Specific conductivity	A temperature-corrected measure of a water sample's ability to conduct electricity; measurements are corrected to 25°C. Waters with higher concentrations of dissolved ions conduct electricity more efficiently than waters with low ionic concentrations.
Taxa	A group of organisms of any taxonomic rank (e.g., family, genus, species).
Total dissolved solids	Organic and inorganic substances that are dissolved in water and will pass through a 0.45 micrometre filter.
Total Kjeldahl nitrogen	A measure of ammonia and organic nitrogen. It is used as an indicator of biologically available nitrogen.
Total suspended solids	A measurement of the concentration of particulate matter found in water.
Transformation	The process of converting data through replacement of a variable by a function of that variable.
Variable	A characteristic, number or quantity whose associated value may change or be studied.
Water Column	The water in any waterbody from the surface down to the substrate.
Young-of-the-year	Young fish produced in the current reproductive year.
Zooplankton	Small, sometimes microscopic animals that live suspended in the water column.

Notes: Bolded concentrations are higher than effluent limits. Water quality data shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to effluent limits. Therefore, values slightly above effluent limits may be displayed as being equal to the limits and identified as exceedances. Concentrations equal to the limits were not identified as exceedances. In cases where 25% or more of data were <DL, no mean or standard deviation was calculated.

mg/L = milligrams per litre; µg/L = micrograms per litre; µS/cm = microsiemens per centimetre; mg-N/L = milligrams nitrogen per litre; mg-P/L = milligrams phosphorus per litre; Bq/L = becquerels per litre; + = plus; °C = degrees Celsius; NTU = nephelometric turbidity unit; $CaCO_3$ = calcium carbonate; SiO_2 = silicon dioxide; TDS = total dissolved solids; TSS = total suspended solids; TOC = Total organic carbon; DOC = dissolved organic carbon; BTEX = benzene, toluene, ethylbenzene, and xylene; Min = minimum; Max = maximum; SD = standard deviation; nd = not detected; < = less than; DL = detection limit; % = percent; MDMER = Metal and Diamond Mining Effluent Regulations; EEM = Environmental Effects Monitoring; WL = Water Licence; W = concentration is higher than the Water Licence effluent limits or outside the recommended pH range; - = no effluent limit or no data.

Table 2: Water Quality Data for MEL-13, 2018

Parameter	Unit	Guidelines					Sampling Date (dd-mm-yyyy)				Median	Mean	Min	Max	SD	nd	Count	% Above Guideline				
		A	C	D	S	Q	23-07-2018	20-08-2018	26-08-2018	04-09-2018								A	C	D	S	Q
Radionuclides																						
Radium-226	Bq/L	-	-	-	-	-	<0.005	<0.005	<0.005	<0.005	<0.005	-	<0.005	<0.005	-	4	4	-	-	-	-	-
Ungrouped Analytes																						
Cyanide (free)	mg/L	-	-	-	-	-	<0.001	<0.001	<0.001	<0.001	<0.001	-	<0.001	<0.001	-	4	4	-	-	-	-	-

Notes: Bolded concentrations are higher than water quality guidelines. Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

[a] = the ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (0.5592 mg-N/L) is based on the combination of field pH (8.2) and water temperature (10.0°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH

[b] = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.2 to 8.2). The guideline is calculated based on the individual pH for each sample.

[c] = guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5.

[d] = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (24 to 25 mg/L). The guideline is calculated based on the individual hardness value for each sample.

[e] = guideline is for chromium VI.

[f] = Used median for hardness (as $CaCO_3$) because value was unavailable.

[C] = concentration is higher than the Canadian Water Quality Guidelines for the Protection of Aquatic Life – Chronic or outside the recommended pH, DO or total alkalinity range.

[S] = concentration is higher than the Aesthetic Objectives for Canadian Drinking Water Quality or outside the recommended pH range.

mg/L = milligrams per litre; µg/L = micrograms per litre; µS/cm = microsiemens per centimeter; mg-N/L = milligrams nitrogen per litre; mg-P/L = milligrams phosphorus per litre; Bq/L = becquerels per litre; + = plus; °C = degrees Celsius; NTU = nephelometric turbidity unit; $CaCO_3$ = calcium carbonate; SiO_2 = silicon dioxide; TDS = total dissolved solids; TSS = total suspended solids; TOC = Total organic carbon; DOC = dissolved organic carbon; BTEX = benzene, toluene, ethylbenzene, and xylene; Min = minimum; Max = maximum; SD = standard deviation; nd = not detected; < = less than; % = percent; MDMER = Metal and Diamond Mining Effluent Regulations; WL = Water Licence; - = Parameter below MDMER or WL guideline, or no guideline or no data; A = Canadian Water Quality Guidelines for the Protection of Aquatic Life – Acute; C = Canadian Water Quality Guidelines for the Protection of Aquatic Life – Chronic; D = Guidelines for Canadian Drinking Water Quality; S = Aesthetic Objectives for Canadian Drinking Water Quality; Q = Site-Specific Water Quality Objectives.

Dear Jennifer,

Re: Report on Sublethal Toxicity Analysis of Wastewater for MMER - August 2018

Enclosed are the reports for sublethal testing conducted on the sample of MEL-14 collected 2018-08-07. Data are presented in electronic format.

As you are aware, submission of sublethal toxicity data via RISS is a requirement of the MMER regulation. We would be pleased to enter this information on your behalf, for a fee. Please review the attached reports, and in an e-mail to **reporter@aquatox.ca**, provide us with your RISS user name and password (supplied to you by ECCC), along with written permission for AquaTox to access RISS on your behalf. We will then enter your results. In the future, if you would prefer us to enter the data automatically at the time the reports are issued, please indicate this in writing.

If you have any questions about the results, do not hesitate to contact me.

Sincerely,

AQUATOX TESTING & CONSULTING INC.

Martina Rendas
Project Manager

TOXICITY TEST REPORT

Fathead minnow
EPS 1/RM/22

Work Order : 236864
Sample Number : 55841

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-07
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-09
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	23.0 °C
Sampled By :	J. Brown	Date Tested :	2018-08-09
Sample Description :	Clear, yellow, odourless.		

Test Method : Test of Larval Growth and Survival Using Fathead Minnows. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/22 , 2nd ed. (February 2011).

7-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth from Biomass)	>100%	–	–
LC50	>100%	–	–

The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

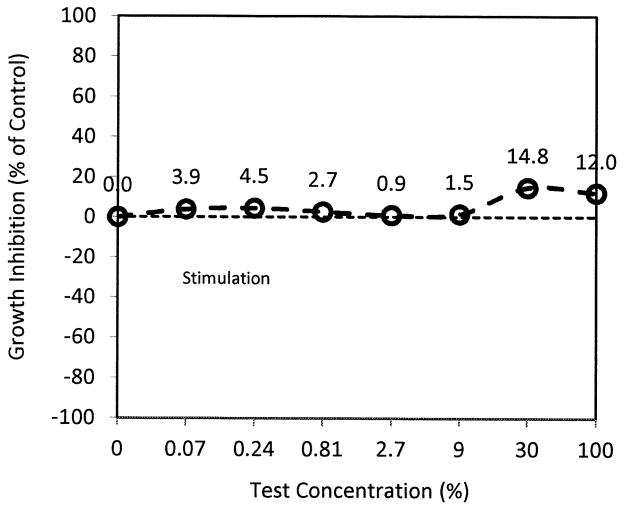
Date Tested :	2018-07-31		
Test Duration :	7 days	Analyst(s) :	MV, RD, MR
IC25 Growth (from Biomass) :	0.87 g/L	LC50 :	1.00 g/L
95% Confidence Limits :	0.78 - 0.93 g/L	95% Confidence Limits :	0.93 - 1.07 g/L
Statistical Method :	Non-Linear Regression (CETIS)[a]	Statistical Method :	Linear Regression (MLE) (CETIS)[a]
Historical Mean IC25 :	0.94 g/L	Historical Mean LC50 :	1.10 g/L
Warning Limits (± 2SD) :	0.71 - 1.24 g/L	Warning Limits (± 2SD) :	0.92 - 1.31 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS

Test Organism :	*Pimephales promelas*	Test Type :	Static Renewal
Organism Batch :	Fm18-08	Control/Dilution Water :	Well water (no additional chemicals)
Organism Age :	~07:00 - 21:15 h at start of test	Test Volume / Replicate :	300 mL
Source :	In-house culture	Test Vessel :	420 mL polystyrene beaker
Culture Mortality/Diseased :	0.38 % (previous 7 days)	Depth of Test Solution :	8 cm
pH Adjustment :	None	Organisms per Replicate :	10
Sample Filtration :	None	Number of Replicates :	3
Hardness Adjustment :	None	Daily Renewal Method :	80-85% syphoned and replaced
Test Aeration :	None	Test Method Deviation(s):	None

COMMENTS



•All test validity criteria as specified in the test method cited above were satisfied.

•No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.

•Inflated swim bladders were confirmed in all test organisms used in this test.

Work Order : 236864
Sample Number : 55841

TOXICITY TEST REPORT

Ceriodaphnia dubia
EPS 1/RM/21

Work Order : 236864
Sample Number : 55841

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-07
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-09
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	23.0 °C
Sampled By :	J. Brown	Date Tested :	2018-08-09
Sample Description :	Clear, yellow, odourless.		

Test Method : Test of Reproduction and Survival using the Cladoceran *Ceriodaphnia dubia*. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/21, 2nd ed. (February 2007).

6-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Reproduction)	>100 %	–	–
LC50	>100 %	–	–

The results reported relate only to the sample tested and as received.

SODIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-07-31		
Test Duration :	6 days	Analyst(s) :	MW, MR
IC25 Reproduction :	1.09 g/L	LC50 :	2.74 g/L[2]
95% Confidence Limits :	0.90 - 1.30 g/L	95% Confidence Limits :	2.17 - 3.68 g/L
Statistical Method :	Non-linear Regression[1] (CETIS)[a]	Statistical Method :	Linear Regression (MLE) (CETIS)[a]
Historical Mean IC25 :	1.31 g/L	Historical Mean LC50 :	2.21 g/L
Warning Limits (± 2SD) :	1.00 - 1.72 g/L	Warning Limits (± 2SD) :	1.87 - 2.61 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS

Sample Filtration :	None	Test Volume per Replicate :	15 mL
Test Aeration :	None	Test Vessel :	19 mL polystyrene vial
pH Adjustment :	None	Depth of Test Solution :	4.8 cm
Hardness Adjustment :	None	Number of Replicates :	10
Renewal Frequency :	Once daily (≤24 h)	Organisms per Replicate :	1
Renewal Method :	Transferred to fresh solutions	Number of Concentrations :	7 + 1 Control
Control/Dilution Water :	Well water (no chemicals added)	Test Method Deviation(s) :	None

COMMENTS

[1]Poisson weighting (CETIS)[a] was applied.

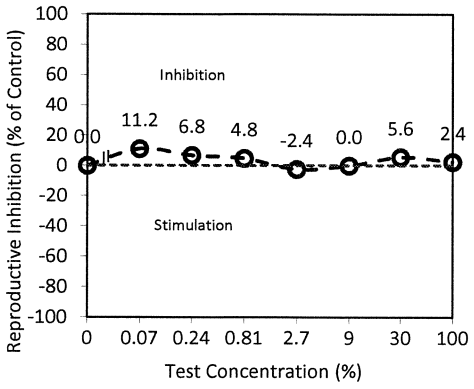
[2]Note: The reference toxicant LC50 test result exceeded the 95% warning limits for historical data. No other unusual circumstances were observed and therefore the test result is considered acceptable.

•All test validity criteria as specified in the test method cited above were satisfied.

Work Order : 236864
Sample Number : 55841

TEST ORGANISMS

Test Organism :	*Ceriodaphnia dubia*	Range of Age (at start of test) :	07:50 h - 19:50 h
Organism Batch :	Cd18-08	Mean Brood Organism Mortality :	0%
Organism Origin :	Single in-house mass culture	Ephippia in Culture :	No
Test Organism Origin :	Individual in-house cultures		



Brood Organism Neonate Production

Replicate :	1	2	3	4	5	6	7	8	9	10	Mean
Total (third or subsequent brood):	12	18	15	12	16	12	12	14	12	15	13.8
Total (first three broods):	25	28	27	25	23	26	27	23	26	25	25.5

No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.

NOTES : •All young produced by a test organism during its fourth and subsequent broods were discarded and not included in the above counts. The presence of two or more neonates in any test chamber, during any given day of the test, constitutes a brood.

•[3] Outlier according to Grubbs Test [b]. Outlying data points were not excluded from statistical analysis, since they could not be attributed to error.

"x"= test organism mortality
"*"= accidental test organism mortality
"–"=4th brood (see 'NOTES')

Test Method : Test for Measuring the Inhibition of Growth using the Freshwater Macrophyte, *Lemna minor*. Method Development and Application Section, Environmental Technology Centre, Environment Canada. Ottawa, Ontario. Report EPS 1/RM/37, 2nd ed. (January 2007).

7-DAY TEST RESULTS

Effect	Value (%)	95% Confidence Limits	Statistical Method
IC25 (Frond Yield)	72.3%	36.4 - 86.5	Linear Interpolation (CETIS)[a]
IC25 (Weight)	>97.0	–	–

The results reported relate only to the sample tested and as received.

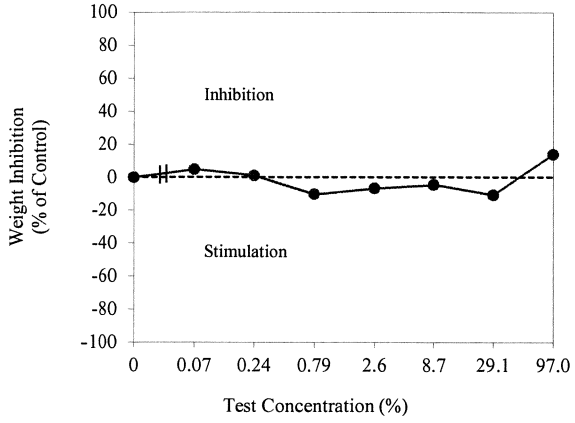
POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-08-15	Historical Geometric Mean IC25 :	2.04 g/L
Test Duration :	7 days	Warning Limits (± 2SD) :	1.52 - 2.74 g/L
IC25 (Frond Production) :	2.16 g/L	Growth Medium :	Modified APHA
95% Confidence Limits :	1.95 - 2.39 g/L	Analyst(s) :	MA, CZN
Statistical Method :	Non-Linear Regression (CETIS)[a]		

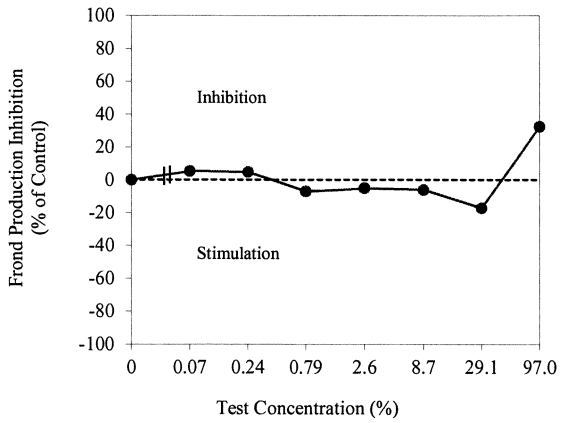
The reference toxicant test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS

Test Organism :	*Lemna minor* L., Strain 7730	Test Type :	Static (no sub-samples required)
Organism Batch :	Lm18-07	Control/Dilution Medium :	Modified APHA
Culture Origin :	UTCC 492	Medium Preparation Water :	Distilled Water
Test Organism Source :	Axenic in-house culture	Source of Water :	Morning Mist
Culture Medium :	Modified Hoaglands E+	Medium Preparation Chemicals :	Modified APHA stocks A, B, C (10 mL/L)
Age (on Test Day 0) :	10 days	Nutrient Spiking of Sample :	Modified APHA stocks A, B, C (10 mL/L)
Health Criteria (in APHA) :	13.33-fold frond increase in 7 days	Replicates per Concentration :	4
Organism Acclimation :	21:15 h in APHA medium	Test Volume per Replicate :	100 mL
Inoculum (Test Day 0) :	2 plants (3 fronds per plant)	Test Vessel :	250 mL glass Erlenmeyer flask
Sample Filtration :	1 µm (Whatman GF/C)	Depth of Test Solution :	4.0 cm
Sample Pre-aeration :	20 min. at ≤100 bubbles/min.	Photoperiod/Light Intensity :	Continuous, 4460 - 5250 lux
pH Adjustment :	None	Test Method Deviation(s) :	None
Hardness Adjustment :	None		



COMMENTS



•All test validity criteria as specified in the test method cited above were satisfied.

•Statistical analysis could not be performed using non linear regression, since a suitable model could not be found. Therefore, test results were calculated using Linear Interpolation (CETIS)[a]. In test concentrations where frond production/weights were stimulated (greater than the control), data were replaced with control values for the purposes of statistical analysis, as recommended by Environment Canada (2005).

TOXICITY TEST REPORT

Pseudokirchneriella subcapitata

EPS 1/RM/25

Work Order : 236864
Sample Number : 55841

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-07
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-09
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	23.0 °C
Sampled By :	J. Brown	Date Tested :	2018-08-09
Sample Description :	Clear, yellow, odourless.		

Test Method : Growth Inhibition Test Using a Freshwater Alga. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/25, 2nd ed. (March 2007).

72-h TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth)	>90.91 %	–	–

The results reported relate only to the sample tested.

ZINC (AS ZINC SULPHATE) REFERENCE TOXICANT DATA

Date Tested :	2018-08-21	Statistical Method :	Non-Linear Regression (CETIS)[a]
Organism Batch :	Ps18-08	Historical Mean IC25 :	10.4 µg/L
Test Duration :	72 hours	Warning Limits (± 2SD) :	4.9 - 22.3 µg/L
IC25 Growth :	8.8 µg/L	Analyst(s) :	AS, MDS, CZN
95% Confidence Limits :	7.5 - 10.2 µg/L		

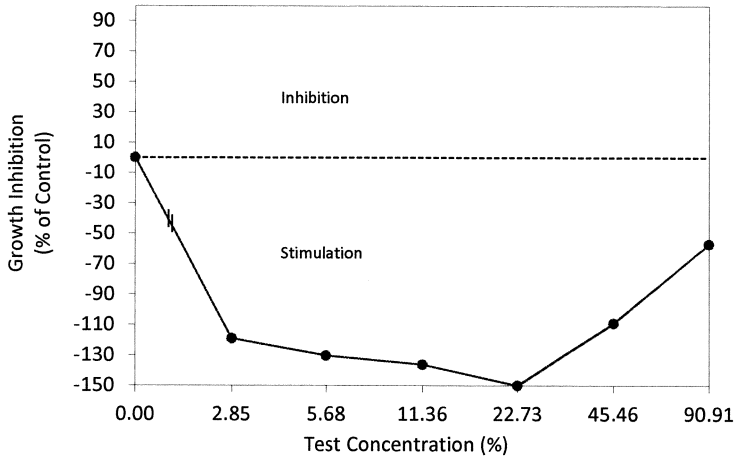
The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST ORGANISM

Test Organism :	*Pseudokirchneriella subcapitata*	Source :	In-house culture
Culture Origin :	University of Waterloo, Waterloo ON	Cell Density at 0-h :	9818 cells/mL
Strain Number :	CPCC 37	Inoculum Prepared :	00:05 h prior to test initiation
Organism Batch :	Ps18-08	Age (at start of test) :	3 days (in exponential growth)

•Algal growth curve is determined at least twice per year as required by the test method cited above.
•No unusual appearance or treatment of culture prior to testing.

TEST CONDITIONS



Test Type :	Static	Volume per Replicate :	220 µL
Test Duration :	72 hours	Control Replicates :	10
Mean Temperature (± SD):	24.3°C (± 0.3)	Test Replicates :	4
Sample Pre-aeration :	None	Concentrations Tested :	10 + Control
Sample Filtration :	0.45 µm preconditioned filter	Photoperiod :	Continuous light
Volume Filtered:	≥10 mL	Light Intensity :	3800-4320 lux
Control/Dilution Water :	Millipore Milli-Q (no chemicals added)	pH Adjustment :	None
Enrichment Medium :	Stock 2B: EDTA reduced to 25%	Hardness Adjustment :	None
Test Vessel :	U-shaped polystyrene microplate	Test Method Deviation(s) :	None

COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.

Dear Jennifer,

Re: Report on Sublethal Toxicity Analysis of Wastewater for MMER - August 2018

Enclosed are the reports for sublethal testing conducted with Fathead Minnow, *Lemna minor*, and *Pseudokirchneriella subcapitata* on the sample of MEL-14 collected 2018-08-13. Data are presented in electronic format. The corresponding test with *Ceriodaphnia dubia* was unsuccessful, and requested submission of a sample to retest. Our understanding resampling was not possible at the time of notification.

As you are aware, submission of sublethal toxicity data via RISS is a requirement of the MMER regulation. We would be pleased to enter this information on your behalf, for a fee. Please review the attached reports, and in an e-mail to reporter@aquatox.ca, provide us with your RISS user name and password (supplied to you by ECCC), along with written permission for AquaTox to access RISS on your behalf. We will then enter your results. In the future, if you would prefer us to enter the data automatically at the time the reports are issued, please indicate this in writing.

If you have any questions about the results, do not hesitate to contact me.

Sincerely,

AQUATOX TESTING & CONSULTING INC.

Martina Rendas
Project Manager

IC25 (Growth from Biomass)	>100%	–	–
LC50	>100%	–	–

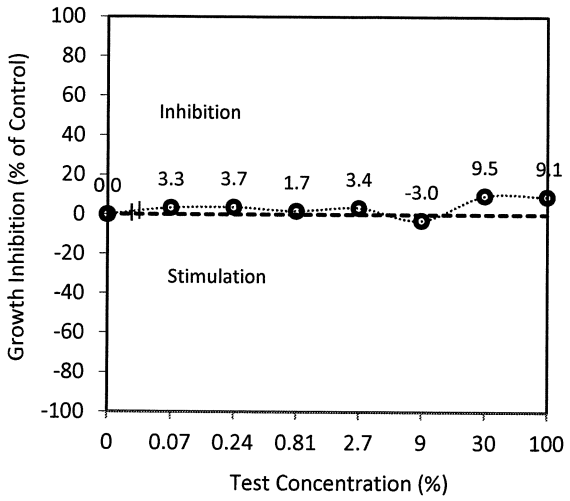
The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-08-28	Analyst(s) :	MV, RD, MA
Organism Batch :	Fm18-08	Test Duration :	7 days
IC25 Growth (from Biomass) :	0.90 g/L	LC50 :	1.03 g/L
95% Confidence Limits :	0.81 - 0.97 g/L	95% Confidence Limits :	0.96 - 1.11 g/L
Statistical Method :	Non-Linear Regression (CETIS)[a]	Statistical Method :	Linear Regression (MLE) (CETIS)[a]
Historical Mean IC25 :	0.93 g/L	Historical Mean LC50 :	1.09 g/L
Warning Limits (± 2SD) :	0.71 - 1.23 g/L	Warning Limits (± 2SD) :	0.91 - 1.30 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS



Test Organism :	*Pimephales promelas*	Test Type :	Static Renewal
Organism Batch :	Fm18-08	Control/Dilution Water :	Well water (no additional chemicals)
Organism Age :	~07:00 - 20:35 h at start of test	Test Volume / Replicate :	300 mL
Source :	In-house culture	Test Vessel :	420 mL polystyrene beaker
Culture Mortality/Diseased :	0.77 % (previous 7 days)	Depth of Test Solution :	8 cm
pH Adjustment :	None	Organisms per Replicate :	10
Sample Filtration :	None	Number of Replicates :	3
Hardness Adjustment :	None	Daily Renewal Method :	80-85% syphoned and replaced
Test Aeration :	None	Test Method Deviation(s):	None

COMMENTS

- All test validity criteria as specified in the test method cited above were satisfied.
- No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.
- Inflated swim bladders were confirmed in all test organisms used in this test.

TOXICITY TEST REPORT

Lemna minor
EPS 1/RM/37

Work Order : 236923
Sample Number : 55913

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project	Date Collected :	2018-08-13
Location :	Rankin Inlet NU	Time Collected :	07:00
GPS Coordinates :	63° 02' 15.5"N 92° 13' 06.3"W	Date Received :	2018-08-15
Substance :	MEL-14	Time Received :	10:45
Sampling Method :	Grab	Temperature upon Receipt :	21.0 °C
Sampled By :	D. Gorton	Date Tested :	2018-08-16
Sample Description :	Clear, light yellow, odourless.		

Test Method : Test for Measuring the Inhibition of Growth using the Freshwater Macrophyte, *Lemna minor*. Method Development and Application Section, Environmental Technology Centre, Environment Canada. Ottawa, Ontario. Report EPS 1/RM/37, 2nd ed. (January 2007).

7-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Frond Yield)	38.2%	26.6 - 52.1	Non-Linear Regression* (CETIS)[a]
IC25 (Weight)	42.0%	26.5 - 63.2	Non-Linear Regression (CETIS)[a]

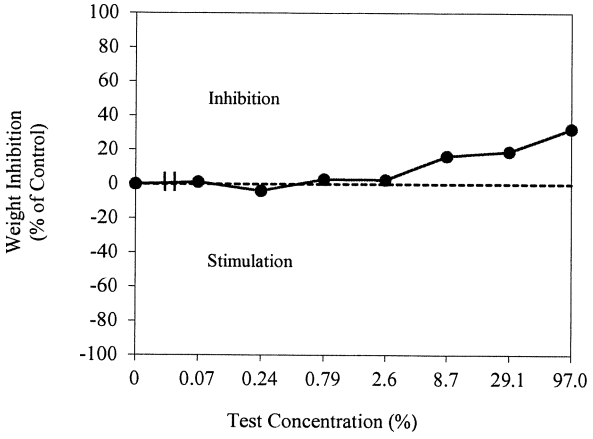
The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

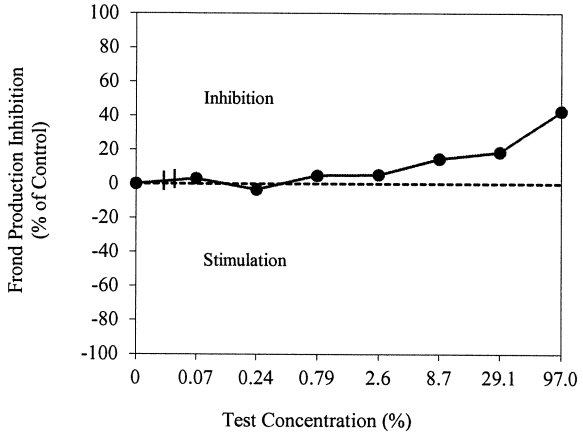
Date Tested :	2018-08-15	Statistical Method :	Non-Linear Regression (CETIS)[a]
Organism Batch :	Lm18-08	Historical Geometric Mean IC25 :	2.04 g/L
Test Duration :	7 days	Warning Limits (± 2SD) :	1.52 - 2.74 g/L
IC25 (Frond Production) :	2.16 g/L	Growth Medium :	Modified APHA
95% Confidence Limits :	1.95 - 2.39 g/L	Analyst(s) :	MA, CZN

The reference toxicant test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS



Test Organism :	*Lemna minor* L., Strain 7730	Test Type :	Static (no sub-samples required)
Organism Batch :	Lm18-08	Control/Dilution Medium :	Modified APHA
Culture Origin :	UTCC 492	Medium Preparation Water :	Distilled Water
Test Organism Source :	Axenic in-house culture	Source of Water :	Morning Mist
Culture Medium :	Modified Hoaglands E+	Medium Preparation Chemicals :	Modified APHA stocks A, B, C (10 mL/L)
Age (on Test Day 0) :	9 days	Nutrient Spiking of Sample :	Modified APHA stocks A, B, C (10 mL/L)
Health Criteria (in APHA) :	22.2-fold frond increase in 7 days	Replicates per Concentration :	4
Organism Acclimation :	23:20 h in APHA medium	Test Volume per Replicate :	100 mL
Inoculum (Test Day 0) :	2 plants (3 fronds per plant)	Test Vessel :	250 mL glass Erlenmeyer flask
Sample Filtration :	1 µm (Whatman GF/C)	Depth of Test Solution :	4.0 cm
Sample Pre-aeration :	20 min. at ≤100 bubbles/min.	Photoperiod/Light Intensity :	Continuous, 4100 - 5290 lux
pH Adjustment :	None	Test Method Deviation(s) :	None
Hardness Adjustment :	None		



COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.
*Box-Cox weighting (CETIS)[a] was applied.

Work Order : 236923
Sample Number : 55913

Substance :	MEL-14	Time Received :	11:00
Sampling Method :	Grab	Temperature upon Receipt :	21.0 °C
Sampled By :	D. Gorton	Date Tested :	2018-08-16
Sample Description :	Clear, light yellow, odourless.		

Test Method : Growth Inhibition Test Using a Freshwater Alga. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/25, 2nd ed. (March 2007).

72-h TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth)	>90.91 %	–	–

The results reported relate only to the sample tested and as received.

ZINC (AS ZINC SULPHATE) REFERENCE TOXICANT DATA

Date Tested :	2018-08-21	Statistical Method :	Non-Linear Regression (CETIS)[a]
Organism Batch :	Ps18-08	Historical Mean IC25 :	10.4 µg/L
Test Duration :	72 hours	Warning Limits (± 2SD) :	4.9 - 22.3 µg/L
IC25 Growth :	8.8 µg/L	Analyst(s) :	AS, MDS, CZN
95% Confidence Limits :	7.5 - 10.2 µg/L		

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST ORGANISM

Test Organism :	*Pseudokirchneriella subcapitata*	Source :	In-house culture
Culture Origin :	University of Waterloo, Waterloo ON	Cell Density at 0-h :	10955 cells/mL
Strain Number :	CPCC 37	Inoculum Prepared :	00:10 h prior to test initiation
Organism Batch :	Ps18-08	Age (at start of test) :	3 days (in exponential growth)

•Algal growth curve is determined at least twice per year as required by the test method cited above.
•No unusual appearance or treatment of culture prior to testing.

TEST CONDITIONS

Test Type :	Static	Volume per Replicate :	220 µL
Test Duration :	72 hours	Control Replicates :	10
Mean Temperature (± SD):	24.1°C (± 0.3)	Test Replicates :	4
Sample Pre-aeration :	None	Concentrations Tested :	10 + Control
Sample Filtration :	0.45 µm preconditioned filter	Photoperiod :	Continuous light
Volume Filtered:	≥10 mL	Light Intensity :	3810-4160 lux
Control/Dilution Water :	Millipore Milli-Q (no chemicals added)	pH Adjustment :	None
Enrichment Medium :	Stock 2B: EDTA reduced to 25%	Hardness Adjustment :	None
Test Vessel :	U-shaped polystyrene microplate	Test Method Deviation(s) :	None

COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.

Dear Jennifer,

Re: Report on Sublethal Toxicity Analysis of Wastewater for MMER - September 2018

Enclosed are the reports for sublethal testing conducted on the sample of MEL-14 collected 2018-09-03. Data are presented in electronic format.

As you are aware, submission of sublethal toxicity data via RISS is a requirement of the MMER regulation. We would be pleased to enter this information on your behalf, for a fee. Please review the attached reports, and in an e-mail to **reporter@aquatox.ca**, provide us with your RISS user name and password (supplied to you by ECCC), along with written permission for AquaTox to access RISS on your behalf. We will then enter your results. In the future, if you would prefer us to enter the data automatically at the time the reports are issued, please indicate this in writing.

If you have any questions about the results, do not hesitate to contact me.

Sincerely,

AQUATOX TESTING & CONSULTING INC.

Martina Rendas
Project Manager

TOXICITY TEST REPORT

Fathead minnow
EPS 1/RM/22

Work Order : 237106
Sample Number : 56153

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project		
Location :	Rankin Inlet NU	Date Collected :	2018-09-03
Substance :	MEL-14	Time Collected :	07:00
Sampling Method :	Grab	Date Received :	2018-09-06
Sampled By :	J. Brown	Time Received :	09:45
Temp. on arrival :	22.0°C	Date Tested :	2018-09-06
Sample Description :	Clear, yellow, odourless		
Test Method :	Test of Larval Growth and Survival Using Fathead Minnows. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/22 , 2nd ed. (February 2011).		

TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth from Biomass)	>100%	-	-
LC50	>100%	-	-

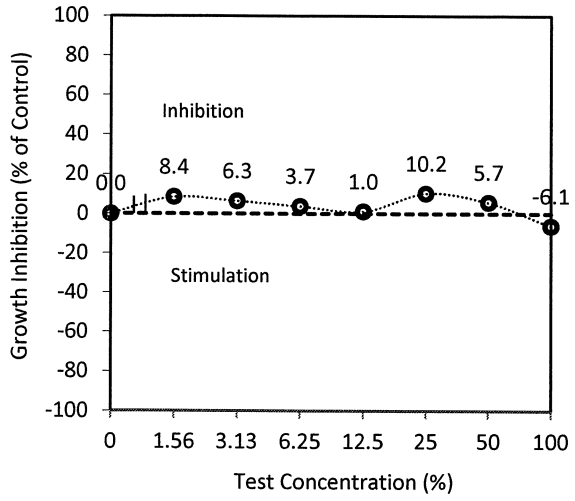
The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-08-28		
Test Duration :	7 days	Analyst(s) :	MV, RD, MA
IC25 Growth (from Biomass) :	0.90 g/L	LC50 :	1.03 g/L
95% Confidence Limits :	0.81 - 0.97 g/L	95% Confidence Limits :	0.96 - 1.11 g/L
Statistical Method :	Non-Linear Regression (CETIS)[a]	Statistical Method :	Linear Regression (MLE) (CETIS)[a]
Historical Mean IC25 :	0.93 g/L	Historical Mean LC50 :	1.09 g/L
Warning Limits (± 2SD) :	0.71 - 1.23 g/L	Warning Limits (± 2SD) :	0.91 - 1.30 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS



Test Organism :	*Pimephales promelas*	Test Type :	Static Renewal
Organism Batch :	Fm18-09	Control/Dilution Water :	Well water (no chemicals added)
Organism Age :	~07:00 - 23:35 h at start of test	Test Volume / Replicate :	300 mL
Source :	In-house culture	Test Vessel :	420 mL polystyrene beaker
Culture Mortality/Diseased :	1.54 % (previous 7 days)	Depth of Test Solution :	8 cm
pH Adjustment :	None	Organisms per Replicate :	10
Sample Filtration :	None	Number of Replicates :	3
Hardness Adjustment :	None	Daily Renewal Method :	80-85% syphoned and replaced
Test Aeration :	None	Test Method Deviation(s):	None

COMMENTS

- All test validity criteria as specified in the test method cited above were satisfied.
- No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.
- Inflated swim bladders were confirmed in all test organisms used in this test.

Work Order : 237106
Sample Number : 56153

Aberrant behaviour or swimming impairment : None

NOTES : *2018-09-13: Replicate 1.56-A was accidentally spilled. Two test organisms were lost from the test vessel, resulting in accidental mortalities (SD/RD). The test organisms that suffered accidental mortalities were excluded from statistical analysis. All test endpoints were calculated from a total of 8 test organisms exposed in replicate 1.56-A (VC).

TOXICITY TEST REPORT

Ceriodaphnia dubia
EPS 1/RM/21

Work Order : 237106
Sample Number : 56153

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project		
Location :	Rankin Inlet NU	Date Collected :	2018-09-03
Substance :	MEL-14	Time Collected :	07:00
Sampling Method :	Grab	Date Received :	2018-09-06
Sampled By :	J. Brown	Time Received :	09:45
Temp. on arrival :	22.0°C	Date Tested :	2018-09-06
Sample Description :	Clear, yellow, odourless		

Test Method : Test of Reproduction and Survival using the Cladoceran *Ceriodaphnia dubia*. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/21, 2nd ed. (February 2007).

TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
LC50	>100%	-	-
IC25 (Reproduction)	90.1%	23.3-96.3	Linear Interpolation (TOXSTAT) d

The results reported relate only to the sample tested and as received.

SODIUM CHLORIDE REFERENCE TOXICANT DATA

Date Tested :	2018-08-28		
Test Duration :	6 days	Analyst(s) :	MW, MA
IC25 Reproduction :	1.46 g/L	LC50 :	2.32 g/L
95% Confidence Limits :	0.98 - 1.82 g/L	95% Confidence Limits :	1.80 - 3.00 g/L
Statistical Method :	Linear Interpolation (CETIS)[a]	Statistical Method :	Binomial (CETIS)[a]
Historical Mean IC25 :	1.30 g/L	Historical Mean LC50 :	2.23 g/L
Warning Limits (± 2SD) :	0.98 - 1.73 g/L	Warning Limits (± 2SD) :	1.84 - 2.70 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS

Sample Filtration :	None	Test Volume per Replicate :	15 mL
Test Aeration :	None	Test Vessel :	19 mL polystyrene vial
pH Adjustment :	None	Depth of Test Solution :	4.8 cm
Hardness Adjustment :	None	Organisms per Replicate :	1
Daily Renewal Method :	Transferred to fresh solutions	Number of Replicates :	10
Control/Dilution Water :	Well water (no chemicals added)	Test Method Deviation(s) :	None

COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.
•Statistical analysis could not be performed using non linear regression, since a suitable model could not be found. Therefore, test results were calculated using Linear Interpolation (Toxstat)[d]. In test concentrations where reproduction was stimulated (greater than the control), data were replaced with control values for the purposes of statistical analysis, as recommended by Environment Canada (2005).

Work Order : 237106
Sample Number : 56153

TEST ORGANISMS

Test Organism :	*Ceriodaphnia dubia*	Range of Age (at start of test) :	19:40 h - 23:40 h
Organism Batch :	Cd18-09	Mean Brood Organism Mortality :	3.3%
Organism Origin :	Single in-house mass culture	Ephippia in Culture :	No
Test Organism Origin :	Individual in-house cultures

NOTES : •All young produced by a test organism during its fourth and subsequent broods were discarded and not included in the above counts. The presence of two or more neonates in any test chamber, during any given day of the test, constitutes a brood.
•[1] Outlier according to Grubbs Test (CETIS)[a]. Outlying data points were not excluded from statistical analysis, since they could not be attributed to error.

"x"= test organism mortality
"*"= accidental test organism mortality
"–"=4th brood (see 'NOTES')

TOXICITY TEST REPORT

Lemna minor
EPS 1/RM/37

Work Order : 237106
Sample Number : 56153

SAMPLE IDENTIFICATION

Company :	Agnico Eagle Mines Limited - Meliadine Project		
Location :	Rankin Inlet NU	Date Collected :	2018-09-03
Substance :	MEL-14	Time Collected :	07:00
Sampling Method :	Grab	Date Received :	2018-09-06
Sampled By :	J. Brown	Time Received :	09:45
Temp. on arrival :	22.0°C	Date Tested :	2018-09-06
Sample Description :	Clear, yellow, odourless		

Test Method : Test for Measuring the Inhibition of Growth using the Freshwater Macrophyte, *Lemna minor.* Method Development and Application Section, Environmental Technology Centre, Environment Canada. Ottawa, Ontario. Report EPS 1/RM/37, 2nd ed. (January 2007).

TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Weight)	>97.0%	-	-
IC25 (Frond Production)	>97.0%	-	-

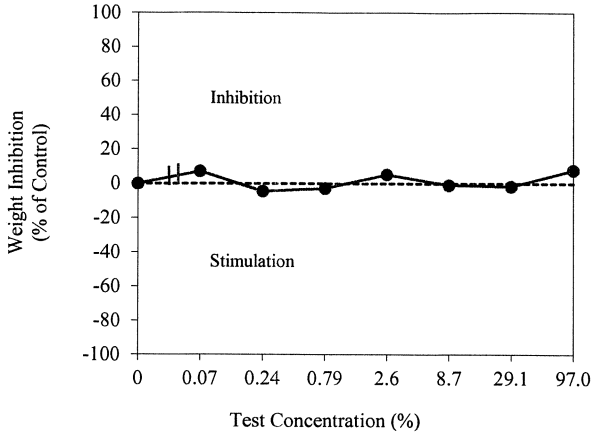
The results reported relate only to the sample tested and as received.

POTASSIUM CHLORIDE REFERENCE TOXICANT DATA

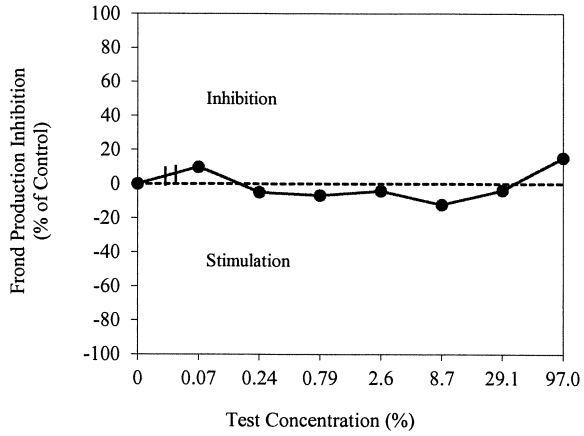
Date Tested :	2018-09-12	Statistical Method :	Non-Linear Regression (CETIS)[a]
Test Duration :	7 days	Historical Geometric Mean IC25 :	2.11 g/L
IC25 (Frond Production) :	2.45 g/L	Warning Limits (± 2SD) :	1.57 - 2.85 g/L
95% Confidence Limits :	1.99 - 2.90 g/L	Growth Medium :	Modified APHA
		Analyst(s) :	MDS

The reference toxicant test was performed under the same experimental conditions as those used with the test sample.

TEST CONDITIONS



Test Organism :	*Lemna minor* L., Strain 7730	Test Type :	Static (no sub-samples required)
Organism Batch :	Lm18-08	Control/Dilution Medium :	Modified APHA
Culture Origin :	UTCC 492	Medium Preparation Water :	Distilled Water
Test Organism Source :	Axenic in-house culture	Source of Water :	Morning Mist
Culture Medium :	Modified Hoaglands E+	Medium Preparation Chemicals :	Modified APHA stocks A, B, C (10 mL/L)
Age (on Test Day 0) :	9 days	Nutrient Spiking of Sample :	Modified APHA stocks A, B, C (10 mL/L)
Health Criteria (in APHA) :	16.16-fold frond increase in 7 days	Replicates per Concentration :	4
Organism Acclimation :	19:50 h in APHA medium	Test Volume per Replicate :	100 mL
Inoculum (Test Day 0) :	2 plants (3 fronds per plant)	Test Vessel :	250 mL glass Erlenmeyer flask
Sample Filtration :	1 µm (Whatman GF/C)	Depth of Test Solution :	4.0 cm
Sample Pre-aeration :	20 min. at ≤100 bubbles/min.	Photoperiod/Light Intensity :	Continuous, 4290 - 5440 lux
pH Adjustment :	None	Test Method Deviation(s) :	None
Hardness Adjustment :	None		



COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.

	D	6	54	48				

NOTES: *No unusual appearance or treatment of culture prior to testing. Test inoculated with healthy plants.

•No significant stimulation (α=0.05) of frond increase was detected by ANOVA-Dunnett Multiple Comparison Test (CETIS)[a] at any test level compared to the control.

•A 12.0-fold increase in frond number was observed in the control over the testing period.

•No outlying data points were detected according to Grubbs Test (CETIS)[a].

Sample Description :	Clear, yellow, odourless		
Test Method :	Growth Inhibition Test Using a Freshwater Alga. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/25, 2nd ed. (March 2007), with deviation(s) as noted below.		

72-h TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Growth)	>90.91%	-	-

The results reported relate only to the sample tested and as received.

ZINC (AS ZINC SULPHATE) REFERENCE TOXICANT DATA

Date Tested :	2018-09-24	Statistical Method :	Nonlinear Regression* (CETIS)[a]
Organism Batch :	Ps18-09	Historical Mean IC25 :	10.4 µg/L
Test Duration :	72 hours	Warning Limits (± 2SD) :	4.8 - 22.3 µg/L
IC25 Growth :	10.3 µg/L	Analyst(s) :	MA
95% Confidence Limits :	8.6 - 11.9 µg/L		

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TEST ORGANISM

Test Organism :	*Pseudokirchneriella subcapitata*	Source :	In-house culture
Culture Origin :	University of Waterloo, Waterloo ON	Cell Density at 0-h :	10409 cells/mL
Strain Number :	CPCC 37	Inoculum Prepared :	00:10 h prior to test initiation
Organism Batch :	Ps18-09	Age (at start of test) :	3 days (in exponential growth)

•Algal growth curve is determined at least twice per year as required by the test method cited above.

•No unusual appearance or treatment of culture prior to testing.

TEST CONDITIONS

Test Type :	Static	Volume per Replicate :	220 µL
Test Duration :	72 hours	Control Replicates:	10
Mean Temperature (± SD):	24.0°C (± 0.0)	Test Replicates :	4
Sample Pre-aeration :	None	Concentrations Tested :	10 + Control
Sample Filtration :	0.45 µm preconditioned filter	Photoperiod :	Continuous light
Volume Filtered:	≥10 mL	Light Intensity :	4160-4350 lux
Control/Dilution Water :	Millipore Milli-Q (no chemicals added)	pH Adjustment :	None
Enrichment Medium :	Stock 2B: EDTA reduced to 25%	Hardness Adjustment :	None
Test Vessel :	U-shaped polystyrene microplate	Test Method Deviation(s) :	None

COMMENTS

Noted Deviation(s) : A reference toxicant test was not started within 14 days of the toxicity test, as required by the test method.

•All test validity criteria as specified in the test method cited above were satisfied.

*Box Cox weighting (CETIS)[a] was applied.

NOTES : **Statistically significant stimulation, according to ANOVA/Dunnett Multiple Comparison Test (CETIS)[a], (a=0.05).
•Control replicates 5 and 6 used for pH measurement.
•The Mann-Kendall test shows that there is no inhibitory gradient (α=0.05).
• [1]Outlier according to Grubbs Test (CETIS)[a]. Outlying data points were not excluded from statistical analysis, since they could not be attributed to error.

On February 2nd, during an inspection of the exploration camp retention tanks it was noticed by a member of the Site Services team that water was flowing on to Meliadine Lake near the discharge area of the sewage treatment plant. The environment department and site services supervisor were notified immediately and an inspection was conducted to determine the source of the water. it was discovered that a valve at the base of one of the retention tanks had been left open, resulting in the draining of the contents of all 4 tanks (connected in series). Discharge from the sewage treatment plant had been suspended since November 2017 due to exceedances. The quality of the substance is to be verified and is likely not deleterious.

Follow Up Report – February 2nd 2018 MEL-07 Treated Water Discharge

Description of Exceedance:

On February 2nd, during an inspection of the exploration camp retention tanks it was noticed by a member of the Site Services team that water was flowing on to Meliadine Lake near the discharge area of the sewage treatment plant. The environment department and site services supervisor were notified immediately and an inspection was conducted to determine the source of the water. It was discovered that a valve at the base of one of the retention tanks had been left open, resulting in the draining of the contents of all four tanks, which are connected in series. Discharge from the sewage treatment plant had been suspended since November 2017 due to exceedances.

Samples were collected from a melt channel in the ice, and sent for laboratory analysis. A spill report was issued on February 2nd 2018 through the NT-NU Spill Report. As a response to the spill report issued, Christine Wilson (INAC) visited the Meliadine Exploration Camp on February 2nd 2018, and was unable to collect a representative sample, as there was no pooling on the surface of the ice.

Jeff Tulugak (KIA) also inspected the spill area on February 2nd, 2018. A telephone inquiry was received by Craig Broom (Environment Canada) and Dan Gorton provided an account of the spill information available to date on February 5th, 2018.

Picture 1: Channel formed by release water flowing through ice into Meliadine Lake.

Picture 2: Release valve left open causing the spill.

Picture 3: Discharge hose connected to retention tank release valve.

Samples were collected from the STP release valve on February 2nd, shortly after the release occurred. The samples did not arrive at the laboratory within the recommended 24 hours timeframe for fecal coliform analysis. The delay was due to the delivery not being picked up at the airport by the receiving party. Total coliforms were expressed in MPN as opposed to CFU, which are the recommended units in the water license. Although these are not the preferred units, they can be converted.

Table 1: Laboratory analysis of retention tank treated water samples collected at spill site.

The sample collected from the retention tank discharge had **214 MPN/100mL fecals** and **285 MPN/100mL E.coli.**

Spill Discharge Location:

The MEL-07 effluent discharges to land at a location situated approximately 65 m from the ordinary high water mark of Meliadine Lake (see Figure 1). Once the effluent reaches the end of the pipe, it travels along a rock channel intended to reduce the flow and prevent erosion. The effluent will then follow the rock channel to Meliadine Lake. It is expected that with the extreme cold temperatures on February 2nd, and the fact that the effluent discharges to land first, the bacteria would likely not have survived.

Figure 1: View from above - MEL-07 discharge configuration with rock channel and flow path to Meliadine Lake

Spill cause:

Investigation into the release was inconclusive. However, it is believed that a water truck operator failed to close the release valve after transferring water to a truck.

Spill response:

The release was deemed to be caused by human error. The release valve is now fitted with a locking mechanism. A supervisor now keeps a register to record which operator is in possession of the key.

K — ADDITIONAL INFORMATION, COMMENTS, ACTIONS PROPOSED OR TAKEN TO CONTAIN, RECOVER OR DISPOSE OF SPILLED PRODUCT AND CONTAMINATED MATERIALS

A sample of treated water from Mel-14 (final discharge point to Meliadine Lake) was collected on July 23, 2018. Upon receiving the sampling results, the total aluminum concentration was found to be 4.39 mg/L which exceeded the permitted discharge limit of 2 mg/L. When the exceedance was observed, the lab was requested to re-analyze the sample to determine if the result was an outlier; however, the sample had been disposed of and re-analysis was not possible at the date of the request.

This spill is being reported as per the 2AM-MEL1631 Nunavut Water Board License, part F item 3.

A follow up report will be issued.

MELIADINE

Follow Up Report: #18-409
July 23, 2018 MEL-14 Aluminum Concentration Criteria Exceeded

Description of Incident:

A sample of treated water from MEL-14 (final effluent sampling port prior to discharge to Meliadine Lake) was collected on July 23, 2018. Upon review of the laboratory analysis results, the total aluminum concentration was found to be 4.39 mg/L which exceeded the permitted discharge limit of 2 mg/L.
As per the obligations under the Nunavut Water Board License 2AM-MEL1631, Part F, item 3 pursuant to subsection 12(3) of the Nunavut Waters and Nunavut Surface Rights Tribunal Act., samples were collected for laboratory analysis to assess the total metal concentrations and other water quality parameters during final effluent discharge at MEL-14. The laboratory results were received on August 8, 2018, however, the exceeded criteria for the total aluminum concentration was not observed at the initial time of the data review and data input. During the quarterly reporting for MDMER-EEM (RIIS) on October 1, 2018, the exceeded concentration was observed and reported immediately.

Exceedance Cause and Corrective Measures

The exceeded criteria for final effluent discharge criteria for total aluminum concentrations is assumed to be a laboratory error. When the exceeded criteria was observed, the lab was requested to re-analyze the sample to determine if the reported concentration was a result of laboratory error; however, the sample had been disposed of and re-analysis was not possible at the date of the request.

When comparing the total aluminum concentrations from a sample collected and analyzed on the same day from MEL-13 (the discharge location at Meliadine Lake), total aluminum concentrations were also elevated (6.64 mg/L). Results for total aluminum concentration were then compared to results from 2018 sampling events. The results from July 23, 2018 had the maximum concentrations for both MEL-13 and MEL-14. Table 1 presents a summary of laboratory analysis for MEL-13 and MEL-14 in 2018 and includes the minimum, maximum and average total aluminum concentrations for samples collected in 2018. Figure 1 shows the aluminum concentrations for MEL-13 and MEL-14 in 2018. No other samples collected and analyzed in 2018 have exceeded criteria concentrations for total aluminum at MEL-14.

The Environment Department at Meliadine is currently implementing a data management system for laboratory results. Once it has been fully commissioned, it should mitigate delays with reporting criteria exceedances and improve the timing for requests that may be made if re-analysis is required at the laboratory.

A sample of treated water from Mel-14 (final discharge point to Meliadine Lake) was collected on August 19th 2018. Upon receiving the sampling results, the TDS was found to be 1430 mg/L which exceeded the permitted discharge limit of 1400 mg/L.

This spill is being reported as per the 2AM-MEL1631 Nunavut Water Board License, part F item 3.

A follow up report will be issued.

Follow Up Report: #18-378
August 19, 2018 MEL-14 TDS Concentration Criteria Exceeded

Description of Incident:

A sample of treated water from MEL-14 (final effluent sampling port prior to discharge to Meliadine Lake) was collected on August 19, 2018. Upon review of the laboratory analysis results, the total dissolved solids (TDS) concentration was found to be 1,430 mg/L which exceeded the permitted discharge limit of 1,400 mg/L.

As per the obligations under the Nunavut Water Board License 2AM-MEL1631, Part F, item 3 pursuant to subsection 12(3) of the Nunavut Waters and Nunavut Surface Rights Tribunal Act., samples were collected for laboratory analysis to assess TDS concentrations and other water quality parameters during final effluent discharge at MEL-14. The laboratory results were received on September 13, 2018 and reviewed and reported on September 15, 2018. With regards to your question on reporting delay, due to the remote location and the extensive list of parameters that we sample for the Mel-14 sample, the delay in receiving results from the lab is generally 3-4 weeks. This is because the lab sub-contracts part of the analysis to their sister lab in Burnaby BC, so it can take a while for the sample to be received and processed.

Cause and Corrective Measures

The sample was collected at 10:30 am on August 19, 2018. During this time, there was an unscheduled power outage and effluent release had stopped at the effluent water treatment plant (EWTP). Water was not pumped through the sampling port located at MEL-14 during this time. The person that conducted the sampling was a summer intern student who has returned to school and the sampling conditions and confirmation of the location that the sample was collected has not been verified. Based on the field parameter monitoring, the power outage, review of laboratory results from previous and post sampling events, the TDS concentrations reported from the laboratory analysis for MEL-14 on August 19, 2019 are assumed to be not representative for the final effluent discharged the sampling port for MEL-14 to Meliadine Lake. It is possible that it was sampled from a port that was not treated and not discharging to Meliadine Lake.

Table 1 presents the operational report, which summarizes the monitoring results at the EWTP on August 19, 2018. Table 2 presents the daily volume effluents discharged at MEL-14 to Meliadine Lake in August 2018.

Training for all personnel responsible has been conducted to ensure that future MEL-14 sampling is always collected from the same location, after treatment when the power and pumps are working. In addition,

the Environment Department at Meliadine is currently implementing a data management system for laboratory results. Once it has been fully commissioned, it should mitigate delays with reporting criteria exceedances and improve the timing for requests that may be made if re-analysis is required at the laboratory.

Agnico eagle understands the importance to meet water quality discharge criteria without exceedances. All departments involved discussed the EWTP changes or updates daily in a morning water management meeting and the monitoring and comparisons of data was an important part of a decision-making process.

1.0 INTRODUCTION

Quality assurance and quality control (QA/QC) practices determine data integrity and are relevant to all aspects of the Meliadine AEMP water quality monitoring component. Golder Associates Ltd. (Golder) applied QA/QC practices throughout the program, from sample collection to data analysis and reporting. Quality assurance (QA) is the set of procedures incorporated into standard procedures, so that field sample collection is carried out to an acceptable standard and does not introduce errors or bias; quality control (QC) refers to the system of validation checks performed to measure data quality, to evaluate whether data quality objectives are met. The QA/QC procedures in 2018 followed relevant requirements outlined in the Meliadine AEMP Design Plan (Golder 2016).

This appendix describes QA/QC practices applied during this study, evaluates QC data, and describes the implications of QC results to the interpretation of study results.

2.0 QUALITY ASSURANCE PROCEDURES

Quality assurance applicable to this program covers three areas of internal and external management: field work, laboratory analysis, and office operations.

2.1 Field Work

Golder field crews are trained to be proficient in standardized field sampling procedures, data recording, and equipment operations applicable to water quality sampling. Field work was completed according to approved specific work instructions to field crews and established internal technical procedures. Specific work instructions are standardized forms that reference appropriate technical procedures and provide specific sampling instructions for the work to be undertaken. For example, specific work instructions provide field staff with descriptions of exact sampling locations, equipment needs and calibration requirements, sample handling and storage requirements, sample labelling and shipping protocols, and internal and laboratory contacts. The specific work instructions also provide specific guidelines for field record keeping and sample tracking. Golder technical procedures are consistent with information described in the relevant scientific literature (e.g., Environment Canada 1993; APHA 2012), and outline relevant information regarding protocols for field sample collection and in situ field measurements.

One crew member was responsible for managing the sample documentation process so that:

- required samples are collected or reasons are documented as to why a sample was not collected
- chain-of-custody and analytical request forms are filled out appropriately
- established labelling and documentation procedures are followed

2.2 Laboratory Analyses

ALS Environmental (ALS; Edmonton location), an analytical laboratory accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA), was used for the analysis of water samples collected during the 2018 field programs. Under CALA's accreditation program, performance evaluations are conducted for laboratory procedures, methods, and internal QC. Therefore, the analytical data reported by ALS were considered reliable.

One member of the water quality monitoring team from Golder was designated as the laboratory liaison to streamline communications with the laboratory.

2.3 Office Operations

Relevant elements of office-based QA were:

- using appropriately trained personnel for each data management, analysis, and reporting task
- using standardized data manipulation and summary tools, where applicable
- filing hard-copy, electronic data, and project information according to standardized protocols
- using a data management system to maintain an organized, consistent system to store, check and export field and laboratory data field and laboratory data storage, QC, and retrieval
- senior review of work at appropriate steps during the data analysis and reporting process

3.0 QUALITY CONTROL PROCEDURES

3.1 Field Procedures

Four types of QC samples were used in this program to evaluate data quality:

- **Field blanks** consist of deionized water provided by the analytical laboratory that is transferred to sample bottles in the field. Field blanks are handled the same way and analyzed for the same constituents as the water samples collected during the field program (e.g., preserved, filtered). Field blanks are used to detect potential sample contamination during sample collection, handling, shipping, and analysis.
- **Equipment blanks** consist of deionized water provided by the analytical laboratory that is transferred into equipment that comes into contact with samples (e.g., the Kemmerer sampler). After being run through the equipment, the water is then transferred into sample bottles. The equipment blanks are handled in the same way (e.g., preserved and filtered) and analyzed for the same constituents as the water samples collected during the field program. Equipment blanks are used to detect potential sample contamination from equipment used during sample collection.
- **Travel blanks** consist of deionized water provided in sampling bottles by the analytical laboratory. Travel blanks accompany the field samples through collection and transportation. They are shipped, handled, stored, and treated in the same way as the collected samples. For this program, travel blanks were opened in the field for the amount of time taken to collect a sample, and then closed. Travel blanks are used to detect potential sample contamination related to ambient conditions or shipping and laboratory analysis.
- **Duplicate samples** are additional samples collected at the same time and location as surface water samples collected during a field program, using the same sampling methods. They are used to check within-station variation, and the precision of field sampling methods and laboratory analysis.

QC samples accounted for approximately 16% of the total number of water samples submitted for analysis. All QC samples were submitted “blind” (i.e., so as to not to identify them as QC samples) to the laboratory to test the validity of the analysis process and were analyzed for the same set of parameters as the collected water samples.

3.2 Field and Laboratory Data Quality Control Procedures

Field-collected data, datasheets and the field notebook were reviewed for completeness and unexpected values and trends. Upon receipt of water quality data from the laboratory, a series of standard checks were performed to screen for potential data quality issues (Sections 3.2.1 to 3.2.8):

- screening of laboratory and field results
- review of detection limits (DLs)
- review of units
- review of holding time exceedances
- checking for contamination in blank samples
- comparison of duplicate samples

3.2.1 Screening of Laboratory and Field Results

The following screening procedures were completed on laboratory and field results in 2018:

- project chain-of-custody (COC) forms and analytical request forms were compared to sampling records, to confirm sampling locations matched assigned sample control numbers and analyses were requested for all required parameters
- laboratory results were reviewed to confirm analysis of all required parameters
- field and laboratory data from the same sample were reviewed to check that data were similar for common parameters
- logic checks were conducted, including checking for presence of zero values, comparisons of TDS and specific conductivity, hardness and alkalinity, total and dissolved phosphorus, total and dissolved organic carbon, and total and dissolved metals
- unusual data relative to previously collected data were identified through a visual comparison of 2018 data to historical data

Laboratory results were considered for re-analyses if:

- values were assessed as substantially higher or lower than expected, based on comparisons to historical concentrations
- parameters were detected in concentrations above five times the DL in a field blank, but similar concentrations were not measured in the travel blank or in samples analyzed during the same sampling event (i.e., contamination during laboratory analyses may have occurred)

If re-analysis confirmed the original analysis result (i.e., RPD less than 20%), the original result was retained. If the re-analysis was notably different than the original result (i.e., RPD greater than 20%), then a decision was made to keep the original or re-analyzed result based on discussions with the laboratory regarding any QC issues of the original and re-analyzed results, holding time exceedances, historical concentrations, concentrations of other parameters within the same sample, and results of the QC samples. The rationale for requesting re-analyses or revising the original result to the re-analyzed result was documented.

3.2.2 Detection Limits

Detection limits were specified for all chemical analyses for the Meliadine AEMP water quality program. The project standard DLs and the DLs provided by the laboratory for individual samples were compared.

If laboratory DLs were higher than the project standard DLs, the laboratory was notified and requested to provide an explanation for the change in DLs. If possible, a parameter was re-analyzed at the project standard DL. Changes in DLs by the laboratory during the program could cause limitations when comparing results with different DLs and results to water quality guidelines. An increase in DL above measured concentrations reduces the ability to detect spatial and temporal patterns; an increase in DL above a water quality guideline reduces the ability to detect guideline exceedances when concentrations are below DLs.

3.2.3 Units

The units reported by the laboratory were compared against the expected units, as coded into the database, for each parameter.

3.2.4 Holding Time

Holding times between sample collection and analysis for each parameter are specified by the laboratory, based on Table 1060: I – Summary of Special Sampling and Handling Requirements, *The Standard Methods for the Examination of Water and Wastewater* (APHA 2012). The laboratory reviews holding times for exceedances and identifies data that may be unreliable due to holding time exceedances. Holding time exceedances are considered when determining the validity of re-analyzed results from the laboratory.

3.2.5 Blank Samples

Concentrations in travel and field blanks were considered notable if they were greater than or equal to five times the corresponding DL. This threshold takes into account the potential for reduced precision when concentrations approach or are below DLs (AENV 2006; APHA 2012). This criterion does not apply to pH, however, because DLs are not applicable to the pH scale.

3.2.6 Duplicate Samples

Differences between concentrations measured in duplicate water samples were calculated as the RPD for each parameter. Before calculating the RPD, concentrations below the DL were replaced with the DL value in cases when only one of the concentrations for a given parameter was detectable. The RPD was calculated as per Equation 1:

$$RPD = (|difference\ in\ concentration\ between\ two\ of\ the\ duplicate\ samples|/mean\ concentration)\ x\ 100$$

[Equation 1]

The RPD value for a given parameter was notable if both conditions apply:

- the RPD was greater than 20%
- concentrations in one or both samples were greater than five times the DL

The number of parameters with exceedances of the evaluation criteria was compared with the total number of parameters analyzed to evaluate analytical precision.

Within-site variability and field sampling precision of duplicate sample results were rated as:

- **low and high**, respectively, if less than 10% of the parameters included in the duplicate sample analysis were notably different from one another
- **moderate**, if 10% to 30% of the parameters included in the duplicate sample analysis were notably different from one another
- **high and low**, respectively, if more than 30% of the parameters included in the duplicate sample analysis were notably different from one another

3.2.7 Comparison of Dissolved and Total Concentrations

Dissolved concentrations were compared to their corresponding total concentrations for nutrient and metal constituents. If the dissolved concentration was 20% greater than the corresponding total concentration, and both (total and dissolved) concentrations were greater than five times the DL, the dissolved concentration was considered notable.

3.3 Office Quality Control Procedures

Office-based QC procedures were as follows:

- saving unaltered field datasheets, field notebooks, and laboratory files (e.g., COC forms, analysis request forms, certificates of analysis) in the Meliadine AEMP water quality monitoring program directory, to document the original and final sources of laboratory and field water quality data from each program
- comparing sample field and laboratory data entered into the Meliadine AEMP water quality monitoring program data management system against field datasheets and final laboratory reports to confirm data accuracy
- creating backup files before each major data processing step
- verifying the accuracy of calculations performed to generate summary statistics and complete guideline comparisons
- documenting the final results for the QA/QC assessment annually in an appendix to the annual report

4.0 2018 FIELD AND LABORATORY DATA QUALITY RESULTS

4.1 Screening of Individual Laboratory and Field Results

4.1.1 Chain-of-Custody Review

A review of the COC forms indicated that Radium-226 was not requested for analysis for the travel blank (T-18-07-01) sample collected on 23 July 2018. The Radium-226 analysis was erroneously omitted from the COC form.

4.1.2 Parameters Requested for Analysis

All requested parameters were analyzed by the laboratory.

4.1.3 Field Data Review

Based on the review of the field data, all field dissolved oxygen (DO) measurements collected in March were further evaluated because the values were outside the expected range. Winkler titrations were performed alongside field measurements at two stations: MEL-01-02 and MEL-02-01. At MEL-01-02 and MEL-02-01, Winkler dissolved oxygen measurements were 6.62 and 5.94 mg/L, compared to corresponding probe measurements of 18.5 and 18.8 mg/L, respectively. As a result, DO meter data were deemed unreliable and excluded from analysis.

Two field pH values in July and twenty field pH values in August were different than expected, relative to laboratory values (Table 6A-1). On 30 August 2018, the field crew noted an issue with the calibration of the field water quality meter and re-calibrated the meter, at which point pH values returned to within the normal range for subsequently samples stations. No issues with the field water quality meter were noted by the field crew during the July program. In all cases, the field values were invalidated because field pH values were outside the range of historical values at these locations, whereas laboratory pH values were within the range of historical values. However, as laboratory pH was measured outside the holding time requirement, it is acknowledged that these laboratory pH data have corresponding uncertainty. Corresponding field pH profile values were also invalidated.

4.1.4 Laboratory Data Review

Thirty-nine laboratory results, which represented less than 1.5% of the 2018 laboratory data, in 65 samples were further evaluated because of reasons outlined in Table 6A-1. Re-analysis of samples for certain parameters was requested when data logic checks indicated a potential problem with the data. In all cases, reanalysis confirmed the original result and the original result was retained, with the following exception. The concentration of dissolved nickel in sample D7-03 collected on 1 September 2018 was notably different upon reanalysis (0.776 µg/L) relative to the original result (1.97 µg/L). The reanalyzed result was closer to the expected value based on comparison to the total nickel concentration (0.88 µg/L); therefore, the original results was revised by the laboratory.

4.2 Analytical Methods

All required parameters under the AEMP Design Plan (Golder 2016) were analyzed by the laboratory using the standard analytical methods requested during the program (Table 6A-2).

4.3 Detection Limits

A few parameters were analyzed by the laboratory using DLs higher than the requested DL (Table 6A-2). Requested DLs were met for most parameters, with the exception of total dissolved solids (70 samples), reactive

silica (17 samples), sodium (2 samples), total vanadium (2 samples), dissolved selenium (20 samples), dissolved thallium (four samples), dissolved tin (13 samples), and dissolved vanadium (2 samples). Generally, detection limits were adjusted due to sample matrix effects (e.g., chemical interference, colour, turbidity).

4.4 Units

The laboratory reported the expected units for each parameter in 2018.

4.5 Holding Time

To maintain sample integrity, water samples for laboratory analyses were submitted as soon as possible after collection. Holding times may be exceeded for samples if there are delays in sample delivery to the laboratory, or if the laboratory is unable to initiate testing promptly following sample receipt. Analytical holding times were met for most constituents, with the exception of laboratory pH (76 samples), total dissolved solids (59 samples), total suspended solids (70 samples), turbidity (76 samples), nitrate (78 samples), nitrite (78 samples), orthophosphate (78 samples), total Kjeldahl nitrogen (11 samples), total dissolved phosphorus (3 samples), total mercury (1 sample), dissolved mercury (3 samples), and total cyanide (17 samples).

Holding times for laboratory pH (15 minutes), turbidity, nitrate, nitrite and orthophosphate (three days) were exceeded in the majority of samples during each program, because the holding times are very short for these constituents. Holding times for the other parameters were exceeded due to a sample backlog at the laboratory that resulted in a delay in initiation of analysis.

Holding time exceedances for pH, nutrients and turbidity are not uncommon. A study on holding time exceedances for these parameters conducted by the Department of Environment and Conservation in Newfoundland and Labrador (2010) found that although parameters concentrations differed between samples processed within and outside recommended holding times (by up to 21 days), the results were not significantly different (at $P<0.05$). Therefore, they concluded that the data were still valid, even with a delay in processing beyond the holding time. Holding times for the 2018 Meliadine dataset for these parameters were not exceeded by more than 21 days. Holding times for total and dissolved mercury and total cyanide were only exceeded by one day, and therefore data quality was considered acceptable.

4.6 Blank Samples

Six blank samples (four travel blanks and two equipment blanks) were collected and analyzed during the 2018 program (Table 6A-3). The frequency of detectable concentrations (i.e., above the DL) in the blank samples was 13%. However, only 1% of concentrations in blank samples were reportable detections (i.e., greater than five times the DL); therefore, no parameters were detected at a frequency or magnitude that were likely to influence the results of the water quality samples.

4.7 Duplicate Samples

Six duplicate water quality samples were collected during the 2018 program: two replicates were collected for each program (Table 6A-4).

A small percentage (i.e., 3%) of the paired duplicate concentrations had an RPD of more than 20% when one or both concentrations were above five times the DL (Table 6A-5). The site variability and field precision for the 2018 dataset was rated as low and high, respectively.

4.8 Internal Laboratory Quality Control

No issues were identified in the review of internal laboratory quality control results.

5.0 SUMMARY OF DATA QUALITY

The results of the review of field and laboratory data indicated that field measurements and laboratory data were of acceptable quality. Key findings from the 2018 QA/QC results are:

- In general, field measurements and results of laboratory samples collected during the 2018 sampling program were within the ranges that would be expected for the Meliadine water quality program, with the exception of two field pH measurements collected in July and several field pH measurements collected in August. These field pH measurements were invalidated, because the values were far outside the range of historical variation at these stations.
- No issues were identified in analytical methods used or units reported by the laboratory.
- Holding times recommended by the laboratory were exceeded for some parameters. Holding time exceedances were not expected to have affected data quality for the Meliadine water quality program.
- Evaluation of the water quality QC samples indicated that:
  - No notable contamination occurred in the blank samples.
  - Site variability and field precision for the 2018 dataset were rated as low and high, respectively.

The overall quality of the water quality data was rated high. Therefore, the results reported in the report are considered reliable and meet the needs of the program.

MEL-03-01	MEL-03-01	-	20-Aug-18		Field pH was higher than expected relative to laboratory pH (7.42)	8.52		
MEL-03-02	MEL-03-02	-	26-Aug-18		Field pH was higher than expected relative to laboratory pH (7.48)	8.51		
MEL-03-03	MEL-03-03	-	20-Aug-18		Field pH was higher than expected relative to laboratory pH (7.42)	8.64		
MEL-03-04	MEL-03-04	-	26-Aug-18		Field pH was higher than expected relative to laboratory pH (7.44)	8.47		
MEL-03-05	MEL-03-05	-	26-Aug-18		Field pH was higher than expected relative to laboratory pH (7.45)	8.56		
MEL-05-03	MEL-05-03		29-Aug-18		Field pH was higher than expected relative to laboratory pH (7.46)	8.62		
MEL-05-05	MEL-05-05		29-Aug-18		Field pH was higher than expected relative to laboratory pH (7.51)	8.63		

Table 6A-1: Summary of Re-evaluated Data for Field and Laboratory Results, Meliadine, 2018

Station Name	Station Sample ID	Lab ID	Sample Date	Parameter	Reason for Evaluation	Result	Unit	Decision
Water Chemistry Data								
MEL-01-02	MEL-01-02	L2064973-4	05-Mar-18	Total lead	Greater than 20% RPD between replicates	0.055	µg/L	Concentrations were confirmed by re-analysis; original result was retained.
MEL-01-02	R-18-01	L2064973-11	05-Mar-18	Total lead	Greater than 20% RPD between replicates	0.074	µg/L	
MEL-03-03	MEL-03-03	L2139293-3	25-Jul-18	Total nickel	Concentration was greater than five times the method detection limit and exceeded their relative total/dissolved metal concentration by more than 20%.	0.46	µg/L	
				Dissolved nickel		0.70	µg/L	
MEL-03-01	MEL-03-01	L2139293-1	25-Jul-18	Total dissolved solids	Non-linear relationship between TDS and laboratory specific conductivity	33	mg/L	
				Laboratory specific conductivity		68	µS/cm	
MEL-02-05	MEL-02-05	L2137049-2	21-Jul-18	Total dissolved solids	Non-linear relationship between TDS and laboratory specific conductivity	35	mg/L	
				Laboratory specific conductivity		74.3	µS/cm	
MEL-01-09	MEL-01-09	L2139293-7	24-Jul-18	Total aluminum	Greater than 20% RPD between replicates	29.1	µg/L	
				Dissolved aluminum		22.2	µg/L	
				Radium-226		100	Bq/L	
	R-18-07-02	L2139293-12	24-Jul-18	Total aluminum		20.6	µg/L	
				Dissolved aluminum		17.1	µg/L	
				Radium-226		<4.1	Bq/L	
MEL-01-07	MEL-01-07	L2139293-6	24-Jul-18	Dissolved manganese		2.71	µg/L	
	R-18-07-01	L2139293-8				1.73	µg/L	
MEL-03-01	MEL-03-01	L2153439-2	20-Aug-18	Total nickel	Concentration was greater than five times the method detection limit and exceeded their relative total/dissolved metal concentration by more than 20%.	0.412	µg/L	
				Dissolved nickel		0.499	µg/L	
MEL-03-01	MEL-03-01	L2153439-2	20-Aug-18	Total dissolved solids	Greater than 20% RPD between replicates	48	mg/L	
				Total iron		17.8	µg/L	
				Dissolved iron		4.2	µg/L	
	R-18-01	L2153439-1		Total dissolved solids		35	mg/L	
				Total iron		12	µg/L	
				Dissolved iron		6.1	µg/L	
Lake B7	B-07-01	L2137049-11	22-Jul-18	Total aluminum	Concentration was greater than five times the method detection limit and exceeded their relative total/dissolved metal concentration by more than 20%.	3.33	µg/L	
				Dissolved aluminum		4.33	µg/L	
Lake A8	A8-02	L2139293-10	24-Jul-18	Total nickel		0.69	µg/L	
				Dissolved nickel		0.90	µg/L	
Lake A8	A8-03	L2139293-11		Total nickel		0.86	µg/L	Concentrations were confirmed by re-analysis; original result was retained.
				Dissolved nickel		1.14	µg/L	
Lake D7	D7-03	L2161089-3	01-Sep-18	Total copper		0.89	µg/L	
				Dissolved copper		1.4	µg/L	
		L2161089-3		Total nickel		0.88	µg/L	
				Dissolved nickel		1.97	µg/L	Result revised to 0.776 µg/L upon reanalysis
	D7-01	L2161089-1		Total lead		0.019	µg/L	Concentrations were confirmed by re-analysis; original result was retained.
				Dissolved lead		0.083	µg/L	
	D7-02	L2161089-2		Total uranium		0.066	µg/L	
				Dissolved uranium		0.081	µg/L	

µg/L = micrograms per litre; µS/cm = microSiemens per centimeter; mg/L = milligrams per litre; Bq/L = Becquerels per litre.

Table 6A-2: Summary of Analytical Methods and Detection Limits, Meliadine Mine, 2018

Parameter	Unit	Total Number of Samples	Standard Project Analytic Methodologies	Method Description	Standard ALS Detection Limit	MDMER Required Detection Limit
Conventional Parameters						
pH (laboratory)	unitless	65	APHA 4500H	Meter	0.1	n/a
Specific conductivity	µS/cm	65	APHA 2510B	Meter	1	1
Hardness (as $CaCO_3$)	mg/L	65	APHA 2340B	Calculation	0.2	1

(a) As per Schedule 3 of the MDMER (Government of Canada 2002).

(b) The list of elements reported for metals analysis includes metalloids such as arsenic and non-metals such as selenium, which are collectively referred to as "metals" in this table.

µS/cm = microSiemens per centimetre; $CaCO_3$ = calcium carbonate; mg/L = milligrams per litre; mg-N/L = milligrams nitrogen per litre; mg-P/L = milligrams phosphorus per litre; µg/L = micrograms per litre; Bq/L = Becquerels per litre; NTU = nephelometric turbidity unit; ICPMS = Inductively Coupled Plasma Mass Spectrometry; CVAFS = Cold Vapour Atomic Fluorescence Spectrophotometry.

Cyanide	mg/L	<0.001	<0.001	<0.001	<0.001	<0.001	<0.001
Radium-226	Bq/L	-[c]	-[d]	<6.4	<0.006	<4.7	<0.0045

(a) Field crew confirmed this sample was collected as a travel blank.

(b) The list of elements reported for metals analysis includes metalloids such as arsenic and non-metals such as selenium, which are collectively referred to as "metals" in this table.

(c) Radium-226 was not included in analysis during the under-ice program.

(d) Due to a technical error by the field crew, Radium-226 was not requested for analysis.

Grey shading indicates the concentration was greater than 5 times the detection limit.

All results that exceeded their detection limit by greater than 5-times were confirmed by reanalysis.

µS/cm = microSiemens per centimetre; $CaCO_3$ = calcium carbonate; mg/L = milligrams per litre; mg-N/L = milligrams nitrogen per litre; mg-P/L = milligrams phosphorus per litre; µg/L = micrograms per litre; Bq/L = Becquerels per litre; NTU = nephelometric turbidity unit; < = less than.

(a) The list of elements reported for metals analysis includes metalloids such as arsenic and non-metals such as selenium, which are collectively referred to as "metals" in this table.
(b) Radium-226 analysis was not included as an analyte for this station.
Grey shading indicates a greater than 20% relative percent difference between replicates, when both sample concentrations were 5-times greater than the detection limit.
Light grey shading indicates a greater than 20% relative percent difference between replicates, when at least one sample concentration was 5-times greater than the detection limit.
µS/cm = microSiemens per centimetre; $CaCO_3$ = calcium carbonate; mg/L = milligrams per litre; mg-N/L = milligrams nitrogen per litre; mg-P/L = milligrams phosphorus per litre; µg/L = micrograms per litre; Bq/L = Becquerels per litre; NTU = nephelometric turbidity unit; < = less than.

Table 6A-5: Summary of Relative Percent Differences Between Water Quality Duplicate Samples, Meliadine, 2018

Station Number	Date	Total Number of Parameters	Relative Percent Difference Above 20% (when one parameter was above five times the detection limit)		Relative Percent Difference Above 20% (when both parameters were above five times the detection limit)		Relative Percent Difference Above 20% (when one or both parameters were above five times the detection limit)	
			Number of Parameters	Percent of Total Parameters (%)	Number of Parameters	Percent of Parameter (%)	Number of Parameters	Percent of Parameter (%)

APPENDIX 6B

Normal Range Data Screening

Data collected between 1995 and 2013 (i.e., pre-2015 data) were compiled and compared to AEMP monitoring data (collected between 2015 to 2018) to evaluate if Near-field and Mid-field area AEMP datasets are suitable for inclusion in normal range calculation. An analysis conducted as part of the FEIS (Agnico Eagle 2014; in Appendix 7.4-A) concluded that the 2013 dataset was comparable to baseline data collected at Meliadine Mine prior to 2013. Prior to pooling the pre-2015 dataset, it was reviewed further to evaluate the suitability of including these data in the normal range calculation. Data were initially assessed for representativeness of the current AEMP sampling areas. During the assessment, sampling station DI4 was (located approximately 10 kilometres southeast of the Mine site removed from the dataset due to its distance from other sampling areas, and limited connection to other areas of Meliadine Lake.

For the historical stations retained in the pre-2015 dataset, the laboratory data were evaluated to determine if the detection limits (DL; where available) were comparable to AEMP detection limits, and if a sufficient percentage of results was above the DL. For conventional parameters, major ions and selected nutrients, the detection limits were similar to the current AEMP DLs, or most of the data were above the detection limit. Metals and nitrogen parameters were not retained due to large number of non-detects, and DLs generally being at least one order of magnitude higher than AEMP DLs. The inclusion of such results would artificially increase the range of baseline results and compromise normal range calculation. Historical field data were retained and included in the normal range calculation.

Sample sizes were comparable among datasets, with a pre-2015 sample size of approximately 21 and AEMP samples sizes ranging between approximately 14 (2015 and 2018) to 25 (2017).

The screening procedure for potential inclusion of data in the normal range calculation for open-water conditions was as follows:

- Near-field area data collected between 2015 and 2017 were qualitatively compared to data (i.e., pre-2015 data) collected at stations located in the vicinity of the AEMP Near-field area between 1995 and 2013). Pre-2015 data were pooled and compared to AEMP Near-field data using box-and-whisker plots. Total metals were excluded from this comparison because the detection limits were not comparable to the AEMP dataset. The 2015 to 2017 Near-field dataset differed from the pre-2015 dataset for several major ions (Figure 6B-1), suggesting that some aspects of water quality in the Near-field area were affected by pre-construction exploration activities.
- Mid-field area data collected between 2016 and 2017 during open-water conditions were compared to Near-field and reference area data collected at the same time, to evaluate whether a spatial pattern among areas was visually evident. Spatial patterns with increasing divergence in concentrations among areas were observed for several ions (Appendix 6F). Therefore, the Mid-field area AEMP data were then qualitatively compared to pre-2015 baseline data collected in the vicinity of the Near-field and reference areas using box-and-whisker plots; baseline data were not collected in the vicinity of the Mid-field area. Total metals were excluded from this analysis because the detection limits were not comparable to the AEMP dataset. A visual difference in the variation of the 2015 to 2017 Mid-field area dataset was observed relative to the pre-2015 pooled dataset for several parameters (Figure 6B-2), suggesting that Mid-field area water quality was also influenced by pre-construction exploration activities.

- Reference area data collected during the AEMP monitoring program (2015 to 2018) did not show the same spatial patterns as the Near-field and Mid-field areas, and so was included in the normal range calculation. Additionally, pre-2015 data were included in the normal range calculation because the FEIS (Agnico Eagle 2014) assessment of the data concluded that the pre-2015 data were appropriate as baseline.

Normal ranges were not calculated for ice-covered conditions for the following reasons:

- During ice-cover conditions, AEMP sampling occurs at the Mid-field and Near-field areas. Therefore, AEMP reference area data were not available for inclusion in the normal range calculation.
- Near-field area data collected under-ice between 2016 and 2018 were not suitable for inclusion in the normal range calculation, because temporal trends were observed for several ions, indicating potential changes in water quality in the Near-field area during pre-construction (Figure 6B-3), which was also suggested by open-water season data.
- Mid-field area data collected under-ice between 2016 and 2018 were also not suitable for inclusion in normal range calculation. Mid-field area data were plotted as box-and-whisker plots alongside pre-2015 data collected in the vicinity of the Near-field and reference areas during winter. The Mid-field area AEMP data visually differed from the pre-2015 dataset for several parameters (Figure 6B-4), resulting in uncertainty in whether this difference was due to a mine-related influence or natural spatial heterogeneity.
- Pre-2015 data were not used to calculate the normal range because after evaluation of the dataset (i.e., DLs) only conventional parameters and major ion data were available and the sample size was limited (n = 4 to 8).

Therefore, due to lack of ice-cover season pre-2015 data, AEMP monitoring program reference area data, and the potential for a mine-related influence on the available pre-construction Near-field and Mid-field area datasets, normal range calculation was not completed for ice-covered conditions.

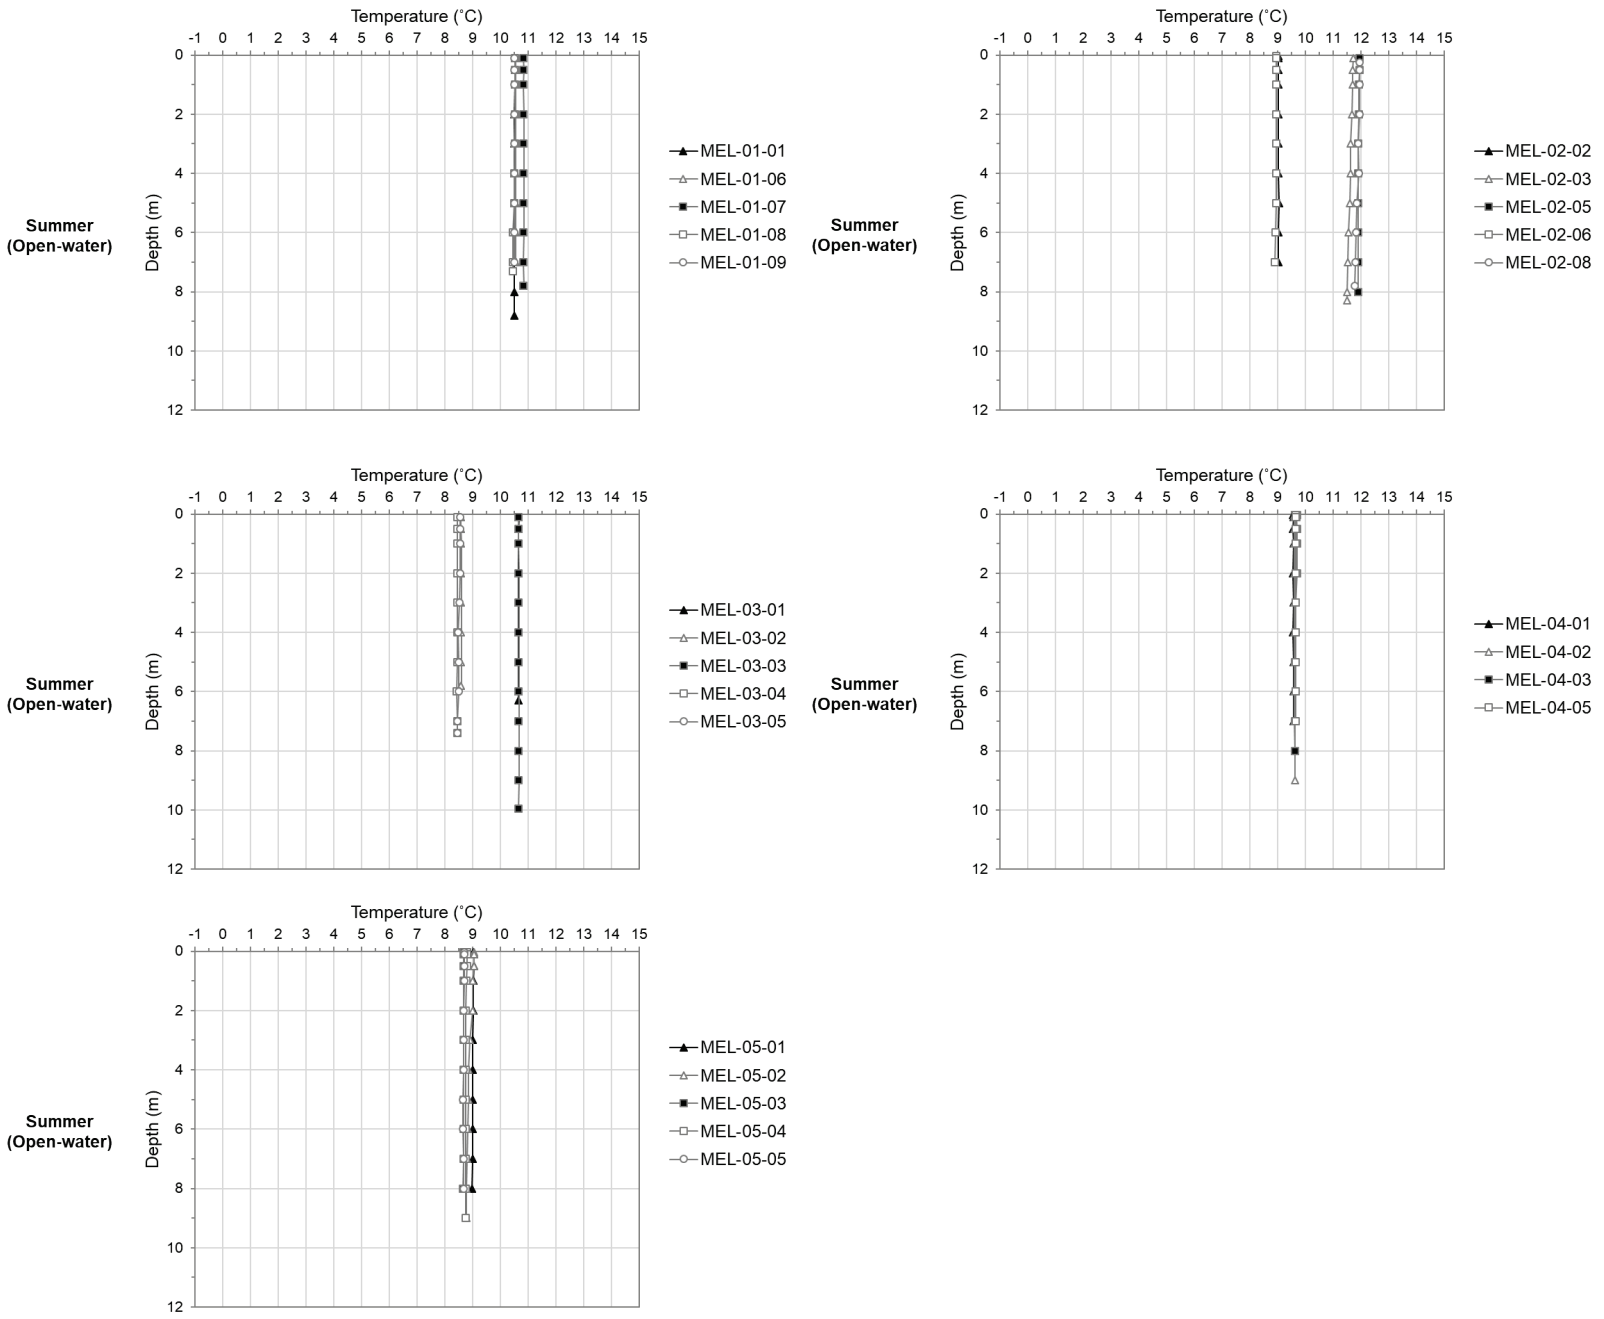
6C.1.0 FIELD PROFILE PLOTS

6C.1.1 Temperature



m = metre; °C = degrees Celsius; MEL-01 = Near-field; MEL-02 = Mid-field.

Figure 6C.1-1: Temperature Profiles at Stations on Meliadine Lake, Under-ice (March) 2018

m = metre; °C = degrees Celsius; MEL-01 = Near-field; MEL-02 = Mid-field; MEL-03 = Reference Area 1; * = a field profile was conducted at these stations but water quality samples were not collected.

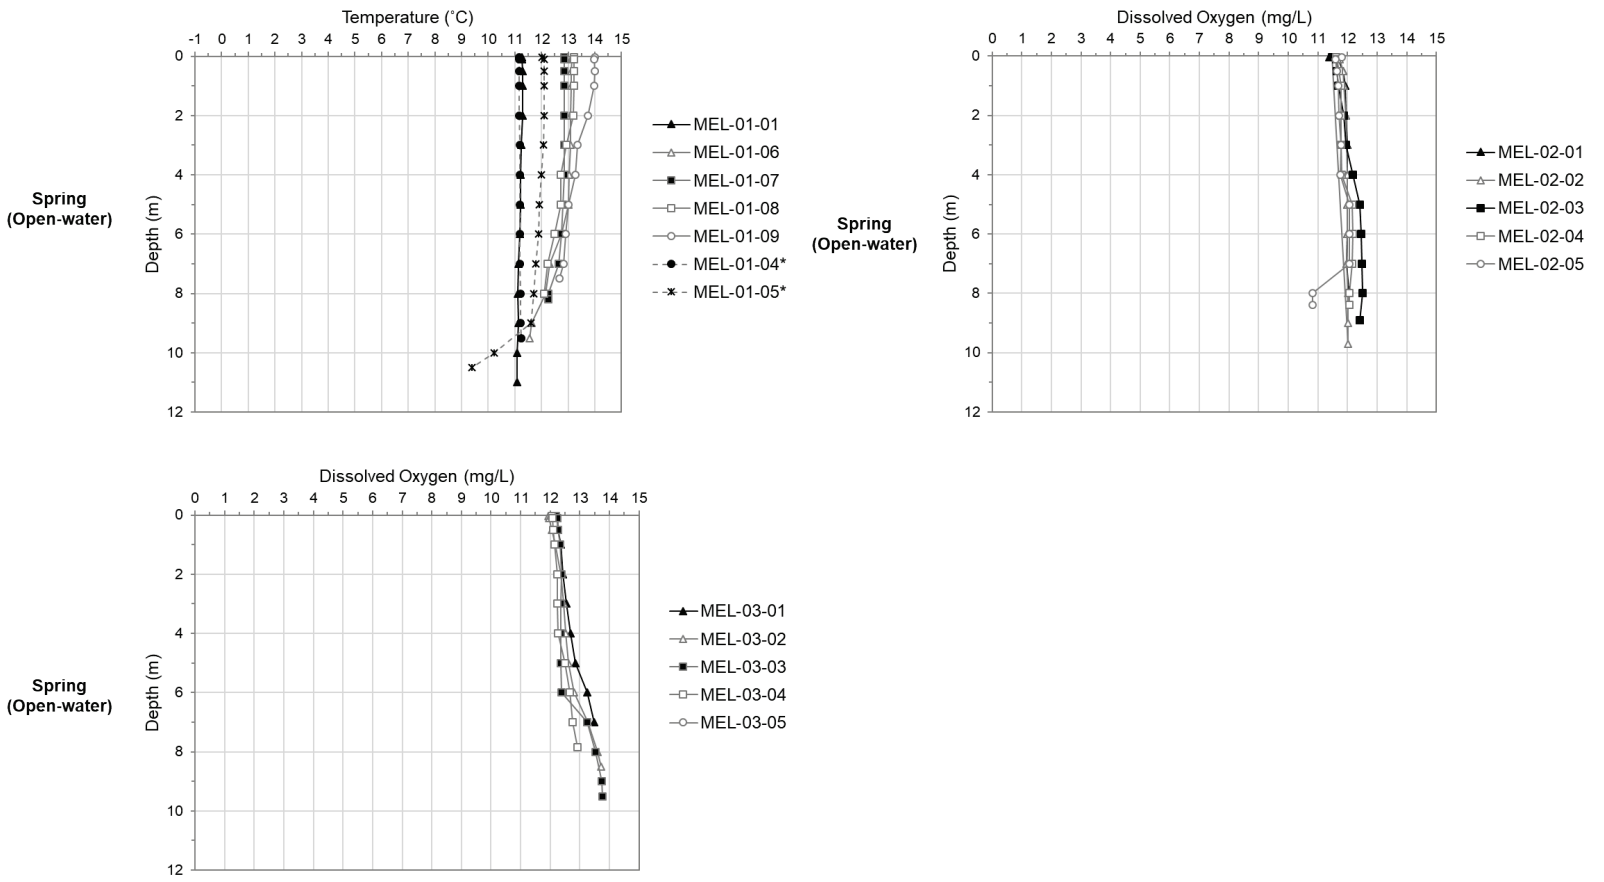


Figure 6C.1-2: Temperature Profiles at Stations on Meliadine Lake, Open-water (July) 2018

m = metre; °C = degrees Celsius; MEL-01 = Near-field; MEL-02 = Mid-field; MEL-03 = Reference Area 1; MEL-04 = Reference Area 2; MEL-05 = Reference Area 3.

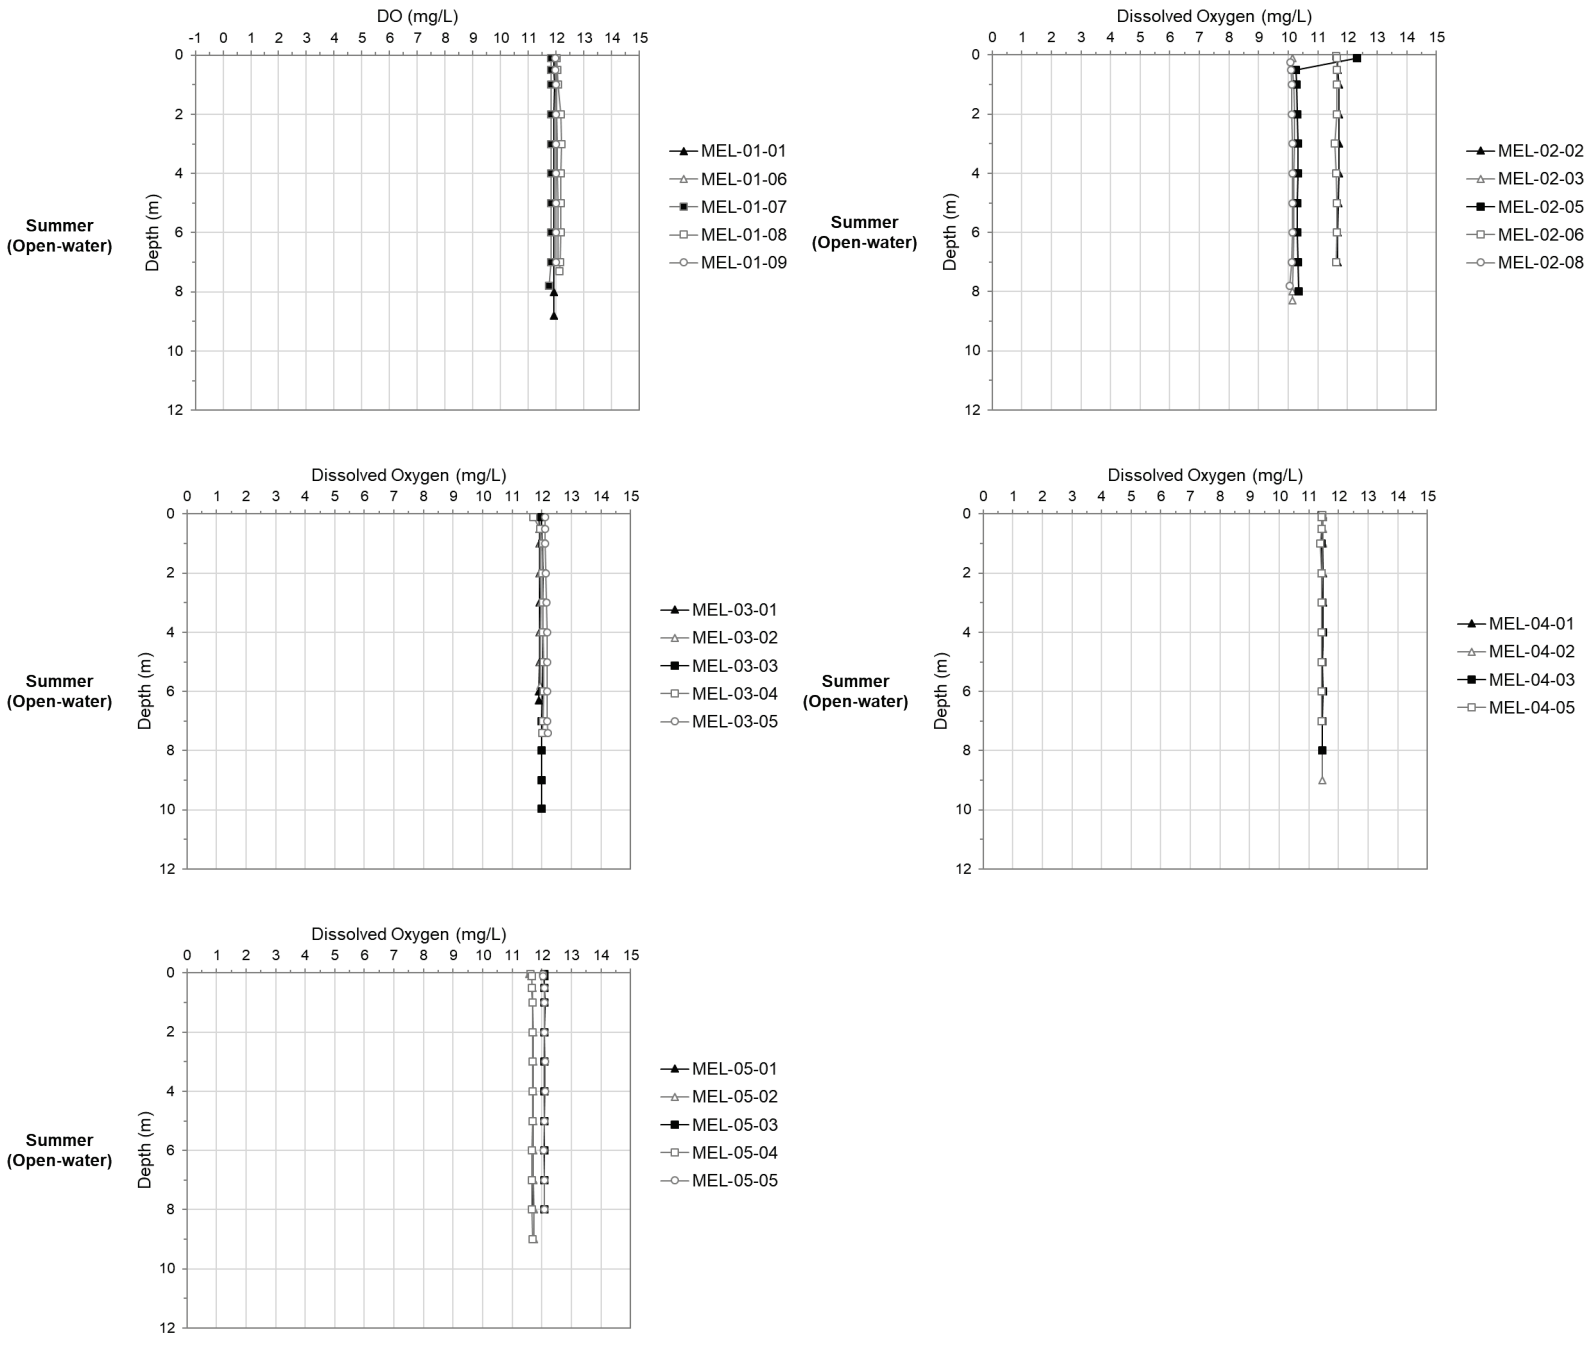

Figure 6C.1-3: Temperature Profiles at Stations on Meliadine Lake, Open-water (August) 2018

6C.1.2 Dissolved Oxygen

m = metre; mg/L = milligrams per litre; MEL-01 = Near-field; MEL-02 = Mid-field; MEL-03 = Reference Area 1; * = a field profile was conducted at these stations but water quality samples were not collected.

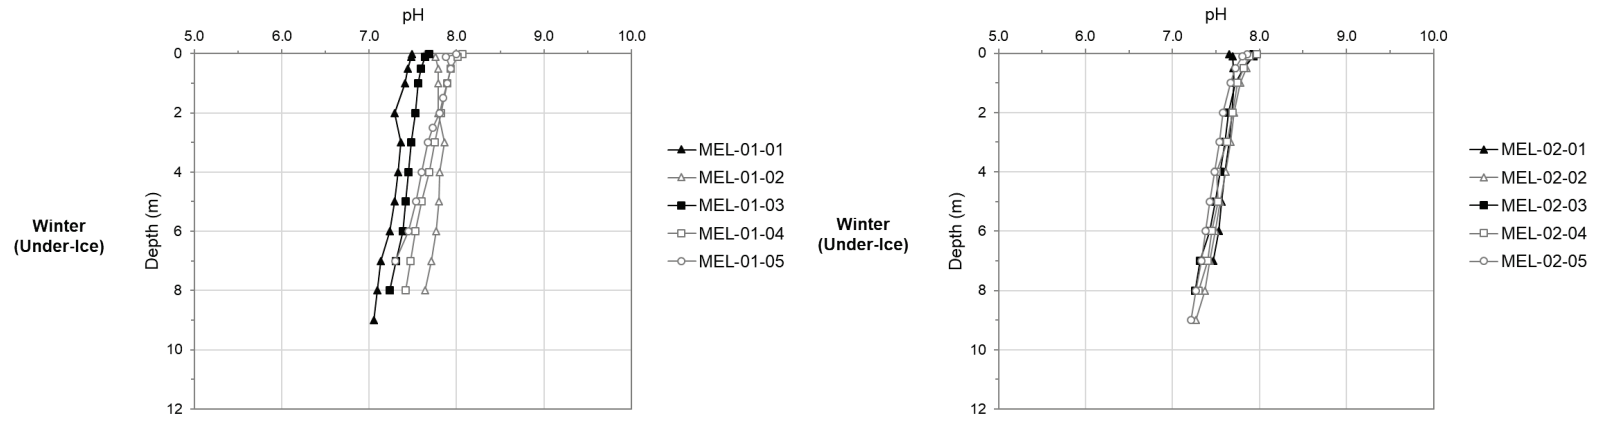

Figure 6C.1-5: Dissolved Oxygen Profiles at Stations on Meliadine Lake, Open-water (July) 2018

m = metre; mg/L = milligrams per litre; MEL-01 = Near-field; MEL-02 = Mid-field; MEL-03 = Reference Area 1; MEL-04 = Reference Area 2; MEL-05 = Reference Area 3.

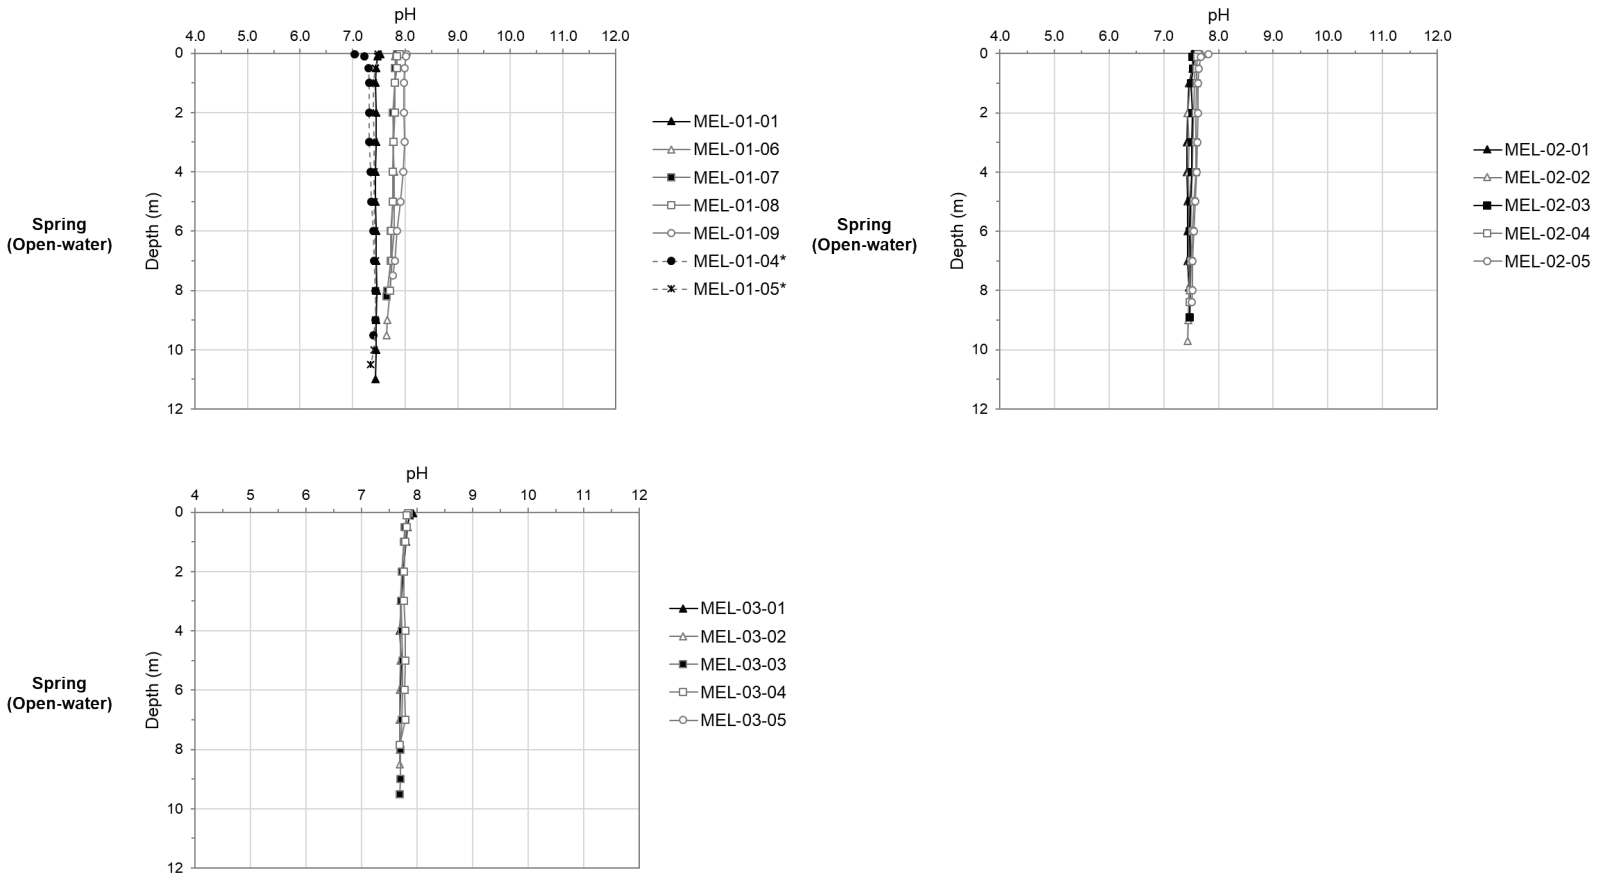

Figure 6C.1-6: Dissolved Oxygen Profiles at Stations on Meliadine Lake, Open-water (August) 2018

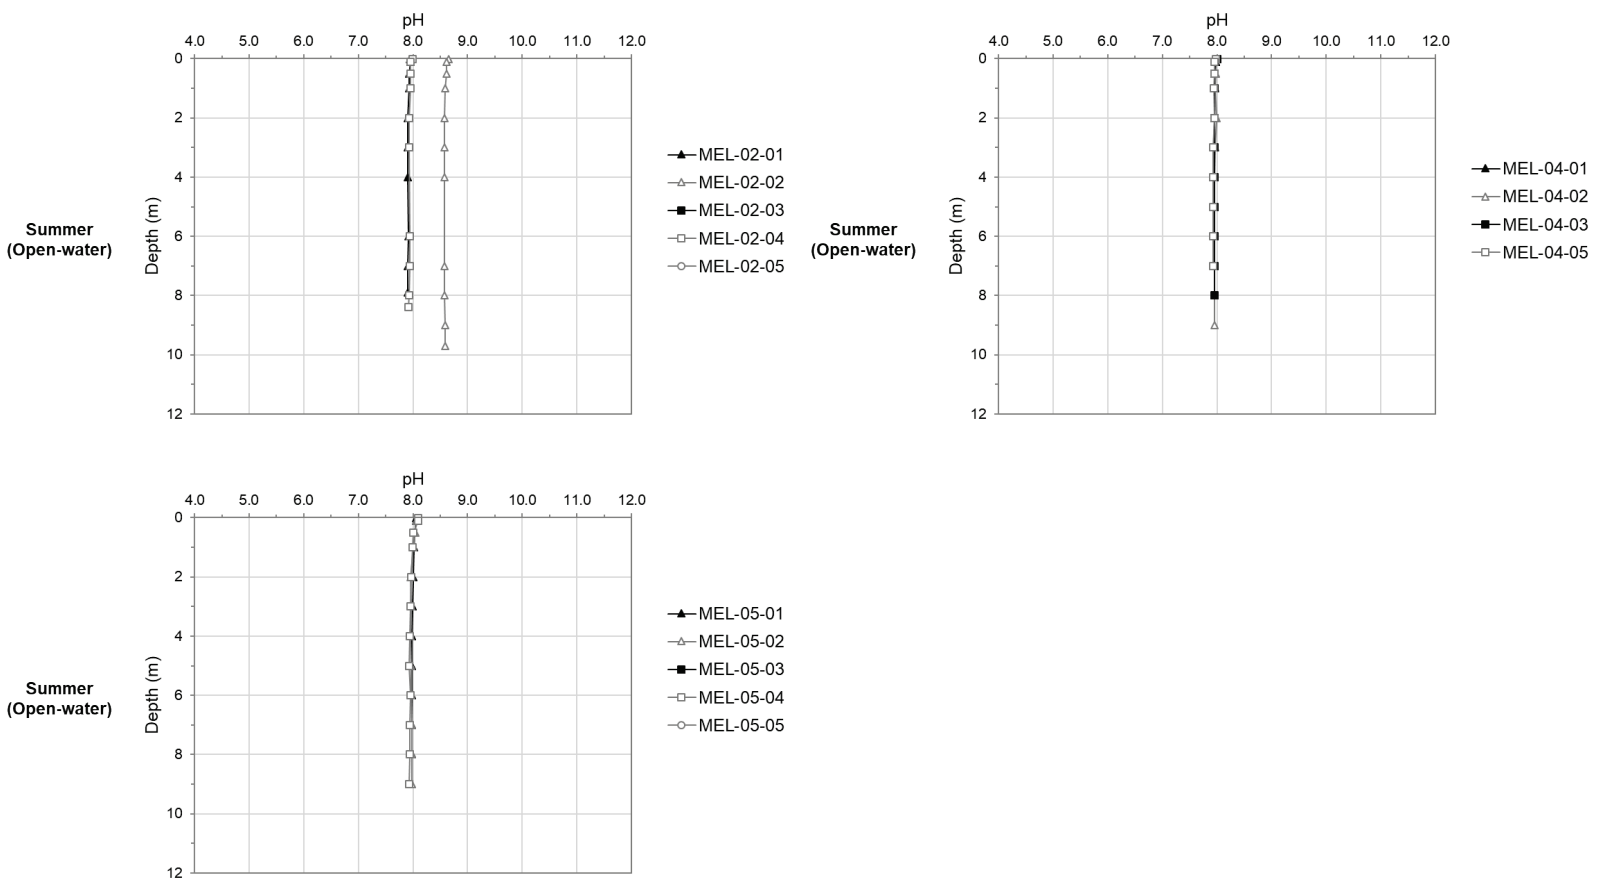
6C.1.3 pH

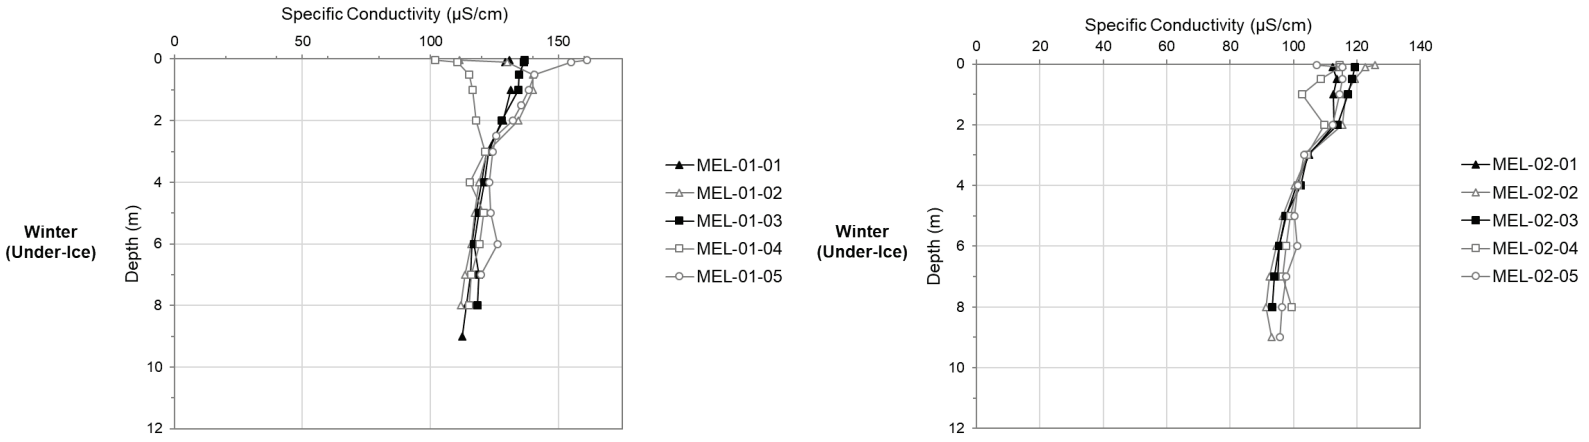


m = metre; MEL-01 = near-field; MEL-02 = mid-field.

Figure 6C.1-7: pH Profiles at Stations on Meliadine Lake, Under-ice (March) 2018

m = metre; MEL-01 = Near-field; MEL-02 = Mid-field; MEL-03 = Reference Area 1; * = a field profile was conducted at these stations but water quality samples were not collected.

Figure 6C.1-8: pH Profiles at Stations on Meliadine Lake, Open-water (July) 2018



m = metre; MEL-02 = mid-field; MEL-04 = reference area 2; MEL-05 = reference area 3.

Note: pH measured during open-water conditions in August were outside the acceptable range at all MEL-01 (Near-field) and MEL-03 (Reference Area 1) stations as well as at selected MEL-02 (Mid-field), and MEL-05 (Reference Area 3) stations. Data was deemed unreliable and invalidated.

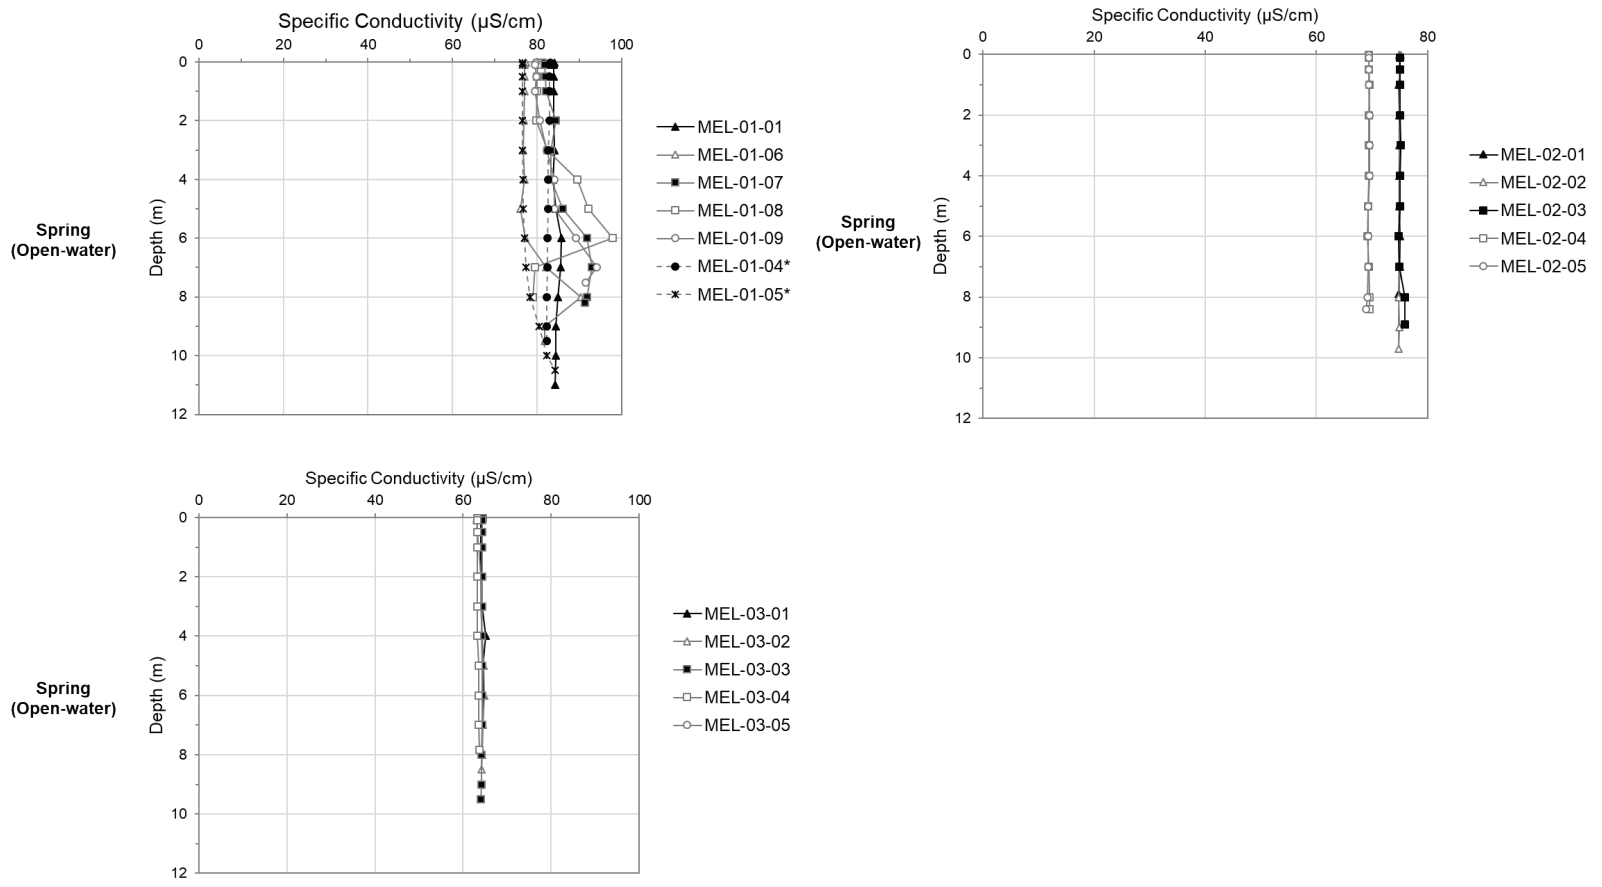


Figure 6C.1-9: pH Profiles at Stations on Meliadine Lake, Open-water (August) 2018

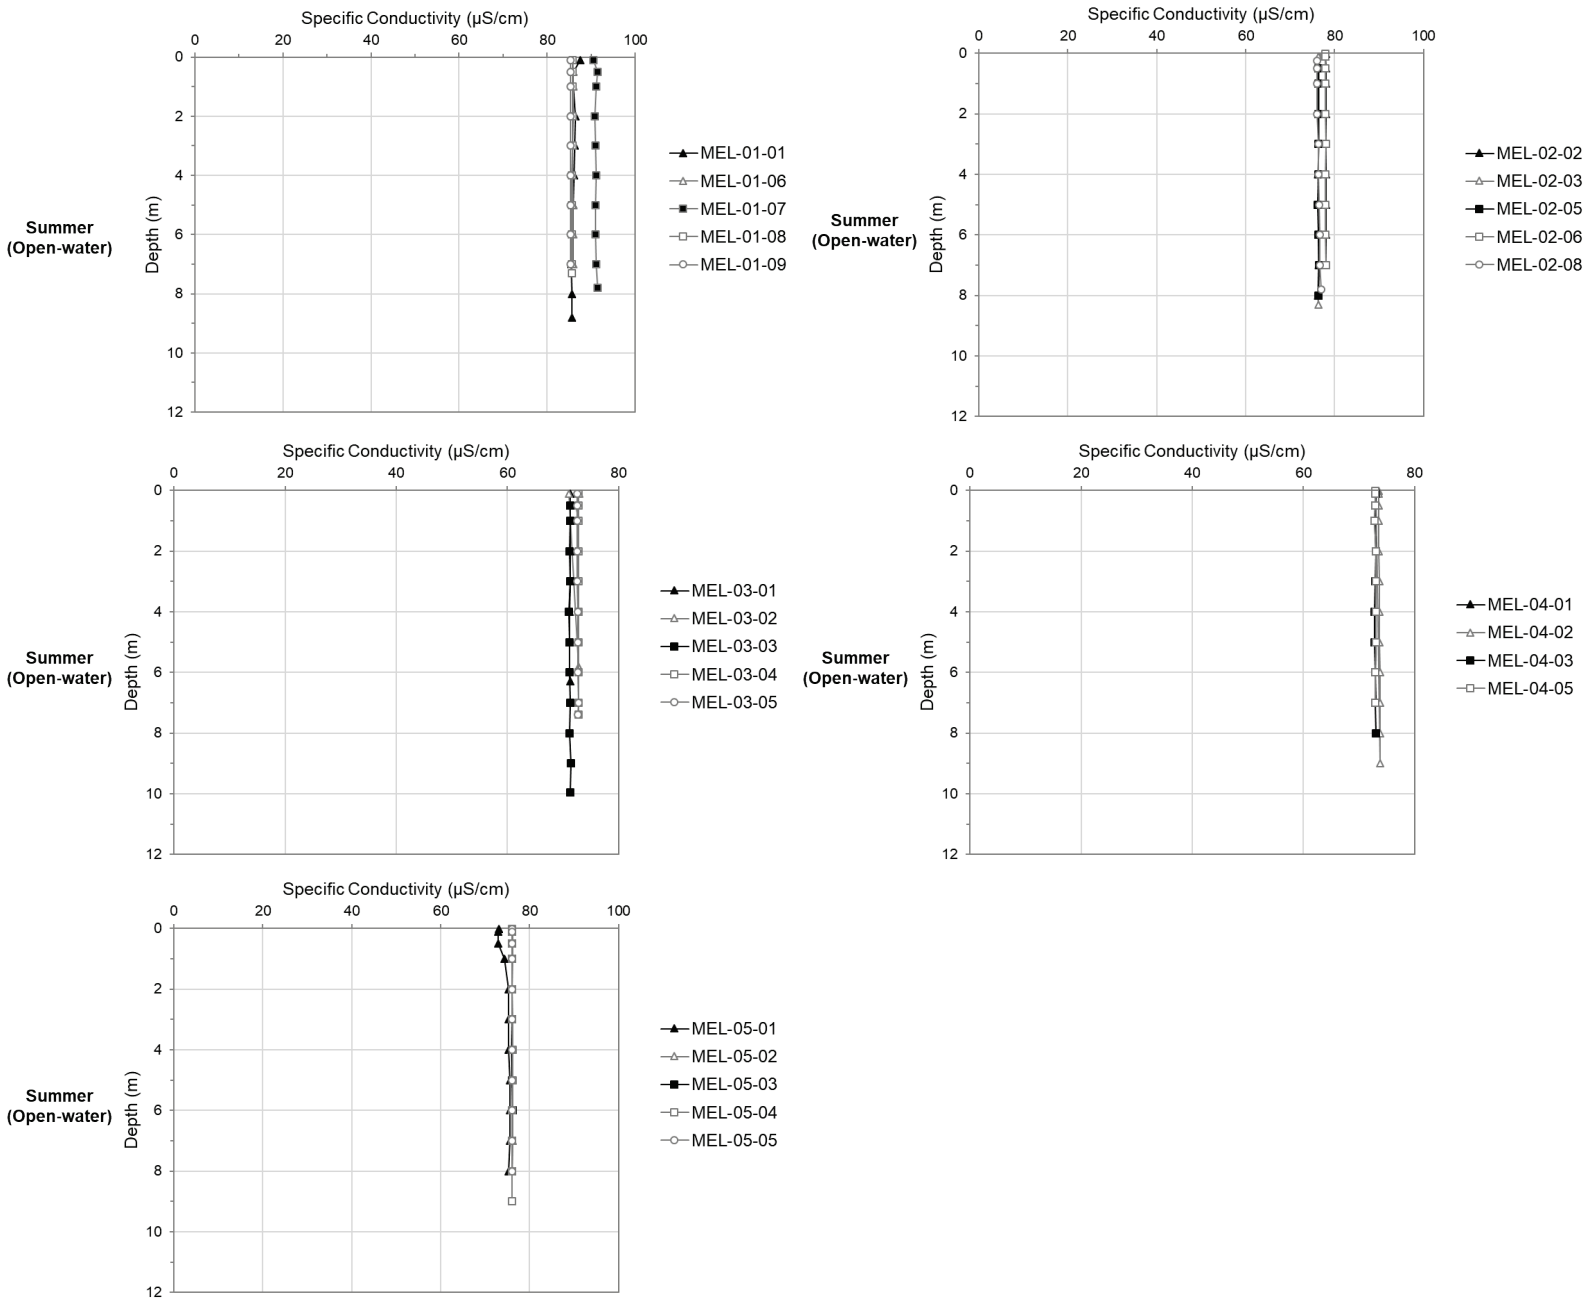
6C.1.4 Specific Conductivity



m = metre; µS/cm = microSiemens per centimetre; MEL-01 = Near-field; MEL-02 = Mid-field.

Figure 6C.1-10: Specific Conductivity Profiles at Stations on Meliadine Lake, Under-ice (March) 2018

m = metre; µS/cm = microSiemens per centimetre; MEL-01 = Near-field; MEL-02 = Mid-field; MEL-03 = Reference Area 1; * = a field profile was conducted at these stations but water quality samples were not collected.

Figure 6C.1-11: Specific Conductivity Profiles at Stations on Meliadine Lake, Open-water (July) 2018

m = metre; µS/cm = microSiemens per centimetre; MEL-01 = Near-field; MEL-02 = Mid-field; MEL-03 = Reference Area 1; MEL-04 = Reference Area 2; MEL-05 = Reference Area 3.

(a) Several new stations were added to the near-field exposure area during the July program and MEL-01-02, MEL-01-03, MEL-01-04, and MEL-01-05 were discontinued. However, field measurements were collected at MEL-01-04 and MEL-01-05.

mg/L = milligrams per litre; µS/cm = microSiemens per centimetre.

(a) During the August open water program, water quality samples were not collected at MEL-02-01 or 02-04. Instead, samples were collected at MEL-02-06 and 02-08, which were sediment sample locations.

(b) A depth reading at 0.025 m could not be taken due to wave action.

(c) Data were invalidated based on quality checks (Appendix 6A).

mg/L = milligrams per litre; µS/cm = microSiemens per centimetre.

(a) The ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (0.73 mg-N/L) is based on the combination of field pH (8.0) and water temperature (13.3°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample. When field pH was not available laboratory pH was used.

(b) Guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.3 to 8.0). The guideline is calculated based on the individual pH for each sample.

(c) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5.

(d) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (23.7 to 37.1 mg/L as $CaCO_3$). The guideline is calculated based on the individual hardness value for each sample.

(e) Guideline is for chromium VI.

(f) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (23.7 to 37.1 mg/L as $CaCO_3$) and DOC (2.89 to 3.96 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines were calculated within the validated range for hardness (13.8 to 250.5 mg/L as $CaCO_3$) and DOC (0.3 to 17.3 mg/L).

(g) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.3 to 8.0), hardness (23.7 to 37.1 mg/L as $CaCO_3$) and DOC (2.89 to 3.96 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines were calculated within the validated range of pH (6.5 to 8.13), hardness (23.4 to 399 mg/L as $CaCO_3$) and DOC (0.3 to 22.9 mg/L). When field pH was not available laboratory pH was used.

Note:

No concentrations were higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; DOC = dissolved organic carbon; $CaCO_3$ = calcium carbonate; - = no guideline or data not measured.

(a) The ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (0.22 mg-N/L) is based on the combination of field pH (8.6) and water temperature (11.9°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample. When field pH was not available laboratory pH was used.

(b) Guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.4 to 8.6). The guideline is calculated based on the individual pH for each sample. When field pH was not available laboratory pH was used.

(c) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5. When field pH was not available laboratory pH was used.

(d) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (17.7 to 30.1 mg/L as $CaCO_3$). The guideline is calculated based on the individual hardness value for each sample.

(e) Guideline is for chromium VI.

(f) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (17.7 to 30.1 mg/L as $CaCO_3$) and DOC (2.28 to 3.07 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines were calculated within the validated range for hardness (13.8 to 250.5 mg/L as $CaCO_3$) and DOC (0.3 to 17.3 mg/L).

(g) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.3 to 7.9), hardness (17.7 to 30.1 mg/L as $CaCO_3$) and DOC (2.28 to 3.07 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. Guidelines that fell outside the validated range for pH (6.5 to 8.13), hardness (23.4 to 399 mg/L as CaCO3) and DOC (0.3 to 22.9 mg/L) were constrained to within the validated guideline range as per CCME (2018) guidance. When field pH was not available laboratory pH was used.

Note:

No concentrations were higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

Half of the detection limit value was used for total Kjeldahl nitrogen to calculate total nitrogen concentrations.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; DOC = dissolved organic carbon; $CaCO_3$ = calcium carbonate; - = no guideline or data not measured.

(a) Data were invalidated because they fell well outside historical range.

(b) The ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (1.16 mg-N/L) is based on the combination of field pH (7.8) and water temperature (12.2°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample. When field pH was not available laboratory pH was used.

(c) Guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.3 to 7.8). The guideline is calculated based on the individual pH for each sample. When field pH was not available laboratory pH was used.

(d) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5. When field pH was not available laboratory pH was used.

(e) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (20.4 to 38.7 mg/L as $CaCO_3$). The guideline is calculated based on the individual hardness value for each sample.

(f) Guideline is for chromium VI.

(g) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (20.4 to 38.7 mg/L as $CaCO_3$) and DOC (2.21 to 2.66 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines were calculated within the validated range for hardness (13.8 to 250.5 mg/L as $CaCO_3$) and DOC (0.3 to 17.3 mg/L).

(h) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.3 to 7.8), hardness (20.4 to 38.7 mg/L as $CaCO_3$) and DOC (2.21 to 2.66 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. Guidelines that fell outside the validated range for pH (6.5 to 8.13), hardness (23.4 to 399 mg/L as CaCO3) and DOC (0.3 to 22.9 mg/L) were constrained to within the validated guideline range as per CCME (2018) guidance. When field pH was not available laboratory pH was used.

Note:

Grey shaded concentrations are higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units;
mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; DOC = dissolved organic carbon; $CaCO_3$ = calcium carbonate; - = no guideline or data not measured.

(a) The ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (0.97 mg-N/L) is based on the combination of field pH (8.0) and water temperature (9.6°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample. When field pH was not available laboratory pH was used.

(b) Guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.9 to 8.0). The guideline is calculated based on the individual pH for each sample. When field pH was not available laboratory pH was used.

(c) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5. When field pH was not available laboratory pH was used.

(d) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (21.2 to 22 mg/L as $CaCO_3$). The guideline is calculated based on the individual hardness value for each sample.

(e) Guideline is for chromium VI.

(f) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (21.2 to 22 mg/L as $CaCO_3$) and DOC (2.23 to 2.27 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines were calculated within the validated range for hardness (13.8 to 250.5 mg/L as $CaCO_3$) and DOC (0.3 to 17.3 mg/L).

(g) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.9 to 8.0), hardness (21.2 to 22 mg/L as $CaCO_3$) and DOC (2.23 to 2.27 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. Guidelines that fell outside the validated range for pH (6.5 to 8.13), hardness (23.4 to 399 mg/L as CaCO3) and DOC (0.3 to 22.9 mg/L) were constrained to within the validated guideline range as per CCME (2018) guidance. When field pH was not available laboratory pH was used.

Note:

No concentrations were higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; DOC = dissolved organic carbon; - = no guideline or data not measured.

(a) The ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (0.97 mg-N/L) is based on the combination of field pH (8.0) and water temperature (9.0°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample. When field pH was not available laboratory pH was used.

(b) Guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.5 to 8.0). The guideline is calculated based on the individual pH for each sample. When field pH was not available laboratory pH was used.

(c) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5. When field pH was not available laboratory pH was used.

(d) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (22.4 to 22.8 mg/L as $CaCO_3$). The guideline is calculated based on the individual hardness value for each sample.

(e) Guideline is for chromium VI.

(f) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (22.4 to 22.8 mg/L as $CaCO_3$) and DOC (2.27 to 2.37 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines were calculated within the validated range for hardness (13.8 to 250.5 mg/L as $CaCO_3$) and DOC (0.3 to 17.3 mg/L).

(g) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.5 to 8.0), hardness (22.4 to 22.8 mg/L as $CaCO_3$) and DOC (2.27 to 2.37 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. Guidelines that fell outside the validated range for pH (6.5 to 8.13), hardness (23.4 to 399 mg/L as CaCO3) and DOC (0.3 to 22.9 mg/L) were constrained to within the validated guideline range as per CCME (2018) guidance. When field pH was not available laboratory pH was used.

Note:

No concentrations were higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; DOC = dissolved organic carbon; - = no guideline or data not measured.

APPENDIX 6E

Statistical Outliers

Table 6E-1: Outliers Identified in the Water Quality Datasets during Spatial Statistical Analysis

Parameter	Unit	Year	Month	Area	Station	Outlier	SR Value	P-value with Outlier included
2018 Spatial Analysis Under-ice								
Sodium	mg/L	2018	March	Near-field	MEL-01-03	8.27	4.19	**<0.001**
Reactive silica (as SiO_2)	mg/L	2018	March	Near-field	MEL-01-05	0.767	3.79	**<0.001**
Total Kjeldahl nitrogen	mg/L	2018	March	Mid-field	MEL-02-05	0.227	4.94	0.168
Total lead	µg/L	2018	March	Near-field	MEL-01-05	0.107	5.46	**0.082**
Total uranium	µg/L	2018	March	Near-field	MEL-01-03	0.019	3.55	**<0.001**
2018 Spatial Analysis Open-water								
Total dissolved solids	mg/L	2018	August	Reference 1	MEL-03-02	20	-3.72	**<0.001**
Dissolved organic carbon	mg/L	2018	August	Mid-field	MEL-02-08	2.28	-3.95	**<0.001**
Turbidity	NTU	2018	September	Reference Area 2	MEL-04-02	0.84	10.01	**<0.001**
Calcium	mg/L	2018	August	Mid-field	MEL-02-05	5.03	-6.19	**<0.001**
Chloride	mg/L	2018	July	Near-field	MEL-01-06	11.3	-4.31	**<0.001**
Fluoride	mg/L	2018	July	Near-field	MEL-01-08	0.01[(a)]	-3.60	**0.004**
		2018	July	Reference Area 1	MEL-03-01	0.01[(a)]	-5.55	
Potassium	mg/L	2018	August	Mid-field	MEL-02-05	0.252	-24.24	**<0.001**
Sodium	mg/L	2018	August	Mid-field	MEL-02-05	1.84	-15.55	**<0.001**
Sulphate	mg/L	2018	July	Near-field	MEL-01-08	3.77	-3.66	**<0.001**
Total phosphorus	mg/L	2018	August	Near-field	MEL-01-07	0.0202	7.74	0.223
Total aluminum	µg/L	2018	July	Near-field	MEL-01-09	29.1	4.54	**<0.001**
Total copper	µg/L	2018	July	Near-field	MEL-01-01	1.34	7.53	**0.005**
Total mercury	µg/L	2018	August	Mid-field	MEL-02-06	0.00025[(a)]	-3.53	**<0.001**
Total uranium	µg/L	2018	September	Reference Area 3	MEL-05-01	0.005[(a)]	-5.03	**<0.001**

(a) measurement was less than the detection limit and set as one-half the detection limit for statistical analysis.

Note:

Outliers were identified during statistical testing as those having SR values greater than or equal to an absolute value of 3.5.

Bold values indicate statistical significance. Tests were considered significant at P <0.1.

Underlined values indicate that the results of the analysis were influenced by the outlier.

SR = studentized residual; mg/L = milligrams per litre; µg/L = micrograms per litre; NTU = nephelometric turbidity unit; calc = calculated; $CaCO_3$ = calcium carbonate; SiO_2 = silicon dioxide.

(a) = the ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (2.3699 mg-N/L) is based on the combination of field pH (7.5) and water temperature (12.8°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample. When field pH was not available laboratory pH was used.

(b) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.0 to 7.5). The guideline is calculated based on the individual pH for each sample. When field pH was not available laboratory pH was used.

(c) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5. When field pH was not available laboratory pH was used.

(d) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (18.7 to 21.5 mg/L as $CaCO_3$). The guideline is calculated based on the individual hardness value for each sample.

(e) Guideline is for chromium VI.

(f) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (18.7 to 21.5 mg/L as $CaCO_3$) and DOC (2.3 to 3.3 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines fell within the validated range for hardness (13.8 to 250.5 mg/L as $CaCO_3$) and DOC (0.3 to 17.3 mg/L).

(g) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.0 to 7.5), hardness (18.7 to 21.5 mg/L as $CaCO_3$) and DOC (2.3 to 3.3 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. Guidelines that fell outside of the validated range for pH (6.5 to 8.13), hardness (23.4 to 399 mg/L as $CaCO_3$) and DOC (0.3 to 22.9 mg/L) were constrained to within the validated range as per CCME (2018) guidance. When field pH was not available laboratory pH was used.

Note:

In cases where 50% or more of data were <DL, no mean or standard deviation was calculated.

Half of the detection limit value was used for total Kjeldahl nitrogen to calculate total nitrogen concentrations.

Grey shaded concentrations are higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units;
mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; Bq/L = Becquerel per litre; DOC = dissolved organic carbon; $CaCO_3$ = calcium carbonate; - = no guideline or data not measured.

Radium-226	Bq/L	-	-	-	-	-	-	-	-	-	-	0	0

(a) The ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (1.53 mg-N/L) is based on the combination of field pH (7.6) and water temperature (13.4°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample. When field pH was not available laboratory pH was used.

(b) Guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.3 to 7.6). The guideline is calculated based on the individual pH for each sample. When field pH was not available laboratory pH was used.

(c) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5. When field pH was not available laboratory pH was used.

(d) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (22.8 to 25 mg/L as $CaCO_3$). The guideline is calculated based on the individual hardness value for each sample.

(e) Guideline is for chromium VI.

(f) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (22.8 to 25 mg/L as $CaCO_3$) and DOC (2.56 to 4.07 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines fell within the validated range for hardness (13.8 to 250.5 mg/L as $CaCO_3$) and DOC (0.3 to 17.3 mg/L).

(g) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.3 to 7.6), hardness (22.8 to 25 mg/L as $CaCO_3$) and DOC (2.56 to 4.07 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. Guidelines that fell outside of the validated range for pH (6.5 to 8.13), hardness (23.4 to 399 mg/L as CaCO3) and DOC (0.3 to 22.9 mg/L) were constrained to within the validated range as per CCME (2018) guidance. When field pH was not available laboratory pH was used.

Note:

In cases where 50% or more of data were <DL, no mean or standard deviation was calculated.

Half of the detection limit value was used for total Kjeldahl nitrogen to calculate total nitrogen concentrations.

Grey shaded concentrations are higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; Bq/L = Becquerel per litre; DOC = dissolved organic carbon; $CaCO_3$ = calcium carbonate; - = no guideline or data not measured.

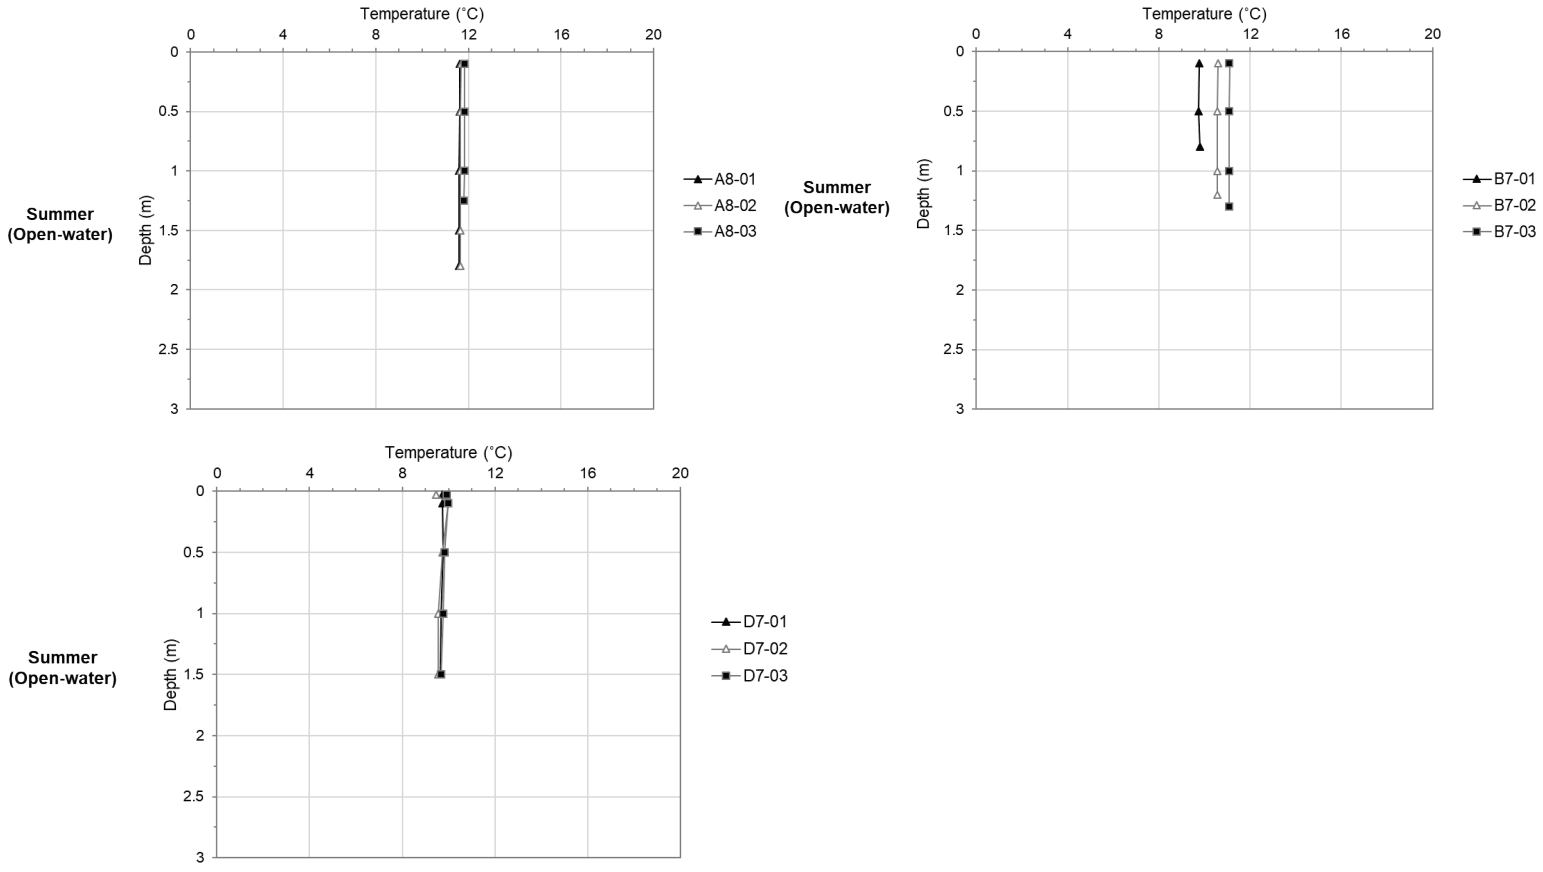
7A.1.0 FIELD PROFILE PLOTS



7A.1.1 Temperature

m = metre; °C = degrees Celsius.

Note: Stations D7-02 and D7-03 were not visited during the July program.

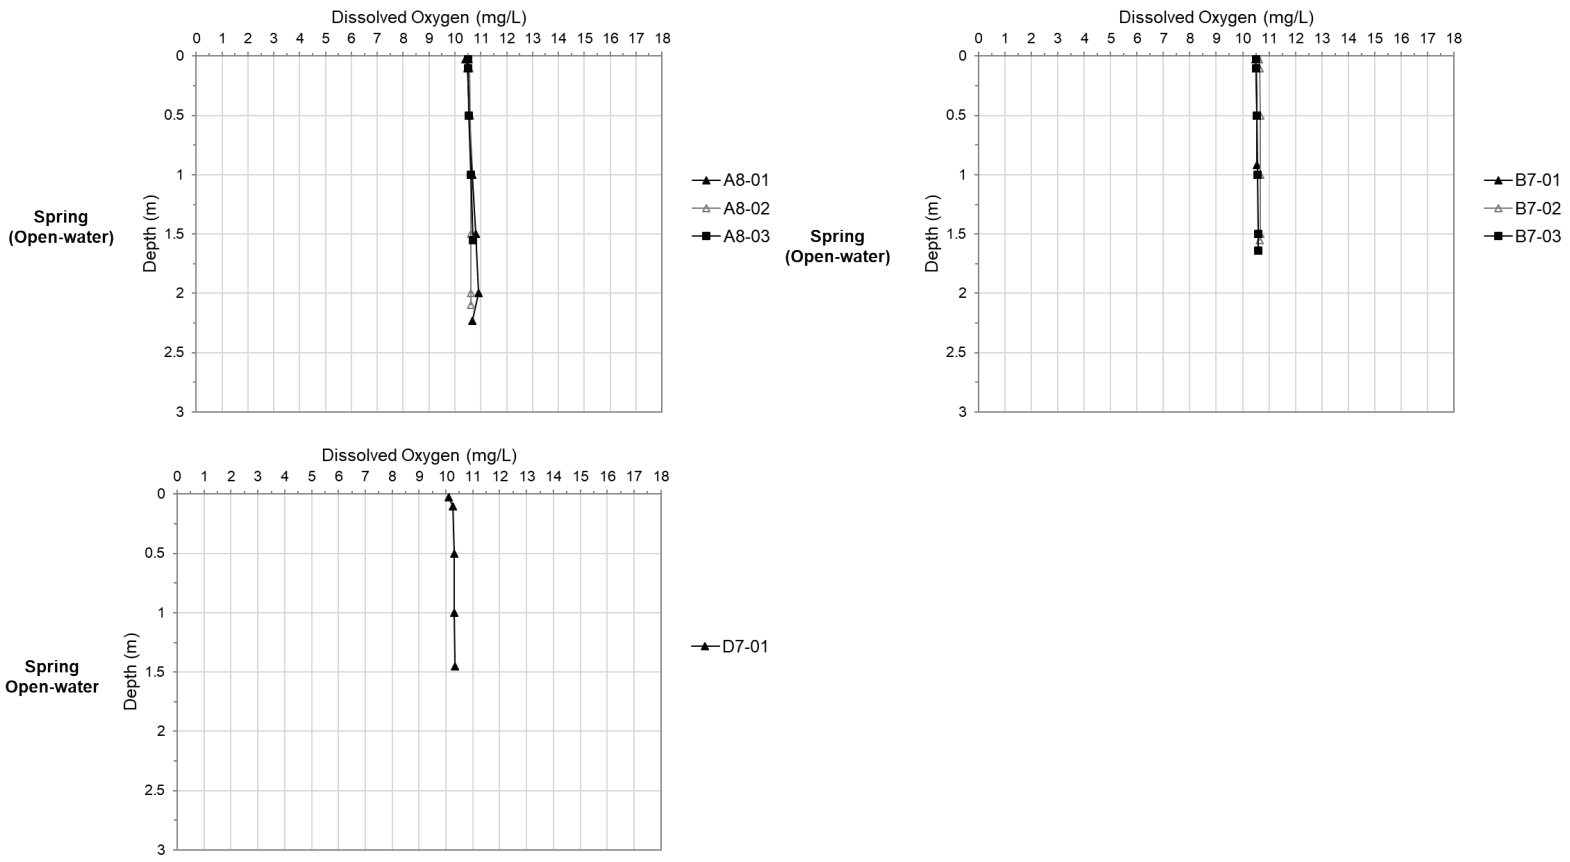


Figure 7A.1-1: Temperature Profiles at Stations on Peninsula Lakes A8, B7 and D7, Open-water (July) 2018

m = metre; °C = degrees Celsius.

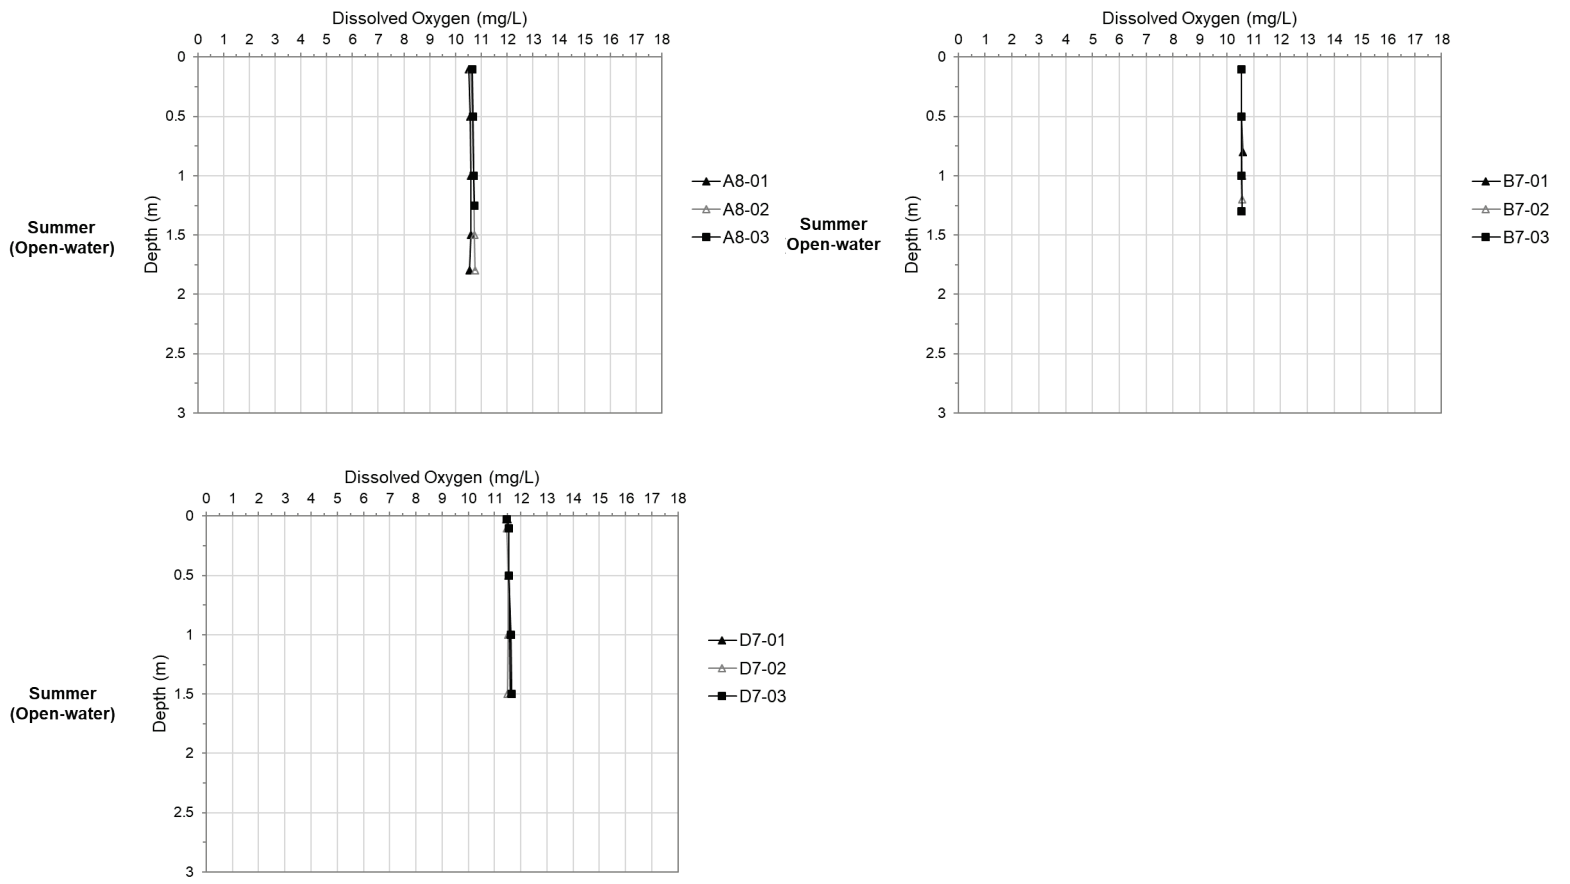

Figure 7A.1-2: Temperature Profiles at Stations on Peninsula Lakes A8, B7 and D7, Open-water (August) 2018

7A.1.2 Dissolved Oxygen

m = metre; mg/L = milligrams per litre.
Note: Stations D7-02 and D7-03 were not visited during the July program.

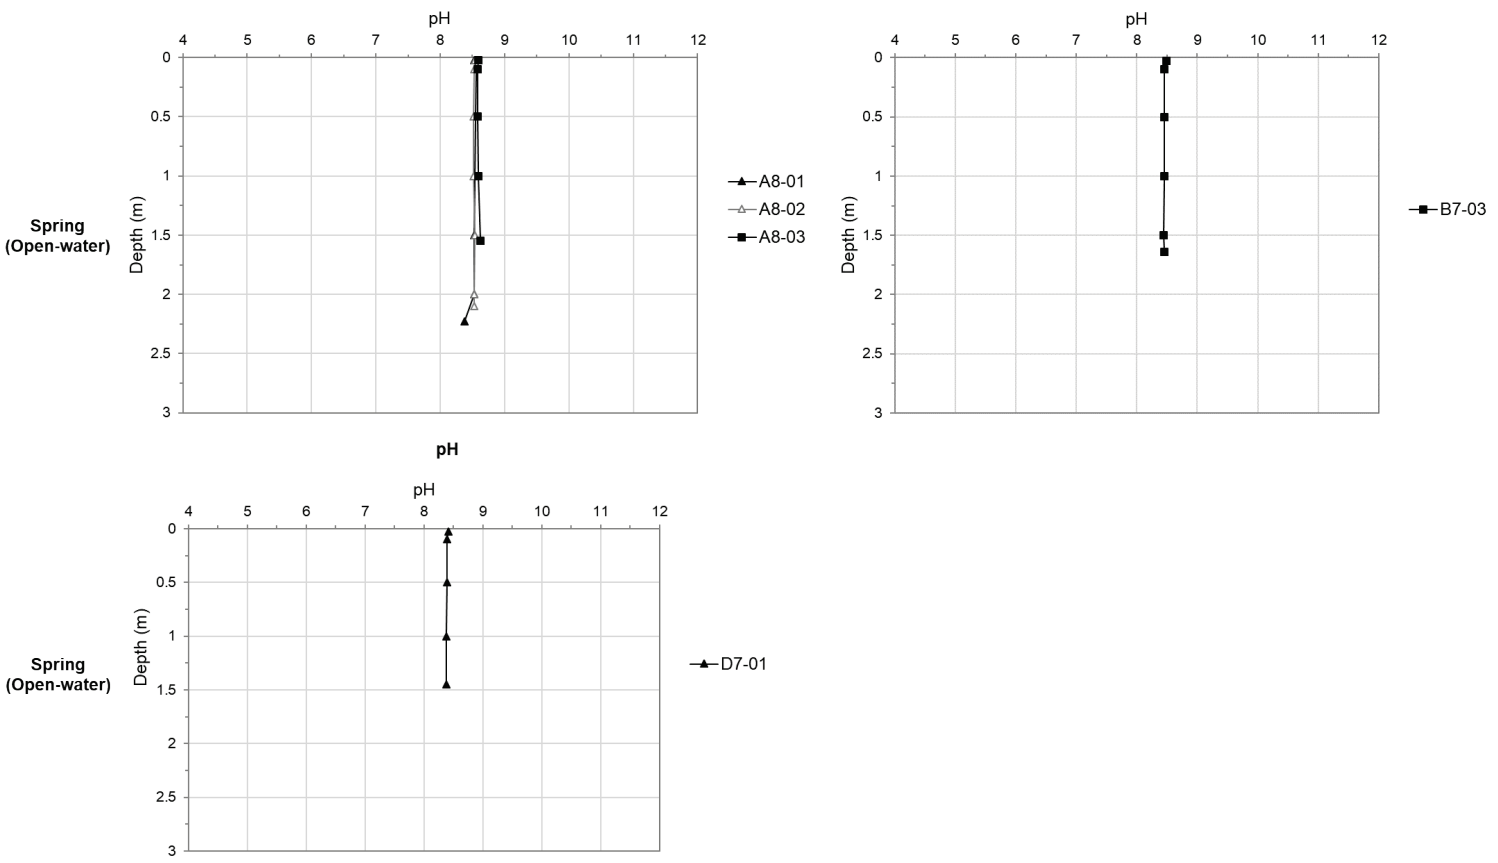

Figure 7A.1-3: Dissolved Oxygen Profiles at Stations on Peninsula Lakes A8, B7, and D7, Open-water (July) 2018

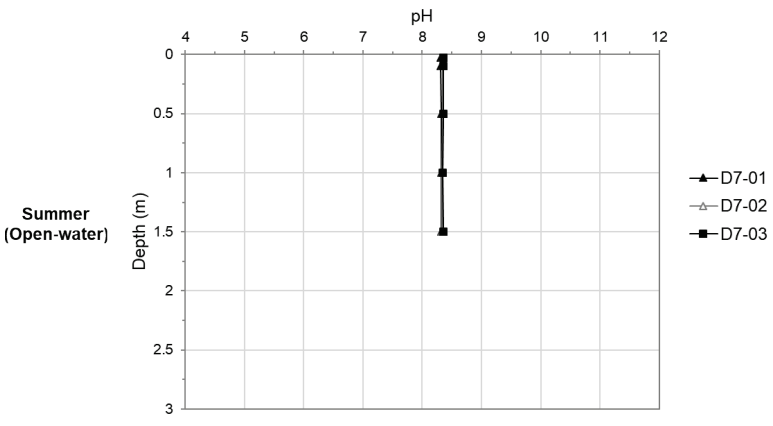
m = metre; mg/L = milligrams per litre.

Figure 7A.1-4: Dissolved Oxygen Profiles at Stations on Peninsula Lakes, Open-water (August) 2018

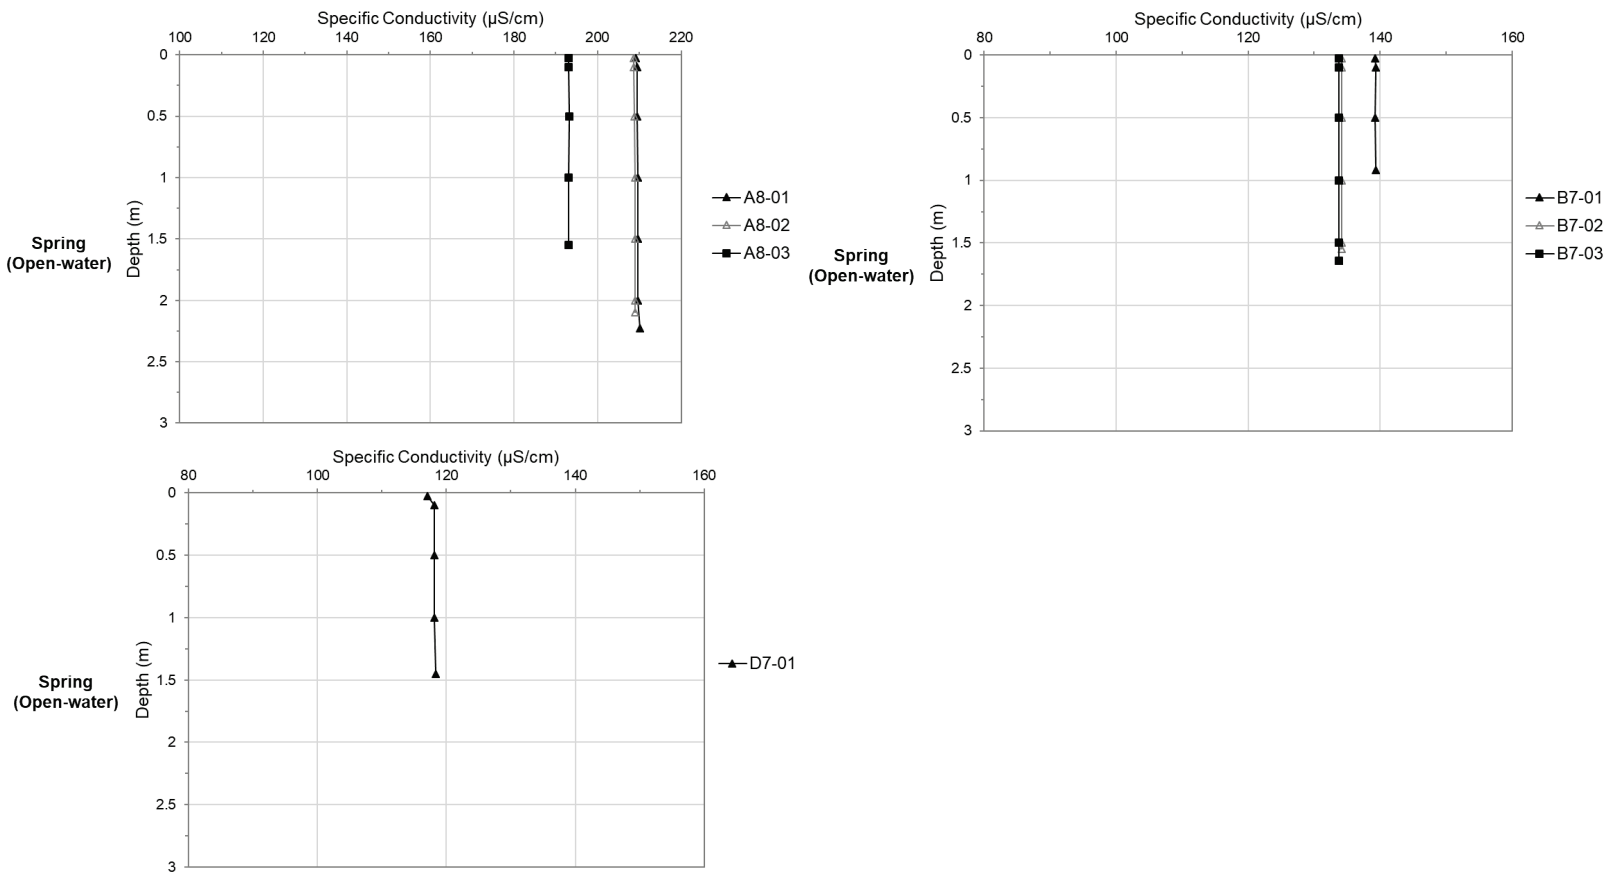


7A.1.3 pH

m = metre; mg/L = milligrams per litre.

Note: pH measured during open-water conditions in July were outside the acceptable range at stations B7-01 and B7-02. Data were deemed unreliable and invalidated. Stations D7-02 and D7-03 were not visited during the July program.

Figure 7A.1-5: pH Profiles at Stations on Peninsula Lakes A8, B7, and D7, Open-water (July) 2018



m = metre; mg/L = milligrams per litre.

Note: pH measured during open-water conditions in August were outside the acceptable range at all A8 and B7 stations. Data was deemed unreliable and invalidated.

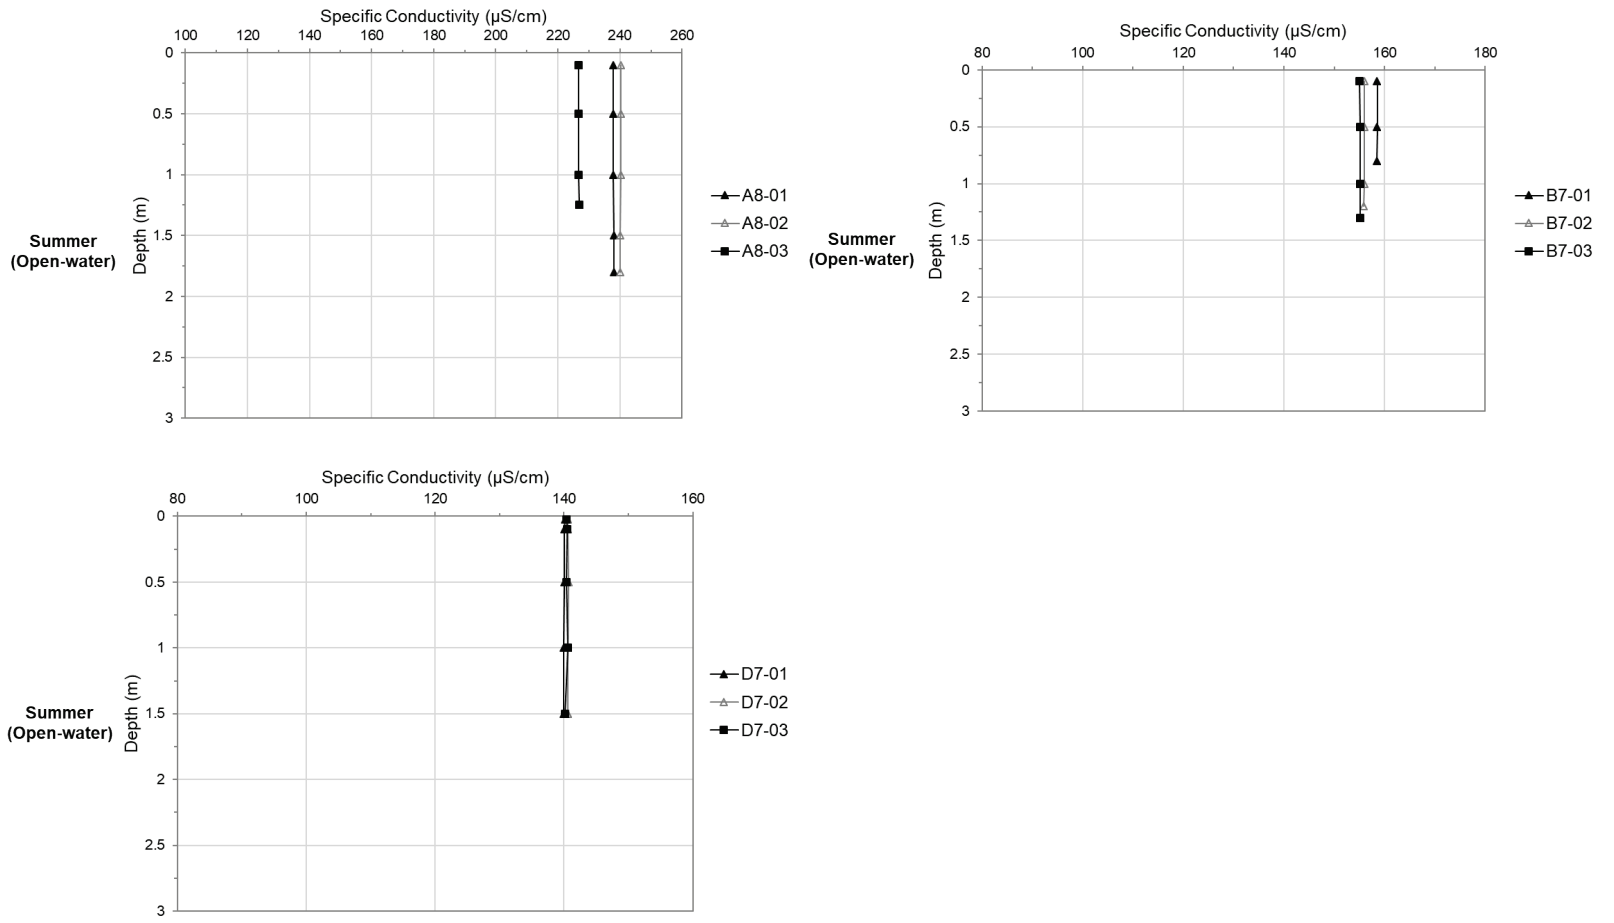


Figure 7A.1-6: pH Profiles at Stations on Peninsula Lakes A8, B7, and D7, Open-water (August) 2018

7A.1.4 Specific Conductivity

m = metre; µS/cm = microSiemens per centimetre.
Note: Stations D7-02 and D7-03 were not visited during the July program.

Figure 7A.1-7: Specific Conductivity Profiles at Stations on Peninsula Lakes A8, B7, and D7, Open-water (July) 2018

(a) Temperature for some samples fell above the aesthetic guideline of 15˚C but were not flagged in this table because the guideline is not relevant.

(b) The ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (0.16 mg-N/L) is based on the combination of field pH (8.6) and water temperature (15.6°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample. When field pH was not available laboratory pH was used.

(c) Guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.8 to 8.6). The guideline is calculated based on the individual pH for each sample. When field pH was not available laboratory pH was used.

(d) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5. When field pH was not available, the laboratory pH was used.

(e) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (79.8 to 86.2 mg/L as $CaCO_3$). The guideline is calculated based on the individual hardness value for each sample.

(f) Guideline is for chromium VI.

(g) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (79.8 to 86.2 mg/L as $CaCO_3$) and DOC (3.23 to 4.12 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines fell within the validated range for hardness (13.8 to 250.5 mg/L as $CaCO_3$) and DOC (0.3 to 17.3 mg/L).

(h) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.8 to 8.6), hardness (79.8 to 86.2 mg/L as $CaCO_3$) and DOC (3.23 to 4.12 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines fell within the validated range for pH (6.5 to 8.13), hardness (23.4 to 399 mg/L as $CaCO_3$) and DOC (0.3 to 22.9 mg/L). When field pH was not available laboratory pH was used.

Note:

No concentrations were higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; DOC = dissolved organic carbon; - = no guideline or data not measured.

Cyanide	mg/L	-	0.0050	0.20	-	-	<0.001	<0.001	<0.001	<0.001	<0.001	<0.001

(a) Temperature for some samples fell above the aesthetic guideline of 15˚C but were not flagged in this table because the guideline is not relevant.

(b) The ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (0.19 mg-N/L) is based on the combination of field pH (8.5) and water temperature (17.0°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample. When field pH was not available laboratory pH was used.

(c) Guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.5 to 8.5). The guideline is calculated based on the individual pH for each sample. When field pH was not available laboratory pH was used.

(d) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5. When field pH was not available laboratory pH was used.

(e) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (55.2 to 58.4 mg/L as $CaCO_3$). The guideline is calculated based on the individual hardness value for each sample.

(f) Guideline is for chromium VI.

(g) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (55.2 to 58.4 mg/L as $CaCO_3$) and DOC (3.85 to 4.05 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. All guidelines fell within the validated range for hardness (13.8 to 250.5 mg/L as $CaCO_3$) and DOC (0.3 to 17.3 mg/L).

(h) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.5 to 8.6), hardness (55.2 to 58.4 mg/L as $CaCO_3$) and DOC (3.85 to 4.05 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. Guideline that fell outside the validated range for pH (6.5 to 8.13), hardness (23.4 to 399 mg/L as $CaCO_3$) and DOC (0.3 to 22.9 mg/L) were constrained to within the validated guideline range as per CCME (2018) guidance. When field pH was not available laboratory pH was used.

Note:

No concentrations were higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; DOC = dissolved organic carbon; - = no guideline or data not measured.

(a) Temperature for some samples fell above the aesthetic guideline of 15˚C but were not flagged in this table because the guideline is not relevant.

(b) The ammonia guideline is pH and temperature dependent. The guideline that results in the minimum ammonia guideline (0.2058 mg-N/L) is based on the combination of field pH (8.4) and water temperature (18.0°C). Guidelines calculated with temperature and pH values falling outside the defined range (i.e., pH 6.0 to 10.0 and temperature 0°C to 30°C) should be used with caution, as the WQG does not necessarily accurately reflect toxic effects at the low and high pH and temperature extremes. The guideline is calculated based on the individual field pH and temperature measurements for each sample.

(c) Guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (8.3 to 8.4). The guideline is calculated based on the individual pH for each sample.

(d) Guideline is pH dependent: 5 µg/L at pH < 6.5 and 100 µg/L at pH ≥ 6.5.

(e) Guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (44 to 50 mg/L). The guideline is calculated based on the individual hardness value for each sample.

(f) Guideline is for chromium VI.

(g) Guideline is hardness and DOC dependent. The guideline range shown is based on the hardness (43.6 to 49.5 mg/L) and DOC (4.02 to 4.73 mg/L) range observed in the dataset. The guideline is calculated based on the individual hardness and DOC for each sample. Guidelines calculated with hardness and DOC values falling outside the validated range (i.e., hardness 13.8 to 250.5 mg/L as CaCO3 and DOC 0.3 to 17.3 mg/L) were constrained to within the validated range as per CCME guidance (CCME 2018).

(h) Guideline is pH, hardness and DOC dependent. The guideline range shown is based on the of field pH (7.79 to 7.8), Hardness (43.6 to 49.5 mg/L) and DOC (4.02 to 4.73 mg/L). The guideline is calculated based on the individual hardness and DOC for each sample. Guidelines calculated with pH, Hardness and DOC values falling outside of the validated range (i.e., pH 6.5 to 8.13, hardness 23.4 to 399 mg/L and DOC 0.3 to 22.9 mg/L) were constrained to within the validated range as per CCME guidance (CCME 2018). The minimum guideline is 2 µg/L based on minimum Hardness of 23.4 mg/L, DOC of 0.3 mg/L and maximum pH of 8.13. Zinc toxicity increases as the pH increases, when field pH was not available laboratory pH was used.

No concentrations were higher than water quality guidelines.

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision *after* comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.

CCME = Canadian Council of Ministers of the Environment; SSWQO = site-specific water quality objective; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; mg/L = milligrams per litre; mg-P/L = milligrams phosphorus per litre; mg-N/L = milligrams nitrogen per litre; µg/L = micrograms per litre; DOC = dissolved organic carbon; - = no guideline or data not measured.

8A.1.0 INTRODUCTION

Quality assurance and quality control (QA/QC) practices determine data integrity and are relevant to all aspects of the Meliadine AEMP sediment quality monitoring program. Golder Associates Ltd. (Golder) applied these practices throughout the activities, from sample collection to data analysis, and reporting. Quality Assurance (QA) is the set of procedures incorporated into the program's standard procedures, so that the field sample collection is carried out to a high standard which does not introduce errors or bias. Quality Control (QC) is the system of validation checks performed to measure quality to determine if the data quality objectives have been met. The QA/QC procedures in 2018 followed relevant requirements outlined in the Meliadine AEMP Design Plan (Golder 2016).

This appendix describes QA/QC practices applied during sediment quality monitoring, evaluates QC data, and describes the implications of QC results to the interpretation of results.

8A.2.0 QUALITY ASSURANCE PROCEDURES

Quality assurance applicable to this monitoring component of the AEMP covers three areas of internal and external management: field work, laboratory analysis, and office operations.

8A.2.1 Field Work

Golder field crews are trained to be proficient in standardized field sampling procedures, data recording, and equipment operations applicable to sediment quality sampling. Field work during the 2018 sediment program was completed according to approved specific work instructions and established technical procedures. Specific work instructions are standardized forms that reference appropriate technical procedures and provide specific sampling instructions for the work to be undertaken. For example, specific work instructions provide field staff with descriptions of exact sampling locations, equipment needs and acceptance criteria, sample handling and storage requirements, sample labelling and shipping protocols, and internal and laboratory contacts. Specific work instructions also provide specific guidelines for field record keeping and sample tracking. Golder technical procedures are consistent with information described in the relevant scientific literature and regulatory guidance documents (e.g., Environment Canada 1993; APHA 2012), and outline relevant information regarding protocols for field sample collection and in situ field measurements.

One crew member was responsible for managing the sample documentation process so that:

- required samples were collected or reasons were documented as to why a sample was not collected
- chain-of-custody and analytical request forms were filled out appropriately
- established labelling and documentation procedures were followed

8A.2.2 Laboratory Analyses

A Canadian Association for Laboratory Accreditation Inc. (CALA) accredited analytical laboratory, ALS Environmental (ALS; Edmonton location), was used for the analysis of sediment samples collected by Golder for the 2018 field program. Under CALA's accreditation program, performance evaluation assessments are conducted for laboratory procedures, methods, and internal QC. Therefore, the analytical data reported by ALS were considered reliable.

One member of the sediment quality monitoring team from Golder was designated as the laboratory liaison to streamline communications with the laboratory.

8A.2.3 Office Operations

Relevant elements of office-based QA were:

- using appropriately trained personnel for each data management, analysis, and reporting task
- senior review of work
- using standardized data manipulation and summary tools, where applicable
- filing hard-copy, electronic data, and project information according to standardized protocols
- using a data management system to maintain an organized, consistent system to store, check and export field and laboratory data field and laboratory data storage, QC, and retrieval

8A.3.0 QUALITY CONTROL PROCEDURES

8A.3.1 Field Control Procedures

One QC sample type was used in this program to evaluate data quality from samples collected in the field:

- **Duplicate samples** are additional samples collected at the same time and location as original sediment samples collected during a field program, using the same sampling methods. They are used to check within-site variation, and the precision of field sampling methods and laboratory analysis.

QC samples (i.e., duplicates) accounted for approximately 10% of the total number of sediment samples submitted for analysis. All QC samples were submitted “blind” (i.e., so not to identify them as QC samples) to the laboratory to test the validity of the analysis process. These samples were analyzed for the same set of parameters as the original collected sediment samples.

8A.3.2 Field and Laboratory Data Quality Control Procedures

Field datasheets and the field notebook were reviewed for completeness and unexpected values and trends. Upon receipt of sediment quality data from the laboratory, a series of seven standard checks were performed to screen for potential data quality issues (Sections 3.2.1 to 3.2.5):

- verified that all samples were analyzed
- review of detection limits (DLs)
- review of units
- review of holding times exceedances
- compare duplicates

8A.3.2.1 Screening of Individual Laboratory Results

The following screening procedures were completed for individual laboratory results in 2018:

- Project chain-of-custody (COC) forms and analytical request forms were compared to sampling records to confirm sampling locations, matched assigned sample control numbers (SCNs), and analysis requests for all required parameters.
- Laboratory results were reviewed to confirm analysis of all required parameters.
- Field and laboratory data from the same sample were reviewed to check that field and laboratory data were similar.
- Logic checks were conducted, including a check for the presence of zero values
- Outliers from historical data were identified through a visual comparison of 2018 data to historical data.

Laboratory results were considered for re-analyses if:

- Values were assessed as higher or lower than expected, based on comparisons to historical concentrations.

If re-analysis confirmed the original analysis result (i.e., RPD less than 30%), the original result was retained. If the re-analysis was notably different than the original result (i.e., RPD greater than 30%), then a decision was made to keep the original or re-analyzed result based on discussions with the laboratory regarding any QC issues of the original and re-analyzed results, holding time exceedances, historical concentrations, concentrations of other parameters within the same sample, results of the QC samples, or a combination of these factors. The rationale for requesting re-analyses or revising the original result to the re-analyzed result was documented.

8A.3.2.2 Detection Limits

Detection limits were specified for all chemical analyses required by the 2018 sediment program. Project standard DLs and the DLs provided by the laboratory for individual samples were compared.

If laboratory DLs were higher than the project standard DLs, the laboratory was notified and requested to provide an explanation for the change in DLs. If possible, a parameter was re-analyzed at the project standard DL. Changes in DLs by the laboratory during the program can limit the analysis and interpretation of sediment quality data. Limitations can occur when comparing results with different DLs and results to sediment quality guidelines. Specifically, an increase in DL above measured concentrations reduces the ability to detect spatial and temporal patterns; whereas an increase in DL above a sediment guideline reduces the ability to detect guideline exceedances when concentrations are below DLs.

8A.3.2.3 Units

For each parameter, the units reported by the laboratory were compared against expected units, as coded into the database.

8A.3.2.4 Holding Time

For each parameter the holding time between sample collection and analysis was specified by the laboratory based on Sample Holding Time Re-evaluation (US EPA 2005). The laboratory reviewed holding times for any exceedances and identified any data that may have been unreliable due to holding time exceedances. Holding time exceedances were considered when determining the validity of re-analyzed results from the laboratory.

8A.3.2.5 Duplicate Samples

Differences between concentrations measured in duplicate sediment samples were calculated as the RPD for each parameter. Before calculating the RPD, concentrations below the DL were replaced with the DL value in cases when only one of the concentrations for a given parameter was detectable. The RPD was calculated as per Equation 1:

$$RPD = (|difference\ in\ concentration\ between\ two\ of\ the\ duplicate\ samples|/mean\ concentration)\ x\ 100$$

[Equation 1]

The RPD value for a given parameter was notable if both conditions apply:

- The RPD was greater than 30%.
- Concentrations in one or both samples were greater than five times the DL.

The number of parameters with exceedances of the evaluation criteria was compared with the total number of parameters analyzed to evaluate analytical precision.

Within-site variability and field sampling precision of duplicate sample results were rated as:

- **Low and high**, respectively, if less than 10% of the parameters included in the duplicate sample analysis were notably different from one another
- **Moderate**, if 10% to 30% of the parameters included in the duplicate sample analysis were notably different from one another
- **High and low**, respectively, if more than 30% of the parameters included in the duplicate sample analysis were notably different from one another

8A.3.3 Office Quality Control Procedures

Office-based QC procedures followed by the 2018 sediment study were:

- Saving unaltered field datasheets, field notebooks, and laboratory files (e.g., COC forms, analysis request forms, certificates of analysis) in the Meliadine AEMP sediment quality monitoring program directory to document the original and final sources of laboratory and field sediment quality data from each program.
- Comparing sample field and laboratory data entered into the Meliadine AEMP sediment quality monitoring program data management system against field datasheets and final laboratory reports to confirm data accuracy.
- Creating backup files before each major data processing step.
- Verifying the accuracy of calculations performed to generate summary statistics and complete guideline comparisons.
- Documenting the final results for the QA/QC assessment annually in the Annual Environmental Effects Monitoring and Aquatic Effects Monitoring Program report.

8A.4.0 2018 LABORATORY DATA QUALITY RESULTS

8A.4.1 Screening of Individual Laboratory Results

8A.4.1.1 Chain-of-Custody Review

No issues were found in the COC forms.

8A.4.1.2 Parameters Requested for Analysis

All requested parameters were analyzed by the laboratory.

8A.4.1.3 Laboratory Data Review

Thirty-nine laboratory results, which represented less than 1.5% of the 2018 laboratory dataset were further evaluated because of reasons outlined in Table 8A-1. Re-analysis of samples for certain parameters was requested when data logic checks indicated a potential problem with the data. In all cases, re-analysis confirmed the original result and the original result was retained.

8A.4.2 Analytical Methods

All required parameters under the AEMP Design Plan (Golder 2016) were analyzed by the laboratory using the standard analytical methods requested during the program (Table 8A-2).

8A.4.3 Detection Limits

Requested DLs (Table 8A-2) were met for all parameters with exception of total organic carbon in one sample, MEL-05-01 where the DL was 0.075%, however, this did not impact the outcome of the analysis.

8A.4.4 Units

The laboratory reported the expected units for each parameter in 2018.

8A.4.5 Holding Time

To maintain sample integrity, sediment samples for laboratory analyses were submitted as soon as possible after collection.

Holding times were exceeded for samples where the laboratory was unable to initiate testing promptly following sample receipt or there were delays in sample delivery to the laboratory. Analytical holding times were met for most constituents, with the exception of laboratory mercury (3 samples) and total organic carbon (3 samples).

8A.4.6 Duplicate Samples

Two duplicate sediment quality samples were collected during the 2018 program (Table 8A-3).

A small percentage (i.e., 4%) of the paired duplicate concentrations had an RPD of more than 30% when one or both parameter concentrations were above five times the DL. The site variability and field precision for the 2018 dataset was rated as low and high, respectively.

8A.4.7 Internal Laboratory Quality Control

ALS flagged three samples as having failed the internal QC evaluation for beryllium and lithium, MEL-03-03, MEL-05-02 and its replicate MEL-05-02B. After contacting ALS for clarification, ALS stated that failure for lithium was a method blank failure for lithium, reporting 0.57 mg/kg when the allowable limit is 0.50 mg/kg, with explanation qualifier B. This qualifier indicates that the method blank had slightly more lithium detected than

normal. This trace amount (0.07 mg/kg) may be significant if sample results are between 0.5 mg/kg and 2.5 mg/kg. Samples with levels higher than 2.5 mg/kg (as in all 3 of the above samples) would not be significantly affected, and would be reported as observed. When typical measurement uncertainty is allowed for these observed results, the reported increased lithium concentration is insignificant.

For beryllium, ALS clarified that the recovery in the in-house prepared Laboratory Control Sample (LCS) of 121.5%, was greater than the limit of 120%, with qualifier MES ( ). When several metals are measured in one QC sample, the chances of random failure increase. CCME (1999) recognizes that measurement uncertainty may occasionally cause a metal recovery to fail, and if that failure is low (less than 10% outside allowable limits) for no more than 1 metal in a list of 10 metals or more, this is more likely due to random uncertainty rather than laboratory preparation or measurement failure. As beryllium was the only metal that had a high recovery, the recovery exceedance was less than 10% over the limit, and the list of metals was 28 elements long, this does not indicate analytical failure.

In both cases, review of the QC data assured ALS that results were acceptable and should be reported, and hence these were included in the report dataset.

8A.5.0 SUMMARY OF DATA QUALITY

The review of field and laboratory data indicated that field measurements and laboratory data were of high quality. Key findings from the 2018 QA/QC results are as follows:

- No issues were identified in analytical methods used or units reported by the laboratory.
- Holding times recommended by the laboratory were exceeded for a few parameters. These holding time exceedances were not expected to have affected data quality for the Meliadine sediment quality program.
- Evaluation of the sediment quality QC samples indicated that within-site variability and field precision for the 2018 dataset were rated as low and high, respectively.

The overall quality of the sediment quality data was rated high. Therefore, the results reported in the report are considered reliable and meet the needs of the program.

Uranium	µg/g	4.22	4.07	3.6%	1.85	2.28	20.8%
Vanadium	µg/g	56.8	56.7	0.2%	36.1	41.4	13.7%
Zinc	µg/g	93.9	95.4	1.6%	49.4	59.4	18.4%

(a) The list of elements reported for metals analysis includes metalloids such as arsenic and non-metals such as selenium, which are collectively referred to as “metals” in this table.

Grey shading indicates a greater than 30% relative percent difference between replicates, when at least one replicate sample concentration was 5-times greater than the detection limit.

Light grey shading indicates a greater than 30% relative percent difference between replicates, but replicate sample concentrations were not 5-times greater than the detection limit.

RPD = Relative Percent Difference; µg/g = micrograms per gram; < = less than.

Bolded values are higher than sediment quality guidelines. ISQG = Interim Sediment Quality Guideline; PEL = Probable Effect Level.
$^{(I)}$ = value higher than the Interim Sediment Quality Guideline.
$^{(P)}$ = value higher than the Probable Effect Level.

Sediment quality data shown in this table were rounded to reflect laboratory precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Measured concentrations equal to the guideline values were not identified as exceedances.
- = no guideline or data.

APPENDIX 8F

Statistical Outliers

Table 8F-1: Outliers Identified in the Sediment Quality Dataset During Statistical Analysis

Parameter	Unit	Year	Area	Station	Outlier	SR Value	*P*-value with Outlier included	Change in Analysis	Data Entry Error
2018 Spatial Analysis									
Total Organic Carbon	% / %Fines	2018	Reference Area 1	MEL-03-02	0.86	-4.454	**0.003**	N	N
Arsenic	µg/g %Fines	2018	Reference Area 3	MEL-05-01	45.1	5.217	0.104	**Y**	N
Barium	µg/g %Fines	2018	Reference Area 3	MEL-05-01	280	3.845	**0.026**	N	N
Calcium	µg/g %Fines	2018	Reference Area 3	MEL-05-01	19125	6.476	**0.038**	N	N
Cobalt	µg/g %Fines	2018	Reference Area 3	MEL-05-01	49.3	6.106	0.214	**Y**	N
Copper	µg/g %Fines	2018	Reference Area 1	MEL-03-02	22.9	-3.941	**0.007**	N	N
Lead	µg/g %Fines	2018	Reference Area 3	MEL-05-01	22.3	6.425	**0.006**	N	N
Molybdenum	µg/g %Fines	2018	Near-field	MEL-01-09	12.5	3.93	**0.064**	N	N
Nickel	µg/g %Fines	2018	Reference Area 3	MEL-05-01	152.5	5.887	0.263	**Y**	N
Strontium	µg/g %Fines	2018	Reference Area 3	MEL-05-01	103.8	7.65	**0.097**	N	N
Thallium	µg/g %Fines	2018	Reference Area 3	MEL-05-01	0.7	4.479	**0.085**	N	N
Uranium	µg/g %Fines	2018	Reference Area 3	MEL-05-05	8.2	5.3150	**0.060**	N	N
Zinc	µg/g %Fines	2018	Reference Area 3	MEL-05-01	277.5	7.981	**0.090**	N	N

Note:
Outliers were identified during statistical testing as those having SR values greater than or equal to an absolute value of 3.5.
Bold values indicate statistical significance. Tests were considered significant at $P < 0.1$.
Underlined values indicate that the results of the analysis was influenced by the outlier.
SR = studentized residual; µg/g = micrograms per gram.

1.0 INTRODUCTION

Meliadine Lake sediments were characterized under baseline conditions as having a higher proportion of sand compared to silt, and limited amounts of clay (Golder 2014). However, the 2015 and 2016 sampling programs carried out under baseline conditions identified variability in substrate composition as a potential confounding factor for the combined 2018 Environmental Effects Monitoring (EEM) Program/Aquatic Effects Monitoring Program (AEMP) for the Mine (Golder 2018a). Specifically, the Near-field area had a higher proportion of fines (clay and silt) compared to the Mid-field area and reference areas, where bottom sediments consisted predominantly of sand. This study design consideration was also acknowledged by Agnico Eagle Mines Limited, in response to review comments from Environment and Climate Change Canada (ECCC), Indigenous and Northern Affairs Canada (INAC) and Kivalliq Inuit Association (KIA) on the 2017 AEMP Annual Report (Golder 2018b).

Prior to the 2018 EEM/AEMP benthic invertebrate and sediment sampling event, a Sediment Reconnaissance Survey was conducted in Meliadine Lake to assess substrate composition in greater detail in planned sampling areas. The reconnaissance survey was intended to collect information that could be used to optimize sampling station locations to further limit substrate variability between stations and areas, to the extent possible during field work.

The 2018 survey is documented in this appendix with respect to field methods, substrate analysis, and reporting of the data/information collected. Recommendations are also made to optimize 2018 station selection for the Sediment Quality and Benthic Invertebrate Community EEM/AEMP components. The recommendations consider results from both the 2018 Sediment Reconnaissance Survey and the 2018 Plume Delineation Study (Section 2.4.4 of the main report).

2.0 METHODS

2.1 Field Survey

Sediment quality samples were collected from Meliadine Lake from 17 to 27 July 2018, at or close to the existing Near-field, Mid-field, and Reference area stations previously sampled in 2015 and 2016 (see Figure 9A-1 and for stations sampled in July 2018). Existing stations and new reconnaissance stations were sampled in July 2018. Locations of all stations sampled for sediment since 2015 are listed in Table 9A-1. Some stations were relocated from the originally intended coordinates because of unfavourable sampling conditions that resulted in poor sampling efficiency, or to confirm suitable substrates at stations that align with the new permanent CP1 diffuser, which became operational in 2018.

Field crews were provided with the following sampling criteria, as listed in Specific Work Instructions (unpublished file information), to provide consistency among sampling stations and areas:

- Water depth of 7 to 10 m
- Grab sampler fullness of >40%
- High retrieval success

Retrieval success was defined as: (1) the grab sampler penetrated the sediments, without displacing/disturbing the sediments and upon retrieval; (2) the jaws of the sampler were fully closed and free from debris (e.g., rocks or vegetation); (3) sediment was not “overflowing” the top of the sampler; and (4) sampling success, as defined by the three previous criteria, was repeatable over three grab samples.

If the above sampling criteria could not be achieved at a station previously sampled in 2015 or 2016, sampling was repeated within the general location of the station for a sampling effort of up to three grabs. The stations were then adjusted to within a 5 to 10 m radius of the original sample locations for additional attempts (while maintaining the original station code).

At each station, sediment samples were collected using a petite Ponar grab (15.24 cm x 15.24 cm). Three grabs were composited for sample submission, with the exception of stations MEL-02-07 and MEL05-04, where four grabs were composited. Supporting environmental data and observations were recorded during each sampling attempt to facilitate data interpretation and station selection for the 2018 EEM/AEMP. Specifically, the following information was recorded at each station:

- water depth
- sediment composition based on visual observation (% sand,% fines)
- sediment odour/colour
- sampler fullness
- sampling success rate/ease of collection
- presence of coarse substrates (gravel/cobble/bedrock)
- presence of vegetation

The total sampling effort undertaken comprised 248 grab attempts at the stations shown in Figure 9A-1. In total, 21 composite sediment samples were collected and submitted to ALS Environmental (ALS) for particle size and total organic carbon (TOC) analysis. Samples were stored in food grade polyethylene bags and kept cool before being submitted to ALS.

2.2 Data Evaluation

A desktop analysis was conducted to evaluate the information available for each station, in terms of water depth, grab sample fullness (as% fullness), and consistency of particle size/TOC relative to other stations/areas. The findings informed the optimization of station selection for the 2018 EEM/AEMP field program in August, along with findings from the 2018 Plume Delineation Study and information available from the 2018 water quality monitoring program.

3.0 RESULTS

3.1 Field Sampling and Sediment Characterization

Due to inclement weather and resulting unsafe conditions that occurred during the July sampling event, preference was given to the two exposure areas (Near-field and Mid-field) and two of the three reference areas (Reference area 1 and Reference area 3). Of the two reference areas, priority was given to Reference area 3, because the 2016 data indicated the substrates in this area were most similar to Near-field area substrates. Reference area 1 was sampled because it was identified as the reference area for the 2018 EEM program.

All reconnaissance stations sampled were located within the profundal zone of the lake. Most locations sampled were within the 7 to 10 m depth range, which was targeted the 2018 EEM/AEMP survey.

Results from the field survey and the subsequent laboratory determination of particle size and TOC for a subset of stations are summarized in Table 9A-1. The following observations suggest that sediment composition is inherently variable in the EEM and AEMP sampling areas of Meliadine Lake, both within and among areas, to various degrees.

- Sampling efficiency (i.e., the effort required to obtain the minimum of three sediment samples) differed both within and across areas, but was generally lowest in the Mid-field area, where up to 36 attempts were needed for successful grabs, followed by the Near-field area. Sampling at Reference area 3 stations was the most efficient, with three of four samples having a 100% success rate. The two stations sampled in Reference area 1 had lower retrieval success (i.e., 50% and 60%), but still met acceptability criteria.
- Sediments at the Near-field area stations were primarily composed of silt (mean = 76%) with some sand present up to a maximum of 26%.
- Sediments in the Mid-field area and reference areas had a more even mix of sand and silt. Of these areas, the Mid-field area and Reference area 3 had proportionally more sand, whereas Reference area 1 had proportionally more silt.
- Clay content was relatively low in all samples, ranging from 1.2% to 6.1% across all areas sampled; however, the field crews noted that the Ponar grab frequently encountered bedrock or hard-packed clay substrates when sampling in some EEM and AEMP areas.
- TOC varied from 1.5% to 9.9% across all areas sampled during the reconnaissance survey; the average across all areas and stations was 5.3%.

a) Indicates that the station will also be used for water quality sampling.

b) Fullness values only include grabs that were retained for sediment analysis (i.e., successful grabs).

c) Efficiency is the% of successful grabs out of the total attempts for that station.

Note: Grab attempts and efficiency are not available for 2015. TOC = total organic carbon; - = not applicable or not available.

3.2 Sampling Station Optimization for the EEM/AEMP 2018 August Program

In consideration of the results of the Sediment Reconnaissance Survey (Section 3.1) and Plume Delineation Study (Section 2.4.4 of the main report) results, five stations within each of the EEM and AEMP areas were selected for sampling during the August 2018 EEM/AEMP program, as summarized below:

- **Near-field Stations (EEM/AEMP):** MEL-01-01 was retained because it was also retained as part of the water quality component Near-field station re-alignment, after review of the 2018 Plume Delineation Study results. Furthermore, sampling in July 2018 confirmed that sampling efficiency and grab fullness at this station were acceptable. The other four stations confirmed by the water quality re-alignment (i.e., MEL01-06, MEL01-07, MEL01-08 and MEL01-09) were adopted as 2018 sediment and benthic monitoring stations, because they also had acceptable sampling efficiency and grab fullness. Furthermore, substrate composition was relatively consistent among the five 2018 Near-field water quality stations.
- **Mid-field Stations**: 2018 sediment stations were selected to maintain alignment with water quality but to also avoid excessive sampling effort in retrieving acceptable grab samples. Therefore, MEL-02-06 and MEL-02-08 were chosen to replace MEL-02-01 and MEL-02-04, because of difficulty retrieving acceptable samples from MEL-02-01 and MEL-02-04. For stations that were re-sampled for consistency with previous years, locations were adjusted to within 5 to 10 m of the original sample locations based on sampling success.
- **Reference Area Stations (EEM/AEMP):** Stations were selected to align monitoring stations between water quality and the benthic invertebrate community surveys. Reconnaissance data at these areas were limited, but served as a confirmation of the characteristics of these sampling stations compared to previous years, and whether they are suitable as a reference to the exposure areas. For stations that were resampled for consistency with previous years, some stations were adjusted to within 5 to 10 m of the original sample locations.

Sample Reception

On September 14, 2018, Cordillera Consulting received 24 samples from Golder Associates Inc. When samples arrived to Cordillera Consulting, exterior packaging was initially inspected for damage or wet spots that would have indicated damage to the interior containers.

Next, samples were logged into a proprietary software database (INSTAR1) where the clients assigned sample name was recorded along with a Cordillera Consulting (CC) number for cross-reference. Each sample was checked to ensure that all sites and replicates recorded on field sheets or packing lists were delivered intact and with adequate preservative. Any missing, mislabelled or extra samples were reported to the client immediately to confirm the total numbers and correct names on the sample jars. The client representative was notified of the arrival of the shipment and provided a sample inventory once intake was completed.
See table below for sample inventory:

Table 1: Summary of sample information including Cordillera Consulting (CC) number

Sample Sorting

- Using a gridded Petri dish, fine forceps and a low power stereo-microscope (Olympus, Nikon, Leica) the sorting technicians removed the invertebrates and sorted them into family/orders.
- The sorting technician kept a running tally of total numbers excluding organisms from Porifera, Nemata, Platyhelminthes, Ostracoda, Copepoda, Cladocera and terrestrial drop-ins such as aphids. These organisms were marked for their presence (given a value of 1) only and left in the sample. They were not included towards the 300-organism subsample count.
- Where specimens are broken or damaged, only heads were counted.
- Subsampling was conducted with the use of a Marchant Box.
- When using the Marchant box, cells were extracted at the same time in the order indicated by a random number table. If the 300th organism was found part way into sorting a cell then the balance of that cell was sorted. If the organism count had not reached 300 by the 50th cell then the entire sample was sorted.
- The total number of cells sorted and the number of organisms removed were recorded manually on a bench sheet and then recorded into INSTAR1
- Organisms were stored in vials containing 80% ethanol and an interior label indicating the site names, date of sampling, site code numbers and portion subsampled. This information was also recorded on the laboratory bench sheet and on INSTAR1.
- The sorted portion of the debris was preserved and labeled separately from the unsorted portion and was tested for sorting efficiency (Sorting Quality Control – Sorting Efficiency). The unsorted portion was also labeled and preserved in separate jars.

Percent sub-sampled and total countable invertebrates pulled from the samples were summarized in the table below.

Table 2: Percent sub-sample and invertebrate count for each sample

Sample	Date	EMS	CC#	500 micron fraction	
				% Sampled	# Invertebrates

Sorting Quality Control - Sorting Efficiency

As a part of Cordillera's laboratory policy, all projects undergo sorting efficiency checks.

- As sorting progresses, 10% of samples were randomly chosen by senior members of the sorting team for resorting.
- All sorters working on a project had at least 1 sample resorted by another sorter.
- An efficiency of 90 % was expected (95% for CABIN samples).
- If 90/95% efficiency was not met, samples from that sorter were resorted.
- To calculated sorting efficiency the following formula was used:

$$\frac{\#OrganismsMissed}{TotalOrganismsFound} * 100 = \%OM$$

In sample CC191382, the subsample fell below the threshold for sorting efficiency. This was a result of a new sorter not understanding the difference between an anterior end and a posterior end of an Oligochaete. All samples by this individual were reanalyzed and to ensure proper sample enumeration.

Table 3: Summary of sorting efficiency

CC #	Number of Organisms Recovered (initial sort)	Number of Organisms in Re-sort	Percent Recovery
CC190804	149	0	100%
190816	57	2	96%
		Average Recovery	98%

Taxonomic Effort

The next procedure was the identification to genus-species level where possible of all the organisms in the sample.

- Identifications were made at the genus/species level for all insect organisms found including Chironomidae (Based on CABIN protocol).
- Non-insect organisms (except those not included in CABIN count) were identified to genus/species where possible and to a minimum of family level with intact and mature specimens.
- The Standard Taxonomic Effort lists compiled by the CABIN manual[1], SAFIT[2] , and PNAMP[3] were used as a guide line for what level of identification to achieve where the condition and maturity of the organism enabled.
- Organisms from the same families/order were kept in separate vials with 80% ethanol and an interior label of printed laser paper.
- Chironomidae was identified to genus/species level where possible and was aided by slide mounts. CMC-10 was used to clear and mount the slide.
- Oligochaetes was identified to family/genus level with the aid of slide mounts. CMC-10 was used to clear and mount the slide.
- Other Annelida (leeches, polychaetes) were identified to the family/genus/species level with undamaged, mature specimens.
- Mollusca was identified to family and genus/species where possible
- Decapoda, Amphipoda and Isopoda were identified at family/genus/species level where possible.
- Bryozoans and Nemata remained at the phylum level
- Hydrachnidae and Cnidaria were identified at the family/genus level where possible.
- When requested, reference collections were made containing at least one individual from each taxa listed. Organisms represented will have been identified to the lowest practical level.
- Reference collection specimens were stored in 55 mm glass vials with screw-cap lids with polyseal inserts (museum quality). They were labeled with taxa name, site code, date identified and taxonomist name. The same information was applied to labels on the slide mounts.

Taxonomy Staff

The taxonomists for this project were certified by the Society of Freshwater Science (SFS) Taxonomic Certification Program at level 2 which is the required certification for CABIN projects:

Scott Finlayson: Group 1 General Arthropods (West); Group 2 EPT (East/West); Group 3 Chironomidae (East/West); Group 4 Oligochaeta

Adam Bliss: Group 1 General Arthropods (East/West); Group 2 EPT (East/West); Group 3 Chironomidae (East/West)

Rita Avery: Group 1 General Arthropods (East/West); Group 2 EPT (East/West)

Taxonomic Keys

Below is a reference list of taxonomic keys utilized by taxonomists at Cordillera Consulting. Cordillera taxonomists routinely seek out new literature to ensure the most accurate identification keys are being utilized. This is not reflective of the exhaustive list of resources that we use for identification. A more complete list of taxonomic resources can be found at Southwest Association of Freshwater Invertebrate Taxonomists. (2015). http://www.safit.org/Docs/SAFIT_Taxonomic_Literature_Database_1_March_2011.enl

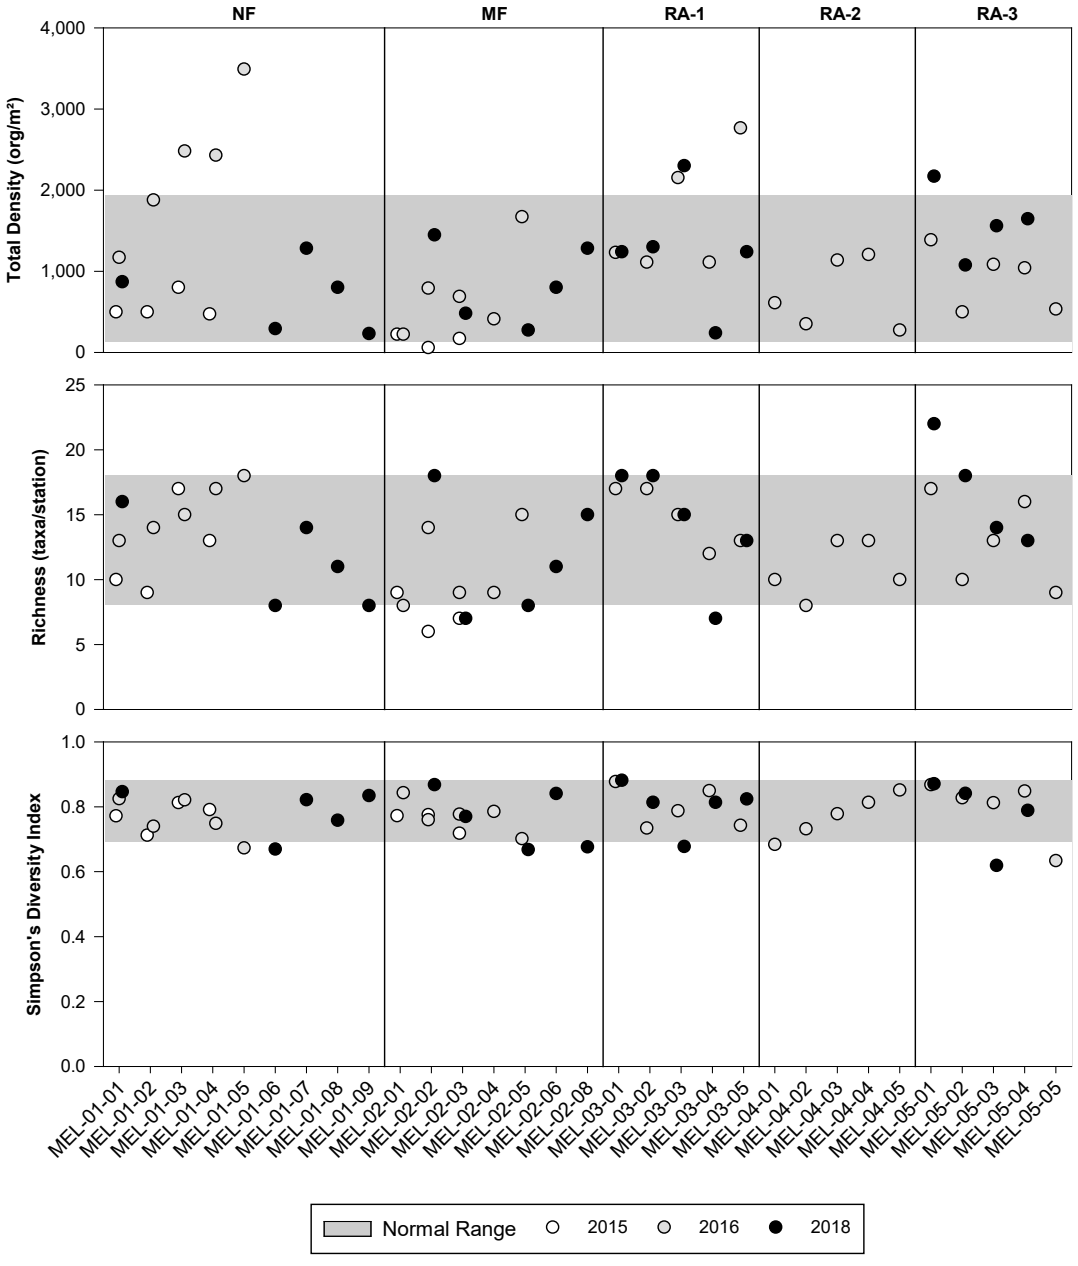
1.0 WITHIN-STATION VARIABILITY

Benthic invertebrate subsamples collected at Reference area Station MEL-05-04 were analyzed separately to provide information on the variability of benthic invertebrate endpoints within a single station, and the suitability of pooling subsamples in the field. Within-station estimates of variability for total invertebrate density and richness were summarized as the mean, summary statistics, and the % standard error (%SE = standard error expressed as the percentage of the mean) (Table 9C-1), and data for individual subsamples were plotted. Visual evaluation of the data for individual subsamples indicated a moderate degree of within-station variation (Figure 9C-1).

Values of %SE greater than 20% indicate a moderate level of variation at the subsample level and are slightly higher than desirable for benthic invertebrate data (Elliott 1971). At MEL-05-04, within-station variability was very low for richness and moderate for total abundance (Table 9C-1). These results are similar to those reported for other Arctic lakes in Northern Canada that are characterized by low invertebrate densities (e.g., Lac de Gras; Golder 2014) and where similar sampling methods were used for monitoring of benthic invertebrate communities under an Aquatic Effects Monitoring Program (AEMP).

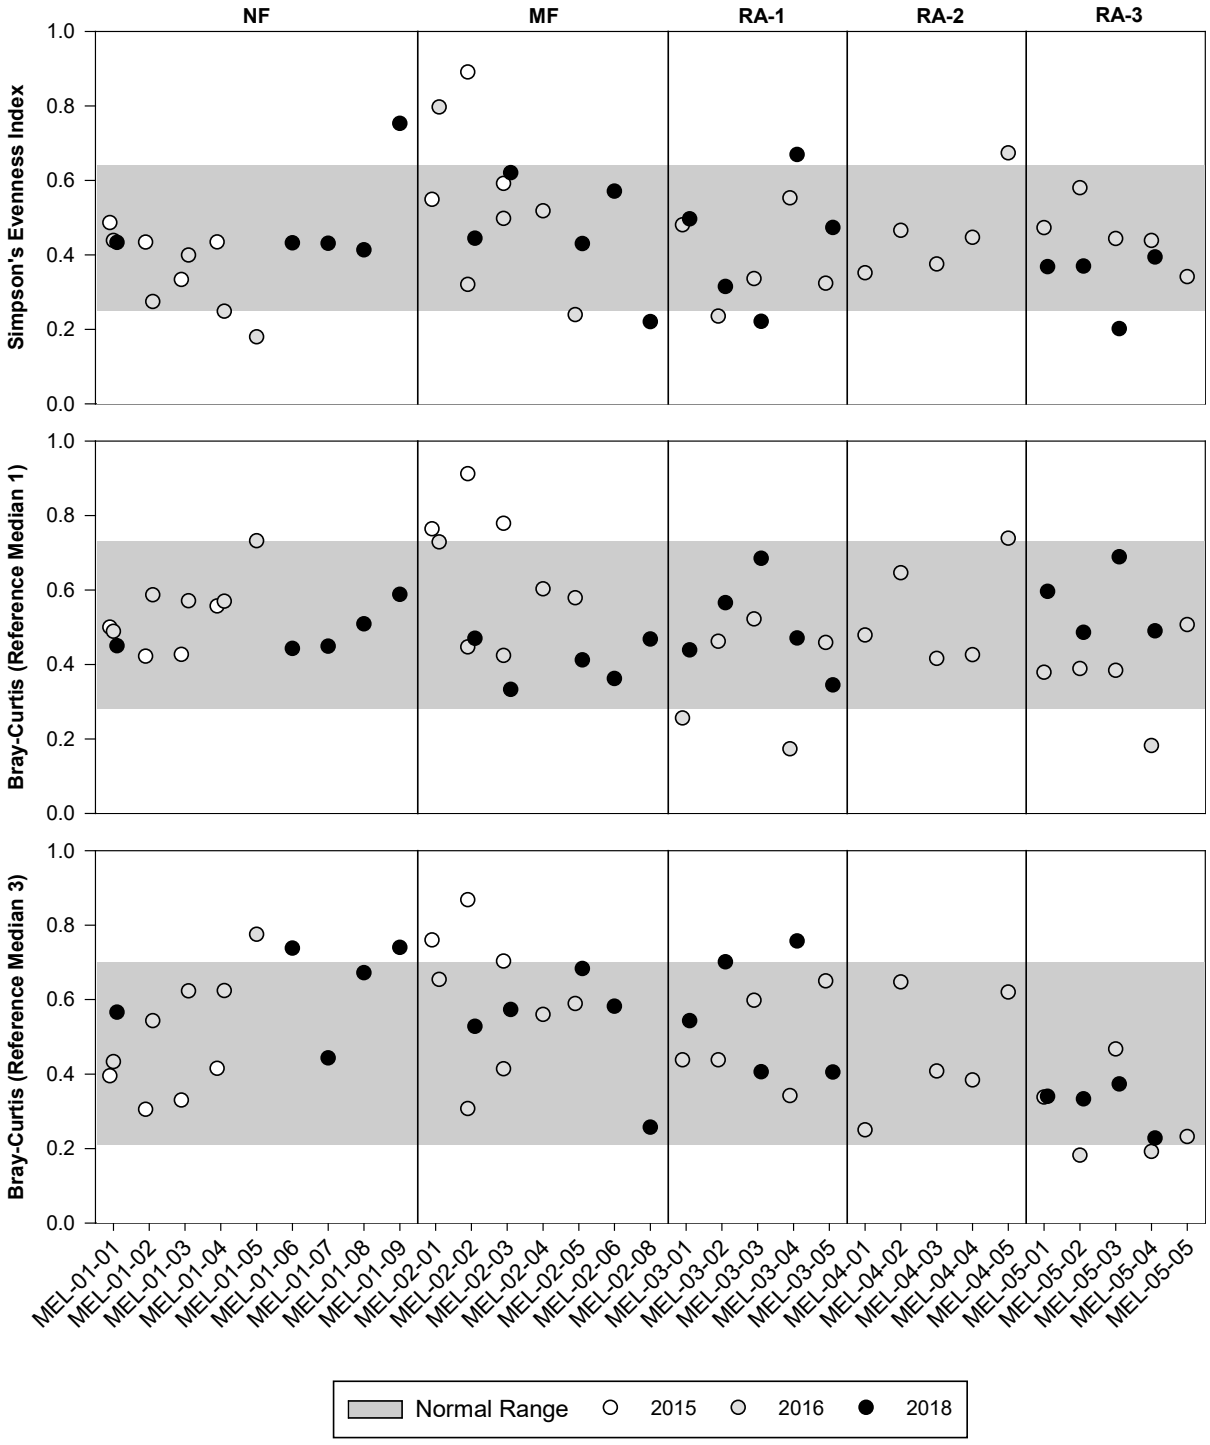
Table 9C-1: Within-Station Variation in Benthic Community Variables in Meliadine Lake, 2018

Station-Replicate	Total Abundance (organisms/subsample)	Richness (no. of taxa/subsample)
MEL-05-04-A	19	8
MEL-05-04-B	61	8
MEL-05-04-C	15	9
MEL-05-04-D	57	9
MEL-05-04-E	39	9
Mean	**38.2**	**8.6**
% Standard error	**24.7**	**2.8**
Median	*39*	*9*
Maximum	*61*	*9*
Minimum	*15*	*8*
Standard deviation	*21.1*	*0.5*
Standard error	*9.4*	*0.2*



LTL = lowest taxonomic level.

Figure 9C-1: Within-station Variability for Total Abundance and Richness in Meliadine Lake, August 2018



2.0 TEMPORAL VARIABILITY

Temporal variability within benthic invertebrate community sampling areas was plotted to provide information on the variability of benthic invertebrate variables, at the lowest taxonomic level, over the sampling years 2015, 2016 and 2018. Visual evaluation of the data for individual areas indicate a moderate degree of within-station variation (Figure 9C-2 to Figure 9C-4). The majority of the data fell within the normal range calculated for each of the benthic invertebrate variables.

NF = Near-field; MF = Mid-field; RA-1 = Reference area 1; RA-3 = Reference area 3.

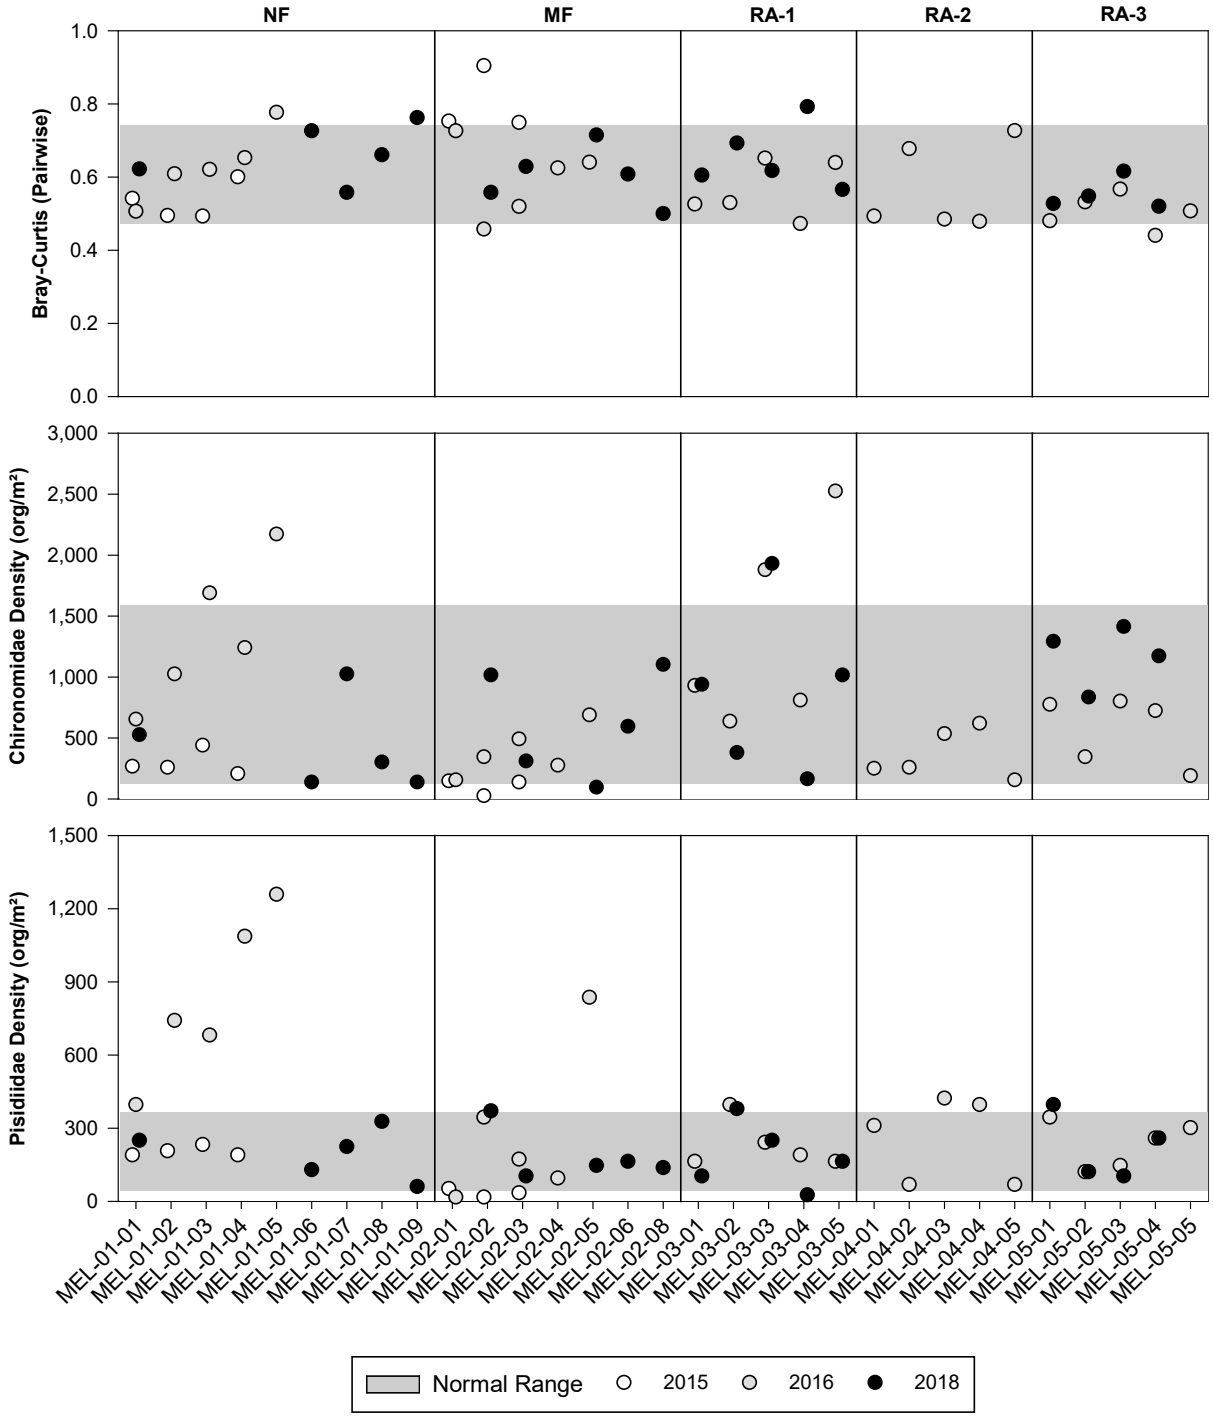


Figure 9C-2: Temporal Variability in Each Sampling Area for Total Benthic Invertebrate Density, Richness, Simpson's Diversity Index, Meliadine Lake 2015, 2016 and 2018

NF = Near-field; MF = Mid-field; RA-1 = Reference area 1; RA-3 = Reference area 3.

Note: BCI (Reference 1 Median and Reference 3 Median) were calculated using the EEM method.

Figure 9C-3: Temporal Variability in Each Sampling Area for Simpson's Evenness Index, Bray Curtis Index (EEM Reference 1 Median) and Bray Curtis Index (EEM Reference 3 Median), Meliadine Lake 2015, 2016 and 2018

NF = Near-field; MF = Mid-field; RA-1 = Reference area 1; RA-3 = Reference area 3.

Figure 9C-4: Temporal Variability in Each Sampling Area for Bray Curtis Index (Pairwise Method), Chironomidae Density and Pisidiidae Density, Meliadine Lake 2015, 2016 and 2018

3.0 OUTLIER SCREENING

Benthic invertebrate endpoint data for 2018 were displayed as box-and-whisker plots for visual assessment to identify potential outliers (Figure 9C-5) as per EEM TGD (EC 2012). The results for station MEL-05-05 resulted in an outlier for total density, richness, diversity and evenness. Only one invertebrate was present in the sample from MEL-05-05, which consisted of a composite of five grabs. The sample met all sampling criteria for grab sampler fullness and sediment particle size. However, based on initial data screening, MEL-05-05 was excluded from the statistical analysis, because the unusually low abundance in this sample suggested a data quality issue potentially related to improper sample preservation. Outliers from other stations were also examined, but there was no indication that the data were suspect, and the differences relative to station means were minor. Therefore, no other samples were excluded prior to statistical analysis.

Prior to statistical analyses, statistical outliers were identified using standardized residuals, which provide a measure of the difference between observed and expected values (i.e., residuals), normalized to the variance of the dataset, and were calculated as follows:

Standardized Residual: $x_z = \frac{x_i}{\sigma}$

Where:

x_z is the standardized residual

x_i is the residual of a data point

σ is the sample standard deviation

Data points with standardized residuals greater than |3.5| (i.e., more than 3.5 standard deviations from the sample mean), were identified as observations that may be unusual and were omitted from the statistical analysis. When an outlier was detected, the validity of the data point was examined. If the outlier was determined to be the result of a data entry error, it was corrected. If the outlier was not the result of data entry errors and could not be resolved otherwise, the analysis was completed with and without the outlier included.

Based on the above analysis, no statistical outliers were identified in the 2018 benthic invertebrate dataset.

a) Suspected to be Schistocephalus solidus.
b) Derived using otoliths.
c) Refer to Table 2 for maturity codes designations.
d) Calculated value: regression completed for standard and total length, equation y=0.893x -0.392 (r^2= 0.990).
e) Calculated value: regression completed for carcass and total weight, equation y=0.7035x + 0.033 (r^2=0.951).
f) Calculated value: regression completed using histology plus fecundity subsample weights and total gonad weight, equation y=0.9792x - 0.0009 (r^2=0.999).
d = day; m = month; y = year; NF = Near-field; RA1 = Reference Area 1; mm = millimetre; g = gram; F = female; M = male; U = unknown; A = adult; J = juvenile; mg = milligram; µm = micrometre; - = not recorded or not applicable.

Table 10B-4: Statistical Outliers Excluded from Statistical Analysis for the Meliadine Lake Fish Health Program, 2018

Sex	Parasites	Parameter	Dependent	Covariate	Statistical Test	Fish Identification Number	Studentized Residual
Female	Included	Relative gonad size	Gonad weight	Body weight	$ANCOVA_{log}$	ML18URA1THST5039	4.0
Female	Included	Relative liver size	Liver weight	Body length	ANCOVAlog	ML18URA1THST5281	-4.6
Male	Included	Relative body weight	Body weight	Total weight	$ANCOVA_{log}$	ML18URA1THST5028	3.3[(a)]
Female	Excluded	Weight-at-age	Body weight	Age	ANCOVA	ML18UNFTHST4120	5.5
Female	Excluded	Weight-at-age	Body weight	Age	ANCOVA	ML18URA1THST5017	3.6[(a)]
Female	Excluded	Relative liver weight	Liver weight	Total length	$ANCOVA_{log}$	ML18URA1THST5281	-2.9[(a)]
Population	Included	Relative body weight	Body weight	Total length	$ANCOVA_{rank}$	ML18URA1THST5153	4.2

Note: Outlier threshold defined as a studentized residual greater than |4.0|.

a) Value removed due to high leverage.

ANOVA = analysis of variance; ANCOVA = analysis of covariance; log = logarithm base 10; rank = rank transformed data; - = not applicable.

a) F = frayed, erosion of tips of gill lamellae resulting in "ragged" gills; C = clubbed, swelling of the tips of the gill lamellae; M = marginate, gills with light/discoloured margin along tips of lamellae; P = pale
b) 1 = minor erosion.
c) A = normal; C = "fatty" liver.
d) B = normal.
e) 0 = none; 1 = <50%; 2 = 50%; 3 = >50%.
f) 1 = few observed parasites; 2 = moderate parasite infestation; 3 = numerous parasites.
g) B = normal; S = swollen; M = mottled, gray discolouration; G = granular appearance and texture
% = percent; N or 0 = normal, no deformities or aberrations observed.

11A1.0 INTRODUCTION

Quality assurance and quality control (QA/QC) procedures are applied during all aspects of a monitoring program, and are used to determine data integrity. Quality assurance (QA) procedures include training of personnel, data management, and other technical practices designed to confirm that high quality data are consistently generated. Quality control (QC) procedures include steps to measure and evaluate data quality, as well as the corrective actions that are applied when data quality objectives are not achieved.

The QA/QC procedures implemented during the 2018 plankton monitoring programs under the Aquatic Effects Monitoring Program (AEMP) for the Meliadine Gold Mine Project (Project) are described in the following sections. QA/QC procedures and results for the 2015, 2016, and 2017 plankton monitoring programs are reported by Golder (Golder 2018). An evaluation of the QC data and implications for the interpretation of the AEMP study results is also included.

11A2.0 QUALITY ASSURANCE

Similar to water quality (Appendix 6A) and sediment quality (Appendix 7A), the QA procedures implemented for the 2018 plankton monitoring program can be classified into three categories of data management. These include field operations, laboratory analyses, and office operations.

11A2.1 Field Operations

Quality assurance procedures for field operations involve field crew training, pre-field meetings, and the use of standardized methods and explicit instructions for collecting and handling field data. Field staff for the Project were trained to be proficient in standardized field sampling procedures, data recording, and equipment operation. Golder Associates Ltd. (Golder) developed specific work instructions (SWI) for the field component of Project, based on standardized technical procedures that are consistent with widely accepted field protocols described in relevant scientific literature (e.g., Environment Canada 1993). Field work was completed according to the SWI, which included the exact locations of sampling sites and detailed step by step instructions for field tasks, including:

- equipment maintenance
- sample collection, handling, preservation, labelling, storage, and shipping
- record keeping and sample tracking

The SWI also included contact information for members of the project team and the analytical laboratory, as well as references to applicable technical procedures. Field data were recorded on standardized field data sheets or in a bound field notebook. Chain of custody forms were used to track samples sent to the analytical laboratory, and receipt of the samples at the laboratory was confirmed. The crew lead was responsible for tracking samples to confirm that all required samples were collected, chain of custody and analytical request forms were complete and correct, and that labelling and documentation procedures were followed. Field crews checked in with component managers, as needed, and submitted daily reports to provide updates on completed tasks.

Pre-field meetings were held with the field crew and project/component manager prior to the start of each field program to discuss the purpose of the field program, the role of each crew member, specific details of the SWI, equipment needs, field logistics, and contingency plans.

11A2.2 Laboratory Analyses

Water samples collected in 2018 for depth integrated nutrient (DIN) and chlorophyll *a* analyses were submitted to a Canadian Association for Laboratory Accreditation Inc. (CALA) accredited laboratory; therefore, confidence in the reliability of the analytical results received from the laboratory is considered high. To receive accreditation, a laboratory must pass an evaluation of its internal procedures, analytical methods, and QC processes.

A designated member of the project team was responsible for liaising with the analytical laboratories.

11A2.3 Office Operations

Quality assurance procedures implemented for office-based tasks included the following:

- having trained personnel complete data management, analysis, and reporting tasks
- using standardized data storage, manipulation, and summary tools, as required
- establishing a data management system to support consistency, QC, and data retrieval
- senior review of data deliverables at appropriate milestones

11A3.0 QUALITY CONTROL

QC steps implemented during the 2018 plankton monitoring program activities can be classified into the same three categories used describe QA procedures: field operations, laboratory analyses, and office operations.

11A3.1 Field Operations

Quality control procedures implemented during field operations included the collection of QC samples that were used to check the precision of field sampling methods and laboratory analyses. QC samples collected in support of the plankton monitoring programs included:

- **Duplicate DIN samples:** Duplicate samples consisted of paired, depth integrated water samples collected at the same time and location, using the same methods. Duplicate samples were collected at randomly selected stations in Meliadine Lake, and represented approximately 10% of the total number of DIN samples submitted for analysis. All QC samples were submitted “blind” to the analytical laboratory and analyzed for the same set of parameters as the other DIN samples.
- **Triplicate chlorophyll *a* samples:** Triplicate samples were collected at all stations in Meliadine Lake and were kept cool and dark until filtered and frozen prior to sample shipment.
- **Duplicate phytoplankton samples:** These samples were collected at randomly selected stations in Meliadine Lake.

11A3.2 Laboratory Analyses

To support analysis of the DIN samples, the analytical laboratory prepared in-house QC samples and analyzed them along with the field collected samples. The objective was to confirm the quality and reliability of the analytical results. QC analyses and sample types included duplicate analyses, spiked samples, and method blanks.

Plankton R Us performed an internal QC of the phytoplankton taxonomy by performing replicate counts on 10% of the samples. Replicate phytoplankton samples were chosen at random and processed at different times from the original analysis to reduce bias. The laboratory QC results were reviewed to confirm the quality of the data and to evaluate whether the laboratory identified any questionable results for specific parameters.

11A3.3 Office Operations

QC operations implemented in the office focussed on confirming and maintaining the quality of in situ measurement data and analytical results, as well as verifying the accuracy of data summaries (i.e., summary statistics and plots). Field data entered into the Project database were compared against the field data sheets and field notebook to confirm their accuracy. Unaltered data files from the laboratory were saved to the Project directory and were used as a reference to confirm the accuracy of the data entered into the Project database. Laboratory data were also screened for quality. Backup files were created before each major data analysis operation and calculations were reviewed to confirm the accuracy of the results.

11A3.4 Laboratory Data Screening

A series of standard data screening steps were completed upon receipt of water chemistry results from the analytical laboratory to identify potential issues with the DIN dataset, including:

- verification that all requested parameters and samples were analyzed
- verification that the appropriate detection limits (DLs) were used and data were reported in the appropriate units
- data logic checks (e.g., comparisons of dissolved and total nitrogen and phosphorus concentrations)
- identification of outliers
- review of duplicate sample results for unacceptable variation
- review of laboratory QC results (i.e., sample temperature and integrity of containers upon receipt, holding times, laboratory blanks and recoveries from spiked samples, internal duplicates, review of laboratory qualifiers and notes)
- review of the final dataset for completeness, and confirmation that sources of unexpected values and trends have been identified

Prompt completion of the screening steps allowed for potential re analysis of samples by the laboratory to verify questionable data or to generate data for missing parameters. If samples were re analyzed by the laboratory and the data were still considered questionable, qualifiers for consideration during data summary and analysis steps were added to the dataset, or the data were excluded from further analyses.

11A3.5 Quality Control Data Evaluation

11A3.5.1 Depth-integrated Nutrients

Differences between concentrations measured in duplicate DIN samples were evaluated based on the relative percent difference (RPD), where:

$$RPD = \frac{|C1 - C2|}{\frac{(C1 + C2)}{2}} * 100$$

where C1 is the concentrations in the sample and C2 is the concentration in the second or duplicate sample.

The RPD was only calculated if both of the paired concentrations in the duplicate samples were greater than five times the DL. The RPD for a given parameter was flagged if it was greater than 20%.

11A3.5.2 Chlorophyll *a*

Chlorophyll *a* data were checked thoroughly for errors or omissions. RPDs were not calculated for chlorophyll *a,* as samples were collected in triplicate at all sampling stations as part of the study design. Anomalous results were clarified with the analytical laboratory and data believed to be recorded in error was flagged and omitted from statistical analyses.

11A3.5.3 Phytoplankton

The inherent variability associated with phytoplankton samples prevents the establishment of a QC threshold value. For the purposes of the plankton QC, the proportion of each major group was calculated and the occurrence of dominant species used to assess consistency between the field samples and duplicate samples analyzed. In addition, the RPD was used to assess the overall similarity between the field and duplicate samples. Due to high variability in species occurrence, the comparisons were made at the major group level for both abundance and biomass, rather than the species level. Differences in total abundance and biomass were also evaluated. RPDs greater than 50% were flagged and follow-up assessments of the data were performed. Plots of the relative abundance results for the field and duplicate samples were made so that duplicate results could be evaluated on a case by case basis.

11A3.6 Quality Control Results

A summary of the quality control samples collected during the plankton monitoring program is provided in Table 11A-1. Detailed QC results for DIN and phytoplankton are presented in Section 11A4.0 (Table 11A-2 to Table 11A-6). The results from each type of sample are provided in the sections below.

Table 11A-1: Summary of Quality Control Samples Collected in 2018

Type of Sample	Summer 2018
Duplicates – Depth Integrated Nutrients	MEL-01-09 MEL-03-01
Duplicates – Phytoplankton	MEL-02-02 MEL-04-05 MEL-05-01

11A3.6.1 Depth Integrated Nutrients

To maintain sample integrity, DIN samples for laboratory analyses were submitted as soon as possible after collection. However, holding time exceedances are a common issue for water samples collected from remote areas because transport of samples to the laboratory is subject to the availability of scheduled charter flights. Holding times may also be exceeded if the laboratory is unable to initiate testing promptly following sample receipt. Analytical holding times were met for most parameters, with the exception of nitrate, nitrite, and orthophosphate.

Two duplicate DIN samples were collected in support of the 2018 plankton program (Table 11A-1). RPDs could not be calculated for the majority of DIN parameters due to concentrations being less than five times the detection limit (Table 11A-2). RPDs exceeded 20% for total Kjeldahl nitrogen, total nitrogen and total phosphorus in the duplicate samples collected at MEL-01-09. RPDs were all below 20% in the duplicate samples collected at MEL-03-01.

A single equipment blank sample was also collected and submitted for analysis of all DIN parameters. Concentrations of all DIN parameters were below detection limits in the equipment blank sample.

Dissolved concentrations measured in the DIN samples, including duplicates, were compared to their corresponding total concentrations. The majority of dissolved parameter concentrations in the dataset met quality criteria (i.e., for paired total and dissolved concentrations that were more than five times the DL, the dissolved concentration was no more than 20% higher than the total concentration). Concentrations of dissolved Kjeldahl nitrogen were more than 20% higher than concentrations of total Kjeldahl nitrogen in 8 of the 26 DIN samples collected; however, statistical analysis of total Kjeldahl nitrogen was not undertaken in the plankton targeted study. Therefore, these results would not have impacted the analysis of nutrient variability in Meliadine Lake.

11A3.6.2 Chlorophyll *a*

No errors or omissions were found in chlorophyll *a* data reported in 2018.

11A3.6.3 Phytoplankton

A total of three duplicate phytoplankton samples were collected from Meliadine Lake in 2018 (Table 11A-3 and Table 11A-4). For phytoplankton, RPD values were below 50% when calculated on total biomass (Table 11A-3). However, at the major group level, all three duplicate samples for phytoplankton biomass had RPDs greater than 50% for one or more taxonomic group. Affected groups included cyanobacteria, cryptophytes and dinoflagellates. Similarly, for phytoplankton abundance, based on total abundance, RPDs were less than 50%, but at the major group level, 2 out of 3 duplicates had RPDs greater than 50% for one or more taxonomic group (Table 11A-4). Affected groups included chlorophytes, cryptophytes, and dinoflagellates. In general, where high RPDs were observed, the biomass or abundance of the taxa tended to be low in both samples in comparison with the total biomass or abundance of the sample. A visual examination of relative abundance and relative biomass plots for paired duplicate samples indicates that the general composition of the samples appears to be similar between duplicates (Figure 11A-1 and Figure 11A-2). In addition, the dominant taxon (i.e., the taxon contributing the most biomass or abundance to the sample) was consistent between duplicates.

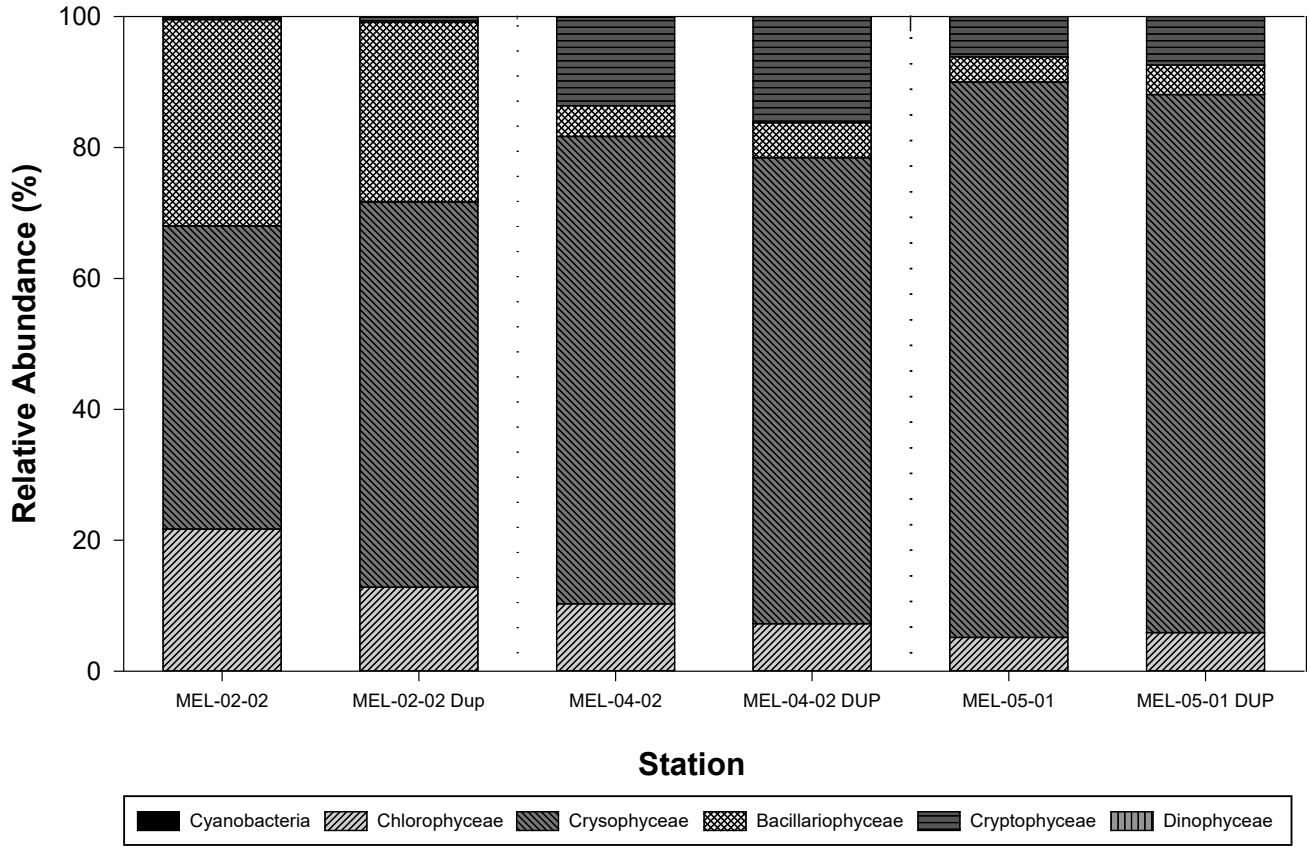

Figure 11A-1: Relative Abundance of Major Phytoplankton Taxonomic Groups in Duplicate Samples, Meliadine Lake, 2018

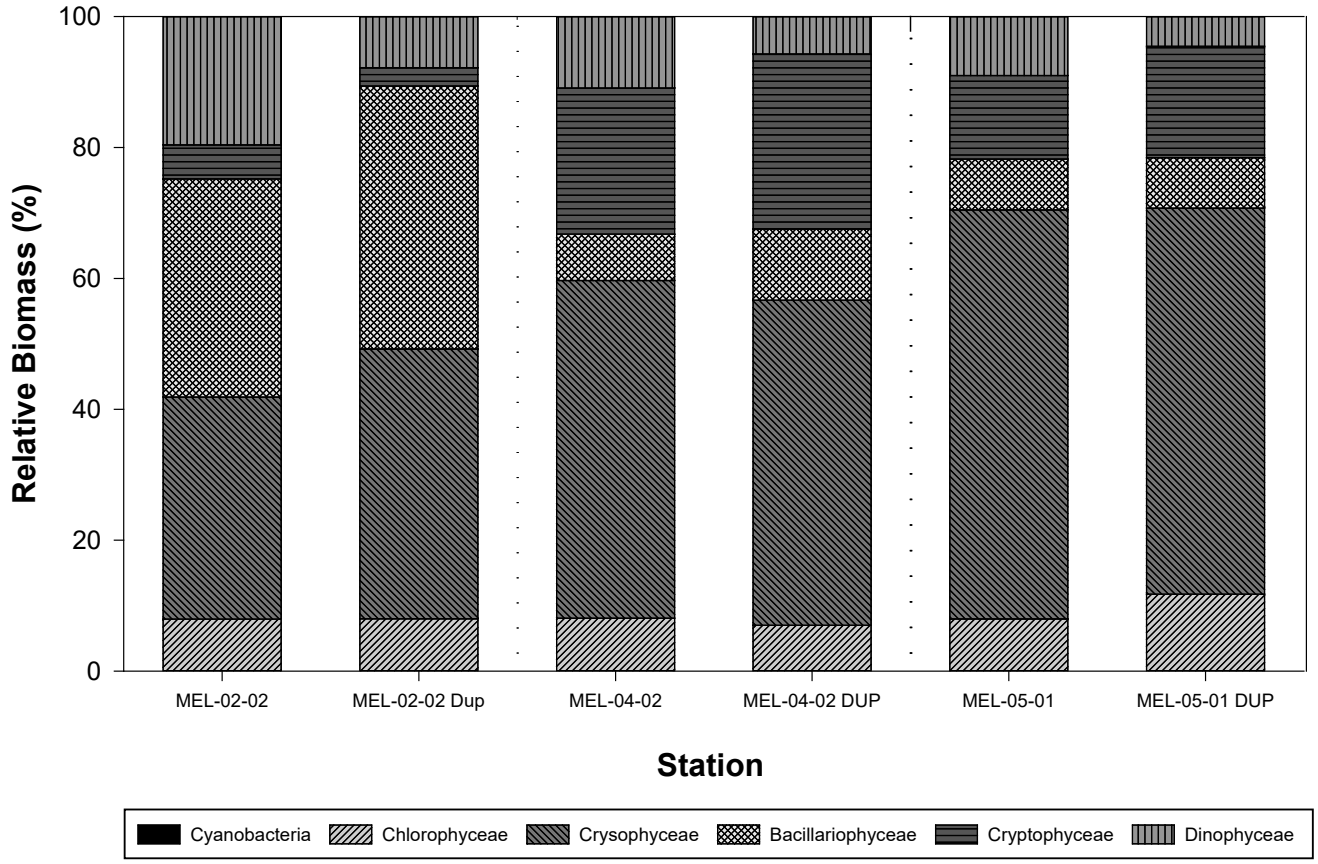

Figure 11A-2: Relative Biomass of Major Phytoplankton Taxonomic Groups in Duplicate Samples, Meliadine Lake, 2018

11A3.7 Data Quality Summary

Key QC findings for the 2018 plankton monitoring programs are as follows:

- A total of 12% of paired concentrations in duplicate DIN samples had a RPD greater than 20%. Each of the three RPD exceedances came from duplicate samples collected at MEL-01-09 in August 2018, where RPDs for concentrations of total Kjeldahl nitrogen, total nitrogen and total phosphorus exceeded 20%. All RPDs for the other set of DIN duplicate samples collected at MEL-02-01 in 2018 were below 20%.
- Concentrations of dissolved parameters were generally lower than corresponding total concentrations for the DIN samples. Dissolved concentrations were higher than total concentrations for 4.4% of comparisons.
- RPDs for total phosphorus concentrations in 2018 were below 20% in all samples.
- The dominant taxon was consistent between duplicate samples for phytoplankton biomass and abundance.
- RPDs for total phytoplankton biomass and abundance were below 50% for all duplicates.
- RPDs above 50% were observed in the majority of duplicates for major phytoplankton taxonomic groups; however, graphical presentation of the relative abundance of major phytoplankton groups showed that variation between duplicates was actually low, and that the proportions of major groups were similar between duplicates.

Differences between original and QC samples were deemed minor, and within the range of variability expected in plankton data. Based on this assessment, the plankton monitoring data are considered adequate to meet the needs of the AEMP for the Mine.

11A4.0 DETAILED RESULTS TABLES

Table 11A-2: Depth integrated Nutrient Water Quality Duplicate Results, 2018

Station	Units	DL	RPD Alert Limit	MEL-03-01		RPD (%)[a]	MEL-01-09		RPD (%)[a]
Sample Name				Sample	Duplicate		Sample	Duplicate

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B8J0420
Received: 2018/07/26, 11:35

accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Maxxam Analytics Mississauga
(2) This test was performed by Maxxam Analytics Kitimat
(3) This test was performed by Campo to Burnaby Subcontract
(4) Dissolved Organic Carbon (DOC) present in the sample should be considered as non-purgeable DOC.
(5) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(6) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.
(7) Radium-226 results have not been corrected for blanks.
(8) Total Organic Carbon (TOC) present in the sample should be considered as non-purgeable TOC.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.0°C

Revised Report (2018/10/03): Client sample ID changed as per client request, and GPS coordinates included.

Sample TZ1946 [MEL-14ac (MDMER and EEM)] : GPS coordinates: 63°02'15.5'' 92°13'06.3''

Sample TZ1947 [MEL-13 (WL and EEM)] : GPS coordinates: 63°01'44.6'' 92°09'14.6''

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.0°C

Revised Report (2018/10/03): Client sample ID changed as per client request, and GPS coordinates included.

Revised Report (2018/12/11): Client sample ID and GPS coordinates for lab ID TZ1946 updated per client request.

Revised Report (2018/12/11): Client sample ID and GPS coordinates for lab ID TZ1947 updated per client request.

Sample TZ1946 [MEL-14] : GPS coordinates: 63°02'15.5'' 92°13'06.3''

Sample TZ1947 [MEL-13] : GPS coordinates: 63°01'44.6'' 92°09'14.6''

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B8L7292
Received: 2018/08/22, 14:00

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Maxxam Analytics Mississauga
(2) This test was performed by Maxxam Analytics Kitimat
(3) This test was performed by Campo to Burnaby Subcontract
(4) Dissolved Organic Carbon (DOC) present in the sample should be considered as non-purgeable DOC.
(5) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(6) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.
(7) Radium-226 results have not been corrected for blanks.
(8) Total Organic Carbon (TOC) present in the sample should be considered as non-purgeable TOC.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	10.3°C
Package 2	10.0°C
Package 3	10.3°C

Revised report (2018/09/21): Includes Repeat values for TDS.

Revised Report (2018/12/12): Client sample ID changed to MEL-14 per client request.

Sample HOA138 [MEL-22 CP5] : TKN < Ammonia: Both values fall within the method uncertainty for duplicates and are likely equivalent.

Sample HOA139 [RO EFFLUENT] : TKN < Ammonia: Both values fall within the method uncertainty for duplicates and are likely equivalent.

Sample HOA140 [DCP1- DOWNSTREAM] : Total Cyanide < Free Cyanide: Both values fall within the method uncertainty for duplicates and are likely equivalent.

Sample HOA141 [2018-0083] : Total Cyanide < Free Cyanide: Both values fall within the method uncertainty for duplicates and are likely equivalent.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Sample Matrix: Water
Samples Received: 5

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Silica (Reactive)	4	N/A	2018/08/27	AB SOP-00011	EPA 370.1 R1978 m
Silica (Reactive)	1	N/A	2018/08/28	AB SOP-00011	EPA 370.1 R1978 m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	4.0°C

Revised Report (2018/10/12): Client sample ID changed as per client request, and GPS coordinates included.

Sample UD8907 [MEL-14ac (MDMER and EEM)] : GPS coordinates: 63°02'15.5'' 92°13'06.3''

ELEMENTS BY ATOMIC SPECTROSCOPY (WATER) Comments

Matrix Spike Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.
Sample UD8910 [MEL-22 CP5] Elements by CRC ICPMS (dissolved): RDL raised due to concentration over linear range, sample dilution required.
Sample UD8910 [MEL-22 CP5] Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.
Sample UD8912 [DCP1- DOWNSTREAM] Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.
Sample UD8913 [2018-0083] Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	4.0°C

Revised Report (2018/10/12): Client sample ID changed as per client request, and GPS coordinates included.

Revised Report (2018/12/11): Client sample ID and GPS coordinates for lab ID UD8907 updated as per client request.

Sample UD8907 [MEL-14] : GPS coordinates: 63°02'15.5'' 92°13'06.3''

ELEMENTS BY ATOMIC SPECTROSCOPY (WATER) Comments

Matrix Spike Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.
Sample UD8910 [MEL-22 CP5] Elements by CRC ICPMS (dissolved): RDL raised due to concentration over linear range, sample dilution required.
Sample UD8910 [MEL-22 CP5] Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.
Sample UD8912 [DCP1- DOWNSTREAM] Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.
Sample UD8913 [2018-0083] Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B872191
Received: 2018/08/25, 11:30

Sample Matrix: Water
Samples Received: 5

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Silica (Reactive)	4	N/A	2018/08/27	AB SOP-00011	EPA 370.1 R1978 m
Silica (Reactive)	1	N/A	2018/08/28	AB SOP-00011	EPA 370.1 R1978 m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Sampler Initials: PS

			Matrix Spike		Spiked Blank		Method Blank		RPD	
QC Batch	Parameter	Date	% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9119329	Reactive Silica	2018/08/27	NC	80 - 120	98	80 - 120	<0.050	mg/L	1.5	20
9119332	Reactive Silica	2018/08/27	115	80 - 120	100	80 - 120	<0.050	mg/L	13	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B8L8915
Received: 2018/08/23, 10:55

procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Analytics Mississauga
(2) This test was performed by Maxxam Analytics Kitimat
(3) This test was performed by Campo to Burnaby Subcontract
(4) Dissolved Organic Carbon (DOC) present in the sample should be considered as non-purgeable DOC.
(5) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(6) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.
(7) Radium-226 results have not been corrected for blanks.
(8) Total Organic Carbon (TOC) present in the sample should be considered as non-purgeable TOC.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	17.3°C
Package 2	11.3°C

Revised Report (2018/10/02): Client sample ID changed as per client request, and GPS coordinates included.

Sample HOI317 [2018-0088] : TOC< DOC: Both values fall within the method uncertainty for duplicates and are likely equivalent.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Silica (Reactive)	3	N/A	2018/09/05	AB SOP-00011	EPA 370.1 R1978 m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	-0.7°C

Revised Report (2018/10/03): Client sample ID changed as per client request, and GPS coordinates included.

Sample UE3700 [MEL-13 (WL and EEM)] : GPS coordinates: 63°01'44.6'' 92°09'14.6''

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B8M4749
Received: 2018/08/29, 12:00

accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Maxxam Analytics Mississauga
(2) This test was performed by Maxxam Analytics Kitimat
(3) This test was performed by Campo to Burnaby Subcontract
(4) Dissolved Organic Carbon (DOC) present in the sample should be considered as non-purgeable DOC.
(5) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(6) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.
(7) Radium-226 results have not been corrected for blanks.
(8) Total Organic Carbon (TOC) present in the sample should be considered as non-purgeable TOC.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	9.7°C

Revised Report (2018/12/18): Client sample ID changed to MEL-14 and GPS coordinates included per client request.

Sample HPR218 [MEL-14] : TKN < Ammonia: Both values fall within the method uncertainty for duplicates and are likely equivalent.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B874301
Received: 2018/08/31, 09:11

Sample Matrix: Water
Samples Received: 1

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Silica (Reactive)	1	N/A	2018/09/05	AB SOP-00011	EPA 370.1 R1978 m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.7°C

ELEMENTS BY ATOMIC SPECTROSCOPY (WATER) Comments

Sample UF2178 [MEL-SR-8] Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.
Sample UF2179 [ITIVIA MEL-SR-3] Elements by CRC ICPMS (total): RDL raised due to concentration over linear range, sample dilution required.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.7°C

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Received: 2018/08/31, 09:11

Sample Matrix: Water
Samples Received: 1

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Silica (Reactive)	1	N/A	2018/09/05	AB SOP-00011	EPA 370.1 R1978 m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Maxxam Analytics Mississauga
(2) This test was performed by Maxxam Analytics Kitimat
(3) This test was performed by Campo to Burnaby Subcontract
(4) Dissolved Organic Carbon (DOC) present in the sample should be considered as non-purgeable DOC.
(5) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.
(6) Values for calculated parameters may not appear to add up due to rounding of raw data and significant figures.

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B8M4777
Received: 2018/08/29, 12:00

(7) Radium-226 results have not been corrected for blanks.
(8) Total Organic Carbon (TOC) present in the sample should be considered as non-purgeable TOC.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.7°C

Revised Report (2018/12/18): Client sample ID changed to MEL-13 as per client request.

MEL-13 - GPS coordinates: 63°01'44.6'' 92°09'14.6''
MEL-03-01 - GPS coordinates: 63°06'52.2'' 92°20'23.6''

Sample HPR416 [MEL-03-01] : TOC< DOC: Both values fall within the method uncertainty for duplicates and are likely equivalent.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Received: 2018/09/01, 11:35

Sample Matrix: Water
Samples Received: 2

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Silica (Reactive)	2	N/A	2018/09/05	AB SOP-00011	EPA 370.1 R1978 m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	3.7°C

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B874816
Received: 2018/09/01, 11:35

Sample Matrix: Water
Samples Received: 2

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Silica (Reactive)	2	N/A	2018/09/05	AB SOP-00011	EPA 370.1 R1978 m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	3.7°C

Revised Report (2018/12/12): Client sample ID and GPS coordinates updated as per client request.

Sample UF4499 [MEL-13] : GPS coordinates: 63°01'44.6'' 92°09'14.6''

Sample UF4500 [MEL-03-01] : GPS coordinates: 63°06'52.2'' 92°20'23.6''

Results relate only to the items tested.
