SECTION 1 • INTRODUCTION

Agnico Eagle Mines Limited operates the Meliadine Gold Mine (the Mine) located approximately 25 kilometers north of Rankin Inlet, Nunavut, and 80 km southwest of Chesterfield Inlet in the Kivalliq Region of Nunavut. The Mine is subject to the terms and conditions of both the amended Project Certificate 006 issued by the Nunavut Impact Review Board (NIRB) in accordance with the Nunavut Land Claims Agreement Article 12.5.12 on March 2, 2022 (NIRB, 2022) and Amended Water Licence No. 2AM-MEL1631 (the Licence), issued by the Nunavut Water Board (NWB) on October 25, 2024 and approved by the Minister of Northern Affairs on November 22, 2024 (NWB, 2024).

In accordance with Terms and Conditions (T&C) 22, 23, and 31 of the NIRB Project Certificate, Agnico Eagle has developed a waste rock and quarry monitoring plan to characterize the metal leaching and acid rock drainage (ML/ARD) potential of excavated materials on-site.

As per Schedule B, Item 9 of the Licence, this report provides the ML/ARD characterization results of all samples collected in 2025 for geochemical analysis, including waste rock from the underground and open pit development areas, and filtered tailings from the Process Plant.

1.1. Background

The Mine is situated in an Archaean Greenstone belt with the gold being hosted within mafic and ultramafic igneous rocks, iron formations, and fine-grained sedimentary rocks (siltstones and mudstones). Six separate mineralized zones will be mined by open pit, with the Tiriganiaq deposit also mined by underground methods. The current mine plan has mining completed by 2032. The completed mine footprint will have five Waste Rock Storage Facilities (WRSFs) (WRSF 1, 3, 6, 7 and 9). The Mine Waste Management Plan presents as-built and expected waste rock placement and usage on site per major location.

The Water Licence requirements guiding geochemical monitoring at the Meliadine Mine are listed in the table below. Monitoring practices are detailed within the Meliadine Mine Waste Management Plan and ARD-ML Sampling and Testing Plan.

Table 1-1: Meliadine regulatory requirements for geochemistry

Document	Section/Term and Condition	Description
Nunavut Water Board Water Licence No: 2AM-MEL1631	PART D, Item 7	7. The Licensee shall use Waste Rock and fill material for construction, including the construction of any infrastructure, only from approved sources that have been demonstrated by appropriate geochemical analyses to not produce Acid Rock Drainage and to be Non-Metal Leaching, and free of contaminants.
NIRB Project Certificate No.: 006	T&C 22	The Proponent shall report annually to the NIRB on the adaptations it has made to the Mine Waste Management Plan and practices based on results obtained through monitoring.

NIRB Project Certificate No.: 006	T&C 23	Prior to the commencement of excavation at the Discovery deposit, the Proponent, in consultation with Natural Resources Canada, shall update its Mine Waste Management Plan to assess the potential for acid rock drainage and to identify any monitoring and mitigation measures that may be required in this development area.
NIRB Project Certificate No.: 006	T&C 31	The Proponent shall maintain an appropriate setback distance between project quarries and fish-bearing or permanent water bodies as required to prevent acid rock drainage or metal leaching into such water bodies.

The Mine's geological setting and baseline geochemical study are included in the Final Environmental Impact Statement (FEIS) for the Meliadine Gold Mine (Golder, 2014) with further refinement in the Geochemical Characterization and Source Term Report (Lorax, 2022). The baseline geochemical study found that there was a low potential for ARD generation in the waste rock of the Tiriganiaq deposit and a higher ML/ARD potential for ore and tailings. Arsenic was identified as the principal metal leaching constituent of concern due to the presence of elevated arsenic concentrations, occurrence of arsenopyrite, and because arsenic can be mobile under the neutral pH conditions which are likely to prevail at Meliadine due to the low prevalence of PAG rock (the exception being the Discovery Zone) (Golder 2014).

As baseline studies established that specific geochemical management criteria (i.e., segregation of waste rock by ML or ARD potential) were not required for the operation, the objective of the characterization program outlined within the Mine Waste Management Plan is to confirm the findings from the baseline studies and ensure that the current management practices are protective of the receiving environment. Results from this program are used to inventory the geochemical characteristics of the mined materials.

Construction Rock Sampling	Nunavut Water Board | Water Licence No: 2AM-MEL1631 Part D, Item 7	Confirm that material with potential for ARD or ML was not used in construction.	New Infrastructure	ABA and multi-element content following aqua regia digestion	ABA and multi-element content following aqua regia digestion	1 grab sample per 12,500 tonnes placed or 1 sample per 12,500 tonnes removed from quarry/borrow pit	36	100%

Note: ABA includes paste pH, total sulphur, sulphate sulphur, total carbon, carbonate, and Modified Sobek NP

SECTION 3 • SAMPLING

3.3. Underground Waste Rock

In 2025, a total of 76 ML/ARD unique samples were collected from waste rock that was mined as part of underground development activities. The location of the rock samples can be seen in the isometric view of the Mine in Figure 2. The samples were taken throughout the underground mine from levels 125 to 625 from both Tiriganiaq and Wesmeg deposits.

Sampling occurred in transverse headings between ore lenses in barren host rock. The samples mainly consisted of sedimentary and volcanoclastic rocks, with minor barren iron formations. Sample collection from blasted muck piles was performed by the Underground Geology team as follows:

- Monthly sampling recovered 6 samples plus one duplicate for a total of at least 7 samples per month.
- The choice of the sample location has been selected by:
    - Choosing 3 from each of the top three priority waste headings for the month (i.e., one from each heading); and
    - 3 additional samples from the other most active headings each month.
- One laboratory duplicate was designated from the 5 samples outside of the field duplicate and its parent.

Each sample was approximately 1 kg and generally representative of the lithology being sampled.

3.3. Open Pit Waste Rock

In 2025, a total of 378 ML/ARD unique samples were collected in the TIR01 pit, sampling locations are visualized in Figures 3 and 4. For PUM01 and PUM02, a total of 103 ML/ARD samples were collected. Sampling locations are visualized for PUM01 in Figures 5 and 6 and for PUM02 in figures 7 and 8

Samples are collected from the reverse circulation drill cuttings of production blast holes that were 5 to 10m in length. Sampling included the following:

- Samples are collected in waste intervals across all lithologies;
- 1 sample is collected per 12,500 tonnes of blasted material;
- 1 duplicate is taken per 100,000 tonnes of blasted material; and
- 1 laboratory duplicate taken for every 12,500 tonnes of blasted material.

The samples from Tiriganiaq were collected from the following formations:

- 230 samples from the SAM Formation (Kwa-s);
- 55 samples from the Upper Oxide Formation (Ksc-wa / UO); and
- 92 samples from the Wesmeg Formation (MV).

For the Pump pits, the samples were collected from the following formations:

- 46 samples from overburden (OVB); and
- 57 samples from the Wesmeg Formation (MV).

Each sample collected was approximately 1 kg and generally representative of the lithology being sampled.

3.3. Filtered Tailings

In 2025, 49 ML/ARD samples were collected from filtered tailings generated from underground and open pit ore processing. Samples of approximately 1 kg were collected regularly throughout the year, except during periods when the process plant was shut down. Sampling included the following:

- 24 grab samples collected at the mill immediately downstream of the filter press at an approximate two-week frequency;
- 24 composite samples, each representing a two-week period and consisting of daily 200 g tailings aliquots collected after the filter press;
- 4 field duplicates were taken throughout the year; and
- 6 laboratory duplicate samples were taken throughout the year.

SECTION 4 • LABORATORY TESTING

All ML/ARD samples collected were shipped to SGS Laboratories Lakefield, Ontario, an accredited laboratory with specialization in ML/ARD. Analyses conducted on all samples included:

- Acid-base accounting (ABA)
  - Paste pH
  - Total sulphur (LECO)
  - Sulphate sulphur (HCl leach)
  - Total carbon (LECO)
  - Carbonate (CO3) by the difference of total carbon and total carbon analysis of the residue remaining following an HCl leach
  - Neutralization potential (modified Sobek)
- Elemental analysis by aqua regia digestion and ICP-MS finish.

Tailings samples were also analyzed for weak-acid dissociable (WAD) cyanide, total cyanide, and free cyanide.

Following an investigation in 2021, SGS Lakefield changed the analytical method used to assess carbonate content from a pyrolysis technique to hydrochloric acid leach (ASTM E1915, MEND 2009) after it was revealed the former method resulted in a biased low carbonate content. As such, an assessment of carbonate content by hydrochloric acid leach was used on all samples analyzed from 2022 forward. Details of the investigation and outcome can be found in the 2021 Metal Leaching and Acid Rock Drainage Monitoring Report submitted as Appendix 10 of the 2021 Annual Report.

4.1. Quality Assurance/Quality Control

Internal laboratory quality assurance and quality control (QA/QC) testing was carried out at SGS Laboratories, which involved analysis of duplicates, blanks, and certified reference materials. Any laboratory duplicate results that did not adhere to the required precision specifications would trigger a re-analysis.

Field duplicates were collected in 2025 as part of the internal quality control procedures. Duplicate samples are collected simultaneously in the field at the same sampling location and using identical sampling procedures as the parent samples. Duplicates are used to assess sampling variability and the reproducibility of the laboratory analyses. In 2025:

- 13 duplicates of underground waste rock were collected from a total of 76 samples, representing 17.1% of samples taken;
- 84 duplicates of open pit waste rock were collected from a total of 481 samples, representing 17.4% of samples taken;
- 4 duplicates were taken for the operational filtered tailings from a total of 49 samples,

representing 8.2% of samples taken.

Overall, collected and analyzed duplicate samples represent 16.7% of the samples collected throughout 2025 for geochemical monitoring (605 samples in total).

In 2025, one laboratory duplicate was requested from each shipment sent to SGS Laboratories for both open pit and underground sampling and periodically requested for tailings because of the low volume of material sampled. This practice allows the direct comparison of results from the same sample tested twice to confirm that the laboratory results were within an acceptable margin of error. In 2025:

- 11 laboratory duplicates were analyzed from a total of 76 samples representing 14.5% of Underground samples taken;
- 64 laboratory duplicates were analyzed from a total of 605 samples representing 10.6% of Open Pit samples taken .
- 5 laboratory duplicates were analyzed from a total of 49 samples representing 10.2% of Underground samples taken

Overall the laboratory duplicate samples represent 13.2% of the samples collected as part of the 2025 geochemical monitoring.

A summary of QA/QC results is summarized in Table 4-1. Based on the results of the data quality review, the data were considered acceptable.

SECTION 5 • RESULTS AND DISCUSSION

ARD Calculations Methodology

Based on Agnico Eagle's Geochemical Characterization Guide (2021), results of Modified Sobek NP should be compared with NP calculated from carbonate, and subsequently the more conservative method used to represent Neutralization Potential (NP) in NPR calculation and ARD assessment.

Following the results of the study in 2021 discussed in the previous section, from 2022 onward, NP quantified from the Modified Sobek titration method (NP-mod) was used as the measure of NP for all samples. It should be noted that prior to 2021, NP-Ca was used since it was the more conservative parameter at the time of interpretation. The change to NP-mod in 2021 compared with previous years is attributed to carbonate content which was biased low in laboratory analyses conducted prior to April 2021 with the pyrolysis method, as discussed in Section 4.

Acid Potential (AP) was calculated based on the amount of sulphide sulphur, calculated by difference of total sulphur and sulphate sulphur, as per Agnico Eagle's Geochemical Characterization Guide (2021). As stated in Agnico Eagle's 2020 Metal Leaching and Acid Rock Drainage Monitoring Report, project prediction studies indicated that the main sulphide minerals in the waste rock was pyrite, but also with arsenopyrite and lesser pyrrhotite, and chalcopyrite (Golder 2014). Sulphate minerals are rare in waste rock and ore, but introduced in the mill as a byproduct of SO_2 air destruction of WAD-CN species, resulting in formation of non-acid generating sulphate precipitates in tailings (i.e., Gypsum) (Lorax, 2022). As a result, the main consideration for AP is the presence of sulphide minerals at Meliadine.

The potential for ARD was assessed using NP/AP ratios (or neutralization potential ratios, NPR). Ratios below 1 were used to indicate potential for ARD (PAG or Potentially Acid Generating), whereas ratios above 2 indicate low potential for ARD (non-PAG). Ratios between 1 and 2 are considered *Uncertain*, meaning that there is an uncertain chance that the samples in question have the potential to produce ARD.

Notes: P stands for percentile (e.g. P5 equals 5th percentile); NP-mod stands for NP by Modified Sobek titration method; NP-Ca stands for NP by carbonate content by TIC.

ARD classification for 2025 samples is presented in Figure 9. As predicted by Golder (2014) and further refined by Lorax (2022), the majority of the operational waste rock samples collected to date are non-PAG. One of the 2025 samples falls within the Uncertain classification. This samples represents a total of 432 tonnes which was part of the 494,849 tonnes kept underground for the backfilling of stopes.

This sample is considered a low risk given the excess neutralization in all other samples collected and its deposition location.

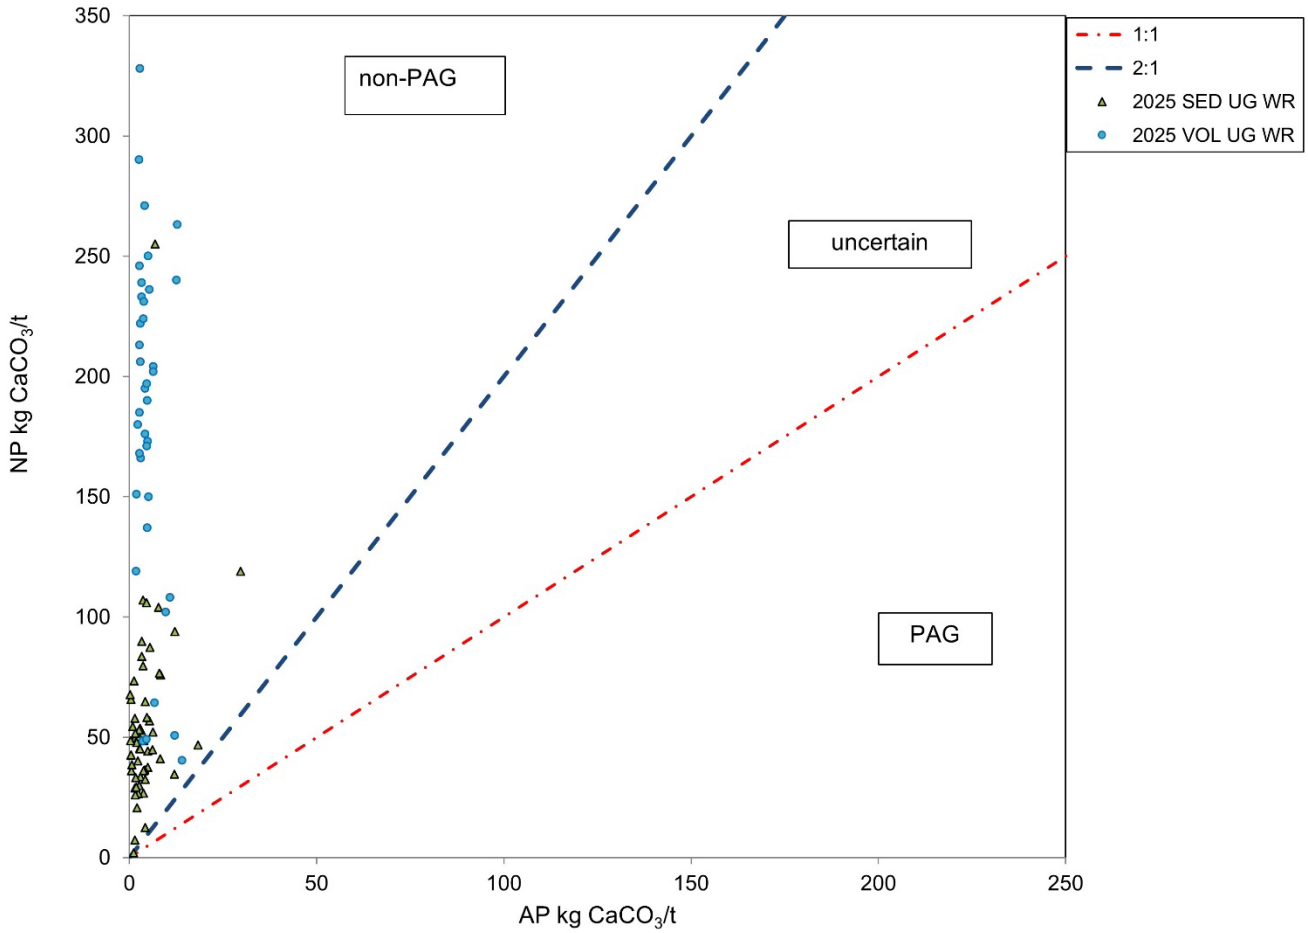

Figure 9: ARD classification for 2025 Underground waste rock samples

Note: SED is for sedimentary, VOL is for mafic volcanic.

5.1.2. Metal Leaching

Metal leaching was predicted by Golder (2014), and further confirmed by Lorax (2022), to be low enough that management of waste rock to inhibit leaching was not required. However, based on project screening studies, arsenic was determined to be the main element of interest and analysis of this element (and all regulated elements) were part of operational monitoring since mining began. A statistical summary for arsenic is provided in Table 5-1, with complete element composition results provided in Appendix A.

To ensure arsenic concentrations are within project predictions, results have been compiled and compared against average and maximum arsenic concentrations reported by Golder (2014). As shown in Figure 10, solid phase arsenic concentrations for samples collected between 2017 and 2025 mainly fall within the average concentration, with only five samples in the past eight years exceeding the maximum concentration predicted by Golder (2014).

Classification of TIR01 waste rock samples is provided in Figure 11. Three samples collected in 2025 had an NPR below 1 (PAG), five samples had an NPR between 1 and 2 (uncertain) and all remaining samples in 2025 yielded NPRs greater than 2 (non-PAG).

Classification of PUM01 and PUM02 waste rock samples is provided in Figure 8. One sample collected in 2025 had an NPR below 1 (PAG), two samples had an NPR between 1 and 2 (uncertain) and all remaining samples in 2025 yielded NPRs greater than 2 (non-PAG).

Through investigation of the PAG results, it has been determined that they are associated with rock samples collected in proximity to ore bearing material. All eight of the sample results that returned as

PAG were from blast patterns that were designated as ore patterns. As such, the material hauled from these patterns either went to be milled or was sent to WRSF3 or WRSF6 for placement, depending on how far from the ore zone the material was.

There was a blast from TIR01 that had one sample return a result of Uncertain. Some of the blast material used for Channel 11 for construction. It is estimated that 3% of the blast, or 190 tonnes of material, was placed in the construction of the channel with the rest going to WRSF3 for disposal. It is important to note that the classification is based on drill hole sampling and the material associated with each drill hole is approximately 400 tonnes, meaning that the total volume moved from a blast is not necessarily all classified as Uncertain, only a portion of it.

Overall, the PAG or uncertain samples represent 2.3% of the total open pit waste rock samples collected. These results are consistent with baseline geochemical characterization programs (Golder, 2016; Lorax, 2022), and confirm the low risk for ARD for Tiriganiaq and Pump Open Pit waste rock given the excess neutralization potential in the other samples collected in 2025.

5.2.2. Metal Leaching

Metal leaching was predicted by Golder (2014), and confirmed by Lorax (2022), to be low enough that management of waste rock to inhibit leaching was not required. However, based on project screening studies, arsenic was determined to be the main element of interest and analysis of this element (and all regulated elements) were part of operational monitoring since mining began. A statistical summary for arsenic is provided in Table 5-2 and 5-3, with complete element composition results provided in Appendix B.

To ensure arsenic concentrations are within project predictions, results have been compiled and compared against average and maximum arsenic concentrations reported by Golder (2014). As shown in Figure 13 for Tirganaiq and Figure 14 for the Pump pits, solid phase arsenic concentrations mainly fall within or near the average concentration, with nine samples between 2021 and 2025 exceeding the maximum concentration predicted by Golder (2014).

5.3. Filtered Tailings

5.3.1. ARD Potential

2025 filtered tailings samples ABA laboratory results are provided in Appendix C with summary statistics provided in Table 5-3. The higher sulphur content in the filtered tailings compared to the waste rock is a result of the sulphides associated with gold in ore.

ARD classification for 2025 samples is provided in Figure 15. Samples collected in 2025 had an average NPR of 2.3, and no samples had an NPR below 1. Most tailings samples fall within the non-PAG category for 2025, as seen in Figure 15.

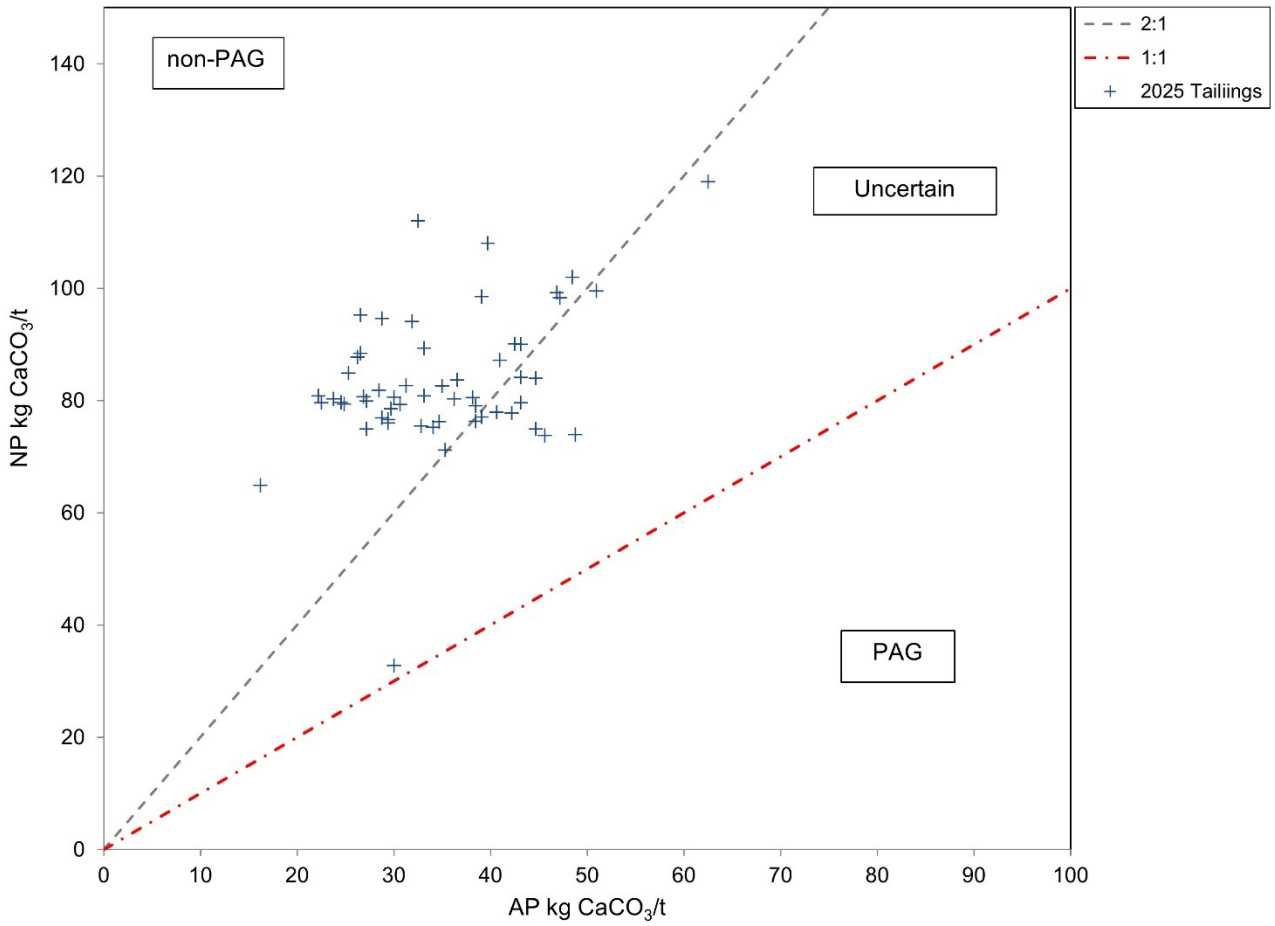

Figure 15: ARD classification of 2025 Operational filtered tailings samples

Project prediction studies found that there was higher ML/ARD potential for ore and tailings compared to waste rock. However, tailings are still expected to be largely non-PAG, and the FEIS estimated an NPR of 2.7 for the tailings using NP-mod. The FEIS assessment was completed using an NPR cutoff of 1.2 to define ARD potential in tailings (e.g., NPR > 1.2 classified as non-PAG), based on the INAC (2009) guidelines. This guideline has since been revised to more conservative non-PAG NPR cutoff of 2, as recommended by MEND (2009). Given that tailings samples often have an NPR between 1.2 and 2, this update resulted in a significant portion of tailings being reclassified from non-PAG to 'Uncertain'.

Filtered tailings NPR values using NP-mod over time are presented in Figure 16. In 2025 a majority of tailings were classified as non-PAG (NPR 2.3), representing a decrease in the ARD potential relative to tailings produced in 2024 (NPR of 1.9).

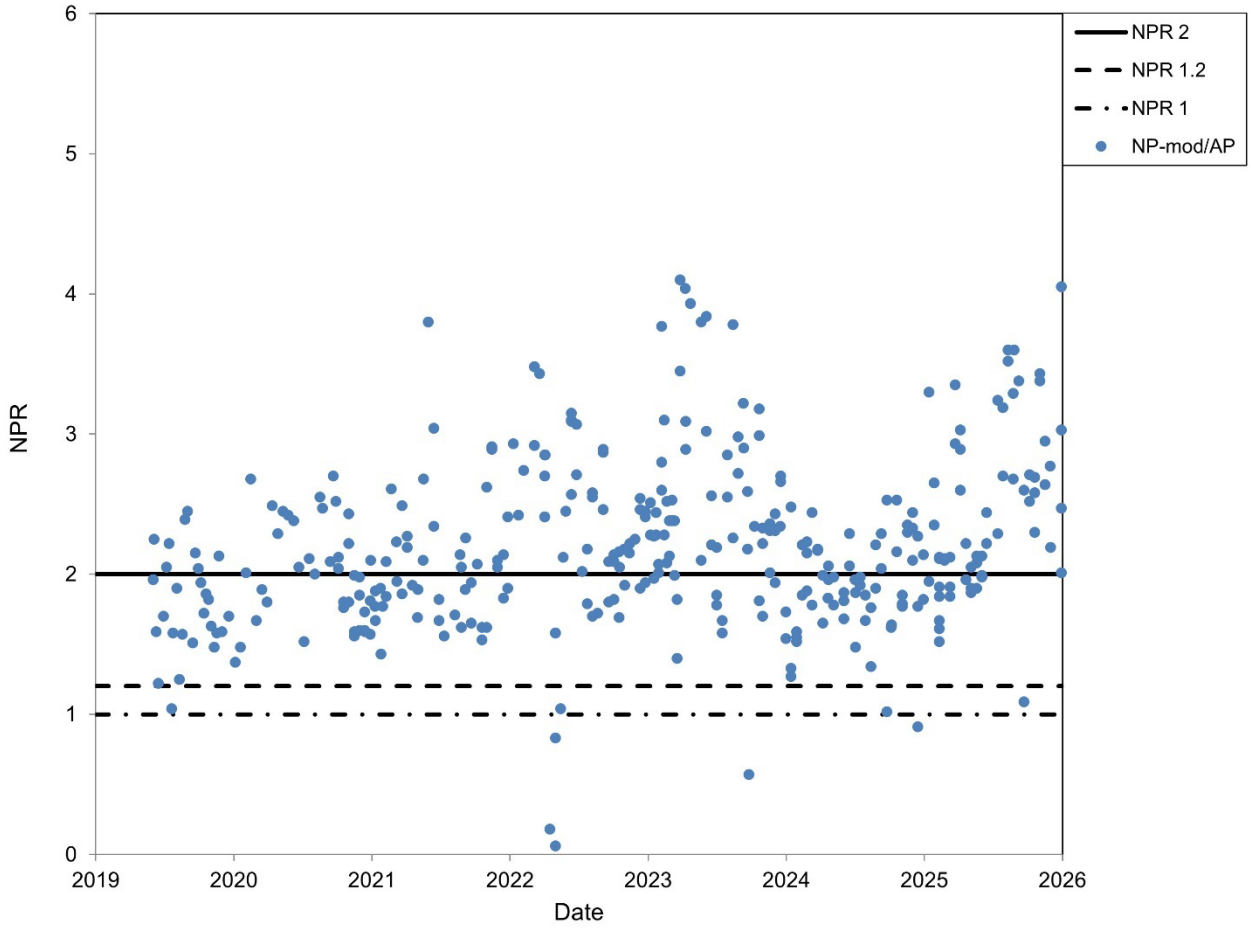

Figure 16: NPR versus time for Operational filtered tailings samples

Despite the presence of tailings samples classified as PAG and uncertain from 2019 to 2025 sampling based on MEND (2009) NPR guidelines, Agnico Eagle does not consider the tailings to pose an ARD risk for the site, for the following reasons:

- Tailings are being stored in a facility that will re-develop permafrost and inhibit water movement post-operations;
- Placement of the tailings includes compacting by a vibrator packer and sloping to shed water off the facility, which will lower oxygen diffusion into the tailings and limit water contact, both established mechanisms to reduce ARD;
- There is enough carbonate in the tailings that ARD may never occur as the actual ratio that ARD onset is expected is much closer to 1.0;
- If ARD could develop, permafrost freeze back is expected to occur well before the onset of ARD due to the amount of carbonate in the tailings and arctic climate slowing reaction rates. The late potential onset of acidic conditions is based on the slow oxidation rate of sulphides, and therefore slow rate of neutralization consumption of carbonates and if slow enough,

silicate neutralization. While tailings may be classified as uncertain, they are expected to contain enough carbonate to neutralize the acidity produced until freeze back occurs. Furthermore, the SGS Lakefield laboratory completed an investigation showing that past carbonate analyses were biased low (Section 3), meaning that there is more carbonate than previously shown, which would only extend the delay to consumption of carbonate; and

- Progressive reclamation is a part of the facility management for closure, meaning a cover will be placed over most of the tailings before the mine ceases operations. The cover, consisting of waste rock and till, will eventually encapsulate the entire tailings facility in closure. The cover is designed to promote permafrost aggradation and minimize tailings contact water, mitigating the long term ML/ARD potential of tailings stored in the dry stack facility

5.3.2. Metal Leaching

A statistical summary for arsenic is provided in Table 5-4, with complete element composition results provided in Appendix C. Given the presence of arsenic in the ore rock and background concentrations in the area, results for this element are summarized below and presented in Figure 17.

Arsenic concentrations in filtered tailings samples ranged from a minimum of 2700 mg/kg to a maximum of 11,000 mg/kg, with a median of 7,600 mg/kg in 2025. These values are higher when compared to waste rock since ore is associated with increased abundances of sulphides, including arsenopyrite.

Forecasted arsenic concentrations in surface contact water across life of mine are provided in the water balance and water quality model (WBWQM) as part of the Annual Report.

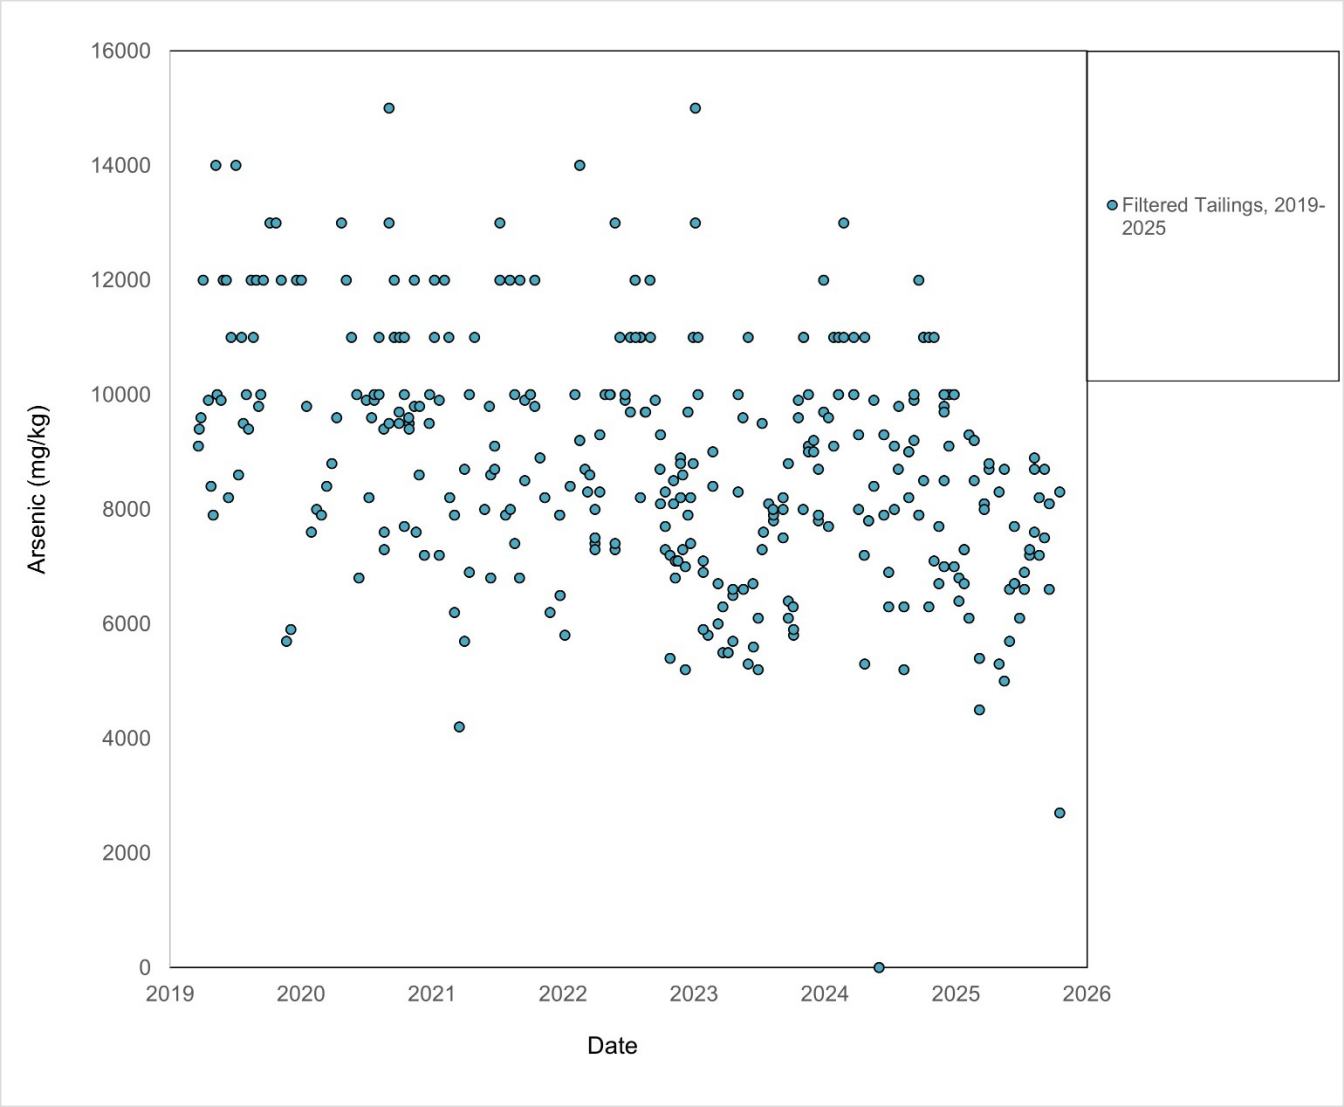

Figure 17: Solid phase Arsenic results from 2019-2025 Operational tailings samples

5.4. Construction Rock Sampling

The Mine uses open pit waste rock for construction projects such as berms, channels, roads and pads. Though the material has been sampled in the pit before use for construction, as due diligence, a post-construction sampling program was conducted in 2025 to confirm that the rock used for construction is classified as non-PAG. Nine construction projects completed in 2025 were sampled as part of this program.

A sampling methodology was created where a grab sample of rocks 1 to 5 cm in size would be collected for every 12,500 tonnes placed. Each sample weighed between 1 kg and 2 kg. Samples were collected on average 80m apart, depending on the quantity of material used for construction. Some samples will be closer and some further apart as seen in Figure 18.

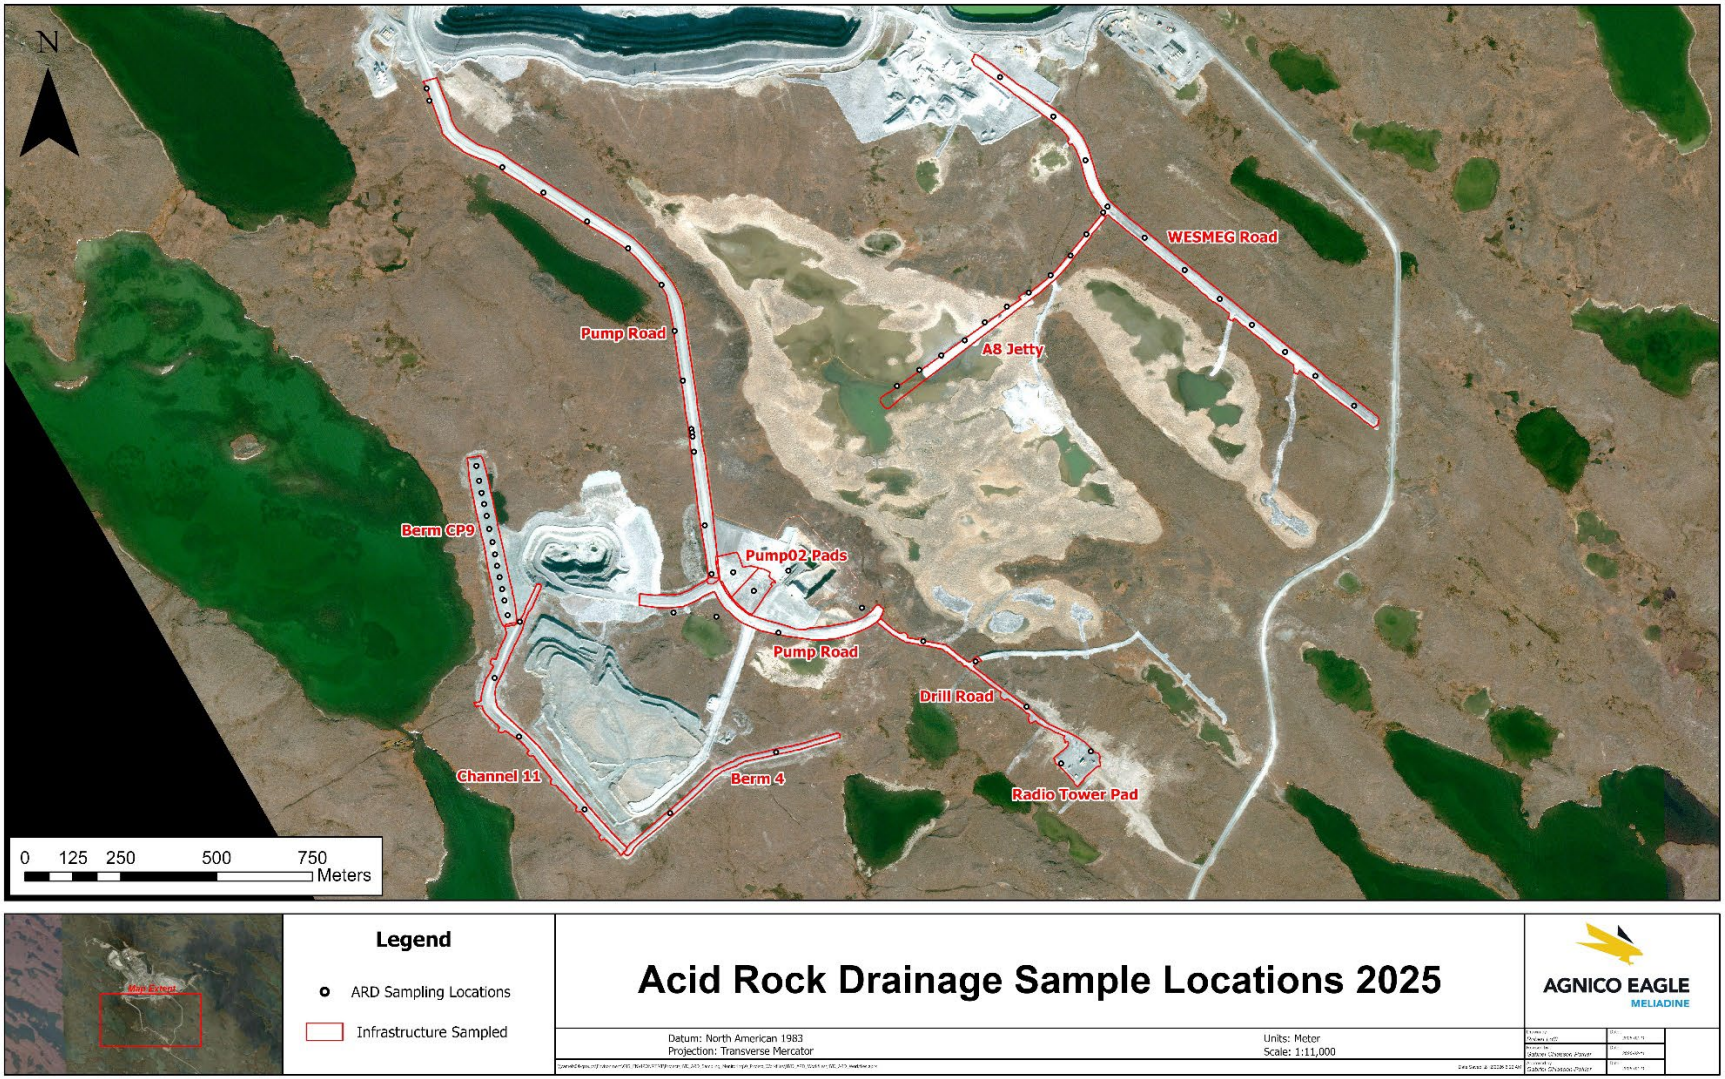

Figure 18: Construction sampling locations for 2025

Figure 19 below shows the ARD classification of the 2025 construction rock sampling program. The material used for these projects is classified predominately as non-PAG. There was four samples from the constructed infrastructure that returned a result of Uncertain, which will be followed up on in 2026. A sampling strategy similar to the one used on Pump Road will be used to resample the locations and confirm if the material is Uncertain/PAG.

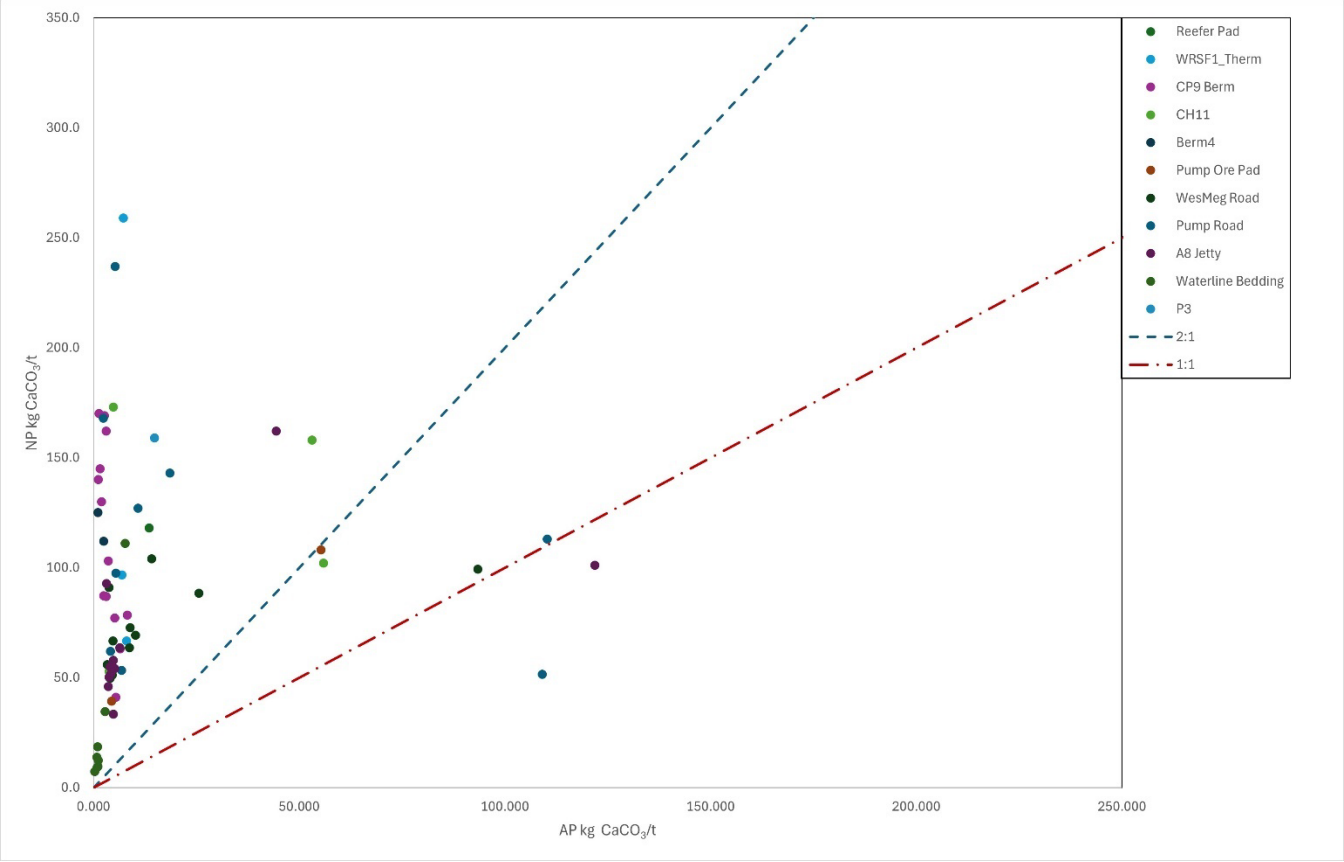

Figure 19: ARD classification of 2025 Construction Projects samples

Figure 12 also shows the sample results for the material from borrow pits used for the waterline construction in 2025; samples denoted as Waterline Bedding. There were eight grab samples collected from borrow pit material in 2025 and all samples were non-PAG.

In follow up to the Uncertain result from Pump Road collected last year, a sampling methodology created to sample tightly, every ten meters around the original PAG sample, and then step out to a larger spacing as distance increased from the center. In total, eight confirmatory samples were taken with two returning at Uncertain or PAG. It has been found that there is a section of approximately 20m of between 1+170m and 1+190m that contains PAG material. This material will be removed during closure and likely before the onset of any acid generation form the rock.

SECTION 6 • CONCLUSION

Based on geochemical characterization results obtained to date for the waste rock samples from underground/open pit development areas, the risk for ARD from the excavated materials is considered low. Both ABA and trace element results are within the prediction studies for the project.

One sample from the underground mine had an NPR between 1 and 2, indicating Uncertain ARD potential. This is consistent with the expectation for a small proportion of PAG rock to be mined from the Tiriganiaq deposit (Open Pit and Underground). Despite this classification, these samples do not represent a risk due to the small proportion of PAG rock and excess neutralization potential of the remaining underground waste rock samples collected in 2025. Arsenic concentrations in underground waste rock samples in 2025 were at the levels predicted by Golder (2014) aside from two samples that were over the maximum prediction.

Four samples from the open pits had an NPR below 1, and ten samples with an NPR between 1 and 2. However, these samples do not represent a significant risk due to expected blending with the excess neutralization potential of the remaining open pit waste rock samples collected in 2025. Arsenic concentrations in open pit waste rock samples in 2025 were slightly higher on average than the Golder (2014) average prediction, with seven samples above the maximum prediction.

The filtered tailings results show a higher potential for ML/ARD compared to waste rock, consistent with baseline studies. However, the risk for ARD remains low due to the management systems in place and closure approach developed for the TSF The management of the tailings in a compacted and frozen facility will ensure that the potential of these tailings to produce ARD is inhibited. The progressive covering of the tailings during operations is designed to mitigate the long term ML/ARD potential of tailings by limiting oxygen availability, and minimizing the potential for dry stack facility runoff to interact with tailings.

It is anticipated that the tailings ARD potential will fluctuate from year to year depending on the grade of ore processed. However, it is expected that the ARD potential will remain close to the predicted baseline (Golder 2014).

The construction material sourced from the open pits this year was predominantly non-PAG with only four Uncertain/PAG samples. These sample locations will be resampled and further samples will be taken in a step out pattern from that location to confirm the Uncertain/PAG result and delineate the extent of Uncertain/PAG rock. As expected, samples from the borrow pit material used for the waterline construction in 2025 has returned results of non-PAG.

In conclusion, based on the 2025 monitoring results for ML/ARD characterization, areas around PAG results in the infrastructure will be resampled and results analyzed to determine if remediation will be required before or during closure. All other results are in line with the predictions from the project baseline studies (Golder 2014). Geochemical monitoring for operational waste rock, tailings, and other excavated or construction material will continue in 2026 and results will be reviewed internally as they become available to ensure there is no risk to the receiving environment.

Accreditation Descriptions

CALA:
SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation found at https://directory.cala.ca/#. Analytes and SGS Method Codes marked with a “Y” in the “CALA” column in the table denote ISO/IEC17025 accreditation

PALA:
SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025:2005 for specific tests as listed on their scope of accreditation found at https://www.ceaeq.gouv.qc.ca/documents/publications/listes.htm#labo_accr. Analytes and SGS Method Codes marked with a “Y” in the “PALA” column in the table denote ISO/IEC17025:2005 accreditation

Accreditation Descriptions

CALA:
SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation found at https://directory.cala.ca/#. Analytes and SGS Method Codes marked with a “Y” in the “CALA” column in the table denote ISO/IEC17025 accreditation

PALA:
SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025:2005 for specific tests as listed on their scope of accreditation found at https://www.ceaeq.gouv.qc.ca/documents/publications/listes.htm#labo_accr. Analytes and SGS Method Codes marked with a “Y” in the “PALA” column in the table denote ISO/IEC17025:2005 accreditation

Accreditation Descriptions

PALA:
SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025:2005 for specific tests as listed on their scope of accreditation found at https://www.ceaeq.gouv.qc.ca/documents/publications/listes.htm#labo_accr. Analytes and SGS Method Codes marked with a “Y” in the “PALA” column in the table denote ISO/IEC17025:2005 accreditation

*NP (Neutralization Potential)

$$= \frac{50 \times (N \text{ of HCL} \times \text{Total HCL added} - N \text{ NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.04 will be calculated using a 0.04 value.

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.04 will be calculated using a 0.04 value.

Accreditation Descriptions

CALA:

SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation found at https://directory.cala.ca/#. Analytes and SGS Method Codes marked with a “Y” in the “CALA” column in the table denote ISO/IEC17025 accreditation

PALA:

SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025:2005 for specific tests as listed on their scope of accreditation found at https://www.ceaeq.gouv.qc.ca/documents/publications/listes.htm#labo_accr. Analytes and SGS Method Codes marked with a “Y” in the “PALA” column in the table denote ISO/IEC17025:2005 accreditation

Accreditation Descriptions

CALA:
SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation found at https://directory.cala.ca/#. Analytes and SGS Method Codes marked with a “Y” in the “CALA” column in the table denote ISO/IEC17025 accreditation

PALA:
SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025:2005 for specific tests as listed on their scope of accreditation found at https://www.ceaeq.gouv.qc.ca/documents/publications/listes.htm#labo_accr. Analytes and SGS Method Codes marked with a “Y” in the “PALA” column in the table denote ISO/IEC17025:2005 accreditation

Accreditation Descriptions

CALA:
SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation found at https://directory.cala.ca/#. Analytes and SGS Method Codes marked with a “Y” in the “CALA” column in the table denote ISO/IEC17025 accreditation

PALA:
SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025:2005 for specific tests as listed on their scope of accreditation found at https://www.ceaeq.gouv.qc.ca/documents/publications/listes.htm#labo_accr. Analytes and SGS Method Codes marked with a “Y” in the “PALA” column in the table denote ISO/IEC17025:2005 accreditation

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.04 will be calculated using a 0.04 value.

ABA - Modified Sobek

*NP (Neutralization Potential)
 = 50 x (N of HCL x Total HCL added - N NaOH x NaOH added)

                        Weight of Sample

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.04 will be calculated using a 0.04 value.

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.04 will be calculated using a 0.04 value.

Project : PO#OL-1504866
LR Report : **CA19770-APR25**

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.04 will be calculated using a 0.04 value.

*NP (Neutralization Potential)

$$= \frac{50 \times (N \text{ of HCL} \times \text{Total HCL added} - N\ NaOH \times NaOH \text{ added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.04 will be calculated using a 0.04 value.

Accreditation Descriptions

CALA:

SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation found at https://directory.cala.ca/#. Analytes and SGS Method Codes marked with a “Y” in the “CALA” column in the table denote ISO/IEC17025 accreditation

PALA:

SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025:2005 for specific tests as listed on their scope of accreditation found at https://www.ceaeq.gouv.qc.ca/documents/publications/listes.htm#labo_accr. Analytes and SGS Method Codes marked with a “Y” in the “PALA” column in the table denote ISO/IEC17025:2005 accreditation

*NP (Neutralization Potential)

$$= \frac{50 \times (N \text{ of HCL} \times \text{Total HCL added} - N \text{ NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.04 will be calculated using a 0.04 value.

*NP (Neutralization Potential)

$$= \frac{50 \times (\text{N of HCL} \times \text{Total HCL added} - \text{N NaOH} \times \text{NaOH added})}{\text{Weight of Sample}}$$

*AP (Acid Potential) = % Sulphide Sulphur x 31.25
*Net NP (Net Neutralization Potential) = NP-AP
NP/AP Ratio = NP/AP
*Results expressed as tonnes CaCO3 equivalent/1000 tonnes of material
Samples with a % Sulphide value of <0.04 will be calculated using a 0.04 value.

Accreditation Descriptions

CALA:

SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation found at https://directory.cala.ca/#. Analytes and SGS Method Codes marked with a “Y” in the “CALA” column in the table denote ISO/IEC17025 accreditation

PALA:

SGS Canada Industries & Environment conforms to the requirements of ISO/IEC 17025:2005 for specific tests as listed on their scope of accreditation found at https://www.ceaeq.gouv.qc.ca/documents/publications/listes.htm#labo_accr. Analytes and SGS Method Codes marked with a “Y” in the “PALA” column in the table denote ISO/IEC17025:2005 accreditation
