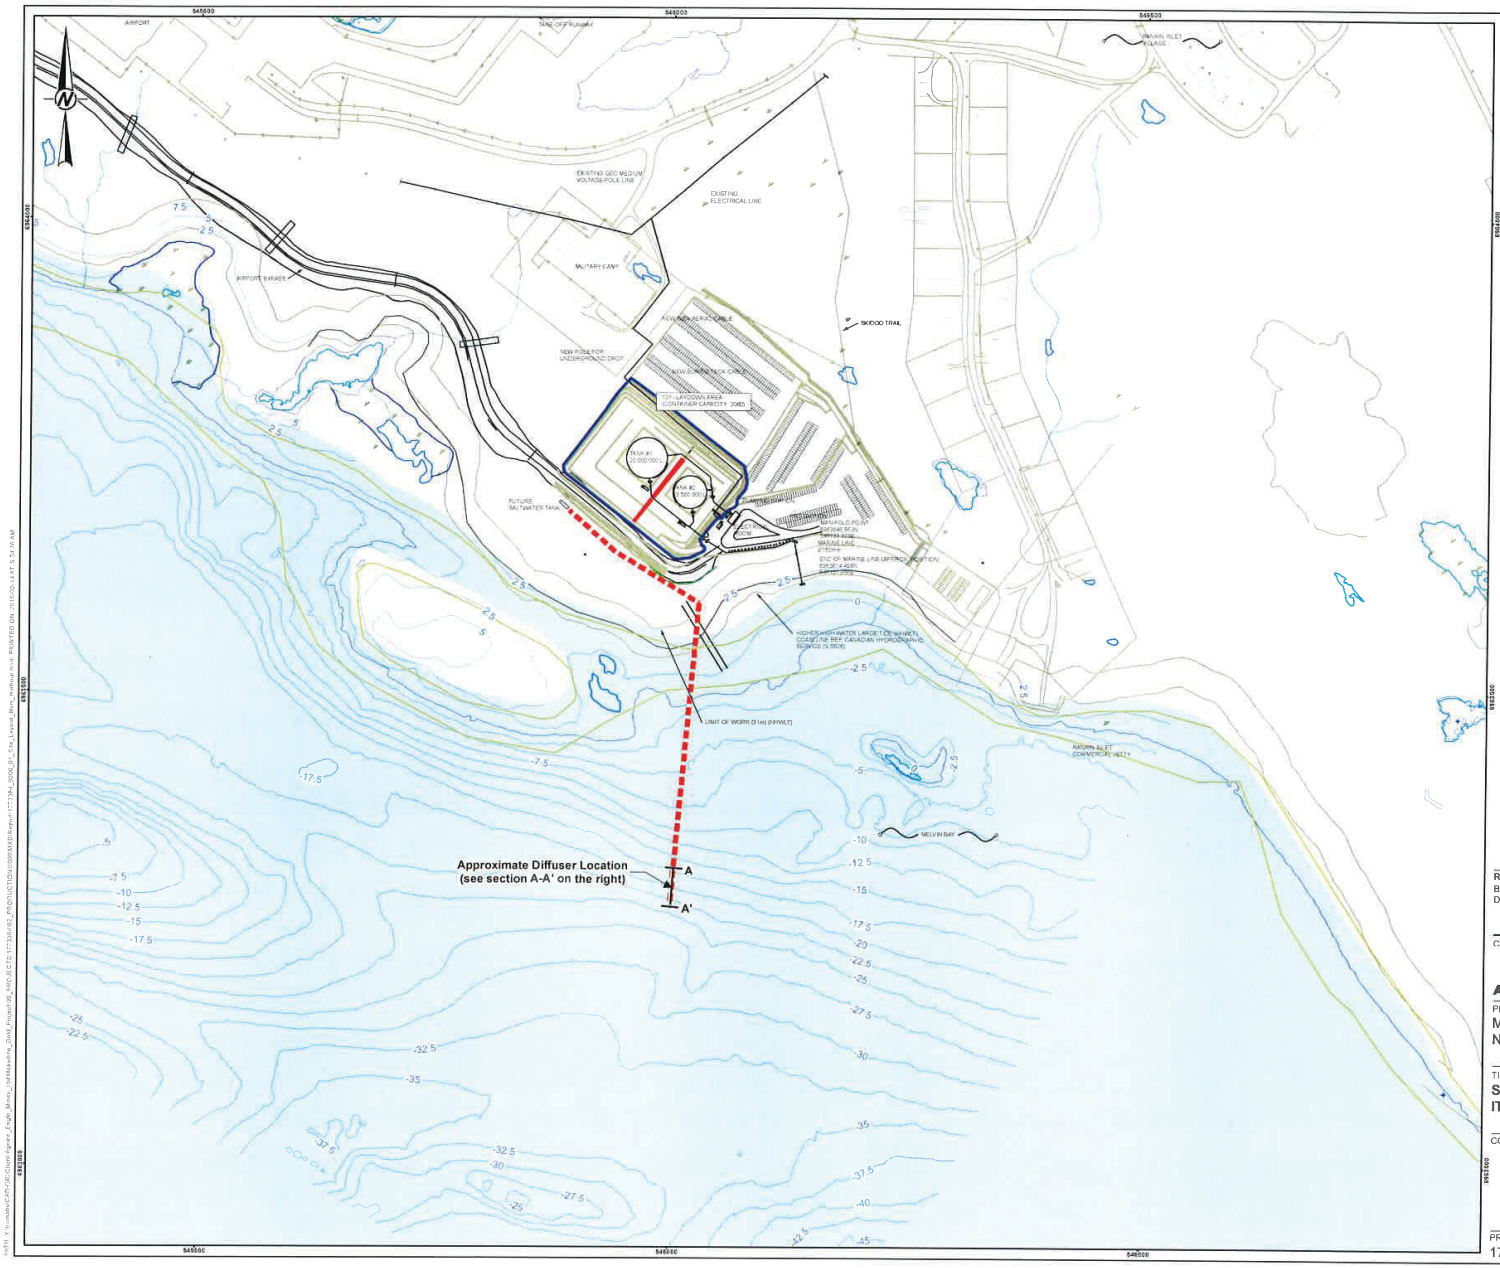
1.0 INTRODUCTION

Golder Associates Ltd. (Golder) was retained by Agnico Eagle Mines Limited (Agnico Eagle) to undertake a modelling assessment of groundwater discharge into the marine environment near Rankin Inlet. This modelling assessment consisted of nearshore oceanographic modelling of the discharge. The study did not include geotechnical, structural or hydraulic engineering assessments of the outfall. This technical memorandum was updated to account for an additional modelling scenario and updated baseline data collected by Golder from Melvin Bay in September 2018 as well as to account for increased discharge velocity resulting from a change to the diffuser port size. This memorandum should be read in conjunction with "Important Information and Limitations of this Report".

1.1 Scope of Work

The objective of this work is to assess the near field mixing of the treated groundwater effluent disposal with respect to relevant environmental guidelines. The scope of the work includes:

- Near field modelling of dispersion of treated groundwater effluent plume using CORMIX (Doneker and Jirka 2007).
- Assess the plume dilution behavior.



For the purpose of this scope of this work, it is assumed that the discharges will consists of only pumped water at quantities and qualities per the estimated underground inflow volumes (Golder 2016) and estimated groundwater inputs to surface storage for management (Agnico Eagle 2017). Section 2.1 describes the modelling conditions.

1.2 Physical Setting

In September 2018, a field program was conducted by Golder in Melvin Bay. Field parameters measured included temperature, conductivity, pH, dissolved oxygen, salinity, and oxidation-reduction potential. The measurement depth ranged from 0.3 m to 26.7 m at three different locations in Melvin Bay (i.e., the exposure area and two new reference areas). The field measurement results are summarized in Appendix A. Nearshore bathymetry (Agnico Eagle 2017 data) and the approximate discharge location is shown in Figure 1, to the south of the Tank Farm at the Itivia Fuel Storage Facility. Based on the bathymetry of Melvin Bay at Itivia Harbour, the diffuser would be placed on the seabed at a depth of approximately 20 m, to ensure an unconstrained mixing zone and to avoid interference with use of Itivia Harbour by ships and boats at high and low tide.

2.0 NEAR FIELD MODELLING

The Cornell Mixing Zone Expert System (CORMIX; Doneker and Jirka 2007) was applied to calculate numerical simulations of the near-field mixing and dilution behavior of treated groundwater effluent entering the nearshore coastal receiving environment in Melvin Bay. CORMIX is one of the most extensively applied models for predicting near-field discharge plume mixing and dilution of both conservative and non-conservative substances in surface water bodies. CORMIX calculates plume boundary interactions to estimate plume fate in terms of dilution and geometry relative to mixing zone regulations (Doneker and Jirka 2007). Nearshore ambient and treated groundwater effluent characteristics required to implement the mixing model are presented in the sections that follow.

2.1 Conditions for Modelling

2.1.1 Ambient Conditions

Assumptions made to characterize the ambient conditions of the receiving marine waters are as follows:

- Weak current: Ambient current velocity of 0.01 m/s and zero wind velocity were considered for this scenario which represented a slack tide condition during ice covered season.
- Mean current: Current speed of 0.2 m/s with no wind was used for this scenario.
- Open water condition: The water temperature and TDS (salinity) were considered to be 0°C (to account for the start and end of the open water season) and 33,300 mg/L, respectively.
- Water depth at discharge location is 20 m.

2.1.2 Discharge Conditions

Following discharge conditions based on estimated underground inflows were used for the near field mixing analysis:

- Flow rate of 800 m^3/d discharged over a 12 hour period (for an equivalent flow rate of 1,600 m^3/day), with TDS of 39,600 mg/L.
- Treated groundwater effluent temperature: 0°C.
- Outfall length: 230 m from the shoreline as shown.
- A single nozzle for discharge which has inside diameter of 68.07 mm (standard 3.0 inch port, DR9 (PE 4710), 252 psi) was used.
- Nozzle elevation from seabed: 1 m.
- Direction of discharge is perpendicular to the bathymetry contour and 90° vertical angle (upward port).

2.1.3 Modelling Scenarios

Table 1 lists the combination of effluent flow rate and ambient current speed in two simulation scenarios. Table 2 lists the CORMIX model input parameters. The target dilution at the edge of the near-field mixing zone is 11 as per analysis presented in Appendix B.

Table 1: Modelling Scenarios

Parameter	Scenario	
	1	2
Treated Groundwater Effluent Rate (m^3/d)[1]	1,600	1,600
Ambient Current Speed (m/s)	0.01	0.20
Discharge Velocity (m/s)	5.1	5.1

Note: 1. Daily flow rate is 800 m^3/day but this volume will be discharged over 12 hours for an equivalent flow rate of 1,600 m^3/day.

Table 2: CORMIX Model Input Parameters

Parameter	Value	Source
Depth at Discharge	20 m	Based on 2017 bathymetry survey completed by Agnico Eagle
Coastal Current (Velocity)	Low = 0.01 m/s Mean = 0.2 m/s	Based on CCG (2008) and assumed
Roughness Value	0.020	Assumed (equivalent to minimum roughness value of similar seabed). This value does not affect vertical jet results.
Wind Speed	0 m/s	Assumed
Water Condition	Saline, non-stratified	Based on Agnico Eagle (2014) and confirmed through Sep. 2018 sampling
Ambient water temperature	Open water season (start and end condition): 0°C	Conservative estimate to capture the start and end of the open water season for discharge
Effluent Flow Rate	1,600 m^3/d[1]	Per underground inflow and storage estimates (Agnico Eagle 2014; Golder 2016)
Effluent Temperature	0°C	Based on Diamond Drill Hole groundwater data (Agnico Eagle 2017)
Effluent Concentration	100%	Assumed
Discharge Type	Single Port	Assumed
Distance from Nearest Bank	230 m	Assumed
Horizontal Angle of Discharge	Perpendicular to bathymetric contour	Assumed
Vertical Angle of Discharge	90°	Assumed
Port Height above Seabed	1.0 m	Assumed
Port Diameter	0.0681 m	Assumed (3.0" port, DR 9, 252 psi)

Note: 1. Daily flow rate is 800 m^3/day but this volume will be discharged over 12 hours for an equivalent flow rate of 1,600 m^3/day.

3.0 RESULTS

Figures 2 and 3 present the near-field treated groundwater effluent plume dilution for a discharge of 800 m^3/day (an effective effluent rate of 1,600 m^3/d) in weak and mean ambient current conditions respectively, via the diffuser. For weak ambient current conditions, the maximum plume (centreline) height is 11.1 m from the seabed. For mean current conditions, the maximum plume (centreline) height is 5.6 m above the seabed. After reaching the maximum height, the negatively buoyant plumes settle towards the bottom as gravity starts to dominate over the initial jet momentum, and this is illustrated by the plume centrelines of Figures 2 and 3. For both scenarios, the plume centreline dilution factor reaches 11 within 1 m horizontal distance and 6 m vertical distance above the port. At

100 m distance from the diffuser, the dilution factors are 70 and 470 for scenarios 1 and 2 respectively, which are much higher than the required dilution of 11.

Figure 4 shows the changes in chloride concentration along the centrelines of the plumes, illustrating that at less than 5 m distance from the diffuser, the chloride concentration meets the required criteria. Figure 5 shows the changes in TDS concentration along the centrelines of the plumes, illustrating that at less than 1 m distance from the diffuser, the TDS concentration meets the required criteria.

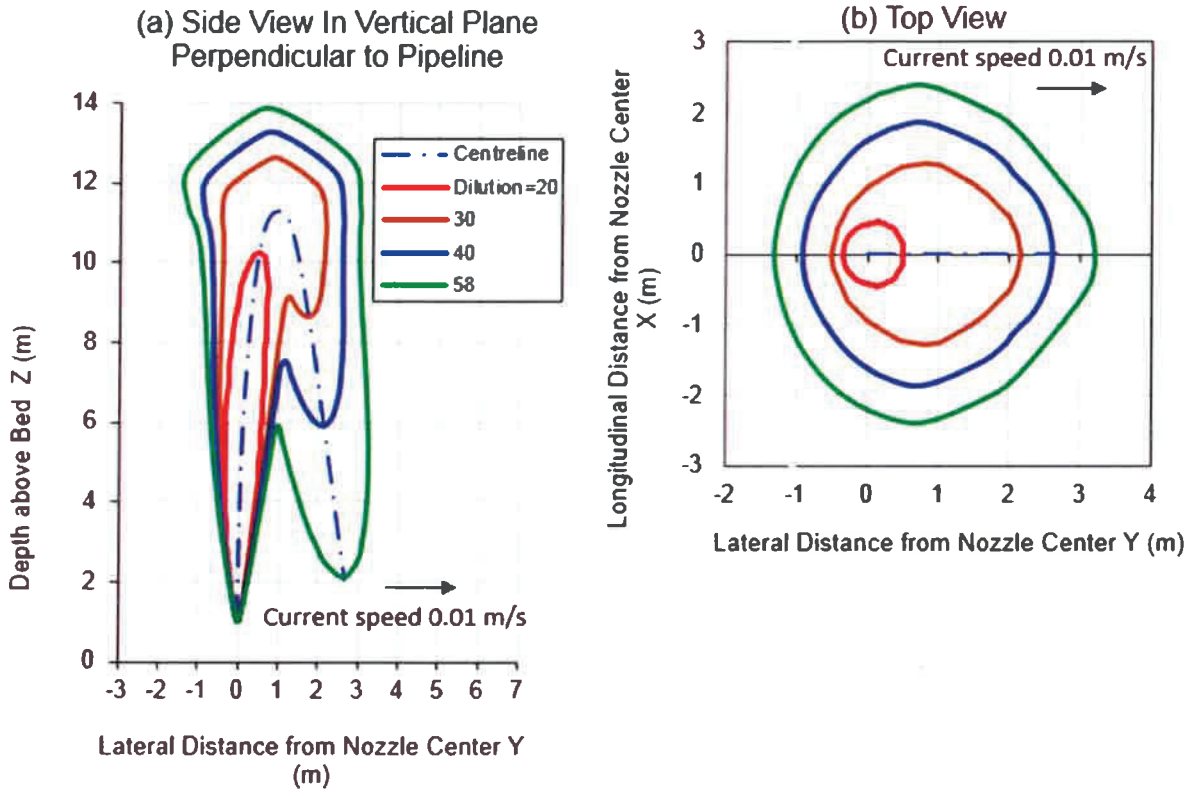

Figure 2: Dilution contours for a flow rate of 800 m^3/day (effective effluent flow rate of 1,600 m^3/d) in weak ambient current

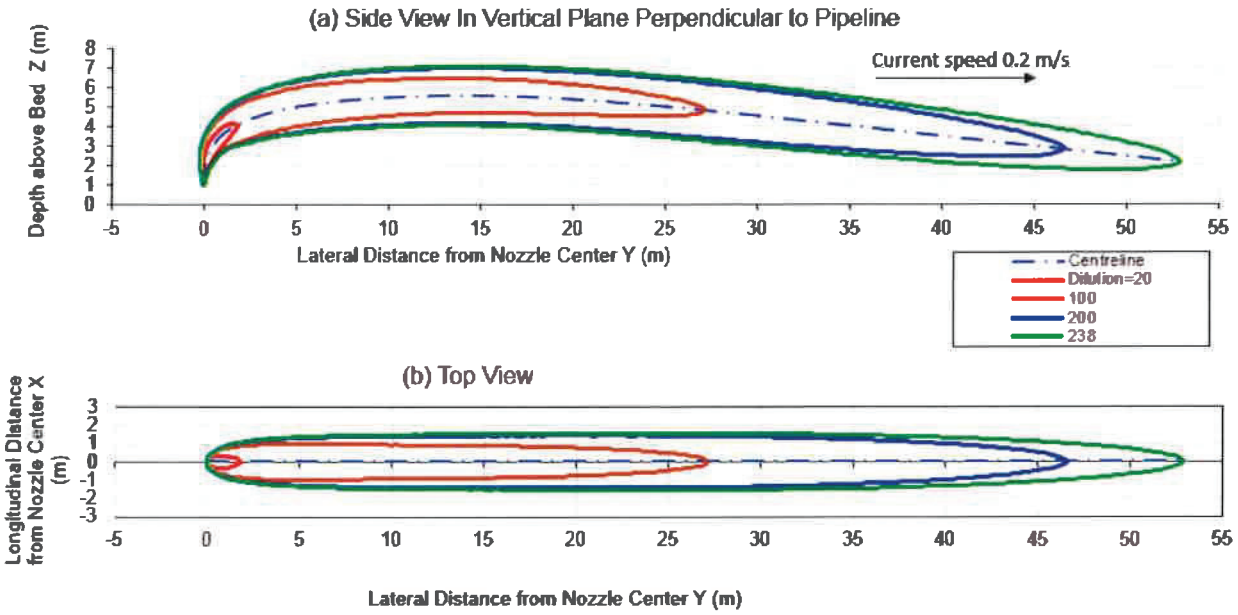

Figure 3: Dilution contours for a flow rate of 800 m³/day (effective effluent flow rate of 1,600 m³/d) in mean ambient current

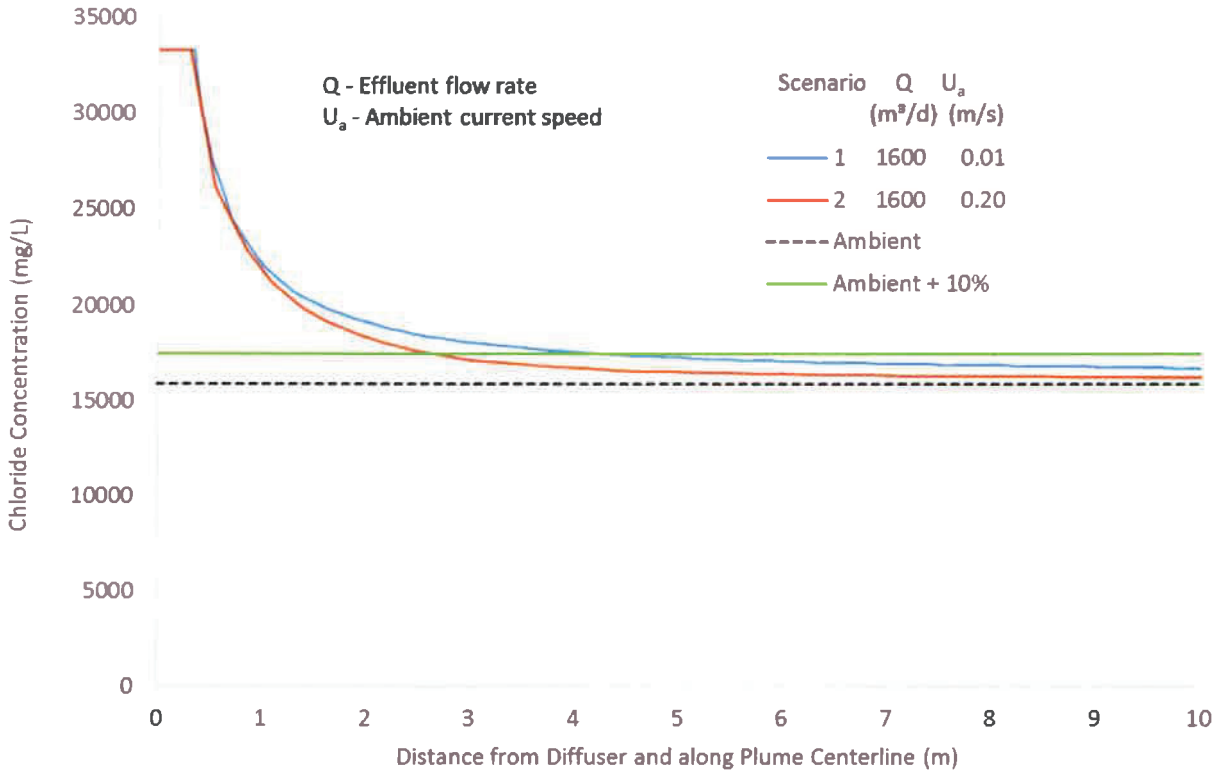

Figure 4: Chloride concentration along the plume centreline for both scenarios

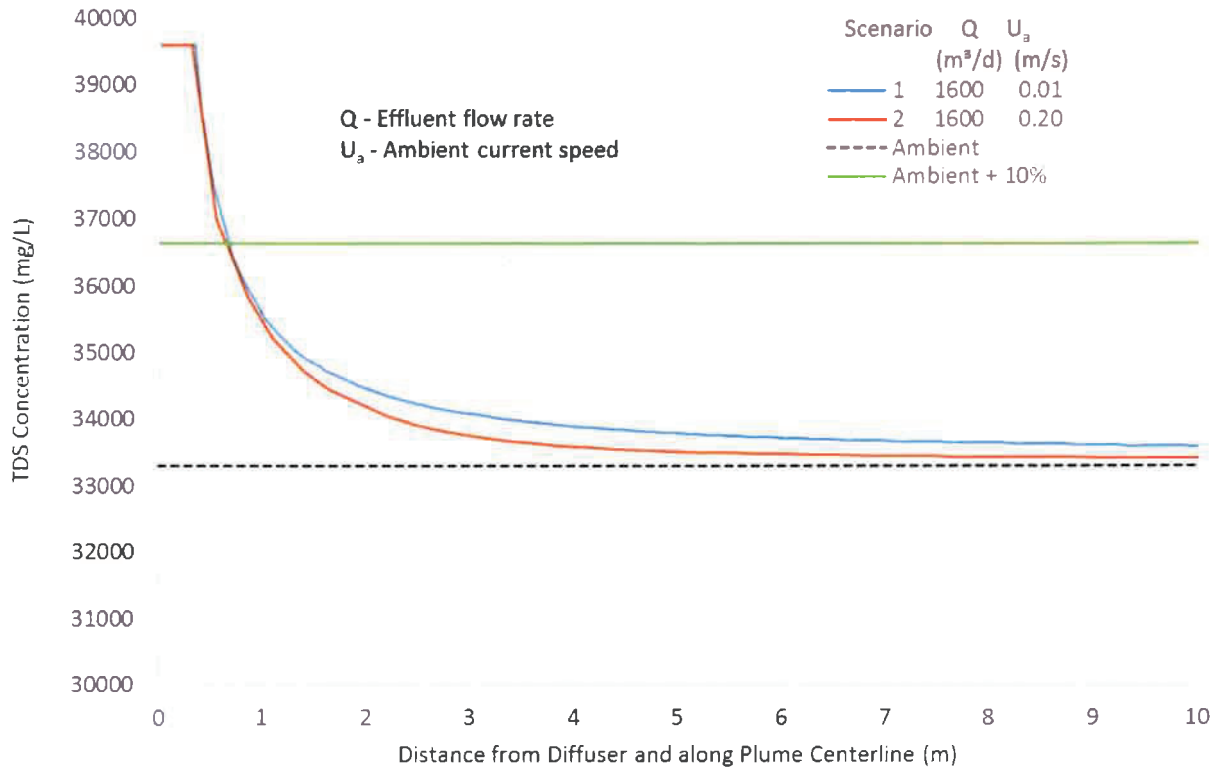

Figure 5: TDS concentration along the plume centreline for both scenarios

3.1 Temperature Sensitivity Analysis

For the simulated scenarios (800 m^3/day discharged over 12 hours for an effective flow rate of 1,600 m^3/day under weak and mean ambient current conditions), a sensitivity analysis simulation was conducted to review the effect of effluent and ambient temperature changes. The simulation conditions were otherwise identical to those for scenarios 1 and 2 except that the effluent temperature was increased to 20°C, and the ambient water temperature was increased to 8.5°C. The 20°C effluent temperature is understood to be the highest (though not expected) possible effluent temperature, as communicated by Agnico Eagle in November 2018. The 8.5°C was the water temperature measured in August 2011 at depth of 13 m below water surface (Stantec 2012).

The effluent temperature change results in effluent density change from 1031.85 kg/m^3 to 1028.30 kg/m^3, and the ambient water temperature change results in ambient water density change from 1026.76 kg/m^3 to 1025.89 kg/m^3. The temperature changes result in a slight change of the density difference between effluent and ambient water from 5.09 kg/m^3 to 2.41 kg/m^3. The plumes remain negatively buoyant with this temperature change, but not as strongly negative as under the original temperature assumptions for the ambient and effluent temperatures (both 0°C).

Table 3 summarizes the simulation results for sensitivity analysis on temperature change for the two scenarios. This table illustrates the following:

- The plumes rise to higher elevations than the plumes with the originally assumed temperature of 0°C due to reduced negative buoyancy.
- Similar to the original discharge plumes, the required dilution is met at less than 1 m distance from the diffuser.
- At an effective flow rate of 1,600 m³/day, the dilution factors at 100 m from the diffuser are increased due to accelerated plume mixing.

Table 3: Summary of simulation results for effluent temperatures of 20°C and ambient temperature of 8.5°C

Parameter	Scenario	
	1	2
Effluent flow rate (m³/d)[1]	1,600	1,600
Ambient current velocity (m/s)	0.01	0.2
Horizontal distance (m) from diffuser where required dilution of 11 is met	<1	<1
Maximum plume (centerline) height (m)	16.2	6.3
Dilution factor at 100 m from diffuser	163	563
Simulation results for originally assumed temperatures of 0°C		
Maximum plume (centerline) height (m)	11.1	5.6
Dilution factor at 100 m from diffuser	70	470

Note: 1. Daily flow rate is 800 m³/day but this volume will be discharged over 12 hours for an equivalent flow rate of 1,600 m³/day.

4.0 CONCLUSIONS

Mixing analysis was conducted for a diffuser designed for Melvin Bay, Rankin Inlet NWT. The simulation results show the following:

1) Dilution of the treated groundwater effluent plume is achieved within 5 m of the diffuser under the assumed conditions for the ambient and discharge conditions tested under assumed and increased temperatures.
2) After initial mixing, the plume migrates along the seabed under gravity and achieves further dilution and mixing with ambient water; concentrations within the 100 m regulatory mixing zone will thus meet discharge criteria per regulatory requirements and/or background concentrations for non-regulated parameters per the modelled conditions.
3) The results are valid for placement of the diffuser in Melvin Bay in water depths of at least 20 m.
4) Sensitivity analysis was performed for increased effluent and ambient temperatures. The required dilution of 11 is met within 1 m of the diffuser and dilution factors at 100 m from the diffuser were increased from the base case.

IMPORTANT INFORMATION AND LIMITATIONS OF THIS REPORT

Standard of Care: Golder Associates Ltd. (Golder) has prepared this report in a manner consistent with that level of care and skill ordinarily exercised by members of the engineering and science professions currently practising under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this report. No other warranty, expressed or implied is made.

Basis and Use of the Report: This report has been prepared for the specific site, design objective, development and purpose described to Golder by the Client. The factual data, interpretations and recommendations pertain to a specific project as described in this report and are not applicable to any other project or site location. Any change of site conditions, purpose, development plans or if the project is not initiated within eighteen months of the date of the report may alter the validity of the report. Golder can not be responsible for use of this report, or portions thereof, unless Golder is requested to review and, if necessary, revise the report.

The information, recommendations and opinions expressed in this report are for the sole benefit of the Client. No other party may use or rely on this report or any portion thereof without Golder's express written consent. If the report was prepared to be included for a specific permit application process, then upon the reasonable request of the client, Golder may authorize in writing the use of this report by the regulatory agency as an Approved User for the specific and identified purpose of the applicable permit review process. Any other use of this report by others is prohibited and is without responsibility to Golder. The report, all plans, data, drawings and other documents as well as all electronic media prepared by Golder are considered its professional work product and shall remain the copyright property of Golder, who authorizes only the Client and Approved Users to make copies of the report, but only in such quantities as are reasonably necessary for the use of the report by those parties. The Client and Approved Users may not give, lend, sell, or otherwise make available the report or any portion thereof to any other party without the express written permission of Golder. The Client acknowledges that electronic media is susceptible to unauthorized modification, deterioration and incompatibility and therefore the Client can not rely upon the electronic media versions of Golder's report or other work products.

The report is of a summary nature and is not intended to stand alone without reference to the instructions given to Golder by the Client, communications between Golder and the Client, and to any other reports prepared by Golder for the Client relative to the specific site described in the report. In order to properly understand the suggestions, recommendations and opinions expressed in this report, reference must be made to the whole of the report. Golder can not be responsible for use of portions of the report without reference to the entire report.

Unless otherwise stated, the suggestions, recommendations and opinions given in this report are intended only for the guidance of the Client in the design of the specific project. The extent and detail of investigations, including the number of test holes, necessary to determine all of the relevant conditions which may affect construction costs would normally be greater than has been carried out for design purposes. Contractors bidding on, or undertaking the work, should rely on their own investigations, as well as their own interpretations of the factual data presented in the report, as to how subsurface conditions may affect their work, including but not limited to proposed construction techniques, schedule, safety and equipment capabilities.

APPENDIX B

Environmental Guidelines

The intention of the treated groundwater effluent discharge objectives is to set the allowable effluent concentrations at the end-of-pipe and edge of a regulatory mixing zone. These allowable concentrations can then be used to design the diffuser to achieve the required dilution within the mixing zone. There is no specific definition for size of a mixing zone for discharges to Canadian coastal and estuarine waters. However, a radius of 100 m from the point of discharge is widely used for environmental compliance assessments. For example, the Guidelines for the Discharge of Treated Municipal Wastewater in the Northwest Territories (NWT 1992) provide guidance that the limits of initial mixing zone are 100 m from all points of discharge. For the current study, a 100 m regulatory mixing zone was applied.

Final effluent quality included in the model and assessment was based on measured groundwater quality from the borehole samples (see Section 3.4.2, Table 3 of the FEIS Addendum) and constrained by various regulations and guidelines to achieve non-acutely lethal effluent that will meet chronic guidelines or background concentrations at the edge of the regulatory mixing zone. The regulations and guidelines considered included:

- The proposed Metal and Diamond Mining Effluent Regulations (MDMER; GC 2017).
- Acute water quality guidelines for protection of marine aquatic life (CCME 2003; BC MOE 2017a, b).
- Fisheries and Oceans Canada Measures to Avoid Causing Harm to Fish and Fish Habitat (DFO 2013).

Zinc	mg/L	0.055	0.133

Notes:
"<" Concentration is below the reported detection limit (RDL).
(1) End of pipe discharge criteria is based on the minimum of the following (refer to Tables 8 and 9 of the FEIS Addendum):
Amended Metal and Diamond Mining Effluent Regulations (MDMER; GC 2017) Schedule 4 Authorized Limits of Deleterious Substances - Maximum Authorized Monthly Mean Concentration.
Canadian Council of Ministers of the Environment (CCME 2003) Short-term Water Quality Guidelines (WQG) for the Protection of Aquatic Life - Marine.
British Columbia Ministry of Environment (BC MOE 2017a) Approved Water Quality Guidelines for Marine Aquatic Life (Short-Term).
BC MOE Working Water Quality Guidelines for Marine Aquatic Life (BC MOE 2017b).
(2) 95% Upper Confidence Level of the Mean (UCLM) of the August 2016 to September 2017 diamond drillhole groundwater data provided by Agnico Eagle. 95% UCLM calculated using the US EPA ProUCL Version 5.1 software. Agnico Eagle will monitor groundwater quality and criteria will be updated as necessary based on observed changes.
(3) A 95% UCLM could not be calculated due to low detection rates within the dataset. The maximum concentration has been used for conservative purposes.

In addition to the above and since chloride ions mainly constitute the salt content in the marine water and ultimately the treated groundwater effluent plume, chloride guidelines are used to assess the near-field mixing zone. No local or federal guideline was available for chloride discharges in the marine environment, and therefore, the guideline published by the BC MOE (2017a) was used for the analysis. The guideline states:

> *"Human activities should not cause the chloride of marine and estuarine waters to fluctuate by more than 10% of the natural chloride expected at that time and depth".*

This indicates that the chloride concentration at the mixing zone boundary should not exceed the ambient chloride concentration of 15,900 mg/L by 1,590 mg/L (10%). The behavior of the discharge in the marine environment is influenced by density. For the purposes of this assessment, it is assumed that treatment of the groundwater will be such as to achieve a TDS concentration of the treated groundwater effluent that is +/- 10% (in line with the BC MOE 2017a guideline) of the maximum TDS concentration of 36,000 mg/L measured in September 2018 at Melvin Bay. Therefore, the assumed effluent TDS concentration will be up to approximately 39,600 mg/L. It is conservatively assumed that the chloride concentration of 33,300 mg/L remains unchanged in the treated groundwater effluent.

To reach a chloride concentration difference of no more than 10% at the edge of regulatory mixing zone, the required plume dilution factor via the diffuser is 11, per the equation below:

$$S = \frac{C_{eff} - C_a}{C_{edg} - C_a} = \frac{C_{eff} - C_a}{110\% C_a - C_a} = \frac{33{,}300 - 15{,}900}{110\% * 15{,}900 - 15{,}900} = 11$$

where S is required dilution factor, C_{eff} is effluent chloride concentration (33,300 mg/L), C_a is ambient chloride concentration (15,900 mg/L), and C_{edg} is chloride concentration at the edge of regulatory mixing zone. Per the BC MOE (2017a) guideline, the upper bound of C_{edg} is 10% greater than ambient chloride concentration.

There are also no federal or provincial specific criteria for mixing zone discharges regarding thermal changes to the marine environment. However, per the BC MOE (2017a) guideline:

> *"Temperature at the mixing zone boundary should not change by more or less than 1°C from natural ambient background temperatures, and the hourly rate of change should not exceed 0.5°C."*

This is taken into consideration for the model, which conservatively assumes treated groundwater effluent discharge and ambient ocean temperatures of 0°C, to account for start and end of temperatures for the open water season.

APPENDIX C • SPECIFIC WORK INSTRUCTIONS FOR UNDER-ICE MARINE WATER QUALITY SAMPLING PROGRAM – WINTER 2019

Specific Work Instructions	SWI-001

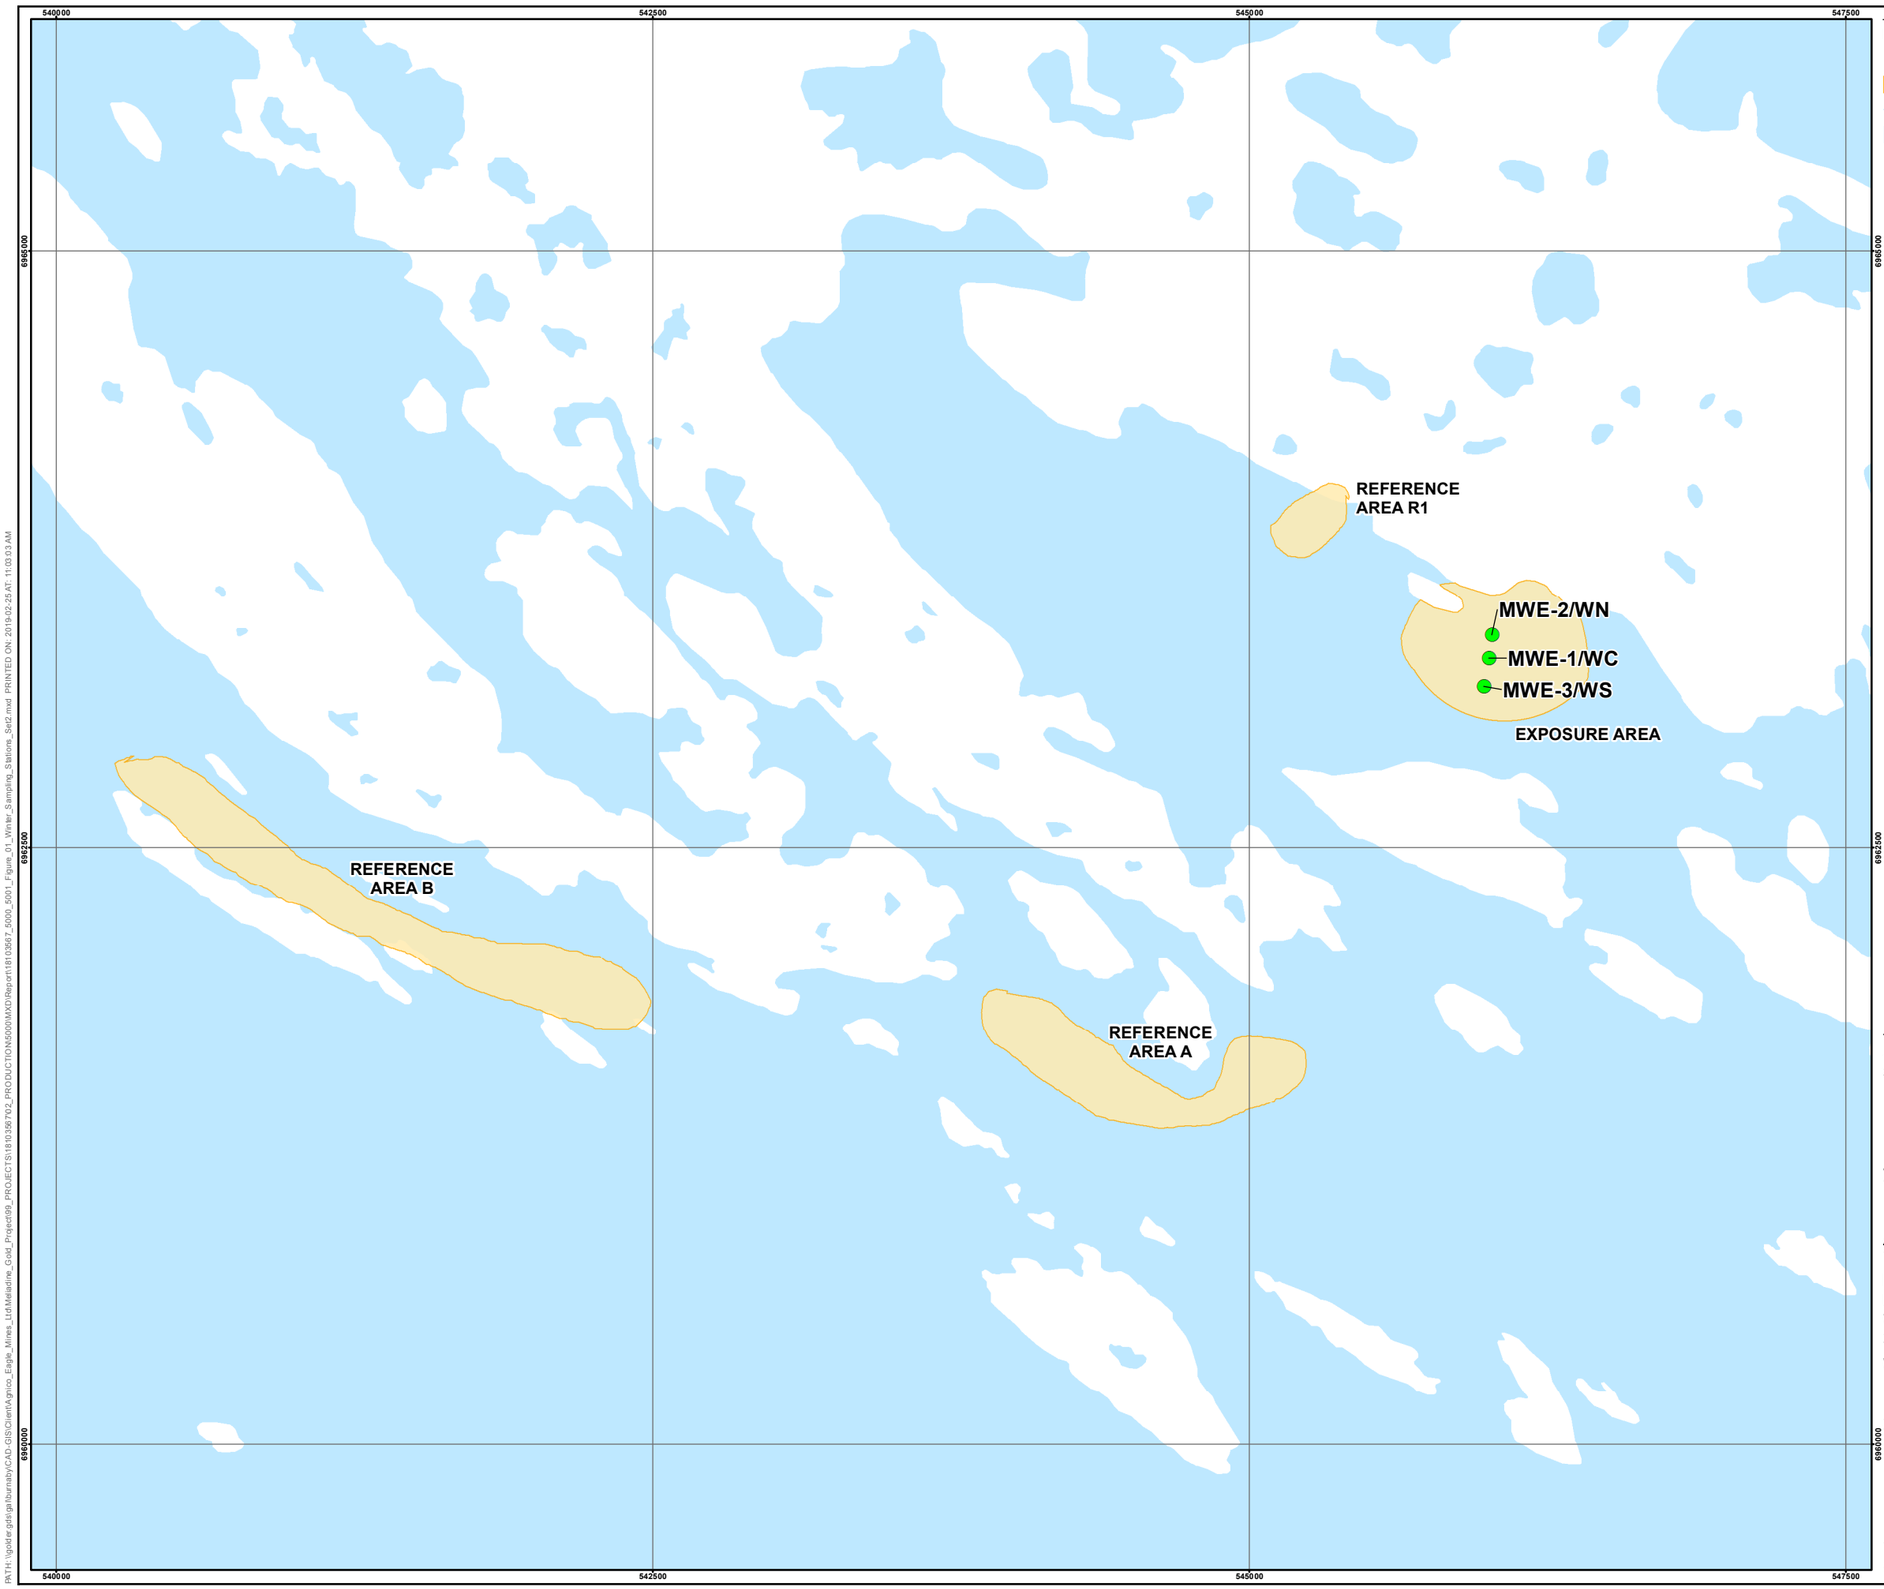
SPECIFIC WORK INSTRUCTIONS FOR UNDER-ICE MARINE WATER QUALITY SAMPLING PROGRAM - WINTER 2019 - MELIADINE GOLD MINE

1.0 PURPOSE

The purpose of this document is to provide Specific Work Instructions (SWI) for water quality sample collection at the Meliadine Project Area in Melvin Bay, Rankin Inlet, NWT during under-ice conditions in March, April, and May 2019.

2.0 FIELD PROGRAM

2.1 Marine Environment



The marine monitoring study area for the under-ice marine water quality survey includes the area anticipated to be potentially influenced by Project activities. The exposure stations to be monitored were selected to correspond with the location of potential exposure to diffuser discharge In Melvin Bay. The exposure area will be monitored at three sampling stations. Station MWE-1/WC, MWE-2/WN and MWE-3/WS are located at, north (offshore) and south (inshore) of the location of the proposed diffuser discharge.

Detailed information on the sampling station locations and sampling parameters is provided in Table 1. Maps illustrating the location of the sampling locations are provided in Figure 1.

Table 1: Sampling Stations and Sampling Parameters for Under-Ice Marine Water Quality Sampling Program

Station ID	NAD 83, 15 V		Expected Water Depth (m)	Sample Depth (m)	No. of Samples by Sample Type	
	Easting (m)	Northing (m)			Discrete Water Quality [(a)]	In situ profiles
MWE-1/WC	546002	6963295	20	1 at 1 m; 1 at 5 m above the bottom	2	1
MWE-2/WN	546014	6963391	10	1 at 1 m; 1 at 5 m above the bottom	2	1
MWE-3/WS	545981	6963176	25	1 at 1 m; 1 at 5 m above the bottom	2	1

(a) Includes 10% blind duplicates for QA/QC.

The following data will be collected at each sampling station (Table 1):

- Measurements of snow cover (m), ice-thickness (m), total water depth (m), and the height of the water head in the augered hole (m).
- In situ vertical physico-chemical profiles at 0.5 m depth intervals throughout the water column.
- Winkler test for confirmation of dissolved oxygen (DO) concentrations if YSI readings fall outside the acceptable ranges.
- Collection and processing of discrete water quality samples at targeted depths for detailed water chemistry analyses.

Standard QC samples (including field duplicates, field blanks, trip blanks, and equipment blanks) will be collected in accordance with established quality assurance (QA) procedures (see Section 3.3).

3.0 PROCEDURES

Each sampling area will be accessed by snowmobile.

Specific sampling stations will be located using a Global Positioning System (GPS) device loaded with Universal Transverse Mercator (UTM) coordinates for each station (North American Datum [NAD] 83, Zone 13V).

At each sampling station, a hole will be drilled through the ice using an ice auger. The diameter of the hole should be wide enough to allow deployment of the sampling equipment. All snow and loose ice will be cleared from the hole with a slotted spoon prior to commencement of sampling.

3.1 Physico-Chemical Profile Measurements

In situ parameters measured at each location included water depth, temperature, conductivity (salinity), dissolved oxygen, turbidity, and chlorophyll concentration (optional). Vertical profiles will be collected using a conductivity / temperature / depth (CTD) probe (e.g. RBR XR-620) or multi-meter probe (e.g. YSI) equipped with dissolved oxygen, turbidity and fluorometer sensors.

Maintenance and calibration of a CTD profiler and associated sensors are normally performed by the instrument provider and are usually completed immediately prior to the reconnaissance program. No field quality checks of any of the parameters are required beyond the cast acceptability check and range checks.

Multi-meter probes, such as YSI, may require calibration on-site.

Multi-meter Calibration

A YSI multi-parameter water quality meter (multi-meter) will be used for conducting in-situ water quality field sampling. This multi-meter is factory-calibrated once per year for pH, water temperature, specific conductivity, and DO concentrations. Calibration records must be maintained.

Prior to collecting field samples, the multi-meter should be tested indoor in a stable environment for DO, pH, and specific conductivity. The multi-meter should be calibrated every four days or if readings are outside of the acceptable ranges, as determined by the parameter headings on the field datasheet (Appendix A). Refer to the YSI manual for further information on calibration.

Calibrate the multi-meter according to accepted protocols and record all necessary data in the multi-meter calibration log and/or field book. Note all out-of-range data in the field notebook and provide this information to the project field coordinators as soon as possible**.**

Under-ice Physico-chemical Water Column Profiling

Water quality profile measurements will be collected at each sampling station using the procedure below:

- Record exact coordinates where measurements were taken on the field datasheet (Appendix A).
- Record snow cover depth (m).
- Drill hole and record ice thickness (m) and height of water head in augered hole (m).
- Measure and record water depth using a hand-held depth sounder.
- Collect water column profile measurements (pH, temperature [°C], DO [mg/L and % saturation], and specific conductivity [µS/cm with the reading corrected to 25°C]) before collecting water samples. Record measurements at the following depths:
  - First measurement just beneath ice bottom (0.1 m).
  - Second measurement at 0.5 m below ice bottom.
  - Third measurement at 1.0 m below the ice bottom.
  - All subsequent measurements taken every 0.5 m depth interval until just above (0.5 m) seafloor.
- At each sampling depth, allow the sensors on the multi-meter to stabilize prior to recording the measurements. This will help to avoid hysteresis (differences in readings during downcast and upcast) and will result in more accurate readings. Record measurements on the field datasheet and log all data with the multi-meter.
- If using a CTD, measurements will be taken throughout the water column by lowering the probe from the surface to the bottom at a vertical speed of approximately 0.5 m/sec while the probe is recording measurements at a frequency of 6 Hz (6 measurements per second).
- Immediately following data collection, all data will be checked for erroneous values, outliers and to be certain that all data and configuration files are present and properly named. If the instrument software allows, all data should be reviewed graphically for outliers as well as trends, and to confirm that all sensors are functioning properly during the deployment. All profile data, datasheets and field notes will be saved to a computer and backed up on an external hard drive.

IMPORTANT: Verify that the multi-meter is calibrated and working properly before starting work for the day, and that calibration procedures and schedule are followed during the course of the program.

3.2 Discrete Water Quality Samples

Discrete water quality samples collected w analyzed for a suite of parameters, including:

- conventional parameters (i.e., conductivity, hardness, laboratory pH, total dissolved solids [TDS], total suspended solids [TSS], total organic carbon [TOC], dissolved organic carbon [DOC], and turbidity)
- major ions (i.e., bicarbonate, calcium, carbonate, chloride, fluoride, hydroxide, magnesium, potassium, sodium, sulphate, sulphide, and silicate)
- nutrients (i.e., nitrate, nitrite, total Kjeldahl nitrogen [TKN], total ammonia, total phosphorus [TP], total dissolved phosphorus [TDP], and orthophosphate)
- total and dissolved metals and metalloids (i.e., aluminum, antimony, arsenic, barium, beryllium, bismuth, boron, cadmium, cesium, chromium, cobalt, copper, gallium, iron, lead, lithium, manganese, mercury, molybdenum, nickel,

rhenium, rubidium, selenium, silicon, silver, strontium, tellurium, thallium, thorium, tin, titanium, tungsten, uranium, vanadium, yttrium, zinc, and zirconium)

- total and dissolved mercury

3.2.1 Sample Collection

For the marine environment, collect a water sample at the following target depths:

- At deeper (offshore) stations (water depth > 5 m), collect at 1 m below base of ice layer and in mid-column (5 m above the bottom), unless a pycnocline is present, in which case collect the sample below the pycnocline. Note that stratification is not expected during winter.
- Collect in situ readings (multi-meter) at the sample collection depth.

Water quality sampler (e.g. Niskin bottle or Kemmerer) samplers will be used to collect water samples at each station after the water column profiling is completed.

A few basic protocols should be followed when collecting the samples:

- Wear nitrile gloves when using samplers, and when rinsing and filling all bottles and jugs.
- Do not touch the inside of the bottles or the inside of the caps.
- Keep bottles in a clean environment (e.g., clean cooler) while collecting samples.
- Remember to check that the screws at the top and bottom of the Kemmerer samplers are tightened each time they are used.
- All water quality samples collected must have corresponding multi-meter profile measurements.

Follow these steps to collect the water quality samples:

- Triple-rinse the samplers with sea water.
- Collect a water sample from the required depth using the sampler.
- Record the sampling depth on the field datasheet.
- Fill the laboratory provided bottles (See Table 2) following instructions from the laboratory.
- Label the samples as “Station ID” (Table 1)[1] and depth at which the sample was taken.
- Verify that there are field readings for temperature, pH, specific conductivity, and dissolved oxygen at depths corresponding to the water sample collection.
- Make sure that samples do not freeze after collection (e.g., use coolers, heat packs).

The laboratory-provided bottles (Table 2) will be filled directly in the field from the sampler. Be sure to take the complete set of bottles for each station in the field.

ALS bottles do not need to be triple-rinsed with sample water before filling. The only time rinsing is required is if a sample is being transferred from one bottle to another, or if a bottle will be re-used to hold the filtered sample (e.g., dissolved metals). Information on filtering samples is provided in Section 3.2.2. Alternatively, filtration for dissolved metals can be

[1] Pre-printed labels were created for the bottle sets.

done in the laboratory conditions. In this case no preservatives should be added into the sample bottle and appropriate note should be made on the bottle and chain of custody (COC) form.
