It is recognised that no plan can foresee the many circumstances and combinations of events that may arise with respect to a particular incident. It is accepted that the Master and officers of the vessel will exercise prudent judgement, assess risk factors, and make decisions under emergency conditions on the basis of incomplete information. The guidance contained herein is always subject to events beyond the control of the parties named.

1.2. COMPANY POLICY

Quality is an integrated part of the Transport Desgagnés Inc.'s business idea and operating philosophy. Quality reflects the approach to all aspects of conduct and policy in ship owning, ship operation, and ship management. Quality means Safety, Punctuality, and Efficiency in securing the requirements of our customers. The final measure of quality is customer satisfaction.

In pursuing the objectives, Transport Desgagnés Inc. has outlined the following main policies to be known and observed by all personnel:

- Maximum safety for personnel, environment, ship and cargo in all operational activities shall always be the overriding consideration;
- Strict observation of relevant regulations shall always be the rule;
- Maximum emphasis shall be put on proper and careful planning of operations as insufficient planning and preparation is the most frequent reason for operational irregularities; and
- Transport Desgagnés Inc.'s management expertise and market knowledge shall be fully utilized in the structuring and management of vessel operations and crew training.

Transport Desgagnés Inc.'s Quality and Safety Management System has been established to enable the company's management to implement the above objectives in a consistent manner. In this context, Quality and Safety Management becomes an important means of achieving the objectives.

All Company personnel will adhere to this policy and will correct, or identify to appropriate supervisory levels, situations that will run counter to this policy.

This Shipboard Marine Pollution Emergency Plan is describing in details the procedures to be followed in any oil/NLS spill incident or threats of spills.

1.3. ADMINISTRATION AND UPDATING

This Shipboard Marine Pollution Emergency Plan should be reviewed by the company annually, and as needed in light of changes in local law or regulation, contact names and numbers, and company policy. In addition, this Plan should be reviewed and evaluated after every drill, exercise, and spill, and where lessons learned requires changes.

The Quality, Safety, Security and Environment Department is responsible for revising the Plan.

The Master should submit to the company any additional or updated information involving the vessel, the shipboard personnel, and on-board equipment. In addition, the Master and his officers are encouraged to submit proposals for changes to the Plan.

1.4. DISTRIBUTION LIST

The Shipboard Marine Pollution Emergency Plan is distributed as follows:

RECIPIENTS	NUMBER OF COPIES	LOCATION
M/T *Dara Desgagnés*	1	Master's office
M/T *Esta Desgagnés*	1	Master's office
M/T *Jana Desgagnés*	1	Master's office
Transport Desgagnés Inc.	1	Transport Desgagnés Emergency Room
Flag State Administration	1	Transports Canada, Marine Safety

Shipboard Marine Pollution Emergency Plan

Section 2 — Reporting Requirements

GENERAL

A. The Canadian "Pollutant Discharge Reporting Regulations", SOR 95-351 and, Article 8 and Protocol I of MARPOL 73/78, require that the nearest coastal state should be notified of actual or probable discharges of oil/NLS to the sea. The intent of the requirement is to ensure that coastal states are informed without delay of any incident giving rise to pollution, of the marine environment, as well as the need for assistance and salvage measures, so that appropriate action may be taken.

B. The reporting requirements of this section comply with those of regulation 37 Annex I and 17 Annex II of MARPOL 73/ 78.

C. When the ship is involved in an incident which results in the discharge of oil or NLS, the Master is obliged under the terms of MARPOL 73/ 78 to report details of the incident, without delay, to the nearest Coastal State by means of the fastest telecommunication channels available. Transport Canada's Publication – *Guidelines for Reporting Incidents Involving Dangerous Goods, Harmful substances, and Marine Pollutants* (TP 9834) gives detailed reporting procedures when the incident occurs in Canadian waters or fishing zones.

D. The intent of these requirements are to ensure that Coastal States are informed, without delay, of any incident giving rise to pollution, or threat of pollution of the marine environment, as well as of assistance and salvage measures, so that appropriate action may be taken.

E. Without interfering with shipowners' liability, some coastal states consider that it is their responsibility to define techniques and means to be taken against a marine pollution incident and approve such operations which might cause further pollution, i.e. lightening. States are in general entitled to do so under the International Convention relating to Intervention on the High Seas in Cases of Oil Pollution Casualties, 1969 and the Protocol relating to Intervention on the High Seas in Case of Pollution by Substances other than Oil, 1973.

2.1 WHEN TO REPORT

All oil/NLS discharge in excess of the quantity permitted by laws and regulations must be reported.

2.1.1 ACTUAL DISCHARGE

The Master is obliged to report to the nearest Coastal State whenever there is a discharge of oil resulting

- from damage to the vessel.
- from damage to the vessel's equipment.
- for the purpose of securing the safety of a ship or saving life at sea.
- during the operation of the vessel in excess of the quantity or instantaneous rate permitted under the present Convention.
- During the operation of the ship, a discharge of oil/NLS in excess of the quantities permitted by the Canadian Regulations for the Prevention of Pollution from Ships and for Dangerous Chemicals SOR/2007-86, and the Arctic Shipping Pollution Prevention Regulations, e.g.:

    - 0 PPM Arctic waters
    - 5 PPM Inland waters
    - 15 PPM Outside inland waters

Reports to coastal states should be in the style given in Section 2.2.

2.1.2 PROBABLE DISCHARGE

The Master is obliged to report even when no actual discharge of oil or NLS has occurred but there is a probability that one could.

However, as it is not practicable to lay down precise definitions of all types of situations involving probable discharge of oil/NLS which would warrant an obligation to report the Master is obliged to judge by himself whether there is such a probability and whether a report should be made.

Therefore, it is recommended that, at least, the following events

- Damage, failure or breakdown which affects the safety of the ship (e.g. collision, grounding, fire, explosion, structural failure, flooding, cargo, cargo shifting etc.)

or

- Failure or breakdown of machinery or equipment which results in impairment of the safety of navigation (e.g. failure or breakdown of steering gear, propulsion, electrical generating system, essential shipborne navigation aids etc.)

are carefully considered by the Master – taking into account the nature of the damage failure or break- down of the ship, machinery or equipment as well as the ship's location, proximity to land, weather, state of the sea and traffic density – as cases in which a probable discharge is most likely.

If in doubt, the Master should always make a report in cases aforementioned.

In all cases the Authorities should be kept informed by the Master as how the situation progress and be advised when all threat of pollution has passed.

2.1.3 FOLLOW UP REPORTS

Once the vessel has transmitted an initial report, further reports should be sent at regular intervals to keep those concerned informed of developments.

Follow up reports to coastal states should always be in the style given in Section 2.2, and should include information about every significant change in the vessel's condition, the rate of the release and spread of oil/NLS, weather conditions, and details of agencies notified and clean-up activities.

2.2 INFORMATION REQUIRED

As required in article 8 and Protocol I of MARPOL 73/ 78 Convention the Master or other persons having charge of the ship should report the particulars of any pollution incident. In this context the International Maritime Organization (IMO), in 1997, adopted Resolution A. 851 (20) "General Principles for Ship Reporting Systems and Ship Reporting Requirements, including Guidelines for Reporting Incidents involving Dangerous Goods, Harmful Substances and/ or Marine Pollutants".

The intent of the Resolution aforementioned is to enable Coastal States and other interested parties to be informed, without delay, of any incident giving rise to pollution, or threat of pollution of the marine environment, as well as of assistance and salvage measures, so that appropriate action may be taken.

Nothing in this chapter relieves the Master in using sound judgement to make sure that any incident or probable discharge is reported as quickly as possible in the prevailing situation.

When transmitting initial reports to the authorities of the nearest Coastal State the Master or other persons dealing with such a transmission should take note of Resolution A. 851 (20).

Especially, the format of the initial report as well as supplementary of follow-up reports should conform to the guidance contained in Res. A. 851 (20).

All reporting whether initial or follow-up, should follow IMO´s reporting format as outlined below and should contain the following information

LABEL	FUNCTION	EXPLANATION
A	Ship	Name, call sign and nationality
B	Date and time (UTC) of event	A 6-digit group giving day of month (first two digits), hours & minutes (last four digits)
C or:	Position	A 4-digit group giving latitude in degrees and minutes suffixed with N or S, and a 5-digit group giving longitude in degrees and minutes suffixed with E or W
D	Position	True bearing (first 3 digits) and distance (state distance) in nautical miles from clearly identified landmark (state landmark)
E	True course	A 3-digit group
F	Speed at time of incident	In knots and tenths of knots as a 3-digit group
L	Route information	Details of intended track
M	Radio communications	Full details of radio stations (names) and frequencies being guarded
N	Time (UTC) of next report	A 6-digit group as under BB above
P	Cargo on board: can be included in "RR" as relevant	Type(s) and quantity(ies) of cargo/ bunker on board and brief details of any harmful substances and gases that could endanger persons or the environment, pollution category, manufacturer, etc.
Q	Defects, damage or deficiencies or other limitations	Brief details of conditions of the ship as relevant; ability to transfer cargo/ ballast/ bunker fuel
R	Description of pollution or possible overboard discharge	Brief details of pollution; this should include the type(s) of oil or NLS, an estimate of the quantity discharged, whether the discharge is continuing, the cause of the discharge and, if possible, an estimate of the surface area of the spill and the movement and area

S	Weather conditions	Brief details of weather and sea conditions prevailing including wind force and direction and relevant swell details
T	Ship's representative and/ or owner	Name, address, telex and telephone number of the ship's owner and representative (charterer, manager or operator of the ship or their agents)
U	Ship's size and type	Details of length, breadth and type of ship as well as draught
X	Miscellaneous and additional information	Any other information including relevant details such as brief details of incident, need for outside assistance, action being taken to limit further discharge; details of any personnel injuries sustained, details of P & I Club and local correspondent.

Note: See blank form at the end of this section.

All follow-up reports by the Master should include information relevant to the Coastal State Authorities to keep them informed as the incident develops.

Follow-up reports should include information on any significant changes in the ship's condition, the rate of release and spread of the substances, weather and sea conditions and clean-up activities underway.

In this context details of bunker and cargo disposition, condition of any empty tanks and nature of any ballast carried are information needed by those involved in order to assess the threat posed by an actual or probable discharge from the damaged ship.

The following additional information should be sent to TRANSPORT DESGAGNÉS INC. either at the same time as the initial report or as soon as possible thereafter:

- Number of casualties;
- Further details of damage is still sustained;
- Whether damage is still sustained;
- Assessment of fire risk and precautions taken;
- Damage to other ships or property;
- Disposition of cargo on board and quantities involved;
- Time (UTC) assistance was requested and time (UTC) assistance expected to start;
- Name of salvor and type of salvage agreement;
- Whether further assistance is required;

- Priority requirements for spare parts and other materials;
- Details of outside parties advised or aware of the incident;
- Any other important information.

After transmission of the information contained in an initial report, as much as possible of the information essential for the safeguarding of life and the protection of the ship and the marine environment should be reported to the coastal state, owner and/or operator, in order to keep them informed of the situation as the incident develops. This information should include items P, Q, R, S and W, as appropriate.

Blank forms are available at the end of section as well as in the Master's office.

2.3 WHOM TO CONTACT

The Master is responsible for reporting any incident involving an actual or probable discharge of oil or NLS.

Nothing in this chapter relieves the Master from using sound judgement to make sure that any incident is reported as quickly as possible in the prevailing situation.

2.3.1 COASTAL STATE CONTACTS

In order to expedite response and minimize damage from a pollution incident, it is essential that appropriate coastal states are notified without delay. This process is begun with the Initial Report. Guidelines for compiling reports are provided in Section 2.2.

The report should be transmitted in one of the following manner:

1. If the incident occurs in Canadian waters or fishing zone, the report shall be made with the highest possible priority and using the quickest means available, to a pollution prevention officer.

2. If the vessel is in area governed by Vessel Traffic Services (VTS) Standards, the report should, where expedient, be routed through that system. If area not covered by VTS but covered by Coast Guard radio station system, the report should, where expedient, be routed through the latter system.

3. If the incident occurs outside Canadian waters and fishing zones, the report should be made to the nearest coastal state through an appropriate coast station, preceded by the safety signal (if the incident affects the safety of the navigation), or by the urgency signal (if the incident affects the safety of the ship or persons);

4. On appropriate frequencies in the band 405-525 kHz, 1605-2850 kHz or 156-174 MHz;

5. If the ship is not within reach of an MF or VHF coast radio station, to the most appropriate HF coast radio station or on the maritime satellite communication system.

6. When the ship is within or near an area where a ship movement reporting system has been established, to the designated radio station of that system.

This Plan includes, in APPENDIX 1, a list of agencies or officials of administration responsible for the receipt, transmission and processing of urgent reports of incidents involving harmful substances including oil or noxious liquid, E.G., ships to coastal state.

2.3.2 PORT CONTACTS

Notification of local agencies will speed response. However, the variety of trades in which ships engage may make it impractical to list local agencies in the Plan. Where this is feasible, the Master should obtain details concerning local reporting procedures upon arriving in port.

Nevertheless, a list of Coastal State Contacts is available in Appendix 1 as required by article 8 of MARPOL 73/78 and a list of National Operational Contacts is available in Appendix 2.

If an oil/NLS spill occurs, whatever the cause, it is the Master's duty to immediately activate the vessel's Oil/NLS Pollution Team, and report the incident. Precise details of whom to notify locally should be obtained on arrival, but the following is a guide:

a) Local Authority (Coast Guard/Government);
b) Owners/Owners' Managers;
c) Owners Local Representatives / Spill Manager;
d) Terminal / Loading Master;
e) Local State (Environmental) Authority and, if time permits;
f) Local Fire Department (in case of explosion and/or fire);
g) Agent;
h) Port Authority;
i) The vessel's local P&I representative (P&I Club List of Correspondents is filed in the Master's office);
j) Charterer; and
k) Clean-up Contractor.

If a change in the ship's range of trade or a change in the addresses of persons/ Authorities of the ports/ terminals served regularly takes place the Master or any other person aboard delegated by the Master is required to issue a new list.

2.3.3 SHIP INTEREST CONTACTS

The Plan provides details of all those parties with an interest in the ship who should be advised in the event of an incident. While reporting an incident to other interests, it should be remembered that in the event of a serious incident, the ship's personnel may be fully engaged in saving life and taking steps to control and minimise the effects of the casualty. They should therefore not be hampered by having non-essential communications requirements imposed upon them. Thus, Transport Desgagnés Inc. officials should ensure these communications are made.

The Plan clearly specifies who will be responsible for informing the various interested parties such as cargo owns insurers and salvage interests. It is also essential that both the ship's plan and the company's corporate plan are coordinate d to guarantee that all parties having an interest are advised and that duplication of reports is avoided.

A list of ship interest contacts is detailed in Appendix 3, which also indicates the order of priority for notifying those concerned. Out-of-hours contacts are included.

Precise details of whom to notify will vary from company to company, but the following is a guide:

- Head Office;
- Charterer;
- Classification Society; and
- P & I Club.

All further reports and copies of messages sent to coastal states and/or port authorities should be sent to the company. If required, the company's office will be staffed as soon as possible after receipt of an initial report.

Once the initial report has been made, the company's corporate plan (Office Contingency Plan) will ensure that other interests such as Flag State authorities, P & I Club, Classification Society, and others, are notified and kept up to date on the incident.

These updating reports are a vital necessity to ensure appropriate measures are being taken whilst unnecessary risks and expenses are avoided.

The master or owner of a ship must report, without delay, any discharge or anticipated discharge of a pollutant to a Pollution Prevention Officer (PPO). These initial reports should be made to any Marine Communications and Traffic Services (MCTS) on the frequencies listed in the publication, Radio Aids to Marine Navigation (RAMN) - DFO 5470 (Great Lakes and Atlantic) and DFO 5471 (Pacific).

In addition to the above process for reporting spills from a ship to PPO's through the Marine Communications and Traffic Services (MCTS), the Coast Guard maintains a 24-hour Duty Manager alerting process which can be contacted at the numbers listed below.

The alphabetical reference letters in the above format are from the guidelines for reporting incidents involving dangerous goods, harmful substances and /or marine pollutants. The letters do not follow the complete alphabetical sequence as certain letters are used to designate information required for other standard reporting formats, e.g., those used to transmit route information.

Section 3 — Steps to Control Discharge

Whenever an oil/NLS spill occurs, it is the duty of the person finding the spill to inform immediately the Master of responsible officer, who should call out the vessel's Oil/NLS Pollution prevention team (see Appendix 4). Remember that an oil/NLS spill may create a fire or explosion hazard, requiring safety precautions to be observed.

Ship personnel will most probably be in the best position to take quick action to mitigate or control the discharge of oil or noxious liquid substances from their ship.

Therefore, this Plan provides the Master with clear guidance on how to accomplish this mitigation for a variety of situations.

It is the Master's responsibility to initiate a response in the event of a discharge of oil/NLS or substantial threat of discharge – actual or probable – into the waters.

In no case action should be taken that in any way could jeopardize the safety of personnel either onboard or ashore.

In cases of a discharge of noxious liquid substances the Master has to refer to the "Characteristics of Liquid Chemicals Proposed for Marine Transport in Bulk" (Data Sheets) provided onboard for any NLS cargo. Considerations have to be made to any danger resulting from discharge of such substances, i.e. mixing with water, air and other materials/substances.

Special consideration is to be taken in case of the necessity to transfer cargo into another compartment onboard the compatibility of the material to be transferred and the material of pipes and tanks to be used for such action.

The following enumeration specifies different kinds of possible operational spills with regard to reactions to be taken.

3.1 OPERATIONAL SPILLS

3.1.1 OPERATIONAL SPILL PREVENTION

Crew members shall maintain a close watch for the escape of oil or NLS during bunker or cargo operations.

Prior to bunker or cargo transfer the competent crew members should mobilize the spill equipment, as far as available on board, and place it close to the planned operation, e.g. along the railing on the side at which bunker operation takes place.

Before bunker or cargo handling commences, all deck scuppers and open drains must be effectively plugged. Accumulations of water should be drained periodically and scupper plugs replaced immediately after the water has run off. Any free floating substances should be removed prior to draining.

Bunker or cargo tanks which have been topped up should be checked frequently during the remaining operations to avoid an overflow.

Unless there are permanent means for retention of any slight leakage at ship/ shore connections for bunker or cargo transfer, it is essential that a drip tray is in place to catch any leaking substance.

3.1.2 PIPELINE LEAKAGE DURING CARGO AND BUNKER TRANSFER

Measures to implement immediately:

- Stop all cargo and bunkering operations and close manifold valve;
- Sound general alarm bell; notify situation by public address system;
- Initiate emergency response procedures;
- Inform terminal/bunkering personnel of incident

Further measures:

If a leakage occurs from a pipeline, valve, hose or metal arm, operations through that connection should be stopped immediately until the cause has been as contained and the defect remedied.

The defective pipe section should be isolated. Affected sections should be drained down to an available empty or slack tank.

If there is any possibility of released vapours entering an engine room or the accommodation intake, appropriate preventive steps must be taken quickly.

If a leakage occurs from a hydraulic pipeline, operations should be stopped immediately.

Initiate clean-up procedures.

The removed substances and the used clean-up material should be retained on board until it can be discharged to a reception facility.

Inform in line with Section 2 all parties interested about Pipeline Leakage and the actions taken so far.

Refer to checklist in Appendix 5.

3.1.3 TANK OVERFLOW DURING LOADING OR BUNKERING

If there is a tank overflow all bunker/cargo operations should be stopped immediately and should not be restarted until the fault has been rectified and all hazards from the released substances have been eliminated.

If there is any possibility of released vapours entering an engine room or the accommodation intake, appropriate preventive steps must be taken quickly.

As far as the substance permits in view of the material compatibility of tanks/pipes, shift liquid from the tank overflowed to an available empty or slack tank or prepare pump(s) or transfer the excess ashore.

Initiate clean-up procedures.

The removed substances and the used clean-up material should be retained on board until it can be discharged to a reception facility.

Inform in line with Section 2 all parties interested about Tank Overflow and actions taken so far.

AFTER DEALING WITH AN OIL/NLS SPILL, ONCE CLEANUP OPERATIONS ARE COMPLETED, REQUEST PERMISSION TO RESUME OPERATIONS FROM PROPER AUTHORITIES.

Refer to checklist in Appendix 5.

3.1.4 HULL LEAKAGE

Signs leading to the suspicion of hull fractures:

- Excessive list;
- Oil/NLS in water around the vessel.

Measures to implement:

- Stop all cargo and bunkering operations and close manifold valve;
- Sound general alarm bell; notify situation by public address system;
- Initiate emergency response procedures;
- Inform terminal/bunkering personnel of incident

Further measures:

- Use the Oil/NLS Pollution Prevention team in an attempt to locate the source of leakage;
- Consider whether to stop air intake into accommodation and non-essential air intake in engine room.

When the source of leakage is identified:

- Reduce the hydrostatic head of leaking cargo/bunker tank by transferring in an empty or slack tank;
- Consider changing trim/list condition to use seawater as equalising or exceeding bunker tank hydrostatic pressure;
- Consider possibility of pumping water in ballast tank to change effect of hydrostatic pressure;
- Consider possibility of pumping water into leaking cargo/bunker tank to create a water cushion to prevent further oil/NLS loss;

- If the leakage is located below the waterline, call in divers for further investigation.

If it is not possible specifically to identify the tank:

- The level of oil/NLS in the vicinity of the suspected area should be lowered. Remember to consider the effect of hull stresses and stability of the vessel.

AFTER DEALING WITH AN OIL/NLS SPILL, ONCE CLEANUP OPERATIONS ARE COMPLETED, REQUEST PERMISSION TO RESUME OPERATIONS FROM PROPER AUTHORITIES.

Refer to checklist in Appendix 5.

3.1.5 SPILLS CAUSED BY EQUIPMENT IN MACHINERY SPACES

If operational spills are caused by a failure of equipment in machinery spaces any further operations of this equipment should be stopped immediately or measures are to be taken to avoid a spill.

Such equipment may be:

- Oily-water separating equipment or oil filtering equipment to oil bilge water from the engine room bilges
- Valves in pipes connecting ballast/ bilge/cargo systems
- Cooling pipes in cooler systems
- Gearing of bow thrusters
- Stern tubes

3.2 SPILL RESULTING FROM CASUALTIES

Priority actions

In responding to a casualty, the master's priority will be to ensure the safety of personnel and the ship and to take action to prevent escalation of the incident. In casualties involving spills, immediate consideration should be given to measures aimed at preventing fire, personnel exposure to toxic vapours, and explosion, such as altering course so that the ship is upwind of the spilled cargo, shutting down non-essential air intakes, etc. If the ship is aground, and cannot therefore manoeuvre, all possible sources of ignition should be eliminated and action should be taken to prevent toxic vapours or flammable vapours entering accommodation and engine-room spaces. When it is possible to manoeuvre, the master, in conjunction with the appropriate shore authorities, may consider moving his ship to a more suitable location in order, for example, to facilitate emergency repair work

or lightening operations, or to reduce the threat posed to any particularly sensitive shoreline areas. Such manoeuvring may be subject to coastal State jurisdiction
Prior to considering remedial action, the master will need to obtain detailed information on the damage sustained by his ship. A visual inspection should be carried out and all cargo tanks, bunker tanks, and other compartments should be sounded. Due regard should be paid to the indiscriminate opening of ullage plugs or sighting ports, especially when the ship is aground, as loss of buoyancy could result.

Having assessed the damage sustained by the ship, the master will be in a position to decide what action should be taken to prevent or minimize further discharge. When bottom damage is sustained, hydrostatic balance will be achieved (depending on physical properties) fairly rapidly, especially if the damage is severe, in which case the time available for preventive action will often be limited. When significant side damage is sustained in the way of fuel/lubrication and/or cargo tanks, bunkers or cargo will be released fairly rapidly until hydrostatic balance is achieved and the rate of release will then reduce and be governed by the rate at which bunkers or cargo is displaced by water flowing in under the bunkers or cargo. When the damage is fairly limited and restricted, for example, to one or two compartments, consideration may be given to transferring the substance involved internally from damaged to intact tanks. When considering the transfer of oil or noxious liquid substances from a damaged tank to an intact tank, the master should consider:

1. the extent of the damage;
2. hydrostatic balance;
3. the ship's ability to transfer cargo; and
4. the physical properties of the substance(s) (for ships certified to carry NLSs) involved such as:
    - solubility;
    - density;
    - water reactivity
    - solidification; and
    - compatibility.

Great care in casualty response must be taken to consider stability and strength when taking actions to mitigate the spillage of oil or noxious liquid substance or to free the ship if aground. The Plan provides the master with detailed guidance to ensure that these aspects are properly considered. Nothing in this section shall be construed as creating a requirement for damage stability plans or calculations beyond those required by relevant international conventions.

Internal transfers should be undertaken only with a full appreciation of the likely impact on the ship's overall longitudinal strength and stability. When the damage sustained is

extensive, the impact of internal transfers on stress and stability may be impossible for the ship to assess. Contact may have to be made with the owner or operator or other entity in order that information can be provided so that damage stability and damage longitudinal strength assessments may be made. These could be made within the head office technical departments. In other cases, classification societies or independent organizations may need to be contacted. Additionally, in the case of ships certified to carry NLSs, consideration as to the compatibility of all substances involved such as cargoes, bunkers, tanks, coatings, piping, etc., must also be considered before such an operation is undertaken.

Mitigating Activities

If safety of both the ship and the personnel has been addressed the Master shall care for following issues:

- Assessment of the situation and monitoring of all activities as documented evidence
- Care for further protection of the personnel, use of protection gear, assessment of further risk for health and safety
- Containment of the spilled material by absorption and proper and safe disposal of all material onboard until proper delivery ashore under close guidance of the safety information given by the Product Data Sheet
- Decontamination of personnel after finishing the cleanup process

3.2.1 LIGHTERING / SHIP-T0-SHIP TRANSFER

If a ship becomes disabled or stranded, it may be necessary to transfer all or part or her cargo/bunker to another ship. In the case of tankers, reference should be made, to the *Ship-to-Ship Transfer Manual* available onboard and approved by the Classification Society.

In Ship-to-Ship transfer operations involving a specialized ship, the Master of that ship will normally be in overall charge.
In the case of non-specialized ships, the Master or other person in overall charge of the operation should be mutually agreed and clearly established by the Masters concerned prior to the start of operations. In all cases each master remains responsible for the safety of his own ship, its crew, cargo/bunker and equipment and should not permit their safety to be jeopardized by the action of the other Master, his owner, regulatory officials or others.

The Ship-to-Ship transfer operations should be coordinated with the appropriate responsible local Authority. In addition, the Master should take note of supplemented instructions issued by the Company.

The operation will be greatly expedited if the ship to be lightened makes the following preparations where possible:

a) Establish contact with the lightening ship and makes a detailed plan of the proposed operation including the designation of a communication channel. Fixed or portable hand-held radio telephones may be usefully employed;

b) Lay out mooring lines, heaving lines, messengers, stoppers, fenders, etc. If no large fenders are available, mooring ropes and any other soft material should be strung over the ship's side in strategic positions;

c) Prepare the cargo manifold and have reducers ready available to facilitate the connection of a wide range of hoses (from 200mm to 400mm) on both sides of the ship. In most cases the lightening ship will prefer to berth with her port side to the disabled ship's starboard side, if this is practicable;

d) Top-up derricks or cranes to assist in hose connection. Also have messenger ropes, lifting tackles, etc. available;

e) Have the anchors cleared ready for use, if in waters where use may be possible;

f) Brief the officers and crew on the operation, with particular reference to the safety aspects and complete the appropriate safety check list if possible.

Cargo transfer:

If the disabled ship has power and its cargo piping system is intact, transfer should be made in the usual way.

If the ship's pipelines are not intact, approved portable submersible pumps with power packs should be obtained. The power for submersible pumps may be electric, air or hydraulic. When using submersible pumps, the tanks being emptied of cargo may be counter-flooded with water in order to reduce the head. This may also assist in preventing pollution.

3.2.2 GROUNDING OR STRANDING

The GENERAL ALARM must be sounded immediately for the personnel to muster at their designated positions.

If the vessel is aground and therefore cannot manoeuvre, all possible sources of ignition must be eliminated and action taken to prevent flammable vapours from entering the engine room spaces or the accommodation.

The Master's next priority should be to ensure that he as soon as possible receives detailed information on the damage that the vessel has sustained, in order to find out what remedial action needs to be taken to ensure the safety of the vessel and its crew.

- A visual inspection should be carried out.
- All cargo and bunker tanks to be sounded (ullage)
- All other compartments which have contact with the sea should be sounded to ensure that they are intact.
- Soundings of cargo tanks are to be compared with last soundings to check for possible leaks.
- Any list shall be noted and included in the report for assistance.

Also consider:

- Danger to the vessel's complement if the vessel should slide off grounding site.
- Danger of vessel being broken down by heavy seas or swells.
- Health hazards to the vessel's complement and surrounding population due to release of hazardous substances is dangerous concentrations.
- That fire may start due to released flammable substances due to uncontrolled ignition sources.
- Furthermore, the vessel's Master must take into account the following considerations:
- Is the vessel constantly being struck in the seaway?
- Is the vessel exposed to torsion?
- Sounding to be taken around the vessel to establish the vessel's position on the bottom.
- Are there strong tidal currents in the grounding area?

- May the vessel drift further up on the shore, due to high tides, wind and waves?

3.2.2.1 PREVENTION OF FIRE AND EXPLOSION

If the ship is aground and therefore cannot manoeuvre, all possible sources of ignition should be eliminated and action taken to prevent flammable vapours from entering the machinery spaces or the accommodation.

3.2.2.2 EXTENSION OF HULL DAMAGE

First, a visual inspection should be carried out.

Check for visible oil along hull or in wake of the ship during day time. At night a stick with white cloth (or sheet of sorbent) around it may be lowered into the water alongside the ship to check for oil leakages.

All ballast/ bunker tanks to be sounded (ullage).
All other compartments which may have contact with the sea should be sounded to ensure that they are intact.

Soundings of ballast/cargo/bunkers tanks are to be compared with last soundings to check for possible leaks.

Sounding to be taken around the ship establish the ship's position on the grounding area.

When the ship is aground, due regards should be given to the indiscriminate opening of ullage plugs, sighting ports etc. as loss of buoyancy could be the result of such actions.

Any list of the ship shall be noted and included in the report for assistance.

3.2.2.3 PROCEDURES TO REDUCE OR STOP OUTFLOW OF OIL OR NLS

The Master should assess the possibility of damage to the environment and whatever action can be taken to reduce further damage from any release, such as:

- Transfer of bunkers/cargo internally, provided shipboard piping system is in an operational condition and in careful view of the compatibility of the substance and the tanks/pipes used for transfer, and taking into account the impact on the ship's overall stress and stability
- Isolate damaged/ penetrated tank(s) hermetically to ensure that hydrostatic pressure in tanks remains intact during tidal changes

- Evaluate the necessity of transferring bunkers/cargo to barges or other ships and request such assistance accordingly
- Evaluate the possibility of additional release of oil or NLS in close co-operation with coastal states.

In case of large differences between the tide levels, the Master should try to isolate the damaged tank(s) to reduce additional loss of substances.

3.2.2.4 REFLOATING BY OWN MEANS

The Master should also evaluate the question of refloating the vessel by own means. Before such an attempt is made, it must be determined:

- whether the ship is damaged in such a way that it may sink, break up or capsize after getting off
- whether the ship after getting off may have manoeuvring problems upon leaving the dangerous area by own means
- whether machinery, rudder or propeller are damaged due to grounding or may be damaged by trying to get off ground by own means
- whether the ship may be trimmed or lightened sufficiently to avoid damage to other tanks in order to reduce additional pollution
- weather evaluation: whether there is time/ reason to await improvements in weather or tide.

3.2.2.5 SECURING THE SHIP

The risk of further damage to the ship is greater in an attempt to refloat the ship by own means, than in remaining aground until professional assistance has been obtained, the ship's Master should try to secure the ship as much as possible by:

- Trying to prevent the ship from moving from is present position
- By dropping anchors (adequate water depth and anchor ground provided)
- By taking ballast into empty tanks, if possible
- Trying to reduce longitudinal strain on hull by transferring ballast or bunkers internally
- Reducing fire risk by removing all sources of ignition.

Inform in line with Section 2 all parties interested about the Grounding and the actions taken so far.

3.2.3 TOUCHING BOTTOM

Should the vessel experience unusual shaking or vibrations of the hull, unexplained movements or changes in engine revolutions, it may be suspected that the vessel has touched bottom. Procedures should be initiated to ensure that vessel is intact and that there is no oil/NLS leakage.

- If vessel has pilot on board, ask for possible explanation.
- Stop engine immediately, and observe any unexpected speed reduction.
- Consult vessel's charts for area and check depth information.
- Observe accurate position by bearings of fixed points.
- Check for visible oil/NLS along hull or in wake of vessel during day time. At night a stick with white cloth (or sheet of sorbent) around it may be lowered into the water alongside the vessel to check for oil/NLS leakage.
- Take soundings of all tanks, cargo/bunkers and other compartments (ballast tanks etc) to ensure that the vessel has not sustained any damage.
- Isolate penetrated tank by closing the tank hermetically. Very important when large differences in tides occur.

If the vessel is aground, follow instructions provided in 3.2.2

3.2.4 COLLISION

Should the ship be involved in a collision with another ship, the Master should as soon as possible identify the extent of damage to his own vessel.

When a collision occurs, the GENERAL ALARM should be sounded immediately for the personnel to muster at their designated Muster Stations.

The following check list should assist the Master in assessing the situation:

- Are any tanks penetrated above or below the waterline?
- If ships are dead in the water and interlocked, what is most prudent, to stay interlocked or separate?

- Is there any spill at present – small or large? Will a separation of the interlocked ships create a larger spill than if the ships stay interlocked?
- If there is a spill, will the separation of the ships cause sparks that can ignite the spilled material or other flammable substances leaked out from the ships?
- Are the ships creating a greater danger to other traffic in the area if the are interlocked than if separated?
- Is there a danger to either ship of sinking after being separated?
- If the ships are separated, how is the manoeuvrability of the own ship?

Shut down all none essential air intakes.

Isolate damaged/ penetrated tank(s) by hermetically closing the tank(s), if possible.

When it is possible to manoeuvre, the Master, in conjunction with the appropriate shore authorities, should consider moving his ship to a more suitable location in order to facilitate emergency repair work or lightening operations, or to reduce the threat posed to any sensitive shoreline areas.

Inform in line with Section 2 all parties interested about the collision and the actions taken so far.

3.2.5 FIRE AND EXPLOSION

When a fire and/or explosion occur, the FIRE ALARM must be sounded immediately for the personnel to muster at their designated positions.

Chemical fires produce additional hazards and great care is necessary when fighting them. The data sheets of all chemical cargoes must be carefully studied before and during carriage, so that all personnel are familiar with their properties.

- Water may react with some chemicals with the following results:
  - Productions of flammable solutions;
  - Production of toxic vapours;
  - Re-ignition due to low auto-ignition temperature;
  - Production of heat and increased amounts of flammable gases.
- Chemicals soluble in water will destroy normal foam.
- Some chemicals produce toxic vapours when heated. While burning a chemical transformation may produce highly toxic vapours of a different chemical composition.
- Some chemicals that are heavier than water can be blanketed with water if the jet stream is applied slowly and carefully.
- All personnel are to wear breathing apparatus ready for immediate use should toxic vapours or fumes be produced.
- The Emergency Team should always wear breathing apparatus at fire practices.
- The Emergency Team should supplement any fixed fire fighting system with foam or water sprays, if appropriate.
- Small fires in scuppers or around decks should be fought with appropriate portable extinguishers.
- Any sealed space in which a fixed fire fighting system has been used should be entered only after thorough ventilation and testing of the atmosphere.

Should an explosion and a fire occur on board; the vessel's Emergency Teams will under the leadership of the Chief Officer initiate the necessary steps to bring the situation under control.

Such steps shall be:

- Find out immediately where the fire/explosion has taken place.
- Try to determine the extent of damage, and if anyone of the compliment is injured or dead.
- Deploy the members of the vessel's Emergency Teams to the positions deemed best for fighting the fire.
- Use all available means to fight the fire such as:
- Water w/spray nozzles
- Water cannons (monitors)
- Foam cannons (monitors)
- CO2
- Try to contain the fire and prevent it from spreading to other parts of the vessel.

The occurrence shall be reported to the local authorities, informing them about the situation and if the fire cannot be controlled by the complement, request outside assistance as per section 4.

In case of fire and explosion the following priorities exist when the Damage control measures are initiated:

- Rescue lives.
- Limiting the damage to vessel and cargo.
- Preventing environnemental pollution.

When alerting the local authority and firefighting contractors, report as per IMO-format (Section 2), but most important give:

- Name of vessel and nationality.
- Location.
- Type of incident and cargo on board.
- If anyone is injured or missing.
- Any oil/NLS spill or threat of spill.

3.2.6 HULL FAILURE

Should the ship loose one or more shellplatings, develop major cracks, or suffer severe damage to the hull, the Master should immediately sound the GENERAL ALARM to call the crew members to their Muster Stations, and inform them of the situation, and prepare lifeboats for launching if necessary.

The Master should then asses the situation, and confers with his senior officers.

The Master should obtain the latest weather forecast and asses its impact on the present situation.

Furthermore, the following questions should be considered and should be asked:

- Is the ship in any immediate danger of sinking or capsizing?

If YES:

- Send distress message
- Immediately abandon the ship

If NO, initiate damage control measures as found necessary by considering the following points:

- Can the vessel manoeuvre on its own?
- Has the ship lost buoyancy?
- If the ship has a list due to loss of ballast, cargo/ bunker or buoyancy, is it necessary and possible to rearrange the bunker or ballast by internal transfer operation in order to bring the ship to an even keel?
- Is it necessary to dump cargo in order to maintain stability without changing the stress situation?

- Can this operation wait till another ship/ barge can receive that cargo?
- Is there any abnormal change in the ship's stability and stress situation?
- Can the change in the ship's stability and stress situation be monitored and calculated on board? If not, the Master should seek assistance.
- Does the ship need assistance or escort to nearest port of refuge or repair port?
- Might it be prudent to salve part of the crew members in case the situation should worsen, or is it necessary to abandon the ship totally?

Inform in line with Section 2 all parties interested about the Hull Failure and the actions taken so far.

3.2.7 EXCESSIVE LIST

Should the ship for some reasons suddenly start to list excessively during discharging/ loading operations, or bunkering, all ongoing operations should be stopped immediately until the cause has been determined.

The Officer on Duty should inform the Master and/ or Chief Officer without delay.

The Master should try to determine the reason for the excessive list, and take steps to rectify the situation and to stabilize the ship's condition:

- Check reason(s) for list;
- Soundings/ ullage to be taken in all tanks;
- Bunker/ ballast/cargo pumps to be made ready;
- Consider measures to minimize list in transferring liquid from one compartment to another;
- Ensure water tightness of empty spaces;
- Close all openings;
- Secure vent pipes to avoid ingress of water;
- If bunkering: Change to corrective tanks for rectifying the situation;
- If ballasting/ deballasting: Change to corrective tanks to rectify the situation;
- If there is reason to believe that the list may cause any spill, notify as per Section 2;
- If the ship's crew is in jeopardy, prepare lifeboats for launching, and notify as per Section 2.

If the situation is brought under control, inform all parties interested.

3.2.8 EQUIPMENT FAILURE

If the main engine stops or steering gear fails, the bridge watch shall immediately:

- Call Master and Chief Engineer.
- If vessel is considered to be in immediate danger, prepare for dropping an anchor.

When the Master comes to the bridge, his first priority shall be to assess the situation and get a complete picture of the situation, and base his further action based on:

- Position of the vessel relative to shore, shallows or installations.
- Weather and drift (speed and direction).
- Estimated time to get engine or steering gear back into operations.

Action should be taken according to worst case scenario development of the situation.

Main engine failure:

The main engine instruction book failure search list should be used to locate the failure. If the engine cannot be repaired within the permissible time given by the Master, emergency operation of the main engine should be considered on the Master's order.

Steering gear failure:

For location of the steering gear failure, the ICS "STEERING GEAR GUIDANCE ON TEST ROUTINES AND CHECK LISTS" can be used in addition to the steering gear instruction book.

3.2.9 DANGEROUS REACTIONS OF CARGO (for vessels certified to carry NLSs)

In case of spillage of NLS cargo on deck, in the water or incidental mixture with other cargo through internal tank leakage consider dangerous reactions of such mixture. Promptly consult the Data Sheet available for the cargo shipped onboard about possible hazards and necessary precautions/actions to be taken according to the information provided.

Take necessary actions for the safety of the crew for the case of (possible) contamination with the spilled material or its vapours.

3.2.10 DANGEROUS CARGO RELEASE (for vessels certified to carry NLSs)

When a dangerous cargo release is detected, the vessel's emergency team must, under the leadership of the chief officer initiate the necessary steps to bring the situation under control.

Such steps should be:

If at sea or at berth

- First to Raise the alarm

The leaking product must be identified as soon as possible so that potential hazards to the vessel, crew and the environment can be determined by checking with the Material Safety Data Sheet for the substance involved. Particular concern is to be given to flammability and toxicity of vapours.

Engine room personnel should be instructed to switch ventilation to the re-circulation mode and to close air intakes. All non-essential water intakes should be closed after having determined which ones must remain open.

As soon as a source of leakage has been determined, steps to minimise/stop leakage are to be established. This may include discharging, internal cargo transferring and adjusting list and trim.

Radio warnings should be broadcast.

Spills, and probable spills, must be reported immediately to the company and to the authorities in accordance with the rules and regulations.

If at Terminal

- Stop cargo transfer, if any, and raise the alarm.

Ensure that ventilation is switched to the re-circulation mode and that all air intakes are closed. All non-essential water intakes should be closed after having determined which ones must remain open.

Be ready to leave berth without assistance in case of an emergency. Consideration should be given as to lifeboat use in case of vessel evacuation.

3.2.11 LOSS OF TANK ENVIRONMENTAL CONTROL (for vessels certified to carry NLSs)

Consider any hazards arising out of loss of environmental control in view of possible explosion dangers by contacting the Data Sheets of the cargo concerned.

Avoid any intake of air into the uncontrolled spaces to avoid a dangerous mixture to be built up within the respective space.

3.2.12 CARGO CONTAMINATION YIELDING A HAZARDOUS CONDITION (for vessels certified to carry NLSs)

Normally proper cargo stowage should have reduced this eventuality to a minimum.

Measures to be implemented immediately:

- Sound emergency alarm.
- Turn ship off wind.
- Shut accommodations ventilation.
- Eliminate all sources of ignition.
- With the help of M.S.D.S. (reactivity) try to evaluate the type of reaction you can expect.
- Records events and communications.

Personnel Safety:

- Refer to Emergency Procedure for Ship Carrying Dangerous Goods (Ems). If personnel to work in vicinity of noxious substance, they must be protected by required equipment.
- Check cargo(es) against IBC code chapter 17 column "n" if letter E is present, respiratory equipment is necessary for escape purposes. Advices crew by Public Address (P.A.) accordingly.

Further measures:

- Monitor toxic vapours.
- Assess the extend of reaction.
- Initiate mitigation of hazardous cargo contamination release if practicable (if limited quantity on deck, consider washing overboard with copious amount of water).

3.2.13 HAZARDOUS VAPOUR RELEASE (for vessels certified to carry NLSs)

Measure to be implemented immediately:

- Sound Emergency Alarm.
- Shut accommodations ventilation.
- Eliminate all sources of ignition.
- Turn vessel off wind.
- With the help of M.S.D.S. assess if fire, explosion or toxic vapours risk are present.
- Assess cause of vapour release.
- Record events and communications.

Personnel Safety

- Refer to Emergency Procedures for Ship Carrying Dangerous Goods (EmS). If personnel to work in vicinity of noxious substance, they must be protected by required equipment.
- Check cargo(es) against IBC code chapter 17 column "n" if letter E is present, respiratory equipment is necessary for escape purposes. Advices crew by Public Address (P.A.) accordingly.

Further measures:

- Monitor toxic vapours.
- Initiate mitigation of hazardous vapour release if practicable
- A very isolated source of hazardous vapour can be directed away with the air draft of an open, high pressure, fog nozzle.

When a spill on board creates toxic, corrosive or flammable vapours, the master should consider manoeuvring the vessel to the extend that, in his judgment, spill and weather conditions permit, so that vapours move away from vessel accommodation and operation spaces.

Entry into spaces with suspected gas leaks should always be with a self-contained breathing apparatus (SCBA) and protective clothing, monitoring equipment and under supervision by a responsible vessel's officer. Gases that are inert and normally considered to be non-flammable and non-toxic may cause an oxygen deficient atmosphere in compartment spaces. Other gases have narcotic effects while others change composition and produce highly poisonous gas when in contact with fire.

Ventilation to remove leaking of gases may not always be effective, particularly with heavier-than-air gases that settle and accumulate in low spaces. When dealing with flammable vapours and gases, ignition sources (naked lights, electric tools, etc.) should be prohibited.

3.3 OTHER CONSIDERATIONS

3.3.1 STRESS AND STABILITY – GENERAL CONSIDERATIONS

a. Great care must be taken when taking actions to mitigate the spillage of oil or free the ship if aground.

b. Internal transfers should only be undertaken when the overall impact on stress and stability has been calculated.

c. When damage is extensive, the impact of internal transfers on stress and stability may be impossible for the Master to assess. Contact should be made with the technical manager for the necessary calculations to be carried out.

d. Information required by the Technical Manager will include:

1) Intact Ship's condition.

2) Damage - location and extent.

3) Condition of ship- draft- cargo fuel loss or change in amount and disposition

4) Local Conditions- tide- wind- sea state- weather forecast If the ship has sustained extensive structural damage consideration may be given to transfer all or part of the cargo /bunkers to another ship. This should not be undertaken without a full assessment of the impact this will have on the stability and stress of the ship at all stages of the transfer The ship to ship transfer operations should be co-ordinated with the appropriate local authority. Current cargo, bunker and ballast information, including quantities and specifications, is available in the ships office.

3.3.2 MITIGATING ACTIVITIES

If safety of both the ship and the personnel has been addressed the Master shall care for following issues:

- Assessment of the situation and monitoring of all activities as documented evidence.
- Care for further protection of the personnel, use of protection gear,
- Assessment of further risk for health and safety.
- Containment of the spilled material by absorption and safe disposal

- Within leakprof containers of all onboard until proper delivery ashore with due consideration to possible fire risk.

- Decontamination of personnel after finishing the cleanup process.

- Disposal of removed oil and clean-up material.

- Isolation procedures.

Shipboard Marine Pollution Emergency Plan

Section 4 — National and Local Coordination

Quick efficient co-ordination between the ship and Coastal States or other parties involved becomes vital in mitigating the effects of any pollution incident.

As the identities and roles of various national and local Authorities involved vary widely from state to state and even from port to port, the Master should take note of these particularities, as far as possible. In this context the Master should call upon the owner's representatives in the state/ port of question to receive the relevant information.

Prior to undertaking mitigation actions – especially in cases of an actual discharge due to casualties in the territorial waters of a Coastal State – the Master should contact the Coastal State for authorization of his action.

The Master should co-ordinate all his activities with the Coastal State.

The Master should call the Coastal State for allowance to use chemical agents for response to pollution on the sea. Without authorization of the Authorities of the appropriate Coastal State no chemical agents should be used.

Where no responsibility for discharge response by a Coastal State is noticed the Master should take all the necessary steps as deemed appropriate to minimize the escape of oil or NLS.

With respect of the accident happened the Master should take measures as stated in Section 2 and Section 3 of this Plan.

a) Canada

Canadian Coast Guard Pollution Prevention Officer in the area that the vessel is in; Contact of a PPO can be made via any CGRS or VTS.

Operation Centre, H.O.
Phone: (613) 990-5600 – 24 hrs/day
Fax: (613) 995-4700
TLX: 0053 3128

East Coast, ECAREG VTS Centre, Dartmouth, N.S. (1-800-565-1633)
Or via any Coast Guard radio station.
Phone: (902) 426-5664/5
TLX: 019-22625 or 019-22510, Cable: ECAREG Canada

West Coast, WESTREG via any Coast Guard radio station
Phone: (604) 661-6011
TKX: 043-52586, Cable: WESTREG Canada
Arctic, NORDREG or via any Coast Guard radio station.
Phone: (819) 979-5724
TLX: 063-15529, Cable: NORDREG Canada

b) United States

U.S. Coast Guard Captain of the Port in the area that the vessel is in and National Response Centre (1-800-424-8802) as required by federal regulations. Telex: 892427

Failure to notify the National Response Centre in addition to the local Coast Guard is punishable by a fine up to $10,000 or one year in prison. It is important that both the Coast Guard and the National response Centre be notified at the toll free number whenever a spill occurs in U.S. waters.

See Vessel Response Plan Procedures

c) International Port / Waters

Appropriate equivalent government body for that particular country the vessel is in (see Appendix 1).

Section 5 — Additional Information

5.1 PLAN REVIEW PROCEDURES

This plan can only be changed and/or updated by the Quality, Safety, Security and Environment Management Team.

All comments, corrections and suggestions shall be directed to the above department through the qsse@desgagnes.com email address. All users of the plan have the responsibility of pointing out changes that affect the validity and/or use of the plan.

Major changes on the plan shall be made as soon as possible.

Any change or update which requires a page change shall be entered in the "Record of changes".

All approved changes shall be sent, without delay to the registered copy holders, as follows:

- Owners Emergency Response Room
- Vessel;
- Canadian Coast Guard, Marine Safety.

5.2 REVISION OF PLAN

The plan must be kept updated at all times which means that if any changes occur during the operation and which may affect this document, it must be corrected and recorded and all parties concerned must be advised.

5.3 ON BOARD SPILL EQUIPMENT

5.3.1 INVENTORY

To get the inventory and the storage location for all spill kit materials, consult appendix 7.

If your Vessel is also equipped with an Emergency Air Pump, please consult appendix 8 to familiarize with the Procedure and Piping Arrangement for Oil Spill Air Pump.

5.3.2 PLANNED VERIFICATIONS & MAINTENANCE SCHEDULE

1. Prevention equipment

1.1 Tank lids, checks

- Tank lids sit squarely on coatings
- Packing is in good condition
- Cleats have sufficient movement
- Ullage ports are tight
- Packing of ullage ports in good condition
- Drain valve closed and plug fitted on manifold drip trays

1.2 Deck pipelines (cargo, bunker, thermal oil and hydraulic)

- General condition of deck lines, no apparent leakage
- State of temporary repairs, if any; head office informed of situation
- Check expansion joints for signs of leakage
- All manifolds and unused hoses blanked and fully bolted
- Sample/pressure cocks fitted tightly, no leakage

1.3 Hull plating check

- Assessment condition of hull for signs of damage or possible weak spots, notify Head office of areas of concern.

1.4 Miscellaneous

- Proper opening/closing of pressure/vacuum valves on tanks
- Proper operations of Wessoe gauges

2. Containment equipment

Check:

- Drip trays are sound with no obvious cracks or holes
- Save-alls around bunker tanks are sound and drain plugs fitted
- Condition of scupper plugs
- Proper operation of diaphragm pumps
- Sufficient inventory on board at all times

3. Spillage equipment

Check:

- Oil dispersant and solvant available. USE AS DIRECTED ONLY
- Foam & dry powder fixed extinguishing systems are operational and ready for immediate use
- Company's Oil/NLS Response Plan has been brought to attention of all involved parties
- All communication methods have been proved satisfactory

4. Equipment

Check:

- All components of bilge oily separator work satisfactorily
- A sign is in place in vicinity of overboard discharge relating to use of valves and the need for them to be sealed in port
- All components of the ballast discharge monitoring system works satisfactorily
- Oil/Water interface detector is in good working order and readily available.

WARNING:

THE MASTER SHOULD ENSURE THAT BEFORE ANY DISPERSANTS OR DETERGENTS ARE USED, LOCAL AUTORISATION IS OBTAINED AS INDISCRIMINATE USE OF SUCH MATERIALS MAY BE HARMFUL TO ENVIRONMENT.

5.4 EVIDENCE REQUIRED FROM THE VESSEL

(Text extract from The Nautical Institute's The Master Role in Collecting Evidence, 1989)

"In order to defend claims of oil/NLS pollution and to prevent future spills, owners and their insurers will require a detailed account of how the spill occurred, the steps taken to prevent the spill, and the efforts made to minimise damage. Such an account should be supported by the items of evidence listed below, and the Master should ensure that such information and documents are retained and available. This information includes the following:

1. Log books in which the following information should be recorded:

    a) Use of such equipment as scupper plugs and drip trays,
    b) Carrying out of oil/NLS spills drills
    c) The procedures followed during transfer of oil/NLS within the vessel
    d) Evidence of previous oil/NLS pollution in berth or port area

2. Engine Room logs in which the following information should be recorded:

    a) Bunkering procedures
    b) Members of the crew in charge of bunkering operations
    c) Methods of effecting emergency stops
    d) Times and results of inspections of equipment used in cargo and bunkering operations, and
    e) Rates and sounding / ullages during loading and discharging operations

3. A copy of the bunkerer's instruction or delivery note containing an acceptable loading rate.

4. Records of stocks of cleaning materials such as sprayers and absorbent material

5. Samples of any oil/NLS that has been discharged from the vessel

6. Video films of the extent of the film (if possible)

7. A record of the quantity of pollutant

8. If the pollution was caused by broken equipment on board the vessel, the broken parts should be preserved

9. Accounts of the events from all the members of the crew involved in the incident

10. Oil record book

11. Cargo loading / discharge plan

12. Owners / charterer's instructions

13. Tank and pipeline diagrams

14. Sounding pipe and ullage plug diagram

15. Vessel's Contingency plan

16. All relevant telexes, cables and other correspondence

In addition of the information listed above, the Master should ensure that a record is made of the following information:

1. The operation being carried out at the time of the spill and the grades of oil/NLS involved

2. The type of oil/NLS which went over the side

3. The quantity of pollutant on deck, and the quantity which went over the side

4. Actions taken to report the spill

5. Action taken to commence cleaning operations

6. The state of the tide at the time of the spill

7. The extent of the pollution, the extent of the area which the spill covered and whether it affected other vessels or properties

8. The weather condition at the time of spill

9. The identity of any vessels in the vicinity when the oil/NLS spill occurred

10. The date, time when, and place where the spill occurred

11. Details of the action taken on board to contain and clean up the pollutant

12. Details of the action taken on shore to contain and clean up the pollutant

13. The type and industrial name of the oil dispersant or any other chemical used

Appendix 1
List of Coastal State Contacts

37

Regulation ~~26~~ of Annex I of the International Convention for the Prevention of Pollution from Ships, 1973, as modified by the Protocol of 1978 relating thereto (MARPOL 73/78) (Shipboard Oil Pollution Emergency Plan), entered into force on April 4, 1993. The Shipboard Marine Oil Pollution Emergency Plan should include as an appendix the list of agencies or officials of administrations responsible for receiving and processing reports as developed and updated by the Organisation in compliance with Article 8 of MARPOL 73/78.

The attached list contains contact details for coastal stated known at the time of publication. This list has three sources of information: 1) the Provisions Concerning the Reporting of Incidents Involving Harmful Substances under MARPOL 73/78 (the IMO Publication); 2) responses to the IMO Shipboard Marine Pollution Preparedness, Response and Co-operation Information System (OPRC Questionnaire); and 3) the International Tanker Owner Pollution Federation (ITOPF). It is recognised that the list may not be complete.

The information has been provided in response to the OPRC Questionnaire, as well as directly by Member States with amendments to the list. Additions and / or amendments to the list will continue to be provided by the International Maritime Organisation (IMO).

***

Coast stations and their frequencies are given in the ITU List of Coast Stations, and also in appropriate national publications, e.g. Admiralty List of Radio Signals Vol 1.

Appendix 2
List of National Operational Contact Points

37

This information enables compliance with Regulation ~~26~~ of Annex 1 of MARPOL 73/78 which, inter alia, requires that shipboard marine pollution emergency plans (SMPEP) shall contain a list of authorities or persons to be contacted in the event of an oil pollution incident.

Appendix 3
List of Ship Interest Contacts

Liste des contacts en cas d'urgence
Emergency Contact List

Appendix 4
Oil Pollution Prevention Team

1. Shipboard Oil Pollution Prevention Team Organisation Chart

2. Shipboard Oil Pollution Prevention Team General Responsibilities

The following crew members are in charge in the event of a spill – actual or probable – to bring the accident under control, limit outflows, organize onboard clean-up procedures and determine the additional manpower needed.

2.1 Master

Overall in charge of operation on board dealing with a spill; responsible for all steps to be taken especially for the two main categories – reporting and action. Report incident as required (Chapt. 2,2). Remains as owner's senior representative until relieved by the Fleet Manager, Superintendent or Head Office Representative.

2.2 3rd Officer

Secretary to Master. Transmit and receive reports as requested by Master. Keep log of all events and progress.

2.3 Chief Officer

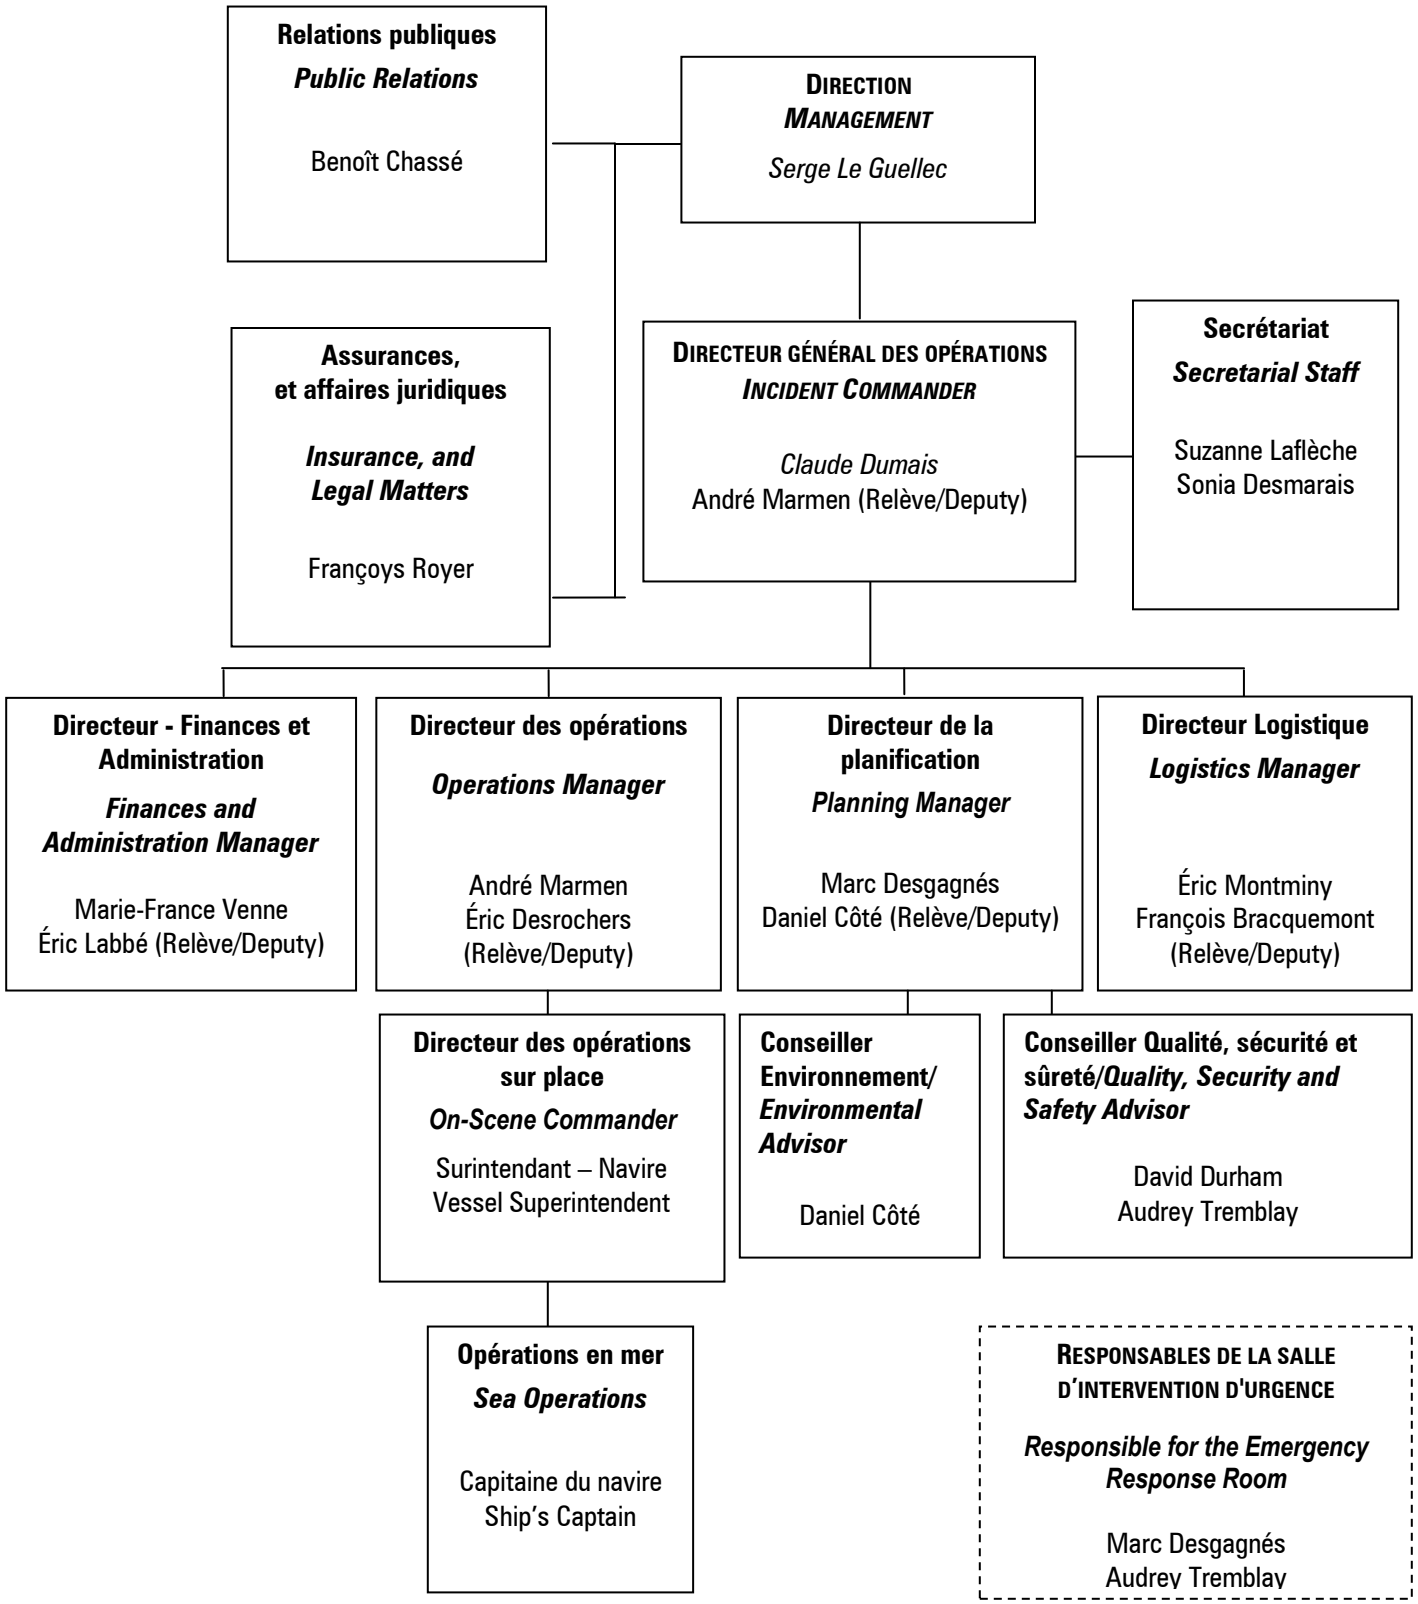
In charge of deck operation. Keep Master informed and updated on the situation and the results from actions taken to limit outflow.

2.4 Chief Engineer

In charge of bunker operation; should keep the Master informed and updated on the situation and the results from action taken to limit oil outflow.

2.5 Duty Officer

Mobilise deckhands to the best position for keeping escaping oil from running over the vessel's sides. Mobilise fire fighting squad as needed.



2.6 Duty Engineer

Assist Chief Engineer. Prepare for fire fighting. Ensure sufficient power and water to deck; organize on board clean-up equipment.

2.7 Duty Deckhand

Position sorbent material to prevent any oil from reaching the railing. Commence clean-up by using the on board spill clean-up equipment.

3. Shore Oil Pollution Prevention Team Organisation Chart

4. Shore Oil Pollution Prevention Team General Responsibilities

4.1 Incident Commander

He is the leader of the team and responsible for co-ordination between all parties. He is the main interlocutor of the Master, authorities and various entities. Contacts classification Societies & Shipyards.

4.2 On-Scene Commander

The Shore Operation Manager arranges and provides information for emergency, medical assistance as needed. He provides additional personnel and equipment as required.

4.3 Planning Manager

He is the adviser for safety, security and environmental matters.

He communicates with relatives or manning agency in case of casualties amongst officers and crew members.

4.4 Insurance and Finance Manager

The insurance manager advises on liability and insurance matters. He confers with underwriters and local agents. He consults and requires the advice of P & I Club average adjusters and salvage interface. He is also responsible for all matters relating to finance.

4.5 Logistics Manager

In charge to deliver to the ship the fire fighting and the pollution control equipment as well as the other spares and materials as required by circumstances.

4.6 Public Relations Coordinator

The Public Relation Coordinator as official media spokesman, will maintain a constructive dialogue with the news media, make available to the press relevant information about any on-going operation, supply additional relevant background information, prepare and distribute press releases, arrange press conferences as appropriate and assess the need to contact a public relations firm.

4.7 Secretaries

The secretaries and the operators are on duty during working hours. They are responsible for the ship documentation and will provide the Emergency Response Team with any necessary plans, notices and so forth.

5. Organisation

5.1 Permanence

The Emergency Response Team is operational on a non-stop 24-hour basis.

5.1 Emergency Response Room

A fully-equipped Emergency Response Room is at the disposal of the Emergency Response Team.

5.2 Communication equipment

The equipment listed below is available in the main office or in the emergency response room:

- Main switchboard phone lines plus dedicated phone lines
- Fax machines
- Computers with access to Internet
- Electronic board, flip charts, etc.

5.3 Documentation

- Vessels detailed plans
- Nautical documentation
- Company Contingency Plans
- SOPEP
- VRP
- SERS
- Emergency Response Team Handbook

Appendix 5
Operational Spills Check list

A. Operational oil/NLS spill response check list

This check list is intended for response guidance when dealing with an oil/NLS spill during bunkering operations. Responsibility for action to deal with other emergencies which result from the oil/NLS spill will be as laid down in existing plans, such as the Emergency Muster List.

ACTION TO BE CONSIDERED	ACTION TAKEN		PERSON RESPONSIBLE
IMMEDIATE ACTION			
Sound emergency alarm	Yes ❑	No ❑	Person discovering incident
Initiate vessel emergency response procedures	Yes ❑	No ❑	Officer on duty
INITIAL RESPONSE			
Cease bunkering operations	Yes ❑	No ❑	Chief engineer
Close manifold valves	Yes ❑	No ❑	Chief engineer
Stop air intake to accommodation	Yes ❑	No ❑	Officer on duty
Stop non-essential air intake to engine room	Yes ❑	No ❑	Engineer on duty
Locate source of leakage	Yes ❑	No ❑	Chief engineer
Commence clean-up procedures using absorbents and permitted solvents	Yes ❑	No ❑	Chief officer
Comply with reporting procedures	Yes ❑	No ❑	Master
SECONDARY RESPONSE			
Assess fire risk from release of flammable substances	Yes ❑	No ❑	Chief officer
Reduce oil level in relevant tank by dropping oil into an empty of slack tank	Yes ❑	No ❑	Chief engineer
Drain affected line to empty or slack tank	Yes ❑	No ❑	Chief engineer
Prepare pumps for transfer of oil, to other tanks or to shore or lighter	Yes ❑	No ❑	Chief engineer
FURTHER RESPONSE			
Pump water into leaking tank to create water cushion and prevent further oil loss	Yes ❑	No ❑	Chief engineer
If leakage is below waterline, arrange divers for further investigation	Yes ❑	No ❑	Master
Calculate stresses/stability. If necessary, request shore assistance with this	Yes ❑	No ❑	Chief officer
Transfer bunkers to alleviate high stresses	Yes ❑	No ❑	Chief officer
Stow residues from clean-up carefully prior to disposal			Officer on duty

B. Casualty oil/NLS spill response check list

This check list is intended for response guidance when dealing with an oil/NLS spill following a casualty. Responsibility for action to deal with the casualty itself will be as laid down in existing plans, such as the Emergency Muster List.

The term "navigator" refers to the officer responsible for passage planning and voyage analysis, usually the second officer.

ACTION TO BE CONSIDERED	ACTION TAKEN		PERSON RESPONSIBLE
IMMEDIATE ACTION			
Sound emergency alarm	Yes ❑	No ❑	Officer on duty
Initiate vessel emergency response procedures	Yes ❑	No ❑	Officer on duty
INITIAL RESPONSE			
Stop air intake to accommodation	Yes ❑	No ❑	Officer on duty
Stop non-essential air intake to engine room	Yes ❑	No ❑	Engineer on duty
Assess further danger to ship or personnel such as capsize or immediate sinking	Yes ❑	No ❑	Master
Cease all cargo and other non-essential operations	Yes ❑	No ❑	Officer on duty
Assess whether oil/NLS has actually been spilt	Yes ❑	No ❑	Chief officer
Is there a probability that it will be spilt	Yes ❑	No ❑	Master
Comply with reporting procedures	Yes ❑	No ❑	Chief engineer
Sound oil/NLS compartments			Chief officer
Sound around vessel if aground			Master
Request outside assistance	Yes ❑	No ❑	Chief officer
Counter excessive list	Yes ❑	No ❑	Officer on duty
Contain spilt oil/NLS	Yes ❑	No ❑	Chief officer
Commence clean-up procedures using absorbents and permitted solvents	Yes ❑	No ❑	Chief officer
FURTHER RESPONSE			
Assess fire risk from release of flammable substances	Yes ❑	No ❑	Chief officer
Consider evacuation of non-essential crew	Yes ❑	No ❑	Master
Assess likelihood of further damage to vessel of cargo	Yes ❑	No ❑	Master
Calculate stresses/stability. If necessary, request shore assistance with this	Yes ❑	No ❑	Chief officer
Transfer cargo or bunkers to alleviate high stresses	Yes ❑	No ❑	Chief officer
Request assistance or escort to port of refuge	Yes ❑	No ❑	Master
Manoeuvre upwind of spill/away from land	Yes ❑	No ❑	Master
Assess whether tide will worsen situation	Yes ❑	No ❑	Navigator
Obtain weather forecast and assess effect	Yes ❑	No ❑	Navigator
Prepare pumps for transfer of oil/NLS to other tanks or to shore or lightening vessel	Yes ❑	No ❑	Chief Engineer

LLOYD'S STANDARD FORM OF SALVAGE AGREEMENT

(Approved and Published by the Council of Lloyd's)

NO CURE – NO PAY

1 Name of the salvage Contractors: (referred to in this agreement as "the Contractors")	**2** Property to be salved: The vessel: her cargo freight bunkers stores and any other property thereon but excluding the personal effects or baggage of passengers master or crew (referred to in this agreement as "the property")
3 Agreed place of safety:	**4** Agreed currency of any arbitral award and security (if other than United States dollars)
5 Date of this agreement	**6** Place of agreement
7 Is the Scopic Clause incorporated into this agreement? State alternative: Yes/No	
8 Person signing for and on behalf of the Contractors Signature:	**9** Captain or other persons signing for an on behalf of the property Signature:

A **Contractors' basic obligation:** The Contractors identified in Box 1 hereby agree to use their best endeavours to salve the property specified in Box 2 and to take the property to the place stated in Box 3 or to such other place as may hereafter be agreed. If no place is inserted in Box 3 and in the absence of any subsequent agreement as to the place where the property is to be taken the Contractors shall take the property to a place of safety.

B **Environmental protection:** While performing the salvage services the Contractors shall also use their best endeavours to prevent or minimise damage to the environment.

C **Scopic Clause:** Unless the word "No" in Box 7 has been deleted this agreement shall be deemed to have been made on the basis that the Scopic Clause is not incorporated and forms no part of this agreement. If the word "No" is deleted in Box 7 this shall not of itself be construed as a notice invoking the Scopic Clause within the meaning of sub-clause 2 thereof.

D **Effect of other remedies:** Subject to the provisions of the International Convention on Salvage 1989 as incorporated into English law ("the Convention") relating to special compensation and to the Scopic Clause if incorporated the Contractors services shall be rendered and accepted as salvage services upon the principle of "no cure - no pay" and any salvage remuneration to which the Contractors become entitled shall not be diminished by reason of the exception to the principle of "no cure - no pay" in the form of special compensation or remuneration payable to the Contractors under a Scopic Clause.

E **Prior services:** Any salvage services rendered by the Contractors to the property before and up to the date of this agreement shall be deemed to be covered by this agreement.

F **Duties of property owners:** Each of the owners of the property shall cooperate fully with the Contractors. In particular:

- **i** the Contractors may make reasonable use of the vessel's machinery gear and equipment free of expense provided that the Contractors shall not unnecessarily damage abandon or sacrifice any property on board;
- **ii** the Contractors shall be entitled to all such information as they may reasonably require relating to the vessel or the remainder of the property provided such information is relevant to the performance of the services and is capable of being provided without undue difficulty or delay;
- **iii** the owners of the property shall co-operate fully with the Contractors in obtaining entry to the place of safety stated in Box 3 or agreed or determined in accordance with Clause A.

G. **Rights of termination:** When there is no longer any reasonable prospect of a useful result leading to a salvage reward in accordance with Convention Articles 12 and/or 13 either the owners of the vessel or the Contractors shall be entitled to terminate the services hereunder by giving reasonable prior written notice to the other.

H **Deemed performance:** The Contractors' services shall be deemed to have been performed when the property is in a safe condition in the place of safety stated in Box 3 or agreed or determined in accordance with clause A. For the purpose of this provision the property shall be regarded as being in safe condition notwithstanding that the property (or part thereof) is damaged or in need of maintenance if (i) the Contractors are not obliged to remain in attendance to satisfy the requirements of any port or habour authority, governmental agency or similar authority and (ii) the continuation of skilled salvage services from the Contractors or other salvors is no longer necessary to avoid the property becoming lost or significantly further damaged or delayed.

I **Arbitration and the LSSA Clauses:** The Contractors remuneration and/or special compensation shall be determined by arbitration in London in the manner prescribed by Lloyds Standard Salvage and Arbitration Clauses ("the LSSA Clauses") and Lloyd's Procedural Rules. The provisions of the LSSA Clauses and Lloyd's Procedural Rules are deemed to be incorporated in this agreement and form an integral part hereof. Any other difference arising out of this agreement or the operations hereunder shall be referred to arbitration in the same way.

J **Governing law:** This agreement and any arbitration hereunder shall be governed by English law.

K **Scope of authority:** The Master or other person signing this agreement on behalf of the property identified in Box 2 enters into this agreement as agent for the respective owners thereof and binds each (but not the one for the other or himself personally) to the due performance thereof.

L **Inducements prohibited:** No person signing this agreement or any party on whose behalf it is signed shall at any time or in any manner whatsoever offer provide make give or promise to provide or demand or take any form of inducement for entering into this agreement.

IMPORTANT NOTICES

1 **Salvage security.** As soon as possible the owners of the vessel should notify the owners of other property on board that this agreement has been made. If the Contractors are successful the owners of such property should note that it will become necessary to provide the Contractors with salvage security promptly in accordance with Clause 4 of the LSSA Clauses referred to in Clause I. The provision of General Average security does not relieve the salved interests of their separate obligation to provide salvage security to the Contractors.

2 **Incorporated provisons.** Copies of the Scopic Clause; the LSSA Clauses and Lloyd's Procedural Rules may be obtained from (i) the Contractors or (ii) the Salvage Arbitration Branch at Lloyd's, One Lime Street, London EC3M 7HA.

Tankprüfung:

- Alle LT für jedes Schiff mit Wasserdruck entsprechend Tabelle.
- Alle Ballasttanks mit Luftdruck 0, 2 bar. Nach Fertigstellung Prüfung mittels Überlauf durch Wasser.
- Alle Betriebstanks mit Luftdruck 0, 2 bar. Endprüfung durch Befüllen mit Medium während der Bebunkerung des Schiffes.

tank test:

- With water pressure corresponding to the table for all cargo tanks for each ship.
- With 0, 2 bar compressed air for all ballast water tanks.
  After completion tank test by means of overflow with water.
- With 0, 2 bar compressed air for all service tanks. During bunkering of the ship the final tank test will be done tank filling with medium.

U.S. OPEN FORM SALVAGE AGREEMENT

Codename -- MARSALV®

This **SALVAGE AGREEMENT** ("The Agreement"), between _____, Master and/or Owner and/or Underwriter of the vessel _____ ("The Vessel") and _____("The Salvor"), is for salvage services rendered or to be rendered to the Vessel, her cargo and other property currently lying at or near _____, under the following terms and conditions:

FIRST: The Salvor shall use his best endeavors to salve the Vessel, her cargo and other property and deliver same safely afloat, hauled or drydocked at or near _____, at which place and time the Salvor's services will terminate unless otherwise mutually agreed.

SECOND: The Master and crew of the Vessel agree to lend their aid and assistance to the Salvor, who shall be entitled, free of expense, to the reasonable use of the Vessel's equipment.

THIRD: The Salvor's services are to be performed on the following basis (check and initial):

[_] **No Cure-No Pay** (Compensation to be conditioned upon successful salvage of the Vessel and/or her cargo and/or other property. In such case, the Salvor's compensation shall be pursuant to the criteria and other provisions of Article 13 of the 1989 International Convention on Salvage shown on the reverse of this Agreement).

[_] **No Cure-No Pay, Fixed Fee $_____**

[_] **Per Diem/Hourly at $_____ per day/hour pro rata**

[_] **Other** _____

_____

FOURTH: Notwithstanding the election(s) made in Paragraph THIRD, the Salvor shall in any event be entitled to compensation for actions he takes to prevent or minimize damage to the environment, pursuant to Articles 13 and 14 of the 1989 International Convention on Salvage shown on the reverse of this Agreement.

FIFTH: The Salvor shall have a lien upon the Vessel, her cargo and other property for services rendered pursuant to Paragraphs THIRD and FOURTH, and his statement for services rendered shall be submitted as promptly as possible after completion or termination of such services. In lieu of arrest or attachment of the Vessel the Salvor may demand reasonable security for such services from the Vessel and cargo interests as a condition for releasing same.

SIXTH: This Agreement shall be governed by and construed in accordance with the Federal Maritime Law of the United States. Any dispute arising out of this Agreement shall be referred to arbitration in the United States in accordance with the applicable Arbitration Rules of the Society of Maritime Arbitrators, Inc. The Arbitrator(s) shall be familiar with maritime salvage. Any award made hereunder may include interest, attorney's fees and costs, and shall be final and binding. For the purpose of enforcement the Award may be entered for judgment in any court of competent jurisdiction.

Dated this ____ day of _____, 20___

For: **SALVOR**	For: **VESSEL, CARGO and/or PROPERTY**

INTERNATIONAL CONVENTION ON SALVAGE, 1989

Article 13

Criteria for Fixing the Reward

1. The reward shall be fixed with a view to encouraging salvage operations, taking into account the following criteria without regard to the order in which they are presented below:

(a) the salved value of the vessel and other property;
(b) the skill and efforts of the salvors in preventing or minimizing damage to the environment;
(c) the measure of success obtained by the salvor;
(d) the nature and degree of the danger
(e) the skill and efforts of the salvors in salving the vessel, other property and life;
(f) the time used and expenses and losses incurred by the salvors;
(g) the risk of liability and other risks run by the salvors or their equipment;
(h) the promptness of the services rendered;
(i) the availability and use of vessels or other equipment intended for salvage operations;
(j) the state of readiness and efficiency of the salvor's equipment and the value thereof.

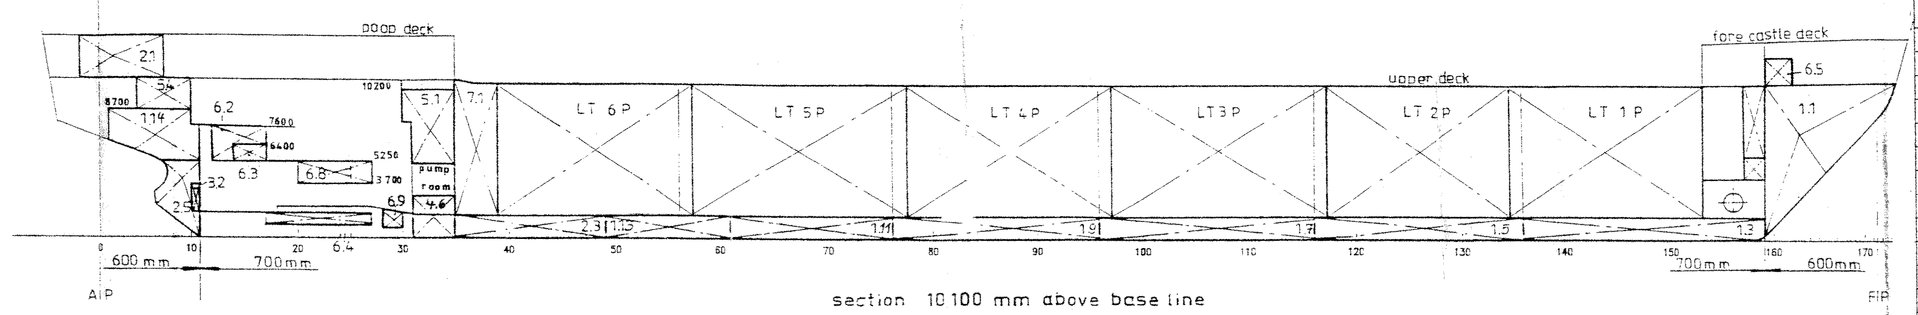
2. Payment of a reward fixed according to paragraph 1 shall be made by all of the vessel and other property interests in proportion to their respective salved values. However, a State Party may in its national law provide that the payment of a reward has to be made by one of these interests, subject to a right of recourse of this interest against the other interests for their respective shares. Nothing in this article shall prevent any right of defence.

3. The rewards, exclusive of any interest and recoverable legal costs that may be payable thereon, shall not exceed the salved value of the vessel and other property.

Article 14

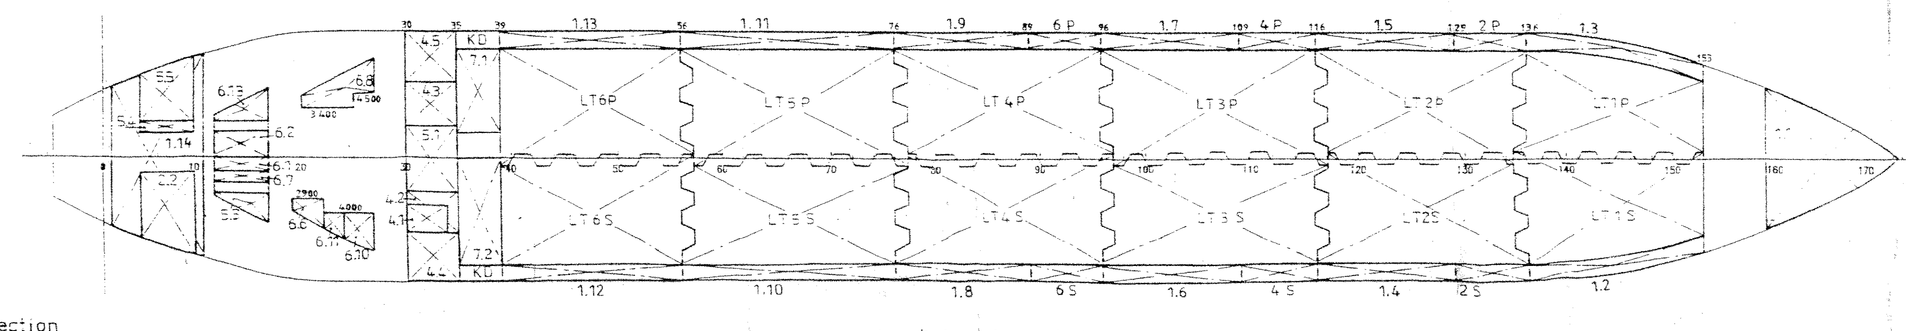
Special Compensation

1. If the salvor has carried out salvage operations in respect of a vessel which by itself or its cargo threatened damage to the environment and has failed to earn a reward under article 13 at least equivalent to the special compensation assessable in accordance with this article, he shall be entitled to special compensation from the owner of that vessel equivalent to his expenses as herein defined.



2. If, in the circumstances set out in paragraph 1, the salvor by his salvage operations has prevented or minimized damage to the environment, the special compensation payable by the owner to the salvor under paragraph 1 may be increased up to a maximum of 30% of the expenses incurred by the salvor. However, the tribunal, if it deems it fair and just to do so and bearing in mind the relevant criteria set out in article 13, paragraph 1, may increase such special compensation further, but in no event shall the total increase be more than 100% of the expenses incurred by the salvor.

3. Salvor's expenses for the purpose of paragraphs 1 and 2 means the out-of-pocket expenses reasonably incurred by the salvor in the salvage operation and a fair rate for equipment and personnel actually and reasonably used in the salvage operation, taking into consideration the criteria set out in article 13, paragraph 1(h), (i) and (j).



4. The total special compensation under this article shall be paid only if and to the extent that such compensation is greater than any reward recoverable by the salvor under article 13.

5. If the salvor has been negligent and has thereby failed to prevent or minimize damage to the environment, he may be deprived of the whole or part of any special compensation due under this article.

6. Nothing in this article shall affect any right of recourse on the part of the owner of the vessel.

Section below poop

Loading informations

To comply with the requirements of damage stability, vessel's cargo has depending on cargo's density, to be distributed as mentioned hereinafter:

Transportation of clean oil products and lightweight chemicals of category C:

–Cargo density from 0.63 t/m³ to 0.932 t/m³
The cargo has to be homogenly distributed over the central tanks port and starboard.

–Cargo density from 0.932 t/m³ to 1.55 t/m³
The cargo to be equally distributed to all central tanks.

To ensure damaged stability, ballast water in double bottom tanks is required (see damage stability).

In correspondence with the material list the dimensions of members of tank bulkheads are designed for :
–In case of central and slop tanks
density 1.31 to 1.55 t/m³ ; pv = 0 bar (without gas pressure)
density 0.63 to 1.30 t/m³ ; pv = 0.2 bar

In connection with this :
Transverse tank bulkheads areable to resist loading to on side and the centre longitudinal tank bulkhead to both sides only.

More cargo informations see "TRIM AND STABILITY CALCULATION" drawing No. 996.25.06 .

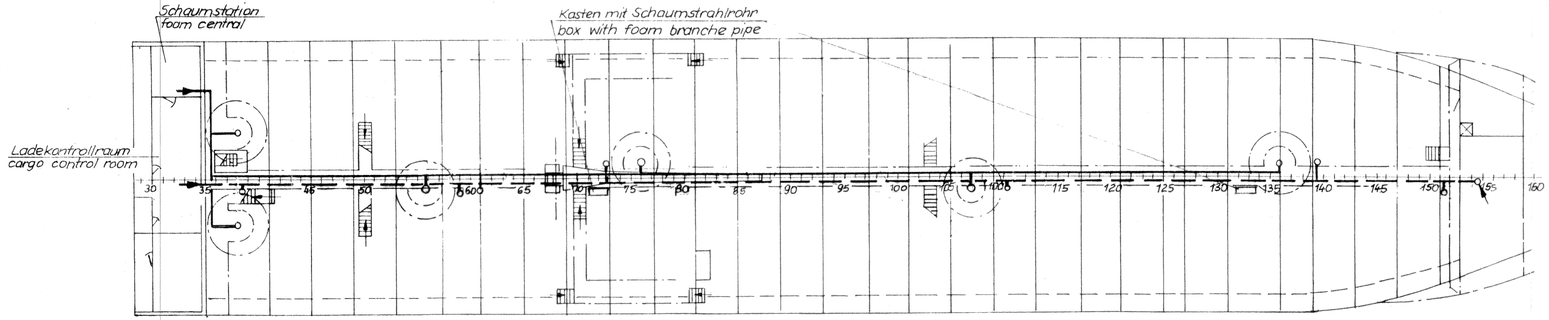
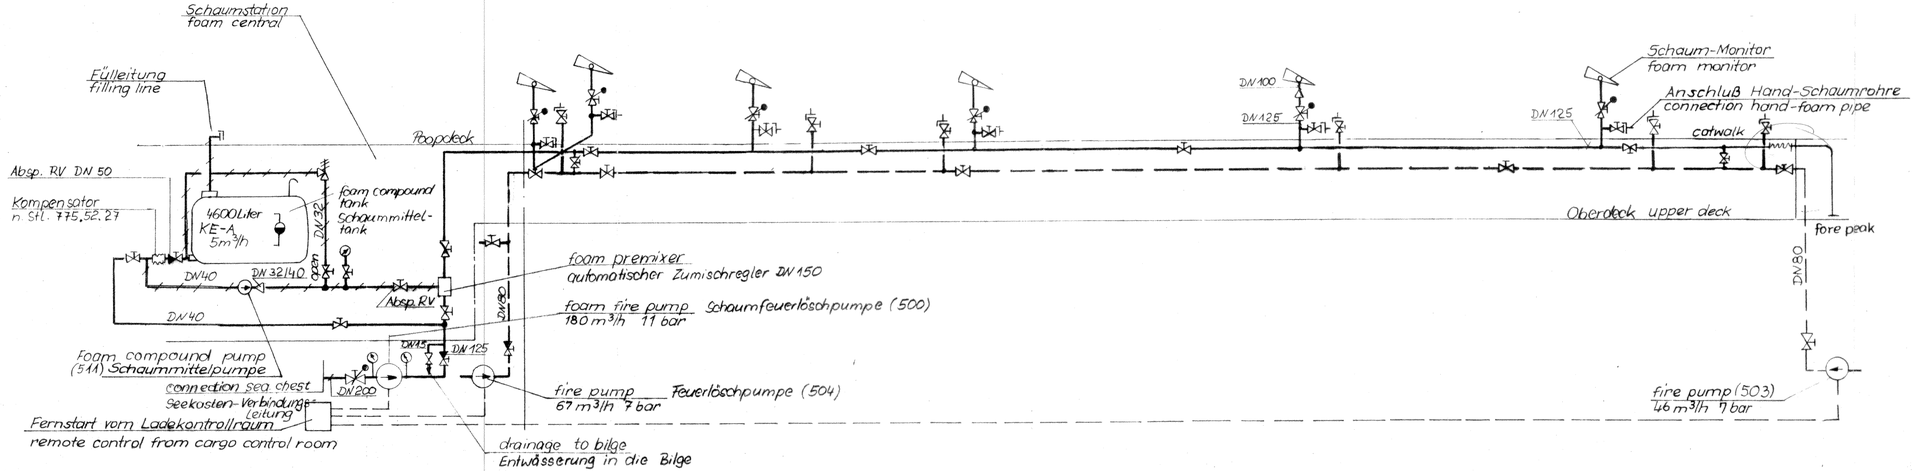
Foam and water extinguishing lines on cargo deck

- See drawing #996.51.35



Procedures for Oil Spill Air Pump



- Procedure to pump out Driptrays Manifolds:

  1. Connect suction hose from air driven 1" pump to connections A, B, C and D as desired.
  2. Connect discharge hose of air driven 1" pump to either the port dropline E or STBD dropline F on deck. This will usually be the Port dropline E.
  3. Open valves as needed and pump contents to the connected sloptank (E or F).
  4. Close valves and continue with other drip trays using above procedure.
  5. When completed drain/purge hoses to slop tank and disconnect.

- Procedure to pump liquid from the Deck:

  1. Connect suction hoses to Y-section of air driven 2" pump.
  2. Connect port side hose with valve G and STBD side hose with valve H to Y-section.
  3. Connect discharge hose of air driven 2" pump to either the Port dropline E or STBD dropline F on deck. This will usually be the Port dropline E.
  4. Open valves as needed and pump liquids to the connected sloptank (E or F).
  5. When finished pumping liquids drain/purge hoses and close valves and disconnect.

APPENDIX C - MEL-ENV-0029: Agnico Pre-discharge and Spill Response Sea Can checklists & OHF Ship to Shore Fuel Discharge Procedure

OHF / Ship to Shore Fuel Discharge

	PROCEDURE NUMBER:		**MEL-ENV-0029**
People concerned	• **Environment** • **Site Services** • **Procurement and Logistics** • **Health and Safety**	**Prepared by**	**Environment Department**
		Authorized by	**Erika Voyer – Environment General Supervisor**
Effective :	**July 12, 2017**	***"Safety First, Safety Last … Safety Always!"*** ***"No Repeats" – Our Stepping Stone to ZERO HARM***	
This procedure corresponds to the required minimum standard. Each and every one also have to comply with the rules and regulations of the Nunavut Government in terms of health and safety at work.			

Objective:

- To ensure that prior to the discharge of any fuel into the Agnico Eagle Rankin Inlet Tank Farm or Agnico Eagle Rankin Inlet Oil Handling Facility (OHF) that all proper steps are in place to ensure compliance with Canadian Shipping Act, as well as Nunavut Water Board License, Nunavut Impact Review Board Certificate and other laws and regulations.

Concerned departments:

Environment

Health & Safety

Site Services

Procurement and Logistics

Risks/ Impacts Legend

Health & Safety

Process/quality

Legal Requirement

Environment

Prior to the beginning of the annual fuel discharge the following must be completed.

Procedure	*Risks/ Impacts*
1. The Oil Pollution Emergency Plan (OPEP) must be reviewed on an annual basis and updated prior to the first annual discharge. This will include but not limited to: a) Reviewing the Phone numbers for emergency's b) Updating maps c) Review and if necessary update equipment lists d) Review roles and responsibilities e) Update Declaration This is the responsibility of the Environment department.	
2. Contact Canadian Coast Guard and Transport Canada Pollution Prevention and make them aware of plans for transferring of fuel into our OHF for that season. This is the responsibility of the Environment department.	
3. Complete *Inventory report for Spill Response Sea Can at AEM's Oil Handling Facility in Rankin Inlet.* (*Inventory Checklist found on Page 6) This is the responsibility of the Environment Department.	
4. Ensure Shipping Company has provided Hose Testing Annual certification. This is the responsibility of the Environment Department.	
5. All personnel who will be a part of the fuel transfer (including Rankin Inlet Supervisor and third part contractor Intertek) must review the OPEP and be familiar with preventive measures to take and with the steps to take in the case of a spill event while fueling. This is the responsibility of the Department of Procurement and Logistics.	
6. Install secondary containment underneath each connection of conduit on land. This is the responsibility of the Environment Department	

7. Monitor secondary containment underneath each connection of conduit on land. This is the responsibility of the Department of Procurement and Logistics.	
8. Ensure there is two way functional communications between the OHF and the off-loading Vessel. This is the responsibility of the Department of Procurement and Logistics.	
9. Ensure there is lighting in place at the transfer flange to provide illumination during any transfers taking place during the low to no light hours. This is the responsibility of the Department of Procurement and Logistics.	
10. Prior to any discharge Agnico Eagle must receive a copy of the Ship/Shore checklist completed by the shipping company. Agnico Eagle should also verify this has been completed (as much as realistically possibly without boarding the ship). This is the responsibility of the Department of Procurement and Logistics.	
11. Contact must be made with both the H&S and Environmental Departments prior to the discharge of fuels. Meliadine Health & Safety meliadine.healthandsafety@agnicoeagle.com Meliadine Environment meli.environment@agnicoeagle.com This is the responsibility of the Department of Procurement and Logistics.	
12. The *Pre-discharge Checklist for AEM's Oil Handling Facility in Rankin Inlet* must be completed, signed and provided to the Environment Department prior to discharge. (*Checklist found on Page 5) This must be done for each fuel tanker for each campaign. This is the responsibility of the Department of Procurement and Logistics.	
Transfer	
1. Once the above points are completed, the ship to shore transfer can commence.	

2. Photos of the complete fuel transfer process should be taken, visually proving that all above procedures have been reached. This is the responsibility of Environment and Procurement and Logistics Departments.	
3. During the ship-to-shore transfer, Agnico Eagle will have competent personnel on location at all times to monitor the fuel transfer and maintain contact with the tanker's crew. This is the responsibility of the Department of Procurement and Logistics.	
4. Monitor the fuel transfer at the beginning of each transfer and after that on an hourly basis checking the manifold, conduit, tank, and any connection points on land for spills and/or leaks. Communication between shore and ship should take place on an hourly basis. This is the responsibility of the Department of Procurement and Logistics.	
5. We are required by law to have a fuel spill scenario every two years. However, since we have shift work at Meliadine, to ensure adequate training annually we will do mock spill/training and switch shifts each year. This way each shift completes every second year. This is the responsibility of the Environment Department in conjunction with the Emergency Response Team to plan and execute.	

OHF / Ship to Shore Fuel Discharge

Pre-discharge Checklist for Agnico Eagle's Oil Handling Facility in Rankin Inlet

Date :

Inspected By :

Time :

Vessel Unloading :

Pre-Discharge Check List	Conform	Non-conform	Comments
Is there two way communications between the OHF and the off-loading Vessel?			
Has a review of response material checklist been completed?			
Current Copy of OPEP and Declaration at the OHF.			
Prior to discharge, have the certification of the transfer conduits been received?			
Has there been secondary containment placed underneath each connection of Conduit?			
Is lighting in place at the transfer flange to provide illumination during any transfers taking place during the low to no light hours.			
Prior to discharge, has the Vessels' Ship/Shore checklist been reviewed and a completed copy received by Agnico Eagle?			
Prior to discharge inform H&S and Environment Departments that fuel transfer will commence.			
Has the emergency response equipment been reviewed with all personnel and contractors on shore?

Inventory report for Spill Response Sea Can at Agnico Eagle's Oil Handling Facility in Rankin Inlet

Date :

Inspected By :

Time :

Vessel Unloading :

Subject	Conform	Non-conform	Comments
Is the material and PPE stored in a manner that is organized and accessible in order to easily respond to spill?			
Are the sea cans in physically good shape? Easy to open?			
Are the sea cans identified as "Environmental Emergency Sea Can"?			
Is all the spill material in place?			
6 x Anchor sets (25 kg anchor, chain ballast, rode line and marker buoy)			
4 x Tow bridles with bullet float			
32 x 8" float x 12" skirt Optimax 2 Boom – 25' Sections			
1 x mini Max hydraulic skimmer with pump, power pack			
1 x Aluminum boat with 15 hp prop motor			
10 x 1/2" polyester yacht braid rope (600' rolls)			
5 x Drive pin anchors			
5 x slater anchors			
5 x wing anchors			
30 x sorbent boom, 5" x 4 per bag			
4 x mustang floater suit			

8 x personal floatation devices			
12 x oil resistant gloves			
12 x leather gloves			
2 x sledge hammer with fiberglass handle			
2 x spade – long handle			
2 x Fire extinguisher – 20 lb ABC with brackets			
20 x Tyvex Suit XL			
1 x Alberta standard #3 First aid kit			
4 x Storage totes for small items			
1 x quick tank (500 gallon / 1893 ltrs.)

APPENDIX D – MSDS for P-50 Diesel

SECTION 1. PRODUCT AND COMPANY IDENTIFICATION

Product name	:	DIESEL FUEL
Synonyms	:	Seasonal Diesel, #1 Diesel, #2 Heating Oil, #1 Heating Oil, D50, Arctic Diesel, Farm Diesel, Marine Diesel, Low Sulphur Diesel, LSD, Ultra Low Sulphur Diesel, ULSD, Mining Diesel, Naval Distillate, Dyed Diesel, Marked Diesel, Coloured Diesel, Furnace special, Biodiesel blend, B1, B2, B5, Diesel Low Cloud (LC). Marine Gas Oil
Product code	:	101802, 100107, 100668, 100658, 100911, 100663, 100652, 100460, 100065, 101796, 101793, 101795, 101792, 101794, 101791, 100768, 100643, 100642, 100103, 101798, 101800, 101797, 101788, 101789, 101787, 102531, 100734, 100733, 100640, 100997, 100995, 100732, 100731, 100994
Manufacturer or supplier's details		Petro-Canada P.O. Box 2844, 150 - 6th Avenue South-West Calgary Alberta T2P 3E3 Canada
Emergency telephone number		Suncor Energy: +1 403-296-3000; Poison Control Centre: Consult local telephone directory for emergency number(s).

Recommended use of the chemical and restrictions on use

Recommended use	:	Diesel fuels are distillate fuels suitable for use in high and medium speed internal combustion engines of the compression ignition type. Mining diesels, marine diesels, MDO and naval distillates may have a higher flash point requirement.
Prepared by	:	Product Safety: +1 905-804-4752

SECTION 2. HAZARDS IDENTIFICATION

Emergency Overview

Appearance	Bright oily liquid.
Colour	Clear to yellow (This product may be dyed red for taxation purposes).
Odour	Mild petroleum oil like.

GHS Classification

Flammable liquids	:	Category 3
Acute toxicity (Inhalation)	:	Category 4

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

Skin irritation	:	Category 2
Carcinogenicity	:	Category 2
Specific target organ toxicity - single exposure	:	Category 3 (Central nervous system)
Specific target organ toxicity - repeated exposure	:	Category 2 (Liver, thymus, Bone)
Aspiration hazard	:	Category 1

GHS Label element

Hazard pictograms :

Signal word : Danger

Hazard statements : H226 Flammable liquid and vapour.
H304 May be fatal if swallowed and enters airways.
H315 Causes skin irritation.
H332 Harmful if inhaled.
H336 May cause drowsiness or dizziness.
H351 Suspected of causing cancer.
H373 May cause damage to organs (Liver, thymus, Bone) through prolonged or repeated exposure.

Precautionary statements : **Prevention:**
P201 Obtain special instructions before use.
P202 Do not handle until all safety precautions have been read and understood.
P210 Keep away from heat/sparks/open flames/hot surfaces. - No smoking.
P233 Keep container tightly closed.
P240 Ground/bond container and receiving equipment.
P241 Use explosion-proof electrical/ ventilating/ lighting/ equipment.
P242 Use only non-sparking tools.
P243 Take precautionary measures against static discharge.
P260 Do not breathe dust/ fume/ gas/ mist/ vapours/ spray.
P264 Wash skin thoroughly after handling.
P271 Use only outdoors or in a well-ventilated area.
P280 Wear protective gloves/ eye protection/ face protection.
P281 Use personal protective equipment as required.
Response:
P301 + P310 IF SWALLOWED: Immediately call a POISON CENTER or doctor/ physician.
P303 + P361 + P353 IF ON SKIN (or hair): Remove/ Take off immediately all contaminated clothing. Rinse skin with water/ shower.
P304 + P340 + P312 IF INHALED: Remove victim to fresh air

™ Trademark of Suncor Energy Inc. Used under licence.

and keep at rest in a position comfortable for breathing. Call a POISON CENTER or doctor/ physician if you feel unwell.

Petro-Canada is a Suncor Energy business.

™ Trademark of Suncor Energy Inc. Used under licence.

P308 + P313 IF exposed or concerned: Get medical advice/ attention.
P331 Do NOT induce vomiting.
P332 + P313 If skin irritation occurs: Get medical advice/ attention.
P362 Take off contaminated clothing and wash before reuse.
P370 + P378 In case of fire: Use dry sand, dry chemical or alcohol-resistant foam for extinction.
Storage:
P403 + P233 Store in a well-ventilated place. Keep container tightly closed.
P403 + P235 Store in a well-ventilated place. Keep cool.
P405 Store locked up.
Disposal:
P501 Dispose of contents/ container to an approved waste disposal plant.

Potential Health Effects

Primary Routes of Entry	:	Eye contact Ingestion Inhalation Skin contact Skin Absorption
Target Organs	:	Skin Eyes Respiratory Tract
Inhalation	:	May cause respiratory tract irritation. Inhalation may cause central nervous system effects. Symptoms and signs include headache, dizziness, fatigue, muscular weakness, drowsiness and in extreme cases, loss of consciousness.
Skin	:	Causes skin irritation.
Eyes	:	Causes eye irritation.
Ingestion	:	Ingestion may cause gastrointestinal irritation, nausea, vomiting and diarrhoea. Aspiration hazard if swallowed - can enter lungs and cause damage.
Aggravated Medical Condition	:	None known.

Carcinogenicity:

IARC	No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.
ACGIH	No component of this product present at levels greater than or equal to 0.1% is identified as a carcinogen or potential carcinogen by ACGIH.

™ Trademark of Suncor Energy Inc. Used under licence.

Petro-Canada is a Suncor Energy business.

™ Trademark of Suncor Energy Inc. Used under licence.

equal to 0.1% is identified as a carcinogen or potential carcinogen by OSHA.

NTP No component of this product present at levels greater than or equal to 0.1% is identified as a known or anticipated carcinogen by NTP.

SECTION 3. COMPOSITION/INFORMATION ON INGREDIENTS

Pure substance/mixture : Mixture

Hazardous components

Chemical Name	CAS-No.	Concentration (%)
kerosine (petroleum), hydrodesulfurized	64742-81-0	70 - 100 %
kerosine (petroleum)	8008-20-6	
fuels, diesel	68334-30-5	
fuel oil no. 2	68476-30-2	
Alkanes, C10-20-branched and linear	928771-01-1	0 - 25 %
Soybean oil, Methyl ester	67784-80-9	0 - 5 %
Rape oil, Methyl ester	73891-99-3	
Fatty acids, tallow, Methyl esters	61788-61-2	

SECTION 4. FIRST AID MEASURES

If inhaled : Move to fresh air.
Artificial respiration and/or oxygen may be necessary.
Seek medical advice.

In case of skin contact : In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes.
Wash skin thoroughly with soap and water or use recognized skin cleanser.
Wash clothing before reuse.
Seek medical advice.

In case of eye contact : Remove contact lenses.
Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes.
Obtain medical attention.

If swallowed : Rinse mouth with water.
DO NOT induce vomiting unless directed to do so by a physician or poison control center.
Never give anything by mouth to an unconscious person.
Seek medical advice.

Most important symptoms : First aider needs to protect himself.

™ Trademark of Suncor Energy Inc. Used under licence.

and effects, both acute and delayed

SECTION 5. FIREFIGHTING MEASURES

Suitable extinguishing media	:	Dry chemical Carbon dioxide (CO2) Water fog. Foam
Unsuitable extinguishing media	:	Do NOT use water jet.
Specific hazards during firefighting	:	Cool closed containers exposed to fire with water spray.
Hazardous combustion products	:	Carbon oxides (CO, CO2), nitrogen oxides (NOx), sulphur oxides (SOx), sulphur compounds (H2S), smoke and irritating vapours as products of incomplete combustion.
Further information	:	Prevent fire extinguishing water from contaminating surface water or the ground water system.
Special protective equipment for firefighters	:	Wear self-contained breathing apparatus for firefighting if necessary.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Personal precautions, protective equipment and emergency procedures	:	Use personal protective equipment. Ensure adequate ventilation. Evacuate personnel to safe areas. Material can create slippery conditions.
Environmental precautions	:	If the product contaminates rivers and lakes or drains inform respective authorities.
Methods and materials for containment and cleaning up	:	Prevent further leakage or spillage if safe to do so. Remove all sources of ignition. Soak up with inert absorbent material. Non-sparking tools should be used. Ensure adequate ventilation. Contact the proper local authorities.

SECTION 7. HANDLING AND STORAGE

Advice on safe handling	:	For personal protection see section 8. Smoking, eating and drinking should be prohibited in the application area. Use only with adequate ventilation.

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

In case of insufficient ventilation, wear suitable respiratory equipment.
Avoid spark promoters. Ground/bond container and

™ Trademark of Suncor Energy Inc. Used under licence.

equipment. These alone may be insufficient to remove static electricity.
Avoid contact with skin, eyes and clothing.
Do not ingest.
Keep away from heat and sources of ignition.
Keep container closed when not in use.

Conditions for safe storage : Store in original container.
Containers which are opened must be carefully resealed and kept upright to prevent leakage.
Keep in a dry, cool and well-ventilated place.
Keep in properly labelled containers.
To maintain product quality, do not store in heat or direct sunlight.

SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Components with workplace control parameters

Components	CAS-No.	Value type (Form of exposure)	Control parameters / Permissible concentration	Basis
kerosine (petroleum), hydrodesulfurized	64742-81-0	TWA	200 mg/m3	ACGIH
kerosine (petroleum)	8008-20-6	TWA	100 mg/m3	NIOSH REL

Engineering measures : Use only in well-ventilated areas.
Ensure that eyewash station and safety shower are proximal to the work-station location.

Personal protective equipment

Respiratory protection : Use respiratory protection unless adequate local exhaust ventilation is provided or exposure assessment demonstrates that exposures are within recommended exposure guidelines. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.

Filter type : organic vapour cartridge or canister may be permissible under certain circumstances where airborne concentrations are expected to exceed exposure limits. Protection provided by air-purifying respirators is limited. Use a positive-pressure, air-supplied respirator if there is any potential for uncontrolled release, exposure levels are unknown, or any other circumstances where air-purifying respirators may not provide adequate protection.

Hand protection
Material : neoprene, nitrile, polyvinyl alcohol (PVA), Viton(R). Consult your PPE provider for breakthrough times and the specific glove that is best for you based on your use patterns. It should be realized that eventually any material regardless of their imperviousness, will get permeated by chemicals. Therefore, protective gloves should be regularly checked for

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

wear and tear. At the first signs of hardening and cracks, they should be changed.

Remarks	:	Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary.
Eye protection	:	Wear face-shield and protective suit for abnormal processing problems.
Skin and body protection	:	Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place.
Protective measures	:	Wash contaminated clothing before re-use.
Hygiene measures	:	Remove and wash contaminated clothing and gloves, including the inside, before re-use. Wash face, hands and any exposed skin thoroughly after handling.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance	:	Bright oily liquid.
Colour	:	Clear to yellow (This product may be dyed red for taxation purposes).
Odour	:	Mild petroleum oil like.
Odour Threshold	:	No data available
pH	:	No data available
Pour point	:	No data available
Boiling point/boiling range	:	150 - 371 °C (302 - 700 °F)
Flash point	:	> 40 °C (104 °F) Method: closed cup
Auto-Ignition Temperature	:	225 °C (437 °F)
Evaporation rate	:	No data available
Flammability	:	Flammable in presence of open flames, sparks and heat. Vapours are heavier than air and may travel considerable distance to sources of ignition and flash back. This product can accumulate static charge and ignite.
Upper explosion limit	:	6 %(V)
Lower explosion limit	:	0.7 %(V)
Vapour pressure	:	7.5 mmHg (20 °C / 68 °F)

™ Trademark of Suncor Energy Inc. Used under licence.

Relative vapour density	:	4.5
Relative density	:	0.8 - 0.88
Solubility(ies)		
Water solubility	:	insoluble
Partition coefficient: n-octanol/water	:	No data available
Viscosity		
Viscosity, kinematic	:	1.3 - 4.1 cSt (40 °C / 104 °F)
Explosive properties	:	Do not pressurise, cut, weld, braze, solder, drill, grind or expose containers to heat or sources of ignition. Runoff to sewer may create fire or explosion hazard.

SECTION 10. STABILITY AND REACTIVITY

Possibility of hazardous reactions	:	Hazardous polymerisation does not occur. Stable under normal conditions.
Conditions to avoid	:	Extremes of temperature and direct sunlight.
Incompatible materials	:	Reactive with oxidising agents and acids.
Hazardous decomposition products	:	May release COx, NOx, SOx, H2S, smoke and irritating vapours when heated to decomposition.

SECTION 11. TOXICOLOGICAL INFORMATION

Information on likely routes of exposure

Eye contact
Ingestion
Inhalation
Skin contact
Skin Absorption

Acute toxicity

Product:

SECTION 13. DISPOSAL CONSIDERATIONS

Disposal methods

Waste from residues	:	The product should not be allowed to enter drains, water courses or the soil. Offer surplus and non-recyclable solutions to a licensed disposal company. Waste must be classified and labelled prior to recycling or disposal. Send to a licensed waste management company. Dispose of as hazardous waste in compliance with local and national regulations. Dispose of product residue in accordance with the instructions of the person responsible for waste disposal.
Contaminated packaging	:	Do not re-use empty containers.

APPENDIX E –Ship to shore checklist and cargo pre arrival - Coastal Shipping LTD

Ship / Shore Cargo Checklist

Vessel: _____
Port: _____
Date: _____
Operation: ❒ Discharge ❒ Load

Letter Codes

A Any procedures and agreements should be in writing in the remarks column of this checklist or other mutually acceptable form. In either case, the signature of both parties is required

P In the case of a negative answer, the operation should not be carried out without the permission of the port authority.

R Items to be rechecked regularly, not exceeding the time specified in the declaration

General cargo considerations: (check (•) under Ship/Shore if OK, otherwise provide comment)

Item	Ship	Shore	Code	Comments
Is the vessel securely moored?			**R**	Stop Cargo at_____knts wind velocity Disconnect at_____knts wind velocity Unberth at_____knts wind velocity
Are emergency towing wires correctly positioned?			**R**	
Is there safe access between the ship and the shore?			**R**	
Is the ship ready to move under it's own power?			**P R**	
Is there an effective deck watch in attendance on the ship and adequate supervision on shore?			**R**	
Is the agreed ship/shore communication system operative?			**A R**	Method:
Has the emergency signals to be used by the ship and shore been explained and understood?			**A**	
Have the procedures for cargo, bunkering and ballast been agreed upon?			**A R**	
Have the hazards associated with toxic substances within the cargo being handled been identified and understood?				
Has the emergency shutdown procedure been agreed?			**A**	
Are fire-hoses and fire fighting equipment on board and ashore positioned and ready for immediate use?			**R**	
Are cargo and bunker hoses/arms in good condition, properly rigged and appropriate for intended use?				
Are scuppers effectively plugged drip tray valves closed both on board and ashore?			**R**	
Are unused cargo and bunker connections properly secured with blank flanges fully bolted?				
Are Sea and overboard discharge valves closed when not in use?				
Are all cargo and bunker tank lids closed?			**A R**	
Is the agreed tank venting system being used?				
Has the operation of P/V valves been verified?				
Are flashlights in use of an approved type?				
Are portable VHF/UHF radios of an approved type?				
Are the ships MF/HF radios grounded, VHF radios set to low power and 10 cm radars shut off?				
Is any portable electrical equipment disconnected?				
Are all external doors and ports in the accommodation closed?			**R**	
Are air intakes, which may permit the entry of cargo vapours, closed?				
Is the galley staff informed of loading/discharged operations?				
Are Smoking regulations being observed?			**R**	
Are naked light rules being observed?			**R**	
Is there provision for an emergency escape?				

Ship / Shore Cargo Checklist

Are there sufficient personnel on board and ashore to deal with an emergency?			**R**	
Are adequate insulating means in place in the ship shore connection?				
Is the pumproom ventilation adequate?			**R**	
Have the requirements for closed loading been agreed?				
Has a vapour return line been connected?				
If so, have the operating parameters been agreed?				
Are ship emergency fire control plans located externally?				
Are appropriate signals being displayed?				

Inert Gas Systems (if in use):

Item	Ship	Shore	Code	Comments
Is the Inert Gas System operational and in good working order?			**P**	
Are deck seals in good working order?			**R**	
Are Liquid levels in P/V breakers Correct? Have O^2 Analysers been calibrated and are working properly?			**R** **R**	
Are IG pressure and Oxygen recorders working properly? Are all Cargo tanks at positive pressure with O^2content of <8%?			**R** **P R**	
Are all IG Tank valves correctly set and locked?			**R**	
Are all the persons in charge of cargo operations aware that in the case of failure of the Inert Gas Plant, discharge operations should cease and the terminal be advised?			**R**	

Tank Cleaning (if planned while ship is at berth):

Item	Ship	Shore	Code	Comments
Has the port authority approved any tank-cleaning operations planned during the ships stay?			**P**	

Operations:

Item	Value	Ship	Shore
Initial cargo transfer rate to be used (m^3/hr, bbls/hr, etc)			
Maximum cargo transfer rate to be used (m^3/hr, bbls/hr, etc)			
Topping off rate to be used (m^3/hr, bbls/hr, etc)			
Maximum hose pressure to be used (bar)			
Quantity of cargo to be transferred (m3, bbls of each grade)			
Hose to be drained after transfer complete	❒ Ashore ❒ Back to vessel		
Hose to be cleared by	❒ Gravity ❒ Comp. Air ❒ Pig		
Emergency stop button located	❒ On Ship ❒ Ashore		

Declaration:

We the undersigned have checked, where appropriate jointly the items on this checklist and are satisfied that the entries made are to the best of our knowledge correct.We have also made arrangements to carry out repetitive checks as necessary and agreed that those items with the letter **R** in the column **Code** should be rechecked at intervals not exceeding_____hours.

Signatures:

For Vessel	**For Shore**
Name: _____	Name: _____
Rank: _____	Position: _____
Signature: _____	Signature: _____
Date & Time: _____	Date & Time: _____

Cargo Preparation Checklist

Vessel: __
Port: __
Date: __

Prior to entering a port or terminal:

Item	Completed
Emergency towline, anchor releasing mechanism, and mooring lines and winches are inspected to determine that the equipment is ready for use and in good condition.	

Prior to cargo transfer operations an examination and testing of the following items:

Item	Completed
All external doors, ports, and similar openings, which lead directly from the tank deck to the accommodation or machinery spaces, are closed.	
P/V valves and the venting system have been inspected and properly set for the transfer operation and the high-level alarm system has been tested. A High Level and PV Valve Checks form has been completed	
Pumproom strainer covers, inspection plates, and drain plugs are properly positioned and secure.	
Flange connections are all fully bolted and tightened with no improvised arrangements in place.	
Visual examination of all hoses and verification of hose certificate before use.	
Sea and overboard discharge valves, when not in use, are securely closed, lashed and sealed.	
Fire extinguishing and pollution control equipment is in place and ready for immediate deployment.	
Scupper plugs have been inspected and are in place and secured.	
Bondable drip trays are available for each manifold connection to be made.	
Tools for deploying, connecting blowing, pigging, disconnecting and recovering cargo hose are prepared as required.	
All cargo transfer valves are operational and positioned as be required. Closed valves are lashed as appropriate.	
When loading multiple grades, sufficient segregation is in place and ship personnel are made aware.	
Manifold(s) to be used are fitted with the correct reducers or adaptors for expected connection and all unused manifolds are drained and blanked.	
All pressure and temperature gauges on manifolds to be used are functioning correctly and calibrated.	
Emergency shut down mechanism has been tested and ship personnel are familiar with its use.	
Fire wires are positioned correctly, if required by terminal.	
Sufficient auxiliary machinery is running to ensure adequate electrical power is available during cargo operations.	
Compressed air is available on deck to run SOPEP pumps and blow/pig hoses are required.	
A list of responsible officers on duty during transfer is posted and readily available. Crew are familiar with their watches during cargo operations.	
Arrangements have been made to ensure the Master and/or the Chief Officer will be on board and available at all times during cargo operations.

APPENDIX F – The Central and Arctic Regional Response Plan (2008)

Canadian Coast Guard
Central & Arctic Region

Regional Response Plan

December 2008

LETTER OF PROMULGATION

The *Central & Arctic Regional Response Plan (2008)* replaces the *Central & Arctic Region Contingency Chapter (2006)* and the *Arctic Response Strategy (1999)*. This plan is a component of the *Canadian Coast Guard Nationa Response Plan* which is the responsibility of the Director of Safety and Environmental Response Systems, Ottawa. It establishes the framework and the procedures by which Central & Arctic Region will prepare for, assess, respond to and document actions taken in response to pollution incidents in this Region.

The saving of life is of paramount consideration and the Plan is subordinate to the operational requirements of marine search and rescue.

The Plan has been reviewed by the internal partners identified in Section 3.3 in context to the services they may provide and by the external partners identified in Sections 3.4 and 3.5 to confirm their mandated response authorities.

Responsibility for the *Regional Response Plan* lies with the Assistant Commissioner Coast Guard Central & Arctic Region. The Central & Arctic Region Environmental Response branch is the custodian of the plan. The responsibility for specific sections is identified in Section 7 - Plan Maintenance and Custodians. Comments, recommendations and communications relating to the various sections are clearly identified in this section.

REVISION RECORD

Section 1 - INTRODUCTION

1.1. Authority

This plan is based upon the policy and guiding principles set forth in the *National Response Plan* of the *Canadian Coast Guard National Response Strategy*.

1.2. Purpose

The *Central and Arctic Regional Response Plan* is designed as a guide to Canadian Coast Guard staff and relevant stakeholders involved in marine spill responses. It outlines the Regional application of the various roles of On-Scene Commander (OSC) (active response), Federal Monitoring Officer (FMO) (ensuring the Responsible Party fulfills their obligations), and as a Resource Agency (in assistance to other Lead Agencies).

It contains the specific information and activities that are pertinent to all spill response activities within Central & Arctic Region (C&A Region).

1.3. Area of Responsibility

For the purposes of marine pollution response Central & Arctic Region is defined geographically as:

- The contiguous waters of the Canadian Arctic (North of 60^{o} Latitude) to the limits of the International Boundary, including the North Slope Area of the Yukon Territories, and internal waters of the Northwest Territories and the Territory of Nunavut; and

- The waterways contained within the provinces of Alberta, Saskatchewan, Manitoba, Ontario, and a western portion of Quebec commencing at the east wall of the Beauharnois Lock in the St. Lawrence River.

(see Figure 1-1 Fisheries and Oceans Central & Arctic Region)

Significant waterways include the Canadian Great Lakes and interconnecting waterways to the international Boundary with the United States, Hudson and James Bays, Lake Winnipeg, Lake Athabasca and interconnecting waterways, Great Slave Lake, Mackenzie River and the Northwest Passage in the Canadian Arctic.

There are also a number of specific geographic locations which, although not excluded from Canadian Coast Guard's mandate, require coordination between the managing authorities and this plan. These areas include the waters associated with

the various Port Authorities (Hamilton, Thunder Bay, Toronto and Windsor) and the St. Lawrence Seaway Authority (Welland Canal, St. Lawrence Locks) as defined by the *Canada Marine Act, 1998*.

Figure 1-1: Fisheries and Oceans Central & Arctic Region

1.4. Safety Policy

Safety is the first and foremost consideration in any pollution response in Central & Arctic Region. This commitment is expressed throughout this and other documents as well as in the programs relied on by the Environmental Response (ER) branch to prepare for such spills (i.e. training and exercising programs). General safety procedures and considerations to be followed by all members of the Regional Response Team are identified in Section 5.7 of this plan.

1.5. Links to the National Response Plan

The Guiding Principles and Mandate (including legislative, interdepartmental, intergovernmental and international agreements) as well as designation of Lead and Resource Agency roles are contained in the *National Response Plan Section 1 – Introduction.* The mechanism for activating the Environmental Response National Response Team is also defined in the *National Response Plan*.

1.6. Regional Response Plan Structure

The Regional Response Plan is structured to reflect the three fundamental phases of Environmental Response activities. These are:

1) Preparedness - through the regional application of Contingency Planning (resulting in specific response strategies), Training (state of personnel readiness), Exercising (state of system readiness) and Inventory Maintenance and Management (state of mechanical/equipment readiness).

2) Response Operations - identifying the mechanisms for:
   - *Initiating* (through a dedicated Duty Officer and Assessment process),
   - *Sustaining* (Operational functions as Lead or Resource Agency),
   - *Controlling* (using the Response Management System), and
   - *Finalizing* the response activity (decommissioning and reporting).

3) Claims, Recovery and After-action activities - for the documentation and recovery of spent resources from the polluter, their agents, national or international funding conventions.

Surrounding these fundamentals are the specifics of the Environmental Response Program in Central and Arctic Region that are too cumbersome to be included in the main text of this Response Plan. They include: Regional Agreements and Memoranda of Understanding, Regional Organization and the specific Annexes which support the program. Finally, the Response Plan includes the preliminary and supplementary matter such as Letter of Promulgation, Record of Revision and the Identification of Custodians and the Plan Maintenance process.

1.7. Linkages to other Response Plans in the Region

When a pollutant is spilled into the water, the Canada Shipping Act is not the only legislation that applies. Recognizing that being designated Lead Agency for pollution response to mystery spills and spills from vessels does not preclude other agencies from completing their mandate CCG acknowledges that the Internal and External Partners listed in Sections 3.4 and 3.5 have plans that are active within Central & Arctic Region.

1.8. Linkages to International Joint Plans

International Joint Plans and agreements affecting Central & Arctic Region include:

- Canada-United States Joint Marine Pollution Contingency Plan
- Canada-Denmark Agreement for Co-operation Relating to the Marine Environment, Annex B (Joint Marine Contingency Plan concerning Incidents resulting from Shipping Activities)
- Great Lakes Water Quality Agreement, Annex 9
- International Boundary Waters Treaty Act

The Canadian Coast Guard Environmental Response Branch also provides technical support for the Emergency Prevention, Preparedness and Response (EPPR) Working Group of the Arctic Council. The EPPR Working Group exchanges information on best practices for preventing spills, preparing to respond to spills should they occur, and practical response measures for use in the event of a spill.

The Arctic Council is an intergovernmental forum of the eight circumpolar countries (Canada, Denmark, Finland, Iceland, Norway, Sweden, the Russian Federation and the United States of America) that provides a mechanism to address the common concerns and challenges faced by the Arctic governments and the people of the Arctic.

Some work has been initiated with the Russian Federation for the development of a Joint Pollution Response Plan. To date no agreements have been signed.

Section 2 - AGREEMENTS AND MEMORANDA OF UNDERSTANDING

2.1 Overview

The Canadian Coast Guard (CCG), both Central & Arctic and National Headquarters, maintain numerous memoranda and letters of understanding and agreement between other government departments which outline shared responsibilities in pollution response. A brief description of the major agreements is listed below.

- Letter of Agreement between Canadian Coast Guard, Environmental Response Branch and Canadian Coast Guard, Operational Services and Canadian Coast Guard, Technical Services regarding the use of Environmental Response First Response Units (FRUs) by non-environmental response staff. This agreement concerns the use of FRUs at the various CCG facility sites (bases, sub-bases and search and rescue stations).

- Northwest Territories/Nunavut Spills Working Agreement. This agreement formalizes procedures whereby spill investigation and monitoring in the Northwest Territories (NT) and Nunavut (NU) can be coordinated.

- Fisheries & Oceans (DFO) and Environment Canada (EC) Letter of Agreement respecting transfer of responsibility as lead agency for mystery spills from Environment Canada (EC) to the Canadian Coast Guard/Fisheries & Oceans Canada (July 1996)

- Transport Canada (TC) and Fisheries & Oceans (DFO) Memorandum of Understanding respecting Marine Transportation Safety & Environmental Protection (May 1996). This MOU outlines the responsibilities transferred from TC to DFO in accordance with the *Public Service Rearrangement and Transfer of Duties Act*. Those pertinent to this plan include:
    a) The responsibility for ensuring the provision of pollution clean up services
    b) The authority to take actions to mitigate or prevent pollution from ships

- Letter of Understanding between the Canadian Coast Guard and the Hamilton Port Authority to outline the roles that the CCG and the HPA will

play in the event of a pollution incident which falls within the mandate of the Canadian Coast Guard.

- Letter of Understanding between the Canadian Coast Guard and the Thunder Bay Port Authority to outline the roles that the CCG and the TBPA will play in the event of a pollution incident which falls within the mandate of the Canadian Coast Guard.

- Letter of Understanding between the Canadian Coast Guard and the Toronto Port Authority to outline the roles that the CCG and the TPA will play in the event of a pollution incident which falls within the mandate of the Canadian Coast Guard.

- Letter of Understanding between the Canadian Coast Guard and the Windsor Port Authority to outline the roles that the CCG and the WPA will play in the event of a pollution incident which falls within the mandate of the Canadian Coast Guard.

Some memoranda of understanding and letters of agreement have been rendered defunct by virtue of the dissolution or reorganization of the entities that signed the original document. It is the Region's intent to assess the need for an MOU and in those cases where renewal is needed, to draft a new MOU and submit to the partner organization the request for re-entry into that agreement. For further information on these memoranda, please contact the Environmental Response Planning Section.

Section 3 - ORGANIZATION

3.1 General Application

This section describes the primary working relationships between Fisheries and Oceans (DFO), Canadian Coast Guard, Environmental Response branch (CCG/ER) and the various internal and external partners, clients and external resources.

Internal partners include: Other DFO sectors, directorates and branches, and other federal departments which provide direct assistance or have specific mandates which directly affect response activities.

External partners include those entities that share the burden of pollution response for their specific area of responsibility. These agencies include the provincial and territorial government ministries with the generic mandate of pollution response.

Clients include those entities that are specifically identified by the *Canada Shipping Act (CSA)* and have direct involvement in the response regime; they include Oil Handling Facilities (OHF), Legislated Ships and Non-legislated Ships.

External resources are those resources outside of the government that the Canadian Coast Guard may engage while conducting spill response activities. These include the Response Organizations (RO) certified by Transport Canada and other independent contractors which may perform more specific functions.

3.2 Fisheries and Oceans, Canadian Coast Guard - Environmental Response Branch (CCG/ER)

The Assistant Commissioner, Canadian Coast Guard through the Maritime Services Directorate and the Superintendent of Environmental Response (ER) directs the Regional Environmental Response Team. This team represents one facet of the overall crisis management structure within Central and Arctic Region and performs the function of the Lead Response Agency for pollution incidents as defined in the *National Response Plan – Section 1* of the *Canadian Coast Guard National Response Strategy.* The branch consists of approximately seventeen (17) full time employees (FTEs).

Internally, the Environmental Response Branch is made up of five (5) distinct but integrated functions:

1) *Direction and Administration* - providing the overall guidance, management and liaison with Headquarters. The Superintendent holds the responsibility for escalating a response and/or dedicating resources.
2) *Planning* - providing the design and management of plans and procedures to facilitate the preparedness posture of the Region (responsible for developing and maintaining intradepartmental, interdepartmental, client and regime stakeholder relationships).

3) *Operations and Inventory Maintenance & Management* - provide the management and maintenance of equipment to ensure the operational response readiness of the Region.
4) *Training* - provides the coordination and delivery of educational materials, to internal as well as external partners and clients, in support of the overall preparedness posture of the Region.
5) *Exercising* - provides the management and coordination of internal and external partners and clients to validate, practice and reinforce all aspects of the Response readiness of the Region.

In addition to these core functions, each staff member is required to actively participate in the operational aspects of the response regime based upon their skill and ability levels. This includes assuming various roles within the Response Management Structure acting as Duty Officer (DO) and supporting the overall emergency preparedness structure within the Region (not necessarily related exclusively to oil spills or pollution).

In the context of this Plan, the Environmental Response Branch is tasked to:

- Fulfill the Canadian Coast Guard's obligations as Lead Agency in an OSC or FMO posture in responding to marine pollution incidents from ships in waters of Canadian interest as well as from unknown sources.
- Act as a Resource Agency in support of a response led by another agency when requested.
- Staff a Duty Officer position on a 24/7 basis which, together with other agency representatives, will assess or direct the assessment of spill reports.
- Ensure that an appropriate response to pollution incidents is initiated on a timely basis.
- Provide initial response capabilities throughout the region.
- Monitor response and clean-up priorities when polluter has accepted responsibility.
- Ensure international commitments in spill preparedness and response are fulfilled.
- Provide a pollution response capability for lightering, salvage and offshore recovery operations.
- Provide Regional and HQ briefings on status of emergency operations.
- Evaluate, acquire and maintain specialized marine emergency countermeasures equipment and develop deployment techniques.
- Develop, distribute and maintain the *Central and Arctic Regional Response Plan* of the *Canadian Coast Guard National Response Strategy* (including area annexes) on behalf of Fisheries and Oceans.
- Review and comment on other government as well as industry pollution response plans upon request.
- Provide pollution response related training to Canadian Coast Guard and civilian personnel.

- Conduct spill response exercises according to the Canadian Coast Guard National Exercise Program (NEP) standards.
- Provide detailed explanations of response operations and policies to representatives of the media, interest groups, industry, police and Provincial and Municipal governments.
- Provide a centre of expertise for pollution concerns.
- Develop and foster a good working relationship with other authorities, shipping and oil/chemical handling communities.
- Working with Environmental Response Headquarters and the Chemical Industry to develop, implement and maintain a corresponding and complimentary regional capability for spills of hazardous and noxious substances other than oil.

3.3 Internal Partners – Fisheries and Oceans

Other branches and directorates within Fisheries and Oceans which directly and in a continuous active way support preparedness and response activities include:

Marine Traffic and Communications Branch (MTCS) – CCG/Marine Programs Directorate

Marine Traffic and Communications Services operates a marine VHF/MF/HF communications system (depending on location) primarily for the provision of marine safety information, distress coordination and marine traffic regulation. MCTS will support Environmental Response (ER) activities by:

- Establishment of Movement Restriction Areas (MRA's) or exclusion zones as directed by the Federal Monitoring Officer (FMO) or On Scene Commander (OSC).
- Providing communications/radio equipment operators in support of off-site ER operations.
- Dissemination of marine information and issuing marine Notices to Shipping (NOTSHIPS).
- Providing vessel tombstone information including, but not limited to, vessel name, call sign, nationality, tonnage, dangerous cargo type and quantity.

Regional Operations Centre (ROC) and Fleet Resources – CCG/Operational Services Directorate

Regional Operations Centre

The ROC provides notification to the Environmental Response Duty Officer (ERDO) when notified of a spill or an occurrence which may result in a spill. Upon receiving information regarding a spill, the ROC confirms the report using reliable resources and agencies. When the incident has been confirmed the Operation Centre begins the alerting and notification procedure. A schedule of ERDOs, approved by the Superintendent Environmental Response Canadian Coast Guard, will be maintained by the ER Regional Emergency Operations Officer (REOO) and forwarded to ROC for distribution.

The Regional Operations Centre will support the Environmental Response Branch during a marine pollution incident by:

- Maintaining up to update contact lists for Canadian Coast Guard and other government agencies for use as incidents progress.
- Coordinating the allocation of CCG resources as required by the FMO or the OSC to respond to a marine pollution incident.
- Provide communications support (when necessary).

Fleet Resources

Fleet Resources may be called upon to provide a host of support and/or lead services depending upon the type and severity of the situation and limitations or constraints of the vessel. Commanding Officers maintain full responsibility for the operation and safety of their vessel and personnel and therefore, will/may:

- Be called upon to be interim On-scene Commander.
- Be the principal point of contact aboard ship for the Environmental Response Duty Officer or On Scene Commander.
- Investigate spill reports for the purpose of confirmation.
- Provide surveillance and monitoring of third party (or pollutant) as required.
- Initiate early spill response; containment, boom or sorbent material deployment, clean up and recovery procedures.
- Provide site safety, (i.e. fire fighting, first aid and crowd control).

Fleet does maintain their own limited capabilities to respond to their needs as required.

Canadian Coast Guard Bases

In preparation for and during a pollution incident, CCG bases may also provide resources for response. These resources are generally within the scope of normal base activities and include:

- Small vessel use
- Base facilities (boardrooms, workshops)
- Helicopter landing pads
- Boat launch and docking slips
- Staging areas

Safety, Security and Emergency Services Branch – DFO Corporate Services

For large spills of a significant nature the Regional Manager of Safety, Security & Emergency Services may provide the following:

- Advice and recommendations to the On Scene Commander on issues of site and employee safety and the application of departmental security policy measures.
- General occupational health & safety and security advice to the On-Scene Commander/Deputy On-Scene Commander as per the departmental Loss Control Manual.

- A Health & Safety Officer to perform the functions of the Heath & Safety Officer described in the Response Management System User Guide. This person will report directly to the OSC or FMO throughout the duration of the response.

On occasions when the Regional Manager of Safety & Security (or delegate) is not available, or when spills are of a minor nature, the On-Scene Commander shall appoint a member of the response team to fulfill the general duties required.

Communications Branch – DFO Communications
Communications team manages the media (external) handling inquiries from print, radio, television and internet news organizations through the application of *Fisheries & Oceans Crisis Communications Plan*. Communications branch coordinates all aspects of information being released to ensure the public is getting the most relevant, accurate information as soon as practicable.

Legal Services
The DFO Legal Services in CCG Headquarters section will provide legal advice and guidance in the event of a marine pollution incident where CCG may or has been engaged. This especially includes advice on the issuance of Letters of Undertaking (LOUs) and in situations where Canadian Coast Guard may have to take command and control of an incident away from the Polluter.

Other DFO Resources
Indirectly, but just as significant in the event of a spill, is the availability of other DFO resources. This includes any and all appropriate functions including, but not limited to the following:

- Trenton Joint Rescue Coordination Centre – CCG, Maritime Services Directorate, Search and Rescue Branch (SAR)
- Finance and Administration – Human Resources and Corporate Services Directorate
- Human Resources - Human Resources and Corporate Services Directorate
- Facilities – Real Property
- Other Technical Resources – CCG, Integrated Technical Services Directorate
- Fish Habitat Branch – Habitat Fisheries and Oceans Management

3.4 Internal Partners – Other Government Departments

Other federal departments which provide direct assistance or have specific mandates which directly affect response activities include:

Environment Canada (EC)
There are two (3) Environment Canada regions located within Central & Arctic region. They are Ontario, Prairie and Northern and Pacific and Yukon Regions.

The Environmental Emergencies Section provides:

- In Ontario, the Co-chair (with the Ontario Ministry of the Environment (MOE)) of the Regional Environmental Emergencies Team (REET).
- In the Arctic (consisting of the three Territories), the Co-chair (with the relevant Territorial Government, Department of Environment) for the Arctic Regional Environmental Emergencies Team.
- Coordination of the Shoreline Cleanup and Assessment Teams (SCAT).
- Advice concerning environmental impacts associated with vessel source spills, resource sensitivity and prioritization, environmental forecasting, spill and cleanup monitoring and clean up techniques and priorities
- Sampling assistance, identification and characterization of materials

The REET serves as a mechanism for the provision of consolidated, coordinated and comprehensive environmental information and advice concerning the fate and effects of hazardous and noxious substances, spill trajectories, resources and shoreline protection strategies, clean up priorities, physical and chemical counter measures, remedial endpoints, damage assessment, and the management of hazardous wastes generated during a spill and other matters which arise while planning and responding to emergency events which affect or risk environmental quality. In the planning mode REET members meet to improve contingency plans, resolve regional preparedness issues and exchange new scientific and response ideas.

In Ontario Region, Environment Canada has divided the province into eighteen (18) REET areas and plans to hold one (1) REET meeting per area per year, consolidating some areas where possible and maintaining annual meetings in the higher risk areas (Windsor, Sarnia, Sault Ste. Marie).

Two of three primary Arctic REET (AREET) areas are in Prairie and Northern Region: the Northwest Territories and Nunavut Territory. There is no REET established in Alberta, Saskatchewan and Manitoba.

The Meteorological Service of Canada (part of EC and REET) provides:

- Meteorological forecasting

The Canadian Wildlife Service (part of EC and REET) provides

- Advice on wildlife protection, rescue and rehabilitation
- Permits for wildlife hazing and capture

Transport Canada (TC)

The Environmental Response Systems Division in Ottawa is responsible for Canada's Marine Oil Spill Preparedness and Response Regime. It:

- works with other federal agencies and departments, such as Fisheries and Oceans Canada, the Canadian Coast Guard and Environment Canada to establish guidelines and regulatory framework for preparedness and response to oil spills and spills of noxious and hazardous substances into Canada's marine environment.

- Manages the National Aerial Surveillance Program

There are two Transport Canada regions located within Central & Arctic region. They are Ontario and Prairie and Northern regions.

The Aircraft Services Directorate provides:

- Aerial surveillance as part of the Prevention mandate within Transport Canada, and can provide aerial spill tracking, recording, and personnel transport.

The Marine Safety Branch provides:

- Technical advice and recommendations to the On-Scene Commander or the Ship Owner regarding, but not limited to, lightering, damage assessment and salvage.

  Note: The MOU between Transport Canada and Fisheries & Oceans Respecting Marine Transportation Safety & Environmental Protection (May 1996) Annex D – E-5 states that "Transport Canada and Fisheries and Oceans will jointly approve salvage operations, emergency lightering or discharge of cargo." After discussing this clause with two senior surveyors, they both agree – Marine Safety does not approve salvage plans. Marine Safety advises and recommends only.
- Restriction of transit or movement of a vessel following a damage assessment.
- Spill investigation and enforcement of the various aspects of the pollution prevention conventions and legislation in Canada
- Regional planning, in conjunction with EC and CCG, for the selection of Places of Refuge. Note: in the Great Lakes and connecting channels, selection of a place of refuge will be determined in conjunction with the USCG and USEPA.
- Monitoring of the spill preparedness activities of Oil Handling Facilities (OHFs) and certified Response Organizations (ROs) through a review and audit process.

Indian and Northern Affairs Canada (INAC)

Canadian Coast Guard (CCG) works most closely with INAC in Nunavut (NU) and the Northwest Territories (NT). INAC has lead responsibilities in the Arctic for spills on water which do not originate at federal facilities, exploration facilities or from ships and barges. INAC also, by letter of agreement, will investigate ship-source spills on behalf of CCG. INAC is also a member of the Beaufort Sea Emergency Preparedness Working Group, along with CCG/DFO, EC, TC and other appropriate agencies.

National Energy Board (NEB)

Based in Calgary, Alberta, the National Energy Board is an independent Agency that reports to parliament through the Ministry of Natural Resources. The NEB is the

Lead Agency for spills that occur at offshore and nearshore oil and gas exploration and production facilities.

In the event of a marine pollution incident where CCG is requested for assistance as a resource agency, CCG is available to provide pollution response expertise as indicated under Section 7.2 of the *National Response Plan* as it relates to NEB.

Public Safety Canada

Public Safety Canada is the federal coordinating department responsible for engaging relevant federal departments in an integrated Government of Canada response to an emergency.

For emergencies requiring an integrated Government of Canada response, federal support is based on a regional "single- window" concept. This concept is intended to facilitate regional interdepartmental and intergovernmental coordination, while not unduly restricting operations. Coordination includes sharing of pertinent information in order to maintain situational awareness.

The Government Operations Centre (GOC) is a 24/7facility where an integrated Government of Canada response is managed. It is the focal point of information management flow and provides strategic-level activities. It's permanent staff includes watch officers, duty officers specializing in national communications as well as a geomatics team to map incidents.

Indirect support from other federal departments in the form of advice or resources also comes from: Heritage Canada (Parks Service) in the form of support to REET, National Defense regarding assistance and resources, RCMP with respect to investigations and those sections or departments specifically identified in the various Memorandums of Understanding (MOU) as outlined in Section 2 of this chapter.

3.5 External Partners - Provincial and Territorial Ministries and Departments

In general, liaison with provincial and territorial concerns is facilitated through REET (Regional Environmental Emergencies Team), which is chaired by Environment Canada (EC) or, in the case of the Province of Ontario, is co-chaired by Environment Canada and the Ontario Ministry of the Environment (MOE). The following agencies have the primary mandate for marine or freshwater pollution response in their province or territory of jurisdiction:

Territory or Province	Department
Northwest Territories	Environment and Natural Resources
Nunavut	Department of Environment
Alberta	Alberta Environment
Saskatchewan	Saskatchewan Environment

Manitoba	Manitoba Conservation
Ontario	Ontario Ministry of the Environment

In emergency situations conflicts sometimes arise with respect to legal and administrative jurisdiction and application of standards and common practices. To facilitate these issues the various Ministries related to emergency measures are usually contacted to provide coordination and clarify where necessary the concerns. These include:

- Government of Nunavut – Department of Community of Government Services, Emergency Management Division
- Government of the Northwest Territories – Department of Municipal and Community Affairs – Emergency Services Division
- Government of the Yukon Territories – Department of Community Services, Emergency Measures Organization
- Government of Ontario - Ministry of the Community Safety & Correctional Service, Emergency Measures Ontario
- Government of Manitoba –Manitoba Emergency Measures Organization
- Government of Saskatchewan – Resource Management and Corrections & Public Safety, Saskatchewan Emergency Measures Organization
- Government of Alberta – Ministry of Municipal Affairs, Public Safety Division, Emergency Management Alberta

Provincial Governments can provide consolidated access to local, municipal and provincial resources.

Central & Arctic Region recognizes that First Nations have a vested interest in response operations that may occur in their territory and will ensure that they are represented on the REET or have access to the Federal Monitoring Officer or On Scene Commander through the CCG Liaison Officer.

3.6 Clients

With respect to ship-source pollution incidents, there are three major groups the Canadian Coast Guard will be directly engaged with. These are Oil Handling Facilities, Legislated Ships and Ships as defined in *Part XV* of the *Canada Shipping Act.*

Oil Handling Facilities (OHF)

Operators of facilities that transfer oil to or from oil tankers over 150 gross registered tonnes or other vessels over 400 gross registered tonnes are required by the Canada Shipping Act (2001) to:

- Have an Oil Pollution Emergency Plan (OPEP) on site.
- Have a declaration conforming to the regulations on site.
- Take reasonable measures to implement their required oil pollution emergency plan in the event of an oil pollution incident.

- Have on site the resources required to contain a spill of oil equal to the facility's rated capability within one hour.
- Begin recovery/cleanup operations of oil equal to the facility's rated capability within 6 hours.
- Have an arrangement with a certified Response Organization (RO) that permits the handling of spills beyond the rated capabilities of the Oil Handling Facility.[1]

Legislated Ships

In Canadian waters, ships over 400 gross registered tonnes and oil tankers over 150 gross registered tonnes are required to have a Shipboard Oil Pollution Emergency Plan (SOPEP) and an arrangement with a certified Response Organization (RO) to respond to an oil pollution incident of an amount equivalent to the maximum amount of product that the vessel can carry as fuel and/or as cargo up to a maximum of 10,000 tonnes.[1]

Other ships as defined by Part XV of the Canada Shipping Act (CSA)

Any ship that is less than 400 GRT or any tanker less than 150 GRT is still covered by the *Canada Shipping Act (2001)* in that it must report the potential or actual pollution incident to a Pollution Response Officer, or in the case of an incident in Canadian Arctic Waters as defined by the Arctic Waters Pollution Prevention Act to a Pollution Prevention Officer. The ship must take immediate steps to mitigate or remedy the situation. These ships are not required to have a Shipboard Oil Pollution Emergency Plan nor an arrangement with a certified Response Organization.

3.7 External Resources

There are two main categories of external resources that the Canadian Coast Guard (CCG) will engage. These are the Response Organizations certified by Transport Canada under the *Canada Shipping Act (2001)* and other contractors.

Response Organizations (ROs)

Response Organizations are privately established pollution response companies certified by Transport Canada. These companies hold a certificate of designation to handle oil spills of up to 10,000 tonnes (T). Response Organizations can provide the polluter or any lead agency with the resources, trained personnel and operational management structure to deal with a marine oil pollution incident within its identified Geographical Area of Response (GAR).

The Eastern Canada Response Corporation (ECRC) is the only certified response organization in Central & Arctic Region. The company is certified to ten thousand tonnes (10 000T) and two of its three regions cover Central & Arctic Region.

[1] There is no requirement for an Oil Handling Facility nor a Legislated Ship to have an arrangement with a Response Organization certified by Transport Canada in Canadian waters north of 60° North Latitude

1) ECRC Great Lakes Region is managed from the Response Centre in Corunna, Ontario. Its area of coverage includes all waters
   - south of 60 degrees north in the provinces of Alberta, Saskatchewan, Manitoba and Ontario to that portion of the St. Lawrence River in the Province of Ontario
   - to a line drawn between Butternut Bay (Latitude 44 31' 12" north and Longitude 75 46' 54" west) on the Canadian side
   - to Oak Point (Latitude 44 30' 48" north and Longitude 75 45' 20" west) on the US side of the St. Lawrence River.

2) ECRC Quebec Region (also known as Societé d'Intervention Maritime Est du Canada - SIMEC) is managed from the Response Centre in Quebec City, Quebec and has staffed Response Centres in Verchères, Quebec and in Sept-Iles, Quebec. Their coverage includes:
   - James Bay, Ungava Bay and in Hudson Bay south of the sixtieth parallel North and that portion of the St. Lawrence River in the Province of Ontario
   - to a line drawn between Butternut Bay (Latitude 44 31' 12" North and Longitude 75 46' 54" West) on the Canadian side to Oak Point (Latitude 44 30' 48" north and Longitude 75 45' 20" West) on the US side of the St. Lawrence River.

There are no certified response organizations established north of 60° N latitude.

Although resources from the Response Organizations in the south may be made available for use north of 60°, they must obtain the necessary approvals to move equipment from their designated area of response.

Contractors

Private sector contractors may be engaged by the CCG as required. All standard government contracting rules apply.

Section 4 – PREPAREDNESS

4.1 Overview

Oil spill preparedness is defined by the advanced planning used to create systems to effectively and efficiently combat the range of spills likely to be encountered.

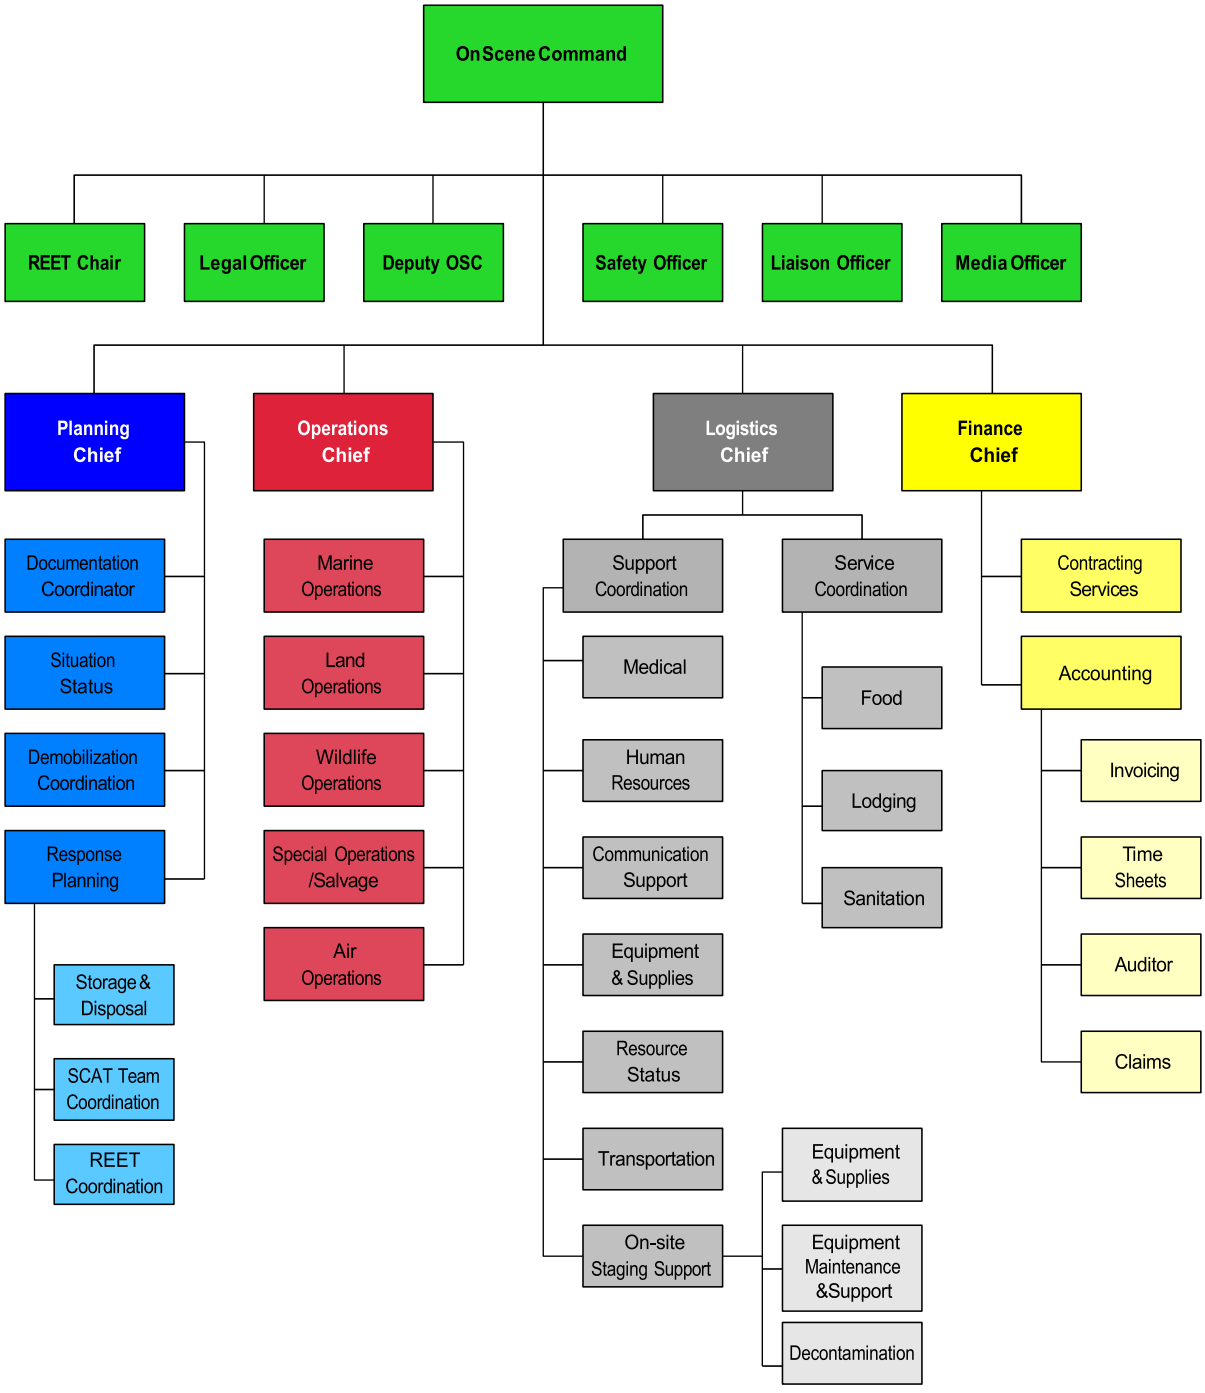
In Central and Arctic Region, preparedness involves:

- The development of regional procedures to be followed in the event of an incident, coordinated by the Planning section.
- The implementation, training and maintenance of the Response Management System (RMS) to manage and combat the incident.
- The identification of priorities, development of strategies, logistics and tactics necessary to fulfill those priorities, lead by the Planning section.
- The liaising with internal and external partners, clients and resources that may be involved in pollution response activities, lead by the Planning section.
- The training and continued maintenance and upgrading of skills, coordinated through the Training specialist.
- The exercising and quality assurance activities required to continuously reinforce the training and contingency planning activities, facilitated through the Exercise specialist.
- The asset management including the acquisition, lifecycle maintenance, operational readiness and storage of equipment lead by the Operations section and Inventory specialist.
- The integration of other Canadian Coast Guard Assets and Human Resources, when necessary, through the Training and Exercising processes.

The Memorandum of Understanding (MOU) between the Director General/Maritime Services (MS) and the Director General/Integrated Technical Support (ITS) of the Canadian Coast Guard (March 2004) specifies that the ITS Directorate will be the single CCG focus for the life cycle management of all CCG physical assets and for the development of all technical solutions. It is unknown when ITS will assume the services of design, procurement, in-service support and disposal of all equipment and systems required to satisfy ER's mandate. In the interim, ER will remain the focal point.

4.2 Response Management System (RMS)

The Canadian Coast Guard uses the Response Management System (RMS) as its emergency management system. It is based on, and operates under the same principles as the Incident Command System (ICS) which was developed in the U.S. to coordinate multi-agency responses to large forest fires. The system was adjusted to reflect the current marine oil spill response regime and Canadian law. The Canadian Coast Guard does not implement the ICS principle of unified command, but will participate in any command structure used by the Polluter or Other Lead Agency.



The RMS uses a “management by objectives” approach. It outlines the roles and responsibilities of individual positions, identifies the reporting structure, establishes a common set of terminology and uses standardized forms and paperwork. The central document in the RMS process is the Incident Action Plan, which documents the existing conditions and outlines objectives and strategies for recovery and response.

The system structure is designed to expand or contract to best fit the specific circumstances of the incident. Not all positions within the system will be staffed for every incident; in those cases the supervising position shall be responsible for all subordinate tasks/roles. Regional staff members have been designated as members of the Regional Response Team and may be called upon to fill specified roles in this management system (see Figure 4.1 for a fully expanded system design).

The system also contains management tools that can be used by the On Scene Commander and response personnel to better manage the system and the spill incident. These tools include a field operations guidebook, forms, reports, established meeting schedules and agendas. The RMS will also be used by the Federal Monitoring Officer and their Incident Monitoring Team while monitoring the Polluter’s response to an incident.

The detailed RMS process is contained in a separate document referenced in Section 9.1 of this plan (Response Management Systems User’s Guide, Version 3.0 (May 2006)).

Figure 4.1 - CCG RMS Command Structure

4.3 Planning

Area Plans

To facilitate an effective and efficient response, Canadian Coast Guard administers 16 area plans as an annex to the Central & Arctic Regional Response Plan. They are Keewatin, Baffin, Beaufort Sea & Amundsen Gulf, Great Slave Lake, Hudson & James Bay, Kitikmeot, Mackenzie River & Delta, Inland Waters S of 60, Lake Erie, Lake Huron, Lake of the Woods, Lake Ontario, Lake Superior, St. Lawrence, St. Mary's and St. Clair & Detroit areas. These plans incorporate detailed response information for specific manageable geographic areas or response communities. The normal operating period for an area plan is the first 12-24 hours of a spill response.

They are developed and maintained as follows:

1) Risk Analysis
   The risk analysis determines which communities or areas are most likely to be endangered by a potential oil spill and why, their associated environmental sensitivities, plus the typical type of spill that could be expected. When considering the environmental sensitivities, the focus is on what is most likely to be impacted and to consider as many factors as are applicable. A single factor discovered in the risk assessment is just one of many layers in the decision to make a site a priority.

2) Priority Identification/Verification
   Current priorities are discussed with members of the Regional Environmental Emergencies Team (REET) at planning meetings. It provides the opportunity for additions, deletions or modifications. Where there are no REET meetings held, community consultations are organized by the Planning section.

3) Strategy and Tactics Development
   Canadian Coast Guard determines RMS objectives for the agreed upon priorities. Strategies are designed, that name the activities relative to those objectives. Those activities may be response actions to be implemented, or may be the type of resources that could be affected by the spill. For area plan development, tactics provide the detail for implementing the selected strategies. Tactics then specify the resources, both human and equipment, to facilitate, to install or to maintain the strategy.

4) Updating
   Area plans are reviewed and updated annually.

Regional Procedure Development

Regional procedures for notification, verification, activation and cost recovery of a response are all described in the *Central & Arctic Regional Response Plan* of the *Canadian Coast Guard National Response Plan*. Supporting documentation in the

form of Standard Operating Procedures and supplementary plans (e.g. Health & Safety Plan and Media Relations Plan) are not included in the Regional Response Plan but are referenced in Section 9.

Liaison with External and Internal Partners, Clients and Resources

To ensure that all partners, clients and resources are aware of the Canadian Coast Guard's mandate and responsibilities as they pertain to pollution preparedness and response, the Environmental Response Planning Section takes the initiative to:

- Work with Internal Partners within Fisheries & Oceans to communicate the branch's needs in the event of a pollution incident.

  Exception: Coordination of the Duty Officer (DO) function between Environmental Response (ER) and the Regional Operations Centre (ROC) is coordinated by the Regional Emergency Operations Officer REOO).
- Work with other government departments that have a mandate for pollution response within their jurisdiction to communicate the role that Canadian Coast Guard plays in marine and freshwater pollution incidents and to share what resources Canadian Coast Guard maintains for pollution response activities and the mechanism to access these resources in the event that another Lead Agency may require them for a non-CCG mandated spill or other type of emergency.
- Liaise with potential clients (oil handling facilities, shipping companies and other operators) so that CCG expectations in the event of an incident are understood.
- Provide copies of area plans to CCG vessels that are relevant to their area of operations. CCG ER will brief Operations at the pre and post season conferences on any changes to the plans and/or to the captain and/or crew's responsibilities.
- Maintain a network of contractors that can provide services to Canadian Coast Guard in the event of a pollution incident that exceeds the resource capability of the region.
- Upon request of the Regional Advisory Councils (RACs) or Secretariat (Transport Canada) on Marine Oil Spill Response, provide information on Central & Arctic Region's preparedness and spill response activities.

Arctic Community Emergency Plans

The Canadian Coast Guard is committed to assisting Arctic communities in the development of the marine pollution component of their Community Emergency Plans. This commitment was made in 1999 when the CCG Arctic Response Strategy (ARS) was published. The Arctic Response Strategy has since been re- assessed and viable components have been incorporated into the text of this Plan.

4.4 Training Program and Curriculum

Introduction

The Training Curriculum of the Environmental Response Branch is focused on providing the necessary skills and knowledge for responders to function effectively during a spill response operation. As the competencies required for an effective spill response are described and organized within the Response Management System (RMS), so too can the training curriculum be described in the context of RMS.

With RMS as the framework for spill response, all response team members will be trained in theory and application of RMS. The level of training complexity will vary by level of individual responsibility, but all members will have fundamental knowledge of the structure and processes that drive the RMS.

In addition to the training curriculum described in this section, it is understood that there are competencies and certifications required that are not specific to ER or spill response. These would include driver's licenses, radio operator's licenses, and familiarity with basic electronic equipment such as phones, fax machines, cell phones and laptop computers.

Training Curriculum

Command Staff

During a spill response operation, the command staff will vary depending on the size and complexity of the spill.
On a smaller spill, senior ER staff members may be appointed to command positions with few subordinate or supporting positions.
On larger scale spills, the OSC may be the Director of Maritime Services, or Assistant Commissioner Canadian Coast Guard, with multiple support positions from ER staff, CG fleet, base personnel and contractors.

To adequately prepare personnel for the management functions of spill response, the following curriculum has been identified:

On Scene Command Course (OSC)
This course trains participants in all aspects of spill response including planning, implementation, and supervision. Other topics include legislation, legal issues, financial responsibilities, and media relations. Prerequisites include BOSRC, MSROC, PPO designation, media relations and management training.

Response Management System Course (RMS)
The current RMS curriculum is an introductory two-day course on the system and its user's guide. It is anticipated that future development will include multiple levels of training which will include organizational structure and

responsibilities, as well as in-depth requirements of each position within this emergency management structure.

Federal Monitoring Course (FMO) - Proposed
Subject to national development, this course will augment the On Scene Command Course to provide those persons designated as Canadian Coast Guard Federal Monitoring Officers the necessary skills and knowledge to perform FMO duties.

Operations Section

During a spill response operation, the operations section of the RMS may be populated by regional ER staff, CCG fleet officers and crew, CCG/DFO base personnel or contractors. The resident knowledge of this group will vary, and a comprehensive ER training program exists to train responders in spill response operations. Training for members of the CCG Regional Response Team (RRT) personnel is offered in the following three areas:

(a) Safety Training
(b) Operational Training
(c) Specialty Training

(a) Safety Training

Health and Safety training is required to ensure compliance with federal and provincial legislation with the ultimate goal of ensuring the health and safety of response personnel. Additional video and printed reference material is available through the Canadian Coast Guard ER Training Officer.

Site Safety Course
The Site Safety Course is designed for response personnel prior to commencing work on a response site. Topics include employer and employee responsibilities, classification and hazards of petroleum products, and the safety practices and considerations associated with both water-based and shore-based operations. Site safety training is mandatory for Regional Response Team members and all volunteers or short time workers who may be employed during a response.

Workplace Hazardous Materials Information System (WHMIS)
This 3-hour course is provided to Canadian Coast Guard employees to ensure compliance with appropriate worker safety legislation. It was developed to ensure workers have the necessary information to work safely with hazardous materials in their workplace.

First Aid/CPR
This 16 hour course provides the participants with the skills and knowledge to successfully obtain the St. John Ambulance Standard First Aid Certificate. The primary focus of this 14-hour course is to provide adequate knowledge

and level of skill to persons in positions of responsibility to provide for persons suffering from respiratory and circulatory arrest. Preventative measures are discussed.

Small Non-Pleasure Vessel Basic Safety Course - MED A3
The 8-hour MED A3 course is *required by regulation* for crewmembers of small non-pleasure vessels of not more than 150 GT operating not more than 20 miles offshore. Topics include marine hazards and emergencies, marine firefighting, lifesaving appliances and abandonment and survival and rescue skills.

Transportation of Dangerous Goods (TDG)
This 6-hour course provides personnel with the responsibility for the transportation of dangerous goods to be aware of and comply with safety measures and appropriate legislation concerning TDG.

(b) Operational Training
There are various levels of oil spill response courses designed for response team members, ships crews and other responders who may be expected to assist with marine oil spill response. Operational training related to the assessment and response to petroleum spills is delivered by ER while training for response to hazardous and noxious materials spills is obtained outside of the Branch.

First Responder Oil Spill Training (FROST)
This 1 day course is designed specifically for CCG personnel in Central & Arctic Region who are designated custodians of First Response Units (FRUs), and may be tasked with deployment of the pollution countermeasures equipment. It has also been adapted for use in communities north of 60° where Arctic Community packs function as first response units.
It teaches First Responders to:

- assess an oil spill according to its extent, possible source and likely behavior
- deploy boom for containment and protection purposes and in support of response activities
- work safely at the spill site

Basic Oil Spill Response Course (BOSRC)
This 20 hour course instructs First Responders how to:

- assess an oil spill according to its extent, possible source and likely behavior
- deploy boom for containment and protection purposes and in support of response activities
- operate oil recovery equipment
- undertake basic shoreline cleanup operations
- work safely at the spill site

Marine Spill Response Operations Course (MSROC)

This 40-hour course will enable trained and experienced personnel to coordinate and supervise the response operations of a marine oil spill. It is intended to train individuals to be On Scene Commander (OSC) for small (tier 1) spills, or operations section chief on larger spills. Topics include legislative framework, safety, equipment suites and strategies, media relations, RMS, shoreline assessment and cleanup techniques, and disposal. Prerequisites include BOSRC, a Radio Operator License and current or future deployment to a spill response team.

Environmental Response Duty Officer (ERDO) Training

This 15 hour course is a prerequisite for duty officers for the ER branch and the regional operations centre. It introduces the participant to CCG mandate, lead agency responsibilities and introductory spill assessment techniques. It also integrates delivery of training on the Marine Pollution Incident Reporting System (MPIRS), the database used to capture spill report and response information.

Pollution Response Officer (PRO) Training

This three day course is currently provided by the Environmental Response Branch of the Canadian Coast Guard and is required training for all Environmental Response personnel. Participants who successfully complete this course earn the designation of Pollution Response Officer under Part 8 of the Canada Shipping Act (2001). This course examines the powers of a PRO, specific procedures related to vessel directions and detentions and the legal framework and implications surrounding the execution of those powers. Course participants also learn sampling procedures and gain an understanding of the role of other government agencies involved in a marine pollution incident.

Pollution Prevention Officer (PPO) Training

This 40 hour course is currently provided by the Marine Safety Branch of Transport Canada. It is a prerequisite for any officer of the Canadian Coast Guard to be delegated Pollution Prevention Officer (PPO) powers under the *Arctic Waters Pollution Prevention Act*. Participants learn the existing pollution prevention and response regime, the powers of a PPO and the specific tasks of prevention, control, investigation and prosecution.

Small Vessel Operator Proficiency

This 21-hour course meets the training needs of the small vessel master. This course is required by regulation (for vessels less than 5GT on sheltered and near coastal voyages) and teaches participants to effectively manage safety of those on board, protect the vessel from damage and protect the marine environment.

Basic Barge Operator Training
This course was developed and is delivered by regional ER staff. Through both classroom and practical sessions, the course introduces participants to safe boating practices and procedures, rules of the road, collision regulations, load plans for pollution response vessels, safe deployment of oil spill response equipment and basic trailer towing and maneuvering.

Single Side Sweep System
The single side sweep is an equipment suite designed to allow one vessel to perform oil containment and recovery, and allow for temporary storage. This two day training session is provided to some ER staff and crews of Canadian Coast Guard vessels that can support this equipment. This training typically is conducted with crews who have previously completed BOSRC.

HAZMAT Awareness
This 6-hour course is intended for First Responders on the scene of a hazardous materials incident and shows how to assess the incident. Topics include; First Responder's role and responsibilities, scene safety, recognizing and identifying hazardous materials, incident management, and sources of assistance.

HAZMAT Technicians Level
This 40-hour course is designed for responders to releases or potential releases of hazardous substances. The focus is on recognizing and evaluating a hazardous materials incident, organizing the response team, protecting response personnel, identifying and using response resources, implementing basic control measures, decision-making, and protecting the public and environment. Emphasis is on hands-on use of equipment practically applying lecture information through exercises. Participants will wear fully encapsulating suits.
Prerequisite: Hazmat Awareness.

(c) Specialty Training
Specialty training includes training that only select members of the Regional Response Team (RRT) will have to apply.

Shoreline Clean up and Assessment (SCAT)
This 24-hour course covers how oil impacts the shoreline. Specific topics include shoreline types and effects of oil, wind, waves and ice on shorelines. Shoreline protection and cleanup methods are described in depth. Field exercises are conducted as part of the training.

Media Training
This 16-hour course is designed to provide participants with the skills and knowledge to communicate effectively and proficiently with various forms of media. Topics include; developing and disseminating incident information to

news media, incident personnel, other appropriate agencies and organizations.

Communications System Training
This 8 hours hands-on course provides participants with the knowledge and skills to provide communications in support of a spill response. Topics include; mobile telephone, fax, and intercom set up, preparing communication plans, and internal/external spill response communications.

Wildlife Rehabilitation
The capture and treatment of oiled wildlife is typically assigned to the trained experts at Canadian Wildlife Service (CWS). This CWS training is periodically made available to outside agencies, and some ER staff may participate to facilitate a better understanding of each others' role at the time of a spill.

Financial Management
This training is provided by the Public Service Commission (PSC) and teaches government spending and cost accounting principles. It is imperative that any response team member who may have to purchase assets or manage contracts be familiar with these practices and procedures.

Planning Section

During a spill response operation, the planning section of the RMS will likely be populated with ER staff whose substantive positions are as Planning Officers within the branch. Therefore, the planning skills and training required to effectively and efficiently perform these tasks should be resident within our branch staff.

Should additional personnel be required to fulfill these roles, they would require training in RMS, as well as Site Safety (as required by OSH regulation). The required planning skills and spill response knowledge may be acquired through various training or experience factors, and would be assessed prior to assignment on the response team. In addition to planning skills, preferred training might include SCAT, FROST and/or BOSRC, and MSROC.

Logistics Section

During a spill response operation, the logistics section of the RMS will likely be populated with ER staff whose substantive position involves the tracking of spill response equipment inventory and human resources within the region. Therefore, the skills and training required to efficiently and effectively perform the logistics function should be resident within our regional ER staff.

Should additional personnel be required to fulfill these roles, they would require training in RMS, as well as Site Safety (as required by OSH regulation). The required logistical skills may be acquired through various training or experience factors (knowledge of IRCMS and TMA, BOSRC training) and would be assessed prior to assignment on the response team.

Finance Section

During a spill response operation, the finance section of the RMS will likely be populated by regional finance staff whose substantive positions involve government expenditure and cost accounting knowledge and application. Therefore, the skills and knowledge required to effectively and efficiently perform the finance function should be resident within regional Canadian Coast Guard staff. These personnel will require RMS and Site Safety training prior to deployment on a spill response team.

Training Records

Records for personnel trained in spill response and/or emergency management are maintained by the Region.

4.5 Exercise Program

Introduction

Under the guidelines of the National Exercise Program (NEP), the Environmental Response Branch will implement a Regional Exercise Program. This program will be conducted over a three-year cycle. Coordination of the program will be the responsibility of the Regional Exercise Officer (RXO) of the Environmental Response Branch. Exercises will be designed and conducted in coordination with departmental staff, CCG base staff and CCG vessels on a regular basis. The purpose of the Regional Exercise Program is to validate environmental response training and regional emergency preparedness standards, policies and procedures.

Canadian Coast Guard will, through regional and area-specific exercising, ensure high priority initiatives such as exercising complex equipment (i.e. Lori Brush skimmers, sweep systems and command/communications facilities) are undertaken and will use industry and private sources of personnel where possible and/or appropriate.

Exercise Planning Matrix

The matrix below represents a typical three year exercising cycle followed by Canadian Coast Guard. The program cycle is designed to test all 17-response functions as outlined under NEP as well as including the different types of exercises. It includes internal, external (with other government departments as well as private sector organizations) and international exercises.

Table 4.1 *- Central & Arctic Region Exercise Matrix*

EXERCISE TYPE	YEAR1	YEAR2	YEAR3
Notification	**Quarterly**	**Quarterly**	**Quarterly**
Management	**2**	**2**	**2**
Operational drills	**3**	**3**	**3**
Combined Functional	**1**	**1**	**1**
Full Scale	**0**	**1**	**0**

Notification exercises will test the regional call-out system. Some of these exercises will be internal to the branch, some will be a full regional call-out to all CCG and DFO staff as well as to external resources (eg: freight contractors to check their availability to move Marine Emergency Response Trailers (MERTs) or First Response Units (FRUs).

Management exercises will focus on the development of the spill through the Response Management System (RMS).

Operational Drills will focus on equipment deployments in packages (i.e. a First Response Unit, NOFI V-Sweep).

Combined Functional exercises will be an equipment deployment (operational drill) with the goal of implementing a tactic designed in one of the Region's Area Plan Annexes.

A *Full Scale* exercise will incorporate a management-type exercise with the concurrent deployment of a spill countermeasure system (system = pollution containment, recovery, primary and secondary storage devices)

Exercising Partnership

Canadian Coast Guard will endeavor to participate, by request and on a situation by situation basis, in exercises lead by Oil Handling Facilities (OHFs), certified Response Organizations (ROs) and other government agencies throughout the Region.

Central and Arctic Region is a part of the Canadian Coast Guard response community and as such is also part of the International Response Community. Canadian Coast Guard's regional boundaries are in such close proximity with our United States neighboring response communities that joint exercising is a high priority. Specifically this region conducts joint exercises in the geographic areas of the Great Lakes and the Beaufort Sea with the United States Coast Guard's (USCG) (9^{th}) ninth (Great Lakes) and (17^{th}) seventeenth (Alaska) districts, respectively.

Exercise Evaluation and Shared Learnings

An important part of the National Exercise Program is the evaluation and use of subsequent findings. Four types of information can be learned from an exercise, all of which lead to improvement of overall response capability.

1) Contingency planning
2) Response techniques
3) Response training
4) Exercise program development

The primary sources of the information and learning will be the formal exercise evaluation report that is produced for every exercise by the evaluation team. This formal exercise report will follow the format laid out in Section 11 of the *Canadian Coast Guard National Exercise Program Planning and Evaluation Guide*.

4.6 Inventory Management, Maintenance and Infrastructure

Inventory Response Control Management System

To ensure that a nationally consistent and effective state of preparedness is maintained, an Inventory Response Control & Management System (IRCMS) has been implemented which utilizes The Management Authority database as its main tool. CCG HQ administers this system in concert with regional IRCMS Officers. In this region the program is administered by the Logistics and Statistics Officer in the Operations Section.

This system has been developed to:

- Maintain a real time record of the location and quantity of resources;
- Maintain a proper state of readiness through a pro-active approach using work orders and preventative maintenance;
- Assist in keeping response managers informed about Environmental Response's state of preparedness;
- Assist in the tracking of National Response Team personnel or equipment assigned to National or International incidents

Pre-positioned Equipment Caches and Depots

Central and Arctic Region covers an extremely large geographical and culturally diverse portion of Canada. There are, in essence, two zones of operation which are entrenched in the *Canada Shipping Act*. These are:

- the Arctic Zone, or all areas of Canadian jurisdiction north of 60^0 North Latitude; and
- the Central Zone, dominated in a marine transportation sense by the Great Lakes, but which include the southern portions of Hudson and James Bay, along with the major waterways and watersheds of Lake Winnipeg, Winnipegosis, Lake of the Woods, and Lake Athabasca.

The Environmental Response (ER) Branch has pre-positioned equipment to facilitate and maintain an effective response operation. Response strategies in each of the two zones (Central or Arctic) are based upon identification of local and regional response. This is means that the equipment generally required for such a spill size is contained within the Region. This capacity is supplemented by nationally available resources, which would be "cascaded" from/to other regions when and if required. Preparedness capacities in other regions are identified in their respective Regional Response Plans.

Arctic Zone

Arctic Community Packs (ACPs) are placed in northern communities for rapid (local) initial response. Canadian Coast Guard provides initial response training to members of the communities so that they may effectively deploy equipment in the ACPs in the event of a spill. Access (keys) for the ACPs have been given to an official in each community in most cases. The Senior Response Officer (ER-Hay River) maintains the current key holder listing.

The inventory for each Canadian Coast Guard Arctic Community Pack location is listed in Table 4-2. The program has received funding under the Health of the Oceans Initiative to proceed with placing Arctic Community Packs in additional sites. The equipment profiles at the existing Arctic Community Pack sites will be changed to reflect characteristics of the community. The inventory at all communities will be "site specific" and will coincide with response strategies designed by the ER planning group. The locations for the proposed additional Arctic Community Packs are: Baker Lake, Broughton Island (Qikiqtarjuaq), Chesterfield Inlet, Churchill, Hall Beach, Kimmirut, Iqaluit, Pangnirtung, Tuktoyaktuk and Yellowknife.

The main base of operations with Environmental Response dedicated personnel is located in Hay River, Northwest Territories. This base is home to a Rapid Air Transportable (RAT) cache of equipment known as the "RAT150". The RAT150T used in conjunction with the "Delta" (Δ) 1000T meets planning standards for a 1000 tonne (T) response. The selection of equipment for the RAT150 must meet pumping rates / capacities of 1000T thresholds and be complimentary[2] to the equipment held in the Δ1000T depots.

The response package, warehoused in Hay River, will be maintained in 100% readiness during the shipping season. The equipment will be broken down and be containerized such that it will fit through the smallest cargo door of any of the selected aircraft. Equipment will be TDG compliant, be palletized as appropriate, and labelled for ease of selection and loading.

[2] The logistics of moving large bulky items (ISO containers) in the arctic necessitates a LCM, deck barge, cargo vessel, icebreakers or any combination thereof. Consequently it is estimated that the 1000T design capacity would be available staged on-scene in 5 - 7 days. Following the doctrine *something sooner rather than everything later* having 150T of the 1000T equipment suite air-lifted within 48 hours is preferable to having nothing until the entire 1000T capacity arrives a week later.

Table 4-2 *- Canadian Coast Guard Arctic Community Pack Locations*

LOCATION	EQUIPMENT SUMMARY			
	Boom (24")	**Skimmers**	**Boats**	**Storage**
Arctic Bay (Ikpiarjuk)	3,650'	TDS-118	16' Aluminum	Open top Tank
Cambridge Bay (Ikaluktutiak)	1,350'	TDS-118	16' Aluminum	Open top Tank
Cape Dorset (Kinngait)	1500'	TDS-118	16' Aluminum	Open top Tank
Clyde River (Kangiqtugaapik)	4,500'	TDS-118	16' Aluminum	Open top Tank
Coppermine (Kugluktuk)	1,350'	TDS-118	16' Aluminum	Open top Tank
Coral Harbour (Salliq)	1,500'	TDS-118	16' Aluminum	Open top Tank
Gjoa Haven (Uqsuqtuuq)	1,350'	TDS-118	16' Aluminum	Open top Tank
Holman (Ulukhaktok)	1,500'	TDS-118	16' Aluminum	Open top Tank
Rankin Inlet (Kangiqsiniq)	2,200'	TDS-118	16' Aluminum	Open top Tank
Resolute (Qausuittuq)	1,350'	TDS-118	16' Aluminum	Open top Tank
Hay River FRU +	1,000'	-	37' Seatruck 42' Cutter	-

In combination with the RAT150T, equipment found in the ∆1000T depots will be at a 1000T capacity. Hence, the delta or "∆" is the difference between the RAT150T and a full 1000T. The ∆1000T depots will have containerized heavier equipment (not suitable for air transport to smaller communities) augmenting the RAT150T to a 1000T capacity, ready to be loaded on deck barge, Canadian Coast Guard icebreaker or freighter. While response personnel cascade in to the spill site pre-identified local, CCG base and available ER personnel will mobilize to the centres and load the equipment on suitable marine transport.

Three ∆1000T depots are strategically located in the northern communities of Tuktoyaktuk (NorthWest Territories), Iqaluit (Nunavut), and in Churchill (Manitoba). For the purposes of response in Central & Arctic Region, Churchill is included in the Arctic Zone of operations despite it being south of 60° North Latitude due to the similarities in response characteristics that it shares with locations north of 60° North Latitude.

Table 4-3 *- Canadian Coast Guard Arctic Design Inventory*[3]

PCM equipment	Description	Hay River RAT150T	Tuk Δ1000T	Iqaluit Δ1000T	Churchill Δ1000T

	Liquid waste	2	0	0	0

Central Zone

The Central zone is dominated by the Great Lakes and has well defined road transportation infrastructure.

Local / first response inventories have been established at all regional Canadian Coast Guard shore-side facilities that have fleet assets or a significant number of program vessels and that have operational personnel to deploy the equipment. Standardized inventory consists of a 20-24' trailer with a 1000' (nominal) of 24" boom and related accessories.

The 2500T Rapid Road Transportable cache is centred around the St. Mary's River and from time to time in major CCG facilities in Ontario. The response package warehoused in a series of 45' transport trailers will be maintained in 100% readiness during the shipping season. The primary purpose of the RRT 2500T system is significant containment of resources; shoreline, sheltered, and off-shore sweep and recovery ability; and staging and storage transfer area equipment.

[3] Inventories in Tuktoyaktuk and Iqaluit are at 95% completion. The Churchill Depot is at about 50% (pending the construction of a new and adequate facility) with the bulk of the inventory in storage at the Thundar Bay Coast Guard base. The RAT 150 needs an evaluation of the command and control component as well as storage for the second Saccke burner.

Table 4-4 *Canadian Coast Guard RRT 2500T Design Inventory*

PCM equipment	Description	BOOMERT #1-5 (each)	SKIMMERT #1 and #2[4]	Softside
Skimmers	Light to medium product/ disk type	-	3

Thunder Bay	Lake Superior	SAR crew	ITS field services
Tobermory	Lake Huron	SAR crew	
Hay River	Mackenzie River & Delta	ER personnel	ITS field services

[4] An additional SkimMERT is being added this year to accommodate additional hoses. The exact configuration of each SKIMMERT is not known yet so the inventories will remain listed together for this year.

Section 5 - RESPONSE OPERATIONS

5.1 Pattern of Response

Based upon the principles outlined in the *National Response Plan*, *(Sections 1.3, 1.5 & 4.4),* Central and Arctic Region assesses, notifies relevant parties, and initiates the tasking/deployment of necessary resources. This is based upon the determination of CCG's role as Lead or Resource Agency and the appropriate CCG Posture. The Duty Officer (DO) is tasked with this initial assessment, which is then verified by the Superintendent, Environmental Response. The appropriate response is activated by the Superintendent who in turn assigns an On-scene Commander (OSC) or Federal Monitoring Officer (FMO) and notifies Canadian Coast Guard (CCG) Management. Upon termination of the incident cost recovery actions are undertaken. To illustrate the generic process see Figure 5-1-Typical Sequence of Events and Table 5-1-Typical Functions Descriptions has been provided.

CCG Expectations of Ships for Response

In most instances when a spill occurs the initial report will trigger the mobilization of local response organizations. It is not normally practical for ship personnel to be directly involved in the clean up activities.

Small Spills

Ships are expected to take whatever actions listed in their Shipboard Oil Pollution Emergency Plan (SOPEP) that are reasonable and necessary to prevent the oil from escaping over the side and having done so, to take action to clean-up the oil contained on deck. Spilled oil should not be washed overboard, nor should degreasers or dispersants be used on spilled oil in the water. Once the oil is in the water, the ship's ability to respond in a practical manner is greatly reduced. It is Canadian Coast Guard's expectation that a response organization or other competent contractor be called upon to provide operational response capability at the discretion of the Polluter.

Where there is no availability of local response contractors or where there is a delay in response activation, the Master of the vessel should consider the use of available materials to contain and clean up the spilled oil by, for example, using ship-stocked absorbent material or utilizing mooring ropes or air filled hoses as makeshift booms.

Large Spills

The ship is restricted as to what action it can take to respond to a major spill. In the case of a casualty the safety of the ship and crew take priority. Therefore the ship's actions will be limited to reporting the incident details

to the appropriate authorities and to ensure that a response is initiated. In large spills it is Canadian Coast Guard's expectation that the Polluter appoint an On-Scene Commander (OSC) which may be a representative of the company that owns the ship or the ship's insurer.

Canadian Coast Guard needs to be kept informed as to the escalating response costs accrued by the Polluter during a response in order to prepare for the possibility that the Polluter will cease their response activities once their Limit of Liability is reached.

CCG expectations of Oil Handling Facilities (OHF) for Response

In most instances when a spill occurs, the initial report will trigger the mobilization of the facility response team. It is normal, in most cases, for the oil handling facility personnel to be the initial responders when a spill occurs.

Small Spills

For the purpose of this plan, a small spill will be defined based on the maximum oil transfer rate of the oil handling facility (i.e. what Level it is assigned under the *Canada Shipping Act, 2001),* which directly links to the minimum spill size to which it must be prepared to respond to within one hour. Oil handling facilities are required to have the resources on site to contain a spill of a minimum size within one hour and have the resources required to recover, or where the oil cannot be recovered the resources to control a spill of a minimum spill size within six hours. Response organizations may be called upon to provide additional operational response capability at the discretion of the Polluter.

Large Spills

For the purposes of this plan, any spill above the facility's minimum spill size will be characterized as a large spill. Oil handling facility personnel are still expected to deploy their on-site equipment. Response organizations will likely be called upon to provide additional operational response capability at the discretion of the Polluter.

Figure 5-*1 - Pattern of Response – Typical Sequence of Events*

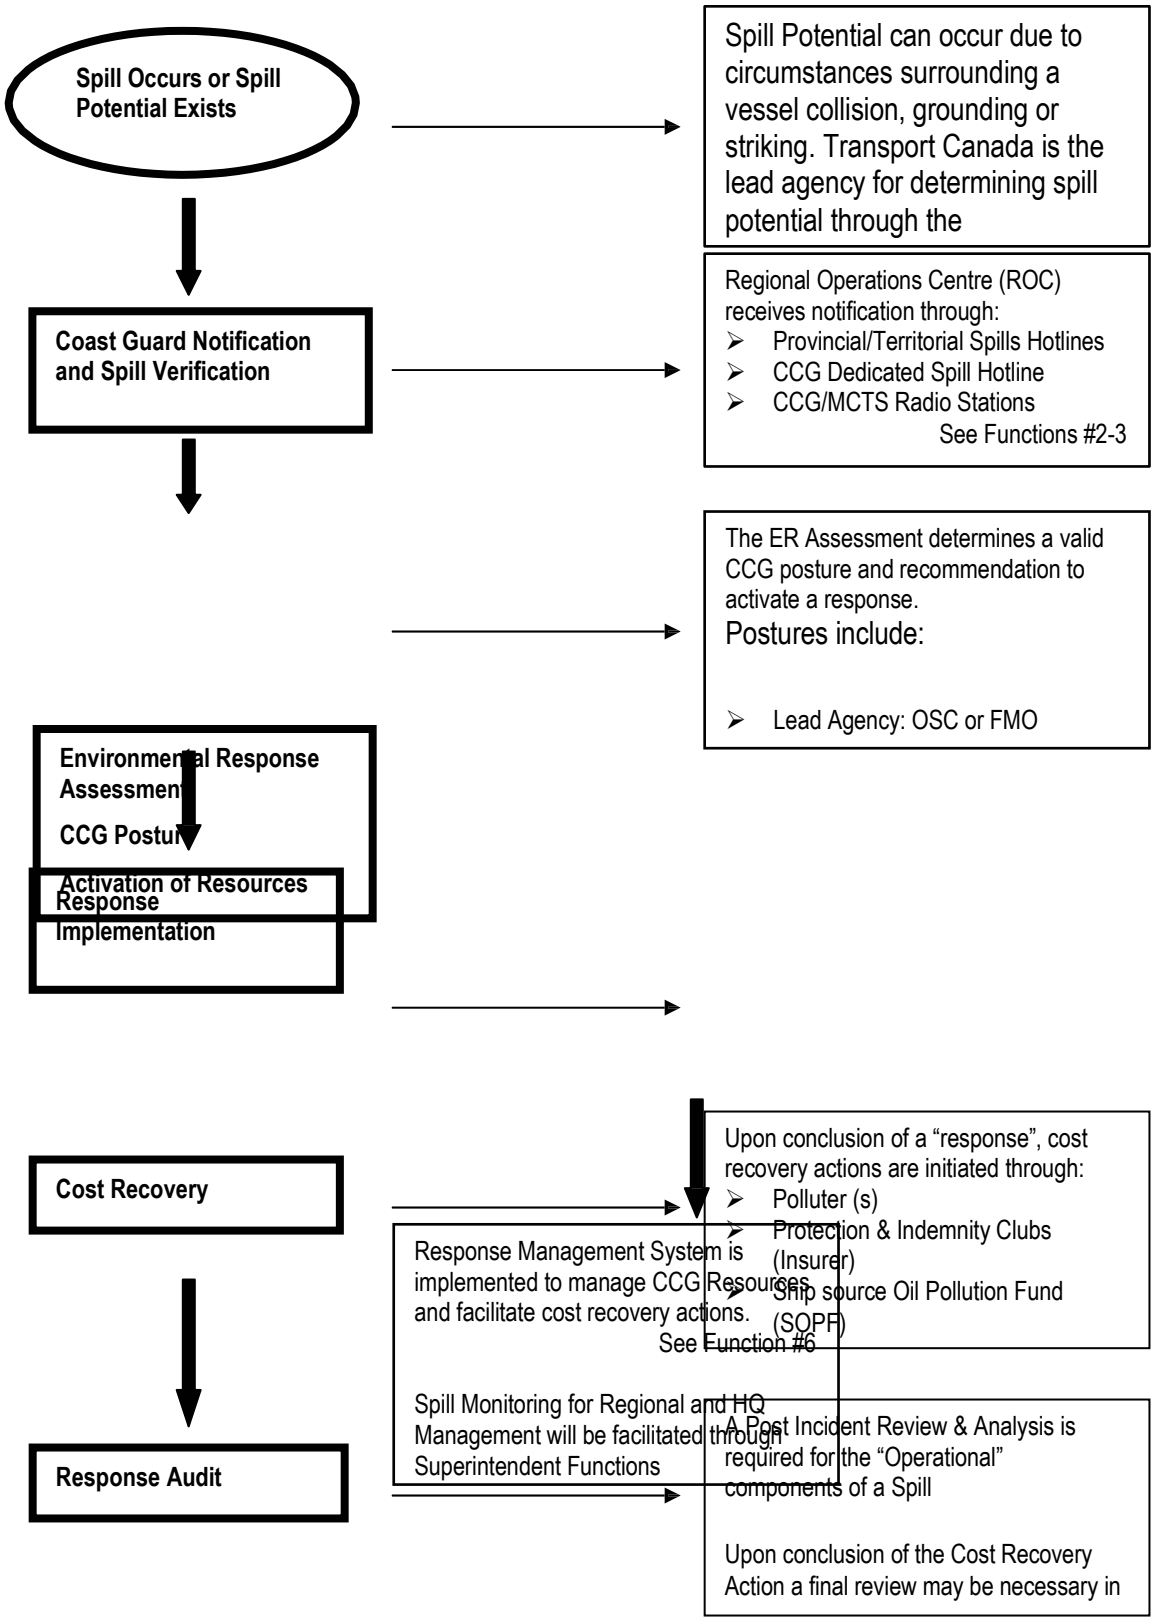

Table 5-1 *- Pattern of Response – Function Descriptions*

Function		***Description***
1	**Responsible Party/Third Party Functions** *(Spill occurs or sufficient potential risk exists)*	• Spill is sighted/reported. Spill reports originate from source (to regulatory body) or by third party (to various emergency or dedicated pollution hotlines) • Transport Canada is responsible for determining potential risk
2	**Spills Hotline Functions** *(Canadian Coast Guard Notification)*	• Assessment for dissemination • Dissemination (fan out according to applicable procedures) to relevant parties, calls from other spill hotlines are received by CCG-ROC.
3	**CCG-ROC Duty Officer Functions** *(Canadian Coast Guard Spill Verification)*	• Spill Assessment-pollution verification ➢ Mandate Confirmation ➢ Pollution Verification ➢ Source Credibility • Notification to ERDO • Dissemination • Initiation of MPIRS
4	**ER Duty Officer Functions** *(Environmental Response Assessment – CCG Posture)*	• Spill Assessment-response analysis • Source Control/Mitigation • Safety Issues • Tactical & Logistical Issues • Recommendation to Superintendent of likely Response Posture • Documentation – MPIRS
5	**Superintendent Functions** *(Environmental Response Assessment – Activation of CCG Resources)*	• Response Posture Evaluation ➢ Potential Risk to CCG Personnel and Equipment ➢ Propriety of request ➢ International Implications • Identification of OSC/FMO • Obtain an Order-In-Council (Arctic) • Obtain a Finance Code & Regional File Number • Notification of Senior Management and ongoing monitoring • MPIRS documentation • Obtain AC CCG sign off on MPIRS situation report
6	**OSC/FMO Functions** *(Response Implementation*	• Management or monitoring of response using the Response Management System (RMS). Escalation or de-escalation in accordance with needs of the incident. • Consolidation of all documentation upon conclusion of the response for Cost Recovery purposes. • Coordinate final debrief to facilitate future improvements to the systems and processes in place.
7	**Chief Financial Officer Function** *(Cost Recovery)*	• Utilizing CCG Ship-source and Marine Pollution Response Costing Principles and Documentation Standards (DFO 6332) compile pollution response costs recovery claim.

8.	**Internal** **Review Team Functions** *(Audit)*	• Utilizing the National Exercise Program Planning and Evaluation Guide, a Team is selected to complete the Post-Incident Review of an incident. • Improvements & corrective actions are to be documented

5.2 Spill Potential or Pollution Risk Assessment

Given an actual spill (i.e. pollutant in the water), the activities specified in this plan are rather obvious. However, in the event of vessel grounding, striking or collision that does not immediately result in a release, the responsibility for determining the risk of pollution rests with a Pollution Prevention Officer (PPO) within the Marine Safety (MS) branch of Transport Canada (TC). Should TC-MS be unable to make that determination, the Canadian Coast Guard (CCG), Environmental Response Duty Officer (ERDO) will complete that requirement. In some cases this may involve engaging a marine architect as no accredited expertise for vessel stability assessment resides within the ER section.

For all other areas where Canadian Coast Guard is the Lead Agency, this activity shall be considered the responsibility of the Canadian Coast Guard, Environmental Response Duty Officer.

5.3 Notification

To facilitate the notification of Canadian Coast Guard, and in addition to the existing Marine Communications system, a series of call-out or “Spill Hotline” agreements with the Province of Ontario, Nunavut and Northwest Territories and other Federal Departments within the Region have been implemented.

In addition, Central and Arctic Region, provides a 24 hr public access spills hotline:

24 hour toll free - Spills Hotline:
1-800-265-0237

Notification may occur through various mechanisms, depending upon the manner in which the spill (incident) occurs.

5.4 Verification

In all cases, spill information is initially processed and verified through the Regional Operations Centre (ROC) located in Sarnia, Ontario (See Section 3.3 – Organization). The ROC Officer on duty:

1. Determines whether the pollution is within Canadian Coast Guard’s mandate as Lead Agency or as a potential Resource Agency
2. Establishes the credibility of the source

3. Identifies the following:
    - Incident name (nature of incident)
    - Time of call (local / UTC)
    - Time of spill (local/UTC) *(if available)*
    - Reported by / call back particulars
    - Source determination
    - Incident background and description of clean-up activities (if any)
    - On-scene environmental/atmospheric conditions
    - Pollutant type and quantity
    - Verifying party contact information (as applicable)
4. Initiates an MPIRS entry for the following cases:
    - Originally pursuing verification as Canadian Coast Guard mandate but additional information about source changes lead to another agency
    - Canadian Coast Guard mandate and verified no pollution
    - Canadian Coast Guard mandate and verified pollution
    - Likely to impact on / impacting on foreign waters
    - Significant impact on region, though not falling under Canadian Coast Guard mandate.
    - Request for Canadian Coast Guard as a resource agency.
5. Enters information into MPIRS (indicated in #3 above) as well as name of paged ERDO.

This information is then relayed to the Environmental Response Duty Officer to determine Canadian Coast Guard posture. It should be noted that all spill incidents, irrespective of CCG's mandate, may require Canadian Coast Guard resources if requested (see Resource Agency Role in Section 1.5 of the *National Response Plan).*

By agreement, spill verification will be completed by the Regional Operations Centre (ROC) Duty Officer. The verification will be complete when the ER Duty Officer is advised where Canadian Coast Guard is Lead Agency. (see Figure 5.2 Pollution Verification Process and Figure 5.3 Response Analysis Process)

5.5 Spill Assessment – Environmental Response Duty Officer

To facilitate the requirement for efficient and rapid notification and assessment of incidents, Central and Arctic Region, in accordance with the *National Response Plan,* Section 4.4, has instituted a 24-hr year round monitoring regime integrated with the Regional Operations Centre (ROC). The following sections identify the context in which this activity is carried out.

Coordination

The coordination of the ER Duty Officer is the responsibility of the ER Regional Emergency Operations Officer (REOO). These duties include assigning shifts in an equitable manner, keeping records of the duty officer schedules, maintaining equipment required to perform ER Duty Officer functions, reviewing individual ER Duty Officer performance, reviewing ER Duty Officer procedures, and liaising with the ROC and National HQ.

Performance

The ER Duty Officer function shall be performed by the following positions provided sufficient experience, appropriate training, and at the discretion of the Superintendent ER:

- ✓ Senior Officers
- ✓ Those in capacity to act for Senior Officer.

Review

The ER Duty Officer procedures shall be reviewed in reaction to:

- Changes at the Regional Operations Centre (ROC) affecting the ER Duty Officer function
- Changes in Canadian Coast Guard (CCG) policy on the response to ship source pollution
- In consideration of accepted recommendations stemming from exercises and operational responses.

The individual officer performance shall be reviewed in context of their execution of a spill assessment.

Responsibilities

At the beginning of the ER Duty Officer's shift the following are required:

- Functioning communication equipment (pager, cell phone/Blackberry);
- The necessary analytical tools (e.g. spill assessment forms, Greenwood's Guide to Great Lakes Shipping, Area Plans, Oil Spill Response Field Guide, OSH reference tools, and the CANUTEC Emergency Response Guide book.)

During the ER Duty Officers shift the following are required to be complete:

- MPIRS cases for any spill reports that required ER Duty Officer analysis by noon of the next business day;
- Extra Duty Reports;
- Notification of the next ER Duty Officer and the ER Regional Emergency Operations Officer of any on-going cases.

Availability

The availability of the ER Duty Officer is 24 hours/7 days a week. Pages must be responded to within 10 minutes of notification. Should the ER Duty Officer (DO) be unable to fulfill their duties at any time during the shift, they are required to

notify the ER Regional Emergency Operations Officer (REOO) immediately who will notify the ROC of any changes immediately. The following activities conflict with the performance of the ER Duty Officer function:

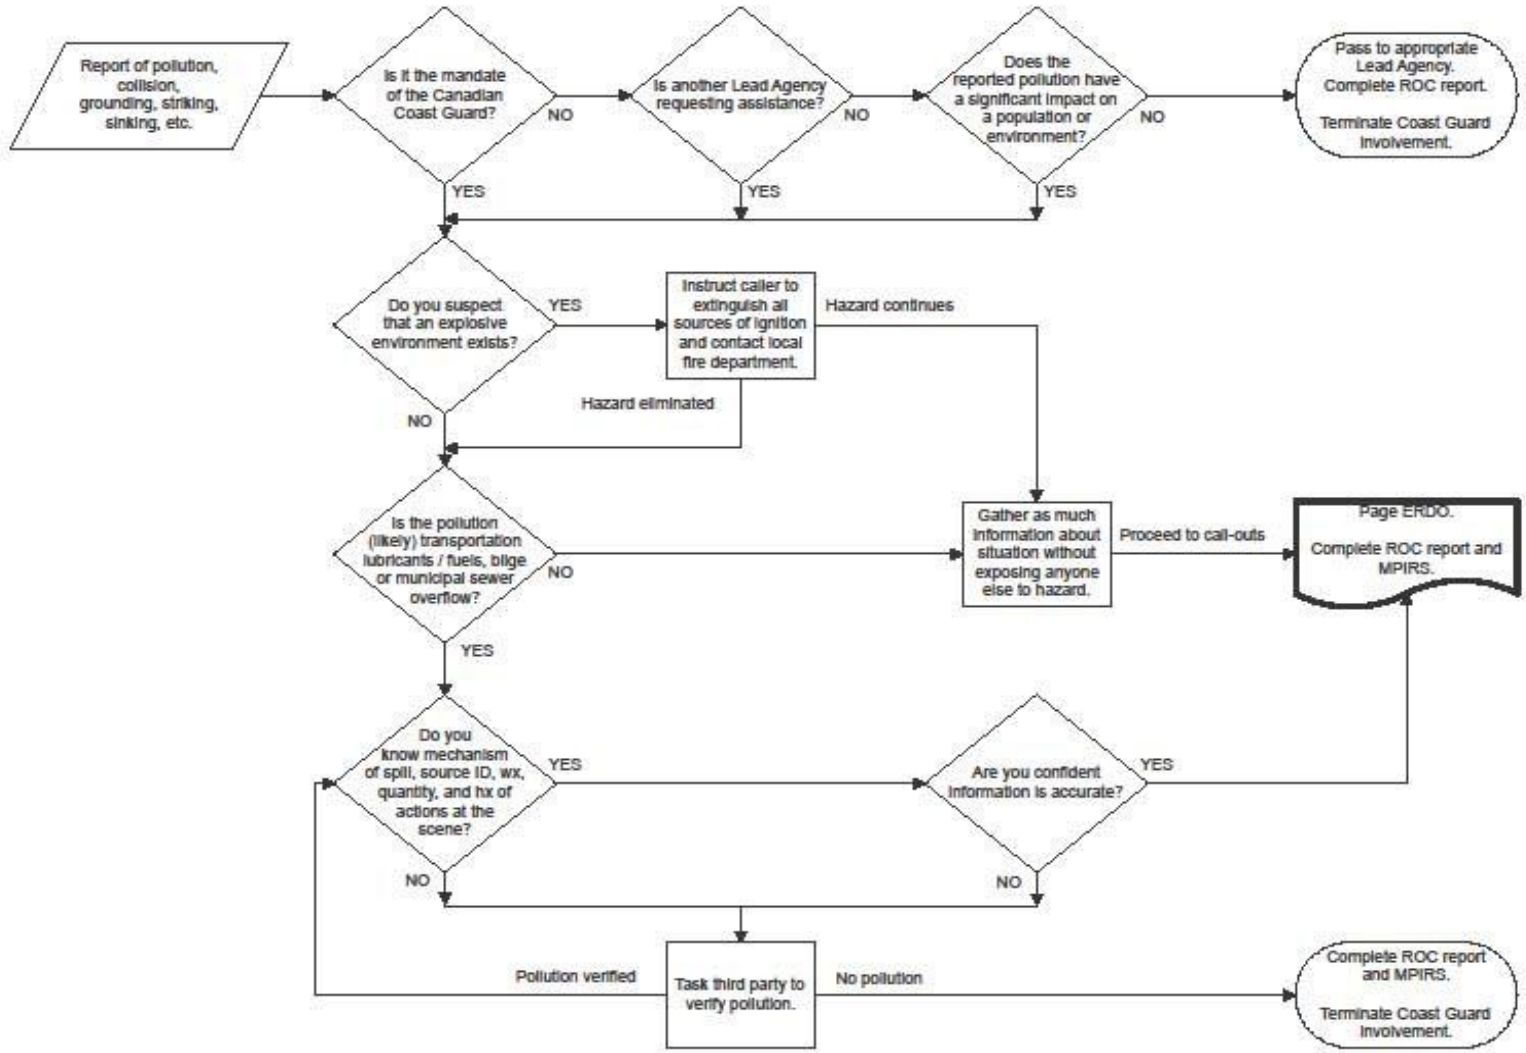
- travel out of country / region / pager range;
- inability to respond immediately due to performance of other job functions (instructing a course, running an exercise, delivering a presentation, involved in a maintenance run that would be too difficult to reschedule, chairing a meeting, or participating in any activity that requires attendance or would be inappropriate to leave);
- inability to respond immediately due to personal reasons (vacation, sickness, etc.).

Should an individual become unavailable for a significant portion of the shift for reasons noted above, that shift may be assigned to another officer at the discretion of the ER Regional Emergency Operations Officer.

Function

The primary function of the ER Duty Officer is to complete an initial incident assessment and analysis, making a recommendation to the Superintendent of ER as to the appropriate course of action. [**]

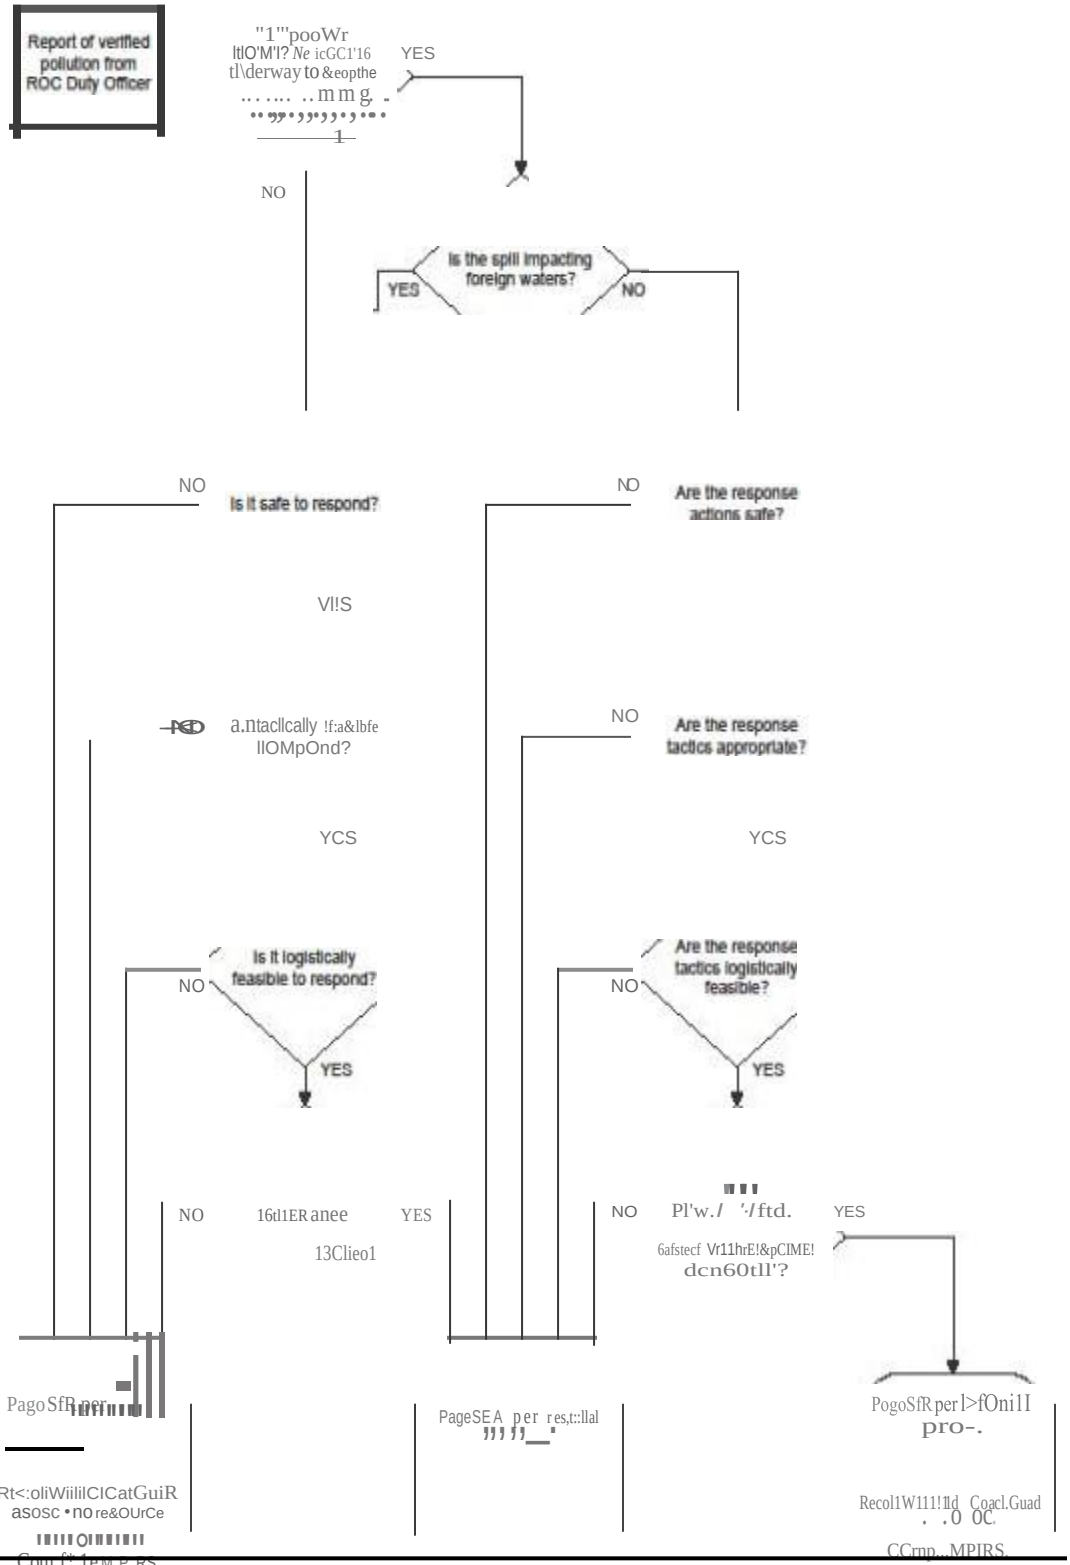
The initial assessment will be complete for the following cases:



- Canadian Coast Guard mandate and verified pollution
- Likely to impact on / impacting on foreign waters
- Significant impact on region, though not falling under Canadian Coast Guard mandate.
- Request for Canadian Coast Guard as a resource agency.

The analysis function is complete when the Superintendent ER is informed and advised of the recommended course of action that will consider the following (see flow chart):

- polluter's actions and intentions (if applicable);
- safety concerns, tactical, logistical, and environmental feasibility of any response.



[**] The ER Duty Officer does not need to notify the Superintendent of any incidents that require "no activation" of CCG resources (assets/personnel) in monitoring/clean-up activity.

Spill assessment: *pollution verification process*

complete MPIRS.

5.6 Activation of Canadian Coast Guard Response Resources

In the event of small (0-150 T) to medium size (150-1000 T) spill incidents, the Superintendent, Environmental Response, acting upon the assessment provided by the Duty Officer, initiates/activates the appropriate response. This entails, but is not limited to, the following activities:

- Identification of overall health and safety risks to response personnel.
- Establishing the propriety of the recommended response posture. This includes the verification of international issues in border areas.
- Verification of Canadian Coast Guard capability to respond, impact on normal regional operations and, if necessary, the potential requirement for the notification and activation of the National Response Team.
- Assignment of the designated On-Scene Commander (OSC) or Federal Monitoring Officer (FMO). SROs are typically assigned as FMO/OSC for incidents occurring within their geographic area.
- Obtaining the necessary Order-in-Council, for spills in Arctic Waters
- Obtaining the financial project code, and forwarding it to the OSC/FMO.
- Signing a contract with the Response Organization (RO) in accordance with PWGSC contracting rules.
- Creation and dissemination of initial situation report to Regional and National management in accordance with the *Safety and Environmental Response Systems (SERS) – Incident Notification Guidelines*.
- Completion of MPIRS to document above activities.

For significantly larger spill incidents (1000T and above) the Superintendent, Environmental Response shall immediately assume the OSC/FMO role, notify Regional and National management of the situation and initiate the Response Management System (RMS) (and activation of the National Response Team, if necessary) in addition to the above activities. Upon stabilization of the immediate emergency, the Assistant Commissioner, Canadian Coast Guard, Central and Arctic Region and/or Director General, Canadian Coast Guard shall assess the requirement for assigning a new OSC/FMO.

5.7 Response Implementation

As stated previously (Section 4 - Preparedness), the Canadian Coast Guard will employ the Response Management System (RMS) as its primary management and operational tool. At the heart of this system is the development of clear obtainable objectives and the implementation of the supporting tactical deployment. This is achieved through the creation of incident action plans spanning specified operational time periods. For small spills these plans can be rather informal. As spill size and impacts increase, so to will the complexity of

operational assignments and hence a need for greater formalization of the Incident Action Plan.

All operations shall be carried out in accordance with the Guiding Principles set out in *Section 1.3* of the *National Response Plan* and the *Oil Spill Response Field Guide* (ISBN 0-660-16112-5).

Central and Arctic Region covers an extremely large geographical and culturally diverse portion of Canada. There are, in essence, two zones of operation which are entrenched in the *Canada Shipping Act*.
These are the:

- Arctic zone, or all areas of Canadian jurisdiction north of 60^0 N Latitude;
- Central zone, dominated in a marine transportation sense by the Great Lakes, but which include the southern portions of Hudson, James and Ungava Bay, along with the major waterways and watersheds of Lake Winnipeg, Winnipegosis, Lake of the Woods, and Lake Athabasca.

Arctic zone – first response
The highest risk of pollution in the arctic is during a ship fuel transfer to facilities in Canada's northern communities. Should pollution occur, the vessel and oil handling facility have responsibilities to implement their Oil Pollution Emergency Plans (OPEP) that deal with source control. The next step would be for the community to respond using its response plan, protecting the identified priority area(s) and employing the response equipment in an Arctic Community Pack, if so equipped.

Arctic zone – escalation
If the pollution is beyond the ship, facility, and community response then the Rapid Air Transportable (RAT)150T will be the first line Canadian Coast Guard ER response (Arctic icebreakers or Special River Nav-aid Tenders may have been on-scene first). Upon activation of the RAT150T, standing offers with aviation contractors will be called up. Closest ER personnel will be dispatched to the community to assess, plan, assemble (and train) responders, while preparing to stage the in-coming equipment. The Hay River base personnel will transport the pallets to the airport where they will be loaded into the awaiting airframe. Upon arrival the pallets will be unloaded and a trailer tongue and wheels affixed to the pallet to facilitate movement (by ATV if necessary) to a forward staging area and ultimately to a beach site. The timeframe for full forward staged capacity with personnel at any community with suitable runways is under 48 hours.

The hospitality industry of Arctic communities can be rapidly overwhelmed with the influx of as little as 10 people. Experience has shown that these communities could only support 10-15 additional personnel and only offer 10-15 community responders. Consequently, the RAT was designed considering the amount and type of equipment that is most easily handled by a combination of trained

Canadian Coast Guard personnel and community responders. The RAT150T response is predicated on an in-community response with the following positions identified in the table below:

Table 5-2 *Anticipated personnel usage for the RAT150T in an Arctic community*

Position	Canadian Coast Guard responder	Community responder
OSC	X	
OSC support		X
Chief Ops & Planning	X	
Logs – services	X	X
Logs – support	X	X
Ops skimming (A)	X	X

Ops shoreline (A)	X	X X X X
Ops shoreline (B)	X	X X X X
Ops booming vessel (A)	X	X
Ops booming vessel (B)	X	X
Transfer / disposal	X	X
Totals	**11**	**16**

Upon escalating beyond a RAT150T response, the Δ1000T will be stood up. Standing offers / arrangements with local contractors will be activated to move the containers / seatrucks to a location where they can be transferred to a ship / barge. If required, closest Canadian Coast Guard base personnel will be dispatched to the depot to assist. The closest suitable marine transportation asset will also be contracted to move the equipment to the spill site. The timeframe for full forward staged capacity with personnel is estimated at one week.

As the 150T response is predicated on an in-community response a larger spill would have to be supported by a Canadian Coast Guard icebreaker, rented camp barge, or flown in from surrounding communities.

Table 5-3 *Anticipated personnel usage for the 1000T in an Arctic community.*

Totals	**14**	**13**	**13**

Central Zone – first response

The highest risk of pollution occurring in the region is found in the Great Lakes. Statistically the areas in the Great Lakes of highest risk are the connecting channels due to volumes, numbers of transits, and convergence factors (existing VTS / navigational aid systems recognize this). Areas with traditionally high pleasure craft and small commercial craft traffic experience frequent (though low in volume) pollution incidents.

If the pollution is in the local vicinity of a Canadian Coast Guard Search and Rescue (SAR) station or facility with operational staff, a First Response Unit (FRU) may be deployed as an initial attempt at containment. If more equipment sweeps systems or recovery units are required then the Rapid Road Transportable (RRT) 2500T will be activated.

Transfer of Lead Agency

Transfer of Lead from CCG

Should an incident initially appear to fall within the jurisdiction of the Canadian Coast Guard yet later is determined to be another government agency's

responsibility, the CCG-appointed OSC or FMO will verbally acknowledge the transfer of Lead Agency responsibility followed by written confirmation on the terms of the transfer (this may require time for termination of a response contract with CCG and the establishment of a response contract with the appropriate Lead Agency.) When the Lead is transferred from CCG to another Lead Agency, CCG will submit an invoice of its response costs to the Lead Agency for response activities undertaken up to the time of transfer recognition.
Should the Lead Agency wish to retain CCG as a Resource Agency, the criteria in Section 7 of the *National Response Plan* of the *CCG National Marine Spills Response Plan* will apply.

Transfer of Lead to CCG
When the Lead is transferred to Canadian Coast Guard from another agency, the Canadian Coast Guard will incorporate the appropriate costs borne by the other agency in the initial stages of the spill into its claim to the Polluter or to the Ship Source Oil Pollution Fund, (SOPF) as the case may be.

Safety Procedures and Considerations

All petroleum cargoes are considered hazardous substances. Canadian Coast Guard command, clean-up, monitoring and verification personnel have protective equipment and training available to them up to Level “D”. All Environmental Response branch staff have been issued with a variety of personal protective equipment (PPE) and are expected to deploy to a spill site (includes exercises and training) with all appropriate gear. Safety glasses and rain suits with rubber boots and gloves are appropriate for Canadian Coast Guard's traditional verification of and response to oil pollution.

Bulk chemical carriers, rail cars, road trailers, sour (H2S) petroleum products or BTX (benzene, toluene, xylene) carried on oil tankers are all sources of substances for which Canadian Coast Guard personnel are not readily equipped for. In most cases where the pollutant reported is suspected to be from one of these sources Canadian Coast Guard assets should not be tasked to verify. If it falls within Canadian Coast Guard mandate the ER program personnel will get directly involved in the verification, likely looking to other government departments or contractors to continue with the assessment and response.

When the pollution is reported to the ROC by a member of the public, or by a credible professional as a mystery spill, closer examination of the circumstances or probable cause of the pollution will occur as part of spill verification. During the conversation with the individual reporting the incident the ROC Duty Officer will want to find out what it is that they observed. These are:

- Colour [typical petroleum silvery to rainbow to dark purple / brown or is it frothy, green organic matter, rusty, etc.]
- Odour [does it smell like gas, diesel, rotten eggs, no odour]
- Proximity to any likely source [vessel, industrial outfall, municipal outfall, midlake, mid channel, washed up industrial storage drum]

- Volumes [football field sized, shopping mall parking lot big, or a thin ribbon]
- Other factors [heavy rainfall in last 12 hours; seasonal conditions / times / areas known for algae blooms; fish or animal kills].

By picking up on any "flags" during an assessment it can be reasonably determined whether the pollution should not/should be classified as a hazardous substance (for which CCG personnel are unable to respond to). The ER duty officer will consult with experts in Environment Canada (EC), Spills Action Centre (SAC), and CANUTEC, as appropriate to determine the safety for personnel.

Alternative countermeasures

Alternative countermeasures are those non-mechanical techniques utilized in oil spill response operations such as in-situ burning, dispersant application, and shoreline cleaner application.

Central Zone

The likelihood of approval of in-situ burning operations on the Great Lakes or in connecting channels or inland lakes is minimal. The use of dispersants in the Great Lakes, connecting channels or in inland waterways will not be considered. Shoreline cleaner agents approved by Environment Canada may be considered.

Arctic Zone

In view of the difficulties associated with mounting an effective response in the Arctic, the CCG has recommended that further research be done in the areas of in-situ burning, the use of dispersants (reference Quebec paper) and other oil in ice recovery methods. This research should be operational R&D and assume that the product spilled is Arctic diesel and that the spill occurs during the Arctic shipping season.

5.8 Summary Report and Post Incident Review

It is regional policy to provide a Summary Report and/or conduct a formal Post Incident Review for incidents deemed noteworthy or valuable by the OSC/FMO or Assistant Commissioner, Canadian Coast Guard.

Summary Report

The summary report shall contain at minimum the following, but can include any information deemed relevant by the OSC/FMO.

Summary Incident Report Format

(a) Overview of Crisis Event

- spill source (not cause), initial environmental conditions and assessment of situation

(b) Spill chronology
- spill response activities and climate/wind /sea condition data
- key response objectives (success and failures in implementation), major shifts in tactics, other agencies involvement

(c) Costs and cost recovery issues
- total estimated cost summary
- identification of Cost Recovery requirements and options

(d) References
- Situation Reports

Post Incident Review

The main objective of a Post Incident Review is the evaluation of the incident to ultimately improve Canadian Coast Guard's effectiveness at spill response. To that end, this requirement is essentially similar to the principles of exercise evaluation. Therefore, when required, the review shall be conducted in accordance with the principles contained in the *National Exercise Program – Evaluation guidelines, Chapter 11*.

This entails six distinct tasks:

1) Brief the Evaluation Team
2) Brief the Response Team
3) Evaluate the Incident
4) Prepare a Preliminary Summary of Key Observations
5) Hold an Incident Debriefing Session
6) Prepare an Official Post Incident Evaluation Report

Post Incident Evaluation Report Format

(a) Executive Summary -Summarizes overall findings and observations

(b) Overview of Incident Objectives -Briefly describes the key objectives, environmental conditions and initial situation assessment

(c) Evaluation Techniques and Criteria - Describes the technique(s) (i.e. self, peer or independent evaluation) and the major evaluation criteria used

(d) Assessment of Key Incident Objectives - This provides a critical appraisal of the incident objectives or major shifts in tactics. Each key objective assessment will include the following:

Findings – A summary statement describing key positive and negative findings.

Specific Observations - Observed decisions and tasks noted during the incident by responders, management and interested parties.

Conclusions - Assessment of the impact of the finding on overall achievement of the incident objective(s)

Recommendations – A description of potential corrective or follow-up action required to implement the findings to improve overall marine spill response preparedness.

(e) Appendices or Attachments - May or may not be required

Section 6 – CLAIMS & COST RECOVERY

6.1 Purpose

The purpose of this section of the *Regional Response Plan* is to outline the requirements and regional processes to assist in the creation of a claim to the relevant fund or directly to a polluter.

The ability of Canadian Coast Guard to recover or pursue recovery of response expenses or costs associated with monitoring activities is set out in the *Marine Liability Act, Part 6, "Liability and Compensation for Pollution"*. This ability to recover costs is seen as the embodiment of the polluter-pay-principle set out in the *National Response Plan, Guiding Principles, Section 1.3*.
Note: That at this time there is no mechanism to recover monitoring costs from an oil handling facility.

In addition to the above and recognizing the potential financial risks and impacts to Canada, Canadian legislation also provides for the creation and maintenance of a Ship-Source Oil Pollution Fund, (SOPF). This fund, in addition to the International Oil Pollution Compensation Fund (IOPCF) and the Protection & Indemnity (P&I) Clubs, provides for the assessment of claims/loss against member ships and/or shipping companies. Neither of these funds hinder nor otherwise limit Canadian Coast Guard's ability to lay claims directly against a Polluter. However, the Polluter is only required to reimburse a claim up to its Limit of Liability. This limit is calculated using the guidelines established in the *Convention on Limitation of Liability for Maritime Claims (LLMC), 1976*.

6.2 Policy Guidelines

The following points serve as regional guidelines for pursuing cost recovery activities:

- The decision to seek cost recovery should be made based on common sense and in consultation with other operational and finance team members.
- Cost recovery should be avoided in situations where the administrative costs of recovery action exceed the dollars expected to be recovered.
- Cost recovery embodies the "Polluter Pays" principle.
- Costs incurred while acting as a resource agency must be recovered from the lead agency.
- Costs incurred while acting as OSC/FMO are recoverable from either the polluter, its P&I Club, the Ship-Source Oil Pollution Fund or from the International Oil Pollution Compensation Fund.

6.3 Responsibilities

On-Scene Commander/Federal Monitoring Officer (OSC/FMO)
The OSC/FMO is responsible for ensuring that complete and accurate documentation is provided for a timely and effective cost recovery process. The OSC/FMO is responsible for preparing all documentation necessary to initiate cost recovery.

Regional Finance Staff
Response, monitoring and administrative costs must be calculated in accordance with national financial accounting and recording practices. Senior administrative officers within Maritime Services may be called upon to provide expert advice as required. It is recommended that a regional finance representative be on-scene as soon as possible to help establish procedures, to safeguard documentation, and to ensure the integrity of the costing process.

Environmental Response Headquarters
The Environmental Response Senior Advisor for Cost Recovery and Claims will submit those claims that are intended for the Ship-Source Oil Pollution Fund and to International Fund Conventions in accordance with the guidelines specified by each. The Advisor will also issue equipment charge-out rates periodically for use by all regions.

6.4 Process
The Response Management System (RMS) documentation (field notes, Incident Action Plans, Minutes and meeting records, time sheets and any and all expense records, invoices/requisitions etc.) shall form the basis of data for the Cost Recovery action.

The Region will initiate cost recovery actions against the Polluter. Should the Polluter be unable or unwilling to pay the costs, the Region will forward the claim to HQ Senior Advisor for Cost Recovery and Claims for submission to the Ship-Source Oil Pollution Fund. Should the costs of the response exceed the Limit of Liability of the Polluter, reimbursement of costs will be through the SOPF and then through the IOPCF. Claims associated with mystery spills will be submitted directly to HQ for a claim against the SOPF.

6.5 Documentation
Proper documentation alleviates the need to reconstruct the incident after the fact, reduces the volume of questions, and adds credence to the claim. The key source of information that enables various parties to determine the degree of reasonableness of the actions taken and the costs claimed is the part of the cost recovery summary known as a “narrative”. That justification is considered to be a critical component to successful and timely claims.

The regional guideline for producing cost summaries and documentation handling is as follows:

Incidents of minimum complexity and limited expenditures (under $15K)

- Expenditures may be summarized within the body of the Final Report, including any description of "calculated" values (i.e. administration costs)
- Original invoices shall be kept on the dedicated spill file.

Incidents of medium complexity and moderate expenditures (up to $50K)

- Expenditures will be summarized in a single table by Cost Element within the body of the Final Report.
- A supporting cost summary document or appendix shall be created to provide a detailed cost summary by date. Copies of the expenditure documentation will be included.
- Original invoices shall be kept on the dedicated spill file organized by date.

Incidents of high complexity and significant expenditures ($50K plus)

- Expenditures will be summarized in a single table by Cost Element within the body of the Final Report. (similar to medium complexity incidents)
- A supporting cost summary document will be created summarizing the daily expenditures by individual cost element, followed by a cumulative summary of each cost element (spreadsheet of all daily summaries). The sum total of all cost elements will then be summarized for use in the final report.
- Due to the volume of transactions, copies of the expenditure documents will not be provided in the supporting cost summary document.
- Original invoices will be kept in their original state, filed by date and archived when feasible to a dedicated file.

Table 6.1 Sample Cost Element Table

Cost Element	Description
Personnel	Includes hourly regular and overtime costs associated with CCG Staff (includes EBP)
Equipment	Includes cost of all CCG assets, based upon established charge out rates
Purchases/Expendables	Includes expendables such as office supplies and PPE
Travel	Includes meals and accommodation costs incurred by CCG staff accordance with TB travel directive.
Contractors	Includes the costs of all private sector contractor/goods and services.
Administration	Includes the cost of CCG administration.
Total Estimated Cost

- Cost Recovery Related Policies, Memorandum dated October 26, 1998, File AWE 1001-5-2-1 (AWEA)

6.7 Third Party Claims

While monitoring or responding to an incident, Canadian Coast Guard will refer all inquiries regarding third party claims to the Polluter. In the case of a mystery spill, the Canadian Coast Guard will encourage claimants to submit a claim directly to the Ship Source Oil Pollution Fund.

Section 7 - PLAN MAINTENANCE AND CUSTODIANS

7.1 *Maintenance Process*

Responsibility
The *Regional Response Plan* of the *Canadian Coast Guard Marine Spills Response Plan* for Central & Arctic Region is the responsibility of:

Assistant Commissioner, Canadian Coast Guard
Central & Arctic Region
520 Exmouth Street
Sarnia, Ontario
N7T 8B1
fax (519) 383-1991

Revision Requests
All requests or suggestions for revision to this plan should be forwarded, in writing, to the above noted address and should include the following information:

- Originator (including return address and telephone number)
- Date
- Subject (i.e. request for revision)
- Suggested change (including section and page number references)
- Reason for revision

All formally received requests will be acknowledged in writing and assessed for inclusion into the plan. Upon approval the revision will be distributed accordingly.

Revision Record
Upon receiving a revision transmittal, recipients are requested to ensure that its number is next in sequence to the previous issue, process the amendments according to the transmittal instructions and complete the revision record in this section.

Should there be any discrepancies or questions, the recipient should contact the Canadian Coast Guard, Assistant Commissioner, Central & Arctic Region at the above address.

The onus is on the plan holder to maintain a current plan.

7.2 *Canadian Coast Guard Custodians*

This document is structured to reflect the fundamental phases of Environmental Response (ER) activities and hence reflects the co-operative nature of each

aspect of the Central and Arctic Region Environmental Response organization. In conjunction with this, each component has been assigned to a specific section within the branch (e.g. training is the responsibility of the Training Officer). The Assistant Commissioner – Canadian Coast Guard, Central and Arctic Region retains the overall responsibility for the document's implementation. The Emergency Plan Development Officer (EPDO) facilitates the physical management and co-ordination of this document.

These custodial relationships herein are designed to facilitate the annual review and maintenance of the *Regional Response Plan*.

Letter of Promulgation	Emergency Plan Development Officer
Record of Revision	Plan Holders
Section 1 – Introduction	Emergency Plan Development Officer
Section 2 - Agreements & Memoranda of Understanding	Emergency Plan Development Officer
Section 3 – Organization	Emergency Plan Development Officer
Section 4 – Preparedness 4.2 RMS	 Regional Training Officer
4.3 Planning	Emergency Plan Development Officer
4.4 Training	Regional Training Officer
4.5 Exercising	Regional Exercise Officer
4.6 Inventory Maintenance & Management	Regional Emergency Operations Officer
Section 5 – Response Operations	Regional Emergency Operations Officer
Section 6 – Claims & Cost Recovery	TBD
Section 7 - Plan Maintenance & Custodians	Emergency Plan Development Officer
Section 8 – Contacts	Emergency Plan Development Officer
Section 9 – References & Annexes	Responsibility for each annex is assigned in each Annex.

All unassigned sections shall be considered the responsibility of the Emergency Plan Development Officer unless otherwise indicated.

7.3 Plan Distribution

The *Regional Response Plan* shall be distributed to all holders of the *Canadian Coast Guard Marine Spills Response Plan*, in accordance with the Area of Responsibility set in Section 1 - Introduction. This includes the relevant Federal and Provincial Lead Agencies as described in the National Response Plan Section 1, sub-section 1.5; all Canadian Coast Guard Management; Facilities and Vessels; all Oil Handling Facilities and relevant certified Response Organizations by request and in accordance with Transport Canada-Marine

Safety, Compliance and Enforcement division. All subsequent revisions will be automatically distributed to these plan holders.

Any member of the general public wishing to obtain a copy may do so through the Fisheries and Oceans, Canadian Coast Guard, National Headquarters. These plan holders will not be advised of revisions.

Section 8 – CONTACTS

8.1 Pollution Reports for Canadian Coast Guard, Central & Arctic Region

To report a pollution emergency anywhere within Central & Arctic Region telephone the Canadian Coast Guard, Regional Operations Centre (ROC) toll free at:

1-800-265-0237

or report via

Marine Radio on VHF, Channel 16.

8.2 Other Lead Agencies that Maintain Spill Report Lines

APPENDIX I – Latest MOCK Scenario

AGNICO EAGLE

On August 4, 2018 the AEM Environment Department conducted a mock spill event at the Itivia refueling station/tank farm with AEM emergency response (ERT) members, Orbit Garant Environmental/health and safety AEM warehouse staff, AEM Site Service/HTO vice president and AEM community relations personnel., Spill Training contractor, Nunatta Environmental was on site to assist and provide advice/training, The Rankin Inlet Fire Chief also attended the event as an observer.

An AEM ENV Tech documented the spill response actions and acted as the "Control Room" responder, Rankin Inlet dispatch and the ENV Tech/ENV Coordinator on site.

The mock scenario involved a broken fuel line fitting at the onshore receiving manifold during refueling (from offshore ship) of the fuel storage tanks at Itivia.

14:12 – Spill occurs (4000 L of leaking fuel towards the shoreline) Dave Loder spotted fuel leaking from the broken fitting/line

14:13 – ERT responder calls the vessel to stop transfer of fuel ASAP and relays the message of a leaking fitting to the Captain.

14:18 - Confirmation from the Captain that the transfer has stopped. During that time, AEM Site Service blocked the access to the area and called "CODE 1" to Rankin Inlet dispatch and requested to have environmental personnel contact ERT responder on the radio.

14:19- ERT responder asks ENV Coordinator to contact the coast guard
14:20 – ERT responder requested heavy equipment from construction/site services to dig a trench (no operators in area)

14:25 – Fire Marshall from Rankin Inlet arrived (did not participate but was ready with staff if assistance needed assistance)

14:25- AEM Warehouse staff from Itivia and started deploying booms along coast from emergency sea-can/ ERT responder supported.

14:38- Additional AEM Environment Dep't staff were travelling on the road to Meliadine site when the "CODE 1" was called (came to Itivia to provide support) and helped deploy absorbent booms and rags as ERT responder instructed.

15:50 – full ERT team arrived for assistance- First ERT responder (Commander) instructed immediate deployment of marine curtain (water was too rough 80 km/hr winds- did not want to put anyone's safety at risk; deployed on shore)

16:00 – More absorbent booms are placed in front of the marine barrier to collect spill and prevent it from going under marine barrier- no operators present for heavy equipment; ERT and environment staff attempted to make a trench – did not succeed due to bed rock

16:04 – Absorbent padding was placed on top of spill where visible product was observed behind marine barrier (wind blowing toward shore)

17:25 – ERT, ENV and Agnico staff declare the spill has been contained and absorbed; called off the ”CODE 1” and spill report prepared with follow up investigation of event.

Summary:

Nunatta - guided and assisted AEM staff (total 14 on site) to implement the correct procedures and equipment handling to successfully participate in the mock spill training event (fuel leak/water); the ERT commander did a great job of delegating responsibilities with everyone; all communication was satisfactory during the event. Heavy equipment (excavator) would be required as the area is underlain be bedrock – shovels and picks were not effective to dig a collection trench. It took 23 minutes for the spill to go from the pipe connection to the marine barrier- it would in a realistic scenario take ERT a minimum of 1 hour (It took 1.5hr) to get from Meliadine to Rankin Inlet (includes time to prepare) and Environment Dep’t staff members could mobilize within 50 minutes. In order to provide additional line of defense to capture fugitive oil/fuel spills the overburden on the inter-tidal zone should be removed so that loose absorbent can be spread. Nunatta advised that we contact Department of Fisheries and Oceans and ask if we can remove some rock along the beach in case of an emergency (this is fish habitat). A collection trench or sump would reduce the speed of any spill.

AEM and Nunatta Comments/Recommendations

- Buoys that can be attached to the maritime barrier or the fuel line were not blown up- these should be blown up prior to refueling season
- Sea-cans that contain Emergency environmental spill response should be placed together (one is placed on top of hill- these sea-cans should be placed as close to the shore manifold as possible)
- Shore line where fuel line connects should be cleaned of all obstructions to prevent injury to staff and damaging the containment booms
- Life jackets or mustang suits must be worn while working near the water and/or on boats
- It’s required that AEM warehouse staff working at Itivia area review the OPEP and Emergency Response Plan with ENV Tech prior to barge/fuel transfer season (both rotations)
- AEM observed that the OPEP and Spill Contingency plan was located in the Itivia warehouse office
- Follow up with DFO; if strip of overburden can be removed from inter-tidal zone to facilitate spill response and pro spill prevention measures
- Order more shackles
- OPEP should include the local municipality emergency numbers (I included this document in the PDF)
- AEM and ERT members will conduct annual training with Environment Dep’t staff.
- Lighter anchors (20 pound range) for the boat (ordered); currently have 60 pound anchors

APPENDIX J – Product Transfer Area Assessment

Meliadine Gold Project

Product Transfer Area Assessment – Rankin Inlet Itivia Oil Handling Facility

January 6th 2019

Prepared for:

Environment and Climate Change Canada

Prepared by:

Agnico Eagle Mines Limited – Meliadine Division

Document Control

Version	Date	Tank/EC number	Section	Revision	Author
1	January 2019	EC# 00044507		Implementation of the Product Transfer Area Assessment – Rankin Inlet Itivia Oil Handling Facility for the ERP	Dan Gorton Env. Coordinator
2					

1. Introduction

The purpose of this document is to satisfy the requirement of section 15 of the Storage Tank Systems for Petroleum Products and Allied Petroleum Products Regulations made pursuant to Canadian Environmental Protection Act, 1999 which states

15 (1) The owner or operator of a storage tank system must ensure that petroleum product and allied petroleum product transfer areas are designed to contain any releases in liquid form in the environment that occur during the transfer process. In accordance to the STSPPR a ''transfer area" means the area around the connection point between a delivery truck, railcar, aircraft or vessel and a storage tank system in which the tanks have an aggregate capacity of more than 2 500 L. Furthermore, Subparagraph 2.1(2) of the STSPPR states a person must not release or permit or cause any release of a petroleum product or allied petroleum product, in liquid form in the environment, during the transfer of the product to or from a storage tank system if, in the case of a system that has a transfer area, the release during transfer reaches outside the transfer area.

2. Summary

Location: 62°48'16.66" N, 92°05'5.32" W. Itivia Road, Rankin Inlet.

Tank System ID: EC# 00044507

Figure 1 and 2: Agnico Eagle Ltd.'s Itivia Site Fuel Storage Area

Figure 3 and 4: Agnico Eagle Ltd.'s Itivia Site Fuel Storage Containment

The diesel (13.5ML and 20ML) storage tank system owned by Agnico Eagle Mines (AEM), located at Rankin Inlet was evaluated in accordance with Environment and Climate Change Canada's (ECCC) approach to transfer area protection. A number of potential incidents, risk and related receiving environments were identified for this product transfer area. The risk evaluation identified two risks requiring action. The risks were mitigated by designing secondary containment for the two product transfer areas.

At the marine line connection point, a 400L concrete spill basin was installed to catch small quantities of product in the event of a pinhole leak at the connection point, or during disengagement of the coupling. At the vehicle refueling station, a secondary containment area was designed to accommodate a fuel tanker during refueling. This containment area is designed to capture small spills that may result during disengagement of the dry quick connect coupling.

In addition, there were several procedures related mitigation measures developed for this site to address the identified risks (see Section 5 - SOP).

3. Background

The oil handling facility contains two steel tanks of 13.5ML (tank 1) and 20ML (tank 2) capacity. The tank system is owned and operated by Agnico Eagle Mines Limited. Tank 1 was installed in 2017 and Tank 2 was installed in 2018. Both tanks are operational 12 months of the year. The tanks are refilled annually (July to October). There have been no previous failures where product reached the environment with this storage tank system.

Refueling station to truck transfer area

There is one loading arm with dry quick connect coupling for tank truck filling operation, connected to an insulated pumping station (watertight 20' container). A single continuous 3m x 100mm hose transfers fuel from the loading arm to the fuel truck. The flow rate is a maximum of 800 L/min, or less, depending on the truck.

Transfer of fuel into trucks is performed in conformance with procedures outlined in:

- The National Fire Code of Canada (NFCC);
- The American Petroleum Institute (API) Standard: 2610-94: *"Design, Construction,*
- *Operation, Maintenance and Inspection of Terminal and Tank Facilities"*
- The Canadian Petroleum Products Institute (CPPI, 1992*): "Professional Driver's*
- *Manual".*
- Canadian Council of Ministers of Environment (CCME) – Code of Practice (COP) 2003.
- Agnico Eagle fuel transfer procedure.

Ship to shore transfer area

The ship to shore PTA consists of a marine line connection with flange connection and check value. A 400L concrete spill basin is present beneath the connection point. Product is transferred via a 120m x

100mm hose at a rate of 250m^3/h. The ship's pumping system is fitted with an emergency shut off system which is activated when pumping pressure is lost.

Transfer of from ship to shore is performed in conformance with procedures outlined in:

- The National Fire Code of Canada (NFCC);
- The American Petroleum Institute (API) Standard: 2610-94: *"Design, Construction,*
- *Operation, Maintenance and Inspection of Terminal and Tank Facilities"*
- The Canadian Petroleum Products Institute (CPPI, 1992*): "Professional Driver's*
- *Manual".*
- Canadian Council of Ministers of Environment (CCME) – Code of Practice (COP) 2003.

The risks identified under the following table (Section 3) as needing action have been addressed.

4. Analysis of Product Transfer Area Risks

The table below lists potential incidents, outcomes, description of PTA and receiving environments that have been identified for the storage tank system on site. The table also provides an evaluation of identified risks and an assessment on whether further action is required, and a list of mitigation measures.

Table 1: Product Transfer Risk Assessment - refueling station to fuel truck

Potential Incident	Outcome	PTA and Receiving Environment	Spill Consequence	Probability	Potential Impact	Evaluation	Mitigation Measures
Overfill during loading of fuel truck	Approximately 132.27L product is captured in secondary containment	Secondary containment Adjacent soil/gravel area within ~10m Melvin Bay	Low: the product is confined secondary containment. Moderate: the product reaches bare ground. High: the product reaches a water body.	Moderate	Low	No Action Required	Secondary containment with 40000L capacity at tanker connection point Scully fitted with optic overfill prevention system Permanent indoor structure with visual display for operator in cold weather
Overfill device fails	Product flows into 40000L secondary containment			Moderate	Low	No Action Required	Shut off button and tanker overfill pipe
Coupling/equipment fails at pump station-hose connection.	Broken piping/hose releases ~1000L of fuel to adjacent gravel area.			Moderate	Moderate	No Action Required	Shut off button, drainage to low point on roadside. Emergency Response Plan and Spill Contingency Plan Trained spill response staff and equipment for large spills on site.
Absence of inspection (pre-op, checklist)	Faulty component or leak is not detected resulting in slow release of ~1L of product			Moderate	Moderate	No Action Required	Pre-op inspection (daily by M&T and AEM) Standard Operating Procedure (SOP)
Public access	Member of the public attempts to take or release fuel			Low	Low	No Action Required	Signage and surveillance cameras Fuel system security coded Community awareness conducted by AEM
Vehicle contact with building/equipment	Broken piping releases ~1000L of fuel to adjacent gravel area.			Low	Moderate	No Action Required	Secondary containment structure protects fuel station from collision by forming a barrier. Fuel lines connected to tank farm can only release contents of the line.

Table 2: Product Transfer Risk Assessment – refueling station to fuel truck cont.

Potential Incident	Outcome	PTA and Receiving Environment	Spill Consequence	Probability	Potential Impact	Evaluation	Mitigation Measures
Inappropriate equipment for arctic conditions (arm/valve)	Valves and components fail in arctic conditions releasing ~100L of product			Moderate	Moderate	No Action Required	Valves and hoses suitable for arctic conditions installed. Pre-op inspection (daily by M&T and AEM)
Operator spills small amount of fuel while uncoupling hose	~100ml of fuel is captured in secondary containment			High	Low	No Action Required	Portable drip tray used within secondary containment

Table 3: Product Transfer Risk Assessment – Ship to shore

Potential Incident	Outcome	PTA and Receiving Environment	Spill Consequence	Probability	Potential Impact	Evaluation	Mitigation Measures
Leakage if fuel remains in line after off loading and leakage at all couplings in the line (by the boat and outside the connections)	Maximum of ~1500L of fuel is released to Melvin Bay	Secondary containment Adjacent soil/gravel area within ~10m Melvin Bay	Low: the product is confined secondary containment. Moderate: the product reaches bare ground. High: the product reaches a water body.	Moderate	High	No Action Required	Trained Intertek Personal oversee product transfer Line is cleared of fuel following transfer
Coupling/equipment fails at onshore coupling	Maximum of ~1500L of fuel is released to Melvin Bay			Moderate	High	No Action Required	Ships pumping system shuts off if hose pressure is lost. Trained Intertek Personal oversee product transfer Transfer point is up gradient of pumping point so line does not completely drain if uncoupled. Emergency Response Plan and Spill Contingency Plan Marine spill response equipment adjacent to transfer point.
Coupling/equipment fails at offshore coupling	Maximum of ~1500L of fuel is released to Melvin Bay			Moderate	High	No Action Required	Spill contained onboard at pumping area.
Public interference	Transfer hose is damaged by passing boat or transfer impacted by public protest			Low	High	No Action Required	Community awareness conducted by AEM Boat traffic monitored by Desgagnes and Intertek
Operator spills small amount of fuel while uncoupling hose	~100ml of fuel is captured in secondary containment			High	Low	No Action Required	Portable drip tray used within secondary containment

Table 4: Product Transfer Risk Assessment - Ship to shore cont.

Potential Incident	Outcome	PTA and Receiving Environment	Spill Consequence	Probability	Potential Impact	Evaluation	Mitigation Measures
Vehicle contact with piping between transfer point and tank	Broken piping releases ~5000L of fuel to adjacent gravel area, potentially reaching Melvin Bay.			Low	High	No Action Required	Rock barrier protects pipeline from vehicles. Double walled piping installed beneath roadway. Fuel lines connected to tank farm can only release contents of the line.

Please see Appendix A for the calculations relating to the product transfer areas. In summary, potential product spillage, volume has been calculated as follows:

Fueling station: a confirmed maximum delivery rate of 800 L/min and an emergency shut off time of 8 seconds would result in a product spillage volume of approximately 108.72L. Based on 10cm hose at 3m in length, a potential spill at the tank / hose connection would result in an additional volume of 23.55 L, for a total 132.27 L of fuel spilled.

Ship to shore: a confirmed maximum delivery rate of 4166.67 L/min and an emergency shut off time of 8 seconds would result in a product spillage volume of approximately 556 L. Based on 10 cm hose at 122 m in length, a potential spill at the tank / hose connection would result in an additional volume of 957 L, for a total 1512 L of fuel spilled.

5. Mitigation of Risks

Refueling station to truck transfer area
At the vehicle refueling station, a 40,000L secondary containment area was installed to accommodate a fuel tanker in the event of an accidental overfill or connection failure during fuel transfer. This area is a lined and bermed depression where the transfer station and the fuel truck are located during the fuel transfer process.

In the event of a spill three potential receiving environments have been identified for the refueling system: the gravel area surrounding the refueling station and extending a distance of approximately 10 meters, the adjacent soil/ground surface, and the adjacent body of water, Melvin Bay.

Any product amount of 1000L or less that spills onto the gravel area can be recovered using the spill kit and heavy equipment on site. For spills of over 1000L, the product will likely reach the adjacent soil/ground surface and/or the Melvin Bay directly via overland surface flow (depending on the season). The low point containing a double wall culvert would contain the product before reaching soil or Melvin Bay. During winter, the likely hood of product flowing to the shoreline increases; however, snow berms can be quickly installed. Mitigation measures include;

- 60 L secondary containment for hose storage
- 40000L secondary containment for refueling of fuel trucks
- Standard Operating Procedure
- Trained operators
- Spill kit at refueling area containing absorbent pads
- Personnel monitor transfer from viewing window in pump station
- Five wire optic transfer system to prevent overfill
- Containment designed to hold 110% of fuel truck load limit

Ship to shore transfer area
At the marine line connection point, a 400L concrete spill basin was installed to catch small quantities of product in the event of a pinhole leak at the connection point, or during disengagement of the coupling.

In the event of a spill three potential receiving environments have been identified for the fuel transfer system: the gravel area partially surrounding the secondary containment and extending a distance of approximately 5 meters, the adjacent soil/ground surface, and the adjacent body of water, Melvin Bay.

Any product amount of 100L or less that spills onto the gravel area can be recovered using the spill kit and shovels. For spills of over 100 L, the product will likely reach the adjacent soil/ground surface and/or Melvin Bay directly via overland surface flow (depending on the season). During winter, the likely hood of product flowing to the shoreline increases; however, snow berms can be quickly installed. Mitigation measures include;

- 400L secondary containment at onshore connection point
- Pump and 1000L portable containments on standby during transfer if concrete containment overfills
- Trained Intertek Personnel oversee product transfer
- Standard Operating Procedure

- Emergency Response Plan and Spill Contingency Plans on site
- Oil Pollution Prevention Plan on site
- Marine spill response equipment on site

6. Standard Operating Procedure (SOP)

Refueling station to truck transfer area

The AEM procedure for refueling fuel trucks in summarized as follows;

1. Perform an inspection of the vehicle.
2. Park the vehicle in the vicinity of the refueling tank and shut off your ignition.
3. Install wheel chocks on either side of the tanker tire.
4. Inspect the entire working area including the steps up to the HMI and the area in front of the loading arm and scully system; call your supervisor if there are problems.
5. Install the portable spill containment underneath the connection point.
6. Check the maximum capacity for the tanker being used. Ensure to only fill the tanker at 90% of the capacity to have room for fuel expansion at different temperatures, and a safe level for haulage. Verify the current tank level from the electronic gauge on the side of the tanker, fill the tank to 37800 L maximum (18.9 in each compartment).
7. At the valve control panel, lift all the levers up, and make sure the valves are open.
8. Remove the cap of the scully plug and push and twist it onto the receiving end on the truck. Make sure the green light is on before continuing.
9. Connect the loading arm to the tanker.
10. Below is a picture of the final arrangement. Make sure the valve are open on each side.
11. Open the valve on the building.
12. Enter the control room and begin to program the fuel loading on the HMI.
13. Enter the applicable Microload identification and load sequence.
14. Enter the volume measure with the pop-up keypad.
15. Select the tank from which to pump fuel.
16. Select the start button to activate the pump.
17. Once the fueling begins, the operator must monitor the situation diligently; this includes checking for leaks or monitoring any other unusual situations. The operator must be at the connection point at all times during fueling.
18. When finished pumping, close the valve on the building.
19. Disconnect the loading arm first, and then the truck level control.
20. Put the arm back and the truck level control in place. Close the valve.
21. Put the protection bag over the scully and the hose. Verify if the caps are put back on the truck.
22. Put back the portable spill containment, and unhook the overflow hose, install the cap and close the valve.
23. At the valve control panel, pull down all the lever to close valve, and make sure they are closed.
24. Complete the mechanical verification in the pump station, just beside the HMI trailer. Make sure they have no leaks on the equipment.
25. Before you leave, make sure the three doors are locked at the fuel station.
26. Remove the wheel chocks and fully inspect the vehicle before beginning to bring the fuel to the Meliadine Fuel Tank Farm.

27. If you encounter any emergency or a spill occurs, call your supervisor immediately and the supervisor of Agnico Eagle Mine Meliadine.

Ship to shore transfer area

The AEM procedure for refueling tanks in summarized as follows, however the fuel transfer is overseen by Intertek (contracted first responder);

1. The Oil Pollution Emergency Plan (OPEP) must be reviewed on an annual basis and updated prior to the first annual discharge. This will include but not limited to:
   a) Reviewing the phone numbers for emergencies
   b) Updating maps
   c) Review and if necessary update equipment lists
   d) Review roles and responsibilities
   e) Update Declaration
2. Contact Canadian Coast Guard and Transport Canada Pollution Prevention and make them aware of plans for transferring of fuel into our Oil Handling Facility (OHF) for that season.
3. Complete *Inventory report for Spill Response Sea Can at AEM's Oil Handling Facility in Rankin Inlet.*
4. Ensure Shipping Company has provided Hose Testing Annual certification.
5. All personnel who will be a part of the fuel transfer (including Rankin Inlet Supervisor and third part contractor Intertek) must review the OPEP and be familiar with preventive measures to take and with the steps to take in the case of a spill event while fueling.
6. Install and monitor secondary containment underneath each connection of conduit on land.
7. Ensure there is two-way functional communications between the OHF and the off-loading vessel.
8. Ensure there is lighting in place at the transfer flange to provide illumination during any transfers taking place during the low to no light hours.
9. Prior to any discharge Agnico Eagle must receive a copy of the ship/shore checklist completed by the shipping company. Agnico Eagle should also verify this has been completed (as much as realistically possibly without boarding the ship).
10. Contact must be made with both the H&S, Environment, Warehouse and Community Relations Departments prior to the discharge of fuels.
11. The *Pre-discharge Checklist for AEM's Oil Handling Facility in Rankin Inlet* must be completed, signed and provided to the Environment Department prior to discharge.
12. Photos of the complete fuel transfer process should be taken, proving that all above procedures have been reached.
13. During the ship-to-shore transfer, Agnico Eagle will have competent personnel on location at all times to monitor the fuel transfer and maintain contact with the tanker's crew.
14. Monitor the fuel transfer at the beginning of each transfer and after that on an hourly basis checking the manifold, conduit, tank, and any connection points on land for spills and/or leaks. Communication between shore and ship should take place on an hourly basis.
15. Have a fuel spill scenario annually to cover both crews .

7. Conclusion

The Itivia Fuel Tank Farm, owned by Agnico Eagle Mines and located in Rankin Inlet, NU, has recently undergone modifications to mitigate risks associated with transfers of fuel at the ship to shore transfer area, as well as the truck transfer station. A 400L concrete spill basin was installed at the ship to shore PTA, beneath the on-shore connection point from the ship. This ship to shore PTA was designed to contain spills that may occur in the event of a pinhole leak at the connection point, or during unexpected disengagement of the coupling. Additionally, a 40,000L secondary containment was constructed for the truck transfer area. Fuel transfer vehicles now park within a lined and bermed depression, designed to contain spills that may occur from an accidental overfill, coupling device failures, and other spill scenarios while transferring fuels.

In addition to the secondary containment areas noted above, emergency spill response equipment is located near the ship to shore transfer valve on shore. In the event of a spill reaching Melvin Bay, Marine containment booms, anchors, trench shovels, absorbant pads, pumps and a dedicated boat and ATV are accessible year-round, and regular spill response training is conducted with members of the Meliadine Emergency Response Team and Environment Department. Meliadine Environment Technicians also conduct regular inspections of the Itivia site in order to ensure proper spill prevention and containment equipment is available, and that proper fuel transfer protocols are followed. All of the measures noted above are in place in order to contain, mitigate and prevent spills during the process of transferring fuel.

Appendix A - Potential Spill Quantities

Fuel Station to Fuel Truck

Flow rate = 800L/min maximum rate
Scully arm and hose length: 300cm, 10cm diameter

1. Calculate Volume of Spill (from time it takes operator to shut off pumping)
   800L/min = 800/60s = 13.34
   8s = time it takes for operator to turn off the pump should the tank start to overflow

   Volume = 13.34L/s * 8s
   = 108.72
2. Calculate the Volume of the pipe:

   Radius = (diameter of the pipe / 2)

   Radius = (10/2)
   = 5

   Volume of a cylinder: V = πr2h

   Volume = 3.14 * 5^2 * 300
   = 23550

3. 1 Litre = 1000m^3
   Volume in Litres = (volume in cm^3) * (1L/1000cm^3)
   Volume = (23550 / 1000 L)
   = 23.55 L

   Total Potential Spill = 108.72 + 23.55
   = 132.27 L

Therefore, the amount of a potential spill at the site would be 23.55L of fuel in the hose, plus 108.72L (using 8s before shut off) for a total of 132.27L.

Ship to shore:

Flow rate = 4166.67L/min maximum rate
Transfer hose length: 12192cm, 10cm diameter

1. Calculate Volume of Spill (from time it takes operator to shut off pumping)
   4166.67L/min = 4166.67/60s = 69.45
   8s = time it takes for operator to turn off the pump should the tank start to overflow

   Volume = 69.45L/s * 8s
   = 555.6L

2. Calculate the Volume of the pipe:

   Radius = (diameter of the pipe / 2)

   Radius = (10/2)
   = 5

   Volume of a cylinder: V = πr2h

   Volume = 3.14 * 5^2 * 12192
   = 957072

3. 1 Litre = 1000m^3
   Volume in Litres = (volume in cm^3) * (1L/1000cm^3)
   Volume = (957072 / 1000 L)
   = 957.07 L

   Total Potential Spill = 555.6 + 957.07
   = 1512.67 L

Therefore, the amount of a potential spill at the site would be 957.07 L of fuel in the hose, plus 555.6 L (using 8s before shut off) for a total of 1512.67 L.

APPENDIX K – STR’s Cross Reference Table

Table 1. Cross-reference of STS Regs, s. 30 to 32, to this emergency plan for P-50 Diesel Storage Tank System STS EC-00044507

STS Regs reference	Information required	Location of information in this emergency plan
s. 30(1)	The owner or operator of a storage tank system must prepare an emergency plan taking into consideration the following factors:	
s. 30(1)(a)	- the properties and characteristics of each petroleum product (i.e. Jet A1) or allied petroleum product stored in each tank of the system and	- MSDS for P-50 Diesel in Appendix D of the OPEP - Spill Contingency Plan and Hazardous Materials Management Plan, submitted with the annual report
s. 30(1)(a) continued	- the maximum expected quantity of the petroleum product or allied petroleum product to be stored in the system at any time during any calendar year; and	Can be find in section 4.1
s. 30(1)(b)	- the characteristics of the place where the system is located and of the surrounding area that may increase the risk of harm to the environment or of danger to human life or health.	- Site Description outline in section 4.1 and 4.3 of the OPEP
s. 30(2)	The emergency plan must include:	
s. 30(2)(a)	- a description of the factors considered under s. 30(1)	- See the rows above.
s. 30(2)(b)	- a description of the measures to be used to prevent, prepare for, respond to, and recover from any emergency that may cause harm to the environment or danger to human life or health;	- OPEP: s. 10 Spill Procedures s. 10.2 Spill Reporting s. 11 Spill Scenarios and Responses; s. 12 Spill Prevention; s. 12.1 Spill Training; .
s. 30(2)(c)	- a list of the individuals who are required to carry out the plan and a description of their roles and responsibilities;	- OPEP: s. 9 Roles and Responsibilities s. 9.1 First Responder s. 9.2 Emergency Control Group Figure 3. response Management System.

Table 1. Cross-reference of STS Regs, s. 30 to 32, to this emergency plan (continued)

STS Regs reference	Information required	Location of information in this emergency plan
s. 30(2)(d)	- identification of the training required for each of the individuals listed under s. 30(2)(c);	- OPEP s. 12.1 Training and Appendix I Mock scenario
s. 30(2)(e)	- a list of the emergency response equipment included as part of the plan, and	- OPEP s. 7 Equipment and PPE

	the equipment's location; and	
s. 30(2)(f)	- the measures to be taken to notify members of the public who may be adversely affected by the harm or danger referred to in s. 30(2)(b)	- OPEP s. 8.1.1 Communication with the Public
s. 30(3)	The owner or operator of a storage tank system must ensure that the emergency plan is ready to be implemented:	
s. 30(3)(a)	- in the case of a storage tank system that is installed before the coming into force of these Regs, no later than two years after the day on which these Regs come into force (i.e. by 12 Jun 2010); and	N/A
s. 30(3)(b)	- in any other case, before the day on which the first transfer of petroleum products or allied petroleum products into any tank of the storage tank system occurs.	- OPEP v.1.1 Sept 2017 - Spill Contingency Plan v6 March 2017
s. 31(1)	The owner or operator of a storage tank system must keep: - the emergency plan up-to-date and - keep a copy of it readily available for the individuals who are required to carry it out, - as well as a copy at the place where the storage tank system is located if that place is a place of work.	- OPEP is reviewed annually prior every shipping season and a hard copy is available at the Rankin Inlet Marshalling facility during transfer operations - Spill Contingency Plan is reviewed annually season and a hard copy is available at the Rankin Inlet Marshalling facility during transfer operations
s. 31(2)	The owner or operator must notify the Minister of the civic address of each location where the emergency plan is kept.	- No civil address, coordinates are at page ii of this document.

Table 1. Cross-reference of STS Regs, s. 30 to 32, to this emergency plan (continued)

STS Regs reference	Information required	Location of information in this emergency plan
s. 32(1)	If the owner or operator of a storage tank system has prepared an emergency plan with respect to the system on a voluntary basis or for another government or under an Act of Parliament and the plan meets the requirements of s. 30(1) and (2), they may use that plan for the purposes of meeting those requirements.	- OPEP and Spill Contingency Plan
s. 32(2)	If the plan does not meet all of the requirements of s. 30(1) and (2), the owner or operator may use the plan if they amend it so that it meets all of those requirements.	- OPEP and Spill Contingency Plan

List of Tables

Table 1. Drilling waste areas surveyed for natural revegetation. Site name, location, year and ecotype of each area surveyed is included. Ecotypes are described as low-lying sedge hummock-hollow (SH), upland heath hummock-hollow (HH) and upland lichen-heath (LH). Some drilling waste areas were in transitional areas between ecotypes (SH/HH). 3

Table 2. Difference in the percent cover of species between the drilling waste and paired undisturbed control plots. Values are the average % differences with standard error across all sites within a given year and only species with >5% differences in at least one year are included. Negative values indicate lower cover on the drilling wastes compared with the control and positive values indicate higher cover on the drilling waste compared to the control. 10

Table 3. Species presence/absence on the drilling wastes compared with paired undisturbed control plots. Negative values represent the total percentage of sites where a species was present in the paired control plots but not on the drilling waste. Positive values represent the total percentage of sites where a species was present on the drilling waste but not the paired control plots. All values are expressed as a percentage of sites where a species was present/absent (i.e. x/5*100). Only species where presence/absence differences were found at > 2 sites (>40%) are included. 11

Table 4. Non-native invasive plant species identified by the Canadian Endangered Species Conservation Council that have been found in Nunavut. 13

List of Figures

Figure 1. Map of drilling waste areas sampled in 2018. The year of drilling is given for each of the sites surveyed. The Meliadine site is shown for reference and all drilling waste sites were outside of the mine footprint. 2
Figure 2. Low-lying sedge hummock-hollow (M93-30) (left) and upland heath hummock-hollow (M12-1860) (right). 4
Figure 3. Transitional form low-lying sedge hummock-hollow to upland heath (M08-735) (left) and upland lichen heath (M17-2396) (right). 5
Figure 4. Small pockets of drilling waste evident at the surface of older sites (Left M93-30, Above M93-40). 6
Figure 5. Larger patches of drilling waste evident at the surface on newer drilling sites (left M12-1863; right M17-2398). 6
Figure 6. Sampling design at each drilling waste site. Three 1 m^2 plots were placed directly adjacent to one another at the center of the long axis of the delineated drilling waste area (ex. at a drilling waste area 24 m long, the center sampling plot would be placed from 11.5-12.5 m). At each site an undisturbed control transect was placed at least 10 m from the edge of the drilling wastes and 3 control plots (1m^2 each) were placed in undisturbed vegetation. 7
Figure 7. Non-metric multidimensional scaling ordination of species percent cover data on drilling wastes (red) and undisturbed control sites (black) in the disturbance years of 1993 (squares), 1998 (circles), 2008 (triangles), 2012 (crosses) and 2017 (x's). A stress value of < 0.05 indicates a good fit. The stress value for the above ordination was 0.047. 8
Figure 8. Species richness of drilling wastes and undisturbed control plots in different disturbance years. Both treatment (drilling waste and control) and year (1993, 1998, 2008, 2012, 2017) were significantly different (ANOVA, p<0.0f). Different letters represent significant differences (p <0.05) between control and waste sites within each year from a Tukey HSD post-hoc test. Bars present means with standard deviation (n=5). 9

Preface

On June 1, 2018 Agnico Eagle Mines and the University of Saskatchewan were successful in receiving a Natural Sciences and Engineering Research Council (NSERC) Collaborative Research and Development grant. The grant entitled "Tundra Restoration: Niche construction in early successional plant-soil systems" will support on-site and laboratory research from June 2018 to June 2022. The primary objective of this research is to address Term and Condition no. 41 of the Project Certificate for the Meliadine site: *"Prior to the commencement of operations, the Proponent shall develop a progressive re-vegetation program for disturbed areas that are no longer required for operations, such program to incorporate measures for the use of test plots, reseeding and replanting of native plants as necessary."* Several additional scientific objectives that support this primary objective will also be examined: i) Characterization of initial and realized niches of biological soil crusts and tundra vascular plants across a chronosequence of naturally recolonized drilling waste dumps; ii) Characterization of initial and realized niches of actively restored biological soil crusts on disturbed substrates iii) Characterization of initial and realized niches of actively restored tundra vascular plants on disturbed substrates. In addition to the scientific work, the project will include the development of a youth education program and local community engagement in Rankin Inlet and Baker Lake, NU.

Below is a summary timeline for key project activities and deliverables. For a timeline including all activities and deliverables see Appendix A.

Milestone	Description of activities	Anticipated starting date	Anticipated completion date
Natural recolonization of drilling wastes	Study natural recolonization of drilling waste dumps 2-17 yrs old by biological soil crusts and vascular plants. Specific recommendations of species for restoration will be developed.	2018-06-01	2019-08-31
Active restoration with tundra surface layers	Transplanting of tundra plugs, shredded surface layers and biological soil crusts onto disturbed substrates. Specific recommendations of restoration practice and species for restoration will be developed.	2019-06-01	2021-08-31
Youth education program	Collaboratively develop and deliver an education program on-site for one week in 2019 and 2020 for youth from Rankin Inlet and Baker Lake, NU. The program will focus on arctic ecology, restoration and skills in environmental monitoring and research.	2019-01-31	2021-01-31
Community meetings	We will hold community meetings in Rankin Inlet and Baker Lake. Working with Agnico's community relations department we will identify key groups to host. Our research and restoration of tundra environments will be presented and discussed.	2019-06-01	2021-08-31
Website development	Creation of project website providing information to restoration practitioners and the public on general arctic ecology and restoration practice in the North, as well as key findings from the research.	2019-08-31	2022-06-01

Technical reports for Agnico Eagle	Detailed technical reports for AEM on the restoration techniques examined. Guidelines and standard operating procedures for on-going monitoring will be included. Preliminary report January 2021, final report January 2022. Yearly progress reports November 2018-2021.	2018-11-30	2022-06-01

Executive Summary

This technical report directly addresses the first of several objectives associated with a Natural Sciences and Engineering Research Council (NSERC) Collaborative and Research Development grant held by Agnico Eagle Mines and the University of Saskatchewan. The grant entitled "Tundra Restoration: Niche construction in early successional plant-soil systems" will support on-site and laboratory research from June 2018 to June 2022. The primary objective of this research is to address Term and Condition no. 41 of the Project Certificate for the Meliadine site: "*Prior to the commencement of operations, the Proponent shall develop a progressive re-vegetation program for disturbed areas that are no longer required for operations, such program to incorporate measures for the use of test plots, reseeding and replanting of native plants as necessary.*" The specific objective addressed in the following technical report is the characterization of initial and realized niches of biological soil crusts and tundra vascular plants across a chronosequence of naturally recolonized drilling waste dumps. This work was completed in summer 2018.

A total of 25 drilling waste sites were examined across a range of ecotypes including low-lying hummock-hollow complexes dominated by sedges, upland hummock-hollow complexes dominated by heath and upland lichen-heath often with frost boil features. Following delineation of each drilling waste site, a transect was placed along the long axis of the waste site and three survey plots ($1m^2$) were placed at the center of this transect. In addition, at each site a control transect was placed at least 10 m from the edge of the drilling waste and three adjacent 1 m^2 plots were placed in undisturbed vegetation of the same type, slope and aspect as the disturbed area. The percent cover of all vegetation species present was estimated by eye and the drilling waste and organic matter depth was measured in the center of each plot.

We found that natural revegetation of drilling wastes is occurring at the Meliadine site. The community composition between drilling wastes and the paired undisturbed tundra was similar 20-25 years post disturbance and species richness recovered within 6 years. Due to the different life history characteristics of tundra plants, individual species responses to disturbance were observed. While sedges and mosses may recover more rapidly on these drilling wastes, dwarf shrubs and lichens may require longer to recover. These trends in natural recovery are important for guiding future restoration efforts and techniques. Specifically, targeting sedge and moss species for transplanting and/or seeding of disturbed substrates may be a highly effective strategy for initiating the development of early successional tundra communities.

Based on our findings we provide the following suggestions to improve and/or maintain the relatively rapid natural revegetation of the drilling wastes: i) Placement of drilling wastes on the landscape that allow for remnant patches or islands of intact tundra throughout the disturbed area; ii) Apply drilling wastes in thin layers to allow for vegetative establishment; and iii) Promote establishment of bryophyte communities in the early stages of revegetation to support long-term ecosystem recovery.

Given the findings of this study we suggest that active restoration of the drilling wastes is likely not required for the recovery of the tundra plant communities, if the timeline for recovery is ~20 years. Therefore, in our on-going work to develop tundra restoration techniques, we suggest developing active restoration trials at other disturbed areas on the Meliadine site.

Drilling Waste Site Description

Ecotypes

A total of 25 drilling waste sites were examined across a range of ecotypes including low-lying hummock-hollow complexes dominated by sedges, upland hummock-hollow complexes dominated by heath and upland lichen-heath often with frost boil features. Low-lying hummock-hollow complexes dominated by sedges were characterized by high soil moisture, often with standing water surrounding hummock-hollow complexes of approximately 30 cm in height. The primary vegetation found in this ecotype was *Dryas integrifolia*, *Carex aquatilis*, and *Scorpidium scorpioides*. Upland hummock-hollow complexes were similar in size to low-lying complexes, however due to a high landscape position had drier soil conditions and were dominated by *Rhododendron lapponicum, Loiseleuria procumbens, Cassiope tetragona,* and species of *Cetraria* lichen. The upland heath ecotype were typically associated with upper slope locations and well developed frost boil features. The primary vegetation in the upland heath ecotype was *Alectoria ochroleuca*, *Cassiope tetragona, Tomentupnum nitens,* and species of *Cetraria* lichen.

Drilling waste sites were grouped by time since drilling and included sites created in 1993, 1997-1998, 2008, 2012-2013 and 2017 (n=5 per age group) (Figure 1). Of the sites surveyed, 5 were low-lying sedge, 9 upland heath, 7 transitional between low-lying sedge and upland heath, and 4 lichen-heath ecotypes (Figures 2 and 3, Table 1). Ecotypes were not equally represented across age categories because drilling tended to be localized within the landscape for a given year. Older sites (1993, 1997-1998) occurred more frequently in low-lying sedge and sedge-heath transitions, while four of the five 2017 sites were in lichen-heath tundra. Due to the nature of drilling, some sites we sampled were spatially clustered together (i.e. 2008 and 2017 sites).

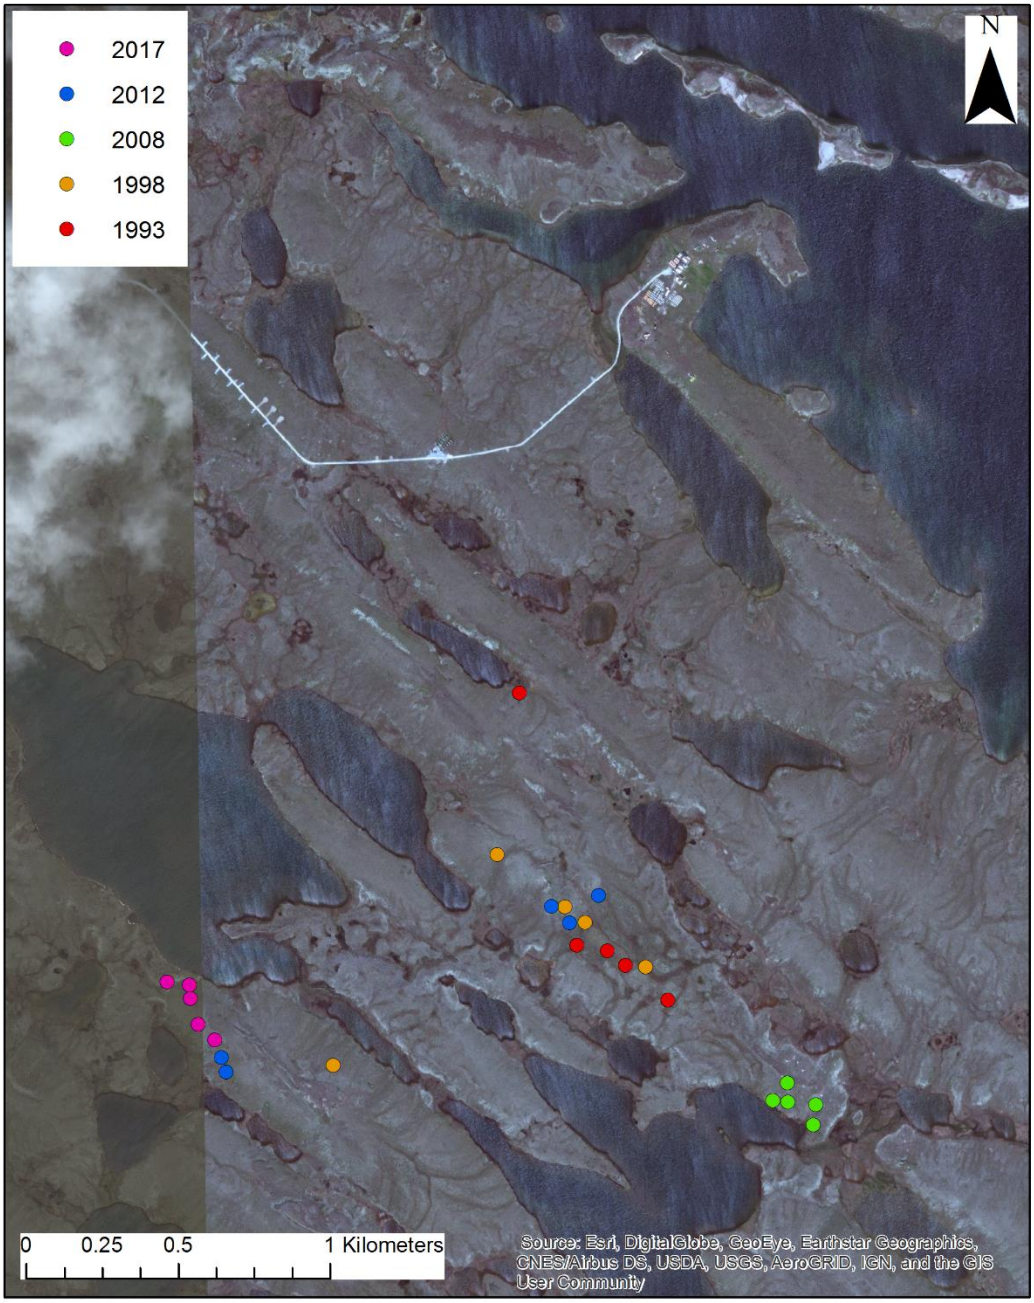

Figure 1. Map of drilling waste areas sampled in 2018. The year of drilling is given for each of the sites surveyed. The Meliadine site is shown for reference and all drilling waste sites were outside of the mine footprint.

Table 1. Drilling waste areas surveyed for natural revegetation. Site name, location, year and ecotype of each area surveyed is included. Ecotypes are described as low-lying sedge hummock-hollow (SH), upland heath hummock-hollow (HH) and upland lichen-heath (LH). Some drilling waste areas were in transitional areas between ecotypes (SH/HH).

Delineation of Drilling Waste Sites

The approximate area of each drilling waste site was delineated by determining the extent of drilling waste at each location. The presence of drilling waste was either observed on the surface or below the surface by digging up to ~15 cm in depth. The average size of the drilling waste sites was 21 m x 9 m or 189 m^2. The largest drilling waste area sampled was from 1993 (W93-32) with an area of 1472 m^2. On average the 2008 drilling waste sites surveyed had the smallest area (77 m^2). In general, older drilling waste sites were covered with more vegetation and at times were difficult to locate. However, even at sites created in 1993 small patches of drilling waste were present at the surface (Figure 4). Newer drilling waste sites (i.e. 1-5 years old) generally had large patches of waste visible at the surface (Figure 5).

Figure 4. Small pockets of drilling waste evident at the surface of older sites (Left M93-30, Above M93-40).

Figure 5. Larger patches of drilling waste evident at the surface on newer drilling sites (left M12-1863; right M17-2398).

Sampling Design

Following delineation of each drilling waste site (see description above), a transect was placed along the long axis of the waste site and three survey plots were placed at the center of this transect (Figure 6). The three plots were each 1 m^2 and were placed immediately adjacent to one another. In each plot percent cover was estimated by eye for all species present. Following completion of the vegetation survey, a soil/drilling waste sample was taken in the center of each plot and the depth of both drilling waste and organic matter were measured.

At each drilling waste site a control transect was placed at least 10 m from the edge of the drilling waste. Along the transect three adjacent 1 m^2 plots were placed in undisturbed vegetation of the same type, slope and aspect as the disturbed area. In control plots, percent cover was estimated by eye for all species present and a soil sample was taken in the center of each plot to determine the depth of the organic matter. For all statistical analyses the average across the three plots either on the drilling wastes or in the control plots was used for each site.

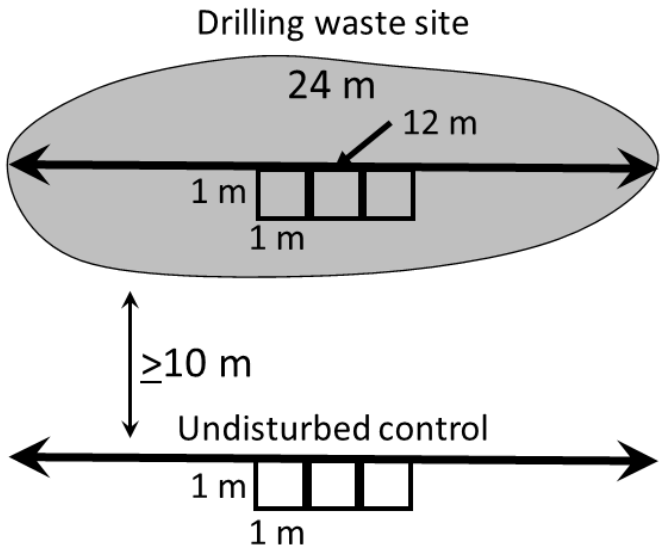

Figure 6. Sampling design at each drilling waste site. Three 1 m^2 plots were placed directly adjacent to one another at the center of the long axis of the delineated drilling waste area (ex. at a drilling waste area 24 m long, the center sampling plot would be placed from 11.5-12.5 m). At each site an undisturbed control transect was placed at least 10 m from the edge of the drilling wastes and 3 control plots (1m^2 each) were placed in undisturbed vegetation.

Vegetation Community Recovery

Community-level Differences

Recovery of the tundra vegetation at the drilling waste sites was examined through comparison of vegetation in disturbed and undisturbed survey plots at each site, as well as, examination of vegetative recovery over time (i.e. across time since disturbance). Community differences between drilling wastes and undisturbed controls over time were explored using non-metric multidimensional scaling ordination (NMDS). NMDS provides an ordination based on a distance or dissimilarity matrix, therefore objects that are ordinated closer to one another are more similar than those that are far apart (McCune and Grace, 2002). Overlap between drilling sites from 1993 and 1998 and their respective controls were evident (i.e. overlapping black and red squares and circles) suggesting that 20-25 years following disturbance the plant communities on drilling wastes are similar to undisturbed tundra (Figure 7). More recently disturbed sites from 2008, 2012 and 2017 had distinct communities (i.e. black and red triangles,

crosses and x's are separated along the axes) suggesting that >10 years is required for disturbed tundra communities to naturally recover.

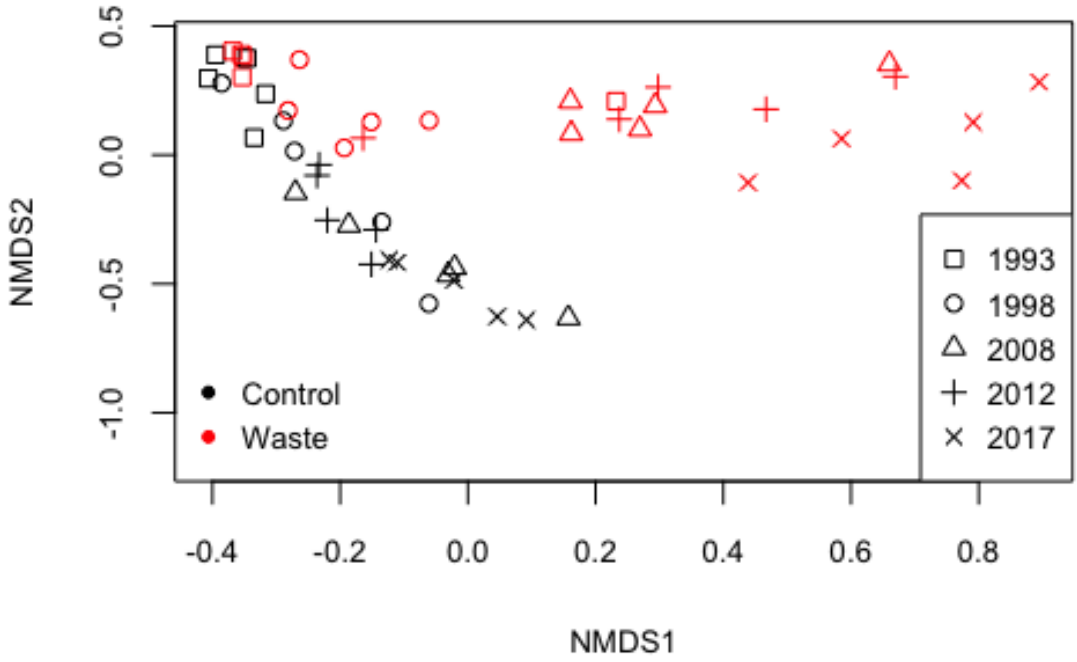

Figure 7. Non-metric multidimensional scaling ordination of species percent cover data on drilling wastes (red) and undisturbed control sites (black) in the disturbance years of 1993 (squares), 1998 (circles), 2008 (triangles), 2012 (crosses) and 2017 (x's). A stress value of $\leq$ 0.05 indicates a good fit. The stress value for the above ordination was 0.047.

To test for the effect of drilling wastes on community composition over time a PERMANOVA with Euclidean distances was used (Okasanen et al., 2015). PERMANOVA is a non-parametric multivariate analysis of variance that uses distance matrices. Treatment (i.e. drilling waste or control), year (i.e. 1993, 1998, 2008, 2012, 2017) and the interaction of treatment and year were fixed effects in the analysis and species cover was the response. All fixed effects were significantly different indicating that the plant communities are different between drilling wastes and control sites, as well as with time since disturbance ($p < 0.05$). A significant interaction between treatment and year is consistent with the NMDS since we observed that plant communities at older sites (1993, 1998) were similar between the drilling waste and control sites, but more recently disturbed communities were not.

Species Richness

Species richness was compared between the disturbed drilling wastes and the undisturbed control plots for each year included in the study. There were significant differences in species richness over time ($df=4$, $F=2.96$, $p=0.03$), between drilling waste and undisturbed controls ($df=1$, $F=19.763$ $p < 0.001$), and the interaction between time and drilling waste/control ($df=4$, $F=3.24$, $p=0.02$). Sites disturbed in 2017 had significantly lower species richness compared to their respective controls ($p < 0.001$), however, there were no significant differences in species richness between disturbed and undisturbed plots for sites

from 1993, 1998, 2008 and 2012 (Figure 8). Natural recovery of the tundra ecosystem results in similar species richness within 6 years. This trend is encouraging as it suggests that species richness can recover quickly and similar numbers of species are able to colonize the disturbed area. However, individual species may still be excluded on these recovering drilling wastes due to differences in the life history traits (i.e. growth form, reproduction and growth rate) of arctic vegetation.

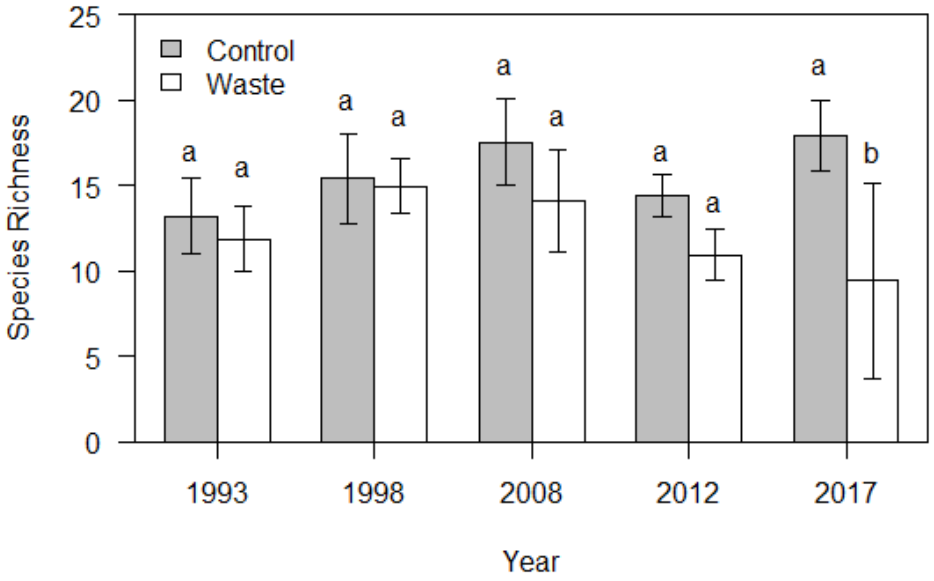

Figure 8. Species richness of drilling wastes and undisturbed control plots in different disturbance years. Both treatment (drilling waste and control) and year (1993, 1998, 2008, 2012, 2017) were significantly different (ANOVA, p<0.0f). Different letters represent significant differences (p <0.05) between control and waste sites within each year from a Tukey HSD post-hoc test. Bars present means with standard deviation (n=5).

Individual Species Response

Delayed dwarf shrub establishment was observed in recently disturbed sites, with the three most abundant ericaceous dwarf shrubs (*Cassiope tetragona, Dryas integrifolia* and *Loiseleuria procumbens*) having lower cover 1-2 years following disturbance (Table 2). Although there was variability across years since disturbance, in general, low-lying shrub cover increased over time with similar dwarf shrub cover present following 20 years of natural recovery.

Table 2. Difference in the percent cover of species between the drilling waste and paired undisturbed control plots. Values are the average % differences with standard error across all sites within a given year and only species with >5% differences in at least one year are included. Negative values indicate lower cover on the drilling wastes compared with the control and positive values indicate higher cover on the drilling waste compared to the control.

Year	Difference in Species percent cover (average % difference)				
	Dwarf Shrubs			**Sedge**	
	Cassiope tetragona	*Dryas integrifolia*	*Loiseleuria procumbens*	*Carex aquatilis*	
2017	**-9.0 (3.4)**	-4.3 (1.7)	-1.2 (1.2)	**8.6 (0.8)**	
2012	**5.3 (1.8)**	-2.4 (1.6)	0 (0)	1.5 (0.7)	
2008	1.6 (1.0)	2.9 (1.4)	**-9.6 (4.6)**	-0.7 (1.4)	
1998	4.1 (3.7)	**8.4 (3.8)**	0 (0)	-0.3 (3.0)	
1993	-0.6 (0.5)	-1.3 (2.4)	-1.2 (0)	0 (4.5)	
	Mosses		**Lichens**		
	Bryum spp.	*Scorpidium scorpioides*	*Cetraria* sp.	*Alectoria ochroleuca*	Fruticose Lichen
2017	-1.3 (1.2)	-0.3 (0.3)	**-20 (7.7)**	**-6.3 (1.3)**	**-8.7 (4.2)**
2012	4.1 (4.3)	-0.1 (0.1)	**-7.2 (3.1)**	0 (0.6)	-0.4 (0.4)
2008	**8.3 (2.3)**	0 (0)	**-14 (4.7)**	**-7.7 (3.0)**	**-4.1 (0.8)**
1998	**5.3 (2.9)**	-0.3 (0.2)	**-6.4 (3.2)**	-2.2 (1.4)	-1.9 (1.7)
1993	0.9 (1.5)	**-13 (5.4)**	-1.5 (1.1)	0.1 (0.1)	-0.9 (0.4)

Higher cover of *Carex aquatalis* in the early years of recovery are not surprising since sedges can often rapidly establish on disturbed arctic sites. Previous revegetation studies from Alaskan tundra found that native sedges established on disturbed sites in 5-10 year and had an aboveground biomass equal to undisturbed tundra (Chapin and Chapin, 1980). Sedges are often more dominant in lower-lying landscape positions in tundra ecosystems. Higher sedge cover on drilling wastes were observed only in 2012 and 2017. The 2012 sites were located in sedge (n=2) or heath (n=3) dominated hummock-hollow complexes, whereas, 2017 sites were in heath dominated hummock-hollow (n=1) and lichen heath (N=4) ecotypes. Therefore, sedge establishment of disturbed substrates may be occurring naturally across ecotypes indicating that these species could be useful for active restoration efforts.

One to two years following disturbance both mosses and lichens had a lower cover on the drilling wastes than the undisturbed controls. However, some moss species, such as *Bryum* spp. appear to recover quickly and establish at higher percentages on drilling wastes than the undisturbed tundra. *Bryum* sp. are acrocarpous, or carpet forming, are tolerant of high levels of solar radiation and are known to establish on disturbed substrates, especially slightly alkaline substrates (McKnight et al., 2013). Other moss species, such as *Scorpidium scorpioides*, have lower establishment on the disturbed substrates. *S. scorpioides* are pleurocarpous, or branched, and tend to be found in moist depressions in the landscape. In addition, saline conditions are known to inhibit or prevent growth of S. *scorpioides* (Vitt et al., 1993). Salinity associated with the drilling waste materials may be inhibiting the establishment of *S. scorpioides* over time. Lichen cover was lower across almost all ages of drilling wastes which is not surprising as

lichens are commonly regarded as slow-growing (Werner, 1990; Seminara et al., 2018). Despite the lower percent cover of lichens on the drilling wastes there was a clear trend of increasing cover over time. This is exemplified by *Cetraria* sp. that had 20% less cover on the drilling wastes 1-2 years following disturbed but only 1.5% less cover 25 years following disturbance.

Sedges and mosses may be important early colonizers and appear to establish relatively rapidly under natural recolonization. Dwarf shrubs and lichens are likely to require more time for natural recolonization and these growth forms may require active restoration efforts if shorter revegetation timelines (i.e. < 20 years) are required.

Presence/absence of plant species had similar trends to those observed for the percent cover differences (Table 3). Investigating presence/absence data is critical to understanding specific species response, because it reveals species that could be excluded from the disturbed sites. Dwarf shrubs (*Cassiope tetragona* and *Dryas integrifolia)* including *Salix* spp. were absent from 60-80% of recently disturbed drilling waste sites (i.e. 2012, 2017) (Table 3). Similarly, several moss and lichen species were absent from 60-100% of drilling waste sites that were disturbed within the last 10 years. As discussed above the slow-growing nature of these species likely accounts for the slow rates of colonization. It also appears that there may be some *Carex* spp. that are absent from the drilling wastes even after 25 years of natural recovery.

Table 3. Species presence/absence on the drilling wastes compared with paired undisturbed control plots. Negative values represent the total percentage of sites where a species was present in the paired control plots but not on the drilling waste. Positive values represent the total percentage of sites where a species was present on the drilling waste but not the paired control plots. All values are expressed as a percentage of sites where a species was present/absent (i.e. x/5*100). Only species where presence/absence differences were found at > 2 sites (>40%) are included.

Year	Presence/absence of species on drilling wastes vs. paired controls (% of sites)						
	Shrubs	**Dwarf Shrubs**				**Sedge**	**Forb**
	Betula glandulosa	*Cassiope tetragona*	*Dryas integrifolia*	*Salix spp.*	*Salix reticulata*	*Carex spp.*	*Pedicularis sp.*
2017	0	**-80**	**-80**	20	-20	-20	0
2012	20	**-60**	0	**-60**	**-80**	0	0
2008	0	0	40	0	-20	0	-20
1998	**60**	-40	0	40	-40	-20	**60**
1993	0	-40	20	0	40	**-60**	-40

	Tomenthypnum nitens	*Distichium spp.*	*Alectoria ochroleuca*	*Dactylina arctica*	*Thamnolia spp.*	*Xanthoparmelia spp.*	
2017	**-60**	-40	0	**-100**	**-60**	**-60**	
2012	**-60**	-40	-20	-20	-40	-20	
2008	**-60**	**-60**	**-80**	**-60**	**-80**	-20	
1998	0	0	-40	-40	20	-20	
1993	-20	20	0	-0	-20	-20	

Only two species were found to occur on the majority of drilling waste sites in comparison to the paired control plots: *Betula glandulosa and Pedicularis sp* (Table 3). Both species were found on 60% of the drilling waste at sites disturbed in 1998, and *B. glandulosa* was also found on 20% of the drilling waste sites in 2012. It is possible that both of these species benefit from the exposed substrate and high light conditions on the drilling waste surfaces. A survey of more sites across the landscape is needed to support these initial results, but it is clear that there are species that may be excluded from the drilling wastes and others that may benefit from the disturbance.

Overall tundra disturbed by the deposition of drilling wastes at the Meliadine site appears to recover relatively rapidly (i.e. within 20 years) without any active restoration. The community composition between drilling wastes and the paired undisturbed tundra was similar 20-25 years post disturbance and species richness recovered within 6 years. Due to the different life history characteristics of tundra plants, individual species responses to disturbance were observed. While sedges and mosses may recover more rapidly on these drilling wastes, dwarf shrubs and lichens may require longer to recover. These trends in natural recovery are important for guiding future restoration efforts and techniques. Specifically, targeting sedge and moss species for transplanting and/or seeding of disturbed substrates may be a highly effective strategy for initiating the development of early successional tundra communities.

Invasive Species

We examined 25 drilling wastes sites ranging in age from 1-25 years across the landscape at Meliadine, NU (Figure 1). At each of these sites we surveyed all species present in six $1m^2$ plots (3 on drilling wastes, 3 in undisturbed tundra). Within these 150 survey plots no invasive species were detected. In addition, no invasive species were noted at any other location on site, however, no systematic survey was conducted.

The University of Saskatchewan will conduct invasive plant surveys once a year during the summers of 2019, 2020, and 2021. We will provide and implement "*protocols for reducing Project-related effects to plant populations and communities, primarily through the mitigation and management of invasive species, and includes both environmental and follow-up monitoring"* as required by the Project Certificate (No.006, Condition 37) for the Meliadine site. These surveys will allow for early detection of any non-native invasive species present on the Meliadine site and provide the distribution and abundance of any invasive species found. A targeted monitoring approach, which focuses on high probability sites of initial invasive species establishment will be used.

Invasive plant monitoring will follow the survey protocol outlined by Oldham 2006 for exotic plants along Northwest Territories highways. Our survey study area will include the footprint of the Meliadine mine, as well as, the main access road from Rankin to the Meliadine site. Road surveys will consist of driving at a low speed (30km/hr on the road into site, and posted speed limits within the mine footprint) along all roadways in the study area. During road surveys, we will be looking for any invasive plants. All roads will be driven twice, to ensure both roadsides are surveyed.

On the main access road, we will stop every 2km for an informal roadside walking survey. At each informal roadside survey, we will record latitude and longitude, walk 50 meters along both sides of the road and record if any invasive species are encountered (location, pictures). Within the mine

footprint, areas of high likelihood of invasive species colonization, such as intersections, will be surveyed through formal roadside surveys. At each formal roadside survey location, we will record the latitude and longitude, describe the local habitat with reference to native species nearby, and walk 50m in all directions looking for invasive species. Additional locations with a high likelihood of invasive species colonization within the mine footprint, such as the exploration camp and main camp, will also be surveyed by the formal approach with a focus on the perimeter of the disturbed area. We will consult with the AEM environment team for other targeted locations (storage buildings, gravel pits) while ensuring we are only conducting surveys in safe areas clear of mining related activity.

Based on a 2010 report from the Canadian Endangered Species Conservation Council, there are 14 non-native plant species that have been recorded in Nunavut (Table 4). While looking for species previously recorded as invasive in Nunavut, we will take samples of any plants we cannot identify in the field to confirm their identification.

Table 4. Non-native invasive plant species identified by the Canadian Endangered Species Conservation Council that have been found in Nunavut.

Scientific name	**Common name**
Carum carvi	Wild Caraway
Taraxacum officinale	Common Dandelion
Sonchus arvensis	Field Sow Thistle
Leucanthemum vulgare	Oxeye Daisy
Thlaspi arvense	Field Pennycress
Capsella bursa-pastoris	Shepherd's Purse
Barbarea vulgaris	Yellow Rocket
Amaranthus retroflexus	Green Amaranth
Hordeum vulgare	Common Barley
Puccinellia distans	Spreading Alkali Grass
Vicia cracca	Tufted Vetch
Papaver somniferum	Opium Poppy
Plantago major	Common Plantain
Polygonum aviculare	Prostrate Knotweed

Colonization of Drilling Wastes

Bryophytes played an important role in the initial and early colonization of drilling wastes across the landscape. Moss species, particularly *Bryum* spp. were found on 88% of the drilling waste sites and were only absent at three sites all of which were disturbed in 2017. In addition, *Bryum* spp. had higher cover on the drilling wastes compared with the paired undisturbed tundra controls 10-20 years following disturbance. These early colonizing acrocarpous moss species appear to be the first macro biological soil crust component to establish. Biological soil crusts (BSCs) are communities of mosses, liverworts, lichens, bacteria, cyanobacteria and fungi that are commonly found throughout the arctic, especially on recently disturbed soils (Bowker et al, 2018). Mature BSCs appear to naturally develop approximately 10 years following disturbance with BSCs present on all but one drilling waste site from the disturbance years 1993-2008. These early colonizers and the subsequent development of mature biological soil crusts (Figure 9) likely play an important role in increasing water hold capacity and maintaining soil moisture at the surface, which is critical for soil nutrient cycling processes and germination of vascular plants from seed (Forbes and Jefferies 1999; Stewart et al. 2011a,b,c). In addition, early bryophyte colonizers provide surface roughness that can trap wind blown seed (Belnap and Harper, 2003). Through wetting and drying cycles moss mats can also provide a significant input of carbon, nitrogen and phosphorus that in turn promote key ecosystem processes, such as carbon and nitrogen cycling (Stewart 2011a,b).

Figure 9. Early acrocarpous moss establishment on 4-5-year-old drilling waste (left GT13-70) and mature biological soil crust 20-year-old drilling wastes (right M98-230).

On-going work is being completed in the laboratory at the University of Saskatchewan to examine the development and function of BSC assemblages in relation to soil physical, chemical and microbial properties. We are also working to develop successional models of BSCs based on the realized niche of primary macro and micro BSC phyla. This will allow us to assess the primary factors that determine the initial colonization of the disturbed substrates and the subsequent development and function of these critical early successional communities.

BSC and underlying substrate samples were collected from three drilling waste sites for each of the following disturbance years: 1998, 2008 and 2013. Five samples of crust and the underlying

substrate were collected by pushing a 7 cm diameter by 6.5 cm deep cylindrical sampling cup into the ground, cutting around it with a knife and extracting the sample. Samples were then tapped out of the sample jar, turned upright and returned to the cup and closed tightly. Samples were stored in coolers until brought to the university, where they were then housed in the PhytoTRON (Diurnal cycle of 18.5 hrs light/5.5 hrs dark with 15°C during light and 5°C during dark with relative humidity ~50%) and watered regularly with approximately 125 ml of water (MilliQ ®Ultra-Pure). Subsamples of each crust surface (~ 2.5 cm) and underlying substrate (> 2.5 cm to depth of sample) were collected within 1 week of return from the field and were stored at -80°C until analysis. DNA will be extracted (DNeasy PowerPlant Pro Kit, Qiagen) from these BSCs and underlying substrate. Molecular analysis will be conducted using Illumina MiSeq sequencing. Bryophytes and lichens, bacteria (16S) and fungal ITS will be examined for each BSC and underlying soil sample. In addition, BSC and substrates immediately underlying BSCs will be characterized for pH, ammonium (NH_4), nitrate (NO_3), dissolved organic nitrogen and dissolved organic carbon.

To better understand the role these early colonizing communities have in driving recovery of ecosystem function, gas flux measurements and enzyme assays have and will be completed. Gas flux measurements of all sampled BSCs were measured in August 2018. A Fourier Transform InfaRed-Multicomponent Gas Analyzer was used to determine carbon dioxide (CO_2), methane (CH_4) and nitrogen dioxide (N_2O) flux under both dark and light conditions. Measurements of N_2 fixation were made using acetylene reduction assays (Stewart et al., 1967). For the subsequent years of sampling (2019 and 2020), a series of enzyme assays to measure mineralization (chitinase and protease assays, following Hendel & Marxsen (2005)), nitrification (potential nitrification assay, following Hoffman et al. 2007)) and denitrification (potential denitrification assay, following Luo et al., 1996)) will be performed.

Finally, two microclimate monitoring stations were deployed on drilling wastes from 2013. At each site, two zones were established; one with exposed drilling waste and no BSC establishment and the other colonized by BSCs. In each zone, soil surface temperature is being monitored with fine wire copper constant thermocouples, BSC moisture is being monitored with impedence clips (Coxson, 1991) and soil moisture sensors were inserted to measure below surface moisture conditions. PAR (Photosynthetically Active Radiation) sensors were installed to measure light intensity and Leaf Wetness Smart sensors were deployed to provide the percent wetness just above the surface of the BSCs. These instruments were connected to a dataloggers (CR1000X Campbell Scientific Inc or HOBO loggers) and hourly means are being recorded until 2020. Additionally, an inventory of BSC was conducted by use of $5cm^2$ grids in a $25cm^2$ quadrats to measure surface cover by visual estimates. This will allow us to examine the microclimatic conditions associated with these developing BSC communities.

Substrate Characterization

The average depth of drilling waste and organic matter in impacted sites was 3.7 ± 3.2 and 2.4 ± 3.2 respectively (Figure 10). The average depth of organic matter in control sites across the landscape was 7.7 ± 2.9 cm. The deepest deposits of drilling waste were > 15 cm and found at 1993 sites, M93-40 and M98-230. The deepest organic layer depth was found in a control site at 20 cm. While drilling waste depth was similar across the differently aged sites, higher organic matter accumulation was evident at older sites (Figure 11).

Figure 10. Drilling waste ~3 cm in depth underlain by an organic soil horizon (left) and organic matter accumulation over drilling waste (right).

The depth of drilling waste and organic matter (OM) was assessed at each site by measuring the depth of each substrate type within the center of each 1 m^2 vegetation survey plot. Drilling waste depth was similar across all disturbance years and OM in undisturbed control plots was also similar across the landscape (Figure 11). The highest amount of OM found on drilling wastes was found in sites >25 years old (i.e. 1993), while very low to no OM was found on recently disturbed sites (i.e. 2017).

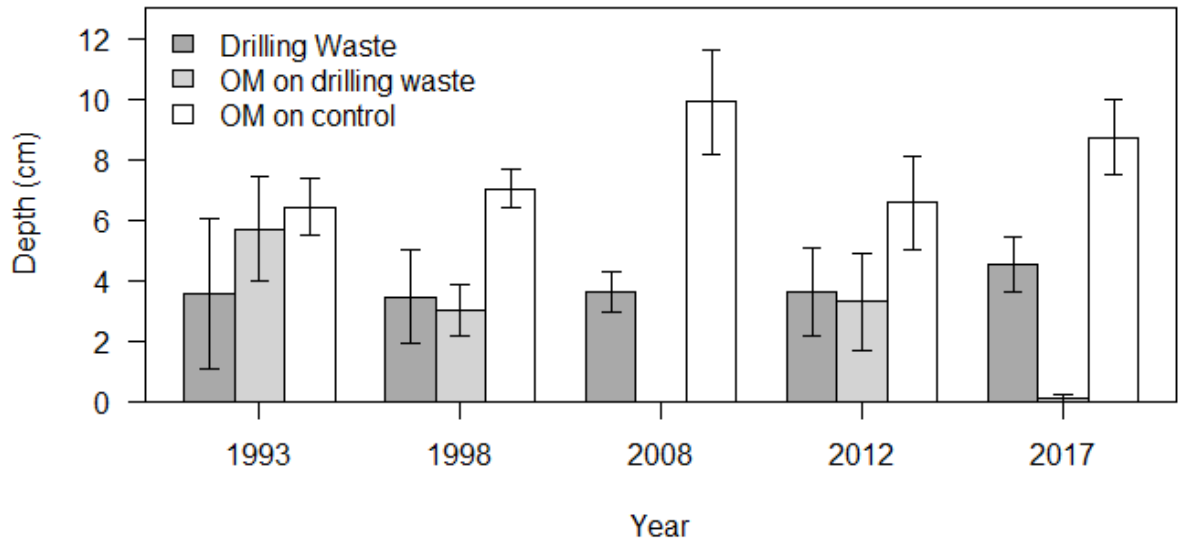

Figure 11. Depth of drilling waste, organic matter found over drilling waste and depth of organic matter in undisturbed controls plots. Bars are means with standard error (n=5).

Sites surveyed in 2008 were an anomaly with no OM depth detected (Figure 11). It possible that our sampling design biased placement of survey plots to areas with exposed drilling waste. However, we also found lower percent cover of several species (Table 2) and the highest number of absent species on drilling wastes (Table 3) at 2008 sites. The lack of organic matter accumulation could be due to the physicochemical properties of the drilling wastes inhibiting vegetative establishment or may be associated with the landscape position of 2008 sites. All 2008 sites were in close proximity to one another and were the most south-easterly sites sampled (Figure 1). Differences in landscape conditions (i.e. moisture, aspect, soil properties) in this area may impact natural revegetation. The 2008 sites were classified as heath hummock-hollow or transitional sites between heath hummock-hollow and sedge hummock-hollow. The mid-slope position of these sites would likely contribute to drier soil conditions, which may be limiting vegetative growth and hence OM accumulation. To confirm if/why lower OM accumulation is occurring in 2008, further survey of 2008 drilling waste sites in other landscape locations and assessment of the physicochemical characteristics of these drilling wastes is needed.

The relatively high OM depth measured at 2012 sites is also unexpected (Figure 11). Accumulation of OM in tundra ecosystems is generally considered to occur very slowly due to the short growing season and relatively low biomass production each year (Hobbie et al. 2002; Hugelius et al. 2010). It is very unlikely that approximately 4 cm of OM would accumulate within 6 years. We noted that on several drilling waste sites, wastes were found in depressions or hollows, with hummocks remaining intact above the level of the wastes. It is highly possible that some slumping is occurring in these hummock-hollow landscapes that could result in the burial of drilling wastes and appearance of OM accumulation on the drilling waste surface. These results should be interpreted with caution both due to the possible biasing of measurement due to the sampling design and the low numbers of replication (i.e. n=5) in each age category.

Best Practices to Promote Natural Recovery on Drilling Wastes

Based on the characterization of drilling waste sites and the tundra vegetation present on drilling wastes ranging from 1-25 years it is evident that natural revegetation is occurring on these wastes. Sources of vegetative materials for recolonization and depth of drilling waste appear to be two of the primary driving factors in determining the extent of recovery. Given these driving factors we suggest the following practices to promote natural revegetation processes.

1. Leaving areas of intact tundra vegetation dispersed throughout the area where drilling wastes are contained is essential. In hummock-hollow tundra, dispersal of drilling wastes into hollows, allows for hummocks to stay intact and act as source population for revegetation. Hummocks provide not only aboveground islands for revegetation but also maintain connectivity with intact belowground soil systems.

2. Thinly spread drilling wastes appear to undergo revegetation processes more quickly. In general, a depth of ~3 cm allowed for natural recolonization to proceed. Whereas depth of drilling waste > 15 cm can impede ecosystem recovery with little recovery observed even 20 years after disturbance. Underlying microtopography of drilling waste sites should be considered in managing wastes with an emphasis placed on limiting drilling wastes.

3. Direct colonization of drilling wastes in the first ~5 years is primarily driven by the colonization of acrocarpous mosses. Establishment of these early colonizing moss communities appears to facilitate the development of cohesive and diverse biological soil crusts in later years (~10-20 years). Mature biological soil crusts may act to further stabilize exposed drilling wastes and promote establishment of vascular plant species. **Promoting bryophyte cover in early stages may be beneficial to long-term tundra vegetation establishment.** Surface moisture is essential for establishment of early bryophyte communities and therefore practices that promote retention of surface moisture may assist in recovery.

Conclusions

Natural revegetation of drilling wastes is occurring at the Meliadine site. In our initial project proposal, we had proposed to examine active restoration on drilling waste sites. The first step in preparing to conduct active restoration was to examine a chronosequence of drilling waste sites across the landscape. This approach allows us to determine patterns of natural recolonization and use this information to inform active restoration practice. From the 25 drilling waste sites with paired undisturbed controls that were examined, we found that the community composition between drilling wastes and the paired undisturbed tundra was similar 20-25 years post disturbance and species richness recovered within 6 years. Due to the different life history characteristics of tundra plants, individual species responses to disturbance were observed. While sedges and mosses may recover more rapidly on these drilling wastes, dwarf shrubs and lichens may require longer to recover. These trends in natural recovery are important for guiding future restoration efforts and techniques. Specifically, targeting sedge and moss species for transplanting and/or seeding of disturbed substrates may be a highly effective strategy for initiating the development of early successional tundra communities.

Drilling waste depth was similar across all disturbance years and OM in undisturbed control plots was also similar across the landscape. The highest amount of OM found on drilling wastes was

found in sites >25 years old (i.e. 1993), while very low to no OM was found on recently disturbed sites (i.e. 2017). However, we found surprisingly large depths of OM on the drilling wastes in a short time period (ex. ~4 cm in 6 years). This trend warrants further investigation to determine the source and cause of this OM.

Based on our findings we provide suggestions to improve and/or maintain the relatively rapid natural revegetation of the drilling wastes. Placement of drilling wastes on the landscape that allow for remnant patches or islands of intact tundra throughout the disturbed area are essential for recolonization. Applying drilling wastes in thin layers may also assist with more rapid vegetative establishment. Finally, promotion of bryophyte communities in the early stages of revegetation may have long-term benefits for ecosystem recovery. Over the next three summers we will continue to monitor, survey and conduct laboratory trials to better understand the initial colonization and succession of species on these drilling wastes, particularly by bryophytes, lichens and biological soils crusts.

Finally, given the findings of this study we suggest that active restoration of the drilling wastes is likely not required for the recovery of the tundra plant communities, if the timeline for recovery is ~20 years. Therefore, in our on-going work to develop tundra restoration techniques, we suggest developing active restoration trials at other disturbed areas on the Meliadine site.

ACTIVITY SCHEDULE
(Refer to instructions to see if this section applies to your application. Use additional page(s) if necessary.)

Milestone	Description of activities	Anticipated starting date	Anticipated completion date
Milestone 0.1: Hiring HQP and field season preparation	All HQP will be hired and preparation for the field season completed. Preparations will include start-up meetings with the project team including AEM representatives. Planning of project logistics for year 1 and development of field plans.	2018-01-01 2018-06-01	2018-05-31 2018-07-01
Milestone 1.1: Natural recolonization of drilling wastes	Study natural recolonization of drilling waste dumps 2-17 yrs old by biological soil crusts and vascular plants. Specific recommendations of species for restoration will be developed.	2018-06-01 2018-07-01	2019-08-31 2018-11-30 Initial Technical report
Milestone 1.2: Development of HOF models	Hierarchical logistic regression modelling or Huisman Olff Fresco (HOF) models will be applied to examine optima and niche ranges of key naturally recolonizing foundational and early successional tundra species.	2018-09-01	2019-09-01
Milestone 1.3: Belowground niche ranges on waste dumps	Root density of key naturally recolonizing vascular plants will be plotted against key physicochemical parameters to determine niche ranges. This information will be used to further define HOF models in Milestone 1.2.	2018-09-01	2019-09-01
Milestone 0.3: Youth Education program	Collaboratively develop and deliver an education program on-site for one week in 2019 and 2021 for youth from Rankin Inlet and Baker Lake, NT. The program will focus on arctic ecology, restoration and skills in environmental monitoring and research.	2019-01-31	2020-01-31
Milestone 3.3: Assesment soil propagules in donor materials	The soil propagule bank in homogenized and plugs for transplant with be assessed. Specific recommendations on species present for restoration in local tundra will be developed.	2019-06-01	2020-01-01
Milestone 2.1: Active restoration with BSCs waste dumps	Transplanting of biological soil crusts on 10 drilling waste dumps. Specific recommendation of restoration practice and species for restoration will be developed. Active restoration of drilling wastes not required. Site of active restoration TBD. BSC development on drilling wastes will be examined through a chronosequence but not active restoration.	2019-06-01	2021-08-31

Personal identification no. (PIN)	Family name of applicant
441262	Stewart

ACTIVITY SCHEDULE
(Refer to instructions to see if this section applies to your application. Use additional page(s) if necessary.)

Milestone	Description of activities	Anticipated starting date	Anticipated completion date
Milestone 2.4: Active restoration with BSCs Waste Rock	Transplanting of biological soil crusts on 5 waste sites. Specific recommendation of restoration practice and species for restoration will be developed. This will be included in active restoration trial, location TBD.	2019-06-01	2021-08-31
Milestone 3.1: Active restoration with vascular plants	Transplanting of tundra plugs on 25 drilling waste dumps. Specific recommendation of restoration practice and species for restoration will be developed. This will be included in active restoration trial, location TBD.	2019-06-01	2021-08-31
Milestone 3.2: Belowground niches ranges at donor sites	The belowground niches ranges at undisturbed donor sites will be determined for key tundra vascular plants.	2019-06-01	2021-08-31
Milestone 2.3: Recovery of ecosystem function restored BSCs	Role of BSCs in recovery of key ecosystem services will be determined through examining community composition of actively restored BSCs with indicators of ecosystem function (ex. N and C fixation).	2019-06-14	2021-09-01
Milestone 0.4: Community meetings	We will hold community meetings in Rankin Inlet and Baker Lake. Working with Agnico's community relations department we will identify key groups to host. Our research and restoration of tundra environments will be presented and discussed	2019-08-01	2021-08-31
Milestone 2.2: Niche ranges of restored BSCs	Initial and realized niches of actively restored BSCs will be determined on drilling waste dumps and waste rock.	2019-09-01	2021-09-01
Milestone 0.6: Technical reports for Agnico Egale	Detailed technical reports for AEM on the restoration techniques examined. Guidelines and standard operating procedures for on-going monitoring will be included. Preliminary report January 2021, final report January 2022. Additional dates of yearly updates/technical reports on project progress.	2020-01-01 2018-11-30 2019-11-30	2022-01-01

Personal identification no. (PIN)	Family name of applicant
441262	Stewart

ACTIVITY SCHEDULE
(Refer to instructions to see if this section applies to your application. Use additional page(s) if necessary.)

Milestone	Description of activities	Anticipated starting date	Anticipated completion date
Milestone 0.5: Website development	Creation of project website providing information to restoration practitioners and public on general information on arctic ecology and restoration practice in the North, as well as key findings from the research.	2020-01-31 2019-06-01	2022-01-31
Milestone 3.4: Belowground niche ranges restored vasculars	The belowground niches of transplanted tundra species will be delineated on drilling waste dumps that were actively restored. Specific recommendation of restoration practice and species for restoration will be developed.	2020-06-01	2022-01-01

Sediment and Erosion Management Plan

MARCH 2019
VERSION 1

EXECUTIVE SUMMARY

This document presents the Sediment and Erosion management plan (the Plan) at the Meliadine Gold Project. The purpose of this Plan is to provide consolidated information on the management and monitoring of potential areas subjected to erosion. This is accomplished by reviewing the potential effects of total suspended solids (TSS) and turbidity, the Federal guidelines and the license requirements, followed by the periods and types of activities subjected to erosion, and the specific monitoring and mitigating measures.

General findings on the effects of TSS on fish and fish habitat have been listed, such as sublethal and lethal effects on fish and their eggs. Federal TSS Guidelines have been cited, distinguishing the short-term and long-term exposure thresholds. Turbidity guidelines are also discussed in the present document. The Plan presents the monitoring and mitigating actions related to three (3) specific periods of activity: Periods of construction near water – during construction and operation; periods of freshet or significant runoff events – during construction, operation and closure; periods of potential impact to waterbodies – during operation. The proposed monitoring and mitigating measures are discussed for those periods of activity.

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) is developing the Meliadine Gold Project (Project), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. Situated on the western shore of Hudson Bay, the Project site is located on a peninsula between the east, south, and west basins of Meliadine Lake (63°1'23.8'' N, 92°13'6.42"W), on Inuit owned lands. The Project is located within the Meliadine Lake watershed of the Wilson Water Management Area (Nunavut Water Regulations Schedule 4).

As presented in Table 1.1, there are four phases to the development of the Tiriganiaq deposit: 3.5 years construction (Q4 Year -5 to Q2 Year -1), 8.5 years mine operation (Q2 Year -1 to Year 8), 3 years closure (Year 9 to Year 11), and post-closure (Year 11 forwards).

Table 1.1 Overview of Timeline and General Activities

Phase	Year	General Activities
Construction	Year -5 to year -1	• Construct site infrastructure • Develop the underground mine ramp • Stockpile ore
Operations	Year -1 to 8	• Mining operations • Stockpile ore • Dry stack tailing deposition
Closure	Year 9 to 11	• Decommission of underground mine surface opening • Cover on top of tailings • Decommission non-essential mine infrastructure • Fill open pits with active pumping
Post-Closure	Year 11 forwards	• Site and surrounding environment monitoring

This document presents the Sediment and Erosion Management Plan (the Plan). The purpose of this Plan is to provide consolidated information on the management and monitoring of potential areas subjected to erosion. This is accomplished by presenting first a review of the potential effects of total suspended solids (TSS) and turbidity, the Federal guidelines and the license requirements, followed by the periods and type of activities subjected to erosion, and the specific monitoring and mitigating measures.

As per Nunavut Impact Review Board (NIRB) Meliadine Project Certificate No.006 Condition 28, the Sediment and Erosion Management Plan should be developed to prevent or minimize the effects of destabilization and erosion that may occur due to Project activities. The plan should also detail sediment control plans to prevent and/or mitigate sediment loading into surface water within the Project area.

The objectives of the plan are:

- To prevent the release of sediment into streams and waterbodies during construction activities;
- To reduce and mitigate erosion and the release of sediment during operations activities;
- To specify erosion and sediment control measures that, if implemented and maintained, will help Agnico Eagle maintain compliance with the Federal Fisheries Act, specifically with Section 36(3) of the Act, which prohibits the deposition of deleterious substances into waterbodies frequented by fish; and
- To provide references to approvals, relevant standards, control plans and procedures for training, communications, investigation and corrective action, and audits that are required under the Project Agreement.

SECTION 2 • TOTAL SUSPENDED SOLIDS/TURBIDITY EFFECTS, FEDERAL GUIDELINES AND LICENSE REQUIREMENTS

2.1 Effects of Total Suspended Sediments on Fish Habitat

Suspended sediments, and associated effects on water clarity, have the potential to affect fish and fish habitat in a variety of ways, including but not limited to:

- Smothering of deposited eggs or siltation of spawning habitats;
- Smothering of benthic invertebrate communities;
- Decreased primary productivity caused by reduced light penetration;
- Reduced visibility, which may decrease feeding efficiency and/or increase predator avoidance; and
- Clogging and abrasion of gills.

Moreover, the general findings for effects of TSS on fish and fish habitat indicate the following:

- Effects of TSS depend on both the concentration of TSS and duration of exposure;
- Effects of TSS can also be influenced by the size and shape of suspended particles;
- Lethal concentration of TSS on fish over acute exposure ranges from hundreds to hundreds of thousands of mg/L;
- Sublethal effects on fish (reduced growth, changes in blood chemistry, histological changes) associated with chronic exposures tend to be exhibited at TSS concentrations ranging from the tens to hundreds of mg/L;
- There is considerable uncertainty about potential effects of low TSS concentrations over long time periods;
- Overall, the most sensitive group of aquatic organisms to TSS appears to be salmonids, and guidelines are developed to protect this group;
- Adult salmonids are generally more sensitive to short durations of high concentrations of suspended sediments than juvenile salmonids; and
- Low suspended sediment levels are known to cause egg mortality (40 %) to rainbow trout at long durations (7 mg/L at 48 days). Guidelines for long-term exposure reflect these findings.

More details are located in the report from Fisheries and Oceans Canada (DFO) on the effects of sediments on fish and their habitat (Fisheries and Oceans Canada, 1999).

2.2 Federal Guidelines

2.2.1 TSS Guidelines

The Canadian Council of Ministers of the Environment (CCME) specifies separate guidelines for TSS for clear and high flow periods. The guidelines are derived primarily from Caux *et al*. (1997), with application intended mainly for British Columbia streams. In the case of the application to the Meliadine Project lakes, the clear flow guidelines would be most relevant; even during freshet. The

lakes would not expect to see large natural fluctuations in TSS except in localized areas for short periods.

The guidelines put forth by the CCME recognize that the severity of effects of suspended sediments is a function of both the concentration of suspended sediments and the duration of exposure. Guidelines are intended to protect the most sensitive taxonomic group and the most sensitive life history stages.

Table 2.1 Existing Federal TSS Guidelines (after Agnico Eagle, 2018)

Source	Short-Term Exposure	Long-Term Exposure
CCME (1999)	Anthropogenic activities should not increase suspended sediment concentrations by more than 25 mg/L over background levels during any short-term exposure period (e.g., 24-h).	For longer term exposure (e.g., 30 days or more), average suspended sediment concentrations should not be increased by more than 5 mg/L over background levels.
MMER (2002)	Maximum authorized concentration in a composite effluent sample = 22.5 mg/L. Maximum authorized concentration in a grab sample of effluent = 30 mg/L.	Maximum authorized monthly mean effluent concentration = 15 mg/L.

2.2.2 Turbidity Guidelines

Turbidity guidelines put forth by the CCME (1999) are based on extrapolation from the TSS guidance above, adjusted by a factor of about 3:1 (a typical average ratio for TSS: turbidity). In the case of turbidity for clear water, CCME (1999) recommends a maximum increase of 8 Nephelometric Turbidity Units (NTU) from background levels for a short-term exposure (e.g., 24-hour period), and a maximum average increase of 2 NTU from background levels for a longer term exposure (e.g., 30-day period).

CCME (1999) notes that in some cases short-term resuspension of sediments and nutrients in the water column can augment primary productivity, and in other cases, changes in light penetration may be inconsequential if a system is limited by other factors such as nutrients. The Caux *et al*. (1997) study considered effects of suspended sediment not only on fish but also on algae and zooplankton. In summary, the recommendations put forth by Caux *et al*. (1997) are based mainly on the most sensitive taxonomic group, which is salmonids.

However, research has shown that widespread, chronic turbidity can result in reduced light penetration and subsequent reductions of primary productivity (Fisheries and Oceans Canada, 1999; Canadian Council of Ministers of the Environment, 1999; Lloyd, Koenings, & Laperriere, 1987). Consequently, water clarity is of concern at broader spatial scales and longer time frames. It should be noted that DFO's report on effects of sediment on fish and their habitat (DFO, 1999) endorses the guidelines for TSS put forth by the CCME (1999), but does not recommend following guidelines for turbidity. Rather, turbidity may be used as a surrogate for suspended sediment only when the relationship between the two parameters is established for a particular waterbody.

2.3 License Requirements for the Protection of Fish and Fish Habitat at Meliadine

The Nunavut Water Board (NWB) Type A Water License for the Meliadine Project includes:

All surface runoff and/or discharge from drainage management systems, at the Monitoring Program Stations MEL-SR-1 to MEL-SR-TBD referred to in Part I, Item 11, during the Construction/Operation of any facilities and infrastructure associated with this project, including laydown areas and All-weather Access Road, where flow may directly or indirectly enter a Water body, shall not exceed the Effluent quality limits in Table 2.3.

Table 2.3 Effluent Quality Limits

Parameter	Maximum Average Concentration	Maximum Concentration of Any Grab Sample
Total Suspended Solids (TSS) (mg/L)	50.0	100.0
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

SECTION 3 • SEDIMENT AND EROSION MONITORING AND MITIGATION

3.1 Sediment and Erosion During Specific Periods

The purpose of the Plan is to ensure that Agnico Eagle will successfully monitor signs of sedimentation and erosion and minimize its resulting effects. This plan presents the monitoring and mitigating actions related to three (3) specific periods of activity for Meliadine:

- Periods of construction near water – during construction and operation;
- Periods of freshet or significant runoff events – during construction, operation and closure;
- Periods of potential impact to waterbodies – during operation.

The construction of water management infrastructure could potentially lead to excess TSS. Therefore, erosion control methods must be considered during construction of water management infrastructure. In addition, erosion control must be considered during any dewatering activity.

The freshet season at Meliadine occurs approximately from mid-May until the end of June. In addition, there can be periods of high water flow due to rainfall events from late May – early October. As most site construction has been completed at the Meliadine site there are new areas and infrastructure that have become potentially vulnerable to excess water during the freshet season and in response to rainfall, such as, but not limited to:

- Culverts and other water management infrastructures;
- Newly constructed embankments, such as roads and berms;
- Water channels; and
- Surface runoff.

Water transfer and water discharge during operation can also lead to erosion and sedimentation.

3.2. Erosion and Sediment Monitoring

In order to monitor potential erosion and sedimentation, smaller water management infrastructure such as culverts, cross drains, surface runoff and ditches are inspected daily during freshet, on a monthly basis thereafter and daily after significant rain events. Larger culverts and bridges are inspected more often if they represent a risk for daily operations, for the receiving environment or for the health and safety of workers. More specifically, the following aspects are monitored during visual inspections:

- Accumulation of debris near the inlet of the crossings, impeding the free flow of water at those locations;
- Bed erosion upstream and downstream of watercourse crossing structures;
- Scour under bridge abutments and abutment foundations; and
- Erosion along cutslopes and fillslopes of embankments (rill and gully erosion), etc.

Newly excavated channels are inspected on a regular basis and after significant rain events. Erosion signs along the channel flow are monitored and documented. Inspections are carried out during the spring when surficial ice moves towards the inlet of the diversion channels to ensure that no ice

blockage causes water buildup upstream of the channel, which could lead to subsequent erosion problems. It is important to develop a database to determine if adverse trends are occurring. If adverse trends are observed, then mitigation will be undertaken to prevent a major incident.

The frequency of water and turbidity sampling are in accordance with the requirements of the Type A Water License. The frequency will be increased if required during the freshet season or during heavy rainfall events. Procedures for turbidity monitoring include:

- Collection of water at the site of sediment entrance (exposure), and at a reference site (i.e., in the same watercourse/waterbody in an area unaffected by the sedimentation [upstream, at least 50 m away where water does not appear to be impacted]).
- Analyze samples for turbidity using a field turbidity meter and compare the exposure sample to the reference sample.
- If the exposure sample results are higher than the reference then mitigation will be undertaken (ie installation of silt fencing, silt barrier booms, etc) to prevent any impact to watercourses.

If Agnico Eagle is actively working in an area with elevated turbidity – the work will stop until the level of clarity returns to an acceptable level.

Monitoring will be documented with site photographs and inspection forms.

3.3 Mitigating Measures

The following mitigation measures could be used, if required, to reduce risks associated with erosion and sedimentation.

- Riprap or clean non-acid generating/non-metal leaching rockfill could be used to armor shorelines, bridge abutments, culverts inlets and outlets and toe berms;
- Ditches managing high volumes of water could be armored for erosion control and reduce the speed of water flow;
- Sedimentation basins could be constructed at sensitive locations to allow settlement of finer sediments;
- Ditches, culverts and other water crossing structures should be maintained free of debris to allow free flow of runoff water;
- Installation of erosion control material such as turbidity barriers, silt curtains or straw booms;
- Site-specific erosion issues may arise during the mine operation that require specific local corrective actions;
- In-stream construction during periods when streams are expected to be dry or frozen to the bottom (i.e., during winter or fall). Isolation methods will be used for work below the high water mark for streams with flowing water at the time of construction;
- Materials installed below the high water mark (i.e., riprap) will be cleaned prior to installation to avoid adding deleterious substances to watercourses. Where concrete is installed, it will be allowed to cure fully prior to installation;

- Riparian areas will be maintained whenever possible to minimize erosion and impacts to fish habitat, with vegetation removal limited to the width of the workspace footprint. Disturbed areas along the streambanks will be stabilized and allowed to re-vegetate upon completion of work to minimize future erosion;
- Debris and excess materials resulting from construction will be removed from the work site to prevent them reaching water bodies; and
- When using equipment that creates tracks on the surface, run the equipment slowly to create grooves running perpendicular the slope and not parallel to the slope. This type of texture on slopes can slow the speed of runoff and reduce the amount of erosion and sediment transported downhill. This method must also be combined with an additional method of catching sediment at the base of the slope, such as a silt fence, straw log, etc.

EXECUTIVE SUMMARY

The Shipping Management Plan was developed in accordance with federal legislation, notably the *Canada Shipping Act* and the *Arctic Waters Pollution Prevention Act,* and associated regulations. It also recognizes the international conventions and protocols signed by Canada. Agnico Eagle provides the necessary human, material and financial resources to meet or exceed the legal requirements attributable to the company that arise from shipping-related activities. Shipping contractors are encouraged to do the same. Agnico Eagle and its shipping contractors carry third party liability insurance.

All shipping is carried out during the open water season and follows the recommended shipping routes that are presently in use for the annual sea lift to Rankin Inlet and other Kivalliq communities. Ice breaking is not conducted to extend the shipping season.

Upon arrival at Rankin Inlet, all vessels anchor either outside or inside Melvin Bay. Dry cargo is lightered onto barges for transport through the access passage using tugs. The barges then transport the dry cargo by barge to the existing gravel ramp used by the hamlet of Rankin Inlet during the annual sealift to dock. Large fuel tankers anchor outside of Melvin Bay. Ship-to-ship fuel transfer is the first step in moving the fuel to the Itivia tank farm. The small tanker navigates the access passage and anchors off Itivia where a ship-to-shore floating hose transfers the fuel to the tank farm.

It is Agnico Eagle's intent to prioritize the road transport of hazardous materials, including explosive-related materials, to the Meliadine site to avoid having such cargo remain in storage at the Itivia laydown yard. Other contingency measures associated with shipping-related activities include the Spill Contingency Plan, Risk Management and Emergency Response Plan, and the Oil Pollution Emergency Plan (OPEP). Risk and hazard assessments of shore-based marine response activities are undertaken as part of training the Emergency Response Team (ERT).

Agnico Eagle personnel and the Master of the ship are responsible for security matters related to the shipping-related activities. While it is anticipated that the RCMP will not be involved in security matters, all criminal activities or matters of a grave nature (e.g., smuggling) will be referred to the RCMP in Rankin Inlet. Mitigation measures to prevent smuggling are in place. Mitigation measures are also employed to minimize potential negative socio-economic effects from shipping-related activities; positive socio-economic impacts are anticipated.

Navigation through the Labrador Sea, Hudson Strait and Hudson Bay is not challenging during the open water season. No major hazards were identified along the shipping and tug-barge routes under normal conditions. Shipping can be carried out without pilotage as the shipping routes entail minor hazards not significantly reducing ship safety.

All ships, tugs and tankers use electronic charts and other electronic navigational aids to provide safety in transit, reduce the risk of accidents, and remain within the recommended shipping routes.

Traffic through the access passage is coordinated to avoid shipping conflicts, and speed is reduced to ensure safety. To maximize the safety of the persons travelling in boats near the Rankin Inlet access passage, Agnico Eagle informs the community of the shipping activities, promotes actions that will allow the ship and the small boats to see one another, and, through the Community Liaison Committee, recommends that all those in small boats wear personal floatation devices.

On board waste management (solid and hazardous wastes, sewage) is the responsibility of shipping contractors. Agnico Eagle requires the shipping contractors to conform to the *Ballast Management Control and Management Regulations*, which should reduce the risk of invasive species being introduced as a result of shipping activities. Agnico Eagle expects to contract vessels that meet applicable environmental requirements in addition to being reliable and having a superior safety record.

Care is taken to avoid disturbing marine mammals within the shipping routes as much as possible. As part of shipping companies' standard operating procedures, ship crew monitors the shipping routes for marine mammals from the Hudson Strait to Rankin Inlet. Mitigation measures may comprise, if safe to do so, slowing the ship and stay at distance from marine mammals.

Vessels contracted by Agnico Eagle are required to have an approved Shipboard Oil Pollution Emergency Plan (SOPEP). If an environmental emergency occurs along the shipping routes, the SOPEP is activated. Close coordination is maintained with Agnico Eagle's shore-based supervisors who can activate Agnico Eagle Emergency Response Plan and OPEP to provide assistance to a vessel. Accidents or malfunctions during transit will be reported to Transport Canada, in accordance with provisions under the *Canada Shipping Act* (CSA 2001) and subsequent regulations. Spills would also be reported to the Environmental Emergencies 24-Hour Report Line and, if necessary, advice would be requested from the Regional Environmental Emergencies Team (REET). Assistance could be sought from nearby ships and the Canadian Coast Guard (CCG).

SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) gained extensive experience in shipping fuel and dry cargo to the Meadowbank Gold Mine (Meadowbank) since its construction began in 2008 and commercial production in 2010. Similar shipping, lightering and ship-to-shore fuel transfer procedures developed and in use for Meadowbank are employed for the Meliadine Gold Mine in Rankin Inlet.

Dry cargo barges undergo lightering operations at the existing gravel ramp used by the hamlet during the annual sealift in Itivia Harbour[1]. A tank farm, sea can storage and a laydown yard is also located at Itivia (Figure 1-1).

1.1 Shipping Needs

A total of approximately 40,000 tonnes of dry cargo (equipment and supplies) and 50 million litres of diesel fuel is required annually for the operations of the Meliadine Mine. To meet these needs, approximately 8 vessels annually deliver dry goods and up to 6 tankers will annually deliver diesel fuel. At this time, dry cargo shipping operations have been contracted to Desgagnes Transarktic.

All shipping is carried out during the open water season (typically from early July to late October) and follow the recommended shipping routes presently in use for the annual sea lift to Rankin Inlet and other Kivalliq communities. There will not be any ice breaking to extend the shipping season.

The priorities in shipping dry cargo and fuel are:

- The protection of the crew and others in small boats that the ship may come across;
- The protection of the marine environment; and
- The preservation of the ship and its cargo.

All ships, tugs and tankers are equipped with electronic navigational aids. Ships are not serviced in Rankin Inlet and arrive with enough fuel for the return voyage south.

The Meliadine Mine is anticipated to contribute to shipping in Hudson Strait and Hudson Bay by about 14 ships during construction and 8 to 12 ships during operations. This represents an increase in ship traffic in Hudson Strait, Hudson Bay and to Rankin Inlet, and extra care is required in regards to marine safety. This includes ensuring there is adequate spill response equipment on the ships and at the Itivia

[1] The current plan is to lighter cargo using the existing gravel ramp in Itivia Harbour. This ramp is currently used by the Hamlet of Rankin Inlet during the annual sealift. The assessment of potential effects related to the use of this ramp are consistent with those discussed in Section 8.3.4 of the FEIS (e.g., propeller wash from nearshore Mine vessels berthing at the landing ramp may result in adverse effects to marine water quality with associated indirect effects on marine wildlife). The conclusions of the assessment remain the same.

Oil Handling Facility. Spill response personnel need to have adequate training and equipment to effectively respond to a spill in the marine environment[2].

1.2 Shipping Routes

The marine transport of dry cargo is comprised of four main segments, all within the recommended shipping routes:

- Bécancour, Québec on the St. Lawrence River, along the coast of Labrador to the Hudson Strait;
- Through Hudson Strait to Hudson Bay (see Appendix A for marine hydrographic charts showing the shipping routes);
- Across Hudson Bay to Marble Island, this being approximately 45 km offshore Rankin Inlet; and
- From Marble Island to the barrier islands, through the islands to an anchoring point either inside or outside of Melvin Bay and Itivia. Access to anchoring locations inside Melvin Bay occurs through the access passage (Figure 1-1).

Dry cargo and transport barges are loaded onto ocean-going container ships in eastern ports, almost exclusively Bécancour, and delivered directly to Rankin Inlet[3]. The first vessels of the year normally arrive in Rankin Inlet in early July or August. This first container ship includes two (2) transport barges to transport dry cargo to shore, and two (2) tugs.

Up to twelve (12) container ships arrive throughout the open water shipping season delivering dry cargo[4]. All ships follow the recommended shipping routes and are equipped with complete electronic navigation aids for navigation in restricted waters.

The port of departure for transporting fuel is different from that for dry cargo. The first leg of the voyage is from an east coast refinery along the coast of Labrador to the Hudson Strait with the remainder of the voyage being the same as for the ships carrying dry goods.

1.3 Lightering Procedures

1.3.1 Dry Cargo

Sea cans, large equipment, machinery, general cargo and vehicles are lightered onto the barges (that arrived during the first dry cargo trip) for transport to shore using tugs and then lightered to shore using the existing gravel ramp in Itivia Harbour. During lightering operations, attention is directed to

[2] Oil Pollution Emergency Plan details spill response at the Itivia Oil Handling Facility.
[3] Agnico Eagle's shipping routes within Nunavut are non-compulsory pilotage areas during the ice free shipping season.
[4] To this point there are no alternative routes under consideration, however future routing may include Churchill to Rankin Inlet on occasion.

stabilizing the barges at the gravel ramp, with due consideration being given to the prevailing and expected wind, weather, and tide conditions.

Most dry cargo is transported in marine shipping containers (TEUs; Twenty-foot Equivalent Unit) of general cargo vessels fitted with cranes. Most materials arrive in sea cans, which are stacked in the Itivia laydown yard or moved immediately to site. The use of sea cans provides secondary protection against spills and facilitates rapid transfer from ship to shore.

The tug-barge used to ferry the dry cargo to shore is highly manoeuvrable and capable of transiting the access passage with its changing current patterns. The tidal current in the area is half a knot (0.93 km/h). Navigation proceeds at a slow speed in periods of low visibility. Traffic through the access passage is coordinated through communication between the tugs to avoid shipping conflicts and to ensure safety.

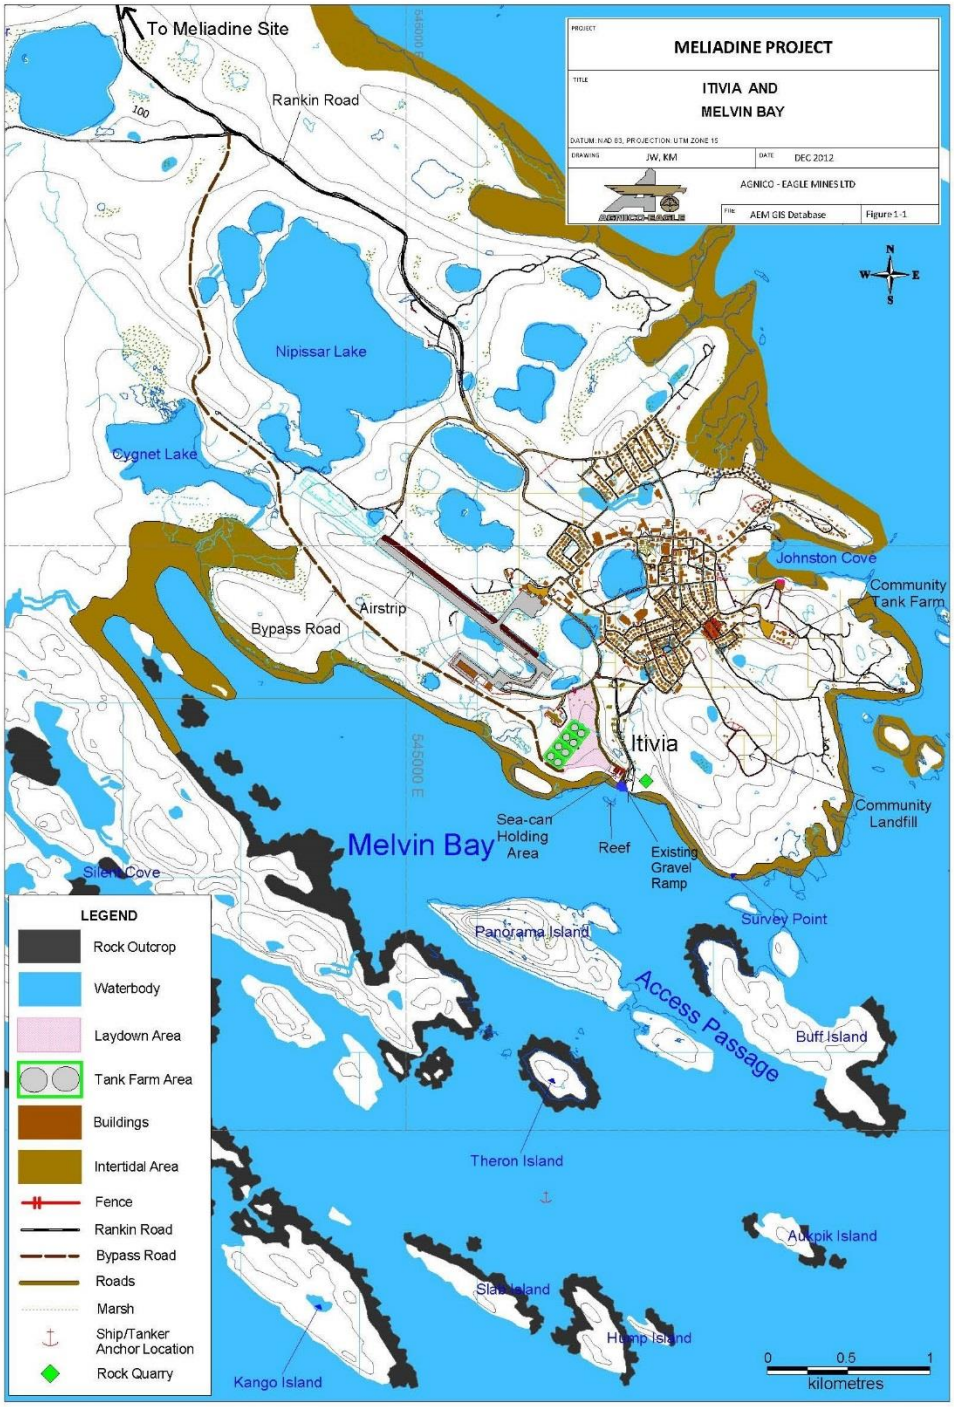

Figure 1.1 Itivia and Melvin Bay

Masters of tugs, large and small tankers, and dry cargo ships are responsible for their vessels at all times – for the safe navigation of their vessels from the port of departure to Rankin Inlet. For tugs this also includes responsibility for the barge they are towing or pushing. When a barge is laid alongside a dry cargo vessel for lightering containers or equipment from the cargo ship to the barge, a loading supervisor on the ship takes charge of the barge. When a cargo barge is stabilized at the gravel ramp for lightering to shore, a shore supervisor takes charge of the cargo barge.

The shore crew then conducts a "roll-on/ roll-off' operation using wheel loaders equipped with forks, trucks and trailers to unload the cargo from the barges. Cargo is stockpiled on the laydown area before being transported to the Meliadine Mine.

For the majority of the shipping season, outgoing cargo is loaded onto lightering barges and subsequent container ships for the return trip to southern ports. Outgoing cargo could include construction equipment being demobilized following the completion of construction and/or hazardous or other waste being sent to a certified waste management facility for treatment, recycling and/or disposal in another provincial or territorial jurisdiction. No barges, fuel vessels or tugs remain at Rankin Inlet over the winter; all return to southern ports.

1.3.2 Diesel Fuel

Large tankers delivering diesel fuel anchor in the same general location as the dry cargo vessels (Figure 1-1). Ship-to-ship transfer of fuel occurs at this location from the larger tanker to a smaller tanker that can navigate the access passage. The carrying capacity of the small tanker will be either 7,300 m^3 or 10,500 m^3. The one selected at any one time is subject to its availability when a large fuel tanker is set to deliver fuel to Agnico Eagle. The smaller tankers are able to navigate the access passage into Melvin Bay while the large tanker cannot. The small tanker anchors opposite Itivia[5]. From there a floating hose of some 300-500 m is connected to a shore-based pipeline for transfer of fuel to the tank farm. Contingency measures related to the transfer of fuel are described in the Oil Pollution Emergency Plan.

1.3.3 Explosives and Hazardous Materials

Part of the dry cargo received each year is ammonium nitrate, which is used on site to manufacture explosives. Bulk ammonium nitrate is shipped as prill, which is inert and does not require special handling during transit. The ammonium nitrate remains in sea cans at the mine site until needed[6]. Other needed raw materials and blasting related products arrive in sea cans and are stored in secure locations at the mine site. Ammonium Nitrate (to be used as an explosive) is also listed in schedule 1 of the *Environmental Emergency Regulations* under the *Canadian Environmental Protection Act*. Further information related to transport of ammonium nitrate is provided in the Explosives

[5] The anchoring location will vary based on a number of factors such as tide, wind and draught of the small tanker.
[6] An on-site Emulsion Plant has been constructed for the manufacturing of explosives. More details on that subject are available in the Explosives Management Plan.

Management Plan (Agnico Eagle 2018). Agnico Eagle notified Environment and Climate Change Canada of the expected quantity of ammonium nitrate to be shipped by barge and stored on site, and received a response from ECCC indicating that Agnico Eagle has met the requirements of the E2 registration.[7]

It is Agnico Eagle's intent to prioritize the road transport of hazardous materials, including explosive-related materials, to the Meliadine site to avoid having such cargo remain in storage at the Itivia laydown yard. Sensitive products such as explosives, boosters and caps are transported directly to the Meliadine Mine. However, in the eventuality of a delay in their transit to the mine site, these products will be temporarily stored in Rankin Inlet according to applicable regulations which include locked storage under constant surveillance. All handling, transport, storage, manufacture and use of explosives are subject to federal approval under the *Explosives Act*, and the *Nunavut Mine Health and Safety Act*. In addition, the latest Ship Safety Bulletin issued by Transport Canada's Marine Safety Directorate is followed when loading and unloading explosives.

Sodium cyanide is used to optimize gold recovery from the ore. This product is used at the Meliadine site. Due to transportation restrictions, normally a full year's supply of sodium cyanide is transported and stored on site. The product is transported, stored, handled, transferred and used in compliance with appropriate legislation and applicable Best Management Practices. Agnico Eagle is a signatory to the International Cyanide Management Code.

Hazardous waste and contaminated soil is managed on a yearly basis; consequently there will be little to no accumulation of such wastes at the mine site during operations, subject to seasonal shipping considerations. Hazardous waste that cannot be managed on site is appropriately packaged for transport in sea cans and sent via a dry cargo vessel to a certified hazardous waste management facility for treatment, recycling and/or disposal in another provincial or territorial jurisdiction. Agnico Eagle contracts shipping companies that are certified under the IMDG code (International Maritime Dangerous Goods).

Itivia is presently connected to the hamlet by a municipal road and a private bypass road, which is used for the transport of all its dry cargo and fuel around the community. This includes explosives, cyanides and dangerous goods.

[7] E-mail submitted by Martin Theriault of Agnico Eagle to ECCC on September 13, 2018 and an e-mail received by Martin Theriault of Agnico Eagle from Christina Firth of ECCC, September 13, 2018.

SECTION 2 • RELATED DOCUMENTS

The Shipping Management Plan covers the scope of shipping activities for the Meliadine Mine. It is part of the Environmental Management and Protection Plan.

Management and monitoring plans for the Meliadine Mine that provided input to the Shipping Management Plan include the following:

- Spill Contingency Plan;
- Risk Management and Emergency Response Plan;
- Oil Pollution Emergency Plan;
- Shipboard Oil Pollution Emergency Plan (shipping companies); and
- Occupational Health and Safety Plan.

2.1 Spill Contingency Plan

The cornerstone of spill contingency planning for Agnico Eagle is the Spill Contingency Plan covering all spills on land, water and ice. It forms part of the Environmental Management and Protection Plan. The Spill Contingency Plan, coupled with the Risk Management and Emergency Response Plan, describes the processes to be followed when responding to a spill to the environment.

2.2 Risk Management and Emergency Response Plan

The Risk Management and Emergency Response Plan focuses on responding to all emergencies in a timely and adequate manner. It commits Agnico Eagle to being prepared for and providing adequate resources - qualified personnel and equipment - to handle a wide variety of emergency situations.

Risk and hazard assessments of shore-based marine response activities are undertaken as part of training for Emergency Response Team (ERT).

2.3 Oil Pollution Emergency Plan (OPEP)

The Oil Pollution Emergency Plan complements the Spill Contingency Plan and should not be construed as superseding it. The OPEP only provides contingency planning for the Oil Handling Facility (OHF) at Itivia.

The OPEP complies with the requirements for procedures, equipment and resources as set out in the *Canada Shipping Act* (s.s. 660.2(4)) specific to the fuel handling facility, the bulk incoming transfer of fuel from ship-to-shore and spill scenarios directly relating to this operation. Further, the OPEP provides direction to Agnico Eagle personnel and/or contractors and to Agnico Eagle's ERT in emergency spill response situations. It also contributes in developing oil pollution scenarios, defining the roles and responsibilities of management and responders, and outlining the measures taken to prevent spills. The OPEP seeks to minimize potential health and safety hazards, environmental damage and cleanup costs.

Spills resulting from ship-to-ship fuel transfer will be the responsibility of the ships contracted by Agnico Eagle and ship's Master. Agnico Eagle will provide assistance wherever possible in these instances.

2.4 Shipboard Oil Pollution Emergency Plan

The Shipboard Oil Pollution Emergency Plan (SOPEP)[8] contains all information and operational instructions as required by the International Marine Organization's "*Guidelines for the Development of the Shipboard Marine Pollution Emergency Plan*". Vessels contracted by Agnico Eagle will be required to have an approved SOPEP. The preparation of the SOPEP is the responsibility of the shipping company and is maintained by the vessel's Master. However, close coordination is maintained with Agnico Eagle's shore-based Itivia supervisors who can activate the Emergency Response Plan (ERP) and OPEP in providing assistance to a vessel in the near-shore area. These two plans have close links to the SOPEP and, as required, include training exercises at regular intervals to ensure ship and shore can cooperate in responding to any spill of fuel or any other hazardous product in the immediate vicinity of Itivia. SOPEP(s) arerequired to include how vessel contractor(s) maintain spill equipment and the frequency and framework for training vessel personnel in vessel-based spill response. This includes, but is not limited to:

- Spill equipment audits;
- Maintaining posted list of spill equipment;
- Requirements for spill response drills; and
- On-going training refreshers (e.g. annual renewals).

Accidents or malfunctions during transit will be reported to Transport Canada, in accordance with CSA 2001 and subsequent regulations. If the accident involves the loss of fuel or chemicals, the SOPEP would be activated and on-board spill response materials and equipment put to use. Spills would also be reported to the Government of Nunavut Spill Line and to the Environmental Emergencies 24-Hour Report Line and, if necessary, advice would be requested from the Regional Environmental Emergencies Team. Assistance could be sought from nearby ships and the Canadian Coast Guard (CCG). Spill response resources such as those maintained by the Canadian Coast Guard at select locations along the Kivalliq coast could be dispatched to the spill site. A sea can with spill response materials is maintained by the CCG in Rankin Inlet. Permission to use this material will have to be obtained from CCG before usage.

Outside help could be requested for major accidents such as accidental grounding/stranding of a vessel. Under these circumstances, the safety of the crew and maintaining the integrity of the vessel would be the first priority.

[8] Spills and their effect on Marine Wildlife are addressed in Oil Pollution Emergency Plan.

2.5 Occupational Health and Safety

All activities carried out by Agnico Eagle must consider the attendant risks and be carried out with safety first in mind. Agnico Eagle will conduct all activities in accordance with the Workers' Safety and Compensation Commission (WSCC) Occupational Health and Safety legislation.

SECTION 3 • APPLICABLE FEDERAL ACTS, REGULATIONS AND GUIDELINES

The Plan was prepared in accordance with federal legislation outlined in Table 3-1. Numerous regulations exist under the *Canada Shipping Act* and these can be found at www.tc.gc.ca and www.canada.ca The regulations included here are most relevant to the environment and the Shipping Management Plan.

Table 3-2 lists international conventions and protocols signed by Canada. Canada is a signatory to International Marine Organization (IMO) International Convention for the Prevention of Pollution from Ships (MARPOL) and International Convention for the Safety of Life at Sea (SOLAS). As such, Canadian marine laws, regulations and guidelines rules are a reflection of these international conventions, protocols and agreements.

At this time, Agnico Eagle has contracted Desgagnes Transarktic to ship to Rankin Inlet. Even so, the shipping companies could change over the construction, operation and closure phases of the Meliadine Mine. Shipping contractors used by Agnico Eagle will abide by Canadian laws and regulations, applicable MARPOL 73/70 annexes, and international conventions. Inspections carried out by federal inspectors will ensure that all applicable statutes are followed. This could include the review of required plans (SOPEP), an audit of the emergency response equipment carried by the vessel, and the means to prevent the discharge of any oil, oily water or other hazardous waste in Arctic waters. Agnico Eagle will notify Transport Canada if contracted shipping companies change.

All vessels transiting through and operating in Canadian Arctic waters are required to comply with the *Arctic Waters Pollution Prevention Act* (AWPPA), the *Canada Shipping Act* 2001 (CSA 2001), the *Marine Transportation Security Act* (MTSA), the Marine Transportation Security Regulations (MTSR), the *Marine Liability Act* (MLA), and all associated regulations, including requirements for vessel construction and operations (see Table 3-1). While the provisions of the CSA 2001 apply in all Canadian waters, vessels in Arctic waters north of 60°N and out to the 200 nautical mile limit of Canada‘s Exclusive Economic Zone are also subject to the provisions of the AWPPA. The AWPPA prohibits discharges of oil, chemicals, garbage and other wastes generated onboard vessels. It does allow for the discharge of untreated sewage[9]. The *Marine Liability Act* sets out a regime that requires vessels operating in Canadian jurisdiction, including Arctic waters, to carry insurance to pay for damages from oil spills.

Two vessel control systems are established under the *Arctic Shipping Pollution Prevention Regulations* – the Zone/Date System and the Arctic Ice Regime Shipping System, which provide for operational safety by taking into account the vessel‘s capability to operate safely by virtue of ice strengthening, and the ice conditions it will encounter[10].

[9] Ships are to only discharge gray water and treated sewage when the ship is at least 50 km from Rankin Inlet.
[10] Agnico Eagle will only ship dry goods and fuel during the open water season.

Vessels servicing the Mine will be required to comply with the AWPPA and regulations while in a Shipping Safety Control Zone[11].

Shipping companies contracted by Agnico Eagle must have an approved SOPEP, and verify that equipment and operating procedures are consistent with Canadian Marine laws, regulations and guidelines, and with IMO agreements to which Canada is a signatory. It is the responsibility of the Master of the ship to ensure safe passage through Canadian waters and to maintain up-to-date charts and publications[12].

Agnico Eagle will provide the necessary human, material and financial resources to meet or exceed the legal requirements attributable to the company that arise from shipping. The marine equipment used on the Meliadine Mine will meet task specifications for reliability, safety and capability of meeting or exceeding environmental requirements and guidelines. Shipping contractors will be encouraged to do the same.

International Maritime Dangerous Goods Code	
International Convention for the Safety of Life at Sea, 1974, SOLAS 74	

SECTION 4 • MARINE WILDLIFE

> Marine mammals have been the basis of the Inuit economy for over 4,000 years. They provide meat, fat, oil, leather, tools and materials for fabrication of arts and crafts. The top layers of the skin yield "muktuk", which is still highly prized as a food rich in vitamin C and high in energy content. *(Fisheries and Oceans Canada http://www.dfo-mpo.gc.ca/Science/publications/uww-msm/articles/beluga-eng.htm)*

The reaction of marine wildlife to vessel traffic is predicted to not be significant and, providing mitigation measures are employed, should not lead to any residual effects (see Volume 8, Marine Environment and Impact Assessment). The effects of vessel traffic on marine mammals and birds were assessed in the Environmental Impact Assessment (EIA). This included a Traditional Knowledge (TK) study of the marine environment between Chesterfield Inlet and Whale Cove. Together, scientific and traditional knowledge were used to develop mitigation measures to eliminate potential residual effects. Of greatest interest in the TK study was the distance vessels remained from Marble Island, this being an important area for whales, seals, marine birds, and, on occasion, walruses.

Agnico Eagle includes in its contracts that ships must remain mindful of marine areas having a high density of marine mammals and birds and stay within the recommended shipping route, wherever possible[13]. Agnico Eagle requests that ships provide their ship track data for inclusion in annual reporting.

4.1 Interactions and Potential Effects

Vessel discharges (sewage, solid wastes, ballast water), the sight of the vessels and their movement, vessel noise, as well as accidental spills and releases have the potential to interact with and disturb marine wildlife and affect life cycle activities. Possible interactions between shipping and marine wildlife can have the following potential effects:

- Marine mammals may retreat to the water should a vessel pass too close to an island or reef where they have pulled themselves out of the water;
- The foraging of marine birds and mammals may be interrupted when vessels approach and pass them in the shipping route;
- The improper treatment and release of ballast water, grey water and bilge water could alter the water quality and contaminate the food supply;
- Marine mammal mortalities or injuries may result from collisions with the ship;

[13] Frobisher Bay and Button Islands key marine habitat sites overlap with the proposed shipping route at their southern and northern boundaries, respectively. This overlap is unavoidable as these two sites almost completely cover the entrance to Hudson Strait from the Atlantic Ocean (see Volume 8 for more details).

- Marine bird mortalities or injuries may result from collisions with the ship; and
- Fuel and/or oil spills could result in mortalities and, for marine birds, could lead to the loss of foraging and brood rearing habitat. A Spill Risk Assessment is provided in Appendix E.

4.2 Mitigation Measures

As part of shipping companies' standard operating procedures, ship crews monitor the shipping route for marine mammals from Hudson Strait to Rankin Inlet. In addition, a vessel-based Marine Mammal and Seabird Observer (MMSO) program has been implemented during all routine shipping activities in the Regional Study Area (RSA). Protocol for the MMSO program is provided in the Marine Environmental Management Plan (MEMP) in Appendix D. The MEMP is based upon the most current marine mammal and seabird baseline information available for the area impacted by shipping for the Meliadine Mine, as documented in the revised marine baseline report (Appendix B). The ship's Master will be notified if there is a concern of the ship striking a marine mammal. Ship personnel will make a decision if actions are required to avoid a possible collision. This may include, if safe to do so, slowing the ship until the animal has travelled clear of the ship's course. Subject to safe navigation and emergency response, ship personnel shall take every precaution to avoid disturbance, harassment, injury or mortality of marine wildlife by implementation of the following mitigation measures:

- Adherence to monitoring requirements as outlined in the vessel-based MMSO program (Appendix D);
- Ships will, when possible, maintain a straight course and constant speed, and avoid erratic behaviour;
- Marine mammals will be given right of away as safe navigation allows. Under no circumstances, other than in the case of an emergency, will ships approach within 300 m of a walrus or polar bear observed on sea ice[14];
- Ships will remain at least 2 km from Marble Island to avoid disturbing seals, walrus and marine birds that might be in the vicinity. This would significantly reduce interactions between marine wildlife and vessels, and also reduce the noise in near-shore areas;
- Ships will look out for marine mammals and avoid them as possible. If marine mammals are encountered, and remain in the area, effort will be made to avoid them by maintaining a 500 m buffer zone;
- Ships will maintain a minimum distance of 500 m from marine mammals engaged in feeding activities;
- Ships will avoid accelerating within 500 m of a marine mammals;
- If it is not possible for the ship to move away from or detour around a stationary marine mammal or group of marine mammals, the ship will reduce its speed and wait until the animal(s) move to the side and remain at least 500 m from the ship prior to resuming speed;

[14] As all shipping will occur during the open water season, collision with young seals in liars will not happen.

- When marine mammals appear to be trapped or disturbed by ship movements, the ship will implement appropriate measures to mitigate disturbance, including stoppage of movement until the marine mammal has moved away from the immediate area;
- The ship will not be operated in such a way as to separate an individual member(s) of a group of marine mammals from other members of the group. When weather conditions require, such as when visibility decreases, the ship will adjust its speed accordingly to avoid the likelihood of the ship striking an animal;
- Subject to ship and human safety considerations, the following mitigation techniques will be implemented to avoid impacts to migratory birds nests in low lying shoreline habitats:
    - Barge-tug or shipping vessels will travel at a slow speed (2 knots or less) when transiting through the near shore islands and reefs to reduce wake[15];
    - Barge-tug or shipping vessels would only travel through the near shore islands and reefs when there is good visibility or adjust their speed according to the conditions;
- Implementation of monitoring and reporting procedures for ship-bird collisions. Any incidents of bird mortalities associated with near-shore lighting and infrastructure, intertidal construction activities, and ship operations are to be recorded and reported to Environment Canada (Canadian Wildlife Services) as outlined in Appendix D;
- Ballast water will only be released in designated areas and if there is no marine wildlife in the area; and
- Bilge water, grey water and sewage will be properly treated and only released in areas where no marine wildlife is present and at least 50 km from Itivia.

Spills from ships in transit could affect marine wildlife coming in contact with any petroleum product spilled. In the event of a spill, the ship personnel will discourage marine wildlife from coming in contact with the spilled material. The product most likely to be spilled would be diesel fuel, which floats on the water surface and has a high rate of evaporation. However, these occurrences are expected to be rare and the activation of the SOPEP would significantly reduce their impact. Preventive and contingency measures already in place substantially reduce the risk to marine wildlife from spills.

Adaptive management will allow mitigation measures to be modified in response to new information arising from monitoring carried out by the vessel crews and from traditional knowledge. Appendix D summarizes how and when adaptive management will be implemented during shipping activities for the Meliadine Mine.

[15] Vessel wakes from nearshore Mine vessels engaged in transportation activities were assessed as a minor linkage in the FEIS. Potential effects assessed included shoreline erosion. The conclusion of the FEIS was that any wake effects from Mine related barges are expected to be within the normal variation experienced during tidal cycles and storms within Melvin Bay (see Section 8.3.4.3 of the FEIS for additional details).

4.3 Monitoring and Reporting

Agnico Eagle will discuss with contracted vessel operators the monitoring of marine wildlife. Contracted vessels by Agnico Eagle will be requested to collect incidental monitoring data during their voyage and to report it to Agnico Eagle. In addition, a vessel-based MMSO program will be implemented during routine shipping activities in the RSA. This program will be executed by trained observers stationed on-board vessel(s). A proposed protocol for this program is provided in the MEMP in Appendix D.

The MMSO program includes protocols on data collection and reporting requirements. Agnico Eagle will share the data with Inuit organizations and/or government agencies for their information. If effects monitoring identifies potential for effects on marine mammal populations along the shipping route, Agnico Eagle will provide updates and identify adaptive management measures in consultation with the Kivalliq Inuit Association and the Hunters and Trappers Organizations of the Kivalliq communities.

SECTION 5 • SAFETY OF PERSONS USING SMALL BOATS IN THE SHIPPING ROUTE

The most likely areas where interactions may occur between small boats and barges-tugs and/or ships or vessels are:

1. Melvin Bay, particularly in the access passage;
2. Where the ship is transiting through the near shore islands and reefs; and
3. The area between Marble Island and the near shore islands.

Subject to ship and human safety considerations, mitigation measures to safeguard the safety of those in small boats will include the following:

- Agnico Eagle will consult with the community members mooring or beaching their boats in Melvin Bay on the shipping activities that can be expected over the ice free shipping season. Protocols will be developed to minimize the interaction between barge-tug or ship and small boats;
- Barge-tug or ship will travel at a slow speed (2 knots or less) when transiting through the near shore islands and reefs to reduce the wake and not compromise the safety of people travelling in small boats along the shipping route. The slower speed will reduce the wake of the ship;
- Barge-tugs or ships would only travel through the near shore islands and reefs when there is good visibility or adjust their speed according to the conditions. This would allow the ship and the small boats to be in visual contact;
- Barge-tugs or ships will restrict themselves to the recommended shipping route thereby not surprising any small boat travelling outside the shipping route;
- The ship will sound its horn if a small boat seems unaware of its presence; and
- Agnico Eagle, through the Community Liaison Committee, will recommend that all those in small boats wear personal floatation devices.

SECTION 6 • SMUGGLING PREVENTION AND POLICE SERVICES

Smuggling, particularly alcohol and prohibited substances, could have negative socio-economic effects on the community. It is Agnico Eagle's intent to avoid or minimize all negative socio-economic effects.

Measures to prevent smuggling will include:

- The crew of the ship will not be allowed to take any alcohol ashore;
- Any crew member under the influence of alcohol, or attempting to take alcohol ashore will be disciplined by the ship's Master; and
- Agnico Eagle security will send any crew member having alcohol back to the ship for disciplinary action, or refer the matter to the Royal Canadian Mounted Police (RCMP) if prohibited substances are involved.

While it is anticipated that the RCMP will not be involved in security matters, all criminal activities or matters of a grave nature will be referred to the RCMP in Rankin Inlet.

SECTION 7 • IDENTIFIABLE THIRD PARTY LIABILITIES

Agnico Eagle and its shipping contractors will carry third party liability insurance. Identifiable third party liabilities related to shipping include but are not limited to:

- Hamlet of Rankin Inlet, in the event of spill in Melvin Bay that adversely impacts the marine environment;
- Hunters and trappers, should a ship or tanker run aground and adversely impact the marine environment by spilling fuel or other chemicals into the marine environment;
- Small boat owners, should a ship or tanker collide with a small boat in the shipping route; and
- Hunters and trappers, should a vessel collide with a large marine mammal such as a whale along a shipping route.

Mitigations for possible third party liabilities are identified in Section 11 of this Plan (Hazard Identification Analysis of Marine Routes).

SECTION 8 • ON BOARD WASTE MANAGEMENT

The six (6) annexes of MARPOL promote the elimination of deliberate, negligent or accidental discharge of ship-source pollutants into the marine environment (see also Transport Canada 2009). The list of harmful ship-source discharges includes: oil, noxious liquid substances and dangerous chemicals, sewage, garbage and air pollution. Canadian laws and regulations mirror the MARPOL annexes and conventions.

Agnico Eagle will contract vessels that meet applicable environmental requirements in addition to being reliable and having a superior safety record.

8.1 Sewage

Vessels are to have an approved sewage treatment plant meeting Canadian standards[16]. Holding tanks with the capacity for all grey and treated sewage while in port are expected to be part of the ship's infrastructure. Agnico Eagle will advise ships that disposal of waste water into the environment is to be avoided within 50 km of Rankin Inlet.

Sewage sludge from the sewage treatment plant can be incinerated in the on-board incinerator.

8.2 Solid Waste

Solid waste materials are to be incinerated on board, not disposed of in the marine environment. Modern incinerators operating at very high combustion temperatures are expected on all vessels. These will be capable of incinerating food and other domestic waste, residual oil separated from bilge water, waste oil and sludge. Ash from incineration will remain on board and be taken south for treatment, recycling and/or disposal in a certified waste management facility. By incinerating waste on board, the risk of introducing invasive non-aquatic species to the Rankin Inlet area is reduced. This would not be the case if the waste was transferred onshore for incineration/disposal.

The design and operation of shipboard incinerators in Canada are specified under the International Marine Organization, Marine Environmental Pollution Committee 76 (40), Annex V. Standard specifications for shipboard incinerators allow for the incineration of solid wastes approximating in composition to household waste and liquid wastes arising from the operation of the ship, e.g., domestic waste, cargo-associated waste, maintenance waste, operational waste, cargo residues, and fishing gear. Operating temperatures are similar to those for the incinerator at the Meliadine site, and flue gases are cooled rapidly to limit the *in vivo* formation of dioxins.

[16] If all sewage is to be incinerated, there will not be any need for sewage treatment.

Tugs will remain on site for the duration of the shipping season. Their waste will be incinerated with the ash stored in containers, which will be shipped south at the end of the shipping season for treatment, recycling and/or disposal in a certified waste management facility.

Hazardous waste will not be incinerated but returned south for treatment, recycling and/or disposal in a certified waste management facility.

SECTION 9 • BALLAST WATER MANAGEMENT

Ballast water is essential to control trim, list, draught, stability, and/or stresses on a vessel. Ballast water control and management regulations protect waters under Canadian jurisdiction from non-indigenous aquatic organisms and pathogens that can be harmful to ecosystems. Agnico Eagle recognises that when a new organism is introduced to an ecosystem, negative and irreversible changes may result, including a change in biodiversity. The *Ballast Management Control and Management Regulations* are intended to minimize the probability of introduction of harmful aquatic organisms and pathogens from vessels' ballast water while also protecting the safety of vessels (Transport Canada 2007).

While an exemption exists in the regulations for vessels operating exclusively in waters under Canadian jurisdiction or certain adjacent waters, any Canadian vessel that has operated outside these waters may carry harmful aquatic organisms or pathogens in their residual ballast and, as such, is not eligible to exemption.

Agnico Eagle expects to use vessels largely active in the coasting trade that operate almost exclusively in waters under Canadian jurisdiction. However, these vessels do on occasion venture into waters outside Canadian jurisdiction and, as such, will require a Ballast Water Management Plan (BWMP). The regulations require the preparation and carriage of a BWMP for each vessel, and for copies to be submitted to Transport Canada. The BWMP will be specific to the vessel.

If Agnico Eagle were to contract vessels originating from waters outside the jurisdiction of Canada, a BWMP would be required. All BWMP (reviewed by the National Administration) carried on ships of foreign origin would be based on the following international guidelines and guiding principles:

- IMO Resolution A.868(20): *Guidelines for the Control and Management of Ships Ballast Water to Minimize the Transfer of Harmful Aquatic Organisms and Pathogens*, in particular Section 7.1;
- The *Model Ballast Water Management Plan* developed by the International Chamber of Shipping and the International Association of Independent Tanker Owners;
- Regulation B-1 of the IMO's *Regulations for the Control and Management of Ships' Ballast Water and Sediments*; and
- Part B of the Annex to Resolution MEPC.127 (53): *Guidelines for Ballast Water Management and Development of Ballast Water Management Plans*.

Agnico Eagle will require contracted vessels not eligible for exemption to have a BWMP and provide Agnico Eagle with a copy.

9.1 Ballast Water Exchange

It is recognised by the IMO that the exchange of ballast water in deep ocean areas or open seas offers a means of limiting the probability that harmful aquatic organisms and pathogens be transferred from/in vessels ballast water. If it is necessary to take on and discharge ballast water in the same port to facilitate safe cargo operations, care should be taken to avoid unnecessary discharge of ballast water that has been taken up in another port as this could introduce harmful aquatic organisms. In particular, sediment found in the vessel's ballast tanks should be disposed of at sea in areas outside 200 nautical miles (370 km) from land and in water depths exceeding 2,000 m.

Vessels take on ballast water in segregated chambers for the main purpose of stabilizing the vessels by adding the weight of the water and maintaining a specified draught. Vessels laden with dry cargo or fuel will take on less ballast water than empty vessels. As all ships on the inward voyage to Rankin Inlet will be laden, they will have a minimum of ballast water. However, on the outward journey, these vessels will take on ballast water.

In the event that a ship is contracted from waters outside jurisdiction of Canada, ballast exchange is to occur before entering Canadian waters. The ballast exchange and documentations needs to be made according to the *Ballast Management Control and Management Regulations* (Transport Canada 2007).

In the case of non-transoceanic navigation, and where ballast water is taken on-board outside waters of Canadian jurisdiction, the water is to be exchanged before entering Canadian waters at a location at least 50 nautical miles offshore, in water at least 500 m deep. If this is not possible due to safety or other reasons, the ballast water exchange can occur in the alternate designated area in Hudson Strait, east of 70°west longitude, where the water is over 300 m deep.

All coastal trade vessels will in all likelihood not venture more than 200 nautical miles from shore and will not exchange ballast water outside waters of Canadian jurisdiction. All the same, ballast water exchanges for all vessels operating in waters under Canadian jurisdiction are expected to meet the provisions of the Regulations, and to follow Part A of the IMO *Guidelines for Ballast Water Management and Development of Ballast Water Management Plans*, and the IMO *Guidelines for Ballast Water Exchange*.

SECTION 10 • SAFETY

Safety is a top priority for Agnico Eagle. It begins with all personnel (Agnico Eagle, contracted employees and contractors) wearing the appropriate personal protection equipment suitable for the task at hand and for the weather conditions at the time. Secondly, personnel must understand the hazards associated with the task, the safe procedures in carrying it out, and how not to place oneself in harm's way. Accident prevention will be supported by a proactive program to identify and correct potential hazards before an accident occurs.

Agnico Eagle or contracted supervisors will ensure that the interactions between ship and shore are carried out with the safety and the health of the employees first in mind.

SECTION 11 • HAZARD IDENTIFICATION ANALYSIS OF MARINE ROUTES

Hazard: Anything that has the potential to cause harm.

Likelihood: The probability/chance of harm occurring as a result of exposure to a hazard.

Severity: The level of harm that may occur as a result of exposure to or contact with a hazard.

Risk: The likelihood of harm occurring combined with the potential severity to produce a level of risk or risk rating.

Navigation through the Labrador Sea, Hudson Strait and Hudson Bay is not challenging during the open water season[17]. No major hazards were identified along the shipping and tug-barge routes under normal conditions. Electronic charts combined with electronic navigation aids for the shipping routes ensure the vessel remains on course where bathymetry and physical hazards are known.

Subject to ship and human safety considerations, the average speed of the vessels in open waters is expected to be less than 14 knots (26 km/h). Once ships approach the offshore islands and reefs off Rankin Inlet, and subject to ship and human safety considerations, the ship's speed will be slowed to 2 knots or less (3.7 km/h) to navigate the shipping route through the islands to their anchor point outside Melvin Bay. Shipping can be carried out without pilotage as the shipping routes entail minor hazards that do not significantly reduce ship safety. Any actions required by the crews of the ships and tugs are expected to be well within their capabilities.

At the anchor point, cargo will be lightered from the ships onto barges which will travel to the lightering location via the access passage. The tugs-barges will be highly manoeuvrable and capable of transiting the access passage with its changing currents and will not require pilotage. The tidal current in the access passage can be half a knot (0.93 km/h). Navigation will proceed at a slow speed in periods of low visibility. Traffic through the access passage will be coordinated to avoid shipping conflicts and to ensure safety.

However, out of the ordinary events have been identified that could increase the level of hazard and necessitate associated mitigation measures:

- Mechanical failure occurring on the ship or tug thereby placing it in jeopardy in the shipping route;
- Tug-barge or ship running aground due to a navigational error or mechanical failure;

[17] Agnico Eagle's shipping routes within Nunavut are non-compulsory pilotage areas during the ice free shipping season

- Loss or damage to sea cans in heavy seas;
- Barge tow line breaking in heavy seas;
- Collision of tug-barge or ship carrying dry cargo and fuel to Itivia through the access passage;
- Tug-barge or ship sinking upon hitting ice; and
- Tug-barge or ship colliding with a small boat.

The access passage deserves special attention as:

- Dry cargo for Agnico Eagle and the hamlet and fuel for Agnico Eagle could all be unloaded at the same time; and
- The access passage is 150 m wide at its narrowest point and, although two-way traffic is theoretically possible, it raises the risk of collisions and groundings. To reduce the risk, it is best that a single tug-barge or ship be in the access passage at any one time.

SECTION 12 • RISK ANALYSIS OF MARINE ROUTES

All ships, tugs and tankers use electronic charts and other electronic navigational aids to provide safety in transit, reduce the risk of accidents, and remain within the recommended shipping route presently in use for the annual sea lift to Rankin Inlet and other Kivalliq communities. For an extra measure of safety, weather warnings are updated regularly. Also, shipping companies likely to be employed by Agnico Eagle commonly sail in Hudson Bay and to Rankin Inlet and are aware of its marine hazards.

The potential severity of shipping hazards[18] cannot be changed in most circumstances, what can be reduced is their likelihood. This is possible through the application of mitigation measures. And the level of risk can be defined as the likelihood of harm posed by a hazard combined with its potential severity. The objective is, through the use of mitigation measures, to reduce the risk as low as practically possible. Residual risk is what remains after mitigation measures have been applied. And those having the highest potential residual risk would be aggressively managed.

Mitigation reduces the probability of occurrence and increases safety. The following mitigation/safety measures will be implemented subject to ship and human safety considerations:

- Where available, electronic navigation aids be used in all instances;
- Ship speeds in open water remain less than 14 knots in the absence of marine mammals, and once within the barrier islands and reefs near Rankin Inlet, 2 knots or less;
- Shipping is only carried out during the ice free season. Should ice be encountered, the vessel will either sail around it at a reduced speed or proceed slowly through the ice;
- Tug-barge or ship will remain within recommended shipping routes ;
- Fuel tankers and the fuel tanker barges will be double hulled;
- Tug-barge operations will proceed when there is good visibility from the anchor point of the ships to the barge at Itivia and/or adjust their speed according to the conditions;
- Traffic through the access passage will be coordinated to avoid conflicts and ensure safety. Communication between tugs will coordinate movement through the access passage;
- Agnico Eagle will provide emergency response equipment and materials as outlined in the OPEP if necessary. Tug or ship will also provide their own emergency response equipment.
- Crews will follow standard operating procedures and adherence to these will be monitored; and
- Tug-barge or ship crews are to be trained for responses to hazards that can normally be expected in northern waters.

[18] One hazard that can be reduced is shipping when ice is present. Agnico Eagle has opted to only ship during the ice-free season thereby greatly reducing this hazard.

Appendix C outlines the methodology used in the risk analysis of the transportation routes and how various mitigation measures reduced the risk level.

SECTION 13 • SOCIO-ECONOMIC IMPACT OF SHIPPING

Agnico Eagle does not believe that shipping activities related to the Meliadine Mine will result in an increased demand on local public service providers (i.e., fire, police, ambulance, medical, and maintenance) in Rankin Inlet. In most circumstances, any emergency response will be undertaken by Agnico Eagle personnel and/or the ship's crew. Agnico Eagle personnel and the Master of the ship will be responsible for security matters related to the shipping-related activities.

Shipping may impact socio-economic activities in Rankin Inlet. Itivia will be jointly used by the hamlet and Agnico Eagle during the ice free shipping season, which will require coordination. Mitigation measures will be employed to minimize negative socio-economic effects:

- Communication between tugs will coordinate movement through the access passage and use of the Designated Hamlet Landing Beach during lightering operations to avoid conflicts and ensure safety;
- Agnico Eagle has a separate storage area from the community.

The mitigation of negative socio-economic effects in smuggling alcohol and prohibitive substances into the community were described earlier.

Positive socio-economic effects will arise from the increased number of dry cargo and fuel tankers coming to the community. The crews of these ships will in all likelihood come ashore when the boat is anchored and contribute to the local economy through the:

- Use of restaurants, hotels and stores in the community;
- Purchase of local Inuit art; and
- Guided tours to the barrens for fishing and wildlife experiences.

SECTION 14 • PUBLIC AND MEDIA COMMUNICATIONS

When an environmental emergency occurs, the public will be provided with timely and accurate information as to the nature of the incident, the steps being taken to correct the problem, and, if necessary, what citizens should do to protect themselves. This information is intended to protect the overall community well being, including human health, to provide timely information amongst the public, to ensure cooperation from all interested parties, and to reduce the spread of concern or alarm through the dissemination of inaccurate information.

Each agency involved in a major spill event may provide its own media communications, and may designate spokespersons for such; however, from the Arctic REET's (Regional Environmental Emergencies Team) perspective, a coordinated response is preferable. To that end, the government lead Agency is expected to act as the official spokesperson for the response, with support provided by personnel within the Arctic REET, as required.

Transport Canada guidelines will be followed to ensure proper authorities are informed without delay so that appropriate action may be taken when:

- Any incident occurs involving the loss, or likely loss, of dangerous goods into the marine environment; or
- Any incident occurs giving rise to pollution or threat of pollution to the marine environment; or
- Any oil pollution incident occurs involving the loading or unloading of oil to or from tanker-to-tanker and from tanker to the OHF.

1.0 MARINE ENVIRONMENT REVISED BASELINE

1.1 Purpose and Scope

This report represents an update to the marine baseline information originally presented in Agnico Eagle's Final Environmental Impact Statement (FEIS). These revisions have been undertaken in accordance with Meliadine Gold Project (Project) Certificate Condition 79, which states the following:

"Prior to any Project-related shipping, the Proponent will update its marine baseline information to ensure that it includes the most recent information on marine wildlife abundance and distribution, carefully considers seasonal distribution patterns of marine wildlife, and incorporates western scientific and Inuit Qaujimajatuqangit knowledge sources. The updated marine baseline should be made available to appropriate authorities for feedback, then incorporated into the Proponent's Shipping Management Plan (SMP), with continued updates on a regular basis as new information becomes available."

This report was updated with new environmental information now available in the public domain (as of January 2016), as well as information provided through consultation with regulators and as a result of technical responses prepared by the proponent in response to information requirements (IRs) submitted as part of the FEIS review process. The majority of the new information provided relates specifically to the abundance and distribution of marine wildlife species in the Local Study Area (LSA) and Regional Study Area (RSA) (Figure B-1 and Figure B-2) and incorporates best available science with Inuit Qaujimajatuqangit. Information presented in this report should be reviewed in conjunction with the Marine Environmental Management Plan (MEMP) (Appendix D) and the Spill Risk Assessment (Appendix E), to inform monitoring, mitigation and adaptive management strategies for the Project.

1.2 Existing Environment in Melvin Bay / Itivia Harbour

In August 2011, a field program was conducted by Nunami Stantec at Itivia and at two nearby reference sites in Melvin Bay (Figure B-1). The objective of the field program was to collect physical and biological baseline information in the marine LSA (Figure B-1), with a focus on the Project footprint corresponding with the proposed floating dock facility (landing barge). The field program investigated bathymetry, water and sediment chemistry, aquatic lower-trophic organisms (phytoplankton, zooplankton, and benthic invertebrates) and fish and fish habitat. Results from Nunami Stantec's field program are provided in detail in Appendix 8.2-A of the FEIS, with a general summary provided below for bathymetry, water, and sediment chemistry (Agnico Eagle 2014).

1.2.1 Physical Environment

Depth soundings were collected along shore-perpendicular transects in the LSA. Water depths at Itivia and in Melvin Bay were determined to be shallow, with maximum depths in the Project footprint reaching 6.6 metres (m). A large rocky reef is present approximately 125 m offshore of the high water mark near the proposed landing barge facility. Cobble and gravel were the dominant substrates in the nearshore environment of the Project footprint (Figure B-3).

Figure B-4: Summer circulation of water in the Hudson Bay Complex (extracted from Stewart and Barber 2010; inset after Ingram and Prinsenberg 1998)

Water quality profiles were collected at one location in the LSA with an YSI 600QS multi-meter. Parameters measured included temperature, conductivity, pH, dissolved oxygen, salinity, and oxidation-reduction potential. Mean surface water temperature (at 1 m depth) in the harbour was 8.86 ± 0.52 degrees Celsius (°C), with a salinity of 29.32 ± 0.03 ppt, and a pH of 8.08 ± 0.03. Bottom water was slightly colder than surface water at 8.49 ± 0.57°C; with similar salinity and pH values. No thermal stratification was observed. The pH was near constant across the LSA (range from 8.05 to 8.10) and throughout the water column (range from 8.05 to 8.10).

Mean conductivity ranged from 45.6 ± 0.1 mS/cm at the surface to 45.7 ± 0.1 mS/cm at the bottom. Dissolved oxygen ranged from 114.5 ± 1.0% at the surface to 114.1 ± 1.2% at the bottom.

Water samples were collected for chemistry analysis at one location in the LSA using a Van Dorn sampler deployed at mid-depth. Parameters analyzed included major anions, alkalinity, total suspended solids, total dissolved solids, pH, conductivity, total metals, total Kjeldahl nitrogen, ammonia, nitrate and nitrite, total phosphate, and total organic carbon. Results were compared to Canadian Council of Ministers of the Environment (CCME) guidelines (maximum levels) for Protection of Marine Aquatic Life (PMAL). Total alkalinity in the marine LSA ranged from 142 to 144 milligrams per litre (mg/L), with bicarbonate (HCO3-) as the major representative ion. Nitrate, nitrite, total Kjeldahl nitrogen, dissolved orthophosphate, and total phosphorus were below detection limits (typically <0.050 mg/L). Total organic carbon values were low (ranging from 2.8 to 3.6 mg/L). Approximately 78% of all analyzed metals (33 of 42) were below detection limits. All sample parameters for which CCME PMAL guidelines exist were within acceptable limits.

Sediment samples were collected for chemistry analysis at 3 locations in the marine LSA footprint using a petite ponar grab. Metal concentrations were compared to CCME Interim Sediment Quality Guidelines (ISQG). Sediment chemistry was near constant across the LSA. Metal concentrations were variable and ranged from below analytical detection limits to exceeding CCME ISQCs. Chromium slightly exceeded the CCME ISQG of 52.3 milligrams per kilogram (mg/kg) at all sample stations, with average (±SD) concentrations in the marine LSA footprint measured at 55.8 ± 5.89 mg/kg. The precision analyses (CV) indicate some heterogeneity of marine sediments in the study area.

1.2.2 Biological Environment

Plankton

Phytoplankton abundance, richness, and diversity were similar across all sites within the marine LSA, and a total of 33 taxa were recorded. Dinoflagellates were the dominant taxa at all sites and included Peridinium/Gonyaulax spp. and Dinophysis spp. The ciliate *Tintinnida* was present at low percentages at 2 of the sites.

Zooplankton abundance, richness, and diversity differed between sites, and a total of 44 taxa were recorded. An unidentified rotifer species, possibly Notommatidae, was identified as the dominant taxa at all sites. Calanoid copepods were also present at all 3 sites.

Benthic Invertebrates

Benthic invertebrate abundance, richness, and diversity differed amongst sites. Polychaetes were the dominant taxa at all sites and included Polychaeta: Sedentaria (burrowing or tube-dwelling), Capitellidae, and Cirratulidae and/or Paraonidae. Polychaeta: Errantia (free-swimming) were the next dominant taxa and included Nephtyidae, Syllidae, and Pholoidae. Also present was nematode subclass Hoplonemertea, the Myidae and Tellinidae clams, the amphipod families of Ischyroceridae, Oedicerotidae, and Zopfiaceae, as well as 11 additional polychaete families. At 1 site, a single sponge (*Porifera*), 2 hydrozoan taxa, 1 flatworm (*Playhelminthes*), Terebellidae and Opheliidae polychaetes, 3 gastropod, and 3 bivalve taxa, several crustaceans (copepod, amphipod, decapods), and one sea squirt (*Urochordata*) were also identified.

Benthic species are not thought to occupy the intertidal zone in Hudson Bay on a permanent basis; rather, they occur seasonally when the habitat is not influenced by ice (Stewart and Lockhart 2005). Baseline studies completed in the LSA support this assumption (Nunami Stantec Ltd. 2012). Few invertebrate species were observed in the nearshore habitat, and abundance was low. Most of the individuals observed were less than 1 cm, suggesting a low biomass. Nearshore macrophyte coverage was found to be equally sparse (ranging from 2 to 5% coverage).

Fishes

Six species of marine fish (n=156) were identified during gill net and beach seine sampling in the marine LSA, including Greenland cod (*Gadus ogac*) (52%), slender eelblenny (*Lumpenus fabricii*) (27%), fourhorn sculpin (kanayok in Inuktitut) (*Myoxocephalus quadricornis1*[1]) (15%), unidentified sculpin (possibly juvenile; 3%), Arctic staghorn sculpin (*Gymnocanthus tricuspis*) (2%), and Arctic sculpin (*Myoxocephalus scorpioides*) (1%). The range of total lengths of the dominant fish taxa were 118 to 520 mm for Greenland cod, 180 to 210 mm for slender eelblenny, and 205 to 315 mm for fourhorn sculpin species. Arctic char were not observed during the baseline field study but were reported to be in the area at the time of the field study (west of Melvin Bay near the Barrier Islands).

Marine Birds

A black guillemot (*Cepphus grylle*) and a pair of sandhill cranes (*Grus canadensis*) were identified in the LSA during the baseline field program.

Marine Mammals

No marine mammals were observed in the LSA during the baseline field program.

1.3 Existing Environment within Hudson Bay / Hudson Strait Shipping Corridor

Golder conducted a comprehensive literature review to characterize the physical and biological environment in the proposed shipping corridor in Hudson Bay and Hudson Strait (Figure B-2). The following information sources were reviewed:

- available records of consultation with regulatory agencies, public stakeholders, and Inuit communities;
- available scientific literature / data reports;
- DFO Integrated Fisheries Management Plans;
- DFO Stock Status Reports;
- DFO's Mapster database;
- DFO's Ocean Data Inventory;

[1] Referenced by it's European (Triglopsis quadricornis) name in Appendix 8.2-A of the FEIS - Nunami Stantec Marine Baseline Report for Itivia Harbour, Rankin Inlet, NU

- Environment Canada's Key Marine Habitat for Migratory Birds;
- Fisheries and Oceans Canada's (DFO) Mapster database;
- governmental and non-governmental environmental resources including:
- Important Bird Areas (IBAs) spatial database;
- Marine Baseline Report - Itivia and Melvin Bay, Rankin Inlet, NU produced by Nunami Stantec Ltd. (2012);
- NIRB Guidelines for the Preparation of an Environmental Impact Statement for the Agnico Eagle Mines Ltd. Meliadine Project (NIRB File No. 11MN034) (NIRB 2012);
- Nunavut Planning Commission web resources including the Nunavut Wildlife Resource and Habitat Values final report (2008);
- Nunavut Wildlife Management Board Reports / Guidance Documents;
- OBIS-Seamap database (Duke University);
- previous marine-based environmental impact statements completed in the Project area (e.g., AREVA and others as available);
- regional fisheries catch statistics (e.g., DFO annual catch data);
- federal Species at Risk Act (SARA) database;
- The Canadian Circumpolar Institute and the Tungavik Federation of Nunavut, Nunavut Atlas (1992); and
- Inuit Qaujimajatuqangit (IQ) collected for local coastal areas.

1.3.1 Physical Environment

Hudson Bay is one of the world's largest inland seas, with a total surface area of approximately 830,000 square kilometres (km^2) (Prinsenberg 1984). It is connected to the Atlantic Ocean by Hudson Strait and the Labrador Sea; and to the Arctic Ocean by the Foxe Basin, Fury and Hecla Strait. Hudson Bay is a relatively shallow waterbody, with an average depth of approximately 100 m. The oceanographic regime in Hudson Bay is complex and manifests all the features of an Arctic system (Macdonald and Kuzyk 2011). It is highly influenced by the influx of cold saline waters (between approximately 32.5 and 33.5 ppt) from the Arctic Ocean and Baffin Bay, through Foxe Basin and Hudson Strait, by wind-stress during both the open-water and ice-cover season, by powerful tides (Stewart and Barber 2010), and by a large freshwater input from both runoff and ice melt (Stewart and Lockhart 2005; Ingram and Prinsenberg 1998). Less saline surface outflows occur along the eastern shores of James Bay and Hudson Bay north to Hudson Strait. In Hudson Bay, estimates of average residence time of water range from 1.0 to 6.6 years (Ingram and Prinsenberg 1998).

Water in the region freezes over each winter and becomes ice-free each summer, with sea-ice first forming in late October and continuing to expand until a maximum ice cover is reached by the end of April. In winter and early spring, the ice floes that cover most of Hudson Bay are kept in constant motion by wind forces. A shore lead system develops along the land-fast ice that forms from the coast of Hudson Bay as a result of wind blowing

seaward (Barber and Massom 2007). Major polynyas (stretches of open-water surrounded by sea ice) are found in the northwest sector (including Foxe Basin) and in the vicinity of the Belcher Islands in Eastern Hudson Bay. The northwestern region of Hudson Bay, encompassing part of the Project LSA and RSA, is an area where there is a large and persistent reoccurring polynya (Saucier et al. 2004).

Waters in the Hudson Bay region are characterized by moderate to strong semidiurnal tides of Atlantic origin, a marked summer pycnocline, and greater mixing inshore than offshore (Stewart and Lockhart 2005; Ingram and Prinsenberg 1998). Although marine productivity in Hudson Bay proper is low in comparison with other oceans of similar latitudes, productivity in Hudson Strait is typically twice higher than in other oceans of similar latitudes because of the sustained nutrient availability supplied by tidal mixing throughout an extended ice-free season (Ferland et al. 2011; Sibert et al. 2011).

The southern James Bay region is shallower and influenced to a much greater extent by freshwater runoff, thus supporting a wider variety of temperate-water species that are rare or absent elsewhere in Canada's Eastern Arctic waters (Stewart and Lockhart 2004). Seasonal ice cover also occurs in James Bay, with ice beginning to recede in late May, and the area becoming ice-free by the end of July. Polynyas are found predominantly along both coasts of James Bay during winter.

The Hudson Bay marine ecosystem is abnormally cold relative to other regions of the same latitude, and its climate is characterized by long and cold winters and cool summers (Stewart and Lockhart 2004). The entire area exhibits extreme temporal (seasonal and annual) and spatial variations in the range of average temperatures and average precipitation. Northwestern Hudson Bay experiences the greatest influence of cold Arctic air masses and has the harshest climate, with typical strong winds and persistent low temperatures. Other areas of the bay have less extreme conditions affected by moderate southern or marine influences. There is also a strong average precipitation gradient across the region, from less than 200 millimetres (mm) per year in the northwest to over 800 mm per year in the southeast (Stewart and Lockhart 2004). The upper air circulation of weather systems over Hudson Bay water is mainly related to the persistent, counter-clockwise air flow around a low pressure vortex that is situated over Baffin Island in winter, but weakens and retreats northward in summer (Stewart and Barber 2010).

There is considerable seasonal variation in Hudson Bay with respect to water circulation. In summer, surface water in Hudson Bay moves cyclonically (counter clockwise), influenced by cold saline Arctic water from Foxe Basin that enters in the northwest via Roes Welcome Sound (Prinsenberg 1986a; Tan and Strain 1996). During the transit, surface water is diluted by meltwater and runoff from the land, warmed by the sun, and mixed by the wind as it circulates, thus generating strong vertical stratification of the water column. Most of the river runoff water remains in the nearshore coastal regime in summer, with limited exchange into the interior of the Bay (Granskog et al. 2011). These water masses move eastward along the southern coast and are subsequently deflected northward and exit to the northeast into Hudson Strait (Figure B-2). About half of the freshwater transport from Hudson Bay to Labrador Sea is the result of water pulses associated with anticyclonic, surface-trapped eddies that propagate through Hudson Strait as a result of storms and/or local instability processes (Sutherland et al. 2011).Deep water in Hudson Bay moves in the same general direction as surface water, although it is influenced by bottom topography (Ingram and Prinsenberg 1998; Wang et al. 1994). Intermittent flow of this dense water (approximately 34.1 ppt) over the sill that separates Foxe Channel from Hudson Bay likely maintains the homogeneous bottom layer in Hudson Bay (Stewart and Barber 2010). The incursion of

Arctic waters creates Arctic oceanographic conditions in Hudson Bay, which extend farther south than elsewhere in North America and serve as the main driver of the Hudson Bay ecosystem (Stewart and Lockhart 2004).

The residual currents in Hudson Bay that are independent of tides are wind-driven and density-driven. Monthly mean current velocities are in the range of 4 to 6 centimetres per second, with stronger currents occurring in summer than in winter and more variability occurring at the surface than at depth (Prinsenberg 1986b). Winds are generally weaker and more variable in summer than in fall when strong northwesterly winds occur. The density-driven component is stronger in early summer when surface freshwater input from runoff and ice melt is highest (Prinsenberg 1982), and weakest in late winter/early spring when surface runoff input is lowest, local salinity is offset by salt excreted by the growing sea-ice, and wind-driven mixing of surface waters is not possible due to ice cover.

The tidal regime in Hudson Bay is influenced by powerful tides from the Atlantic Ocean that surge twice a day via Hudson Strait (Stewart and Barber 2010). These tides move as a Kelvin wave and propagate counter clockwise around Hudson and James Bay following the shoreline contour and overshadowing local tides and the Arctic tidal influence (Freeman and Murty 1976). In general, both tidal amplitude and range decreases as one moves counter-clockwise along the coast. The semidiurnal tidal amplitude ranges from 1.50 m along the western shore at Churchill to 0.10 m along the eastern shore near Inukjuak (Prinsenberg and Freeman 1986; Prinsenberg 1988a). The range in height between high and low water also varies, ranging from 0.5 m at Inukjuak (Inoucdjouac) and 2 m along the east side of James Bay to as high as 4.6 m along the west coast of Hudson Bay (Dohler 1968).

Hudson Bay is nearly entirely covered by ice in winter and is free of ice in summer. Depending on the weather, timing of sea ice formation or breakup may occur earlier or later by up to a month, but the general patterns remain similar. The ice formation in Hudson Bay usually begins in the north-western part (Repulse Bay) in October and spreads rapidly southward along the western coast during November (Cohen et al. 1994). By mid-December, from 90 to 100% of Hudson and James bays are covered with ice. Maximum ice cover usually occurs in April and May, and maximum ice thickness can occur between late February and early June and can reach 285 centimetres (cm) (Loucks and Smith 1989). The ice breakup begins in June in southern James Bay and Chesterfield Inlet and the region is usually entirely ice free in the first week of August (Stewart and Lockhart 2004; Cohen et al. 1994). Ice cover is an important feature of the Hudson Bay marine ecosystem. Ice distribution determines the distribution of marine biota and affects marine ecological processes in the water column and near the ice edge (Melnikov 1980). During ice formation, most of the seawater salt is expelled from the ice. This increases the salinity of the surface water, thereby increasing its density and deepening its layer (up to 100 m) and enhancing mixing of the water column (Prinsenberg 1988b). Formation of dense deep water is facilitated in the shore lead polynya system within which increased brine rejection is able to overcome buoyancy in the surface layer. This provides a mechanism to shunt approximately 6 to 16% of river runoff inputs into deeper waters that have an apparent residence time of about 4 to 14 years (Granskog et al. 2011).

As the pack-ice forms in northwestern Hudson Bay, predominant northwest winds continuously push it to southeastern Hudson Bay. The pack-ice forms rafts and ridges and increases in overall ice thickness, which increases freshwater input in this area in the spring (Prinsenberg 1988b). In northwest Hudson Bay, in contrast, the ice is constantly formed and removed continuing the salt input into the water column. This constant removal of the ice by northwest winds and tidal mixing develops leads and recurring polynyas. There are several polynyas that form close to shore, such as in Roes Welcome Sound, at the northern tip of Coats Island, and at

Akimiski Island, which is one of the most southerly polynyas in Canadian waters. These polynyas provide important habitat for various species of marine birds, such as the Hudson Bay eider, which overwinters in this region (Martini and Protz 1981; Nakashima 1988).

The Hudson Bay marine ecosystem is characterized by strong vertical stratification of the water column in spring and summer, particularly offshore (Roff and Legendre 1986; Anderson and Roff 1980; Prinsenberg 1986a). The vertical stratification is caused by a dilution of cold Arctic saline surface water by freshwater runoff and sea-ice melt, which is subsequently warmed by the sun, and mixed by the wind. The stratification results in a strong vertical density gradient between fresh, warm water at the surface and cold, saline deeper water. The vertical density gradient impedes vertical mixing, thereby limiting nutrient input to surface waters and lowering biological productivity. A strong summer pycnocline can be observed at depths between 15 and 25 m (Anderson and Roff 1980; Prinsenberg 1986a; Ferland et al. 2011). Heating of the surface layer and freshwater input decrease as summer progresses. This increases the depth of the pycnocline. In winter, the vertical stratification is the weakest due to the increase in density of surface water and, therefore, there is an increase in vertical mixing.

Physical conditions that promote large-scale mixing or upwelling in the region during spring and summer remain limited, but ice edges along the well-developed shore lead system (where the coastal fast ice and mobile pack ice meet) correspond with areas of upwelling and associated stimulation of nutrient fluxes and primary production (Stewart and Barber 2010). In the area where the shore lead prevails (nearshore), the isotopic composition of phytoplankton during summer suggests the presence of an open system influenced by the upwelling of deep waters and related nutrient replenishment (Kuzyk et al. 2010). Another key process that supports the re-injection of nutrients in surface waters in Hudson Bay is the vertical mixing driven by tidal currents (Sibert et al. 2011). Tides in the region are known to enhance marine productivity (Stewart and Barber 2010) and to contribute to the development of local biological hotspots that are used by marine mammals as summer habitats, such as in the northwest region of the Bay (Higdon and Ferguson 2010).

At a deep-water station in southeastern Hudson Bay, surface salinity ranged from 24 ppt in August to 28 ppt in April, and surface temperature ranged from -1.5°C in April to 8°C in August (Figure B-5). At depths below 50 m, water temperature and salinity were relatively stable throughout the year. As water depth increased, water temperature progressively decreased as salinity increased, with mean water temperature below -1.4°C and salinity greater than 33 ppt at approximately 100 m water depth (Ingram and Prinsenberg 1998).

Freshwater runoff, wind-driven mixing, and tidal influence have great effects on water column characteristics in the Hudson Bay ecosystem. Vertical stratification near large river plumes varies seasonally and spatially. It is usually directly related to the runoff volume and inversely related to the tidal kinetic energy (Freeman et al. 1982). The water column stratification is stronger during freshet and weaker with distance from the river mouth. The salinity and temperature gradients are usually weaker when wind-driven mixing and tidal energy are strongest. The volume of the freshwater runoff in the region is high, with a mean discharge rate of 30 900 cubic metres per second for all rivers combined (The Canadian Encyclopaedia). These high runoff volumes determine oceanographic conditions in the area by creating very low surface salinities and strong vertical density gradients.

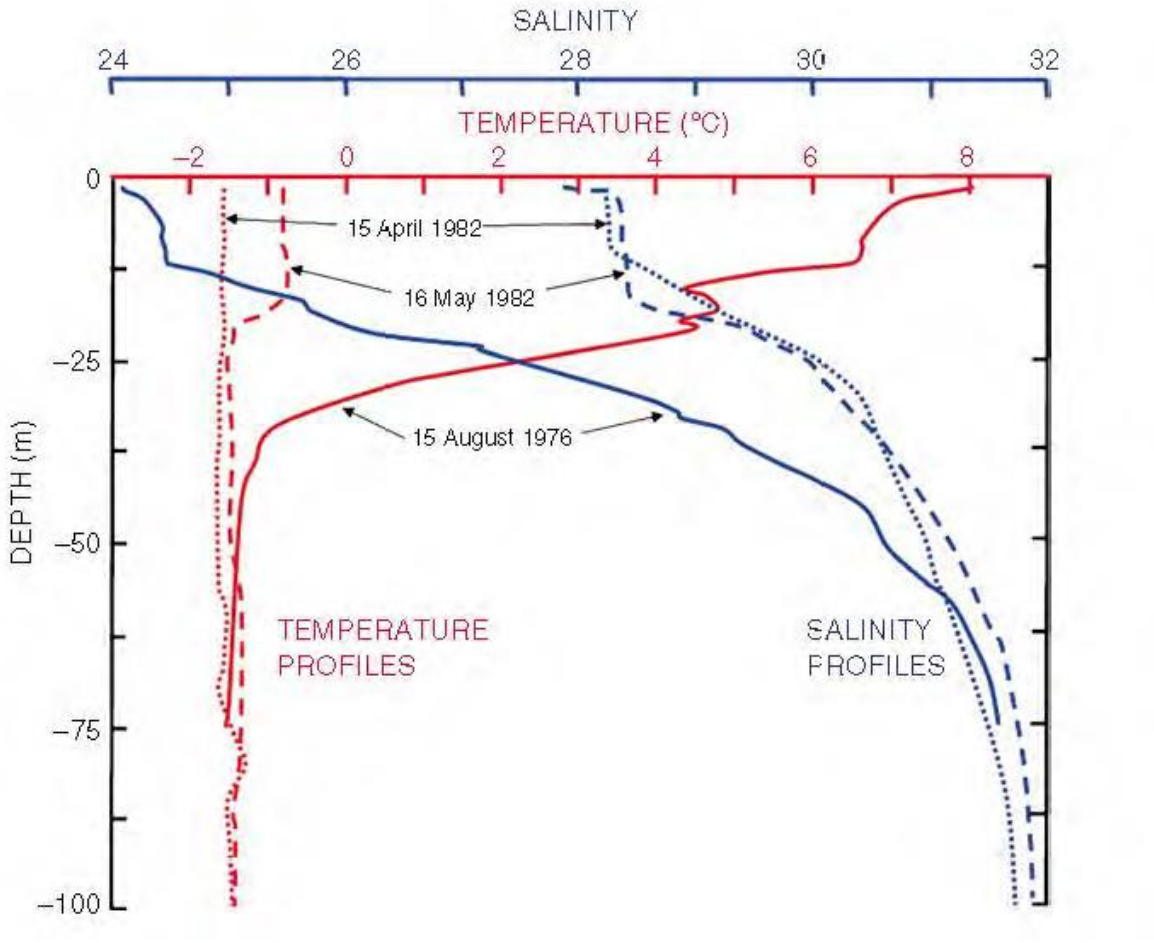

Figure B-5: Representative Vertical Profiles of Temperature and Salinity in Southeastern Hudson Bay in April (dashed line), May (dashed-dotted line), and August (solid line) (extracted from Stewart and Barber 2010; Redrawn from Ingram and Prinsenberg 1998)

High freshwater runoff volumes are also partly responsible for the difference between inshore and offshore oceanographic conditions in Hudson Bay during summer. In general, salinity and temperature in Hudson Bay increases with distance from shore (during summer). For example, surface salinity in Hudson Bay ranged from 10 ppt near major rivers to 30 ppt in offshore locations of the bay, and surface temperature ranged from 4°C in nearshore areas to 11°C in offshore locations (Anderson and Roff 1980; Prinsenberg 1986a). Lower salinities in the inshore region are due to dilution effects, whereas lower nearshore temperatures in western Hudson Bay are due to strong northwesterly wind effects causing upwelling of colder deep water to the surface (Figure B-6). In southern Hudson Bay, lower temperatures are a result of pack-ice, which lingers along the shore well into summer. Higher temperatures offshore cause stronger vertical stratification. During periods with low water temperatures (−1.75°C to 1.25°C), considerably higher rates in both bedload and suspended sediment transport are observed along the shore in comparison with a summer situation (9°C to 17°C), with similar wave heights and current velocities (Héquette and Tremblay 2009). The winter increase in suspended sediment transport is likely due to lower sediment settling velocities resulting from significant increases in fluid kinematic viscosity at low temperature. Hudson Strait is a wide, deep-water channel (on average 150 km wide, 750 km long, and

400 m deep) that connects Hudson Bay and Foxe Basin with the Labrador Sea and Davis Strait (Harvey et al. 2001). It acts as a transition zone between brackish waters in Hudson Bay and more oceanic waters of the Labrador Sea. Hudson Strait is covered with ice from mid-December to July (Hudon et al. 1993). The oceanographic regime in Hudson Strait is affected by strong tidal currents (up to 2 to 3 m/s) and high tidal elevations (tidal amplitudes are 6 to 9.5 m). These tides cause intensive vertical mixing in the water column, disrupting vertical density stratification and, therefore, enhancing biological productivity by increasing nutrient availability in the surface layer (Drinkwater and Jones 1987; Drinkwater 1986, 1990; Harvey et al. 2001).

The physical processes in Hudson Bay and Hudson Strait have a strong influence on the oceanographic and biological processes over the Labrador Shelf, affecting the water temperature and salinity characteristics in the area (Drinkwater and Harding 2001). At the eastern entrance of Hudson Strait, low salinity waters from Hudson Bay and Foxe Basin flowing eastward converge with cold Baffin Land Current waters from the north and warmer deep West Greenland Current waters. The Hudson Strait strong tidal currents result in intensive vertical mixing of these waters and the residual current carries the resulting mixture eastward onto the Labrador Shelf (Drinkwater and Jones 1987). This results in increased mixing over the Labrador Shelf, with reduced vertical density stratification relative to the Baffin Island Shelf to the north (Lazier 1982). Primary productivity is subsequently enhanced by elevated surface nutrient concentrations in eastern Hudson Strait (Drinkwater and Jones 1987) and on the northern Labrador Shelf (Kollmeyer et al. 1967).

Since 2005, recurrent expeditions of the CCGS Amundsen in Hudson Bay (Arcticnet 2014) have supported the collection of ambient noise and acoustic backscattering data. The primary dataset is composed of records obtained with a SIMRAD EK60 3-frequency split-beam echosounder that was operated continuously during the field campaigns (Polar Data Catalogue 2014). In parallel, AURAL-M2 (Autonomous Underwater Recorder for Acoustic Listening-Model 2) passive hydrophones were attached on mooring arrays deployed nearby Churchill and Great Whale River to document the seasonality of underwater sound, including marine mammal vocalizations and ambient noise (Polar Data Catalogue 2014).

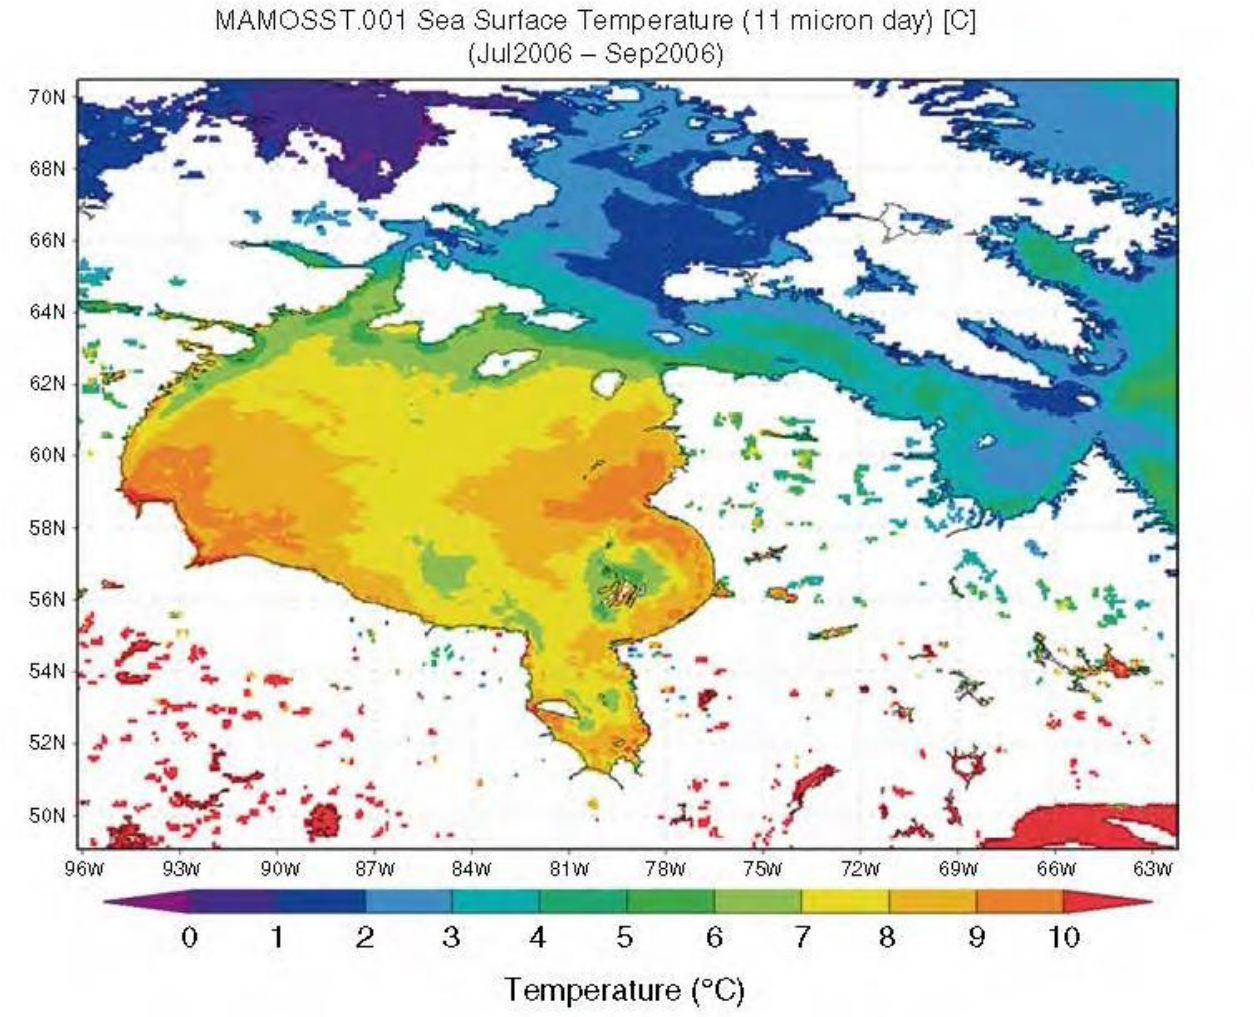

Figure B-6: Summer (July to September) sea surface temperature in 2006 (Stewart and Barber 2010)

1.3.2 Biological Environment

The marine ecosystem of Hudson Bay encompasses a large geographical area that includes James Bay, Hudson Bay, Fox Basin, and Hudson Strait. Four important features characterize this unique ecosystem:

1) an extreme southerly penetration of Arctic marine water from the north;

2) a very large volume of freshwater runoff that enters the Hudson Bay watershed each year from land;

3) seasonal coverage of sea-ice; and

4) the dynamic coastal geomorphology of the coastal zone where exposure of new shoreline (made up of coastal salt marshes and wide tidal flats) presently occurs at a rate of up to 15 m/year (horizontal) as part of an isostatic rebound of the land from the weight of the Laurentide Ice Sheet, which once covered this entire region (Stewart and Lockhart 2004).

These key features combine to form critical habitat areas for many species of marine fauna including anadromous fish and large concentrations of migratory species including shorebirds, waterfowl, seabirds, and marine mammals. The following section provides an overview of the biological characteristics of each taxa (by key species) potentially impacted by shipping activities in the RSA.

1.3.2.1 Fishes

Approximately 60 species of fish are known to inhabit estuarine waters of Hudson Bay and James Bay (CARC 1991). Fewer species are present in the northern limits of the RSA, where arctic species predominate. Arctic char, Arctic cod, and other species contribute directly to the domestic fishery, and indirectly to the food chain of marine and terrestrial mammals and birds. Fish species considered important to the local commercial, recreational, and subsistence fisheries are identified in Table B-1. An overview on the biology of these species is provided below.

Table B-1: Overview of Marine Fish Species Found within the Local and Regional Study Areas

Common Name	Species	Inuktitut Name	Habitat	*SARA* Status[a]	COSEWIC Status[b]	Of Cultural, Economic or Subsistence Importance	LSA	RSA
Arctic char	*Salvelinus alpinus*	ᐃᖃᓗᖅ ᐱᖅ / ᑕᕆᐅᕐᓕ ᒥᐅᑕᖃᖅ	Anadromous (Riede 2004). In the marine environment, they are found in coastal areas in waters 30 to 70 m deep (Billard 1997).	No status	Not assessed	Yes	✔	✔
Greenland cod	*Gadus ogac*	ᐅᓪ ᖃᖅ	Demersal[c]. Coastal waters up to 400 m deep (Coad and Reist 2004; Cohen et al. 1990).	No status	Not assessed	Yes	✔	✔
Polar cod	*Arctogadus glacialis*	ᐅᓪ ᖃᖅ	Cryopelagic[d] or epontic[e] (Coad and Reist 2004). Marine waters down to 1,000 m; Mainly found in the shallower areas of the water column (Scott and Scott 1988).	No status	Not assessed	Yes	✔	✔
Arctic cod	*Boreogadus saida*	ᐅᓪ ᖃᖅ	Cryopelagic or epontic. Marine waters down to approximately 1400 m. Favour coastal areas during the summer and winter months (Coad and Reist 2004). Spawning occurs under the Arctic ice (DFO 2011b).	No status	Not assessed	Yes	✔	✔
Fourhorn sculpin (marine form)	*Myoxocephalus quadricornis*	ᑲᓇᕐᖃᖅ	Benthic. Shallow coastal estuarine environments (Morrow 1980). In spring, they move to deeper waters for the summer and are generally found in waters 45 m to 100 m deep (Muus 1999).	No status	Not at Risk	Yes	✔	✔
Arctic staghorn sculpin	*Gymnocanthus tricuspis*	ᑲᓇᕐᖃᖅ	Benthic. Prefers sandy bottoms (Fedorov 1986; Coad and Reist 2004). Coastal areas, close to shore (ArcOD 2011).	No status	Not assessed	Yes	✔	✔
Arctic sculpin	*Myoxocephalus scorpioides*	ᑲᓇᕐᖃᖅ	Benthic. Shallow marine environments up to 275 m (Coad and Reist 2004).	No status	Not assessed	Yes	✔	✔
Slender eel blenny	*Lumpenus fabricii*	ᒪᓕ ᖃᓄᐊᑉ ᑐᑦ	Sandy to rocky habitats. Seem to prefer seagrass and algae, where they spawn (Mecklenburg and Sheiko 2004).	No status	Not assessed	No	✔	✔
Greenland halibut	*Reinhardtius hippoglossoides*	ᖃᓕᕆᔨᓪ	Epibenthic. Surface to deep waters down to 2000 m (Coad and Reist 2004).	No status	Not assessed	Yes	✔	✔

[a] SARA.The *Act* is a key federal government commitment to prevent wildlife species from becoming extinct and secure the necessary actions for their recovery. It provides for the legal protection of wildlife species and the conservation of their biological diversity (extracted from *SARA* 2012).

[b] COSEWIC (Committee on the Status of Endangered Wildlife in Canada) is a committee of experts that assesses and designates which wildlife species are in some danger of disappearing from Canada. It is up to Government to legally protect wildlife species designated by COSEWIC. The potential impacts of legal listing are for Government to analyse, and the SARA applies only to wildlife species on the SARA legal list (extracted from COSEWIC 2012).

[c] live on or near the seafloor.

[d] cold, deep marine environments.

[e] associated with the lower interface of the sea ice.

Arctic char (*Salvelinus alpinus*)

Arctic char exhibit anadromous and land-locked life history types (DFO 2006c). The anadromous forms of this species spend a large portion of its life cycle in the coastal marine environment (Riede 2004; Billard 1997). Spawning occurs in freshwater rivers, with annual migrations to marine waters occurring in the spring after the first 2-6 years of life (DFO 2006c). During autumn, adults migrate back to freshwater habitats to overwinter (Richardson et al. 2001). Arctic char feed on crustacean and other fish including capelin (Mallotus villosus), sand lance (Ammodytes spp.), Arctic cod, and juvenile Greenland cod (Richardson et al. 2001; Coad and Reist 2004).

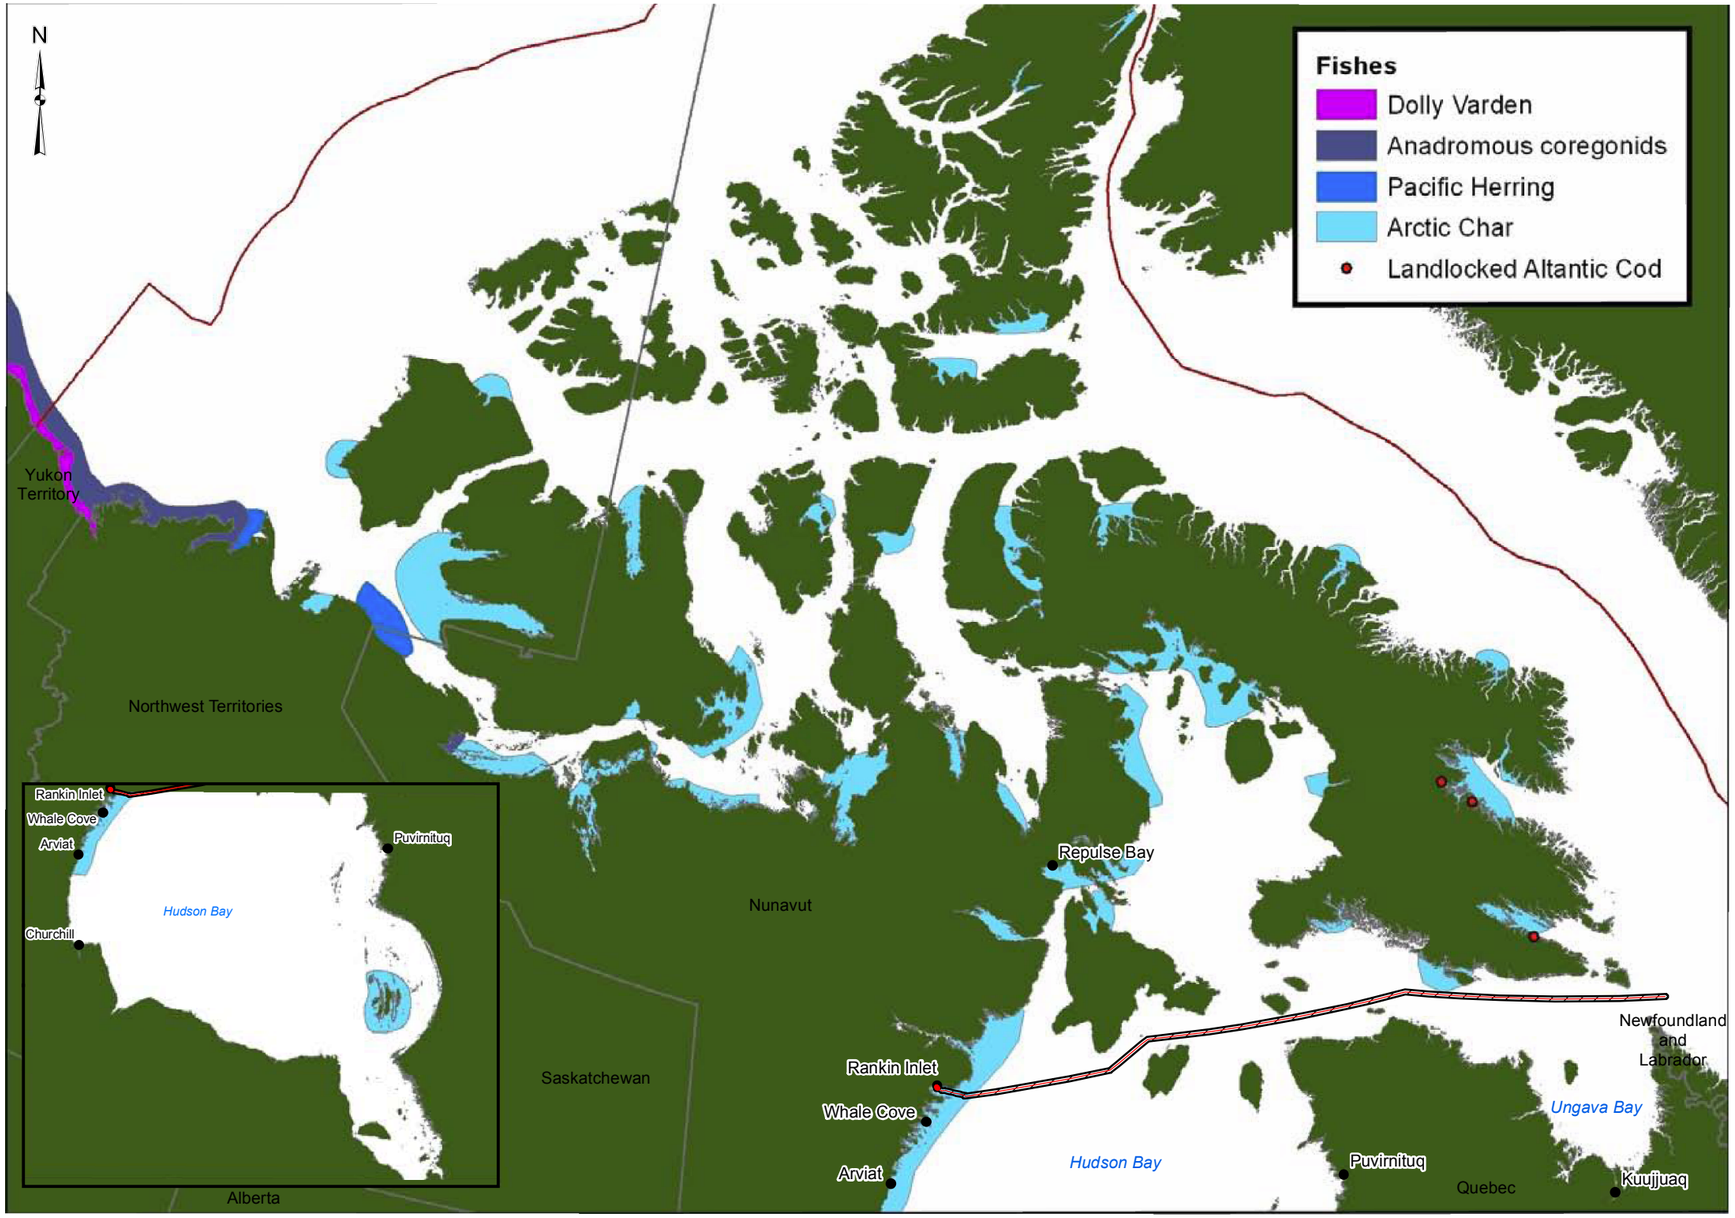
In the RSA, Arctic char can be found along the western and northern coast of Hudson Bay and coastal areas of Hudson Strait (Coad and Reist 2004), with high abundances identified near Arviat, Chesterfield Inlet, Cape Dorset, and Kimmirut (NPC 2008) (Figure B-7). Arctic char are harvested commercially, recreationally, and for subsistence use (Canadian Circumpolar Institute 1992; Heather and usher 2004). Kangiqliniq Hunter and Trappers Association consider Arctic char an important food fish species for the residents of Rankin Inlet (Nunami Stantec Ltd. 2012).

Greenland cod (*Gadus ogac*)

Greenland cod are a demersal[2] fish found most commonly in coastal waters up to 400 m deep (Coad and Reist 2004; Cohen et al. 1990). They feed on crustaceans, molluscs, sea stars, worms, and other fish including capelin, polar cod juvenile Greenland cod and Greenland halibut (Coad and Reist 2004). Greenland cod spawn at the mouths of freshwater rivers during spring (DFO 2006a). Their habitat range overlaps with the RSA, primarily occupying inlets and estuaries along both coasts of Hudson Bay extending south to Arviat along the west coast and to the Eastmain River estuary in James Bay along the east coast (Coad and Reist 2004; Ochman and Dodson 1982; Hunter et al. 1984).

Polar cod (*Arctogadus glacialis*)

The habitat range of polar cod includes offshore continental shelf waters of the RSA in Hudson Bay and Hudson Strait (Cohen et al. 1990; NPC 2008). They exhibit cryopelagic[3] or epontic[4] life history types (Coad and Reist 2004), although they frequent primarily the upper surface waters in Hudson Bay (Scott and Scott 1988). Polar cod are closely associated with sea-ice and spawn underneath the ice during winter (Bradstreet et al. 1986; Craig et al. 1982). Prey species include other fish and crustaceans; predators include seabirds, seals, whales, and other fish (Bradstreet 1982).



Arctic cod (*Boreogadus saida*)

Arctic cod are a key species in the arctic marine ecosystem (DFO 2011b). Like polar cod, Arctic cod exhibit cryopelagic or epontic life history types and have a short life span (Coad and Reist 2004). They live in marine waters down to 1,400 m (Coad and Reist 2004) and inhabit coastal areas during the summer and winter months (Cohen et al. 1990). Arctic cod feed on epibenthic mysids, amphipods, copepods, and other fish (Coad and Reist 2004). Spawning is thought to occur in late autumn and winter under the sea-ice. Arctic cod are a main food source for marine mammal and seabirds, particularly narwhals and murres (DFO 2011b).

There is no commercial harvest of Arctic cod in the Canadian Arctic (DFO 2011b). Subsistence fishery records indicate that Arctic cod have been traditionally harvested in Arviat, Whale Cove, Coral Harbour, Cape Dorset, Kimmirut (Canadian Circumpolar Institute 1992; Heather and Usher 2004). Their habitat range overlaps with that of the RSA and extends into the Hudson Bay and Hudson Strait (Coad and Reist 2004).

Fourhorn sculpin (*Myoxocephalus quadricornis*)

Fourhorn sculpins are a benthic species (Coad and Reist 2004) and are generally found in shallow coastal estuarine waters (Morrow 1980). In the spring, this species migrates to deeper waters for the summer months where they are typically found in waters 45 to 100 m in depth (Muus 1999). They feed on crustaceans, molluscs, and fish (Coad and Reist 2004). Spawning occurs in shallow waters where pairing and egg laying occur in gravel substrate (Muus 1999). This species is distributed throughout Hudson Bay and Hudson Strait (Coad and Reist 2004). Fourhorn sculpins have been traditionally harvested in Arviat, Whale Cove, Coal Harbour, Cape Dorset, and Kimmirut (Canadian Circumpolar Institute 1992; Heather and Usher 2004).

Arctic staghorn sculpin (*Gymnocanthus tricuspis*)

The Arctic staghorn sculpin are a benthic species preferring sandy bottom types but also frequenting mud, gravel, and rocky habitats (Fedorov 1986; Coad and Reist 2004). This species tends to inhabit near-shore areas (ArcOD 2011). Spawning occurs in late autumn and winter (ArcOD 2011). Artic staghorn sculpin feed primarily on benthic amphipods and worms (Fedorov 1986). They are not a commercially harvested species and do not represent a major target species of the subsistence fishery.

Arctic sculpin (*Myoxocephalus scorpioides*)

Arctic sculpin are known to occur in the RSA, with a regional distribution extending from James Bay and the Straits of Belle Isle to Greenland (Fishbase 2012). They are a benthic species found primarily in shallow marine environments up to 275 m in depth (Coad and Reist 2004). Spawning occurs during autumn (Coad and Reist 2004). Prey items include mainly crustaceans (Coad and Reist 2004). They are not a commercially harvested species and do not represent a major target species of the subsistence fishery.

Slender eelblenny (*Lumpenus fabricii*)

The slender eel blenny can be found in a variety of marine environments from sandy bottoms to rocky habitats but are rarely found in intertidal areas (Coad and Reist 2004; Mecklenburg and Sheiko 2004). They are closely associated with seagrass and macroalgae in the nearshore where they spawn during autumn (Mecklenburg and Sheiko 2004). This species feeds on crustaceans, worms, clams, and other fish eggs (Coad and Reist 2004). Its habitat range includes both Hudson Strait and Hudson Bay (Coad and Reist 2004). They are not a commercially harvested species and do not represent a major target species of the subsistence fishery.

Greenland halibut (*Reinhardtius hippoglossoides*)

The Greenland halibut is an epibenthic species and can be found at the surface to waters down to 2,000 m (Coad and Reist 2004). This species feeds on other fishes, crustaceans and squids (Coad and Reist 2004). Its habitat range includes the Hudson Strait (Coad and Reist 2004). The Greenland halibut has become increasingly important in developing commercial fisheries in the eastern Arctic (Coad and Reist 2004); however, they do not represent a major target species of the subsistence fishery.

Hearing Abilities of Marine Fish

It is well known that fish use sound for communication, detection of predators and prey, and learning about their environment (Popper and Fay 1999; Zelick et al. 1999; Fay and Popper 2000; Popper et al. 2003). All fish species can hear with varying degrees of sensitivity within the frequency range of sound produced by seismic sources and other industrial sound sources (Popper and Fay 1973; Fay 1988; Popper and Fay 1993; Fay 2000). The hearing range for most fish is believed to be in the frequency range of 100 to 1000 hertz (Hz) (Fay 1988). A smaller number of species can detect sounds to over 3,000 Hz, while a very few can detect sounds to well over 100 kHz. Because of wide differences in hearing capability and morphologies among fish species, behavioural responses and the susceptibility of fish to auditory trauma varies greatly. There is considerable anatomical and physiological variation amongst fish with respect to hearing structures, suggesting that various species may detect and process sound in different ways (Popper and Fay 1993). Fish can be divided into 2 broad categories: hearing generalists and hearing specialists (Popper et al. 2003; Ladich and Popper 2004). Hearing generalists are fish species without any auditory system specializations. They have poor auditory sensitivity characterized by a narrow bandwidth of hearing, typically detecting sounds from below 50 Hz up to 1 or 1.5 kHz (Popper et al. 2003). This includes most bottom-dwelling species such as Greenland halibut (Popper et al. 2003). The majority of fish species that fall into this category generally do not hear frequencies much above 1 kHz, with peak sensitivities around 300 to 500 Hz (Ladich and Popper 2004). The sound pressure detection threshold can be as high as 120 dB re 1 µPa at 1 m at the most sensitive frequency (Nedwell et al. 2004). Hearing specialists have specialized auditory structures connected to well-developed pressure sensitive organs (Popper and Fay 1993). These morphological adaptations allow hearing specialists to detect sound pressure with greater sensitivity (i.e., lowering their hearing threshold) and in a wider bandwidth than “generalists”, and makes hearing specialists more sensitive to high-amplitude sound introduced into the marine environment.

Hearing thresholds for many Arctic species of fish are largely unknown. Underwater noise generated by vessel engines and cavitation can affect fish behaviour. Behavioural changes may cause disruption to migration patterns or spawning events and movement away from valuable food sources and have the potential to cause population-level effects. Fish are particularly sensitive if these changes occur over a critical period when they have a short window of opportunity to complete an activity.

Over 60 species of marine fish may be found in the LSA and RSA including: Greenland cod (*Gadus ogac*), slender eelblenny (*Lumpenus fabricii*), fourhorn sculpin (*Triglopsis quadricornis*), Arctic staghorn sculpin (*Gymnocanthus tricuspis*) and Arctic sculpin (*Myoxocephalus scorpioides*), Arctic char (*Salvelinus alpinus*), Arctic cod (*Boreogadus saida*), and polar cod (*Arctogadus glacialis).* Polar cod and Arctic cod are both hearing specialist species and are likely to be present in the RSA. Cod fish can detect both sound acceleration and sound pressure over a substantial frequency range; 20 to 150 KHz. Sound pressure thresholds in cod fish in the frequency range 60 to 300 Hz lie in the range 80 to 90 dB re 1 µPa at 1 m. Although hearing thresholds for most of these fish species are largely unknown, hearing thresholds for closely related species such as the walleye pollock

(*Theragra chalcogramma*) and the Atlantic cod (*Gadus morhua L.)* are known and may be used as surrogates for Greenland cod. The hearing ability of walleye pollock, from three different age groups (corresponding to size-classes), was determined from auditory evoked potentials by Mann et al. 2009. Walleye pollock hearing was most sensitive between 100 and 200 Hz, with thresholds around 75 dB re: 1 µPa (Mann et.al 2009). Hearing sensitivity decreased as frequency increased up to 450 Hz. The three age groups of walleye pollock did not show a difference in hearing sensitivity, although there was a noticeable interaction between frequency and age

as well as a trend with older fish having a slightly lower mean threshold level. Water temperature appears to have an effect on the hearing thresholds at 350 Hz for walleye pollock. Each degree of temperature increase (from 8 to 12°C) resulted in an 8.3-dB decrease in hearing threshold, with hearing being largely changed by local temperature over their natural range of occurrence. However, walleye pollock are generally found in the marine environment at temperatures less than those used during the Mann et al. 2009 laboratory experiments. In the Bering Sea, walleye pollock are generally found in 3–6°C waters and avoid temperatures less than 0°C (Kotwicki et al. 2005). They may be found in temperatures as warm as 10–12°C (Bailey et al. 1999). Based on the above results, Mann et al. 2009 suggests that the hearing thresholds of walleye pollock are generally similar to those of other gadid fishes.

Hearing studies on Atlantic cod demonstrated that this species is sensitive to pure tones in the frequency range of 30 to 470 Hz. Greatest sensitivity was observed between 60 to 310 Hz and the hearing threshold ranged from 78 to 117 dB re: 1 µPa (Chapman and Hawkins 1973). Changes in levels of ambient sea noise caused variation in thresholds in most frequency bands. In calm sea conditions, unmasked thresholds can be obtained. Thresholds were largely independent of the sound source distance within 1.7 to 50 m, suggesting that cod are sensitive to acoustic pressure (Chapman and Hawkins 1973).

1.3.2.2 Marine Birds

The Hudson Bay marine ecosystem provides resources of critical importance to resident and migrant marine birds throughout the year. At least 43 species of seabirds, shorebirds, waterfowl, and marine-associated raptors frequent offshore, inshore, intertidal, or salt marsh habitats of the Hudson Bay marine ecosystem (Table B-2). Few of these species are year-round residents. Most pass through the area during summer for staging, moulting, nesting, and brooding purposes (Canadian Circumpolar Institute 1992) prior to transiting to their traditional wintering grounds in the south, many of which fall outside the NSA (e.g., Arctic terns, red-necked phalaropes). Thus, impacts to certain long-range migratory species have the potential for transboundary effects. Marine bird species present year-round in Hudson Bay / Hudson Strait are limited to common eider, king eiders, black guillemot, dovekie, and ivory gull. These species have adapted to accessing prey in polynyas, where current and tidal action keep waters ice-free throughout the winter. FigureB- 8 and Figure B-9 provide an overview of marine bird distribution in the RSA based on historical sightings, current scientific knowledge, and IQ.

Table B-2: Overview of Seabird Species Potentially Present within the Local and Regional Study Areas

Common Name	Species	Seasonal Occurrence	Distribution	Other Relevant Information	SARA Status[a]	COSEWIC Status[b]	Of Cultural, Economic or Subsistence Importance	LSA	RSA
Black guillemot	*Cepphus grylle*	year-round	coastal / offshore	Harvested for subsistence. Nests in small colonies on steep shores on Southampton and Coats islands.	No status	Not assessed	Yes	✔	✔
Thick-billed murre	*Uria lomvia*	summer	coastal / offshore	Large breeding colony (520 000 pairs) on Akpatok Island in Hudson Strait. Traditional knowledge suggests that murres winter in large numbers in area of open water west of the Belcher Islands in southeast Hudson Bay. Moulting adult birds with their young complete swimming migration in August from a number of known bird colonies in Hudson Bay through the Hudson Strait to offshore areas of Newfoundland and Labrador (Mallory and Fontaine 2004).	No status	Not assessed	Yes	✔	✔
King eider	*Somateria spectabilis*	year-round	coastal	Widely distributed in James Bay and Hudson Bay.	No status	Not assessed	Yes	✔	✔
Common eider	*Somateria mollissima*	year-round	coastal / offshore	Hudson Bay subspecies overwinter in areas where open water and shallow depth coincide. Breeds along rocky coasts or tundra throughout Hudson Bay. Present along ice edge and at polynyas. Feed exclusively on blue mussel.	No status	Not assessed	Yes	✔	✔
Northern fulmar	*Fulmarus glacialis*	summer / fall	coastal / offshore	Rare visitor to James Bay in late fall. Observed at Coats Island.	No status	Not assessed	No	✔	✔
Black-legged kittiwake	*Rissa tridactyla*	summer	coastal / offshore	Occurs on the open waters of northern Hudson Bay in July and August, and occasionally at Churchill in early summer.	No status	Not assessed	No	✔	✔
Dovekie	*Alle alle*	year-round	coastal / offshore	Winter offshore in Hudson Bay, Hudson Strait and Gulf of St. Lawrence.	No status	Not assessed	No	✔	✔

Table B-2: Overview of Seabird Species Potentially Present within the Local and Regional Study Areas

Common Name	Species	Seasonal Occurrence	Distribution	Other Relevant Information	SARA Status[a]	COSEWIC Status[b]	Of Cultural, Economic or Subsistence Importance	LSA	RSA
Long-tailed duck	*Clangula hyemalis*	May-Oct	coastal	Occur in large numbers close to shore in Hudson and James Bay. Some individuals also overwinter on open water of James Bay.	No status	Not assessed	No	✔	✔
Canada goose	*Branta canadensis*	summer and fall	coastal	Spring and fall transient. Breeds in large numbers along the coasts (McConnell River Migratory Bird Sanctuary) and on the islands of Hudson Bay and James Bay (e.g., Southampton Island).	No status	Not assessed	Yes	✔	✔
Lesser snow goose	*Anser caerulescens*	May – Sept	coastal	Migratory species. Breeding colonies occur along the coasts (McConnell River Migratory Bird Sanctuary) and on the islands of Hudson Bay (e.g., Southampton Island). Hudson Bay supports over 50% of the eastern Arctic breeding population.	No status	Not assessed	Yes	✔	✔
Atlantic Brant	*Branta bernicla*	April to October	coastal	Migratory species. Breed on Southampton Island. During the fall migration, > 50% of the population frequents eelgrass habitat in James Bay.	No status	Not assessed	No	✔	✔
Glaucous gull	*Larus hyperboreus*	summer	coastal / offshore	Breed along the northern coasts of Hudson Bay, the Belchers, and widely throughout the Canadian Arctic.	No status	Not assessed	No	✔	✔
Herring gull	*Larus argentatus*	April-Nov	coastal / offshore	Migratory species. Breed along the coasts of Hudson Bay and James Bay in summer and in the Belchers.	No status	Not assessed	No	✔	✔
Ross's gull	*Rhodostethia rosea*	spring and autumn	coastal / offshore	Established nesting areas near Churchill, McConnell River Migratory Bird Sanctuary, and in the Canadian High Arctic (Devon Island). May overwinter in polynyas.	TH (Schedule 1)	TH	No	✔	✔
Ivory gull	*Pagophila eburnean*	year-round	coastal / offshore	Occur in Hudson Bay during both summer and winter, but breed in the	EN (Schedule 1)	EN	No	✔	✔

Hudson Bay / Hudson Strait provides key breeding habitat for numerous species, including many birds that are primarily Arctic breeders and others that are rarely seen in breeding condition outside the Arctic Islands. The only species listed under the SARA with the potential to occur in the RSA are the Ross's gull and the ivory gull (listed as Threatened and Endangered under Schedule 1 of SARA, respectively) (Table B-2). Those bird species identified as having special ecological or cultural importance, or holding special conservation status, with home ranges overlapping with the RSA are identified in Table B-2.

Three designated migratory bird sanctuaries occur along the shorelines of Hudson Bay / Hudson Strait: one south of Arviat in western Hudson Bay (McConnell River), and 2 on Southampton Island in northern Hudson Bay (Harry Gibbons and East Bay). Although these sites are generally a fair distance from the proposed shipping route, birds do forage offshore to considerable distances and may be vulnerable to impacts associated with shipping activities. For instance, hundreds of thousands of thick-billed murre fledglings migrate with molting adults from colonies in Hudson Strait (Hantzsch Island and Digges Sound) to Newfoundland by swimming, while those that nest on Akpatok Island overwinter west of the Belcher Islands.

Approximate densities of seabirds in the RSA during late summer / early fall have been identified by means of vessel-based seabird surveys undertaken in Hudson Bay and Hudson Strait in 2005 as part of the 2005 ArcticNet expedition (McKinnon et al. 2009). Mean seabird density indices were highest in Hudson strait (8.3 ± 1.9 birds/km^2) and lowest in southern Hudson Bay (0.36 ± 0.2 birds/km^2). Where mean density indices were high, sightings were dominated by northern fulmars or dovekies (or both). The results suggest that several seabird populations that migrate eastward through Hudson Strait converge at the eastern mouth of the Hudson Strait, thus representing a major staging area for migrant seabirds during September and October, particularly for northern fulmar, dovekie, and thick-billed murre.

In Hudson Strait, the mean density index of seabirds sighted within transects (both sitting on the sea and in flight) was 8.3 ± 1.9 birds/km^2. The species most commonly documented sitting on the sea were northern fulmar (65.8% of sightings) and dovekie (14.2%). The species most commonly documented in flight were Dovekie (48.3% of sightings) and northern fulmar (38.7%). Other species sighted (sitting on the sea and in flight) included, in order of abundance, thick-billed murre, black-legged kittiwake, glaucous gull, common eider and black guillemot (McKinnon et al. 2009).

In Hudson Bay, the mean density index of seabirds within transects (both sitting on the sea and flying) was 0.36 ± 0.2 birds/km^2. Species sighted sitting on the sea included thick-billed murre, herring gull, and glaucous gull. The species most commonly documented in flight were Canada goose (36.4% of sightings) and herring gull (23.6%). Other species sighted in flight included, in order of abundance, thick-billed murre, northern fulmar, black guillemot, black-legged kittiwake, glaucous gull, common eider, and long-tailed duck (McKinnon et al. 2009).

1.3.2.3 Marine Mammals

There are 11 species of marine mammals potentially present within the RSA for variable periods of time and at different times throughout the year (Table B-3). This includes 4 species of cetaceans (3 toothed whales and one baleen whale), 6 species of pinnipeds (seals and walrus), and the polar bear. Narwhal (*Monodon monoceros*), beluga (*Delphinapterus leucas*), and bowhead whales (*Balaena mysticetus*) are known to overwinter in Hudson Strait and in polynyas within Hudson Bay. Atlantic walrus (*Odobenus rosmarus rosmarus*), bearded seal (*Erignathus barbatus*), ringed seal (*Phoca hispida*), and harbour seal (*Phoca vitulina concolor*) are year-round residents to at least portions of Hudson Bay. Polar bears are also common in the RSA, entering the pack-ice in early November following their denning season but retreat to coastal areas during the summer ice-free season. The remainder of marine mammals identified in Hudson Bay / Hudson Strait are migratory and seasonal visitors, limited largely by the presence of solid land-fast ice throughout the winter and spring. There is a pronounced geographic bias on the distribution of several species within Hudson Bay; for example, belugas are strongly associated with the western part of Hudson Bay with substantial attraction to estuaries such as the Churchill River. Table B-4 provides a summary of marine mammal species harvested throughout the year by Coastal Inuit communities in Nunavut. An overview on the biology of each marine mammal species potentially present in, or in the vicinity of, the RSA is provided below.

Ringed seal (*Phoca hispida*)

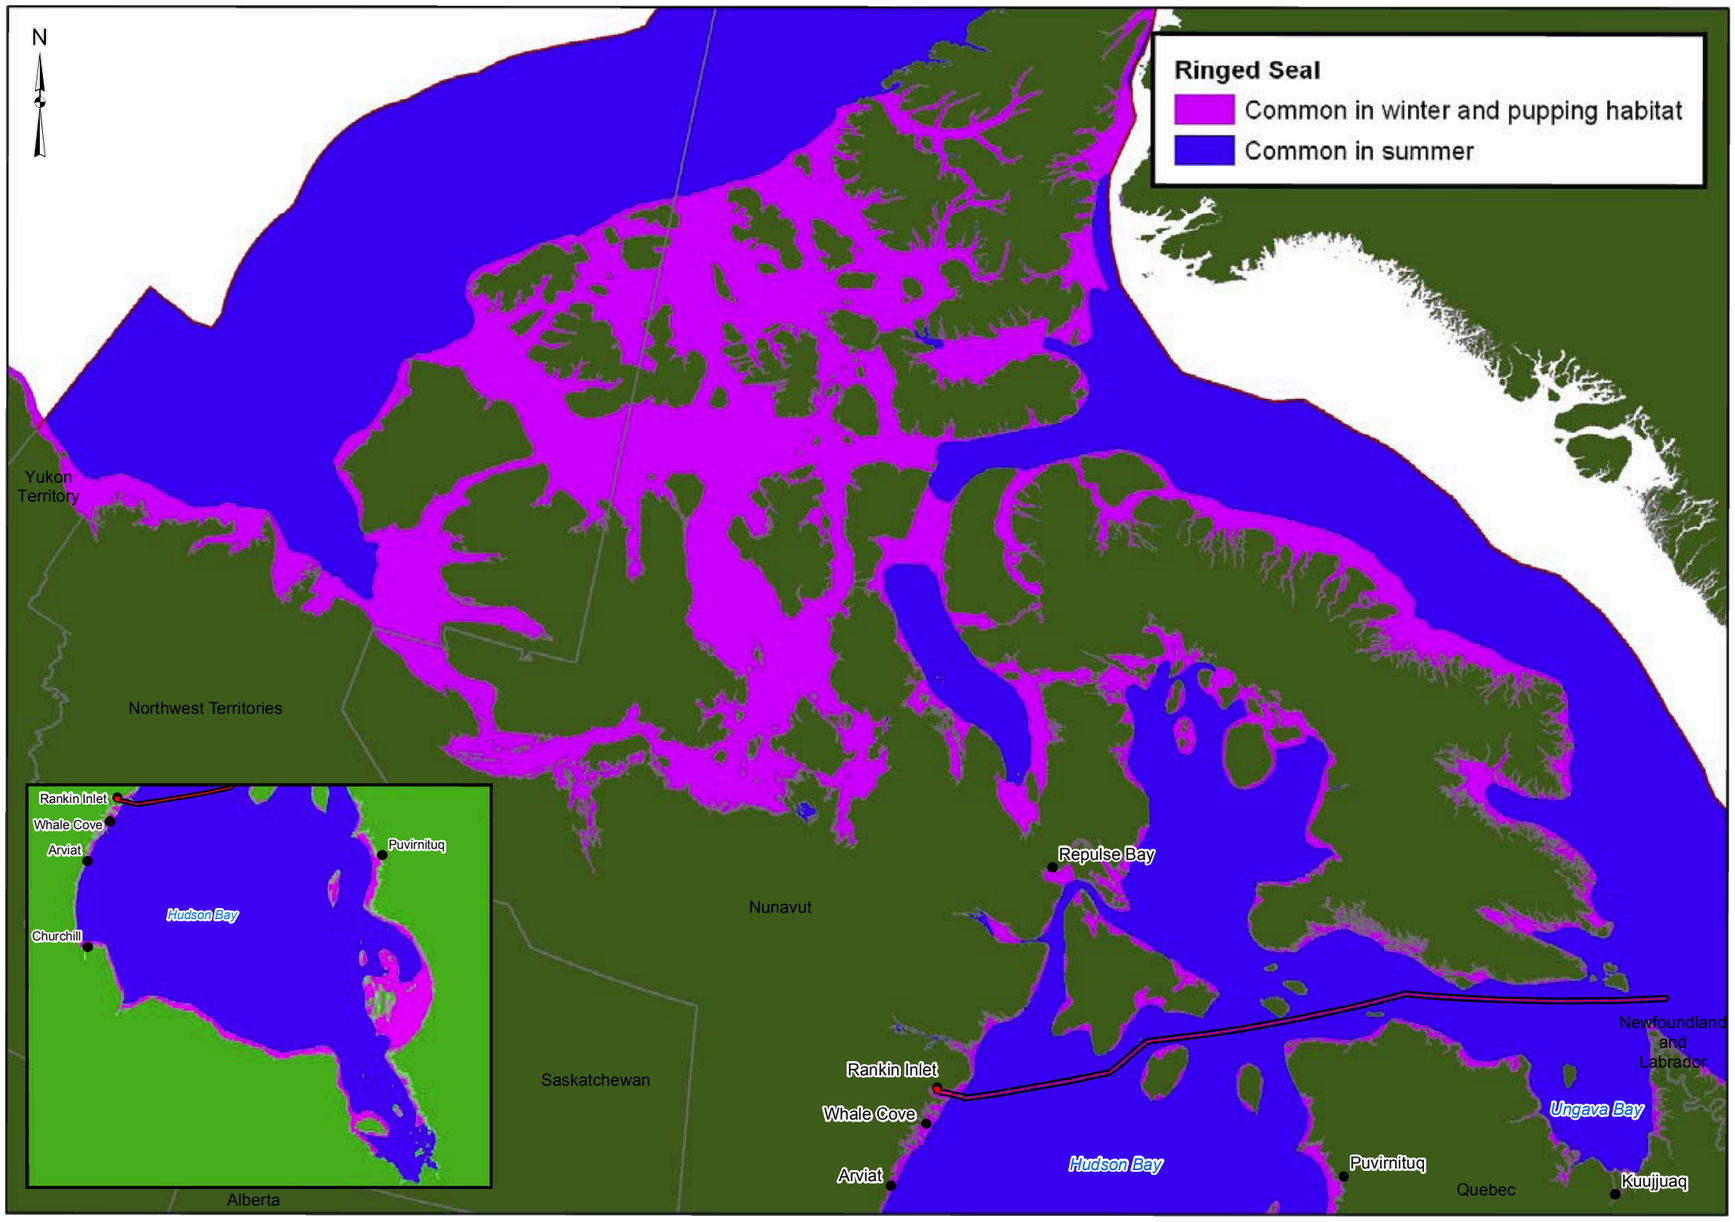
The ringed seal has a circumpolar distribution that is closely associated with the distribution of land-fast ice. This species occurs at the southern limit of their range in Hudson Bay where it is present year-round (Mansfield 1967; Stewart and Lockhart 2005). Ringed seals are the most abundant and widespread seal in the Arctic; however, their numbers in western Hudson Bay declined between 1995 and 2010 based on annual aerial surveys conducted during spring/summer (Lunn et al. 2000; Vincent-Chambellant 2010; Ferguson and Young 2011). The results of two DFO aerial surveys in 2007 and 2008 indicate the relative density of ringed seals in western Hudson Bay falls in the range estimated in previous years and is consistent with estimates derived from surveys conducted in other Arctic areas (DFO 2009). In western Hudson Bay, density estimates for ringed seals varied greatly from year to year and there is inter-annual variation widely reported in the literature for the density of ringed seals hauled-out on the ice (DFO 2009). In 2007 and 2008, ringed seal relative densities in western Hudson Bay were estimated at 0.92 ±0.07 seal/km^2 and 0.44±0.05 seal/km^2 respectively with an abundance of 73170±5440 and 33701±3704 individuals respectively (DFO 2009)... Several factors, in addition to an actual change of seal abundance, could contribute to inter-annual variation including: ice type and conditions, water depth, temperature, wind speed and cloud cover, and time of the day and year could potentially affect ringed seal presence, haul-out activity and detectability (DFO 2009). DFO (2009) notes that many ringed seals may not have been available for detection in 2008 relative to 2007, and a declining population might not be an accurate interpretation of results.

The ability of ringed seals to maintain breathing holes in the land-fast ice enables them to occupy large areas that are inaccessible to other marine mammals except during the summer. During winter, their preferred habitat consists of ice leads and polynyas where breathing holes are easiest to maintain. In spring, breeding adults occur in highest densities in areas of stable land-fast ice with good snow cover where they maintain birth lairs for pup rearing (Hamill and Smith 1991), whereas non-breeders occur at the floe edge or in the moving pack-ice (Stewart and Lockhart 2005). Pups are born in early spring (March/April) and weaned prior to break-up of the sea-ice in late June (Evans and Raga 2001). Pups will remain in subnivean[5] dens during a 5 to 8 week lactation

[5] situated or occurring under the snow

period to avoid detection from predators such as polar bears (Evans and Raga 2001). During the open-water season (July-Sept), ringed seals are commonly observed hauled-out on the sea-ice in large numbers. Juveniles may move offshore at this time, but adults remain around islands and within the bays and fiords (McLaren 1958a; Dunbar and Moore 1980). As such, seals are unlikely to occur in large numbers in the proposed offshore shipping corridor during summer.

Figure B-10 provides an overview of ringed seal distribution in the RSA based on historical sightings, current scientific knowledge, and IQ.



Ringed seals are considered a keystone species[6] (Ferguson et al. 2005), as both adults and pups are an important food source for polar bears (Smith et al. 1991). Other predators include Arctic fox, walrus, wolves, humans, and dogs (Hammill and Smith 1991). Juvenile ringed seals prey mainly on crustaceans under the ice, whereas adults prey on crustaceans and small fish (e.g., Arctic cod) (Richard 2001). This species serves as the main target of the Coastal Inuit subsistence hunt, with all communities in Nunavut (28 out of 28) actively harvesting this species (Priest and Usher 2004). The number of ringed seals harvested in Rankin Inlet is variable, ranging from 55 to 356 animals over a 5 year period (Priest and Usher 2004). The meat is considered a staple of the local diet, and seal hides are used for clothing and sold commercially. Concerns have been raised over possible declines in ringed seal abundance in western Hudson Bay, as indicated by Inuit traditional knowledge, due to reduced pregnancy rate (Stirling 2005), reduced pup survival and recruitment (Holst et al. 1999; Ferguson et al. 2005), later age of maturation and older age structure (Vincent-Chambellant 2010), and increased number of polar bears (Regehr et al. 2007).

Bearded seal (*Erignathus barbatus*)

Bearded seals are large, solitary seals, which have a circumpolar distribution in Arctic and sub-Arctic waters (Mansfield 1967). This species is sparsely distributed throughout their range, and are most abundant in areas where they have access to sea-ice upon which to haul-out, and in shallow water depths where they can access the seafloor (typically <200 m; Kingsley et al. 1985) to feed on crustaceans, molluscs, and fish (e.g., Arctic cod, polar cod, sculpin) (Burns and Frost 1979; Finley and Evans 1983). They are commonly found along continental shelf areas associated with high benthic productivity.

Since this species has only a limited capability to maintain breathing holes in solid ice, they are generally excluded from areas of land-fast ice during much of the year (e.g., High Arctic Archipelago) and are mostly found amongst the pack-ice where the surface is always accessible (Burns et al. 1981). As such, bearded seals move with the receding and forming ice, often travelling considerable distances to the north (seawards) in the summer and back south in the winter (Gilchrist and Robertson 2000). Studies of their general distribution have led to adopt the 250 m benthic contour interval as a measure to delineate the area in which bearded seals are commonly seen (Stephenson and Hartwig 2010). Figure B-11 provides an overview of bearded seal distribution in the RSA based on historical sightings, current scientific knowledge, and IQ.

[6] a keystone species is a species that plays a critical role in maintaining the structure of an ecological community and whose impact on the community is greater than would be expected based on its relative abundance or total biomass

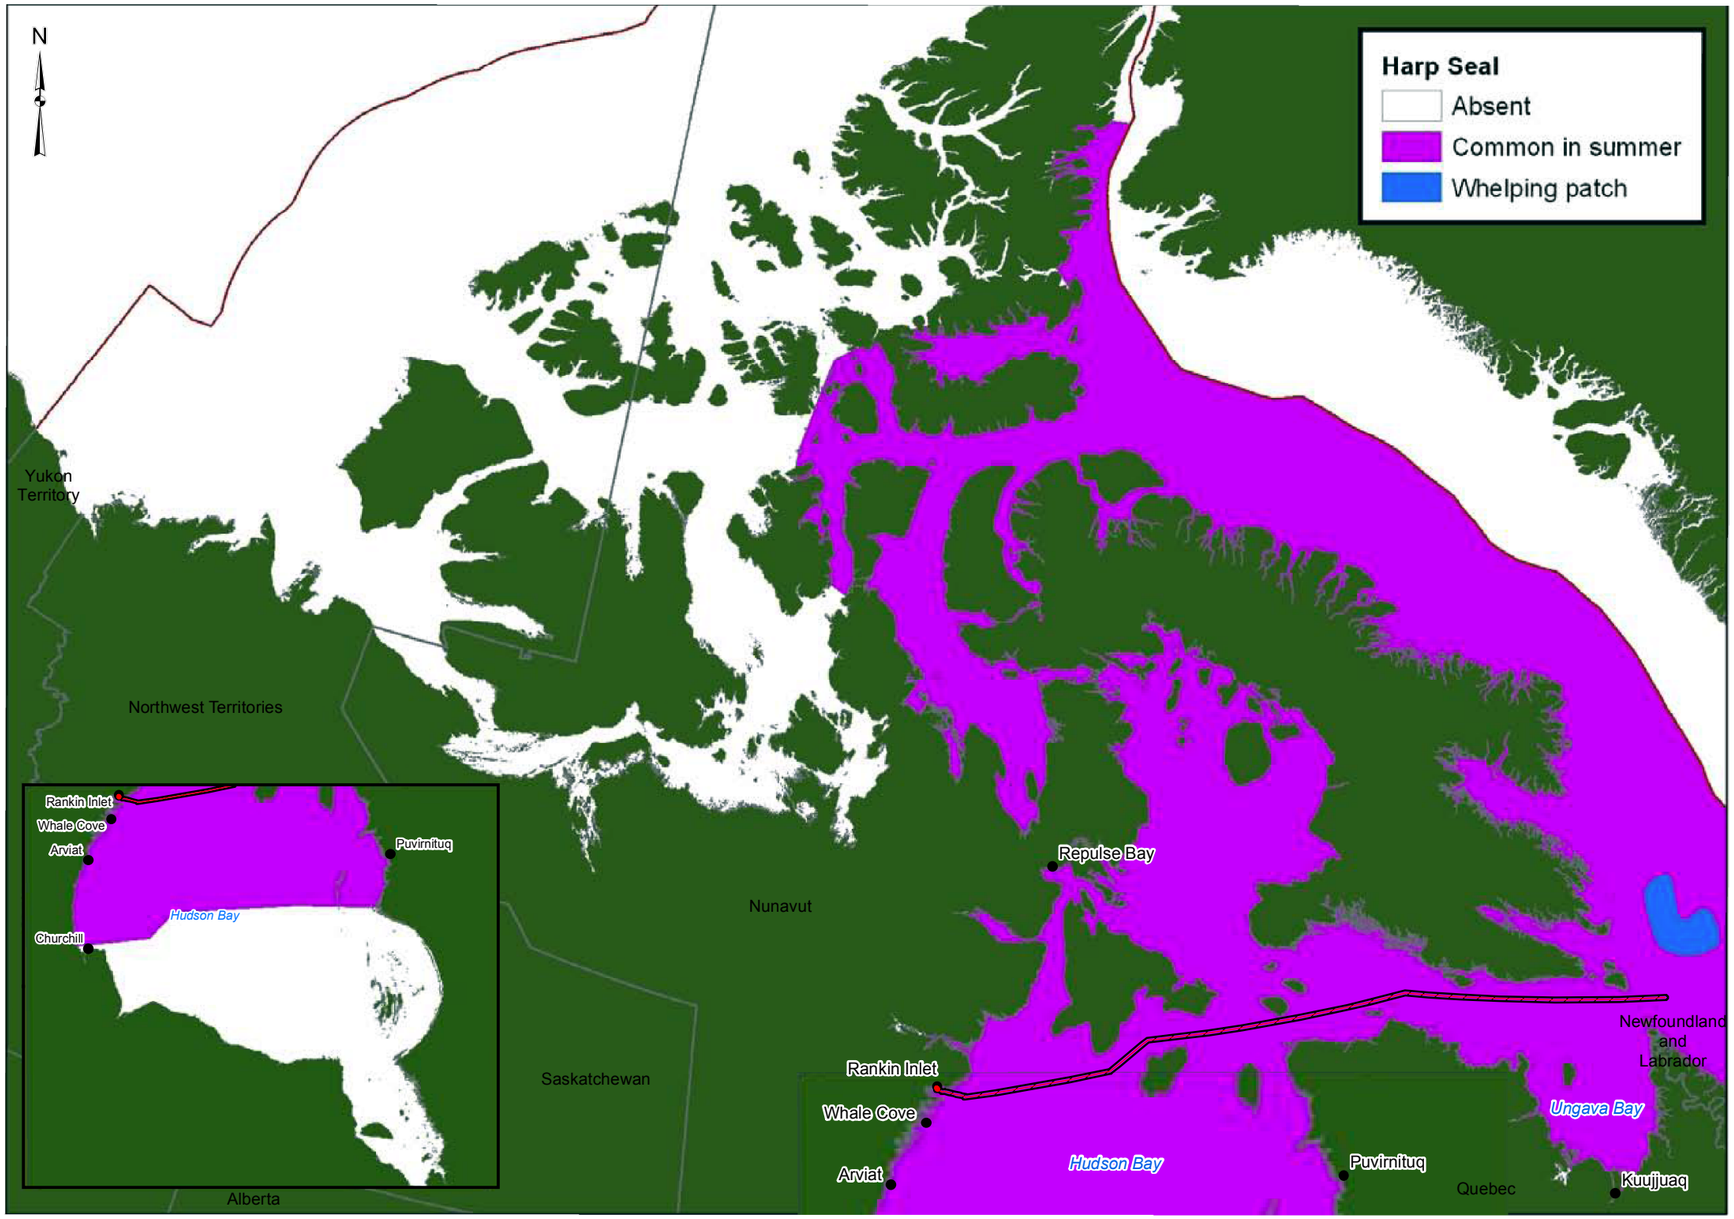
FIGURE B-11



Y:\burnaby\CAD-GIS\Client\Agnico_Eagle_Mines_Ltd\Meliadine_Gold_Project\99_PROJECTS\1535029_WL_Tech_Sup\02_PRODUCTION\5000\MXD\Report\1535029_Figure_B-11_Distribution_of_Bearded_Seal.mxd

Bearded seal pups are born in late April on the ice, weaned approximately 12 to 18 days later, and then abandoned (Evans and Raga 2001). Mating occurs in the water shortly after weaning, and involves a 2-month delayed uterine implantation period. Both males and females mature around 6 years of age and reproduce biannually until 20 to 30 years of age (Evans and Raga 2001). Males actively vocalize underwater during the breeding season, with calling behaviour associated with territorial or mating displays (Richardson et al. 1995a). Bearded seals are estimated to number approximately 100 000 in the Canadian Arctic, and are especially abundant in Hudson Strait, Foxe Basin, and along the west coast of Hudson Bay (Mansfield 1967; Davis et al. 1980). The main predators of the bearded seal are polar bears and humans. This species is harvested throughout the year by virtually all coastal Inuit communities in Nunavut (27 of 28) (Furgal et al. 2002; Hovelsrud et al. 2008; Priest and Usher 2004), with hunting taking place from July to October. The meat is consumed and the tough flexible hide is used for harpoon lines, dog harnesses, whips, boot soles, and to cover boats called Umiak (Richard 2001). No Total Allowable Catch (TAC) limits exist for bearded seal in Nunavut. Population trends are listed as unknown by DFO (DFO 2015) and COSEWIC defines the status of bearded seals as 'Data Deficient' (DFO 2015)

Harp seal (*Pagophilus groenlandicus*)

The harp seal is a widespread species found in the northern Atlantic and Arctic oceans (Sergeant 1976). Their range includes northern Hudson Bay, Foxe Basin, Baffin Island, Davis Strait, Gulf of St Lawrence, Newfoundland, southern Greenland, Iceland, northern Norway, the White Sea, the Barents Sea, and the Kara Sea. Three distinct genetic populations are recognized: the Northwest Atlantic stock, the Greenland Sea stock, and the White Sea stock. Genetic evidence demonstrates that little gene flow occurs between the 3 stocks (Perry et al. 2000). Harp seals in Hudson Bay / Hudson Strait belong to the Northwest Atlantic stock and are only present in the RSA from ice break-up in early June until just before freeze-up (early October), at which point they migrate east outside the NSA and into the Gulf of St. Lawrence. Thus, impacts to harp seals due to the Project have the potential for transboundary effects. Harp seals are less common than ringed or bearded seals, but may have been more numerous and widespread in the past and may be re-occupying their former range (Stewart and Lockhart 2004). Figure B-12 provides an overview of harp seal distribution in the RSA based on historical sightings, current scientific knowledge, and IQ.

During spring (late February to April), female harp seals aggregate on the pack-ice along the southeast coast of Labrador ('Front') and in the Gulf of St. Lawrence where they form dense and highly-synchronized "whelping herds" and give birth to a single pup. Pups are nursed for 12 days, after which they remain fasting on the pack-ice for approximately 2 weeks before entering the water to feed (Lavigne and Kovacs 1988; Lydersen and Kovacs 1996). Adult females attain sexual maturity at 4 to 6 years of age (Frie et al. 2003). Reproductive maturity occurs in males at about 8 years of age. Towards the end of lactation, females come into estrus and mate (Lavigne and Kovacs 1988). Gestation lasts about one year, including a 3 to 4 month period of delayed implantation (Stewart et al. 1989). The life span of harp seals is approximately 20 to 30 years. Both males and females are sexually active until the ends of their lives, showing no evidence of reproductive senescence (Ronald and Healey 1981).

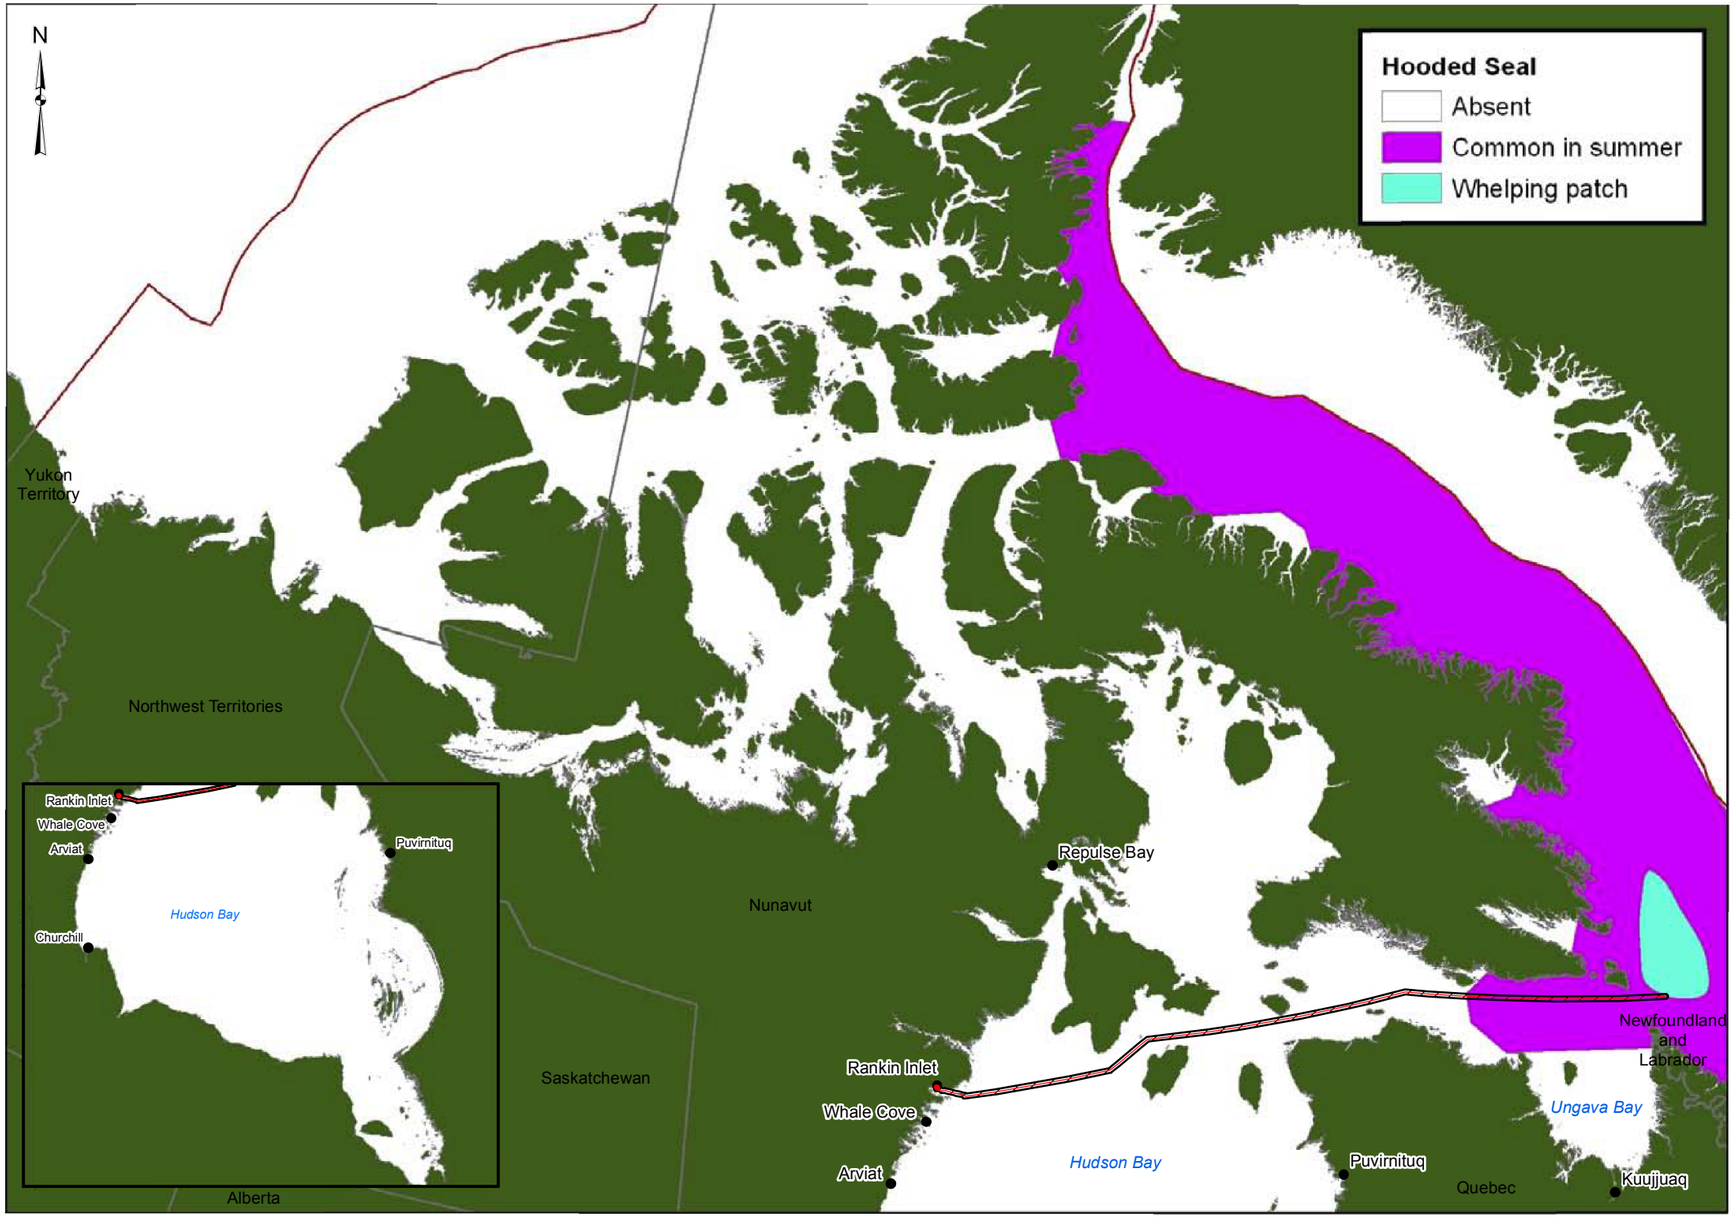
FIGURE B-12

Y:\burnaby\CAD-GIS\Client\Agnico_Eagle_Mines_Ltd\Meliadine_Gold_Project\99_PROJECTS\1535029_WL_Tech_Sup\02_PRODUCTION\5000\MXD\Report\1535029_Figure_B-12_Distribution_of_Harp_Seal.mxd



Harp seals undergo a moult in the post-breeding months, from early April to early May (Lavigne and Kovacs 1988). They are a highly social species that travel and forage in groups. The Northwest Atlantic population is highly migratory; after breeding, individuals follow the pack-ice up the coast of Labrador and spend the summer feeding in Baffin Bay, with small numbers entering Hudson Bay and Hudson Strait around Baffin Island before returning south to the Gulf of St. Lawrence during autumn, resulting in an annual migration of over 5000 km (Lavigne and Kovacs 1988). Natural predators of harp seals include polar bears, killer whales, Greenland shark, and humans (Lavigne and Kovacs 1988). Harp seals consume a wide range of fish and invertebrate prey that varies along their migration route (Lavigne 2002). Fish prey includes capelin, Arctic cod, Atlantic cod (Gadus morhua), Atlantic herring (Clupea herringus), and redfish (Sebastes sp.) (Lawson et al.1995). Pups and juveniles prey primarily on crustaceans, particularly euphausiids and amphipods (Haug et al. 2000; Nilssen et al. 2001).

The harp seal global population is presently estimated at 8 million individuals, with pup production at 1.4 million pups per year (Stenson et al. 2003; Potelov et al. 2003; Haug et al. 2006). The Northwest Atlantic stock is estimated to number 5.9 million individuals (DFO 2005a). This is a marked recovery from an estimated low of around 1.8 million recorded in the early 1970s (Sergeant 1976) linked to a population crash from overharvesting. This led to the near cessation of hunting and the gradual recovery of this stock. Catch levels have increased repeatedly during the last decade, with the Canadian and Greenland hunt now presently the largest marine mammal harvest in the world (DFO 2007). As of 2011, the Northwest Atlantic harp seal population was at the highest levels observed since monitoring began almost 60 years ago. Pup production in 2008 was on the order of 1.63 million animals with a total population size of around 8.0 to 8.7 million animals increasing to 8.6 to 9.6 million animals in 2010 (Hammill and Stenson 2011).According to Hammill and Stenson (2011) the likelihood that the population is no longer growing exponentially needs to be considered further, particularly within the context of levels of carrying capacity (K) to understand the dynamics of the population. It is important to note however, there is some uncertainty associated with reproductive rates and how density dependence is expressed in the models used to predict these population trends (DFO 2012). The 2010 assessment assumed that reproductive rates would remain high, predicting a population between 8.61 to 9.55 million animal (95% CI 7.80 to 10.80 million; DFO 2012). However, since 2008 reproductive rates have declined resulting in a 2012 population estimate of 7,700,000 (95% CI=6,900,000-8,400,000). The current population of Northwest Atlantic harp seals is estimated to have declined slightly since 2008; nevertheless it is near its highest level since the mid-19th Century (DFO 2012).

This species is hunted throughout Nunavut primarily during the months of June through September (Priest and Usher 2004), with pups representing the majority of the harvest. Both meat and blubber are consumed, and the pelts are sold commercially. Subsistence harvests are currently not regulated, but the commercial harvest is regulated by the 2011 to 2015 Integrated Fisheries Management Plan for Atlantic Seals. Seals are also caught incidentally in fishing gear (DFO 2012). DFO sets TACs within a 3-year period for the Northwest Atlantic population. In addition to Canada's commercial harvest, some harp seals are still taken in subsistence hunts in Labrador, Newfoundland, northern Quebec, and in Nunavut. Aboriginal peoples and non-Aboriginal coastal residents who reside north of latitude 53 degrees can hunt seals for subsistence purposes without a permit (DFO 2006b). Between 1983 and 1995, Canadian catches of Northwest Atlantic harp seals averaged approximately 52,000 seals per year, with catches increasing significantly to a range of 226,000 to 366,000 between 1996 and 2006 (DFO 2012). Since 2007 Canadian catches have declined significantly with DFO (2012) reporting a catch of 40,370 in 2011. Catches in the Canadian Arctic remains low at under 1,000 Northwest Atlantic harp seals per year (DFO 2012).

Hooded seal (*Cystophora cristata*)

The hooded seal occurs throughout much of the North Atlantic and Arctic Oceans (King 1983) preferring deeper water and occurring farther offshore than harp seals (Sergeant 1976; Campbell 1987; Lavigne and Kovacs 1988; Hammill and Stenson 2006). They are a highly migratory species, and are considered a rare visitor to Hudson Bay / Hudson Strait (Stewart and Lockhart 2004). Thus, impacts to hooded seals due to the Project have the potential for transboundary effects. As primarily deep-water feeders, the 200 m bathymetric contour interval has been adopted to estimate the offshore distribution boundary of this species (Stephenson and Hartwig 2010). Figure B-13 provides an overview of hooded seal distribution in the RSA based on historical sightings, current scientific knowledge, and IQ. They are generally associated with heavy pack ice, and their presence would extend until ice break-up (Sergeant 1974).

Y:\burnaby\CAD-GIS\Client\Agnico_Eagle_Mines_Ltd\Meliadine_Gold_Project\99_PROJECTS\1535029_WL_Tech_Sup\02_PRODUCTION\5000\MXD\Report\1535029_Figure_B-13_Distribution_of_Hooded_Seal.mxd

Hooded seals of the Western North Atlantic stock breed synchronously during mid to late March in heavy pack-ice areas off the coast of eastern Canada and around Greenland. Breeding of this population is divided into 4 whelping areas. The “Front” herd (largest of the 4) breeds off the coast of Newfoundland and Labrador, the “Gulf” herd breeds in the Gulf of St. Lawrence, the “Davis Strait” herd breeds between Baffin Island and western Greenland, and the “West Ice” herd breeds in the Greenland Sea near the island of Jan Mayen (Sergeant 1974, 1976; Folkow et al. 1996). These breeding herds are considered to belong to 2 recognized populations (Hammill and Stenson 2006). Seals whelping near Jan Mayen are thought to constitute the Northeast Atlantic population, while hooded seals whelping and breeding in Davis Strait, the Gulf and at the Front are all thought to belong to the Northwest Atlantic population (Hammill and Stenson 2006). The breeding season for this polygamous species is brief lasting only 2 to 3 weeks, with mating taking place in the water (Boness et al. 1988; Kovacs 1990). This species has the shortest lactation period for any mammal, with most pups being weaned in 4 days (Bowen et al. 1987). Hooded seals moult in July, with each breeding stock congregating at separate traditional sites away from the whelping areas. Many seals are reported to migrate to the pack-ice east of Greenland in Denmark Strait at this time (Sergeant 1974, 1976; Folkow et al. 1996). Hooded seals form loose aggregations in specific areas during the breeding and moulting season and generally remain solitary outside this period. Hooded seal life span is approximately 25 to 30 years (Kovacs 2002).

The Northwest Atlantic population has been estimated at approximately 600 000 animals (593 500, +67 200 SE, Hammill and Stenson 2006), of which 90% are estimated to whelp at the Front (Stenson et al. 2006). The DFO 2011 to 2015 Integrated Fisheries Management Plan for Atlantic Seals still estimates the hooded seal herd in the northwest Atlantic to have increased from 478,000 in 1965, to approximately 600,000 animals currently (DFO 2011c). The Northeast Atlantic population is estimated at between 70 000 and 90 000 animals, although there is considerable uncertainty around these estimates due to scarcity of data and limited understanding of the relationships between whelping areas (ICES 2006). Hooded Seals are annually harvested by coastal Inuit of Greenland and Canada for subsistence purposes (Kovacs 2002) and have been commercially hunted at the Front since the late 1800s (Kovacs 2008b). Harvesting occurs primarily during the months of July through December (Table B-5). For the Canadian harvest, the TAC has been set at 10 000 seals per year since 1998 (ICES 2006). For the period 2000-2004, the total estimated catch of hooded seals was 48 188 (Kovacs 2008b). By-catch of hooded seals in coastal net fisheries has been reported from the United States, from trawl fisheries off Norway and Newfoundland, and salmon drift nets used off Greenland (Woodley and Lavigne 1991; Reeves et al. 1992; Waring et al. 2005).

Harbour seal (*Phoca vitulina concolor*)

The harbour seal is the most widely-distributed of all pinnipeds, inhabiting temperate, sub-Arctic and Arctic coastal areas on both sides of the North Atlantic and North Pacific Oceans. As this species does not maintain breathing holes in the ice, their distribution in the RSA is limited to locations where currents maintain open water year-round, typically in freshwater or estuarine rapids, in small coastal polynyas, or at the ice floe edge (Mansfield 1967). Harbour seals are not typically found in offshore waters exceeding 50 m depth (COSEWIC 2007). This depth limitation is supported by radio telemetry studies that have indicated that the 50 m benthic contour line may be used to demarcate their offshore limit of distribution (Stephenson and Hartwig 2010). Figure B-14 provides an overview of their distribution in the RSA based on historical sightings, current scientific knowledge, and IQ. Adults tend to be solitary in the water but haul out in small sedentary groups on rocky shores, where pupping occurs. Harbour seals are harvested by coastal Inuit communities primarily during the period from July through October (Table B-4).

Atlantic walrus (Odobenus rosmarus rosmarus)

The walrus (*Odobenus rosmarus*) has a circumpolar distribution and is the largest pinniped occurring in the Canadian Arctic. Individuals inhabiting coastal areas of the RSA belong to the Atlantic stock, 1 of 2 subspecies recognised. Walrus in the Canadian Arctic include two genetic populations, with seven different stocks (DFO 2013). The Baffin Bay (BB), west Jones Sound (WJS) and Penny Strait-Lancaster Sound (PS-LS) stocks comprise the high Arctic population. The central Arctic population is composed of the north and central Foxe Basin (N-FB and C-FB) and Hudson Bay-Davis Strait (HB-DS) stocks (DFO 2013). According to DFO (2013), the relationship between these six stocks and walrus distributed in south and east Hudson Bay (S&E-HB) is currently unknown. Recent aerial and satellite telemetry studies have been used to develop abundance estimates for six of the walrus stocks that make up the high Arctic and central Arctic populations in Canada. Based on those estimates, total allowable removals (TARs) were calculated for each stock using the Potential Biological Removal method (PBR) (DFO 2013). The aerial surveys of walrus haul outs conducted in 2007 to 2011 provided data to enable the calculation of abundance estimates for all stocks, with the exception of the S&E-HB stock (DFO 2013). However, it is likely that individual stock abundance estimates were underestimated due to incomplete survey coverage, inter-annual variability in distribution, and unfavourable weather and ice conditions (DFO 2013).

According to DFO (2013) stock estimates and associated TARs for walrus belonging to the high Arctic population are as follows:

- Baffin Bay stock was estimated at approximately 1,250 walrus in 2009 (based on a count of 571) resulting in an annual TAR of 10 to11 walruses;
- West Jones Sound stock was estimated at 503 (coefficient of variation (CV) = 0.07) walruses in 2008, (based on a count of 404) resulting in an annual TAR of seven or eight walrus; and
- Penny Strait-Lancaster Sound stock was estimated at between 661 (CV = 2.08) and 727 (CV = 0.07) walrus in 2009 (based on a count of 557) resulting in an annual TAR of 10to12 walrus.

However, dividing the harvest of the three stocks that make up the high Arctic population was not possible (DFO 2013). The average annual Canadian reported harvest (reported over 25 years) was approximately 14, less than the combined annual TAR of 27 to 31 walrus (DFO 2013).

The combined population estimates for the north and central Foxe Basin stocks in 2011 ranged from 8,153 (CV = 0.07) to 13,452 (CV = 0.43) animals and was based on counts of 6,043 and 4,484, respectively, using different survey dates and different adjustment factors (DFO 2013). The annual TARs is currently 106 to166 walruses and with a yearly harvest level of approximately 185 animals (DFO 2013). Further investigation into walrus movements within Foxe Basin and exchange with the larger Hudson Bay-Davis Strait stock is required to better understand how and if these stocks interact (DFO 2013).

Walruses from the Hudson Bay-Davis Strait stock summer in the Hoare Bay area on southeast Baffin Island. Population estimates were between 1,420 (CV = 0.07) and 2,533 individuals (CV = 0.17) in 2007 (based on a count of 1,056 animals; DFO 2013). The calculated annual TARs for the Hudson Bay-Davis Strait stock is currently 18 to 38 with local annual harvests of approximately 36 walruses (DFO 2013).

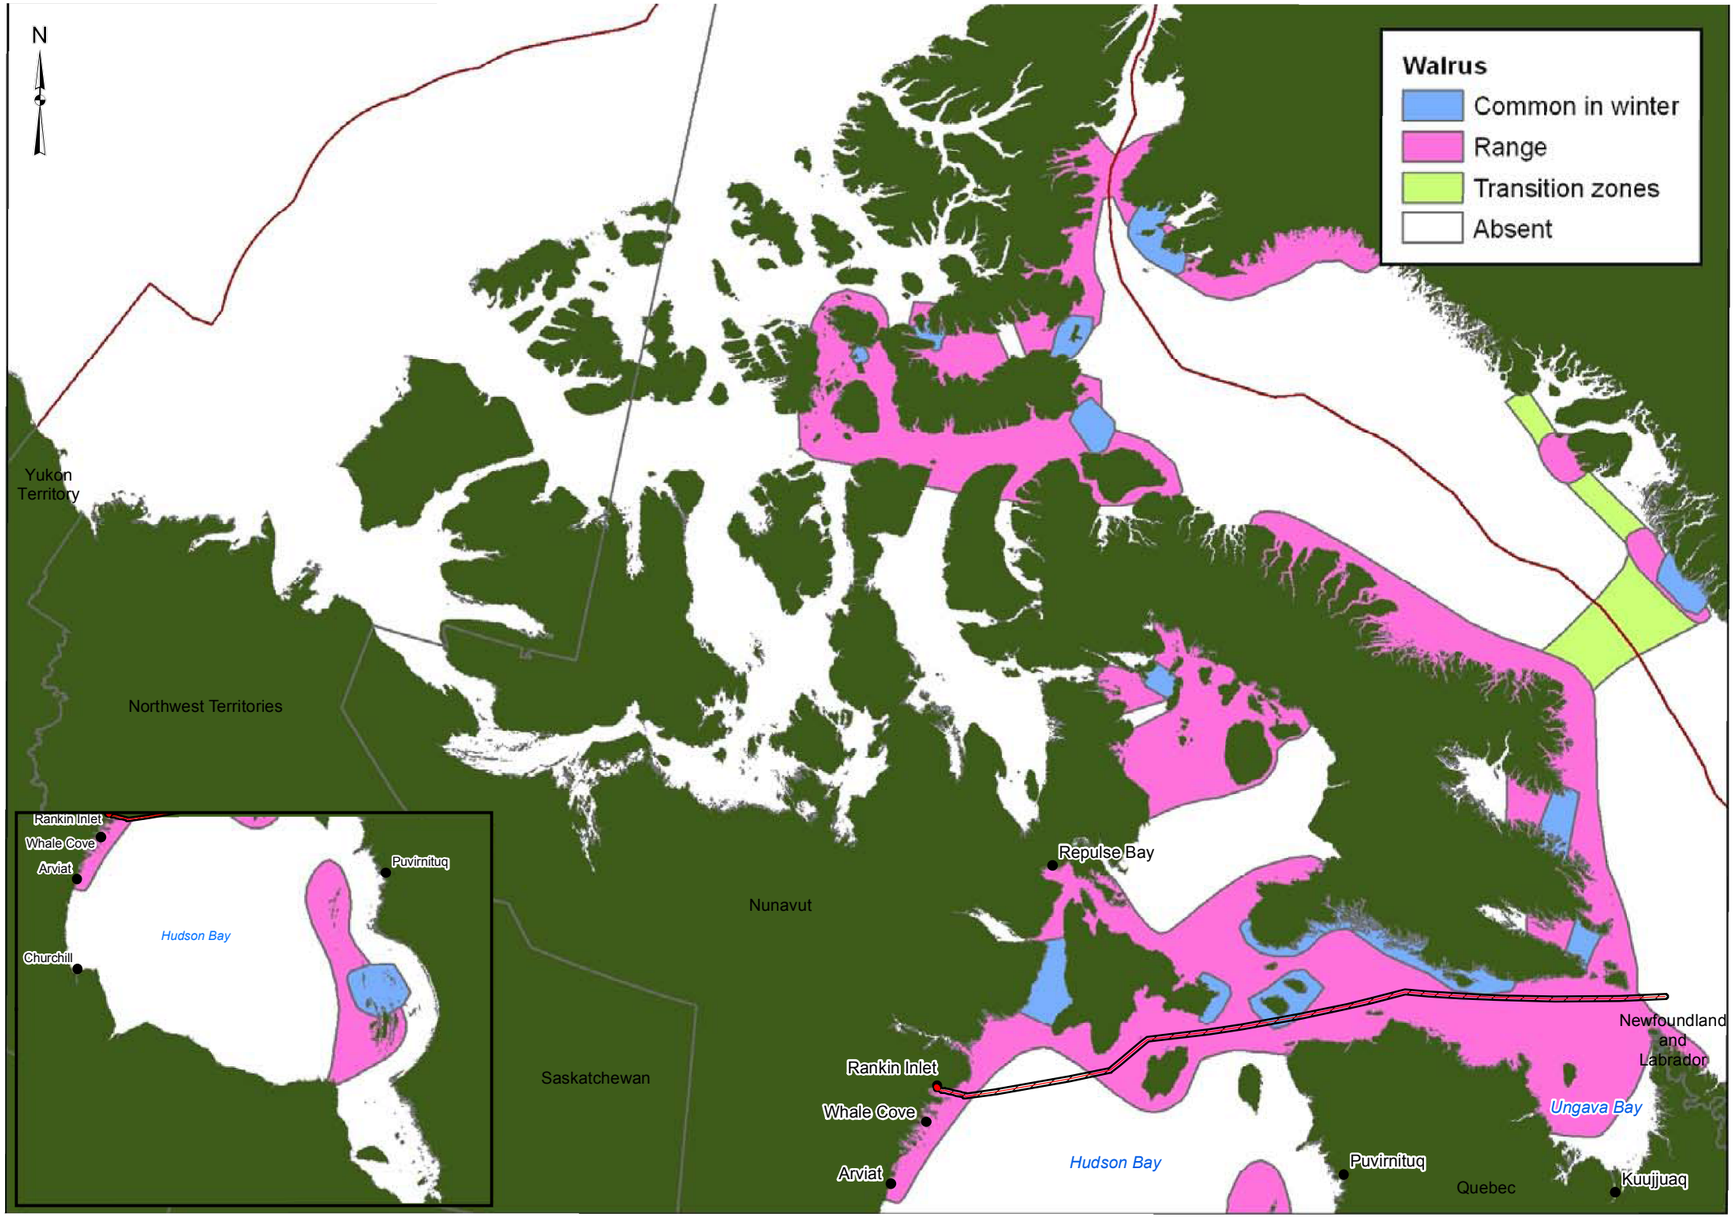
According to DFO (2013), the central Arctic population lacks sufficient data for a meaningful population estimate. Changes in the abundance of the Atlantic walrus population during the past 45 years remain unclear (COSEWIC 2006). Modelling indicates that populations in the Eastern Canadian Arctic have been in steady decline (Witting and Born 2005). The current total abundance of the Atlantic walrus is poorly known, the most recent information suggests a population size of 18,000 to 20,000 individuals (COSEWIC 2006). The population status of Atlantic walrus was recently upgraded to “Special Concern” (COSEWIC 2006). Walruses are harvested year-round by coastal Inuit communities in the Nunavut region (Table B-4; Priest and Usher 2004). Between 1996 and 2001, hunters reported an average annual walrus catch (landed) of 2/year from Arviat, 3/year from Chesterfield Inlet, 5/year from Rankin Inlet and none for the communities of Baker Lake or Whale Cove during that same period (NWMB 2004). Walrus hunting is subject to the terms of the Nunavut Land Claims Agreement and is legislated under the Marine Mammal Regulations of the *Fisheries Act*.

Walrus require large areas of shallow water (<80 m) with substrate that supports a productive bivalve community, the reliable presence of open water over these feeding areas, and suitable ice or land nearby upon which to haul out (Evans and Raga 2001). Atlantic walrus are highly gregarious and are associated with moving pack-ice for most of the year. In Hudson Bay, the paucity of sea-ice during summer forces walrus to haul-out in predictable locations on land. The main concentration of walruses in southern Hudson Bay is in the Belcher Islands (Sanikiluaq) (Figure B-15; DFO 2002). The main concentration of walruses in northern Hudson Bay resides on the northeast side of Coats Island and in Coral Harbour on the southeast side of Southampton Island (Figure B-15; DFO 2002). Walrus in both areas are present year-round with an estimated summer population of 2000 animals. The main concentration of walruses in Hudson Strait resides at Cape Dorset on the Foxe Peninsula (Figure B-15; DFO 2002). Walruses may occasionally haul out at the East Bay Bird Sanctuary on Southampton Island and the Bowman Bay Wildlife Sanctuary on Baffin Island (COSEWIC 2006).The general distribution of walrus and their preference for shallow near shore areas substantially reduces the potential for interaction of walrus with Project vessels in the shipping corridor (RSA). Figure B-16 provides a summary of distribution of haul-outs and areas of known important habitat for Atlantic Walrus in the Marine RSA and Adjacent Arctic Waters.

Walrus are characterized by a highly polygamous mating system, with breeding herds forming in January - April. They are long-lived animals (approximately 40 years) with a low reproductive rate. Females attain reproductive maturity at approximately 5 to 7 years of age, with a typical calving interval of 3 years (Garlich-Miller and Stewart 1999). Males reach sexual maturity at 6 to 10 years of age, although likely cannot successfully compete for females until they are older. Mating takes place in the water, usually from January to April, and pregnancy lasts 15 to 16 months. Females, therefore, can only give birth a maximum of once every 2 years, though it is more commonly 3 years between calves. This results in a pregnancy rate that is much lower than that of other pinnipeds. Walrus calves are born on land or on the pack-ice between late April and early June. The nursing period typically lasts for 2 years, with weaning occurring gradually over this time.

Behavioral responses of walrus to man-made noise are shown to be variable (DFO2002). Aircraft noise has been correlated with evidence of stampedes, with attendant mortality, as well as partial habituation to the noise (Born et al. 1995). Some individuals at haul outs may allow ships to approach quite close while others will react to ships 2 km away (Born et al. 1995). Displacement from haul outs for up to 9 hours has been noted as a result of in-air noise, with females and calves being the most susceptible to this type of disturbance (Salter 1979, Miller 1982). Suitable walrus habitat has been shown to be decreasing as human activities in the north expand

(COSEWIC 2006). Noise disturbance caused by motorized transportation and hunting have caused herds to abandon haul out near communities in favour of less accessible islands and shores (Born et al. 1995).



Interviews were conducted with Inuit hunters from Coral Harbour and Cape Dorset to document their knowledge regarding the seasonal distribution and abundance of walruses in northern Hudson Bay and western Hudson Strait (Orr and Rebizant 1987). Harvesters for Coral Harbour noted that during the winter, walruses were found along the floe edge from Leyson Point to Hut Point, with sightings of usually less than 100 walruses (Orr and Rebizant 1987). At the floe edge of Ruin Point, as many as 1,000 walruses have been noted, although usually sightings were around 500 individuals. Reports of sightings of 500 walrus at South Bay were also shared (Orr and Rebizant 1987). In the spring walrus were primarily noted in the area of South Bay, between Native Point and Ruin Point, with most sightings consisting of groups less than 100 individuals. The highest concentrations of walrus, up to 500, appeared to be at the floe edge near Renny Point. As ice breaks up in late spring, greater numbers of walrus (>500) are found near Leyson Point (Orr and Rebizant 1987). During the summer greater numbers of walrus were reported, with sightings common from Sea Horse Point, west along Bell Peninsula, to Ruin Point. Walrus Island, Bencas Island, the north and eastside of Coats Island and Evans Strait are all areas reported to have high concentrations (>1000) of walrus by hunters (Orr and Rebizant 1987). Harvesters noted that there appears to be a localized migration in the early fall, from the Coats Island and Walrus Island area, across to Evans Strait (Orr and Rebizant 1987). Harvesters reported more than 1,000 walrus hauled out or swimming in the area of Cape Pembroke (Orr and Rebizant 1987).

Cape Dorset hunters noted that during the winter months, walrus are sporadically distributed along the coast of Foxe Peninsula from Cape Dorchester to Chamberlain Island, with the largest number of walruses around Cape Dorchester (Orr and Rebizant 1987). Salisbury Island and Nottingham Island reported as many as 500 walruses in the area between the two islands. Most sightings documented were in groups from 20 to 50 individuals during the winter months (Orr and Rebizant 1987). Cape Enavolik, Shuke Island and Sakkiak Island were all noted to support as many as 1,000 walruses, with most individuals observed either swimming or hauled out on floating pack ice near the floe edge. During the spring, walruses can be found from Cape Dorchester to Dorset Island, commonly in groups of ~1,000 animals along the coast, while the groups from around the tip of Salisbury Island and the southeast side of Nottingham Island were similar to the winter numbers of approximately 500 individuals. In the spring, walrus were most commonly observed hauled out on floating pack ice (Orr and Rebizant 1987). In the summer months, walrus numbers decline in the vicinity of Cape Dorset; hunters suggested that walrus prefer the area along the west coast of Foxe Peninsula, from Lloyd Point to the group of islands north of Cape Dorchester during this time (Orr and Rebizant 1987). Walruses are known to travel around the islands of Mills, Salisbury and Nottingham in late summer, but hunting usually occurs along the west coast of Foxe Peninsula. Large groups of walrus of 500 to1000 individuals have been noted in the summer along the south, west and north coast of Salisbury Island and along the southeast coast of Nottingham Island (Orr and Rebizant 1987). In July and August, concentrations of over 1,000 walruses were reported around Cape Dorchester. During the fall, reports by hunters are similar to those made during the summer, with a slight decrease in the numbers along the northwest coast of Foxe Peninsula. This may be due to a seasonal migration of these animals to islands in Hudson Strait with noted increases in the number of animals observed around Nottingham and Salisbury Islands during this time (Orr and Rebizant 1987).

The main changes in seasonal distribution of the Northern Hudson Bay-Davis Strait walrus population occurred in the early to mid-1900 (COSEWIC 2006). This included the abandonment of haul outs along the west coast of Hudson Bay north to Chesterfield Inlet, Digges Island, Cumberland Sound, and on the Gyrfalcon Islands (Born et

al. 1995). During this time, walruses were rare in western Hudson Bay, but were moving northward where the coastline offered more suitable haul out (COSEWIC 2006). Walruses were numerous at islands near the community of Whale Cove from 1942 to 1945, but are uncommon in this area now (Fleming and Newton 2003). Small groups are sometimes seen at the floe edge south of Whale Cove (Gamble 1988; Fleming and Newton 2003). Inuit report that walruses were more numerous in the Chesterfield Inlet area in the early 1990s than in times previous (Fleming and Newton 2003). Some haul out in western Hudson Bay have been abandoned, but walrus have been noted to be hauled out (Figure B-16) in small numbers in summer at:

- Bibby Island (61°53'N, 93°05'W);
- Term Point (62°08'N, 92°28'W);
- “Little Walrus Island” in Mistake Bay;
- Sentry Island (61°10'N, 93°51'W);
- Wag Island (63°23'N, 90°38'W);
- Marble Island (62°41'N, 91°08'W); and
- Fairway Island (63°15'N, 90°33'W;Low 1906; Degerbøl and Freuchen 1935; Loughrey 1959; Reeves 1978; Born et al. 1995; DFO 2000; Fleming and Newton 2003).

Beluga whale (Delphinapterus leucas)

Beluga whales are circumpolar in distribution, typically occurring in warm shallow estuaries during summer and migrating south during autumn to over-winter in the pack-ice, at established polynyas, or along prominent ice leads where open water conditions prevail (Doidge and Finley 1993; NAMMCO 2005). Beluga whales in the Canadian Arctic are sub-divided into 7 populations based on summer distribution and genetic differences (COSEWIC 2004a). The highest concentrations of belugas in the Canadian Arctic occur in the Hudson Bay region (Stephenson and Hartwig 2010), where animals during summer are observed in concentrated groups along both eastern and western coasts, as well as in James Bay and in nearby Ungava Bay (Gosselin et al. 2013). Each spring and fall, Hudson Strait is considered an important migration route for over 60,000 beluga whales from the Eastern and Western Hudson Bay populations (Gosselin et al., 2013; Richard 2005, 2010). Estuaries serve as important feeding and calving grounds for beluga whales, with their first arrival in these areas timed with the initial ice breakup in late June and their abundance increasing into the summer. Molecular genetic studies indicate at least two populations in Hudson Bay: a western Hudson Bay (WHB) stock and an eastern Hudson Bay (EHB) stock (Brennin et al. 1997; Brown Gladden et al. 1997; De March and Postma 2003). The WHB stock numbers about 57 000 individuals (Richard 2005). Genetic studies (Turgeon et al. 2012) and satellite telemetry (Bailleul et al. 2012) have shown that the two stocks overwinter together, where interbreeding likely occurs. Beluga whales in James Bay appear to constitute a distinct breeding population (Postma et al. 2012).

Most beluga whales present during summer in the Hudson Bay region belong to the WHB stock and occur in shallow coastal waters along western Hudson Bay (Martin et al. 2001), concentrating in the Churchill, Nelson, and Seal River estuaries (Stephenson and Hartwig 2010). The most recent population estimate for the WHB population was estimated at approximately 57,300 animals (95% C.I.: 37,700 to 87,100) (Richard 2005), making this stock of beluga the most abundant cetacean species in the region. Individuals from the EHB stock occur during summer along the shores of eastern Hudson Bay, including the Nastapoka River and the Little Whale River estuaries in northeastern Nunavik (Quebec's Arctic region) (Stephenson and Hartwig 2010). The EHB stock, currently listed as endangered by COSEWIC, was depleted by intensive commercial hunting between the 1860s and the early 1900s and has decreased from an estimated pristine population size of 12,500 to about 3,000 individuals in 2009 (Hammill et al. 2009). Aerial line transect surveys conducted in 2011 provided revised abundance estimates of the EHB stock at 3,351 animals (CV 48.9%; 95% CI: 1552 to 7855), which included correction factors for submerged animals and an additional 354 individuals counted during dedicated surveys in Little Whale River estuary (Gosselin et al. 2013). An uncorrected density estimate of 0.02 individuals / km^2 (CV 47.1%) was reported for EHB beluga whales in the eastern Hudson Bay survey area (Gosselin et al. 2013). The 2011 EHB abundance estimate is higher than that of 2008 (2,646 individuals; Gosselin et al. 2009), lower than that of 2004 (4,274 individuals; Gosselin 2005), and in line with model predictions of the stock abundance for 2011 (Doniol-Valcroze et al. 2011).

Belugas have been observed in many areas of Hudson Strait during the summer months (July and August), and even throughout the fall from September to November (Lewis et al. 2009). Migration is believed to begin northward along the coast of Hudson Bay during late August / early September (COSEWIC 2004a). In early August, satellite tagging studies and aerial surveys indicate a behavioural shift with beluga starting to migrate from southwestern Hudson Bay estuaries (e.g., Seal, Churchill and Nelson rivers; Sergent 1973; Smith 2007). Most beluga have left Hudson Bay by early September, with some following the west coast of Hudson Bay northward into Rankin inlet, while others mover eastward along the southern coast of Hudson Bay then northward along the Nunavik coastline or crossing Hudson Bay via offshore waters (Smith 2007). In late

September, beluga whales tagged in eastern Hudson Bay begin migrating northward along the coast and move through Hudson strait in the months of October and November (Lewis et al., 2009). Although some beluga whales have been reported to overwinter in polynyas in northwest Hudson Bay and in James Bay, in general, beluga whales over-winter in highly productive areas in Hudson Strait, Davis Strait, and Baffin Bay (Gosselin et al. 2009; Hammill and Lesage 2009; Hammill et al. 2009; DFO 2010a; Stephenson and Hartwig 2010). Smith (2000) suggests that it appears that the Western Hudson Bay, Eastern Hudson Bay, Ungava Bay and possibly James Bay stocks join together to winter in Hudson Strait. Figure B-17 provides an overview of beluga whale distribution in the RSA based on historical sightings, current scientific knowledge, and IQ. The presence of beluga whales along the shipping corridor is thought to be low, given their general distribution pattern and preference for shallow nearshore waters.

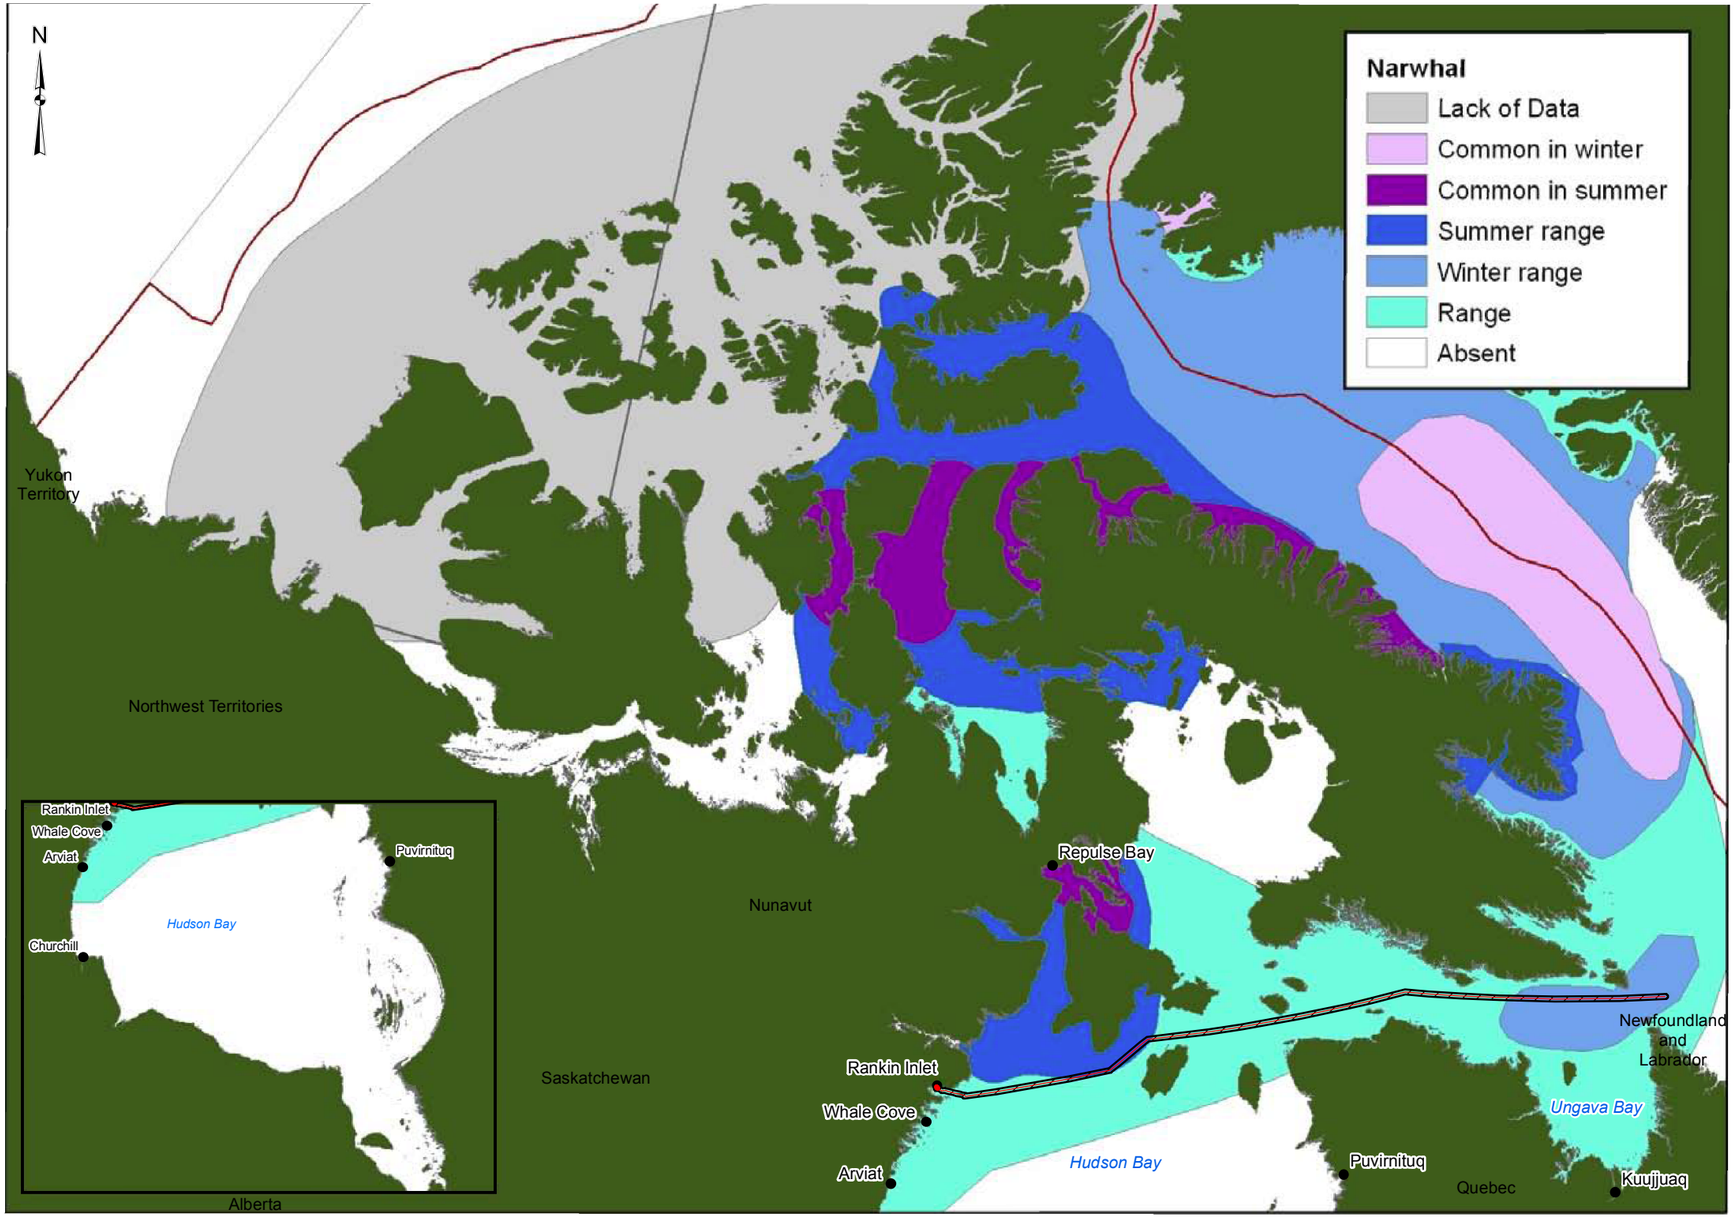
FIGURE B-17

Y:\burnaby\CAD-GIS\Client\Agnico_Eagle_Mines_Ltd\Meliadine_Gold_Project\99_PROJECTS\1535029_WL_Tech_Sup\02_PRODUCTION\5000\MXD\Report\1535029_Figure_B-17_Distribution_of_Beluga_Whales.mxd

Beluga whales are harvested year-round by most coastal Inuit communities (20 out of 28) (Table B-4) (Priest and Usher 2004). During summer, they are mostly hunted along the western coast of Hudson Bay up to 35 km offshore (Canadian Circumpolar Institute 1992) from Arviat to Cape Fullerton. They are hunted primarily for their tusks and their meat. The meat is eaten or fed to dogs.with (Born *et al.* 1995).

Over the 5-year period from 1996 to 2001, the total annual mean number of beluga whales taken through hunting was approximately 1,339 for all of Nunavut, whereas annual rates of belugas harvested from the community of Rankin Inlet ranged from 22 in 1998 to 1999 to 116 in 1999 to 2000 (Priest and Usher 2004). Subsistence harvest of beluga whales by Nunavik Inuit communities is directed towards a mixture of the WHB and EHB stocks, with the reported 2010 harvest consisting of 45 beluga whales taken near Sanikiluaq (Belcher Islands), 16 in the eastern Hudson Bay area, 15 in Ungava Bay, 146 in Hudson Strait in the spring and 58 in the fall (Doniol-Valcroze et al. 2011).

Narwhal (*Monodon monoceros*)



Two of 3 recognized populations of narwhals occur in the Canadian Arctic (Baffin Bay and Hudson Bay), with the third stock residing in East Greenland (COSEWIC 2004b). The populations are distinguished by means of their summer distribution, although the degree of genetic interchange between the 3 stocks is poorly known. The summer range of northern Hudson Bay narwhals includes the waters surrounding Southampton Island, with the larger aggregations in Repulse Bay, Frozen Strait, Western Foxe Channel, and Lyon Inlet (Figure B-18). Most narwhal are assumed to winter in eastern Hudson Strait and range over an area of roughly 250 000 km² (COSEWIC 2004b), while some occur in open leads and polynyas in northern Hudson Bay and western Hudson Strait. The core summering areas potentially overlap with the proposed open-water shipping route between Rankin Inlet and eastern Hudson Strait (Figure B-18).

Little information is known on narwhal habitat requirements. Throughout the year, they appear to be closely associated with the Arctic pack-ice, following the distribution of the ice and moving towards coastal areas when these are ice free. In summer, they appear to prefer coastal areas and ice-free shallow bays. During freeze-up, the coastal areas are abandoned, and the narwhals move offshore (Heide-Jørgensen 2002). During their fall migrations, and later while wintering in the pack ice, narwhals tend to prefer deep fjords and the continental slope, where depths range from -1000 to -1500 m and upwelling zones may increase biological productivity. The quality of sea-ice habitat, particularly the presence of leads in fast-ice and the density of broken pack-ice, appears to highly influence habitat selection (COSEWIC 2004b). Given that narwhal are an ice-associated species, it is likely that potential effects of climate change will result in changes to their habitats, prey availability, and increased natural mortality and may lead to changes in abundance, distribution and stock structure (Laidre and Heide Jorgensen 2005, Laidre et al. 2008). Narwhals generally travel in small groups in summer (<10 individuals), but gather in concentrations of many hundreds of animals during migrations in the spring and fall.

In Nunavut, local residents and scientists have observed killer whales feeding and hunting on marine mammals including narwhals (Steltner et al. 1984; Campbell et al. 1988; Stewart et al. 1995; Laidre et al. 2002; Higdon and Ferguson, 2009). Killer whales may be an important predator of narwhals, as indicated by their evasive behavioural responses when killer whales are nearby (Campbell et al. 1988; Laidre et al. 2002). This evasive behaviour may lead to more narwhals being available to hunters as narwhals tend to seek protection near shorelines, in bays or in inlets when killer whales are present. DFO is working with Nunavut HTOs to gather information on killer whale abundance and distribution in Nunavut, to evaluate their impact on their prey (Ferguson et al. 2012, 2011, Higdon et al. 2011).

Mating in narwhals occurs between March and May, and calving occurs in July and August. Since the lactation period exceeds 12 months, the interval between successive conceptions is usually 3 years, but about 20% of females conceive at the first breeding season following birth of their calves (Heide-Jorgensesn 2002). The basic life history features of the narwhal are similar to those of other medium-sized toothed whales (Hay 1985), with long life spans and sexual maturity estimated to be 6 to 7 years for females and 9 years for males (Garde et al. 2007). Narwhals feed heavily during migrations, but very little during the open water season (Hay and Mansfield 1989). Fish, squid, and shrimp make up the narwhal diet, particularly Arctic cod and polar cod (Heide-Jorgensen 2002). Their main predators are killer whales, polar bears, and humans, and possibly occasionally Greenland sharks and walruses (Hay and Mansfield 1989). Narwhal are harvested by coastal Inuit communities in Nunavut throughout the year under a quota system. The blubber is highly prized by the Inuit for food and is consumed locally or traded to other Inuit communities. The meat is also consumed as food. Narwhal tusks are a valuable economic commodity. Coral Harbour, Chesterfield Inlet, Rankin Inlet, Cape Dorset, Whale Cove, Kimmirut, Arviat, Baker Lake, and Hall Beach.

In 2008, DFO conducted a survey of the summer aggregation area for the Northern Hudson Bay narwhal population. Given apparent defects in the 2008 survey and uncertainty in the results, including the estimation of sustainable catches, a new survey was recommended (DFO 2012a,b). In August 2011, DFO conducted additional aerial surveys of the Northern Hudson Bay summer aggregation area. The 2011 surveys of the summering aggregations of Northern Hudson Bay narwhals produced a population estimate of 12,485 (95% CI: 7,515 to 20,743) (DFO 2012a). On the basis of this survey, an annual Total Allowable Landed Catch (TALC) of 157 narwhals for the Northern Hudson Bay population was allocated (DFO 2012a). In northern Hudson Bay, the harvest quota is to be shared among hunters in Repulse Bay, Coral Harbour, Chesterfield Inlet, Rankin Inlet, Cape Dorset, Whale Cove, Kimmirut, Arviat, Baker Lake, and Hall Beach (DFO 2012b). COSEWIC (2004b) currently recognizes narwhal in the Canadian Eastern Arctic as a species of “Special Concern”.

Bowhead whales (*Balaena mysticetus*)

The bowhead whale is the only baleen whale that occurs in circumpolar Arctic waters year-round. This species is especially well adapted to life in seasonally ice-covered seas by having no dorsal fin, a thick blubber layer, a low surface area to volume body ratio, and an enlarged head that they use to break through thick sea-ice (Montague 1993). Males tend to be smaller than females and reach sexual maturity at 12 to 13 m body length (Koski et al. 1993). Females reach sexual maturity at 12 to 14 m (Koski et al. 1993), which corresponds to >25 years in age (Rosa et al. 2004). There is evidence that the lifespan of bowhead whales can exceed 150 years (DFO 1999). Mating is believed to occur in February or March, with calves born from April to early June. Calves remain with their mothers for nearly a year (Koski et al. 1993).

Bowhead whales that occur in Hudson Bay/Hudson Strait belong to the Eastern Canadian Arctic-West Greenland (EC-WG) population, 1 of 4 populations present in Arctic waters. This population has a home range of approximately one million square kilometres, with summering grounds occurring in western Baffin Bay, the Canadian High Arctic, northern Foxe Basin, and northwestern Hudson Bay (COSEWIC 2009). Thus, impacts to the EC-WG bowhead whale population due to the Project have the potential for transboundary effects. Studies indicate that EC-WG bowhead whales travel large distances (Dueck et al. 2006; Ferguson et al. 2010a), may be spread over thousands of kilometres, and may segregate by size, sex, or reproductive status (Finley 2001). In the Hudson Bay region there are important areas of aggregation including the spring nursery area in northern Foxe Basin, northwest Hudson Bay for summering locations and Hudson Strait for wintering habitat in (Higdon and Ferguson 2010). Historic bowhead concentration areas, including possible nursery areas, include Roes Welcome Sound and around Rankin inlet (Reeves and Cosens 2003). The fall migration occurs over 2 to 3 months starting in late August/September. Wintering grounds are located in areas of unconsolidated pack-ice, such as northern Hudson Bay, Hudson Strait, central Davis Strait, southern Baffin Bay, and off West Greenland. These areas provide shelter and protection from their main predator killer whales. During spring, whales from southeastern Baffin Island travel to summering areas in Prince Regent Inlet and Gulf of Boothia by either a southern route via Hudson Strait and Fury and Hecla Strait, or a northern route via Lancaster Sound. In April and May, some bowheads move west transiting through Hudson Strait to their summer aggregation areas in northwest Hudson Bay (Reeves and Mitchell 1990) and also to northern Foxe Basin (NWMB 2000). Bowhead cow-calf pairs have been observed using the flow edge as a nursery area in northern Foxe Basin (Cosens and Blouw 2003). Figure B-19 provides an overview of bowhead whale distribution in the RSA based on historical sightings, current scientific knowledge, and IQ. Seasonal migration and general distribution patterns of EC-WG bowhead whales are thought to be largely dictated by ice conditions (Ferguson et al. 2010a), water depth and temperature (Thomson et al. 1986; Finley 2001; Harwood et al. 2010), predators (NWMB 2000; Finley 2001; Laidre et al. 2008; Ferguson et al. 2010b), and abundance and distribution of their main prey species including euphausiids, copepods, and epibenthic organisms (mysids and gammariid amphipods) (Thomson et al. 1986; LGL 1987; Finley 2001; Harwood and Smith 2002; COSEWIC 2009).

FIGURE B-19

Y:\burnaby\CAD-GIS\Client\Agnico_Eagle_Mines_Ltd\Meliadine_Gold_Project\99_PROJECTS\1535029_WL_Tech_Sup\02_PRODUCTION\5000\MXD\Report\1535029_Figure_B-19_Distribution_of_Bowhead_Whales.mxd

The population of EC-WG bowhead whales is currently estimated at 6,344 animals (95% CI 3119 to 12 906; COSEWIC 2009). EC-WG bowhead whales are currently designated as 'special concern' (COSEWIC 2009) and are being considered for listing under the federal SARA. EC-WG bowhead whales currently support a limited subsistence harvest by Inuit in Nunavut, which is co-managed by the Nunavut Wildlife Management Board (NWMB) and DFO. The population crosses international boundaries and in 2007, the International Whaling Commission granted Greenland a quota of two animals per year from this population pending annual review of the hunt sustainability.

Killer whale (Orcinus orca)

Killer whales are widely distributed throughout the Canadian Arctic, where they likely prey on a large variety of marine mammal species, including those harvested by coastal Inuit communities. They are known to migrate into Hudson Bay, Foxe Basin, and the central High Arctic each summer when open-water conditions allow (Dunbar and Moore 1980; Higdon 2007; COSEWIC 2008a), likely seeking out prey, such as seals (Leatherwood et al. 1976) and juvenile bowhead whales (Finley 2001). Declining summer sea ice may be allowing killer whales to expand their range in the Arctic, as they have been observed with increasing frequency in the Hudson Bay region (Higdon 2007). There is little available information on abundance or density of killer whales in Nunavut, and it is unknown if increases in sightings are representative of a growing population (Higdon 2007). The Inuit Traditional Ecological Knowledge of Killer Whales (Westdal 2009) summarised information on killer whales provided by workshop participants from Rankin Inlet, Arviat, Repulse Bay, Igloolik, and Hall Beach. Participants from Rankin Inlet indicated that killer whales have been around for a long time. In the past, there were not many killer whales seen near Rankin Inlet. About half the participants said that sightings have increased in recent years, and two participants mentioned that killer whales have been sighted by people in the community every summer since 2000 (Volume 9, Section 9.3.1.3.3.3). Figure B-20 provides an overview of killer whale distribution in the RSA based on historical sightings, current scientific knowledge (satellite telemetry studies and prey distribution), and IQ. Killer whales are not actively hunted by coastal Inuit communities in the Canadian Arctic.

FIGURE B-20

Y:\burnaby\CAD-GIS\Client\Agnico_Eagle_Mines_Ltd\Meliadine_Gold_Project\99_PROJECTS\1535029_WL_Tech_Sup\02_PRODUCTION\5000\MXD\Report\1535029_Figure_B-20_Distribution_of_Killer_Whales.mxd

Polar bear (Ursus maritimus)

Polar bears in the Canadian Arctic are segregated into 13 sub-populations, with those occurring in the RSA belonging to the Western Hudson Bay (WHB), Foxe Basin (FB), and Davis Strait (DS) sub-populations (Thieman et al. 2008). Delineation of the geographic separation of these three sub-populations is shown on Figure B-21. Polar bears generally occur at low densities throughout their range and are most abundant in shallow water areas near shore or where currents or upwellings increase biological productivity near ice edges associated with open water, polynyas, or lead systems (Schliebe et al. 2008). The productivity of polar bear habitat is closely linked to the physical attributes of sea ice and the density and distribution of ice-dependent seals, especially ringed and harp seals (COSEWIC 2008b; Peacock et al. 2013). From early winter until spring, polar bears are dispersed predominantly over sea-ice along the coast where they may range >200 km offshore. The annual ice melt generally forces polar bears in Hudson Bay and James Bay ashore from mid-July through late August, when they are at their maximum yearly weight from feeding on fat, newly-weaned seals. IQ on aspects of climate change from residents of Baker Lake and Arviat suggests that ice is melting earlier in recent years (as early as June) and may be forcing bears to retreat ashore sooner than in previous years (GN 2005). Polar bears tend to show long-term site fidelity with respect to preferred terrestrial summering grounds and spend several months of the open-water season in coastal areas, with some individuals also found inland (COSEWIC 2008b). During the summer, the WHB sub-population tends to congregate on coastal capes and headlands between Cape Churchill and Arviat (Figure B-22; Stapleton et al. 2014; Stirling et al. 1999). Arviat residents have reported that polar bears are becoming more common in areas in which they have not been observed previously, particularly during the summer months (GN 2005). The FB polar bear sub-population concentrates along the coastline during late summer and is observed in highest densities on Southampton Island, on several islands near Lyon Inlet, and on coastal islands throughout the Foxe Basin area (Figure B-23; Garshelis et al. 2012). In the Project area, the DS sub-population congregates along coastal areas of Frobisher Bay, on Akpatok Island, and along the northern tip of Ungava Bay (Labrador / Quebec border) at the entrance to Hudson Strait (Figure B-23; Peacock et al. 2013). During the open-water season, polar bears also have been observed offshore swimming in ice-free waters of Hudson Bay as reported during aerial surveys and other field investigations being conducted in the region (S. Atkinson 2013, pers. comm.). The majority of these sightings occurred less than 5 km from shore and in waters adjacent to larger islands (S. Atkinson 2013, pers. comm.; M. Dyck 2014, pers. comm.). No open-water surveys targeting polar bears have been conducted during the summer, and, therefore, no at-sea density estimates are available for this species during this period. However, the number of polar bears occurring offshore during the open-water summer season is thought to be minimal (S. Atkinson 2013, pers. comm; M. Dyck 2014, pers. comm.).

During fall, there is a gradual northward movement of the WHB subpopulation along the south coast of Hudson Bay, as bears gather to await the formation of new sea ice in November (Amstrup et al. 2007). Some polar bears tagged in the Churchill region moved northward along the Kivalliq Coast as far as Chesterfield Inlet (Stirling et al. 1999). Polar bears may overlap with the RSA and LSA in Melvin Bay during the winter time. During winter and spring, polar bears belonging to the Davis Strait sub-population use the sea ice along Davis Strait, Labrador Sea, and west to Ungava Bay and eastern Hudson Strait (Peacock et al. 2013). During winter, the FB sub-population generally is restricted within the mouth of Hudson Strait (COSEWIC 2008b). Figure B-23 provides an overview of polar bear distribution in the RSA based on historical sightings, current scientific knowledge, and IQ.

FIGURE B-23

Y:\burnaby\CAD-GIS\Client\Agnico_Eagle_Mines_Ltd\Meliadine_Gold_Project\99_PROJECTS\1535029_WL_Tech_Sup\02_PRODUCTION\5000\MXD\Report\1535029_Figure_B-23_Distribution_of_Polar_Bear.mxd

When the majority of individuals move back onto the ice in November during freeze–up, pregnant females remain on land near the coast to dig maternity dens in deep snowdrifts and frozen ground. Breeding occurs in March to May, implantation is delayed until fall, and birth is generally thought to occur from late November to mid-January. Although some cubs are born in earth dens, most births occur in snow dens that may be occupied for 5 to 6 months during the maternal event (Schliebe et al. 2008). Only pregnant female polar bears den for this extended period of time, during which time they rely on fat stores for energy and sustenance. The average litter size is less than 2. Cubs are dependent upon mothers until after the start of their third year of life. Age of first reproduction is normally 5 to 6 years for females. These factors contribute to the low reproductive potential for the species (Schliebe et al. 2008).

The WHB subpopulation was shown to have declined by 22% between 1987 and 2004, from approximately 1294 indiviudals in 1,987 to 935 individuals in 2004 (Regehr et al. 2007). However, recent aerial surveys conducted during summer of 2011 estimate abundance of the WHB sub-population at just over 1000 animals (Stapleton et al. 2014). The highest concentrations of bears occurred along the coasts and surrounding islands, particularly in the area south of Arviat. This study is supported by IQ shared by Inuit Elders indicating that the number of polar bears and dens along the western coast of Hudson Bay are increasing (COSEWIC 2008b). Results from a compilation of interviews conducted with local Inuit by the Nunavut Tunngavik Incorporated (NTI) indicate that polar bear numbers in the Rankin Inlet region have been increasing since the 1980s (GN 2005).

The DS sub-population was recently estimated by Peacock et al. (2013) by compiling 35 years of mark-recapture studies. This sub-population was estimated to number 2,158 individuals (±180 SE) in 2007 - an increase from the last population assessment conducted in 1970. The population is thought to be influenced by low recruitment rates, average adult survival rates, high population density when compared to other sub-populations in the area, as well as high prey density but variable ice conditions. Peacock et al. (2013) suggest that the DS subpopulation appears to be stable and likely may be experiencing the effects of density dependence.

Mark-recapture surveys conducted from 1989 to 1994 estimated the FB sub-population at 2,197 individuals (+256 SE) (Taylor et al. 2006). In 2004, the estimated abundance of this sub-population had increased to 2,300 animals. Information from traditional knowledge studies suggested the population was increasing and the opinion of various scientists agreed that an increase may have occurred due to low historical harvests rates (COSEWIC 2008b). Recent aerial surveys conducted during the late summer of 2009 and 2010 generally agreed with these previous population assessments, and estimate polar bear abundance for the FB subpopulation at approximately 2580 individuals (95% CI about 2,100 to 3,200),; Garshelis et al. 2012). The FB sub-population, characterized by average litter sizes, robust annual growth rates, and good body conditions (Garshelis et al. 2012), appears to be near stable taking into account current harvest levels.

Polar bears are harvested by coastal Inuit communities in Nunavut throughout the year under a quota system. The polar bear quota increased from 8 to 21 bears from the 2010-2011 to the 2011-2012 annual quota for the Western Hudson Bay sub-population, which includes the area around the communities of Arviat, Baker Lake, Whale Cove, Rankin Inlet, and Chesterfield Inlet (GN 2011). The 2013-2014 recommended quota is 24 bears (GN 2013). The number of polar bears hunted in Rankin Inlet from 1996 to 2001 ranged from 1 to 13 bears (Priest and Usher 2004). The annual 2013-2014 hunting quota for the FB subpopulation is 106 bears and includes 7 communities in Nunavut and 4 in Quebec (GN 2013; COSEWIC 2008b). The annual quota for the DS

subpopulation was 61 bear for 2012-2013; the recommended 2013-2014 quota is 48 bears (GN 2013). COSEWIC (2008b) currently recognizes polar bears in the Canadian Arctic as a species of “Special Concern”.

Hearing Abilities of Marine Mammals

Marine mammals are acoustically diverse, with wide variations in ear anatomy, frequency range, and amplitude sensitivity (Ketten 1991). An animal’s sensitivity to sound varies with frequency. Response to underwater sound likely depends strongly on the presence of and level of sounds in the frequency bands or range of frequencies to which the animal is most sensitive (Richardson et al. 1995a). The general trend is that larger species, such as bowhead whales, tend to have better hearing sensitivities at lower frequency ranges than smaller species, such as beluga whales and narwhal. Hearing abilities are generally only well understood in certain captive species where audiograms (plots of hearing threshold at different sound frequencies) have been developed based on behavioural response studies (reactions to sound) and electrophysiological experiments (measuring auditory evoked potentials) (Erbe 2002).

Toothed Whales (Beluga, Narwhal, Killer Whale)

The hearing abilities of beluga whales and narwhals at high frequencies are exceptionally well developed. This likely is related to their use of high frequency sounds for echolocation. Audible frequencies for toothed whales range from 80 Hz to 150 kHz, but they are most sensitive to sounds in the frequency range of 8 to 90 kHz (Richardson et al. 1995a).

Beluga whales are considered ‘mid-frequency cetaceans’ (Southall et al. 2007), meaning their most sensitive hearing range occurs in the mid-frequency range. Using sound for foraging, navigation, and social purposes, they are a highly vocal species with call types consisting of echolocation clicks, pulsed tones, whistles, and noisy vocals. Echolocation clicks are produced in the 40 to 60 kHz and 100 to 120 kHz range, with source levels reported at 206 to 225 dB re 1 µPa at 1 m (Au 1993). Non-echolocation calls (e.g., whistles) are centered on frequencies below 6 kHz, but may sometimes attain frequencies up to 14 kHz (Schevill and Lawrence 1949; Sjare and Smith 1986), with dominant frequencies ranging between 400 Hz and 8.3 kHz. Belugas can detect frequencies as low as 40 to 75 Hz; however, their sensitivity at this range is poor (Awbrey et al. 1988). Beluga whales have been documented to communicate with one another at distances of over 300 to 500 m (Bel’kovich and Shchekotov 1992).

No behavioural or electrophysiological audiograms are available for narwhals. Their vocalizations include echolocation clicks, pulsed tonal calls, and whistles. Narwhal echolocation sounds have been recorded at 40 kHz, with source levels reported at 218 dB re 1 µPa at 1 m (Mohl et al. 1990). Pulsed tones are produced in the 500 Hz to 5 kHz range, and whistles have been reported in the 300 Hz to18 kHz range, with dominant frequencies occurring at 300 Hz to10 kHz (Ford and Fisher 1978).

Baleen Whales (Bowhead Whales)

On a comparative basis, the baleen whale auditory system does not appear as specialized as that of toothed whales (Ketten 1997). Audiograms are not available for baleen whales due to the lack of these animals in captive settings, which is required (based on current technology) to conduct behavioural and electrophysiological hearing studies. Hearing thresholds and frequency sensitivities in baleen whales are thus inferred from anatomical ear structure, vocalizations, and behavioural studies in the wild (Richardson et al. 1995a). In general,

most baleen whale species have been shown to react to frequencies below 1 kHz (Richardson et al. 1995a). They have an estimated auditory bandwidth of 7 Hz to 22 kHz (Southall et al. 2007).

Hearing in bowhead whales can be inferred indirectly by the frequency at which they vocalize and the levels of sound at which behavioural reactions occur. Bowhead whales have been shown to react to sound with dominant frequencies between 50 and 500 Hz (Richardson et al. 1995a). Avoidance behaviour has been reported when bowhead whales were exposed to low broadband sounds of 90 dB re 1µPa (Richardson et al. 1995a). The majority of the sounds produced by bowhead whales are low frequency-modulated calls, with reported frequency ranges of approximately 25 to 900 Hz (Ljungblad et al.1982; Clark and Johnson 1984; Cummings and Holliday 1984). Bowhead vocalizations include pulsive and tonal sounds, the latter either descending, ascending, constant, or inflecting in frequency (Clark and Johnson 1984). The duration of bowhead vocalizations range from short 0.5 second signals to long and melodic 4 to 5 second tones (Clark and Johnson 1984). Most single-note tones carry little sound energy above 400 Hz (Wursig and Clark 1993). Source levels from tonal moans and pulsive sounds range from 128 to 185 dB re 1 µPa at 1 m, with some vocalizations recorded by hydrophones up to 20 km away from calling whales (Clark et al. 1986).

Singing behaviour is considered to be an advanced form of vocalization in baleen whales (Clark 1991). Songs are composed of units, phrases, and themes; units sung in a sequence form phrases, a repetition of a phrase is a theme, and several themes combined create a song that can last several minutes (Payne and McVay 1971). Songs have been documented to change within and between seasons (Clark and Johnson 1984; Würsig and Clark 1993; Tervo et al. 2007).

Pinnipeds (Seals and Walrus)

Underwater hearing sensitivity in seals and walrus falls in between that of baleen and toothed whales, with an estimated auditory bandwidth between 75 Hz and 75 kHz. Phocinid seals, such as the ringed seal and bearded seal, have underwater hearing thresholds between 60 and 85 dB re 1 µPa at 1 m, with flat audiograms between 1kHz and 30 to 50 kHz (Mohl 1968; Terhune and Ronald 1972, 1975; Terhune 1981). Some phocinids have been documented to be able to detect very high frequency sounds up to 180 kHz, although, their sensitivity to sounds above 60 kHz is poor and frequencies cannot be discriminated (Mohl 1968).

Ringed seal vocalizations include barks, clicks, and yelps, all of which occur in the 400 Hz to 16 kHz frequency range, with dominant frequencies concentrated above 5 kHz (Stirling 1973; Cummings et al. 1984). Source levels are between 95 and 130 dB re 1 µPa at 1 m, considerably lower in energy than other marine mammal vocalizations, and likely the reason why ringed seal vocalizations generally are detectable only within 1 km of the source (Cummings et al. 1984).

Bearded seals vocalize in the form of ‘songs’, which are presumed to be associated with territoriality and courtship (Ray et al. 1969; Budelsky 1993). Songs have been recorded at between 20 Hz and 6 kHz, with dominant frequencies occurring at 1 to 2 kHz, and source levels of 178 dB re 1µPa at 1 m (Ray et al 1969; Stirling et al 1983; Cummings et al. 1984). Unlike ringed seals, bearded seal vocalizations can be detected as far as 25 km from the source (Cleator et al. 1989).

Few studies have measured the audiogram of the walrus. In general, walrus have sensitive hearing to low frequency sounds (Kastelein et al. 2002). A study of an 18-year-old captive walrus reported an optimal hearing range between 1 kHz and 12 kHz, with maximum sensitivity (67 dB re 1 µPa at 1 m) occurring at 12 kHz

(Kastelein et al. 2002). Hearing sensitivity fell gradually below 1 kHz and dropped off sharply above 12 kHz (Kastelein et al. 2002). Walrus vocalizations include bell tones (male-specific), clicks, taps, knocks, rasps, and grunts. The dominant frequencies of most vocalizations occur between 400 and 1200 Hz (Ray and Watkins 1975). Clicks and taps are produced in the 100 Hz to 10 kHz range, with dominant frequencies concentrated below 2 kHz. Rasps are produced in the 200 to 600 Hz range, with dominant frequencies occurring between 400 and 600 Hz. The dominant frequencies of grunts occur below 1 kHz (Scheville et al. 1966; Ray and Watkins 1975; Stirling et al. 1983). Vocalizations in walrus are typically associated with herd organization and coordination behaviour (Richardson et al. 1995a).

Polar Bear

Little is known on underwater hearing abilities in polar bears. In-air hearing has been studied on captive subjects (using auditory evoked potentials to produce audiograms) demonstrating that polar bears can likely hear in-air at a slightly wider range of frequencies than humans (up to 25 kHz) and have absolute hearing thresholds below 27 to 30 dB re 20 µPa at 1 m (Nachtigall et al. 2007).

1.3.2.4 Species at Risk

COSEWIC and SARA-listed species potentially occurring within the RSA include 4 marine bird species and 6 marine mammal species, as outlined in Table B-5.

Table B-5: Species at Risk Potentially Occurring in the Shipping Corridor in Hudson Bay / Hudson Straight

Common Name	Species	SARA Status[(a)]	COSEWIC Status[(b)]
Marine Mammals			
Narwhal	*Monodon monoceros*	No status	SC
Beluga whale	*Delphinapterus leucas*	No status	EN – EHB stock SC – WHB stock
Bowhead whale	*Balaena mysticetus*	No status	SC
Polar bear	*Ursus maritimus*	SC – Schedule 1	SC
Walrus	*Odobenus rosmarus*	No status	SC
Killer Whale	*Orcinus orca*	No status	SC
Marine Birds			
Peregrine falcon	*Falco peregrinus tundrius*	SC-Schedule 1	SC
Ross's gull	*Rhodostethia rosea*	TH – Schedule 1	TH
Ivory gull	*Pagophila eburnea*	EN – Schedule 1	EN
Red knot	*Calidris canutus*	EN - *rufa ssp.* – Schedule 1 SC - *islandica ssp.* – Schedule 1	EN - *rufa ssp.* SC - *islandica ssp.*

(a) SARA (Species at Risk Act).The Act is a key federal government commitment to prevent wildlife species from becoming extinct and secure the necessary actions for their recovery. It provides for the legal protection of wildlife species and the conservation of their biological diversity (extracted from SARA 2012).

(b) COSEWIC (Committee on the Status of Endangered Wildlife in Canada) is a committee of experts that assesses and designates which wildlife species are in some danger of disappearing from Canada. It is up to Government to legally protect wildlife species designated by COSEWIC. The potential impacts of legal listing are for Government to analyse, and the Species at Risk Act (SARA) applies only to wildlife species on the SARA legal list (extracted from COSEWIC 2012).

EN=Endangered, SC=Special Concern, TH=Threatened

Mitigation measures will be implemented to avoid or minimize any adverse effects from the Project on species at risk (SAR) in the marine environment regardless of the 'significance' of effects determined as part of the assessment. If marine-based SAR are encountered during the Project, including evidence of a SAR (e.g., dens, nests or eggs of a SAR), the primary mitigation measure implemented will be avoidance. A monitoring program will be undertaken to confirm that mitigation measures are successful. The results of monitoring will be provided to the relevant agency with management responsibility for the applicable SAR involved. Mitigation and monitoring strategies will be consistent with applicable status reports, recovery strategies, action plans and management plans that may become available during the Project.

Detailed mitigation measures proposed for the Project effects are discussed in detail in the sections below. In some instances, mitigation measures for one species are also relevant for other species. Follow-up and monitoring is discussed for all species in Section 8.3.11 of the FEIS.

1.3.2.5 Sensitive/Protected Areas

Measures have been taken by federal, provincial, and territorial governments, non-governmental organizations, as well as international organizations to identify, evaluate and protect areas of biological importance in Nunavut's marine and coastal environment. This section provides an overview of these protected areas in Hudson Bay / Hudson Strait in relation to the proposed shipping corridor (RSA).

Marble Island

Marble Island, located approximately 45 km southeast (offshore) of Rankin Inlet (Figure B-24) in proximity to the existing shipping corridor, was identified during the traditional knowledge study as an important congregation area for whales, seals, and birds (FEIS Volume 9, Section 9.3). This area has a long history of diverse use by Inuit who first came to the island as seasonal hunters, taking advantage of its wide variety of wildlife (Davis 1996). Marble Island is formally listed on the Canadian Register of Historic Places (Parks Canada 2012). Stewart et al. (1991) recommended the Rankin Inlet–Marble Island marine area to Parks Canada for consideration as a national marine park to conserve and protect the following key ecological and cultural features of this area:

- a dense, breeding population of threatened peregrine falcons near Rankin Inlet;
- a large breeding colony of common eider on Marble Island;
- anadromous stocks of Arctic char, which are locally harvested by Inuit communities;
- unique oceanographic conditions influenced by the influx of Chesterfield Inlet waters;
- maritime historical sites at Marble Island from the Knight Expedition and the whaling period including 2 shipwrecks; and
- evidence of historical coastal Inuit cultures (Stewart and Lockhart 2005).

Both the exceptional peregrine population and the maritime historical sites at Marble Island are facing increasing human disturbance and would benefit from the protection afforded by National Parks designation as they are

located near the growing community of Rankin Inlet and are a stop for tourists visiting by cruise ship. The area's rocky Canadian Shield shoreline provides a greater variety of marine habitats than the Churchill-Nelson area. Diana and Meliadine rivers provide small-scale estuarine habitats. This area would afford some protection to historical bowhead whale habitats, although more suitable bowhead whale habitat is present to the north in Roes Welcome Sound. All Project vessels along the shipping route will maintain a minimum distance of 2 km from Marble Island in order to avoid disrupting sensitive marine species located on or around the Island.

Ecologically and Biologically Significant Areas

DFO has identified a number of Arctic Ecologically and Biologically Significant Areas (EBSAs) in Hudson Bay and Hudson Strait using criteria from the Convention on Biological Diversity (Cobb 2011). These areas have been previously identified as important in ecosystem overviews, stock status reports, and traditional knowledge studies. Those EBSAs in the Hudson Bay Complex biogeographic region that overlap with the proposed shipping corridor are described below and illustrated in Figure B-24:

Southampton Island (including Coats Island) (EBSA 1.5)

- Largest island in Hudson Bay and situated near the confluence of Hudson Bay and Foxe Basin waters resulting in dynamic oceanographic mixing, and high marine productivity.
- Summer and winter use by the Northern Hudson Bay-Davis Strait population of Atlantic Walrus (Special Concern under COSEWIC).
- The waters surrounding Southampton Island are important spring and fall migration routes for beluga whales (Endangered under COSEWIC) and EC-WG bowhead whales (Special Concern under COSEWIC).
- Important nesting areas occur on Coats Island for seabirds (thick-billed murre, common eider, and black guillemot), which feed on aggregations of marine fish (e.g., capelin and Arctic cod) (Mallory and Fontaine 2004). The largest single colony of common eider in Nunavut occurs in East Bay.
- Southampton, Coats, and Mansel islands also are considered important denning and summer refuge habitat for the Foxe Basin polar bear population. Polar bears also frequent the land-fast ice adjacent to the islands in winter.
- Data confidence for this area is high due to intensive marine bird studies, tagging and survey data for marine mammals, and published IQ. The Southampton Island area scores high for several EBSA criteria.

Western Hudson Bay (Whale Cove to Arviat) (EBSA 1.6)

- Important area for beluga, killer whale, seabirds and Arctic char.
- Dense kelp beds occur along the coastline and provide important habitat for fish in the area.
- Area supports a wealth of LEK and TEK from the communities of Whale Cove, Rankin Inlet, and Arviat on the importance of marine mammals and fish (DFO 2011a).
- Important Arctic char stocks exist in this area and use the marine environment for feeding.

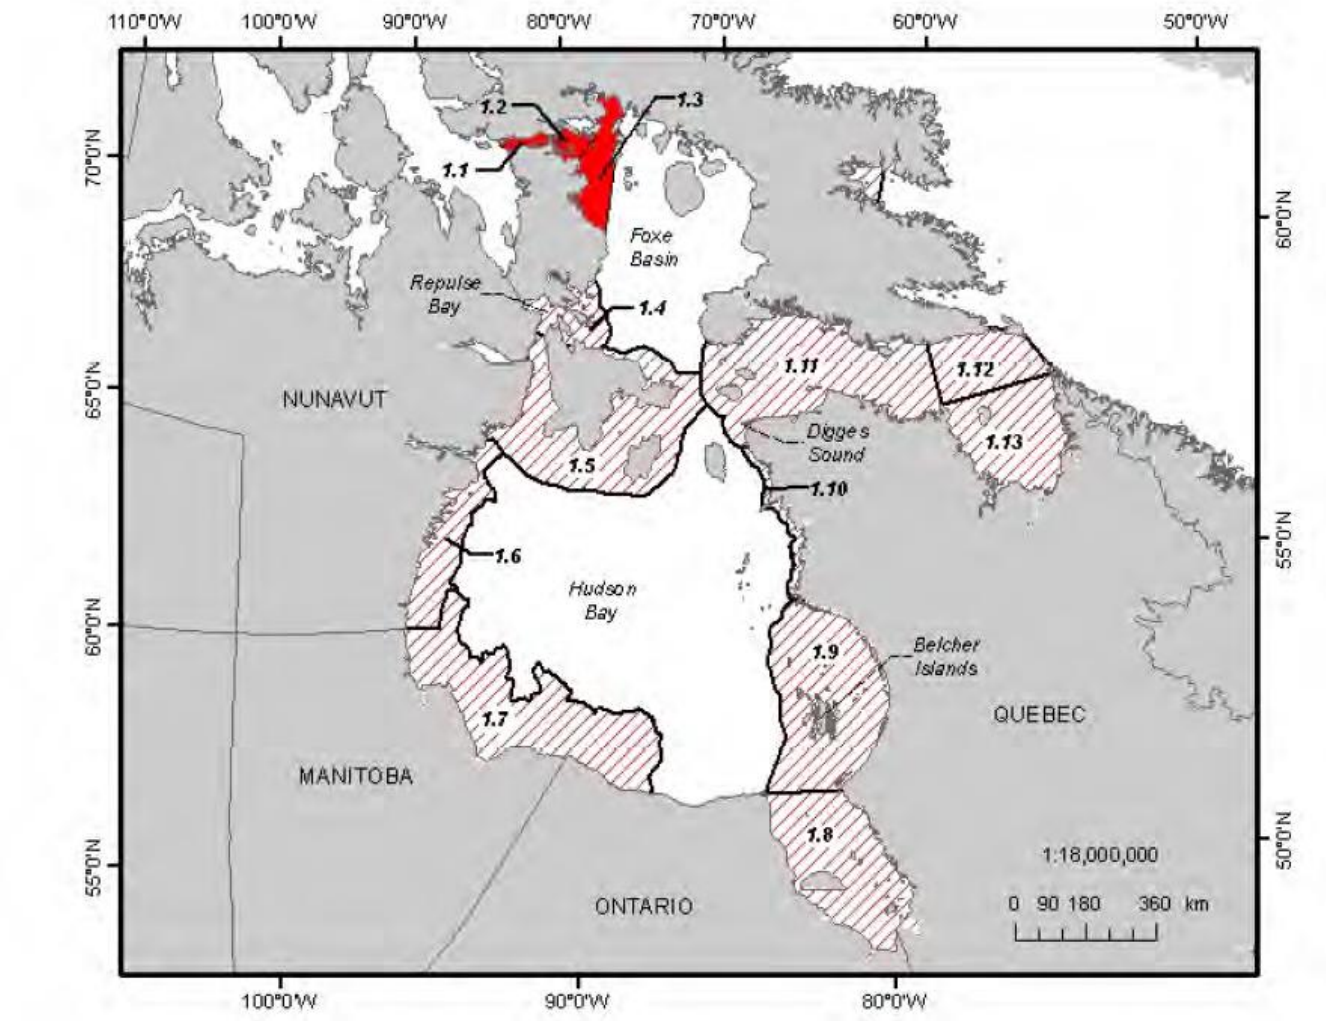

Figure B-24: Preliminary EBSA Identification Results for Foxe Basin (in solid red; 1.1 to 1.3) and for Hudson Bay / Hudson Strait (in red hatched lines; 1.4 to 1.12) as Determined Through a Series of Workshops Conducted in 2009 (DFO 2010b) (extracted from Cobb 2011)

Western Hudson Bay/Churchill/Nelson/Seal Estuaries (EBSA 1.7)

- The Nelson and Churchill estuaries provide an important habitat for a number of marine mammals and fish including the world's largest summer aggregation of beluga whales (Endangered under COSEWIC). Up to 3000 beluga whales congregate annually in the Nelson River estuary, with smaller numbers in the Churchill River estuary, to rear young and feed in these waters. Although the reason for these aggregations is not known, 2 commonly reported hypotheses are 1) thermal advantage from warm freshwater to initiate moulting; and 2) an evolutionary adaptation to take refuge from predation by killer whales in the shallow estuaries. Aggregations of approximately 70 000 beluga whales in this area are important for population fitness consequences.

- The Churchill region represents a key denning, feeding, and point of mobilization for Western Hudson Bay polar bear, which head north along the newly formed sea-ice to hunt ringed seal during fall/winter.
- A high degree of certainty exists for biophysical data available for this area due to Manitoba Hydro EIA Projects on the Nelson and Churchill rivers, as well as ongoing studies investigating the effects of climate change on marine mammals.
- The Seal River estuary was identified in 1999 as an Important Bird Area and is globally important for migrating black scoter.
- The Seal River is a Canadian Heritage River and remains a pristine, high-grade, remote wilderness river. It is the largest remaining undammed river in northern Manitoba. Harbour seals travel considerable distances up the Seal River estuary, representing an important adaptation to the freshwater environment by a marine mammal.
- The Province of Manitoba has designated a number of legally protected and managed lands, and identified Areas of Special Interest (candidate protected areas) along the Manitoba coastline for various ecological and biological reasons.
- Five internationally recognized Important Bird Areas have been identified along this part of Hudson Bay.
- Wapusk National Park and the provincially designated Churchill Wildlife Management Area, which extends to the Manitoba border and protects one of the world's largest known polar bear maternity denning areas. This national park also protects important caribou habitat. Similarly, the Kaskatamagan Wildlife Management Area (provincial designation) was established to protect the fragile coastal and tundra ecosystems and to protect important habitat for a number of bird species. The Churchill Special Conservation Area, designated to conserve and protect the Ross's gull, is also an integral part of the primary polar bear migration corridor in Manitoba.
- Hubbart Point, located north of the Seal River estuary, is an aggregation area for older male polar bears during the ice-free season. Beluga whales also congregate in waters off Hubbart Point, which is part of the North Hubbart Area of Special Interest.

West and Central Hudson Strait (EBSA 1.10):

- Serves as a key channel for Arctic waters via Foxe Basin, the outflow of Hudson Bay water, and also periodic intrusions of Atlantic water into northeastern Hudson Bay.
- Major seasonal migration route for all marine mammals that spend the summer in Hudson Bay and Foxe Basin and winter in either Hudson Strait or Davis Strait, including beluga whale, narwhal, and bowhead whale. The use of Hudson Strait by migrating marine mammals has been well documented through tagging studies and IQ.
- Walrus spend winters in west and central Hudson Strait on ice flows and on islands, such as Nottingham and Salisbury, where strong currents maintain open water. Walrus also overwinter on the northern shore of Hudson Strait near Kimmirut.
- Productivity is higher in West and Central Hudson Strait than Foxe Basin or Hudson Bay.

Support a number of important seabird nesting and feeding areas that occur on the northern and southern shores. Twenty percent of the North American population of thick-biller murres and a small colony of Atlantic Puffins are found near the Digges Sound and 10% of the Canadian population of common eiders breed and feed near Markham Bay (Mallory and Fontaine 2004).

- Physical oceanography in this EBSA has been well studied as part of long-term studies on Arctic flow-through.

Eastern Hudson Strait (EBSA 1.11):

- Heavily influenced by oceanographic conditions from Davis Strait resulting in high productivity.
- Important area for shrimp - Canadian Shrimp Fishing Area 3 occurs near Northern Ungava Bay eastward to Resolution Island.
- Supports western extent of Greenland halibut habitat.
- Provides significant overwintering refuge for Hudson Bay beluga whales and approximately 5000 to 8000 bowhead whales during winter.
- Support important occurrences of cold water corals in the deeper waters of the strait (Kenchington et al. 2011).

Ungava Bay (EBSA 1.12):

- Support Ungava Bay beluga whale stock, which has been reduced to as few as approximately 50 animals and may be extirpated (presently listed as Endangered under COSEWIC).
- Support important occurrences of corals in the deeper waters of the bay (Kenchington et al. 2011).
- Support 2 large colonies of thick-billed murre on Akpatok Island (Mallory and Fontaine 2004). Collectively, these colonies constitute the largest number of breeding thick-billed murre in Canada (>20% of the Canadian population). Black guillemots also nest along the Akpatok Island coast.
- A large portion of the breeding population of common eiders aggregate on the islands off the western shore of Ungava Bay. Key nesting sites occur at the Eider, Plover, Payne, and Gyrfalcon islands and the islands of northeastern Ungava Bay.
- Approximately 80 to 100 polar bear (~5% of the Davis Strait population) den and rear cubs along the southern shore of Akpatok Island during summer.

National Parks

To date, Parks Canada has established 2 National Parks in the Hudson Bay marine ecosystem: Wapusk and Ukkusiksalik (Stewart and Lockhart 2005). Wapusk National Park, established on 24 April 1996, is situated east of Churchill and protects an area of 11 475 km^2 that extends southward from Cape Churchill. Resources within the boundaries of the park are of national and international importance, including one of the world's largest known polar bear denning areas, and vital habitat for hundreds of thousands of waterfowl and shorebirds that nest along the coast of Hudson Bay or gather and feed there during the annual spring and fall migrations

(Stewart and Lockhart 2005). Park management is overseen by a board with representatives from the federal and provincial governments, the municipality of Churchill, and the First Nations of Fox Lake and York Factory. Ukkusiksalik National Park, established on 23 August 2003, extends westward from Roes Welcome Sound to include Wager Bay and the Brown and Piksimanik rivers, encompassing an area of 23 500 km^2 (Stewart and Lockhart 2005). Inuit residents from the Kivalliq communities, including Chesterfield Inlet, use this area for subsistence hunting and fishing.

Parks Canada also has identified several marine regions in arctic Canada within which it plans to recognize as Natural Areas of Canadian Significance. Two of the Natural Areas of Canadian Significance overlap with the proposed RSA, including Hudson Bay and Hudson Strait (Stewart and Lockhart 2005). The National Marine Parks Policy guides this process. Each area is intended to represent the natural, historical, and cultural diversity within a region. While National Marine Parks have yet to be established in northern Canada, Parks Canada has sought advice on which areas might make the best and most representative marine parks in the Hudson Bay and Hudson Strait marine regions. In Hudson Bay, Stewart et al. (1991) recommended 2 areas to Parks Canada for consideration as national marine parks – the Churchill-Nelson area and the Rankin Inlet-Marble Island area.

The Churchill-Nelson area was recommended for consideration as a National Marine Park prior to the establishment of Wapusk National Park, with the primary goal to protect the summer resident population of beluga whales in the Nelson, Churchill, and Seal rivers estuaries (known as the largest concentration of beluga whales in the world) (Stewart and Lockhart 2005). Other important physical, biological, and human use characteristics of this area include 1) extensive low-lying marshy coastal plains with wide tidal mud flats; 2) large estuarine habitats of the Churchill and Nelson rivers; 3) exceptional autumn concentrations of polar bears on the islands and headlands near Cape Churchill; 4) breeding shorebirds and waterfowl including the common eider; and 5) pre-historical coastal cultures, historical ports of entry instrumental in the exploration and development of central Canada, and the region's only deep water port for international shipping (Stewart and Lockhart 2005).

As noted earlier, the Rankin Inlet-Marble Island area was recommended as a National Marine Park to conserve and protect several key ecological and cultural features in this area (Stewart et al. 1991). The area of Hudson Strait immediately northeast of the Hudson Bay marine region was recommended as the most representative candidate for consideration as a future national marine park in the Hudson Strait marine region (DFO 2005b).

Migratory Bird Sanctuaries

Environment Canada's Canadian Wildlife Service (EC-CWS) has established 11 migratory bird sanctuaries in Nunavut to control and manage areas of key importance for the protection of migratory bird species and their habitat (Stewart and Lockhart 2005). Three of these sanctuaries occur within, or in the vicinity of, the proposed RSA: the McConnell River Migratory Bird Sanctuary south of Arviat, and the Harry Gibbons and East Bay Migratory Bird Sanctuaries on the southeast coast of Southampton Island. Both areas include terrestrial, wetland, and marine habitats, with the latter typically consisting of nearshore foraging areas for migratory birds. The Migratory Birds Convention Act prohibits activities in Migratory Bird Sanctuaries. Canadian Wildlife Service manages the activities that can be carried out within these areas. Prohibitive measures are placed on what activities can occur in these areas, as outlined in the Bird Sanctuary Regulations. Although important fish habitat could be protected through migratory bird sanctuaries, it is not an effective measure unless there is valuable bird habitat associated with the area that coincides with important or critical fish habitat.

The McConnell River Migratory Bird Sanctuary, established in 1960 to protect a small colony of lesser snow geese, encompasses 32 800 hectares (ha) along the west coast of Hudson Bay south of Arviat. This sanctuary is owned by the Coastal Inuit of Nunavut and subject to co-management agreements under the Nunavut Land Claims Agreement (Stewart and Lockhart 2005). Subsistence hunting and fishing activities presently occur within the sanctuary, mostly by community members of Arviat. In 1982, under the terms of the Ramsar Convention, the sanctuary was designated as a "Wetland of International Importance especially as Waterfowl Habitat" (Ramsar Site 248) because it provided major nesting habitat for multiple migratory bird species including Canada geese, lesser snow geese, and Ross's goose. Up to 200 000 birds colonize this sanctuary on an annual basis, with habitat degradation presently occurring due to a local increase in the snow goose population (Stewart and Lockhart 2005).

The Harry Gibbons Migratory Bird Sanctuary is located on Southampton Island in northern Hudson Bay, encompassing extensive tidal flat and wetland habitat areas along the Boas River delta and associated estuarine environment in the Bay of God's Mercy. This area supports large nesting colonies of lesser snow goose (population >500 000 birds in 1997), Atlantic brant, Canada goose, and tundra swan (Stewart and Lockhart 2005). Smaller breeding colonies of migratory birds are located outside the sanctuary at Ell Bay and Bear Cove (Stewart and Lockhart 2005).

The East Bay Migratory Bird Sanctuary is located on Southampton Island near the community of Coral Harbour. Established in 1959, this area encompasses 113 800 ha including marine, intertidal, and subtidal components. Notable bird species include Arctic tern, Atlantic brant, lesser snow goose, Canada goose, common and king eider, black guillemot, jaeger, herring and Sabine's gull, red knot, red phalarope, red-throated loon, ruddy turnstone, and several species of plover and sandpiper.

Important Bird Areas

Important Bird Areas (IBAs) are sites recognized as being globally important habitat for the conservation of bird populations, as designated by Bird Studies Canada, Nature Canada, and Birdlife International (Birdlife International 2012), an international bird protection organization. Collectively, these organizations support the international conservation of discrete sites that provide habitat for threatened birds, large groups of birds, and birds restricted by range or by habitat. Three Important Bird Areas occur within, or in the vicinity of the RSA; including Harry Gibbons and East Bay Migratory Bird Sanctuaries (sites #NU022 and #NU023 respectively) on Southampton Island, and McConnell River Migratory Bird Sanctuary south of Arviat.

International Biological Programme

In 1975, the International Biological Programme recognized a number of areas of biological, geological, and historical importance in northern Canada that were in urgent need of special protection (Nettleship and Smith 1975). Several of these areas, which have since been offered protection, and which occur within or in the vicinity of the RSA, include McConnell River (McConnell River Migratory Bird Sanctuary), and Boas River (Harry Gibbons Migratory Bird Sanctuary). Other areas near the RSA that have been identified as International Biological Programme sites but are not yet protected include Coats Island and Digges Islands. Coats Island is located northeast of Southampton Island. Digges Islands (West and East) are located in Digges Sound, at the northwest tip of the Ungava Peninsula in Western Hudson Strait. Both areas support key terrestrial habitats for migratory birds and seasonal habitats for several marine mammal species (Nettleship and Smith 1975).

Key Marine Habitat for Migratory Birds

EC-CWS has established 'key marine habitat' sites for migratory birds located near the proposed shipping route. Some of these sites overlap with existing protected/sensitive areas such as migratory bird sanctuaries designated by EC-CWS, IBAs, and/or International Biological Program sites. These areas were primarily established to protect terrestrial or coastal resources for marine birds. 'Key marine habitat' sites designated by EC-CWS aim specifically to identify important marine habitat areas for marine avifauna. Not all of these sites are protected under legislation; however, as local knowledge increases regarding habitat use and the overall importance of these sites to marine birds, legal protection status may follow. Generally, these areas are used by marine birds from late April through September. Additional details on the key marine habitat sites for migratory birds located near the proposed shipping route are summarized in Table B-6 and FigureB- 8 (adapted from Mallory and Fontaine 2004).

Table B-6: Environment Canada Key Marine Habitat Sites for Migratory Birds Located Near the Proposed Shipping Route

Site Name	Sensitivities	Biological Significance	Status	Size (km^2)		Distance from shipping lane (km)
				Marine	Land	
Coats Island near Cape Pembroke	Sensitive to disturbance of important nesting sites along coast, important foraging grounds and staging / breeding areas in the marine environment, and key migratory corridors. Concerns around increases in vessels in the area coming close to Coats and Walrus islands.	Important nesting areas occur on Coats Island for seabirds (thick-billed murre, common eider, and black guillemot), which feed on aggregations of marine fish (e.g., capelin and Arctic cod). Glaucous gull and peregrine falcon can be found along the cliffs at the colonies. Home to a large Iceland gull (*Larus glaucoides*) colony and the largest single colony of common eider in Nunavut occurs in East Bay.	International Biological Programme site (Region 9, Site No. 6-3) and an IBA (NU005).	1918	0	Overlaps
Digges Sound	Sensitive to disturbance of important nesting sites along coast, important foraging grounds and staging / breeding areas in the marine environment, and key migratory corridors. Concerns around increases in vessels in the area. Colonies are considered to be some of the most disturbed by human activities in the Canadian Arctic.	20% of North American population of thick-billed murre and a small colony of Atlantic puffin (*Fratercula arctica*) and razorbill (*Alca torda*) occur near Digges Sound. 10% of the Canadian population of common eider breed and feed near Markham Bay. Other species that also breed here are black guillemot, glaucous gull, Iceland gull, herring gull, and Arctic tern.	International Biological Programme site (Region 9, Site No. 6-7) and an IBA in Canada (NU001).	2207	102	~3

Table B-6: Environment Canada Key Marine Habitat Sites for Migratory Birds Located Near the Proposed Shipping Route

Site Name	Sensitivities	Biological Significance	Status	Size (km²)		Distance from shipping lane (km)
				Marine	Land	
Frobisher Bay	Sensitive to disturbance of important nesting sites along coast, important foraging grounds and staging / breeding areas in the marine environment, and key migratory corridors. Concerns around increases in vessels in the area and potential hydrocarbon exploration. The complex nature of currents in the region suggests that a potential oil spill in southern Davis Strait could not reach this marine area.	Colony of 3% of Canadian thick-billed murre population. Glaucous gull, black-legged kittiwake, and possibly Northern fulmar breed here. Nearby Loks Land is thought to support Nunavut's largest known colony of razorbill (not been visited since 1953). Dovekies congregate off the Hall Peninsula in August. An important nesting, feeding, and migration stop-over for common eider, Iceland gull, ivory gull, and harlequin duck (*Histrionicus histrionicus*). Canada goods and long-tiled ducks may also be found here.	Hantzsch Island is an International Biological Programme site (Region 9, Site No. 7-10) and a Canadian IBA (NU025).	12442	1336	Overlaps
Button Islands	Sensitive to disturbance of important nesting sites along coast, important foraging grounds and staging / breeding areas in the marine environment, and key migratory corridors. Concerns around increases in vessels in the area and potential hydrocarbon exploration. The complex nature of currents in the region suggests that oil spills in southern Davis Strait could enter this marine area. Oil spills associated with shipping could endanger a large number of marine birds and pollute their feeding areas.	Black-legged kittiwake and northern fulmar forage near the Button Islands. Ivory gulls and common eider have been observed. Thick-billed murre breed here.	International Biological Programme site (Region 9, Site No. 6-8).	3909	81	Overlaps

Table B-6: Environment Canada Key Marine Habitat Sites for Migratory Birds Located Near the Proposed Shipping Route

Site Name	Sensitivities	Biological Significance	Status	Size (km^2)		Distance from shipping lane (km)
				Marine	Land	
Akpatok Island	Sensitive to disturbance of important nesting sites along coast, important foraging grounds and staging / breeding areas in the marine environment, and key migratory corridors - particularly for murres. Shoreline around Akpatok Island is considered to be "high hazardous risk of oil spills". Concerns around increases in vessels in the area and potential hydrocarbon exploration. The complex nature of currents in the region suggests that oil spills in southern Davis Strait could reach this marine area. Oil spills associated with shipping could endanger a large number of marine birds and pollute their feeding areas.	Large breeding colony of thick-billed murre. Black guillemots also nest along the Akpatok Island coast. Black guillemot nest along the island's coast. Peregrine falcon and glaucous gull also breed here.	Biological Programme site (Region 9, Site No. 6-6) and an IBA in Canada (NU007).	4943	859	82
Ungava Bay Archipelagoes	Sensitive to disturbance of important nesting sites along coast, important foraging grounds and staging / breeding areas in the marine environment, and key migratory corridors.	Support a large portion of breeding common eider. Eider occur in this area from April through October	The Plover and Payne, Gyrfalcon, and north eastern Ungava Bay islands are Canadian IBA (NU027, NU028, NU029).	5624	5	93
Sleeper Islands	Degradation of staging and foraging areas, particularly for eiders. Potential hydrocarbon exploration. Prevailing west and north west winds render the east coast of the Bay most susceptible to oil damage.	Common eiders nest here in the summer months. Over 30 species of birds have been observed in the Sleeper Islands.	IBA site (NU033).	1880	90	536

Table B-6: Environment Canada Key Marine Habitat Sites for Migratory Birds Located Near the Proposed Shipping Route

Site Name	Sensitivities	Biological Significance	Status	Size (km^2)		Distance from shipping lane (km)
				Marine	Land	
Belcher Islands	Degradation of staging and foraging areas, particularly for eiders. Excessive harvest of down from breeding colonies. Potential hydrocarbon exploration. Prevailing west and north west winds render the east coast of the Bay most susceptible to oil damage.	Common eider nest here in the summer. In the winter, polynyas and the floe edge support substantial numbers of common eider and long-tailed duck.	The North Belcher and South Flaherty islands are Canadian IBA (NU031, NU100).	5 to 15 recurrent, small polynyas		680
Northern Ontario Coastline	Degradation of staging and foraging areas, particularly for ducks. Potential hydrocarbon exploration.	Black scoter moult along this marine area feeding on blue mussels and other molluscs. Common eiders are year-round residents. Canada geese and lesser snow geese make use of coastal areas.	Waters in James Bay are part of the James Bay Preserve.	7860	41	607
Markham Bay	Disturbance and sensitivity to potential pollution of foraging, staging and migrating areas.	Support a large portion of breeding common eider. Support substantial numbers of Kumlien's gull (*Larus glaucoides kumlieni*) colonies and black guillemot. Eiders occur in this area from April through October.	No special designation.	4015	423	58
East Bay	Disturbance and sensitivity to potential pollution of foraging, staging and migrating areas.	Supports Arctic Canada's largest single colony of common eider. Supports colony of black guillemot and a large population of lesser snow goose. Substantial numbers of Atlantic brant and Sabine's gull also breed here. Supports some of the highest known breeding densities of shorebirds in the eastern Arctic. Red phalarope are the most common shorebirds.	Migratory Bird Sanctuary and a Canadian IBA (NU023).	274	1	84

Areas of High Biological Importance

Fisheries and Oceans Canada sponsored an Arctic Marine Workshop to bring together expert knowledge on marine fauna and habitat use in the Canadian Arctic (Stephenson and Hartwig 2010). The objective of the workshop was to identify overlapping areas of habitat use by different Arctic species, and, therefore, areas of High Biological Importance (HBI) to wildlife. In total, 19 HBI were identified; 3 of these occur within, or in the vicinity of, the proposed RSA including Southampton Island, Chesterfield Inlet, and Hudson Strait. The Southampton Island HBI extends from Cape Bylot to Ell Bay and includes the north and west coasts of Coats Island. This area provides important habitat for several species of seal, walrus (including an overwintering area), and numerous marine bird species. It also provides key denning habitat for polar bears and important foraging grounds for bowhead whales. The Chesterfield Inlet HBI consists of the Hudson Bay coast from Whale Cove to Arviat. This area provides key habitat for beluga whales, killer whales, several species of seal, Arctic char, and several seabird species along the coast. The Hudson Strait HBI, which includes Akpatok, Salisbury, and Nottingham Islands, has been identified as being amongst the most productive areas in the Arctic (Stephenson and Hartwig 2010), supporting several large seabird colonies along the coast, key shrimp habitat, and important overwintering areas for several marine mammals including narwhal, beluga whale, and walrus. This area is known to be more productive than Hudson Bay due to an increased level of surface mixing and a large tidal exchange. The ice edge, which extends the length of the Strait during winter, is also considered dynamic habitat for numerous Arctic marine species.

Bowhead Whale Critical Habitat Areas

Wheeler et al. (2012) investigated critical summer and fall habitat for bowhead whales in the eastern Canadian Arctic by performing a monthly ecological niche factor analysis for 3 bowhead whale spatial datasets in contrast to concurrent eco-geographical variable datasets (including sea surface temperature, chlorophyll, ice cover, water depth, slope, and distance to shore) to determine overall bowhead whale habitat suitability in this region. The study produced 11 habitat suitability models, and resulted in the development of a composite map of predicted high suitability habitat for the months of June to October. In total, 21 discrete areas were identified (with low confidence) within the Eastern Canadian Arctic as ‘critical habitat’ during the open-water season (Figure B-25). Of these, 9 (Areas 13, 14, 15, 16, 17, 18, 19, 20, and 21) were located within, or in the vicinity of, the proposed RSA or shipping corridor between Rankin Inlet and eastern Hudson Strait. Coastal Inuit knowledge (referred to as Inuit Qaujimajatuqangit or IQ – see Figure B-26) supported the identification of critical habitat in northwest Ungava Bay (Big Island; Area 15). Aerial surveys (Cosens and Innes 2000) and telemetry studies (Dueck et al. 2006) supported the identification of critical habitat near Southampton and Coats islands (Area 20). There was no corroborating IQ or scientific evidence to support other identified critical habitat in northern Hudson Bay, Hudson Strait, and Labrador (Areas 13 to 15, 18, and 19). This may be due to bowhead whales no longer frequenting these areas, or population surveys and IQ studies were not conducted in these areas.

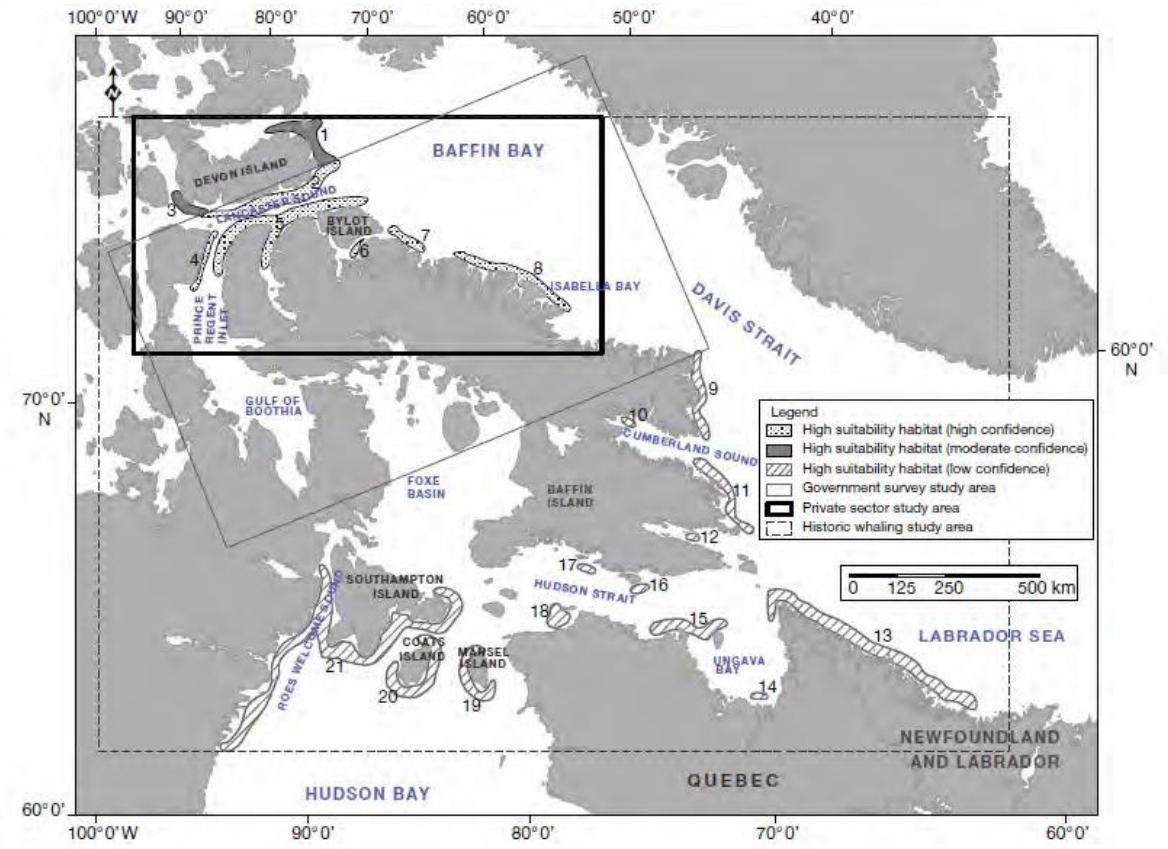

Figure B-25: Discrete Areas of Highly Suitable Bowhead Whale Habitat Identified for 3 or More Months from June to October in the Eastern Canadian Arctic (by analytical confidence) Produced by Ecological Niche Factor of 3 Bowhead Location Datasets and Associated Eco-Geographical Variables (extracted from Wheeler et al. 2012)

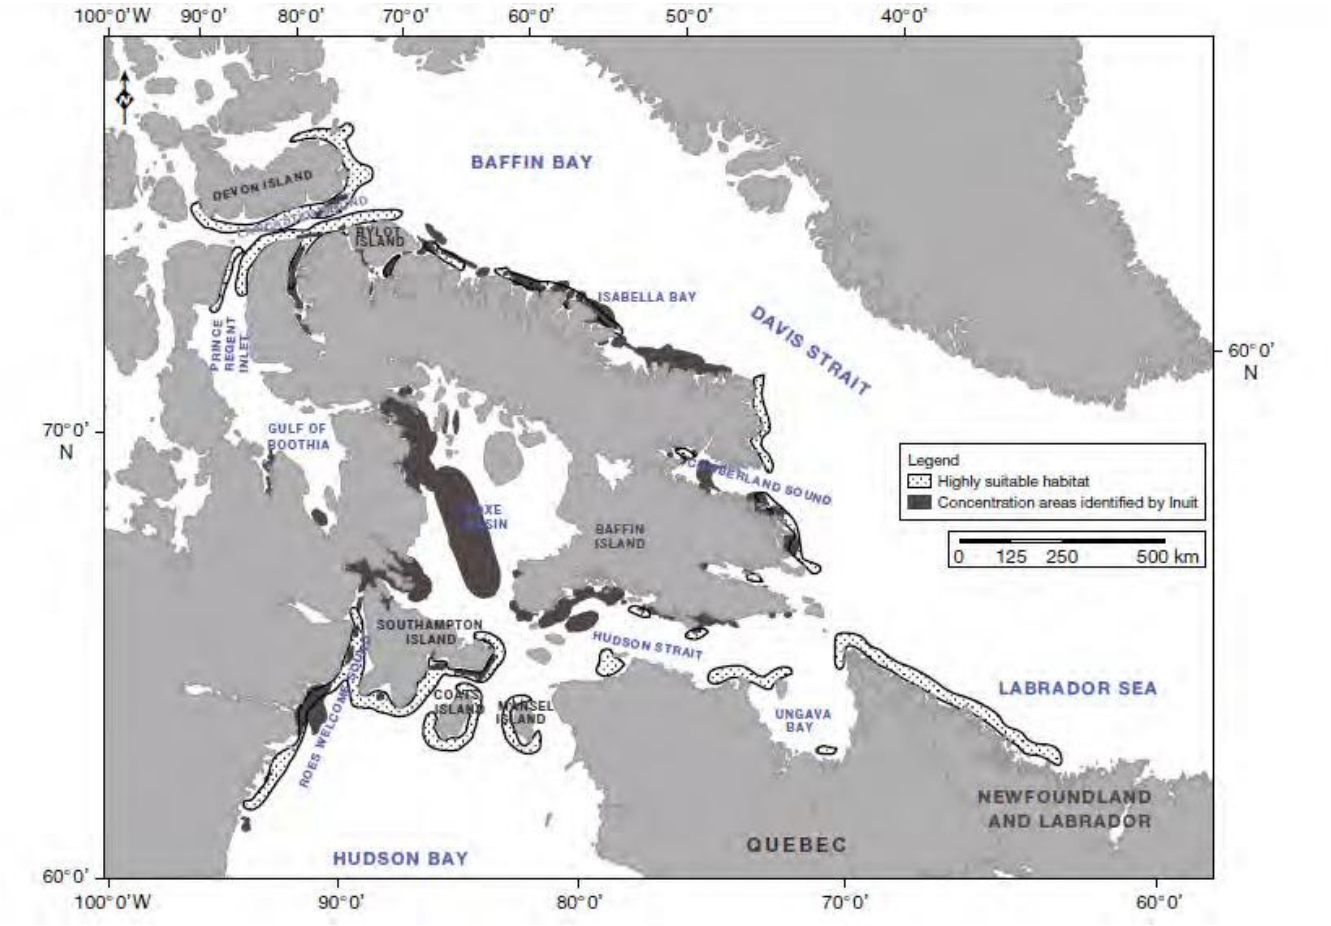

Figure B-26: Comparison of Highly Suitable Bowhead Whale Habitat Predicted by Ecological Niche Factor Analyses with Bowhead Concentration Areas Identified by Inuit in Nunavut, Canada, in Late Spring, Summer, and Early Fall (adapted from NWMB 2000 and Wheeler et al. 20

1.4 Traditional Knowledge

Sources of IQ for marine wildlife included the following:

- IQ studies conducted by Nanuk Enterprises in 1997 and 1998 in Rankin Inlet and Chesterfield Inlet. The results of these studies are summarized in FEIS Volume 9, Section 9.3;
- IQ studies conducted by Nanuk Enterprises in 2010-2011 in Rankin Inlet, Chesterfield Inlet, and Whale Cove. The full report is included as FEIS Volume 9, Appendix 9.3-A and summarized in FEIS Volume 9, Section 9.3;
- Interview conducted on 15 July 2011 by Nunami Stantec in Rankin Inlet with representatives from the Kangiqliniq Hunters and Trappers Organization. The full report is included as Appendix 8.2-A of the FEIS;
- IQ studies conducted by Nanuk Enterprises / Outcrop Ltd. during 2012, consisting of interviews with local hunters, fishers, tour operators, and experienced seamen representing the communities of Rankin Inlet,

Chesterfield Inlet, and Whale Cove. The 2012 interviews focused on marine resources along the proposed shipping route through Hudson Bay and the marine approaches to Rankin Inlet. The full report is included as FEIS Volume 9, Appendix 9.3-C and summarized in FEIS Volume 9, Section 9.3; and

- A literature review of the Nunavut Atlas (Canadian Circumpolar Institute 1992) and the Inuit Land and Occupancy Project (Freeman and Murty 1976) conducted by Golder in 2012 summarizing historical Traditional Resource Use (TRU) in the Rankin Inlet region and surrounding communities as described in FEIS Volume 9, Section 9.3.

Collectively, these studies identify the following main points of interest with respect to traditional resource use and traditional knowledge in the Project area:

- Itivia is commonly used by local community members for small boat operations including boat mooring and launching. The location of the proposed landing barge corresponds with the only navigable area at Itivia during a low tide;
- Arctic char represent an important food species for the local community and are mainly harvested during August in the Rankin Inlet region. Some residents also participate in the commercial Arctic char fishery, which occurs approximately 40 to 50 km (25 to 30 miles) outside Rankin Inlet, although it occurred closer historically. Other fish species locally harvested in the Project area (in marine waters) include sculpin, cod, capelin, whitefish, and trout;
- Hunting and fishing in Melvin Bay is thought to be less productive today than in the past (1960s and 1970s), a factor potentially linked to recent increases in local vessel traffic in the bay;
- Marine mammal species harvested in the Rankin Inlet region include the following:
- Beluga whales - hunted during the open-water season (primarily in August and September) – mainly near Marble Island. Most individuals summer near Churchill and migrate north along the west coast of Hudson Bay beginning in late August. Some individuals overwinter in polynya areas (when ice conditions allow) in northwestern Hudson Bay, Roes Welcome Sound, and Hudson Strait;
- Walruses – uncommon in Rankin Inlet in recent years, this species is hunted year-round in areas north of Marble Island. During summer and winter, large numbers of walruses haul-out on Bencus, Coats, Walrus, and Southampton islands;
- Polar bears – hunted primarily during winter on the sea-ice. Hunting is based on a quota system, which was lowered for the WHB sub-population during the 2010-2011 harvest to 8 individuals due to concerns for the population size, and then raised to 21 individuals for the 2011-2012 quota following increased reports by community members of problem bears near the communities (GN 2011). Some individuals have been observed on Marble Island and swimming offshore during the summer months between the surrounding islands. There is some concern by community members that increased shipping in the area may result in adverse impacts on polar bears, including behavioural disturbance (active avoidance or displacement effects) and/or physical injury / mortality from potential ship strikes;

- Four species of seal (ringed, bearded, harp, and harbour) – hunted throughout the year (on sea-ice and in open-water), with ringed seals being the most commonly hunted species. Recent increases in the number of harp seals near Rankin Inlet may represent influx of animals from adjacent Chesterfield Inlet that have been displaced by increased shipping / icebreaking activities in this area;
- Hunters have expressed concern over the proximity of the shipping route to Marble Island and potential effects of shipping on marine mammal distribution / migration, and hunting activities in this area. However, the implementation of a 2 km buffer (exclusion zone) around Marble Island for all Project vessels is deemed sufficient to mitigate these concerns;
- Narwhals and bowhead whales are not an important subsistence species for the Rankin Inlet community and are uncommon in the Rankin Inlet area. Narwhals summer north of Rankin Inlet in Daly Bay, Roes Welcome Sound, and Foxe Basin and winter in pack-ice regions of eastern Hudson Strait and Davis Strait. Bowhead whales are occasionally observed near Repulse Bay, Frozen Strait, Southampton Island, and Chesterfield Inlet;
- Hudson Strait is considered an important migratory corridor for marine mammals (beluga whales, narwhals, bowhead whales, and harp seals) transiting between Davis Strait / Labrador Sea and Hudson Bay / Foxe Basin. The critical migratory periods are early summer (June) and fall (late August to October). Proposed shipping activities for the Project coincide with the fall migratory period;
- Killer whales appear to be increasing locally in number particularly near Marble Island, although this species is not traditionally harvested. Concerns have been raised regarding the potential effects of the increasing killer whale population on other marine mammals due to predation, particularly with respect to bowhead whales;
- Several marine bird species are known to forage and/or nest in the Project area, including eider ducks (common eiders), black guillemots, Arctic terns, and several species of gull. Most nesting periods fall outside the shipping season (open-water). Egg harvesting occurs in spring for goose, eider duck, tern, guillemot, and gull. Shorebirds and raptors are not harvested by Inuit. The number of marine birds in Melvin Bay in recent years is thought to have decreased;
- Locally harvested shellfish species include blue mussels and clams. Historically, shellfish harvesting occurred along the north shore of Melvin Bay. Today, the harvest mainly occurs outside the harbour due to related health advisories from the Department of Health and Social Services. Scallops collected from the stomachs of hunted walruses are highly regarded by elders;
- Seaweeds (marine vegetation) are not locally harvested in the Project area in Melvin Bay;
- With respect to climate change, several major changes have been observed over the past 20 years in Rankin Inlet and include later freeze-ups, shorter sea-ice periods, decreases in land-fast ice, greater uncertainty in weather conditions, higher frequency of severe storm events, decreases in marine mammals observed in July, and changes in the timing of moulting of ringed seals (occurring as early as April); and
- Rankin Inlet community members recognize 2 shipping routes for access to Rankin Inlet (see Maps 1 and 2 in FEIS Volume 9, Appendix 9.3-C). In the deep-water sections of the shipping corridor, the exact shipping routes are not marked and likely vary by several kilometres. Recent increases in local shipping activity have been linked to several large Projects in the region including Meliadine, Meadowbank, Kiggavik, Baffinland, and Roche Bay.

2.0 CLOSURE

APPENDIX C • RISK ANALYSIS OF MARINE TRANSPORTATION ROUTES

The approach used for the risk assessment draws on that of Areva for the Kiggavik Project[21].

A hazard is a condition with the potential to cause personal injury or death, property damage, environmental harm, or loss of service. Hazard severity along shipping and tug-barge routes can range from catastrophic resulting in fatalities and/or loss of the ship to minor where the incident does not significantly reduce ship safety and where mitigation measures are well within the crew's capabilities. A complete range of hazard severity is presented below in Table C-1.

Table C-1 Hazard Severity for Ship and Tug with Barge Routes

Hazard Severity and Rating Value	Definition
Catastrophic (Value 4)	Results in multiple fatalities and/or loss of the ship, tug or barge.
Hazardous (Value 3)	Reduces the capability of the ship or its operator's ability to cope with adverse conditions to the extent that there would be: • Large reduction in safety margin or functional capability; • Crew physical distress/excessive workload such that operators cannot be relied upon to perform required tasks accurately or completely; • Serious injuries to a small number of the crew; and • Possible fatality of one or more of the crew.
Major (Value 2)	Reduces the capability of the ship or its operators to cope with adverse operating conditions to the extent that there would be: • Significant reduction in safety margin or functional capability; • Significant increase in operator workload; • Conditions impairing operator efficiency or creating significant discomfort; • Physical distress to crew, including injuries; and • Major environmental damage, and/or major property damage.
Minor (Value 1)	Does not significantly reduce ship safety. Actions required by operators are well within their capabilities. Include: • Slight reduction in safety margin or functional capabilities; • Slight increase in workload such as routine ship navigation plan changes; • Some physical discomfort to the crew; and • Minor occupational illness and/or minor environmental damage, and/or minor property damage.

Likelihood ranges from probable where the incident is anticipated to occur one or more times in shipping and barge movements over the life of the Project, to extremely improbable where it is not anticipated to occur during the entire life-of-mine for the Project to any of the ships, tugs and barges contracted to AEM. Table C-2 provides a complete range of likelihoods.

[21] Areva. 2011. Kiggavik Project, Environmental Impact Statement, Marine Transportation, Tier 3 Technical Appendix 2J.

Table C-2 Likelihood of Mishap along Ship and Tug-Barge Routes

Likelihood and Rating Value	Definition
Probable (Value 4)	Qualitative: Anticipated to occur one or more times in ship or tug-barge operations over the life of the Project. Quantitative: Probability of occurrence per operational hour is greater than $1x10^{-5}$.
Remote (Value 3)	Qualitative: Unlikely to occur to each ship or tug-barge during its contract with the mine. May occur several times in the life of all ships and tankers for the life of the Project. Quantitative: Probability of occurrence per operational hour is less than $1x10^{-5}$ but greater than $1x10^{-7}$.
Extremely Remote (Value 2)	Qualitative: Not anticipated to occur to each ship or tug-barge while it is contracted by AEM during the life of the Project. May occur a few times in the life-of-mine to the ships and tankers contracted to AEM. Quantitative: Probability of occurrence per operational hour is less than $1x10^{-7}$ but greater than $1x10^{-9}$.
Extremely Improbable (Value 1)	Qualitative: So unlikely that it is not anticipated to occur during the entire life-of-mine for the Project to any of the ships and tankers contracted to AEM. Quantitative: Probability of occurrence per operational hour is less than $1x10^{-9}$.

The hazard severity value is multiplied by the likelihood value to determine the risk level. Table C-3 outlines the risk levels outcomes, which range from negligible to catastrophic.

Table C-3 Risk Levels

Severity and Value		Likelihood			
		Extremely Improbable	Extremely Remote	Remote	Probable
		1	2	3	4
Minor	1	1	2	3	4
Major	2	2	4	6	8
Hazardous	3	3	6	9	12
Catastrophic	4	4	8	12	16

Risk Levels 1-2 represent a negligible to low level of hazard to shipping. It does not significantly reduce the safety of the ship or tug-barge. Actions required by the ship's or tug's crew are well within their capabilities to avoid harm to the vessel, the crew and the environment.

Risk Levels 3-4 represent low to major risk. There is a significant reduction in the safety margin or functional capability of the ship or tug-barge. A great effort on the part of the crew will be required to avoid damage to the ship, major environmental effects and/or injuries to the crew.

Risk Levels 6-9 represent major to hazardous risk. The ship's or tug-barge's crew will have difficulty in coping with the adverse conditions to the extent the ship or tug barge will have a large reduction in its safety margin or functional capability, which could lead to serious injury to the crew and possible environmental harm.

Risk Levels 12-16 represent hazardous to catastrophic risk and is to be avoided. There could be fatalities, loss of the vessel, and/or major environmental harm.

Table C-4 Preliminary Risk Analysis of Tug-Barge and Ship Marine Routes

Preliminary Risk Analysis of Tug-Barge and Ship Marine Routes							
Hazard	Before Controls			Mitigation Measures	After Mitigation		
	Severity	Likelihood	Risk Level		Severity	Likelihood	Residual Risk
Tug-barge or ship runs aground	3	3	9	• Use electronic navigation aids; • Remain in shipping lanes; • Buoys within the near-shore islands; • Monitor adherence to standard operating procedures; and • One way traffic only in the access passage to Melvin Bay and Itivia harbour.	3	2	6
Loss of or damage to sea cans in heavy seas	2	3	6	• Lock sea cans to the deck; • Use appropriate stacking height for voyage; and • Slow tug tow speed in heavy seas.	2	2	4
Tug-barge or ship has mechanical failure	2	3	6	• Regular preventative maintenance schedule; • Maintain an inventory of critical parts on board; and • Have redundant critical systems.	2	2	4
Barge tow line breaks	2	3	6	• Have redundant tow line for safety purposes; and • Slow tow speed in heavy seas.	2	2	4
Collision or grounding of tugs between mooring location of large ships and Itivia harbour	3	4	12	• One way traffic only in the access passage to Melvin Bay and Itivia harbour; • Install Automatic Identification System on all tugs; and • Tugs proceed at a slower speed during low visibility periods.	3	2	6
Tug-barge or ship collides with a small boat from Rankin Inlet	2	3	9	• Education of public on use of shipping lanes; • Make public aware of incoming ships and tug-barge traffic in Melvin Bay; • Tugs-barge and ships proceed at a slow speed in periods of low visibility; and • Tug-barge and ships use horn in periods of heavy fog.	2	2	4
Tug-barge or ship sinks upon hitting ice	4	3	12	• Shipping is scheduled for open water; • Sail around ice; and • Slow vessel speed to avoid damage.	3	2	6

1.0 INTRODUCTION

Agnico Eagle Mines Limited (Agnico Eagle) plans to ship approximately 40,000 tonnes of dry cargo (equipment and supplies) and 122 million litres of diesel fuel annually for the operations of the Meliadine Gold Mine in Rankin Inlet, Nunavut (the Mine). To meet these needs, approximately 8 ships per year will be needed to deliver dry cargo and up to 4 additional ships per year to deliver fuel. All shipping will be carried out during the open water season (typically from early July to late October) and will follow recommended shipping routes that are presently in use for the annual sea lift to Rankin Inlet and other communities (Figure D-1 and Figure D-2). The Mine will not involve any ice breaking to extend the shipping season. This Marine Environmental Management Plan (MEMP) has been developed for the Mine to meet the Terms and Conditions of the Project Certificate related to shipping activities and potential marine spills. It should be considered a living document that can be updated throughout the Mine lifecycle in order to implement adaptive management techniques. Updates shall be made in consultation with the relevant regulatory agencies (e.g., DFO, CWS, and the Government of Nunavut) as appropriate.

The MEMP has been designed to provide protocols for conducting a vessel-based Marine Mammal and Seabird Observer (MMSO) program during all routine shipping activities in the Local and Regional Study Area (LSA and RSA) and for conducting monitoring of marine wildlife and their habitats (wildlife defined as mammals, fish, and birds - including upland birds, migratory birds, waterbirds, raptors, and seabirds) in the event of any Mine-related fuel spill in the RSA.

During routine shipping operations, Mine-specific mitigation measures designed to minimize Mine impacts on marine mammals and seabirds will be initiated by vessel-based MMSOs and implemented by the ship's crew. In the event of a spill, the shipping contractor will be responsible for retaining a qualified environmental professional (QEP)[1] to implement the wildlife monitoring framework described below. The MMSO will work with the QEP to provide on-site information as required.

Data collected by the MMSOs will provide information to the Government of Nunavut and other applicable regulators (e.g., Canadian Wildlife Service) regarding the location, behaviour, abundance, and species observed as well as any interactions with Mine vessels during shipping activities in the RSA.

[1] An applied scientist or technologist who is registered and in good standing with an appropriate professional organization constituted under an Act. The QEP must be acting under that association's code of ethics, and subject to the organization's disciplinary action. The QEP should have experience in the area of interested. In this case the area of interest includes marine spill response monitoring for marine mammals, birds fish and their habitats.

2.0 MARINE MAMMAL AND SEABIRD OBSERVER PROGRAM

2.1 Routine Shipping Operations

This section outlines the protocol for undertaking a vessel-based Marine Mammal and Seabird Observer (MMSO) program involving full-time marine wildlife monitoring during all routine shipping activities in the LSA and RSA (Figure D-1 and Figure D-2) in accordance with Project Certificate Condition 82, which states the following:

"The Proponent shall require all contracted shipping companies to provide full-time marine wildlife monitoring using trained observers and established data collection and recording protocols. Monitoring plans should include provisions for all Species at Risk Act (SARA) and for the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) listed species (birds and mammals)."

The seabird survey protocols were revised in February 2017 to include specific survey protocols for seabirds as laid out in Section 4.0 of the Eastern Canada Seabirds at Sea (ECSAS) standardized protocol for pelagic seabird surveys from moving and stationary platforms.

A review of relevant marine mammal survey protocols was also undertaken and the marine mammal survey protocols were revised based on the following guidance documents:

- Guidelines for Minimising the Risk of Disturbance and Injury to Marine Mammals from Seismic Surveys (JNCC 2010).
- Recommended seabird and marine mammal observational protocols for Atlantic Canada (Moulton and Mactavish 2004)

The MMSOs will record marine mammal and seabird observations based on the protocols presented below through the LSA and RSA (Figure D-1 and Figure D-2). Datasheets outlined in Attachment A and Attachment B and daily reports outlined in Attachment C will be completed throughout the transit, copied for backup purposes and provided to Agnico Eagle upon arrival in Rankin Inlet or, when transiting from Rankin Inlet, will be provided as online communications allows, once the vessel has exited the RSA. Additional reporting requirements in the event of a spill are outlined in Section 2.2.1.5.

2.1.1 Observer Qualifications and Training

Appropriately qualified MMSOs should be selected based on their knowledge and experience with the MMSOs protocols laid out below. Previous wildlife observation field experience will be considered an asset during the MMSO selection process. Depending on the level of experience of the selected MMSO, a MMSO training session(s) will be considered and will be completed by qualified/certified marine wildlife observers with previous arctic wildlife monitoring experience. The training, if required, will review the monitoring protocols outlined below and provide instruction on how to spot and identify marine mammal and seabird species.

Primary objectives of the training will could include the following, dependent on the expertise of the MMSOs:

- Role and responsibilities of MMSOs;
- Review of the MEMP including mitigation measures;
- Health, Safety, and Environment;

- Review of marine mammal and seabird species identification (including upland birds (including migratory birds), waterbirds, raptors, as well as seabirds) observation, identification, and distance estimation methods;
- Review of operation of MMSO equipment (reticle binoculars, GPS system);
- Distances estimation techniques for various scenarios (reticle binoculars, no horizon);
- Review of, and classroom practice with, data recording and data entry; and
- Reporting templates and requirements.

2.1.2 Program Protocol

Mitigation measures outlined in Section 4.2 of the Shipping Management Plan will be implemented during all Mine shipping activities by the shipping contractor(s). MMSOs will not be directly responsible for implementing mitigation measures. The role of the MMSO is to record and report on marine mammals and seabird sightings during shipping activities, and to advise the contractor (i.e., captain and ship crew) on the location of observed marine mammals and if any action is recommended based on mitigation measures outlined in the Shipping Management Plan.

The following protocol will be implemented during the MMSO program:

- A minimum of one trained MMSO will be present on-board the Mine shipping vessels during all transits within the RSA;
- The MMSO will conduct marine mammal and seabirds observations in the RSA from the bridge during daylight hours as described in Section 2.1;
- The MMSO will observe and record sightings of marine mammals and birds during vessel movements in the RSA (including upland birds, migratory birds, waterbirds, raptors, and seabirds) as well as environmental conditions as described in Section 2.1;
- A communication plan will be established between the MMSO(s) and the ship's crew in order to provide information regarding marine mammal and seabird sightings;
- The shipping contractor will initiate mitigation measures designed to minimize Mine impacts on marine mammals and seabirds, as identified in the Shipping Management Plan; and
- MMSOs will assist in observing for marine mammals and seabirds in the event of a spill (see Section 2.2).

The MMSO program will allow for the opportunity of adaptive management techniques to be implemented if monitoring identifies potential for adverse effects on marine wildlife along the shipping route. This may include modification of mitigation measures in response to new information arising from the monitoring carried out by the MMSO and vessel crew. Adaptive management will be conducted in consultation with the Kivalliq Inuit Association, the Hunters and Trappers Organizations of the Kivalliq communities, and the relevant regulators.

2.1.3 Marine Mammal Observing Protocols

Dedicated marine mammal observations will be conducted in the RSA. The protocol outlined in this section are best conducted along a transect line, therefore, it is best to start a marine mammal observation period when the vessel is and will be moving in a straight line for an extended period of time. Note the time and location (GPS) of the start and end of each observation period as well as the vessel speed (in knots). If vessel speed or direction changes significantly during the observation period, record the time and location and the change.

Observer Position

Observations will be done from a high location on the vessel and ideally outdoors if possible and will be conducted at the same location each time. For marine mammal observations with a single observer, the MMSO will position themselves in the middle of the ship at the front (bow) to observe marine mammal on both the starboard and the port side (Figure D-3).

Observation Period

MMSO observation periods (marine mammal and seabird observations) should not last longer than 2 hours to mitigate observer fatigue and eye strain, and a MMSO observation day should not exceed 12 hours. Based on these requirements, dedicated marine mammal observations will be conducted over a 1.5 hours period following a seabird survey (approximately 30 minutes). A suggested MMSO schedule for moving and stationary ships is provided below in Table D-1 and Table D-2.

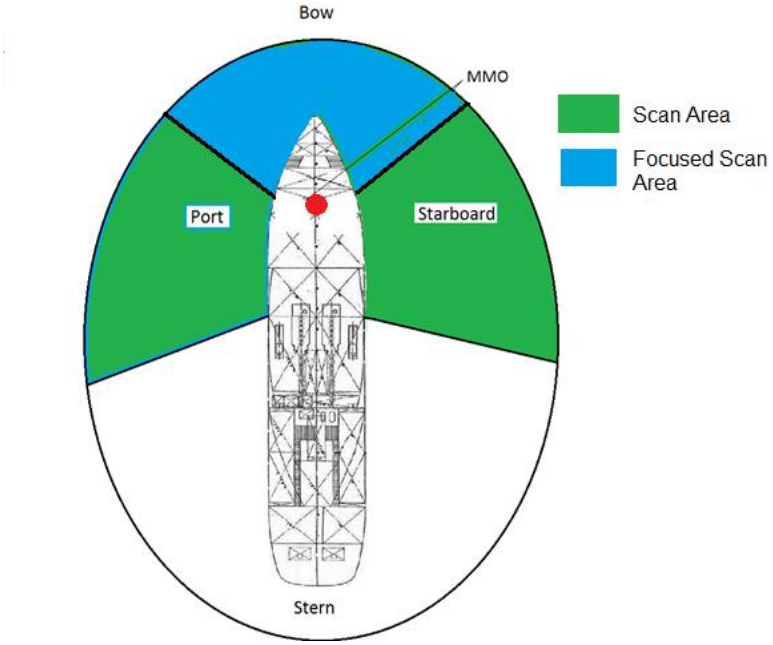

Figure D-3: MMSO position and respective observation field on a hypothetical ship

2.1.3.1 Scan Routine

The following scan routine should be conducted throughout the marine mammal observation period. Scan the water with the naked eye and use binoculars only to focus on possible sightings. Perform S and U scans of the observation field about every 20 seconds (Figure D-4). The most important aspect of marine mammal observing is to constantly scanning the observation field to capture animals that could be located in the peripheral view for brief moments (e.g., surfacing). Scans should be made from the middle of the vessel (for one MMSO) and cover the scan area shown in Figure D-3 with a focus on the water ahead and to the side to the moving vessel (e.g., focused scan area in Figure D-3). If the vessel is stationary (e.g., anchored) scans should be conducted over the entire scan area (e.g., blue and green in Figure D-3) in a uniform fashion. When the vessel is stationary, less priority can be attributed to marine mammal observations and the MMSO can switch to an observation schedule similar to that shown in Table D-2.

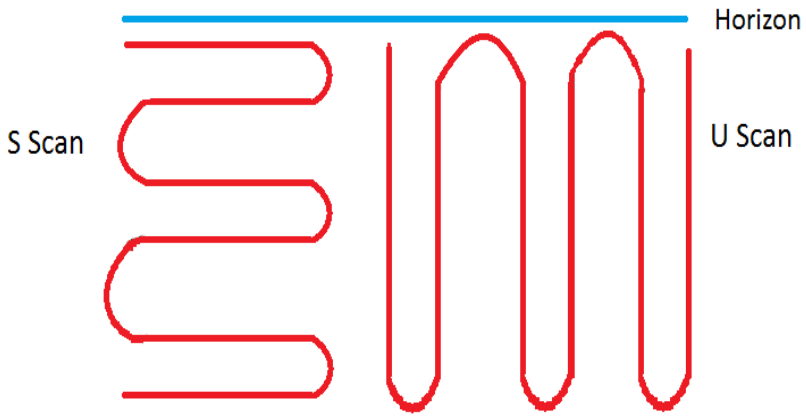

Figure D-4: S and U scanning techniques

All marine mammals observed during the dedicated marine mammal observational periods as well as incidental sightings will be recorded including GPS location, distance to animal, angle to animal, number of individuals, species, behaviour etc. (see Section 2.1.5.2 below). If a species is unknown or if a blow is the only detection of the animal observed, then mark the sighting as unknown. Marine mammals in large groups that are close together should be marked as a single sighting. When possible, photographs of marine mammal sightings will be taken and recorded alongside sightings records.

Angle to a marine mammal or group of marine mammal can be calculated using a Pelorus or by estimating the angle with an angle board. Figure D-5 shows how an angle to a marine mammal from the vessel should be estimated.

On-effort sightings should be recorded by the MMSO only, with no assistance permitted by other crew members. If additional sightings are made by other crew members or if sightings are made outside the designated marine mammal observation period (see Table D-1) then these sighting should be marked as incidental sightings on the marine mammal sighting record (Attachment A). Sightings of pinnipeds hauled-out on land will be recorded as off-effort sightings. Bow-riding dolphins or porpoises are also not recorded as on-effort sightings unless they are observed prior to their initial approach to the vessel (as it was assumed that the sighting of a bow-riding cetacean was not random but rather influenced by the presence of the vessel). Bow-riding dolphins or porpoises are recorded as incidental (off-effort) sightings.

All efforts will be made to avoid double counting individuals or groups of individuals. If a marine mammal is counted twice in the sightings record, then a note of a re-sighting should be marked. Additional information to be collected for marine mammals is outlined in Section 2.1.5.2 below.

18:30	Daily Reporting

Notes: The full 30 minutes may or may not be used for seabird surveys depending on the survey method implemented. Further details are described in Section 2.1.4 below.

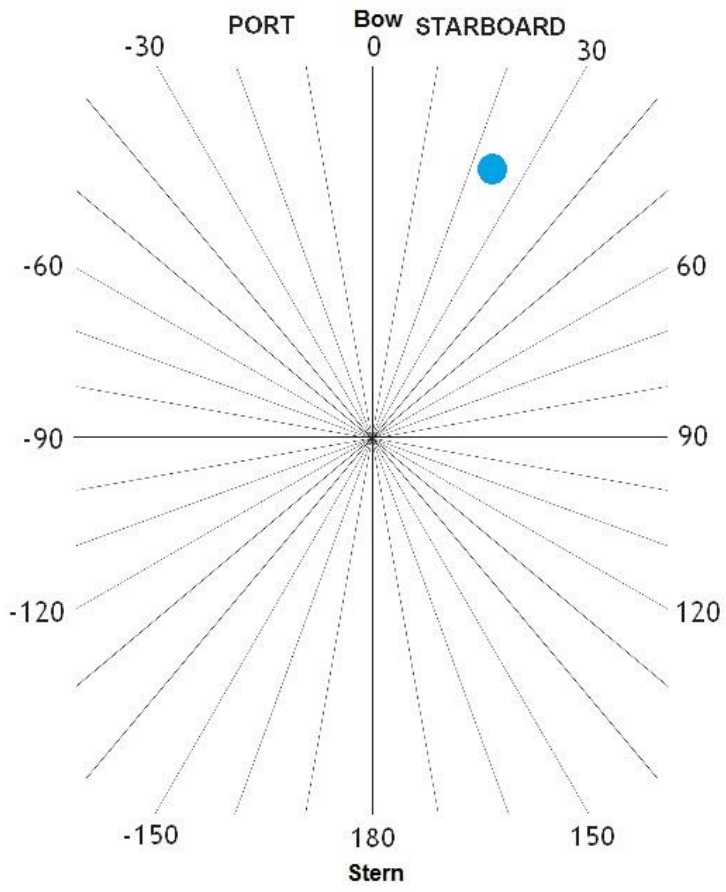

Figure D-5: Angle to Marine Mammal (blue dot) is approximately 22º

2.1.3.2 Estimating Distance

Observers should practice estimating the distance bands prior to beginning surveys. This can be accomplished by using reticle binoculars as described below or with a distance gauge made from a transparent plastic ruler (see Attachment B).

Record the distance to each marine mammal or group of marine mammal (to the centre of the group). For all marine mammals, estimate the angular distance between the marine mammal(s) and the observer.

Using Reticle binoculars

Reticle binoculars have a built in scale called a reticle (Attachment B). Estimating distances to marine mammals using reticles is based upon the distance to the horizon which is dependent on:

- the height of the observer eye above sea level in meters; and
- radians per reticle mark for the type of binoculars.

The height of the eye includes the height of the platform above the surface of the water. The number of radians (usually milliradians[2]) will depend on the type of reticles binoculars that are used. The number of radians per reticle mark can be used to produce a distance table based on an equation provided by the binocular manufacture. An example of an equation provided by Fujinon 2006 is:

Distance = (eye height + height above sea level in meters) x 1000 / # of milliradians

Reticle binoculars cannot be used to estimate distance if the horizon is obscured (by fog or land), or if they are used from a different height above sea level. Their use becomes minimal in nearshore waters.

2.1.4 Seabird Survey Protocols

Seabird survey will be conducted in the RSA. The protocols laid out bellow were extracted and adapted from the Canadian Wildlife Service (CWS) standardized protocol for pelagic seabird surveys from moving and stationary platforms (Gjerdrum et al. 2012).

Observer Position

Observations should be done from a high location on the vessel, when possible, at a location as close to the edge of the platform as possible to increase the detection of seabirds, especially for individuals that use the waters at the base of the vessel. All surveys should be conducted at the same location each time.

2.1.4.1 Survey Protocol – Moving Vessel

Transect Methods

Moving vessel seabird surveys should be conducted along a transect line when the vessel is and will be moving along a straight line for an extended period of time. Note the time and location (GPS) of the start and end of each survey period (described below) as well as the vessel speed (in knots) as laid out in the seabird survey sighting form (Attachment B).

During transect surveys, the observer is to look forward from the vessel, scanning at a 90° angle from either the port (left) or starboard (right) side depending where he or she is located. The transect width within seabirds are recorded is 300 m from the side of the vessel (see Figure D-6). Scan ahead regularly (e.g., every minute) to spot birds that may dive as the vessel approaches.

All birds observed within this 300 m transect, whether flying or on the water, are recorded and are considered in-transect sightings. The methods for recording birds on the water verses birds in flight are outlined below. All five minute surveys should begin with a snapshot survey to capture flying birds. The perpendicular distance from the line to the seabirds detected on the water or in flight is estimated for each sighting. Birds observed outside the 300 m transect are also recorded if this does not affect observations within the 300 m transect. Distance categories “E” and “T” in Figure D-6 are both considered not in transect. Binoculars and spotting scopes can be used to confirm species identification and other details as necessary. Information that will be collected during each sighting is outlined in Section 2.1.5.4.

[2] unit of angular measurement

Moving platform transect survey are best conducted when travelling at a minimum of 4 knots (7.4 km/h) and a maximum of 19 knots (35.2 km/h). These surveys can be done when the ship is travelling less than 4 knots, but birds are often attracted to slow moving or stationary ship. If birds are clearly gathering around the ship and settling on the water when the ship is moving at decreased speeds cease the surveys until the ship resumes a higher speed. If the ship is no longer moving (e.g., anchored or on standby) switch to the stationary platform survey methods described below.

Observation Period

Each seabird survey period will be conducted during six consecutive five-minute periods which is repeated three times a day to capture morning, afternoon and evening periods (see Table D-1). These five minute surveys should be dedicated to surveying for seabirds only. These surveys should be completed regardless if birds are present or not. If the vessel is not moving (stationary), use the method for stationary vessel described in Section 2.1.4.2 below.

Short breaks should be taken at the end of each five minute period to record the vessel's position and any conditions that may have changed since the last five minute survey period. If ship speed or direction changes significantly the survey period, record the time and location (GPS), cease the current survey and begin a new five minute survey period.

The frequency of the seabird surveys outlined in Table D-1 has been selected to provide time for the MMSO to:

- have dedicated seabird and marine mammal observation periods (as described above);
- take necessary breaks to avoid observer fatigue; and
- conduct daily reporting.

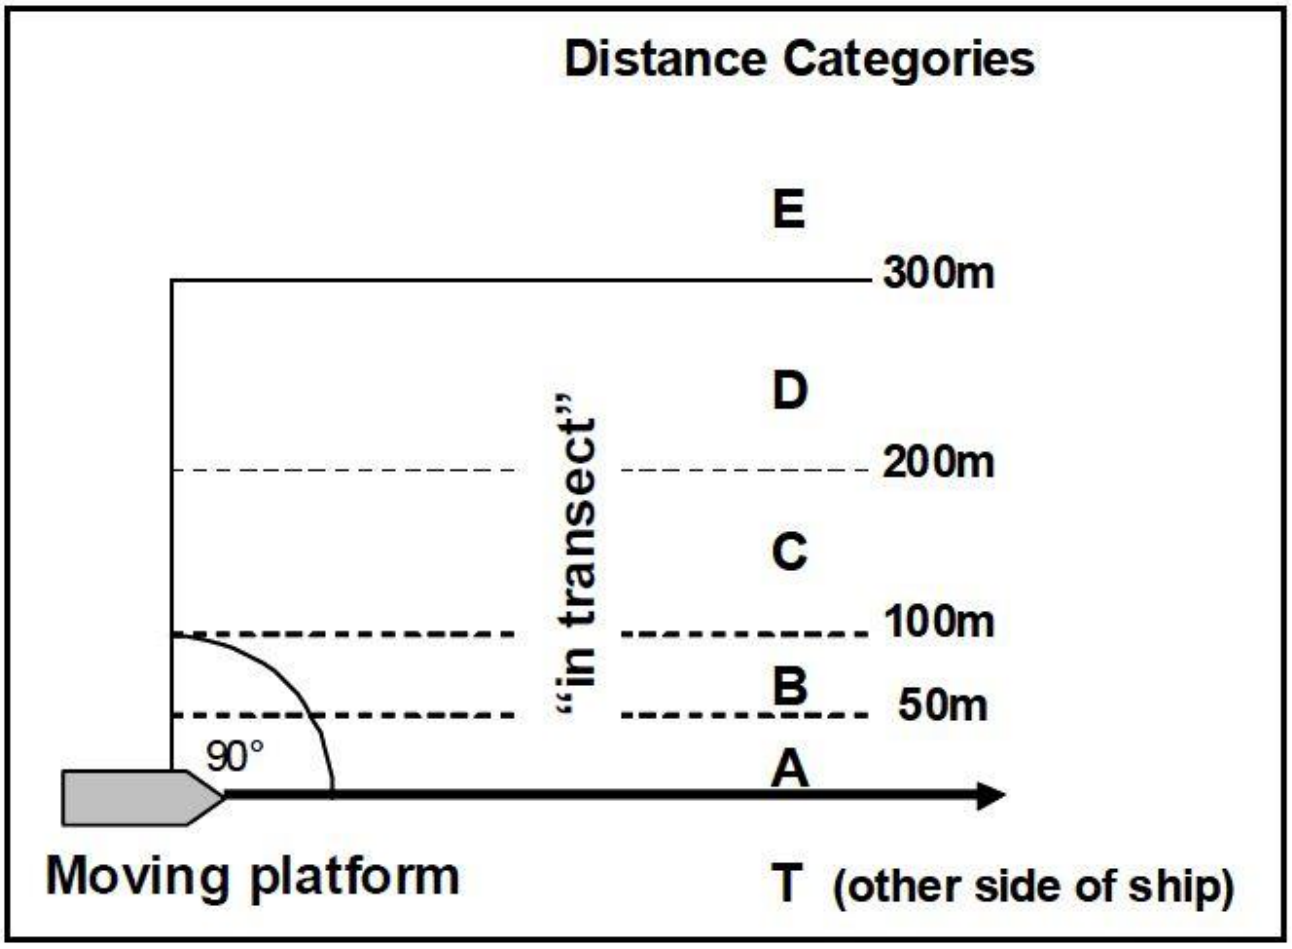

Figure D-6: Illustration of a survey using a 90° scan, covering a 300 m transect from a moving platform (extracted from Gjerdrum et al. 2012)

Birds on the Water

All birds observed on the water are continuously recorded throughout the five minute survey period. If birds in the transect fly off the surface of the water as the vessel approaches, use binoculars to help count them, and record these birds as being on the water as outlined in the seabird survey sighting form (Attachment B). These birds are not subsequently counted as a flying bird during a snapshot survey (described below for flying bird).

Birds on the water may be observed up ahead of the platform, perhaps as far as 400 m or 500 m, but still within the 300 m transect (Figure D-6). Because these individuals may dive or fly away as a result of the approaching ship, they should be counted as in transect and their perpendicular distance recorded when they are first observed. If the five minute survey will end before the ship reaches them they should be recorded in the next five minute survey period.

Birds in Flight – Snapshot method

All five min surveys should begin with a snapshot of flying birds. Flying birds are not recorded continuously throughout the five minute survey period as with birds on the water, as this would overestimate bird density. Create a routine of snapshot counts to record flying birds during the survey period. Only use the snapshot method when there are many birds observed flying in the area. The number of snapshots done will depend on the speed of the vessel (Table D-3).

During each snapshot, record flying birds as in transect if they are flying above the 300 m transect. Record all other flying birds that are seen outside of the 300 m transect or between snapshot intervals as not in transect.

Some species may fly in long lines across the 300 m survey transect. At the time of the snapshot, the number of birds in the flock is recorded and the distance class is assigned according to the location of the centre of the flock. All the birds in the flock are recorded as in transect if the centre is within the 300 m transect. If the centre of the flock is outside the 300 m transect, all birds are recorded as not in transect.

Large Groups of Birds

When very large numbers of birds are encountered that overwhelm the observer's ability to count the number of birds and measure the distance to flocks the snapshot method can be used to count all birds in flight and on the water. If this protocol is used, note the change in protocol on the seabird survey sighting form (Attachment B). If it is not practical to estimate distance to each bird or flock of birds, the observer should at least indicate whether the birds were observed in or out of transect. If it is not practical to note which birds are on the water and which are in flight use the following guidelines:

- If the majority of the birds are in the air, they can be recorded as flying.
- If birds appear first on the water and then fly away as the vessel approached, or they continuously move between the water and air, recorded them being as on the water.

Birds that follow the Vessel

To avoid double counting birds, once a bird is recorded in-flight it is not subsequently recorded again if it follows the ship and it is not recorded on subsequent snapshots. If many birds are following the vessel and it becomes difficult to determine which individuals have already been recorded, the number of birds following the ship can be estimated and recorded at regular intervals (i.e., in between each five minute survey or as possible).

Table D-3: Intervals at Which Instantaneous or "Snapshot" Counts of Flying Birds Should be conducted during a Moving Vessel Survey

Platform Speed (knots)	Interval Between Counts (minutes)
<4.5	2.5
4.5 – 5.5	2.0
5.5 – 8.5	1.5
8.5 – 12.5	1.0
12.5 - 19	0.5

Poor Visibility

When a survey period cannot be done because of poor visibility (i.e., when the entire width of the 300 m transect is not visible), the extent of visibility should be noted on the seabird survey information form.

Observation Periods with no birds

If no birds are observed during a five minute survey period, “no seabirds observed” must be noted on the seabird survey information form.

2.1.4.2 Survey Protocol – Stationary Vessel

Scan Method

Surveys while the vessel is stationary (e.g., on standby or anchored) are done using instantaneous counts, or “snapshots” of birds within a 300 m “semi-circle” area from the vessel. These surveys are conducted by scanning through a 180° arc, limiting observations to a semi-circle around the observer (Figure D- 7)

The area should be scanned from one side to the other, and all seabirds on water and in flight that are observed within 300 m are systematically recorded. Birds visible beyond 300 m are also, if possible. The distance to seabirds (inside and outside the 300 m area) from the observer is estimated and recorded for all birds. Birds observed outside the 300 m semi-circle are recorded as not in semi-circle on the seabird survey information form. Binoculars and spotting scopes can be used to confirm species identification and other details as necessary.

Observation Period

When the vessel is stationary, less priority can be attributed to marine mammal observations. Therefore, scans should be completed once every hour when the vessel is stationary (Table D-2). The length of each scan will depend on the number of birds present at the time of the scan (e.g., it may only last a few seconds if there are no birds present).

Poor Visibility

When an observation period cannot be done because of poor visibility (i.e., when the entire width of the 300 m transect is not visible), the extent of visibility should be noted on the seabird survey information form.

Observation Periods with no birds

If no birds are observed during a five minute survey period, “no seabirds observed” must be noted on the seabird survey information form.

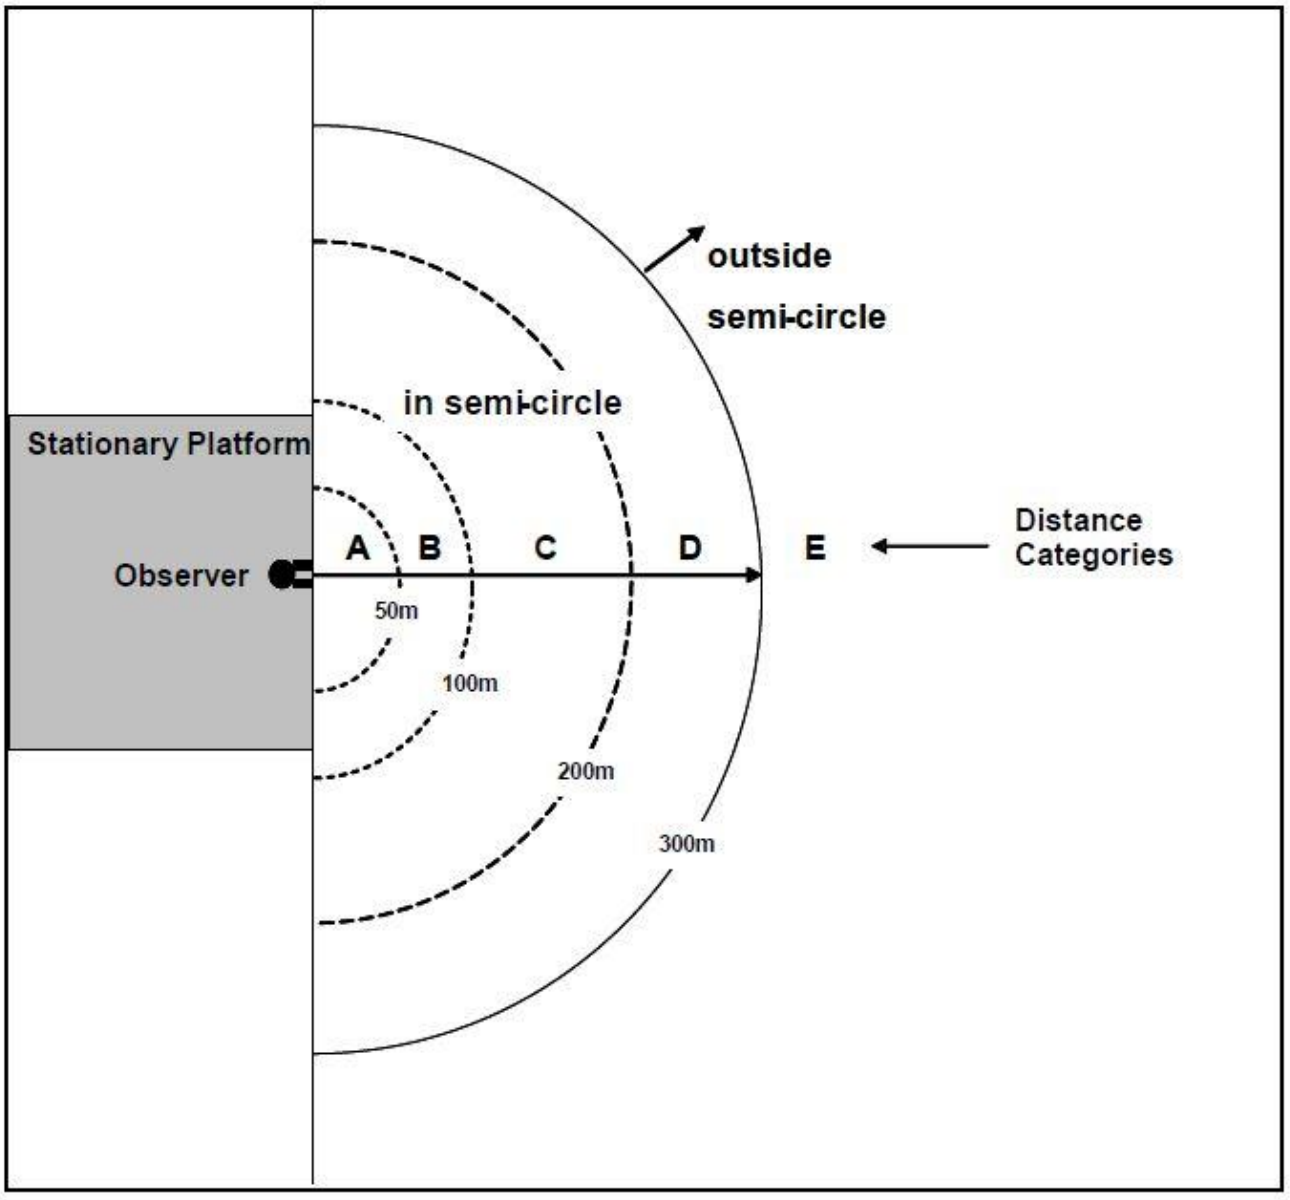

Figure D- 7: Survey using an 180º scan, surveying an area 300 m from a stationary observer (Extracted from Gjerdrum et al. 2012)

2.1.4.3 Estimating Distance

Observers should practice estimating the various distance bands prior to beginning surveys. This can be accomplished by using reticle binoculars as described above in Section 2.1.3.2 or with a distance gauge made from a transparent plastic ruler (see Attachment B).

Record the distance to each bird or flock of birds (to the centre of the flock). For all birds, estimate the perpendicular distance between the bird(s) and the observer (Figure D-6). If a group of birds is straddling the 300 m boundary with the flock centre located in D (some individuals inside and some individuals outside the transect) record the entire flock as being in D. If the flock centre is outside the transect, record the entire flock as distance class E. It is very important to record distance to birds within the 300 m strip, but if this is not possible (i.e., too busy), you may use the code 3 = within 300 m but no distance recorded. Distance T is used to indicate that the bird or flock was observed on the opposite side of the vessel.

2.1.5 Recording Observations

2.1.5.1 General Environmental Information

This information should be collected for both marine mammal and seabird observations as shown on the marine mammal and seabird sightings forms in Attachment A and Attachment B.

Ship name, agency and type: Agency is the company that has requested the survey (e.g., Agnico Eagle Mines Limited, Meliadine Division). Type may include container vessel, barge, tug, or fuel supply vessel.

Observer(s): Indicate the first and last name of the observer. Also record the name of any additional observers assisting with the survey.

Date: Date that the observation period occurred. Use format DD-MMM-YYYY (e.g. 12-Apr-2008)

Time start/Time end: Time (using 24-hour notation) at the start and end of each seabird survey or marine mammal observation. Use Universal Time (UTC) to standardize across regions.

Coordinates at start and end of observation period of track of observation period: GPS coordinates of the vessel.

Platform activity: Platform activity may influence observations and should therefore be noted. Activities could include traveling, off-loading, anchored etc.

Visibility: Estimate visibility in km from 0.3 (which is 300 m) to 20 km; estimates should also be made on foggy days.

Sea state code: Select Sea state code according to codes in Appendix II.

Swell height: Estimate the height of the swell.

Weather conditions: Record the general weather conditions at the time of the survey according to codes in Appendix II. Record the most prominent conditions within the survey area. For example, if there are distant fog patches that do not directly affect the survey conditions, the weather code will be 0 or 1. Alternatively, if there is <50% cloud cover but you are travelling through fog patches, the weather code will be 2.

Glare conditions: Light reflecting off the surface of the water can often influence detection. Record the glare conditions at the time of the survey according to codes in Appendix II.

Wind speed or force: Enter the speed of the wind in knots if instrument to measure wind is available on the bridge or use Beaufort code from Appendix III. When taking measurements from a moving platform, be sure to record the TRUE wind speed/direction.

Wind direction: Enter compass direction (**N, NE, E, SE, S, SW, W, or NW**) of the wind. See note above regarding true wind speed/direct.

Ice Type and Concentration: If ice is present during the survey, indicate the type and concentration using codes from Appendix IV. Indicate in the notes if the ice is present only beyond the transect limits.

Platform speed (knots): If speed changes during observation period, enter new speed and time that the change happened.

Platform direction: Enter compass direction (**N, NE, E, SE, S, SW, W, or NW**); if direction changes during the observation period enter new direction and time at which change happened.

Observation side: Starboard (right) or Port (left).

Height (metres): Enter height of observers' eye above water from observation point in metres.

Outdoors or Indoors: Circle **Out** when doing observations from a position outdoors and **In** for indoor observations. Remember survey should be conducted from the same location on the vessel each time.

Other Notes: Make note of disturbances or relevant activities in the area, especially if there are large vessels or fishing activities nearby, or if your vessel is sounding the fog horn.

2.1.5.2 Marine Mammal Sightings Record

Species: choose the species observed. Record all unknowns, even if they are identified only as "baleen whale" or "toothed whale".

Number of individuals: Record the number of marine mammals in each sighting. Record groups as one sighting (e.g., one line item), if they behave as a group and have the same morphological and behavioural characteristics (e.g., all adults of the same species). Record other individuals from the group that have different characteristics (e.g., different species or juveniles of the same species) in the next line but link all the sighting together to indicate they were a single sighting.

Distance: Record the distance to the marine mammal when first observed

Angle: Sighting angle to the marine mammal can be calculated using a Pelorus or an angle board

Behaviour: Chose a behaviour based on the list below

- ***Surfacing***: Marine mammals will surface in order to breathe, often exposing their backs.
- ***Breaching***: full or partial jump out of the water
- ***Fluking***: Some whales bring their tail flukes high up into the air on a deeper dive.
- ***Flipper-slapping***: Marine mammals may use their flippers to slap the surface of the water.
- ***Lob-tailing***: Whales raise their fluke high into the air in order to slap the surface of the water.
- ***Spyhopping***: Head of the marine mammal will surface out of the water as a means to get an in-air look.

- ***Porpoising***: high speed swimming is more efficiently accomplished if an animal jumps out of the water, usually observed in dolphins, porpoises, and pinnipeds.
- ***Bow- or Wake-riding***: Some species of dolphins and porpoises are attracted to ride the bow or the wake of a passing vessel.
- ***Logging***: Marine mammals resting at the surface.
- ***Feeding***: Marine mammals observed feeding on fish, krill or other marine mammals
- ***Hauled*-out**: For pinnipeds only. When they haul themselves onto land. Remember these individuals should be recorded as off-effort sightings.

Age: If possible, select whether the marine mammal is a:

- **Adult**
- **Juvenile**
- **Immature**

Sex: If possible, Male or Female

Direction of travel (N, NE, E, SE, S, SW, W, or NW): which direction the marine mammals are traveling. Not if they change the direction of travel in response to the vessel.

Note: Space is provided to record other important information, such as the presence of fishing vessels in the survey area, if the marine mammal suddenly changes behaviour etc.

2.1.5.3 Seabird Sightings Record

Observation period information: Fill in all the fields within the seabird survey form at the beginning of every five minute transect survey period (moving survey) or every scan (stationary survey).

Scan type (for stationary platforms only): Conduct a 180° scan for all stationary surveys. If part of the survey area is obstructed, indicate the scan angle used.

Scan direction (for stationary platforms only): Indicate the true (not magnetic) bearing when looking straight ahead, at centre of semi-circle.

With snapshot? Enter whether the snapshot method for birds in flight is being used by checking **Y or N.**

Species: choose the species observed. Record all unknowns, even if they are identified only as “gull” or “bird”.

Number of individuals: Record the number of birds in each sighting in the count field. Record groups of birds as one sighting, if they behave as a group and have the same morphological and behavioural characteristics (e.g., all adults of the same species in breeding plumage flying in the same direction). Record other individuals from the group that have different characteristics (e.g., different species or juveniles of the same species) in the next row but link all the sighting together to indicate they were a single sighting.

In transect or semi-circle? Y or N: Enter whether a bird observed is in (Y) or out (N) of the transect. Give priority to birds that are in transect; record birds seen outside of the observation area if this does not affect "in-transect" observations.

Behaviour (flying, on sea, and/or feeding): Record which activity a bird or group of birds is doing by selecting the activity from the drop-down menu.

Associated with platform? Y or N: Enter whether birds are following/associated with the moving platform with either a **Y** (Yes) or **N** (No).

Distance: Record the distance to each bird or flock of birds (to the centre of the flock). For all birds, estimate the perpendicular distance between the bird(s) and the observer (Figure D-6). Distance categories are as follows: A = 0 to 50 m, B = 51 to100 m, C = 101 to 200 m, D = 201 to 300 m, and E = >300 m.

Age: If possible, select whether the bird is a:

- **A** (adult plumage)
- **J** (juvenile, first coat of true feathers acquired before leaving nest)
- **I** (immature, first fall or winter plumage that replaces juvenile plumage and may continue in a series that includes first-spring plumage, but is not the complete adult plumage).

Plumage of adults: If possible, choose whether the bird has:

- **B** (breeding plumage usually in spring and summer – will apply to most birds seen during the survey)
- **NB** (non-breeding plumage, fall and winter plumage)
- **M** (moult, transitional phase between these two plumages, often with some flight feathers missing; generally not flying when molting)

Sex: (Male or Female)

Flight direction (N, NE, E, SE, S, SW, W, or NW): which direction birds in flight are heading, if not associated with platform (this info can be obtained from instruments on the bridge). If birds are flying erratically such that no one direction is appropriate, record them as ND (no direction).

Note: Space is provided to record other important information, such as the presence of fishing vessels in the survey area, if a particular bird was carrying fish, etc.

2.1.5.4 Additional Information

MMSOs will record any responsive actions undertaken by the vessel crew in response to sightings (e.g., reducing vessel speeds). This will be recorded on a daily basis as outlined in the MMSO daily reporting template provided in Attachment C and will include:

- Description of any vessel mitigation implemented (e.g., reduction in speeds, evasive maneuvers etc.); and
- Record of any vessel-animal collision (marine mammal or seabird) including the following information:
  - date, time, spatial coordinates;

- wind speed and direction, visibility, precipitation, sea state;
- number of animals found dead or injured on the deck (seabirds) and on the water (seabirds or marine mammals); and
- if search lights or vessel lighting sources were active at the time of collision.

This information will be summarized in a daily report by the MMSO. All records of vessel strikes on marine mammals and bird collisions will be provided to Fisheries and Oceans Canada (DFO) and the Canadian Wildlife Service (CWS) on a weekly basis, as vessel communications allow (i.e., as internet connections allow). Immediate reporting will be required in the event that a ship strike occurs on a marine mammal, or multiple bird collisions occur (involving more than five individuals) and the incidents appear related (i.e., similar time period, location, and weather conditions). In this instance, the regional Environment Canada (EC) Wildlife Enforcement Officer (contact information provided below) will be contacted to provide advice on the implementation of adaptive management techniques (see Merkel and Johansen 2011) to attempt to reduce the likelihood of collisions occurring in the future.

2.2 Spill Scenario

This section outlines the protocol for undertaking wildlife monitoring in the event of a major fuel spill in the LSA and RSA in accordance with Project Certificate Condition 64, which states the following:

"*The Proponent shall develop a framework for monitoring of marine bird species and their habitat in the event of a major marine fuel spill. Specific details regarding the scope of follow-up monitoring may be further refined if and when such an event were to occur."*

There are three potential scenarios during Mine shipping operations when a fuel spill could occur:

1) During shipping activities;

2) During ship-to-ship fuel transfer; or

3) During ship-to-shore transfer of fuel.

A spill risk assessment (SD8-1: Appendix E) was conducted at 14 sites along the shipping route to better understand how a potential fuel spill would behave over time within the RSA.

In the event of a fuel spill, the following wildlife monitoring framework will be implemented. It will be the responsibility of the shipping contractor(s) to employ a qualified environmental professional (QEP) to implement this framework in the event of an incident and will be a requirement of the shipping contract. It is recommended that a QEP be retained under contract on a stand-by basis during the shipping season to be able to respond to a spill in a timely fashion.

Not all spill scenarios will require the implementation of all aspects of this framework (i.e., a small spill contained close to the vessel will not require the same level of monitoring as a larger spill). It is the responsibility of the QEP, in consultation with the relevant regulators, to determine what aspects of the framework should be implemented.

The monitoring framework outlined below is intended to be a 'living document' which provides an opportunity for adaptive management techniques to be implemented throughout an event. The objective of the framework is to provide a strategy for the coordination of marine wildlife monitoring in order to minimize potential effects as a result of an incident. The framework should be amended as new information becomes available (e.g., changes to the extent of a spill) and should ultimately address both potential acute effects to wildlife and their habitats as well as potential long term chronic effects.

There is an opportunity to involve local communities and hunters, other organizations, institutions, government departments and/or individual researchers during the initial response phase and the follow-up phase during an incident. These opportunities include, but are not limited to:

- Providing information regarding sensitive resources in the area;
- Assisting in collecting baseline sediment and water quality samples;
- Assisting with wildlife surveys;
- Collecting wildlife who have come into contact with the spill;
- Providing information regarding the extent and direction of a spill; and
- Assisting with on-going wildlife monitoring.

The involvement of these organizations in the wildlife monitoring framework should be coordinated by the QEP as well as the vessel response team (to be identified in Shipboard Oil Pollution Emergency Plan (SOPEP) or Agnico Eagle's Emergency Response Team (ERT) depending on who is taking on coordination of the clean-up efforts (See section 2.0 of the Shipping Management Plan).

Monitoring during a spill event is divided into two phases, an 'Initial Response Phase' and a 'Follow-up Phase'.

2.2.1 Initial Response Phase

The initial response phase addresses the management of anticipated acute effects of the spill on marine wildlife and their habitats. The framework for the initial response phase should be managed and updated to incorporate new information as it becomes available.

Within 24 hours of an incident, the following marine wildlife monitoring objectives should be achieved:

- Identify a QEP to coordinate the wildlife monitoring framework; and
- Set-up of a 24 hour communication line and provide contact information to the community where local community members and other interested parties can call-in to report fouled or at-risk wildlife sightings.

2.2.1.1 Surveys and Sampling

2.2.1.1.1 Marine Wildlife

During the initial phases of a spill, all wildlife observed in direct contact with the fuel spill or present in the vicinity of the spill will be recorded in a wildlife sightings record (see example in Table D-4). Encounters may be called in by local community members, other vessels, MMSO(s) onboard Mine vessel(s), or by the spill response teams themselves. If possible, the QEP or suitable designate will conduct an initial survey of the affected area to record all species occurrences as soon as possible following a spill. This may be via ground, small support vessel or by aircraft and if possible, should be continued on a daily basis until the spill is contained. Aerial surveys can assist the focus of ground surveys, depending on the extent of a spill. The purpose of these surveys is to identify wildlife resources at risk within the vicinity of the spill and develop appropriate management strategies for minimizing risk and/or impacts to these resources. Resources to be identified during the surveys include presence of pelagic birds, waterfowl, marine mammals, and sensitive fish and wildlife habitat.

In the event that a spill reaches landfall, an intertidal community structure survey should be completed in affected areas and at suitable reference locations in the region. The intertidal surveys should involve intertidal quadrat-based transect sampling and should be conducted in accordance with DFOs marine habitat assessment guidelines as outlined in Attachment E.

Table D-4: Example of a Wildlife Sightings Record in the Event of a Spill

Common Name	Number of Individuals	Date/Time	Location (GPS location if possible in UTM)	Behaviour	Condition of Animal*	Photos**
MAMMALS						
BIRDS						
FISH						

Notes: * - note if the animal has been in contact will the spill or not, if individuals have been observed moving towards the spill, or if the animal is dead.

** Photos should be attached when possible

2.2.1.1.2 Marine Habitats and Benthic Communities

Marine water, surficial sediment, and benthic invertebrate tissue samples should be collected in the affected area(s) as soon as practical to establish baseline and initial spill conditions for water, sediment and tissue quality at the time of the spill. Samples should be collected from a near field to far field direction and should start as close to the spill as possible. The sampling plan should be evaluated on an on-going basis during the initial response phase to determine if the sampling intensity is appropriate relative to the nature of the spill (e.g., additional sampling sites may be required if the trajectory of the fuel spill changes).

Standard sample collection and environmental effects monitoring methods and analytical requirements implemented during fuel spills are provided in Table D-5. Ultimately, monitoring requirements will be at the discretion of the applicable regulators (e.g., EC-CWS and DFO).

Table D-5: Example of Sampling Methods and Analytical Requirements

Parameter	Location	Collection Methods	Laboratory Analyses
Water	Sites should be distributed from a near field to far field direction. Locations as close as possible to the perimeter of the spill should be collected first.	*In situ* measurement of pH, conductivity, salinity, temperature and turbidity throughout the water column. One sample should be collected at each site with a grab sampler (e.g., a Niskin bottle or Kemmerer). *In situ* and water samples should be collected at the surface, mid-water and deep water.	• BTEX/VPH • EPH • VOCs • PAHs (parent) • Total and Dissolved Metals (including mercury) • TOC • Major ions • General parameters
Sediment	Sites should be distributed from a near field to far field direction. Locations as close as possible to the perimeter of the spill should be collected first.	Five replicates collected at each shore site where sediments are sand-sized (e.g., less than approximately 2.0 mm) or finer. For shoreline areas, samples collected with a grab sampler (e.g., Ponar) at high tide, or a stainless steel spoon and bowl at low tide, with replicates randomly distributed within the sample area. For each station, samples should be collected at high and mid to low intertidal zone. For deepwater stations, one surface sediment sample should be collected.	• BTEX/VPH • EPH • VOCs • PAHs (parent) • Metals (including mercury) • TOC • Grain size distribution
Tissue – Requires a DFO scientific fish collection permit	Sites should be distributed from a near field to far field direction. Locations as close as possible to the perimeter of the spill should be collected first.	Five replicates consisting of a composite of 20 individual bivalves collected randomly at each station where bivalves are present. Bivalves should be shucked and the soft tissues rinsed in with deionized water to remove shell pieces and other debris. Tissue samples will be handled with clean stainless steel instruments (i.e., scalpels), weighed and divided between two certified-clean, laboratory-supplied glass containers with Teflon®-lined lids, which will be then stored in a freezer. The samples will be transported on ice (frozen) to an accredited lab for analysis of parent and alkylated PAHs (following silica-gel cleanup to remove natural polar organic compounds that can cause false positives), metals, lipids and moisture content.	• PAH (parent) after silica-gel clean-up. • Metals • Moisture • Lipids

2.2.1.2 Species and Habitats of Immediate Risk

Marine species and habitats of immediate risk from the spill should be identified in order of priority (see Table D-6). This will depend on a variety of factors including the location of the spill, timing, and prevalent weather conditions. Examples of sensitive habitats of potential immediate risk include fish bearing streams, narwhal congregation areas, walrus haul-outs, coastal nesting bird sites etc. Specific locations of habitats are important to note. A revised marine baseline report (SD8-1: Appendix B of the Shipping Management Plan) provides the most current information on known sensitive marine resources in the RSA. Figure B-3 of SD8-1: Appendix B – Revised Baseline – Marine Environment outlines the various coastal habitat types in Melvin Bay in the event of a spill within the limits of the harbour.

The above information should be provided by the QEP to the spill response team and others involved in the spill clean-up (e.g., the Canadian Coast Guard) along with recommendations on what environmental resources are of greatest concern to protect. The QEP should also be involved in discussions relating to the implement of mitigation measures to avoid impacts to sensitive resources. Recommendations regarding mitigation from the QEP should be made in consultation with the relevant regulatory agencies (DFO for marine mammals and fish, CWS for marine birds and the Government of Nunavut for polar bears). The CWS provides spill response guidance on what techniques are available to be used during a spill in relation to marine birds (provided in Attachment D), this includes:

- Hazing;
- Dispersing Oil;
- Bird Collection;
- Wildlife Monitoring (as covered by this framework);
- Beached Bird Surveys (as covered by Section 3.2.1.1);
- Drift Blocks; and
- Live Oiled Bird Response (CWS 2012).

Several of these techniques require specific training and permit authorization before implementation. Therefore, prior to initiation of any of these techniques, the CWS should be contacted for input and guidance.

No similar guidance is provided by DFO for dealing with marine mammals in the event of a spill. DFOs Marine Mammal Response Program is responsible for tracking and responding to contaminated animals (DFO 2015). In the event of a major fuel spill in the RSA, DFO should be contacted immediately by the QEP to determine appropriate mitigation techniques to be utilized to limit potential adverse impacts on marine mammals.

Table D-6: Species and Habitats of Immediate Management Concern

Species and/or Habitat	Location*	Comments

Notes: * A general description of the location of the species (e.g., haul-out areas, congregating areas, fish bearing streams etc.) or specific GPS locations (in UTM) if available

2.2.1.3 Fish and Marine Wildlife Permitting

Table D-7 provides an overview of permitting requirements that may be required to implement the wildlife monitoring framework in the event of a major fuel spill. The CWS and DFO should be contacted to determine the course of action in relation to the collection of live or dead wildlife during the initial response phase.

Table D-7: Potential Permitting Requirements

Agency	Permit	Required for
CWS	Variance Order to the Migratory Bird Regulations	Required for collection, transportation, holding, treating and hazing of migratory birds (live and dead).
DFO	Fish Collection Permit	Required for the collection of marine species (live or dead).
Government of Nunavut	Scientific Research Permit	May be required for the collection of wildlife in Nunavut (live or dead).

2.2.1.4 Daily Assessment Objectives in Order of Priority

Daily assessment objectives should be reviewed each morning and updated as necessary by the QEP. An example of daily assessment objective list is provided below. These objectives will change over the course of an event as the spill is contained and cleaned up.

1) Determine maximum extent of spill area to define hazard zones to marine wildlife and their habitats. The extent of the spill will be in-flux, therefore, seek an update each morning from the spill response team.

2) From the spill origin, travel by boat along the shoreline to search for wildlife or evidence of wildlife.

3) Survey pelagic areas for birds and marine mammals.

4) Document species observations and important habitat areas that may potentially be at risk from spilled product. Bird species observations should detail species, number, behaviour, condition (oiled, not oiled), and location (UTMs). Visual and auditory indications should be used.

5) Conduct marine mammal monitoring; use binoculars to scan for the presence of marine mammals within spill area from on-shore vantage points located at a high location that have good vantage areas. The MMSO(s) can assist with this duty.

6) Update the spill response team and relevant regulators (CWS and DFO) regarding the observations of wildlife.

7) Maintain and monitor the 24 hour wildlife hotline and respond to information gathered.

8) Document impacts to wildlife and habitat, severity of impact, and potential biological implications on a daily and cumulative basis.

9) Implement and maintain wildlife deterrence strategies from oil impacted areas in consultation with the relevant regulatory agency.

2.2.1.5 Reporting

Updates to CWS and DFO regarding observations of wildlife should be a daily objective during a major fuel spill event. In addition, all wildlife sightings records (Table D-4) should be provided on a weekly basis to DFO and the CWS by the QEP.

2.2.2 Follow-up Phase

During the initial phase, all resources should be focused on limiting the effects of the spill. The follow-up phase consists of follow-up monitoring that should be executed through a long-term monitoring framework. The objective of this framework is to assess impacts to wildlife resources and their habitats as a result of the spill and any cleanup measures implemented (e.g., dispersants), as well as to measure the success of applied mitigation techniques.

The follow-up monitoring framework should be developed after the completion of the initial phase monitoring. This allows the follow-up monitoring to focus on species and habitats that have been most impacted by the spill. The framework may contain, but will not be limited to:

- Marine bird surveys;
- Coastal nest surveys;
- Marine mammal surveys;
- Fish surveys;
- Sediment quality monitoring; and
- Water quality monitoring.

The follow-up phase framework should be completed in consultation with the relevant regulatory agencies. It should also provide a mechanism to allow for local community members to be involved in monitoring, remediation and reporting efforts.

3.0 SUMMARY

This MEMP outlines the protocol for monitoring of marine mammals and seabirds during routine shipping operations of the Meliadine Gold Mine. Mine-specific mitigation measures designed to minimize Mine impacts on marine mammals and seabirds will be initiated by vessel-based MMSOs and implemented by the ship's crew. The MEMP also provides a framework to monitor for marine wildlife and their habitats in the event of a Mine-related spill. An opportunity for inclusion of local community members exists and should be considered an asset when implementing this plan. Communication and consultation with relevant regulatory agencies is essential when attempting to implement adaptive management strategies during routine operations as well as during a spill event.

This plan should be considered a living document that can be updated throughout the Mine in order to implement adaptive management techniques.

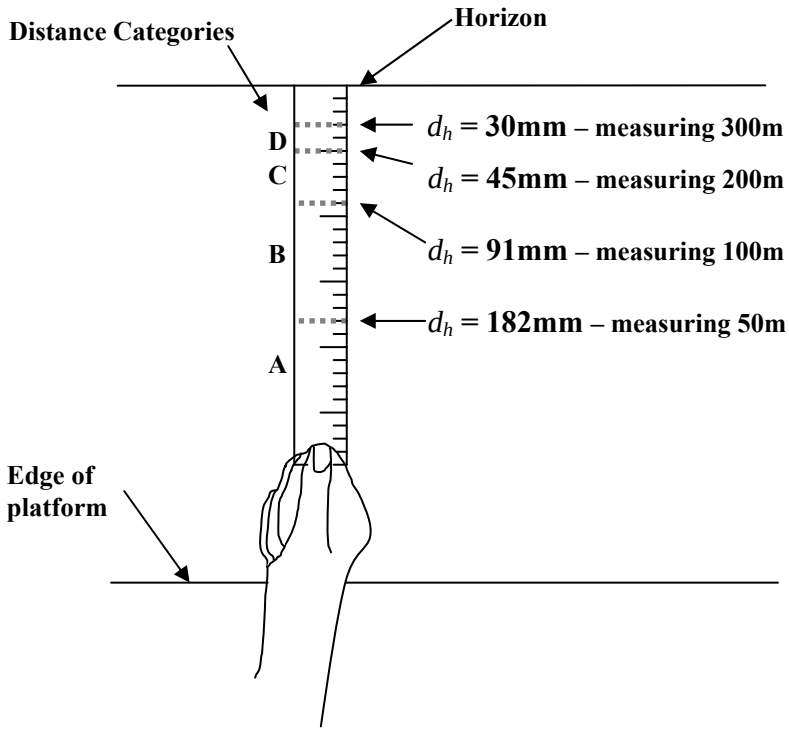
APPENDIX I. Estimating distance categories

The various distance categories can be estimated using the following equation[1]:

$$d_h = 1000\frac{(ah3838\sqrt{h}) - ahd}{h^2 + 3838d\sqrt{h}}$$

e.g. if a = 0.730 m, h = 12.5 m, and d = 300 m



then d_h = 30.0 mm

where:

d_h = distance below horizon (mm)
a = distance between the observer's eye and the ruler when observer's arm is fully out-stretched (m)
h = height of the observer's eye above the water at the observation point (m)
d = distance to be estimated (m; a separate calculation is required for each of 50, 100, 200, 300)

Distances are easily estimated using a gauge made from a transparent plastic ruler. A different ruler will be required for each combination of observer arm length (a) and platform height (h). Calculate d_h for the boundary of each distance class (A, B, C, D) and mark them on the ruler (dashed lines in figure). To use the gauge, extend the arm fully and keep the top end of the ruler aligned with the horizon. The dashed lines now demark the distance class boundaries on the ocean surface. Keep the gauge nearby during surveys to quickly verify bird distances.

Measurements for an observer with a = 73 cm and h = 12.5 m:

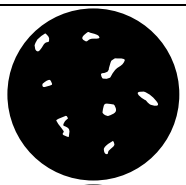
[1] Formula derived by J. Chardine, based on Heinemann 1981. A spreadsheet is available from the corresponding author to perform this calculation.

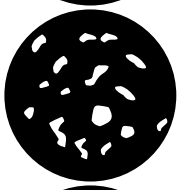
APPENDIX II. Codes for general weather conditions and glare

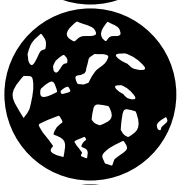
Code	Description	Explanation
	Weather conditions	
0		< 50% cloud cover (with no fog, rain, or snow)
1		> 50% cloud cover (with no fog, rain, or snow)
2		patchy fog
3		solid fog
4		mist/light rain
5		medium to heavy rain
6		fog and rain
7		snow
	Glare conditions	
0		none
1		slight/grey
2		bright on the observer's side of vessel
3		bright and forward of vessel

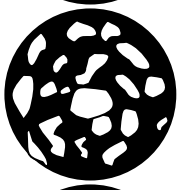
APPENDIX III. Codes for sea state and Beaufort wind force

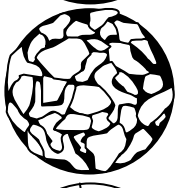
Wind Speed (knots)	Sea state code and description	Beaufort wind force and description
0	**0** Calm, mirror-like	**0** calm
01 – 03	**0** Ripples with appearance of scales but crests do not foam	**1** light air
04 – 06	**1** Small wavelets, short but pronounced; crests do not break	**2** light breeze
07 – 10	**2** Large wavelets, crests begin to break; foam of glassy appearance; perhaps scattered white caps	**3** gentle breeze
11 – 16	**3** Small waves, becoming longer; fairly frequent white caps	**4** moderate breeze
17 – 21	**4** Moderate waves with more pronounced form; many white caps; chance of some spray	**5** fresh breeze
22 – 27	**5** Large waves formed; white foam crests more extensive; probably some spray	**6** strong breeze
28 – 33	**6** Sea heaps up; white foam from breaking waves blows in streaks in direction of wind	**7** near gale
34 – 40	**6** Moderately high long waves; edge crests break into spindrift; foam blown in well-marked streaks in direction of wind	**8** gale
41 – 47	**6** High waves; dense streaks of foam in direction of wind; crests of waves topple and roll over; spray may affect visibility	**9** strong gale
48 – 55	**7** Very high waves with long overhanging crests; dense foam streaks blown in direction of wind; surface of sea has a white appearance; tumbling of sea is heavy; visibility affected	**10** storm
56 - 63	**8** Exceptionally high waves; sea is completely covered with white patches of foam blown in direction of wind; edges blown into froth; visibility affected	**11** violent storm
64 +	**9** Air filled with foam and spray; sea completely white with driving spray; visibility seriously affected	**12** hurricane

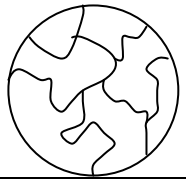












APPENDIX IV. Codes for ice conditions

Adapted from NOAA: Observers Guide to Sea Ice

Sea Ice Forms

Code	Name	Description
0	New	small, thin, newly formed, dinner plate-sized pieces
1	Pancake	rounded floes 30 cm - 3 m across with ridged rims
2	Brash	broken pieces < 2 m across
3	Ice Cake	level piece 2 - 20 m across
4	Small Floe	level piece 20 - 100 m across
5	Medium Floe	level piece 100 -500 m across
6	Big Floe	level, continuous piece 500 m - 2 km across
7	Vast Floe	level, continuous piece 2 - 10 km across
8	Giant Floe	level, continuous piece > 10 km across
9	Strip	a linear accumulation of sea ice < 1 km wide
10	Belt	a linear accumulation of sea ice from 1 km to over 100 km wide
11	Beach Ice or Stamakhas	irregular, sediment-laden blocks that are grounded on tidelands, repeatedly submerged, and floated free by spring tides
12	Fast Ice	ice formed and remaining attached to shore

Sea Ice Concentration

Code	Concentration	Description	
0	< one tenth	"open water"	
1	two-three tenths	"very open drift"	
2	four tenths	"open drift"	
3	five tenths	"open drift"	
4	six tenths	"open drift"	
5	seven to eight tenths	"close pack"	
6	nine tenths	"very close pack"	
7	ten tenths	"compact"	

APPENDIX V. Species codes for birds seen in Eastern Canada

Common name	Species code	Latin name
COMMON, REGULAR OR FREQUENTLY SEEN SPECIES		
Northern Fulmar	NOFU	*Fulmarus glacialis*
Great Shearwater	GRSH	*Puffinus gravis*
Manx Shearwater	MASH	*Puffinus puffinus*
Sooty Shearwater	SOSH	*Puffinus griseus*
Wilson's Storm-Petrel	WISP	*Oceanites oceanicus*
Leach's Storm-Petrel	LESP	*Oceanodroma leucorhoa*
Northern Gannet	NOGA	*Morus bassanus*
Red Phalarope	REPH	*Phalaropus fulicaria*
Red-necked Phalarope	RNPH	*Phalaropus lobatus*
Long-tailed Jaeger	LTJA	*Stercorarius longicaudus*
Parasitic Jaeger	PAJA	*Stercorarius parasiticus*
Pomarine Jaeger	POJA	*Stercorarius pomarinus*
Great Skua	GRSK	*Stercorarius skua*
Herring Gull	HERG	*Larus argentatus*
Iceland Gull	ICGU	*Larus glaucoides*
Glaucous Gull	GLGU	*Larus hyperboreus*
Great Black-backed Gull	GBBG	*Larus marinus*
Black-legged Kittiwake	BLKI	*Rissa tridactyla*
Common Murre	COMU	*Uria aalge*
Thick-billed Murre	TBMU	*Uria lomvia*
Razorbill	RAZO	*Alca torda*
Dovekie	DOVE	*Alle alle*
Atlantic Puffin	ATPU	*Fratercula arctica*
SPECIES MORE COMMONLY SEEN INSHORE		
Common Loon	COLO	*Gavia immer*
Red-throated Loon	RTLO	*Gavia stellata*
Red-necked Grebe	RNGR	*Podiceps grisegena*
Horned Grebe	HOGR	*Podiceps auritus*
Great Cormorant	GRCO	*Phalacrocorax carbo*
Double-crested Cormorant	DCCO	*Phalacrocorax auritus*
Greater Scaup	GRSC	*Aytha marila*
Common Eider	COEI	*Somateria mollissima*
Harlequin Duck	HARD	*Histrionicus histrionicus*
Long-tailed Duck	LTDU	*Clangula hyemalis*
Surf Scoter	SUSC	*Melanitta perspicillata*
Black Scoter	BLSC	*Melanitta nigra*
White-winged Scoter	WWSC	*Melanitta fusca*
Red-breasted Merganser	RBME	*Mergus serrator*
Black Guillemot	BLGU	*Cepphus grylle*

Common name	Species code	Latin name
INFREQUENTLY OR RARELY SEEN SPECIES		
Cory's Shearwater	COSH	*Calonectris diomedea*
Audubon's Shearwater	AUSH	*Puffinus lherminieri*
Lesser Scaup	LESC	*Aythya affinis*
King Eider	KIEI	*Somateria spectabilis*
South Polar Skua	SPSK	*Stercorarius maccormicki*
Bonaparte's Gull	BOGU	*Larus philadelphia*
Ivory Gull	IVGU	*Pagophila eburnea*
Black-headed Gull	BHGU	*Larus ridibundus*
Laughing Gull	LAGU	*Larus articilla*
Ring-billed Gull	RBGU	*Larus delawarensis*
Lesser Black-backed Gull	LBBG	*Larus fuscus*
Sabine's Gull	SAGU	*Xema sabini*
Common Tern	COTE	*Sterna hirundo*
Arctic Tern	ARTE	*Sterna paradisaea*
Roseate Tern	ROTE	*Sterna dougallii*
CODES FOR BIRDS IDENTIFIED TO FAMILY OR GENUS		
Unknown Bird	UNKN	
Unknown Shearwater	UNSH	*Puffinus* or *Calonectris*
Unknown Storm-Petrel	UNSP	Hydrobatidae
Unknown Duck	UNDU	Anatidae
Unknown Eider	UNEI	*Somateria*
Unknown Phalarope	UNPH	*Phalaropus*
Unknown Jaeger	UNJA	*Stercorarius*
Unknown Skua	UNSK	*Stercorarius*
Unknown Gull	UNGU	Laridae
Unknown Tern	UNTE	*Sternidae*
Unknown Alcid	ALCI	Alcidae
Unknown Murre or Razorbill	MURA	*Uria* or *Alca*
Unknown Murre	UNMU	*Uria*

APPENDIX VI. Codes for associations and behaviours

From Camphuysen and Garthe (2004). Choose one or more as applicable.

Code	Description
Association	
10	Associated with fish shoal
11	Associated with cetaceans
13	Associated with front (often indicated by distinct lines separating two water masses or concentrations of flotsam)
14	Sitting on or near floating wood
15	Associated with floating litter (includes plastic bags, balloons, or any garbage from human source)
16	Associated with oil slick
17	Associated with sea weed
18	Associated with observation platform
19	Sitting on observation platform
20	Approaching observation platform
21	Associated with other vessel (excluding fishing vessel; see code 26)
22	Associated with or on a buoy
23	Associated with offshore platform
24	Sitting on offshore platform
26	Associated with fishing vessel
27	Associated with or on sea ice
28	Associated with land (e.g., colony)
50	Associated with other species feeding in same location

Code	Description	Explanation
Foraging behaviour		
30	Holding or carrying fish	carrying fish towards colony
32	Feeding young at sea	adult presenting prey to attended chicks (e.g., auks) or juveniles (e.g., terns)
33	Feeding	method unspecified (see behaviour codes 39,40,41,45)
36	Aerial pursuit	kleptoparisitizing in the air
39	Pattering	low flight over the water, tapping the surface with feet while still airborne (e.g., storm-petrels)
40	Scavenging	swimming at the surface, handling carrion
41	Scavenging at fishing vessel	foraging at fishing vessel, deploying any method to obtain discarded fish and offal; storm-petrels in the wake of trawlers picking up small morsels should be excluded
44	Surface pecking	swimming birds pecking at small prey (e.g., fulmar, phalaropes, skuas, gulls)
45	Deep plunging	aerial seabirds diving under water (e.g., gannets, terns, shearwaters)
49	Actively searching	persistently circling aerial seairds (usually peering down), or swimming birds frequently peering (and undisturbed by observation platform) underwater for prey
General behaviour		
60	Resting or apparently sleeping	reserved for sleeping seabirds at sea
64	Carrying nest material	flying with seaweed or other material; not to be confused with entangled birds
65	Guarding chick	reserved for auks attending recently fledged chicks at sea
66	Preening or bathing	birds actively preening feathers or bathing
Distress or mortality		
71	Escape from ship (by flying)	escaping from approaching observation platform
90	Under attack by kleptoparasite	bird under attack by kleptoparasite in an aerial pursuit, or when handling prey at the surface
93	Escape from ship (by diving)	escaping from approaching observation platform
95	Injured	birds with clear injuries such as broken wings or bleeding wounds
96	Entangled in fishing gear or rope	birds entangled with rope, line, netting or other material (even if still able to fly or swim)
97	Oiled	birds contaminated with oil
98	Sick/unwell	weakened individuals not behaving as normal, healthy birds, but without obvious injuries
99	Dead	bird is dead

Birds and Oil - CWS Response Plan Guidance

March 29, 2017
Report No. Doc 613-1671431

Birds and Oil - CWS Response Plan Guidance

In all circumstances where a polluter is identified the burden of cleanup and response lies with the polluter. However, responsibility for government overview of a response to an oil spill depends on the source of the spill. The identified **lead agency** has responsibility to monitor an oil spill response and to take control if an appropriate response is not undertaken by a polluter or their agent.

Lead agency responsibilities lie with:

- **Environment Canada**
  - For spills and incidents on federal lands and from federal vessels
  - Potentially for land-based incidents in waters frequented by fish
  - May take lead if environment is not being protected by other leads, Cabinet Directive 1973
- **Canadian Coast Guard**
  - For spills from ships
  - All spills of unknown sources in marine environment
- **Provincial Department of Environment**
  - For spills from land-based sources
- **Canada-Newfoundland and Labrador Offshore Petroleum Board (C-NLOPB) and Canada-Nova Scotia Offshore Petroleum Board (C-NSOPB)**
  - For spills related to offshore oil and gas exploration and production
- **Transport Canada**
  - To investigate ship source and mystery spills in the marine environment

The Canadian Wildlife Service has the responsibility for licensing activities which involve the handling or disturbance of birds, and of providing advice and often direction to other agencies, responders and the polluter during oil spill incidents.

1. Hazing[1]

Purpose: Prevent birds from coming in contact with oil

Options:

- Hazing by helicopter
- Hazing by FRC or other watercraft
- Release of scare devices (e.g. Breco Buoys, Phoenix Wailer)
- Use of hazing sound makers: propane cannons, whizzers, bangers, pyrotechnic devices etc.

Scare devices have a limited range of influence and likely are not a viable option with a large slick. Use of Breco Buoys and Phoenix Wailers can be used but we consider them to be largely ineffective in the situation of a large slick. Logistically, helicopter hazing would be difficult unless it was possible for a helicopter to remain on a platform offshore overnight. Hazing by FRC or other vessels would be ideal.

[1] There are several scare techniques which may be effective and do not require a permit, however a permit under the Migratory Bird Regulations **is required** for the use of aircraft or firearms (defined as capable of emitting at projectile at more than 495 feet per second). Propane cannons, blank pistols or pyrotechnical pistols firing crackers shells with **less than 495fps are legal without a permit**. Most scare tactics are relatively short lived in terms of effectiveness as birds acclimatize to the disturbance so scare techniques should be alternated to be effective.

Short-term focused hazing by the most expedient means should be attempted to move the birds away from the slick, if logistical conditions permit. Vessels at the site should have the ability to use sound makers (propane canons, pyrotechnic devices) to disperse birds in local areas. Such equipment should be deployed immediately to these ships with trained personnel to operate them. The vessels on site should be tasked to actively search and monitor for congregations of birds which could be vulnerable to oiling. If such groups are found then attempts should be made to disperse the birds away from the oil.

2. Disperse oil

Purpose: Prevent birds from contacting oil by getting oil off the surface of the water as soon as possible.

Options:

- Dispersants
- Mechanical dispersal with FRCs or other vessels
- Natural dispersal by environmental conditions

For small spills, mechanical dispersal would be the preferred method.

3. Bird Collection[2]

Purpose: Implement a humane response to oiled birds as required by Environment Canada's National Policy on Oiled Birds and Oiled Species At Risk (http://www.ec.gc.ca/ee-ue/default.asp?lang=En&n=A4DD63E4-1)

Options:

- The only option would be a ship-based effort to detect and collect dead and live oiled birds, both within the slick and adjacent to it.

All vessels in or near the slick should understand the need to collect birds. All vessels should have dip-nets, large plastic collecting bags to hold dead birds, and cloth bags or cardboard boxes in which to hold live oiled birds. Efforts should be made to retrieve live oiled birds to ensure they are dealt with humanely.

4. Wildlife monitoring

Purpose: Determine potential impact of spill

Options:

- Ship-based surveys for oiled and unoiled wildlife
- Aerial surveys for oiled and unoiled wildlife. Will require structured surveys (e.g. strip or transect surveys of spill area)
- Placement of CWS staff on vessels and aircraft

[2] Only those individuals authorized to do so (nominee on an existing federal salvage permit) can be involved with the collection of migratory birds.

Dedicated ship-based bird surveys should be initiated immediately. Ideally arrangements should be made to have a CWS observer on vessels or flights. In addition trained seabird observers need to be placed on all vessels monitoring a slick. This should continue until the slick is dispersed.

5. Beached Bird Surveys

Purpose: Determine impact of spill on wildlife and retrieve any live oiled wildlife on beaches.

Options:

- Conduct daily beached bird surveys during the incident and until one week after slick has been removed or dissipated.

CWS or other government officials (CCG, Enforcement Officers) will oversee the collection of dead and live oiled birds[3] as instructed in CWS' protocol for collecting birds during an oil spill response. This would only be required in circumstances where a large number of birds are potentially oiled or if the spill occurs in a sensitive area.

6. Drift Blocks

Purpose: Drift blocks may be deployed in slick to provide an estimate of bird mortality.

Options:

- Release from vessel
- Release from aircraft

The deployment of drift blocks would only be expected if there was a large spill and blocks should be released as soon as possible after a spill (CWS should be consulted to determine protocol for drift block deployment and tracking). The polluter or their agent would be expected to ensure drift blocks are tracked and collected as appropriate.

7. Live oiled bird response

Purpose: Implement a humane response to oiled birds as required by Environment Canada's National Policy On Oiled Birds And Oiled Species At Risk

Options:

- Rehabilitation
- Euthanization

CWS will be consulted to determine the appropriate response and treatment strategies which may include cleaning and rehabilitation or euthanization. CWS policy specifically requires that species at risk or other species of concern be rehabilitated.

[3] Only those individuals authorized to do so (nominee on an existing federal salvage permit) can be involved with the collection of migratory birds.

ATTACHMENT E

DFO's Marine Foreshore Environmental Assessment Procedure

March 29, 2017
Report No. Doc 613-1671431

MARINE FORESHORE ENVIRONMENTAL ASSESSMENT PROCEDURE

Marine development projects have the potential to effect fish[1] and fish habitat[2]. Fisheries and Oceans Canada (DFO) is responsible for the protection and management of fish habitats under the authority of the *Fisheries Act* and may request plans, specifications and environmental assessments specific to marine projects where more detailed information is required. Assessments may be necessary for all types of projects, including, but not limited to aquaculture, log handling, industrial port development, marinas, private moorage facilities, marine repair facilities, pipeline or outfall installations, vessel launches or barge ramps, dredging projects and shoreline protection projects (breakwaters and seawalls). Presented below are standardized, transect-based assessment procedures intended to provide DFO with the basic information required to determine the potential effects of a development project on fish habitat.

Assessment Area

For comparative purposes, the assessment area should include both the foreshore site proposed for development as well as the adjacent foreshore. This will provide a context for the project and may provide data about cumulative effects if similar developments already occur on-site. A large scale site plan, preferably an enlargement of the hydrographic chart, with a small scale insert of the general geographic location will serve as a base map of the study area.

Tidal Height and Water Depth Measurements

The lowest normal tide (0.0 m), or chart datum, will be used as the reference point for the measurement of tidal height and water depth. Tidal height is recorded as positive relative to chart datum, while water depth below chart datum will be recorded as a negative value. For example, if the assessment is made when the tide is at 2 m, and observations are taken at a water depth of 6 m, then the depth will be recorded as -4 m. Tidal height will be corrected using the closest secondary port to the reference port found in the Canadian Tide and Current Tables, with further correction made for daylight savings time as required.

Transect Layout

Transects should be established perpendicular to the shoreline at regular intervals both within and adjacent to the proposed or active development area so as to sample representative fish habitat conditions. A preliminary low water reconnaissance or dive survey may be advisable to establish

---

[1] shellfish, crustaceans, marine animals and any parts of shellfish, crustaceans or marine animals, and the eggs, sperm, spawn, larvae, spat and juvenile stages of fish, shellfish, crustaceans and marine animals;

[2] shellfish, crustaceans, marine animals and any parts of shellfish, crustaceans or marine animals, and the eggs, sperm, spawn, larvae, spat and juvenile stages of fish, shellfish, crustaceans and marine animals;

appropriate boundaries for the assessment. Transects should begin at the highest high water mark (HHWM: distance referenced as Station 0.0 m) and, at a minimum, extend to a depth of -20 m (–30 m if the development has the potential to effect deeper benthic habitats). Though small-scale intertidal projects may only require intertidal transects, care must be taken to ensure that a representative sample is collected across the proposed development area. Procedural manuals are available from DFO if sampling of intertidal clam or benthic invertebrates is required. To ensure complete assessment of marine plants and animals in the photic zone, deeper transects may be necessary, especially to determine the effects of sunken debris or woodwaste accumulations resulting from existing developments. Transects should be spaced approximately 25 m apart, although this interval may vary depending on the width of the site. The number of transects required will depend on the nature of the foreshore development proposed, anticipated effects of the development, and local site conditions (tides and currents, geography, fetch, geology, etc.). Transects should be individually numbered and indicated on the site plan, and their commencement point referenced to benchmarks, where possible.

Recording Observations

Habitat inventories should be conducted during the more productive spring and summer months. At that time, algae and saltmarsh species are more readily identifiable, enabling a better assessment of the productive capacity of the site.

Observations should be recorded every 5 m along the transect or at significant changes in habitat type. Observations should include substrate type and composition, presence and relative abundance of marine animals and plants, and any other notable features (e.g., debris accumulations) using the following format:

Substrate

Substrate types are to be subdivided into the following size class categories:

- Bedrock
- Boulder (>256 mm diameter)
- Cobble (64-256 mm diameter)
- Gravel (2-64 mm diameter)
- Sand (0.0625-2 mm diameter)
- Silt/Mud/Clay (<0.0625 mm diameter)

Substrate types are recorded cumulatively as percentages out of a total of 100% (e.g., Boulder 5%; Cobble 15%; Gravel 60%, Sand 20%)

Marine Plants

Marine plants include rooted vascular vegetation (e.g., eelgrass, saltmarsh vegetation, etc.) and marine algae (e.g., rockweed, kelp, etc.). Marine plant observations are recorded as percent areal coverage estimated per 5 m × 1 m transect segment. Observations can be recorded as percentages (5%, 10%, 15%, etc.) or by utilizing the following areal coverage classes:

+	<5%
1	5-25%
2	>25-50%
3	>50-75%
4	>75-100%

Sessile Animals

Many marine animals permanently attached to substrates function as important fish habitat (e.g., barnacles, bay mussels, etc.). Sessile animals are recorded as percent areal coverage along the transect line using either estimated percentages or by areal coverage classes, as presented above.

Motile Animals

Motile animals include fish and marine invertebrates such as crabs and snails. These can be individually counted along the transect or, where too numerous, their estimated numbers can be recorded. Population estimates will most likely be applied to species such as herring or mysid shrimp that naturally occur in large numbers.

Other Features

Accumulations of wood bark and debris, sunken logs or other waste materials arising from onsite or nearby development activities should also be recorded. For wood bark and related small size debris, observations are recorded as percent areal coverage estimates per 5 m × 1 m transect segment and estimated deposition depth (e.g., 15% / 10 cm). For larger materials (sunken logs, wood chunks, etc.), observations can be recorded by individual piece count or by estimate of percent areal coverage.

Observations should be correlated to the transect distance from the HHWM and (corrected) tidal height or water depth (e.g., Sta. 0+80 m / +4.5 m), with information compiled in tabular form, by transect. Common names of observed animals and plants are acceptable for the data table; a species list with scientific names should, however, be appended to the report.

General marine plant categories (e.g., rockweed, eelgrass, bull kelp, saltmarsh, etc.) and any other notable features should be sketched to scale directly on a copy of the site plan, drawings or photographs of the site. A site profile should be prepared for each transect showing the slope of the foreshore and the location of indicator marine plants or invertebrates. A sketch of the proposed marine development should be superimposed over the site plan so that any potential effect of the project on fish habitat is clear. Compensatory habitat proposed for offsetting altered habitat should also be sketched on site maps and profiles to enable review of the positioning of replacement habitat relative to the project.

Photographic Documentation

It is essential to produce a photographic record along the intertidal and subtidal transects. A videographic record of subtidal transects is also recommended. Photos and videos provide a real-time record of characteristic fish habitat at the proposed site and can be invaluable to future post-development site monitoring. Photographic records also facilitate comparison of the productivity of natural habitats with any compensatory habitat constructed to offset habitat losses. As visibility may be a problem, careful attention should be given to appropriate tidal levels, and midday lighting conditions are recommended. Aerial photos, taken at low tide, are often useful to put the site into context with the surrounding area and to verify information provided from other sources.

Assessment reports should include photographs of representative fish habitat types. Depending upon the scope of the proposed foreshore development, an unedited, labelled copy of the assessment video may also be required for the report submission. The video footage should be referenced with pertinent information (e.g., time, date, depth, heading, etc.), and a written or recorded interpretation should accompany the video.

Summary of information to be submitted

1. Basemap showing tenure area boundaries, surrounding area, transect locations and sampling stations
2. Shoreline video/photographs of intertidal zone
3. Underwater video/photographs of transects
4. Tabular data for each transect describing substrate type and composition, marine plants, sessile and motile marine animals, and other notable features
5. Habitat map showing location of different substrate types, plants, animals and operational infrastructure
6. Profile diagrams of each transect showing slope, sediment types and the major marine plants or animals observed
7. Photographs of site and aerial photographs if available.

As a global, employee-owned organisation with over 50 years of experience, Golder Associates is driven by our purpose to engineer earth's development while preserving earth's integrity. We deliver solutions that help our clients achieve their sustainable development goals by providing a wide range of independent consulting, design and construction services in our specialist areas of earth, environment and energy.

ATTACHMENT A

ADIOS2 Hypothetical Spill Modelling Inputs and Outputs

1.0 INTRODUCTION

This report presents a desktop level assessment of potential diesel fuel spill risk in the marine environment related to the Meliadine Gold Project (Project). The effects of fuel spills on sensitive biological receptors such as marine mammals and marine birds are discussed in Section 8.3.6.5 of the Final Environmental Impact Statement (FEIS) for the Meliadine Project. Golder Associates Inc. (Golder) has applied a modified version of the risk assessment strategy presented in ITOPF-TIP16 Contingency Planning for Marine Oil Spills (ITOPF 2011) based on existing Project information and available biophysical data in the Project area. This report includes an overview of oil spills in Canadian waters and potential open-water P50 diesel spills near Melvin Bay (ship-to-shore and ship-to-ship fuel transfer areas near Rankin Inlet) and along the primary deep-draught shipping route used by Project vessels during Project construction and operations phases (Figure E-1). The behavior of a diesel fuel spill in the marine environment was assessed at 14 different hypothetical spill locations in the Project area, considering aspects of evaporation, dispersion, spreading and potential distance traveled from the spill location. Five locations near Melvin Bay were considered in the assessment as these corresponded with ship-to-shore and ship-to-ship fuel transfer areas where a higher potential for fuel spills would occur (Figure E-1). Nine locations along the shipping route were also considered in the assessment as these corresponded with navigation zones in close proximity to islands or known sensitive/important coastal areas for marine mammals and/or marine birds; including Walrus Island, Coats Island, Ungava Peninsula, and Eastern Hudson Strait (Figure E-1). This assessment considered a low-probability, large spill scenario of 2 Million Litres (ML) (2,000 cubic metres [m^3]) of P50 diesel and a worst case spill scenario of 20 ML (20,000 m^3) of P50 diesel released at sites in Melvin Bay and along the shipping route. An additional spill scenario of a 100,000 litres (L) (100 metres m^3) spill was also considered at the ship-to-ship and ship-to-shore fuel transfer sites near Melvin Bay, representing smaller spills that could occur during fuel transfer activities.

The Project is primarily land-based with operations in the marine environment limited to six fuel tanker transits to Rankin Inlet from eastern North America during the open-water season (approximately August to October), and subsequent transfer of this fuel to shore using established fuel transfer locations near Melvin Bay. There were no Project-specific meteorological or oceanographic data collected as part of the baseline assessment for the Project; therefore, this assessment is based solely on information from existing literature and available third party data. Because of the limited marine operations planned for the Project, resulting in an overall low probability of a spill, this analysis was conducted with a simple fuel weathering model that does not include detailed hydrodynamic modelling.

2.0 OIL SPILLS IN CANADIAN WATERS

No information is available in the public domain/published literature related to existing fuel spill rates (e.g., frequency of spills) in the Hudson Bay region, although broader-scale information is available. The Arctic Monitoring and Assessment Programme (AMAP 2010) conducted an assessment of the effects of oil and gas activities in the Canadian Arctic to quantify the potential impacts from oil spills to the Arctic ecosystem and human health. Spills in the Arctic are considered rare and are typically associated with tanker traffic, with the most common location of spills occurring near ports (ITOPF 2011). From 1972 to 2003, a total of 1,226 oil spills were reported in the Canadian Arctic region; equivalent to a total volume of 3.3 ML (3,300 m^3) and a spill frequency of 2.5 spills per year. Of this total, 75 spills consisted of diesel fuel, equivalent to 334,000 L (334 m^3) and a frequency of one spill every 0.4 years (AMAP 2010).

Transport Canada commissioned WSP (formerly GENIVAR) to prepare a risk assessment for marine ship-based spills in Canadian waters north of the 60° North parallel (WSP 2014a). The study found the probability of oil spills in the Canadian Arctic is significantly lower than in the rest of Canada primarily due to the lower vessel traffic and volumes of oil transported. For the years 2002 to 2011, the volume of refined cargo products transported in the Arctic represented 0.18% of total volumes in Canada. The risk assessment found there to be a very low risk across the Canadian Arctic for a ship-source oil spill, however, the risk is slightly higher for the Hudson Strait and the coast of Labrador, mostly due to higher volumes of oil transported and traffic in these areas. Estimates of fuel spill frequency rates in the Arctic ranged from a return period of 285 years (i.e., one spill approximately every 285 years) for small spills (10 to 99.9 m^3) to 920 years for medium spills (100 to 999.9 m^3) and 92,000 years for large spills (1,000 to 9999.9 m^3) (WSP 2014a). According to the study, the frequency estimate for spills larger than 10,000 m^3 (10 ML) is zero for fuel oil and refined cargo products due to the lack of historical spills in this size range.

The trends of spill frequency have decreased over time due to improved technology, navigation, construction of vessels, and more stringent regulations (AMAP 2010; Anderson et al. 2012; WSP 2014b). Marine transportation in the Arctic is limited due to seasonal presence of ice. The lower frequency of ship transits in the Arctic region will downward bias spill rates calculated from Arctic data when compared to global statistics of spill frequency. However, as climate change causes a decrease in ice cover and the potential for transportation and other industrial activities in the Arctic increases, potential for spills may increase as well.

A study titled “Probability of Oil Spills from Tankers in Canadian Waters” by SL Ross Environmental Research Ltd. (SL Ross) predicts the frequency of oil spills from tankers in various areas of Canada (SL Ross 1999). The expected spill rate per year is calculated by multiplying the tonnage of oil loaded and unloaded at Canadian ports by spill frequencies derived from historical statistics. The expected spill rates for large (> 159,000 L) medium (8,000 to 159,000 L), and small (< 8,000 L) spills of product oil is 2.5, 12.3, and 36 spills per 10^8 ML loaded or unloaded per year, respectively.

3.0 MARINE TRANSPORT OF DIESEL FUEL FOR THE MELIADINE PROJECT

The FEIS for the Meliadine Project states that approximately 122 ML (122,000 m^3) of P50 diesel fuel will be delivered annually during operations. P50 is an Arctic diesel fuel with a lower temperature pour point than other diesel fuels. Based on the total volume of diesel fuel that will be transported throughout the life of the Project and spill rates reported by SL Ross (1999), the overall likelihood of a fuel spill for the Project is once every 36 years for small spills and once every 526 years for large spills. The approximate Project life that includes construction, operations, and closure is 18 years.

During construction and operations, approximately six large tankers will arrive to deliver P50 diesel fuel throughout the open-water shipping season. Each vessel trip will deliver approximately 20 ML (20,000 m^3) of P50 diesel fuel. The large tankers will anchor in deeper waters outside of Melvin Bay upon arrival in Rankin Inlet (Figure E-1). Large tanker to small tanker transfer of diesel fuel will occur at the large freighter anchor location. The carrying capacity of the small tanker will be either 7,300 m^3 or 10,500 m^3, depending on which vessel is used. Therefore, each of the six large tanker deliveries will take two to three trips to offload all of the fuel. The small tankers will anchor opposite Itivia and a floating pipeline of some 300 to 500 metres (m) will connect to a shore-based pipeline for transfer of fuel to the Project tank farm located near Itivia in Rankin Inlet. Fuel will be transferred through the pipeline at approximately 400 cubic metres per hour (m^3/h) for about 18 to 26 hours (h), depending on the carrying capacity of the small tanker. Agnico Eagle Mines Limited (AEM) has prepared an Oil Pollution Emergency Plan (SD 8-2) that details necessary actions to be implemented to reduce or minimize the loss of diesel fuel. Communication between the small tanker and the shore will be maintained throughout the transfer to safeguard the transfer of the diesel and to avoid overfilling of the tanks.

4.0 WEATHERING PROCESSES OF OIL SPILLS

The fate, toxic effect and weathering of an oil spill depends on the specific gravity, pour point, viscosity, chemical composition of refined and non-refined components, volume released, area of spreading, and the environmental conditions involved (ITOPF 2002). Environmental conditions include wind speed and direction, water depth, wave energy, solar radiation, current speed and direction, water temperature and distance to land. The weathering processes include dispersion, evaporation, spreading, adsorption to sediments, biodegradation, dissolution, emulsification, and photo oxidation (Figure E-2). Dispersion, evaporation, and spreading are the primary processes for determining fate and transport of diesel fuel, which is the primary fuel type being used for the Project. Oil dispersion is largely dependent upon the type of oil and the sea state, dispersing most rapidly with low viscosity oils, in the presence of breaking waves (ITOPF 2002). The rate of evaporation depends on ambient temperatures, wind speeds, and type of fuel. Spreading of the slick depends to a great extent on the viscosity of oil, the volume and the wind stress on the slick and surface water (Lehr et al 2002).

Diesel fuel has a low viscosity and will weather rapidly when spilled into the marine environment (NOAA 2006). With a lower density than water, diesel fuel will tend to stay on the water surface and be readily dispersed by wave action. Over 90% of a small spill of diesel in the marine environment is either evaporated or naturally dispersed over a time scale of several hours to days (NOAA 2006).

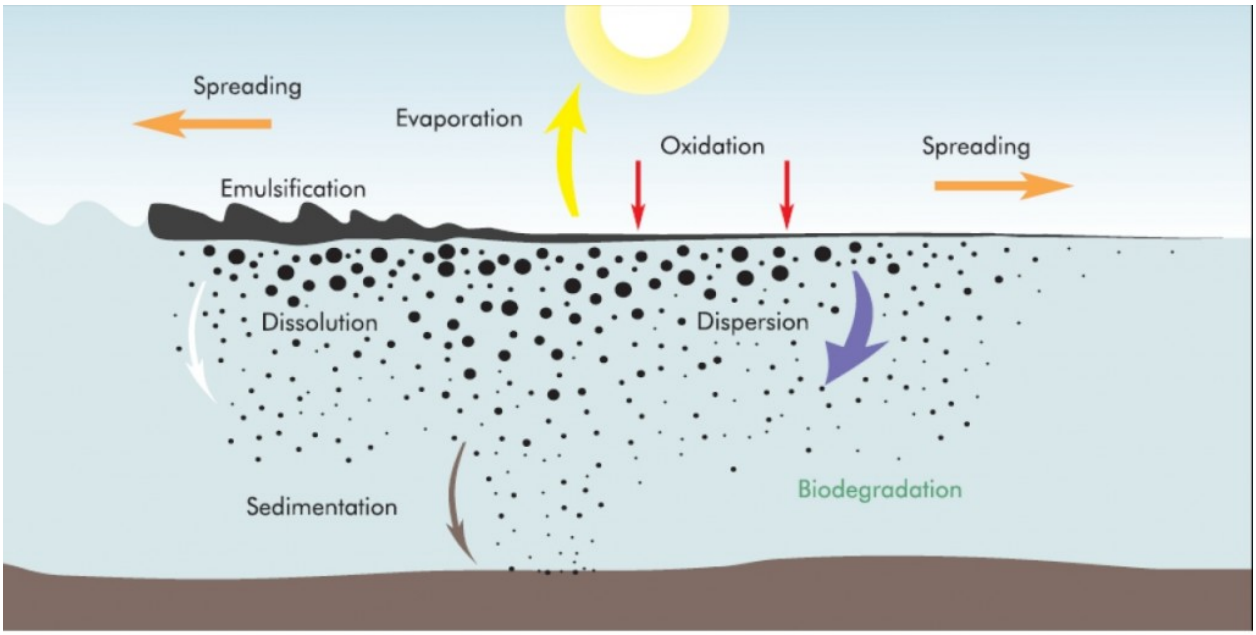

Figure E-2: Weathering Processes Action on Spilled Oil. Source: ITOPF 2002

5.0 OIL SPILL INTERACTION WITH SEA ICE

This section provides a summary of the potential ice conditions along the transportation route during the months of August to October and addresses potential effects of oil and fuel interactions and dispersion on ice covered waters in the event of a spill. The ADIOS model does not incorporate oil-ice interaction in its algorithms. Other models like the Oil Weathering Model (OWM) and Sea Ice-Ocean-Oilspill Modelling System (SIOMS) do, but they are still under development. The limited marine operation for the Project and the lack of data along the route limits the necessity and applicability of ice process-based models to this Project.

5.1 Sea Ice along the Transit Corridor

Hudson Bay is usually completely covered by ice by December or January and typically free of ice from August to October (Gagnon and Gough 2005). Sea ice in southwestern Hudson Bay typically does not breakup until well into the summer because winds and ocean currents tend to push large accumulations of ice into this region (Etkin 1991). The presence of sea ice into summer keeps waters of Hudson Bay at lower temperatures in comparison with other regions situated at similar latitudes. Hudson Bay is an enclosed bay sheltered by land with limited narrow access channels to larger ocean basins. Therefore, Hudson Bay water temperature, sea ice flows, and circulation are not strongly influenced by ice flows from other ocean basins. Instead, Hudson Bay dynamics are primarily controlled by local meteorological and micro-climate influences such as local wind and air temperature variations (Saucier and Dionne 1998; Gagnon and Gough 2005).

Ice melt starts in May and June, as an open water area develops along the northwestern shore, and a narrow coastal lead (i.e., space between ice floes, refer to Figure E-6) develops around the rest of the Bay. Open water

starts to appear and expand around the shorelines in June and July. By the end of July, large patches of ice are limited to only the southern reaches of the Bay (CIS 2011). Figure E-3 shows that along the transportation route, the average ice break-up dates occur on July 2 for most of the route and on June 18 on the west side of Hudson Bay near Rankin Inlet.

Normal clearing of the pack ice progresses southward from the Chesterfield Inlet - Southampton Island area and westward from Eastern Hudson Bay. The melting of sea ice is a slow process which accelerates in July as air and water temperatures begin to warm with increased summer solar radiation. The ice pack in Hudson Bay typically breaks up into several large patches of ice prior to finally clearing in August (CIS 2011).

Sea ice typically begins to form along the northwestern shores of Hudson Bay in late October. Ice flows from Foxe Basin may also start to move into northeastern Hudson Bay in late fall. In November, the sea ice begins to accumulate and thicken as prevailing winds push it east and southeast toward the margins of the Bay. Finally, by December, Hudson Bay becomes covered with first-year ice, which continues to thicken into the winter months (CIS 2011).

In Hudson Strait, freeze-up starts as early as mid-October and as late as the first week of December as shown in Figure E-4, while complete clearing has occurred as early as late as July and as early as September. Sea ice in Hudson Strait and Ungava Bay is mostly formed locally but winds and currents can carry floes from Foxe Basin or Davis Strait into these areas. Freeze-up typically starts in western Hudson Strait and ice formation progresses eastward over the late fall months and cover the entire Hudson Strait by December (CIS 2011).

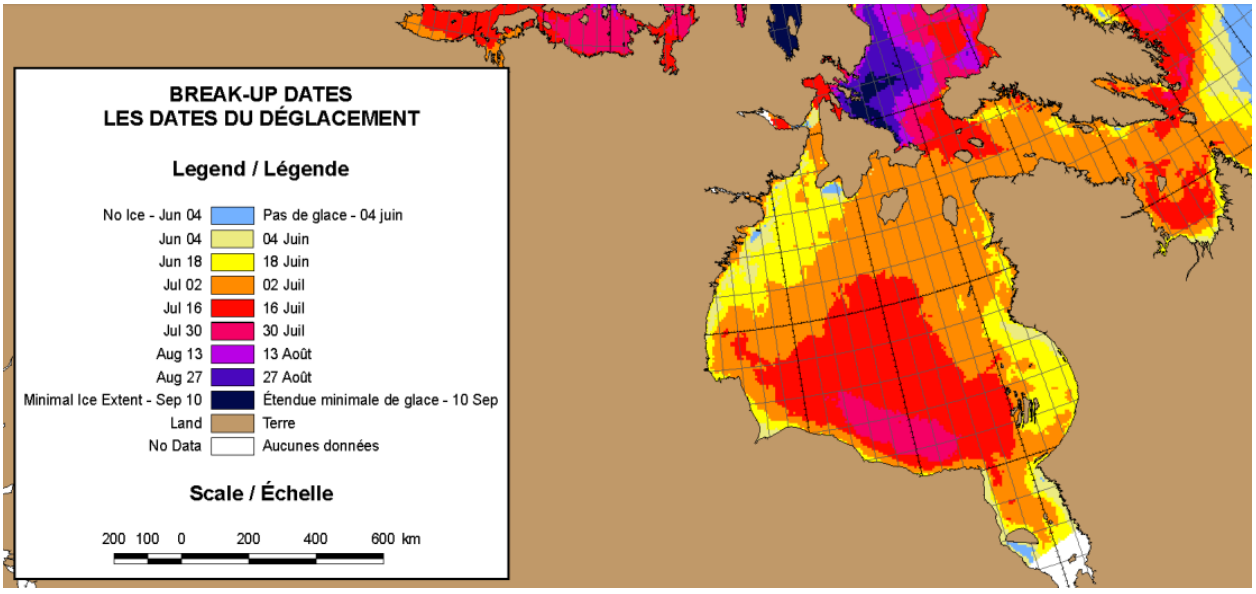

Figure E-3: Ice break-up and dates at Hudson Bay and Hudson Strait, source: CIS (2011)

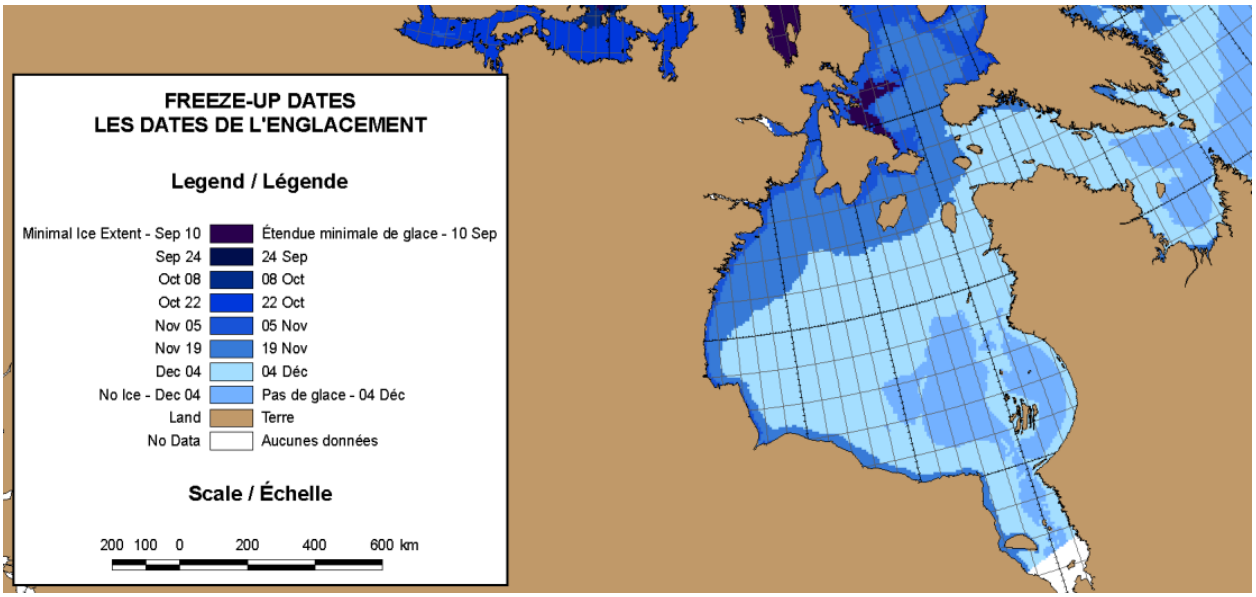

Figure E-4: Ice freeze-up dates at Hudson Bay and Hudson Strait, source: CIS (2011)

Ice-break up along the transportation route break-up occurs on June 18 in northwestern Hudson Bay in northeastern Hudson Bay as shown in Figure E-3. Therefore, early June and July are the months of greatest relevance in terms of potential oil spill interaction with sea ice.

The dates of ice freeze-up and break-up are derived from sea ice concentration data, which refers to the proportional surface area, covered by ice and is categorized over a range presented as fractional tenths (0 to 10/10). The ice break-up date represents the earliest day of the year when ice concentration reaches 5/10 or less. The ice freeze-up date represents the earliest day of the year when ice concentration reaches 5/10 or more (Gagnon and Gough 2005).

Figure E-5 presents ice concentration maps of Hudson Bay from July to November taken from the Sea Ice Climatic Atlas prepared by CIS (2011). The following observations are made from Figure E-5:

- In July (Figure E-5a), the median concentration of ice along the eastern portion of the transportation route is around 3-4/10 (open drift ice) and close pack fast ice (8-9/10) is expected on the northwest shoreline;
- The area within the route is considered ice-free for the months of August (Figure 8.2-B-4a), September (Figure E-5b) and October (Figure E-5c); and
- During November, freeze-up is expected on the northwest shoreline (4-9/10) and south shoreline of Southampton Island.

According to Dickins (2011), 1-5/10 drift ice conditions represent the greatest challenge in terms of spill containment and recovery. For ice concentrations of 6/10 and greater, spilled oil will tend to move at similar drift rates as sea ice. The intrusion of drift ice from Foxe Basin could interfere with Project vessels along the navigation route during the open water season from August to October.

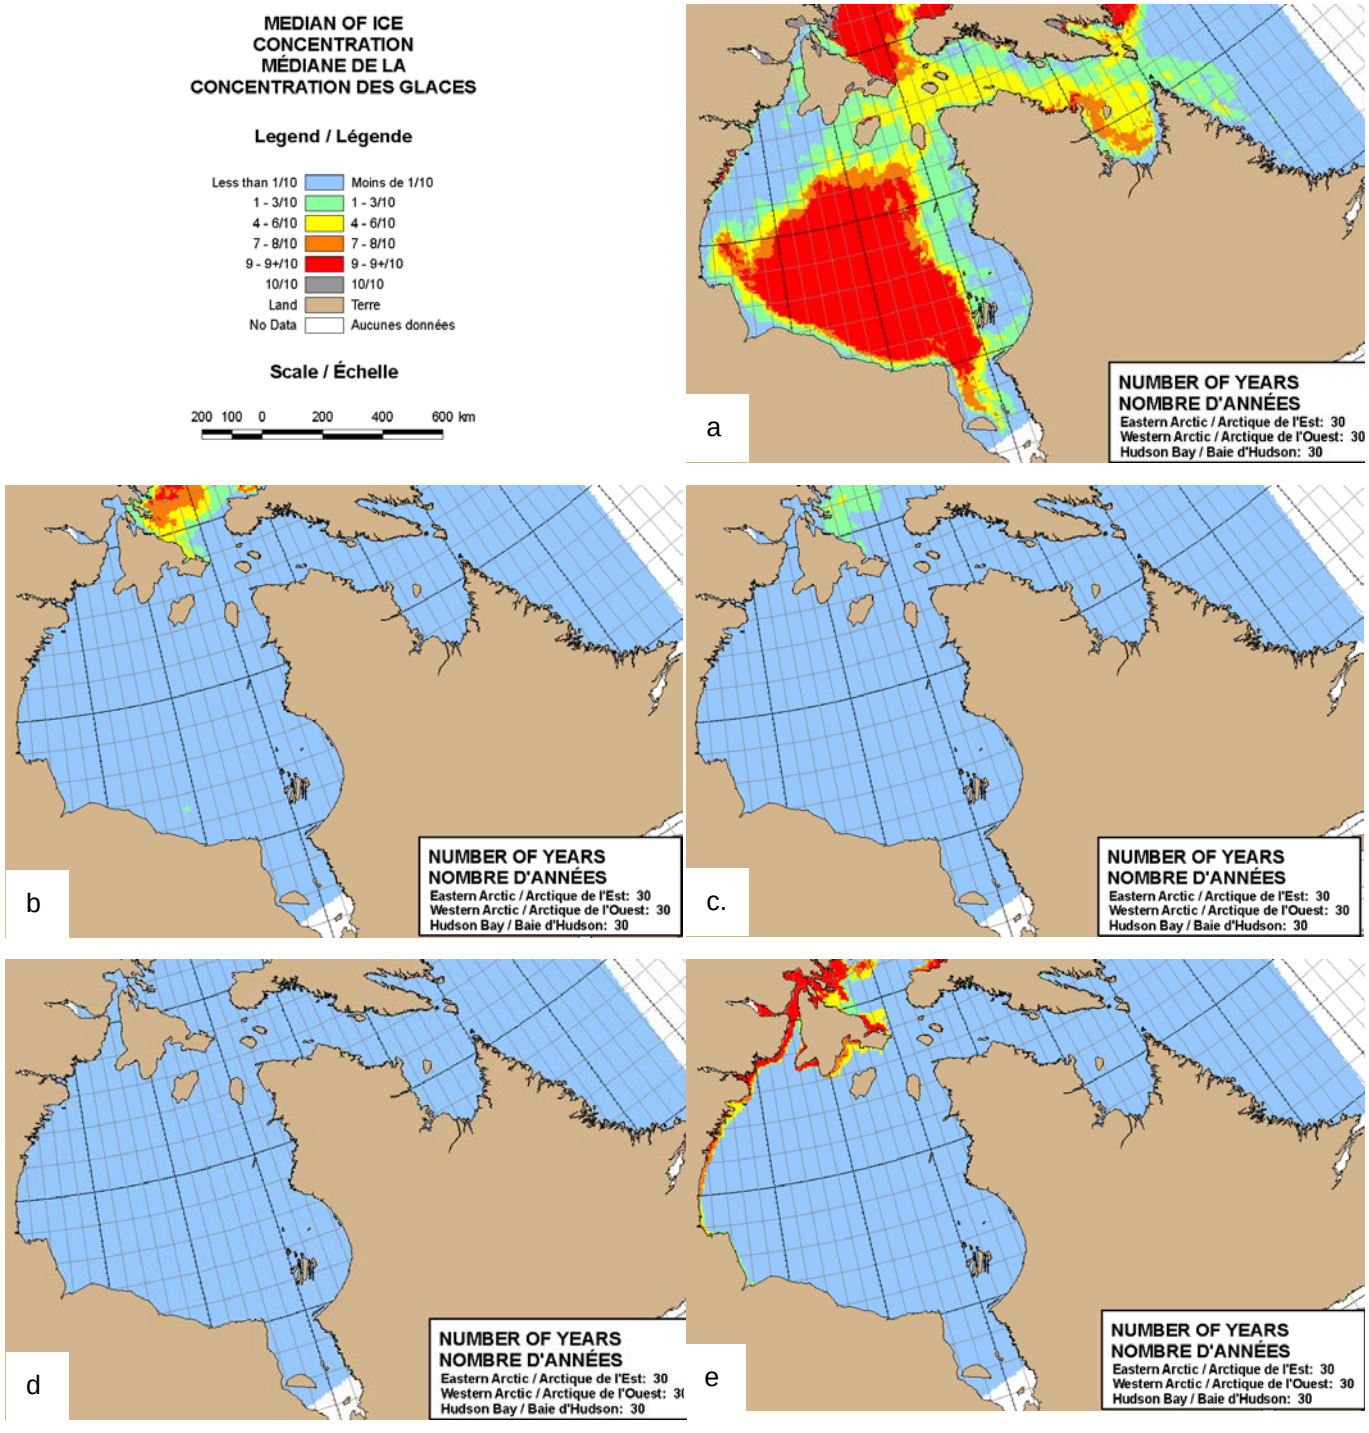

Figure E-5: Median of ice concentration in Hudson Bay and Hudson Strait during a) July, b) August, c) September, d) October and e) November, source: CIS (2011)

5.2 Ice Dispersion of a Potential Oil Spill

The behaviour of a spill in ice-covered waters is determined by the sea ice conditions at the time of the spill. Sea ice can be present in the seawater in multiple forms. A thorough understanding of the ice condition, ice coverage, energy conditions and the type of the spill and oil properties may help inform the study to determine the potential spill behaviour and fate and, consequently, improve the effectiveness for human response strategies to different spill events.

Several experiments described in Dickins (2011) have been designed to evaluate the response of the spill in different ice conditions: on and under drift and closed pack and fast ice, on surface melt pools, on snow and ice, in slush between floes, and under ice floes. Figure E-6 presents a schematic showing a range of ice and oil interactions resulting from oil spills in ice-covered waters.

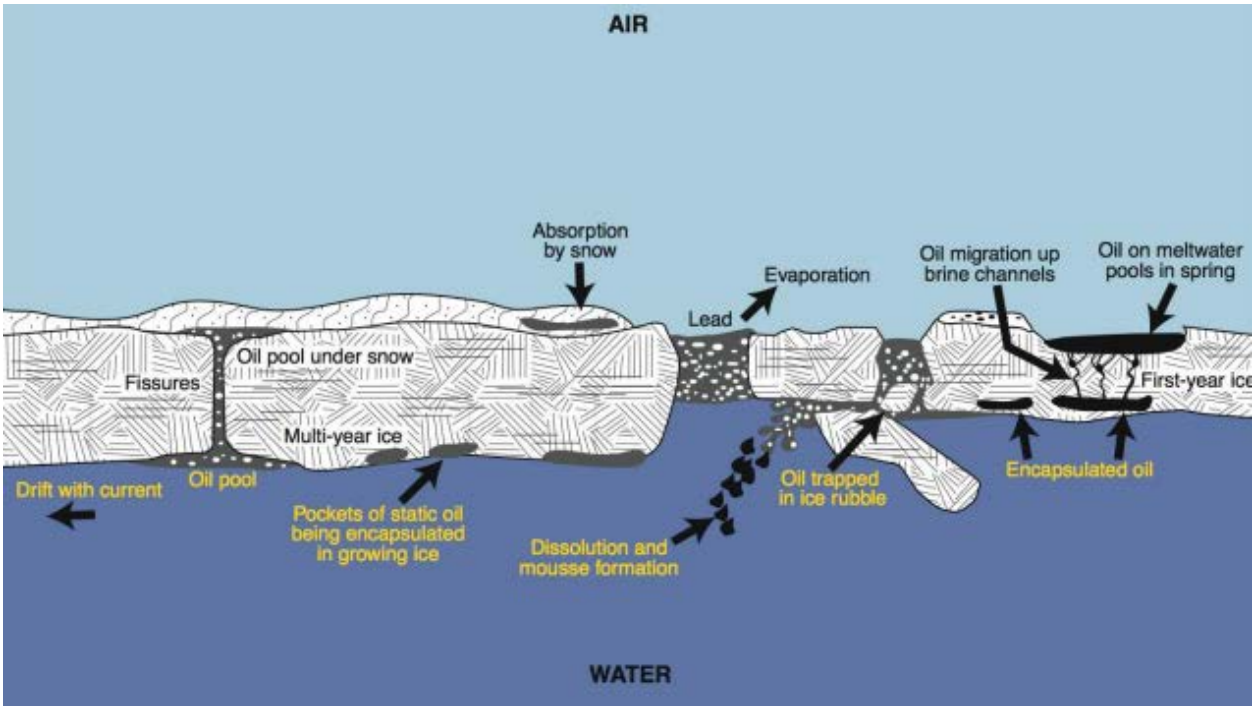

Figure E-6: Schematic showing ice and oil interactions (source: Dickins, 2011; derived from original sketch by A. Allen)

For the purposes of this study, the oil type P50 diesel fuel is examined. Some characteristics of P50 diesel are listed below:

- Most crude oils and light products such as diesel and gasoline experience significant evaporation (Potter et al. 2012);
- Small diesel spills usually evaporate and disperse naturally within a day for spills of 500 to 5,000 gallons, even in cold water (NOAA 2016);
- Diesel oil spreads very quickly to a thin film of rainbow and silver sheens (NOAA 2016);

- Diesel has a very low viscosity and is readily dispersed into the water column when winds reach 5-7 knots or with breaking waves (NOAA 2016);
- Since diesel is much lighter than seawater it is not possible to sink and accumulated on the seafloor (NOAA 2016);
- Wave action can disperse diesel to form droplets that are small enough to be kept in suspension and moved by the currents (NOAA 2016);
- Moderately volatile; will leave residue (up to one-third of spill amount) after few days (OSHA 2013);
- Moderate concentrations of toxic (soluble) compounds (OSHA 2013);
- Will “oil” intertidal resources resulting in potential for long-term contamination (OSHA 2013); and
- Cleanup can be very effective (OSHA 2013).

Table E-1 outlines different oil spill response methods for oil releases in cold and icy conditions, including a description of advantages and disadvantages for each method, as described by Lampala (2011).

Table E-1: Response Methods Used on Oil Spill Events

Method	Description
Mechanical recovery	From the environmental point of view, the mechanical recovery is usually considered as the most favorable oil spill combating method. Several skimmer types and techniques exist, but, because of variations in circumstances and climate conditions, ice coverage varies case-specifically and conditions may change even during response to a single incident, necessitating a toolbox of several response tools.
In-situ burning	*In situ* burning is particularly suitable for use in icy conditions, sometimes offering the best option for removal of surface oil. *In situ* burning of thick, fresh oil slicks can often be initiated very quickly through ignition of the oil with simple devices such as an oil-soaked sorbent pad. Oil from the water's surface can be removed efficiently and well via *in situ* burning: It is reported that the removal efficiency for thick slicks can exceed 90%. Oil removal rates of 2,000 m^3/hr can be achieved with a fire area of about 10,000 m^2.
Chemical Recovery	Dispersant chemicals work by enhancing the natural dispersion of the oil into the water column. A dispersant consists of a mixture of surfactants (surface-active agents) in a solvent. When applied to an oil slick, the surfactants will be positioned at the oil–water interface and contribute to formation of small oil droplets that will readily be mixed into the water column and be rapidly diluted and later biodegraded.
Bioremediation	Bioremediation is natural biodegrading of spilled oil, which to a certain extent can be accelerated through the addition of nutrients, oil-degrading bacteria, or both. Nutrient and bacteria addition has been tested, and some positive effects have been observed. It had been assumed that biodegrading does not occur in cold and icy conditions or is at least very slow; however, lab and field tests have shown that a low water temperature and even the presence of ice do not hamper the biodegrading of oil as much as expected. Nonetheless, it should be noted that bioremediation is a slow process that very seldom, if ever, can be considered as the primary countermeasure. The most beneficial use of bioremediation is as a secondary combating method that completes the recovery result after application of some other cleanup method.
Others	■ Use of vacuum pumps to suck oil between and under ice blocks. ■ Use of air bubbles to separate the oil and ice, with an air-induced current directing the oil into free water between ice blocks. ■ Use of propeller flow to direct oil under ice in the desired direction. ■ Creation of an ice boom to prevent drifting of oil in an undesired direction. ■ Use of specialized saw to cut slots in ice where oil can be removed.

Note:
The information in this table was derived from Lampala (2011).

In general, interactions between Project vessels and sea ice along the navigation route are predicted to be rare during the open- water season. However, changes in climate and larger scale weather patterns can result in variation to the typical break-up and/or freeze-up dates. Also, occasional incursions of drift ice from Foxe Basin and Davis Strait can be expected along the navigation route, particularly in Hudson Strait and Ungava Bay.

6.0 DIESEL FUEL SPILL SCENARIOS

For this analysis, we considered a worst case spill scenario of 20 ML (20,000 m^3) assuming all (100%) of the P50 diesel fuel carried on the ship was spilled. A second spill scenario was considered for 2 ML (2,000 m^3) based on the conservative assumption of 10% of the total P50 diesel fuel (20 ML) being carried on a single ship for the Project. Previous research indicates that spill volumes are best expressed as being equivalent to 5% to 10% of the total fuel being transported (McKenna and McClintock 2005; Coastal Ocean Resources 2013).Therefore, the 100% diesel spill assumed in the worst case scenario is extremely conservative and unlikely.

The Automated Data Inquiry for Oil Spills (ADIOS2), an oil weathering model (NOAA 2014), was used to provide estimates of the expected characteristics and behavior of fuel spilled in the marine environment. We analyzed a 20 ML and a 2 ML fuel spill at four locations in Melvin Bay and ten locations along the shipping route (Table E-2). Additional scenarios of 100,000 L (100 m^3) spills were analyzed at the four fuel transfer locations in Melvin Bay – as these represent smaller-scale spills that could occur during transfer of fuel from ship-to-ship or ship-to-shore. One of the main causes of fuel spills is related to navigational error where a tanker deviates from its planned track along the shipping route. The modelled scenarios assumed that the fuel spill would occur near the center of the main shipping lane and that ships would not deviate from this route (Figure E-1).

Table E-2: Hypothetical Fuel Spill Locations

Location Number	Location Name	UTM Zone	Easting (metres)	Northing (metres)
1	Ship-to-ship fuel transfer site outside Melvin Bay	15	546,173	6,961,117
2	Ship-to-shore fuel transfer site in Melvin Bay	15	546,143	6,963,142
3	Shipping route south of Walrus Island	16	641,869	6,988,220
4	Shipping route north of Coats Island	17	456,430	7,000,031
5	Shipping route north of Ungava Peninsula	18	351,235	6,986,598
6	Shipping route in Eastern Hudson Strait	20	399,876	6,775,840
1A	West Melvin Bay	15	545,185	6,963,365
2A	East Melvin Bay	15	546,798	6,962,172
3A	Entrance to Melvin Bay	15	549,334	6,960,588

6.1 Model Parameters

6.1.1 Extremal Analysis for Rankin Inlet and Coral Harbour Winds

Historical hourly wind records were obtained for Rankin Inlet (station ID: 71083) and Coral Harbour (station ID: 71915). The Rankin Inlet station is located at 62.82° N, 92.12° W at an elevation of 32.3 metres (m) above mean sea level (msl) and the Coral Harbour station is located at 64.78° N, 83.92° W at an elevation of 62.2 m above msl. Figure E-7 shows wind roses for the hourly record at Rankin Inlet from 1981 through 2012 for all wind measurements over the duration of the record (Figure E-7a) and for a filtered subset of only wind measurements made during the open water seasons (August to October) over the duration of the record (Figure E-7b). Figure E-8 shows wind roses for the hourly record at Coral Harbour for the same time period for all wind measurements over the duration of the record (Figure E-8a) and for a filtered subset of only wind measurements made during the open water seasons (August to October) over the duration of the record (Figure E-8b). In general, the prevailing wind direction at both sites is from the north-northwest (prevailing winds from 343° at both stations). The wind distribution observed between the full record and the record limited to open water seasons only are nearly identical at both stations. This indicates that there is no seasonal bias during the open water season that is not observed during the full annual distribution. Wind speed statistics were calculated for both stations and the results are shown in Table E-3 and Table E-4. Data were filtered for “0” values.

Wind speeds recorded at Rankin Inlet and Coral Harbour between 1981 and 2012 were used to determine probability distributions of wind speeds and their associated return periods. A peaks-over-threshold (POT) analysis was used to calculate the peak wind speeds of the largest storms during the 31-year record at each site. Extreme wind speeds were determined by filtering the record for peak wind speeds during storms with speeds greater than the 95 percentile value (Table E-3) sustained for at least 4 hours.

An extremal analysis following Leenknecht et al. (1992) was applied to the station record of extremes in order to determine the 5, 10, 25, 50 and 100-year wind speeds at the site. A time series of 77 maximum wind speeds measured during discrete storms between 1981 and 2012 were input to the extremal analysis. The analysis included the application of Fisher Tippett Type 1 (FT-1) and Weibull distributions to the peak water level time series. Results of the analysis for Rankin Inlet are summarized in Table E-5 and a plot of the Weibull distribution with shape parameter (k) = 1.15 is shown in Figure E-9. Results of the analysis for Coral Harbour are summarized in Table E-6 and a plot of the Weibull distribution with k = 2.00 shown in Figure E-10. The wind analysis indicates that the prevailing winds are from the north-northwest (343°) at both Rankin Inlet and Coral Harbour, while the extreme storm winds are from the north-northwest (343°) at Rankin Inlet and from the northeast (40°) at Coral Harbour. Therefore, wind direction for the 50-year storm should be applied as 343° for oil spill model points near Melvin Bay (represented by Rankin Inlet winds) and as 40° for oil spill model points along Hudson Strait (represented by Coral Harbour winds).

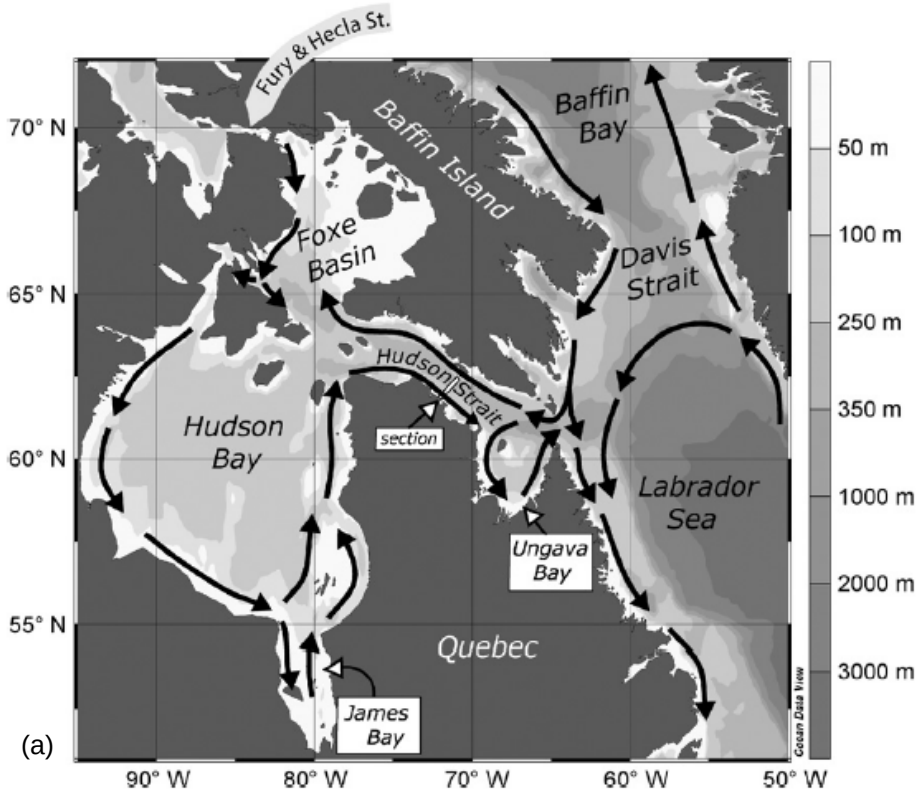
6.1.2 Spill Scenarios and Input Parameters

ADIOS2 predicts changes over time in the density, viscosity, and water content of diesel fuel, including evaporation and dispersion rates. The following assumptions were made for model set-up:

- ADIOS 2 diesel fuel oil (Canada), equivalent to P50;
- Spill of 100,000 L (100 m^3) and 2 ML (2,000 m^3) for near-shore spills;
- Spill of 2 ML (2,000 m^3) for shipping route spills;
- Spill of 20 ML (20,000 m^3) for shipping route spills;
- Sea salinity of 32 parts per thousand (ppt);
- Surface water and diesel fuel temperature of 5° Celsius (C);
- Sediment load of 5 milligrams per litre (mg/L);
- Spill occurs near the center of the proposed shipping lane; and
- Spill scenarios assume no mitigation.

Winds and waves are generally the driving physical forces used to determine the oil drift slick speed and distance travelled (DNV 2011). Golder analyzed winds from Rankin Inlet and Coral Harbour and performed an extremal analysis for 31-years of hourly data (Section 6.1.1). For modeling simulations, Golder used mean, 2-year, and 50-year wind conditions. For the 31-year record, the majority of the winds from both stations originated from 343° (North-Northwest). The extreme winds at Rankin Inlet also originate from North-Northwest (typically 343°), but the extreme winds at Coral Harbour originate from the northeast (typically 40°). For all scenarios except the 50-year extreme wind scenario, the fetch was measured along the axis of prevailing wind direction from 343° to 163°. The 50-year extreme wind scenario was measured along the axis of the dominant wind direction. In Rankin Inlet, extreme winds typically blow from 343° to 163° and this wind alignment would be applicable for points in Melvin Bay and Hudson Bay (points 1, 1A, 2, 2A, 3A, 4A, and 5A). At Coral Harbour, extreme winds blow from 40° to 220° and this wind alignment would be applicable for points along Hudson Strait (points 3, 4, 5, 6A, 7A, 8A and 6). Wind-related model parameters (i.e., fetch, distance to shore, and wind speeds) for the hypothetical fuel spill locations are provided in Table E-7. Summary tables and figures from the ADIOS2 model simulations inputs and outputs are provided in Attachment A.

Table E-7: Wind Related Model Parameters for Spill Scenarios along Shipping Route



Location (Number)	Fetch (km)			Distance to Shore (km)			Wind Speed (m/s)		
	Mean	2-yr	50-yr	Mean	2-yr	50-yr	Mean	2-yr	50-yr
Ship-to-ship fuel transfer (1)	0.5	Mean[1]	Mean[1]	0.9	Mean[1]	Mean[1]	6.6	19.0	25.4

Notes:
1. Cells listed as “Mean” indicates that cell values are equivalent to the mean wind case values.

The 2 ML and 20 ML spill scenarios were each modelled with and without the influence of currents on the slick trajectory. A summary of the predominant current velocities at each location is presented in the results table in Section 6.3, Table E-9 through Table E-11. A background literature review was conducted to provide the oceanographic conditions along the shipping route with particular attention to the surface currents along the route. Current velocity along the western portion of the shipping route (Rankin Inlet to Coats Island) is predominantly forced by tides running along the axis of the route, but the eastern portion of the route through Hudson Strait east of Coats Island is dominated by the cyclonic circulation forcing a current to the east-southeast (Drinkwater 1986; Drinkwater 1988; Saucier et al 2004). South of the proposed shipping route in Hudson Bay, currents have been modelled to predict the seasonal cycle of water masses and sea ice by Saucier et al. (2004) and Wang et al. (1994). Currents from the Arctic Ocean flow around both sides of Southampton Island from the north (Ingraham and Prisenburg 1998). Coastal currents flow counter-clockwise along the southwestern portion of Hudson Bay towards James Bay, north along the eastern coast of Hudson Bay and through the southern Hudson Strait into the Labrador Sea. The surface eddy current is strongest during ice-free periods and reaches 15 to 20 centimetres per second (cm/s) (Saucier et al. 2004) in northeastern Hudson Bay. Current enters into Hudson Strait from the Atlantic along the southern shore of Baffin Island and exits along the northern shore of Quebec (Drinkwater 1986; Drinkwater 1988; Ingraham and Prisenburg 1998; Straneo and Saucier 2008). In the center of Hudson Strait there is a cyclonic pattern which brings the current across the channel from the north to south. Figure E-11 provides an overview of circulation patterns for the region, adapted from Straneo and Saucier (2008) and Drinkwater (1986).

Current data are available at several mooring locations in Hudson Strait and west of Southampton Island from the MERICA (*etudes des MERs Interieures du Canada*) 2003 to 2007 oceanographic data collection program (DFO 2015). Surface current data from representative sites were used to supplement or verify the literature review.

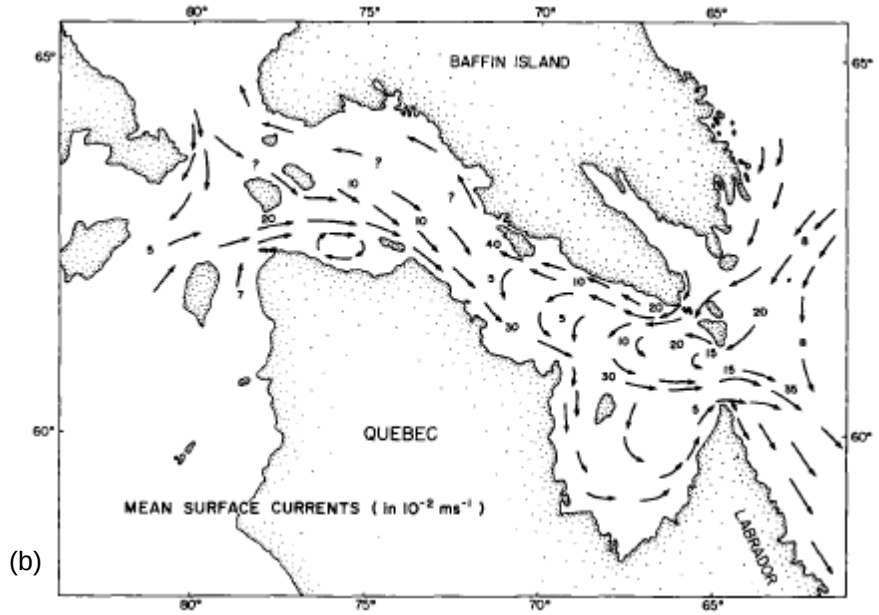

Figure E-11: (a) Hudson Bay system bathymetry and schematic circulation. Source: Straneo and Saucier 2008 and (b) Surface circulation in Hudson Strait and Ungava Bay. Source: Drinkwater 1986

Mean surface currents were considered at the locations along the shipping route when available. No information on currents in Melvin Bay near Rankin Inlet were available, therefore, no currents were applied to locations 1, 2, 1A, 2A, or 3A in the calculations. For the purpose of this analysis, predominant current direction and velocity at each location were used based on the availability of data, influence of currents on dispersion, and periodicity of the tides. Peak tidal currents were not considered because the tides are semi-diurnal and would switch direction multiple times during the course of a potential oil spill which could continue weathering for 12 hours or longer.

Currents were not input into the ADIOS2 model because these scenarios were considered instantaneous releases of fuel and each part of the slick would therefore experience the same net displacement (Lehr et al. 2002). The input of currents into the ADIOS2 model is generally used for modeling a spill from a fixed point such as an offshore platform. Mean surface currents were used for calculation of the slick velocity as a vector sum in combination with drift resulting from wind velocity.

6.1.3 Modelling Methodology

The ADIOS2 model output provided weathering half-life, and equations presented by the Australian Maritime Safety Authority were used to calculate the time for a spill to reach shore and the quantity of fuel from a spill that would be deposited on shore (DNV 2011). The quantity and proportion of fuel deposited on shore was determined after calculating the quantity of fuel remaining in the slick at the shore. The time between the occurrence of the spill and the slick initially reaching the shore (T_{shore}) depends primarily on the distance to shore (D_{zone}), wind velocity in the direction of the shore (V_{wind}), and the slick's velocity represented as a fraction (3%) of the wind velocity (RV_{drift}) (DNV 2011):

$$T_{shore} = \frac{D_{zone}}{V_{wind} RV_{drift}}$$

The quantity remaining in the slick (Q_s) relates to the original spill quantity (Q), weathering half-life to the quantity of fuel remaining (H), and time to shore (T_{shore}) (DNV 2011).

$$Q_s = Q * 2^{-T_{shore}/H}$$

For the scenarios where the mean surface current was considered, the slick velocity was calculated as a vector combination of the wind velocity and the current velocity:

$$V_{slick} = V_{wind} RV_{drift} + V_{current} RV_{drift}$$

Studies have found that slick transport due to surface currents is typically 60% (RV_{drift}) of the ambient current speed (Blaikley et al 1977): A new distance to shore was calculated based on the trajectory of the slick (V_{slick}) and used to determine the quantity deposited on shore.

6.2 Spills near Melvin Bay

The spill scenarios in Melvin Bay were completed for three different spill volumes: 100,000 L, 2 ML, and 20 ML, representing an average spill scenario, a large but low-probability spill scenario (10% spilled from a large tanker), and a worst case spill scenario (100% spilled from a large tanker), respectively. The weathering half-life (time required for removal of 50% of the diesel fuel from the sea surface) was determined using the ADIOS2 model. The amount of time it would take for a fuel spill to reach the shoreline given anticipated wind effects was then determined (originating from approximately 343º from the spill location) (Table E-8) along with the proportion of fuel estimated to be deposited on shore under the different spill scenarios.

Weathering characteristics for a 2 ML fuel spill are shown in Figure E-12. This figure illustrates the amount of fuel that would evaporate and disperse over time following the initial spill. For all spill scenarios considered at the fuel transfer locations near Melvin Bay, the weathering half-life was determined to be < 35 h. The time required for the spill to reach shore varied from approximately 6 minutes (min) (0.1 h) to 1 h 20 min. For all sites in Melvin Bay, it was determined that between 89% and 100% of the total volume of spilled diesel fuel would reach shore assuming no responsive mitigation occurred.

Table E-8: Distance to Shore, Weathering Half-Life, Time to Shore, and Estimated Percent of Spill Deposited on Shore for 100,000 L, 2 ML, and 20 ML Diesel Fuel Spill Scenarios in Melvin Bay

Location	Spill Amount (L)	Distance to Shore (km)	Weathering Half-Life (h)			Time to Shore (h)			% Deposited on Shore

6.3 Spills along Shipping Route

Diesel fuel spills have the potential to occur anywhere along the shipping route. For the purpose of the ADIOS2 analysis, ten (10) sites were chosen along the shipping route that correspond with either areas of the route that are in close proximity to land (e.g., pinch points) or established sensitive habitat areas for marine mammals and/or marine birds. These sites include Walrus Island, Coats Island, Ungava Peninsula and Eastern Hudson Strait (sites numbered 3 to 6); and entrance to Melvin Bay, western Hudson Bay, Hudson Bay crossing, western Hudson Strait near Charles Island, mid-point Hudson Strait, and eastern Hudson Strait north of Ungava Bay (sites numbered 3A to 8A). Tables E-4 and E-5 include the weathering half-life, time to shore, and proportion of spill deposited on shore for the 2 ML and 20 ML spill scenarios, respectively, (for mean, 2-yr, and 50-yr wind speeds). The weathering half-life was predicted to be less than 19 h for all the 2 ML scenarios and less than 34 h for all the 20 ML scenarios. Depending on the distance to shore and wind scenario, the time to shore would vary from about 4 h to 50 days for the 2 ML scenario and the amount of fuel predicted to be deposited on shore would vary from 0% to 66%. For the 20 ML scenario, the amount of fuel predicted to be deposited on shore would vary from 0% to 79%. The trajectory of the slick drift is a primary factor in the amount, if any, of fuel deposited on shore. For example, at site 3 (Walrus Island), 16% of the spill is deposited on shore for the 20 ML, 2-yr wind spill scenario because the direction of the slick drift is 163°, directly towards Coats Island. For the 50-yr wind scenario, the direction of the slick drift is 220°, towards the open water of Hudson Bay.

The influence of currents on the trajectory of the slick drift was considered using the mean currents at each site when data was available. Table E-9 provides the mean current velocity at each site, resultant wind and current vector speed and direction, distance to shore in the direction of the resultant vector, time to shore, and proportion of spill deposited on shore for the different 2 ML and 20 ML spill scenarios.

The predominant current patterns enhance the rate at which the fuel would spread across the water surface, particularly along narrower portions of the route where current speeds can be enhanced and slicks spread in the direction of the current. This typically results in the slick trajectory being altered to more parallel to the shipping route and in most cases less fuel deposited on the shore. However, in some cases, the change in trajectory results in a shorter distance to shore and a higher proportion of fuel deposited onshore.

Table E-9: Distance to Shore, Weathering Half-Life, Time to Shore, and Estimated Percent of Spill Deposited on Shore for 2 ML Diesel Fuel Spill Scenarios along Shipping Route

6.4 Discussion of Mapped Results

Maps representing the results of the hypothetical spill scenarios are presented in Figure E-13 through Figure E-24. The maps are provided for the 2 ML and 20 ML spill scenarios, three (mean, 2-yr, and 50-yr) wind scenarios, and with and without currents. Each map shows the estimated trajectory of the spill at the fourteen locations based on the wind and current for the given scenario and the spill volume remaining (percentage) at a given distance based on the weathering results from the ADIOS2 model. The percentage of the spill volume remaining is shown by the color ramp gradation from red (more remaining) to green (less remaining). The extent of the slick drift is shown at the start of the spill (100% volume), at one half-life (50% spill volume remaining), and when the slick reaches shore or is weathered to 1% of the spill volume remaining (whichever occurs first). If the slick is estimated to reach shore, the percentage of the spill volume remaining is labeled at this location. In some cases, particularly in Melvin Bay, the spill reaches shore quickly and only two colored lines are shown on the map. Wind vectors are also provided for each scenario to illustrate the wind direction and speed used for a given map scenario.

There is a slight apparent difference in spill trajectory angles between the westernmost points when compared to the easternmost points despite scenarios that use the same wind direction. This slight apparent difference in spill trajectory angles is a function of the map projection extending over a large area and over multiple UTM zones and is therefore a projection distortion rather than a measureable difference in trajectory.

It is important to consider these maps as a depiction of the potential fuel spill trajectory and percent remaining at a coarse scale under a very specific set of climate conditions. As noted on the maps, the length of the fuel spill path represents the estimated travel distance and the angle represents the calculated spill trajectory given the specific wind, current, and spill volume conditions bracketed by each spill scenario. The actual distance travelled and the angle of the spill trajectory will be highly dependent on the site-specific ambient conditions and the nature and location of the spill at the time of a potential spill. In general, the width of a fuel spill at land fall and the length of shoreline that could potentially be affected by a given fuel spill is difficult to estimate due to the high degree of uncertainty related to the spreading of a slick (DNV 2011).

A summary of the mapped scenarios follows:

- The dominant slick drift trajectory for the modelled scenarios is towards the south-southeast (163°) for all scenarios without currents except for the 50-yr wind scenario at sites east of site 5A, where it is towards the southwest (220°). The south-southeast trajectory results in a slick trajectory headed towards open water at sites 4A, 5A, 7A, and 8A. At sites in Melvin Bay (1, 2, 1A, and 2A) the fuel slick reach shore within a few hours. Trajectory at these sites is less important as they are almost entirely bounded by land, resulting in a majority of the spill reaching land in any direction. At sites 3A, 3, 4, 5, 6A, and 6, the slick is estimated to reach shore with 50% or less of the spill volume remaining.
- The 50-yr wind scenario at sites 3 and sites further east results in a slick trajectory to the southwest (220°). Under this scenario a slick at site 3 would head towards open water and sites 5 and 6 would have a longer distance to travel to shore than for the other wind scenarios. Differences in the direction to shore for slicks originating at sites 4, 6A, 7A, and 8A are minimal between wind scenarios.
- The percentage of the fuel deposited on shore increases for the 20 ML spill scenario versus the 2 ML spill scenario because of the increase in the weathering half-life.

- The addition of mean currents in the modelling typically results in altering the slick trajectory to a more parallel orientation to the shipping route and in most cases less fuel deposited on the shore. However in some cases the trajectory results in a shorter distance to shore and more fuel deposited on the shore. For example, at site 6 the trajectory of the spill drift is altered when an eastward current is considered such that the slick heads towards open water rather than south-southeast towards land in close proximity. Conversely, for site 3, 9% of a 20 ML spill volume is estimated to reach shore for the mean wind and no surface current scenario, but due to the orientation of the shipping route with respect to Coats Island, 15% of the spill volume is estimated to reach shore when the surface current is considered. Similarly, site 6A increases from 20% to 28%, and site 7A increases from 1% to 3% with the addition of the current forcing.

7.0 CONCLUSIONS

Although diesel spills have a low likelihood of occurrence, it is important to understand where the spill will travel and the best way to mitigate impacts. Based on the total amount of diesel fuel transported and predicted spill rates reported by SL Ross (1999), the overall likelihood of a fuel spill ranges from a return period of 285 years (i.e., one spill approximately every 285 years) for small spills (10 to 99.9 m^3) to 920 years for medium spills (100 to 999.9 m^3) and 92,000 years for large spills (1,000 to 9999.9 m^3) (WSP 2014a). If a spill was to occur near Melvin Bay, it is predicted that for all spills, a majority of the fuel would reach the nearby shoreline within several hours without mitigation efforts. If a spill was to occur along the shipping route, the amount of weathered fuel, the trajectory of the slick, and amount deposited on shore varies by site and wind and current scenario. The different spill scenarios are provided in summary tables in Sections 6.2 and 6.3 and presented in oil spill projection maps in Appendix C. Proximity of land in the direction of the slick drift is a primary consideration for the potential for fuel to be deposited on shore. The inclusion of mean currents in the modelling typically results in reorienting the slick trajectory along an alignment that is more parallel to the shipping route and in most cases this results in less fuel deposited on the shore, with the exception of sites 3, 6A, and 7 where there is an increase in percentage (of about 2% to 8%) of remaining fuel that reaches the shore.

An important consideration when interpreting the hypothetical fuel spill scenarios is the relative response times. Without mitigation, a spill in Melvin Bay is estimated to reach shore relatively quickly and with a higher proportion of the spill reaching shore before being naturally dispersed, however, there is potential for a more rapid spill response in this area. Open water spills along the shipping route are predicted to be less severe in most cases, but the potential response time is slower due to the distance offshore. As part of the Oil Pollution Emergency Plan (SD 8-2), AEM has committed to pre-emptive and responsive mitigation actions to reduce or minimize the loss of diesel fuel during ship-to-ship and ship-to-shore transfers near Melvin Bay.

This analysis has been conducted to assess the potential for impacts associated with a diesel fuel spill in the marine environment. The ADIOS2 model was used with the input of local wind speed to approximate wave conditions and then predict the weathering half-life of the fuel. This is a one-dimensional analysis and does not account for other site-specific effects such as modifications to the wave height, period and direction due to local bathymetry. Therefore it is an approximation of the travel time and percent diesel fuel remaining to be used for planning and decision making purposes.

8.0 CLOSURE

EXECUTIVE SUMMARY

Agnico Eagle Mines Limited (Agnico Eagle) has developed the Meliadine Gold Project (Project), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The mine plan includes open pits and underground mining methods for the development of the Tiriganiaq gold deposit, which includes two open pits (Tiriganiaq Pit 1 and Tiriganiaq Pit 2) and one underground mine.

This document presents the Landfarm Management Plan for the Project and forms a component of the documentation series produced for the Type A Water Licence Application. The Plan describes the design features and operational procedures for the landfarm located at the Project for the storage and treatment of petroleum hydrocarbon contaminated soils.

On-site storage and remediation has been established as the preferred method for treatment of light petroleum hydrocarbon contaminated soil that may be generated on the proposed mine site. The landfarm is designed to receive soils, rock, snow, and ice contaminated with petroleum hydrocarbons. This will include light hydrocarbons such as diesel and gasoline being treated in the landfarm.

The landfarm is located just off the industrial pad, approximately 200 metres from Collection Pond 1 (CP1) and is shown on Figure 2-1. The central location of the landfarm (Figure 2-1) was chosen to minimize the footprint of the site and the transport distance of contaminated material from potential spill locations. The landfarm is expected to effectively treat up to 5,000 cubic metres of contaminated soil over the construction, operations, and closure of the Project, and 500 cubic metres of snow and ice annually. Water accumulating in the landfarm is not discharged directly to the receiving environment. It is first sent through an oil/water separator, before being discharged to CP1 for further treatment. The landfarm has an impervious liner and no impacts on shallow groundwater are anticipated.

A report of landfarm activities is prepared annually by Environment Department, indicating the volume of material added to the facility, amount of material removed, disposal or re-use location, analysis results, volume and type of nutrient addition, visual inspection results, and volume of contact water pumped.

Soils contaminated with light end petroleum hydrocarbons are remediated in accordance with the criteria stated in The Government of Nunavut, Environment Department's Environmental Guideline for the Management of Contaminated Sites. When remediated, the soils will be removed from the facility and can be used for construction purposes, such as part of the cover of the Tailings Storage Facility, Landfill or stacked in the Waste Rock Storage Facility.

In addition Agnico Eagle continues remediation of the historical landfarm associated with the Type B Water License – 2BB-MEL1424 that was in use for the former Meliadine Exploration Camp.

SECTION 1 • INTRODUCTION

1.1 Project History

Agnico Eagle Mines Limited (Agnico Eagle) has developed the Meliadine Gold Project (Project), located approximately 25 kilometres (km) north of Rankin Inlet, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. Situated on the western shore of Hudson Bay, the proposed Project site is located on a peninsula between the east, south, and west basins of Meliadine Lake (63°1'23.8'' N, 92°13'6.42"W), on Inuit Owned Lands. The Project is located within the Meliadine Lake watershed of the Wilson Water Management Area (Nunavut Water Regulations Schedule 4).

The mine plan proposes open pit and underground mining methods for the development of the Tiriganiaq gold deposit, with two open pits (Tiriganiaq Pit 1 and Tiriganiaq Pit 2) and one underground mine. The mine will produce approximately 12.1 million tonnes (Mt) of ore, 31.8 Mt of waste rock, 7.4 Mt of overburden waste, and 12.1 Mt of tailings. There are four phases to the development of Tiriganiaq: just over 4 years of construction (Q4 Year -5 to Year -1), 8 years of mine operation (Year 1 to Year 8), 3 years of closure (Year 9 to Year 11), and post-closure (Year 11 forwards).

The Landfarm Management Plan (Plan) focuses on minimizing the waste footprint on-site, and maximizing remediation potential through implementation of bioremediation experience and research carried out at the Agnico Eagle's Meadowbank Gold Mine.

During the advanced exploration phase of the Project, the Nunavut Water Board (NWB) approved amendment #6 to Water Licence 2BB-MEL1424, which allowed the operation of a light PHC soil stockpile. This approval supported using a landfarm developed inside a bermed and lined area previously used to store fuel bladders. Soil contaminated with light PHC is being deposited in this bermed and lined area for treatment. To date, there is approximately 1500 cubic metres (m^3) of contaminated soil being treated. This quantity resulted from inadvertent spills that occurred during the advanced exploration phase of the Project.

When possible, materials contaminated with heavy hydrocarbons (e.g., hydraulic fluid or grease), are to be segregated, packaged, and shipped south for treatment and/or disposal.

1.2 Objectives

On-site storage and remediation has been established as the preferred method for treatment of light PHC contaminated soil that may be generated at the proposed mine. Specifically, remediation through landfarming has been identified as the primary treatment option and, as such, is the focus of this contaminated soil management plan. A pilot project to enhance rates of bioremediation through addition of a nutrient source is being carried out at Meadowbank and will be employed at the Project should it prove successful. Alternate contingency options in the event that landfarming is not successful or as efficient as planned are also discussed.

This Plan is a component of the Responsible Mining Management System (RMMS)[1]. The objectives of this Plan are to:

- provide an overview of contaminated soil management at the Project;
- describe the physical setting, location, and design criteria of the landfarm;
- define acceptable types of contaminated soils to be placed in the landfarm and conditions for removal of treated soil;
- define operating procedures and monitoring requirements for the landfarm; and
- describe contingency options for alternate treatment/storage of PHC contaminated soil.

1.3 Related Documents

Spill prevention is the first stage in contaminated soil management at the Project. Documents containing information related to this Plan and submitted as part of the Type A Water Licence Application include:

- Spill Contingency Plan;
- Environmental Management and Protection Plan; and
- Risk Management and Emergency Response Plan.

There is also a related Oil Pollution Emergency Plan (Agnico Eagle 2018), which is specific to spills at Agnico Eagle's Itivia Oil Handling Facility located in Rankin Inlet. The Oil Handling Facility is located on the shore of Melvin Bay, which is part of Hudson Bay. The Oil Pollution Emergency Plan was prepared as a requirement of the *Canadian Shipping Act* and associated regulations. It is submitted to Transport Canada for approval prior to any shipping related to the Project.

1.4 Spill Prevention

Similar to the waste management philosophy, plans are to actively work towards minimizing spills through suitable work procedures. Plans developed from the environmental impact study address the management of spills on land, ice, water, and into the marine environment. When spills do occur, the goal is to limit the spread of the spill, and then manage contaminated material resulting from the spill. The Spill Contingency Plan describes spill prevention measures.

[1] The RMMS is described in the Environmental Management and Protection Plan.

SECTION 2 • LANDFARM DESIGN

2.1 Background

In the event of a spill, on-site storage and remediation is the most practical and efficient method in handling contaminated soil, particularly in an isolated location such as the Project. Any PHC contaminated soils generated during the construction, operation, and closure phases will be adequately managed. Soils contaminated with light PHCs, such as diesel, gasoline, and light oils will be treated on-site in a landfarm. This method involves spreading, mechanical mixing, addition of nutrients and water and placing the contaminated soil in windrows within a containment area, and promoting conditions favorable for the volatilization and aerobic microbial degradation of hydrocarbons. When possible, materials contaminated with heavy hydrocarbons (e.g., hydraulic fluid or grease), are to be segregated, packaged, and shipped south for treatment and/or disposal.

There are currently PHC contaminated soils, totalling approximately 3706 m³, stored on-site in two landfarms resulting from spills that occurred during the exploration and construction phases (approximately 1500 m^3 in Type A Landfarm, and 2206 m^3 in Type B Landfarm).

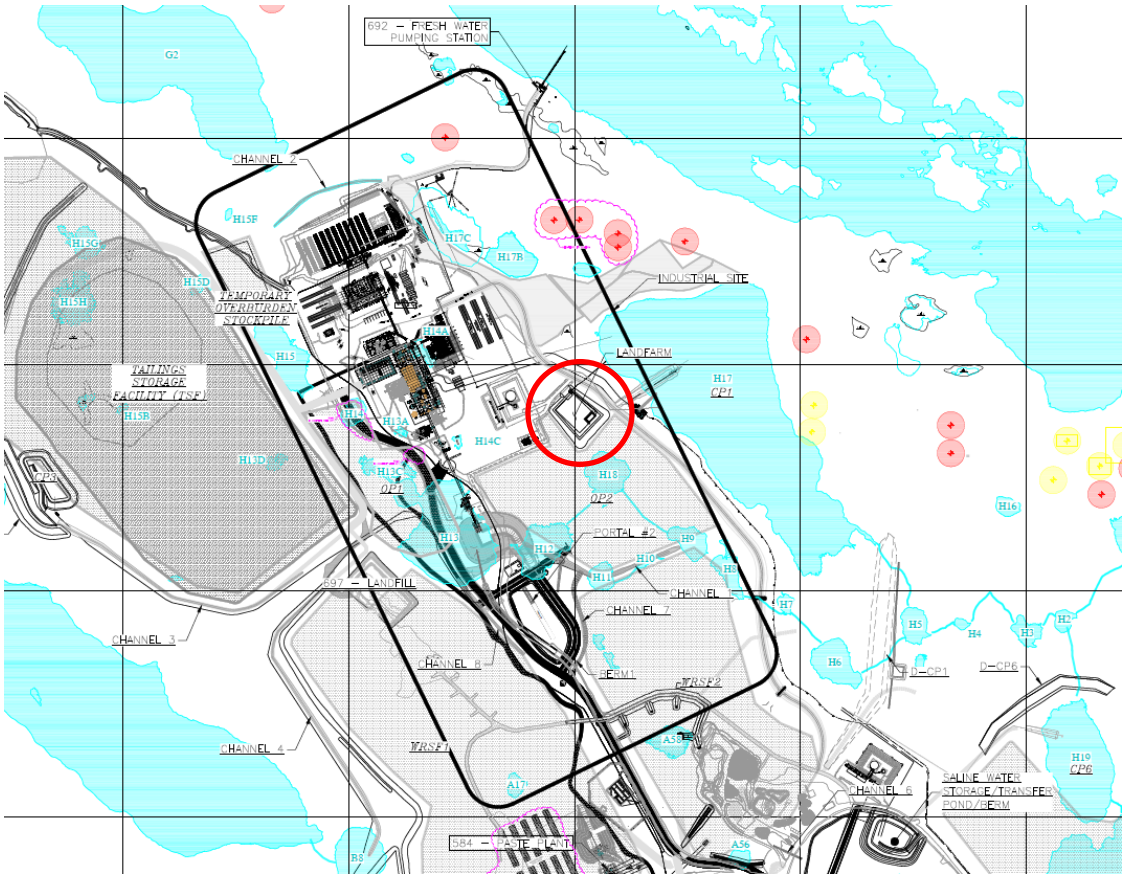
Landfarm option analysis prepared for Agnico Eagle by Golder Associates (2007) identified factors relevant to landfarming in the north. This includes environmental factors and physical properties of the soil that affect microbial growth and rates of biodegradation, including temperature, pH, soil moisture, nutrient content, salinity, and soil particle size.

Although rates of biodegradation decline with temperature, landfarming is still a feasible technique in Arctic climates as demonstrated by the Meadowbank landfarm. Degradation in the north is typically restricted because microbial activity slows between 0 to -5 degrees Celsius (°C) restricting biodegradation to the months of June to September[2]. Nevertheless, degradation was reported at 90% over two summers on Resolution Island (Paudyn et al. 2008).

It is estimated that soils contaminated with light end PHCs would require three full summer seasons for complete remediation. When remediated, the soils will be removed from the facility and can be used for construction purposes such as part of the cover of the Tailings Storage Facility (TSF) or stacked in the Waste Rock Storage Facility (WRSF). Based on a remediation period of three seasons, it would be possible to close the landfarm facility on three years after the end of the process plant operation.

2.2 Location

The overall site plan showing the main infrastructure for the Project, including the landfarm, is shown in Figure 2-1. The area has no exposed bedrock and up to 20 metres (m) of glacial-fluvial till that has little ground ice and shows no permafrost degradation. The central location of the landfarm was chosen to minimize the footprint of the site and the transport distance of contaminated material from



[2] Even though bioremediation ceases below -5°C, volatilization of the PHCs does continue but at a much slower rate.

potential spill locations. The management of all waste generated at the Project in the form of dry stack tailings, waste rock, incinerator, and landfill waste are located in close proximity to the main infrastructure.

2.2.1 Proximity of Surface Water

The landfarm is located adjacent to the infrastructure pad, approximately 200 m from Collection Pond 1 (CP1). The landfarm is located on land that slopes towards the southwest corner, which results in any rainwater or snowmelt draining to temporary water storage having the capacity to store a 1:100 wet year spring freshet plus 500 m^3 of water from melting of contaminated snow/ice. Drainage from the landfarm may be used as water in the turning of the windrows during the remediation process. Excess water is collected within a sump inside the landfarm and will be pumped to an oil pre-treatment plant to remove any hydrocarbons. The treated water will then be discharged into the CP1. Discharge from CP1, is controlled by a dike, which stops direct flow to Meliadine Lake. Meliadine Lake is the source of freshwater for the site and is used by Inuit for traditional pursuits. If water is to be discharged from CP1 to Meliadine Lake, it is treated to meet compliance criteria. Except for a short duration during the spring freshet or a heavy rainfall, water ponding will be eliminated in the landfarm by the end of the summer such that a sufficient storage capacity is available for the upcoming spring freshet.

Figure 2-1 Landfarm Site Location Plan

2.2.2 Proximity of Groundwater

In the Project area, the groundwater within the active layer is estimated to reach 1.5 m in October. The active layer begins to form in July when temperatures largely remain above 0°C, and deepens to a maximum in October. Shallow groundwater flow in the area of the landfarm is towards the industrial site.

To prevent movement of contaminants from the landfarm facility into groundwater and the surrounding environment, Environment Canada (SAIC 2006) recommends implementation of a barrier with 10^{-7} centimetres per second hydraulic conductivity at a thickness of 0.6 m. The Meliadine landfarm has an impervious liner and no impacts on shallow groundwater are anticipated.

2.3 Design

The landfarm is designed to receive soils, rock, snow, and ice contaminated with petroleum hydrocarbons. This will include light hydrocarbons such as diesel and gasoline. The design volume of the landfarm is based on allowances for the materials being treated at Meadowbank.

The average floor slope is 3.1% going in the designed direction of northwest to southeast, matching the natural ground slope. This slope is still adequate allowing leachate/drainage from the PHC soils and internal runoff to gradually seep through the filter berm into the sump area. The water collected in the sump will be pumped to the oil separator for oil removal before being discharge into CP1. The sump area was built as per design capacity.

The geomembrane liner crest elevation was installed at an elevation of 74.80 m, it does allow for 0.45 m of freeboard before reaching the geomembrane liner crest elevation.

2.3.1 Soil Volume Requirements

The landfarm was built with the expectation of effectively treating up to 5,000 m^3 of contaminated soil over the construction, operations, closure of the Project, and 500 m^3 of snow and ice annually. Based on the experience at Meadowbank, the volume of PHC would be approximately 350 m^3 per year during construction, operation, and closure phases. Table 2-1 outlines the estimated volumes of contaminated soils and rock, and contaminated snow and ice expected during each phase of the mine.

Table 2-1 Estimated Volume of Petroleum Hydrocarbon Contaminated Soil and Ice/Snow to be Managed

Project Phase	Volume of PHC Soil/Rock (m^3)	Annual PHC Snow/Ice (m^3)
Advanced exploration	2,209 (volume in exploration landfarm to date)[(a)]	500 per year
Predevelopment (2 years)	350 (175 per year)	
Construction (3 years)	1,050 (350 per year)	
Operations (7 years)	2,450 (350 per year)	
Closure & Reclamation (2 years)	700 (350 per year)	
Total	**4,970**	

[(a)] The contaminated soil in the advanced exploration landfarm will be transferred to the mine landfarm upon its completion and commissioning.

As described in the Landfarm Design & Management Plan (Agnico Eagle 2008), it is estimated that soils contaminated with light end PHCs would require three full summer seasons for complete remediation. When remediated, the soils will be removed from the landfarm and used on-site, placed in a WRSF or used as cover at the TSF.

2.3.2 Design Specifications

The design criteria for the landfarm is outlined in Table 2-2. Its footprint is approximately 11,000 square metres (m^2), with a perimeter berm that is approximately 2.0 m high over the landfarm surface. The geometry and characteristics of the landfarm are shown in Table 2.2.

Table 2-2 Geometry and Characteristics of the Landfarm

Item	Actual
Dimensions of Perimeter Berm Crest Exterior (avg.)	86.8 m x 68.4 m
Dimensions of Perimeter Berm Crest Interior (avg.)	74.4 m x 53.3 m
Side Slopes of Perimeter Berm (avg.)	1V:2.5H (40%)
Perimeter Berm Crest Width (avg.)	3.5 m
Perimeter Berm Height (Min. to Max.)	1.4 m to 5.2 m
Perimeter Berm Crest Elevation (avg.)	75.25 m
Dimensions of Filter Berm Crest Interior (avg.)	19.0 m x 12.0 m
Side Slopes of Filter Berm (avg.)	1V:1.5H (67%)
Filter Berm Crest Width (avg.)	1.0 m
Geomembrane Liner Crest Elevation	74.80 m
Interior Floor Slope (avg.)	-3.1% (NW to SE)
Fill Thickness Above Original Ground for Inside Base/ Sump Area (Min.)	1.52 / 1.48 m
Fill Thickness Above Liner	0.5 m
Inside Base Surface area Including Sump Area	3,794 m^2
Sump Surface Area	144 m^2

Table 2-3 indicates the growth and stabilization of the volume of PHC considering remediation over three years and the maximum volume of contaminated material that is anticipated to be stored over a period of 13 years.

The size of the landfarm is based on the design criteria (Table 2-2), the estimated volume of material (Table 2-3), and the requirement to turn over the surface of the piles during the summer months. The designed footprint of the landfarm is 11,000 m^2 with a useful landfarm surface of 3,650 m^2. Contaminated material is piled 1.5 m so that the material is below the crest height of the perimeter berm. At the maximum estimated capacity of the facility, three windrows having each 890 m^3 of PHC will cover 1,800 m^2 allowing 1,850 m^2 for turnover and water management.

Table 2-3 Volume of Petroleum Hydrocarbon Contaminated Material in the Landfarm

Mine Year	Estimated PHC Produced (m^3)	Accumulated PHC in Landfarm for Remediation (m^3)	Treated PHC Removed from Landfarm (m^3)	Hydrocarbon Contaminated Snow or Ice to Landfarm (m^3)	Maximum Accumulated PHC in Landfarm (m^3)

SECTION 3 • LANDFARM OPERATION AND MANAGEMENT

Agnico Eagle is responsible for managing and implementing the landfarm operation plan. Operation and monitoring of the landfarm as well as designation of training requirements will be the responsibility of the Environment General Supervisor, Coordinators or designate.

3.1 Acceptable Landfarm Material

3.1.1 Contaminants

The landfarm facility will only treat and/or store light PHC contaminated soils that have been generated through mine related activities at the Project and which have been transferred from the Project's advanced exploration camp landfarm upon closure. Material from the Hamlet of Rankin Inlet or other sites will not be accepted without approval from the NWB, Crown-Indigenous Relations and Northern Affairs, Water Resources Inspectors, and the Kivalliq Inuit Association.

The following products are acceptable for treatment in the landfarm if generated on-site and spilled on soil:

- diesel fuel;
- gasoline;
- hydraulic oil
- aviation fuel (Jet A);
- other light oil (e.g., engine oil, lubricating oil);

In the event that the contaminant source is unknown, soil samples will be analyzed for PHCs and possibly additional contaminants prior to placement in the landfarm. These additional parameters could include total metals, oil and grease, and volatile organic compounds. Analysis for additional compounds will be determined by the Environment Department on a case-by-case basis. If there is uncertainty whether or not the material contains additional, unknown contaminants, the material should be placed in totes/drums until lab results confirm that they can be placed in the landfarm.

Concentrations of contaminants will be compared to the site background values (for metals) and/or criteria in the Government of Nunavut (GN) *Guidelines for Contaminated Site Remediation* (GN 2009). If this analysis indicates soil contamination above background or GN guidelines for any substance not approved for landfarming (i.e., non-PHC contaminants), the spill material will not be placed in the landfarm. This is to ensure that PHC contaminated soils are not contaminated with other products.

Spills of non-PHC material (e.g., solvents) will be placed in drums and stored on-site for shipment to approved facilities during shipping season.

3.1.2 Grain Size

Bioremediation of very coarse-grained, larger soil material, is inhibited as it does not readily retain moisture. However, volatilization will occur more rapidly (SAIC 2006). It has been noted that this material likely contains lower concentrations of contaminants due to a lower volume-to-surface area ratio, and can typically be screened out prior to landfarming (SAIC 2006). As a result, soils and rock material with grain size less than 2.5 centimetres (cm) will be separated from larger-grained material, where possible. This will occur at the spill location or in the landfarm using a screen sieve, should it prove necessary. The two soil fractions will be treated separately in the landfarm.

3.2 Contaminated Soil Additions

3.2.1 Spill Excavation

Soil contaminated with the above-described petroleum hydrocarbon materials will be excavated and transported to the landfarm facility in dump trucks or other approved methods. Care will be exercised to ensure that the entire spill is excavated (verified by olfactory and visual assessment, or sampling if necessary) and that none of the contaminated material is lost during transport.

3.2.2 Placement in the Landfarm

As described above, larger coarse material (rocks) will be separated from the finer material (sand and gravel) in the landfarm and assessed visually for PHC staining and product. If the material is saturated it will be spread to allow volatilization in the designated area of the landfarm.

Materials identified as acceptable in the landfarm will be placed in windrows with dimensions about 18 m wide at base x 1.5 m high x 34 m long. Windrows may be piled wider, higher, or longer as space permits. A record will be kept by the on-site Environmental Coordinator or designate of the amount of contaminated soil placed in the landfarm and the location of each load within it.

3.2.3 Decontamination of Soil Movement Equipment

The decontamination of soil movement equipment is outlined in the Landfarm Soil Movement Procedure, included as the Appendix A to this Management Plan.

3.3 Contaminated Snow

Petroleum hydrocarbon contaminated snow and ice will be placed in a designated snow-cell area and treated as contact water after snowmelt. After snowmelt, the contaminated water will pumped through the site's oil-water separator to remove PHC residue. The treated water will be discharged to the CP1.

Snow accumulation in the Landfarm will be allowed to melt and accumulate in the Landfarm sump where it will be treated through the oil-water separator as needed upon melt or used in the bioremediation process for the contaminated soil. Any excess snow accumulation in the Landfarm will be moved to the snowcell.

3.4 Remediation

Remediation of fine grained PHC contaminated soil in the landfarms occurs naturally through volatilization and aerobic microbial degradation. Soil aeration, nutrient amendment and water addition, are recognized as methods for improving rates of remediation. Agnico Eagle commissioned the National Research Council Canada to undertake the bioremediation research study to optimize the biodegradation process. Agnico Eagle will look at increasing biodegradation rates through potential opportunities such as nutrient amendment.

3.4.1 Absorbent Materials

Coarse-grained soils are not readily bio-remediated, but concentrations of PHC contaminants may still be reduced through volatilization. Oil absorbent pads will be used to help remove visible product from coarse-grained material.

3.4.2 Aeration

To promote aerobic conditions throughout the windrows, soil will be mixed mechanically with earth-moving equipment. This turnover of soil piles will occur approximately two to four times per year, during the summer months.

3.4.3 Soil Moisture

Prior to turning, site personnel will ensure that soil is not so dry as to generate significant dust, nor overly saturated. If soil is too dry, non-contaminated water from within the landfarm containment area will be used as a moisture source and sprayed on the piles. If no accumulated water is available, water from CP1 or freshwater will be used. If the windrows are saturated, aeration will be delayed until the moisture content is reduced.

3.4.4 Nutrient Amendment

The use of sewage sludge as a nutrient amendment has precedent in the north. Sewage sludge as a nutrient source has also been proposed for the Milne Inlet Mary River Project (EBA 2010). This material not only provides the benefit of nutrients, but also adds organic matter to help retain moisture and microorganisms. Furthermore, the use of sewage sludge produced on-site helps to reduce the waste footprint of the mine by re-directing this material from disposal facilities and avoids needing to import a chemical fertilizer. The use of sewage sludge or another recommended nutrient amendment will be considered for optimization of biodegradation.

3.5 Removal of Soil From the Landfarm

3.5.1 Government of Nunavut Remediation Guidelines

The following parameters will be measured and compared with the GN industrial remediation criteria to determine whether PHC contaminated soil has been adequately remediated:

- benzene, toluene, ethylbenzene and xylene (BTEX); and
- petroleum hydrocarbon fractions 1 - 4.

The GN remediation criteria are characterized for agricultural/wildlife, residential/parkland, commercial, and industrial land uses. At the Project, remediation to agricultural/wildlife criteria is targeted; however, if these criteria cannot be met, industrial criteria will be followed.

The GN remediation criteria for coarse-grained soils will be applied. Table 3-1 presents the applicable Tier 1 criteria for coarse-grained soil, assuming agricultural/wildlife or industrial land uses.

Table 3-1 Summary of Relevant GN Tier 1 Soil Remediation Criteria for Surface Soil (mg/kg)

	Land Use Criteria (mg/kg)	
	Agricultural/Wildlife	**Industrial**
Benzene	0.03	0.03
Toluene	0.37	0.37
Ethylbenzene	0.082	0.082
Xylene	11	11
PHC Fraction 1	30	320
PHC Fraction 2	150	260
PHC Fraction 3	300	1,700
PHC Fraction 4	2,800	3,300

mg/kg = milligram per kilogram

3.5.2 Sampling and Analysis

Landfarm windrows will be sampled annually at the end of the summer season to determine if remediation objectives have been met. Representative composite samples will be taken of each windrow to estimate remaining PHC concentrations. For each 10 m of windrow length, one composite sample will be collected, each consisting of three surface sub-samples and three sub-samples at 1 m depth. Sub-samples will be taken approximately 3.3 m apart, and will be taken from both sides of the windrow. Sampling QA/QC measures will include collection of 1 duplicate per 10 samples.

After two seasons of treatment in the landfarm, degradation rates will be assessed to estimate the total remediation time required for PHC contaminated soil under these conditions. If remediation to GN guidelines is feasible within the life-of-mine timeframe, landfarm operations will continue, with aeration and possible nutrient amendments as described above. If rates of degradation are not sufficient through this method, alternate options will be further investigated as described in Section 4.2.

3.5.3 Soil Removal

Coarse-grained soils will be assessed near the end of the summer season by Environment Department technicians for PHC product and odour. Based on the experience learned at Meadowbank, Agnico

Eagle is confident that confirmatory sampling and laboratory analysis is not required prior to removing coarse-grained soil from the Landfarm. Observations show that volatilization of PHCs from coarse-grained soil occurs more rapidly than biodegradation. It has been noted that this material likely contains lower concentrations of contaminations due to a lower volume-to surface area ratio, and can typically be screened out prior to landfarming. Thus, the use of a photoionization detector (PID) is sufficient to confirm material is in a suitable state to be removed from the landfarm. When PHC odours are no longer detected, the material will be removed to waste rock storage facility or at the TSF to be used as cover material.

When sample analysis of fine-grained material at the end of a season indicates that concentrations of contaminants are below GN guidelines, a soil pile or the appropriate section of a pile will be deemed acceptable for removal from the facility. Interim monitoring may be conducted through measurements of headspace with a portable instrument (e.g., flame ionization detector), but samples will be confirmed by an accredited laboratory prior to soil removal.

When remediated, the soils will be removed from the facility and can be used for construction purpose such as normal overburden (i.e., part of the cover of the TSF) or stacked in the WRSF. Based on a remediation period of three seasons, it would be possible to close the landfarm facility three years after the end of the process plant operation.

3.6 Water Management

Since the landfarm facility is uncovered to facilitate natural weathering, water accumulating inside the bermed area may come into contact with contaminated material.

While the landfarm has an impermeable liner, visual inspections by the Environment Department will be conducted for seepage of contact water coming through the perimeter berm, or the accumulation of water within the containment berm. This will be conducted on a weekly basis starting after freshet and continuing until October when water is likely to be present. In the event of water accumulation or seepage, the ponded water will be pumped through the site's oil-water separator to remove PHC residue and will be analyzed for BTEX, lead, and oil and grease prior to discharge to CP1 or used on the windrows to increase moisture content, as required. Water accumulating in the landfarm will not be discharged directly to the receiving environment.

3.7 Winter landfarm management

Uncontaminated snow will be removed as much as possible during winter to minimize the quantity of spring melt water inside the berm. Care will be taken to ensure contaminated snow/soil is not disturbed by leaving a base layer of snow of no less than 10 cm in place. Following snowmelt, any contaminated product left from winter spill clean-up operations will be padded up. The base soil in these areas will be excavated and added to existing remediation windrows as soon as possible after snowmelt to minimize migration into the facility substrate.

3.8 Landfarm Closure and Reclamation

After removal of all remediated soil and prior to closure and reclamation of the landfarm, the berm and base will be sampled on a 10 m grid, to determine if these soils are free from PHC contamination. Results of this analysis will be compared to GN criteria set out in Table 3-1. No excavation will be necessary if agricultural/wildlife criteria are met. If industrial criteria are used, the landfarm will be covered with 2 m of waste rock or other material used for reclamation. The surrounding berm will be breached to avoid water accumulation on the landfarm.

3.9 Summary of Activities

A summary of landfarm activities including monitoring of the physical condition and potential environmental impacts of the landfarm is provided in Table 3-2. An annual report will be prepared indicating the volume of material added to the facility, amount of material removed, disposal or reuse location, all analysis results, volume and type of nutrient addition, visual inspection results, and volume of contact water pumped. This information will be appended to Agnico Eagle's NWB Annual Report.

Table 3-2 Summary of Landfarm Activities, Analyses, and Records

Activity	Analysis	Frequency of Analysis	Record
Excavation of spill and transport of contaminated material to landfarm.	If unsure of full excavation - F1-F4, BTEX If contaminant source unknown, F1-F4, BTEX, metals, oil and grease, VOCs	As needed	Date, time and location of spill and excavation; estimated volume of spill; estimated quantity of excavated soil; storage/disposal location of excavated soil, if applicable. Any evidence of remaining product
Soil aeration	NA	Two to four times over the summer	Date and time of the aeration; location; soil condition (moisture, odour, granulometrie, etc.)
Soil treatment with sewage sludge as nutrient supplement.	Visual inspection to ensure proper incorporation	At least once during summer on selected windrows	Date and time; type of treatment (aeration or nutrient amendment); location in landfarm; any odour noticed during aeration
Sampling for progress of remediation	Hydrocarbon vapour in headspace (by PID); F1-F4, BTEX (laboratory)	Vapour – as needed; Laboratory - annually	Date and time; location; odour; laboratory report
Soil removal from landfarm	Removal subject to meeting GN criteria	Once GN criteria are met	Date and time; location; quantity of soil removed; final location
Ponded contact water	BTEX, oil and grease, lead – as specified in Water Licence	Prior to any dewatering; if re-used in landfarm, no sampling necessary	Date and time, location, laboratory report, in Annual Report
Seepage	Visual inspection; BTEX, oil and grease, lead – as specified in Water License	Weekly during summer	Location, extent, approximate depth, evidence of sheen
Identification of maintenance requirements	Visual inspection of landfarm	Twice over the summer	Inspected areas; condition of berm and base; previously unidentified safety concerns

SECTION 4 • CONTINGENCY OPTIONS

This section describes the contaminated soil management plan, should a large spill event occur, and if landfarm treatment prove not successful.

4.1 Large Spill Event

A large spill event producing a quantity of soil that cannot be contained in the landfarm is unlikely because the landfarm is designed to hold nearly two times as much contaminated soil as is expected to be produced. Nevertheless, in this event, soils will be placed in a temporary storage area. A temporary stockpile area would be set up on an emergency basis, such as in the Waste Rock Storage Facility (WRSF) or the Tailings Storage Facility (TSF). As space becomes available, the soil would be added to the landfarm. Through spill prevention measures discussed earlier in this Plan, Agnico Eagle is minimizing the probability of this scenario occurring.

4.2 Alternate Treatment Options

Should landfarm treatment not perform as anticipated and it is evident that rates of degradation are not sufficient to meet GN Tier 1 criteria within the life-of-mine and the anticipated closure, the following alternative treatment options will be considered. Implementation will be after development of a more detailed protocol and approval of a revised plan by the NWB.

4.2.1 Soil Amendment

Since pH, salinity, moisture content, and microbial population density all affect rates of biodegradation by microbes, these factors may be monitored and adjusted through soil amendments if they are not found to be optimal (SAIC 2006). In addition, the height of soil windrows could be reduced to maximize air exposure if space in the landfarm allows.

4.2.2 Tier 2 – Modified-Criteria Approach

According to the GN *Environmental Guideline for Contaminated Site Remediation* (GN 2009), in cases where site conditions, land uses, receptors, or exposure pathways are different from those assumed in the development of the Tier 1 criteria, modified criteria may be permitted. This process requires the collection of site-specific information on exposure and risk estimates, and is subject to GN approval. For this Project, landfarmed soils are to be encapsulated in a WRSF rather than used in surface applications, as assumed in Tier 1, reducing the likelihood of exposure to any remaining contamination. Therefore, the Tier 2 approach could be warranted if Tier 1 criteria cannot be met. Any consideration for this approach would be based on soil sampling results and science based information.

4.2.3 Direct Placement in Waste Rock Storage Facility or on Tailings Storage Facility

Another option for management of contaminated soil if bioremediation proves not effective would be the direct placement of this material in a WRSF or on the TSF. Although the use of PHC contaminated soils in these storage areas is not optimal, the quantity generated on-site is small in comparison to the quantity of waste rock and cover on the TSF. While this method would not result in the treatment of soil, it is a viable contingency option because it would allow for the safe disposal of the contaminated material. Encapsulation and freeze-back would occur, eliminating any movement of contaminants. Over time, this material would undergo natural degradation. Consideration of this option would also include a suitable monitoring program for PHCs, which would be incorporated into the Closure and Reclamation Plan.

SECTION 5 • ASSESSMENT AND REPORTING

5.1 Feasibility

After two seasons of treatment in the landfarm, degradation rates of PHC contaminants are assessed to estimate the total remediation time required under these conditions. If remediation to GN guidelines is feasible within the life-of-mine timeframe, landfarm operations will continue, with aeration and possible nutrient amendments as described above. If rates of degradation are not sufficient through this method, alternate options will be further investigated (Section 4).

5.2 Reporting

Reporting of landfarm activities is submitted annually by the Environment Department, indicating the volume of material added to the facility, amount of material removed and disposed or the re-use location, and confirmatory analysis results. This information will be appended to Agnico Eagle's NWB Annual Report.

5.3 Plan Review and Continual Improvement

The Landfarm Management Plan is reviewed annually by the Meliadine Environmental Department, and, if necessary, updated at least every two years of operation.

DOCUMENT ID: NU-E&I-PRO – Land farm soil movement	
People concerned: Site services HEO, environmental department	**Effective Date: 2018-03-13**
This procedure corresponds to the required minimum standard. Each and everyone also have to comply with the rules and regulations of the Nunavut Government in terms of health and safety at work.	

Rev #	Date	Description	Initiator
0	2018-03-13	Draft	Guillaume Gemme

Objective:

- Safe operation of equipment during land farm soil movement

Definitions (If applicable):
This procedure is in place to ensure proper usage of heavy equipment on the land farm during the soil movement process.

Page 1 of 4

2019-02-17 *This document is void 24 hours after printing*

Tool/Equipment Required	PPE Required
• Heavy equipment (Backhoe/excavator/ Dozer/ Etc.) equipped with flat lip bucket to avoid membrane damage • Measuring device (Ex: Measuring tape) • Shovel and broom	• Standard PPE

Specific Training Requirements
• Appropriate Heavy equipment operator training. (Class 2 Operator or equivalent)

1. Access to the Land farm a. Before entering the land farm, the operator need to have the approval of the Site Services field Supervisor and be accompanied by an environmental representative. 2. Soil movement a. Following the environmental department direction, proceed with the requested soil movement work. (Drawing of the work to be done including exact location, dimension of the area and maximum deepness to reach need to be done by Environment department before proceeding with the work) b. Sampling will be completed by environment department following procedure : MEL-ENV-Permanent Land farm & Soil Sampling

AGNICO EAGLE NUNAVUT

3. Equipment decontamination
   a. Before exiting the area, make sure to remove all contaminated soil from the heavy equipment.
   b. Using a hand shovel remove all contaminated soil on the equipment. If required use a broom to reach all potential contaminated parts of equipment
   c. Call the field supervisor to assess the equipment cleanness before exiting the land farm.

MELIADINE GOLD MINE

Water Quality and Flow Monitoring Plan

JANUARY 2019
VERSION 1

EXECUTIVE SUMMARY

The Water Quality and Flow Monitoring Plan (the Plan) has been prepared in accordance with the requirements of the Nunavut Water Board Type A water license 2AM-MEL1631. The Plan is one component of the *Aquatic Effects Management Program* (AEMP) and is closely associated with the *Water Management Plan* and the *Metal and Diamond Mining Effluent Regulations (MDMER)*.

Section 2 of this Plan includes an overview of the monitoring programs and mine development schedule. Section 3 provides specific details (including sampling locations and parameters to be measured) for the compliance monitoring program, along with general guidance for the event monitoring program. An adaptive management program is described for regulated discharge and non-regulated discharges in Section 3. Requirements of the flow monitoring program are described in Section 4, and an overview of the reporting requirements in Section 5.

SECTION 1. INTRODUCTION

The Water Quality and Flow Monitoring Plan (the Plan) has been prepared in accordance with the requirements of the Nunavut Water Board Type A water license 2AM-MEL1631 (the License). The Plan is one component of the *Aquatic Effects Management Program* (AEMP) and is closely associated with the *Water Management Plan* and the *Metal and Diamond Mining Effluent Regulations (MDMER)*. The implementation and periodic updates to this Plan are the responsibility of the Meliadine Environment Department under the guidance of the Meliadine Environment Superintendent or designate.

The Plan summarizes the monitoring locations, sampling frequency, monitoring parameters, compliance discharge criteria and an adaptive management plan for water quality at the Meliadine Gold Project.

The purpose of this Water Quality and Flow Monitoring Plan is to establish the program that is to be implemented and followed by AEM's Meliadine environmental management team to monitor the performance of the waste and water management systems at the Meliadine Gold Project. The program includes:

- Verifying and validating the predicted water quality values with empirical measurements of the mine site water quality and flows;
- A comparison of measured water quality data to compliance requirements stipulated in the License; and
- A framework for adaptive management that allows the identification and rectification, where necessary, of unexpected trends or non-compliance in water quality and flows.

The Plan provides information on the locations of the monitoring stations at the various stages of mining. These monitoring locations are used to evaluate the performance of the mine waste and water management system.

The objectives of the monitoring program are:

1) To track the chemistry of the contact and non-contact water prior to and during discharge;

2) To assist in identifying if water treatment is required prior to discharge; and

3) To minimize the potential impacts of mining activities on the surrounding environment.

Additional locations outside the footprint of the mine (and outside the scope of this Plan) will be monitored under the *Meliadine Gold Project Aquatic Effects Management Program* (Golder 2016).

SECTION 2. OVERVIEW

2.1 OVERVIEW OF SITE WATER MANAGEMENT PLAN

Details of overall water management are discussed in the Meliadine Water Management Plan which is updated annually. A network of berms, dikes, containment ponds, channels, culverts and sumps are in place and maintained to facilitate water management (Section 3 of the *Water Management Plan*).

As specified in the *Water Management Plan*, surface contact water is intercepted, diverted and contained within various containment ponds prior to evaporation or treatment. Contact water from the Underground Mine is collected in underground sumps and recirculated for use in various underground operations. Underground contact water that is not used for operations is stored underground and any excess water that cannot be stored underground is pumped to the Saline Ponds or to the Saline Water Treatment Plant (SWTP) for treatment (See Section 3.9 of the *Water Management Plan*). Additional Saline Storage ponds will be developed on the Meliadine site (surface) in the future as groundwater inflows in the underground workings of the mine are greater than predicted. Agnico Eagle has received approval from the Nunavut Impact Review Board to discharge saline water via a diffuser to the sea in Rankin Inlet (Melvin Bay).

2.2 MONITORING PROGRAMS

This Plan has been divided into two levels of monitoring to characterize the range of impacts between the sources of contact water in the individual mine facilities and the point of discharge or release to the receiving environment. The two levels of monitoring include:

1) Compliance monitoring; and

2) Event monitoring.

2.2.1 Compliance Monitoring Program (CM)

The CM sites are those stipulated in the License; these sites vary from contact water collection ponds, structures such as ditches, culverts prior to discharge to the receiving environment and local lakes surrounding the mine site. The requirements of the License, including water quality limits, will be applied at the applicable mine discharge points identified in the CM program.

The CM program provides a mechanism to assess water quality at specified sites, and to confirm and document compliance of discharge with regulatory requirements. As part of adaptive water management, these internal monitoring stations provide protection to the receiving water environment, provide data to predict pit re-flooding water quality and ensure exceedances of predicted or regulated levels are appropriately managed or mitigated to reduce impacts.

2.2.2 Event Monitoring Program (EM)

The EM sites result from unexpected events such as spills, accidents, and malfunctions. The response programs for such events are discussed in greater detail in the following four (4) documents:

- Meliadine Spill Contingency Plan (March 2019;
- Meliadine Emergency Response Plan (May 2018);
- Meliadine Freshet Action Plan (March 2019); and
- Meliadine Water Management Plan (March 2019).

Each accidental release will require mobilization of site equipment to stabilize the release, procedures to contain, neutralize, and dispose of the discharge, and recommendations for monitoring the site following the incident.

2.3 OVERVIEW OF MINE DEVELOPMENT SCHEDULE

The Mine Plan and key mine development activities, including mine waste management are currently used concurrently with the *Water Management Plan*.

The Mine Plan proposes one underground mine (Tiriganiaq Underground Mine) and two open pits (Tiriganiaq Open Pit 1 and Tiriganiaq Open Pit 2) for the development of the Tiriganiaq gold deposit.

The Mine is estimated to produce approximately 14.9 million tonnes (Mt) of ore, 31.8 Mt of waste rock, 7.4 Mt of overburden waste, and 14.9 Mt of tailings. The following phased approach is proposed for the development of the Tiriganiaq gold deposit;

- Phase 1: 3.5 years for Mine Construction. Construction began in 2015 and is estimated to be completed in Q2 of 2019 (Q4 Year -5 to Year Q2 -1);
- Phase 2: 8.5 years for Mine Operations, beginning in 2019 (Q2 Year -1 to Year 8);
- Phase 3: 3 years Mine Closure (Year 9 to Year 11); and;
- Phase 4: Post-Closure (Year 11 forward).

Mining facilities on surface will include a plant site and accommodation buildings, three ore stockpiles, a temporary overburden stockpile, a tailings storage facility (TSF), three waste rock storage facilities (WRSFs), a water management system that includes containment ponds, water diversion channels, retention dikes/berms, and a series of water treatment plant

SECTION 3. MONITORING PROGRAM

The monitoring program is presented in three sections; requirements of the compliance monitoring program, an overview of the event monitoring program, and then details of the adaptive management program for monitoring results.

3.1 COMPLIANCE MONITORING PROGRAM

The CM program monitors the chemistry of four local lake surrounding the mine site (E3, G2, H1 and B5) as well as mine contact water collected and diverted at specified locations prior to release into the receiving water environment. The sampling is conducted in order to confirm and document compliance with regulatory requirements. The types of water and the timing of the CM program include:

- Non-contact water from local lakes;
- Mine contact water collected from drainage of different structures; and
- Monitoring points located within the containment ponds prior to release into the receiving water environment

The CM sampling program has multiple monitoring stations across the project site, with sampling at different stages of the mine life. All of the CM stations, a description of their location, parameters to be monitored and sampling frequency are listed in Table 3.1. Specific details for the monitoring parameter groups are provided in Table 3.2. In summary, Agnico Eagle follows 5 groups of parameters, as identified in Meliadine's Type A Water License Schedule I Table 1.

Figures 3.1 shows the approximate location of each of the sampling sites. The actual location of each sampling site is determined by access and safety considerations and are marked by a stake that defines the exact location of the collection point for sampling events with appropriate attached signage in English, Inuktitut and French.

GPS coordinates for all compliance monitoring stations were confirmed, as required in Part I, Item 6 of the NWB Type A water license.

3.1.1 General Sampling and Analysis Program

Samples are collected in clean laboratory-supplied containers and preserved as directed by the analytical laboratory. During all phases, samples are analyzed offsite at an accredited commercial lab (ALS in Burnaby BC, Maxxam Analytics in Ottawa, AquaTox in Puslinch, or H2Lab in Val d'Or). Samples sent to commericial laboratories may change as the site matures and additional requirements occur.

Table 3.3 summarizes the minimum sample volumes, container, preservation, and holding times for each analyte. This information is from the *USEPA Methods for Chemical Analysis of Water and Waste Water* (*EPA-600/4-79-020, 1979*).

Table 3.1: Monitoring Program

Station	Description	Phase	Monitoring Parameters	Frequency
Mine Site				
MEL-D-1	Dewatering: Water transferred from lakes to Meliadine Lake during dewatering of lakes	Construction	As defined in the Water Management Plan referred to in Part D, Item 12	Prior to discharge and Weekly during discharge
			Volume (m3)	Daily during periods of discharge
MEL-SR-1 to TBD	Surface Runoff – runoff downstream of Construction areas at Meliadine Site and Itivia Site, Seeps in contact with the roads, earthworks and any Runoff and/or discharge from borrow pits and quarries	Construction, and Operation	As defined in the Water Management Plan referred to in Part D, Item 18 and Part I, Item 11	Prior to Construction, Weekly during Construction
			Group 1	Monthly during open water or when water is present upon completion
MEL-11	Water Intake from Meliadine Lake	Construction, Operation, and Closure	Full Suite	Monthly during periods of intake
			Volume (m3)	Daily during periods of intake
MEL-12	Water treatment plant (pre-treatment) coming from CP1, off the pipe and not in the pond	Construction (prior to release), Operations, and Closure	Group 1	Monthly during periods of discharge
MEL-03-01 (and AEMP Stations)	Mixing zone in Meliadine Lake, Station 1; and MDMER exposure stations for final discharge point within mixing zone	Construction (prior to release), Operations, and Closure	Full Suite, Group 3 (MDMER)	Monthly during periods of discharge
MEL-14	Water treatment plant from CP-1 (post-treatment), end of pipe (before offsite release) in the plant before release.	Construction (upon effluent release), Operations, and Closure	Full Suite, Group 3	Prior to discharge and Weekly during discharge

			Volume (m3)	Daily during periods of discharge Once prior to discharge and Monthly thereafter
			Acute Lethality	Once prior to discharge and Monthly thereafter
MEl-15	Local lake E-3	Operations, and Closure	Group 2	Bi-annually during open water
MEL-16	Local Lake G2	Construction, Operations, and Closure	Group 2	Bi-annually during open water
MEL-17	Local Pond H1	Construction, Operations, and Closure	Group 2	Bi-annually during open water
MEL-18	Local Lake B5	Construction, Operations, and Closure	Group 2	Bi-annually during open water
MEL-19	CP-2 Collection of natural catchment drainage from the outer berm slopes of the Landfarm and industrial pad	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-20	CP-3 Collection of drainage from dry stacked tailings	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-21	CP-4 Collection of drainage from WRSF1	Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-22	CP-5 Collection of drainage from WRSF1 and WRSF2	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-23	CP-6 Collection of drainage from WRSF3	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-24	Seepage from the Landfill between the landfill and Pond H3	Construction, Operations, and Closure	Group 1	Monthly during open water or when Water is present
MEL-25	Secondary containment area at the Itivia Site Fuel Storage and Containment Facility	Construction, Operation, Closure	Group 4, Volume (m3)	Prior to discharge or transfer of Effluent

Table 3.2: Monitoring Parameters

Group	Parameters
1	pH, turbidity, hardness, alkalinity, chloride, fluoride, sulphate, total dissolved solids (TDS), total suspended solids (TSS), total cyanide, ammonia nitrogen, nitrate, nitrite, phosphorus, orthophosphate, Total Metals (aluminum, arsenic, barium, cadmium, chromium, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, thallium, and zinc).
2	**Total and Dissolved Metals**: aluminum, antimony, arsenic, barium, beryllium, boron, cadmium, chromium, copper, iron, lead, lithium, manganese, mercury, molybdenum, nickel, selenium, silver, strontium, thallium, tin, titanium, uranium, vanadium, and zinc. **Nutrients**: ammonia-nitrogen, total Kjeldahl nitrogen, nitrate-nitrogen, nitrite-nitrogen, orthophosphate, total phosphorus, total organic carbon, dissolved organic carbon, and reactive silica. **Conventional Parameters**: bicarbonate alkalinity, chloride, carbonate alkalinity, turbidity, conductivity, hardness, calcium, potassium, magnesium, sodium, sulphate, pH, total alkalinity, TDS, TSS, total cyanide, free cyanide, and weak acid dissociable (WAD) cyanide..
3	**MDMER parameters**: total cyanide, arsenic, copper, lead, nickel, zinc, radium-226, TSS, pH, total ammonia and temperature. **MDMER additional requirements**: Effluent volumes and flow rate of discharge, Acutely Lethality tests (Rainbow Trout and Daphnia magna) and environmental effects monitoring (EEM).
4	Total arsenic, total copper, total lead, total nickel, TSS, ammonia, benzene, toluene, ethylbenzene, xylene, total petroleum hydrocarbons (TPH), and pH
Full Suite	Group 2, Total Petroleum Hydrocarbons, Turbidity. Non Acutely-lethal (Rainbow Trout and Daphnia magna) for discharge only.
Flow	Flow data-logger
Field measurements	Field pH, specific conductivity, dissolved oxygen, and temperature.

Table 3.3: Summary of Sampling Requirements for each Analyte

Parameters	Matrix Holding Time				Type of Bottle	Preservative	Volume

Type of bottle:
P.S.V.T.: plastic bottle, bag or glass bottle with Teflon cap
P, T: Plastic bottle or plastic bottle with Teflon cap
P.T.V.: Plastic bottle or glass bottle with plastic or Teflon cap
PPS: Sterile propyl ethylene bottle
VA: Clear or amber glass with aluminium or Teflon seal
VB: Amber glass (or clear glass covered with aluminium paper) aluminium seal of Teflon
VT: Clear or amber glass bottle with Teflon seal
Preservative:
AC: 0.1ml (100µl) of HCl per 100ml of sample
AcZn: 0.2ml zinc acetate 2N per 100ml of sample and NaOH 10N to pH >9
AN: HNO3 to pH <2
AS: H2SO4 to pH <2
E: 2.5ml EDTA 1.5% (p/v) per 100ml of sample if heavy metals are suspected
ED: 0.1ml diamine ethylene 45 mg/l per 100 ml of sample
EDTA: 1ml EDTA 0.25M per 100ml of sample
N: No preservative
NaOH: NaOH 10N to >12
TS: Sodium thiosulfate final concentration in the sample of 0.1% (p/v)

3.1.2 Compliance Monitoring Stations and Discharge Criteria

Further details of the specific CM stations and discharge criteria stipulated under the License are provided below.

3.1.2.1 *Dewatering Activities*

All Waters from dewatering activities at Monitoring Program Stations MEL-D-1 through MEL-D-TBD shall be directed to Meliadine Lake and shall not exceed the quality limits presented in Table 3.4 as stipulated in Part D, Item 12 of the License.

Table 3.4: TSS and pH Criteria at CM Stations MEL-D-1 through MEL-D-TBD

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of Any Grab Sample
TSS	15.0	30
pH	6.0 to 9.5	6.0 to 9.5

All surface runoff and/or discharge from drainage management systems, at the Monitoring Program Stations MEL-SR-1 to MEL-SR-TBD during the Construction/Operation of any facilities and infrastructure associated with this project, including laydown areas and All-weather Access Road, where flow may directly or indirectly enter a Water body, shall not exceed the Effluent quality limits presented in Table 3.5, as stipulated in Part D, Item 18 of the License.

Table 3.5: Effluent Criteria at CM Station MEL-SR-1 to MEL-SR-TBD

Parameter	Maximum Average Concentration	Maximum Concentration of Any Grab Sample
Total Suspended Solids (TSS) (mg/L)	50.0	100.0
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	6.0 to 9.5	6.0 to 9.5

3.1.2.2 *Water Collection System*

A water collection system comprised of berms, dikes, containment ponds, channels, culverts and sumps was developed to control water at the Meliadine project (Section 3 of the *Water Management Plan*). Diversion berms, diversion channels and culverts will direct surface water towards containment ponds and associated dikes. Pending salinity levels, water in containment pond CP5 will be treated by a Reverse Osmosis (RO) treatment plant prior to be discharged in CP1.

Contact water from the Underground Mine is collected in underground sumps and recirculated for use in various underground operations. Underground contact water that is not used for operations is stored underground and any excess water that cannot be stored underground is pumped to the Saline Ponds. Saline water collected in the Saline Ponds is temporarily stored and then actively evaporated or pumped to the SWTP for treatment prior to being pumped to CP1.

At CP1, the water is treated for total suspended solids (TSS) at the Effluent Water Treatment Plant (EWTP) and either transferred to the process plant for use as make-up water or discharged through the diffuser located in Meliadine Lake

Effluent discharged from CP1 at CM station MEL-14 shall be directed to Meliadine Lake through the Meliadine Lake Outfall Diffuser and shall not exceed the effluent quality limits presented in Table 3.7, as stipulated in Part F, Item 3 of the License.

Table 3.6: Effluent Criteria at CM Station MEL-14

Parameter	Maximum Average Concentration	Maximum Concentration of Any Grab Sample
pH	6.0 to 9.5	6.0 to 9.5
TSS (mg/L)	15	30
TDS (mg/L)	1400	1400
Total (T)-Al (mg/L)	2.0	3.0
T-As (mg/L)	0.3	0.6
T-CN (mg/L)	0.5	1
T-Cu (mg/L)	0.2	0.4
NH_4-N (mg/L)	14	18
T-Ni (mg/L)	0.5	1
T-Pb (mg/L)	0.2	0.4
T-P (mg/L)	2.0	4.0

T-Zn (mg/L)	0.4	0.8
Total Petroleum Hydrocarbons (TPH) (mg/L)	5	5

The Discharge of Effluent from the Final Discharge Point at Monitoring Program Station MEL-14 shall be demonstrated to be non-Acutely Lethal under the following test in accordance with the Schedule I of the License:

a. Acute Lethality of Effluents to Rainbow Trout (as per Environment Canada's Environmental Protection Series Biological Test Method EPS/1/RM/13 July 1990, published by the Department of the Environment, as amended in December 2000, and as may be further amended from time to time.

Itivia Marshalling Area

Surface water runoff from the bulk fuel tank storage areas is collected within the tank's secondary containment enclosures that are equipped with an HDPE liner; these are designed to contain petroleum products released due to spill events. Water collected in the secondary containment enclosures at CM station MEL-25 is discharged to land in a controlled manner according to the Nunavut Water Board Type A water license # 2AM-MEL16331.

All effluent being discharged from the secondary containment enclosures at the itivia marshalling facility shall not exceed the effluent quality limits presented in Table 3.9, as stipulated in Part F, Item 5 of the water license.

Table 3.7: Effluent Criteria at CM Station MEL-25

Parameter	Maximum Average Concentration	Maximum Concentration of Any Grab Sample
pH	6.0 to 9.5	6.0 to 9.5
TSS (mg/L)	15.0	30.0
Benzene (ug/L)	370	370
Toluene (ug/l)	2	2
Ethylbenzene (ug/L)	90	90
Lead (mg/L)	0.1	0.1
Oil and Grease (mg/L)	5.0 and no visible sheen	5.0 and no visible sheen

3.1.2.3 *Receiving Environment*

Receiving water quality monitoring is discussed in the Aquatic Effects Management Program (AEMP) (March 2019). Within the AEMP are numerous monitoring programs: water quality, sediment quality, benthic invertebrate communities, and fish health and fish tissue chemistry. The Meliadine Lake monitoring program was designed around the key aspects of Environmental Effects Monitoring (EEM) requirements under the Metal and Diamond Mining Effluent Regulations. Water quality data are analyzed to determine if there are differences between the Near-field exposure area, the Mid-field exposure area, and the pooled reference areas of Meliadine Lake.

3.2 EVENT MONITORING

The Event Monitoring (EM) program addresses the site specific monitoring that is required following any accidental release. A "release" may be caused by:

- Spills, including unidentified seepage (Meliadine Spill Contingency Plan; March 2018); or
- Emergencies (Meliadine Emergency Response Plan; May 2017).

The EM program is designed to verify whether contamination of the surface soil and/or any nearby receiving environment and active zone has occurred as a result of an accidental release of a hazardous material or contaminated water. Verification is done through monitoring of surface runoff and nearby receiving environment during and following remedial activity. It is anticipated that due to the presence of permafrost beneath most of the mine footprint (active layer app 1.5m in depth), there will be minimal impact to groundwater from surface spills or accidental releases.

The EM plan is developed on a site specific basis subsequent to a spill or other incident, and considers the type of product spilled, the potential receptors and the potential for any remaining contamination after clean up. The plan is coordinated by the Environmental Department.

In the event of an accidental release, the water quality of any downstream receptor as well as an upstream reference (background) is sampled to determine severity of impact. Should the spill have happened over snow cover, as much contaminated snow will be removed as possible. Verification sampling would occur in the area after thaw to determine if the clean – up is complete or if further remediation is necessary. The specific parameters monitored as part of the EM program will depend on the nature of the spill, and will be determined for the specific material released.

The EM program for a particular spill will cease upon obtaining satisfactory analytical results from the potentially affected areas or as required by regulators.

3.3 ADAPTIVE MANAGEMENT PROGRAM

Results of the water quality monitoring are reviewed by the Meliadine Environment Department. Chemical trends of constituents of interest are tracked for mine site monitoring and for the AEMP program. This allows for early detection of significant changes in water quality within the mine site prior to discharge. If triggers and thresholds, such as in the AEMP program, are exceeded in the receiving environment action plans are then implemented to ensure that environmental protection objectives are met.

An adaptive management program has been designed for the Meliadine Gold Project to evaluate the monitoring data and provide a framework for action, if necessary. The program has two levels - a trigger level to compare the monitoring data against, and an action plan of mitigative measures for identified exceedances.

The adaptive management program is divided into two sections, one for parameters with regulated discharge criteria at specific monitoring locations, as specified in the License and by the Metal Diamond Mining Effluent Regulations (MDMER). The second section is for measured parameters for which no discharge limits have been identified in the License such as those in the AEMP or EEM.

Saline Water Treatment Plant Influent and Effluent

Water samples are collected weekly at both the inlet and outlet of the SWTP. Samples taken at the inlet of the SWTP represent the water quality of either Sump 75 or the Saline Pond, which will vary depending on the treatment priority for saline water storage. The results of the sample analysis are used by SWTP

operators to fine-tune the treatment process and ensure its optimal performance. Samples taken at the outlet of the SWTP are analyzed to provide the quality of treated water produced by the SWTP that is transferred to CP1.

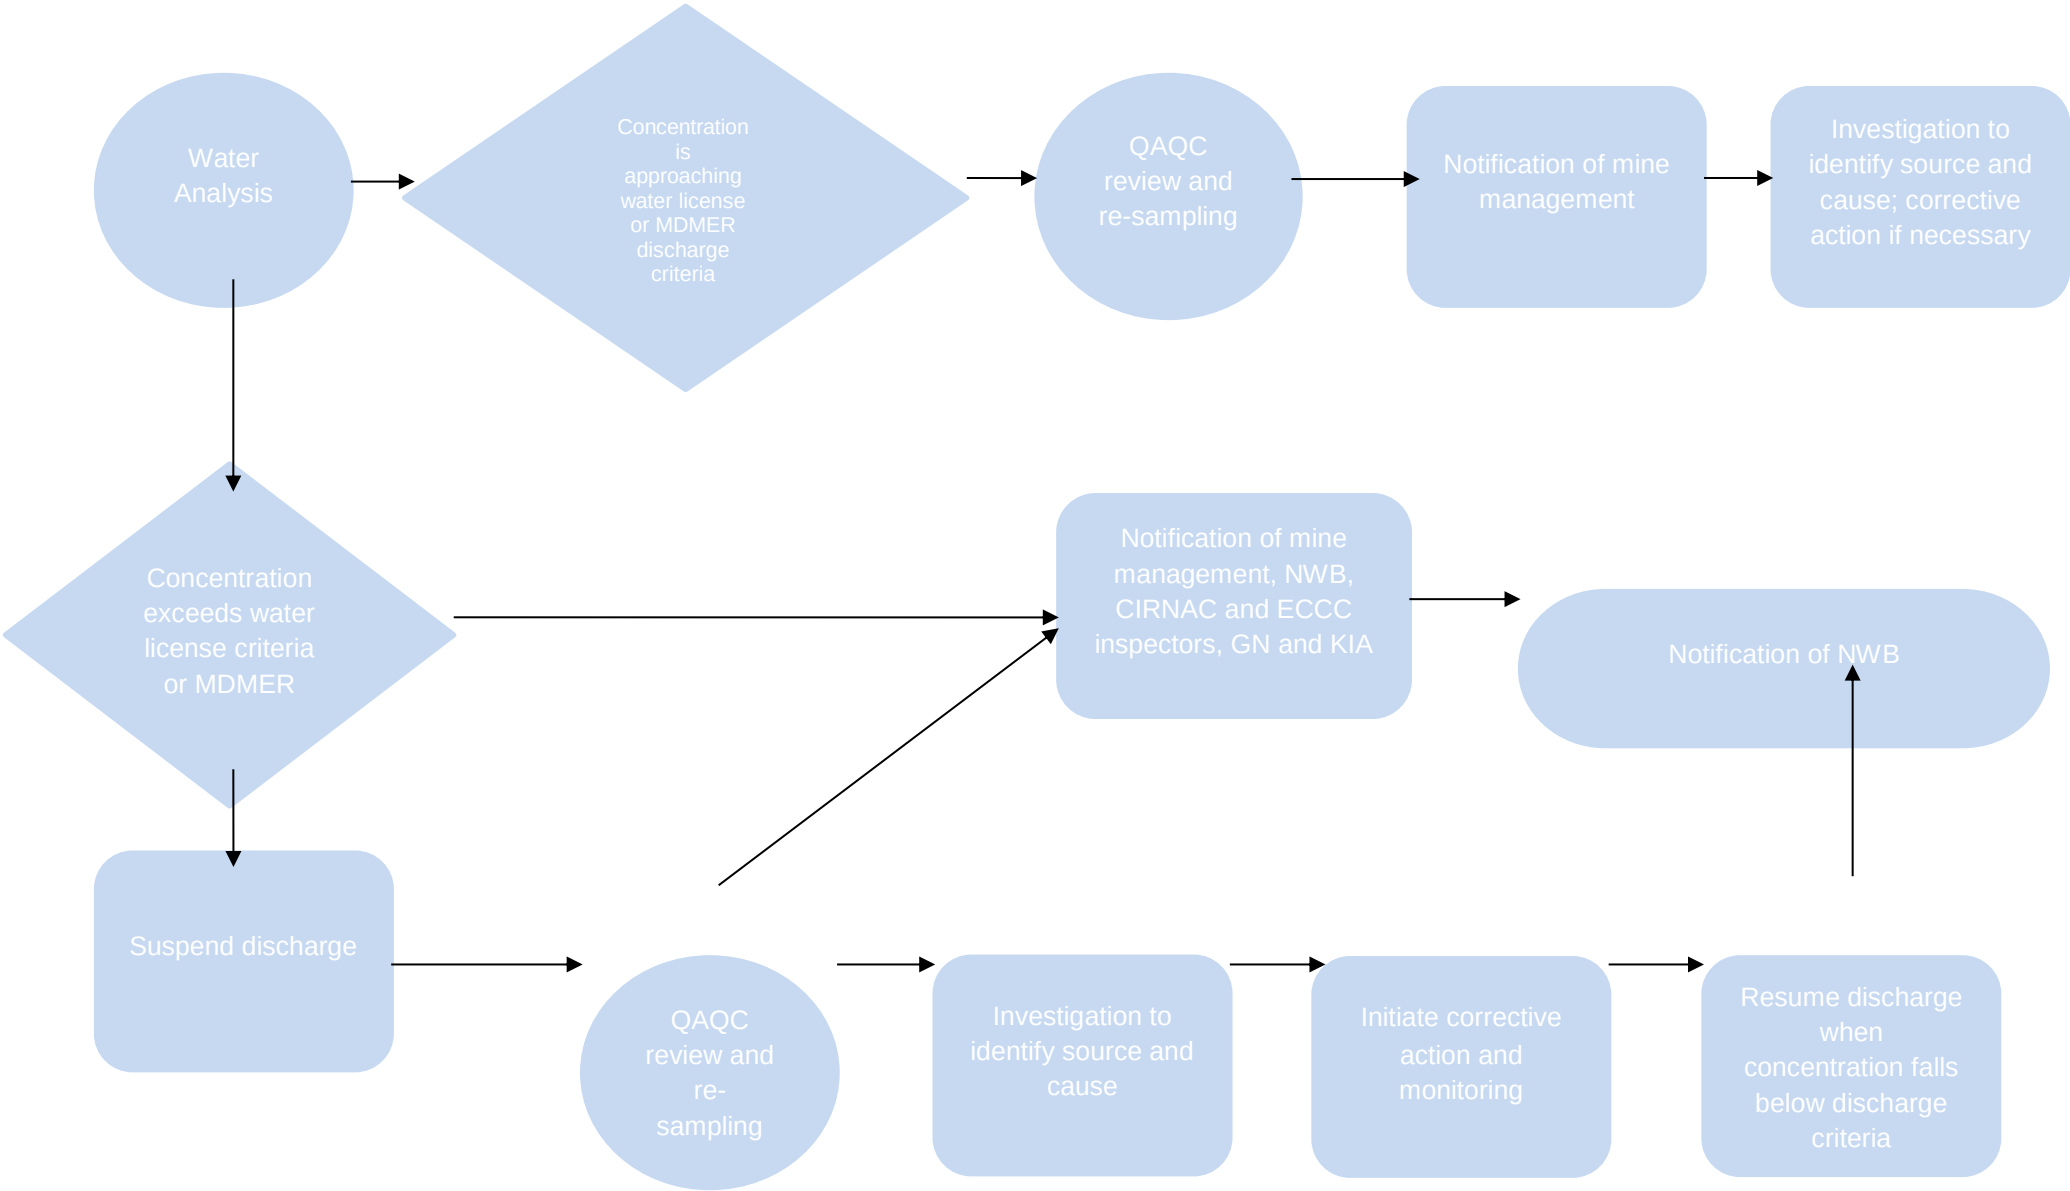
Water samples are analyzed for the following parameters: pH, conductivity, temperature, Total Suspended Solids (TSS), Total Dissolved Solids (TDS), chloride, ammonia, nitrite, nitrate, total phosphorus, total metals, total cyanide, and total mercury.

3.3.1 Adaptive Management Program for Regulated Discharge

3.3.1.1 *Action Plan*

In the case of an exceedance of a License limit or MDMER discharge limit, an action plan will be implemented. The adaptive management program requires that if one or more of the key monitored parameters exceed the respective limits, a staged sequence of responses will follow. Table 3.12 summarizes the staged adaptive action plan for the CM program for regulated discharge. Figure 3.1 is a logic diagram showing the decision path for evaluating analytical results for regulated discharges.

In addition to the mitigative measures listed above, a number of other possible alternatives are available to reduce or treat contaminants. These mitigation measures include:



- Best management practices for sediment and erosion control would be employed to reduce TSS concentrations (i.e., flow control, sedimentation basin construction silt fencing, etc; see Sediment and Erosion Management Plan);
- Addition of a coagulant for the reduction of TSS in pond water;
- Use of geotextile or reamouring of banks to filter and reduce TSS in pond/ditch water;
- Deployment of absorbent booms and/or barriers within ponds to isolate surface petroleum hydrocarbon films for removal and/or treatment;
- Adjustments to on-site sewage treatment for the reduction of BOD and E. coli concentrations; Addition of lime to increase a low pH value or reduce metal concentrations;
- Removal of the offending source rock or the prevention of surface waters coming into contact with the offending source rock in the case of ARD; and/or
- Implementation of the *Freshet Action Plan* to proactively identify any issues around areas of concern; conduct additional monitoring, and control and contain seepage or movement of TSS on site.

Table 3.6: Action Plan for Regulated Discharge

Example	Action Plan

Exceeds water license discharge criteria or MDMER	1. Suspension of discharge activities; 2. QA/QC review and analysis, and re-sample water at the particular location if necessary; 3. Notification of mine management (General Mine Manager or designate and Environment Superintendent, or designate) and the regulators: Nunavut Water Board, CIRNAC and ECCC inspectors, GN and the Kivalliq Inuit Association; 4. Investigation to identify possible source(s) and cause(s) of the exceedance; 5. Initiation of corrective actions or water treatment, and follow up monitoring; and 6. Resumption of discharge when concentrations are below the discharge criteria

Figure 3.2: Logic Diagram for Regulated Discharge

3.3.2 Adaptive Management Program for Non-Regulated Discharge

Aside from targeted monitoring studies (i.e. “Effects Assessment Studies”) such as those following construction, the AEMP is the main program aimed at measuring and assessing potential impacts of contaminants in the receiving aquatic environment that are not regulated under MDMER or NWB. This program combines with the Environmental Effects Monitoring (EEM) required under MDMER.

The program is designed to take an integrated, ecosystem-based approach that links mitigation and monitoring of physical/chemical effects to key ecological receptors in the receiving environment. It addresses key issues identified in the Meliadine EA (i.e., mining-related activities with the potential to affect water quality, fish habitat and fish populations). Monitoring results are intended to inform the “adaptive management” process”, supporting the early identification of potential problems and development of mitigation options to address them by comparing results to established threshold and trigger levels.

3.3.2.1 *AEMP Action Level and Significance Threshold*

The AEMP Response Framework links monitoring results to management actions, with the purpose of maintaining the assessment endpoints within acceptable ranges. It is a systematic approach for evaluating AEMP results and responding appropriately, such that potential unexpected effects are identified and mitigation is undertaken to reduce or reverse them, thereby preventing the occurrence of a significant adverse effect. This is accomplished by continually evaluating monitoring data and implementing follow-up actions (e.g., confirmation, further study, mitigation) at pre-defined levels of change in measurement endpoints (i.e., Action Levels). For purposes of this Response Framework, the following terms are used: effect, normal range, benchmark, Action Level, and Significance Threshold.

Action Level – Action Levels (Low, Moderate, and High) are pre-defined levels of environmental change that exceeds normal ranges or benchmarks, or results of statistical tests, or a combination of these. For example, exceedance of the normal range and approach of a benchmark by a water quality parameter in the near-field exposure area may be defined as the Low Action Level. A change that falls within the normal range of variability for the study area would not trigger an Action Level.

Significance Threshold – The Significance Threshold, for the purposes of an AEMP Response Framework, is a magnitude of change that would result in significant adverse effects. It is a clear statement of environmental change that must never be reached. The AEMP Response Framework is designed to prevent reaching the significance threshold for all assessment endpoints.

3.3.2.2 *Action Levels*

The proposed Action Levels are designed to provide an early warning indication of potential adverse effects to plankton and benthos (i.e., food for fish), to fish health, and to the assurance of normal ecological function (including water quality and sediment quality). The proposed Low Action Levels (Table 8-2 and 8-3) are designed such that changes of sufficient magnitude to trigger a Low Action Level response are reported, documented, investigated, and ultimately addressed (i.e., mitigation measures or operation changes are implemented) before Significance Thresholds would ever be reached; if a Low Action Level is reached, Medium and High Action Levels (with response actions) are developed to provide further adaptive management guidance to the Mine to avoid reaching the Significance Thresholds. The type of management response taken after reaching an Action Level will depend on the type and magnitude of effect observed.

Further details on the integrated aquatic effects action plan are provided in Golder, 2018.

SECTION 4. FLOW VOLUMES

Flow volumes within the mine footprint will be measured daily during periods of discharge. Flow volume measurements will be conducted using volumetric flow meters attached to applicable pumps. For permanent pumping arrangements such as fresh water pumping systems flows will be measured using permanent in line flow meters. For periodic batch discharges, such as secondary containment sumps, portable flow meters or calculated pump time and capacity methods will be used.

Detailed pump records are maintained including date, pond/sump number, receiving location of pumped water, pump ID, duration of pumping, and total volume pumped. The average flow rates, total discharge per event and total cumulative discharge will be reported annually.

The monitoring locations for water flow volumes, in accordance with Part I, Item 9, and Table 2 of the Water License, include:

- The volume of fresh Water obtained from Meliadine Lake at Monitoring Program Station MEL-11;
- The volume of fresh Water transferred to the Meliadine Lake during lakes' dewatering activities;
- The volume of fresh Water obtained along the road and Meliadine River for dust suppression activities;
- The volume of Effluent discharged from Final Discharge Point at Monitoring Program Station MEL-14;
- The volume of reclaim Water obtained from CP1;
- The volume of Effluent discharged onto tundra at Monitoring Program Station MEL-25 or transferred to CP1 from the Itivia Site Fuel Storage and Containment Facility; and
- The volume of Effluent and Fresh Water transferred to the pits during pits' flooding.

SECTION 5. REPORTING

Reporting of water quality results is to be conducted on two levels a) monthly and annually with the results of the monitoring program and per MDMER requirements and b) in response to exceedances.

5.1 ANNUAL REPORTING

An annual report is to be submitted to the NWB, KIA, Department of Fisheries and Oceans, Crown-Indigenous Relations and Northern Affairs Canada, Nunavut Impact Review Board, Government of Nunavut, and other interested parties by March 31st of the following year. The report is to summarize the following:

- Monitoring results for each sampling station during the year and for the life of mine (construction to end of closure); activities during the year at each station; and any exceedances at stations, the action plan applied to the exceedance, and the results of the action plan;
- Annual seep water chemistry results; including location of the samples, sources of the water collected, and results of chemical analyses of the samples;
- Receiving water monitoring results;

- Spills and any accidental releases; event monitoring activities conducted following containment, remediation, and reclamation; and the results of EM program, any exceedance in EM results, and the action plan following the exceedance;
- Measured flow volumes;
- Effluent flow rates, volumes and calculated chemical loadings following the requirements of MDMER; and
- Results of QA/QC analytical data.

5.2 EXCEEDANCE REPORTING

Any measured concentration at a CM station exceeding a regulated discharge criterion stipulated in the License or MDMER will be reported to the NWB and Environment Canada and Climate Change upon receipt of the analysis. In addition, results of the action plan will be reported and, where necessary, mitigation options identified within 90 days after receipt of the analyses.

Exceedances in the concentration of a parameter in receiving water will be reported as specified in the AEMP and EEM – MDMER accordingly.

Meliadine	Meeting	Kivalliq Inuit Association (KIA)	KIA and Agnico Eagle Meliadine On-Site Working Group	29-Nov-18 Meliadine	1.1 The On-Site Working Group shall: 1.1.1 share information and communicate among themselves relating to on-site matters; 1.1.2 attempt to resolve on-site issues and matters of concern arising out of the Meadowbank Project that affect Inuit interests, in an informal way, if appropriate and in a timely manner; 1.1.3 assign follow-up responsibility to the most appropriate member, AEM or KIA department; 1.1.4 refer recurrent or unresolved issues to the appropriate Committee, providing any information and documentation as may be required to assist the Committee in addressing any such issues; 1.1.5 address any matter related to the implementation of the Agreement as the Implementation Committee or any other Committee may direct from time to time; 1.1.6 carry out any other duties and responsibilities as set out in the Agreement or as may be agreed by the Parties.	N/A	Complete
Meliadine	Site Visit	Rankin Inlet Public	Meliadine Open House Site Visit	20-Oct-18 Meliadine	Meliadine Open House for Rankin Inlet Residents Underground tour contest 5 different bus departure times (9 a.m, 10:30 a.m., 12 p.m., 1:30 p.m, 2:30 p.m)	N/A	Complete
Meliadine	Event	Rankin Inlet Public	Rankin Inlet Charity Fundraiser Gala	1-Dec-18 Rankin Inlet	AEM sponsored event organized and hosted by the Hamlet of Rankin Inlet. The event raises funds and provides $45,000 in funding towards 5 non-profit/charitable community organizations	N/A	Complete
Meliadine	Meeting	Community Liaison Committee	Rankin Inlet CLC Meeting	10-May-18 Rankin Inlet	1. review current terms of reference 2. draft of updated TOR 3. expectations of committee by AEM 4. expectations of committee by hamlet representatives 5. AEM update on initiatives and meladine camp program status 6. Hamlet council update on community wellness initiatives 7. Legacy project discussions	Survey was carried out by Councilor Lindell about possible infrastructure needs in community. Needs were identified as a cultural center and housing units.	Complete
Meliadine	Meeting	Community Liaison Committee	Rankin Inlet CLC Meeting	4-Jun-18 Rankin Inlet	Two items were discussed:Community Information Session scheduled June 13th (dust, blasting, shipping, construction and caribou).	Follow up meeting to be secured with Council with construction manager.	Complete
Meliadine	Event	Rankin Inlet Public	Rankin Inlet Family Day	28-Jul-18 Rankin Inlet	Rankin Inlet Family Day organized by hamlet, sponsored by AEM Adrian Angidlik (Guest Services Leader) said a few words to welcome everyone.	N/A	Complete
Meliadine	Site Visit	Rankin Inlet Youth	Rankin Inlet Students Site Visit	9-Nov-18 Rankin Inlet	Rankin Inlet high school visits visited Meliadine site - kitchen, maintenacne and coreshack. Presentation was given on health and safety rules, the site and opportunities for the future.	N/A	Complete
Meliadine	Meeting	Rankin Inlet RCMP	Agnico Eagle RCMP Meeting	8-Aug-18 Rankin Inlet	Alcohol and drugs, violence, collaboration with site Security team, monitoring	Further information sharing and collaboration.	Complete
Meliadine	Meeting	Rankin Inlet HTO	Rankin Inlet HTO Meetings	15-May-18 Rankin Inlet	Environment and Community Relations to discuss EIS for difusser project, wildlife monitoring and ICMC	- Agnico Eagle will contact HTO when EIS for diffuser project is available - continue discussions on wildlife monitoring - Agnico Eagle will involve HTO in ICMC meetings	Complete
Meliadine	Meeting	Rankin Inlet HTO	Rankin Inlet HTO Meetings	14-Sep-18 Rankin Inlet	to address the concerns of the community that were shared during the community roundtable on the evening of September 13, 2018. Agnico Eagle and Kangiqlinq discussed the concerns raised by the community regarding drinking water and changes to fish in the area the Char River and Meliadine Lake	Main outcomes: - It was decided that in addition to wildlife monitoring previously discussed, that a community-based monitoring program should also be included to look at fish monitoring, air quality and dust, and water quality. - Agnico Eagle and Kangiqlinq agreed that they will work together to draft an agreement that Kangiqlinq members will be directly involved in Agnico Eagle's monitoring of freshwater in the area of the Char River and Meliadine Lake and to ensure that the results of that monitoring are communicated directly to Kangiqlinq. If the monitoring shows negative results, Kangiqlinq and Agnico Eagle will discuss potential mitigation measures and communicate these to the appropriate regulatory authorities. Agnico Eagle will also provide capacity support to Kangiqliq - Kangiqlinq and Agnico Eagle agreed that the final designs will be shared with Kangiqlinq at the same time as it shared with regulatory bodies (CIRNAC, DFO, ECC) and that if Kangiqlinq thinks it is necessary at that time, meet in person to explain the design details and give Kangiqlinq the opportunity to provide any further advice to be incorporated in or improve the design. Agnico will also inform Kangiqlinq if they ever become aware of any pipeline engineering failures.	Complete
Meliadine	Meeting	Rankin Inlet HTO	Rankin Inlet HTO Meetings	26-Sep-18 Rankin Inlet	MOU with Rankin Inlet HTO and donating cabin material to HTO	- Funding agreement for wildlife monitoring and community-based monitoring - Main areas of focus are: air quality and dust, water quality, and fish	Complete

Meliadine	Meeting	Rankin Inlet HTO	Rankin Inlet HTO Meetings	7-Dec-18 Rankin Inlet	The purpose of the meeting was to discuss the possible location of TSS sediment Control structures at the Itivia site. Currently there is a large volume of TSS laden runoff coming from upstream of the Itivia site (Hamlet of Rankin Inlet) which passes through AEM's leased land adjacent to the Itivia site during the freshet period.	– Agnico staff advised Clayton of our intent to address the TSS even though the majority came from a 3rd party (Hamlet) upstream of the culvert on the leased property. Clayton understood and advised that any impingement on the snowmobile trail would be an issue. AEM staff mentioned to Clayton that we likely won't be installing structures because of reason already stated above (velocity of freshet flow too high). Also we would look at other solutions. We did state that there should be a lot less potential for elevated TSS as the construction has been completed, the snow appears to be clean now, and a cover was placed on the northernmost pad (not there last spring). At any rate we told Clayton that we would look at other solutions and he was ok with that. He did think that the Hamlet should be involved and I said we would contact them at some point – meeting adjourned.	Complete
Meliadine	Site Visit	Government - ED&T	CEDO Visit to Meliadine	15-Mar-18 Meliadine	presentation about training and project advancement and tour of the facilities.	N/A	Complete
Meliadine	Site Visit	Government	Meliadine visit by Senator Patterson	19-Mar-18 Meliadine	Meliadine visit by Senator Denis Patterson - supper and site tour.	N/A	Complete
Meliadine	Site Visit	Government	Meliadine Government Site Tour	6-Jun-18 Meliadine	June 6th: Tour to view facilities and discuss AEM training and hiring challenges	No recorded outcomes	Complete
Meliadine; AWAR	Public Meeting	Rankin Inlet Public	ICMC Meetings	30-Aug-18 Rankin Inlet	Covered: • What is the International Cyanide Management Code, and what is Agnico Eagle trying to achieve (ICMC certification) • What is cyanide, what is it used for, how is it used, how is it disposed of • How is cyanide transported to Meliadine • Health and safety management on cyanide (storage, monitoring), risks of accidental releases • Where can community members go if they have concern (Tusaajugut, Community Complaints System)	Questions on road closure and risks of cyanide spills	Complete
Meliadine; AWAR	Meeting	Rankin Inlet Emergency Services, Rankin Inlet HTO, Government, Rankin Inlet Health Centre, Rankin Inlet Gun Club, Nunavut Parks, Rankin Inlet RCMP, Airports	ICMC Meetings	5-Jun-18 Rankin Inlet	Covered: • What is the International Cyanide Management Code, and what is Agnico Eagle trying to achieve (ICMC certification) • What is cyanide, what is it used for, how is it used, how is it disposed of • How is cyanide transported to Meliadine • Health and safety management on cyanide (storage, monitoring), risks of accidental releases • Where can community members go if they have concern (Tusaajugut, Community Complaints System) • Commitments: sharing draft Emergency Response plan, continue outreach, some training sessions	Main outcomes: - The Department of Defence will restrict access to their site during transportation - Agnico Eagle to provide shipping window dates and mock drill date - Agnico Eagle will reach out to other stakeholders suggested by attendees - Consider lending radios to external respondures or ensure a common channel is available Rankin community to be notified at least 72 hours in advance	Complete
Meliadine; AWAR	Meeting	Rankin Inlet Emergency Services, Rankin Inlet HTO, Government	ICMC Meetings	31-Jul-18 Rankin Inlet	Covered: • What is the International Cyanide Management Code, and what is Agnico Eagle trying to achieve (ICMC certification) • What is cyanide, what is it used for, how is it used, how is it disposed of • How is cyanide transported to Meliadine • Health and safety management on cyanide (storage, monitoring), risks of accidental releases • Where can community members go if they have concern (Tusaajugut, Community Complaints System) • Commitments: sharing draft Emergency Response plan, continue outreach, some training sessions	No further concerns on route proposed, som suggestions on further stakeholders to contact	Complete
Meliadine; Itivia; AWAR	Public Meeting	Rankin Inlet Public	Rankin Inlet Community Meetings	13-Jun-18 Rankin Inlet	Meliadine Project Update (construction on site, infrastructure, targets) Itivia Project Update (bypass road construction, dust control, boat launch, barge season) AWAR (health and safety procedures) Caribou management (levels/triggers, rules of the road)	It was clarified with attendees that they could use the bridge at Little Meliadine, that buggy whip	Complete
Meliadine; Rankin Inlet Diffuser	Public Meeting	Rankin Inlet Hamlet Council	Rankin Inlet Diffuser Meetings	6-Mar-18 Rankin Inlet	Inform the Hamlet about the project (summary of the pipeline, diffuser and storage tank connection point).	No recorded outcomes	Complete
Meliadine; Rankin Inlet Diffuser	Public Meeting	Rankin Inlet Public	Rankin Inlet Diffuser Meetings	15-Mar-18 Rankin Inlet	Community meeting to present the diffuser project.	No recorded outcomes	Complete

Executive Summary

The Agnico Kivalliq Projects

The Meadowbank and Meliadine gold mines are located in the Kivalliq region of Nunavut on Inuit owned lands (IOL). Meadowbank falls approximately 70 km north of the Hamlet of Baker Lake, or 110 km by road. Whale Tail, a satellite deposit to the Meadowbank mine, is located approximately 50km north of Meadowbank. Meliadine is located near the western shore of Hudson Bay, about 25 km north of Rankin Inlet.

Agnico Eagle Mines (AEM) acquired the Meadowbank property from Cumberland in 2007, with construction of the mine taking place between 2007 and 2010. The mine began production in 2011 and processes an average of 11,000 tonnes of ore per day from three deposits. It is expected to continue to produce gold until 2019, though the nearby Whale Tail development is expected to effectively extend the life of the mine for years to come.

About 290 km southeast of Meadowbank, Agnico Eagle's Meliadine gold project began construction and development activities in 2017. Meliadine is forecast to begin operation in 2019, producing an estimated 5.7 million ounces of gold over a 15-year mine life.

About this Report

This report provides the results of the Agnico Eagle Projects Socio-Economic Monitoring Program (SEMP), developed in consultation with the Kivalliq Socio-Economic Monitoring Committee (SEMC). The purpose of this report is to:

- comply with the relevant sections of the **Nunavut Land Claims Agreement** (NLCA),
- comply with the terms and conditions of the **Meadowbank Project Certificate** issued by the NIRB, including reporting on the socio-economic impact predictions made in Cumberland Resource's Final Environmental Impact Statement (Meadowbank FEIS);
- comply with the terms and conditions of the **Meliadine Project Certificate** issued by the NIRB, including reporting on the socio-economic impact predictions made in Agnico Eagle's Final Environmental Impact Statement (Meliadine FEIS);
- identify any **unanticipated effects** associated with the mines;
- identify and recommend **mitigation measures**;
- act as the primary vehicle for reviewing the findings of the SEMP in **collaboration** with members of the Socio-Economic Monitoring Committee (SEMC);
- fulfill best practices in **social responsibility**; and
- act as a **valuable resource** for communities, governments and interested stakeholders.

Summary of Findings

Table 1 below provides an overview of the results of this year's monitoring program. Please refer to the Methods section for a more detailed description of how to read the table.

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Table 1. Monitoring results summary[1]

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
VSEC 1. EMPLOYMENT						
1.1 Total project employment (Agnico Eagle & contractors)						
Project employment (permanent, temporary, on-call & contractor)	N/A	→	↓	N/A	↑	Total Meadowbank employment levels measured as a snapshot in December, were relatively stable in 2017 and continue to significantly exceed the levels predicted in the FEIS. Meliadine employment increased significantly in 2017, corresponding with the onset of major construction activity.
1.2 Project Inuit employment (Agnico Eagle)						
Project Agnico Eagle employment (Inuit & non-Inuit)						Meadowbank Agnico Eagle Inuit FTEs have been holding relatively steady for the past 3 years (221, 221 and 218), representing between 28% and 29% of the total Agnico Eagle workforce. Contractor Inuit employment over the same time timeframe increased from 25 to 48 – though this may be a result of better tracking in 2017 where FTES are used compared with employment numbers in prior years. In 2017, there were 130 total Inuit FTEs at Meliadine (including both Agnico Eagle and contractor employees), representing approximately 18% of the workforce. This is below the Meliadine FEIS prediction of a 20% Inuit workforce during peak construction (340 employees). While the number of Meliadine Agnico Eagle FTEs has varied between 8 and 15 over the past five years, 2017 saw a sharp decline in the Inuit employment rate due to a large increase in non-Inuit employees. This may be explained by the requirements for more specialized labour during the construction phase.
Inuit FTEs	N/A	→	→	N/A	→	
Inuit FTE rate	N/A	→	→	N/A	→	
Project contractor employment (Inuit & non-Inuit)						
Employees / FTEs	N/A	→	↑	N/A	↑	
Inuit employee / FTE rate	N/A	↓	↑	N/A	↓	
1.3 Project Agnico Eagle employment by Kivalliq community						
Project employment by Kivalliq community	N/A	↑	↑	N/A	↑	In 2017, over half (53%) of Meadowbank's Kivalliq-based employees were from Baker Lake and approximately 61% of Meliadine's Kivalliq-based employees were from Rankin Inlet. Additionally, Arviat supplies a large and increasing proportion of Agnico Eagle's Inuit workforce, reaching a high of 70 employees in 2017. Employees from the remaining Kivalliq communities (Chesterfield Inlet, Coral Harbour, Whale Cove and Naujaat) rose in each community, increasing cumulatively from 26 employees to 44 between 2016 and 2017.
1.4 Project employment by gender						
Project employment (gender)						Agnico Eagle female employment at Meadowbank has been steadily increasing since 2013, from a low of 10% up to 20%. It is at its highest level since the mine began production and has now surpassed the Canadian mining sector average of 17%. Meliadine female employment has increased steadily, though the rate declined from 24% to 15% in 2017 due to a substantial increase in the number of employees and contractors for construction activity.
employees	N/A	↑	↑	N/A	↑	
rate	N/A	↑	↑	N/A	↓	
1.5 Project turnover						
Project turnover (Inuit & non-Inuit)	N/A	↓	↓	N/A	/	The turnover rate for Meadowbank permanent Inuit employees remained stable in 2017 at 28%, while temporary employee turnover rate is showing signs of stabilizing near 50% following a drop from 2010 to 2014.
Agnico Eagle Inuit employee turnover by reason	N/A	↓	↓	N/A	↓	

[1] For the current reporting year, all 'last year' Meliadine movements are considered neutral, as 2017 represents the first year of major construction activities and therefore has no comparable year against which to measure trends.

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
Percent turnover by community	N/A	↑	↑	N/A	↓	Meliadine's turnover rate for permanent Inuit employees continued a sharp 2-year decline in 2017, with 0 employee turnover, while it's temporary employee turnover rate remained similar to Meadowbank's at 55%. Of the 6 Inuit employees comprising 2017 turnover, 4 resigned and 2 were dismissed. 2017 saw a large increase in turnover in Meadowbank employees from Coral Harbor and Naujaat, with nearly as many employees leaving as were working there when the annual snapshot was taken (just over for Coral Harbor at 109% and just under at Naujaat at 92%).
VSEC 2. INCOME						
2.1 Income paid to projects' Inuit employees						
Income paid to Agnico Eagle project Inuit employees	N/A	↑	→	N/A	↑	2017 total income paid to Agnico Eagle's Inuit employees remained relatively stable from the previous year at $19.4M. This follows a steady annual increase between 2013 and 2016, with the 2015 and 2016 increase largely attributable to increased activity at Meliadine.
2.2 Income by Kivalliq community						
Median employment income of tax filers by Kivalliq community	↑	↑	N/A	↑	N/A	The most recent data available for this indicator is from 2015. Median employment income has increased gradually overall in the Kivalliq region since 2006, with no significant inflection (i.e. change in growth rate) since 2010. Among the Kivalliq communities with highest levels of Meadowbank employment (Baker Lake, Rankin Inlet, and Arviat), only Rankin Inlet shows a significant increase in the income growth rate when comparing the 2006-2010 period to the 2010-2015 period.
VSEC 3. CONTRACT EXPENDITURES						
3.1 Contract expenditures						
Contract expenditures on NTI-registered businesses						In 2017, contract expenditures doubled from a total of $205M to $408M across the two projects, largely due to increased spending at the Whale Tail site, as well as the start of construction at Meliadine. This increase corresponded with a decline in the total proportion of expenditures (Meadowbank, including Whale Tail, and Meliadine) going to NTI-registered vs. non-NTI registered firms, from 55% in 2016 to 47% in 2017. This decline in proportion is fully attributable to Meliadine spending, where the proportion declined from 55% in 2016 to 41% in 2017.
NTI expenditures	N/A	↑	↑	N/A	↑	
Proportion NTI	N/A	↑	→	N/A	↓	
2017 NTI-registered business expenditures by Nunavut community	N/A	N/A	N/A	N/A	N/A	In 2017, just over half of the spending on NTI-registered firms went to firms located in Rankin Inlet, followed closely by Baker Lake and Iqaluit, with 23% each. Meliadine is expected to far exceed the FEIS predictions of $175M contract spending on Kivalliq-based businesses over the 3.5-year construction phase.
Contract expenditure on Nunavut-based businesses						Total contract expenditures on Nunavut-based businesses more than doubled in 2017 from $216M to $511M. The proportion of contract expenditure spending on Nunavut-based businesses remained relatively stable at 59% over this time period across the two projects.
Nunavut-based expenditures	N/A	↑	↑	N/A	↑	
Proportion Nunavut-based	N/A	/	↑	N/A	↓	
Contract expenditures from Meadowbank on Baker Lake-based businesses and from Meliadine on Rankin Inlet-based businesses	N/A	↓	↑	N/A	↑	Meadowbank expenditures on Baker Lake-based businesses and Meliadine expenditures on Rankin Inlet-based businesses continued a 2-year upward trend in 2017, corresponding with construction at Meliadine and Whale Tail, respectively. The proportion of contract expenditures has risen by $43M over the past two years in Baker Lake, although this is still less than when Meadowbank began operation. This suggests that spending has diversified to other communities across the territory.
VSEC 4. EDUCATION AND TRAINING						
4.1 Investment in school-based initiatives						
Agnico Eagle investments in school-based initiatives	N/A	↓	↑	N/A	↑	Up until 2014, Agnico Eagle contributed approximately $284K/year to a variety of school-based initiatives. With the expiry of the MOU with the Department of Education in 2015, these contributions dropped to $39K. They remained unchanged in 2016 and rose to $55K in 2017 due to a doubling of scholarship funding.
4.2 Secondary school graduation by region						

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
Secondary school graduation rate by region	↑	↑	N/A	↑	N/A	The graduation rate in Kivalliq region fluctuates from year to year, though shows an overall upward trend that began in 2008. Rates have been at all-time highs for the region, and consistently higher than those in the other two regions, since 2010.
4.3 Project training and education						
Agnico Eagle investments in mine training and education programs	N/A	→	↓	N/A	↓	From 2014 to 2016, there was a consistent level of investment by Agnico Eagle (~$2.3M/year) in external mine training programs (e.g. Kivalliq Mine Training Society). In 2017, this dropped to $195K as the KMTS lost their federal funding; the future of the organization is currently uncertain.
Average mandatory training hours provided to Agnico Eagle Inuit employees	N/A	↑	→	N/A	↑	In 2017, mandatory training hours remain fairly stable at Meadowbank, indicative of steady rates of turnover. These hours have increased at Meliadine, likely due to the influx of new employees. Specific training hours declined at Meadowbank from 84 hours / Inuit FTE in 2015, down to 51 hours in 2017, while Meliadine values have fluctuated from 28 in 2015 to 10 in 2016 and up again to 25 in 2017. Annual fluctuations in the number of training hours largely reflect changing demand for additional positions and so are not considered negative or positive.
Average specific training hours provided to Agnico Eagle Inuit employees	N/A	↑	↓	N/A	↑	
Participation in career and skills programs	N/A	/	↓	/	↓	Participants in TASK week and graduates from the Arviat Diamond Drillers and Welders Program had remained steady until last year, decreasing by 12 and 11 respectively. Meadowbank's Haul Truck Driver Program also saw a decline in 2017 from 34 to 26 participants. These fluctuations could be explained by the success of each program as well as changing demand for specific skills at Meadowbank.
Meadowbank pre-apprenticeship and apprenticeship participation by type	N/A	↑	↑	N/A	N/A	The number of Inuit apprenticeships increased by 3 in 2017. In addition to the number of Inuit participants, the apprenticeship program has seen growth over the past 4 years in diversity, moving from two offered programs in 2013 to seven in 2017.
4.4 Project employment by skill level						
Project Agnico Eagle Inuit employees by skill-level	N/A	↑	↑	N/A	↑	2017 has seen an increase in Inuit employees at higher skill levels, with the total number of skilled, management and professional employees rising from 6 in 2016 to 15 in 2017.
VSEC 5. CULTURE AND TRADITIONAL LIFESTYLE						
5.1 Perceptions of culture and traditional lifestyle						
Self-reported effect of project on culture and traditional activities	N/A	N/A	N/A	N/A	N/A	Data currently unavailable.
5.2 Culture and traditional lifestyle						
Proportion of total population identifying Inuktitut as their mother tongue by community	→	↓	N/A	↓	N/A	The proportion of the population identifying Inuktitut as their mother tongue has remained relatively stable in the smaller Kivalliq communities from 2006 to 2016, but has declined in Rankin Inlet, Baker Lake, and Chesterfield Inlet (by 10 to 18 percentage points) over this period.
Use of AWAR by community	N/A	↑	↓	N/A	N/A	The Agnico Eagle-owned and operated all-weather access road (AWAR) that connects Baker Lake to the Meadowbank mine is accessible to the communities for hunting purposes. Community members accessed the road 2366 times in 2015, 1874 times in 2016, and 1716 times in 2017.
5.3 Country food use at project						
Country food kitchen usage	N/A	→	→	N/A	N/A	Meadowbank has maintained its practice of offering meals including char, muskox, and caribou (approximately 4,500 meals/year, or one per month per employee, since 2011). At Meliadine, Agnico Eagle offered about 21 meals with Arctic char this past year, twice on a five-week rotational schedule, which was consumed by approximately 50% of the staff.
Country food night events	N/A	→	↓	N/A	N/A	The number of country food events held at Meadowbank decreased from 14 in 2016 to 4 in 2017 – largely due to a lack of country food availability. Turnout for these events has averaged 36 attendees per event in 2016 and 43 in 2017. Agnico Eagle also offered country food at an event as a part of Pakallak Tyme, a cultural festival held in Rankin Inlet to celebrate the end of the Arctic winter and the coming of spring.
VSEC 6. POPULATION DEMOGRAPHICS						
6.1 Employee migration						
Project Agnico Eagle Inuit employees						There has been a gradual increase in the number of Inuit Meadowbank workers who now reside in outside of Nunavut, from 7 in 2011 to 21 in

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
residing outside Nunavut						2015 (or 7% of the Inuit workforce), though this number has remained stable in 2016 and 2017. The FEIS predicts both "positive and negative components" of migration but does not refer to migration out of Nunavut.
Total Inuit employees	N/A	↑	→	N/A	↑	
Proportion of Inuit to Non-Inuit employees	N/A	↑	→	N/A	↑	
6.2 Population estimates in Kivalliq communities						
Population estimates of Kivalliq communities						Yearly population estimates do not indicate an increase in the population growth rate of Baker Lake or of other communities with significant Meadowbank employment (Arviat, Rankin Inlet) since the mine opened, or relative to other communities in the region. If other factors (births and deaths) are assumed constant, the population data does not suggest significant migration to Baker Lake (or other communities with high Meadowbank employment).
Estimates in communities	↑	↑	↑	↑	↑	
Annual percent change	→	→	→	→	→	
VSEC 7. INDIVIDUAL AND COMMUNITY WELLNESS						
7.1 Agnico Eagle Programs						
Agnico Eagle wellness programs offerings & utilization by project employees	N/A	/	/	N/A	/	Meadowbank and Meliadine have a number of ongoing programs that offer readiness, counselling and support services to employees and their families. Due to difficulties in assessing participation in counselling programs (in part due to privacy issues), no trends can be drawn on employee targeted program utilization. Program utilization offered to communities has increased over the past two years – largely due to the new Mandatory Training (Site Readiness) and Work Readiness programs.
Agnico Eagle wellness programs offerings & utilization by community members	N/A	↑	↑	N/A	↑	
7.2 Perceptions of health & wellness						
Self-reported effect of project on health & wellness	N/A	N/A	N/A	N/A	N/A	Data for this metric is currently unavailable.
7.3 Criminal violations						
Criminal violations per hundred people by Kivalliq community	↑	→	N/A	↑	N/A	Total criminal violation rates in Baker Lake and Rankin Inlet reached historic high levels in 2011 and 2012, following the opening of Meadowbank. Recent data (2017) indicates a continuing downward trend (since 2012) in criminal violations in Baker Lake, along with those in Arviat. However, Rankin Inlet and Chesterfield Inlet have seen sharp rises in criminal violations over the past one to two years.
Criminal violations per hundred people by type (Baker Lake, Rankin Inlet, Chesterfield Inlet)						
Baker Lake	→	↓	↓	→	↓	
Rankin Inlet	→	↓	↑	→	↑	
Chesterfield Inlet	↑	→	↑	↑	↑	
7.4 Health centre visits						
Health centre/clinic visits by Kivalliq community by reason for visit	N/A	N/A	N/A	N/A	N/A	Data for this metric is currently unavailable.
7.5 Housing						
Persons on waitlist for public housing by community	/	/	/	/	/	The number of persons on a waitlist for housing has been increasing in Baker Lake and Arviat steadily since 2010. Rankin Inlet has seen a substantial decrease in wait lists over this same period. This may be the result of additional construction of private dwellings as an economic center for the region.
7.6 Food security						
Food security by region or community	N/A	N/A	N/A	N/A	N/A	Data for this metric is currently unavailable.
7.7 Suicide						
Suicides per 10,000 people by region	/	/	/	/	/	There is a persistent and territory-wide suicide crisis in Nunavut. The factors contributing to suicide are numerous and complex, so it is difficult to assess impacts of Meadowbank on suicide rates. Community suicide rates (e.g. for Baker Lake) are highly variable from year to year. Trends are more apparent in long-term and/or regional data.
VSEC 8. HEALTH AND SAFETY						

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
8.1 Health and safety training						
Average (per FTE) mandatory training hours provided to Agnico Eagle Inuit employees	N/A	/	→	N/A	↑	A steady increase in overall mandatory training hours for full-time employees has occurred at both Meadowbank and Meliadine from 2015 to 2017. Health and safety training increased for Inuit and non-Inuit employees in 2017 at Meliadine. None of the data collected permits an assessment of the impacts of Agnico Eagle's projects and their programs on the general health status of workers and their families.
8.2 Health and safety on-site						
Average (per-FTE) visits by project Agnico Eagle employees to clinic for work-related or other reasons	N/A	↓	→	N/A	↓	There was a small rise in visits to Agnico Eagle clinics for work-related injuries in 2017, though this is largely accounted for by an increase in employment. Overall, the number of clinic visits has been fairly stable since 2012, and the clinic continues to serve an important function in addressing the health and medical needs of workers.
Project combined lost-time and light duty accident frequency (per 200,000 person-hours)	N/A	↓	↑	N/A	↓	Lost-time and light duty accident frequency decreased for four years in a row up to 2015 but increased in 2016 (from .57 to .72) and in 2017 to 1.62.
VSEC 9. COMMUNITY INFRASTRUCTURE AND SERVICES						
9.1 Use of GN health services						
Kivalliq community health centre visits per capita	↓	↑	N/A	↑	N/A	Per capita health centre visits in communities with the most Agnico Eagle employees (Baker Lake, Rankin Inlet, and Arviat) are beginning to show an upward trend, most notably in Baker Lake and Arviat. The number of employees referred to their community health care centres for personal or work-related reasons ranges from 14 to 58 people per year, though it is difficult to draw a relationship between changes in this indicator and use of GN Health Services.
Persons transported from site to access health services (province & Nunavut)	N/A	↑	↓	N/A	↑	
Incidents requiring use of GN health services	N/A	/	↓	N/A	↑	
9.2 Use of public infrastructure						
Estimates of use of public physical infrastructure directly related to Project (airports, port, meeting facilities, roads)	N/A	N/A	N/A	N/A	N/A	The use of public physical infrastructure by Meadowbank and its employees consists primarily of the use of airports and has been relatively consistent since operation began in 2010. There are no indications of significant positive or negative impacts on this infrastructure. Having just begun construction and development in 2017, it is too soon to conclude what impacts Meliadine may be having on Rankin Inlet's airport or port.
All-weather access road (AWAR)	N/A	/	↓	N/A	N/A	
9.3 Social assistance						
Per capita social assistance expenditures by community	↓	/	N/A	↓	N/A	Despite declines from historical highs, social assistance data does not show a clear correlation between mine-related employment and social assistance requirements in Baker Lake or Arviat. Data suggests that both expenditures and percentage of households receiving social assistance have been declining in Rankin Inlet since Meadowbank opened.
Percentage of households receiving social assistance by community	↓	↓	↓	↓	↓	
VSEC 10. NUNAVUT ECONOMY						
10.1 Royalties and taxes						
Project compensation, royalties and taxes paid	N/A	↑	↑	N/A	↑	Cumulative project royalties, taxes and other payments paid by Agnico Eagle to the GN, GoC, NTI and KIA increased at both Meadowbank and Meliadine in 2017. At Meadowbank this is largely due to IIBA payments to the KIA following 2017 agreements. At Meliadine this is largely due to increases in payroll taxation following the onset of major construction.
10.2 Trade balance						
Nunavut trade balance	↓	↑	N/A	↑	N/A	Nunavut's net exports have increased steadily since 2008, following a dramatic increase in the trade deficit from 2006 to 2008 that was linked to the construction activities at Meadowbank. Since Meadowbank began operations in 2010, Nunavut's net exports have increased by approximately $131M. No trend regarding the impacts of Meliadine on Nunavut's trade balance can be determined with the current available data.

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
10.3 Nunavut GDP						
Nunavut GDP by all industries and mining, quarrying and oil & gas	↑	↑	↑	N/A	↑	Coinciding with Meadowbank becoming operational, Nunavut's GDP has grown at an average of 6% annually from 2009 to 2017. A sharp increase of 12% occurred in 2017.
Nunavut GDP by all industries and mining, quarrying and oil & gas	↓	↑	↑	N/A	↑	According to the Conference Board of Canada, Meadowbank has been a driver of Nunavut's GDP growth, both during the construction of the mine and since production began in 2010. The 12% increase observed over the past year may in part be attributed to construction activities at Meliadine and Whale Tail, most notably a large increase in contract expenditures for the two construction projects.

Introduction

The Agnico Kivalliq Projects

The Meadowbank and Meliadine gold mines are located in the Kivalliq region of Nunavut on Inuit owned lands (IOL). Meadowbank falls approximately 70 km north of the Hamlet of Baker Lake, or 110 km by road. Whale Tail, a satellite deposit to the Meadowbank mine, is located approximately 50km north of Meadowbank. Meliadine is located near the western shore of Hudson Bay, about 25 km north of Rankin Inlet.

Agnico Eagle Mines (AEM) acquired the Meadowbank property from Cumberland in 2007, with construction of the mine taking place between 2007 and 2010. The mine began production in 2011 and processes an average of 11,000 tonnes of ore per day from three deposits. As of December 31, 2017, Meadowbank had approximately 5 million tonnes of proven and probable reserves grading 2.28 grams of gold per tonne, containing 345,000 ounces of gold. It is expected to continue to produce gold until 2019, though the nearby Whale Tail development is expected to effectively extend the life of the mine for years to come.

About 290 km southeast of Meadowbank, Agnico Eagle's Meliadine gold project began construction and development activities in 2017. The project has approximately 16 million tonnes of proven and probable reserves grading 7.12 grams of gold per tonne, containing 3.7 million ounces of gold. Meliadine is forecast to begin operation in 2019, producing an estimated 5.7 million ounces of gold over a 15-year mine life. The project is expected to produce approximately 170,000 ounces of gold in 2019 and 385,000 ounces in 2020.

Report Purpose

This report provides the results of the Agnico Eagle Projects Socio-Economic Monitoring Program (SEMP), developed in consultation with the Kivalliq Socio-Economic Monitoring Committee (SEMC). The purpose of this report is to:

- comply with the relevant sections of the **Nunavut Land Claims Agreement** (NLCA),
- comply with the terms and conditions of the **Meadowbank Project Certificate** issued by the NIRB, including reporting on the socio-economic impact predictions made in Cumberland Resource's Final Environmental Impact Statement (Meadowbank FEIS);
- comply with the terms and conditions of the **Meliadine Project Certificate** issued by the NIRB, including reporting on the socio-economic impact predictions made in Agnico Eagle's Final Environmental Impact Statement (Meliadine FEIS);
- identify any **unanticipated effects** associated with the mines;
- identify and recommend **mitigation measures**;
- act as the primary vehicle for reviewing the findings of the SEMP in **collaboration** with members of the Socio-Economic Monitoring Committee (SEMC);
- fulfill best practices in **social responsibility**; and
- act as a **valuable resource** for communities, governments and interested stakeholders.

Report Structure

The following two sections provide background information on the SEMP, including relevant context and methodology. The remainder of this report presents project-specific and public data related to 10 valued socio-economic components (VSECs) to ensure the requirements of individual project certificates are being adequately met. Additionally, whenever possible, the report provides a cumulative / regional lens to better identify and assess the effects of Agnico Eagle's projects on the Kivalliq region.

The report is organized by VSEC, including: a summary page describing the VSEC, relevant FEIS predictions, the associated indicators and metrics used to monitor the VSEC, and key findings; and descriptions of existing Agnico Eagle programs and practices that are relevant to performance (enhancing benefits or mitigating impacts) for indicators associated with that VSEC.

For each indicator, this report addresses the following:

- **Prediction:** Provide the prediction from the projects' FEIS against which the indicator will be assessed. This will include directionality and magnitude as well as specific targets/levels, where available.
- **Data and Trends:** Present and describe the indicator data in a clear manner through the use of charts, tables and text.
- **Interpretation:** Analyse the data and assess trends against the specific indicator prediction and impact / goal statements, more generally. Where possible, examine changes in trends over time with respect to the periods before and after the commenced operation, recognizing that isolating the effects of individual projects will become challenging with multiple operations in the region.

Context

Socio-Economic Monitoring Committees

In 2007, the Government of Nunavut established three regional-based socio-economic monitoring committees (SEMCs) to monitor the socio-economic impacts of projects in each of the Territory's regions against project certificate terms and conditions specified by the NIRB. The SEMCs' Terms of Reference state that the committees will assist proponents in developing project monitoring programs and prepare reports and publish information on the impact of major development projects on the health and well-being of communities and residents in the region.

Both the Kivalliq and Meadowbank committees are required to produce annual monitoring reports, with the former focused at the level of the region and the latter at the project level. This system allows for project-level information to inform a regional picture of the socio-economic health of the Kivalliq, better capturing cumulative effects. This will become increasingly important as additional mining operations come on line in the region.

The first Meadowbank socio-economic monitoring report was completed in consultation with the Kivalliq SEMC and accepted by the Nunavut Impact Review Board in 2015. This is the first report produced under the new Agnico Eagle Projects SEMP, providing monitoring data for both Meadowbank and Meliadine. It builds on the foundation laid in the previous Meadowbank reports, evolving to address gaps, minimize overlap with regional SEMC reporting, increase consistency across SEM reports from different operators, and improve Agnico Eagle's and the SEMC's understanding of trends (i.e. relationships between indicators and causality). The Methods section of this report provides further information on the report's design, indicator selection and differences between this report and the previous report.

NIRB Project Certificate Conditions

Conditions 63 and 64 of the Meadowbank Mine Project Certificate issued by the NIRB require that a Meadowbank SEMC be established and that the project proponent work with the Governments of Nunavut (GN) and Canada to develop a Terms of Reference for a Meadowbank Socio-Economic Monitoring Committee. Agnico Eagle submitted the Terms of Reference for the Meadowbank SEMC in July of 2007, satisfying Condition 63. In order to better reflect the socio-economic monitoring needs and priorities of the Meadowbank SEMC, the terms of reference were modified in 2012 (see Appendix A). Following a number of iterations and meetings, a Terms of Reference for the Meadowbank Socio-Economic Monitoring Program was finalized in October 2014, at the SEMC working group meeting in Baker Lake.

Meadowbank Project Certificate, Condition 63:
"Within six (6) months of the issuance of a Project Certificate, the GN and INAC shall form a Meadowbank Gold Mine Socio-Economic Monitoring Committee ("Meadowbank SEMC") to monitor the socio-economic impacts of the Project and the effectiveness of the Project's mitigation strategies. The monitoring shall supplement, not duplicate, the monitoring required pursuant to the IIBA negotiated for the Project, and on the request of Government or PC, could assist in the coordination of data collection and tracking data trends in a comparable form to facilitate the analysis of cumulative effects. The terms of reference shall focus on the Project, include a plan for ongoing consultation with KivIA (Kivalliq Inuit Association) and affected local governments and a funding formula jointly submitted by GN, INAC and Cumberland. The terms of reference shall be submitted to NIRB for review and subsequent direction within six (6) months of the issuance of a Project Certificate. Cumberland is entitled to be included in the Meadowbank SEMC." (Nunavut Impact Review Board, 2006, p. 20)

Condition 64:
"Cumberland shall work with the GN and INAC to develop the terms of reference for a socio-economic monitoring program for the Meadowbank Project, including the carrying out of monitoring and research activities in a manner which will provide project specific data which will be useful in cumulative effects monitoring (upon request of Government or NPC) and consulting and cooperating with agencies undertaking such programs. Cumberland shall submit draft terms of reference for the socio-economic monitoring program to the Meadowbank SEMC for review and comment within six (6) months of the issuance of a Project Certificate, with a copy to NIRB's Monitoring Officer." (Nunavut Impact Review Board, 2006, p. 20)

Meliadine Project Certificate, Condition 89
"The Proponent shall develop the Meliadine Socio-economic Monitoring Program to monitor the predicted impacts outlined in the FEIS as well as regional concerns identified by the Kivalliq Socio-economic Monitoring Committee (SEMC). Where possible, the Proponent is encouraged to work in collaboration with all other socio-economic stakeholders such as the KIA, GN, AANDC and the communities of the Kivalliq region in developing this program, which should include a process for adaptive management and mitigation in the event unanticipated impacts are identified. Details of the Meliadine Socio-economic Monitoring Program are to be provided to the NIRB upon finalization, and within one year of issuance of the Project Certificate."

The Inuit Impact and Benefit Agreement (IIBA)

The original Inuit Impact and Benefits Agreement (IIBA) between Cumberland Resources and the Kivalliq Inuit Association (KIA) was signed in August of 2006. A Production Decision under the IIBA was given to the KIA by Agnico Eagle in December of 2007. This Production Decision was a key point in triggering many of the requirements under the IIBA and led to implementation of the agreement after Meadowbank went into production.

In 2009, Agnico Eagle and the KIA began a review of the IIBA with both parties suggesting changes in the text to refine and improve the functionality of the IIBA in achieving its objective of maximizing Inuit benefit from the Meadowbank Project in the form of employment, training and business opportunities. Agreement on a revised IIBA was subsequently reached with the final revised IIBA Agreement approved by the two parties on October 18, 2011. The IIBA for Meadowbank was renegotiated in 2017 and is well-aligned with the 2015/2017 Meliadine IIBA and 2017 Whale Tail IIBA.

A key feature of the IIBA was the establishment of an Implementation Committee with members from the KIA and Agnico Eagle to monitor and manage the implementation of the IIBA. The 2017 Meadowbank IIBA, following the structure established by the 2015/2017 Meliadine IIBA, also established the Employment and Culture Committee (ECC) and the Business Opportunities Committee (BOC). These three committees work together to consider Inuit employment, contracting, training and other project-related IIBA matters.

Methods

Indicator Selection

In the summer of 2017, Agnico Eagle, with their partners in the SEMC, created the Agnico Kivalliq Projects Socio-economic Monitoring Program. This program provides the framework for socio-economic monitoring of Agnico Eagle's mineral projects in the Kivalliq Region of Nunavut. This includes monitoring against the predicted impacts described in the Final Environmental Impact Statements (FEIS) of each project, as well as the concerns and priorities identified by the Kivalliq Socio-Economic Monitoring Committee (Kivalliq SEMC). This program superseded the project-specific SEMP for the Meadowbank Gold Mine. By integrating multiple projects within a single monitoring framework, it aimed to promote consideration of cumulative impacts and streamline development and review of monitoring reports, while respecting the unique regulatory requirements of individual projects.

The Agnico Kivalliq Projects Socio-Economic Working Group (Working Group) was established to support the design and implementation of the SEMP. The Working Group supported the development of the Program framework and supported the identification of and access to priority data useful in improving the socio-economic performance of the projects.

Other key inputs into the development of the SEMP included:

- A Gap Analysis undertaken in June 2017 that reviewed the Meliadine FEIS, IIBA, Project Certificate and previous Meadowbank SEMP as well as data availability and reliability to develop a short-list of potential indicators for inclusion in the Program.
- Participation in a territorial socio-economic monitoring workshop to discuss and collaboratively develop a group of core indicators and identify and discuss common assessment methodologies, practices and challenges.

Data Sources

Table 1 outlines the data sources for each metric. Data collected by Agnico Eagle cover the years 2010 (or 2011) to 2017. Data from non-project sources (e.g. GN departments, Nunavut Bureau of Statistics, StatsCan) often cover the years 2006 to 2016. For consistency, analysis typically begins in 2010, unless pre-2006 data is needed for a better understanding of baseline conditions prior to mine construction. Where Government of Canada census data is required, only 2006, 2011, and 2016[2] data is available and changes during intervening years cannot be reported.

For certain metrics reliant on non-project sources, data for the reporting year (2017) was not available at the time of publication. In some cases, there is a regular time lag in the release of data due to verification and approval requirements and only data up to 2015 or 2016 is reported. In other cases, data for the reporting year is expected but had not been made available at the time of report finalization. These cases are flagged for the reader wherever such data is presented.

[2] Some 2016 census data was not yet released when this report was finalized.

Analysis and Interpretation

Throughout this report, we present available data using a combination of narrative, tables and charts. We provide an interpretation of the data for each indicator, including identification of significant trends and an explanation for the trends where possible. Given the complexity of socio-economic phenomenon (i.e. multiple factors at play), there are limitations in establishing causal relationships between mining activities and certain and certain socio-economic indicators.

In addition, to the narrative interpretation provided for the indicators, summary tables are included at the front end of each VSEC section. These tables provide a high-level snapshot of trends for the various indicators and metrics through the use of arrows and symbols. These trends are considered separately for both Meadowbank and Meliadine. The dimensions are used to summarize trends in the summary table:

Time horizon

The time horizons over which trends / movements are viewed.

- **Pre-development (pre-dev)**: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine)
- **Post-development (post-dev)**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year.
- **Last year**: movement from 2016 to 2017

Direction

The direction of movement of the indicator over the given time period.

- 🡅: Increasing
- 🡇: Decreasing
- 🡆: Remaining stable
- **/:** No discernable trend
- **N/A:** Not applicable

Value

The value of the movement / trend relating to the achievement of desired impacts or goals.

- **Positive**: change in indicator towards the achievement of the desired impact or goal
- **Negative**: change in indicator away from the achievement of the desired impact or goal
- **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

For the current reporting year, all ‘last year’ Meliadine movements are considered neutral, as 2017 represents the first year of major construction activities and therefore has no comparable year against which to measure trends.

Involvement of Socio-Economic Monitoring Committee

Stratos engaged with members of the SEMC to ensure the content, structure, and look and feel of this report are as useful as possible. This engagement included ongoing discussions with GN’s department of Economic Development and Transportation (who coordinate and chair the SEMC), as well as participation in the April 2018 SEMC meeting in Arviat at which Stratos presented a plain language summary of early results.

VSEC 1: Employment

IMPACT / GOAL STATEMENT

Increased, stable employment for Inuit (including women and challenged workers) across Kivalliq communities

OVERARCHING FEIS PREDICTIONS

Meadowbank: "The potential impacts of employment are likely to take some time to gain full momentum, and overall are considered of high magnitude, positive, long term and of high significance, specifically to those individuals and their families who are able to benefit." (Cumberland Resources, 2006, 120)

Meliadine: "Project would increase the demand for labour during construction and operational phases, which should lead to a considerable number of local jobs." (Golder Associates, 2014, 1-C-46)

TRENDS & INTERPRETATIONS

	Meadowbank trends			Meliadine trends		
Metric	Pre-dev	Post-dev	Last year	Pre-dev	Last year	**Interpretation**
1.1 Total project employment (Agnico Eagle & contractors)						
Project employment (permanent, temporary, on-call & contractor)	N/A	→	↓	N/A	↑	Total Meadowbank employment levels measured as a snapshot in December, were relatively stable in 2017 and continue to significantly exceed the levels predicted in the FEIS. Meliadine employment increased significantly in 2017, corresponding with the onset of major construction activity.
1.2 Project Inuit employment (Agnico Eagle)						
Project Agnico Eagle employment (Inuit & non-Inuit)						Meadowbank Agnico Eagle Inuit FTEs have been holding relatively steady for the past 3 years (221, 221 and 218), representing between 28% and 29% of the total Agnico Eagle workforce. Contractor Inuit employment over the same time timeframe increased from 25 to 48 – though this may be a result of better tracking in 2017 where FTES are used compared with employment numbers in prior years. In 2017, there were 130 total Inuit FTEs at Meliadine (including both Agnico Eagle and contractor employees), representing approximately 18% of the workforce. This is below the Meliadine FEIS prediction of a 20% Inuit workforce during peak construction (340 employees). While the number of Meliadine Agnico Eagle FTEs has varied between 8 and 15 over the past five years, 2017 saw a sharp decline in the Inuit employment rate due to a large increase in non-Inuit employees. This may be explained by the requirements for more specialized labour during the construction phase.
Inuit FTEs	N/A	→	→	N/A	→	
Inuit FTE rate	N/A	→	→	N/A	→	
Project contractor employment (Inuit & non-Inuit)						
Employees / FTEs	N/A	→	↑	N/A	↑	
Inuit employee / FTE rate	N/A	↓	↑	N/A	↓	
1.3 Project Agnico Eagle employment by Kivalliq community						
Project employment by Kivalliq community	N/A	↑	↑	N/A	↑	In 2017, over half (53%) of Meadowbank's Kivalliq-based employees were from Baker Lake and approximately 61% of Meliadine's Kivalliq-based employees were from Rankin Inlet. Additionally, Arviat supplies a large and increasing proportion of Agnico Eagle's Inuit workforce, reaching a high of 70 employees in 2017. Employees from the remaining Kivalliq communities (Chesterfield Inlet, Coral Harbour, Whale Cove and Naujaat) rose in each community, increasing cumulatively from 26 employees to 44 between 2016 and 2017.
1.4 Project employment by gender						
Project employment (gender)						Agnico Eagle female employment at Meadowbank has been steadily increasing since 2013, from a low of 10% up to 20%. It is at its highest level since the mine began production and has now surpassed the Canadian mining sector average of 17%. Meliadine female employment has increased steadily, though the rate declined from 24% to 15% in 2017 due to a substantial increase in the number of employees and contractors for construction activity.
employees	N/A	↑	↑	N/A	↑	
rate	N/A	↑	↑	N/A	↓	
1.5 Project turnover						
Project turnover (Inuit & non-Inuit)	N/A	↓	↓	N/A	/	The turnover rate for Meadowbank permanent Inuit employees remained stable in 2017 at 28%, while temporary employee turnover rate is showing signs of stabilizing near 50% following a drop from 2010 to 2014. Meliadine's turnover rate for permanent Inuit employees continued a sharp 2-year decline in 2017, with 0 employee turnover, while it's temporary employee turnover rate remained similar to Meadowbank's at 55%. Of the 6 Inuit employees comprising 2017 turnover, 4 resigned and 2 were dismissed. 2017 saw a large increase in turnover in Meadowbank employees from Coral Harbor and Naujaat, with nearly as many employees leaving as were working there when the annual snapshot was taken (just over for Coral Harbor at 109% and just under at Naujaat at 92%).
Agnico Eagle Inuit employee turnover by reason	N/A	↓	↓	N/A	↓	
Percent turnover by community	N/A	↑	↑	N/A	↓	

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management & Mitigation

A number of programs are in place to encourage Inuit employment and retention at Meadowbank and Meliadine, as outlined in Table 2 below. Agnico Eagle offers programs to increase general educational and skills attainment among Kivalliq residents, facilitate entry into Meadowbank and Meliadine employment, as well as training, career development and upward mobility programs for existing employees. While many of these training programs are primarily relevant to VSEC 4: Education and Training, they are also discussed here due to a positive supporting effect on Inuit employment rates and retention.

Table 2: Agnico Eagle Employment Management and Mitigation Initiatives

Program	Purpose / Description / Outcomes
MOU with Department of Education	A Memorandum of Understanding was first signed in April 2012 to establish a strengthened partnership between the Government of Nunavut Department of Education and Agnico Eagle, with a focus on increasing the number of students in the Kivalliq region who are able to successfully transition from high school to trades and mining-related career opportunities. This work involved *Mining Matters*, a branch of the Prospectors and Developers Association of Canada (PDAC) that is dedicated to bringing knowledge and awareness about Canada's geology and mineral resources to students and educators. In 2013, Agnico Eagle and the *Mining Matters* group participated with the GN Department of Education, Curriculum Review Services to assist in a review of the Earth Sciences Curriculum of Nunavut Schools. During 2014, Agnico Eagle continued to sponsor the Mining Matters program as part of the MOU with Education. Agnico Eagle continued to pursue a renewed MOU with the Department of Education through 2016. In September 2017, Agnico Eagle and the Government of Nunavut established a Memorandum of Understanding that identifies 10 priority areas for collaboration, including education.
Kivalliq Science Educations Community	In 2017, Agnico Eagle once again invested $25,000 for the 2017-2018 regional Math Camp, Science Camp and Kivalliq Science Fair programs operated by the Kivalliq Science Educators Community. The regional science camp was organized in Chesterfield Inlet and the weeklong program included a mix of traditional, cultural and educational studies related to sciences. The program provides science credits to participants.

Program	Purpose / Description / Outcomes
Kivalliq Mine Training Society	The KMTS is an Inuit-private sector partnership created to strengthen the Kivalliq region labour force through the creation and funding of training opportunities in the seven Kivalliq hamlets. The KMTS has also enjoyed financial support from the Nunavut Department of Economic Development and Transportation and Agnico Eagle Mines. A major focus of the KMTS program has been to support Agnico Eagle's Mine Training Initiatives, such as the Career Path, different trainee programs, pre-trades programs, work readiness programs and workplace literacy strategies. Prior to 2015 the KMTS also supported the development and delivery of the community-based Work Readiness to help prepare Inuit for employment opportunities. The KMTS also supported the Arviat Drillers program as well as some other community-based initiatives, such as the Making it Work program, which provided support to employees and their families to cope with the challenges that come with employment at a mine site. Since 2017 KMTS was no longer able to receive funding to support program delivery to Agnico Eagle and communities. Despite the lack of substantial funding, Agnico Eagle Mines did not reduce its training delivery since the company is strongly committed to developing the local workforce.
Labour Pool Process	The Labour Pool Process (formerly 'Labour Pool Initiative'), implemented in 2014 and revised in 2015, is based on an agreement between Agnico Eagle and the KIA through the IIBAs to offer pre-employment opportunities to Inuit from all Kivalliq communities. The goal of the program is to pre-qualify candidates from Kivalliq communities through 5 steps: employment information sessions, online application (facilitated by Employment Information Sessions), the Work Readiness Program, mandatory trainings (more details provided below), and the Labour Pool List (facilitated by the Labour Pool Coordinator).
Labour Pool Process - Step 1: Employment Information Sessions	As part of the Labour Pool Process, employment information sessions are conducted in all Kivalliq communities. The purpose of the information sessions is to give information about the mines, the work lifestyle, and career opportunities as well as knowing how to apply online. In 2017, Agnico Eagle held employment information sessions in all seven communities on a quarterly basis.
Labour Pool Process – Step 2: Online Application (Community Coordinators)	The first step in the Labour Pool Process is to apply online. In order to facilitate online application in the communities, Agnico has a Community Coordinator in each Kivalliq community who can deliver employment information sessions, and provide one-on-one assistance to interested candidates with their online application.
Labour Pool Process – Step 3: Work Readiness Training Program	In collaboration with the Kivalliq Mine Training Society (KMTS), Agnico Eagle developed a Work Readiness Training program as a pre-employment initiative. In 2017, the Work Readiness Training was delivered by Northern College. The Work Readiness program is the first step of the Labour Pool Process for those individuals who have applied online. The objective of the program is for Inuit workers to be better prepared for the work environment in an industrial setting. Graduates of the program are eligible to continue the Labour Pool Process and attend the mandatory trainings given on-site. The program provides coaching on a range of issues including: awareness of employers' unspoken expectations, communication in the workplace, and problem-solving skills for resolving workplace issues. The program was implemented in April 2013. The program is delivered over a five-day period at the community level and is scheduled throughout the year. In 2017, the program was delivered by a visiting instructor in six Kivalliq communities resulting in 240 participants from various communities, from which 84% successfully completed the program. Arviat runs its own Work Readiness training sessions and had 78 graduates in 2018.

Program	Purpose / Description / Outcomes
Labour Pool Process – Step 4: Mandatory Training Program (previously 'Site Readiness')	The mandatory training program delivered on site is the second step of the Labour Pool process, following the Work Readiness Program. Graduates of the mandatory trainings are eligible to enter the Labour Pool. The Mandatory Training Program is a five-day training provided at the Meadowbank site. Throughout the week, participants are enrolled in diverse activities such as mandatory training sessions, site visits, job initiation, information sessions on training and career opportunities, as well as interviews and discussions on employment opportunities with a Human Resource representative to assess career ambitions and identify work interest. Afterwards, candidates wanting to work for the Camp Department are given short term on-call assignments. All other applicants become part of the Labour Pool list until a job opportunity matching their interest and competencies becomes available. In 2017, 193 individuals participated in Site Readiness, of which 173 successfully completed the program.
Labour Pool Process – Step 5: Labour Pool List	The Labour Pool List is a list of candidates who have successfully completed the steps of the Labour Pool Process. These candidates are now eligible for opportunities with Agnico Eagle or Agnico Eagle's contractors. The list is managed by the Labour Pool Coordinator.
Summer Student Employment Program	Agnico's companywide policy offers summer employment programs to the children of all Agnico employees (both Inuit and non-Inuit) that are undertaking postsecondary education. Summer job opportunities were also offered to Inuit students who are participating in post-secondary activity, even if they had no family relative working at the mine. Historically, there have been no applications to Agnico Eagle's Summer Student program by the children of Inuit employees. The program will continue to be offered in 2018. In 2017, Agnico advertised a summer student program to attract Inuit post-secondary students from Kivalliq communities, including students enrolled in trades with the Nunavut Arctic College and with the Nunavut Sivuniksavut program. This program was offered and advertised in each Kivalliq Community. The posting attracted three eligible applicants, of which all were contacted. Two applicants declined the offer and one accepted but later resigned before starting employment. At the 2018 Socio-Economic Monitoring Committee (SEMC) meeting, the GN Department of Finance expressed that it was sometimes difficult to place summer student applicants. Agnico Eagle is open to working with the GN in potentially placing eligible and interested Inuit summer students at the projects, who can otherwise not be accommodated with the GN.
Haul Truck Trainee Program	The Haul Truck Trainee program is a 28-day (336 hour) program to certify haul truck operators, which includes training on a simulator, in the classroom, and on the job. The program is aimed at existing employees in entry level positions (dishwashers, janitors, chambermaids, etc.). This year, 26 employees were enrolled in the Haul Truck Trainee Program. Among those, a total of 23 trainees successfully completed the Program (18 men, 5 women). In order to provide the best training possible to all the trainees, there is a maximum of 4 trainees at a time with one trainer.
Process Plant Trainee Program	With the success of the Haul Truck Trainee Program, a Process Plant Trainee Program was developed in 2015. The 28-day program provides employees with an understanding of the mining and milling process and trains them to be competent and certified to fill positions as a process plant helper or a utility person. In 2017, a total of five (5) employees enrolled in the program. Amongst those, two (2) were delivered to the Process Plant.

Program	Purpose / Description / Outcomes
Super Operator Program	Implemented in the second half of 2016, the Super Operator Program is an extension of the Process Plant Trainee Program. This 168-hour training is provided to employees who have successfully completed the Process Plant Trainee Program. The extension of the Process Plant Trainee Program will consist in teaching the basics of maintenance principles in order to have employees with more diversified skills in the Process Plant Department. These employees will eventually be able to perform specific basic maintenance repairs throughout the plant. In 2017, every Inuit employee that was trained as a Process Plant Trainee received the Super Operator Training.
Arviat Community Training Programs	In 2011, the Hamlet of Arviat proposed a partnership to invest in a community-based drilling school that would provide Inuit with the skills needed to work in diamond drilling. With advice and support from Agnico Eagle, the Hamlet brought together a range of partners to acquire the drilling equipment, develop the curriculum, and operate the training program. Government training agencies, the KIA, and drilling companies provided partnership investments. In 2013, the program offering was expanded to include a Welder's Helper program. Agnico Eagle invested $195,000 in the Arviat training programs in the 2017-2018 funding year. Over the past 5 years the program has graduated 65 trained driller's helpers, all of whom have found employment. In 2017-2018 funding year, the Mechanical Welding Program graduated 6 students.
Career Path Program	The Career Path Program was designed in 2012, with the intention of supporting upward mobility of Inuit employees at Meadowbank. This program identifies the incremental steps that an employee is required to complete to advance in their chosen career of interest. In 2017, the Career Path system was available in eight (8) areas of activity; Underground (Meliadine only), Drill, Industrial Mechanic, Maintenance, Process Plant, Road Maintenance, Field Services, and Mine Operations. The objective of the Career Path Program is to have only internal promotions for Inuit, and for no external candidates (southerners) to be hired to fill a position that is part of the program.
Training Formula (formerly 'Training Curriculum')	The Training Formula program, implemented in 2014, provides tools, tips, guideline and standards to improve the proficiency of Agnico trainers. The formal manual includes three sections: training theory, training standards, and training delivery.
E-Learning Training	Before coming to an Agnico site for the first time, newly hired employees must complete their Mandatory Training online, which consists of six (6) modules: General Induction, WHMIS, Fire Suppression, Job Hazard Analysis and Work Card, Spill Response, and Occupational Health and Safety (Personal Protective Equipment, Ladder Safety, Surface Standard Operating Procedure). The General Induction chapter provides general information about Agnico Eagle and working life at the mines. As per the requirement of the IIBAs, in 2017 two new e-learning lessons were developed and added to the General Induction. The Inuit Impact and Benefit Awareness module (IIBA) provides general awareness on: Agnico's Commitment to Indigenous People, history of the Nunavut Agreement and the different Inuit organization branches, what an IIBA is and why the sites have one, and a high level overview of the benefits and impact mitigation provided through the IIBAs. The Archaeology module informs workers on how to identify potential archaeological sites (ex. fox traps, tent circles, hunting blinds) and what to do if a worker finds one when working in the tundra. An objective of these lessons is also to give each employee and contractor employee cross-cultural context before arriving on one of Agnico's sites.
Training and Learning Management System	The Training Management System (TMS) as well as the Learning Management System (LMS) were initially implemented in 2013, in order to ensure better management of training activities and to monitor the proper management of the e-learning training. In response to the GN's request for increased information on training programs in 2014, both systems were modified in 2015. The systems are now capable of producing more detailed reports: by training program, by participation level, by graduation level and by hour.

Program	Purpose / Description / Outcomes
Apprenticeship Training ('Apprenticeship Program' and 'Pre-Apprenticeship Program')	The Apprenticeship Program combines on-the-job learning and in-school technical instruction to allow Inuit employees the opportunity to be educated and trained in the trade of their choice. By the end of the program, the apprentice is able to challenge their Certificate of Qualification (COQ) to become a Journeyperson and will also have the opportunity to challenge their Red Seal Exams. Currently, we offer seven (7) trades: cook, carpenter, millwright, electrician, heavy duty equipment technician, welder, and plumber. In 2015, two (2) employees completed their apprenticeship training within Agnico and in 2016, two (2) employees completed their apprenticeship training within the company. As of the end of 2017, there were 16 apprentices and pre-apprentices. There were no graduates for the 2017 year, but since the program takes time to complete, we are expecting to have three (3) graduates in the next two (2) years.
Role Model Program	The Role Model program began in 2015 as a way to recognize exemplary Inuit employees. Since then, it has grown into a program to: recognize the hard work of individual Inuit employees; identify examples to inspire Inuit employees, community members, youth, etc. on how to achieve personal and/or work success; and serve as an incubator program to identify and support future Inuit leadership in the company. Role models are nominated and chosen by a committee annually. They can be nominated and chosen for a variety of reasons, including demonstrating good work-life balance/dedication to upgrading one's education/skills; positive attitude; exemplifying traditional Inuit values at home or at work; overcoming personal challenges; involvement in communities; demonstrating leadership skills, etc. A Role Model is recognized through posters and is also provided opportunities to represent the company and speak on behalf of their own experiences at various events (trade shows, symposiums, high school visits, etc.). Some Role Models are also enrolled in the Leadership Development Program in order to continue to foster management and supervisory skills. In 2017, there were 8 Role Models at Meadowbank and 4 Role Models at Meliadine.
TASK Week	The Trades Awareness Skills and Knowledge Week (TASK Week) was initiated in 2012 and has evolved in its structure through the years. TASK week is now a full week program that allows students to focus on one trade for the entire week. TASK week is also aligned with Agnico's IIBA commitment Schedule C, 16, by promoting the mine industry through career awareness and co-operating with educational authorities in the implementation of mining sector content in schools. TASK Week is a joint initiative between Jonah Amitnaaq Secondary School (JASS) and Agnico Eagle, and has active cooperation from other authorities and businesses each year. The 2017 TASK Week was held in Baker Lake from May 8th to May 12th and saw 58 senior high school students from JASS participate. Six (6) trades were features: Mechanics, Welding, Electrical, Culinary Arts, Hairdressing, and Environmental Studies (which included Work Readiness training). In 2017 Agnico again brought trainers and apprentices/tradespeople from Meadowbank, including four of Meadowbank's Inuit apprentices/Red Seal, all from Baker Lake. Agnico believes that having students exposed to role models from their community has a positive impact on participants in the program.

Program	Purpose / Description / Outcomes
Financial Literacy Training	In collaboration with CPA Canada, in 2017 a Financial Literacy training course was delivered at Meadowbank mine site. The need for financial literacy training was identified through the Baker Lake Wellness Plan. The training overviews why financial literacy is important, savings vehicles, budgeting, and goal setting. The training was held twice at Meadowbank with 33 participants, including Inuit participants. Modified Financial Literacy trainings were also held in Baker Lake, both at a public community session as well as delivery to grades 7-9 & 12 at the Jonah Amitnaaq Seconary School. Basic financial literacy training is also included in the Work Readiness program. Agnico has also had preliminary discussions with the Nunavut Housing Corporation to include financial literacy information on site, on subjects like rent scales or home savings programs. Agnico Eagle plans to continue offering opportunities at both mine sites to improve financial literacy in 2018 in collaboration with Sunlife Financial.

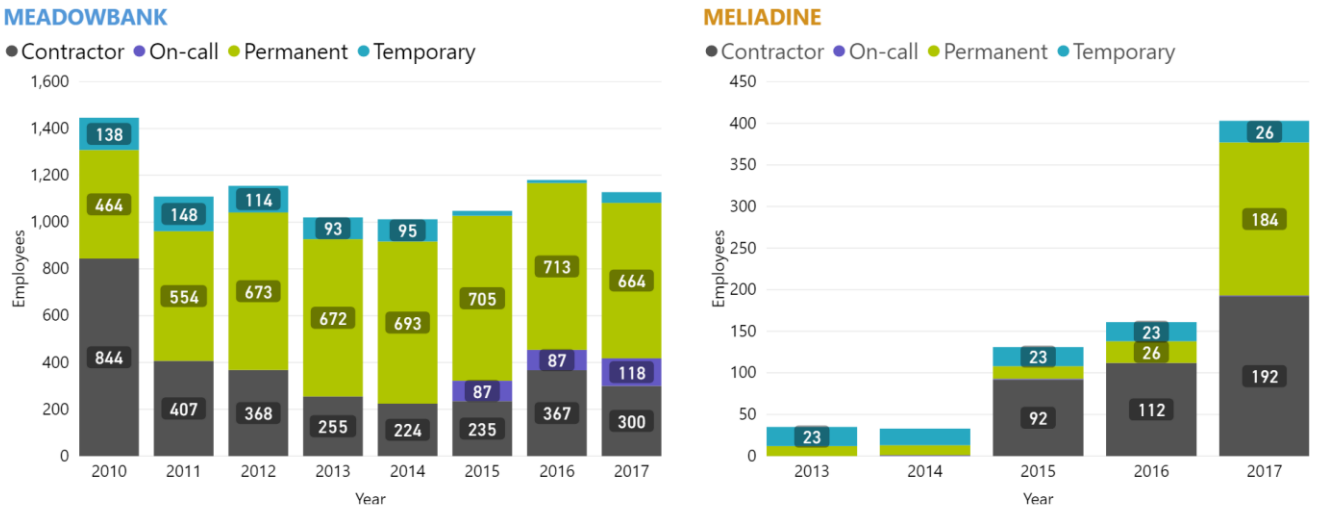
1.1 Total project employment (Agnico Eagle & contractors)

Predictions

MEADOWBANK

"It is expected that the construction phase workforce will average 160 and peak at 310, and the operation phase workforce is estimated at 370."

MELIADINE



- "1700 positions, mostly contractors during construction phase" (Golder Associates, 2014, p. 1-117)
- "700 positions during operational phase" (Golder Associates, 2014, p. 1-118)

Data & Trends

Chart 1 provides an overview of direct employment at Meadowbank and Meliadine. These numbers are measured as a snapshot of employment taken in December of each year. This data may differ largely from Full-Time Equivalent data (FTEs) – especially for contractors. Additional FTE descriptions and data are provided in the following section. Employees at the mines are divided into one of the following categories:

- *Permanent*: Agnico Eagle employees whose current jobs are not specifically tied to a short-term project, with positions expected to be required throughout the life of the mines
- *On-call*: Agnico Eagle employees with an indefinite contract who are called upon when the need arises
- *Temporary*: Agnico Eagle employees whose current job will not continue beyond a specified period of time (a set contract)
- *Contractors*: Employees of contractors

Chart 1. Project employment (permanent, temporary, on-call & contractor)

(Agnico Eagle Mines, 2017)

Interpretations

The years between 2010 and 2012 saw Meadowbank moving from construction and commissioning phases to a fully operational mine. As is to be expected, this coincided with a movement away from contractors and towards employees hired by Agnico Eagle directly. An increase in contractors is noticeable again in 2016, due to increased activity at the Whale Tail site. The total Meadowbank employee figures to date have significantly exceeded the values predicted in the FEIS for employment at the mine, largely due to an expansion of the project scale from the initial Cumberland project proposal. The drop in Meadowbank temporary employees seen in 2015 and continuing in 2016 is largely due to Agnico Eagle shifting employees in certain departments to on-call status as turnover occurred. This was due to uncertainty about the Whale Tail project. Permanent employment also decreased by 7%, from 705 to 713 from 2016 to 2017, while on-call employees increased by 35%, from 87 to 118. With the approval of the Whale Tail project, this trend towards on-call status is expected to reverse in 2018.

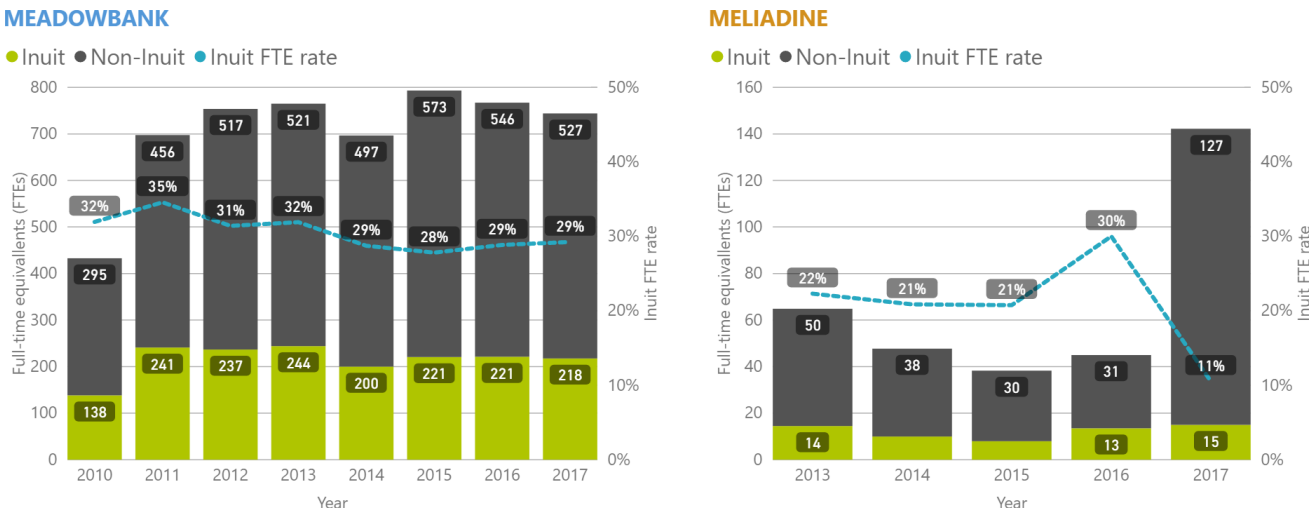
Meliadine employment grew dramatically in 2017, coinciding with the movement of the advanced exploration project into the construction phase. This is most pronounced for contractors, with the number of FTE contractor employees jumping from 112 to 591 between 2016 and 2017. This number is still dramatically below the estimated 1700 positions predicted in the FEIS for the peak construction phase, estimated to be between Q3 2017 and Q2 2018. It should be noted that 2017 contractor figures for both Meliadine and Meadowbank are scientifically lower than the FTE values presented in the following section. This may be due to the timing of the snapshot data.

1.2 Project Inuit employment (Agnico Eagle)

Predictions

MEADOWBANK

There are no specific predictions in the Meadowbank FEIS regarding Inuit or Nunavummiut employment rates at Meadowbank.



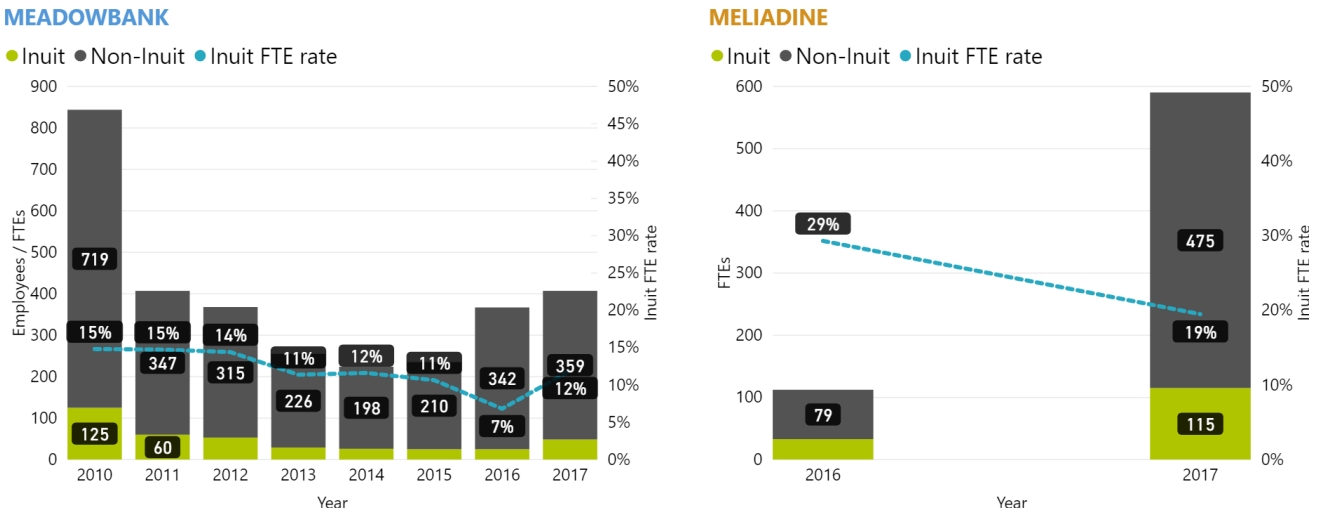
MELIADINE[3]

- 20% (340 positions) of peak construction phase workforce will be Inuit. (Golder Associates, 2014, p. 1-117)
- 20% (140 positions) of operational phase workforce will be Inuit. (Golder Associates, 2014, p. 1-118)

Data & Trends

Chart 2 provides an overview of Agnico Eagle Inuit and non-Inuit full time equivalents (FTEs) at Meadowbank and Meliadine. FTEs are a way to control for differences in the number of hours worked by different individuals, thereby providing a more accurate and comparable picture of employment over time and between projects. One FTE represents 2,184 person-hours of work – or the approximate number of hours worked by one employee on a full-time basis for a year. In other words, in 2017, there was the equivalent of approximately 218 full-time Inuit employees working at Meadowbank. The blue lines are the Inuit FTE rate each year.

Chart 2. Project Agnico Eagle employment (Inuit & non-Inuit)



(Agnico Eagle Mines, 2017)

Chart 3 provides an overview of Agnico Eagle Inuit and non-Inuit employees / full time equivalents (FTEs) at Meadowbank and Meliadine.

[3] Note that the Meliadine predictions include contractors.

Chart 3. Project contractor employment (Inuit & non-Inuit)[4]

(Agnico Eagle Mines, 2017)

Interpretation

Meadowbank Agnico Eagle Inuit FTEs has been holding relatively steady for the past 3 years (221, 221 and 218), representing between 28% and 29% of the total Agnico Eagle workforce. There were no predictions made in the Cumberland FEIS regarding Inuit employment rates at Meadowbank.

In 2017, there were 130 total Inuit FTEs at Meliadine (including both Agnico Eagle and contractor employees), representing approximately 18% of the workforce. This is below the Meliadine FEIS prediction of a 20% Inuit workforce during peak construction (340 employees). While the number of Meliadine Agnico Eagle FTEs has varied between 8 and 15 over the past five years, 2017 saw a sharp decline in the Inuit employment rate due to a large increase in non-Inuit employees. This may be explained by the requirements for more specialized labour during the construction phase.

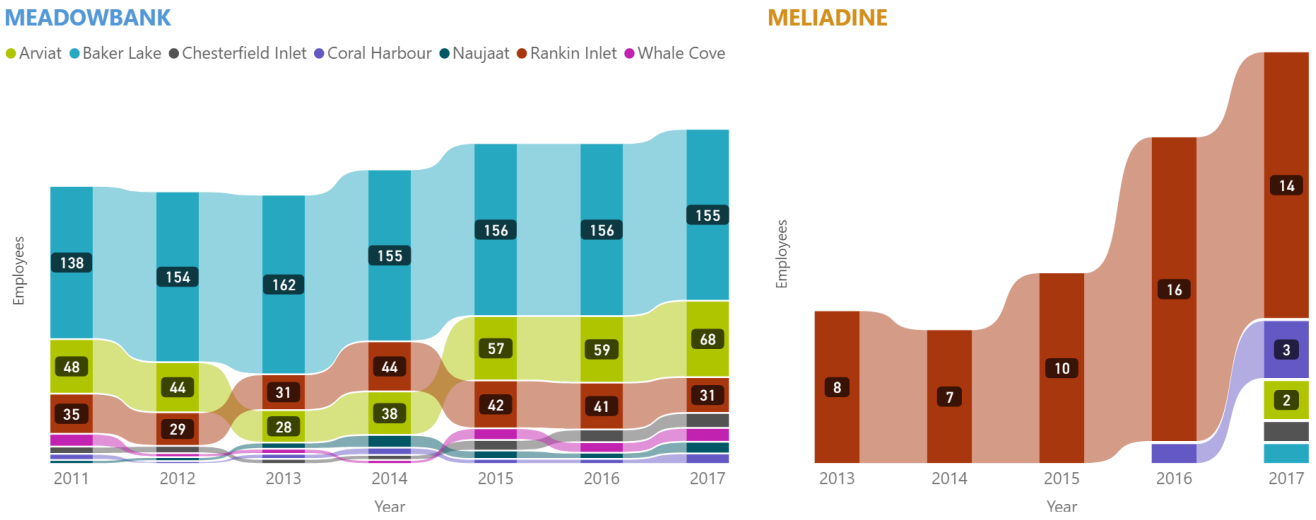
1.3 Project Agnico Eagle employment by Kivalliq community

Predictions

MEADOWBANK

There are no specific predictions in the Meadowbank FEIS regarding Kivalliq community resident employment rates.

MELIADINE



There are no specific predictions in the Meadowbank FEIS regarding Kivalliq community resident employment rates.

Data & Trends

Chart 4 provides an overview of the total number of Inuit employees by community of hire in the Kivalliq. Note that the chart is displaying the number of employees (permanent, temporary and on-call) as opposed to FTEs as provided in the previous section.

[4] Due to data availability, 2017 Meadowbank contractor data and all Meliadine contractor data represent full time equivalents (FTEs), derived based on person-hours worked. The remainder of data points (Meadowbank 2010 to 2016) represent the number of employees as a snapshot at one time of year. Trends between these years should be interpreted with caution.

Chart 4. Project employment by Kivalliq community

(Agnico Eagle Mines, 2017)

Interpretation

In 2017, over half (53%) of Meadowbank's Kivalliq-based employees were from Baker Lake and approximately 61% of Meliadine's Kivalliq-based employees were from Rankin Inlet. This likely reflects a number of factors, including: the size of those communities, the mines' proximities to the respective communities; preferential hiring provisions outlined in the IIBA to give preference to Inuit from those communities; as well as training and recruiting efforts by Agnico Eagle focused in Rankin Inlet and Baker Lake.

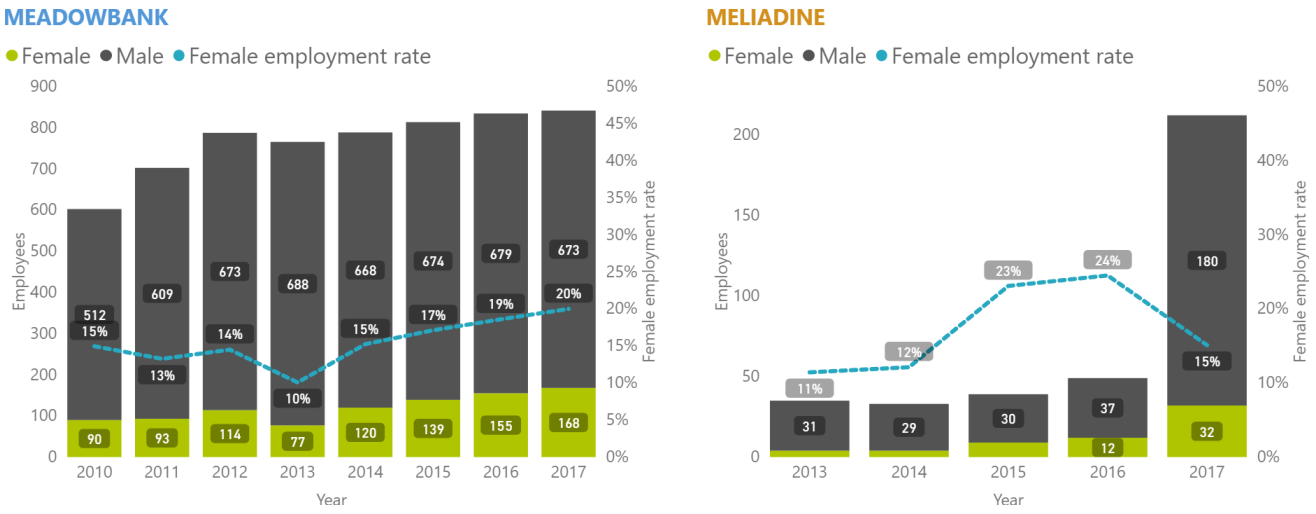
Additionally, Arviat supplies a large and increasing proportion of Agnico Eagle's Inuit workforce, reaching a high of 70 employees in 2017, up from 57 and 59 the previous 2 years. 2017 employment numbers for the remaining communities are: Chesterfield Inlet (13); Whale Cove (11); Coral Harbour (11); and Naujaat (9).

1.4 Project employment by gender

Predictions

MEADOWBANK

There are no specific predictions in the Meadowbank FEIS regarding Kivalliq community resident employment rates.



MELIADINE

There are no specific predictions in the Meadowbank FEIS regarding Kivalliq community resident employment rates.

Data & Trends

Chart 5 provides an overview of the number and rate of Agnico Eagle female employment at Meadowbank and Meliadine.

Chart 5. Project employment (gender)

(Agnico Eagle Mines, 2017)

Interpretation

There are no formal goals for gender employment rates at either Meadowbank or Meliadine. Agnico Eagle female employment at Meadowbank has been steadily increasing since 2013, from a low of 10% up to 20%. It is at its highest level since the mine began production and has now surpassed the Canadian mining sector average of 17%. Meliadine female employment has increased steadily, though the rate declined from 24% to 15% in 2017 due to a substantial increase in the number of employees and contractors for construction activity.

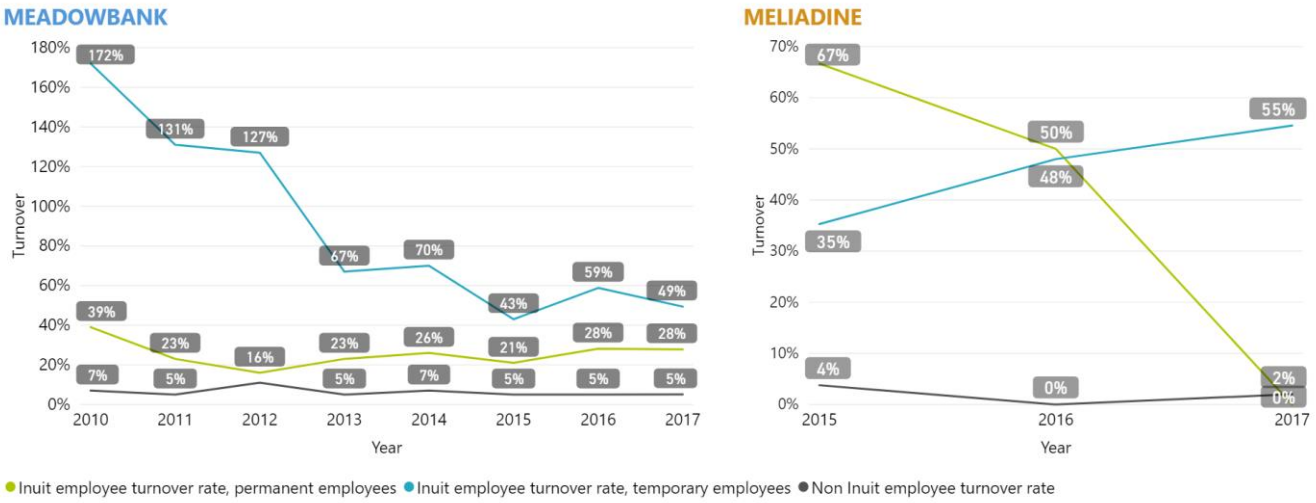
During 2017, there were 116 permanent, 24 temporary and 53 on call female employees at both Meadowbank and Meliadine. Agnico Eagle participates in the Mining Industry Human Resource Council's *Gender Equity in Mining (GEM) Works Initiative*, which works towards achieving greater gender equality in the mining sector.

1.5 Project turnover

Predictions

MEADOWBANK

There are no specific predictions in the Meadowbank FEIS regarding Kivalliq community resident employment rates.



MELIADINE

There are no specific predictions in the Meadowbank FEIS regarding Kivalliq community resident employment rates.

Data & Trends

Chart 6 below provides an overview of Inuit and non-Inuit turnover rates for permanent and temporary / on-call employees. Turnover rates are the percentage of Meadowbank employees that leave Agnico Eagle's employ during each fiscal year by dividing the number of terminations by the average number of employees in a given year.

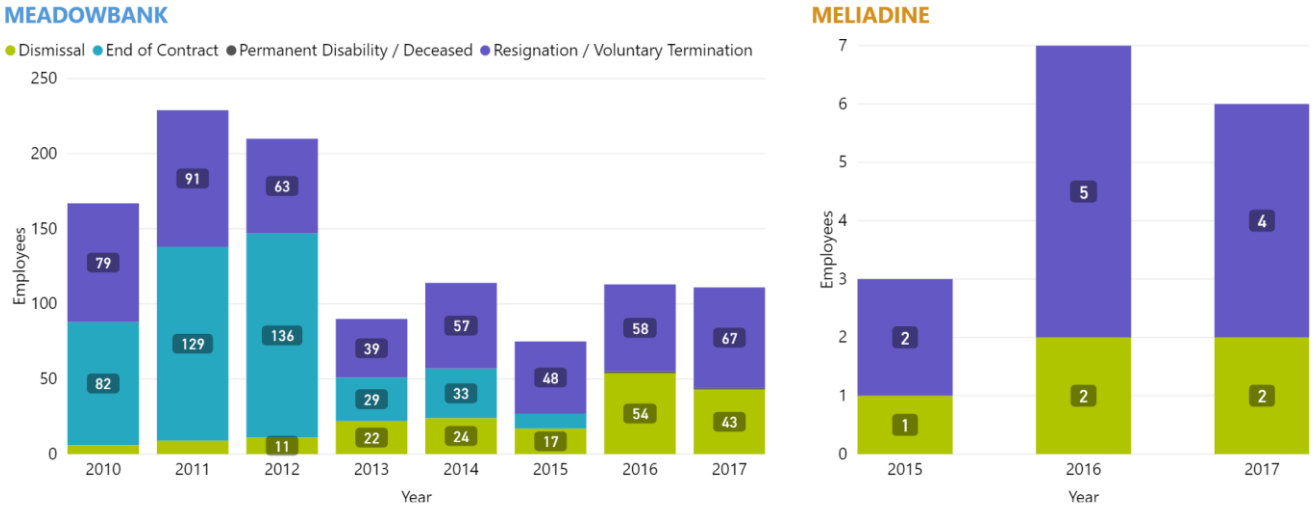


Chart 6. Turnover rates, 2010 – 2016 (Inuit and non-Inuit)

(Agnico Eagle Mines, 2017)

Chart 7 provides an overview of turnover by reasons for leaving at both Meadowbank and Meliadine.

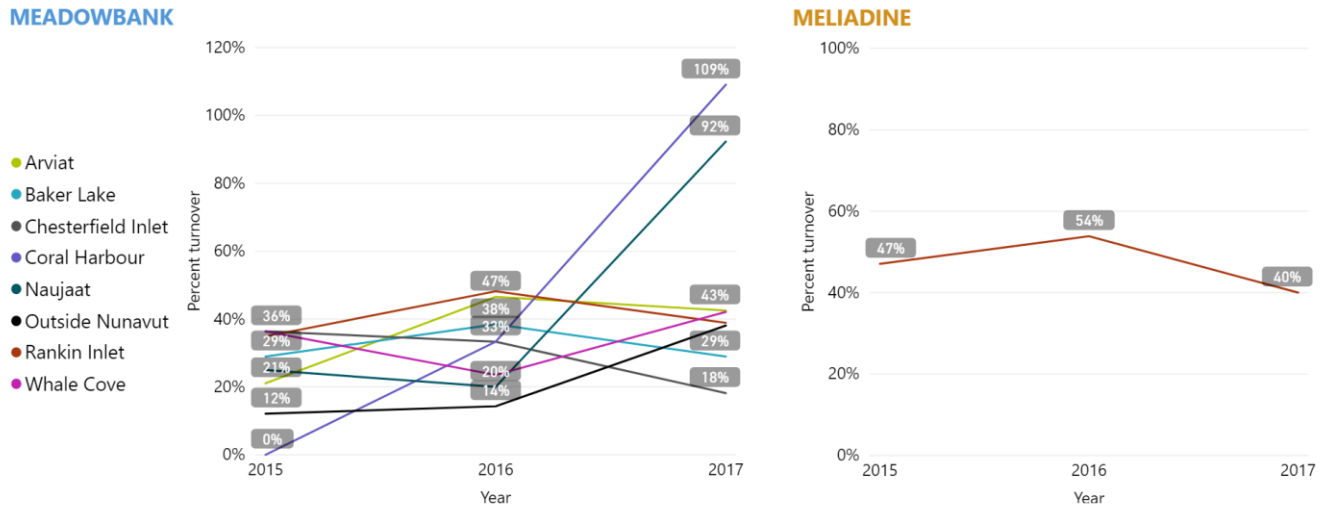

Chart 7. Agnico Eagle Inuit employee turnover by reason

(Agnico Eagle Mines, 2017)

Chart 8 below shows the percentage of turnover by community for both projects for 2015 through 2017, the only years for which this data is currently available.

Chart 8. Percent turnover by community

(Agnico Eagle Mines, 2017)

Agnico Eagle conducts focus group meetings to gather information on reasons for resignation and voluntary termination. Interviews were used to collect qualitative information on common reasons why employees have left. This investigation and exit interview information collected since 2010 has led to the below list of reasons commonly cited in exit interviews. These include:

- Does not like the schedule/camp life
- Miss their family
- Found another job
- Family situation or spousal relationship issues
- Conflict with employee/supervisor
- No babysitter
- Does not like the job/lack of advancement

In 2017, the majority of resignations at Meadowbank were related to family situation (43%), followed by lack of childcare (14%) and dislike of the schedule or camp life (including homesickness) (14%). At Meliadine, almost all resignations were due to the employee finding another job (75%).This data should be interpreted with caution, as self-reported data may be subject to a number of reporting biases.

In 2017 Agnico Eagle and Kivalliq Inuit Association commissioned an Inuit Workforce Barriers Study, which is expected to be finalized mid-2018. The purpose of the study is to better understand existing barriers and develop potential strategies for Inuit employment at the project sites. The outcomes of this study will inform future SEMRs interpretation of turnover.

Interpretation

Since 2010, turnover rate for Meadowbank permanent Inuit employees has been consistently higher than that for permanent non-Inuit employees (approximately four to six times higher over the past four years). The turnover rate for permanent Inuit employees remained stable in 2017 at 28%, up from 21% in 2015 but approximately the same as in 2014 (26%). Dismissals decreased in 2017, down to 43, after a jump in the previous year from 17 to 54. Meadowbank's drop in the temporary & on-call Inuit employee turnover rate between 2010 and 2013 is likely due the shift of temporary employees away from set-contracts (contracts with a defined end-point which therefore manifest as turnover) towards on-call temporary employees. These employees now have an indefinite contract

and are called upon when the need arises. This turnover rate increased to 59% in 2016 from a low of 43% in 2015.

2017 saw a large increase in turnover in Meadowbank employees from Coral Harbor and Naujaat, with near as many employees leaving as were working there when the annual snapshot was taken (just over for Coral Harbor at 109% and just under at Naujaat at 92%). While relatively small in number (6 for each community), this still represents a large increase from pervious years, as well as a much higher value generally than can be found across employees coming from other Kivalliq communities.

Meliadine's turnover rate for permanent Inuit employees continued a sharp 2-year decline in 2017, with permanent 0 employee turnover, due in part to a small number of permanent employees (the number of permanent employees grew from 2 to 18 during 2017). In 2017 most Inuit employees were in temporary status. Of the 6 Inuit temporary employees comprising 2017 turnover, 4 resigned and 2 were dismissed.

VSEC 2: Income

IMPACT / GOAL STATEMENT

Increased income in Kivalliq communities

OVERARCHING FEIS PREDICTIONS

Meadowbank: "The potential impacts of increased income are considered of high magnitude, positive, long-term and of high significance, particularly to those individuals and their families who are able to benefit. It is expected that overall community effects, moderate in significance, are likely to be most experienced in Baker Lake, as most direct employment will occur here." (Cumberland Resources Ltd., 2006, p. 121)

Meliadine: "Project would directly and indirectly contribute to disposable income of employees and other local people." (1-C-48)

TRENDS & INTERPRETATIONS

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
2.1 Income paid to projects' Inuit employees						
Income paid to Agnico Eagle project Inuit employees	N/A	↑	→	N/A	↑	2017 total income paid to Agnico Eagle's Inuit employees remained relatively stable from the previous year at $19.4M. This follows a steady annual increase between 2013 and 2016, with the 2015 and 2016 increase largely attributable to increased activity at Meliadine.
2.2 Income by Kivalliq community						
Median employment income of tax filers by Kivalliq community	↑	↑	N/A	↑	N/A	The most recent data available for this indicator is from 2015. Median employment income has increased gradually overall in the Kivalliq region since 2006, with no significant inflection (i.e. change in growth rate) since 2010. Among the Kivalliq communities with highest levels of Meadowbank employment (Baker Lake, Rankin Inlet, and Arviat), only Rankin Inlet shows a significant increase in the income growth rate when comparing the 2006-2010 period to the 2010-2015 period.

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management & Mitigation

Programs aimed at encouraging greater educational attainment, recruiting local employees, supporting professional development and skill advancement, and increasing local contracting and business opportunities can all have a positive supporting effect on income indicators in the Kivalliq. These programs are outlined in the respective sections of this report (VSEC 1, 3 and 4).

2.1 Income paid to projects' Inuit employees

Predictions

MEADOWBANK

"Direct project wages paid to people in Kivalliq Region, primarily Baker Lake, could exceed $4 M annually"

MELIADINE

"Project would directly and indirectly contribute to disposable income of employees and other local people." (Golder Associates, 2014, 1-C-48)

Data & Trends

Chart 9 shows employment income paid to Meadowbank's Agnico Eagle Inuit employees from 2010 to 2017, as well as Income paid to Meliadine's Agnico Eagle Inuit employees from 2014 to 2017. Meadowbank income data for certain years has been re-stated from previous reports to address past data collection gaps or errors.

Chart 9. Income paid to Agnico Eagle project Inuit employees

(Agnico Eagle Mines, 2017)

Interpretation

2017 total income paid to Agnico Eagle's Inuit employees remained relatively stable from the previous year at $19.4M. This follows a steady annual increase between 2013 and 2016, with the 2015 and 2016 increase largely attributable to increased activity at Meliadine.

Meadowbank saw a 4% reduction in income paid to their Inuit employees in 2017, corresponding with a similar reduction in person-hours worked. With 89% of Meadowbank's Inuit workforce residing in the Kivalliq region (50% in Baker Lake), income in 2017 continues to significantly exceed (by approximately 4.5 times) the FEIS prediction of $4 million in direct project wages annually to Kivalliq residents.

Meliadine has seen income nearly double annually since 2015, corresponding to an increase in construction activity and employment. Meliadine's FEIS does not offer any specific dollar-value predictions of income, instead noting an increase in disposable income of employees and other local people. The $1.3M paid to Inuit employees in 2017 likely corresponds closely to the location of Meliadine's Inuit workforce, with 87% residing in the Kivalliq, and 61% residing in Rankin Inlet.

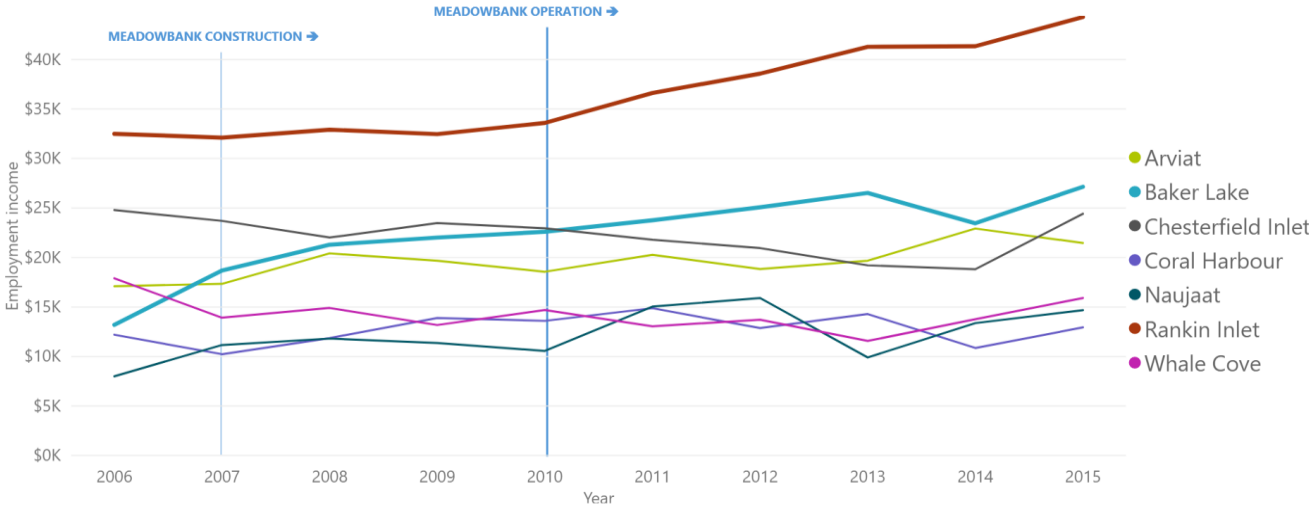
Contractors working at both Meliadine and Meadowbank also have Inuit employees who receive income. In previous reports, this income was estimated based on the Inuit employment rates of contractors and contract value. Due to methodological concerns, these estimates are no longer included in this report.

2.2 Income by Kivalliq community

Predictions

MEADOWBANK

The Meadowbank FEIS makes no specific predictions regarding changes in the median income of Kivalliq communities but does predict that Baker Lake will experience the most positive effects of increased income.



MELIADINE

"Project would directly and indirectly contribute to disposable income of employees and other local people." (Golder Associates, 2014, 1-C-48)

Data & Trends

Chart 10 shows the median income of tax filers in each Kivalliq community from 2000 through to 2015, the latest year for which data is available.

Chart 10. Median employment income of tax filers by Kivalliq community

(Statistics Canada, 2017c)

Interpretation

As shown in Chart 10, median income in Baker Lake and Rankin Inlet have been above the median income for the Kivalliq region during several years since Meadowbank opened, including 2015. It is recognized that other factors influence median employment income in each community (spin-off effects, unrelated economic

development, changes in public sector employment, etc.) and that these factors may mask the effect of Meadowbank and Meliadine employment income, especially for communities that have relatively few Agnico Eagle employees or that have a high median employment income to start with (e.g. Rankin Inlet, as the Government of Nunavut regional centre for the Kivalliq Region, has significant public-sector employment).

Median employment income has increased gradually in the Kivalliq region since 2006, with no significant inflection (i.e. change in growth rate) since 2010. Among the Kivalliq communities with highest levels of Meadowbank employment (Baker Lake, Rankin Inlet, and Arviat), only Rankin Inlet shows a significant increase in income growth rate when comparing the 2006-2010 period to the 2010-2015 period. Employment income increased in 2015 in all Kivalliq communities, after a decline or stabilization in income in most communities in 2014.

VSEC 3: Contracting and Business Opportunities

IMPACT / GOAL STATEMENT

Increased opportunities for Inuit-owned and local businesses

OVERARCHING FEIS PREDICTIONS

Meadowbank: “The potential impacts of employment are likely to take some time to gain full momentum, and overall are considered of high magnitude, positive, long term and of high significance, specifically to those individuals and their families who are able to benefit.” (Cumberland Resources Ltd., 2006, p. 121)

Meliadine: "Project spending on goods and services would increase the demand locally, allowing local businesses (and new businesses) to grow and become more cost-effective." (1-C-47)

TRENDS & INTERPRETATIONS

Indicator / Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
3.1 Contract expenditures						
Contract expenditures on NTI-registered businesses						In 2017, contract expenditures doubled from a total of $205M to $408M across the two projects, largely due to increased spending at the Whale Tail site, as well as the start of construction at Meliadine. This increase corresponded with a decline in the total proportion of expenditures (Meadowbank, including Whale Tail, and Meliadine) going to NTI-registered vs. non-NTI registered firms, from 55% in 2016 to 47% in 2017. This decline in proportion is fully attributable to Meliadine spending, where the proportion declined from 55% in 2016 to 41% in 2017.
NTI expenditures	N/A	↑	↑	N/A	↑	
Proportion NTI	N/A	↑	→	N/A	↓	
2017 NTI-registered business expenditures by Nunavut community	N/A	N/A	N/A	N/A	N/A	In 2017, just over half of the spending on NTI-registered firms went to firms located in Rankin Inlet, followed closely by Baker Lake and Iqaluit, with 23% each. Meliadine is expected to far exceed the FEIS predictions of $175M contract spending on Kivalliq-based businesses over the 3.5-year construction phase.
Contract expenditure on Nunavut-based businesses						Total contract expenditures on Nunavut-based businesses more than doubled in 2017 from $216M to $511M. The proportion of contract expenditure spending on Nunavut-based businesses remained relatively stable at 59% over this time period across the two projects.
Nunavut-based expenditures	N/A	↑	↑	N/A	↑	
Proportion Nunavut-based	N/A	/	↑	N/A	↓	
Contract expenditures from Meadowbank on Baker Lake-based businesses and from Meliadine on Rankin Inlet-based businesses	N/A	↓	↑	N/A	↑	Meadowbank expenditures on Baker Lake-based businesses and Meliadine expenditures on Rankin Inlet-based businesses continued a 2-year upward trend in 2017, corresponding with construction at Meliadine and Whale Tail, respectively. The proportion of contract expenditures has risen by $43M over the past two years in Baker Lake, although this is still less than when Meadowbank began operation. This suggests that spending has diversified to other communities across the territory.

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management & Mitigation

The IIBA acts as the primary vehicle for increasing the level of Inuit participation in contracting. Details are provided in Table 3 below.

Table 3: Agnico Eagle Contracting and Business Opportunities Management and Mitigation Initiatives

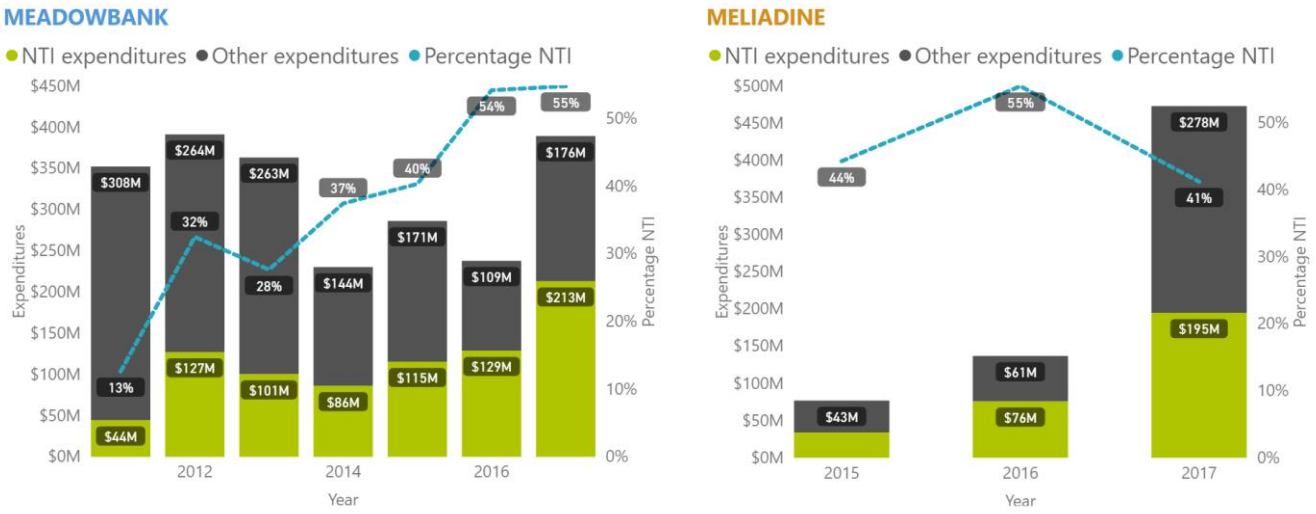
Initiative	Purpose / Description / Outcomes
Agnico Eagle Nunavut IIBA Procurement Process	Through the implementation of the Meliadine IIBA in 2015, Agnico Eagle moved to a prequalification procurement process, which requires all suppliers to prequalify in categories in order to submit a tender. Additionally, NTI-registered companies are eligible for preference points. This process replaces the Inuit Business Opportunities Initiative. In 2017 with the signing of the IIBAs for Meadowbank and Whale Tail, as well as the revision of the Meliadine IIBA, all three sites followed the new procurement process. and Whale Tail).
IIBA Pre-qualification Assistance, Workshops and Entrepreneurial Training	As per the IIBAs, Agnico provides workshops and assistance to Inuit Firms to promote and facilitate their access to Agnico Eagle's business opportunities as well as entrepreneurial training and support to Inuit businesses. In 2017, Agnico Eagle partook in a number of activities to achieve the objectives of these requirements, including a workshop at the 2017 Kivalliq Trade Show in Rankin Inlet on prequalification and tendering, one-on-one contract management support, and supporting a CPA Canada Financial Training for businesses in Rankin Inlet on financial statements and money management and growth. In 2018, Agnico Eagle is expanding its offerings in workshops and assistance through on-line and in-person lessons and trainings to interested businesses, and regular information and resources through a quarterly e-newsletter for businesses.
Inuit Arts and Crafts	In 2017, Agnico Eagle invited local Arts and Crafts vendors at both sites to showcase work and sell to interested employees. Ivalu came to Meliadine during the site Pakallak Tyme festivals, and Jessie Oonark came to Meadowbank before Christmas. Both vendors visited their respective site twice to see both crews. In 2017 Agnico Eagle and KIA worked on developing a list of Inuit arts and crafts dealers. In 2018 a strategy will be developed to facilitate internal purchasing (for gifts or prizes, for example). Agnico is also considering ways to include Agnico employees who are also artists in the strategy.

3.1 Contract expenditures

Predictions

MEADOWBANK

"With continuing preferential contracting, local business participation in the project is expected to grow with time." (Cumberland Resources Ltd., 2006, p. 7)



MELIADINE

- $866M (2012 dollars) over 3.5-year construction phase on contracted goods and services; 20% ($175M) in Kivalliq (Golder Associates, 2014, 1-117)
- $127M over 10-year operations phase; 20% ($25M annually) in Kivalliq. (Golder Associates, 2014, 1-118)

Data & Trends

Chart 11 details the value and proportion of contract expenditures that went to Nunavut Tunngavik Incorporated (NTI)-registered businesses over time.

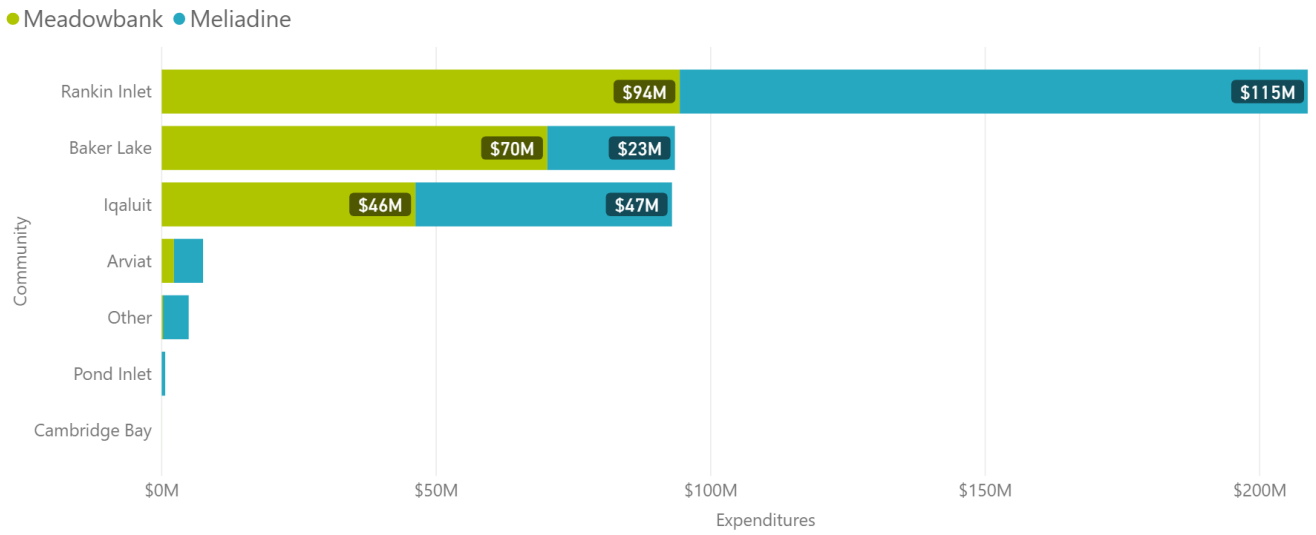


Chart 11. Contract expenditures on NTI-registered businesses

(Agnico Eagle Mines, 2017)

Chart 12 further breaks down contract expenditures on NTI-registered businesses in 2017 by the community in which those businesses are registered. This data is currently only available for 2017, though will be available for subsequent years in future reports.

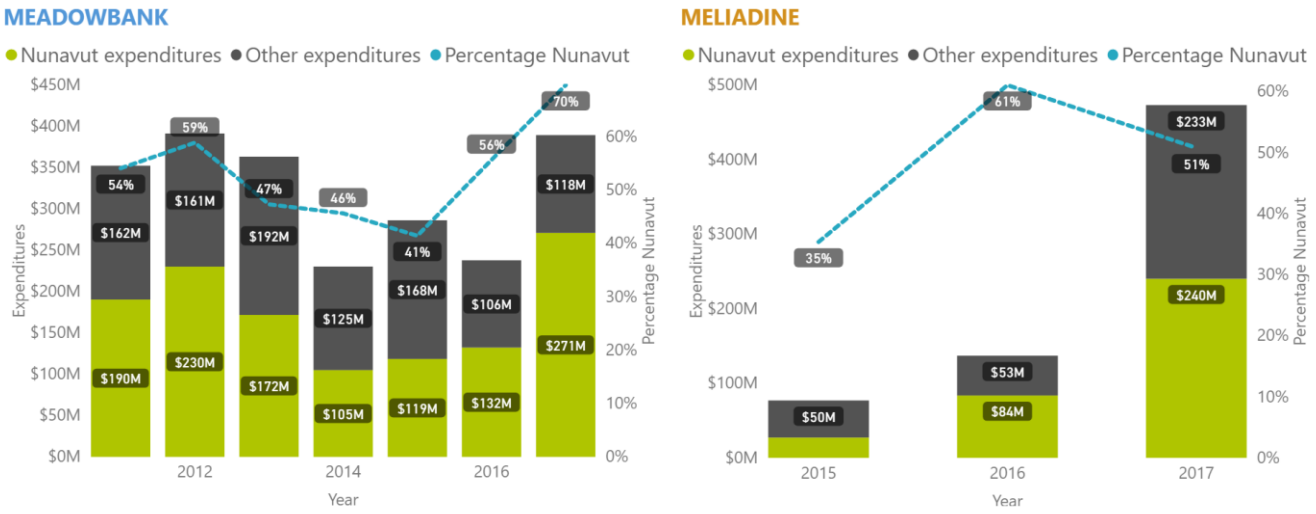

Chart 12. 2017 NTI-registered business expenditures by Nunavut community

(Agnico Eagle Mines, 2017)

Chart 13 details the value and proportion of contract expenditures that went to Nunavut-based businesses over time.

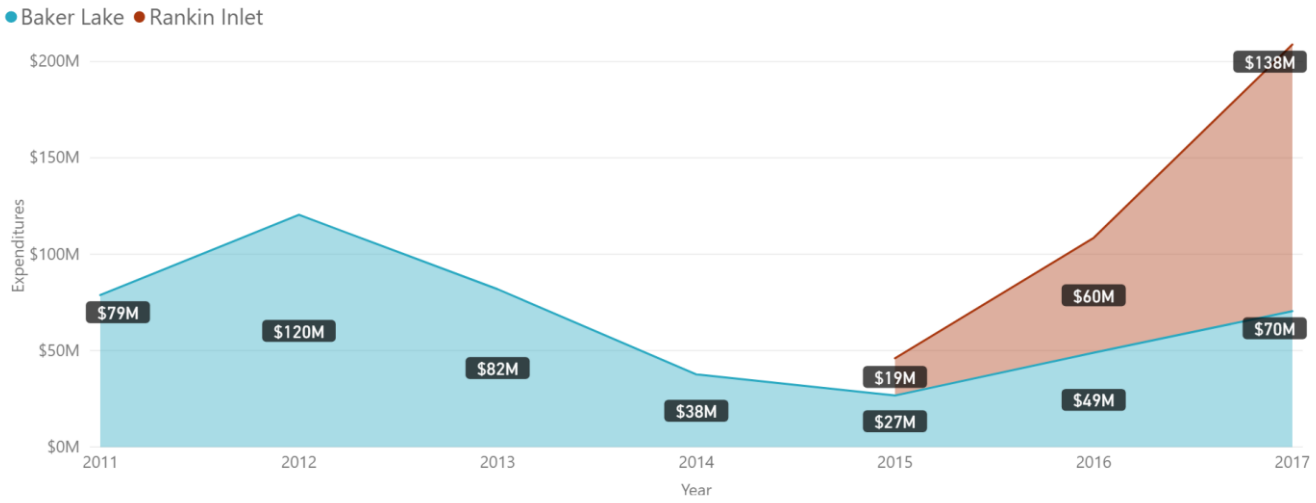

Chart 13. Contract expenditure on Nunavut-based businesses

(Agnico Eagle Mines, 2017)

Chart 14 shows the value from Meadowbank contract expenditures on Baker Lake-based businesses as well as the value of contract expenditures from Meliadine on Rankin Inlet-based businesses.

Chart 14. Contract expenditures from Meadowbank on Baker Lake-based businesses and from Meliadine on Rankin Inlet-based businesses

(Agnico Eagle Mines, 2017)

Interpretation

NTI maintains a registry of Inuit firms in accordance with Article 24 of the *Nunavut Land Claims Agreement*. In 2017, expenditures on NTI-registered businesses essentially doubled from a total of $205M to $408M across the two projects. This sizable increase is largely attributable to increased spending at the Whale Tail site (captured as part of Meadowbank's spending), as well as the beginning of major construction at Meliadine.

This large dollar-value increase corresponded with a decline in the total proportion of expenditures going to NTI-registered vs. non-NTI registered firms, from 55% in 2016 to 47% in 2017 across the two projects. This decline in proportion is fully attributable to Meliadine spending, where the proportion declined from 55% in 2016 to 41% in

2017. There are a number of factors that may have contributed to this decline, including the need for specialized services not offered by local firms and the meeting of local business capacity. The proportion of Meadowbank spending on NTI-registered firms remained relatively steady in 2017 at 55%, following three years of steady increases. In 2017, just over half of the spending on NTI-registered firms went to firms located in Rankin Inlet, following closely by Baker Lake and Iqaluit, with 23% each.

Agnico Eagle's contract expenditures on Nunavut-based businesses (which includes NTI-registered businesses) more than doubled in 2017 from $216M to $511M, amounting to 70% of the total contract expenditures. The proportion of contract expenditure spending on Nunavut-based businesses remained relatively stable at 59% over this time period across the two projects. This increase in expenditures on Nunavut-based businesses above those on NTI-based businesses reflects additional spending on businesses located in the territory but which are not registered as Inuit firms through NTI – either because they do not meet the criteria or have not registered for other reasons. Meadowbank expenditures on Baker Lake-based businesses and Meliadine expenditures on Rankin Inlet-based businesses continued a 2-year upward trend in 2017, corresponding with construction at Whale Tail and Meliadine, respectively. Contract expenditures are still lower in Baker Lake than when Meadowbank opened, suggesting that spending has diversified to other communities across the territory.

Meliadine is expected to far exceed the FEIS predictions of $175M (2012 dollars) of contracted of goods and services from Kivalliq-based businesses over the 3.5-year construction phase, with the 2017 (the first year of major construction) value alone estimated at $134M (2012 dollars[5]) in expenditures on Kivalliq-based, NTI-registered businesses.

[5] 2012 dollars calculated with Bank of Canada's Inflation Calculator https://www.bankofcanada.ca/rates/related/inflation-calculator/

VSEC 4: Education and Training

IMPACT / GOAL STATEMENT

Improved educational attainment in Kivalliq communities, increasing mining-related skill level of Kivalliq workforce, and enhanced skill profile and promotion of Inuit employees.

OVERARCHING FEIS PREDICTIONS

Meadowbank: "The potential impacts of education and training are considered of medium magnitude, positive, long term and of high significance, specifically to those individuals and their families who are able to benefit." (Cumberland Resources Ltd., 2006, p. 121)

Meliadine: Improved educational attainment in Kivalliq communities (i.e. high school graduation rates), increasing mining-related skill level of Kivalliq workforce, and an enhanced skill profile and promotion of Inuit employees. (Golder Associates, 2014, p. 1-C-48)

TRENDS & INTERPRETATIONS

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
4.1 Investment in school-based initiatives						
Agnico Eagle investments in school-based initiatives	N/A	↓	↑	N/A	↑	Up until 2014, Agnico Eagle contributed approximately $284K/year to a variety of school-based initiatives. With the expiry of the MOU with the Department of Education in 2015, these contributions dropped to $39K. They remained unchanged in 2016 and rose to $55K in 2017 due to a doubling of scholarship funding.
4.2 Secondary school graduation by region						
Secondary school graduation rate by region	↑	↑	N/A	↑	N/A	The graduation rate in Kivalliq region fluctuates from year to year, though shows an overall upward trend that began in 2008. Rates have been at all-time highs for the region, and consistently higher than those in the other two regions, since 2010.
4.3 Project training and education						
Agnico Eagle investments in mine training and education programs	N/A	→	↓	N/A	↓	From 2014 to 2016, there was a consistent level of investment by Agnico Eagle (~$2.3M/year) in external mine training programs (e.g. Kivalliq Mine Training Society). In 2017, this dropped to $195K as the KMTS lost their federal funding; the future of the organization is currently uncertain.
Average mandatory training hours provided to Agnico Eagle Inuit employees	N/A	↑	→	N/A	↑	In 2017, mandatory training hours remain fairly stable at Meadowbank, indicative of steady rates of turnover. These hours have increased at Meliadine, likely due to the influx of new employees.
Average specific training hours provided to Agnico Eagle Inuit employees	N/A	↑	↓	N/A	↑	Specific training hours declined at Meadowbank from 84 hours / Inuit FTE in 2015, down to 51 hours in 2017, while Meliadine values have fluctuated from 28 in 2015 to 10 in 2016 and up again to 25 in 2017. Annual fluctuations in the number of training hours largely reflect changing demand for additional positions and so are not considered negative or positive.
Participation in career and skills programs	N/A	/	↓	/	↓	Participants in TASK week and graduates from the Arviat Diamond Drillers and Welders Program had remained steady until last year, decreasing by 12 and 11 respectively. Meadowbank's Haul Truck Driver Program also saw a decline in 2017 from 34 to 26 participants. These fluctuations could be explained by the success of each program as well as changing demand for specific skills at Meadowbank.
Meadowbank pre-apprenticeship and apprenticeship participation by type	N/A	↑	↑	N/A	N/A	The number of Inuit apprenticeships increased by 3 in 2017. In addition to the number of Inuit participants, the apprenticeship program has seen growth over the past 4 years in diversity, moving from two offered programs in 2013 to seven in 2017.
4.4 Project employment by skill level						
Project Agnico Eagle Inuit employees by skill-level	N/A	↑	↑	N/A	↑	2017 has seen an increase in Inuit employees at higher skill levels, with the total number of skilled, management and professional employees rising from 6 in 2016 to 15 in 2017.

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management and Mitigation

Agnico Eagle offers a number of programs outlined in Table 4 below to increase general educational and skills attainment among Kivalliq residents as well as training, career development and upward mobility programs for existing employees.

Table 4: Agnico Eagle Employment Management and Mitigation Initiatives

Program	Purpose / Description / Outcomes
MOU with Department of Education	A Memorandum of Understanding was first signed in April 2012 to establish a strengthened partnership between the Government of Nunavut Department of Education and Agnico Eagle, with a focus on increasing the number of students in the Kivalliq region who are able to successfully transition from high school to trades and mining-related career opportunities. This work involved *Mining Matters*, a branch of the Prospectors and Developers Association of Canada (PDAC) that is dedicated to bringing knowledge and awareness about Canada's geology and mineral resources to students and educators. In 2013, Agnico Eagle and the *Mining Matters* group participated with the GN Department of Education, Curriculum Review Services to assist in a review of the Earth Sciences Curriculum of Nunavut Schools. During 2014, Agnico Eagle continued to sponsor the Mining Matters program as part of the MOU with Education. Agnico Eagle continued to pursue a renewed MOU with the Department of Education through 2016. In September 2017, Agnico Eagle and the Government of Nunavut established a Memorandum of Understanding that identifies 10 priority areas for collaboration, including education.
Kivalliq Science Educations Community	In 2017, Agnico Eagle once again invested $25,000 for the 2017-2018 regional Math Camp, Science Camp and Kivalliq Science Fair programs operated by the Kivalliq Science Educators Community. The regional science camp was organized in Chesterfield Inlet and the weeklong program included a mix of traditional, cultural and educational studies related to sciences. The program provides science credits to participants.
Kivalliq Mine Training Society	The KMTS is an Inuit-private sector partnership created to strengthen the Kivalliq region labour force through the creation and funding of training opportunities in the seven Kivalliq hamlets. The KMTS has also enjoyed financial support from the Nunavut Department of Economic Development and Transportation and Agnico Eagle Mines. A major focus of the KMTS program has been to support Agnico Eagle's Mine Training Initiatives, such as the Career Path, different trainee programs, pre-trades programs, work readiness programs and workplace literacy strategies. Prior to 2015 the KMTS also supported the development and delivery of the community based Work Readiness to help prepare Inuit for employment opportunities. The KMTS also supported the Arviat Drillers program as well as some other community-based initiatives, such as the Making it Work program, which provided support to employees and their families to cope with the challenges that come with employment at a mine site. Since 2017 KMTS was no longer able to receive funding to support program delivery to Agnico Eagle and communities. Despite the lack of substantial funding, Agnico Eagle Mines did not reduce its training delivery since the company is strongly committed to developing the local workforce.

Program	Purpose / Description / Outcomes
Labour Pool Process	The Labour Pool Process (formerly 'Labour Pool Initiative'), implemented in 2014 and revised in 2015, is based on an agreement between Agnico Eagle and the KIA through the IIBAs to offer pre-employment opportunities to Inuit from all Kivalliq communities. The goal of the program is to pre-qualify candidates from Kivalliq communities through 5 steps: employment information sessions, online application (facilitated by Employment Information Sessions), the Work Readiness Program, mandatory trainings (more details provided below), and the Labour Pool List (facilitated by the Labour Pool Coordinator).
Labour Pool Process - Step 1: Employment Information Sessions	As part of the Labour Pool Process, employment information sessions are conducted in all Kivalliq communities. The purpose of the information sessions is to give information about the mines, the work lifestyle, and career opportunities as well as knowing how to apply online. In 2017, Agnico Eagle held employment information sessions in all seven communities on a quarterly basis.
Labour Pool Process – Step 2: Online Application (Community Coordinators)	The first step in the Labour Pool Process is to apply online. In order to facilitate online application in the communities, Agnico has a Community Coordinator in each Kivalliq community who can deliver employment information sessions, and provide one-on-one assistance to interested candidates with their online application.
Labour Pool Process – Step 3: Work Readiness Training Program	In collaboration with the Kivalliq Mine Training Society (KMTS), Agnico Eagle developed a Work Readiness Training program as a pre-employment initiative. In 2017, the Work Readiness Training was delivered by Northern College. The Work Readiness program is the first step of the Labour Pool Process for those individuals who have applied online. The objective of the program is for Inuit workers to be better prepared for the work environment in an industrial setting. Graduates of the program are eligible to continue the Labour Pool Process and attend the mandatory trainings given on-site. The program provides coaching on a range of issues including: awareness of employers' unspoken expectations, communication in the workplace, and problem-solving skills for resolving workplace issues. The program was implemented in April 2013. The program is delivered over a five-day period at the community level and is scheduled throughout the year. In 2017, the program was delivered by a visiting instructor in six Kivalliq communities resulting in 240 participants from various communities, from which 84% successfully completed the program. Arviat runs its own Work Readiness training sessions and had 78 graduates in 2018.
Labour Pool Process – Step 4: Mandatory Training Program (previously 'Site Readiness')	The mandatory training program delivered on site is the second step of the Labour Pool process, following the Work Readiness Program. Graduates of the mandatory trainings are eligible to enter the Labour Pool. The Mandatory Training Program is a five-day training provided at the Meadowbank site. Throughout the week, participants are enrolled in diverse activities such as mandatory training sessions, site visits, job initiation, information sessions on training and career opportunities, as well as interviews and discussions on employment opportunities with a Human Resource representative to assess career ambitions and identify work interest. Afterwards, candidates wanting to work for the Camp Department are given short term on-call assignments. All other applicants become part of the Labour Pool list until a job opportunity matching their interest and competencies becomes available. In 2017, 193 individuals participated in Site Readiness, of which 173 successfully completed the program.
Labour Pool Process – Step 5: Labour Pool List	The Labour Pool List is a list of candidates who have successfully completed the steps of the Labour Pool Process. These candidates are now eligible for opportunities with Agnico Eagle or Agnico Eagle's contractors. The list is managed by the Labour Pool Coordinator.

Program	Purpose / Description / Outcomes
Summer Student Employment Program	Agnico's companywide policy offers summer employment programs to the children of all Agnico employees (both Inuit and non-Inuit) that are undertaking postsecondary education. Summer job opportunities were also offered to Inuit students who are participating in post-secondary activity, even if they had no family relative working at the mine. Historically, there have been no applications to Agnico Eagle's Summer Student program by the children of Inuit employees. The program will continue to be offered in 2018. In 2017, Agnico advertised a summer student program to attract Inuit post-secondary students from Kivalliq communities, including students enrolled in trades with the Nunavut Arctic College and with the Nunavut Sivuniksavut program. This program was offered and advertised in each Kivalliq Community. The posting attracted three eligible applicants, of which all were contacted. Two applicants declined the offer and one accepted but later resigned before starting employment. At the 2018 Socio-Economic Monitoring Committee (SEMC) meeting, the GN Department of Finance expressed that it was sometimes difficult to place summer student applicants. Agnico Eagle is open to working with the GN in potentially placing eligible and interested Inuit summer students at the projects, who can otherwise not be accommodated with the GN.
Haul Truck Trainee Program	The Haul Truck Trainee program is a 28-day (336 hour) program to certify haul truck operators, which includes training on a simulator, in the classroom, and on the job. The program is aimed at existing employees in entry level positions (dishwashers, janitors, chambermaids, etc.). This year, 26 employees were enrolled in the Haul Truck Trainee Program. Among those, a total of 23 trainees successfully completed the Program (18 men, 5 women). In order to provide the best training possible to all the trainees, there is a maximum of 4 trainees at a time with one trainer.
Process Plant Trainee Program	With the success of the Haul Truck Trainee Program, a Process Plant Trainee Program was developed in 2015. The 28-day program provides employees with an understanding of the mining and milling process and trains them to be competent and certified to fill positions as a process plant helper or a utility person. In 2017, a total of five (5) employees enrolled in the program. Amongst those, two (2) were delivered to the Process Plant.
Super Operator Program	Implemented in the second half of 2016, the Super Operator Program is an extension of the Process Plant Trainee Program. This 168-hour training is provided to employees who have successfully completed the Process Plant Trainee Program. The extension of the Process Plant Trainee Program will consist in teaching the basics of maintenance principles in order to have employees with more diversified skills in the Process Plant Department. These employees will eventually be able to perform specific basic maintenance repairs throughout the plant. In 2017, every Inuit employee that was trained as a Process Plant Trainee received the Super Operator Training.
Arviat Community Training Programs	In 2011, the Hamlet of Arviat proposed a partnership to invest in a community-based drilling school that would provide Inuit with the skills needed to work in diamond drilling. With advice and support from Agnico Eagle, the Hamlet brought together a range of partners to acquire the drilling equipment, develop the curriculum, and operate the training program. Government training agencies, the KIA, and drilling companies provided partnership investments. In 2013, the program offering was expanded to include a Welder's Helper program. Agnico Eagle invested $195,000 in the Arviat training programs in the 2017-2018 funding year. Over the past 5 years the program has graduated 65 trained driller's helpers, all of whom have found employment. In 2017-2018 funding year, the Mechanical Welding Program graduated 6 students.

Program	Purpose / Description / Outcomes
Career Path Program	The Career Path Program was designed in 2012, with the intention of supporting upward mobility of Inuit employees at Meadowbank. This program identifies the incremental steps that an employee is required to complete to advance in their chosen career of interest. In 2017, the Career Path system was available in eight (8) areas of activity; Underground (Meliadine only), Drill, Industrial Mechanic, Maintenance, Process Plant, Road Maintenance, Field Services, and Mine Operations. The objective of the Career Path Program is to have only internal promotions for Inuit, and for no external candidates (southerners) to be hired to fill a position that is part of the program.
Training Formula (formerly 'Training Curriculum')	The Training Formula program, implemented in 2014, provides tools, tips, guideline and standards to improve the proficiency of Agnico trainers. The formal manual includes three sections: training theory, training standards, and training delivery.
E-Learning Training	Before coming to an Agnico site for the first time, newly hired employees must complete their Mandatory Training online, which consists of six (6) modules: General Induction, WHMIS, Fire Suppression, Job Hazard Analysis and Work Card, Spill Response, and Occupational Health and Safety (Personal Protective Equipment, Ladder Safety, Surface Standard Operating Procedure). The General Induction chapter provides general information about Agnico Eagle and working life at the mines. As per the requirement of the IIBAs, in 2017 two new e-learning lessons were developed and added to the General Induction. The Inuit Impact and Benefit Awareness module (IIBA) provides general awareness on: Agnico's Commitment to Indigenous People, history of the Nunavut Agreement and the different Inuit organization branches, what an IIBA is and why the sites have one, and a high level overview of the benefits and impact mitigation provided through the IIBAs. The Archaeology module informs workers on how to identify potential archaeological sites (ex. fox traps, tent circles, hunting blinds) and what to do if a worker finds one when working in the tundra. An objective of these lessons is also to give each employee and contractor employee cross-cultural context before arriving on one of Agnico's sites.
Training and Learning Management System	The Training Management System (TMS) as well as the Learning Management System (LMS) were initially implemented in 2013, in order to ensure better management of training activities and to monitor the proper management of the e-learning training. In response to the GN's request for increased information on training programs in 2014, both systems were modified in 2015. The systems are now capable of producing more detailed reports: by training program, by participation level, by graduation level and by hour.
Apprenticeship Training ('Apprenticeship Program' and 'Pre-Apprenticeship Program')	The Apprenticeship Program combines on-the-job learning and in-school technical instruction to allow Inuit employees the opportunity to be educated and trained in the trade of their choice. By the end of the program, the apprentice is able to challenge their Certificate of Qualification (COQ) to become a Journeyperson and will also have the opportunity to challenge their Red Seal Exams. Currently, we offer seven (7) trades: cook, carpenter, millwright, electrician, heavy duty equipment technician, welder, and plumber. In 2015, two (2) employees completed their apprenticeship training within Agnico and in 2016, two (2) employees completed their apprenticeship training within the company. As of the end of 2017, there were 16 apprentices and pre-apprentices. There were no graduates for the 2017 year, but since the program takes time to complete, we are expecting to have three (3) graduates in the next two (2) years.

Program	Purpose / Description / Outcomes
Role Model Program	The Role Model program began in 2015 as a way to recognize exemplary Inuit employees. Since then, it has grown into a program to: recognize the hard work of individual Inuit employees; identify examples to inspire Inuit employees, community members, youth, etc. on how to achieve personal and/or work success; and serve as an incubator program to identify and support future Inuit leadership in the company. Role models are nominated and chosen by a committee annually. They can be nominated and chosen for a variety of reasons, including demonstrating good work-life balance/dedication to upgrading one's education/skills; positive attitude; exemplifying traditional Inuit values at home or at work; overcoming personal challenges; involvement in communities; demonstrating leadership skills, etc. A Role Model is recognized through posters and is also provided opportunities to represent the company and speak on behalf of their own experiences at various events (trade shows, symposiums, high school visits, etc.). Some Role Models are also enrolled in the Leadership Development Program in order to continue to foster management and supervisory skills. In 2017, there were 8 Role Models at Meadowbank and 4 Role Models at Meliadine.
TASK Week	The Trades Awareness Skills and Knowledge Week (TASK Week) was initiated in 2012 and has evolved in its structure through the years. TASK week is now a full week program that allows students to focus on one trade for the entire week. TASK week is also aligned with Agnico's IIBA commitment Schedule C, 16, by promoting the mine industry through career awareness and co-operating with educational authorities in the implementation of mining sector content in schools. TASK Week is a joint initiative between Jonah Amitnaaq Secondary School (JASS) and Agnico Eagle, and has active cooperation from other authorities and businesses each year. The 2017 TASK Week was held in Baker Lake from May 8th to May 12th and saw 58 senior high school students from JASS participate. Six (6) trades were features: Mechanics, Welding, Electrical, Culinary Arts, Hairdressing, and Environmental Studies (which included Work Readiness training). In 2017 Agnico again brought trainers and apprentices/tradespeople from Meadowbank, including four of Meadowbank's Inuit apprentices/Red Seal, all from Baker Lake. Agnico believes that having students exposed to role models from their community has a positive impact on participants in the program.
Financial Literacy Training	In collaboration with CPA Canada, in 2017 a Financial Literacy training course was delivered at Meadowbank mine site. The need for financial literacy training was identified through the Baker Lake Wellness Plan. The training overviews why financial literacy is important, savings vehicles, budgeting, and goal setting. The training was held twice at Meadowbank with 33 participants, including Inuit participants. Modified Financial Literacy trainings were also held in Baker Lake, both at a public community session as well as delivery to grades 7-9 & 12 at the Jonah Amitnaaq Seconary School. Basic financial literacy training is also included in the Work Readiness program. Agnico has also had preliminary discussions with the Nunavut Housing Corporation to include financial literacy information on site, on subjects like rent scales or home savings programs. Agnico Eagle plans to continue offering opportunities at both mine sites to improve financial literacy in 2018 in collaboration with Sunlife Financial.

4.1 Investment in school-based initiatives

Predictions

MEADOWBANK

"Cumberland and KIA will address the need for a broader based project education and training initiatives [sic] to assist those who wish to develop skills that will position them for project employment. This education and training initiatives [sic] will also include an element to address motivational issues around getting children through high school. Such measures would be intended to contribute to encouraging a commitment to education on the part of youth." (Cumberland Resources Ltd., 2006, p. 121)

MELIADINE

Positive impact on the funding of the education system. (Golder Associates, 2014, p. 1-C-48)

Data & Trends

Chart 15 shows Agnico Eagle's investments in a range of school-based initiatives from 2010 to 2017. The MOU with the Department of Education expired in 2015. In September 2017, Agnico Eagle and the Government of Nunavut established a Memorandum of Understanding that identifies 10 priority areas for collaboration, including education.

Chart 15. Agnico Eagle investments in school-based initiatives

Agnico Investments	2010	2011	2012	2013	2014	2015	2016	2017	Total
Scholarships	$14K	$14K	$14K	$14K	$14K	$14K	$14K	$30K	**$128K**
MOU with GN Department of Education		$175K	$175K	$175K	$175K				**$700K**
Mining Matters Science Program		$90K	$80K	$70K	$70K				**$310K**
Kivalliq Science Educators Community Programs		$15K	$15K	$25K	$25K	$25K	$25K	$25K	**$155K**
Total	**$14K**	**$294K**	**$284K**	**$284K**	**$284K**	**$39K**	**$39K**	**$55K**	**$1,293K**

(Agnico Eagle Mines, 2017)

Interpretation

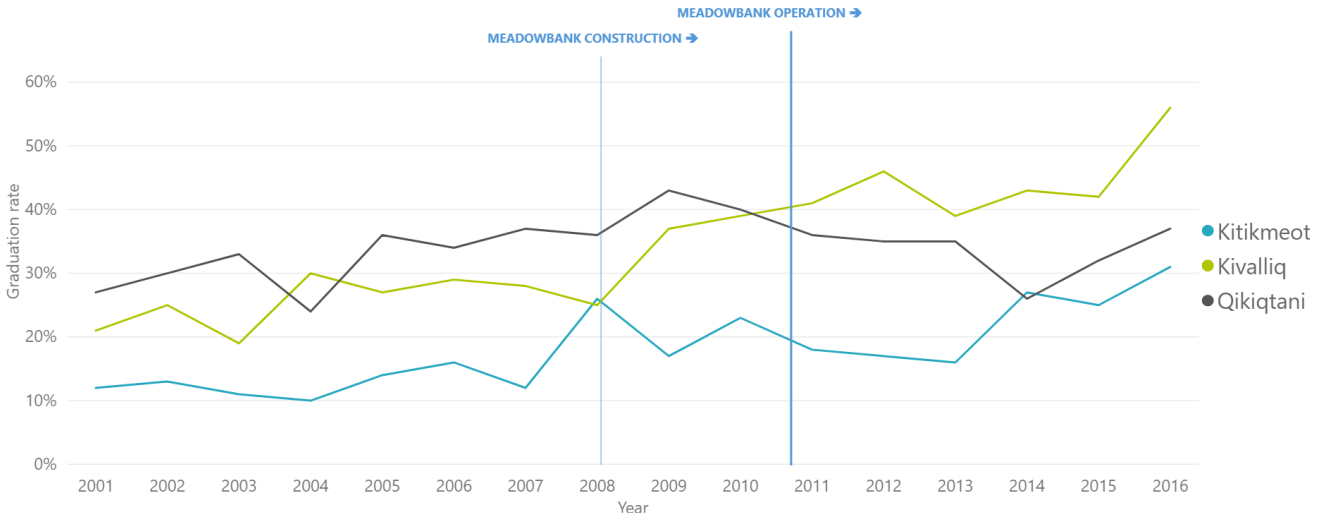
Up until 2014, Agnico Eagle has made total annual contributions of approximately $284,000/year to a variety of school-based initiatives with the goals of: building interest in math, science and mining among school-aged children; motivating students with scholarships and career opportunities; and increasing educational outcomes overall in the Kivalliq region. Since the expiry of the MOU with the Department of Education in 2015, total contributions have been significantly lower ($39,000), rising to $55,000 in 2017 due to a doubling of scholarship funding. The Meliadine FEIS predicts a positive impact on the funding of the education system; further insights on whether this prediction is met should be available next year, with the implementation of the MOU between Agnico Eagle and the Government of Nunavut.

4.2 Secondary school graduation by region

Predictions

MEADOWBANK

There are no specific predictions made in the Meadowbank FEIS regarding school attendance or graduation.



MELIADINE

Positive impact on educational achievement, dropout rates, school attendance. (Golder Associates, 2014, p. 1-C-48)

Data & Trends

Chart 16 provides secondary school graduation rates by region between 1999 and 2016. Graduation rates by region and by Kivalliq community for 2017 were not available at the time of writing.

Chart 16. Secondary school graduation rate by region

(Department of Education, 2017)

Interpretation

The graduation rate in Kivalliq region has fluctuated since the opening of the Meadowbank mine, with an overall upward trend that began in 2008. Graduation rates in Kivalliq region have been at all-time highs for the region, and consistently higher than those in the other two regions, since 2010.

A range of complex and interacting factors affect graduation rates, including the housing shortage, household food insecurity, health status, social problems such as high rates of teenage pregnancy and substance abuse (higher than the rest of Canada), and the legacy of the residential school system (Office of the Auditor General, 2013). Agnico Eagle's projects may have an impact on some of these factors, as described in subsequent sections, but attribution is a challenge due to the multiple and interacting factors.

Graduation rates are useful measures but only provide a partial picture of the state of education in the Kivalliq region. The education system in Nunavut faces a number of policy and operational challenges which may result in students graduating without achieving required competencies (CBC News, 2015; Rohner, 2014). These challenges can lead to students graduating from high school with inadequate literacy, numeracy and problem-solving skills, which can limit their employability and their access to training (e.g. inability to pass apprenticeship

entrance exams). At the time of writing, no public data on student K-12 performance in Nunavut was identified (i.e. performance relative to international standards or those of other jurisdictions).

4.3 Project training and education

Predictions

MEADOWBANK

"Cumberland and KIA will address the need for broader based project education and training initiatives to assist those who wish to develop skills that will position them for project employment." (Cumberland Resources Ltd., 2006, p. 121)

MELIADINE

The Project's "effects on education, training, and capacity in the RSA and LSA should be positive and long lasting." (Golder Associates, 2014, p. 1-120)

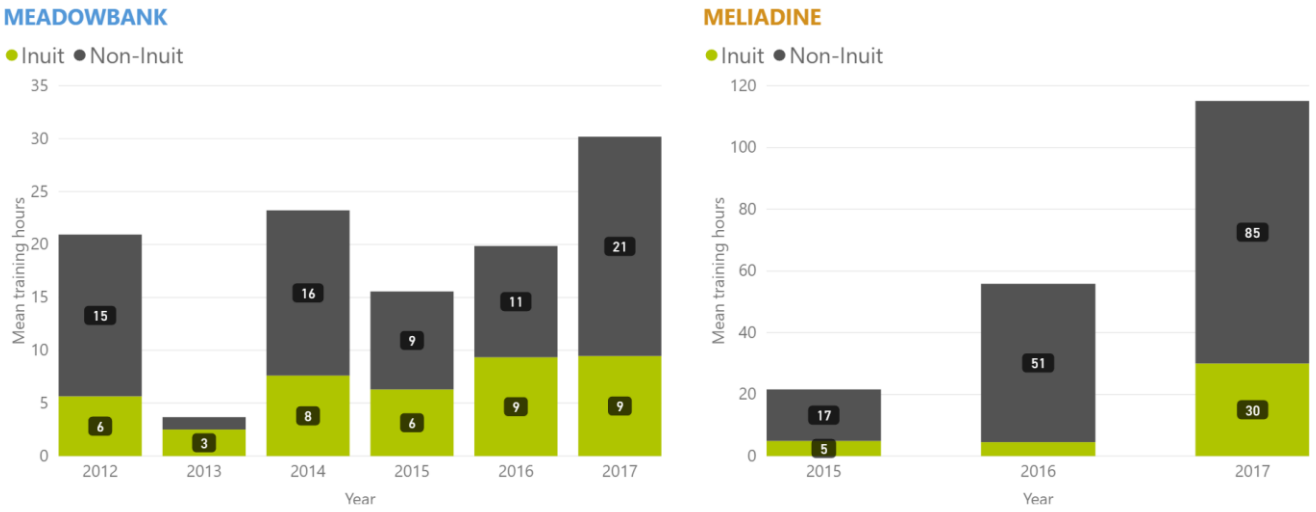
"AEM will provide and promote Project-related education and training programs." (Golder Associates, 2014, p. 1-120)

Data & Trends

Chart 17 provides an overview of Agnico Eagle's investments in mine training and education programs.

Chart 17. Agnico Eagle investments in mine training and education programs

Agnico Investments	2010	2011	2012	2013	2014	2015	2016	2017	Total
Kivalliq Mine Training Society (cash & in-kind)				$1,188K	$2,267K	$1,937K	$2,339K		**$7,731K**
Arviat Diamond Drillers & Welders Program	$250K	$60K	$190K	$190K	$190K	$190K	$190K	$195K	**$1,455K**
Total	**$250K**	**$60K**	**$190K**	**$1,378K**	**$2,457K**	**$2,127K**	**$2,529K**	**$195K**	**$9,186K**



(Agnico Eagle Mines, 2017)

The Kivalliq Mine Training Society (KMTS) has provided support for the development and delivery of community-based Work Readiness to help prepare Inuit for employment opportunities. The KMTS has also supported the Arviat Drillers program, as well as some interesting community-based initiatives, such as the Coping with FIFO (Fly-in-fly-out) program and Community Net-work program, which have provided support to communities to help employees and their families cope with the challenges that come with employment. As of 2017, KMTS lost its federal funding and the future of the organization is currently uncertain.

Chart 18 shows average mandatory training hours provided to Inuit and non-Inuit employees. This is calculated by dividing the total number of training hours by the number of FTE employees. Mandatory training includes:

- **Health and Safety training:** this includes mandatory training related to compliance with the Nunavut Mine Act, as well as training that is mandated according to Agnico Eagle Health and Safety policies. Many of these training sessions are offered via e-learning prior to the employee's arrival on site. Other health and safety training relevant to an individual's job is also provided on site.
- **General training:** this consists of training activities required at a departmental level and covers many employees working in different departments. General training includes training on light duty equipment as well as enterprise software systems and cross-cultural training.

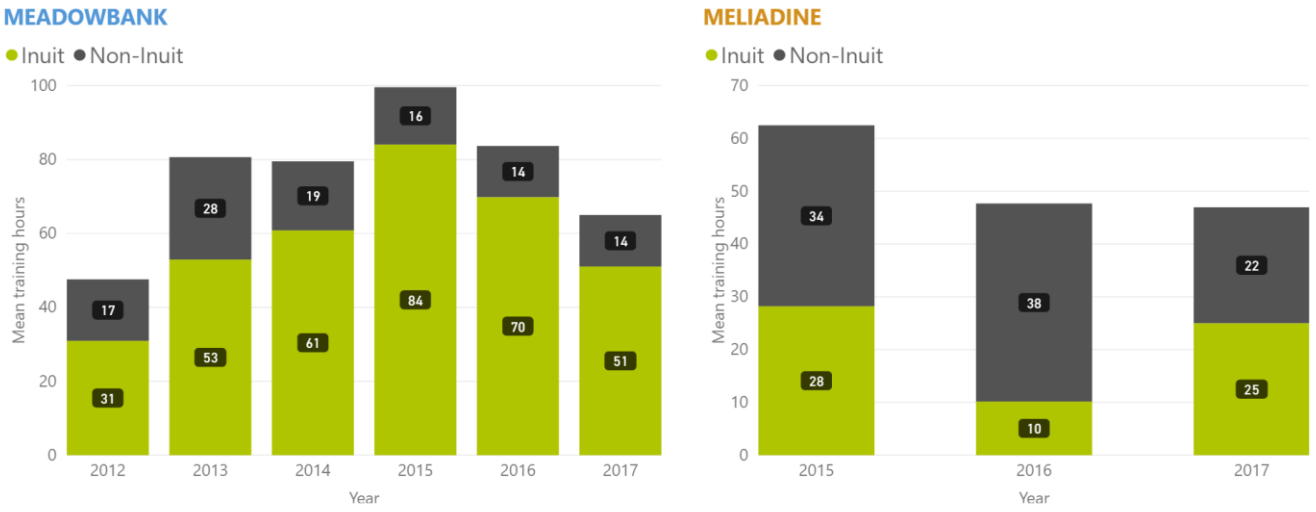


Chart 18. Average mandatory training hours provided to Agnico Eagle Inuit employees

(Agnico Eagle Mines, 2017)

Chart 19 shows the average specific training hours provided to Inuit and non-Inuit employees. Specific training is focused on developing individual competencies related to a specific position. This training qualifies individual workers for promotion following their progression through the Career Path. These training programs are provided through a combination of in-classroom (theory) learning as well as practical (one-on-one) learning.

Chart 19. Average specific training hours provided to Agnico Eagle Inuit employees

(Agnico Eagle Mines, 2017)

Chart 20 shows the participants in and/or graduates of a range of career and skills programs supported by Agnico Eagle, as well the Haul Truck Drivers Program, run at Meadowbank.

Chart 20. Participation in career and skills programs

AGNICO SUPPORTED PROGRAMMING

program	2010	2011	2012	2013	2014	2015	2016	2017	Total

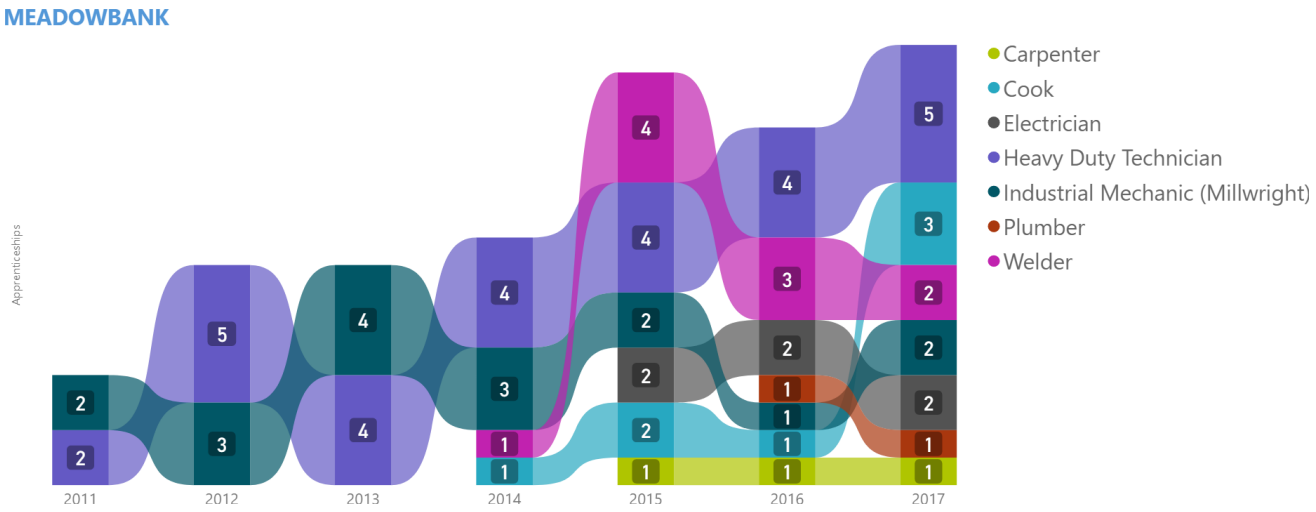
Arviat Diamond Drillers & Welders Program (graduates)	12	24	12	24	18	18	15	6	**129**



MEADOWBANK PROGRAMMING

program	2010	2011	2012	2013	2014	2015	2016	2017	Total
Haul truck drivers program (participants)	33	55	15	19	33	28	34	26	**243**

(Agnico Eagle Mines, 2017)

Chart 21 shows the number of Inuit employees in pre-apprentice or apprentice roles at Meadowbank, categorized by type of apprenticeship (heavy duty technician, industrial mechanic, and others). Apprenticeship positions are expected to begin at Meliadine in 2018.

Chart 21. Meadowbank pre-apprenticeship and apprenticeship participation by type

(Agnico Eagle Mines, 2017)

Interpretation

Agnico Eagle's financial investments in externally-delivered training programs have dropped substantially in 2017 due to the KMTS' loss of federal funding, and subsequently their loss of funding from Agnico Eagle.

Mandatory training hours (detailed in Chart 18) remain fairly stable at Meadowbank (9 hours per Inuit FTE), and have increased substantially in 2017 at Meliadine. Due to the requirement for greater mandatory training for new employees, this large increase is likely due to the influx of new employees at Meliadine. Similarly, the relatively flat numbers at Meadowbank are likely indicative of steady rates of turnover.

Average specific training hours (detailed in Chart 19) have seen a decline at Meadowbank over the past two years from a high of 84 hours / Inuit FTE in 2015, down to 51 hours in 2017. Average specific training hours provided to

Inuit employees at Meliadine have fluctuated from 28 in 2015 to 10 in 2016 and up again to 25 in 2017. Annual fluctuations in the number of specific training hours largely reflect changing demand at Meadowbank for additional positions for which specific training is provided.

Participation in Agnico Eagle-supported career programming has also fluctuated. The Haul Truck Drivers Program at Meadowbank has seen a decline from 34 participants in 2016 to 26 participants in 2017. Participants in TASK week and graduates from the Arviat Diamond Drillers and Welders Program remained steady until the past year, declining by 12 and 11, respectively. These fluctuations could be explained by the success of each program as well as changing demand for specific skills at Meadowbank.

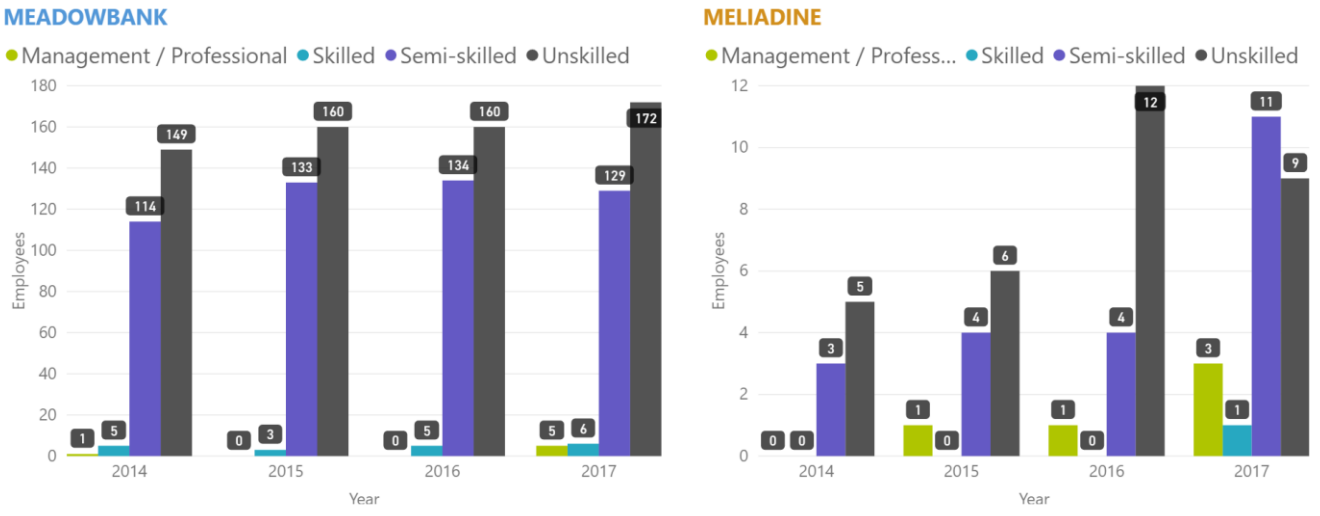
The number of Inuit apprenticeships increased by three people in 2017 (from 13 to 16). 2015 saw the first two land claim beneficiaries graduate from Agnico Eagle's apprenticeship program, with one receiving a certificate as a millwright and the other as a welder. An additional two Inuit employees completed their apprenticeships in 2016, both graduating as heavy-duty equipment technicians. There were no new graduates in 2017. In addition to the number of Inuit participants, the apprenticeship program has seen growth over the past 4 years in diversity of occupations, moving from two offered programs in 2013 to seven in 2017.

4.4 Project employment by skill level

Predictions

MEADOWBANK

There are no specific predictions in the Cumberland FEIS regarding the skill level of Inuit employees at Meadowbank.



MELIADINE

The Project will have a "positive impact on the skill levels of local labour force." (Golder Associates, 2014, p. 1-C-48)

Data & Trends

Chart 22 shows the number of Inuit employees at each skill level between 2014 and 2017. Note that Agnico Eagle changed how various skill levels are classified in 2013 and 2014. Due to these changes, year over year trends of Inuit employment by skill level cannot be drawn pre-2014.

Chart 22. Project Agnico Eagle Inuit employees by skill-level

(Agnico Eagle Mines, 2017)

Interpretation

Prior to 2017, the data had not indicated significant changes in the promotion of Inuit workers up the skills ladder or the hiring of Inuit into higher skill categories (e.g. professional or management job classifications), despite individual success stories and large investments in training and programming. However, 2017 has seen a substantial increase in Inuit employees at higher levels, with the total number of skilled, management and professional employees rising from six in 2016 up to 15 in 2017. While still relatively few – 95% of Inuit employees at the projects are employed in unskilled and semi-skilled positions – this does represent a positive step.

VSEC 5: Culture and Traditional Lifestyle

IMPACT / GOAL STATEMENT

Respect and support for Inuit culture, language and traditional lifestyle in the workplace and in communities

OVERARCHING FEIS PREDICTIONS

Meadowbank: "There is potential for both negative and positive impacts, of any magnitude, on traditional ways of life, which could be of high significance. Any net impact, since it would be an impact of cultural change, would be long term and continue beyond the life of the project. The impact would be experienced primarily in Baker Lake." (Cumberland Resources Ltd., 2006, p. 123)

Meliadine:

- The "Project may contribute to weakening of traditional culture." (Golder Associates, 2014, p. 1-C-46)
- "The Project may result in a reduction of cohesion due to higher levels of inequality in the family or community." (Golder Associates, 2014, 1-C-50)

TRENDS & INTERPRETATIONS

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
5.1 Perceptions of culture and traditional lifestyle						
Self-reported effect of project on culture and traditional activities	N/A	N/A	N/A	N/A	N/A	Data currently unavailable.
5.2 Culture and traditional lifestyle						
Proportion of total population identifying Inuktitut as their mother tongue by community	→	↓	N/A	↓	N/A	The proportion of the population identifying Inuktitut as their mother tongue has remained relatively stable in the smaller Kivalliq communities from 2006 to 2016, but has declined in Rankin Inlet, Baker Lake, and Chesterfield Inlet (by 10 to 18 percentage points) over this period.
Use of AWAR by community	N/A	↑	↓	N/A	N/A	The Agnico Eagle-owned and operated all-weather access road (AWAR) that connects Baker Lake to the Meadowbank mine is accessible to the communities for hunting purposes. Community members accessed the road 2366 times in 2015, 1874 times in 2016, and 1716 times in 2017.
5.3 Country food use at project						
Country food kitchen usage	N/A	→	→	N/A	N/A	Meadowbank has maintained its practice of offering meals including char, muskox, and caribou (approximately 4,500 meals/year, or one per month per employee, since 2011). At Meliadine, Agnico Eagle offered about 21 meals with Arctic char this past year, twice on a five-week rotational schedule, which was consumed by approximately 50% of the staff.
Country food night events	N/A	→	↓	N/A	N/A	The number of country food events held at Meadowbank decreased from 14 in 2016 to 4 in 2017 – largely due to a lack of country food availability. Turnout for these events has averaged 36 attendees per event in 2016 and 43 in 2017. Agnico Eagle also offered country food at an event as a part of Pakallak Tyme, a cultural festival held in Rankin Inlet to celebrate the end of the Arctic winter and the coming of spring.

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management and Mitigation

To encourage respect and support for Inuit culture at Meadowbank and Meliadine, Agnico Eagle provides cross cultural training, access to traditional foods, and documentation and services in Inuktitut as outlined in Table 5 below.

Table 5: Agnico Eagle Cultural and Traditional Lifestyle Management and Mitigation Initiatives

Program	Purpose / Description / Outcomes
Cross Cultural Training Program	Implemented in 2010 at Meadowbank, the Cross Cultural Training Program has been provided to numerous employees. It is a 5 hour in-class training course. This course allows employees from different cultures and backgrounds to understand each other's culture in order to improve understanding and communication at the workplace. The program was revisited with the assistance of the Nunavut Literacy Council in 2013, and a revised program was initiated in 2014. This program is mandatory for all Agnico Eagle employees and contractors who will be on site for six months or more. Cross-cultural training began at Meliadine in 2017. During 2017, Meliadine had 6 sessions and is planning on providing the training more often as the workforce stabilizes during the transition from Construction to Operations.
Access to Country Food	As described in section 5.3 below, Meadowbank serves country food meals (i.e. char or caribou) as part of the standard menu served by the mine's kitchen, offered once weekly. In addition, employees can bring their own country foods to the mine site and use a separate Inuit kitchen to prepare and share these foods. In 2016, the Meadowbank Human Resources department led by the HR Inuit Agent began holding 'Country Food Nights'. Country food was purchased and provided by Agnico, and employees volunteered to cook dinner for others in the Country Food Kitchen. In 2016, there were 14 Country Food Nights, including an event where elders from the community were invited to attend. It was estimated that approximately 500 people participated in the nights over the course of the year. In 2017, the Human Resources department held 4 Country Food Nights. The number of events held was less than in 2016 because of a lack of human resources (the mine had one HR Inuit Agent for part of the year), but also because of a lack of country food availability. From approximately September until the end of the year the Human Resources department could not secure country food to be able to hold the events. In May 2017, the Human Resources department started tracking the use of the country food kitchen, which included the attendance generated by the Country Food nights. In 2017, there were approximately 170 people who used the Country Food kitchen, but probably more since there was a part of the year that was not tracked. The Meliadine site also serves country food as part of its standard menu (twice on a 5 week rotational menu). Currently there is no country food kitchen at the Meliadine site although there is planned to be one in Operations. In the meantime, country food is incorporated when possible in on-site events, such as at the Pakallak Tyme spring festival.
Inuktitut Use	Agnico Eagle makes efforts to facilitate the use of the Inuktitut language at their sites by providing the following documentation and services in Inuktitut: • Policies, employee handbooks, and other human resource related documents • Recruitment materials (job postings) • Online mandatory training materials that focus on health and safety • Key directional and safety signage posted in and around the mine site • Bilingual human resource counsellors • Bilingual employees based in communities (Community Coordinators) that support recruitment, retention, and other communications

Program	Purpose / Description / Outcomes
	• Religious events (services in Inuktitut or special events at site) Note that the *Nunavut Mine Act* requires, for safety reasons, that all work communications during operating hours use English as the common language. As per the IIBAs, Agnico must provide 'Inuktitut as a second language' training to selected staff. As part of the new Leadership Development Program (LDP) at Meadowbank, a 'Language Passport' was developed. The pocket small booklet contains approximately 175 words and phrases in Inuktitut (roman orthography and phonetic), English and French. The words and phrases include greetings, workplace terms, environmental terms, social phrases, and common words about people, clothing, objects and body parts. The booklet is given out as part of the LDP to help supervisors better communicate with their employees both on and off the job, although the booklet will be made more widely available in the future. The booklet was developed for the program by the Nunavut Literacy Council.
Cultural Events	In order to support cross-cultural understanding and celebration, Meadowbank and Meliadine hold various cultural events on-site, such as Nunavut Day, Pakallak Tyme, and square dances.

5.1 Perceptions of culture and traditional lifestyle

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS specifically related to impacts on the perceptions of culture and traditional lifestyle.

MELIADINE

"Perceptions of [the Project's] effects may lead to mental stress and changes in behaviour (i.e., diet)." (Golder Associates, 2014, p. 1-C-45)

Data & Trends

As part of the revised SEMP, Agnico Eagle has committed to the development of an Inuit employee survey to gather data and insights on the perceptions of the projects' impacts on culture and traditional lifestyle, along with other topics. This survey was not administered during the 2017 reporting year.

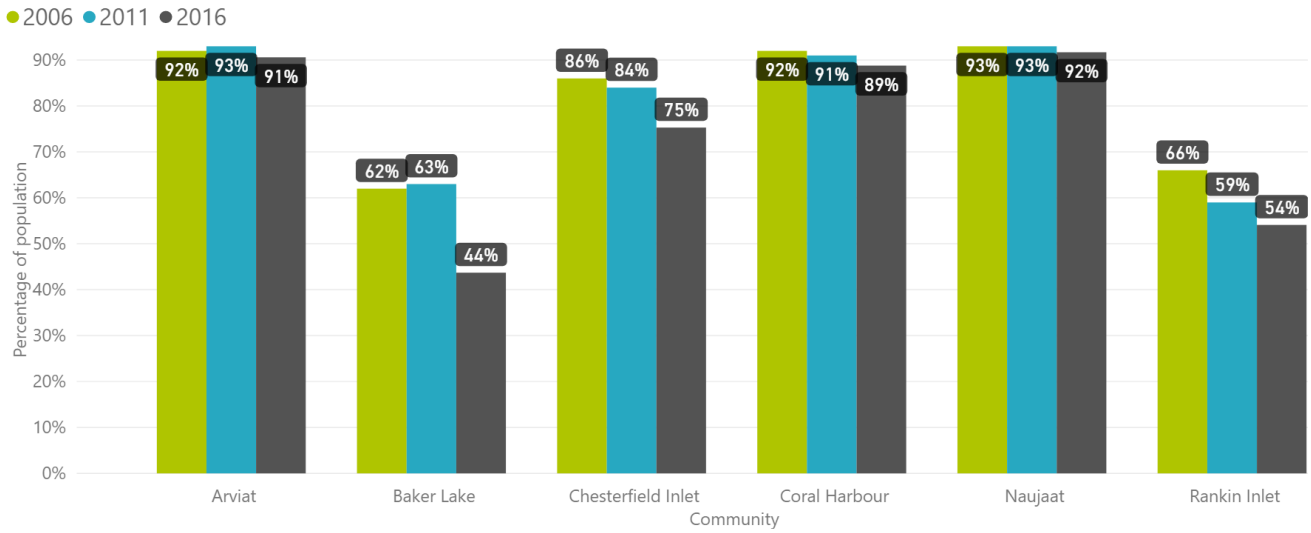
5.2 Culture and traditional lifestyle

Predictions

MEADOWBANK

"The project will not significantly restrict access to or productivity of lands used for traditional activity." (Cumberland Resources Ltd., 2006, p. 122)

MELIADINE



"The construction of the All-weather Access Road (AWAR) may increase access to areas outside of Rankin Inlet by local residents." (Golder Associates, 2014, p. 1-C-52)

"The Project may have a negative impact on the use of culturally important areas." (Golder Associates, 2014, p. 1-C-46)

Data & Trends

Chart 23. Proportion of total population identifying Inuktitut as their mother tongue by community shows the proportion of the total community population that identifies Inuktitut as their Mother Tongue, by Kivalliq community.

Chart 23. Proportion of total population identifying Inuktitut as their mother tongue by community

(Statistics Canada, 2016b; Statistics Canada, 2011b; Statistics Canada, 2006b)

Beginning in 2014, Agnico Eagle has asked its Inuit employees what languages they speak. In 2014, of the 269 Inuit employees, 188 (70%) spoke Inuktitut. In 2015, of the 302 employees, 240 (79%) spoke Inuktitut. In 2016, of the 302 employees, 252 (83%) spoke Inuktitut.

The Agnico Eagle-owned and operated all-weather access road (AWAR) that connects Baker Lake to the Meadowbank mine is accessible to the communities for hunting purposes. Community members accessed the road 2366 times in 2015, 1874 times in 2016, and 1716 times in 2017. Data is not yet available on the community use of the AWAR that connects Rankin Inlet to Meliadine.

Interpretation

Chart 23 demonstrates that the proportion of the population identifying Inuktitut as their mother tongue has remained relatively stable in the smaller Kivalliq communities from 2006 to 2016, but has declined in Rankin Inlet, Baker Lake, and Chesterfield Inlet (by 10 to 18 percentage points) over this period. The decline in Baker Lake is perhaps the most notable, with a decline of 19 percentage points over the past 5-year period.

Agnico Eagle has made efforts to facilitate use of Inuktitut at Meadowbank by translating policies and training materials, offering a number of services in Inuktitut and facilitating social and recreational programs at Meadowbank that encourage and support the Inuktitut language and culture. While the mine offers some services and documentation in Inuktitut, it also enforces the use of English as the standard language for communication in the workplace for safety reasons.

Meadowbank controls traffic on the all-weather access road (AWAR) connecting Baker Lake to the Meadowbank mine road, but it is accessible to community members to provide easier access to hunting trails and participate in traditional activities by ATV. Road users must abide by AWAR rules including following the speed limit, giving priority to heavy equipment, leaving the road after kilometre 85 and not hunting within one kilometre of the road for safety reasons. Hunters may approach the site up to one kilometre. Snowmobile crossings have also been established in consultation with the Baker Lake Hunters and Trappers Organization. There has been a decrease in the number of times the road was accessed since 2015, although there are a number of factors that could explain this trend (e.g. diversion of hunting patterns to other regions).

5.3 Country food use at project

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS specifically related to country food use at the mine site.

MELIADINE

There are no predictions in the Meliadine FEIS specifically related to country food use at the mine site.

Data & Trends

Agnico Eagle estimates meals served featuring country food (arctic char and caribou) at approximately 4,500 per year at Meadowbank, and 4,200 per year at Meliadine. Agnico Eagle also holds country food events at its projects, including 14 events at Meadowbank in 2016 and 4 and 1 events at Meadowbank and Meliadine, respectively, in 2017.

Interpretation

The number of meals served featuring country food has remained steady at Meadowbank since 2011; this number represents one serving of country food per month to all on-site staff. The total number of Inuit employees at the site has also remained relatively steady since it began production in 2010 (approximately 375). The number of country food events held at Meadowbank decreased from 14 in 2016 to 4 in 2017 due to a lack of availability of country food. Use of the country food kitchen – including both independent use and country food events –has averaged 36 attendees per event in 2016 and 43 attendees in 2017.

At Meliadine, Agnico Eagle offered about 21 meals with Arctic char this past year, twice on a five-week rotational schedule, which was consumed by approximately 50% of the staff. Agnico Eagle also offered country food at an on-site Pakallak Tyme event, held around the same time as a cultural festival of the same name held in Rankin Inlet to celebrate the end of the Arctic winter and the coming of spring.

No data or information was available on baseline levels of country food consumption for Inuit workers prior to employment, or on consumption of country food while off rotation.

VSEC 6: Population Demographics

IMPACT / GOAL STATEMENT

Understand what changes are occurring in Kivalliq migration, if any

OVERARCHING FEIS PREDICTIONS

Meadowbank: "The potential impacts of migration are complex and are likely to have both positive and negative components, but of low magnitude. Any effects of migration are long term but are likely to be low significance. It is not likely that migration to any other community than Baker Lake would be significant." (Cumberland Resources Ltd., 2006, p. 126)

Meliadine: "The cumulative effects of the Meliadine, Kiggavik, and Meadowbank Projects on in-migration might be less than the effects of each project individually considering the dampening effects on the volume of in-migration caused by the variation in the current progress of each project, presumed interdependence of certain projects, and resulting estimated labour force growth." (Golder Associates, 2014, p. 1-147)
"Migration impacts were projected only in Rankin Inlet, the closest community to the mine and the only one connected to the Project by road." (Golder Associates, 2014, p. 1-110)

TRENDS & INTERPRETATIONS

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
6.1 Employee migration						
Project Agnico Eagle Inuit employees residing outside Nunavut						There has been a gradual increase in the number of Inuit Meadowbank workers who now reside in outside of Nunavut, from 7 in 2011 to 21 in 2015 (or 7% of the Inuit workforce), though this number has remained stable in 2016 and 2017. The FEIS predicts both "positive and negative components" of migration but does not refer to migration out of Nunavut.
Total Inuit employees	N/A	↑	→	N/A	↑	
Proportion of Inuit to Non-Inuit employees	N/A	↑	→	N/A	↑	
6.2 Population estimates in Kivalliq communities						
Population estimates of Kivalliq communities						Yearly population estimates do not indicate an increase in the population growth rate of Baker Lake or of other communities with significant Meadowbank employment (Arviat, Rankin Inlet) since the mine opened, or relative to other communities in the region. If other factors (births and deaths) are assumed constant, the population data does not suggest significant migration to Baker Lake (or other communities with high Meadowbank employment).
Estimates in communities	↑	↑	↑	↑	↑	
Annual percent change	→	→	→	→	→	

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management and Mitigation

No specific programs are in place to manage or mitigate migration in the Kivalliq region.

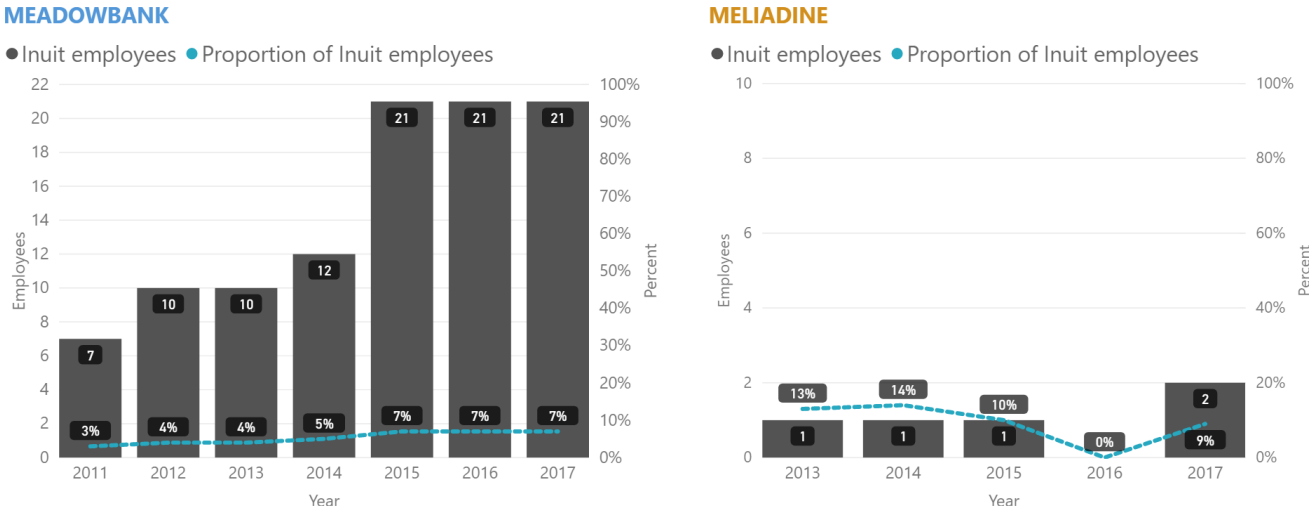
6.1 Employee migration

Predictions

MEADOWBANK

The Meadowbank FEIS suggests that in-migration of Southerners to Baker Lake would be the primary concern.

MELIADINE



"It is likely that much of the potential in-migration happens when members of Kivalliq resident families return at home in the expectation of employment." (Golder Associates, 2014, p. 1-109)

"In-migration could also happen by out-of-area workers, especially during the operations phase." (Golder Associates, 2014, p. 1-110)

Data & Trends

Chart 24 shows the number and proportion of Agnico Eagle Inuit workers who are currently residing outside Nunavut.

Chart 24. Project Agnico Eagle Inuit employees residing outside Nunavut

(Agnico Eagle Mines, 2017)

Interpretation

2010 to 2013 saw a gradual increase in the number of Meadowbank Inuit workers who reside in outside the territory. In 2015, this number rose more substantially than in previous years, from 12 (4% of Inuit workforce) to 21 (7% of Inuit workforce). This number has remained constant in 2016 and 2017. Other migration data (e.g. Inuit workforce moving to/from Baker Lake following employment) is not available.

Meliadine's Inuit workforce residing outside of Nunavut ranged from 0 to 1 individuals from 2013 to 2016, and rose to 2 individuals in 2017 (9% of Inuit workforce). Given the relatively few Inuit employees at Meliadine, small fluctuations in the numbers can have large impacts on the percentage.

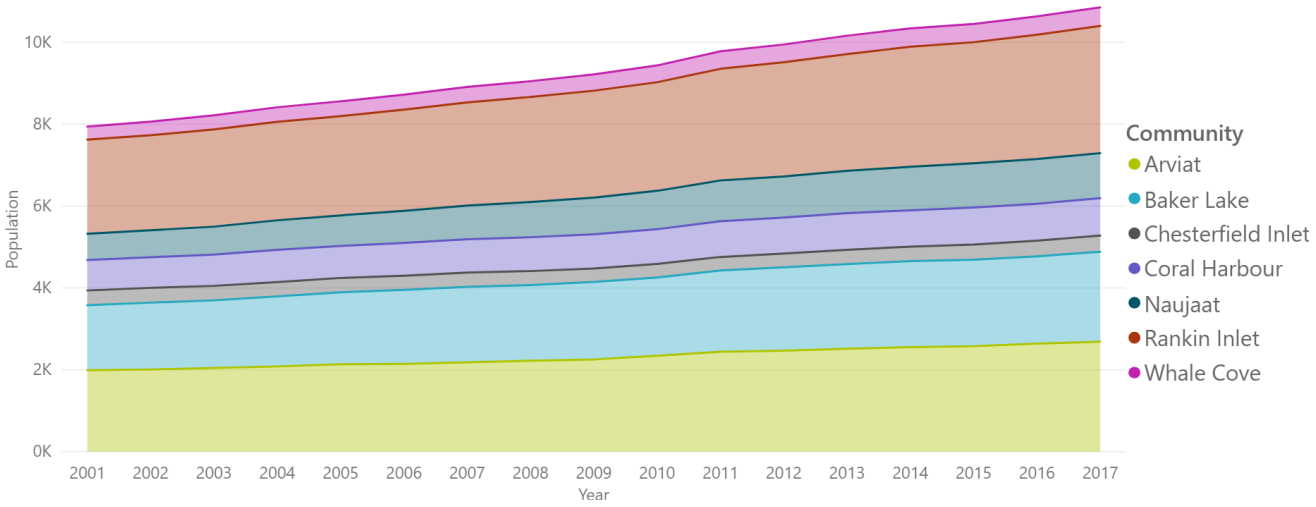
Employment at Agnico Eagle's projects provides Inuit workers with income and skills that may facilitate moving out of the territory. Other factors unrelated to the mines, such as the housing shortage in Nunavut, lower cost of living, and better educational and job opportunities in the provinces, may also contribute to out-migration.

6.2 Population estimates in Kivalliq communities

Predictions

MEADOWBANK

The Meadowbank FEIS states that “it is not likely that migration to any other community than Baker Lake would be significant”, but does not provide any specific predictions on changes to populations in Kivalliq communities.



MELIADINE

“A large majority of in-migration is expected to occur in Rankin Inlet where the supply of public services could accommodate for increased demand.” (Cumberland Resources Ltd., 2014, p. 1-125)

Data & Trends

Chart 25 shows population estimates for Kivalliq communities.

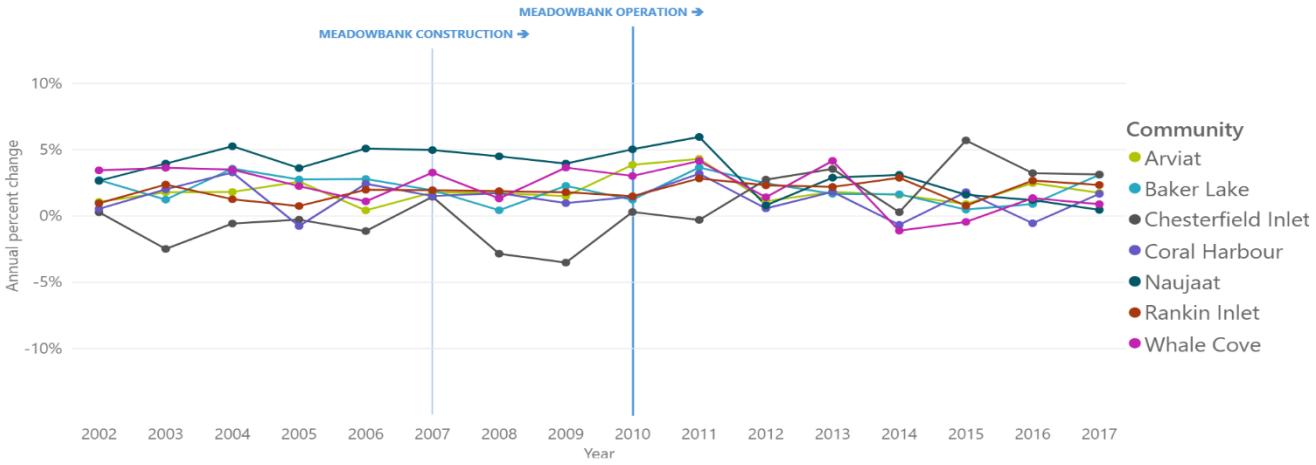


Chart 25. Population estimates of Kivalliq communities

(Statistics Canada, 2018)

Chart 26 shows the annual (year over year) percent change in the population estimates for Kivalliq communiteis.

Chart 26. Annual percent change in population estimates of Kivalliq communities

(Statistics Canada, 2018)

Interpretation

Population change results from the interaction of three variables: births, deaths, and migration. Migration can be for economic or other reasons. The populations of all Kivalliq communities have increased at a relatively steady rate since 2006. The data does not indicate an increase in the population growth rate of Baker Lake or of other communities with significant Agnico employment (Arviat, Rankin Inlet) since Meadowbank opened, or relative to other communities in the region. If other factors are assumed constant, the population data does not indicate any significant migration to Kivalliq communities with high Agnico employment.

The proportion of the Kivalliq population that are Inuit have remained relatively stable over this time (84% in 2016, the latest year for which data is available) (Nunavut Bureau of Statistics, 2016).

At this time, only Agnico Eagle's data on employees residing in outside of Nunavut suggest a possible impact of Agnico Eagle's projects on migration out of the Kivalliq. Without information on how many of these employees now residing outside of the territories originally resided in Kivalliq communities (and which ones), it is not possible to determine the significance of the change.

VSEC 7: Individual and Community Wellness

IMPACT / GOAL STATEMENT

Contribute and collaborate to enhance individual and community wellness

OVERARCHING FEIS PREDICTIONS

Meadowbank: Potential impacts on individual and community wellness are complex, far reaching, and given human nature, difficult to predict with certainty. Individual and community wellness is intimately associated with potential impacts on traditional ways of life as discussed above. In addition, however, individual decisions on the use of increased income, household management in relation to rotational employment, migration, public health and safety, disturbance particularly during the construction phase, and Cumberland's support for community initiatives are being negotiated in the IIBA are [sic] the other drivers that have the potential to effect [sic] individual and community wellness." (Cumberland Resources Ltd., 2006, p. 123)

Meliadine: The "Project may contribute to weakening of traditional culture." (Golder Associates, 2014, p. 1-C-46)
"The Project may result in a reduction of cohesion due to higher levels of inequality in the family or community." (Golder Associates, 2014, 1-C-50)

TRENDS & INTERPRETATIONS

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
7.1 Agnico Eagle Programs						
Agnico Eagle wellness programs offerings & utilization by project employees	N/A	/	/	N/A	/	Meadowbank and Meliadine have a number of ongoing programs that offer readiness, counselling and support services to employees and their families. Due to difficulties in assessing participation in counselling programs (in part due to privacy issues), no trends can be drawn on employee targeted program utilization. Program utilization offered to communities has increased over the past two years – largely due to the new Mandatory Training (Site Readiness) and Work Readiness programs.
Agnico Eagle wellness programs offerings & utilization by community members	N/A	↑	↑	N/A	↑	
7.2 Perceptions of health & wellness						
Self-reported effect of project on health & wellness	N/A	N/A	N/A	N/A	N/A	Data for this metric is currently unavailable.
7.3 Criminal violations						
Criminal violations per hundred people by Kivalliq community	↑	→	N/A	↑	N/A	Total criminal violation rates in Baker Lake and Rankin Inlet reached historic high levels in 2011 and 2012, following the opening of Meadowbank. Recent data (2017) indicates a continuing downward trend (since 2012) in criminal violations in Baker Lake, along with those in Arviat. However, Rankin Inlet and Chesterfield Inlet have seen sharp rises in criminal violations over the past one to two years.
Criminal violations per hundred people by type (Baker Lake, Rankin Inlet, Chesterfield Inlet)						
Baker Lake	→	↓	↓	→	↓	
Rankin Inlet	→	↓	↑	→	↑	
Chesterfield Inlet	↑	→	↑	↑	↑	
7.4 Health centre visits						
Health centre/clinic visits by Kivalliq community by reason for visit	N/A	N/A	N/A	N/A	N/A	Data for this metric is currently unavailable.
7.5 Housing						
Persons on waitlist for public housing by community	/	/	/	/	/	The number of persons on a waitlist for housing has been increasing in Baker Lake and Arviat steadily since 2010. Rankin Inlet has seen a substantial decrease in wait lists over this same period. This may be the result of additional construction of private dwellings as an economic center for the region.
7.6 Food security						
Food security by region or community	N/A	N/A	N/A	N/A	N/A	Data for this metric is currently unavailable.
7.7 Suicide						

Suicides per 10,000 people by region	/	/	/	/	/	There is a persistent and territory-wide suicide crisis in Nunavut. The factors contributing to suicide are numerous and complex, so it is difficult to assess impacts of Meadowbank on suicide rates. Community suicide rates (e.g. for Baker Lake) are highly variable from year to year. Trends are more apparent in long-term and/or regional data.

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management and Mitigation

A number of programs are in place to encourage individual and community wellness in the Kivalliq region, such as site tours for Kivalliq residents, community liaison, and counselling programs, as outline in Table 6 below.

Table 6: Agnico Eagle Individual and Community Wellness Management and Mitigation Initiatives

Program	Purpose / Description / Outcomes
Baker Lake Wellness Report & Implementation Plan	In the 2011 Meadowbank IIBA, Agnico Eagle committed to prepare for the KIA an annual community-driven report on the wellness of the Inuit residents of Baker Lake. Two Wellness Reports and Implementation Plans (for 2015 and 2016) have been developed and submitted. These are posted on the Agnico Eagle website. For the purpose of developing Hamlet wellness indicators that are meaningful to Baker Lake residents, qualitative community-based research was conducted to capture how Baker Lake residents define and perceive their Hamlet's wellness. Statistical information (including the data presented in this report, where community-specific data were available) was also included in the report.
Community Funding Agreements	In 2015, Agnico initiated new community activity agreements (Community Initiatives Fund Agreements) with the Hamlets of Baker Lake, Rankin Inlet, Arviat and Chesterfield Inlet. In 2017, Agnico established or renewed Community Initiatives Fund agreements with all Kivalliq hamlets. The purpose of the funds is to invest in community-based activities that will enrich the cultural and social wellbeing of the community. Each hamlet is responsible for the allocation of the funds in alignment with the purpose and is guided by the Agnico Donations Policy Agreement

Community Coordinators Program	In 2016, the Community Coordinators program expanded to sponsor part-time Agnico Eagle Coordinators in all Hamlets in the Kivalliq Region. Agnico Eagle's offices in the communities of Rankin Inlet and Baker Lake already had Agnico Eagle staff working full and part-time to provide community relations support.
	
	The objective of the community-based Agnico Eagle Coordinators is to provide a point of contact in each community to facilitate communications, provide services, and coordinate activities in the following areas:
	
	- Support to the HR department by:
	  ○ Assisting HR and other Agnico Eagle departments to locate employees or potential employees as required
	  ○ Contact employees in advance of their shift departure times
	- Support to the Recruitment team by guiding interested individuals in the application process outlined by the Labour Pool Process
	- Provide advice and assistance to Agnico Eagle to organize and hold information sessions in the community on Agnico Eagle projects and initiatives, including those Labour Pool and business opportunities initiatives outlined in the IIBAs
	- Provide updates to the Hamlet Council on Agnico Eagle activities

Program	Purpose / Description / Outcomes
	- Distribute Agnico Eagle information and promotional materials The increase of community involvement requirements for Agnico Eagle to achieve recruitment goals and the obligations for the NIRB and IIBA renders the Community Coordinators essential for Agnico Eagle's Nunavut operations. In 2017, the Community Coordinators attended Agnico Eagle training to ensure they have the proper tools and resources to fulfill their responsibilities.
Community Liaison Committee	Agnico Eagle continued to host meetings with the Meadowbank Community Liaison Committee in 2017 to discuss issues of concern or interest. The committee consists of various representatives including the Elders Society, youth, the business community, adult education committee, the Hamlet, Nunavut Arctic College and the Hunters and Trappers Organization of Baker Lake. Meetings are held in both English and Inuktitut and meetings are held at minimum twice per year, ideally four times per year. The Committee brings insight on issues and provides advice to Management on solutions.
Site Tours for Baker Lake Residents	Each year, Agnico Eagle offers a variety of ways for the residents of Baker Lake, as well as various other groups or individuals from the Kivalliq region, to visit Meadowbank Site. The list below outlines the major visits to the site during 2017: - Each year in August, Agnico Eagle invites the residents of Baker Lake to come on a site tour at Meadowbank Mine. In 2017, Meadowbank welcomed four (4) tours, for a total of approximately 100 visitors. - In January 2017, Meadowbank received the MLA and Mayor of Baker Lake - In October 2017, a site visit by the Baker Lake high school was held
Site Tours for Rankin Inlet Residents	In 2017, Agnico Eagle offered tours of the Meliadine site to approximately 100 residents of Rankin Inlet – approximately 100 visitors had the opportunity to visit the site.
Counselling Programs	Agnico Eagle offers a number of counselling programs for its employees and their families. These programs are described in further detail in section 7.1.

7.1 Agnico Eagle Programs

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS regarding community wellness programs and usage at Meadowbank.

MELIADINE

There are no predictions in the Meliadine FEIS regarding community wellness programs and usage at Meliadine.

Data & Trends

Chart 27 provides an overview of wellness programs offered by Agnico Eagle to its employees. Utilization data of Inuit counselling and on-site visits by nurses and doctors are not tracked by Agnico Eagle.

Chart 27. Agnico Eagle wellness programs offerings & utilization by project employees

Wellness program / initiative	2011	2012	2013	2014	2015	2016	2017	**Total**
Coping with FIFO Program				24	64	12		**100**
Employee Assistance Program	2	2	3	6	6	52	57	**128**
Inuit counseling					not measured			**0**
On site visits by nurses & doctors					not measured			**0**

(Agnico Eagle Mines, 2017)

Chart 28 provides an overview of wellness programs offered by Agnico Eagle to Kivalliq community members.

Chart 28. Agnico Eagle wellness programs offerings & utilization by community members

Wellness program / initiative	2012	2013	2014	2015	2016	2017	**Total**
Elder Visition Program / Eld...	12	12	8	4	23		**59**
Site Readiness Program				155	128	193	**476**
Work Readiness Program				155	151	240	**546**

(Agnico Eagle Mines, 2017)

Interpretation

It is difficult to assess participation in counselling programs at Meadowbank, as privacy concerns limit the ability to track or publicize this information. Where data can be and are collected, all counselling programs have seen some usage by their intended audience. The use of the Family Employee Assistance Program increased significantly in 2016 and remained at a high level 2017. The Family Employee Assistance Program consists of two services: one from Consultants BCH and the other from Homewood. Agnico Eagle is reviewing the data to determine if this large increase is due to change in actual program usage or reporting inconsistencies.

The Elder Visitation Program was less used in 2015 than in 2014 (falling from 8 to 4 visits). Although the program was not formally in place in 2016, there were 23 Elder visits on site during the year including 3 elders who attended Country Food Nights and 20 elders attending during Baker Lake Residents Visits. There were no recorded visits from elders to site in 2017, however elders involvement is a major part of Module 0 in the Leadership Development Program, which is held in Baker Lake. During this day visit to Baker Lake, there is a question-answer period between Agnico Eagle staff and a panel of elders, who speak about the history of the hamlet and provide advice on how supervisors can incorporate Inuit Quajimajatunqangit into their supervision practices. Agnico Eagle and KIA are working to have an Elder assigned to work with each IIBA On-Site Working Group (at Meadowbank and Meliadine) in 2018.

The Coping with FIFO (fly-in fly-out) program did not run in 2017, due to the loss of KMTS funding. Previous years had seen program participation fluctuate between 12 and 64 persons per year. While three sessions took place at Meadowbank in 2015-16, Agnico Eagle noted that recruiting participants for this program in its last year was challenging.

7.2 Perceptions of health & wellness

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS regarding the perceptions of health and wellness in the Kivalliq region.

MELIADINE

"Perceptions of Project effects may lead to mental stress and changes in behaviour (i.e., diet)." (Golder Associates, 2014, p. 1-C-48)

Data & Trends

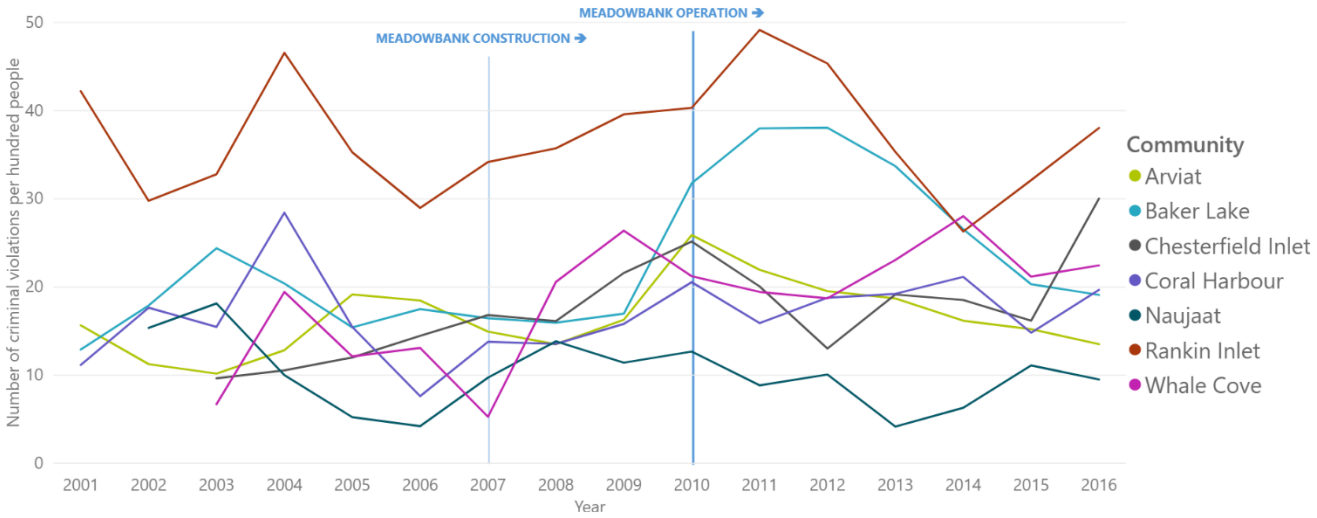
As part of the revised SEMP, Agnico Eagle has committed to the development of an Inuit employee survey to gather data and insights on health and wellness, along with other topics. This survey was not administered during the 2017 reporting year.

7.3 Criminal violations

Predictions

MEADOWBANK

There are no specific predictions in the Meadowbank FEIS regarding criminality in the Kivalliq region.



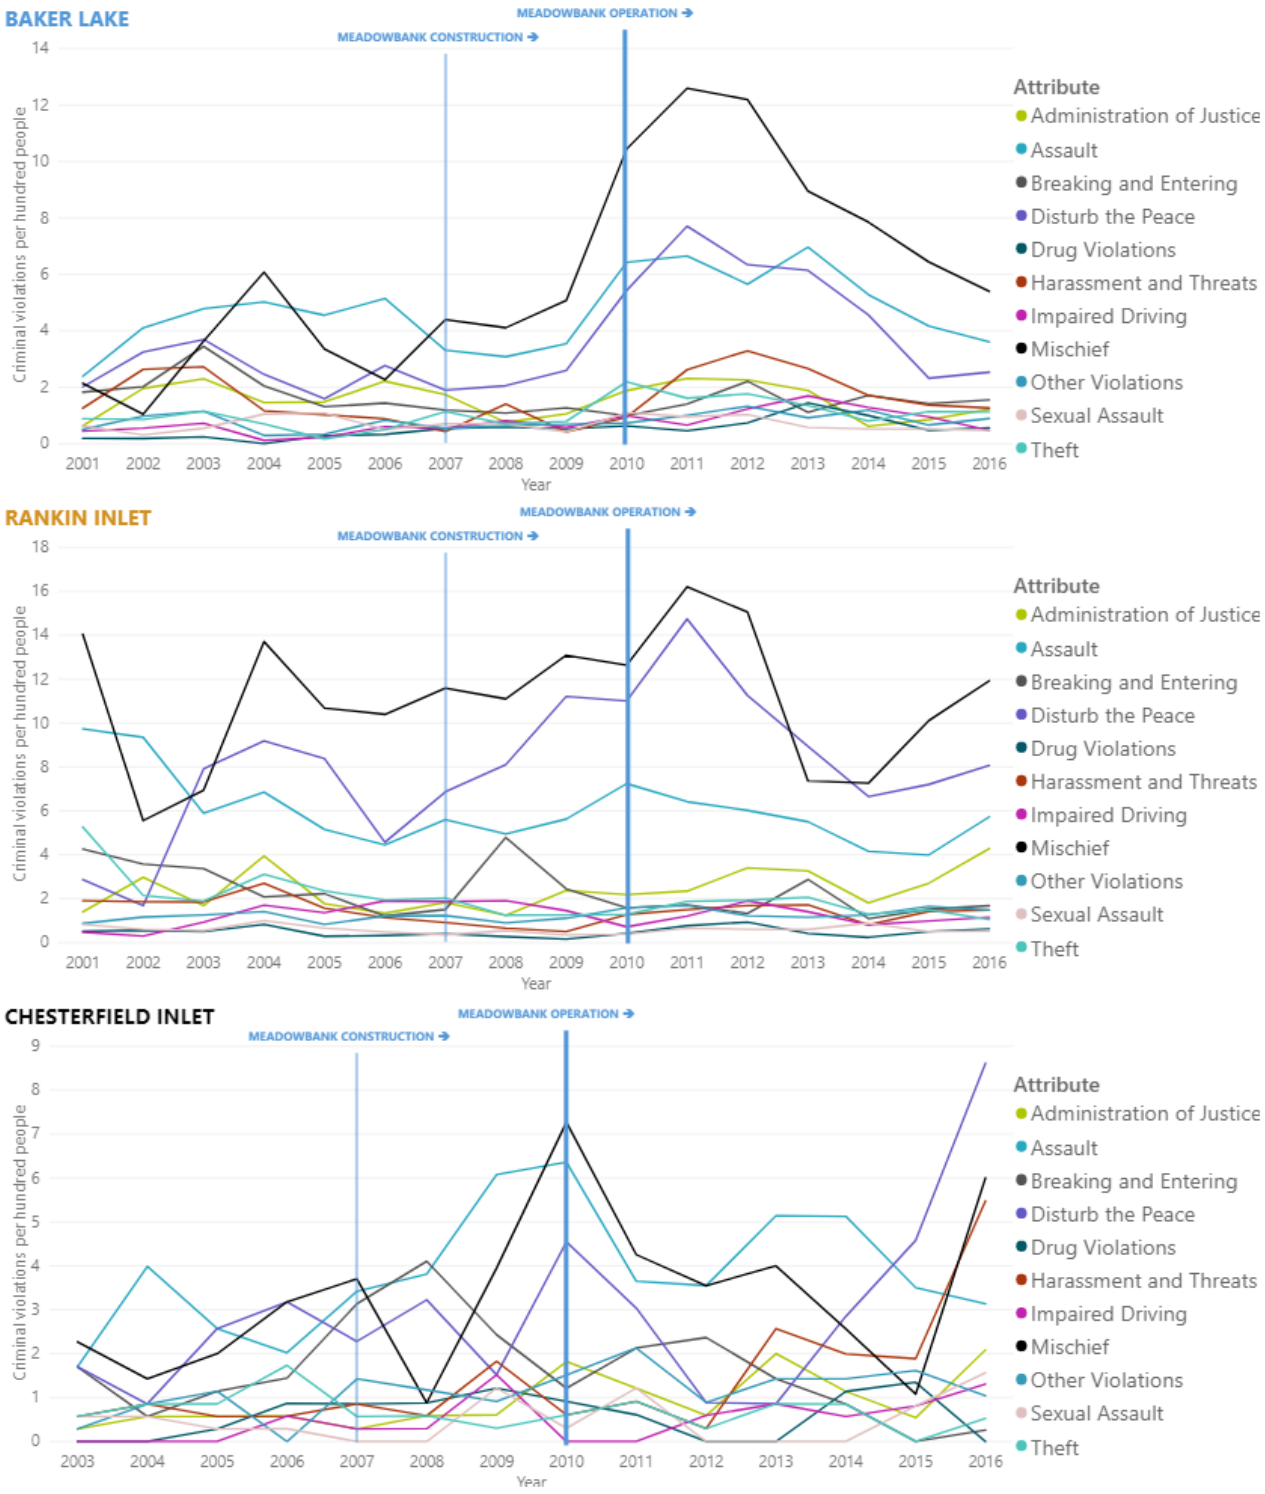
MELIADINE

"The Project may result in increased social inequality leading to higher crime rates." (Golder Associates, 2014, p. 1-C-49)

Data & Trends

Chart 29 shows the criminal violations rate (number of violations per 100 people[6]) for each community in the Kivalliq region from 1999 to 2016, the latest year for which data is available.

Chart 29. Criminal violations per hundred people by Kivalliq community



(Statistics Canada, 2017a)

Chart 30 shows the criminal violations rate by type for Baker Lake, Rankin Inlet and Chesterfield Inlet to 2016, the latest year for which data is available.

[6] Note that StatsCan provides criminal violation data per 100,000 people. The report authors use a per 100 people measurement that is more intuitive in a Nunavut context

Chart 30. Criminal violations per hundred people by type (Baker Lake, Rankin Inlet, Chesterfield Inlet)

(Statistics Canada, 2016e; Statistics Canada, 2017b)

Interpretation

With the exception of Rankin Inlet, all communities had fewer than 25 total criminal violations per hundred people in the 2006 - 2009 period (baseline). Baker Lake, Rankin Inlet, and Arviat all experienced significant increases in total criminal violation rates since the Meadowbank mine began production. Additional expendable income can lead to alcohol and drug abuse and intensify existing social problems such as violence; a high percentage of police call-outs are believed to be related to alcohol (Buell, 2006). This is further supported by a recent study, which found that the proximity of mines had a larger impact on an individual's average alcohol consumption per week than proximity to casinos or bars (Godfrey, 2017).

After 2010, the total criminal violations rate in Arviat steadily decreased and returned to approximately 2006-levels in 2013 and continued to decline through 2016. Total criminal violation rates in Baker Lake and Rankin Inlet reached historic high levels of approximately 51 and 47 per 100 people, respectively, in 2011 and 2012. Recent data indicates a downward trend (since 2012) in criminal violations in Baker Lake, with the 2016 number slightly above the 2006-2009 baseline. While Rankin Inlet experienced a similar decline up until 2014, the total number of criminal violations in the community has increased over the past 2 years.

In Baker Lake, rates of harassment and threats, mischief, disturbing the peace, and theft more than doubled or tripled in the early years following the beginning of mine production (2010 – 2012). The rates of more serious crimes, including assault and sexual assault, also increased significantly (by 65% - 95%) during this same period. With the exception of assault, impaired driving, and drug violations, there was a decrease in all types of violations in Baker Lake in 2013, consistent with the decrease in the rate of total criminal violations. 2015 and 2016 saw continued decrease in the most common violations (assault and mischief) and relatively stable levels of other violations.

Rankin Inlet similarly saw a rise in mischief, disturbing the peace and assaults up until 2012, which was followed by a decline in most types of crime in 2013 and 2014. 2015 and 2016 saw a steady rise in these most common violation, though still below their 2011 highs.

From 2015 to 2016, Chesterfield Inlet experienced sharp increases in the rates of mischief, harassment and threats, and disturbing the peace, with the last two violation types reaching all-time highs for the available data. In 2016, the total criminal violation rate in Chesterfield Inlet was the second highest among Kivalliq communities.

7.4 Health centre visits by reason for visit

Predictions

MEADOWBANK

"The potential public health and safety impacts of the project, of unknown magnitude, are negative, and, because there is such high impact at the individual level in the event that a risk is realized, the effects must be considered long term and of high significance." (Cumberland Resources Ltd., 2006, p. 126)

MELIADINE

There are no specific predictions on the use of GN Health services from a wellness perspective in the Meliadine FEIS. (though other relevant predictions are provided in VSECs 8 and 9).

Data & Trends

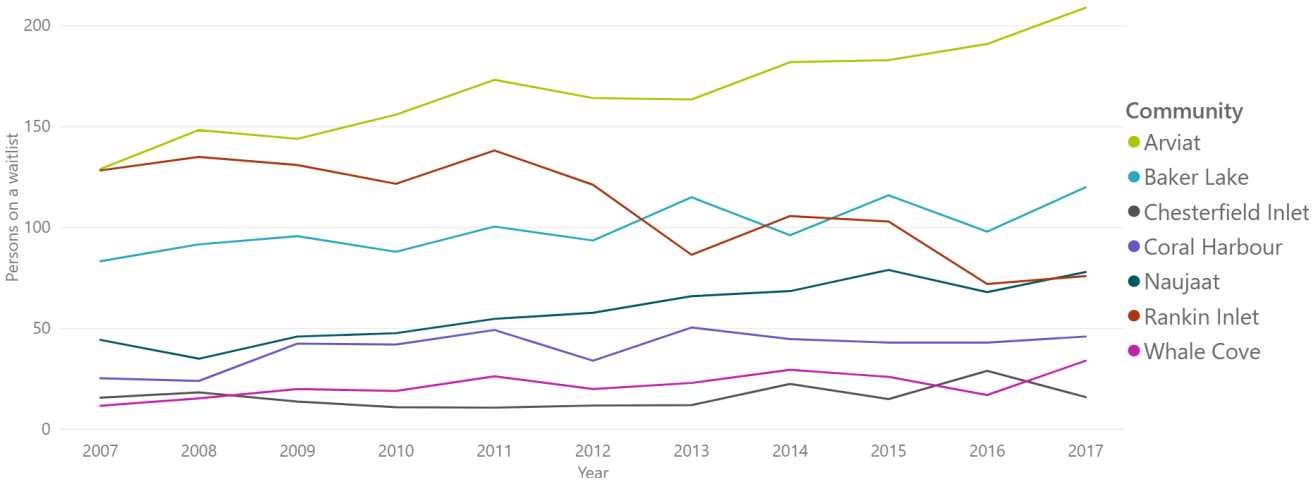
Data unavailable at this time.

7.5 Housing

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS regarding housing in the Kivalliq region.



MELIADINE

“Project may induce in-migration to Rankin Inlet leading to overcrowding of housing and detrimental public health effects.” (Cumberland Resources Ltd., 2014, p. 1-C-48)

Data & Trends

Chart 31 shows the number of citizens in the Kivalliq region who were on a waiting list for public housing in 2010, by community.

Chart 31. Persons on waitlist for public housing by community

(Nunavut Housing Corporation, 2018)

At the time of this report, data on overcrowding rates was not available.

Interpretation

Housing in Nunavut is largely government owned and controlled. Therefore, the dynamics of housing supply and demand in response to changes in individual income are different than those one might expect in other housing markets in Canada.

The number of persons on a waitlist for housing has been increasing in Baker Lake and Arviat steadily since 2010. Rankin Inlet has seen a substantial decrease in wait lists over this same period. This may be the result of additional construction of private dwellings as an economic center for the region.

The relationship between housing conditions and mining activity in the Kivalliq region is unclear, but there is a range of potential pathways of effects. For example, increased income may lead to an increase in the construction and purchase of private housing, and a decrease in waitlists or overcrowding rates. However, increased in-migration (as noted as a potential impact to Rankin Inlet in the Meliadine FEIS) could increase overcrowding and waitlists. Currently, the data does not indicate increased in-migration as a result of the mines as a pathway affecting housing outcomes.

While a useful indicator, waitlists only tell a small part of the story of housing in Nunavut. The last comprehensive survey completed on housing in Nunavut was the 2010 Nunavut Housing Needs Survey (NHNS). The survey provided a more comprehensive picture of the state of and attitudes around housing in the territory. For example, the NHNS found that 65% of Kivalliq public housing was below housing standards – either being overcrowded or requiring major repairs or both.

7.6 Food security

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS specifically related to impacts on the consumption of country foods.

MELIADINE

- "The Project will have a negative effect on food security in that perceptions of the Project may lead to mental stress and changes in behaviors (i.e., diet)." (Golder Associates, 2014, p. 113)
- "Project employment may increase time and resources available for harvesting nutritious country foods." (Golder Associates, 2014, p. 1-C-46)

Data & Trends

The Inuit Health Survey reported that nearly 70 per cent of Inuit households in Nunavut are food insecure. This is over eight times higher than the national average and among the highest documented food insecurity rates for an Indigenous population in a developed country. However, there is currently no source of annual government data on food security in the Kivalliq region and for individual Kivalliq communities[7]

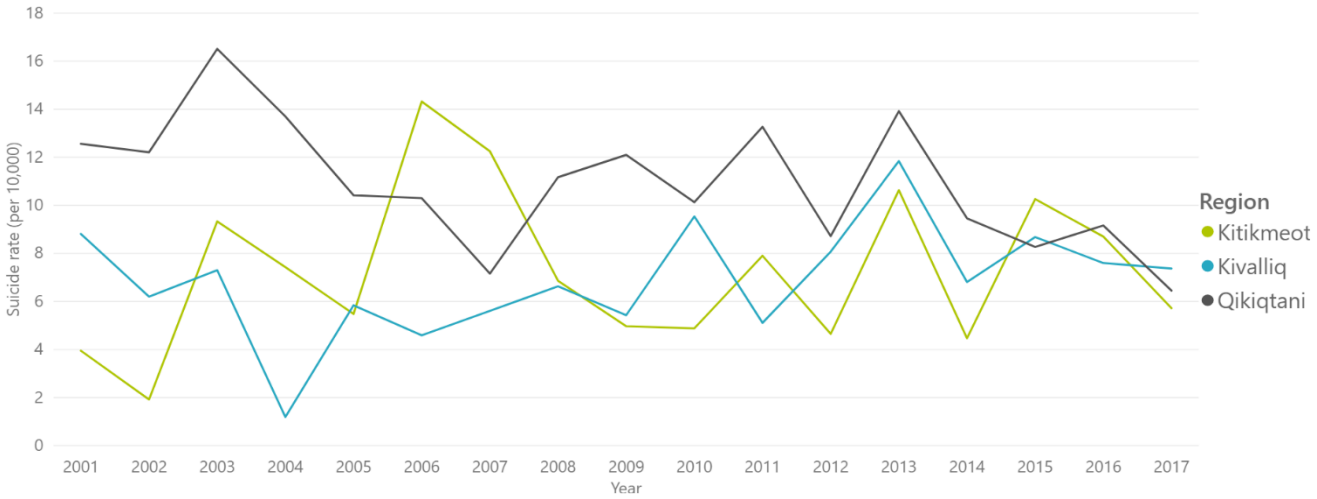
7.7 Suicide

Predictions

MEADOWBANK

There are no specific predictions in the Meadowbank FEIS regarding suicide in the Kivalliq region.

MELIADINE



There are no specific predictions in the Meliadine FEIS regarding suicide in the Kivalliq region.

Data & Trends

Chart 32 shows the suicide rate per 10,000 people by region from 2000 to 2017.

[7] http://www.nunavutfoodsecurity.ca/sites/default/files/files/Resources/Strategy/NunavutFoodSecurityStrategy_ENGLISH.pd

Chart 32. Suicides per 10,000 people by region

(Department of Justice, 2018)

Interpretation

Suicide rates in Nunavut remains at crisis levels, ranging from 5 to 25 times the rate of suicide in Canada (NTI, 2016). As shown in Chart 32, the suicide rate in all three regions of Nunavut in 2017 is similar to that in 2000. Underlying risk factors are numerous and long-standing; they range from the effects of historical trauma and its symptoms to the high rates of child sexual abuse, alcohol and drug use, poverty, high school dropout rates, and the cultural losses brought about by residential schools and forced relocations.

Due to the persistent and territory-wide nature of this crisis, it is difficult to assess the impacts of Agnico's projects on suicide rates in Kivalliq communities (Eggerston, 2015). Furthermore, given the small populations of Kivalliq communities and the highly variable numbers of suicides observed in each community, short-term trends are difficult to discern. The number of suicides in the Kivalliq region each year from 2010 to 2017 were: 8, 5, 8, 12, 7, 9 and 8 and 8. These numbers alone do not point to a particular trend since Meadowbank began production.

In July of 2016, NTI released the National Inuit Suicide Prevention Strategy, which sets out a series of actions and interventions to address the high number of deaths by suicide among Inuit. The Strategy promotes a shared understanding of the context and underlying risk factors for suicide in Inuit communities and guides policy at the regional and national levels on evidence-based approaches to suicide prevention (NTI, 2016). Other community level programs – including B.L.A.S.T. (Baker Lake Against Suicide Team) – are working to address the suicide crisis at the hamlet-level.

VSEC 8: Health and Safety

IMPACT / GOAL STATEMENT

Strong health and safety culture. Zero workplace accidents.

OVERARCHING FEIS PREDICTIONS

Meadowbank: The FEIS considers both the health and safety of workers and the public and recognizes that one may affect the other. “Health and safety of workers and the population at large is subject to legislation and perhaps more importantly to best practices. Health and safety training also has applications in personal life – workers often not only use new health and safety training on-the-job, but also at home in the course of daily tasks.” (Cumberland Resources Ltd., 2006, p. 126)

Meliadine: “Project health and safety training may improve health and safety at mine site and outside of the workplace.” (Golder Associates, 2014, p. 1-C-49)

TRENDS & INTERPRETATIONS

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
8.1 Health and safety training						
Average (per FTE) mandatory training hours provided to Agnico Eagle Inuit employees	N/A	/	→	N/A	↑	A steady increase in overall mandatory training hours for full-time employees has occurred at both Meadowbank and Meliadine from 2015 to 2017. Health and safety training increased for Inuit and non-Inuit employees in 2017 at Meliadine. None of the data collected permits an assessment of the impacts of Agnico Eagle’s projects and their programs on the general health status of workers and their families.
8.2 Health and safety on-site						
Average (per-FTE) visits by project Agnico Eagle employees to clinic for work-related or other reasons	N/A	↓	→	N/A	↓	There was a small rise in visits to Agnico Eagle clinics for work-related injuries in 2017, though this is largely accounted for by an increase in employment. Overall, the number of clinic visits has been fairly stable since 2012, and the clinic continues to serve an important function in addressing the health and medical needs of workers.
Project combined lost-time and light duty accident frequency (per 200,000 person-hours)	N/A	↓	↑	N/A	↓	Lost-time and light duty accident frequency decreased for four years in a row up to 2015 but increased in 2016 (from .57 to .72) and in 2017 to 1.62.

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management and Mitigation

A number of training programs are in place to support a strong health and safety culture and minimize health and safety incidents at Meadowbank and Meliadine, as outlined in Table 7 below.

Table 7: Agnico Eagle Health and Safety Management and Mitigation Initiatives

Program	Purpose / Description / Outcomes
Emergency Response Team (ERT) Training	Meadowbank employs an Emergency Response Team (ERT) to assist and help in any type of situation. To join the team, a candidate must demonstrate: an interest in safety, good attendance and good behaviour at work, and be in good physical condition. An ERT practice takes place weekly and each member must attend at least six (6) practices throughout the year. In 2017 there were no Inuit members.
JOH&S Committee Training	Members of the Joint Occupational Health and Safety (JOH&S) committee received training in order to improve their skills related to the management of Health & Safety. The training covered various topics including: Roles & Responsibilities of the JOH&S committee, interpretation of the Mines Act & Regulations, conducting inspections, conducting accident/incident investigations due diligence, part of the Criminal code and Supervision Formula training as well as a coaching phase. Both the Meadowbank and Meliadine JOH&S Committee has Inuit representation.
Employee Health & Safety Training	General health and safety training, as required by the *Nunavut Mine Act*, and in line with Agnico Eagle's Health and Safety policies, is provided in English, French and Inuktitut prior to an employee's arrival on site. Further information is provided in section 8.1.

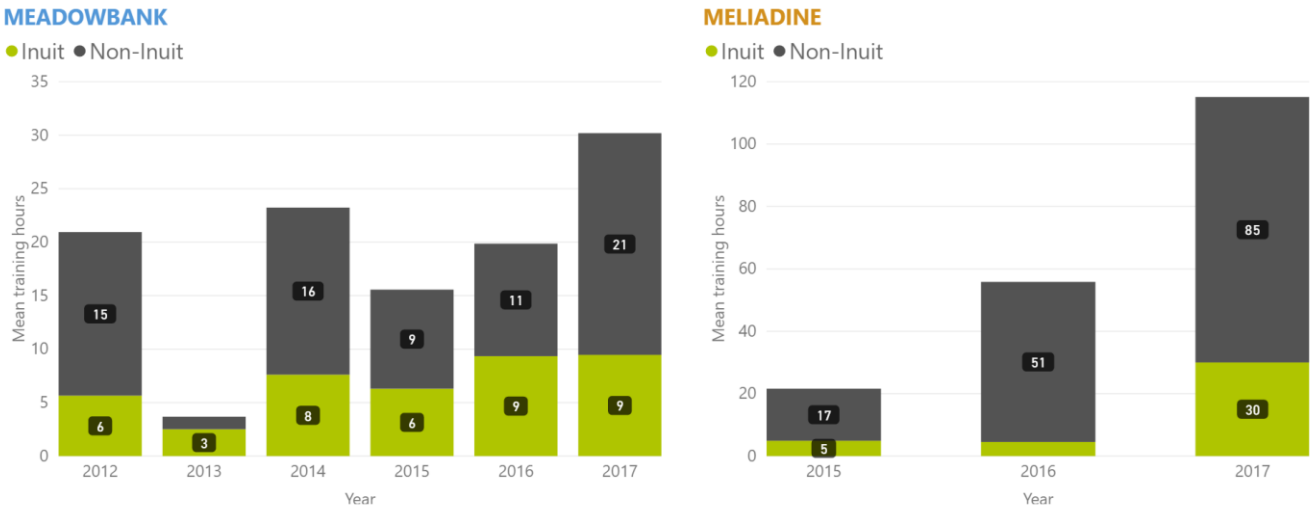
8.1 Health and safety training

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS regarding health and safety training at Meadowbank.

MELIADINE



"Project health and safety training may improve health and safety at mine site and outside of the workplace." (Golder Associates, 2014, p. 1-C-49)

Data & Trends

Chart 33 shows average mandatory training hours provided to Inuit and non-Inuit employees. This is calculated by putting the total number of training hours over the number of FTE employees. Mandatory training includes:

- **Health and Safety training** includes mandatory training related to compliance with the Nunavut Mine Act, as well as training that is mandated according to Agnico Eagle Health and Safety policies. Many of these training sessions are offered via e-learning prior to the employee's arrival on site. Other health and safety training relevant to an individual's job is also provided on site.
- **General training** consists of training activities required at a departmental level and covers many employees working in different departments. General training includes training on light duty equipment as well as enterprise software systems and cross-cultural training.

Chart 33. Average (per FTE) mandatory training hours provided to Agnico Eagle Inuit employees

(Agnico Eagle Mines, 2017)

Interpretation

A steady increase in overall mandatory training hours for full-time employees has occurred at both Meadowbank and Meliadine from 2015 to 2017. For full-time Inuit employees at Meadowbank, the average number of training hours was maintained from 2016 to 2017, while non-Inuit hours almost doubled. This is likely due to increased activity at Whale Tail, where the majority of staff are contractors. Additionally, there is a 3-year mandatory refresher for many H&S courses, including e-learning, required by Agnico Eagle. This may partially explain the bumps at Meadowbank in 2014 and 2017 for non-Inuit employees, as the relatively higher turnover for Inuit employees would make this effect less pronounced.

None of the data collected permits an assessment of the impacts of Agnico Eagle's projects and their programs on the general health status of workers and their families outside the workplace.

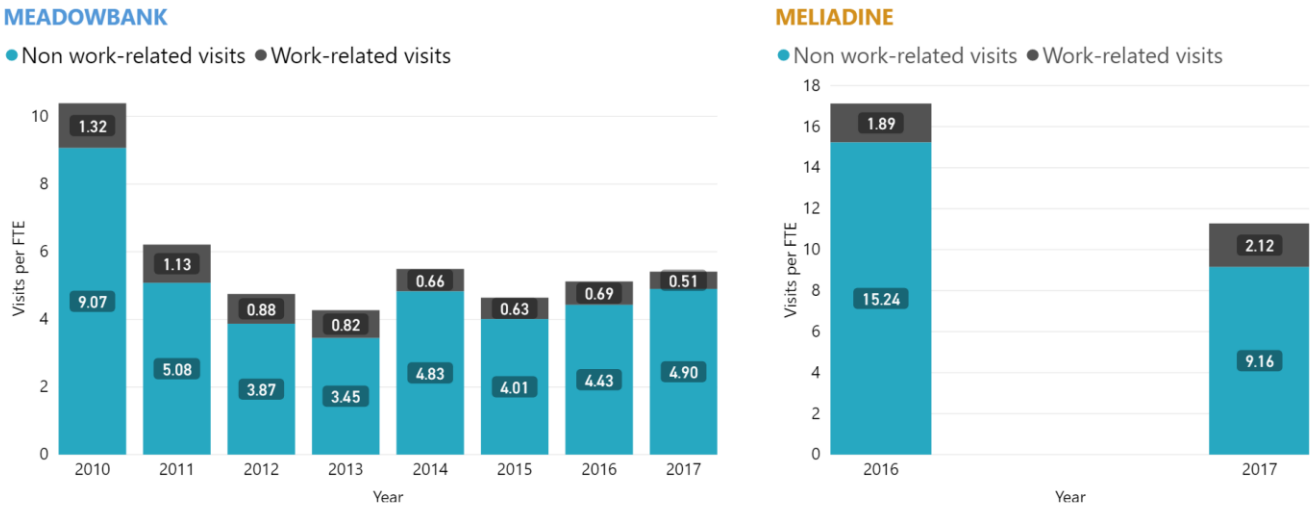
8.2 Health and safety on-site

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS regarding health and safety on-site at Meadowbank.

MELIADINE



There are no predictions in the Meliadine FEIS regarding health and safety on-site at Meliadine.

Data & Trends

The following charts provide an overview of the health and safety performance for Meadowbank and Meliadine.

Chart 34 shows the visits per FTE to Agnico Eagle clinic for work-related reasons (e.g. injuries) or other reasons (e.g. personal conditions ranging from minor ailments, such as colds, to severe conditions, such as myocardial infection).

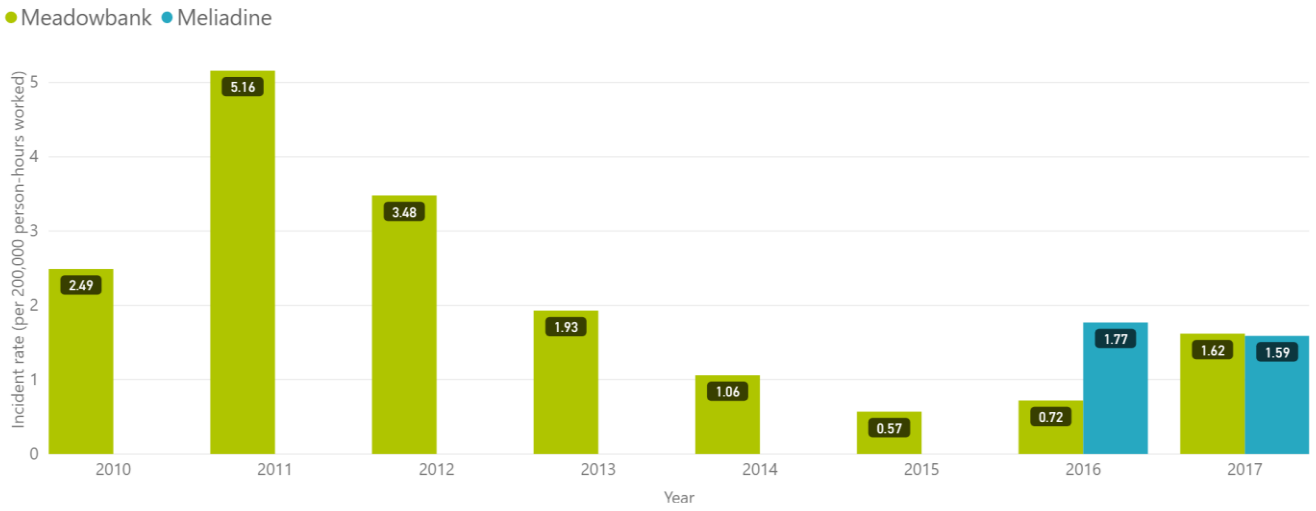


Chart 34. Average (per-FTE) visits by project Agnico Eagle employees to clinic for work-related or other reasons

(Agnico Eagle Mines, 2017)

Chart 35 shows the combined lost-time and light duty accident frequency on site, per 200,000 person-hours worked.

Chart 35. Project combined lost-time and light duty accident frequency (per 200,000 person-hours)

(Agnico Eagle Mines, 2017)

Interpretation

In all years, over 80% of visits to Agnico Eagle clinics, at both Meadowbank and Meliadine, have been for non-work-related conditions. It appears that the clinics serve an important function in addressing the general non-work-related health/medical needs of workers.

Clinic visits at Meadowbank for work-related injuries declined from 1.3 visits per FTE in 2010 to 0.66 in 2014, and have remained stable in the following years – ranging from 0.51 to 0.69 visits per FTE. The decline in visits for work-related injuries is consistent with overall improvements in health and safety performance at the mine that are also reflected in the lost time and light duty accident frequency rate.

Clinic visits at Meliadine for work-related injuries increased from 1.8 visits per FTE in 2016 to 2.1 in 2017, which is somewhat higher than the number of visits per FTE at Meadowbank at the beginning of operation.

The lost time and light duty accident frequency rate (incidents per 200,000 person-hours worked) at Meadowbank decreased from a high of 5.16 in 2011 to 0.57 in 2015. Since then, the rate has increased each year to a level of 1.62 in 2017 but remains historically low when compared to 2010 to 2013. The recent increases may be the result of increased activity at the Whale Tail deposit.

The lost time and light duty accident frequency rate at Meliadine decreased slightly in 2017 to 1.59, which is similar to the rate at Meadowbank.

Beginning in 2012, Agnico Eagle developed and then implemented its Responsible Mine Management System, which includes workplace health and safety management. The current data does not provide any indication of how health and safety training is affecting practices at home and community health and safety outcomes.

VSEC 9: Community Infrastructure and Services

IMPACT / GOAL STATEMENT

- Community infrastructure (transportation, energy, water, services) is maintained
- Social assistance costs are reduced during and beyond the life of the mines

OVERARCHING FEIS PREDICTIONS

Meadowbank: "The impacts on social services and infrastructure, of low to medium magnitude, are considered largely positive in the medium term and of moderate significance. There is some potential for closure to have a negative impact on social service delivery." (Cumberland Resources Ltd., 2006, p. 128)

Meliadine: "The Project will increase demand on various public services, putting additional pressure on resources, and human resources in particular. This would have a negative effect on users. However, increased training of labour force could have a beneficial effect on capacities in the long-term." (Golder Associates, 2014, p. 1-C-53)

TRENDS & INTERPRETATIONS

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
9.1 Use of GN health services						
Kivalliq community health centre visits per capita	↓	↑	N/A	↑	N/A	Per capita health centre visits in communities with the most Agnico Eagle employees (Baker Lake, Rankin Inlet, and Arviat) are beginning to show an upward trend, most notably in Baker Lake and Arviat. The number of employees referred to their community health care centres for personal or work-related reasons ranges from 14 to 58 people per year, though it is difficult to draw a relationship between changes in this indicator and use of GN Health Services.
Persons transported from site to access health services (province & Nunavut)	N/A	↑	↓	N/A	↑	
Incidents requiring use of GN health services	N/A	/	↓	N/A	↑	
9.2 Use of public infrastructure						
Estimates of use of public physical infrastructure directly related to Project (airports, port, meeting facilities, roads)	N/A	N/A	N/A	N/A	N/A	The use of public physical infrastructure by Meadowbank and its employees consists primarily of the use of airports and has been relatively consistent since operation began in 2010. There are no indications of significant positive or negative impacts on this infrastructure. Having just begun construction and development in 2017, it is too soon to conclude what impacts Meliadine may be having on Rankin Inlet's airport or port.
All-weather access road (AWAR)	N/A	/	↓	N/A	N/A	
9.3 Social assistance						
Per capita social assistance expenditures by community	↓	/	N/A	↓	N/A	Despite declines from historical highs, social assistance data does not show a clear correlation between mine-related employment and social assistance requirements in Baker Lake or Arviat. Data suggests that both expenditures and percentage of households receiving social assistance have been declining in Rankin Inlet since Meadowbank opened.
Percentage of households receiving social assistance by community	↓	↓	↓	↓	↓	

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management and Mitigation

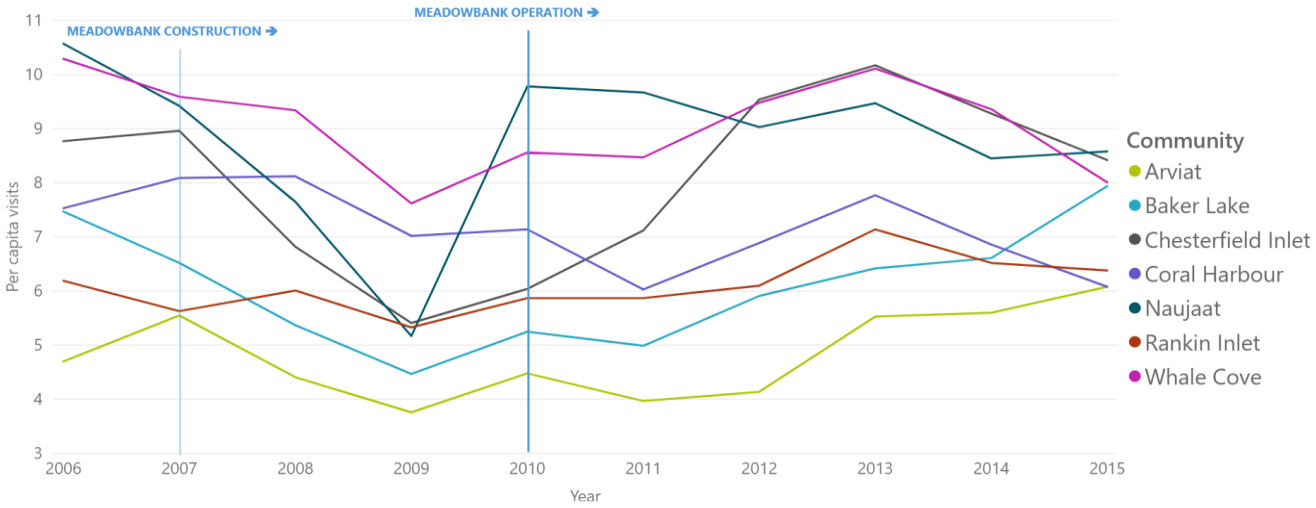
Local community infrastructure and services capacity was taken into account in the project design for both Meadowbank and Meliadine, leading to a number of operational decisions, including an on-site clinic at both projects as well as the on-site airstrip at Meadowbank. Further, a number of Agnico Eagle's economic programs are meant to improve community infrastructure and services in the long term. For example, programs which aim to increase local employment, contracting and business opportunities can reduce social assistance expenditures over time. These programs are outlined in the respective sections of this report (see VSEC 1 and 3).

9.1 Use of GN health services

Use Predictions

MEADOWBANK

"Increased employment and business opportunities will result in increased income, a measure of economic security, capacity building that will contribute to employability over the long term, and improved self-image of employees and their families. This could result in reducing dependence on government social services." (Cumberland Resources Ltd., 2006, p. 128)



MELIADINE

"Project-induced in-migration may increase demand on health services" (Golder Associates, 2014, p. 1-C-58)

Data & Trends

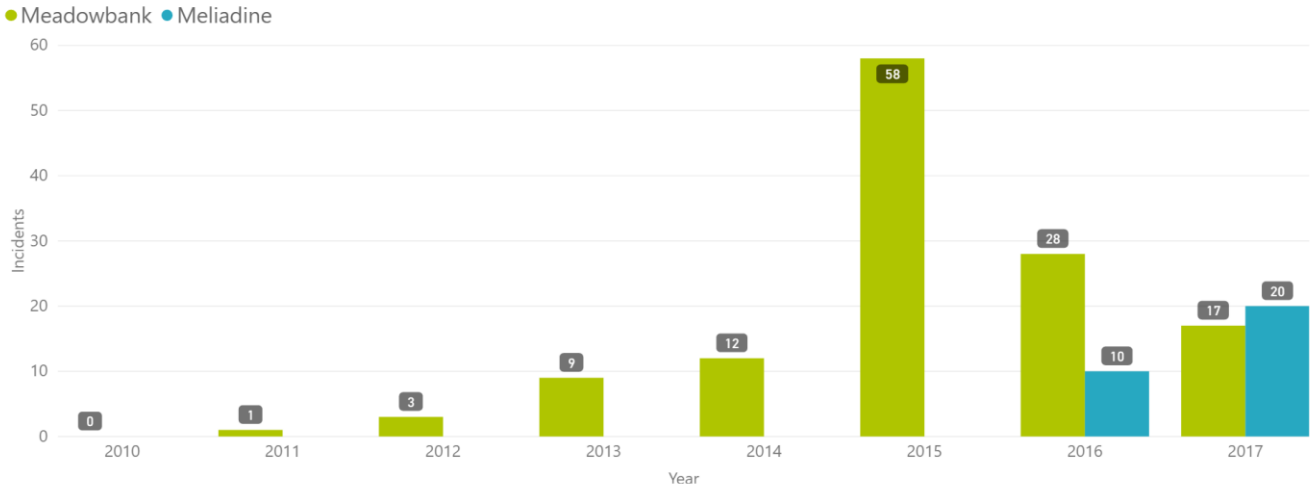


Chart 36 shows the number of per capita visits to community health centres in Kivalliq communities.

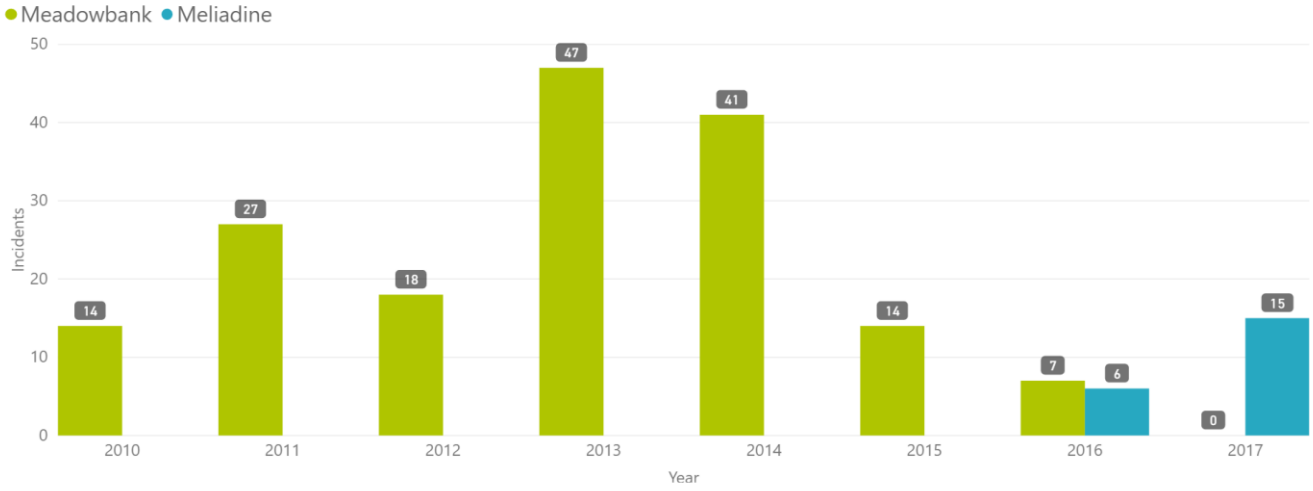
Chart 36. Kivalliq community health centre visits per capita



(Department of Health, 2017)

Chart 37. Persons transported from site to access health services (province & Nunavut)

(Agnico Eagle Mines, 2017)

Chart 38. Incidents requiring use of GN health services

(Agnico Eagle Mines, 2017)

Interpretation

Most Kivalliq communities experienced steady or declining community health centre visits up to 2009. From 2009 to 2010, which coincides with Meadowbank's start-up and operation, per capita visits increased in every community except Coral Harbour. However, since 2010, per capita visits have remained relatively steady in most communities with the exception of Chesterfield Inlet and Baker Lake. While per capita visits increased slightly in Baker Lake from 2011 to 2013, the levels remain lower than 2006 and 2007 levels. In 2017, per capita visits increased in Arviat and Baker Lake, and decreased in Rankin Inlet.

Additional information on the reasons for health centre visits and client demographics may provide more insight on the reasons for changes observed in each community, including the noteworthy increase in Chesterfield Inlet and potential linkages to the Meadowbank mine and/or other factors. Currently, this data alone does not indicate:

- whether a Meadowbank worker, on average, is a higher user of health care services than other workers or unemployed people or if there is a counter effect where employees use on-site medical services in lieu of GN health services while on rotation; and

- to what extent these referrals are for work-related reasons.

From 2010 to 2015, there was a continuous increase in the number of persons transported from the site to access health services (provinces and Nunavut), from 0 in 2010 to 58 in 2015. This number has declined in recent years and was 17 persons transported in 2017.

From 2010 and 2016, there have been 7 to 47 incidents per year that have required GN Health Services. The number of these incidents peaked in 2013 and 2014, and have since declined significantly with zero incidents reported for 2017.

9.2 Use of public infrastructure

Predictions

MEADOWBANK

"The impacts on social services and infrastructure, of low to medium magnitude, are considered largely positive in the medium term and of moderate significance. There is some potential for closure to have a negative impact on social service delivery." (Cumberland Resources Ltd., 2006, p. 128)

MELIADINE

There are no specific predictions in the Meliadine FEIS regarding the use of public infrastructure.

Data & Trends

The Meadowbank mine has dedicated energy, water, transportation (airstrip and road), health and communications infrastructure and is therefore largely non-reliant on the public physical infrastructure of Baker Lake. Areas of potential impact on public infrastructure include the use of Kivalliq community airports to transport Nunavut employees between their home communities and the mine site and the use of community meeting spaces for public engagement. The operation also uses the community barge landing facilities, which is located east of the hamlet. Travel through the hamlet is not required to transport sealift materials from the barge to the site.

The all-weather access road connecting Baker Lake to the Meadowbank mine (Meadowbank AWAR) was constructed and paid for by Agnico Eagle. Meadowbank controls traffic on this road, but it is accessible to community members to provide access to hunting trails and participate in traditional activities by snowmobile and ATV. The Meadowbank AWAR community use is measured at 2366 trips in 2015; 1874 in 2016 and 1716 in 2017.

The Meliadine mine also has its own dedicated energy, water and communications infrastructure as well as an on-site health clinic. However, unlike Meadowbank, the Meliadine may use local health care facilities in certain cases. Meliadine also uses community meeting spaces for public engagement. Regarding transportation infrastructure, Meliadine uses the Rankin Inlet airstrip for all employee transport, although the airport itself is not used for chartered flights. Meliadine also uses the community barge landing and boat launch area, with the location of this area is much more central in Rankin Inlet as compared to Baker Lake. Until October 2017, Agnico Eagle also used the community tank farm during the installment and commissioning of its own tanks.

The all-weather access road connecting Rankin Inlet to the Meliadine mine (Meliadine AWAR) was constructed and paid for by Agnico Eagle from kilometer 7, with the addition of a new bridge spanning Char River on the hamlet's section of road. In 2017 Agnico Eagle used the hamlet's roads from the barge lay-down area to kilometer 7, although Agnico Eagle's use of community roads will drop significantly once the by-pass road (currently in construction) is finished in 2018. Meliadine AWAR community use is not yet measured.

2017 estimates of use of this infrastructure directly related to Meadowbank are as follows:

- Use of Baker Lake Airport to access commercial flights (estimates not available)
- Barges received in Baker Lake 9 vessels for 87 000 m^3 (or 4 full vessels)
- Use of Baker Lake Community Centre: Between 5 and 10 times per year
- Use of other Nunavut airports to access commercial/chartered flights: Between 2000 and 3000 times per year (passenger trips)

2017 estimates of use of infrastructure directly related to Meliadine are as follows:

- Use of Rankin Airport to access commercial flights (estimates not available)
- Use of Rankin Inlet airstrip for cargo and passengers: 196 flights
- Barges received in Rankin Inlet: 13 vessels for 176 000 m^3 (or 8.5 full vessels)
- Use of Rankin Inlet Community Hall (estimates not available)
- Use of the community boat launch area for barge landings (estimates not available)
- Use of the hamlet roads to transport goods from the barge to the operations (estimates not available)
- Use of community tank farm during commissioning of Agnico Eagle tank farm (estimates not available)

Available numbers represent best estimates, and do not include use of infrastructure by employees while they are not actively travelling for work related purposes (personal travel) or while they are doing non-work-related activities.

Interpretation

The use of public physical infrastructure by Meadowbank and its employees consists primarily of the use of airports and has been relatively consistent since operation began in 2010. There are no indications of significant positive or negative impacts on this infrastructure.

There is greater use of public infrastructure in Rankin Inlet from Meliadine than in Baker Lake from Meadowbank. This is largely due to the use of the Rankin Inlet airstrip, local roads (as the bypass road has not yet been completed) and the relatively central location of the community boat launch area for barge landings as compared to Baker lake. There are no indications of significant positive or negative impacts on this infrastructure.

9.3 Social assistance

Predictions

MEADOWBANK

"The impacts on social services and infrastructure, of low to medium magnitude, are considered largely positive in the medium term and of moderate significance. There is some potential for closure to have a negative impact on social service delivery." (Cumberland Resources Ltd., 2006, p. 128)

MELIADINE

"Project will also contribute to a better standard of living for the residents of the region as well as reducing dependence on social assistance programs" (Golder Associates, 2014, p. 1-xlviii)

Data & Trends

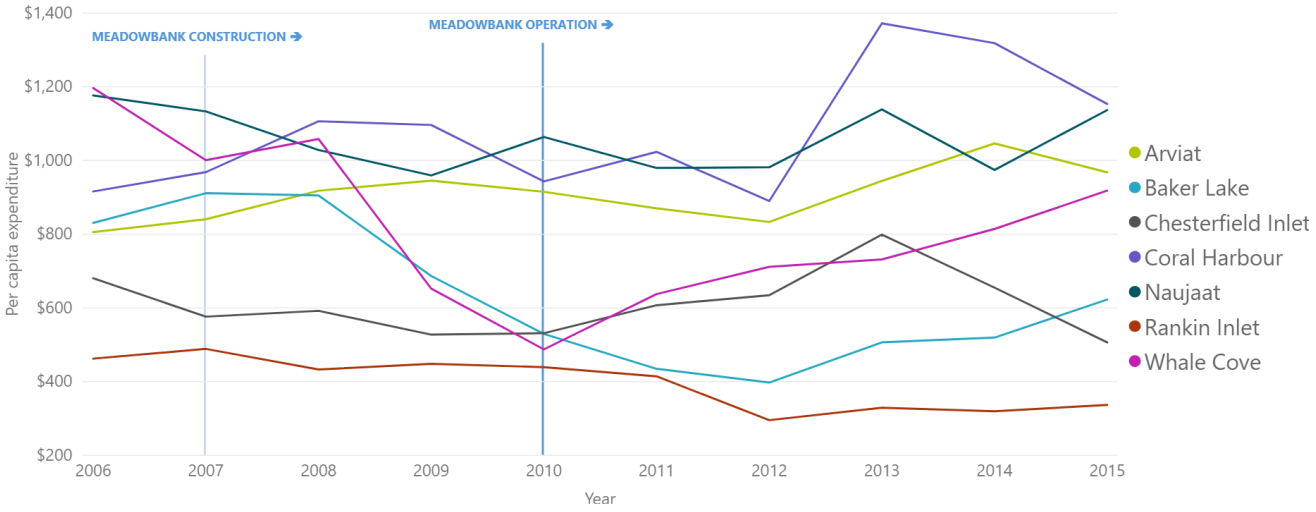


Chart 39 and Chart 40 show social assistance expenditures (in dollars) and the Department of Family Services' social assistance case load (# of cases) by Kivalliq community over time. Data for 2016 and 2017 are not available for either metric at the time of writing this report.

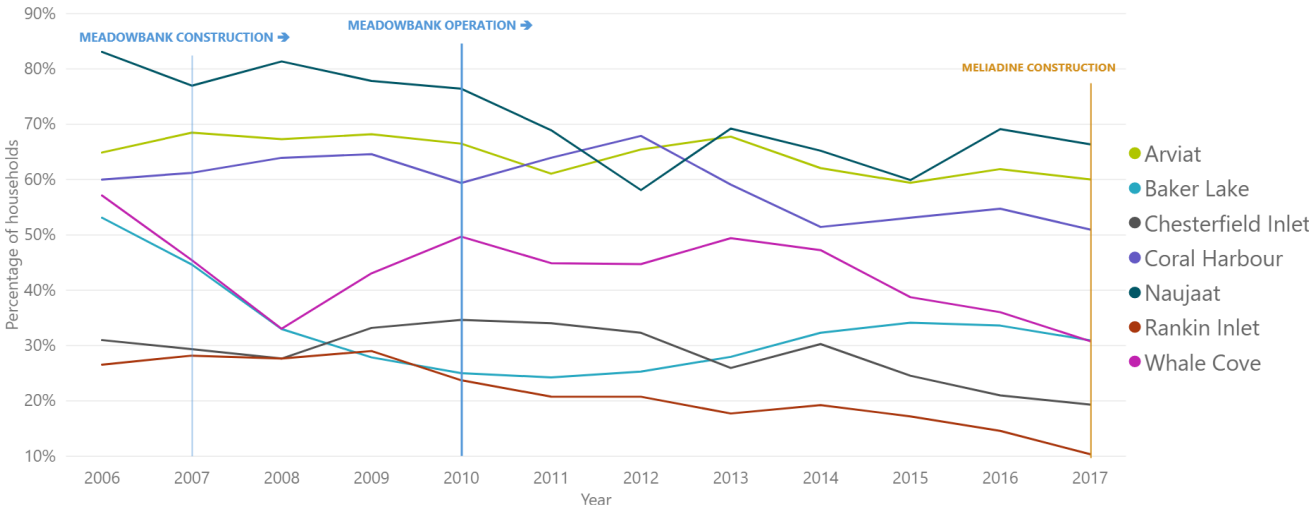
The following definitions are used in interpreting the charts below:

1) **Social Assistance** or income support is a program of last resort for Nunavummiut who, because of inability to obtain employment, loss of principal family provider, illness, disability, age or any other cause cannot provide adequately for themselves and their dependents. Social assistance is provided by the Government of Nunavut in the form of monthly financial payments to help individuals meet a minimum standard of living. All residents of Nunavut between the ages of 18 and 59 can apply for social assistance.
2) **Expenditures** are payments to social assistance recipients for food, shelter, utilities and fuel. This financial support is calculated to meet the basic needs of recipients and their dependents.
3) **Caseloads** refers to a single family receiving social assistance from the Department of Family Services

The Department of Family Services, Government of Nunavut, notes that it uses reasonable efforts to provide accurate and up-to-date information, but that some of the information provided is gathered manually and as a result may not be completely accurate. Since the year 2000, the social assistance program has been delivered without an electronic case management system.

Chart 39. Per capita social assistance expenditures by community



(Department of Family Services, 2018; Statistics Canada, 2011a; Statistics Canada, 2016a; Statistics Canada, 2006a)

A note on methodology

Caseload refers to the number of households receiving social assistance. The percentage of households in a community receiving social assistance was determined by dividing the average monthly caseload by the estimated number of households. The number of households is based on 'private dwellings occupied by usual residents' as reported in the census. Data from the 2006, 2010, and 2016 censuses were used, interpolating the number of households for intervening years by assuming a constant rate of change between censuses, and extrapolating the number of households for 2017 using the rate of change from the previous 5 years.

Chart 40. Percentage of households receiving social assistance by community

(Department of Family Services, 2017)

Interpretation

Per capita social assistance expenditures began to increase in 2010-2011 for several communities (including Baker Lake and Arviat) following a period of declining or steady expenditure in earlier years, including a notable decline in 2007/08 coinciding with construction starting at Meadowbank. There has been a continuous increase in expenditures for Baker Lake since 2011, while those of Rankin Inlet have remained relatively constant. However, per capita expenditures in both Baker Lake and Rankin Inlet are lower in 2015 than historic high levels prior to 2007/08.

For the Kivalliq region as a whole, per capita social assistance expenditures decreased gradually from 2007 to 2011, rose significantly in 2012, and have remained stable since then at a level (~$750) that is slightly lower than what it was in 2007 and 2006 (~$800).

The percentage of households receiving social assistance in Baker Lake declined significantly between 2006 and 2011, from 54% to 24%, coinciding with construction at Meadowbank and the opening of the mine. The proportion households receiving social assistance increased gradually between 2011 and 2015 (from 24% to 34%) but has remained below 2007 levels. In 2015, Baker Lake had the third lowest percentage of households receiving social assistance in the region (after Rankin Inlet and Chesterfield Inlet).

Despite declines from historical highs, social assistance data does not show a clear correlation between Agnico-related employment and social assistance requirements in Baker Lake or Arviat. Data suggests that both expenditures and percentage of households receiving social assistance have been declining in Rankin Inlet since Meadowbank began operation.

VSEC 10: Nunavut Economy

IMPACT / GOAL STATEMENT

Increased economic activity (GDP) and benefits to Inuit organizations and the Government of Nunavut through royalties and taxes

OVERARCHING FEIS PREDICTIONS

Meadowbank: "The economic impacts on the economy of Nunavut, of high magnitude, are positive over the medium term and of high significance, particularly during the construction phase." (Cumberland Resources Ltd., 2006, p. 129)

Meliadine: "The Project would add substantially to the income of government, e.g. through taxes and royalties. However, it will also lead to increased costs, since demand for various services will go up. Given that its fiscal burden (costs) will be smaller than the public revenues it generates, the Project would lead to a better fiscal position of all levels of government." (Golder Associates, 2014, p. 1-C-52)

TRENDS & INTERPRETATIONS

Metric	Meadowbank trends			Meliadine trends		Interpretation
	Pre-dev	Post-dev	Last year	Pre-dev	Last year	
10.1 Royalties and taxes						
Project compensation, royalties and taxes paid	N/A	↑	↑	N/A	↑	Cumulative project royalties, taxes and other payments paid by Agnico Eagle to the GN, GoC, NTI and KIA increased at both Meadowbank and Meliadine in 2017. At Meadowbank this is largely due to IIBA payments to the KIA following 2017 agreements. At Meliadine this is largely due to increases in payroll taxation following the onset of major construction.
10.2 Trade balance						
Nunavut trade balance	↓	↑	N/A	↑	N/A	Nunavut's net exports have increased steadily since 2008, following a dramatic increase in the trade deficit from 2006 to 2008 that was linked to the construction activities at Meadowbank. Since Meadowbank began operations in 2010, Nunavut's net exports have increased by approximately $131M. No trend regarding the impacts of Meliadine on Nunavut's trade balance can be determined with the current available data.
10.3 Nunavut GDP						
Nunavut GDP by all industries and mining, quarrying and oil & gas	↑	↑	↑	N/A	↑	Coinciding with Meadowbank becoming operational, Nunavut's GDP has grown at an average of 6% annually from 2009 to 2017. A sharp increase of 12% occurred in 2017.
Nunavut GDP by all industries and mining, quarrying and oil & gas	↓	↑	↑	N/A	↑	According to the Conference Board of Canada, Meadowbank has been a driver of Nunavut's GDP growth, both during the construction of the mine and since production began in 2010. The 12% increase observed over the past year may in part be attributed to construction activities at Meliadine and Whale Tail, most notably a large increase in contract expenditures for the two construction projects.

Understanding the trends & interpretations table

Time horizon	Direction	Value
Pre-dev: trend prior to the operation / construction phase of the project (2010 for Meadowbank; 2017 for Meliadine) **Post-dev**: trend from the onset of operation of Meadowbank (2010). As 2017 is the first year of major construction at Meliadine, post-development trends are not considered for the current reporting year. **Last year**: movement from 2016 to 2017	↑ Increasing ↓ Decreasing → Remaining stable / No discernable trend **N/A** Not applicable	■ **Positive**: change in indicator towards the achievement of the desired impact or goal ■ **Negative**: change in indicator away from the achievement of the desired impact or goal ■ **Neutral**: no observed change in indicator with regard to the achievement of the desired impact or goal

Existing Management and Mitigation

Maximizing benefits for the Nunavut economy is achieved through Agnico Eagle actions to maximize local employment and local contracting, and ensure community health, safety and well-being – as described under previous VSECs in this report.

10.1 Royalties and taxes

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS regarding royalties and taxes for Kivalliq, Nunavut or Canada.

MELIADINE

"Project would increase public revenues, e.g. through taxes and royalties. Total tax effects during construction might be $27 million. The annual tax effect during operations might be $21 million." (Golder Associates, 2014, p. 1-C-47)

Data & Trends

Chart 41 below presents royalty, taxes and other payments paid by Agnico Eagle to the GN, GoC, NTI, and KIA.

Chart 41. Project payments, royalties and taxes paid

MEADOWBANK

	2010	2011	2012	2013	2014	2015	2016	2017	Total
GN payroll taxes GN (territorial taxes, WSCC)						$3.4M	$2.9M	$2.8M	**$9.1M**
GN property taxes	$1.2M	$1.2M	$1.2M	$1.2M	$1.8M	$1.8M	$1.8M	$1.8M	**$12.0M**
GoC payroll taxes (federal taxes, EI, CPP)						$30.9M	$31.3M	$30.4M	**$92.6M**
KIA IIBA payments (Meadowbank 2017 IIBA)								$2.5M	**$2.5M**
KIA IIBA payments (Whale Tail 2017 IIBA)								$6.5M	**$6.5M**
KIA payments (2011 IIBA) (confidential)				Confidential					
KIA royalties (N/A until Whale Tail)									**$0.0M**
NTI royalties (confidential)				Confidential					
Total	**$1.2M**	**$1.2M**	**$1.2M**	**$1.2M**	**$1.8M**	**$36.1M**	**$36.0M**	**$44.0M**	**$122.7M**

MELIADINE

	2015	2016	2017	Total
GN payroll taxes GN (territorial taxes, WSCC)	$0.3M	$0.2M	$0.5M	**$0.9M**
GN property taxes				**$0.0M**
GoC payroll taxes (federal taxes, EI, CPP)	$1.3M	$1.6M	$5.4M	**$8.4M**
KIA IIBA payments	$1.5M	$1.5M		**$3.0M**
KIA royalties				**$0.0M**
NTI royalties (confidential)		Confidential		
Total	**$3.1M**	**$3.3M**	**$5.9M**	**$12.3M**

(Agnico Eagle Mines, 2017)

Interpretation

Meadowbank's payroll taxes paid to the federal government have held steady over the past three years at approximately $30M. Unfortunately, data is not available prior to 2015, however, we would expect the taxation to remain commensurate to the FTEs at the site, which has remained relatively stable since 2011. Maxes paid to the GN have declined slightly over the same period from approximately $3.4M in 2015 to $2.8M in 2017.

Meliadine's federal payroll taxes to rose by 238% to $5.4M in 2017, commensurate with a similar rise in Agnico Eagle FTEs over the same period (223%). The total Agnico Eagle Meliadine payroll taxation in 2017 (both GoC and GN) was $5.9M. While the construction tax effects predicted in the FEIS is $27M, this number includes both contractor and Agnico Eagle employment. Contractor payroll and taxation data is unavailable; however, we can estimate the total taxation effect (from payroll) based on Agnico Eagle's data and contractors FTE levels for 2017 at approximately $28.7M[8], just above the FEIS prediction. While this relies on a number of assumptions (most notably a similar level of compensation paid to both Agnico Eagle and contractor staff) it does provide an indication that the prediction is being met.

Given the location of the mine on Inuit Owned Lands, all resource royalties flow directly to NTI and the KIA as the Inuit authority. Compensation paid to KIA stems from Meadowbank, Meliadine and exploration activities. Due to confidentiality terms within the various agreements under which payments and royalties are made, not all data can be reported on.

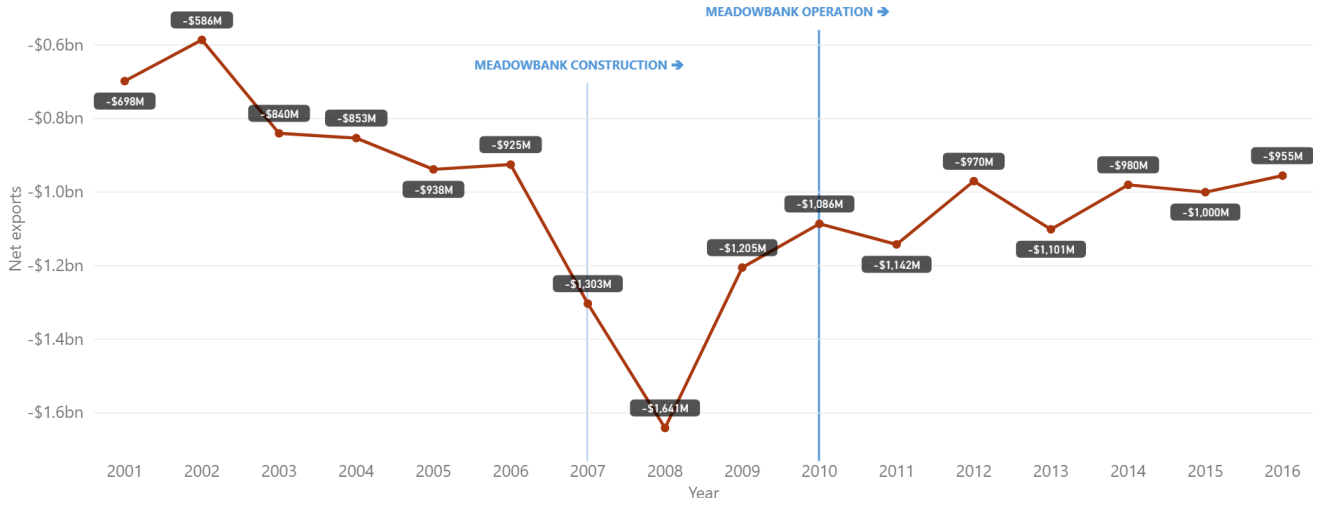
10.2 Trade balance

Predictions

MEADOWBANK

There are no predictions in the Meadowbank FEIS regarding trade balance in Nunavut.

MELIADINE



The Project will increase Nunavut's trade deficit to $1866 million from the 2010 deficit of $878 million (in 2002 dollars) during construction phase. (Golder Associates, 2014, p. 1-117)

Data & Trends

Chart 42 depicts Nunavut's trade balance from 2000 to 2016 in chained 2007 dollars. The trade balance is calculated by subtracting the value of total goods imports from total exports.

[8] Calculated by: $\frac{Contractor\ FTEs\ (2017)}{Agnico\ Eagle\ FTEs\ (2017)} * Agnico\ Eagle\ Payroll\ Taxes\ (2017) + Agnico\ Eagle\ Payrol\ Taxes\ (2017)$

Chart 42. Nunavut trade balance

(Statistics Canada, 2016d)

Interpretation

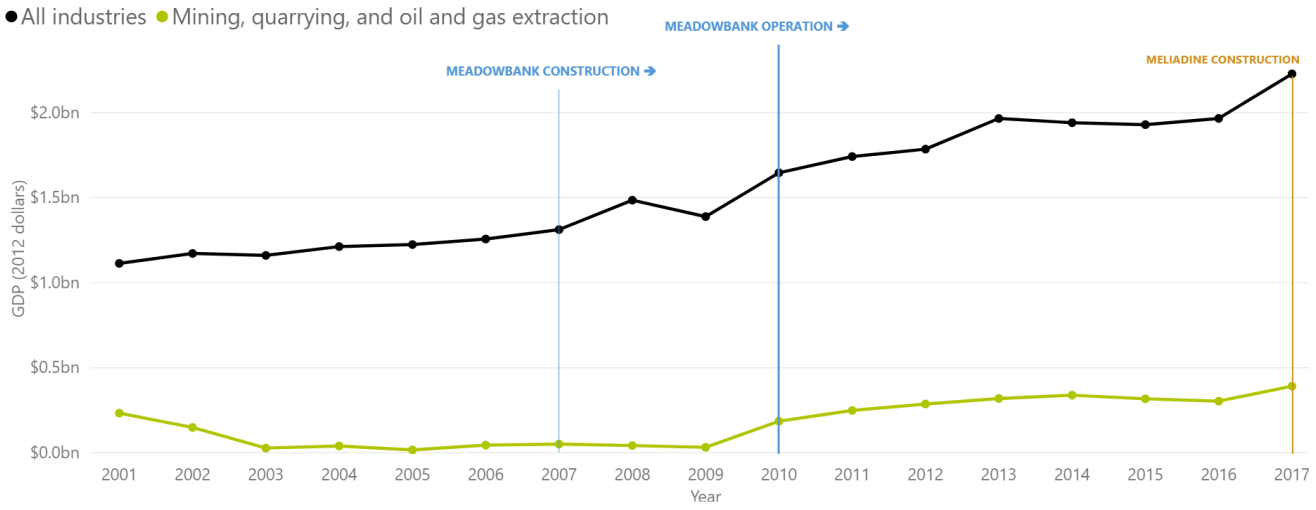
Between 2006 and 2008, Nunavut's trade deficit increased significantly by $338M coinciding with major construction activities at Meadowbank. However, since Meadowbank began operations in 2010, Nunavut's net exports have increased by approximately $131M, bringing the value to $33M above the 2006 figure. There are no predictions in the Meadowbank FEIS regarding the project's potential impact on Nunavut's trade balance, however the Meliadine FEIS predicts that Meliadine will contribute to a large increase in Nunavut's trade deficit during construction phase (down to a deficit of $1,866 million). No trend regarding Meliadine's impacts on the trade balance can be determined with the current available data.

10.3 Nunavut GDP

Predictions

MEADOWBANK

"The results indicate that during the construction phase, the project would contribute $120.3 M to the GDP of Nunavut … During the operations phase, the annual contribution to GDP would be $35.5M…" (Cumberland Resources, 2006, p. 119)



MELIADINE

"Investment and expenditures of [the] Project would temporarily expand the size of the economies of Nunavut and the Kivalliq region. Total effects during construction might be $520 million. The annual effect during operations might be $272 million." (Golder Associates, 2014, p. 1-C-47)

Data & Trends

The following chart shows the value of Nunavut gross domestic product (GDP), in current prices, from 2000 to 2017.

Chart 43. Nunavut GDP by all industries and mining, quarrying and oil & gas

(Statistics Canada, 2017)

Interpretation

Nunavut's GDP steadily increased from 2000 to 2008 at an average annual rate of approximately 4%. Following a decline in 2009 due to the global recession, a sharp increase was seen in 2010, when Meadowbank began production. Coinciding with Meadowbank becoming operational, Nunavut's GDP has grown at average annual rate of approximately 6% from 2009 to 2017. As seen in the chart above, the growth from 2009 onwards can largely be attributed to an increase in mining, quarrying and oil & gas activity. Given that Meadowbank was the only operating mine in Nunavut from 2010 to 2015 (Baffinland's Mary River Project began operations in 2015), the GDP growth data suggest that Meadowbank's contribution to GDP has exceeded the FEIS prediction. Mining industry GDP growth was relatively flat in 2013-2016, reflecting general business conditions in the industry. For Meadowbank, this has been a period of relatively stable operation and reduced total contract expenditures (as described under VSEC 3: Contracting and Business Opportunities). The increase in Nunavut's GDP (12%) in 2017 may in part be attributed to construction activities at Meliadine and Whale Tail, most notably a large increase in contract expenditures for the two construction projects.

TERMS OF REFERENCE

1 PURPOSE

1.1 This document sets out the terms of reference ("Terms of Reference") for the Socio-Economic Monitoring Working Group (the "Working Group") for AEM Kivalliq Projects in its activities in relation to the Socio-Economic Monitoring Program (the "Program") for AEM Kivalliq Projects. This Working Group aims to support the Kivalliq Socio-Economic Monitoring Committee (the "KvSEMC") in its regional monitoring initiatives, and to support the Program. The Working Group will identify areas of mutual interest to the Parties and socio-economic monitoring priorities of the KvSEMC related to AEM's projects in the Kivalliq region.

1.2 The purpose of the Program, from a socio-economic point of view, is described in Section 135 of the *Nunavut Planning and Project Assessment Act* ("NuPPAA") and Article 12, Part 7 of the *Nunavut Land Claims Agreement* ("NLCA"), the relevant provisions of which provide as follows:

NuPPAA section 135(3):

(a) measure the impact of the project on the ecosystemic and socio-economic environments of the designated area;

...

(d) assess the accuracy of the predictions contained in the project impact statement.

NLCA section 12.7.2:

(a) to measure the relevant effects of projects on…. socio-economic environments of the Nunavut Settlement Area;

...

(d) to assess the accuracy of the predictions contained in the project impacts statements.

1.3 The establishment of the Working Group is to satisfy and to fulfil parts of the terms and conditions set out in the Meadowbank Project Certificate (PC004), the Meliadine Project Certificate (PC006), and the Whale Tail Project Certificate (00X) issued by the Nunavut Impact Review Board (the "NIRB") in respect of AEM projects within the Kivalliq Region (the "Projects") to the extent that these project certificates address socio-economic monitoring.

2 KvSEMC AND REGIONAL MONITORING BACKGROUND

2.1 The KvSEMC is a forum for stakeholders to meet on an annual to semi-annual basis and present data, and consider socio-economic impacts and benefits of mining projects on the Kivalliq region.

2.2 The KvSEMC reviews the Program results annually, including the consideration of areas of mutual interest and socio-economic monitoring priorities as identified by the Working Group.

2.3 The KvSEMC supports a collaborative monitoring framework by providing data to support socio-economic impacts monitoring, recommending the prioritization of identified areas for monitoring and mitigation, and providing recommendations for areas of monitoring and mitigation that have yet to be identified.

3 WORKING GROUP MEMBERSHIP AND MEMBER ROLES AND RESPONSIBILITIES

3.1 The Working Group consists of:

a. At least one AEM representative (who is chair of a meeting if it relates to Projects monitoring)
b. At least one Government of Nunavut representative (who is chair of a meeting if it relates to territorial monitoring); and
c. At least one Government of Canada representative.

3.2 Each member is responsible for the costs they incur to participate in activities of the Working Group.

3.3 AEM will:

a. identify indicators and share Project-specific data that relates to the Program;
b. participate in the collaborative analysis and interpretation of data for reporting purposes;
c. present for review the effectiveness of AEM's socio-economic mitigation measures; and
d. prepare and provide presentations summarizing annual Program report findings and conclusions for the KvSEMC.

3.4 The Government of Nunavut will:

a. identify indicators and share government-sourced data that relates to the Program and other KvSEMC reporting requirements;
b. participate in the collaborative analysis and interpretation of data for reporting purposes; and
c. review the effectiveness of AEM's socio-economic mitigation measures.

3.5 The Government of Canada will:

a. identify indicators and share applicable socio-economic data from the Nunavut General Monitoring Plan;
b. participate in the collaborative analysis and interpretation of data for reporting purposes; and
c. review the effectiveness of AEM's socio-economic mitigation measures.

3.6 Collection, use, and disclosure of information and data under these Terms of Reference, by each member of the Working Group, is subject to any rules governing the collection, use, and disclosure of personal and/or confidential information and data, applicable to each member respectively, in accordance with the provisions of any privacy legislation or corporate policies. This obligation survives the dissolution of the Working Group and the existence of the Projects.

3.7 The Parties acknowledge that:

a. AEM is best able to collect and provide data concerning workforce demographics, employment, training and procurement in relation to the Projects; and
b. the Government of Nunavut and the Government of Canada are best able to collect and provide public statistics on general health and well-being, food security, demographics and other socio-economic indicators at the community and territorial level.

4 WORKING GROUP MANDATE

4.1 The Working Group aims to support the development of the Program framework and to undertake collaborative monitoring in order to identify and access data in relation to the Program. This data will be useful in improving the socio-economic performance of the Projects. Collaborative monitoring will involve combining Project-specific performance data with data generated or provided by other members of the Working Group in order to support adaptive-management measures implemented by the Working Group members and to minimize adverse effects and maximize benefits from the Projects.

4.2 The Working Group shall monitor the Program by analyzing the monitoring data in order to assess the accuracy of socio-economic impact predictions made in the final environmental impact statements of the Projects; assess the effectiveness of current practices to mitigate adverse effects and enhance positive effects of the Projects; obtain early warning should mitigation measures or measures to enhance positive effects not be achieving their intended outcome; and provide timely detection of unanticipated outcomes.

4.3 The Working Group aims to improve understanding of prioritized socio-economic issues in order to increase confidence in socio-economic assessment predictions.

4.4 The Working Group will provide monitoring data and objective analysis in a manner that is focused, efficient and cost-effective.

5 REPORTING AND COMMUNICATION

5.1 AEM will prepare an annual socio-economic report for the Projects (the "Program Report") and provide the Program Report to the Working Group and the KvSEMC for review, prior to its submission to the NIRB. Annual Program Reports are due for submission to NIRB on June 30 of each year, containing data with respect to the previous calendar year (January to December) and presented at the Project- and regional-scale of operations. The Program Report will further describe AEM's participation on the KvSEMC, other collaborative monitoring processes and any activities related to understanding socio-economic processes.

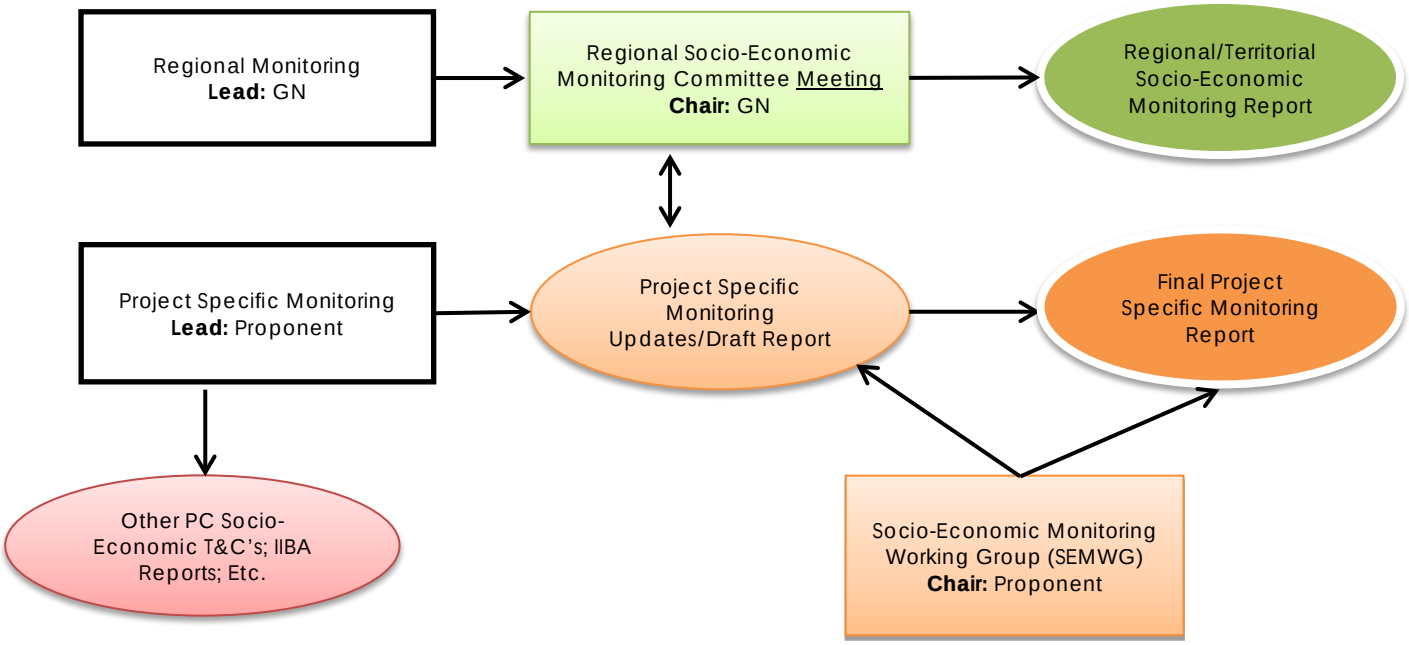
5.2 Annual reporting in respect of the Whale Tail project will only commence following the start of construction activities if AEM decides to proceed with the project after the issuance of a project certificate.

5.3 AEM will prepare and circulate a draft of the Program Report to the Working Group and KvSEMC for review prior to the KvSEMC meeting. The draft Program Report executive summary should be in plain language and translated for potential unilingual community representatives.

6 MEETINGS

6.1 The Working Group will continue to meet for as long as there remains at least one (1) Project in the Kivalliq Region.

6.2 The Working Group will meet at least twice per year for the purposes of reviewing and providing direction on the development of the Program Report.



6.3 The Working Group will meet at least once a year for its members to engage in the analysis and interpretation of data to support the SEMC Report.

6.4 The meeting schedule may be changed if agreed to in writing by all members of the Working Group.

6.5 The Working Group will endeavor to meet face to face whenever practical. However, recognizing Nunavut's unique logistical challenges and the competing deadlines involved in reporting, teleconferences and email circulation will also satisfy meeting requirements if agreed to in writing by all members.

7 RELATIONSHIP WITH REGIONAL AND TERRITORIAL MONITORING

7.1 The diagram outlines the relationship between Project-specific monitoring and regional/territorial monitoring, and its respective reporting requirements:

8 PROJECT CLOSURE

8.1 Mine Closure

AEM will consult the Working Group and KvSEMC two (2) years in advance of the expected date of closure for each Project in order to better inform project-specific socio-economic closure planning, and keep the Working Group and KvSEMC informed of the progress of planning leading up to the submission of the project-specific socio-economic closure plan, submitted under the final closure plan. Planning will detail specific measures that may mitigate, at least to some extent, the potential for negative effects as a result of Project closure.

8.2 Premature Mine Closure

In the event of premature (temporary or final) closure of the Project, AEM will consult with the Working Group and KivSEMC before submitting an updated Socio-Economic Management Plan to NIRB.

9 REVIEW OF TORS

These Terms of Reference may be reviewed by the Working Group periodically for any required changes that may be applicable as Projects evolve from construction, through operations and closure. Similarly, as any other exploration or mine development activities of AEM are approved within the Kivalliq Region, these Terms of Reference shall be reviewed and amended as necessary to accommodate additional terms and conditions applicable to the Project that may be issued by NIRB as part of a project certificate(s). Any changes to the Terms of Reference will be in writing.

Appendix N-1

Project Certificate 006 terms and conditions cross-reference table

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
Air Quality		
1	Prior to commencing construction activities, the Proponent shall update its Air Quality Monitoring Plan, and shall consider installing two real-time air monitoring stations in advance of mining operations. The updated plan shall include, but is not limited to, details regarding the following: a. Description of real-time air monitoring stations including proposed timing of installation, location, and any factors considered with regards to planning for the installation; b. Plans for the collection of total suspended dust samples year round, including sampling for metals content relevant to the Project; c. Description of snowpack surveys and dustfall collectors; d. Description of lichen surveys; e. Identification of near field, far field and reference sites that are located with consideration of ambient wind conditions; f. Baseline data collected prior to significant construction activity; and g. A description of the proposed annual reporting mechanism and response framework.	See: • Air Quality Monitoring Plan, Version 1 (November 2015) • Terrestrial Environment Management and Monitoring Plan (TEMMP), Version 2 (November 2015) and Agnico Eagle's Meliadine Gold Project 2018 Annual Report. Collection of air monitoring started December 2018, snowpack survey to start before 2019 freshet, procedure completed
2	The Proponent shall demonstrate through monitoring of air quality at the aboveground emissions points at the mine site and at the Tiriganiaq site that sulphur dioxide (SO2) and nitrous dioxide (NO2) emissions remain within predicted levels and, where applicable, within limits established by all applicable guidelines and regulations. In cases where exceedances occur, the Proponent shall provide an explanation for the exceedance, a description of planned mitigation, and shall conduct additional monitoring to evaluate the effectiveness of mitigative measures.	See Agnico Eagle's Meliadine Gold Project 2018 Annual Report, in which it is noted that the measured annual average concentrations were well below the Government of Nunavut Ambient Air Quality Standards, and FEIS maximum predicted values.
3	Prior to commencing construction activities the Proponent shall update its dust management and monitoring plan to address and/or include the following additional items: a. Align plan requirements with commitments made in the FEIS and during the Final Hearing to monitor dust along the all-weather access road and associated roads and trails. b. Verify commitments to the utilization of dust suppressants along the all-weather access road including and associated roads and trails, including a description of the type of suppressant to be utilized, the frequency and timing of applications to be made throughout the various seasons of road use. c. Outline the specific adaptive management measures to be considered should monitoring indicate that dust deposition is higher than predicted, specifically where traffic along the all-weather access road is greater than initially predicted.	Refer to dust management plan in Agnico Eagle's Meliadine Gold Project 2018 Annual Report (Appendix I-1). Calcium chloride was used along the entire AWAR in 2018, the alternative chemical supressant (Dust stop) was tested to evaluate the performance in terms of dust suppression but did not shows to be more effective than the calcium chloride. Dust stop also required special equipment for application that was not available at the time the dust suppression was required. Dust supressant will be apply on the entire AWAR in 2019 as well as water. Agnico meet with the Hamlet to ensure effective dust supressant in 2019
4	The Proponent shall develop and implement an Incineration Management Plan that takes into consideration the recommendations provided in Environment Canada's Technical Document for Batch Waste Incineration (2010).	See Incineration Management Plan and Agnico Eagle's Meliadine Gold Project 2018 Annual Report (Appendix I-1)
5	The Proponent shall provide all stack testing conducted on temporary or permanent incinerators operated for the Project to the NIRB in the annual report for that year.	Stack testing was conducted in 2018, see Agnico Eagle's Meliadine Gold Project 2018 Annual Report for results
6	The Proponent shall employ appropriate dust suppression measures when conducting activities in the landfill such as topping or capping.	The landfill is progressively capped and during the activity, visual monitoring occurs and if necessary, water is apply. Please refer to Agnico Eagle's Meliadine Gold Project 2018 Annual Report and the Dust management plan (Appendix I-1)
Climate and Meteorology		
7	The Proponent shall provide within its annual report to the NIRB, calculations of greenhouse gas emissions generated by activities at the Itivia port and other Project sources including mine-related road traffic and aircraft associated with the Project. Calculations shall take into consideration, fuel consumption as measured by the Proponent's purchase and use as well as the fuel use of its contractors and sub-contractors.	Greenhouse Gas are provided in Agnico Eagle's Meliadine Gold Project 2018 Annual Report. The amount is base on the amount of fuel consumed from the project reserves and therefor only project-related traffic is calculated. Please refer to the Greenhouse Gas Reduction Plan in Appendix I for more details. Project related and non-related traffic is discussed in Agnico Eagle's Meliadine Gold Project 2018 Annual Report.
8	To actively engage Inuit in initiatives related to climate change, where it is feasible, the Proponent shall endeavour to include the participation of Inuit from affected communities when undertaking climate-change related studies and research.	Consultation with Inuits occured regarding the windfarm project, continued efforts to engage with inuit and partner in long term sustainable energy sources including wind power and hydroelectricity. In 2019 an education program in association with the University of Saskatchewan will occur and climate change will be part of the discussion to raise the awareness. The MOU signed with the KHTO will also raise the participation in different studies related with climate change

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
9	Prior to the commencement of operations, the Proponent shall develop a Greenhouse Gas Emissions (GHG) Reduction Plan which includes, but is not limited to: a. An estimate of the Project's GHG baseline emissions; b. A description of monitoring measures to be undertaken, including the methods, frequency, parameters, and a description of data analysis; and, c. A description of mitigative and adaptive strategies planned, and taken, toward reducing the Project-related emission of greenhouse gases over the Project's life.	Greenhouse Gas Emissions (GHG) Reduction Plan was submitted to the NIRB February 1st 2019 and can be found in Agnico Eagle's Meliadine Gold Project 2018 Annual Report (Appendix I-1). Results are found in Agnico Eagle's Meliadine Gold Project 2018 Annual Report
Noise and Vibration		
10	The Proponent shall further develop and implement its noise abatement plan to protect people and wildlife from mine activity noise, including, blasting, drilling, equipment, vehicles and aircraft. The noise abatement plan will be developed in consultation the Government of Nunavut, Environment Canada and Health Canada as appropriate, and at a minimum is to include: a. Restrictions on blasting and drilling when migrating caribou, birds or local carnivores may be affected; b. The establishment of strict standards for noise levels; use of equipment and vehicles with the best noise attenuation devices; c. When practical, the use of fences or berms around noisy machinery or sites; d. Flight corridor restrictions over sensitive areas with known concentrations of wildlife and birds whenever possible; e. Requiring with the exception of take off and approach for landing, a minimum flight altitude of 300 metres above ground level when flights to and from the mine site are passing near sensitive wildlife and bird areas; and, f. The incorporation of the use of sound metres to monitor sound levels at locations in and around the mine site and local study area. The location and design of the sound metres shall be selected in consultation with EC and set up immediately upon issuance of the Project Certificate for the purpose of obtaining baseline data, and shall be maintained for data collection during and after operations.	Noise Abatement and Monitoring Plan, Version 2 (March 2017) • Terrestrial Environment Management and Monitoring Plan (TEMMP), Version 2 (November 2015)
11	The Proponent shall conduct noise and vibration monitoring at Project accommodations sites located at the Tiraginiaq mine site. Sampling shall be undertaken during the summer and winter months during all phases of Project development, with reporting of results and implementation of associated mitigation measures as necessary reported to the NIRB.	Noise monitoring is presented in Agnico Eagle's Meliadine Gold Project 2018 Annual Report. For the vibration monitoring, due to equipment malfunction and avaibility, no monitoring occured in 2018. Equipment was received in December, surface blasts are monitored since and underground monitoring will start in April 2019
Terrestrial Environment		
12	The Proponent shall conduct further permafrost mapping to document permafrost temperature, thickness of seasonal thaw and amount of ground ice in the Project development area, with such information to be available to inform the detailed design of Project infrastructure (i.e., dikes and tailings storage facility designs and talik predictions for lakes that are to be dewatered or used for saline water storage).	See Agnico Eagle's Meliadine Gold Project 2018 Annual Report – Appendix B (2018 Annual Geotechnical Inspection)
13	The Proponent shall undertake additional geotechnical investigations as required to identify sensitive landforms, modify engineering design for Project infrastructure (i.e., dikes, tailings storage facility, waste rock pile and landfill), and develop and implement preventative and/or mitigation and monitoring measures to minimize the impacts of the Project's activities and infrastructure on sensitive landforms. Plans for the investigations, mitigative and monitoring measures are to be included within an updated Environmental Protection Plan.	See in Agnico Eagle's Meliadine Gold Project 2018 Annual Report a summary of the geotechnical report and the complete report in Appendix B. The updated Environmental Management and Protection Plan is in Appendix I-1
14	The Proponent is encouraged to conduct more detailed thermal analysis to support detailed design of the dikes and the tailings storage facility, including seepage and stability analysis, and shall incorporate the results of the analysis into Project design. Details of the thermal analyses undertaken are to be provided to the NIRB.	See Agnico Eagle's Meliadine Gold Project 2018 Annual Report – Appendix B: 2018 Annual Geotechnical Inspection.

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
15	The Proponent shall assess the potential environmental effects of a post closure failure of the geomembrane of the Tailings Storage Facility while tailings are in a thawed state. This assessment shall include, at a minimum: a. A description of the potential environmental effects of such a failure; b. Identification of the monitoring measures employed to detect environmental changes that could result; c. Identification of proposed mitigation measures to address any changes identified during monitoring; and d. Updated Risk Management Plan and Closure and Reclamation Plan reflecting changes which result from the post-closure failure assessment. A summary of the results from this assessment and implications to project infrastructure and operational plans shall be provided to the NIRB.	Mitigation measures are outlined in the Risk Management and Emergency Response Plan, Preliminary Closure and Reclamation Plan. Extensive risk assessment was performed during the trade-off study between conventional slurry TSF and dewatered dry-stack tailings storage. Ultimately, dewatered dry stack facitily was chosen over TSF due to better environmental performance and inherently lower risk
16	The Proponent shall finalize and implement a comprehensive erosion management plan to prevent or minimize the effects of destabilization and erosion resulting from Project activities.	See Freshet Action Plan and • Sediment and Erosion Management Plan Agnico Eagle's Meliadine Gold Project 2018 Annual Report (Appendix I-1)
17	The Proponent shall monitor the effects of the Project on permafrost conditions relative to Project infrastructure, including along the all-weather access road and associated roads, waste rock stockpile, trails and quarries. Through its monitoring the Proponent must demonstrate that permafrost integrity is maintained with implementation of appropriate preventative measures should permafrost degradation be observed.	See Meliadine Gold Project 2018 Annual Report – Appendix B for the thermal monitoring program
18	The Proponent shall provide the NIRB with copies of as-built drawings and final design plans for Project infrastructure as they are developed/finalized to assist with the Board's ongoing monitoring efforts.	Ongoing, as-built drawings and final design plans for Project infrastructure are being submitted to NWB as infrastructure is being built. Construction summary report is also provided monthly
19	The Proponent shall develop and implement a monitoring program for its Tailings Storage Facility and Waste Rock Storage Facility (including dikes). The monitoring program is to include, but shall not be limited to: a. Plans for monitoring the thermal condition and stability of storage facilities (including deformation of the cover) and dikes, including the use of thermistor cables, temperature loggers, and core sampling technology as required to monitor dike stability and tailings freezeback efficiency, including for example, factors such as ice content and stability; and, b. Measures proposed to ensure the safe containment and structural integrity of Project infrastructure, and to prevent contamination of waterbodies. Details of the monitoring program shall provided to the NIRB.	The monitoring program for the Tailing Storage Facility was submitted to the NWB November 15th 2018 and the Waste Rock Facility Storage monitoring program will be submit prior to construction
20	The Proponent shall explore the feasibility and practicality of topsoil/organic matter salvage as part of phased approach to Project development, with updates to its Closure and Reclamation Plan to reflect any changes based on this investigation. The Closure and Reclamation Plan should be updated on an on-going basis as more information becomes available from similar reclamation projects, including experience with implementing closure and reclamation plans at the Meadowbank mine site, as applicable.	Research are ongoing with the University of Saskatchewan for progressive re-vegetation. See Meliadine Gold Project 2018 Annual Report and Appendix I-1. The interim closure and reclamation plan will be updated within six months of commercial operation

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
21	The Proponent shall update its Waste Management Plan to include details which explain how the design employed for Project landfills is expected to protect the integrity of the local environment, including permafrost integrity, and water quality for adjacent waterbodies. The Proponent shall demonstrate its consideration for the use of liners at waste management facilities, where feasible.	Landfill and waste Management Plan were submitted in which it notes that based on the proposed design, management and operating procedures, a liner for the landfill is not considered necessary. The Landfill and Waste Management Plan includes the objective of reducing, reusing, and recycling to minimize wastes. The recycling wood option with the community is something Agnico Eagle will investigate in the future
Geology (including Geochemistry)		
22	The Proponent shall report annually to the NIRB on the adaptations it has had made to the Mine Waste Management Plan and practices based on results obtained through monitoring.	See Mine Waste Management Plan in Meliadine Gold Project 2018 Annual Report Appendix I-1.
23	Prior to the commencement of excavation at the Discovery deposit, the Proponent, in consultation with Natural Resources Canada, shall update its Mine Waste Management Plan to assess the potential for acid rock drainage and to identify any monitoring and mitigation measures that may be required in this development area.	Scheduled for 2024
Hydrogeology and Groundwater Quanity and Quality		
24	The Proponent shall, reflecting any direction from the Nunavut Water Board during water licensing, collect new hydraulic data (e.g., from new monitoring wells) in key areas during the pre-development, construction and operation phases to better define vertical and horizontal ground flow in the project development area.	Report submitted Q4 2016, updated reports and/or information will be provided throughout operations
25	The Proponent shall submit a detailed Groundwater Management Plan to the NIRB which includes mitigation measures designed to address the potential for higher-than-predicted volumes of saline water inflows into the underground mine, treatment and disposal methods, and details of its plan to monitor saline water at site. The plan must identify uncertainties pertaining to predictions for groundwater quality and quantity and inform adaptive management strategies for the site. CIRNAC should be consulted with respect to the contents of the Plan and any required mitigation measures.	See Groundwater Management Plan in Meliadine Gold Project 2018 Annual Report Appendix I-1. Also the SWTP OMM done in July 2018 and the design report was sent to the NWB. Discharge saline effluent to the marine environment is also a mitigation measure.
26	To assess the flow of groundwater into the lake the Proponent shall carry out continued analyses over time to confirm and update, accordingly, the approximate fill time for the mine pits as identified in the FEIS.	Estimates of the approximate fill time for the mine pits at closure are provided in the Water Management Plan in Meliadine Gold Project 2018 Annual Report Appendix I-1
27	The Proponent shall update its Aquatic Effects Monitoring Plan (AEMP) to include, at a minimum: a. Details regarding the monitoring of non-point sources of discharge, selection of appropriate reference sites, measures to ensure the collection of adequate baseline data at Meliadine Lake prior to and during construction activities, including information on chemical loading in the snowpack, and the mechanisms proposed to monitor for and treat runoff and sediment; b. A description of measures to be undertaken as relate to dustfall monitoring, designed in accordance with the following: i. To establish Phase 1 all-weather access road baseline data and a description of plans for data collection during Project operations for comparison; ii. To facilitate comparison with existing guidelines; iii. To assess the seasonal deposition (rates, quantities) and chemical composition of dust entering aquatic systems along representative distance transects of the all-weather access road and Rankin Inlet by-pass road; c. A description of water quality monitoring to be conducted at Little Meliadine Lake; and d. Details regarding comparisons of results to be run against predicted values and the analysis of data to be undertaken on an annual basis, or as may be required.	See: Aquatic Effects Monitoring Program (AEMP) Design Plan 6513-REP-03 (April 2015) submitted to the NWB with the Proponent's Type A Water Licence application. Air Quality Monitoring Plan, Version 1 (November 2015). Data are provided in Agnico Eagle's Meliadine 2018 Annual report and Appendix G-1

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
28	The Proponent shall develop and implement a sediment and erosion management plan to prevent or minimize the effects of destabilization and erosion that may occur due to Project activities. The plan should also detail sediment control plans to prevent and/or mitigate sediment loading into surface water within the Project area.	See Freshet Action Plan and • Sediment and Erosion Management Plan in Agnico Eagle's Meliadine Gold Project 2018 Annual Report (Appendix I-1) and geotechnical report (Appendix B-2)
29	The Proponent shall develop and implement adequate monitoring and maintenance procedures to ensure that the culverts and other conduits that may be prone to blockage do not significantly hinder or alter the natural flow of water from areas associated with the proposed mine. In addition, the Proponent shall monitor, document and report the withdrawal rates for water removed and utilized for all domestic and industrial purposes.	Existing culverts and road infrastructure are inspected by Agnico on a regular basis, according to the watercourse crossing inspection and maintenance program. Refer to the Road Management Plan and the Freshet Action Plan. In addition, they were inspected during the Annual Geotechnical Inspection, and recommendations on how to prevent blockage are provided in the report (Agnico Eagle's Meliadine Gold Project 2018 Annual Report Appendix B). Water from culverts is not utilized for domestic or industrial purposes.
Freshet Aquatic Environment		
30	The Proponent shall update its Aquatic Effects Monitoring Plan (AEMP) to include, at a minimum: a. Provide details for additional reference lakes to be included within its sampling and monitoring programs; b. Updates to include sedimentation within relevant monitoring programs; and c. Results from additional testing for mercury in fish tissue, and include test results in updated baseline data.	See Aquatic Effects Monitoring Program (AEMP) Design Plan 6513-REP-03 (April 2015) submitted to the NWB with the Proponent's Type "A" Water Licence application. Data are provided in Agnico Eagle's Meliadine 2018 Annual report and Appendix G-1
31	The Proponent shall maintain an appropriate setback distance between project quarries and fish-bearing or permanent water bodies as required to prevent acid rock drainage or metal leaching into such water bodies.	Borrow Pits and Quarries Management Plan mandates maintaining of a setback of at least 31 m from watercourses. All rock, used in construction, is NPAG, as discussed in Agnico Eagle's Meliadine 2018 Annual report and Appendix C-1
32	Prior to the commencement of construction, the Proponent shall submit to the NIRB, a Site Drainage and Silt Control Plan.	See Freshet Action Plan and • Sediment and Erosion Management Plan in Agnico Eagle's Meliadine Gold Project 2018 Annual Report (Appendix I-1)
33	The Proponent shall meet or exceed the guidelines set by Fisheries and Oceans Canada for blasting thresholds and implement practical and effective measures to ensure that residue and by-products of blasting do not negatively affect fish and fish habitat.	Blast monitorng was restarted in 2019. Due to equipment malfunction and avaibility, no monitoring occured in 2018. The 2017 report can be provided if require.
34	The Proponent shall ensure that all Project infrastructure in watercourses is designed and constructed in such a manner that it does not obstruct or limit the natural movement of water in fish bearing streams and rivers.	Not yet applicable
Vegetation		
35	The Proponent shall ensure that Project components and activities are planned and conducted in such a way as to minimize the Project footprint; this should include input from potentially affected communities where applicable.	Minimization of the footprint is one of engineering objectives in the design of the project's components. The estimate of disturbed area (app. 484 ha) was completed and refers to specific plant communities and specific habitat types as requested and can be found in Agnico Eagle's 2018 Annual Report for the Meliadine Gold Mine and Appendix H-6
36	The Proponent shall ensure that equipment and supplies brought to Project sites are clean and free of soils that could contain plant seeds not naturally occurring in the area. Vehicle tires and treads in particular must be inspected, and cleaned if required, prior to transport into Nunavut for use in Project areas.	Vehicle tires and treads were inspected prior to transportation to Nunavut for use in Project areas and no issues were raised. However no inspection sheets were completed. In 2019, a procedure accompanied with an inspection checklist will be provided for inspection.

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
37	The Proponent shall incorporate protocols for monitoring for the potential introduction of invasive vegetation species (e.g. surveys of plant populations in previously disturbed areas) into its Terrestrial Environment and Monitoring Plan. Any introductions of non-indigenous plant species must be promptly reported to the Government of Nunavut Department of Environment.	See the TEMMP and the Progressive re-vegetation program report in Meliadine Agnico Eagle's 2018 annual report and Appendix H-6 and Appendix H-1

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
38	The Proponent shall conduct sampling to determine baseline levels for metals in soils found in areas with berry-producing plants near the Project area, and shall update relevant vegetation sections within the Terrestrial Management and Monitoring Plan to incorporate ongoing monitoring of these parameters prior to commencing operations.	Please refer to Agnico Eagle's Meliadine 2018 annual report and Appendix H-6. Sampling completed in 2017 and planned for 2019 and thereafter every 3 years
39	The Proponent shall develop and establish an on-going monitoring program to determine the distribution, abundance, and health of vegetation species used as caribou forage (such as lichens) near Project areas, prior to commencing operations.	Loss and disturbance of caribou forage (such as lichen) are provided in Agnico Eagle's Meliadine 2018 annual report and Appendix H-6
40	The Proponent shall review, on an annual basis, all monitoring information and the vegetation mitigation and management plans developed under its Environmental Management Plan and Terrestrial Environment and Monitoring Plan (TEMMP) and adjust such plans as may be required to effectively prevent or reduce the potential for significant adverse project effects on vegetation abundance, diversity and health, taking into account lessons learned at other northern mining developments where appropriate.	Additional reporting in terms of impacts to specific plant communities are provided in Agnico Eagle's Meliadine 2018 annual report and Appendix H-6.
41	Prior to the commencement of operations, the Proponent shall develop a progressive re-vegetation program for disturbed areas that are no longer required for operations, such program to incorporate measures for the use of test plots, reseeding and replanting of native plants as necessary. It is further recommended that this program be directly associated with the management plans for erosion control established for the Project and incorporate lessons learned at Meadowbank.	Please refer to the Progressive re-vegetation program report in Agnico Eagle's Meliadine 2018 annual report and Appendix I-1
42	The Proponent shall include re-vegetation strategies in its Closure and Reclamation Plan that support progressive reclamation and that promote natural revegetation and recovery of disturbed areas compatible with the surrounding natural environment and incorporate lessons learned at Meadowbank	Not yet applicable; the Preliminary Closure and Reclamation Plan will be revised at a later date and will incorporate findings from the re-vegetation study
Terrestrial Wildlife and Wildlife Habitat		
43	The Proponent shall continue to develop and implement Project-specific monitoring for the terrestrial environment through its Terrestrial Environment Management and Monitoring Plan (TEMMP), and will demonstrate appropriate refinements to design, incorporation of analytical methods and elaboration of methodologies. The TEMMP shall contain clear thresholds to allow for the assessment of long-term trends and cumulative effects where project interactions are identified. Coordination and cooperation will be required where data collection, analysis and interpretation, or responsibility for mitigation and management requires the efforts of multiple parties (e.g., government, Kivalliq Inuit Association, communities).	Please refer to Agnico Eagle's Meliadine 2018 annual report and Appendix H-6. The KHTO coordinator will participate in the monitoring and the interpretation of the data and AEM will revise the TEMMP.
44	In consultation with the Government of Nunavut (GN) and other relevant parties, the Proponent shall further develop its Terrestrial Environment Management and Monitoring Plan (TEMMP) to include increased caribou monitoring across the regional study area and additional details on the scope and design of monitoring programs. The Proponent shall also demonstrate consideration for contributing to existing and planned regional monitoring initiatives associated with terrestrial wildlife and wildlife habitat as appropriate. Monitoring should be adequate to test impact predictions, monitor impact thresholds and trends over time, and to support implementation of mitigation measures as proposed in the Final Environmental Impact Statement.	Agnico provides support for the GN caribou satellite-collaring program, support for muskoxen surveys and will collaborate with KHTO to conduct the wildlife surveys on AWAR and do the hunter harvest study now that the MOU is signed between AEM and the KHTO. The GN shared updated caribou data. Please refer to Agnico Eagle's Meliadine 2018 annual report and appendix H-6
45	The Proponent shall demonstrate consideration for cooperating with existing and planned regional and/or community-based monitoring initiatives associated with terrestrial wildlife and wildlife habitat that produce information pertinent to mitigating project-induced impacts. The Proponent shall give special consideration for supporting regional studies of population health and harvest programs for Qamanirjuaq caribou which help address areas of uncertainty for Project impact predictions.	Agnico provides support for the GN caribou satellite-collaring program, support for muskoxen surveys and will collaborate with KHTO to conduct the wildlife surveys on AWAR and do the hunter harvest study now that the MOU is signed between AEM and the KHTO. The GN shared updated caribou data. Please refer to Agnico Eagle's Meliadine 2018 annual report and appendix H-6

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
46	The Proponent shall update its Terrestrial Environment Management and Monitoring Plan (TEMMP) for the Project to include a detailed harvest study prepared in consultation with the Government of Nunavut (GN) and other affected parties. The design of the harvest study should demonstrate consideration for the following:a. Hiring of a dedicated local survey coordinator through local Hunters and Trappers Organizations (HTOs) and provision of adequate resources for the HTOs to run the program;b. The potential effects on caribou populations and on caribou behaviour resulting from increased human access caused by the all-weather access road and associated roads and trails; and,c. Increasing local knowledge of the project development areas, including establishing baseline harvesting levels prior to unrestricted public access on the all-weather access road.	The Hunter Harvest Agreement is incorporated into the funding agreement with the HTO. A work plan is expected to be established in 2019. For effects on caribou populations and on caribou behaviour resulting from increased human access caused by the all-weather access road and associated roads and trails please refer to Agnico Eagle's Meliadine 2018 annual report and appendix H-6
47	The Proponent shall share information with the Government of Nunavut (GN) relating to the migration of caribou and include the GN as a party respecting caribou monitoring and movement through Project development areas, including the all-weather access road and associated roads and trails.	Agnico entered the Memorandum of Understanding with GN on March 1, 2017 to share and increase the common knowledge of possible disturbance effects on caribou and muskoxen and their migration
48	In consultation with the Government of Nunavut, the Kivalliq Inuit Association, the Kivalliq Wildlife Board and local Hunters and Trappers Organizations, the Proponent shall develop appropriate monitoring and mitigation measures relating to the harvesting of caribou and improved harvesting access granted by the all-weather access road. These measures shall be included within a Road Access Management Agreement that must be in place prior to construction of phase 2 of the all-weather access road. The Road Management Agreement shall include the following specific measures: • During periods when large aggregations of caribou (greater than 50 individuals) are detected within 1 km of the all-weather access road (AWAR), the road will be closed to public access via car and truck by means of a barrier at the southern gate. Public access using all-terrain vehicles (ATVs) will be allowed. • During periods when large aggregations of caribou (greater than 50 individuals) are observed within 1 km of the AWAR, the road will be closed to public access via barriers at bridges on the AWAR to prevent all vehicle access, including ATVs. This will allow ATVs to enter areas previously accessible along existing trails while not facilitating access via bridges constructed specifically for the Project. • Following consultation with the Nunavut Wildlife Management Board, as required under the Nunavut Wildlife Act, it is recommended that a no-shooting zone (1 km wide) on either side of the road should be established as a condition of public access to the AWAR and compliance with this Agnico Eagle policy should be monitored and reported by the Proponent. • Dedicated 'road monitors' should patrol the road to ensure compliance with the provisions of the Road Management Plan (SD 2-9) relating to public safety and wildlife. Monitoring should be increased during periods of road closure when large aggregations of caribou are present. • All incidents of hunting involving shooting along or across the AWAR should be reported by the Proponent to the GN. • During periods when large aggregations of caribou are detected near the Project, harvest monitoring intensity should be increased to ensure that levels of caribou harvesting are properly documented.	The Road Access Management Agreement to be submitted to the NIRB at least 60 days prior to the commencement of increased traffic related to the marine outflow activities,
49	The Proponent is encouraged to consult with the Nunavut Research Institute (NRI) on the research permitting process as it relates to the Nunavut Scientists Act. The Proponent is encouraged to share monitoring and research study design with the NRI four (4) months prior to the anticipated commencement of research activities to facilitate licensing review.	Not applicable, At present, Agnico Eagle Meliadine has no active NRI permits in its name
50	The Proponent shall develop a strategy for the recovery of terrestrial wildlife habitat in a progressive manner that is consistent with the Nunavut Wildlife Act.	Revegetation study in collaboration with the University of Saskatchewan started in 2018, please refer to Agnico Eagle's annual report and Appendix I-1
51	The Proponent shall not conduct routine helicopter flights over, or land in, Iqalugaaruup Nunanga Territorial Park. The Proponent will communicate this commitment to all helicopter companies contracted by it to undertake work at the Meliadine Project site prior to the start of such contracted work. Emergency flights, specifically medical evacuation flights and/or search and rescue overflights are excepted from adherence to this requirement.	Agnico's Air Traffic Management Plan (part of the Wildlife Protection and Response Plan) imposes restrictions on air traffic
52	The Proponent shall undertake periodic surveys and a habitat assessment for muskoxen in the regional study area by partnering with, or complementing, the existing regional muskox monitoring programs.	Agnico provides support for muskoxen surveys and perform weekly wildlife survey on the AWAR
53	Prior to construction of Project infrastructure and Phase 2 of the all-weather access road, the Proponent shall conduct a survey that is sufficient to locate any dens of foxes, bears or wolverines that could be damaged or destroyed during construction or operation of the Project.	Den survey was completed in 2018 and the report provided to the NIRB in December 2018; no active dens were observed. Discussion for the den survey to be done on the AWAR prior to the commencement of increased traffic associated with the transport of saline water on the all-weather access road was initiated with the NIRB

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
54	The Proponent shall ensure that road safety barriers or berms associated with Project infrastructure, all-weather access road and associated roads/trails are constructed to allow for the safe passage of caribou and other terrestrial wildlife while achieving the objective of separating public road use with Project-related mine traffic.	According to the FEIS and TEMMP, roadways are constructed to allow for the safe passage of caribou by using shallower shoulder angles and finer gravel instead of boulders). Observations of unimpeded caribou migration through the site confirm the safety of roadways. The ATV/Snowmobile trail to bypass the mine is still considered and no issues with wildlife crossing was raised during public consultation
55	In consultation with the Government of Nunavut (GN) and other affected parties, the Proponent shall set thresholds for direct mortality of wolf, grizzly bear, polar bear, wolverine, and fox to ensure monitoring and mitigation for the Project is responsive to undesirable rates of mortality. The Proponent shall reach an agreement with the appropriate Designated Inuit Organization regarding compensation or any direct mortality of wildlife resulting from the Project.	Please refer to Agnico Eagle's Meliadine 2018 annual report and appendix H-6, Compensation for animal mortalities are set in Appendix 6.1 of the Schedule J of the IIBA (July 2015)
56	The Proponent shall report annually to the NIRB regarding its terrestrial environment monitoring efforts, with inclusion of the following information:a. Description of all updates to terrestrial ecosystem baseline data;b. A description of the involvement of Inuit in its monitoring programs;c. A detailed presentation and analysis of the distribution relative to Project infrastructure and activities for caribou and other terrestrial mammals observed during surveys and incidental sightings;d. Results of the annual monitoring program, including field methodologies and statistical approaches used to support conclusions drawn; ande. An assessment and presentation of annual environmental conditions including timing of snowmelt, green-up, as well as standard weather summaries.	Wildlife monitoring reports are provided monthly to the GN, KIA and NIRB. Consultations with HTO about its involvement in monitoring programs are ongoing. For all other items, please refer to Agnico Eagle's Meliadine 2018 annual report and appendix H-6 for more details
57	Within its annual report to the NIRB, the Proponent shall incorporate a review section which includes:a. An examination for trends in the measured natural variability of Valued Ecosystem Components in the region relative to the baseline reporting;b. A detailed analysis of wildlife responses to operations with emphasis on wildlife behaviour, mortalities and displacements (if any), and responses to operations of the all-weather access road and associated access roads/trails;c. A demonstration and description of how the monitoring results, including the all-weather access road and associated access roads/trails contribute to cumulative effects of the project; andd. Any proposed changes to the monitoring survey methodologies, statistical approaches or proposed adaptive management stemming from the results of the monitoring program.	In 2018 the project was in construction stage, evaluation and assessment of observed trends in Valuable Environmental Components was not feasible. This will be complete every three (3) years, beginning with the 2019 annual report that will summarize data from 2017, 2018, and 2019.
Birds and Bird habitat		
58	The Proponent shall ensure all employees working at Project sites receive awareness training regarding the importance of avoiding known nests and nesting areas and avoiding large concentrations of foraging and moulting birds.	Please refer to Agnico Eagle's Meliadine annual report appendix I-1 (Wildlife Protection and Response Plan)
59	If Species at Risk or their nests and eggs are encountered during Project activities or monitoring programs, the primary mitigation measure must be avoidance. The Proponent shall establish clear zones of avoidance based on the species-specific nest setback distances outlined in the Terrestrial Environment Management and Monitoring Plan.	Please refer to Terrestrial Environment Management and Monitoring Plan (November 2015). A nest was found in 2018 and reported to ECCC (see in Agnico Eagle's Meliadine 2018 annual report Appendix H-6 for details)
60	The Proponent shall ensure that the mitigation and monitoring strategies developed for Species at Risk are updated as necessary to maintain consistency with any applicable status reports, recovery strategies, action plans and management plans that may become available during the duration of the Project.	Agnico periodically checks the Species at Risk Registry of the Government of Canada for changes in endangered, threatened, and special concern species. The shipping management plan Species at Risk table was updated in 2018 to include Harlequin Duck as per the request of the NIRB.
61	Prior to bird breeding season, the Proponent shall either conduct clearing activities or identify and install nesting deterrents (e.g., flagging) to discourage birds from nesting in areas likely to be disturbed by construction/clearing activities. If clearing is to take place during the nesting season, a nest survey should take place to identify nests and any identified nests must remain undisturbed until the young have fledged or left the nest. Any nests identified shall be included as part of the annual reporting for the Terrestrial Environmental Mitigation and Monitoring Plan (TEMMP).	Please refer to Terrestrial Environment Management and Monitoring Plan (November 2015). A nest was found in 2018 and reported to ECCC (see in Agnico Eagle's Meliadine 2018 annual report Appendix H-6)

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
62	The Proponent shall protect any nests found (or indicated nests) with a buffer zone determined by the setback distances outlined in its Terrestrial Environment Mitigation and Monitoring Plan (TEMMP), until the young have fledged. If it is determined that observance of these setbacks is not feasible, the Proponent will develop nest-specific guidelines and procedures to ensure bird's nests and their young are protected.	Please refer to Terrestrial Environment Management and Monitoring Plan (November 2015). A nest was found in 2018 and reported to ECCC (see in Agnico Eagle's Meliadine 2018 annual report Appendix H-6)
63	Any incidents of bird mortalities associated with lighting infrastructure, construction activities, and Project vessel operations are to be recorded and reported to Environment Canada (Canadian Wildlife Services). The Proponent shall work with the Canadian Wildlife Services to determine appropriate recording and reporting format and timing.	Agnico is committed to reporting the bird mortalities as specified in the condition. No bird mortalities related to site activities was detected in 2018.
64	The Proponent shall develop a framework for monitoring of marine bird species and their habitat in the event of a major marine fuel spill. Specific details regarding the scope of follow-up monitoring may be further refined if and when such an event were to occur.	Please refer to the Shipping Management Plan n Agnico Eagle's Meliadine 2018 annual report Appendix I-1
65	The Proponent shall maintain reduced speeds to sufficiently ensure that wakes are equal or less than the mean natural seasonal wave height to prevent wake action from negatively impacting migratory bird nests in low lying shoreline habitat.	Please refer to the Shipping Management Plan n Agnico Eagle's Meliadine 2018 annual report Appendix I-1
66	The Proponent shall ensure all Project vessels are checked for bird strikes after a suspected event and include details of its protocol to do so, as well as results, within its updated Terrestrial Environment Mitigation and Monitoring Plan.	Please refer to Agnico Eagle's Meliadine 2018 annual report and appendix H-7. Information can also be found in the shipping management plan Appendix I-1
67	The Proponent shall submit an updated Oil Pollution Prevention Plan including measures to avoid adverse effects to species at risk and migratory birds from spills, as well as details regarding monitoring of effects of a spill on species at risk and migratory birds.	The Oil Pollution Prevention (Emergency) Plan and the Shipping Management plan submitted in Agnico Eagle's Meliadine 2018 annual report Appendix I-1
68	The Proponent shall demonstrate consideration for the potential cumulative effects of other development projects and shipping activities (including community resupply) when assessing their cumulative effects on marine birds in the Hudson Strait, in its annual report.	Not yet addressed, will complete the first cumulative effects assessment in the 2019 annual report to allow for three (3) years of data collection.
69	Subject to safety requirements, the Proponent shall require all Project related aircraft to maintain a cruising altitude of at least:a. 650 m during point to point travel when in areas likely to have migratory birdsb. 1100 m vertical and 1500 m horizontal distance from observed concentrations of migratory birdsc. 1100 m over the area identified as a key site for moulting snow geese during the moulting period (July-August), and if maintaining this altitude is not possible, maintain a lateral distance of at least 1500 m from key sites for moulting snow geese.	Please refer to Agnico Eagle's Meliadine 2018 annual report Appendix I-1 (Air Traffic Management Plan, provided with the Wildlife Protection and Response Plan). Modifications were done to ensure compliance with term and condition 69
70	The Proponent shall ensure that pilots are informed of minimum cruising altitude guidelines and that a daily log or record of flight paths and cruising altitudes of aircraft within all Project areas is maintained and made available for regulatory authorities such as Transport Canada to monitor adherence and to follow up on complaints.	Please refer to Agnico Eagle's Meliadine 2018 annual report Appendix I-1 (Air Traffic Management Plan, provided with the Wildlife Protection and Response Plan). Pilots were reminded in 2018 and document were signed
71	The Proponent shall develop detailed and robust mitigation and monitoring plans for migratory birds, reflecting input from relevant agencies, the Kivalliq Inuit Association and communities.	Observations of migratory birds is part of the TEMMP and the MMSO, please refer to Agnico Eagle's Meliadine 2018 annual report Appendix (H-6 and H-7) . Discussion about monitoring for migratory birds will be implimented with the KHTO now that the MOU is signed
72	The Proponent shall continue to develop and update relevant monitoring and management plans for migratory birds under the Proponent's Environmental Protection Plan and Terrestrial Environment Mitigation and Monitoring Plan (TEMMP) prior to construction. The key indicators for follow up monitoring under this plan will include upland birds (including migratory birds), waterbirds, raptors, and seabirds including migration and wintering.	Plese refer to the TEMMP and Shipping Management Plan. Monitoring results can be found in Agnico Eagle's Meliadine 2018 annual report Appendix (H-6)
73	The Proponent's monitoring program shall assess and report, on annual basis, the extent of terrestrial habitat loss due to the Project to verify impact predictions and provide updated estimates of the total Project footprint.	Please refer to Agnico Eagle's Meliadine 2018 annual report and appendix H-6 (app. 484 ha)

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
74	The Proponent's Terrestrial Management and Monitoring Plan (TEMMP) shall include mitigation measures implemented to prevent the use of water attenuation ponds by waterfowl and waterbirds and monitoring that assesses whether the mitigation measures are working or revised or further deterrent measures are required.	Please refer to Agnico Eagle's Meliadine 2018 annual report and Appendix H-6. Monitoring related to bird use of water attenuation pond will continue and other alternatives like kites and owls were bought and will be tested in 2019
75	The Proponent shall implement mitigation measures and monitoring programs to limit the attraction of predators and scavengers to Project facilities in the TEMMP and other plans such as the Landfill and Waste Management Plan as appropriate.	Agnico is working on elimination of attractants to all wildlife, including predators. Please refer to TEMMP, Landfill and Waste Management plans. Weekly inspections are performed at the incinerator, the landfill and other area where attractant can be found. Also toolbox meeting are performed monthly with topics such as waste segregation, wildlife attractantc and other subjects.
Marine Environment		
76	The Proponent shall update all relevant plans including, but not limited to: the Shipping Management Plan, Wildlife Mitigation and Monitoring Plan, and Adaptive Management Plan, in order to address concerns and identify potential impacts of the Project and proposed mitigation measures designed to protect the integrity of the marine environment. The Shipping Management Plan shall also incorporate updates for all Project-related shipping.	Please refer to Shipment Management Plan,, Spill Contingency Plan and Oil Pollution Emergency Plan. Agnico Eagle's Meliadine 2018 annual report and Appendix H-7 also discuss this condition
77	The Proponent shall ensure that it maintains the necessary equipment and trained personnel to respond to all sizes of potential spills associated with the Project in a self-sufficient manner.	See: Spill Contengency Plan and the O.P.E.P. A mock spill training course occured in 2018, see details in Agnico Eagle's Meliadine 2018 annual report Appendix F2
78	Prior to the shipping of Project supplies, the Proponent shall conduct fuel spill dispersion modeling that will, at a minimum, consider: a. Modeling of oil spills in the following areas: i. Pinch points, including: Hudson Strait, Melvin Bay area including Itivia Harbour and Panorama Island; ii. Shallow water and shorelines; and, iii. Areas that have been identified as having high flows and/or high concentrations of marine mammals, marine fish or seabirds; b. Open water and ice-covered conditions; c. Spill volumes up to and including loss of a full tanker cargo; and, d. Differences in the quantity and properties of each type of bulk fuel transported by vessels when they are at, or in transit to, the port of Rankin Inlet.	Please refer to the Shipping Management Plan (Appendix E of the plan)
79	Prior to any Project-related shipping, the Proponent will update its marine baseline information to ensure that it includes the most recent information on marine wildlife abundance and distribution, carefully considers seasonal distribution patterns of marine wildlife, and incorporates western scientific and Inuit Qaujimajatuqangit knowledge sources. The updated marine baseline should be made available to appropriate authorities for feedback, then incorporated into the Proponent's Shipping Management Plan (SMP), with continued updates on a regular basis as new information becomes available.	Please refer to the Shipping Management Plan (Appendix B of the plan)
80	The Proponent shall assess its available baseline information for Melvin Bay and for the area surrounding the fuel transhipment anchorage to ensure that both are adequate for the detection of Project-related impacts, particularly related to contaminants.	Please refer to the Shipping Management Plan.
81	Prior to any Project-associated shipping, the Proponent shall revise and update the Terrestrial Environment Management Plan (TEMMP) and/or the Shipping Management Plan (SMP) to include following information: a. a plan for involvement of local hunters in wildlife baseline studies and monitoring program; b. a plan for coordinating wildlife studies/monitoring activities with other organizations, institutions, government departments and/or individual researchers conducting wildlife studies in the regional study area; and c. measures to be applied to avoid or reduce the disturbance, harassment, injury or mortality of marine mammals due to shipping activities.	Please refer to the Shipping Management Plan.
82	The Proponent shall require all contracted shipping companies to provide full-time marine wildlife monitoring using trained observers and established data collection and recording protocols. Monitoring plans should include provisions for all Species At Risk Act (SARA) and for the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) listed species (birds and mammals).	Please refer to Agnico Eagle's Meliadine 2018 annual report and Appendix H-7. Agnico shared the data with ECCC but encountered issues with ECCC database.

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
83	The Proponent shall ensure that, subject to vessel and human safety considerations, all Project shipping adhere to the following mitigation procedures while in the vicinity of marine mammals (including polar bear) and birds: a. Marine mammals will be given right of way; b. Ships will when possible, maintain a straight course and constant speed, avoiding erratic behavior; and c. When marine mammals appear to be trapped or disturbed by vessel movements, the vessel will implement appropriate measures to mitigate disturbance, including stoppage of movement until wildlife have moved away from the immediate area.	Please refer to the Shipping Management Plan
84	Prior to any Project-related shipping, the Proponent will prepare a map of terrestrial walrus haulouts (uglit) in the Project area, and use this information for route planning, fuel spill modeling, and sensitive area identification. The map should include all available sources of information on uglit locations, including scientific knowledge and Inuit Qaujimajatuqangit and shall be updated by the Proponent whenever new information becomes available.	Please refer to the Shipping Management Plan
85	The Proponent shall consider ways to monitor disturbance to walruses at terrestrial haulout sites, including but not limited to remote monitoring (e.g., time-lapse cameras) and community-based monitoring or Inuit Qaujimajatuqangit surveys.	Monitoring for walruses at haulouts is performed by the vessel monitor, please refer to Agnico Eagle's Meliadine 2018 annual report and appendix H-7. Now that the MOU is signed, discussion regarding walrusses monitoring will be implemented with the KHTO
86	The Proponent is encouraged to liaise with relevant stakeholders, regulatory agencies and/or forums (e.g. the Marine Environmental Working Group associated with the Mary River Project), that might allow for participation in relevant research and management initiatives and increasing understanding and mitigation of potential cumulative effects associated with the Project's shipping activities through the Hudson Strait.	Monitoring for walruses at haulouts is performed by the vessel monitor, please refer to Agnico Eagle's Meliadine 2018 annual report and appendix H-7. Now that the MOU is signed, discussion regarding walrusses monitoring will be implemented with the KHTO
	Economic Development, Contracting and Business Opportunities	
87	The Proponent is strongly encouraged to participate in the work of the Kivalliq Socio-Economic Monitoring Committee along with other agencies and the communities of the Kivalliq region, and to identify areas of mutual interest and priority for inclusion into a collaborative monitoring framework that includes socio-economic priorities related to the Project, communities, and the Kivalliq region as a whole.	Please refer to Agnico Eagle's Meliadine 2018 annual report and the SEMP report
88	The Proponent is encouraged to work in collaboration with other socio-economic stakeholders including for example, the KIA, GN, AANDC, and communities of the Kivalliq region, to establish a socio-economic working group for the Project to develop and oversee the Meliadine Socio-economic Monitoring Program. The working group should develop a Terms of Reference which outlines each member's roles and responsibilities with regards to, where applicable, project-specific socio-economic monitoring throughout the life of the Project. The Terms of Reference are to be provided to the NIRB upon completion, and within one year of issuance of the Project Certificate.	Please refer to Agnico Eagle's Meliadine 2018 annual report section 12 and the SEMP
89	The Proponent shall develop the Meliadine Socio-economic Monitoring Program to monitor the predicted impacts outlined in the FEIS as well as regional concerns identified by the Kivalliq Socio-economic Monitoring Committee (SEMC). Where possible, the Proponent is encouraged to work in collaboration with all other socio-economic stakeholders such as the KIA, GN, AANDC and the communities of the Kivalliq region in developing this program, which should include a process for adaptive management and mitigation in the event unanticipated impacts are identified. Details of the Meliadine Socio-economic Monitoring Program are to be provided to the NIRB upon finalization, and within one year of issuance of the Project Certificate.	Please refer to Agnico Eagle's Meliadine 2018 annual report and the SEMP
90	Prior to the commencement of operations, the Proponent is required to undertake an analysis of the risk of temporary mine closure, giving consideration to how communities in the Kivalliq region may be affected by temporary and permanent closure of the mine, including economic, social and cultural effects. The results of this analysis are to be provided to the NIRB upon completion.	An analysis of the risk of temporary mine closure was submitted to the NIRB February 1st 2019

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
91	Within 3 months of the NIRB's acceptance of the Proponent's analysis of the risk of temporary mine closure referenced above, the proponent is expected to update its Socio-Economic Management Plan or to include within a newly developed plan or framework, a description of its plan to collect and analyze Project-specific and regional data at closure and post-closure phases, as well as its defined measures to help mitigate impacts which may result from Project closure(s), both temporary and final.	Monitoring impacts is typically done within the Socio-Economic Monitoring Plan framework (SEMP), and coordinated with the KvSEMC and SEMWG. In Agnico Eagle's Socio-Economic Monitoring Working Group Terms of Reference section 8, "AEM will consult with the Working Group and KvSEMC two years in advance of the expected date of closure for each Project in order to inform project-specific socio-economic closure planning" and "In the event of premature (temporary or final) closure of one or more of the Projects, AEM will consult with the Working Group and KivSEMC before submitting updated project-specific Socio-Economic Monitoring Plans to NIRB". Additionally, Agnico Eagle completed and submitted to NIRB its Conceptual Socio-Economic Closure Plan, while originally for Whale Tail Project Certificate Condition 51, was extended to include all Projects including Meliadine. Monitoring consideration for closure and post-closure will be incorporated into the ongoing work of this plan.
Employment		
92	The Proponent shall submit a detailed staff schedule to the NIRB and to the Government of Nunavut in the first 6 months following the issuance of a Project Certificate. The schedule should, at a minimum, provide a description of: a. Title of positions required by department and division; b. Quantity of positions available by Project phase and year; c. Transferable skills, both certified and uncertified which may be required for, or gained during, employment within each position; and, d. The National Occupational Classification (NOC) code for each individual position. The Proponent is encouraged to consult the Government of Nunavut during development of the schedule. A new schedule should be submitted following any significant deviation from original predictions.	Requested information sent to NIRB and GN on November 3, 2015
93	The Proponent is encouraged to register all trades occupations, journeypersons and apprentices working with the Project and to register any trades occupations listed in its forecast, as well as to provide the Government of Nunavut with information regarding the number of registered apprentices and journeypersons from other jurisdictions employed at the Project during each year of the Project's life.	Please refer to Agnico Eagle's Meliadine 2018 annual report. As of the end of 2018, there were 4 apprentices and pre-apprentices at Meliadine.
94	The Proponent shall update its labour force analysis utilizing current or the most recent baseline information as may be available from the Nunavut Bureau of Statistics or Statistics Canada. The updated labour force analysis is to be provided to the NIRB within 6 months of the Project Certificate being issued. The Proponent is encouraged to work collaboratively with other stakeholders to monitor any impacts the Project may have on the labour force characteristics of the Kivalliq region during all project phases.	Agnico Eagle submitted the latest staff schedule on May 2, 2018, and will submit an updated version in 2019. Agnico Eagle also submitted the IIBA-required Labour Market Analysis (LMA) to NIRB in March 2019.
Education and Training		
95	The Proponent is encouraged to work with training organizations and/or government departments offering mine-related or other training in order to provide additional opportunities for residents and employees to gain meaningful and transferable skills and certifications.	Agnico Eagle works with training organizations and government departments regularly through the Kivalliq Socio-Economic Monitoring Committee, through the IIBA with the Kivalliq Inuit Association, through the Memorandum of Understanding with the Government of Nunavut, and through one-on-one partnerships and collaboration with organizations such as the Hamlet of Arviat, the Nunavut Literacy Council, Nunavut Arctic College, Aglu Consulting, and more.

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
96	Prior to construction, the Proponent shall develop an easily referenced listing of formal certificates and licences that may be acquired via on-site training or training during Project employment. The listing shall indicate which of these certifications and licences would be transferable to a similar job site within Nunavut, and should be updated on an annual basis, and is to be provided to the NIRB upon completion and as may be revised.	A list of training can be found in Agnico Eagle's Meliadine 2018 annual report Appendix L-1
97	The Proponent's project-specific socio-economic monitoring program should be updated to address the potential impacts to education and training which may arise from temporary, final and/or post-closure phases.	Education and training metrics are already included in the current Socio-Economic Monitoring Plan (SEMP) so these will be monitored up until at least 2 years before closure, at which time section 8 of the Socio-Economic Monitoring Working Group Terms of Reference will be triggered. As above, this will be considered also in the Conceptual Socio-Economic Closure Plan work.
98	The Proponent is encouraged to work with the members identified as potential stakeholders in the socio-economic monitoring working group and with the Kivalliq Socio-Economic Monitoring Committee to review and monitor education utilization rate trends on an on-going basis to understand if the Project can be determined to be having an impact on the education system of the Kivalliq region and/or on any communities in particular.	Please refer to Agnico Eagle's Meliadine 2018 annual report and the SEMR
Population Demographics		
99	The Kivalliq Socio-Economic Monitoring Committee and its membership are encouraged to engage in the monitoring of demographic changes including the movement of people into and out of the Kivalliq communities and the territory as a whole. This information may be used in conjunction with monitoring data obtained by the Proponent from recent hires and/or out-going employees in order to assess the potential effects of the Project on migration.	Please refer to Agnico Eagle's Meliadine 2018 annual report and the SEMR
100	The Proponent is encouraged to work with the Kivalliq Socio-Economic Monitoring Committee to design and implement a voluntary survey to be offered to its Nunavummiut employees on an annual basis in order to identify changes of address, housing status (i.e. public/social, privately owned/rented, government, etc.), and migration intentions, while respecting confidentiality of all persons involved. The survey should be designed in collaboration with the Government of Nunavut, the Nunavut Housing Corporation and other relevant stakeholders. Non-confidential results of the survey are to be reported to the Government of Nunavut and the NIRB.	Agnico Eagle is developing the survey in 2019 and will consult with the necessary groups listed above.
101	The Proponent shall include with its annual reporting to the NIRB a summary of employee origin information as follows:a. The number of Inuit and non-Inuit employees hired from each of the Kivalliq communities, specifying the number from each;b. The number of Inuit and non-Inuit employees hired from each of the Kitikmeot and Qikiqtani regions, specifying the number from each;c. The number of Inuit and non-Inuit employees hired from a southern location or other province/territory outside of Nunavut, specifying the locations and the number from each; andd. The number of non-Canadian foreign employees hired, specifying the locations and number from each foreign point of hire.	Please refer to Agnico Eagle's Meliadine 2018 annual report
Traditional Activity and Knowledge		
102	Prior to commencing construction of the Discovery spur road to pass Meliadine Lake, the Proponent shall provide to the NIRB, details regarding the design features for the Meliadine Lake community boat launch, including traffic turnoffs from the all-weather access road, relevant signage, parking areas, considerations for public safety around the boat launch, plans for garbage removal and treatment of other refuse including buildings and equipment which may be stored at the site, as well as plans to monitor and/or maintain the site, including frequency and timing. These details, once finalized, shall also be incorporated, as updates, to various mitigation, monitoring and/or management plans as applicable.	Expected in 2024

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
103	The Proponent is encouraged to consult with the Kangiqliniq Hunters and Trappers Organization and the Kivalliq Socio-Economic Monitoring Committee and to make all reasonable efforts to engage Elders and community members of the Kivalliq communities in order to have community level input into updates to its monitoring plans, programs and mitigative measures. This type of engagement will ensure that these programs and measures have been informed by traditional activities, cultural resources, and land use as such may be implicated or impacted by ongoing Project activities. All plans are to include a feedback mechanism for consulting with residents of the Kivalliq, including the provision of results from the Proponent's wildlife monitoring programs to each community. The Proponent shall submit updated plans to the NIRB within 30 days' of their revision and/or finalization.	Please refer to Agnico Eagle's Meliadine 2018 annual report Appendix K1 (public consultations and engagements)
Non-Traditional Land Use and Resource Use		
104	The Proponent is encouraged to consult with outfitting and guiding businesses that operate in the LSA and RSA regarding use of the area, specifically as it relates to hunting, fishing and guiding within proximity of the AWAR. Results of this consultation should be incorporated into updated plans where applicable.	In 2018, Agnico Eagle conducted a phone survey of all Kivalliq businesses, specifically on business information and opportunities, which included outfitting and guiding businesses. During the survey Agnico Eagle asked for general comments or questions from respondents. There were no comments or questions on the interaction of the businesses with the AWAR
105	The Proponent is strongly encouraged to consider incorporating information obtained from local outfitting and guiding businesses into its Hunter Harvest Survey where possible, and to include these organizations as potential respondents to surveys undertaken.	Now that the MOU is signed with the KHTO, surveys and HHS will be discussed and local outfitting and guiding businesses into it
Cultural, Archaeological and Paleontological Resources		
106	The Proponent shall, in consultation with the Government of Nunavut's Territorial Archaeologist, determine a reporting frequency for the provision of inspection reports to the Government of Nunavut regarding the status of the Meliadine River Bridge, the Char River Bridge, and the M5 Bridge Crossing during the spring freshet period (mid-May to June) and during the remainder of the ice-free period to freeze-up (July to October).	Weekly inspections of the bridges during freshet 2018 were sent to the Government of Nunavut.
107	The Proponent shall consult with the Government of Nunavut – Department of Culture and Heritage in developing a mitigation plan to address ice buildup at the Meliadine River Bridge, the Char River Bridge, and the Bridge Crossing at M5. The Proponent shall submit this mitigation plan to the NIRB once finalized.	As part of the Road Management Plan, frequent inspections at the various bridges along the AWAR are done. No significant ice buildup impacting the downstream has been noticed to date. Any issues will be brought to the GN and NIRB's attention.
Individual and Community Wellness		
108	The Proponent is encouraged to consider providing access to counseling and treatment programs for substance and gambling addictions, and programs which address domestic, parenting, and marital issues that could affect employees and/or their families.	Please refer to Agnico Eagle's Meliadine 2018 annual report and SEMR
109	The Proponent is encouraged to work with the Kivalliq Socio-Economic Monitoring Committee to monitor potential indirect effects of the Project, including indicators such as the prevalence of substance abuse, gambling issues, family violence, marital problems, rates of sexually transmitted infections and other communicable diseases and others as deemed appropriate.	Please refer to Agnico Eagle's Meliadine 2018 annual report and SEMR

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
110	The Proponent shall provide the NIRB with a description of wellness and cultural diversity/acceptance programming made available to employees and family or community members and shall report the following information with respect to each program to the NIRB annually:a. Language of instruction;b. Uptake by employees and/or family members where relevant,noting Inuit and non-Inuit participation rates;c. Completion rates for enrolled participants, noting Inuit and non-Inuit rates; andd. Issues as may relate to program content which may have been noted or present either on site or in the community and which affect Project employment or employee wellness.	Please refer to Agnico Eagle's Meliadine 2018 annual report and SEMR. The updated SEMR will be provided June 30th, details on the programs are included in the SEMR
111	In its annual reporting to the NIRB, the Proponent is strongly encouraged to provide detailed descriptions of all employee programs and training including:a. Descriptions of the goals of each program offered;b. Language of instruction;c. Schedules and location(s) of when each program was offered;a. Uptake by employees and/or family members where relevant, noting Inuit and non-Inuit participation rates; and,b. Completion rates for enrolled participants, noting Inuit and non-Inuit rates.	Please refer to Agnico Eagle's Meliadine 2018 annual report and SEMR. The updated SEMR will be provided June 30th, details on the programs are included in the SEMR
112	The Proponent is encouraged to investigate measures and programs designed to assist Project employees with pursuing home ownership or accessing affordable housing options.	Please refer to Agnico Eagle's Meliadine 2018 annual report. Agnico Eagle has shared financial literacy materials from its Work Readiness Program as well as details on Agnico's direct rental deduction program with the Nuanvut Housing Corporation in October 2017. Agnico Eagle will reach out again to NHC in 2019 with the intention to collaborate on the topic of home ownership and affordable housing options. Nunavut Housing Corporation is also invited to participate in the Kivalliq Socio-Economic Monitoring Committee.
	Community Infrastructure	
113	The Proponent is encouraged to collaborate with the Kivalliq Socio-Economic Monitoring Committee and the Government of Nunavut – Nunavut Housing Corporation, to design and implement a voluntary employee survey to be completed on an annual basis in order to identify any changes of address, detailed occupancy status (i.e., public/social, privately owned/rented, government, number of people sharing the resident space, etc.), housing preferences, migration intentions, and reasons for migration while respecting confidentiality of all person involved. Non-confidential results of the survey are to be reported to the Government of Nunavut and the Nunavut Impact Review Board.	Agnico Eagle is developing the survey in 2019 and will consult with the necessary groups listed above.
114	The Proponent is encouraged to collaborate with the Government of Nunavut – Nunavut Housing Corporation prior to the development and inception of its programs relating to financial literacy and planning to ensure that relevant and accurate information about housing and home ownership is available and considered for inclusion.	The project plan will be developed by Q4 in order to execute the project in 2019. The Nunavut Housing Corporation and other relevant stakeholders will be involved in the survey design.
115	The Proponent is encouraged to work collaboratively with the Government of Nunavut Department of Health to monitor the impacts of the Meliadine Gold Project on health services within the LSA communities and specifically, Rankin Inlet.	Please refer to Agnico Eagle's Meliadine 2018 annual report and SEMR
	Public and Worker Health and Safety	
116	The Proponent shall update the air quality monitoring aspect of its environmental and health risk monitoring program to include the following parameters for particulate matter: a. An analysis of the metals content of the dust collected in passive monitoring; and b. Discrete samples to be collected on a frequency to be determined in collaboration with the Government of Nunavut, from the camp, and analyzed for acrolein and aldehyde. Results are to be incorporated into the Proponent's annual reporting for submission to the NIRB.	Please refer Agnico Eagle's Meliadine 2018 annual report and Appendix H-5. Aldehyde samples will start in 2019 the monitoring plan was agreed by the GN and stack testing was complete in 2018
	Accidents and malfunctions	
117	Prior to construction Phase 2 of the all-weather access road and the Rankin Inlet bypass road, the Proponent shall consult applicable laws in Canada and Nunavut as well as meet with all regulatory agencies and the public as it finalizes its road operations plans.	Design report for the by pass road, community meeting done in 2018 and inspection with regulators occured for the bypass road.
118	The Proponent shall include in an updated Terrestrial Wildlife Management and Monitoring Plan (TEMMP), plans for increased caribou monitoring efforts including weekly winter track surveying and summer and fall surveys undertaken on foot twice per month. These results shall be reported to the NIRB with the Proponent's annual reporting requirements.	Please refer to Agnico Eagle's Meliadine 2018 annual report and Appendix H-6. In 2018, caribou monitoring efforts included the review of the remote sensing data, ground-based and aerial surveys, caribou behaviour and the winter track survey.

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
119	The Proponent shall include within its updated Terrestrial Wildlife Management and Monitoring Plan, a commitment to establishing deterrents along the AWAR at any areas where it is observed that caribou are attracted to the AWAR and their presence may present a risk of collisions with traffic along the AWAR (such as areas where caribou are utilizing the AWAR to facilitate movement, areas where caribou may be licking minerals/road salt from the road, areas where caribou are gathering to avoid insects, etc.).	Please refer to Agnico Eagle's Meliadine 2018 annual report and Appendix H-6. At the Meliadine site and on the AWAR, wildlife has the right of way. During caribou migration, the AWAR is close, therefor no deterrant is needed
120	The Proponent shall contract only Transport Canada certified shippers to carry cargo for the Project, and will ensure shippers are aware of the requirements of the Shipping Management Plan, the Risk Management and Emergency Response Plan and the Oil Pollution Emergency Plan (OPEP).	TC certification of shipper was provided to NIRB in December 2016. Shippers letter-commitment to abide by Agnico's Shipment Management Plan was provided to NIRB in October 2017. Project-related shipping activities, including the number and schedule of ships received can be found in Agnico Eagle's 2018 Meliadine annual report
121	The Proponent shall monitor the ingress/egress of Project related ships at Rankin Inlet and report any accidents or spills immediately to the regulatory agencies as required by law and to NIRB's Monitoring Officer.	Please refer to the Shipment Management Plan
122	The Proponent shall ensure that best practices are used at all times during ship to shore and other marine-based fuel transfer events, including implementing measures specifically designed to prevent leaks and spills resulting from ice forming on the hoses during fuel transfers	Please refer to Oil Pollution Emergency Plan. Shipment of fuel to Meliadine is undertaken only during the ice-free shipping season. Dates of marine-based fuel transfer events can be found in Agnico Eagle's Meliadine 2018 annual report
123	The Proponent shall ensure that the necessary spill response equipment and training is available prior to commencing project shipping.	Please refer to the Shipment Management Plan and the OPEP.
124	Prior to construction, the Proponent shall update its Spill Contingency Plan specific to a major spill event occurring on the bypass road and within proximity to (and including potential spills into) Nipissar Lake.	Please refer to Spill Contingency Plan

T&C #	Term and Condition (NIRB Project Certificate No. 006)	2019 status
125	The Proponent shall implement all such measures necessary to protect public and mine traffic on all Project roads. The measures undertaken shall include, but are not limited to: a. Prior to expansion of the AWAR, the Proponent shall update its Roads Management Plan to include a detailed consultation plan specifying the methods the Proponent will use to provide the Kivalliq Inuit Association, members of the Hunters and Trappers Organizations in the area, residents of Rankin Inlet and the Hamlet of Rankin Inlet with information regarding the safety requirements of AWAR use. The updated Plan is to be submitted to the Nunavut Impact Review Board, Kivalliq Inuit Association, Kangiqliniq Hunters and Trappers Organization, and the Government of Nunavut; b. Prior to the opening of the AWAR to the public, and annually thereafter, advertise and hold at least one community meeting in the Hamlet of Rankin Inlet and Chesterfield Inlet to explain to the community the rules for use of the road; c. Prior to the opening of the AWAR to the public, the Proponent shall address enforcement of health and safety rules for the operation of the road (i.e., no shooting zone) and implement necessary communications with the public (i.e., signage and public meetings), which includes, but is not limited to: i. Maintaining manned and unmanned gates as proposed along the all-weather access road; ii. The posting of signs in English and Inuktitut along the road at appropriate intervals (i.e., 10 km and bridge crossings); and iii. Place notices at least quarterly on the radio and television to explain to the community the rules for use of the road; d. Once the AWAR expansion is completed and the road is opened to the public, the Proponent shall conduct a vehicle survey four times annually (once during the weekdays during the winter season, once during the week end days during the winter season, once during the weekdays during the summer season and once during the week end days during the summer season) to record the number and types of mine vehicles and the number and type of public vehicles using the AWAR over a 12 hour period (8:00 am to 8:00 pm). The vehicle survey data shall be collated as indicated above and provided in the Proponent's Annual Report; e. Prior to the development of the Discovery deposit, the Proponent shall update its Road Management Plan for the planned operation of the twinned road which could include additional rules, Project infrastructure, or other measures designed to maintain safety for employees and the public; and f. Report all accidents or other safety incidents on the road, to the Government of Nunavut, Kivalliq Inuit Association, the Hamlet of Rankin Inlet and the NIRB immediately.	a) Expension planned in 2024 b) Meeting held June 13th 2018 at Rankin and one is planned in Chesterfield in 2019. This will be done every year as requested c) Barrier installed at km 8 and is monitored by the gatehouse d) Vehicle survey performed 4 times in 2018 e) Planned in 2024 f) No accident or incident occured on the AWAR in 2018
126	Prior to expansion of the AWAR, the Proponent shall prepare and add to the finalized Roads Management Plan (SD 2-9), a detailed consultation plan specifying the methods the Proponent will use to provide the Kivalliq Inuit Association, members of the Hunters and Trappers Organizations in the area, residents of Rankin Inlet and the Hamlet of Rankin Inlet with information regarding the safety requirements and any limitations on public AWAR use (i.e. the "rules of the road") and to ensure that this information continues to be clearly communicated on an on-going basis while the public has access to the AWAR.	On June 13th, 2018, Agnico Eagle held a Meliadine Project Update public meeting in Rankin Inlet which included information on AWAR use procedure. A pamphlet summarizing the road safety rules was also developed was be mail-dropped to all Rankin Inlet residents. All the information and documentation is available on the website: http://aemnunavut.ca/community/roads/
127	The Proponent shall, in coordination and consultation with the Kivalliq Inuit Association and the Hunters and Trappers Organizations of the Kivalliq communities, provide updates to its Shipping Management Plan to identify adaptive management measures that will be employed if effects monitoring identifies potential for effects on marine mammal populations along the shipping route.	Please refer to the Shipment Management Plan
128	The Proponent shall provide the NIRB with a detailed design for the system that includes the location of the pipeline in relation to the saline effluent storage tank at Itivia, the location of submerged collars supporting the pipeline and the design of the diffuser.	Submitted to NIRB on February 15
128	The Proponent shall conduct and submit to the Board a hazard and operability assessment of the pipeline and marine outfall system as part of the land authorization process.	Land authorization process initiated February 18.
130	To assess the environmental impact of the Project on the seabed and marine environment if the effluent discharge pipeline is abandoned in place or removed.	To be done 12 months prior removal
131	The Proponent shall ensure its Marine Environment Management Plan addresses a procedure for engagement with the Kangiqliniq Hunters and Trappers Organization (HTO) to confirm the commencement and ending of the open water season for marine effluent discharge each year. The Proponent shall also engage with the HTO and the community of Rankin Inlet when developing a program for monitoring saline effluent temperature going into the subsea pipeline, ice thickness on Melvin Bay in the vicinity of the discharge and determining appropriate communication and safety protocols applicable for travel by community members through Itivia and Melvin Bay	Now that the MOU is signed between AEM and the KHTO, AEM intends to engage with the KHTO and the community of Rankin Inlet to: · confirm the commencement and end of the open water season for marine effluent discharge each year · develop a procedure for monitoring of saline effluent temperature going into the subsea pipeline and ice thickness on Melvin Bay in the vicinity of the discharge and determining appropriate communication and safety protocols applicable for travel by community members through Itivia and Melvin Bay.
