1.6 Gauge fills. – Once it has been determined that a liquid filled gauge is in order, the next step is selecting the type of fill. **Glycerin** satisfies most applications. While being the least expensive fill, its usable temperature range is 20/180°F. **Silicone** filled gauges have a broader service range: –40/250°F. Oxidizing media require the use of **Halocarbon,** with a service range of –40/250°F. Pointer motion will be slowed at the low end of the low end of these temperature ranges.

1.7 Mounting – Users should predetermine how the gauge will be mounted in service: stem (pipe), wall (surface) or panel (flush). Ashcroft wall or panel mounting kits should be ordered with the gauge. See Section 3.

2.0 TEMPERATURE

2.1 Ambient Temperature – To ensure long life and accuracy, pressure gauges should preferably be used at an ambient temperature between –20 and +150°F (–30 to +65°C). At very low temperatures, standard gauges may exhibit slow pointer response. Above 150°F, the accuracy will be affected by approximately 1.5% per 100°F. Other than discoloration of the dial and hardening of the gasketing and degradation of accuracy, non-liquid filled Type 1279 (phenolic case) and 1379 (aluminum case) Duragauge® gauge, with standard glass windows, can withstand continuous operating temperatures up to 250°F. Unigauge models 2½˝ and 3½˝ 1009 and 1008S liquid filled gauges can withstand 200°F but glycerin fill and the acrylic window of Duragauge® gauges will tend to yellow. Silicone fill will have much less tendency to yellow. Low pressure, liquid filled Types 1008 and 1009 gauges may have some downscale errors caused by liquid fill expansion. This can be alleviated by venting the gauge at the top plug (pullout the blue plug insert). To do this the gauge must be installed in the vertical position.

Although the gauge may be destroyed and calibration lost, gauges can withstand short times at the following temperatures: gauges with all welded pressure boundary joints, 750°F (400°C); gauges with silver brazed joints, 450°F (232°C) and gauges with soft soldered joints, 250°F (121°C). For expected long term service below –20°F (–30°C) Duragauge® and 4½˝ 1009 gauges should be hermetically sealed and specially lubricated; add "H" to the product code for hermetic sealing. Add variation XVY for special lubricant. Standard Duralife® gauges may be used to –50°F (–45°C) without modification.

2.2 Accuracy – Heat and cold affect accuracy of indication. A general rule of thumb for **dry gauges** is 0.5% of full scale change for every 40°F change from 75°F. Double that allowance for gauges with hermetically sealed or liquid filled cases, except for Duragauge® gauges where no extra allowance is required due to the elastomeric, compensating back. Above 250°F there may exist very significant errors in indication.

2.3 Steam service – In order to prevent live steam from entering the Bourdon tube, a siphon filled with water should be installed between the gauge and the process line. Siphons can be supplied with ratings up to 4,000 psi. If freezing of the condensate in the loop of the siphon is a possibility, a diaphragm seal should be used to isolate the gauge from the process steam. Siphons should also be used whenever condensing, hot vapors (not just steam) are present. Super heated steam should have enough piping or capillary line ahead of the siphon to maintain liquid water in the siphon loop.

2.4 Hot or very cold media – A five foot capillary line assembly will bring most hot or cold process media within the recommended gauge ambient temperature range. For media above

750°F (400°C) the customers should use their own small diameter piping to avoid possible corrosion of the stainless steel. The five foot capillary will protect the gauges used on the common cryogenic (less than –300°F (200°C) gases, liquid argon, nitrogen, and oxygen.) The capillary and gauge must be cleaned for oxygen service. The media must not be corrosive to stainless steel, and must not plug the small bore of the capillary.

2.5 Diaphragm seals – A diaphragm seal should be used to protect gauges from corrosive media, or media that will plug the instrument. Diaphragm seals are offered in a wide variety of designs and corrosion resistant materials to accommodate almost any application and most connections. Visit www.ashcroft.com for details.

2.6 Autoclaving – Sanitary gauges with clamp type connections are frequently steam sterilized in an autoclave. Gauges equipped with polysulfone windows will withstand more autoclave cycles than those equipped with polycarbonate windows. Gauges equipped with plain glass or laminated safety glass **should not be autoclaved.** Gauge cases should be vented to atmosphere (removing the rubber fill/safety plug if necessary) **before** autoclaving to prevent the plastic window from cracking or excessively distorting. If the gauge is liquid filled, the fill should be drained from the case and the front ring loosened before autoclaving.

3.0 INSTALLATION

3.1 Location – Whenever possible, gauges should be located to minimize the effects of vibration, extreme ambient temperatures and moisture. Dry locations away from very high thermal sources (ovens, boilers etc.) are preferred. If the mechanical vibration level is extreme, the gauge should be remotely located (usually on a wall) and connected to the pressure source via flexible tubing.

3.2 Gauge reuse – ASME B40.100 recommends that gauges not be moved indiscriminately from one application to another. The cumulative number of pressure cycles on an in-service or previously used gauge is generally unknown, so it is generally safer to install a new gauge whenever and wherever possible. This will also minimize the possibility of a reaction with previous media.

3.3 Tightening of gauge – Torque should never be applied to the gauge case. Instead, an open end or adjustable wrench should always be used on the wrench flats of the gauge socket to tighten the gauge into the fitting or pipe. NPT threads require the use of a suitable thread sealant, such as pipe dope or teflon tape, and must be tightened very securely to ensure a leak tight seal.

CAUTION: Torque applied to a diaphragm seal or its attached gauge, that tends to loosen one relative to the other, can cause loss of fill and subsequent inaccurate readings. Always apply torque **only** to the wrench flats on the lower seal housing when installing filled, diaphragm seal assemblies or removing same from process lines.

3.4 Process isolation – A shut-off valve should be installed between the gauge and the process in order to be able to isolate the gauge for inspection or replacement without shutting down the process.

3.5 Surface mounting – Also known as wall mounting. Gauges should be kept free of piping strains. The gauge case mounting feet, if applicable, will ensure clearance between the pressure relieving back and the mounting surface.

3.6 Flush mounting – Also known as panel mounting. The applicable panel mounting cutout dimensions can be found at www.ashcroft.com

4.0 OPERATION

4.1 Frequency of inspection – This is quite subjective and depends upon the severity of the service and how critical the accuracy of the indicated pressure is. For example, a monthly inspection frequency may be in order for critical, severe service applications. Annual inspections, or even less frequent schedules, are often employed in non-critical applications.

4.2 In-service inspection – If the accuracy of the gauge cannot be checked in place, the user can at least look for (a) erratic or random pointer motion; (b) readings that are suspect – especially indications of pressure when the user believes the true pressure is 0 psig. Any gauge which is obviously not working or indicating erroneously, should be immediately valved-off or removed from service to avoid a possible pressure boundary failure.

4.3 When to check accuracy – Any suspicious behavior of the gauge pointer warrants that a full accuracy check be performed. Even if the gauge is not showing any symptoms of abnormal performance, the user may want to establish a frequency of bench type inspection.

4.4 When to recalibrate – This depends on the criticality of the application. If the accuracy of a 3-2-3% commercial type gauge is only 0.5% beyond specification, the user must decide whether it's worth the time and expense to bring the gauge back into specification. Conversely if the accuracy of a 0.25% test gauge is found to be 0.1% out of specification then the gauge should be recalibrated.

4.5 Other considerations – These include (a) bent or unattached pointers due to extreme pressure pulsation; (b) broken windows which should be replaced to keep dirt out of the internals; (c) leakage of gauge fill; (d) case damage – dents and/or cracks; (e) any signs of service media leakage through the gauge including its connection; (f) discoloration of gauge fill that impedes readability.

4.6 Spare parts – As a general rule it is recommended that the user maintain in inventory one complete Ashcroft® instrument for every ten (or fraction thereof) of that instrument type in service.

5.0 GAUGE REPLACEMENT

It is recommended that the user stock one complete Ashcroft® instrument for every ten (or fraction thereof) of that instrument type in service. With regard to gauges having a service history, consideration should be given to discarding rather than repairing them. Gauges in this category include the following:

a. Gauges that exhibit a span shift greater than 10%. It is possible the Bourdon tube has suffered thinning of its walls by corrosion.

b. Gauges that exhibit a zero shift greater than 25%. It is likely the Bourdon tube has seen significant overpressure leaving residual stresses that may be detrimental to the application.

c. Gauges which have accumulated over 1,000,000 pressure cycles with significant pointer excursion.

d. Gauges showing any signs of corrosion and/or leakage of the pressure system.

e. Gauges which have been exposed to high temperature or exhibit signs of having been exposed to high temperature – specifically 250°F or greater for soft soldered systems; 450°F or greater for brazed systems; and 750°F or greater for welded systems.

f. Gauges showing significant friction error and/or wear of the movement and linkage.

g. Gauges having damaged sockets, especially damaged threads.

h. Liquid filled gauges showing loss of case fill.

NOTE: ASME B40.100 does not recommend moving gauges from one application to another. This policy is prudent in that it encourages the user to procure a new gauge, properly tailored by specification, to each application that arises.

6.0 ACCURACY: PROCEDURES/DEFINITIONS

Accuracy inspection – Readings at approximately five points equally spaced over the dial should be taken, both upscale and downscale, before and after lightly rapping the gauge to remove friction. **A pressure standard with accuracy at least four times greater than the accuracy of the gauge being tested is recommended.**

Equipment – A finely regulated pressure supply will be required. It is critical that the piping system associated with the test setup be leaktight. The gauge under test should be positioned as it will be in service to eliminate positional errors due to gravity.

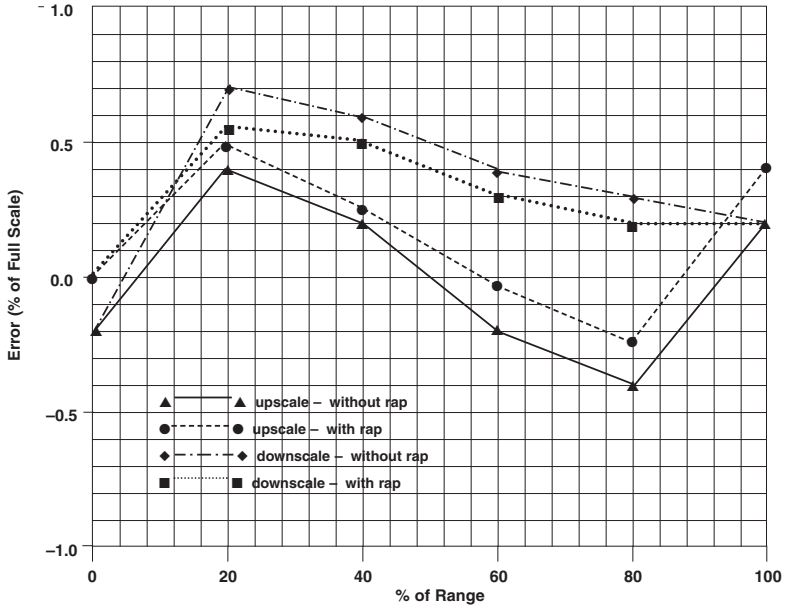
Method – ASME B40.100 recommends that **known** pressure (based on the reading from the pressure standard used) be applied to the gauge under test. Readings including any error from the nominal input pressure, are then taken from the gauge under test. The practice of aligning the pointer of the gauge under test with a dial graduation and then reading the error from the master gauge ("reverse reading") can result in inconsistent and misleading data and should NOT be used.

Calibration chart – After recording all of the readings it is necessary to calculate the errors associated with each test point using the following formula: ERROR in percent = 100 times (TRUE VALUE minus READING) ÷ RANGE. Plotting the individual errors (Figure 1) makes it possible to visualize the total gauge characteristic. The plot should contain all four curves: upscale – before rap; upscale – after rap; downscale – before rap; downscale – after rap. "*Rap*" means lightly tapping the gauge **before** reading to remove friction as described in ASME B40.100.

Referring to Figure 1, several classes of error may be seen:

Zero – An error which is approximately equal over the entire scale. This error can be manifested when either the gauge is

FIG. 1



TYPICAL CALIBRATION CHART

INDICATED VALUE (PSI)

True Value – PSI	Increasing – Without RAP	Increasing – With RAP	Decreasing – Without RAP	Decreasing – With RAP
0	–.4	0	–.4	0
40	+.8	+1.0	+1.4	+1.1
80	+.4	+.5	+1.2	+1.0
120	–.4	–1.0	+.8	+.6
160	–.8	–.5	+.6	+.4
200	+.4	+.8	+.4	+.4

ERROR (% OF FULL SCALE)

True Value – % of Range	Increasing – Without RAP	Increasing – With RAP	Decreasing – Without RAP	Decreasing – With RAP
0	–.20	0	–.20	0
20	+.40	+.50	+.70	+.55
40	+.20	+.25	+.60	+.50
60	–.20	–.05	+.40	+.30
80	–.40	–.25	+.30	+.20
100	+.20	+.40	+.20	+.20

dropped or overpressured and the Bourdon tube takes a permanent set. This error may often be corrected by simply repositioning the pointer. Except for test gauges, it is recommended that the pointer be set at midscale pressure to "split" the errors.

Span – A span error exists when the error at full scale pressure is different from the error at zero pressure. This error is often proportional to the applied pressure. Most Ashcroft gauges are equipped with an internal, adjusting mechanism with which the user can correct any span errors which have developed in service.

Linearity – A gauge that has been properly spanned can still be out of specification at intermediate points if the response of the gauge as seen in Figure 1 (Typical Calibration Chart) is not linear. The Ashcroft Duragauge® pressure gauge is equipped with a rotary movement feature which permits the user to minimize this class of error. Other Ashcroft gauge designs (e.g., 1009 Duralife®) require that the dial be moved left or right prior to tightening the dial screws.

Hysteresis – Some Bourdon tubes have a material property known as hysteresis. This material characteristic results in differences between the upscale and downscale curves. This class of error can **not** be eliminated by adjusting the gauge movement or dial position.

Friction – This error is defined as the difference in readings before and after lightly tapping the gauge case at a check point. Possible causes of friction are burrs or foreign material in the movement gearing, "bound" linkages between the movement and the bourdon tube, or an improperly tensioned hairspring. If correcting these potential causes of friction does not eliminate excessive friction error, the movement should be replaced.

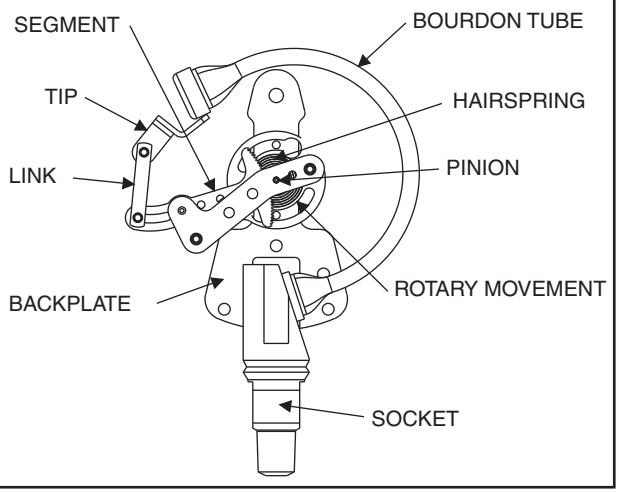
6.1 Calibration – Rotary Movement Gauges and Type 1259 Gauges – Inspect gauge for accuracy. Many times gauges are simply "off zero" and a simple pointer adjustment using the micrometer pointer is adequate. If inspection shows the gauge warrants recalibration to correct span and/or linearity errors, proceed as follows:

a. Remove ring, window and, if solid front case, the rear closure assembly.

b. Pressurize the gauge **once** to full scale and back to zero.

c. Refer to Figure 2 (Ashcroft System Assembly w/Rotary Gear Movement) for a view of a typical Ashcroft rotary system assembly with component parts identified. Refer to Figure 2A for link configuration of Type 1259 gauge.

FIG. 2 ASHCROFT SYSTEM ASSEMBLY W/ROTARY GEAR MOVEMENT



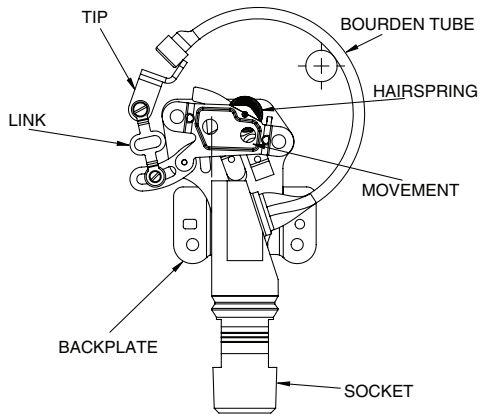


FIG. 2A ASHCROFT TYPE 1259 SYSTEM ASSEMBLY

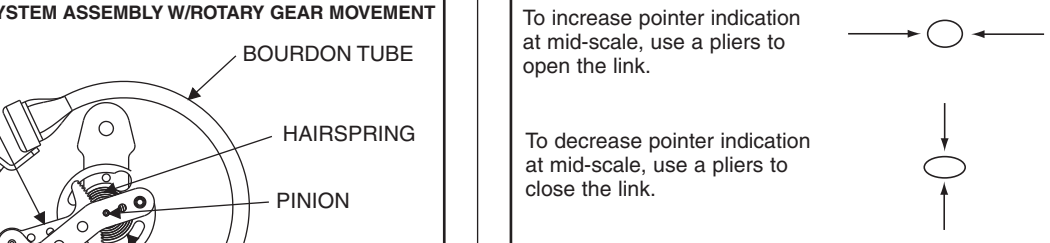


d. Adjust the micrometer pointer so that it rests at the true zero position. For open front gauges the pointer and dial must also be disassembled and the pointer should then be lightly pressed onto the pinion at the 9:00 o'clock position.

e. Apply full scale pressure and note the magnitude of the span error. With open front gauges, ideal span (270 degrees) will exist when at full scale pressure the pointer rests exactly at the 6:00 o'clock position.

f. If the span has shifted significantly (span error greater than 10%), the gauge should be replaced because there may be some partial corrosion inside the Bourdon tube which could lead to ultimate failure. If the span error exceeds 0.25%, loosen the lower link screw and move the lower end of the link toward the movement to increase span or away to decrease span. An adjustment of 0.004 inch will change the span by approximately 1%. This is a repetitive procedure which often requires more than one adjustment of the link position and the subsequent rechecking of the errors at zero and full scale pressure.

g. Apply midscale pressure and note error in reading. Even though the gauge is accurate at zero and full scale, it may be inaccurate at the midpoint. This is called linearity error. For corrections to linearity with the Type 1259 gauges refer to Figure 2B. For rotary movement gauges, note the following: if the error is positive, the movement should be rotated counter clockwise. Rotating the movement one degree will change this error by approximately 0.25%. Rotating the movement often affects span and it should be subsequently rechecked and readjusted if necessary according to step 6.1e and 6.1f.

FIG. 2B LINEARITY ADJUSTMENT & LINK CONFIGURATION FOR ASHCROFT TYPE 1259

h. While recalibrating the gauge, the friction error – difference in readings taken with and without rap – should be

noted. This error should not exceed the basic accuracy of the gauge. If the friction error is excessive, the movement should be replaced. One possible cause of excessive friction is improper adjustment of the hairspring. The hairspring torque,or tension, must be adequate without being excessive. The hairspring should also be level, unwind evenly (no turns rubbing) and it should never tangle.

NOTES:

1 For operation of test gauge external zero reset, refer to page 17.

2 For test gauge calibration procedure, refer to Figure 2 on page 18.

7.0 DIAPHRAGM SEALS

7.1 General – A diaphragm seal (isolator) is a device which is attached to the inlet connection of a pressure instrument to isolate its measuring element from the process media. The space between the diaphragm and the instrument's pressure sensing element is solidly filled with a suitable liquid. Displacement of the liquid fill in the pressure element, through movement of the diaphragm, transmits process pressure changes directly to a gauge, switch or any other pressure instrument. When diaphragm seals are used with pressure gauges, an additional 0.5% tolerance must be added to the gauge accuracy because of the diaphragm spring rate.

Used in a variety of process applications where corrosives, slurries or viscous fluids may be encountered, the diaphragm seal affords protection to the instrument where:

- The process fluid being measured would normally clog the pressure element.
- Pressure element materials capable of withstanding corrosive effects of certain fluids are not available.
- The process fluid might freeze due to changes in ambient temperature and damage the element.

7.2 Installation – Refer to bulletin OH-1 for information regarding (a) seal configurations; (b) filling fluids; (c) temperature range of filling fluids; (d) diaphragm material pressure and temperature limits; (e) bottom housing material pressure and temperature limits; (f) pressure rating of seal assembly; (g) accuracy/temperature errors of seal assembly; (h) diaphragm seal displacement. The volumetric displacement of the diaphragm must at least equal the volumetric displacement of the measuring element in the pressure instrument to which the seal is to be attached.

It is imperative that the pressure instrument/diaphragm seal assembly be **properly** filled prior to being placed in service. Ashcroft diaphragm seal assemblies should only be filled by a seal assembler certified by Ashcroft Inc. Refer to section 3.3 for a cautionary note about not applying torque on either the instrument or seal relative to the other.

7.3 Operation – All Ashcroft® diaphragm seals, with the exception of Type 310 mini-seals, are continuous duty. Should the pressure instrument fail, or be removed accidentally or deliberately, the diaphragm will seat against a matching surface preventing damage to the diaphragm or leakage of the process fluid.

7.4 Maintenance – Clamp type diaphragm seals – Types 100, 200 and 300 – allow for replacement of the diaphragm or diaphragm capsule, if that ever becomes necessary. The Type 200 top housing must also be replaced with the diaphragm. With all three types the clamping arrangement allows field disassembly to permit cleaning of the seal interior.

7.5 Failures – Diaphragm failures are generally caused by either corrosion, high temperatures or fill leakage. Process media build-up on the process side of the diaphragm can also require seal cleaning or replacement. Consult Customer Service, Stratford CT for advice on seal failures and/or replacement.

WARNING: All seal components should be selected considering process and ambient operating conditions to prevent misapplication. Improper application could result in failure, possible personal injury, property damage or death.

8.0 DAMPENING DEVICES

8.1 General – Some type of dampening device should be used whenever the pressure gauge may be exposed to repetitive pressure fluctuations that are fairly rapid, high in magnitude and especially when transitory pressure spikes exceeding the gauge range are present (as with starting and stopping action of valves and pumps). A restricted orifice of some kind is employed through which pressure fluctuations must pass before they reach the Bourdon tube. The dampener reduces the magnitude of the pressure pulse thus extending the life of the Bourdon tube and movement. This reduction of the pressure pulsation as "seen" by the pressure gauge is generally evidenced by a reduction in the pointer travel. If the orifice is very small the pointer may indicate the average service pressure, with little or no indication of the time varying component of the process pressure.

Commonly encountered media (e.g. – water and hydraulic oil) often carry impurities which can plug the orifice over time thus rendering the gauge inoperative until the dampener is cleaned or replaced.

Highly viscous media and media that tend to periodically harden (e.g., asphalt) require a diaphragm seal be fitted to the gauge. The seal contains an internal orifice which dampens the pressure fluctuation within the fill fluid.

8.2 Throttle Screws & Plugs – These accessories provide dampening for the least cost. They have the advantage of fitting completely within the gauge socket and come in three types: (a) a screwed-in type which permits easy removal for cleaning or replacement; (b) a pressed in, non-threaded design and (c) a pressed in, threaded design which provides a highly restrictive, helical flow path. Not all styles are available on all gauge types.

8.3 Ashcroft Pulsation Dampener – Type 1106 Ashcroft pulsation dampener is a moving pin type in which the restricted orifice is the clearance between the pin and any one of five preselected hole diameters. Unlike a simple throttle screw/plug, this device has a self-cleaning action in that the pin moves up and down under the influence of pressure fluctuations.

8.4 Ashcroft Pressure Snubber – The heart of the Type 1112 pressure snubber is a thick porous metal filter disc. The disc is available in four standard porosity grades.

8.5 Ashcroft Needle Valves – Type 7001 thru 7004 steel needle valves provide varying degrees of dampening. These devices, in the event of plugging, can easily be opened to allow the pressure fluid to clear away the obstruction.

8.6 Chemiquip® Pressure Limiting Valves – Model PLV-255, PLV-2550, PLV-5460, PLV-5500 and PLV-6430, available with and without built-in snubbers, automatically "shut off" at adjustable preset values of pressure to protect the gauge from damage to overpressure. They are especially useful on hydraulic systems wherein hydraulic transients

(spikes) are common.

9.0 TEST EQUIPMENT & TOOL KITS

See our website www.ashcroft.com for more details

9.1 Pressure Instrument Testing Equipment

Type 1305D Deadweight Tester

Type 1327D Pressure Gauge Comparator

Type 1327CM “Precision” Gauge Comparator

9.2 Tools & Tool Kits For Recalibration of 4½˝ and Larger Gauges

Type 2505 universal carrying case for 1082 test gauge

Type 266A132-01 span wrench for 1082 test gauge

Type 1281 socket O-Ring kit for 1279/1379 lower connect

Type 1285 4½˝ ring wrench for 1279/1379 lower & back connect

Type 1286 6˝ ring wrench for 1379 lower & back connect

Type 3220 pointer puller (all gauges except 1009 Duralife®)

Type 3530 pinion back-up tool for 1009 Duralife®

Type 3220 Handjack set

Type 1105 Tool Kit

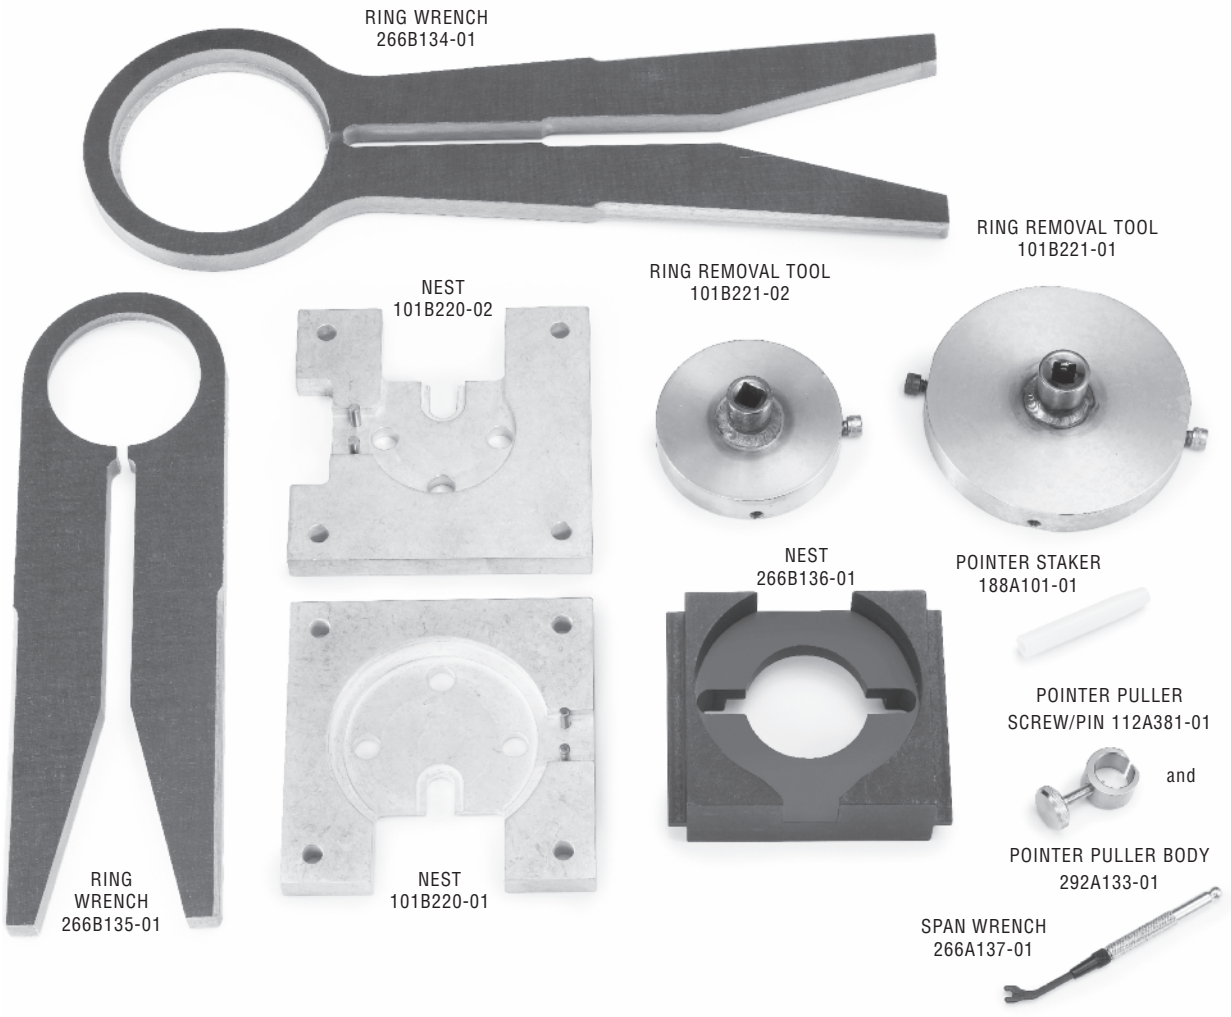
9.3 Kits to Convert a Dry Gauge to a Liquid Filled or Weather Proof Case Gauge

Type 1280 conversion kit for 4½˝ lower connect 1279/1379

Type 1283 conversion kit for 4½˝ back connect 1279/1379

Type 1284 conversion kit for 6˝ lower & back connect

TYPE 1105
TOOL KIT



TYPE 3220
HAND JACK SET

9.4 2½ & 3½ 1009 Duralife® Gauge Tools

Description	Part No.
Pointer Puller Screw/Pin[2][3][4]	112A381-01
Pointer Puller Body[2][3][4]	292A133-01
Pointer Staker[2][4]	188A101-01
Span Wrench[2][5] (to adjust span)	266A137-01
Ring Wrench 3½″[1][5] (for ring removal) (35 1009)	266B134-01
Ring Wrench 2½″[1][5] (for ring removal) (25 1009)	266B135-01
Nest 2½″ & 3½″[1][5] (to hold gauge for ring removal) (25/35 1009)	266B136-01
Ring Removal Tool[6] (25 1009)	101B221-02
Ring Removal Tool[6] (35 1009)	101B221-01
Nest 2½″[6] (to hold gauge for ring removal) (25 1009)	101B220-02
Nest 3½″[6] (to hold gauge for ring removal) (35 1009)	101B220-01
Type 1230 throttle plug insertion (¼ NPT) for 1009 Duralife®)	1230
Type 1231 throttle plug insertion (⅛ NPT) for 1009 Duralife® (body only)	1231
Tool to open orifice on push-in throttle plug	101A206-01

(1) Formerly 1206T Tool Kit.
(2) Formerly some parts in 1205T Tool Kit.
(3) Both parts must be purchased together.

(5) Previous design only.
(6) Current design only.

ASHCROFT® Type 1188 Bellows Gauge Calibration Procedure

CALIBRATION & TROUBLE CORRECTION DIAGRAM

RANGE SPAN ADJUSTMENT

RANGE TOO SHORT
Adjust slide "S" inward

RANGE TOO LONG
Adjust slide "S" outward

POINTER JUMPING

STICKY PARTS
Clean all bearings and gear teeth

LOOSE HAIRSPRING
Remove backlash by disengaging pinion & rotate to tighten

COUNTER BALANCE RUBBING
Bend if necessary to clear socket in travel

NOTE: After adjusting range span, set both movement stops. Set the underload stop so that the pointer will stop at zero. Set the overload stop so that the pointer will pass the maximum range approximately 5˝.

After adjusting span re-zero pointer by removing from pinion and re-assembling at the proper dial mark.

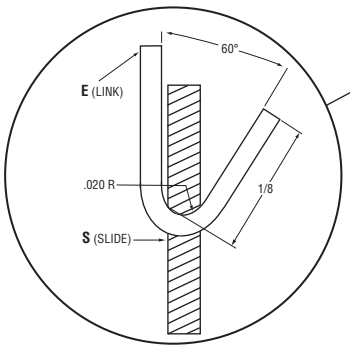
SLUGGISH MOVEMENT

TIGHT HAIRSPRING
Loosen by disengaging pinion & rotate

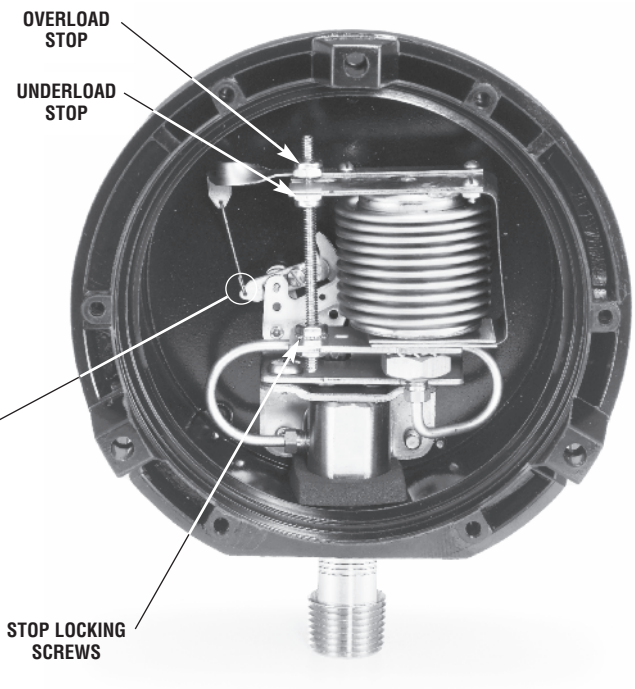
NON LINEAR

NON LINEAR FIRST 3RD.

ADJ. ANGLE OF PULL BY INCREASING ANGLE "A"



NON LINEAR LAST 3RD.



ADJ. ANGLE OF PULL BY DECREASING ANGLE "A"

NOTE: To increase or decrease angle "A," bend tip inward or outward as required. Doing this may run the movement segment off the pinion. This can be corrected by cutting off one end off the link "E" decreasing its length, or makin a new length from .032 dia. phos. bronze wire.
Caution: When reproducing link end, follow figure 44 very closely. this will prevent too much play, or, binding in operation.

REF: Replacing System Bellows
After assembling bellows to the gauge socket securely, subject system to 30 psi for five minutes, allowing bellows to travel approximately 1/8˝ against the overload stop. After this, heat treat system for 15 hours at 250°F, this procedure is necssary to prevent gauge drift.

SLIDE AND LINK (angle "A")

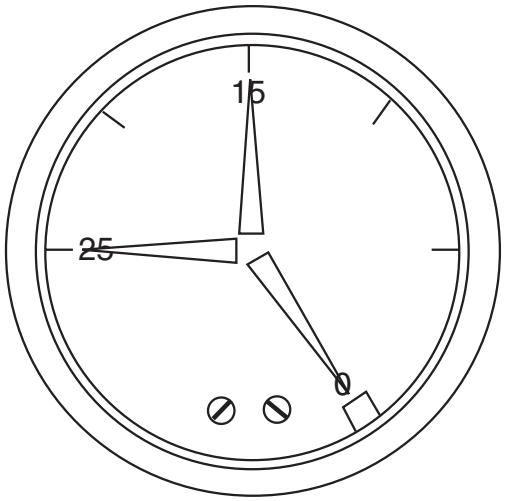
All sales subject to standard terms and conditions of sale. I&M008-10173-3/10 (1188)

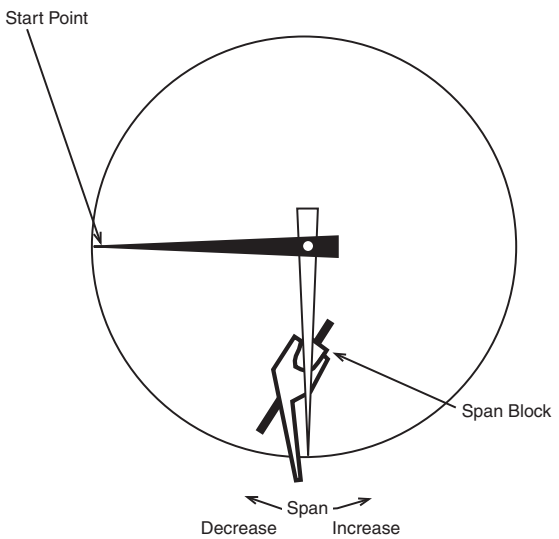


1. Remove ring, window and gasket pointer.
2. Using a pencil, refer to dial and mark the 0 and 25˝ Hg positions on the case flange.
3. Remove dial.
4. Apply 25˝ Hg vac.
5. Lightly press pointer onto pinion carefully aligning it with the 25˝ Hg vac. mark on the flange.
6. Release vacuum fully.
7. Note agreement of pointer to zero mark on flange.
8. If span is high or low, turn span block as shown in Figure 1.

Figure 1 –

9. Repeat steps 4 through 8 until span is correct.
10. Remove pointer.
11. With 25˝ Hg vac applied, reassemble dial, dial screws (finger tight) and point.
12. Apply 15˝ Hg vac. and note accuracy of indication. If required, slide dial left or right to reduce error to 1% maximum.
13. Firmly tighten dial screws.
14. Firmly tap pointer onto pinion.
15. recheck accuracy at 15 and 25˝ Hg vac. (Figure 2).
16. Reassemble window, gasket and ring.

Figure 2 –



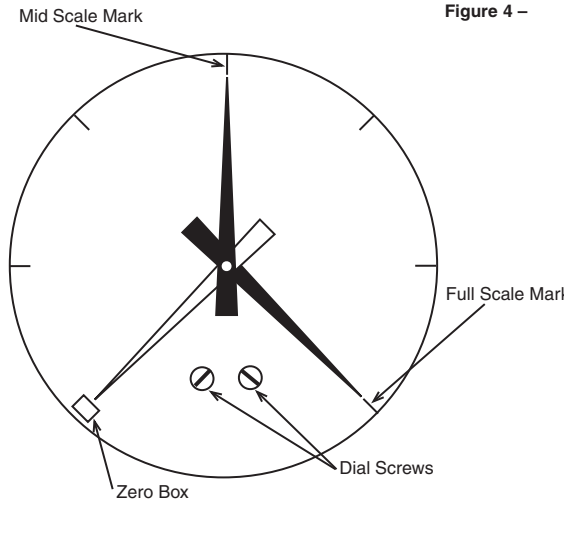
Notes: See page 10 for any tools required to calibrate.

For models produced prior to September 2008 for 2½˝ version and December 2008 for 3½˝ version.
Back of gauge will have a date code sticker.

© 2010 Ashcroft Inc., 250 East Main Street, Stratford, CT 06614-5145, USA, Tel: 203-378-8281, Fax: 203-385-0499, www.ashcroft.com
All sales subject to standard terms and conditions of sale. I&M008-10077 9/01 AMR 05/10

Step 1. With the dial off, install pointer at 9 o'clock "lightly," Figure 3.

Figure 3 –



Step 2. Go to full scale pressure…rotate span block with tool until pointer rests at 6 o'clock.

Step 3. Go to zero pressure (9 o'clock)…if pointer has not moved away from start point, go to Step 4. If pointer has moved, repeat Step 1 until span is correct.

Step 4. Install dial with screws snug.

Figure 4 –

Step 5. Install pointer centered in zero box, Figure 4.

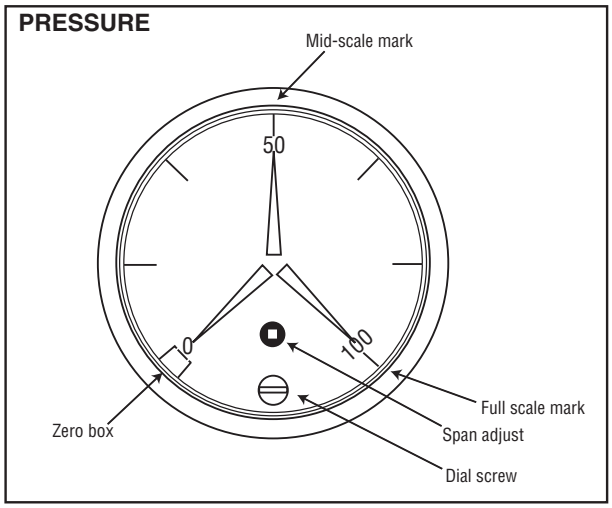
Step 6. Go to full scale pressure…check that pointer is within 1% of full scale mark. If not, remove pointer and dial and return to step 1, Figure 4.

Step 7. Go to mid-scale pressure…rotate dial until mid-scale mark is aligned with pointer, Figure 4.

Step 8. Tighten dials screws and stake on pointer.

Step 9. Check zero and full scale. Reassemble window, gasket and ring.

Notes: See page 10 for any tools required to calibrate.



For models produced prior to September 2008 for 2½˝ version and December 2008 for 3½˝ version.
Back of gauge will have a date code sticker.

ASHCROFT® Current Type 1009 Duralife® Calibration Procedure – Pressure and Vacuum Range

Calibration – 1009 Duralife® Gauge –
Inspect gauge for accuracy. At times gauges are simply "off zero" and opening the ventable plug at the top of the gauge will relieve internal gauge pressure and correct the offset. If this is not adequate and inspection shows that the gauge warrants recalibration to correct zero, span and/or linearity errors, proceed as follows:

Remove ring, window, and gasket using Ashcroft Ring Removal Tools P/N 101B220-02 and 101B221-02 for 2½" gauges and 101B220-01 and 101B221-01 for 3½" gauges.

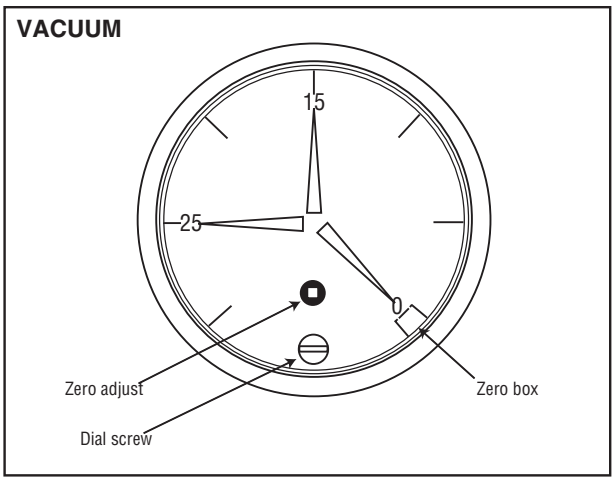
Positive Pressure Ranges –

1. Adjust pointer with a slotted screwdriver until it is in the center of the zero box. This is often all that is required it correct calibration issues.

2. Apply full scale pressure. If error exceeds 1% rotate the black span adjustment device with a #0 square drive bit. Clockwise increases span, counterclockwise decrease span.

3. Fully exhaust pressure and check that pointer still is still in the zero box. If not, repeat step 1 and 2

4. Once 0 and full scale are within tolerance, pressurize gauge to mid-scale.



5. If gauge is within 1%, calibration is complete. If not loosen the dial screw and rotate dial left or right to adjust midpoint. Retighten dial screw.

6. If an adjustment was made in step 5, recheck the gauge at zero and full scale, adjust accordingly until zero, mid and full scale points are in tolerance.

Vacuum Range –

1. Adjust pointer with a slotted screwdriver until it is in the center of the zero box. This is often all that is required it correct calibration issues.

2. Apply 25 inches Hg vacuum. If the error exceeds 1% adjust pointer with a slotted screwdriver until gauge is within tolerance.

3. Vent to 0 pressure and check pointer position in the zero box. If error exceeds 1% rotate the black span adjustment device with a #0 square drive bit. Clockwise rotation moves pointer clockwise, counterclockwise rotation moves the pointer counterclockwise.

4. Repeat step 1 and 2 until 0 and 25 inches of Hg are within gauge tolerance.

5. Apply 15 inches Hg vacuum. If gauge is within 1%, calibration is complete. If not loosen the dial screw and rotate dial left or right to adjust midpoint. Retighten dial screw.

6. If an adjustment was made in step 4, recheck the gauge at zero and 25 inches of Hg vacuum, adjust accordingly until zero, 15 and 25 inches Hg are in tolerance.

7. Continue below.

Re-assemble window and ring to gauge:

a. If plastic window is used, push window back into front of gauge, ensure the o-ring does not roll out of window groove (lubricate if necessary). Align the tabs of the window with the tabs of the case front. Once window is in place, install ring and tighten with tools referenced above and shown on page 10.

b If safety glass is used, reinstall window, gasket, and ring. Ensure that the gasket is seated properly under all four tabs of the ring and does not wrinkle when ring is tightened.

Note: Tighten ring: Apply 120-200inlb of torque. Rotate ring clockwise to tighten. Warning: over tightening of safety glass may induce cracking.

Notes: See page 10 for any tools required to calibrate.

For models produced after September 2008 for 2½˝ version and December 2008 for 3½˝ version.
Back of gauge will have a date code sticker.

FILL IDENTIFICATION	1	1	1	1	1
THREADED RING	–	–	1	1	1
TOP FILL PLUG	–	–	1	1	–

1. When Halocarbon fill is a requirement, rear case diaphragm bladder material is Viton instead of the standard Buna diaphragm bladder. Consult factory for part number.

TEMPERATURE LIMITS[1]				60 psi and Under Down Scale Zero Shift Required
	Ambient	Process	Storage	
Dry (IP66)	–20/200°F (–29/93°C)	–20/250°F(1) (–29/121°C)	–40/250°F (–40/121°C)	NONE
LF (glycerin)	20/150°F (7/66°C)	20/200°F (7/93°C)	0/150°F (–18/66°C)	NONE
(silicone)	–40/150°F (–40/66°C)	–40/200°F (–40/93°C)	–40/150°F (–40/66°C)	.12 psi
(halocarbon)	–40/150°F (–40/66°C)	–40/200°F (–40/93°C)	–40/150°F (–40/66°C)	.12 psi

Note: Other than discoloration of the dial and hardening of the gasketing that may occur as ambient or process temperatures exceeds 150°F, non-liquid-filled gauges with standard glass windows, can withstand continuous operating temperatures up to 250°F (121°C). Liquid-filled gauges can withstand 200°F (93°C) but glycerin fill and acrylic window will tend to yellow. Accuracy at temperatures above or below the reference ambient temperature of 68°F will be affected by approximately .4% per 25°F. Gauges with welded joints will withstand 750°F (450°F (232°C) with silver brazed joints) for short times without rupture, although other parts of the gauge will be destroyed and calibration will be lost. For continuous use and for process or ambient temperatures above 250°F (121°C), a diaphragm seal or capillary or siphon is recommended.
(1) Available for temperature below –20°F, see Production Information page ASH-PI-21B for details

1. Unscrew front threaded ring (turn CCW). Remove and discard glass window. For range spans 60 psi and under, shift pointer down scale by the amount shown in the table. With either the glass or plastic window, replace the O-ring with one furnished in the kit.
2. Remove protective paper from acrylic plastic window taking care not to scratch window. Assemble window in gauge.
3. Moisten face of threaded ring with silicone oil or silicone grease where ring bears up against window. Replace front threaded ring and tighten firmly hand tight. See instructions on reverse side for applying proper torque to ring to establish desired squeeze on O-ring seal. **(Fig. 4).**
It is important to hold gauge **rigidly,** otherwise ring lugs may be damaged during removal or assembly process.
4. From rear of gauge, remove and discard these parts: rear cover and cover gaskets from case.
Note: Disregard Step Nos. 5a and 5b if converting to hermetically sealed version.
When converting a 45-1379 with the top fill hole configuration, p/n 256A176-01 fill plug is required and must be ordered separately.
5. Filling Procedures:
a. Manual Filling Procedure: Place gauge face down on bench and **tip gauge** by blocking up front with a ⅜ inch block at the 12 o'clock dial position. Tipping of the gauge is necessary so fluid will flow into front cavity of the case. Pour in fill liquid to within about 1⁄16 inch of rear seal lip. When bubbles stop rising, front cavity is filled. Remove ⅜ inch block and pour in liquid until level is about 1⁄16 inch below rear sealing lip.
Note: An alternative method of filling is to fill the front dial cavity, adding the front window, etc., as in Step No. 3. Then fill the rear of the gauge. This method eliminates the need to tip the gauge.
b. Vacuum Pump Fill Procedure: (This procedure is recommended when filling a large number of gauges.) Place gauge face down and insert a ⅛ inch diameter tube, connected to a vacuum pump, through the 12 o'clock position hole in the rear, solid front portion of the case **(see Fig. 5).** Evacuate the air from the front dial cavity while pouring in the fill fluid through the case back. The vacuum will displace the air with fluid. When the dial cavity is solidly filled, remove the tubing and continue to pour the fill fluid to within 1⁄16 inch BELOW the O-ring channel lip.
Pre-measuring fill amount is not necessary with above methods. For reference, amount of fill is approximately 400 ml. or 14 fluid oz. (4½˝ GA.) and 455 ml. or 16 fluid oz. (6˝ GA.).
c. Note: The liquid fill level should be ⅜˝ (±⅛) as measured from the inside of the ring at the 12:00 o'clock position.
6. On lower connection gauges, assemble rear seal diaphragm to case.
For back connection gauges see instructions on reverse side. **(Fig. 2/4).**
7. For 1279:
Assemble rear cover and six self tapping screws in a criss-cross pattern and torque to 12 in lbs. (±2 in lbs.)
For 1379:
- Thread rear ring and torque to 200 in lbs
- Install stainless steel back cover using two screws. Torque screws to 14 in lbs. (±2 in lbs.)

8. Assemble throttle screw to threaded hole in socket.
Note: If system is monel (socket wrench flat stamped "PHS" or "PH") use monel throttle screw.
9. Check appropriate box on fill identification label, and peel off label back, and attach fill label to gauge case.
10. If gauge is to be repackaged:
a. Include enclosed instruction sheet inside carton.
b. Change type number on carton label to:
(1) Hermetically Sealed – 1279(*)SH.
(2) Liquid Filled – 1279(*)SL.
*Bourdon Tube System Code

Glycerin or silicone should not be used in applications involving Oxygen, Chlorine, Nitric Acid, Hydrogen Peroxide or other strong oxidizing agents, because of danger of spontaneous chemical reaction, ignition or explosion. Halocarbon should be specified. Products with this fill can be ordered from factory.

The use of fluids other than those listed in the table above (for example, Hydrocarbon-based oils) may result in leakage caused by a reaction between the fluid and the elastomeric seals. Consult the factory before filling with any other fluid.

TYPE 1279 & 1379 SOLID FRONT DURAGAUGE®
PRESSURE GAUGE CONVERSION INSTRUCTIONS TO:

- **Convert A Standard Dry Gauge To A Liquid Filled Gauge**
- **Convert A Standard Dry Gauge To A Dry, Weatherproof IP66 Gauge**

ASHCROFT®

INSTRUCTIONS FOR USING CONE TOOL AND RING WRENCH

Garter Spring & Diaphragm Assembly (Back Connection Gauge Only)

A. Place cone tool over socket shank as shown.

B. Moisten lip of socket and outer O-ring surface with silicone oil or grease.

C. Place diaphragm with rib side facing upward over cone into case grove. Diaphragm O-ring must be completely in socket-shank grove.

D. Place garter spring over cone as shown and slide onto diaphragm in socket grove

E. Assemble rear cover with screws per step 7.

Front Ring Assembly (All Gauges)

A. Assemble ring to case by hand to start.

B. Place ring on wrench as shown

C. Use ½˝ drive extension and torque ring to 200 in. lb

Alternate Method

A. Tighten ring snugly by hand

B. Mark case and ring.

C. Turn ring another 100 to 120 degrees (slightly less than ½ turn) using the ring wrench and ½˝ drive socket wrench or place the blunt end of a wooden or plastic dowel against a ring lug and tap with a hammer.

BACK CONNECTION ASSEMBLED GAUGE

Fig. 2

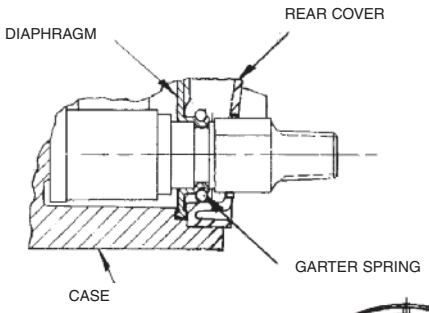

Fig. 3

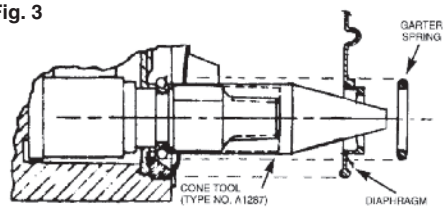

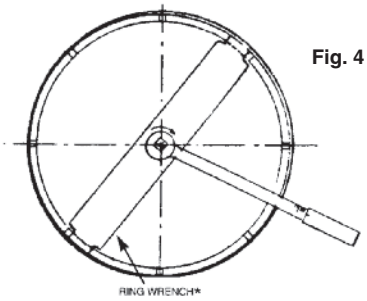

Fig. 4

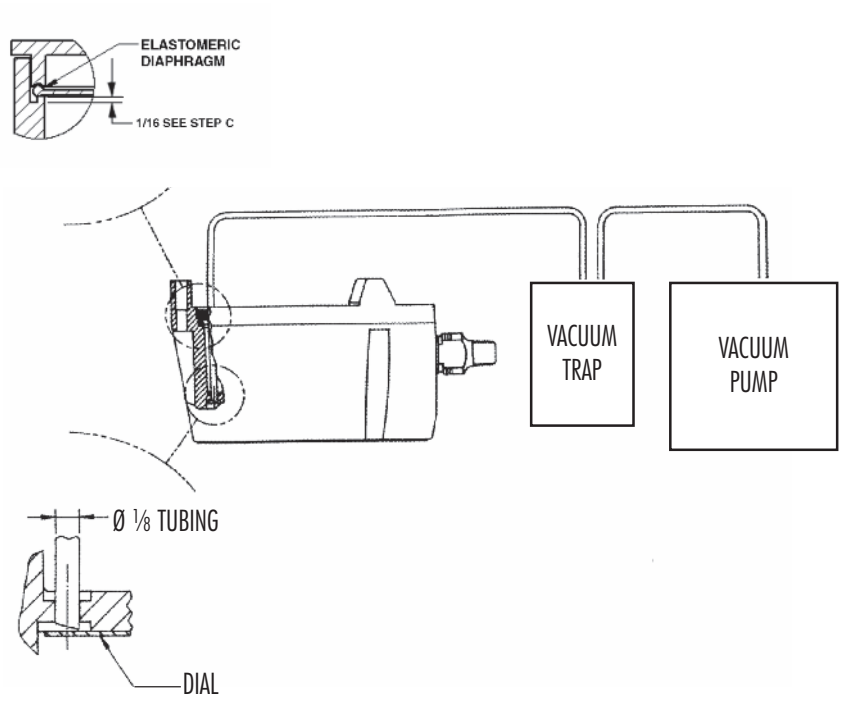
INSTRUCTIONS FOR LIQUID FILLING ASHCROFT® TYPE 1279 AND 1379 SOLID FRONT DURAGAUGE® PRESSURE GAUGES USING A VACUUM PUMP

A. Insert a length of ⅛ ˝ diameter tubing through the 12 o'clock position hole in the rear, solid front portion of the case, as shown.



B. Evacuate the air from the front dial cavity while pouring in the fill fluid through the case back. The vacuum will displace the air with fluid.*

C. When the dial cavity is solidly filled, remove the tubing and continue to pour the fill fluid to within 1/16 ˝ below the o-ring channel lip, as shown.

D. When converting a 45-1379 with the top fill hole configuration, p/n 256A176-01 fill plug is required and must be ordered separately.

*To prevent breakage, reduce vacuum to 15 in. Hg for plain glass and safety glass.

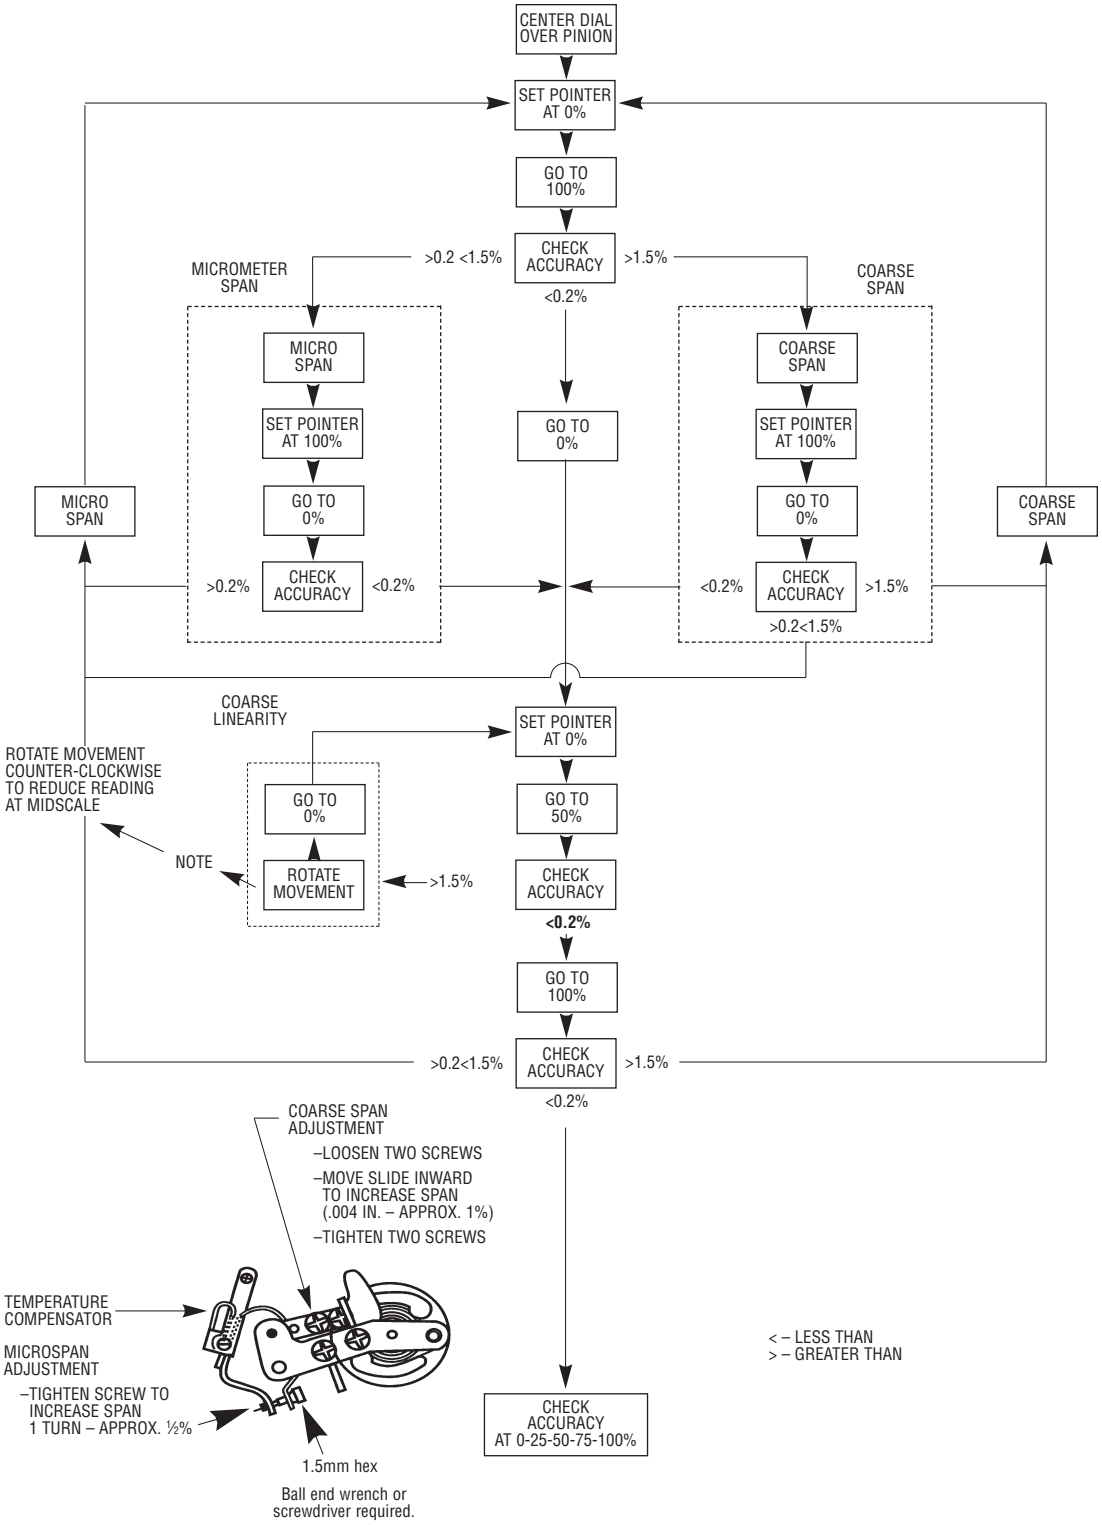
INSTRUCTIONS FOR USE OF EXTERNAL EASY ZERO™ ADJUST FEATURE*

Fig. 1

1. LOOSEN RING-LOCKING SCREW **A**.
2. OBTAIN REQUIRED ADJUSTMENT BY ROTATING KNOB **B** CLOCKWISE OR COUNTER-CLOCKWISE.
3. TIGHTEN SCREW **A** DOWN ON KNOB **B**.

*Applicable only for test gauge with hinged ring design.



ADDITIONAL CALIBRATION INSTRUCTIONS

1) "Standards shall have nominal errors no greater than ¼ of these permitted for the gauge being tested." *(Ref: ASME B40=100-1998)*
2) The instrument used as the calibration standard should have a maximum range no greater than 2x that of the gauge being tested. (i.e. Do not use a 400psi standard to test a 15psi gauge.)
3) "Known pressure shall be applied at each test point on increasing pressure (or vacuum) from one end to the other end of the scale. At each test point the gauge shall be . . .
lightly tapped, and then read . . ."
(*Ref: ASME B40.1 ¶ 6.2.4.1*)
4) To read gauge indication, move eye over red pointer tip at OD of printed dial until red reflection in mirror band is no longer visible, and then read the pointer position in reference to the dial.

LEFT BLANK

ASHCROFT

MODEL 310, DIAPHRAGM SEAL

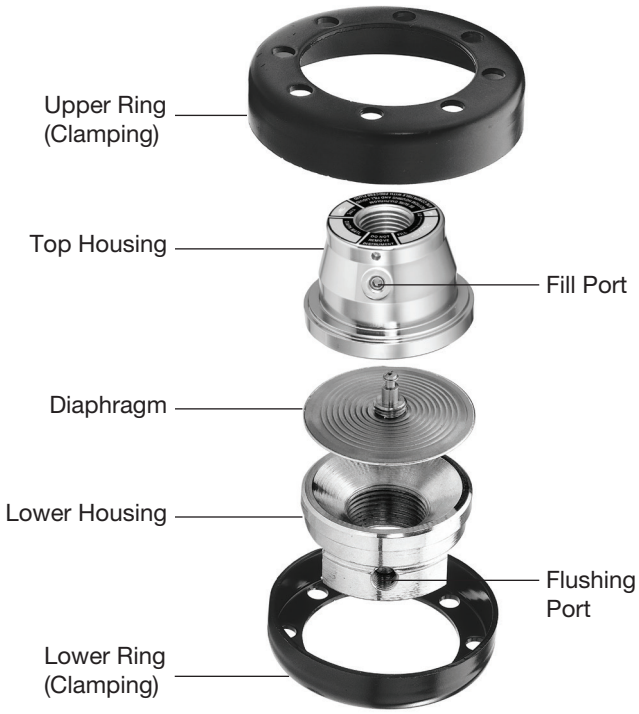
LEFT BLANK

Diaphragm Seal Installation and Maintenence Manual

ASHCROFT®

1. Introduction

A diaphragm seal is a device that attaches to the process side of a pressure-measuring instrument to separate the instrument from the process fluid while transmitting pressure across a flexible membrane. The volume enclosed by the diaphragm, the top housing, and the measuring element is completely filled with a pressure transfer fluid. A change in pressure at the process connection causes a displacement of the filling fluid due to deflection of the diaphragm, transferring the change in pressure to the sensing element of the pressure instrument.



2. Safety Information

WARNING: Serious injury or equipment damage can result from failure to properly install, maintain, or operate these components. To assure safe operation and maintenance procedures, read carefully and follow the instructions in this manual.

- Follow all instructions in this document to avoid exposure to pressurized fluid
- Use proper tools and safety equipment in installing or maintaining components
- Assure that process pressure and temperatures are properly monitored and maintained, and the process fluid is appropriate and compatible with the wetted materials of the diaphragm seal
- Follow all of your company's safety procedures in the event of a leak or diaphragm seal failure

3. Diaphragm Seal Components

Though the exact components will vary between specific models, most diaphragm seals will share the same essential parts.

3.1 Top Housing

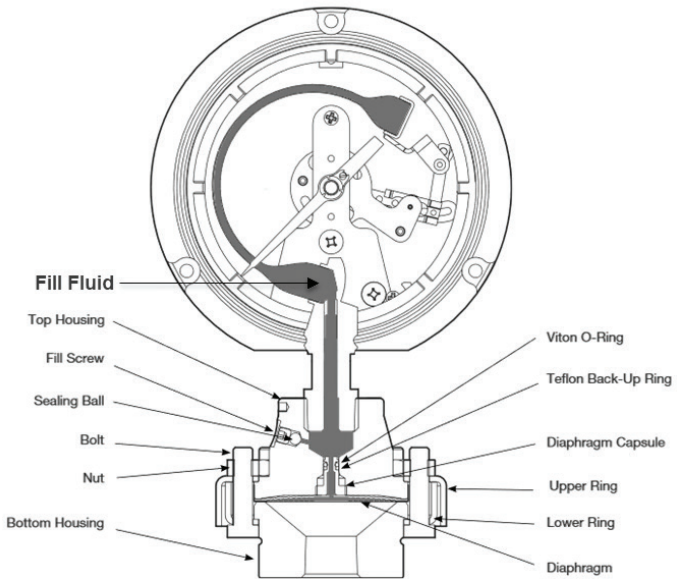
The top housing of the diaphragm seal is used to connect to the pressure measurement instrument. The fill port allows for assemblies to be vacuum filled, then sealed with a ball bearing in a conical seat and secured with a set screw.

3.2 Diaphragm

The diaphragm serves to separate the process fluid from the filling fluid, and as such is a component wetted to the process. Diaphragms can be welded or threaded into the top housing, which in turn can be welded or clamped to a lower housing. Changes in pressure cause the diaphragm to deflect, displacing fill fluid and transmitting pressure to the pressure-measuring instrument. It is important to ensure that a diaphragm has sufficient displacement to operate a pressure-measuring instrument across its entire span. For detailed diaphragm seal and instrument compatibility, see Ashcroft Product Information Page DS-PI-82, "Minimum and Maximum Pressures for Diaphragm Seals," found at Ashcroft.com

3.3 PTFE Gasket

All 100- and 200-series seals are supplied with a single-use PTFE skirted gasket. Refer to Section 4.2.3 for process considerations related to these gaskets.



© 2019 Ashcroft Inc. 250 East Main Street 06614, Tel: 203-378-8281 • Fax: 203-378-0499, All specifications are subject to change without notice.
All sales subject to standard terms and conditions. www.ashcroft.com All rights reserved. 100-200-300_seal_im_RevA_07-26-19

3.4 Lower Housing

The lower housing connects a diaphragm seal to the user's process, and is therefore a wetted part. Lower housings are designed to mate with the process They are avaiable in a wide variety of thread sizes. Lower housings can optionally be provided with threaded flushing connections which can be used to clean the inside of the seal or to flush out process media.

3.5 Fill Fluid

A filling fluid (sometimes referred to as "system fill," "pressure sensing fluid," or, "hydraulic fluid") is required to transmit pressure from the diaphragm membrane to the pressure sensing device. Diaphragm seal assemblies are filled via a vacuum filling process that ensures the system contains no air gaps. Fill fluids are selected based on operating conditions; primarily temperature. Though normally not in contact with the process media, a diaphragm failure may bring process media in contact with the fill fluid, so compatibility with the process media should be a consideration.

4. Specifications

4.1 100/200/300-Series Seals

4.1.1 Threaded Seals: 100, 101, 200, 201, 300, 301

Connections	100, 200, 300: threaded process connection 101, 201, 301: threaded process connection with flushing port
Process Connection Sizes	¼ to 1½ NPT female ¼ to 1 NPT male
Instrument Connection Sizes	¼ or ½ NPT female
Pressure Ratings	2,500 psi (5,000 psi optional)
Added Instrument Tolerance	±0.5% typical
Wetted Components	Diaphragm, bottom housing, PTFE gasket
Non-Wetted Components	Top Housing, clamp rings, assembly hardware

4.2 Temperature Information

4.2.1 Thermal Dissipation

Seals will dissipate thermal energy, though ambient and process conditions will greatly affect the amount of heat that can be lost through the seal. Accessories designed for dissipating heat, such as siphons or capillaries, should be used whenever dealing with elevated process temperatures.

4.2.2 Elastomers and Polymeric materials

Seals made with elastomeric or polymeric wetted components will have lower pressure ratings than those made from metallic components. Refer to the applicable data sheet for temperature and pressure ratings for seals with non-metallic diaphragms or bottom housings.

4.2.3 PTFE Gasketing

The highest acceptable process temperature for PTFE gaskets is 500F. The lowest acceptable temperature is limited by the fill fluid, the lowest of which is Syltherm XLT, rated to -150ºF. For process temperatures below -150ºF or exceeding 500ºF, consider a temperature dissipating device, such as capillary or a a microTube™ or siphon. For processes that are not compatible with PTFE, consider an all-welded diaphragm seal.

Diaphragm Seal Installation and Maintenence Manual

ASHCROFT®

6. Installation

6.1 General Information

Instruments attached and filled to diaphragm seals should never be tightened or loosened at the top housing. Doing so will alter the dynamics of the fill fluid and diaphragm movement, causing errors in the reading. Assemblies should ONLY be installed and/or tightened at the diaphragm seal lower housing. Most diaphragm seals can be purchased with either a locking device (XLD) or with the instrument welded to the top housing of the seal to prevent tampering (XDU).

Diaphragm seals should be installed in accordance with any safety precautions or installation specifications applicable to the end user. That said, the general principles in the following sections still apply.

6.2 Flushing Ports

Use of flushing ports is application-specific and are often used when process media has the potential to clog inside the lower housing, whether due to process media solidification, suspended solids, polymerization, or other factors. Diaphragm seals with flushing ports must have the flushing ports plugged prior to startup. Flushing ports on most seals are ¼ NPT, though some configurations may have ⅛ or ½ NPT flushing ports. Diaphragm seals can be ordered with the flushing ports pre-plugged with the "XPU" variation. Note that to prevent thread galling or stripping, factory-installed flush plugs may not be fully tightened and should be checked for tightness prior to pressurization.

6.3 Threaded Seals

Note: Torque should never be applied to the pressure instrument when installing the diaphragm seal. Most seals are supplied with either wrench flats or spanner holes to be used when installing the seal into process piping.

Threaded seals are most commonly supplied with NPT threads per ASME B1.20.1. NPT threads require the use of a suitable thread sealant, such as pipe dope or PTFE tape, and must be tightened securely to prevent galled threads and to ensure a leak-tight seal. Torque values will vary by connection size, though 2-3 full turns past finger-tight is often used as a guideline. Refer to ASME B1.20.1 for detailed information regarding NPT threads. For alternate thread types (metric, BSP, etc.), refer to the applicable specification.

7. Maintenence

7.1 Storage

Diaphragm seal assemblies should be stored in accordance with the storage requirements for all instruments attached, as well as any temperature limits listed above. Common instrumentation is shown in the table below. Refer to the respective data sheets or maintenance guides for detailed storage requirements for Ashcroft pressure instruments. Note that certain fill fluids (e.g., distilled water) may have storage and process temperature limitations narrower than the below data.

Pressure Instrument	Minimum Storage Temperature °F (°C)	Maximum Storage Temperature °F (°C)
Pressure Gauge (Dry)	-40 (-40)	250 (121)
Pressure Gauge (Glycerin-filled)	0 (-18)	150 (66)
B-series switches	-20 (-28)	150 (65)
A- Series Switches	-40 (-40)	257 (125)

7.2 Frequency of Inspection

Inspection frequency is application-specific and depends on the severity of the service and how critical the accuracy of the pressure instrument is. For example, a monthly inspection may be necessary for severe service applications, such as corrosive process media or heavy pulsation and vibration. Annual inspections, or even less frequent schedules, are often employed in non-critical applications.

7.3 Removal from Service

Diaphragm seals should be properly isolated and vented from the process prior to disassembly. Most diaphragms can be inspected by removing the diaphragm seal from the process (either by unthreading or by removing it from the mating flange) and viewing the diaphragm through the lower housing. If additional inspection is needed, 100- and 200-series diaphragm seals can be disassembled by removing the clamping screws and separating the top housing and diaphragm from the lower housing. Note that the PTFE wetted gaskets on certain seals are single use, and must be replaced anytime the compression is lost. Replacement gaskets can be ordered from Ashcroft (part number 124A287-01). 300-series seal should not be disassembled, as the diaphragm is merely clamped between the top and bottom housing; disassembling will result in loss of fill fluid.

© 2019 Ashcroft Inc. 250 East Main Street 06614, Tel: 203-378-8281 • Fax: 203-378-0499, All specifications are subject to change without notice.
All sales subject to standard terms and conditions. www.ashcroft.com All rights reserved. 100-200-300_seal_im_RevA_07-26-19

7.4 Diaphragm Seal Failures and Troubleshooting

100, 200, and 300-series diaphragm seal are continuous duty as defined by ASME B40.2. Should the pressure instrument fail or be removed accidentally, the diaphragm will seat against a matching surface in the top housing preventing damage to the diaphragm or leakage of the process fluid.

In the event that a diaphragm failure is suspected, the assembly should be immediately isolated from the process and the cause for failure determined. Most diaphragm failures are caused by corrosion, high temperatures, or fill leakage. Process media build-up in the lower housing can also require cleaning or replacement. In the event of a diaphragm failure due to corrosion, it is critical that the wetted materials of the assembly be evaluated for compatibility before it is replaced.

7.4.1 Troubleshooting Guide

Symptom	Possible Cause	Solution
Instrument not responding to pressure	Poor filling process, loss of fill fluid	Refill diaphragm seal and instrument assembly
	Process media clog or accumulation in lower housing	Clean out lower housing; alternately, use a seal with a flushing port
Process media leaking from process connection	Threaded seals: Inadequate thread sealing	Check that the seal has been properly torqued and that the threads have been sealed with pipe dope or PTFE tape
Rusted bolts/top housing/flange	Corrosive atmosphere	In most cases rust will not affect the performance of the seal. Consider more corrosion-resistant non-wetted materials.
Upscale shift on pressure reading	Temperature error – High Temp	Consider a heat dissipation accessory, such as a capillary or MicroTube™ Siphon
	Overfilling	Refill diaphragm seal and instrument assembly
	Diaphragm permeation	Certain process media can permeate the very thin diaphragm material and react with fill fluid. Review wetted material compatibility

LEFT BLANK

BALDOR

AC INDUCTION MOTOR (0.5 AND 0.75 HP)

LEFT BLANK

Baldor-Reliance AC & DC Motor Installation & Maintenance

Note! The manufacturer of these products, Baldor Electric Company, became ABB Motors and Mechanical Inc. on March 1, 2018. Nameplates, Declaration of Conformity and other collateral material may contain the company name of Baldor Electric Company and the brand names of Baldor-Dodge and Baldor-Reliance until such time as all materials have been updated to reflect our new corporate identity.

Safety Notice: Be sure to read and understand all of the Safety Notice statements in MN408 or Product Specific manual for your motor. A copy is available at: http://www.baldor.com/support/product_manuals.asp

ACCEPTANCE

Thoroughly inspect this equipment before accepting shipment from the transportation company. If any damage or shortage is discovered do not accept until noted on the freight bill. Report all damage to the freight carrier.

SAFETY

Eye bolts, lifting lugs or lifting openings, if provided, are intended only for lifting the motor and motor mounted standard accessories not exceeding, in total 30% of the motor weight. These lifting provisions should never be used when lifting or handling the motor and driven equipment. Eye bolt lifting capacity rating is based on a lifting alignment coincident with eye bolt center line. Eye bolt capacity reduces as deviation from this alignment is increased. Be sure eye bolts are tight and prevented from turning before lifting.

INSTALLATION OUTSIDE THE USA:

Refer to MN408 and MN1383 for Compliance with European Directives. Copies are available at:
http://www.baldor.com/support/product_manuals.asp

MOTOR ENCLOSURE

ODP, Open drip proof motors are intended for use in clean, dry locations with adequate supply of cooling air. These motors should not be used in the presence of flammable or combustible materials. Open motors can emit flame and/or molten metal in the event of insulation failure.

TEFC, totally enclosed motors are intended for use where moisture, dirt and/or corrosive materials are present in indoor and outdoor locations.

Explosion protected motors, as indicated by a Nationally Recognized Testing Laboratory Certification mark and marking with Class, Division and Temperature Code are intended for installation in hazardous locations as described in Article 500 of the NEC. Refer to MN408 for more details.

MOUNTING

Foot mounted machines should be mounted to a rigid foundation to prevent excessive vibration. Shims may be used if location is uneven.

Flange mounted machines should be properly seated and aligned. Note: If improper rotation direction is detrimental to the load, check rotation direction prior to coupling the load to the motor shaft.

For V-belt drive, mount the sheave pulley close to the motor housing. Allow clearance for end to end movement of the motor shaft. Do not overtighten belts as this may cause premature bearing failure or shaft breakage.

Direct coupled machines should be carefully aligned and the shaft should rotate freely without binding.

GENERAL

The user must select a motor starter and overcurrent protection suitable for this motor and its application. Consult motor starter application data as well as the National Electric Code and/or applicable local codes.

Special motors for use by United States Government including special specifications, master plans, etc. refer to the applicable master plans and specifications involved.

On motors received from the factory with the shaft blocked, remove blocking before operating the motor.

If motor is to be reshipped alone or installed to another piece of equipment, the shaft block must be installed to prevent axial movement and prevent brinelling of the bearings during shipment.

TESTING

If the motor has been in storage for an extensive period or has been subjected to adverse moisture conditions, check the motor insulation resistance with a meg ohm meter. Depending on storage conditions it may be necessary to regrease or change rusted bearings. Contact your local sales office if resistance is less than 5 meg ohms.

WARNING: Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury.

WARNING: Be sure the system is properly grounded before applying power. Electrical shock can cause serious or fatal injury.

INSTALLATION

This motor must be installed in accordance with National Electric Code, NEMA MG-2, IEC standards or local codes.

WIRING
Connect the motor as shown in the connection diagrams. If this motor is installed as part of a motor control drive system, connect and protect the motor according to the control manufacturers diagrams. Refer to MN408 for additional details on lead marking. The wiring, fusing and grounding must comply with the National Electrical Code or IEC and local codes. When the motor is connected to the load for proper direction of rotation and started, it should start quickly and run smoothly. If not, stop the motor immediately and determine the cause. Possible causes are: low voltage at the motor, motor connections are not correct or the load is too heavy. Check the motor current after a few minutes of operation and compare the measured current with the nameplate rating.

GROUNDING
Ground the motor according to NEC and local codes. In the USA consult the National Electrical Code, Article 430 for information on grounding of motors and generators, and Article 250 for general information on grounding. In making the ground connection, the installer should make certain that there is a solid and permanent metallic connection between the ground point, the motor or generator terminal housing, and the motor or generator frame. In non-USA locations consult the appropriate national or local code applicable.

ADJUSTMENT
The neutral is adjustable on some DC motors. AC motors have no adjustable parts.

Noise
For specific sound power or pressure level information, contact your local sales office.

VIBRATION
This motor is balanced to NEMA MG1, Part 7 standard.

BRUSHES (DC Motors)
Periodically, the brushes should be inspected and all brush dust blown out of the motor. If a brush is worn 1/2, (length specified in renewal parts data), replace the brushes.

WARNING: Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions, should be permanently guarded to prevent accidental contact by personnel. Accidental contact with body parts or clothing can cause serious or fatal injury.

Reassemble and seat the new brushes using a brush seating stone. Be sure the rocker arm is set on the neutral mark.

INSPECTION
Before connecting the motor to an electrical supply, inspect for any damage resulting from shipment. Turn the shaft by hand to ensure free rotation. Motor leads must be isolated before the shaft will turn freely on permanent magnet motors.

DRAIN PLUGS
One or more condensation drain plugs are provided on each endplate for various motor mounting configurations. For Washdown and totally enclosed, fan cooled or non-ventilated motors, the plugs in the lowest portion of the ends shields should be removed for operation (unless the motor has special stainless steel drains). All drains are located in the lowest portion of the ends shields.

MOUNTING
Mount the motor on a foundation sufficiently rigid to prevent excessive vibration. Grease lubricated ball bearing motors may be mounted with the feet at any angle. After careful alignment, bolt motor securely in place. Use shim to fill any unevenness in the foundation. Motor feet should sit solidly on the foundation before mounting bolts are tightened.

IP (Ingress Protection)
IP designations include two numerals, the first characteristic numeral is for ingress solid bodies and from dust. The second for ingress protection from liquid - water. Motors marked less than IP23 require additional protection from water.

GUARDING
After motor installation is complete, a guard of suitable dimensions must be constructed and installed around the motor/gearmotor. This guard must prevent personnel from coming in contact with any moving parts of the motor or drive assembly but must allow sufficient cooling air to pass over the motor. If a motor mounted brake is installed, provide proper safeguards for personnel in case of brake failure. Brush inspection plates and electrical connection cover plates or lids, must be installed before operating the motor.

STARTING
Before starting motor remove all unused shaft keys and loose rotating parts to prevent them from flying off. Check direction of rotation before coupling motor to load. The motor should start quickly and run smoothly and with little noise. If the motor should fail to start the load may be too great for the motor, the voltage is low or the motor has been miswired. In any case immediately shut motor off and investigate the cause.

ROTATION
To reverse the direction of rotation, disconnect and lockout power and interchange any two of the three AC power leads for three phase motors. For two-phase four wire, disconnect and lockout power and interchange the AC line leads on any one phase. For two phase three wire, disconnect and lockout power and interchange phase one and phase two AC line leads.

Maintenance Procedures

WARNING: Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury.

WARNING: Surface temperatures of motor enclosures may reach temperatures which can cause discomfort or injury to personnel accidentally coming into contact with hot surfaces. Protection should be provided by the user to protect against accidental contact with hot surfaces. Failure to observe this precaution could result in bodily injury.

Lubrication Information
Refer to motor nameplate for recommended lubricant. If none is shown, the recommended lubricant for anti-friction bearings (-15°F to 120°) is POLYREX EM. For Min Start Temp -100°F use AEROSHELL #7. For roller bearings is ExxonMobil SHC-220.

Relubrication Intervals
(For motors with regrease capability)
New motors that have been stored for a year or more should be relubricated. Lubrication is also recommended at Table 1 intervals.

LUBRICATION INSTRUCTIONS
Cleanliness is important in lubrication. Any grease used to lubricate anti friction bearings should be fresh and free from contamination. Properly clean the grease inlet area of the motor to prevent grease contamination.

1. Select service conditions from Table 2.
2. Select lubrication interval (Table 1).
3. Adjust lubrication interval with multiplier from Table 3.
4. Select volume of grease from Table 4.

LUBRICATION PROCEDURE
Bearings should be lubricated while stationary and the motor is warm.

1. Locate the grease inlet, clean the area, and replace the pipe plug with a grease fitting.
2. Locate and remove the grease drain plug, if provided.
3. Add the recommended volume of the recommended grease.
4. Replace the grease inlet plug and run the motor for 15 minutes.
5. Replace the grease drain plug.

SPECIAL APPLICATIONS
For special temperature applications, contact your local sales office.

Relubrication Intervals
Recommended relubrication intervals are shown in Table 1. It is important to realize that the recommended intervals of Table 2 are based on average use. Refer to additional information contained in Tables 2, 3 and 4.

Table 1 Relubrication Interval

NEMA (IEC) Frame Size	Rated Speed (RPM)			
	3600	1800	1200	900
Up to 210 incl. (132)	5500Hrs.	12000Hrs.	18000Hrs.	22000Hrs.
Over 210 to 280 incl. (180)	3600Hrs.	9500Hrs.	15000Hrs.	18000Hrs.
Over 280 to 360 incl. (225)	2200Hrs.	7400Hrs.	12000Hrs.	15000Hrs.
Over 360 to 5800 incl. (400)	2200Hrs.	3500Hrs.	7400Hrs.	10500Hrs.

* Relubrication intervals are for ball bearings.
For vertically mounted motors and roller bearings, divide the relubrication interval by 2.

** For motors operating at speeds greater than 3600 RPM, contact your local sales office for relubrication recommendations.

Table 2 Service Conditions

Severity of Service	Hours per day of Operation	Ambient Temperature Maximum	Atmospheric Contamination
Standard	8	40° C	Clean, Little Corrosion
Severe	16 Plus	50° C	Moderate dirt, Corrosion
Extreme	16 Plus	>50° C* or Class H Insulation	Severe dirt, Abrasive dust, Corrosion, Heavy Shock or Vibration
Low Temperature		<-29 ° C **	

* Special high temperature grease is recommended (Dow Corning DC44).

** Special low temperature grease is recommended (Aeroshell 7).

Note: Different grease types are generally incompatible and should not be mixed. Mixing different types can cause lubricant and bearing failure. Thoroughly clean bearing and cavity before changing grease type.

Table 3 Lubrication Interval Multiplier

Severity of Service	Multiplier
Standard	1.0
Severe	0.5
Extreme	0.1
Low Temperature	1.0

Some motor designs use different bearings on each motor end. This is normally indicated on the motor nameplate. In this case, the larger bearing is installed on the motor Drive endplate. For best relubrication results, only use the appropriate amount of grease for each bearing size (not the same for both).

Table 4 Amount of Grease to Add

Frame Size NEMA (IEC)	Bearing Description (These are the "Large" bearings (Shaft End) in each frame size)			
	Bearing	Weight of Grease to add * oz (Grams)	Volume of grease to be added	
			in^3	teaspoon
56 to 140 (90)	6203	0.08 (2.4)	0.15	0.5
140 (90)	6205	0.15 (3.9)	0.2	0.8
180 (100–112)	6206	0.19 (5.0)	0.3	1.0
210 (132)	6307	0.30 (8.4)	0.6	2.0
250 (160)	6309	0.47 (12.5)	0.7	2.5
280 (180)	6311	0.61 (17)	1.2	3.9
320 (200)	6312	0.76 (20.1)	1.2	4.0
360 (225)	6313	0.81 (23)	1.5	5.2
400 (250)	6316	1.25 (33)	2.0	6.6
440 (280)	6318	1.52(40)	2.5	8.2
440 (280)	6319	2.12 (60)	4.1	13.4
5000 to 5800 (315–400)	6328	4.70 (130)	9.2	30.0
5000 to 5800 (315–400)	NU328	4.70 (130)	9.2	30.0
360 to 449 (225–280)	NU319	2.12 (60)	4.1	13.4
AC Induction Servo				
76 Frame 180 (112)	6207	0.22 (6.1)	0.44	1.4
77 Frame 210 (132)	6210	0.32 (9.0)	0.64	2.1
80 Frame 250(160)	6213	0.49 (14.0)	0.99	3.3

Typical IEC vs NEMA Lead Marking

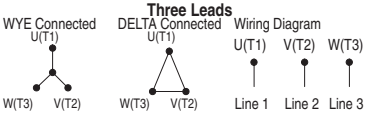
Single Phase Non-Reversible
Refer to the connection diagram provided on the motor.

Single Phase Reversible

Dual Voltage Reversible

DC Motors
Lead markings can be translated between IEC and NEMA designations as follows:

	NEMA	IEC
Armature	A1, A2	A1, A2
Series Field	S1, S2	D1, D2
Shunt Field	F1, F2	E1, E2



Refer to the connection diagram provided on the motor.

Three Phase
For single winding 3 phase motors, lead markings can be directly translated between IEC and NEMA designations. For these motors, the lead markings are:

U1=T1 U2=T4 U3=T7 U4=T10
V1=T2 V2=T5 V3=T8 V4=T11
W1=T3 W2=T6 W3=T9 W4=T12

Refer to the connection diagram provided on the motor. Some examples are as follows:

Three Leads

Six Leads

1.0 SAFETY INSTRUCTIONS - DEFINITION OF TERMS

⚠ WARNING

Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

⚠ CAUTION

Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

NOTICE

Used without the safety alert symbol, indicates a potential situation which, if not avoided, may result in an undesirable result or state, including property damage.

2.0 INTRODUCTION

2.1 Historical Experience

2.1.1 Based on over thirty years experience in the butterfly industry, Bray can state without question the majority of all field problems for resilient seated butterfly valves are directly related to poor installation procedures. For this reason, it is very important all distributor salespeople educate their customers regarding proper installation of resilient seated butterfly valves.

2.2 Butterfly Valve Seat / Disc Function

2.2.1 Before reviewing the proper installation, maintenance, and repair procedures for resilient seated butterfly valves, let's discuss the seat-disc function of a butterfly valve. The seat in a resilient seated butterfly valve has molded o-rings on its flange face. As a result, no gaskets are required as these o-rings serve the function of a gasket. The flange face and molded o-rings of the seat extend beyond the body face-to-face to ensure sealing at the flange faces. The seat material, which extends past the face is compressed in installation and flows toward the center of the valve seat I.D.

© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

2.2.2 In essence, the elastomer seat acts as a liquid, and the displaced elastomer moves toward the point of least resistance. The seat I.D. of all resilient seated butterfly valves is smaller than the disc O.D. This difference, the disc-seat interference, plus the increased interference due to the elastomer movement toward the seat center after installation, has been engineered so as to be the basis for pressure rating capability and the related seating/unseating torques. Any change in this interference due to improper installation directly affects the pressure rating and seating/unseating torques.

2.2.3 Finally, unlike many valve types, the resilient seated butterfly valve's disc actually extends beyond the face of the valve body at given angles of opening (say, 30° or more) when installed between flanges.

⚠ CAUTION

It is very important before installation to ensure the critical chordial dimension of the disc at the full open position is less than the adjacent pipe flange I.D.

2.3 Shipmment and Storage

2.3.1 The seat, disc, stem and bushing of the resilient seated butterfly valve should be coated with silicone lubricant unless specified otherwise

2.3.2 The disc should be positioned at 10° open. **Note:** See page 2 for special considerations for valves with spring return actuators.

2.3.3 Valves should be stored indoors with a preferred temperature range from 40°F (4°C) to 85°F (29°C).

2.3.4 While valves are in storage, they should be opened and closed once every 3 months.

2.3.5 Ship and store valves so that no heavy loads are applied to the bodies.

2.3.6 Polymer and elastomer parts should not be stored in the presence of sunlight or artificial light with high ultraviolet content, or any source of radiation as these are primary causes of aging.

2.3.7 If a component is cooled below 59°F (14°C), the entire valve assembly should be allowed to rise above 68°F (20°C) before installing into service.

2.3.8 Valve end protectors should only be removed at the time of valve installation.

© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

3.0 INSTALLATION CONSIDERATIONS - PIPING AND VALVE ORIENTATION AND PLACEMENT

3.1 Piping and Flanged Compatibilities

3.1.1 Piping

3.1.1.1 These valves have been engineered so that the critical disc chord dimension at the full open position will clear the adjacent inside diameter of most types of piping, including Schedule 40, lined pipe, heavy wall, etc.

3.1.2 Metal Flanges

3.1.2.1 Resilient seated butterfly valves have been designed to be suitable for all types of flanges (ASME, DIN, JIS and other international flange standards), whether flat-faced, raised face, slip-on, weld-neck, etc. Proper alignment of any butterfly valve between flanges is critical to good performance of the valve. The flange bolts must also be evenly tightened around the circumference of the valve, providing consistent flange compression of the molded o-ring in the seat face.

3.1.2.2 Since Bray does not recommend the use of gaskets between flanges on resilient seated butterfly valves, a uniform flange face is critical to proper valve sealing. Most weld-neck and slip-on flanges conforming to ASME specifications have an appropriate flange face. Types A and B butt-weld stub-end flanges also provide a suitable mating surface for the molded o-ring.

3.1.2.3 It should be noted that Type C butt-weld stub-end flanges have an “as formed” flange face. The varying surface of this flange face can create sealing problems between any resilient-seated butterfly valve and the flange face. For this reason, Type C flanges are not recommended for use with resilient-seated butterfly valves.

3.1.3 Non-Metallic Flanges

3.1.3.1 When non-metallic flanges, such as plastic or PVC, are used with resilient seated butterfly valves, care must be taken not to over-tighten the flange bolts. The inherent flexibility of these non-metallic flange materials allow them to be over-tightened relatively easily. Flexing caused by this over-tightening can actually reduce the compression of the valve between the flanges, causing leaks between the valve and the flange face. Proper alignment and firm, even, but not excessive tightening of flange bolts are especially important with non-metallic flanges. In some cases, non-metallic flanges of low quality will not mate tightly with butterfly valves regardless of the care taken during installation.

© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

3.2 Valves with Spring Return Actuators

3.2.1 Fail Closed Assemblies

3.2.1.1 If the valve is supplied with an actuator, the butterfly valve is shipped in the full closed position (as no air pressure is present to compress the springs and open the disc).

⚠ CAUTION

Installing the valve with the disc in the full closed position may create a compression set on the seat causing higher than expected torques or premature seat failure. It is recommended to:

> Remove the actuator. Be sure to scribe the valve and actuator to ensure the re-installed actuator is in the exact same quadrant as originally configured

> Install the valve per the attached installation tag instructions

> Re-install the actuator ensuring it is in the proper quadrant

3.2.2 Fail Open Assemblies

3.2.2.1 If the valve is supplied with an actuator, the butterfly valve disc is shipped in the full open position (as no air pressure is present to compress the springs and close the valve disc.) The sealing surface, or disc edge, is therefore exposed. Damage to that surface will cause premature seat failure.

⚠ CAUTION

Use caution installing the valve being careful not to damage the disc edge. It is recommended to:

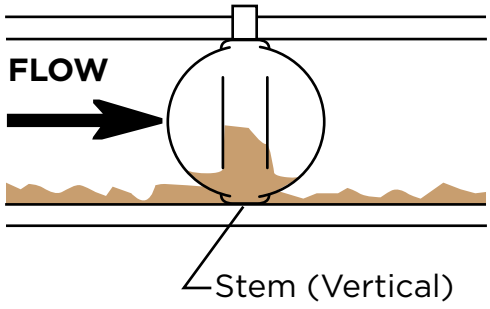
> Remove the actuator. Be sure to scribe the valve and actuator to ensure the re-installed actuator is in the exact same quadrant as originally configured

> Install the valve per the attached installation tag instructions

> Re-install the actuator ensuring it is in the proper quadrant.

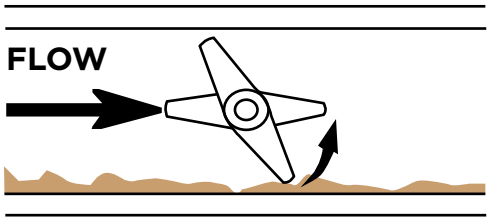
3.2.3 Valve Location

3.2.3.1 Resilient seated butterfly valves should be installed if possible a minimum of 6 pipe diameters from other line elements, i.e., elbows, pumps, valves, etc. of course, 6 pipe diameters are not always practical, but it is important to achieve as much distance as possible.



3.2.3.2 Where the resilient seated butterfly valve is connected to a check valve or pump, use an expansion joint between them to ensure the disc does not interfere with the adjacent equipment.

© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

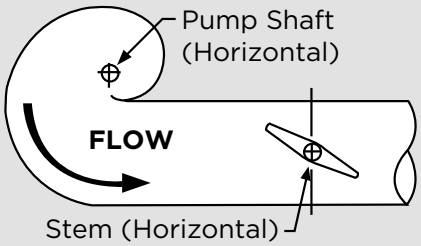


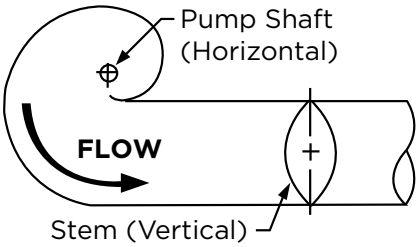
3.2.4 Valve Orientation

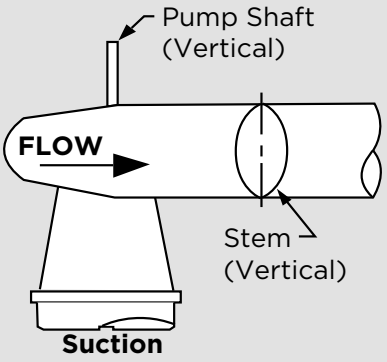
3.2.4.1 In general, Bray recommends the resilient seated valve be installed with the stem in the vertical position and the actuator mounted vertically directly above the valve; however, there are those applications as discussed below where the stem should be horizontal. NOTE: Bray does not recommend valves be installed in an upside-down position.

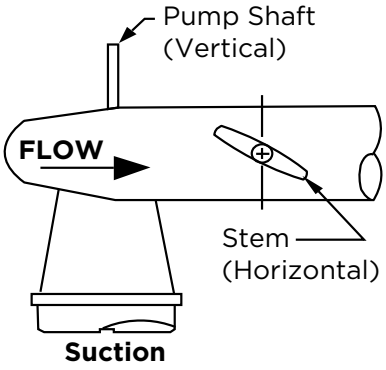
3.2.4.2 For slurries, sludge, mine tailing, pulp stock, dry cement, and any media with sediment or particles, Bray recommends the resilient seated valve be installed with the stem in the horizontal position with the lower disc edge opening in the downstream direction as illustrated below.

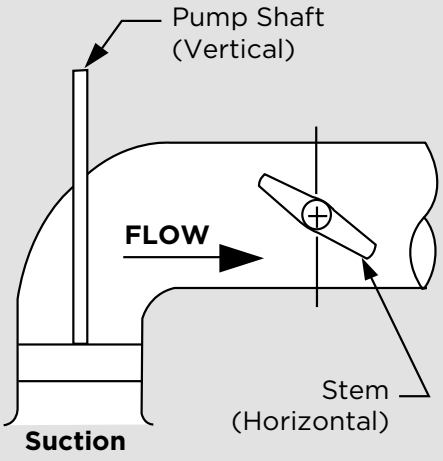
Incorrect Installation
Sludge builds up on the disc

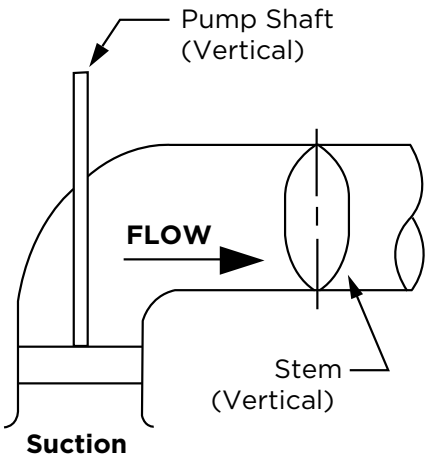






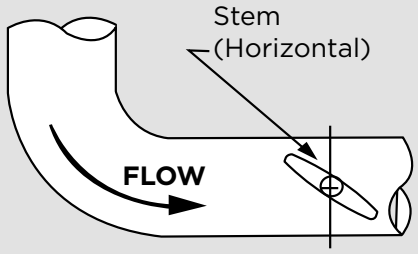


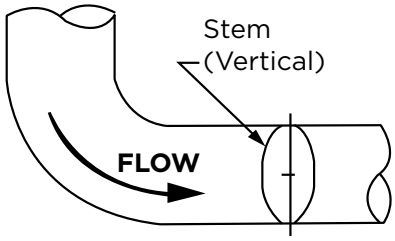


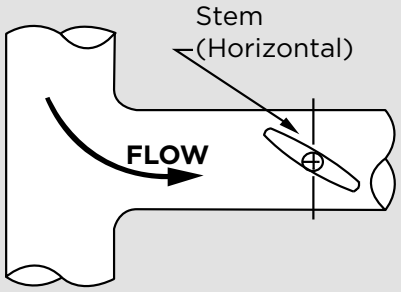


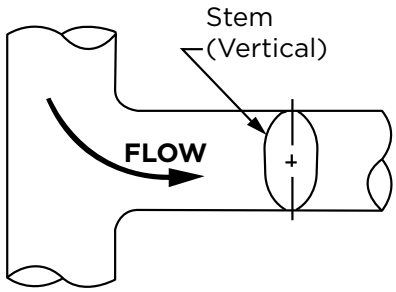
Stem (Horizontal)

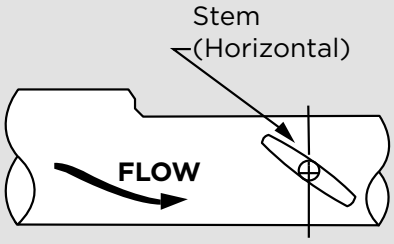
Correct Installation
Sludge passes under the disc

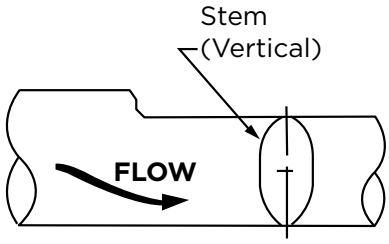








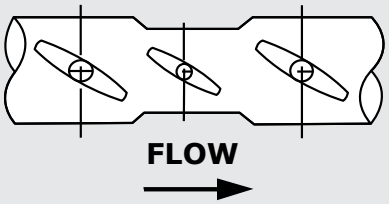


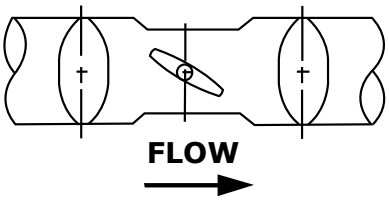


© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

3.2.4.3 Resilient seated butterfly valve located at the discharge of a pump should be oriented as follows:

	INCORRECT INSTALLATION	CORRECT INSTALLATION
1. Centrifugal Pump Pump shaft horizontal and stem vertical		
2. Centrifugal Pump Pump shaft vertical and stem horizontal		
3. Axial Pump Pump shaft vertical and stem vertical		





© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

3.2.4.4 Butterfly valves located downstream of a bend or pipe reducer should be oriented as follows:

	INCORRECT INSTALLATION	CORRECT INSTALLATION
1. Bend		
2. Tee		
3. Pipe Reducer		

© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

3.2.4.5 Butterfly valves in combination for control/isolation applications should be installed as follows:

INCORRECT INSTALLATION	CORRECT INSTALLATION
	
Combination with all valve stems in the same direction accelerates possible noise, vibration, and erosion problems.	Combination with the stem of the control valve at right angle to those of other valves tends to cancel the drift of the fluid, and reduces noises, vibration, and erosion.

4.0 INSTALLATION PROCEDURE

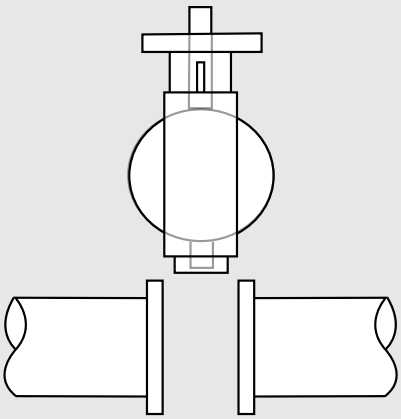
4.1 General Installation

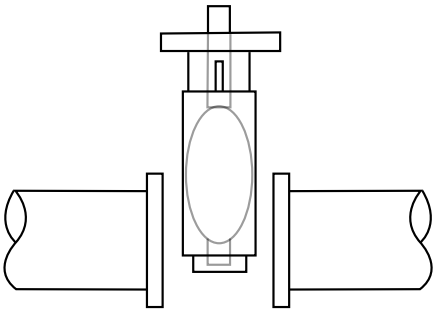
4.1.1 Make sure the pipeline and pipe flange faces are clean. Any foreign material such as pipe scale, metal chips, welding slag, welding rods, etc., can obstruct disc movement or damage the disc or seat.

4.1.2 The Bray elastomer seat has molded o-rings on the face of the seat. **As a result, no gaskets are required as these o-rings serve the function of a gasket.**

4.1.3 Align the piping and then spread the pipe flanges a distance apart so as to permit the valve body to be easily dropped between the flanges without contacting the pipe flanges (see Figure 1 page 11).

4.1.4 Check to see that the valve disc has been positioned to a partially open position, with the disc edge about 1/2 inch to 3/8 inch inside the face of the seat, (approximately 10° open) **(see Figure 1 page 11) Note: See page 6 for special consideration for valves with spring return actuators.**

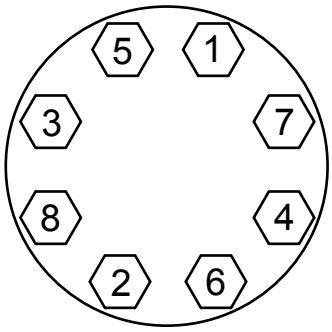




4.1.5 Insert the valve between the flanges as shown in Figure 1 of page 11, taking care not to damage the seat faces. Always pick the valve up by the locating holes or by using a nylon sling on the neck of the body.

⚠ WARNING

Never pick up the valve by the actuator or operator mounted on top of the valve.



© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

Figure 1 - Insert Resilient Seated Butterfly Valve Between Flanges

INCORRECT INSTALLATION	CORRECT INSTALLATION
	
⚠ CAUTION	
Pipe not spread, disc opened beyond valve body face; **Results:** Disc edge damaged when it hits pipe flange.	Pipe spread and aligned, disc rotated; **Results:** no undesirable beginning seating/ unseating torque, disc edge protected.

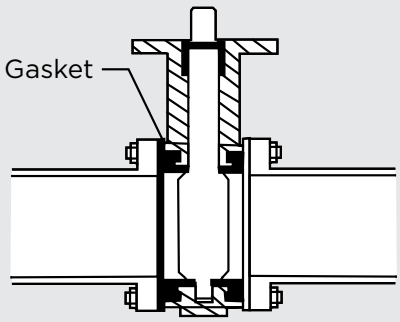
4.1.6 Place the valve between the flanges, center it, and then span the valve body with all flange bolts, but do not tighten the bolts. Carefully open the disc to the full open position, making sure the disc does not hit the adjacent pipe I.D. Now systematically remove jack bolts or other flange spreaders, and hand-tighten the flange bolts as shown in Figure 2 below. Very slowly close the valve disc to ensure disc edge clearance from the adjacent pipe flange I.D. Now open the disc to full open and tighten **all** flange bolts per specification as shown in **Figure 2**. Finally, repeat a full close to full open rotation of the disc to ensure proper clearances (See Figures 3 & 4 page 7).

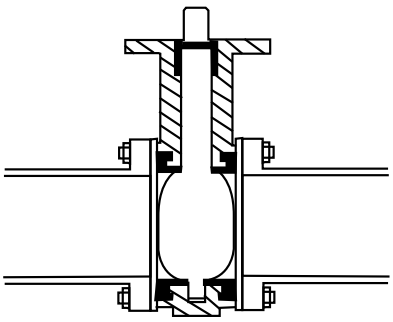
Figure 2 - Flange Bolt Tightening Pattern

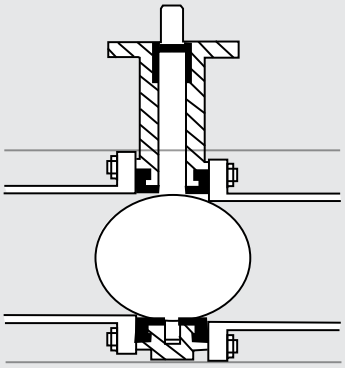
© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

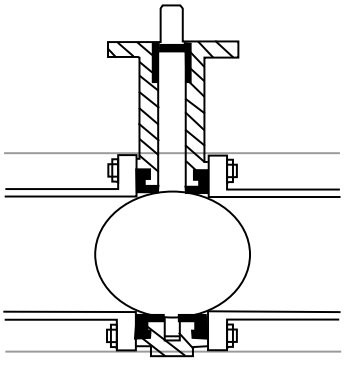
4.1.7 For additional flange bolting information please reference the Resilient Seated Butterfly Valve Technical Manual and "Typical Flange Bolting Guide" found at www.bray.com

Figure 3 - Initial Centering and Flanging of Valve









INCORRECT INSTALLATION	CORRECT INSTALLATION
	
Disc in closed position; gaskets used; **Results:** Seat distorted and over-compressed causing high initial unseating torque problems.	Bolts snugged, not torqued tight, disc edge within body face-to-face but not fully closed, no flange gaskets; **Results:** No disc edge damage, proper sealing allowed.

Figure 4 - Final Aligning and Tightening of Flange Bolts

INCORRECT INSTALLATION	CORRECT INSTALLATION
	
Piping misaligned; **Results:** Disc O.D. strikes pipe I.D. causing disc edge damage, increased torque & leakage. Seat face o-rings will not seal properly with incorrectly aligned piping.	Piping aligned properly when bolts tightened, disc in full open position; **Results:** disc clears adjacent pipe I.D., seat face seals properly, no excessive initial torque.

4.1.8 When resilient seated butterfly valves are to be installed between ASME welding type flanges, care should be taken to abide by the following procedure to ensure no damage will occur to the seat:

© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

4.1.8.1 Place the valve between the flanges with the flange bores and valve body aligned properly. The disc should be in the 10° open position.

4.1.8.2 Span the body with the bolts.

4.1.8.3 Take this assembly of flange-body-flange and align it properly to the pipe.

4.1.8.4 Tack weld the flanges to the pipe.

4.1.8.5 When tack welding is complete, remove the bolts and the valve from the pipe flanges and complete the welding of the flanges. Be sure to let the pipe and flanges cool before installing the valve.

⚠ CAUTION

Never complete the welding process (after tacking) with the valve between pipe flanges. This causes severe seat damage due to heat transfer.

4.2 Installation of Bray PTFE Seated Butterfly Valves in Plastic Flanges.

4.2.1 Bray recommends the following guidelines when PTFE Seated Valves are installed between plastic flanges:

4.2.1.1 The valve body should be coated with epoxy, not nylon. The extra thickness of the nylon coating slightly reduces the seat compression, and every advantage to maximize seat compression should be taken with plastic flanges.

4.2.1.2 The plastic flange can be either one piece construction, or two piece construction comprised of a stub end and a backup ring.

4.2.1.3 The plastic flange style can be butt-weld, socket or slip-on, but butt-weld and socket are preferred.

4.2.1.4 The plastic flange face must be flat. Concave and convex flange faces are not acceptable. This includes flange faces that were originally flat but later distorted into a concave shape by over tightening the flange bolts.

4.2.1.5 The plastic flange face surface may have grooves or serrations, provided the grooves do not exceed .100” (2.54 mm) in width or .020” (.508 mm) in depth. If the grooves are less than .100” (2.54 mm) in width, the groove depth must not exceed the width. However, fine conentric or “phonograph record” grooves are acceptable regardless of the groove depth.

© 2020 BRAY INTERNATIONAL, INC. ALL RIGHTS RESERVED. BRAY.COM The Information contained herein shall not be copied, transferred, conveyed, or displayed in any manner that would violate its proprietary nature without the express written permission of Bray International, Inc.

4.2.1.6 Flange gaskets must not be used with PTFE seats, since they create an uncontrolled over compression that can buckle the PTFE and damage the seat. If a damaged face, a flange gasket can appear to cure the leak to atmosphere, while simultaneously damaging the PTFE seat and creating a second leak across the disc or up the stem hole. Leaks across the plastic flange must be cured without the use of gaskets, by proper selection and installation of the flange.

4.2.1.7 The bolts holding plastic flanges should be installed in strict conformance to the recommended practices of the plastic flange manufacturer. This usually involves aligning the flanges accurately, using lubricated bolts, and tightening the bolts in the proper sequence and to the specified torque. Uniform stress across the flange prevents leakage.

5.0 MAINTENANCE AND REPAIR

⚠ WARNING

No valve maintenance, including removal of manual or power actuators, should be performed until the piping system is completely depressurized.

5.1 The many Bray features minimize wear and maintenance requirements. No routine lubrication is required. **All components – stem, disc, seat, bushing, stem seal, etc., are field replaceable, no adjustment is required.** If components require replacement, the valve may be removed from the line by placing the disc in the near closed position, then supporting the valve and removing the flange bolts.

APPENDIX - DISASSEMBLY/ASSEMBLY INSTRUCTIONS

6.0 Appendix A - Series 20/21 Resilient Seated Butterfly Valves

6.1 Disassembly

6.1.1 Remove handle, gear operator or power actuator from actuator mounting flange.

6.1.2 Remove the body bolts and pull the lower body half away from the seat.

6.1.3 Pull the seat and disc stem from the upper body half.

6.1.4 Remove bushing and seal from the upper body.

6.1.5 Push the seat into an oval shape and remove the disc stem by withdrawing the short stem end first.

6.2 Assembly

6.2.1 Push the long stem end of the disc into the seat.

6.2.2 Then push the seat over the disc's short stem.

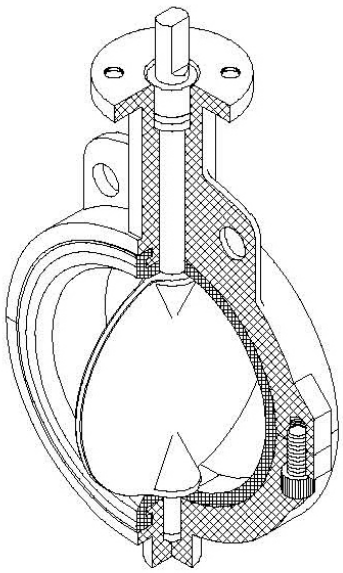
6.2.3 Place the disc stem and seat into the upper body half.

6.2.4 Align the lower body with the upper body and position lower body in the seat.

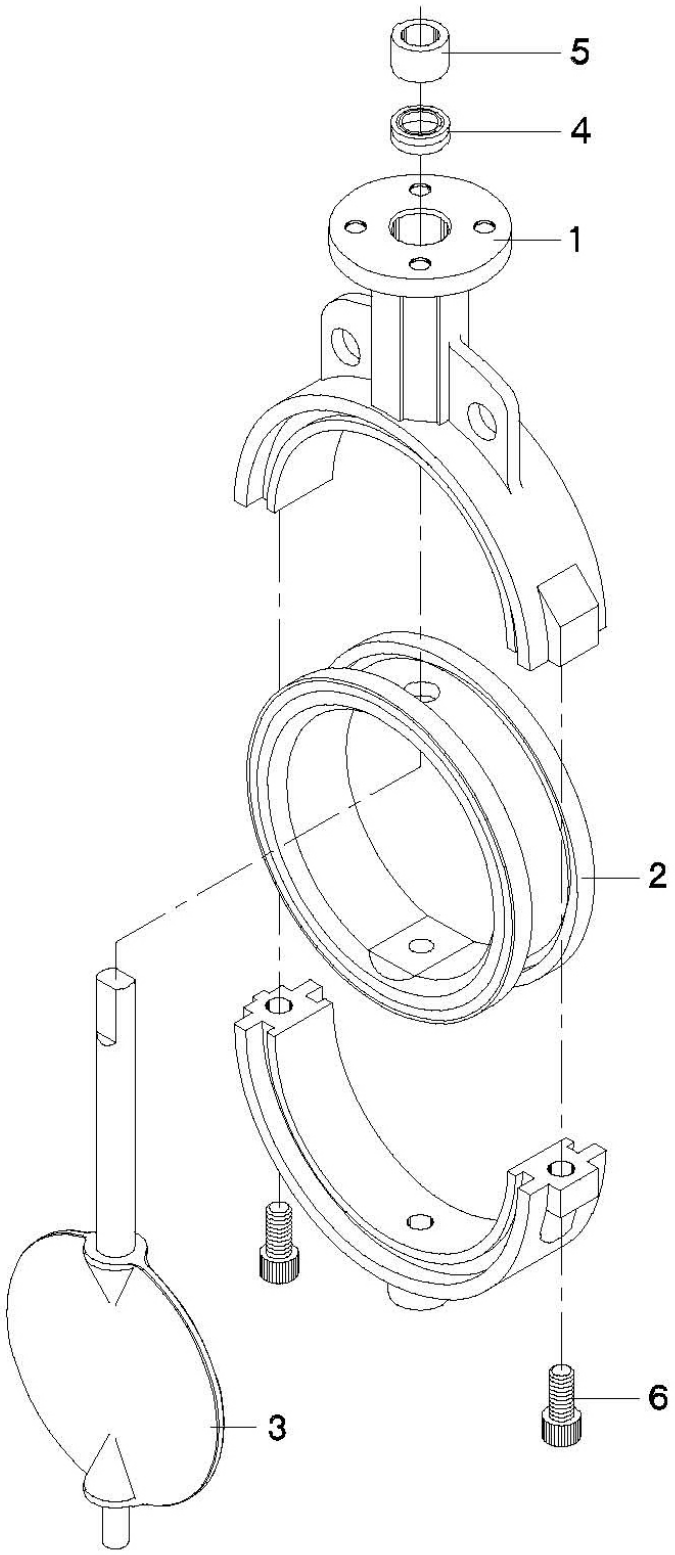
NOTICE

The body halves have a matching casting node on one side only to ensure correct assembly of body halves.

6.2.5 Replace the body bolts and tighten.



6.2.6 Install the stem seal, then the stem bushing.
Note: It is recommended that the stem bushing be coated with a light amount of silicone grease before installation in the valve body. This coating of silicone grease will assist in keeping the stem bushing in the valve body until an actuator is mounted on the valve.



6.2.7 Replace handle, manual gear operator or power actuator on the actuator mounting flange.

7.0 Appendix B - Series 22/23 Resilient Seated Butterfly Valves

7.1 Disassembly

7.1.1 Remove the handle, gear operator, or power actuator from actuator mounting flange.

7.1.2 Remove the "Spirolox"® retaining ring and the two C-ring stem retainers from the stem hole.

7.1.3 Then remove the stem, bushing and seal.

7.1.4 Remove the disc from the seat, protecting the disc edge at all times.

7.1.5 Remove the seat energizer from the stems and seat.

7.1.6 Remove the lower and upper stems from the disc or remove the lower stem if the upper stem is connected to the disc.

7.1.7 Compress the seat just enough to allow the disc to be removed along with the seal capsules.

7.1.8 Remove the retainer bushing and upper stem seal.

7.2 Assembly

7.2.1 Install the stem bearings in upper and lower body halves.

7.2.2 Place the body seal strip on the lower body half, overlapping the body width by approximately 0.19" on both sides.

7.2.3 Press the seat to make the I.D. elliptical, then insert the shaft seals and place the disc into the seat. Rotate the disc hubs into alignment with the seat.

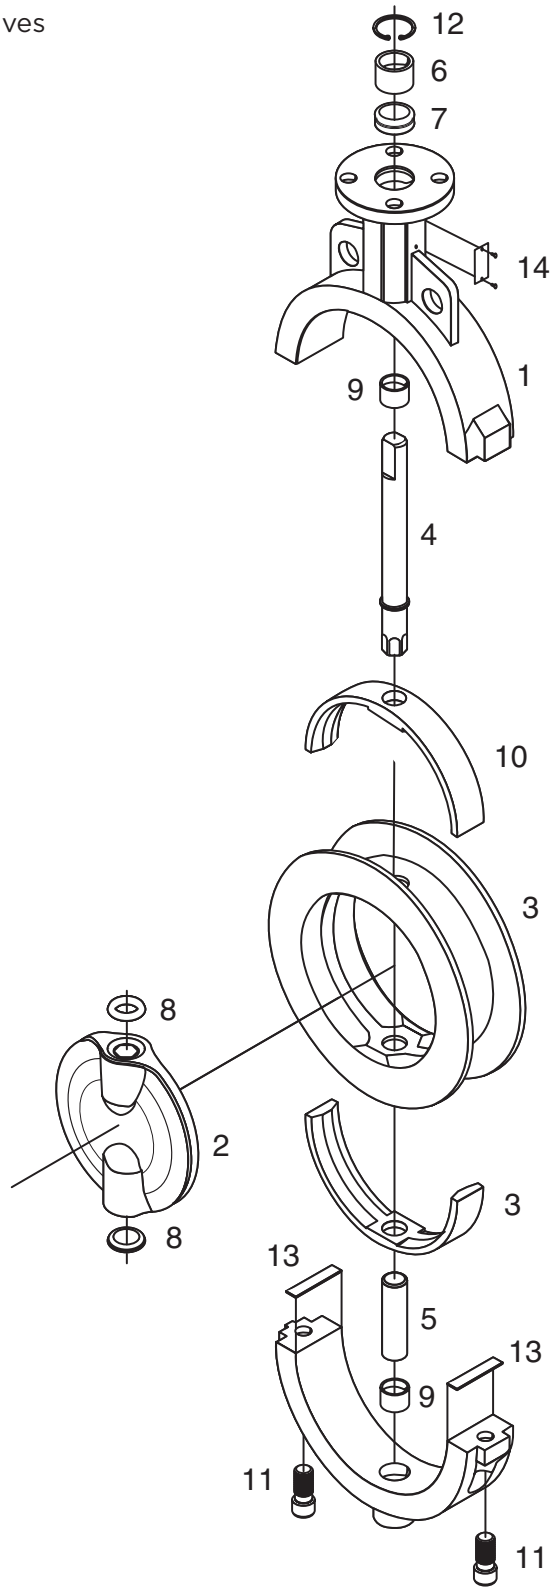
7.2.4 Insert the upper and lower stems.

7.2.5 Slip one seat energizer strip onto the lower portion of the upper shaft.

7.2.6 Insert the upper shaft with the pre-installed seat energizer strip into the disc/seat sub assembly.

7.2.7 Drive the upper shaft into the disc and slip one seat energizer strip onto the lower shaft.

7.2.8 Rotate the disc into the open position and insert the disc/seat/stems/energizer sub assembly into the upper body half.



7.2.9 Place the lower body half over the seat, and ensure that both body halves are properly aligned (identified by cast-on markings.

7.2.10 Attach and tighten the body fasteners.

8.0 Appendix C - Series 30/31 Resilient Seated Butterfly Valves

8.1 Disassembly

8.1.1 Remove the handle, gear operator, or power actuator from actuator mounting flange.

8.1.2 Remove the "Spirolox"® retaining ring and the two C-ring stem retainers from the stem hole.

8.1.3 Then remove the stem, bushing and seal.

8.1.4 Remove the disc from the seat, protecting the disc edge at all times.

8.1.5 Push the seat into an oval shape, and then remove the seat from the body.

8.2 Assembly

8.2.1 Push the valve seat into an oval and push it into the body with seat stem holes aligned to body stem holes.

NOTICE

When installing the seat the larger hole should be on top and the smaller hole should be on bottom.

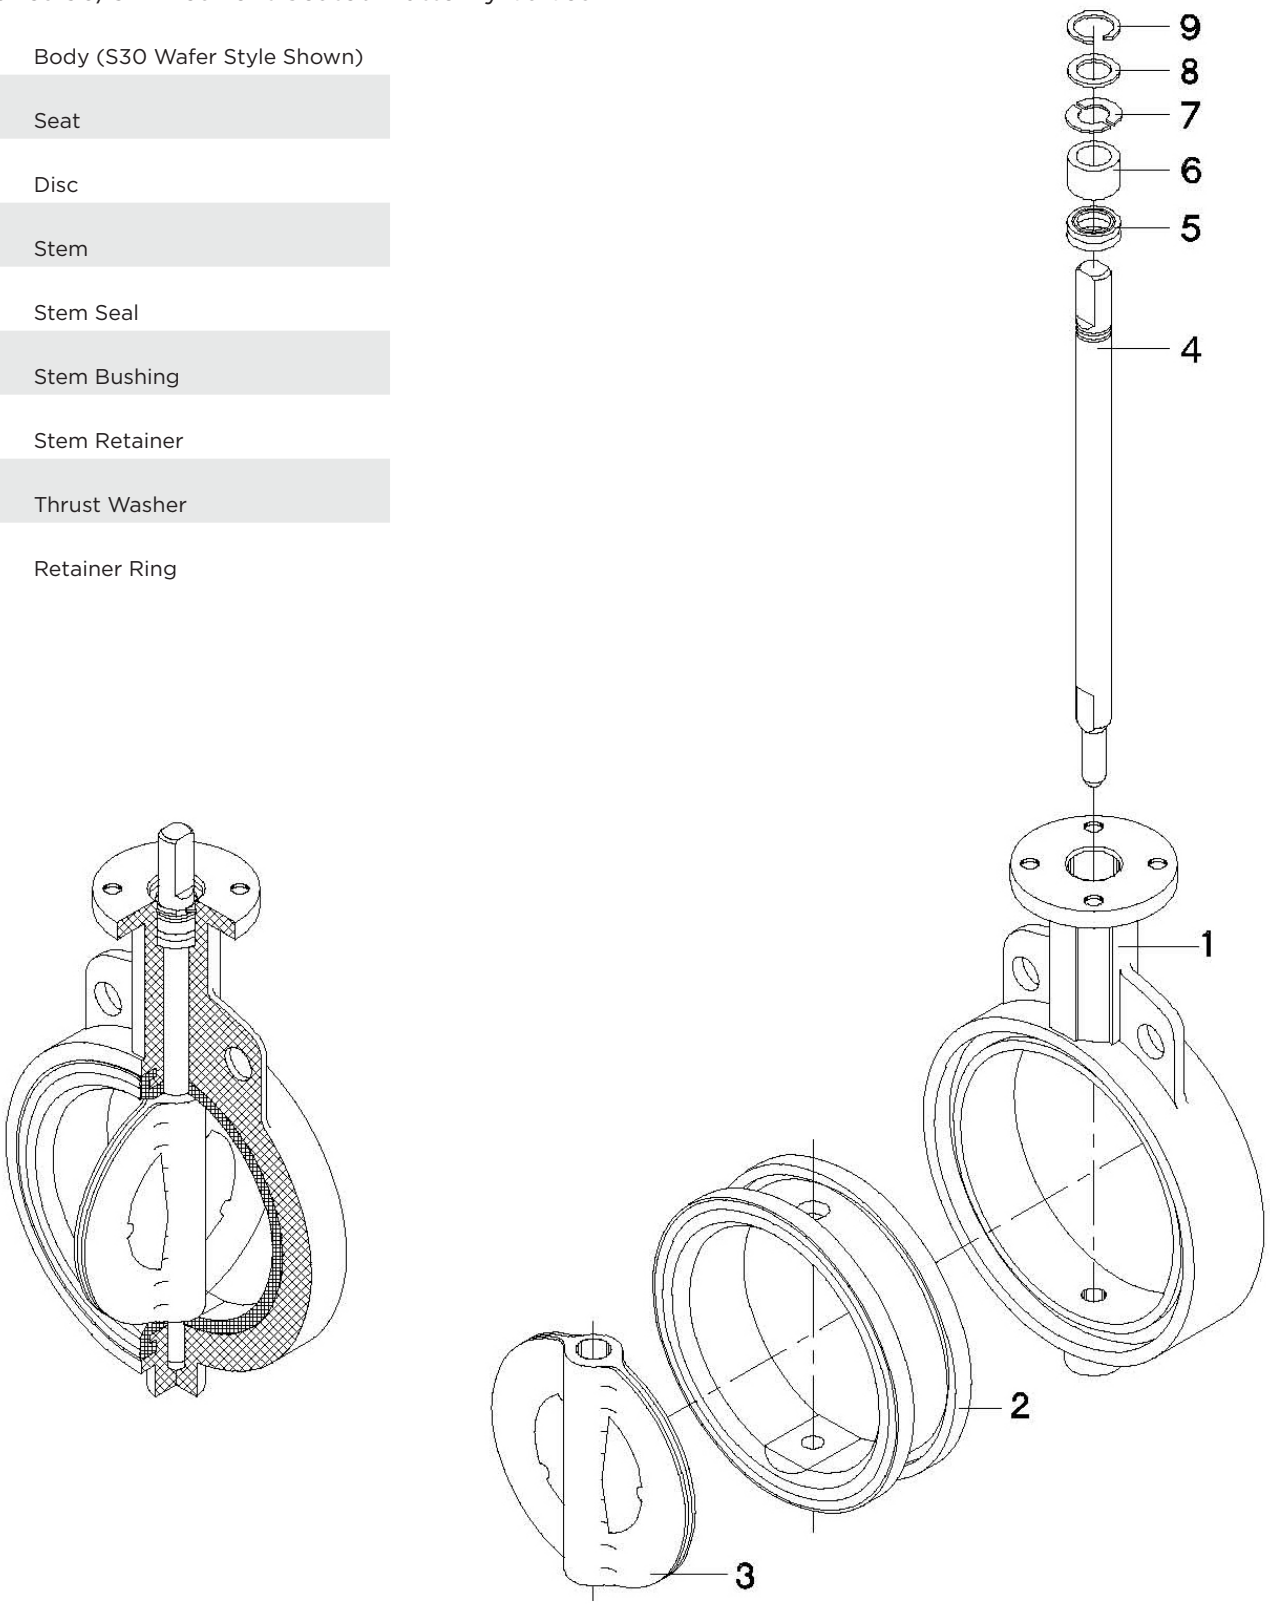
8.2.2 Insert stem seal and bushing.

8.2.3 Push stem into the stem hole of the body until the bottom of the stem is flush with the inner top edge of the seat.

8.2.4 Install a light coating of silicone or grease on the I.D. of seat. Insert the disc into the seat by lining up the disc holes with the stem holes of the seat. **Note: The broached double "D" flats in the disc must be toward the bottom of the valve body.**

8.2.5 With a downward pressure and rotating the stem back and forth, push the stem until the stem touches the bottom of the body stem hole.

8.2.6 Make certain that when pushing the stem through the disc bottom, the broached flats of stem and disc are aligned.



8.2.7 Replace the stem bushing and two stem retainers, then replace the "Spirolox"® retaining ring back into position.

8.2.8 Replace handle, manual gear operator or power actuator on the actuator mounting flange.

9.0 Appendix D - Series 3A/3AH Resilient Seated Butterfly Valves

9.1 Disassembly

9.1.1 Remove the handle, gear operator, or power actuator from actuator mounting flange.

9.1.2 Remove the "Spirolox"® retaining ring and the two C-ring stem retainers from the stem hole.

9.1.3 Then remove the stem, bushing and seal.

9.1.4 Remove the disc from the seat, protecting the disc edge at all times.
Note: The seat is bonded to the body and is not easily field replaceable. Please contact your local Bray representative for seat replacement.

9.2 Assembly

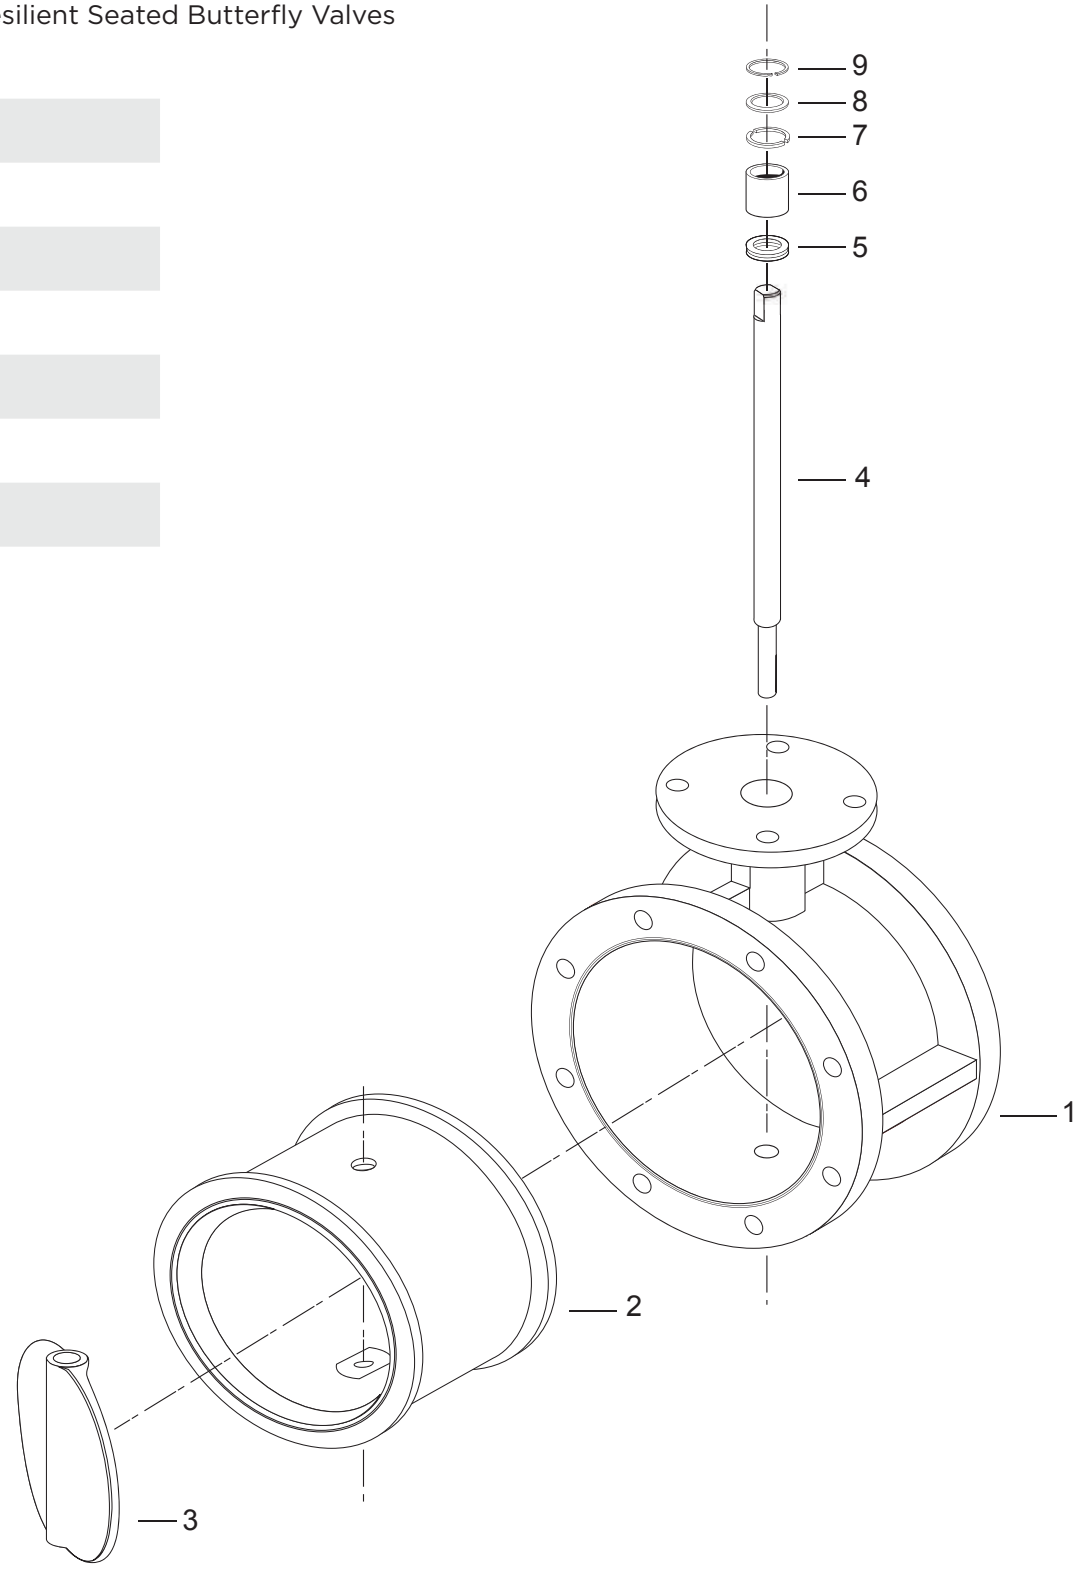
9.2.1 Insert stem seal and bushing.

9.2.2 Push stem into the stem hole of the body until the bottom of the stem is flush with the inner top edge of the seat.

9.2.3 Install a light coating of silicone or grease on the I.D. of seat. Insert the disc into the seat by lining up the disc holes with the stem holes of the seat. Note: The broached double "D" flats in the disc must be toward the bottom of the valve body.

9.2.4 With a downward pressure and rotating the stem back and forth, push the stem until the stem touches the bottom of the body stem hole.

9.2.5 Make certain that when pushing the stem through the disc bottom, the broached flats of stem and disc are aligned.



9.2.6 Replace the stem bushing and two stem retainers, then replace the "Spirolox"® retaining ring back into position.

9.2.7 Replace handle, manual gear operator or power actuator on the actuator mounting flange.

10.0 Appendix E - Series 31H Resilient Seated Butterfly Valves

10.1 Disassembly

10.1.1 Remove the handle, gear operator, or power actuator from actuator mounting flange.

10.1.2 Remove the "Spirolox"® retaining ring and the two C-ring stem retainers from the stem hole.

10.1.3 Then remove the stem, bushing and seal.

10.1.4 Remove the disc from the seat, protecting the disc edge at all times.
Note: Valve is provided with the seat bonded to the body and therefore is not easily field replaceable. Please contact your local Bray representative for seat replacement.

10.2 Assembly

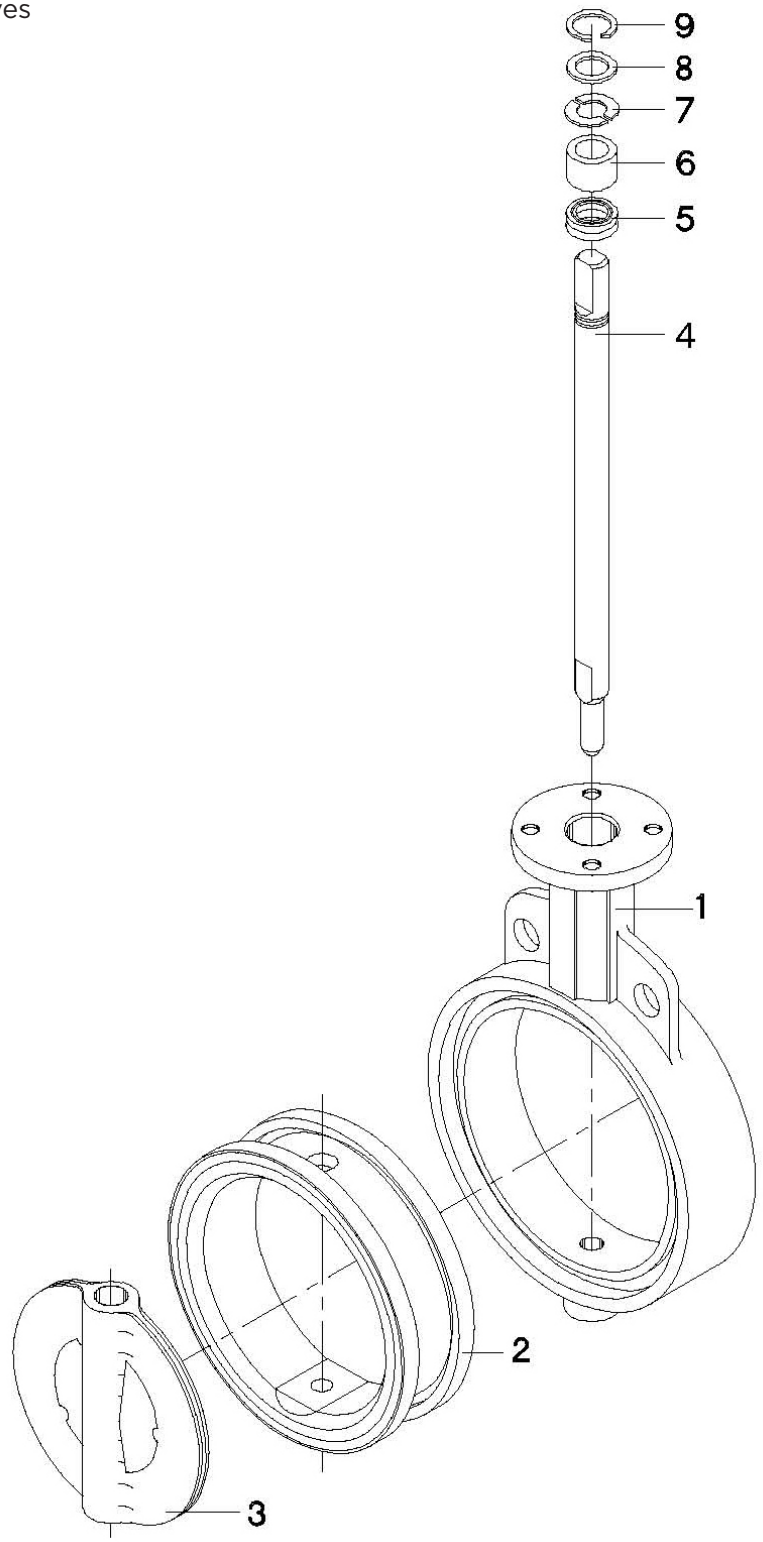
10.2.1 Insert stem seal and bushing.

10.2.2 Push stem into the stem hole of the body until the bottom of the stem is flush with the inner top edge of the seat.

10.2.3 Install a light coating of silicone or grease on the I.D. of seat. Insert the disc into the seat by lining up the disc holes with the stem holes of the seat.
Note: The broached double "D" flats in the disc must be toward the bottom of the valve body.

10.2.4 With a downward pressure and rotating the stem back and forth, push the stem until the stem touches the bottom of the body stem hole.

10.2.5 Make certain that when pushing the stem through the disc bottom, the broached flats of stem and disc are aligned.



109.2.6 Replace the stem bushing and two stem retainers, then replace the "Spirolox"® retaining ring back into position.

10.2.7 Replace handle, manual gear operator or power actuator on the actuator mounting flange.

11.0 Appendix F - Series 31U Resilient Seated Butterfly Valves

11.1 Disassembly

11.1.1 Remove the handle, gear operator, or power actuator from actuator mounting flange.

11.1.2 Remove the "Spirolox"® retaining ring and the two C-ring stem retainers from the stem hole.

11.1.3 Then remove the top stem bushing and seal, upper stem and retaining rod.

11.1.4 Remove the disc from the seat, protecting the disc edge at all times.

11.1.5 The upper and lower stem bearings will remain in the valve behind the seat.
Note: The seat is bonded to the body and is not easily field replaceable. Please contact your local Bray representative for seat replacement.

11.2 Assembly

11.2.1 Install a light coating of silicone or grease on the I.D. of seat.

11.2.2 Insert the lower stem inside the disc before inserting the disc into the seat.

11.2.3 Insert the disc into the seat by lining up the disc holes with the stem holes of the seat.

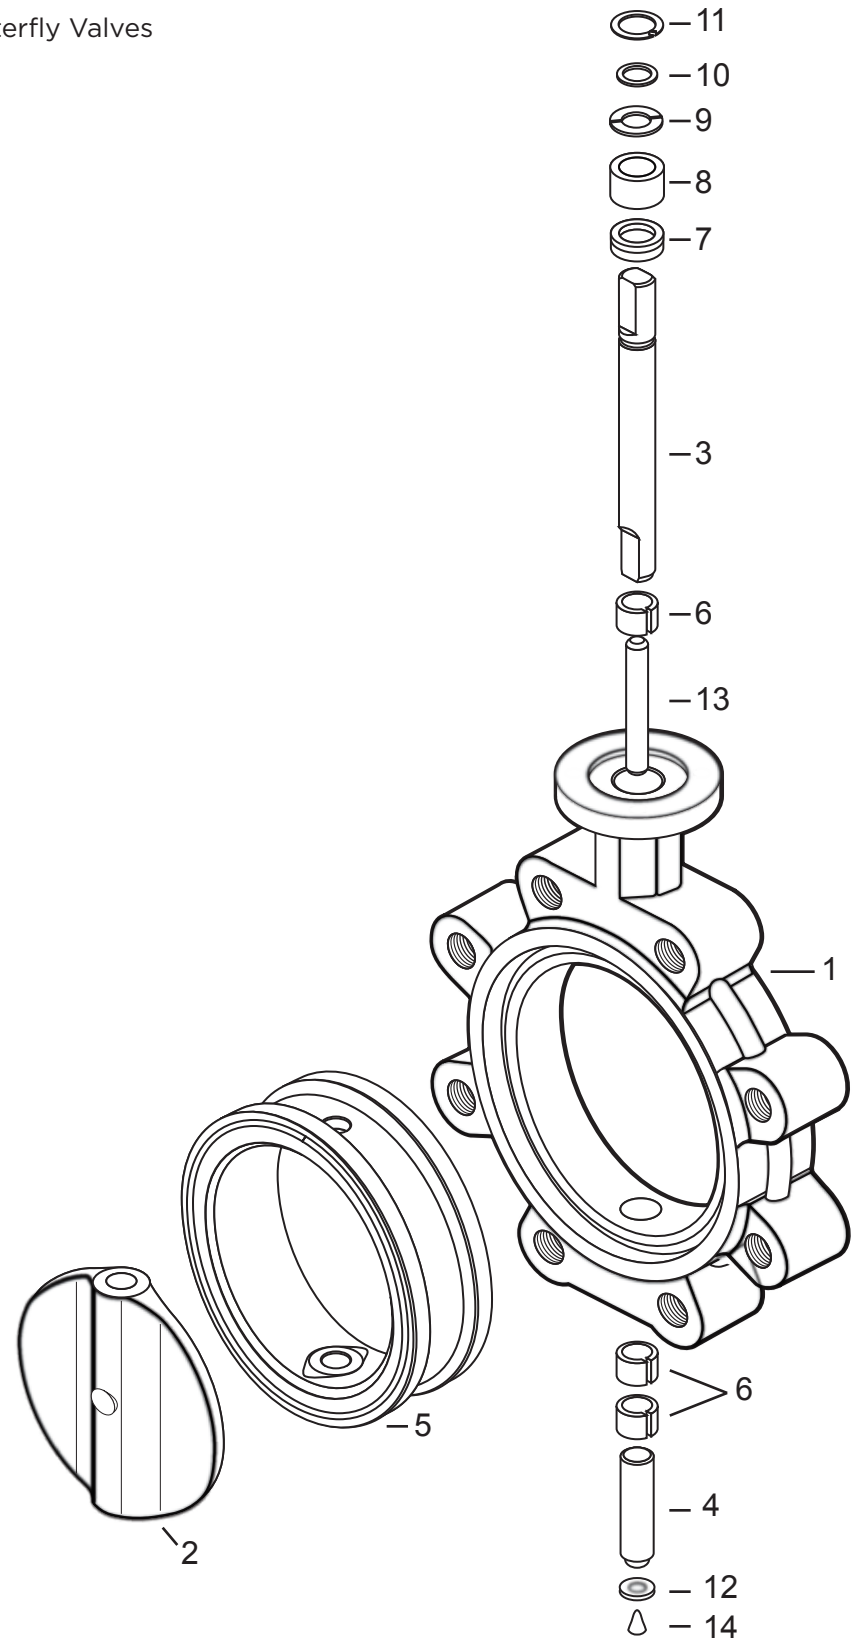
11.2.4 Line up the disc using a T-Bar (Allan key style)

11.2.5 With a downward pressure and rotating the T-Bar back and forth, push the lower stem until the lower stem touches the bottom of the body stem hole recess.
Note: The broached double "D" flats in the disc must be toward the bottom of the valve body.

11.2.6 Make certain that when pushing the stem through the disc bottom, the broached flats of stem and disc are aligned.

11.2.7 Insert the spacer bar and upper stem into the disc and valve.

11.2.8 Replace the top stem bushing and seal and two stem retainers.



11.2.9 Then replace the two "C" ring stem retainers and the "Spirolox"® retaining ring back into position in the top stem hole.
Note: It is recommended that a torque and seat test be done to confirm all is in order with the maintenance of the valve.

11.2.10 Replace the handle, manual gear operator or power actuator on the actuator mounting flange.

12.0 Appendix G - Series 32/33 Resilient Seated Butterfly Valves

12.1 Disassembly

12.1.1 Remove the gear operator or power actuator from the actuator mounting flange.

12.1.2 Secure the valve in a horizontal position with the taper-pin nuts facing upward.

⚠ CAUTION

Prior to removal of the valve stem the valve disc must be secured and supported to insure it does not drop out of the valve body once the stem is removed. Lay the valve down with two wood blocks located under the disc at the 6 o'clock and 12 o'clock positions making sure the blocks are in close contact with the disc but not supporting the valve.

121.1.4 Remove the packing gland by removing the retaining screws and sliding the gland off the top of the stem.

12.1.5 Remove bottom plate and thrust bearing to expose bottom of stem.

12.1.6 Remove nuts and washers from ends of taper pins and drive taper pins out of the disc. Avoid damaging the disc coating or surface when removing taper-pins.

12.1.7 Once taper-pins are removed, drive the stem, bushing, and packing out of the valve body through the top.

12.1.8 Remove the disc from the seat, protecting disc edge at all times.

12.1.9 Push the seat into an oval shape, and then remove the seat from the body.

12.2 Assembly

12.2.1 Replace bottom thrust bearing and plate.

12.2.2 Push the seat into an oval and push it into the body with seat stem holes aligned to body stem holes.

12.2.3 De-bur taper-pin grooves in the stem.

12.2.4 Push stem into stem hole of body until the bottom of the stem is flush with the inner top edge of the seat.
Note: The end of the stem containing the keyway must be toward the top of the valve body.

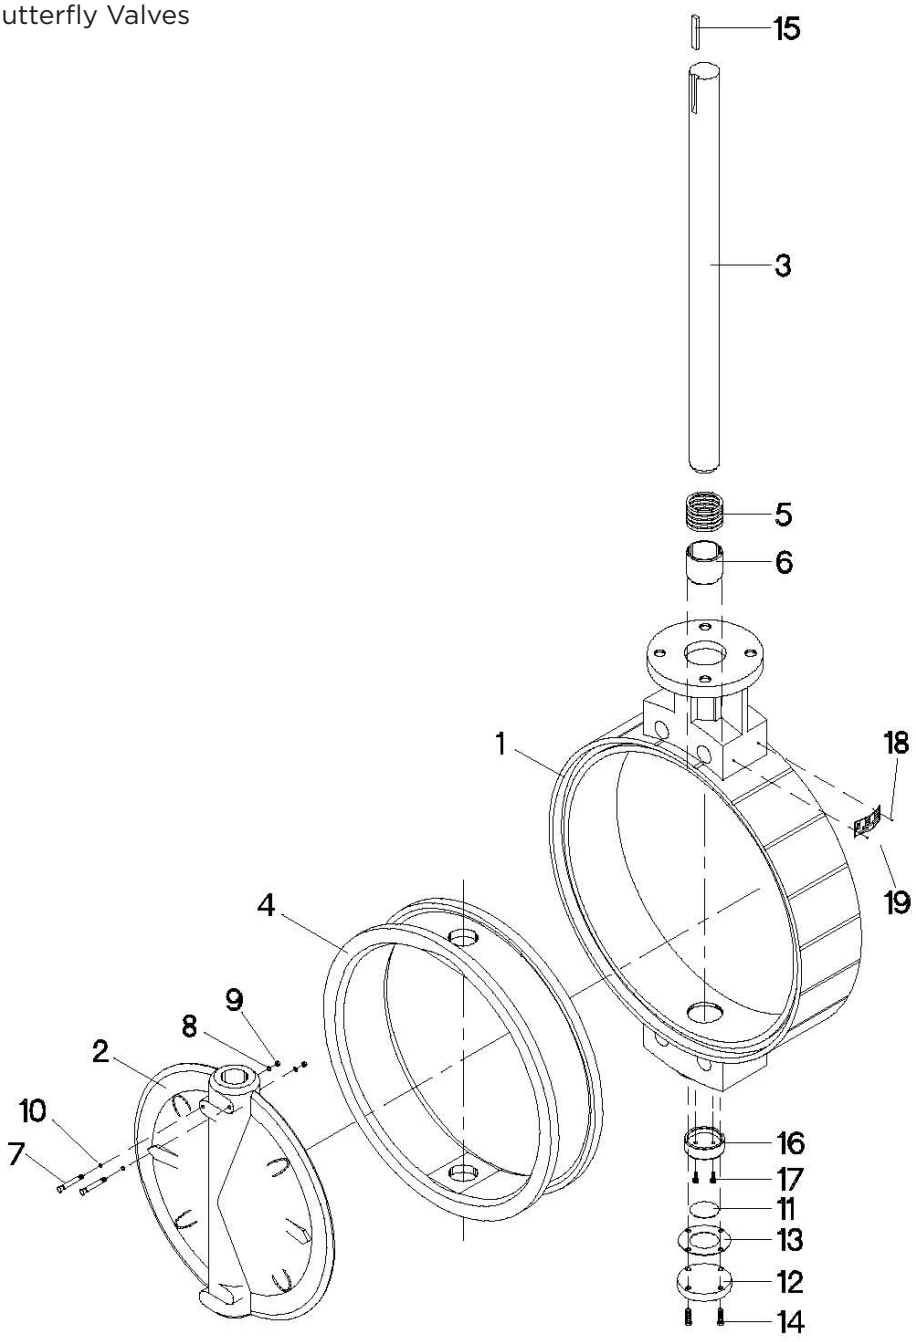
12.2.5 Install a light coating of silicone or grease on the I.D. of the seat.

12.2.6 Insert the disc into the seat by lining up the disc hole with the upper stem hole of the seat.

12.2.7 With a downward pressure and rotating the stem back and forth, push the stem until the stem touches the bottom of the body stem hole.
Note: Make certain that when pushing the stem to the bottom of the body, the taper-pin grooves in the stem line up with the holes in the disc face.

12.2.8 Tap the taper-pins into their holes from the large side of the hole, making sure the pins fit tightly in the hole and allow no movement of the stem in the disc.
Note: Ensure that the taper-pin o-rings are in place before completing valve assembly.

12.2.9 Replace the washers and nuts on the ends of the taper-pins.



12.2.10 Replace bushing, packing, and packing gland, and then tighten the retaining screws snugly.

12.2.11 Replace manual gear operator or power actuator on the actuator mounting flange.

13.0 Appendix H - Series 35/36 Resilient Seated Butterfly Valves (Taper Pin Disc/Stem Connection)

13.1 Disassembly

13.1.1 Remove the gear operator or power actuator from the actuator mounting flange.

13.1.2 Secure the valve in a horizontal position with the taper-pin nuts facing upward.

⚠ CAUTION

Prior to removal of the valve stem the valve disc must be secured and supported to insure it does not drop out of the valve body once the stem is removed. Lay the valve down with two wood blocks located under the disc at the 6 o'clock and 12 o'clock positions making sure the blocks are in close contact with the disc but not supporting the valve.

13.1.3 Remove the packing gland by removing the retaining screws and sliding the gland off the top of the stem.

13.1.4 Remove bottom plate and thrust bearing to expose bottom of stem.

13.1.5 Remove nuts and washers from ends of taper pins and drive taper pins out of the disc. Avoid damaging the disc coating or surface when removing taper-pins.

13.1.6 Once taper-pins are removed, drive the stem, bushing, and packing out of the valve body through the top.

13.1.7 Remove the disc from the seat, protecting disc edge at all times.

13.1.8 Push the seat into an oval shape, and then remove the seat from the body.
Note: Valves 54" and larger are provided with the seat bonded to the body and therefore is not easily field replaceable. Please contact your local Bray representative for seat replacement.

132.2 Assembly

13.2.1 Replace bottom thrust bearing and plate.

13.2.2 Push the seat into an oval and push it into the body with seat stem holes aligned to body stem holes.
Note: Valves 54" and larger are provided with the seat bonded to the body and therefore is not easily field replaceable. Please contact your local Bray representative for seat replacement.

13.2.3 De-bur taper-pin grooves in the stem.

13.2.4 Push stem into stem hole of body until the bottom of the stem is flush with the inner top edge of the seat.
Note: The end of the stem containing the keyway must be toward the top of the valve body.

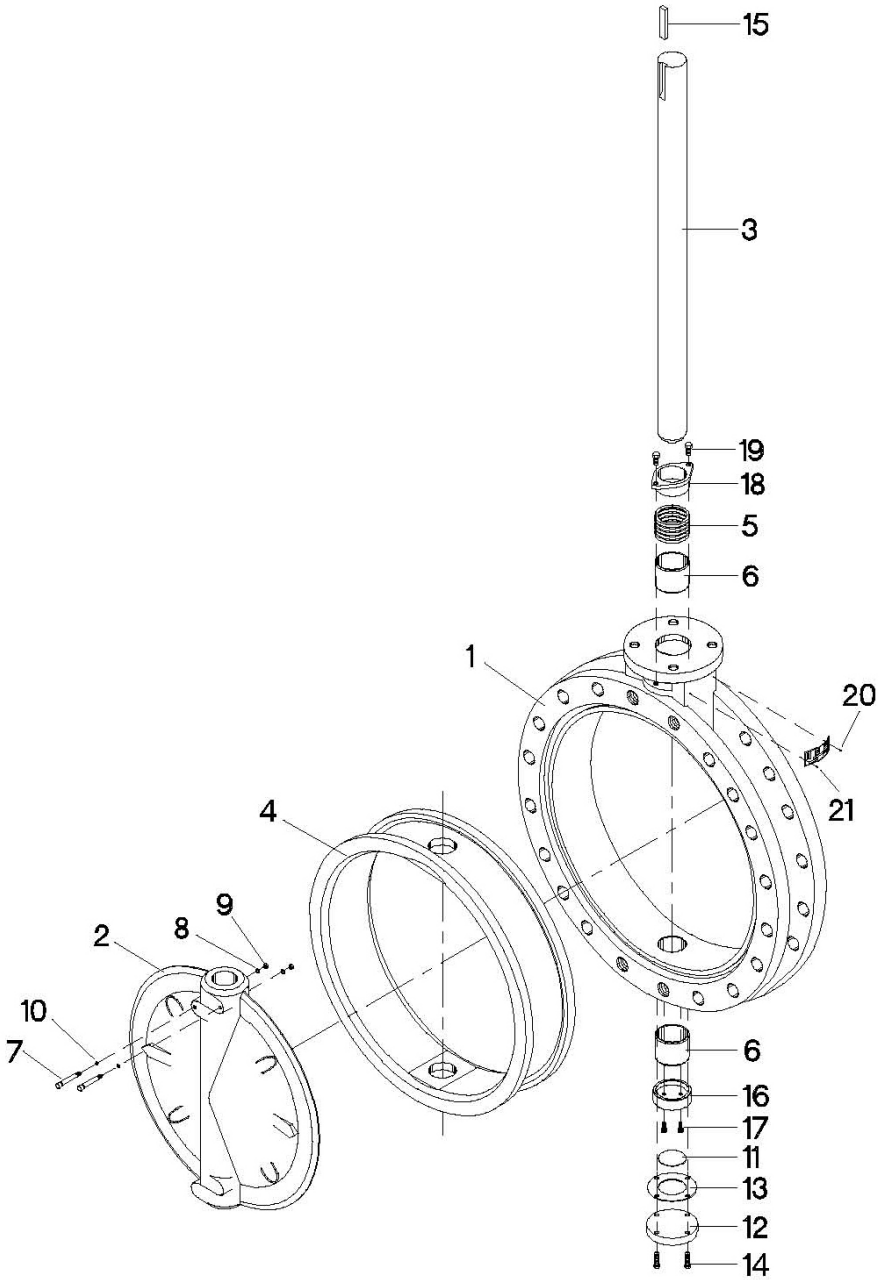
13.2.5 Install a light coating of silicone or grease on the I.D. of the seat.

13.2.6 Insert the disc into the seat by lining up the disc hole with the upper stem hole of the seat.

13.2.7 With a downward pressure and rotating the stem back and forth, push the stem until the stem touches the bottom of the body stem hole.
Note: Make certain that when pushing the stem to the bottom of the body, the taper-pin grooves in the stem line up with the holes in the disc face.

13.2.8 Tap the taper-pins into their holes from the large side of the hole, making sure the pins fit tightly in the hole and allow no movement of the stem in the disc.
Note: Ensure that the taper-pin o-rings are in place before completing valve assembly.

13.2.9 Replace the washers and nuts on the ends of the taper-pins.



13.2.10 Replace bushing, packing, and packing gland, and then tighten the retaining screws snugly.

13.2.11 Replace manual gear operator or power actuator on the actuator mounting flange.

14.0 Appendix I - Series 35/36 Resilient Seated Butterfly Valves (Internal Spiine or Keyed Disc/ Stem Connection)

14.1 Disassembly

14.1.1 Remove the gear operator or power actuator from the actuator mounting flange.

14.1.2 Secure the valve in a horizontal position.

CAUTION

Prior to removal of the valve stems the valve disc must be secured and supported to insure it does not drop out of the valve body once the stems are removed. Lay the valve down with two wood blocks located under the disc at the 6 o'clock and 12 o'clock positions making sure the blocks are in close contact with the disc but not supporting the valve.

14.1.3 Removal of the lower valve stem:
- > Remove the bottom plate screws, bottom plate, bottom plate gasket and thrust bearing.
- > Remove the locking nut from the tie bolt.
- > Remove the stem retainer.
- > Secure a hoist to the lower stem (end is imperial threaded).
- > Then use the hoist to remove the lower stem from the valve body.
- > Remove the stem bearing.

14.1.4 Removal of the upper valve stem:
- > Remove the packing gland by removing the retaining screws and sliding the gland off the top of the stem.
- > Secure a hoist to the upper stem (end is imperial threaded).
- > Then use the hoist to remove the upper stem including the tie bolt from the valve body.

14.1.5 Removal of the valve disc:
- > Remove the wood blocks noted above from below the disc.
- > Using a rubber hammer, pound one area of the disc (ex. 12 o'clock position) repeatedly until the disc clears the face of the valve body.

14.1.6 Removal of packing and bearings:
- > Remove the stem packing.
- > Use a slotted screwdriver to carefully remove the upper and lower stem bearings.

14.1.7 Removal of the valve seat:
Note: Valves 54" and larger are provided with the seat bonded to the body and therefore is not easily field replaceable. Please contact your local Bray representative for seat replacement.

WARNING

Set the valve body in an upright position and secure it in a floor vice capable of handling the weight of the valve body and seat.
Note: Be sure to not clamp the seat in the vice.

14.1.8 Insert a slotted screwdriver into the space between the body and the seat on the face of the valve at the 12 o'clock position.

14.1.9 Carefully leverage the seat away from the body.

14.1.10 Push the seat into an oval shape and remove the seat from the body.

14.0 Appendix I - Series 35/36 Resilient Seated Butterfly Valves (Internal Spiine or Keyed Disc/ Stem Connection)

14.2 Assembly

14.2.1 Installation of the valve seat:

Note: Valves 54" and larger are provided with the seat bonded to the body and therefore is not easily field replaceable. Please contact your local Bray representative for seat replacement.

⚠ WARNING

Set the valve body in an upright position and secure it in a floor vice capable of handling the weight of the valve body and seat.

Note: Be sure to not clamp the seat in the vice.

- Check to assure the interior surface of the valve body is clean.
- Install a light coating of silicone lubricant on the interior surface of the valve body.
- Push the seat into an oval and push it into the body with seat stem holes aligned to the body stem holes.

14.2.2 Installation of the valve disc:

Note: Before installing the disc, check to assure the upper and lower stems are matched to the upper and lower stem holes in the disc.

- With the valve still in the vice in a vertical position, hoist the upper stem with the splined end or the double keyed end pointing upward.
- Push the upper stem into the stem hole of the upper body until the bottom of the stem exceeds the upper stem hole of the seat by 20-50 mm.
- Apply a light coating of silicone or grease on the I.D. of the seat.
- Insert the disc into the seat with the splined end or the double keyed end up.
- Push the disc into the seat while inserting the upper stem into the upper stem hole in the disc.
- Adjust the disc to assure the lower stem hole of the disc is properly aligned with the lower body stem hole.

14.2.3 Installation of the lower stem:

- Close the valve so that the disc is inside the edge of the seat.
- Carefully place the valve in a horizontal position assuring that there is no damage to the body and disc coatings and disc edge.
- Insert the stem bearing into the bottom stem hole of the body.
- Insert the lower stem into the body and disc.

Note: The cone-shaped end of the lower stem should be toward the center of the disc.

14.2.4 Installation of the upper stem:

⚠ CAUTION

Hoist the valve to an angle and secure it (be careful not to go to high so the lower stem does not drop out).

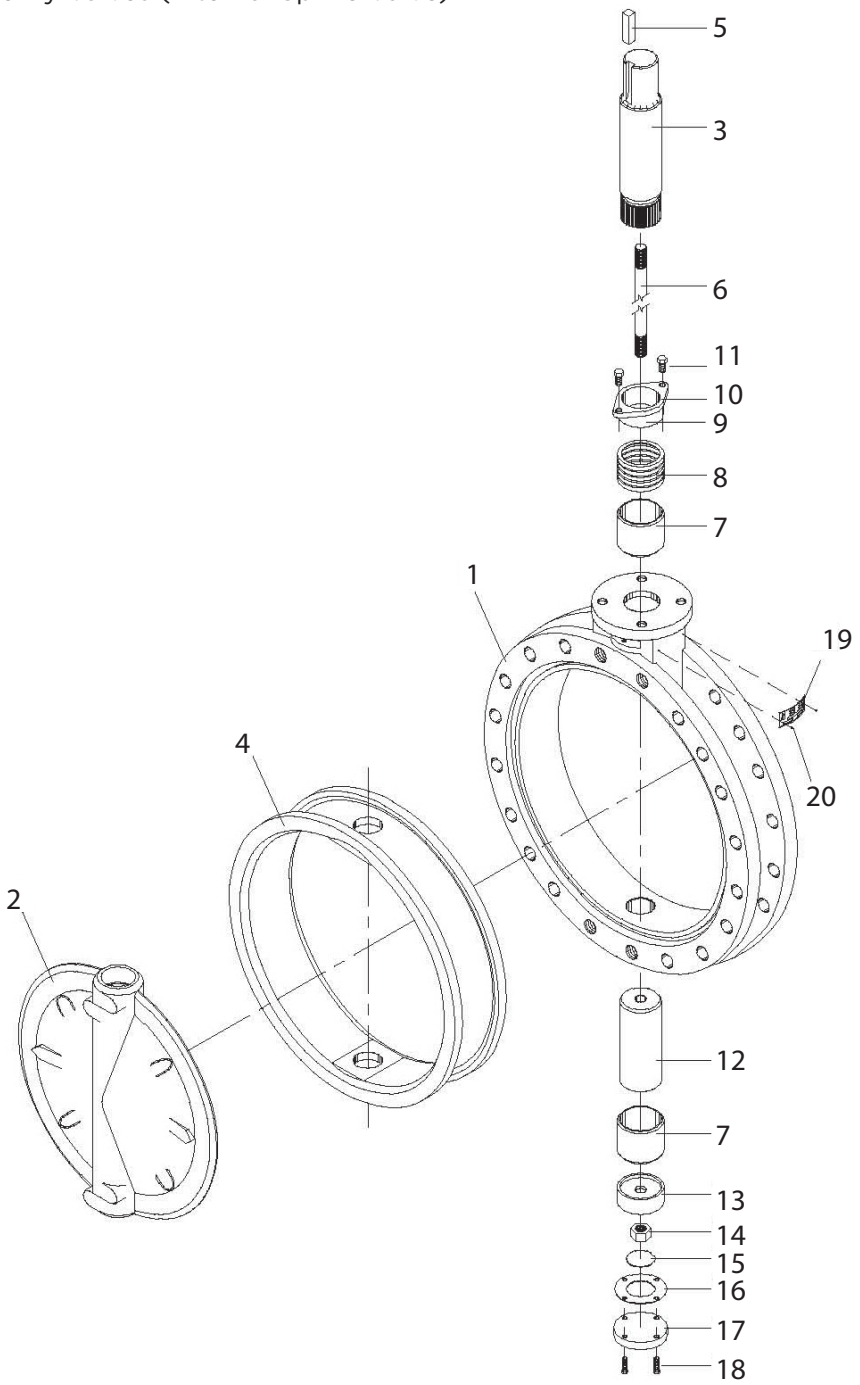
- Remove the upper stem from the valve.
- Screw the tie bolt with lock nut to the splined or the double keyed end of the upper stem, tighten the lock nut and insert the upper stem into the valve with the tie bolt end first.

Note: The tie bolt will go through the disc and reach to the bottom of the valve.

Note: During this step, the keyway of the upper stem should be vertical to the front face of the valve.

14.2.5 Installation of packing and bearings (upper valve stem):

- Insert the stem bearing into the top hole of the body followed by the stem packing and packing gland follower.
- Use two hexagon bolts to fasten the packing gland.



14.2.6 Installation of packing and bearings (lower valve stem):

- Insert the stem retainer into the bottom hole of the body using a nut to fasten it.
- Install the locking nut on the tie bolt.
- Install the thrust bearing, bottom plate gasket and bottom plate follower.
- Use four hexagon bolts to fasten the bottom plate tightly.

15.0 Appendix J - Series 36H Resilient Seated Butterfly Valves

15.1 Disassembly

15.1.1 Remove the gear operator or power actuator from the actuator mounting flange.

15.1.2 Secure the valve in a horizontal position with the taper-pin nuts facing upward.

⚠ CAUTION

Prior to removal of the valve stem the valve disc must be secured and supported to insure it does not drop out of the valve body once the stem is removed. Lay the valve down with two wood blocks located under the disc at the 6 o'clock and 12 o'clock positions making sure the blocks are in close contact with the disc but not supporting the valve.

15.1.3 Remove the packing gland by removing the retaining screws and sliding the gland off the top of the stem.

15.1.4 Remove bottom plate and thrust bearing to expose bottom of stem.

15.1.5 Remove nuts and washers from ends of taper pins and drive taper pins out of the disc. Avoid damaging the disc coating or surface when removing taper-pins.

15.1.6 Once taper-pins are removed, drive the stem, bushing, and packing out of the valve body through the top.

15.1.7 Remove the disc from the seat, protecting disc edge at all times.
Note: Valve is provided with the seat bonded to the body and therefore is not easily field replaceable. Please contact your local Bray representative for seat replacement.

15.2 Assembly

15.2.1 Replace bottom thrust bearing and plate.

15.2.2 De-bur taper-pin grooves in the stem.

15.2.3 Push stem into stem hole of body until the bottom of the stem is flush with the inner top edge of the seat.
Note: The end of the stem containing the keyway must be toward the top of the valve body.

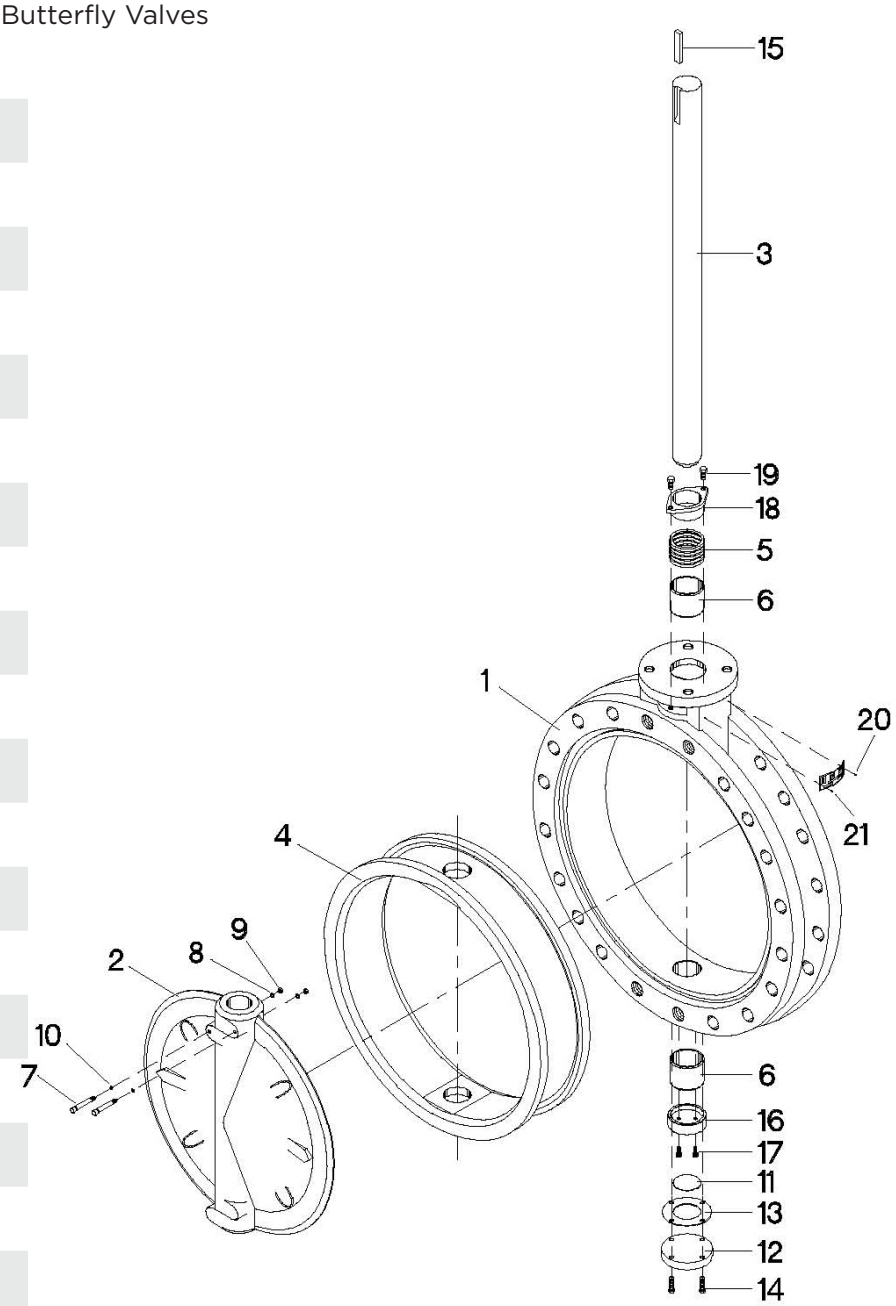
15.2.4 Install a light coating of silicone or grease on the I.D. of the seat.

15.2.5 Insert the disc into the seat by lining up the disc hole with the upper stem hole of the seat.

15.2.6 With a downward pressure and rotating the stem back and forth, push the stem until the stem touches the bottom of the body stem hole.
Note: Make certain that when pushing the stem to the bottom of the body, the taper-pin grooves in the stem line up with the holes in the disc face.

15.2.7 Tap the taper-pins into their holes from the large side of the hole, making sure the pins fit tightly in the hole and allow no movement of the stem in the disc.
Note: Ensure that the taper-pin o-rings are in place before completing valve assembly.

15.2.8 Replace the washers and nuts on the ends of the taper-pins.



15.2.9 Replace bushing, packing, and packing gland, and then tighten the retaining screws snugly.

15.2.10 Replace manual gear operator or power actuator on the actuator mounting flange.

BRAY

SERIES 63, SOLENOID VALVE

LEFT BLANK

Bray Series 63-N4/N7 Installation & Maintenance Instructions

General Purpose/Rain Tight/Water Tight and Rain Tight/Water Tight/Explosion Proof

For S63-N4 see O&M Instructions for information on: Operation, Positioning, Mounting, Cleaning, Preventive Maintenance, Causes of Improper Operation, Disassembly, and Reassembly of basic valve.

DESCRIPTION

S63 N4/N7 Solenoid coils are thermoplastic encapsulated pull-type for use with Bray solenoids. These solenoids have three lead wires with one wire for grounding and a ½ NPT male conduit connection. S63 N4 Solenoids are designed to meet Enclosure Type 1-General Purpose, Types 3 and 3S-Raintight, and Types 4 and 4X-Watertight. S63 N4/N7 Solenoids meet Enclosure Types 3 and 3S-Raintight, Types 4 and 4X-Watertight, Type 7 Explosion proof Class I, Division 1, Groups A, B, C, & D and Type 9 - Dust - Ignition proof Class II, Division 1, Groups E, F, & G.

STORAGE

Bray Series 63 N4/N7 are not weatherproof until the unit is properly installed, or all conduits and applicable port connections are sealed off and prepared for storage. The units may be shipped with temporary covers to prevent foreign matter from entering through the conduit openings; however, the user is responsible for replacing with the proper sealing plugs to support its NEMA/IP ratings.

To prevent condensation from forming inside the unit, maintain a near constant external temperature and store indoors in a well ventilated, clean, dry room. The temperature shall be between 40°F (4°C) and 85°F (29°C), with a relative humidity less than 70%. Store units away from vibration and direct sunlight exposure, and place units on a shelf or wooden pallet in order to protect against dampness. Keep units covered to protect against dust and dirt; if storing for long term, placing the unit inside a plastic sealed bag may be preferred.

Bray cannot accept responsibility for deterioration caused on-site once the cover is removed or due to improper storage.

OPERATION

When the solenoid is energized, the core assembly is drawn into the plugnut/core tube sub-assembly. When the solenoid is de-energized, spring force returns the core assembly to the original position.

Enclosure Types 7 and 9 Only

CAUTION

To prevent fire or explosion, do not install solenoid and/or valve where ignition temperature of hazardous atmosphere is less than 160° C. Open circuit before disassembling.

Positioning

Solenoid may be mounted in any position.

Valve Mounting

The solenoid is assembled onto an actuator and is rigidly supported using the actuator body mounting provisions.

CAUTION

Solenoid coil wiring must be carried out by trained personnel.

Wiring

Wiring must comply with local codes and the National Electrical Code. The solenoid is provided with lead wires and one grounding wire, which is green or green with a yellow stripe. To facilitate wiring, the solenoid may be rotated 360° in 90° increments. To rotate solenoid, remove the four mounting screws, reposition solenoid and replace screws. Torque screws evenly in a crisscross manner to 12 in-lbs [1.3 Nm].

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc. The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

Solenoids have a ½-14 NPT male thread. For connection to rigid metal conduit, metal type NPT electrical fittings should be used.

WARNING

For the watertight and explosion proof solenoid, electrical fittings must be approved for use in hazardous locations.

CAUTION

Temperature of external casing of coil can burn skin.

Solenoid Temperature

Standard solenoids are designed for continuous duty service. When the solenoid is energized for a long period, the solenoid becomes hot and can be touched by hand only for an instant. This is a safe operating temperature.

MAINTENANCE

WARNING

To prevent the possibility of personal injury or property damage, turn off electrical power, depressurize valve, and vent medium to a safe area before servicing. .

Cleaning

All solenoid valves should be cleaned periodically. The time between cleaning will vary depending on medium and service conditions. In general, if the voltage to the solenoid is correct, sluggish valve operation, excessive noise, or leakage will indicate that cleaning is required. In the extreme case, faulty valve operation will occur and the valve may fail to shift. Clean strainer or filter when cleaning the valve.

Preventive Maintenance

- Keep the medium flowing through the solenoid valve as free from dirt and foreign material as possible.
- While in service, the solenoid valve should be operated at least once a month to ensure proper opening and closing.
- Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. Replace any worn or damaged parts.

Causes of Improper Operation

- **Faulty Control Circuit:** Check the electrical system by energizing the solenoid. A metallic click signifies that the solenoid is operating. Absence of the click indicates loss of power supply. Check for loose or blown fuses, open-circuited or grounded solenoid, broken lead wires or splice connections.
- **Burned-Out Solenoid:** Check for open-circuited solenoid. Check supply voltage; it must be the same as specified on nameplate and marked on the solenoid. Check ambient temperature and check that the core is not jammed. If necessary, replace pilot valve.
- **Low Voltage:** Check voltage across the solenoid leads. Voltage must be at least 85% of rated voltage.

ORDERING INFORMATION FOR REPLACEMENT PILOT VALVE WITH SOLENOID:

1. Specify valve Catalog Number
2. Solenoid Catalog Number
3. Serial Number
4. Voltage
5. Frequency

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc. LEFT BLANK

BRAY

SERIES 01, MANUAL OPERATOR (LEVER)

LEFT BLANK

Series 01 Handle and Notch-Plate

Bray offers handle assemblies for standard Resilient Seated Valves from 1"-6" [25-152 mm] (Through 12" [305 mm] with undercut disc assemblies). These quarter turn handles have a locking spring and a directional pointer for valve disc position indication. Bolted notch plates with on-off stops to prevent over rotation of the valve disc complete the assembly.

WARNING: Do not use handle or notch plate to lift a valve assembly.

The following procedure is recommended when mounting a Series 01 handle and notch plate on a resilient seated valve:

NOTE: For readjustment of the handle and notch plate assembly in the field, remove the handle and notch plate from the valve and remount according to the procedures below.

Figure 1

Figure 2

Step 1: Mount the handle without the notch plate and use it to assure that the "Double D" flats on the valve stem are aligned parallel with the face of the valve ***(See Figure 1)***.

NOTE: When mounting the Series 01 handle with the valve out of the line it is more accurate to measure from the face of the valve to the disc face at the 90° and 270° positions using the handle to adjust the disc until the measurements are equal ***(See Figure 2)***.

Step 2: Once the Double D flats on the stem and the disc are centered, remove the handle and attached the notch plate to the mounting pad on the valve with two (2) fasteners ***(See Figure 3)***. Do not tighten the bolts.

Step 3: Carefully replace the handle and make sure the latch on the lever properly engages the first notch ***(See Figure 4)***.

Step 4: Tighten the notch plate fasteners.

Figure 3

Figure 4

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.

The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

LEFT BLANK

BRAY

SERIES 04, MANUAL OPERATOR (HANDWHEEL)

LEFT BLANK

Series 04 Gear Operator Mounting and Lubrication Instructions

For heavy-duty on-off and throttling service of 2" – 48" (51-1219 mm) Quarter Turn Valves. The Series 04 gear operator is self lubricated for smooth trouble-free operation. The rugged cast iron body with o-ring body seals is weatherproof to IP65. A self locking worm and worm gear drive holds the valve in the desired position. Features include a readily accessible hand-wheel, a valve position indicator and mechanical travel stops which permit field adjustment of valve position to specific degrees of rotation.

WARNING

Gear operator handwheel is attached to manual override shaft with a split spring pin. The pin is designed to shear if excessive force is applied to handwheel before internal gears or housing is damaged. Gear operator with or without valve should never be lifted by handwheel.

The gear operator is mounted to the valve as follows:

- Manually operate the gear operator until the output shaft is in line with the valve stem. On valve sizes through 12" (305 mm) the valve stem will be aligned with the "double-D" stem. On valves larger than 12" (305 mm) the gear operator and valve stem alignment will be with the keyway on the full diameter stem.
- Place the correct stem adaptor, if required, onto the valve stem. It is recommended that a small amount of grease is applied to the adaptor for easier assembly to the valve stem and gear operator drive shaft.
- Install the mounting studs into the gear unit base mounting holes. The shorter threaded end fits into the gear unit base.

CAUTION

Care must be taken not to jam fingers or hand between gear operator and valve.

- Mount the gear unit onto the valve stem. Make certain that the mounting studs are correctly aligned with the holes on the top plate of the valve or the valve mounting bracket. It may be necessary to rotate the gear operator hand-wheel to align the studs with the mounting holes.
- Lower the gear operator onto the valve and secure in place by fitting the lock washers and hex nuts.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

Adjustment of travel stops in the field is achieved as follows:

(The instructions are for a standard clockwise to close application).

Adjustment of the "Closed" position travel stop:

Figure 1

Figure 2

- Looking on the end of the gear operator the right hand bolt is the close adjustment. ***(See Figure 1)***
- Remove the valve position indicator and view the position of the valve stem. ***(See Figure 2)***
- Rotate the close travel stop screw clockwise until the screw touches the quadrant.
- We have to consider that in the full closed position the stem "double D" flats align with the position of the valve disc ***(See Figure 3)***. Similarly on the full diameter stem the keyway position will align with the valve disc position.
- Loosen the lock nut and back off the close travel stop screw one turn in the counter-clockwise direction.
- Rotate the hand-wheel until the sides of the "double D" or the sides of the keyway are parallel with the face of the valve. ***(See Figure 4)***
- Verify that the "double D" or keyway is still parallel to the valve face.
- Carefully re-tighten the travel stop lock nut
- Replace the valve position indicator.
- At this point apply a sealant to the lock nut of the close travel stop to ensure that it will not be readjusted.
- When factory setting the close stop, as the valve is not in line, instead of aligning the shaft with the face of the valve, it is more accurate to measure from the face of the valve to the disc face at the 3 o'clock and 9 o'clock positions and adjust the gear unit until the measurements are equal.

Figure 3

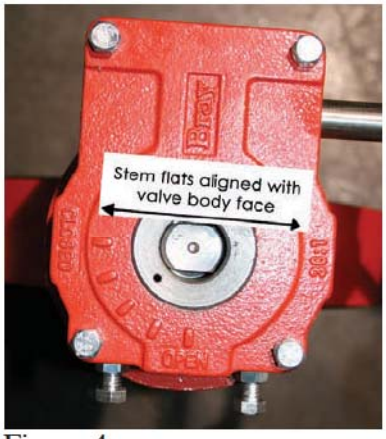

Figure 4

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

Adjustment of the "Open" position travel stop:

- Looking on the end of the gear operator the left hand bolt is the open adjustment.
- Remove the valve position indicator and view the position of the valve stem.
- We have to consider that in the full open position the stem "double D" flats align with the position of the valve disc. Similarly on the full diameter stem the keyway position will align with the valve disc position.
- Loosen the lock nut and back off the open travel stop screw one turn in the counter-clockwise direction.
- Rotate the hand-wheel until the sides of the "double D" or the sides of the keyway are perpendicular with the face of the valve.
- Rotate the open travel stop screw clockwise until the screw touches the quadrant.
- Verify that the "double D" or keyway is still perpendicular to the valve face.
- Carefully re-tighten the travel stop lock nut.
- Replace the valve position indicator.
- At this point apply a sealant to the lock nut of the open travel stop to ensure that it will not be readjusted.

Lubrication Procedures

These instructions are to be used during original assembly or during re-assembly after service for lubricating Series 04 worm gear operators. Proper lubrication is necessary to insure smooth operation and long life of the unit. Failure to adhere to these instructions may lead to loss of performance or premature failure of the operator.

I. Lubricant

The lubricant must be a high pressure or extreme pressure petroleum grease with a lithium based thickener, which meets the NLGI grade 2. The grease must exhibit a high degree of tackiness or stringiness, which enhances its ability to cling tenaciously to the lubricated surfaces.

The grease should meet the following specifications as a minimum. Any deviation below these specifications must be approved by the Bray USA Engineering Department.

Typical Properties	ASTM Test Method	Result
NLGI Grade Number		2
Soap Type		Lithium
Color		Brown
Mineral Oil Viscosity, SUS @ 210°F [100°C]	D2161	80
Penetration (Worked 60 Strokes)	D217	285
Dropping Point (Maximum Temperature)	D566	363°F [184°C]
Oil Separation	D1742	5.0%
Rust Preventative Test	D1743	Pass
Timken EP Test	D2509	45lbs [20.4kg]
Wheel Bearing Test (60mph [660rpm] @ 250°F [121°C] leakage)	D1263	2.8gms
Oxidation Stability 100hrs, psi drop	D942	6
Water Washout Test (% loss @ 175°F [80°C], typ.)	D1264	7

[1]National Lubricating Grease Institute

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

II. Application

Lubricate all gears, pinions, bearings, shafts, gaskets, seals (o-rings) and contact surfaces as they are being assembled.

- **Contact surfaces**
  Apply grease liberally to all mating surfaces.
- **O-Rings**
  Fill grooves with grease before installing o-rings.
- **Gaskets**
  Gasket and gasket surfaces should be greased on both sides prior to installation.
- **Bearings**
  Sleeve type bearings should be coated with grease before they are pressed into the housing. Thrust washers should be coated with grease on both sides prior to installation.
- **Shafts**
  Lubricate shafts before installing them into the housing.
- **Pinions and other spur gears**
  Grease should be applied to the gear teeth in such a way that it is carried through the meshing of the gears. After applying the grease, rotate the gears enough times so that the slowest gear in the set makes at least two (2) revolutions.
- **Worm and worm gear set**
  Lubricate both hubs and shoulders of the worm gear prior to installing it in the housing. Apply grease to the worm and worm gear teeth in such a way that it is carried through the meshing of the gears. After applying the grease, rotate the worm enough times so that the worm gear makes at least two (2) complete cycles (one cycle being from closed to open to closed or open-closed-open). After cycling, inspect and re-apply grease if necessary.

Note: Gear operators intended for marine service or buried service, and so specified on the Purchase Order or Sales Order, must have the housing(s) filled with grease.

All information herein is proprietary and confidential and may not be copied or reproduced without the expressed written consent of BRAY INTERNATIONAL, Inc.
The technical data herein is for general information only. Product suitability should be based solely upon customer's detailed knowledge and experience with their application.

CHEMLINE

TYPE 21, BALL VALVE

LEFT BLANK

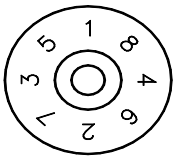
CHEMLINE Plastics Limited

Your Pipeline To Quality Valves, Strainers, Flowmeters and Controls

55 Guardsman Road
Thornhill, Ontario
L3T 6L2
Canada
Tel: 905-889-7890
Fax: 905-889-8553

MAINTENANCE & INSTALLATION INSTRUCTIONS
For Chemline Type 21 True Union Ball Valve Size 1/2"- 4"

Installation:



1. Make sure all surfaces are clear and free of debris prior to installing valve in pipeline. Pipeline should be empty at connection site.

2. Valve should be set to the closed position.

3. When installing valves with socket connections, ensure that only PVC solvent cement is used. Excessive use of cement can cause sticking in the valve interior, therefore use caution when applying cement, especially on vertical piping.

4. For threaded connections we recommend the use of sealing tape and, with the use of a strap wrench, to tighten no more than 2 full turns past finger-tight. Use of a pipe wrench can deform the pipe or union nut and cause damage to the valve and/or connection(s).

5. Flanged connections should be torqued evenly and in a symmetrical pattern with a torque wrench and as per the figure and chart below:

RECOMMENDED FLANGE BOLT TORQUES

VALVE SIZE	FLANGE	BOLT TORQUE	IN FT-LB	AXIAL MISALIGNMENT	PARALLELISM (INCH)
	PSI - 50	PSI - 100	PSI – 150		
1½	11	13	14	0.04	0.03
2	13	14	16	0.04	0.03
2½	13	14	16	0.04	0.03
3	18	20	22	0.04	0.03
4	20	20	22	0.04	0.04
5	22	15	29	0.04	0.04
6	25	15	32	0.04	0.04
8	25	32	40	0.06	0.04
10	25	32	40	0.06	0.04
12	29	36	43	0.06	0.04

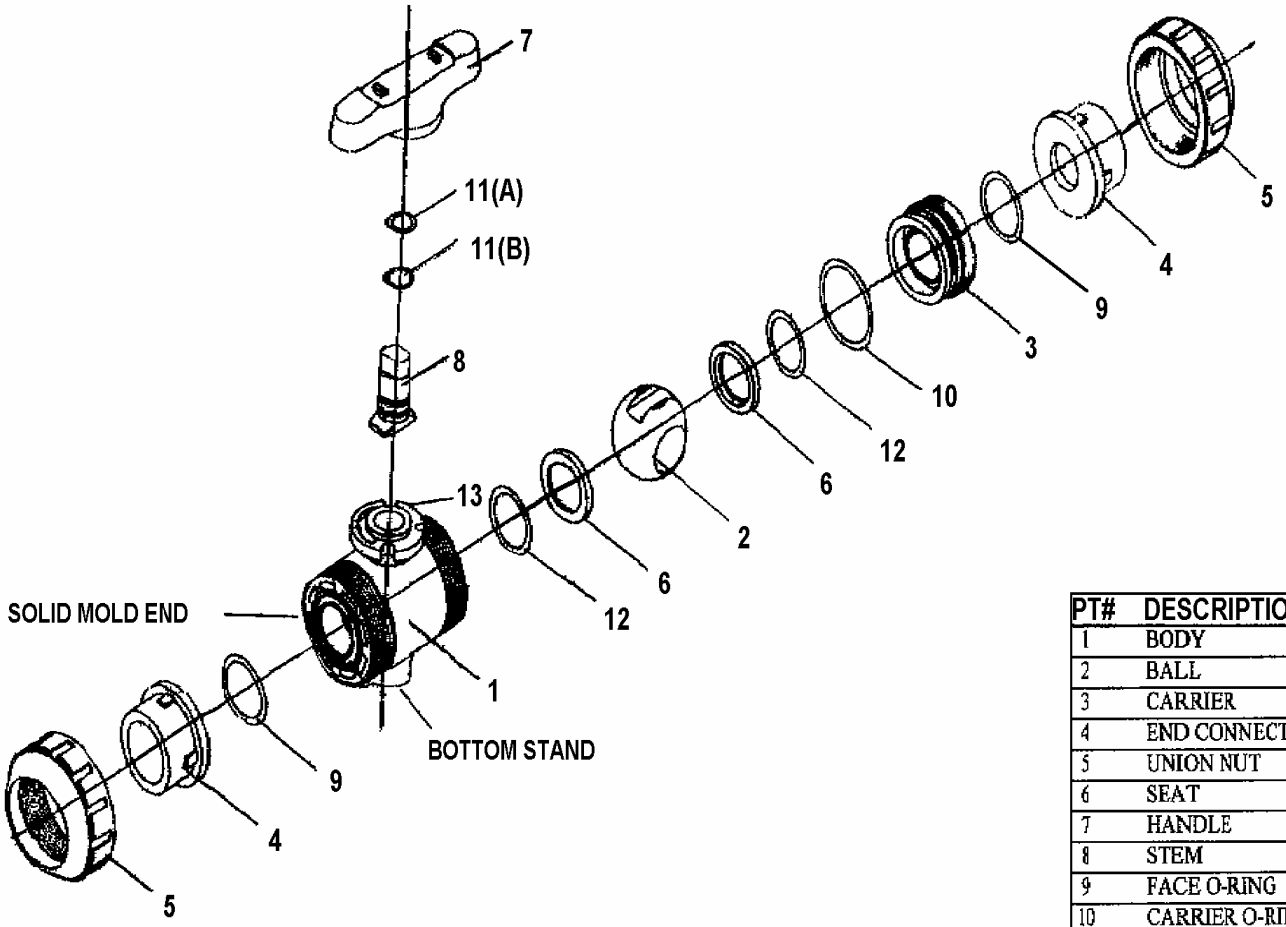
20	72	-	-		
24	72	-	-		

Maintenance Instructions Type 21 Ball Valve cont.



Maintenance:

Refer to **ASSEMBLY DRAWING T21V Rev. 0.** And proceed as follows:

1. Turn valve to the closed position.
2. Unscrew union nut (5) from both ends of valve.
3. Remove end connectors (4).
4. On solid mold end, remove face o-ring (9). This completely disassembles this end of valve.
5. Pull upward on handle (7) to remove.
6. On opposite end of valve, remove face o-ring (9) and use handle (7) as a spanner wrench to remove carrier (3).
7. Remove carrier o-ring (10).
8. Remove seat (6) and seat cushion (12) to expose ball (2).
9. Remove ball (2) by pushing from solid molded end of body.
10. Remove stem (6) by pushing it down into body (1).
11. Remove stem o-rings 11(A) and 11(B) from groves in stem.
12. Remove other seat (6) and seat cushion (12).
13. Inspect all parts for wear and replace as necessary.
14. Before re-assembling valve, lubricate all o-rings with Dow Corning III silicone compound or equivalent.
15. To re-assemble valve follow steps 1 through 10 in reverse order.

NOTE: If mounting actuator on mounting flange (13), make sure handle (7) is removed and stem (6) and actuator are aligned.

After replacing carrier (3), the face of the carrier should remain slightly projected from the end of the body. Make sure the ball rotates smoothly with only a touch of resistance.

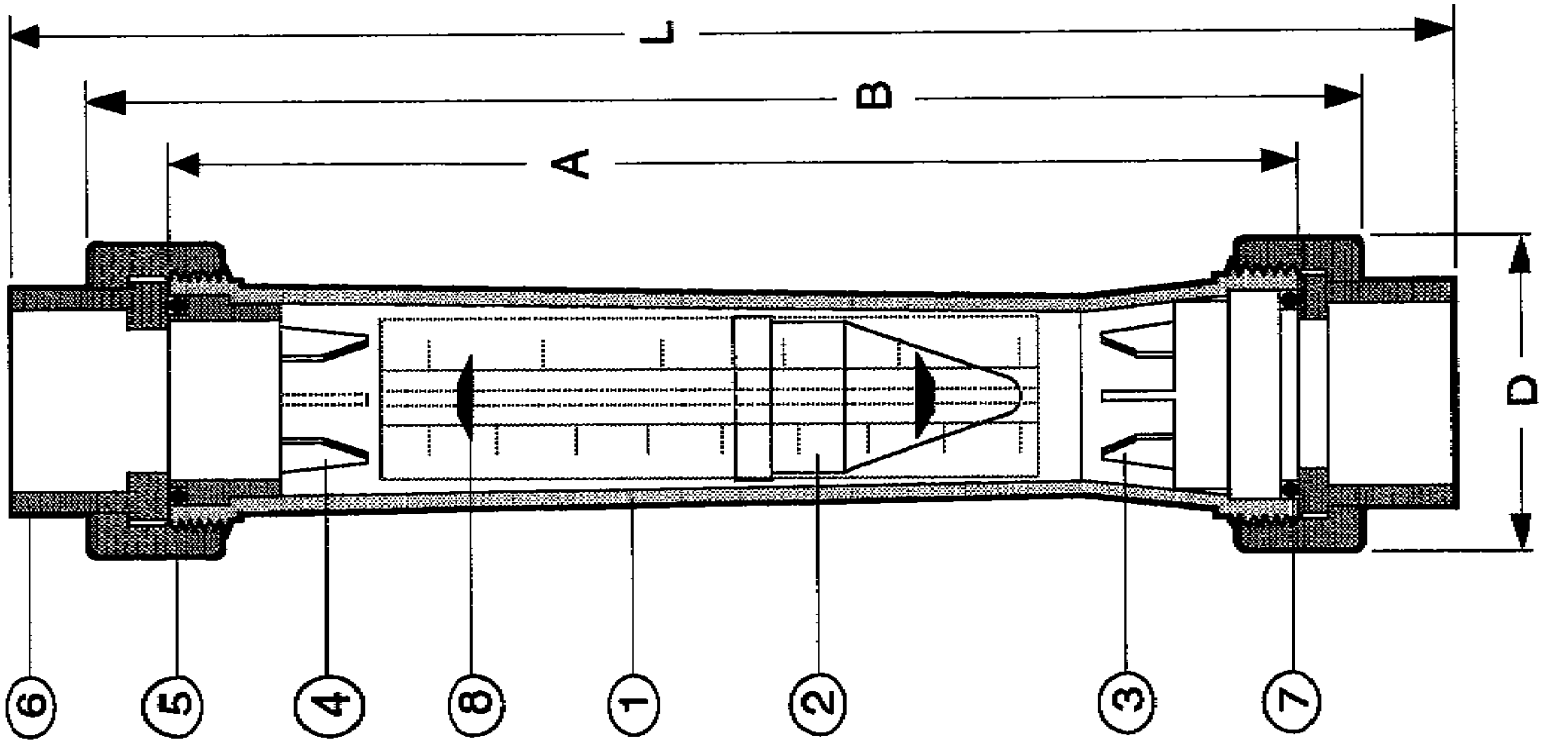
55 Guardsman Road
Thornhill, Ontario
L3T 6L2
Canada
Tel: 905-889-7890
Fax: 905-889-8553

INSTALLATION & MAINTENANCE INSTRUCTIONS
For Chemline FC/FS Series Variable Area Flowmeter Sizes 5" and 7"

Installation & Maintenance:



Refer to **ASSEMBLY DRAWING SFM1 REV 0**. And proceed as follows:

1. Install in line (where flow readings are required).
2. Unscrew union nuts (5).
3. Remove end connectors (6).
4. Tube (1) will slide out when end connectors (6) are removed.
5. Upper and lower float stops will come out with the end connectors (6).
6. Remove and clean or replace o-rings (7).
7. Remove float (2) from tube (1) and clean.
8. Remove range indicator (8) from tube and clean or replace.
9. It is recommended that spare o-rings (7) and range indicators (8) be kept.

Maximum Working Pressures and Temperature Ranges

Construction				
Tube	**Union Nuts**	**Ends**	**Pressure**	**Temperature**
PVC	PVC	PVC	150 psi	0 to 60° C
Polyamide (PA)	PVC	PVC	150 psi	0 to 60° C
Polyamide (PA	PPG	PP or CPVC	150 psi	0 to 80° C
Polysulfone (PSU)	PPG	PP or CPVC	150 psi	0 to 90° C
Polysulfone (PSU)	PVDF	PVDF	150 psi	0 to 120° C
PVDF	PVDF	PVDF	150 psi	-40 to 120° C

Ranges, Conversion Charts, Sizing, Scale Correction Factors etc. are available on the Chemline Data Page and also available from the Chemline Technical Department.

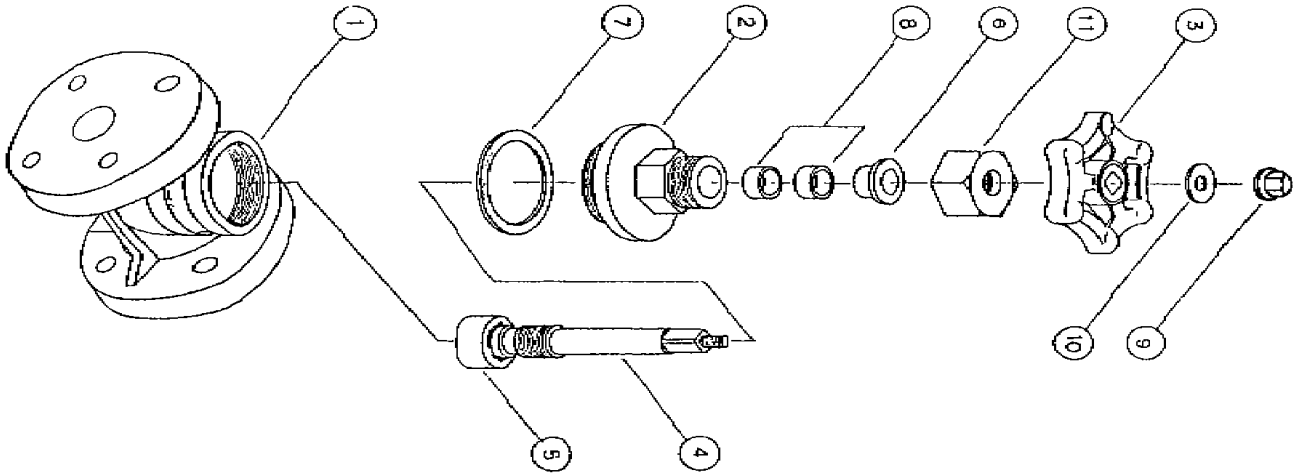
MAINTENANCE INSTRUCTIONS
For Chemline Globe Valves Sizes 1/2" - 2"

Maintenance (Sizes 1/2" to 2")

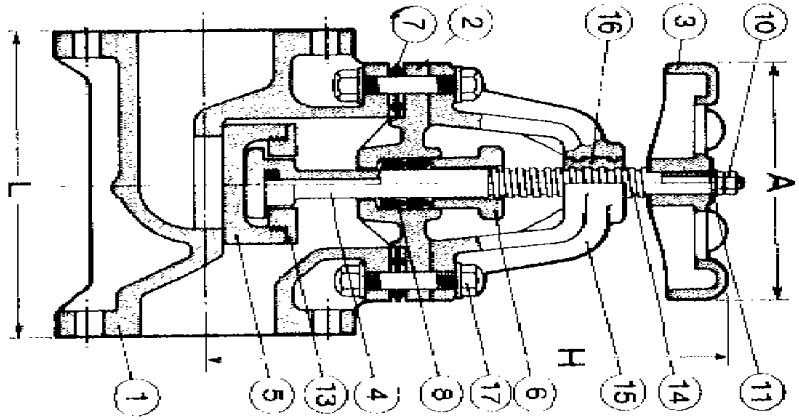
Refer to **ASSEMBLY DRAWING GV-01(A).** And proceed as follows:

1. Remove bonnet and stem assembly (2 through 5) by unscrewing gland nut (6). The complete stem assembly should lift out of the valve body.
   (Note: make sure there is no pressure in line prior to removing valve.)



2. The stem (4) is removed from the bonnet assembly by first removing the handwheel (3) by unscrewing nut (9). Loosen the stem packing (8) and inspect for excessive wear and cracking.

3. Lubricate the seal (7) before replacing the shaft (4). Dow Corning III silicone compound recommended.



4. Inspect the body seat (1) and disc seat (5) for excessive wear and pitting. Pitting is caused by foreign objects being jammed between the sealing surfaces when closing the valve. If the disc seat (5) is damaged, replace the part.
   Important: If the body seat is damaged replace the complete valve.

5. To reassemble valve, reverse steps 1 to 4 above.

   (NOTE) When replacing the stem assembly back into the valve body, be sure that the stem NOT in the closed position. If it is, the stem may be over extended and could damage the body seat when the bonnet is re-tightened.

MAINTENANCE INSTRUCTIONS
For Chemline Needle Valves Sizes 1/4" - 3/8" - 1/2"

Maintenance (all sizes):

Refer to **ASSEMBLY DRAWING CNV1 rev 0.** And proceed as follows:

1. Valve can be serviced in line as unit' s complete topworks can be removed in one piece.
2. Remove panel nut (6) and lift off bonnet (4).
3. Handle (2) stem (3) and thread insert (5) will lift out in one piece.
4. Remove and inspect seal (7) for wear and abrasion.
5. Replace seal if necessary.
6. To reassemble valve follow steps 2 through 5 in reverse order.

Note: Seal wear can be compensated for by hand tightening the cap.

MAINTENANCE INSTRUCTIONS
For Chemline 3/8" - 1-1/2" SB Series Pressure Relief Valves

Installation:

1. Always mount a filter or strainer in the line immediately before the valve to avoid damage to the valve from dirt or particles. Valve is spring operated, therefore can be installed in any orientation.

2. **To adjust pressure use the adjustment screw (8) and a pressure gauge**.
   - the valve will be closed at the set pressure and will start to open when the operating pressure rises above the set pressure.
   - connect the compressed air supply to the inlet of the valve. Adjust the flow of the air to the desired set pressure by turning clockwise to increase the set pressure, counterclockwise to decrease it.
   - with the valve being closed, adjust the screw (8) until the valve starts to open. Fix the adjusting screw in place with the locking nut (9).

3. For installation in an application where the temperature is 0^{o} C or less. Check with Chemline Engineering
   Technical staff prior to installation.

Maintenance

Refer to **ASSEMBLY DRAWING SB10/11 rev 0.** And proceed as follows.

1. Loosen and remove cap (10).

2. Loosen counter nut (9) and remove adjustment screw (8).

3. Remove body cap (12a), body bolt (12b), body nut (12c) and washer (12d).

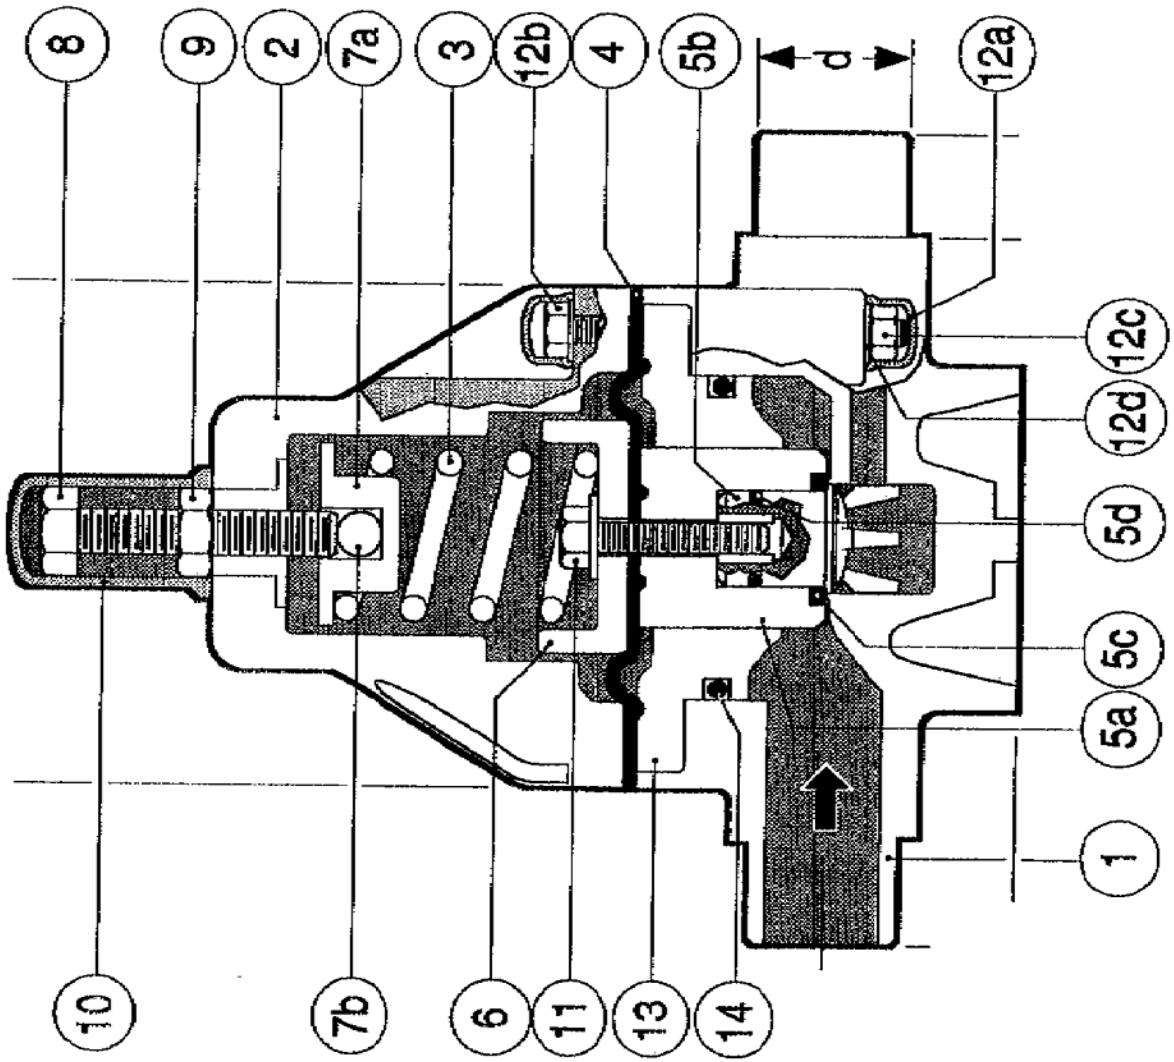
4. Lift up and remove bonnet (2).

5. Remove pressure plate (7a) and ball bearing (7b) to reach relief spring (3).

6. Loosen piston screw (11), remove spring plate (6) and draw piston assembly (5) downward and out of body (1).
   Note: Piston assembly (5) is all parts (5a) outer piston assembly
   (5b) inner piston assembly
   (5c) seat
   (5d) piston o-ring

Piston assembly is removed from body as a unit. It can then be further disassembled into the component parts listed above.

7 Remove diaphragm (4).



8. Remove seal (14) at intermediate flange (13).

9. Inspect all parts for wear and abrasion, replace seals, diaphragm etc. if necessary.

10. To re-assemble valve follow steps 1 through 9 in reverse order.

INSTALLATION & MAINTENANCE INSTRUCTIONS
For Chemline Series SR50 Pressure Reducing Valve Sizes 3/8" to 1-1/2"

Installation:

1. Always mount a filter or strainer in the line immediately before the valve to avoid damage to the valve from dirt or particles. Valve is spring operated, therefore can be installed in any orientation.

2. **To adjust pressure use the adjustment screw (8) and a pressure gauge**.
   - the valve will be closed at the set pressure and will start to open when the operating pressure rises above the set pressure.
   - connect the compressed air supply to the inlet of the valve. Adjust the flow of the air to the desired set pressure by turning clockwise to increase the set pressure, counterclockwise to decrease it.
   - with the valve being closed, adjust the screw (8) until the valve starts to open. Fix the adjusting screw in place with the locking nut (9).

3. For installation in an application where the temperature is 0^{o} C or less. Check with Chemline Engineering
   Technical staff prior to installation.

4. **Size vs Working Pressure**
   3/8" - 1-1/2" set pressure 15 psi to 135 psi. Minimal backlash, should be no more than approx. 3 psi.

5. **Operating Temperature Range**
   PVC up to 50^{o} C
   PP up to 70^{o} C
   PVDF up to 100^{o} C

Maintenance:

Refer to **ASSEMBLY DRAWING SR501 rev 0**. And proceed as follows:

1. Loosen and remove cap (10).

2. Loosen counternut (9) and remove adjusting screw (8).

Install. & Maint. SR Pressure Reducing Valve Sizes 3/8” – 1-1/2” Cont.

3. Remove cap (12d), nut (12c), washer O-ring (12b) and bolt (12a).

4. Lift up and remove bonnet (2).

5 Remove pressure plate (7a) and ball bearing (7b) to reach spring (3).

6. Loosen piston screw (11), remove spring plate (6) and draw piston (5a) downward and out of body (1).

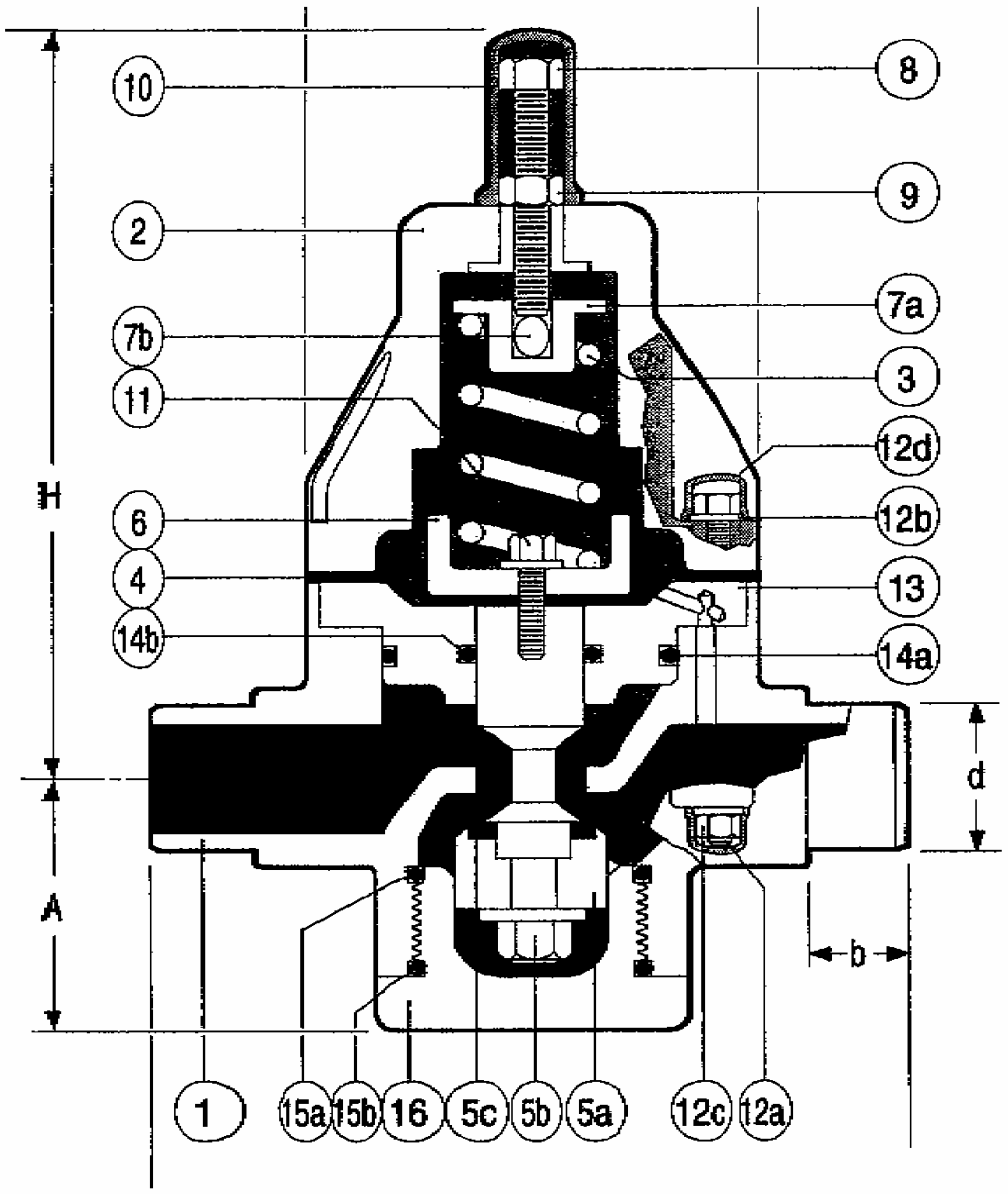
7 When piston has been removed, it can be further disassembled into the component parts (5a) inner piston, (5b) hex nut and (5c) seat.

8. Remove diaphragm (4).

9. Remove O-ring seals (14a) and (14b) at intermediate flange (13).

10. Inspect all parts for wear and abrasion, replace O-rings, diaphragm etc. if necessary.

11. To re-assemble, follow steps 1 through 9 in reverse.



WEIGHT & DIMENSION CHART

1.0 Introduction

Cla-Val Rubber-Flex Duckbill Check Valves are designed to provide outstanding back-flow prevention; eliminating costly and unwanted back-flow from rivers, oceans, storm water, and is an excellent choice for sewage diffuser systems. Cla-Val Rubber-Flex Duckbill Check Valves are fully passive flow devices requiring neither maintenance nor any outside sources of power or manual assistance to operate. They are offered as direct replacements for ineffective and maintenance ridden flap-type check valves as well as for new/existing construction and custom applications. Each check valve is manufactured to exacting specifications ensuring a perfect fit and usability and is available in a wide variety of elastomers to meet the design requirements of the application. This installation, operation and maintenance manual will cover the general practices for the proper installation, operation and maintenance of the Cla-Val Rubber-Flex Duckbill Check Valves.

1.1 Model RF-DBF: Rubber-Flex Duckbill Check Valve

This type of rubber check valve is designed to bolt directly to existing flanges or new installations. Flanges are drilled to ANSI 125/150# standard but other drill patterns are available upon request. This style of rubber check valve can be installed in either vertical or horizontal applications.

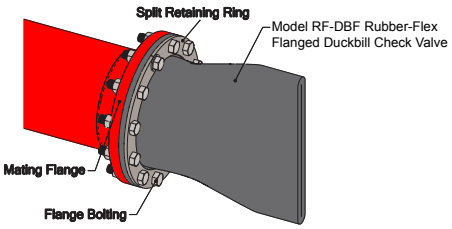

Figure 1: Model RF-DBF

1.2 Model RF-DBI: Rubber-Flex Flanged In-Line Duckbill Check Valve

This type of rubber check valve is designed to fit directly inside of existing piping systems. The design is supplied with a flat face rubber flange which allows installation between existing pipe flanges eliminating the requirement for a valve body. Flanges are drilled to ANSI 125/150# standard but other drill patterns are available upon request. This style of rubber check valve can be installed in either vertical or horizontal applications.

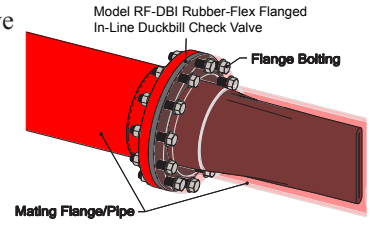

Figure 2: Model RF-DBI

1.3 Model RF-DBO: Rubber-Flex Slip-On Duckbill Check Valve

This type of rubber check valve is designed to easily slip over an existing pipe and is affixed to the pipe with heavy duty stainless steel clamps. This style of rubber check valve can be installed in either a vertical or horizontal orientation for most applications. *Note: External Clamp shown is of a general style and will change depending on the size of the supplied check valve.*

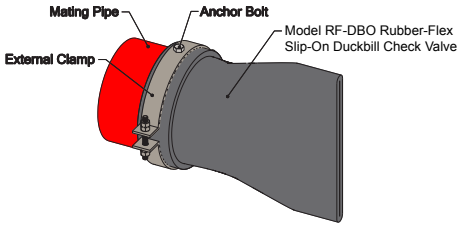

Figure 3: Model RF-DBO

1.4 Model RF-DBI-IN: Rubber-Flex Slip-In In-Line Duckbill Check Valve

This type of rubber check valve is designed to slip directly inside of an existing pipe and is supplied with a stainless steel expandable clamp to secure in place. This style of rubber check valve can be installed in either a vertical or horizontal orientation for most applications.

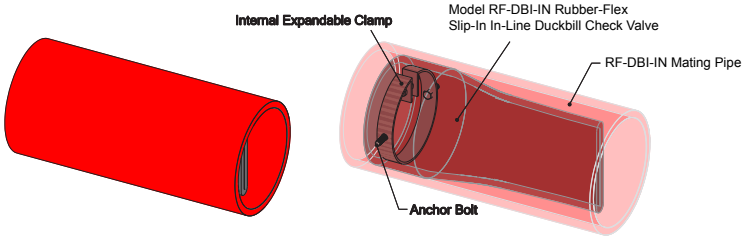

Figure 4: Model RF-DBI-IN

1.5 Model RF-DBJ: Rubber-Flex Jacket Style Duckbill Check Valve

This type of rubber check valve is designed with a full metal enclosure (Model RF-DBJ Shroud) which allows easy installation in existing piping systems. Flanges are drilled to ANSI 125/150# standard but other drill patterns are available upon request.

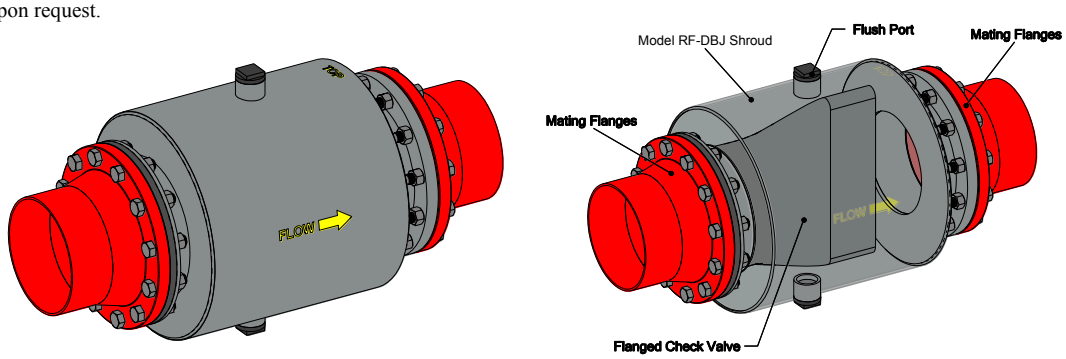

Figure 5: Model RF-DBJ

1.6 Model RF-DBI-LH: Rubber-Flex Low Head Loss In-Line Duckbill Check Valve

This type of rubber check valve is designed to slip directly inside of an existing pipe with the supplied stainless steel expandable clamp or retaining ring to secure in place; it can be fastened from either the inlet or discharge end of the valve. The standard Model RF-DBI-LH valve must be installed in a truly round pipe. Out of round pipe may cause distortion of the valve causing valve failure.

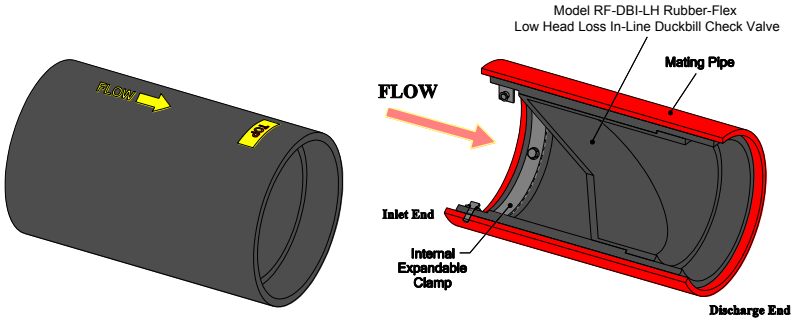

Figure 6: Model RF-DBI-LH Rubber-Flex Low Head Loss In-Line Duckbill Check Valve

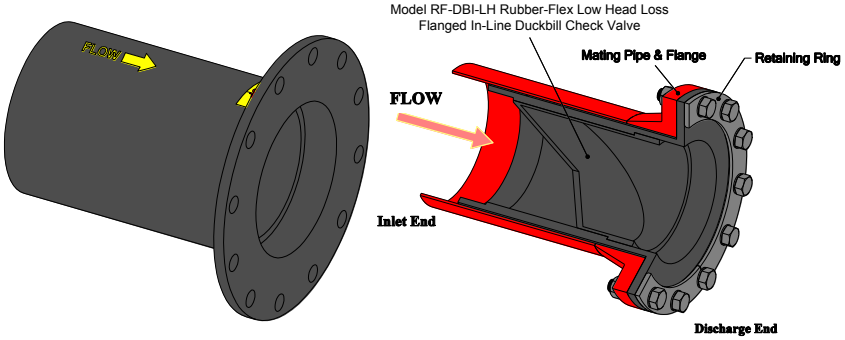

Figure 7: Model RF-DBI-LH Rubber-Flex Low Head Loss Flanged In-Line Duckbill Check Valve

Note: For flanged versions of Model RF-DBI-LH Low Head Loss In-Line Rubber Check Valves the integrated rubber flange can be located on either the inlet or discharge end depending on required installation orientation.

2.0 Storage and Handling

2.1 Storage

2.1.1 Inside

The ideal storage location for a Cla-Val Rubber-Flex Duckbill Check Valve is in a warehouse setting with a relatively dry and cool location. Store the check valve in a vertical position on a pallet or wooden platform similar to as shown in Figure 8 below.

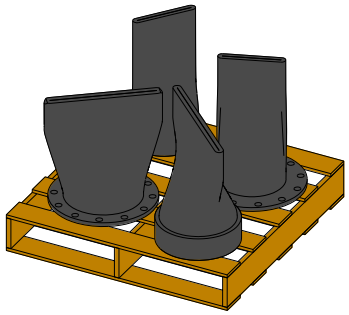

Figure 8: Typical Check Valve Storage Position

2.1.2 Outside

If the rubber check valve is to be stored outside, keep the check valve protected in a waterproof crate until ready for installation. Keep the check valve protected from any external elements such as direct UV exposure. Do not lay other boxes on top of the check valve or check valve box.

2.2 Handling

Care should be taken when handling the Cla-Val Rubber-Flex Duckbill Check Valves whether big or small to reduce the possibility of damaging the check valve during installation. For large size check valves, special care should be taken in loading, hoisting, and lowering; being careful not to hit adjacent equipment, forklift tines, crane cables, etc. Model RF-DBF & RF-DBO valves 36" and larger are manufactured with a lifting support hole to assist in the safe and proper lifting/installation of these check valves. The lifting support holes are not intended to support the entire weight of the check valve and care must be taken to adequately support the cuffed or flanged end as well. *Note: Cla-Val will not be responsible or liable for damage to the rubber check valve, adjacent equipment, or injury to personnel if these steps are not taken.*

3.0 Prior to Installation

3.1 Inspect the Received Check Valve

Rubber-Flex check valves are fully inspected at the factory and are carefully packaged to arrive at the job site ready for installation. Upon receipt of the check valve(s), inspect for damage that may have occurred during transportation and immediately contact your transportation company to report any damage. Check the item(s) received against the packing slip to ensure that all items have been received. For any questions or concerns about the received product contact your Agent or Cla-Val at info@cla-val.com or for immediate assistance call (800) 942-6326.

3.2 Verify the System Parameters

Check the system design parameters for the application to ensure the specified/supplied Cla-Val Rubber-Flex Duckbill Check Valve(s) will meet the system requirements.

3.3 Check Valve Mating Surface

Inspect the mating flange/surface to ensure that it is undamaged and clean and free of all foreign matter before installation of the check valve. For slip-on style of rubber check valves, the mating pipe must be free of sharp edges which may damage the inside sealing diameter of the check valve.

3.4 Safety Area

Always check your work area before installation for safety hazards which may cause injury or damage to personnel or product. Develop and discuss a safety and exit plan for you and your fellow employees in the event of an emergency.

4.0 Installation

Note: Each Cla-Val Rubber-Flex Check Valve installation can be considered a major pipe installation and the same safety requirements as used in pipe contracting installations should be implemented. Each Cla-Val Rubber-Flex Check Valve regardless of size should be installed in the same manner. Cla-Val will accept no responsibility for an improperly installed Rubber-Flex Check Valve(s) or the improper use of this product. Incorrect installation may result in injury to personnel, reduced check valve service life and/or damage to other adjacent equipment.

4.1 Rubber-Flex Check Valve Installation

4.1.1 Model RF-DBF: Rubber-Flex Flanged Duckbill Check Valve Installation

4.1.1.1 Step 1: Align

Position/Align the Flanged Rubber check valve into the system. For horizontal applications the bill of the check valve should be in vertical orientation relative to the ground unless there are clearance issues. In the case of clearance issues the check valve may be rotated to a maximum of 35 degrees to allow clearance to the ground.

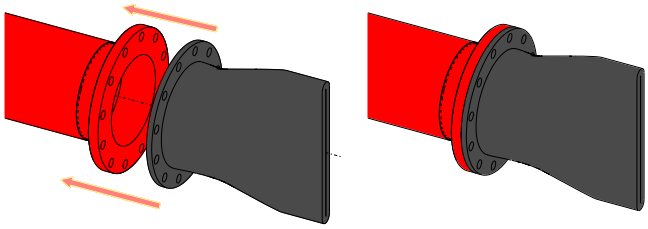

Figure 9: Model RF-DBF Installation Step 1

4.1.1.2 Step 2: Retaining Rings

Position the split retaining rings onto the flange of the check valve. Use a flat washer to properly cover the split in the retaining ring.

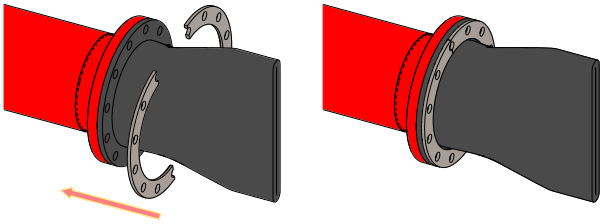

Figure 10: Model RF-DBF Installation Step 2

4.1.1.3 Step 3: Flange Bolting

Insert the flange bolting and tighten the flange bolting hardware to a “snug” tight fit before torqueing. Proceed to section 4.1.7 for proper bolt torqueing and a sample torqueing pattern.

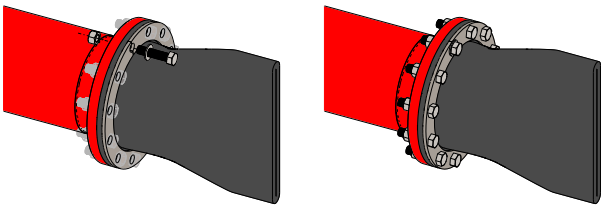

Figure 11: Model RF-DBF Installation Step 3

4.1.2 Model RF-DBI: Rubber-Flex Flanged In-Line Duckbill Check Valve

4.1.2.1 Step 1: Insert

Insert the Slip-In flanged rubber check valve into the existing pipe. For horizontal applications the bill of the check valve should be installed in a vertical orientation in the mating pipe as shown in below in Figure 9.

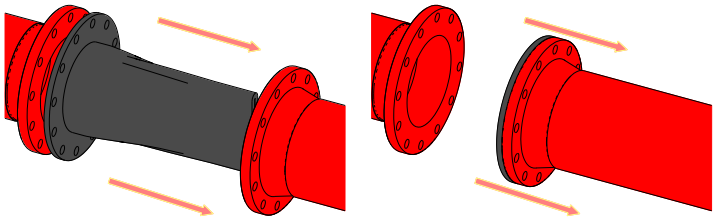

Figure 12: Model RF-DBI Installation Step 1

4.1.2.2 Step 2: Attach

Re-attach the 2 mating pipe flanges.

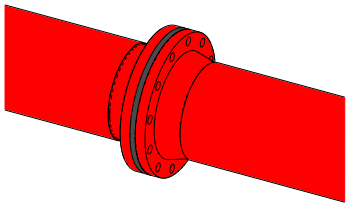

Figure 13: Model RF-DBI Installation Step 2

4.1.2.3 Step 3: Flange Bolting

Add the flange bolting to the installation and tighten to a "snug" tight fit before torqueing. Proceed to step 4.1.7 for proper bolt torqueing and a sample torqueing pattern.

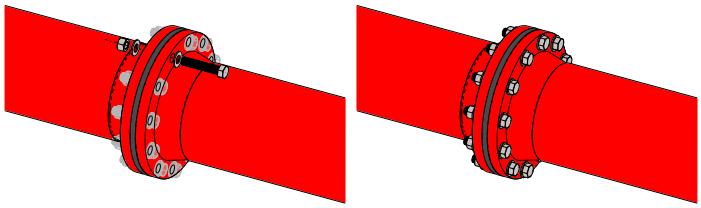

Figure 14: Model RF-DBI Installation Step 3

4.1.3 Model RF-DBO: Rubber-Flex Slip-On Duckbill Check Valve Installation

4.1.3.1 Step 1: Slip-On

For Slip-On rubber check valves, slip the rubber check valve over the existing pipe. For horizontal applications the bill of the check valve must be installed in a vertical orientation relative to the ground unless there are clearance issues. In the case of clearance issues the check valve may be rotated to a maximum of 35 degrees to allow clearance to the ground. To ease installation it is acceptable but not necessary to add soapy water to the exterior of the pipe to facilitate the installation of the check valve.

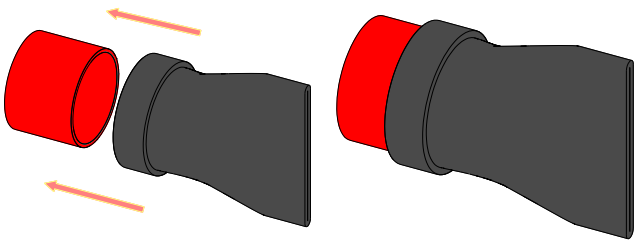

Figure 15: Model RF-DBO Installation Step 1

4.1.3.2 Step 2: External Clamps

Add the external clamps to the slip-on rubber check valve. For nominal diameters less than or equal to 10″ the check valve will be supplied with either T-Bolt or Worm Gear Clamps. For nominal diameters greater than 10″, the check valve(s) will be supplied with fabricated stainless steel clamp(s). If the valve are supplied with more than one fabricated stainless steel clamp, then rotate the additional clamps which will place the clamping section at opposite angles from the first clamp. This will ensure that even pressure is applied to the valve. *Note: The supplied number of clamps will vary depending on size and application.*

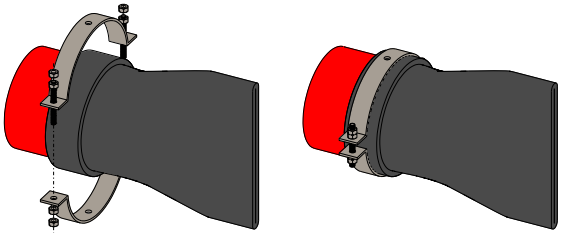

Figure 16: Model RF-DBO Installation Step 2

4.1.3.3 Step 3: Tighten Clamps

Tighten the external clamp until the rubber is compressed by the external clamp and a tight fit is achieved then proceed to section 4.1.8 for anchor bolting/pinning to anchor the slip-on check valve to the mating piping.

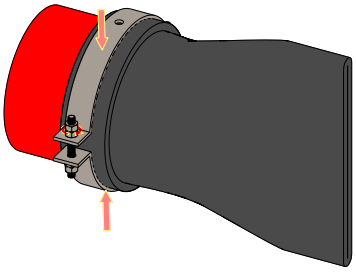

Figure 17: Model RF-DBO Installation Step 3

4.1.4 Model DBI-IN: Rubber-Flex Slip-In In-Line Duckbill Check Valve Installation

4.1.4.1 Step 1: Slip-In

Insert the slip-in check valve inside the existing pipe. For horizontal applications the bill of the check valve must be installed in vertical orientation as shown below in Figure 15.

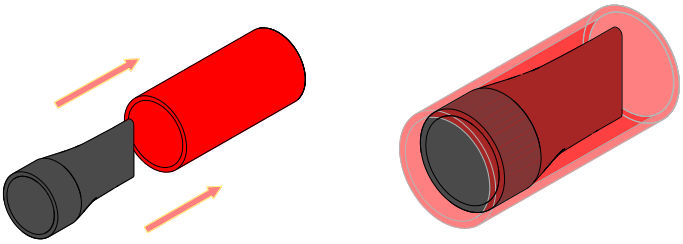

Figure 18: Model RF-DBI-IN Installation Step 1

4.1.4.2 Step 2: Insert Clamp

Insert and the expandable internal clamp into the rubber check valve.

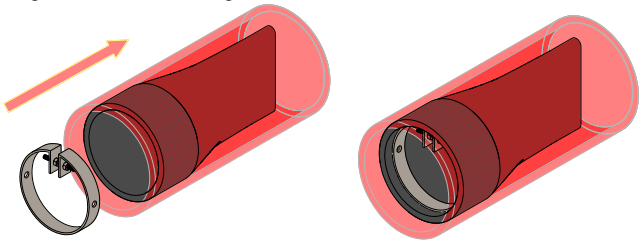

Figure 19: Model RF-DBI-IN Installation Step 2

4.1.4.3 Step 3: Expand Clamp

Tighten the expandable internal clamp until the stainless steel portion of the clamp has imbedded itself into the rubber of the valve. Tighten the lock nut once the internal expandable clamp is in the proper position and proceed to section 4.1.8 for anchor bolting/pinning to anchor the slip-in check valve to the mating pipe. When installing multiple internal expandable clamps ensure the clamps are evenly spaced/ rotated to provide even clamping pressure as well as the internal expandable fasteners located in a position that minimizes flow interference. *Note: This style of check valve installation relies on external pressure of the internal expandable clamp to ensure that the valve does not move, care should be taken to ensure proper sealing.*

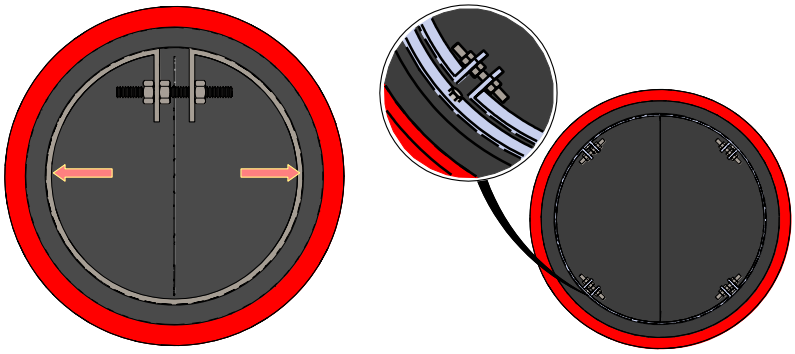

Figure 20: Model RF-DBI-IN Installation Step 3

4.1.5 Model RF-DBJ: Rubber-Flex Jacket Style Duckbill Check Valve Installation

4.1.5.1 Step 1: Align/Insert

Align/Insert the Model RF-DBJ Assembly into the required breach opening noting the position of flow and orientation of the valve. The assembly should be installed to where the top notation on the Model RF-DBJ shroud is in the vertical position as shown in Figure 21. Use a gasket where required, supplied by others. *Note: Ensure the bill of the check valve is in the vertical position when installed.*

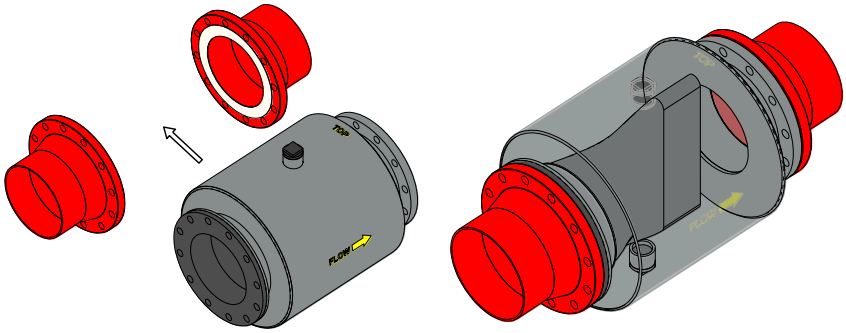

Figure 21: Model RF-DBJ Installation Step 1

4.1.5.2 Step 2: Flange Bolting

Secure the Model RF-DBJ assembly to the mating flanges with the appropriate flange bolting hardware. Follow the procedures in section 4.1.7 for proper flange bolt torqueing.

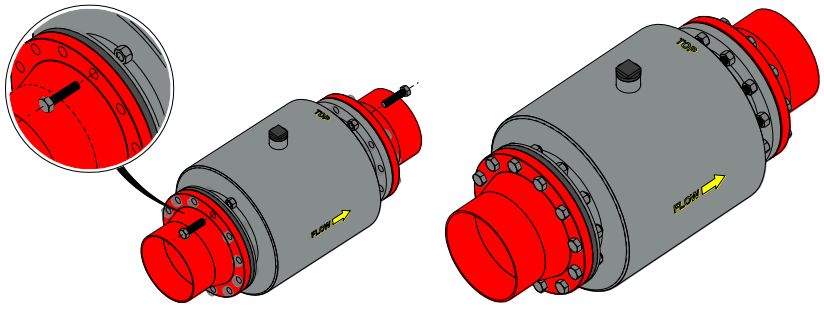

Figure 22: Model RF-DBJ Installation Step 2

4.1.6 Model RF-DBI-LH: Rubber-Flex Low Head Loss In-Line Duckbill Check Valve Installation

4.1.6.1 Slip In Model RF-DBI-LH

4.1.6.1.1 Step 1: Insert Valve

The RF-DBI-LH valve must be installed in a horizontal pipe and will be supplied with **a "FLOW" direction label and a "TOP"** label to ensure proper installation orientation within the pipe. Insert the slip-in check valve inside the existing pipe and push until inlet/discharge end is flush with end of pipe.

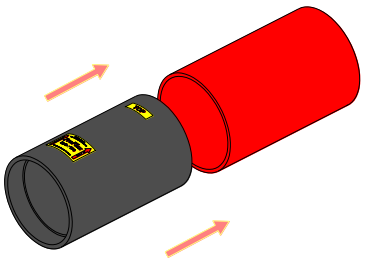

Figure 23: Model RF-DBI-LH Installation Step 1

4.1.6.1.2 Step 2: Insert Clamp

Insert the expandable internal clamp(s) into the rubber check valve in either the inlet or discharge end depending on installation orientation and ensuring that the adjustable bolts are located at the top of the valve. When installing multiple internal expandable clamps ensure the clamps are evenly spaced/ rotated to provide even clamping pressure as well as the internal expandable fasteners located in a position that minimizes flow interference.

Figure 24: Model RF-DBI-LH Installation Step 2

4.1.6.1.3 Step 3: Expand Clamp

Tighten the expandable internal clamp until the stainless-steel portion of the clamp has imbedded itself into the rubber of the valve. Tighten the lock nut once the internal expandable clamp is in the proper position and proceed to section 4.1.8 for anchor bolting/pinning to anchor the slip-in check valve to the mating pipe.
Note: This style of check valve installation relies on external pressure of the internal expandable clamp to ensure that the valve does not move, care should be taken to ensure proper sealing.

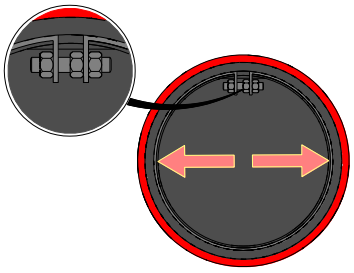

Figure 25: Model RF-DBI-LH Installation Step 3

4.1.6.2 Flanged Model RF-DBI-LH

4.1.6.2.1 Step 1: Insert

The RF-DBI-LH valve must be installed in a horizontal pipe and will be supplied **with a "FLOW" direction label and a "TOP" label to** ensure proper installation orientation within the pipe. Insert the slip-in flanged check valve inside the existing pipe and push until flanged inlet/discharge end is flush with end of pipe.
Note: Model RF-DBI-LH Flanged Check Valve can be supplied with the integrated rubber flange in the inlet or discharge position depending on the required installation parameters.

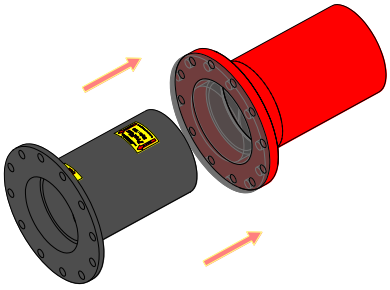

Figure 26: Model RF-DBI-LH Flanged Installation Step 1

4.1.6.2.2 Step 2: Retaining Ring & Bolting Installation

Attach and secure the retaining ring in place with the flange bolting hardware and

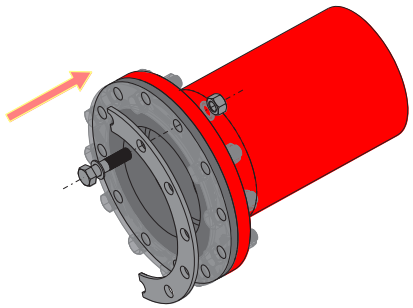

Figure 27: Model RF-DBI-LH Flanged Installation Step 2

4.1.7 Flange Bolt Torqueing (Model RF-DBF/RF-DBI/RF-DBJ & Flanged RF-DBI-LH)

Torqueing should then be accomplished in steps gradually and as evenly as possible around the circumference of the flange. The bolts should be tightened in an alternating sequence similar to a star pattern shown below in Figure 18 to within the proper torque range specified for the size of check valve to be installed. The flange bolting is not **considered tight and "locked-on" until the edges of the check** valve flange bulges out or extrudes slightly. Refer to appendix A for the proper ranges of torque values as well as further examples of the proper patterns used for torqueing the flange bolting. *Note: Never tighten bolts on a flanged rubber check valve to the point where there is contact between the retaining ring and mating flange. This type of tightening will crush the integrated* **rubber** *flange of the check valve* **and** *cause* **a** *premature failure.*

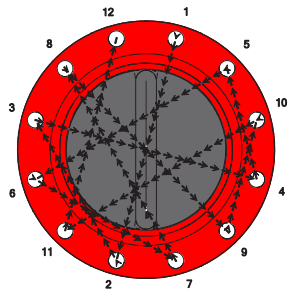

Figure 28: Sample Flange Torqueing Sequence

4.1.8 Anchor Bolts/Pins (Model RF-DBO/RF-DBI-IN/RF-DBI-LH)

After the Check Valve is installed, drill a hole or holes, depending on the valve size number of clamps, through the cuff of the check valve and into the mating pipe using the center hole on the clamp as a guide. Insert a bolt, which will be sufficient in length to completely travel through the clamp, valve and mating pipe. Completely weld or use some other means of ensuring that this bolt/pin will not fall out or be removed.

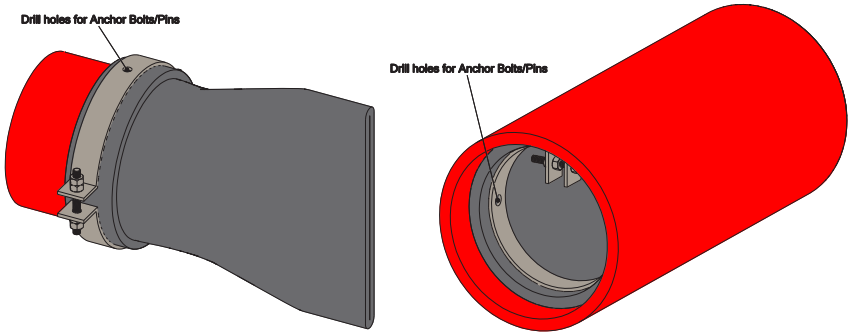

Figure 29: Model RF-DBO, RF-DBI-IN & RF-DBI-LH Typical Drilled Through Hole Positions

4.1.8.1 Model RF-DBO: Insert the Bolt/Pin through the drilled hole(s) and completely weld or use some other means of ensuring that this bolt/pin will not fall out or be removed from the expandable clamp.

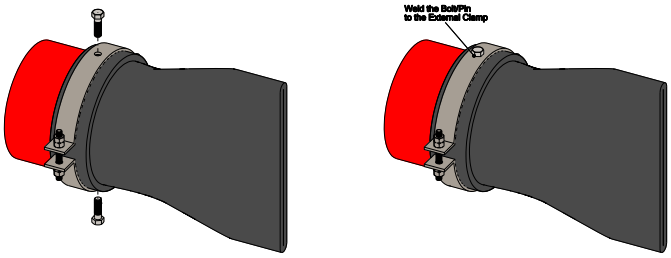

Figure 30: Model RF-DBO Anchor Bolt/Pin Install

4.1.8.2 Model RF-DBI-IN: Insert the Bolt/Pin through the drilled hole(s) and completely weld or use some other means of ensuring that this bolt/pin will not fall out or be removed from to the internal expandable clamp.

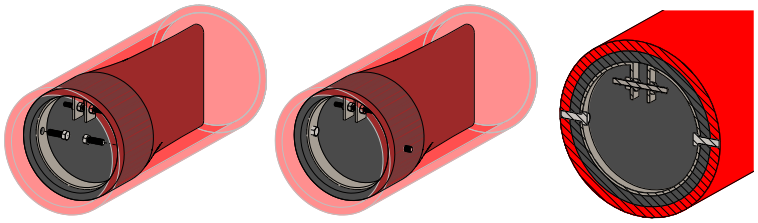

Figure 31: Model RF-DBI-IN Anchor Bolt/Pin Installation

4.1.8.3 Model RF-DBI-LH: Insert the Bolt/Pin through the drilled hole(s) and completely weld or use some other means of ensuring that this bolt/pin will not fall out or be removed from to the internal expandable clamp.

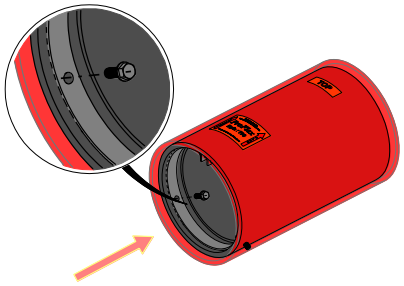

Figure 32: Model RF-DBI-LH Anchor Bolt/Pin Installation

5.0 Operation

The Rubber-Flex Duckbill Check Valves require little operational requirements. Each unit is an elastomeric back flow device which relies solely on inlet flow pressure and back flow pressure to provide operation.

6.0 Maintenance

Rubber-Flex Duckbill Check Valves require little maintenance. Periodic inspections can ensure that the check valve will provide years of maintenance-free service. Check for cuts or gouges which can easily be repaired with a self-curing rubber compound (Contact Cla-Val). Ensure that the bill section is free from any debris that may have been lodged in the bill. This will be the only areas of concern that require periodic inspection.

7.0 Appendix A

7.1 Torque Data

Table 1: Model RF-DBF/RF-DBO/RF-DBJ/RF-DBI-LH	
Size	Approx. Torque Values
1" thru 2"	20 - 40 ft./lbs.
2.5" thru 5"	25 - 60 ft./lbs.
6" thru 12"	35 - 140 ft./lbs.
14" thru 18"	50 - 180 ft./lbs.
20" thru 24"	60 - 200 ft./lbs.
26" thru 40"	70 - 300 ft./lbs.
42" thru 50"	80 - 300 ft./lbs.
52" thru 60"	100 - 400 ft./lbs.
66" thru 72"	200 - 500 ft./lbs.
78" thru 90"	300 - 600 ft./lbs.
96" thru 108"	400 - 700 ft./lbs.
120"	500 - 800 ft./lbs.

DE- Sicherheitshinweise

Der Liquiphant M FTL50, FTL51 darf nur als Grenzschalter für Flüssigkeiten verwendet werden.
Bei unsachgemäßem Einsatz können Gefahren von ihm ausgehen.
Das Gerät darf **nur von qualifiziertem und autorisiertem Fachpersonal** unter strenger Beachtung dieser Betriebsanleitung, der einschlägigen Normen, der gesetzlichen Vorschriften und der Zertifikate (je nach Anwendung) eingebaut, angeschlossen, in Betrieb genommen und gewartet werden.
In der Gebäudeinstallation ist ein Netzschalter für das Gerät leicht erreichbar in dessen Nähe zu installieren.
Er ist als Trennvorrichtung für das Gerät zu kennzeichnen.

EN- Notes on Safety

The Liquiphant M FTL50, FTL51 is designed for point level detection in liquids.
If used incorrectly it is possible that application-related dangers may arise.
The level limit switch Liquiphant M FTL50, FTL51 may be installed, connected, commissioned, operated and maintained **by qualified and authorised personnel only**, under strict observance of these operating instructions, any relevant standards, legal requirements, and, where appropriate, the certificate.
Install an easily accessible power switch in the proximity of the device.
Mark the power switch as a disconnector for the device.

FR- Conseils de sécurité

Le Liquiphant M FTL50, FTL51 doit être exclusivement utilisé comme détecteur de niveau pour liquides.
Il peut être source de danger en cas d'utilisation non conforme aux prescriptions.
L'appareil ne doit être installé, raccordé, mise en service et entretenu **que par un personnel qualifié et autorisé**, qui tiendra compte des indications contenues dans la présente mise en service, des normes en vigueur et des certificats disponibles (selon l'application).
Installer un commutateur réseau à proximité immédiate de l'appareil, en veillant à ce qu'il soit facilement accessible.
Marquer ce commutateur comme prise de coupure de l'appareil.

ES - Notas sobre seguridad

El detector de nivel Liquiphant M FTL50, FTL51 ha sido diseñado para la detección de límite en fluidos.
Su empleo inapropiado puede resultar peligroso.
El equipo deberá ser montado, conectado, instalado y mantenido **única y exclusivamente por personal cualificado y autorizado**, bajo rigurosa observación de las presentes instrucciones de servicio, de las normativas y legislaciones vigentes, así como de los certificados (dependiendo de la aplicación).
Instalar un interruptor de fácil acceso en las proximidades del equipo.
Identificar el interruptor como desconectador del equipo.

IT - Note sulla sicurezza

Il Liquiphant M FTL50, FTL51 è particolarmente studiato per l'impiego come soglia di livello in liquidi.
Un'installazione non corretta può determinare pericolo.
Lo strumento può essere montato **solamente da personale qualificato ed autorizzato**.
La messa in esercizio e la manutenzione devono rispettare le indicazioni di collegamento, le norme e i certificati di seguito riportati.
Installare un interuttore per l'alimentazione in prossimità del dispositivo.
Marcare l'interuttore come disconnessione del dispositivo.

NL- Veiligheidsinstructies

Gebruik de Liquiphant M FTL50, FTL51 alleen als niveauschakelaar voor vloeistoffen.
Indien niet correct gebruikt kunnen gevaarlijke situaties ontstaan.
Het instrument **alleen door gekwalificeerd en geautoriseerd personeel** laten inbouwen, aansluiten, in bedrijf nemen en onderhouden.
Neem de instructies in deze Inbedrijfstellingsvoorschriften, de desbetreffende normen, de wettelijke voorschriften en eventuele certificaten in acht.
Installeer een makkelijk bereikbare voedingschakelaar in de nabijheid van het instrument.
Kenmerk de voedingschakelaar specifiek voor het instrument.

DE- Behandlung
Am Gehäuse, Flansch oder Verlängerungsrohr anfassen.

Fehlfunktion	Ursache	Maßnahme
Schaltet nicht	Versorgungsspannung fehlt	Versorgung prüfen
	Signalleitung defekt	Signalleitung prüfen
	Elektronikeinsatz defekt - FEL51 direkt an L1 und N angeschlossen	Austauschen - FEL51 immer über externe Last anschließen
	Dichte der Flüssigkeit zu gering	Am Elektronikeinsatz Dichte auf > 0,5 einstellen
	Schwinggabel verkrustet	Schwinggabel säubern
	Schwinggabel korrodiert (Anzeige am FEL: rot/gelb blinkt, FEL58: grün blinkt 0,3 Hz)	Schwinggabel komplett mit Prozessanschluss austauschen
	FEL51: Relais mit zu großem Innenwiderstand angeschlossen	Geeignetes Relais anschließen
	FEL51: Relais mit zu geringem Haltestrom angeschlossen	Widerstand parallel zum Relais anschließen
	FEL54: Kontakte verschweißt (nach einem Kurzschluss)	FEL54 austauschen; Sicherung in den Kontaktstromkreis
Schaltet falsch	Minimum-/Maximum- Sicherheitsschaltung vertauscht	Am Elektronikeinsatz Sicherheitsschaltung richtig einstellen
Fehlschaltung, sporadisch	Dichter schwerer Schaum, wilde Turbulenzen, aufgeschäumte Flüssigkeit	Liquiphant im Bypass montieren
	Extreme Funkstörung	Verbindungskabel abschirmen
	Extreme Vibrationen	Entkoppeln, dämpfen, Schwinggabel 90° drehen
	Wasser im Gehäuse	Deckel und Kabeldurchführungen fest zuschrauben
	FEL52: Ausgang überlastet	Last, (Leitungs-) Kapazität verringern
Fehlschaltung nach Netzausfall	FEL57, Verhalten beim Einschalttest (wiederkehrende Prüfung)	Schaltverhalten FEL57 beachten; Anlagensteuerung nach Netzausfall bis ca. 45 s blockieren

Fault	Reason	Remedy
Does not switch	No power	Check power
	Faulty signal line	Check signal line
	Faulty electronic insert - FEL51 connected directly to L1 and N	Exchange - always connect FEL51 via external load
	Density of liquid too low	Set density to > 0.5 at electronic insert
	Fork encrusted	Clean fork
	Fork corroded (Indication on FEL: red/yellow flashes, FEL58: green flashes 0.3 Hz)	Exchange fork and process connection
	FEL51: Internal resistance of connected relay too large	Connect suitable relay
	FEL51: Holding current of connected relay too low	Connected resistor in parallel with relay
	FEL54: Contacts welded together (after short-circuit)	Exchange FEL54; put fuse in contact circuit
Switches incorrectly	Min-/Max- fail-safe mode set wrongly	Set correct mode at electronic insert
Sporadic faulty switching	Thick heavy foam, very turbulent conditions, foaming liquid	Mount Liquiphant in bypass
	Extreme RFI	Use screened cable
	Extreme vibration	Decouple, damp, turn fork 90°
	Water in housing	Screw cover and cable gland tight
	FEL52: Output overloaded	Reduce load,(cable) capacitance
Switches incorrectly after power failure	FEL57, behaviour during switch-on test (functional test)	Observe switching behaviour of FEL57; After power failure blockplant control for up to 45 s

FR- Recherche de défauts

Défaut	Cause	Mesure
Ne commute pas	Tension d'alimentation manquante	Vérifier la tension d'alimentation
	Câble de signal défectueux	Vérifier le câble de signal
	Electronique défectueuse - FEL51 relié directement á L1 et N	Remplacer - Relier FEL51 toujours via la charge externe
	Densité du liquide trop faible	Régler la densité sur > 0,5 sur l'électronique
	Lames vibrantes encroûtées	Nettoyer les lames vibrantes
	Lames vibrantes corrodées (Sur FEL: rouge/jaune clignote, FEL58: vert clignote 0,3 Hz)	Remplacer les lames vibrantes ainsi que le raccord process
	FEL51: relais avec résistance interne trop élevée	Raccorder un relais approprié
	FEL51: relais avec courant de maintien trop faible	Raccorder une résistance en parallèle au relais
	FEL54: contacts soudés (après un court-circuit)	Remplacer FEL54; fusible dans le circuit courant
Mauvaise commutation	Sécurité min/max inversée	Régler correctement le circuit de sécurité sur l'électronique
Mauvaise commutation, sporadique	Mousse dense et lourde, fortes turbulences, liquide émulsionné	Monter le Liquiphant en bypass
	Parasites puissants	Blinder le câble de liaison
	Vibrations importantes	Découpler, amortir, tourner la fourche de 90°
	Eau dans le boîtier	Visser fermement le couvercle et les entrées de câble
	FEL52: surcharge de la sortie	Réduire la charge et la capacité (de ligne)
Mauvaise commutation après coupure	FEL57, comportement lors du test de mise sous tension (test cyclique)	Observer le comportement du FEL57 à la mise sous tension; bloquer la commande de l'installation après coupure de courant pendant max. 45 s

Fallo	Causa	Solución
No conmuta	No hay alimentación	Comprobar alimentación
	Señal defectuosa	Comprobar cable de señal
	Electrónica defectuosa - FEL51 conectada directamente a L1 y N	Cambio - Siempre conectar FEL51 vía una carga externa
	Densidad del líquido demasiado baja	Fijar densidad a > 0.5 en la electrónica
	Horquillas con adherencias	Limpiar horquillas
	Horquillas corroidas (En FEL: rojo/amarillo parpadea, FEL58: verde parpadea 0.3 Hz)	Cambiar la horquilla y la conexión a proceso
	FEL51: Relé con resistencia interna demasiado grande	Conectar un relé adecuado
	FEL51: El relé conectado retiene muy poca corriente	Resistencia conectada en paralelo con el relé
	FEL54: Contactos soldados juntos (después del corto circuito)	Cambiar FEL54; poner fusible en el circuito de contacto
Conmuta incorrectamente	El modo de fallo mín./máx. está mal ajustado	Ajustar el modo correcto en la electrónica
Fallos de conmutación esporádicos	Espuma muy densa, turbulencias, líquidos espumosos	Montar el Liquiphant en bypass
	RFI extremo	Utilizar cable apantallado
	Vibraciones extremas	Desacoplar, amortiguar y girar las horquillas 90°
	Agua en el cabezal	Roscar la cubierta y el prensaestopas firmemente
	FEL52: Salida con sobretensión	Reducir carga, capacidad (cable)
Conmuta incorrectamente después de un fallo de alimentación	FEL57, comportamiento durante la comprobación de conmutación (test de funcionamiento)	Observar el comportamiento de conmutación del FEL57; del fallo de alimentación, bloqueo del control de la planta durante 45 s aprox.

IT - Individuazione e eliminazione delle anomalie

Guasto	Motivo	Rimedio
Non commuta	Mancanza alimentazione	Controllare l'alimentazione
	Linea segnale guasta	Controllare segnale linea
	Inserto elettronico guasto - FEL51 connesso direttamente a L1 e N	Sostituire - connettere sempre FEL51 mediante carico esterno
	Densità del liquido troppo bassa	Impostare la densità a > 0,5 sull'inserto elettronico
	Forcella incrostata	Pulire la forcella
	Forcella corrosa (Sul FEL: rosso/giallo lampeggiano, FEL58: verde lampeggiano 0,3 Hz)	Sostituire la forcella e la connessione al processo
	FEL51: resistenza interna del relè connesso troppo grande	Collegare il relè adeguato
	FEL51: corrente di mantenimento del relè connesso troppo grande	Connettere resistenza in parallelo al relè
	FEL54: contatti saldati insieme (dopo il corto circuito)	Sostituire FEL54; mettere il fusibile nel circuito di contatto
Commuta non correttamente	Modalità di sicurezza min-/max-impostata in modo errato	Impostare la modalità corretta nell'inserto elettronico
Commutazione sporadicamente difettosa	Schiuma pesante e torbida condizioni molto turbolente, liquido che produce schiuma	Montare il Liquiphant nel bypass
	RFI forte	Usare cavo schermato
	Forte vibrazione	Disaccoppiare, smorzare, ruotare la forcella di 90°
	Acqua nella custodia	Avvitare correttamente il coperchio e il passacavi
	FEL52: Uscita sovraccaricata	Ridurre il carico, capacità (cavo)
Commutazione non corretta dopo la mancanza alimentazione	FEL57, comportamento durante la fase di test all'accensione (test di funzionamento)	Osservare il comportamento di commutazione del FEL57; dopo il ripristino di una mancanza di alimentazione inibire il controllo dell'impianto per 45 s

Fout	Oorzaak	Maatregel
Schakelt niet	Voeding ontbreekt	Voeding kontroleren
	Signaalleiding defect	Signalleiding kontroleren
	Insert defect - FEL51 direct op L1 en N aangesloten	Ver vangen - FEL51 altijd via een belasting aansluiten
	Dichtheid van de vloeistof te gering	Op elektronica- insert dichtheid op > 0, 5 instellen
	Trilvork te veel vervuild	Trilvork reinigen
	Trilvork gecorrodeerd (LED op FEL knippert rood/geel, FEL58: groen knippert 0,3 Hz)	Trilvork compleet met procesaansluiting vervangen
	FEL51: Relais met te groteinwendige weerstand aangesloten	Passender relais aansluiten
	FEL51: Relais met te geringe houdstroom aangesloten	Weerstand parallel aan relais aansluiten
	FEL54: Contacten verkleeft (na een kortsluiting)	FEL54 vervangen; zekering in circuit aanbrengen
Schakelt foutief	Minimum- /Maximum- fail-safe instelling verwisseld	FEL fail-safe keuze correct instellen
Sporadische foutschakeling	Dik zwaar schuim, wilde turbulentie, opgeschuimde vloeistof	Liquiphant in by-pass monteren
	Extreme RFI invloed	Verbindingskabel afschermen
	Extreme vibraties	Ontkoppelen, dempen, vork 90° draaien
	Water in de behuizing	Deksel en wartels vast aandraaien
	FEL52: uitgang overbelast	Schakelbelasting verminderen
Foutmelding	FEL57, gedrag bij inschakelen na netuitval (periodieke testfunctie)	Schakelgedrag FEL57 controleren; procesherstart na netuitval ca. 45 s blokkeren

DE- Ergänzung Fehlersuche

Ist das Schaltverhalten der Gabel ungewöhnlich, kann an PIN 4 der Diagnosebuchse die Gabelfrequenz gemessen werden.
Bei den Elektronikeinsätzen FEL51/52/54/55/56/57/58 ist dies eine sinusförmige Schwingung deren Amplitude einen Rückschluss auf den Gabelzustand zulässt.
Bei FEL50A ist aufgrund eines Rechtecksignals nur noch die Gabelfrequenzmessung möglich.

EN- Trouble- shooting Supplement

If the switching behaviour of the fork is abnormal, the fork frequency can be measured at PIN 4 of the diagnosis socket.
With electronic inserts FEL51/52/54/55/56/57/58 this is a sinusoidal vibration whose amplitude makes it possible to determine the condition of the fork.
With FEL50A, only the fork frequency measurement is possible due to a rectangular pulse signal.

FR- Additif recherche de défauts

Si la commutation de la fourche est inhabituelle, il est possible de mesurer la fréquence de cette dernière au PIN 4 de la prise diagnostic.
Pour l es électroniques FEL51/52/54/55/56/57/58 il s'agit d'une oscillation sinusoïdale dont l'amplitude permet d'évaluer l'état de la fourche.
Pour FEL50A, le signal rectangulaire ne permet qu'une mesure de la fréquence de fourche.

ES – Suplemento para la identificación de fallos

Si el comportamiento de conmutación de la horquilla es anormal, puede medir la frecuencia de la misma en el PIN 4 del interruptor de diagnosis. Con las electrónicas FEL51/52/54/55/56/57/58 se consigue una vibración sinusoidal cuya amplitud hace posible determinar la condición de la horquilla.
Con FEL50A, sólo es posible medir la frecuencia de la horquilla debido a una señal de impulsos rectangular.

IT – Supplemento alla ricerca dei malfunzionamenti

Se le condizioni di commutazione dei rebbi non è normale la frequenza di vibrazione può essere misurata al PIN 4 del connettore per la diagnosi. Con gli inserti elettronici FEL51/52/54/55/56/57/58 è possibile determinare la condizione dei rebbi anche tramite l'ampiezza dell'onda sinusoidale. Con FEL50A il segnale è un onda quadra, per cui è possibile valutare solo il valore di frequenza.

NL– Bijlage problemen oplossen

Indien het schakelgedrag van de trilvork niet normaal verloopt kan de frequentie van de vork gemeten worden op pen 4 van de diagnoseconnector.
Bij de elektronica inserts van de FEL51/52/54/55/56/57/58 is dit een sinusvormige trilling waarvan de amplitude een beeld geeft van de conditie van de vork.
Bij de FEL50A is alleen de vorkfrequentie te meten als gevolg van een rechthoekig pulssignaal.

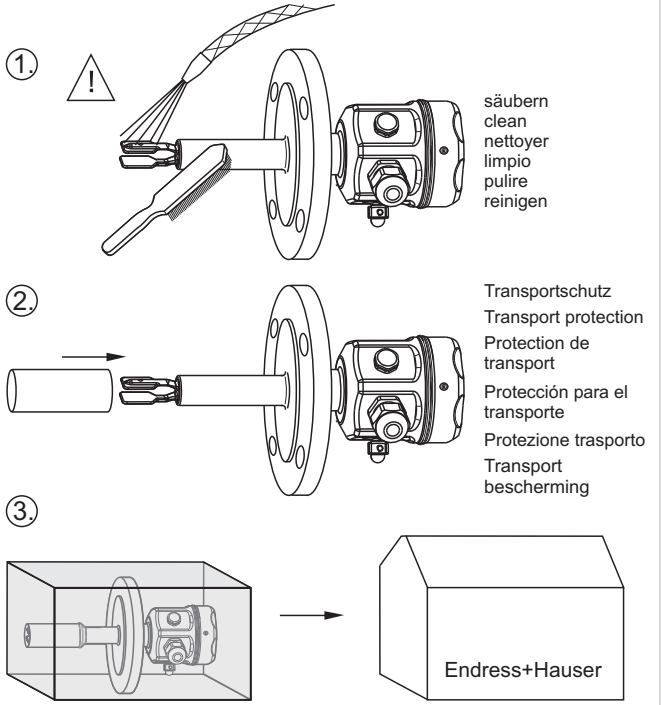
Installationsregel: Bei der Installation ist zu beachten, dass elektrische Betriebsmittel (Elektronikeinsätze) die mit nichteigensicheren Stromkreisen gespeist wurden, grundsätzlich **nicht** mehr mit eigensicheren Stromkreisen zusammengeschaltet werden dürfen.



Installation specification: During installation, please keep in mind that electrical resources (electronic inserts) which are powered by non-intrinsically-safe circuits may **no** longer be interconnected with intrinsically-safe circuits.

Directive d'installation : Lors de l'installation, tenir compte du fait que les matériels électriques (électroniques) alimentés par des circuits sans sécurité intrinsèque **ne** doivent plus être connectés à des circuits à sécurité intrinsèque.

Normas de instalación: Durante la instalación, tenga en cuenta que los elementos eléctricos (electrónicas) alimentadas por circuitos no instrínsecamente seguros, **no** podrán estar interconectadas con circuitos intrínsecamente seguros.

Specifiche di installazione: Durante l'installazione è necessario tenere presente che gli impianti elettrici (inserti elettronici) alimentati da circuiti elettrici non a sicurezza intrinseca **non** possono più essere collegati con circuiti elettrici a sicurezza intrinseca.

Installatievoorschrift: Bij de installatie moet erop worden gelet, dat elektrisch materieel (elektronica-units) die via niet-intrinsiekveilige circuits worden gevoed, in principe **niet** meer met intrinsiekveilige circuits mogen worden samengeschakeld.

d Sicherheitshinweise

Der FTE 31 darf nur als Füllstandsgrenzschalter für spezifizierte Schüttgüter eingesetzt werden. Bei unsachgemäßem Gebrauch können Gefahren von ihm ausgehen.

Das Gerät darf nur von **qualifiziertem und autorisiertem Fachpersonal unter besonderer Beachtung dieser Betriebsanleitung**, der gesetzlichen Vorschriften und der Zertifikate (je nach Anwendung) eingebaut, angeschlossen, in Betrieb genommen und gewartet werden.

Achtung!
= verboten - führt zu fehlerhaftem Betrieb oder Zerstörung.

e Notes on safety

The FTE 31 paddle switch is a level limit switch, designed for use in fine-grained bulk solids in non-hazardous areas.
If used incorrectly it is possible that application-related dangers may arise.
The FTE 31 paddle switch may be installed, connected, commissioned, operated and maintained **by qualified and authorised personnel only,** under strict observance of these operating instructions, any relevant standards, legal requirements, and, where appropriate, the certificate.

Caution!
= forbidden - leads to incorrect operation or destruction.

f Conseils de sécurité

Le FTE 31 est un détecteur de niveau à palette rotative pour produits solides en vrac de faible granulométrie, utilisable en zones non explosibles. Il peut être source de danger en cas d´utilisation non conforme aux prescriptions. L´appareil ne doit être installé, raccordé, mis en service et maintenu **que par un personnel qualifié et autorisé,** qui tiendra compte des indications contenues dans la présente mise en service, des normes en vigueur et des certificats disponibles (selon l´application).

Attention!
= interdit - peut provoquer des dysfonctionnements ou la destruction.

INSTALLATION & OPERATION MANUAL

ENVIREQUIP MIXERS

SECTION 1 – INSPECTION

- Make sure that all mixer parts have been removed from the crate(s) before discarding.
- Each mixer should be carefully checked for any possible shipping damage. Any shipping damage should be reported immediately to the TRANSPORT COMPANY.
- Check the paint and make any necessary touch-ups.

SECTION 2 – INSTALLATION

- Most mixer problems can be avoided by following proper installation and operation instructions. The following is a list of hints to help insure proper installation and therefore satisfactory mixer service.
- Please read all appropriate instruction manuals prior to proceeding with the mixer installation.
- For shipment, the gear-case is **drained of oil** (except for Nord drives) so **be sure to fill** the gear case with the proper lubricant to the proper level. DO NOT OVERFILL – note: if the reducer is already filled, (as is the case with NORD drives.
- Install breather(s) – if you forget to install the breather(s) the seals may fail.

CAUTIONS:

- Lock out the motor starter if any person is in the tank.
- Remove wick form the breather vent plug.
- Do NOT paint breather or the vent plug.

MOST COMMON PROBLEMS:

- Mixer shaft(s) not vertical.
- Impeller going through liquid level.
- Make sure the impeller blades have been installed onto the hubs in the proper position with regards to Rotation and Direction of flow.
- Please also note the impeller blades are installed with the hub ears always backing the blade into the flow.

- Also be sure that the leading edge and NOT the trailing edge is presented into the flow and that the angle at the impeller tip (angle of attack) from the horizontal is closer to 15” rather than to 75”

CAUTIONS:

- If the angle of attack at the impeller tip is closer to 75”, either an incorrect hub in combination with the correct impeller blade (or vice versa) has been incorrectly assembled to make an incorrect matching of possible hub and blade combinations. For help in determining what the correct combination should, please refer to the mixer nameplate that will have the Rotation and the Direction of thrust written on it. Once you know the combination, refer to the pictorial guide of impeller/hub installation positions of A, B, C or D.
- Depending on whether the concave or the convex surface is facing the fluid, if the angle of attack at the impeller is closer to 75”, the HP drawn will be 2 to 3 times greater than what it should be. This can result in OVERLOADING the motor and damaging the mixer.
- Make sure that the impeller blades are installed in the correct position for the required rotation e.g. if the impeller blades are installed up-side-down, the pumping capacity will be reduced by about 65%. Check the mixer nameplate for the flow direction and install the impeller blades to suit.

POTENTIALLY DAMAGING SITUATIONS FOR MIXERS – CAUTIONS:

- Prolonged operation of the mixer (impeller) at the liquid interface causes increased stress on the shaft and impeller for which the system was NOT DESIGNED to accommodate.
- Installations where there is a large hydraulic flow (or Velocity) in the mixer reservoir: Make sure that if such a flow is present, that the flow is BAFFLED or dispersed over a larger area (as opposed to directed flow via a pipe), or that the flow be re-directed away from the impeller/shaft assembly, or is introduced evenly e.g. via a weir.
- If this cannot be done, this external hydraulic flow will exert additional un-designed-for stress loads and deflection on the mixer shaft and impeller which can result in component failure.
- Sparging-in air or other gasses: If a mixer has not been selected to handle gassing, there is every probability that damage will occur due to the un-designed-for enormous unbalanced loads generated by the gasses rising.
- Do not attempt to install a mixer all assembled as a unit as this will cause extra undersigned-for stresses – Failure to abide by the above constraints may CAUSE DAMAGE NOT UNDER WARRANTY.
- Before permanently wiring the motor, check for the correct rotation of the low speed shaft. Normal is Clock-wise looking down from the top of the tank, although the reverse may also be required. Please check mixer NAMEPLATE for other instructions (eg Letters A,B,C or D)

- Read and follow the instructions of all tags and nameplates before operating.
- Check the mixer full load motor amperage and voltage before operating any mixer.
- It is recommended that the mixer impeller be rotated by hand in order to check for smooth operation. NB: For crown & worm drives, remove the fan cover and rotate the fan manually.
- Always operate the mixer in a fluid which has a specific gravity and viscosity less than or equal to the design specific gravity and viscosity.
- Do not dump the contents of large bags of chemicals directly onto the rotating mixer impeller(s); but add the contents into the reservoir gradually. This will also promote better mixing.
- Before starting the mixer, make sure the impeller is not buried in solids or a "set-up" fluid. NB: If solids have settled-out, then dilute or jog the mixer clockwise then counter-clockwise.
- Please check that there is no directed flow from an external source at the impeller or shaft unless the mixer was specifically designed to accommodate these additional stress loads, as mixers could be damaged.
- During START-UP, please listen for unusual noises and check for excessive vibration.
- Check the temperature of the motor and gear reducer. The temperature should not exceed 180^{o}F (82^{o}C). If they are too hot, please STOP THE OPERATION of the mixer and contact ENVIREQUIP immediately.
- Measure the motor amperage. The measured amperage must be less than the nameplate rating value. If the amps are over, please check the rotational speed of the great reducer/mixer output shaft. Place a piece of tape onto the shaft (or use an RPM counter if available, and count the number of revolutions for a period of e.g. 10 seconds using your watch second hand. Multiply the result by (6) for 60 Hz operation and this will provide you with the rotational speed of the mixer. Check rotation and impeller blade installation to be sure they are correct. If the power draw remains high, please check with ENVIREQUIP.

  NOTE: Record the full load motor amperage (FLA) and measure them every (3) months. Some motor amperage readings are poor indicators at low loads.

CAUTION:

- **DO NOT STAY IN THE TANK DURING MIXER ROTATION**
- Never use the mixer impeller as a foot stand or support for body weight – as such actions could damage the mixer as well as result in serious bodily injury.
- As with any rotating equipment, in order to avoid injury, extreme care should be taken to avoid contacting the rotating parts including not connecting the motors to the electrical power source until the mixer is completely assembled. Then, vacate the tank prior to operating the mixer.
- Before making field changes of motor horsepower, mixer speed, shaft length, impeller diameter or width, etc. Be sure to consult with ENVIREQUIP.
- After any plant electrical work has been done, check that the mixer(s) rotation(s) are correct as power lines may be been reversed.

SECTION 3 – MIXER ASSEMBLY – Closed tanks are Flange Mounted

- Open tank models usually are mounted on a steel structure. Level the drive as closely as possible. This assures that the shaft will turn in a true vertical position. Incorrect mounting is often a cause of mechanical difficulty with a mixer. Unless specified on the mixer assembly drawing, the mixer extension shaft is designed to run in a true vertical position. NEVER angle or side mount the mixers.
- While operating, there is a random fluid motion in the vessel that exerts great forces on the extension shaft of the mixer. The mixer accommodates these forces since they are transmitted directly to the support mounting(s). Therefore, the mounting system must be RIGID. It must support that static mixer weight as well as live mixer reactions that result from Torque and Bending Moment. It is not enough to design the support system for acceptable levels of stress. It must be rigid enough to take care of Start-up Torque Load (**2.5** times the Torque) and preclude large deflections that may result in mixer vibration.
- When designing the support structure to accommodate bending moments, be sure that the structure is sufficiently rigid so that the mixer extension shaft will not move more than 1/32" per 10 feet (0.8m per 3.05 meters) of shaft length due to deflection of the support structure.
- After the great drive (with the motor already flange-mounted onto the drive) has been properly installed, the mixer extension shaft should be installed into the gear drive's hollow output shaft (quill shaft) and fastened in the quill shaft with the thrust plate and secured in position with the threaded bolt provided – use Locktite Blue (or equivalent) or in the case of an output shaft coupling, bolt the mating flanges together.
- Mixer blades over 20" in diameter are generally bolted to a welded hub. **Check the welds** on the hub on your **yearly** overall inspection.

SECTION 4 – MOTORS – 5 HP WEG MOTORS SUPPLIED

- These mixers are supplied with the finest electric motors available. They are manufactured by a nationally known manufacturer (e.g. Nord, WEG, Brook etc). Under normal operation conditions, within specified temperatures, proper installation and maintenance, these motors are guaranteed to deliver rated output.
- In order to get top performance from any electric motor, be sure that there is plenty of air circulation and a minimum of obstructions. On fan cooled motors, be sure not to choke off the suction inlets, also be sure to check the allowable temperature that's indicated on the motor nameplate. Don't decrease the service life of a motor by operating it at excessively high ambient temperatures.
- In order to avoid damage to the motor during temporary overloads, jams, etc., be sure that correctly sized overload protection is provided. Starter overload heater elements can be sized from the full load current of the motor as shown on the motor nameplate. It is advisable to consult a supplier of motor control equipment when selecting thermal overload heaters.
- Before the motor is permanently wired, check to be sure that the output shaft rotation is correct. (Normally clockwise looking down from the mixer drive, but sometimes counter-clockwise depending on the process requirements).

CAUTION

- Make sure to check rotation of the mixer before it is operated. **To reverse the rotation** of standard 3 phrase electric motors, simply switch any 2 power leads.

SECTION 5 – PEDESTALS: SHAFT & GEARBOX REMOVAL – EVG SERIES

Series EVG standard design of the dry-well pedestal and shaft catcher is one where the flinger (for the dry well) and the shaft catcher are one-in-the-same part serving both purposes.

Shaft Removal and/or to Remove the Gear Reducer – see assembly drawing

1. Lock-out electrical power to the electric motor
2. If the electrical wiring is not long enough to allow removal of the gear reducer, disconnect the motor wiring.
3. Remove the safety cover located on top of the gear reducer exposing the bolt (#3) and top plate (#4) which holds the shaft (#12).
4. Slowly remove the top bolt (#3).
5. As the bolt is loosened, the shaft and impeller assembly will be lowered a distance of about 0.125" (3.175mm).
6. After the bolt has been loosened sufficiently, the flinger (#8) will come into contact with the Pedestal to the inner support pipe (#11) and stop there.
7. Remove the bolts holding together the Adaptor Plate Reducer to Pedestal top plate (#7).
8. Inside of the pedestal ($10), you can now see the flinger (#8) which rests on the collar / clamp (2) bolts / shaft catcher (#9).
9. Prior to undoing the set screws on the collar / clamp, make preparation to handle the shaft which will now fall through the dry well (#11) and into the tank.
10. Once the shaft is secured, loosen the set screws on the flinger assembly or clamp bolts (#9).
11. **To reinstall the shaft** (et al) follow the above procedure in Reverse.

NOTE: In order designs, the flinger was welded onto the shaft. In that case, the shaft can only be removed vertically through the top of the Pedestal.

CAUTION:

- Prior to loosening the (3) set screws on the flinger / shaft catcher, please ensure that there is some means of holding the shaft in place (if no clamp is supplied, use 2 pieces of wood 4" x 4" or 6" x 6" with tightening bolts to hold the shaft in place via friction.) **IF NOT, THE SHAFT WILL DROP INTO THE TANK**, possibly causing damage to the equipment or vessel and bodily injury. Shafts are often of sufficient weight to cause serious bodily injury **or even death** were it not properly secured.
- You may want to install a plastic hose in the pedestal so that you can monitor if the gear reducer is losing oil and collecting in the dry-well pedestal.

- **A split collar is used to prevent the shaft from accidentally falling from the gear reducer.**

NOTE: On older EVG series, there may not be a split ring but rather a flinger that rests on the dry well seal to hold the shaft in place.

1. Insert eye-bolt in top center of the impeller shaft.
2. Slowly lift up the complete impeller shaft assembly a distance of 6mm (0.25”).
3. Remove the split collar that rests against the top of the quill shaft of the gearbox.
4. Slowly lower the complete shaft / impeller assembly a distance of 10 to 12mm (0.375” to 0.50”).
5. At this point, the flinger / clamp assembly will come into contact with the pedestal top inner support pipe / dry well.
6. Remove bolts.
7. Lift off the complete gear reducer until the gearbox clears the shaft and eye-bolt.
8. Then reinstall the gear drive, follow the above procedure in reverse.

Shaft Straightness:

- When shipped, the mixer extension shaft was straight to within 0.003” per foot (0.25mm per meter) of shaft length for mixers equipped with centre-less ground shafts (special order – uncommonly used). If the shaft does not appear to be damaged, but the run-out is **greater than** the above standard, the shafting supplied may have been “smooth-turn” (more commonly used), which might not be dimensionally the same over the entire length of the shaft. This is probably still acceptable. In such cases, or where it might be difficult to obtain an accurate shaft run-out value, we may apply another rule: 0.25 to 0.50% of the impeller diameter = the maximum shaft run-out at the bottom of the shaft. E.g.:
- 50” diameter impeller 0.14 to 0.28”
- 100” diameter impeller 0.26 to 0.53”
- 150” diameter impeller 0.40 to 0.67”
- Flanges are used as shaft couplings when shaft extensions exceed approximately 12”-0” (3.65mm). Ensure that the bolts are **tightened** and that a product like Never Seize (or equivalent) is used. Refer to the table in this manual for torque tightening values.
- Recheck bolt tightness after 1500 hours (or 3 months) OR <u>tack weld the nuts to prevent this</u>. These couplings are welded onto the shafts with (4 to 6) gussets and are not removable.

CAUTION:

- Handle the shaft carefully to be sure that it is not bent
- After the shaft has been installed, check it for straightness. Storage and handling may have resulted in a bend. To check it, an indicator is placed at the end of the shaft, and the high speed shaft is then rotated by hand. Run-out of the total shaft should not be greater than the above referenced values. If the run-out is greater than the above values, the shaft can be re-straightened in the field.

- **To re-straighten the shaft**, follow this procedure:
- Where the maximum positive readout is found, place the indicator on that side of the shaft.
- Heat the shaft at a point of 180^0 from the indicator, (and just below the 1^{st} in-tank coupling if applicable), apply heat just below the mounting nozzle.
- The shaft will grow toward the indicator as heat is applied to it. However, **DO NOT permit the surface temperature to go over 500^0F (260^oC).** Use Tempilstics or equivalent.
- The shaft will straighten since it will draw more than it grows.
- After each heating process, rotate the shaft and recheck until the straightness is within tolerance to meet the allowable tolerance.
- **To install any impeller**, simply slide the impeller hub onto the extension shaft above the shaft keyway. Install Hook type (Gib) key into the keyway making sure that the pin is inserted into the correct hole for proper impeller location. Lower the hub (with or without blades bolted on) down onto the key. Tighten set screw. Bolt on blades if not already done.

NOTE:

All MIX-TECH Portable mixers operate at least 35% below the 1^{st} Critical Speed or harmonic frequency – there is no danger of "hitting-on" or approaching the 1^{st} Critical Speed – (unless specifically mentioned otherwise)

Please refer to the specific manufacturer's installation and operating manual.

Correct lubrication practices are essential to long life and satisfactory performance of a gear drive. Be sure to use the right lubricants as recommended. With proper lubrication maintenance, the gear drive will carry its rated design load and provide years of satisfactory operation.

SECTION 6 – SHAFTS, IMPELLERS & COUPLINGS

IMPELLERS:

- Make sure that the impeller blades have been installed onto the hubs in the proper position with regard to Rotation and Direction of Flow. Please also note that the impeller blades are installed with the hub's ears ALWAYS BACKING the blade INTO the flow. Also be sure that the leading edge and NOT the trailing edge is presented into the flow, and that the angle at the impeller tip (angle of attack) from the horizontal is closer to 15^0 rather than to 75^0.

CAUTION:

- If the angle of attack at the impeller tip is closer to 75^0, either an incorrect hub in combination with the correct impeller blade (OR VICE VERSA) has been incorrectly assembled to make an incorrect matching of possible hub and blade combinations. For help in determining what the correct combination should be, please refer to the mixer nameplate that will have the Rotation and Direction of Thrust written on it. Once you know the combination, refer to the pictorial guide of impeller / hug installation positions A,B,C, or D.
- Depending on whether the concave or the convex surface is facing the fluid, if the angle of attack at the impeller is closer to 75^0, the HP drawn will be 2-3 times greater than what it should be. This could result in OVERLOADING THE MOTOR and damaging the mixer.
- Make sure that the impeller blades are installed in the correct position for the required rotation: e.g. if the impeller blades are installed up-side-down, the pumping capacity will be reduced by about 65%. Check the mixer nameplate for the flow direction and install the blades to suit.

SECTION 7 – GEAR DRIVE MAINTENANCE

CAUTION:

- By following instructions, many premature gear and bearing failures can be avoided.
- Keeping a maintenance log is highly recommended.
- Lubricant used in the gear case must be free of dirt, metal particles and other contaminants. Use only NEW OIL. Strain the oil if there is any possibility that it contains contaminants.
- To equalize pressure inside and outside the gear case, a breather is installed on top of the unit. This breather normally requires no maintenance, and must NOT be blocked. Check hole for free breathing.

PORTABLE MIXERS:

- Lubricant for PORTABLE MIXERS (Series EHG), the Crown and worm gear reducers are filled FOR LIFE (20,000 hours or 4 years) with synthetic oil.

CAUTION:

- For shipment the gear case is drained of oil (except for NORD drives). Be sure to fill the gear case with the proper lubricant to the proper leve. Install breather. **DO NOT OVERFILL.** N.B. if the reducer is already filled (as is the case with NORD drives), do not forget to install the breather(s) **or the seals may fail.**

RECOMMENDED LUBRICANTS FOR NORD HELICAL GEARING:

- These Nord Gear reducers are factory-filled with Shell Omala 220 mineral oil or with Chevron ISO FM 220 food grade oil (if required) or equivalent, or with Shell Omala 220 regular mineral oil fill <u>when the mixer is provided with a dry well seal unless otherwise specified.</u>

Note:
- A reducer previously filled with Shell Omala 220 mineral oil can be drained (as much as practical to achieve) and Chevron ISO FM 220 substituted without any harmful chemical reactions or reduction to the lubricating quality of the new (or old) oil.
- Please note that the gear reducers for MIX-TECH'S "EVG" SERIES ARE Nord Parallel shaft drives. The top output bearing is grease-packed although there is no grease nipple. Please remove the seal and **re-pack** the bearing with grease (refer to Nord Instructions on the WEB by putting in the Nord Unit Serial Number. The output shaft seals are "Quadrilip" having 2 discrete grease-filled pockets.

GEAR DRIVE MAINTENANCE FOR SERIES EVG & EVGX PARALLEL SHAFT DESIGN GEAR REDUCERS:

- Recommended oil change intervals in Nord IOM:
- Synthetic lubricants should be changed every 20,000 service hours or every 4 years

- Mineral oils should be changed every 10,000 service hours or after 2 years. See gear reducer service manual (IOM)

CAUTION:

Units should be checked out periodically for increased noise, surface temperature, vibration, shaft movement and amperage draw. Units with inspection covers should not be operated with the inspection covers removed.

PROCEDURE FOR RE-GREASING THE UPPER OUTPUT BEARING equipped with Tapered roller bearing option:

1. Remove upper output shaft seal(s).
2. Inspect bearing cavity for presence of grease. The bearing cavity should be packed to approximately 1/3 full with grease.
3. If required, inject grease into the taper roller bearing until the cavity is filled to 1/3. A Needle Nozzle is generally required on the grease gun, because the shim(s) partially cover the access to the bearing cavity.
4. Install new upper output seals.

NOTE:

The other bearings in these gear boxes are open and are submerged in oil.

The recommended interval for changing the gearbox oil is every 10,000 hours of operation.

- The standard ambient temperature selected is 15 to 125^{o}F (9 to 52^{0}C) for the gear reducer.
- Some gear reducers are equipped with bulls-eye oil level indicators, **others have a plug**.

SECTION 8 – BOLTS

- Impeller blades and other in-tank fasteners are supplied as standard with lock-washers.

NOTE:

For bolting locations that are not easily accessible, you might want to consider tack welding the nuts to prevent nuts from loosening.

CAUTION:

- Extreme care should be taken to see that locking devices are properly installed and to be sure that the bolts / studs are properly tightened and lubricated.

It is recommended that all in-tank fasteners (and all other bolts) be rechecked for tightness **after the first 1500 hours of operation** and subsequently at each scheduled shut-down and that a suitable lubricant be used e.g. Never seize or equivalent.

NOTE:

Once the nuts are tightened, it is a good idea to tack weld them to prevent the need for re-tightening them every 3 months.

RECOMMENDED BOLT TORQUE VALUES:

BOLT SIZE			**TIGHTENING TORQUE**					
			Ft.lbs.	**Nm**			**Ft.lbs.**	**Nm.**
a.	0.25”	-20	5	7	0.875”	-9	320	434
b.	0.3125”	-18	10	14	1.0”	-8	490	664
c.	0.375”	-16	20	27	1.125”	-8	560	760
d.	0.50”	-13	60	81	1.25”	-7	710	963
e.	0.625”	-11	120	163				
f.	0.75”	-10	200	271				

NOTE:

Tighten all bolts as specified. Lubricate all fasteners with an anti-seize product. If no lubrication is used when tightening the bolts as specified, multiply the table values by 1.3

GEAR REDUCER & MOUNTING PLATE BOLTS:

These bolts are also subject to high loads and should be properly torque to prevent bolt stretch and/or reducer wobble. For situations with large reducers or long shafts with large reducers, use additional care to make sure that these bolts are installed and torque properly.

This "Turn of the nut Method" can be summed up n one sentence:
"Turn the Nut ½ to 2/3 turns beyond the snug tight position, this applies to any bolt of any size. However, fasteners should be clean, rust-free and lightly oiled.

In cases where the nut is not accessible, the bolt may be turned ½ to ¾ turn beyond snug tight.

LEVER ARM SYSTEM:

Bolt Size	**Lever Arm**
¼" - 3/8"	6" handle
7/16" – 5/8"	12" handle
¾" – 1.125"	24" handle
1.25" And over	36" handle

NOTE:

This lever arm system should be used with or without lock washers. If lock washers show signs of splitting or fatigue, they must be replaced.

SECTION 9 – OPERATION

- The mixers that you have purchased have been designed to accommodate all the loads that will be encountered in the normal course of operation.

CAUTION:

- Care must be taken to avoid prolonged operation of the mixer impeller(s) at liquid interface. These mixers were not designed to operate under those severe conditions and could become damaged.

SECTION 10 – MOTOR REMOVAL & INSTALLATION OF MOTORS

- **For Nema "C" Flanged Motors** (NOT integral motors): The motors supplied have been installed onto the reducers. In the event of motor maintenance, remove the bolts which hold the gear reducer's Nema "C" flange adaptor to the motor's "C" face. Remove the coupling half and service the standard NEMA motor as required.
- **Installation:** reverse the procedure.
- Please refer to "COUPLING ENCLOSED" cross sectional drawing which shows the mounting distance 1 13/16" (46.03mm). Note that the coupling is keyed onto the motor shaft (key provided).
- In the case of NORD integral motors: The motor can then be removed exposing the high speed pinion gear mounted on the motor shaft. The motor can then be serviced as required.

SECTION 11 – TROUBLE-SHOOTING / MIXER PERFORMANCE

PERFORMANCE:

- If you find that the mixer is not performing according to your expectations, one of the things that directly affects mixer performance are the BAFFLES (or lack thereof).
- Also check that the impeller blades are in the correct configuration A,B,C or D, that the correct blades are matched to the correct hubs and that the rotation is correct. (Please refer to Section 6 Pages 7, 8 & 9 for more information.

NOTE:

Baffles always help any mixer application by providing the means to convert rotational motion into top-to-bottom pumping / mixing.

- If the viscosity of the fluid is over 25,000 cp. Then baffles are not necessary.
- If the vessel is rectangular in shape, baffles may not be necessary.
- In circular or square vessels, the use of baffles is MANDATORY.

OTHER METHODS: Of achieving top-to-bottom motion without using baffles:

- Off-centering the mixer by 20% (uses the vessel as a baffle)
- Angle mounting (into a quadrant) – often seen on Portable Mixers. If you want to angle-mount a larger mixer, please check to be sure that the shaft was designed to accept these additional stress loads.

NOTE:
OIL LEAK(S) FOR Series EVG supplied with a flinger / shaft catcher & dry well seal.

FOR SERIES EVGX:
There is an oil overflow plastic pipe indicating oil leaks.

- If one of the 2 output oil seals were to fail (very rare), then the oil would migrate down the output shaft and be pumped by the flinger into the moat surrounding the dry well pipe. Any such leak would be contained by our sealed pedestal – access to it is by a plug.
- Any other oil leak will be visible on the outside of the gear reducer.

SYMPTOM	**REASON(S)**	**SOLUTION**
Oil leak on the reducer	Vent plug not installed or Vent plug painted over or Vent plug failure.	Clean up oil and remove the vent plug. If this stops the leak, change vent plug.
Oil leak on top of reducer	Motor and/or top bolts not tightened.	Use Teflon tape and tighten bolts
Oil leak on end plate	Bolts loose	Tighten bolts
Oil leak on top of reducer	Gasket between motor & the reducer failed	Replace gasket & silicone sealant
Sign of oil on baseplate	Drain pipe & valve damaged	Use Teflon tape/sealant to reseal
Oil leak on reducers with C Flanged motor(s)	If the vent was not installed plugged or faulty, the oil pressure in the reducer might have exceeded 2 psi causing the input oil seal to "blow-out" / reverse	Change the input oil seal

NOISE: Under normal circumstances, Envirequip mixers operate quietly and without vibration. If there is a metal-on-metal noise, check to see if the top bolt #3 is properly tightened to the shaft. If the bolt is not, the shaft will be lower than it should be and the flinger / shaft catcher may be touching the dry well pipe.

HEAT: Check the temperature of the reducer and motor. If hot, (>140^{0}F) that is **too hot** - check the oil level.

NOTE: On Series EVG & EVGX, an oil expansion chamber is supplied to minimize problems with over-filling of oil into the gear case. Care should be taken NOT to overfill the gear reducer with oil.

SECTION 12 – WARRANTY

- These mixers should provide long and satisfactory service. Only the finest materials were employed in their manufacture. However, if any defects in materials or workmanship occur, the defective part(s) must be returned to ENVIREQUIP (Division of 6445772 Canada Inc.) freight prepaid. ENVIREQUIP reserves the right to repair or replace, at its discretion, any part that proves to have been defective in materials or workmanship.
- ENVIREQUIP is not responsible for the warranties on components purchased, e.g. motors, but will endeavour to help to obtain resolution of any problem(s) with any of our sub-supplier(s) as regards their warranties.
- In any warranty claim involving any of our sub-suppliers, their warranty rules and Terms & Conditions will also rule.
- For a warranty, even if for a valid claim, to be acted upon, the original invoice must be paid. If the equipment is not paid, there is no warranty expressed or implied.
- ENVIREQUIP specifically excludes any liability as to loss of production, improper use of the equipment, abuse, any other liability expressed or implied that exceed the limited warranty given as applies to the equipment being free of defects in materials and/or workmanship.
- ENVIREQUIP's warranty is for (1) year against defects in materials or workmanship and also includes a Process warranty.
- The Process warranty only applies to the conditions that were specified at the time of bidding.
- Please refer to the terms and conditions as well as to the warranty for complete details.
- **The maximum liability on any given order cannot exceed the value of the amount of the original order.**

Call: 1-514-386-1043

SECTION 13 – MAINTENANCE LOG

We highly recommend you make a log for these items complete with the date checked and your signature, which is information required for warranty claims.

SUGGESTED ITEMS TO LOG:

CHECK OIL

CHANGE OIL

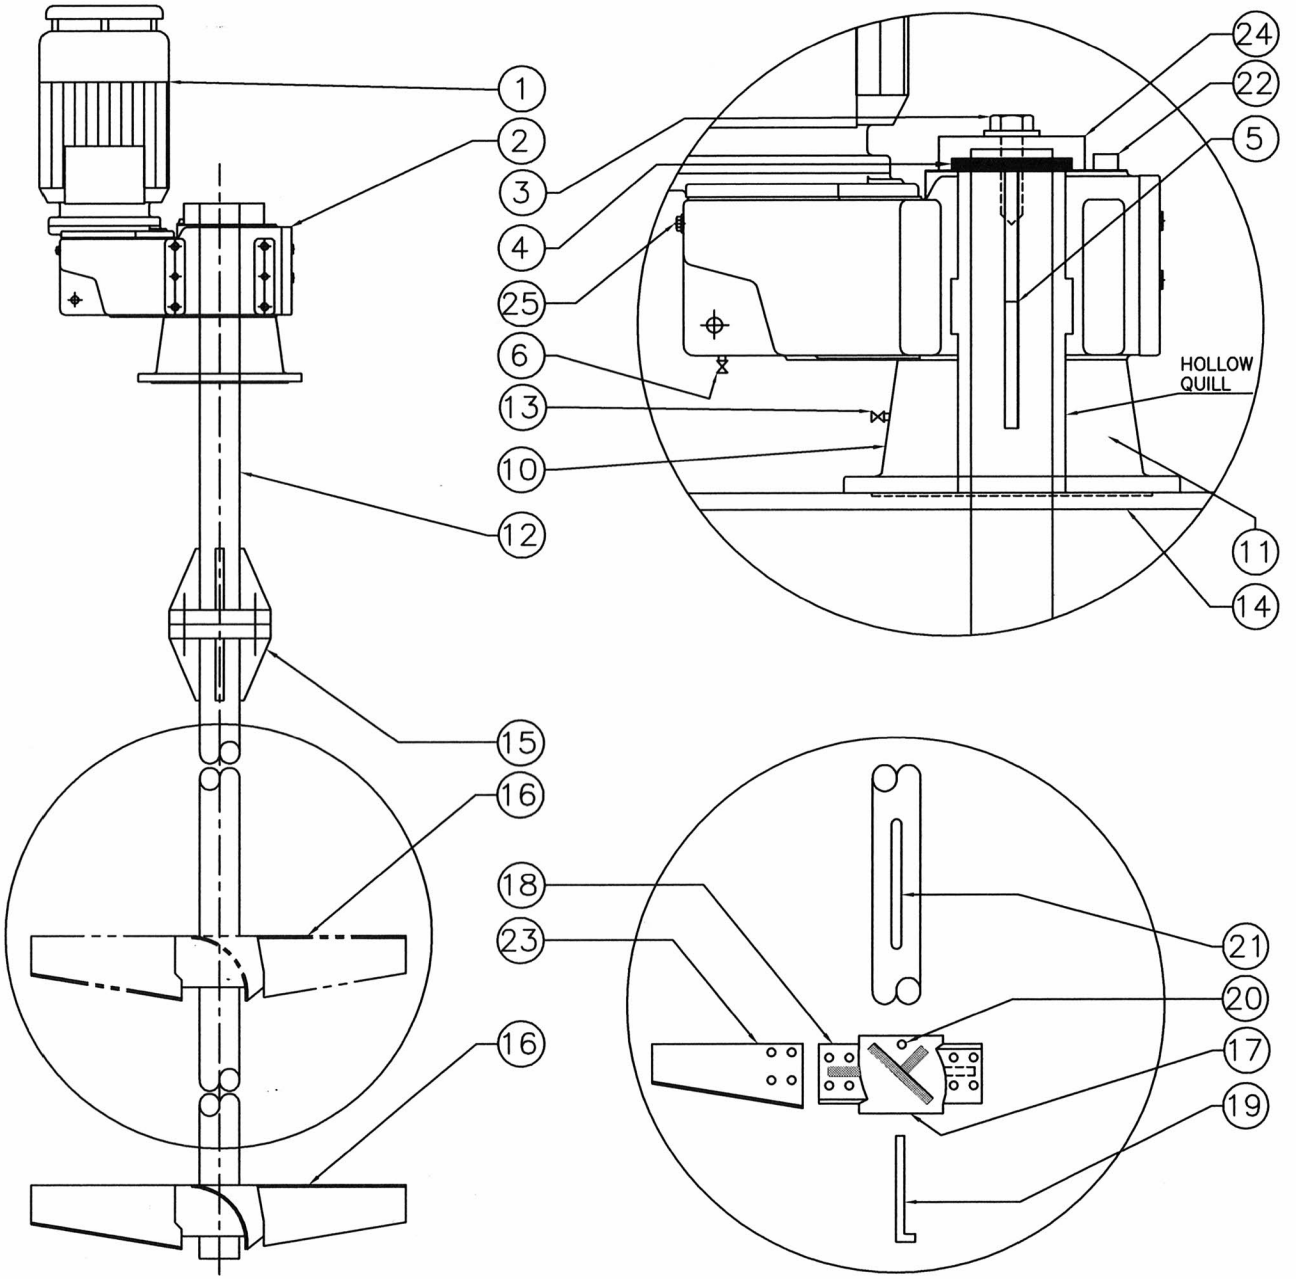
CHECK PEDESTAL FOR OIL LEAKAGE

CHECK FOR HEAT

CHECK FOR NOISE

CHECK FOR VIBRATION

CHECK BOLT TIGHTNESS:



- Top bolt & pedestal bolts
- Base bolts
- Clamp
- Coupling
- Hub & blades
- Reducer end cover bolts

CHECK MOTOR AMPERAGE

CHECK ROTATION AFTER ELECTRICAL WORK

OTHER

This page is intentionally left blank

Assembly instructions T4E

The general installation and maintenance instructions must be observed.

1. Plug Subassembly:
   - 1.1 Assemble PFA diaphragm **(040)** over the plug stem **(020)** with the aid of diaphragm guide.
   - 1.2 Place metal diaphragm **(050)** (optional) and thrust gland **(060)** over the plug stem and slide it down to the PFA diaphragm.
   - 1.3 Remove the guide.
   - 1.4 Place the grounding spring **(070)** over the plug stem and slide it down to the thrust gland.
2. Top Cap Subassembly:
   - 2.1 Adjusting the hexagon bolts **(090)** so the bottom of the thrust gland is flush with the bottom face of the top cap **(080).**
   - 2.2 Assembly the stop **(110)** using the hexagon bolts **(120).**
3. Apply a thin, even film of silicone to the entire outside surface of the plug.
4. Place the pre-assembled plug into the body. The plug ports shall be lined up in the open position.
5. Slide the pre-assembled top cap over the plug stem down until it rests on the thrust gland.
6. Apply Loctite to the top cap fasteners. Place the four bolts **(100)** and tighten them using the criss-cross method according the recommended torques.
7. Loosen the adjuster bolts (¼-½ turn) and rotate the plug three times to make it move upward.
8. Retighten the adjuster bolts according to the recommended torques.
9. Open and close the valve a couple of times to make sure the stops lines the plug ports properly with the runs in the body.
10. Slide the stop collar **(130)** over the stem afterwards place the stop collar retainer **(140)**.
11. Place the wrench **(150)** and fasten it by using the washer **(180)** and the bolt **(190)**.
12. All valves shall be seat tested in both flow directions.

Disassembly instructions T4E

For all jobs which are to be carried out on an installed valve, the works safety requirements and the general accident prevention instructions must be observed. Moreover, the general installation and maintenance instructions for atomac fluorcarbon resin lined valves must be considered.

1. Prior to disassembly, the valve must be cleared of all fluid according to the above-mentioned instructions. Particular care must be taken that during rinsing and draining of the piping, the valve is opened and closed repeatedly. These cycles (opening and closing) are to be repeated during draining of the piping. Only when following this procedure, is it ensured that all remaining pressure inside the body is eliminated.
2. For disassemble the valve put the body on a work bench with a soft cover (rubber mat).
3. Disassemble the wrench by removing the bolt **(190)** and washer **(180)**.
4. By pushing up the stop collar **(130)** the stop collar retainer **(140)** can easily be removed.
5. Unscrew the top cap bolts **(100)** and remove the top cap **(080)** from the body **(010)**.
6. Turn the plug **(020)** several timer to make it move upwards.
7. Remove the grounding spring **(070)**, thrust gland **(060)**, metal diaphragm **(050)** (optional) and the
   PFA diaphragm **(040)**.
8. If necessary the stop **(110)** can be removed by unscrew the stop fasteners **(120)**.

1.1 Important Safety Information

FLSmidth recommends that equipment be installed, operated, and maintained in accordance with all applicable governmental safety and health laws, regulations, and generally recognized industrial standards.

The information provided in this chapter is intended to provide a general overview of safety guidelines recommended by FLSmidth, and is not an exhaustive list of all standard safety procedures. The specific guidelines outlined below may or may not apply to your particular equipment. FLSmidth is neither responsible nor liable for incorrect or unsafe practices or policies.

Follow all governing safety standards and local jobsite procedures.

1.1.1 Hazard Signal Indicators

Danger, Warning, and Caution indicators are located throughout the manual at specific points of interest and alert the reader to the relative degree of a hazard.

These notices are given to prevent personal injury, death, equipment damage, and improper service, and must be followed to reduce or eliminate these risks. Always heed these notices, and practice common sense when performing any maintenance or repair procedure.

Hazard Symbol	Symbol Description
	This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury and death.
	“Danger” indicates an imminently hazardous situation which, if not avoided, could result in death.
	“Warning” indicates a potentially hazardous situation which, if not avoided, could result in death, serious injury, or property damage.
	“Caution” indicates a potentially hazardous situation which, if not avoided, MAY result in minor or moderate injury and property damage. It may also be used to alert against unsafe practices.
	“Notice” is used to draw attention to detailed instructions. These notes are intended to give further important information regarding the equipment or a step in a procedure.

Table 1-1: Hazard Signal Indicators

1.1.2 Safety Signs and Symbols

Additional safety signs and symbols may appear along with the Danger and Caution indicators, and are used to specify certain hazards. These warnings describe particular areas where special care and procedures are required in order to prevent serious injury and possible death.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

1.1.2.1 Mandatory Action Symbols

Mandatory Action Symbols are referred to as Personal Protective Equipment (PPE) and are identified by a blue circle with a white symbol in the middle signifying the type of protective equipment required. These symbols indicate a mandatory action required to safeguard personal health and avoid risk of personal injury.

FLSmidth recommends that personnel wear the correct PPE at all times, and that all PPE meet local country standards, and where appropriate, international standards such as ISO, ANSI and EN. Follow all governing safety standards and local jobsite procedures.

The following table contains the comprehensive list of mandatory action symbols and their descriptions. The symbols below may or may not apply to your equipment.

Mandatory Action Symbols	Description	Mandatory Action Symbols	Description
	General Mandatory Action		Wear Protective Clothing
	Refer to Instruction Manual		Use Handrail
	Wear Ear Protection		Wear a Face Shield
	Wear Eye Protection		Wear Head Protection
	Connect an Earth Terminal to the Ground		Wear High Visibility Clothing
	Disconnect Plug from Outlet		Wear a Mask
	Wear Opaque Eye Protection		Wear a Safety Harness
	Wear Safety Footwear		Disconnect Before Carrying Out Maintenance or Repair
	Wear Protective Gloves		Use This Walkway

Table 1-2: Mandatory Action Symbols

1.1.2.2 Prohibition Symbols

FLSmidth recommends the use of prohibition symbols that are used to indicate a prohibited action. They are identified by a red circle with a diagonal line running through and the black symbol in the middle (sometimes accompanied by words). These symbols signify what you should not do or what is prohibited.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

The following table contains the comprehensive list of prohibition symbols and their descriptions. The symbols below may or may not apply to your equipment.

Prohibition Symbols	Description	Prohibition Symbols	Description
	General Prohibition		No Pushing
	No Smoking		No Sitting
	No Open Flame, Fire, Open Ignition Source, or Smoking		No Stepping on the Surface
	No Thoroughfare		Do Not Use Lift in Event of Fire
	No Access for People with Active Implanted Cardiac Devices		No Eating or Drinking
	No Metallic Articles or Watches		Do Not Use Lift for People
	Do Not Touch		No Running
	No Heavy Load		No Climbing
	No Reaching In		Do Not Enter

Table 1-3: Prohibition Symbols

1.1.2.3 Warning Symbols

FLSmidth recommends the use of warning symbols that are used to signify potential danger. These symbols are identified by a triangle with a yellow background and a black symbol in the middle signifying the danger.

The following table contains the comprehensive list of warning symbols and their descriptions. The symbols below may or may not apply to your equipment.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Warning Symbols	Description	Warning Symbols	Description
	General Warning		Automatic Start-up
	Explosive Material		Crushing
	Floor Level Obstacle		Flammable Material
	Drop Fall		Sharp Element
	Slippery Surface		Corrosive Substance
	Electricity		Crushing of Hands
	Forklift and Other Industrial Vehicles		Counter Rotating Rollers
	Overhead Load		Battery Charging
	Toxic Material		Oxidizing Substance
	Hot Surface		Explosive Atmosphere

Table 1-4: Warning Symbols

There may be additional types of signage to those shown above depending on the country or site. Make sure that you familiarize yourself with, and **understand the signage that is used at your site.**

1.2 Safe Working Practices

Safe working practices are essential when working in construction areas with heavy equipment. The high noise levels, dust conditions, and ever-present danger of high-powered machinery demands that safety be observed by all personnel on the jobsite, and most specifically by those working on or in the immediate area of the equipment.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Do not install, operate, maintain, or repair this equipment until you have read and fully understand the instructions and warnings in this manual. Failure to follow these safety precautions could result in personal injury, death, or property damage.

- Proper care is your responsibility.
- All maintenance and repair of this equipment shall be performed in accordance with safety warnings. Failure to do so may result in personal injury or property damage.

1.2.1 Operator Responsibilities

Machinery is to be operated by those with prior experience operating sophisticated equipment and systems, and who have been appropriately trained and certified in the proper use of this particular machinery.

FLSmidth recommends that equipment be installed, operated, and maintained in accordance with all applicable governmental safety and health laws, regulations, and generally recognized industrial standards.

1.2.2 General Safety Recommendations

FLSmidth recommends that assembly, operation, and maintenance personnel observe the following general safety guidelines.

- Perform both a pre-start inspection as well as a walk-around inspection. This can be done by the installer, operator, or a designated maintenance technician.
- Do not put equipment into operation unless all regularly scheduled maintenance and any unscheduled, but necessary, repairs have been performed.
- Adhere to the recommended maintenance schedule for machinery and component parts.
- Use all of the systems designed to keep people safe when in the area of the equipment, including proper safety signs and any standards appropriate to the specific country where the site is located.
- Do not override any safety system.
- Engage the equipment controls slowly.
- Ease components into motion gradually to prevent shock load damage and unnecessary wear on gear cases and other moving parts.
- Keep hands and anything you are holding out of any area with moving parts.
- Prevent tripping and falling hazards around the equipment according to your site requirements.
- Make sure that all working components come to a complete stop before reversing the controls.
- Do not leave the operator's station unattended while the equipment is in operation.
- Be familiar with the emergency shutdown procedures and locations where they can activate an emergency stop system shutdown.

Note: FLSmidth cannot anticipate every possible circumstance that may involve a potential hazard, therefore, the safety and informational prompts in this manual are not all-inclusive. If a tool, procedure, work method, or maintenance technique not specifically recommended by FLSmidth is used, make sure that it's safe prior to use. Make sure that lubrication, maintenance, or repair procedures do not damage the machinery or make it unsafe for operation. For more information on maintenance and repair procedures for items furnished but not manufactured by FLSmidth, refer to the original equipment manufacturer instructions.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

1.2.3 Unauthorized Modifications

Unauthorized modifications to the equipment may impair its function and capacity to operate safely, and may lead to shortened equipment life and unsafe operating conditions. Do not take shortcuts on equipment repair. Read all instructions thoroughly.

1.2.4 Lockout/Tagout (Energy Isolation)

The purpose of Lockout/Tagout (LOTO) and related procedures is to avoid electrocution or accidental start-up of the machine(s) or parts during maintenance or service. An unwanted start or movement can lead to serious injury or death.

Follow all governing safety standards and local jobsite procedures.

Examples of potential risk include:

1. A machine that was switched off is suddenly restarted from a remote control panel or locally by mistake.
2. A machine unexpectedly energizes due to a failure in the machine control system.
3. Residual energy such as compressed gas or liquid, as well as spring or gravity loads, is suddenly released and applies considerable force to one or more parts.

Further, FLSmidth recommends that chains, blocking, locking pins or other hardware be used for isolating, securing or blocking machines or equipment from mechanical energy sources, including springs and gravity loads.

The equipment used for securing the machinery must be strong enough to effectively prevent movement of the machine, for example, using a weak chain will provide a false sense of security as it may break.

Follow all governing safety standards and local jobsite procedures.

1.2.5 Fire Extinguishers

Fire is a major cause of loss of life and property throughout the world. While fire normally does not pose a grave danger on open construction sites with steel and concrete as major materials, it may occur at any time and anywhere.

Have fire extinguishers available and know how to use them. Inspect and have them serviced as recommended on their instruction plates.

Follow all governing safety standards and local jobsite procedures.

1.2.6 Emergency Procedures

The best way to deal with emergencies is to prevent them in the first place.

Follow all governing safety standards and local jobsite procedures.

Each site will have its own procedures, which you will learn at your site induction. If the emergency procedures are not provided to you, it is your duty to seek out the emergency procedures, telephone numbers, and radio channels that are used on site.

NOTICE

Always follow site procedures when dealing with an emergency situation. Use your site emergency call procedure and be ready to provide relevant information.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

1.2.7 Equipment Safety Signs and Labels

Equipment supplied by FLSmidth is fitted with safety signs and labels in accordance with global safety standards. Read and understand all safety signs and labels on your equipment before installing, operating, lubricating, or maintaining this equipment. Make sure safety signs and labels are legible.

Replace any safety signs and labels that are damaged or missing. If a safety sign or label is attached to a part that is replaced, install a new safety sign or label on the replacement part.

1.2.8 Protective Devices

Your equipment may be fitted with devices that are designed to provide protection for personnel who are working on or around the equipment. To maintain safety it is critical that these devices are kept in place and correctly maintained.

Protective devices may include the following:

- Emergency stop switches
- Safety trip wires
- Interlocks
- Guards

1.2.8.1 Emergency Stop Switches

Moving machines are typically fitted with emergency stop (E-stop) switches located at strategic places on the machine. These E-stop switches will immediately cut off the power source to the machine, and, once triggered, require manual (physical) reset before the machine may be started again either locally or from a remote control room.

Locate the nearest E-stop switch as close to moving parts as possible. In some cases, such as with a long belt conveyor, this can be difficult to achieve. In this case, the conveyor could be fitted with cables running along the length of the machine and tied to the E-stop switches. The belt can be stopped at any time by pulling a cable from any location. The figure below is a typical E-stop switch fitted to a local control station in the field.

Figure 1-1: Emergency Stop Switch

1.2.8.2 Safety Trip Wire

Trip wire assembly and switches (one cord on each side) allow equipment to be stopped without using the control panel push buttons.

Follow all governing safety standards and local jobsite procedures.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Trip wire cords are connected to E-stop switches. Once one of the trip wire cords is pulled, the wiring circuit is broken and the motor will stop.

> **Note:** If your equipment includes a vacuum pump motor, be advised that this is not stopped by the trip wire system.

The following figure shows a typical trip wire switch that is often installed along each side of the equipment.

Figure 1-2: Trip Wire Emergency Stop Switch

> **DANGER**
>
> **Never use a trip wire or emergency stop switch as a means of isolating equipment. Trip wire and emergency stop switches are normally controlled through software systems and as such they do not provide positive isolation.**

1.2.8.3 Interlocks

Machines equipped with interlocks prevent a malfunction from having disastrous consequences. The power source may be cut off if problems are detected, such as:

- Motor overload (current too large)
- Speed too slow (speed monitors)
- Part of machine out of normal range (proximity switch)
- Excessive vibrations (vibration detector)
- Excessive heating of machine (thermo couple)

Belt alignment switches are used on conveyor belts to monitor whether the belt is properly aligned, and notify the operator if the belt is moving outside the roller path.

If you are operating a chain of transport equipment, a stop on any machine will automatically stop all upstream machines to avoid overfilling the stopped machine. The downstream machines will, in most cases, be allowed to continue so that they will empty themselves.

1.2.8.4 Guards

Guards prevent the possibility of personnel becoming entangled in moving parts. Keep guards intact and securely in place at all times while the machine is operating.

If you need to remove guards to conduct maintenance work or clear a blockage, make sure that the equipment is shut down, isolated, and rendered safe before doing so.

Follow all governing safety standards and local jobsite procedures.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Do not operate any part of the equipment if all guards are not securely in place.

There are some moving parts of the equipment for which guards are not practical. Such unguarded areas have been evaluated as safe to work around with proper training and safe work practices.

1.3 Equipment-Specific Risks and Hazards

It is strictly prohibited to operate the cyclone under conditions other than those described within this manual.

Do not weld on this piece of equipment. No welding or hot work is allowed near the cyclone system without first covering the equipment to protect it.
There is risk of igniting rubber-lined components.

Operating with a pressure or temperature that is above the specified limits may result in leaking, and damage the equipment. This may lead to injuries.

Shut down and lock out the cyclone system before performing any maintenance. The system operates under pressure that may lead to injuries if it is started during maintenance.

Corrosion and wear create a safety risk. Repair or replace components that corrode or wear.

Do not step on the cyclone system. Only use appropriate equipment such as ladders and platforms.

1.4 General Risks and Hazards

Working at industrial sites unavoidably poses hazards from various activities and conditions. In the following sections, several well-known industry hazards are outlined and precautions are described accordingly.

Follow all governing safety standards and local jobsite procedures.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

1.4.1 Identifying and Controlling Hazards

It is important to identify and control hazards before beginning any work or task. This is called risk management. There are four basic steps in risk management:

1. Identify the hazards: Before you begin any task on or around the equipment, inspect the area and consider the task to make sure that you are able to identify hazards or potential hazards.
2. Assess the risks: When you have identified the hazards or potential hazards, assess each one to determine the overall level of risk. Risk is determined as the potential severity of the hazard and the likelihood of an incident being caused by it.
3. Eliminate or control the hazards: If the risk is too great, put controls in place to eliminate or control the hazard. Controls will vary according to the situation so it is up to the established site procedures and the personnel conducting the task to find methods that are suitable for the conditions.
4. Reassess the risks if conditions change: Whenever the conditions that existed when the initial assessment was conducted change, carry out the assessment of the hazards and risks again. This is to make sure that the changed conditions do not increase the likelihood of an incident or increase the severity of an incident.

Follow all governing safety standards and local jobsite procedures.

1.4.2 Ladders

When the working height is greater than 1.8 m (6 ft) special considerations and equipment is required. Put site emergency procedures in place when conducting work at heights to make sure that any incident will be handled with a proper emergency response.

Follow all governing safety standards and local jobsite procedures.

1.4.3 Scaffolds

Scaffolds are an important means of ensuring safety when working at heights. Make sure that anyone constructing or climbing on scaffolds is aware of the basic safety precautions. Correct any scaffold deemed unsafe immediately.

Follow all governing safety standards and local jobsite procedures.

1.4.4 Railings

FLSmidth recommends that all stairways, open-sided floors, and loading docks contain perimeter or fall protection devices such as a removable guardrail, a guardrail fence, or two chains strong enough to withstand the weight of someone sitting on it.

Follow all governing safety standards and local jobsite procedures.

1.4.5 Elevated Work Conditions

Train personnel riding in or working from the following devices to the local jobsite requirements and maintain 100% tie-off procedures.

- Personnel lifts
- Hoisting devices
- Elevated work platforms

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Follow all governing safety standards and local jobsite procedures.

1.4.6 Harness and Line (Fall-Arrest System)

FLSmidth recommends that fall arrest system components be properly rated and mutually compatible.

Follow all governing safety standards and local jobsite procedures.

1.4.7 Cranes and Lifting Operations

Operating cranes, whether mobile or fixed, present unique risks for both the operator and the equipment. Train crane operators by approved site management.

Follow all governing safety standards and local jobsite procedures.

1.4.8 Moving Parts on Stationary Equipment

The primary risk associated with stationary machinery is that anyone close enough to the machine may get hands, arms, feet, or loose clothing caught in the moving parts: shafts, rollers, cranks, v-belt drives, and so forth. This type of accident often occurs when the victim is climbing on or gets too close to a machine that starts suddenly via a remote control, or is already running. The consequences will be injuries (squeezing or crushing of extremities), but can also result in death.

Make sure that personnel near components of moving equipment are safe. Make sure that all procedures are followed, and equipment guards are in place and undamaged before starting work. Never place your body near any moving parts, and always wear the correct PPE.

Follow all governing safety standards and local jobsite procedures.

1.4.9 Remote Starts

Remote starting of machines will normally be accompanied by a start warning: either audible (siren), visual (flashing lights), or both. The start warning is intended to allow employees enough time to move to a safe distance away from the machinery.

If maintenance or repair work is to be carried out, machines are furnished with a power source or controls that permit Lockout/Tagout (LOTO).

Follow all governing safety standards and local jobsite procedures.

1.4.10 Confined Spaces

Confined Space Entry (CSE) is the entry of personnel into any space or structure not normally intended for human occupancy, in which entry, movement within or exit is restricted, such as underground vaults, tanks, storage bins, pits and diked areas, vessels, silos, and so forth. These enclosed or partially enclosed spaces:

- Are large enough for an employee to enter fully and perform assigned work
- Are not designed for continuous occupancy by the employee
- Have a limited or restricted means of entry or exit

Follow all governing safety standards and local jobsite procedures.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

1.4.11 Welding, Cutting, and Brazing

FLSmidth recommends that all welding and brazing operations have proper ventilation. Fumes such as those produced when working with zinc, cadmium, and painted surfaces can be toxic.

Follow all governing safety standards and local jobsite procedures.

1.4.12 High Temperatures

Operations involving high air temperatures, radiant heat sources, high humidity, direct physical contact with hot objects, or strenuous physical activities can have a high potential for causing heat-related illness/injury. Workplaces with these conditions may include iron and steel foundries, nonferrous foundries, cement plants, rubber products factories, electrical utilities (particularly boiler rooms), chemical plants, mining sites and smelters. Potential hazards are thermal burns due to contact with hot equipment or exposure to high temperatures.

Follow all governing safety standards and local jobsite procedures.

1.4.13 Power Lines

Be aware of power lines in the area and consider all power lines energized unless proper measures have been taken for de-energizing.

Follow all governing safety standards and local jobsite procedures.

1.4.14 Inclement Weather

The local Health and Safety Executive (HSE) or business management can provide a means to determine the weather forecast for the project location. FLSmidth recommends that you take precautionary measures during severe conditions.

Follow all governing safety standards and local jobsite procedures.

1.4.15 Noise and Vibrations

Prolonged exposure to loud noise can impair hearing or cause permanent hearing loss. To protect from hearing loss, FLSmidth recommends the following:

- Always wear PPE to protect against noise.
- Measure the noise levels for areas that may be considered a noise hazard.
- All personnel working in areas that exceed permissible exposure levels are required to wear jobsite-approved ear protection.

Excessive noise can permanently damage your hearing. If you need to raise your voice to be heard, wear hearing protection.

Some tools and equipment can expose employees to vibrations that can be harmful if not properly mitigated. Some vibration when operating this equipment is to be expected. However, excessive vibration is often an indication of a problem with the machine. Trace the sources of excessive vibration and rectify any problems as soon as possible. Do not allow yourself to be exposed to vibration for long periods of time.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Follow all governing safety standards and local jobsite procedures.

1.4.16 Pinch and Crush Points

Pinch points or crush points are a major hazard for personnel working around equipment. Loose clothing or hand tools that are placed anywhere near a pinch point can result in the person being dragged into rotating or moving equipment.

- Always be aware of pinch point hazards.
- Never attempt to remove material from a moving conveyor or other equipment.
- Never place your hands, any part of your body, or anything you are holding in a location where rotating or moving parts could pinch the item and drag you in.
- Never work on any part of a conveyor or equipment that is running.
- Never work on a stopped conveyor unless it has been correctly shut down, isolated, locked out, and tagged out.

Crushing and shearing points can occur in the following locations on equipment:

- Between the belt and drive pulley
- Between the belt and take-up rolls
- Between the belt and idler rolls

This equipment may be provided with casings and covers, specifically at the discharge and feeding points, to reduce injuries from pinching or crushing. Have maintenance and repair work done only by specifically instructed personnel.

Follow all governing safety standards and local jobsite procedures.

1.4.17 Electrical Energy

Electrical hazards have the potential to cause serious injury to personnel or damage to equipment. FLSmidth recommends that only trained, competent, and authorized personnel work on electrical components and equipment. Follow correct isolation procedures when working on electrical equipment. FLSmidth further recommends that the following precautions be taken:

- Do not override or bypass any electrical safety functions.
- Keep control panel doors closed at all times.
- Do not use oversized fuses, buss bars, or heaters.
- Connect the motor drives and accessories to an electrical ground, such as an underground water piping system, the frame of a building, or other electrical ground.

Do not undertake electrical work if you are not trained, competent, and authorized to do so.

FLSmidth recommends that electrical systems comply with the relevant electrical provisions, and that all work done on the electrical system be done by certified electricians. All electrical components must be interconnected and grounded according to correct and safe electrical procedures.

Follow all governing safety standards and local jobsite procedures.

1.4.18 Surface Heat

Certain components on equipment can become hot during operation. Be aware of potential hot components in your working area and treat them with caution.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

FLSmidth recommends that if any components seem disproportionately hot, shut down the equipment and investigate and report immediately. Excessively hot components can indicate a mechanical problem and may result in equipment damage and unsafe situations for personnel.

During commissioning, operation, maintenance, repair, and shutdown, contact of hot machine components or electrical equipment may occur. Instruct all personnel accordingly.

CAUTION

Never place your hands on any item of equipment until you are certain it is at a safe temperature.

1.4.19 Lines, Tubes, and Hoses

FLSmidth recommends that operators and maintenance personnel take precautions to isolate and de-pressurize, if necessary, any pressurized lines or vessels before they are opened. Observe the following safety points:

- Inspect all lines, tubes, and hoses carefully.
- Do not use your bare hands to inspect for leaks.
- Tighten all connections to the recommended torque.
- Do not bend or strike high pressure lines.
- Do not install bent or damaged lines, tubes, or hoses.
- Repair any loose or damaged hydraulic oil lines, tubes, and hoses.

CAUTION

Leaks can cause fires.

Note: Even though the equipment is switched off and electrically isolated, the contents of pipes and vessels may still be under high pressure.

If high-pressure water or air hoses are used, FLSmidth recommends that all quick-connectors are fitted with a safety clip similar to one shown in the figure below.

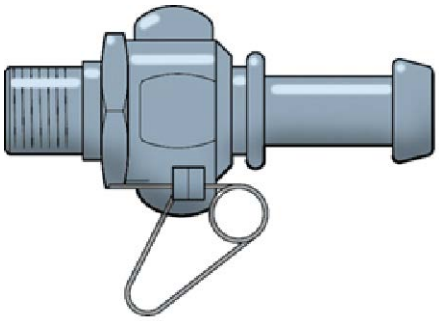

Figure 1-3: Safety Clip

1.4.20 Mechanical Stability

The machine and its components are designed to minimize hazards due to insufficient mechanical stability; however, during transport and assembly, maintenance, repair, shutdown, disposal, and storage, machine parts may tip or fall and endanger the staff.

During commissioning FLSmidth recommends that extensive static and dynamic tests be carried out. Do not overload the machine during operation, and use it only for its intended purpose.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

1.5 Hazardous Chemicals and Materials

Many materials used in the industry contain hazardous ingredients that potentially pose health risks to employees. FLSmidth recommends that the appropriate Safety Data Sheet (SDS) be obtained for all hazardous materials used on site, and that the SDS be available for personnel and supervisors working with these chemicals. Careful study of the SDS and adherence to the required safety precautions can improve on-site safety.

FLSmidth also recommends that chemicals be properly labeled.

Follow all governing safety standards and local jobsite procedures.

1.5.1 Mineral Powders (Silica)

Mineral powders may be natural, such as sand or gravel, but very often they are an intermediate product in the cement or mining industry (ore concentration). Mineral powders will also be generated as dust from grinding or cutting operations in stone or concrete, or by handling dry soil.

Follow all governing safety standards and local jobsite procedures.

1.5.2 Acids and Bases

Strong acids include nitric (HNO_3), sulphuric (H_2SO_4), hydrochloric (HCl), phosphoric (H_3PO_4) acid, and hydrofluoric acid (HF). Strong acids give off heat when diluted with water, which may lead to vapor explosions.

Some systems use an acid wash containing hydrochloric (muriatic) or other acids. These acids can cause severe burns, irritation of mucous membranes, and skin irritation even in dilute solutions. Fumes may cause respiratory problems. Eye protection, skin protection, and respiratory masks are required when working with this material.

Follow all governing safety standards and local jobsite procedures.

1.5.3 Cyanide

In some processes, including gold mining, the use of cyanide (calcium cyanide CaCN; potassium cyanide KCN; sodium cyanide NaCN) is common. Any work with a direct risk of interacting with cyanide requires additional training.

Follow all governing safety standards and local jobsite procedures.

1.5.4 Solvents

The most abundant toxic materials are solvents; other toxic materials include pigments (lead), paint, binders (epoxies, polyesters) and additives (organotin).

Follow all governing safety standards and local jobsite procedures.

1.6 Emergency Preparedness Plan

Refer to your site emergency preparedness plan.

Note: Emergency preparedness plans are a critical component of safety.

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

2.1 Using this Manual

This manual describes the FLSmidth Urethane Cyclone and outlines its installation, maintenance, and operational procedures. It also includes a number of FLSmidth-recommended best practices.

FLSmidth has designed this equipment to provide dependable, efficient, and economical operation throughout its entire period of service. In order to achieve the desired level of performance and make sure that the equipment has full warranty coverage, it is required that users thoroughly read, understand, and follow the contents of this manual before carrying out the installation of the equipment, making any adjustments, or operating the equipment. Regular care and maintenance must also be performed as outlined in this manual.

The accessory pieces of equipment (items furnished but not manufactured by FLSmidth) shall be stored, installed, operated, and maintained according to the original equipment manufacturer instructions for complete warranty protection.

Note the following:

- The procedures described in this manual do not relieve users of the responsibility to exercise caution and common sense.
  - Users are responsible for their own personal safety when operating this equipment.
  - Users must comply with all safe working procedures and instructions relevant to their work site at all times.
- Pictures, descriptions, and technical data may not match your equipment in every aspect.
- The information, specifications, and illustrations in this manual are written according to information available at the time it was produced; therefore, this information may change at any time. These changes could include one or more of the following: lubrication, storage, installation instructions, maintenance, and so forth. FLSmidth reserves the right to make changes without notice and without obligation to replace existing manuals.
- FLSmidth will not furnish editable electronic copies of any data, manuals, or drawings at any time and accepts no liability whatsoever for unauthorized changes or alterations to the data provided.
- All information contained in this manual is the property of FLSmidth. None of the content may be copied or made public without prior written consent from FLSmidth.
- English is the governing language. When manuals are translated into any other language, FLSmidth is not liable for damages caused by errors in translation. The English translation will govern in case of discrepancies. In the event there is confusion, notify your FLSmidth representative immediately. Refer to http://www.flsmidth.com/en-US/Contact for the applicable address and telephone numbers for the FLSmidth office nearest you.
- FLSmidth accepts no liability to update the information contained in this manual. These materials are provided as is WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT. YOU ASSUME COMPLETE RESPONSIBILITY AND RISK FOR USE OF THESE MATERIALS. Some jurisdictions do not allow the exclusion of implied warranties, so the above exclusion may not apply to you.
- BY USING THIS MANUAL YOU AGREE THAT YOU HAVE READ, UNDERSTAND, AND AGREE TO THE TERMS OF USE.

2.2 Installation and Start-Up Services

Experienced FLSmidth engineers and service personnel are available to assist in the installation, safety training, and start-up of your FLSmidth equipment. These personnel have technical expertise and firsthand knowledge of this equipment, as well as the backing of the engineering and research facilities of FLSmidth.

Service personnel instruct on proper safety, operating and maintenance procedures, advise on best practices and troubleshooting assembly, and can supervise the entire installation and start-up.

To request this assistance, make arrangements at the earliest possible date, outlining the services required and the approximate duration of needed service.

Refer to your FLSmidth representative or http://www.flsmidth.com/en-US/Contact to submit your request concerning the availability and charges for these services.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

2.3 Shipment and Receiving

Carefully inspect your shipment immediately upon receipt. Although every precaution is taken when shipping to make sure that your items arrive undamaged and as ordered, damage or other issues may occur during shipment. If equipment packaging is damaged, immediately contact your FLSmidth representative for further instructions.

> **Note:** All equipment must be stored in their original shipping containers, especially when such containers are wooden crates or cardboard cartons as this will maintain necessary storage protection.

- Refer to the installation lifting instructions before handling the equipment.
- Carefully handle boxes when opening for inspection to prevent damage or loss of contents. Repack all parts, or store them in a safe place with all protective covers reinstalled until assembly.

In case of damage or missing parts, immediately notify the carrier and your FLSmidth representative at http://www.flsmidth.com/en-US/Contact.

> **NOTICE**
> **You must notify FLSmidth within the time frame specified in your contract in the event of shortages or discrepancies on the shipment. FLSmidth is not responsible for replacing items if notification occurs outside the contractual time. If no time frame has been specified in your contract, you must notify FLSmidth within 30 days of shipment receipt.**

2.4 Parts and Repair Orders

Please contact FLSmidth for parts, repair orders, and equipment service, referring to http://www.flsmidth.com/en-US/Contact for the FLSmidth office nearest you.

To make sure that the right replacement parts are received and to avoid undue delay, please provide the following information with each order:

- **Style of Unit:** Urethane Cyclone
- **Serial Number:** This is found on the unit nameplate.
- Size: This is found on the unit nameplate.
- **Specific Component Part Numbers and Descriptions:** See individual component part nameplates included on the drawings for these part numbers.
- **Special Field Modifications:** This is important if the original material or design has been changed. Include drawings and other descriptive information.

2.5 Warranty Conditions

Your FLSmidth-provided equipment (the “Equipment”) is designed with dependability in mind. However, this unit can be damaged through misuse and by failing to follow the storage, installation, and maintenance procedures outlined in this manual.

FLSmidth will not be responsible for damage to the Equipment, component parts, or other related structures, nor will the warranty coverage on the Equipment be valid if any of the following apply:

- The Equipment is operated in an incorrect or negligent manner.
- The Equipment is not maintained in accordance with provided instructions.
- Operating conditions fall outside those specified for the Equipment, as originally designed and supplied.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

The Equipment must be installed only by trained personnel who have been thoroughly trained in the safety procedures pertaining to it.

All drawings and erection or installation instructions must be followed. Drawings provided will always govern. In the event of any discrepancies, notify your FLSmidth representative immediately, referring to http://www.flsmidth.com/en-US/Contact for contact information.

2.5.1 Limited Warranty

a. FLSmidth warrants the Equipment to be free from defects in material and workmanship. Refer to your contract for specific warranty terms and conditions.

b. FLSmidth warranties are subject to the Equipment being properly stored, erected, installed, maintained, and operated in accordance with FLSmidth instructions and good industry practice and exclude ordinary wear and tear, improper loading of software or firmware, corrosion, erosion, chemical or abrasive action, power failures, power surges, other fluctuations in power, excessive heat, improper lubrication, extended storage before start-up, unauthorized repair, replacement, modification or alteration of the Equipment; or application outside the contractual design limitations of the Equipment.

c. Buyer shall provide FLSmidth with written notice of a defect in materials or workmanship, including a full description thereof, within 14 days after the defect is or should have been detected and in any event before expiration of the warranty period.

d. FLSmidth agrees to repair or, at its option, replace at its expense, FCA shipping point (Incoterms 2010) any Equipment or parts and components thereof, excluding the costs of dismantling and re-installation of the Equipment or parts and components, that prove during the warranty period to contain defects in materials or workmanship.

e. The remedies stated in this Article are Buyer's exclusive remedies for breach of this FLSmidth warranty. In no event shall the exclusive remedies in this Article be considered or alleged to have failed their essential purpose. **Buyer agrees that if there are any discrepancies or inconsistencies between this Limited Warranty and the warranty terms and conditions accompanying the Contract, the warranty terms and conditions accompanying the Contract shall always govern.**

f. EXCEPT FOR THE EXPRESS WARRANTY STATED IN THIS ARTICLE, FLSMIDTH EXPRESSLY DISCLAIMS ALL OTHER WARRANTIES, WHETHER EXPRESS, IMPLIED, STATUTORY, AT LAW OR IN EQUITY. THERE ARE NO IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS OF PURPOSE, OR OTHERWISE.

2.6 Accessory Equipment Manufacturer Information

Whenever the installation, lubrication, maintenance, or operation of an accessory piece of equipment (item which is furnished by FLSmidth but is fabricated by a third party) is discussed in the FLSmidth instruction manual, this information is provided only as a courtesy, as provided by the manufacturer at that time, and with no warranty expressed or implied. This information must be verified by consulting the original equipment manufacturer (OEM) manuals, which are the ruling documents for any accessory equipment.

As manufacturer instructions or recommendations may change over time, it is the user's responsibility to periodically consult the manufacturer to obtain the most up-to-date information, including maintenance instructions and recall information.

NOTICE

In the event of any discrepancies between the information found in the FLSmidth instruction manual and the information in the OEM manuals, notify your FLSmidth representative immediately, referring to http://www.flsmidth.com/en-US/Contact.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

As with any mechanical equipment, there are safety concerns associated with the installation of the primary and accessory equipment. It is absolutely essential that installers, operators, maintenance personnel, and supervisors be instructed in safe working practices.

2.7 FLSmidth Offices

After completion of the contract, all service and spare parts will be supported by the closest FLSmidth regional headquarters. To find the FLSmidth office nearest you, refer to http://www.flsmidth.com/en-US/Contact.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Chapter 3: Storage

3.1 Long-Term Storage Introduction 26
3.1.1 Maintaining Warranty 26
3.1.2 Storing OEM Components 26
3.2 Covered or Indoor Storage 26
3.3 Outdoor Storage 26
3.4 Equipment Support 27
3.5 Preventing Corrosion 27
3.5.1 Protective Finishes or Seal Coats 28
3.6 Storing Elastomer Components 28
3.7 Storing BPC Rubber Components 28
3.8 Storing Instrumentation and Valves 28
3.9 Storing Fiberglass Reinforced Plastic Components 29
3.10 Environmental Precautions 29

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

3.1 Long-Term Storage Introduction

The storage procedures in this manual are general guidelines and standard practices that aid in maintaining the condition of the equipment during long-term and pre-commissioning storage. If storage time is between 3 and 24 months, the following procedures shall be followed. If storage time is to exceed 24 months, contact FLSmidth for further instructions.

3.1.1 Maintaining Warranty

FLSmidth warranties are subject to the equipment being properly stored as outlined below.

When storing items for extended periods—six months or longer—detailed records must be kept and regularly updated for the duration of the storage period. In the event of a warranty claim, these records must be submitted to FLSmidth to show that all equipment and components have been properly maintained during the storage period. A paid periodic inspection by an FLSmidth service personnel may be required to maintain the warranty. For the specific terms and conditions of your equipment warranty please contact your FLSmidth representative.

Failure to comply with these storage instructions will void the FLSmidth warranty.

3.1.2 Storing OEM Components

FLSmidth provides vendor documentation that includes installation, operation and maintenance manuals for all parts supplied by FLSmidth, but manufactured by a sub-contractor. This can include, but is not limited to, the following: actuators, bearings, blowers, compressors, gear boxes, heaters, HPU, and other instruments.

3.2 Covered or Indoor Storage

Store cyclones, liners, rubber-lined manifold components, valves, and other auxiliary equipment in covered or indoor storage if possible; indoor storage is preferable.

Covered storage consists of any structure with a roof to protect the equipment and components from the sun and rain.

Indoor storage consists of an enclosed structure that will protect from sun, rain, wind, and dust. It is preferable that the structure be well ventilated.

Covered or indoor storage require the following conditions:

- A constant temperature between 5 and 40°C (41 and 104°F), with no sudden temperature fluctuation
- A relative air humidity ≤ 50%
- Protection from extreme weather conditions
- Relatively free of dirt or dust deposits

3.3 Outdoor Storage

Only use outdoor storage for cyclones, rubber-lined manifold components, valves, and other auxiliary equipment if indoor or covered storage is not possible.

Site selection for outdoor storage of FLSmidth supplied equipment and accessories shall be:

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

- Level, well-drained, clean, and dry, with a firm surface
- Isolated or barricaded from possibility of physical damage from transport vehicles
- Accessible for periodic inspection and maintenance
- Away from direct sunlight, moisture, and excessive vibration
- Away from high concentrations of dust or corrosive gas

Protective Covering

Equipment must be completely covered with a heavy, opaque, plastic weather covering. It is essential that the plastic be opaque to prevent direct sunlight from reaching the equipment. It is preferable that the opaque covering be a light color to minimize heat under the covering. Flange protectors are usually supplied with rubber-lined flanges.

Elevate the equipment a minimum of 51 mm (2 in) above ground level to make sure that adequate ventilation and prevention of moisture condensation under the covering.

Inspections

A painted and protective corrosion-resistant coating must be inspected on monthly intervals, and repaired, re-applied, or replaced as necessary.

In the event of substantial corrosion (other than loose surface rusting) consult FLSmidth for recommendations for corrective action.

3.4 Equipment Support

Support all large fabricated equipment components in a manner that will allow free air flow under and around the component being stored. Place steel beam or wood timber supports (not supplied by FLSmidth) of significant size and strength at appropriate load-bearing locations. Store and support all components shipped on skids and pallets or in crates and shipping containers in a manner that will allow free air flow under and around the skid, pallet, crate, or shipping container.

3.5 Preventing Corrosion

Equipment that is in storage or that is out of service for more than 30 days **must** be protected against corrosion damage.

Regularly scheduled equipment inspections are critical for proper storage of FLSmidth supplied equipment and components. These inspections include the following:

- Inspect primer paints, protective finishes, seal coats, and corrosion protection treatments thoroughly on a monthly schedule.
- Repair, re-apply, or replace protective coatings as necessary.

If there is substantial corrosion (other than loose surface rusting), contact FLSmidth for recommendations for corrective action.

FLSmidth will not be responsible for the condition of protective coatings after the equipment leaves the contracted fabrication facility. FLSmidth assumes no responsibility for field surface preparation or touch-up of shipping damage to protective coatings.

Identification tags that are removed for field painting prior to assembly must be reattached to the original components for correct identification.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

3.5.1 Protective Finishes or Seal Coats

In most cases, equipment is supplied with a complete protective finish or seal coat. Regularly inspect these finishes for deterioration. If rust or oxidation is found, clean the surfaces and re-apply the appropriate protective finishes.

All paint must be applied using the paint manufacturer's recommended processes and environmental conditions. Protective finishes or seal coats for repair purposes are not supplied by FLSmidth.

3.6 Storing Elastomer Components

Elastomer and elastomer-covered (such as neoprene, nitrile, and chlorobutyl) products in storage can be adversely affected by temperature, humidity, ozone, sunlight, oils, solvents, corrosive liquids and fumes, insects, rodents, and radiation. Proper care shall be taken to meet the following requirements.

- Elastomer parts shall be protected from physical damage by objects that can cut or tear.
- If stored below 0°C (32°F), some products may become stiff and will need to be warmed before being placed in service. Do not store elastomer products near sources of heat, such as radiators and base heaters.
- To protect against the adverse effects of ozone, do not store elastomer products near electrical equipment that may generate ozone or in geographical areas of known high ozone concentrations. Avoid exposure to direct and reflected sunlight.
- Whenever feasible, store elastomer products in their original shipping containers, especially when such containers are wooden crates or cardboard cartons, since this will provide protection against the deteriorating effects of oils, solvents, and corrosive liquids. This will also afford some protection against ozone and sunlight.
- Since certain rodents and insects thrive on rubber products, provide adequate protection against them.
- Rotate all elastomer products on a first-in, first-out basis. Even if all above conditions are met, a prolonged length of time in storage will result in the deterioration of elastomeric products.

3.7 Storing BPC Rubber Components

The blue pale crepe (BPC) gum rubber used in the manufacture of the cyclone liners is adversely affected by heat. However, if the components are correctly stored according to the directions provided in 3.2 "Covered or Indoor Storage" on page 26 and 3.3 "Outdoor Storage" on page 26, ambient temperatures of less than 49°C (120°F) (preferably less than 38°C [100°F]) can be maintained.

The equipment will not be damaged by freezing conditions as long as it is kept dry, but the rubber becomes brittle at low temperatures. If below freezing conditions are involved, use care when handling it to avoid damaging the projecting rubber splash skirts and similar rubber components.

BPC rubber is damaged by ozone. Do not store this equipment near possible ozone sources such as high voltage rectifier equipment.

3.8 Storing Instrumentation and Valves

Where auxiliary equipment includes instrumentation and automatic valves, use particular care to prevent moisture and moisture condensation during storage.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

3.9 Storing Fiberglass Reinforced Plastic Components

Fiberglass reinforced plastic products in storage can be adversely affected by temperature, ozone, sunlight, and corrosive liquids and fumes. Proper care shall be taken to meet the following requirements.

- The ideal storage temperature for fiberglass reinforced plastics is 0°C to 32°C (32°F to 90°F) with a maximum limit of 38°C (100°F). If stored below 0°C (32°F), some products may become brittle and caution must be taken when placing these components into service. Do not store fiberglass reinforced plastic products near sources of heat, such as radiators and base heaters.
- Whenever feasible, fiberglass reinforced plastic products shall be stored in their original shipping containers, especially when such containers are wooden crates or cardboard cartons, since this will provide protection against the deteriorating effects of corrosive liquids and fumes and will also afford some protection against ozone and sunlight.
- All fiberglass reinforced plastics products shall be on a first-in, first-out basis. Even if all above conditions are met, a prolonged length of time in storage will result in the deterioration of fiberglass reinforced plastics products.

3.10 Environmental Precautions

The following table highlights the major environmental precautions that must be addressed in order to maintain proper condition throughout and after long-term storage. Table 3-1 outlines the specific precautions for equipment that is stored for up to six months.

Items	Environmental Precautions				
	Temperature	**Humidity**	**Ventilation**	**Cleanliness**	**UV Exposure**
Metal and machined parts	No	Yes	Yes	Yes	No
Elastomer parts (urethane, polyurethane, rubber)	Yes	No	Yes	Yes	Yes
Fiberglass parts	Yes	No	No	Yes	Yes
Polypropylene/polyethylene filter components	Yes	Yes	No	No	Yes

Table 3-1: Environmental Precautions—Storage Up to Six Months

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

4.1 Cyclone Function

Cyclones separate solids from liquids and, under certain circumstances, liquids from liquids. For proper function, the materials to be separated must have a difference in specific gravity and must be capable of being mechanically separated. Cyclones do not provide chemical emulsion separation.

Particles with the same mass and shape have the same settling velocity. This means that large, heavy particles (high mass) settle more quickly than small, light particles (low mass). The centrifugal force in a cyclone increases the settling velocity. Heavy particles move quickly to the cyclone housing wall and then move to the cyclone underflow. Light particles are sucked to the cyclone center and then move to the cyclone overflow. The smaller the cyclone, the higher the centrifugal forces and the smaller the particles that move to the cyclone underflow.

The involute inlet creates the centrifugal forces that allow the cyclone to function. Typically, cyclones are fed by centrifugal pumps. The higher the feed pressure, the higher the centrifugal forces and the smaller the particles that move to the cyclone underflow.

4.1.1 Selection

The primary consideration in selecting the proper size and design of the cyclone is the classification objective rather than the capacity, unlike many other process devices.

For each specific classification objective, FLSmidth calculates the proper relationship between the inlet orifice, vortex finder, and apex orifice size. All cyclones are engineered for the specific application prior to shipment.

There is seldom any necessity for changing the orifice sizes unless the classification objectives or plant operating conditions are altered.

The Urethane Cyclone is available with diameters from 13 to 380 mm (0.5 to 15 in).

4.2 Cyclone Overview

Cyclones have no moving parts and require only minimal maintenance.

Urethane Cyclones are available in various materials, including:

- Urethane (RU)
- Food grade urethane (RT90)
- High temperature urethane (RI)
- Ultrane (RW)—only available for cyclones with a diameter of 250 mm (10 in) or larger
- Royal cast (RC)—only available for cyclone with a diameter of 250 mm (10 in) or larger
- Natural gum rubber (apex liner and adjustable apex only)
- Other urethane materials are available upon request

4.2.1 Inlet Head

When slurry enters the cyclone, the first wear liner that it encounters is the inlet head (with a cover plate liner for some cyclone models). The inlet head sets the size and shape of the inlet orifice for the cyclone.

The inlet orifice size governs the pulp entrance velocity, but its major function is to provide a smooth flow pattern at the point of entry. All KREBS® cyclones are designed with an involute entry that orientates the particles before they reach the tangential point of contact with the cylinder wall. This design minimizes turbulence at the inlet head and reduces the possibility of turbulence or ricocheting particles to short-circuit oversize particles into the vortex finder.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

The involute entry also allows for the use of vortex finders that are larger than a direct tangential entry for equivalent separations. This obtains lower pressure drops, greater unit capacities, and sharper separations.

4.2.2 Vortex Finder

From the standpoint of its impact on operating results, the vortex finder is the most critical of all orifices. The vortex finder size has the greatest effect on pressure drop for a given volume; in general, the larger the vortex finder, the coarser the cut and the greater the proportion of solids that report to overflow. Conversely, a smaller vortex finder normally means a finer cut and lower solids, but too small of a vortex finder may reduce volume and velocity enough that it could cause inferior performance.

For any slurry, seek an optimum balance between permissible dilution, largest vortex finder, and lowest pressure drop possible for the desired objective. Since most classification problems involve a fixed volume, the size of the vortex finder and pressure drop are interdependent.

4.2.3 Apex Insert

The apex insert is a wear component at the bottom of the cyclone that governs the apex orifice size. The apex orifice discharges the coarse material in a form that maximizes density and smoothness of discharge. It must be large enough to allow the tonnage reporting there to exit with a slight conical cross-sectional shape, but it must not be used to control separation.

The apex orifice must never be so small that a roping condition exists. Roping is an indication that a larger tonnage is reporting to the underflow than the apex orifice is allowing to discharge. Therefore, the remainder is reporting to overflow, reducing the effectiveness of classification.

4.2.4 Inlet, Cylinder, and Cone Housings

Inlet, cylinder, and cone housings are constructed of steel or fiberglass. They retain the wear components (inlet head, cylinder, cone, and apex insert) of the cyclone. The housings are long-lasting components that can be reused when cyclones are repaired or refurbished.

4.3 Add-On Features

The following are add-on features that are available for the cyclone. If you have purchased one or more add-ons, refer to the descriptions below.

4.3.1 CycloStack™

The CycloStack™ is a molded elastomer control device that is installed below the apex of a modified cyclone. The CycloStack™ reduces the moisture in the underflow product by constricting the flow of liquid out of the cyclone underflow. It maximizes the density in the underflow without losing valuable product to the overflow.

The overflow piping is designed to alleviate any fluctuations in the main body of the cyclone that result from feed fluctuations. Therefore, the configuration of the overflow piping is critical to the smooth, consistent operation of the CycloStack™.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

4.3.2 CycloWash™

The CycloWash™ attachment provides a method for obtaining an extremely sharp separation and a clean underflow product. The tangential inlet ports in the CycloWash™ cylinder give a smooth flow pattern for the injected water at the point of entry, thus eliminating turbulence and the possibility of coarse particles being short-circuited into the vortex stream.

The CycloWash™ is a low cost, trouble-free system for obtaining an extremely sharp separation by cyclonic classification. CycloWash™ attachments are available for all sizes of cyclones Ø76 through 762 mm (Ø3 through 30 in), and require only a single fresh water connection for operation.

The operation of this device is based upon the theory that clear water injected through the CycloWash™ attachment displaces the slime fraction that ordinarily reports to the underflow. The displacement water is injected in a smooth flow pattern which eliminates turbulence and the short-circuiting of coarse particles into the vortex stream. Field installations in various de-sliming applications have proven conclusively that the CycloWash™ is extremely beneficial in sharpening cyclone classification.

A typical application is the preparation of mine backfill from tailings in which the removal of minus 20 micron slime is necessary for acceptable drainage rates underground.

> **Note:** For this application, the performance of the CycloWash™ has proven outstanding. With the addition of a relatively small volume of water, the drainage rate has been doubled with no loss of sand in the overflow product.

4.3.3 Corrosive Duty Cyclone Design

In corrosive duty cyclones, the basic cyclone design has been adapted to the unusual temperature, pressure, and corrosion that are often encountered in chemical process industries.

- The feed inlet and overflow adapters are elastomer lined spool piece adapters that have either no Victaulic groove connections or Victaulic connections with the elastomer wrapped around the end of the pipe. The adapters are spark tested to make sure they provide lining integrity.
- All whetted surfaces of the top cover plate are lined with elastomer, including the area mating with the overflow adapter.
- The vortex finder is completely elastomer lined, and it has been spark tested to make sure it provides lining integrity.
- The molded liners for the inlet head, cylinder section(s), and conical section(s) have integral molded gaskets to seal at the flanged joints.

  > **Note:** Molded elastomer liners and vulcanized linings are offered in premium blue pale crepe (BPC) gum rubber, nitrile, neoprene, chlorobutyl, and other materials. Many of these elastomer liners are interchangeable with silicon carbide ceramic or alumina ceramic liners where additional abrasion resistance is required.

- Standard sectionalized metal housings are constructed of cast or fabricated steel, and are generally designed for operating pressures of up to 345 kPa (50 psig). All welds are continuous and water tight.

  > **Note:** Special designs for higher system pressures are available.

- Cyclone housings are painted inside and outside with an epoxy coating system for corrosive service.
- Assembly hardware is of 18-8 stainless steel material unless otherwise noted.

Cyclone applications involving unusual temperature, pressure, or corrosive conditions may not permit the use of elastomer liners. FLSmidth also offers unlined cast and fabricated cyclones in materials such as:

- Carbon steel
- Types 304 and 316 stainless steel
- Duplex 2205
- Alloy 20
- Monel

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

- Inconel
- Nickel 200
- CD4MCU
- 254SMO
- Other materials as required for the application

For very fine separations, alumina ceramic cyclones are available in the following diameters for installation in compact vessels that are sized for high capacity.

- 12.7 mm (0.5 in)
- 25.4 mm (1 in)
- 50.8 mm (2 in)
- 76.2 mm (3 in)

5.1 Installation Overview

This section provides tips and guidelines for installing your Urethane Cyclone. The recommendations in this assembly guide are based on FLSmidth's previous field erection and supervisory experience with similar projects. If you have problems or questions regarding installation, contact your FLSmidth representative. Refer to http://www.flsmidth.com/en-US/Contact for the FLSmidth office nearest you.

This equipment has been designed for a specific duty cycle. The project requirements and specifications, operating conditions, and safety factors comprise the design parameters for this system. As its intended design use is specific, the valve must not be used for other purposes. If it is so used, the owner assumes full liability.

The instructions and recommendations in this installation guide are general in nature. They are designed to accommodate common variations in equipment designs. Therefore, the actual assembly requirements for your equipment may vary somewhat from these guidelines. In all cases, the actual project drawings in Appendix C: "Drawing Package" on page 69 take priority over these instructions.

FLSmidth field service professionals are also available to guide site contractors through common variations to these instructions. For assistance, refer to http://www.flsmidth.com/en-US/Contact for the FLSmidth office nearest you.

Prior to beginning installation of the equipment, make sure all of the assembly drawings are readily available and all installation personnel are familiar with them. These drawings can be found in Appendix C: "Drawing Package" on page 69 of this manual.

If there are any problems in the installation of the cyclones, please contact FLSmidth for assistance. Our staff will be happy to assist you. Refer to http://www.flsmidth.com/en-US/Contact.

5.2 Receiving

When removing the cyclone from the packing, account for all parts by comparing individual items with the packing slip.

Where possible with the given transportation and handling limitations, cyclones are shipped in the complete assembled form. Component parts such as pipe fittings and spare parts are frequently placed inside the cone section of the cyclone.

5.3 Cyclone Installation

Cyclones are typically assembled before they are delivered to site.

⚠ CAUTION

Make sure that the urethane flanges are not stressed during installation. Do not over-torque the fasteners, which can deform the urethane

1. Securely mount each cyclone on a soundly-constructed frame so that stresses on the overflow and underflow piping are minimized. Do not force the urethane cyclone into an unnatural position.
2. Assemble the inlet flange to its mating piping.
3. Assemble the overflow connection.
4. Install the cyclone mounting plate. Do not force the urethane cyclone into an unnatural position.
5. Install the cyclone mounting plate.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

5.4 Pressure Gauge Installation (if applicable)

Refer to “Add-On Drawings” in section C.3.

A pressure gauge and diaphragm assembly are optional with most cyclones.

The assembly is available with a 0.25 inch connection for use with fine solids or a 1.25 inch connection for use with coarse solids. Refer to the pressure gauge information in “Add-On Drawings” in section C.3.

1. Position the diaphragm assembly on the pipe nipple. Align the bolt holes in the diaphragm assembly with the holes in the pipe nipple.
2. Apply pipe sealant to the diaphragm assembly bolt threads.
3. Insert the diaphragm assembly bolts through the diaphragm assembly and pipe nipple. Tighten the nuts on the end of the two diaphragm assembly bolts. Only hand tighten the nuts.
4. Fill the upper chamber of the diaphragm with a suitable, light machine oil. Any light weight machine oil is suitable.
5. Apply pipe sealant to the pressure gauge threads on the diaphragm assembly.
6. Install the pressure gauge onto the end of the diaphragm assembly. Only hand tighten the pressure gauge.

5.5 Planning for Pump Installation

If adequate pressure is available in the cyclone feed line, a pump may not be required.

Carefully engineer the size and type of pump, and the size and length of the pipe line used for pumping to the cyclone, or battery of cyclones, for the specific job.

Wear on a pump varies approximately proportionately to the cube of the velocity. In order to minimize the pump speed and pump maintenance, the cyclone must be as near to the pump as possible. A certain inlet pressure at the cyclone will be required, so there is also a power saving by having the static and friction head as low as possible.

Wear results in a much higher pump maintenance cost than cyclone maintenance cost.

5.6 Piping Design

When designing cyclone piping, the most important consideration is to establish a velocity that prevents particle segregation in the pipe line, and at the same time holds the velocity to a minimum to reduce wear, which increases rapidly with an increase in velocity.

With a large majority of installations for pumping slurries, the velocity range falls between 1.5 and 4.6 m/s (5 and 15 f/s).

The major factors in determining the optimum velocity in a pipeline are:

- Particle size
- Angularity of the coarser fractions
- Specific gravity of solids
- Slimes content
- Pulp density
- Viscosity

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

5.7 CycloStack™ Installation (if applicable)

Refer to the CycloStack™ and overflow pipe information in "Add-On Drawings" in section C.3 during installation.

1. If the CycloStack™ is not pre-assembled to the cyclone:
   a. Install an adapter ring (or serrated retainer plate for a clamp CycloStack™) to the cyclone in order to attach the CycloStack™ below the apex.
   b. Bolt the CycloStack™ and retaining ring (or backing flange for a flanged CycloStack™) below the existing apex housing.

      Note: No modifications are required to install the CycloStack™.

      - Make sure that the cyclone is mounted so that the product can be stacked on the ground, discharged onto a conveyor, or discharged into a screw classifier. As needed, discuss the mounting location with FLSmidth to determine the ideal placement.
      - If you are mounting the cyclone above a screw classifier, mount the cyclone approximately half-way up the flights of the screw to maximize the mixing and de-watering of the fines.

   c. Install the overflow piping so that the end of the overflow reducer is the required minimum measurement below the base of the lower flange of the apex. Refer to Table 5-1.

Overflow Reducer Model	Minimum Distance Below Apex Discharge
C7197	1219 mm (48 in)
C7297	1524 mm (60 in)
C7397	1524 mm (60 in)

Table 5-1: Overflow Reducer Positioning

2. Fill the top half of both gauge guards with light-weight oil.
3. Install the vacuum line with the gauge and valve in a place where they are readily accessible to the operator. Refer to the CycloStack™ and overflow pipe information in "Add-On Drawings" in section C.3.
   a. Clamp the valve securely so that no air is leaking.
   b. Make sure there is no damage to the CycloStack™.
4. Install the overflow piping.
   a. Make sure that the CycloStack™ overflow piping is sized so that it will be full with a minimum of 2 to 3 m/sec (6 to 9 ft/sec) flow velocity.

      Note: The overflow piping must establish a siphon for the CycloStack™ work effectively.

   b. Make sure that no air is leaking. Air leaks inhibit the operation of the unit.

5.8 CycloWash™ Installation (if applicable)

1. Install the CycloWash™.
2. Set up the inlet water line to the CycloWash™.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

- The volume of water required for the CycloWash™ is dependent upon the characteristics of the particular installation. In most instances, the best results are obtained when the water volume is equal to or greater than the volume of water reporting in the cyclone underflow product when the wash attachment is not used.
  - For example, an underflow with particles of 2.6 specific gravity at 70% solids and 35 gpm flow rate has 10.8 tph of solids and 4.6 tph of water. The 4.6 tph of water is 18.4 gpm. In this case, the provide at least 18 gpm of injection water through the CycloWash™ attachment for optimum performance.

3. Install a flow rate monitoring device on the inlet water line for the CycloWash™ to measure and control the volume of injection water.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

6.1 Operation Overview

The cyclone is chemical resistant in some cases.

The maximum recommended operating temperature is 60°C (140°F).

If there are any problems in the operation of the cyclones, please contact FLSmidth for assistance. Our staff will be happy to assist you. Refer to http://www.flsmidth.com/en-US/Contact.

6.2 Cyclone Start-Up

When starting the cyclone, first run water through the system to inspect for leaks and make sure that the operation is correct. Only feed slurry to the system after making sure that it is running correctly with water.

For cyclones with a CycloStack™, a small amount of water is released by the CycloStack™ during start-up and shutdown.

1. Inspect the feed pump and other equipment to make sure that they are clean and ready for operation.
2. Open the correct number of cyclone isolation valves for the desired operation and feed pressure.
3. Prepare the system to run water to the cyclone in the place of feed.
4. For cyclones with a CycloWash™ and CycloStack™:
   a. Start the CycloWash™ injection water.

      Note: Starting the CycloWash™ injection water before introducing feed slurry to the cyclone will keep the CycloWash™ injection ports from plugging.

   b. For initial start-up, close the siphon control valve.
5. Start the feed pump to send water to the cyclone.
6. For initial start-up with a cyclone that has a CycloWash™ and CycloStack™:
   a. Start the pump to reduce the make-up water requirements.
   b. After water is discharging from the overflow pipe, open the siphon control valve only enough to allow a very slight bleed of water out through the CycloStack™.
7. Set the pressure at the feed distributor to 0.2 to 0.3 bar (2.9 to 4.4 psi) higher than the necessary operating pressure. Refer to “Capacity Curve and Cyclone Simulation” in section C.2.

      Note: The pressure loss in the feed distributor is up to 0.3 bar (4.4 psi), so the feed pressure will be higher than the pressure measured at the feed distributor.

   a. Adjust the feed pressure as needed by increasing or decreasing the pump speed, and opening or closing the cyclone isolation valves to control the number of cyclones that are operating in the system.

      Note: A pressure that is too low coarsens the separation, and may result in excessive solids in the overflow.

      Note: For some applications, a simulation cannot be created. When this occurs, run the cyclones with the originally-specified flow rate to achieve the feed pressure that was specified at the time of ordering. Refer to “Capacity Curve and Cyclone Simulation” in section C.2.
8. Measure the pressure in the feed distributer as it builds to make sure that it does not rise above the maximum operating pressure.

   A pressure that is too high can lead to leaking and damage.
9. Inspect the cyclone system for leaks.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

a. If the system has a leak, tighten the necessary nuts, bolts, and flanges.

b. If the leak does not stop:

i. Disassemble the leaking line or equipment.

ii. Clean the disassembled equipment.

iii. Inspect the equipment for damage. Repair or replace the components as needed.

10. Inspect the cyclone system for operation function.

Note: When the cyclone is operated with water, the water will spray out of the discharge. Do not attempt to troubleshoot the spraying discharge because it is normal at this step of start-up.

a. Make sure that the pressure measurement devices indicate the pressure correctly.

11. Send feed to the cyclone.

12. For cyclones with a CycloStack™ or CycloWash™:

a. As needed, adjust the siphon control valve to increase the vacuum and increase the solids coming from the CycloStack.

b. As needed, adjust the CycloStack™ vacuum to get the desired underflow density. Refer to 6.6.2 “CycloStack™ Adjustments” on page 50.

13. Take samples from the underflow, overflow, and feed. Refer to “Cyclone Sampling (Optional)” in section 6.5.

6.3 Cyclone Adjustments

Numerous factors influence the operation of a cyclone, such as distribution of particle sizes, percent feed solids, specific gravity of solids, and liquid and pulp viscosity.

Following is a brief discussion of some factors influencing cyclone operation, which the operator is normally able to vary:

6.3.1 Feed Dilution

Feed dilution is the most effective control available.

- Increase the dilution water addition for a finer and sharper separation.
- Adjust the dilution water to maintain a constant level in the sump.

Note: If using dilution water to maintain the sump level, be aware of the potential change in the separation. For very dilute feeds, the change in the separation will be minimal.

6.3.2 Pressure Measurement

Pressure drop across a cyclone is the pressure differential between the cyclone inlet and overflow. When the cyclone discharges to the atmosphere, a condition that is always recommended, the inlet pressure indicated on the gauge is, for practical purposes, the pressure drop.

The pressure measurement is the energy required to force a given volume through a cyclone fitted with a certain combination of orifices. It is not an indication of a developed force-pattern or throughput, except as related to one particular set of operating conditions.

Excessive pressures result in higher costs for pump operation and maintenance; avoid them wherever possible. It is generally not recommended to have a pressure drop above 276 kPa (40 psi).

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

In general, a higher pressure drop results in a greater throughput capacity for the cyclone. A higher pressure drop will also produce a finer separation.

6.3.3 Cyclone Orifices

Various orifices have on the cyclone performance. Changing the orifice requires shutting down the system.

Inlet Orifice

An increase in the inlet area will increase the capacity of the cyclone and coarsen the separation slightly.

- Cyclones with a diameter of 100 mm (4 in) or smaller have a fixed inlet orifice.
- Cyclones with a diameter larger than 100 mm (4 in) have multiple inlet head size options. The inlet head can be replaced as needed to change the inlet orifice size.

Vortex Finder

The vortex finder has the greatest impact on the operating results of all the orifices. The vortex finder size has a major effect on the cyclone capacity at a fixed pressure drop and also significantly affects the cyclone separation.

- The larger the vortex finder diameter, the greater the cyclone capacity will be at a given pressure drop.
- A larger diameter vortex finder will also coarsen the cyclone separation and send a larger proportion of solids to the overflow.

Various vortex finder sizes are available and the entire part can be replaced.

Apex Orifice

Fixed and manually adjustable apexes are available but fixed apexes are more common. Fixed apexes are available in various sizes, and the entire part can be easily replaced to optimize the underflow solids.

6.4 Cyclone Monitoring

6.4.1 Apex Orifice

Monitor the shape of the apex orifice. If the shape changes within a very short period of time, it may be an indication that a change in the process has occurred.

6.4.2 Cyclone Discharge

Optimum Discharge

The optimum discharge is a cone of approximately 20–30 degrees.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Image may not reflect exact equipment

Figure 6-1: Optimum Discharge

Spray Discharge

A spray discharge occurs when the discharge cone exceeds approximately 30 degrees. It occurs when too much water and too many fines are in the underflow.

Image may not reflect exact equipment

Figure 6-2: Spray Discharge

Roping Discharge

A roping discharge occurs when the discharge cone is more narrow than approximately 20 degrees. When it occurs, solids cannot discharge properly and there is risk of misplaced coarse material in the overflow. Overflow piping may become plugged.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Image may not reflect exact equipment

Figure 6-3: Roping Discharge

6.4.3 Feed Conditions

Any change in the feed conditions can result in a change to cyclone performance. Keep the feed conditions as near as possible to the conditions that the cyclone was designed for.

6.5 Cyclone Sampling (Optional)

NOTICE

Not all cyclone applications require sampling. Contact FLSmidth if you have questions regarding whether sampling is recommended for your application. Refer to http://www.flsmidth.com/en-US/Contact.

Incorrect sampling procedures may result in improper adjustments to the cyclone.

6.5.1 Sample Cups

For ease of sampling, use sampling cups that meet the following standards:

- Large enough to contain the sample volume without splashing or overflowing—a typical sample cup is typically 0.25 to 0.5 L (0.26 to 0.53 qt).
- Slit in the cap that approximately 5 to 10 mm (0.20 to 0.39 in) so that it fills slowly, allowing the sampling cup to be moved through the stream before it fills
- Prevent splashing
- Clean

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

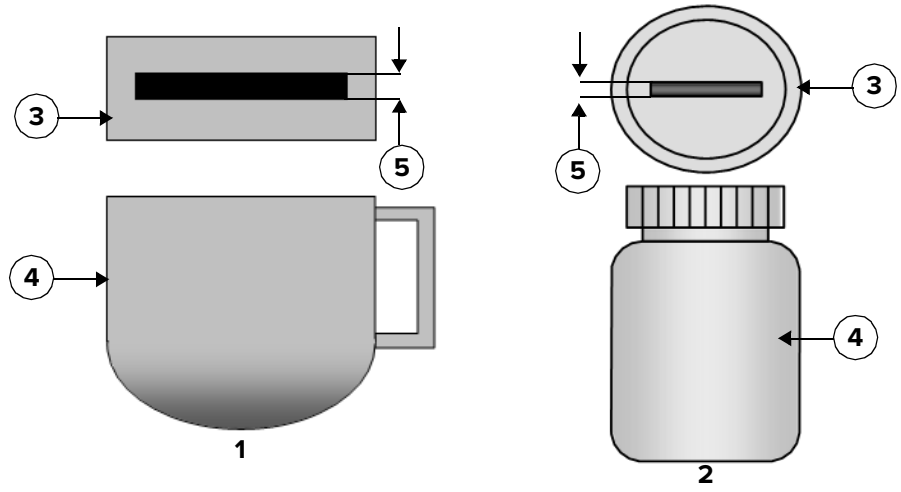

Image may not reflect exact equipment

1 Sampling cup for sample at cyclone	**2** Sampling cup for sample at port	**3** Top view
4 Side view	**5** Slit in the cap	

Figure 6-4: Sample Cups

6.5.2 Taking Samples

The cyclone is designed for a specific operating duty. Any deviations to the feed affect the cyclone performance. The feed, underflow, and overflow must be sampled to make sure that the cyclone system is running at its optimal level. The samples taken must be representative.

Samples must be taken with the cyclone is running and after the process has stabilized following start-up.

- Take an overflow sample directly from the sampling port in the overflow launder.
- Take an underflow sample directly from the underflow. The proper sampling location must be determined by the customer.
- Take a feed sample at a point where the slurry is well mixed.

  Note: FLSmidth manifolds come with an optional sampling port at the feed distributor that allow the sample to be taken immediately before it enters the cyclone.

1. At the designated sample location, fill the sample cup.
   - When taking samples from a stream, move the sample cup through the stream instead of taking it from one point in the stream.
   - When taking samples from a sample port:
     i. Open the port completely.
     ii. Allow the slurry to run out for a few seconds.
     iii. Make sure that the stream from the port is constant and a high enough volume to provide a representative sample.
     iv. Fill the sample cup until it is full but not overflowing.
     v. Close the port.
2. Compare the sample results with the calculated values of the simulations. Refer to “Capacity Curve and Cyclone Simulation” in section C.2.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED.

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

6.6 CycloStack™ Operation (if applicable)

6.6.1 Vacuum Gauge Readings

The higher the vacuum gauge reading, the dryer the solids discharge is.

The cyclones are typically operated in the range of 55 to 138 kPa (8 to 20 psig) inlet pressure.

The vacuum gauge is located with the siphon valve. It will read an average of 76 to 127 mm (3 to 5 in) of mercury vacuum for the correct siphon. An insufficient vacuum will cause excess water to exit through the CycloStack™.

6.6.2 CycloStack™ Adjustments

Adjust the CycloStack™ attachment at the vacuum bleed line and valve until you optimize its performance.

- For large CycloStack™ adjustments, adjust the siphon control valve on the cyclone overflow line.
- For small, fine-tuning CycloStack™ adjustments, adjust the needle valve at the siphon control valve.

6.7 Flows, Densities, and Tonnages Calculations

Tonnage Solids Formula

$$\text{GPM of slurry} \times \text{Specific gravity of slurry} \times \text{\% solids} = \text{Dry tons per hour}$$

Tonnage Slurry Formula

$$\frac{\text{Dry tons per hour}}{\text{\% solids}} = \text{Slurry per hour}$$

Pulp Specific Gravity Formula

$$\frac{100 \times \text{SG of solids} \times \text{SG of liquid}}{100 \times \text{SG of solids} - \text{\% solids}(\text{SG of solids} - \text{SG of liquid})} = \text{Specific gravity of pulp}$$

Percent Solids in Pulp Formula

$$\frac{\text{TPH solids}}{\text{TPH slurry}} \times 100 = \text{\% solids in pulp}$$

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Gallons Per Minute Formula

$$\frac{\text{TPH solids} \times 4}{\text{SG slurry} \times \text{\% solids}} = \text{GPM of slurry}$$

Percent Solids by Volume Formula

$$\frac{\text{\% solids by weight} \times \text{SG pulp}}{\text{SG solids}} = \text{\% solids by volume}$$

Gallons Per Minute Per Dry TPH

$$\frac{4}{\text{SG pulp} \times \text{\% solids}} = \text{GPM per TPH}$$

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Chapter 7: Maintenance

7.1 Maintenance Overview 54
7.2 Cyclone Handling 54
7.3 Interior Surface Maintenance 54
7.4 CycloStack™ Maintenance (if applicable) 54
7.5 CycloWash™ Maintenance (if applicable) 55

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED.

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

7.1 Maintenance Overview

This chapter provides detailed information on maintaining the equipment and its systems safely and efficiently. Regular care and maintenance must be performed as outlined in this chapter.

For maintenance instructions specific to an accessory piece of equipment (item which is furnished by FLSmidth but is fabricated by a third party) refer to the original equipment manufacturer documentation.

Do not install, operate, maintain, or repair this equipment unless you have read and understand the instructions and warnings in Chapter 1: "Safety". Failure to follow these safety precautions could result in personal injury, death, or property damage.

If there are any problems in the installation or operation of the cyclones, please contact FLSmidth for assistance. Our staff will be happy to assist you. Refer to http://www.flsmidth.com/en-US/Contact.

7.2 Cyclone Handling

Urethane Cyclones are very lightweight, which makes maintenance easier. For cyclones with a diameter of 152 mm (6 in) or smaller, the cone sections are generally connected by stainless steel clamps for ease of connection by operators.

7.3 Interior Surface Maintenance

The replacement schedule for your cyclone segments depends on the precise operating conditions at your plant. With experience, determine a regular maintenance schedule for your equipment.

Inspect the interior of the cyclone regularly to make sure that it is smooth. When the interior surfaces become worn or uneven, replace the segment of the cyclone (such as cone section, vortex finder, or apex). Unlike cyclones with steel housings and replaceable elastomer or ceramic liners, this urethane cyclone is designed for complete segment replacement as the interior of the segments wear.

Replace the apex once it opens more than 10% of its original size.

7.4 CycloStack™ Maintenance (if applicable)

The CycloStack™ has no moving mechanical parts, so it requires very little maintenance.

1. Regularly inspect the condition of the CycloStack™. Replace the CycloStack™ when it becomes worn or damaged. Refer to the siphon control bill of materials in "Add-On Drawings" in section C.3 for the part numbers.
    a. Keep a spare CycloStack™ in stock at all times. They have a relatively long life, but a minor investment in a spare CycloStack™ may prevent production delays when replacement is necessary.

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

2. Regularly inspect the feed inlet pressure gauge and overflow vacuum gauge. Replace the gauges when they become worn or damaged. Refer to the siphon control bill of materials in “Add-On Drawings” in section C.3 for the part numbers.

7.5 CycloWash™ Maintenance (if applicable)

The truncated cone supplied with the CycloWash™ is manufactured of nitrite bonded silicon carbide: a material with exceptionally good wear resistance. However, due to the high rotational velocity and solids concentration in the CycloWash™, it is prone to wear.

Inspect the CycloWash™ periodically to determine the extent of wear and need for replacement.

> **Note:** The diameter of the truncated cone orifice with the vortex finder diameter and other cyclone orifices are engineered for each specific application. Optimum performance can only be obtained when these orifices are in proper relationship.

Chapter 8: Troubleshooting

8.1 Troubleshooting Overview 58
8.1.1 Cyclone Troubleshooting 58
8.1.2 CycloStack™ Troubleshooting (if applicable) 59

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

8.1 Troubleshooting Overview

The following chart describes a potential problem or operating condition and then defines the most common cause or source of the problem with suggestions for corrective action.

8.1.1 Cyclone Troubleshooting

Problem	Possible Cause	Corrective Action
1. Coarse material is in the overflow.	a. The pressure drop is too high.	1. Reduce the pressure drop through one of the two methods: a. Reduce the flow to the cyclone. b. Operate additional cyclones in the manifold.
	b. The apex diameter is too small.	1. Increase the apex diameter until you obtain a constant 30 degree cone angle on the discharge. Note: Certain styles of the urethane fixed apexes can be cut to increase the diameter. An adjustable apex that is already fully open must be replaced with a larger apex.
2. The cyclone pressure drop fluctuates wildly.	a. The sump is not being maintained at a constant level.	1. Slow the pump down or increase the dilution water to the sump to maintain a constant sump level.
	b. Air is entrained in the slurry.	1. Change the feed so that it angles against a side wall of the sump or install a baffle plate.
3. The separation is not fine enough.	a. The cyclone feed density is too high.	1. Increase the dilution water to the feed.
	b. The cyclone pressure drop is too low.	1. Speed up the pump. 2. Install a smaller diameter vortex finder.
	c. The cyclone diameter is too large.	1. Replace the cyclones with smaller diameter cyclones.
4. The underflow is too dilute.	a. The apex is too large.	1. Decrease the apex diameter until you obtain a 30 degree cone discharge. Do not allow the discharge to rope. a. For adjustable apexes, tighten the worm driven clamp. b. For fixed apexes, replace the apex for a smaller size.
	b. The pressure drop is too low.	1. Increase the flow to the cyclone by operating fewer cyclones in the manifold.

Table 8-1: Cyclone Troubleshooting

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

8.1.2 CycloStack™ Troubleshooting (if applicable)

Problem	Possible Cause	Corrective Action
1. The underflow density is too low.	a. The siphon control valve setting is too low.	1. Close the siphon control valve until you get the desired underflow density.
	b. The cyclone apex opening is too large.	1. Replace the cyclone apex with a size that is 13 to 25 mm (0.5 to 1 in) smaller.
2. There is too much coarse material in the cyclone overflow.	a. The siphon control valve setting is too high.	1. Open the siphon control valve until the coarse material in the overflow disappears.
	b. The cyclone apex opening is too small.	1. Replace the cyclone apex with a size that is 13 to 25 mm (0.5 to 1 in) larger.
3. The cyclone is operating erratically, with uneven flow or flushing.	a. The overflow pipe is underwater.	1. Change the piping to make sure the overflow pipe is above the water.
4. The CycloStack™ is plugged or the cyclone is vibrating or shaking excessively.	a. The cyclone apex opening is too small.	1. Replace the cyclone apex with a size that is 13 to 25 mm (0.5 to 1 in) larger.
5. The CycloStack™ is overly sensitive, and you cannot control it with the siphon control valve.	a. The adjustments are incorrectly being done at the siphon control valve.	1. Adjust the needle valve for fine-tuning adjustments to the CycloStack™.
6. The CycloStack™ fails to close when the cyclone is operating on water alone, or the CycloStack™ consistently or intermittently discharges a very wet product when the cyclone is operating with solids.	a. The vacuum is too low.	1. If the vacuum gauge reading is lower than 50.8 mm (2.0 in), close the bleed valve further or completely.
	b. Air is leaking from the system.	1. Look for an air leak in the hose connection between the bleed valve and the overflow pipe at the cyclone. Tighten the connections or replace the hose as needed to address any leaks. 2. Look for an air leak in the overflow pipe assembly. Tighten the connections as needed to address any leaks. 3. Look for an air leak in the CycloStack™. Tighten the connections or replace the CycloStack™ as needed to address any leaks. 4. Look for an air leak in the cyclone feed line. Tighten the connections or replace the hose as needed to address any leaks.
	c. The overflow pipe is not full.	1. Increase the flow to meet the design flow, or replace the piping or vortex finder. The overflow pipe must be full and establish a siphon.
	d. The slurry inlet pressure is too low.	1. If possible, increase the slurry inlet pressure to a minimum of 55 kPa (8 psi). Cyclones can operate with an inlet pressure as low as 34 kPa (5 psi), but operation will be erratic

Table 8-2: CycloStack™ Troubleshooting

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED. 1/6/21
FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Problem	Possible Cause	Corrective Action
	e. The pump speed is too slow as read at the inlet pressure gauge. Insufficient feed volume stops the cyclone from overflowing and will not let a siphon form to close the CycloStack™. The feed water flushes out the bottom apex opening.	1. Increase the pump speed. Use a tachometer or another speed measuring device to determine the pump speed. Do not rely on the motor speed stated on the nameplate; differences between assumed and actual voltage to the motor can change the motor and pump speed. 2. If the pump turns over at the right speed but does not pump at the right speed, it is worn. Repair or replace the pump. 3. If the pump liner or impeller is worn, repair or replace the pump.
	f. The cyclone bottom cone liner has worn excessively. The larger opening causes a higher flow of water to report through the CycloStack™.	1. Replace the bottom cone liner.
	g. The cyclone overflow pipe is too short.	1. Replace the overflow pipe as needed to make sure that it extends the proper amount below the base of the apex.
	h. The cyclone feed is surging, causing a fluctuating inlet pressure.	1. If the incoming feed lines or return feed lines are sending air bubbles into the inlet of the feed pump, address the air entrapment by installing baffles in the feed sump or installing a larger, deeper sump. 2. If changes to the sump level cause the pump to surge, return some of the cyclone overflow to the sump as make-up water to maintain a steady level in the sump. Ideally, operated the sump in a slightly overflow condition, using make-up water to keep the sump level steady. 3. If the sump has low slope angles in the bottom, re-design the sump so that the angles are sufficiently steep.
	i. The V-belts driving the feed pump are slipping.	1. Set the V-belts to the correct tension.
	j. The cyclone overflow piping is restricted, causing back-pressure to develop inside the cyclone and preventing a siphon from forming.	1. Clear the restriction from the overflow pipes. 2. Replace the piping if it is too small.
	k. The apex liner opening is too large. In cases where a large amount of feed water must be processed for a low percentage of solids by weight, the apex must be smaller than typical.	1. Replace the apex with a smaller size.
7. The cyclone becomes blocked with sand.	a. The apex insert is too small. If the solids flow is too restricted, the CycloStack™ may cause plugging.	1. Remove the lower cone or apex section where the CycloStack™ is fitted. 2. Clean out any blockages. 3. Look for any loose or worn liners, and replace the liners as needed. 4. As needed, replace the apex insert with a larger size. Contact FLSmidth for assistance.
8. An excessive amount of sand or coarse particles are in the cyclone overflow.	a. The apex insert is too small, forcing solids into the overflow.	1. Contact FLSmidth for apex sizing assistance. Do not design the overflow piping to break to the atmosphere, or unnecessary siphoning will occur.
9. Water is flushing out the siphon control piping.	a. The top pipe in the overflow elbow is too low.	1. Increase the height of the top pipe in the overflow elbow.

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

Problem	Possible Cause	Corrective Action
10. An excessive amount of water continually discharges through the apex. High underflow densities cannot be maintained.	a. The apex insert is too large.	1. Replace the apex insert with a smaller size. Contact FLSmidth for assistance.
	b. The overflow pipe is too large for the flow rate.	1. Replace the overflow pipe with a smaller pipe.
	c. The pump speed is too slow as read at the inlet pressure gauge. Insufficient feed volume stops the cyclone from overflowing and will not let a siphon form to close the CycloStack™. The feed water flushes out the bottom apex opening.	1. Increase the pump speed. Use a tachometer or another speed measuring device to determine the pump speed. Do not rely on the motor speed stated on the nameplate; differences between assumed and actual voltage to the motor can change the motor and pump speed. 2. If the pump turns over at the right speed but does not pump at the right speed, it is worn. Repair or replace the pump. 3. If the pump liner or impeller is worn, repair or replace the pump.

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

D.1 Using this Appendix

Whenever the installation, lubrication, maintenance, or operation of an accessory piece of equipment, which has been furnished by FLSmidth but was fabricated by a third party, is discussed in the FLSmidth instruction manual, this information is provided only as a courtesy, and is included as-is, with no warranty expressed or implied. This information must be verified by consulting the original equipment manufacturer (OEM) instruction manuals, which are the ruling documents for the accessory equipment.

As manufacturer instructions or recommendations may change over time, it is the user's responsibility to periodically consult the manufacturer to obtain the most up-to-date information, including maintenance instructions and recall information.

In the event of any discrepancies, notify your FLSmidth representative immediately. Refer to FLSmidth Offices below.

As with any mechanical equipment, there are safety concerns associated with the installation of the primary and accessory equipment. It is absolutely essential that installers, operators, maintenance personnel, and supervisors be instructed in safe working practices.

Appendix E: Commissioning

E.1 Dry Commissioning E.1
E.2 Commissioning with Water E.2
E.3 Commissioning with Slurry E.3

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED.

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

E.1 Dry Commissioning

Sign off by initialing and dating each commissioning step made.

Commissioning Point	Commissioner Sign-Off
Inspect all upstream and downstream equipment according to the respective manufacturer and supplier recommendations, including all tanks, pumps, pipes, and valves. Make sure all equipment is free of debris.	
Visually inspect the cyclone manifold. Correct any observed problems.	
Make sure that the underflow launder and discharge nozzle are free of debris that could lodge and plug in the discharge nozzle. **Note:** The launder splash cover may need to be removed during this process.	
Make sure that the overflow launder and discharge nozzle are free of debris that could lodge and plug in the discharge nozzle.	
Make sure that all fasteners are in place and properly torqued to the manufacturer's recommendation.	
If pressure gauges and pressure transmitters are supplied, make sure that they are installed on the feed header or near the feed connection to the system. If the underflow and overflow do not discharge at atmospheric pressure, install pressure gauges on these additional lines near the cyclone.	
Notes and Comments:	

Table E-1: Dry Commissioning

_____ _____

(Site Commissioner) (Date)

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

E.2 Commissioning with Water

Commissioning the hydrocyclone, valves, and instrumentation with water is optional but highly recommended. Performing the recommended commissioning identifies any leaks or other problems present in the system before adding hot and corrosive gypsum slurry.

If commissioning with water is desired, sign off by initialing and dating each commissioning step made. Complete all steps in E.1 “Dry Commissioning” on page 79 before commissioning the cyclone with water.

Commissioning Point	Commissioner Sign-Off
Fill the permanent or temporary cyclone feed tank with plant process water.	
Set up the cyclones for initial operation. Open all but two of the cyclone isolation valves.	
Make sure that any valves on the cyclone manifold overflow and underflow discharge lines are in the open position.	
Start the feed pump. The water does not need to run at the specified operating pressure or flow.	
After water begins discharging into the overflow launder, watch for any water leaks in the piping connections in the manifold and on the process lines. **Note:** During commissioning, it is normal to notice low or no flow in the cyclone underflow. No corrective action is necessary for a lack of underflow.	
If the piping connections leak more than a slow trickle, stop the feed pump and tighten or repair the fasteners at the leaking connections as required. Re-start the feed pump to confirm that all significant leaks have been repaired.	
Shut down the cyclone feed pumps. Close the pump suction and discharge isolation valves as needed.	
Drain the process water from the system. Dispose of the water as directed by the plant procedures.	
Notes and Comments:	

Table E-2: Commissioning with Water

_____ _____

(Site Commissioner) (Date)

Copyright © 2021 FLSmidth. ALL RIGHTS RESERVED.

FLSmidth is constantly striving to improve its products and must therefore reserve the right to change designs, materials, specifications, and price without notice.

E.3 Commissioning with Slurry

Complete all steps in E.1 “Dry Commissioning” on page 79 and, if desired, E.2 “Commissioning with Water” on page 80 before starting the cyclone with slurry. After performing the commissioning with slurry steps, normal plant operation may begin.

Commissioning Point	Commissioner Sign-Off
Make sure that all safety protocols are in place.	
Set up the cyclones for initial operation. Open all but two of the cyclone isolation valves.	
Open all of the valves on the cyclone manifold overflow and underflow discharge lines.	
If the cyclone has a CycloStack™ or CycloWash™, close the siphon control valve.	
Make sure that the absorber solids concentration is within the recommended and specified range before operating the gypsum de-watering cyclones.	
Start the cyclone feed pump.	
If the cyclone has a CycloStack™, open the siphon control valve after water is discharging from the overflow pipe. Open the valve only enough to allow a very slight bleed of water out through the CycloStack™.	
Obtain the desired cyclone feed pressure. Refer to 6.3.2 “Pressure Measurement” on page 45.	
Allow the system to run until it is operating at steady rate (usually 5 to 10 minutes).	
Look for leaks at all of the joints. Tighten the fasteners at any leaking joints.	
Perform samples. As desired, continue operating the system or shut it down until you get the results from the samples. • Sample the overflow and underflow streams of the cyclones, and measure the solids concentration. Record these values. • If possible, sample the feed, and measure the solids concentration and particle size distribution. Record these values. • Record any relevant process data, such as the cyclone feed pressure, pump speed, volumetric flow rate, and number of operating cyclones. If one or more of the samples are not within the desired or expected results, contact FLSmidth for specific recommendations. The recommendations may include, but are not limited to, modifying the apex diameter to increase or decrease the cyclone underflow solids concentration or changing the number of operating cyclones.	
Notes and Comments:

Introduction and Safety

Introduction

CAUTION:

- Read this manual carefully before installing and using the product. Improper use of the product can cause personal injury and damage to property, and may void the warranty.
- Observe accident prevention regulations in force.
- Save this manual for future reference, and keep it readily available at the location of the unit.

Purpose of this manual

The purpose of this manual is to provide the necessary information for:

- Installation
- Operation
- Maintenance

Safety

Precautions

WARNING:

- The operator must be aware of safety precautions to prevent physical injury.
- You must observe the instructions contained in this manual. Failure to do so could result in physical injury, damage, or delays.
- Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.[R]
- A certified electrician must supervise all electrical work. Comply with all local codes and regulations. [R]

Safety terminology and symbols

About safety messages

It is extremely important that you read, understand, and follow the safety messages and regulations carefully before handling the product. They are published to help prevent these hazards:

- Personal accidents and health problems
- Damage to the product
- Product malfunction

Hazard levels

Hazard level	Indication
 DANGER:	A hazardous situation which, if not avoided, will result in death or serious injury

Hazard level	Indication
WARNING:	A hazardous situation which, if not avoided, could result in death or serious injury
CAUTION:	A hazardous situation which, if not avoided, could result in minor or moderate injury
NOTICE:	• A potential situation which, if not avoided, could result in undesirable conditions • A practice not related to personal injury

Electrical hazards

Electrical hazards are indicated by the following specific symbol. This symbol warns for presence of a dangerous voltage.

Electrical Hazard:

User safety and health

Introduction

All government regulations, local health and safety directives must be observed.

Prevent danger due to electricity

All danger due to electricity must be avoided. Electrical connections must always be carried out in compliance with the following:

- The standard connections shown in the product documentation that is delivered together with the product
- All international, national, state, and local regulations. (For details, consult the regulations of your local electricity supplier.)

For more information about requirements, see sections dealing specifically with electrical connections.

Product warranty

Coverage

Xylem undertakes to remedy faults in products from Xylem under these conditions:

- The fault is due to defects in design, materials, or workmanship.
- The fault is reported to a Xylem representative within the warranty period.
- The product is used only under the conditions described in this manual.
- All service and repair work is done by qualified and authorized personnel. All modifications must be done by qualified technicians.
- Genuine Xylem parts are used.

Limitations

The warranty does not cover faults caused by these situations:

- Deficient maintenance
- Improper installation
- Modifications or changes to the product and installation made without consulting Xylem

- Incorrectly executed repair work
- Normal wear and tear

Xylem assumes no liability for these situations:

- Bodily injury
- Material damage
- Economic loss

Warranty claim

Xylem products are high quality products with expected reliable operation and long life. However, should the need arise for a warranty claim, then contact your Xylem representative.

Qualification of personnel

All work on the product should be carried out by certified electricians or Xylem authorized mechanics.

Xylem disclaims all responsibility for work done by untrained, unauthorized personnel.

Support

Xylem only supports products that have been tested and approved. Xylem does not support unapproved equipment.

Product Description

Introduction

Product description

The ENM-10 is the simplest possible method for level control. A mechanical switch in a plastic casing, freely suspended at the desired height from its own cable. When the liquid level reaches the regulator, the casing will tilt and the mechanical switch will close or break the circuit, thereby starting or stopping a pump or actuating an alarm device. No wear, no maintenance. In sewage pumping stations, for ground water and drainage pumping – in fact, for most level control applications – the ENM-10 is the ideal solution.

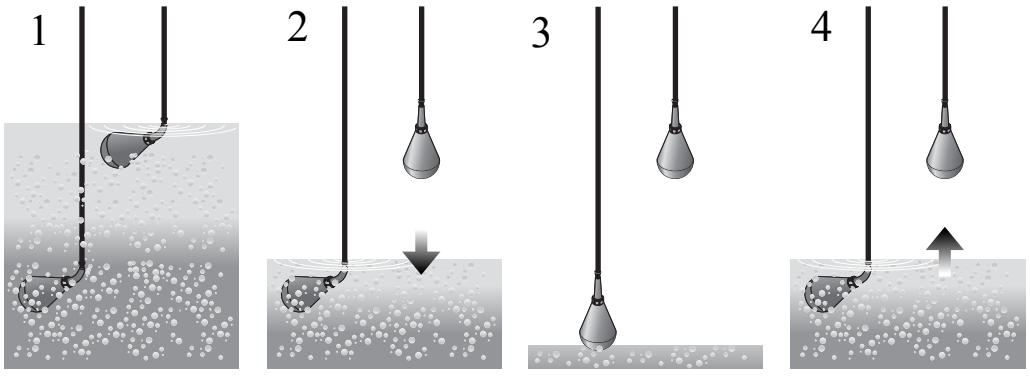
Liquid density

The product is available in different versions for different liquid densities.

Temperature limit

The regulator can withstand up to 60°C (140°F).

Manual coverage



This manual is applicable to the following versions:

- Standard version Blue casing of ENM-10
- EX-version Black casing of ENM-10.

Available languages

For manuals in other languages, visit *tpi.xyleminc.com*

Process description

WS004996A

1. When the pumped media reaches a predetermined level, the upper level regulator tips over to horizontal position and the pump starts to drain the basin.
2. The basin is drained of fluid.
3. The pump stops when the lower level regulator returns to the vertical position.
4. The basin fills up again. The process restarts.

Material

Standard version

Part	Material
Regulator casing	Polypropylene
Cable sheath	PVC or Nitrile/PVC rubber compound

The plastic components are welded and screwed together. Adhesive is never used. Impurities and deposits will not adhere to the smooth casing.

EX-version

The version for Ex-applications has a black casing, made conductive by adding carbon to the polypropylene.

Cable lengths

For liquids with specific density between 0.95 and 1.10 g/cm^3, the following cables are available:

Version	Lengths m (ft)
Standard	• 6 m (20 ft) • 13 (42) • 20 (65) • 30 (100) • 50 (167)
Ex-version	• 6 m (20 ft) • 13 (42) • 20 (65) Nitrile/PVC rubber cable

Electrical data

Country	Electrical data
Canada	5 A, 250 V, DC 10 A, 250 V, AC
Denmark	10 A, 250 V, AC
Switzerland	6 A, 250 V, AC
Sweden	10 A, 230 V, AC Resistive load 3 A, 250 V, AC Inductive load 5 A, 30 V, DC Resistive load *1 mA, 5 V, DC, Gold Contact

* Part no: 594 79 19 and 594 79 20

Micro switch

The level regulator contains a micro switch, max rated 250 VAC/10 A.

Low-voltage supply

In many cases, local codes require that the regulator is connected to a low-voltage supply, even though it is approved for a higher voltage.

It is recommended that the regulator is connected to a low-voltage supply, 48 V or 24 V, and a protective transformer.

Electrical data for Ex-approved installation

Description	Data
Maximum input voltage, U_i	30 V
Maximum input current, I_i	100 mA
Maximum input power, P_i	1.2 W
Depth of immersion	Max 20 m

For cable

Description	Data
Maximum internal capacitance, C_i:	1.8 nF
Maximum internal inductance, L_i:	10 µH

Installation

There are special rules that apply to installation in an explosive atmosphere. Intrinsically safe circuits are normally required: Ex i. Use a EX-safety barrier, for example, Prod. No. 84 01 07.

Approvals

CE, CSA, SEMKO, NEMKO, DEMKO, EX

LVD approval according to EN61058

CSA approval: Cert No. 1330172

Cl.I Zone 0, Gr. IIC;

CL.I Div.1 Gr A, B, C and D

Cl.II Gr. E, F and G

Cl.III when installed to the certified Intrinsically Safe relay, Ex ia, rated for the locations per submitter control drawing and installation manual.

Applied standards

- EN 60079-0:2009/IEC 60079-0:2007
- EN 60079-11:2007/IEC 60079-0:2006
- EN 60079-26:2007/IEC 60079-26:2006

Intrinsically safe circuits are required for the automatic control system.

Use a Ex-safety barrier: For example, Prod. No. 84 01 07

0080

Mechanical Installation

Precautions

CAUTION:

- Read this manual carefully before installing and using the product. Improper use of the product can cause personal injury and damage to property, and may void the warranty.
- The operator must be aware of safety precautions to prevent physical injury.

General

To conform to local regulations, the regulators are normally connected through a transformer to a low-tension control circuit.

Make sure that two regulators are used, one for starting and one for stopping.

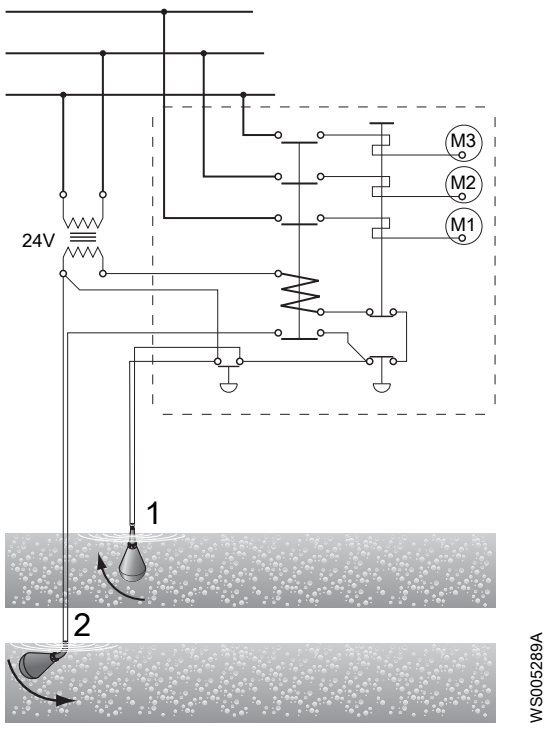
If an alarm is required at a given level, then connect a third regulator.

Identical regulators can be used for all functions.

Make sure that the cables do not become tangled during the installation.

The regulator cables must hang freely from each other.

Electrical Installation



Precautions

WARNING:

- Before starting work on the unit, make sure that the unit and the control panel are isolated from the power supply and cannot be energized. This applies to the control circuit as well.[R]
- There is a risk of electrical shock or explosion if the electrical connections are not correctly carried out or if there is fault or damage on the product. [R]
- A certified electrician must supervise all electrical work. Comply with all local codes and regulations. [R]
- All electrical equipment must be grounded (earthed). Make sure that the ground (earth) lead is correctly connected by testing it. [R]
- Make sure that all unused conductors are insulated. [R]

Ex-installation

EX-safety barrier

Intrinsically safe circuits are required for the automatic control system. EX-safety barrier (Prod. No. 84 01 07) must be installed.

Maintenance

General

To ensure its continual operation:

- Clean the product, especially when fat/grease covers the plastic surface
- Make an occular inspection of the regulator. Make sure neither cable, protective sleeve or plastic casing show any signs of damage.
- A damaged regulator cannot be repaired in any way, due to the hermetic encapsulation. If the product is found to be damaged, replace it with a new one

EX-istallations

Make absolutely sure that the Ex-barrier is operating correctly.

- The LED changes when the switch is toggled.

Xylem |'zīləm|

1) The tissue in plants that brings water upward from the roots
2) A leading global water technology company

We're 12,500 people unified in a common purpose: creating innovative solutions to meet our world's water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.

For more information on how Xylem can help you, go to xyleminc.com

Section 1 Specifications

Specifications are subject to change without notice.

Measuring Technique	Infrared Duo scattered light technique for color-independent turbidity measurement Turbidity in accordance with DIN EN 27027 / TS equivalent DIN 38414
Measuring Range	t-line turbidity: 0.001–4000 FNU/NTU ts-line, inline turbidity: 0.001–4000 FNU/NTU; TSS content: 0.001 mg/L–50 g/L hs-line, highline turbidity: 0.001–4000 FNU/NTU; TSS content: 0.001 mg/L–500 g/L TSS
Reproducibility	Turbidity < 1 %, Total Suspended Solids (TSS) < 3 %
Measuring Accuracy	Turbidity up to 1000 FNU/NTU: without calibration < 5 % of the measured value ± 0.01 FNU/NTU with calibration < 1 % of the measured value ± 0.01 FNU/NTU
Technique variation coefficient	1 % in accordance with DIN 38402
Response Time	1 s ≤ T90 ≤ 300 s (adjustable)
Calibration	Zero point permanently set from the factory, gradient once for the TS content
Cable Length	10 m (33 ft), max. 100 m (328 ft) with extension cable
Ambient Temperature	0 to +40 °C (32 to 104 °F)
Pressure Range	Stainless steel: ≤ 6 bar or ≤ 60 m (87 psi) PVC: ≤ 1 bar or ≤ 10 m (14,5 psi)
Flow Velocity	Max. 3 m/s (the presence of air bubbles affects the measurement)
Materials	Optics carrier and sleeve: stainless steel 1.4571 or PVC black
	Wiper shaft: stainless steel 1.4104
	Wiper arm: stainless steel 1.4581
	Wiper rubber: silicone rubber (standard) Optional: Viton[1] (LZX578)
	Windows and light guide: quartz glass
	O-rings (optics carrier, wiper, windows): NBR (acrylonitrile butadiene rubber)
	Housing seals: NBR 70
	Sensor connecting cable (hard-wired): 1 cable pair AWG 22 / 12 V DC twisted, 1 cable pair AWG 24 / data twisted, common cable screen, Semoflex (PUR)
	Sensor connection plug (hard-wired): type M12 enclosure rating IP 67
	Threaded cable fitting: stainless steel 1.4305
Inspection interval	On request 1/year service contract with guarantee extension to 5 years
Dimensions	Tank probe: D x L 60 mm x 200 mm (2 x 8 in.) Probe for pipe installation: D x L 60 mm x 315 mm (2 x 12.4 in.) (Pipe installation fitting: DN 65 / PN 16 DIN 2633; < 5 bar (73 psi); for pipes from DN 80) Distance sensor - wall (floor): TS > 10 cm (4 in.), turbidity > 50 cm (20 in.)
Weight	Tank probe: approx. 1.8 kg (63 oz) (t-line: approx. 0.6 kg (21 oz)) Probe for pipe installation: approx. 2.4 kg (85 oz) Pipe installation fitting: approx. 2.7 kg (95 oz) (without probe) Pipe installation safety fitting:approx. 18 kg (40 lb) (without probe)
User Maintenance	1 h / month, typical
Certifications	CE

Section 2 General Information

2.1 Safety Information

Please read this entire manual before unpacking, setting up, or operating this equipment. Pay attention to all danger and caution statements. Failure to do so could result in serious injury to the operator or damage to the equipment.

Make sure that the protection provided by this equipment is not impaired, do not use or install this equipment in any manner other than that specified in this manual.

2.1.1 Use of Hazard Information

DANGER
Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.

CAUTION
Indicates a potentially hazardous situation that may result in minor or moderate injury.

Important Note: *Information that requires special emphasis.*

Note: *Information that supplements points in the main text.*

2.1.2 Precautionary Labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed

	This symbol, if noted on the instrument, references the instruction manual for operation and/or safety information.
	This symbol indicates that a risk of electrical shock and/or electrocution exists.
	Electrical equipment marked with this symbol may not be disposed of in European public disposal systems after 12 August of 2005. In conformity with European local and national regulations (EU Directive 2002/96/EC), European electrical equipment users must now return old or end-of life equipment to the Producer for disposal at no charge to the user. ***Note:*** *For return for recycling, please contact the equipment producer or supplier for instructions on how to return end-of-life equipment, producer-supplied electrical accessories, and all auxiliary items for proper disposal.*

2.2 Sensor Overview

Note: *All sensors are also available without wipers for special applications.*

t-line: 0.001–4000 FNU/NTU

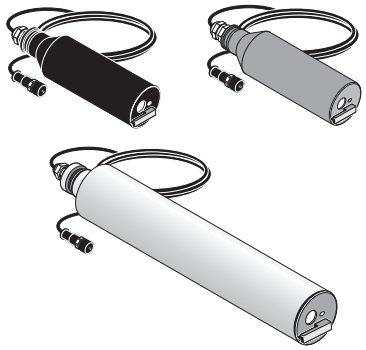
High-resolution turbidity probe made of plastic for the outlets of sewage treatment plants and bodies of water.

ts-line: 0.001–4000 FNU/NTU; 0.001 mg/L–50.0 g/L

High-precision turbidity and solids probe made of stainless steel or plastic for color-independent measurement of fine turbidities and sludges.

hs-line: 0.001–4000 FNU/NTU; 0.001 mg/L–500.0 g/L

High-precision turbidity and solids probe made of stainless steel or plastic for color-independent measurement of highly concentrated sludges.



inline: 0.001–4000 FNU/NTU; 0.001 mg/L–50.0 g/L

High-precision pipe installation probe for turbidity and solids made of stainless steel for color-independent measurement of fine turbidities and sludges.

highline: 0.001–4000 FNU/NTU; 0.001 mg/L–500.0 g/L

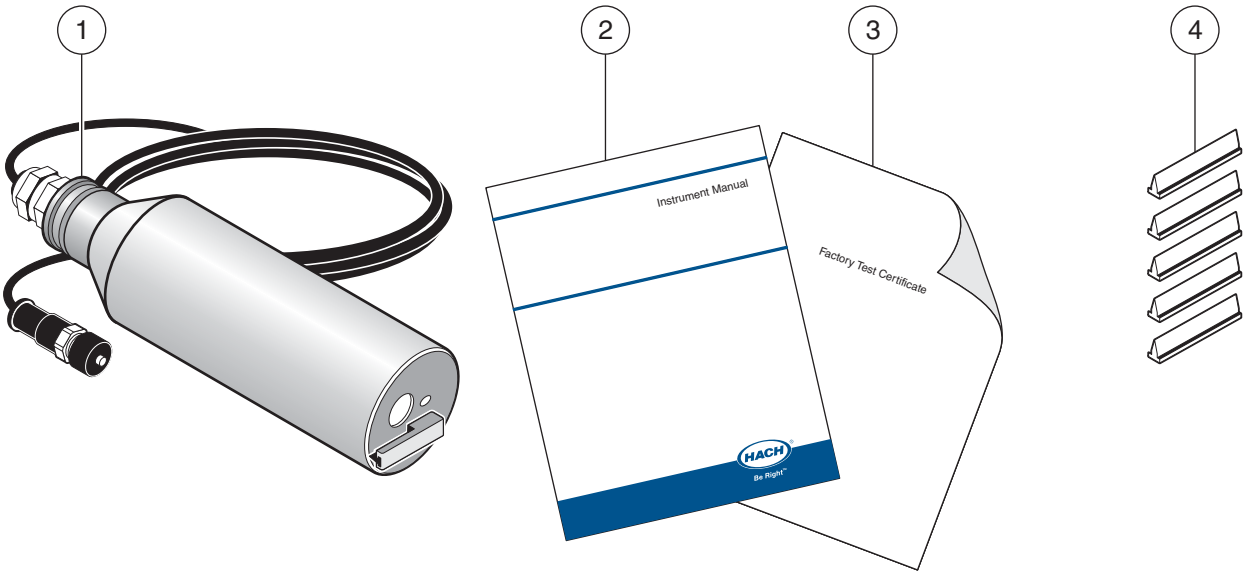
High-precision pipe installation probe for turbidity and suspended solids made of stainless steel for color-independent measurement of highly concentrated sludges.

Figure 2 Solitax sc Sensors

2.3 Measuring Principle

The measuring principle is based on a combined infrared absorption scattered light technique that measures the lowest turbidity values in accordance with DIN EN 27027 just as precisely and continuously as high sludge content. Using this method, the light scattered sideways by the turbidity particles is measured over an angle of 90°.

2.4 Handling



The sensor contains high-quality optical and electronic assemblies. Make sure the sensor is not subjected to any hard mechanical knocks. There are no customer-serviceable items inside the sensor.

Section 3 Installation

DANGER
Only qualified personnel should conduct the tasks described in this section of the manual.

3.1 Unpacking the Instrument

Figure 3 Items Supplied with Sensorl

1.	SOLITAX sc Sensor	**3.**	Factory Test Certificate
2.	User Manual	**4.**	Wiper Set (for 5 changes) LZX050

3.1.1 Function Check

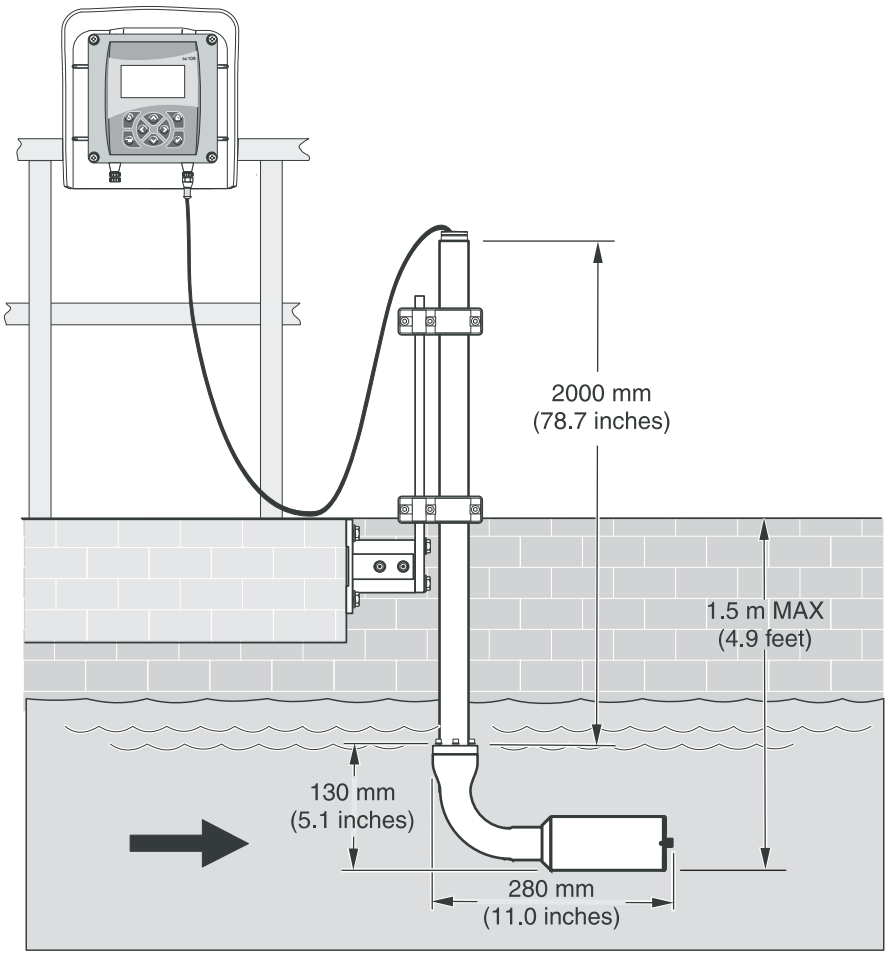
After unpacking, both components should be checked for any transport damage and a short function check performed prior to installation.

To perform a function check, connect the sensor to the display unit and power the unit. Shortly after the unit is plugged in, the display is activated and the instrument switches to the measurement display. Measured values taken in air is meaningless.

If no messages appear in the lower part of the display, the function check is then complete.

3.2 Sensor Installation

Figure 4 on page 10 illustrates the installation overview for Solitax sc Models t-line, ts-line, and hs-line for immersion in open tanks.



The maximum distance from the mounting surface to the sensor without the use of an extension tube is 1.5 m (4.9 ft). When that distance exceeds 1.5 m (4.9 ft), one of the following extension tubes is required and can be ordered separately:

- 1.0 m (3.28 ft) extension pipe LZY413
- 1.8 m (5.90 ft) extension pipe LZY414

To ensure a suitable measuring position, install the probe to the following conditions:

- The probe optical window must have a ground clearance of at least 30 cm (11.8 in.).
- Install the probe with the optical window facing (downstream) in the direction of the flow to minimize the risk of fouling.
- Avoid installation sites where air bubbles are inconsistent. If this not possible, try moving the probe slightly or adjusting its alignment to minimize the bubble effect.
- Protect the probe against the oncoming flow of large objects, such as branches or ice and against flow surges.
- Avoid installing the probe with the optical window facing into direct light or facing a highly-reflective surface.

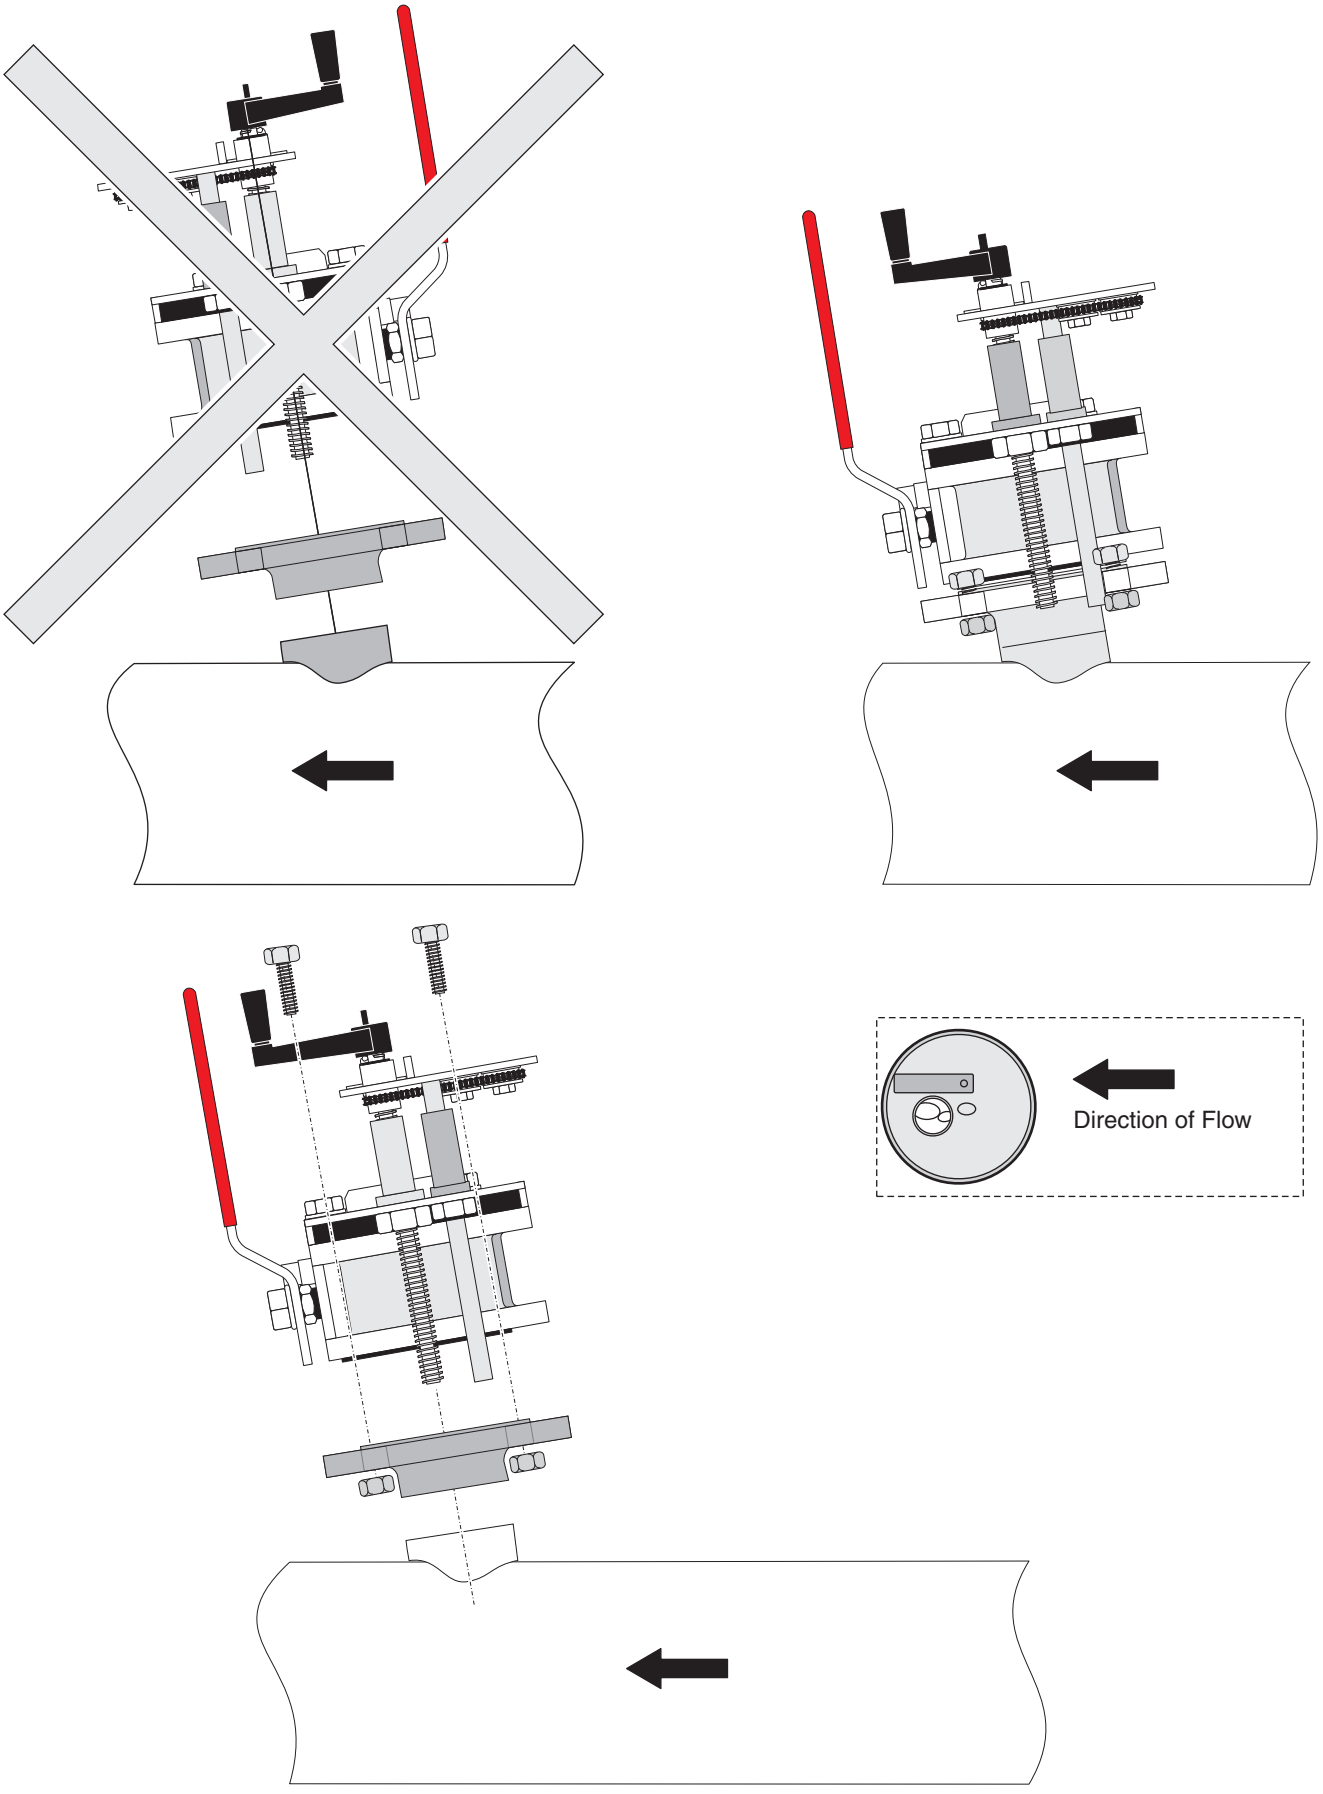


Figure 4 Sensor Installation Overview

3.3 Pipe Installation

- Install the sensor in an up-flow pipe section for best results. Do not mount the sensor in a down-flow pipe section.
- Mounting in a horizontal pipe section is acceptable if the sensor is fully immersed at all times. Usually, mounting 90 degrees from the top of the pipe guarantees full immersion. Do not mount on the top or bottom of a horizontal pipe section.
- Install the sensor in a pipe that is equal to or greater than 4 inches in diameter.
- Install the sensor at least 1.5 m (5 ft.) or three times the pipe diameter (whichever is greater) downstream of pumps, valves, or pipe elbows.
- Install the sensor on the discharge side of a pump, if possible, with a dilution or flush valve installed on the suction side of the pump.
- If the sensor is to be used to measure sludge with significant amounts of debris, install it after a sludge grinding pump or after a pump with a grinding/comminuting unit in front of it.
- Install the sensor within 7.8 m (25 ft.) of the controller with the standard probe cable. Optional cable extensions can be added for a maximum combined distance of 100 meters (330 ft.).
- If the flange cannot be welded to the pipe due to incompatibility of materials between the stud and the pipe, it is recommended that a stainless steel pipe section be fabricated. Weld the flange onto the stainless steel pipe section and attach the stainless steel section as a segment of the process pipe.

Figure 5 Proper Positioning for Insertion into Pipe

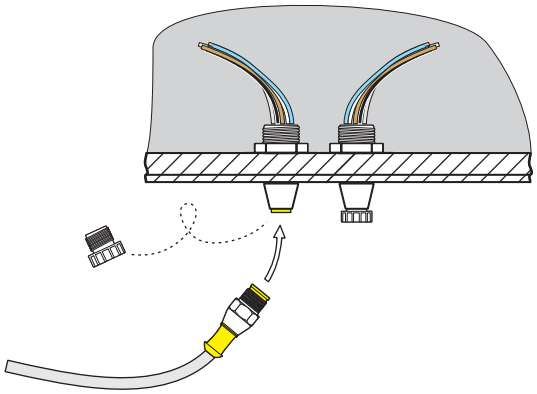
3.4 Connecting sensor cable

CAUTION
Always lay cables and hoses so they do not pose a trip hazard and are not bent.

1. Unscrew the protective cap on the controller socket and retain it.
2. Pay attention to the guide in the plug and push the plug into the socket.
3. Tighten the nuts.

Connector cables are available in various lengths (refer to Section 7 Replacement Parts and Accessories on page 23). Maximum overall cable length: 50 m (165 ft).

Figure 6 Connection of the sensor plug to the controller



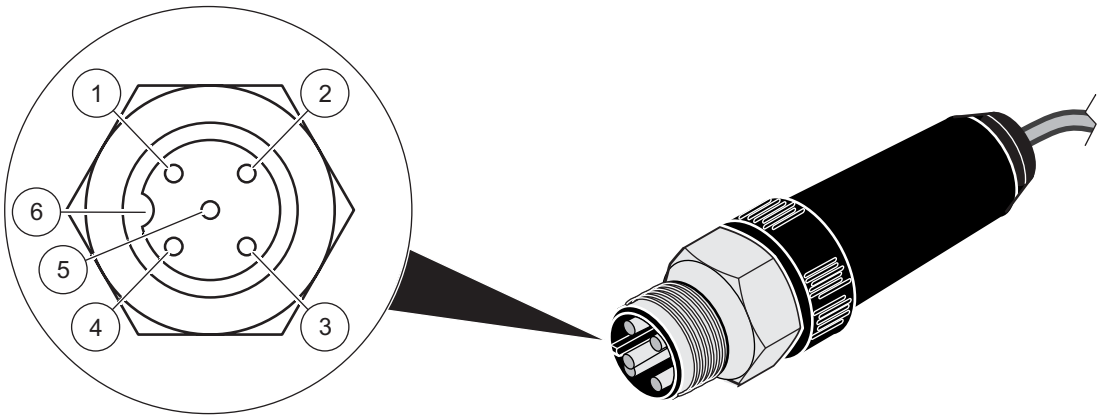


Figure 7 Sensor connector pin assignment

Number	Description	Cable colour (Standard-Cable)
1	+12 VDC	brown
2	Ground	black

4	Data (–)	white
5	Screen	Screen (grey)
6	Notch	–

This page is intentionally left blank

Section 4 Operations

4.1 Use of an sc controller

Before using the sensor in combination with an sc controller, refer to the controller user manual for navigation information.

4.2 Sensor Setup

When a sensor is initially installed, the serial number of the sensor will be displayed as the sensor name. To change the sensor name refer to the following instructions:

1. Select Main Menu.
2. From the Main Menu, select SENSOR SETUP and confirm.
3. Highlight the appropriate sensor if more than one sensor is attached and confirm.
4. Select CONFIGURE and confirm.
5. Select EDIT NAME and edit the name. Confirm or cancel to return to the Sensor Setup menu.

4.3 Sensor Data Logging

A data memory and event memory per sensor are available via the sc controller. While measured data are saved in the data memory at stipulated intervals, the event memory collects numerous events such as configuration changes, alarms and warning conditions. Both the data memory and the event memory can be read out in CSV format. For information on how you can download the data, please see the controller manual.

4.4 Sensor Diagnostics Menu for pH and ORP

SELECT SENSOR (if more than one sensor is attached)

STATUS	
ERROR LIST	See section 6.1 on page 21.
WARNING LIST	See section 6.2 on page 21..

4.5 Sensor Setup Menu

SELECT SENSOR (if more than one sensor is attached)

WIPE	
Initiates a wiping action on the sensor window.	
CALIBRATE	
SET OUTMODE	Select the behavior of the outputs during calibration for zero point setting (Hold, Active, Transfer, Selection). Hold maintains the last reading prior to going into the menu. Active transmits the current level readings, corrected with previous calibration data until new data is entered. Set Transfer transmits the value designated during the system setup
SENSOR MEASURE	Displays the current, uncorrected measured value.
CONFIGURE	Select the calibration type and follow the calibration steps for 2 point, 3 point, 4 point, and 5 point calibration.
FACTOR/2 POINTS/ 3 POINTS/4 POINTS/ 5 POINTS	Display depends on the selection in configuration.
SET CAL DEFAULT	Return the instrument to the default calibration settings.

4.5 Sensor Setup Menu (continued)

CONFIGURE	
EDIT NAME	Enter up to a 10-digit name in any combination of symbols and alpha or numeric characters.
SET PARAMETER	This setting configures the Solitax to measure turbidity or suspended solids. The Solitax cannot simultaneously measure both. Choose “TRB” for turbidity measurements, or “TS” for suspended solids measurement. This selection determines which units may be selected in the “Meas Units” menu.
MEAS UNITS	Choose from the displayed units. TRB (FNU, EBC, TE/F, NTU); TS (mg/L, g/L, ppm, %) Default: FNU If TRB was selected in set parameter, select “NTU” (commonly used in the U.S.), FNU, EBC, or TE/F. If TS was selected, choose mg/L, g/L, ppm, or %. Press enter to choose the selection. If the units selected result in a reading that exceeds 4 digits, the display will only show dashes. For example, if mg/L were selected, and the measurement was 10,500 mg/L, the display will show dashes until the reading drops to 9999 or lower.
CLEAN INTERVAL	Select the cleaning interval (1, 5, 15 or 30 minutes; 1, 4, or 12 hours; 1, 3, 7 days) Default: 12 hours This is the interval between wiper cleaning of the sensor window. It is recommended to start with a setting of 30 minutes. This time may be adjusted according to the application. If readings continue to be accurate, try a longer interval. If not, shorten the interval.
RESPONSE TIME	This is a damping function. While the Solitax takes readings continually, it will average them together over the period of the response time. Once the response time has elapsed, the displayed reading, 4-20 outputs, and alarm status are updated. (0 to 300 seconds) Default: 3 seconds
LOGGER INTERVAL	This is the datalog interval, with options from 1–15 minutes. Values logged are the average of the all readings during the previous logging interval. The controller will hold approximately 360 days of readings for one sensor at 15 minute intervals, or 24 days at 1 minute intervals (and proportional in between). Default:10 minutes
SET DEFAULTS	Resets all user-editable options to the factory-defaults.
TEST/MAIN	
PROBE INFO	Displays the sensor type, entered name of the sensor (Default: sensor serial number), the sensor serial number, the software version number, and the sensor driver version number.
PROFILE	Select Profile Counter to display the number of wipes made (from 20000 backwards). Select Reset Config to manually reset the profile counter.
COUNTER	Shows the number of hours or cycles left for operating hours, test/maint, gasket, and the motor.
TEST/MAIN	WIPE—Initiates the wiping action of the wiper.
	SIGNALS—displays the signal outputs for the device.
	OUTPUT MODE—Select the behavior of the instrument outputs (Hold, Active, Transfer, Selection)
	DEFAULT SETUP—Resets all user-editable options to the factory defaults.

4.6 Calibration

There are two calibration techniques; depending on whether turbidity or suspended solid is required (refer to section 4.6.2 or section 4.6.3 on page 18). Before calibration, determine the behavior of the 4–20 outputs and alarm relays while the user is in the CALIBRATE menu (refer to section 4.6.1).

4.6.1 Setting the Outmode

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and press confirm.
4. Select SET OUTMODE. Select the available Out Mode (Active, Hold, Transfer) and confirm.

4.6.2 Calibration for Turbidity

Turbidity calibration requires the use of a Turbidity Standard Solution. The manufacturer recommends the 800 NTU Turbidity Standard Solution (part of the calibration kit No. 57330-00). A zero-point calibration using deionized water is also recommended.

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and press confirm.
4. Select SENSOR MEASURE and confirm.
5. Place the sensor in the calibration cylinder with deionized water, mounting it with the supplied clamp. The tip of the probe should be approximately 1-inch below the surface of the water. Record the reading from the sensor measure display.
6. Select OFFSET. Multiply the reading obtained in step 5 and enter the value.
7. Select SENSOR MEASURE.
8. Rinse the outside of the StablCal® 800 NTU standard with water to remove any dust or debris adhering to the surface of the bottle. Gently invert both StablCal standard bottles a minimum of 50 times. Remove the lid and seal from each bottle. Slowly (to avoid creating bubbles) pour the contents of the bottles into the calibration cylinder. Immediately place the tip of the probe into the positioning bracket in the calibration cylinder. The tip of the probe should be approximately 1-inch below the surface standard. Allow the reading to become stable on the SENSOR MEASURE screen. Record the value (measured value). Calculate the factor. Refer to section 4.6.2.1.
9. Select FACTOR to display the corrected measurement.

4.6.2.1 Calculating the Factor

$$\text{New Factor} = \frac{\text{800 NTU Standard}}{\text{measured value}}$$

For example, if a sample measures 750 NTU using the sensor and the standard is 800 NTU, the new factor would be calculated as follows:

$$\text{New Factor} = \frac{\text{800 NTU}}{\text{750 NTU}} = 1.07$$

4.6.3 Calibration for Suspended Solids

Suspended solids calibration requires calibration to the actual sample. This optimizes the compensation for the particle size and shape typical at a measuring site. It is best performed by mounting the sensor as usual for normal measurement, and then grab samples collected and evaluated by laboratory methods. While a single point calibration is usually sufficient to provide accuracy, the SOLITAX does offer the ability to calibrate with up to 5 calibration points.

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and press confirm.
4. Select CONFIGURE and confirm.
5. Select the number of points desired for calibration (the unit with linearly interpolate values between calibration points). Select Factor for a single point calibration.
6. Mount the sensor as is during normal operation. Alternatively, place the sensor in the calibration cylinder (or a container with dark, non-reflective walls) 2 inches of clearance from the probe face with the probe face submerged by 1 inch or more.
7. Select SENSOR MEASURE and record the reading.
8. Immediately take a grab sample. Determine the total suspended solids using a gravimetric method such as Method 2540 D in *Standards Methods for the Examination of Water and WasteWater.*
9. Calculate the new factor. Refer to section 4.6.3.1 for single point (Factor) calibration. Refer section 4.6.3.2 on page 18 for multiple point calibrations.
10. Select FACTOR and press confirm. The corrected measurement should be displayed.

4.6.3.1 For Single Point (Factor) Calibration

Calculate the new factor:

$$\text{New Factor} = \frac{\text{Determined gravimetric value}}{\text{measured value}}$$

For example, if a sample measures 2.3 g/L using the SS sensor and the gravimetric value was 2.0 g/L, the new factor would be calculated as follows:

$$\text{New Factor} = \frac{2.0\ \text{g/L}}{2.3\ \text{g/L}} = 0.87$$

4.6.3.2 Multi-point Calibration

1. Repeat steps 6–8 in section 4.6.3 on page 18 at different times to obtain different measurements.
2. From the CONFIGURE menu, select the appropriate calibration point menu.
3. Enter the pairs of values for each reading, the target value being the laboratory determined value, and the actual value being the reading that the SOLITAX produced in step 5. The pairs should be entered in order from lowest values to highest.

Section 5 Maintenance

DANGER
Only qualified personnel should conduct the tasks described in this section of the manual.

Proper maintenance of the measuring windows in the sensor is critical for accurate measurements. The measuring windows should be checked monthly for soiling and the wiper checked for wear.

Important Note: *The seals must be replaced every 2 years by the Service Department. If the seals are not changed regularly, water may enter the probe head and seriously damage the instrument.*

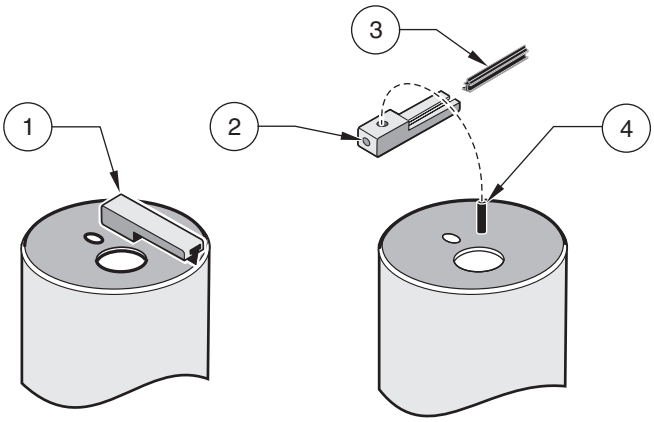
5.1 Maintenance Schedule

Maintenance Task	Duration
Visual inspection	monthly
Check calibration	monthly *(depending on the ambient conditions)*
Inspection	six months (counter)
Seal change	every 2 years (counter)
Change wiper and reset counter	as per counter (20000 cycles)

5.2 Cleaning the Sensor Measuring Windows

CAUTION
Always were
- ***Safety glasses,***
- ***Gloves and***
- ***Overal***

handling hydrochloric acid and observe safety regulations.



The measuring windows are made of quartz glass. If necessary, they can be cleaned with a cleaning agent and a cloth.

5.3 Replacing the Wiper

The life of the wiper is dependent on the number of cleaning actions performed and the type of deposits to be removed. The life of the wiper varies. The wipers supplied with the instrument should last for approximately one year.

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select TEST/MAINT and press confirm.
4. Select PROFILE and confirm. Change the wiper, see section 5.3 on page 20.
5. Select RESET CONFIG and confirm.
6. Select MAN. RESET ARE YOU SURE? and confirm.

Figure 8 Wiper Replacement

1.	Wiper arm	**3.**	Wiper
2.	M4 hex socket head bolt	**4.**	Wiper axle

Section 6 Troubleshooting

6.1 Error Codes

In the case of an error, the indication of the measured value flashes on the display and all the contacts and current outputs allocated to this sensor are placed on hold. The following conditions will result in flashing measured values:

- Data transmission between controller and sensor interrupted

On the Main menu open the SENSOR DIAG menu using **ENTER** and determine the cause of the fault.

Table 1 Error Messages

Error Displayed	Cause	Solution
POS. UNKNOWN	Wiper position unknown	Open the TEST/MAINT menu and trigger the ”WIPE” function, if the problem persists contact the manufacturer's customer service
LED FAULTY	Faulty LED	Contact customer service
MOIST	Moisture value > 10	Remove the sensor immediately and store in a dry place, contact customer service
CAL. DATA	Factory calibration data lost	Contact customer service

6.2 Warnings

A warning results in a flashing warning icon on the right of the display, all menus, contacts and outputs remain unaffected and continue to work normally. On the Main menu open the SENSOR DIAG menu using **ENTER** and determine the cause of the warning.

A warning may be used to trigger a relay and users can set warning levels to define the severity of the warning.

Table 2 Warnings

Warning Displayed	Cause	Solution
WARNING	Cause	Action

Section 7 Replacement Parts and Accessories

7.1 Immersion Sensors[1]

Description	Catalog Number
Turbidity, t-line sc, PVC with wiper (0.001 to 4000 NTU)	LXV423.99.10000
Turbidity, t-line sc, PVC without wiper (0.001 to 4000 NTU)	LXV423.99.12000
Turbidity and Suspended Solids, ts-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV423.99.10100
Turbidity and Suspended Solids, ts-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV423.99.12100
Turbidity and Suspended Solids, ts-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV423.99.00100
Turbidity and Suspended Solids, ts-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV423.99.02100
Turbidity and Suspended Solids, hs-line sc, PVC with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV423.99.10200
Turbidity and Suspended Solids, hs-line sc, PVC without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV423.99.12200
Turbidity and Suspended Solids, hs-line sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV423.99.00200
Turbidity and Suspended Solids, hs-line sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV423.99.02200

[1] All sensors come with the sensor, replacement wipers, and manual.

7.2 Insertion Sensors[1]

Description	Catalog Number
Turbidity and Suspended Solids, inline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV424.99.00100
Turbidity and Suspended Solids, inline sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 50 g/L)	LXV424.99.02100
Turbidity and Suspended Solids, highline sc, stainless steel with wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV424.99.00200
Turbidity and Suspended Solids, highline sc, stainless steel without wiper (0.001 to 4000 NTU, 0.001 mg/L to 500 g/L)	LXV424.99.02200

[1] All sensors come with the sensor, replacement wipers, and manual.

7.3 Replacement Parts

Description	Catalog Number
Set of wipers (for 5 changes) made of silicone for normal applications	LZX050
Set of wipers (for 5 changes) made of Viton for e. g. media containing oil	LZX578
SOLITAX sc User Manual, english	DOC023.54.03232
Extension cable, 5 m (16.4 ft)	LZX848
Extension cable, 10 m (33 ft)	LZX849
Extension cable, 15 m (50 ft)	LZX850
Extension cable, 20 m (65 ft)	LZX851
Extension cable, 30 m (100 ft)	LZX852
Extension cable, 50 m (165 ft)	LZX853

7.3 Replacement Parts (continued)

Description	Catalog Number
Extension pipe, 1,0 m (3.28 ft)	LZY413
Extension pipe, 1,8 m (5.90 ft)	LZY414
Installation kit, fixed-point (for t-line, ts-line, and hs-line immersion sensors)	LZX414.00.10000
Consisting of:	
Base	ATS010
Mounting plate	HPL061
Holding clamp (2×)	LZX200
Assembly pipe 2 m	BRO075
HS small parts set	LZX416
Installation kit with straight adapter	LZX414.00.20000
Kit, screws and seals for sensor adapters	LZX417
Miscellaneous hardware for probe installation kit	LZX416
Second fastening point, includes: bracket, sensor pipe stand, sensor pipe stand bracket, screws, and grommet)	LZX456
Sensor fixed-point mounting kit: Sensor pipe bracket	ATS010
Sensor pipe stand bracket	LZX200
L-bracket	ATS011
Adapter, Sensor 90° elbow	AHA034
Ball valve for insertion probes without adapting flange	LZX337
Welded flange made of C-steel for the pipe installation fitting	LZX703
Welded flange made of stainless steel for pipe installation safety fitting	LZX660

Section 9 Limited warranty

Hach Company warrants its products to the original purchaser against any defects that are due to faulty material or workmanship for a period of one year from date of shipment unless otherwise noted in the product manual.

In the event that a defect is discovered during the warranty period, Hach Company agrees that, at its option, it will repair or replace the defective product or refund the purchase price excluding original shipping and handling charges. Any product repaired or replaced under this warranty will be warranted only for the remainder of the original product warranty period.

This warranty does not apply to consumable products such as chemical reagents; or consumable components of a product, such as, but not limited to, lamps and tubing.

Contact Hach Company or your distributor to initiate warranty support. Products may not be returned without authorization from Hach Company.

Limitations

This warranty does not cover:

- Damage caused by acts of God, natural disaster, labor unrest, acts of war (declared or undeclared), terrorism, civil strife or acts of any governmental jurisdiction
- Damage caused by misuse, neglect, accident or improper application or installation
- Damage caused by any repair or attempted repair not authorized by Hach Company
- Any product not used in accordance with the instructions furnished by Hach Company
- Freight charges to return merchandise to Hach Company
- Freight charges on expedited or express shipment of warranted parts or product
- Travel fees associated with on-site warranty repair

This warranty contains the sole express warranty made by Hach Company in connection with its products. All implied warranties, including without limitation, the warranties of merchantability and fitness for a particular purpose, are expressly disclaimed.

Some states within the United States do not allow the disclaimer of implied warranties and if this is true in your state the above limitation may not apply to you. This warranty gives you specific rights, and you may also have other rights that vary from state to state.

This warranty constitutes the final, complete, and exclusive statement of warranty terms and no person is authorized to make any other warranties or representations on behalf of Hach Company.

Limitation of Remedies

The remedies of repair, replacement or refund of purchase price as stated above are the exclusive remedies for the breach of this warranty. On the basis of strict liability or under any other legal theory, in no event shall Hach Company be liable for any incidental or consequential damages of any kind for breach of warranty or negligence.

Section 1 Specifications

Specifications are subject to change without notice.

Specification	Details
Component description	Microprocessor-controlled and menu-driven controller that operates the sensor and displays measured values.
Operating temperature	-20 to 60 ºC (-4 to 140 ºF); 95% relative humidity, non-condensing with sensor load <7 W; -20 to 50 ºC (-4 to 104 ºF) with sensor load <28 W
Storage temperature	-20 to 70 ºC (-4 to 158 ºF); 95% relative humidity, non-condensing
Enclosure[1]	NEMA 4X/IP66 metal enclosure with a corrosion-resistant finish
Power requirements	**AC powered controller:** 100-240 VAC ±10%, 50/60 Hz; Power 50 VA with 7 W sensor/network module load, 100 VA with 28 W sensor/network module load (optional Modbus, RS232/RS485, Profibus DPV1 or HART network connection).
	24 VDC powered controller: 24 VDC—15%, + 20%; Power 15 W with 7 W sensor/network module load, 40 W with 28 W sensor/network module load (optional Modbus, RS232/RS485, Profibus DPV1 or HART network connection).
Altitude requirements	Standard 2000 m (6562 ft) ASL (Above Sea Level)
Pollution degree/Installation category	Polution Degree 2; Installation Category II
Outputs	Two analog (0-20 mA or 4-20 mA) outputs. Each analog output can be assigned to represent a measured parameter such as pH, temperature, flow or calculated values. Optional module supplies three additional analog outputs (5 total).
Relays	Four SPDT, user-configured contacts, rated 250 VAC, 5 Amp resistive maximum for the AC powered controller and 24 VDC, 5A resistive maximum for the DC powered controller. Relays are designed for connection to AC Mains circuits (i.e., whenever the controller is operated with 115 - 240 VAC power) or DC circuits (i.e., whenever the controller is operated with 24 VDC power).
Dimensions	½ DIN—144 x 144 x 180.9 mm (5.7 x 5.7 x 7.12 in.)
Weight	1.7 kg (3.75 lb)
Compliance information[2]	CE approved (with all sensor types). Listed for use in general locations to UL and CSA safety standards by ETL (with all sensor types). Certain AC mains powered models are listed for use in general safety locations to UL and CSA safety standards by Underwriters Laboratories (with all sensor types).
Digital communication	Optional Modbus, RS232/RS485, Profibus DPV1 or HART network connection for data transmission
Data logging	Secure Digital Card (32 GB maximum) or special RS232 cable connector for data logging and performing software updates. The controller will keep approximately 20,000 data points per sensor.
Warranty	2 years

Section 2 General information

In no event will the manufacturer be liable for direct, indirect, special, incidental or consequential damages resulting from any defect or omission in this manual. The manufacturer reserves the right to

[1] Units that have the Underwriters Laboratories (UL) certification are intended for indoor use only and do not have a NEMA 4X/IP66 rating.

[2] DC powered units are not listed by UL.

make changes in this manual and the products it describes at any time, without notice or obligation. Revised editions are found on the manufacturer's website.

2.1 Safety information

NOTICE

The manufacturer is not responsible for any damages due to misapplication or misuse of this product including, without limitation, direct, incidental and consequential damages, and disclaims such damages to the full extent permitted under applicable law. The user is solely responsible to identify critical application risks and install appropriate mechanisms to protect processes during a possible equipment malfunction.

Please read this entire manual before unpacking, setting up or operating this equipment. Pay attention to all danger and caution statements. Failure to do so could result in serious injury to the operator or damage to the equipment.

Make sure that the protection provided by this equipment is not impaired. Do not use or install this equipment in any manner other than that specified in this manual.

2.1.1 Use of hazard information

⚠ DANGER

Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.

⚠ WARNING

Indicates a potentially or imminently hazardous situation which, if not avoided, could result in death or serious injury.

⚠ CAUTION

Indicates a potentially hazardous situation that may result in minor or moderate injury.

NOTICE

Indicates a situation which, if not avoided, may cause damage to the instrument. Information that requires special emphasis.

2.1.2 Precautionary labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed. A symbol on the instrument is referenced in the manual with a precautionary statement.

	This symbol, if noted on the instrument, references the instruction manual for operation and/or safety information.
	This symbol indicates that a risk of electrical shock and/or electrocution exists.
	This symbol indicates the presence of devices sensitive to Electro-static Discharge (ESD) and indicates that care must be taken to prevent damage with the equipment.
	Electrical equipment marked with this symbol may not be disposed of in European domestic or public disposal systems. Return old or end-of-life equipment to the manufacturer for disposal at no charge to the user.

2.1.3 Certification

⚠ CAUTION

This equipment is not intended for use in residential environments and may not provide adequate protection to radio reception in such environments.

Canadian Radio Interference-Causing Equipment Regulation, ICES-003, Class A:

Supporting test records reside with the manufacturer.

This Class A digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

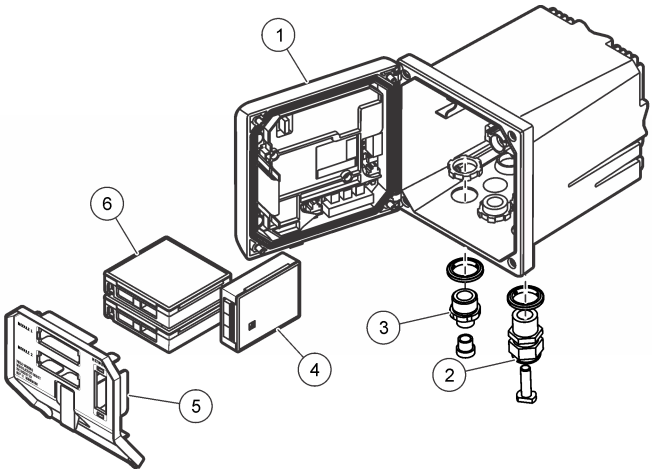
Cet appareil numérique de classe A répond à toutes les exigences de la réglementation canadienne sur les équipements provoquant des interférences.

FCC Part 15, Class "A" Limits

Supporting test records reside with the manufacturer. The device complies with Part 15 of the FCC Rules. Operation is subject to the following conditions:

1. The equipment may not cause harmful interference.
2. The equipment must accept any interference received, including interference that may cause undesired operation.

Changes or modifications to this equipment not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment. This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at their expense. The following techniques can be used to reduce interference problems:



1. Disconnect the equipment from its power source to verify that it is or is not the source of the interference.
2. If the equipment is connected to the same outlet as the device experiencing interference, connect the equipment to a different outlet.
3. Move the equipment away from the device receiving the interference.
4. Reposition the receiving antenna for the device receiving the interference.
5. Try combinations of the above.

2.2 Product overview

The controller displays sensor measurements and other data, can transmit analog and digital signals, and can interact with and control other devices through outputs and relays. Outputs, relays, sensors and sensor modules are configured and calibrated through the user interface on the front of the controller.

Figure 1 shows the product components. Components may vary according to controller configuration. Contact the manufacturer if parts are damaged or missing.

Figure 1 System components

1 Controller	**4** Network module (optional)
2 Strain relief assembly (optional depending on controller version)	**5** High-voltage barrier
3 Digital connection fitting (optional depending on controller version)	**6** Sensor modules (optional)

2.2.1 Sensors and sensor modules

The controller accepts up to a maximum of two sensor modules or two digital sensors (depending on the controller configuration), along with one communication module. A single digital sensor and a single sensor module can be installed in combination. A variety of sensors can be wired to the sensor modules. Sensor wiring information is given in the specific sensor manuals and in the user instructions for specific modules.

2.2.2 Relays outputs and signals

The controller has four configurable relay switches and two analog outputs. An optional analog output module can increase the number of analog outputs to five.

2.2.3 Device scans

With two exceptions, the controller automatically scans for connected devices without user input when it is powered on. The first exception is when the controller is powered on for the first time before initial use. The second exception is after the controller configuration settings have been set to their default values and the controller is powered on. In both cases, the controller first displays the language, date and time edit screens. After the language, date and time entries are accepted, the controller performs a device scan. Refer to Connect a digital sc sensor on page 20 for instructions about how to scan for devices when the controller is already powered on.

2.2.4 Controller enclosure

The controller enclosure is NEMA 4X/IP66-rated and has a corrosion-resistant finish designed to withstand corrosive environmental constituents such as salt spray and hydrogen sulfide. Protection against environmental damage is strongly recommended for outdoor use.
Note: *Units that have the Underwriters Laboratories (UL) certification are intended for indoor use only and do not have a NEMA 4X/IP66 rating.*

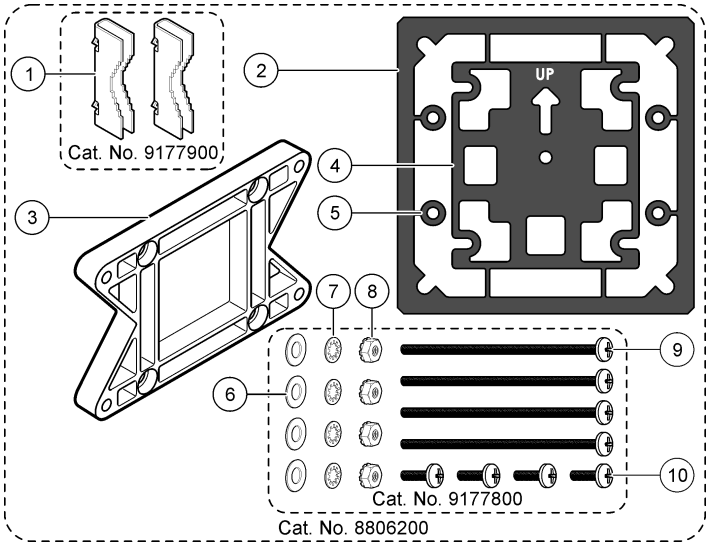
2.2.5 Controller mounting options

The controller can be mounted to a panel, to a wall or to a vertical or horizontal pipe. A neoprene sealing gasket is included and can be used to reduce vibration. The gasket can be used as a template for panel mounting before the inner gasket component is separated.

Section 3 Installation

3.1 Mounting components and dimensions

⚠ CAUTION



Personal injury hazard. Only qualified personnel should conduct the tasks described in this section of the manual.

The controller can be installed on a surface, panel or pipe (horizontal or vertical). For mounting options and instructions, refer to Figure 2, Figure 3 on page 8, Figure 4 on page 9, Figure 5 on page 10 and Figure 6 on page 11.

For horizontal pipe mounts, the mounting feet (Figure 2) must be attached to the mounting bracket in a vertical position.

For both horizontal and vertical pipe mounts, attach the mounting bracket to the controller as shown in Figure 5 on page 10.

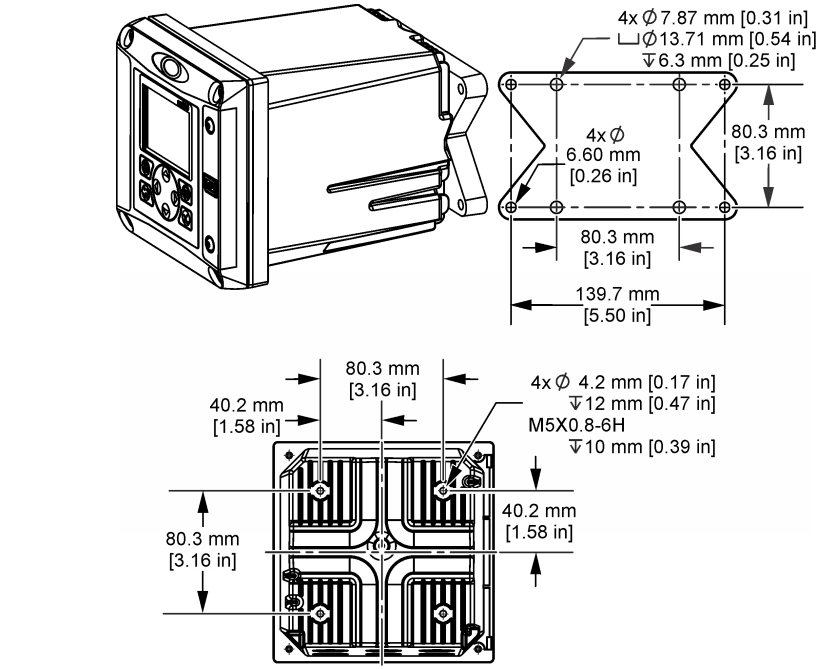
Figure 2 Mounting components

1 Mounting foot (2x)	**6** Flat washer, ¼-inch ID (4x)
2 Sealing gasket for panel mount, Neoprene	**7** Lock washer, ¼-inch ID (4x)
3 Bracket for wall and pipe mounting	**8** M5 x 0.8 Keps hexnut (4x)
4 Vibration isolation gasket for pipe mount	**9** Pan head screws, M5 x 0.8 x 100mm (4x) (Used for variable diameter pipe mount installations)
5 Vibration isolation washer for pipe mount (4x)	**10** Pan head screws, M5 x 0.8 x 15 mm (4x)

Note: *A bracket for panel mounting is available as an optional accessory.*

3.2 Controller mounting

Figure 3 Surface mounting dimensions



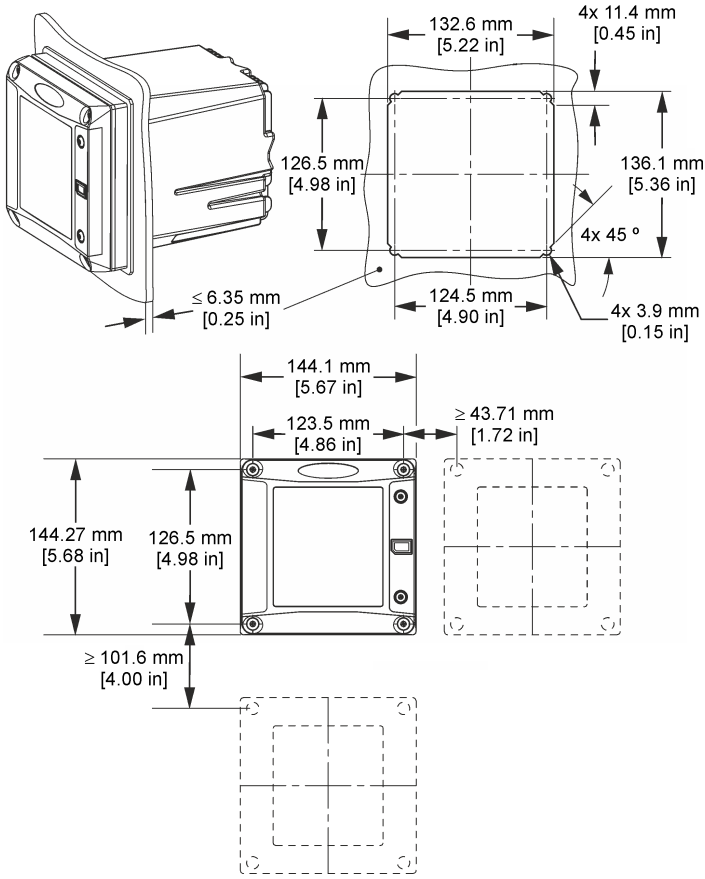


Figure 4 Panel mounting dimensions

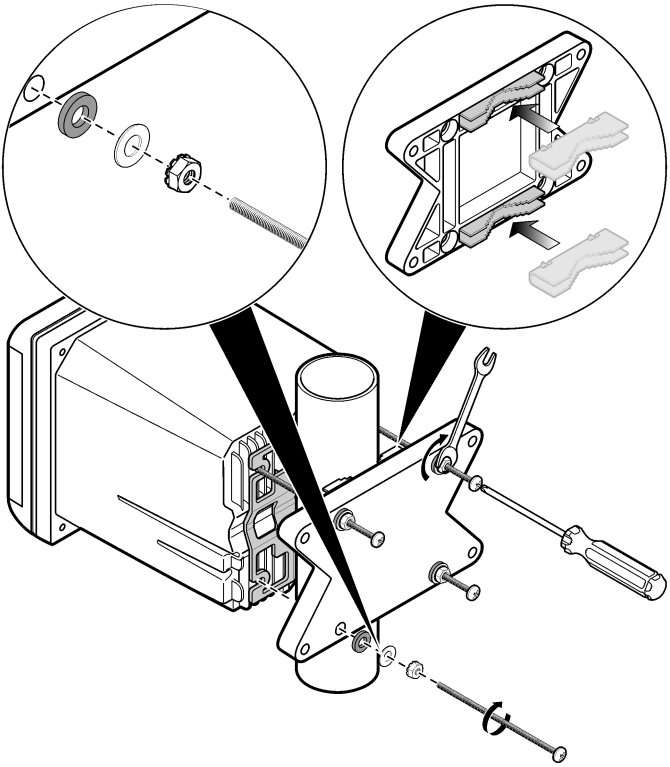
Note: *If using the bracket (optional) for panel mounting, push the controller through the hole in the panel and then slide the bracket over the controller on the back side of the panel. Use the four 15 mm pan head screws (supplied) to attach the bracket to the controller and secure the controller to the panel.*

Figure 5 Pipe mounting (vertical pipe)



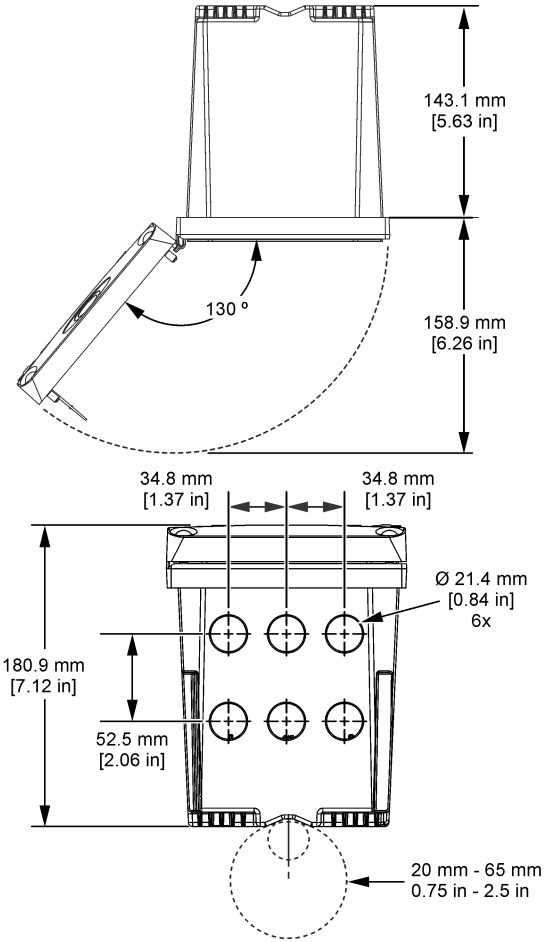


Figure 6 Top and bottom views

3.3 High-voltage barrier

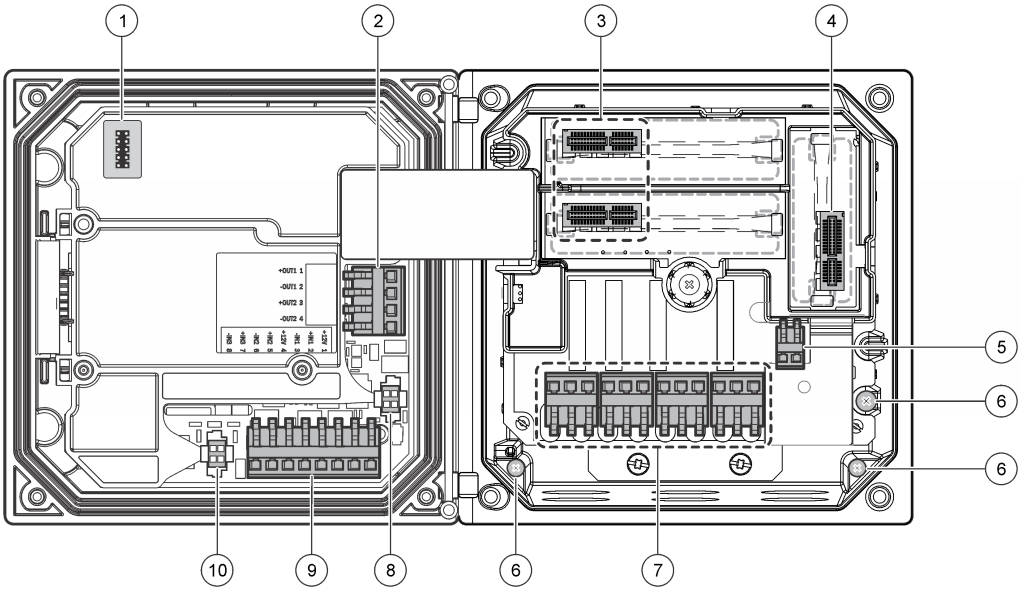
High-voltage wiring for the controller is located behind the high-voltage barrier in the controller enclosure. The barrier must remain in place except when installing modules or when a qualified installation technician is wiring for power, alarms, outputs or relays. Do not remove the barrier while power is applied to the controller.

3.4 Electrostatic discharge (ESD) considerations

NOTICE

Potential Instrument Damage. Delicate internal electronic components can be damaged by static electricity, resulting in degraded performance or eventual failure.

Refer to the steps in this procedure to prevent ESD damage to the instrument:



- Touch an earth-grounded metal surface such as the chassis of an instrument, a metal conduit or pipe to discharge static electricity from the body.

- Avoid excessive movement. Transport static-sensitive components in anti-static containers or packages.
- Wear a wrist strap connected by a wire to earth ground.
- Work in a static-safe area with anti-static floor pads and work bench pads.

3.5 Wiring overview

Figure 7 shows an overview of the wiring connections inside the controller with the high voltage barrier removed. The left side of the figure shows the back side of the controller cover.
Note: *Remove connector caps from the connectors before module installation.*

Figure 7 Wiring connections overview

1 Service cable connection	**5** AC and DC power connector[3]	**9** Discrete input wiring connector[3]
2 4-20 mA output[3]	**6** Ground terminals	**10** Digital sensor connector[3]
3 Sensor module connector	**7** Relay connections[3]	
4 Communication module connector (e.g., Modbus, Profibus, HART, optional 4-20 mA module, etc.)	**8** Digital sensor connector[3]	

3.6 Wiring for power

⚠ WARNING

Potential Electrocution Hazard. Always disconnect power to the instrument when making electrical connections.

[3] Terminals can be removed for improved access.

⚠ WARNING

Potential Electrocution Hazard. If this equipment is used outdoors or in potentially wet locations, a **Ground Fault Interrupt** device must be used for connecting the equipment to its mains power source.

⚠ DANGER

Electrocution Hazard. Do not connect AC power to a 24 VDC powered model.

⚠ WARNING

Potential Electrocution Hazard. A protective earth (PE) ground connection is required for both 100-240 VAC and 24 VDC wiring applications. Failure to connect a good PE ground connection can result in shock hazards and poor performance due to electromagnetic interferences. ALWAYS connect a good PE ground to the controller terminal.

NOTICE

Install the device in a location and position that gives easy access to the disconnect device and its operation.

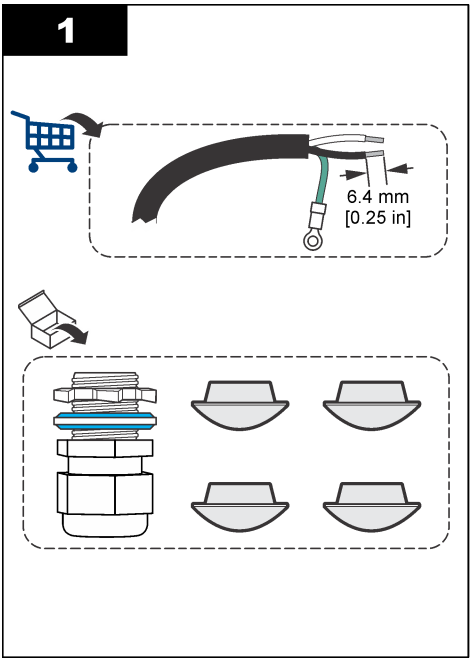
The controller can be purchased as either a 100-240 VAC powered model or a 24 VDC powered model. Follow the appropriate wiring instructions for the purchased model.

The controller can be wired for line power by hard-wiring in conduit or wiring to a power cord. Regardless of the wire used, the connections are made at the same terminals. A local disconnect designed to meet local electrical code is required and must be identified for all types of installation. In hard-wired applications, the power and safety ground service drops for the instrument must be 0.82 to 1.31 mm^2 (18 to 16 AWG). Make sure that the field wiring insulation is rated 80 °C (176 °F) minimum.

Notes:

- The voltage barrier must be removed before making any electrical connections. After making all connections, replace the voltage barrier before closing the controller cover.
- A sealing type strain relief and a power cord less than 3 meters (10 feet) in length with three 18-gauge conductors (including a safety ground wire) can be used to maintain the NEMA 4X/IP66 environmental rating.
- Controllers can be ordered with AC power cords pre-installed. Additional power cords may also be ordered.
- The DC power source that supplies power to the 24 VDC powered controller must maintain voltage regulation within the specified 24 VDC-15% +20% voltage limits. The DC power source must also provide adequate protection against surges and line transients.

Wiring procedure



Refer to the illustrated steps that follow and Table 1 or Table 2 to wire the controller for power. Insert each wire into the appropriate terminal until the insulation is seated against the connector with no bare wire exposed. Tug gently after insertion to make sure that there is a secure connection. Seal any unused openings in the controller box with conduit opening sealing plugs.

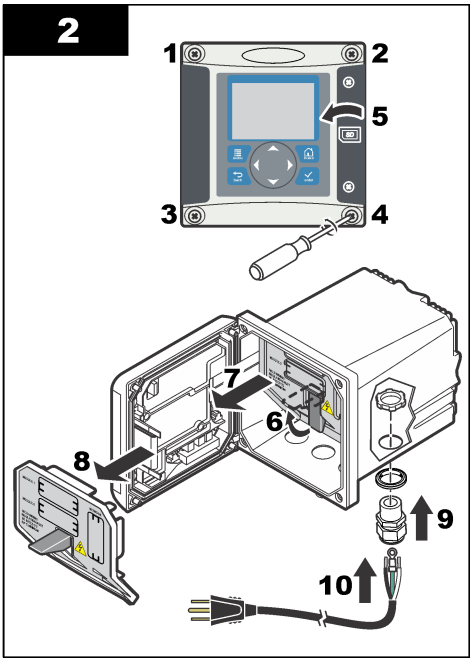


Table 1 AC power wiring information (AC powered models only)

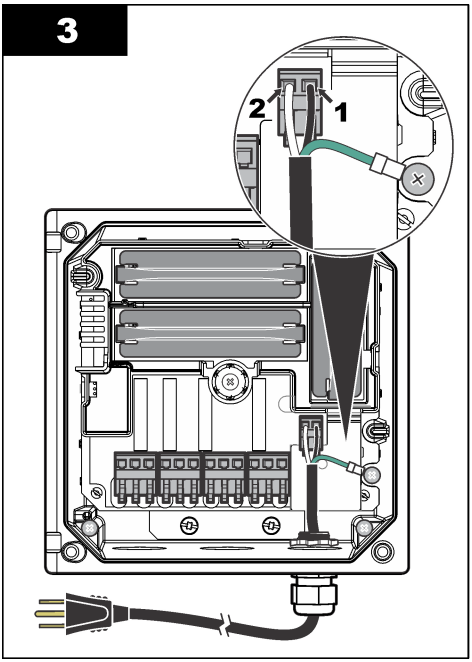

Terminal	Description	Color—North America	Color—EU
1	Hot (L1)	Black	Brown
2	Neutral (N)	White	Blue
—	Protective Earth (PE) Ground lug	Green	Green with yellow stripe

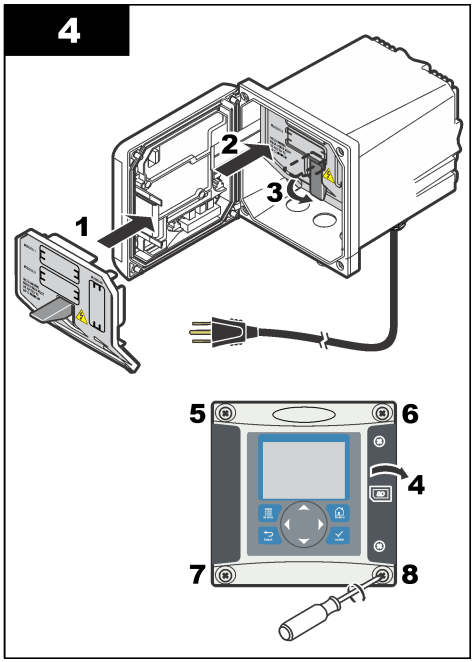

Table 2 DC power wiring information (DC powered models only)

Terminal	Description	Color—North America	Color—EU
1	+24 VDC	Red	Red
2	24 VDC return	Black	Black
—	Protective Earth (PE) Ground lug	Green	Green with yellow stripe

3.7 Alarms and relays

The controller is equipped with four unpowered, single pole relays rated 100-250 VAC, 50/60 Hz, 5 amp resistive maximum. Contacts are rated 250 VAC, 5 amp resistive maximum for the AC powered controller and 24 VDC, 5A resistive maximum for the DC powered controller. The relays are not rated for inductive loads.

3.8 Wiring for relays

⚠ WARNING
Potential Electrocution Hazard. Always disconnect power to the instrument when making electrical connections.

⚠ WARNING
Potential fire hazard. The relay contacts are rated 5A and are not fused. External loads connected to the relays must have current limiting devices provided to limit current to < 5 A.

⚠ WARNING
Potential fire hazard. Do not daisy-chain the common relay connections or jumper wire from the mains power connection inside the instrument.

⚠ WARNING
Potential electrocution hazard. In order to maintain the NEMA/IP environmental ratings of the enclosure, use only conduit fittings and cable glands rated for at least NEMA 4X/IP66 to route cables in to the instrument.

AC line (100—250 V) powered controllers

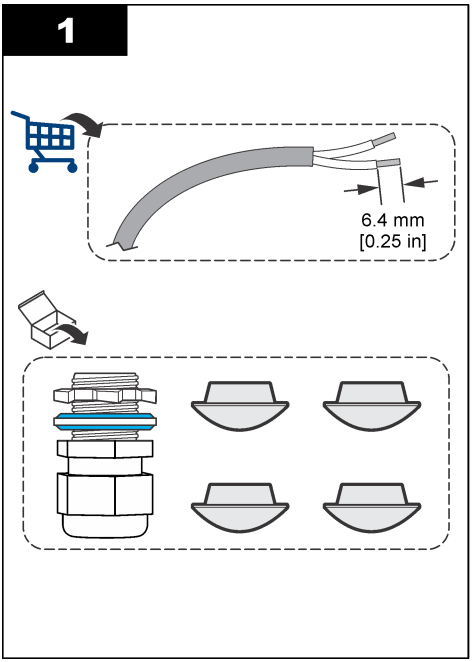
⚠WARNING

Potential electrocution hazard. AC mains powered controllers (115 V–230 V) are designed for relay connections to AC mains circuits (i.e., voltages greater than 16 V-RMS, 22.6 V-PEAK or 35 VDC).

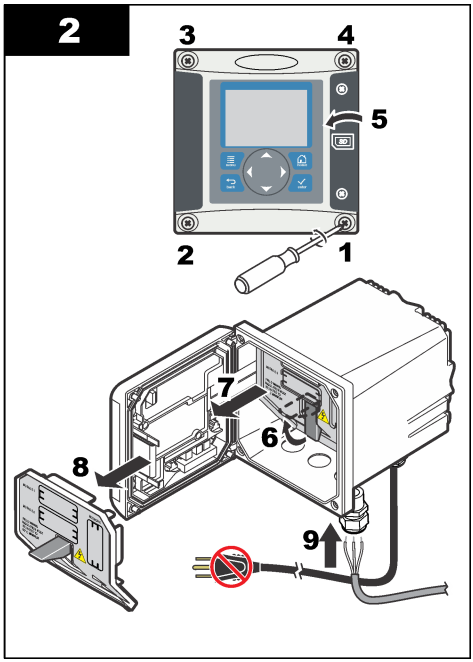
The wiring compartment is not designed for voltage connections in excess of 250 VAC.

24 VDC powered controllers

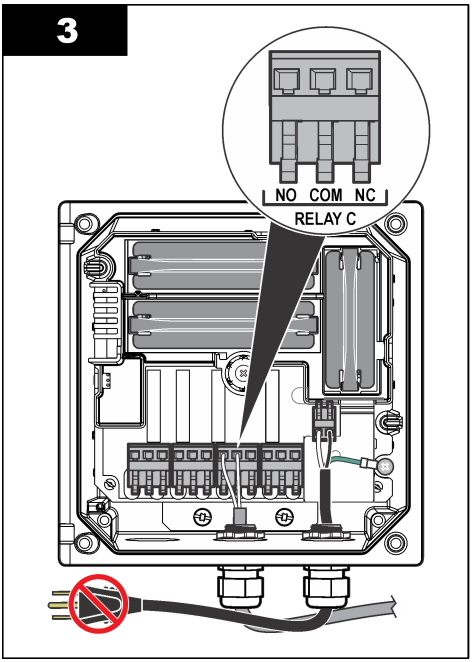
⚠WARNING



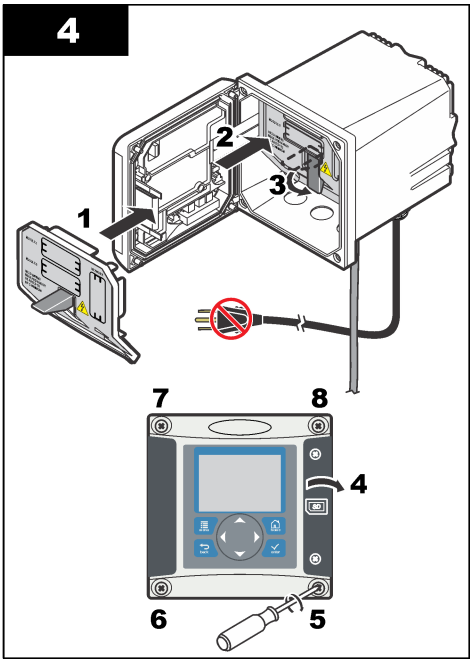
Potential electrocution hazard. 24 V powered controllers are designed for relay connections to low voltage circuits (i.e., voltages less than 16 V-RMS, 22.6 V-PEAK or 35 VDC).



The 24 VDC controller relays are designed for the connection to low voltage circuits (i.e., voltages less than 30 V-RMS, 42.2 V-PEAK or 60 VDC). The wiring compartment is not designed for voltage connections above these levels.



The relay connector accepts 0.82 to 1.31 mm^2 (18 to 16 AWG) wire (as determined by load application). Wire gauge less than 18 AWG is not recommended. Make sure that the field wiring insulation is rated 80 °C (176 °F) minimum.



The Normally Open (NO) and Common (COM) relay contacts will be connected when an alarm or other condition is active. The Normally Closed (NC) and Common relay contacts will be connected when an alarm or other condition is inactive (unless the Fail Safe is set to Yes) or when power is removed from the controller.

Most relay connections use either the NO and COM terminals or the NC and COM terminals. The numbered installation steps show connection to the NO and COM terminals.

3.9 Analog output connections

⚠ WARNING

Potential Electrocution Hazard. Always disconnect power to the instrument when making electrical connections.

⚠ WARNING

Potential electrocution hazard. In order to maintain the NEMA/IP environmental ratings of the enclosure, use only conduit fittings and cable glands rated for at least NEMA 4X/IP66 to route cables in to the instrument.

Two isolated analog outputs (1 and 2) are provided (Figure 8). Such outputs are commonly used for analog signaling or to control other external devices.

Make wiring connections to the controller as shown in Figure 8 and Table 3.
Note: *Figure 8 shows the back of the controller cover and not the inside of the main controller compartment.*

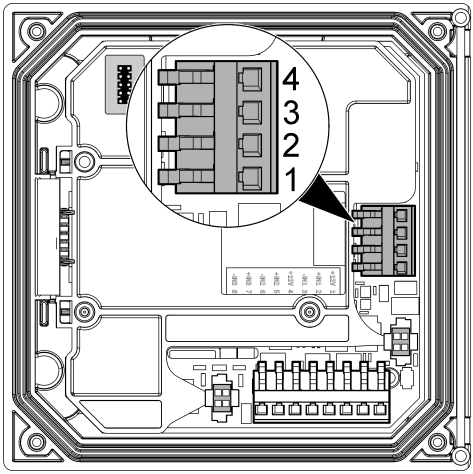


Table 3 Output connections

Recorder wires	Circuit board position
Output 2–	4
Output 2+	3
Output 1–	2
Output 1+	1

1. Open the controller cover.
2. Feed the wires through the strain relief.
3. Adjust the wire as necessary and tighten the strain relief.

4. Make connections with twisted-pair shielded wire and connect the shield at the controlled component end or at the control loop end.
   - Do not connect the shield at both ends of the cable.
   - Use of non-shielded cable may result in radio frequency emission or susceptibility levels higher than allowed.
   - Maximum loop resistance is 500 ohm.
5. Close the controller cover and tighten the cover screws.
6. Configure outputs in the controller.

Figure 8 Analog output connections

3.10 Discrete input wiring connections

⚠ WARNING

Potential Electrocution Hazard. Always disconnect power to the instrument when making electrical connections.

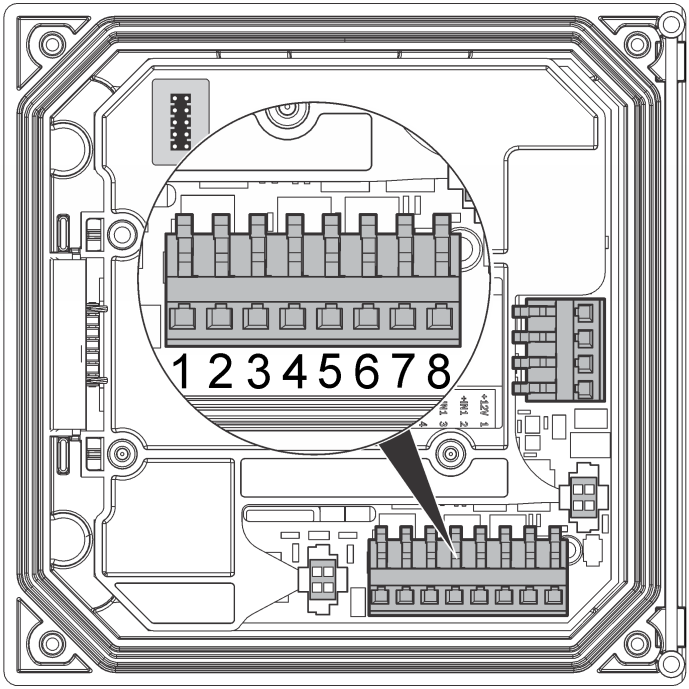
⚠ WARNING

Potential electrocution hazard. In order to maintain the NEMA/IP environmental ratings of the enclosure, use only conduit fittings and cable glands rated for at least NEMA 4X/IP66 to route cables in to the instrument.

Three discrete inputs are provided for switch closure inputs or logic level voltage inputs. Make wiring connections and configure jumper settings to the controller as shown in Figure 9, Table 4 and Figure 10.

Note: *Figure 9 shows the back of the controller cover and not the inside of the main controller compartment.*

Figure 9 Discrete input wiring connections



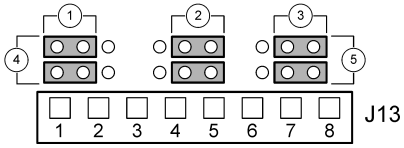


Table 4 Input connections

Discrete inputs	Connector position - Switch input	Connector position - Voltage input
Input 1+	3	2
Input 1-	2	3
Input 2+	6	5
Input 2-	5	6
Input 3+	8	7
Input 3-	7	8

Figure 10 Jumper settings

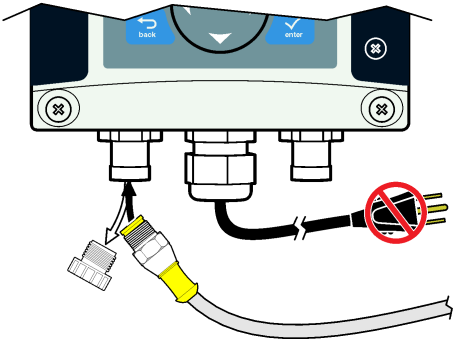
1 Input 1 configuration jumpers	**4** Jumpers positioned to the left for switch inputs
2 Input 2 configuration jumpers	**5** Jumpers positioned to the right for voltage inputs
3 Input 3 configuration jumpers	

1. Open the controller cover.
2. Feed the wires through the cable gland.
3. Adjust the wire as necessary and tighten the cable gland.
4. The jumpers are positioned immediately behind the connector. Remove the connector for improved access to the jumpers and configure the jumper settings according to the type of input as shown in Figure 10.
5. Close the controller cover and tighten the cover screws.
6. Configure inputs in the controller.

Note: *In* ***switch input*** *mode the controller supplies 12 volts to the switch and is not isolated from the controller. In* ***voltage input*** *mode the inputs are isolated from the controller (user input voltage from 0 to 30 volts).*

3.11 Connect a digital sc sensor

Note: *To connect an analog sensor, refer to the instructions supplied in the module or sensor manual.*



A digital sc sensor can be connected to the controller using the keyed quick-connect fitting (Figure 11). A digital sensor can be connected with the controller powered on or off.

When a sensor is connected with the controller powered on, the controller does not automatically perform a device scan. To make the controller perform a device scan, navigate to the Test/Maintenance menu and select Scan Devices. If a new device is found, the controller performs the installation process without further user action.

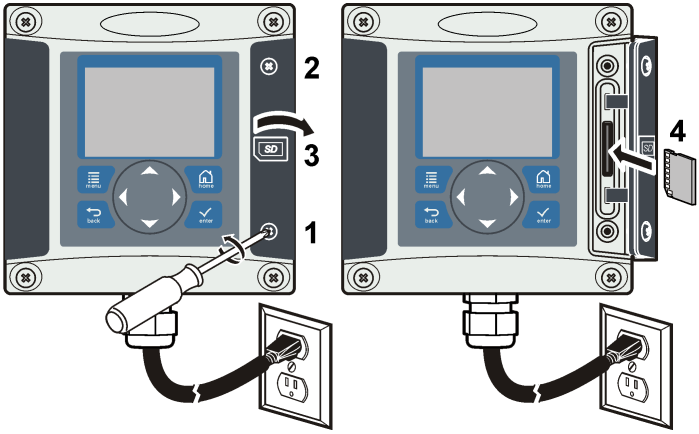
When a sensor is connected with the controller powered off, the controller will perform a device scan when it is powered on again. If a new device is found, the controller performs the installation process without further user action.

Retain the connector cap to seal the connector opening in case the sensor must be removed.

Figure 11 Digital sensor quick connect

3.12 Connect the optional digital communication output

The manufacturer supports Modbus RS485, Modbus RS232, Profibus DPV1 and HART communication protocols. The optional digital output module is installed in the location indicated by item 4 in Figure 7 on page 12. Refer to the instructions supplied with the network module for more details.



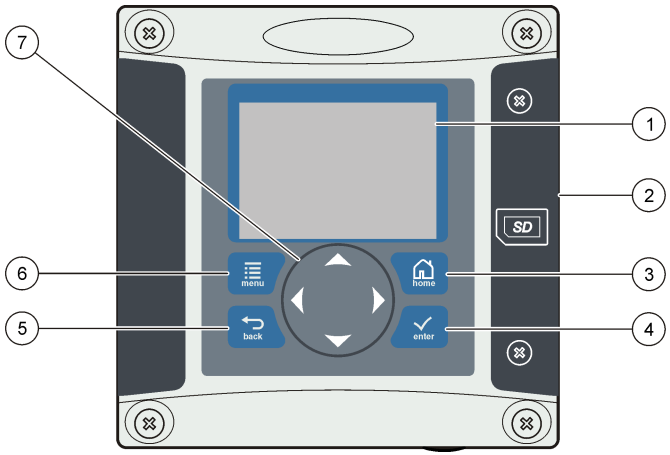
For information about Modbus registers, go to http://www.de.hach.com or http://www.hach.com and search *Modbus registers* or go to any sc200 product page.

3.13 Install a Secure Digital (SD) memory card

For instructions on how to install an SD card in the controller, refer to Figure 12. Information on how to use the SD memory card can be found in Using the secure digital memory (SD) card on page 42.

To remove an SD card, push down on the edge of the card and release, then pull the card up and out of the slot. After the card is removed, close the slot cover and tighten the cover screws.

Figure 12 SD card installation



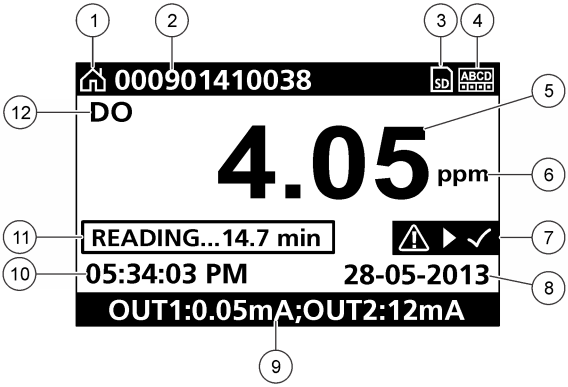
Section 4 User interface and navigation

4.1 User interface

The keypad has four menu keys and four directional keys as shown in Figure 13.

Figure 13 Keypad and front panel overview

1 Instrument display	**5** **BACK** key. Moves back one level in the menu structure.
2 Cover for secure digital memory card slot	**6** **MENU** key. Moves to the Settings Menu from other screens and submenus.
3 **HOME** key. Moves to the Main Measurement screen from other screens and submenus.	**7** Directional keys. Used to navigate through the menus, change settings, and increment or decrement digits.
4 **ENTER** key. Accepts input values, updates, or displayed menu options.	



Inputs and outputs are set up and configured through the front panel using the keypad and display screen. This user interface is used to set up and configure inputs and outputs, create log information and calculated values, and calibrate sensors. The SD interface can be used to save logs and update software.

4.2 Display

Figure 14 shows an example of the main measurement screen with a DO sensor connected to the controller.

The front panel display screen shows sensor measurement data, calibration and configuration settings, errors, warnings and other information.

Figure 14 Example of Main Measurement screen

1 Home screen icon	**7** Warning status bar
2 Sensor name	**8** Date
3 SD Memory card icon	**9** Analog output values
4 Relay status indicator	**10** Time
5 Measurement value	**11** Progress bar
6 Measurement unit	**12** Measurement parameter

Table 5 Icon descriptions

Icon	Description
Home screen	The icon may vary depending on the screen or menu being displayed. For example, if an SD card is installed, an SD card icon appears here when the user is in the SD Card Setup menu.
SD memory card	This icon appears only if an SD card is in the reader slot. When a user is in the SD Card Setup menu, this icon appears in the upper left corner.
Warning	A warning icon consists of an exclamation point within a triangle. Warning icons appear on the right of the main display below the measurement value. Push the **ENTER** key then select the device to view any problems associated with that device. The warning icon will no longer be displayed once all problems have been corrected or acknowledged.
Error	An error icon consists of an exclamation point within a circle. When an error occurs, the error icon and the measurement screen flash alternately in the main display. To view errors, push the **MENU** key and select **Diagnostics**. Then select the device to view any problems associated with that device.

4.2.1 Additional display formats

- From the Main Measurement screen push the **UP** and **DOWN** arrow keys to switch between measurement parameters
- From the Main Measurement screen push the **RIGHT** arrow key to switch to a split display of up to 4 measurement parameters. Push the **RIGHT** arrow key to include additional measurements. Push the **LEFT** arrow key as needed to return to the Main Measurement screen
- From the Main Measurement screen push the **LEFT** arrow key to switch to the graphical display (see Graphical display on page 23 to define the parameters). Push the **UP** and **DOWN** arrow keys to switch measurement graphs

4.2.2 Graphical display

The graph shows concentration and temperature measurements for each channel in use. The graph supplies easy monitoring of trends and shows changes in the process.

1. From the graphical display screen use the up and down arrow keys to select a graph and push the **HOME** key.
2. Select an option:

Option	Description
MEASUREMENT VALUE	Set the measurement value for the selected channel. Select between Auto Scale and Manually Scale. For manual scaling enter the minimum and maximum measurement values
DATE & TIME RANGE	Select the date and time range from the available options

Section 5 System startup

When initially powered up, the Language, Date Format and Date/Time screens appear in order. After these options are set, the controller performs a device scan and displays the message **Scanning for devices. Please wait...** If a new device is found, the controller performs an installation process before displaying a main measurement screen.

If the scan finds previously installed devices without configuration changes, the main measurement screen of the device in the number one position appears immediately after the scan is complete.

If a device has been removed from the controller or is not found during the next power-cycled or menu-driven scan, the controller displays a **Device missing** message and prompts to delete the missing device.

If no sensor is connected to an installed analog module, the controller will indicate an error. If devices are connected but not found by the controller, refer to Troubleshooting on page 46.

5.1 Set the language, date and time for the first time

The controller displays the language, date and time edit screens when the controller is powered on for the first time, and when it is powered on after the configuration settings have been set to their default values.
After the language, date and time options are set for the first time, update the options as necessary through the sc200 setup menu.

1. In the Language screen, highlight a language in the options list and push the **ENTER** key. English is the default language for the controller.
   The selected language is saved. The Date Format screen appears.
2. In the Date Format screen, highlight a format and push the **ENTER** key.
   The date and time format is saved. Next, the Date /Time screen appears.
3. In the Date/Time screen, push the **RIGHT** or **LEFT** arrow keys to highlight a field, then push the **UP** and **DOWN** arrow keys to update the value in the field. Update the other fields as necessary.
4. Push the **ENTER** key.
   The changes are saved and the controller performs a start-up scan for devices. If connected devices are found, the controller displays the main measurement screen for the device in the number one position. If the controller fails to find connected devices, refer to Troubleshooting on page 46.

5.2 Controller configuration information

General information about configuration options is listed in the table.

1. To navigate to the menu options, from the Settings Menu, select sc200 Setup.

Option	Description
Security setup	Sets the passcode preferences (refer to Security setup on page 25)
Output setup	Configures the controller analog outputs (refer to Configure the controller analog outputs on page 27)

Option	Description
Relay setup	Configures the controller relays (refer to Configure relays on page 30)
Display setup	Configures the controller display (refer to Display setup on page 39)
Set Date/Time	Sets the controller time and date (refer to Update the date and time on page 40)
Datalog setup	Configures data logging options. Available only if Calculation has been setup. At least one sensor must be attached to enter a calculation (refer to Set the datalog mode and interval on page 40)
Manage Data	Select the device from the list of installed components to view the data or event log
Error Hold Mode	**Hold Outputs**—Holds outputs at last known value when controller loses communication with the sensor. **Transfer Outputs**—Switches to transfer mode when controller loses communication with the sensor. Outputs transfer to a pre-defined value.
Calculation	Configures the controller math function (refer to Set up a calculation on page 40)
sc200 Information	**S/W VER:**—Displays the current version of controller software **Bootloader VER:**—Displays the current Bootloader version. The Bootloader is a file that loads the main operating system for the controller **S/N:**—Displays the controller serial number **Version:**—Displays the current version of controller hardware
Discrete Input Setup	Configures three discrete input channels (refer to Set up the discrete inputs on page 41)
Language	Assigns the language used in the controller (refer to Update the display language on page 42)

2. Select an option and push **ENTER** to activate the menu item.

Section 6 Advanced operation

6.1 Security setup

6.1.1 Enable or disable the passcode

By default the passcode option is disabled and all configuration settings and calibrations can be changed. When the passcode function is enabled, access to Sensor calibration and Test/Maint menus requires a passcode.
To enable the passcode:

1. From the Settings Menu, select sc200 Setup and push the **ENTER** key.
2. Select Security Setup and push the **ENTER** key.
3. Select Set Passcode and push the **ENTER** key.
4. Select Disabled or Enabled and push the **ENTER** key.
   The passcode is enabled.
5. Push the **BACK** key to return to the sc200 Setup Menu, or push the **MENU** key to return to the Settings Menu.

6.1.2 Edit the passcode

The passcode is factory set to SC200. The Edit Passcode menu option appears in the Security Setup menu only after the passcode feature is enabled and a valid passcode has been entered.
A passcode consists of up to six upper or lower-case alpha, numeric and special characters. Passcodes are case-sensitive.

To edit the passcode:

1. Make sure the passcode is enabled. Refer to Enable or disable the passcode on page 25 for information on how to enable the passcode.
2. From the Settings menu, select Security Setup and push **ENTER**.
3. Use the arrow keys to enter the current valid passcode and push **ENTER**.
   The Edit Passcode option appears in the Security Setup menu.
4. Select Edit Pass Code and push **ENTER**.
   The Edit Pass Code screen appears.
5. Use the arrow keys to edit the passcode and push **ENTER**.
   The new passcode is saved and the Security Setup menu appears.
   Note: *All menus stay accessible until the* ***HOME*** *key is pushed or the controller is restarted.*
6. Push the **HOME** key or perform a controller restart.
   The new passcode settings are saved, and the new passcode is required to enter the Security Setup, Datalog Setup and Test/Maint menus.

6.1.3 Protect features

This option is only displayed if an analyzer or sensor that supports this feature is connected to the controller. Security categories are displayed that are defined by the connected analyzer or sensor. The user can then enable or disable password protection against individual menu options within these categories.

6.2 Configure a 4-20 mA input module

An analog module must be installed in the controller.

1. Determine what output the connected device is using (0-20 mA or 4-20 mA). This information will be used to set the scale.
2. Determine what the 20 mA value is equal to (e.g, 100 psi).
3. Determine what the low end (0 or 4 mA) value is equal to (e.g., 10 psi). This information will be used to set the display range.
4. From the Settings Menu, select Sensor Setup.
5. Select Configure.
6. Update the options.
   a. Highlight an option and push **ENTER**.
   b. Make a selection or update the entries.
   c. Push **ENTER** to save the changes.

Option	Description
Edit name	Edits the module name
Edit units	Edits the measurement units
Edit parameter	Edits the parameter name
Display range **For the 0-20 mA scale:** • **Set the 20 mA value** • **Set the 0 mA value** **For the 4-20 mA scale:** • **Set the 20 mA value** • **Set the 4 mA value**	Sets the values used for the selected scale (0-20 mA or 4-20 mA)

Option	Description
Signal average	Sets how often signals are averaged. Higher values produce a smoother signal but increase the time it takes for a signal to respond to a change in the process value.
Set resolution— **X.XXX, XX.XX, XXX.X, XXXX**	Sets the number of decimal places used in the display.
Select scale— **4-20 mA or 0-20 mA**	Sets scale used for the 4-20 mA input
Data log interval—5 sec, 30 sec, 1 min, 2 min, 5 min, 10 min, 15 min, 30 min, 60 min	Sets how often data is logged to the internal controller memory.
Reset defaults—Push ENTER to reset configuration settings or push the BACK key to cancel.	Resets configuration settings to the default values.

For additional information, refer to the *sc200 4–20 Analog Input Module User Manual*.

6.3 Configure a 4-20 mA output module

The Network Setup option appears in the Settings Menu only if an analog output module or other network module such as Modbus or Profibus is installed in the controller.

Outputs for analog output modules are set at 4-20 mA. Outputs can be assigned to represent a measured parameter such as pH, temperature, flow or calculated values.

1. From the Settings menu, select Network Setup.
2. Select Edit Name and enter a name for the module. Push **ENTER** to save the name.
3. Select an output (A, B, C, D) and push **ENTER**.
   a. Highlight an option and push **ENTER**.
   b. Make a selection from the list or update the entries.
   c. Push **ENTER** to save the changes.

Option	Description
Select Source	Selects the output to configure—None, sensor 1 name, sensor 2 name, calculation (if set up). For sensor output, Select Parameter sets the measurement options. When the measurement is autorange, Set Range sets the range.
Set Low Value	Sets the 4 mA value (default: 0.000). (Range and units depend on sensor)
Set High Value	Sets the 20 mA value (default: 1.000). (Range and units depend on sensor)
Set Transfer	Sets the transfer value. Range 3.0 to 25.0 mA (default 4.000).
Set Filter	Sets a time-average filter value of 0 (default) to 120 seconds.

For additional information, refer to the *sc200 4-20 Output Module User Manual*.

6.4 Configure the controller analog outputs

The controller analog outputs can be assigned to represent the measured parameter or secondary measurements such as temperature and calculations. To configure the options, highlight a menu option, push **ENTER** and select an option or update the entries. Push **ENTER** after an option is selected or the entries are updated.

1. From the Settings menu, select sc200 Setup.
2. Select Output Setup.
3. Select Output 1 or Output 2.

4. Choose Select Source and select a source from the list. Typically the source is one of the sensors attached to the system. If an analog input card is installed, the analog input may be used as a source.
5. From the Output Setup menu, choose Select Parameter and choose an option from the list. Parameters will vary depending on the type of sensors installed.
6. From the Output Setup menu, select Set Function and choose a function. Further setup options will vary depending on which function is chosen.

Option	Description
Linear	Signal is linearly dependent on the process value
PID	Signal works as a PID (Proportional, Integral, Derivative) controller
Logarithmic	Signal is represented logarithmically within the process variable range
Bilinear	Signal is represented as two linear segments within the process variable range

7. From the Output Setup menu, select Activation. Use the information in the table below the chosen function to configure the options.
8. If Transfer is or will be selected as the Error Hold Mode, or if the Transfer will be used during calibration or other functions within the sensor menu, select Set Transfer from the Output Setup menu and enter the transfer value.
9. From the Output Setup menu, select Set Filter and enter the filter value.
10. From the Output Setup menu, select Scale and choose the scale (0-20 mA or 4-20 mA).

- **Linear**

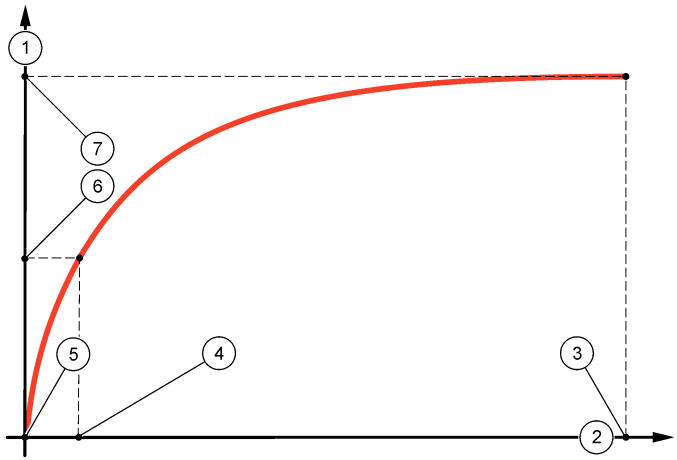
Option	Description
Set low value	Sets the low endpoint of the process variable range
Set high value	Sets the high endpoint of the process variable range

- **PID**

Option	Description
Set mode (Auto or Manual)	Auto—the signal is automatically controlled by the algorithm within the analyzer using proportional, integral, and derivative inputs. Manual—the signal is controlled by the user through manual adjustment of the % change value. This option is shown as Manual Output after the manual set mode is selected.
Phase (Direct or Reverse)	The direction in which the signal responds to process change. Direct—signal increases as the process increases. Reverse—signal increases as process decreases.
Set setpoint	Creates a desired control point of process
Prop band	A function of the difference between the measured signal and the desired setpoint.
Integral	The period of time from the injection point of a reagent to contact with the measuring device.
Derivative	Used to compensate for the 2nd order effects of the process. The majority of applications can be controlled without the use of the derivative setting.
Transit time	Stops all PID control for a selected period of time as the sample travels from the control pump to the measurement sensor.

- **Logarithmic**

Option	Description
Set 50% value	Sets the value corresponding to 50% of the process variable range.
Set high value	Sets the upper value of the process variable range.



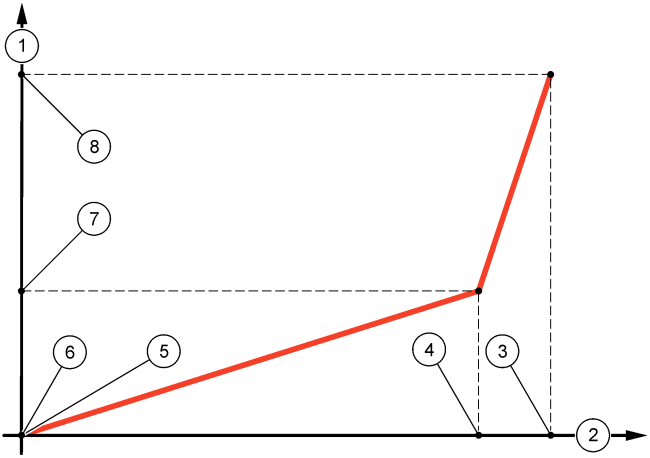
- **Bilinear**

Option	Description
Set low value	Sets the low endpoint value of the process variable range.
Set high value	Sets the high endpoint value of the process variable range.
Set knee point value	Sets the value at which the process variable range divides into another linear segment.
Set knee point current	Sets the value of the current at the knee point value.

6.4.1 Logarithmic output mode

Figure 15 shows in graph form the operation of the logarithmic output mode.

Figure 15 Logarithmic output



1 Output current axis	**5** Minimum output current (0-4 mA)
2 Source value axis	**6** 50% output current
3 High value	**7** Maximum output current (20 mA)
4 50% value	

6.4.2 Bilinear output mode

Figure 16 shows in graph form the operation of the bilinear output mode.

Figure 16 Bilinear output

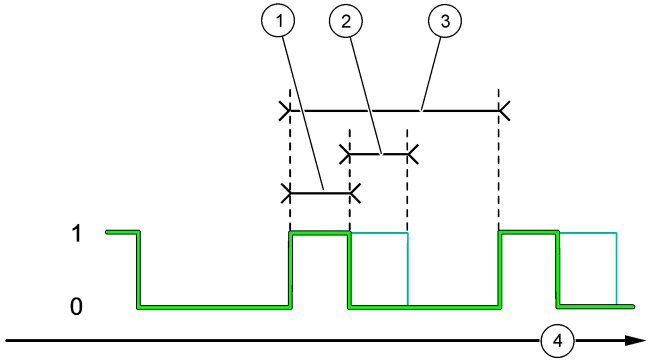
1 Output current axis	**5** Low value
2 Source value axis	**6** Minimum output current (0-4 mA)
3 High value	**7** Knee point current
4 Knee point value	**8** Maximum output current (20 mA)

6.5 Configure relays

The Normally Open (NO) and Common (COM) relay contacts will be connected when an alarm or other condition is active. The Normally Closed (NC) and Common relay contacts will be connected when an alarm or other condition is inactive (unless the Fail Safe is set to Yes), or when power is removed from the controller. To select a menu option, highlight the option and push **ENTER**.

1. From the sc200 Setup menu, select Relay Setup.
2. Select a relay from the list.
3. From the Relay Setup menu, choose Select Source and push **ENTER**. Normally, a source is one of the sensors attached to the system, but the controller can also function as a source. If an analog input module is installed, the source may be the analog input.
4. From the Relay Setup menu, select Set Parameter and choose from the list of parameters. The list of parameter options will vary with the type of attached sensor.
5. From the Relay Setup menu, select Set Function and choose from the list. Further setup will depend on the function chosen.

Option	Description
Scheduler Function (available if the controller is selected as the relay source)	Relay switches at certain times independently of any process value
Alarm Function	Relay activates when upper or lower alarm value is exceeded
Feeder Control Function	Relay indicates if a process value exceeds or falls below a setpoint
Event Control Function	Relay toggles if a process value reaches an upper or lower limit
Pulse Width Modulation (PWM) Control Function	Relay uses a Pulse Width Modulation control depending on a process value



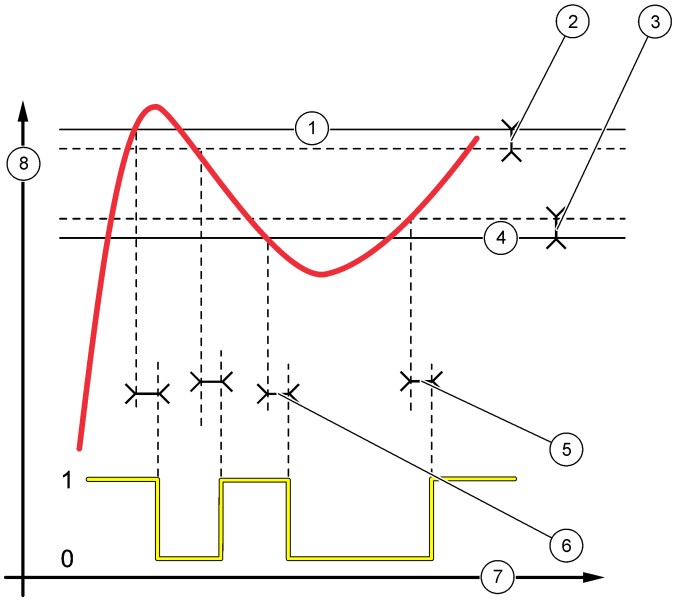
Option	Description
Frequency control	Relay switches with a frequency depending on a process value
Warning	Relay indicates warning and error conditions in probes

6. From the Relay Setup menu, select Set Transfer and choose Active or Inactive.
7. From the Relay Setup menu, select Fail Safe and choose Yes or No.
8. From the Relay Setup menu, select Activation.
   The activation options for the selected function appear. Use the information in the table below each function to update the options.
9. Test the relay function to make sure it is properly energizing the connected device. To do relay testing, go to the Setting menu, then select **Test/Maint>Test Relay**.

- **Scheduler Function (refer to Figure 17)**

Option	Description
Hold outputs	Holds outputs in the present ON or OFF state
Run days	Sets the weekday(s) that the relay operates. Options: Sunday, Monday, Tuesday., Wednesday, Thursday, Friday, Saturday
Start time	Sets the start time.
Interval	Sets the time between activation cycles (Default value: 5 min).
Duration	Sets the period of time the relay is energized (Default value: 30 sec).
Off delay	Sets the time for additional hold/output time after the relay has been turned off.

Figure 17 Scheduler function



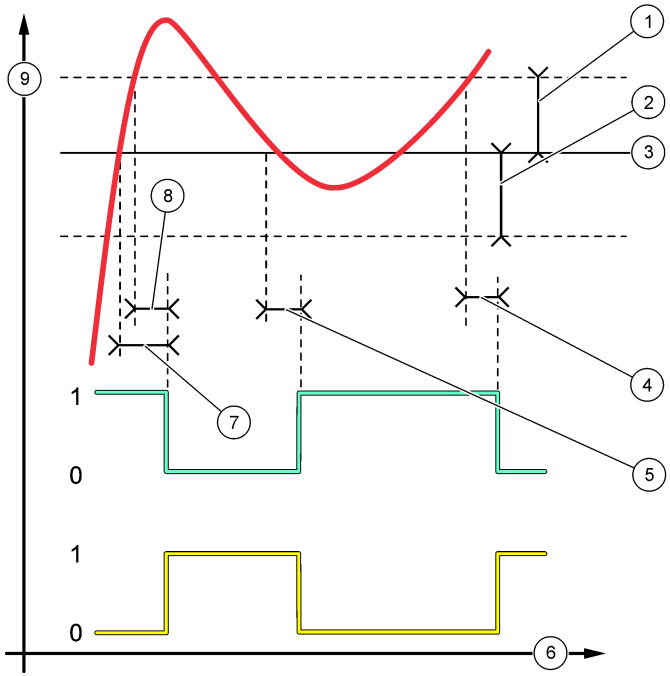
1 Duration	**3** Interval
2 OFF delay	**4** Time (x-axis)

- **Alarm Function (refer to Figure 18)**

Option	Description
Low alarm	Sets the value where the relay will turn on in response to decreasing measured value. For example, if the low alarm is set for 1.0 and the measured value drops to 0.9, the relay activates.
High alarm	Sets the value where the relay will turn on in response to increasing measured value. For example, if the high alarm is set for 1.0 and the measured value increases to 1.1, the relay activates.

Option	Description
Low deadband	Sets the range where the relay remains on after the measured value increases above the low alarm value. For example, if the low alarm is set for 1.0 and the low deadband is set for 0.5, the relay remains on between 1.0 and 1.5. Default is 5% of the range.
High deadband	Sets the range where the relay remains on after the measured value decreases below the high alarm value. For example, if the high alarm is set for 4.0 and the high deadband is set for 0.5, the relay remains on between 3.5 and 4.0. Default is 5% of the range.
Off delay	Sets a time (0-300 seconds) to delay the relay from normally turning off (Default: 0 seconds).
On delay	Sets a delay time for the relay to turn on (Default: 0 seconds).

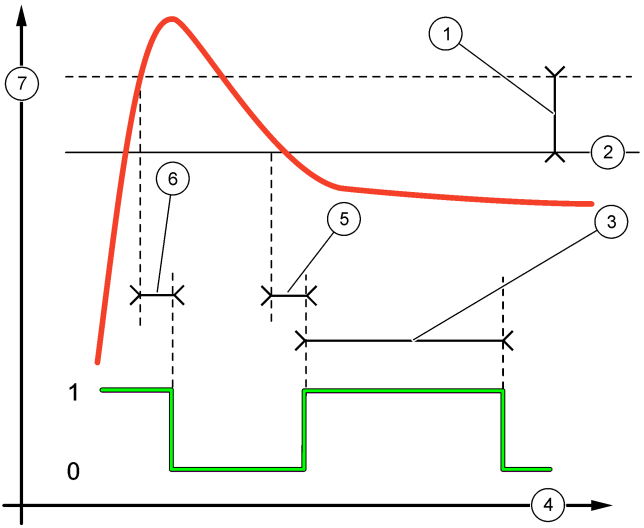
Figure 18 Alarm function



1 High alarm	**5** ON delay
2 High deadband	**6** OFF delay
3 Low deadband	**7** Time (x-axis)
4 Low alarm	**8** Source (y-axis)

- **Feeder Control Function (refer to Figure 19 and Figure 20)**

Option	Description
Phase	Defines the relay status if the process value exceeds the setpoint. High (default)—turns the relay on when the process value exceeds the setpoint. Low—turns the relay on when the process value falls below the setpoint.
Set setpoint	Sets the process value at which the relay toggles. The default value is different for each sensor.
Deadband	Sets the area for an amount of change necessary after the relay setpoint is reached in order to satisfy a condition.

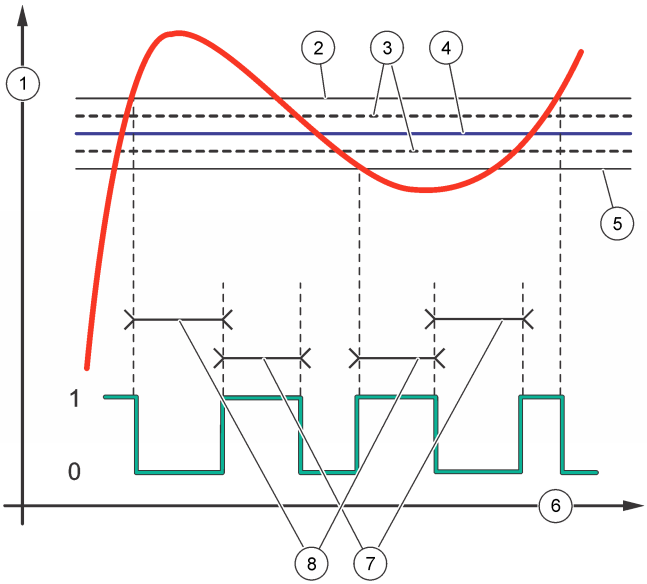


Option	Description
Overfeed timer	Sets a time period for de-activating an active relay if the process setpoint cannot be reached. Once an overfeed alarm is present, it must be manually reset.
Off delay	Sets a delay time for the relay to turn off (default: 0 seconds).
On delay	Sets a delay time for the relay to turn on (default: 0 seconds).

Figure 19 Feeder control function

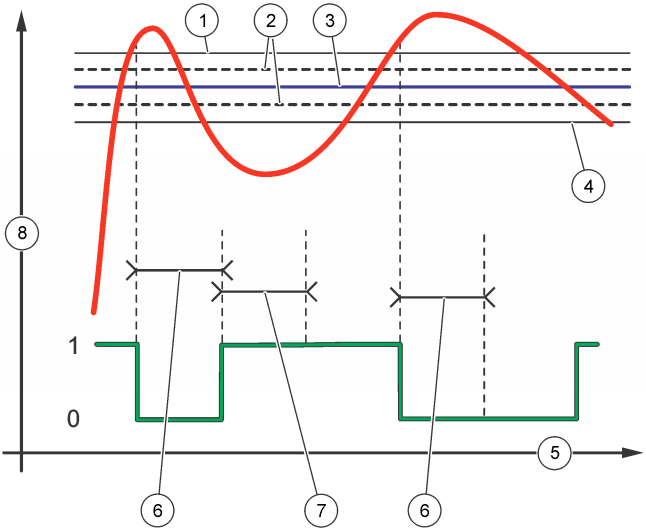
1 Deadband (Phase = Low)	**6** Time (x-axis)
2 Deadband (Phase = High)	**7** ON delay (phase set high)
3 Setpoint	**8** OFF delay (phase set low)
4 OFF delay (phase set high)	**9** Source (y-axis)
5 ON delay (phase set low)	

Figure 20 Feeder control function (Phase low, Overfeed timer)



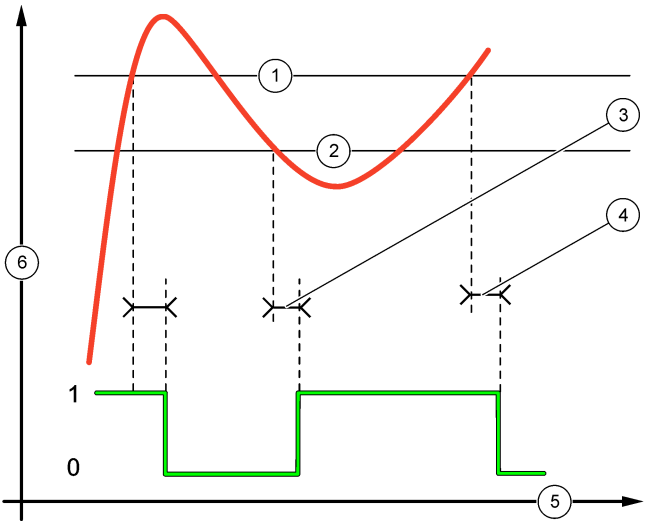
1 Deadband	**5** ON delay
2 Setpoint	**6** OFF delay
3 Overfeed timer	**7** Source (y-axis)
4 Time (x-axis)	

- **Event Control Function (refer to Figure 21, Figure 22 and Figure 23)**



Option	Description
Set setpoint	Sets the value where the relay will turn on.
Deadband	Sets a hysteresis so the relay will not swing unregulated when the process value converges to the setpoint.
OnMax timer	Sets the maximum time the relay can stay on independent from the measured value (default: + 0 min).
OffMax timer	Sets the maximum time the relay can stay off independent from the measured value (default: + 0 min).
OnMin timer	Sets the minimum time the relay can stay on independent from the measured value (default: + 0 min).
OffMin timer	Sets the minimum time the relay can stay off independent from the measured value (default: + 0 min).

Figure 21 Event control function (no delay)

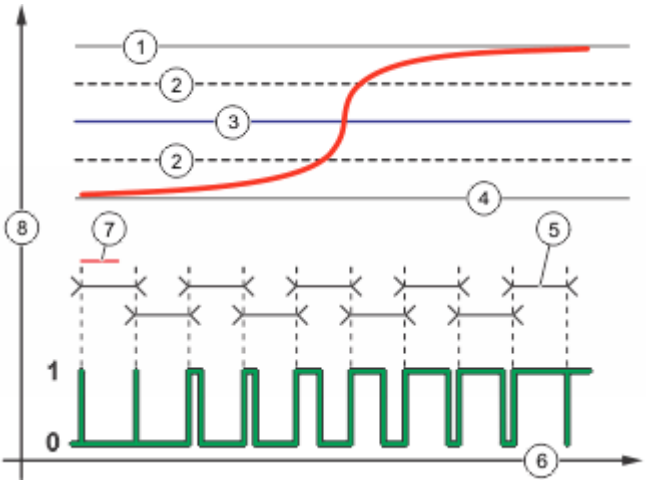


1 Source (y-axis)	**5** Low alarm
2 High alarm	**6** Time (x-axis)
3 Deadband	**7** OnMax-time
4 Setpoint	**8** OffMax-time

Figure 22 Event control function (OnMin timer, OffMin timer)

1 High alarm	**5** Time (x-axis)
2 Deadband	**6** OffMin timer
3 Setpoint	**7** OnMin timer
4 Low alarm	**8** Source (y-axis)

Figure 23 Event control function (ON/OFF delay)

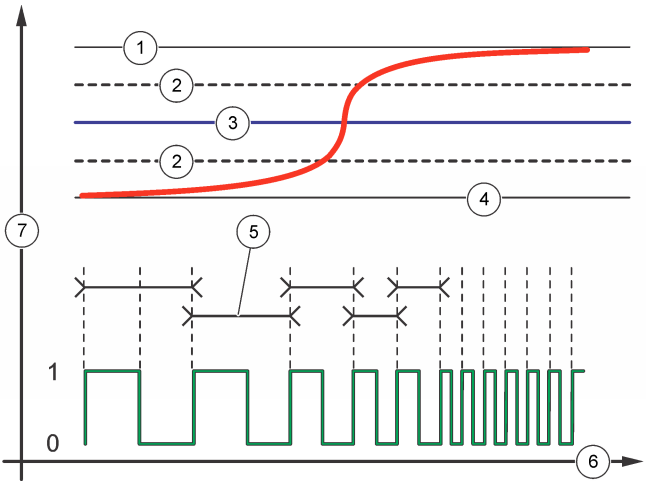


1 High alarm	**4** OFF delay
2 Low alarm	**5** Time (x-axis)
3 ON delay	**6** Source (y-axis)

- **Pulse Width Modulation Control Function (refer to Figure 24)**

Option	Description
Set mode	Auto—the relay output works as a PID controller. Manual—the signal is controlled by the user through manual adjustment of the % change value. This option is shown as Manual Output after the manual set mode is selected.
Phase	Reverses the leading sign of the control deviation for the PID controller (default: Reverse). The phase selects whether the relay will operate at the first part of a cycle (direct phase) or the second part (reverse phase).
Set setpoint	Creates a setpoint value.
Dead zone	The range above and below the setpoint. In this set range, the PID controller does not take action to change the Pulse Width Modulation On/Off Ratio output signal until the limits of the dead zone are reached.
Period	Sets the cycle duration of the PWM output signal (default: 5 seconds).
Min width	Sets the minimum PWM ratio (default: 1.0 second).
Max width	Sets the maximum PWM ratio (default: 4.0 seconds).
Prop band	Sets the proportional part of the PID controller. The proportional part of the controller supplies an output signal which is linearly dependent to the control deviation. The proportional part reacts on any changes at the input but starts to oscillate easily if the value is set high. The proportional part cannot completely compensate for disturbances.
Integral	Sets the integral part of the PID controller (default: 000 minutes). The integration part of the controller supplies an output signal. The output signal increases linearly if the control deviation is constant. The integration part responds slower than the proportional part and can completely compensate disturbances. The higher the integration part, the slower it responds. If the integration part is set too low, it starts to oscillate.

Figure 24 Pulse Width Modulation function (linear mode)



1 High alarm	**5** Period
2 Deadband	**6** Time (x-axis)
3 Setpoint	**7** Phase
4 Low alarm	**8** Selected source (y-axis)

- **Frequency Control Function (refer to Figure 25)**

Option	Description
Set mode	Auto—The relay works as a PID controller. Manual—the signal is controlled by the user through manual adjustment of the % change value. This option is shown as Manual Output after the manual set mode is selected.
Phase	Reverses the leading sign of the control deviation for the PID controller (default: Reverse). The phase selects whether the relay will operate at the first part of a cycle (direct phase) or the second part (reverse phase).
Set setpoint	Sets the process value which is controlled by the PID controller.
Dead zone	In this set range, the PID controller does not take action to change the output frequency until within the limits of the dead zone.
Pulse width	Sets the cycle duration (0-600 seconds) of the PWM output signal. (default: 0.5 seconds) The cycle duration is equal to the duty cycle of the output signal.
Minimum pulses	Sets the minimum number of pulses per minute at which the relay can operate. Range: 0.001–4.000 (default: 1.000)
Maximum pulses	Sets the maximum number of pulses per minute at which the relay can operate. Range: 0.001–60.000 (default: 04.000). This value cannot be set lower than Minimum Pulses value.
Prop band	Sets the proportional part of the PID controller. The proportional part of the controller supplies an output signal which is linearly dependent to the control deviation. The proportional part reacts on any changes at the input but starts to oscillate easily if the value is set high. The proportional part cannot fully compensate for disturbances.
Integral	Sets the derivative part of the PID controller (default: 000 minutes). The integration part of the controller generates an output signal. The output signal increases linearly if the control deviation is constant. The integration part responds slower than the proportional part and can fully compensate disturbances. The higher the integration part, the slower it responds. If the integration part is set too low, it starts to oscillate.

Figure 25 Frequency control function

1 High limit	**5** Cycle duration
2 Deadband	**6** Time (x-axis)
3 Setpoint	**7** Selected source (y-axis)
4 Low limit	

- **Warning Function**

Option	Description
Warning	Sets the level for warning activation. Refer to the sensor manual for the numbers for individual warning messages.

6.6 Display setup

Configures the controller display.

1. From the Settings menu, select sc200 Setup and push **ENTER**.
2. Select Display Setup and push **ENTER**.

Option	Description
Adjust Order	View and modify the measurement display order. • **See Current Order**—View the current display order • **Add Measurements**—Add selected measurements to the display • **Remove Measurements**—Remove selected measurements from the display • **Reorder List**—Select one or more measurements and change their order in the display • **See Default Order**—View the default display order • **Set to Default**—Set the display order to the default configuration ***Note:*** *Some of the above will not be available if no adjustment is possible for that option (e.g.* ***Reorder List*** *and* ***Remove Measurements*** *will not be available if only one measurement is selected for display).*
Display Contrast	Adjust the contrast to a value between the minimum of +1 and the maximum of +9
Edit Name	Assigns a name to the controller

6.7 Update the date and time

1. From the Settings menu, select sc200 Setup and push **ENTER**.
2. Select Set Date/Time and push **ENTER**.
3. Select Date Format from the Set Date/Time screen and push **ENTER**.
4. Select a format and push **ENTER**.
5. Select Date/Time from the Set Date/Time screen and push **ENTER**.
6. Update the entries.
   a. Use the right and left arrow keys to highlight a field.
   b. Use the up and down arrow keys to change the values in the field and push **ENTER**.
   c. At the end of the date field, push the right arrow to wrap down to the time fields.
   d. Use the up and down and arrow keys to update the time fields.
7. Push **ENTER** to save the changes.
   The controller returns to the Set Date/Time menu.

6.8 Set the datalog mode and interval

Datalog Setup is available if a calculation has been set up.

1. From the Settings menu, select sc200 Setup and push **ENTER**.
2. Select Datalog Setup and push **ENTER**.
3. Select Set Mode and push **ENTER**.
4. Select an option (Snap Shot, Average, Maximum, Minimum) and push **ENTER**.
5. From the Datalog Setup menu, select Set Interval and push **ENTER**.
6. Select an interval from the list and push **ENTER**.

6.9 Set up a calculation

1. From the Settings menu, select sc200 Setup and push **ENTER**.
2. Select Calculation and push **ENTER**. Select a menu option and choose from the displayed list or update the entry. Refer to the table below for more information about each option.

Option	Description
Set variable X	Selects the sensor for the x variable
Set parameter X	Selects the sensor measurement for the x variable
Set variable Y	Selects the sensor for the y variable
Set parameter Y	Selects the sensor measurement for the y variable
Set formula	Select the math function to implement: • **None**—Disables the math function • **X-Y**—Subtraction function • **X+Y**—Addition function • **X/Y**—Division function • **[X/Y]%**—Percentage function • **[X+Y]/2**—Average function • **[X*Y]**—Multiplication function • **[X-Y]%/X**—Difference function
Display format	Selects the number of digits and decimal points

Option	Description
Set units	Selects the units for the calculated reading
Set parameter	Selects the parameter for the calculated reading

3. Push **ENTER** to save the selection or setting and return to the Calculation menu.

6.10 Set up the discrete inputs

Use these inputs to switch closure inputs or logic level voltage inputs.

1. Press the **MENU** key.
2. Select sc200 Setup and push **ENTER**.
3. Select Discrete Input Setup and push **ENTER**.
4. Select the desired channel (Input 1, Input 2 or Input 3) and push **ENTER**.
5. Select a control logic option and push **ENTER**.

Option	Description
Disable	This channel is disabled and not used.
On/High	This channel is active when either the switch input is On (or closed), or the logic level voltage input is at a High level.
Off/Low	This channel is active when either the switch input is Off (or opened), or the logic level voltage input is at a Low level.

6. Select a warning option and push **ENTER**.

Option	Description
Off	An active discrete input does not trigger a device warning.
On	An active discrete input triggers a device warning.

7. Select an output mode option and push **ENTER**.

Option	Description
Active	Output level continues to represent operating conditions.
Hold	Output level is held static.
Transfer	Output level moves to a pre-configured value.

8. Select the sensors that will have their outputs (analog and relay) affected when one of the discrete inputs becomes active. Push **ENTER**.
9. Use the arrows to select the On Delay value (the duration time delay between the discrete input activation and the configured response of the controller). Push **ENTER**.
10. Use the arrows to select the Off Delay value (the duration time delay between the discrete input de-activation and the configured response of the controller). Push **ENTER**.
11. Repeat steps 4–10 for each desired channel.
12. If a discrete input needs to be changed after initially set up:
    a. Repeat steps 1–4 and an Input Settings menu appears with the following options:
       - Control Logic
       - Set Warning
       - Output Mode
       - On Delay
       - Off Delay
    b. Select the desired option and push **ENTER**.

c. Make the desired changes and push **ENTER** to save the changes and return to the Inputs Setting menu.

6.11 Update the display language

The display language can be changed through the Setup menu.

1. From the Settings Menu, select sc200 Setup and push **ENTER**.
2. Select Language and push **ENTER**.
   The list of language options appears. English is the default language for the controller.
3. Highlight the language to be used for the controller and push **ENTER**.
   The selected language is saved and is used for the controller display. The display returns to the sc200 Setup menu.

6.12 Using the secure digital memory (SD) card

An SD card must be installed in the controller.

- The SD card can be used to update software and firmware and to download event and data logs. If the SD card is installed while the controller is in the Settings Menu, push the **HOME** key and then the **MENU** key to verify the option is visible. The SD icon will also be visible in the upper status bar of the main measurement screen when a card is installed.
- Data log files on the SD card are available in XML and binary formats.
- DataCom is used to convert files from binary to CSV format. Refer to the DataCom manual for more information on how to use the application. For a copy of the DataCom manual, software updates or other downloadable resources, go to http://www.de.hach.com or http://www.hach.com. Search *DataCom* or go to any sc200 product page.

6.12.1 Updating software

Notes:

- The controller does not automatically transfer information to or from an SD card.
- When the SD card is put in multiple controllers, each controller has a separate set of folders in the SD card memory. To make sure software updates are in the correct folder for the controller in use, it is best to use a separate dedicated SD card for each controller.

1. From the Settings Menu, select SD Card Setup and push the **ENTER** key.
2. Select Upgrade Software and push the **ENTER** key.

   Note: *If the Upgrade Software option does not appear, do the steps in* Firmware updates with SD cards on page 44.
3. Select a device from the list and push the **ENTER** key. The list of options includes the controller and all connected devices that have software placed in the appropriate folder on the SD card.
4. If more than one version of the upgrade software is available, select the version with the highest number and push the **ENTER** key.
5. Push the **ENTER** key to begin the software transfer.
   The display will show "Transferring files. Please wait..." The percentage of completion appears in the bottom left corner of the display. The upgrade cannot be halted once it has begun.

   - When the transfer is successful, the display will show "Transfer complete" along with a prompt to push **ENTER** to restart the controller or to push the **BACK** key and exit to the SD Card Setup menu. Controller updates take effect when the controller is restarted. A restart is not necessary for sensor updates.
   - If the transfer is unsuccessful, the display will show "Transfer failed" and an error message. Press the **ENTER** key to acknowledge the warning and exit out of the menu. Error messages are different for each sensor. Refer to the applicable sensor manual.

6.12.2 Saving data and event logs with SD cards

Notes:

- Data and event logs can be downloaded to an SD card and viewed with any device capable of reading an SD card.
- Data logs store the measurement data at selected intervals in a packed binary format (.flg file).
- Event logs store a variety of events that occur on the devices such as configuration changes, alarms and warning conditions. Event logs are set up during the sensor or module configuration process. Event logs are stored in a CSV format.

1. From the Settings Menu, select SD Card Setup and push the **ENTER** key.
2. Select Save Logs and push the **ENTER** key.
3. If more than one device appears on the screen, all devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Select the devices from which logs will be saved and push the **ENTER** key.
4. Select the time period from which logs are to be saved.

Option	Description
Last Day	All logs from the last full 24 hours, starting from 12:00 a.m., and any additional time remaining on the current day
Last Week	All logs from the last full week (7 days) starting from 12:00 a.m., and any additional time remaining on the current day
Last Month	All logs from the last full month (30 days) starting from 12:00 a.m., and any additional time remaining on the current day
All	Save all logs in memory
New	All logs that are new since the last time logs were saved to the SD card

5. Push the **ENTER** key to confirm the choice, and push the **ENTER** key again to begin the file transfers.
6. Allow time for the files to transfer. The display will show Transferring files. Please wait... and the percentage of files transferred.
   If the transfer is successful, the display will show "Transfer complete." If the transfer is not successful, the display will show "Transfer failed."
7. Do one of the following:
   a. Push the **ENTER** key to exit back to the SD Card Setup menu.
   b. Push the **HOME** key to return to the measurement screen.
   c. Push the **BACK** keys to return to the Settings Menu.

6.12.3 Access data and event log files on the SD card

A PC with an SD Card reader device or USB adapter is necessary to view the event and data logs kept on the SD Card. Excel 2003 or higher (for XML files) or the Data Com application (for binary flg files) is necessary to open the event and data logs.
Data logs have the following structure: Device Name, Device Serial Number, Device Identification, Data Log, Time Stamp.

Event logs have the following structure: Device Name, Device Serial Number, Device Identification, Event Log, Time Stamp.

To view data or event log files stored on the SD card:

1. Attach the card reader device to the PC (if necessary) and install the SD card that contains the files in the reader device.
2. In the SD card directory, open the HACH folder.
3. Select the Logs folder.
4. Select a device folder.

The event and data log files in the folder are shown.

5. To view XML data log files:
   a. Make sure the HachDatalog.xsl style sheet exists in the device folder.
   b. Open the Excel application.
   c. Go to File, Open.
   d. Select the data log file.
   e. In the Import XML dialog box, select **Open the file with the following style sheet applied** and select **HachDatalog.xml**.
   f. Click OK to view the data.
6. To view binary data log (.flg) files:
   a. Make sure the device driver (.flg.drv) file exists in the device folder.
   b. Open Data Com.
   c. In the File Viewer section, click Open.
   d. Select the data log file.
      The data log file is shown in the box and a comma separated values (csv) file with the same file name is created. This csv file can be opened in Excel.

6.12.4 Firmware updates with SD cards

The latest firmware updates can be placed on an SD card. The SD card can then be used to update the controller or device firmware.

A PC and a USB card reader or other device capable of reading an SD card are necessary.

1. Find the zip file at http://www.hach.com and copy it to the PC.
2. Extract file(s) from the zip folder and save them to the SD card.
3. Remove the SD card and update the controller and device firmware. Refer to Updating software on page 42.

6.12.5 Backup settings to an SD card

Saves the configuration of a device to the SD card.

1. Push the **MENU** key.
2. Select SD Card Setup and push **ENTER**.
3. Select Manage Configuration and push **ENTER**.
4. Select Backup Settings and push **ENTER**.
5. Select the devices to be backed up. All devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Push **ENTER** to begin the file transfers. If backup files already exist on the SD card, a confirmation window appears. Select the devices again and push **ENTER**. Wait for the "Transfer complete" message.
6. Push **ENTER** again to return to the Manage Configuration menu.

6.12.6 Restore settings to the controller

This menu selection only appears if a (serial number-specific) backup file for the controller or one of the sensors connected to it exists on the SD Card. This menu selection loads the configuration of a specific device from the SD card to the same device (serial number-controlled function).

1. Push the **MENU** key.
2. Select SD Card Setup and push **ENTER**.
3. Select Manage Configuration and push **ENTER**.
4. Select Restore Settings and push **ENTER**.
5. Select the device that will be restored. All devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Push **ENTER** to begin the file transfers.

6. When the transfer is complete, push **ENTER**.
7. To have the settings take effect immediately, restart the controller. Push the **BACK** key to exit the Manage Configuration menu.

6.12.7 Transfer settings to another device

All device settings including calibration, sensor name, selected temperature and measurement units and data logging settings are transferred.

1. Push the **MENU** key.
2. Select SD Card Setup and push **ENTER**.
3. Select Manage Configuration and push **ENTER**.
4. Select Transfer Settings and push **ENTER**. Two options appear:
   - Retrieve Settings
   - Copy Settings
5. To retrieve settings from the controller (or a device connected to it) and put the settings on the SD card:
   a. Select Retrieve Settings and push **ENTER**.
   b. Select the devices that contain the information to be transferred. All devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Push **ENTER** to begin the file transfers. Wait for the "Transfer complete" message.
   c. If files already exist on the SD card, a confirmation window appears. Select the devices again and push **ENTER**. Wait for the "Transfer complete" message.
   d. Push **ENTER** to return to the Manage Configuration menu.
6. To copy settings from the SD card to a controller (or a device connected to it):
   a. Select Transfer Settings and push **ENTER**.
   b. Select Copy Settings and push **ENTER**.
   c. Select the devices on the SD card. All devices are selected by default. To deselect an item, highlight the selection and push the left arrow key. Push **ENTER** to begin the file transfers.
7. When the transfer is complete, push **ENTER** to restart the connected devices.
8. Push **ENTER** to restart the controller or push **BACK** to return to the Manage Configuration menu.

6.13 Using the service port

The service port is used to download data files from the controller and install new versions of controller and sensor firmware. To download data and update software, use the service port in combination with DataCom and a service cable (LZX887).

6.14 Using DataCom

When using the service port, it is necessary to use DataCom. DataCom is a PC Application Utility that downloads data log and event log files from the controller and installed sensors. Files are downloaded from the controller through the controller service port or they can be placed on a Secure Digital Memory (SD) card installed in the controller. In addition, DataCom is used to upload software for the controller and sensors. The DataCom application must be installed on a PC to read the files.

Refer to the DataCom manual for more information on how to use the application. The DataCom manual, software updates and other downloadable resources are available at http://www.de.hach.com or http://www.hach.com on any sc200 product page.

Section 7 Maintenance

⚠ DANGER

Multiple hazards. Only qualified personnel must conduct the tasks described in this section of the document.

7.1 Cleaning the controller

⚠ DANGER

Electrocution hazard. Remove power from the instrument before doing maintenance or service activities.

Note: *Never use flammable or corrosive solvents to clean any part of the controller. Use of these solvents may degrade the environmental protection of the unit and may void the warranty.*

1. Make sure the controller cover is securely closed.
2. Wipe the controller exterior with a cloth dampened with water, or with a mixture of water and mild detergent.

7.2 Fuse replacement

Fuses are not user-serviceable items. The need for fuse replacement in controllers indicates severe technical failure and is therefore considered to be a service activity. If a blown fuse is suspected, contact Technical Support.

7.3 Battery replacement

The lithium ion backup battery is not user replaceable. Contact technical support for replacement.

Section 8 Troubleshooting

Problem	Resolution
No current output	Verify current output configuration.
	Test current output signal using the Test/Maintenance submenu. Input a current value and verify the output signal at the controller connections.
	Contact Technical Support.
Incorrect current output	Verify current output configuration.
	Test current output signal using the Test/Maintenance submenu. Input a current value and verify the output signal at the controller connections. If the output is incorrect, perform an output calibration.

Problem	Resolution
No relay activation	Make sure relay connections are secure.
	If using an external power source, make sure the relay wiring is correct.
	Make sure the relay configuration is correct.
	Test the relay activation through the Test/Maintenance menu. The relay should energize and de-energize as selected.
	Make sure the controller is not in calibration mode and that the relay is not being held.
	Reset the Overfeed Timer to make sure the timer has not expired.
Secure Digital Memory (SD) card not recognized by the controller	Make sure the SD card is properly oriented. The copper traces should face toward the controller display.
	Make sure the SD card is fully seated in the slot and the spring lock is engaged.
	Make sure the SD card is properly formatted with a Fat 32 format. The MMC format is not supported. Follow the instructions of the card manufacturer to format the SD card on a PC.
	Make sure the card is not larger than 32 GB.
	Make sure an SD card is being used. Other types of cards (such as xSD, micro SD, mini SD) will not work properly.
Information not saving, or not saving properly to the SD card.	Make sure the SD card is properly formatted with the FAT 32 format. The MMC format is not supported. Follow the instructions of the card manufacturer to format the SD card on a PC.
	If the SD card has previously been in use, format the card with the Fat 32 format, install the card in the controller, and try downloading files.
	Try a different SD card.
SD card full	Read the SD card with a PC or other card reader device. Save important files and then delete some or all of the files on the SD card.
Controller cannot find software updates on the SD card.	Make sure an appropriate folder is created by installing the SD card in the controller. An update folder will automatically be created.
	Install the SD card on a PC and make sure the software files are located in the appropriate update folder.
	If the same SD card is used with multiple controllers, each controller will have a separate folder on the system. Make sure the software updates are in the folder dedicated to the controller in use.
Display is lit but shows no characters or characters are faint or blurry.	Adjust the display contrast
	Make sure protective film has been removed from display.
	Clean the outside of the controller, including the display screen.

Problem	Resolution
Controller will not power up, or powers up intermittently	Make sure the AC power connections are properly terminated in the controller.
	Make sure the power strip, line power, wall plug are all properly plugged in.
	Contact Technical Support
Network or sensor module not recognized	Make sure the module is properly installed.
	Make sure the module selector switch is set to the proper number.
	Remove sensor module and install the module into the second analog slot. Apply power to the controller and allow the controller to perform a device scan.
	Contact Technical Support.
Sensor not recognized ***Note:*** *Example of possible display message: *****	If the sensor is an analog sensor and a corresponding module is installed in the controller, refer to the instructions supplied with the Network or Sensor Module.
	Make sure the digital connector wiring harness is seated on the inside of the door assembly and that the wiring harness is not damaged.
	If the digital sensor is connected to the controller with a digital termination box, user supplied junction box, digital extension cables, or a user-supplied extension cable, connect the sensor directly to the controller and perform a device scan. If the controller recognizes the sensor, check that all the wiring in the junction boxes or extension cables is correct.
	Make sure that only two sensors are installed in the controller. Although two analog module ports are available, if a digital sensor and two analog modules are installed, only two of the three devices will be seen by the controller.
	Contact Technical Support
Device Missing error message appears	Perform a Device Scan from the Test/Maintenance menu.
	Power cycle the controller

8.1 Test and Maintenance menu

1. From the Settings Menu, select Test/Maint and push **ENTER**.

Option	Description
Scan devices	Performs a scan for active and missing devices.
Output cal • **Output 1** • **Output 2**	Lets the user calibrate the 4–20 mA outputs with a 250 ohm resistor in series to the mA output terminals. The settings for each output are adjusted until the correct value (4 mA or 20 mA) is supplied. Calibrate 4 mA output (Min: 0 Max: 25000) Calibrate 20 mA output (Min: 35000 Max: 65533)
Hold outputs	Sets the value the controller sends to an external system for a defined period of time. After the time period, the instrument goes back to reporting real time values. Set activation—Launch or release Set Outmode—Hold Outputs (default) or Transfer Outputs Set Channels—All (default) or select from hardware list

Option	Description
Test output • **Output 1** • **Output 2**	Lets the user select a mA value that is sent by the controller for verification. Min: 0 mA (default +04.00) Max: 25.00 mA
Status	View status of all modules, sensors and relays.
Test relay—A, B, C, D	Energize or De-energize the selected relay
Overfeed reset	Resets the Overfeed Timer.
Reset default config	Resets the controller configuration settings to the default values (language, date and time, relay function and data output function).
Restart sc200	Performs a controller restart
Simulation (only displays if sensors or modules are connected)	After the sim value is entered, the controller outputs this value as if it was the value sent from the sensor. The simulation stops after the user exits the screen. Source- • <Module 1> • <Module 2> (Footer displays current source selection) Parameter—Source measurement type (footer displays current source selection) Sim value—Use arrow keys to change value (footer displays current source selection)
Modbus stats	Displays Error and Good count stats for selected port. • Sensor port 1, 2, 3 or 4 • Network port • Service port • Clear stats
System data	Displays the current system current, temperature and voltage data.

8.2 Warning and error conditions

Follow the steps below to acknowledge controller warnings.

1. From the Settings menu, select Diagnostics and push **ENTER**.
2. Select the device (controller, sensor, network card) with the warning or error and push **ENTER**.
3. Select the warning, error or event list and push **ENTER**.
4. Select Yes and push **ENTER** to acknowledge the warning.
   Note: *Errors cannot be acknowledged.*
5. For more information on a specific warning, error or event, refer to the device manual.

Section 9 Device scan information

Display message	Action
Installing device...please wait	The controller has found a new device. No action is necessary. The controller automatically performs an installation process for the new device and displays the main measurement screen of the device installed in the number one position.
Device missing <device id>	A previously installed device has been removed from the controller or is not detected. • Push the **Enter** key to continue. • Push the left arrow key to select or de-select a missing device. • Push the **Enter** key to delete the missing device. The controller will display the main measurement screen for the device in the number one position. ***Note:*** *This message also displays when a device is missing and a new device has been installed. After the missing device is deleted, the controller automatically installs the new device and displays Installing device...please wait. The controller then displays the main measurement screen for the device installed in the number one position.*

Section 10 Replacement parts and accessories

Note: *Product and Article numbers may vary for some selling regions. Contact the appropriate distributor or refer to the company website for contact information.*

Description	Item number
4 GB Secure Digital Memory (SD) card	9218100
Connector kit for digital sensor	9201000
Controller installation kit	8806200
DataCom cable	LZX887
Mounting bracket inserts	9177900
Plug, conduit opening (set of 3)	5868700
Power cord kit, with strain relief, 125 VAC, U.S.-style plug	9202900
Power cord kit, with strain relief, 230 VAC, European-style plug	9203000
Screw driver	6134300
SD card reader	9218200
SD card cover kit for sc200 controller	9200900
Screws for controller installation kit	9177800
Cord grip kit (1)	9178000
Sealing washer for cord grip assembly	1033814
UV protection screen	8809200
Weather and sun shield w/ UV protection screen	9220600
Sensor and communication modules	
Conductivity module	9013000

Description	Item number
Flow module	9012700
4-20 mA input module	9012800
pH and DO module	9012900
4-20 mA output module	9334600
HART network module kit	9328100
Modbus network module	9013200
Profibus network module	9173900
Profibus M12 connector kit	9178500
Profibus M12 socket (hard wire to quick connector adapter)	9178200
Profibus M12 T-splitter	9178400

This document is the original instructions.

1 Preliminary note

This document is part of the device and contains information about the correct handling of the product.

This document is intended for specialists. These specialists are people who are qualified by their training and their experience to see risks and to avoid possible hazards that may be caused during operation or maintenance of the device.

Read this document before use to familiarise yourself with operating conditions, installation and operation. Keep this document during the entire duration of use of the device.

Adhere to the warning notes and safety instructions.

1.1 Symbols used

▶ Instruction

> Reaction, result

[…] Designation of pushbuttons, buttons or indications

→ Cross-reference

Important note
Non-compliance can result in malfunction or interference.

Information
Supplementary note.

1.2 Warning signs used

⚠ WARNING

Warning of serious personal injury.
Death or serious irreversible injuries may result.

⚠ CAUTION

Warning of personal injury.
Slight reversible injuries may result.

NOTE

Warning of damage to property.

2 Safety instructions

2.1 General

Follow the operating instructions. Non-observance of the instructions, operation which is not in accordance with use as prescribed below, wrong installation or incorrect handling can affect the safety of operators and machinery.

The installation and connection must comply with the applicable national and international standards. Responsibility lies with the person installing the device.

2.2 Target group

The device must only be installed, connected and put into operation by a qualified electrician.

2.3 Electrical connection

Disconnect the unit externally before handling it. Also disconnect any independently supplied relay load circuits.

Make sure that the external voltage is generated and supplied according to the requirements for safe extra-low voltage (SELV) since this voltage is supplied without further measures near the operating elements and at the terminals for the supply of connected sensors.

The wiring of all signals in connection with the SELV circuit of the device must also comply with the SELV criteria (safety extra-low voltage, safe electrical isolation from other electric circuits).

If the externally supplied or internally generated SELV voltage is externally grounded, the responsibility lies with the user in accordance with the applicable national installation regulations. All statements in this manual refer to the unit the SELV voltage of which is not grounded.

It is not allowed to supply external voltage to the terminals for the pulse pick-up supply. The consumption of current which exceeds the value given in the technical data is not allowed.

An external main switch must be installed for the unit which can switch off the unit and all related circuits. This main switch must be clearly assigned to the unit.

2.4 Operation

Be careful when handling the unit once power is applied. This is only allowed by qualified personnel due to the protection rating IP 20.

The design of the unit corresponds to the protection class II except for the terminal blocks. Protection against accidental contact (finger protection to IP 20) for qualified personnel is only guaranteed if the terminal screw has been completely screwed in.

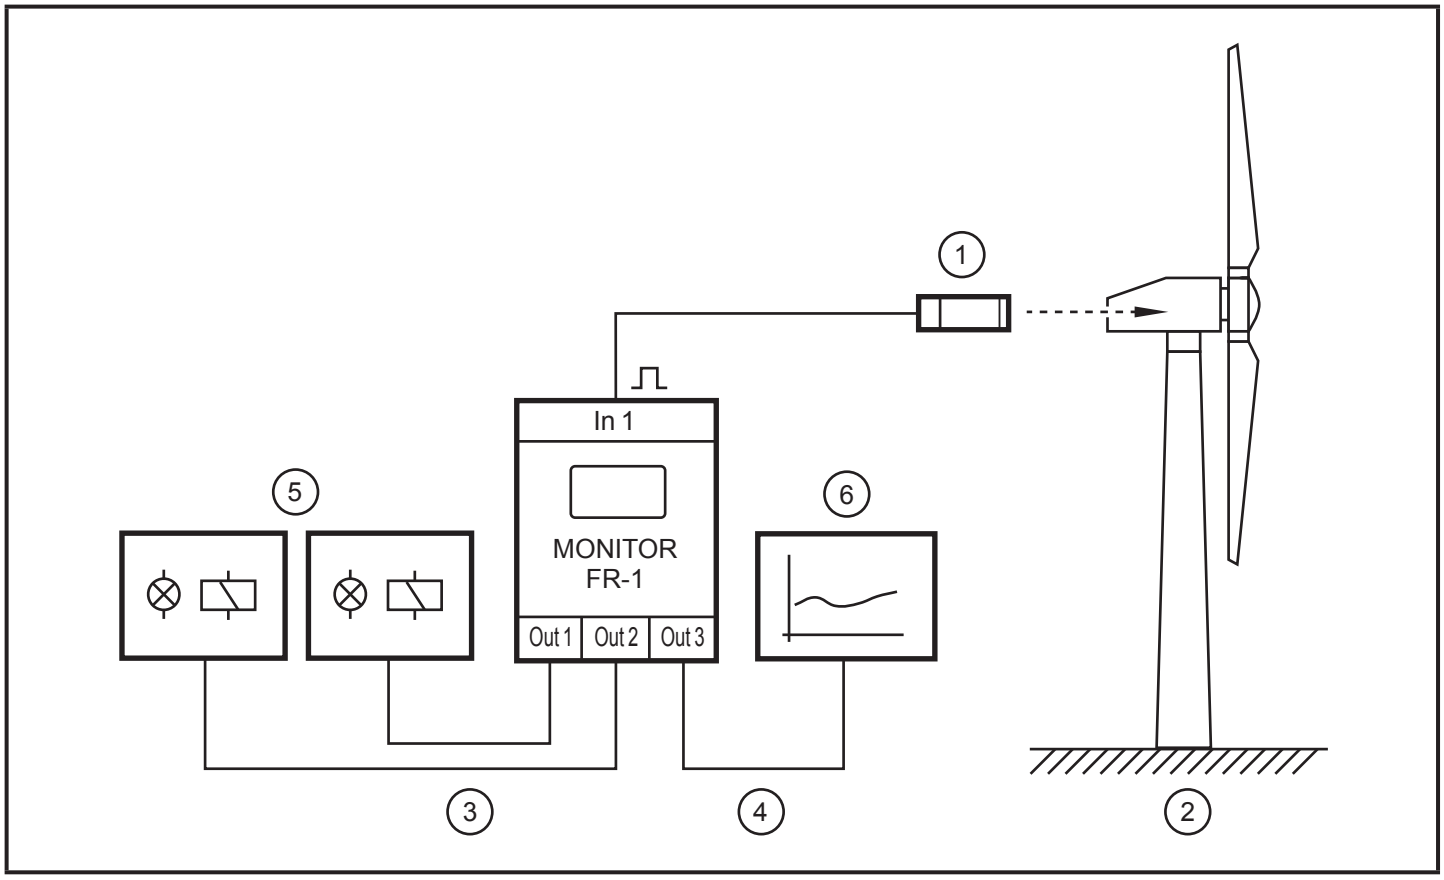
2.5 Installation location

For the correct operation the unit must be mounted in a housing (protection rating IP 40 or higher) which can only be opened using a tool or in a locked control cabinet.

The device has been tested for an impact energy of 1 joule according to EN61010.

2.6 Housing temperature

As described in the technical specifications below the device can be operated in a wide ambient temperature range. Because of the additional internal heating the operating elements and the housing walls can have high perceptible temperatures when touched in hot environments.



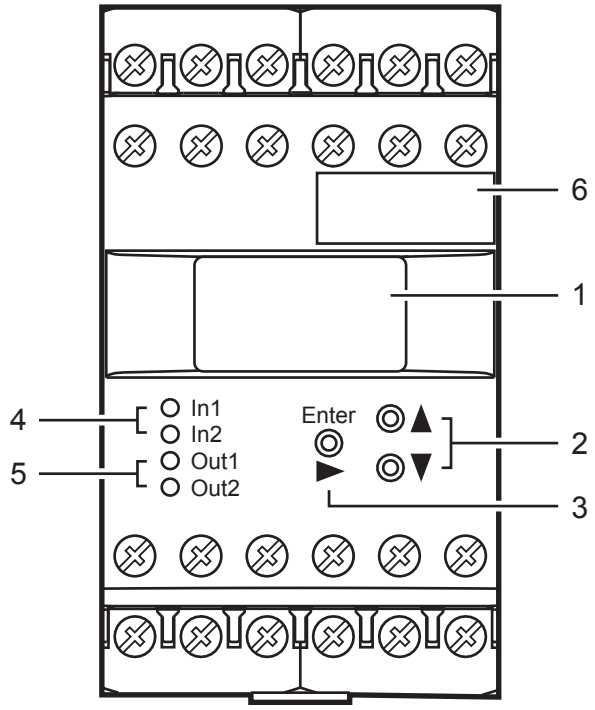
2.7 Tampering with the device

In case of malfunction of the unit or queries please contact the manufacturer. Any tampering with the device can seriously affect the safety of operators and machinery. This is not permitted and leads to the exclusion of any liability and warranty claims.

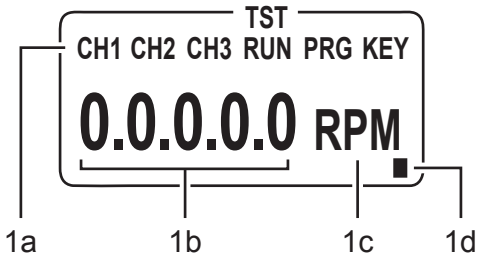
3 Functions and features

The monitor FR-1/FR-1N is a pulse evaluation system. It monitors rotating, linear, vibrating or oscillating movements.

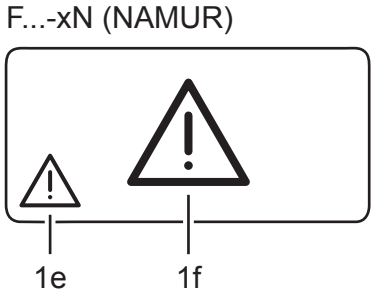
It receives the pulses from external sensors, measures the pulse interval and calculates the input frequency. This value is compared with the set switch points; the outputs are switched in accordance with the set parameters. The integrated frequency-to-current converter converts the input frequency into an analogue output signal.



Example: speed monitoring in a wind power station



1: sensor at the rotor or generator shaft
2: wind power station
3: switching outputs
4: analogue output
5: signals depending on the selected switching functions
6: recording or display



⚠ WARNING

The device is not approved for safety-related tasks in the field of operator protection.
Using an electrical connection of the outputs from two or more units to achieve a redundant circuit, they can also be used for safety-related tasks. All applicable technical standards must be followed.

4 Operating and display elements

1	OLED display	
1a	Indicators for input channels and operating modes	
	CH...	Input channels
	RUN	Run mode (normal operating mode)
	TST	Test mode (check of the switching characteristics without pulse pick-up connected)
	PRG	Programming mode (setting of the parameter values)
	KEY	Locking
1b	Actual values and parameter values (5-digit, numerical)	
	Rotational speed	0...60,000 RPM
	Pulses	0.1...1,000.0 Hz
	Analogue value	0/4...20.5 mA
	Outside the value ranges the display shows "----".	
1c	Parameter abbreviation and units (3-digit, alphanumeric)	
1d	Display is in stand-by mode, no values visible (→ 4.1)	
1e	Display in display mode Symbol for wire break/ short circuit on the cable of the pulse pick-up (only F...-xN)	
1f	Display in standby mode Symbol for wire break/ short circuit on the cable of the pulse pick-up (only F...-xN)	

2	[▲] and [▼] buttons	
	Selection of the actual value display, parameter selection, setting of the parameter values	
3	[Enter/▶] button	
	Selection of the operating mode, acknowledgement of the parameter value, front reset	
4	LEDs In1/2 (yellow)	Input pulse
5	LEDs Out1/2 (green)	Switching status of the outputs 1 and 2
	Off	Output is not switched. (Relay deenergised, transistor blocked)
	On	Output is switched. (Relay energised, transistor switched)
	Flashing quickly	Output is kept latched. (Parameter SOx, Store Output)
	Flashing slowly	The delay time has an effect on the output. The output switches when the delay time has elapsed and the trigger event is still present (parameter DTx, Delay Time)
6	Panel for labelling	

F...-xN = device with NAMUR input

4.1 Display stand-by mode

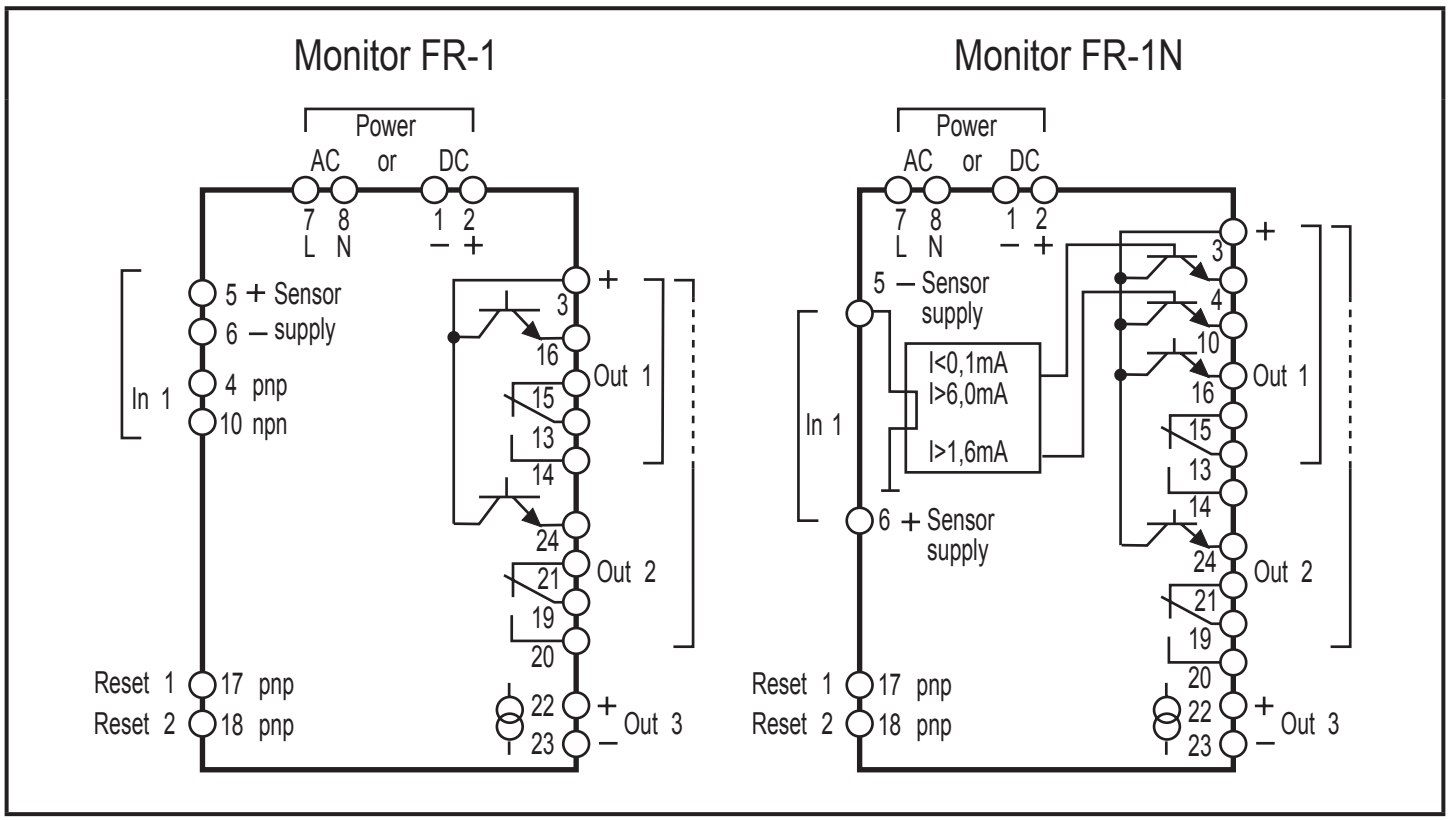
If no button is pressed for more than 10 minutes, the display changes to the stand-by mode. Values and units are no longer visible.
The stand-by mode can be identified by a flashing rectangle.

Even if no values and units are visible, the device continues its monitoring function on the basis of the set parameters and switches the relay and transistor outputs accordingly.

Press any button to switch the display on again.

5 Installation

5.1 Installation of the device



- ▶ Install the device on a 35 mm DIN rail.
- ▶ Leave enough space between the unit and the top and bottom of the control cabinet to enable air circulation and to avoid excessive heating.
- ▶ Take into account the internal heating of all units when mounting several units side by side. The environmental conditions must be observed for every unit.

5.2 Installation of the sensors

▶ Follow the manufacturer's installation instructions.

6 Electrical connection

6.1 Terminal connection

Terminal connection

⚠ WARNING

Do not use unconnected terminals such as terminal 9 as support point terminal.

6.2 Voltage supply (power)

▶ Voltage supply see type label.

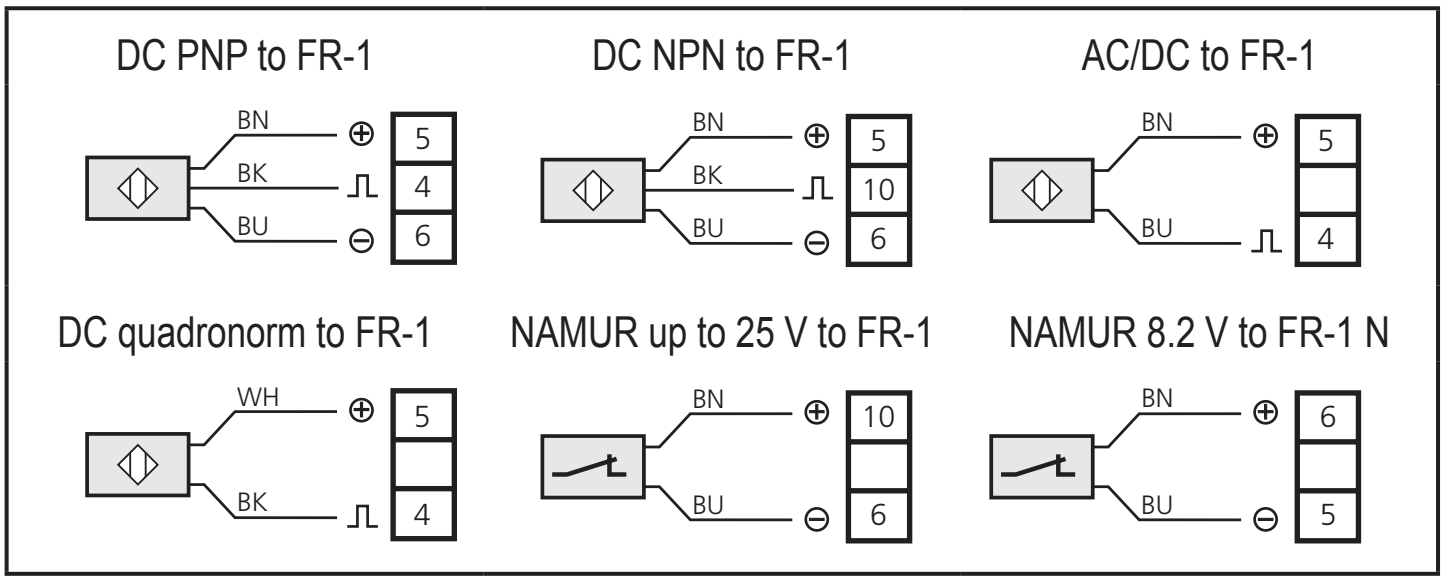
▶ The device may only be operated using one of the possible voltage connections, i.e. either terminals 7/8 (AC) or terminals 1/2 (24 V DC).

▶ All supply and signal cables must be laid separately. Use a screened cable if required in the application.

6.2.1 AC supplies

▶ The AC supply cable must be protected according to the cross-section used (max. 16 A).

If the unit is supplied on AC, the low voltage provided for the sensor supply meets the SELV criteria according to EN 61010, overvoltage category II, soiling degree 2.



6.2.2 DC supplies

- ▶ The SELV criteria (safety extra-low voltage) must be met for the DC supply.
- ▶ The DC supply cable L+ (terminal 2) must be protected externally with a 315 mA time-lag fuse (5 x 20 mm or similar).

The DC supply terminals are directly connected to the sensor supply terminals.

6.3 Inputs

6.3.1 Connection of the sensors (In1)

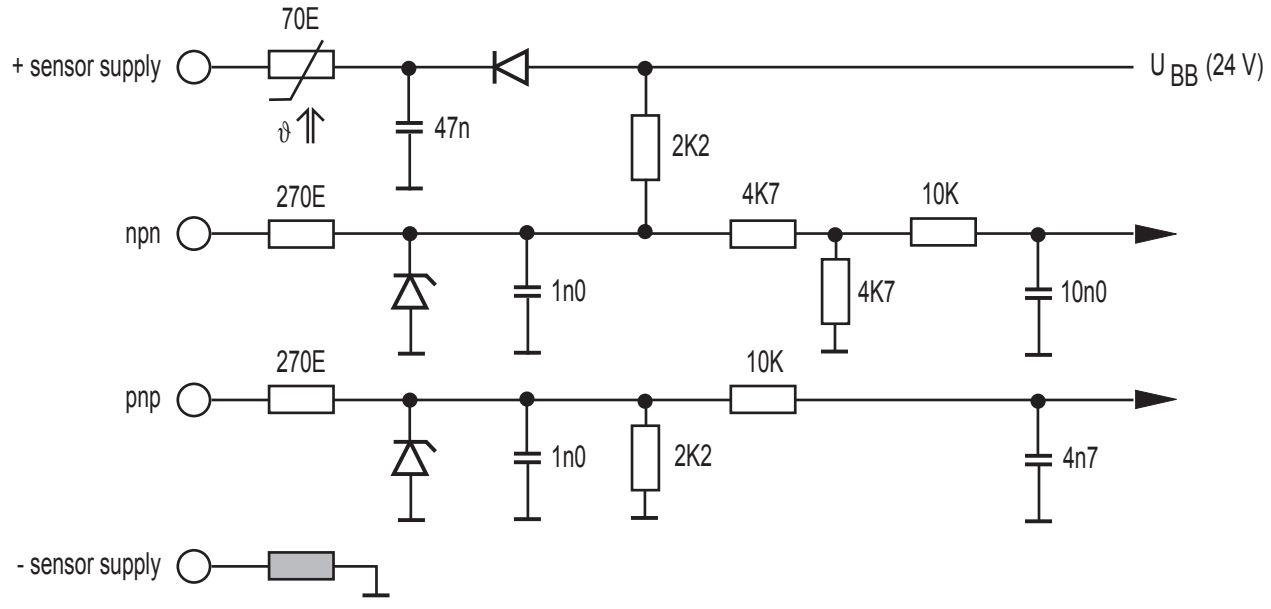
Connection of the sensors

The connection of mechanical switch contacts is not recommended since they tend to bounce and produce faulty pulses.

The terminals 5/6 can be used for the sensor supply or for the reset inputs (only F...-x).

6.3.2 Reset inputs (reset 1 and 2)

The start-up delay can be started or a saved error can be reset via the reset inputs (terminals 17/18).



- ▶ The internal +24 V DC voltage (terminal 5) or an external +24 V DC voltage is connected with terminal 17 or 18 via a closing contact.
- ▶ If an external voltage is used, the negative reference point of this voltage must be connected to terminal 1 of the monitor.

When the contact is opened (+ 24 V DC no longer applied), the start-up delay or the memory reset starts.

A +24 V DC continuous signal leads to a permanent bridging of the monitoring, i.e. the same state as during the start-up delay is indicated. When the voltage is no longer applied and the set start-up delay has elapsed, monitoring starts.

Note on F...-xN:
The +24 V DC signal voltage required for the reset inputs is not available to the F...-xN. This must be taken from an external voltage source. The reference point (GND) of the external power supply must be connected to terminal 1 of the monitor; otherwise no switching operation is possible.

6.3.3 Typical input circuit F...-x

6.4 Outputs

6.4.1 Relay outputs (Out1, 2)

► To prevent excessive wear and to comply with the EMC standards, interference suppression of the contacts is required for switching inductive loads.

⚠ WARNING

If the device is operated on an AC supply (terminals 7/8) this must use the same supply cable as the voltage supply to switch an AC voltage via the relay outputs.

If the relay outputs are used for switching very small currents (e.g. PLC inputs), considerable contact resistance can arise. In this case use the transistor outputs.

6.4.2 Transistor outputs (Out1, 2)

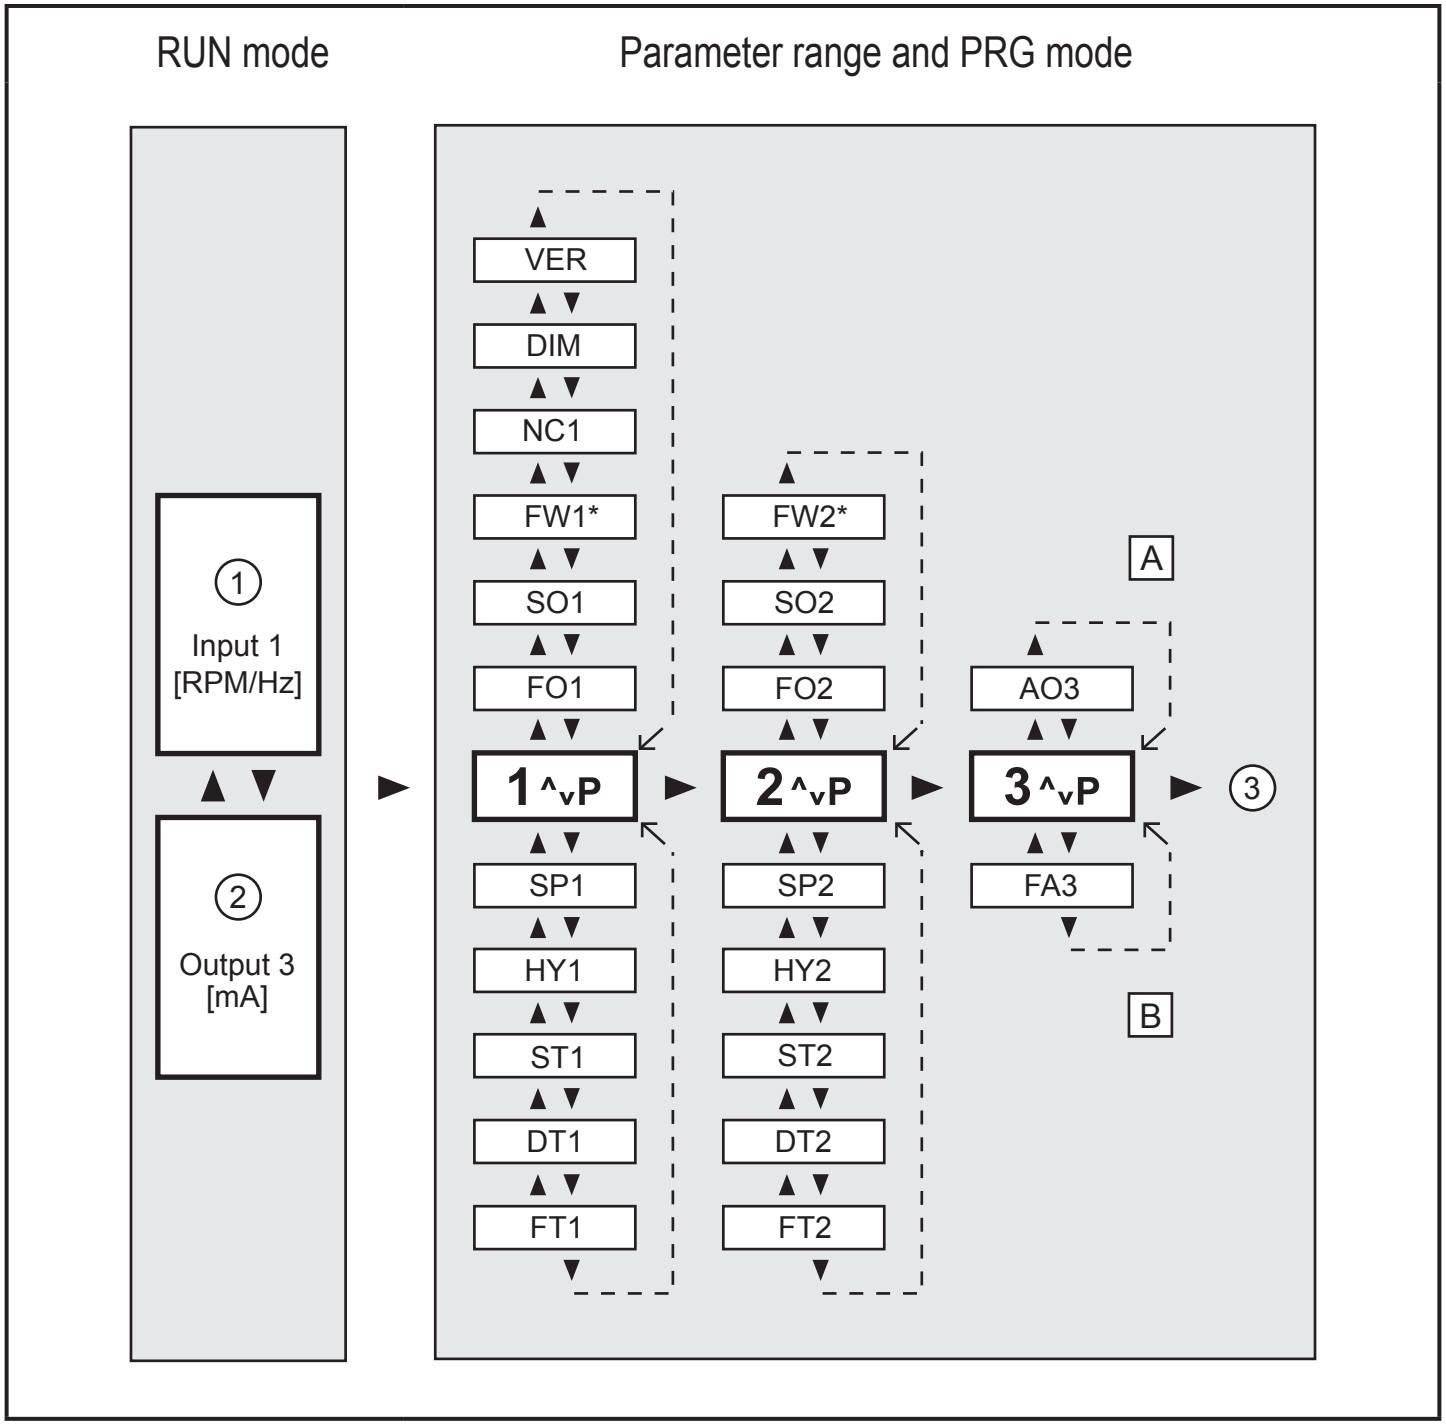
- ▶ The transistor outputs need an external voltage of +24 V DC on terminal 3.
- ▶ Connect the reference point (GND) of the external power supply to terminal 1 of the monitor. Otherwise no switching operation is possible.
- ▶ The SELV criteria (safety extra-low voltage) must be met for the DC supply of the transistor outputs.
- ▶ The DC supply cable L+ (terminal 3) must be protected externally with a 315 mA time-lag fuse (5 x 20 mm or similar).

6.4.3 Analogue output (Out 3)

The analogue output is not electrically separated from the pulse pick-up supply and the 24 V DC supply voltage.
No dangerous contact circuits must be connected to the analogue output.

6.5 Additional outputs for NAMUR devices (F...-xN)

6.5.1 Fault output



The fault output (terminal 4) indicates a wire fault between monitor and sensor (wire break/short circuit). In case of a fault the respective output is blocked.

6.5.2 Stepping output

Signals from NAMUR sensors cannot be transferred to the inputs of other systems by simple cable links. To use the signals for other inputs, the F...-xN monitor provides a copy of the input pulses at the stepping output (terminal 10, ratio 1:1).

7 Navigation and parameter overview

The pushbuttons [▲] / [▼] and [Enter/►] are used for the navigation, entry of values and acknowledgement within the parameters arranged in columns.

1: Indication: actual value input 1
2: Indication: actual value output 3
3: Back to the RUN mode

A: System parameters
B: Application parameters

*) only F...-xN

7.1 System parameters

7.1.1 FOx

Function Output (switching function of the outputs 1/2)

1	Relay energised (transistor output switched) when the current value is below the switch point SPx (signalled state: "minimum speed"/"blocked").	
2	Relay de-energised (transistor output blocked) when the current value is below the switch point SPx (signalled fault: "underspeed "/"blocked").	
3	Relay energised (transistor output switched) when the current value is above the switch point SPx (signalled state: "rotational speed reached").	
4	Relay de-energised (transistor output blocked) when the current value is above the switch point SPx (signalled fault: "overspeed").	
5	Relay is energised (transistor output switched) within a frequency range (acceptable range).	
6	Relay is de-energised (transistor output blocked) within the frequency range. With the functions 5 and 6 a frequency range above and below the switch point SPx is defined in connection with the parameter **HYx** (hysteresis).	
	SPx = $(f_{max} + f_{min}) \div 2$	
	HY = $((SP - SP_{min}) \div SP) \times 100$ [%]	
	Values	1...6
	Default settings	FO1 = 2
		FO2 = 3

7.1.2 SOx

Store Output (latching function outputs 1/2)

When this parameter is active, the respective output does not switch back automatically but must be reset.	
Values	0 = inactive
	1 = front reset ([Enter/▶] > 3 s)
	2 = front reset and external reset
Default value	0 (inactive)

7.1.3 FWx

Function Wire Break Monitoring (only F...-xN)

Relay characteristics for wire fault or short circuit, i.e. input frequency = 0		
Frequency > SPx	FWx = inactive (0)	FWx = active (1)
FOx = 1 or 4	relay energised	relay de-energised
FOx = 2 or 3	relay de-energised	relay remains de-energised
Frequency < SPx	FWx = inactive (0)	FWx = active (1)
FOx = 1 or 4	relay energised	relay de-energised
FOx = 2 or 3	relay de-energised	relay remains de-energised
Frequency in the range	FWx = inactive (0)	FWx = active (1)
FOx = 5	relay deenergised	relay remains de-energised
FOx = 6	relay energised	relay deenergised

In case of fault the preset analogue initial value AO3 is available at the analogue output.	
Values	0 = inactive
	1 = active
Default value	0

7.1.4 NC1

Number of Cams (input 1)

Number of cams detected per revolution. On the basis of this value the monitor calculates the rotational speed (measured frequency ÷ NC1 = displayed speed in RPM). For frequency measurements NC1 = 1 should remain set.	
Values	1...999
Default value	1

7.1.5 DIM

Dimension (display format)

Indication in Hz or RPM (revolutions per minute). When a new unit is selected, the monitor converts all existing values into the new unit!	
Values	0 = RPM
	1 = Hz
Default value	0 = RPM

7.1.6 VER

Software version

The installed software version is displayed (5-digit number with abbreviation VCO).

7.1.7 AO3

Analogue Offset (for analogue output 3)

Current value displayed and provided for an input value of 0 Hz/RPM.	
Value range	0.0...20 mA (typical setting: 0.0 or 4.0 mA)
Default value	4.0 mA

7.2 Application parameters

7.2.1 SPx

Switch Point (outputs 1/2)

Value at which the output 1/2 changes its switching state according to switching function FOx.	
Values	0.1 ... 1000.0 Hz or 1 ... 60000 RPM (unit depends on DIM)
Default value	SP1 = 100 RPM, SP2 = 1000 RPM

7.2.2 HYx

Hysteresis (for switch points SP1/SP2)

The hysteresis value determines the distance between the switch-off point and the switch point SPx. Prevents a possible chattering of the switching output. In connection with the switching functions 5 and 6 (FOx) an acceptable range or an error range can be defined.	
Values	0.0...1000.0 % of the value for SPx
Default value	5.0

7.2.3 STx

Start-Up Delay Time (for outputs 1/2)

Enables the suppression of error messages when a plant is started. When the device is switched on or when the 24 V signal is removed from the reset input, the respective output for the time set here is in the "good" state (= no fault).	
Values	0.0...1000.0 s

Default value	0.0 (no start-up delay)

7.2.4 DTx

Delay Time (for outputs 1/2)

Enables a delayed switching of the outputs 1/2. The respective output switches only if the current value is above or below the switch point for more than the time set here.	
Values	0.0...1000.0 s
Default value	0.0 (no delay time)

7.2.5 FTx

Fleeting Time (for outputs 1/2)

If an event occurs, the output changes its state during the set time and then switches back to the initial state.	
Values	0.0...1000.0 s
Default value	0.0 (fleeting time not active)

7.2.6 FA3

Final Value Analogue (for analogue output 3)

Input value in Hz or RPM at which the final value 20 mA is displayed or provided. The output signal is limited to 20.5 mA.	
Value range	0.1 ... 1000.0 Hz or 1 ... 60000 RPM (unit depends on DIM)
Default value	1000 RPM

8 Programming

⚠ WARNING

If programming takes place during operation, dangerous contact voltage may occur. Therefore ensure that programming is done by a qualified electrician.

Parameter changes during operation, especially changes to the switching function and the switch points can lead to malfunction in the plant. Therefore disconnect it during the change and then check the function.

Programming consists of 6 steps:	
1. Change from the RUN mode to the parameter range 1 or 2 or 3	[Enter/►]
2. Selection of the requested parameter (FOx, SOx, NCx, etc.)	[▲] / [▼]
3. Change to the PRG mode	[Enter/►]
4. Setting or changing the parameter value	[▲] / [▼]
5. Acknowledgement of the set parameter value	[Enter/►] > 3 s
6. Return to the RUN mode	[Enter/►] > 3 s

8.1 Programming example DT1 (Delay Time, output 1)

Operation	Display
Change from the RUN mode to the parameter range (here 1)	
► Briefly press [Enter/►] once. > The 1st parameter range is displayed.	
Selection of the requested parameter (here DT1)	
► Press the [▼] button until the parameter DT1 is displayed with the currently set value (here default value 0.0).	
Change to the PRG mode	
► Briefly press [Enter/►] once. > The unit is in the programming mode. > PRG indicator visible, parameter abbreviation flashes.	

Setting or changing the parameter value	
▶ Press [▲] / [▼] until the requested parameter value is displayed (→ 8.2.3 Numerical entries).	
Acknowledgement of the set parameter value	
▶ Press [Enter/▶] until the parameter abbreviation no longer flashes and the indicator PRG has disappeared. > The new parameter value is indicated and effective.	
Return to the RUN mode	
▶ Press [Enter/▶] for about 3 s or wait for the time-out function (approx. 15 s). > The unit is again in the RUN mode, the current value is indicated.	

8.2 Notes on programming

8.2.1 RUN mode

During programming the unit internally remains in the RUN mode (RUN indicator visible).
This means that until a new value is acknowledged with [Enter/▶], the unit carries out its monitoring function on the basis of the previously set parameters and switches the relay and transistor outputs accordingly.

The monitoring function of the monitor is deactivated by continuously pressing [Enter/▶] in the RUN mode. The deactivation is effective as long as the button is pressed.

8.2.2 Time Out Function

If during programming no pushbutton is pressed for approx. 15 s, this is seen as a cancellation.
Parameter changes which are not acknowledged with [Enter/▶] are rejected.
The previously set parameter value is restored and remains effective for the monitoring functions.

8.2.3 Numerical entries

▶ Press [▲] or [▼] and hold it.

The smallest decade becomes active and is counted up or down depending on the selected pushbutton (e.g. 1, 2, 3,...0). Then comes the next decade, etc.

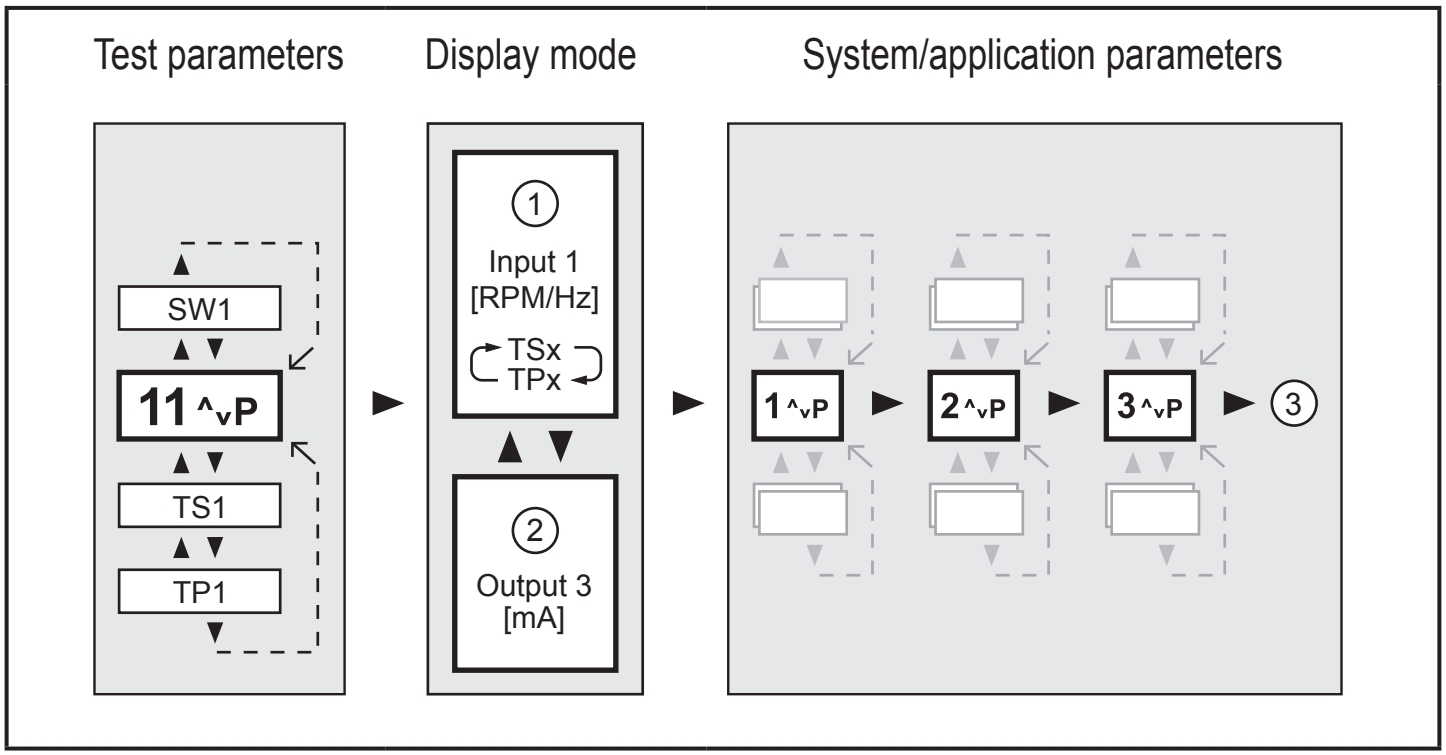
As soon as the pushbutton is released, the active decade flashes. It is set by pressing [▲] or [▼] several times. The preceding decade then flashes and can be set.

8.2.4 Factory Reset

The factory default values can be restored by pressing [▲] and [▼] simultaneously during power on. All previously entered parameter values are lost.

8.2.5 KEY function (locking)

The unit can be locked to prevent incorrect entries.
After locking, only the actual value indication can be switched with the [▲] and [▼] buttons. Parameter range and PRG mode can no longer be selected.



Locking	Unlocking
▶ Press [▲] and [▼] simultaneously and hold them pressed. > The KEY indicator flashes. ▶ Release the pushbuttons when the KEY indicator is continuously indicated.	▶ Press [▲] and [▼] simultaneously and hold them pressed. > The KEY indicator flashes. ▶ Release the pushbuttons when the KEY indicator is no longer indicated.

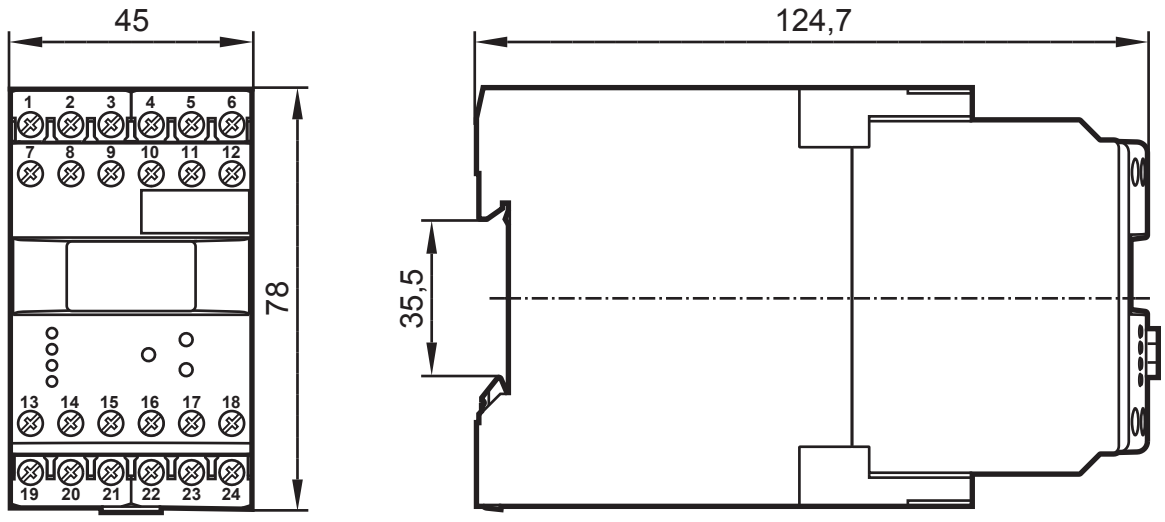
9 Test mode

In the test mode the switching behaviour of the monitor can be checked, set and stored without any connected pulse pick-up. The monitor runs through a freely definable frequency range and switches the outputs according to the selected switching function and switch points.

9.1 Activate the test mode

► Apply the operating voltage and press [Enter/►] simultaneously.
> The display indicates the parameter range 11 and "TST".
> In addition to the system and application parameters, the parameters for the test frequency are available.

1: Test frequency
2: Analogue output
3: Back to the test parameters



9.2 Terminate the test mode

► Switch off the unit.

9.3 Test parameters

SW1	Sweep on input 1	
	Change of speed of the test frequency	
	Values	1...5 (1 = fast, 5 = slow)
	Default value	1
TS1	Test Start on input 1	
	Initial value of the test frequency	
	Values	1...60,000 RPM or 0.1...1000.0 Hz
	Default value	50 RPM
TP1	Test Stop on input 1	
	Final value of the test frequency	
	Values	1...60,000 RPM or 0.1...1000.0 Hz
	Default value	1500 RPM

10 Scale drawing

11 Technical data

11.1 Overview

Art. no.	DD2503	DD2510	DD2603
Monitor type	FR-1	FR-1	FR-1N
Supply voltage Frequency range Power consumption	see type label		
Sensor types	PNP/NPN; NAMUR		NAMUR (to EN 50227)
Sensor supply	24 V DC		8.2 V DC
Input frequency	≤ 5 kHz	≤ 3 kHz	≤ 5 kHz
Relay outputs	2 changeover contacts potential free		
Switching current	≤ 6 A	≤ 4 A	≤ 6 A
Switching voltage	≤ 250 V AC; B300, R300		
Transistor outputs	PNP switched; externally supplied		
Switching current	≤ 15 mA; short-circuit proof		
Switching voltage	24 V DC (± 20%)		
Analogue output	0/4...20 mA, short-circuit proof, no feedback		
Load	≤ 500 ohms		
Protection housing / terminals	IP 50 / IP 20		
Ambient temperature	-40...60 °C	–10...60 °C	-40...60 °C

Art. no.	DD2503	DD2510	DD2603
Storage temperature	-40...85° C	-25…80°C	-40...85° C
Max. relative air humidity	80 % (31 °C) linearly decreasing to 50 % (40 °C)		
Maximum operating altitude	2000 m above sea level		
Connection	21 dual-chamber terminals; 2 x 2.5 mm² (AWG 14)		
cULus test conditions	housing dimensions for temperature rise test: 200 x 200 x 150 mm		

Data sheets can be found at:
www.ifm.com → Data sheet search → article number.

11.2 Approvals/standards

EC declarations of conformity, approvals etc. can be downloaded at:
www.ifm.com → Data sheet search → Article number → More information

12 Maintenance, repair, disposal

The device is maintenance-free.

- ▶ Do not open the housing as the device does not contain any components which can be repaired by the user. The device must only be repaired by the manufacturer.
- ▶ Dispose of the device in accordance with the national environmental regulations.

IWAKI AMERICA
MAGNETIC DRIVE PUMP
MD/WMD SERIES

IWAKI AMERICA

Thank you for having selected an Iwaki America MD/WMD Series magnetic drive pump. This instruction manual deals with the correct handling, maintenance, inspection and troubleshooting procedures for the MD/WMD magnetic drive pump. Please read through it carefully to ensure the optimum performance, safety and long service of your pump.

1 SAFETY INSTRUCTIONS

Turn off the power supply
Working without disconnecting the power supply may cause an electrical shock. Before performing any assembly or maintenance procedures involving the pump, make sure to turn the power supply switch off and to stop the pump and other related devices.

Terminate operation
When you detect any signs of abnormal operation, terminate pump operation immediately.

For specified application only
The use of a pump in any applications other than those clearly specified may result in injury or damage to the pump. Use the pump strictly in accordance with the pump specifications and application capabilities.

Modification
Never modify the pump. Iwaki America will not be responsible for any accident or damage of any kind caused by the user remodeling the pump without first obtaining permission or instructions from Iwaki America.

Protective clothing
If application involves the handling of hazardous liquids, protective gear (gloves, glasses, clothing, etc) must be worn before performing any maintenance on the pump. Please follow safety guidelines established for such applications.

Operation
Operation of the pump and related system must be by experienced or knowledgeable personal. The pump operator or pump operation supervisor must not allow any personal who have little or no knowledge of the pump to operate the unit.

Power
Do not operate the pump at a different voltage than specified on the nameplate. This may result in damage to the unit or fire. Only the specified voltage must be used.

Do not submerge
If the motor or power cable becomes wet or damp fire or electric shock may occur. The unit should be installed in such a manner to prevent contact with fluids or in a wet environment. Follow all local, state and government regulations for the installation and wiring of the pump.

Spill accident
Protective measures should be taken against any accidental spill or leakage of any hazardous liquids as a result of unexpected damage to the pump or the related piping. Please follow safety guidelines established for such occurrences.

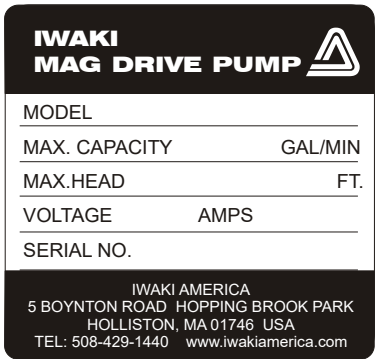
Operating site must be free of water and humidity
The pump is not designed to be water-proof or dust-proof. The use of the pump in places with splashing water or humidity above 90% may result in an electrical shock or short circuit.

Do not damage power cord
Do not cut, abrade or forcibly pull the power cord. Excessive heat or heavy load applied to the cable may damage the cable and finally result in a fire or an electrical shock.

Do not cover the motor
Covering the motor during operation may result in an accumulation heat inside the motor and cause a fire or a mechanical failure. Proper ventilation is necessary for the motor.

Grounding
Do not operate the pump without proper grounding; otherwise an electrical shock may result. Follow all local, state and government regulations for the installation and wiring of the pump.

Power cord cannot be replaced
Never use a damaged power cable; otherwise, a fire or an electrical shock may result. Handle the power cord carefully, as it cannot to be replaced by a new cable. (The complete motor must be replaced if damaged).



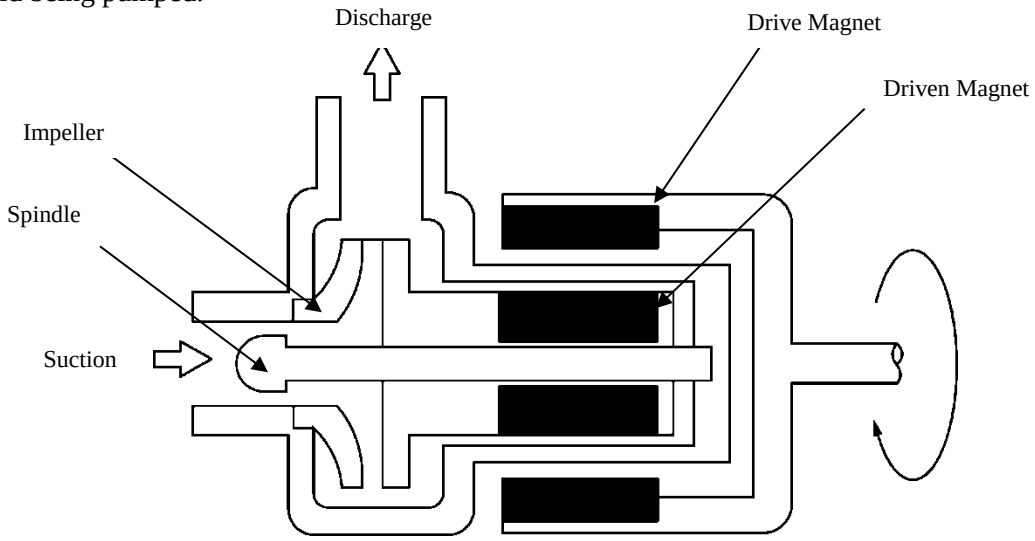
Location and storage
Do not install or store the pump in the following places:

* Places where a flammable gas or material is used or stored.
* Places where the ambient temperature is extremely high (104°F or higher) or extremely low (32°F or lower).

Static Electricity Hazard
When low electric conductivity liquid such as ultra-pure water is handled, static electricity may be generated in the pump, which may cause static discharge and damage the pump. Take appropriate countermeasures to avoid and remove any potential static electricity.

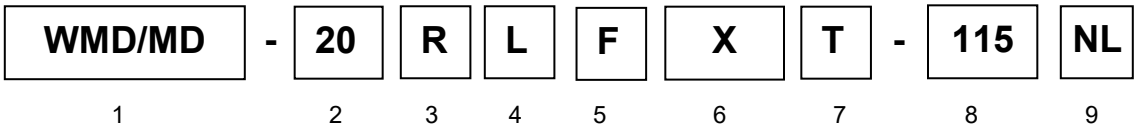
2 UNPACKING AND INSPECTION

Open the package and check that the product conforms to your order. Also, check each of the following points. For any problem or inconsistency, contact your distributor at once.



1. Check that the model number indicated on the nameplate conforms to the specifications of your order.

2. Check that all the accessories you ordered are included.



3. Check that the pump body and parts have not been accidentally damaged or that any bolts have not been loosened in transit.

3 OPERATING PRINCIPLE

A sealless magnet drive pump uses magnet torque to transmit energy from the motor to the impeller. A magnet coupling is formed using an inner, or driven magnet, attached to the impeller and an outer, or drive magnet, attached to the motor shaft. This design eliminates mechanical shaft seals or packing, since there is no direct connection between the motor shaft and the impeller. The front and rear casings, sealed with a static o-ring, form the pump or liquid end. The magnetic field is transmitted from the drive magnet through the rear casing to the driven magnet that is attached to the impeller. The combined coupling torque of the drive magnet and impeller magnet provides the driving power to the fluid being pumped.

4 MODEL IDENTIFICATION GUIDE

1. **Series name (WMD specifies US motor design)**

2. **Pump Size (6, 10, 15, 20, 30, 55, 70, 100)**

3. **R = Rotating Spindle (leave blank for MD-6, MD-10 and Fluoroplastic models)**

4. **L = UL Listed Motor, included in 6, 10, 55, 70, 100 Polypropylene models, 30, 55, 100 Fluoroplastic models**

5. **Material**
   Blank: Polypropylene models
   F: Fluoroplastic models

6. **Pump type**
   Blank: Standard Impeller
   Z: High Head Impeller
   X: High Flow Impeller
   X,Y,Z: Fluoroplastic models

7. **Suction/Discharge Port Connections**
   Blank*: Hose Connection
   T: Threaded Connection

   * All Fluoroplastic models have threaded connections

8. **Power source voltage:**
   115: 115V (50/60Hz)
   220: 220/240V(50/60Hz)
   230: 230V (50/60Hz)

9. **NL = UL Listed 115V Motor (applies to 15, 20, 30, 40 sizes) Polypropylene models**

Notes:

1. Pump performance data is based on pumping clean water at ambient temperature.
2. The maximum flow rate is at 0 discharge head.
3. Maximum viscosity of liquid: 1.0 cP (for a specific gravity of 1.0)
4. Permissible liquid temperature: 32-176°F (0 – 80°C). Note, permissible temperature range may differ depending upon the type of liquid and operating conditions.)
5. The maximum specific gravity of the liquid is the value at max. flow rate. The value varies depending on the flow rate, ambient temperature, viscosity of liquid, etc.
6. Motor: Single-phase capacitor-run induction motor or 3-phase induction motor.

* Built-in thermal protector
A thermal protector is built in the motor. The protector automatically stops motor operation when the motor is overheated. (The motor starts again when the temperature falls to normal.)

Typical Construction/Materials

No.	Part Name	Qty	Material
1	Front Casing	1	GFRPP (Note 1)
2	Rear Casing	1	
3	Impeller	1	
4	Thrust	2	Alumina Ceramic
5	O-ring	1	FKM or EPDM (Note 2)
6	Screw	4~6	Stainless steel
7	Bearing	2	Fluororesin containing filler material (Note 3)
8	Spindle	1	Alumina ceramic
9	Motor	1	

Note 1: The material of the impeller used in MD-70RZ, 100R, 100R-5 is CFRPP.
Note 2: More elastomer options available
Note 3: The material of the bearing used in (W)MD-20RZ, 30RZ, and MD-70RZ is PPS.

6 HANDLING INSTRUCTIONS

1. **Handle the pump carefully**
   Strong impact to the pump assembly may result in damage or reduced performance.

2. **Starting**
   Before priming the pump be sure the power is turned off then proceed with filling the pump end with water. Note, the pump must be fully primed before starting.

   Next close the valve on the outlet or discharge side of pump. Turn on power to the pump, when full speed is reached gradually open the discharge vale until specified flow rate is achieved.

   Caution
   Operating the pump dry (without liquid) may cause severe damage.

3. **Stopping**
   When stopping the pump, first close the discharge valve gradually. When it is completely closed, turn off the power switch so that the pump stops. Never stop the pump suddenly by quickly closing a valve (i.e., solenoid or hydraulic valves).

   Caution
   Quick valve closure may cause water hammer that can cause severe damage to the pump.

4. **Temperature**
   The pump itself may not suffer a change in performance due to temperature fluctuation. However, the liquid may change in terms of viscosity, vapor pressure, and corrosive properties. Pay special attention to changes in liquid characteristics as a result of temperature fluctuation.

Liquid temperature range:	32 – 176°F (0 – 80°C)
Ambient temperature range:	32 – 104°F (0 – 40°C)

5. As there is a powerful magnet inside the pump unit, do not use any liquid that contains metallic substances such as iron, nickel, etc.

6. Do not operate the pump in the following places:
   - Places exposed to rain and/or wind.
   - Places where the temperature falls below 32°F (0°C).
   - Places where corrosive gas (such as chlorine) is present.
   - Places exposed to splashing of water or fluid being pumped.
   - Places where the ambient temperature is 104°F (40°C) or above.
   - Places where explosive or combustible materials/gases are present.

7. Do not operate the pump with the following liquids:

- For the compatibility to chemical liquid or any special liquid, contact an Iwaki America sales representative.
- Liquids that significantly swell polypropylene.
- Paraffinic hydrocarbons such as gasoline and kerosene.
- Halogenated hydrocarbons such as trichloroethylene and carbon tetrachloride.
- Ether and low-grade ester
- Slurry
  (For a chemical compatibility to guide contact Iwaki America customer service.)

8. To prevent fire and explosions, do not place dangerous or flammable substances near the pump.

9. Be sure unit is properly ground.

10. If a pumped is damaged, it can be dangerous to operate. Contact factory for assistance.

11. Avoid direct physical contact with the motor or pump during operation, as surface temperatures may be extremely high due to operating conditions.

7 INSTALLATION, WIRING AND CONNECTIONS

7.1 Installation

1. **Installation site**
   Installation site must have an ambient temperature of 32-104°F (0-40°C) and a relative humidity lower than 90%. Install the pump where maintenance and inspection work can be done easily.

2. **Pump installation method**
   This pump is not self-priming. It is recommended that the pump shall be installed in a position lower than the liquid level of the suction tank by at least 12 inches (30 cm). If this distance is too short, air may enter the pump, causing damage.

3. **Direction of pump discharge port**
   The discharge port can be directed as desired. However, for efficient elimination of air in the pump end, it is recommended that the discharge port be positioned in the horizontal direction.

4. **Anchoring of base**
   The base of the pump must be anchored firmly. The pump must not be mounted in a vertical position.

7.2 Piping instructions

1. To minimize frictional resistance, the shortest piping possible with a minimum number of bends should be utilized on the inlet or suction side of the pump.

2. Use a corrosion-resistant vinyl hose that is rated at or above the pressure rating of the pump (see specification table).

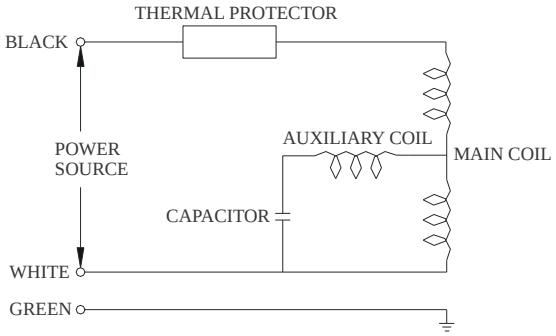
3. Hose size (for hose-barb style pumps)
   Select hose size in accordance with the diameter of the pump connections. As the hose tends to be crushed under the force, the use of a braided reinforced hose is recommended. Note, if the connection on the suction side is loose air may be mixed in with pumped fluid.

   (In the case of high temperature liquids, special attention must be paid to the selection of a hose.)

4. Hose connection
   Be sure to cut the ends of the hose straight. Press the hose end firmly against the discharge or suction port until it reaches the bottom of the port. Use a fastener (such as a hose clamp) to make the connection tight and leak free.

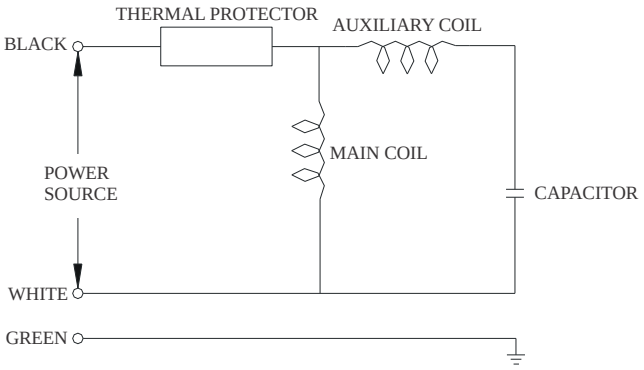
   Caution
   Do not over tighten the connection ports (suction and discharge) excessively as they are made of plastic resin and are could be damaged.

5. Valve installation
   Install valves close to the suction and discharge ports.
   - Suction side valve:
     For easy liquid removal and pump maintenance
   - Discharge side valve:
     For adjustment of the discharge rate or head and for easy removal and pump maintenance.



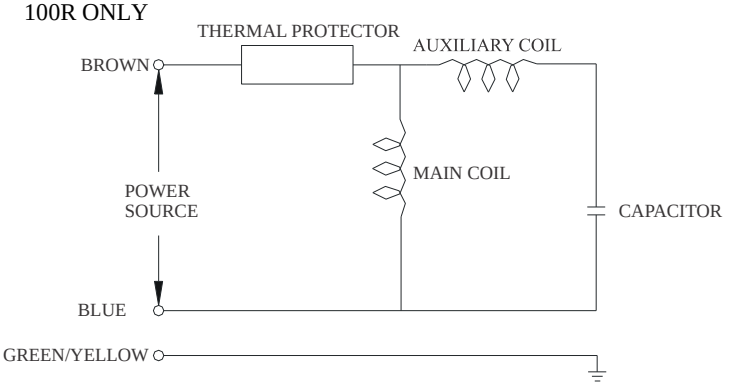
7.3 Wiring

1. Prior to wiring the pump, confirm the voltage indicated on the nameplate is correct for your installation. (Observe all local and national regulations regarding electrical work.) The connection diagram is presented on the next page.

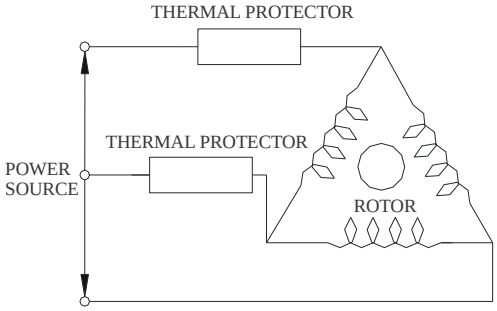


2. The pump does not have an external switch. It starts when power is supplied to the pump wires.

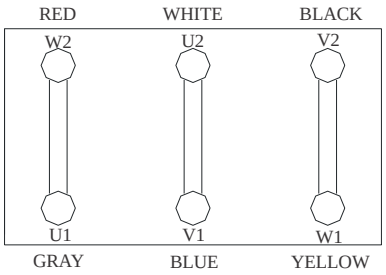
Wiring diagrams



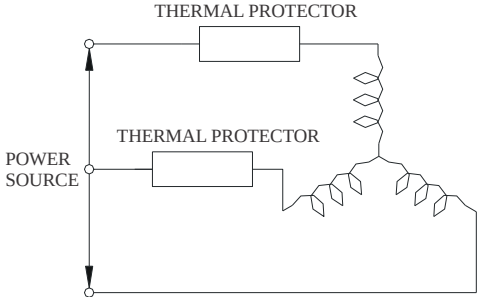
• (W)MD-15R, 20R, 20RX, 20RZ, 30R, 30RX and 30RZ (Single-phase capacitor run motor with thermal protector)

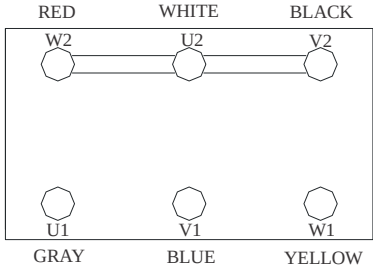


• (W)MD-40R, 40RX, 40RZ, 55R, 70R, 70RZ, and 100R (Single-phase capacitor run motor with thermal protector)

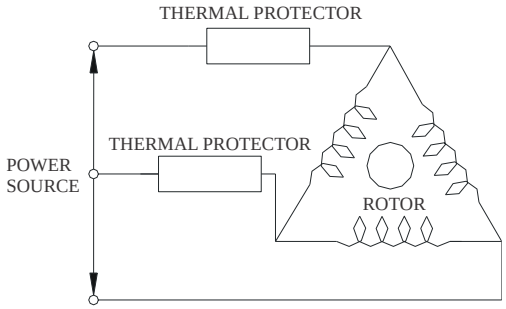


100R ONLY





• MD-70R, 70RZ, and 100R models (3-phase motor, 220/380V)



220V

380V

• (W)MD-70R, 70RZ, and 100R models (3-phase motor,400/440V)

8 ASSEMBLY

1. Place the motor on end vertically so that the shaft is pointed upward.

2. Install the drive magnet on the motor shaft and position the shaft flush with the inside of the magnet. Note: On WMD models, screw the bracket to the motor first.

3. Insert the rear casing into the magnet/motor bracket.

4. Install the impeller and O-ring into the rear casing.

5. Place the front casing over the pump, making sure that the volute casing is aligned.

6. Using a hex head driver, fasten the liquid end to the bracket using six screws. Tighten in a star pattern.

9 OPERATION

Caution

- Before operating the pump, confirm that connections to the discharge and suction ports are secure.
- Dry run operation (operation without liquid in the pump) damages the pump. Be sure to fill the pump with liquid prior to startup.
- Do not operate the pump with closed, or almost entirely closed, suction and/or discharge side valve(s). A closed suction valve will cause dry-run operation.
- Do not open or close the suction or discharge side valve suddenly, this may result in decoupling and damage to the pump end. (Under such circumstances, turn off the power supply immediately. When the motor stops rotating, the magnetic coupling will be reconnect automatically.)

No.	Operation Step	Note
1	Check piping, wiring and voltage.	Check connections to confirm they are secure and leak-free. Check the power supply voltage by referring to the information on the nameplate.
2	Open and close valves.	Fully open suction side valve. Fully close discharge side valve.
3	Check that pump chamber is filled with liquid.	Fill pump chamber with priming liquid. Be sure suction line is completely filled, this is especially important if pump is above liquid level.
4	Supply power to pump	After steps 1 to 3 above, connect power supply to start pump.
5	Adjust discharge capacity & head to desired values.	Adjust discharge side valve gradually till desired discharge capacity and head are obtained. Do not open or close valves suddenly. **Note: Do not keep discharge side valve closed for more than 1 minute.** **Note: Check that pump is operating normally. If not, turn off power immediately and eliminate cause referring to 'Causes of Trouble and Troubleshooting' section (p.27).**
6	Checkpoints during operation	Be careful to prevent solids from entering the pump. Solids in the pump may cause impeller to be locked stopping liquid circulation. The motor continues to rotate even if impeller is locked. In such a case, turn off power supply at once.

Pump Stopping Procedure

No.	Stopping Step	Description
1	Close discharge side valve.	Close discharge side valve gradually. Do not use electromagnetic valve for quick closing.
2	Switch power off.	Check that motor stops smoothly after power supply is disconnected. If not, pump should be inspected. (For details, contact Iwaki or your dealer.)

How to store pump when it is out of use for a long time

Remove the liquid from the pump if it is to be stored for a long period of time. In addition, run it with water for about 5 minutes every 3 months to prevent rust on the motor bearing.

Warning

- Before draining the pump, turn off the power supply.
- Be sure to wear proper safety gear (gloves, protective shoes, etc.) when handling pump end for draining purposes, especially when a hazardous chemical is being pumped.

Caution

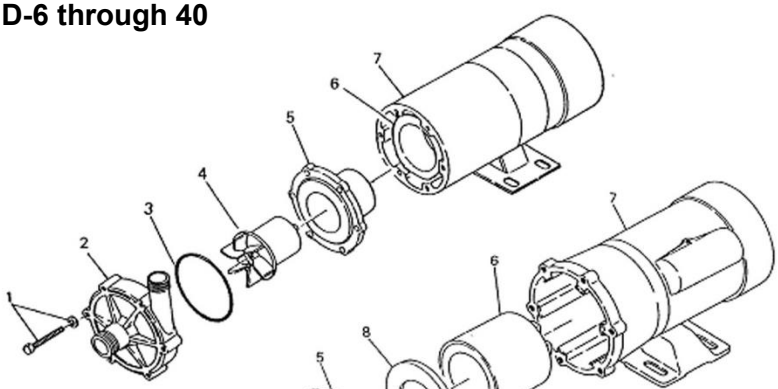
Note that residual liquid may run from the discharge and suction ports when the housing is removed. Do not allow any electric parts to come in contact with the liquid.

Never discharge hazardous or chemical liquid over the ground or floor in the plant. Instead, use a draining pan (or container). Observe each applicable local law or regulation for the handling or disposal of hazardous liquids.

Draining procedure

1. Turn off the power supply. (Make sure no other operator will turn the power supply on accidentally.)
2. Close the discharge and suction sides valves fully.
3. Remove the hoses piping attached to the pump.
4. Remove the screws on the pump base to detach the pump from its mounting location.
5. Rotate the pump.
6. Discharge hazardous liquids appropriately.

10 MAINTENANCE/INSPECTION



Maintenance and inspection

- When the pump has been used for a long time, the front casing screws attaching the pump head to the motor bracket may loosen. Tighten screws periodically taking care not to deform the plastic parts. Also, after pump has been stored for a long time, tighten screws before pump is used again.

- Daily inspection
  Check operating conditions (vibration, noise) as well as electric current value and pump discharge capacity. As soon as you find any abnormality, turn off power and refer to "Troubleshooting" on page 27.

13 TROUBLESHOOTING

	Pump does not start.	Pump is not pumping or flow is insufficient.	Electric current is high.	Excessive noise or vibration.	Liquid leaks.	
Power is not supplied or wiring is faulty.	○		○			Check power connections or contact your dealer.
Motor is out of order (short coil or capacitor failure).	○		○			Contact your dealer.
There is residual air in the pump.		○		○		Eliminate air from pump end completely.
Air is sucked in via suction port.		○		○		Check suction connection.
Pump is running dry.		○		○		Supply priming water to pump.
Specific gravity/viscosity of liquid is too high.	○	○	○			Confirm application with pump specifications.
Periphery of impeller magnet is in contact with rear casing.	○	○	○	○		Contact your dealer.
Impeller is damaged.	○	○	○	○		Contact your dealer.
Foreign matter is stuck to impeller.		○	○	○		Contact your dealer.
O-ring is damaged.					○	Contact your dealer.
Loose front casing bolts.		○			○	Tighten bolts.

Safety Precautions

Overview

READ THIS MANUAL IN ITS ENTIRETY BEFORE BEGINNING OPERATION.

- **DO NOT** install, operate or service this equipment (or any portion thereof) without fully understanding the information contained herein.
- **DO NOT** operate this equipment in any manner other than that for which it has been designed or approved.

NOTE: A copy of this manual **must** be provided to the operator of this equipment and **must** be kept with the equipment at all times.

The safety instructions presented throughout this manual do not supersede any other directives or practices associated with this equipment or its operation. Rather, they are to be used in addition to any other applicable guidelines set forth by governing bodies (ANSI, ISO, OSHA, MSHA, etc.), plant administrators, signs, tags or placards, etc. (Refer to the **TAGS** section of this manual for information regarding safety and instructional tags provided with the equipment.) In the event of conflicting information, **always use the guidelines providing the highest degree of protection/safety.**

The safety instructions used throughout this manual and on the equipment contain a "signal word" (CAUTION, WARNING or DANGER) that indicates the seriousness of the hazard as described below.

DANGER *indicates an imminently hazardous situation, which, if not avoided, will result in death or serious injury.*

WARNING *indicates a potentially hazardous situation, which, if not avoided, could result in death or serious injury.*

CAUTION *indicates a potentially hazardous situation, which, if not avoided, may result in minor or moderate injury.*

CAUTION *(used without the safety alert symbol) indicates a potentially hazardous situation, which, if not avoided, may result in property damage.*

The safety instructions listed below are general guidelines. Additional safety instructions are listed throughout this manual as required. **All** safety instructions **must** be followed at all times to ensure personal safety and to prevent equipment damage.

Verify that all personnel are clear of any/all moving or rotating parts (or parts that are subject to movement or rotation) before installing, operating or servicing this equipment or any portion thereof.

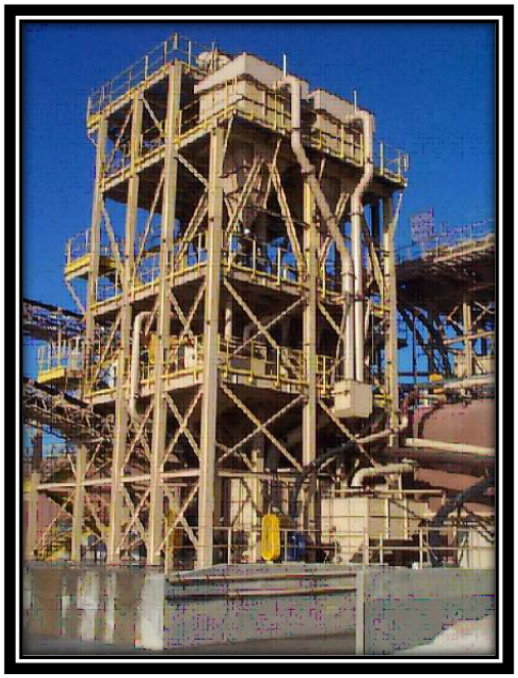
Verify that all guards and safety devices are in place, secured and functional before operating this equipment or any portion of it. **DO NOT** circumvent or disable any safety devices.

Lockout/Tagout all controls and secure all applicable components to prevent unexpected movement before performing any maintenance, repairs or adjustments on this equipment or any portion thereof.

Lockout/Tagout power at the source before accessing any electrical panels or devices on this equipment or before performing any maintenance or repairs to the power line(s) feeding this equipment.

Wear appropriate personal protective equipment at all times.

Obey all safety tags and signs and replace any that are illegible or missing.



If any questions arise concerning the safe operation of this equipment, or if clarification of any information is required, cease operation and contact **McLanahan Corporation** immediately.

The McLanahan Pump

Introduction

The Aggregate Processing Division of McLanahan is a major manufacturer of process plants for the minerals industry. The McLanahan Model lllr is the latest generation of successful abrasion/corrosion-resistant slurry handling pumps.

This manual should be carefully read before attempting to install or operate this McLanahan Model lllr Pump.

Service, Selection and Support

Total Service

From design to installation and beyond, McLanahan engineers are available to give advice on your slurry pumping needs and solutions for your problems.

The McLanahan Model lllr range has been designed to offer a wide choice of pump sizes to suit most slurry pumping applications. A standard questionnaire is available to ensure that the most complex installation, as well as the more straightforward pumping application, receives individual consideration.

McLanahan can also advise on the ancillary components within the pumping system. The provision of low head loss valves, gland feed pumps, priming devices and flexible bends, all incorporating application specific linings for trouble-free life, are an important aspect of ensuring a totally successful pump installation.

Design Specifications and Options

The McLanahan Model lllr standard casing is designed for a maximum working pressure of 88psi (6 bar). A high pressure casing is available, rated at 272psi (18.5 bar). Please contact McLanahan for pressures higher than this.

The pump units in the McLanahan Model lllr range are designated by the size of suction and discharge ports. Units up to 4” (100mm) have equal size suction and discharge; above this, the Model lllr has a larger suction than discharge. Size is given in inches i.e. 8”/6” (200/150mm) Model lllr has an 8” (200mm) suction port and a 6” (150mm) discharge port.

Suction and discharge flanges are universal and, as a standard, are available in ASA150 drilling patterns. Other drilling patterns (metric & BS4504) are available to special order. Orientation of discharge to 4 positions according to installation requirements.

The McLanahan Model lllr pump components are designed and manufactured in accordance with appropriate International Quality Standards, such as ISO9000.

"Pumptec" Computer Software

Many complex calculations are needed in order to

- Size a pump
- Establish the optimum pipeline carrying velocity
- De-rate the pump for a slurry duty
- Calculate pipeline friction head losses
- Calculate power absorbed
- Analyze the system head

McLanahan Corporation uses unique software, **Pumptec,** to perform these calculations.

The pump is able to adapt to a change of V-belt sheave ratios and different speeds. However, it is **crucial** to recalculate duty parameters and check motor and drives to guarantee that they are not overloaded under any normal operating condition.

Please consult McLanahan Corporation before making any changes to your pump system to ensure the correct combination of speed and power is selected.

Input criteria required:

- Volume to be pumped
- Percent solids
- Gradation of solids (top size & 50% passing size)
- Specific Gravity of Solids
- Specific Gravity of Liquid
- Temperature of Liquid
- Elevation above sea level
- Height of liquid level in tank (**if negative suction**, height from liquid surface to center line of pump inlet)
- Vertical height from pump inlet to discharge point
- Pressure required at delivery point
- Pipe diameter (inside diameter important)
- Pipe material
- Pipe fittings – type and quantity

Pumptec: Computer Aided Support

To complement and facilitate optimum selection of your slurry system, McLanahan uses **Pumptec.**

This unique computer program:

- Analyzes the effects of changing slurry density
- Calculates the P_{50} particle size from a sieve analysis
- Calculates settling velocities and select pump sizes
- Calculates pipeline frictional losses in various pipe materials and pipe fittings
- Calculates the pump duty and selects a pump and drive based on input parameters
- Prints full application and selection data including NPSH, BEP, RPM, HP, etc.

Troubleshooting is made easier using **Pumptec** Software to evaluate different scenarios.

Design Condition (To be filled in by distributor or owner)

The following data should be completed as a record of the duty for which the pump was originally sold. During its lifetime the pumping requirements may change; if so, the new speed and operating conditions must be carefully engineered. McLanahan engineers are able to assist you in doing this. U.S. units are used, unless otherwise noted.

Details of Solids

Description of Solids: _____

Specific Gravity Solids: S=_____ Quantity of Solids M: _____ dry tons/hr

Particle Size: Topsize= _____mesh (mm). 50% passing size= _____mesh (mm).

Quantity: _____gpm (l/s)
Pressure: _____psi (m)

Technical Data

Pump Mass: _____lbs (kg).
Motor Mass: _____lbs (kg).
Pump Shaft Size: _____mm
Noise Level: _____db (A)

Gland Options

Gland Seals

The **gland** is usually the weakest point on any **pump**; therefore, it requires the most attention and maintenance. All glands need cooling and lubrication between the sliding surfaces, so **a leisurely drip from the glands is normal**. **NOTE: DO NOT PREVENT DRIP.** All glands must be finally adjusted while the pump is running.

The McLanahan Glands have been developed to minimize the attention and service needed; Pressure of the fluid being pumped, the size and shape of the solid particles and the concentration of the solid particles in the liquid all affect wear and tear on pumps. Three unique seal arrangements have been developed and McLanahan engineers can give advice regarding the optimum selection for a specific duty.

"H" and "P" Glands

The slurry pressure at the gland is reduced by back pump out vanes on the impeller. The rubber axial expeller, which is a stretch fit on the shaft of the "H" and "P" glands, is used to avert waste.

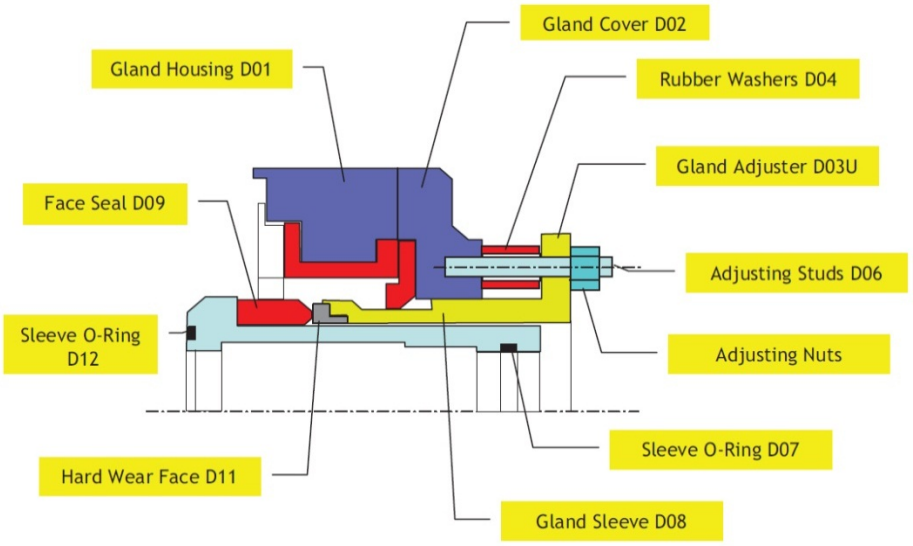
The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the "H" Gland, the adjusting gland must be eased **outward** to increase the sealing pressure. The geometric shape of the **gland seal** is carefully designed to provide a flawless seal while limiting the amount of "digging" onto the gland sleeve.

The gland sealing water must be as clean as possible and at a pressure of about 3-5psi (2-4m water gauge) above the discharge pressure. A high-flushing water pressure results in greater water use and greater dilution of the pumped slurry without any benefit to the seal.

“D” Gland

This is a unique type of mechanical seal. The **face seal** runs against the **hard wearing face**.



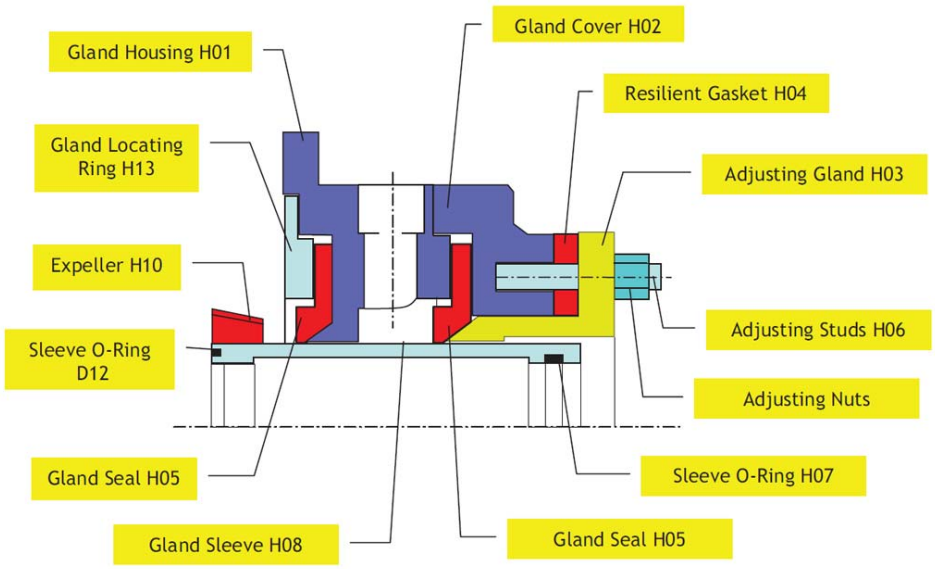
The **face seal** acts as a spring and if any grit particles get between the rotating rubber and stationary **wear face** it is pressed into the rubber. The **face seal** is a stretch fit on the **shaft sleeve**. As the gland pressure increases, the rubber extends axially and increases the pressure at the rubbing interface. Be sure not to over-tighten the adjusting sleeve.

When the pump is first started, ensure that the adjusting nuts are finger tight. While the pump runs, adjust the gland nuts so there are approximately five (5) drops per minute from the gland. This should reduce to one (1) occasional drop and run satisfactorily for up to a year without further attention in a good application.

Dry Gland

Also known as "D" type gland
This gland has a unique proprietary design and is unlike conventional mechanical seals. A rotating rubber **face seal** is adjusted against a static **hard wearing face**; it is **self-lubricating** - pressure from inside the pump head forces small amounts of liquid between the surfaces for lubrication.

Note: The gland needs no external water source to lubricate the gland; both small amounts of water and the fines do exit the pump, accumulating at its base, hence the term **dry gland**.

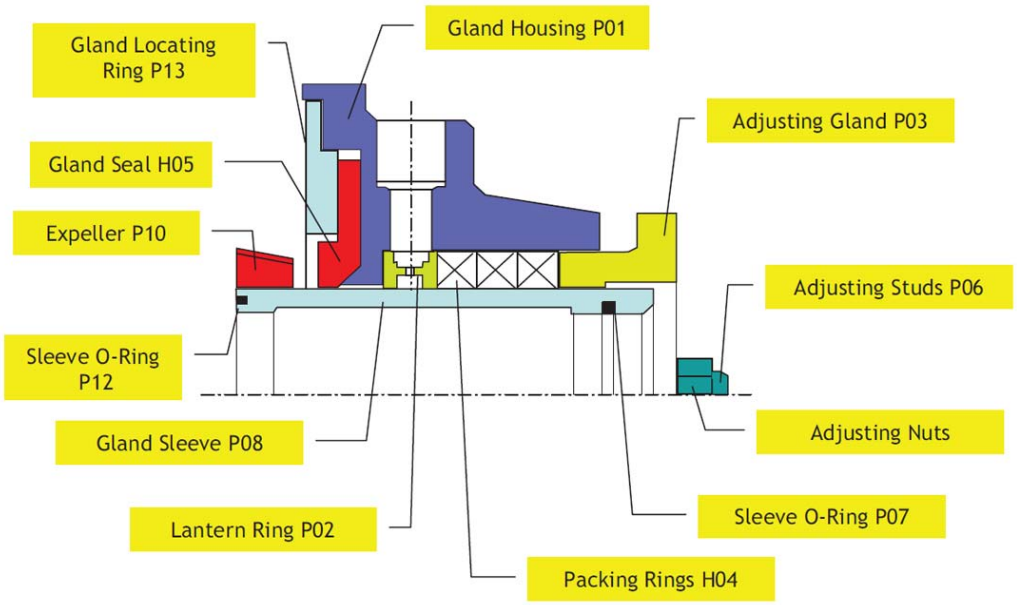


The **face seal** acts as a spring; if any grit particles get between the rotating rubber and **stationary wear face**, it is pressed into the rubber. The **face seal** is a stretch fit on the shaft sleeve. As the gland pressure increases, the rubber extends axially and increases the pressure at the rubbing interface.

While the pump is running, adjust the gland nuts so there are approximately five (5) drops per minute from the gland. This should reduce to one (1) occasional drop and run satisfactorily for up to one year without further attention in a typical application.

Hydrostatic Gland

Also known as "H" type gland
This gland has a unique proprietary design with the lowest maintenance and longest life. The unique rubber gland seal is designed to deflect inwards to provide an effective seal. The **slurry pressure** at the gland is reduced by back pump out vanes on the impeller; when fitted, it is reduced by the **rubber axial expeller**, which is a stretch fit on the shaft of the "H" gland sleeve.



The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the H Gland, the adjusting gland must be eased outwards to increase the sealing pressure. The geometric shape of the **gland seal** is carefully designed to give a good seal while limiting the amount of "digging" onto the gland sleeve.

The gland sealing water must be as clean as possible at a pressure of about 5psi (4m water gauge) above the discharge pressure and at a volume of between 1 to 5 gpm depending on pump size. A high-flushing water pressure results in greater water use and greater dilution of the pumped slurry without any benefit to the seal.

Packed Gland

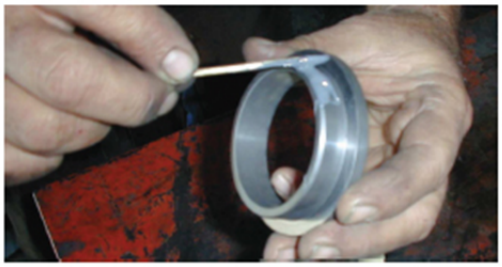
“P” Type Gland
In a classic “stuffing box” design, sealing is obtained by compressing the gland packing rings onto the shaft sleeve. The gland offers the capacity to seal the pump even at high pressures, for instance, in series pumping.

The solids are restrained by the outward centrifugal swirl behind the impeller, the axial expeller and the restricted path to the seal interface.

With the “P” gland, the adjusting gland must face inwards to increase the sealing pressure. The geometric shape of the **gland seal** is carefully designed to give a good seal while limiting the amount of “digging” onto the gland sleeve.

The gland sealing water must be as clean as possible at a pressure of about 5psi (4m water gauge) above the discharge pressure and at a volume of between 1 to 5 gpm depending on pump size. A high flushing water pressure results in greater water use and greater dilution of the pumped slurry without any benefit to the seal.

A pressure-fed grease supply can be used with the “P” gland; be sure to use synthetic rubber parts (special order).



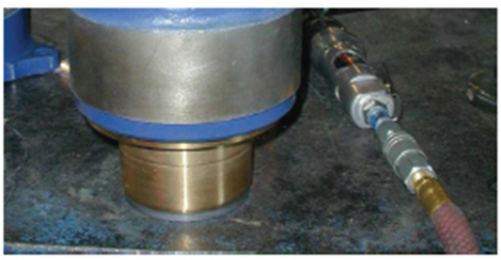
Assembly of Dry Gland – Hard Wear Face & Gland Adjuster (2” x 2” shown)

1. Check all components

2. Extrude epoxy from package & mix thoroughly

3. Apply epoxy to outer rim of Hard Wear Face (D11)

4. Place ‘O’ Ring (D10) on outer rim of Hard Wear Face (D11). Position ‘O’ Ring at leading edge.



5. Position Hard Wear Face & ‘O’ Ring into Gland Adjuster (D03U)

6. Using a slight twisting motion Carefully push Hard Wear Face into Adjuster

7. Wipe off excess epoxy

8. Place a heavy object on top of the assembly until dry (min 30 minutes)

General Pump Suction Requirements

A pump does not "suck," as fluid has no tensile strength. The centrifugal expulsion of fluids creates a low pressure area at the eye of the impeller; atmospheric pressure, plus any static head, pushes fluid into the pump. It is essential that suction systems do not restrict flow from the sump into the pump. With slurries, this is even more important as the solids themselves can settle and cause obstructions to flow.

In order to maintain the short pipelines and prevent obstruction**, cleaning is essential**. A trap to remove tramp material is beneficial as well.

Air entrained in the slurry reduces the pump's capacity and head; an air vent pipe on the suction pipe close to the pump inlet is often essential.

The pump will operate best if the flow velocity approaching the impeller is evenly distributed across the suction eye, and is sensibly axial, without swirl.

Pump performance is potentially impaired by a number of factors. Intake conditions in the sump, such as the formation of vortices, can cause an uneven flow over the eye of the impeller. Intake conditions in the suction pipeline, such as a sharp bend just before the pump, can affect performance as well.

Installation

Important Notes

- The maintenance of rotating machinery should be done by experienced mechanics.
- Protective clothing as well as proper tools and lifting equipment, all in good condition, must be used.
- Do not lift heavy weights without mechanical aids.
- Do not take any risks with your health and safety.
- If a pump has run without discharge, the fluid temperature and pressure may be dangerously high.
- The casing suspension arm is fitted as a maintenance aid only.
- The installer must ensure that guards are fitted in accordance with national & local regulations.

The following notes cover most situations; however, certain installations will require additional assessments.

Noise

Because of its heavy construction, rigid bearing housing and the sound attenuation due to the rubber lining, the noise generated by a bare shaft McLanahan Pump is low: less than 70dB (A).

The noise emission from a complete pump and drive unit will be dependent upon various factors including that from the motor, its fan and the V-belt drive. To obtain an indication of the noise level generated by a specific complete unit, take the highest component noise level, which is generally the motor, and multiply by 1.15.
For example:

dB (A) pump + dB (A) motor + dB (A) drive = 1.15 x dB (A) motor.

Other factors, including the piping system and hydraulically-generated noise as well as any reflected noise, will affect the final installed figure.

Foundations

Location and dimensions must be checked and matched to the pump-certified drawing when holding down bolts, bolt holes in steel work or pockets in concrete. The foundations must be rigid.

The pump base must be level in its final position; it must also be rigidly supported at each bolt, which is designed to hold it down, before the bolts are tightened.

Pipe Work

The suction and delivery pipe work must be independently supported and the pump must not be used as an anchor to pull the pipes into position.

The procedure for discarding solids in an emergency situation should be planned before it is needed. If the removal of suction and delivery pipe work is planned ahead of time, it will facilitate unblocking and servicing of the pump.

Precautionary checks that need to be completed include:

- Areas that could cause restriction on the suction side
- The possibility of thermal expansion in the pipework causing undue loads on the pump
- The pipework should match up to the pump without strain

The lining on the McLanahan model lllr is continued out to form gaskets on the suction and discharge flanges, therefore the use of joint rings or additional gaskets is not necessary. Connections to the pump should be made using flat-faced flanges only.

When fitting McLanahan pumps to rubber-lined equipment such as valves, hose or lined pipe, a steel gasket must be used.

Power

Check that the motor voltage, power and starter rating and supply match.

Gland Services

If gland sealing water is required, the quantity, quality and availability should be checked.

Access

Crane capacity and access routes from the delivery point should be checked. Access for maintenance, protection from flooding, as well as ventilation for motor cooling, must all be checked.

Impeller Adjustment Axially

The position of the rotating element must be set so there is a minimum running clearance, approximately 1/16” – 1/8” between the suction bush and the impeller. The bearing housing must then be locked into position. This clearance should be checked by bolting a dummy flange or stub pipe to the suction flange. This ensures any movement of the rubber lining on connection is allowed. Once connected to suction and delivery lines, the unit should be checked for free rotation.

Coupling Alignment

The pump and motor couplings must be aligned in accordance with good engineering practice. Axial or radial run-out must be less than 0.05 mm total indicated reading on a clock gauge. With V-belt pulleys, the faces of the couplings must be exactly in line and the shafts must be parallel to each other. A check with a straight edge or string line across the pulley faces should have no visible gap.

Motor Rotation

Before the belts are fitted or the couplings are connected, the direction of rotation of the motor must be checked. Incorrect motor rotation can cause the impeller to unscrew and destroy the pump.

Tension V-belts

When the motor's direction of rotation is correct, fit and tension the V-belts in accordance with the maker's recommendation. In general, a quarter to a half twist of the belt will be possible at the center of the belt by simply using fingers. Check the tension after a few running hours.

Belt Guard

The belt guard provided with this pump unit is manufactured with the shaft aperture fully closed with mesh. On installation of the V-belt drive and determination of pulley centers, the shaft guard is offered up and the mesh relieved locally to allow the shafts to pass through. Allowance may be required for movement of shafts when belt tensioning.

The mesh should be relieved and a guard should be fitted in a manner which prevents accidental contact with the rotating parts of the drive assembly.

The installer must ensure that the guard is installed in accordance with national and local regulations.

Gland Service

When these are fitted, be sure that gland water supply and protection systems are working.

Greased Bearings

The pump bearings have been greased at the factory. **Over-greasing them can cause them to overheat**; they should be looked over but may not need grease. **Suitable grease types** are: Shell Alvania 3, Mobil EP2, Caltex LS3 or their equivalents.

Final Checks

- All nuts and bolts are tight
- Gland adjusting nuts are finger tight
- No loose material is lying around the pump set
- The guards are securely fitted and the pump is safe to start

The running speed of the pump must not exceed the following:

Pump	1½ x 1½	2x2	3x3n	4x4	6x5	8x6	10x8	12x10
MAX RPM	2750	2400	2100	1600	1400	1200	1200	900

Electrical Installation

This equipment must be installed and controlled in accordance with applicable national and local regulations.

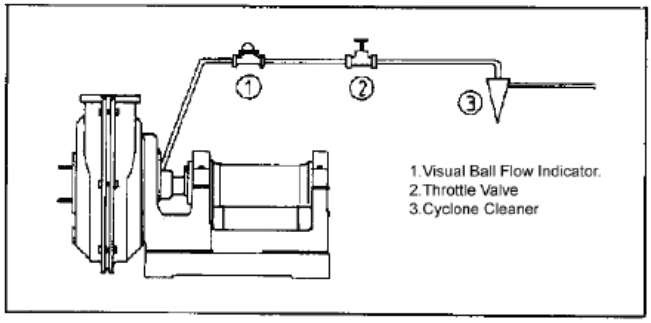
Gland Services

On the hydrostatic gland and also on the packed gland, it is usually necessary to have a clean water flushing supply to the gland.

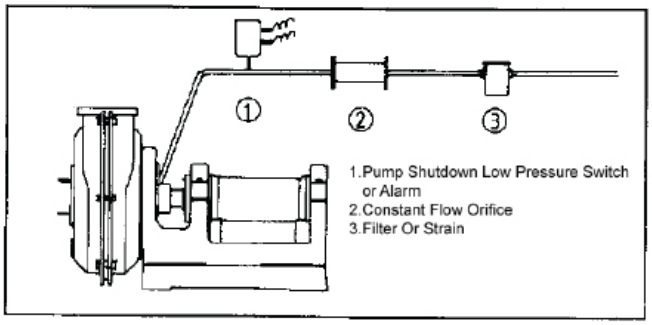
The pressure should be 3-5 psi (2-4m) water gauge above the pump discharge pressure (remember to include the S.G. of the slurry) and the flow rate should be in accordance with the table below.

Pump	units	1½x1½	2x2	3x3n	4x4	6x5	8x6	10x8	12x10
Water flow.	USgpm	1	1	1	2	2	2	3	4
Water flow.	liter/sec	0.04	0.04	0.05	0.07	0.07	0.09	0.1	0.2

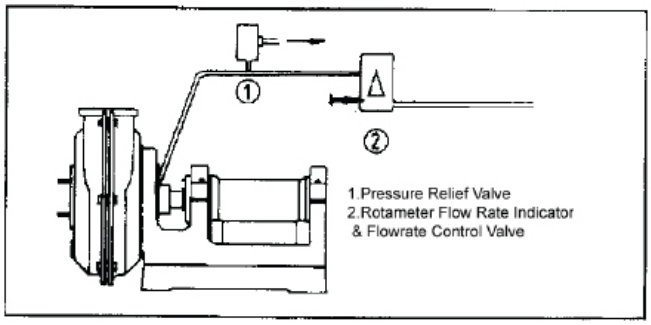
The gland flushing water should be clean. The life of the gland and gland sleeve is significantly affected by the cleanliness of the flushing water. Although a few particles will not do instant damage, the seal life will be reduced. Slurry must not be used.



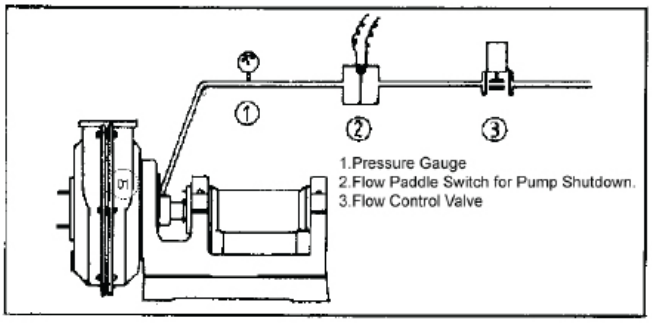
There are many combinations of flow control devices that may be used. A few of these are shown on the diagram below. The objective is to maintain a secure supply of clean flushing water to extend the gland life.



With pumps in series, there are three main ways of supplying gland service water.



- Individual dedicated pumps at the correct pressure and flow rate.
- One large pump at the highest pressure throttling down the supply to each pump in the series.
- One multi-stage pump tapping off a supply at a different stage to each pump in the series.



Gland Service Systems

These are a few typical systems. Any selection of items may be combined.

Lubrication and Cooling

Additional grease must only be added about twice per year, as the bearings are already lubricated. **DO NOT over grease the bearings**.

The bearing assemblies are all checked in the factory to prove that they are correctly assembled.

The bearings are designed to run at high temperatures (maximum 120° C) and the grease has to be compatible with this operating condition. Clean grease must be used.

If water gets into the bearings, the assembly must be stripped, thoroughly dried and greased over; then, any seal failure must be corrected.

Recommended greases are Shell Alvania 3, Mobile EP2, Caltex LS3 or their equivalents.

Start-Up Procedure

The recommended procedure to follow is listed below:

- Check the free rotation of the pump
- If required, verify that water for gland services is running
- At first start, or after any work on the electric motor terminal box, check direction of rotation **with drive belts removed**.
- Prime the pump
- Check that all guards are in place and that the pump is safe to run
- Start the pump
- If the pipeline is empty and there is no discharge valve (possibly due to abrasive nature of the product), the pump motor may be bogged down for a period of time and the pump may begin to go through the process of cavitation. This condition should be examined to evaluate the possible long term effect on the equipment.
- Check the pump for noise, vibration or any hot spots.
- **Adjust the gland to maintain a drip**, which is necessary for lubrication and for cooling.

Shutdown Procedure

This depends ultimately on the system and process flow requirements but the following procedure is recommended.

- Stop the flow of solids into the sump.
- Turn the sluicing water or run system on water only to wash out the pump and delivery pipeline.
- Shut down the pump.
- Shut down the gland service water system.

In cold weather, the pump and auxiliary equipment should be drained to prevent freezing damage.

Disassembly Procedure

Check that all power is switched off and isolated and that it is safe, electrically and mechanically, to work the pump. The following sequence is a general guide to stripping the pump for inspection. Refer to Cross Section drawings in Appendix.

On sizes up to the 4x4 (100x100) there is no separate suction bush or liner.

1. Remove the suction pipe and inspect for wear.
2. Check the suction bush liner for wear, noting any uneven wear pattern and position. Check the axial clearance.
3. Between the suction bush liner and the eye of the impeller (or on smaller pumps between the casing liner and eye of the impeller).
4. Remove nuts and suction bush. The suction bush liner is pushed out of the suction bush from the suction side. Some water spread under the lip of the suction bush liner will lubricate its passage out of the suction bush.

5. Remove casing bolts after supporting the suction side casing. Lift off the suction side casing. A crane will be necessary on the larger pumps.
6. The impeller is exposed for inspection. Hold the shaft using a spanner, which is a good fit, on the flats between the gland and the flinger. The impeller is screwed onto the shaft with an Acme right hand thread. The impeller may be very tightly locked onto the shaft and may need an impact force or a long lever to loosen it. If the impeller is to be used again, protect the rubber against damage. Inspect the impeller and note unusual wear patterns in the flow passages and back or front pump out vanes. Check that the "O" ring behind the impeller has sealed against the gland sleeve and slurry has not corroded the impeller or shaft thread. This "O" ring should be replaced at every strip-down.
7. Remove the axial expeller, which is a stretch fit on the gland sleeve. If "D" gland is fitted, the gland sleeve should be removed at this point.
8. Support the gland side casing, undo the casing to pedestal nuts and remove casing half along with the gland assembly. Undo the gland holding screws and remove the gland assembly. Undo liner nuts. The casing liner can now be removed for inspection; be sure to note any unusual wear patterns.
9. Remove bearing pedestal caps and fixings; unfasten the axial positioning jack to enable bearing assembly to be removed.
10. To disassemble the bearing assembly, remove the gland sleeve, flinger and bearing covers. The bearings can be inspected at this stage. If there is no sign of damage, the bearings should not be disturbed and they should merely be washed out with mild solvent oil and re-greased.
11. Press the shaft (with the bearing still fitted) out of the bearing housing. Push the shaft from the impeller side out of the bearing housing. The inner ring of the front bearing will still be attached to the shaft and can be removed later.
12. The remainder of the front bearing can then be withdrawn from housing.
13. Loosen the tab washer, undo the locknut and pull the end bearing off of the shaft.

Notes:

1. The 2x2, 3x3 and 4x4 pumps do not have a loose suction bush liner or suction bush.
2. The 10x8 (250/200) and larger sizes have the inside gland cover, which is held in position by (H14 / P14 / D14). Undo and withdraw the inside gland cover from the impeller side.
3. The Casing Suspension Arm is fitted as a maintenance aid ONLY and as much may be used to support **singularly**, either of the casing halves and its associated liner or the impeller. It must not be used for any other purpose. Suspension arm not fitted to 1.5 x 1.5 and 2x2 (50/50) pump.

Assembly Procedure

Before assembly, ensure all parts are clean and free of old grease and dirt. The new bearings or replacement bearings should be generously filled with grease between the rollers. Check that the Neoprene grease seals are not soft or distorted. Replace if necessary.

1. Clamp the shaft horizontally in a vice. Heat the spherical roller end bearing in an oil bath or induction heater to 240°F (115°C) and fit it to the drive end of the shaft using clean insulated gloves. Ensure the inner ring of the bearing is hard against its seat by tapping it with a brass pin. Fit the tab washer and the lock nut.
2. Fit the inner ring of the front bearing to the impeller end of the shaft. Ensure, by tapping with a brass pin, that it is hard against its seat.
3. Clamp bearing housing securely, grease bearing. Fit shaft and end bearing assembly into housing. Ensure that outer race of bearing is hard against seat.
4. Fit neoprene seal and bearing cover seal to end cover and fix to bearing housing using set screws.

5. Mount bearing housing vertically with front end upwards and wedge shaft so it is central in the housing. Fill front bearing with grease and carefully tap outer ring into bearing housing.
6. Fit neoprene seal and bearing seal cover to front cover and fix to bearing housing using set screws. Fit V-Ring Seal to shaft and place with slight tension against front cover. Fit flinger ring to shaft and locate in position using screw clamp supplied with flinger ring.
7. Set bearing housing assembly into pedestal and loosely assemble bearing pedestal caps with pedestal cap screws; fit axial positioning jack. Rarely, shims are required for shaft alignment; if factory fitted, the thickness of shim required will be stamped on the vertical face of the pedestal adjacent to the pedestal cap stud.
8. If "D" gland is to be fitted – loosely assemble gland components without damaging the wearing face when fitting. Leave the gland sleeve out, as well as "O" rings and face seal. Fit the gland side liner into the gland side casing by securing with liner nuts. Bolt the gland assembly loosely to the casing. Fit the casing and gland assembly to the pedestal using fixings; take care not to damage the wearing face against the shaft on assembly. Fit the "O" rings and face seal to gland sleeve. Slide home onto shaft, through casing and into the gland assembly. Carefully align gland components (specifically check concentricity of gland parts relative to the shaft) and tighten all fixings.
9. If "H" or "P" gland is to be fitted, fit "O" rings to gland sleeve. Slide home onto the shaft. Loosely assemble gland components, slide over shaft and onto the gland sleeve. Fit the gland side liner into the gland side casing securing with liner nuts. Fit the casing to the pedestal using fixings. Carefully align the components of the gland assembly (specifically check concentricity of gland parts relative to the shaft) and fit to the casing. The axial expeller will then have a stretch fit over the gland sleeve.
10. Smear the impeller thread on the shaft with protective long life graphite grease before screwing on the impeller, ensuring that the impeller "O" ring is fitted into the gland sleeve.
11. Fit the suction side liner in the suction side casing using liner nuts.
12. Fit the suction bush liner inside the suction bush before bolting it to the suction side casing using the bolts. NOTE: using soapy water will facilitate the process.
13. Check the concentricity of the fit between suction bush liner and the impeller.
14. Using the axial positioning jack, adjust the impeller toward the suction bush liner, keeping the holding down studs loose. Check the axial clearance between the impeller and the suction bush liner. A steel ring or dummy flange should be bolted to the suction flange to simulate any distortion in the suction bush liner when connected to the suction pipe before the axial clearance is checked. This clearance should be set at approximately 1/8". Rotate the shaft to ensure effective clearance.
15. Tighten the bearing holding down nuts and the axial positioning jack.

ATTENTION PLANT OPERATORS:
HANG THIS NEAR YOUR PUMP

McLanahan Model IIIr Centrifugal Pump With Type "D" Gland

MOTOR DIRECTION TEST

	*ALWAYS PERFORM THE MOTOR DIRECTION TEST WITH THE V BELTS REMOVED*

Note: The pump ships with the V-belts removed

	*WARNING: RUNNING THE PUMP IN THE WRONG DIRECTION MAY CAUSE THE IMPELLER TO UNSCREW, AND DESTROY THE PUMP.*

A motor direction test should be carried out without the belts installed before running the pump for the first time, or after any work on the motors, switchgear or softstart that may affect the direction of rotation of the motor.

STARTING UP AND RUNNING THE PUMP

	*BEFORE STARTING, ENSURE THAT THIS PUMP IS BEING SUPPLIED WITH GLAND SERVICE WATER. RUNNING THE PUMP WITHOUT GLAND SERVICE WATER WILL DESTROY THE GLAND*

With the pump full of water, and all isolation valves open (if present) start the pump. The pump should immediately start pumping.

BEFORE STARTING THE PUMP FOR THE FIRST TIME

The gland should be pre-set before starting the pump for the first time. To do so:

- Fill the feed sump with water and open the suction isolation valve (if present).
- Evenly adjust the gland Adjusting Nuts (see section 5) so a steady trickle leaks from the gland. Note: On a "P" Gland, tightening the nuts decreases the leak rate.

	*WARNING: THE PUMP MUST NOT BE ALLOWED TO RUN IF IT DOES NOT DISCHARGE*
	*DANGER: RUNNING THE PUMP WITH NO DISCHARGE WILL CAUSE THE LIQUID INSIDE THE PUMP TO HEAT UP. IN EXTREME CASES THIS CAN LEAD TO THE LIQUID BOILING, & THE PUMP CASE MAY EXPLODE*

The outside of the pump may not feel hot, as the rubber lining of the pump acts as thermal insulation. If by accident the pump has run without pumped discharge, it must be stopped immediately and the cause of the problem investigated.

	*DANGER: IF IT IS SUSPECTED THAT THE PUMP HAS OPERATED WITHOUT DISCHARGE, EXTREME CAUTION SHOULD BE USED IN DRAINING THE PUMP – THE LIQUID INSIDE MAY BE DANGEROUSLY HOT AND UNDER PRESSURE*

PRIMING

The McLanahan centrifugal pump is NOT self-priming. For this reason the pump must be installed with a flooded suction, or with the appropriate system for suction lift.

ADJUSTING THE "P" TYPE PACKED GLAND:

Before starting, the gland should have been adjusted so a steady trickle leaks from the gland (see section 2). Check that Gland Service Water is being supplied. See the Manual for details of the flow & pressure requirements.

Final adjustment of the gland should be done with the pump in operation. Tighten the adjusting nuts until the leak reduces to drips. (60 drops /minute maximum, 5 TO 45 drops per minute minimum). Care must be exercised not to tighten too much, which may lead to damage to the seal.

	*WARNING: THE ADJUSTING NUTS SHOULD BE ADJUSTED INCREMENTALY, EVENLY, AND IN TURN, TO ENSURE THAT THE GLAND COMPONENTS STAY PARALLEL. TIGHTENING ONE NUT MORE THAN THE OTHERS MAY CAUSE MISALIGNMENT AND DAMAGE TO THE GLAND*

STOPPING THE PUMP

Before stopping the pump, it is advisable (if possible) to run the pump on clear water before turning it off, to prevent solids from settling out in the pump casing.

LUBRICATION

The Pump comes from the factory fully greased. The Shaft Bearings should be greased with the correct grade of grease every 1000 hours of operation. Inject grease into the grease nipples by six strokes of a regular size (2" diameter body) grease gun.

The recommended grease is "Conoco Tacna HD No. 2" or equivalent grade grease.

MAINTENANCE

Except for attention to the gland while the pump is in operation, there is no daily maintenance required on the pump. It is essential, however, that routine inspections be carried out, with the first such inspection taking place approximately three months from startup. This inspection should provide some idea of the wear rate, which will be a guide for scheduling future inspections and maintenance. For instructions on dismantling and reassembling the pump, see the instruction manual supplied with the pump.

SPARES

Recommended spare parts are listed in the instruction manual. It is recommended that a supply of the wear parts listed be kept in stock so as to minimize down time in the event of failure of the part. (SEE NEXT PAGE)

PUMP BEARING TEMPERATURE

On high speed duties it is to be expected that the bearings will run hotter than on low speed duties. At 150 F (65 C) the assembly will be uncomfortable to the hands for more than a second or two, but this is not unduly hot for the bearing assemblies. The bearings are designed to run at high temperatures, maximum 120° C.

Appendix - Long Term Storage

General:

The following are recommendations in reference to long term storage of McLanahan Pumps and Drives; McLanahan does not accept liability for components under these conditions. Documentation and photographic evidence is necessary for warranties to apply.

Preventive Maintenance for Stored Rotating Spares

In the absence of data on premature bearing failures and armature/shaft sag and imbalance, we recommend a general procedure as follows:

The motor shaft targets should generally be used on any motor of 50HP or higher. They also should be used on fans and any other large rotating equipment that sits in storage for lengthy periods of time. By rotating these shafts monthly (or more, depending on the floor vibrations), you are preventing armature and shaft sag as well as false brinelling of the bearings into the races.

You may also find some smaller motors that have premature bearing failures after prolonged storage in your facility. If this is the case, the shaft targets should be attached (with double-stick foam tape) and smaller motors must be rotated.

What is False Brinelling?

Whenever a **non-rotating bearing** is subjected to external vibration, **false brinelling** can occur. A protective oil film cannot form between the races and rotating elements when the bearing isn't turning, causing metal-to-metal contact. False brinelling can occur during transportation, typically truck or rail, and during motor storage if the storage area is subject to vibration.

Another type of brinelling, **true brinelling** occurs in **rotating bearings**.

Pump

If stored, the pump should be kept in a clean, dry, vibration-free environment. The shaft should be rotated manually every three (3) months, or at the same interval as recommended by the electric motor manufacturer. In order to care for the natural rubber linings and components, follow the recommendations below.

Electric Motor

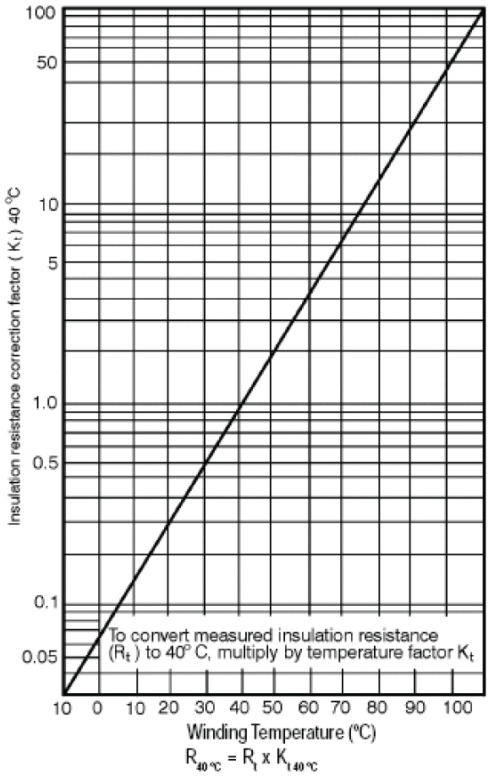
The following information is reprinted from the WEG "Installation and Maintenance Manual for NEMA low Voltage Electric Motors"

Storage

Motors should be raised by their eyebolts and never by their shafts. It is important that high rating three phase motors be raised by their eyebolts. Raising and lowering must be steady; otherwise bearings may be harmed. When motors are not immediately installed, they should be stored in their normal upright position in a dry even temperature place, free of dust, gases and corrosive atmosphere. Other objects should not be placed on or against them. Motors stored over long periods are subject to loss of insulation resistance and oxidation of bearings.

Bearings and lubricant deserve special attention during prolonged periods of storage. Depending on the length and conditions of storage it may be necessary to re-grease or change rusted bearings. The weight of the rotor in an inactive motor tends to expel grease from between the bearing surfaces thereby removing

the protective film that impedes metal-to-metal contact. As a preventive measure against the formation of corrosion by contact, motors should not be stored near machines which cause vibrations, and every 3 month their shafts should be rotated manually.



Insulation resistance fluctuates widely with temperature and humidity variations and the cleanliness of components. When a motor is not immediately put into service it should be protected against moist, high temperatures and impurities, thus avoiding damage to insulation resistance. If the motor has been in storage more than six month or has been subjected to adverse moisture conditions, it is best to check the insulation resistance of the stator winding with a megohmeter. If the resistance is lower than ten megohms the windings should be dried in one of the two following ways:
1) Bake in oven at temperatures not exceeding 194 degrees F until insulation resistance becomes constant.
2) With rotor locked, apply low voltage and gradually increase current through windings until temperature measured with thermometer reaches 194 degrees F. Do not exceed this temperature. If the motor is stored for an extensive period, the rotor must be periodically rotated. Should the ambient conditions be very humid, a periodical inspection is recommended during storage. It is difficult to prescribe rules for the true insulation resistance value of a machine as resistance varies according to the type, size and rated voltage and the state of the insulation material used, method of construction and the machine's insulation antecedents. A lot of experience is necessary in order to decide when a machine is ready or not to be put into service. Periodical records are useful in making this decision.

The following guidelines show the approximate values that can be expected of a clean and dry motor, at 40°C test voltage in applied during one minute.

Insulation resistance Rm is obtained by the formula: $Rm = Vn + 1$

Where: Rm – minimum recommended insulation resistance in MΩ with winding at 40°C
Vn – rated machine voltage in kV

In case the test is carried out at a temperature other than 40°C, the value must be corrected to 40°C using an approximated curve of insulation resistance vs temperature of the winding (see graph below).

Example:
Ambient temperature = 50°C
Motor winding resistance at 50°C = 1.02 MΩ
Correction to 40°C

R 40°C = R 50°C x K 50°C
R 40º C = 1.02 x 1.3
R 40º C = 1.326 M&
The minimum resistance Rm will be:
Rm = Vn + 1
Rm = 0.440 + 1
Rm = 1.440 MΩ

On new motors, lower values are often attained due to solvents present in the insulating varnishes that later evaporate during normal operation.

This does not necessarily mean that the motor is not operational, since insulating resistance will increase after a period of service. On motors which have been in service for a while, a comparison of the values recorded in previous tests on the same motor under similar load, temperature and humidity conditions, serves as a better indication of insulation condition than that of the value derived from a single test. The cause for any substantial or sudden reduction should be determined, followed by corrective action.

Insulation resistance is usually measured with a **megger**.

In the event that insulation resistance is inferior to the values derived from the above formula, motors should be subjected to a drying process.

Drying the windings

Only qualified personnel should carry out this operation. The temperature should not rise more than 5°C per hour and the overall temperature should not exceed 105°C; if either of these two things occur, vapor which is harmful to the insulation, may be generated.

Temperature should be accurately controlled and insulation resistance should be properly measured at regular intervals during the drying process. During early stages of drying, insulation resistance will decrease as a result of the temperature increasing. However, the resistance will increase again when the insulation dries a little more.

The drying process should be extended until successive measurements of insulation resistance indicate that a constant value above the minimum acceptable value has been attained. It is extremely important that the interior of the motor be well-ventilated during the drying operation to ensure that the dampness is really removed.

Heat for drying can be obtained from outside sources such as an oven or space heater, or by introducing a current through the actual winding of the motor being dried.

Electric machines should be installed in order to allow an easy access for inspection and maintenance. Should the surrounding atmosphere be humid, corrosive or contain flammable substances or particles, it is essential to ensure an adequate degree of protection. The installation of motors in environments where there are vapors, gases or dusts, flammable or combustible materials, subject to fire or explosion, should be undertaken according to appropriate and governing codes, such as NEC Art. 500 (National Electrical Code) and UL-674 (Underwriters Laboratories, Inc.) standards.

Under no circumstances are motors to be enclosed in boxes or covered with materials which may impede or reduce the free circulation of ventilating air. Machines fitted with external ventilation should be at least 50cm from the wall to permit the passage of air. The opening for the entry and exit of air flow should never be obstructed or reduced by conductors, pipes or other objects. The place of installation should allow for renewal at a rate of 700 cubic feet per minute for each 75 HP motor capacity.

Rubber Products

Rubber products in storage can be adversely affected by several factors, including:

- Temperature
- Humidity
- Ozone
- Sunlight
- Oils
- Solvents
- Corrosive liquids and fumes
- Insects and rodents
- Radiation

The warehousing area should be relatively cool, dark and free from dampness and mildew. All rubber products should be used on a first-in, first-out basis since even under these conditions an unusual length of time in storage can result in the deterioration of certain products.

The ideal storage temperature for rubber products is 50 to 70°F (10 to 21°C) with a maximum limit of 100°F (38°C). If stored below 32°F (0°C), some products may become stiff and should be warmed before being placed in service. Rubber products should not be stored near sources of heat, such as radiators and base heaters.

Rubber products **should not** be stored under conditions of high or low humidity.

To protect against the adverse effects of ozone, rubber products should not be stored near electrical equipment that may generate ozone and should not be stored for any lengthy period in geographical areas of known high ozone concentrations. Exposure to direct and reflected sunlight should also be avoided.

Whenever viable, rubber products should be stored in their original shipping containers, especially when such containers are wooden crates or cardboard cartons; this will provide protection against the deteriorating effects of oils, solvents and corrosive liquids, and will also provide some protection against ozone and sunlight.

Certain rodents and insects thrive on rubber products, so the equipment must be protected.

McLanahan ***Pump Applications***

Sand plants
Feeding sand and water to all types of classification and dewatering plants; effluent water transfer duties.

Coal preparation plants
For dense medium circuits, feeding hydrocyclones, filtrate pumping, handling the underflow from thickeners, disposal of effluent, etc.

Chemical manufacturing & Environmental applications
McLanahan pumps, by virtue of their various rubber linings, are suitable for pumping many chemical solutions, acid or alkaline, at moderate temperatures and for the disposal of effluent.

Cement manufacture
Slurry feed to: tube mill circuits, thickener feed and underflow, flotation plant circuits.

Metalliferous mining
Mill circuits, feeding hydrocyclones, cyanide plant filter residues, concentrates, tailings disposal and other pulp and slurry handling duties.

Irrigation systems and dredging
Silt removal in dams and canal sand traps

Paper mills
China clay slurries, paper stock, effluent disposal

Steel works and manufacturing applications
Pickling acid distribution circuits in plate and wire de-scaling plants, abrasive wet scrubber blow-down

Power stations
Boiler house ash disposal, de-scaling plants

China clay production
Feeding slurry to hydrocyclones and for general use in the preparation of china clay

Glass manufacturing
Feeding polishing media, sand plants, handling effluent

Troubleshooting

If a pump fails to pump through a blockage, switch off **immediately**. Take extreme care as the pump may be filled with scorching steam and solids at a high pressure.

Wear and Replacement of Parts

To obtain the best service and performance from the pump, periodic routine inspections should be executed. The rate of wear on pumps is not precisely predictable since it varies from one application to the next, so intervals at which these inspections should be made vary. Initially, the pump should be allowed to run for a period of time (for example, three months); afterward, an examination of the pump will give some idea of the length of life, which may be expected from the rubber-covered parts.

No Discharge When Pump Runs

The pump must not be allowed to run if it does not discharge. If it is noted that the pump has been running without discharge, cease it immediately.

Take extreme care in dismantling after such an occurrence due to high temperature and pressure, which may be present in the pump casing. Do not remove the drain plug until the fluid temperature in the pump has dropped.

Air Lock

Air lock in the casing is the most common cause of failure on a newly installed pump. Even when a pump is well below water level, it may retain a large bubble inside the casing, which prevents the start of pumping. This phenomenon is far more likely with horizontal undershot discharge branch arrangements than any other practical configuration. It is least likely with horizontal overshot arrangements.

If you suspect air lock as the cause of failure to pump, start and stop pump several times to drive the air out, one fraction at a time. When using this procedure, ensure that you do not damage the motor starter or burn out the motor by trying too many starts in a short period of time. The number of permissible attempts will vary with the equipment installed but usually it is safe to try one start every three to four minutes.

Inadequate Prime

Failure to pump may be caused by inadequate priming. This is usually rectified by allowing more time for priming to occur.

It is possible when “jet priming” to have such a small amount of priming water that the pump will never prime; in this case, more water for the priming option will be needed.

Usually, the diameter of the priming branch should be at least one-third of the diameter of the suction pipe. NOTE: 2” (50mm) will prime 6” (150mm), 3” (80mm) will prime 8” (200mm) etc. The minimum water required is about 30% of the pump capacity.

If priming is by vacuum pump, there must be a valve or at least an air-lock on the delivery side. The vacuum pump must be able to “beat” the air leakage throughout the gland. To assist in this, always attempt to prime with the gland water running, no matter what style of priming is being attempted.

Installation Faults

Failure to discharge on start-up can be caused by installation faults. The most common is inadequate sump capacity. The result of installing a sump with inadequate capacity is to risk repeated air-locks of the pump. This can happen when the pump reduces the water level, either allowing a vortex to form, which air-locks the pump, or (when water is introduced to the sump) it entrains so much air that it produces the same effect.

A small sump can easily prevent any discharge reaching the end of the pump discharge line. The only remedy is to extend the sump capacity. We recommend sumps of at least one minute's pumping time as a minimum. NOTE: This recommendation does not apply to feed regulating sumps in sand plants where greater capacity is required.

Other installation faults are more obvious, such as tramp material lodged over a pump suction or a kinked suction hose.

Brief Discharge Only

1. Air Lock

A pump with a suction lift and partial air lock will often start to pump at a greatly reduced rate after each start, and then it will give up completely. At the discharge end of the pipe this may appear as a brief surge followed by failure.

This problem can only be overcome by closer attention to the priming system.

2. Obstructed Suction

If the suction line is obstructed either by tramp material or a delaminated suction hose lining, the pump may start well. However, when the discharge rate rises, the suction obstruction throttles the pump in a way that it quickly fails by gross cavitation.

Detection of this sort of condition is difficult. The only way to guarantee finding out what is actually happening is by using a vacuum gauge immediately before the pump suction. An obstructed suction line will be indicated by a sudden increase in vacuum reading immediately before the failure.

3. Lack of Delivery Resistance

A pump, which is required to pump with a suction or with a fair length of suction pipe, although with practically no resistance on the delivery side, may pump briefly before failing. The reason for this is that centrifugal pumps on open discharge need positive pressure on the suction eye to prevent gross cavitation. If the installation does not provide sufficient positive pressure on the suction side, the pump will fail.

Usually, the easiest way to overcome this difficulty is to artificially create resistance on the delivery side by extending the pipe work or introducing a valve or other resistance, such as an orifice.

Pumps water but not solids

1. Air Leaks on Suction Side

Joints in the suction line or air entrainment with feed into a sump may be insufficient if they are made poorly. Poorly made joints sometimes prevent a pump from pumping water satisfactorily. However, when solids are introduced (particularly coarse solids) the pump has a more arduous duty; it has to entrain the solids into the fast moving stream in the suction pipe. In effect, it has to "dredge" the solids

into the stream. Even if the solids were already moving in the right general direction, they must be accelerated up to the water velocity and thus they act as a suction resistance for the pump.

Introducing solids into an aerated system will cause failure. The pump can only handle a small margin of solids when pumping water alone. Air leaks can usually be detected as water leaks when the pump is not running; **where water can get out, air can get in**. Air entrainment with the feed can sometimes be overcome by the use of baffles in the sump. The air bubbles have time to rise to the surface before being drawn down to the suction.

2. Poor Suction Line

Several different factors in the suction line may allow a pump to appear adequate when it is not. A long suction line, a line with a considerably small diameter or a line with a restriction (sudden step-downs in diameter are the worst) will all affect whether or not the pump can handle solids. The reasons for this are explained in the two previous paragraphs.

Reworking the suction line is the only solution to this problem. If the line increased in diameter it should be brought to the pump inlet diameter by a specially rolled flanged taper pipe. It must not be stepped down by a mismatch.

3. Electric Motor Wrongly Wired

Most Squirrel Cage Induction Motors can be wired in two ways: **Star** or **Delta**. In order to reduce the current surge when a motor is brought **on line**, some users start their motors in **Star.** They do this because this mode gives good starting torque and a reduced starting current surge. Then, change to running their motors in **Delta** once smooth starting has been achieved. The **Delta** mode of powering the motor increases the speed close to synchronous speed, which is maximum, and maintains a constant speed under variations in load.

If a motor is left to run continuously in **Star**, it will vary its speed dramatically with load. If a mistake has been made in the wiring of the motor, it may appear that the pump is unable to pick up solids but is still pumping water. The reason would be that on **Star**, the motor speed drops when the solids load comes on.

To detect this fault, the easiest method is to check the speed of the motor shaft and compare it with the Nameplate rating. There should not be more than a few RPM difference between Nameplate RPM rating and actual speed, no matter what load the pump is pulling.

NOTE: Correction of this fault is intended for an electrician.

Overloads for Motor Trip Out

1. Wrong Pump Speed

The power drawn by a centrifugal pump discharging through a given delivery system is approximately proportional to the cube of its speed. As an example, if the speed is changed by 20% to 1.2 times the original speed, you can expect its power demand to rise by the cube of 1.2, i.e. 1.728, or nearly 73% above the original. Even a rise in speed of 10% to 1.1 times the original speed will give a rise of 33% in power demanded by the pump.

The relationship is not exact but it is close enough for field calculation purposes.

If a pump is run at the wrong speed, it can make a considerable difference to the load drawn from the motor.

Calculation of the correct pump speed is based on:

- Flow rate to be pumped
- Difference in height between pump and discharge points
- Length, diameter and inner surface of pipeline through which pump must deliver
- Number of elbows, bends, valves, other fittings in pipeline
- Equipment at end of pipeline such as hydrocyclones, pressurized distributors, jets, etc.
- Grading, tonnage and specific gravity of solids to be pumped
- Pump performance curves

As far as fault finding is concerned, the actual RPM of a pump should be compared with the RPM specified. Corrections to pump speed can be made by pulley changes.

2. Changed Pipeline System

It is not uncommon for a pump speed to be calculated on the basis of a pipeline system intended to be used at the time of the negotiations for the purchase of the pump, but to be commissioned into service with a different pipeline system. A client may say, "but it's not such a high lift so the pump does not have to work quite so hard." **This is not true.** At a given pump speed, a pump will pump a larger amount through a shorter pipeline (or lesser vertical height) and **will take more power**, not less.

When confronted with this situation, the only thing to do is to calculate the correct **head** and RPM before making a pulley change. The affinity rule can be used or the drive can be recalculated.

3. Low Voltage

The power consumed by an electric motor is the product of the voltage, amperage and power factor for the motor. If a pump demands a certain power from the motor, the motor in turn will demand corresponding amperage from the electric supply system. However, if the voltage of the electric supply system happens to be lower than normal, the motor will draw extra amps to meet the pump's power demand. This way the power consumed by the motor, the product of voltage, amperage and power factor remains unchanged.

Circumstances where lower than standard voltages might be encountered include:

- When power supply is from a generator set
- At the end of a long trailing cable
- At the end of an electric supply system remote from the nearest transformer substation
- In an area where very heavy start-up loads can occur, such as near large crusher stations or long conveyor installations

Low voltage can readily cause a motor overload by drawing higher than expected amps; this is, in no way, related to the pump itself.

If low voltage is suspected as the cause of motor overload, a qualified electrician should be called.

4. Wrongly Set Overload Protection

All motor starting equipment has some form of overload protection equipment built into the system so a burnt out motor or locked-rotor motor does not cause more extensive damage. If a motor repeatedly drops out on overload and there is no other readily apparent reason, the electrical overload protection equipment should be checked.

5. Mechanical Fault in Pump

The pump shaft should be free to turn by hand. Remove the V-belts and check the pump shaft for freedom to turn. If there is no resistance, the fault must be in the motor. If a jarring or resistance can be felt when attempting to turn the pump shaft, drop off the suction pipe and check the clearance between the impeller and suction plate. Also check for blockages.

If this proves clear, remove the suction bush and look for marks on the surface of the impeller, which might indicate if the impeller has been rubbing. In this case, rotate the shaft again to determine if the resistance is still present; if it is, remove the impeller and inspect the gland side liner. If there is still no evidence of rubbing, rotate the shaft by hand again to check that the resistance is still present; then, remove the gland sleeve. If the resistance can still be felt by hand it can only be the bearings of the pump.

The remedies for the faults, which may be revealed by this step-by-step approach are:

- Impeller rubs on suction bush: release bearing housing, set impeller to suction bush clearance by adjusting position of bearing housing until impeller runs free. Tighten bearing housing. Replace suction pipe. Re-align belt drive.
- Impeller rubs on gland half lining; reset the suction bush clearance. Check for movement of casing liner.
- Seizure in the gland area. Strip and inspect.
- Shaft tight in bearings; there is no simple field remedy if the pump shaft is found to be tight in the bearings, the rotating assembly must be removed and stripped for inspection of the bearings and grease seals.

6. Air Entrainment

In sump-fed pump systems, air entrainment with the pump feed can produce periodic overloads on the motor by the following sequence of events:

- Air entrainment with feed gives the pump a “spongy” pulp, which reduces the pump throughput and power.
- Flow through the sump is reduced allowing air in the feed now entering the sump to escape to the surface. Solids, of course, reach the pump suction.
- The pump now has a largely de-aired pulp of far greater percentage solids than intended, and the power demand rises. At this stage the pump may choke. This is a dangerous condition.
- Pump entrains the accumulated solids into suction pipeline and begins to pump normally again, increasing throughput through sump.
- Air entrainment begins to reach pump suction again and sequence repeats.
- Air entrainment can permanently reduce slurry throughput and make it appear as if the pump is not working.

In small installations this surge may be repeated at three minute intervals; in large installations, it may take as long as five minutes for the full cycle to complete. If the cycle terminates at stage three, the pump may explode, if it is left to run while blocked.

Pump Handles Only a Limited Percentage Solids

Pump Speed Incorrect

With increasing solids feed into a pumping system three major factors will limit the percentage solids handled:

- Friction resistance increases, leaving less pressure on the delivery side to maintain the velocity in the pipeline
- Critical (settling) velocity for the pulp in the pipeline increases
- Pump performance "drops" so that the total head generated by the pump diminishes

Clearly, if the pump speed has been calculated for water only, increasing tonnages of solids are fed into the system; the combination of factors above may soon produce a situation where the pipeline velocity is too low to maintain movement of the solids.

Air Entrainment

Under 15.3, section 1 above, there is an explanation of how a pump can handle water, but due to the air entrainment, fails when solids are introduced to the system. The same fault can sometimes explain why a pump appears to perform well on pulp up to a certain percentage solids, then "gives up" when this is passed.

Poor Suction Line

A suction line layout as described in 15.3, section 2 is far worse as the percentage solids is increased and can become completely blocked.

Cavitation

If a pump is expected to draw relatively coarse solids from a sump below the pump centerline, depending on the speed of the pump and its capacity in relation to the flow rate being handled, it may suffer from cavitation. When this happens, and the onset is often quite sudden and sharp, the total head generated by the pump diminishes dramatically. As described previously, the conditions for blocking a line are suddenly created; namely reduced delivery pressure for maintaining flow combined with increased requirement for velocity in the pipeline.

Generally, if cavitation is the source of the trouble, there is ample evidence; audible cavitation "rattle" in the pump or from the bearings, sudden reduction in power demand, the gland leaks or draws air and there is a dramatic drop in delivery pressure.

The solution to the problem is to make the suction arrangements as smooth as possible without restrictions as well as to arrange for the feed to come gradually up to load without sudden surges of solids. If these measures do not overcome the problem it may be necessary to change the suction line to a size larger and fit a flat topped taper-piece to the pump suction. If trouble persists, a larger pump will have to be installed. Something effective must be done as the situation is potentially dangerous.

Gland Will Not Seal Adequately

1. Poor Adjustment

The outer seal of a Hydrostatic gland assembly must be allowed to rub lightly on the gland sleeve for an effective seal to be maintained. If the gland adjuster is pushed in too far this will lift the seal off the sleeve and the gland will leak profusely. When seeing a leaking gland, most people immediately think

to tighten it. With the Hydrostatic gland, the **gland adjuster must be moved outward to reduce leakage.**

Type D and P glands should be tightened for reduction of leakage in the same way as standard packed glands in water pumps. **Over tightening should be avoided**, especially on "D" glands as a drip is always necessary to lubricate the rubber face seal.

2. Dry Running

The glands will not be damaged by a few seconds of running without lubrication and cooling by water, but if either gland runs for a length of time without water in the pump, there is danger of melting the rubber seals. If a Type D gland has been correctly adjusted, this is a fairly remote danger because without hydraulic pressure to force the rubber seal against the gland seat, the seal should run without touching the seat. However, do not run a pump in dry conditions because of the danger of damaging the gland seals.

Once seals have been damaged in this way, they must be replaced.

3. Too Much Sealing Pressure

Too much water pressure in either type of gland can make the glands almost impossible to seal reliably. With Hydrostatic glands the solution to the problem is to insert a pressure control in the gland water line. With Type D glands the problem usually only arises with pumps being run in a series or as booster pumps. In either case, the only solution is to convert the pump over to H gland or P gland and provide suitably pressured gland water.

4. Inadequate Prime

The "snore" condition for operating a pump is very difficult to seal without unacceptable leakage. Under this condition a pump continuously receives a good proportion of air drawn in with the pulp from the sump, in which the level is too low, or the sump has inadequate capacity, or both. The sump should contain a minimum of one minute's pumping time.

Excessive Heat in Drive

1. Slack V-belts

The most common cause for generation of heat in the drive to a newly installed pump is undoubtedly lack of tension in the V-belts. All V-belts should be tensioned periodically and newly commissioned drives should be re-tensioned an hour or so after start up.

This fault is easily detected (pulleys are the hottest part of the drive) as the belts will have been slipping.

2. Hot pump Bearings

On high speed duties it is to be expected that the bearings will run hotter than on low speed duties. Providing the shaft is free spinning by hand, the heat generated while running under power is probably immaterial. At 150°F (65°C) the assembly will be uncomfortable to the hands for more than a second or two; this is not unduly hot for the bearing assembles. If the bearing is failing, the shaft will not run free.

3. Inadequate Lubrication of Pump Bearings

The bearings will be charged with grease before dispatch from the factory. Details of lubricants are given in this Manual.

Addition of grease should be tried if bearings become very hot or noisy. Excess greasing should be avoided.

4. Motor Runs Hot

Motors are intended to run hot. With Continuous Maximum Rated Motors, the temperature rises are surprising and are allowed for in the design of the motor and the selection of the insulation.

Generally, heat from a motor can be safely ignored, provided the amperage drawn is lower or equal to the nameplate rating. Many motors are fitted with Thermistors in the windings, which sense the temperature rise and are wired to operate a cut-out relay if the temperature exceeds a safe limit.

If a pump is choked when the motor starts, the protection must trip out the supply to the motor.

Bearing troubles in motors are generally indicated b noise as well as heat and can sometimes be detected by use of a long-stemmed screwdriver. The blade of the screwdriver is pushed against the bearing cover and the ear of the investigator pushed up to the handle. With a limited amount of experience bearing "rumble" can quite easily be detected.

Sudden Reduction in Discharge

1. Change in Feed Conditions

Operators do not always recognize a pump as simply one element in a complete system and any change in that system will bear on all the parts of it. For instance, if a screen rejecting plus ¼" (6 mm) material is worn and passes 1" (25 mm) stones, this affects the pump performance. The suction resistance of the larger stones will cause the suction pressure to reduce and have less head available for pushing the pulp through the delivery side piping.

At the pump, the larger stones will make a significant difference to the pump performance, decreasing flow and potentially causing damage to Impeller and Linings.

In the pipeline, the large stones will probably progress by "saltation," that is, leaping along the bottom of the pipe. The rest of the pulp is fully in suspension and has to flow past these slow moving obstacles. Overall this means the resistance of the pipeline to flow has increased, thus, again reducing flow.

A simple fault such as a screen cloth with a hole in it can cause a sudden reduction in discharge. If it causes the pipeline to block, the condition is potentially dangerous.

Other changes in feed conditions, which must be investigated are: increased tonnage of solids, change of grading of solids and change in manner of introduction of solids to pump system. On this last count, a plant, which was started in summer, and is bin-fed via a vibrating feeder, will perform differently in winter when the wetter feed "hangs up" in the feed bin and collapses down onto the feeder intermittently in larger dollops.

2. Air leaks on the Suction Pipe

A pipe, which has been steadily wearing away from the inside may break through to the open air near a flange (in a welded area) at the bottom of the pipe, which is where the coarsest solids run. In a suction pipe this will almost certainly allow air into the pipe with all the resultant ills described elsewhere.

Frequently, a pinhole leak will not allow enough air into a pump for any of the five faults listed to become critical. Operators, being human, postpone the repair or replacement of the worn pipe. The last chapter of the saga occurs surprisingly quickly and usually on nightshift – when fault produces a blocked pipeline.

3. Suction Blockage

In dredging applications there is always the danger that the pump suction will be suddenly submerged in collapsed solids from the surrounding pit contours. When pumping from a sump, the same thing can happen when solids, which have been clinging precariously to the steel sides of the sump, subside and momentarily block the pump suction.

If the pump is feeding a fair length of delivery piping, it will not be possible for the long column of pulp in that piping to come instantly to rest when the suction gets blocked. The pulp in an 8" (200mm) pipe, 1000 ft (300 m) long, moving at 10ft/sec (3 m/sec) has considerable momentum. It cannot be stopped dead in the same short length of time it takes to block the suction.

The result is a massive reduction in pressure throughout the system. It can cause a massive "water hammer" and surges that can split the pump casing, valves and piping. This can cause hoses to collapse – delivery as well as suction – and almost invariably leads to a great gulp of air being sucked through the pump gland. Usually this is sufficient to air-lock the pump.

When an operator hears the air hiss into the gland and then has to contend with the resultant air-lock, the assumption is that the gland is at fault for pump failure. However, the trouble generally begins at the end of the suction pipe and the gland collapses afterward.

In dredging applications, better control should be taken over the pit development. In sump-fed systems, the feed pulp can sometimes be directed to flush away any build-up of solids on the sides or valleys of the sump.

If this is not possible, a larger capacity take-off box at the base of the sump must improve the situation. The blocked pipeline situation is potentially dangerous.

4. Tramp Material

The simplest explanations of a fault should never be overlooked. If the complaint is sudden reduction in discharge, drain the sump and before removing any pipe work or dismantling the pump in any way, examine the take-off box at the base of the sump.

Sudden Increases in Power Demand

5. Damage Inside Pump

Pumps wear with each use. Results of abrasion, which will give an increase in power demand, are shown below in order of occurrence frequency.

- Excessive gap between impeller and suction bush
- Cut or ripped rubber in suction bush or casing gland rubbing against impeller
- Worn out cutwater
- Worn out or broken casing liners
- Impeller worn through back shroud
- Impeller passages worn significantly wider than intended

6. Change in Pipeline System

DO NOT alter pipeline system by shortening or changing layout. If altered, it will pump larger amounts and take more power.

7. Low Voltage

A new installation near the pump site can make a significant difference in the amount of voltage available, depending on the electric distribution system in the area. Lower volts means higher current for the same power output of the motor.

8. Changed Pump Speed

When dismounting both pump and motor pulleys, electricians have, in the past, interchanged the pulleys when reassembling the pump set. Ensure this does not happen.

9. Air Entrainment

In sump-fed pump systems, air entrainment can produce cyclic pump overload, caused by a change to the amount or direction in which a sump is fed. It could also be caused by a casual change to the feed type baffle arrangement in the sump.

Rapid Component Wear

1. Air Entrainment

As an experiment, place some sand in an empty bottle, fill the bottle to the very top with water, place the palm of one hand over the top and shake the bottle. You will find it difficult to move the sand vigorously against your hand. Now tip out a third of the water, and repeat the test. You will undoubtedly feel the sand in the air-water froth hitting your palm.

The point of the experiment is to show how much more readily sand can move around in froth than it can in water without air bubbles. Therefore any air leaks in the suction side accelerate abrasion.

If air entrainment is severe enough to produce an air lock in the presence of solids and water, the result is an escalation of the abrasion rate.

Air entrainment can also cause severe abrasion indirectly. With cyclic changes in pulp density due to air, the pump may have to handle far denser pulp than intended. This is also an abrasive accelerator.

2. Properties of the Solids

When confronted with a rapid abrasion problem such as coarse or sharp-edged particles, always reduce pump speed if possible. A larger pump with a larger diameter impeller will be rotating slower at the suction eye of the impeller for a given head than a smaller pump would. So, if wear on the leading edge of the vanes occurs, a larger pump would help.

3. Change in Feed Conditions

A change in feed conditions, such as extra tonnage, coarser grading or higher proportion of crushed material will all affect the rate of wear on a pump. As an example, deposits from a river are notoriously variable; the proportion of crushed sand in relation to natural sand can vary widely. However, to the operator, sand is sand, and the fact that the pump is now handling, say 80% crushed material, while three months ago it was 60% natural sand may not appear significant.

If there is a permanent change in feed conditions, which makes component life unsatisfactory, consider modifying the pump. A two-stage pump set will allow each pump to run at about 70% of the speed that a single unit would run, which would make a significant change to the abrasion rate.

4. Shaft Misalignment

After several years of wear and tear, the saddles on the pedestal occasionally wear out, thus allowing the shaft to point downward. If the eccentricity of the shaft through the gland is severe enough, the gland will not seal properly. There will also be a misalignment between the eye of the impeller and the suction bush, which will detract from pump performance. In this case, the most effective solution, reducing cost and saving time, would be to purchase a new pedestal. Temporarily, the saddles may be packed with shims; however, these inevitably get lost during impeller adjustment.

Mechanical Failure

1. Broken Shaft

Typically, the only broken shafts on McLanahan pumps are those where there has been tramp material in the feed, a bearing has seized, or slurry has worn through the gland sleeve. In this case, wear will of course weaken the shaft.

2. Broken Pedestal or Casing

Although the front bracket of the pump pedestal appears massive, it can be broken down from the box section of the pedestal by simply starting the pump backwards. As a result, the impeller will begin to unscrew from the shaft, and while in motion, strikes the suction bush, which is fixed in place by the flange of the suction pipe work. Because something has to give, occasionally, with older shafts, the thread in the shaft is stripped instead of the pedestal being broken.

Realigning broken pedestals can be quite difficult; therefore, the quickest, most cost-effective way to fix a broken pedestal is merely to replace it.

A pump running backwards is an electrical problem, which is overcome quite easily, and should not happen to begin with. Electricians are required to check the direction of rotation of a motor prior to fitting the V-belts onto the pulleys.

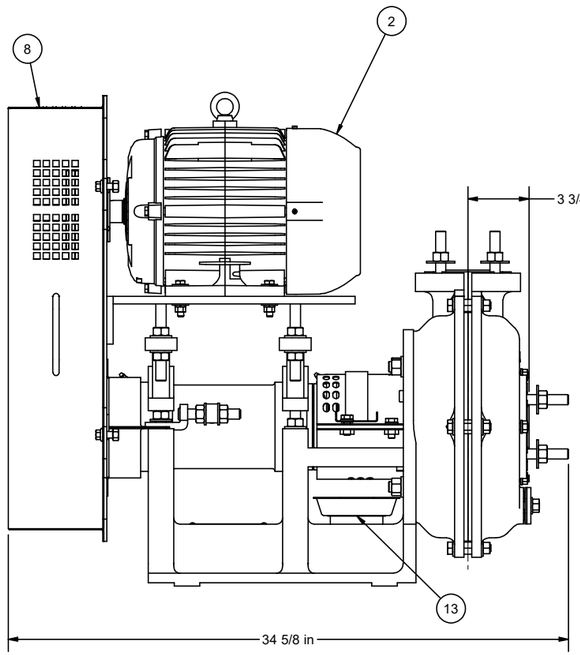
3. Pump Explodes

The centrifugal pump (McLanahan or any other) can potentially explode by running with pulp or water in the casing when there is no discharge. This can happen in a pump that is drawing pulp from a sump and pumping it to a cyclone through a rising pipeline. If the pump receives a sudden surge of solids, which blocks off the suction, flow will cease. In the delivery line, the solids will settle in the rising pipe but will be unable to enter the casing because the impeller will still be spinning.

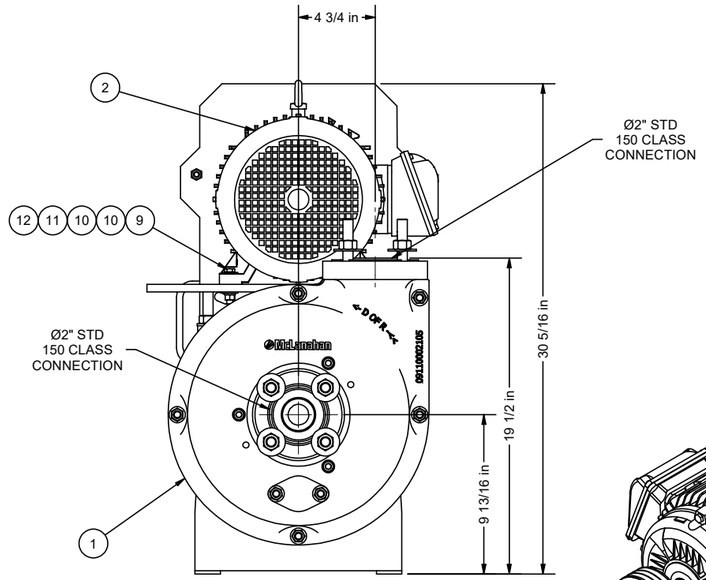
As the impeller rotates, the pump will continue absorbing power. The power raises the fluid temperature. The water will eventually boil and the pressure may be enough to destroy the rubber or cause the pump head to explode. **If a pump head feels unusually warm and is not discharging**, switch the power off immediately. **Do not approach the pump** until it has been relieved of pressure, preferably through the suction or discharge pipework by flushing away the solids plugs. A sign that a pump may explode will be a considerable amount of steam leaking from the gland.

NOTE: at this point, even if a pump does not feel hot, be extremely cautious when dismantling, as the pump may be full of scalding water. Do not remove the drain plug until certain the fluid temperature in the pump has reduced. If in doubt, carefully clear blockages in the manner described above.

2X2 DRY GLAND PUMP SPARE PARTS LIST



OVERVIEW



McLANAHAN CORPORATION recommends that you keep certain replacement parts at your facility. These parts will be available in the event of a breakdown and will also be available to perform any repairs that must be made as a result of regularly scheduled maintenance checks. **McLANAHAN CORPORATION** stocks a wide variety of commonly used components; however storing these parts at your facility will eliminate the expense of air-freighting critical parts that may be required during a breakdown situation. Refer to the "PARTS LIST AND ASSEMBLY" drawing(s) to assist with parts identification, part numbers and quantities. Contact the Parts Department at **McLANAHAN CORPORATION** for price and availability of all parts for your McLanahan equipment.

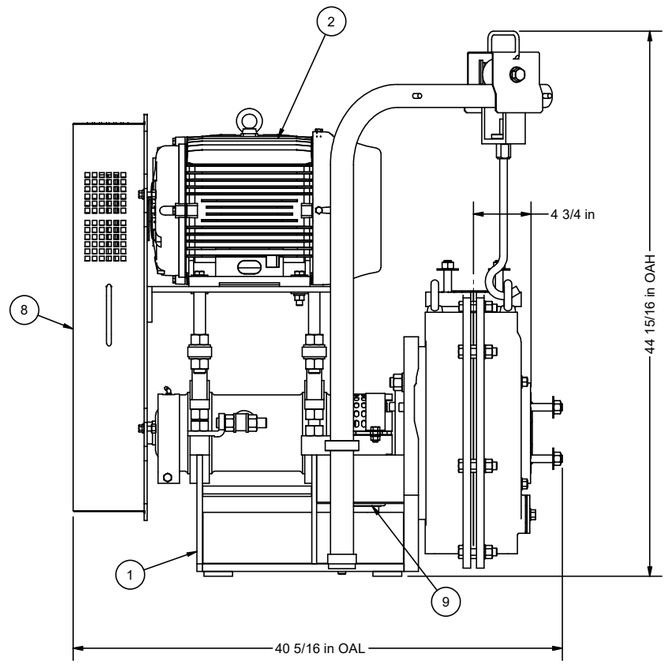
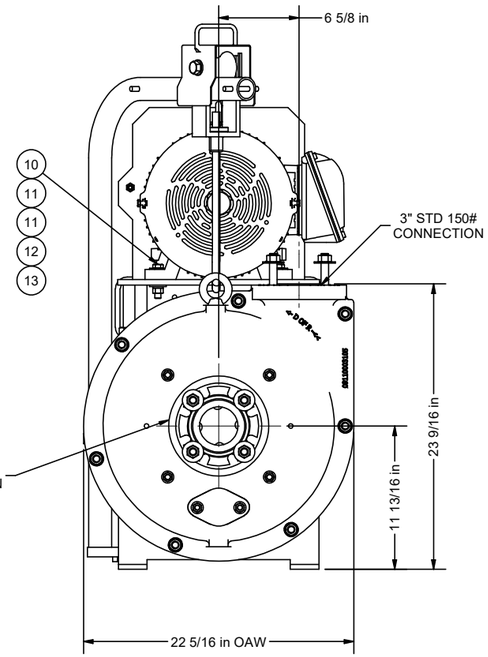
3 X 3 DRY GLAND PUMP SPARE PARTS LIST

OVERVIEW



McLANAHAN CORPORATION recommends that you keep certain replacement parts at your facility. These parts will be available in the event of a breakdown and will also be available to perform any repairs that must be made as a result of regularly scheduled maintenance checks. **McLANAHAN CORPORATION** stocks a wide variety of commonly used components; however storing these parts at your facility will eliminate the expense of air-freighting critical parts that may be required during a breakdown situation. Refer to the "PARTS LIST AND ASSEMBLY" drawing(s) to assist with parts identification, part numbers and quantities. Contact the Parts Department at **McLANAHAN CORPORATION** for price and availability of all parts for your McLanahan equipment.



Qty	Part Number	Description	Lead Time	Price Each
1	09110003321	Dry Gland Repair Kit	Stock	$1223.00
1	09110003225	Bearing Repair Kit	Stock	$675.00

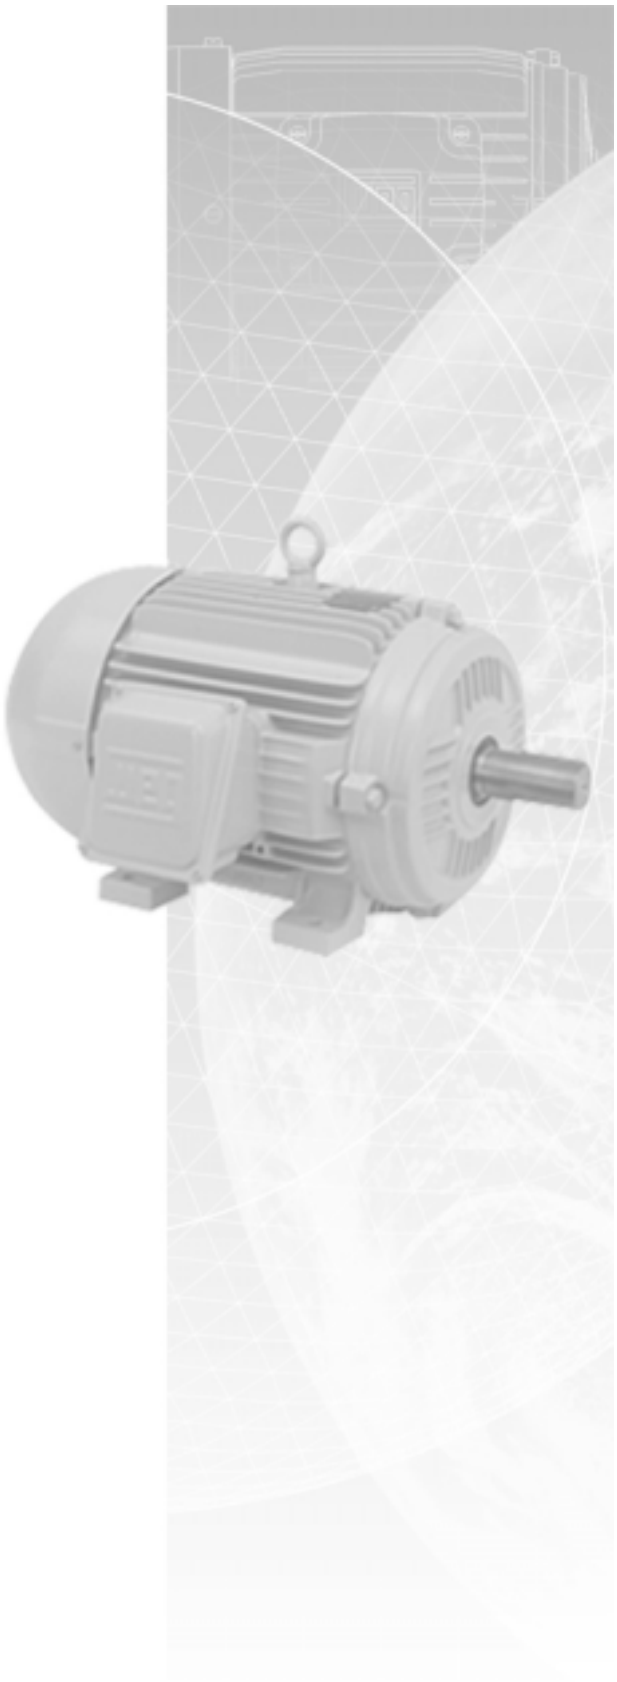
INSTALLATION AND MAINTENANCE MANUAL FOR NEMA LOW VOLTAGE ELECTRIC MOTORS



The electric motor is the item of equipment most widely used by man in his pursuit of progress, as virtually all machines and many renowned inventions depend upon it.
By virtue of the prominent role the electric motor plays in the comfort and welfare of mankind, it must be regarded and treated as a prime power unit embodying features that merit special attention, including its installation and maintenance.
This means that the electric motor should receive proper attention.
Its installation and routine maintenance require specific care to ensure perfect operation and longer life of the unit.
THE WEG ELECTRIC MOTOR INSTALLATION AND MAINTENANCE MANUAL provides the necessary information to properly install, maintain and preserve the most important component of all equipment:

THE ELECTRIC MOTOR!

1. Introduction

This manual covers all the three-phase and single-phase asynchronous squirrel-cage induction motors, from 140T to 580T frame sizes.

The motors described in this manual are subject to continuous improvement and all information is subject to change without notice.
For further details, please consult WEG.

2. Basic Instructions

2.1 Safety Instructions

All personnel involved with electrical installations, either handling, lifting, operation and maintenance, should be well-informed and up-to-date concerning the safety standards and principles that govern the work and carefully follow them.
Before work commences, it is the responsibility of the person in charge to ascertain that these have been duly complied with and to alert his personnel of the inherent hazards of the job in hand.
It is recommended that these tasks be undertaken only by qualified personnel and they should be instructed to:

- avoid contact with energized circuits or rotating parts,
- avoid by-passing or rendering inoperative any safeguards or protective devices,
- avoid extended exposure in close proximity to machinery with high noise levels,
- use proper care and procedures in handling, lifting, installing, operating and maintaining the equipment, and
- follow consistently any instructions and product documentation supplied when they do such work.

Before initiating maintenance procedures, be sure that all power sources are disconnected from the motor and accessories to avoid electric shock.
Fire fighting equipment and notices concerning first aid should not be lacking at the job site; these should be visible and accessible at all times.

2.2 Delivery

Prior to shipment, motors are factory-tested and balanced. They are packed in boxes or bolted to a wooden base.
Upon receipt, we recommend careful handling and a physical examination for damage which may have occurred during transportation.
In the event of damage and in order to guaranty insurance coverage, both the nearest WEG sales office and the carrier should be notified without delay.

2.3 Storage

Motors should be raised by their eyebolts and never by their shafts. It is important that high rating three-phase motors be raised by their eyebolts. Raising and lowering must be steady and joltless, otherwise bearings may be harmed.
When motors are not immediately installed, they should be stored in their normal upright position in a dry even temperature place, free of dust, gases and corrosive atmosphere.
Other objects should not be placed on or against them.
Motors stored over long periods are subject to loss of insulation resistance and oxidation of bearings.

Bearings and lubricant deserve special attention during prolonged periods of storage. Depending on the length and conditions of storage it may be necessary to regrease or change rusted bearings. The weight of the rotor in an inactive motor tends to expel grease from between the bearing surfaces thereby removing the protective film that impedes metal-to-metal contact.
As a preventive measure against the formation of corrosion by contact, motors should not be stored near machines which cause vibrations, and every 3 month their shafts should be rotated manually.

Insulation resistance fluctuates widely with temperature and humidity variations and the cleanliness of components. When a motor is not immediately put into service it should be protected against moist, high temperatures and impurities, thus avoiding damage to insulation resistance.
If the motor has been in storage more than six month or has been subjected to adverse moisture conditions, it is best to check the insulation resistance of the stator winding with a megohmeter.
If the resistance is lower than ten megohms the windings should be dried in one of the two following ways:

1) Bake in oven at temperatures not exceeding 194 degrees F until insulation resistance becomes constant.
2) With rotor locked, apply low voltage and gradually increase current through windings until temperature measured with thermometer reaches 194 degrees F. Do not exceed this temperature.

If the motor is stored for an extensive period, the rotor must be periodically rotated.
Should the ambient conditions be very humid, a periodical inspection is recommended during storage. It is difficult to prescribe rules for the true insulation resistance value of a machine as resistance varies according to the type, size and rated voltage and the state of the insulation material used, method of construction and the machine's insulation antecedents. A lot of experience is necessary in order to decide when a machine is ready or not to be put into service. Periodical records are useful in making this decision.

The following guidelines show the approximate values that can be expected of a clean and dry motor, at 40°C test voltage in applied during one minute.

Insulation resistance Rm is obtained by the formula:

$$Rm = Vn + 1$$

Where: Rm - minimum recommended insulation resistance in MΩ with winding at 40°C
Vn - rated machine voltage in kV

In case the test is carried out at a temperature other than 40°C, the value must be corrected to 40°C using an approximated curve of insulation resistance v.s temperature of the winding with the aid of Figure 2.1; it's possible verify that resistance practically doubles every 10°C that insulating temperature is lowered.

Example:

Ambient temperature = 50°C
Motor winding resistence at 50°C = 1.02 MΩ
Correction to 40°C

$$R_{40°C} = R_{50°C} \times K_{50°C}$$

$$R_{40°C} = 1.02 \times 1.3$$

$$R_{40°C} = 1.326\ M\Omega$$

The minimum resistence Rm will be:

$$Rm = Vn + 1$$
$$Rm = 0.440 + 1$$
$$Rm = 1.440\ M\Omega$$

On new motors, lower values are often attained due to solvents present in the insulating varnishes that later evaporate during normal operation. This does not necessarily mean that the motor is not operational, since insulating resistance will increase after a period of service.
On motors which have been in service for a period of time much larger values are often attained. A comparison of the values recorded in previous tests on the same motor under similar load, temperature and humidity conditions, serves as a better indication of insulation condition than that of the value derived from a single test. Any substantial or sudden reduction is suspect and the cause determined and corrective action taken.
Insulation resistance is usually measured with a MEGGER.
In the event that insulation resistance is inferior to the values derived from the above formula, motors should be subjected to a drying process.

2.3.1 Drying the windings

This operation should be carried out with maximum care, and only by qualified personnel. The rate of temperature rise should not exceed 5°C per hour and the temperature of the winding should not exceed 105°C. An overly high final temperature as well as a fast temperature increase rate can each generate vapour harmful to the insulation.
Temperature should be accurately controlled during the drying process and the insulation resistance measured at regular intervals.
During the early stages of the drying process, insulation resistance will decrease as a result of the temperature increase, but the resistance will increase again when the insulation becomes dryer.
The drying process should be extended until sucessive measurements of insulation resistance indicate that a constant value above the minimum acceptable value has been attained. It is extremely important that the interior of the motor be well ventilated during the drying operation to ensure that the dampness is really removed.
Heat for drying can be obtained from outside sources (an oven), energization of the space heater (optional), or introducing a current through the actual winding of the motor being dried.

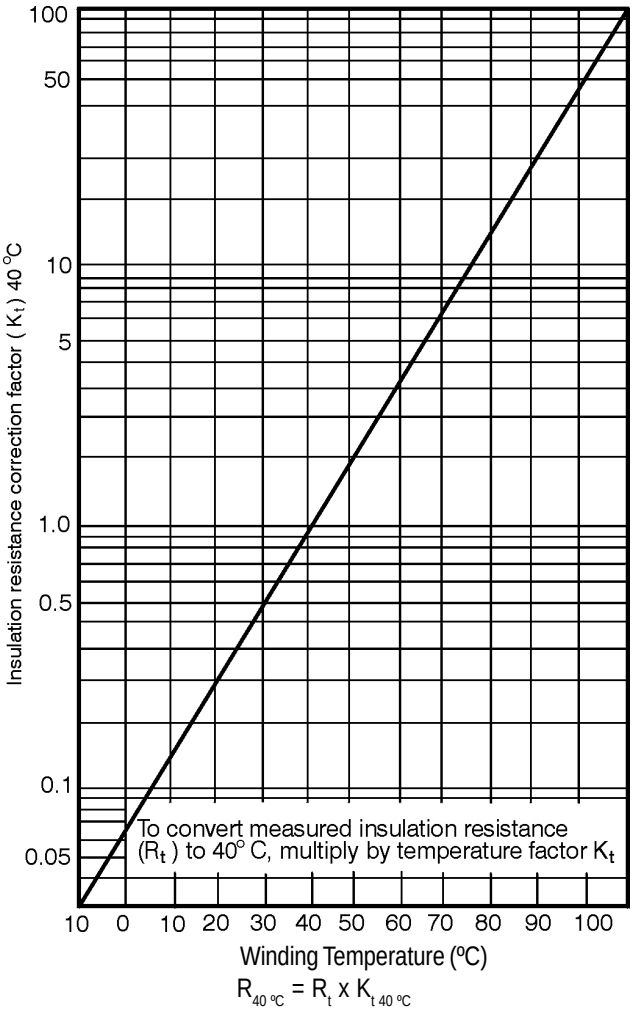

Figure 2.1

3. Installation

Electric machines should be installed in order to allow an easy access for inspection and maintenance. Should the surrounding atmosphere be humid, corrosive or contain flammable substances or particles, it is essential to ensure an adequate degree of protection.
The installation of motors in environments where there are vapours, gases or dusts, flammable or combustible materials, subject to fire or explosion, should be undertaken according to appropriate and governing codes, such as NEC Art. 500 (National Electrical Code) and UL-674 (Underwriters Laboratories, Inc.) Standards.
Under no circumstances can motors be enclosed in boxes or covered with materials which may impede or reduce the free circulation of ventilating air. Machines fitted with external ventilation should be at least 50cm from the wall to permit the passage of air.
The opening for the entry and exit of air flow should never be obstructed or reduced by conductors, pipes or other objects.
The place of installation should allow for air renewal at a rate of 700 cubic feet per minute for each 75 HP motor capacity.

3.1 Mechanical Aspects

3.1.1 Foundation

The motor base must be levelled and as far as possible free of vibrations. A concrete foundation is recommended for motors over 100 HP. The choice of base will depend upon the nature of the soil at the place of erection or of the floor capacity in the case of buildings.
When dimensioning the motor base, keep in mind that the motor may occasionally be run at a torque above that of the rated full load torque.
Based upon Figure 3.1, foundation stresses can be calculated by using the following formula:

$$F1 = 0.2247\ (0.009\ x\ g\ x\ G - 213\ Tmáx/A)$$

$$F2 = 0.2247\ (0.009\ x\ g\ x\ G + 213\ Tmax/A\ )$$

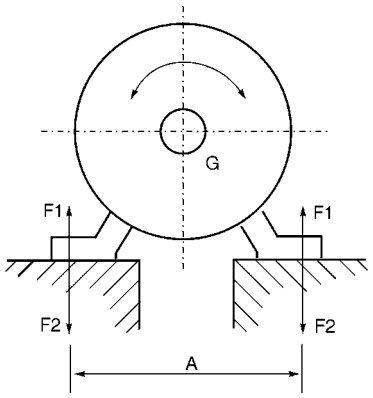

Figure 3.1 - Base stresses

Where:

F1 and F2 - Lateral stress (Lb)
g - Force of gravity (32.18 ft/s^2)
G - Weight of motor (Lb)
Tmax - Maximum torque (Lb . Ft)
A - Obtained from the dimensional drawing of the motor (in)

Sunken bolts or metallic base plates should be used to secure the motor to the base.

3.1.2 Types of Bases

a) Slide Rails

When motor drive is by pulleys the motor should be mounted on slide rails and the lower part of the belt should be pulling.
The rail nearest the drive pulley is positioned in such a manner that the adjusting bolt be between the motor and the driven machine.
The other rail should be positioned with the bolt in the opposite position, as shown in Figure 3.2.
The motor is bolted to the rails and set on the base. The drive pulley is aligned such that its center is on a plane with the center of the driven pulley and the motor shaft and that of the machine be parallel.

The belt should not be overly stretched, see Figure 3.11.
After the alignment, the rails are fixed.

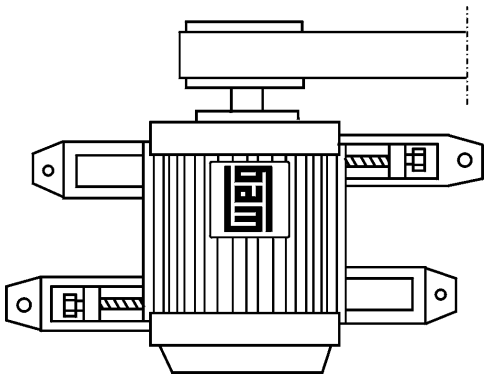

Figure 3.2 - Positioning of slide rails for motor alignment

b) Foundation Studs

Very often, particularly when drive is by flexible coupling the motor is anchored directly to the base with foundation studs.
It is recommended that shim plates of approximately 0.8 inches be used between the foundation studs and the feet of the motor for replacement purposes. These shim plates are useful when exchanging one motor for another of larger shaft height due to variations allowed by standard tolerances.
Foundation studs should neither be painted nor rusted as both interfere with to the adherence of the concrete, and bring about loosening.
After accurate alignment and levelling of the motor, the foundation studs are cemented and their screws tightened to secure the motor.

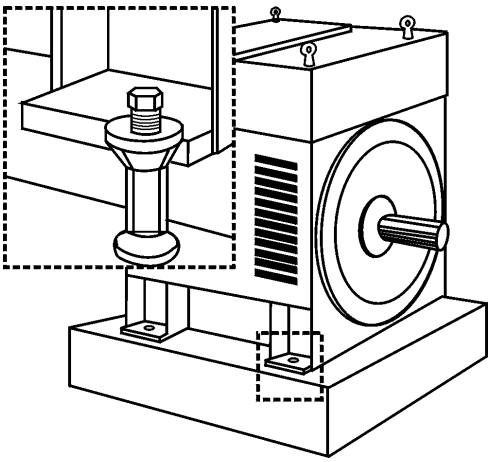

Figure 3.3 - Motor mounted on a concrete base with foundation studs

3.1.3 Alignment

The electric motor should be accurately aligned with the driven machine, particularly in cases of direct coupling. An incorrect alignment can cause bearing failure vibrations and even shaft rupture.
The best way to ensure correct alignment is to use dial gauges placed on each coupling half, one reading radially and the other exially - Figure 3.5.

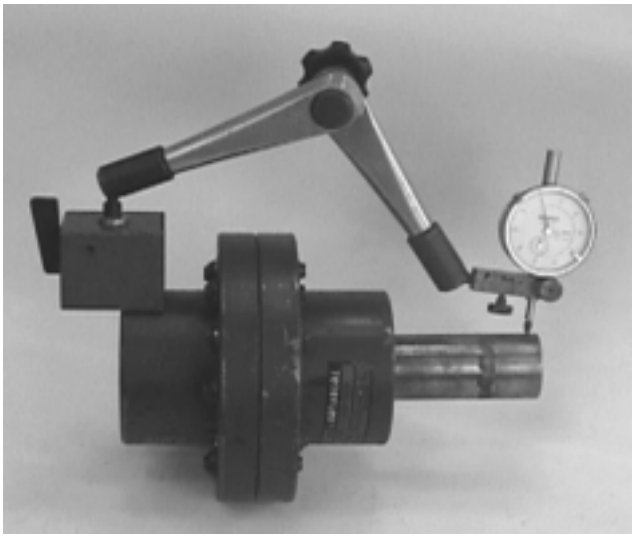

Figure 3.5 - Alignment with dial gauges

Thus, simultaneous readings are possible and allow for checking for any parallel (Figure 3.6a) and concentricity deviations (Figure 3.6b) by rotating the shafts one turn.
Gauge readings should not exceed 0.02 inches. If the installer is sufficiently skilled, he can obtain alignment with feeler gauges and a steel ruler, providing that the couplings are perfect and centered - Figure 3.6c.

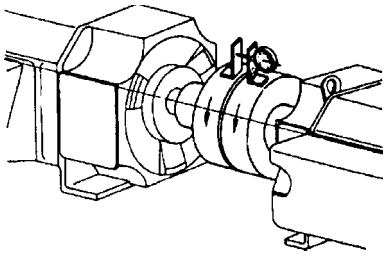

Figure 3.6a - Deviation from parallel

Figure 3.6b - Deviation from concentricity

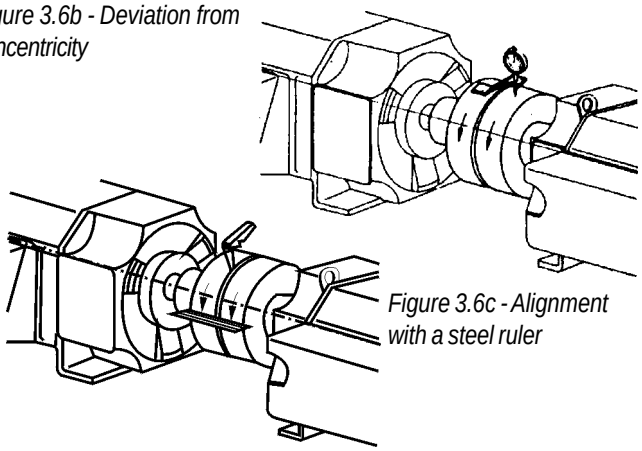

Figure 3.6c - Alignment with a steel ruler

3.1.4 Coupling

a) Direct Coupling

Direct coupling is always preferable due to its lower cost, space economy, no belt slippage and lower accident risk.
In the case of speed ratio drives, it is also common to use a direct coupling with a reducer (gear box).

CAUTION: Carefully align the shaft ends using, whenever feasible, a flexible coupling.

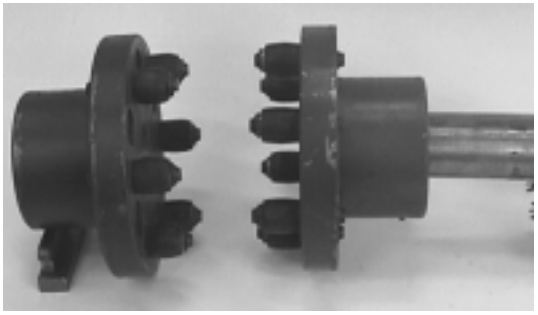

Figure 3.7 - A type of direct coupling

b) Gear Coupling

Poorly aligned gear couplings are the cause of jerking motions which bring about the vibration of the actual drive and vibrations within the motor.

Therefore, due care must be given to perfect shaft alignment: exactly parallel in the case of straight gears, and at the correct angle for bevel or helical gears.
Perfect gear engagement can be checked by the insertion of a strip of paper on which the teeth marks will be traced after a single rotation.

c) Belt and Pulley Coupling

Belt coupling is most commonly used when a speed ratio is required.
Assembly of Pulleys: To assemble pulleys on shaft ends with a keyway and threaded end holes the pulley should be inserted halfway up the keyway merely by manual pressure.
On shafts without threaded end holes the heating of the pulley to about 80°C is recommended, or alternatively, the devices illustrated in Figure 3.8 may be employed.

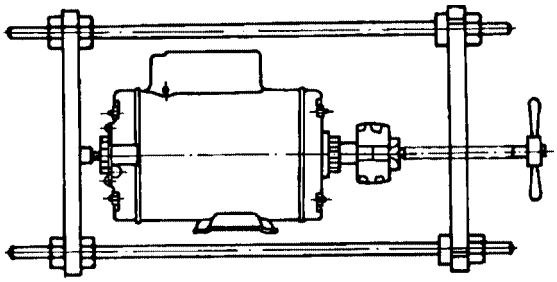

Figure 3.8 - Pulley mounting device

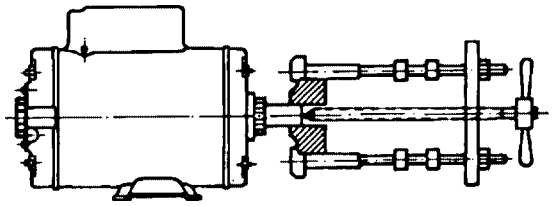

Figure 3.8a - Pulley extractor

Hammers should be avoided during the fitting of pulleys and bearings. The fitting of bearings with the aid of hammers leaves blemishes on the bearing races. These initially small flaws increase with usage and can develop to a stage that completely impairs the bearing.
The correct positioning of a pulley is shown in Figure 3.9.

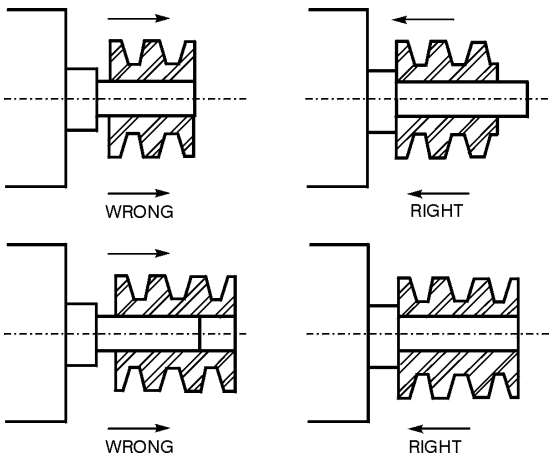

Figure 3.9 - Correct positioning of pulley on the shaft

RUNNING: To avoid needless radial stresses on the bearings it is imperative that shafts are parallel and the pulleys perfectly aligned. (Figure 3.10).

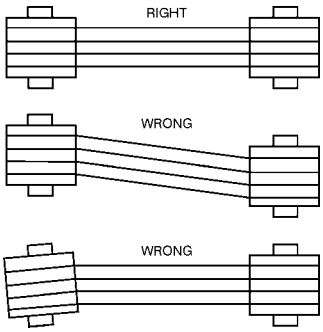

Figure 3.10 - Correct pulley alignment

Laterally misaligned pulleys, when running, transmit alternating knocks to the rotor and can damage the bearing housing. Belt slippage can be avoided by applying a resin (rosin for example).
Belt tension should be sufficient to avoid slippage during operation (Figure 3.11).
Pulleys that are too small should be avoided; these cause shaft flexion because belt traction increases in proportion to a decrease in the pulley size. Table 1 determines minimum pulley diameters, and Tables 2 and 3 refer to the maximum stresses acceptable on motor bearings up to frame 580. Beyond frame size 600, an analysis should be requested from the WEG engineering.

Important: 1) Peripheral speeds for solid grey cast iron pulleys FC 200 is V = 115 ft/s.
2) Use steel pulleys when peripheral speed is higher than 115 ft/s.
3) V-belt speed should not exceed 115 ft/s.

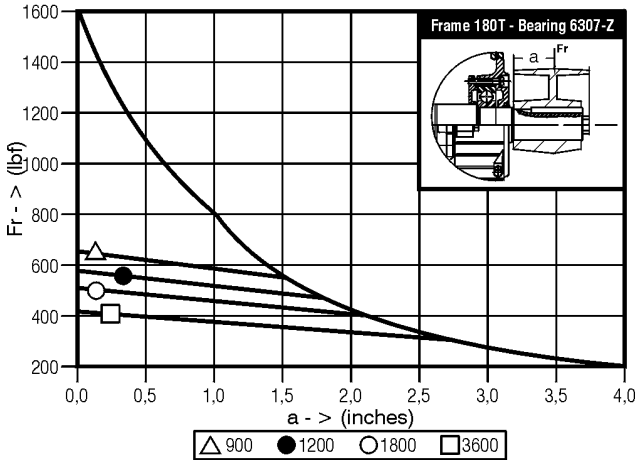
The maximum radial load for each frame are determined, by graphs.

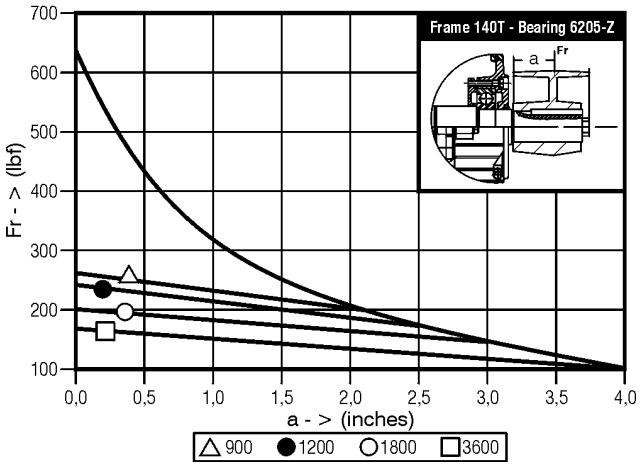
INSTRUCTIONS ON HOW TO USE THE GRAPHS

1 - Maximum radial load on shaft.
2 - Maximum radial load on bearings.



Where: X - Half of pulley width (inches)
Fr- Maximum radial load in relation to the diameter and pulley width.

Example:
Verify whether a 2HP motor, II Pole, 60Hz withstands a radial load of 110Lb, considering a pulley width of 4 inches.



Frame: 145T
Fr: 110Lb
X: 2 inches

1 - Mark the distance X
2 - Find out line N = 3600 for bearing
Based on the above, this bearing withstands a radial load of 130Lb.

3.2 Electrical Aspects

3.2.1 Feed System

Proper electric power supply is very important. The choice of motor feed conductors, whether branch or distribution circuits, should be based on the rated current of the motors as per NFPA-70 Standard article 430.
Tables 4, 5 and 6 show minimum conductor gauges sized according to maximum current capacity and maximum voltage drop in relation to the distance from the distribution center to the motor, and to the type of installation (Overhead or in ducts).

To determine the conductor gauge proceed as follows:

a) Determine the current by multiplying the current indicated on the motor nameplate by 1.25 and then locate the resulting value on the corresponding table.
If the conductor feeds more than one motor, the value to be sought on the table should be equal 1.25 times the rated current of the largest motor plus the rated current of the other motors.
In the case of variable speed motors, the highest value among the rated currents should be considered.
When motor operation is intermittent, the conductors should have a current carrying capacity equal or greater, to the product of the motor rated current times the running cycle factor shown on Table 7.

***Table 7** - Running cycle factor*

Motor Short

Motor short time rating / Duty Classification	5min	15min	30 at 60min	Continuos
Short (operating valves, activating contacts etc)	1.10	1.20	1.50	-
Intermittent (passenger or freight elevators, tools, pumps, rolling bridges etc)	0.85	0.85	0.90	1.40
Cyclic (rolling mills,mining machines etc)	0.85	0.90	0.95	1.40
Variable	1.10	1.20	1.50	2.00

b) Locate the rated voltage of the motor and the feed network distance in the upper part of the corresponding table. The point of intersection of the distance column and the line referring to current will indicate the minimum required gauge of the conductor.

Example:
Size the conductors for a 15 HP, three-phase, 230V, 42A, motor located 200 feet from the main supply with cables laid in conduits.

a) Current to be located: 1.25 x 42A = 52.5A
b) Closest value on table 6:55A
c) Minimum gauge: 6 AWG

3.2.2 Starting of Electric Motor

Induction motors can be started by the following methods:

Direct Starting

Whenever possible a three-phase motor with a squirrel cage rotor should be started directly at full supply voltage by means of a contactor (Connection diagram a). This method is called Direct-on-Line (DOL) starting.
There are DOL starter assemblies available combining a three-pole contactor, a bimetal relay (overload protection device), and a fuse (short circuit protection on branch circuit).
DOL starting is the simplest method, only feasible however, when the locked rotor current (LRC) does not influence the main electric supply lines.
Initial locked rotor current (LRC) in induction motors reach values six to eight times the value of the full load current. During starting by the DOL method, starting current can reach these high levels. The main electrical supply should be rated sufficiently, such that during the starting cycle no supply disturbance to others on the power network is caused by the voltage drop in the main supply.
This can be achieved under one of the following situations:

a) The rated main supply current is high enough for the locked rotor current not to be proportionally high.
b) Motor locked rotor current is low with no effect on the networks.
c) The motor is started under no-load conditions with a short starting cycle and, consequently, a low locked rotor current with a transient voltage drop tolerable to other consumers.

Starting with a compensating switch (auto-transformer starting)

Should direct on line starting not be possible, either due to restrictions imposed by the power supply authority or due to the installation itself, reduced voltage indirect starting methods can be employed to lower the locked rotor current. The single line connection diagram (C) shows the basic components of a compensating switch featuring a transformer (usually an auto-transformer) with a series of taps corresponding to the different values of the reduced voltage. Only three terminals of the motor are connected to the switch, the other being interconnected as per diagram, for the indicated voltage.

Star-Delta starting

It is fundamental to star-delta starting that the three-phase motor has the necessary numbers of leads for both connections:

6 leads for Y/Δ
or 12 leads for YY/ΔΔ

All the connections for the various voltages are made through terminals in the terminal box in accordance with the wiring diagram that accompanies the motor. This diagram may be shown on the nameplate or in the terminal box.
The star-delta connection is usually used only in low-voltage motors due to normally available control and protection devices. In this method of starting the locked rotor current is approximately 30% of the original LRC. The locked rotor torque is reduced proportionally as well. For this reason, it is very important before deciding to use

***Table 4** - Wire and cable gauges for single-phase motor installation (voltage drop < 5%) (in conduits)*

star-delta starting to verify if the reduced locked rotor torque in "STAR" connection is enough to accelerate the load.

3.2.3 Motor Protection

Motor circuits have, in principle, two types of protection: motor overload, locked rotor and protection of branch circuit from short circuits. Motors in continuous use should be protected from overloading by means of a device incorporated into the motor, or by an independent device, usually a fixed or adjustable thermal relay equal or less than to the value derived from multiplying the rated feed current at full load by:

- 1.25 for motors with a service factor equal or superior to 1.15 or;

- 1.15 for motors with service factor equal to 1.0.

Some motors are optionally fitted with overheating protective detectors (in the event of overload, locked rotor, low voltage, inadequate motor ventilation) such as a thermostat (thermal probe), thermistor (PTC), RTD type resistance which dispense with independent devices.

THERMOSTAT (THERMAL PROBE)**:** Bimetallic thermal detectors with normally closed silver contacts. These open at pre-determined temperatures. Thermostats are series connected directly to the contactor coil circuit by two conductors.

THERMISTORS: Semi-conductor heat detectors positive temperature coeficient (PTC) that sharply change their resistance upon reaching a set temperature. Thermistors, depending upon the type, are series or parallel-connected to a control unit that cuts out the motor feed, or actuates an alarm system, in response to the thermistors reaction.

RESISTANCE TEMPERATURE DETECTORS (RTD) - PT 100:The resistance type heat detector (RTD) is a resistance element usually manufactured of copper or platinum.
The RTD operates on the principle that the electrical resistance of a metallic conductor varies linearly with the temperature. The detector terminals are connected to a control panel, usually fitted with a temperature gauge, a test resistance and a terminal changeover switch.

Subject to the desired degree of safety and the client's specification, three (one per phase) or six (two per phase) protective devices can be fitted to a motor for the alarm stems, circuit breaker or combined alarm and circuit breaker, with two leads from the terminal box to the alarm or circuit breaker system and four for the combined system (alarm and circuit breaker).
Table 9 compares the two methods of protection.

3.3 Start-up

3.3.1 Preliminary Inspection

Before starting a motor for the first time, it will be necessary to:

a) Remove all locking devices and blocks used in transit and check that the motor rotates freely;

b) Check that the motor is firmly secured and that coupling elements are correctly mounted and aligned.;

c) Ascertain that voltage and frequency correspond to those indicated on the nameplate. Motor performance will be satisfactory with main supply voltage fluctuation within ten per cent of the value indicated on the nameplate or a frequency fluctuation within five per cent or, yet, with a combined voltage and frequency variance within ten per cent;

d) Check that connections are in accordance with the connection diagram shown on the nameplate and be sure that all terminal screws and nuts are tight;

e) Check the motor for proper grounding. Providing that there are no specifications calling for ground-insulated installation, the motor must be grounded in accordance with prevalent standard for grounding electrical machines. The screw identified by the symbol ⏚ should be used for this purpose.
This screw is generally to be found in the terminal box or on one foot of the frame;

f) Check that motor leads connecting with the mains, as well as the control wires and the overload protection device, are in accordance with Nema Standards;

g) If the motor has been stored in a damp place, or has been stopped for some time, measure the insulating resistance as recommended under the item covering storage instructions;

h) Start the motor uncoupled to ascertain that it is turning in the desired direction. To reverse the rotation of a three-phase motor, invert two terminal leads of the mains supply.
High voltage motors bearing an arrow on the frame indicating rotation direction can only turn in the direction shown.

3.3.2 The First Start-up

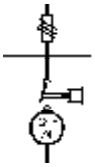
Three-Phase Motor with Cage Rotor:
After careful examination of the motor, follow the normal sequence of starting operations listed in the control instructions for the initial start-up.

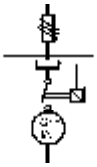
3.3.3 Operation

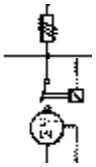
Drive the motor coupled to the load for a period of at least one hour while watching for abnormal noises or signs of overheating.
Compare the line current with the value shown on the nameplate.
Under continuous running conditions without load fluctuations this should not exceed the rated current times the service factor, also shown on the nameplate.
All measuring and control instruments and apparatus should be continuously checked for anomalies, and any irregularities corrected.

3.3.4 Stopping

Warning:







To touch any moving part of a running motor, even though

disconnected, is a danger to life and limb.

Three-phase motor with cage rotor:
Open the stator circuit switch. With the motor at a complete stop, reset the auto-transformer, if any, to the "start" position.

Notes:
- The ZZ bearings from 6201 to 6307 do not require relubrication as its life time is about 20,000 hours.
- Tables 1 and 2 are intended for the lubrication period under bearing temperature of 70ºC (for bearings up to 6312 and NU 312) and temperature of 85ºC (for bearings 6314 and NU 314 and larger).
- For each 15ºC of temperature rise, the relubrication period is reduced by half.
- The relubrication periods given above are for those cases applying Polyrex® EM grease.
- When motors are used on the vertical position, their relubrication interval is reduced by half if compared to horizontal position motors.

Compatibility of Polyrex® EM grease with other types of grease:

Containing polyurea thickener and mineral oil, the Polyrex® EM grease is compatible with other types of grease that contain:
- Lithium base or complex of lithium or polyurea and highly refined mineral oil.
- Inhibitor additive against corrosion, rust and anti-oxidant additive.

Notes:
- Although Polyrex® EM is compatible with types of grease given above, we do no recommended to mix it with any other greases.
- If you intend to use a type of grease different than those recommended above , first contact WEG.
- On applications (with high or low temperatures, speed variation, etc), the type of grease and relubrification interval are given on an additional nameplate attached to the motor.

4. Maintenance

A well-designed maintenance program for electric motors can be summed up as: periodical inspection of insulation levels, temperature rise, wear, bearing lubrication and the occasional checking of fan air flow.
Inspection cycles depend upon the type of motor and the conditions under which it operates.

4.1 Cleanliness

Motors should be kept clean, free of dust, debris and oil. Soft brushes or clean cotton rags should be used for cleaning. A jet of compressed air should be used to remove non-abrasive dust from the fan cover and any accumulated grime from the fan and cooling fins.
Oil or damp impregnated impurities can be removed with rags soaked in a suitable solvent.
Terminal boxes fitted to motors with IP55 protection should be cleaned; their terminals should be free of oxidation, in perfect mechanical condition, and all unused space dust-free.
Motors with IPW 55 protection are recommended for use under unfavourable ambient conditions.

4.2 Lubrication

Proper lubrication extends bearing life.

Lubrication Maintenance Includes:

a) Attention to the overall state of the bearings;
b) Cleaning and lubrication;
c) Critical inspection of the bearings.

Motor noise should be measured at regular intervals of one to four months. A well-tuned ear is perfectly capable of distinguishing unusual noises, even with rudimentary tools such as a screw driver, etc., without recourse to sophisticated listening aids or stethescopes that are available on the market.
A uniform hum is a sign that a bearing is running perfectly. Bearing temperature control is also part of routine maintenance.
Constant temperature control is possible with the aid of external thermometers or by embedded thermal elements. WEG motors are normally equipped with grease lubricated ball or roller bearings.
Bearings should be lubricated to avoid metallic contact of the moving parts, and also for protection against corrosion and wear. Lubricant properties deteriorate in the course of time and mechanical operation: furthermore, all lubricants are subject to contamination under working conditions.
For this reason lubricants must be renewed and any lubricant consumed needs replacing from time to time.

4.2.1 Periodical Lubrication

WEG motors are supplied with sufficient grease for a long running period. Lubrication intervals, the amount of grease and the type of bearing used in frames 140T to 580T are to be found in Tables 11, 12 and 13.
Lubrication intervals depend upon the size of the motor, speed, working conditions and the type of grease used.

4.2.2 Quality and Quantity of Grease

Correct lubrication is important!
Grease must be applied correctly and in sufficient quantity as both insufficient or excessive greasing are harmful.
Excessive greasing causes overheating brought about by the greater resistance encountered by the rotating parts and, in particular, by the compacting of the lubricant and its eventual loss of lubricating qualities.
This can cause seepage with the grease penetrating the motor and dripping on the coils.

GREASES FOR MOTOR BEARINGS

For operating temperatures from -30 to 170ºC	
Type	**Supplier**
Polyrex® EM	Esso

4.2.3 Lubricating Instructions

a) Frame 140T to 210T motors
Frame 140T to 210T size motors are not fitted with grease nipples. Lubrication is carried out during periodical overhauls when the motor is taken apart.

Cleaning and Lubrication of Bearings

With the motor dismantled and without extracting the bearings from the shaft, all existing grease should be removed and the bearings cleaned with Diesel oil, kerosene or other solvent, until thoroughly clean.
Refill the spaces between the balls or rollers and the bearing cages with grease immediately after washing. Never rotate bearings in their dry state after washing.
For inspection purposes apply a few drops of machine oil. During these operations maximum care and cleanliness is recommended to avoid the penetration of any impurities or dust that could harm the bearings. Clean all external parts prior to reassembly.

b) Frame 360T to 580T Motors
Motors above 360T frame size are fitted with regreasable bearing system.
The lubrication system from this frame size upwards was designed to allow the removal of all grease from the bearing races through a bleeder outlet which at the same time impedes the entry of dust or other contaminants harmful to the bearing.
This outlet also prevents injury to the bearings from the well-known problem of over-greasing.

It is advisable to lubricate while the motor is running, to allow the renewal of grease in the bearing case.
Should this procedure not be possible because of rotating parts in the proximity of the nipple (pulleys, coupling sleeves, etc.) that are hazardous to the operator the following procedure should be followed:
- Inject about half the estimated amount of grease and run the motor at full speed for approximately a minute; switch off the motor and inject the remaining grease.
The injection of all the grease with the motor at rest could cause penetration of a portion of the lubricant through the internal seal of the bearing case and hence into the motor.

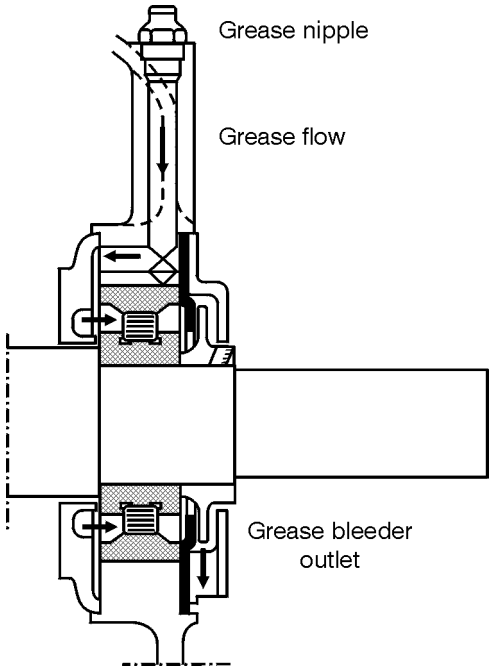

Figure 4.1 - Bearings and lubrication system

Nipples must be clean prior to introduction of grease to avoid entry of any alien bodies into the bearing.
For lubricating use only a manual grease gun.

Bearing Lubrication Steps

1. Cleanse the area around the grease nipples with clean cotton fabric.
2. With the motor running, add grease with a manual grease gun until the lubricant commences to be expelled from the bleeder outlet, or until the quantity of grease recommended in Tables 12 or 13 has been applied.
3. Allow the motor to run long enough to eject all excess grease.

4.2.4 Replacement of Bearings

The opening of a motor to replace a bearing should only be carried out by qualified personnel.
Damage to the core after the removal of the bearing cover can be avoided by filling the gap between the rotor and the stator with stiff paper of a proper thickness.

Providing suitable tooling is employed, disassembly of a bearing is not difficult.
The extractor grips should be applied to the sidewall of the inner ring to be stripped, or to an adjacent part.
To ensure perfect functioning and to prevent injury to the bearing parts, it is essential that the assembly be undertaken under conditions of complete cleanliness and by competent personnel.
New bearings should not be removed from their packages until the moment of assembly.
Prior to fitting a new bearing, ascertain that the shaft has no rough edges or signs of hammering.

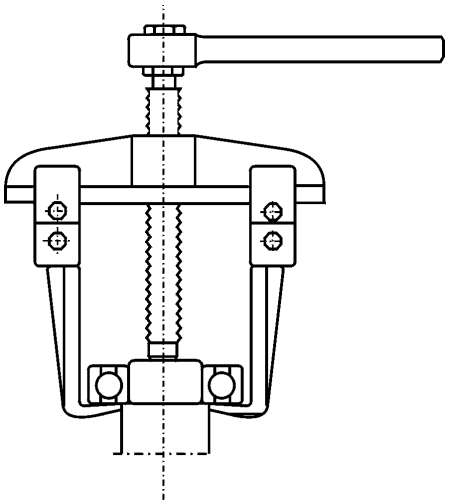

Figure 4.2 - A bearing extractor

During assembly bearings cannot be subjected to direct blows.
The aid used to press or strike the bearing should be applied to the inner ring.

4.3 Air Gap Checking (Large Rating Open Motors)

Upon the completion of any work on the bearings check the gap measurement between the stator and the rotor using the appropriate gazes.
The gap variation at any two vertically opposite points must be less than 10% of the average gap measurement.

4.4 Explosion Proof Motor Repair Steps

4.4.1 Objective

In view of the heavy liability associated with burning of motors of this type, this product has been designed and manufactured to high technical standards, under rigid controls. In addition, in many areas it is required that explosion proof motors ONLY be repaired by licensed personnel or in licensed facilities authorized to do this type of work.
The following general procedures, safeguards, and guidelines must be followed in order to ensure repaired explosion proof motors operate as intended.

4.4.2 Repair Procedure and Precautions

Dismantle the damaged motor with appropriate tools without hammering and/or pitting machined surfaces such as enclosure joints, fastening

holes, and all joints in general.
The position of the fan cover should be suitably marked prior to removal so as to facilitate reassembly later on.
Examine the motor's general condition and, if necessary, disassemble all parts and clean them with kerosene. Under no circumstances should scrapers, emery papers or tools be used that could affect the dimensions of any part during cleaning.
Protect all machined parts against oxidation by applying a coating of vaseline or oil immediately after cleaning.

STRIPPING OF WINDINGS
This step requires great care to avoid knocking and/or denting of enclosure joints and, when removing the sealing compound from the terminal box, damage or cracking of the frame.

IMPREGNATION
Protect all frame threads by inserting corresponding bolts, and the joint between terminal box and frame, by coating it with a non-adhesive varnish (ISO 287 - ISOLASIL).
Protective varnish on machined parts should be removed soon after treating with impregnating varnish. This operation should be carried out manually without using tools.

ASSEMBLY
Inspect all parts for defects, such as cracks, joint incrustations, damaged threads and other potential problems.
Assemble using a rubber headed mallet and a bronze bushing after ascertaining that all parts are perfectly fitted.
Bolts should be positioned with corresponding spring washers and evenly tightened.

TESTING
Rotate the shaft by hand while examining for any drag problems on covers or fastening rings.
Carry out running tests as for standard motors.

MOUNTING THE TERMINAL BOX
Prior to fitting the terminal box all cable outlets on the frame should be sealed with a sealing compound (Ist layer) and an Epoxy resin (ISO 340) mixed with ground quartz (2nd layer) in the following proportions:

340A resin	50 parts
340B resin	50 parts
Ground quartz	100 parts

Drying time for this mixture is two hours during which the frame should not be handled and cable outlets should be upwards.
When dry, see that the outlets and areas around the cables are perfectly sealed.
Mount the terminal box and paint the motor.

4.4.3 Miscellaneous Recommendations

- Any damaged parts (cracks, pittings in machined surfaces, defective threads) must be replaced and under no circumstances should attempts be made to recover them.
- Upon reassembling explosion proof motors IPW55 the substitution of all seals is mandatory.
- Should any doubts arise, consult WEG.

5. Malfunctioning

Most malfunctions affecting the normal running of electric motors can be prevented by maintenance and the appropriate precautions.
While ventilation, cleanliness and careful maintenance are the main factors ensuring long motor life, a further essential factor is the prompt attention to any malfunctioning as signalled by vibrations, shaft knock, declining insulation resistance, smoke or fire, sparking or unusual slip ring or brush wear, sudden changes of bearing temperatures.
When failures of an electric or mechanical nature arise, the first step to be taken is to stop the motor and subsequent examination of all mechanical and electrical parts of the installation.
In the event of fire, the installation should be isolated from the mains supply, which is normally done by turning off the respective switches.
In the event of fire within the motor itself, steps should be taken to restrain and suffocate it by covering the ventilation vents.
To extinguish a fire, dry chemical or $C0_2$ extinguishers should be used - never water.

5.1 Standard Three-Phase Motor Failures

Owing to the widespread usage of asynchronous three-phase motors in industry which are more often repaired in the plant workshops, there follows a summary of possible failures and their probable causes, detection and repairs.
Motors are generally designed to Class B or F insulation and for ambient temperatures up to 40°C.
Most winding defects arise when temperature limits, due to current overload, are surpassed throughout the winding or even in only portions thereof. These defects are identified by the darkening or carbonizing of wire insulation.

5.1.1 Short Circuits Between Turns

A short circuit between turns can be a consequent of two coinciding insulation defects, or the result of defects arising simultaneously on two adjacent wires. As wires are randomly tested, even the best quality wires can have weak spots. Weak spots can, on occasion, tolerate a voltage surge of 30% at the time of testing for shorting between turns, and later fail due to humidity, dust or vibration.
Depending on the intensity of the short, a magnetic hum becomes audible.
In some cases, the three-phase current imbalance can be so insignificant that the motor protective device fails to react. A short circuit between turns, and phases to ground due to insulation failure is rare, and even so, it nearly always occurs during the early stages of operation.

5.1.2 Winding Failures

a) One burnt winding phase

This failure arises when a motor runs wired in delta and current fails in one main conductor.
Current rises from 2 to 2.5 times in the remaining winding with a simultaneous marked fall in speed. If the motor stops, the current will increase from 3.5 to 4 times its rated value.
In most instances, this defect is due to the absence of a protective switch, or else the switch has been set too high.

b) Two burnt winding phases

This failure arises when current fails in one main conductor and the motor winding is star-connected. One of the winding phases remains currentless while the others absorb the full voltage and carry an excessive current.
The slip almost doubles.

c) Three burnt winding phases

Probable cause 1

Motor only protected by fuses; an overload on the motor will be the cause of the trouble.
Consequently, progressive carbonizing of the wires and insulation culminate in a short circuit between turns, or a short against the frame occurs.
A protective switch placed before the motor would easily solve this problem.

Probable cause 2

Motor incorrectly connected. For example: A motor with windings designed for 230/400V is connected through a star-delta switch to 400V connection.
The absorted current will be so high that the winding will burn out in a few seconds if the fuses or a wrongly set protective switch fail to react promptly.

Probable cause 3

The star-delta switch is not commutated and the motor continues to run for a time connected to the star under overload conditions.
As it only develops 1/3 of its torque, the motor cannot reach rated speed. The increased slip results in higher ohmic losses arising from the Joule effect. As the stator current, consistent with the load, may not exceed the rated value for the delta connection, the protective switch will not react.
Consequent to increased winding and rotor losses the motor will overheat and the winding burn out.

Probable cause 4

Failures from this cause arise from thermal overload, due to too many starts under intermittent operation or to an overly long starting cycle.
The perfect functioning of motor operating under these conditions is only assured when the following values are heeded:
a) number of starts per hour;
b) starting with or without load;
c) mechanical brake or current inversion;
d) acceleration of rotating masses connected to motor shaft;
e) load torque vs. speed during acceleration and braking.

The continuous effort exerted by the rotor during intermittent starting brings about heavier losses which provoke overheating.
Under certain circumstances with the motor idle there is a possibility that the stator winding is subjected to damage as a result of the

heating of the motor. In such a case, a slip ring motor is recommended as a large portion of the heat (due to rotor losses) is dissipated in the rheostat.

5.1.3 Rotor Failures

If a motor running under load conditions produces a noise of varying intensity and decreasing frequency while the load is increased, the reason, in most cases, will be an unsymmetrical rotor winding.
In squirrel-cage motors the cause will nearly always be a break in one or more of the rotor bars; simultaneously, periodical stator current fluctuations may be recorded. As a rule, this defect appears only in molded or die cast aluminum cages.
Failures due to spot heating in one or another of the bars in the rotor stack are identified by the blue coloration at the affected points.
Should there be failures in various contiguous bars, vibrations and shuddering can occur as if due to an unbalance, and are often interpreted as such. When the rotor stack acquires a blue or violet coloration, it is a sign of overloading.
This can be caused by overly high slip, by too many starts or overlong starting cycles. This failure can also arise from insufficient main voltage.

5.1.4 Bearing Failures

Bearing damage is a result of overloading brought about by an overly taut belt or axial impacts and stresses.
Underestimating the distance between the drive pulley and the driven pulley is a common occurrence.
The arc of contact of the belt on the drive pulley thus becomes inadmissibly small and thereby belt tension is insufficient for torque transmission.
In spite of this it is quite usual to increase belt tension in order to attain sufficient drive.
Admittably, this is feasible with the latest belt types reinforced by synthetic materials.
However, this practice fails to consider the load on the bearing and the result is bearing failure within a short time.
Additionally there is the possibility of the shaft being subjected to unacceptably high loads when the motor is fitted with a pulley that is too wide.

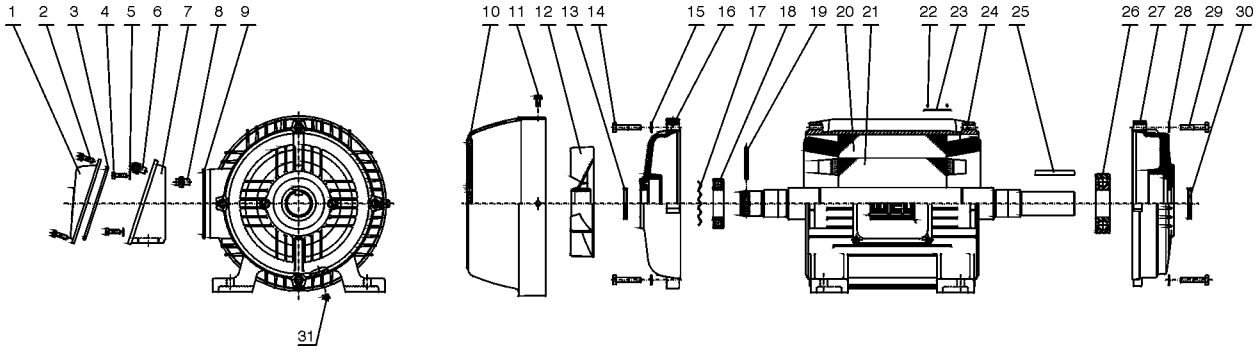
5.1.5 Shaft Fractures

Although bearings traditionally constitute the weaker part, and the shafts are designed with wide safety margins, it is not beyond the realm of possibility that a shaft may fracture by fatigue from bending stress brought about by excessive belt tension.
In most cases, fractures occur right behind the drive end bearing.
As a consequence of alternating bending stress induced by a rotating shaft, fractures travel inwards from the outside of the shaft until the point of rupture is reached when resistance of the remaining shaft cross-section no longer suffices.
Avoid additional drilling the shaft (fastening screw holes) as such operations tend to cause stress concentration.

5.1.6 Unbalanced V-Belt Drives

The substitution of only one of a number of other parallel belts on a drive is frequently the cause of shaft fractures, as well as being malpractice.
Any used, and consequently stretched belts retained on the drive, especially those closest to the motor, while new and unstretched belts are placed on the same drive turning farther from the bearing, can augment shaft stress.

5.1.7 Damage Arising from Poorly Fitted Transmission Parts or Improper Motor Alignment



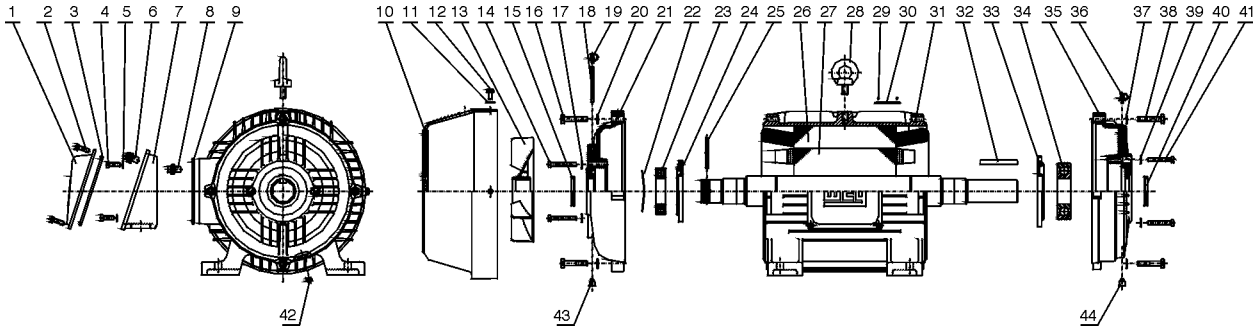
Damage to bearing and fracture in shafts often ensue from inadequate fitting of pulleys, couplings or pinions. There parts “knock” when rotating. The defect is recognized by the scratches that appear on the shaft or the eventual scalelike flaking of the shaft end.
Keyways with edges pitted by loosely fitted keys can also bring about shaft failures.
Poorly aligned couplings cause knocks and radial and axial shaking to shaft and bearings.
Within a short while these malpractices cause the deterioration of the bearings and the enlargement of the bearing cover bracket located on the drive end side.
Shaft fracture can occur in more serious cases.

5.2 Troubleshooting chart

FAILURE	PROBABLE CAUSE	CORRECTIVE MEASURES
Motor fails to start	• No voltage supply • Low voltage supply • Wrong control connections • Loose connection at some terminal lug • Overload	• Check feed connections to control system and from this to motor. • Check voltage supply and ascertain that voltage remains within 10% of the rated voltage shown on the motor nameplate. • Compare connections with the wiring diagram on the motor nameplate. • Tighten all connections. • Try to start motor under no-load conditions. If it starts, there may be an overload condition or a blocking of the starting mechanism. Reduce load to rated load level and increase torque.
High noise level	• Unbalance • Distorted shaft • Incorrect alignment • Uneven air gap • Dirt in the air gap • Extraneous matter stuck between fan and motor casing • Loose motor foundation • Worn bearings	• Vibrations can be eliminated by balancing rotor. If load is coupled directly to motor shaft, the load can be unbalanced. • Shaft key bent; check rotor balance and eccentricity. • Check motor aligment with machine running. • Check shaft for warping or bearing wear. • Dismantle motor and remove dirt or dust with jet of dry air. • Dismantle motor and clean. Remove trash or debris from motor vicinity. • Tighten all foundation studs. If necessary, realign motor. • Check lubrication. Replace bearing if noise is excessive and continuous.
Overheating of bearings	• Excessive grease • Excessive axial or radial strain on belt • Deformed shaft • Rough bearing surface • Loose or poorly fitted motor end shields • Lack of grease • Hardened grease cause locking of balls • Foreign material in grease	• Remove grease bleeder plug and run motor until excess grease is expelled. • Reduce belt tension. • Have shaft straightened and check rotor balance. • Replace bearings before they damage shaft. • Check end shields for close fit and tightness around circumference. • Add grease to bearing. • Replace bearings. • Flush out housings and relubricate.
Intense bearing vibration	• Unbalanced rotor • Dirty or worn bearing • Bearing rings too tight on shaft and/or bearing housing • Extraneous solid particles in bearing	• Balance rotor statically and dynamically. • If bearing rings are in perfect condition, clean and relubricate the bearing, otherwise, replace bearing. • Before altering shaft or housing dimensions, it is advisable to ascertain that bearing dimensions correspond to manufacturer's specifications. • Take bearing apart and clean. Reassemble only if rotating and support surfaces are unharmed.
Overheating of motor	• Obstructed cooling system • Overload • Incorrect voltages and frequecies • Frequent inversions • Rotor dragging on stator • Unbalanced electrical load (burnt fuse, incorrect control)	• Clean and dry motor; inspect air vents and windings periodically. • Check application, measuring voltage and current under normal running conditions. • Compare values on motor nameplate with those of mains supply. Also check voltage at motor terminals under full load. • Exchange motor for another that meets needs. • Check bearing wear and shaft curvature. • Check for unbalanced voltages or operation under single-phase condition.

6. Spare Parts and Component Terminology

THREE-PHASE MOTORS IP55 NEMA
Frames 140T - W180T - 180T - 210T and W210T



Part Nr.	Description

1 About this document

This manual

- Is part of the pump
- Applies to all of the afore-mentioned series
- Describes safe and appropriate operation during all operating phases

1.1 Target groups

Target group	Duty
Operating company	► Keep this manual available where the installation is used, including for later use. ► Make sure the staff read and follow this manual and the other applicable documents, especially the safety instructions and warnings. ► Observe any additional rules and regulations referring to the installation.
Qualified staff, fitter	► Read, observe and follow this manual and the other applicable documents, especially the safety instructions and warnings.

Tab. 1 Target groups and their duties

1.2 Other applicable documents

Document	Purpose
ATEX additional instructions	Operation in potentially explosive areas
Order data sheet	Technical specifications, operating conditions
Setup drawing	Setup dimensions, connection dimensions etc.
Technical description	Technical specifications, operating limits
Sectional drawing	Sectional drawing, part numbers, component designations
Supplier documentation	Technical documentation for supplier parts
Spare parts list	Ordering spare parts
Document of compliance	Returning the pump to the manufacturer
Declaration of conformity	Legal confirmation that the pump meets all requirements of the applicable EC directive(s) (→ 9.4 Declaration of conformity according to EC machine directives, Page 45).

Tab. 2 Other applicable documents and their purpose

1.3 Warnings and symbols

Warning	Risk level	Consequences of non-observance
⚠ DANGER	Immediate acute risk	Fatal or serious injury
⚠ WARNING	Potential acute risk	Fatal or serious injury
⚠ CAUTION	Potentially hazardous situation	Minor bodily harm
NOTE	Potentially hazardous situation	Material damage

Tab. 3 Warnings and consequences of non-observance

Symbol	Meaning
⚠	Safety warning sign ► Observe all information indicated by the safety warning sign to avoid injury or death.
►	Instruction
1. , 2. , ...	Multiple-step instructions
✓	Requirement
→	Cross reference
ⓘ	Information, note

Tab. 4 Symbols and their meaning

1.4 Technical terms

Term	Meaning
Pump unit	Pump with motor
Quenching medium	Medium for quenching shaft seals
Barrier medium	Pressurised barrier medium for shaft seals
Flushing medium	Medium for flushing the sealing faces in the seal space or plain bearing
Auxiliary operating systems	Devices for operating the pump

Tab. 5 Technical terms and their meaning

2 Safety

The manufacturer does not accept any liability for damage resulting from non-observance of the entire documentation.

2.1 Intended use

The intended use of the pump is defined in the technical documents. If the pump is to be used for operating data other than those specified in the order data sheet, the operator should check carefully whether the pump version, the accessories and the materials are suitable for the new operating conditions.

- Adhere to the operating limits (→ order data sheet, technical description).
- Only use the pump to pump the agreed pumped media (→ order data sheet).
- Avoid dry running:
  Initial damage such as destruction of mechanical seal and plastic parts within only a few seconds.
  – Make sure the pump is never put into operation or operated without pumped medium.
- Avoid cavitation:
  – Fully open the suction-side fitting; do not use the fitting to adjust the flow rate.
  – Do not open the pressure-side fitting beyond the agreed operating point.
  – Ensure a sufficient $NPSH_{installation}$.
- Avoid overheating:
  – Do not operate the pump while the pressure-side fitting is closed.
  – Minimum permissible flow rate 0.1 x Q_{opt} (minimum flow rate → order data sheet)
- Avoid damage to the motor:
  – Do not open the pressure-side fitting beyond the agreed operating point.
  – Observe the number of permitted motor start-ups per hour (→ manufacturer's specifications).
- Consult the manufacturer about any other use of the pump.
- Adhere to the operating limits for pressure and temperature (→ 9.2.7 Operating limits for pressure and temperature , Page 41).

Avoiding common types of misuse (examples)

- The power uptake of the pump increases with increasing density of the pumped medium. To avoid any overloading of the pump and motor, maintain the permissible density (→ order data sheet).
  Lower densities are allowed. Adapt the auxiliary systems accordingly.
- Adhere to the limits for solids content and grit size when pumping solids-carrying fluids (→ order data sheet, technical description).
- When using auxiliary operating systems:
  – Make sure the operating medium is compatible with the product medium.
  – Ensure a permanent supply of the respective operating medium.

2.2 General safety instructions

Take note of the following instructions before carrying out any work.

2.2.1 Product safety

The pump has been constructed according to the latest technology and established technical safety rules. Nevertheless, a potential risk to life and limb of the operator or other persons or damage to the pump and other property cannot be completely excluded.

- Only operate the pump if it is in perfect technical condition; only use it as intended, staying aware of safety and risks and adhering to the instructions in this manual.
- Keep this manual and all other applicable documents complete, legible and accessible to staff at all times.
- Refrain from any procedures that would endanger staff or third parties.
- If a safety-relevant fault occurs, shut down the pump immediately and have the fault eliminated by appropriate staff.
- In addition to the entire documentation, comply with statutory or other safety and accident-prevention regulations as well as with the applicable standards and guidelines in the country where the pump is operated.
- The assembly of incomplete pump units delivered by the customer must be made in accordance with EC machine directive 2006/42/EC.

2.2.2 Operator's obligations

Safety-conscious operation

- Only operate the pump if it is in perfect technical condition; only use it as intended, staying aware of safety and risks and adhering to the instructions in this manual.
- Ensure the following are observed and monitored:
  – Adherence to intended use
  – Statutory or other safety and accident-prevention regulations
  – Safety regulations governing the handling of hazardous substances
  – Applicable standards and guidelines in the country where the pump is operated
- Make protective equipment available.

Staff qualifications

- Make sure all staff assigned with work on the pump have read and understood this manual and all other applicable documents, especially the safety, maintenance and repair information, before beginning with work.
- Organise responsibilities, areas of competence and the supervision of staff.
- Make sure all work is carried out by specialist technicians only:
  – Fitting, repair and maintenance work
  – Work on the electrical system
- Make sure trainee staff only work on the pump under supervision of specialist technicians.

Safety devices

- Provide the following safety devices and verify their integrity:
  – For hot, cold and moving parts: contact protection of the pump provided by the customer
  – If electrostatic charging is possible: provide appropriate earthing

Warranty

- Obtain the manufacturer's approval before carrying out any modifications, repairs or alterations during the warranty period.
- Only use original parts or parts that have been approved by the manufacturer.

2.2.3 Duties of staff

- Observe and keep legible all directions given on the pump, e.g. the arrow indicating the direction of rotation and the markings for flushing connections.
- Pump and components:
  – Do not step on them or use as a climbing aid
  – Do not use them to support boards, ramps or beams
  – Do not use them as a fixing point for winches or supports
  – Do not use them for storing paper or similar materials
  – Do not de-ice using gas burners or similar tools
- Do not remove the protection against accidental contact with hot, cold and moving parts during operation.
- Use protective equipment if necessary.
- Carry out work on the pump only while the pump is not running.
- Before carrying out any fitting or maintenance work, isolate the motor from its supply voltage and secure it against being switched back on again.
- Reinstall the safety devices according to regulations after any work on the pump.

2.3 Special hazards

2.3.1 Potentially explosive areas

- (→ ATEX additional instructions)

2.3.2 Hazardous pumped media

- Observe the safety regulations for handling hazardous substances when handling hazardous pumped media (e.g. hot, flammable, explosive, poisonous or potentially harmful).
- Use protective equipment when carrying out any work on the pump.

3 Layout and function

3.1 Description

Horizontal centrifugal block pump with volute casing and single-entry, single-stage radial impeller; nominal pressure PN 10.

The casing dimensions and connection dimensions correspond to EN 22858/ISO 2858, with the addition of pump sizes 40-25-160 and 40-25-125.

3.2 Labels

3.2.1 Type plate

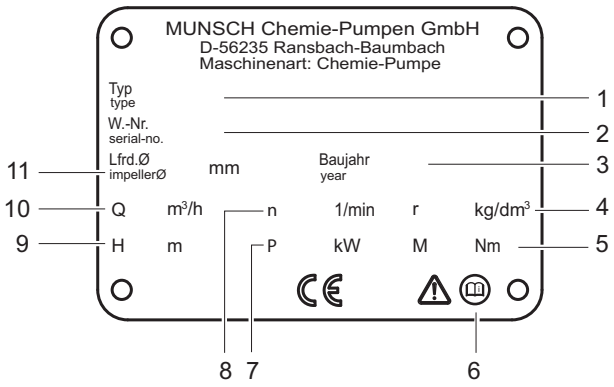

Fig. 1 Type plate (example)

1 Pump type
2 Serial number
3 Year of construction
4 Density
5 Torque
6 Note on operating manual
7 Power consumption
8 Speed
9 Pump head
10 Flow rate
11 Impeller diameter

3.2.2 Type plate with ATEX

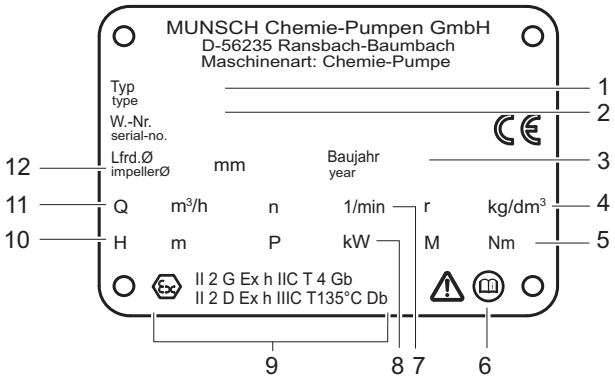

Fig. 2 Type plate with ATEX (example)

1 Pump type
2 Serial number
3 Year of construction
4 Density
5 Torque
6 Note on operating manual
7 Speed
8 Power consumption
9 Explosion protection code
10 Pump head
11 Flow rate
12 Impeller diameter

3.2.3 Pump type code

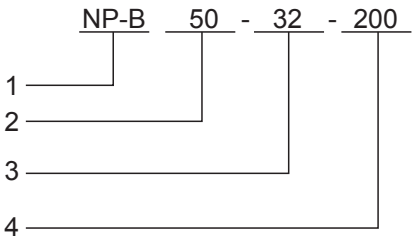

Fig. 3 Pump type code (example)

1 Series
2 Suction nozzle DN [mm]
3 Pressure joint DN [mm]
4 Nominal impeller diameter [mm]

3.3 Layout

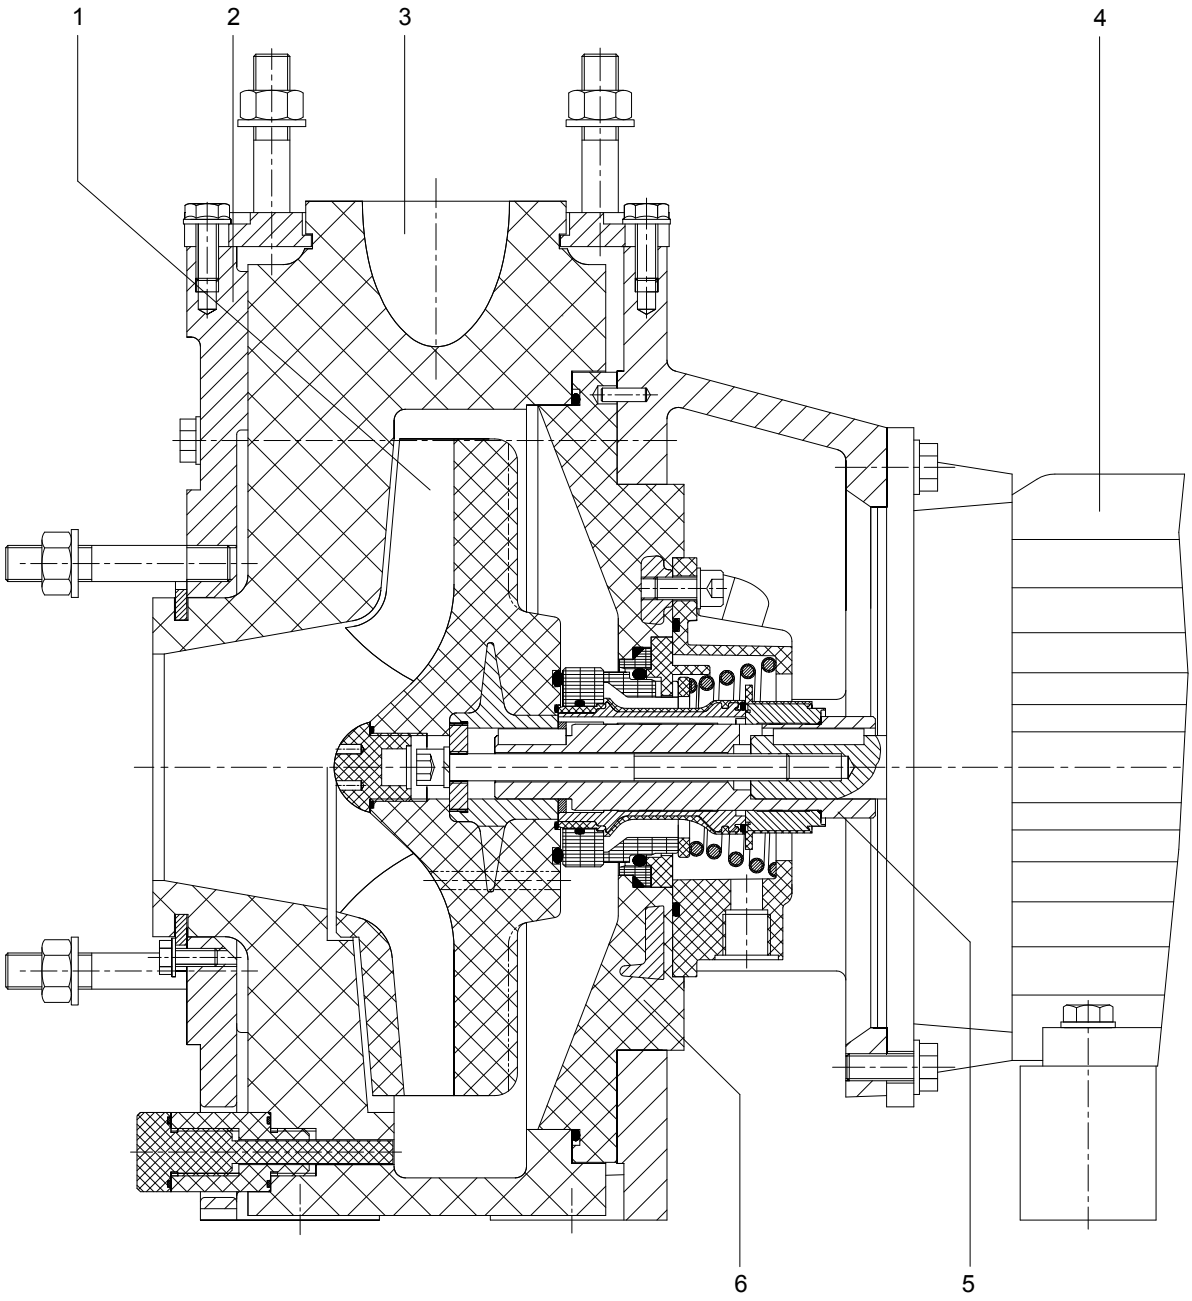

Fig. 4 NP-B layout (with single-action mechanical seal)

1 Impeller
2 Suction flange
3 Pump casing
4 Motor
5 Pump shaft
6 Casing cover

3.4 Shaft seals

Only one of the following shaft seals can be used.

3.4.1 Mechanical seals

Mechanical seals will always show some functional drip leakage.

Use of double mechanical seals only possible from motor size 100 L upwards

- Single mechanical seal
- Double mechanical seal with quench
- Double mechanical seal with using a pressurised barrier medium

3.5 Auxiliary operating systems

Specification and connection points of the sealing systems and flushing options

- (→ 9.2.2 Parameters for auxiliary operating systems, Page 39).
- (→ 9.2.8 Flushing options , Page 42).

3.5.1 Sealing systems

Only one of the following sealing systems can be used.

Quenching

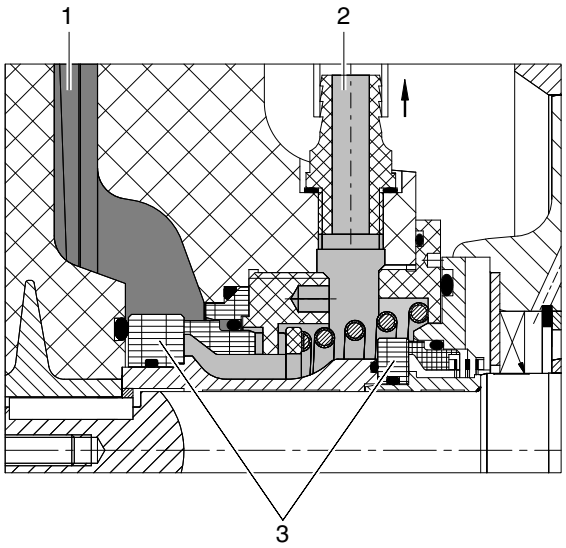

Fig. 5 Double mechanical seal with quench – operating principle

1 Pumped medium
2 Quenching medium (unpressurised)
3 Double mechanical seal

The pressure of the pumped medium on the product-side mechanical seal is higher than the pressure of the quenching medium during quenching. The sealing friction surfaces of the product-side seal are lubricated by the pumped medium. The sealing friction surfaces of the atmosphere-side seal are lubricated by the quenching medium.

Application examples:

- Pumped media that crystallize in air, causing long-term damage to the seal
- Prevention of odours
- Cooling of seals

Variant	Characteristics of the quenching medium
Open system	• Supplied and drained continuously • Unpressurised • Clean fluid
Closed system	• Circulated in a closed circuit • Unpressurised

Tab. 6 Quenching (in preparation) – variants and characteristics

Variant	Characteristics of the barrier medium
Open system	• Supplied and drained continuously • Pressurised • Clean fluid
Closed system	• Circulated in a closed circuit • Pressurised

Tab. 7 Using a pressurised barrier medium (in preparation) – variants and characteristics

Using a pressurised barrier medium

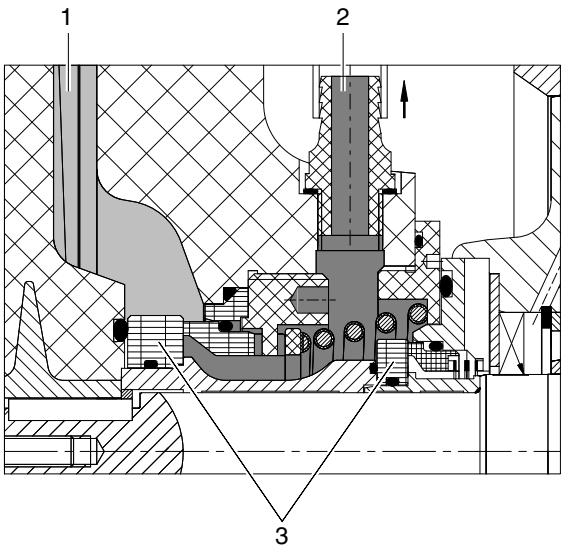

Fig. 6 Double mechanical seal with pressurised barrier medium – operating principle

1 Pumped medium
2 Barrier medium (pressurised)
3 Double mechanical seal

When using a pressurised barrier medium, the pressure of the barrier medium on the product-side mechanical seal is higher than the pressure of the pumped medium. The sealing friction surfaces are lubricated by the barrier medium.

Application examples:

- Pumped media that crystallize or carry solids, causing long-term damage to the seal
- Toxic pumped media
- Pumped media presenting an environmental hazard

3.5.2 Flushing options

Flushing options and parameters for REA-F, REA-F/D seals (→ 9.2.8 Flushing options , Page 42).

- Spring chamber flushing
- Stationary flushing
- Permanent flushing

4 Transport, storage and disposal

4.1 Transport

Weight specifications (→ individual order documents)

4.1.1 Unpacking and inspection on delivery

1. Unpack the pump/unit on delivery and check it for transport damage.
2. Report any transport damage to the manufacturer without delay.
3. Dispose of packaging material according to local regulations.

4.1.2 Lifting

⚠ DANGER

Death or crushed limbs caused by falling loads!

- ► Use lifting gear appropriate for the total weight to be transported.
- ► Fasten the lifting gear as shown in the illustrations below.
- ► Do not stand under suspended loads.

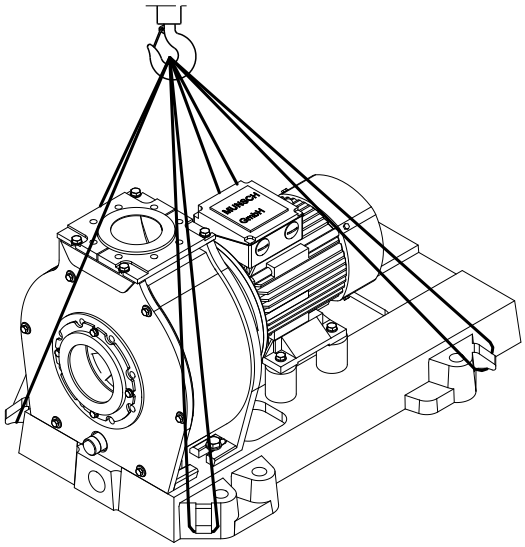

Fig. 7 Fastening the lifting gear to the pump unit with base plate

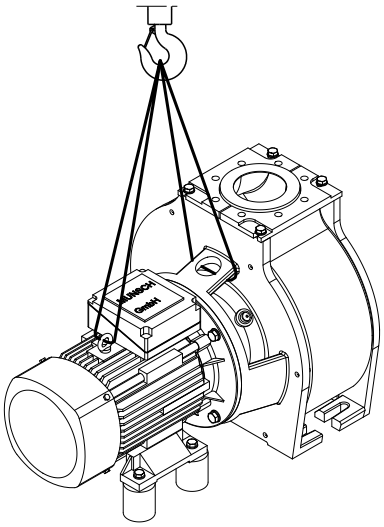

Fig. 8 Fastening the lifting gear to the pump unit without base plate

- ► Lift the pump unit properly.

4.2 Preservation

No preservation required

► Do not preserve the pump.

4.3 Storage

NOTE

Material damage due to inappropriate storage!

► Store the pump in an appropriate manner.

1. Seal all openings with blank flanges, blind plugs or plastic covers.
2. Make sure the storage room meets the following conditions:
   – Dry
   – Frost-free
   – Vibration-free
3. Turn the motor shaft once a month:
   – Remove any existing transport protection devices first. Keep the transport protection devices for later use.
   – Make sure the shaft and the bearing change their rotational position in the process.

4.4 Disposal

Plastic parts can be contaminated by poisonous or radioactive pumped media to such an extent that cleaning is insufficient.

⚠ WARNING

Risk of poisoning and environmental damage due to the pumped medium or oil!

► Use protective equipment when carrying out any work on the pump.

► Prior to the disposal of the pump:
   – Collect any pumped medium and oil or grease which run out and dispose of them separately according to local regulations.
   – Neutralise residues of pumped medium in the pump.

► Remove the plastic parts and dispose of them according to local regulations.

► Dispose of the pump according to local regulations.

5 Setup and connection

For pumps in potentially explosive areas (→ ATEX additional instructions)

NOTE

Material damage caused by dirt!

► Do not remove the covers and sealing covers until immediately before connecting the pipes to the pump.

5.1 Preparing the setup

5.1.1 Checking the ambient conditions

► Make sure the required ambient conditions are met (→ 9.2.1 Ambient conditions, Page 39).

5.1.2 Preparing the setup site

► Make sure the setup site meets the following conditions:
- Pump freely accessible from all sides
- Sufficient space for installation/removal of the pipes and for maintenance and repair work, especially for the removal and installation of the pump and motor
- Pump not exposed to external vibrations (damage to bearings)
- Frost protection
- Sufficient leak protection available according to local regulations

5.1.3 Preparing the foundation and setup surface

Setup options:
- with concrete foundation
- with steel foundation frame
- without foundation

► Make certain that the foundation and setup surface meet the following conditions:
- Level
- Clean (no oil, dust or other impurities)
- Capable of bearing the weight of the pump unit and all operating forces
- Stability of the pump unit ensured
- For concrete foundation: Standard concrete of strength class B 25

5.1.4 Preparing the pump

1. Take the following measures after long storage times / downtimes.

Storage time/ downtime	Measure
> 2 years	► Replace the motor bearing if necessary (→ operating manual of the motor manufacturer). ► Replace the elastomer seals (O-rings, shaft seal rings).

Tab. 8 Measures after long storage times/downtimes

2. Remove any transport protection devices which are present.
Keep the transport protection devices for later use.

5.1.5 Installing the heat insulation

Only necessary to maintain the temperature of the pumped medium.

NOTE

Material damage caused by overheating!

► Only install the heat insulation on the volute casing.

► Install the heat insulation appropriately.

5.2 Setting up the pump unit

✓ Aids, tools and materials:
- Fasteners / screws (→ setup drawing)
- Washers

Only necessary if the pump unit is fixed to the setup surface or base plate at the setup site.

NOTE

Material damage due to incorrect installation!

► Do not screw the motor or motor sub-structure to the setup surface or base plate.

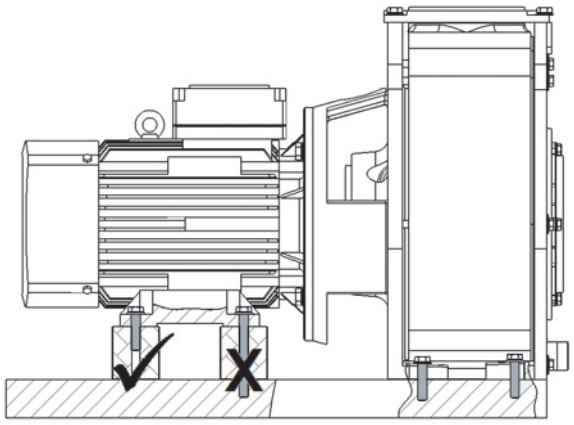

Fig. 9 Fastening the pump unit

1. Set down the pump unit onto a suitable setup surface or base plate, then align it.
2. Ensure that the pump and motor feet / sub-structures are aligned.
   Use suitable washers, when necessary.
3. Screw the pump onto the intermediate lantern and the suction flange to the setup surface or base plate.
4. Make sure the pump unit is not deformed.

5.3 Setup with foundation

NOTE

Material damage due to base plate distortion!

► Set and fasten the base plate on the foundation as described in the following.

5.3.1 Setting the pump unit with base plate on the foundation

✓ Implements, tools and materials:
- Foundation bolts (→ Setup drawing)
- Steel washers
- Mortar grout, non-shrinking
- Spirit level

1. Lift the pump unit with base plate (→ 4.1 Transport, Page 14).
2. Working from below, hang the foundation bolts in the fixation holes of the base plate.

Observe the manufacturer's instruction when using chemical anchors.

3. Set down the pump unit with base plate onto the foundation. When doing this, sink the foundation bolts into the prepared anchoring holes.

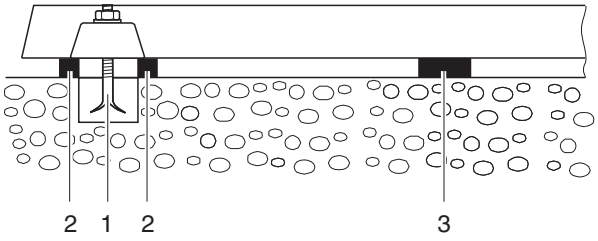

Fig. 10 Setup with foundation

4. Use steel washers to align the base plate to height and system measurements as described in the following:
   - Position 1 steel washer (2) each left and right of next to each foundation bolt (1).
   - If the distance between anchoring holes is > 750 mm, position additional steel washer (3) centrally at each of the base plate.
5. Make certain that the base plate and the steel washers are in full surface contact.
6. Use a machine spirit level to check the permissible height deviation (1 mm/m) lengthwise and crosswise.
7. Repeat procedure until the base plate is correctly aligned.

5.3.2 Fastening the base plate

Filling out the base plate with mortar grout will improve the damping behaviour.

1. Fill the anchoring holes with mortar grout.
2. Once the mortar grout has set:
   – Screw the base plate tight at three points with the specified tightening torque (→ 9.2.4 Tightening torques, Page 40).
3. Before tightening the remaining screws, compensate any unevenness of the fixation surface, using metal shims next to every screw.
4. Fill the base plate with moulding material if applicable. Knock on the base plate to ensure that no cavities are created in the process.
5. Make sure the base plate is not deformed.

5.4 Setup without foundation

✓ Implements, tools and materials:
   – Fasteners / screws (→ setup drawing)
   – Washers

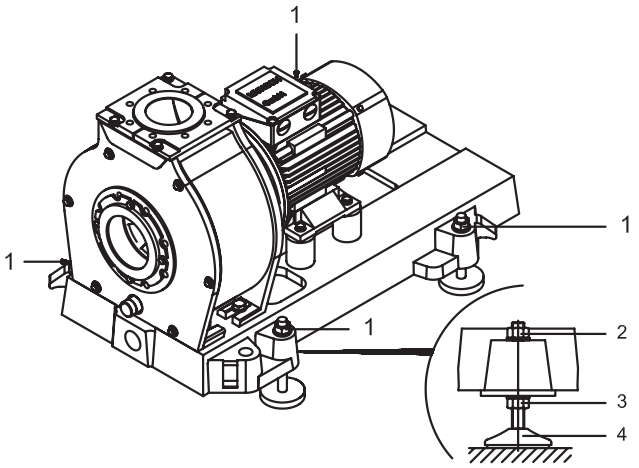

Fig. 11 Setup without foundation

1. Lift the pump unit with base plate (→ 4.1.2 Lifting, Page 14).
2. Mount the four levelling feet (1) as shown in the illustration.
3. Set down the pump unit with base plate onto the setup surface.
4. Adjust the height of the base plate using levelling feet (1) as shown above:
   – Use wrench to hold the hexagon at levelling foot (4).
   – Slacken hexagon nut (2).
   – Adjust height by turning hexagon nut (3).
   – Tighten hexagon nut (2) (→ 9.2.4 Tightening torques, Page 40).
   – Use a machine spirit level to check the permissible height deviation (1 mm/m) lengthwise and crosswise.
   – Repeat procedure until the base plate is correctly aligned.

5.5 Planning pipes

5.5.1 Laying out supports and flange connections

NOTE

Material damage due to excessive forces and torques of the pipes on the pump!

► Do not exceed approved limits (→ 9.2.6 Socket loads acc. to ISO 5199, Page 41).

1. Calculate pipe forces taking into account every possible operating condition:
   – Cold/warm
   – Empty/full
   – Unpressurised/pressurised
   – Position shifts of flanges
2. Ensure the pipe can slide freely in the supports and does not seize up due to corrosion.

5.5.2 Specifying nominal diameters

Keep the flow resistance in the pipes as low as possible.

1. Specify suction pipe nominal width ≥ suction nozzle nominal width.
2. Specify pressure pipe nominal width ≥ pressure joint nominal width.

5.5.3 Specify pipe lengths

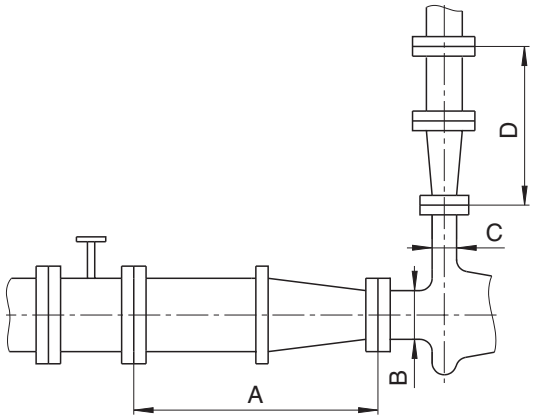

Fig. 12 Straight pipe lengths upstream and downstream of the pump (recommended)

A > 5x DNs
B DNs
C DNd
D > 5x DNd

► Observe recommend minimum values when installing the pump.

Suction side: Shorter pipes are feasible but can restrict hydraulic performance data.

Pressure side: Shorter pipes are feasible but can lead to increased operating noise.

5.5.4 Optimising changes in cross-section and direction

1. Avoid bends with radii smaller than 1.5 times the pipe diameter.
2. Avoid abrupt changes of cross-sections in the pipes.

5.5.5 Providing safety and monitoring devices (recommended)

Avoid impurities

1. Integrate filter into the suction pipe.
2. To monitor the level of dirt, install a differential manometer with contact manometer.

Avoiding reverse operation

1. Install a non return valve between the pressure joint and stop valve to ensure the medium does not flow back after the pump is switched off.
2. To enable bleeding, provide a bleeding connection between the pressure joint and non return valve.

Make provisions for isolating and shutting off the pipes

For maintenance and repair work.

► Provide shut-off devices in the suction and pressure pipes.

Enable measurements of the operating conditions

1. Provide manometers for pressure measurements in suction and pressure pipes.
2. Provide for motor-side output measurement.
3. Provide for pump temperature measurements.

5.6 Connecting pipes

NOTE

Material damage due to excessive forces and torques of the pipes on the pump!

► Do not exceed approved limits (→ 9.2.6 Socket loads acc. to ISO 5199, Page 41).

NOTE

Material damage due to excessive tightening torques of the flange connections and housing connections!

► The torques on the flange connection and housing connection are dependent on the seal type and size. Observe the correct guideline values based on the type of screw connection:
  – (→ Tab. 18 Hexagon head bolt **901.2** – steel/cast iron pairings, Page 40).
  – (→ Tab. 20 Flange connection, Page 40).

5.6.1 Avoid impurities in the pipes

NOTE

Material damage due to impurities in the pump!

► Ensure no impurities enter the pump.

1. Clean all pipe sections and fittings prior to assembly.
2. Ensure no flange gaskets protrude inwards.
3. Remove any blank flanges, plugs, protective films and/or protective paint from the flanges.

5.6.2 Installing auxiliary piping

Observe the manufacturer's specifications for any existing auxiliary operating systems.

1. Install the auxiliary pipes at the auxiliary connections without stress and leaks.
2. To avoid air enclosures: install the pipes so that they ascend to the pump.

5.6.3 Installing the suction pipe

1. Remove the transport and sealing covers from the pump.
2. Install the suction pipe without stress and leaks.
   To avoid air enclosures: install the pipes so that they ascend to the pump.
3. Ensure no seals protrude inwards.
4. For suction operation: Install a foot valve in the suction pipe to prevent the pump and suction pipe from running empty during downtimes.

5.6.4 Installing the pressure pipe

1. Remove the transport and sealing covers from the pump.
2. Install the pressure pipe without stress and leaks.
3. Ensure no seals protrude inwards.

5.6.5 Checking that the pipe connection is stress-free

✓ Pipe installed and cooled down

1. Disconnect the connection flange of the pipes from the pump.
2. Check whether the pipe is freely moveable in all directions within the range of expected expansion:
   – Nominal width < 150 mm: by hand
   – Nominal width > 150 mm: with a small lever
3. Make sure the flange surfaces are parallel.
4. Reconnect the connection flange of the pipes to the pump.

5.7 Connecting the electrical system

5.7.1 Connecting the motor

Observe the specifications of the motor manufacturer.

DANGER

Risk of fatal injury due to electric shock!

► Have all electrical work carried out by qualified electricians only.

► Isolate the installation from its supply voltage and secure it against being switched back on again prior to any work on the electrical system.

1. Connect the motor according to the circuit diagram.
2. Ensure the electrical power does not pose any risks.
3. Install an EMERGENCY STOP switch.

5.7.2 Checking the direction of rotation

Only possible when putting the pump into service (→ 6.1 Putting the pump into service for the first time, Page 21).

6 Operation

For pumps in potentially explosive areas (→ ATEX additional instructions)

6.1 Putting the pump into service for the first time

6.1.1 Identifying the pump version

► Identify the pump version (→ order data sheet).

Pump versions vary, for example in the shaft seal and auxiliary operating systems.

6.1.2 Checking the downtime

► Check the downtime (→ Tab. 8 Measures after long storage times/downtimes, Page 16).

6.1.3 Preparing auxiliary operating systems (if available)

The manufacturer assumes no liability for damage caused by installing or using a third-party or non-approved auxiliary operating system.

Sealing systems

1. Make sure the quenching/barrier medium is suitable for mixing with the pumped medium.
2. Identify the sealing system (→ order data sheet) (→ 3.5.1 Sealing systems, Page 12).
3. Install the sealing system (→ manufacturer's instructions).
4. Ensure the parameters required for the installed sealing system (→ 9.2.2 Parameters for auxiliary operating systems, Page 39).

6.1.4 Filling and bleeding

✓ If available: Auxiliary operating systems are ready for operation

⚠ WARNING

Risk of injury and poisoning due to hazardous pumped media!

► Use protective equipment when carrying out any work on the pump.

► Collect any leaking pumped medium safely and dispose of it according to local regulations.

1. Open the suction-side fitting.
2. Open the pressure-side fitting.
3. Fill the pump and the suction pipe with pumped medium.
4. Open the auxiliary operating systems, if available, and check the flow rate.
5. Make sure all connections are tight.

6.1.5 Checking the direction of rotation

✓ Transport protection devices removed

⚠ DANGER

Risk of fatal injury due to rotating parts!

► Use protective equipment when carrying out any work on the pump.

► Keep a sufficient distance to rotating parts.

NOTE

Material damage caused by dry running!

► Make sure the pump is filled properly.

1. Switch the motor on and immediately off again.
2. Check whether the motor's direction of rotation corresponds to the arrow indicating the direction of rotation of the pump.
3. If the direction of rotation is different:
   – Swap two phases (→ 5.7.1 Connecting the motor, Page 20).

6.1.6 Switching on the pump

✓ The pump is correctly set up and connected
✓ The motor is correctly set up and connected
✓ All connections stress-free and leak-free
✓ Any existing auxiliary system are ready for operation
✓ All safety devices installed and checked for integrity
✓ The pump has been correctly prepared, filled and bled

⚠ DANGER

Risk of injury due to running pump!

► Do not touch the running pump.
► Do not carry out any work on the running pump.
► Allow the pump to cool down completely before starting any work.

⚠ WARNING

Risk of injury and poisoning due to hazardous pumped media!

► Use protective equipment when carrying out any work on the pump.
► Collect any leaking pumped medium safely and dispose of it according to local regulations.

NOTE

Material damage caused by dry running!

► Make sure the pump is filled properly.

NOTE

Risk of cavitation when throttling the suction flow rate!

► Fully open the suction-side fitting; do not use the fitting to adjust the flow rate.
► Do not open the pressure-side fitting beyond the operating point.

NOTE

Material damage caused by overheating!

► Do not operate the pump while the pressure-side fitting is closed.
► Observe the minimum flow rate (→ order data sheet).

NOTE

Material damage due to partial load operation!

► Do not operate below the minimum flow rate (0.1 x Q_{opt}).

1. Open the suction-side fitting.
2. Close the pressure-side fitting.
3. Switch on the motor and check whether it is running smoothly.
4. As soon as the motor is running at nominal speed, open the pressure-side fitting slowly until the operating point is reached.
5. With hot pumped media, make sure any temperature changes do not exceed 50 °C/h.
6. After the initial stress caused by pressure and operating temperature, check whether the pump is not leaking.

6.1.7 Switching off the pump

✓ Pressure-side fitting closed (recommended)

⚠ WARNING

Risk of injury due to hot pump components!

► Use protective equipment when carrying out any work on the pump.

1. Switch off the motor. If available, maintain the following functions:
   – With double mechanical seals: Barrier pressure until pump is unpressurised
2. Check all connecting screws and tighten them if necessary.

6.2 Operating

6.2.1 Making preparations for operation

► If necessary, perform the following steps:
  – Prepare any auxiliary operating systems (→ 6.1.3 Preparing auxiliary operating systems (if available), Page 21).
  – Fill and bleed the pump (→ 6.1.4 Filling and bleeding, Page 21).

6.2.2 Switching on the pump

✓ Pump put into service properly
✓ Operation prepared properly

⚠ DANGER

Risk of injury due to running pump!

► Do not touch the running pump.
► Do not carry out any work on the running pump.
► Allow the pump to cool down completely before starting any work.

⚠ WARNING

Risk of injury and poisoning due to hazardous pumped media!

► Use protective equipment when carrying out any work on the pump.
► Collect any leaking pumped medium safely and dispose of it according to local regulations.

NOTE

Material damage caused by dry running!

► Make sure the pump is filled properly.

NOTE

Risk of cavitation when throttling the suction flow rate!

► Fully open the suction-side fitting; do not use the fitting to adjust the flow rate.
► Do not open the pressure-side fitting beyond the operating point.

NOTE

Material damage caused by overheating!

► Do not operate the pump while the pressure-side fitting is closed.
► Observe the minimum flow rate (→ order data sheet).

NOTE

Material damage due to partial load operation!

► Do not operate below the minimum flow rate (0.1 x Q_{opt}).

1. Open the suction-side fitting.
2. Close the pressure-side fitting.
3. Switch on the motor and check whether it is running smoothly.
4. As soon as the motor is running at nominal speed, open the pressure-side fitting slowly until the operating point is reached.
5. Make sure the temperature changes do not exceed 50 °C/h at pumps with hot pumped media.

6.2.3 Switching off the pump

✓ Pressure-side fitting closed (recommended)

⚠ WARNING

Risk of injury due to hot pump components!

► Use protective equipment when carrying out any work on the pump.

► Switch off the motor. If available, maintain the following functions:
  – With double mechanical seals: Barrier pressure until pump is unpressurised

6.3 Shut-down

⚠ WARNING

Risk of injury and poisoning due to hazardous pumped media!

- ▶ Use protective equipment when carrying out any work on the pump.
- ▶ Collect any leaking pumped medium safely and dispose of it according to local regulations.

⚠ DANGER

Risk of fatal injury due to electric shock!

- ▶ Have all electrical work carried out by qualified electricians only.
- ▶ Isolate the installation from its supply voltage and secure it against being switched back on again prior to any work on the electrical system.

⚠ DANGER

Risk of injury due to running pump!

- ▶ Do not touch the running pump.
- ▶ Do not carry out any work on the running pump.
- ▶ Before carrying out any fitting or maintenance work, isolate the motor from its supply voltage and secure it against being switched back on again.

▶ Take the following measures if operation is interrupted:

Pump is	Measure
...shut down for a prolonged period	▶ Take measures according to the pumped medium (→ Tab. 10 Measures to be taken, depending on the pumped medium behaviour, Page 24). ▶ Isolate the motor from its supply voltage and secure it against being switched back on again.
...emptied	▶ Close the suction-side and pressure-side fittings.
...dismounted	▶ Disconnect the electrical connections and secure the motor against being switched back on again
...put into storage	▶ Follow the storage instructions (→ 4.3 Storage, Page 15).

Tab. 9 Measures to be taken if operation is interrupted

Behaviour of the pumped medium	Duration of the interruption to service (depending on process)	
	Short	Long
Solids sedimenting	▶ Flush the pump.	▶ Flush the pump.
Solidifying/ freezing, non-corrosive	▶ Heat up or empty the pump and containers.	▶ Empty the pump and containers.
Solidifying/ freezing, corrosive	▶ Heat up or empty the pump and containers.	▶ Empty the pump and containers. ▶ Clean and dry the pump. ▶ Preserve the containers if necessary.
Remains liquid, non-corrosive	–	–
Remains liquid, corrosive	–	▶ Empty the pump and containers. ▶ Clean and dry the pump. ▶ Preserve the containers if necessary.

Tab. 10 Measures to be taken, depending on the pumped medium behaviour

6.4 Restoring the pump to service

1. Check the downtime (→ Tab. 8 Measures after long storage times/downtimes, Page 16).
2. Carry out all steps as for the initial start-up (→ 6.1 Putting the pump into service for the first time, Page 21).

6.5 Operating the stand-by pump

✓ Stand-by pump filled and bled

ⓘ Operate the stand-by pump at least once a week.

1. Fully open the suction-side fitting.
2. Open the pressure-side fitting until the stand-by pump reaches operating temperature and is evenly heated(→ 6.1.6 Switching on the pump, Page 22).

7 Maintenance

For pumps in potentially explosive areas (→ ATEX additional instructions)

Trained service technicians are available for fitting and repair work. Present a pumped material certificate (DIN safety data sheet or document of compliance) upon request.

7.1 Monitoring

The inspection intervals depend on the load placed on the pump.

⚠ DANGER

Risk of injury due to running pump!

- ► Do not touch the running pump.
- ► Do not carry out any work on the running pump.

⚠ WARNING

Risk of injury and poisoning due to hazardous pumped media!

- ► Use protective equipment when carrying out any work on the pump.

1. Check at appropriate intervals:
   - – Compliance with minimum flow rate
   - – Roller bearing temperature < 70 °C
   - – Normal operating conditions unchanged
   - – Concentration of the quenching/barrier medium in the closed system
2. For trouble-free operation, ensure the following:
   - – No dry running
   - – No leaks
   - – No cavitation
   - – Suction-side gate valves open
   - – Unobstructed and clean filters
   - – Sufficient supply pressure
   - – No unusual running noises and vibrations
   - – No impermissible leaks at the shaft seal
   - – Proper functioning of auxiliary operating systems

7.2 Maintenance

Service life of the roller bearings for operation within the permissible operating range: > 2 years

Intermittent operation, high temperatures, low viscosities and aggressive ambient and process conditions reduce the service life of roller bearings (→ operating manual of the motor manufacturer).

Mechanical seals and plain bearings are subject to natural wear, which strongly depends on the actual operating conditions. Therefore, general statements regarding their service life cannot be made.

⚠ DANGER

Risk of fatal injury due to electric shock!

- ► Have all electrical work carried out by qualified electricians only.
- ► Isolate the installation from its supply voltage and secure it against being switched back on again prior to any work on the electrical system.

⚠ DANGER

Risk of injury due to running pump!

- ► Do not touch the running pump.
- ► Do not carry out any work on the running pump.
- ► Before carrying out any fitting or maintenance work, isolate the motor from its supply voltage and secure it against being switched back on again.

⚠ WARNING

Risk of injury and poisoning due to hazardous or hot pumped media!

- ► Use protective equipment when carrying out any work on the pump.
- ► Allow the pump to cool down completely before performing any work.
- ► Make sure the pump is unpressurised.
- ► Empty the pump, safely collect the pumped medium and dispose of it in accordance with environmental rules and requirements.

7.2.1 Mechanical seals

Mechanical seals will always show some functional drip-leakage (→ manufacturer's instructions).

Double mechanical seals with quench: Any dramatic rise of the quench system level indicates a major leak at the product-side mechanical seal.

Double mechanical seals with pressurised barrier medium: A dramatic pressure drop in the barrier system (loss of lubricating fluid) indicates a major leak at one of the mechanical seals.

► If there is a major leak: Replace the mechanical seal with its auxiliary seals and check the functionality of auxiliary operating systems.

7.3 Dismounting the pump

⚠ DANGER

Risk of injury due to running pump!

► Do not touch the running pump.
► Do not carry out any work on the running pump.
► Before carrying out any fitting or maintenance work, isolate the motor from its supply voltage and secure it against being switched back on again.

⚠ DANGER

Risk of fatal injury due to electric shock!

► Have all electrical work carried out by qualified electricians only.
► Isolate the installation from its supply voltage and secure it against being switched back on again prior to any work on the electrical system.

⚠ WARNING

Risk of injury and poisoning due to hazardous or hot pumped media!

► Use protective equipment when carrying out any work on the pump.
► Allow the pump to cool down completely before performing any work.
► Make sure the pump is unpressurised.
► Empty the pump, safely collect the pumped medium and dispose of it in accordance with environmental rules and requirements.

⚠ WARNING

Risk of injury due to heavy components!

► Pay attention to the component weight. Lift and transport heavy components with suitable lifting gear.
► Set down components safely and secure them against overturning or rolling away.

7.3.1 Returning the pump to the manufacturer

✓ The pump is unpressurised
✓ Pump completely empty
✓ Electrical connections disconnected and motor secured against being switched back on again
✓ Pump cooled down
✓ Auxiliary systems shut down, unpressurised and emptied
✓ Manometer lines, manometer and fixtures dismounted

1. Enclose a truthfully completed declaration of compliance when returning pumps or components to the manufacturer. Order a form for the document of compliance from the manufacturer if necessary.
2. Take the measures required to return the pump to the manufacturer as specified in the following table, depending on the repair work required.

Repairs	Measure for return
At the customer's premises	▶ Return the defective component to the manufacturer.
At the manufacturer's premises	▶ Flush the pump and decontaminate it if it has been used with hazardous pumped media. ▶ Return the entire pump unit (not disassembled) to the manufacturer.
At the manufacturer's premises for warranty repairs	▶ Only in the event of hazardous pumped media: – Flush and decontaminate the pump. ▶ Return the entire pump unit (not disassembled) to the manufacturer.

Tab. 11 Measures for return

7.3.2 Preparations for dismounting the pump

✓ The pump is unpressurised
✓ Pump completely empty, flushed and decontaminated
✓ Electrical connections disconnected and motor secured against being switched back on again
✓ Pump cooled down
✓ Auxiliary systems shut down, unpressurised and emptied
✓ Manometer lines, manometer and fixtures dismounted

The pumps are constructed in process architecture as standard. The slide-in unit can be dismounted without removing the volute casing and piping.

1. Observe the following when dismounting the pump:
   – Mark the precise installation orientation and position of all components prior to the disassembly.
   – Dismount the components concentrically without canting.
   – Dismount the pump (→ sectional drawing).
2. Unscrew the fixation bolts between the pump/plug-in unit and base plate.
3. If necessary, undo the pipes.
4. Lift the pump out of the installation (→ 4.1.2 Lifting, Page 14).

7.3.3 Loosen connectors (if applicable)

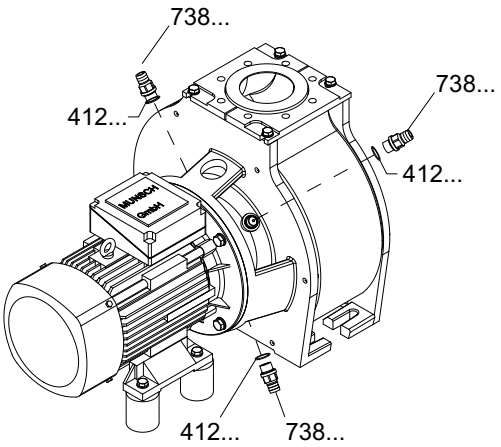

Fig. 13 Loosening the connectors

1. Loosen and unscrew existing fittings **738...**.
2. Remove and replace O-rings **412...**.

7.3.4 Dismounting the pump casing

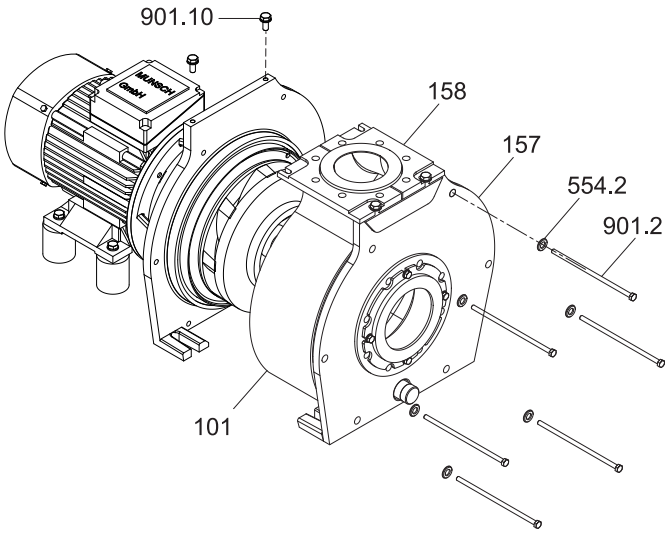

Fig. 14 Dismounting the pump casing

1. Loosen hexagon head bolts **901.10** at intermediate lantern **146**.
2. Undo the hexagon head screws **901.2**.
3. Slide off pump casing **101** with suction flange **157** and pressure flange **158**.

7.3.5 Dismounting the impeller and front shaft sleeve

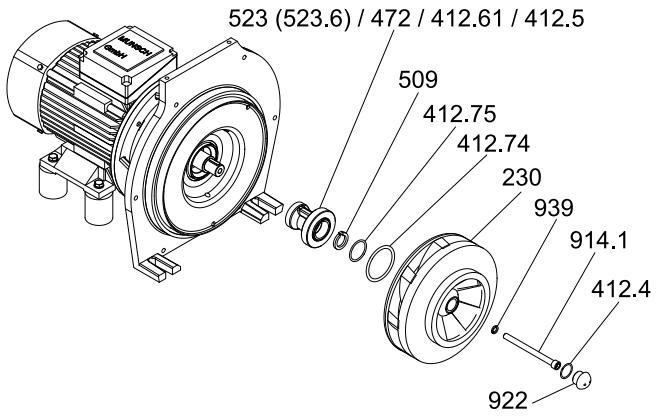

Fig. 15 Dismounting the impeller and front shaft sleeve

1. Loosen impeller screw **922** using circlip pliers and remove the screw.
2. Undo the socket head cap screw **914.1** and remove with the SCHNORR spring washer **939**.
3. Extract impeller **230**.
4. Extract intermediate ring **509**.
5. Remove and replace the O-rings **412.4**, **412.74** and **412.75**.
6. Remove the rotating seal ring **472** with shaft sleeve **523** (**523.6**) from the pump shaft **211**.

7.3.6 Dismounting the product-side MUNSCH-REA-F mechanical seal

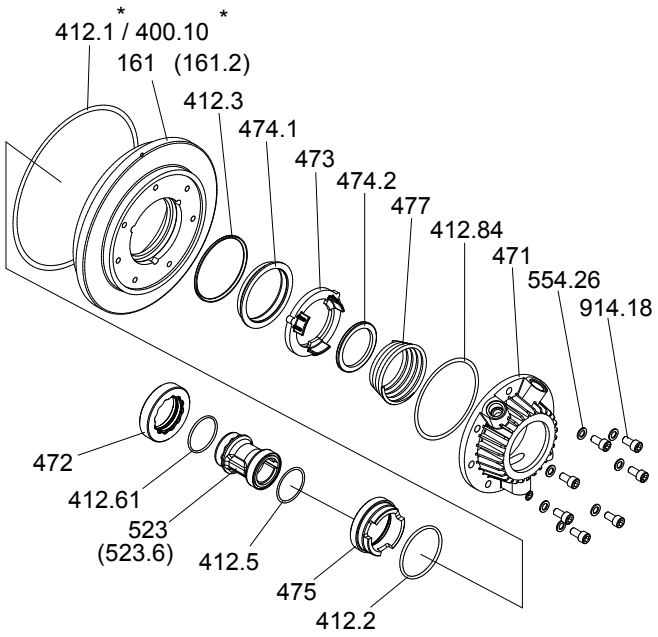

Fig. 16 Dismounting the product-side MUNSCH-REA-F mechanical seal

1. Undo the rotating seal ring **472** from the shaft sleeve **523** (**523.6**).
2. Take the casing cover **161** (**161.2**) out of the intermediate lantern **146** and set it down with the seal cover **471**.
3. Take the O-ring **412.1** or gasket **400.10** off the casing cover **161** (**161.2**) and replace it if necessary.
4. Extract stationary seal ring **475**.
5. Turn the casing cover upside down.
6. Undo the socket head cap screws **914.18** and remove the washers **554.26**.
7. Remove the seal cover (**471**).
8. Remove spring **477** and thrust ring **474.2**.
9. Remove stationary seal ring holder **473**.
10. Remove thrust ring **474.1**.
11. Take out the O-rings **412.61**, **412.5**, **412.2**, **412.84**, **412.3** and replace them.

7.3.7 Disassembling the atmosphere-side mechanical seal

Only with MUNSCH-REA-F/D double mechanical seal

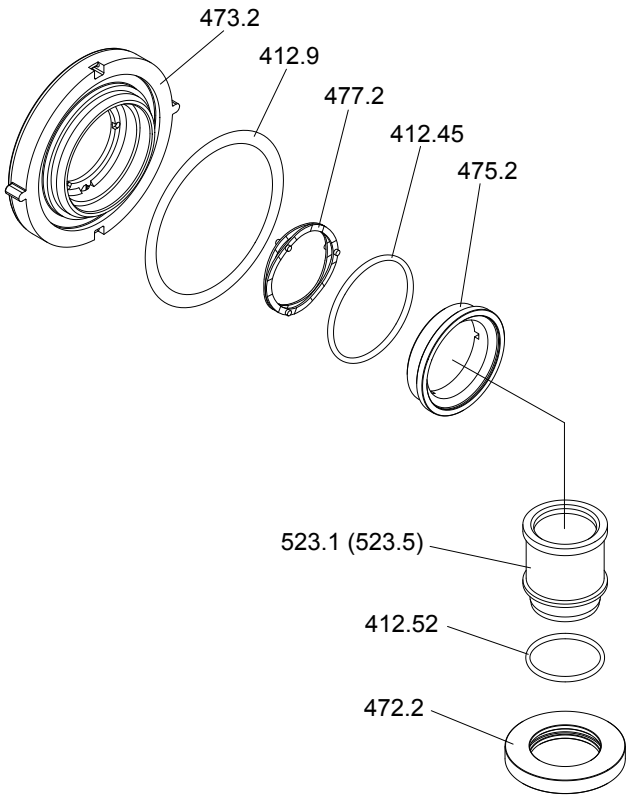

Fig. 17 Dismounting the MUNSCH-REA-F/D mechanical seal

1. Remove the rotating seal ring **472.2** and shaft sleeve **523.1** (**523.5**) from the shaft.
2. Remove the stationary seal ring holder **473.2** from the pump.
3. Pull the stationary seal ring **475.2** out of the stationary seal ring holder **473.2**.
4. Remove spring **477.2**.
5. Remove and replace O-rings **412.52**, **412.45**, **412.9**.

7.3.8 Dismounting the rear shaft sleeve

Only on pumps with MUNSCH-REA-F single mechanical seal

► Pull the rear shaft sleeve **523.1** (**523.5**) off the pump shaft **211**.

7.3.9 Dismounting the pump shaft

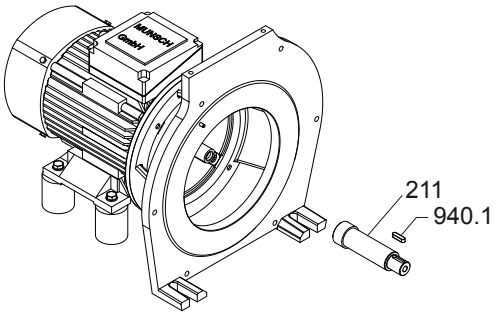

Fig. 18 Dismounting the pump shaft

► Pull the pump shaft **211** off the motor shaft.

7.4 Installing the pump

7.4.1 Preparing the installation

1. Observe the following for the installation:
   – Replace worn out parts with original spare parts.
   – Replace the seals.
   – Before installation, lubricate all O-rings (**412.4/.8/.10/.18/.47/.51**) that are stressed by shearing during installation with lubricant which is approved for the process and compatible with the O-ring material.
   – Tighten the screws/nuts crosswise with a torque key in an appropriate manner.
     Observe any tightening torques which deviate from standard (→ 9.2.4 Tightening torques, Page 40).
   – Reinstall the components concentrically without canting according to the applied marks.
2. Clean all components (→ 9.2.5 Cleaning agents, Page 40). but do not remove the applied marks.
3. Install the pump (→ sectional drawing).

The pump is installed in the reverse order of its disassembly. The following sections show particular aspects to be observed when installing the pump.

7.4.2 Fitting the casing cover

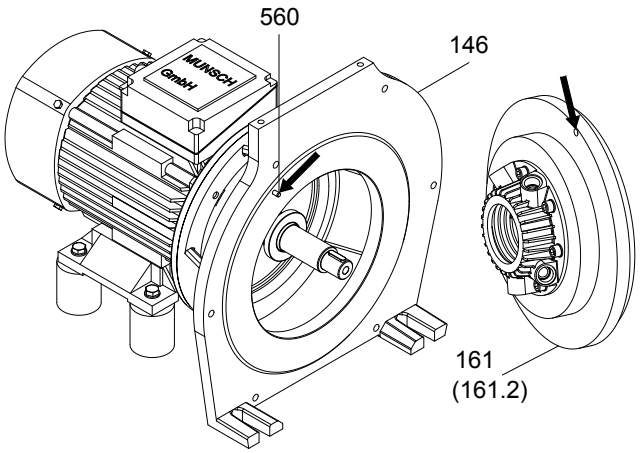

Fig. 19 Fitting the casing cover

► Fit the casing cover **161** (**161.2**) into the intermediate lantern **146**.
Make sure the pin **560** is in the bore hole of the casing cover **161** (**161.2**).

7.4.3 Installing the pump in the installation

► (→ 5 Setup and connection, Page 16).

7.5 Ordering spare parts

For trouble-free replacement in the event of damage, we recommend keeping entire plug-in units or spare pumps available on site.

The application guidelines according to DIN 24296 recommend keeping a supply for two years of continuous use (→ 9.3 Spare parts for two years of continuous operation according to DIN 24296, Page 44).

► Have the following information ready to hand when ordering spare parts (→ type plate):
   – Short designation of the pump
   – Serial number
   – Year of construction
   – Part number
   – Designation
   – Quantity

8 Troubleshooting

If faults occur which are not specified in the following table or cannot be traced back to the specified causes, please consult the manufacturer.

Possible faults are assigned a number in the table below. Use this number to find the cause and remedy in the troubleshooting table.

Fault	Number
Pump not pumping	1
Pumping rate insufficient	2
Pumping rate too high	3
Pumping pressure too low	4
Pumping pressure too high	5
Pump running roughly	6
Roller bearing temperature too high	7
Pump leaking	8
Excessive motor power uptake	9

Tab. 12 Fault/number assignment

Fault number									Cause	Remedy
1	2	3	4	5	6	7	8	9		
X	–	–	–	–	–	–	–	–	Supply/Suction pipe and/or pressure pipe closed by fitting	▶ Open the fitting.
–	X	–	X	–	–	–	–	–	Supply/Suction pipe not fully opened	▶ Open the fitting.
X	X	–	X	–	X	–	–	–	Supply/Suction pipe, pump or suction strainer blocked or encrusted	▶ Clean the supply/suction pipe, pump or suction strainer.
–	X	–	X	–	X	–	–	–	Supply/Suction pipe cross-section too narrow	▶ Increase the cross-section. ▶ Remove encrustations from the suction pipe. ▶ Open the fitting completely.
X	–	–	–	–	–	–	–	–	Transport sealing cover not removed	▶ Remove the transport sealing cover. ▶ Dismount the pump and check for dry-running damage.
–	X	–	X	–	X	–	–	–	Suction head too large: $NPSH_{pump}$ larger than $NPSH_{installation}$	▶ Increase the supply pressure. ▶ Consult the manufacturer.
X	–	–	–	–	X	–	–	–	Supply/Suction pipe and pump not bled properly or not filled up completely	▶ Fill the pump and/or pipes completely and bleed them.
X	–	–	–	–	X	–	–	–	Supply/Suction pipe contains air pockets	▶ Install a fitting for bleeding. ▶ Correct the pipe installation.
X	X	–	X	–	X	–	–	–	Air is sucked in	▶ Seal the source of malfunction.
X	X	–	X	–	X	–	–	–	Excessive amount of gas: pump cavitating	▶ Consult the manufacturer.
–	X	–	X	–	X	–	–	–	Temperature of pumped medium too high: pump cavitating	▶ Increase the supply pressure. ▶ Lower the temperature. ▶ Consult the manufacturer.

Fault number									Cause	Remedy
1	2	3	4	5	6	7	8	9		
–	X	–	X	–	–	–	–	X	Viscosity or density of the pumped medium outside the specified range for the pump	▶ Consult the manufacturer.
–	X	–	X	–	–	–	–	–	Geodetic pump head and/or pipe flow resistance too high	▶ Remove sediments from the pump and/or pressure pipe. ▶ Install a larger impeller and consult the manufacturer.
–	X	–	–	X	X	–	–	–	Pressure-side fitting not opened wide enough	▶ Open the pressure-side fitting.
X	X	–	–	X	X	–	–	–	Pressure pipe blocked	▶ Clean the pressure pipe.
X	X	–	X	–	X	–	–	–	Pump running in wrong direction	▶ Swap any two phases at the motor.
X	X	–	X	–	–	–	–	–	Motor speed too low	▶ Compare the required motor speed with the specification on the pump type plate. Replace the motor if necessary. ▶ Increase the motor speed if speed control is available.
–	X	–	X	–	X	X	–	–	Pump components worn out	▶ Replace any worn-out pump components.
–	–	X	X	–	X	–	–	X	Pressure-side fitting opened too wide	▶ Throttle with pressure-side fitting. ▶ Mill down the impeller. Consult the manufacturer and adjust the impeller diameter.
–	–	X	–	–	X	–	–	X	Geodetic pump head, pipe flow resistances and/or other resistances lower than specified	▶ Throttle the flow rate with the pressure-side fitting. Observe the minimum flow rate. ▶ Mill down the impeller. Consult the manufacturer and adjust the impeller diameter.
–	–	X	–	X	–	–	–	–	Viscosity lower than expected	▶ Mill down the impeller. Consult the manufacturer and adjust the impeller diameter.
–	–	X	–	X	X	X	–	X	Motor speed too high	▶ Compare the required motor speed with the specification on the pump type plate. Replace the motor if necessary. ▶ Reduce the motor speed if speed control is available.
–	–	X	–	X	X	–	–	X	Impeller diameter too large	▶ Throttle the flow rate with the pressure-side fitting. Observe the minimum flow rate. ▶ Mill down the impeller. Consult the manufacturer and adjust the impeller diameter.
X	X	–	X	–	X	–	–	–	Impeller out of balance or clogged up	▶ Dismount the pump and check for dry-running damage. ▶ Clean the impeller.
–	X	–	X	–	X	–	–	–	Hydraulic components of the pump dirty, clotted or encrusted	▶ Dismount the pump. ▶ Clean the components.
–	–	–	–	–	–	X	–	X	Roller bearing in motor defective	▶ Replace the roller bearing.

Fault number									Cause	Remedy
1	2	3	4	5	6	7	8	9		
–	–	–	–	–	–	X	–	–	Lubricant: excessive, insufficient or unsuitable	► Reduce, top up or replace the lubricant.
–	–	–	–	–	–	–	X	–	Connecting screws not tightened properly	► Tighten the connecting screws.
–	–	–	–	–	–	–	X	–	Mechanical seal worn	► Replace mechanical seal.
–	–	–	–	–	–	–	X	–	Housing seal defective	► Replace the housing seal.
–	–	–	–	–	–	–	X	–	Shaft sleeve is infiltrated	► Replace shaft sleeve and/or O-rings.
–	–	–	–	–	X	X	X	X	Pump distorted	► Check the pipes and pump fastenings.
–	X	–	X	–	X	–	–	X	Motor running on 2 phases	► Check the fuse and replace it if necessary. ► Check the cable connections and insulation.

Tab. 13 Troubleshooting table

9.2 Technical specifications

Further technical specifications (→ order data sheet)

9.2.1 Ambient conditions

Consult the manufacturer about operation under other ambient conditions.

Temperature [°C]	Relative humidity [%]		Setup level above sea level [m]
	Long-term	Short-term	
–20 to +40	≤ 85	≤ 100	≤ 1000

Tab. 15 Ambient conditions

9.2.2 Parameters for auxiliary operating systems

Quenching/barrier medium in open system

Medium	Volume flow [l/h]	Pressure
Quenching medium	30	Unpressurised
Barrier medium	30	▶ (→ diagram below).

Tab. 16 Operating parameters for quenching/barrier medium in open system (in preparation)

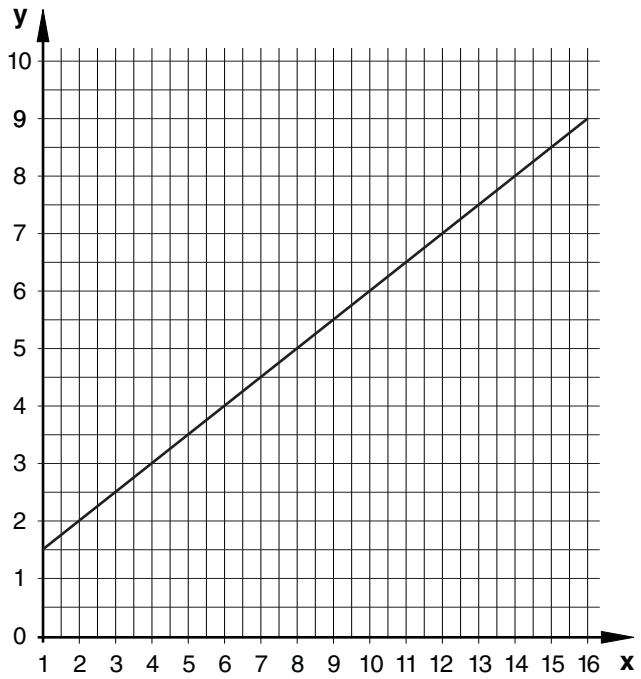

Fig. 28 Using a pressurised barrier medium (in preparation) – pressure of barrier medium

x Pressure at pressure socket [bar]

y Required pressure for using a pressurised barrier medium [bar]

9.2.3 Noise pressure levels

Measuring conditions:

- Distance to pump: 1 m
- Operation: cavitation-free
- Motor: IEC standard motor
- Tolerance ±3 dB

Lower-noise motor versions are available if the expected noise values exceed the permissible limits.

Nominal motor power PM [kW]	Noise pressure level [dB] for pump with motor at speed [min^{-1}]			
	1450	1750	2900	3500
1,5	58	58,5	63	64
2,2	60	60,5	66	67
3,0	62	62,5	68	69
4,0	63	63,5	69	70
5,5	65	65,5	71	72
7,5	66	66,5	72	73
11,0	68	68,5	74	75

Tab. 17 Noise pressure levels

9.2.4 Tightening torques

Tighten the screws/nuts with torques properly in accordance with the general technical rules. Deviating torques are dealt with in the following.

The following figures apply to new screws and nuts.

The following values only apply to the assembly procedure.

Thread size	Tightening torque [Nm]
	Casing bolts
M 8	–
M 10	15
M 12	30
M 16	45
M 20	75

Tab. 18 Hexagon head bolt **901.2** – steel/cast iron pairings

Thread size	Tightening torque [Nm]
M 8	25
M 10	45
M 12	55

Tab. 19 Socket head cap screw **914.1** – steel/steel pairings

Tighten hand-tight for plastic/plastic pairings, e.g. impeller screw **922**.

Thread size	Tightening torque [Nm]	Nominal diameter DN [mm]	Number of screws
M 12	12	25	4
M 16	15	32	4
M 16	19	40	4
M 16	23	50	4
M 16	34	65	4
M 16	19	65	8
M 16	23	80	8
M 16	26	100	8
M 16	35	125	8
M 20	45	150	8
M 20	45	200	12
M 20	55	200	8
M 20	55	250	12
M 20	65	300	12

Tab. 20 Flange connection

9.2.5 Cleaning agents

Application area	Cleaning agents
Foodstuff and drinking water sector	E.g. spirit, Ritzol 155, strong alkaline soap suds, steam blast (for individual components only)
Other	Benzine, wax solvents, diesel, petrol, alkaline cleaners

Tab. 21 Cleaning agents

9.2.6 Socket loads acc. to ISO 5199

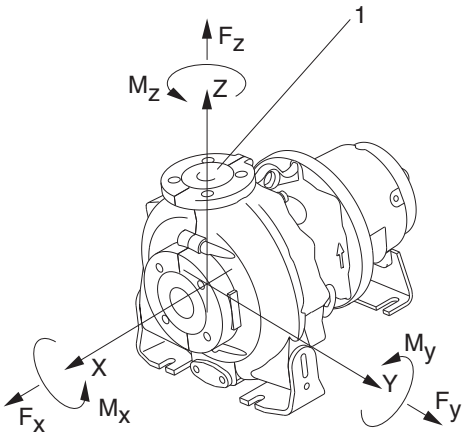

Fig. 29 Socket loads at the pump

1 Pressure socket

Nominal diameter DN [mm]	Fx [N]		Fy [N]	Fz [N]		∑ F [N]
	Pull	Push		Pull	Push	
25	600	300	500	700	350	1100
32	800	400	700	900	450	1500
40	1100	550	900	1200	600	2000
50	1500	750	1300	1600	800	2500
65	1900	950	1600	2000	1000	3500
80	2400	1200	2100	2600	1300	4500
100	3000	1500	2600	3300	1650	5500
125	3600	1800	3200	4000	2000	6500

Tab. 22 Socket load – forces

Nominal diameter DN [mm]	Mx [Nm]	My [Nm]	Mz [Nm]	∑ M [Nm]
25	900	600	800	1550
32	1200	800	700	1700
40	1300	900	1000	1850
50	1400	1000	1100	2000
65	1500	1100	1200	2150
80	1600	1200	1300	2300
100	1800	1300	1500	2600

9.2.7 Operating limits for pressure and temperature

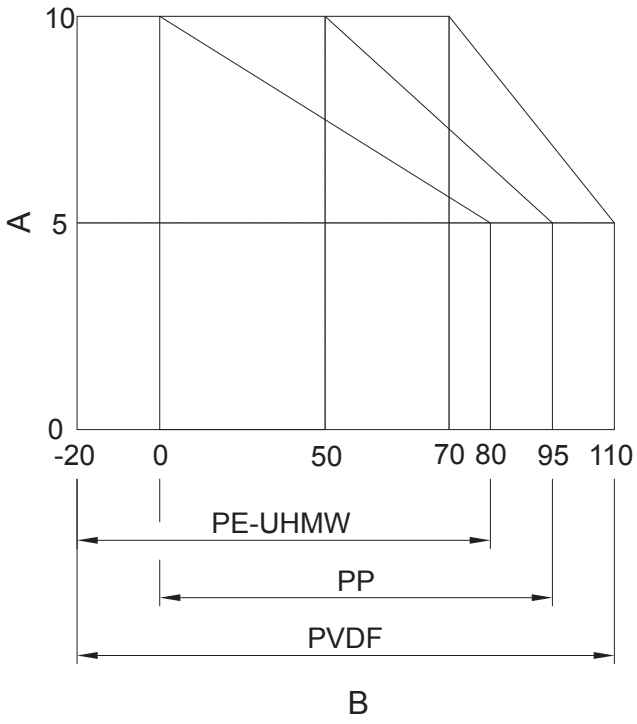

Fig. 30 Operating limits for pressure and temperature

A Permissible pump interior pressure [bar]

B Temperature of pumped medium [°C]

9.2.8 Flushing options

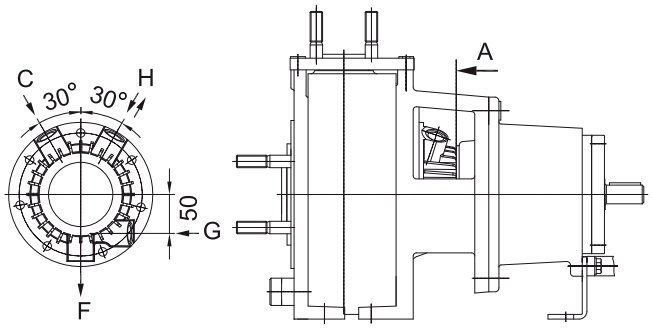

Fig. 31 Connection points

Seal type	Flushing type	Connection points	Flushing medium data	Supply	Notes / comments
REA F	Spring chamber flushing	Input H Output F	Clean, product-compatible, non-corrosive, usually tap water	Internal supply system	Depressurised flushing
	Permanent flushing	C	Clean, product-compatible, non-corrosive Amount: 0.9 – 1.5 l/min Pressure: max. 10 bar		► Seal connection C tightly when not in use.
	Stationary flushing	C	Clean, product-compatible, non-corrosive Amount: 5 – 8 l/min Pressure: max. 10 bar	Internal supply system	
REA F/D	Continuous barrier fluid (with barrier pressure)	Input G Output H	Clean, product-compatible, non-corrosive Kinematic viscosity = max. 15 mm²/s Minimum throughput rate = 0.25 l/min Return temperature = max. 60 °C Temperature difference between feed and return flow = max. 25 K Does not exceed boiling point	Internal supply system	Example for barrier medium: Water Recommended throughput rate: 0.5 l/min
	Barrier fluid in thermal siphon circuit	Input G Output H	Clean, non-crystallising, product-compatible, high boiling point, good lubrication, environmentally friendly, non-corrosive Kinematic viscosity = max. 5 mm²/s Return temperature = max. 60 °C Temperature difference between feed and return flow = max. 25 K Does not exceed boiling point	Thermal siphon container, pressurised	Example for barrier medium: Water, vegetable oil, glycol/water mixture Barrier pressure > Pressure on medium side of mechanical seal. ► Attach the container 1.5 to 2 metres above the mechanical seal. Lines must be laid with an upward or downward slope. Avoid horizontal sections.
	Continuous barrier fluid (without barrier pressure)	Input G Output H	Clean, product-compatible, non-corrosive Kinematic viscosity = max. 15 mm²/s Minimum throughput rate = 0.25 l/min Return temperature = max. 60 °C Temperature difference between feed and return flow = max. 25 K Does not exceed boiling point	Internal supply system	Depressurised flushing

Seal type	Flushing type	Connection points	Flushing medium data	Supply	Notes / comments
REA F/D	Quench	Input G Output H	Clean, non-crystallising, product-compatible, high boiling point, good lubrication, environmentally friendly, non-corrosive Kinematic viscosity = max. 5 mm²/s Return temperature = max. 60 °C Temperature difference between feed and return flow = max. 25 K Does not exceed boiling point	Depressurised operation with quench tank	Depressurised flushing with atmosphere-side mechanical seal operated as a quench seal ▶ Attach the container 1 to 2 metres above the mechanical seal. Lines must be laid with an upward or downward slope. Avoid horizontal sections.
	Permanent flushing	C	Clean, product-compatible, non-corrosive Amount: 0.9 – 1.5 l/min Pressure: max. 10 bar		▶ Seal connection C tightly when not in use.
	Stationary flushing	C	Clean, product-compatible, non-corrosive Amount: 5 – 8 l/min Pressure: max. 10 bar		

Tab. 24 Flushing options and parameters for REA-F, F/D seals

9.3 Spare parts for two years of continuous operation according to DIN 24296

9.3.1 Commissioning

Part no.	Part designation	Number of identical pumps (including spare pumps)							
		1	2	3	4	5	6 or 7	8 or 9	10 or more
		Set/Quantity of spare parts							
–	Repair set for mechanical seal	1	1	1	2	2	2	3	25 %

9.4 Declaration of conformity according to EC machine directives

MUNSCH

EG-Konformitätserklärung des Herstellers

nach der EG-Maschinenrichtlinie 2006/42/EG Anhang II, Nr. 1 A

EC Declaration of Conformity by the Manufacturer

as defined by machinery directive 2006/42/EC, Annex II, No. 1 A

CE

MUNSCH Chemie-Pumpen GmbH
Im Staudchen
56235 Ransbach-Baumbach
Germany

Mr Johann Dausenau,
MUNSCH Chemie-Pumpen GmbH,
is authorised to compile the technical documentation.

We hereby declare that the pump units

Machine Type:	Standardized Chemical Pump	Chemical Pump in Close-Coupled Design	Chemical Pump in Close-Coupled Design	Chemical Pump in Close-Coupled Design
		With Mechanical Seal	With Magnetic Drive	
Design Designation:	**NP**	**NP-B** **SP-K**	**MNP-B**	**MSP-K**

are in accordance with all relevant provisions of the EC Machinery Directive.

The following harmonised standards (or parts of these standards) were applied:

☒	DIN EN ISO 12100 : 2011-03	☐	
☒	DIN EN 809 : 2012-10	☐	
☐		☐	
☐		☐	
☐		☐	

The product complies with the aforesaid standards insofar as it is used at the contractually agreed conditions. The operator is responsible for this.

In the event of any structural change or use not as intended, this declaration becomes invalid unless the manufacturer's prior written approval has expressly been given.

Ransbach-Baumbach, 31.05.2014

Dipl.-Ing. Stefan Munsch
Managing Director

NORD Gear Limited
Toll Free in Canada: 800.668.4378

NORD Gear Corporation
Toll Free in the United States: 888.314.6673

1. Importance of the operating instructions

These operating instructions are intended to provide general information and safety guidelines. It is the responsibility of the buyer, machine builder, installer and user of the NORD product to make sure that all the proper safetynotes and operating instructions have been reviewed and understood. If the contents of this instruction or any applicable operating instructions are not understood, please consult NORD.

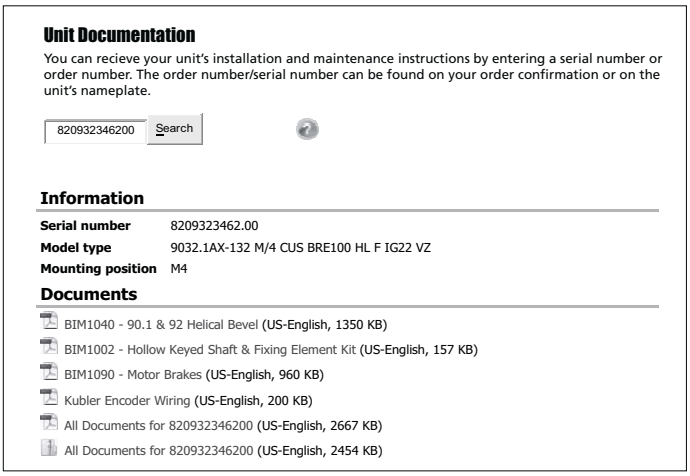
⚠ *WARNING* ⚠

Electric motors, gearmotors, electrical brakes, variable frequency drives, and gear reducers contain potentially dangerous high-voltage, rotating-components and surfaces that may become hot during operation. All work involved in the transport, connection, commissioning and maintenance of any NORD product must be carried out by qualified and responsible technicians.

2. Inspect incoming freight

Before accepting shipment from the freight company, thoroughly inspect the NORD equipment for any shipping and handling damage. If any goods called for in the bill of lading or express receipt are damaged, or if the quantity is short, do not accept until the freight express agent makes an appropriate notation on your freight bill or express receipt. If any concealed loss or damage is discovered later, notify your freight carrier or express agent at once, and request a formal review of your claim.

Claims for loss or damage in shipment must not be deducted from the NORD invoice, nor should payment of the NORD invoice be withheld awaiting adjustment of such claims, as the carrier guarantees safe delivery. NORD will try to assist in collecting claims for loss or damage during shipment; however, this willingness on our part does not remove the transportation company's responsibility in reimbursing you for collection of claims or replacement of material.



3. Obtaining detailed operating instructions

One can receive the detailed installation and maintenance instructions by entering a serial number (or NORD order number) at the appropriate location on the NORD web site.

i. Record the serial number from your gearmotor, gear reducer, or motor nameplate, or record the serial number found on your order confirmation.

ii. Go to **www.nord.com/docs** to download the appropriate operating instructions.

EXAMPLE: www.nord.com/docs

4. Intended use

NORD is a supplier of electric motors, gearmotors, reducers, electromechanical brakes, mechanical variators, and electrical variable frequency drives that are intended for commercial installations on larger systems and machines.

⚠ *WARNING* ⚠

NORD does not accept any liability for damage or injury caused by:

- Inappropriate use, operation or adaptation of the drive system.
- Unauthorized removal of housing covers, safety and inspection covers, guarding, etc.
- Unauthorized modifications to the drive system.
- Improper servicing or repair work on the drive system.
- Damage caused during shipment or transportation.
- Disregard of the important Safety Notes or Operating Instructions.

5. Notes concerning warranty and liability

All units are supplied according to the terms described in our standard "Conditions of Sale." The unit limited warranty is also defined in our "Conditions of Sale" and is located in the back of our product catalogs as well as the back of your order invoice.

All NORD Safety Notes and all related NORD Operating instructions shall be considered up-to-date at the time in which they were compiled by the buyer, machine builder, installer or user. NORD reserves the right to incorporate technical modifications and information updates to any safety/operating instructions that are within the scope of providing additional knowledge or clarification, communicating design changes, or product enhancements. Information updates may include any NORD product, or subsequent products purchased and supplied by NORD; No specific claims can be derived from the information or illustrations and descriptions contained in the safety notes or related operating instructions.

⚠ *WARNING* ⚠

NORD assumes no liability for personal injury, equipment damage or malfunctions resulting from failure to comply with any installation safety notes. The applicable national, regional, and local work regulations and safety requirements must also be complied with. Failure to comply with any safety notes or regulations may result in serious injury, damage to property, or even death.

6. Checklist for installation and operation

- ☑ Verify that the purchased NORD product has been supplied with the expected accessories & options. Check the received goods and packing slip to make sure items are properly received.
- ☑ Make sure that you have all of the required Operating Instructions for your NORD electric motor, gearmotor, reducer, electromechanical brake, mechanical variable speed drives, or electrical variable frequency drives.
- ☑ Consult NORD if you feel you are missing any documentation or if you have questions.

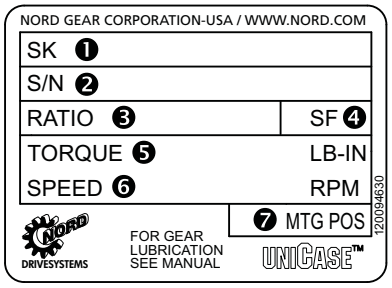
1. Safety & information symbols

All work including transportation, storage, installation, electrical connection, commissioning, servicing, maintenance and repair must be performed **only by qualified specialists or personnel**. It is recommended that repairs to NORD Products are carried out by the NORD Service Department. Instructions related to operational safety will be emphasized as shown.

Symbol	Meaning
⚠	**General Warning or Hazard -** Severe risk or danger of personal injury or death by working around dangerously high electrical voltage or moving machinery. Proper safety precautions must be taken.
STOP	**Possible Harmful Situation -** Care must be taken to avoid the possibility of damaging the drive unit, driven machine, or the environment.
ℹ	**Important Note -** Useful note or tip to help assure trouble-free operation.
♻	**Material Disposal Note -** Important note concerning suggested material disposal.

2. Safety warnings

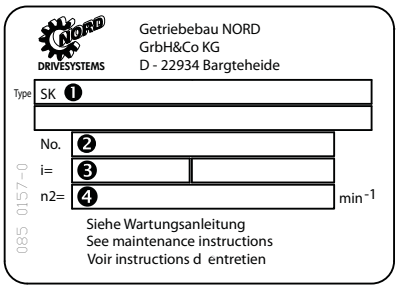
⚠ GENERAL WARNINGS ⚠



- All work involved in the transport, connection, commissioning and maintenance of any NORD product must be carried out by qualified and responsible technicians. All applicable national, regional, and local work regulations and safety requirements must also be complied with. **NORD assumes no liability for personal injury, accidental death, or equipment damage and malfunctions resulting from failure to comply with installation or operating instructions, safety notes, or any work regulations and laws!**
- Gear unit installation and maintenance work may only be performed when no power is available to the prime mover or motor. Electric motors, electrical brakes, and variable frequency drives, contain potentially dangerous high-voltage. Prior to installation or maintenance, shut down the power at the circuit breaker or power switch. **While working on the drive, make sure the power from the prime mover is isolated or secured on "lock-out" to prevent accidental start-up and to safeguard against injury!**
- Surfaces of motors and gear units may become hot during operation or shortly after start-up. In some instances additional protection against accidental contact may be necessary. **Use caution to avoid burns or serious injury!**

3. Observe published performance range & nameplate data

STOP HARMFUL SITUATION STOP



Observe the data on all reducer nameplates and verify published ratings for the NORD item/s in question. Do not operate any NORD equipment outside the published performance range. Failure to comply may result in damage to the drive unit, driven machine, or the environment.

U.S. Nameplate

❶ Model/Type
❷ Serial Number
❸ Gear Ratio
❹ Service Factor
❺ Torque Rating
❻ Output Speed RPM
❼ Mounting Position

European Nameplate

❶ Model/Type
❷ Serial Number
❸ Gear Ratio
❹ Speed

4. Transportation and handling

Make sure that all eyebolts and lifting lugs are tight and lift only at designed points. Protect the mounting surface from possible damage during transportation.

⚠ WARNING ⚠

Do not attach other machinery or loads to the NORD assembly, since the supplied lifting bolts are not designed for this purpose.

If the gearmotor or assembly is equipped with two suspension eye bolts, then both locations should be used for transportation and placement of the unit; in this case the tension force of the slings must not exceed a 45° angle.

In some instances it may be appropriate to use additional lifting straps or slings in order to assure safe transportation of the assembly. Always use sufficiently rated handling equipment and ensure that adequate safety measures are taken to protect personnel from injury during transportation. Once the NORD assembly is properly installed, remove the transportation fixtures.

7. DISPOSAL

MATERIAL DISPOSAL

Properly dispose of all used gear units and internal parts in accordance with all local regulations. In particular, all lubricants must be properly collected and disposed.

For confirmation of specific materials used in a specific reducer or gearmotor assembly, please consult NORD with the appropriate unit identification or serial number.

Components	Material
Gear wheels, shafts, rolling bearings, parallel keys, snap rings, spacers, shims, etc.	Steel
Gear housing and housing components	Cast iron or Aluminum (depending on type and size)
Worm gears	Bronze alloy
Radial seals, sealing caps, and rubber components	Elastomers with some steel
Coupling components	Plastic or Elastomer with Steel
Housing gaskets and flat oil seals	Asbestos-free sealing or gasket material (various types used)
Gear Oil	Mineral, SHC-Synthetic or PG-Synthetic (can vary)

1. Storage

IMPORTANT NOTE

For storage periods longer than 9 months, or for storage in less than desirable conditions, please consult NORD for recommendations.

Storage for up to 9 months is possible, so long as the following conditions are observed:

- Store the gear unit in its actual mounting position in accordance with the specified oil fill-level, in a clean and dry temperature controlled area. Avoid temperature fluctuations within the range of 0°C and 40°C (32°F to 104°F) and avoid relative humidity conditions in excess of 60%.
- Protect all exposed or unpainted shaft and flange surfaces with an anti-corrosion agent (such as CRC® SP400™ Corrosion Inhibitor).
- Store in a location free from shock and vibration, to avoid false brinelling of bearing elements and raceways.
- Whenever possible, rotate the shafts periodically, by hand if necessary, to help prevent brinelling (bearing damage) and to help keep the shaft seals pliable.
- Avoid direct exposure to the sun or UV light and aggressive or corrosive materials in the environment (ozone, gases, solvents, acids, caustic solutions, salts, radioactivity, etc.

2. Commissioning

Prior to gear unit start-up, complete the following:

- Check the lubricant and be sure the gear unit is filled with the proper oil type, to the proper level, as determined by the mounting position.
- Check the condition of all shaft seals and all assembled flange gasket areas. If any change is detected in the shape, color, hardness or permeability, or if any leaks are detected, the corresponding shaft seals and/or gaskets must be replaced.
- Remove all anti-corrosive metal protectant from otherwise bare metal surfaces. Follow product manufacturers directions and warnings during surface protection removal.
- Check the resistance of all motor and brake windings to verify the integrity of the winding insulation and inspect all terminal box openings and wire connection areas to verify that all components are dry and free of corrosion.

• *CRC® and SP400™ are trademarks of CRC Industries.*

1. Installation site

Drives must be properly installed if they are to produce the rated torque. Improper installation may lead to oil leaks, reduced life, or even catastrophic failure. NORD gear drives and motors are intended to be installed at a suitable mounting site under the following conditions:

- Unimpeded airflow to and around the units.
- Accessibility to oil drain, level and breather plugs.
- On brakemotors, allow adequate space for removing the fan guard and replacing and adjusting the brake.
- Mounting surfaces must be flat, torsionally rigid, and dampened against vibration.
- Unless special measures are taken, the immediate vicinity around the gear drive or motor should not be exposed to any aggressive or corrosive substances, contaminated air, ozone, gases, solvents, acids, alkalis, salts, radioactivity, etc.

2. Mounting position

Reducer mounting position charts illustrate the standard mounting positions for horizontal and vertical mounting. All gear units are assembled with the oil fill-level, oil-drain and vent plugs installed in their proper locations, **according to the customer-specified mounting position**. For mounting orientations other than shown consult NORD Gear.

HARMFUL SITUATION

The gear reducer may not receive proper lubrication if the unit is not mounted in the position for which it is designed. Observe the mounting position designated on the reducer nameplate, or specified in the order acknowledgement. Consult NORD prior to changing mounting position in the field. While it is often possible to simply relocate the oil fill-level and vent locations, and adjust the oil fill amount, in some cases, different mounting positions may lend themselves to different internal construction features.

3. Reducer mounting

- The support foundation must be straight, level and flat. Whether the gear unit is foot-mounted or flange-mounted, NORD recommends that the straightness and flatness of the customer-supplied support foundation follow **Table 1**.
- The gear unit must be properly aligned with the driven shaft of the machine in order to prevent additional stress or load forces from being imposed upon the gear unit.
- To facilitate oil drainage it may be desirable to elevate the gear box foundation above the surrounding support structure.
- All bolting surfaces must be clean and free from contamination and corrosion.

Table 1: Recommended Straightness and Flatness of Customer-Supplied Support Foundation

Above (in)	To & Including (in)	General Tolerance on Straigtness & Flatness ISO 2768-2, Tolerance Class K
0.00	0.39	+/- 0.002 in
0.39	1.18	+/- 0.004 in
1.18	3.9	+/- 0.008 in
3.9	11.8	+/- 0.016 in
11.8	39	+/- 0.024 in
39	118	+/- 0.031 in

Above (mm)	To & Including (mm)	General Tolerance on Straigtness & Flatness ISO 2768-2, Tolerance Class K
0	10	+/- 0.05 mm
10	30	+/- 0.1 mm
30	100	+/- 0.2 mm
100	300	+/- 0.4 mm
300	1000	+/- 0.6 mm
1000	3000	+/- 0.8 mm

Straightness: Based upon the length of the corresponding line.

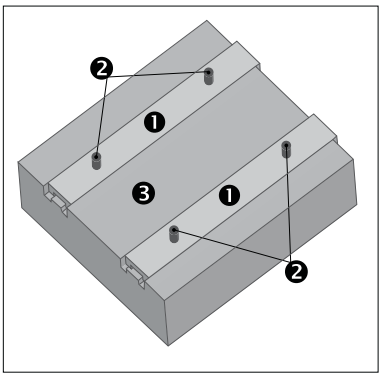
Flatness: Based upon the longer lateral surface or the diameter of the circular surface.

HARMFUL SITUATION

The responsibility for the design and construction of the support foundation is with the user. The foundation must be adequate to withstand normal operating loads and possible overloads while maintaining alignment to attached system components under such loads. ***Motors and drive components mounted on prefabricated base plates can become misaligned during shipment. Always check alignment after installation.***

4. Steel foundation

An engineered structural steel foundation should be designed to provide adequate rigidity and prevent loads from distorting the housing or causing misalignment of internal gears and shafts. When foot-mounting the gear reducer, a base plate or sole plate with suitable thickness (generally equal or greater than the thickness of the drive feet) should be securely bolted to steel supports and extend under the entire gear drive assembly. When flange-mounting the gear unit, the bulk head plate must be engineered to minimize buckling distortions and support the cantilevered weight of the gear unit or gear motor.



HARMFUL SITUATION

Do not weld on the gear unit or use the gear unit as an earth or ground connection for any welding procedure as this may cause permanent damage to the bearings and gears.

5. Concrete foundation

If a concrete foundation is used, allow the concrete to set firmly before bolting down the gear drive. Grout structural steel mounting pads and bolts of sufficient size into the concrete, to adequately distribute the load stress onto the concrete foundation.

Figure 1: Concrete Foundation

❶ Grouted Structural Steel Mounting Pads
❷ Mounting Bolts
❸ Concrete Foundation

6. Bolt connections for footed & flange mounted units

NORD footed reducers and flange-mount reducers (with B5 flange) have clearance designed into the mounting holes to allow for some minor adjustments in alignment. Bolt size, strength and quantity should be verified to insure proper torque reaction capacity whatever the mounting arrangement. Tightening torque for gear reducer mounting bolts, and recommended fastener grades, are provided in Table 2.

Table 2A: Tightening Torque for Inch Reducer Mounting Bolts

Thread Size	Tightening Torque					
	Grade SAE 5 / ASTM A449			Grade SAE 8		
(in)	(lb-in)	(lb-ft)	(Nm)	(lb-in)	(lb-ft)	(Nm)
1/4-20	85	7.1	9.6	120	10.0	13.6
5/16-18	190	16	21	267	22	30
3/8-16	330	28	37	470	39	53
1/2-13	825	69	93	1,170	98	132
5/8-11	1,660	138	188	2,340	195	264
3/4-10	2,960	247	334	4,180	348	472
7/8-9	4,750	396	537	6,700	558	757
1-8	7,100	592	802	10,000	833	1,130
1 1/8-7	-	-	-	14,800	1,233	1,672
1 1/4-7	-	-	-	20,600	1,717	2,327
1 3/8-6	-	-	-	27,200	2,267	3,073
1 1/2-6	-	-	-	35,800	2,983	4,045
1 3/4-5	-	-	-	53,500	4,458	6,045

- Calculated tightening torques are based a conventional 60°, clean and dry (un-lubricated) thread, with thread-friction and head-friction equal to 0.15.
- When using inch-fasteners, NORD recommends a minimum Grade SAE 5 (ASTM A-449) for sizes up to 1-8 UNC, and Grade SAE 8 for all larger sizes.

Table 2B: Tightening Torque for Metric Reducer Mounting Bolts

Above	Tightening Torque					
	ISO Grade 8.8			ISO Grade 10.9		
(mm)	(lb-in)	(lb-ft)	(Nm)	(lb-in)	(lb-ft)	(Nm)
M4	28	2.4	3.2	42	3.5	4.7
M5	57	4.7	6.4	82	6.9	9.3
M6	97	8	11	142	12	16
M8	239	20	27	345	29	39
M10	469	39	53	690	58	78
M12	814	68	92	1,195	100	135
M14	1,283	107	145	1,903	159	215
M16	2,036	170	230	2,965	247	335
M18	2,036	170	230	2,965	247	335
M20	4,071	339	460	5,841	487	660
M22	5,576	465	630	7,966	664	900
M24	6,992	583	790	10,178	848	1,150
M27	10,178	848	1,150	14,604	1,217	1,650
M30	14,161	1,180	1,600	19,914	1,660	2,250
M36	24,605	2,050	2,780	34,606	2,884	3,910
M42	39,563	3,297	4,470	55,671	4,639	6,290

- Calculated tightening torques are based on a conventional 60°, clean and dry (un-lubricated) thread, with thread-friction and head-friction equal to 0.15.
- When using metric-fasteners, NORD recommends a minimum ISO Grade 8.8 bolt.

7. Mounting the prime mover

When the motor is not flange mounted or integrally mounted to the gearbox, it is important to properly secure and align the gear drive with respect to the driven machine before attempting to align the prime mover or motor.

A. After the main gear drive is properly aligned and bolted in place, align the prime mover with respect to the reducer input shaft.

B. Use shims under the feet of the prime mover as needed, and secure in place with the proper mounting bolts. Dowel pins may be field-installed to help prevent misalignment and ensure proper realignment if removed for service.

IMPORTANT NOTE

When using a high speed coupling connection between the prime mover and the reducer, check alignment per the coupling manufacturers recommendations. If the coupling is misaligned, the reducer alignment or shimming is incorrect. Re-align the gear reducer and re-check the high-speed coupling alignment before re-aligning the motor.

SOLID SHAFT CONNECTIONS

1. Solid shaft diameter tolerance

Reducer input and output shaft extensions have a diameter tolerance as specified in **Table 1**.

Table 1: Solid Shaft Diameter Tolerance

Above ø (in)	To & Including ø (in)	Tolerance (in)
0.375	1.750	+0.0000 / -0.0005
1.750	7.500	+0.0000 / -0.0010

Above ø (mm)	To & Including ø (mm)	Tolerance (mm)	ISO 286-2 Fit Class
10	18	+0.012 / +0.001	k6
18	30	+0.015 / +0.002	k6
30	50	+0.018 / +0.002	k6
50	80	+0.030 / +0.011	m6
80	120	+0.035 / +0.013	m6
120	180	+0.040 / +0.015	m6
180	190	+0.046 / +0.017	m6

2. Fitting drive elements onto the reducer solid shaft

Solid input and output shaft extensions are provided with a drill and tap feature as indicated in Table 2. When installing drive elements such as coupling hubs, pulleys, sprockets, or gears, NORD recommends using the threaded hole in the end of the shaft, along with a suitable assembly device fitted into the threaded hole.

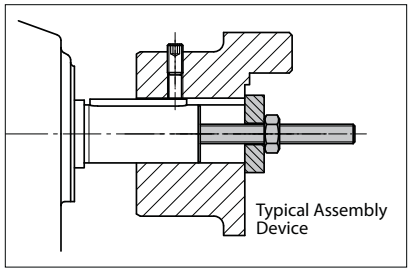


Table 2: Solid Shaft End - Threaded Holes

Above ø (in)	To & Including ø (in)	Tap size & Depth (in)
0.375	0.500	10-24 x 0.43 in
0.500	0.875	1/4-20 x 0.59 in
0.875	0.938	5/16-18 x 0.71 in
0.938	1.100	3/8-16 x 0.87 in
1.100	1.300	1/2-13 x 1.10 in
1.300	1.875	5/8-11 x 1.42 in
1.875	3.500	3/4-10 x 1.73 in
3.500	7.500	1-8 x 2.20 in

Above ø (mm)	To & Including ø (mm)	Tap Size & Depth (mm)
10	13	M4 x 10 mm
13	16	M5 x 12.5 mm
16	21	M6 x 16 mm
21	24	M8 x 19 mm
24	30	M10 x 22 mm
30	38	M12 x 28 mm
38	50	M16 x 36 mm
50	85	M20 x 42 mm
85	130	M24 x 50 mm
130	190	M30 x 60 mm

HARMFUL SITUATION

DO NOT DRIVE or **HAMMER** the coupling hub, pulley, sprocket, or gear into place. An endwise blow to the reducer shaft can generate damaging axial forces and cause damage to the reducer housing, bearings or internal components.

WARNING

To avoid serious injury the user must provide suitable safety guards for all rotating shafts and shaft components such as couplings, chain drives, belt drives, etc. All guarding must adhere to local regulations and safety standards.

3. Installing interference-fit hubs to the reducer shaft

Prior to installing any interference-fit hubs to the reducer shaft, consult with the manufacturer to determine proper assembly and fit. Interference-fits usually require heating the coupling, sprocket or gear hub, per the manufacturer's recommendations. Coupling hub installation typically follows ANSI/AGMA 9002-A86. Always make sure the reducer shaft seals are protected from the heat source. Apply uniform heat to the drive element hub to prevent distortion. NORD does not recommend heating the drive element hub beyond 212°F to 275°F (100°C to 135° C).

WARNING

When using heat to mount a drive element hub, do not use open flame in a combustible atmosphere or near flammable materials. Use suitable protection to avoid burns or serious injury.

HARMFUL SITUATION

When using external chain or belt drives, make sure the reducer is sized so that the shaft and bearings have adequate capacity. To avoid unnecessary bearing loads and additional shaft deflection, mount all power take-off devices (sprockets, pulleys, etc.) so that the applied load center is as close to the gear housing as possible and check component alignment and tension of any belts or chains per the manufacturer's recommendation. Do not over tighten the belts or chains.

4. Coupling installation

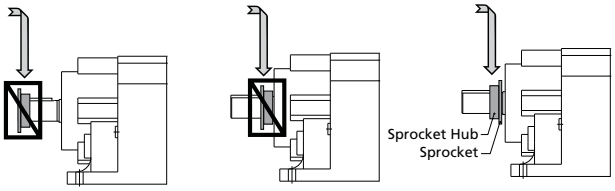
The performance and life of any coupling depends upon how well it is installed. Coupling hubs are typically mounted flush with the shaft ends, unless specifically ordered for overhung mounting. Shaft couplings should be installed according to the coupling manufacturer's recommendations for gap, angular and parallel alignment. To help obtain critical shaft alignment coupling hubs may be installed to the machine shafts prior to final shimming or tightening of the foundation bolts. Proper coupling alignment allows for thermal and mechanical shaft movement during operation and ensures that only torque (no radial load) is transmitted between the mating shafts.

Coupling gap and angular alignment

The shaft gap must be sufficient to accommodate any anticipated thermal or mechanical axial movement. When setting the coupling gap, insert a spacer or shim stock equal to the required spacing or gap between the coupling hub faces. Measure the clearance using feeler gauges at 90-degree intervals, to verify the angular alignment.

Parallel (or offset) alignment

Mount a dial indicator to one coupling hub, and rotate this hub, sweeping the outside diameter of the other hub. The parallel or offset misalignment is equal to one-half of the total indicator reading. Another method is to rest a straight edge squarely on the outside diameter of the hubs at 90° intervals and measure any gaps with feeler gauges. The maximum gap measurement is the parallel or offset misalignment.



Check alignment

After both angular and parallel alignments are within specified limits, tighten all foundation bolts securely and re-check critical alignment. If any of the specified limits for alignment are exceeded, realign the coupling.

5. Installing sheaves (pulleys), sprockets and gears

To avoid unnecessary bearing loads and additional shaft deflection, mount all power take-off devices (sprockets, pulleys, gears, etc.) so that the applied load center is as close to the gear housing as possible, as shown in **Figure 2**.

Figure 2: Sprocket or Gear Mounting

Preferred Mounting of Sprocket or Gear

Align the driver sheave or sprocket with the driven sheave or sprocket by placing a straight-edge length-wise across the face of the sheaves or sprockets. Alignment of bushed sheaves and sprockets should be checked only after bushings have been tightened. Check horizontal shaft alignment by placing one leg of a square or a level vertically against the face of the sheave or sprocket.

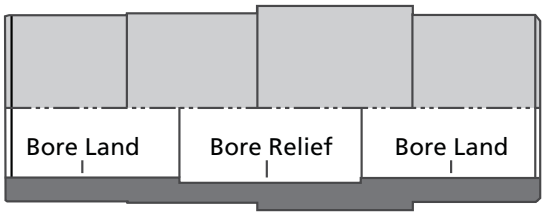
Always check component alignment and tension any belts or chains per the manufacturer's recommendation. The ideal belt or chain tension allows proper wrap of the driver and driven wheels, while maintaining the lowest possible tension of the belts or chain, so that no slipping occurs under load conditions. Check belt or chain tension frequently over the first 24 to 48 hours of operation.

STOP ***HARMFUL SITUATION*** **STOP**

When using external chain or belt drives, make sure the reducer is sized so that the shaft and bearings have adequate capacity. To avoid unnecessary bearing loads and additional shaft deflection, mount all power take-off devices (sprockets, pulleys, etc.) so that the applied load center is as close the gear housing as possible and check component alignment and tension of any belts or chains per the manufacturer's recommendation. Do not over tension the belts or chains.

6. Outboard pinion gear alignment

Align outboard pinion gears and adjust the gear tooth clearance according to the manufacturer's recommendations, checking for acceptable outboard pinion tooth contact. The foundation bolts may have to be loosened and the gear unit moved slightly to obtain proper gear tooth contact. After the unit is moved to correct tooth contact, the prime mover may need to be realigned.



KEYED HOLLOW SHAFT

1. Keyed hollow shaft design

NORD uses high quality carbon steel to manufacture hollow-shafts. Upon request, NORD can provide alternate materials, such as stainless steel. NORD hollow shafts are designed with a bore relief (reduced contact area) between the mating shafts.

The bore relief provides a cavity to hold an anti-seize assembly paste. It also acts as a design feature intended to help prevent corrosion and to facilitate gearbox removal from the solid shaft.

NORD furnishes dual keys designed to be used in each of the bore land areas, as opposed to supplying a single long key. The dual keys are intended to simplify assembly onto the machine's solid shaft.

IMPORTANT NOTE

If a single shaft key or dual shaft keys are supplied by others, the key/s must engage the full bore-land length at each end of the hollow shaft.

2. Key and keyway dimensions

Unless otherwise indicated, inch keys and keyways follow the ANSI B17.1 standard and metric keys and keyways follow the DIN6885-1 standard. Inch bores will typically utilize square keys but in some instances the larger hollow shaft bore sizes utilize the alternate rectangular key shown in the ANSI B17.1 standard.

Key slots for the solid machine shaft should be made with a Class 2, transitional-fit class (slightly loose to slightly tight). Key slots in the female shaft are designed to be a low clearance fit. These suggested practices should allow for easier assembly with the mating solid shaft, without allowing excessive clearance which could cause keys to work loose during reducer operation.

IMPORTANT NOTE

If the key fit is too tight, light filing of the key sides and hand-fitting of the keys may be required.

3. Keyed hollow-shaft bore tolerances

Standard keyed hollow-shaft bore tolerances are shown in the following table.

Table 1 - Keyed hollow bore tolerances

Above ø [in]	To and Including ø [in]	Bore Diameter Tolerance ø [in]
0.4375	1.6250	+0.0010 / -0.0000
1.6250	3.2500	+0.0012 / -0.0000
3.2500	7.0000	+0.0014 / -0.0000

Above ø [mm]	To and Including ø [mm]	Bore Diameter Tolerance ø [mm]
10	18	+0.018 / -0.000
18	30	+0.021 / -0.000
30	50	+0.025 / -0.000
50	80	+0.030 / -0.000
80	120	+0.035 / -0.000
120	180	+0.040 / -0.000
180	190	+0.035 / -0.000

Metric hollow bore tolerances per ISO286-2, Class H7

4. Suggested solid shaft (machine shaft) tolerances

NORD recommends a close fit of the customer-supplied solid shaft or machine-shaft, for the following reasons:

- To help minimize the potential for fretting and corrosion.
- To help prevent excessive free play in the shaft connection that could lead to excessive load stress on the driven system, the gear drive, or both.

Table 2 - Suggested solid shaft tolerances

Above ø [in]	To and Including ø [in]	Shaft Diameter Tolerance Uniform Load ø [in]	Shaft Diameter Tolerance Shock Load ø [in]
0.4375	0.8750	+0.0000 / -0.0005	+0.0000 / +0.0005
0.8750	4.5000	+0.0000 / -0.0010	+0.0000 / +0.0010
4.5000	7.0000	+0.0000 / -0.0012	+0.0000 / +0.0015

Above ø [mm]	To and Including ø [mm]	Shaft Diameter Tolerance Uniform Load ❶ ø [mm]	Shaft Diameter Tolerance Shock Load ❷ ø [mm]
10	18	+0.000 / -0.011	+0.012 / +0.001
18	30	+0.000 / -0.013	+0.015 / +0.002
30	50	+0.000 / -0.016	+0.018 / +0.002
50	80	+0.000 / -0.019	+0.021 / +0.002
80	120	+0.000 / -0.022	+0.025 / +0.003
120	180	+0.000 / -0.025	+0.028 / +0.003
180	190	+0.000 / -0.029	+0.033 / +0.004

❶ **Uniform load: Mating shaft diameter tolerance per ISO286-2, class h6**

❷ **Shock load: Mating shaft diameter tolerance per ISO286-2, class k6**

As indicated in Table 2, different solid shaft tolerances are suggested depending upon the load type.

- If the machine load conditions are considered "Uniform" a clearance fit is allowed.
- If the machine load conditions are considered to have "Shock Load" a light clearance to interference fit condition is suggested.

Typically the machine builder will have good knowledge as to the load type. As an alternate method to classify load type, one could follow the "Mass Acceleration Factor Selection Method" that is discussed in NORD's product catalog/s.

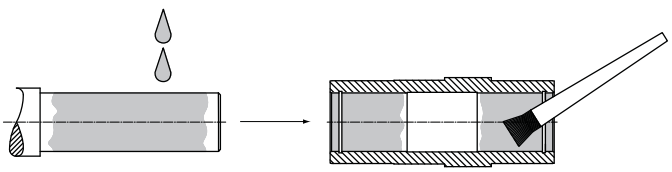
Straightness, roundness, and diameter tolerance variations of both shafts should be controlled as accurately as possible. When mating, solid shaft design features are not controlled, reducer installation may be very difficult without ordering special hollow-bore design features to accomodate.

STOP ***HARMFUL SITUATION*** **STOP**

The supporting solid shaft or driven machine shaft must be of adequate size and strength to withstand normal operating loads and peak loads without damage to itself or any of the system components.

5. Suggested solid-shaft mating shaft surface finish

Controlling the mating shaft surface finish helps to assure proper fit and assembly while minimizing the possibility of corrosion and fretting. NORD recommends that the mating solid shaft surface should be at least 125 micro-inches (3.2 microns) or smoother.



6. Assembly to the machine shaft

A. Clean and remove any dirt, grease, or rust-preventative coatings from both the reducer hollow shaft and the machine shaft.

B. Make sure the edges of both the reducer hollow shaft and machine shaft are free from any nicks or burrs. If nicks or burrs are present remove them using an abrasive material such as an emery cloth.

C. Before installing the gear reducer onto the machine shaft, apply an anti-seize compound or anti-corrosive lubricant to the mating shafts as shown in Figure 1. Assembly and subsequent dismantling will be aided by the anti-seize agent.

Figure 1 – Application of anti-seize to the mating shafts

Apply to machine shaft Apply to bore land area

D. Fit the shaft key/s into place on the machine shaft. Depending upon the key slot design on the machine shaft, it may be necessary to stake or Loctite® the key/s into place so they do not slide axially while fitting the reducer to the shaft.

E. Lift the gear unit assembly into place and align it carefully with respect to the machine shaft.

F. Fit the gear unit assembly onto the machine shaft using a suitable pulling device.

G. Secure the reducer onto the machine shaft in an axial direction, to prevent the reducer from shifting or walking out of place during operation.

STOP ***HARMFUL SITUATION*** **STOP**

Do not use excessive force or try to hammer the gear unit into place. The housing, shafting, bearings or gear wheels may become damaged.

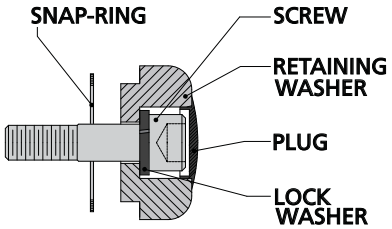
7. Securing the reducer onto the machine shaft

There are slight shaft oscillations during operation in any rotating shaft equipment or any shaft-mounted reducer assembly. Therefore it is important to secure the reducer in an axial direction onto the machine shaft, to prevent the reducer from shifting or walking out of place during operation.

Possible methods to secure the reducer axially to the machine shaft include:

- Using commercial set collars, retaining rings, or snap rings.
- Using the optional "NORD Fixing Element Kit" (see U10280).

The NORD Fixing Element Kit includes all of the necessary parts to secure the shaft by using a tapped hole in the end of the mating male shaft.



Loctite® is a registered trademark of Loctite Corporation U.S.A. and Henkel.

SHAFT FIXING KIT

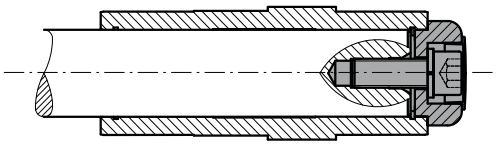
1. Shaft fixing kit - basic design

The NORD Fixing Kit provides a method for securing the reducer in an axial direction, after the keyed-hollow shaft reducer is mounted onto the machine shaft. The fixing kit prevents the reducer from shifting or walking out of place during operation. NORD offers a variety of standard fixing kits, based upon bore size, as shown on Page 2 of this manual.

Figure 1 – Fixing kit components

IMPORTANT NOTE

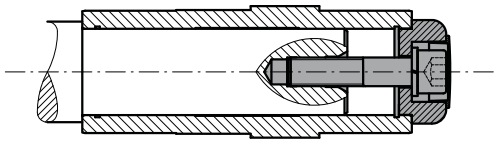
For installation of the keyed-hollow bore reducer to the machine-shaft, see user manual U10270.



2. Assembly types

There are two types of assembly methods commonly used for securing the fixing kit.

Figure 2 – Fixing kit assembly methods



Type 1

The machine-shaft is located against a fixed snap-ring located inside the bore of the reducer.

Type 2

The machine shaft is shouldered and is pulled tight against the hollow-shaft; the snap-ring is no longer required.

HARMFUL SITUATION

The maximum edge break on the solid machine shaft must not exceed the values shown on Page 2 of this manual. Otherwise the load-bearing capacity of the snap-ring will be reduced and may result in failure.

3. Assembly

A. If using a Type 1 assembly, secure the appropriate snap-ring into the bore of the reducer. With Type 2 assembly, no snap-ring is required.

B. Draw the hollow bore gear reducer onto the machine shaft as instructed in U10270. Remember to apply a suitable assembly paste or anti-seize compound to the mating shafts.

C. Install the retaining washer over the end of the hollow bore.

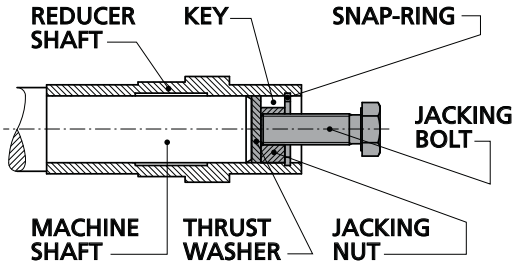
D. Secure the appropriate cap-screw into the machine shaft and tighten the screw based upon the assembly type, as noted below. Then install the protective plug over the screw hole.

Type 1 - Screw tightening

Tighten until lightly snug and secure the screw with a thread-locking compound to prevent the screw from backing out.

HARMFUL SITUATION

Over tightening the retaining screw may cause the snap ring to be pulled out of its seating groove, causing damage to the hollow-bore or snap ring.



Type 2 - Screw tightening

Follow the cap screw manufactures guidelines and tighten the screw to the proper torque, based upon the bolt grade and material. For reference tightening torque values, also see manual U10060, Table 2.

4. Disassembly

When using Type 2 assembly, it is possible to design a simple disassembly tool to allow easier removal of the hollow-bore reducer. The solid shaft is shouldered to rest against the hollow-bore of the reducer. The machine shaft is supported in both of the hollow bore land areas, but the overall length is reduced compared to Type 1 assembly.

Figure 3 – Disassembly Tool

IMPORTANT NOTE

For suggestions on how to construct a disassembly tool for a particular reducer and bore size, please consult NORD's application engineering department.

5. Standard fixing kit size offerings

NORD offers a variety of standard fixing kit sizes as shown by the following tables.

Table 1 - Standard fixing kit size offerings

Shaft Bore [in]	Bolt Size	Allowable Thrust Groove ❷ lb [N]	Allowable Thrust Ring ❸ lb [N]	Max. Edge Break ❹ in [mm]
0.500	10-32	730 [3255]	520 [2300]	0.02 [0.5]
0.750	1/4-20	1800 [7905]	560 [2500]	0.04 [1]
1.000	3/8-16	2900 [13020]	1000 [4600]	0.04 [1]

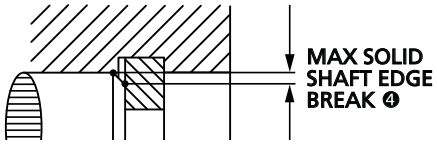
120	M24	196850 [44300]	70000 [15700]	3.0 [0.12]



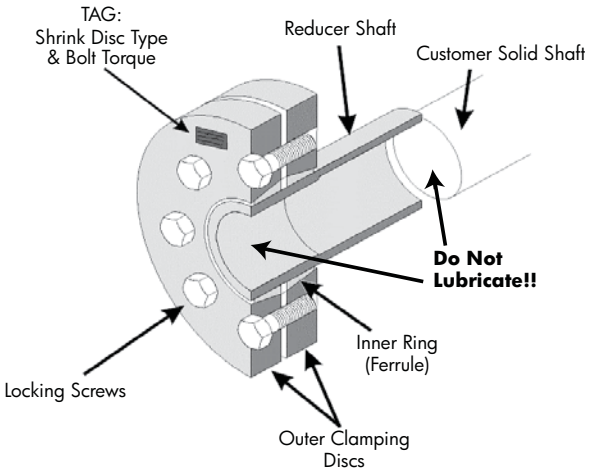
Upon request, additional hollow-bore sizes and fixing kit sizes may be offered.

❶ This fixing kit is not supplied with a snap-ring. A Type 2 machine shaft is required.

❷ Thrust load-bearing capacity of the groove is based upon using a hollow-shaft material with a yield-strength of at least 45,000 psi (310 N/mm²).

❸ Thrust load-bearing capacity of the snap-ring is based upon a typical snap-ring material with a yield-strength of at least 30,500 psi (210 N/mm²).

❹ On the solid machine shaft, observe the maximum edge break (radius or chamfer) shown. A larger edge break will result in reduced load-bearing capacity of the snap-ring.



HOLLOW SHAFT WITH SHRINK DISC

1. Shrink disc design concept

A shrink disc option is adaptable to many NORD hollow-bore reducers. The shrink disc applies a high-capacity, zero backlash, interference fit to the driven machine shaft. The double tapered inner ring converts most all of the screw clamping load into radial contact pressure, as the outer clamping discs are pulled together by proper tightening of the locking screws. As the inner ring is contracted, the clearance between the customer solid shaft and reducer shaft is absorbed.

- In their relaxed state, shrink discs provide a generous assembly clearance, thus eliminating the typical assembly and disassembly challenges of using interference fits.
- Shrink discs also reduce solid machine shaft stresses by eliminating the need for shaft keys and keyways.
- When properly applied, high shrink fits help eliminate shaft fretting corrosion and allow for easier shaft mounting and dismounting.

2. Solid (machine) shaft design guidelines

Always use a solid shaft material of adequate strength and apply proper shaft fits in order to establish adequate clamping force during assembly and assure proper shaft release during disassembly.

- Use solid shaft material with yield strength of at least 52,260 psi (360 N/mm²).
- The solid machine shaft should be machined according to ISO 286-2, Class h6 fit tolerances, with a shaft finish of 125 micro inches (3.2 µm) or smoother, per Table 1.
- The solid machine shaft must extend the full length of the reducer hollow shaft.

HARMFUL SITUATION

Contact NORD when using a shrink disc in an application where the shrink disc connection must simultaneously transmit torque and thrust.

3. Safety

WARNING

- The supporting solid shaft or driven machine shaft must be of adequate size and strength to withstand normal operating loads and peak loads without damage to itself or any of the system components.
- The transmissible torque and the gripping capacity of the shrink disc may be reduced if shaft tolerances or clearances are larger than specified.
- Excessive tightening torque can result in permanent deformation of the inner ring and the reducer hollow bore, making disassembly very difficult. Do not over tighten the shrink disc to compensate for excessive clearance between the machine shaft and reducer bore.
- Observe the published ratings and safety factors for both the reducer and shrink disc. Overload conditions or excessively high torque can cause the shrink disc connection to slip. In extreme cases localized galling or welding of components may occur.

4. Shrink disc shaft tolerances

Recommended solid shaft tolerances and reducer bore tolerances are shown in the table below.

Table 1: Shrink disc shaft tolerances

Above & Including ø [in]	To & Including ø [in]	Solid Shaft Tolerance ø [in]	Reducer Bore Tolerance ø [in]
0.4375	0.6875	+0.0000 / -0.0004	+0.0007 / -0.0000
0.7500	1.1250	+0.0000 / -0.0005	+0.0008 / -0.0000
1.1250	1.9375	+0.0000 / -0.0006	+0.0009 / -0.0000
2.0000	3.1250	+0.0000 / -0.0007	+0.0011 / -0.0000
3.1875	4.6875	+0.0000 / -0.0008	+0.0013 / -0.0000
4.7500	7.0625	+0.0000 / -0.0009	+0.0015 / -0.0000
7.1250	7.5000	+0.0000 / -0.0011	+0.0018 / -0.0000

Above ø [mm]	To & Including ø [mm]	Solid Shaft Tolerance ø [mm]	Reducer Bore Tolerance ø [mm]
10	18	+0.000 / -0.011	+0.018 / -0.000
18	30	+0.000 / -0.013	+0.021 / -0.000
30	50	+0.000 / -0.016	+0.025 / -0.000
50	80	+0.000 / -0.019	+0.030 / -0.000
80	120	+0.000 / -0.022	+0.035 / -0.000
120	180	+0.000 / -0.025	+0.040 / -0.000
180	190	+0.000 / -0.029	+0.046 / -0.000

Shaft/bore tolerances per ISO 282-6, Class h6/H7.

Solid shaft finish should be 125 micro inches (3.2 mocro meters) or smoother.

HOLLOW SHAFT WITH SHRINK DISC

5. Installation

⚠ WARNING ⚠

Disconnect all power sources from the equipment before beginning this installation procedure. Handle the components with care and avoid all sharp machined edges to prevent personal injury.

STOP HARMFUL SITUATION STOP

Do not tighten any of the shrink disc locking screws prior to installing the reducer with shrink disc onto the machine shaft. The inner ring of the shrink disc can become permanently contracted or damaged at relatively low tightening torque.

A. Inspect the gear unit received. Make sure the shrink disc and extended hollow shaft projection is on the side of the reducer where it was specified or ordered.

B. Loosen the shrink disc locking screws but do not take the shrink disc completely apart. Remove and discard any packaging material or transportation spacers that come with the shrink disc.

C. Remove all burrs, rust, corrosion, lubricants, and foreign matter from the surfaces of the solid shaft and hollow-bore.

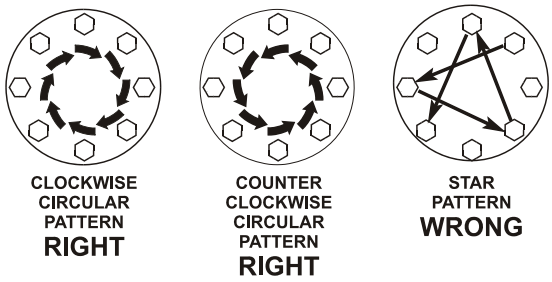
D. Make sure the shrink disk is positioned onto the hollow shaft until the outer clamping ring is flush with the edge of the hollow shaft.

E. To aid in assembly, it is acceptable to lightly grease the solid shaft, only in the area that will come in contact with the bronze-bushing side of the reducer hollow-shaft. ***The reducer hollow shaft must be completely de-greased and free of lubricant, especially in the area of the shrink disc.***

F. Position the gear reducer onto the solid machine shaft and make certain the area under the shrink disc is completely supported by the solid shaft.

G. After confirming the proper positioning of gear reducer and the shrink disc, hand tighten (3) or (4) equally spaced locking screws to make sure the outer collars of the shrink disc are drawn together in a parallel fashion. Then hand-tighten the remaining screws.

H. Refer to Table 2 for the specified tightening torques for the shrink disc locking screws. Using a properly set torque wrench using approximately ¼ (90°) turns; tighten the locking screws, by working in a circular clockwise or counterclockwise sequence around the shrink disc.



I. Continue the tightening sequence (Step H.) even if some locking screws initially require very low tightening torque to achieve ¼ turns; do this for several passes until ¼ turns can no longer be achieved.

J. Reset the torque wrench to approximately 3-5% over-torque and tighten the locking screws for 1 or 2 more passes. This procedure will compensate for relaxation of the locking screws, since tightening of a given screw will always tend to relax the adjacent screw. Without a slight overtorquing of the screws, an infinite number of passes would be required to reach the desired tightening torque.

Table 2 - Shrink Disc Locking Screw Torque

Screw Size	Wrench Size [mm]	Tightening Torque [Nm]	[lb-in]	[ft-lb]
M5	8	7	62	5.2
M6	10	12	106	8.9
M8	13	30	266	22
M10	17	59	522	44
M12	19	100	885	74
M16	24	250	2213	184
M20	30	490	4337	361

BOLT TIGHTENING PATTERN

K. Reset the torque wrench to the correct tightening torque as indicated in Table 2. Make sure each locking screw has been properly tightened until the screws are no longer turning at the specified torque wrench setting. If necessary repeat Steps G. & H.

6. Removal

A. Loosen the shrink disc locking screws in a circular pattern by using ½ (180°) turns, until the shrink disc hub can be moved or until the shrink disc hub and reducer shaft will return to their original fits.

⚠ WARNING ⚠

Do not completely remove the locking screws before the outer clamping disks of the shrink disc are disengaged from the inner ring. A sudden release of the outer collars will create high separating forces and could result in injury or even death.

B. Loosen the outer collars of the shrink disc from the tapered inner ring. This may require tapping the bolts with a **soft faced** hammer or prying lightly between the outer collars.

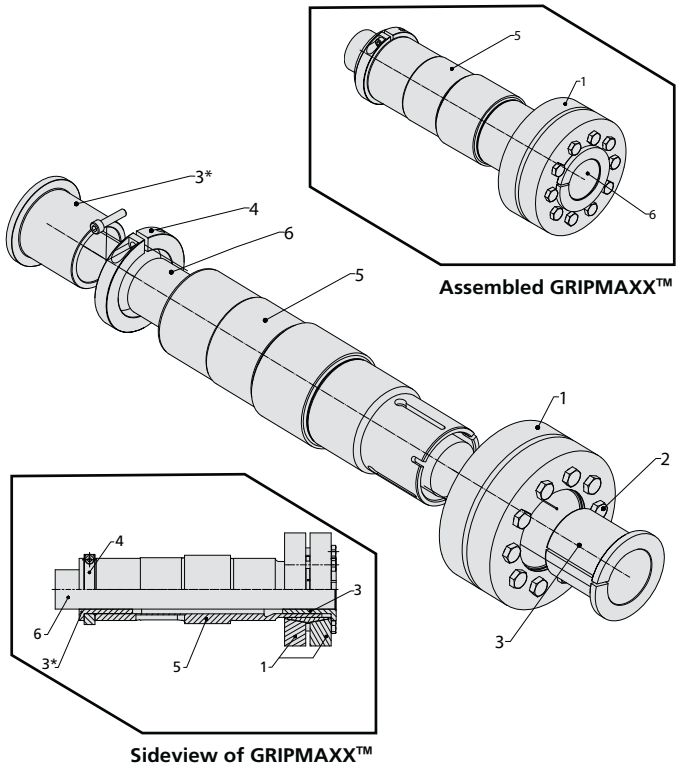
C. Remove the gear reducer from the machine shaft.

7. Re-installation

A. It may be possible to re-use the shrink disc. However the shrink disk should not be re-used if it becomes damaged during removal, or excessively rusty or corroded. Shrink discs must always be disassembled and thoroughly cleaned before re-using.

B. After cleaning the shrink disc, lubricate between the taper of the outer clamping disks and the outside of the inner ring using MOLYKOTE® G-Rapid Plus Paste (product of Dow Corning) or equivalent. In addition, grease screw threads and head contact area with multi-purpose grease.

NORD GRIPMAXX™



1. General information

The NORD GRIPMAXX™ keyless bushing system is adaptable to most all NORD shaft-mounted reducers. The bushing system offers interchangeable bushings to accommodate a large range of driven machine-shaft sizes.

The unique design of the NORD GRIPMAXX™ bushing system offers a number of distinct advantages as follows:

- The NORD GRIPMAXX™ allows the machine builder to utilize standard cold finished shaft stock, without the need for additional shaft machining or shaft keys.
- It uses a NORD shrink disc to apply a high-capacity, zero backlash, interference fit to the driven machine shaft, while eliminating the typical assembly and disassembly challenges of using interference fits.
- The built in clearance between the customer shaft and the bushing system helps to ensure easy installation and removal of the gearbox. To help ensure easy removal, the NORD GRIPMAXX™ bushings are prepared with a special low-wear, corrosion-resistant hardened surface treatment, that minimizes the formation of shaft corrosion and fretting.
- The NORD GRIPMAXX™ is ideal for start-stop operation and bi-directional loading because it does not depend on keys or keyways that transmit torque, which can also can become loose or deform when subjected to these loading conditions.
- Unlike the typical conical or tapered bushing kits, the NORD GRIPMAXX™ design allows a tight fit against a shouldered machine shaft.
- The torque bushing and support bushing are the same part and are fully interchangeable with one another.

2. GRIPMAXX™ assembly detail

Assembled GRIPMAXX™

Sideview of GRIPMAXX™

[1] NORD Shrink Disc
[2] Locking Screw
[3] Bushing (Torque Side)
[3*] Bushing (Support Side)
[4] Clamp Ring
[5] Gear Reducer Hollow Shaft
[6] Machine Shaft

IMPORTANT NOTE

NORD recommends that the machine shaft have a yield strength of at least 52,260psi (360N/mm^2)

IMPORTANT NOTE

Observe the recommended machine shaft tolerances in table 1, page 2.

WARNING

The supporting solid shaft or driven machine shaft must be of adequate size and strength to withstand normal operating loads and peak loads without damage to itself or any of the system components.

3. Installation

⚠ WARNING ⚠

Disconnect all power sources from the equipment before beginning this installation procedure. Handle the components with care and avoid all sharp or machined edges to prevent personal injury.

STOP HARMFUL SITUATION STOP

Do not tighten any of the shrink disc locking screws prior to installing the reducer with shrink disc onto the machine shaft. The inner ring of the shrink disc can become permanently contracted or damaged at a relatively low tightening torque.

Table 1 - Required Machined Shaft Tolerance

Inch Machine Shaft			Metric Machine Shaft		
Above ø [in]	To & Including ø [in]	Tolerance ISO 286-2 [in]	Above ø [mm]	To & Including ø [mm]	Tolerance h11 [mm]
0.4375	0.6875	- 0.0043	10	18	- 0.110
0.7500	1.1250	- 0.0051	18	30	- 0.130
1.1250	1.9375	- 0.0063	30	50	- 0.160
2.0000	2.9375	- 0.0074	50	75	- 0.190

A. Carefully inspect the machine shaft [6] and remove all burrs, rust, corrosion, lubricants, and foreign matter from the shaft surface. Verify that the diameter is within the dimensional tolerances shown in Table 1.

B. Inspect the gear unit received to confirm the correct position of the shrink disc [1]. Make sure the hollow shaft [5] projection is on the side of the reducer where it was specified or ordered.

C. In addition to cleaning the machine shaft [6], remove all dirt, grease or oils from the reducer hollow shaft [5], bushings [3], clamp ring [4], and shrink disk [1]. ***Do not apply lubricants, corrosion preventatives, anti-sieze compounds or coatings to the mating surfaces of the shaft, bushings, clamp collars or shrink disc.***

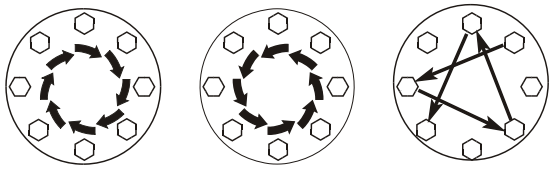
D. Position the clamp ring [4] and support bushing [3*] over the machine shaft [6], making sure the support bushing is in its desired location. Then secure the support bushing [3*] with the clamp ring [4] and tighten the clamp ring screw.

E. Slide the gear reducer unto the machine shaft [6] until the gear reducer stops against the secured support bushing [3*].

F. Without taking the shrink disc [1] apart, loosen the shrink disc locking screws [2]. Slide the shrink disk over the reducer shaft [5] and slide the torque bushing [3] onto the machine shaft, making sure it is seated completely.

G. Confirm the positioning of the shrink disc [1] and torque bushing [3]. ***Do not tighten the shrink disc until the machine shaft and torque bushing are in proper position, or the reducer shaft will be damaged.*** Hand-tighten 3 or 4 or locking screws [2] and make sure the outer collars of the shrink disc are drawn together in a parallel fashion and then hand-tighten the remaining screws.

H. Refer to Table 2 for the specified tightening torques for the shrink disc locking screws. Using a properly set torque wrench using approximately ¼ (90°) turns; tighten the locking screws, by working in a circular clockwise or counterclockwise sequence around the shrink disc.



I. Continue the tightening sequence (Step H.) even if some locking screws initially require very low tightening torque to achieve ¼ turns; do this for several passes until ¼ turns can no longer be achieved.

J. Reset the torque wrench to approximately 3-5% over-torque and tighten the locking screws for 1 or 2 more passes. This procedure will compensate for relaxation of the locking screws, since tightening of a given screw will always tend to relax the adjacent screw. Without a slight overtorquing of the screws, an infinite number of passes would be required to reach the desired tightening torque.

Table 2 - Shrink Disc Locking Screw Torque

Screw Size	Wrench Size [mm]	Tightening Torque [Nm]	[lb-in]	[ft-lb]
M5	8	7	62	5.2
M6	10	12	106	8.9
M8	13	30	266	22
M10	17	59	522	44
M12	19	100	885	74
M16	24	250	2213	184
M20	30	490	4337	361

BOLT TIGHTENING PATTERN

CLOCKWISE CIRCULAR PATTERN **RIGHT**

COUNTER CLOCKWISE CIRCULAR PATTERN **RIGHT**

STAR PATTERN **WRONG**

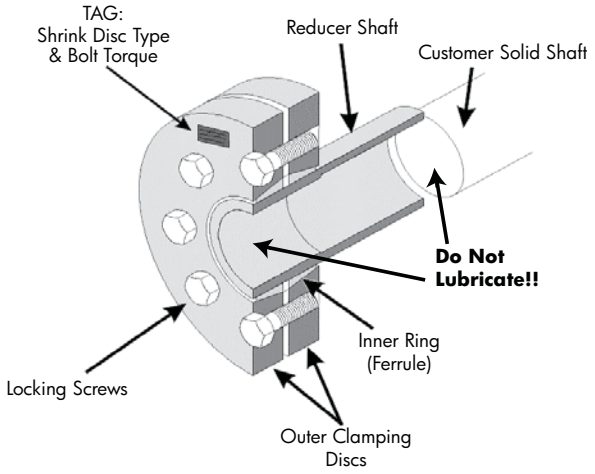
K. Reset the torque wrench to the correct tightening torque as indicated in Table 2. Make sure each locking screw has been properly tightened until the screws are no longer turning at the specified torque wrench setting. If necessary repeat Steps G. & H.

5. Bushing kit removal

A. Loosen the shrink disc locking screws [2] in circular pattern by using ½ (180°) turns, until the shrink disc hub can be moved or until the shrink disc hub and reducer shaft will return to their original fits.

> ⚠ ***WARNING*** ⚠
>
> Do not completely remove the locking screws before the outer clamping disks of the shrink disc are disengaged from the inner ring. A sudden release of the outer collars will create high separating forces and could result in injury or even death.

B. Loosen the outer collars of the shrink disc from the tapered inner ring. This may require tapping the bolts with a **soft faced** hammer or prying lightly between the outer collars.

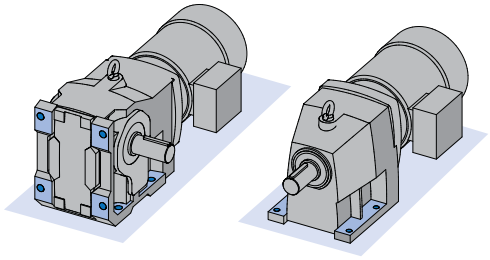


C. Remove the gear reducer from the machine shaft.

6. Re-installation

A. It may be possible to re-use the bushings and shrink disc that are part of the NORD bushing system. However these components should not be re-used if they are damaged during removal, or excessively rusty or corroded.

B. Never re-use any of the bushing kit components without prior cleaning. Shrink discs must always be disassembled and thoroughly cleaned before re-using.



C. After cleaning the shrink disc, lubricate between the taper of the outer clamping disks and the outside of the inner ring using MOLYKOTE® G-Rapid Plus Paste (product of Dow Corning) or equivalent. In addition, grease screw threads and head contact area with multipurpose grease.

REDUCER MOUNTING
FOOTED & FLANGE MOUNT GEAR UNITS

1. Foot-mounted reducers

When installing the foot-mounted gear unit, observe the flatness specifications and bolt tightening torque guidelines provided in U10060 and make sure the mating mounting surface and reducer feet are clean and free of debris. Use of shims under the feet of the gear unit may be required in order to align the output shaft to the driven equipment. Make sure that all feet are supported so that the housing will not distort when it is bolted down. Improper shimming will cause mis-alignment and may reduce the life of the gear unit or cause component failure. Dowel pins may be field-installed to help prevent misalignment and ensure proper realignment if removed for service.

IMPORTANT NOTE

Gear units may be subjected to radial loads or side pull, caused by external chain drives or belt drives. In these instances it is recommended that the mounting base be designed with a slide-plate adjustment to accommodate extra slack in the chain or the belt after the feet are loosened. When using an external chain or belt drive, make sure the reducer is sized so that the shaft and bearings have adequate capacity.

2. Flange-mounted reducers (with B5 flange)

When using the B5 flange to mount the gear unit, the bulk head plate must be engineered to minimize buckling distortions and support the cantilevered weight of the gear reducer or gearmotor. On the B5 mounting flange NORD provides a pilot register or and the flange pilot tolerance as listed per Table 1. When the mating hole is designed with the proper fit, the flange pilot tenon provides a means of accurately positioning the reducer while the hold-down bolts are properly secured; once the reducer is secured, the tenon helps prevent movement of the reducer and it helps locate the center of the reducer output shaft.

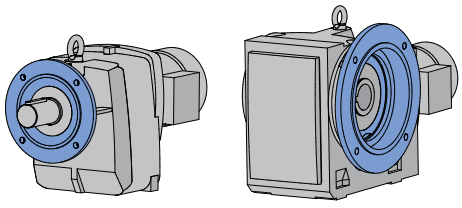


Table : Flange Pilot Tolerance

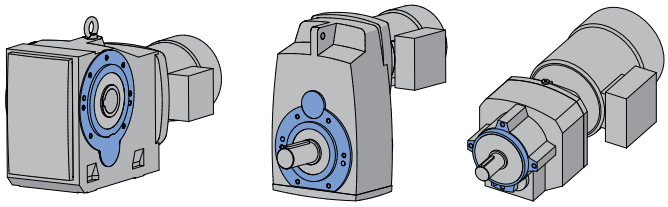
Above ø (in)	To & Including ø (in)	Tolerance (in)	ISO 286-2 Fit Class
1.969	3.150	+0.0005 / -0.0003	j6
3.150	4.724	+0.0005 / -0.0004	j6
4.724	7.087	+0.0006 / -0.0004	j6
7.087	9.055	+0.0000 / -0.0005	h6
9.055	9.843	+0.0000 / -0.0011	h6
9.843	12.402	+0.0000 / -0.0013	h6
12.402	15.748	+0.0000 / -0.0014	h6
15.748	19.685	+0.0000 / -0.0016	h6

Above ø (mm)	To & Including ø (mm)	Tolerance (mm)	ISO 286-2 Fit Class
50	80	+0.012 / -0.007	j6
80	120	+0.013 / -0.009	j6
120	180	+0.014 / -0.011	j6
180	230	+0.000 / -0.013	h6
230	250	+0.000 / -0.029	h6
250	315	+0.000 / -0.032	h6
315	400	+0.000 / -0.036	h6
400	500	+0.000 / -0.040	h6

When installing the flange mounted gear unit, observe the flatness specifications and bolt tightening torque guidelines provided in U10060. Make sure the mating mounting surface and reducer flange are clean and free of debris. Use a straight edge or parallel bar to check for high spots on the mating mounting surface and remove any raised material around the mounting holes.



Set the gear unit into place and tighten the bolts until they are snug. Before final bolt-tightening check for any material gaps between the mating surfaces and if shimming is required, use "U" shaped shims at least 2 times the width of the bolt. Avoid over shimming a very irregular surface as this will make it very difficult to achieve proper alignment.

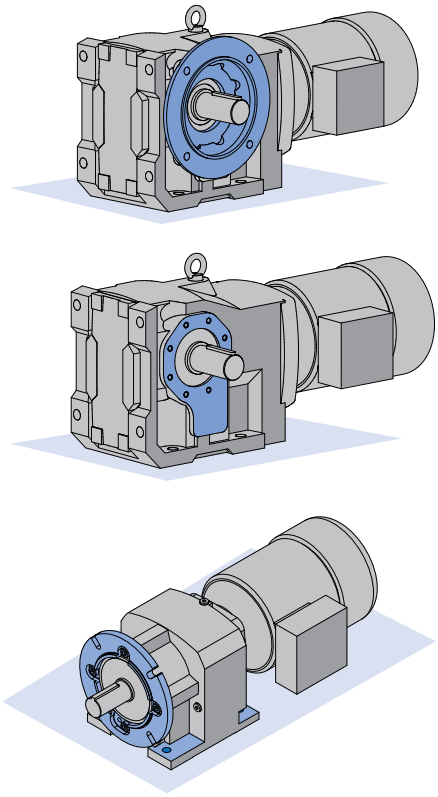
IMPORTANT NOTE

For heavy shock applications, it is advisable to field-install dowel pins through the mounting flange connection (in addition to the mounting bolts). This will help control flange movement or flange rotation and relieve the mounting bolts from this additional stress.

3. Flange-mounted reducers (with B14 flange)

When using the B14 flange to mount the gear unit, the bulk head plate must be engineered to minimize buckling distortions and support the cantilevered weight of the gear reducer or gearmotor. When properly installed, the output flange of the reducer housing is designed to enable the permissible torques and radial forces to be reliably transmitted by the bolt connections.

IMPORTANT NOTE



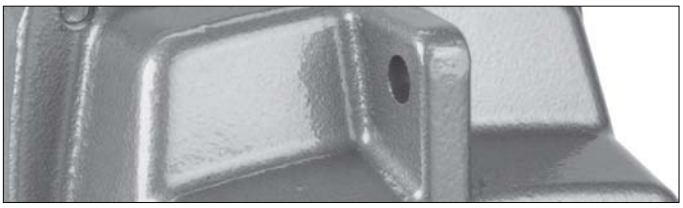
When using the B14 flange-face for mounting, if dowel pin holes are provided in addition to the threaded holes, then it is advisable to also use the proper dowel pins, to help control flange movement or flange rotation and relieve the mounting bolts from this additional stress This is especially important for heavy shock applications.

4. Foot & flange reducer housings

Some gear reducer housings are available with a foot and an output flange. Units with a foot and a B5 Flange are designated with the suffix XF after the primary model number and units with a B14 face-flange are designated with the suffix XZ after the primary model number. When a gear unit is provided with both a foot and a flange, the foot is consider the primary mounting surface. The flange is generally considered to be the secondary mounting option and it is intended that this surface be used for auxiliary add on elements that place minimal load stress on the reducer housing.

HARMFUL SITUATION

To prevent overstress on the main gear unit housing, never tighten the reducer mounting feet and the mounting flange against one-another. Auxiliary add-on elements that are mounted to the reducer flange, must not transmit excessive force, torque or vibration to the main gear housing.



CLINCHER™ SHAFT-MOUNT WITH RUBBER BUFFERS

1. Purpose of the built-in torque arm lug

The preferred method of installing a shaft-mounted Clincher™ reducer is to support the weight of the gear unit or gearmotor assembly from the driven solid machine shaft. In order to restrain the gearbox, react the torque, and keep the gear unit from spinning around the shaft, the Clincher™ gear units have a built-in torque arm lug or tab cast into the reducer housing. This torque tab is intended to be used in conjunction with the NORD Rubber Buffers.

Figure 1: Built-in torque lug

2. Rubber buffers

When specified, NORD provides two rubber buffers that are installed on either side of the gear unit's integral torque lug.

When properly used in tandem, on either side of the torque-arm lug, the rubber buffers help isolate and absorb the load forces present in the system and increase the reducer's service life by reducing cumulative torsional shock loads.

- The primary load force acts in the direction of driven shaft rotation, reacts the torque of the reducer, keeping the gearbox from spinning on the shaft.
- Additional forces present themselves in the direction opposite of the shaft rotation, due to the typical slight out-of-round condition present in the machine shaft. This condition is the reason most shaft mounted-reducers have a slight shaft-wobble, which is normal.

For further dampening it is possible to combine several rubber buffers in a row, on either side of the torque lug.

IMPORTANT NOTE

Please reference Table 1 on page 2 of this manual for dimensional information.

HARMFUL SITUATION

Always mount at least one rubber buffer on either side of the reducer's torque-arm lug. When using rubber buffers in tandem, make sure equal numbers are used on both sides of the torque tab. Failure to do so will not properly cushion the reducer and can result in excessive binding, bearing stress, and damage to the reducer.

3. Machine support

WARNING

It is the responsibility of the machine builder to design a support bracket of adequate strength and rigidity, and supply an appropriate tightening bolt assembly. Failure to do so may result in injury caused from a damaged or broken torque-reaction assembly.

A single customer-supplied machine support bracket, of adequate strength and rigidity, can provide adequate restraint for both directions. This is because when the rubber buffer system is used, the applied load forces are always parallel to the retaining bolt and there are no twisting forces induced onto the bolt in either the clockwise or counter-clockwise direction. In some cases the customer may desire to supply a rigid support on either side of the rubber buffers. In these instances, longer assembly hardware is required.

4. Installation of the rubber buffers

A. Install the Clincher™ hollow bore reducer onto the machine shaft. Line up the hole in the reducer's torque-arm lug with the hole in the machine's support bracket and temporarily hold the reducer in place.

B. Properly secure the gear unit assembly to the driven shaft in an axial direction. If using the NORD Shaft Fixing Kit, follow the instructions in User Manual U10280.

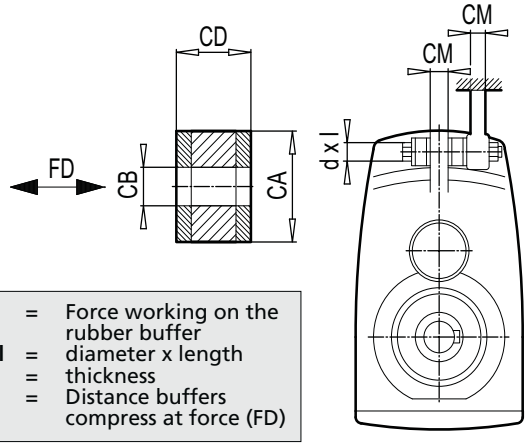
C. Install the rubber buffers on either side of the gear unit's torque-arm lug. Apply a thread locking compound to the end of the fixing bolt. Then place the fixing bolt through the rubber buffers, torque-arm lug and rigid machine support bracket and loosely secure the nut onto the end of the bolt.

D. Tighten the fixing bolt and nut until lightly snug until all of the free play is eliminated from the rubber buffer assembly. Then snug the fixing bolt assembly by tightening an additional 1/4 to 1/2 turn.

E. Tighten the fixing bolt and nut until lightly snugand all of the free-play is eliminated from the rubber buffer assembly. Then snug the fixing bolt assembly by tightening an additional ¼ to ½ turn.

WARNING

To help prevent damage to the rubber buffers, avoid over-tightening.



IMPORTANT NOTE

- A min. of (2) rubber buffers are required for each unit.
- For larger size CLINCHER'S™, NORD offers the heavy-duty rubber buffer (Option VG).
- A metric fixing bolt is preferred for rubber buffer assembly. NORD recommends a minimum ISO Grade 8.8 fixing bolt.

CLINCHER™ SHAFT-MOUNT WITH RUBBER BUFFERS

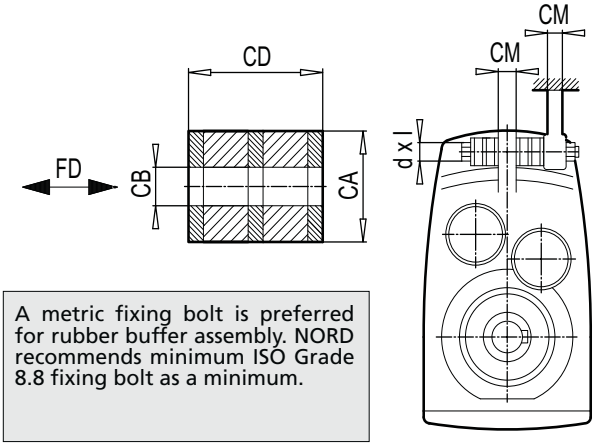


Table 1: Rubber buffer assembly/typical dimensions

Standard Rubber Buffer Assembly Option **(V)**

FD = Force working on the rubber buffer
d x l = diameter x length
c = thickness
S_{FD} = Distance buffers compress at force (FD)

Heavy Duty Rubber Buffer Assembly Option **(VG)**

A metric fixing bolt is preferred for rubber buffer assembly. NORD recommends minimum ISO Grade 8.8 fixing bolt as a minimum.

RIGHT ANGLE SHAFT-MOUNT WITH TORQUE ARM (D)

1. Torque arm (D)

The preferred method of installing a shaft-mounted reducer is to support the weight of the gear unit or gearmotor assembly from the driven solid machine shaft. A torque arm is required in order to restrain the gearbox, react the load torque, and keep the gear unit from spinning around the shaft.

Table 1 (Page 2) provides a list of Torque-Arm (D) part numbers available based upon reducer series and type. The torque-arm is a tear-drop shaped bracket that is mounted to the B14 flange-face of the reducer. Each torque-arm bracket is supplied with a resilient rubber bushing located at the fastening hole-end of the bracket.

IMPORTANT NOTE

The side of the reducer that the torque arm is mounted on, and the angular position can be specified at time of order. Consult the appropriate NORD catalog for specific Torque Arm (D) mounting options and ordering guidelines.

2. Purpose of the built-in resilient rubber bushing

The resilient rubber bushing installed into the fastening hole end of the torque-arm helps isolate and absorb all the load forces present in the system and increase the reducer's service life by reducing cumulative torsional shock loads.

- The primary load force acts in the direction of driven shaft rotation, reacts the load torque of the reducer, and prevents the gearbox from spinning on the shaft.
- Additional forces present themselves in the direction opposite of the shaft rotation, due to the typical slight out-of-round condition present in the machine shaft. This condition is the reason most shaft mounted-reducers have a slight shaft-wobble, which is normal.

HARMFUL SITUATION

Always make sure that the Torque Arm (D) has the resilient rubber bushing installed into the fastening hole end of the torque arm. Failure to do so will not properly cushion the reducer and can result in excessive binding, bearing stress, and damage to the reducer.

3. Machine support

The user must supply a suitably strong and rigid mating machine support that provides load bearing capacity on both sides of the torque-arm bracket.

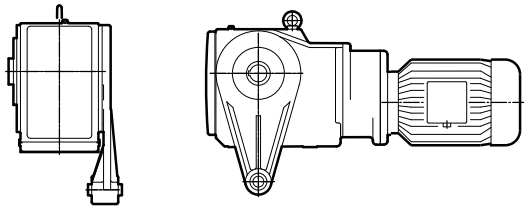
WARNING

It is the responsibility of the machine builder to design a support bracket of adequate strength and rigidity, and supply an appropriate tightening bolt assembly. Failure to do so may result in injury caused from a damaged or broken torque-reaction assembly.

4. Installation of the right-angle reducer with torque arm (D)

A. Make sure the Torque-Arm (D) is mounted in the correct position on the reducer.
   - The torque-arm can be repositioned on the as-received unit by removing the fixing screws, re-position the torque-arm in the correct location, and re-securing the fixing screws to the proper tightening torque, as indicated in Table 2 (Page 2).
   - If the torque-arm was shipped loose, position the torque-arm in the correct location on the gear unit, and secure the torque-arm with the proper fixing screws & tightening torque, as indicated in Table 2 (Page 2).

B. Install the right-angle hollow bore reducer onto the machine shaft. Line up the hole in the reducer's torque-arm with the hole in the machine's support bracket and temporarily hold the reducer in place



C. Properly secure the gear unit assembly to the driven shaft in an axial direction.

D. Place the fastening bolt through the rigid machine support bracket and reducer torque-arm. Then apply a thread locking compound to the end of the fixing bolt and loosely secure the nut onto the end of the bolt.

E. Tighten the fixing bolt to the proper tightening torque as indicated in Table 2 (Page 2).

RIGHT ANGLE SHAFT-MOUNT WITH TORQUE ARM (D)

Table 1 - Torque Arm (D) with rubber buffer

- For all 90.1 Series Helical-Bevel gear units, NORD also offers a bottom mount Torque Arm (K). See User Manual U10620.
- For the large 90.1 Series Helical-Bevel gear units sizes: SK9082.1, SK9086.1, SK9092.1, and SK9096.1, please use the Torque Arm (K).
- A metric fixing bolt is preferred for fastening the Torque-Arm(D) to the machine support bracket.

90.1 HELICAL-BEVEL SHAFT-MOUNT WITH BOTTOM MOUNT TORQUE ARM (K)

1. Torque arm (K)

The preferred method of installing a shaft-mounted reducer is to support the weight of the gear unit or gearmotor assembly from the driven solid machine shaft. A torque arm is required in order to restrain the gearbox, react to the load torque, and keep the gear unit from spinning around the shaft.

Table 1 (Page 2) provides a list of Torque-Arm (K) part numbers available for the 90.1 Series Helical-Bevel gear units. The Torque Arm (K) is secured to the base of the reducer. On most sizes there is an integral resilient rubber bushing located at the fastening hole-end of the torque arm. On the larger sizes, rubber buffers are used in conjunction with the torque arm and when properly used they are applied in tandem, on either side of the torque arm lug.

IMPORTANT NOTE

When ordering the Torque Arm (K) one can specify which side of the reducer to mount the fastening hole that bolts to the machine support bracket. Consult the appropriate NORD catalog for specific Torque Arm (K) mounting options and ordering guidelines.

2. Purpose of the rubber bushing or rubber buffers

Regardless if the Torque Arm (K) is supplied with the integral rubber bushing or whether separate rubber buffers are required, the bushing/buffers help isolate and absorb all the load forces present in the system and increase the reducer's service life by reducing cumulative torsional shock loads.

- The primary load force acts in the direction of driven shaft rotation, reacts the load torque of the reducer, and prevents the gearbox from spinning on the shaft.
- Additional forces present themselves in the direction opposite of the shaft rotation, due to the typical slight out-of-round condition present in the machine shaft. This condition is the reason most shaft mounted-reducers have a slight shaft-wobble, which is normal.

HARMFUL SITUATION

Always make sure that the Torque Arm (K) is used in conjunction with the required rubber bushing/s. Failure to do so will not properly cushion the reducer and can result in excessive binding, bearing stress, and damage to the reducer.

3. Machine support

The user must supply a suitably strong and rigid mating machine support that provides load bearing capacity on both sides of the machine support bracket.

WARNING

It is the responsibility of the machine builder to design a support bracket of adequate strength and rigidity, and supply an appropriate tightening bolt assembly. Failure to do so may result in injury caused from a damaged or broken torque-reaction assembly.

4. Installation of the right-angle reducer with torque arm (K)

A. Make sure the Torque-Arm (K) is mounted so that the machine fastening hole is on the correct side of the reducer.
   - The torque-arm can be repositioned on the as-received unit by removing the fixing screws, re-position the torque-arm in the correct location, and re-securing the fixing screws to the proper tightening torque, as indicated in Table 2 (Page 2).
   - If the torque-arm was shipped loose, position the torque-arm in the correct location on the gear unit, and secure the torque-arm with the proper fixing screws & tightening torque, as indicated in Table 2 (Page 2).

B. Install the right-angle hollow bore reducer onto the machine shaft. Line up the hole in the reducer's torque-arm with the hole in the machine's support bracket ,and temporarily hold the reducer in place

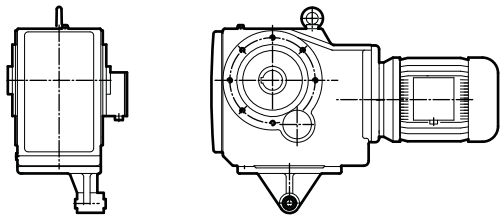
C. Properly secure the gear unit assembly to the driven shaft in an axial direction.

D. Apply thread locking compound to the end of the fixing bolt, then place the fastening bolt through the rigid machine support bracket and reducer torque-arm and loosely secure the nut onto the end of the bolt.

E. If the torque arm has an integral rubber bushing follow step F and skip steps G-H. If the torque arm uses rubber buffers skip forward to steps G-H.

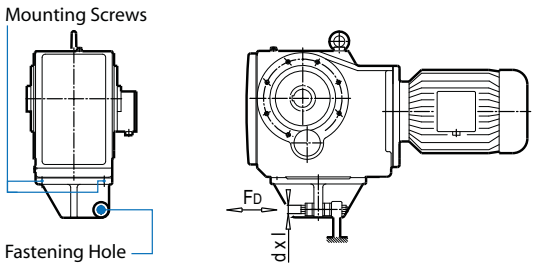
F. Tighten the fixing bolt to the proper tightening torque as indicated in Table 2 (Page 2).

G. Install the rubber buffers on either side of the gear unit's torque-arm lug and place the fixing bolt through the rubber buffers and torque-arm lug and into the rigid machine support bracket.



H. Tighten the fixing bolt and nut lightly snug, until all the free-play is eliminated from the rubber buffer assembly. Then snug the fixing bolt assembly by tightening an additional ¼ to ½ turn.

WARNING



To prevent damage to the rubber buffers, avoid over-tightening.

90.1 HELICAL-BEVEL SHAFT-MOUNT WITH BOTTOM MOUNT TORQUE ARM (K)

Torque Arm (K) with integrated bushing

Torque Arm (K) with rubber buffer

- For most all 90.1 series Helical-Bevel gear units, an optional tear-drop shaped side -mounted torque arm (D) is available. See user manual U10600.

- A metric fixing bolt is preferred for fastening the torque arm (K) to the machine support bracket.

HELICAL & BEVEL REDUCER LUBRICATION

1. Importance of proper lubrication

Proper gearbox lubrication is essential in order to reduce friction, heat, and component wear. Lubricants reduce heat and wear by inserting a protective "fluid boundary" between mating parts and preventing direct metal to metal contact. Lubricants also help prevent corrosion and oxidation, minimize foam, improve heat transfer, optimize reducer efficiency, absorb shock loads and reduce noise.

Most NORD reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position.

2. Standard oil type

The following tables indicate the standard oil fill type used. Please see user manual U11000 for more specific information and for optional helical and bevel gear lubricants:

Serviceable Gear Units	
Helical In-line	Standard Oil Fill: ISO VG 220, Mineral Oil
Clincher Parallel-Shaft	
Right-Angle Bevel	
NORDBLOC® Series In-line	
NORDBLOC®.1 Series In-line	
Standard Series In-line	

IMPORTANT NOTE

For shipping purposes, the following large gear units are supplied without oil:
- Clincher™ Sizes SK10282, SK10382, SK11282 and SK12382
- Right-Angle Bevel Size SK9096.1

Maintenance-free / Lubricated For Life Gear Units	
Clincher™ sizes SK0182NB, SK0282NB & SK1382NB	Standard Oil Fill: ISO VG220 SHC/PAO Synthetic Oil
NORDBLOC® Sizes SK172, SK272, SK371F, SK372, SK373, SK320	

IMPORTANT NOTE

Maintenance-free units are supplied as sealed units with no vent-plug. Consult NORD prior to ordering if interested in ordering any of the above sizes as serviceable gear units.

IMPORTANT NOTE

Consult the sticker adjacent to the fill plug to determine the type of lubricant installed at the factory. Some units have special lubricants designed to operate in certain environments or intended to extend the service life or service temperature range of the lubricant. If in doubt about which lubricant is needed for a certain application, please contact NORD Gear.

3. Lubrication replacement

If the gear unit is filled with mineral oil, the lubricant should be replaced at least after every 10,000 operating hours or after every two years. If the gear unit is filled with synthetic oil, the lubricant should be replaced at least after every 20,000 operating hours or after every four years. Often gear reducers are exposed to extreme ambient conditions, hostile environments, wet conditions, or dirty and dusty operating areas. Especially in these situations, it is important to establish a condition-based oil service interval.

4. Oil viscosity

Viscosity, or the oil's resistance to shear under load, is often considered the single most important property of any gear oil.

- Often one will consider making a viscosity correction to the oil to improve the performance when operating the gear unit at low temperature or high temperature.
- In cases of extreme load conditions, gear pairs and antifriction bearings may be more susceptible to sliding or scuffing wear. In these operating conditions, it may also be beneficial to consider an increased lubrication viscosity and/or a lubrication with improved antiwear additive packages.

IMPORTANT NOTE

The user should consult with their primary lubrication supplier before considering changes in oil type or viscosity.

5. Maximum oil sump temperature limit

To prevent reducer overheating, the reducer's maximum oil sump temperature limit must not be exceeded for prolonged periods of operation (up to 3 hours continuous operation depending upon reducer size).

Oil Type	Maximum Oil Temperature Limit	
	NORD	AGMA 9005-D94
Mineral	80-85°C (176-185°F)	95°C (203°F)
Synthetic	105°C (220°F)	107°C (225°F)

IMPORTANT NOTE

Use caution when specifying gear reducers for high temperature service. If there is concern about exceeding the allowable safe operating temperatures, please consult NORD to discuss alternatives.

HELICAL & BEVEL REDUCER LUBRICATION

6. The importance of routine oil analysis

Routine oil analysis, sound lubrication practices, and good tracking of oil performance trends will help establish proper lubrication maintenance and change-out intervals. To maximize equipment reliability, NORD Gear generally recommends a condition-based lubrication maintenance program. One may take exceptions to this general recommendation on sealed-for-life or maintenance-free gear units or smaller and less costly gear units. In these instances, the replacement cost of the gear unit is often small compared to the costs associated with this type of oil analysis program.

STOP ***HARMFUL SITUATION*** **STOP**

NORD suggests replacing the gear oil if oil analysis indicates any of the following:

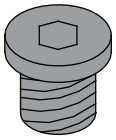
- Viscosity has changed by approximately 10% or more.
- Debris particles (silicon, dust, dirt or sand) exceed 25 ppm.
- Iron content exceeds 150-200 ppm.
- Water content is greater than 0.05% (500 ppm).
- The total acid number (TAN) tests indicate a significant level of oxidative break-down of the oil, and a critical reduction in performance; If the TAN number measured changes by more than 5% over the new oil, then an oil change would be recommended.

7. Mounting position and oil fill quantity

All NORD Gear reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position. ***For additional information, please see the seperate mounting position diagrams and the corresponding oil fill quantity tables for the specified gear unit.***

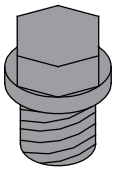
The gearbox nametag will indicate the mounting position that was provided. ***For mounting orientations other than shown in the mounting position charts, please consult NORD Gear.***

STOP ***HARMFUL SITUATION*** **STOP**



Actual oil volume can vary slightly depending upon the gear case size, mounting and ratio. Prior to commissioning the reducer, check the oil-fill level using the reducer's oil-level plug and drain or add additional oil as needed.

8. Oil plug locations



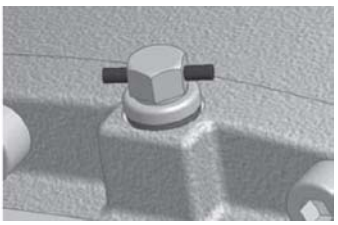
All gear units are assembled with the oil fill-level, oil-drain and vent plugs installed in their proper locations, according to the specified mounting position. All standard plugs are metric and utilize sealing gaskets between the head of the plug and the reducer housing.

9. Drain and fill-level plugs

All reducer drain plugs are metric socket head cap screws. For ease of draining the used oil from the gear reducer use the socket head screw located at the lowest part of the gearbox. For ease of identification, it is NORD's standard practice to provide a hex-head screw for the fill-level plug.

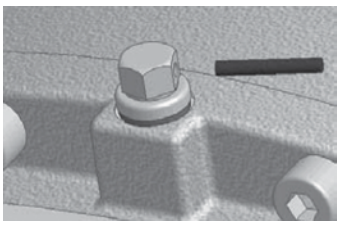
Drain Plug

Fill Level Plug



10. Vent plug locations

Reducer venting allows for air pressure differences that occur during operation, between the inner space of the reducer and the atmosphere, while ensuring leak-free operation. The AUTOVENT™ is standard on all helical-inline gear units.



AUTOVENT™ - The AUTOVENT™ helps prevent bearing and gear damage by blocking entry of foreign material (water, dust, corrosives, etc.). The breather acts like a check valve that opens at approximately 2 psi during operation, closes tightly as the gearbox cools, and produces a slightly negative pressure. This option is perfect for humid conditions and wash-down environments, helping to maintain proper oil cleanliness, and reducing foaming and oxidation.

Open Vent - An optional open vent can be supplied on NORD reducers. The open vent will be closed upon delivery to prevent oil leakage. Before the reducer is put into operation the open vent should be activated by removing the sealing plug.

Sealed open vent

Activated open vent

Filtered Vent - NORD may offer an optional filtered vent, which allows gases to permeate, but does not allow dust and debris to pass through the vent.

HELICAL WORM REDUCER LUBRICATION

1. Importance of proper lubrication

Proper gearbox lubrication is essential in order to reduce friction, heat, and component wear. Lubricants reduce heat and wear by inserting a protective "fluid boundary" between mating parts and preventing direct metal to metal contact. Lubricants also help prevent corrosion and oxidation, minimize foam, improve heat transfer, optimize reducer efficiency, absorb shock loads and reduce noise.

NORD helical-worm reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position.

2. Standard oil type

NORD helical worm gear reducers are filled with ISO VG 680 synthetic-hydrocarbon/polyalphaolefin (SHC/PAO) worm gear oil.

- SHC/PAO worm gear oils have good high and low temperature stability, are compatible with most paint and seal types, and are miscible with mineral oils.
- SHC/PAO worm gear oils also contain a small amount of organic ester and other antiwear (AW) packages to offer improved lubrication conditions, especially in the worm mesh, where a sideways sliding motion prevails.

Please see user manual U11020 for more specific information and for optional helical worm lubricants.

HARMFUL SITUATION

In worm gears avoid using extreme pressure (EP) gear oils containing sulfur-phosphorous chemistries; these additives can react adversely with bronze worm gears, and accelerate wear.

IMPORTANT NOTE

Consult the sticker adjacent to the fill plug to determine the type of lubricant installed at the factory. Some units have special lubricants designed to operate in certain environments or intended to extend the service life or service temperature range of the lubricant. If in doubt about which lubricant is needed for a certain application, please contact NORD Gear.

3. Lubrication replacement

The helical-worm gear oil should be replaced at least after every 20,000 operating hours or after every four years. Often gear reducers are exposed to extreme ambient conditions, hostile environments, wet conditions, or dirty and dusty operating areas. Especially in these situations, it is important to establish a condition-based oil service interval.

4. Efficiency

Helical worm gears reach efficiencies up to 92% and are generally much more efficient than worm-only gear units. However, it is important to consider the following, when using worm gears.

- Worm gears reach their peak rated efficiency, after they undergo a natural run-in process (up to 25 hours operating time at maximum rated load). Catalog published power and torque figures are based upon the rated efficiency after the run-in is complete.
- Worm gears have naturally lower startup efficiencies compared to operating efficiencies. As input speed increases the enhanced hydrodynamic effects of the oil result in less tooth friction and increased worm gear efficiency.

IMPORTANT NOTE

Worm gear reducers applied in cold temperature service, may require increased motor power for the following reasons:

- Lower operating temperatures, cause lubrication viscosity to increase in both the gearbox and in the moving areas of the driven machine.
- Worm-gears have naturally lower start-up efficiencies compared to operating efficiencies.
- In extreme cases, one might need to consider increasing the motor power and lowering the oil viscosity

5. Oil Viscosity

Viscosity, or the oil's resistance to shear under load, is often considered the single most important property of any gear oil.

- Often one will consider making a viscosity correction to the oil to improve the performance when operating the gear unit at low temperature or high temperature.
- In cases of extreme load conditions, gear pairs and antifriction bearings may be more susceptible to sliding or scuffing wear. In these operating conditions, it may also be beneficial to consider an increased lubrication viscosity and/or a lubrication with improved antiwear additive packages.

IMPORTANT NOTE

The user should consult with their primary lubrication supplier before considering changes in oil type or viscosity.

6. Maximum oil sump temperature limit

To prevent reducer overheating, the reducer's maximum oil sump temperature limit must not be exceeded for prolonged periods of operation (up to 3 hours continuous operation depending upon reducer size).

Oil Type	Maximum Oil Temperature Limit	
	NORD	AGMA 9005-D94
Synthetic	105°C (220°F)	107°C (225°F)

IMPORTANT NOTE

Use caution when specifying gear reducers for high temperature service. If there is concern about exceeding the allowable safe operating temperatures, please consult NORD to discuss alternatives.

HELICAL WORM REDUCER LUBRICATION

7. The importance of routine oil analysis

Routine oil analysis, sound lubrication practices, and good tracking of oil performance trends will help establish proper lubrication maintenance and change-out intervals. To maximize equipment reliability, NORD Gear generally recommends a condition-based lubrication maintenance program. One may take exceptions to this general recommendation on sealed-for-life or maintenance-free gear units or smaller and less costly gear units. In these instances, the replacement cost of the gear unit is often small compared to the costs associated with this type of oil analysis program.

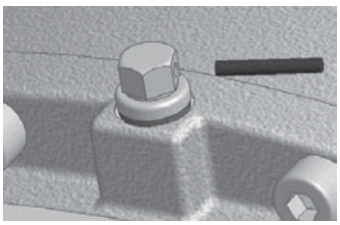
11. Vent plug locations

Reducer venting allows for air pressure differences that occur during operation, between the inner space of the reducer and the atmosphere, while ensuring leak-free operation. The AUTOVENT™ is standard on all helical-inline gear units.



AUTOVENT™ - The AUTOVENT™ helps prevent bearing and gear damage by blocking entry of foreign material (water, dust, corrosives, etc.). The breather acts like a check valve that opens at approximately 2 psi during operation, closes tightly as the gearbox cools, and produces a slightly negative pressure. This option is perfect for humid conditions and wash-down environments, helping to maintain proper oil cleanliness, and reducing foaming and oxidation.

Open Vent - An optional open vent can be supplied on NORD reducers. The open vent will be closed upon delivery to prevent oil leakage. Before the reducer is put into operation the open vent should be activated by removing the sealing plug.

Sealed open vent

Activated open vent

Filtered Vent - NORD may offer an optional filtered vent, which allows gases to permeate, but does not allow dust and debris to pass through the vent.

MINICASE™ WORM REDUCER LUBRICATION

1. Importance of proper gearbox lubrication

Proper gearbox lubrication is essential in order to reduce friction, heat, and component wear. Lubricants reduce heat and wear by inserting a protective "fluid boundary" between mating parts and preventing direct metal to metal contact. Lubricants also help prevent corrosion and oxidation, minimize foam, improve heat transfer, optimize reducer efficiency, absorb shock loads and reduce noise.

2. Maintenance free design

NORD MINICASE™ worm gear reducers are designed to be maintenance-free and are supplied completely sealed. They are factory oil-filled with a pre-determined oil fill amount in accordance to the specified reducer size and mounting position. The synthetic lubrication used is suitable for the life of the product so the MINICASE™ is inherently maintenance free.

3. Standard oil type

NORD MINICASE™ worm gear reducers are filled with ISO VG 680 synthetic-hydrocarbon/polyalphaolefin (SHC/PAO) worm gear oil.

- SHC/PAO worm gear oils have good high and low temperature stability, are compatible with most paint and seal types, and are miscible with mineral oils.
- SHC/PAO worm gear oils also contain a small amount of organic ester and other antiwear (AW) packages to offer improved lubrication conditions, especially in the worm mesh, where a sideways sliding motion prevails.

Please see user manual U11040 for more specific information and for optional MINICASE™ worm lubricants.

HARMFUL SITUATION

In worm gears avoid using extreme pressure (EP) gear oils containing sulfur-phosphorous chemistries; these additives can react adversely with bronze worm gears, and accelerate wear.

4. Efficiency

It is important to consider the following, when using worm gears.

- Worm gears reach their peak rated efficiency, after they undergo a natural run-in process (up to 25 hours operating time at maximum rated load). Catalog published power and torque figures are based upon the rated efficiency after the run-in is complete.
- Worm gears have naturally lower startup efficiencies compared to operating efficiencies. As input speed increases the enhanced hydrodynamic effects of the oil result in less tooth friction and increased worm gear efficiency.

IMPORTANT NOTE

Worm gear reducers applied in cold temperature service, may require increased motor power for the following reasons:

- Lower operating temperatures, cause lubrication viscosity to increase in both the gearbox and in the moving areas of the driven machine.
- Worm-gears have naturally lower start-up efficiencies compared to operating efficiencies.
- In extreme cases, one might need to consider increasing the motor power and/or lowering the oil viscosity.

5. Oil Viscosity

Viscosity, or the oil's resistance to shear under load, is often considered the single most important property of any gear oil.

- Often one will consider making a viscosity correction to the oil to improve the performance when operating the gear unit at low temperature or high temperature.
- In cases of extreme load conditions, gear pairs and antifriction bearings may be more susceptible to sliding or scuffing wear. In these operating conditions, it is also may be beneficial to consider an increased lubrication viscosity and/or a lubrication with improved antiwear additive packages.

IMPORTANT NOTE

The user should consult with their primary lubrication supplier before considering changes in oil type or viscosity.

6. Maximum oil sump temperature limit

To prevent reducer overheating, the reducer's maximum oil sump temperature limit must not be exceeded for prolonged periods of operation (up to 3 hours continuous operation depending upon reducer size).

Oil Type	Maximum Oil Temperature Limit	
	NORD	AGMA 9005-D94
Synthetic	105°C (220°F)	107°C (225°F)

IMPORTANT NOTE

Use caution when specifying gear reducers for high temperature service. If there is concern about exceeding the allowable safe operating temperatures, please consult NORD to discuss alternatives.

FLEXBLOC™ WORM REDUCER LUBRICATION

1. Importance of proper gearbox lubrication

Proper gearbox lubrication is essential in order to reduce friction, heat, and component wear. Lubricants reduce heat and wear by inserting a protective "fluid boundary" between mating parts and preventing direct metal to metal contact. Lubricants also help prevent corrosion and oxidation, minimize foam, improve heat transfer, optimize reducer efficiency, absorb shock loads and reduce noise.

2. FLEXBLOC™ - Sealed or vented options available

FLEXBLOC™ worm gear modules are designed to operate sealed or vented. They are factory oil filled for any mounting configuration with a pre-determined oil level (See User Manual U13300). There are four factors that need to be considered when deciding to use a sealed unit versus a vented unit.

A. If the duty cycle is intermittent, the run times are short, and any build-up of internal pressure or temperature is low to modest, the sealed unit option can be used.

B. If running continuous under moderate to high load, worm gears generate moderate to high operating temperature and a build-up of internal pressure. In these instances a vented option is usually suggested.

C. By design radial shaft seals produce a hydrodynamic pumping action to help push lubricant back into the gear unit. This causes the unit to ingest some air. Tests have shown that this only causes a small pressure increase (1-2 psi) but when combined with "factor B" this minimal pressure can seem significant.

D. When the environment is contaminated with water, dirt, etc., which can be ingested into the breather, increased wear of bearings and gearing, and lubrication breakdown, can result. In these instances the sealed option or an AUTOVENT™ should be considered.

Typical Execution – Sealed maintenance free design

The FLEXBLOC™ is supplied completely sealed and the unit's lubrication is considered suitable for the life of the product, so it is inherently maintenance free.

Optional Execution – A Field Installable Vent Kit Is Ordered

When ordered, NORD can provide field installable vent kit option for most all FLEXBLOC™ Gear units, with exception to the smallest SK1SI31 unit.

Open Vent Kit	P/N 60693500
Autovent™:	P/N 22008005 (vent) + P/N 25308120 (gasket)

3. Standard oil type

FLEXBLOC™ worm gear reducers are oil-filled as follows:

- FLEXBLOC™ inch hollow-bore modules are factory-filled with an ISO VG220 food grade synthetic polyglycol lubricant (suitable for NSF-H1 incidental contact).
- FLEXBLOC™ metric hollow-bore modules are factory filled with an ISO VG220 polyglycol lubricant (unless special ordered).

Please see user manual U11060 for more specific information concerning FLEXBLOC™ lubricants.

4. Efficiency

It is important to consider the following, when ordering worm gears.

- Worm gears reach their peak rated efficiency, after they undergo a natural run-in process (up to 25 hours operating time at maximum rated load). Catalog published power and torque figures are based upon the rated efficiency after the run-in is complete.
- Worm gears have naturally lower startup efficiencies compared to operating efficiencies. As input speed increases the enhanced hydrodynamic effects of the oil result in less tooth friction and increased worm gear efficiency.

IMPORTANT NOTE

Worm gear reducers applied in cold temperature service, may require increased motor power for the following reasons:

- Lower operating temperatures, cause lubrication viscosity to increase in both the gearbox and in the moving areas of the driven machine.
- Worm-gears have naturally lower start-up efficiencies compared to operating efficiencies.
- In extreme cases, one might need to consider increasing the motor power and lowering the oil viscosity

5. Oil Viscosity

Viscosity, or the oil's resistance to shear under load, is often considered the single most important property of any gear oil.

- Often one will consider making a viscosity correction to the oil to improve the performance when operating the gear unit at low temperature or high temperature.
- In cases of extreme load conditions, gear pairs and antifriction bearings may be more susceptible to sliding or scuffing wear. In these operating conditions, it also may be beneficial to consider an increased lubrication viscosity and/or a lubrication with improved antiwear additive packages.

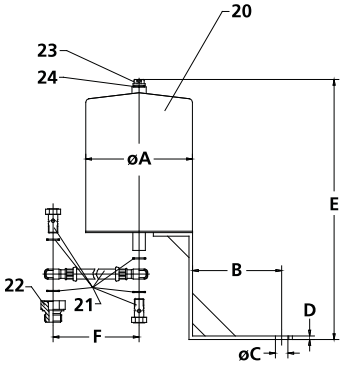
IMPORTANT NOTE

The user should consult with their primary lubrication supplier before considering changes in oil type or viscosity.

6. Maximum oil sump temperature limit

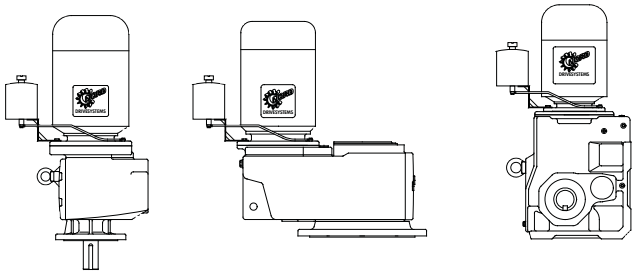
To prevent reducer overheating, the reducer's maximum oil sump temperature limit must not be exceeded for prolonged periods of operation (up to 3 hours continuous operation depending upon reducer size).

Oil Type	Maximum Oil Temperature Limit	
	NORD	AGMA 9005-D94
Synthetic	105°C (220°F)	107°C (225°F)



IMPORTANT NOTE

Use caution when specifying gear reducers for high temperature service. If there is concern about exceeding the allowable safe operating temperatures, please consult NORD to discuss alternatives.



EXPANSION CHAMBERS INSTALLATION & MAINTENANCE MANUAL

Installation Instructions

Sometimes NORD requires the use of an oil expansion chamber when the motor or reducer input is mounted vertically. Consult your NORD catalog for additional information and application considerations.

1. Secure the gear reducer in the proper mounting position for the application and remove the vent plug from the gear reducer. The hose assembly kit (21) will be fitted to the reducer using the housing port provided.
2. When using the larger 2.7 and 5.4 liter chambers, screw the adapter fitting (22) into the reducer housing port. Use all sealing gaskets provided.
3. Mount the overflow tank (20) at the highest location from the reducer, as permitted by the hose assembly kit (21). Typical mounting configurations are represented below. Use one of the input cover's mounting bolts, to mount the chamber support leg to the reducer.

4. Be sure to use the proper fittings. Assemble one end of the vent-hose assembly (21) to bottom of the chamber and one-end to the reducer.
5. Secure the vent-plug (23) and gasket (24) that is supplied with the kit to the top of the expansion chamber.

STOP ***HARMFUL SITUATION*** **STOP**

Remove the protective "rubber element" from the supplied vent prior to use so that an open-vent is formed on top of the overflow tank. Avoid using a pressurized AUTOVENT™ breather on the overflow tank since this may create an undesired pressure-vacuum in the overflow tank.

Expansion Chamber Kit Dimensions & Parts List

Kit Part Number: 28390390 - 0.7 Liter Oil Expansion Chamber

Kit P/N	Ø A	B	Ø C	D	E	F	Units

HELICAL & BEVEL REDUCER LUBRICATION TYPES

Lubrication Tables – Helical and Bevel Gear Units

Standard Oil Lubricants

ISO Viscosity	Oil Type	Ambient Temperature Range	Manufacturer Brand / Type
VG220	MIN-EP	-5 to 40 °C (23 to 104 °F)	Mobil / Spartan EP220 ♦ ❶
	PAO	-35 to 50 °C (-31 to 122 °F)	Mobil / SHC630 ♦ ❷
	FG	-5 to 40 °C (23 to 104 °F)	Shell / FM220 ♦

Optional Oil Lubricants

ISO Viscosity	Oil Type	Ambient Temperature Range	Manufacturer Brand / Type
VG460	PAO	-35 to 80 °C (-31 to 176 °F)	Mobil / SHC634
	FG-PAO	-40 to 80 °C (-40 to 176 °F)	Shell / Cassida GL460
VG220	FG-PAO	-40 to 50 °C (-40 to 122 °F)	Shell / Cassida GL220
VG150	PAO	-40 to 25 °C (-40 to 77 °F)	Mobil / SHC629
	FG-PAO	-45 to 25 °C (-49 to 77 °F)	Shell / Cassida GL220

Grease Options (applied to greased bearings and seal cavities)

NLGI Grade	Grease Type / Thickener	Ambient Temperature Range	Manufacturer Brand / Type
NLGI 2	Standard / Li-Complex	-30 to 60 °C (-22 to 140 °F)	Shell Albida EP 2 ♦ ❶
	High-Temperature / Polyurea	-25 to 80 °C (-13 to 176 °F)	Mobil Polyrex EP 2 ♦ ❷
	Food-Grade / Al-Complex	-25 to 40 °C (-13 to 104 °F)	Mobil Grease FM222 ♦

♦ Stocked Lubricants

❶ Standard product on serviceable gear units

❷ Standard product on maintenance free gear units

IMPORTANT NOTES

- The "Ambient Temperature" is intended to be an operation guideline based upon the typical properties of all the lubricant. The viscosity and other properties of the lubricant change based upon load, speed, ambient conditions, and reducer operating temperatures. The user should consult with their lubrication supplier & NORD gear before considering changes in oil type or viscosity.
- To prevent reducer overheating, observe the maximum operating oil temperature limits:
  Mineral Oil: 80-85 °C (176 – 180 °F).
  Synthetic Oil: 105 °C (225 °F).
- In the following instances, please consult NORD for specific recommendations:
  - √ Gear units will operate in high ambient temperature conditions exceeding 40 °C (104 °F).
  - √ Gear units will operate in cold ambient temperature conditions approaching 0 °C (32 °F) or lower.
  - √ Lower than an ISO VG100 viscosity oil is being considered for a cold-temperature service.
  - √ Fluid grease is required for lubricating the gear unit.
- Observe the general lubrication guidelines outlined in user manual U10750.

Oil Formulation Codes

MIN-EP - Mineral Oil with EP Additive
PAO-EP - Synthetic Polyalphaolefin Oil with EP Additive
PAO - Synthetic Polyalphaolefin Oil
PG - Synthetic Polyglycol Oil
FG - Food-Grade Oil
FG-PAO - Food-Grade, Synthetic Poyalphaolefin Oil
FG-PG - Food-Grade, Synthetic Polyglycol Oil

Lubrication Notes

- Avoid using (EP) gear oils in worm gears that contain sulfur-phosphorous chemistries, as these additives can react adversely with bronze worm gears and accelerate wear.
- Food grade lubricants must be in compliance with FDA 212 CFR 178.3570 and qualify as a NSF-H1 lubricant. Please consult with lubrication manufacturer for more information.
- When making a lubrication change, check with the lubrication supplier to assure compatibility and to obtain recommended cleaning or flushing procedures.
- Do not to mix different oils with different additive packages or different base oil formulation types. Polyglycol (PG) oils are not miscible with other oil types and should never be mixed with mineral oil or polyalphaolefin (PAO) synthetic oil.

Low-end service temperature limit may vary for a specific lubricant; Please also see the important notes on Page 1.

HELICAL WORM REDUCER LUBRICATION TYPES

Lubrication Tables – Helical Worm Gear Units

Standard Oil Lubricants

ISO Viscosity	Oil Type	Ambient Temperature Range	Manufacturer Brand / Type
VG680	PAO	-30 to 60 °C (-22 to 140 °F)	Mobil / SHC636 ♦ ❶
	FG-PAO	-30 to 60 °C (-22 to 140 °F)	Shell / Cassida GL680 ♦ ❷

Optional Oil Lubricants

ISO Viscosity	Oil Type	Ambient Temperature Range	Manufacturer Brand / Type
VG460	PAO	-35 to 50 °C (-31 to 122 °F)	Mobil / SHC634
	FG-PAO	-40 to 50 °C (-40 to 122 °F)	Shell / Cassida GL460

Grease Options (applied to greased bearings and seal cavities)

NLGI Grade	Grease Type / Thickener	Ambient Temperature Range	Manufacturer Brand / Type
NLGI 2	Standard / Li-Complex	-30 to 60 °C (-22 to 140 °F)	Shell Albida EP 2 ♦ ❶
	High-Temperature / Polyurea	-25 to 80 °C (-13 to 176 °F)	Mobil Polyrex EP 2 ♦ ❷
	Food-Grade / Al-Complex	-25 to 40 °C (-13 to 104 °F)	Mobil Grease FM222 ♦

♦ **Stocked Lubricants**

❶ Standard product on serviceable gear units

❷ Standard product on maintenance free gear units

IMPORTANT NOTES

- The "Ambient Temperature" is intended to be an operation guideline based upon the typical properties of all the lubricant. The viscosity and other properties of the lubricant change based upon load, speed, ambient conditions, and reducer operating temperatures. The user should consult with their lubrication supplier & NORD Gear before considering changes in oil type or viscosity.
- To prevent reducer overheating, observe the maximum operating oil temperature limits:

  Synthetic Oil: 105 °C (225 °F).
- In the following instances, please consult NORD for specific recommendations:

√ Gear units will operate in high ambient temperature conditions exceeding 40 °C (104 °F).

√ Gear units will operate in cold ambient temperature conditions approaching 0 °C (32 °F) or lower.

√ Lower than an ISO VG100 viscosity oil is being considered for a cold-temperature service.

√ Fluid grease is required for lubricating the gear unit.

- Observe the general lubrication guidelines outlined in user manual U10770.

Oil Formulation Codes

PAO - Synthetic Polyalphaolefin Oil
PG - Synthetic Polyglycol Oil
FG-PAO - Food-Grade, Synthetic Poyalphaolefin Oil
FG-PG - Food-Grade, Synthetic Polyglycol Oil

Lubrication Notes

- Avoid using (EP) gear oils in worm gears that contain sulfur-phosphorous chemistries, as these additives can react adversely with bronze worm gears and accelerate wear.
- Food grade lubricants must be in compliance with FDA 212 CFR 178.3570 and qualify as a NSF-H1 lubricant. Please consult with lubrication manufacturer for more information.
- When making a lubrication change, check with the lubrication supplier to assure compatibility and to obtain recommended cleaning or flushing procedures.
- Do not to mix different oils with different additive packages or different base oil formulation types. Polyglycol (PG) oils are not miscible with other oil types and should never be mixed with mineral oil or polyalphaolefin (PAO) synthetic oil.

FLEXBLOC™ WORM REDUCER LUBRICATION TYPES

Lubrication Tables – FLEXBLOC™ Worm Gear Units

Standard Oil Lubricants

NORD uses a semi automated assembly process to produce the FLEXBLOC™ gear unit assemblies. During this process the gear units are factory filled in accordance with the following table.

ISO Viscosity	Unit Type	Oil Type	Ambient Temperature Range	Manufacturer Brand / Type
VG220	Inch	FG-PG	-20 to 60 °C (-4 to 140 °F)	Klüber / Klübersynth UH 1-220
	Metric	PG	-20 to 60 °C (-4 to 140 °F)	Klüber / Klübersynth GH 6-220

Please consult with NORD prior to considering any optional lubricants for the FLEXBLOC™ gear unit

IMPORTANT NOTES

- The "Ambient Temperature" is intended to be an operation guideline based upon the typical properties of the lubricant. The viscosity and other properties of the lubricant change based upon load, speed, ambient conditions, and reducer operating temperatures. The user should consult with their lubrication supplier before considering changes in oil type or viscosity.
- To prevent reducer overheating, observe the maximum operating oil temperature limits:
  Synthetic Oil: 105 °C (225 °F).

STANDARD IN-LINE FOOT MOUNTED OIL FILL QUANTITIES

Standard In-line foot mounted lubrication

All Standard In-line reducers are shipped from NORD with a pre-determined oil fill level in accordance to the specified reducer size and mounting position. When filling these gear units the oil must be measured and added until one establishes the proper fill quantity. For additional information please refer to the "Oil & vent plug locations" documentation for your specified gear unit

STOP ***HARMFUL SITUATION*** **STOP**

For mounting orientations other than shown please consult NORD Gear. Reducer modifications may be required.

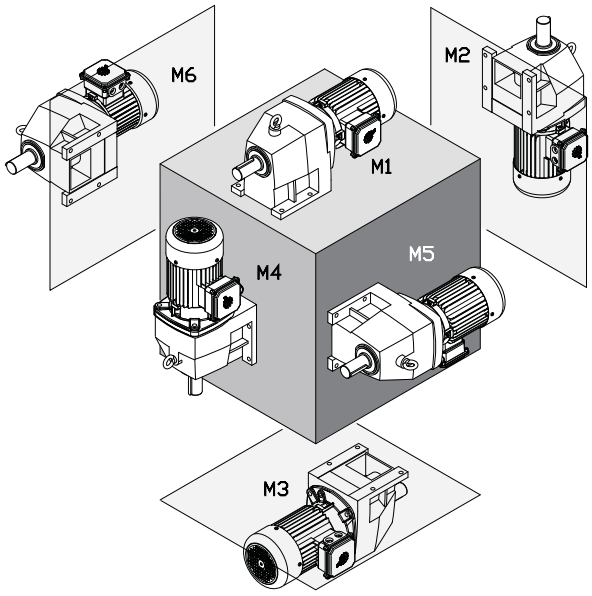
HELICAL IN-LINE FOOT MOUNTED OIL FILL QUANTITIES



Helical In-line foot mounted lubrication

The following NORD Gear reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position. For additional information, please refer to the "Oil Plug & Vent Locations" documentation for your gear unit.

HARMFUL SITUATION

Actual oil volume can vary slightly depending upon the gear case size, mounting and ratio. Prior to commissioning the reducer, check the oil-fill level using the reducer's oil level plug and drain or add addition oil as needed.

For mounting orientations other than shown please consult NORD Gear. Reducer modifications may be required.

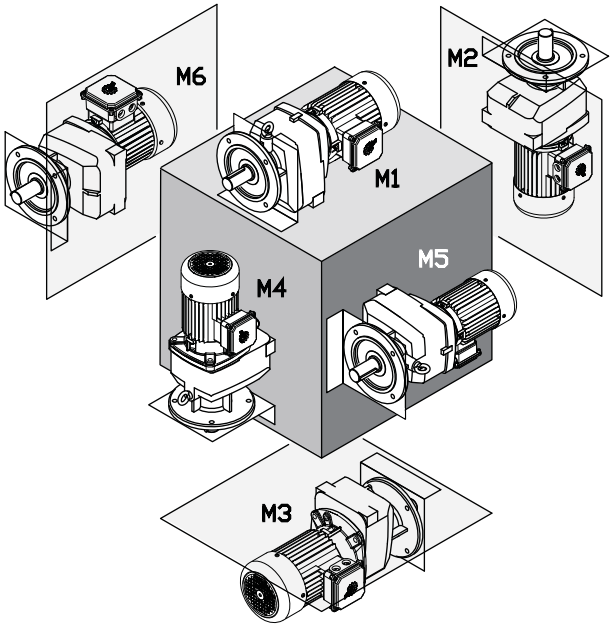
HELICAL IN-LINE FLANGE MOUNTED OIL FILL QUANTITIES



Helical In-line flange mounted lubrication

The following NORD Gear reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position. For additional information, please refer to the "Oil Plug & Vent Locations" documentation for your gear unit.

HARMFUL SITUATION

Actual oil volume can vary slightly depending upon the gear case size, mounting and ratio. Prior to commissioning the reducer, check the oil-fill level using the reducer's oil level plug and drain or add addition oil as needed.

For mounting orientations other than shown please consult NORD Gear. Reducer modifications may be required.

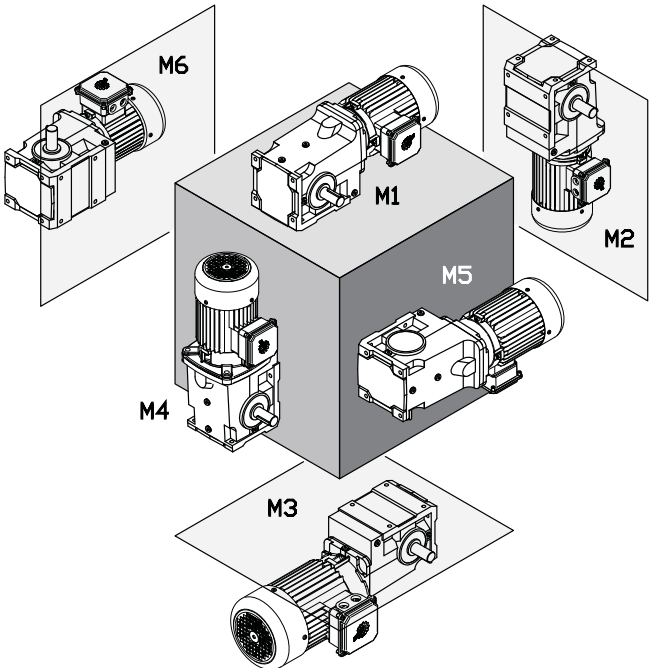
Oil Levels shown apply to base models and gear units ending in AZ, AF, VZ, & VF.

*** For shipping purposes, the larger Helical-bevel gear units are supplied without oil.**

92 HELICAL-BEVEL FOOT MOUNT OIL FILL QUANTITIES



92 Helical-bevel foot mount lubrication

The following NORD Gear reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position. For additional information, please refer to the "Oil Plug & Vent Locations" documentation for your gear unit.

HARMFUL SITUATION

Actual oil volume can vary slightly depending upon the gear case size, mounting and ratio. Prior to commissioning the reducer, check the oil-fill level using the reducer's oil level plug and drain or add addition oil as needed.

For mounting orientations other than shown please consult NORD Gear. Reducer modifications may be required.

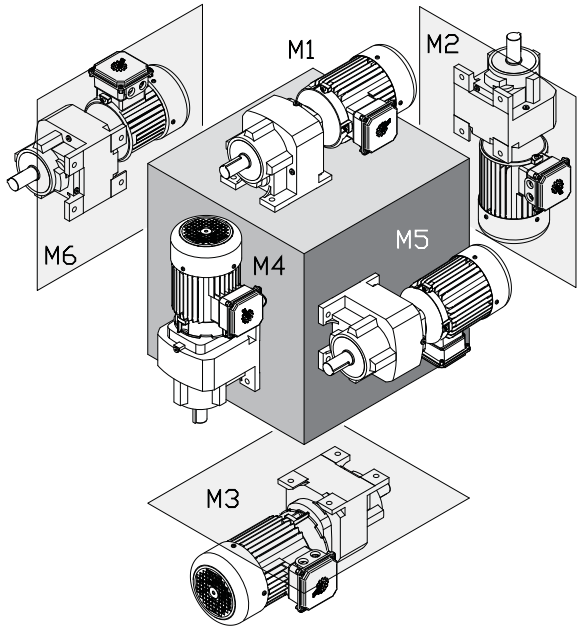
NORDBLOC®.1 FOOT MOUNTED OIL FILL QUANTITIES



NORDBLOC®.1 foot mounted lubrication

The following NORD Gear reducers are shipped from the factory with a pre-determined oil fill level in accordance to the specified reducer size and mounting position. For additional information, please refer to the "Oil Plug & Vent Locations" documentation for your gear unit.

HARMFUL SITUATION

Actual oil volume can vary slightly depending upon the gear case size, mounting and ratio. Prior to commissioning the reducer, check the oil-fill level using the reducer's oil level plug and drain or add addition oil as needed.

For mounting orientations other than shown please consult NORD Gear. Reducer modifications may be required.

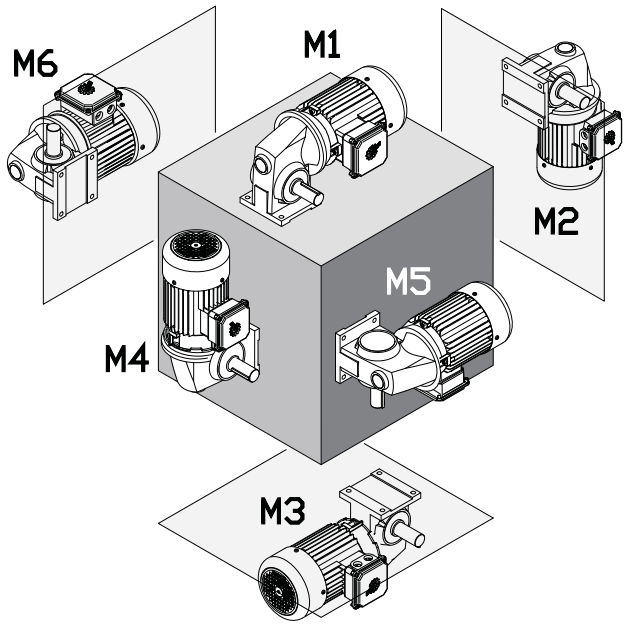
MINICASE® FOOT MOUNT OIL FILL QUANTITIES



MINICASE® foot mount lubrication

All MINICASE® worm-gear reducers are shipped from NORD with a pre-determined oil fill level in accordance to the specified reducer size and mounting position. The MINICASE® series of worm gear reducers are completely sealed. The unit's lubrication is suitable for the life of the product so it is inherently maintenance free.

All MINICASE® worm-gear reducers are filled with a synthetic hydrocarbon or polyalphaolefin (SHC/PAO) oil and utilize synthetic bearing and seal grease. This ensures proper operation throughout the full lifetime of the units.

FLEXBLOC™ OIL FILL QUANTITIES

FLEXBLOC™ lubrication

The following FLEXBLOC™ worm gear modules are designed to be maintenance-free and are typically supplied completely sealed. They are factory oil filled for any mounting configuration with a pre-determined oil level. The unit's lubrication is suitable for the life of the product so it is inherently maintenance free.

- FLEXBLOC™ inch hollow-bore modules are factory-filled with a food grade synthetic polyglycol lubricant (suitable for NSF-H1 incidental contact).
- FLEXBLOC™ metric hollow-bore modules are factory-filled with a standard polyglycol lubricant (unless special ordered).

NORD can provide a field installable vent option for most all FLEXBLOC™ Gear units, with exception to the SK1SI31 unit. For additional information, please refer to the "FLEXBLOC™ Oil Plug & Vent Locations" documentation.

Troubleshooting

This section identifies some of the most common issues involved with NORD Gear speed reducers , and provides recommendations to assist you in defining and answering your questions as you work with our products. You may also contact our Engineering/Application departments if your questions are not answered in the table below.

Problem With the Reducer		Possible Causes	Suggested Remedy
Runs Hot	Overloading	Load exceeds the capacity of the reducer	Check rated capacity of reducer, replace with unit of sufficient capacity or reduce the load.
	Improper lubrication	Insufficient lubrication	Check lubricant level and adjust up to recommended levels
		Excessive lubrication	Check lubricant level and adjust down to recommended levels.
		Wrong lubrication	Flush out and refill with correct lubricant as recommended
Runs Noisy	Loose foundation bolts	Weak mounting structure	Inspect mounting of reducer. Tighten loose bolts and/or reinforce mounting and structure.
		Loose hold down bolts	Tighten bolts
	Failure of bearings	May be due to lack of lubricant	Replace bearing. Clean and flush reducer and fill with recommended lubricant.
		Overload	Check rated capacity of reducer.
	Insufficient lubricant	Level of lubricant in reducer not properly maintained.	Check lubricant level and adjust to factory recommended level.
Output shaft does not turn	Internal parts are broken or missing	Overloading of reducer can cause damage	Replace broken parts. Check rated capacity of reducer.
		Key missing or sheared off on input shaft.	Replace key.
		Coupling loose or disconnected	Properly allign reducer and coupling. Tighten coupling.
Oil Leakage	Worn seals	Caused by dirt or grit entering seal.	Replace seals. Autovent may be clogged. Replace or clean.
	Unit runs hot or leaks	Overfilled reducer	Check lubricant level and adjust to recommended level.
		Vent clogged.	Clean or replace, being sure to prevent any dirt from falling into the reducer.
	Incorrect fill level	Improper mounting position, such as wall or ceiling mount of horizontal reducer.	Check mounting position on the name tag & verify with mounting chart in manual.

NORD GEAR CORPORATION

DRIVESYSTEMS — CONDITIONS OF SALE — WWW.NORD.COM

1. CONTRACT

Any contract between Nord Gear Corporation, hereinafter designated as Seller, and the Buyer is subject to the terms and conditions of sale hereinafter set forth. Any deviation from such terms and conditions must be specifically set forth in writing and consented to by Seller. Accordingly, the Buyer and Seller acknowledge and agree that the terms and conditions set forth below and on the face hereof shall govern Buyer's purchase of the goods described on the face hereof and shall take precedence over and represents the final agreement between Buyer and Seller, notwithstanding any inconsistent, contradictory or other prior or further conditions contained in any oral or written request or purchase order issued by Buyer or any other document furnished by Buyer in connection with its purchase of the Goods, regardless of whether such document or documents are exchanged simultaneously with this Invoice or prior or subsequent thereto. Any additional or different terms or conditions which may appear in any communicaiton, oral or written, from Seller, its officers, employees, agents or representatives, are hereby expressly rejected and shall not be effective or binding upon the Seller, unless specifically hereafter agreed to in writing by Seller and no such additional or different terms or conditions in any document submitted to Seller by Buyer shall become part of the contract between Buyer and Seller, unless such written acceptance by Seller specifically recognizes and assents to their inclusion. Any objection by Buyer to the terms and conditions hereof shall be ineffective unless Seller is advised in writing thereof within two (2) days of the date of this Invoice.

2. CONFIRMATION

An order shall be deemed accepted only when duly confirmed by Seller, at Nord Gear Corporation's home office in Waunakee, Wisconsin, and upon such confirmation the order shall become a contract binding upon the parties hereto, their successors and assigns.

3. PRICES

Prices shown are list prices and may be subject to applicable discounts. Unless otherwise agreed upon in writing, prices are FOB factory Waunakee, Wisconsin. Prices and discounts are subject to change without notice until order is accepted. Seller's prices do not include cost of any inspection permits required.

4. LIMITED WARRANTY

Seller warrants the goods sold hereunder to be free from defects in material and workmanship under normal use and service not arising from misuse, negligence, or accident, including but not limited to the use, installation, and transportation of the goods by the Buyer, its agents, servants, employees, or by carriers. Such obligations under this warranty are limited to remedying any deficiencies in the goods at Waunakee, Wisconsin, or at such place or places in the United States of America as may be designated by Seller. THIS WARRANTY SHALL PERTAIN TO ANY PART OR PARTS OF ANY GOODS TO WHICH BUYER OR ITS ASSIGNS HAS GIVEN WRITTEN NOTICE OF CLAIMED DEFECTS TO SELLER. NORD GEAR CORP. WARRANTS ITS PRODUCTS AGAINST DEFECTS IN MATERIAL AND WORKMANSHIP FOR A PERIOD OF 12 MONTHS FROM DATE OF INSTALLATION OR 18 MONTHS FROM DATE OF SHIPMENT WHICHEVER COMES FIRST ON ALL COMPONENTS. 36 MONTHS FROM DATE OF INVOICE OR 24 MONTHS FROM DATE OF INSTALLATION WHICHEVER COMES FIRST ON GEARS AND HOUSINGS ONLY. PARTS WHICH ARE SUBJECT TO OPERATIONAL WEAR AND TEAR, SUCH AS BELTS & TRACTION DISCS, ARE NOT COVERED BY THE LIMITED WARRANTY. Buyer shall be required to furnish Seller with details of such defects and this warranty shall be effective as to such goods which Seller's examination shall disclose to its satisfaction to have been defective and which at Seller's option shall promptly thereafter be returned to Seller or its nominees. THE LIMITED WARRANTY SET FORTH HEREIN IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED. EXCEPT FOR THE EXPRESS WARRANTIES SET FORTH HEREIN, SELLER HAS MADE AND MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, AS TO THE GOODS SOLD HEREUNDER, INCLUDING, BUT NOT LIMITED TO, THEIR MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. ANY DESCRIPTION OR MODEL OF THE GOODS IS FOR IDENTIFICATION OR ILLUSTRATIVE PURPOSES ONLY AND SHALL NOT BE DEEMED TO CREATE ANY WARRANTY, EXPRESS OR IMPLIED. SELLER MAKES NO REPRESENTATIONS AS TO THE CAPACITY OR PERFORMANCE OF THE GOODS SOLD HEREUNDER, EXCEPT AS SET FORTH IN THE INVOICE'S SPECIFICATIONS OR OTHER VALID AGREEMENT OR CONDITION AGREED TO BETWEEN THE PARTIES, AND ANY SUCH REPRESENTATIONS ARE EXPRESSLY CONDITIONED UPON THE CORRECTNESS OF THE DATA AND INFORMATION FURNISHED BY THE BUYER AND UPON THE GOODS BEING PROPERLY INSTALLED AND MAINTAINED. THE REMEDIES OF THE BUYER PROVIDED HEREUNDER ARE EXCLUSIVE. In no event shall the Seller be liable to the Buyer or to any other person for any loss or damage, direct or indirect, arising out of or caused by the use or operation of the goods, or for the loss of profits, business, or good will, or for any incidental, special or consequential damages. Seller shall in no event be liable to any person or firm (including any assignee or Buyer) except Buyer and its successors. Unless specifically authorized by Seller in writing, Seller shall not become responsible for any repair work done by Buyer or any other party on any goods sold. Any and all costs of the return to the Seller of such goods and all related costs to remove and re-install such goods, shall be borne by Buyer. Goods sold but not manufactured by the Seller are being warranted as to defects in material and workmanship consistent with the limited warranty policy of the original manufacturer of the goods and if there is not such a limited warranty policy, the warranty shall be limited to the provision of the preceding paragraph of Article 4 herein. Standards for the operating characteristics of the gearboxes and the gearmotors are in conformity with Seller's tests.

5. SHORTAGE AND NONCONFORMITY

Any claim of shortage or that the goods do not conform with the specifications of the order or model must be made in writing within ten (10) days after delivery of the goods (as to which such claim is made) to Buyer or its nominees, but in no event shall the claim be later than within the time limit provided by the carrier or insurance company, otherwise such claim shall be deemed waived. Buyer may not return any goods claimed to be in non-conformity without Seller's prior written authorization. Goods returned without permission will not be accepted, including for credit, and will be returned to Buyer, F.O.B. Sellter's plant. Any claim based on the receipt of damaged Goods must be filed with the carrier which delivered the goods. The samples, measurements, dimensions and weights contained in the Seller's catalogs, sales manuals, photographs and drawings constitute only an approximate guide. The Seller reserves the right to make any change which the Seller, in its absolute discretion, considers necessary. While the goods will be delivered principally according to specifications or standards or quantities agreed upon, insignificant deviations or insignificant changes in construction are permissible. The same applies to partial deliveries, In the event that Buyer has a verified claim of shortage or nonconformity of the goods to the specifications of the order or the model, and if such claim has been submitted within the required time limit as set forth above, the Seller shall, at its own expense, make up for the shortage of the goods, or replace or repair the goods, as the case may be, but in no event shall Seller be or become liable to Buyer or to any other person or persons for any loss in damage, direct or indirect, arising out of or caused by such incidents or for the loss of profits, business or good will. The liability of the Seller to Buyer, if any hereunder, for breach of warranty, contract, negligence or otherwise, shall in no event exceed the amount of the purchase price of the goods sold with respect to which any damages are claimed. Shipping dates are estimates unless parties expressly agree on time of the essence.

6. FORCE MAJEURE

The obligation of the Seller shall be modified or excused, as the case may be, for reasons of Acts of God, war, governmental law regulations, strikes or lock-outs, fire, breakdown of machinery, whether in its own business enterprise, or if for any other cause beyond Seller's control, the goods cannot be delivered or their delivery becomes delayed in whole or in part. In the above instances time for delivery shall be extended for the period of the delay caused, with the proviso, however, that either party may cancel in writing the undelivered portion of the order or contract if the delay exceeds six (6) months from the delivery date originally confirmed by Seller. In no event shall Seller become liable in the aforesaid instances to Buyer or any third party for consequential damages or business loss.

7. SHIPMENT AS UNIT

Each shipment by Seller shall be treated as a separate and distinct unit with respect, but only with respect to forwarding, terms of payment, and the making of claims by the Buyer: provided, however, that if the Buyer defaults in the payment of any obligation to Seller or any installments thereof, under any agreement between Buyer and Seller, or if Buyer refuses to accept any goods when tendered for delivery, the Seller may, on fifteen (15) days written notice to the Buyer, without prejudice to Seller's other lawful remedies, either defer further performance until the defaulted payments are made in full, or make future deliveries for cash in advance only, or treat the entire contract or contracts with Buyer as breached by the Buyer and pursue its remedies for breach.

8. BUYER'S REFUSAL OF DELIVERY

If Buyer refuses to accept delivery of any goods tendered for delivery, then Seller, without prejudice to Seller's other lawful remedies, may either store or cause such goods to be stored in a warehouse, for buyer's account and at Buyer's cost, risk and expense, or sell such goods (without notice) to any purchases at public or private sale, and hold the Buyer liable for any difference between (a) the contract price of the goods, and (b) the price at which goods are resold less the costs and expense of such resale including brokerage commissions, or restocking charges.

9. GOODS IN TRANSIT

If prior to delivery or while the goods are in transit, Buyer or Seller becomes bankrupt or insolvent, or any petition in bankruptcy or for the reorganization or for a state court receivership is filed against Buyer or Seller, as the case may be, then the other party hereto may forthwith terminate this contract by giving written notice of such termination. Such termination shall not affect any claim for damages available to the Buyer, provided that if Buyer is then indebted to Seller, the amount of any such damage claim shall be abated to the extent that the indebtedness of Buyer to Seller, as actually paid in money, is abated by any order of judgement entered or any plan adopted in any bankruptcy, reorganization, receivership, or similar proceeding. Such termination shall not prejudice the Seller's rights to any amounts then due under the contract. If Buyer becomes bankrupt or insolvent or any petition in bankruptcy or for reorganizing or if a state court receivership is filed against Buyer, then, at its option Seller may take possession of any goods theretofore sold to Buyer, in connection with which the full purchase price has not been paid, analogous to the terns and provisions set forth in Paragraphs 11 and 12 hereinafter.

10. DELIVERY

(a) Any indicated dates of delivery are approximate only, but NORD Gear will attempt to meet them whenever possible. (b) NORD Gear will not be liable for any penalty clausess contained in any specifications or order submitted unless agreed to in writing by an authorized officer of NORD Gear Corporation. (c) Unless otherwise agreed, delivery of the goods to any carrier shall constitute delivery to the Buyer, and thereafter the risk of loss or damage to the goods shall be upon the Buyer. (d) If the Buyer does not give delivery instructions to the Seller at least (10) days prior to the delivery date ex factory confirmed by the Seller, the Seller may deliver the goods to a carrier of its own choosing, at Buyer's cost and risk, or, at Seller's option, may store the goods on the pier or any warehouse, at Buyer's cost and risk. Any purchase price in such event becomes due and payable within ten (10) days of such storage.

11. PAYMENT OF PURCHASE PRICE

Time of payment is of the essence under the contract. Unless otherwise provided, terms of payment are 30 days net from the date of invoice with a 1% discount if paid within 10 days of date of invoice. Upon default in any of the terms of the contract, or failure to comply with any of the conditions thereof, or upon seizure of the property under execution or other legal process, or if the Buyer becomes bankrupt or insolvent, or any petition for reorganization or for a state court receivership is filed against Buyer, or if the Buyer makes any assignment for the benefit of it's creditors or otherwise sells, encumbers or disposes of the goods, or if for any other reason the Seller should deem itself insecure, the full amount of the purchase price then remaining unpaid shall at once become due and payable at the option of the Seller.

12. BUYER'S DEFAULT

Upon the Buyer's default, the Seller may dispose of the merchandise in any manner that it deems fit and, if it desires to resell same, may do so at private or public sale, with or without notice, and with or without the property being at the place of sale, subject, however, to applicable laws. The Seller or its assigns shall have the right to bid at such sale and may become the purchaser of the property. The proceeds of the sale shall first be applied to the expenses incurred in retaking, repairing, storing and selling the goods, reasonable attorney's fees included, and then shall be applied to the payment of the balance due under the contract. Any surplus amount shall be paid to the Buyer. If a deficiency results after the resale, the Buyer agrees to pay such forthwith, together with reasonable attorney's fees, for the recovery of the goods incurred by the Seller. If upon the Buyer's default, the Seller elects not to resell any goods which it may repossess, then the cost of repossession, including reasonable attorney's fees, shall forthwith be due and payable from Buyer to Seller. Buyer agrees to pay all reasonable costs and reasonable attorneys' fees incurred by Seller in enforcing Seller's rights against Buyer, including Seller's right to payment of the purchase price of the goods and Buyer's payment of all other amounts owing to Seller required under this Invoice and Conditions of Sale.

13. SECURITY INTEREST AND TITLE

In states and localities which are governed by the Uniform Commercial Code, this contract shall serve as security agreement, reserving in Seller a security interest until full payment of purchase price. The provisions of the Uniform Commercial Code regarding security interest shall have preference and apply if inconsistent with other terms of the conditions of sale. In states and localities where the Uniform Commercial Code does not apply, title to the goods shall remain in the Seller or its assigns until full payment of the purchase price. Buyer agrees to execute forthwith any and all documents in such a way and form as Seller may need for filing or recording the security interest under the Uniform Commercial Code with the proper registers or offices, or for filing or recording the conditional sales contract.

14. SALES AND USE TAX

Buyer agrees to bear and pay any sales or use tax in connection with the purchase herein, and to hold the Seller harmless from payment. At the option the Seller, Buyer shall give evidence of payment or of exemption certificate.

15. INSURANCE

The Buyer shall keep the goods insured against damage by fire, water or other casualty as required by Seller, with a company acceptable to Seller, with loss payable to Seller for the total purchase price until the Seller is fully paid. Seller, if it so elects, may place said insurance at Buyer's expense; Seller may cancel such insurance at any time and without notice and may receive the return premium, if any.

16. MODIFICATION BY SELLER

Any contract may be assigned or transferred by the Seller, or the time for the making of any payment due by Buyer may be extended by Seller without derogation of any of the rights of the Seller or its assigns. Waiver by any party of any default shall not be deemed a waiver of any subsequent default.

17. RETURNED GOODS

No goods will be accepted for return unless authorized in writing by Seller. In all cases, transportation and restocking charges will be borne by Buyer.

18. PACKING

The Buyer will be charged for export packaging or other special packing desired. Cost for cartage to ship or transfer express will be added to the invoice. No credit will be allowed if no packing is required.

19. CHANGES/CANCELLATION

NORD Gear will not accept changes in specifications to a confirmed order unless such changes are requested in writing and confirmed back in writing. In addition, the purchaser must to agree to any additional charges that may arise from the change. Placing orders on hold or cancellation of orders require Seller's written approval, and are subject to cancellation and/or restocking charges.

20. BUYER'S RESPONSIBILITY AS TO MAINTENANCE

Buyer shall use and shall require its employees and agents to use all safety devices and guards and shall maintain the same in proper working order. Buyer shall use and require its employees and agents to use safe operation procedures in operating the equipment and shall further obey and have its employees and agents obey safety instructions given by Seller. If Buyer fails to meet the obligations herein, Buyer agrees to defend, indemnify and save Seller harmless from any liability or obligation with regard to any personal injuries or property damages directly or indirectly connected with the operation of the equipment. Buyer further agrees to notify Seller promptly and in any event not later than ten (10) days after notice or knowledge of any accident or malfunction involving Seller's equipment which has caused personal injury or property damages and to cooperate fully with Seller in investigating and determining the causes of such accident and malfunction. In the event that Buyer fails to give such notice to Seller or to cooperate with Seller, Buyer shall be obligated to defend, indemnify and save Seller harmless from any such claims arising from such accident.

21. MISCELLANEOUS PROVISIONS

(a) If for any reason a provision of a contract is legally invalid, then in such event the rest of the contract shall remain in full force and affect, except that the parties shall try to replace such invalid provision closest to their original mutual intentions. (b) This Invoice and these Conditions of Sale constitute the entire agreement between the parties regarding the subject matter hereof and supercedes all prior agreements, understandings and statements, whether oral or written, regarding such subject matter. No modification to, change in or departure from, the provisions of this Invoice and Conditions of Sale shall be valid or binding on Seller, unless approved in writing by Seller. No course of dealing or usage of trade shall be applicable unless expressly incorporated into this Invoice and Conditions of Sale. Any amendments to any contract or contracts between the parties shall be valid only upon the written consent of both parties.

22. NON ASSIGNMENT BY BUYER

Contract or contracts may not be assigned by the Buyer without prior written consent of the Seller.

23. APPLICABLE LAW AND VENUE

All contracts and their interpretation are governed by the applicable, substantive laws of the State of Wisconsin. Any litigation brought by the Buyer regarding this Invoice or goods purchased hereunder may only be brought in the Circuit Court for Dane County, Wisconsin.

NORD GEAR LIMITED

DRIVESYSTEMS — TERMS & CONDITIONS OF SALE — WWW.NORD.COM

1. CONTRACT

Any contract between Nord Gear Limited, hereinafter designated as Seller, and the Buyer is subject to the terms and conditions of sale hereinafter set forth. Any deviation from such terms and conditions must be specifically set forth in writing and consented to by Seller.

2. CONFIRMATION

An order shall be deemed accepted only when duly confirmed by Seller, at Nord Gear Limited's home office in Brampton, Ontario, and upon such confirmation the order shall become a contract binding upon the parties hereto, their successors and assigns.

3. PRICES

Prices shown are list prices and may be subject to applicable discounts. Unless otherwise agreed upon in writing, prices are FOB factory Bramton, Ontario. Prices and discounts are subject to change without notice until order is accepted. Seller's prices do not include cost of any inspection permits required.

4. LIMITED WARRANTY

Seller warrants the goods sold hereunder to be free from defects in material and workmanship under normal use and service not arising from misuse, negligence, or accident, including but not limited to the use, installation, and transportation of the goods by the Buyer, its agents, servants, employees, or by carriers. Such obligations under this warranty are limited to remedying any deficiencies in the goods at Brampton, Ontario, or at such place or places in Canada as may be designated by Seller. This warranty shall pertain to any part or parts of any goods to which Buyer or its assigns has, within one year from date of original factory invoice, given written notice of claimed defects to Seller. Buyer shall be required to furnish Seller with details of such defects and this warranty shall be effective as to such goods which Seller's examination shall disclose to its satisfaction to have been defective and which at Seller's option shall promptly thereafter be returned to Seller or its nominees. EXCEPT FOR THE EXPRESS WARRANTIES SET FORTH ABOVE, SELLER HAS MADE NO WARRANTIES, EXPRESS, IMPLIED OR STATUTORY, AS TO THE GOODS SOLD HEREUNDER, INCLUDING, BUT NOT LIMITED TO THEIR MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. ANY DESCRIPTION OR MODEL OF THE GOODS IS FOR IDENTIFICATION OR ILLUSTRATIVE PURPOSES ONLY AND SHALL NOT BE DEEMED TO CREATE AN EXPRESS WARRANTY. THE REMEDIES OF THE BUYER SET FORTH IN THIS SECTION ARE EXCLUSIVE. In no event shall the Seller be liable to the Buyer or to any other person for any loss or damage, direct or indirect, arising out of or caused by the use or operation of the goods, or for the loss of profits, business, or good will, or for any incidental, special or consequential damages. Seller shall in no event be liable to any person or firm (including any assignee or Buyer) except Buyer and its successors. Unless specifically authorized by Seller in writing, Seller shall not become responsible for any repair work done by Buyer or any other party on any goods sold. Any costs of the return of such goods to Seller shall be borne by Buyer. Goods sold but not manufactured by the Seller are being warranted as to defects in material and workmanship consistent with the limited warranty policy of the original manufacturer of the goods and if there is not such a limited warranty policy, the warranty shall be limited to the provisions of the preceding paragraph of Article 4 herein. Standards for the operating characteristics of the gearboxes and the gearmotors are in conformity with Seller's test. THIS WARRANTY IS IN LIEU OF ALL OTHER EXPRESS OR IMPLIED WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE THE SELLER DOES NOT ASSUME, NOR DOES IT AUTHORIZE ANY PERSON TO ASSUME, ON ITS BEHALF, ANY OTHER OBLIGATION OR LIABILITY.

5. SHORTAGE AND NONCONFORMITY

Any claim of shortage or that the goods do not conform with the specifications of the order or model must be made in writing within ten (10) days after delivery of the goods (as to which such claim is made) to Buyer or its nominees, but in no event shall the claim be later than within the time limit provided by the carrier or insurance company, otherwise such claim shall be deemed waived. The samples, measurements, dimensions and weights contained in the Seller's catalogs, sales manuals, photographs and drawings constitute only an approximate guide. The Seller reserves the right to make any changes which the Seller, in its absolute discretion, considers necessary. While the goods will be delivered principally according to specifications or standards or quantities agreed upon, insignificant deviations or insignificant changes in construction are permissible. The same applies to partial deliveries. In the event that Buyer has a verified claim of shortage or noncomformity of the goods to the specifications of the order or the model, and if such claim has been submitted within the required time limit as set forth above, the Seller shall, at its own expense, make up for the shortage of the goods, or replace or repair the goods, as the case may be, but in no event shall Seller be or become liable to Buyer or to any other person or persons for any loss in damage, direct or indirect, arising out of or caused by such incidents or for the loss of profits, business or good will. Shipping dates are estimates unless parties expressly agree on time of the essence.

6. FORCE MAJEURE

The obligation of the Seller shall be modified or excused, as the case may be, for reasons of Acts of God, war, governmental law regulations, strikes or lock-outs, fire, breakdown of machinery, whether in its own business enterprise, or if for any other cause beyond Seller's control, the goods cannot be delivered or their delivery becomes delayed in whole or in part. In the above instances time for delivery shall be extended for the period of the delay caused, with the proviso, however, that either party may cancel in writing the undelivered portion of the order or contract if the delay exceeds six (6) months from the delivery date originally confirmed by Seller. In no event shall Seller become liable in the aforesaid instances to Buyer or any third party for consequential damages or business loss.

7. SHIPMENT AS UNIT

Each shipment by Seller shall be treated as a separate and distinct unit with respect, but only with respect to forwarding, terms of payment, and the making of claims by the Buyer; provided, however, that if the Buyer defaults in the payment of any obligation to Seller or any installments thereof, under any agreement between Buyer and Seller, or if Buyer refuses to accept any goods when tendered for delivery, the Seller may, on fifteen (15) days' written notice to the Buyer, without prejudice to Seller's other lawful remedies, either defer further performance until the defaulted payments are made in full, or make future deliveries for cash in advance only, or treat the entire contract or contracts with Buyer as breached by the Buyer and pursue its remedies for breach.

8. BUYER'S REFUSAL OF DELIVERY

If Buyer refuses to accept delivery of any goods tendered for delivery, then Seller, without prejudice to Seller's other lawful remedies, may either store or cause such goods to be stored in a warehouse, for Buyer's account and at Buyer's cost, risk and expense, or sell such goods (without notice) to any purchaser at public or private sale, and hold Buyer liable for any difference between (a) the contract price of the goods, and (b) the price at which goods are resold less the costs and expense of such resale including brokerage commissions, or restocking charges.

9. GOODS IN TRANSIT

If prior to delivery or while the goods are in transit, Buyer or Seller becomes bankrupt or insolvent, or any petition in bankruptcy or for the reorganization or for appointment of a receiver is filed against Buyer or Seller, as the case may be, then the other party hereto may forthwith terminate this contract by giving written notice of such termination. Such termination shall not affect any claim for damages available to the Buyer, provided that if Buyer is then indebted to Seller, the amount of any such damage claim shall be abated to the extent that the indebtedness of Buyer to Seller, as actually paid in money, is abated by any order or judgment entered or any plan adopted in any bankruptcy, reorganization, receivership, or similar proceeding. Such termination shall not prejudice the Seller's rights to any amounts then due under the contract. If Buyer becomes bankrupt or insolvent or any petition in bankruptcy or for reorganization or if a state court receivership is filed against Buyer, then, at its option, Seller may take possession of any goods theretofore sold to Buyer, in connection with which the full purchase price has not been paid, analogous to the terms and provisions set forth in Paragraphs 11 and 12 hereinafter.

10. DELIVERY

(a) Unless otherwise agreed, delivery of the goods to any carrier shall constitute delivery to the Buyer, and thereafter the risk of loss or damage to the goods shall be upon the Buyer. (b) If the Buyer does not give delivery instructions to the Seller at least (10) days prior to the delivery date *ex factory confirmed* by the Seller, the Seller may deliver the goods to a carrier of its own choosing, at Buyer's cost and risk, or, at Seller's option, may store the goods on the pier or on any warehouse, at Buyer's cost and risk. Any purchase price in such event becomes due and payable within ten (10) days of such storage.

11. PAYMENT OF PURCHASE PRICE

Time of payment is of the essence under the contract. Upon default in any of the terms of the contract, or failure to comply with any of the conditions thereof, or upon seizure of the property under execution or other legal process, or if the Buyer becomes bankrupt or insolvent, or any petition for reorganization or for appointment of a receiver is filed against Buyer, or if the Buyer makes any assignment for the benefit of its creditors or otherwise sells, encumbers or disposes of the goods, or if for any other reason the Seller should deem itself insecure, the full amount of the purchase price then remaining unpaid shall at once become due and payable at the option of the Seller.

12. BUYER'S DEFAULT

Upon the Buyer's default, the Seller may dispose of the merchandise in any manner that it deems fit and, if it desires to resell same, may do so at private or public sale, with or without notice, and with or without the property being at the place of sale, subject, however, to applicable laws. The Seller or its assigns shall have the right to bid at such sale and may become the purchaser of the property. The proceeds of the sale shall first be applied to the expenses incurred in retaking, repairing, storing and selling the goods, reasonable solicitor's fees included, and then shall be applied to the payment of the balance due under the contract. Any surplus amount shall be paid to the Buyer. If a deficiency results after the resale, the Buyer agrees to pay such forthwith, together with reasonable solicitor's fees, for the recovery of the goods incurred by the Seller. If upon the Buyer's default, the Seller elects not to resell any goods which it may repossess, then the cost of repossession, including reasonable solicitor's fees, shall forthwith be due and payable from Buyer to Seller.

13. SECURITY INTEREST AND TITLE

In provinces which are governed by a Personal Property Security Act, this contract shall serve as Security Agreement, reserving in Seller a security interest until full payment of purchase price. The provisions of the Personal Property Security Act regarding security interest shall have preference and apply if inconsistent with other terms of the conditions of sale herein. In provinces where a Personal Property Security Act does not apply, title to the goods shall remain in the Seller or its assigns until full payment of the purchase price. Buyer agrees to execute forthwith any and all documents in such a way and form as Seller may need for filing or recording the security interest under a Personal Property Security Act with the proper registers or offices, or for filing or recording the Conditional Sales Contract herein.

14. SALES AND USE TAX

The Seller's prices do not include sales, use, excise or other taxes payable to any governmental authority in respect of the sale of Seller's goods. The Buyer shall pay, in addition to the Seller's price the amount of any such taxes or shall reimburse the Seller for the amount thereof that the Seller may be required to pay. At the option of the Seller, Buyer shall give evidence of payment or of exemption certificate.

15. INSURANCE

The Buyer shall keep the goods insured against damage by fire, water or other casualty as required by Seller, with a company acceptable to Seller, with loss payable to Seller for the total purchase price until the Seller is fully paid. Seller, if it so elects, may place said insurance at Buyer's expense; Seller may cancel such insurance at any time and without notice and may receive the return premium, if any.

16. MODIFICATION BY SELLER

Any contract may be assigned or transferred by the Seller, or the time for the making of any payment due by Buyer may be extended by Seller without derogation of any of the rights of the Seller or its assigns. Waiver by any party of any default shall not be deemed a waiver of any subsequent default.

17. RETURNED GOODS

No goods will be accepted for return unless authorized in writing by Seller. In all cases, transportation and restocking charges will be borne by Buyer.

18. PACKING

The Seller does not charge for standard packaging for domestic shipment. The Buyer will be charged, however, for export packaging or other special packing desired. Cost for cartage to ship or transfer express will be added to the invoice. No credit will be allowed if no packing is required.

19. EXPORT ORDER

Export orders are to be accompanied by a confirmed irrevocable Letter of Credit in Seller's favor, in Canadian currency, with an accredited Canadian bank, subject to Seller's draft, with shipping documents attached.

20. CANCELLATION

Placing orders on hold or cancellation of orders require Seller's written approval, and are subject to cancellation and/or restocking charges.

21. BUYER'S RESPONSIBILITY AS TO MAINTENANCE

Buyer shall use and shall require its employees and agents to use all safety devices and guards and shall maintain the same in proper working order. Buyer shall use and require its employees and agents to use safe operating procedures in operating the equipment and shall further obey and have its employees and agents obey safety instructions given by Seller. If Buyer fails to meet the obligations herein, Buyer agrees to indemnify and save Seller harmless from any liability or obligation with regard to any personal injuries or property damages directly or indirectly connected with the operation of the equipment. Buyer further agrees to notify Seller promptly and in any event not later than ten (10) days after notice or knowledge of any accident or malfunction involving Seller's equipment which has caused personal injury or property damages and to cooperate fully with Seller in investigating and determining the causes of such accident and malfunction. In the event that Buyer fails to give such notice to Seller or to cooperate with Seller, Buyer shall be obligated to indemnify and save Seller harmless from any such claims arising from such accident.

22. MISCELLANEOUS PROVISIONS

(a) If for any reason a provision of a contract is legally invalid, then in such event the rest of the contract shall remain in full force and affect, except that the parties shall try to replace such invalid provision with a provision closest to their original mutual intentions. (b) Any amendments to any contract or contracts require the consent in writing by both parties.

23. NON ASSIGNMENT BY BUYER

Contract or contracts may not be assigned by the Buyer without prior written consent of the Seller.

24. APPLICABLE LAW

All contracts are governed by the applicable laws of Ontario.

25. This instrument sets forth the entire understanding and agreement of the parties hereto in respect of the subject matter hereof, and all prior undertakings between the parties hereto, together with all representations and obligations of such parties in respect of such subject matter, shall be superceded by and merged into this instrument.

26. The provisions of this agreement shall bind and enure to the benefit of the parties hereto and their respective heirs, executors, administrators, successors and (subject to any restrictions or assignment herein above set forth) assigns, as the case may be.

27. The parties acknowledge that they have requested this Contract and all notices or other documents relating thereto be drafted in the English language.

Les parties reconnaisent qu'ils ont requis que ce contrat et tous les avis ou autres documents qui s y rapportent soient rediges en langue anglaise.

"Terms and Conditions in French available upon request."

Product Overview

We can match our NORDAC AC vector drives with our Inverter/Vector Duty Motors and UNICASE™ Speed Reducers to provide a total AC Motor Drive solution from one trusted source.

UNICASE™ SPEED REDUCERS

HELICAL IN-LINE
- Foot or Flange Mount
- Torque up to 205,000 lb-in
- Gear ratios – 1.82:1 to over 300,000:1

NORDBLOC® HELICAL IN-LINE
- Foot or Flange Mount
- Torque up to 26,550 lb-in
- Gear ratios – 1.88:1 to over 370:1

PARALLEL HELICAL CLINCHER™
- Shaft, Flange or Foot Mount
- Torque up to 797,000 lb-in
- Gear ratios – 4.26:1 to over 300,000:1

RIGHT ANGLE HELICAL-BEVEL 2-STAGE
- Foot, Flange or Shaft Mount
- Torque up to 5,840 lb-in
- Gear ratios – 4.1:1 to 72:1

RIGHT ANGLE HELICAL-BEVEL
- Foot, Flange or Shaft Mount
- Torque up to 283,000 lb-in
- Gear ratios – 8.04:1 to over 300,000:1

RIGHT ANGLE HELICAL-WORM
- Foot, Flange or Shaft Mount
- Torque up to 27,585 lb-in
- Gear ratios – 4.40:1 to over 300,000:1

MINICASE™ RIGHT ANGLE WORM
- Foot, Flange or Shaft Mount
- Torque up to 3,540 lb-in
- Gear ratios – 5:1 to 500:1

FLEXBLOC™ WORM
- Modular bolt-on options
- Torque up to 4,683 lb-in
- Gear ratios – 5:1 to 3,000:1

HIGH PERFORMANCE MOTORS & BRAKEMOTORS

INVERTER/VECTOR DUTY
- Standard or Energy Efficient
- Integral, NEMA or Metric IEC
- 1/6 to 250 hp

NORDAC AC VECTOR DRIVES

TRIO SK300E
- Motor or remote mounted
- IP55 – washdown
- 380-460V, 3-phase, to 5hp

LEFT BLANK

VL2 & VL3 AGITATOR
MIXER & SHREDDER REDUCERS

NORD DRIVESYSTEMS

VL2 - SPREAD BEARING DESIGN

Increased bearing spreads with an oversized double row spherical bearing on the lower side. It is commonly used in shredders, mixers or applications requiring increased bearing load carrying capacities.

VL3 - SPREAD BEARING DESIGN

In addition to the VLII design an oil leakage control system is added. Our Dry Cavity System provides a very high degree of oil safety. The anti-leak QUADRILIP™ Oil Sealing System is enhanced with an oil collection cavity (just-in-case) and various ways to sense and remove the leakage from the cavity. Standard is a viewable oil sight indicator with an optional capacitive proximity switch and control available for electronic indication of a leak.

OPTIONS TO BOTH DESIGNS

You may include a grease zerk to lubricate the lower bearing, and a removable plug to allow excess grease to purge from the bearing cavity.

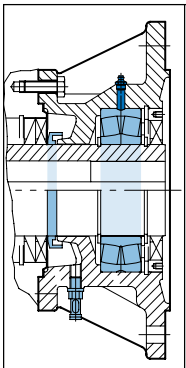
VL2 & VL3 AGITATOR



RATIO & SPEED

OFFSET PARALLEL CLINCHER

- Ratio range : 4.03:1 to 6616.79:1
- Speed range from 1750 rpm motor : 0.26 to 434 rpm
- 95.5% minimum standard efficiency

90 SERIES RIGHT ANGLE BEVEL

- Ratio range : 8.04:1 to 4916.63:1
- Speed range from 1750 rpm motor : 0.36 to 218 rpm
  95.5% minimum standard efficiency

STANDARD CONFIGURATION

- B5 flange housing style
- Output shaft types : Keyed solid shaft, Keyed hollow shaft, Keyless shrink disc connector
- VLII-spread bearing design has an Increased bearing spread, and a Large double row spherical bearing on lower side
- VLIII-dry cavity design : VLII with added oil leakage control, Oil flinger, Oil accumulation cavity, Sight glass to shows if oil is present in the control cavity

STANDARD CONFIGURATION OPTIONS

Regreasable zerk lubricating nipple for lower bearing, Capacitive oil sensing switch, Capacitive oil switch

SHAFT DATA

- AISI 4140 output shaft material
- Inch shaft key dimensions according to AISI B17
- Metric shaft key dimensions according to DIN 6885
- Standard output shaft drill and tap
- Shrink disc size range [in] :1.250 to 7.000
- Shrink disc size range [mm] : 30 to 180

INTERNAL PARTS ASSEMBLY

- Heavy press fit assembly method
- Standard reversing duty
- Typical backlash range [arc minutes] : 6 to 13

GEARING

- Up to AGMA Class 13 quality rating on gears
- 58 Rockwell C minimum hardness of steel gears
- Ground or skive hobbed hard finishing of gear teeth
- Standard drop forged gear blanks
- 275% momentary overload capacity
- Standard hunting tooth ratios

HOUSING

- Class 35 gray iron typical housing material
- Single setup machining method
- UNICASE™ one piece main housing design
- Seals directly contact main housing
- Exceptional housing torsional stiffness
- Thick housing wall section
- Castings are dip sealed

BEARINGS

- ABEC-1 quality bearings
- Bearing spread is larger than standard unit by at least 50%
- Double row spherical lower output bearing
- Optional housing with grease zerk available for lower bearing regreasing
- NIGI 2EP lithium based lower bearing lubricant
- 50,000 + hours of L10 output bearing life

LUBRICANT & SEALING COMPONENTS

- Factory filled ISO 220 mineral oil
- Standard AUTOVENT™ breather style
- QUADRILIP™ output seal system
- 3 double lip & 2 single lip output shaft oil seals
- Double lipped lower flange seal
- Nitrile rubber oil seals

LUBRICANT & SEALING OPTIONS

Custom synthetic lubricating oil, High or low temperature lubricating oil, Fluid grease lubricant, Food grade lubricating oil, Long term storage preparation, Magnetic drain plug, Bullseye sight glass, Custom drain plug, Fluorinated rubber oil seal material

ENVIRONMENTAL PROTECTION

- Exterior primer coverage : all metal exterior surfaces
- Paint type : Water Based Resin
- Paint additive : 316 stainless steel flakes
- USDA incidental contact exposure : H1

ENVIRONMENTAL OPTIONS

Severe duty and washdown duty paint options, Custom paint, Top side shaft covers

GREASE LUBRICATION OF VL2/VL3 ASSEMBLY

TYPICAL VL2/VL3 ASSEMBLY - CLINCHER™ REDUCER SHOWN
BEVEL REDUCER OPTIONS ALSO AVAILABLE

VL2 & VL3 greased bearing lubrication
Standard factory lube:

STANDARD BEARING GREASE – NLGI 2EP Lithium

Ambient Temperature	Formulation
-20 to 140°F (-30 to 60°C)	Mineral

Optional bearing greases, which must be specified at time of order (do not mix grease formulations)

OPTIONAL BEARING GREASES

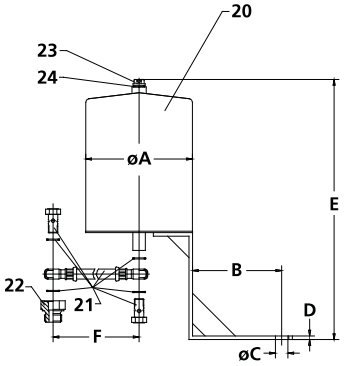
Ambient Temperature	Formulation	Manufacturer	Grease Brand Name
-40 to 230°F (-40 to 110°C)	Synthetic	Shell	Aeroshell 6
-40 to 230°F (-40 to 110°C)	*Food Grade* - Synthetic	Lubriplate	SFL1

Normal grease bearing re-lubrication intervals is every 5000 hours or every10 months (minimum)

GREASE QUANTITY

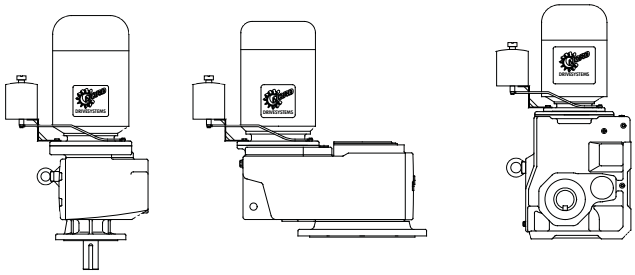
Clincher	**Helical/Bevel**	Grease Quantity
SK2282 - 5282	**SK9012.1 – 9052.1**	1 oz per interval
SK6282 - 8282	**SK9062.1 – 9082.1**	2 oz per interval
SK9282 – 12382	**SK9086.1 – 9092.1**	3 oz per interval

Note: Grease purge housing plug must be removed during the re-lubrication of the bearing.



Remove and dispose of any old grease escaping the purge port, and re-install grease purge plug when finished.

LEFT BLANK



EXPANSION CHAMBERS INSTALLATION & MAINTENANCE MANUAL

Installation Instructions

Sometimes NORD requires the use of an oil expansion chamber when the motor or reducer input is mounted vertically. Consult your NORD catalog for additional information and application considerations.

1. Secure the gear reducer in the proper mounting position for the application and remove the vent plug from the gear reducer. The hose assembly kit (21) will be fitted to the reducer using the housing port provided.
2. When using the larger 2.7 and 5.4 liter chambers, screw the adapter fitting (22) into the reducer housing port. Use all sealing gaskets provided.
3. Mount the overflow tank (20) at the highest location from the reducer, as permitted by the hose assembly kit (21). Typical mounting configurations are represented below. Use one of the input cover's mounting bolts, to mount the chamber support leg to the reducer.

4. Be sure to use the proper fittings. Assemble one end of the vent-hose assembly (21) to bottom of the chamber and one-end to the reducer.
5. Secure the vent-plug (23) and gasket (24) that is supplied with the kit to the top of the expansion chamber.

STOP ***HARMFUL SITUATION*** **STOP**

Remove the protective "rubber element" from the supplied vent prior to use so that an open-vent is formed on top of the overflow tank. Avoid using a pressurized AUTOVENT™ breather on the overflow tank since this may create an undesired pressure-vacuum in the overflow tank.

Expansion Chamber Kit Dimensions & Parts List

Kit Part Number: 28390390 - 0.7 Liter Oil Expansion Chamber

Kit P/N	Ø A	B	Ø C	D	E	F	Units

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
GENERAL INSTRUCTIONS

INTRODUCTION

DO NOT INSTALL, USE OR OPERATE THIS EQUIPMENT UNTIL THIS MANUAL HAS BEEN READ AND UNDERSTOOD. RETAIN THESE INSTRUCTIONS FOR FUTURE USE.

THESE INSTRUCTIONS ARE INTENDED TO SUPPLEMENT GOOD GENERAL PRACTICES FOR THE VARIOUS STYLES OF PLASTEC FANS AND BLOWERS. DETAILED INSTRUCTIONS WILL BE PRESENTED SEPARATELY.

IT IS THE RESPONSIBILITY OF THE USER/PURCHASER TO ASSURE THE INSTALLATION, OPERATION, AND MAINTENANCE OF THIS EQUIPMENT IS CARRIED OUT BY EXPERIENCED AND QUALIFIED PERSONNEL IN THIS TYPE OF WORK.

CONTACT YOUR LOCAL REPRESENTATIVE FOR ANY FURTHER INFORMATION REQUIRED.

SHIPPING & RECEIVING

All fans and blowers have been thoroughly inspected before shipment. Unless otherwise noted. All fans and blowers are test run and approved prior to shipment.
THE RECEIVER MUST NOTE ANY DAMAGE ON THE CARRIER'S BILL OF LADING AND FILE A CLAIM IMMEDIATELY WITH THE FREIGHT COMPANY.
Keep a record of all equipment received including inspection details and date of receipt.

Contact your sales representative for replacement service.

HANDLING

Handle your equipment with caution using proper equipment and safety procedures.

STORAGE

Store fans in a clean, dry location prior to installation to protect against the weather and corrosive atmospheres. If it is necessary to store equipment outdoors, protect from the elements as much as possible. Keep equipment dry and clean. Cover inlets/outlets to prevent collection of moisture, dust, etc.

For equipment stored for extended periods of time (1 month), rotate motor bearings. Records of stored equipment should be kept to assure proper procedures.

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
GENERAL INSTRUCTIONS

INSTALLATION

Area where fan is installed should provide support for rigid mounting of the fan(s).
Fans not supported properly will cause vibration that could cause damage or injury!
Use guy wires to secure roof mounted units, stacks and accessories where excessively windy conditions are prevalent.

CAUTION! Fans contain rotating parts and electrical service is used to operate.
Use appropriate safety precautions during Installation, Operation and Maintenance procedures.

WARNING! Do not install or operate fan in an environment or atmosphere where combustible or flammable materials, gases or fumes are present unless it is specifically designed for that type of environment. Explosion or fire can result.

Roof curbs for mounting of fans should be securely installed prior to fan installation. Fan should be firmly secured to roof curb to prevent vibration.

CAUTION! All electrical work must be done in accordance with local and/or national codes as applied. Work should be performed by qualified electricians.

WARNING! This product must be grounded.

DANGER! Make sure power is turned off and locked in the off position before installing, wiring or servicing fan.

CAUTION! Always check the supply voltage against the motor name plate voltage. Incorrect voltage can damage the motor and void the motor warranty.

WARNING! Keep all wiring clear of rotating or moving parts.

WARNING! Before starting the fan, turn the wheel to assure it rotates freely. **POWER MUST BE OFF DURING THIS OPERATION.**

CAUTION! Before operating any fan or blower, make sure any guards or protective devices required are in place for protection against injury.

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
GENERAL INSTRUCTIONS

TEST & START PROCEDURES

Disconnect power before servicing the unit. Make sure power is turned off and locked in the **OFF** position.

Check that fan/blower is securely attached to the mounting location and that the mounting location is also secure. This unit should not vibrate when operating! Check clearances and all mounting hardware and secure as required.

All fans have sealed for life ball bearings and do not require lubrication. Running the unit for 15 to 20 minutes will assure lubricant to thoroughly mix with the bearings and operate at optimum quietness.

When power is applied to the unit, check for proper rotation of fan wheel/impeller. Most motors allow for reverse rotation and if the fan wheel/impeller is moving in the wrong direction, air performance will be greatly affected. Reverse rotation for a prolonged period of time may cause motor damage that could void the warranty. Check the motor wiring diagram for proper wiring.

Electrical input check should be performed with fan properly loaded (pressure drop) to assure motor name plate amps are not exceeded. Never run a fan at free air.

Check fan RPM against motor name plate to verify correct performance.

The fans are factory tested and checked for vibration so this type of balancing is not required. Vibration could be caused by rough handling during shipment, installation, and weak foundations. Correct as required.

MAINTENANCE

Before performing any maintenance on the fan, be sure power is turned off and locked in the off position at the service entrance.

Ventilators should be carefully checked at least once a year. For critical or rugged applications, a routine check every two or three months is suggested.

All motors carry a one-year warranty from the date of shipment. For repairs within the warranty period, the motor must be taken to the motor manufacturer's authorized service dealer. Contact your representative for additional warranty details.

A periodic motor check should consist of spinning the motor shaft with the power off to be sure the motor turns freely and the bearings run smoothly.

The motor cooling fan and guard should also be maintained by checking and cleaning accumulated dust and debris.

The rotating wheel or propeller requires particular attention since materials in the air being handled can build up on blades to cause destructive vibration or weaken the structure of the propeller by corroding and/or eroding the blades. Regular inspection and corrective action at intervals determined by the severity of each application are essential to good service life and safety.

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
GENERAL INSTRUCTIONS

MOTORS

Periodic checks of voltage, frequency and current of a motor while in operation are recommended. Such checks assure the correctness of frequency and voltage applied to the motor and yield an indication of the fan load. Comparison of this data with previous data will give an indication of the fan performance. Any serious deviations could indicate a potential motor failure.

All motors carry a one-year warranty from date of shipment. For repairs within warranty period, the motor must be taken to the motor manufacturer's authorized service dealer. Contact your representative for additional warranty details.

A periodic motor check should consist of spinning the motor shaft with the power off so to be sure the motor turns freely and the bearings run smoothly.

Repair or replacement of motors is normally performed by a repair station authorized by the manufacturer. Contact your representative or the factory for locations nearest you. DO NOT ship motor to factory without specific authorization forms.

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
GENERAL INSTRUCTIONS

WARRANTY

This Blower Housing Assembly is warranted to be free from defects in material and workmanship for two years from date of original shipment. Any units or parts which prove to be defective and are reported during the warranty period will be replaced at our option when returned to our factory, transportation prepaid by the sender. Deterioration of wear by heat, abrasive action, chemicals, improper installation or operation or lack of normal maintenance shall not constitute defects, and are not covered by warranty. **Transportation to and from the factory for warranty repairs is not covered under warranty and is the sole responsibility of the owner of the equipment**.

The motor is warranted by the motor manufacturer for one year. If the motor becomes defective in the warranty period, it should be taken to the nearest authorized motor service station. If this is not done, the motor manufacturer will not warrant the motor. Call the factory for instructions if authorized service station is not known.

The manufacturer will not be responsible for any installation, removal or re-installation cost or any consequential damage resulting in failure to meet conditions of any warranty.

LIMITATION OF WARRANTY AND LIABILITY: This warranty does not apply to any product or parts which have failed as a result of faulty installation or abuse, or incorrect electrical connections or alterations, made by other, or use under abnormal operating conditions or misapplications of the products and parts.

The manufacturer will not approve for payment any repairs made outside its factory without prior written consent.

The foregoing shall constitute our sole and exclusive warranty and our sole and exclusive liability and is in lieu of all other warranties whether written, oral, implied, or statutory. There are no warranties which extend beyond the description of the page hereof. Seller does not warranty that said goods and articles are merchantable quality or that they are fit for any particular purpose. The liability of seller on any claim of any kind, including negligence, for any loss or damage arising out of, or connected with, or resulting from the sale and purchase of the products and parts covered by this proposal, acknowledgment, order or from performance or breach of any contract pertaining to such sale or purchase, or from the design, manufacture, sale, delivery, resale, installation, technical direction of installation, inspection, repair, operation or use of any products or parts covered by this proposal, acknowledgment, order or furnished by seller shall, in no case exceed the price allocable to the product or parts thereof which give rise to the claim and shall terminate one (1) year after shipment of said products and parts.

In no event, whether as a result of breach of contract, or warranty or alleged negligence, defects, incorrect advise or other causes, shall seller be liable for special or consequential damages including, but not limited to, loss of profits or revenue, loss of use of the equipment or any associated equipment, cost of capital, cost of substitute equipment, facilities or services, down time costs or claims of customers of the purchaser for such damages. The manufacturer neither assumes nor authorizes any persons to assume for it any other liability in connection with the sale of its fan products and parts.

SAFETY ACCESSORIES WARNING: The responsibility for providing safety accessories for equipment supplied by the manufacturer is that of the installer and user of this equipment The manufacturer sells its equipment with and without safety accessories, and accordingly it can supply such safety accessories upon receipt of order.

The user, in making its determination as to the appropriate safety accessories to be installed and any warning notices, should consider (1) the location of the installation, (2) the accessibility of employees and other persons to this equipment, (3) any adjacent equipment, (4) applicable building codes, and (5) requirements of the Federal Occupational Safety and Health Act.

Users and installers of this equipment should read, “RECOMMENDED SAFETY PRACTICES FOR AIR MOVING DEVICES” which is published by Air Movement and Control Association, 30 West University Drive, Arlington Heights, Illinois, 60004.

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
DISASSEMBLY INSTRUCTIONS

PLASTEC UTILITY AND STORM BLOWERS

Before beginning these instructions, place this fan on a bench or table top that can support its weight.

1) Remove Torx head screws from the motor plate. **(These screws require a T-20 bit.)**

2) Lift the assembly clear of the fan housing. Set the fan housing aside.

3) Use a thin flat head screwdriver to pop the black hub cap off the bushing. It may be necessary to reach between the blades of the impeller to do this. **(Be careful not to damage the impeller during this step.)**

4) Remove the shaft bolt, lock washer and washer. The bolt will be 8mm, 10mm or 13mm.

5) Use a gear puller to remove the impeller from the shaft. Always use the bushing as the pulling point. Pulling on the blades or rim of the impeller will cause irreparable damage.

6) Use a 10mm or 13mm socket to remove the four bolts securing the motor plate to the C-face.

(See Illustrations)

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
REASSEMBLY INSTRUCTIONS

PLASTEC UTILITY AND STORM BLOWERS

Before beginning these instructions, place this fan on a bench or table top that can support its weight.

1) Stand the motor on end, so that the shaft is pointing vertically.

2) Set the motor plate onto the C-face and align bolt holes. If motor plate does not fit flush on the C-face, use a small hammer or dead blow mallet to seat the plate onto the rabbet. You should not need much force to seat the plate. Secure the motor plate with four bolts, lock washers and washers.

3) Check the fit of the impeller bushing on the motor shaft. If it slides on easily, then push it onto the shaft and tap to seat it on the shaft shoulder. If it is a tight fit, lubricate the inside of the bushing with 3-in-1 oil or a similar product. Set the impeller on top of the shaft so it sits level. Use a driving rod and mallet, on bushing only, to drive the impeller onto the shaft until it touches the shoulder. Do not hit with excessive force or the bearings may be damaged. Remove any debris that was cut from the inside of the bushing. If there is a gap between the tip of the shaft and the top of the bushing, fill it with stainless steel washer(s).

4) Secure the impeller on the shaft with supplied bolt, lock washer and washer.

5) Cover the bushing with the hub cap and use a mallet to seat it properly. It may be necessary to cut out the raised ring on the inside of the hub cap with a box knife.

6) Select the orientation of the fan housing. There are eight possible orientations. Remember, if the fan is being installed in a weather hood, the motor will be upside down. Use eight Torx head screws to secure the motor assembly to the fan housing. Inspect visually and test electrically before installing the fan.

(See Illustrations)

Installation, Operation & Maintenance Manual
DISASSEMBLY INSTRUCTIONS

PLASTEC PSS SERIES STAINLESS STEEL UTILITY BLOWERS

Before beginning these instructions, place this fan on a bench or table top that can support its weight. For tool size see illustration.

1) Remove Hex cap screws from the motor plate. **(Be careful not to damage the impeller during this operation.)**

2) Lift the assembly clear of the fan housing. Set the fan housing aside.

3) Remove the hub cap and teflon gasket.

4) Loosen the shaft locking screws (hub).

5) Use a gear puller to remove the impeller from the shaft. Always use the bushing as the pulling point. Pulling on the blades or rim of the impeller will cause irreparable damage.

6) Remove the 4 motor plate bolts to remove the motor plate from the motor.

7) Remove the motor support stand if required by this operation.

(See Illustrations)

NOTE: Any new assembly parts or mounting hardware sourced must be 316 Stainless Steel

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
REASSEMBLY INSTRUCTIONS

PLASTEC PSS SERIES STAINLESS STEEL UTILITY BLOWERS

Before beginning these instructions, place this fan on a bench or table top that can support its weight.

1) Stand the motor on end, so that the shaft is pointing vertically.

2) Set the motor plate onto the C-face and align bolt holes. If motor plate does not fit flush on the C-face, use a small hammer or dead blow mallet to seat the plate onto the rabbet. You should not need much force to seat the plate. Secure the motor plate with four bolts, lock washers and washers. Apply the teflon gasket between the motor plate and housing.

3) Check the fit of the impeller bushing on the motor shaft. If it slides on easily, then push it onto the shaft and tap to seat it on the shaft. If it is a tight fit, lubricate the inside of the bushing with 3-in-1 oil or a similar product. Set the impeller on top of the shaft so it sits level. Use a driving rod and mallet, on bushing only, to drive the impeller onto the shaft until it is even with the end of the motor shaft. Do not hit with excessive force or the bearings may be damaged.

4) Secure the impeller on the shaft with supplied locking screws (2).

5) Cover the bushing with the hub cap gasket and hub cap. Lock in place with two screws supplied.

6) Select the orientation of the fan housing. There are eight possible orientations. Remember, if the fan is being installed in a weather hood, the motor will be upside down. Use eight Hex head screws to secure the motor assembly to the fan housing. Inspect visually and test electrically before installing the fan. Ensure the teflon gasket is in place.

(See Illustrations)

NOTE: Any new assembly parts or mounting hardware sourced must be 316 Stainless Steel

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
DISASSEMBLY INSTRUCTIONS

PLASTEC JET SERIES

Before beginning these instructions, place this fan on a bench or table top that can support its weight.

1) Disconnect the fan from its power source.

2) Open the switch box. Take note of the wire positions before removing them from the wiring terminal.

3) Unscrew the plastic locknut from the liquid tight fitting on top of the switch box and the one from the face of the weather cover.

4) Gently pull the conduit and cable out of the top of the switch box and pull the conduit off the cable.

5) Push a short length of cable back into the weather cover. This provides slack for lifting the weather cover off the manifold.

6) Remove the six or eight Phillips head screws from the base ring of the weather cover.

7) Lift the weather cover up and over the top of the manifold, being careful not to damage the cable.

8) If the motor is being replaced, be sure to retrieve the cable and strain relief connector from the wiring box. Take note of the orientation of the wiring positions before removing the cable.

9) Take note of the orientation of the motor as it sits in the fan body. This is important for the reassembly procedure.

10) Remove eight Torx head screws from the motor plate. Lift the motor assembly out of the fan body. Stand on the cooling fan end of the motor. Refer to step #3 of the utility blower disassembly sheet.

(See Illustrations)

PLASTEC VENTILATION, INC.

Installation, Operation & Maintenance Manual
REASSEMBLY INSTRUCTIONS

PLASTEC JET SERIES

Before beginning these instructions, place this fan on a bench or table top that can support its weight.

1) Complete steps one through five of the Utility Blower assembly procedure.

2) Set the motor plate into the fan body in the same orientation as it was before being removed.

3) Secure the motor assembly to the fan body with eight Torx head screws.

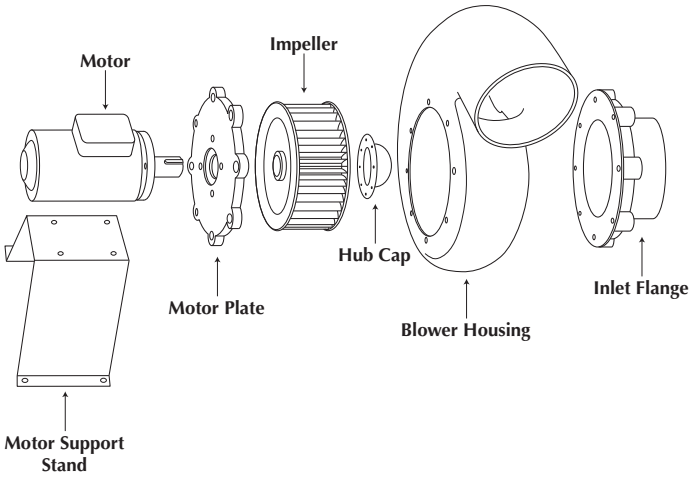
4) Remove the lid from the wiring box. Install the strain relief connector and wire according to the motors and wiring diagram. Close the wiring box.

5) Slide the manifold onto the outlet of the fan body. If it is a tight fit, use a rubber mallet to tap it into position. Use careful strikes to avoid damaging the fan body or manifold. Do not use any adhesive or hardware to secure the manifold. Make sure the drain hole in the manifold is clear from the fan housing outlet.

6) Hold the weather cover over the fan assembly and feed the cable through the liquid tight fitting, from inside to out, while lowering the weather cover over the fan assembly.

7) Push the weather cover down past the fan body so it is seated in the ring on the colored base. Pull any additional slack out of the power cable. Align the holes around the base of the weather cover and the colored ring. Secure it in place with 6 or 8 Phillips head screws.

8) Feed the power cable through the conduit and fit the conduit into the liquid tight fitting in the weather cover. Screw the plastic lock nut onto this liquid tight fitting. Slide the other locknut onto the conduit and make sure it is oriented correctly.



9) Feed the power cable through the liquid tight fitting on top of the switch box and fit positions as before. Screw the second locknut onto the liquid tight fitting. Reconnect the power supply and close the switch box.

ROOF UNIT 15 - ROOF UNIT 30 KIT ASSEMBLY

1) Components of Roof Kit: Roof Curb Cap, Motor Cap, Cap Bracket, Exhaust Guard

2) Place the cap bracket on the motor with the screwing inserts upwards.

3) Fix the motor flange.

4) Place the O-ring seal.

5) Place the impeller.

6) Push in the impeller.

7) Screw the hub cap on the motor shaft.

8) Install the hub cap.

9) Place the roof curb cap O-ring seal.

10) Place the roof curb cap on the housing.

11) Screw the roof curb cap to the housing.

12) Turn over the housing. Reinforce the base before placing the roof curb cap to support.

13) Place the motor/impeller part.

14-17) Screw the motor flange and the cap bracket on the housing indicated in the pictures.

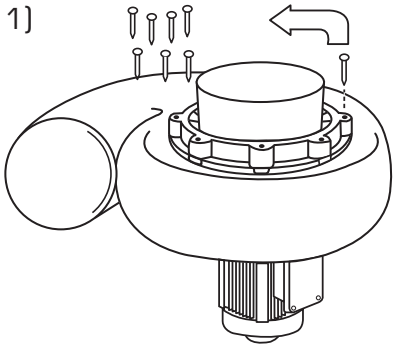
18) Do the correct wiring between the switch and the motor, respecting tension.

19) Screw back on the terminal box lid.

20-21) Place the motor cap and secure with screws.

22-24) Attach switch with screws on the flat side of the motor cap.

25) Place the exhaust cap on the outlet and attach with 4 screws.



26) Finished Assembly.

ATTACHMENT OF PLASTEC FAN TO WEATHER HOOD

1. The motor feet should point vertically upwards for attachment to the underside of the hood top. Ensure that the fan discharge is correctly orientated in relation to the motor feet.
2. It is recommended that the motor is connected to the disconnect switch prior to assembly of motor and weather hood, otherwise access to the terminals may be difficult.
3. Insert the four bolts into the holes in the weather cover. Prevent them from falling out by fitting the barbed washers.
4. Secure weather hood to the motor by means of nuts, large washers and lock washers. This is best accomplished by placing the fan housing on a horizontal surface with the motor shaft vertical, then introduce the holes in the hood to the bolts you have fitted to the motor feet.
5. Ensure that the weather hood is installed in an upright position and that the drain holes in the base panel are clear.

Rotation and Discharge for Centrifugal Fans

Notes:

(1) Direction of rotation is determined from the drive side of fan. ***Standard position is up-blast CCW 360.***

(2) On single inlet fans, drive side is always considered as the opposite fan inlet.

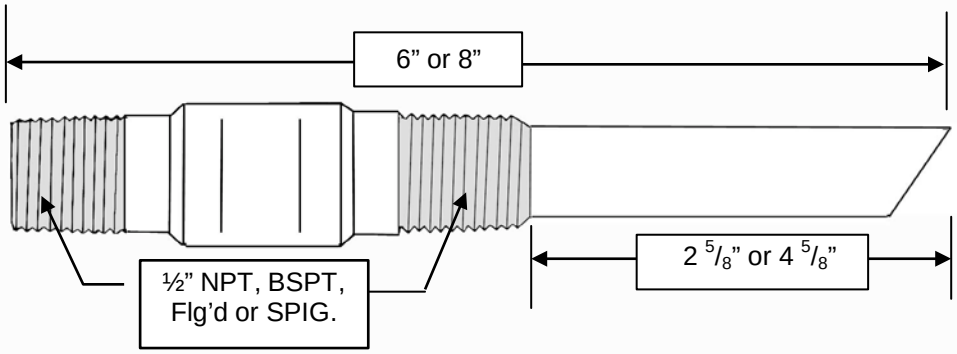
Metering Pump Injection Quills Instructions

Primary Fluid Systems Inc. introduces the Injection Quill, the newest addition to their line of Metering Pump Accessories.
The injection quill is ideal for the injection of chemicals into the center stream of a process pipeline. This provides for a more homogeneous mix to take place in the pipeline. Each quill has a built in stainless steel spring-loaded check, to help prevent back siphoning.
The injection quill is available in two sizes, 6" length suitable for 4"-6" pipe diameters and 8" length suitable for 8"-10" pipe diameters. The connection for both sizes is ½" NPT, BSPT, Flanged or Spigoted.
Six (6) materials of construction are available that provide compatibility for most chemicals injected. Each quill comes standard with a stainless steel spring, except Hastelloy C the standard is Hastelloy. Optional spring and ball materials are available at an extra charge (consult factory) or the quill may be ordered without a spring or ball. (See list on next page) (Pressure and temperature are dependent on the material of construction and vary from 150 and 3000 PSIG and 60º C (140ºF) and 260º C (500ºF).

Typical Installation



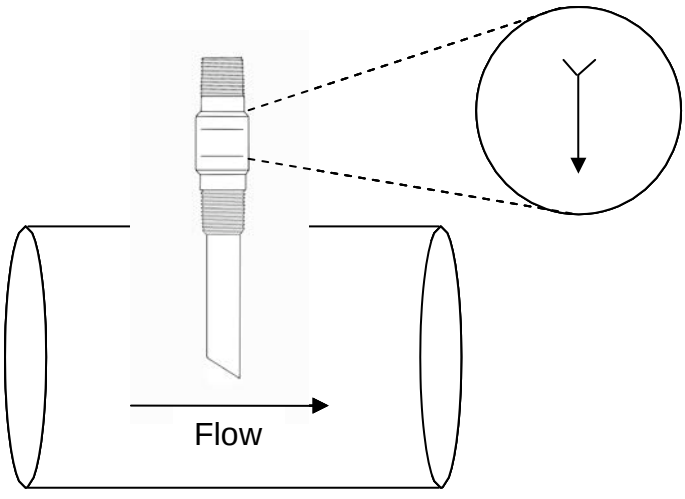


Figure A

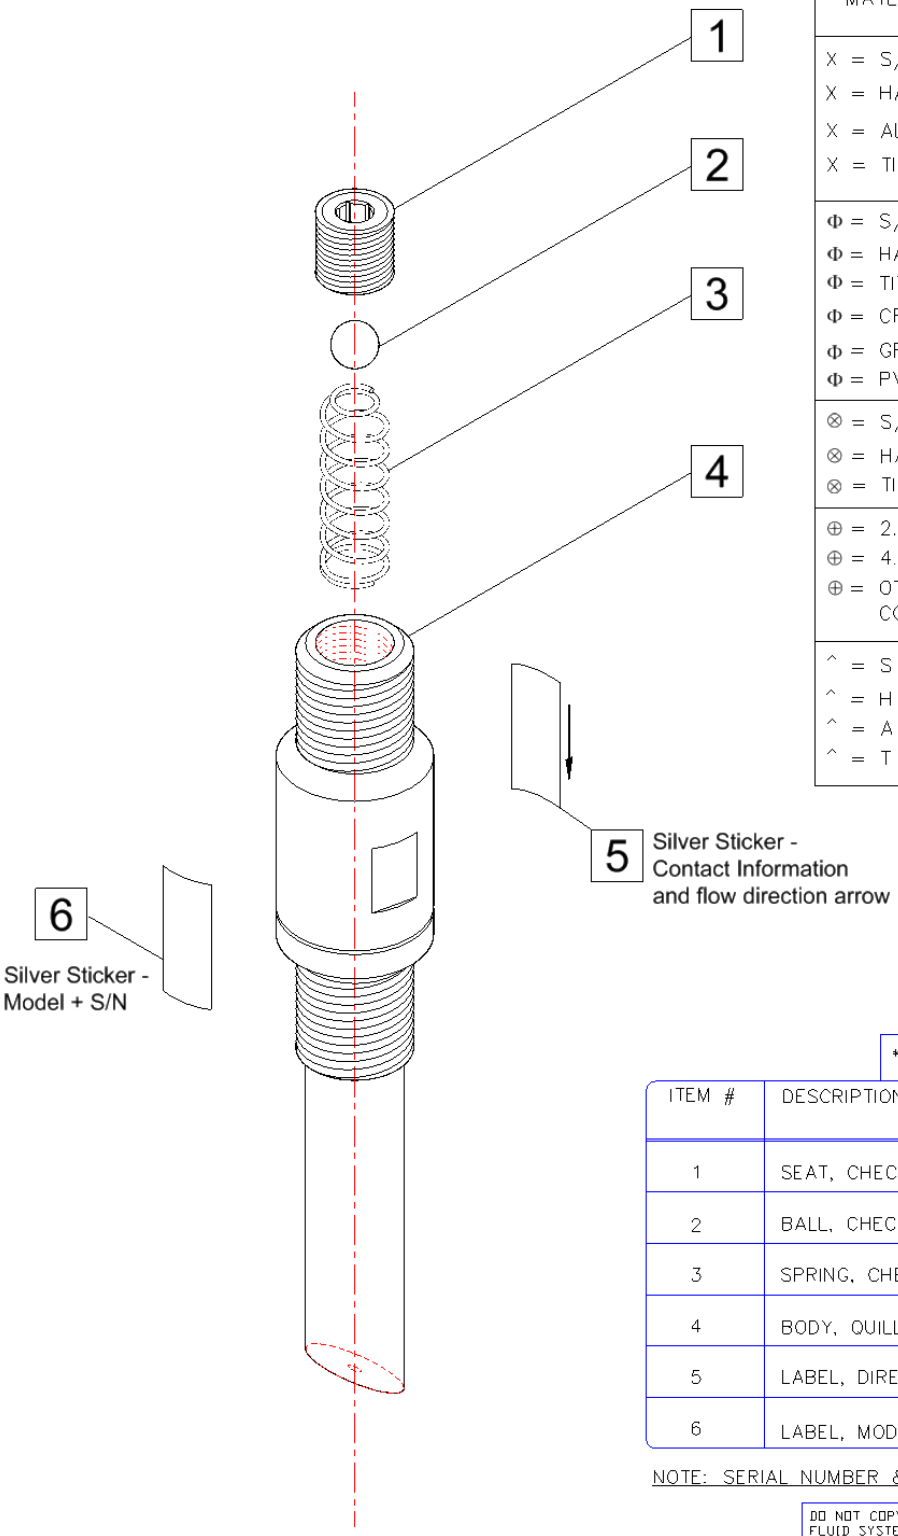
Injection Quill Instructions continued …

1. Install injection quill using the appropriate piping compound and PTFE tape.
2. All injection quills come standard spring assisted. It is recommended, however, if you order a quill without a spring that they be installed in the process line at a 6 o'clock position. This will assist in the check valve seating.
3. 6" length quills are suitable for 4"-6" pipe diameters. Pipe sizes smaller than 4", the quill can be trimmed so that the injection quill is in the centerline of the process pipe. 8" length quills are suitable for 8"-10" pipe diameters.
4. As per the diagram on the previous page, figure (A), install the injection quill in the process so that the stamped arrow in the body is facing downstream. This positions the angle face of the quill into the process stream, increasing the dispersion of the chemical into the process fluid.
5. An isolation valve installed behind the injection quill is recommended for easy maintenance.



Model	Size (length)	Body Material	Ball Check Material	Check Spring Material	Pressure* Max. PSIG	Temperature Max.

**MAXIMUM PSIG RATING BASED ON 73°F (23°C). SEE PAGE 4 OF INJECTION QUILL PRICE LIST FOR TEMP CORRECTION FACTOR.*

NOTE: Check spring is made of 316S/S material, the injection quill may be ordered with less spring if not chemically compatible with product being pumped.
Hastelloy C and Titanium Beta C springs are available from stock.
Other spring materials available on special request, please contact the factory for costs.
316S/S, Hastelloy C, Titanium Gr2, PVDF and Teflon balls available from stock.

Metering Pump PFS Injection Quills Standard Features

- built in, spring loaded check
- 6 materials of construction
- Simple installation, using ½" NPT, BSPT, Flg'd or SPIG. connections
- Available in 2 sizes, 6" or 8" length
- Pressure range to 3000 PSIG

25803530/EN – 04/2018

1 General information

1.1 About this documentation

The current version of the documentation is the original.

This documentation is an integral part of the product. The documentation is written for all employees who assemble, install, start up, and service this product.

Make sure this documentation is accessible and legible. Ensure that persons responsible for the machinery and its operation as well as persons who work on the product independently have read through the documentation carefully and understood it. If you are unclear about any of the information in this documentation or require further information, contact SEW-EURODRIVE.

1.2 Structure of the safety notes

1.2.1 Meaning of signal words

The following table shows the grading and meaning of the signal words for safety notes.

Signal word	Meaning	Consequences if disregarded
⚠ **DANGER**	Imminent hazard	Severe or fatal injuries
⚠ **WARNING**	Possible dangerous situation	Severe or fatal injuries
⚠ **CAUTION**	Possible dangerous situation	Minor injuries
NOTICE	Possible damage to property	Damage to the product or its environment
INFORMATION	Useful information or tip: Simplifies handling of the product.	

1.2.2 Structure of section-related safety notes

Section-related safety notes do not apply to a specific action but to several actions pertaining to one subject. The hazard symbols used either indicate a general hazard or a specific hazard.

This is the formal structure of a safety note for a specific section:

SIGNAL WORD

Type and source of hazard.

Possible consequence(s) if disregarded.

- Measure(s) to prevent the hazard.

25803530/EN – 04/2018

Meaning of the hazard symbols

The hazard symbols in the safety notes have the following meaning:

Hazard symbol	Meaning
	General hazard
	Warning of dangerous electrical voltage
	Warning of hot surfaces
	Warning of risk of crushing
	Warning of suspended load
	Warning of automatic restart

1.2.3 Structure of embedded safety notes

Embedded safety notes are directly integrated into the instructions just before the description of the dangerous action.

This is the formal structure of an embedded safety note:

⚠ **SIGNAL WORD** Type and source of hazard. Possible consequence(s) if disregarded. Measure(s) to prevent the hazard.

1.3 Rights to claim under limited warranty

Read the information in this documentation. This is essential for fault-free operation and fulfillment of any rights to claim under limited warranty. Read the documentation before you start working with the product.

25803530/EN – 04/2018

1.4 Exclusion of liability

Read the information in this documentation, otherwise safe operation is impossible. You must comply with the information contained in this documentation to achieve the specified product characteristics and performance features. SEW-EURODRIVE assumes no liability for injury to persons or damage to equipment or property resulting from non-observance of these operating instructions. In such cases, SEW-EURODRIVE assumes no liability for defects.

1.5 Product names and trademarks

The brands and product names in this documentation are trademarks or registered trademarks of their respective titleholders.

1.6 Copyright notice

25803530/EN – 04/2018

2 Safety notes

2.1 Preliminary information

The following general safety notes have the purpose to avoid injury and damage to property. They primarily apply to the use of products described in this documentation. If you use additional components also observe the relevant warning and safety notes.

2.2 Duties of the user

As the user, you must ensure that the basic safety notes are observed and complied with. Make sure that persons responsible for the machinery and its operation as well as persons who work on the device independently have read through the documentation carefully and understood it.

As the user, you must ensure that all of the work listed in the following is carried out only by qualified specialists:

- Setup and installation
- Installation and connection
- Startup
- Maintenance and repairs
- Shutdown
- Disassembly

Ensure that the persons who work on the product pay attention to the following regulations, conditions, documentation, and information:

- National and regional safety and accident prevention regulations
- Warning and safety signs on the product
- All other relevant project planning documents, installation and startup instructions, and wiring diagrams
- Do not assemble, install or operate damaged products
- All system-specific specifications and conditions

Ensure that systems in which the product is installed are equipped with additional monitoring and protection devices. Observe the applicable safety regulations and legislation governing technical work equipment and accident prevention regulations.

2.3 Target group

Specialist for mechanical work

Any mechanical work may only be performed by adequately qualified specialists. Specialists in the context of this documentation are persons familiar with the design, mechanical installation, troubleshooting, and maintenance of the product who possess the following qualifications:

- Qualification in the mechanical area in accordance with the national regulations
- Familiarity with this documentation

25803530/EN – 04/2018

Specialist for electrotechnical work

Any electrotechnical work may only be performed by electrically skilled persons with a suitable education. Electrically skilled persons in the context of this documentation are persons familiar with electrical installation, startup, troubleshooting, and maintenance of the product who possess the following qualifications:

- Qualification in the electrotechnical area in accordance with the national regulations
- Familiarity with this documentation

Additional qualification

In addition to that, these persons must be familiar with the valid safety regulations and laws, as well as with the requirements of the standards, directives, and laws specified in this documentation. The persons must have the express authorization of the company to operate, program, parameterize, label, and ground units, systems, and circuits in accordance with the standards of safety technology.

Instructed persons

All work in the areas of transportation, storage, operation and waste disposal must be carried out by persons who are trained appropriately. The purpose of the instruction is that the persons are capable of performing the required tasks and work steps in a safe and correct manner.

2.4 Designated use

The product is intended for use in industrial and commercial systems.

In case of installation in electrical systems or machines, startup of the product is prohibited until it is determined that the machine meets the requirements stipulated in the local laws and directives. For Europe, Machinery Directive 2006/42/EC as well as the EMC Directive 2014/30/EU apply.

Using these products in potentially explosive atmospheres is prohibited, unless specifically designated otherwise.

2.5 Transportation/storage

Inspect the shipment for damage as soon as you receive the delivery. Inform the shipping company immediately about any damage. If the product is damaged, it must not be assembled, installed or started up.

Observe the storage information on climatic conditions as given in chapter "Storage conditions" (→ 🗎 167).

The permissible storage temperature is -30 °C to +50 °C.

If the product is not immediately installed, it must be stored in a dry and dust-free location. The product can be stored for up to 9 months without requiring any special measures before startup. Do not store the product outdoors.

The installed lifting eyebolts are in accordance with DIN 580. Observe the loads and regulations specified there. The tension force vector of the slings must not exceed a 45° angle in accordance with DIN 580.

The lifting eyes are designed to carry only the weight of the product. Do not mount any additional loads. If the product has several lifting eyes or lifting eyebolts, then you should use all lifting eyes and lifting eyebolts for attaching transport ropes. Tighten the screwed-in lifting eyes.

The gear units K..167 and K..187 have no lifting eyes and are supplied without lifting eyebolts. Use alternative, suitable slings.

25803530/EN – 04/2018

Use suitable, sufficiently rated handling equipment, that can be used for further transport.

2.6 Installation/assembly

Ensure that the product is installed and cooled according to the regulations in the documentation.

Protect the product from strong mechanical strain. The product and its mounting parts must never protrude into the path of persons or vehicles. Ensure that components are not deformed, particularly during transportation and handling. Electric components must not be mechanically damaged or destroyed.

The following applications are prohibited unless the device is explicitly designed for such use:

- Operation in applications with impermissibly high mechanical vibration and shock loads in excess of the regulations stipulated in EN 61800-5-1
- Use in environments with harmful oils, acids, gases, vapors, dust, radiation, etc.

Observe the danger due to static overdetermination. Gear units with foot (e.g. KA19/29B, KA127/157B or FA127/157B) must not be fastened via the torque arm and the foot plate at the same time. Gearmotors must also not be fastened to the foot plate of the gear unit (e.g. KA19/29B, KA127/157B or FA127/157B, R gear unit with foot-mounted motor) and the foot plate of the motor at the same time.

2.7 Startup/operation

Check the oil level before startup as described in chapter "Inspection/maintenance" (→ 🗎 106).

Check that the direction of rotation is correct in the **decoupled** state. Listen out for unusual grinding noises as the shaft rotates.

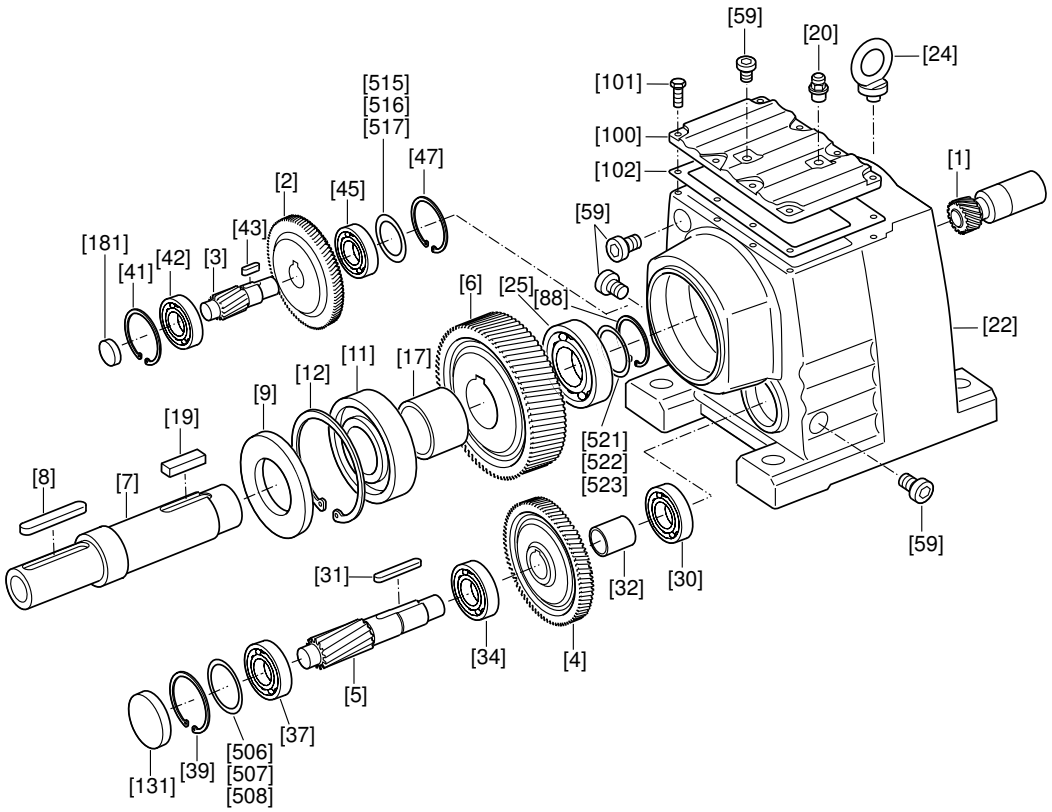
Secure the keys for the test run without output elements.

Do not deactivate monitoring and protection devices even for a test run.

Switch off the gearmotor if in doubt whenever changes occur in relation to normal operation (e.g. increased temperatures, unusual noises, vibrations). Determine the cause. It may be necessary to contact SEW-EURODRIVE.

2.8 Inspection/maintenance

Observe the information in chapter "Inspection/maintenance" (→ 🗎 106).



25803530/EN – 04/2018

3 Gear unit structure

INFORMATION

The following figures are block diagrams. Their purpose is only to make it easier to assign components to the spare parts lists. Discrepancies may occur depending on the gear unit size and version.

25803530/EN – 04/2018

3.9 Nameplate/type designation

3.9.1 Gear unit nameplate

The following figure shows an example of a nameplate for a helical-bevel gear unit with input adapter:

20682047115

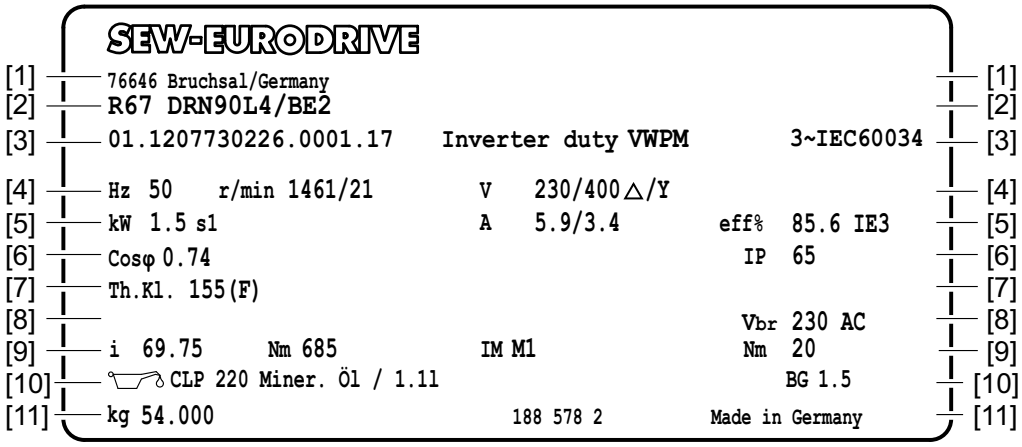
[1] • Address
[2] • Type designation of the gear unit
[3] • Production number
[4] • Input rated speed/rotational speed at the output shaft of the gear unit in min^{-1}
• Gear unit ratio
[5] • Minimum permissible output torque of the gear unit/adapter combination in Nm
• Maximum permissible driving torque in Nm
• Mass in kg
[6] • Maximum permissible output torque of the open gear unit without additional component in Nm
• Mounting position
[7] • Oil type and oil fill volume
• Nameplate number

Explanation of the production number:

01.	0123456789.	0001.	17
Sales organization	Order number	Item number	Year of manu-facture

3.9.2 Type designation of the gear unit

A helical-bevel gear unit with AQA adapter, for example, has the following type designation:



Example: K37/R AQA 80 /1		
Gear unit type	**K**	Helical-bevel gear units
Gear unit size	**37**	19 – 49; 37 – 187
Option	**/R**	e.g. option /R for servo drives: Reduced rotational clearance

25803530/EN – 04/2018

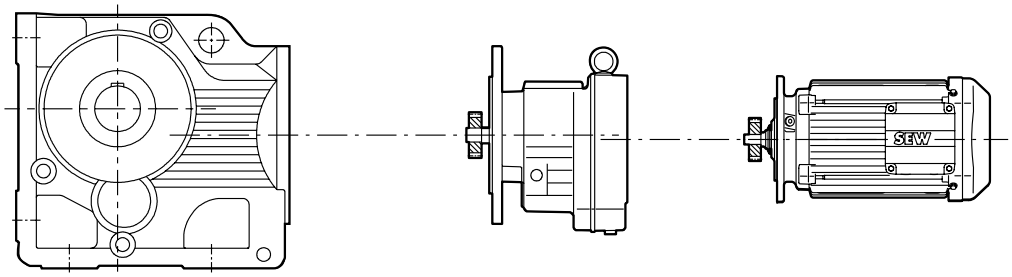
Example: K37/R AQA 80 /1		
Adapter	**AQA**	e.g. adapter for servo drives: AQA: Adapter with keyway AQH: Adapter with clamping ring hub
Adapter size	**80**	
Variants	**/1**	

3.9.3 DRN.. gearmotor nameplate

The following figure shows an example nameplate of a DRN.. gearmotor.

20683265035

[1] • Address
[2] • Type designation gearmotor
[3] • Production number
• Suitability for inverter operation
• Number of phases and underlying rated and power standard
[4] • Rated frequency /Hz
• Rated speed of the motor/rotational speed of the gear unit output shaft /min^{-1}
• Nominal voltage /V
[5] • Rated power /kW and operating mode
• Rated current /A
• Efficiency /%
• Energy efficiency class
[6] • Power factor
• Degree of protection according to IEC 60034-5
[7] • Thermal class
[8] • Brake voltage /V
[9] • Gear unit ratio
• Output torque /Nm
• Mounting position
• Nominal braking torque /Nm
[10] • Oil type and oil fill volume /l
• Brake control
[11] • Mass /kg
• Nameplate
• Country of production



3.9.4 Type designation of a DRN.. gearmotor

The type designation of the gearmotor starts from the component on the output end.

For instance, a multi-stage helical-bevel gearmotor with temperature sensor in the motor winding has the following type designation:

Example: K107R77DRN100LS4 /TF		
Gear unit type	K	1. Gear unit
Gear unit size	107	
Gear unit series	R	2. Gear unit
Gear unit size	77	
Motor series	DRN..	Motor
Motor size	100	
Length	LS	
Number of poles	4	
Motor option temperature sensor	/TF	Option

Example: DRN.. gearmotor

K107 R77 DRN100LS4/TF

20684745867

3.10 Designs and options – R, F, K, S, W gear units

Below an overview of type designations for R, F, K, S, and W gear units and their options.

3.10.1 Helical gear units

Designation	Description
RX..	Single-stage foot-mounted design, output shaft with key
RXF..	Single-stage B5 flange-mounted design, output shaft with key
R..	Foot-mounted design, output shaft with key
R..F	Foot- and B5 flange-mounted design, output shaft with key
RF..	B5 flange-mounted design, output shaft with key
RZ..	B14 flange-mounted design, output shaft with key
RM..	B5 flange-mounted design with extended bearing hub, output shaft with key

3.10.2 Parallel-shaft helical gear units

Designation	Description
F..	Foot-mounted design, output shaft with key
FA..B	Foot-mounted design, hollow shaft with keyway
FH..B	Foot-mounted design, hollow shaft with shrink disk
FV..B	Foot-mounted design, splined hollow shaft to DIN 5480
FF..	B5 flange-mounted design, output shaft with key
FAF..	B5 flange-mounted design, hollow shaft with keyway
FHF..	B5 flange-mounted design, hollow shaft with shrink disk
FVF..	B5 flange-mounted design, splined hollow shaft to DIN 5480
FA..	Hollow shaft with keyway
FH..	Hollow shaft with shrink disk
FT..	Hollow shaft with TorqLOC® hollow shaft mounting system
FV..	Splined hollow shaft to DIN 5480
FZ..	B14 flange-mounted design, output shaft with key
FAZ..	B14 flange-mounted design, hollow shaft with keyway
FHZ..	B14 flange-mounted design, hollow shaft with shrink disk
FVZ..	B14 flange-mounted design, splined hollow shaft to DIN 5480
FM..	B5 flange-mounted design with extended bearing hub, output shaft with key
FAM..	B5 flange-mounted design with extended bearing hub, hollow shaft with keyway

25803530/EN – 04/2018

3.10.3 Helical-bevel gear units

Designation	
K..	Foot-mounted design, output shaft with key
KA..B	Foot-mounted design, hollow shaft with keyway
KAF..B	B5 flange-mounted design, foot-mounted design, hollow shaft with keyway
KF..B	B5 flange-mounted design, foot-mounted design, output shaft with key
KH..B	Foot-mounted design, hollow shaft with shrink disk
KHF..B	B5 flange-mounted design, foot-mounted design, hollow shaft with shrink disk
KV..B	Foot-mounted design, splined hollow shaft to DIN 5480
KF..	B5 flange-mounted design, output shaft with key
KAF..	B5 flange-mounted design, hollow shaft with keyway
KHF..	B5 flange-mounted design, hollow shaft with shrink disk
KVF..	B5 flange-mounted design, splined hollow shaft to DIN 5480
KA..	Hollow shaft with keyway
KH..	Hollow shaft with shrink disk
KT..	Hollow shaft with TorqLOC® hollow shaft mounting system
KV..	Splined hollow shaft to DIN 5480
KZ..	B14 flange-mounted design, output shaft with key
KAZ..	B14 flange-mounted design, hollow shaft with keyway
KHZ..	B14 flange-mounted design, hollow shaft with shrink disk
KVZ..	B14 flange-mounted design, splined hollow shaft to DIN 5480
KM..	B5 flange-mounted design with extended bearing hub, output shaft with key
KAM..	B5 flange-mounted design with extended bearing hub, hollow shaft with keyway

3.10.4 Helical-worm gear units

Designation	Description
S..	Foot-mounted design, output shaft with key
SF..	B5 flange-mounted design, output shaft with key
SAF..	B5 flange-mounted design and hollow shaft with keyway
SHF..	B5 flange-mounted design and hollow shaft with shrink disk
SA..	Hollow shaft with keyway
SH..	Hollow shaft with shrink disk
ST..	Hollow shaft with TorqLOC® hollow shaft mounting system
SAZ..	B14 flange-mounted design and hollow shaft with keyway

25803530/EN – 04/2018

Designation	Description
SHZ..	B14 flange-mounted design and hollow shaft with shrink disk

3.10.5 SPIROPLAN® gear units

Designation	Description
W..	Foot-mounted design, output shaft with key
WF..	B5 flange-mounted design, output shaft with key
WAF..	B5 flange-mounted design and hollow shaft with keyway
WA..	Hollow shaft with keyway
WA..B	Foot-mounted design and hollow shaft with keyway
WH..B	Foot-mounted design and hollow shaft with shrink disk
WHF..	B5 flange-mounted design and hollow shaft with shrink disk
WH..	Hollow shaft with shrink disk
WT..	Hollow shaft with TorqLOC® hollow shaft mounting system

3.10.6 Options

R, F and K gear units:

Designation	Description
/R	Reduced backlash

K, S and W gear units:

Designation	Description
/T	With torque arm

F gear units:

Designation	Description
/G	With rubber buffer

3.10.7 Condition monitoring

Designation	Description
/DUO	Diagnostic Unit Oil = Oil aging sensor
/DUV40A	Diagnostic Unit Vibration = Vibration sensor

25803530/EN – 04/2018

4 Mechanical installation

4.1 Prerequisites for installation

NOTICE

Damage to the gear unit/gearmotor due to improper installation

Damage to property

- Observe the following notes.

Make sure that the following requirements are met before you start installing the unit:

- The drive has not been damaged during transportation or storage.
- The entries on the nameplate of the gearmotor match the voltage supply system.
- In case of abrasive ambient conditions, the output side oil seals must be protected against wear.
- Output shafts and flange surfaces must be completely free from anti-corrosion agent and any kind of pollution. Use a commercially available solvent to clean the flange surfaces. Note that solvent damages the oil seal. Do not let the solvent come into contact with the sealing lips of the oil seals!
- **For standard drives:**
  - Check if the gear unit/gearmotor is designed for the ambient temperature. For the application limits refer to the technical documentation, the nameplate or the lubricant table (see chapter "Lubricant table" (→ 🗎 170)).
  - Make sure the environment contains no hazardous substances (oils, acids, gases, vapors, dusts,...) or radiation.
- **For special designs:**
  - Check if the gear unit/gearmotor is designed for the ambient temperature. You find the application limits on the nameplate.
- **For worm/SPIROPLAN® gearmotors:**
  - Note that no large external mass moments of inertia must be present, which could exert a retrodriving load on the gear unit.
  - Note the self-locking at η' (retrodriving) < 0.5.

    Calculation of η': η' = 2- 1/η
- **Servomotor mounting:**
  - The drive may only be mounted if it is ensured that after the mounting the drive will be sufficiently ventilated. Ventilation prevents heat build-up.

25803530/EN – 04/2018

4.1.1 Required tools/resources

The following tools and resources are required for the mechanical installation:

- Wrench
- Torque wrench for:
  - Gear unit mounting
  - Shrink disks
  - Motor adapter AQH or EWH
  - Input shaft assembly with centering shoulder
- Mounting device
- Compensation elements (shims and spacing rings)
- Fasteners for input and output elements
- Lubricant (e.g. NOCO® fluid)
- Threadlocker compound for input cover with centering shoulder (e.g. Loctite® 243)

INFORMATION

Standard parts are not included in the delivery.

4.1.2 Installation tolerances

Shaft end	Flanges
Diameter tolerance according to DIN 748 • ISO k6 for solid shafts with Ø ≤ 50 mm • ISO m6 for solid shafts with Ø > 50 mm • ISO H7 for hollow shafts • Centering bore in accordance with DIN 332, shape DR	Centering shoulder tolerance to DIN 42948 • ISO j6 with b1 ≤ 230 mm • ISO h6 with b1 > 230 mm

25803530/EN – 04/2018

4.2 Installing the gear unit

⚠ CAUTION

Risk of injury due to improper installation/disassembly

Severe personal injury and damage to property

- Work on the gear unit only when the machine is not in use.
- Secure the drive unit against unintentional power-up.
- Prevent heavy component parts (e.g. shrink disks) against falling during installation/disassembly.

⚠ CAUTION

Risk of injury due to protruding gear unit parts

Severe injuries

- Keep a sufficient safety distance to the gear unit/gearmotor.

⚠ CAUTION

Danger due to static overdetermination if gear units with foot (e.g. KA19/29B, KA127/157B or FA127/157B) are mounted both via the torque arm and via the foot plate.

Risk of injuries and damage to property

- Especially with the KA.9B/T variant, it is not permitted to use the foot plates and the torque arm at the same time.
- Attach the KA.9B/T design only via the torque arm.
- Attach the K.9 or KA.9B design only via the foot plate.
- If you want to use foot plates and torque arms for mounting, contact SEW-EURODRIVE.

⚠ CAUTION

Danger due to static overdetermination in the case of gearmotors when the gear unit is attached to the foot plate (e.g. KA19/29B, KA127/157B or FA127/157B, R gear unit with foot-mounted motor) and the motor is attached to the foot plate as well.

Risk of injuries and damage to property

- Attach only the gear unit or only the motor to the foot plate.

NOTICE

Damage to gear unit/gearmotor due to cold air currents. Condensed water in the gear unit can cause damage.

Damage to property

- Protect the gear unit from direct cold air currents.

INFORMATION

When installing the gear unit, make sure that the oil level and drain plugs as well as the breather valves are easily accessible!

25803530/EN – 04/2018

Mounting position

The gear unit or gearmotor is only allowed to be installed in the specified mounting position. Observe the information on the nameplate. SPIROPLAN® gear units of sizes W10 – W30 are mounting position-independent.

Oil level

Check the mounting position-dependent oil level; see chapter "Inspection/maintenance work on the gear unit" (→ 🗎 113). The gear units are filled with the required oil quantity at the factory. There may be slight deviations at the oil level plug as a result of the mounting position, which are permitted within the manufacturing tolerances.

Adjust the lubricant fill quantities and the position of the breather valve accordingly in the event of a change of mounting position. Observe chapter Lubricant fill quantities and chapter "Mounting positions" (→ 🗎 129).

Contact SEW-EURODRIVE in case of the following mounting position changes:

- Mounting position change to M4: Depending on the operating mode of the drive, an oil expansion tank can be necessary (see chapter "Oil expansion tank" (→ 🗎 93)).
- Changing the mounting position of K gear units to M5 or M6 or within these mounting positions
- Changing the mounting position of size S47 – S97 S gear units to mounting positions M2 and M3
- Changing the mounting positions of R gear units to mounting position M2.

Submounting

The support structure must have the following characteristics:

- Level
- Vibration damping
- Torsionally rigid

The following table shows the maximally permitted flatness defect for foot- and flange-mounting (guide values based on DIN ISO 1101):

Gear unit size	Flatness defect
≤ 67	max. 0.4 mm
77 – 107	max. 0.5 mm
127 – 147	max. 0.7 mm
157 – 187	max. 0.8 mm

Do not twist housing legs and mounting flanges against each other. Observe the permitted overhung and axial loads! Observe the "Project Planning" section in the gear unit/gearmotor catalog for calculating the permitted overhung and axial loads.

25803530/EN – 04/2018

Strength class of the screws

Always mount gearmotors using screws of strength class 8.8. The gearmotors in flange-mounted design and in foot-/flange-mounted design listed in the following table are an exception. Always use screws of strength class 10.9 for these gearmotors. Use suitable washers.

Gear unit	Flange Ø in mm	Strength class of the screws
RF37/R37F	120	10.9
RF47/R47F	140	
RF57/R57F	160	
FF/FAF77 KF/KAF77	250	
FM/FAM67, FM/FAM77 KM/KAM67, KM/KAM77	300	
FM/FAM87 KM/KAM87	350	
FM/FAM97 KM/KAM97	400	
RF147 FM/FAM107 KM/KAM107	450	
RF167 FM/FAM127 KM/KAM127	550	
FM/FAM157 KM/KAM157	660	
RZ37 – RZ87	60ZR – 130ZR	

Corrosion protection for screw connections

Use plastic inserts (2 – 3 mm thick) if there is a risk of electrochemical corrosion between the gear unit and the driven machine. The material used must have an electrical leakage resistance < 10^9 Ω. Electrochemical corrosion can occur between various metals, for example, cast iron and stainless steel. Also install the bolts with plastic washers! Additionally ground the housing. Use grounding screws on the motor.

25803530/EN – 04/2018

4.2.1 Tightening torques for retaining screws

Mount the gearmotors with the following tightening torques:

Screw/nut	Tightening torque ± 10% Strength class 8.8 Nm
M6	11
M8	27
M10	54
M12	93
M16	230
M20	464
M24	798
M30	1597
M36	2778
M42	3995
M48	6022
M56	9650

Mount the specified gearmotors in flange-mounted design with the following increased tightening torques:

Flange Ø mm	Gear unit	Screw/nut	Tightening torque ± 10% Strength class 10.9 Nm
120	RF37	M6	17
140	RF37/RF47	M8	40
160	RF57	M8	40
300	FM/FAM67, FM/FAM77 KM/KAM67, KM/KAM77	M12	137
350	FM/FAM87 KM/KAM87	M16	338
400	FM/FAM97 KM/KAM97	M16	338
450	FM/FAM107 KM/KAM107	M16	338
450	RF147	M20	661
550	FM/FAM127 KM/KAM127	M16	338
550	RF167	M20	661

25803530/EN – 04/2018

Flange Ø mm	Gear unit	Screw/nut	Tightening torque ± 10% Strength class 10.9 Nm
660	FM/FAM157 KM/KAM157	M20	661
60ZR	RZ37	M8	40
70ZR	RZ47	M8	40
80ZR	RZ57	M10	79
95ZR	RZ67	M10	79
110ZR	RZ77	M10	79
130ZR	RZ87	M12	137
250	FF77/KF77/ FAF77/ KAF77	M12	137

4.2.2 Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses

Observe the tightening torques in the following table when screwing in:

Thread	Tightening torque Nm
M10 × 1	8
M12 × 1.5	14
M22 × 1.5	45
M33 × 2	100
M42 × 2	160

25803530/EN – 04/2018

4.2.3 Gear unit mounting

INFORMATION

If you use the gear unit in flange-mounted design or foot/flange-mounted design in connection with VARIBLOC® variable-speed gear units, use screws of 10.9 quality and suitable washers for flange mounting on the customer side.

To improve the friction contact between flange and mounting surface, SEW-EURODRIVE recommends anaerobic gaskets or an anaerobic glue.

INFORMATION

With the gear units KAZ/KZ/FAZ/FZ 107-157, remove the 4 transport protection screws from the B14 flange. The 2 recessed screws **must** remain in the B14 flange.

Foot-mounted gear unit

The following table shows the thread sizes of the foot-mounted gear units depending on the gear unit type and size:

Screw	Gear unit type					
	R/R..F	RX	F/FH..B/ FA..B	K/KH..B/KV..B/ KA..B	S	W
M6	07	–	–	19	–	10/20
M8	17/27/37	–	27/37	29	37	30/37/47
M10	–	57	47	37/39/47/49	47/57	–
M12	47/57/67	67	57/67	57/67	67	–
M16	77/87	77/87	77/87	77	77	–
M20	97	97/107	97	87	87	–
M24	107	–	107	97	97	–
M30	127/137	–	127	107/167	–	–
M36	147/167	–	157	127/157/187	–	–

Gear unit with B14 flange-mounted design and/or hollow shaft

The following table shows the thread sizes of the gear units with B14 flange and/or hollow shaft depending on the gear unit type and size:

Screw	Gear unit type				
	RZ	FZ/FAZ/FHZ/ FVZ	KZ/KAZ/KHZ/ KVZ	SA/SAZ/SHZ	WA
M6	07/17/27	–	–	37	10/20/30[1)]
M8	37/47	27/37/47	37/47	47/57	37
M10	57/67	–	–	–	47
M12	77/87	57/67/77	57/67/77	67/77	–
M16	–	87/97	87/97	87/97	–
M20	–	107/127	107/127	–	–

25803530/EN – 04/2018

Screw	Gear unit type				
	RZ	FZ/FAZ/FHZ/ FVZ	KZ/KAZ/KHZ/ KVZ	SA/SAZ/SHZ	WA
M24	–	157	157	–	–

1) For the W30 design mounted directly on a CMP.. motor or mounted via an EWH.. adapter, the thread size is M8.

Gear unit with B5 flange-mounted design

The following table shows the thread sizes of the gear units with B5 flange depending on the gear unit type, size and flange diameter:

Ø flange mm	Screw	Gear unit type					
		RF/R..F/RM	FF/FAF/ FHF/FVF	FM/FAM KM/KAM	KF/KAF/ KHF/KVF	SF/SAF/ SHF	WF/WAF/ WHF
80	M6	–	–	–	–	–	10
110	M8	–	–	–	–	–	20
120	M6	07/17/27	–	–	–	37	10/20/30/37
120	M8	–	–	–	19	–	–
140	M8	07/17/27/37/47	–	–	–	–	–
160	M8	07/17/27/37/47	27/37	–	19/37	37/47	30/37/47
160	M10	–	–	–	29/39	–	–
200	M10	37/47/57/67	47	–	29/47	57/67	–
200	M12	–	–	–	49	–	–
250	M12	57/67/77/87	57/67	–	57/67	77	–
300	M12	67/77/87	77	67/77	77	–	–
350	M16	77/87/97/107	87	87	87	87	–
400	M16	–	–	97	–	–	–
450	M16	97/107/127/137/ 147	97/107	107	97/107	97	–
550	M16	107/127/137/ 147/167	127	127	127	–	–
660	M20	147/167	157	157	157	–	–

4.2.4 Installation in damp locations or outdoors

NOTICE

Paint can block the breather valve and damage the sealing lips of the oil seals.

Damage to property.

- Thoroughly cover the breather valve and sealing lip of the oil seals with strips prior to painting/re-painting.
- Remove the strips after painting.

25803530/EN – 04/2018

Drives are supplied in corrosion-resistant designs with an according surface protection coating for use in damp areas or outdoors.

- Repair any damage to the paint work (e.g. on the breather valve or the lifting eyes).
- When mounting the motors onto AM, AQ adapters and to AR, AT start-up couplings and slip clutches, seal the flange areas with a suitable sealant (e.g. Loctite® 574).
- In case of setup outdoors, the drives must not be exposed to direct sunlight. Install appropriate protection devices e.g. a cover or a canopy. The protection device must not cause heat build-up.
- The system operator must ensure that no foreign objects (e.g. falling objects or coverings) affect the operation of the gear unit.

4.2.5 Gear unit venting

NOTICE

Dirt and dust in the environment affect the function of the breather valve.

Potential damage to property.

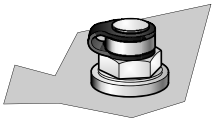
- Check the breather valve function regularly and replace it if necessary.
- In case of high dirt and dust load use a breather filter instead of a breather valve.

The following table lists gear units that do not require venting:

Gear unit	Mounting position
R..07	M1/M2/M3/M5/M6
R..17/R..27/F..27	M1/M3/M5/M6
W..10/W..20/W..30	M1 – M6
W..37/W..47	M1/M2/M3/M5/M6
K..19/K..29	M1/M2/M3/M5/M6

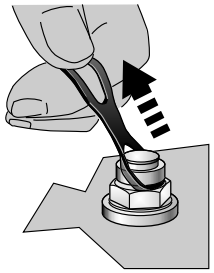
All other gear units are delivered with a breather valve suitable to the mounting position and activated.

Exceptions:



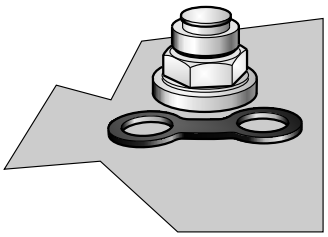
- The following gear units are delivered with a screw plug on the provided breather hole:
  - Gear unit with pivoted mounting position (dynamic)
  - Gear unit for mounting in an inclined position (stationary)
  - Mounting position MX

  A breather valve is supplied in a separate plastic bag attached to the gear unit. Before startup, replace the highest screw plug with the breather valve provided. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).
- For **gear head units** and **gear units with pivoted mounting position** with venting on the input end, a breather valve is supplied in a plastic bag.
- **Enclosed gear units** are delivered without a breather valve.



- Gear units with gear unit venting on fixed piping, with expansion tank, and with ventilation filter are delivered without a breather valve.
- In some countries, the breather valve is installed, but not activated due to possible pressure fluctuations during transport. In such cases the transport protection must be removed. This activates the breather valve (see chapter "Activating the breather valve" (→ 🗎 36)).

Activating the breather valve



1. Before startup, check whether the transport protection on the breather valve has been removed and the valve is therefore activated. The following figure shows a breather valve with transport protection:

2. Remove the transport protection.

⇨ The following figure shows an activated breather valve:

4.2.6 Painting the gear unit

NOTICE

Paint can block the breather valve and damage the sealing lips of the oil seals.

Damage to property.

- Thoroughly cover the breather valve and sealing lip of the oil seals with strips prior to painting/re-painting.
- Remove the strips after painting.

25803530/EN – 04/2018

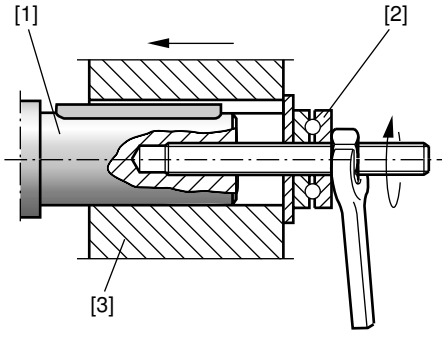
4.3 Gear unit with solid shaft

4.3.1 Assembling input and output elements

NOTICE

Damage to bearing, housing or shafts due to incorrect mounting

Possible damage to property.



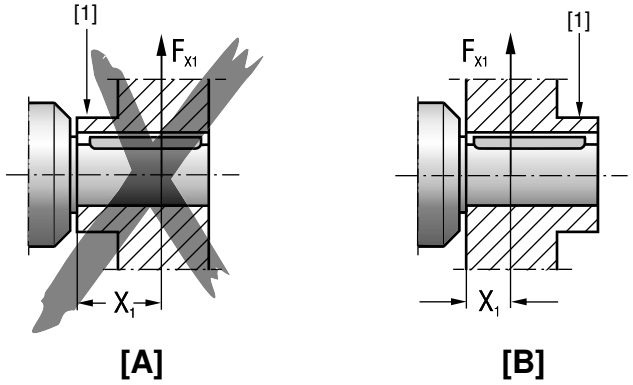
- Only use a mounting device for installing input and output elements (see chapter "Using the mounting device" (→ 🗎 37)). Use the threaded centering bore at the shaft end.
- Never force belt pulleys, couplings, pinions, etc. onto the shaft end by hitting them with a hammer.
- During the installation of belt pulleys, make sure the belt is tensioned correctly in accordance with the manufacturer's instructions.
- Make sure the transmission elements are balanced after fitting and do not give rise to any impermissible radial or axial forces. For the approved values, refer to the catalog "Gearmotors" or "Explosion-Proof Drives".

INFORMATION

Mounting is easier if you first apply lubricant to the output element or heat it up briefly to 80 – 100 °C.

Using a mounting device

The following figure shows a mounting device for installing couplings or hubs on gear unit or motor shaft ends. Should you be able to tighten the screw without any problems, you may not need the thrust bearing on the mounting device.



211368587

[1] Gear shaft end
[2] Thrust bearing
[3] Coupling hub

Avoiding excessive overhung loads

To avoid high overhung loads, mount gears and sprockets according to figure **B**.

211364235

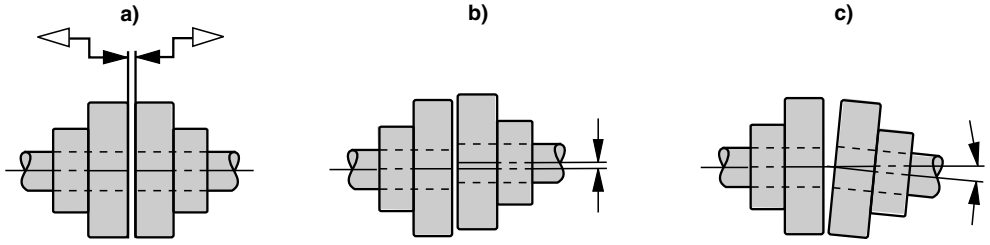
[1] Hub
[A] Incorrect assembly
F_{X1} Overhung load at point X1
[B] Correct assembly

4.3.2 Mounting of couplings

⚠ CAUTION

Risk of injury due to moving drive elements, such as belt pulleys or couplings, during operation.

Risk of jamming and crushing.



- Equip the input and output elements with a touch guard.

Adjust the following misalignments according to the coupling manufacturer's specifications when mounting couplings:

a) Maximum and minimum clearance

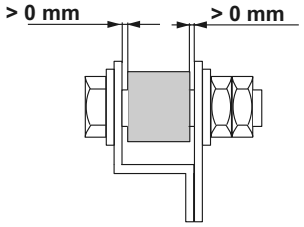
b) Axial misalignment

c) Angular misalignment

211395595

25803530/EN – 04/2018

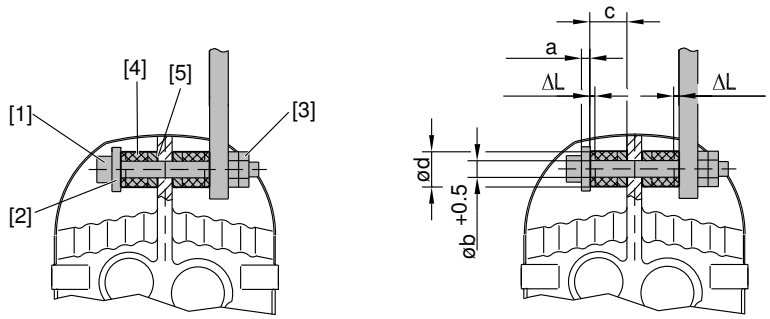
4.4 Torque arms for shaft-mounted gear units



NOTICE

Damage to gear unit due to improper installation

Damage to the gear unit



- Do not place torque arms under strain during installation.
- Always use bolts of quality 8.8 to fasten torque arms.

The following figure shows the mounted torque arm without tension:

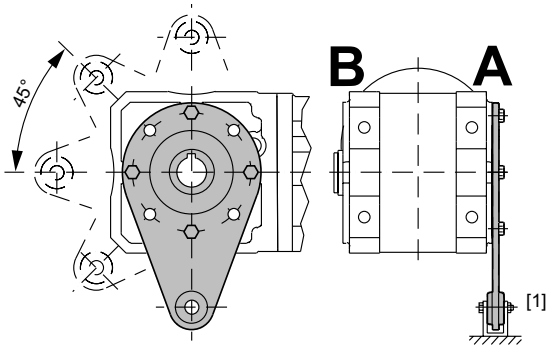
4.4.1 Mounting torque arms for parallel-shaft helical gear units

The following figure shows the torque support for parallel-shaft helical gear units in loose state.

36028797230330379

[1] Screw
[2] Washer
[3] Nuts
[4] Rubber buffer
[5] Metal side of the rubber buffer

a Washer width
b Rubber buffer inner diameter
c Rubber buffer length in loose state
d Rubber buffer diameter
ΔL Preload per rubber buffer in tightened state



Proceed as follows:

1. Make sure that the metal sides of the rubber buffers lay against the gear unit.
2. Use screws [1] and washers [2] according to the following table.
3. Secure the screw connection with a nut [3].
4. Tighten the screw [1] until the preload "Δ L" of the rubber buffers is reached according to the table:

Gear unit	Washer	Rubber buffer			
	a	d	b	c	Δ L
	mm	mm	mm	mm	mm
F..27 /G	5	40	12.5	20	1
F..37 /G	5	40	12.5	20	1
F..47 /G	5	40	12.5	20	1.5
F..57 /G	5	40	12.5	20	1.5
F..67 /G	5	40	12.5	20	1.5
F..77 /G	10	60	21.0	30	1.5
F..87 /G	10	60	21.0	30	1.5
F..97 /G	12	80	25.0	40	2
F..107 /G	12	80	25.0	40	2
F..127 /G	15	100	32.0	60	3
F..157 /G	15	120	32.0	60	3

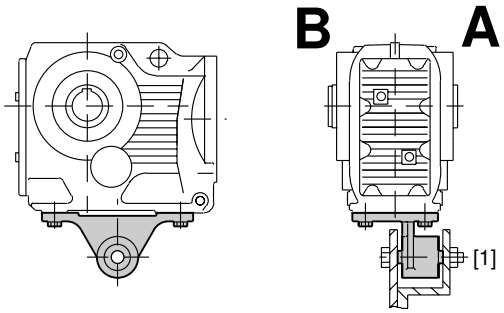
4.4.2 Mounting torque arms for helical-bevel gear unit K..19 – K..49

The following figure shows the torque support for the helical-bevel gear units K..19 – K..49:

[1] Bushing

A Connection side
B Connection side

Observe the following points during assembly:



- Apply bearings to both sides of the bushing [1].
- Mount connection side B so that it mirrors side A.
- Use screws and tightening torques according to the following table:

Gear unit	Screws	Tightening torque ± 10%
		Nm
K..19 /T	4 × M8 × 20 – 8.8	27
K..29 /T	4 × M8 × 22 – 8.8	27
K..39 /T	4 × M10 × 30 – 8.8	54
K..49 /T	4 × M12 × 35 – 8.8	93

25803530/EN – 04/2018

4.4.3 Mounting torque arms for helical-bevel gear unit K..37 – K..157

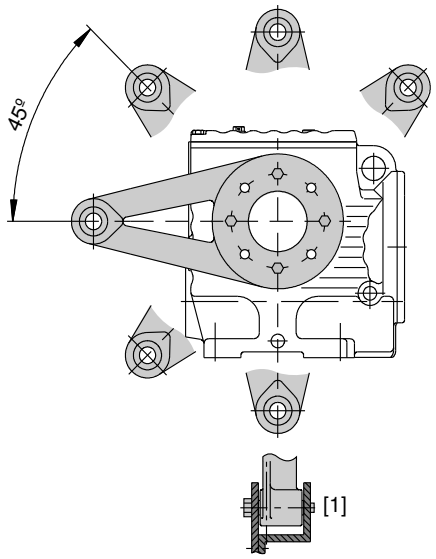
The following figure shows the torque support for the helical-bevel gear units K..37 – K..157.

27021597975585035

[1] Bushing

A Connection side
B Connection side

Proceed as follows:



1. Apply bearings to both sides of the bushing [1].
2. Mount connection side B so that it mirrors side A.
3. Use screws and tightening torques according to the following table:

Gear unit	Screws	Tightening torque ± 10% Nm
K..37 /T	4 × M10 × 25 – 8.8	54
K..47 /T	4 × M10 × 30 – 8.8	54
K..57 /T	4 × M12 × 35 – 8.8	93
K..67 /T	4 × M12 × 35 – 8.8	93
K..77 /T	4 × M16 × 40 – 8.8	230
K..87 /T	4 × M16 × 40 – 8.8	230
K..97 /T	4 × M20 × 50 – 8.8	464
K..107 /T	4 × M24 × 60 – 8.8	796
K..127 /T	4 × M36 × 130 – 8.8	2778
K..157 /T	4 × M36 × 130 – 8.8	2778

25803530/EN – 04/2018

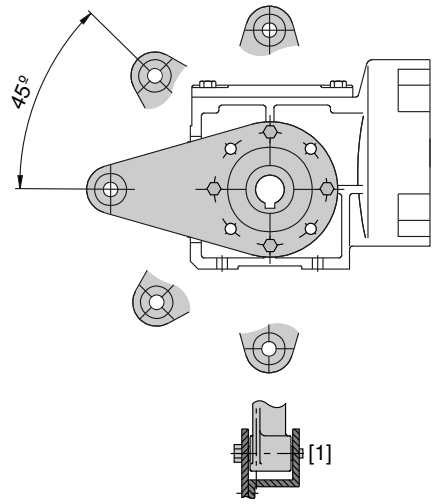
4.4.4 Mounting torque arms for helical-worm gear units

The following figure shows the toque support for helical-worm gear units.

18014398720973707

[1] Bushing

Proceed as follows:



1. Apply bearings to both sides of the bushing [1].
2. Use screws and tightening torques according to the following table:

Gear unit	Screws	Tightening torque ± 10% Nm
S..37 /T	4 × M6 × 16 – 8.8	11
S..47 /T	4 × M8 × 25 – 8.8	27
S..57 /T	6 × M8 × 25 – 8.8	27
S..67 /T	4 × M12 × 35 – 8.8	93
S..77 /T	4 × M12 × 35 – 8.8	93
S..87 /T	4 × M16 × 45 – 8.8	230
S..97 /T	4 × M16 × 50 – 8.8	230

25803530/EN – 04/2018

4.4.5 Mounting torque arms for SPIROPLAN® W gear units

The following figure shows the toque support for SPIROPLAN® W gear units.

18014398720971531

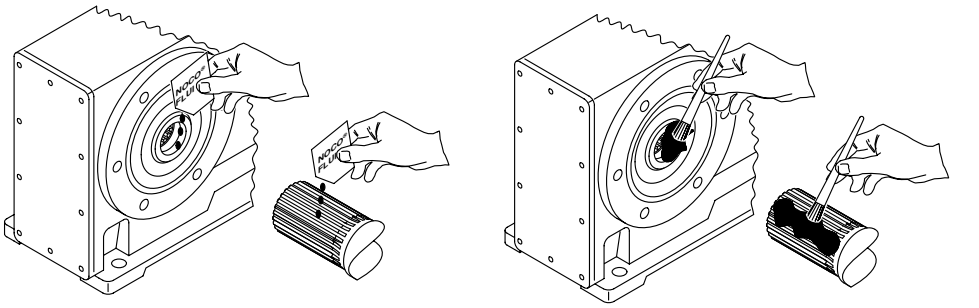
[1] Bushing

Proceed as follows:

1. Apply bearings to both sides of the bushing [1].
2. Use screws and tightening torques according to the following table:

Gear unit	Screws	Tightening torque ± 10% Nm
W..10 /T	4 × M6 × 16 – 8.8	11
W..20 /T	4 × M6 × 16 – 8.8	11
W..30 /T	4 × M6 × 16 – 8.8	11
W..37 /T	4 × M8 × 20 – 8.8	27
W..47 /T	4 x M10 × 20 – 8.8	54

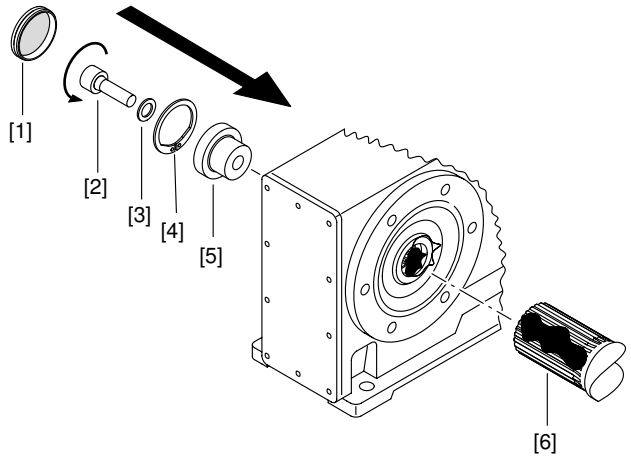
25803530/EN – 04/2018



4.5 Mounting shaft-mounted gear units with splined hollow shaft

INFORMATION

Concerning the configuration of the customer shaft, please also refer to the design notes in the "Gearmotors" catalog.



Proceed as follows:

1. Apply NOCO® fluid. Spread carefully.

20685469067

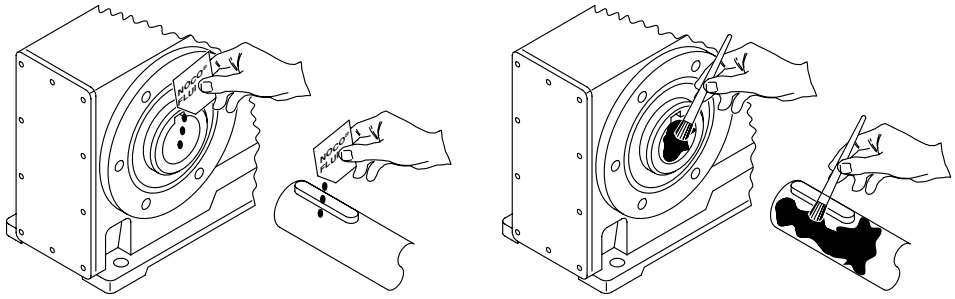
2. Install the shaft and secure it axially. For easier mounting, use a mounting device.

20685473931

[1] Closing plug
[2] Cap screw
[3] Supporting ring
[4] Retaining ring
[5] Washer

25803530/EN – 04/2018

4.6 Shaft-mounted gear unit with keyway

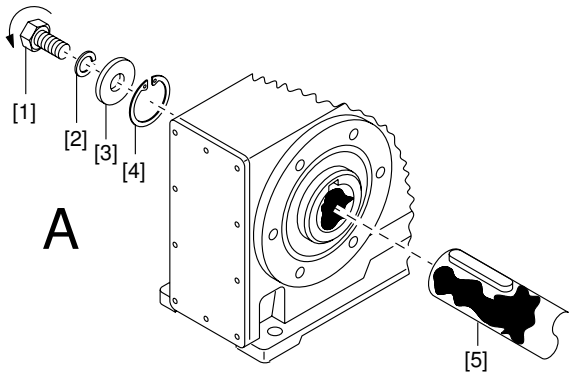


INFORMATION

Concerning the design of the customer shaft, please also refer to the design notes in the "Gearmotors" catalog.

4.6.1 Mounting shaft-mounted gear units with keyway

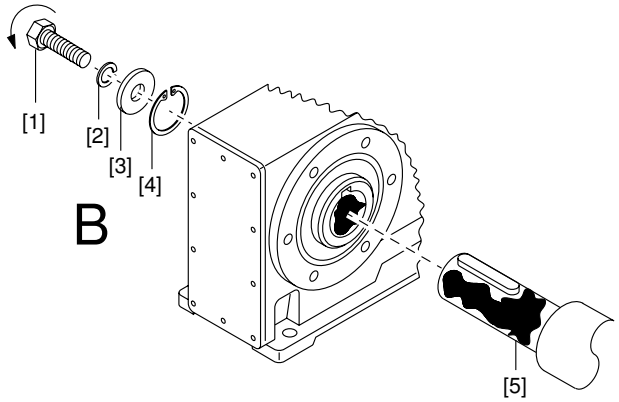
Proceed as follows:



1. Apply NOCO® fluid. Spread carefully.

9007199466257163

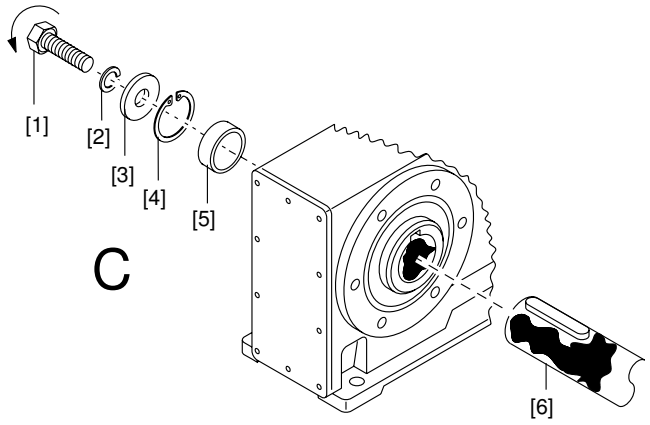
2. Install the shaft and secure it axially. For easier mounting, use a mounting device. Proceed according to one of the **3 mounting types**, depending on the scope of delivery.



A) Mounting a customer shaft (standard scope of delivery):

9007199466259339

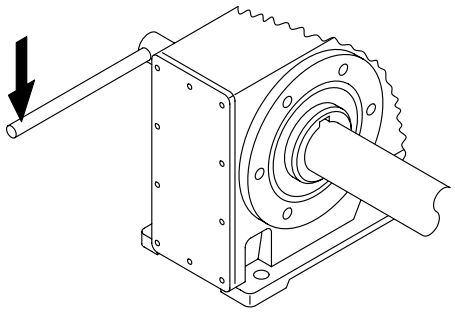
[1] Short retaining screw (standard scope of delivery)
[2] Lock washer
[3] Washer
[4] Retaining ring
[5] Customer shaft



B) Mounting customer shaft with contact shoulder using the SEW-EURODRIVE assembly/disassembly kit:

9007199466261515

[1] Retaining screw
[2] Lock washer
[3] Washer
[4] Retaining ring
[5] Customer shaft with contact shoulder



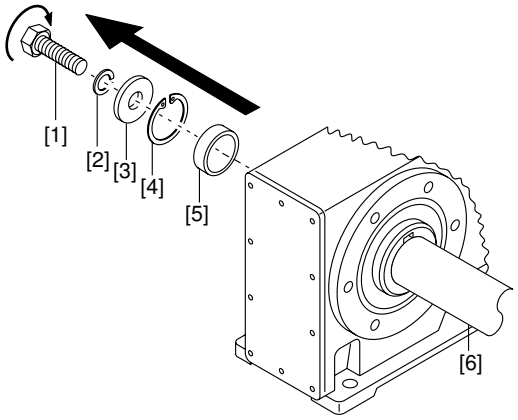
C) Mounting customer shaft without contact shoulder using the SEW-EURODRIVE assembly/disassembly kit:

9007199466263691

[1] Retaining screw
[2] Lock washer
[3] Washer
[4] Retaining ring
[5] Spacer tube
[6] Customer shaft without contact shoulder

3. Tighten the retaining screw to the appropriate torque. Observe the tightening torques specified in the following table.

9007199466265867



Screw	Tightening torque Nm
M5	5
M6	8
M10/12	20
M16	40
M20	80
M24	200

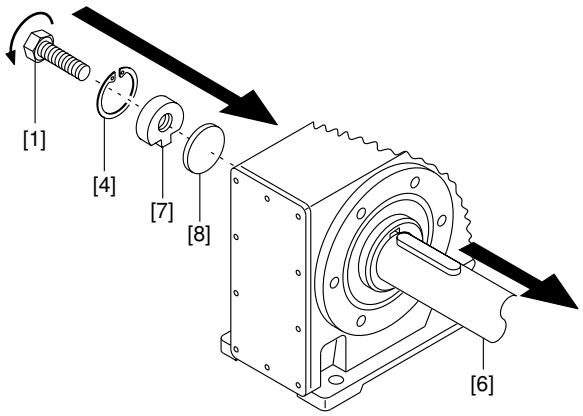
INFORMATION

To avoid contact corrosion, SEW-EURODRIVE recommends that the customer shaft should be lathed down between the 2 contact surfaces.

4.6.2 Removing the shaft-mounted gear unit

This description is only applicable if the gear unit was assembled using the SEW-EURODRIVE assembly/disassembly kit (see step 2 of "Mounting the shaft-mounted gear unit" (→ 🗎 45)).

9007199466268043



[1] Retaining screw
[2] Lock washer
[3] Washer
[4] Retaining ring
[5] Spacer tube
[6] Customer shaft

Proceed as follows:

1. Loosen the retaining screw [1].
2. Remove parts [2] to [4] and, if applicable, the spacer tube [5].
3. Insert the forcing washer [8] and the fixed nut [7] from the SEW-EURODRIVE assembly/disassembly kit between the customer shaft [6] and the retaining ring [4] (see "SEW-EURODRIVE assembly/disassembly kit" (→ 🗎 49)).

25803530/EN – 04/2018

4. Re-install the retaining ring [4].
5. Re-install the retaining screw [1]. Press the gear unit off the shaft by tightening the screw.

9007199466270219

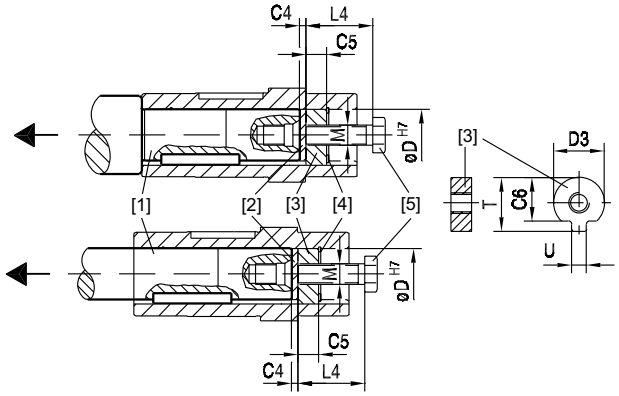
[7] Fixed nut
[8] Forcing washer



25803530/EN – 04/2018

4.6.3 Assembly/disassembly kit by SEW-EURODRIVE

Applies only if the installation/removal kit was previously used for installation.

1. Loosen the retaining screw [5].
2. Remove the retaining ring [4] and, if used, the spacer tube.
3. Insert the forcing washer [2] and the fixed nut [3] between the customer shaft [1] and retaining ring [4] as shown in the following figure.
4. Re-insert the retaining ring [4].
5. Re-install the retaining screw [5]. Now you can force the gear unit off the shaft.

The following figure shows the SEW-EURODRIVE assembly/disassembly kit.

27021606946895115

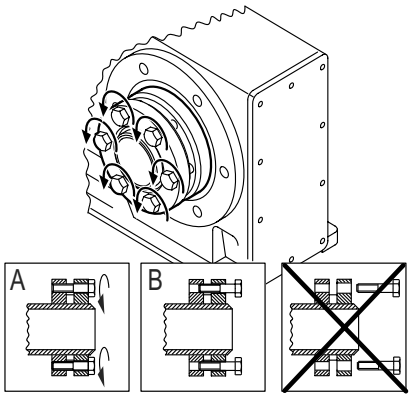
1) Retaining screw

25803530/EN – 04/2018

4.7 Shaft-mounted gear unit with shrink disk

4.7.1 Mounting the shaft-mounted gear unit

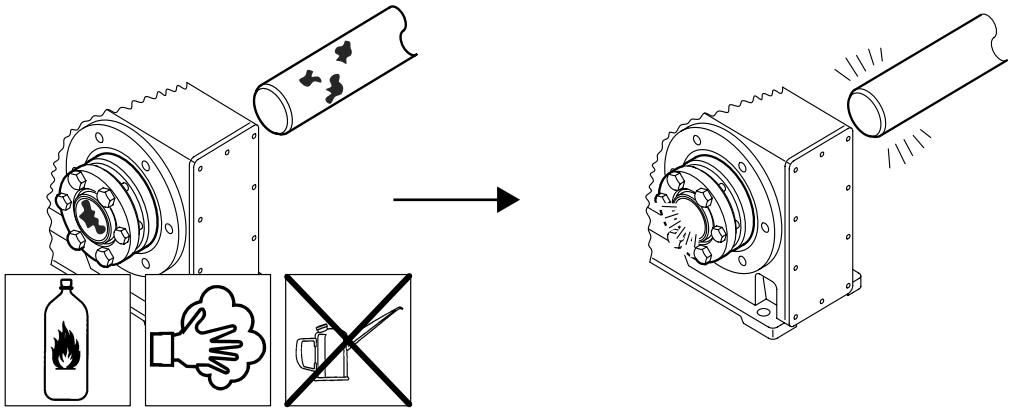
NOTICE



Deformation of the hollow shaft due to tightening the locking screws without first installing the shaft.

Damage to the hollow shaft.

- Never tighten the screws without the shaft installed.



Proceed as follows:

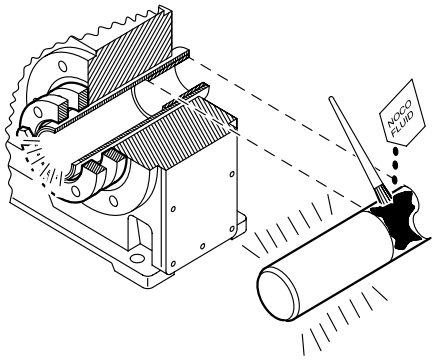
1. Slightly loosen the locking screws. Do not remove the locking screws completely.

9007199466274571

2. Carefully **degrease** the hollow shaft bore and the input shaft using a commercial solvent.

9007199466276747

3. Only apply NOCO® fluid to the input shaft around the bushing.

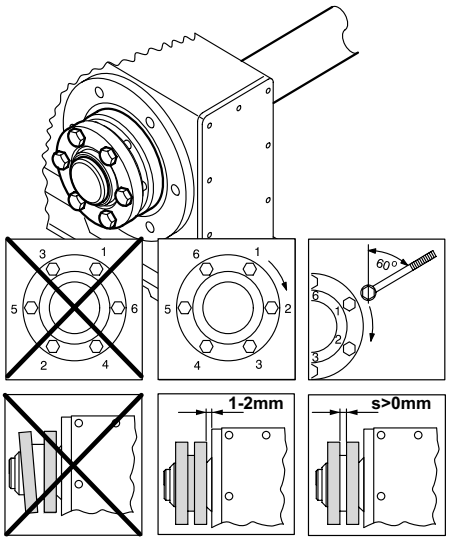


NOTICE

The hollow shaft mounting system is without function if NOCO® fluid is applied directly to the bushing. When the input shaft is installed, NOCO® fluid can get into the clamping area of the shrink disk.

Possible damage to property

- Never apply NOCO® fluid directly to the bushing. The clamping area of the shrink disk must be absolutely free of grease.



25803530/EN – 04/2018

9007199466281099

4. Install the input shaft. Proceed as follows to do so:

- Make sure that the outer rings of the shrink disk are plane-parallel.
- In the case of a gear unit with shaft shoulder, mount the shrink disk at the shaft shoulder up to the stop.
- In the case of a gear unit without shaft shoulder, mount the shrink disk at a distance of 1 mm to 2 mm from the gear unit housing.
- Tighten the locking screws with the specified tightening torque according to the following table. Tighten the screws in several turns. Tighten screws one after the other, not in diametrically opposite sequence.

211542283

INFORMATION

The exact values for the tightening torques are shown on the shrink disk.

INFORMATION

Standard shrink disks and stainless steel shrink disks have the same tightening torques.

Gear unit type				Locking screw ISO 4014/ISO 4017/ ISO 4762	Tightening torque ± 4% Nm
KH..	FH..	SH..	WH..		
19/29	27	37	37	M5	5

Gear unit type				Locking screw ISO 4014/ISO 4017/ ISO 4762	Tightening torque ± 4% Nm
KH..	FH..	SH..	WH..		
37/39/47/49/57/67/77	37/47/57/67/77	47/57/67/77	47	M6	12
87/97	87/97	87/97	–	M8	30
107	107	–	–	M10	59
127/157	127/157	–	–	M12	100
167	–	–	–	M16	250
187	–	–	–	M20	470

5. After installation, make sure the remaining gap "s" between the outer rings of the shrink disk is > 0 mm.
6. To prevent corrosion, grease the outside of the hollow shaft around the shrink disk.

4.7.2 Removing the shaft-mounted gear unit

Proceed as follows:

1. To prevent the outer rings from jamming, loosen the locking screws for a quarter turn, one after the other.
2. Steadily loosen the locking screws one after the other, but do not remove the locking screws completely.
3. If rust has formed on the shaft in front of the hub, remove the rust.
4. Remove the shaft or pull the hub off the shaft.
5. Remove the shrink disk from the hub.

INFORMATION

There is no need to dismantle removed shrink disks before they are reinstalled.

4.7.3 Cleaning and lubricating shaft-mounted gear units

Proceed as follows:

1. If the shrink disk is dirty, clean and lubricate the shrink disk.
2. Lubricate the tapered surfaces. Use one of the following solid lubricants:

Lubricant (Mo S2)	Sold as
Molykote 321 (lube coat)	Spray
Molykote spray (powder spray)	Spray
Molykote G Rapid	Spray or paste
Aemasol MO 19P	Spray or paste
Aemasol DIO-sétral 57 N (lube coat)	Spray

3. Grease the locking screws with a multipurpose grease such as Molykote BR 2.

25803530/EN – 04/2018

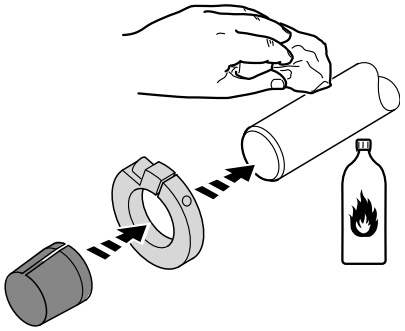
4.8 Shaft-mounted gear units with TorqLOC®

NOTICE

With a fixed flange or foot mounting, stress can build up in the drive train because of the possible tolerance adjustment of the TorqLOC® shaft.

Damage to property

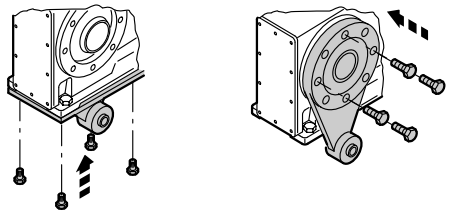
- A flange or foot mounting is only allowed for TorqLOC® mounting if it is ensured that no static overdetermination can occur. Tolerance adjustment of the shaft must be possible.



INFORMATION

In case of flange mounting, installing the clamping ring may not be possible depending on the size.

4.8.1 Mounting a customer shaft without contact shoulder

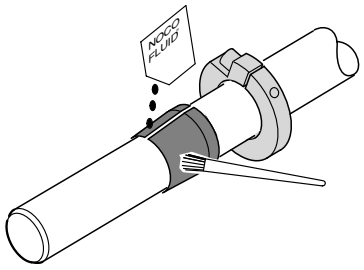


Proceed as follows:

1. Clean the customer shaft and the inside of the hollow shaft. Ensure that all traces of grease or oil are removed.
2. Install the stop ring and the bushing on the customer shaft.

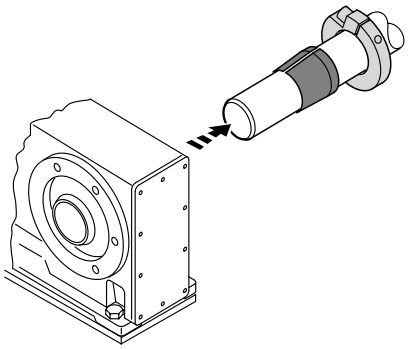
211941003

3. Attach the torque arm to the drive unit. Note the information in chapter "Torque arm for shaft-mounted gear units" (→ 🗎 39).



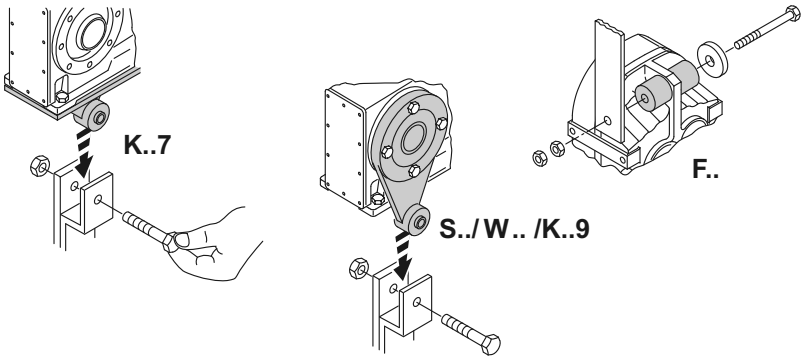
K..7 **S../W../K..9**

20622111627



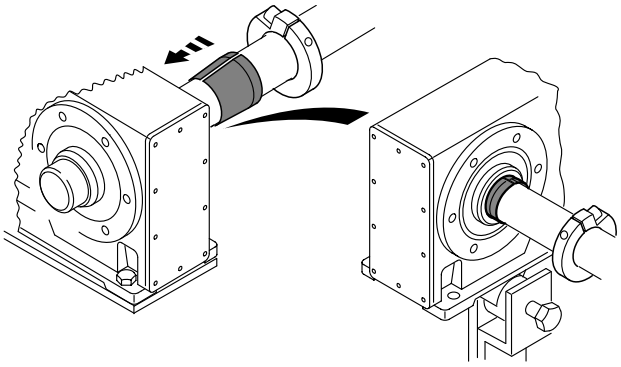
25803530/EN – 04/2018

4. Apply NOCO® fluid directly to the bushing. Spread carefully.



211938827

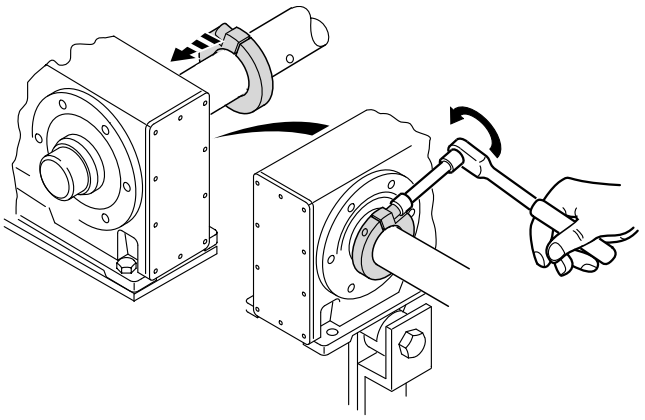
5. Push the gear unit onto the customer shaft.



9007199466677643

6. Preassemble the torque arm. Do not firmly tighten the screws.

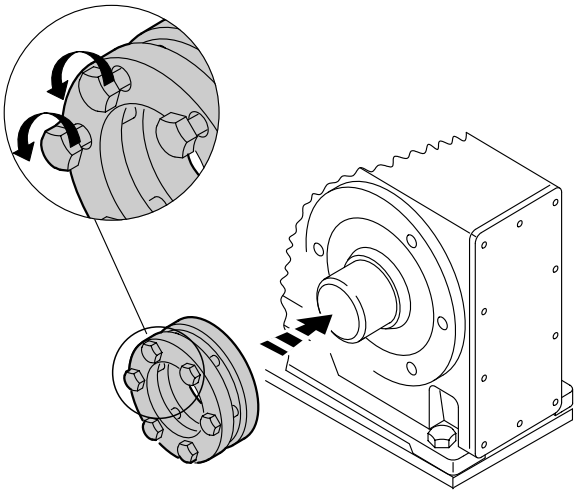
36028797230907147



7. Push the bushing into the gear unit up to the stop.

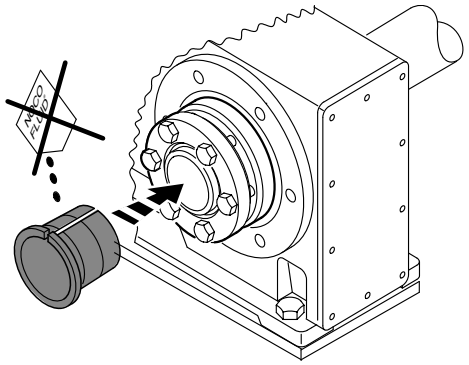
9007199466686347

25803530/EN – 04/2018



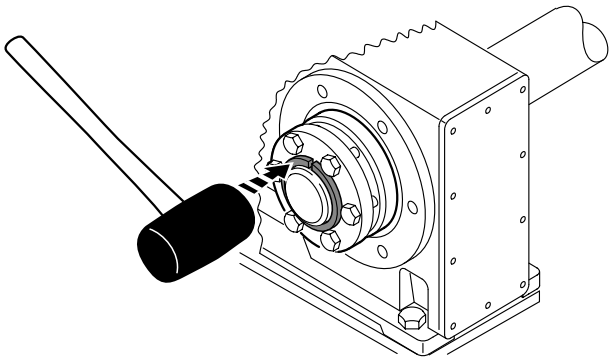
8. Secure the bushing with the stop ring. Attach the stop ring to the bushing with the respective tightening torque. Refer to the following table for the suitable tightening torque.

9007199466741899



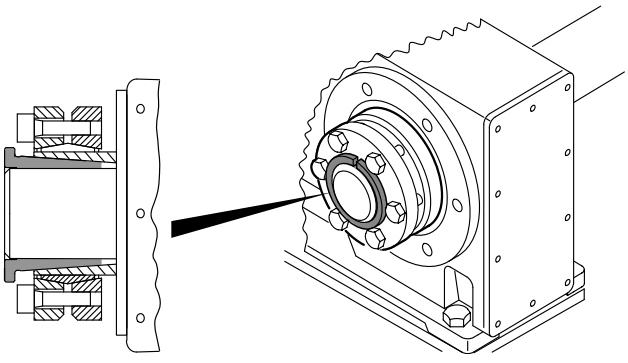
Gear unit type				Tightening torque Nm	
FT..	KT..	ST..	WT..	Standard	Stainless steel
–	–	37	37	10	10
37	37	47	47	10	10
47	39/47	57	–	10	10
57/67	49/57/67	67	–	25	25
77	77	77	–	25	25
87	87	87	–	25	25
97	97	97	–	25	25
107	107	–	–	38	38
127	127	–	–	65	65
157	157	–	–	150	150

9. Make sure that all screws are loosened and slide the shrink disk onto the hollow shaft.



9007199466744075

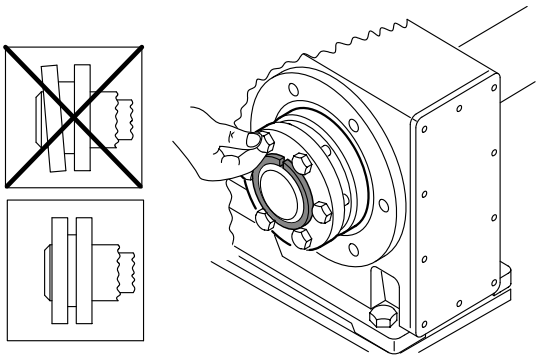
10. Slide the counter bushing onto the customer shaft and into the hollow shaft.



9007199466746251

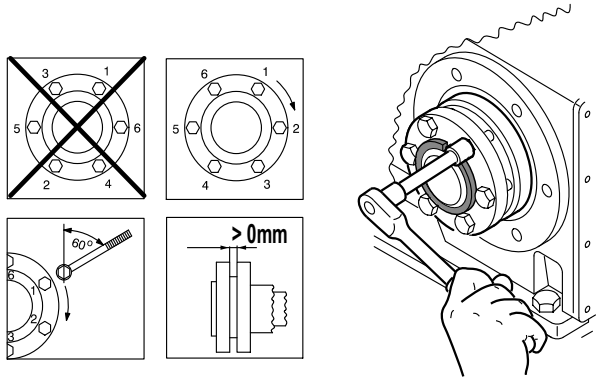
11. In the case of a gear unit **with shaft shoulder**, mount the shrink disk at the shaft shoulder up to the stop. In the case of a gear unit **without shaft shoulder**, mount the shrink disk at a distance of 1 mm to 2 mm from the gear unit housing.
12. Tap lightly on the flange of the counter bushing to ensure that the bushing is fitted securely in the hollow shaft.

9007199466748427



13. Make sure that the customer shaft is seated in the counter bushing.

9007199466750603



25803530/EN – 04/2018

14. Manually tighten the screws of the shrink disk. Make sure that the outer rings of the shrink disk are plane-parallel.

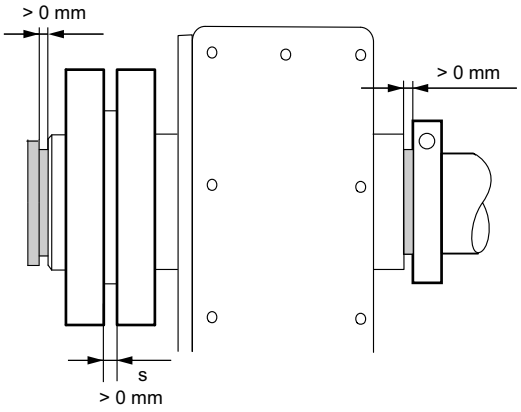
9007199466752779

15. Tighten the locking screws with the specified tightening torque according to the following table. Tighten the screws by working round several times from one bolt to the next (not in diametrically opposite sequence).

18014398721495947

INFORMATION

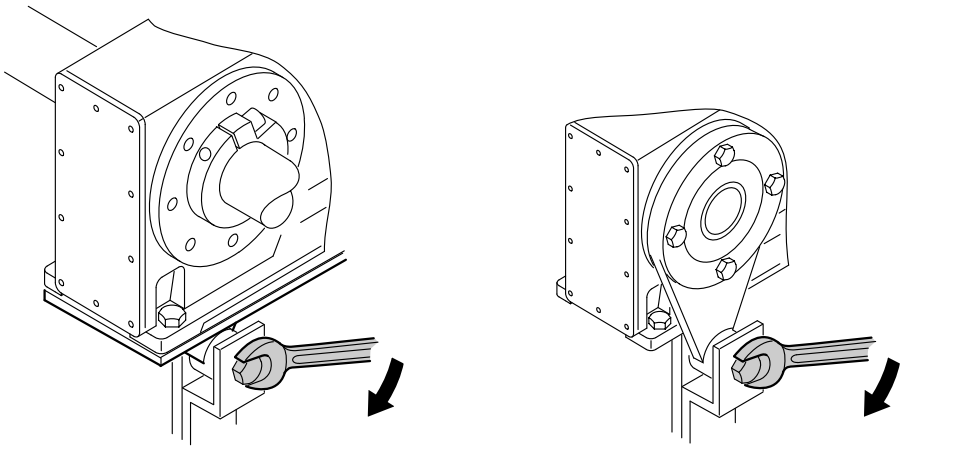
The exact values for the tightening torques are shown on the shrink disk.



INFORMATION

Standard shrink disks and stainless steel shrink disks have the same tightening torques.

Gear unit type				Locking screw	Tightening torque ± 4%
FT..	KT..	ST..	WT..	ISO 4762	Nm
–	–	37	37	M5	4
37	37	47	47	M6	12
47/57/67	39/47/49/57/67	57/67	-	M6	12
77/87/97	77/87/97	77/87/97	–	M8	30
107	107	–	–	M10	59
127/157	127/157	–	–	M12	100

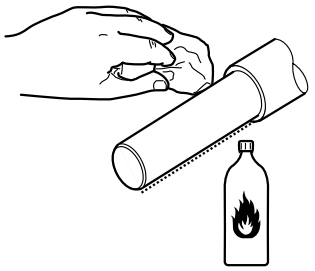


16. After installation, make sure the remaining gap "s" between the outer rings of the shrink disk is > 0 mm.

17. Make sure that the remaining gap between counter bushing and hollow shaft end, as well as between hollow shaft end and the stop ring is > 0 mm.

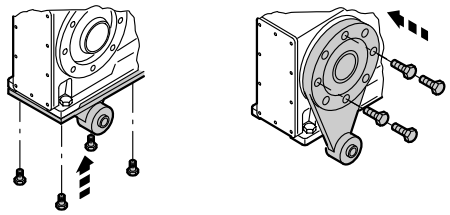
27021600112884107

18. Tighten the torque arm. Note the information in chapter "Torque arm for shaft-mounted gear units" (→ 🗎 39).



20623147019

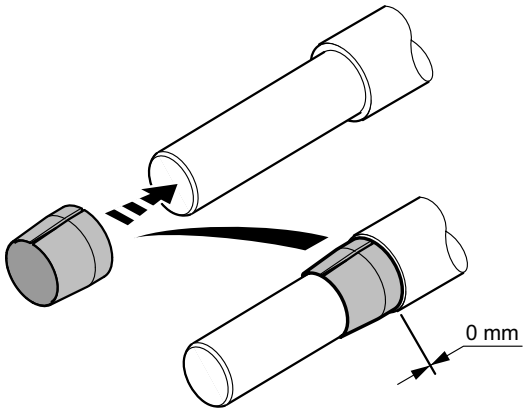
25803530/EN – 04/2018



4.8.2 Mounting a customer shaft with contact shoulder

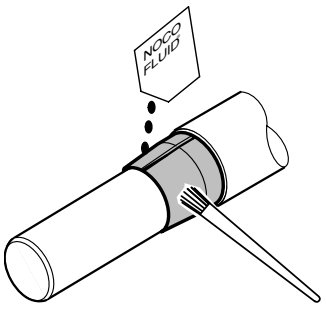
1. Clean the customer shaft and the inside of the hollow shaft. Ensure that all traces of grease or oil are removed.

9007214342258187



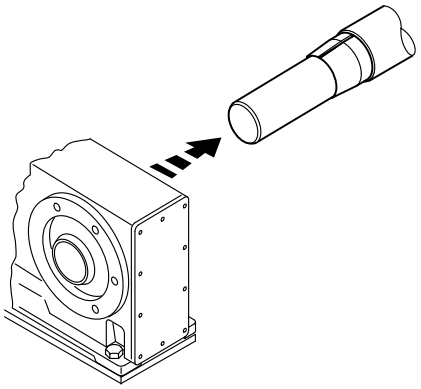
2. Attach the torque arm to the drive unit. Note the information in chapter "Torque arm for shaft-mounted gear units" (→ 🗎 39).

K..7 **S../W../K..9**



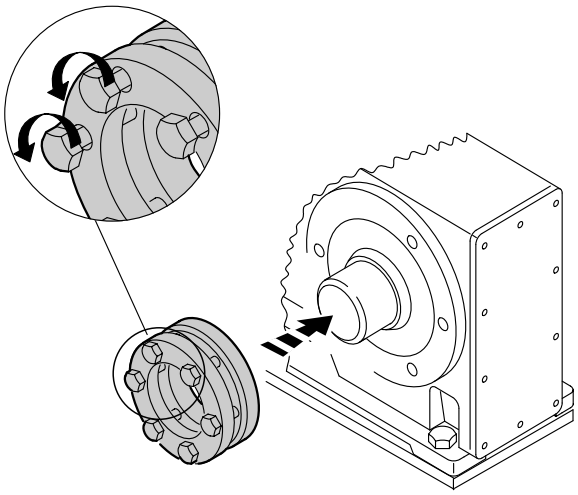
20622111627

3. Slide the bushing onto the customer shaft.



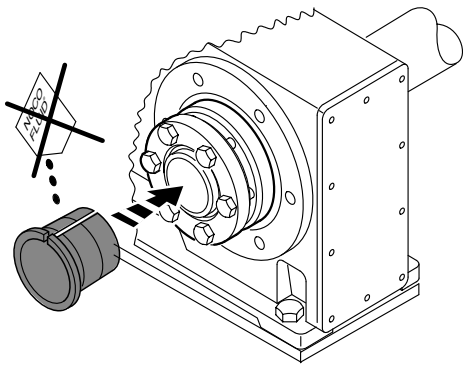
2349377035

4. Apply NOCO® fluid directly to the bushing. Spread carefully.



2349367435

5. Push the gear unit onto the customer shaft.

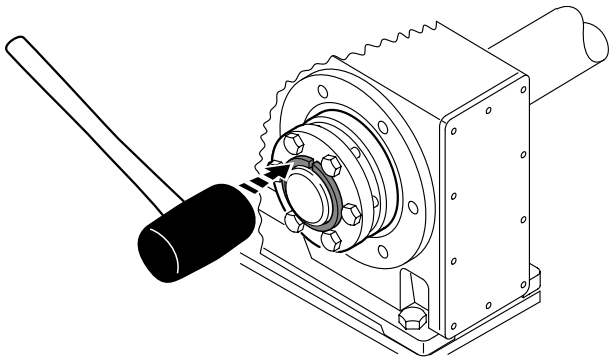


5129650443

6. Ensure that all screws are loosened. Slide the shrink disk onto the hollow shaft.

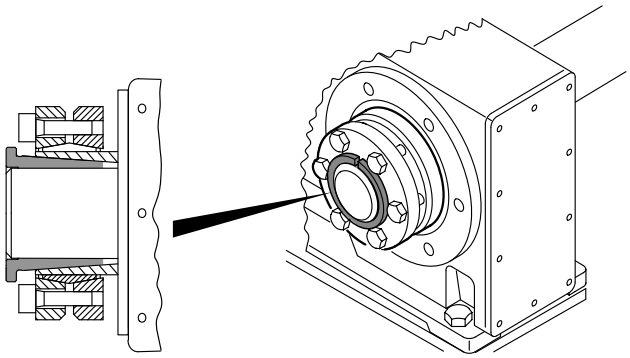
9007199466744075

7. Slide the counter bushing onto the customer shaft and into the hollow shaft.



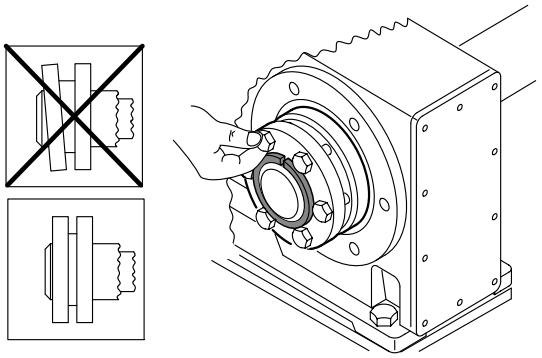
9007199466746251

8. In the case of a gear unit **with shaft shoulder**, mount the shrink disk at the shaft shoulder up to the stop. In the case of a gear unit **without shaft shoulder**, mount the shrink disk at a distance of 1 mm to 2 mm from the gear unit housing.



25803530/EN – 04/2018

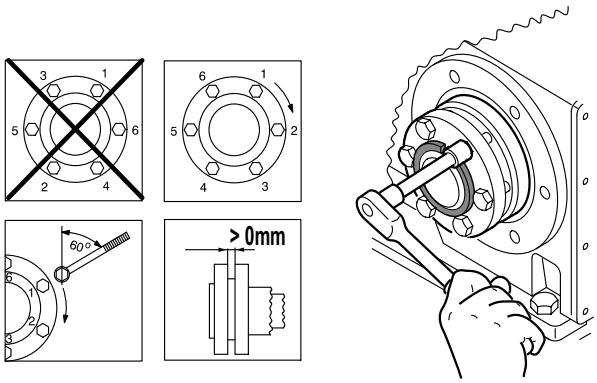
9. Tap lightly on the flange of the counter bushing to ensure that the bushing is fitted securely in the hollow shaft.



9007199466748427

10. Make sure that the customer shaft is seated in the counter bushing.

9007199466750603



11. Manually tighten the screws of the shrink disk. Make sure that the outer rings of the shrink disk are plane-parallel.

9007199466752779

25803530/EN – 04/2018

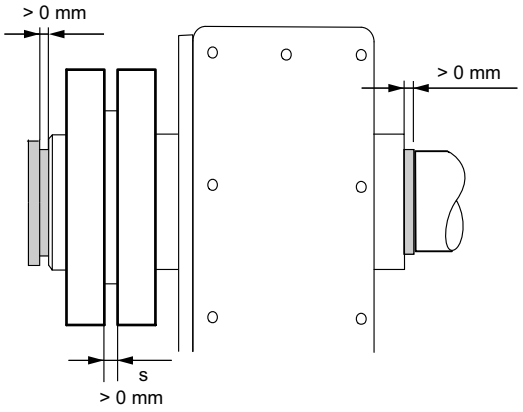
12. Tighten the locking screws with the specified tightening torque according to the following table. Tighten the screws by working round several times from one bolt to the next (not in diametrically opposite sequence).

18014398721495947

INFORMATION

The exact values for the tightening torques are shown on the shrink disk.

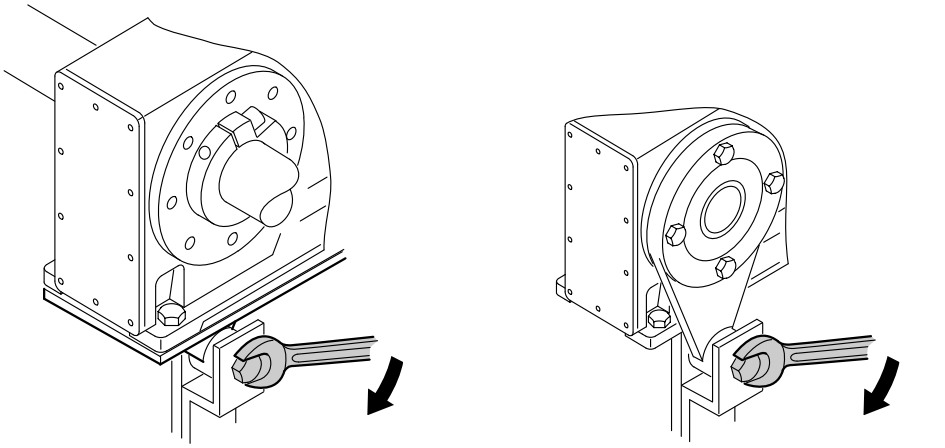
INFORMATION



Standard shrink disks and stainless steel shrink disks have the same tightening torques.

Gear unit type				Locking screw	Tightening torque ± 4%
FT..	KT..	ST..	WT..	ISO 4762	Nm
–	–	37	37	M5	4
37	37	47	47	M6	12
47/57/67	39/47/49/57/67	57/67	-	M6	12
77/87/97	77/87/97	77/87/97	–	M8	30
107	107	–	–	M10	59
127/157	127/157	–	–	M12	100

13. After installation, make sure the remaining gap "s" between the outer rings of the shrink disk is > 0 mm.



25803530/EN – 04/2018

14. Make sure that the remaining gap between counter bushing and hollow shaft end, as well as between the hollow shaft end and customer shaft shoulder is > 0 mm.

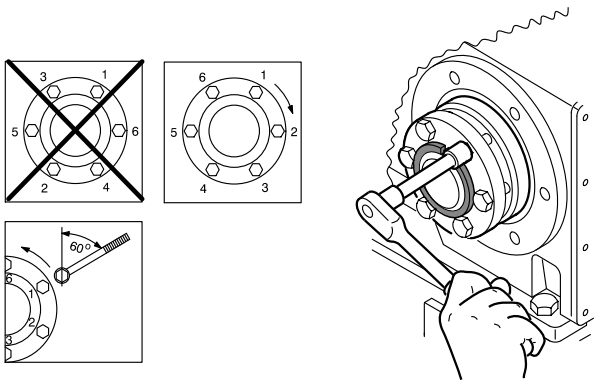
22017650059

15. Mount the torque arm and firmly tighten it. Note the information in chapter "Torque arm for shaft-mounted gear units" (→ 🗎 39).

20623147019

4.8.3 Removing the shaft-mounted gear unit

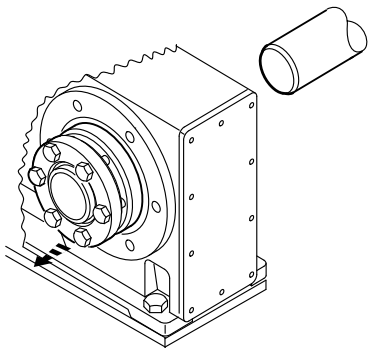
⚠ CAUTION



Risk of burns caused by hot surfaces

Severe injuries

- Let the units cool down before working on them.



Proceed as follows:

1. To prevent the outer rings from jamming, loosen the locking screws for a quarter turn, one after the other.

2903644171

2. Unscrew the locking screws evenly one after the other. Do not remove the locking screws completely.
3. Remove the conical steel bushing. If required, use the outer rings as pullers. Proceed as follows to do so:
   - Remove all the locking screws.
   - Screw the respective number of screws in the tapped holes of the shrink disk.
   - Support the inner ring against the gear unit housing.
   - Pull off the conical steel bushing by tightening the screws.
4. Remove the gear unit from the shaft.

9007202158521227

5. Remove the shrink disk from the hub.

INFORMATION

There is no need to dismantle removed shrink disks before they are reinstalled.

25803530/EN – 04/2018

4.8.4 Cleaning and lubricating shaft-mounted gear units

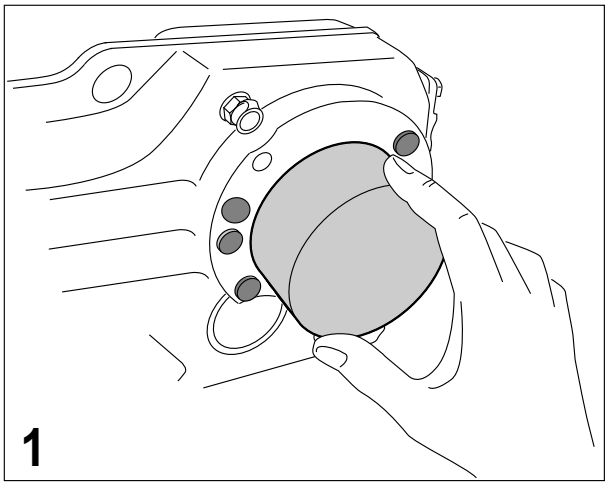
- If the shrink disk is dirty, clean and lubricate the shrink disk.
- Lubricate the tapered surfaces with one of the following solid lubricants:

Lubricant (Mo S2)	Sold as
Molykote 321 (lube coat)	Spray
Molykote spray (powder spray)	Spray
Molykote G Rapid	Spray or paste
Aemasol MO 19P	Spray or paste
Aemasol DIO-sétral 57 N (lube coat)	Spray

- Grease the locking screws with a multipurpose grease such as Molykote BR 2.

25803530/EN – 04/2018

4.9 Mounting the cover



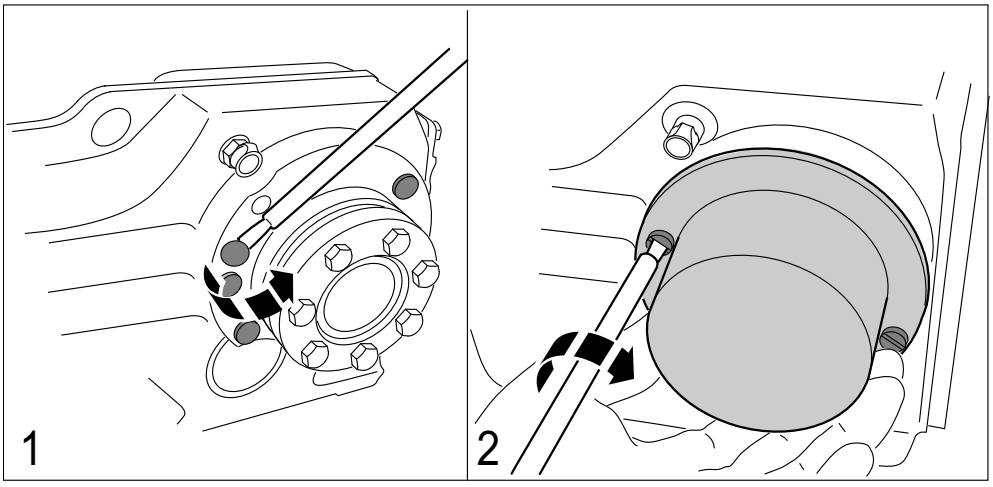
⚠ CAUTION

Injury due to assembly work during operation.

Injury

- Before you begin working on the unit, disconnect the motor from the power supply. Safeguard the drive against unintentional restart.

4.9.1 Mounting the rotating cover



662284299

1. Slide the rotating cover onto the shrink disk until it snaps in.

4.9.2 Mounting the fixed cover

Proceed as follows:

1. Remove the plastic plug on the gear unit housing (see figure 1).

9007199273238539

2. Use the delivered screws to mount the cover to the gear unit housing (see figure 2).

25803530/EN – 04/2018

4.9.3 Operation without cover

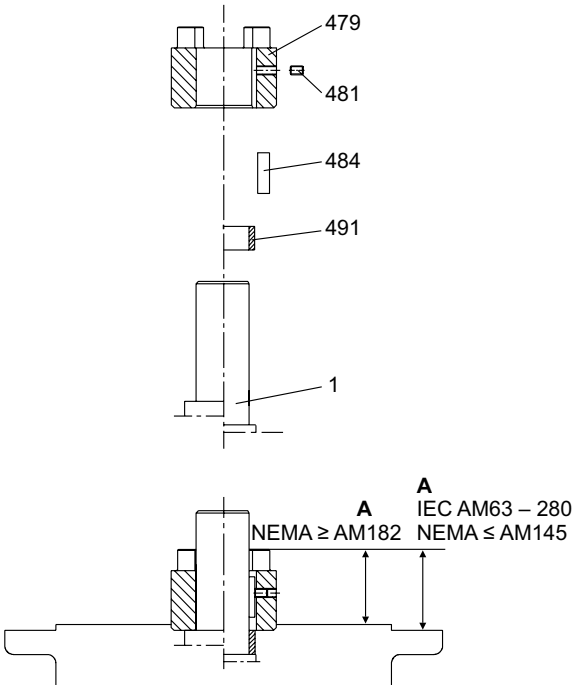
In certain application cases, e.g. with a through-shaft, a cover cannot be installed. The cover is not necessary if the system or unit manufacturer provides corresponding components to guarantee for compliance with the required degree of protection. If this results in additional maintenance, the manufacturer has to describe this in the operating instructions for the system or component.

25803530/EN – 04/2018

4.10 Coupling of AM adapters

4.10.1 Mounting the IEC adapter AM63 – 280/NEMA adapter AM56 – 365

NOTICE



Damage to the adapter due to ingress of moisture or dirt (e.g. dust) when a motor/drive is attached to the adapter.

Damage to the adapter

- Seal the adapter with an anaerobic fluid seal.
- When the motor/drive to be attached has openings or bores that provide access to the inside of the adapter, seal these against dust or liquid.

INFORMATION

To avoid contact corrosion, SEW-EURODRIVE recommends to apply NOCO® fluid to the motor shaft before mounting the coupling half.

20577139211

[1] Motor shaft
[479] Coupling half
[481] Set screw
[484] Key
[491] Spacer tube

Proceed as follows:

1. Clean the motor shaft and flange surfaces of the motor and the adapter.
2. Remove the key from the motor shaft. Replace the key from the motor shaft with the supplied key [484] (not AM63 and AM250).
3. Heat the coupling half [479] to approx. 80 °C – 100 °C and push the coupling half onto the motor shaft. Position as follows:

- IEC adapter AM63 – 225 until stop at motor shaft shoulder.

25803530/EN – 04/2018

- IEC adapter AM250 – 280 to distance "A". The values for the distance "A" are listed in the following table.
- NEMA adapter with spacer tube [491] to distance "A". The values for the distance "A" are listed in the following table.

4. Secure the key and coupling half using the set screw [481] on the motor shaft. Refer to the following table for the required tightening torque "T_A".
5. Check the position of the coupling half. The values for the distance "A" are listed in the following table.
6. Seal the contact surfaces between the adapter and motor using a suitable sealing compound.
7. Mount the motor on the adapter. Ensure that the coupling claws of the adapter shaft are engaged in the plastic cam ring.

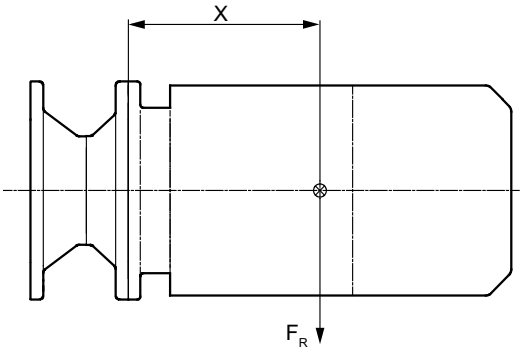
Permitted loads

NOTICE

Overloading of the gear unit due to excessive weight or excessive power rating of an attached motor.

Gear unit failure



- Note that the load data specified in the following table are not to be exceeded.
- Make sure that the approved power rating (torque and speed) on the adapter is observed according to the nameplate.

NOTICE

Danger due to static overdetermination when motors are additionally attached via a foot plate.

Damage to property

- A motor attached at the foot relieves the interface on the adapter, but you have to make sure that the attached foot-mounted motor is attached to the customer's construction stress-free.

9007199273254411

⊗ Motor's center of gravity
X Distance from adapter flange – motor center
F_R Overhung load

Permitted loads for gear unit series R..7, F..7, K..7, K..9, and S..7:

Adapter type		x[1]	F_R[1] N	
IEC	NEMA	mm	IEC adapter	NEMA adapter

1) Maximum rated power of the attached standard electric motor at 1400 1/min

4.10.2 AM adapter with AM../RS backstop

Check the direction of rotation of the drive prior to mounting or startup. In case of a wrong direction of rotation, contact SEW-EURODRIVE.

The backstop is maintenance-free in operation. Backstops have a minimum lift-off speed depending on the size (see following table).

NOTICE

If the speed is below the minimum lift-off speed of the drive, the backstop is subject to wear and heats up.

Possible damage to property.

- In nominal operation the lift-off speed of the drive must not drop below the specified minimum.
- During startup or braking, the lift-off speed of the drive may drop below the minimum levels.

Type	Maximum locking torque of the backstop Nm	Minimum lift-off speed min^{-1}
AM80/90/RS AM143/145/RS	65	820

AM160/180/RS AM254/286/RS	1450	480
AM200/225/RS AM324-365/RS	1950	450
AM250/280/RS	1950	450

4.10.3 Mounting of third-party motors at AM and AR/AL adapters

If a third-party motor is mounted, the customer must ensure that the permitted weight and the power at the adapter are adhered to according to the operating instructions. For information on the permitted loads, refer to chapter "Permitted loads" (→ 🗎 69).

Type	X[1)] mm	F_R[1)] N
AR/AL71	77	375
AR/AL80/90	113	320
AR/AL100/112	144	1560
AR/AL132[2)]	186	1230
AR/AL132	186	3630
AR/AL160/180	251	3540

[1)] If the center of gravity distance x increases, the maximum permitted weight F_{R_max} of the attached motor must be reduced linearly. If the center of gravity distance x decreases, the maximum permitted weight F_{R_max} must not be increased.

[2)] Diameter of the adapter output flange: 160 mm

4.10.4 AM adapter with foot-mounted motor

A foot-mounted motor reduces the loads at the adapter interface. The foot-mounted motor at the adapter must be installed without tensions at the customer construction.

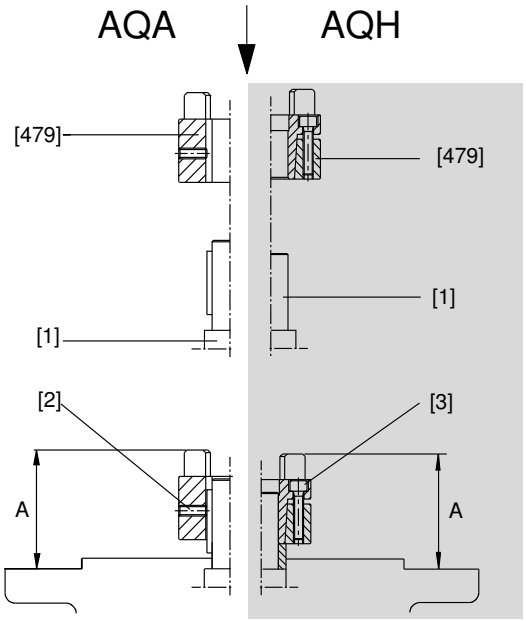
25803530/EN – 04/2018

4.11 AQ. adapter coupling

4.11.1 Mount adapter AQA80 – 190 (with keyway)/Adapter AQH80 – 190 (without keyway)

NOTICE

Damage to the adapter due to ingress of moisture or dirt (e.g. dust) when a motor/drive is attached to the adapter.



Damage to the adapter

- Seal the adapter with an anaerobic fluid seal.
- When the motor/drive to be attached has openings or bores that provide access to the inside of the adapter, seal these against dust or liquid.

INFORMATION

For AQA: To avoid contact corrosion, SEW-EURODRIVE recommends applying NOCO® fluid to the motor shaft before mounting the coupling half.

For AQH: Using NOCO® fluid is not approved.

9007199466855947

[1] Motor shaft
[2] Lock washer
[3] Washer
[479] Coupling half

Proceed as follows:

1. Clean the motor shaft and flange surfaces of the motor and the adapter.
2. **AQH design:** Loosen the screws of the coupling half [479] and loosen the conical connection.
3. **AQA/AQH design:** Heat the coupling half to approx. 80 °C – 100 °C and push the coupling half onto the motor shaft up to distance "A". The values for the distance "A" are listed in the table in chapter "Setting standards and tightening torques" (→ 🗎 74).

4. **AQH design:** Tighten the screws evenly in diametrically opposite sequence, working round several times. The values for the tightening torque "T_A" are listed in the table in chapter "Setting standards and tightening torques" (→ 🗎 74).
5. **AQA design:** Secure the coupling half using the set screw (see figure).
6. Check the position of the coupling half. The values for the distance "A" are listed in the table in chapter "Setting standards and tightening torques" (→ 🗎 74).
7. Mount the motor onto the adapter, making sure that the claws of the two coupling halves engage in each other.
   ⇨ The force that must be applied when joining the two coupling halves is dissipated after final assembly, so there is no risk of any axial load being applied to adjacent bearings.

4.11.2 Setting standards and tightening torques

Type	Coupling Ø	Distance A	Screws		Tightening torque T_A Nm	
	mm	mm	AQA	AQH	AQA	AQH

AQA /AQH 190 /1 /2		76.5				
AQA /AQH 190 /3	38	100	M8	8 × M6	10	14

4.11.3 Permitted loads

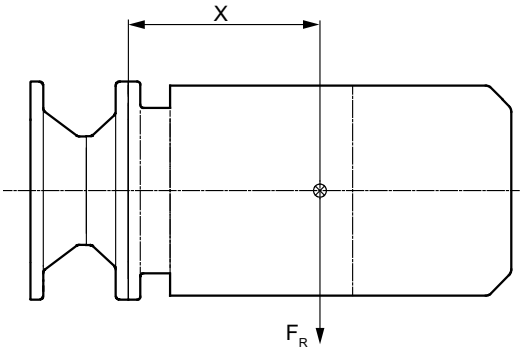
NOTICE

Overloading of the gear unit due to excessive weight or excessive power rating of an attached motor.

Gear unit failure

- Note that the load data specified in the following table are not to be exceeded.
- Make sure that the approved power rating (torque and speed) on the adapter is observed according to the nameplate.

25803530/EN – 04/2018



NOTICE

Danger due to static overdetermination when motors are additionally attached via a foot plate.

Damage to property

- A motor attached at the foot relieves the interface on the adapter, but you have to make sure that the attached foot-mounted motor is attached to the customer's construction stress-free.

The following figure shows the permitted force application points for the permitted maximum weights:

9007199273254411

⊗ Motor's center of gravity
X Adapter flange – motor center distance
F_R Overhung load

Type	x[1)] mm	F_R[1)] N

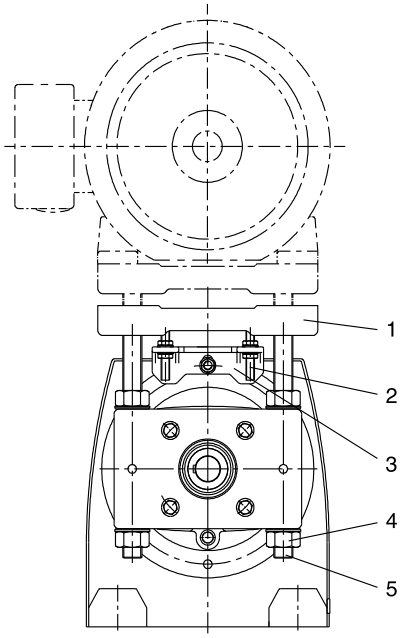
Type	x[1)] mm	F_R[1)] N
EWH02	120	56
EWH03	120	56



1) Maximum load values for connection screws of strength class 8.8. If the center of gravity distance x increases, the maximum permitted weight F_{R_max} of the attached motor must be reduced linearly. If the center of gravity distance x decreases, the maximum permitted weight F_{R_max} must not be increased.

25803530/EN – 04/2018

4.13 AD Input shaft assembly

Observe chapter "Mounting the drive components and output elements" (→ 🗎 37) when installing drive components.

4.13.1 Mounting the cover with motor platform AD../P

212119307

[1] Motor platform
[2] Stud bolt (only AD6/P / AD7/P)
[3] Support (only AD6/P / AD7/P)
[4] Nut
[5] Threaded column

To mount the motor and to adjust the motor platform proceed as follows:

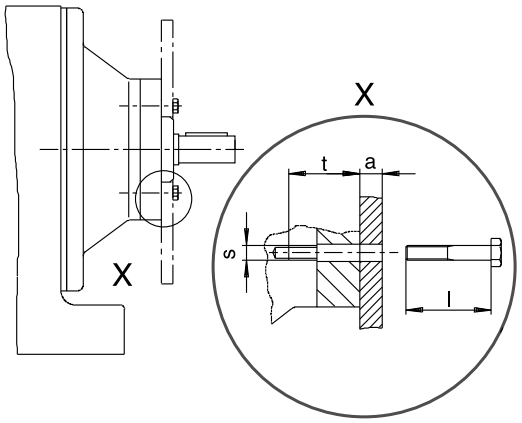
1. Set the motor platform [1] to the required mounting position by evenly tightening the adjusting nuts [4].
2. If necessary, remove the lifting eyebolt/lifting eye of the helical gear unit to reach the lowest adjustment position. Touch up any damage to the paint work.
3. Align the motor on the motor platform [1] so that the shaft ends are in line. Attach the motor.
4. Mount the drive component onto the input side shaft end and the motor shaft.
5. Align drive component, shaft end and motor shaft. If necessary correct the motor position again.
6. Put on the traction elements (V-belt, chain, etc.) and apply a preload by evenly adjusting the motor platform [1]. Do not stress the motor platform and the columns against each other when doing this.
7. To fasten the threaded columns [5] tighten the nuts [4] that are not used for adjustment.

25803530/EN – 04/2018

4.13.2 Special aspects of AD6/P and AD7/P

Proceed as follows:

1. Unscrew the nuts on the threaded bolts [2] before adjustment to allow the threaded bolts [2] to move axially in the support [3] without restriction.
2. Only tighten the nuts when the final adjustment position is reached.



INFORMATION

Do not adjust the motor platform [1] via the support [3].

4.13.3 AD../ZR input shaft assembly with centering shoulder

Mounting applications on the input shaft assembly with centering shoulder

1. Prepare screws of a suitable length for attaching the application. The following figure shows the screw length l = t + a. **Round off the result to the next smaller standard length**.

18014398721603467

a Strength of the additional element
t Screw-in depth (see table)
s Retaining thread (see table)

2. Remove the retaining screw from the centering shoulder
3. Clean the contact surface and the centering shoulder.
4. Clean the threads of the new bolts and apply a thread locking compound (e.g. Loctite® 243) to the first few threads.
5. Place the application on the centering shoulder. Tighten the retaining screws with the specified tightening torque "T_A" (see following table).

Type	Screw-in depth t mm	Retaining thread	Tightening torque T_A for connection screws of strength class 8.8 Nm
AD2/ZR	25.5	M8	27
AD3/ZR	31.5	M10	54
AD4/ZR	36	M12	93
AD5/ZR	44	M12	93
AD6/ZR	48.5	M16	230

25803530/EN – 04/2018

Type	Screw-in depth t mm	Retaining thread	Tightening torque T_A for connection screws of strength class 8.8 Nm
AD7/ZR	49	M20	464
AD8/ZR	42	M12	93

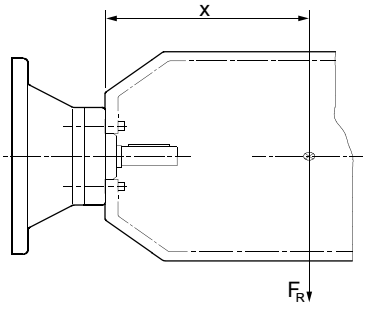
Permitted loads

The following figure shows the permitted force application points for the permitted maximum weights:

NOTICE

Overloading of the gear unit due to excessive weight or excessive power rating of an attached motor.

Gear unit failure



- Note that the load data specified in the following table are not to be exceeded.
- Make sure that the approved power rating (torque and speed) on the adapter is observed according to the nameplate.

NOTICE

Danger due to static overdetermination when motors are additionally attached via a foot plate.

Damage to property

- A motor attached at the foot relieves the interface on the adapter, but you have to make sure that the attached foot-mounted motor is attached to the customer's construction stress-free.

⊗ Motor's center of gravity
X Distance from adapter flange – motor center
F_R Overhung load

1) Maximum load values for connection screws of strength class 8.8. If the center of gravity distance x increases, the maximum permitted weight F_{R_max} of the attached motor must be reduced linearly. If the center of gravity distance x decreases, the maximum permitted weight F_{R_max} must not be increased.

2) Diameter of the adapter output flange: 160 mm

4.13.4 Cover with backstop AD../RS

Check the direction of rotation of the drive prior to mounting or startup. In case of a wrong direction of rotation, contact SEW-EURODRIVE.

The backstop is maintenance-free in operation. Backstops have a minimum lift-off speed depending on the size (see following table).

NOTICE

If the speed is below the minimum lift-off speed of the drive, the backstop is subject to wear and heats up.

Possible damage to property.

- In nominal operation the lift-off speed of the drive must not drop below the specified minimum.
- During startup or braking, the lift-off speed of the drive may drop below the minimum levels.

Type	Maximum locking torque of the backstop Nm	Minimum lift-off speed min^{-1}
AD2/RS	65	820
AD3/RS	425	620
AD4/RS	850	530

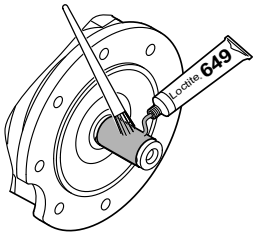
AD8/RS	1950	450

25803530/EN – 04/2018

4.14 Direct mounting of a motor on a gear unit



INFORMATION

Secure all pinions on the motor or input shaft with Loctite® 649 even if a retaining ring is additionally present.

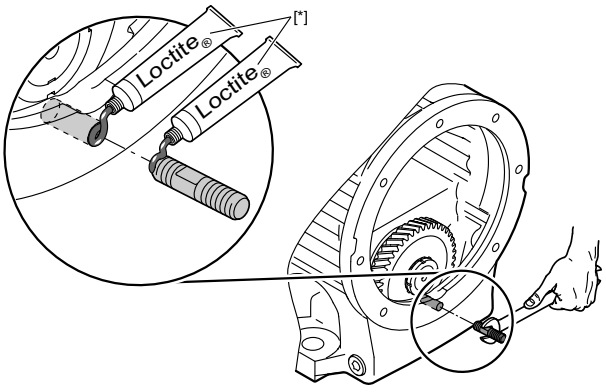
If the pinion is already fastened to the shaft, start cleaning the sealing surface (step 6).

Joining the pinion to the motor or input shaft

1. Clean and degrease the shaft and the bore of the pinion.
2. Apply Loctite® 649 to the shaft after the securing hole over the entire area of the circumference.

22763067787

3. Warm the pinion up to **at least** 100 °C to a **maximum of** 130 °C.
4. Push the pinion onto the shaft.
5. Secure the pinion on the shaft with the retaining ring.



Cleaning the sealing surfaces

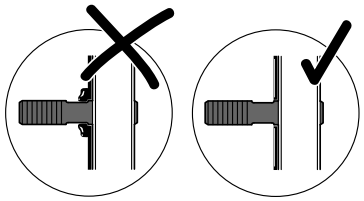
6. Remove oils, grease, irregularities of the surface, rust and old Loctite® residue from the flange surfaces.

Sealing threads that lead into the housing interior

To prevent oil from escaping after installation, flange threads that lead into the housing interior must be sealed!

7. Clean and degrease thread through bores that lead into the housing interior and their studs.
8. Apply Loctite® 574 or Loctite® 5188 (selection according to the table at the end of the chapter) in a continuous ring on the upper threads of the flange thread and the stud.

22795758347



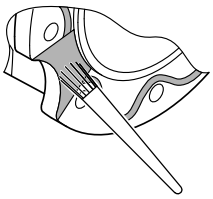
[*] Loctite® according to the table at the end of the chapter

Screwing in the studs

9. Screw the studs into the thread up to the shoulder.

25803530/EN – 04/2018

10. Remove any excess Loctite® (see following diagram) from the sealing surface 60 minutes after screwing in at the latest.



22347379211

Sealing the flange surface

INFORMATION

Always apply the sealant over a large area in narrow places and on the gear units R97, R107, R127, F97 or F107.

11. Only distribute Loctite® 574 or Loctite® 5188 (selection according to the table at the end of the chapter) to one of the sealing surfaces. Apply the sealant in beads or over a large area without gaps. Use a suitable application tool that does not contaminate the sealing surface, for example, a non-shedding brush or a short-hair lamb's wool roller.

Joining flange surfaces

12. Join the flange surfaces together. Next, **immediately** tighten the nuts with the specified torque (see the table at the end). If you tighten the nuts too late, the sealing film can tear.
13. The sealant must harden for 30 minutes and must not come into contact with the gear oil.

Tightening torques

Screw/nut	Tightening torque Nm
M6	11.3
M8	27.3
M10	54
M12	93

25803530/EN – 04/2018

4.15 Accessory equipment

4.15.1 AR.. and AT.. centrifugal and friction couplings

AR.. friction coupling

Drives with a slip clutch consist of a standard gear unit and motor/variable speed gearmotor with an adapter installed between them. This adapter accommodates the slip clutch. In gearmotors with a double gear unit, the slip clutch may be located between the first and second gear units. On delivery, the slip torque is set individually according to the drive selection.

The following figure shows a drive with slip clutch and W speed monitor:

1901048587

[1] Trip cam
[2] Incremental encoder
[3] Driving disk
[4] Friction lining
[5] Cup spring
[6] Slotted nut
[7] Friction hub
[8] Speed monitor

W speed monitor:

The speed monitor is used with constant-speed gearmotors and is connected to the incremental encoder in the adapter.

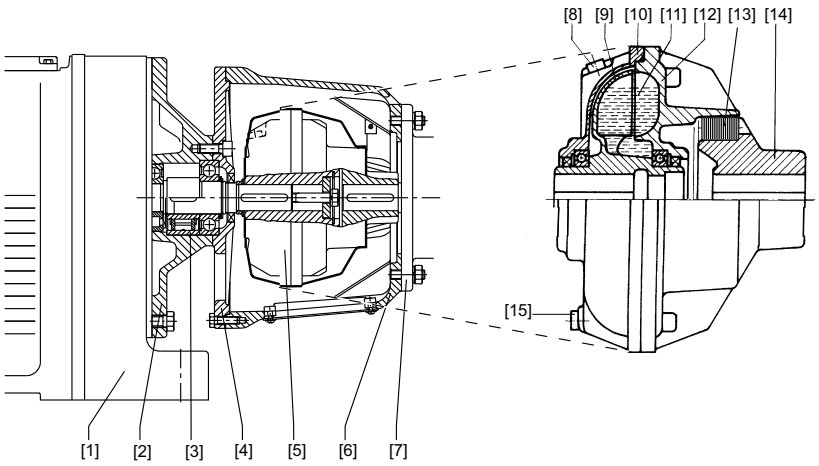
WS slip monitor:

The slip monitor is used with the following components:

- Speed-controlled motors with speed sensor
- VARIBLOC® variable-speed gear units

INFORMATION

For further information about the AR.. coupling, refer to the "Start-up coupling and slip clutch AR.. and AT.." operating instructions.



AT.. hydraulic centrifugal coupling

Hydraulic centrifugal couplings are fluid couplings based on the Föttinger principle. They consist of 2 hinged hemispheres with blades separated by a tight gap.

The applied torque is transmitted by the inertial force of the streaming fluid. This fluid circulates within a closed circuit, between the pump wheel (primary side) [12] on the driving shaft (motor shaft) and the turbine wheel (secondary side) [9] on the driven shaft (gear unit input shaft).

25803530/EN – 04/2018

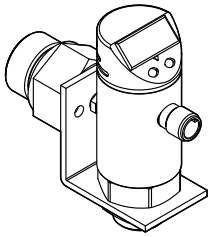
The following figure shows the structure of a drive with hydraulic centrifugal coupling:

9007201155884683

[1]	Gear unit	[6]	Extended housing complete	[11]	Operating fluid (hydraulic oil)
[2]	Basic flange complete	[7]	Motor	[12]	Pump wheel
[3]	Backstop (optional)	[8]	Filler plug	[13]	Elastic components
[4]	Intermediate flange	[9]	Turbine wheel	[14]	Flexible connection coupling

INFORMATION

For detailed information about the AT.. coupling, refer to the "Start-up coupling and slip clutch AR.. and AT.." operating instructions.



4.15.2 Diagnostic units /DUV and /DUO

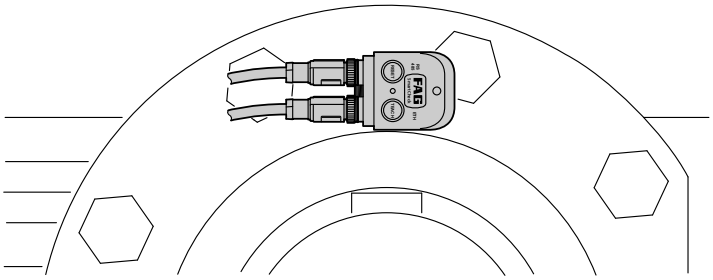
Diagnostic unit DUO

DUO10A comprises a diagnostic unit and a temperature sensor. The temperature sensor (PT100 or PT1000 resistance sensor) is positioned in the gear unit oil to record the oil's temperature. The diagnostic units uses the oil temperature values to calculate the remaining service life of the oil.

The diagnostic unit continuously records the gear unit temperature and calculates the remaining service life for the selected oil type immediately. For this purpose, the diagnostic unit must be supplied with a 24 V voltage supply. Times when the diagnostic unit is switched off are not included in the forecast.

The following figure shows the DUO10A diagnostic unit:

INFORMATION



For further information on the evaluation unit, refer to the manual "DUV30A Diagnostic Unit".

Vibration SmartCheck /DUV40A

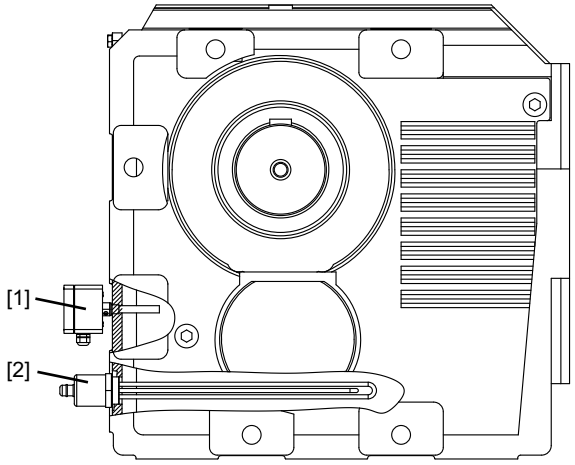
Vibration SmartCheck vibration monitoring is used to detect damage of gear units and gearmotors early (e.g. bearing damage or imbalances). For this purpose, permanent frequency-selective monitoring of the gearmotor is used. Apart from the vibration analysis, additional measured values of up to 3 signal encoders can be detected, recorded and analyzed. The additional signals can be used as reference values for signal analysis e.g. to trigger time or event-based measuring tasks. After the analysis and depending on user-defined alarm limits, the system can switch outputs and display the state using LEDs.

Vibration SmartCheck is configured using the FAG SmartWeb software. If you use several Vibration SmartCheck systems, you can control them via the FAG software SmartUtility Light centrally from one PC.

The full version of the SmartUtility software allows you to open sensors directly via the FAG SmartWeb software, to analyze measurement data in the SmartUtility Viewer and to download configurations or uploading configurations on other devices.

INFORMATION

Further information about the evaluation unit and accessories can be found in the "Vibration SmartCheck" supplement (installation instructions).



25803530/EN – 04/2018

4.15.3 Gear unit heater for gear unit series R..7, F..7, and K..7

An oil heating can be required in order to allow for a smooth startup in the event of a cold start at low ambient temperatures. An oil heating is available with an external or an integrated thermostat depending on the gear unit design.

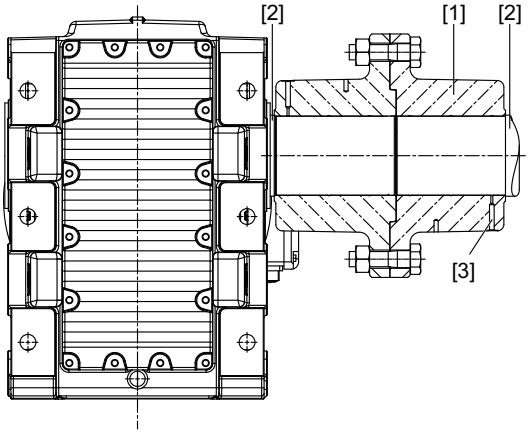
The heater is screwed into the gear unit housing and is controlled via a thermostat. The limit temperature of the thermostat below which the oil must be heated, is set depending on the respective lubricant.

The following figure shows a gear unit with heater and external thermostat:

2060553483

[1] Thermostat [2] Heater

INFORMATION



For further information regarding gear unit heaters, refer to the addendum "Gear unit heaters for gear unit series R..7, F..7 and K..7" to the operating instructions "Gear unit series R..7, F..7, K..7, K..9, S..7, SPIROPLAN® W".

4.15.4 Flange coupling

Flange couplings [1] are rigid couplings for connecting 2 shafts [2].

Flange couplings are suitable for operation in both directions of rotation, but cannot compensate any shaft misalignments.

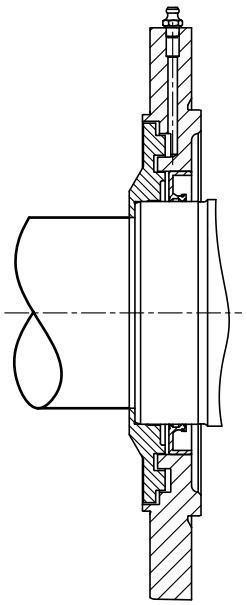
Torque between shaft and coupling is transmitted via a cylindrical interference fit. The two coupling halves are mounted together at the flanges. The couplings are equipped with several disassembly bores [3] for removing the interference fit hydraulically.

27021601961007627

[1] Rigid flange coupling
[2] Customer and gear shaft
[3] Disassembly bores

INFORMATION

For detailed information about the rigid flange coupling, refer to the "Gear Unit Series R..7, F..7, K..7, S..7, and SPIROPLAN® W – Rigid flange coupling" addendum to the operating instructions.



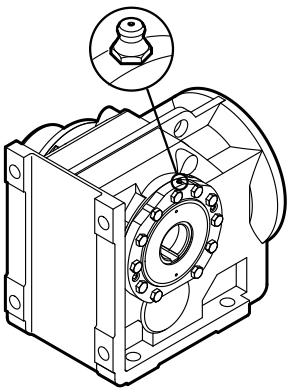
4.15.5 Regreasing the labyrinth seal

Labyrinth seals are used to protect the oil seal in case of very high dust load or other abrasive substances.

Output shaft

The following figure shows an example of a regreasable radial labyrinth seal (taconite).

- Single oil seal with radial labyrinth seal
- Used in **very dusty** environments with abrasive particles



9007204406135947

INFORMATION

The gear shaft must rotate during relubrication.

Position of greasing points

Regreasable sealing systems are usually equipped with taper greasing nipples according to DIN 71412 A. Relubrication must be carried out at regular intervals. The greasing points are located near the output shaft, see following figure:

4986644747

Refilling grease

Regreasable sealing systems can be refilled with lubricating grease. Use moderate pressure to force grease into each lubrication point until new grease leaks out of the sealing gap.

Used grease, including contaminants and sand, is in this way pressed out of the sealing gap.

INFORMATION

Immediately remove the old grease that leaked out.

Inspection and maintenance intervals

Observe the following inspection and maintenance intervals for the regreasing of labyrinth seals:

Time interval	What to do?
Every 3000 operating hours, at least every 6 months	Fill regreasable sealing systems with grease.

Technical data

Sealing and rolling bearing grease

The table shows the lubricants recommended by SEW-EURODRIVE:

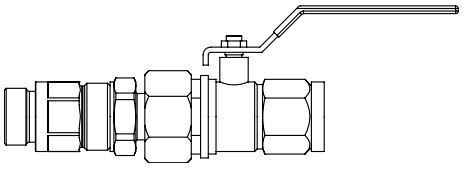
Area of operation	Ambient temperature	Manufacturer	Type
Standard	-40 °C to +80 °C	Fuchs	Renolit CX-TOM 15[1)]
	-40 °C to +80 °C	Klüber	Petamo GHY 133 N
[2)]	-40 °C to +40 °C	Bremer & Leguil	Cassida Grease GTS 2
[3)]	-20 °C to +40 °C	Fuchs	Plantogel 2S

1) Bearing grease based on semi-synthetic base oil
2) Lubricant for the food processing industry
3) Easily biodegradable lubricant for environmentally sensitive areas

INFORMATION

The following grease quantities are required:

- **For fast-running bearings (gear unit input side):** Fill the cavities between the rolling elements one-third full with grease.
- **For slow-running bearings (gear unit output side):** Fill the cavities between the rolling elements two-thirds full with grease.



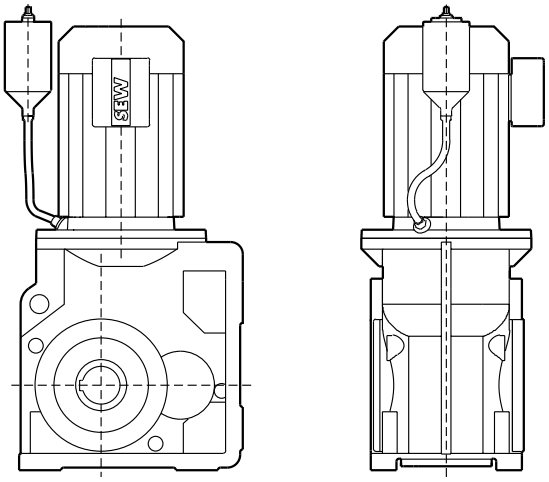
INFORMATION

If a customer wants to use a grease that is not listed in the above table, the customer has to make sure that it is suitable for the intended application.

25803530/EN – 04/2018

4.15.6 Oil drain valve

The gear unit is equipped with an oil drain plug as standard. An oil drain valve can optionally be installed, that enables attaching a drain pipe for changing the gear unit oil.



4984750475

4.15.7 Oil expansion tank

The oil expansion tank allows the lubricant or air space of the gear unit to expand. This means no lubricant can escape the breather valve at high operating temperatures.

SEW-EURODRIVE recommends to use oil expansion tanks for gear units and gearmotors in M4 mounting position and for input speeds > 2000 min^{-1}.

The following figure shows the oil expansion tank of a gearmotor.

4979181323

The oil expansion tank is delivered as assembly kit for mounting onto the gearmotor. In case of limited space or of gear units without motor, the oil expansion tank can also be mounted to nearby machine parts.

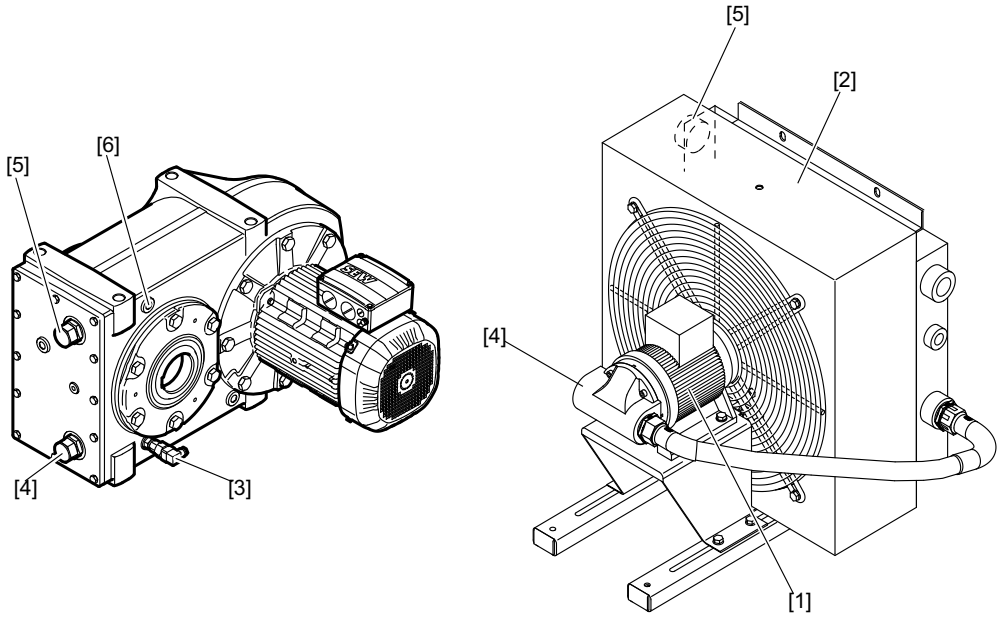
INFORMATION

Transverse acceleration is not permitted for gear units with expansion tank with fixed piping for third party motors and servomotors.

For further information, contact your SEW-EURODRIVE sales representative.

4.15.8 Oil-air cooler for splash lubrication /OAC

If the thermal rating of the naturally cooled gear unit is not sufficient, an oil-air cooling system can be used.



The cooling system is delivered without electrical wiring and piping as a complete unit on a base frame for separate installation.

The standard scope of delivery of the cooling system includes:

- Pump with directly mounted asynchronous motor
- Oil-air heat exchanger
- Temperature switch with 2 switching points

SEW-EURODRIVE uses oil-air cooling systems for standard gear units in sizes OAC 005 and OAC 010.

The following figure shows an example of a standard parallel-shaft helical gear unit next to an oil-air cooler.

9007208235792395

[1]	Motor for pump and fan	[4]	Suction pipe connections
[2]	Oil-air heat exchanger	[5]	Pressure pipe connections
[3]	Temperature switch with 2 switching points	[6]	Option: Oil expansion tank connection

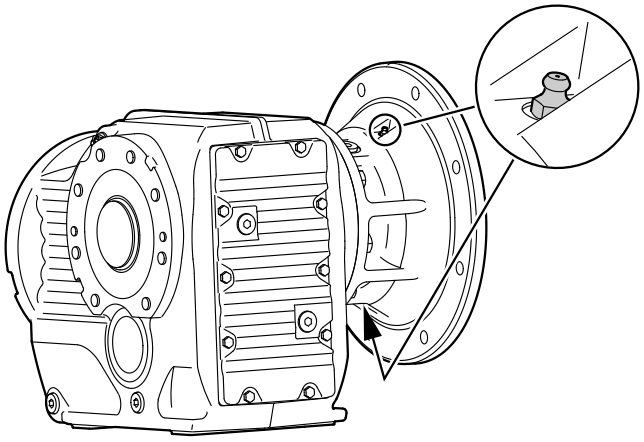
INFORMATION

For more information on the cooling system, refer to the addendum to the operating instructions "Gear unit series R..7, F..7, K..7, K..9, S..7 and SPIROPLAN® W: Oil-air cooler for splash lubrication /OAC".

25803530/EN – 04/2018

4.15.9 Agitator design

Relubrication of the agitator design



A relubrication of the output shaft bearing is offered as an option for the agitator drives FM.., FAM.., KM.. and KAM...

Position of greasing points

INFORMATION

The gear shaft must turn during the relubrication procedure.

Regreasable sealing systems are usually equipped with taper greasing nipples according to DIN 71412 A. The following figure shows the position of the greasing points:

23563258507

Maintenance interval and grease quantities

Relubricate the agitator design after 5000 operating hours. The number of relubrication procedures is limited to 5x. Observe the information on the required grease quantities in the following table:

Size	Grease quantity for relubrication g
67	7
77	15
87	15
97	23
107	50
127	48
157	66

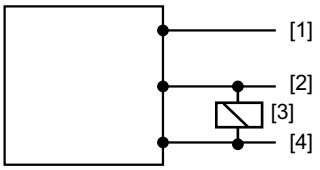
The table shows the lubricants recommended by SEW-EURODRIVE:

Area of operation	Ambient temperature	Manufac-turer	Type
Standard	-40 °C to +80 °C	Fuchs	Renolit CX-TOM 15[1)]
	-40 °C to +80 °C	Klüber	Petamo GHY 133 N
 2)	-40 °C to +40 °C	Bremer & Leguil	Cassida Grease GTS 2
 3)	-20 °C to +40 °C	Fuchs	Plantogel 2S

1) Bearing grease based on semi-synthetic base oil
2) Lubricant for the food processing industry
3) Easily biodegradable lubricant for environmentally sensitive areas

INFORMATION

If a customer wants to use a grease that is not listed in the above table, the customer has to make sure that it is suitable for the intended application.

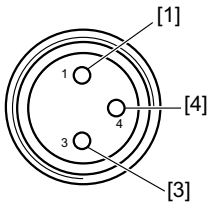


Leak sensor (Drywell design) with the agitator design

A Drywell design with level sensor is offered as an option for the agitator drives FM.., FAM.., KM.. and KAM...

One of the two following sensors is used, depending on the gear unit size:

Level sensor for sizes 67 – 97

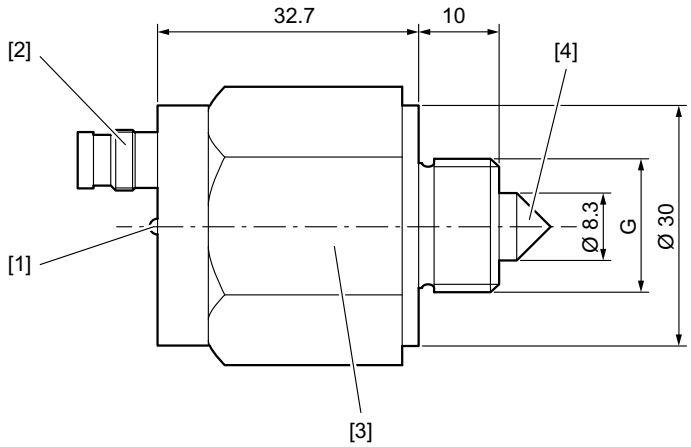


Electrical connection

23527583115

[1] DC 12 V – 32 V
[2] Output
[3] Load
[4] 0 V

Pin assignment



23527590411

[1] DC 12 V – 32 V
[4] Output
[3] Load

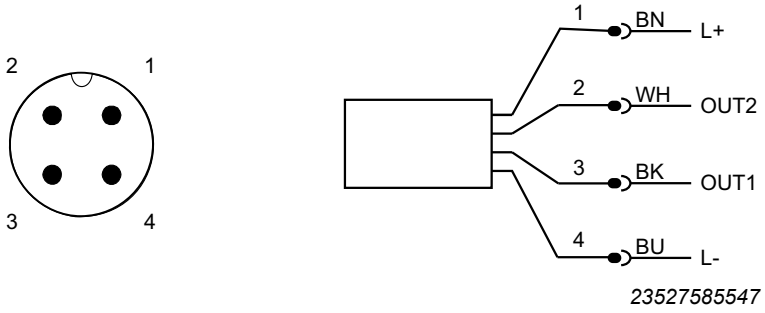
25803530/EN – 04/2018

Dimensions

23563256075

[1] LED function indicator
[2] M8×1 circular connector; 3-pin (alternatively cable termination)
[3] Wrench size: 30
[4] Glass prism

Technical data



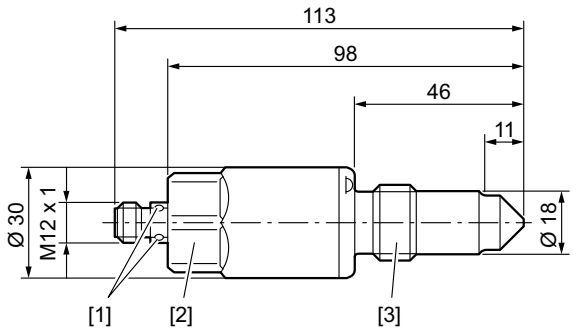
Measuring accuracy	± 0.5 mm
Minimum distance of the glass tip to an opposite surface	≥ 10 mm
Mounting position	Any
Optical display of the switching status	1 LED
Process connection	Male thread G3/8", G 1/2" or M12x1

For more information, please contact SEW-EURODRIVE.

Level sensor for sizes 107 – 157

Electrical connection

M12 plug-in connection:



23527585547

25803530/EN – 04/2018

5 Startup

⚠ CAUTION

Damage to the gear unit due to improper startup.

Possible damage to property.

- Observe the following information.

- Check the correct oil level before startup; see chapter "Inspection/maintenance work on the gear unit" (→ 🗎 113).
- The oil level plugs and oil drain plugs, as well as the breather plugs and breather valves must be freely accessible.
- Observe the maximum and rms values of project planning during startup of gear units with servomotor. The buyer is obliged to make the data available to the end user.
- The most important technical data is provided on the nameplate. Additional data relevant for operation is available in drawings and the order confirmation.
- After gear unit setup, ensure that all retaining screws are tight.
- Make sure that the alignment has not changed after tightening the mounting elements.
- Prior to startup, ensure that rotating shafts as well as couplings are equipped with suitable protective covers.
- If the gear unit has an oil sight glass to monitor the oil level, the oil sight glass must be protected against damage.
- It is essential that there is no open fire or risk of sparks when working on the gear unit.
- Protect the gear unit from falling objects.
- Remove transport protection prior to startup.
- Strictly observe the safety notes in the individual chapters.

5.1 Inverter-operated gearmotors

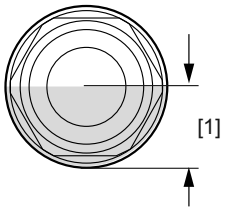
For gear units with servomotor, the maximum and r.m.s. values of project planning must be observed during startup. The buyer is obliged to make the data available to the user.

5.2 Checking the oil level

Before startup, make sure that the oil level corresponds to the mounting position. Observe the chapter "Checking the oil level and changing the oil" (→ 🗎 113).

If the gear unit is equipped with an oil sight glass, you can also determine the oil level at the oil sight glass.

25803530/EN – 04/2018



NOTICE

Damage to the gear unit due to oil leaking from the damaged oil sight glass.

Possible damage to the unit

- Attach a protective device to prevent the oil sight glass from being damaged by mechanical impacts.

1. Observe the information in chapter General information.
2. Check the oil level at the oil sight glass according to the following figure:

4158756363

[1] The oil level must be within this range.

3. Proceed as follows if the oil level is too low:
   - Open the respective oil fill plug, see chapter "Inspection/maintenance for the gear unit" (→ 🗎 113).
   - Fill in new oil of the same type via the oil fill plug up to the mark.
   - Screw in the oil fill plug.

Before startup, make sure that the oil level corresponds to the mounting position. Observe the chapter "Checking the oil level and changing the oil" (→ 🗎 113).

5.3 Pseudo-leakage at shaft seals

Due to their operating principle, seals between moving surfaces at shaft passages cannot be completely tight, as a lubricant film must form during operation. The lubricant film between shaft and sealing lip keeps the built-up of heat and wear on the sealing system to a minimum and ensures the intended service life. The optimum sealing properties are only achieved after the run-in phase.

25803530/EN – 04/2018

5.4 Helical-worm gear units and SPIROPLAN® W gear units

5.4.1 Run-in period

SPIROPLAN® and helical-worm gear units require a run-in period of at least 48 h before reaching their maximum efficiency. A separate run-in period applies for each direction of rotation if the gear unit is operated in both directions of rotation. The table shows the average power reduction during the run-in period.

Helical-worm gear units

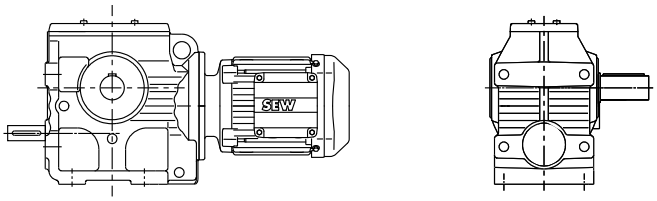
	Worm	
	i range	**η reduction**
1-start	Approx. 50 – 280	Approx. 12%
2-start	Approx. 20 – 75	Approx. 6%
3-start	Approx. 20 – 90	Approx. 3%
4-start	–	–
5-start	Approx. 6 – 25	Approx. 3%
6-start	Approx. 7 – 25	Approx. 2%

SPIROPLAN® gear units

W10/W20/W30		W37/W47	
i range	**η reduction**	**i range**	**η reduction**
Approx. 35 – 75	Approx. 15%		
Approx. 20 – 35	Approx. 10%		
Approx. 10 – 20	Approx. 8%	Approx. 30 – 70	Approx. 8%
Approx. 8	Approx. 5%	Approx. 10 – 30	Approx. 5%
Approx. 6	Approx. 3%	Approx. 3 – 10	Approx. 3%

5.4.2 Helical-worm gear unit with projecting worm shaft

⚠ CAUTION



Risk of injury due to rotating parts

Injury

- Before you operate the helical-worm gear unit using the inserted handwheel or the hand crank, de-energize the drive.
- If the handwheel or the hand crank remains attached to the shaft during operation, take appropriate measures to prevent injuries.

25803530/EN – 04/2018

The following figure shows a helical-worm gearmotor with projecting worm shaft:

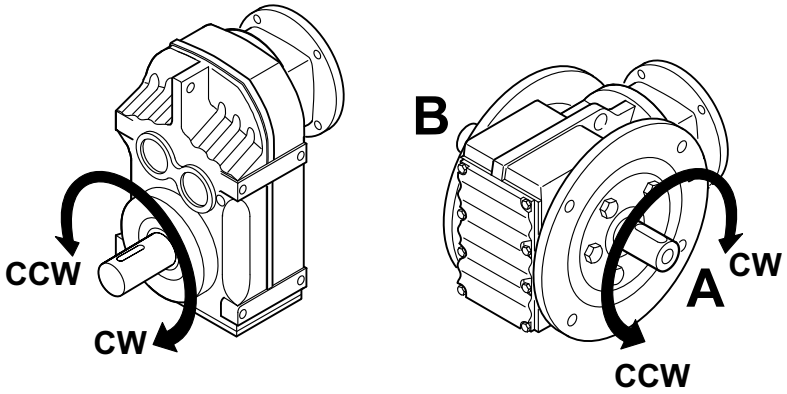
15050784011

5.5 Helical/parallel-shaft helical/helical-bevel gear units

If the gear units were installed according to chapter "Mechanical installation" (→ 🗎 26), no special startup notes must be observed for helical, parallel-shaft helical and helical-bevel gear units.

25803530/EN – 04/2018

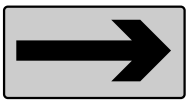
5.6 Gear units with backstop



NOTICE

Operating the motor in the blocking direction could destroy the backstop.

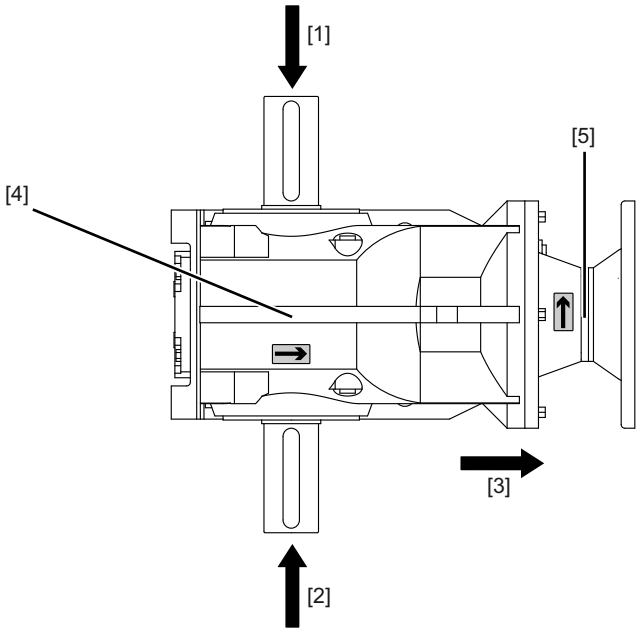
Possible damage to property



- Do not start up the motor in the blocking direction. Before motor startup, make sure the current supply of the motor for the direction of rotation is connected accordingly.
- For control purposes, operation in blocking direction with half the output torque is permitted once.

The purpose of a backstop is to prevent unwanted directions of rotation. During operation, the backstop permits rotation only in the specified direction.

659173899



The permitted direction of rotation is indicated by a direction arrow on the housing:

15985405835

A replacement label is enclosed for the customer.

In right-angle gear units, you also have to indicate whether the direction of rotation is given looking onto the A or B-side.

16117549579

[1] Viewing direction Direction of rotation Output B

[5] Adapter/cover with RS option

5.7 Components made of elastomers with fluorocarbon rubber

⚠ CAUTION

Health risk due to dangerous gases, vapors, and residue created by heating fluorocarbon rubber to > 200 °C.

Damage to health.

- Make sure that components made of fluorocarbon rubber are not exposed to temperatures > 200 °C. Remove the components, if necessary.
- Avoid inhaling fluorocarbon rubber gases and vapors as well as skin and eye contact.
- Avoid contact with the cooled-down fluorocarbon rubber, as dangerous residue has formed while it was heated.

Under normal operating conditions and at temperatures up to 200 °C, fluorocarbon rubber is very stable and safe. However, when heated to more than 300 °C, e.g. by fire or the flame of a cutting torch, fluorocarbon rubber forms harmful gases and vapors as well as residue.

The following components of R..7, F..7, K..7, K..9, S..7, and SPIROPLAN® W gear units can contain elastomers made of fluorocarbon rubber:

- Oil seals

25803530/EN – 04/2018

- Breather valve
- Screw plugs

The user is responsible for safe handling during the service life including eco-friendly disposal.

SEW-EURODRIVE is not responsible for damage caused by improper handling.

25803530/EN – 04/2018

6 Inspection/maintenance

⚠ WARNING

Risk of injury if the drive starts up unintentionally.

Severe or fatal injuries

- Disconnect the drive from the power supply before you start working on the unit.
- Prevent the drive from starting up unintentionally for example, by locking the key switch or removing the fuses from the current supply.

⚠ WARNING

Risk of injury if preloaded shaft connections are loosened.

Severe or fatal injuries

- Before releasing any shaft connections, make sure there is no active torsional torque present that could lead to tension within the system.

⚠ WARNING

Risk of burns due to hot gear unit and hot gear unit lubricant

Severe injuries

- Let the gear unit cool down before you start working on it.
- Carefully remove the oil level plug and the oil drain plug.

NOTICE

Loss of lubricant qualities due to filling of wrong lubricant

Damage to the gear unit

- Do not mix synthetic lubricants and mineral lubricants.
- Do not mix different synthetic lubricants.
- As standard lubricant use mineral oil.

NOTICE

Damage to oil seal caused by cleaning the gear unit with a high pressure device.

Gear unit damage.

- Do not clean the gear unit with a high-pressure cleaning device.

NOTICE

Damage to gear unit due to ingress of foreign objects during maintenance and inspection work

Gear unit failure

- Prevent foreign particles from entering into the gear unit during maintenance and inspection work.

25803530/EN – 04/2018

INFORMATION

Maintain the inspection and maintenance intervals. This is necessary to ensure operational safety.

INFORMATION

Perform a safety check and functional check following maintenance and repair work.

25803530/EN – 04/2018

6.1 Wearing parts

Gearing

If you observe the SEW-EURODRIVE design criteria and the inspection and maintenance intervals, then the gearing components of the gear units will be wear-free after the run-in period. The worm gearing is an exception for design reasons. Depending on the operating conditions, material on the tooth flanks of the worm gear is removed to different extents. The main influencing factors are:

- Rotational speed
- Load
- Operating temperature
- Lubricant (type, viscosity, additives, pollution)
- Switching frequency

For information on the worm gearing service life under certain operating conditions, contact SEW-EURODRIVE.

Rolling bearing

Rolling bearings in the gear unit, adapter and input shaft assembly have a limited service life, even under ideal operating conditions. This nominal bearing service life is a solely statistical value. The actual service life of an individual bearing may deviate greatly from this value. The main influencing factors are:

- Rotational speed
- Equivalent bearing load
- Operating temperature
- Lubricant (type, viscosity, additives, pollution)
- Lubricant supply of the bearing
- Misalignment under operating load

Therefore the rolling bearings must be inspected regularly. Observe the corresponding inspection and maintenance intervals in the chapters "Inspection/maintenance intervals" (→ 🗎 110), "Lubricant change intervals" (→ 🗎 111), "Maintenance of AL/AM/AQ./EWH adapter" (→ 🗎 111) and "AD input shaft assembly maintenance" (→ 🗎 112).

For information on the nominal bearing service life under certain operating conditions, contact SEW-EURODRIVE.

Lubricants

Lubricants are subject to aging. Their service life is limited depending on the load conditions.

The service life significantly depends on the oil operating temperature. The dependency of lubricant change intervals and operating temperature is depicted in the figure in chapter "Lubricant change intervals" (→ 🗎 111).

Oil seals

Oil seals are contact seals that seal unit housings at emerging elements, such as shafts, from the environment. Oils seals are wear parts with a service life that is influenced by the following factors, among others:

- Shaft speed and circumferential velocity at the sealing lip
- Ambient conditions (temperature, dust, humidity, pressure, chemicals, radiation)
- Lubricant (type, viscosity, additives, pollution)
- Surface quality of the sealing
- Lubricant supply of the sealing
- Oil seal material

25803530/EN – 04/2018

Due to the various influencing factors it is not possible to predict the service life. Therefore the oil seals must be inspected regularly. Observe the corresponding inspection and maintenance intervals in the chapters "Inspection/maintenance intervals" (→ 🗎 110), "Lubricant change intervals" (→ 🗎 111), "Maintenance of AL/AM/AQ./EWH adapter" (→ 🗎 111) and "AD input shaft assembly maintenance" (→ 🗎 112).

Cam ring/ coupling ring

The couplings used in the AM, AL, AQ. and EWH adapters are designed to be positive, puncture-proof and low-maintenance claw couplings. They have an impact and vibration-absorbing cam ring (AM, EWH) or coupling ring (AQ., AL). The service life is determined by the following factors, among others:

- Ambient conditions (temperature, chemicals, radiation)
- Operational conditions (switching frequency, impact characteristics)

Adhere to the corresponding inspection and maintenance intervals in chapter "Maintenance of AL/AM/AQ./EWH adapter" (→ 🗎 111).

Rubber buffer

The rubber buffer is required for shaft-mounted gear units of the F and W gear unit types for torque support. Rubber buffers are wear parts with a service life that is influenced by the following factors:

- Load
- Ambient conditions
  - Temperature
  - Humidity
  - Aggressive chemicals, e.g. ozone
- Switching frequency
- Impact characteristics

Flexible bushing

A so-called flexible bushing is required for the torque arm of the S and K gear unit types. Flexible bushings are wear parts with a service life that is influenced by the following factors:

- Load
- Ambient conditions
  - Temperature
  - Humidity
  - Aggressive chemicals, e.g. ozone
- Switching frequency
- Impact characteristics

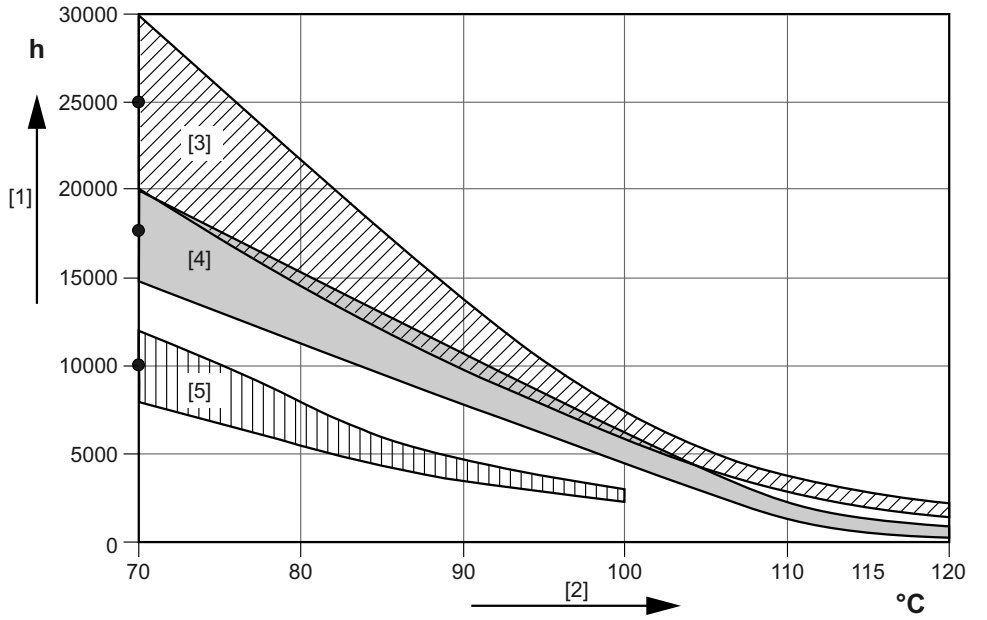
25803530/EN – 04/2018

6.2 Inspection/maintenance intervals

The following table lists the obligatory intervals and the corresponding measures:

Time interval	What to do?
• Every 3000 hours of operation, at least every 6 months	• Check oil and oil level • Check running noise for possible bearing damage • Visual inspection of the seals for leakage • Check that all screw plugs, any oil sight glass, the breather valve and the gear unit cover screws are tight. • For gear units with a torque arm: Check and replace the rubber buffers, if necessary
• Depending on the operating conditions (see illustration in chapter "Lubricant change intervals" (→ 🖹 111)), every 3 years at the latest • according to oil temperature	• Change mineral oil • Replace bearing grease (recommendation) • Replace oil seal (do not install it in the same track)
• Depending on the operating conditions (see illustration in chapter "Lubricant change intervals" (→ 🖹 111)), every 5 years at the latest • according to oil temperature	• Change synthetic oil • Replace bearing grease (recommendation) • Replace oil seal (do not install it in the same track)
• Varying (depending on external factors)	• Touch up or renew the surfaces / anti-corrosion coating

Exceptions



The following gear units are lubricated for life. A scheduled oil change is not necessary:

- Helical gear units R07, R17, R27
- Parallel-shaft helical gear unit F27
- SPIROPLAN® gear units

25803530/EN – 04/2018

6.3 Lubricant change intervals

The following image depicts the change intervals for standard gear units under normal ambient conditions. In case of special designs under severe/aggressive ambient conditions, change the lubricant more frequently.

18014398528211595

[1] Operating hours
[2] Sustained oil bath temperature
• Average value per oil type at 70 °C
[3] CLP PG/CLP PG NSF H1
[4] CLP HC/ CLP HC NSF H1
[5] CLP (CC)/E

6.4 Maintenance of AL/AM/AQ./EWH adapter

The following table lists the obligatory intervals and the corresponding measures:

Time interval	What to do?
• Every 3000 hours of operation, at least every 6 months	• Check the running noises to detect possible bearing damage. • Visually check the adapter for leakage.
• After 10 000 operating hours	• Check the rotational clearance. • Visually check the cam ring (AM, EWH) or coupling ring (AQ., AL).
• After 10 000 operating hours with NBR/FKM oil seals • After 20 000 operating hours with Premium Sine Seal (PSS) adapter oil seals:	• Change the bearing grease. • Change the oil seal. With standard NBR or FKM oil seals, the new oil seal must not be fitted on the previous track. This is allowed with Premium Sine Seal (PSS) adapter oil seals.

6.5 AD input shaft assembly maintenance

The following table lists the obligatory intervals and the corresponding measures:

Time interval	What to do?
• Every 3000 hours of operation, at least every 6 months	• Check the running noises to detect possible bearing damage. • Visually check the adapter for leakage.
• After 10000 operating hours	• Change the bearing grease. • Change the oil seal. Do not mount it in the same track.

25803530/EN – 04/2018

6.6 Inspection/maintenance for the gear unit

6.6.1 Checking the oil level and changing the oil

The procedure when checking the oil level and changing the oil depends on gear unit type, size and mounting position. Determine the code letter (A, B, C, D or E) in the following table in regard of gear unit type and size. Use the code letter to find the reference for the procedure for the corresponding gear unit in the 2nd table.

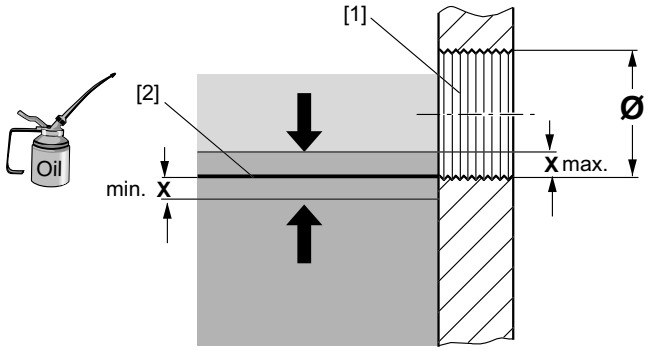
Gear unit type	Size	Code letter for chapter "Checking the oil level and changing the oil"					
		M1	M2	M3	M4	M5	M6
R	R..07 – 27	B					
	R..37 / R..67	A					
	R..47 / R..57	A				B	A
	R..77 – 167	A					
	RX..57 – 107	A					
F	F..27	B					
	F..37 – 157	A					
K	K..19 / K..29	C					
	K..39 / K49	A					
	K..37 – 187	A					
S	S..37	C					
	S..47 – 97	A					
W	W..10 – 30	B					
	W..37 – 47	D			E	D	

Code letter	Chapter "Checking the oil level and changing the oil"	Reference
A:	• Helical gear units... • Parallel-shaft helical gear units... • Helical-bevel gear units...K..39 / K..49, K..37 – 187 • Helical-worm gear units... S..47 – 97 **With oil level plug**	(→ 🗎 114)
B:	• Helical gear units... • Parallel-shaft helical gear units... • SPIROPLAN® gear units... **Without oil level plug, with cover plate**	(→ 🗎 117)
C:	• S..37 helical-worm gear unit • Helical-bevel gear units K..19 / K..29 **Without oil level plug, without cover plate**	(→ 🗎 121)
D:	• SPIROPLAN® W..37 / W..47 **In mounting positions M1, M2, M3, M5, M6 with oil level plug**	(→ 🗎 124)

25803530/EN – 04/2018

Code letter	Chapter "Checking the oil level and changing the oil"	Reference
E:	• SPIROPLAN® W..37 / W..47... **In mounting position M4 without oil level plug and cover plate**	(→ 🗎 126)

Refer to chapter "Mounting positions" (→ 🗎 129) for notes on the mounting positions.



You cannot check the oil level of gear units in pivoted mounting position. The gear units are delivered with the correct oil level. Observe the designations and fill quantities on the nameplate if you have to change the oil.

6.6.2 A: Helical, parallel-shaft helical, helical-bevel and helical-worm gear units with oil level plug

Checking the oil level at the oil level plug

Proceed as follows to check the oil level of the gear unit:

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Determine the position of the oil level plug and the breather valve using the mounting position sheets. See chapter "Mounting positions" (→ 🗎 129).
3. Place a container underneath the oil level plug.
4. Slowly remove the oil level plug. Small amounts of oil may leak out as the permitted maximum oil level is higher than the lower edge of the oil level bore.
5. Check the oil level according to the following figure and the corresponding table.

634361867

[1] Oil level bore
[2] Ideal oil level
X min/max oil level

Ø oil level bore	Approved fluctuation "x" of the oil level mm
M10 × 1	1.5
M12 × 1.5	2
M22 × 1.5	3
M33 × 2	4
M42 × 2	5

6. Proceed as follows if the oil level is too low:
   - Fill in fresh oil of the same type (contact SEW-EURODRIVE if necessary) via the breather bore, up to the lower edge of the oil level bore.

25803530/EN – 04/2018

- Re-insert the breather valve. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).

7. Screw in the oil level plug again. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).

Checking the oil via the oil drain plug

Proceed as follows to check the gear unit oil:

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Determine the position of the oil drain plug using the mounting position sheets. See chapter "Mounting positions" (→ 🗎 129).
3. Remove a little oil from the oil drain plug.
4. Check the oil consistency:
   - Viscosity
   - If you can see that the oil is heavily contaminated, SEW-EURODRIVE recommends to change the oil even if this is outside the service intervals specified in "Inspection and maintenance intervals" (→ 🗎 110).
5. Check the oil level. See chapter "Checking the oil level via the oil level plug" (→ 🗎 114).

Changing the oil via the oil drain plug and the breather valve

⚠ WARNING

Risk of burns due to hot gear unit and hot gear unit oil.

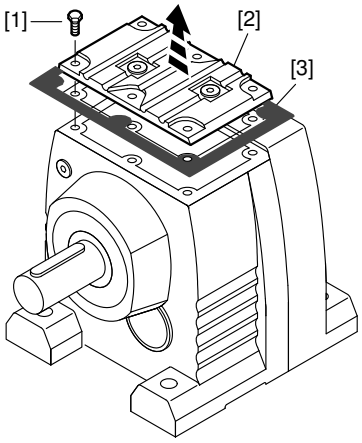
Serious injuries.

- Let the gear unit cool down before you start working on it. Due to the better flowability, the gear unit oil should still be warm so that the gear unit can be drained best.

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Determine the position of the oil drain plug, the oil level plug and the breather valve using the mounting position sheets. See chapter "Mounting positions" (→ 🗎 129).
3. Place a container underneath the oil drain plug.
4. Remove the oil level plug, the breather valve and the oil drain plug.
5. Drain all the oil.
6. Re-insert the oil drain plug. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).
7. Fill in fresh oil of the same type (contact SEW-EURODRIVE if necessary) via the breather bore. Do not mix different synthetic lubricants!
   - Observe the oil fill quantities according to the specifications on the nameplate or according to the mounting position. See chapter Lubricant fill quantities.
   - Check the oil level at the oil level plug.

25803530/EN – 04/2018

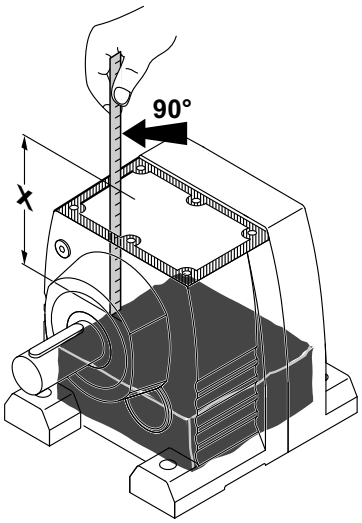
8. Re-insert the oil level plug and the breather valve. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).



25803530/EN – 04/2018

6.6.3 B: Helical, parallel shaft helical, SPIROPLAN® gear units without oil level plug with cover plate

Checking the oil level via the cover plate

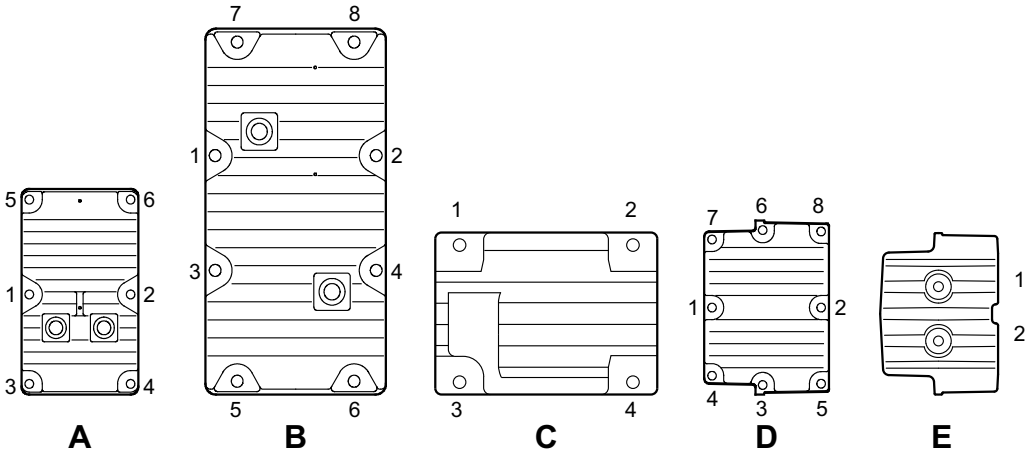


For gear units without oil level bore, the oil level is checked via the cover plate opening. Proceed as follows:

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. To position the cover plate on the top, place the gear unit in the following mounting position:
   - R07 – R57 in M1 mounting position
   - F27 in M3 mounting position
   - W10 – W30 in M1 mounting position
3. Loosen the screws [1] of the cover plate [2] and remove the cover plate [2] and the corresponding gasket [3] (see following figure).

9007199273384203

4. Determine the vertical distance "x" between oil level and sealing surface of the gear unit housing (see following figure).



9007199273387275

5. Compare the determined value "x" to the max. distance between oil level and sealing surface of the gear unit housing specified in the following table. Adjust the fill level if required.

Gear unit type		Max. distance x in mm between oil level and sealing surface of the gear unit housing for mounting position					
		M1	M2	M3	M4	M5	M6
R07	2 stages	52 ± 1	27 ± 1	27 ± 1	27 ± 1	27 ± 1	27 ± 1
	3 stages	49 ± 1	21 ± 1	21 ± 1	21 ± 1	21 ± 1	21 ± 1
R17	2 stages	63 ± 1	18 ± 1	46 ± 1	18 ± 1	46 ± 1	46 ± 1
	3 stages	58 ± 1	11 ± 2	40 ± 2	11 ± 2	40 ± 2	40 ± 2
R27	2 stages	74 ± 1	22 ± 1	45 ± 1	22 ± 1	45 ± 1	45 ± 1
	3 stages	76 ± 1	19 ± 1	42 ± 1	19 ± 1	42 ± 1	42 ± 1
R47	2 stages	–	–	–	–	39 ± 1	–
	3 stages	–	–	–	–	32 ± 1	–
R57	2 stages	–	–	–	–	32 ± 1	–
	3 stages	–	–	–	–	28 ± 1	–
F27	2 stages	78 ± 1	31 ± 1	72 ± 1	56 ± 1	78 ± 1	78 ± 1
	3 stages	71 ± 1	24 ± 1	70 ± 1	45 ± 1	71 ± 1	71 ± 1
		Irrespective of mounting position					
W10		12 ± 1					
W20		19 ± 1					
W30		31 ± 1					

6. Close the gear unit after the oil level check:
   - Re-attach the seal of the cover plate. Make sure that the sealing surfaces are clean and dry.
   - Screw on the cover plate. Tighten the cover plate screw connections working from the inside to the outside. Tighten the cover plate screw connections in the sequence depicted in the following figure. Tighten the cover plate screw connections with the specified tightening torque according to the following table. Repeat the tightening procedure until the screws are properly tightened. To avoid damaging the cover plate, use only impulse wrenches or torque wrenches. Do not use impact screwdrivers.

25803530/EN – 04/2018

27021597782872715

Gear unit type	Image	Retaining thread	Tightening torque T_N Nm	Minimum tightening torque T_{min} Nm
R/RF07/17	E	M6	11	7
R/RF27	D

W30	A			

Checking the oil via cover plate

Proceed as follows to check the gear unit oil:

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Open the cover plate of the gear unit according to chapter "Checking the oil level via the cover plate" (→ 🗎 117).
3. Take an oil sample via the cover plate opening.
4. Check the oil consistency.
   - Viscosity
   - If you can see that the oil is heavily contaminated, SEW-EURODRIVE recommends to change the oil even if this is outside the service intervals specified in "Inspection and maintenance intervals" (→ 🗎 113).
5. Check the oil level. See chapter "Checking the oil level via the cover plate" (→ 🗎 117).
6. Screw on the cover plate. Observe the order and the tightening torques according to chapter "Checking the oil level via the cover plate" (→ 🗎 117).

Changing the oil via the cover plate

⚠ WARNING

Risk of burns due to hot gear unit and hot gear unit oil.

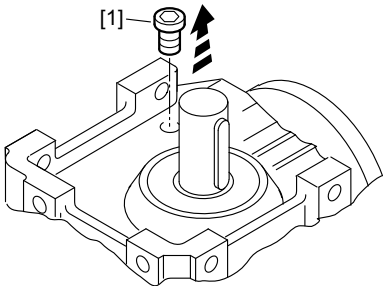
Serious injuries.

- Let the gear unit cool down before you start working on it. Due to the better flowability, the gear unit oil should still be warm so that the gear unit can be drained best.

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Open the cover plate of the gear unit according to chapter "Checking the oil level via the cover plate".
3. Completely drain the oil into a container via the cover plate opening.
4. Fill in fresh oil of the same type (contact SEW-EURODRIVE if necessary) via the cover plate. Do not mix different synthetic lubricants.
   - Fill in the oil as specified on the nameplate or the order confirmation.
5. Check the oil level.
6. Screw on the cover plate. Observe the order and the tightening torques according to chapter "Checking the oil level via the cover plate" (→ 🗎 117).

25803530/EN – 04/2018

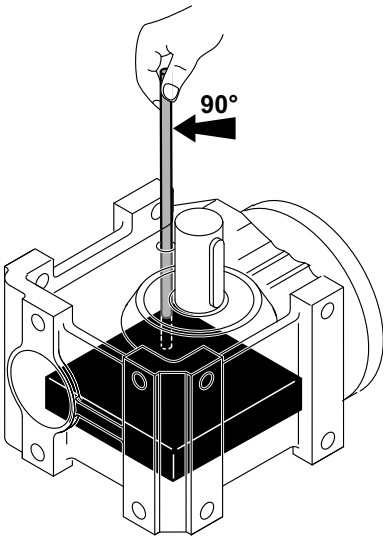
6.6.4 C: Helical-worm gear units S..37 and helical-bevel gear units K..19/K..29 without oil level plug and cover plate



Checking the oil level via screw plug

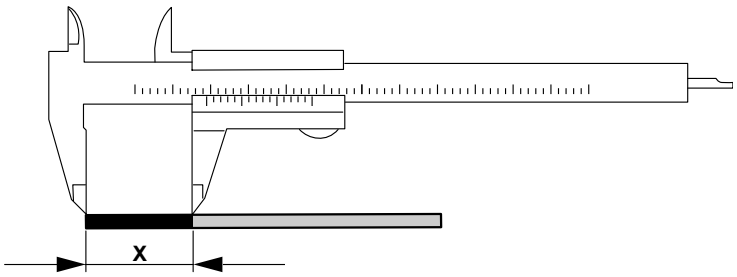
The gear units S..37, K..19, and K..29 are not equipped with an oil level plug or a cover plate. This is why the oil level is checked via the control bore.

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Place the gear unit in the mounting position stated in the following table. Thus the control bore always points upwards.



Gear unit	Mounting position
S..37	M5/M6
K19/29	M6

3. Remove the screw plug [1] as shown in the following figure.



18655371

4. Insert the dipstick vertically via the control bore all the way to the bottom of the gear unit housing. Vertically pull the dipstick out of the control bore, as shown in the following figure.

18658699

5. Determine the size of the section "x" of the dipstick covered with lubricant using a slide-gauge as depicted in the following figure.

18661771

6. Compare the determined value "x" to the min. value depending on the mounting position specified in the following table. Correct the fill level if required.

Gear unit type	Oil level = wetted section "x" in mm of the dipstick Mounting position					
	M1	M2	M3	M4	M5	M6
K..19	33 ± 1	33 ± 1	33 ± 1	35 ± 1	33 ± 1	33 ± 1
K..29	50 ± 1	50 ± 1	50 ± 1	63 ± 1	50 ± 1	50 ± 1
S..37	10 ± 1	24 ± 1	34 ± 1	37 ± 1	24 ± 1	24 ± 1

7. Re-insert and tighten the screw plug. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).

Checking the oil via the screw plug

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Open the screw plug of the gear unit according to chapter "Checking the oil level via screw plug" (→ 🗎 121).
3. Take an oil sample via the screw plug bore.
4. Check the oil consistency.
   - Viscosity
   - If you can see that the oil is heavily contaminated, SEW-EURODRIVE recommends to change the oil even if this is outside the service intervals specified in "Inspection and maintenance intervals" (→ 🗎 110).
5. Check the oil level. See chapter "Checking the oil level via screw plug" (→ 🗎 121).
6. Re-insert and tighten the screw plug. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).

25803530/EN – 04/2018

Changing the oil via the screw plug

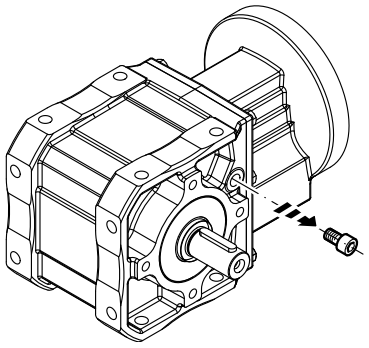
⚠ WARNING

Risk of burns due to hot gear unit and hot gear unit oil.

Serious injuries.

- Let the gear unit cool down before you start working on it. Due to the better flowability, the gear unit oil should still be warm so that the gear unit can be drained best.

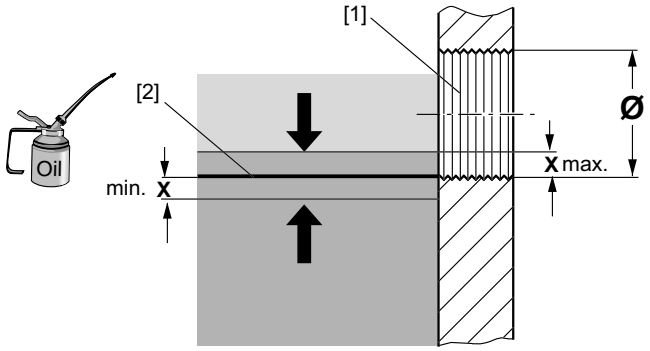
1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Open the cover plate of the gear unit according to chapter "Checking the oil level via the screw plug".
3. Completely drain the oil via the screw plug bore.
4. Fill in fresh oil of the same type (contact SEW-EURODRIVE if necessary) via the control bore. You must not mix different synthetic lubricants.
   - Observe the oil quantity specified on the nameplate or according to the mounting position. Observe chapter Lubricant fill quantities.
5. Check the oil level.
6. Re-insert and tighten the screw plug. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).



25803530/EN – 04/2018

6.6.5 D: SPIROPLAN® W..37/W..47 in mounting position M1, M2, M3, M5, M6 with oil level plug

Checking the oil level at the oil level plug



Proceed as follows to check the oil level of the gear unit:

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Set up the gear unit in M1 mounting position.
3. Slowly remove the oil level plug (see following figure). Small amounts of oil may leak out.

787235211

4. Check the oil level according to the following figure.

634361867

[1] Oil level bore [2] Ideal oil level

Ø oil level bore	Fluctuation "x" for minimum and maximum fill level in mm
M10 × 1	1.5

5. In case the oil level is too low, fill in fresh oil of the same type (contact SEW-EURODRIVE if necessary) via the oil level bore, up to the lower edge of the oil level bore.
6. Screw in the oil level plug again. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).

Checking the oil level at the oil level plug

Proceed as follows to check the oil of the gear unit:

1. Observe the notes in chapter Information on gear unit inspection/maintenance.

25803530/EN – 04/2018

2. Remove some oil at the oil level plug.
3. Check the oil consistency.
   - Viscosity
   - If you can see that the oil is heavily contaminated, SEW-EURODRIVE recommends to change the oil even if this is outside the service intervals specified in "Inspection and maintenance intervals" (→ 🗎 110).
4. Check the oil level. See previous chapter.

Changing the oil at the oil level plug

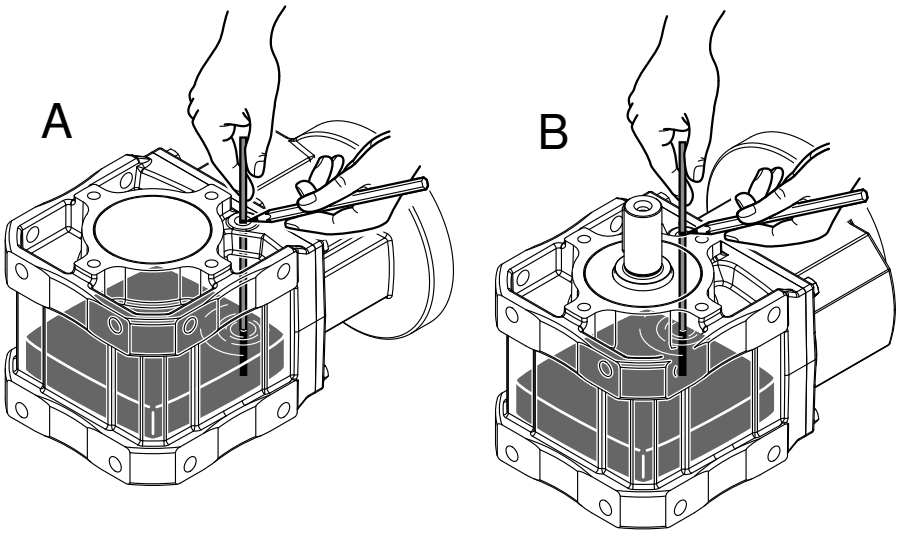
⚠ WARNING

Risk of burns due to hot gear unit and hot gear unit oil.

Serious injuries.

- Let the gear unit cool down before you start working on it. Due to the better flowability, the gear unit oil should still be warm so that the gear unit can be drained best.

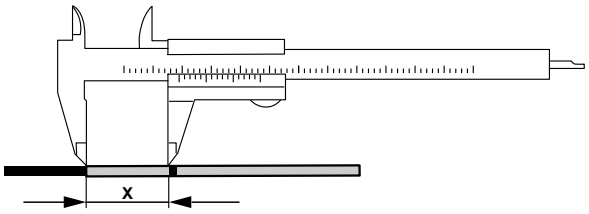
1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Set up the gear unit in M5 or M6 mounting position. See chapter "Mounting positions" (→ 🗎 129).
3. Place a container underneath the oil level plug.
4. Remove the oil level plugs on the A- and B-side of the gear unit.
5. Drain all the oil.
6. Re-insert the lower oil level plug. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).
7. Fill in new oil of the same type (contact SEW-EURODRIVE if necessary) via the upper oil level plug. You must not mix different synthetic lubricants.
   - Observe the oil fill quantities according to the specifications on the nameplate or according to the mounting position. See chapter Lubricant fill quantities.
   - Check the oil level according to chapter "Checking the oil level via oil level plug"
8. Re-insert the upper oil level plug. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).



25803530/EN – 04/2018

6.6.6 E: SPIROPLAN® W..37 / W..47 in mounting position M4 without oil level plug and cover plate

Checking the oil level via screw plug



The W37 / W47 gear units are not equipped with an oil level plug or a cover plate. This is why the oil level is checked via the control bore.

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Set up the gear unit in M5 or M6 mounting position. See chapter "Mounting positions" (→ 🗎 129).
3. Remove the screw plug.
4. Insert the dipstick vertically via the control bore all the way to the bottom of the gear unit housing. Mark the point on the dipstick where it exits the gear unit. Pull out the dipstick vertically (see following figure).

784447371

5. Determine the section "x" between the wetted part and the marking using a caliper (see following figure).

9007200039761803

6. Compare the determined value "x" to the min. value depending on the mounting position specified in the following table. Correct the fill level if required.

Gear unit type	Oil level = section "x" in mm of the dipstick Mounting position during check	
	M5 Lying on the A-side	M6 Lying on the B-side
W37 in M4 mounting position	37 ± 1	29 ± 1
W47 in M4 mounting position	41 ± 1	30 ± 1

25803530/EN – 04/2018

7. Re-insert and tighten the screw plug. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).

Checking the oil via the screw plug

Proceed as follows to check the oil of the gear unit:

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Remove a little oil at the oil screw plug.
3. Check the oil consistency:
   - Viscosity
   - If you can see that the oil is heavily contaminated, SEW-EURODRIVE recommends to change the oil even if this is outside the service intervals specified in "Inspection and maintenance intervals" (→ 🗎 110).
4. Check the oil level. See previous chapter.

Changing the oil via the screw plug

⚠ WARNING

Risk of burns due to hot gear unit and hot gear unit oil.

Serious injuries.

- Let the gear unit cool down before you start working on it. Due to the better flowability, the gear unit oil should still be warm so that the gear unit can be drained best.

1. Observe the notes in chapter Information on gear unit inspection/maintenance.
2. Set up the gear unit in M5 or M6 mounting position. See chapter "Mounting positions" (→ 🗎 129).
3. Place a container underneath the screw plug.
4. Remove the screw plugs on the A- and B-side of the gear unit.
5. Drain all the oil.
6. Re-insert the lower screw plug. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).
7. Fill in fresh oil of the same type (contact SEW-EURODRIVE if necessary) via the upper screw plug. You must not mix different synthetic lubricants.
   - For the required oil quantity, refer to the nameplate or chapter Lubricant fill quantities.
   - Check the oil level according to chapter "Checking the oil level via oil level plug".
8. Re-insert the upper screw plug. Observe for this the tightening torques in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).

25803530/EN – 04/2018

6.6.7 Replacing the oil seal

NOTICE

Damage to oil seal when mounted below 0 °C.

Damage to oil seal.

- Store oil seals at ambient temperatures over 0 °C.
- If necessary, heat the oil seal before mounting it.

Proceed as follows:

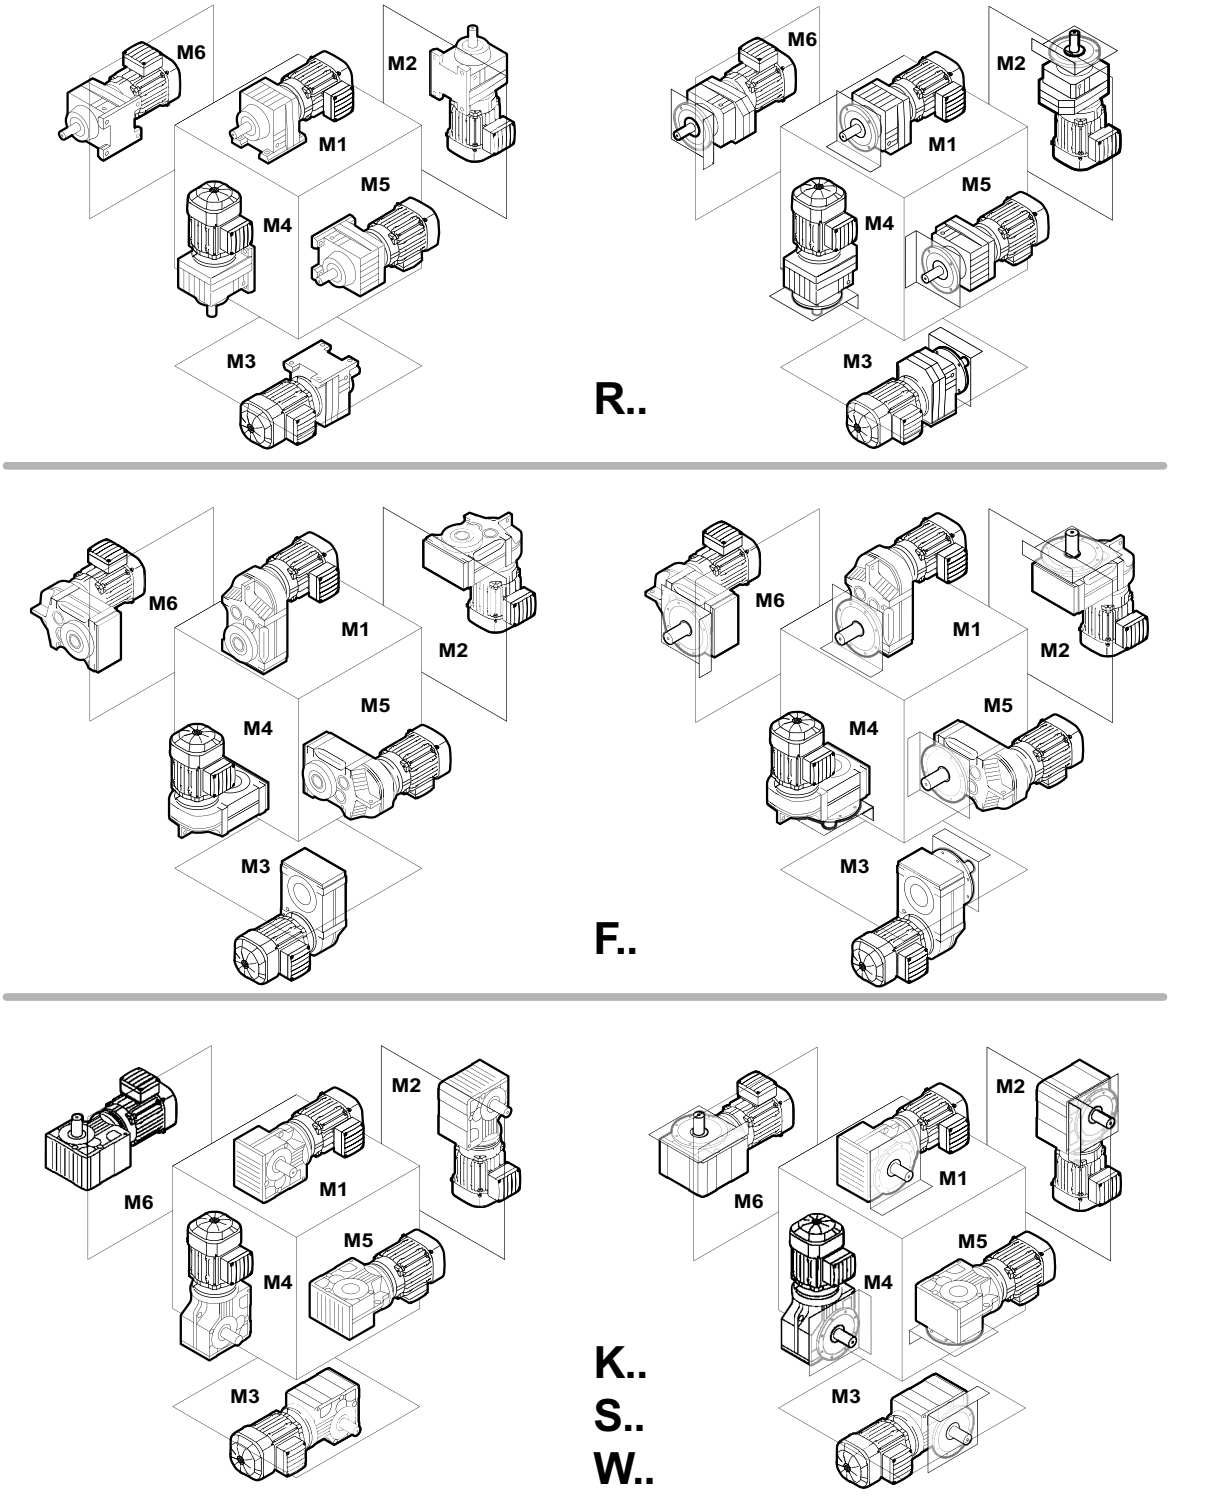
1. Ensure that there is a sufficient grease reservoir between the dust lip and sealing lip, depending on the gear unit design.
2. If you use double oil seals, the space has to be filled with grease for one third.

6.6.8 Painting the gear unit

NOTICE

Paint can block the breather valve and damage the sealing lips of the oil seals.

Damage to property



- Thoroughly cover the breather valve and sealing lip of the oil seals with strips prior to painting/re-painting.
- Remove the strips after painting.

25803530/EN – 04/2018

7 Mounting positions

7.1 Designation of the mounting positions

The following illustration shows the SEW-EURODRIVE mounting positions M1 – M6:

25803530/EN – 04/2018

7.2 Churning losses and thermal rating

* (→ 🗎 X)

Churning losses may occur with the following conditions. They must be considered during thermal check:

- A mounting position where the first gear unit stage is fully immersed in the lubricant. The respective mounting positions of the gear units are indicated with a * in chapter "Mounting position sheets" (→ 🗎 132).
- A high mean input speed and thus a high circumferential velocity of the gear wheels of the input gear stage.

If one or both requirements are met, determine the requirements of the application and the corresponding operating conditions (see chapter "Data for calculating the thermal rating" (→ 🗎 130)) and contact SEW-EURODRIVE. SEW-EURODRIVE can calculate the thermal rating based on the actual operating conditions. The thermal rating of the gear unit can be increased by appropriate measure e.g. by using a synthetic lubricant with higher thermal endurance properties.

INFORMATION

To reduce churning losses to a minimum, use gear units preferably in M1 mounting position.

7.2.1 Data for calculating the thermal rating

The following information is required for calculating the thermal rating:

Gear unit type and design:

- Gear unit ratio i
- Mean input speed $\overline{n}_e$ or mean output speed $\overline{n}_a$ in min^{-1}
- Effective motor torque M_{eff} in Nm
- Input motor power P_e in kW
- Mounting position M1 – M6 or pivoting angle

Installation site:

- Ambient temperature T_{amb} in °C
- In small, closed rooms or in large rooms (halls) or outdoors

Installation on site:

- Space-critical or well ventilated
- Steel or concrete base

7.3 Change of mounting position

Make sure to read the following information when you operate the gearmotor in a mounting position other than the one indicated in the order:

- Adjust the lubricant fill quantity to the changed mounting position.
- Adjust the position of the breather valve.
- When changing the mounting position to M4: Contact SEW-EURODRIVE. Depending on the drive's operating mode, an oil expansion tank might be necessary (see chapter "Oil expansion tank" (→ 🗎 93)).
- For helical-bevel gearmotors: Contact SEW-EURODRIVE if you want to change to mounting position M5 or M6, independent of the initial mounting position.

25803530/EN – 04/2018

- For helical-worm gearmotors: Contact SEW-EURODRIVE when changing to mounting position M2 or M3.
- For helical gearmotors: Contact SEW-EURODRIVE when changing to mounting position M2.
- If you change the mounting position to a mounting position that requires more oil, SEW-EURODRIVE recommends to perform a thermal check/project planning again.

7.4 Universal mounting position M0

SPIROPLAN® W10 – W30 gear units can be ordered with M0 universal mounting position. These small SPIROPLAN® gear units are entirely enclosed due to their small size and have no breather valve. You can use them in any mounting position M1 – M6 without having to adjust the gear unit.

All W10 – W30 gear units of one size have the same oil fill quantity.

7.5 Mounting position MX

Mounting position MX is available for all gear units of the sizes R..7, F..7, K..7, K..9, S..7 and SPIROPLAN® W..7.

In contrast to the M0 mounting position, gear units in MX mounting position must be adjusted according to the mounting position prior to startup.

For mounting position MX, the gear units are delivered with the maximally possible amount of oil and sealed with oil screw plugs. A breather valve is included with each drive. The oil fill volume must be adapted according to the mounting position of the gear unit (see chapter Lubricant fill quantities). Customers will also have to mount the enclosed breather valve at the proper location depending on the mounting position, see chapter Mounting position sheets. For screwing in the breather valve, observe the corresponding tightening torque in chapter "Tightening torques for oil level plugs, oil drain plugs, screw plugs, breather valves and oil sight glasses" (→ 🗎 32).

Check for the correct oil level before startup, as described in chapter Checking the oil level and changing the oil.

7.5.1 Compound gear units in MX mounting position

In MX mounting position, both gear units (primary and subsequent gear unit) are in the same mounting position.

25803530/EN – 04/2018

7.6 Mounting position sheets

7.6.1 Key to the mounting position sheets

INFORMATION

The positions of the breather valve, oil level plug, and oil drain plug specified in the mounting position sheets are binding and comply with the assembly specifications.

The motors are only depicted symbolically on the mounting position sheets.

INFORMATION

For gear units with solid shaft: The displayed shaft is always on the A-side.

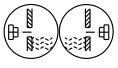
For shaft-mounted gear units: The shaft with dashed lines represents the customer shaft. The output side (= shaft position) is always shown on the A-side.

INFORMATION

SPRIOPLAN® gearmotors are not dependent on the mounting position, except for W..37 and W..47 gearmotors in mounting position M4. However, mounting positions M1 to M6 are also shown for SPIROPLAN® gearmotors to assist you in working with this documentation.

INFORMATION

SPIROPLAN® gearmotors W..10 to W..30 cannot be equipped with breather valves, oil level plugs or oil drain plugs.



SPIROPLAN® gearmotors W..37 and W..47 are equipped with breather valves in mounting position M4 and with oil drain plugs in mounting position M2.

INFORMATION

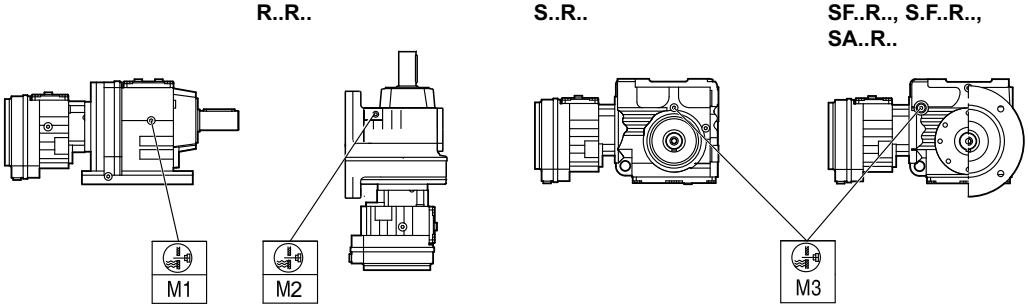
Some gear units can be supplied in mounting position M0. In this case, the gear unit is delivered in a universal mounting position and can be adjusted to various mounting positions by the customer. It may be necessary to contact SEW-EURODRIVE.

Symbols used

The following table shows the icons used in the mounting position sheets.

Icon	Meaning
	Breather valve
	Oil level plug [1]
	Oil drain plug

1) Does not apply to the 1st gear unit (large gear unit) of compound gear units. See chapter "Position of the oil level plug of compound gear units".



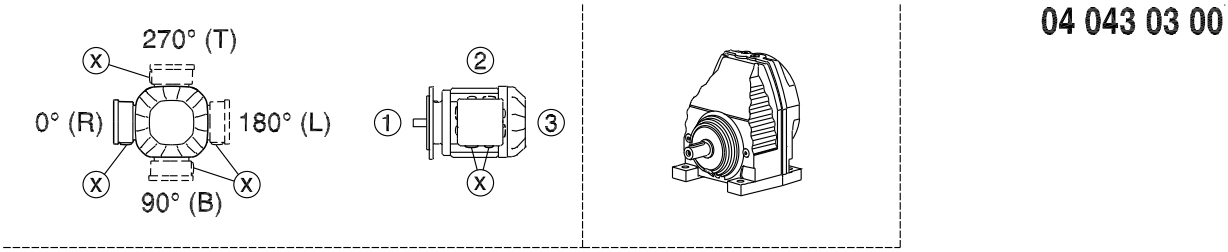
25803530/EN – 04/2018

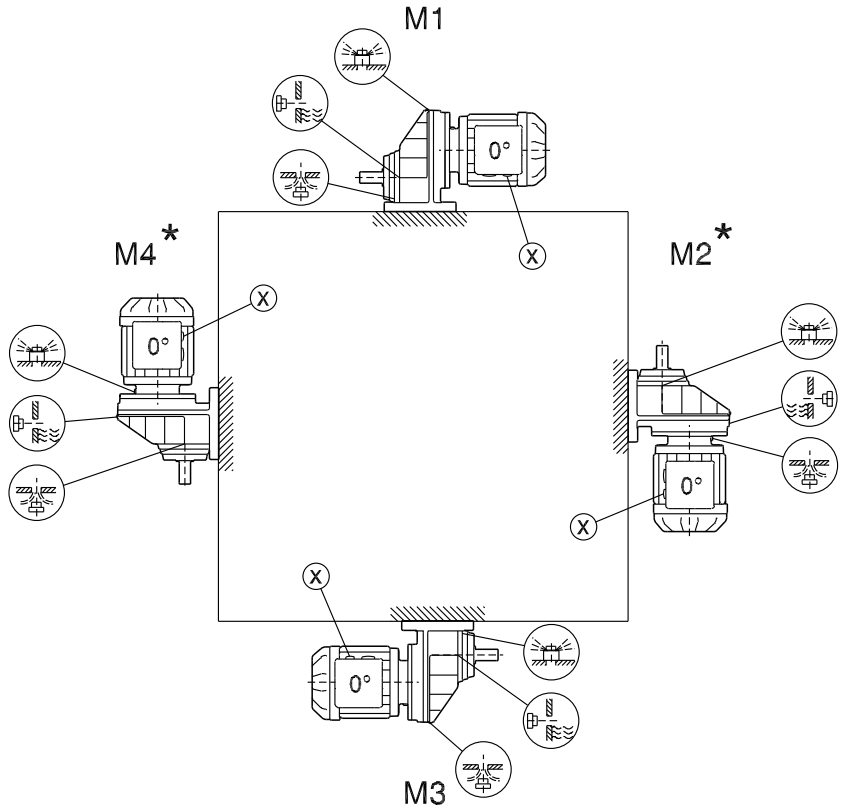
7.6.2 Position of the oil level plug of compound gear units

To ensure sufficient lubrication of the first gear unit (larger gear unit) in case of compound gear units, the following gear units have a higher oil level in the specified mounting positions:

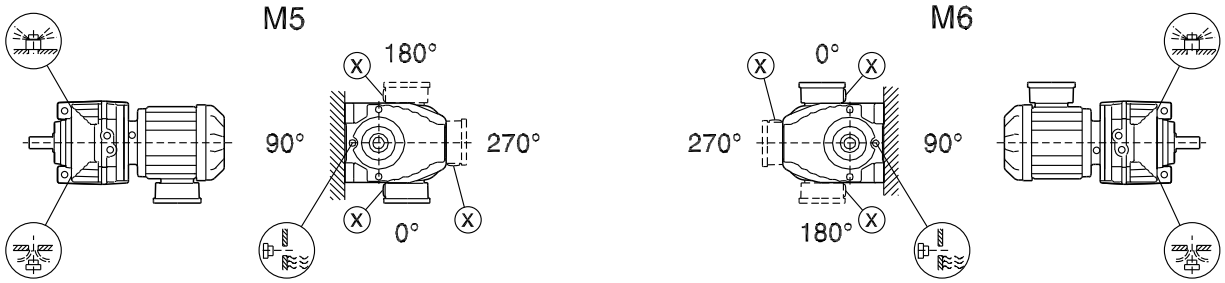
- Helical gear unit type R..R in mounting position M1 and M2
- Helical-worm gear unit type S..R in mounting position M3

The oil level plugs are located at the following positions, deviating from the specifications on the mounting position sheets:





15987248395



Icon	Meaning

8 Technical data

8.1 Extended storage

INFORMATION

For storage periods longer than 9 months, SEW-EURODRIVE recommends the "extended storage" gear unit type. Gear units in this design are designated with a corresponding label.

INFORMATION

The gear units must remain tightly sealed until taken into operation to prevent the VCI anti-corrosion agent from evaporating.

For gear units of the "extended storage" design, the following measures are taken:

- A VCI anti-corrosion agent (**v**olatile **c**orrosion **i**nhibitors) is added to the lubricant.

  Please note that this VCI anti-corrosion agent is only effective in a temperature range of -25 °C to +50 °C.
- The flange contact surfaces and shaft ends are also treated with an anti-corrosion agent.

Observe the storage conditions specified in the following table for extended storage.

8.1.1 Storage conditions

Climate zone	Packaging[1)]	Storage[2)]	Storage duration
Temperate (Europe, USA, Canada, China and Russia, excluding tropical zones)	Packed in containers, with desiccant and moisture indicator sealed in the plastic wrap.	Under roof, protected against rain and snow, no shock loads.	Up to 3 years with regular checks on the packaging and moisture indicator (relative atmospheric humidity < 50%).
	Open	Under roof and enclosed at constant temperature and atmospheric humidity (5 °C < ϑ < 50 °C, < 50% relative humidity). No sudden temperature fluctuations. Controlled ventilation with filter (free from dust and dirt). No aggressive vapors, no shocks.	2 years or more with regular inspections. Check for cleanness and mechanical damage during the inspection. Check corrosion protection.

25803530/EN – 04/2018

Climate zone	Packaging[1)]	Storage[2)]	Storage duration
Tropical (Asia, Africa, Central and South America, Australia, New Zealand excluding temperate zones)	Packed in containers, with desiccant and moisture indicator sealed in the plastic wrap. Protected against insect damage and mildew by chemical treatment.	Under roof, protected against rain and shocks.	Up to 3 years with regular checks on the packaging and moisture indicator (relative atmospheric humidity < 50%).
	Open	Under roof and enclosed at constant temperature and atmospheric humidity (5 °C < ϑ < 50 °C, relative humidity < 50%). No sudden temperature fluctuations. Controlled ventilation with filter (free from dust and dirt). No aggressive vapors, no shocks. Protected against insect damage.	2 years or more with regular inspections. Check for cleanness and mechanical damage during the inspection. Check corrosion protection.

1) The packaging must be carried out by an experienced company using the packaging materials that have been explicitly specified for the particular application.

2) SEW-EURODRIVE recommends to store the gear units according to the mounting position.

25803530/EN – 04/2018

8.2 Lubricants

Unless a special arrangement is made, SEW-EURODRIVE supplies the drives with a lubricant fill adapted for the specific gear unit and mounting position. The mounting position (M1 – M6, see chapter "Mounting positions" (→ 🗎 129)) must be specified in the order. You must adapt the lubricant fill in case of any subsequent changes made to the mounting position (see chapter Lubricant fill quantities).

8.2.1 Bearing greases

The gear unit rolling bearings are given a factory-fill with the greases listed below. SEW-EURODRIVE recommends re-greasing the rolling bearings with a grease filling at the same time as changing the oil.

The table shows the lubricants recommended by SEW-EURODRIVE:

Area of operation	Ambient temperature	Manufacturer	Type
Standard	-40 °C to +80 °C	Fuchs	Renolit CX-TOM 15[1)]
	-40 °C to +80 °C	Klüber	Petamo GHY 133 N
 2)	-40 °C to +40 °C	Bremer & Leguil	Cassida Grease GTS 2
 3)	-20 °C to +40 °C	Fuchs	Plantogel 2S

1) Bearing grease based on semi-synthetic base oil
2) Lubricant for the food processing industry
3) Easily biodegradable lubricant for environmentally sensitive areas

INFORMATION

The following grease quantities are required:

- **For fast-running bearings (gear unit input side):** Fill the cavities between the rolling elements one-third full with grease.
- **For slow-running bearings (gear unit output side):** Fill the cavities between the rolling elements two-thirds full with grease.

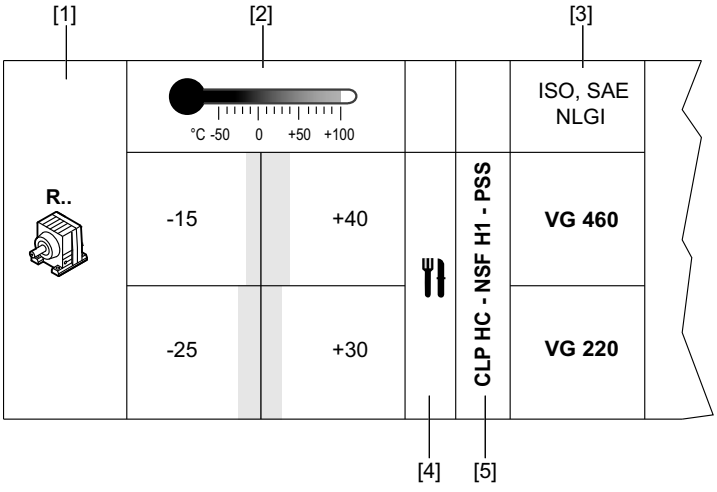
8.2.2 Lubricant table

NOTICE

Selecting improper lubricants may damage the gear unit.

Possible damage to property.

- Observe the following information.



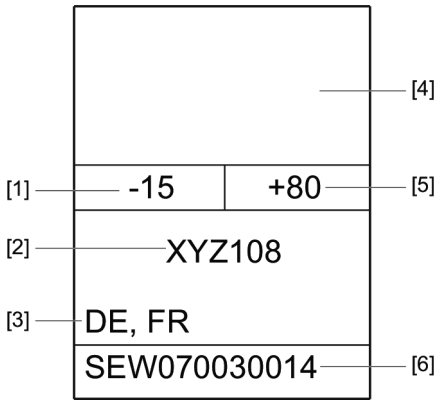
- The oil viscosity and type (mineral/synthetic) that are to be used are determined by SEW-EURODRIVE specifically for each order. This information is noted in the order confirmation and on the gear unit's nameplate.

  If you use other lubricants for the gear units and/or use the lubricants at temperatures outside the recommended temperature range, SEW-EURODRIVE does not assume liability.

  The lubricant recommendation in the lubricant table in no way represents a guarantee regarding the quality of the lubricant delivered by each respective supplier. Each lubricant manufacturer is responsible for the quality of their product.
- Do not mix synthetic lubricants.
- Do not mix synthetic and mineral lubricants.
- Oils of the same viscosity class from different manufacturers do not have the same characteristics. In particular, the minimally and maximally permitted oil bath temperatures are manufacturer-specific. These temperatures are specified in the lubricant tables.
- The values specified in the lubricant tables apply as of the time of printing of this document. The data of the lubricants are subject to dynamic change on the part of the lubricant manufacturers. For up-to-date information about the lubricants, visit:

  www.sew-eurodrive.de/lubricants

Information on table structure



18014416412986635

[1] Gear unit type
[2] Ambient temperature range
[3] Viscosity class
[4] Note on special approvals
[5] Lubricant type

25803530/EN – 04/2018

The specified ambient temperatures are guide values for the preselection of a suitable lubricant. The exact upper and lower temperature limits for project planning are specified in the table with the respective trade name.

Information on the various lubricants

9007217272258699

[1] Lowest oil sump temperature in °C, **going below this value during operation is not permitted**
[2] Trade name
[3] Factory filling for the listed countries
BR: Brazil
CN: China
DE: Germany
FR: France
US: United States of America
[4] Manufacturer
[5] Highest oil sump temperature in °C. The service life will be considerably reduced when exceeded. Observe the lubricant change intervals according to chapter "Lubricant change intervals" (→ 🗎 111).
[6] Approvals regarding compatibility of the lubricant with approved oil seals

Lubricant compatibility with oil seal

Approval	Explanation
SEW07004_ _13:	A lubricant especially recommended with regard to compatibility with the approved oil seals. The lubricant exceeds the state-of-the-art requirements regarding elastomer compatibility.

Approved application temperature range of the oil seals

Oil seal Material class	Permitted Oil sump temperature
NBR	-45 °C to +80 °C
FKM	-25 °C to +115 °C
FKM-PSS	-25 °C to +115 °C

25803530/EN – 04/2018

Limitations of use of oil seals with the specific lubricant are described in the following table:

Material class			Manufacturer		Material	
S	1	NBR	1	Freudenberg		72 NBR 902
			2	Trelleborg		4NV11
	2	FKM	1	Freudenberg	1	75 FKM 585
					2	75 FKM 170055
			2	Trelleborg	1	VCBVR

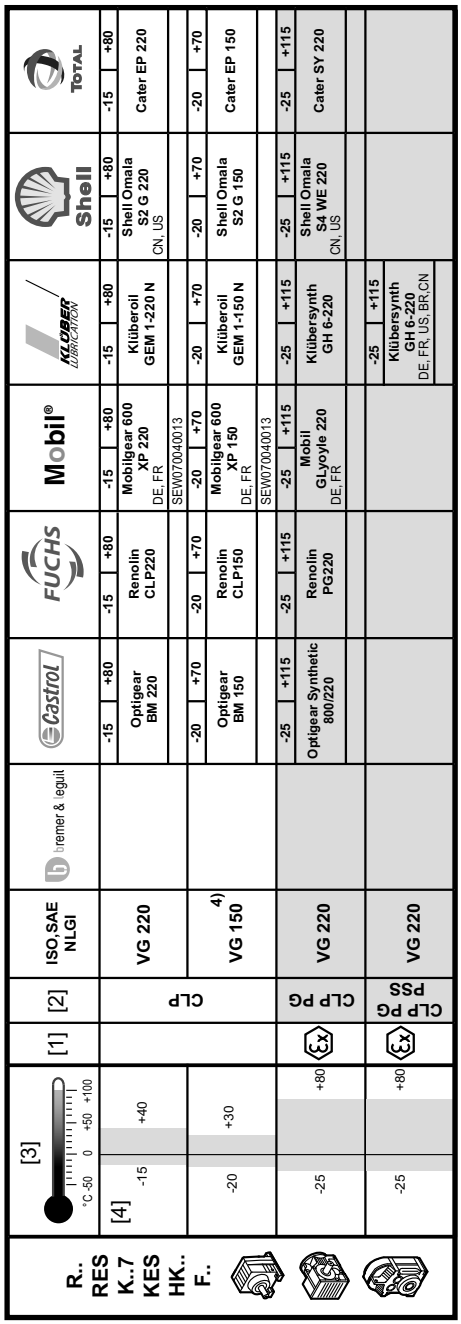
Examples:

S11: Only the elastomer 72NBR902 of the Freudenberg company meets the requirements of the approval in conjunction with the specific lubricant.

S2: Only the elastomer FKM meets the requirements of the approval in conjunction with the specific lubricant.

Key

The following table shows the abbreviations and icons used in the lubricant table and explains what they mean:



Abbreviation/ icon	Meaning
	Synthetic lubricant (marked gray)
	Mineral lubricants
CLP	Mineral oil
CLP PG	Polyglycol (PG)
CLP HC	Synthetic hydrocarbons – polyalphaolefin (PAO)
E	Ester-based oil
	Lubricant for the food processing industry – NSF-H1-compliant
	Easily biodegradable oil for environmentally sensitive areas
	Lubricant suitable for ATEX environment.
1)	Helical-worm gear units with CLP-PG: Contact SEW-EURODRIVE
2)	Special lubricant for SPIROPLAN® gear units only
3)	SEW $f_B \geq 1.2$ required
4)	Observe the critical starting behavior at low temperatures
Oil seal	Oil seal
PSS	Oil seal type PSS (Premium Sine Sealing). The addendum "PSS" at the lubricant type signals compatibility with the sealing system.

8.2.3 Lubricant fill quantities

INFORMATION

The specified fill quantities are **guide values**. The exact values vary depending on the number of gear stages and gear ratio. Check the oil level plug for the exact oil quantity.

INFORMATION

Unless a special arrangement is made, SEW-EURODRIVE supplies the drives with a lubricant fill adapted for the specific mounting position. The mounting position (see chapter "Designation of the mounting positions" (→ 🗎 129)) must therefore be specified in the drive order.

When the mounting position is changed, the lubricant fill quantity must be adapted accordingly (see the following chapters). Consequently, a mounting position may only be **changed** after consultation with SEW-EURODRIVE, **otherwise your rights to claim under limited warranty no longer apply.**

The following tables show guide values for lubricant fill quantities in relation to the mounting position M1 – M6.

25803530/EN – 04/2018

Helical-bevel (K) gear units

INFORMATION

All K..19 and K..29 gear units have a universal mounting position, which means that K..19 and K..29 gear units of the same design are filled with the same oil quantity independent of the mounting position. An exception to this is the M4 mounting position.

K.., KA..B, KH..B, KV..B

Gear unit	Fill quantity in liters

SPIROPLAN® (W) gear units

INFORMATION

SPIROPLAN® gear units W..10 to W..30 have a universal mounting position, which means that gear units of the same design are filled with the same oil quantity independent of the mounting position.

The oil fill quantity of SPIROPLAN® gear units W..37 and W..47 in mounting position M4 is different from that of the other mounting positions.

9 Malfunctions and remedies

⚠ WARNING

Risk of death or injury if the drive starts up unintentionally.

Severe or fatal injuries.

- De-energize the motor before you start working on the unit.
- Secure the motor against unintended power-up.

⚠ CAUTION

Risk of burns due to hot gear unit and hot gear unit oil.

Serious injuries.

- Let the gear unit cool down before you start working on it.
- Carefully remove the oil level plug and the oil drain plug.

NOTICE

Damage to gear unit/gearmotor due to improper operation.

Damage to the gear unit/gearmotor.

- Repair works at SEW-EURODRIVE gear units may only be performed by qualified personnel. In the context of this documentation, qualified personnel are persons who are familiar with the "Technical regulations on operating safety" (TRBS).
- Drive and motor may only be disconnected by qualified personnel.
- Contact SEW-EURODRIVE.

25803530/EN – 04/2018

9.1 Gear units

Fault	Possible cause	Measure
Unusual, regular running noise	• Meshing/grinding noise: Bearing damage	• Check oil consistency, change bearings
	• Knocking noise: Irregularity in the gearing	• Consult SEW-EURODRIVE
	• Deformation of the housing upon tightening	• Check the gear unit mounting for possible deformation and correct if necessary
	• Noise generated by insufficient stiffness of the gear unit foundation	• Reinforce the gear unit foundation
Unusual, irregular running noises	• Foreign objects in the oil	• Check the oil consistency • Stop the drive, contact SEW-EURODRIVE
Oil leaking from inspection cover	• Seal of the inspection cover leaking	• Tighten the screws of the inspection cover and observe the gear unit. Contact SEW-EURODRIVE if oil is still leaking.
	• Seal defective	• Contact SEW-EURODRIVE.
Small amounts of oil leak from the oil seal during run-in phase.	• Function-related pseudo-leakage	• There is no fault. Remove with soft, lint-free cloth and keep monitoring it.
Film of moisture around the dust lip of the oil seal	• Function-related pseudo-leakage	• There is no fault. Remove with soft, lint-free cloth and keep monitoring it.
Oil leaking from the oil seal.	• Oil seal leaking/defective	• Check sealing system. It may be necessary to contact SEW-EURODRIVE.
Oil leaking from motor (e.g. terminal box or fan)	• Too much oil	• Check oil level, correct if necessary
	• Gear unit not ventilated	• Vent gear unit
	• Oil seal leaking/defective	• Check sealing system. It may be necessary to contact SEW-EURODRIVE.
Oil leaking from flange	• Flange gasket leaking/defective	• Check sealing system. It may be necessary to contact SEW-EURODRIVE.
	• Too much oil	• Check oil level, correct if necessary
	• Gear unit not ventilated	• Vent gear unit
Oil leaking from breather valve.	• Too much oil.	• Check oil quantity, correct if necessary
	• Function-related oil mist	• There is no fault.
	• Drive not installed in proper mounting position.	• Install breather valve correctly and adjust the oil level.
	• Frequent cold starts (oil foaming) and/or high oil level.	• Install oil expansion tank.
Output shaft does not turn although the motor is running or the input shaft is rotated.	• Shaft-hub connection in the gear unit interrupted.	• Send in the gear unit/gearmotor for repair

9.2 Adapters AM/AQ./AL/EWH

Fault	Possible cause	Measure
Unusual, regular running noise	• Meshing/grinding noise: Bearing damage	• Contact SEW-EURODRIVE.
Oil leaking.	• Seal defective	• Contact SEW-EURODRIVE.
Output shaft does not turn although the motor is running or the input shaft is rotated.	• Shaft-hub connection in the gear unit interrupted.	• Send in the gear unit/gearmotor for repair.
Change in running noise and/or vibrations	• Spider wear, short-term torque transmission through metal contact	• Change the spider.
	• Screws to secure hub axially are loose	• Tighten the screws
Premature wear of spider	• Contact with aggressive fluids/ oils; ozone influence; excessive ambient temperatures, etc. that can change the physical properties of the spider.	• Contact SEW-EURODRIVE.
	• Impermissibly high ambient/contact temperature for the spider; maximum permitted temperature: -20 °C to +80 °C.	• Contact SEW-EURODRIVE.
	• Overload	• Contact SEW-EURODRIVE.

9.3 AD input shaft assembly

Fault	Possible cause	Measure
Unusual, regular running noise.	• Meshing/grinding noise: Bearing damage.	• Contact SEW-EURODRIVE.
Oil is leaking.	• Seal defective.	• Contact SEW-EURODRIVE.
Output shaft does not turn although the input shaft is rotated.	• Shaft-hub connection in gear unit or cover interrupted.	• Send the gear unit to SEW-EURODRIVE for repair.

25803530/EN – 04/2018

9.4 Service

If you require customer service, include the following information:

- Nameplate data (complete)
- Nature and extent of the problem
- Time the failure occurred and any accompanying circumstances
- Presumed cause
- A digital picture of the failure, if possible

9.5 Waste disposal

Dispose gear units in accordance with the material structure and the regulations in force:

- As steel scrap
  - Housing parts
  - Gears
  - Shafts
  - Rolling bearing
- Parts of the worm gears are made of non-ferrous metals. Dispose of the worm gears appropriately.
- Collect used oil and dispose of it according to the regulations in force.

1 General information

1.1 About this documentation

The current version of the documentation is the original.

This documentation is an integral part of the product. The documentation is intended for all employees who perform work on the product.

Make sure this documentation is accessible and legible. Ensure that persons responsible for the systems and their operation as well as persons who work on the product independently have read through the documentation carefully and understood it. If you are unclear about any of the information in this documentation, or if you require further information, contact SEW-EURODRIVE.

1.2 Structure of the safety notes

1.2.1 Meaning of signal words

The following table shows the grading and meaning of the signal words for safety notes.

Signal word	Meaning	Consequences if disregarded
⚠ **DANGER**	Imminent hazard	Severe or fatal injuries
⚠ **WARNING**	Possible dangerous situation	Severe or fatal injuries
⚠ **CAUTION**	Possible dangerous situation	Minor injuries
NOTICE	Possible damage to property	Damage to the product or its environment
INFORMATION	Useful information or tip: Simplifies handling of the product.	

1.2.2 Structure of section-related safety notes

Section-related safety notes do not apply to a specific action but to several actions pertaining to one subject. The hazard symbols used either indicate a general hazard or a specific hazard.

This is the formal structure of a safety note for a specific section:

SIGNAL WORD

Type and source of hazard.

Possible consequence(s) if disregarded.

- Measure(s) to prevent the hazard.

25957074/EN – 06/2019

Meaning of the hazard symbols

The hazard symbols in the safety notes have the following meaning:

Hazard symbol	Meaning
	General hazard
	Warning of dangerous electrical voltage
	Warning of hot surfaces
	Warning of automatic restart

1.2.3 Structure of embedded safety notes

Embedded safety notes are directly integrated into the instructions just before the description of the dangerous action.

This is the formal structure of an embedded safety note:

⚠ **SIGNAL WORD** Type and source of hazard. Possible consequence(s) if disregarded. Measure(s) to prevent the hazard.

25957074/EN – 06/2019

1.3 Rights to claim under limited warranty

Read the information in this documentation. This is essential for fault-free operation and fulfillment of any rights to claim under limited warranty. Read the documentation before you start working with the product.

1.4 Product names and trademarks

The brands and product names in this documentation are trademarks or registered trademarks of their respective titleholders.

1.5 Copyright notice

© 2019 SEW-EURODRIVE. All rights reserved. Unauthorized reproduction, modification, distribution or any other use of the whole or any part of this documentation is strictly prohibited.

1.6 Other applicable documentation

Observe the corresponding documentation for all further components.

1.6.1 DR..71 – 315, DRN63 – 315, DR2..56 – 80 AC motors

The following publications and documents have to be observed as well:

- Wiring diagrams provided with the motor
- "Gear Unit Series R..7, F..7, K..7, K..9, S..7, SPIROPLAN® W" operating instructions for gearmotors
- Catalogs for AC motors
- Catalogs for gearmotors
- Addendum to the operating instructions "Safety Encoders and Safety Brakes, AC Motors DR.., DRN.., DR2.., EDR.., EDRN.. – Functional Safety"
- "Project Planning for BE.. Brakes" manual – DR.., DRN.., DR2.., EDR.., EDRN.. AC Motors – Standard Brake/Safety Brake"
- If required, "MOVIMOT® MM..D Functional Safety" manual

25957074/EN – 06/2019

2 Safety notes

2.1 Preliminary information

The following general safety notes serve the purpose of preventing injury to persons and damage to property. They primarily apply to the use of products described in this documentation. If you use additional components, also observe the relevant warning and safety notes.

2.2 Duties of the user

As the user, you must ensure that the basic safety notes are observed and complied with. Make sure that persons responsible for the machinery and its operation as well as persons who work on the device independently have read through the documentation carefully and understood it.

As the user, you must ensure that all of the work listed in the following is carried out only by qualified specialists:

- Setup and installation
- Installation and connection
- Startup
- Maintenance and repairs
- Shutdown
- Disassembly

Ensure that the persons who work on the product pay attention to the following regulations, conditions, documentation, and information:

- National and regional safety and accident prevention regulations
- Warning and safety signs on the product
- All other relevant project planning documents, installation and startup instructions, and wiring diagrams
- Do not assemble, install or operate damaged products
- All system-specific specifications and conditions

Ensure that systems in which the product is installed are equipped with additional monitoring and protection devices. Observe the applicable safety regulations and legislation governing technical work equipment and accident prevention regulations.

25957074/EN – 06/2019

2.3 Target group

Specialist for mechanical work

Any mechanical work may only be performed by adequately qualified specialists. Specialists in the context of this documentation are persons familiar with the design, mechanical installation, troubleshooting, and maintenance of the product who possess the following qualifications:

- Qualification in the mechanical area in accordance with the national regulations
- Familiarity with this documentation

Specialist for electrotechnical work

Any electrotechnical work may only be performed by electrically skilled persons with a suitable education. Electrically skilled persons in the context of this documentation are persons familiar with electrical installation, startup, troubleshooting, and maintenance of the product who possess the following qualifications:

- Qualification in the electrotechnical area in accordance with the national regulations
- Familiarity with this documentation

Additional qualification

In addition to that, these persons must be familiar with the valid safety regulations and laws, as well as with the requirements of the standards, directives, and laws specified in this documentation.

The persons must have the express authorization of the company to operate, program, parameterize, label, and ground devices, systems, and circuits in accordance with the standards of safety technology.

Instructed persons

All work in the areas of transportation, storage, operation and waste disposal must be carried out by persons who are trained appropriately. The purpose of the instruction is that the persons are capable of performing the required tasks and work steps in a safe and correct manner.

2.4 Designated use

The product is intended for use in industrial and commercial systems.

In the case of installation in electrical systems or machines, it is prohibited to start the proper operation of the product until it is determined that the machine meets the requirements stipulated in the local laws and directives.

The standards given in the declaration of conformity apply to the product.

25957074/EN – 06/2019

2.5 Transportation/storage

Inspect the shipment for damage as soon as you receive the delivery. Inform the shipping company immediately about any damage. If the product is damaged, it must not be assembled, installed or started up.

The lifting eyebolts are designed to carry only the weight of the motor without gear unit. Tighten installed lifting eyebolts. Mounted gear units have separate suspension attachments, which must be used according to the gear unit operating instructions when lifting the gearmotor. Do not mount any additional loads.

The installed lifting eyebolts are in accordance with DIN 580. Observe the loads and regulations specified there. The tension force vector of the slings must not exceed a 45° angle in accordance with DIN 580.

If necessary, use suitable, sufficiently dimensioned handling equipment.

Observe the following notes when transporting the device:

- Always use all attachment points if available. The attachment points are designed to carry only the mass of the product. Severe or fatal injuries. Do not apply any additional loads.
- Ensure that the product is not subject to mechanical impact.

If the product is not immediately installed, it must be stored in a dry and dust-free location. The product can be stored for up to 9 months without requiring any special measures before startup. Do not store the product outdoors.

Do not transport or store the product on the fan guard.

25957074/EN – 06/2019

2.6 Installation/assembly

Note the following points during installation:

- Make sure that the supports are even, the foot and flange mounting is correct and if there is direct coupling, align with precision.
- Avoid resonance between the rotational frequency and the double supply system frequency.
- Release brake (for motors with mounted brake).
- Turn the rotor by hand and listen for unusual grinding noise.
- Check the direction of rotation in decoupled state.
- Only install or remove belt pulleys and couplings using suitable devices (heat up). Cover the belt pulleys and couplings with a touch guard. Avoid unacceptable belt tension.
- Establish any necessary pipe connections.
- Mounting positions with the shaft end pointing upward must be equipped with a cover to prevent foreign objects from falling into the fan. Ensure that ventilation openings are not obstructed and that used air cannot be drawn in again straight away. The same applies to air from adjacent units.

See also the information in chapter "Mechanical installation" (→ 🗎 32).

2.6.1 Restrictions of use

The following applications are prohibited unless the device is explicitly designed for such use:

- Use in potentially explosive atmospheres
- Use in areas exposed to harmful oils, acids, gases, vapors, dust, and radiation

25957074/EN – 06/2019

2.7 Electric work

2.7.1 Carrying out electric work safely

Observe the following information to carry out electric work safely during installation and maintenance:

- Electric work may only be carried out by electrically skilled persons.
- Always adhere to the 5 safety rules for working on electrical components:
  - Disconnect
  - Secure the drive against restart
  - Check that no voltage is applied
  - Ground and short-circuit it
  - Cover or safeguard neighboring live parts
- When the device is switched on, dangerous voltages are present at all power connections as well as at any connected cables and terminals. This also applies even when the product is inhibited and the motor is at standstill.

2.7.2 Electrical connection

Exceeding the stated tolerances in EN 60034-1 (VDE 0530, Part 1) – voltage ± 5%, frequency ± 2%, curve shape, symmetry – increases the heating and influences electromagnetic compatibility. Adhere to the standard EN 50110. Observe other applicable national regulations, such as DIN VDE 0105 for Germany.

Observe the wiring information and differing data on the nameplate as well as the provided wiring diagram.

The connection must be a permanently secure electrical connection (no protruding wire ends). Use the corresponding cable end equipment. Establish a safe PE connection. When the motor is connected, the distances to non-insulated and live parts must not be shorter than the minimum values according to IEC 60664 and national regulations. With low voltage, the distances should be no shorter than the following values, in compliance with IEC 60664:

Nominal voltage V_N	Distance
≤ 500 V	3 mm
≤ 690 V	5.5 mm

The terminal box must be free from foreign objects, dirt and humidity. Unused cable entry openings and the connection box itself must be sealed so that they are dust- and water-proof.

Secure the key(s) for the test run without output elements.

When operating low-voltage machines with brakes, check that the brake is functioning properly before startup.

Observe the notes in chapter "Electrical installation".

25957074/EN – 06/2019

2.8 Startup/operation

Risk of burns: The surface temperature of the product can exceed 60 °C during operation. Do not touch the product during operation. Let the product cool down before touching it.

Do not deactivate monitoring and protection devices of the machine or system even for a test run.

Depending on the degree of protection, products may have live, uninsulated, and sometimes moving or rotating parts, as well as hot surfaces during operation.

Make sure that any existing transport protection is removed.

In the event of deviations from normal operation, switch the product off. Possible deviations are increased temperatures, noise, or vibration, for example. Determine the cause. Contact SEW-EURODRIVE if necessary.

Ensure that the terminal box is closed and screwed down before applying the supply voltage.

Additional preventive measures may be required for applications with increased hazard potential. Be sure to check the effectiveness of the protection devices after every modification.

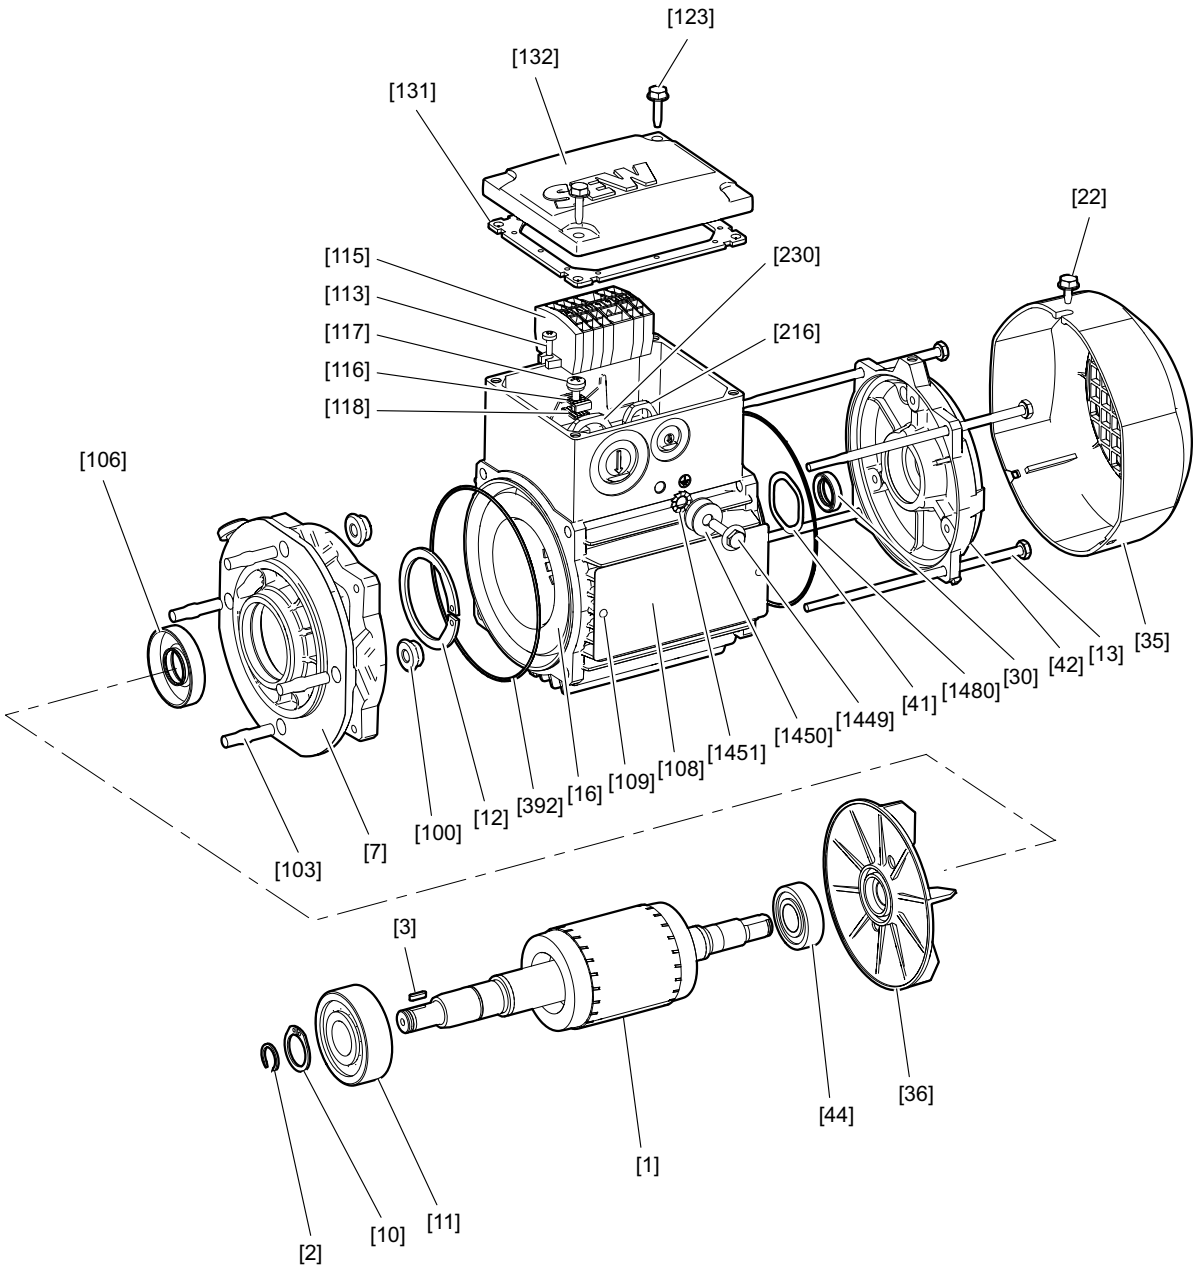
Mechanical blocking or internal protective functions of the product can cause a motor standstill. Removing the cause of this problem can result in the drive re-starting. Disconnect the product from the power supply before you start with troubleshooting.

Overheating of motors with backstop /RS

With low motor speeds, the centrifugal forces are so low that the backstop sprags brush against the inner and outer ring. This causes overheating of the friction surfaces.

- Do not permanently operate motors with backstop /RS below lift-off speed.

25957074/EN – 06/2019



3 Motor structure

3.1 Basic structure

The following figures are schematic representations. Motor size and design may cause deviations.

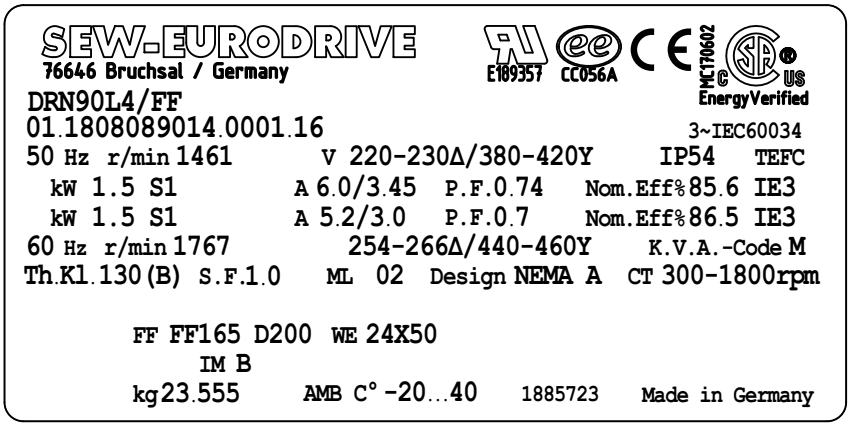
3.9 Nameplate

3.9.1 DRN.. motor nameplate



The following figure shows an example of a nameplate:

9007220942512011

Line	Information
[1]	• Manufacturer, address • CE label
[2]	• Type designation
[3]	• Serial number • Suitability for inverter operation • Number of phases and underlying rating and performance standard
[4]	• Rated frequency • Rated speed • Nominal voltage
[5]	• Rated power and operating mode • Rated current • IE class
[6]	• Power factor • Degree of protection according to IEC 60034-5
[7]	• Thermal class • Rated efficiency for motors included in the validity of the IEC 60034-30-1 standard
[8]	• Flange • Shaft end
[9]	• Mounting position
[10]	• Weight • Part number nameplate • Country of manufacture

3.9.2 DRN.. global motor nameplate

9007216697981707

3.9.3 Markings

The following table lists all the markings that can be provided on a nameplate or attached to the motor, and an explanation of what they mean.

CE	CE mark to state compliance with European guidelines, such as the Low Voltage Directive.
UR	UR logo to confirm that UL (Underwriters Laboratory) is informed about the registered components; register number by UL: E189357
CC056A	DoE mark to confirm compliance with US-American efficiency limit values for AC motors.
c UL US LISTED	UL logo to confirm that a component is UL (Underwriters Laboratory) tested, also valid for CSA in conjunction with the register number
MC170602 c SA US Energy Verified	CSAe mark to confirm compliance with the Canadian efficiency limit values for AC motors
CCC	CCC logo to confirm the adherence to the Chinese regulation for small appliances
VIK	VIK mark to confirm the compliance with the directive of the German Association of Energy and Power Industry (V.I.K.)
FS 02	FS logo with 2-digit number for identification of installed functional safety motor options
EAC	EAC mark (EurAsian Conformity) Confirms compliance with the technical regulations of the economic and customs union of Russia, Belarus, Kazakhstan, Armenia.

25957074/EN – 06/2019

UA.TR. 013	UA.TR mark to confirm compliance with the technical regulations of the country Ukraine.
IE2 EU REGULATION 640/2009 USE WITH VARIABLE SPEED DRIVE ONLY! 1364 171 9	Motors with this mark may only be operated with frequency inverter (VSD = Variable Speed Drive) according to regulation 640/2009.
	BIS mark Confirmation of compliance with the Indian standard IS 12615.
	CEL mark showing energy efficiency in the Chinese grade classification.
	KEL mark confirming the requirements of REELS (Regulation of Energy Efficiency and Labeling Standard).
RENDIMENTO E FATOR DE POTÊNCIA APROVADOS PELO INMETRO PROCEL NBR - 17094-1 INMETRO Registro INMETRO no: 005431/2015	ENCE mark (Brazil) Confirmation of compliance with the Brazilian efficiency limit values for AC motors.

3.9.4 Serial number

The following table lists the structure of a serial number:

Example: 01. 12212343 01. 0001. 18	
01.	Sales organization
12212343	Order number (8 digits)
01.	Order item (2 digits)
0001	Quantity (4 digits)
18	End digits of the year of manufacture (2 digits)

3.10 Type designation

The following table shows the structure of a motor type designation:

DRN132M4/BE11/HR/FI/TF	
DR	Product family
N	Code for product line identification
132M	Size
4	Number of poles
/**BE11**	Brake
/HR	Manual brake release
/FI	Output option
/TF	Thermal motor protection

3.10.1 Designation of the motors

Designation	
DRS..	Standard motor, Standard Efficiency IE1
DR2S..	Standard motor, Standard Efficiency IE1 (2nd generation)
DRE..	Energy-efficient motor, High Efficiency IE2
DRP..	Energy-efficient motor, Premium Efficiency IE3
DRN..	Energy-efficient motor, Premium Efficiency IE3
DRU..	Energy-efficient motor, Super Premium Efficiency IE4
DRL..	Asynchronous servomotor
DR2L..	Asynchronous servomotor (2nd generation)
DRK..	Single-phase operation with running capacitor
DRM..	Torque motor: AC motor for operation at speed n = 0
DR2M..	Torque motor: AC motor for operation at speed n = 0 (2nd generation)
DR..J	Line start permanent magnet motor
56 – 315	Nominal sizes: 56, 63, 71, 80, 90, 100, 112, 132, 160, 180, 200, 225, 250, 280, 315
K, S, M, L, MC, LC, ME, MS, MK, H, LS, LM	Lengths
R, Q P, I B	Power designation (identification of motors with the same size but with different power)
2, 4, 6, 8, 8/2, 8/4, 4/2, 12	Number of poles

25957074/EN – 06/2019

3.11 Designs and options

3.11.1 Output variants

Designation	Description
/FI	IEC foot-mounted motor
/F.A /F.B	Universal foot-mounted motor
/FG	7series integral motor, as stand-alone motor
/FF	IEC flange-mounted motor with bore
/FT	IEC flange-mounted motor with threads
/FL	General flange-mounted motor (other than IEC)
/FM	7-series integral motor with IEC feet
/FE	IEC flange-mounted motor with bore and IEC feet
/FY	IEC flange-mounted motor with threads and IEC feet
/FK	General flange-mounted motor (deviating from IEC) with feet
/FC	C-face flange-mounted motor, dimensions in inch

3.11.2 Mechanical attachments

Designation	Description
/BE..[1)]	Spring-loaded brake with specification of size
/HR	Manual brake release of the brake, re-engaging
/HF	Manual brake release, lockable
/RS	Backstop
/MSW	MOVISWITCH®
/MM03 – MM40	MOVIMOT®
/MO	MOVIMOT® option(s)
/MI	Motor identification module for MOVIMOT®

1) Also available in design for functional safety

3.11.3 Temperature sensor / temperature detection

Designation	Description
/TF	Temperature sensor (PTC thermistor or PTC resistor)
/TH	Thermostat (bimetallic switch)
/KY	1 KTY84 – 130 sensor
/PT	1 or 3 PT100 sensor(s)
/PK	PT1000 temperature sensor

25957074/EN – 06/2019

3.11.4 Encoder

Designation	Description
/ES7S[1], /EG7S[1], /EH7S	Add-on speed sensor with sin/cos interface
/EV7S	Add-on speed sensor ES7S with sin/cos interface, spread shaft via mounting adapter for third-party encoders
/ES7R, /EG7R, /EH7R	Add-on speed sensor with TTL(RS422) interface, U = 9 – 26 V
/EV7R	Add-on speed sensor ES7S with TTL(RS422) interface, spread shaft via mounting adapter for third-party encoders
/ES7C, /EG7C, /EH7C	Add-on speed sensor with HTL interface
/EI7C[1], /EI76, /EI72, /EI71	Built-in incremental encoder with HTL interface and 24/6/2/1 period(s)
/EI8C, /EI8R	Built-in incremental encoder with HTL interface and 1024 periods
/AS7W[1], /AG7W[1]	Add-on absolute encoder, RS485 interface (multi-turn) and sin/cos interface
/AV7W	Add-on absolute encoder AS7W with RS485 interface (multi-turn), spread shaft via mounting adapter for third-party encoders
/AS7Y[1], /AG7Y[1], /AH7Y[1]	Add-on absolute encoder, SSI interface (multi-turn) and sin/cos interface
/AV7Y	Add-on absolute encoder AS7Y with SSI interface (multi-turn), spread shaft via mounting adapter for third-party encoders
/ES7A, /EG7A	Mounting adapter for speed sensors with solid shaft
/EV2T, /EV2R, /EV2S, /EV2C	Add-on incremental encoder with solid shaft
/EH7T	Add-on speed sensor with TTL(RS422) interface
/EK8S, /EK8R, /EK8C	Incremental encoder
/AK8Y, /AK8W, /AK8H	Multi-turn absolute encoder
/EV8S, /EV8R, /EV8C	Incremental encoder
/AV8Y, /AV8W, /AV8H	Multi-turn absolute encoder
/XV.A	Mounting adapter for third-party speed sensors
/XV..	Mounted third-party speed sensors
/XH.A	Mounting adapter for third-party hollow-shaft encoders

1) Also available in design for functional safety

25957074/EN – 06/2019

3.11.5 Connection alternatives

Designation	Description
/IS	Integrated plug connector
/ISU	Integrated plug connector – Design with only the lower part of the plug connector
/ASE.	HAN 10ES plug connector on terminal box with single-locking latch (cage clamp contacts on the motor side)
/ASB.	HAN 10ES plug connector on terminal box with double-locking latch (cage clamp contacts on the motor side)
/ACE.	HAN 10E plug connector on terminal box with single-locking latch (crimp contacts on the motor side)
/ACB.	HAN 10E plug connector on terminal box with double-locking latch (crimp contacts on the motor side)
/AME. /ABE. /ADE. /AKE.	HAN Modular 10B plug connector on terminal box with single-locking latch (crimp contacts on the motor side)
/AMB. /ABB. /ADB. /AKB.	HAN Modular 10B plug connector on terminal box with double-locking latch (crimp contacts on the motor side)
/KCC	6 or 10-pole terminal strip with cage clamp contacts
/KC1	C1-profile-compliant connection of the electrified monorail drive (VDI guideline 3643), for more compact connection areas.
/IV	Other industrial plug connectors according to customer specifications

3.11.6 Ventilation

Designation	Description
/V	Forced cooling fan
/Z	Additional inertia (flywheel fan)
/AL	Metal fan
/U	Non-ventilated (without fan)
/OL	Non-ventilated (closed B-side)
/C	Canopy for the fan guard
/LF	Air filter
/LN	Low-noise fan guard

3.11.7 Bearing

Designation	Description
/NS	Relubrication device
/ERF	Reinforced bearings on A-side with rolling bearing
/NIB	Insulated bearing B-side

25957074/EN – 06/2019

3.11.8 Condition monitoring

Designation	Description
/DUB	Mount-on microswitch for monitoring function and wear of the brake (Diagnostic Unit Brake)
/DUE	Eddy-current sensor for function and wear monitoring of the brake (Diagnostic Unit Eddy Current)

3.11.9 Other additional features

Designation	Description
/DH	Condensation drain hole
/RI	Reinforced winding insulation
/RI2	Reinforced winding insulation with increased resistance against partial discharge
/2W	2nd shaft end on the motor/brakemotor

25957074/EN – 06/2019

3.12 Functional safety

Motors from SEW-EURODRIVE are optionally available with functionally safe motor options. These are designed for implementing safety functions.

SEW-EURODRIVE labels a functionally safe motor option at the drive with an FS logo and a 2-digit number on the motor nameplate. The number is a code that indicates which components in the drive are safety-related. This allows to uniquely identify an available functionally safe motor option via the motor nameplate.

FS logo	Available functionally safe motor option		
	Decentralized inverters	Safety brake	Safety encoder
FS 01	X		
FS 02		X	
FS 04			X
FS 07	X		X
FS 11		X	X

If the FS logo, e.g. with the code "FS-11" is present on the motor nameplate, the combination of safety encoder and safety brake is available for the motor. If an FS logo is available, adhere to the information specified in the corresponding documentation.

If the drive bears the FS logo on the nameplate, adhere to the information in the following document:

- Addendum to the operating instructions "Safety Encoders and Safety Brakes, AC Motors DR.., DRN.., DR2.., EDR.., EDRN.. – Functional Safety"

To determine the safety level for systems and machines yourself, refer to the characteristic safety values in chapter "Characteristic safety values".

25957074/EN – 06/2019

4 Mechanical installation

4.1 Before you start

INFORMATION

Observe the safety notes in chapter 2 of this documentation for the mechanical installation.

INFORMATION

The mounting position for installation must correspond with the specifications on the nameplate.

Install the drive only if the following conditions are met:

- The specifications on the nameplate of the drive correspond to the supply system or the output voltage of the inverter.
- The drive is undamaged (no damage caused by transportation or storage).
- All transport protection has been removed.
- You are certain that the following requirements have been met:
  - Ambient temperature according to the nameplate.

    Note that the temperature range of the gear unit may also be restricted (see "Gear unit" operating instructions).

    Any differing specifications on the nameplate must be observed.
  - No oils, acids, gases, vapors, dusts, radiations, etc.
  - Max. installation altitude 1000 m above sea level.

    Observe the section "Designated use" in chapter 2.
  - Note the restrictions for encoders.
  - Special design: Drive configured in accordance with ambient conditions.

The aforementioned information refers to standard orders. The conditions might be different when you order drives other than the standard. Refer to the order confirmation for deviating conditions.

Functional safety

If the drive has the FS logo on the nameplate, observe the information on mechanical installation in the corresponding addendum to the operating instructions.

25957074/EN – 06/2019

4.2 Preliminary work after longer periods of storage

Depending on the duration and ambient conditions during storage, corrosion, aging of lubricants, embrittlement of sealing elements, and moisture absorption in the insulation can occur.

Perform the described measures on any drives that have been stored for longer than 9 months.

Corrosion

- Check for damage to the motor and/or components (coating, shafts, connection and fastening parts).
- Correct the corrosion damage.

Embrittlement of seals

- Visually inspect seals and look for fissures, hardening, and embrittlement.
- Replace any damaged seals.

Reduced grease service life

If the drives are stored for longer than a year, the service life of the bearing grease is reduced due to aging and de-oiling of the lubricant.

- Check the condition and usability of the rolling bearings.
- Replace any damaged rolling bearings.

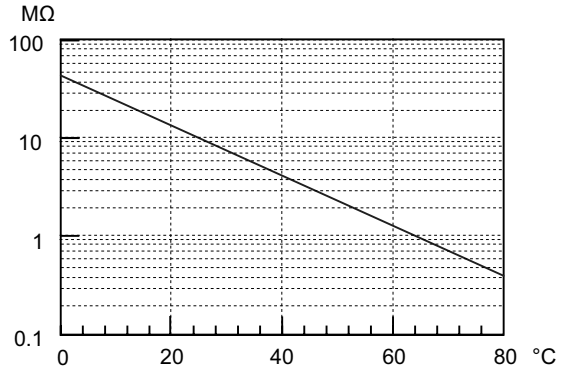
Reduced grease quantity

- If motors are stored for longer than 5 years, regrease them according to the specifications on the motor nameplate using a relubrication device.

Moisture absorption

- Check to see that the wiring space of the motor is dry and clean.
- Remove moisture and dirt.
- If the motor has absorbed moisture, measure the insulation resistance (see chapter "Measuring the insulation resistance" (→ 🗎 34)) and dry the motor (see chapter "Drying the motor" (→ 🗎 35)).

4.2.1 Checking the brake



If motors with brake have been stored or non-operational for longer than 9 months, check their function before taking them into operation.

25957074/EN – 06/2019

4.2.2 Measuring the insulation resistance

The insulation resistance (see following figure) varies greatly depending on the temperature.

If the measured resistance is within the range of the limit characteristic curve (depending on the ambient temperature), the insulation resistance is sufficient. If the value is below the limit characteristic curve, dry the motor.

18014398682805003

25957074/EN – 06/2019

4.2.3 Drying the motor

Use either warm air or an isolation transformer to dry the motor.

INFORMATION

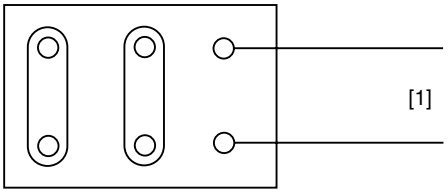
The motors of size 56 and DR..J motors must be dried only by warm air.

⚠ WARNING

Risk of crushing due to torque at the motor shaft.

Severe or fatal injuries.

- Only use warm air for drying DR..J motors.

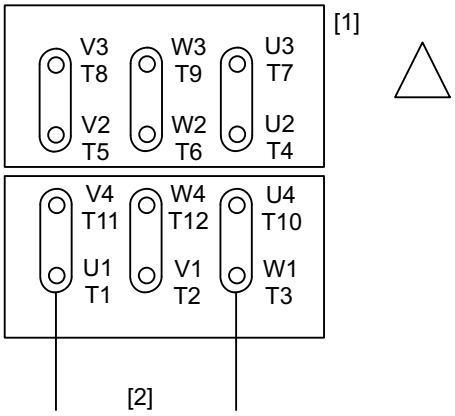


Drying the motor with warm air

1. Dry the motor with warm air.
2. End the drying process when the minimum insulation resistance is exceeded.

Dry the motor with an isolation transformer

1. Connect the windings in series.
2. Auxiliary AC voltage supply max. 10% of the nominal voltage with max. 20% of the rated current



Connect the windings in series: R13 wiring diagram

4.3 Motor installation notes

⚠ CAUTION

Sharp edges due to open keyway.

Risk of cutting injuries.

- Insert the key into the keyway.
- Pull a protective tubing over the shaft.

NOTICE

Improper assembly may damage the drive and corresponding components.

The drive system might be damaged.

- Observe the following information.

- Remove any anti-corrosion agent and dirt from motor shaft ends and flange surfaces. Use a commercially available solvent. Do not allow the solvent to come in contact with the bearings or sealing rings.
- Only install the gearmotor in the specified mounting position on a level, vibration-free and torsionally rigid support structure.
- The mounting position for installation must correspond with the specifications on the nameplate.
- Make sure that there is sufficient clearance around the motor to provide an adequate cooling air supply, and that the motor does not draw in warm exhaust air from other units.
- Align the motor and the driven machine carefully in order to prevent the output shaft from being exposed to unacceptable strain. Observe the permitted overhung and axial forces.
- Do not jolt or hammer the shaft end.
- Use an appropriate cover, e.g. option /C "Canopy", to prevent objects or fluids entering motors in vertical mounting positions (M4/V1).
- Balance components for subsequent mounting on the shaft with a half key (motor shafts are balanced with a half key).
- Existing condensation drain holes are sealed with closing plugs. If contaminated, the condensation drain holes must be checked for proper functioning on a regular basis and cleaned if required.

25957074/EN – 06/2019

4.3.1 Mounting the motor with aluminum feet

To mount motors with a foot made of aluminum, you have to use washers with an outer diameter that is at least twice the screw diameter (e.g. DIN EN ISO 7090).

Use bolts of strength class 8.8 up to max. 10.9.

Tightening torque according to VDI 2230-1.

Motors	Maximum permitted screw lengths
DRN63 – DRN71	M6 × 20
DR2..63 – DR2..71MS	M6 × 20
DRN80 – 90	M8 × 20
DR2..71M – DR2..80	M10 × 25
DRN100 – 132S	M10 × 25

DRN/DR2..63 motors

With DRN/DR2..63 motors, the aluminum foot is slotted in the front due to the limited space.

Position the screws beforehand or fasten the foot with stud bolts.

4.3.2 Installation in damp locations or outdoors

- Use suitable cable glands for the incoming cable (use reducing adapters if necessary) according to the installation instructions.
- If possible, arrange the terminal box in such a way that the cable entries are pointing downwards.
- Seal the cable entry properly.
- Clean the sealing surfaces of the terminal box and the terminal box cover carefully before re-assembly; replace embrittled gaskets.
- If required, touch up the corrosion protection (especially at the eyebolts).
- Check the degree of protection.
- Protect the shaft against corrosion using a suitable anti-corrosion agent.

25957074/EN – 06/2019

4.4 Installation tolerances

Shaft end	Flanges
Diameter tolerance according to EN 50347 • ISO j6 with Ø ≤ 28 mm • ISO k6 with Ø ≥ 38 mm up to ≤ 48 mm • ISO m6 at Ø ≥ 55 mm • Centering bore according to DIN 332, shape DR	Centering shoulder tolerance according to EN 50347 • ISO j6 with Ø ≤ 250 mm • ISO h6 with Ø ≥ 300 mm

4.5 Assembling the input elements

Drive components that are installed on the motor shaft end, e.g. pinions, must be warmed up prior to assembly in order to prevent damage, e.g. to the encoder of stand-alone motors.

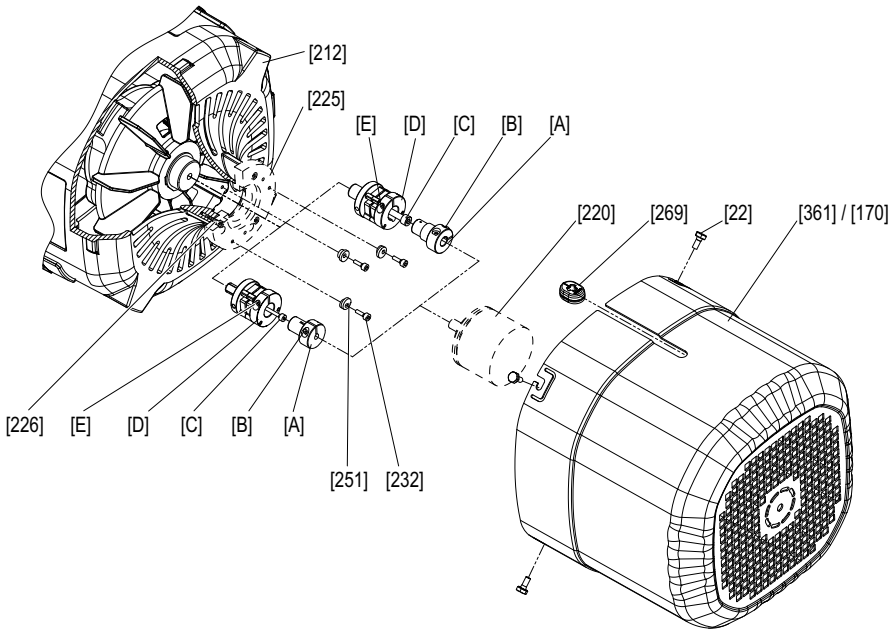
⚠ WARNING

Unsecured key skidding out of the keyway.

Severe or fatal injuries due to flying parts.

- Only operate the motor with attached customer output element (e.g. gear unit), or with a suitably secured key.

25957074/EN – 06/2019



4.6 Encoder mounting adapter

If a drive was ordered with encoder mounting adapter, SEW-EURODRIVE will deliver the drive with enclosed coupling. Do not connect the coupling for operation without the encoder.

4.6.1 Mounting the XV../EV.. encoder mounting adapter to DR..71 – 225, DRN80 – 225 motors

If you have ordered the XV.. or EV.. encoder mounting adapter, the adapter [A] and the coupling [B – E] are enclosed with the motor and are to be assembled by the customer.

The following figure shows how to assemble the coupling and the adapter:

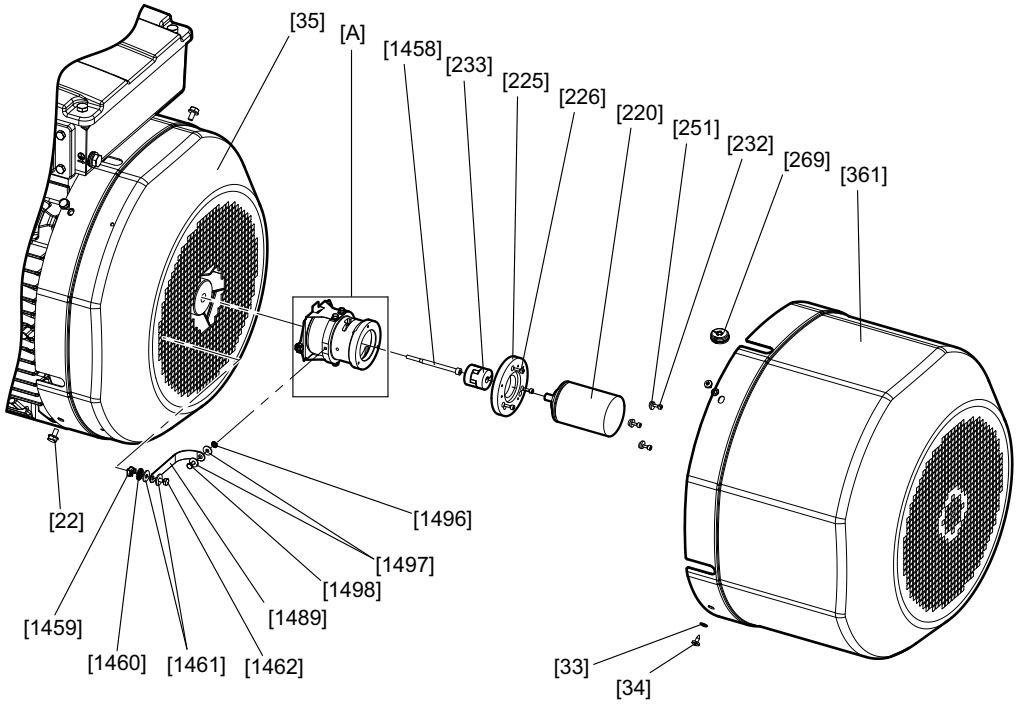
9007202887904779

[22] Screw
[170] Forced cooling fan guard
[212] Fan guard with encoder mount
[220] Encoder
[225] Intermediate flange (XV1A)
[232] Screws (XV1A, XV2A)
[251] Conical spring washers (XV1A, XV2A)
[361] Safety cover
[269] Cable grommet
[A] Adapters
[B] Retaining screw
[C] Central retaining screw
[D] Coupling (spread- or solid shaft coupling)
[E] Retaining screw
[226] Screw

25957074/EN – 06/2019

Mounting the XV../EV.. encoder mounting adapter to DR..71 – 225, DRN80 – 225 motors

1. Remove the safety cover [361], or the forced cooling fan if required.
2. **For XV2A, XV3A, and XV4A:** Remove the intermediate flange [225].
3. Screw the coupling [D] to the bore at the shaft end using screw [C].
4. Plug the adapter [A] onto the pin of the encoder [220].
5. Tighten the central retaining screw [B].
6. **For XV2A, XV3A, XV4A:** Mount the intermediate flange [225] using the screws [226].
7. Plug the encoder [220] with adapter [A] onto the coupling [D].
8. Tighten the retaining screw [E].
9. **For XV1A, XV2A:** Re-install the retaining screws [232] with conical spring washers.
10. **For XV3A, XV4A:** Installed by the customer via bores in the encoder plate.



Motor	Screw	Tightening torque
DR..71 – 132 DRN80 – 132S	[C]	3 Nm
DR..160 – 225 DRN132M – 225:	[C]	8 Nm
All	[226]	3 Nm
All	[B]	3 Nm
All	[E]	3 Nm
All	[232]	3 Nm

25957074/EN – 06/2019

4.6.2 Mounting the XV../EV.. encoder mounting adapter to DR..250 – 280, DRN250 – 280 motors

If you have ordered the XV../EV.. encoder mounting adapter, the coupling [233] is enclosed with the motor and must be installed by the customer.

The following figure shows an example of how the coupling is installed:

18014406225445899

[22]	Screw	[361]	Safety cover (normal/long)
[33]	Washer	[1458]	Screw
[34]	Screw	[1459]	Cage nut
[35]	Fan guard	[1460]	Serrated lock washer
[220]	Encoder	[1461]	Washer
[225]	Intermediate flange (optional)	[1462]	Screw
[226]	Screw	[1489]	Ground strap
[232]	Screws (.V1A, .V2A)	[1496]	Serrated lock washer
[233]	Coupling	[1497]	Washer
[251]	Conical spring washers (.V1A, .V2A)	[1498]	Screw
[269]	Cable grommet	[A]	Encoder mounting adapter

25957074/EN – 06/2019

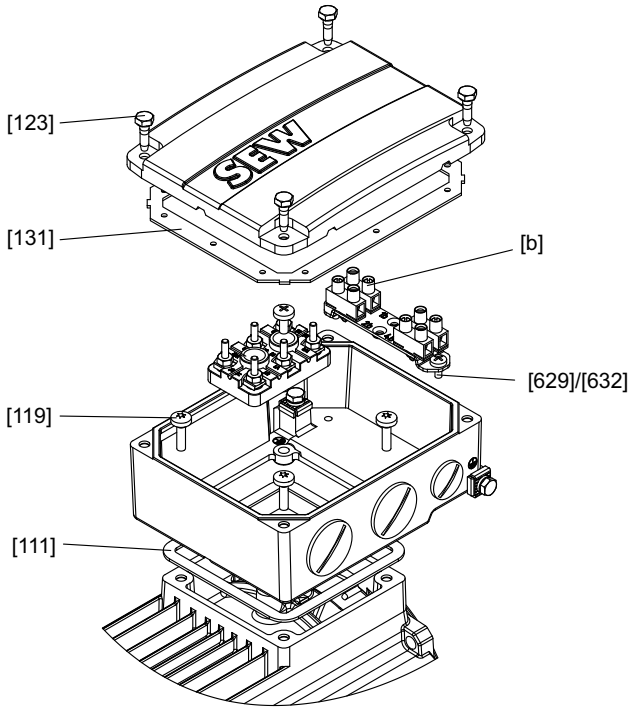
Mounting encoders to XV../EV.. encoder mounting adapters at DR..250 – 280, DRN250 – 280 motors

1. Remove the safety cover [361], or the forced cooling fan if required.
2. Place the coupling [233] onto the pin of the encoder mounting adapter [A].
3. Tighten the screw of the coupling [233] via the slots in the encoder mounting adapter.
4. **For XV2A, XV3A, XV4A:** Mount the intermediate flange [225] to the encoder mounting adapter [A] using screw [226].
5. **For XV1A, XV2A:** Insert the screws [232] with eccentric disk spring washers [251] in the encoder mounting adapter [A].
6. Fasten the encoder [220] to the encoder mounting adapter [A] or the intermediate flange [225].
7. Plug the encoder [220] into the coupling [233].
8. To secure the eccentric disks [251], insert the screws [232].
9. **For XV1A, XV2A:** Tighten the screws [232] while turning the eccentric disks [251] in clockwise direction into the groove of the encoder [220].
10. Tighten the screw of the coupling [233].
11. Insert the encoder cable into the cable grommet [269].
12. Insert the cable grommet [269] into the recess of the safety cover [361] or the forced cooling fan.
13. Mount the safety cover [361] onto the forced cooling fan.

Motor	Screw	Tightening torque
DR..250 – 280 DRN250 – 280	Screw of the coupling [233]	3 Nm
DR..250 – 280 DRN250 – 280	[226]	3 Nm
DR..250 – 280 DRN250 – 280	[232]	3 Nm

4.6.3 XH.A encoder mounting adapter

The XH1A, XH7A and XH8A encoder mounting adapters for hollow shaft encoders are premounted on delivery.



To mount the encoder, proceed as described in chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).

25957074/EN – 06/2019

4.7 Terminal box

4.7.1 Turning the terminal box

The following figure shows the structure of the terminal box variant with terminal board:

9007206616947979

[111] Gasket
[119] Terminal box lower part hex head screws (4 x)
[123] Terminal box cover hex head screws (4 x)
[131] Gasket
[b] Terminal
[629]/ [632] Screws

Proceed as follows to turn the terminal box:

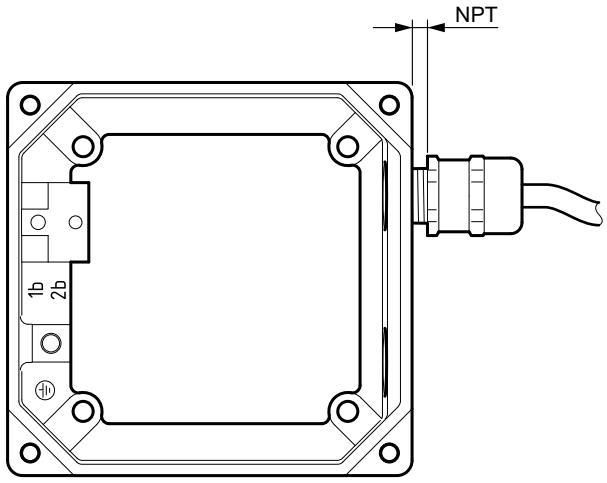
1. Loosen the screws [123] of the terminal box cover. Remove the terminal box cover.
2. Remove the screws [629]/[632].
3. Remove the terminal [b].
4. Remove the retaining screws [119] of the terminal box.
5. Clean the sealing surfaces at the stator shoulder, terminal box lower part and terminal box cover.
6. Check the gaskets [111] and [131] for damages.
7. Replace any damaged seals.
8. ⚠ **DANGER!** Electric shock due to damaged cables. Severe or fatal injuries. When installing the terminal box lower part or the terminal board, make sure the cables are not crushed or twisted. Do not use sharp or pointed objects to align the cables.
   Turn the terminal box to the required position.
9. Make sure that the gasket is positioned correctly [111].

25957074/EN – 06/2019

10. Attach the terminal box lower part.
11. Apply the corresponding tightening torque to tighten the screws [119] of the terminal box lower part.
12. Refer to chapter "Appendix" (→ 🗎 269) for the arrangement of the auxiliary terminals.
13. Secure terminal [b] with screws [629]/[632].
14. Make sure that the gasket is positioned correctly [131].
15. Attach the terminal box cover to the terminal box lower part.
16. Apply the corresponding tightening torque to tighten the screw [123] of the terminal box cover.
17. To make sure that the cables have not been damaged, perform an insulation test after reassembly, see chapter "Preliminary work after longer periods of storage" (→ 🗎 33).

Tightening torques of the terminal box lower part

Motor	Screw	Tightening torque
		Nm
DR..71 – 132 DRN71 – 132S DR2..71– 80	[119]	5
DR..160 – 225 DRN132M – 225	[119]	27.3
DR..250 – 315 DRN250 – 315	[119]	54



Tightening torques of the terminal box cover

Motor	Screw	Tightening torque
		Nm
DR2..56	[123]	3
DR..71 – 132 DRN63 – 132S DR2..63– 80	[123]	4
Aluminum DR..160 – 225 DRN132M – 225	[123]	11.3
Gray cast iron DR..160 – 225 DRN132M – 225	[123]	27.3
DR..250 – 315 DRN250 – 315	[123]	54

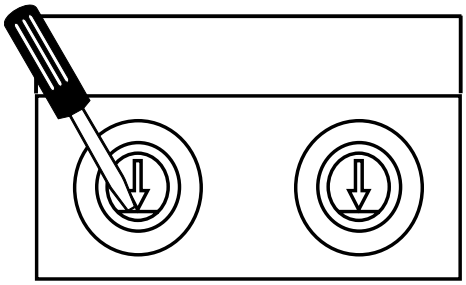
25957074/EN – 06/2019

4.7.2 Terminal box with NPT thread

In terminal boxes with NPT thread, cable glands cannot always be screwed in all the way (up to the O-ring).

14949925387

For applications in wet areas, SEW-EURODRIVE recommends using metric screw fittings.



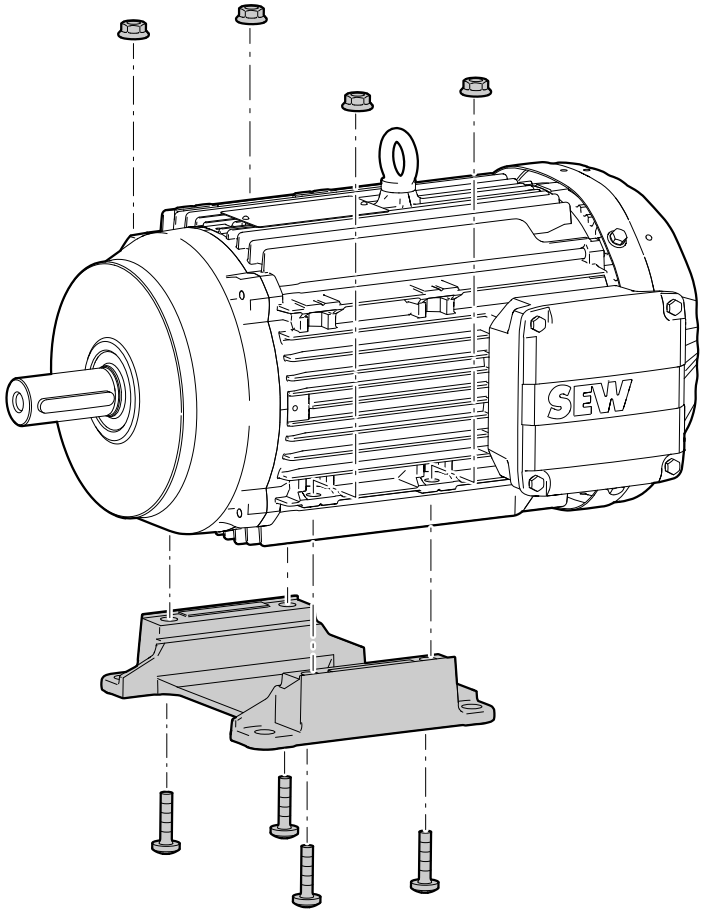
25957074/EN – 06/2019

4.7.3 Breaking open knock-outs

In order to be able to insert cables into the terminal box, the prepared knock-outs must be broken open.

✓ Required tools: Screwdriver or chisel.

1. **NOTICE!** Damage to the terminal box or fragments inside the motor. Possible physical damage. Exercise caution when breaking open the knock-outs.
   Break open the knock-out [K] by using a chisel or screwdriver.
2. Check the opening for residual burr. If any residual burr is present, remove it by using a suitable tool.

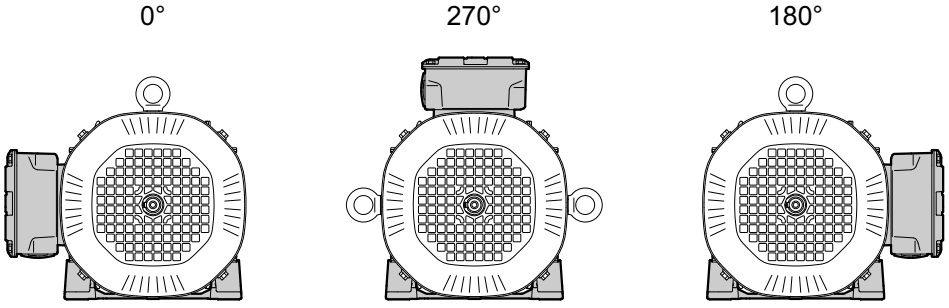


9007200052610443

25957074/EN – 06/2019

4.8 Retrofitting (option /F.A) or modifying (option /F.B) motor feet

4.8.1 DRN71 – 132S, DR2..71 – 80 motors



The following figure shows a motor with option /F.A (retrofit foot).

22845053579

✓ The contact surfaces at the foot [90] and stator [16] are painted.

1. Observe the following figure when selecting the contact surfaces. The figure illustrates the possible terminal box positions with reference to the retrofittable motor feet.

22845056011

2. Remove the paint from the stator [16] contact surface where the foot is to be screwed on.
3. Apply a thin layer of corrosion protection to the contact surfaces after the paint has been removed.
4. Remove the paint from the contact surfaces of the foot [90].

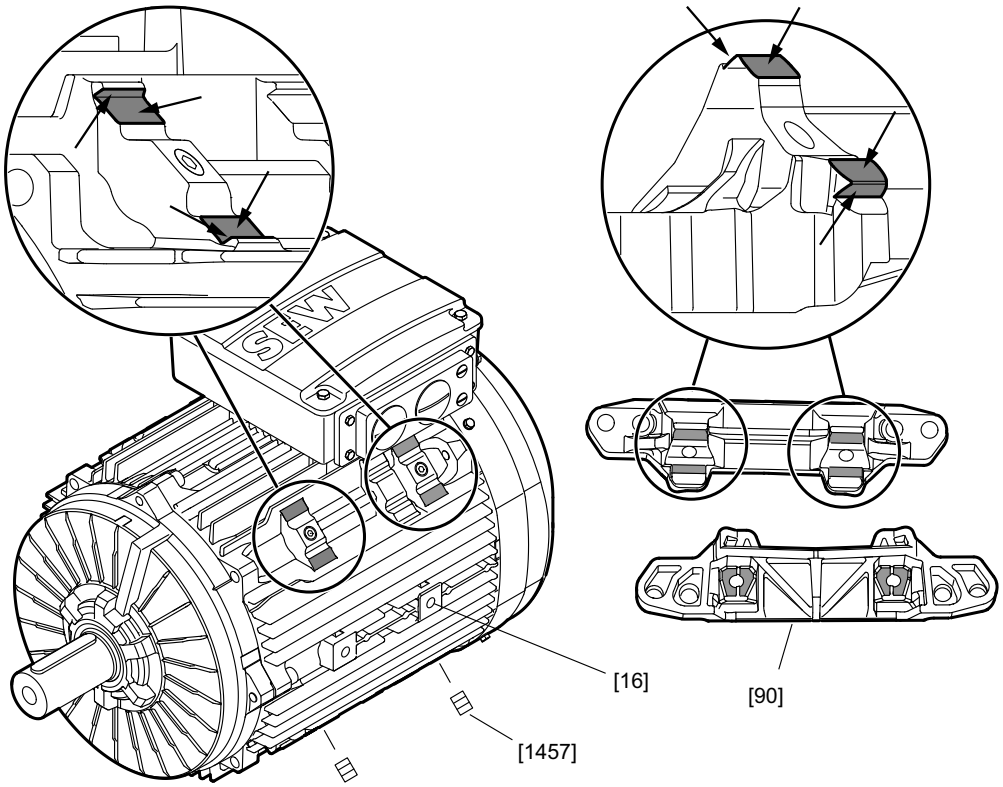
25957074/EN – 06/2019

5. Apply a thin layer of corrosion protection to the contact surfaces after the paint has been removed.
6. Attach the foot [90] to the motor using the screws [94] and washers [91]. Tighten the screws in diametrically opposite sequence. The screws are micro-encapsulated. This is why you have to screw in and tighten the screws quickly.
7. If necessary, you can apply paint or corrosion protection at the joint after attaching the foot [90].

Changing the motor foot position

For converting the motor foot to another position, observe the following points:

- After removing the screws [94], check for damage to the thread or other similar damage.
- When changing the position of the motor foot, apply corrosion protection to unpainted surfaces.



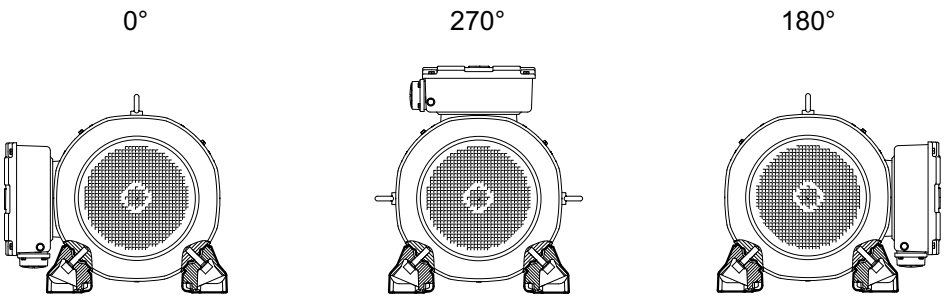
Tightening torques

Motor	Screw	Tightening torque
DRN71 – 90, DR2..71 – 80	M6	11.3 Nm
DRN100 – 132S	M8	27.3 Nm

25957074/EN – 06/2019

4.8.2 DR..250 – 315, DRN..225 – 315 motors

The following figure shows a motor with option /F.A (retrofit feet).

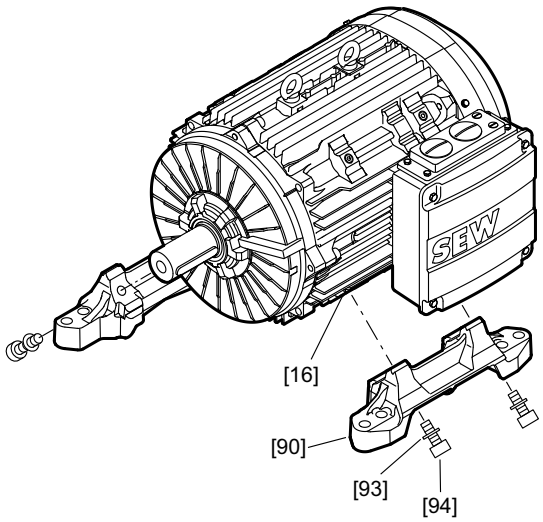


18014406536422539

[16]	Stator	[1457]	Set screw
[90]	Foot		Remove the paint from the marked surfaces.

✓ The tapped holes of the foot mounting surfaces are closed with set screws [1457]. The contact surfaces at the feet [90] and stator [16] are painted.

1. Observe the following figure when selecting the contact surfaces. The figure illustrates the possible terminal box positions with reference to the retrofittable motor feet.



9007211165643403

2. Remove the set screws [1457] from those threads into which you will screw the foot screws [94].
   - ⇨ Sizes 250 – 280: 8 set screws
   - ⇨ Size 315: 12 set screws

25957074/EN – 06/2019

3. Remove the paint from the contact surfaces of the stator [16] where the feet are to be screwed on.
   - ⇨ Sizes 250 – 280: 8 surfaces
   - ⇨ Size 315: 12 surfaces
4. Apply a thin layer of corrosion protection to the contact surfaces after the paint has been removed.
5. Remove the paint from the contact surfaces of the feet [90].
6. Apply a thin layer of corrosion protection to the contact surfaces after the paint has been removed.
7. Attach the feet [90] to the motor using the screws [94] and washers [93]. The screws are micro-encapsulated. This is why you have to screw in and tighten the screws quickly.
8. Apply paint or corrosion protection at the parting line after attaching the feet [90].

Changing motor feet positions

9007206996709387

[16] Stator
[90] Foot
[93] Washer
[94] Screw

For converting the motor feet to another position, observe the following points:

- After removing the screws [94], check for damage to the thread or other similar damage.
- Remove the old micro-encapsulation.
- Clean the threads of the screws [94].
- Apply a high-strength thread locker to the screw threads [94] before inserting the screws again.
- The set screws removed from the new mounting position can be reused for the bores of the old mounting position. After inserting the set screw [1457] into the open tapped holes in the stator [16], paint or corrosion protection can be applied on the bare joining surfaces of the stator.
- When the position of the motor feet is changed, apply corrosion protection to the unpainted surfaces.

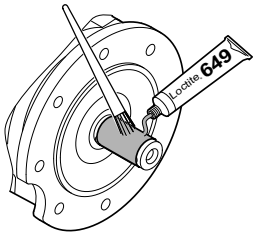
25957074/EN – 06/2019

Tightening torques

Motor	Screw	Tightening torque
DRN225	M16	230 Nm
DR..250/DRN250	M20	464 Nm
DR..280/DRN280	M20	464 Nm
DR..315/DRN315	M20	464 Nm

25957074/EN – 06/2019

4.9 Direct mounting of a motor on a gear unit



INFORMATION

Secure all pinions on the motor or input shaft with Loctite® 649 even if a retaining ring is additionally present.

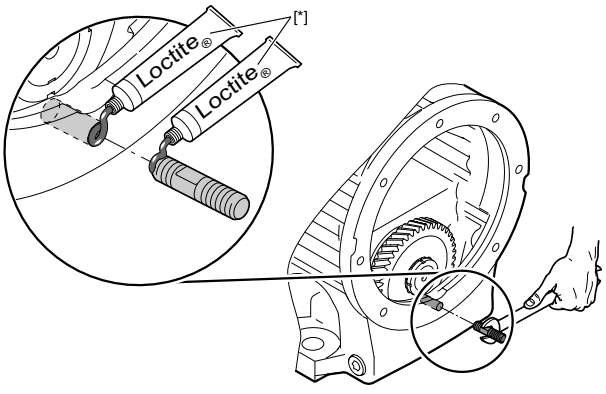
If the pinion is already fastened to the shaft, start cleaning the sealing surface (step 6).

Joining the pinion to the motor or input shaft

1. Clean and degrease the shaft and the bore of the pinion.
2. Apply Loctite® 649 to the shaft after the securing hole over the entire area of the circumference.

22763067787

3. Warm the pinion up to **at least** 100 °C to a **maximum of** 130 °C.
4. Push the pinion onto the shaft.
5. Secure the pinion on the shaft with the retaining ring.



Cleaning the sealing surfaces

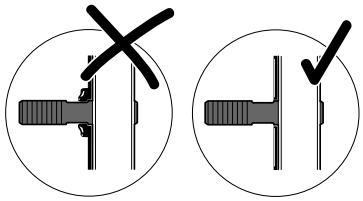
6. Remove oils, grease, irregularities of the surface, rust and old Loctite® residue from the flange surfaces.

Sealing threads that lead into the housing interior

To prevent oil from escaping after installation, flange threads that lead into the housing interior must be sealed!

7. Clean and degrease thread through bores that lead into the housing interior and their studs.
8. Apply Loctite® 574 or Loctite® 5188 (selection according to the table at the end of the chapter) in a continuous ring on the upper threads of the flange thread and the stud.

22795758347



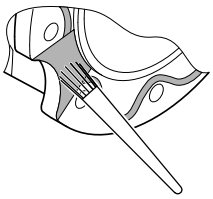
[*] Loctite® according to the table at the end of the chapter

Screwing in the studs

9. Screw the studs into the thread up to the shoulder.

25957074/EN – 06/2019

10. Remove any excess Loctite® (see following diagram) from the sealing surface 60 minutes after screwing in at the latest.



22347379211

Sealing the flange surface

INFORMATION

Always apply the sealant over a large area in narrow places and on the gear units R97, R107, R127, F97 or F107.

11. Only distribute Loctite® 574 or Loctite® 5188 (selection according to the table at the end of the chapter) to one of the sealing surfaces. Apply the sealant in beads or over a large area without gaps. Use a suitable application tool that does not contaminate the sealing surface, for example, a non-shedding brush or a short-hair lamb's wool roller.

Joining flange surfaces

12. Join the flange surfaces together. Next, **immediately** tighten the nuts with the specified torque (see the table at the end). If you tighten the nuts too late, the sealing film can tear.
13. The sealant must harden for 30 minutes and must not come into contact with the gear oil.

25957074/EN – 06/2019

4.9.1 Tightening torques

Screw/nut	Tightening torque Nm
M6	11.3

25957074/EN – 06/2019

4.10 Options

4.10.1 /HR, /HF Manual brake release

The option manual brake release /HR, /HF is preinstalled and set at the factory for some brake sizes. If your drive was not delivered with manual brake release and you wish to retrofit it, observe the instructions in chapter "Retrofitting the /HR, /HF manual brake release" (→ 🗎 203).

Activating and loosening the /HF manual brake release

⚠ WARNING

No brake function due to activated manual brake release.

Severe or fatal injuries.

- Before startup, make sure that the hand lever has been removed or secured against unintentional activation to prevent unintentional brake release during operation.

You can use the option /HF (lockable manual brake release) to continuously mechanically release the BE.. brake with a set screw and a releasing lever.

On delivery, the set screw is inserted far enough to not fall out and to not affect the brake performance. The set screw is self-locking. This prevents it from unintended turning in or from falling out.

In case of BE03 brakes, the set screw is stored in the grommets between the stator fins.

Activating the /HF manual brake release with BE03 brake

Proceed as follows:

1. Screw in the set screw until there is no more clearance at the releasing lever.
2. To release the brake manually, screw in the set screw by 1/2 – 1 turn.

Activating the /HF manual brake release with BE05 – BE122 brake

Proceed as follows:

1. Screw in the set screw until there is no more clearance at the releasing lever.
2. To release the brake manually, screw in the set screw by 1/4 – 1/2 turn.

Loosening the /HF manual brake release with BE03 brake

Proceed as follows:

1. Remove the set screw completely from the thread.
2. Fasten the set screw between the stator fins with both grommets.

Loosening the /HF manual brake release with BE05 – BE122 brake

Proceed as follows:

1. Loosen the set screw at least until the floating clearance of the manual brake release has completely returned, see chapter "Retrofitting the /HR, /HF manual brake release".

25957074/EN – 06/2019

Activating and loosening the /HR manual brake release

⚠ WARNING

No brake function due to activated manual brake release.

Severe or fatal injuries.

- Before startup, make sure that the hand lever has been removed or secured against unintentional activation to prevent unintentional brake release during operation.

You can use the option /HF manual brake release to mechanically release the BE.. brake for a short time via a combination of releasing lever and hand lever. It is designed with a spring mechanism, so that it reengages automatically.

During assembly, the mechanics inside the fan guard is preset at the factory. A hand lever is included in the delivery that is attached to the stator housing.

Activating the /HR manual brake release

Proceed as follows:

1. Remove the hand lever from the stator housing.
2. Screw the thread of the hand lever completely into the thread of the releasing lever.
3. To release the brake, pull the hand lever in the direction away from the terminal box. The correct direction of use is indicated by an arrow symbol on the fan guard or on the closing part on the fan guard opening.

Loosening the /HR manual brake release

INFORMATION

The releasing procedure can be performed with usual force application, do not apply too much force to the lever to avoid damage to the drive.

Proceed as follows:

1. Let go of the lever in the actuated state. The lever automatically reengages to the initial position and the brake is applied.
2. Screw out the hand lever and keep it safe. With motors of sizes 63 – 280, you can attach the hand lever to the stator housing with the provided grommets or clamps.

25957074/EN – 06/2019

4.10.2 Air filter /LF

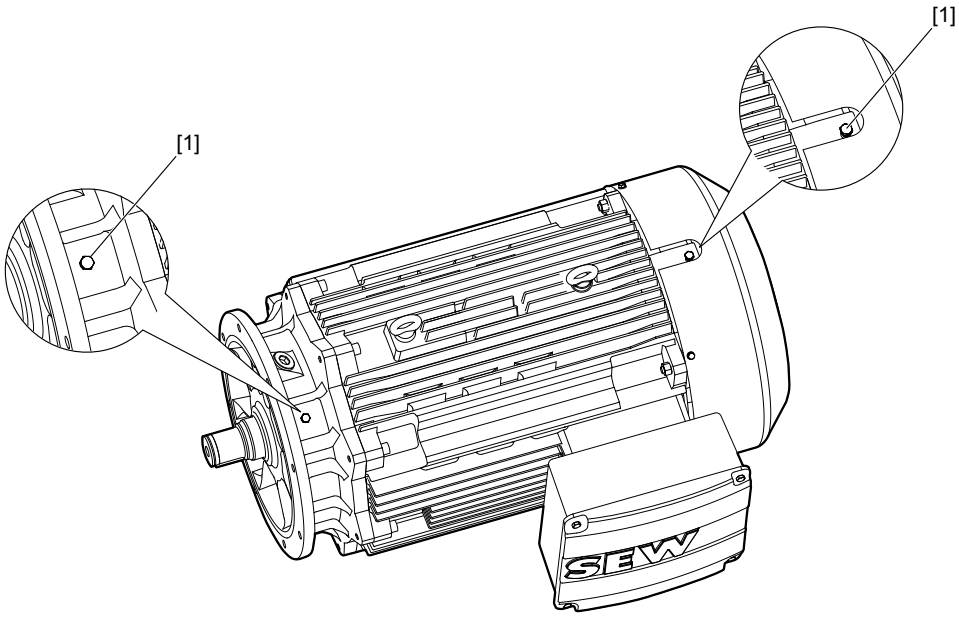
The air filter is a filter fleece that is installed in front of the fan grille. It can be easily removed and installed for cleaning purposes.

The attached air filter prevents dust and other particles that are drawn in by the air flow from being distributed. It also prevents that the ducts between the cooling fins become clogged with dust.

In very dusty environments, the air filter protects the cooling fins from dirt or from becoming clogged.

The air filter must be cleaned or replaced depending on the amount of dust in the environment. No maintenance intervals can be specified due to the individuality of each drive and the environment where it is installed.

Technical data	Air filter
Approvals	All certifications
Ambient temperature	-40 °C to +100 °C
Filter material	Viledon PSB290SG4



25957074/EN – 06/2019

4.10.3 Mounting adapter for measuring nipple

Depending on the respective order specifications, SEW-EURODRIVE delivers the drives as follows:

- With bore
- With bore and included measuring nipples for vibration measurement.

The following figure shows a motor with bores and inserted measuring nipples [1]:

9007201960947467

[1] Bore with inserted measuring nipples

Proceed as follows to connect the customer measuring device:

1. Remove the protective plugs from the bores.
2. Insert the measuring nipple in the bores of the motor and screw in the measuring nipple with a tightening torque of 15 Nm.
3. Plug the mounting adapter of the measuring unit into the measuring nipple.

4.10.4 Second shaft end with optional cover

SEW-EURODRIVE delivers motors with the 2nd shaft end option /2W with the key inserted and secured by transport protection.

⚠ WARNING

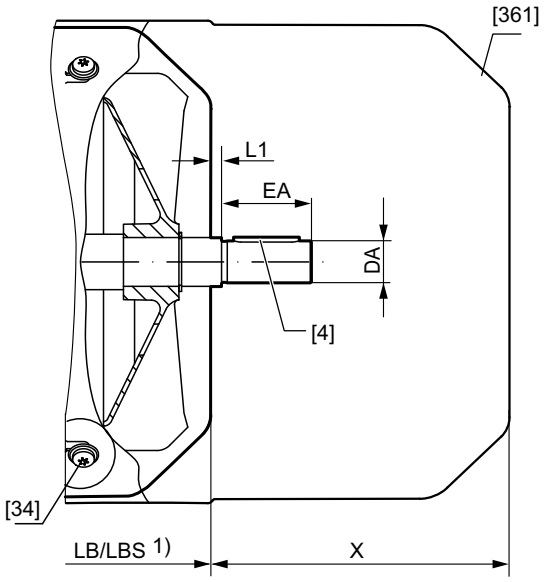
Unsecured key skidding out of the keyway.

Severe or fatal injuries due to flying parts.

- Only operate the motor with a suitably secured key.

⚠ WARNING

Rotating shaft end or attachments.



Severe or fatal injuries.

- Only start the motor with installed protective cover at the second shaft end.

The protection cover must meet the impact resistance requirements of EN 60079-0 (VDE 0170-1):2014-06, chapter 26.4.2.

As an option, SEW-EURODRIVE can also provide the safety cover [361] for the 2nd motor shaft end already installed at the DR..71 – 280 and DRN63 – 280 motors. This is not included in the delivery as standard.

The following figure shows the dimensions of the optional cover.

18014402029073931

[4] Keyway
[34] Tapping screw
[361] Safety cover
LB/LBS Length of the motor/brakemotor

5 Electrical installation

5.1 General information

⚠ WARNING

Electric shock due to incorrect installation.

Severe or fatal injuries.

- Use switch contacts in utilization category AC-3 according to EN 60947-4-1 for switching the motor.
- Use switch contacts to switch the brake. Depending on brake type and type design, the switch contacts meet the specifications in the following utilization categories:
  - Switch contacts for the supply voltage for operation with AC voltage: AC-3 according to EN 60947-4-1, or AC-15 according to EN 60947-5-1.
  - Switch contact for the supply voltage for operation with DC voltage: Preferably AC-3 or DC-3 according to EN 60947-4-1. As an alternative, contacts in utilization category DC-13 according to EN 60947-5-1 are also permitted.
  - Switch contacts for optional cut-off in the DC circuit: AC-3 according to EN 60947-4-1.
- When motors are powered by inverters, you must adhere to the wiring instructions in the frequency inverter operating instructions.

25957074/EN – 06/2019

5.2 Wiring diagrams and terminal assignment diagrams

Connect the motor as shown in the wiring connection diagrams provided with the motor. You can obtain the valid wiring diagrams free of charge from SEW-EURODRIVE.

INFORMATION

Do not connect or start up the motor if the wiring diagram is missing.

5.3 Wiring notes

During installation observe the safety notes in chapter 2 and 5.

5.3.1 Protecting the brake control system against interference

Brake cables must always be routed separately from other unshielded power cables with phased currents to prevent interference with brake control. In particular, power cables with phased currents include:

- Output cables from frequency inverters and servo inverters, soft start units and brake units
- Supply cables for braking resistors and similar options

For line-operated motors and when using AC and DC circuit cut-off, the connection between the brake rectifier and the external switch contact must be in a different power cable that is separate from the motor power supply.

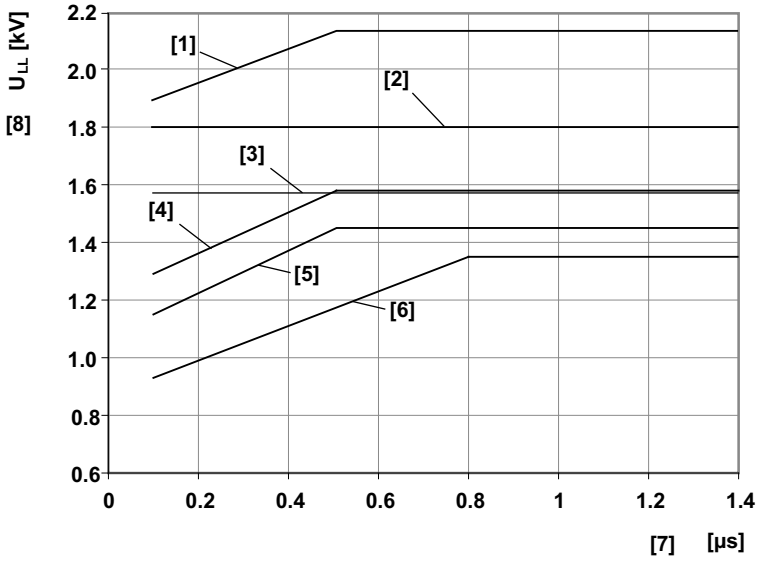
5.3.2 Protecting the motor protection devices against interference

Adhere to the following points to protect motor protection devices by SEW-EURODRIVE against interference:

- You may route separately shielded supply cables together with switched-mode power cables in one cable.
- Do not route unshielded supply cables together with switched-mode power lines in one cable.

25957074/EN – 06/2019

5.4 Special aspects for operation with a frequency inverter



When motors are powered from inverters, you must observe the wiring instructions issued by the inverter manufacturer. You must also observe the operating instructions for the frequency inverter.

5.4.1 Motors with SEW-EURODRIVE frequency inverter

Operation of the motor on SEW-EURODRIVE frequency inverters has been tested. The required dielectric strength values of the motors were confirmed and the startup routines adjusted to the motor data. You can operate the motor with any frequency inverter from SEW-EURODRIVE. To do this, start up the motor as described in the operating instructions for the frequency inverter.

5.4.2 Motor with non-SEW inverter

Operating SEW-EURODRIVE motors on third-party frequency inverters is permitted if the pulse voltages at the motor terminals indicated in the following figure are not exceeded.

9007203235332235

[1] Permitted pulse voltage for DR.., DRN.. motors with reinforced insulation and increased resistance against partial discharge (/RI2)
[2] Permitted pulse voltage for DR.., DRN.. motors with reinforced insulation (/RI)
[3] Permitted pulse voltage according to NEMA MG1 part 31, $V_N \leq 500$ V
[4] Permitted pulse voltage according IEC 60034-25, limit value curve A for nominal voltage $V_N \leq 500$ V, star connection
[5] Permitted pulse voltage according IEC 60034-25, limit value curve A for nominal voltage $V_N \leq 500$ V, delta connection
[6] Permitted pulse voltage according to IEC 60034-17
[7] Voltage rise time
[8] Permitted pulse voltage

The insulation class depends on the voltage.

- ≤ 500 V = standard insulation
- ≤ 600 V = /RI
- > 600 V – 690 V = /RI2

25957074/EN – 06/2019

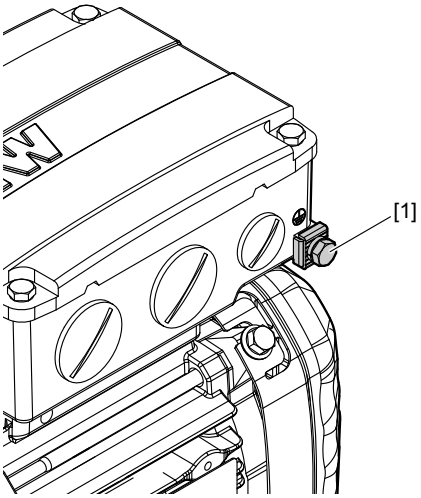
INFORMATION

Compliance with the following limit values must be checked and considered:

- The supply voltage level at the third-party inverter
- The threshold of the brake chopper voltage
- The operating mode of the motor (motor mode/generator mode)

→ If the permitted pulse voltage is exceeded, you must install limiting measures, such as filters, chokes or special motor cables. Consult the manufacturer of the frequency inverter.

25957074/EN – 06/2019

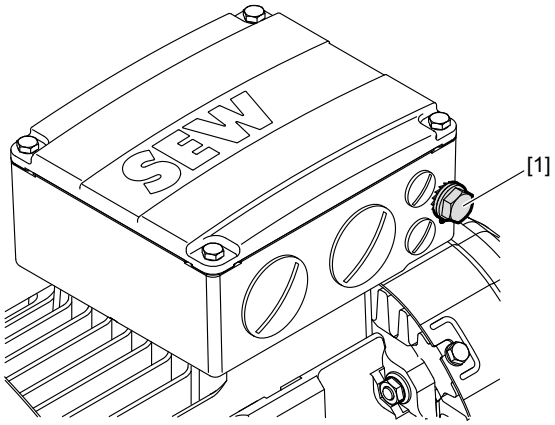


5.5 Exterior grounding at the terminal box, LF grounding

In addition to the interior PE connection, a LF grounding cable can be attached to the outside of the terminal box. It is not installed as standard.

LF grounding can be ordered as completely pre-installed at the factory. For this, an aluminum or gray cast iron terminal box designed for brake connections is required for DR..71 – 132, DRN71 – 132S, DR2..71 – 80 motors. For DR..160 – 225, DRN132M – 225 motors, this option can be combined with all terminal box types.

The option can be combined with "HF grounding" (→ 🗎 67).



DR..71 – 132, DRN71 – 132S, DR2..71 – 80 motors

9007207279069579

[1] LF grounding at the terminal box

DR..160 – 225, DRN132M – 225 motors

8026938379

[1] LF grounding at the terminal box

25957074/EN – 06/2019

5.6 Improving the grounding (EMC), HF grounding

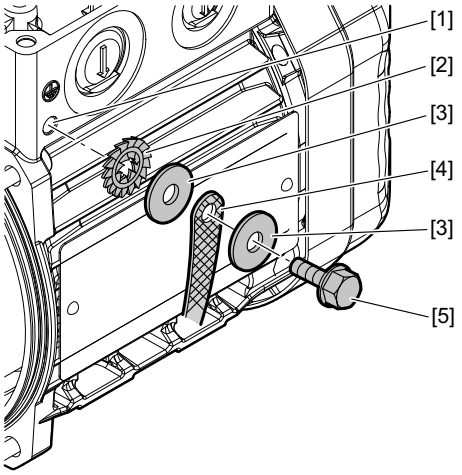
For improved, low-impedance grounding at high frequencies, we recommend using the following connections with corrosion protected connection elements:

HF grounding is not installed as standard.

The HF grounding option can be combined with LF grounding at the terminal box.

If you require LF grounding in addition to HF grounding, you can connect the conductor to the same point.

The HF grounding option can be ordered as follows:



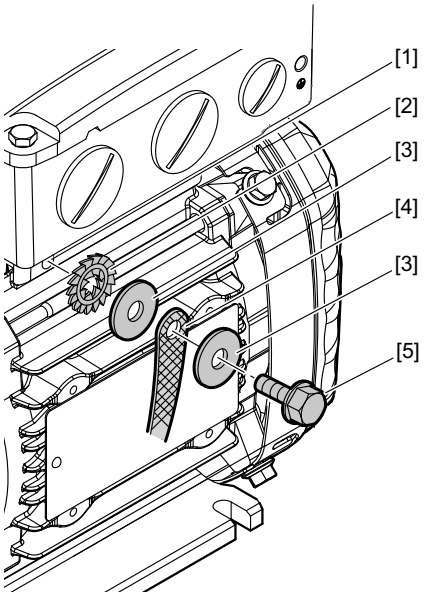
- Completely pre-assembled at the factory
- As "grounding terminal" kit for customer installation; part numbers listed in the following table.

Motors	Part number of "Grounding terminal" kit
DRN63, DR2..56 – 63	21014817
DR..71 – 100M, DRN71 – 100LS, DR2..71 – 80	21015988
DR..100L – 132, DRN100L – 132S	13633945
DR..160 – 225, DRN132M – 225 with aluminum terminal box	

INFORMATION

If 2 or more ground straps are used, you have to attach them with a longer screw. The specified tightening torques refer to a strap thickness of t ≤ 3 mm.

5.6.1 DRN63, DR2..56 – 63 motors with HF(+LF) grounding



22297406859

18014402064551947

[1] Use of tapped hole for lifting eyes
[2] Serrated lock washer DIN 6798
[3] Washer ISO 7089/ISO 7090
[4] Ground strap (not included in the delivery)
[5] Hex head screw ISO 4017 M8 × 18, tightening torque 10 Nm

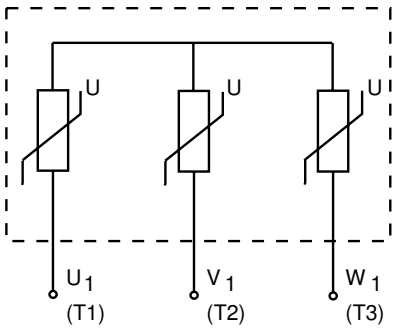
25957074/EN – 06/2019

5.6.6 DR..160 – 315, DRN132M – 315 motors with HF(+LF) grounding

9007202821668107

[1] Use of the tapped holes at the terminal box
[2] Serrated lock washer DIN 6798
[3] Washer ISO 7089/ISO 7090
[4] Ground strap (not included in the delivery)
[5]
- Hex head screw ISO 4017 M8 × 18 (with aluminum terminal boxes of DR..160 – 225, DRN132M – 225 motors), tightening torque 10 Nm
- Hex head screw ISO 4017 M10 × 25 (with gray cast iron terminal boxes of DR..160 – 225, DRN132M – 225 motors), tightening torque 10 Nm
- Hex head screw ISO 4017 M12 x 30 (terminal boxes of DR../DRN250 – 315 motors), tightening torque 15.5 Nm

25957074/EN – 06/2019



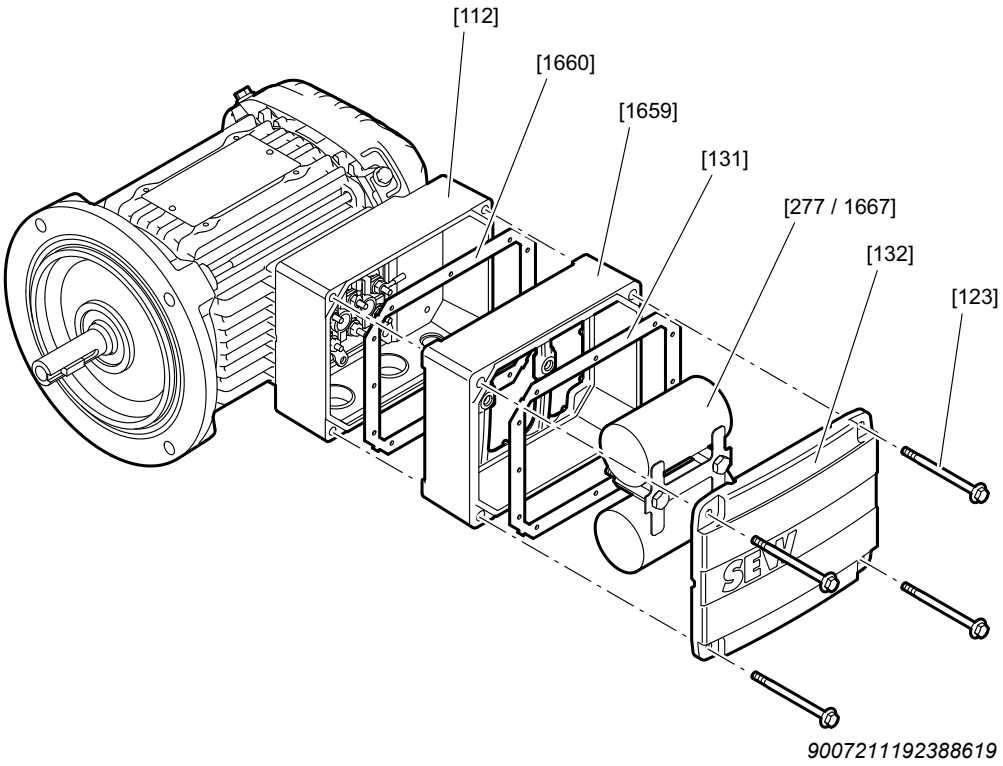
5.7 Special aspects in switching operation

When the motors are used in switching operation, possible interference of the switchgear must be excluded by ensuring suitable wiring. According to EN 60204 (electrical equipment of machines), motor windings must have interference suppression to protect the numerical or programmable logic controllers. As it is primarily switching operations that cause interference, SEW-EURODRIVE recommends installing protective circuit in the switching devices.

If the drive has been delivered with a suppressor circuitry in the motor, you must observe the provided wiring diagram.

5.8 Special aspects of torque motors and low-speed motors

Due to the design of DRM.., DR2M.. torque motors and low-speed motors, very high induction voltages may be generated when they are switched off. Consequently, SEW-EURODRIVE recommends using the varistor circuit shown below for protection. The size of the varistors depends, amongst other factors, on the starting frequency.



2454566155

5.9 Special aspects of DRK.. single-phase motors

Scope of delivery and motor design

DRK.. single-phase motors are delivered with installed running capacitor in the terminal box. Starting relay, centrifugal switch or start-up capacitor are not supplied.

9007211192388619

[112]	Terminal box	[277]/[1667]	Capacitor
[1660]	Seal	[132]	Terminal box cover
[1659]	Adapter piece	[123]	Screw
[131]	Seal		

25957074/EN – 06/2019

5.9.1 Connecting DRK.. single-phase motors

⚠ WARNING

Electric shock due to charged capacitor.

Severe or fatal injuries.

- After disconnection from the power supply, wait 5 seconds before opening the terminal box.

DRK.. single-phase motors are delivered with 1 or 2 installed and connected running capacitors. The data specified in chapter "Technical data" (→ 🗎 262) apply.

INFORMATION

If a running capacitor installed by SEW-EURODRIVE must be replaced, only use capacitors with the same technical data.

INFORMATION

Start-up against the complete rated torque is not possible with only the running capacitors.

Parts which are not supplied must be ordered from specialist retailers and must be connected according to the corresponding instructions and "wiring diagrams" (→ 🗎 284).

Proceed as follows during connection:

- Remove terminal box cover [132]
- Remove adapter piece [1659] with the running capacitors [277]/[1667]
- Perform the connection according to supplied wiring diagrams.

25957074/EN – 06/2019

5.10 Notes regarding the connection of the motor

INFORMATION

It is essential to comply with the valid wiring diagram. Do not connect or start up the motor if this wiring diagram is missing. You can obtain the valid wiring diagrams free of charge from SEW-EURODRIVE.

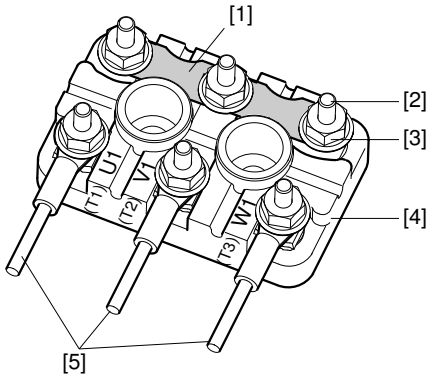
⚠ WARNING

Danger due to contaminated terminal box.

Severe or fatal injuries.

- Seal the terminal box and unused cable entries against dust and humidity.
- Remove present foreign objects, dirt and humidity from the terminal box.

Observe the following points when connecting the motor:

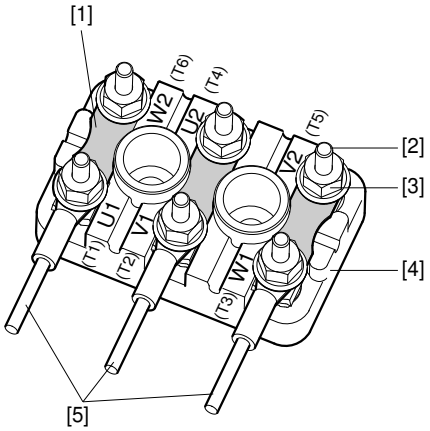


- Check cable cross section
- Arrange terminal links correctly
- Screw on the connections and the PE conductor correctly
- Make sure that the connection cables are not cramped to avoid damage to the cable insulation.
- Observe air gaps, see chapter "Electrical connection" (→ 🗎 13)
- In the terminal box: Check winding connections and tighten them if necessary
- Perform the connection in accordance with the enclosed wiring diagram
- Avoid protruding wire ends
- Connect the motor according to the prescribed direction of rotation

25957074/EN – 06/2019

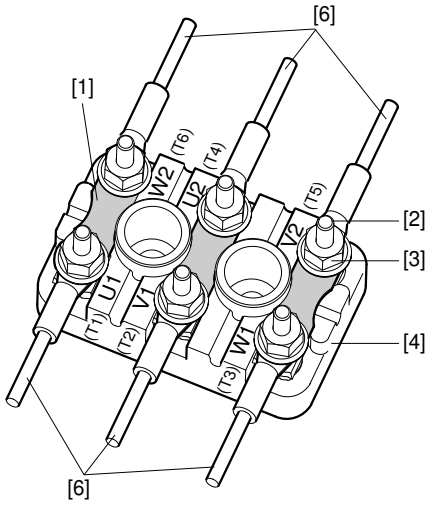
5.11 Connecting the motor via terminal block

5.11.1 According to wiring diagram R13



Arrangement of terminal links with 人 connection

27021598003155723



Arrangement of terminal links with △ connection

DR..71 – 280, DRN63 – 280, DR2..63 – 80 motors
(single-sided supply):

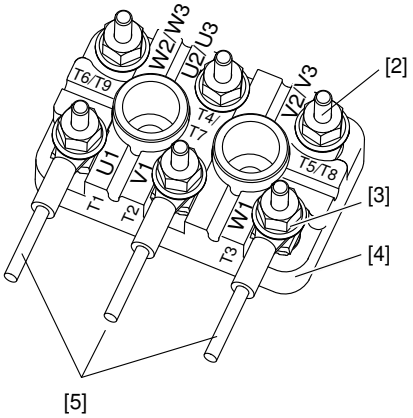
9007199493672075

DR../DRN250 – 315 motors
(double-sided supply):

9007199734852747

[1] Terminal link
[2] Terminal studs
[3] Flange nut
[4] Terminal board
[5] Customer connection
[6] Customer connection with divided connection cable

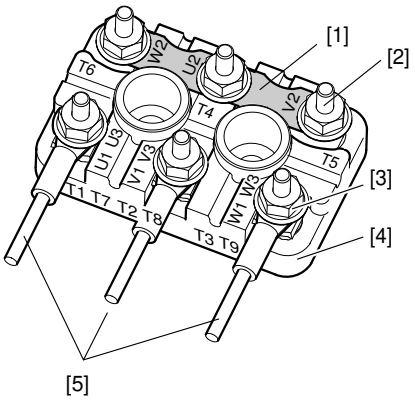
INFORMATION



For DR../DRN250 – 315 motors, SEW-EURODRIVE recommends a double-sided supply for load currents higher than

- M12: 250 A
- M16: 315 A

25957074/EN – 06/2019



5.11.2 According to wiring diagram R76

Arrangement of terminal links with ⅄ connection

2319075083

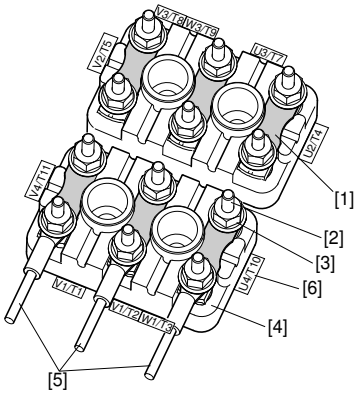
Arrangement of terminal links with ⅄⅄ connection

9007201591100811

[1] Terminal link
[2] Terminal studs
[3] Flange nut
[4] Terminal board
[5] Customer connection

INFORMATION

Three winding lead ends must be rewired to change from high to low voltage:

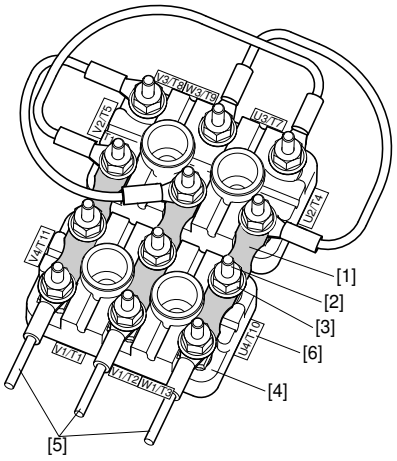


The lines designated U3 (T7), V3 (T8) and W3 (T9) must be reconnected.

- U3 (T7) from U2 (T4) to U1 (T1)
- V3 (T8) from V2 (T5) to V1 (T2)
- W3 (T9) from W2 (T6) to W1 (T3)

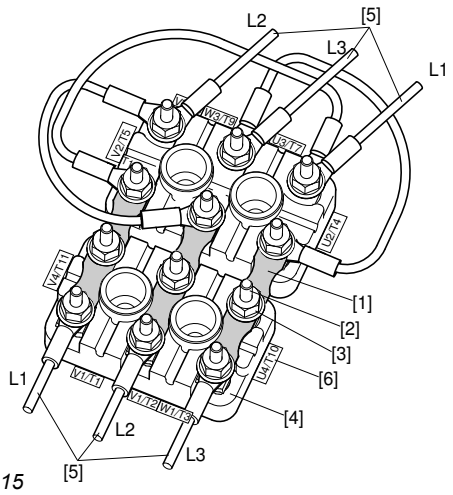
→ Changing from low to high voltage is carried out in reverse order. In both cases, the customer connection is made to U1 (T1), V1 (T2) and W1 (T3). You can change the direction of rotation by interchanging 2 supply cables.

5.11.3 According to wiring diagram R72



Arrangement of terminal links with △ connection

18014400828555147



Arrangement of terminal links with △△ connection

DR..71 – 280, DRN63 – 280, DR2..63 – 80 motors
(single-sided supply):

[4] Terminal board
[5] Customer connection
[6] Wiring designation plate
L1 Conductor 1
L2 Conductor 2
L3 Conductor 3

INFORMATION

For DR../DRN250 – 315 motors, SEW-EURODRIVE recommends a double-sided supply for load currents higher than

- M10: 160 A

5.11.4 Connection variants via terminal block

The motors are supplied and connected differently depending on the electrical design. Arrange the terminal links as shown in the wiring diagram and screw them on firmly. Observe the tightening torques specified in the following tables.

DRN63, DR2..63 motors							
Terminal stud	**Tightening torque hex nut**	**Connection**	**Design**	**Connection type**	**Scope of delivery**	**PE connection screw**	**PE design**

[4] Terminal clip
[5] Flat head screw

25957074/EN – 06/2019

5.12 Connecting the motor plug connector

5.12.1 IS/ISU plug connector

1009070219

The lower part of the /IS, /ISU plug connector option is completely prewired at the factory, including the additional features such as brake control.

The upper connector section of the /IS option is included in the scope of delivery. It must be connected according to the wiring diagram.

The /ISU option is delivered without the upper connector section.

The /IS, /ISU plug connector option has CSA approval up to 600 V. Note for application according to CSA regulations: Tighten the M3 clamping screws with a tightening torque of 0.5 Nm.

Cable cross section

Make sure that the type of cable complies with the applicable regulations. The rated currents are specified on the nameplate. The cable cross sections that can be used are listed in the following table.

Without variable terminal link	With variable terminal link	Link cable	Double assignment (Motor and brake/SR)
0.25 – 4.0 mm^2	0.25 – 2.5 mm^2	Max. 1.5 mm^2	max. 1 × 2.5 and 1 × 1.5 mm^2

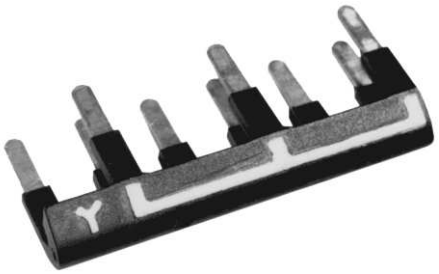
25957074/EN – 06/2019

Wiring the upper section of the plug connector

- Loosen the housing cover screws:
  - Remove the housing cover
- Loosen the screws from the upper section of the plug connection:
  - Remove upper connector section from the cover
- Strip the insulation off the connection cable:
  - Strip off about 9 mm of insulation
- Pass the cable through the cable gland

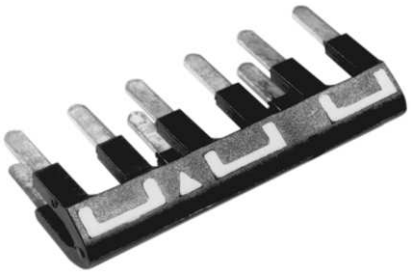
Wiring up as shown in wiring diagram R83

- Connect the lines as shown in the wiring diagram:
  - Tighten the clamping screws with a tightening torque of 0.5 Nm.
- Install the plug connector (see chapter "Installing the connector" (→ 🗎 87))



Wiring up as shown in wiring diagram R81

For ⅄/△ startup:

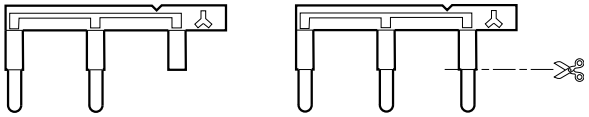


- Connect with 6 lines:
  - Tighten the clamping screws carefully.
  - Motor contactors in the control cabinet
- Install the plug connector (see chapter "Installing the connector" (→ 🗎 87))

For ⅄ or △ operation:

- Connect as shown in the wiring diagram
- Install the variable terminal link as shown in the following figures according to the desired motor operation (⅄ or △)
- Install the plug connector (see chapter "Installing the connector" (→ 🗎 87))

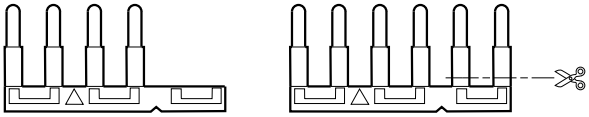
9007200053347851



9007200053349515

Brake control system BSR – preparing the variable terminal link

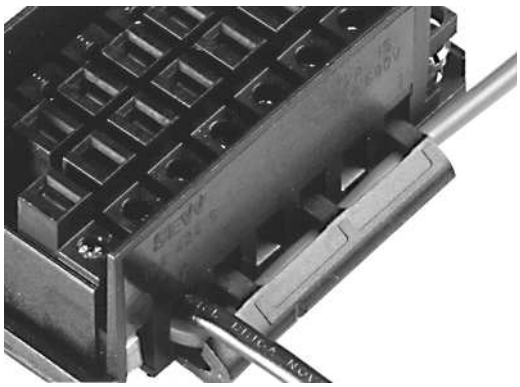
For ⅄operation:



On the ⅄ side of the variable terminal link as shown in the following figure: Remove only the bare metal pin of the marked prong horizontally – install a touch guard!

9007200053520139

For △operation:



On the △ side of the variable terminal link as shown in the following figure: Completely remove two prongs horizontally.

9007200053518475

Wiring according to the R81 wiring diagram for ⅄ or △ operation with double terminal assignment

- At terminal for double assignment:
  - Connect the link cable
- When operation is as required:
  - Insert the link cable in the variable terminal link
- Installing the variable terminal link
- At terminal for double assignment:
  - Connect the motor lead above the variable terminal link
- Connect the other lines as shown in the wiring diagram
- Install the plug connector (see chapter "Installing the connector" (→ 🗎 87))

9007200053521803

25957074/EN – 06/2019

Installing the plug connector

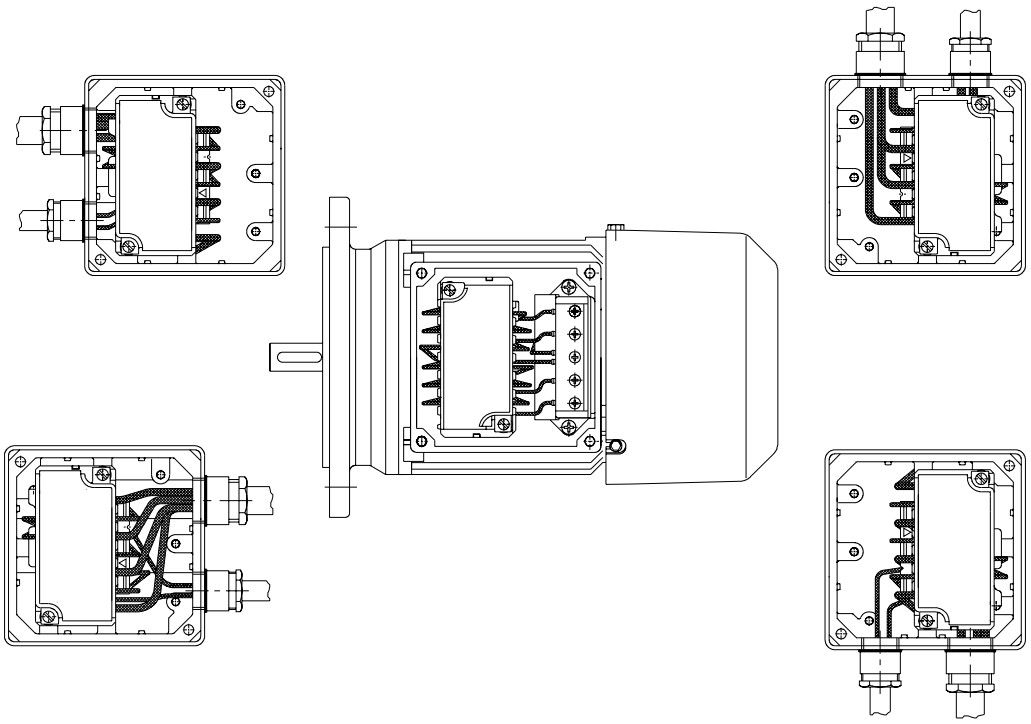
The housing cover of the IS plug connector can be screwed onto the lower housing part depending on the required position of the cable lead. You have to install the upper part in the housing cover according to the position of the lower part:

1. Define the required mounting position.
2. Install the upper section of the plug connector into the housing cover in accordance with the mounting position.
3. Close the plug connector.
4. Tighten the cable gland.
5. Check all screws of tightening and contact connections for tight fit.

⚠ WARNING

No grounding due to incorrect installation.

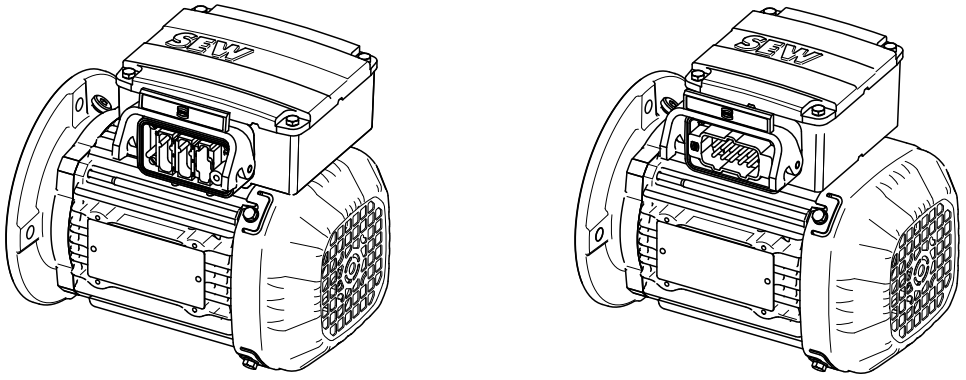
Severe or fatal injuries.



- Tighten the retaining screws of the IS plug connector properly with 2 Nm as these screws also act as protective earth contacts.

IS female connector

9007200053719819



Mounting position of the upper section of the plug connector in the housing cover

25957074/EN – 06/2019

5.12.2 AB.., AD.., AM.., AK.., AC.., AS.. plug connectors

1009065611

The installed AB.., AD.., AM.., AK.., AC.. and AS.. connector systems are based on the connector systems made by Harting.

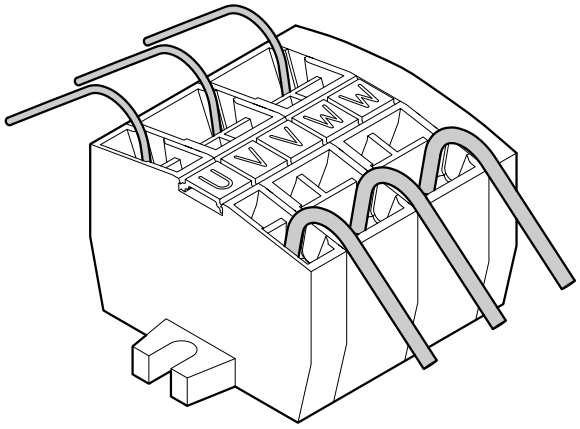
- AB.., AD.., AM.., AK.. Han Modular®
- AC.., AS.. Han 10E / 10ES

The connectors are located at the side of the terminal box. They are locked either using two clamps or one clamp on the terminal box.

The internal motor wiring is performed at the factory according to the order information. The mating connector must be prefabricated by the user.

The mating connector (grommet housing) with socket contacts is not included in the delivery.

INFORMATION



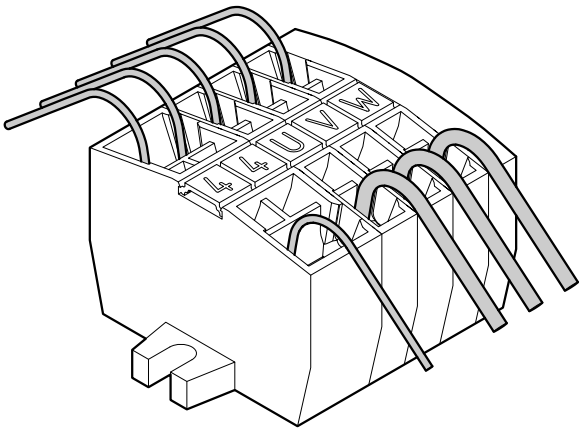
The degree of protection is only guaranteed if the mating connector is plugged in and locked.

5.13 Connecting the motor via terminal strip

5.13.1 According to wiring diagram R10

1. Connect the motor according to the enclosed wiring diagram.
2. Check the maximum cable cross section.
   - ⇨ 2.5 mm² rigid
   - ⇨ 2.5 mm² flexible
   - ⇨ 1.5 mm² flexible with conductor end sleeve
3. The stripping length must be 8 – 9 mm.
4. Connect the protective earth as described in chapter "Variant 6" (→ 🗎 83).

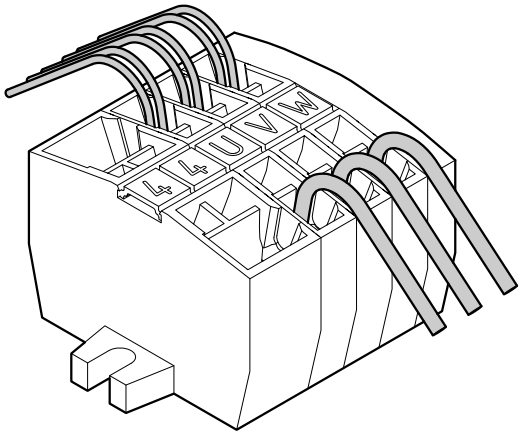
Arrangement of the terminal leads for 人 connection



27830157963

25957074/EN – 06/2019

5.13.2 According to wiring diagram R12

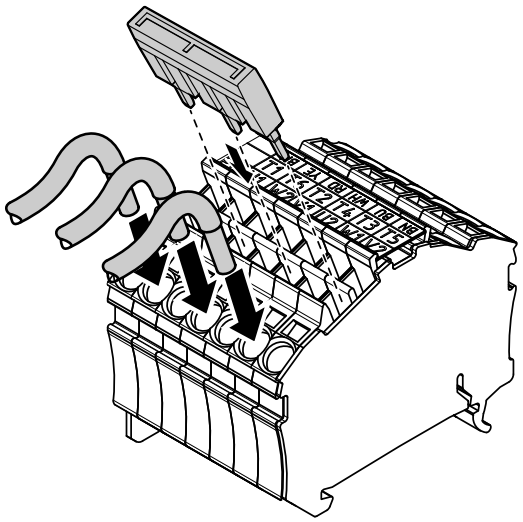


1. Connect the motor according to the enclosed wiring diagram.
2. Check the maximum cable cross section.
   - ⇨ 2.5 mm² rigid
   - ⇨ 2.5 mm² flexible
   - ⇨ 1.5 mm² flexible with conductor end sleeve
3. The stripping length must be 8 – 9 mm.
4. Connect the protective earth as described in chapter "Variant 6" (→ 🗎 83).

Arrangement of the terminal leads for ⅄ connection

27830161547

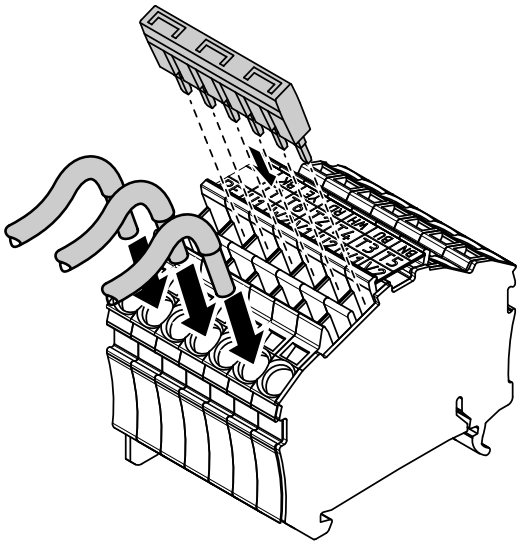
Arrangement of the terminal leads for △ connection



27830154379

25957074/EN – 06/2019

5.13.3 According to wiring diagram C13 with terminal strip /KCC

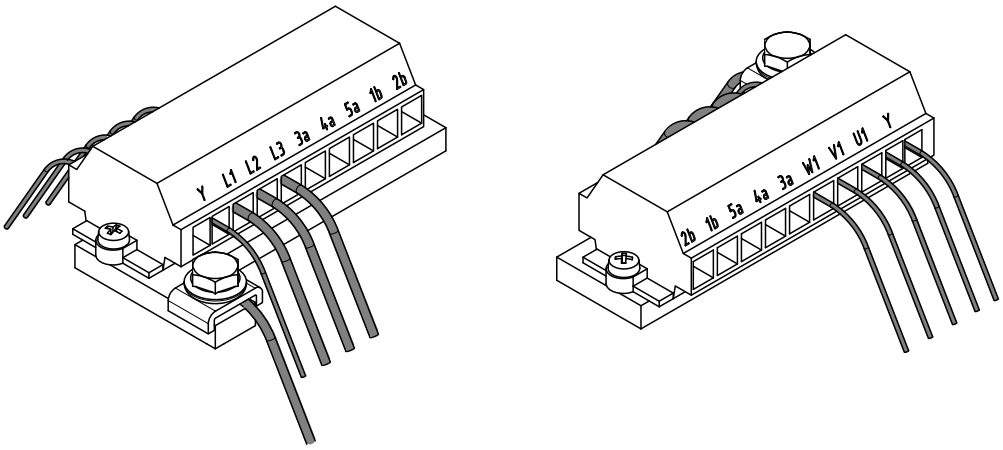


1. Connect the motor according to the enclosed wiring diagram.
2. Check the maximum cable cross section.
   - ⇨ 4 mm² rigid
   - ⇨ 4 mm² flexible
   - ⇨ 2.5 mm² flexible with conductor end sleeve
3. Check the winding connections in the terminal box and tighten them, if necessary.
4. The stripping length must be 10 – 12 mm.

Arrangement of terminal links with ⅄ connection

18014399506064139

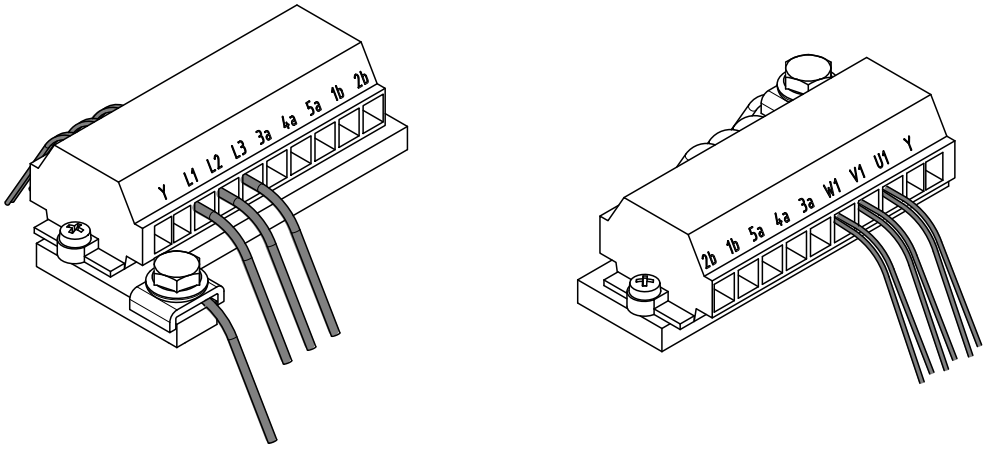
Arrangement of terminal links with △ connection



18014399506066059

25957074/EN – 06/2019

5.13.4 According to wiring diagram C12 with KC1 terminal strip



1. Connect the motor according to the enclosed wiring diagram.
2. Check the maximum cable cross section.
   - ⇨ 2.5 mm² rigid
   - ⇨ 2.5 mm² flexible
   - ⇨ 1.5 mm² flexible with conductor end sleeve
3. The stripping length must be 8 – 9 mm.

Arrangement of the terminal leads for ⅄ connection

18014399512138379

Arrangement of the terminal leads for △ connection

18014399512140299

25957074/EN – 06/2019

5.14 Connecting the brake

The BE.. brakes are powered by energized DC voltage and are released electrically. The brake is applied mechanically when the voltage supply is disconnected.

⚠ WARNING

Delayed brake application or unintentional brake release due to incorrect control or connection.

Severe or fatal injuries, e.g. due to falling hoist.

- Comply with the applicable regulations issued by the relevant employer's liability insurance association regarding phase failure protection and the associated circuit/circuit modification.
- Connect the brake according to the enclosed wiring diagram.
- In case of emergency off, always disconnect all poles of the brake control from the supply voltage.
- Only use suitable contactors with sufficient contact rating (utilization category according to EN 60947-4-1/EN 60947-5-1, see chapter "Brake voltage supply" (→ 🗎 96)).
- For contactor selection, observe the inductive load to switch, and the high current load while switching the brake.

5.14.1 Connecting the brake control

The brake is powered by a brake control system with protection circuit. The brake control is either installed in the motor's terminal box or in the control cabinet. If the motor is prepared for the brake control in the control cabinet, the brake supply cables are connected to a terminal strip in the motor terminal box.

Screw terminals are usually used as terminals on the terminal strip or on the brake control. Terminals with cage clamp technology can also be used.

The connectable cable cross sections are restricted to 2.5 mm^2. If you use larger cable cross sections due to application reasons, additional intermediate terminals must be used.

The brake is internally connected to the motor PE. An additional connection for the brake is not necessary.

⚠ WARNING

Delayed brake application or unintentional brake release due to incorrect control or connection.

Severe or fatal injuries, e.g. due to falling hoist.

- Observe the specifications of this documentation for connecting the brake.
- If you are uncertain about brake control, voltage supply type and design, or overvoltage and short circuit protection, contact the plant manufacturer or SEW-EURODRIVE.

25957074/EN – 06/2019

5.14.2 Permitted brake controls

INFORMATION

The following specifications refer to motors designed for operation at ambient temperatures of -20 °C to +40 °C, and with thermal class 130 (B) or 155 (F). Deviations may occur depending in the installed motor options.

In individual cases, always also observe the additional specifications in the order confirmation and on the motor nameplate.

The brake is designed for operation with AC voltage or DC voltage, depending on the design. A brake control by SEW-EURODRIVE is used that is either installed in the motor terminal box or in the control cabinet.

BE02 – 2 brakes can also be operated without brake control by SEW-EURODRIVE with DC voltage. Observe the information on the motor nameplate. In this case, a suitable overvoltage protection must be installed at the terminal strips in the terminal box using varistors. The varistors are not included in the scope of delivery of the motor. Observe the project planning notes from SEW-EURODRIVE.

The following brake control types are not permitted:

- Operation with AC voltage without brake control by SEW-EURODRIVE with BE02 – 122 brakes.
- Operation with DC voltage without brake control by SEW-EURODRIVE with BE5 – BE122 brakes.
- Operation with third-party brake control systems.

For an overview of available brake controls by SEW-EURODRIVE and of the technical data, refer to chapter "Brake control" (→ 🗎 234).

⚠ WARNING

Severe or fatal injuries

Great and unexpected elongation of the stopping distance.

- Operate each brake with a separate brake control.
- Observe the notes on dimensioning in the catalog, or contact SEW-EURODRIVE.

5.14.3 Optional separation of DC and AC circuits

In case of brakes operated with AC voltage, make sure the disconnection type designated by the manufacturer is applied correctly during the brake connection. The following types are distinguished:

- Cut-off in the AC circuit with normal application time
- Cut-off in AC circuit and DC circuit with shortened application time

The correct switch-off type must be ensured by a respective wiring. Certain brake controls by SEW-EURODRIVE realize the same AC and DC cut-off via integrated switching relays (e.g. BMP1.5), or via mounted relays (e.g. BSR or BUR).

The switch-off type is specified on the included wiring diagrams by a pictogram.

25957074/EN – 06/2019

⚠ WARNING

Delayed brake application or unintentional ongoing brake release due to incorrect switch-off.

Severe or fatal injuries, e.g. due to falling hoist or extended coasting.

- During project planning, consider the required cut-off type and the effects on the expected stopping distance in particular.
- Only use the faster cut-off in the DC and AC circuit for hoists and hoist-like applications.
- When you are not sure if the application is a hoist-like application, contact SEW-EURODRIVE.
- Make sure that the configured cut-off type (AC or AC-DC) is implemented correctly during startup, regardless of the type of application.

5.14.4 Brake voltage supply

The brake voltage supply must match the values specified on the nameplate of the motor. The brake must be supplied via the designated brake control.

The specifications on the nameplate have a tolerance of +/-5% of the stated nominal value, or of the mean value of the stated connection range. Observe order-specific deviations.

Make sure the voltage supply is sufficiently stable by using cable cross sections and voltage sources that are dimensioned accordingly. Make sure the supply voltage does not drop below 90% of the nominal value during starting. This could be caused by an increased inrush current, see chapter "Operating currents" (→ 🗎 226).

In case of single-speed drives (not pole-changing) operated directly at the supply system (meaning without frequency inverter or soft start devices), the brake supply voltage can also be taken from the terminal board of the motor. Adhere to the following restrictions:

- The nominal brake voltage must either match the phase-to-neutral voltage, or the phase-to-phase voltage of the motor (observe nameplate and motor switching type).
- In case of hoists or hoist-like applications, the BSR.. brake control must be used for cut-off in the DC and AC circuits.
- For combinations with BMP3.1 brake control (BE60 – 122) a voltage supply via the terminal board is not permitted.

INFORMATION

In variable-speed motors and motors operated with soft start devices, the brake voltage must not be picked up at the motor terminal board because the voltage there is not constant.

25957074/EN – 06/2019

5.14.5 Switching equipment

The high current utilization during switching the brake (inductive load) requires suitable contactors/switch contacts, to obtain the correct function of the brake.

Depending on brake type and type design, the switch contacts must meet the specifications in the following utilization categories:

- Switch contacts for the supply voltage at AC voltage operation: AC-3 according to EN 60947-4-1, or AC-15 according to EN 60947-5-1.
- Switch contact for the supply voltage at DC voltage operation: Preferably AC-3 or DC-3 according to EN 60947-4-1. As an alternative, contacts in utilization category DC-13 according to EN 60947-5-1 are also permitted.
- Switch contacts for optional separation on DC side: AC-3 according to EN 60947-4-1.

Observe the specifications on the provided wiring diagram.

Using a semi-conductor relay is not permitted.

5.14.6 Brake controls with functional control input

In addition to the voltage supply, the optional brake controls of the BMK.., BMKB.. and BMV.. series offer a control input for a DC 24 V signal with which the brakes can be switched via a PLC.

It is a purely functional input that is not "functionally safe" with respect to safety technology.

Due to their operating principle, fault states can occur in these devices that lead to unintentional ongoing brake release, even if the control voltage has been switched off.

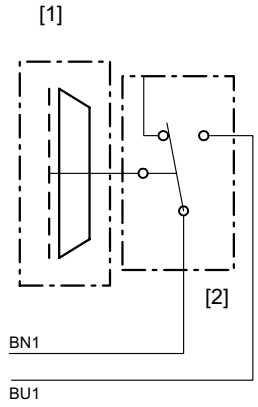
⚠ WARNING

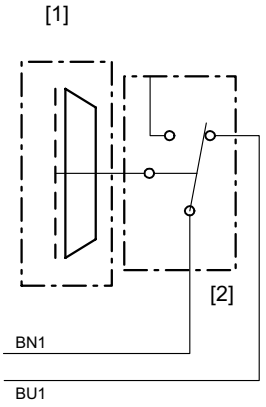
Unintentional ongoing brake release due to unrecognized malfunction of the brake control.

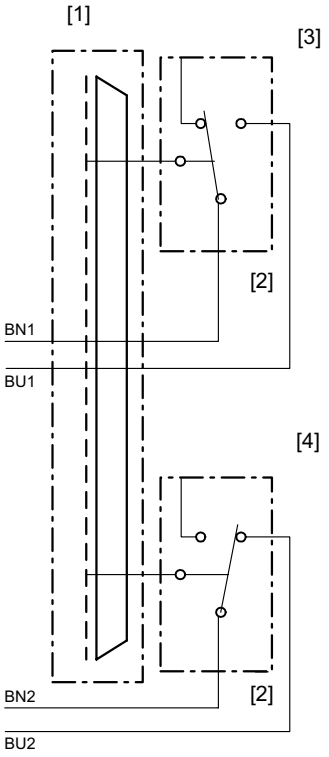
Severe or fatal injuries, e.g. due to falling hoist or extended coasting.

- Always disconnect all poles of the supply and control voltage for hoists and hoist-like applications.
- Ensure that a malfunction of the control input can be detected through additional, suitable diagnostic measures e.g. by monitoring the braking current to meet increased safety and reliability requirements.
- Use the BST.. brake control for functional safety applications.
- If you have any questions regarding the handling of the control input, contact SEW-EURODRIVE.

25957074/EN – 06/2019







5.14.7 Damage protection against overvoltage and short circuit

To obtain protection against overvoltage damages (e.g. due to short circuit), a sufficiently dimensioned fusing must be used at the supply cables.

Observe the notes on dimensioning in the catalog, or contact SEW-EURODRIVE.

5.14.8 Connecting diagnostic unit /DUB

Connect the diagnostic unit as shown in the wiring connection diagrams provided with the motor. The maximum permitted connection voltage is AC 250 V with a maximum current of 6 A. With low voltage, the maximum voltage is AC 24 V or DC 24 V with max. 0.1 A. A subsequent change to low voltage is not permitted.

Function monitoring	Wear monitoring	Function and wear monitoring
		

[1]	Brake	[1]	Brake	[1]	Brake
[2]	Microswitch MP321-1MS	[2]	Microswitch MP321-1MS	[2]	Microswitch MP321-1MS
				[3]	Function monitoring
				[4]	Wear monitoring

25957074/EN – 06/2019

5.14.9 Connecting the diagnostic unit /DUE option for function and wear monitoring

The /DUE diagnostic unit (Diagnostic Unit Eddy Current) is a contactless measuring system for function and wear monitoring of the brake and the continuous measurement of the current working air gap.

The measuring system consists of:

- Sensor, integrated in the magnet body of the brake
- Evaluation unit in the motor terminal box that is supplied via a DC 24 V voltage.

If the diagnostic unit /DUE was ordered, the function and wear monitoring is preinstalled and calibrated at the factory. The customer must connect the diagnostic unit, see wiring diagram. The switching point of the wear monitoring is preset to the maximum permitted value. According to the table in chapter "Evaluation unit" (→ 🗎 210), a reduced value can also be set.

For the status of the evaluation unit, refer to chapter "Retrofitting the /DUE diagnostic unit for function and wear monitoring" (→ 🗎 209).

Information on retrofitting the /DUE diagnostic unit can be found in chapter "Retrofitting the /DUE diagnostic unit for function and wear monitoring" (→ 🗎 209).

Connecting the evaluation unit

The maximum permitted cable cross section at terminals "k" of the evaluation unit is 1.5 mm^2 with conductor end sleeve without plastic collar, 0.75 mm^2 with plastic collar. The recommended cable cross section at terminals "k" is 0.5 mm^2 with conductor end sleeve with plastic collar.

INFORMATION

Use shielded cables to wire the evaluation unit. Connect the shield to the GND potential, or use the shield plate at the user's signal evaluation.

SEW-EURODRIVE recommends routing the power cable of the drive and the cable of the diagnostic unit separately.

- Unless they are shielded, sensor cables must always be routed separately from other power cables with phased currents.
- Provide the appropriate equipotential bonding between drive and control cabinet.

Important characteristics of the cable to be used are:

- Total shielding (outer shield) of the cable
- 100 m maximum length for fixed installation
- 50 m maximum length for cable carrier installation

The required number of cores depends on the type of function/signals that are to be transferred to the higher-level controller and then processed.

At the factory, the diagnostic unit /DUE is pre-installed, calibrated and set to the wear limit permitted for the brake. The diagnostic unit has to be calibrated again after service or maintenance work such as sensor replacement or replacement of the evaluation electronics. The calibration can be take place directly at the evaluation electronics (at the terminal box) or alternatively via the higher-level controller. In the second case, the required signals for calibration have to be routed to the higher-level controller.

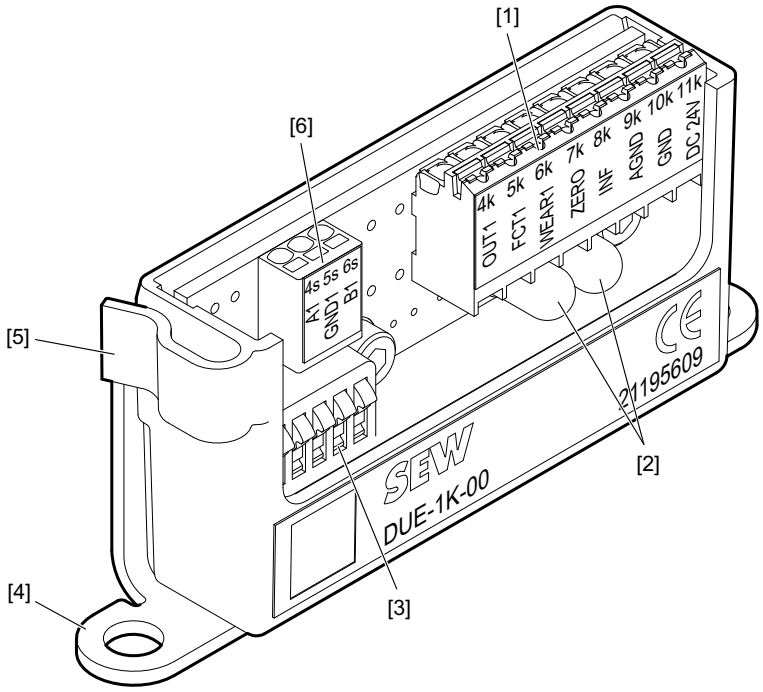
25957074/EN – 06/2019

The reference ground GND and the reference ground analog output AGND have the same potential. In case this potential is not treated separately in the application, AGND is not necessary.

Number of required cores	Function	Abbreviation
3	Voltage supply	DC 24 V
	Reference ground	GND
	Digital output function	FCT
3	Voltage supply	DC 24 V
	Reference ground	GND
	Digital output wear	WEAR
4	Voltage supply	DC 24 V
	Reference ground	GND
	Digital output function	FCT
	Digital output wear	WEAR
4	Voltage supply	DC 24 V
	Reference ground	GND
	Analog output current air gap	OUT
	Reference ground analog output	AGND
6	Voltage supply	DC 24 V
	Reference ground	GND
	Digital output function	FCT
	Digital output wear	WEAR
	Analog output current air gap	OUT
	Reference ground analog output	AGND
8	Voltage supply	DC 24 V
	Reference ground	GND
	Digital output function	FCT
	Digital output wear	WEAR
	Analog output current air gap	OUT
	Reference ground analog output	AGND
	Calibration zero value	ZERO
	Calibration of infinite value	INF

INFORMATION

If the calibration inputs ZERO and/or INF are routed to the outside to a PLC or a controller, they have to be continuously connected to AGND in normal operation to avoid EMC interferences in the calibration cables.



25957074/EN – 06/2019

INFORMATION

Signal outputs of the evaluation unit /DUE that are switched may not be used as voltage supply for other evaluation units /DUE or comparable systems. Each evaluation unit /DUE has to be supplied with voltage separately.

Designation of the components

The system comprises a sensor and single-channel evaluation unit. The function monitoring of the brake is realized via a digital signal (NO contact). A digital output (NC contact) signals if the wear limit was reached. Further, a current output allows for continuous monitoring of the brake wear.

14950549515

[1] Terminals 4k – 11k
[2] LEDs for function and wear, brake
[3] DIP switches S1 – S5
[4] Fastening of terminal box (PE)
[5] Line clip
[6] Terminals 4s – 6s

The connection designation of the terminals are as follows:

Terminal	Designation	Description	Color coding
4s	A1	Sensor 1 connection 1	Brown (BN)
5s	GND1	Sensor 1 shield	Black (BK)
6s	B1	Sensor 1 connection 2	White (WH)

Terminal	Designation	Description
4k	OUT1	Analog output working air gap brake
5k	FCT1	Digital output function brake
6k	WEAR1	Digital output wear brake

Terminal	Designation	Description
7k	ZERO	Input calibration zero value
8k	INF	Input calibration infinite value
9k	AGND	Signal ground AGND
10k	GND	Ground potential GND
11k	DC 24 V	DC 24 V supply

The LEDs have the follow meaning:

LEDs	Designation	Description
Green [2]	FCT1	The brake is open. Electromagnet is active. Pressure plate is in contact with magnet body.
Red [2]	WEAR1	The current working air gap of the brake reached or exceeded the preset maximum working air gap.

25957074/EN – 06/2019

5.15 Options

Connect the options as shown in the wiring connection diagrams provided with the motor. You can obtain the valid wiring diagrams free of charge from SEW-EURODRIVE.

INFORMATION

Do not connect any options if the wiring diagram is missing.

5.15.1 Temperature sensor /TF

NOTICE

Impermissible heating of the motor due to defective /TF temperature sensor.

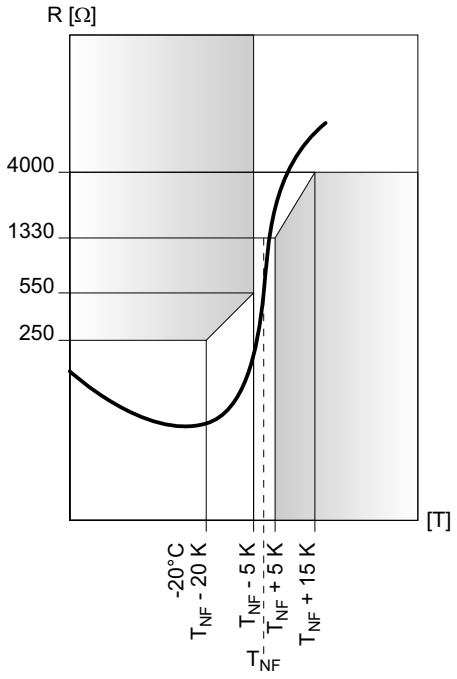
Damage to property.

- Do not connect any voltages > 30 V to the /TF temperature sensor.
- Observe the provided wiring diagram for the connection of the temperature sensor /TF.

The PTC thermistors comply with DIN 44082.

Resistance measurement check (measuring instrument with V ≤ 2.5 V or I < 1 mA):

- Standard measured values: 20 – 500 Ω, hot resistance > 4000 Ω



When using the temperature sensor for thermal monitoring, the evaluation function must be activated to maintain reliable isolation of the temperature sensor circuit. The thermal protection function must become active in case of overtemperature.

If there is a 2nd terminal box for the /TF temperature sensor, this is where you must connect the temperature sensor.

Observe the provided wiring diagram for connecting the temperature sensor /TF. If the wiring diagram is not enclosed, you can obtain it from SEW-EURODRIVE free of charge.

25957074/EN – 06/2019

The figure below shows the characteristic curve of /TF with reference to the nominal response temperature (referred to as T_{NF}).

5470153483

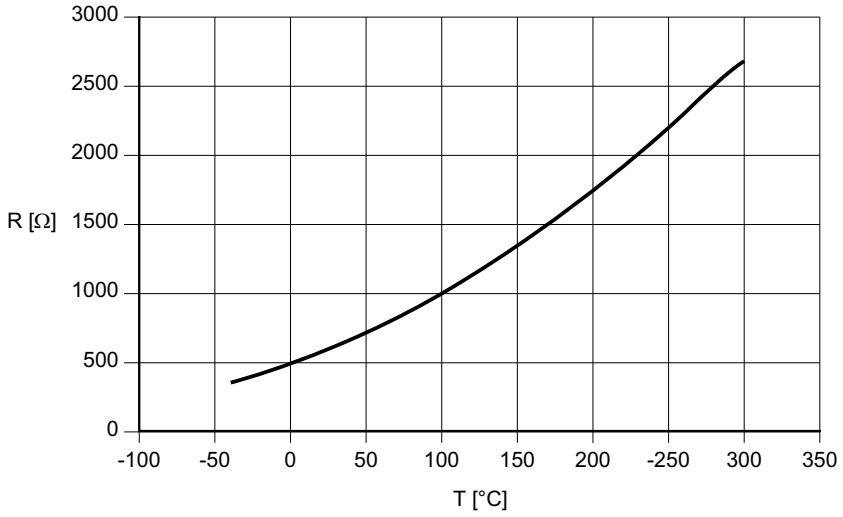
5.15.2 /TH winding thermostats

The thermostats are connected in series as standard and open when the permitted winding temperature is exceeded. They can be connected in the drive monitoring loop.

	AC V	DC V	
Voltage U in V	250	60	24
Current (cos ϕ = 1.0) in A	2.5	1.0	1.6
Current (cos ϕ = 0.6) in A	1.6		
Contact resistance max. 1 Ω at DC 5 V/1 mA			

25957074/EN – 06/2019

5.15.3 Temperature detection /KY (KTY84 – 130)



NOTICE

Excessive self-heating of the temperature sensor can damage the insulation of the temperature detection as well as the motor winding.

The drive system might be damaged.

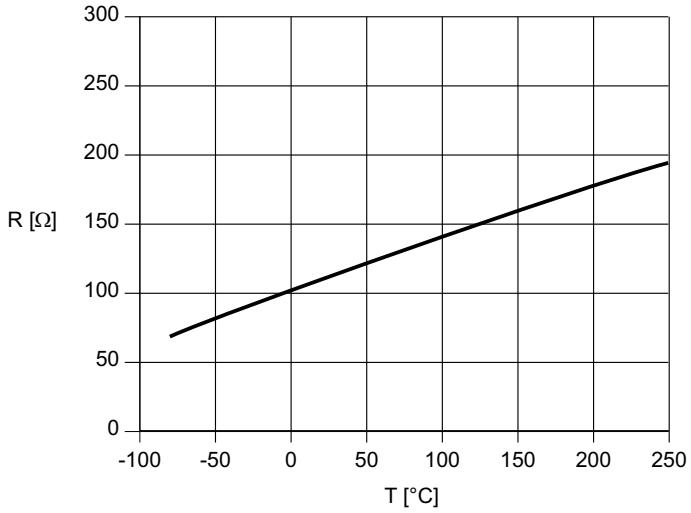
- Use currents > 3 mA in the KTY circuit.
- Observe the correct connection of the KTY to ensure correct evaluation of the temperature detection.
- Observe the polarity during connection.

The characteristic curve in the following figure shows the resistance curve subject to the motor temperature with a measuring current of 2 mA and correct pole connection:

1140975115

Technical data	KTY84 – 130
Connection	Red (+) Blue (−)
Total resistance at 20 – 25 °C	540 Ω < R < 640 Ω
Test current	< 3 mA

5.15.4 Temperature sensor /PT (PT100)



NOTICE

Excessive self-heating of the temperature detection can damage the insulation of the temperature detection as well as the motor winding.

The drive system might be damaged.

- Avoid currents > 3 mA in the circuit of the PT100.
- Observe the correct connection of the PT100 to ensure correct evaluation of the temperature detection.

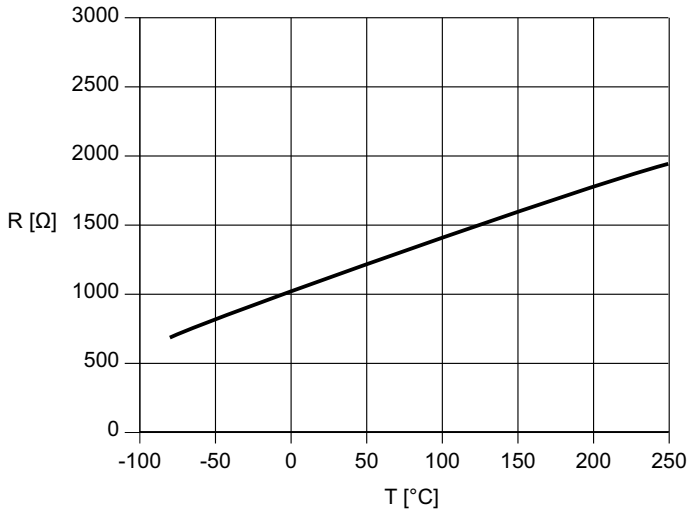
The characteristic curve in the following figure shows the resistance curve subject to the motor temperature.

1145838347

Technical data	PT100
Connection	Red/white
Resistance at 20 – 25 °C per PT100	107.8 Ω < R < 109.7 Ω
Test current	< 3 mA

25957074/EN – 06/2019

5.15.5 Temperature detection /PK (PT1000)



NOTICE

Excessive self-heating of the temperature sensor can damage the insulation of the temperature detection as well as the motor winding.

The drive system might be damaged.

- Avoid currents > 3 mA in the circuit of the PT1000.
- Observe the correct connection of the PT1000 to ensure correct evaluation of the temperature detection.

The characteristic curve in the following figure shows the resistance curve subject to the motor temperature.

17535480203

Technical data	PT1000
Connection	Black/red
Resistance at 20 – 25 °C per PT1000	1077 Ω < R < 1098 Ω
Test current	< 3 mA

5.15.6 Forced cooling fan /V

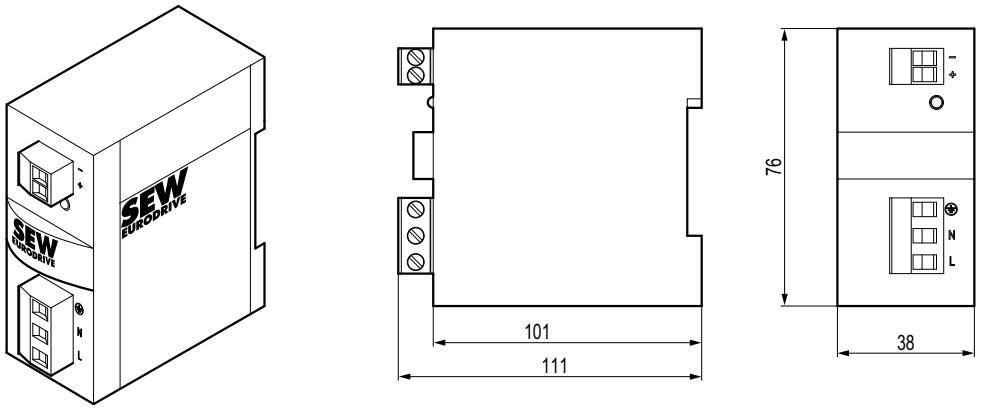
DR..71 – 132, DRN80 – 132, DR2..71 – 80	DC 24 V	24

INFORMATION



For information on how to connect the /V forced cooling fan, refer to chapter "Forced cooling fan /V" (→ 🗎 282).

25957074/EN – 06/2019

5.15.7 UWU52A switched-mode power supply

The forced cooling fan design V for DC 24 V furthermore includes the UWU52A switched-mode power supply, if you have ordered it. It can be ordered using the part number from SEW-EURODRIVE, even after the order has been placed.

The following figure depicts the UWU52A switched-mode power supply:

576533259

Input	AC 110 – 240 V 1.04 – 0.61 A 50/60 Hz
	DC 110 – 300 V 0.65 – 0.23 A
Output	DC 24 V 2.5 A (40 °C)
	DC 24 V 2.0 A (55 °C)
Connection	Screw terminals 1.5 – 2.5 mm^2, separable
Degree of protection	IP20 Mounting on EN 60715 TH35 mounting rail in the control cabinet
Part number	01881817

25957074/EN – 06/2019

5.15.8 Overview of add-on encoders

Refer to the wiring diagrams for information on how to connect add-on encoders:

Encoder	Motors	Encoder type	Mounting type	Supply DC V	Signal	Wiring diagram
ES7S	DR..71 – 132 DRN80 – 132S	Incremental	Shaft-centered	7 – 30	1 V_{PP} sin/cos	68180xx08

INFORMATION

- Maximum oscillation load for encoders ≤ 10 g ≈ 100 m/s² (10 Hz to 2 kHz)
- Shock resistance = 100 g ≈ 1000 m/s² for DR..71 – 132, DRN80 – 132S motors
- Shock resistance = 200 g ≈ 2000 m/s² for DR..160 – 315, DRN132M – 315 motors

25957074/EN – 06/2019

5.15.9 Overview of optical status messages for built-in encoders

INFORMATION

Refer to the wiring diagram for information on how to connect the built-in encoder.

- Observe the information in chapter "Wiring diagrams" (→ 🗎 269) for connection via terminal strip.
- Refer to the enclosed wiring diagram when connecting the EI7. built-in encoder via the M12 connector.
- Refer to the enclosed wiring diagram when connecting the EI8. built-in encoder via the M23 connector.

Encoder	Motors	Supply in DC V	Signals
EI71	DR..71 – 132 DRN71 – 132S DR2..71 – 80 DRN63 (only EI7C)	9 – 30	HTL 1 period/revolution
EI72		9 – 30	HTL 2 periods/revolution
EI76		9 – 30	HTL 6 periods/revolution
EI7C		9 – 30	HTL 24 periods/revolution
EI8R	DRN71 – 132S DR2..71 – 80	7 – 30	TTL (RS-422) 1024 periods/revolution
EI8C	DRN71 – 132S DR2..71 – 80	7 – 30	HTL 1024 periods/revolution

25957074/EN – 06/2019

EI7. B – visual feedback

The EI7. encoders use 2 bi-colored LEDs (red + green each) for visual feedback on the operating state.

LED H1 (at cable output of the encoder) – status and errors

The green LED indicates the status or the configuration of the encoder. It flashes. The flashing frequency indicates the set number of periods.

LED H1 green	
Frequency	**Status/configuration**
LED off	Encoder without voltage or faulty
0.6 Hz	EI71 (1 period per revolution)
1.2 Hz	EI71 (2 periods per revolution)
3 Hz	EI76 (6 periods per revolution)
15 Hz	EI7C (24 periods per revolution)
LED lit continuously	Encoder defective

The red LED is lit when the encoder detects an error.

LED H1 red	
Flash code	**Meaning**
10 s with 1 Hz and 2 s continuous	No valid number of periods can be set
other	Output driver signals a fault (e.g. short circuit or overtemperature)

The H2 LED gives visual feedback on the signal track status.

LED color	Track A	Track B	Track A	Track B
Orange (green and red)	0	0	1	1
Red	0	1	1	0
Green	1	0	0	1
Off	1	1	0	0

EI8. – visual feedback

The EI8. built-in encoders report their operating state visually via a duo LED.

LED light pattern	Meaning
Off	Encoder not supplied or defective
Permanent green light	Encoder operational, no errors
Red/orange, permanent or flashing light	Encoder reports self-diagnostic information or an error. The content depends on the color pattern and frequency.

25957074/EN – 06/2019

Diagnostics LED color orange/red	Meaning and measures
Red	Encoder diagnostics has detected an error. Permanently lit: Error regarding the internal encoder sensors (incremental sensors) Flashes 5 Hz: Error regarding the internal encoder sensors (index sensors): • Check the encoder and pole ring for damage or magnetizable contamination and replace or clean if necessary. • Check the fan to ensure it is seated correctly and check the distance between the pole ring and encoder. If necessary, readjust and resecure the fan and pole ring (see chapter "Removing and mounting built-in encoder EI8." (→ 🗎 167)). Flashes 1 Hz: Error regarding the encoder module electrical interface: • Short circuit/overcurrent of the signal tracks: Eliminate the short circuit or limit the output current of the encoder module. • Interference on the signal tracks: Eliminate the external interference. Observe the information regarding connection technology.
Orange	Encoder diagnostics signals a warning (function of the encoder is given, maintenance may be required) Permanently lit: Warning regarding the internal encoder sensors (incremental sensors). • Implement any necessary measures (see "Diagnostics red") as maintenance measures. Flashes 1 Hz: Warning regarding the internal memory (encoder signal correction). • The encoder signal correction is reinitialized every time the encoder is started.

If none of the measures are successful, please contact the SEW-EURODRIVE Service department in the event of an error. In this case, decommission the built-in encoder.

25957074/EN – 06/2019

5.15.10 Installation notes for encoders

When connecting the encoder to the inverter, observe the provided wiring diagrams and the information in these operating instructions as well as the operating instructions/wiring diagrams of the inverter and the operating instructions/wiring diagrams provided with the third-party encoder.

Proceed as described in chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127) to mount the encoders. Observe the following information:

- Maximum line length (inverter to encoder):
  - 100 m with a capacitance per unit length core – shield ≤ 110 nF/km
  - 100 m with a capacitance per unit length core – core ≤ 85 nF/km
- Core cross-section: 0.20 – 0.5 mm^2; recommendation ≥ 0.25 mm^2
- Use shielded cable with twisted pair cores and apply shield over large area on both ends:
  - In the cable gland of the encoder connection cover or in the encoder connector
  - To the inverter on the electronics shield clamp and to the housing of the D-sub connector
- Install the encoder cables separately from the power cables, maintaining a distance of at least 200 mm.
- Compare the operating voltage with the permitted operating voltage range on the encoder nameplate. Deviations in the operating voltage may overheat and damage the encoder.
- SEW-EURODRIVE recommends the use of stabilized voltage sources and separate supply systems for encoder or other sensor components and active components such as switches and light barriers.
- Supplies with voltage transients and interferences higher than the supply voltage U_B are not permitted.
- Observe the clamping area of 5 to 10 mm of the cable gland of the connection cover. If you use cables with a different cross section, you have to replace the provided cable gland with another suitable EMC-compliant cable gland.
- The cable glands for the cable entry must meet the following conditions:
  - Cramping area is suitable for the used cable(s)
  - The IP degree of protection of the encoder connection is at least as high as the IP degree of protection of the actual encoder
  - The operating temperature range matches the designated ambient temperature range.
- Check the flawless state and the proper seat of the connection cover gasket.
- Tighten the screws of the connection cover with a tightening torque of 2.25 Nm.

25957074/EN – 06/2019

Minimum requirements for encoder cables

Make sure that self-assembled cables fulfill the following requirements:

- Cross section of voltage supply cable:
  - At least 0.25 mm^2 for cable lengths up to 50 m.
  - At least 0.5 mm^2 for cable lengths up to 100 m.
- Cross section of the signal wire:
  - At least 0.25 mm^2.
- Capacitance per unit length:
  - Maximum 70 pF/m – core/core.
  - Maximum 120 pF/m – core/shield.
- The cable must be shielded.
- Differential signals must be routed via twisted wires e.g. Data+ and Data-.

5.15.11 Anti-condensation heating

To protect a shutdown motor from freezing up (rotor blockage) or condensation inside the motor, it can be equipped with an optional anti-condensation heating. The anti-condensation heating consists of strip heaters that are integrated in the winding overhang and supplied with voltage when the motor is switched off. The motor is heated by the current flowing through the strip heaters.

The strip heaters are controlled according to the following principle:

- Motor switched off → anti-condensation heating activated
- Motor switched on → anti-condensation heating deactivated

Observe the permitted voltage according to the nameplate and the enclosed terminal assignment diagram.

25957074/EN – 06/2019

6 Startup

INFORMATION

- It is essential to comply with the safety notes in chapter 2 during installation.
- In case of problems, refer to chapter "Malfunctions" (→ 🗎 263).

If components with functional safety are installed in the motor, observe the following safety note:

⚠ WARNING

Disabling functional safety devices.

Severe or fatal injuries.

- Only qualified personnel is allowed to carry out work on functional safety components.
- Any work on functional safety components must be carried out by strictly observing the specifications in the operating instructions at hand and the respective addendum to the operating instructions. Otherwise, the warranty will become void.

⚠ WARNING

Electric shock due to incorrect installation.

Severe or fatal injuries.

- Use switch contacts in utilization category AC-3 according to EN 60947-4-1 for switching the motor.
- When motors are powered by inverters, you must adhere to the wiring instructions in the frequency inverter operating instructions.

⚠ CAUTION

The surfaces on the drive can be very hot during operation.

Risk of burns.

- Let the motor cool down sufficiently before you start working on it.

NOTICE

The maximum limit torque (M_{pk}) and the maximum current (I_{max}) may not be exceeded, not even for acceleration.

The drive system might be damaged.

- Limit the maximum current at the inverter.

INFORMATION

Limit the maximum speed at the inverter. For information on the procedure, refer to the documentation of the inverter.

25957074/EN – 06/2019

SEW EURODRIVE

INFORMATION

When using DR..250 – 280, DRN250 – 280 motors with BE brake and encoder, observe the following information:

- Only operate the brake as holding brake.
- The brake may only be applied when the speed is ≤ 20 min^{-1}. For higher speeds, please contact SEW-EURODRIVE.
- Emergency stops from higher motor speeds are permitted.

6.1 Before startup

Prior to startup make sure that:

- The drive is undamaged and not blocked.
- Any transport locks have been removed.
- The measures stipulated in chapter "Preliminary work after longer periods of storage" (→ 🗎 33) are performed after storage periods longer than 9 months.
- All connections have been made correctly.
- The direction of rotation of the motor/gearmotor is correct.
  - Motor rotating clockwise: U, V, W (T1, T2, T3) to L1, L2, L3
- All protective covers are installed correctly.
- All motor protection equipment is active and set for the rated motor current.
- There are no other sources of danger.
- Loose elements like keys are appropriately secured.
- The brake is not manually released.
  - The set screw of /HF option is loosened correctly.
  - The hand lever of the /HR option has been removed and correctly attached to the stator using the designated clamps.

6.2 Motors with reinforced bearing

NOTICE

Damage to bearings due to impermissible heating of bearing and motor.

Bearing damage.

- Do not operate cylindrical roller bearings without overhung load.

25957074/EN – 06/2019

6.3 Motors with backstop /RS

An /RS backstop is used to block/prevent a direction of rotation of the motor. The direction of rotation is indicated by an arrow on the fan guard of the motor or on the device housing.

Observe the direction of rotation of the end shaft and the number of stages when you mount the motor to the gear unit. Do not start up the motor in blocking direction (note the correct phase angle when connecting the motor). For inspection purposes, you can operate the backstop once with half the motor voltage in blocking direction.

If a conversion is required to change the blocking direction, follow the instructions in chapter "Altering the blocking direction on motors with a backstop" (→ 🗎 219).

25957074/EN – 06/2019

7 Inspection/maintenance

⚠ WARNING

Risk of injury if the drive starts up unintentionally.

Severe or fatal injuries.

- Before you start working on the unit, disconnect the motor and all connected options from the power supply.
- Secure the motor against unintended power-up.

⚠ CAUTION

Inhaling, swallowing brake abrasion when releasing the brake.

Irritation of the respiratory tract and respiratory organs.

- ✓ Wear a respirator of class FFP2 during the maintenance of brakemotors.
- Avoid swirling of the brake abrasion.
- Remove the brake abrasion with suitable extraction systems or damp cloths that bind dust.
- Make sure that there is adequate ventilation in the work environment.

⚠ CAUTION

The surfaces on the drive can be very hot during operation.

Risk of burns.

- Let the motor cool down sufficiently before you start working on it.

NOTICE

Damage to the oil seals if the temperature is too low during installation.

Possible damage to the oil seals.

- Before assembly, make sure that ambient temperature and the temperature of the oil seal are not below 0 °C.

INFORMATION

Apply grease with a grease depot to the lip of the oil seal before assembly. For further information on lubricants, refer to chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).

INFORMATION

Friction disks at brakemotors may only be replaced by the SEW-EURODRIVE service.

Repairs

Only SEW-EURODRIVE repair workshops or plants that provide the necessary expertise may repair or modify the motor/brakemotor.

Before you take the motor back into operation, check to see if the regulations have been adhered to. Confirm the compliance with a corresponding identification on the motor or by issuing a test report.

25957074/EN – 06/2019

Always perform safety and functional checks following all maintenance and repair work (thermal protection).

25957074/EN – 06/2019

7.1 Inspection and maintenance intervals

The following table lists the inspection and maintenance intervals:

Device/part of device	Time interval	What to do?
Brake BE02	• **If used as a working brake:** At least every 3000 operating hours[1)] • **If used as a holding brake:** Every 0.5 to 4 years, depending on the operating conditions[1)]	Inspect the brake • Measure the brake lining carrier thickness • Inspect the switch contacts and replace them, if necessary (e.g. in case of burnout)
Brake BE03	• **If used as a working brake:** At least every 3000 operating hours[1)] • **If used as a holding brake:** Every 0.5 to 4 years, depending on the operating conditions[1)]	Inspect the brake • Measure the working air gap • Inspect the switch contacts and replace them, if necessary (e.g. in case of burnout)
Brakes BE05 – BE122	• **If used as a working brake:** At least every 3000 operating hours[1)] • **If used as a holding brake:** Every 0.5 to 4 years, depending on the operating conditions[1)]	Inspect the brake: • Measure the brake disk thickness • Brake disk, lining • Measure and set the working air gap • Pressure plate • Driver/gearing • Pressure rings • Suck off any abrasion • Inspect the switch contacts and replace them, if necessary (e.g. in case of burnout)
Motor	• **Every 10000 operating hours**[2)3)]	Motor inspection: • Check rolling bearing and change if necessary • Replace the oil seal • Clean the cooling air ducts
Drive	• Differing[3)]	• Touch up or renew the surface/anti-corrosion coating • Check and clean the air filter. • If applicable, clean condensation drain hole at the bottom of the fan guard • Clean clogged bores
Connection cables	• Regularly	Inspect cables • Check for damages and replace the connection cable if necessary.

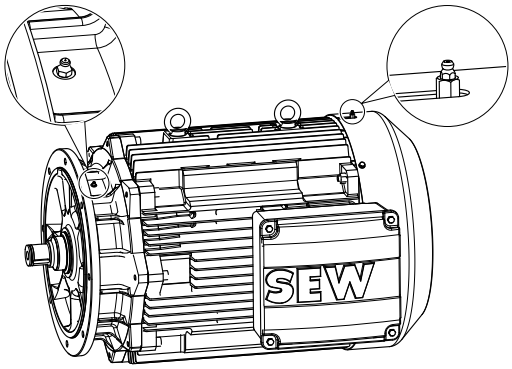
1) Wear times are subject to many factors and can be quite short. The system manufacturer must calculate the required inspection/maintenance intervals individually in accordance with the project planning documents.

2) For the DR../DRN225 – 315 motors with relubrication device, note the shortened relubrication periods in chapter "Bearing lubrication".

3) The interval depends on outer influences and can be very short, e.g. in the event of high dust concentration in the environment.

If you open the motor during inspection/maintenance, you have to clean it before you close it.

25957074/EN – 06/2019



7.2 Bearing lubrication

7.2.1 Bearing lubrication for DR..71 – 280, DRN63 – 280, DR2..56 – 80 motors

In standard design, the bearings are lubricated for life.

7.2.2 Bearing lubrication for DR..250 – 315, DRN225 – 315 motors with relubrication device /NS

Motors of nominal sizes 225, 250, 280, and 315 can be equipped with a relubrication device. The following figure shows the positions of the lubrication devices.

9007199630094091

Under normal operating conditions and at an ambient temperature between -20 °C to +40 °C, SEW-EURODRIVE uses Mobil Polyrex EM (K2P-20 DIN 51825), a polyurea-based mineral high-performance, high-temperature grease for initial lubrication.

For motors in the low temperature range up to -40 °C, SEW-EURODRIVE uses SKF GXN or LGHP2, which are also a polyurea-based mineral greases.

Relubrication

The grease can be purchased from SEW-EURODRIVE in 400 g cartridges. For the relevant order information, refer to chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).

INFORMATION

Only mix lubricants of the same thickness type, the same base oil and the same consistency (NLGI class).

Grease the motor bearings in accordance with the information on the lubricant plate. The used grease collects inside the motor and should be removed every 6 to 8 relubrication cycles during an inspection. Each time you relubricate the bearings, ensure that the bearing is two-thirds full.

Start up the motors slowly after lubrication so that the grease is distributed evenly.

The relubrication channels leading the grease from the grease nipples to the bearings must always be filled with grease. This is usually ensured be adhering to the relubrication intervals. During maintenance work, the grease may remain in the channels and does not need to be removed.

25957074/EN – 06/2019

Re-lubrication period

For the relubrication intervals of the bearings, adhere to the requirements stated in the table:

- Ambient temperature: -20 °C to +40 °C
- Rated speed that corresponds to that of a 4-pole AC motor
- Normal load

In case of higher ambient temperatures, higher speeds, or larger loads, the relubrication intervals are shorter. Use 1.5 times of the stated quantity for the initial filling.

The relubrication channels leading the grease from the grease nipples to the bearings must always be filled with grease. This is usually ensured be adhering to the relubrication intervals. During maintenance work, the grease may remain in the channels and does not need to be removed.

Motors with option	Horizontal mounting position		Vertical mounting position	
	Duration	Quantity	Duration	Quantity
DR../DRN225 – 315 /NS	5000 h	50 g	3000 h	70 g
DR../DRN225 – 315 /ERF /NS	3000 h	50 g	2000 h	70 g

7.3 Reinforced bearings

NOTICE

Damage to bearings due to impermissible heating of bearing and motor.

Bearing damage.

- Do not operate cylindrical roller bearings without overhung load.

In the /ERF (reinforced bearing) option, cylindrical rolling bearings are installed on the A-side. The reinforced bearings must have overhung load applied to them and must never be operated without overhung load.

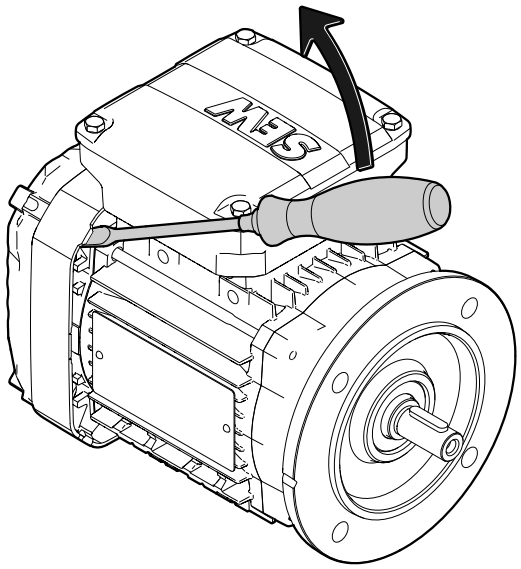
The reinforced bearings are only offered with the /NS (relubrication) option so as to facilitate optimal lubrication of the bearing.

Observe the notes on bearing lubrication in chapter "Bearing lubrication for DR..250 – 315, DRN225 – 315 motors with relubrication device /NS" (→ 🗎 125).

25957074/EN – 06/2019

7.4 Motor and brake maintenance – preliminary work

⚠ WARNING



Risk of injury if the drive starts up unintentionally.

Severe or fatal injuries.

- Before you start working on the unit, disconnect the motor and all connected options from the power supply.
- Secure the motor against unintended power-up.

7.4.1 Removing/installing the fan guard for DRN63 – 71, DR2..63 – 71 motors

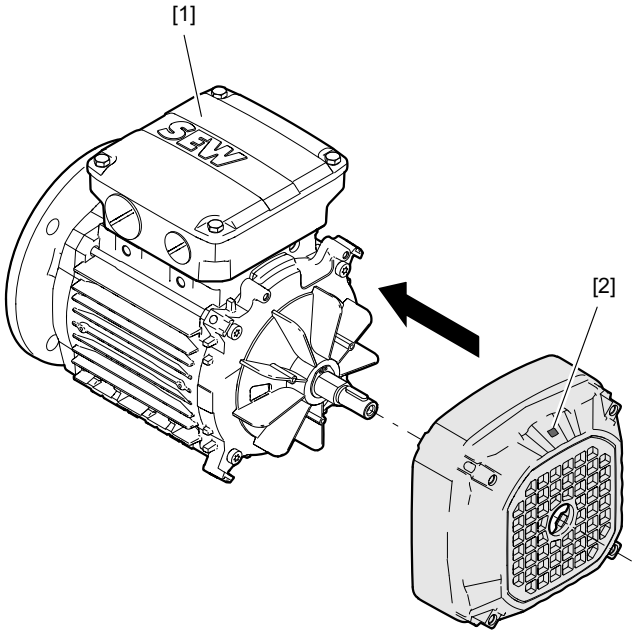
The fan guard for DRN63 – 71, DR2..63 – 71 motors is attached using clips.

9007222099799435

Removing the fan guard

Proceed as follows to remove the fan guard:

1. Using a suitable tool, lever out at least 2 adjacent detents.
   - ⇨ **With EI.. encoder option**: Lever out the detent pair opposite of the terminal box.
2. Pull the detents over the latching cams of the endshield.
   - ⇨ In case of DRN63, DR2..63, loosening all 4 fan guard connections may be required to remove the fan guard, depending on the option.

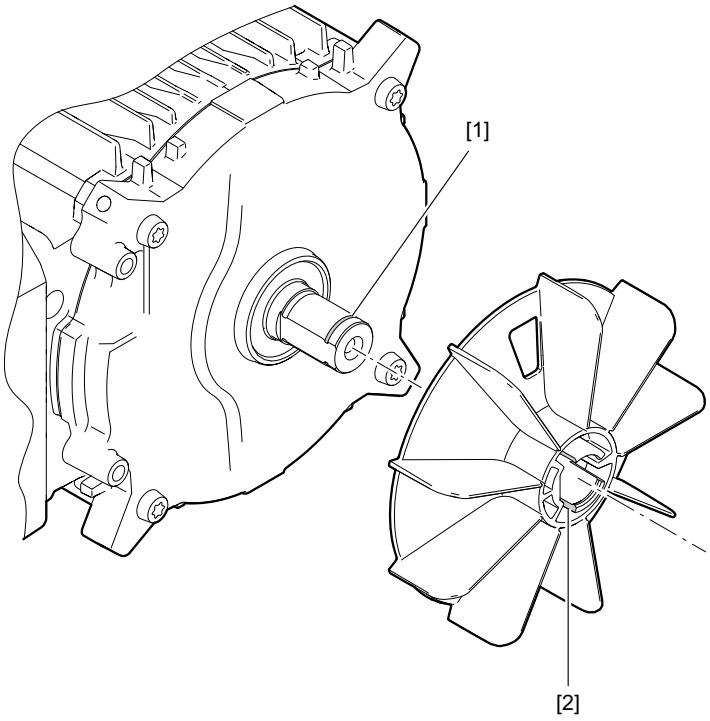


To request for a replacement in case the fan guard is damaged, contact SEW-EURODRIVE.

Reassembly

- ✓ The rectangular marking on the fan guard [2] must point in direction of the terminal box [1].

1. Evenly push the detents of the fan guard onto the latching cams until they snap in.



25957074/EN – 06/2019

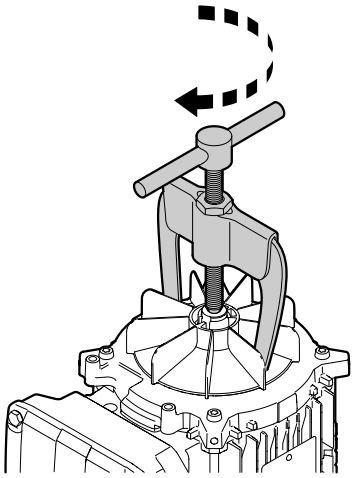
27830526347

7.4.2 Removing/installing the plastic fan for DR..71, DRN63 – 71, DR2..56 – 71 motors

The plastic fan [2] for DR..71, DRN63 – 71, DR2..56 – 71 motors is attached using clips.

23761871115

Removing the fan



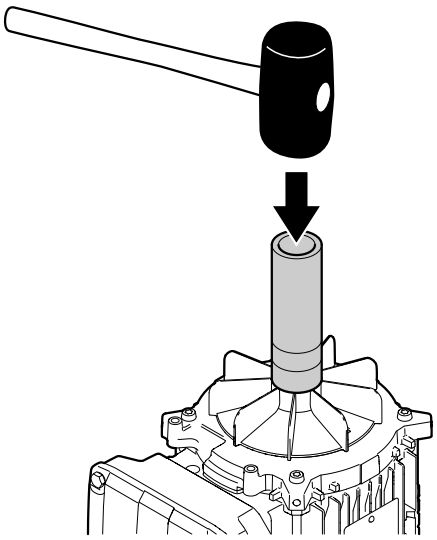
Proceed as follows to remove the plastic fan:

✓ Required tools: 1 puller.

25957074/EN – 06/2019

1. Pull off the fan [2] from the shaft [1] using the puller.
   ⇨ The detent is pulled out of the latching groove.
2. Check that the detent of the fan is not damaged.

To request a replacement in case the fan is damaged, please contact SEW-EURODRIVE.

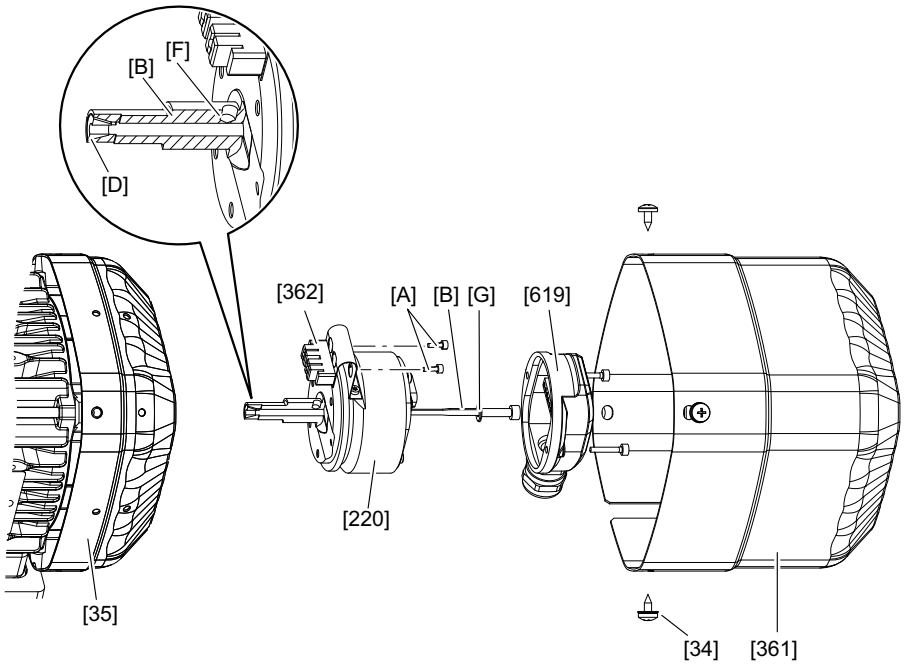


23761866251

Reassembly

✓ Required tools: 1 hammer, 1 hammer insertion tool.

1. Position the fan centrally on the shaft using the precentering.
2. Mount the fan to the shaft using the plain hammer insertion tool and the hammer. The hammer insertion tool must not be placed on the detent but must have a larger diameter.
   ⇨ When the detent snaps into the latching groove, a click can be clearly heard.
3. Check if the detent is snapped into the latching groove.



23761868683

25957074/EN – 06/2019

7.4.3 Removing rotary encoders from DR..71 – 132, DRN80 – 132S motors

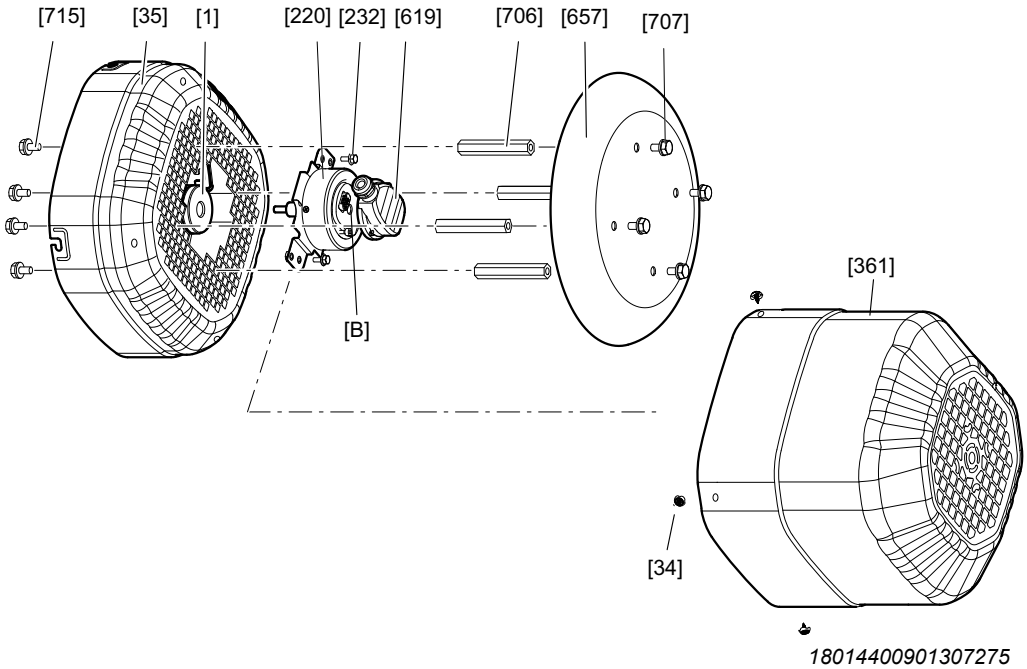
The following figure illustrates the disassembly procedure using the ES7. rotary encoder as an example:

9007201837842187

[34] Tapping screw
[35] Fan guard
[220] Encoder
[361] Safety cover
[362] Expansion anchor
[619] Connection cover
[A] Retaining screws for the torque bracket
[B] Central retaining screw
[D] Cone
[F] Bore
[G] Tooth lock washer

Disassembling ES7./AS7.encoders

1. Remove the safety cover [361], or the forced cooling fan if required.
2. Loosen the screws of the connection cover [619] and remove it. Do not disconnect the encoder cable.
3. Make sure the cone [D] doesn't fall out while the central retaining screw [B] is loosened. Loosen the central retaining screw [B] by 2 – 3 turns. Loosen the cone [D] by tapping lightly onto the screw head.
4. To loosen the expansion anchor [362], remove the retaining screw of the torque bracket [A]. Carefully pull the encoder [220] from the rotor bore.



Reassembly

1. Apply a contact corrosion prevention compound, e.g. NOCO® fluid to the encoder pin.
2. Place the expansion anchor [362] at the torque bracket of the encoder.
3. Push the encoder into the bore in the shaft end to the stop.
4. Tighten the central retaining screw [B] with the inserted tooth lock washer [G].
   ⇨ Tightening torque 2.75 Nm.
5. Press the expansion anchor [362] into the fan guard [35] and check if it is seated correctly.
6. Screw the retaining screws of the torque bracket [A] into the expansion anchor [362] until the stop. Tighten the retaining screws of the torque bracket [A].
   ⇨ Tightening torque 2.25 Nm.
7. Screw on the connection cover [619].
   ⇨ Tightening torque 2.25 Nm.
8. Mount the safety cover [361] onto the forced cooling fan.

25957074/EN – 06/2019

7.4.4 Removing rotary encoders from DR..160 – 280, DRN132M – 280 motors

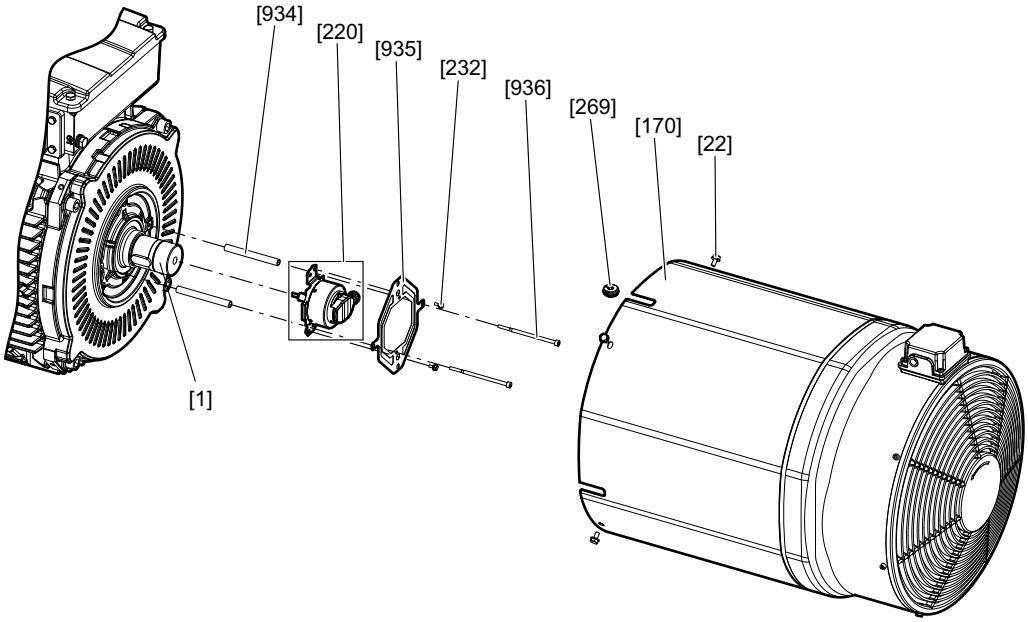
The following figure illustrates the disassembly procedure using the EG7. rotary encoder as an example:

18014400901307275

[1]	Rotor	[B]	Central retaining screw
[34]	Tapping screw	[619]	Connection cover
[35]	Fan guard	[657]	Canopy
[220]	Encoder	[706]	Spacer bolt
[232]	Screws	[707] [715]	Screws
[361]	Safety cover	[A]	Screws

Removing EG7., AG7. encoders

1. Proceed as follows, depending on the design:
   - ⇨ **With canopy:** Remove the screws [707] to disassemble the canopy [657]. If required, counter using a hexagon wrench SW13 on the spacer bolt [706].
   - ⇨ **Without canopy:** Remove the screws [34] to disassemble the safety cover [361].
2. Remove the forced cooling fan if required.
3. Loosen the screws of the connection cover [619] and remove it. Do not disconnect the encoder cable.
4. Remove the retaining screws of the torque bracket [232].
5. Loosen the central retaining screw [B] by 2 – 3 turns to pull off the encoder [220].



Reassembly

1. Apply a contact corrosion prevention compound, e.g. NOCO® fluid to the encoder pin.
2. Push the encoder into the bore in the shaft end to the stop.
3. Tighten the central retaining screw [B] with the inserted tooth lock washer [G].
   ⇨ Tightening torque 8 Nm.
4. Tighten the retaining screws of the torque bracket [232].
   ⇨ Tightening torque 6 Nm.
5. Screw on the connection cover [619].
   ⇨ Tightening torque 2.25 Nm.
6. Mount the safety cover [361] onto the forced cooling fan.
7. Mount the canopy [657] if necessary.

25957074/EN – 06/2019

7.4.5 Removing the rotary encoder from DR..160 – 225, DRN132M – 315 motors with /V forced cooling fan option

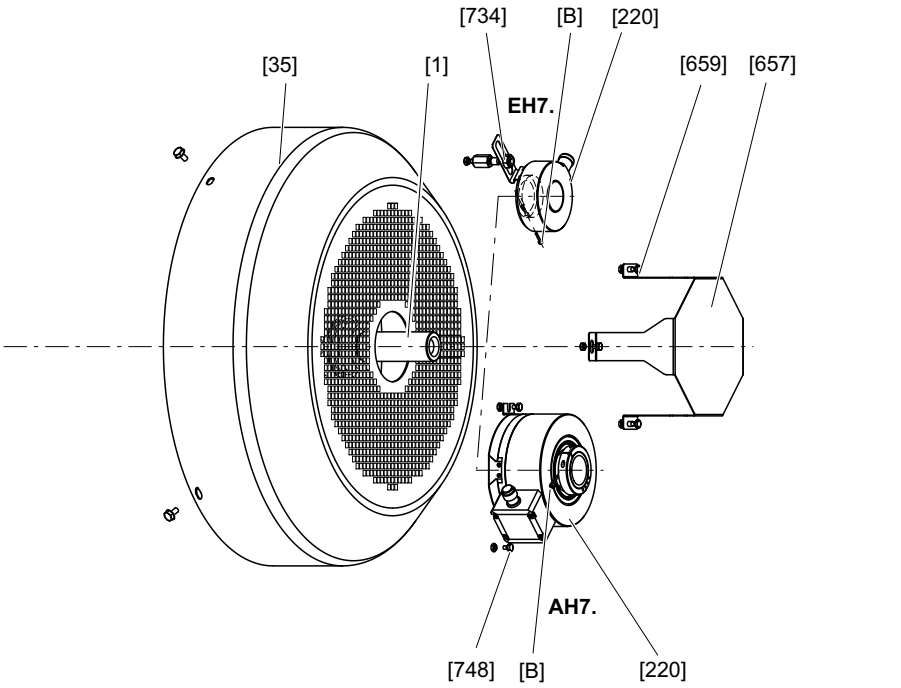
The following figure illustrates the disassembly procedure using the EG7. rotary encoder as an example:

9007206970702987

[22]	Screw	[935]	Torque bracket
[170]	Forced cooling fan guard	[936]	Screw
[232]	Screws	[934]	Spacer bushing
[269]	Cable grommet	[220]	Encoder

Removing EG7., AG7. encoders

1. Remove the screws [22] to disassemble the forced cooling fan [170].
2. Remove the cable grommet [269] with the encoder cable from the forced cooling fan [170].
3. Remove the screws [232] and [936] to disassemble the torque bracket [935].
4. Loosen the screws of the connection cover [619] and remove it. Do not disconnect the encoder cable.
5. Loosen the central retaining screw [B] by 2 – 3 turns to pull off the encoder [220].



Reassembly

1. Apply a contact corrosion prevention compound, e.g. NOCO® fluid to the encoder pin.
2. Push the encoder into the bore in the shaft end to the stop.
3. Tighten the central retaining screw [B] with the inserted tooth lock washer [G].
   ⇨ Tightening torque 8 Nm.
4. Place the torque bracket [935] onto the spacer bushing [934] and tighten the screws [936].
   ⇨ Tightening torque 11 Nm.
5. Tighten the retaining screws of the torque bracket [232].
   ⇨ Tightening torque 6 Nm.
6. Insert the cable grommet [269] into the forced cooling fan [170].
7. Mount the forced cooling fan [170] and tighten the screws [22].
   ⇨ Tightening torque 28 Nm.

25957074/EN – 06/2019

7.4.6 Removing rotary encoders from DR..315, DRN315 motors

The following figure illustrates the disassembly procedure using the EH7. and AH7. rotary encoders as an example:

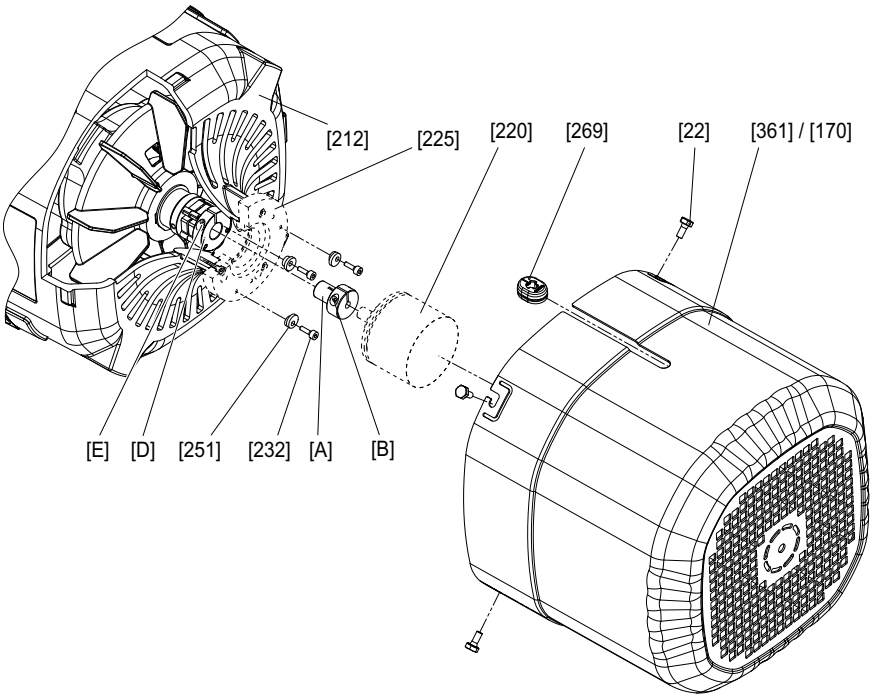
18014398917111435

[35]	Fan guard	[659]	Screw
[220]	Encoder	[734]	Nut
[B]	Central retaining screw	[748]	Screw
[657]	Cover plate		

Removing EH7., AH7. encoders

1. Remove the screws [659] to disassemble the cover plate [657].
2. Depending on the design, remove the encoder [220] from the fan guard [35] as follows:
   - ⇨ **EH7.:** Remove the nut [734].
   - ⇨ **AH7.:** Remove screw [748].
3. Loosen the central retaining screw [B] by 2 – 3 turns to pull off the encoder [220].

25957074/EN – 06/2019



Reassembly

1. Push the encoder into the bore in the shaft end to the stop.
2. Tighten the central retaining screw [B].
   - ⇨ **EH7.:** Tightening torque 3 Nm.
   - ⇨ **AH7.:** Tightening torque 2 Nm.
3. Proceed as follows, depending on encoder:
   - ⇨ **EH7.:** Install the nut [734].
   - ⇨ **AH7.:** Insert and tighten screw [748].
4. Mount the cover plate [657] using the screws [659].

25957074/EN – 06/2019

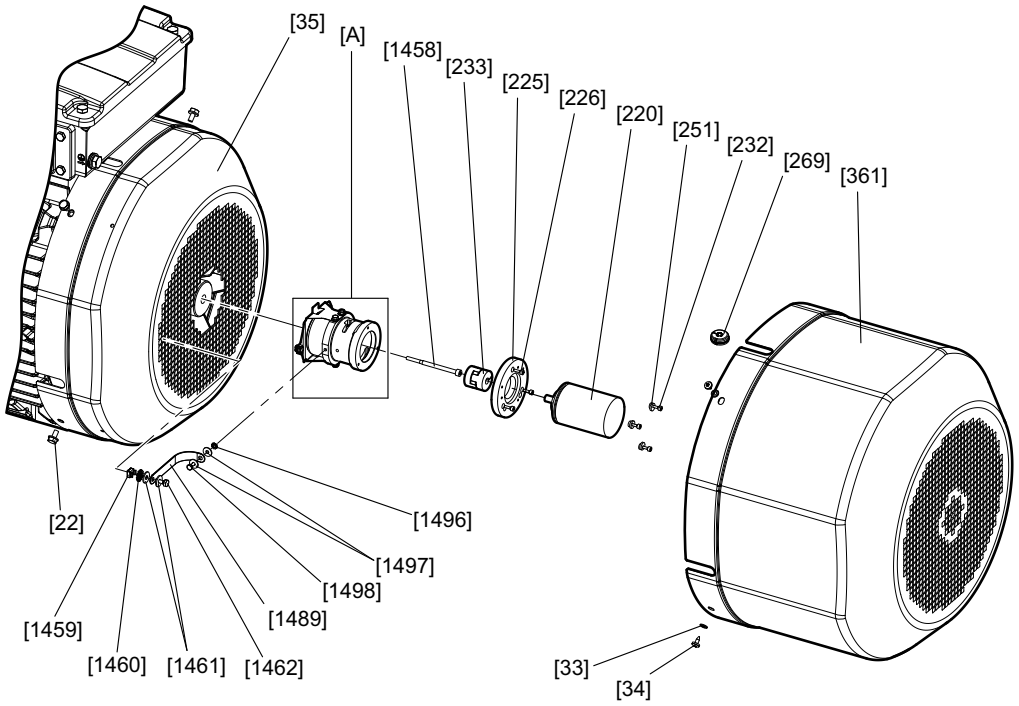
7.4.7 Mounting/removing rotary encoders with XV../EV../AV.. encoder mounting adapter for DR..71 – 225, DRN71 – 225, DR2..71 – 80 motors

The following figure illustrates the disassembly procedure using a third-party encoder as an example:

9007202887906699

[22]	Screw	[361]	Safety cover (normal/long)
[170]	Forced cooling fan guard	[269]	Cable grommet
[212]	Fan guard with encoder mount	[A]	Adapter
[220]	Encoder	[B]	Clamping screw
[225]	Intermediate flange (not with XV1A)	[D]	Coupling (spread- or solid shaft coupling)
[232]	Retaining screws (enclosed with XV1A and XV2A)	[E]	Clamping screw
[251]	Conical spring washers (enclosed with XV1A and XV2A)		

Removing the XV.., EV.., AV.. encoders



1. Remove the safety cover [361], or the forced cooling fan if required.
2. Loosen the retaining screws [232] and turn the conical spring washers [251] outwards.
3. Loosen the clamping screw [E] of the coupling.
4. Remove adapter [A] and encoder [220].

Reassembly

1. Proceed as described in chapter "Encoder mounting adapter" (→ 🗎 40) to mount the encoder.

7.4.8 Mounting/removing rotary encoders with XV../EV../AV.. encoder mounting adapter for DR..250 – 280, DRN250 – 280 motors

The following figure illustrates the disassembly procedure using a third-party encoder as an example:

18014406225445899

[22]	Screw	[361]	Safety cover (normal/long)
[33]	Washer	[1458]	Screw
[34]	Screw	[1459]	Cage nut
[35]	Fan guard	[1460]	Serrated lock washer
[220]	Encoder	[1461]	Washer
[225]	Intermediate flange (optional)	[1462]	Screw
[226]	Screw	[1489]	Ground strap
[232]	Screws (enclosed with .V1A and .V2A)	[1496]	Serrated lock washer
[233]	Coupling	[1497]	Washer
[251]	Conical spring washers (enclosed with .V1A and .V2A)	[1498]	Screw
[269]	Cable grommet	[A]	Encoder mounting adapter

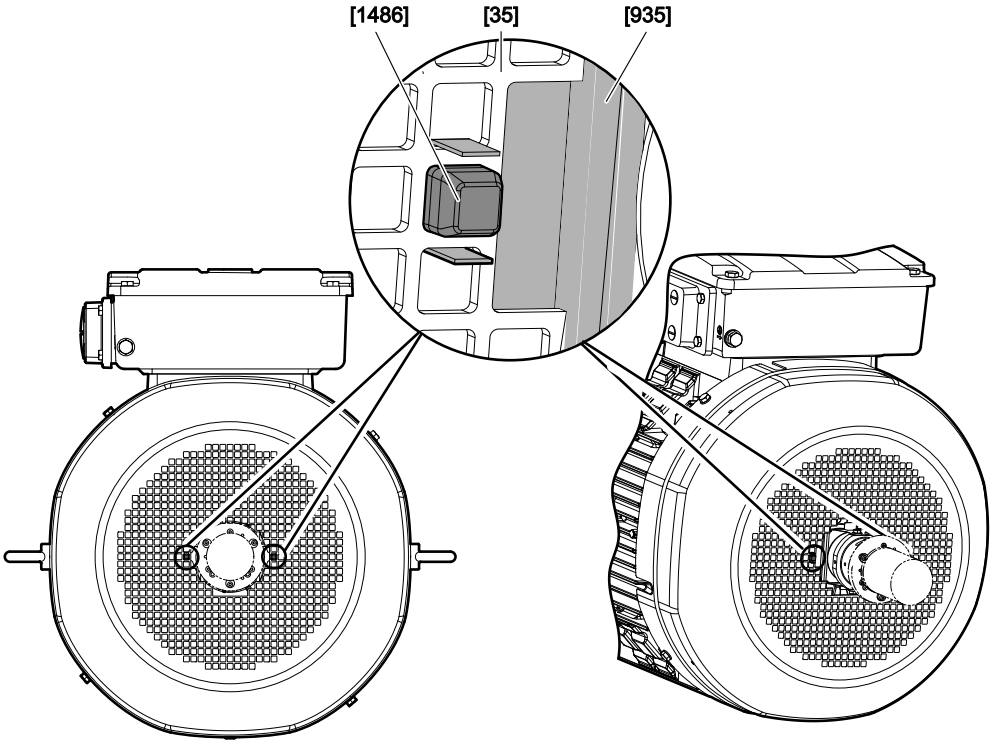
Removing the encoder mounting adapter

1. Remove the screws [34] to disassemble the safety cover [361].
2. Remove the encoder [220], see chapter "Removing EV.., AV.. encoders" (→ 🗎 141).
3. In order to remove the ground strap [1489] from the encoder mounting adapter [A], loosen the serrated lock washer [1496], washer [1497], and screw [1498].
4. Remove the screws [22] to disassemble the fan guard [35].
5. Loosen the screw [1458] to remove the encoder mounting adapter [A].
   - ⇨ **If the encoder mounting adapter cannot easily be removed:** Screw an M6 set screw (length 20 – 35 mm) hand tight in the rotor bore. Screw an M8 set screw (length > 10 mm) into the same bore and push the encoder mounting adapter [A] off the rotor [1]. Remove the M6 set screw from the rotor bore.

25957074/EN – 06/2019

Removing EV.., AV.. encoders

1. Remove the screws [34] to disassemble the safety cover [361].
2. Pull out the cable grommet [269] together with the encoder cable from the safety cover [361].
3. Loosen the retaining screws [232] and turn the conical spring washers [251] outwards.
4. Loosen the screw at the coupling clamping hub [233] at the encoder end, the screw can be accessed through the slots of the encoder mounting adapter [A].
5. Remove the encoder [220] from the encoder mounting adapter [A] or the intermediate flange [225].

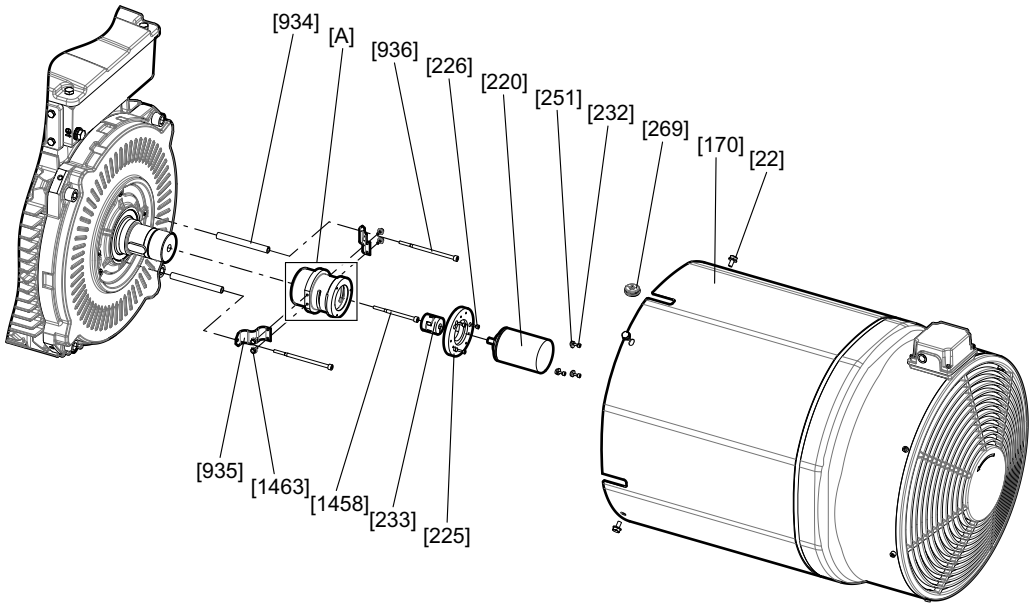


Reassembly

1. Proceed as described in chapter "Encoder mounting adapter" (→ 🗎 40) to mount the encoder.

INFORMATION

When re-installing the fan guard [35], make sure that the torque is supported:



The damping elements [1486] on both sides of the encoder mounting adapter [A] must engage with the ventilation grid (see figure below). The torque plate [935] must protrude from the grid to the left and to the right of the damping element.

9007207498780299

7.4.9 Mounting/removing the rotary encoder with EV../AV../XV.. encoder mounting adapter for DR..250 – 280, DRN250 – 280 motors with /V forced cooling fan option

The following figure illustrates the disassembly procedure using a third-party encoder as an example:

7715965835

[22]	Screw	[269]	Cable grommet
[170]	Forced cooling fan guard	[934]	Spacer bushing
[220]	Encoder	[935]	Torque bracket
[225]	Intermediate flange (optional)	[936]	Screw
[226]	Screw	[1458]	Screw
[232]	Screws (enclosed with .V1A and .V2A)	[1463]	Screw
[233]	Coupling	[A]	Encoder mounting adapter
[251]	Conical spring washers (enclosed with .V1A and .V2A)		

Removing the encoder mounting adapter

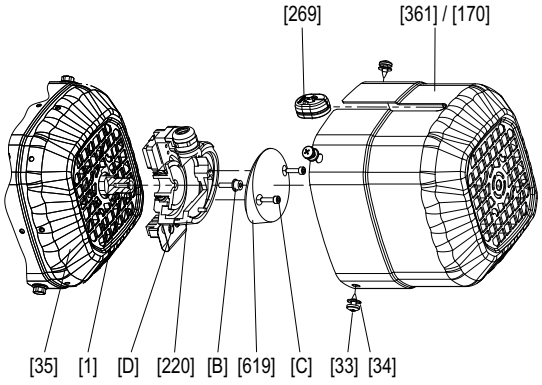
1. Remove the screws [22] to disassemble the forced cooling fan [170].
2. Remove the cable grommet [269] with the encoder cable from the forced cooling fan [170].
3. Loosen the retaining screws [232] and turn the conical spring washers [251] outwards.
4. Loosen the screw at the coupling clamping hub [233] at the encoder end, the screw can be accessed through the slots of the encoder mounting adapter [A].
5. Remove the encoder [220] from the encoder mounting adapter [A] or the intermediate flange [225].
6. Loosen the screws [1458] and [936] to remove the encoder mounting adapter [A]. The torque brackets [935] and screws [1463] can remain at the encoder mounting adapter [A].
   - ⇨ **If the encoder mounting adapter cannot easily be removed:** Screw an M6 set screw (length 20 – 35 mm) hand tight in the rotor bore. Screw an M8 set screw (length > 10 mm) into the same bore and push the encoder mounting adapter [A] off the rotor [1]. Remove the M6 set screw from the rotor bore.

25957074/EN – 06/2019

Removing EV.., AV.., and XV. encoders

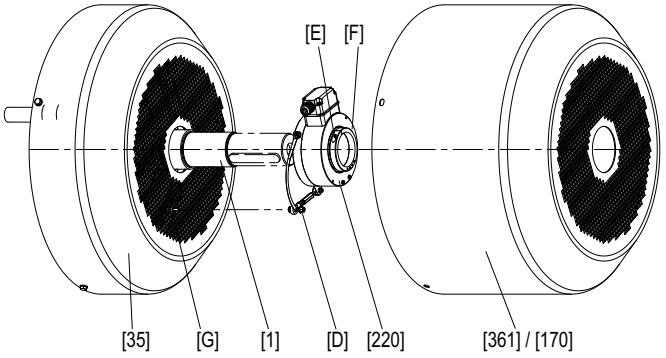
1. Remove the screws [22] to disassemble the forced cooling fan [170].
2. Remove the cable grommet [269] with the encoder cable from the forced cooling fan [170].
3. Loosen the retaining screws [232] and turn the conical spring washers [251] outwards.
4. Loosen the screw at the coupling clamping hub [233] at the encoder end, the screw can be accessed through the slots of the encoder mounting adapter [A].
5. Remove the encoder [220] from the encoder mounting adapter [A] or the intermediate flange [225].

Reassembly



1. Proceed as described in chapter "Encoder mounting adapter" (→ 🗎 40) to mount the encoder.

25957074/EN – 06/2019



7.4.10 Mounting/removing hollow shaft encoders with XH.A encoder mounting adapter for DR..71 – 225, DRN71 – 225, DR2..71 – 80 motors

The following figure illustrates the disassembly procedure using a third-party encoder as an example:

Encoder mounting with XH1A encoder mounting adapter

Encoder mounting with XH7A and XH8A encoder mounting adapter

9007202887902859

[1]	Rotor	[B]	Central retaining screw
[33]	Tapping screw	[619]	Connection cover
[34]	Washer	[C]	Screw connection cover
[35]	Fan guard	[D]	Torque bracket screws
[170]	Forced cooling fan guard	[E]	Screw
[220]	Encoder	[F]	Clamping ring
[269]	Cable grommet	[G]	Nut of the torque bracket
[361]	Safety cover		

Removing hollow shaft encoders form XH1A encoder mounting adapter

1. Remove the safety cover [361], or the forced cooling fan if required.
2. Loosen the screws of the connection cover [619] and remove it. Do not disconnect the encoder cable.
3. Screw out the central retaining screw [B].
4. Remove the torque bracket screws [D].
5. Pull the torque bracket off.
6. Remove the encoder [220] from the shaft end.

25957074/EN – 06/2019

Removing hollow shaft encoders from XH7A and XH8A encoder mounting adapter

1. Remove the safety cover [361], or the forced cooling fan if required.
2. Loosen the screw [E] from clamping ring [F].
3. Remove the torque bracket screws [D].
4. Remove the encoder [220] from the shaft end.

Reassembly of hollow shaft encoders to XH1A encoder mounting adapter

1. Push the encoder [220] on the shaft end.
2. Screw in the screw [D] to mount the torque bracket.
3. Tighten the central retaining screw [B].
   ⇨ Tightening torque 2.9 Nm
4. Screw on the connection cover [619].
   ⇨ Tightening torque 3 Nm.
5. Mount the safety cover [361] onto the forced cooling fan.

Reassembly of hollow shaft encoders to XH7A and XH8A encoder mounting adapter

1. Push the encoder [220] on the shaft end.
2. Screw in the screw [D] to mount the torque bracket.
3. Remove the screw [E] from clamping ring [F].
   ⇨ Tightening torque 5 Nm.
4. Mount the safety cover [361] onto the forced cooling fan.

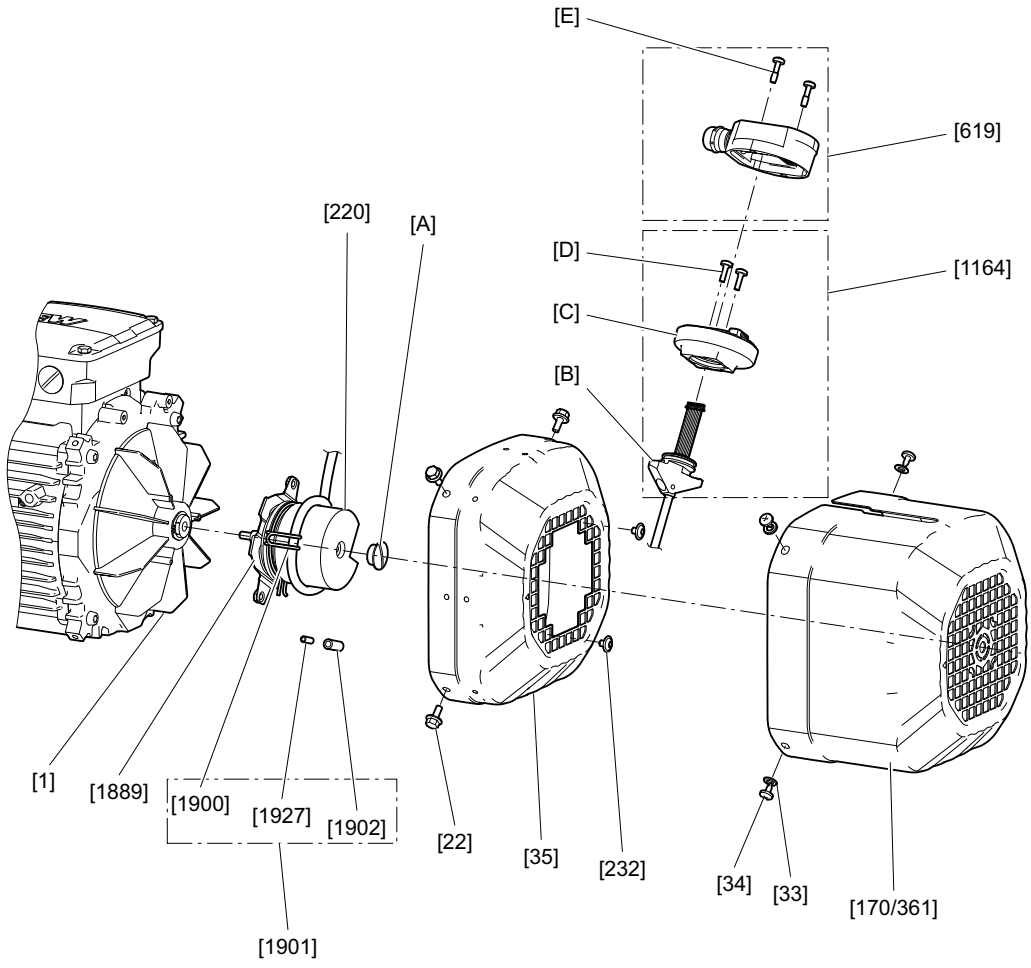
25957074/EN – 06/2019

7.4.11 Encoder mounting adapter EK8A

The encoder mounting adapter EK8A...

Content of the accessory bag [1634]

- Screws [232] for fastening the torque arm of the encoder [220]
- from size DRN180: Insulation coupling [1891]



Mounting the encoder mounting adapter EK8A

1. Unscrew the screws [22].
2. Remove the fan guard [35] from the motor.
3. Remove the protection cap [1143] from the recess of the fan guard [35].
   ⇨ Dispose of the protection cap [1143].
4. Remove the closing plug [950] from the rotor [1].
   ⇨ Dispose of the closing plug [950].

Then proceed with the installation process as described in chapter "Mounting cone shaft encoders EK8./AK8.".

25957074/EN – 06/2019

7.4.12 Removing and mounting cone shaft encoders of motors DRN71 – 132S, DR2..17 – 80

28519543819

[1]	Rotor	[1889]	Torque arm
[22]	Screw (hexagonal)	[1900]	Cable retainer
[33]	Washer	[1901]	Accessory bag
[34]	Screw (cross recess)	[1902]	Threaded sleeve
[35]	Fan guard	[1927]	Set screw
[170]	Forced cooling fan	[A]	Screw plug
[220]	Encoder	[B]	T-slot nut
[232]	Screw (hexalobular)	[C]	Lower part
[361]	Safety cover	[D]	Screw
[619]	Connection cover	[E]	Screw
[1164]	Connection adapter		

Removing encoder EK8./AK8.

1. Unscrew the screws [E].
2. Remove the connection cover [619] from the connection adapter [1164].
3. Loosen the screws [D] in the lower part [C].
   ⇨ Only unscrew the screws [D] to such an extent that the connection adapter [1164] can be moved in the recess of the safety cover [361].
4. Unscrew the screws [34].
5. Remove the safety cover [361] from the motor. When doing this, slide the connection adapter [1164] out of the recess.

6. Unscrew the screws [232].
7. Unscrew the screws [22].
8. Remove the fan guard [35] over the encoder [220]. Guide the connection adapter [1164] with the signal cable through the cutout of the fan guard [35].
9. Unscrew the central screw plug [A] of the encoder [220].
10. Loosen the central retaining screw of the encoder [220].
    ⇨ If the central retaining screw of the encoder [220] cannot be loosened, counter-tighten the spanner flat SW10 of the encoder shaft.
11. Loosen the cone connection.
    ⇨ Encoder EK8., AK8W, AK8Y: To loosen the cone connection, continue turning the central retaining screw of the encoder [220] counterclockwise.
    ⇨ Encoder AK8H: Continue turning the central retaining screw of the encoder [220] counterclockwise. To loosen the cones, screw an M6 screw (≥ 70 mm long) into the bore.
12. Remove the encoder [220] from the rotor [1].

Mounting encoder EK8./AK8.

1. Clean the cone of the encoder [220] and the rotor [1].
2. Remove the central screw plug [A].
3. Insert the encoder [220] into the conical bore of the rotor [1].
4. To secure the encoder [220] in place, tighten the central retaining screw.
    ⇨ Counter-tighten the spanner flat SW 30 of the insulation coupling.
    ⇨ Tightening torque 3.3 Nm.
5. To seal the encoder [220], screw in the central screw plug [A].
    ⇨ Tightening torque 1.8 Nm.
6. Mount the fan guard [35] over the encoder [220]. When doing this, guide the connection adapter [1164] with the signal line through the central grille cutout of the fan guard [35].
7. Use the screws [22] to secure the fan guard [35] to the rear endshield or brake endshield [42] of the motor.
    ⇨ For metal hoods: Tightening torque 3.3 Nm.
    ⇨ For plastic hoods: Tightening torque 2 Nm.
8. Screw the screws [232] through the grille of the fan guard [35] and into the nuts of the torque arm [1889].
    ⇨ If you need to turn the encoder [220] in order for the screws to reach the nuts of the torque arm, turn the encoder [220] clockwise.
    ⇨ Make sure the signal cable is of a sufficient length so that the connection adapter [1164] can be inserted into the recess of the safety cover [361].
    ⇨ Tightening torque 3.3 Nm.
9. Push the connection adapter [1164] up to the end of the recess facing away from the motor.

25957074/EN – 06/2019

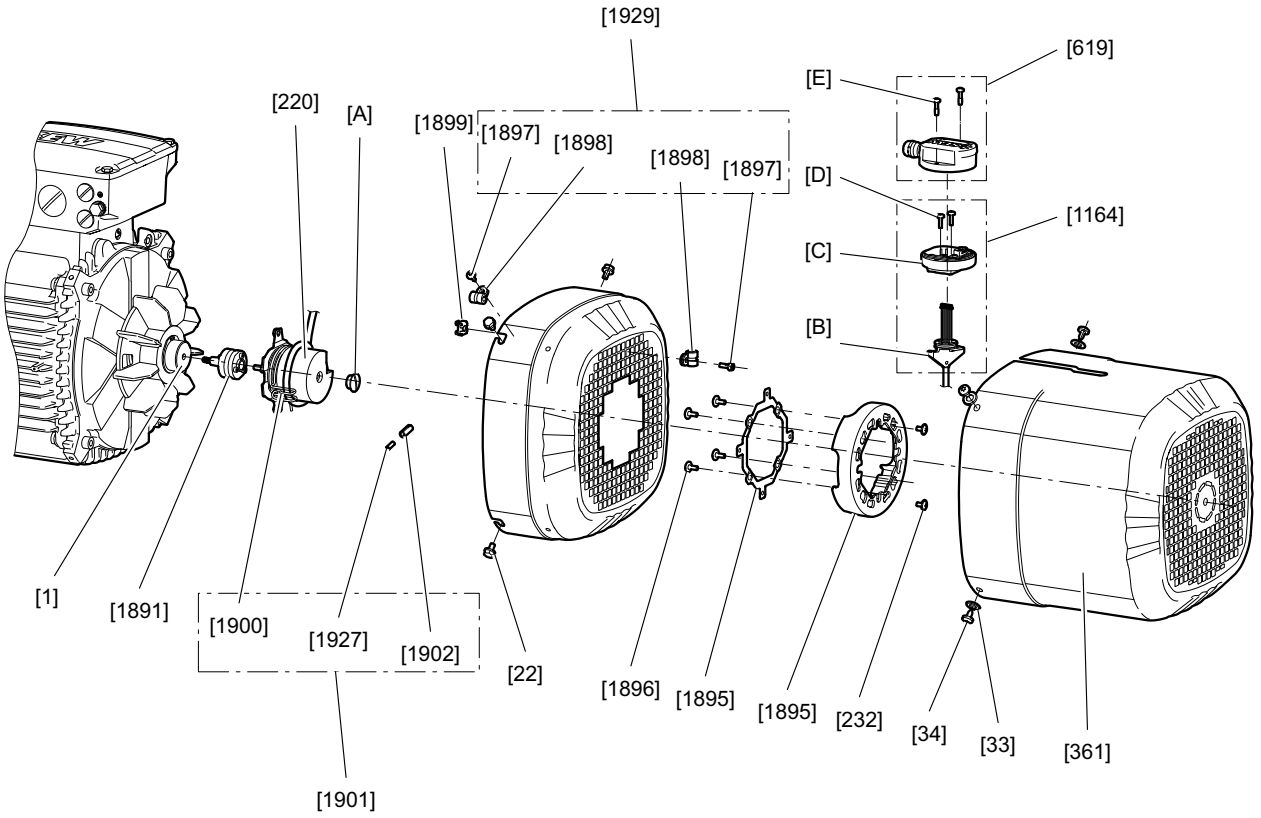
10. Place the safety cover [361] onto the fan guard [35].
    ⇨ The arrow that is cast in the lower part [C] of the connection adapter [1164] indicates the direction of the subsequent cable outlet for the connection cover [619].
    ⇨ If you wish to change the direction of the cable outlet: Unscrew the screws [D]. Twist the lower part [C] against the T-slot nut [B]. Screw in the screws [D]. When doing so, only tighten the screws [D] lightly.
11. Secure the safety cover [361] in place by using the screws [34].
    ⇨ Tightening torque 2 Nm.
12. Turn the connection adapter [1164] clockwise up to the stop.
13. Secure the connection adapter [1164] in place by tightening the screws [D].
    ⇨ Tightening torque 2 Nm.
14. Place the connection cover [619] onto the connection adapter [1164].
15. Screw the screws [E] through the bore in the connection cover [619] and into the bore in the connection adapter [1164].
    ⇨ Tightening torque 2.5 Nm

Removing encoder EK8./AK8. with optional forced cooling fan

1. Unscrew the screws [E].
2. Remove the connection cover [619] from the connection adapter [1164].
3. Loosen the screws [D] in the lower part [C].
    ⇨ Only unscrew the screws [D] to such an extent that the connection adapter [1164] can be moved in the recess of the forced cooling fan [170].
4. Loosen the screws [22].
5. Unscrew the screws [34].
6. Remove the forced cooling fan [170] from the motor. When doing this, slide the connection adapter [1164] out of the recess.
7. Unscrew the screws [232].
8. Remove the signal cable from the slot of the cable retainer [1900].
9. Unscrew the screws [22].
10. Remove the fan guard [35] over the encoder [220]. Guide the connection adapter [1164] with the signal cable through the cutout of the fan guard [35].
11. Unscrew the central screw plug [A] of the encoder [220].
12. Loosen the central retaining screw of the encoder [220].
    ⇨ If the central retaining screw of the encoder [220] cannot be loosened, counter-tighten the spanner flat SW10 of the encoder shaft.
13. Loosen the cone connection.
    ⇨ Encoder EK8., AK8W, AK8Y: To loosen the cone connection, continue turning the central retaining screw of the encoder [220] counterclockwise.
    ⇨ Encoder AK8H: Continue turning the central retaining screw of the encoder [220] counterclockwise. To loosen the cones, screw an M6 screw (≥ 70 mm long) into the bore.
14. Remove the encoder [220] from the rotor [1].

25957074/EN – 06/2019

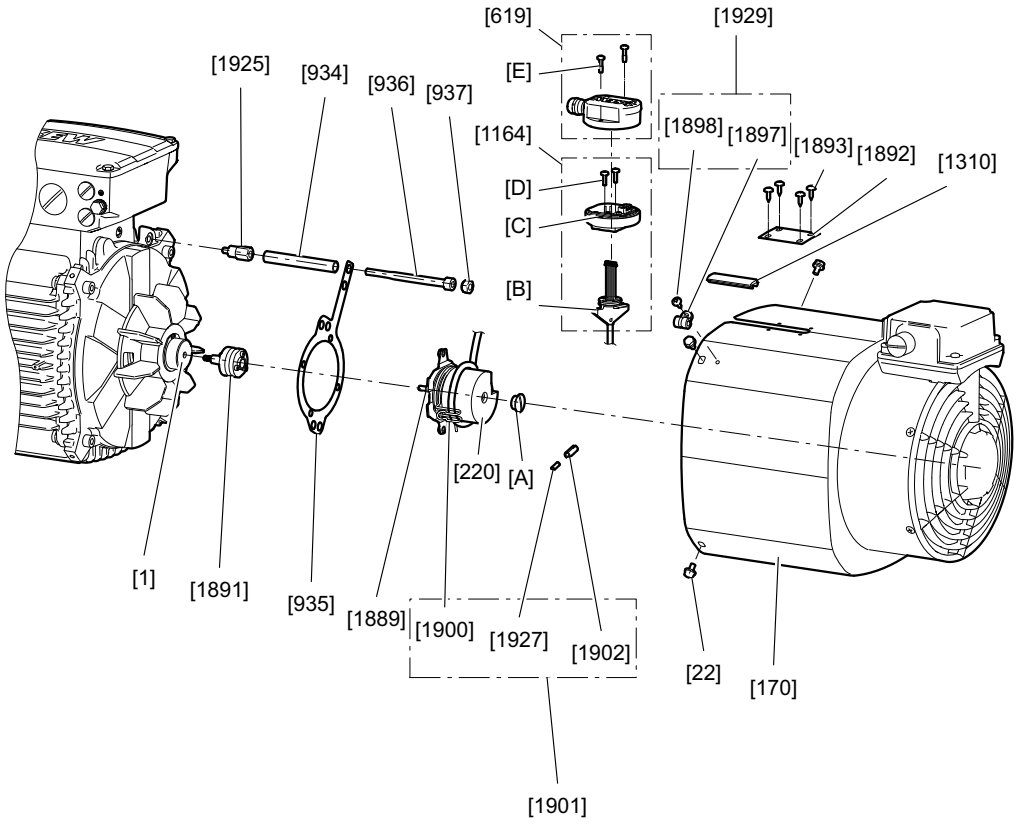
Mounting encoder EK8./AK8. with optional forced cooling fan



1. Clean the cone of the encoder [220] and the rotor [1].
2. Remove the central screw plug [A].
3. Insert the encoder [220] into the conical bore of the rotor [1].
4. To secure the encoder [220] in place, tighten the central retaining screw.
   - ⇨ Counter-tighten the spanner flat SW10 of the encoder shaft.
   - ⇨ Tightening torque 3.3 Nm.
5. To seal the encoder [220], screw in the central screw plug [A].
   - ⇨ Tightening torque 1.8 Nm.
6. Mount the fan guard [35] over the encoder [220]. When doing this, guide the connection adapter [1164] with the signal line through the central grille cutout of the fan guard [35].
7. Attach the screws [22] of the fan guard [35] to the rear endshield or brake endshield [42] of the motor.
8. Screw the screws [232] through the grille of the fan guard [35] and into the nuts of the torque arm [1889].
   - ⇨ If you need to turn the encoder [220] in order for the screws to reach the nuts of the torque arm, turn the encoder [220] clockwise.
   - ⇨ Make sure the signal cable is of a sufficient length so that the connection adapter [1164] can be inserted into the recess of the forced cooling fan [170].
   - ⇨ Tightening torque 3.3 Nm.
9. ⚠ **CAUTION!**
   Improper installation can cause damage to the equipment. Risk of damage to the signal cable. Insert the signal cable into the slot of the cable retainer [1900] in such a way that the signal cable does not come into contact with the rotating forced cooling fan.
10. To turn the cable retainer [1900], loosen the set screw [1927].
11. To secure the cable retainer [1900] in place, tighten the set screw [1927].
    - ⇨ Tightening torque 1.8 Nm.
12. Place the forced cooling fan [170] onto the fan guard [35].
13. Insert the connection adapter [1164] into the recess of the forced cooling fan [170]. The standard alignment of the recess points towards the terminal box.
    - ⇨ The arrow that is cast in the lower part [C] of the connection adapter [1164] indicates the direction of the subsequent cable outlet for the connection cover [619].
    - ⇨ If you wish to change the direction of the cable outlet: Unscrew the screws [D]. Twist the lower part [C] against the T-slot nut [B]. Screw in the screws [D]. When doing so, only tighten the screws [D] lightly.
14. Use the screws [22] to secure the fan guard [35] to the rear endshield or brake endshield [42] of the motor.
    - ⇨ For metal hoods: Tightening torque 3.3 Nm.
    - ⇨ For plastic hoods: Tightening torque 2 Nm.
15. Secure the forced cooling fan with the screws [34].
    - ⇨ Tightening torque 2 Nm.

25957074/EN – 06/2019

16. Push the connection adapter [1164] up to the end of the recess facing away from the motor.
17. Turn the connection adapter [1164] clockwise up to the stop.
18. Secure the connection adapter [1164] in place by tightening the screws [D].
    ⇨ Tightening torque 2 Nm.
19. Place the connection cover [619] onto the connection adapter [1164].
20. Screw the screws [E] through the bore in the connection cover [619] and into the bore in the connection adapter [1164].
    ⇨ Tightening torque 2.5 Nm



25957074/EN – 06/2019

7.4.13 Removing and mounting cone shaft encoders of motors DRN132M – 315

28534173707

[1889]	Torque arm	[E]	Screw

Removing encoder EK8./AK8.

1. Unscrew the screws [E].
2. Remove the connection cover [619] from the connection adapter [1164].
3. Loosen the screws [D] in the lower part [C].
   ⇨ Only unscrew the screws [D] to such an extent that the connection adapter [1164] can be moved in the recess of the safety cover [361].
4. Unscrew the screws [34].
5. Remove the safety cover [361] from the motor. When doing this, slide the connection adapter [1164] out of the recess.
6. Unscrew the screws [232].
7. Unscrew the screws [22].

8. Remove the fan guard [35] over the encoder [220]. Guide the connection adapter [1164] with the signal cable through the cutout of the fan guard [35].
9. Unscrew the central screw plug [A] of the encoder [220].
10. Loosen the central retaining screw of the encoder [220].
    ⇨ If the central retaining screw of the encoder [220] cannot be loosened, counter-tighten the spanner flat SW10 of the encoder shaft.
11. Loosen the cone connection.
    ⇨ Encoder EK8., AK8W, AK8Y: To loosen the cone connection, continue turning the central retaining screw of the encoder [220] counterclockwise.
    ⇨ Encoder AK8H: Continue turning the central retaining screw of the encoder [220] counterclockwise. To loosen the cones, screw an M6 screw (≥ 70 mm long) into the bore.
12. Remove the encoder [220] from the rotor [1].
13. For optional insulation coupling: Remove the encoder [220] from the insulation coupling [1891].

Mounting encoder EK8./AK8.

1. Clean the cone of the encoder [220] and the rotor [1].
2. For optional insulation coupling: Clean the cones of the insulation coupling [1891].
3. Remove the central screw plug [A].
4. For optional insulation coupling: The insulation coupling [1891] must be mounted before the encoder is mounted. Insert the insulation coupling [1891] into the conical bore of the rotor [1]. To secure the insulation coupling in place, tighten the central retaining screw.
    ⇨ Counter-tighten the spanner flat SW 30 of the insulation coupling.
    ⇨ Tightening torque 3.3 Nm.
5. Insert the encoder [220] into the conical bore of the rotor [1].
6. For optional insulation coupling: Insert the encoder [220] into the conical opening of the insulation coupling [1891].
7. To secure the encoder [220] in place, tighten the central retaining screw.
    ⇨ Counter-tighten the spanner flat SW10 of the encoder shaft.
    ⇨ Tightening torque 3.3 Nm.
8. To seal the encoder [220], screw in the central screw plug [A].
    ⇨ Tightening torque 1.8 Nm.
9. Mount the fan guard [35] over the encoder [220]. When doing this, guide the connection adapter [1164] with the signal line through the central grille cutout of the fan guard [35].
10. Use the screws [22] to secure the fan guard [35] to the rear endshield or brake endshield [42] of the motor.
    ⇨ DRN132M – L: Tightening torque 11.3 Nm.
    ⇨ DRN160 – 280: Tightening torque 27.3 Nm.
    ⇨ DRN315: Secure the screws [22] in place with medium-strength thread locker. Tightening torque 5 Nm.

25957074/EN – 06/2019

11. Screw the screws [232] through the support ring/spacer ring [1895] and the grille of the fan guard [35] and into the nuts of the torque arm [1889].
    - ⇨ Make sure the signal cable is of a sufficient length so that the connection adapter [1164] can be inserted into the recess of the safety cover [361].
    - ⇨ Tightening torque 3.3 Nm.
12. Place the safety cover [361] onto the fan guard [35].
    - ⇨ The standard alignment of the recess points towards the terminal box.
    - ⇨ The arrow that is cast in the lower part [C] of the connection adapter [1164] indicates the direction of the subsequent cable outlet for the connection cover [619].
    - ⇨ If you wish to change the direction of the cable outlet: Unscrew the screws [D]. Twist the lower part [C] against the T-slot nut [B]. Screw in the screws [D]. When doing so, only tighten the screws [D] lightly.
13. Secure the safety cover [361] in place by using the screws [34].
    - ⇨ Tightening torque 4.5 Nm
14. Push the connection adapter [1164] up to the end of the recess facing away from the motor.
15. Turn the connection adapter [1164] clockwise up to the stop.
16. Secure the connection adapter [1164] in place by tightening the screws [D].
    - ⇨ Tightening torque 2 Nm.
17. Place the connection cover [619] onto the connection adapter [1164].
18. Screw the screws [E] through the bore in the connection cover [619] and into the bore in the connection adapter [1164].
    - ⇨ Tightening torque 2.5 Nm

Removing encoder EK8./AK8. with optional forced cooling fan

1. For motors EDRN250 – 315: If the screws [1893] are present, unscrew the screws. Remove the support plate [1892]. Slide the sealing strip [1310]**/[1965]** out of the recess.
2. Unscrew the screws [E].
3. Remove the connection cover [619] from the connection adapter [1164].
4. Loosen the screws [D] in the lower part [C].
    - ⇨ Only unscrew the screws [D] to such an extent that the connection adapter [1164] can be moved in the recess of the forced cooling fan [170].
5. Unscrew the screws [22].
6. Remove the forced cooling fan [170] from the motor. When doing this, slide the connection adapter [1164] out of the recess.
7. Unscrew the screws [232].
8. Remove the signal cable from the slot of the cable retainer [1900].
9. To remove the torque arm [935], loosen the screw [936]/hex nut [937]. Guide the connection adapter [1164] with the signal cable through the cutout of the torque arm [935].
10. Loosen the central retaining screw of the encoder [220].
    - ⇨ If the central retaining screw of the encoder [220] cannot be loosened, counter-tighten the spanner flat SW10 of the encoder shaft.

25957074/EN – 06/2019

11. Loosen the cone connection.
    - ⇨ Encoder EK8., AK8W, AK8Y: To loosen the cone connection, continue turning the central retaining screw of the encoder [220] counterclockwise.
    - ⇨ Encoder AK8H: Continue turning the central retaining screw of the encoder [220] counterclockwise. To loosen the cones, screw an M6 screw (≥ 70 mm long) into the bore.
12. Remove the encoder [220] from the rotor [1].
13. For optional insulation coupling: Remove the encoder [220] from the insulation coupling [1891].

Mounting encoder EK8./AK8. with optional forced cooling fan

1. Clean the cone of the encoder [220] and the rotor [1].
2. For optional insulation coupling: Clean the cones of the insulation coupling [1891].
3. Remove the central screw plug [A].
4. For optional insulation coupling: The insulation coupling [1891] must be mounted before the encoder is mounted. Insert the insulation coupling [1891] into the conical bore of the rotor [1]. To secure the insulation coupling in place, tighten the central retaining screw.
    - ⇨ Counter-tighten the spanner flat SW10 of the encoder shaft.
    - ⇨ Tightening torque 3.3 Nm.
5. Insert the encoder [220] into the conical bore of the rotor [1].
6. For optional insulation coupling: Insert the encoder [220] into the conical opening of the insulation coupling [1891].
7. To secure the encoder [220] in place, tighten the central retaining screw.
    - ⇨ Counter-tighten the spanner flat SW10 of the encoder shaft.
    - ⇨ Tightening torque 3.3 Nm.
8. To seal the encoder [220], screw in the central screw plug [A].
    - ⇨ Tightening torque 1.8 Nm.
9. Guide the torque arm [935] over the connection adapter [1164] and the encoder [220].
10. For optional insulation coupling: Mount the spacer bolt [1625].
    - ⇨ M6 screw: Tightening torque 11.3 Nm.
    - ⇨ M8 screw: Tightening torque 27.3 Nm.
11. When mounting the torque arm [935], make sure it is aligned centrally to the encoder [220]. Screw in the screw [936]/hex nut [937] with the spacer bushings [934].
    - ⇨ M6 screw: Tightening torque 11.3 Nm.
    - ⇨ M8 screw: Tightening torque 27.3 Nm.
12. ⚠ **CAUTION!**
    Improper installation can cause damage to the equipment. Risk of damage to the signal cable. Insert the signal cable into the slot of the cable retainer [1900] in such a way that the signal cable does not come into contact with the rotating forced cooling fan.
13. To turn the cable retainer [1900], loosen the set screw [1927].

25957074/EN – 06/2019

14. To secure the cable retainer [1900] in place, tighten the set screw [1927].
    ⇨ Tightening torque 1.8 Nm.
15. To secure the torque arm [1889] of the encoder in place, screw the screws [232] into the bores of the torque arm [935].
    ⇨ Make sure the signal cable is of a sufficient length so that the connection adapter [1164] can be inserted into the recess of the forced cooling fan [170].
16. Place the forced cooling fan [170] onto the rear endshield or brake endshield [42].
17. Insert the connection adapter [1164] into the recess of the forced cooling fan [170]. The standard alignment of the recess points towards the terminal box.
    ⇨ The arrow that is cast in the lower part [C] of the connection adapter [1164] indicates the direction of the subsequent cable outlet for the connection cover [619].
    ⇨ If you wish to change the direction of the cable outlet: Unscrew the screws [D]. Twist the lower part [C] against the T-slot nut [B]. Screw in the screws [D]. When doing so, only tighten the screws [D] lightly.
18. Use the screws [22] to secure the forced cooling fan [170] to the rear endshield or brake endshield [42] of the motor.
    ⇨ DRN132M – L: Tightening torque 11.3 Nm.
    ⇨ DRN160 – 280: Tightening torque 27.3 Nm.
    ⇨ DRN315: Secure the screws [22] in place with medium-strength thread locker. Tightening torque 5 Nm.
19. Push the connection adapter [1164] up to the end of the recess facing away from the motor.
20. For motors EDRN250 – 315: To secure the support plate [1892] in place, screw in the screws [1893]. Slide the sealing strip [1310]/[1965] into the recess.
21. Secure the connection adapter [1164] in place by tightening the screws [D].
    ⇨ Tightening torque 2 Nm.
22. Place the connection cover [619] onto the connection adapter [1164].
23. Screw the screws [E] through the bore in the connection cover [619] and into the bore in the connection adapter [1164].
    ⇨ Tightening torque 2.5 Nm

25957074/EN – 06/2019

7.4.14 Removing and mounting encoder EV8./AV8. with coupling from motors DRN71 – 225

Removing encoder EV8./AV8. with coupling

1. Unscrew the screws [E].
2. Remove the connection cover [619] from the connection adapter [1164].
3. Loosen the screws [D] in the lower part [C].
   ⇨ Only unscrew the screws [D] to such an extent that the connection adapter [1164] can be moved in the recess of the safety cover [361].
4. Unscrew the screws [22].
5. Remove the safety cover [361] from the motor. When doing this, slide the connection adapter [1164] out of the recess.
6. Unscrew the screws [232].
7. Remove the eccentric disks [251] from the circumferential groove of the encoder [220].
8. Unscrew the central screw plug [A] of the encoder [220].
9. Loosen the central retaining screw of the encoder [220].
   ⇨ If the central retaining screw of the encoder [220] cannot be loosened, exert counter-pressure at the Ø 4.1 mm bore of the rear coupling half.
10. Remove the encoder [220] from the coupling [233].

Mounting encoder EV8./AV8. with coupling

1. Remove the central screw plug [A].
2. If the closing plate [646] is present: Unscrew the screws [232] and remove the closing plate [646].
3. Clean the cone of the rotor [1], the encoder [220] and the coupling [233].
4. Insert the coupling [233] into the conical bore of the rotor.
5. To secure the coupling [233] in place, screw in the central retaining screw [F].
   ⇨ Tightening torque 4 Nm
   ⇨ Exert counter-pressure at the Ø 4.1 mm bore of the rear coupling half.
6. To remove the torque arm [1889] from the encoder, unscrew the screws [1888].
7. Remove the central screw plug [A].
   ⇨ For size DRN132M/L: Place the spacer ring [225] between the encoder [220] and the fan guard with encoder mount [212].
8. Insert the encoder [220] into the coupling half with conical bore [233].
9. To secure the encoder [220] in place, tighten the central retaining screw.
   ⇨ Tightening torque 3.3 Nm.
   ⇨ Exert counter-pressure at the Ø 4.1 mm bore of the rear coupling half.
10. To seal the encoder [220], screw in the central screw plug [A].
    ⇨ Tightening torque 1.8 Nm.
11. To secure the eccentric disks [251], insert the screws [232].
12. Tighten the screws [232] while turning the eccentric disks [251] in clockwise direction into the groove of the encoder [220].
    ⇨ Tightening torque 2.25 Nm.

25957074/EN – 06/2019

⇨ Make sure the signal cable is of a sufficient length so that the connection adapter [1164] can be inserted into the recess of the safety cover [361].

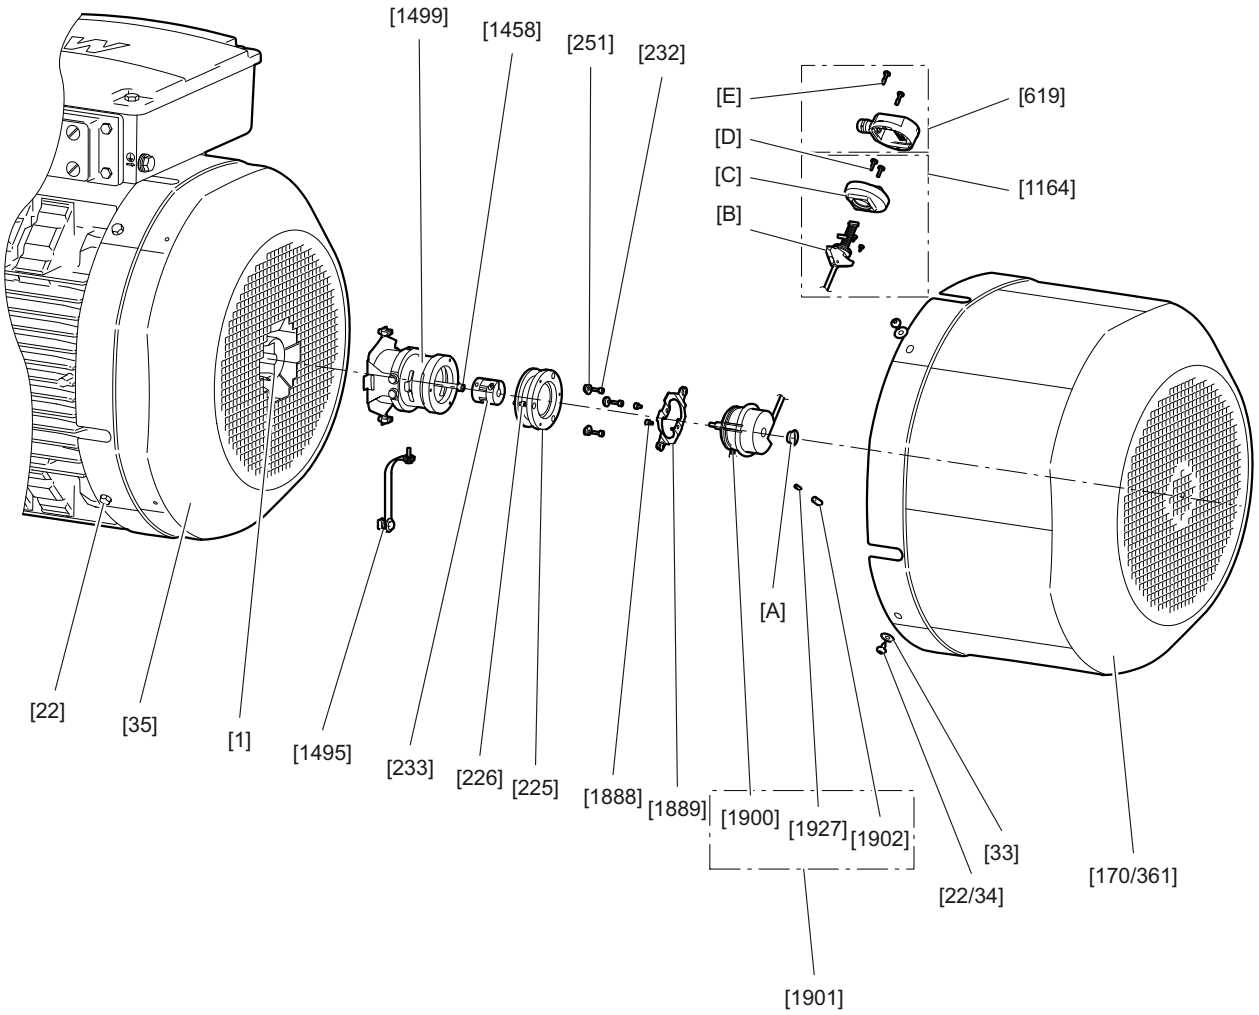
13. Insert the connection adapter [1164] into the recess of the safety cover [361]. The standard alignment of the recess points towards the terminal box.
14. Place the safety cover [361] onto the fan guard [35].
    ⇨ The arrow that is cast in the lower part [C] of the connection adapter [1164] indicates the direction of the subsequent cable outlet for the connection cover [619].
    ⇨ If you wish to change the direction of the cable outlet: Unscrew the screws [D]. Twist the lower part [C] against the T-slot nut [B]. Screw in the screws [D]. When doing so, only tighten the screws [D] lightly.
15. Secure the safety cover [361] in place by using the screws [22].
    ⇨ DRN71 – 132S: Tightening torque 3.3 Nm
    ⇨ DRN132M – L: Tightening torque 11.3 Nm
    ⇨ DRN160 – 225: Tightening torque 27.3 Nm
16. Push the connection adapter [1164] up to the end of the recess facing away from the motor.
17. Turn the connection adapter [1164] clockwise up to the stop.
18. Secure the connection adapter [1164] in place by tightening the screws [D].
    ⇨ Tightening torque 2 Nm.
19. Place the connection cover [619] onto the connection adapter [1164].
20. Screw the screws [E] through the bore in the connection cover [619] and into the bore in the connection adapter [1164].
    ⇨ Tightening torque 2.5 Nm

Removing encoder EV8./AV8. with coupling and optional forced cooling fan

1. Unscrew the screws [E].
2. Remove the connection cover [619] from the connection adapter [1164].
3. Loosen the screws [D] in the lower part [C].
   ⇨ Only unscrew the screws [D] to such an extent that the connection adapter [1164] can be moved in the recess of the safety cover [361].
4. Loosen the screws [22].
5. Unscrew the screws [34].
6. Remove the forced cooling fan [170] from the motor. When doing this, slide the connection adapter [1164] out of the recess.
7. Remove the signal cable from the slot of the cable retainer [1900].
8. Unscrew the screws [232].
9. Remove the eccentric disks [251] from the circumferential groove of the encoder [220].
10. Unscrew the central screw plug [A] of the encoder [220].
11. Loosen the central retaining screw of the encoder [220].
    ⇨ If the central retaining screw of the encoder [220] cannot be loosened, exert counter-pressure at the Ø 4.1 mm bore of the rear coupling half.
12. Remove the encoder [220] from the coupling [233].

25957074/EN – 06/2019

Mounting encoder EV8./AV8. with coupling and optional forced cooling fan



1. Remove the central screw plug [A].
2. If the closing plate [646] is present: Unscrew the screws [232] and remove the closing plate [646].
3. Clean the cone of the rotor [1], the encoder [220] and the coupling [233].
4. Insert the coupling [233] into the conical bore of the rotor.
5. To secure the coupling [233] in place, screw in the central retaining screw [F].
   - ⇨ Tightening torque 3.3 Nm.
   - ⇨ Exert counter-pressure at the Ø 4.1 mm bore of the rear coupling half.
6. To remove the torque arm [1889] from the encoder, unscrew the screws [1888].
7. Remove the central screw plug [A].
   - ⇨ For size DRN132M/L: Place the spacer ring [225] between the encoder [220] and the fan guard with encoder mount [212].
8. Insert the encoder [220] into the coupling half with conical bore [233].
9. To secure the encoder [220] in place, tighten the central retaining screw.
   - ⇨ Tightening torque 3.3 Nm.
   - ⇨ Exert counter-pressure at the Ø 4.1 mm bore of the rear coupling half.
10. To seal the encoder [220], screw in the central screw plug [A].
    - ⇨ Tightening torque 1.8 Nm.
11. To secure the eccentric disks [251], insert the screws [232].
12. Tighten the screws [232] while turning the eccentric disks [251] in clockwise direction into the groove of the encoder [220].
    - ⇨ Tightening torque 2.25 Nm.
    - ⇨ Make sure the signal cable is of a sufficient length so that the connection adapter [1164] can be inserted into the recess of the forced cooling fan [170].
13. ⚠ **CAUTION!**
    Improper installation can cause damage to the equipment. Risk of damage to the signal cable. Insert the signal cable into the slot of the cable retainer [1900] in such a way that the signal cable does not come into contact with the rotating forced cooling fan.
14. To turn the cable retainer [1900], loosen the set screw [1927].
15. To secure the cable retainer [1900] in place, tighten the set screw [1927].
    - ⇨ Tightening torque 1.8 Nm.
16. Place the forced cooling fan [170] onto the fan guard with encoder mount [212].
17. Insert the connection adapter [1164] into the recess of the forced cooling fan [170]. The standard alignment of the recess points towards the terminal box.
    - ⇨ The arrow that is cast in the lower part [C] of the connection adapter [1164] indicates the direction of the subsequent cable outlet for the connection cover [619].
    - ⇨ If you wish to change the direction of the cable outlet: Unscrew the screws [D]. Twist the lower part [C] against the T-slot nut [B]. Screw in the screws [D]. When doing so, only tighten the screws [D] lightly.

25957074/EN – 06/2019

18. Use the screws [22] to secure the forced cooling fan [170] to the fan guard with encoder mount [212] of the motor.
    - ⇨ DRN71 – 132S: Tightening torque 3.3 Nm
    - ⇨ DRN132M – L: Tightening torque 11.3 Nm
    - ⇨ DRN160 – 225: Tightening torque 27.3 Nm
19. Push the connection adapter [1164] up to the end of the recess facing away from the motor.
20. Turn the connection adapter [1164] clockwise up to the stop.
21. Secure the connection adapter [1164] in place by tightening the screws [D].
    - ⇨ Tightening torque 2 Nm.
22. Place the connection cover [619] onto the connection adapter [1164].
23. Screw the screws [E] through the bore in the connection cover [619] and into the bore in the connection adapter [1164].
    - ⇨ Tightening torque 2.5 Nm

25957074/EN – 06/2019

7.4.15 Removing and mounting encoder EV8./AV8. with coupling from motors DRN250 – 280

28588932107

[1]	Rotor	[1499]	Encoder mounting adapter
[22]	Screw (hexagonal)	[1495]	Ground strap SET
[33]	Washer	[1888]	
[34]	Screw (cross recess)	[1898]	Clamp
[35]	Fan guard	[1899]	Cage nut
[170]	Forced cooling fan	[1900]	Cable retainer
[225]	Intermediate flange	[1901]	Accessory bag
[226]	Cap screw	[1902]	Threaded sleeve
[232]	Screw (hexalobular)	[1927]	Set screw
[233]	Coupling	[A]	Screw plug
[251]	Conical spring washer	[B]	T-slot nut
[361]	Safety cover	[C]	Lower part
[619]	Connection cover	[D]	Screw
[1164]	Connection adapter	[E]	Screw
[1458]	Cap screw		

Removing encoder EV8./AV8. with coupling

1. Unscrew the screws [E].
2. Remove the connection cover [619] from the connection adapter [1164].

25957074/EN – 06/2019

3. Loosen the screws [D] in the lower part [C].
   ⇨ Only unscrew the screws [D] to such an extent that the connection adapter [1164] can be moved in the recess of the safety cover [361].
4. Unscrew the screws [34].
5. Remove the safety cover [361] from the motor. When doing this, slide the connection adapter [1164] out of the recess.
6. Unscrew the screws [232].
7. Remove the eccentric disks [251] from the circumferential groove of the encoder [220].
8. Remove the encoder [220] from the intermediate flange [225].
9. Unscrew the central screw plug [A] of the encoder [220].
10. Loosen the central retaining screw of the encoder [220].
11. Remove the encoder with the mounted rear coupling half [233] from the mounting adapter [1499].
    ⇨ If the central retaining screw of the encoder [220] cannot be loosened, counter-tighten the spanner flat SW10 of the encoder shaft.
12. Remove the encoder [220] from the coupling [233].

Mounting encoder EV8./AV8. with coupling

1. Clean the cone of the rotor [1], the encoder mounting adapter [1499] and the coupling [233].
2. Insert the encoder mounting adapter [1499] into the conical bore of the rotor [1].
3. To secure the encoder mounting adapter [1499] in place, screw in the central retaining screw [1458].
   ⇨ Tightening torque 3.3 Nm.
4. Use the screws [22] to secure the fan guard [35] to the rear endshield or brake endshield [42] of the motor.
   ⇨ While doing so, the plastic dampers [1486] of the torque arm for the encoder mounting adapter [1499] must engage into the grille of the fan guard [35].
   ⇨ Tightening torque 27.3 Nm.
5. To secure the ground strap [1495] to the encoder mounting adapter [1499], screw in the screw [1498].
   ⇨ Tightening torque 6.5 Nm
6. To secure the ground strap [1495] to the fan guard [35], screw the screw [1462] into the cage nut [1459].
   ⇨ Tightening torque 11.3 Nm.
7. Place the coupling half with cylindrical internal bore [233] onto the inner pin of the encoder mounting adapter [1499].
8. To secure the coupling half with cylindrical internal bore [233] in place, screw the screw into the conical spring washer of the coupling [233].
   ⇨ Tightening torque 3.3 Nm.
9. To secure the intermediate flange [225] to the encoder mounting adapter [1499], screw in the screw [226].
   ⇨ Tightening torque 3.3 Nm.

25957074/EN – 06/2019

10. To remove the torque arm [1889] from the encoder, unscrew the screws [1888].
11. Remove the central screw plug [A].
12. Insert the encoder [220] into the coupling half with conical bore [233].
13. To secure the encoder [220] in place, tighten the central retaining screw.
    - ⇨ Tightening torque 3.3 Nm.
    - ⇨ Counter-tighten the spanner flat SW10 of the encoder shaft.
14. To seal the encoder [220], screw in the central screw plug [A].
    - ⇨ Tightening torque 1.8 Nm.
15. Insert the encoder [220] with mounted coupling half into the centering of the intermediate flange [225]. The two coupling halves must interlock via the plastic coupling star.
16. To secure the eccentric disks [251], insert the screws [232].
17. Tighten the screws [232] while turning the eccentric disks [251] in clockwise direction into the groove of the encoder [220].
    - ⇨ Tightening torque 2.25 Nm.
    - ⇨ Make sure the signal cable is of a sufficient length so that the connection adapter [1164] can be inserted into the recess of the safety cover [361].
18. Insert the connection adapter [1164] into the recess of the safety cover [361]. The standard alignment of the recess points towards the terminal box.
19. Place the safety cover [361] onto the fan guard [35].
    - ⇨ The arrow that is cast in the lower part [C] of the connection adapter [1164] indicates the direction of the subsequent cable outlet for the connection cover [619].
    - ⇨ If you wish to change the direction of the cable outlet: Unscrew the screws [D]. Twist the lower part [C] against the T-slot nut [B]. Screw in the screws [D]. When doing so, only tighten the screws [D] lightly.
20. Secure the safety cover [361] in place by using the screws [34].
    - ⇨ Tightening torque 4.5 Nm
21. Push the connection adapter [1164] up to the end of the recess facing away from the motor.
22. Turn the connection adapter [1164] clockwise up to the stop.
23. Secure the connection adapter [1164] in place by tightening the screws [D].
    - ⇨ Tightening torque 2 Nm.
24. Place the connection cover [619] onto the connection adapter [1164].
25. Screw the screws [E] through the bore in the connection cover [619] and into the bore in the connection adapter [1164].
    - ⇨ Tightening torque 2.5 Nm

Removing encoder EV8./AV8. with coupling and optional forced cooling fan

1. Unscrew the screws [E].
2. Remove the connection cover [619] from the connection adapter [1164].
3. Loosen the screws [D] in the lower part [C].
   - ⇨ Only unscrew the screws [D] to such an extent that the connection adapter [1164] can be moved in the recess of the forced cooling fan [170].

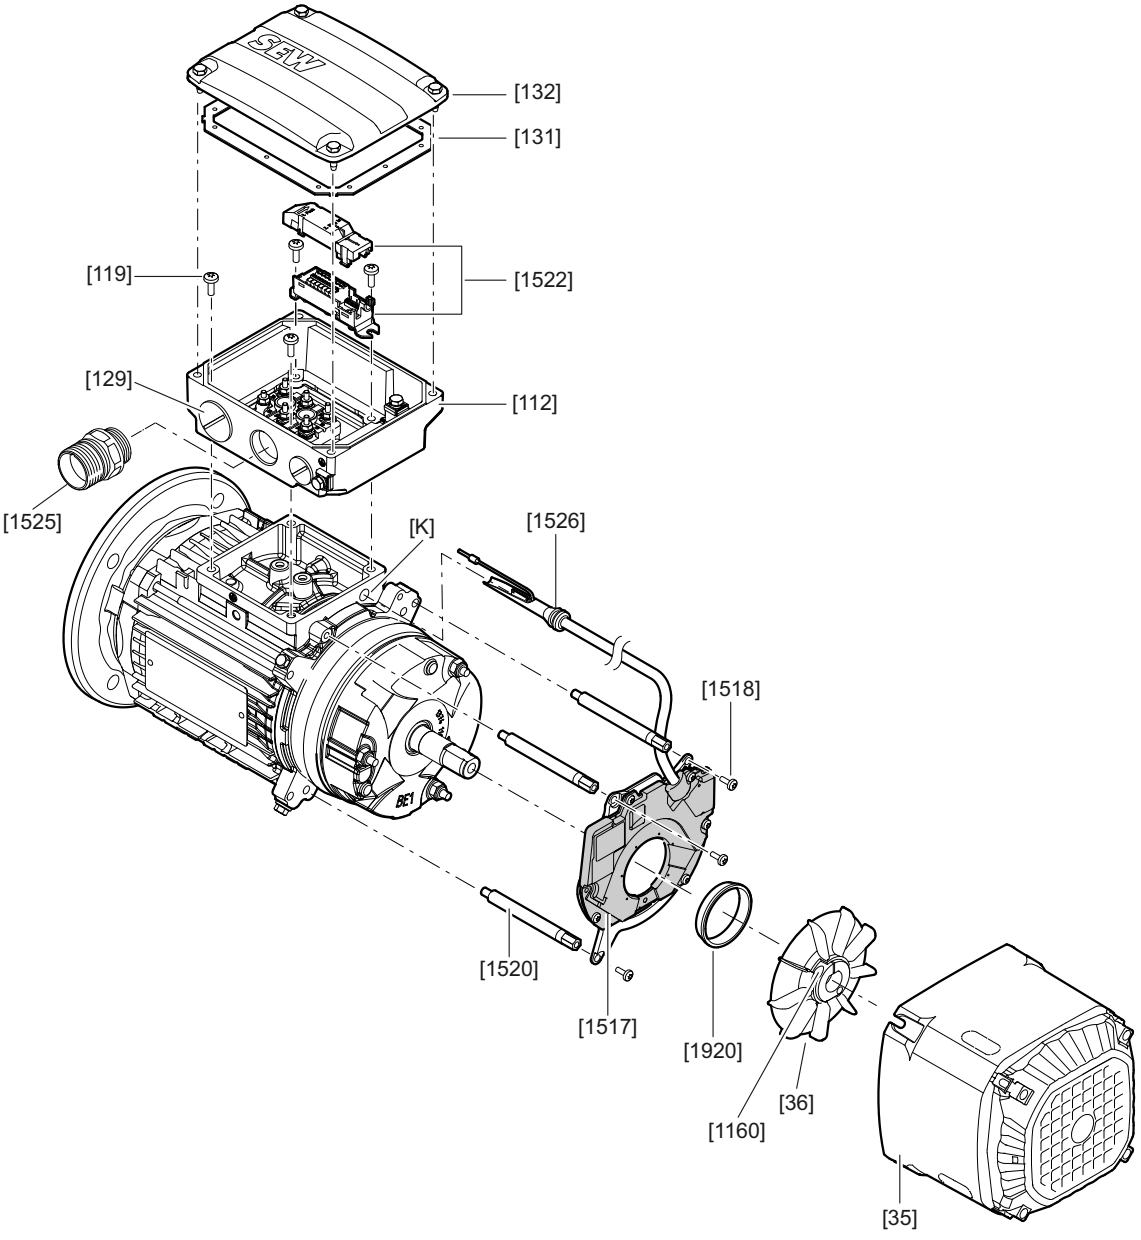
25957074/EN – 06/2019

4. Unscrew the screws [22].
5. Remove the forced cooling fan [170] from the motor. When doing this, slide the connection adapter [1164] out of the recess.
6. If necessary, loosen the set screw [1927].
7. Remove the signal cable from the slot of the cable retainer [1900].
8. Unscrew the screws [232].
9. Remove the eccentric disks [251] from the circumferential groove of the encoder [220].
10. Remove the encoder [220] from the intermediate flange [225].
11. Unscrew the central screw plug [A] of the encoder [220].
12. Loosen the central retaining screw of the encoder [220].
13. Remove the encoder with the mounted rear coupling half [233] from the mounting adapter [1499].
    ⇨ If the central retaining screw of the encoder [220] cannot be loosened, counter-tighten the spanner flat SW10 of the encoder shaft.
14. Remove the encoder [220] from the coupling [233].

Mounting encoder EV8./AV8. with coupling and optional forced cooling fan

1. Clean the cone of the rotor [1], the encoder mounting adapter [1499] and the coupling [233].
2. Insert the encoder mounting adapter [1499] into the conical bore of the rotor [1].
3. To secure the encoder mounting adapter [1499] in place, screw in the central retaining screw [1458].
    ⇨ Tightening torque 3.3 Nm.
4. Use the screws [1485] to secure the torque arm [935] to the mounting adapter [1499].
    ⇨ Tightening torque 6 Nm.
5. Use the sleeves [934], screws [936] and washers [1666] to secure the torque arm [935] to the rear endshield or brake endshield [42].
    ⇨ Tightening torque 11.3 Nm.
6. Use the screws [22] to secure the fan guard [35] to the rear endshield or brake endshield [42] of the motor.
    ⇨ While doing so, the plastic dampers [1486] of the torque arm for the encoder mounting adapter [1499] must engage into the grille of the fan guard [35].
    ⇨ Tightening torque 27.3 Nm.
7. Place the coupling half with cylindrical internal bore [233] onto the inner pin of the encoder mounting adapter [1499].
8. To secure the coupling half with cylindrical internal bore [233] in place, screw the screw into the conical spring washer of the coupling [233].
    ⇨ Tightening torque 3.3 Nm.
9. To secure the intermediate flange [225] to the encoder mounting adapter [1499], screw in the screw [226].
    ⇨ Tightening torque 3.3 Nm.
10. To remove the torque arm [1889] from the encoder, unscrew the screws [1888].

25957074/EN – 06/2019



11. Remove the central screw plug [A].
12. Insert the encoder [220] into the coupling half with conical bore [233].
13. To secure the encoder [220] in place, tighten the central retaining screw.
    ⇨ Tightening torque 3.3 Nm.
    ⇨ Counter-tighten the spanner flat SW10 of the encoder shaft.
14. To seal the encoder [220], screw in the central screw plug [A].
    ⇨ Tightening torque 1.8 Nm.
15. Insert the encoder [220] with mounted coupling half into the centering of the intermediate flange [225]. The two coupling halves must interlock via the plastic coupling star.
16. To secure the eccentric disks [251], insert the screws [232].
17. Tighten the screws [232] while turning the eccentric disks [251] in clockwise direction into the groove of the encoder [220].
    ⇨ Tightening torque 2.25 Nm.
    ⇨ Make sure the signal cable is of a sufficient length so that the connection adapter [1164] can be inserted into the recess of the safety cover [361].
18. ⚠ **CAUTION!**
    Improper installation can cause damage to the equipment. Risk of damage to the signal cable. Insert the signal cable into the slot of the cable retainer [1900] in such a way that the signal cable does not come into contact with the rotating forced cooling fan.
19. To turn the cable retainer [1900], loosen the set screw [1927].
20. To secure the cable retainer [1900] in place, tighten the set screw [1927].
    ⇨ Tightening torque 1.8 Nm.
21. Insert the connection adapter [1164] into the recess of the forced cooling fan [170]. The standard alignment of the recess points towards the terminal box.
    ⇨ The arrow that is cast in the lower part [C] of the connection adapter [1164] indicates the direction of the subsequent cable outlet for the connection cover [619].
    ⇨ If you wish to change the direction of the cable outlet: Unscrew the screws [D]. Twist the lower part [C] against the T-slot nut [B]. Screw in the screws [D]. When doing so, only tighten the screws [D] lightly.
22. Use the screws [22] to secure the forced cooling fan [170] to the rear endshield or brake endshield [42] of the motor.
    ⇨ Tightening torque 27.3 Nm.
23. Push the connection adapter [1164] up to the end of the recess facing away from the motor.
24. For motors EDRN250 – 315: To secure the support plate [1892] in place, screw in the screws [1893]. Slide the sealing strip [1310]/[1965] into the recess.
25. Secure the connection adapter [1164] in place by tightening the screws [D].
    ⇨ Tightening torque 2 Nm.
26. Place the connection cover [619] onto the connection adapter [1164].
27. Screw the screws [E] through the bore in the connection cover [619] and into the bore in the connection adapter [1164].
    ⇨ Tightening torque 2.5 Nm

25957074/EN – 06/2019

7.4.16 Removing and mounting built-in encoder EI8.

A centering ring is required when mounting the built-in encoder EI8. You can order the centering ring via the following part number:

Motor	Built-in encoder	Part number
DRN71 – 132S DR2..71 – 80	Centering ring EI8.	22659129

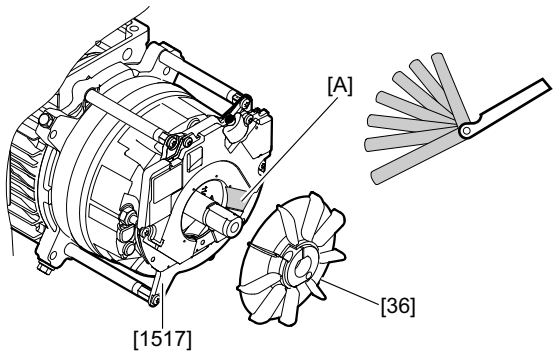
9007227690175499

[35]	Fan guard	[132]	Terminal box cover	[1525]	M23 plug connector
[36]	Fan, complete	[1160]	Cap screw	[1526]	Grommet
[112]	Terminal box lower part	[1517]	Encoder module	[1920]	Centering ring (aid)
[119]	Screw	[1518]	Flat head screw	[K]	Knock-out
[129]	Screw plug	[1520]	Spacer		
[131]	Gasket for cover	[1522]	Connection unit		

Removing EI8. with connection unit

✓ Required resources: Screwdriver

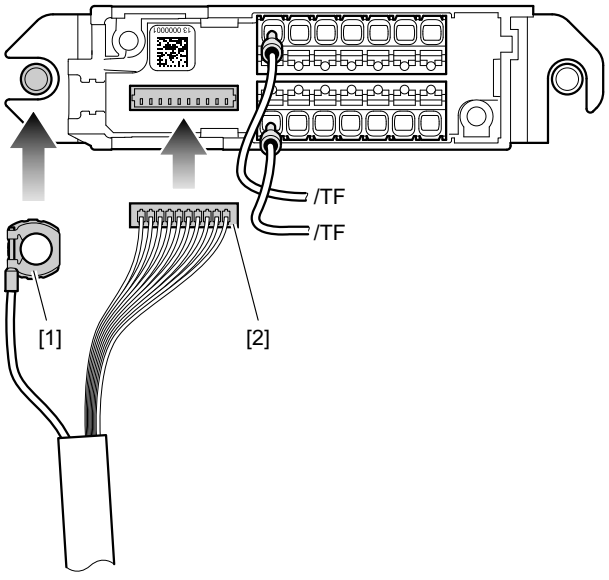
1. Remove the forced cooling fan if required.
2. Remove the screws [22] to disassemble the fan guard [35].
3. Loosen the radial clamping screw [1160]:
   - ⇨ DRN71 – 100: M3 with cylinder head
   - ⇨ DRN112/132S: M4 with cylinder head
4. Remove the fan [36] with bushing and pole ring from the shaft end.
5. Remove the 3 x M4 pan head screws [1518] of the encoder module [1517].
6. If present, remove the hexagonal spacers [1520] (SW8).
7. Unscrew the screws [123] to remove the terminal box cover [132].
8. Remove the cover of the connection unit [1522] by pressing the cover on both sides behind the cable entry.
9. Disconnect the 10-pin board connector.
10. Pull the jack of the encoder cable from the connector.
11. Unscrew the grounding element of the encoder cable.
12. **NOTICE!** Possible defect of the encoder module. Physical damage can occur. Do not pull directly on the encoder module.
    To remove the encoder module [1517] from the motor, pull the encoder cable out of the grommet [1526] and the opening of the knock-out [K].



Mounting EI8. with connection unit

- ✓ Required resources: Feeler gauge, screwdriver, centering ring [1920]

1. Unscrew the screws [123] to remove the terminal box cover [132].
2. **NOTICE!** Damage to the terminal box or fragments inside the motor. Possible physical damage. Exercise caution when breaking open the knock-outs.
   Break open the knock-out [K] by using a chisel or screwdriver.
3. **NOTICE!** Damage to the connector. Possible physical damage. Do not subject the connector to excessive tension.
   Pull the grommet [1526] with encoder cable through the knock-out [K].
   - ⇨ The grommet must engage into the opening of the knock-out [K].
4. If necessary, screw the hexagonal spacers [1520] into the brake endshield.
   - ⇨ Tightening torque 5 Nm.
5. Place the centering ring [1920] onto the pole ring.
6. Push the encoder module [1517] onto the shaft end.
7. Push the fan [36] with bushing and pole ring onto the shaft end.
8. Center the encoder module [1517] with the centering ring [1920] radially to the shaft.
9. Use 3 pan head screws [1518] to secure the encoder module [1517] to the brake endshield or, if applicable, to the hexagonal spacers [1520].
   - ⇨ Tightening torque 2.5 Nm
10. Remove the fan [36] with bushing and pole ring from the shaft end and remove the centering ring [1920].
11. Push the fan [36] with bushing and pole ring onto the shaft end.



25957074/EN – 06/2019

12. To set the distance of 1 mm between the encoder module [1517] and the pole ring, insert a feeler gauge into the designated notch [A].

28744408843

13. Tighten the clamping screw [1160].
    - ⇨ DRN71 – 100, DR2..71 – 80: Tightening torque 1.2 Nm
    - ⇨ DRN112 – 132S: Tightening torque 3.3 Nm
14. Route the encoder cable in the terminal box in such a way that it is not crushed or improperly subjected to stress.
15. Remove the cover of the connection unit [1522] by pressing the cover on both sides behind the cable entry.
16. Apply the shielding of the encoder cable onto the Stocko terminal.
17. Place the connection unit [1522] in the terminal box.
18. To secure the connection unit [1522] in place, screw the Stocko terminal [1] and the shield plate tightly in the terminal box.
    - ⇨ Tightening torque 5 Nm.

28759192843

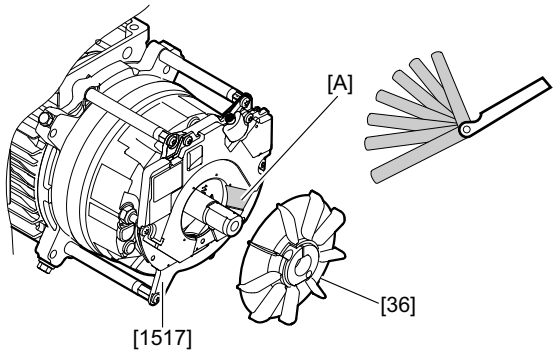
19. Insert the jack of the encoder cable [2] into the connector on the board and insert the encoder cable into the hollow of the connection unit [1522], which serves as strain relief. If applicable, connect the temperature sensor /TF.
20. Connect the customer's evaluation unit for the encoder to the connection unit [1522] with a shield plate.
21. Connect the supply voltage to the encoder module [1517].

22. Attach the cover of the connection unit [1522].
23. Check the visual feedback of the status LED for the encoder module [1517].
    - ⇨ LED lights up green: The encoder module [1517] has been installed correctly and you can continue with the assembly process.
    - ⇨ LED lights up red: Switch off the supply voltage. Set the distance of 1 mm between the encoder module [1517] and the pole ring again. Switch the supply voltage back on. If the status LED still lights up red, please contact the SEW-EURODRIVE Service department.
24. Mount the terminal box cover [132] using the screws [123] (4xM5 SW8).
    - ⇨ Tightening torque 4 Nm
25. Mount the fan guard [35] with the screws [22].
    - ⇨ Tightening torque 2 Nm.
26. Mount the forced cooling fan if applicable.

Removing EI8. with M23 plug connector

- ✓ Required resources: Screwdriver

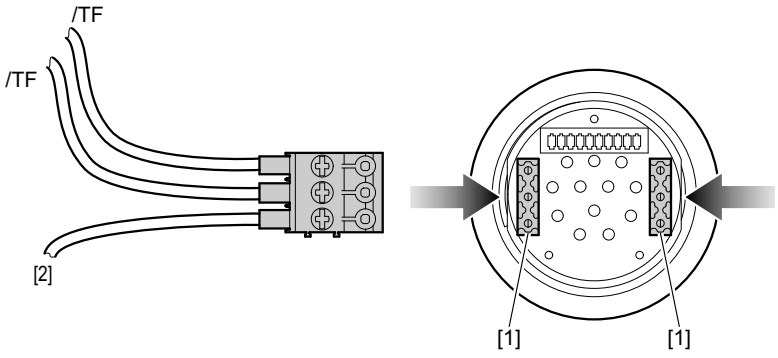
1. Remove the forced cooling fan if required.
2. Remove the screws [22] to disassemble the fan guard [35].
3. Loosen the radial clamping screw [1160]:
   - ⇨ DRN71 – 100: M3 with cylinder head
   - ⇨ DRN112/132S: M4 with cylinder head
4. Remove the fan [36] with bushing and pole ring from the shaft end.
5. Remove the 3 x M4 pan head screws [1518] of the encoder module [1517].
6. If present, remove the hexagonal spacers [1520] (SW8).
7. Unscrew the screws [123] to remove the terminal box cover [132].
8. Remove the protective cover of the M23 plug connector [1525] on the inside of the terminal box.
9. Pull the jack of the encoder cable from the connector.
10. Remove the grounding element of the encoder.
11. **NOTICE!** Possible defect of the encoder module. Physical damage can occur. Do not pull directly on the encoder module.
    To remove the encoder module [1517] from the motor, pull the encoder cable out of the grommet [1526] and the opening of the knock-out [K].



Mounting EI8. with M23 plug connector

- ✓ Required resources: Feeler gauge, screwdriver, centering ring [1920]

1. Unscrew the screws [123] to remove the terminal box cover [132].
2. **NOTICE!** Damage to the terminal box or fragments inside the motor. Possible physical damage. Exercise caution when breaking open the knock-outs.
   Break open the knock-out [K] by using a chisel or screwdriver.
3. **NOTICE!** Damage to the connector. Possible physical damage. Do not subject the connector to excessive tension.
   Pull the grommet [1526] with encoder cable through the knock-out [K].
   - ⇨ The grommet must engage into the opening of the knock-out [K].



25957074/EN – 06/2019

4. If necessary, screw the hexagonal spacers [1520] into the brake endshield.
   ⇨ Tightening torque 5 Nm.
5. Place the centering ring [1920] onto the pole ring.
6. Push the encoder module [1517] onto the shaft end.
7. Push the fan [36] with bushing and pole ring onto the shaft end.
8. Center the encoder module [1517] with the centering ring [1920] radially to the shaft.
9. Use 3 pan head screws [1518] to secure the encoder module [1517] to the brake endshield or, if applicable, to the hexagonal spacers [1520].
   ⇨ Tightening torque 2.5 Nm
10. Remove the fan [36] with bushing and pole ring from the shaft end and remove the centering ring [1920].
11. Push the fan [36] with bushing and pole ring onto the shaft end.
12. To set the distance of 1 mm between the encoder module [1517] and the pole ring, insert a feeler gauge into the designated notch [A].

28744408843

13. Tighten the clamping screw [1160].
    ⇨ DRN71 – 100, DR2..71 – 80: Tightening torque 1.2 Nm
    ⇨ DRN112 – 132S: Tightening torque 3.3 Nm
14. Route the encoder cable in the terminal box in such a way that it is not crushed or improperly subjected to stress.
15. Remove the protective cover of the M23 plug connector [1525] on the inside of the terminal box.
16. Insert the jack of the encoder cable into the connector on the board.
17. Connect the shielding of the encoder cable [2] and, if applicable, the temperature sensor /TF to the screw terminal.

28759196427

18. Insert the screw terminal (with the connection side facing outwards) into one of the two plug connectors [1] on the printed circuit board.
19. Attach the protective cover of the M23 plug connector [1525] to the inside of the terminal box.
20. Connect the evaluation unit for the encoder via the M23 plug connector [1525].
21. Connect the supply voltage to the encoder module [1517].
22. Check the visual feedback of the status LED for the encoder module [1517].
    - ⇨ LED lights up green: The encoder module [1517] has been installed correctly and you can continue with the assembly process.
    - ⇨ LED lights up red: Switch off the supply voltage. Set the distance of 1 mm between the encoder module [1517] and the pole ring again. Switch the supply voltage back on. If the status LED still lights up red, please contact the SEW-EURODRIVE Service department.
23. Mount the terminal box cover [132] using the screws [123] (4xM5 SW8).
    - ⇨ Tightening torque 4 Nm
24. Mount the fan guard [35] with the screws [22].
    - ⇨ Tightening torque 2 Nm.
25. Mount the forced cooling fan if applicable.

25957074/EN – 06/2019

7.5 Inspection/maintenance work for DR..71 – 315, DRN63 – 315, DR2..56 – 80 motors

For the position numbers used in the following descriptions, refer to chapter "Motor structure" (→ 🗎 15).

7.5.1 Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..56 – 80 motors

1. Before starting to perform any work on the motor, disconnect the motor and all mounted options from the power supply before and secure the motor against unintentional power-up.
2. With gearmotors: Remove the motor from the gear unit.

   Remove pinion and oil flinger [107].
3. Remove the forced cooling fan and rotary encoder, if installed (see chapter "Preliminary work for motor and brake maintenance" (→ 🗎 127)).
4. Remove fan guard [35] and fan [36].
5. Remove stator:
   - **DRN63, DR2..63 motors**: Removing the cap screw [19].
   - **DR..71 – 132, DRN71 – 132S, DR2..56, 71 – 80 motors:** Remove cap screws [13] from flanged endshield [7] and rear endshield [42]. Remove stator [16] from flanged endshield [7].
   - **DR..160 – 180, DRN132M – 180 motors:** Loosen cap screw [19] and remove rear endshield [42]. Loosen hex head screw [15] and remove stator from flanged endshield.
   - **DR..200 – 225, DRN200 – 225 motors**
     - Loosen hex head screw [15] and remove flanged endshield [7] from stator.
     - Loosen cap screws [19] and remove the complete rotor [1] together with the rear endshield [42].
     - Loosen cap screws [25] and remove the complete rotor [1] from the rear endshield [42].
   - **DR..250 – 280, DRN250 – 280 motors** without option /ERF or /NS
     - Loosen cap screws [15] and remove the flange [7].
     - Loosen cap screws [19] and remove the rear endshield [42] together with the rotor [1].
     - Loosen cap screws [25] and remove the rear endshield [42] from the rotor [1].
   - **DR..250 – 280, DRN250 – 280 motors with** option /ERF or /NS, or **DR../ DRN315**
     - Loosen cap screws [19] and [25] and remove the rear endshield [42].
     - Loosen cap screws [15] and remove the flange [7] together with the rotor [1].

       Apply tension or pressure mainly via the rotor [1], carry the flange [7] evenly.
     - Loosen hex head screws [609] and remove the flange [7] from the rotor [1].
     - Before disassembly, preferably protect the oil seal seat from damage using adhesive tape or a protective sleeve.
6. Visual inspection: Is there any moisture or gear unit oil inside the stator?
   - If not, proceed with step 9.
   - If there is moisture, proceed with step 7.

25957074/EN – 06/2019

- If there is gear oil, have the motor repaired by a specialist workshop

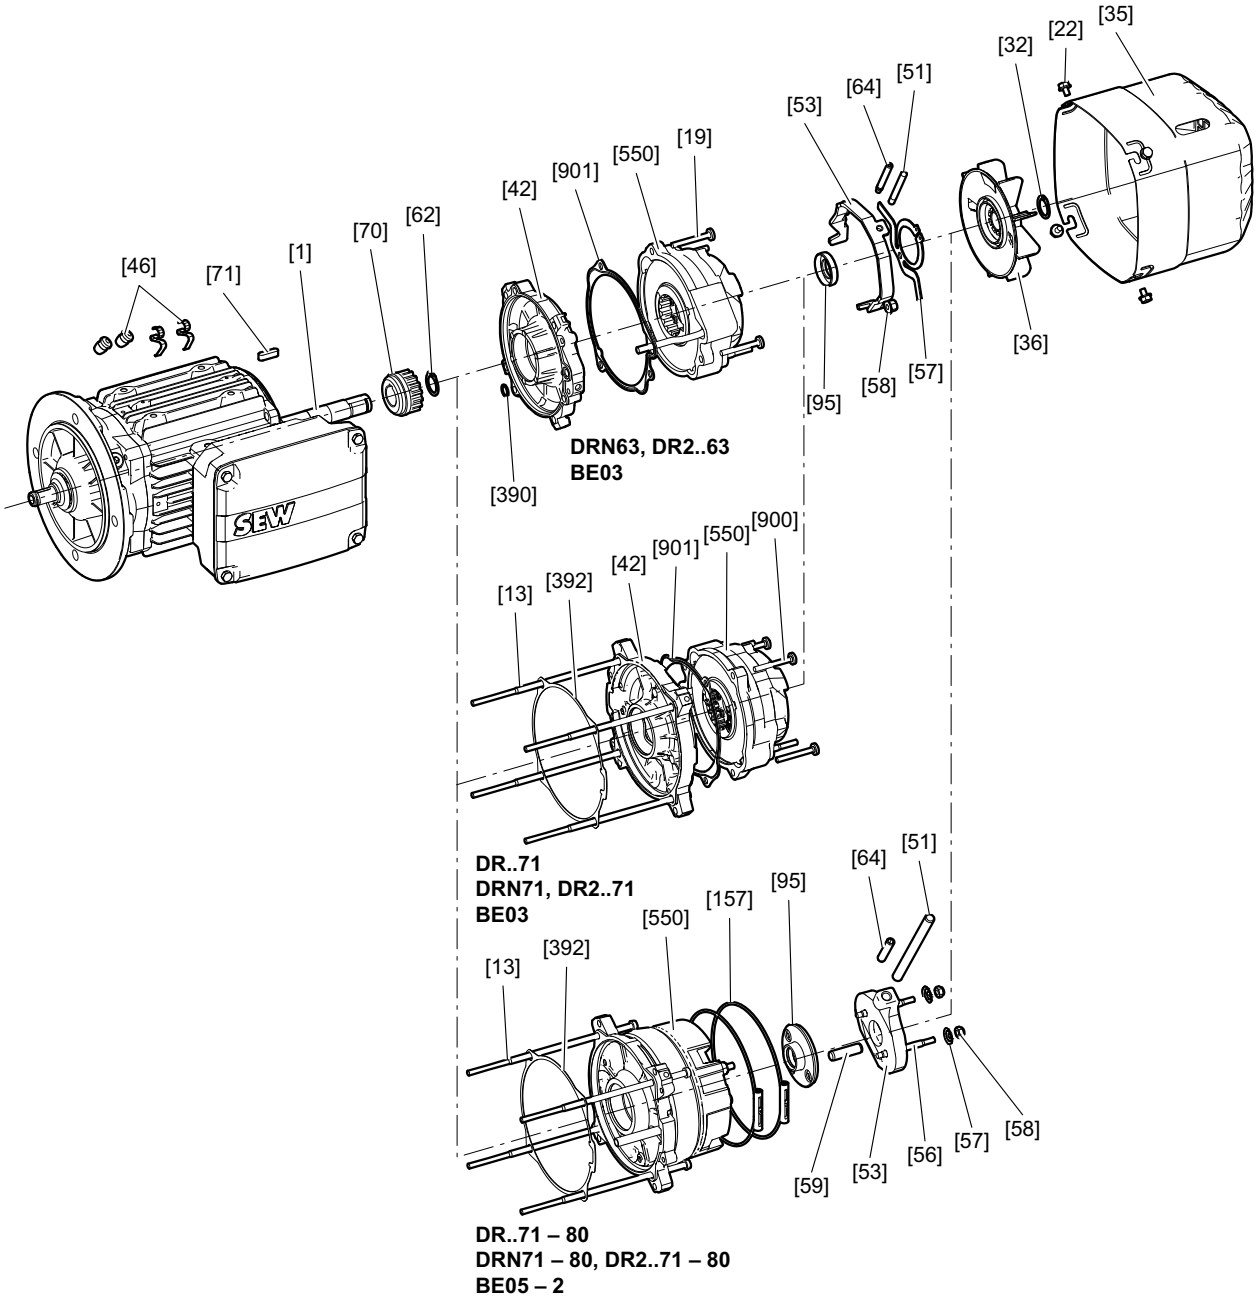
7. If there is moisture inside the stator:
   - With gearmotors: Remove the motor from the gear unit.
   - With motors without a gear unit: Remove the A-flange.
   - Remove the rotor [1].
8. Clean the winding, dry it and check it electrically, see chapter "Drying the motor" (→ 🗎 35).
9. Replace the rolling bearing [11], [44] with permitted rolling bearing types, see chapter "Permitted rolling bearings" (→ 🗎 242).

   Apply tension or pressure to the inner ring of the bearings.
10. **DR..250 – 280, DRN225 – 280 motors with** option /ERF or /NS, or for **DR../ DRN315**
    - Fill the rolling bearing with grease until it is two-thirds full, see chapter "Bearing lubrication" (→ 🗎 125)
    - Notice: Place the oil seal flange [608] and [21] onto the rotor shaft before installing the bearings.
    - Mount the motor vertically starting on the A-side.
    - Place the springs [105] and lubrication ring [604] into the bearing bore of the flange [7].
    - Hang the rotor [1] onto the B-side thread, and guide it into the flange [7].
    - Fasten the oil seal flange [608] to the flange [7] using the hex head screws [609].
11. Reseal the shaft:
    - A-side: Replace the oil seal [106].
    - B-side: Replace the oil seal [30].

      Coat the sealing lip with grease (Klüber Petamo GHY 133).
12. Reseal the stator seat:
    - Seal the sealing surface with duroplastic sealing compound (operating temperature -40 °C to +180 °C), such as "SEW L Spezial".
    - **DR..71 – 132, DRN71 – 132S, DR2..71 – 80 motors**: Replace the seal [392].
    - **DR..71 – 132, DRN63 – 132S, DR2..56 – 80 motors**: Replace the O-ring [1480] if it is deformed or damaged. As an alternative, use e.g. "SEW L Spezial" instead of the O-ring.
    - **DRN63, DR2..56 – 63 motors**: Replace the O-ring [392] if it is deformed or damaged. As an alternative, use a duroplastic sealing compound, e.g. "SEW L Spezial" instead of the O-ring.
13. Install the motor and options.

25957074/EN – 06/2019

7.6 Inspection/maintenance work for DR..71 – 315, DRN63 – 315, DR2..56 – 80 brakemotors

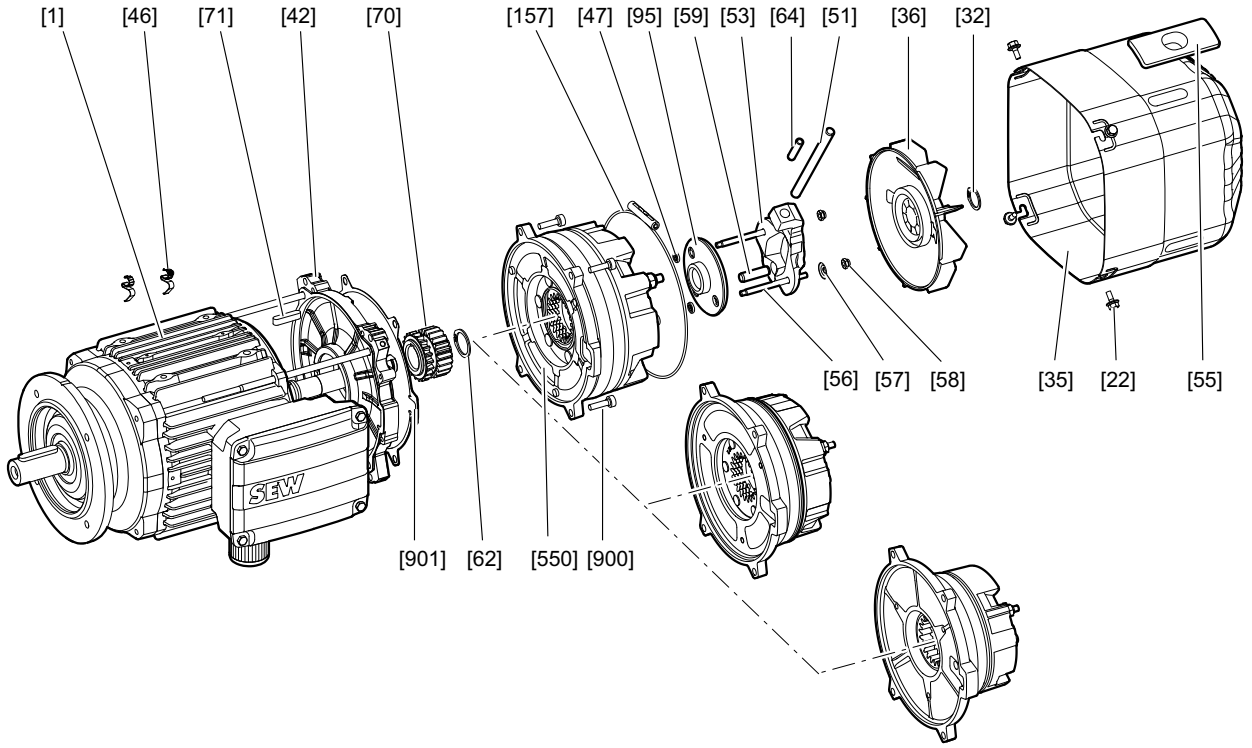


7.6.1 Basic structure of DR2..56 brakemotors

26860872715

[13]	Cap screw	[41]	Equalizing ring	[71]	Key
[22]	Hex head screw	[51]	Hand lever (/HR)	[392]	Gasket
[35]	Fan guard	[62]	Retaining ring	[550]	Pre-assembled brake
[36]	Fan wheel	[70]	Driver		

7.6.2 General structure of DR..71 – 80, DRN63 – 80, DR2..63 – 80 brakemotors



36028797193164939

[1]	Motor	[51]	Hand lever (/HR)	[70]	Driver
[13]	Cap screw	[53]	Releasing lever	[71]	Key
[19]	Screw	[56]	Stud	[95]	Sealing ring
[22]	Hex head screw	[57]	Conical spring	[157]	Clamping strap (optional)

				[1453]	Grommet (for DRN180 instead of [418])
				[1607]	O-ring (DR..250 –280/DRN250 – 280)

25957074/EN – 06/2019

7.6.5 Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..63 – 80 brakemotors

1. Before starting to perform any work on the motor, disconnect the motor and all mounted options from the power supply before and secure the motor against unintentional power-up.
2. With gearmotors: Remove the motor from the gear unit. Remove pinion and oil flinger [107].
3. Remove forced cooling fan and rotary encoder, if installed. See chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
4. Remove the fan guard with encoder mount or fan guard [35] and the fan wheel [36].
5. If applicable, disassemble the sensors of the /DUE option, see chapter "Removing the /DUE diagnostic unit" (→ 🗎 209).
6. **DR..90 – 315, DRN63– 315, DR2..56 – 80 motors**: Remove the brake cpl. [550] (if applicable) with mounted /HR, /HF option manual brake release.
   - **BE02 – 11**: Remove terminal box cover, loosen brake cable and microswitch supply cable of the /DUB option from the terminals.
   - **BE20 – 122**: Loosen locking screws of the brake plug connector [698] and remove plug connector.
   - Loosen screws [13]/[19]/[900], press brake [550] off the endshield [42], and carefully lift off the brake.
7. Remove stator:
   - **DR..71 – 132, DRN63 – 132S, DR2..63 – 80 motors:** Remove cap screws [13] from flanged endshield [7] and rear endshield [42]. Remove stator [16] from flanged endshield [7].
   - **DR..160 – 180, DRN132M – 180 motors:** Loosen cap screw [19] and remove rear endshield [42]. Loosen hex head screw [15] and remove stator from flanged endshield.
   - **DR..200 – 225, DRN200 – 225 motors**
     – Loosen hex head screw [15] and remove flanged endshield [7] from stator.
     – Loosen cap screws [19] and remove the complete rotor [1] together with the rear endshield [42].
     – Loosen cap screws [25] and remove the complete rotor [1] from the rear endshield [42].
   - **DR..250 – 280, DRN250 – 280 motors** without option /ERF or /NS
     – Loosen cap screws [15] and remove the flange [7].
     Apply tension or pressure to the rotor [1], carry the flange [7] evenly.
     – Loosen cap screws [19] and remove the rear endshield [42] together with the rotor [1].
     – Loosen cap screws [25] and remove the rear endshield [42] from the rotor [1].
   - **DR..250 – 280, DRN250 – 280 motors** with option /ERF or /NS, or **DR../ DRN315 motors**
     – Loosen cap screws [19] and [25] and remove the rear endshield [42].
     – Loosen cap screws [15] and remove the flange [7] together with the rotor [1].
     – Loosen hex head screws [609] and remove the flange [7] from the rotor [1].

25957074/EN – 06/2019

– Before disassembly, preferably protect the oil seal seat from damage using adhesive tape or a protective sleeve.

8. Pull the stator back by approx. 3 to 4 cm.
9. Visual inspection: Is there any moisture or gear unit oil inside the stator?
   - If not, proceed with step 11.
   - If there is moisture, proceed with step 10.
   - If there is gear oil, have the motor repaired by a specialist workshop.
10. If there is moisture inside the stator:
    - With gearmotors: Remove the motor from the gear unit
    - With motors without a gear unit: Remove the A-flange
    - Remove the rotor [1]
    - Clean the winding, dry it and check it electrically, see chapter "Drying the motor" (→ 🗎 35).
11. Remove the driver from the shaft.
12. Replace the rolling bearing [11], [44] with permitted rolling bearing types, see chapter "Permitted rolling bearings" (→ 🗎 242).

    Apply tension or pressure to the inner ring of the bearings.
13. Install key [71] and driver [70]:
    - Preheat the driver to allow for easier installation (joining temperature +85 °C to +115 °C).
    - **DR..71, DRN63 – 71, DR2..63 – 71 motors**: Clean the driver seat at the rotor [1] before installation. Glue in the driver using Loctite 649. Join the retaining ring [62] flush to the driver. Protect the sealing surface for the oil seal against scratches.
    - **DR..80 – 315, DRN80 – 315, DR2..56, 80 motors**: Clean the driver at the rotor [1] and coat with anti-corrosion agent NOCO® fluid before fitting. Next, mount the retaining ring [62].
14. Seal the stator again and install it:
    - **DR..71 – 132, DRN63 – 132S, DR2..56 – 80 motors**: Replace the seal [392].
    - **DRN63, DR2..63, DRN132M – 225 and DR..160-225 motors:** Replace O-ring [390].
    - **DR..160 – 315, DRN132M – 315 motors**: Seal the sealing surfaces with duroplastic sealing compound (operating temperature -40 °C to +180 °C), such as "SEW-L-Spezial".
15. **DR..250 – 280, DRN225 – 280 motors with** option /ERF or /NS, or with **DR../ DRN315 motors**
    - Fill the rolling bearing with grease until it is two-thirds full, see chapter "Bearing lubrication" (→ 🗎 125).
    - Notice: Place the oil seal flange [608], [21] onto the rotor shaft before installing the bearings.
    - Mount the motor vertically starting on the A-side.
    - Place the springs [105] and lubrication ring [604] into the bearing bore of the flange [7].
    - Hang the rotor [1] onto the B-side thread, and guide it into the flange [7].

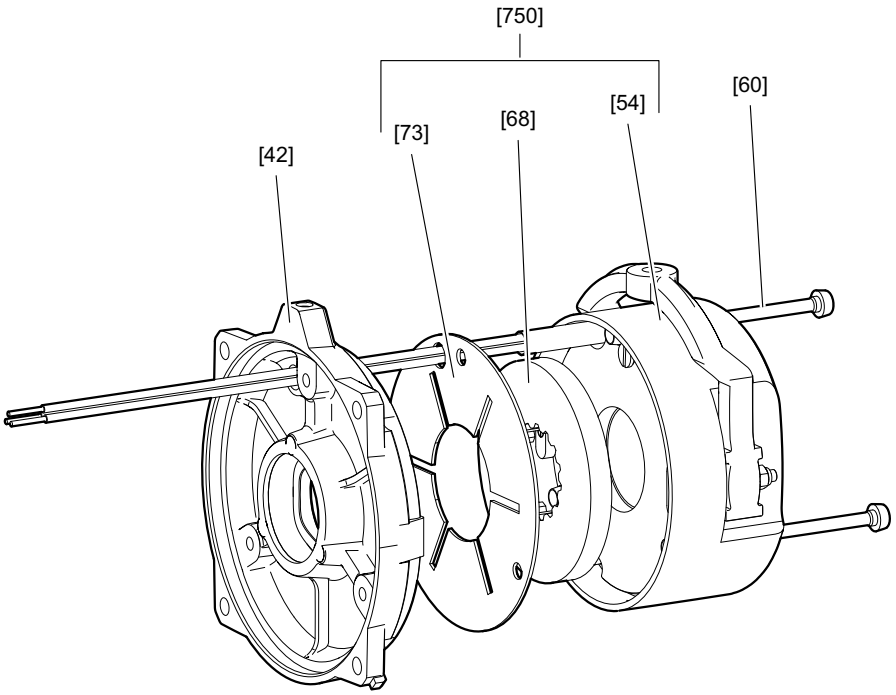
25957074/EN – 06/2019

- Fasten the oil seal flange [608] to the flange [7] using the hex head screws [609].
- Screw in the stator [16] and flange [7] with screws [15].

  Notice: Protect the winding overhang from damage.
- Before mounting the rear endshield, screw in the M8 set screw (approximately 200 mm) into the oil seal flange [21].
- Before mounting the rear endshield [42], insert the set screw in through a bore for the screw [25]. Screw rear endshield to stator [16] using cap screws [19] and hex nuts [17]. Lift the oil seal flange [21] with the set screw, and fasten using 2 screws [25]. Remove the set screw and screw in the remaining screws [25].

16. Reseal the shaft:
    - Replace the oil seal [106] on the A-side.
    - **DR..315, DRN315 motors with /FG option:** Replace the oil seal [250] on the A-side.
    - **DR..250 – 315, DRN250 – 315, DRN225 motors with /NS option:** Replace the oil seal [30] on B-side
    - Apply suitable grease to the sealing lip, see chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).
17. Seal the friction disk of the brake [550] again at the brake endshield [42]:
    - **DRN63 – 71, DR2..63– 71 motors with BE03 brake:** Replace flat gasket [901].
    - **DR..90 – 132, DRN90 – 132S motors:** Replace gasket [901]
    - **DR..160 – 280, DRN132M – 280 motors**: Replace O-ring [901] or [1607].
    - **DR..315, DRN315 motors**: Seal the sealing surface with duroplastic sealing compound (operating temperature -40 °C to +180 °C), such as "SEW L Spezial".
18. Reinstall the brake [550]: Insert the brake cable into the terminal box when installing the brake. Install the brake. Observe the alignment of the brake. (Cams at the endshield, manual brake release position).
    - **BE03 brake**: The self-tapping screws must be distributed and tightened around the brake evenly to prevent the mounted brake from being tilted.
    - **DRN63, DR2..63/BE03 motors**: Tighten screw [19] M5x35 (self-tapping) with a tightening torque of 5 Nm. The screws can be reused.
    - **DRN71, DR2..71/BE03 motors**: Tighten screw [900] M5x20 (self-tapping) with a tightening torque of 5 Nm. New screws must be used each time the brake is mounted again.
    - **DR..71 – 80, DRN71 – 80, DR2..56, 71– 80 motors**: Install cap screws [13]. Tightening torque: 5 Nm
    - **DR..90 – 315, DRN90 – 315 motors**: Install cap screws [900].

Motors	DR..90 – 100, DRN90 – 100	DR..112 – 160, DRN112 – 132	DR..180, DRN160 – 180	DR..200 – 225, DRN200 – 225	DR..250 – 315, DRN250 – 315
Tightening torque	10.3 Nm	25.5 Nm	50 Nm	87.3 Nm	230 Nm



19. Connect the brake connection cable.
    - **BE02 – 11**: Reconnect the brake cable according to the wiring diagram.

- **BE20 – 122**: Plug in the brake plug connector [698] again. Tighten the retaining screws again (tightening torque: 3 Nm)

20. **DR..71 – 315, DRN63 – 315, DR2..63 – 80 motors:** Apply suitable grease to the sealing ring [95], see chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).
21. If applicable: Install sensors of the /DUE option and recalibrate the zero value. See chapter "Retrofitting the /DUE diagnostic unit for function and wear monitoring" (→ 🗎 209).
22. Install the fan wheel [36] and the fan guard [35]. Install available optional equipment.
23. With gearmotors: Replace oil flinger [107] and install the pinion.

25957074/EN – 06/2019

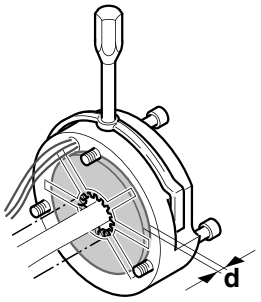
7.6.12 Measuring the wear of the BE02 brake

The working air gap of BE02 brakes cannot be adjusted. Check the brake lining carrier thickness during maintenance.



Replacing individual parts of the brake is not permitted.

✓ The motor and all connected options are disconnected from the power supply.

✓ The motor is protected against unintended restart.

1. Loosen the screws [60].
2. Remove the complete magnet body [54] with pressure plate and, if applicable, installed manual brake release from the brake endshield [42].
3. Make sure the brake springs [50]/[276] and friction plates [73] do not fall out.
4. Remove the brake lining carrier [68] and measure its thickness "d".

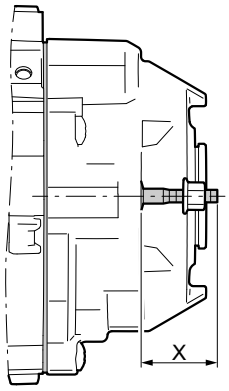
⇨ Replace the brake if the lining thickness is below the minimum permitted value. For the values, refer to chapter "Braking work, working air gap, and brake lining carrier thickness" (→ 🗎 225).

26854192139

7.6.13 Measuring the wear of BE03 brakes

The working air gap of BE03 brakes cannot be adjusted. Check the stroke of the pressure plate during maintenance.

Replacing individual parts of the brake is not permitted.



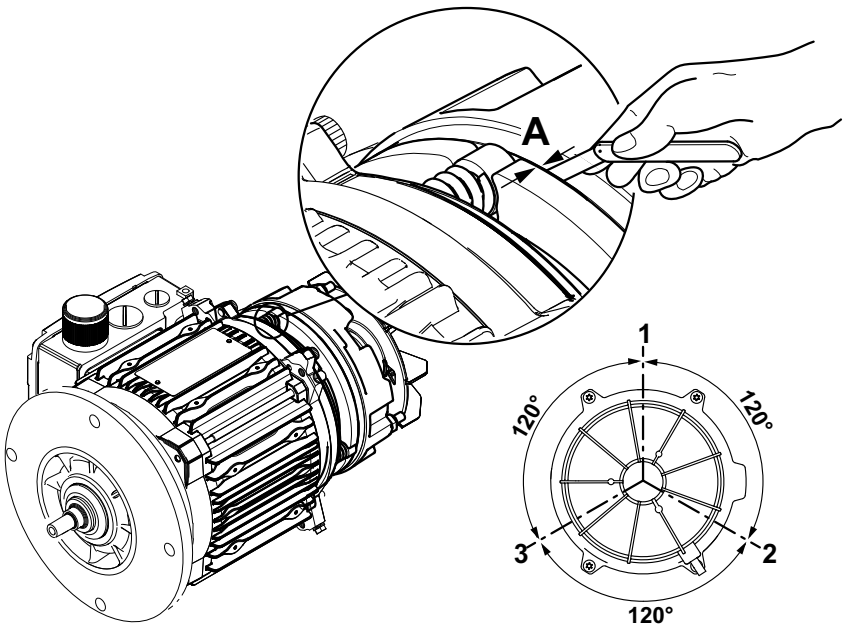
✓ The motor and all connected options are disconnected from the power supply.

✓ The motor is protected against unintended restart.

1. Measure the dimension "X" at the stroke of the studs when the brake is released or applied using a depth gauge or slide gauge.

   ⇨ The difference between both values is the working air gap.

⇨ The maximum permitted working air gap is 0.65 mm. Replace the brake in case this value is exceeded.



23652168459

7.6.14 Setting the working air gap of BE05 – BE122 brakes

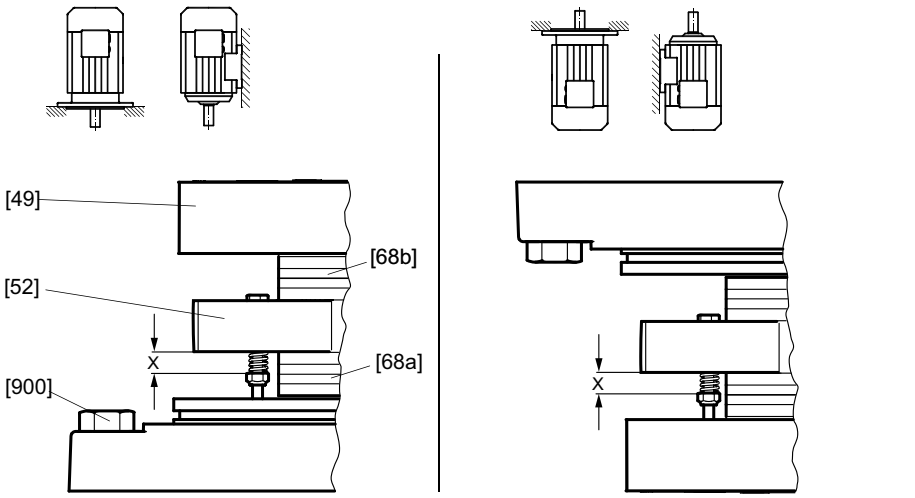
1. Before starting to perform any work on the motor, disconnect the motor and all mounted options from the power supply before and secure the motor against unintentional power-up.
2. Remove the following:
   - Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - Fan guard with encoder mount or fan guard [35]
3. Push the sealing strip [66] aside,
   - Loosen the clamping strap [157] to do this, if necessary
   - Vacuum any abrasion
4. Measure the brake lining carrier [68]:
   - For the minimum thickness of the brake lining carrier, see chapter "Technical data" (→ 🗎 222).
   - If necessary, replace the brake lining carrier according to chapter "Replacing the brake lining carrier of BE05 – BE122 brakes" (→ 🗎 193).
5. **BE30 – 122:** Loosen the setting sleeve [67] by turning it towards the rear end-shield.
6. Measure the working air gap A (see the following figure)

   (use a feeler gauge and measure at three points offset by 120°):
   - **BE05 – 11**: between pressure plate [49] and damping plate [718]
   - **BE20 – 122**: between pressure plate [49] and magnet body [54]

27021597944201611

   - **BE05 – 20:** Tighten the hex nuts [61] until the working air gap is set correctly, see chapter "Braking work, working air gap, and brake lining carrier thickness" (→ 🗎 225).

- **BE30 – 122:** Tighten the hex nuts [61] until the working air gap is initially 0.05 – 0.1 mm larger than the desired setting value (for default values, see chapter "Braking work, working air gap, and brake lining carrier thickness" (→ 🗎 225)). For example, with a desired air gap of 0.4 mm, the preset value must be 0.45 – 0.5 mm.



7. **BE30 – 122:** Evenly apply the setting sleeves [67] to the friction disk [900] by screwing them out of the magnet body.

   Tighten the hex nut [61] with the following tightening torque. Lastly, check the settings of the working air gap and adjust it if necessary.

Brake	Tightening torque
BE30 – BE32	93 Nm
BE60 – BE62	40 Nm
BE120 – BE122	230 Nm

8. If you are mounting the **BE32, BE62, BE122** to a motor with vertical motor axis, set the 3 springs of the brake plate [52] to the following dimension:

Brake	Dimension X in mm
BE32	7.3
BE62	10.0
BE122	10.0

27021598220181131

9. Refit the sealing strip [66] and reinstall the dismantled parts.

25957074/EN – 06/2019

7.6.15 Replacing the brake lining carrier of BE05 – BE122 brakes

In addition to the brake elements listed in column "BE brake", see chapter "Inspection and maintenance intervals" (→ 🗎 123), check the hex nuts [61] for wear when you replace the brake lining carrier. You must always replace the hex nuts [61] when you replace the brake lining carrier.

INFORMATION

- With DR..71 – 80, DRN71 – 80 motors with BE05 – 2 brake, the brake cannot be removed from the motor because the BE brake is directly installed on the brake endshield of the motor.

1. Disconnect the motor and all mounted options from the power supply before starting to work, and secure the motor against unintentional power-up.
2. Remove the following:
   - Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - Fan guard with encoder mount or fan guard [35], retaining ring [32]/[62] and fan [36]
3. Remove the brake cable
   - **BE05 – 11:** Loosen the terminal box cover and unfasten the brake cable from the rectifier.
   - **BE20 – 122:** Loosen locking screws of the brake plug connector [698] and remove plug connector.
4. Remove the rubber sealing collar [66]
5. Remove manual brake release if necessary.
   - Adjusting nuts [58], conical springs [57], studs [56], releasing lever [53], conical seat [255], spherical washer [256]
6. Loosen the hex nuts [61], carefully pull off the magnet body [54] (brake cable!) and take out the brake springs [50]/[276]/[1312].
7. **BE05 – 11:** Remove the damping plate [718], pressure plate [49] and brake lining carrier [68]

   BE20, BE30, BE60, BE120: Remove the pressure plate [49], pole sheet [63] and brake lining carrier [68]

   BE32, BE62, BE122: Remove the pressure plate [49], brake lining carrier [68a] and [68b], and the brake plate [52].
8. Clean the brake components.
9. Install new brake lining carrier(s).
10. Brake parts are installed as described in chapter "Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..63 – 80 brakemotors" (→ 🗎 179).
    - Except for the fan and the fan guard, because the working air gap has to be set first, see chapter "Setting the working air gap of BE05 – BE122 brakes" (→ 🗎 191).
11. In case of manual brake release: Use the adjusting nuts to adjust the floating clearance "s" between the conical springs (pressed flat) and the adjusting nuts (see chapter "Retrofitting the /HR, /HF manual brake release" (→ 🗎 203).

⚠ WARNING

No braking due to incorrectly set floating clearance "s".

Severe or fatal injuries.

- Make sure the floating clearance "s" is correctly set, so that the pressure plate can move up as the brake lining wears.

12. Put the sealing strip [66] in place and re-install the dismantled parts.

INFORMATION

After replacing the brake disk, the maximum braking torque is reached only after several cycles.

7.6.16 Changing the braking torque of BE05 – BE122 brakes

You can alter the braking torque in stages. This can be done in various ways:

- By changing the type and number of brake springs
- By changing the complete magnet (only possible for BE05 and BE1)
- By changing the brake (from motor size 90)
- By changing to a double disk brake (only possible for BE30, BE60, BE120)

For possible braking torque steps, refer to chapter "Technical data" (→ 🗎 222).

25957074/EN – 06/2019

7.6.17 Changing the brake spring of BE05 – BE122 brakes

1. Disconnect the motor and all mounted options from the power supply before starting to work, and secure the motor against unintentional power-up.
2. Remove the following:
   - Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - Fan guard with encoder mount or fan guard [35], retaining ring [32]/[62] and fan [36]
3. Remove the brake cable.
   - **BE05 – 11:** Remove the terminal box cover. Remove the brake cable from the rectifier.
   - **BE20 – 122:** Loosen the locking screws of the brake plug connector [698]. Remove the plug connector.
4. Remove the sealing strip [66] and (if necessary) the manual brake release:
   - Setting nuts [58], conical springs [57], studs [56], releasing lever [53], conical seat [255], spherical washer [256]
5. Unfasten the hex nuts [61] and pull off the magnet body [54]
   - By approx. 50 mm (watch the brake cable!)
6. Replace or add brake springs [50/276/1312]
   - Arrange brake springs symmetrically
7. Brake parts are installed as described in chapter "Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..63 – 80 brakemotors" (→ 🗎 179).
   - Except for the fan and the fan guard, because the working air gap has to be set first, see chapter "Setting the working air gap of BE05 – BE122 brakes" (→ 🗎 191).
8. In case of manual brake release: Use the adjusting nuts to adjust the floating clearance "s" between the conical springs (pressed flat) and the adjusting nuts (see chapter "Retrofitting the /HR, /HF manual brake release" (→ 🗎 203).

⚠ WARNING

No braking due to incorrectly set floating clearance "s".

Severe or fatal injuries.

- Make sure the floating clearance "s" is correctly set, so that the pressure plate can move up as the brake lining wears.

9. Put the sealing strip [66] in place and re-install the dismantled parts.

INFORMATION

Replace the setting sleeves [58] if the removal procedure is repeated.

7.6.18 Changing the magnet body of BE05 – BE122 brakes

1. Disconnect the motor and all mounted options from the power supply before starting to work, and secure the motor against unintentional power-up.
2. Remove the following:
   - Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - Fan guard with encoder mount or fan guard [35], retaining ring [32]/[62] and fan [36]
3. Remove the rubber sealing collar [66] and the manual brake release:
   - Setting nuts [58], conical coil springs [57], studs [56], releasing lever [53], parallel pin [59].
4. Remove the brake cable
   - **BE05 – 11:** Loosen the terminal box cover and unfasten the brake cable from the rectifier.
   - **BE20 – 122:** Loosen locking screws of the brake plug connector [698] and remove plug connector.
5. Loosen hex nuts [61], remove complete magnet body [54], remove brake springs [50]/[276]/[1312].
6. Install new magnet body with brake springs. For the possible braking torque steps, refer to chapter "Technical data" (→ 🗎 222).
7. Brake parts are installed as described in chapter "Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..63 – 80 brakemotors" (→ 🗎 179).
   - Except for the fan and the fan guard, because the working air gap has to be set first, see chapter "Setting the working air gap of BE05 – BE122 brakes" (→ 🗎 191).
8. In case of manual brake release: Use the adjusting nuts to adjust the floating clearance "s" between the conical springs (pressed flat) and the adjusting nuts (see chapter "Retrofitting the /HR, /HF manual brake release" (→ 🗎 203).

⚠ WARNING

No braking due to incorrectly set floating clearance "s".

Severe or fatal injuries.

- Make sure the floating clearance "s" is correctly set, so that the pressure plate can move up as the brake lining wears.

9. Put the sealing strip [66] in place and re-install the dismantled parts.
10. Replace the brake control in the event of an interturn short circuit or a short circuit to frame.

INFORMATION

Replace the setting sleeves [58] if the removal procedure is repeated.

25957074/EN – 06/2019

7.6.19 Replacing BE02 brakes with DR2..56 motors

✓ The motor and all connected options are disconnected from the power supply.

✓ The motor is protected against unintended restart.

1. Disassemble the following parts:
   - ⇨ Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - ⇨ Fan guard with encoder mount [212] or fan guard [35], retaining ring [32]/[62] and fan [36]
2. Remove the terminal box cover and loosen the brake cable from the brake control/ terminals. Attach trailing wire to brake cables, if necessary.
3. Remove the screws and brake (with brake endshield if necessary) from the stator.
   - ⇨ DR2..56: Screws [13]
4. Replace gasket [392]. Observe the alignment of the gasket.
5. If necessary, replace driver [70], key [71], and retaining ring [62], see chapter "Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..63 – 80 brakemotors" (→ 🗎 179).
6. Insert the brake cable of the new brake into the terminal box.
7. Position the new brake. Make sure the cable outlet and brake lining carrier gearing are correctly aligned.
8. Refasten the brake using the screws.
   - ⇨ Cap screws [13]
   - ⇨ Tightening torque 3.3 Nm.
   - ⇨ Tolerance ±10%.
9. Install the disassembled parts of the motor.

25957074/EN – 06/2019

7.6.20 Replacing BE03 brakes for DRN63 – 71 and DR2..63 – 71 motors

✓ The motor and all connected options are disconnected from the power supply.

✓ The motor is protected against unintended restart.

1. Disassemble the following parts:
   - ⇨ Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - ⇨ Fan guard with encoder mount [212] or fan guard [35], retaining ring [32]/[62] and fan [36]
2. Remove the terminal box cover and loosen the brake cable from the brake control/ terminals. Attach trailing wire to brake cables, if necessary.
3. Remove the screws and brake (with brake endshield if necessary) from the stator.
   - ⇨ DRN63, DR2..63 motors: Screws [19]
   - ⇨ DRN71, DR2..71 motors: Screws [900]
4. Replace the gasket [901]. Observe the alignment of the gasket, if necessary.
5. If necessary, replace driver [70], key [71], and retaining ring [62], see chapter "Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..63 – 80 brakemotors" (→ 🗎 179).
6. Insert the brake cable of the new brake into the terminal box.
7. Position the new brake. Make sure the cable outlet and brake lining carrier gearing are correctly aligned.
8. Fasten the brake using screws [19] or [900]. Distribute the screws around the brake and tighten them one after the other.
   - ⇨ DRN63, DR2..63 motors: The screws [19] can be reused. Tightening torque 5 Nm, tolerance ±10%
   - ⇨ DRN71, DR2..71 motors: Use new screws [900]. Tightening torque 5 Nm, tolerance ±10%
9. Seal the shaft.
10. Replace the sealing ring [95].
11. Apply grease to the sealing lip, see chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).
12. ⚠ **DANGER!** No braking due to incorrectly set floating clearance "s". Severe or fatal injuries. Make sure the floating clearance "s" is set correctly so that the pressure plate can move up as the brake lining wears.
    Manual brake release option: Set the floating clearance "s" using the adjusting nuts, see chapter "Retrofitting the /HR, /HF manual brake release" (→ 🗎 203).
13. Install the disassembled parts of the motor.

25957074/EN – 06/2019

7.6.21 Replacing BE05 – 2 brakes for DR..71 – 80, DRN80, DR2..80 motors

✓ The motor and all connected options are disconnected from the power supply.

✓ The motor is protected against unintended restart.

1. Disassemble the following parts:
   - ⇨ Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - ⇨ Fan guard with encoder mount [212] or fan guard [35], retaining ring [32]/[62] and fan [36]
2. Remove the terminal box cover and loosen the brake cable from the brake control/ terminals. Attach trailing wire to brake cables, if necessary.
3. Remove the screws and brake (with brake endshield if necessary) from the stator.
   - ⇨ DR..71 – 80, DRN80, DR2..80: Screws [13]
4. Replace gasket [392]. Observe the alignment of the gasket.
5. If necessary, replace driver [70], key [71], and retaining ring [62], see chapter "Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..63 – 80 brakemotors" (→ 🗎 179).
6. Insert the brake cable of the new brake into the terminal box.
7. Position the new brake. Make sure the cable outlet and brake lining carrier gearing are correctly aligned.
8. Refasten the brake using the screws.
   - ⇨ Cap screws [13]
   - ⇨ Tightening torque 5 Nm.
   - ⇨ Tolerance ±10%.
9. Seal the shaft.
10. Replace the sealing ring [95].
11. Apply grease to the sealing lip, see chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).
12. For designs with corrosion protection /KS and/or IP56/66, the clamping straps of the disassembled brake have to be mounted to the new brake [550]. Seal studs with SEW-L-Spezial, see chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).
13. ⚠ **DANGER!** No braking due to incorrectly set floating clearance "s". Severe or fatal injuries. Make sure the floating clearance "s" is set correctly so that the pressure plate can move up as the brake lining wears.
    Manual brake release option: Set the floating clearance "s" using the adjusting nuts, see chapter "Retrofitting the /HR, /HF manual brake release" (→ 🗎 203).
14. Diagnostic unit option /DUE: Insert the sensor [1151] into the magnet body [54] of the new brake using the screw fitting. Fasten the cable with the terminal [1152/1153] at the magnet body in a way that the sensor cable cannot touch the fan wheel [36]. Then calibrate the zero value, see chapter "Zero value calibration" (→ 🗎 217).
15. Install the disassembled parts of the motor.

25957074/EN – 06/2019

7.6.22 Replacing BE05 – 62 brakes for DR..90 – 225, DRN90 – 225 motors

✓ The motor and all connected options are disconnected from the power supply.

✓ The motor is protected against unintended restart.

1. Disassemble the following parts:
   - ⇨ Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - ⇨ Fan guard with encoder mount [212] or fan guard [35], retaining ring [32]/[62] and fan [36]
2. Loosen the brake cable.
   - ⇨ BE05 – 11: Remove the terminal box cover and loosen the brake cable from the brake control/terminals.
   - ⇨ BE20 – 62: Loosen locking screws of the brake plug connector [698] and remove plug connector.
3. Remove the screws and brake (with brake endshield if necessary) from the stator.
4. Replace the gasket [901]. Observe the alignment of the gasket, if necessary.
5. If necessary, replace driver [70], key [71], and retaining ring [62], see chapter "Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..63 – 80 brakemotors" (→ 🗎 179).
6. BE05 – 11: Insert the brake cable of the new brake into the terminal box.
7. Position the new brake. Make sure the cable outlet and brake lining carrier gearing are correctly aligned.
   - ⇨ BE20 – 62 with manual brake release option: It is important that the manual brake release is positioned properly.
8. Refasten the brake using the screws.
   - ⇨ Cap screws [900]
   - ⇨ Tightening torque for DR..90 – 100, DRN90 – 100: 10.3 Nm
   - ⇨ Tightening torque for DR..112 – 160, DRN112 – 132: 25.5 Nm
   - ⇨ Tightening torque for DR..180, DRN160 – 180: 50 Nm
   - ⇨ Tightening torque for DR..200 – 225, DRN200 – 225: 87.3 Nm
   - ⇨ Tolerance ±10%.
9. Seal the shaft.
10. Replace the sealing ring [95].
11. Apply grease to the sealing lip, see chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).
12. BE20 – 62: Insert the plug connector [698] into the brake and fasten using screws.
    - ⇨ Tightening torque 3 Nm.
13. For designs with corrosion protection /KS and/or IP56/66, the clamping straps of the disassembled brake have to be mounted to the new brake [550]. Seal studs with SEW-L-Spezial, see chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).
14. ⚠ **DANGER!** No braking due to incorrectly set floating clearance "s". Severe or fatal injuries. Make sure the floating clearance "s" is set correctly so that the pressure plate can move up as the brake lining wears.
    Manual brake release option: Set the floating clearance "s" using the adjusting nuts, see chapter "Retrofitting the /HR, /HF manual brake release" (→ 🗎 203).

25957074/EN – 06/2019

15. Diagnostic unit option /DUE: Insert the sensor [1151] into the magnet body [54] of the new brake using the screw fitting. Fasten the cable with the terminal [1152/1153] at the magnet body in a way that the sensor cable cannot touch the fan wheel [36]. Then calibrate the zero value, see chapter "Zero value calibration" (→ 🗎 217).
16. Install the disassembled parts of the motor.

25957074/EN – 06/2019

7.6.23 Replacing BE60 – 122 brakes for DR..250 – 315, DRN250 – 315 motors

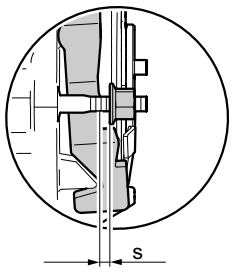
✓ The motor and all connected options are disconnected from the power supply.

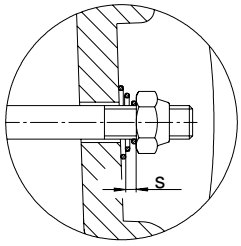
✓ The motor is protected against unintended restart.

1. Disassemble the following parts:
   - ⇨ Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - ⇨ Fan guard with encoder mount [212] or fan guard [35], retaining ring [32]/[62] and fan [36]
2. Unscrew the locking screws of the brake plug connector [698] and remove the plug connector.
3. Remove the screws and brake (with brake endshield if necessary) from the stator.
   - ⇨ DR..250 – 280, DRN250 – 280 motors: Replace the O-ring [1607].
4. If necessary, replace driver [70], key [71], and retaining ring [62], see chapter "Working steps for inspecting DR..71 – 315, DRN63 – 315, DR2..63 – 80 brakemotors" (→ 🗎 179).
5. Seal the shaft.
6. Replace the sealing ring [95].
7. Apply grease to the sealing lip, see chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).
8. Position the new brake. Make sure the cable outlet and brake lining carrier gearing are correctly aligned.
   - ⇨ Manual brake release option: It is important that the manual brake release is positioned properly.
9. Refasten the brake using the screws.
   - ⇨ Cap screws [900]
   - ⇨ Tolerance ±10%.
10. For designs with corrosion protection /KS and/or IP56/66, the clamping straps of the disassembled brake have to be mounted to the new brake [550]. Seal studs with SEW-L-Spezial, see chapter "Order information for lubricants, anti-corrosion agents and sealants" (→ 🗎 245).
11. Insert plug connector [698] in the brake and fasten using screws.
    - ⇨ Tightening torque 3 Nm.
12. ⚠ **DANGER!** No braking due to incorrectly set floating clearance "s". Severe or fatal injuries. Make sure the floating clearance "s" is set correctly so that the pressure plate can move up as the brake lining wears.
    Manual brake release option: Set the floating clearance "s" using the adjusting nuts, see chapter "Retrofitting the /HR, /HF manual brake release" (→ 🗎 203).
13. Diagnostic unit option /DUE: Insert the sensor [1151] into the magnet body [54] of the new brake using the screw fitting. Fasten the cable with the terminal [1152/1153] at the magnet body in a way that the sensor cable cannot touch the fan wheel [36]. Then calibrate the zero value, see chapter "Zero value calibration" (→ 🗎 217).
14. Install the disassembled parts of the motor.

25957074/EN – 06/2019

7.6.24 Retrofitting the /HR, /HF manual brake release





INFORMATION

With BE02 brakes, the manual brake release can only be retrofitted if the brake is completely replaced.

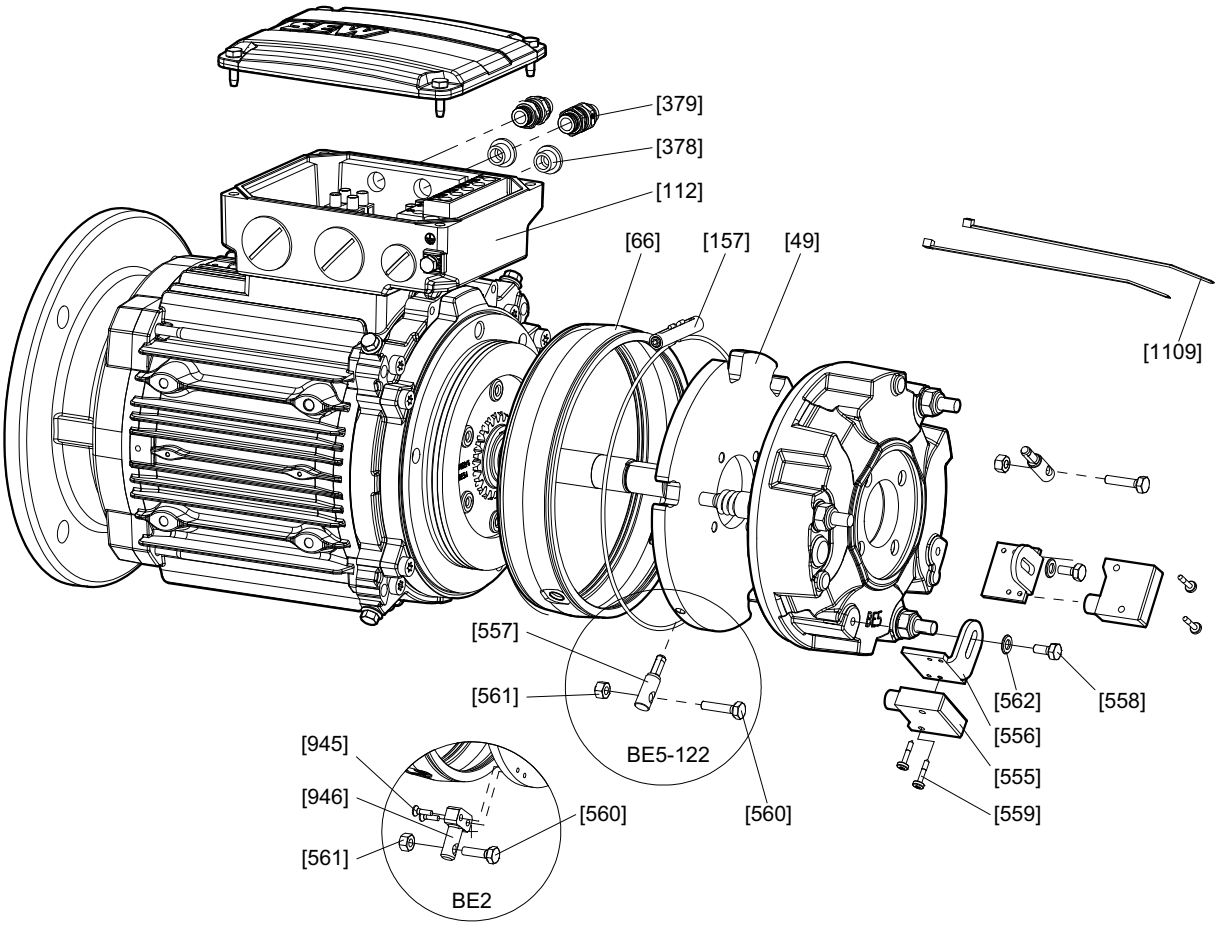
✓ The motor and all connected options are disconnected from the power supply.

✓ The motor is protected against unintended restart.

1. Disassemble the following parts:
   - ⇨ Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - ⇨ Fan guard with encoder mount [212] or fan guard [35], retaining ring [32]/[62] and fan [36]
2. Mount the manual brake release.
   - ⇨ BE03: Position the releasing lever [53] and the spring plate [53] correctly. Mount the flange nut [58]. Attach the hand lever [51]/set screw [64] to the stator using the grommets.
   - ⇨ BE05 – BE11: Remove the old sealing ring [95]. Screw in the studs [56] and glue them. Insert the sealing rings for the manual brake release [95]. Hammer in the parallel pin [59]. Install the releasing lever [53], the conical springs [57] and the adjusting nuts [58].
   - ⇨ BE20 – BE62: Insert O-rings [47] into the magnet body. Screw in the studs [56] and glue them. Install the releasing lever [53], the conical springs [57] and the adjusting nuts [58].
   - ⇨ BE120 – BE122: Insert O-rings [47] in the magnet body. Screw in the studs [56] and glue them.
3. ⚠ **DANGER!** No braking due to incorrectly set floating clearance "s". Severe or fatal injuries. Make sure the floating clearance "s" is set correctly so that the pressure plate can move up as the brake lining wears.
   Set the floating clearance "s" using the adjusting nuts or flange nuts.
   - ⇨ BE03: Between releasing lever and flange nut (see following illustration).
   - ⇨ BE05 – 122: Between conical springs (pressed flat) and adjusting nuts (see following illustration).

BE03	BE05 – 122
	

Brake	Floating clearance s mm
BE03	2.2
BE05, BE1, BE2	1.5



Brake	Floating clearance s mm
BE5	1.7
BE11, BE20, BE30, BE32, BE60, BE62, BE120, BE122	2

4. Install the disassembled parts of the motor.

25957074/EN – 06/2019

7.7 Inspection/maintenance work diagnostic unit /DUB

7.7.1 Basic structure of diagnostic unit /DUB on DR..90 – 315 motors with BE..

18014399594797835

[49]	Pressure plate for DUB	[555]	Microswitch	[561]	Hex nut
[66]	Sealing strip for DUB	[556]	Angle bracket	[562]	Shim
[112]	Terminal box lower part	[557]	Bolt (BE5 and larger)	[945]	Hex head screw (BE2)
[157]	Clamping strap (BE2 – 11)	[558]	Hex head screw	[946]	Mounting plate (BE2)
[378]	Screw plug	[559]	Pan head screw	[1109]	Cable ties
[379]	Screw fitting	[560]	Hex head screw		

25957074/EN – 06/2019

7.7.2 Inspection/maintenance work diagnostic unit /DUB

⚠ WARNING

Risk of injury if the drive starts up unintentionally.

Severe or fatal injuries.

- Before you start working on the unit, disconnect the motor and all connected options from the power supply.
- Secure the motor against unintended power-up.

INFORMATION

Brakes equipped with the /DUB option have at least one microswitch. These can be used for function monitoring or setting a wear monitoring. If 2 microswitches are mounted to one brake, both monitoring statuses can be realized. In this case, first set the switch for wear monitoring, then the switch for function monitoring.

INFORMATION

The specifications provided in the tables on setting the wear monitoring refer to the maximum permitted working air gap for brakemotors without safety options at brake and encoder, see chapter "Braking work, working air gap, and brake lining carrier thickness" (→ 🗎 225). Deviating values apply to brakemotors with the specified safety options. Observe the information in the addendum to the operating instructions "Safety Encoders and Safety Brakes – AC Motors DR.., DRN.., DR2.., EDR.., EDRN.. – Functional Safety".

25957074/EN – 06/2019

7.7.3 Inspection/maintenance work at the /DUB diagnostic unit with microswitch for function monitoring

1. Check the working air gap according to chapter "Setting the working air gap of BE05 – BE122 brakes" (→ 🗎 191) and adjust it if necessary.
2. Screw the hex head screw [560] against the actuator of the microswitch [555] until it trips (brown, blue contacts closed).

   While screwing, install hex nut [561] to eliminate the longitudinal play from the thread.
3. Turn the hex head screw [560] back until the microswitch [555] switches back (contacts brown-blue open). Depending on the brake size, screw out the hex head screw [560] by the specified angle to set the switching hysteresis.

Brake	Angle
BE2, BE5, BE11, BE20, BE30, BE60	60°
BE32, BE62	90°
BE120, BE122	105°

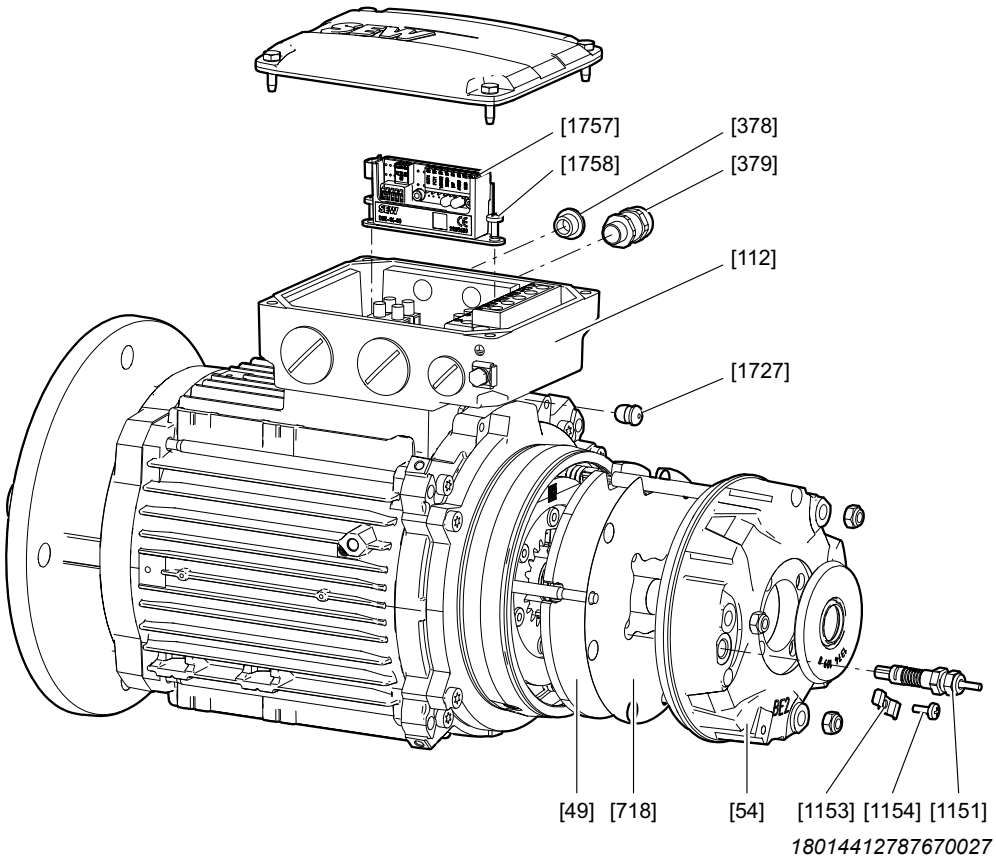
- After reaching the respective end position, tighten the hex nut [561] against the bolts [557]/[945] while holding the hex head screw [560] to keep it in the correct position.
- Switch the brake on and off several times. Check whether the microswitch opens and closes reliably in any motor shaft position. Therefore, change the position of the motor shaft manually several times. In case of incorrect switching, the setting procedure may require to be repeated.
- Check if the cables are routed firmly and if they require additional fastening in form of cable ties [1109]. Make sure the cables are routed in a sufficient distance to the fan wheel of the motor.
- Install the previously removed motor parts again.

25957074/EN – 06/2019

7.7.4 Inspection/maintenance of the diagnostic unit /DUB with microswitch for wear monitoring

1. Check the working air gap according to chapter "Setting the working air gap of BE05 – BE122 brakes" (→ 🗎 191) and adjust it if necessary.
2. Screw the hex head screw [560] against the actuator of the microswitch [555] until it trips (brown, blue contacts closed).

   While screwing, install hex nut [561] to eliminate the longitudinal play from the thread.
3. Screw the hex head screw [560] further in from the actuated switching point, so that the microswitch [555] remains activated (contact brown-blue closed). Depending on the brake size, screw the hex head screw [560] further in by the specified angle to set the wear point:



Brake	Standard brake without safety encoder	With safety brake or safety encoder
BE2	135°	135°
BE5	270°	180°
BE11, BE20, BE30, BE32, BE60, BE62	360°	
BE120	270°	135°
BE122	180°	90°

- After reaching the respective end position, tighten the hex nut [561] against the bolts [557]/[945] while holding the hex head screw [560] to keep it in the correct position.
- Check if the cables are routed firmly and if they require additional fastening in form of cable ties [1109]. Make sure the cables are routed in a sufficient distance to the fan wheel of the motor.
- Install the previously removed motor parts again.

25957074/EN – 06/2019

7.8 Inspection/maintenance work diagnostic unit /DUE

7.8.1 Basic structure of diagnostic unit /DUE

18014412787670027

[49]	Pressure plate for /DUE (BE20 and higher)	[1151]	Distance sensor
[54]	Magnet body complete for /DUE	[1153]	Spring (BE20 – 122)
[112]	Terminal box lower part	[1154]	Mushroom head screw (BE20 – 122)
[378]	Screw plug (DRN200 – 315)	[1757]	Evaluation unit
[379]	Screw fitting (DRN200 – 315)	[1758]	Screw
[718]	Dampening plate (BE1 – 11)	[1727]	Grommet (DRN80 – 180)

7.8.2 Removing the /DUE diagnostic unit

1. Remove forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
2. Remove the fan guard [35] / fan guard with encoder mount [212], or the forced cooling fan [170] by loosening the retaining screws [22].
3. If applicable: Remove the retaining ring [32] and the fan wheel [36] using a suitable tool.
4. Loosen the screw [1154] for the cable fixture clamp [1153].
5. Loosen the union nut of the sensor screw fitting. The sensor cable is free.
6. Loosen the sensor [1151] on the mounting flange. Remove the sensor.

7.8.3 Retrofitting the /DUE diagnostic unit for function and wear monitoring

Designation

For the component designation of the evaluation unit, refer to chapter "Designation of the components" (→ 🗎 101).

Conditions

The /DUE diagnostic unit can only be retrofitted for motor sizes 80 – 315 with brakes BE1 – 122 under the following conditions:

- Exchange of the existing brake without /DUE preparation for a new brake with /DUE preparation.
- Conversion of the terminal box to create room for the evaluation unit of the /DUE diagnostic unit.
- Retrofitting of the evaluation and sensor unit, see chapter "Evaluation unit" (→ 🗎 210).

Whether and to what extent the first two measures in the list are to be carried out depends greatly on the respective motor design. To identify the components that need to be replaced, please contact SEW-EURODRIVE.

Evaluation unit

The evaluation unit has a 5-pin DIP switch that is labeled with the numbers 1 to 5. Use it to set the measuring range and the maximum permitted wear limit (maximum working air gap).

If the brake is used in combination with a safety encoder, or if the brake is designed as safety brake, the setting values for the wear limit are reduced. For the new values, refer to the addendum to the operating instructions for safety brakes and safety encoders.

To activate the DIP switch ≙1, push the switch upwards. To deactivate the DIP switch ≙ 0, push the switch downwards.

The following table shows the DIP switch settings of the evaluation unit for the maximum working air gap.

S1	S2	S3	S4	S5	Wear limit	BE1 – 2 brake	BE5 brake
Sensor Ø 6 mm							
0	**0**	**0**	**0**	**0**	1.2 mm		
0	**0**	**0**	**0**	**1**	1.1 mm		
0	**0**	**0**	**1**	**0**	1.0 mm		
0	**0**	**0**	**1**	**1**	0.9 mm		X
0	**0**	**1**	**0**	**0**	0.8 mm		
0	**0**	**1**	**0**	**1**	0.7 mm		
0	**0**	**1**	**1**	**0**	0.6 mm	X	
0	**0**	**1**	**1**	**1**	0.5 mm		
S1	**S2**	**S3**	**S4**	**S5**	**Wear limit**	**BE11 – 122 brake**	
Sensor Ø 8 mm							
1	**0**	**0**	**0**	**0**	1.2 mm	X

1	**0**	**0**	**1**	**0**	1.0 mm		
1	**0**	**0**	**1**	**1**	0.9 mm		
1	**0**	**1**	**0**	**0**	0.8 mm		
1	**0**	**1**	**0**	**1**	0.7 mm		
1	**0**	**1**	**1**	**0**	0.6 mm		
1	**0**	**1**	**1**	**1**	0.5 mm		

X Factory setting
Setting possible in addition

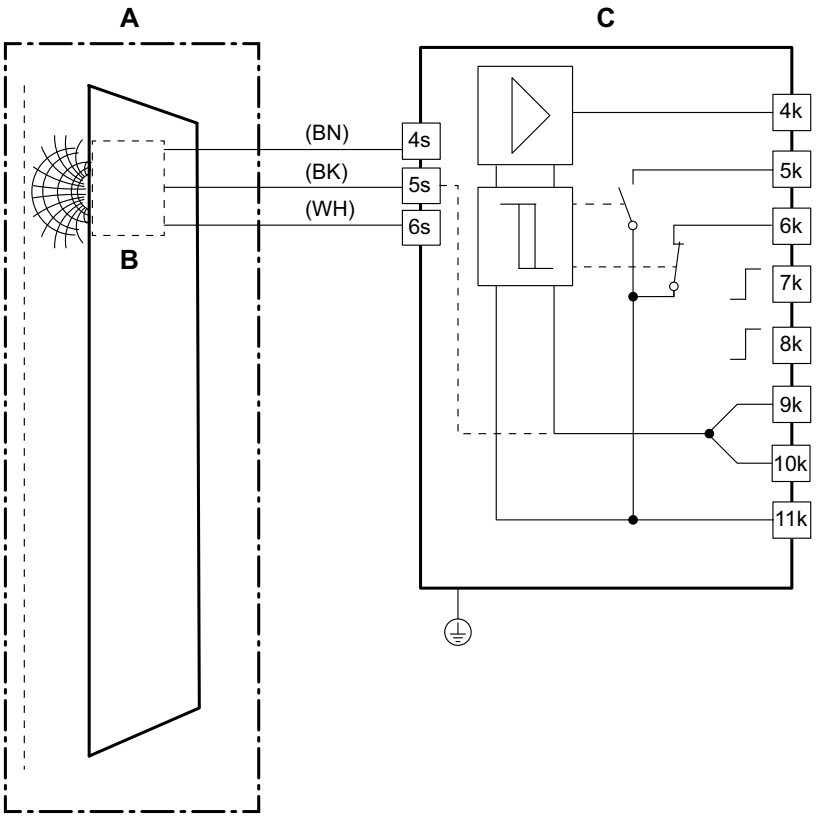
25957074/EN – 06/2019

Setting and mounting the evaluation unit

✓ The motor and all connected options are disconnected from the power supply.

✓ The motor is protected against unintended restart.

1. Set the wear limit using the DIP switches.
2. Screw the evaluation unit into the terminal box after consultation with SEW-EURODRIVE.
3. Connect the sensor, see chapter "Connecting the sensor" (→ 🗎 213).
4. Calibrate the infinite value, see chapter "Calibrating the infinite value" (→ 🗎 215).
5. Install the sensor in the brake, see chapter "Installing the sensor" (→ 🗎 216).
6. Route the cable, see chapter "Cable routing" (→ 🗎 217).
7. Calibrate the zero value, see chapter "Zero value calibration" (→ 🗎 217).
8. To check the function, measure the voltage via terminal 5k to 10k. Switch the brake and check if 24 V are applied.
9. To check if the working air gap is within the permitted range, measure the current between terminals 4k and 10k. Compare the value to the range in the diagram in chapter "Output signals for function and wear monitoring" (→ 🗎 214).



Connecting electronics

The function and wear monitoring is connected according to the following wiring diagram. The maximum permitted cable cross section at terminals "k" is 1.5 mm² with conductor end sleeve without plastic collar, 0.75 mm² with plastic collar. The recommended cable cross section at terminal "k" is 0.5 mm² with conductor end sleeve with plastic collar.

INFORMATION

Use shielded cables to wire the evaluation unit. Connect the shield to the GND potential, or use the shield plate at the user's signal evaluation.

- Unless they are shielded, sensor cables must always be routed separately from other power cables with phased currents.
- Provide for a suitable equipotential bonding between drive and control cabinet.

18014412038672651

[A]	Brake	[4k]	Analog output wear 1 (air gap)
[B]	Eddy current sensor	[5k]	Digital output function 1 (NO contact)
[C]	Evaluation unit	[6k]	Digital output wear 1 (NC contact)
		[7k]	Input calibration zero value
[4s]	Connection sensor A1 (brown cable)	[8k]	Input calibration infinite value
[5s]	Connection sensor GND 1 (black cable)	[9k]	Signal ground AGND
[6s]	Connection sensor B1 (white cable)	[10k]	Ground potential GND
		[11k]	DC 24 V supply

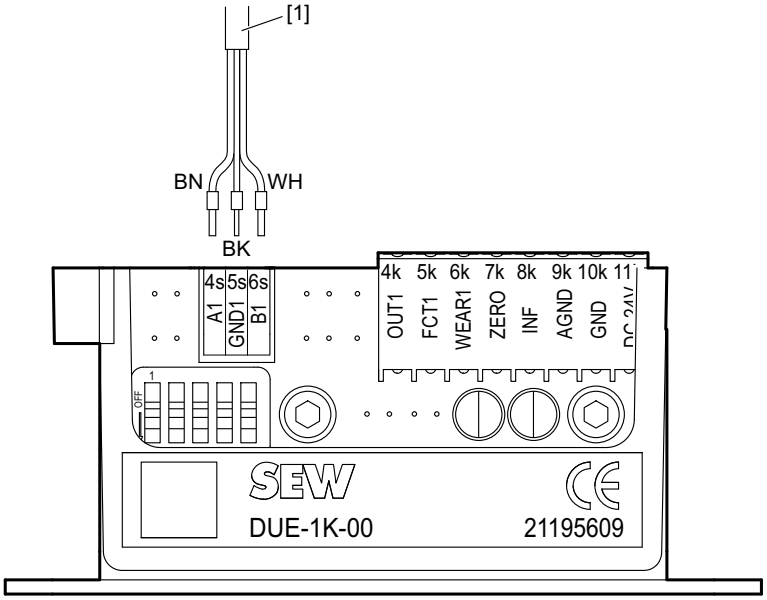
The evaluation unit is supplied with DC 24 V via the terminals GND [10k] and DC 24 V [11k].

Brake monitoring provides digital signals for:

- Function FCT1 [5k] and wear WEAR1 [6k] of the brake.

The working air gap can be monitored continuously via the analog signal (4 – 20 mA) regarding the signal ground [9k]:

- Terminal OUT1 [4k]



Use terminals ZERO [7k] and INF [8k] for calibration.

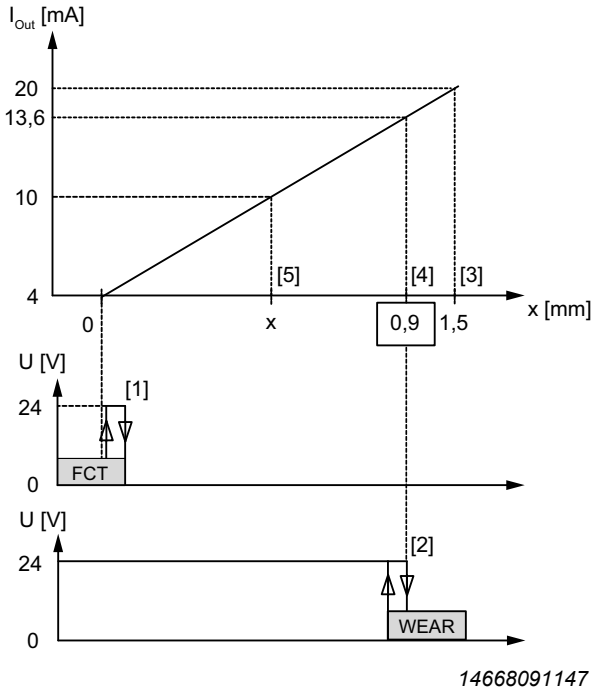
INFORMATION

If values deviate from the factory setting, the wear point setting must be adjusted. See chapter "Evaluation unit" (→ 🗎 210).

25957074/EN – 06/2019

Connecting the sensor

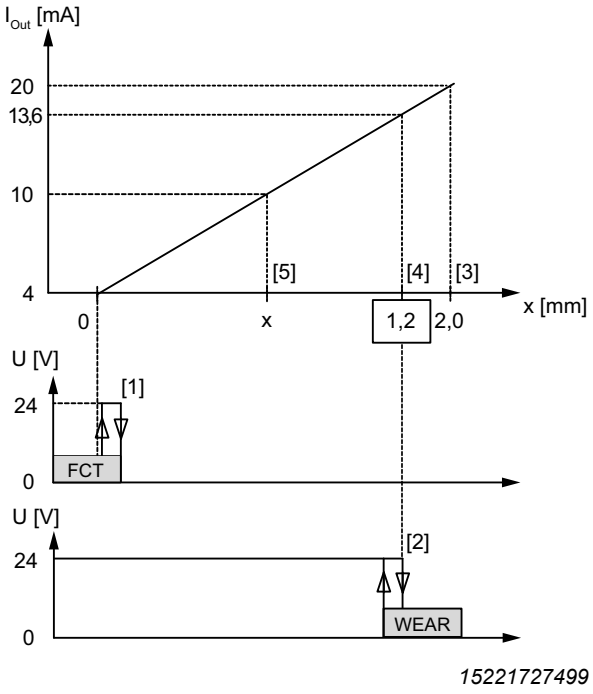
9007214229800843



[1] Brake sensor

The connection cross section of the sensor is 0.14 mm². The litz wires of the sensor cables must be equipped with conductor end sleeves. The cable shield must be isolated against other potentials using a heat shrink tubing. The litz wires can be pushed into the terminals without using tools. Put the sensor cables in the provided line clip, see figure in chapter "Calibrating the infinite value" (→ 🗎 215). To remove the sensor cables, use an electronic screwdriver to disengage the clips.

Output signals for function and wear monitoring



The diagnostic unit /DUE provides an analog signal (4 – 20 mA, DIN IEC 60381-1) for the current working air gap of the brake.

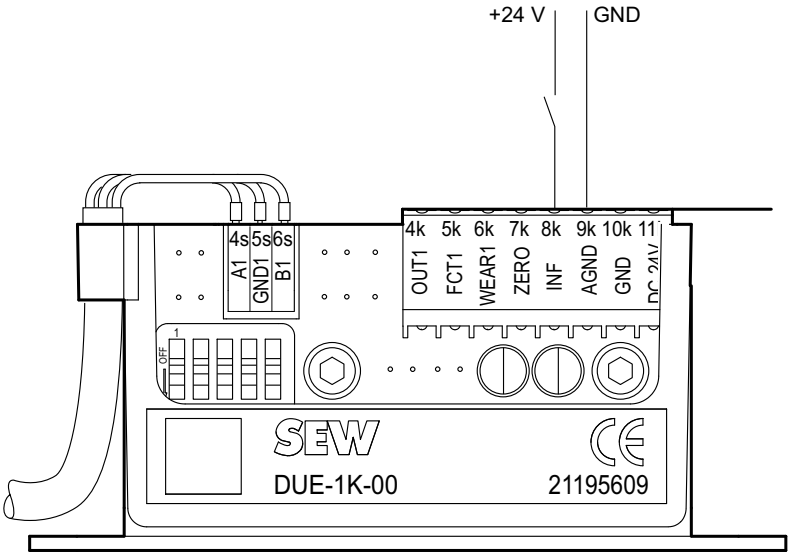
25957074/EN – 06/2019

Calibrating the infinite value

Before you can install the sensor in the brake, the electronics must be calibrated to the actual cable length. During calibration of the infinite value, electronics is adjusted to the sensor cable length. Electronics is reset and previous settings are overwritten.

The sensor must be removed from the brake for the following steps.



Procedure to calibrate the infinite value for the sensor:

1. Make sure that no metallic objects are within a 10 cm radius from the sensor head. The mounting springs may be in contact with the back of the sensor head during calibration.
2. Connect the supply voltage to INF (8k) and AGND (9k) for approx. 5 s. You can use GND (10k) as reference potential instead of AGND (9k). The evaluation unit is supplied via the calibration input during calibration.

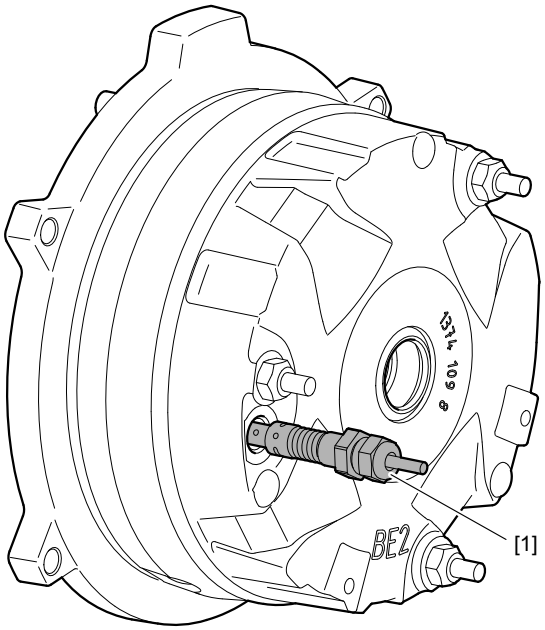
The analog output OUT1 signals 0 mA during the calibration procedure.

The infinite value was successfully calibrated when OUT1 (4k) displays 20 mA. The red LED briefly flashes once per second as visual signal.

The corresponding wiring diagram for the calibration process.

14975067787

During calibration, the digital outputs WEAR1 (6k), FCT1 (5k) send a 0 signal which may lead to error messages (wear limit reached).



Installing the sensor

After calibration, the eddy current sensor can be installed in the magnet body of the brake. When installing the sensor, make sure that the sensor head can be inserted in the stepped bore without pressure being applied.

First install the lower part of the cable gland. Then mount the upper part of the cable gland.

INFORMATION

To ensure that the sensor is correctly inserted in the stepped bore, twist the sensor carefully with the cable before screwing in the cable gland. Protect the sensor cable against damage.

15126940043

[1] Brake sensor

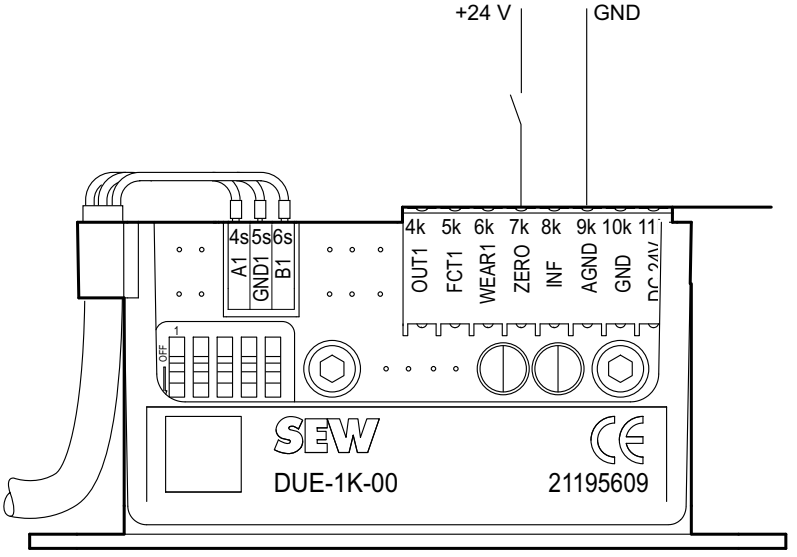
25957074/EN – 06/2019

Cable routing

Prevent the cable from colliding with the fan cable. If necessary, attach the cable to the included clamping strap [157] on the brake using cable ties.

Zero value calibration

During calibration of the zero value, the current working air gap with released (open) brake is written to the evaluation unit. The electronics are reset and previous settings are overwritten. You can save the zero value again at any time without changing the infinite value.



Procedure for calibrating the zero value:

1. Open the brake.
2. Apply the supply voltage to ZERO (7k) and AGND (9k) for approx. 3 seconds. Electronics is in calibration mode. You can use GND (10k) as reference potential instead of AGND (9k). The evaluation unit is supplied via the calibration input during calibration.

The evaluation unit saves the smallest working air gap of the brake. Each write process is indicated by a brief flashing of the red LED.

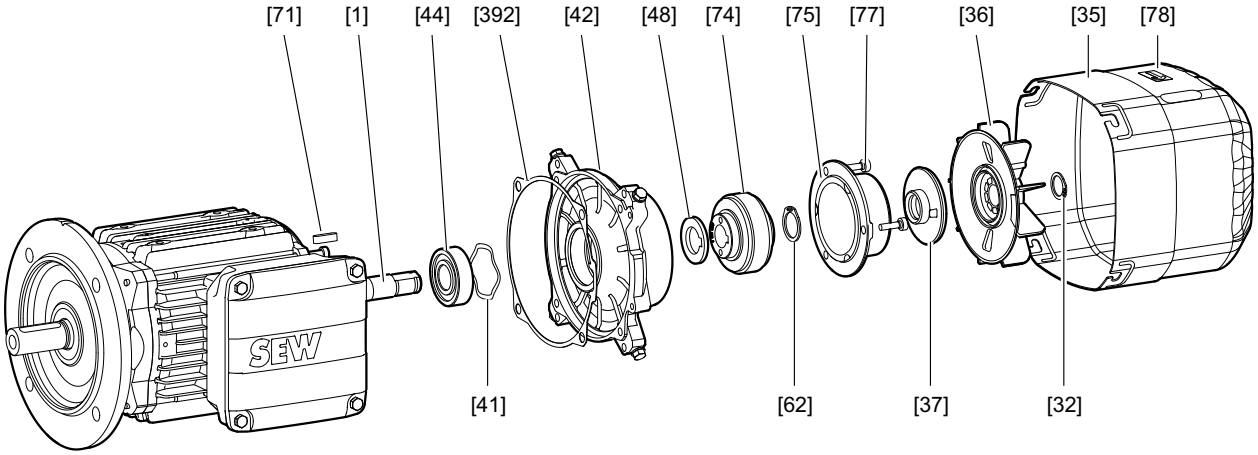
The activated calibration mode is indicated by the following LED state:

LED	State
Green [6]	Off
Red [6]	Flashing (2 Hz)

14977696651

During calibration, the digital outputs WEAR1 (6k), FCT1 (5k) send a 0 signal which may lead to error messages (wear limit reached).

The analog output OUT1 (4k) signals 0 mA during the calibration procedure. After successful calibration, the value is saved. The output has 4 mA with released brake. If a smaller value is available within 3 seconds, the last value is deleted and the new value is saved. The 4 mA at the output remain unchanged.



Status messages of the evaluation unit

Brake	Sensor	Calibration		LEDs and outputs					State
		ZERO	INF	Green	Red	FCT	WEAR	OUT	
Open	Installed	–	–	To	Off	HI	HI	3.6 – 5.6 mA	Brake open, no wear

7.9.3 Changing the blocking direction

Proceed as follows to change the blocking direction:

✓ The motor and all connected options are disconnected from the power supply.

✓ The motor is protected against unintended restart.

1. Disassemble the following parts:
   - ⇨ Forced cooling fan and rotary encoder, if installed, see chapter "Motor and brake maintenance – preliminary work" (→ 🗎 127).
   - ⇨ Fan guard with encoder mount [212] or fan guard [35], retaining ring [32]/[62] and fan [36]
   - ⇨ **DR..71 – 80, DRN71 – 80, DR2..71 – 80 motors:** Sealing flange [75].
   - ⇨ **DR..90 – 315, DRN63, 90 – 315, DR2..63 motors:** Backstop housing, complete [702].
2. Remove the retaining ring [62] and, if necessary, the spacing ring [1406].
3. Dismount the backstop [74] using a puller.
4. To alter the blocking direction, turn around the backstop [74].
5. Check the old grease. If necessary, replace the grease as specified below.
   - ⇨ **DRN63 – 71, DR2..63 – 71 motors**: Glue in the backstop [74] with Loctite 648/649.
   - ⇨ **DR..71 – 315, DRN80 – 315, DR2..80 motors:** Press on the backstop [74].
6. Mount the retaining ring [62].
7. Mount the following parts:
   - ⇨ **DR..71 –80, DRN71 – 80, DR2..71 – 80 motors:** Apply SEW-L-Spezial sealant to the sealing flange [75]. Mount the sealing flange [75].
   - ⇨ **DR..90 – 315, DRN63, 90 – 315, DR2..63 motors:** Replace the gasket [901], O-ring [1607], and if necessary sealing ring [37]. Mount the complete backstop housing [702].
8. Install the disassembled parts of the motor.
9. Replace the label [78] indicating the direction of rotation.

Lubricating the backstop

The backstop is greased at the factory with the corrosion protection low-viscosity grease LBZ 1. If you want to use another grease, make sure it complies with NLGI class 00/000 with a base oil viscosity of 42 mm^2/s at 40 °C on a lithium saponified and mineral oil base. The application temperature range is from -50 °C to +90 °C. See the following table for the amount of grease required:

DR.. motors	**71**	**80**	**90/100**	**112/132**	**160**	**180**	**200/225**	**250/280**	**315**
DRN.. motors	**63/71**	**80**	**90/100**	**112/132S**	**132M/L**	**160/180**	**200/225**	**250/280**	**315**
DR2.. motors	**63/71**	**80**	**–**	**–**	**–**	**–**	**–**	**–**	**–**
Amount of grease in g	9	11	15	20	30	45	80	80	120

The tolerance regarding the grease level is ± 30%.

8 Technical data

8.1 Braking torques

The following table shows the possible braking torque combinations for various sizes of the BE05 – 122 brake. For BE02 and BE03 brakes, the braking torques of each brake are preset at the factory and cannot be adjusted.

⚠ WARNING

Insufficient or excessive braking torque due to impermissible spring pack.

Severe or fatal injuries.

- Maintenance work may only be performed by a trained specialist.
- In case of a conversion, make sure the selected spring set generates nominal braking torques that are permitted for your drive combination and are suitable for the application.
- Observe the project planning note in the manual "Project Planning for BE.. Brakes – DR.., DRN.., DR2.., EDR.., EDRN.. AC Motors – Standard Brake/Safety Brake", or contact SEW-EURODRIVE.

25957074/EN – 06/2019

8.2 Braking work, working air gap, and brake lining carrier thickness

If the brake is used in combination with a safety encoder, or if the brake is designed as safety brake, the maximum values for the working air gap and for the braking work until maintenance are reduced. For the new values, refer to the addendum to the operating instructions for safety brakes and safety encoders.

Brake	Braking work until maintenance[1]	Working air gap		Brake lining carrier
		min.[2]	maximum	minimum
	10^6 J	mm	mm	mm
BE02	15	–[3]	–[3]	min. 5.4 for 0.8 Nm min. 5.6 for 1.2 Nm
BE03	200	0.25	0.65	–[3]
BE05	120	0.25	0.6	11.0
BE1	120	0.25	0.6	11.0
BE2	180	0.25	0.6	11.0
BE5	390	0.25	0.9	11.0
BE11	640	0.3	1.2	12.5
BE20	1000	0.3	1.2	12.5
BE30	1500	0.3	1.2	12.5
BE32	1500	0.4	1.2	12.5
BE60	2500	0.3	1.2	14.0
BE62	2500	0.4	1.2	14.0
BE120	390	0.6	1.2	14.0
BE122	390	0.8	1.2	14.0

1) The specified values are nominal values that were determined during rating operation. The actual braking work that can be reached before maintenance may vary depending on the actual load during operation.
2) When checking the working air gap, note: After a test run, parallelism tolerances on the brake lining carrier may give rise to deviations of ±0.15 mm.
3) The brake lining carrier cannot be replaced. When the minimum brake lining carrier thickness/maximum working air gap is reached, the brake must be replaced.

INFORMATION

In case of drives with BE32, BE62, or BE122 brake in pivoted mounting position, the specified value may be reduced by up to 50%, depending on the pivoting angle.

25957074/EN – 06/2019

8.3 Operating currents

8.3.1 General information on determining operating currents

The tables in this chapter list the operating currents of BE.. brakes at different voltages.

The acceleration current I_B (= inrush current) flows only for a short time (approx. 160 ms for BE02 – BE62, 400 ms for BE60 – BE122 with BMP3.1 brake control) when the brake is released. No increased inrush current occurs when using BG.., BS24 or BMS.. brake control and direct DC voltage supply without control unit (only possible with brake size BE02 – BE2).

The values for the holding currents I_H are rms values. Only use current measurement units that are designed to measure rms values.

INFORMATION

The following operating currents and power consumption values are nominal values. They refer to a coil temperature of +20 °C.

Operating currents and power consumption usually decrease during normal operation due to heating of the brake coil.

Note that the actual operating currents can be higher by up to 25% depending on the ambient temperature and with coil temperatures below +20 °C.

8.3.2 Legend

The following tables list the operating currents of the brakes at different voltages.

The following values are specified:

P_B	Nominal value of the electric power consumption in the brake coil in watt.
U_N	Nominal voltage (rated voltage range) of the brake in V (AC or DC).
I_H	Nominal holding current in A (AC). rms value of the braking current in the supply cable to the SEW-EURODRIVE brake control.
I_{DC}	Nominal holding current in A (DC) in the brake cable with direct DC voltage supply or Nominal holding current in A (DC) in the brake cable with DC 24 V supply via BS24, BSG, or BMV.
I_B	Acceleration current in ampere (AC or DC) when operated with SEW brake control for high-speed excitation.
I_B/I_H	Inrush current ratio ESV.
I_B/I_{DC}	Inrush current ratio ESV for DC 24 V supply with BSG or BMV.

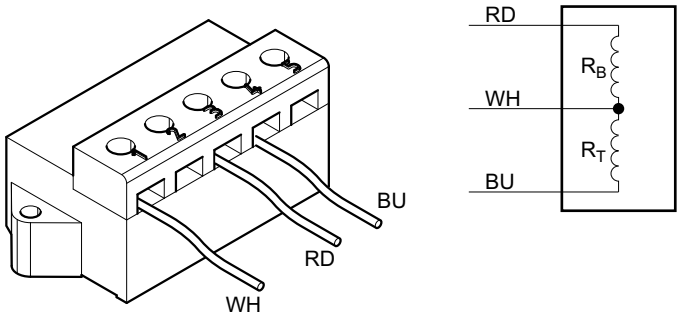
8.4 Resistors

The depicted values apply to the standard temperature range of -20 to +40 °C. Deviating resistances may occur in other temperature ranges, especially in case of drives with permitted temperature above +60 °C, or in case of non-ventilated drives, due to modified winding configurations. The values are available from SEW-EURODRIVE on request.

8.4.1 Resistance measurement BE02, BE03, BE05, BE1, BE2, BE5, BE30, BE32, BE60, BE62

Cut-off in the AC circuit



The following illustration shows how to measure resistance with cut-off in the AC circuit.

9007199497350795

Cut-off in the DC and AC circuits

The following illustration shows how to measure resistance with cut-off in the DC and AC circuits.

18014398752093451

BS	Accelerator coil	RD	Red
TS	Coil section	WH	White
R_B	Accelerator coil resistance at 20 °C in Ω	BU	Blue
R_T	Coil section resistance at 20 °C in Ω		
U_N	Nominal voltage (rated voltage range)		

INFORMATION

When measuring the resistance of the coil section (R_{Sec}) or the acceleration coil (R_{Acc}), remove the white conductor from the brake rectifier; if it remains connected, the internal resistance of the brake rectifier will cause erroneous results.

25957074/EN – 06/2019

8.5 Brake control

The depicted combinations apply to drives in insulation class B or F, and to the standard temperature range of -20 °C to +40 °C.

For the brake control assigned to your drive, refer to the specifications on the motor nameplate.

INFORMATION

The depicted combinations may be limited depending in the present drive configuration (e.g. insulation class H, deviating temperature ranges, etc.). In case of a conversion, check if brake control is permitted for your drive combination. Contact SEW-EURODRIVE if necessary.

8.5.1 Permitted combinations

The table below shows the standard and optional combinations of brakes and brake rectifiers.

BSG	DC 24 V	DC 5.0 A	08254591	Pure white

25957074/EN – 06/2019

BMP..

Half-wave rectifier with electronic switching and integrated voltage relay for cut-off in the DC circuit.

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BMP3.1[1)]	AC 230 – 575 V	DC 2.8 A	08295077	–

1) Only sizes 250 – 315

25957074/EN – 06/2019

8.5.3 Control cabinet

The following tables list the technical data of brake control systems for installation in the control cabinet. The different housings have different colors (= color code) to make them easier to distinguish.

BMS..

Half-wave rectifier without electronic switching.

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BMS1.4	AC 230 – 575 V	DC 1.0 A	08298300	Tar black
BMS1.5	AC 150 – 500 V	DC 1.5 A	08258023	Tar black
BMS3	AC 42 – 150 V	DC 3.0 A	08258031	Mahogany brown

BME..

Half-wave rectifier with electronic switching.

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BME1.4	AC 230 – 575 V	DC 1.0 A	08298319	Vermilion
BME1.5	AC 150 – 500 V	DC 1.5 A	08257221	Vermilion
BME3	AC 42 – 150 V	DC 3.0 A	0825723X	Light blue

BMH..

Half-wave rectifier with electronic switching and heating function

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BMH1.4	AC 230 – 575 V	DC 1.0 A	08298343	Signal green
BMH1.5	AC 150 – 500 V	DC 1.5 A	0825818X	Signal green
BMH3	AC 42 – 150 V	DC 3.0 A	08258198	Zinc yellow

BMP..

Half-wave rectifier with electronic switching and integrated voltage relay for cut-off in the DC circuit.

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BMP1.4	AC 230 – 575 V	DC 1.0 A	08298327	Light gray
BMP1.5	AC 150 – 500 V	DC 1.5 A	08256853	Light gray
BMP3	AC 42 – 150 V	DC 3.0 A	08265666	Light green

25957074/EN – 06/2019

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BMP3.1	AC 230 – 575 V	DC 2.8 A	08295077	–

BMK..

Half-wave rectifier with electronic switching, DC 24 V control input, and cut-off in the DC circuit.

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BMK1.4	AC 230 – 575 V	DC 1.0 A	08298335	Water blue
BMK1.5	AC 150 – 500 V	DC 1.5 A	08264635	Water blue
BMK3	AC 42 – 150 V	DC 3.0 A	08265674	Light pink

BMKB..

Half-wave rectifier with electronic switching, DC 24 V control input, rapid cut-off and LED status display.

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BMKB1.5	AC 150 – 500 V	DC 1.5 A	08281602	Water blue

BMV..

Brake control unit with electronic switching, DC 24 V control input and fast cut-off.

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BMV5	DC 24 V	DC 5.0 A	13000063	Pure white

BST..

Safe brake control with electronic switching, DC 24 V control input and safe DC 24 V control input. Supply via the DC link of the inverter.

Type	Nominal voltage	Nominal output current I_L	Part number	Color code
BST0.6S	AC 460 V	DC 0.6 A	08299714	–
BST0.7S	AC 400 V	DC 0.7 A	13000772	–
BST1.2S	AC 230 V	DC 1.2 A	13001337	–

25957074/EN – 06/2019

8.6.3 Rolling bearing for DR..315, DRN315 motors

Motors	A-side bearing		B-side bearing	
	AC motor	Gearmotor	AC motor	Gearmotor
DR..315K, DRN315S	6319-C3	6319-C3	6319-C3	6319-C3
DR..315S, DRN315M				
DR..315M, DRN315L	6319-C3	6322-C3	6319-C3	6322-C3
DR..315L, DRN315H				

8.6.4 Rolling bearing for DR..250 – 315, DRN250 – 315 motors, with reinforced bearings /ERF

Motors	A-side bearing	B-side bearing	
		AC motor	Gearmotor
DR..250 – 280, DRN250 – 280	NU317E-C3	6315-C3	
DR..315K, DRN315S	NU319E	6319-C3	6319-C3
DR..315S, DRN315M			
DR..315M, DRN315L			6322-C3
DR..315L, DRN315H			

8.6.5 Rolling bearing for DR..200 – 315, DRN200 – 315 motors, with current-insulated rolling bearings /NIB

Motors	B-side bearing	
	AC motor	Gearmotor
DR..200 – 225, DRN200 – 225	6314-C3-EI	6314-C3-EI
DR..250 – 280, DRN250 – 280	6315-Z-C3-EI	6315-Z-C3-EI
DR..315K, DRN315S	6319-C3-EI	6319-C3-EI
DR..315S, DRN315M		
DR..315M, DRN315L		6322-C3-EI
DR..315L, DRN315H		

25957074/EN – 06/2019

8.7 Lubricant tables

8.7.1 Lubricant table for rolling bearings

INFORMATION

Use of wrong bearing grease can damage the bearings.

Motors with sealed bearings

The bearings are 2Z or 2RS closed bearings and cannot be relubricated. They are used for DR..71 – 280, DRN63 – 280, DR256 – 80 motors.

	Ambient temperature	Manufacturer	Type	DIN designation
Motor rolling bearings	-20 °C to +80 °C	Mobil	Polyrex EM[1)]	K2P-20
	+20 °C to +100 °C	Klüber	Barrierta L55/2[2)]	KX2U
	-40 °C to +60 °C	Kyodo Yushi	Multemp SRL[2)]	KE2N-40
	-20 °C to +60 °C	SKF	LHT23[2)]	KE2N-40

1) Mineral lubricant (= mineral-based bearing grease)

2) Synthetic lubricant (= synthetic-based bearing grease)

Motors with open bearings

Motors in the sizes DR..315 and DRN315 always have open bearings. If DR..250 – 280 and DRN225 – 280 motors have the relubrication option /NS, these sizes also have open bearings.

	Ambient temperature	Manufacturer	Type	DIN designation
Rolling bearing	-20 °C to +80 °C	Mobil	Polyrex EM[1)]	K2P-20
	-40 °C to +60 °C	SKF	LGHP 2[1)]	K2N-40

1) Mineral lubricant (= mineral-based bearing grease)

25957074/EN – 06/2019

8.7.2 Order information for lubricants, anti-corrosion agents and sealants

Lubricants, anti-corrosion agents, and sealants may be obtained directly from SEW-EURODRIVE using the following order numbers.

Usage	Manufacturer	Type	Quantity	Order number
Lubricant for rolling bearings	Mobil	Polyrex EM	400 g	09101470
	SKF	LGHP2	400 g	09101276
Lubricant for sealing rings				
Material: NBR/FKM	Klüber	Petamo GHY 133N	10 g	04963458
	FUCHS LUBRITECH	Gleitmo 100 S	1 kg	03258092
Material: EPDM/EPP	Klüber	Klübersynth BLR 46-122	10 g	03252663
Corrosion protection and lubricant	SEW-EURODRIVE	NOCO® fluid	5.5 g	09107819
Sealant	Marston Domsel	SEW-L-Spezial	80 g	09112286

25957074/EN – 06/2019

8.8 Encoders

8.8.1 Incremental encoder E.7S – sin/cos

Encoder		ES7S	EV7S	EG7S	EH7S
Supply voltage	U_B	DC 7 V – 30 V			
Max. current consumption	I_{in}	140 mA_{RMS}			
Max. pulse frequency	f_{max}	150 kHz			180 kHz
Incremental tracks, periods per revolution	A, B	1024 (10 bits)			
	C	1			
Position resolution, increments per revolution	A, B				
Output amplitude per track	U_{high}	1 V_{PP}			
	U_{low}				
Signal output		sin/cos			
Output current per track	I_{out}	10 mA_{RMS}			
Pulse duty factor according to IEC 60469-1, n = constant		–			
Phase offset A: B n = constant		90° ± 3°			90° ± 10°
Accuracy[1)]		0.0194°	–	0.0194°	–
Vibration resistance according to EN 60088-2-6		≤ 100 m/s^2			
Shock resistance according to EN 60088-2-27		≤ 1000 m/s^2		≤ 2000 m/s^2	
Maximum speed	n_{max}	6000 min^{-1}			
Duration until fault message (disabled outputs)[2)]		25 ms	–	25 ms	–
Activation time of rotary encoder internal diagnostics after switching on		–			
Degree of protection in accordance with EN 60529		IP66			IP65
Connection		Terminal box on incremental encoder			12-pin plug connector
Ambient temperature	°C	-30 to +60	-30 to +80	-30 to +60	-40 to +60

1) Due to the stiffness of the torque arm, you have to take into account an automatically resetting ±0.6° twist (depending of the direction of rotation) of the encoder housing compared to the encoder shaft.

2) Sin/cos encoders have a self-diagnostics function. If an error is detected, the sensor reports it by deactivating the output signals to the encoder evaluation unit.

25957074/EN – 06/2019

8.8.2 Incremental encoder E.7R – TTL (RS422), 9 V ≤ U_B ≤ 30 V

Encoder		ES7R	EV7R	EG7R	EH7R
Supply voltage	U_B	DC 7 V – 30 V			DC 10 V – 30 V
Max. current consumption	I_{in}	160 mA_{RMS}			140 mA_{RMS}
Max. pulse frequency	f_{max}	120 kHz			300 kHz
Incremental tracks, periods per revolution	A, B	1024 (10 bits)			
	C	1			
Position resolution, increments per revolution	A, B	4096 (12 bits)			
Output amplitude per track	U_{high}	≥ DC 2.5 V			
	U_{low}	≤ DC 0.5 V			
Signal output		TTL (RS422)			
Output current per track	I_{out}	25 mA_{RMS}			20 mA_{RMS}
Pulse duty factor according to IEC 60469-1, n = constant		50% ± 10%			
Phase offset A: B n = constant		90° ± 20°			
Vibration resistance according to EN 60088-2-6		≤ 100 m/s^2			
Shock resistance according to EN 60088-2-27		≤ 1000 m/s^2		≤ 2000 m/s^2	
Maximum speed	n_{max}	6000 min^{-1}			6000 min^{-1} 2500 min^{-1} at 60 °C
Degree of protection in accordance with EN 60529		IP66			IP65
Connection		Terminal box on incremental encoder			12-pin plug connector
Ambient temperature	°C	-30 to +60	-30 to +60		-40 to +60

8.8.3 Incremental encoder E.7C – HTL

Encoder		ES7C	EV7C	EG7C	EH7C
Supply voltage	U_B	DC 4.75 V – 30 V			DC 10 V – 30 V
Max. current consumption	I_{in}	240 mA_{RMS}			225 mA_{RMS}
Max. pulse frequency	f_{max}	120 kHz			300 kHz
Incremental tracks, periods per revolution	A, B	1024 (10 bits)			
	C	1			
Position resolution, increments per revolution	A, B	4096 (12 bits)			
Output amplitude per track	U_{high}	V_B -2.5 V		V_B -2.5 V	V_B -2 V
	U_{low}	≤ DC 1.1 V			≤ DC 2.5 V
Signal output		HTL/TTL (RS422)		HTL/TTL (RS422)	HTL
Output current per track	I_{out}	60 mA_{RMS}			30 mA_{RMS}
Pulse duty factor according to IEC 60469-1, n = constant		50% ± 10%			50% ± 20%
Phase offset A: B n = constant		90° ± 20°			
Vibration resistance according to EN 60088-2-6		≤ 100 m/s^2			
Shock resistance according to EN 60088-2-27		≤ 1000 m/s^2		≤ 2000 m/s^2	
Maximum speed	n_{max}	6000 min^{-1}			6000 min^{-1} 2500 min^{-1} at 60 °C
Degree of protection in accordance with EN 60529		IP66			IP65
Connection		Terminal box on incremental encoder			12-pin plug connector
Ambient temperature	°C	-30 to +60		-30 to +60	-40 to +60

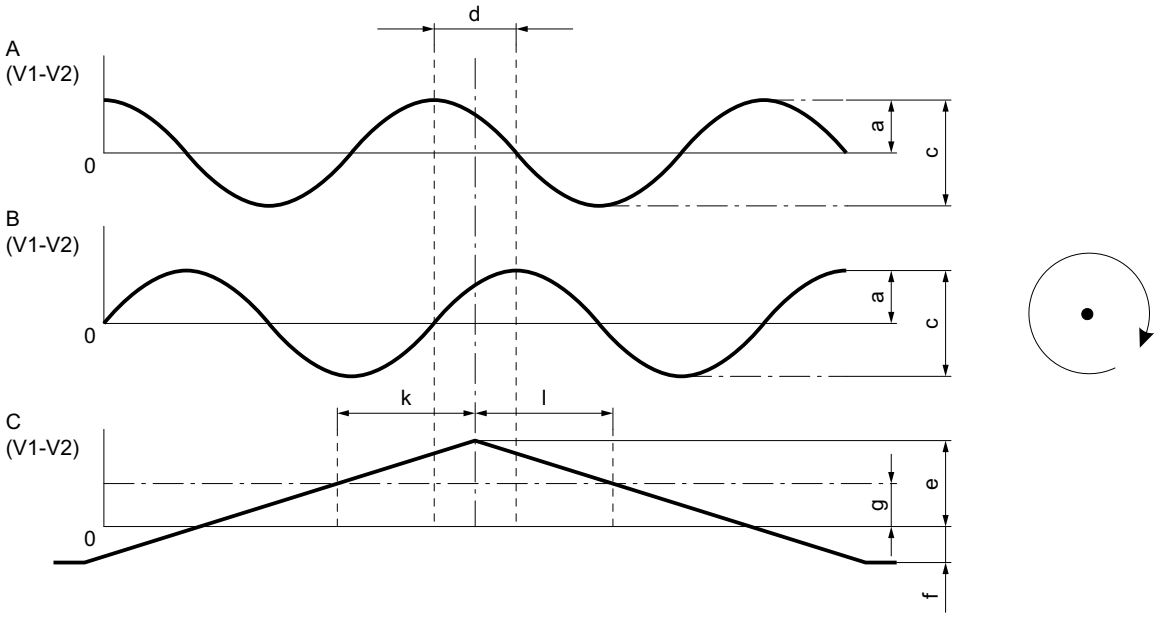
25957074/EN – 06/2019

8.8.4 Incremental encoder E.7T – TTL (RS422) at U_B = 5 V

Encoder		EH7T
Supply voltage	U_B	DC 5 V
Max. current consumption	I_{in}	140 mA
Max. pulse frequency f_{max}	kHz	300
Incremental tracks, periods per revolution	A, B	1024 (10 bits)
	C	1
Position resolution, increments per revolution	A, B	4096 (12 bits)
Output amplitude	U_{high}	≥ DC 2.5 V
	U_{low}	≤ DC 0.5 V
Signal output		TTL (RS422)
Output current per track	I_{out}	20 mA
Pulse duty factor according to IEC 60469-1, n = constant		50% ± 20%
Phase offset A: B n = constant		90° ± 20°
Vibration resistance according to EN 60088-2-6 at 10 Hz – 2 kHz		≤ 100 m/s^2
Shock resistance according to EN 60088-2-27		≤ 2000 m/s^2
Maximum speed	n_{max}	6000 min^{-1} 2500 min^{-1} at 60 °C
Degree of protection according to EN 60529		IP65
Connection		12-pin plug connector
Ambient temperature	°C	-40 to +60

25957074/EN – 06/2019

8.8.5 Incremental encoder E.8.



Encoder		EK8S EV8S 1)	EK8R EV8R 2)	EK8C EV8C
Supply voltage	U_B	DC 7 V – 30 V		DC 4.75 V – 30 V
Supply voltage for functional safety applications	U_{B_FS}	DC 7 V – 30 V	–	
Maximum current consumption, free of load	I_{in}	100 mA (at U_B = 7 V)		
Max. pulse frequency	f_{pulse_max}	150 kHz	120 kHz	
Direction of rotation		A before B when looking at the motor output shaft in clockwise rotation		
Incremental tracks, periods per revolution	A, B	1024 (10 bits)		
	C	1		
Position resolution, increments per revolution	A, B	4096 (12 bits)		
Voltage output signal differential (peak-to-peak) (A' = A - $\overline{A}$; B' = B - $\overline{B}$)	U_{t_diff}	1 V ± 10%	–	
Voltage output signal non-differential (peak-to-peak)	U_t	0.5 V ± 10%	U_{Low} ≤ 0.5 V U_{High} ≥ 2.5 V	U_B ≤ 6 V: U_{Low} ≤ 0.5 V U_{High} ≥ 2.5 V U_B > 6 V: U_{Low} ≤ 3 V U_{High} ≥ U_B - 2.5 V
Signal level output, offset nominal against 0 V (A, B, C, $\overline{A}$, $\overline{B}$, $\overline{C}$)V	U_{t_o}	2.5 V ± 0.3 V	–	
Signal output		sin/cos	TTL (RS422)	HTL
Load resistance/load current differential	R_L/I_L	120 Ω ± 10%		U_B 6 V: 120 Ω ± 10% UB > 6 V: 1 – 3 kΩ
Resistance between tracks and reference ground	R_{gnd}	≥ 1 kΩ	–	
Load capacitance, output	C_o	≤ 20 nF	–	–
Voltage output signal, differential (C' = C - $\overline{C}$) (peak-to-peak)	U_{t_diff} e	0.3 – 1.4 V	–	–
C track offset	g	192 mV ± 5 mV	–	–
Voltage output signal, non-differential (C,$\overline{C}$) (peak-to-peak)	U_{t_C}	–	U_{Low} ≤ 0.5 V U_{High} ≥ 2.5 V	U_B ≤ 6 V: U_{Low} ≤ 0.5 V U_{High} ≥ 2.5 V U_B > 6 V: U_{Low} ≤ 3 V U_{High} ≥ U_B - 2.5 V
Phase angle track C', n = constant	k, l	k = 180° ± 90° l = 180° ± 90°	–	–
Signal width track C	W_C	see figure	90° electrical	
Signal logic track C		see figure	C = log 1, when A = B = log 1	
Pulse duty factor according to IEC 60469-1, n = constant		–	50 % ± 10%	
Phase offset A: B; $\overline{A}$: $\overline{B}$ n = constant	d	90° ± 2°	90° ± 20°	
Accuracy of the incremental section[3)]		0.0194° (70 ")	0.033° (120 ")	
Vibration resistance according to EN 60068-2-6		≤ 10 g (f > 18.5 Hz)		
Shock resistance according to EN 60068-2-27		≤ 100 g (t = 6 ms, 18 pulses)		
Maximum speed	n_{max}	6000 min^{-1}		
Maximum line length		100 m	300 m	100 m

25957074/EN – 06/2019

Encoder		EK8S EV8S 1)	EK8R EV8R 2)	EK8C EV8C
Duration until fault message (disabled outputs)[4]		≤ 25 ms	–	
Activation time of rotary encoder internal diagnostics after switching on		≤ 200 ms	–	
Degree of protection in accordance with EN 60529		IP66		
Installation altitude	h	≤ 4000 m above sea level		
Corrosion protection, surface protection		KS, OS1 – OS4, OSG		
Connection		Integrated encoder plug connector on the fan guard (can be pre-assembled and plugged in the field)		
Ambient temperature of motor	T_{amb}	-30 to +60 °C		
Electronic nameplate		RS485 (serial, asynchronous); 1920 bytes	–	–

1) see figure "Sin/cos signals and phase relationship"
2) see figure "HTL/TTL signals and phase relationship"
3) Due to the stiffness of the torque arm, you have to take into account an automatically resetting ±0.6° twist (depending of the direction of rotation) of the encoder housing compared to the encoder shaft.
4) Sin/cos encoders have a self-diagnostics function. If an error is detected, the sensor reports it by deactivating the output signals to the encoder evaluation unit.

1) relating to measurements in figure "Sin/cos signals and phase relationship"

25957074/EN – 06/2019

8.8.7 Multi-turn absolute encoder A.7Y – SSI (multi-turn) + sin/cos or TTL (RS422)

Encoder		AS7Y	AV7Y	AG7Y	AH7Y
Supply voltage	U_B	DC 7 V – 30 V			DC 9 V – 30 V
Max. current consumption	I_{in}	140 mA			150 mA
Max. pulse frequency	f_{limit}	200 kHz			120 kHz
Incremental tracks, periods per revolution	A, B	2048 (11 bits)			
	C	–			–
Output amplitude per track	U_{high}	1 V_{PP}			≥ DC 2.5 V_{PP}
	U_{low}				≤ DC 0.5 V_{PP}
Signal output		sin/cos			TTL (RS422)
Output current per track	I_{out}	10 mA			20 mA
Pulse duty factor according to IEC 60469-1, n = constant		–			50 ± 20%
Phase offset A: B n = constant		90° ± 3°			90° ± 20°
Accuracy of the incremental section[1]		0.0194°			–
Accuracy of the absolute section		±1 LSB (Least Significant Bit)			–
Scanning code		Gray code			
Position resolution, increments per revolution	A, B	8192 (13 bits)			
Position resolution of the absolute section, increments per revolution		4096 (12 bits)			
Multi-turn resolution		4096 revolutions (12 bits)			
Data transmission		Synchronous, serial (SSI)			
Serial data output		Driver to EIA RS422			Driver to EIA RS485
Serial pulse input		Recommended receiver to EIA RS422			Optocoupler, recommended driver to EIA RS485
Clock frequency		Permitted range: 100 – 2000 kHz (max. 100 m cable length with 300 kHz)			
Clock-pulse space period		12 – 30 µs			
Vibration resistance according to EN 60088-2-6		≤ 100 m/s^2			
Shock resistance according to EN 60088-2-27		≤ 1000 m/s^2			≤ 2000 m/s^2
Maximum speed	n_{max}	6000 min^{-1}		6000 min^{-1} at T_U to 40 °C 4500 min^{-1} at T_U > 40 °C	3500 min^{-1}
Duration until fault message (disabled outputs)[2]		25 ms + 3/4 revolution			–
Activation time of rotary encoder internal diagnostics after switching on		–			
Degree of protection in accordance with EN 60529		IP66			IP56
Connection		Terminal strip in pluggable connection cover			Terminal strip on encoder
Ambient temperature	°C	-30 to +60			-20 to +40

1) Due to the stiffness of the torque arm, you have to take into account an automatically resetting ±0.6° twist (depending of the direction of rotation) of the encoder housing compared to the encoder shaft.

2) Absolute encoders AS7Y, AV7Y, and AG7Y have a self-diagnostics function. If an error is detected, the sensor reports it by deactivating the output signals to the encoder evaluation unit.

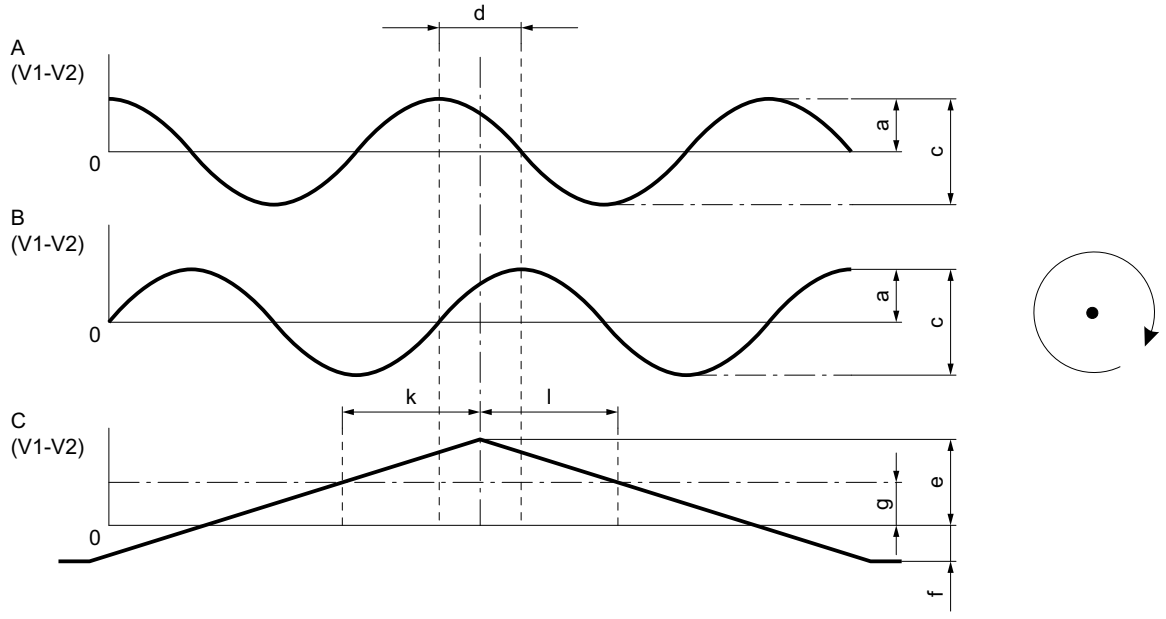
8.8.8 Multi-turn absolute encoder A.7W – RS485 (multi-turn) + sin/cos

Encoder		AS7W	AV7W	AG7W
Supply voltage	U_B	DC 7 V – 30 V		
Max. current consumption	I_{in}	150 mA		
Max. pulse frequency	f_{max}	200 kHz		
Incremental tracks, periods per revolution	A, B	2048 (11 bits)		
	C	–		
Output amplitude per track	U_{high} / U_{low}	1 V_{PP}		
Signal output		sin/cos		
Output current per track	I_{out}	10 mA		
Pulse duty factor according to IEC 60469-1, n = constant		–		
Phase offset A: B n = constant		90° ± 3°		
Accuracy of the incremental section[1)]		0.0194°		
Accuracy of the absolute section		±1 LSB (Least Significant Bit)		
Scanning code		Binary code		
Position resolution, increments per revolution	A, B	8192 (13 bits)		
Multi-turn resolution		65536 revolutions (16 bits)		
Data transmission		RS485		
Serial data output		Driver to EIA RS485		
Serial pulse input		Recommended driver to EIA RS485		
Clock frequency		9600 baud		
Clock-pulse space period		–		
Vibration resistance according to EN 60088-2-6		≤ 100 m/s²		
Shock resistance according to EN 60088-2-27		≤ 1000 m/s²		≤ 2000 m/s²
Maximum speed	n_{max}	6000 min^{-1}	6000 min^{-1} at T_U to 40 °C 4500 min^{-1} at T_U > 40 °C	6000 min^{-1}
Duration until fault message (disabled outputs)[2)]		25 ms + 3/4 revolution		
Activation time of rotary encoder internal diagnostics after switching on		–		
Degree of protection in accordance with EN 60529		IP66		
Connection		Terminal strip in pluggable connection cover		
Ambient temperature	°C	-30 to +60		

1) Due to the stiffness of the torque arm, you have to take into account an automatically resetting ±0.6° twist (depending of the direction of rotation) of the encoder housing compared to the encoder shaft.

2) Absolute encoders AS7W, AV7W, and AG7W have a self-diagnostics function. If an error is detected, the sensor reports it by deactivating the output signals to the encoder evaluation unit.

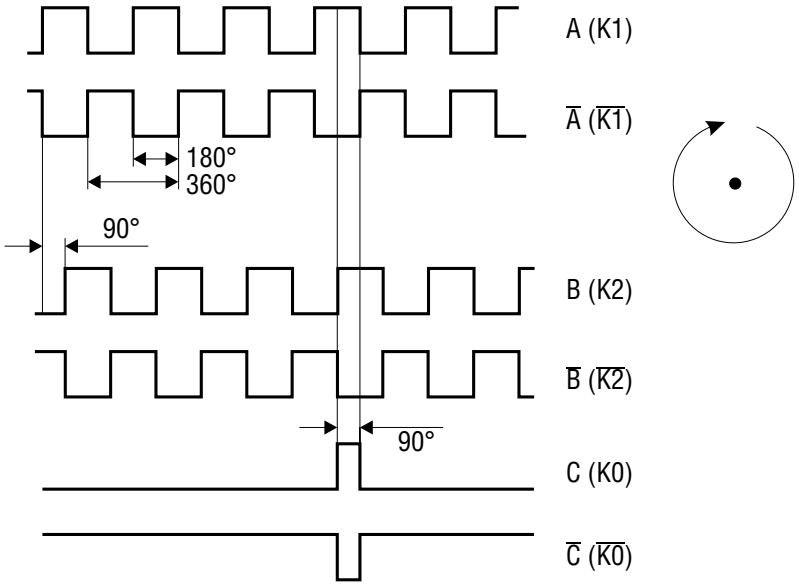
25957074/EN – 06/2019



8.8.9 Multi-turn absolute encoder A.8.

Encoder		AK8Y AV8Y 1)	AK8W AV8W 1)	AK8H AV8H 1)2)
Supply voltage	U_B	DC 7 V – 30 V		DC 7 V – 12 V
Supply voltage for FS applications	U_{B_FS}	DC 7 V – 30 V		–
Max. current consumption, free of load	I_{in}	100 mA (at U_B = 7 V)		80 mA
Max. pulse frequency	f_{pulse_max}	200 kHz		
Direction of rotation		A before B when looking at the motor output shaft in clockwise rotation		
Incremental tracks, periods per revolution	A, B	2048 (11 bits)		1024 (10 bits)
	C	–		
Position resolution, increments per revolution	A, B	4096 (12 bits) (SSI, RS422)	65536 (16 bits) (RS485)	32768 (15 bits) HIPERFACE®
Voltage output signal differential (peak-to-peak) (A' = A - $\overline{A}$; B' = B - $\overline{B}$	U_{t_diff}	1 V ± 10%		HIPERFACE®
Voltage output signal non-differential (peak-to-peak)	U_t	0.5 V ± 10%		
Signal level output, offset nominal against 0 V (A, B, C, $\overline{A}$, $\overline{B}$, $\overline{C}$)V	U_{t_o}	2.5 V ± 0.3 V		
Signal output		sin/cos + SSI, RS422	sin/cos + RS485	
Load resistance/load current differential	R_L/I_L	120 Ω ± 10%		
Resistance between track and reference ground	R_{gnd}	≥ 1 kΩ		
Load capacitance, output		≤ 20 nF		
Voltage output signal, differential (C' = C - $\overline{C}$) (peak-to-peak) e	U_{t_diff}	–	–	
C track offset	g	–	–	
Voltage output signal, non-differential (C,$\overline{C}$) (peak-to-peak)	U_{t_C}	–	–	
Phase angle track C', n = constant	k, l	–	–	
Signal width track C	W_C	–	–	–
Signal logic track C		–	–	–
Pulse duty factor according to IEC 60469-1, n = constant		–		–
Phase offset A: B; $\overline{A}$: $\overline{B}$ n = constant		90° ± 2°		HIPERFACE®
Accuracy of the incremental section[3)]		0.0194° (70 ")		± 0.0144° (± 52 ")
Accuracy of the absolute section		±1 LSB (Least Significant Bit)		
Scanning code/counting direction		Gray code, ascending with the direction of rotation specified above	Binary code, ascending with the direction of rotation specified above	–
Multi-turn resolution		4096 revolutions (12 bits)	65536 revolutions (16 bits)	4096 revolutions (12 bits)
Communication, interface		SSI (synchronous, serial)	RS485 (asynchronous, serial)	HIPERFACE®
Communication, modules		Driver to EIA RS422	Driver to EIA RS485	
Clock frequency/bandwidth		100 – 800 kHz (100 m cable length with maximum 300 kHz)	9600 baud	HIPERFACE®
Clock-pulse space period		12 – 30 µs	–	
Vibration resistance according to EN 60068-2-6		≤ 10 g (f > 18.5 Hz)		

Encoder		AK8Y AV8Y 1)	AK8W AV8W 1)	AK8H AV8H 1)2)
Shock resistance according to EN 60068-2-27		≤ 100 g (t = 6 ms, 18 pulses)		
Maximum speed	n_{max}	6000 min^{-1}		
Maximum line length		100 m		
Duration until fault message (disabled outputs)[4]		≤ 25 ms + 3/4 revolution		HIPERFACE®
Activation time of rotary encoder internal diagnostics after switching on		200 ms		HIPERFACE®
Degree of protection in accordance with EN 60529		IP66		
Installation altitude	h	≤ 4000 m above sea level		≤ 2000 m above sea level
Corrosion protection, surface protection		KS, OS1 – OS4, OSG		
Connection		Integrated encoder plug connector on the fan guard (can be pre-assembled and plugged in the field)		
Ambient temperature of motor	T_{amb}	-30 to +60 °C		
Electronic nameplate		–	RS485 (serial, asynchronous); 1920 bytes	HIPERFACE®; 1792 bytes
Other technical data		On request		



1) see figure "Sin/cos signals and phase relationship"
2) Please observe the specification for the HIPERFACE® interface, Sick AG
3) Due to the stiffness of the torque arm, you have to take into account an automatically resetting ±0.6° twist (depending of the direction of rotation) of the encoder housing compared to the encoder shaft.
4) Absolute encoders A.8. and AG7Y have a self-diagnostics function. If an error is detected, the sensor reports it by deactivating the output signals to the encoder evaluation unit.

8.10 Characteristic safety values

8.10.1 Characteristic safety values for BE.. brakes

The values specified in the following table apply to BE.. brakes in standard applications.

	Characteristic safety values according to EN ISO 13849-1	
Classification	Category B	
System structure	1-channel (Cat. B)	
$MTTF_D$ value	Calculation via B_{10D} value	
B_{10D} value	BE02	1.5×10^6
	BE03	20×10^6
	BE05	16×10^6
	BE1	12×10^6
	BE2	8×10^6
	BE5	6×10^6
	BE11	3×10^6
	BE20	2×10^6
	BE30	1.5×10^6
	BE32	1.5×10^6
	BE60	1×10^6
	BE62	1×10^6
	BE120	0.25×10^6
	BE122	0.25×10^6

SEW-EURODRIVE offers BE.. brakes also as safety brakes up to size BE32. For more information, consult the addendum to the operating instructions "Safety Encoders and Safety Brakes – AC Motors DR.., DRN.., DR2.., EDR.., EDRN.. – Functional Safety".

25957074/EN – 06/2019

8.11 S1 duty cycle DRK.. single-phase motor

The following section describes the data for DRK.. single-phase motor in S1 continuous duty.

The specified starting torques result from the connection of a running capacitor or a running capacitor with start-up capacitor connected in parallel, respectively.

S1 operation at 1500/1800 min^{-1} 230 V)									
							M_A/M_N with C_B	C_A for M_A/M_N

25957074/EN – 06/2019

9 Malfunctions

9.1 General information

⚠ WARNING

Risk of injury if the drive starts up unintentionally.

Severe or fatal injuries.

- Before you start working on the unit, disconnect the motor and all connected options from the power supply.
- Secure the motor against unintended power-up.

⚠ CAUTION

The surfaces on the drive can be very hot during operation.

Risk of burns.

- Let the motor cool down sufficiently before you start working on it.

NOTICE

Improper troubleshooting measures may damage the drive.

The drive system might be damaged.

- Use only genuine spare parts in accordance with the valid parts list.

25957074/EN – 06/2019

9.2 Motor malfunctions

Fault	Possible cause	Measure
Motor does not start up	Supply cable interrupted	Check the connections and (intermediate) terminal points, correct if necessary
	Brake does not release	See chapter "Brake malfunctions"
	Supply cable fuse has blown	Replace fuse
	Motor protection (switch) has triggered	Check that the motor protection (switch) is set correctly; current specification is on the nameplate
	Motor protection does not trip	Check motor protection control
	Error in control or in the control process	Observe the switching sequence; correct if necessary
Motor only starts with difficulty or does not start at all	Motor power designed for delta connection but connected in star	Correct the connection from star to delta; Observe wiring diagram
	Motor power designed for star-star connection but only connected in star	Correct the connection from star to star-star; Observe wiring diagram
	Voltage or frequency differs considerably from the setpoint, at least when switching on the motor	Provide better power supply system; reduce the power supply load; Check cross section of supply cable, replace with cable of larger cross section if necessary
Motor does not start in star connection, only in delta connection	Star connection does not provide sufficient torque	If the delta inrush current is not too high (observe the regulations of the power supplier), start up directly in delta; Check the project planning and use a larger motor or special design if necessary. Contact SEW-EURODRIVE.
	Contact fault on star/delta switch	Check the switch, replace if necessary; Check the connections
Incorrect direction of rotation	Motor connected incorrectly	Swap 2 phases of the motor supply cable
Motor hums and has high current consumption	Brake does not release	See chapter "Brake malfunctions"
	Winding defective	Send motor to specialist workshop for repair
	Rotor rubbing	Send motor to specialist workshop for repair
Fuses blow or motor protection trips immediately	Short circuit in the motor supply cable	Eliminate short circuit
	Supply cables connected incorrectly	Correct the connection; Observe wiring diagram
	Short circuit in the motor	Send motor to specialist workshop for repair
	Ground fault on motor	Send motor to specialist workshop for repair

25957074/EN – 06/2019

Fault	Possible cause	Measure
Severe speed loss under load	Motor overload	Measure power, check project planning and use larger motor or reduce load if necessary
	Voltage drops	Check cross section of supply cable, replace with cable of larger cross section if necessary
Motor heats up excessively (measure temperature)	Overload	Measure power, check project planning and use larger motor or reduce load if necessary
	Insufficient cooling	Provide a cooling air supply or clear cooling air passages, retrofit forced cooling fan if necessary. Check the air filter, clean or replace if necessary
	Ambient temperature too high	Observe the permitted temperature range, reduce the load if necessary
	Motor in delta connection instead of star connection as intended	Correct the wiring, observe the wiring diagram
	Loose contact in supply cable (one phase missing)	Tighten loose contact, check connections, observe wiring diagram
	Fuse defective	Look for and rectify cause; replace fuse
	Line voltage deviates from the rated motor voltage by more than 5% (range A) / 10% (range B)	Adjust motor to line voltage
	Operating mode (S1 to S10, DIN 57530) exceeded, e.g. caused by excessive switching frequency	Adjust the operating mode of the motor to the required operating conditions; consult a professional to determine the proper drive, if necessary
Loud noises	Ball bearing compressed, dirty or damaged	Realign motor and the driven machine, inspect rolling bearing and replace if necessary.
	Vibration of rotating parts	Look for the cause, possibly an imbalance; correct the cause, observe method for balancing
	Foreign bodies in cooling air ducts	Clean cooling air ducts
	For DR.. motors with rotor designation "J": Load too high	Reduce the load

25957074/EN – 06/2019

9.3 Brake malfunctions

Fault	Possible cause	Measure
Brake does not release	Incorrect voltage on brake control unit	Apply the correct voltage; brake voltage specified on the nameplate.
	Brake control unit failed	Renew brake control, check resistors and isolation of the brake coils. Check switchgear, replace if necessary.
	Maximum permitted working air gap exceeded because brake lining worn down.	Measure and set working air gap. If the brake disk is too thin, replace the brake disk.
	Voltage drop along supply cable > 10%	Provide correct connection voltage: brake voltage specifications on the nameplate. Check the cross section of the brake supply cable, increase cross section if necessary.
	Inadequate cooling, brake overheating	Provide for cooling air supply or clear cooling air passages, check air filter, clean or replace if necessary. Replace type BG brake rectifier with type BGE.
	Brake coil has interturn short circuit or a short circuit to frame	Check resistors and isolation of the brake coils; Replace complete brake and brake control (specialist workshop); Check switchgear, replace if necessary.
	Rectifier defective	Replace rectifier and brake coil; it may be more economical to replace the complete brake.
Brake does not brake	Working air gap not correct	Measure and set working air gap. If the brake disk is too thin, replace the brake disk.
	Brake lining worn	Replace entire brake lining carrier.
	Incorrect braking torque	Check the dimensioning and, if necessary, change braking torque by type and number of brake springs, or by selecting a different brake.
Brake does not brake	Working air gap so large that setting nuts for the manual release come into contact	Set the working air gap.
	Manual brake release device not set correctly	Set the setting nuts for the manual release correctly.
	Brake locked by manual brake release HF	Loosen the set screw, remove if needed.
Brake is applied with time lag	Brake is switched only on AC voltage side	Switch both the DC and AC circuits (e.g. by retrofitting a SR current relay to BSR or a UR voltage relay to BUR); Observe wiring diagram.

25957074/EN – 06/2019

Fault	Possible cause	Measure
Noises in vicinity of brake	Gearing wear on the brake disk or the driver caused by jerky start-up	Check the project planning, replace the brake disk if necessary. Have a specialist workshop replace the carrier.
	Alternating torques due to incorrectly set inverter	Check correct setting of inverter according to its operating instructions, correct if necessary.

9.4 Malfunctions when operated with a frequency inverter

The symptoms described in chapter "Motor malfunctions" (→ 🗎 264) can also occur when the motor is operated with a frequency inverter. Refer to the frequency inverter operating instructions for the meaning of the problems that occur and to find information about rectifying the problems.

25957074/EN – 06/2019

9.5 Disposal

Dispose of the motors in accordance with the material structure and the regulations in force:

- Iron
- Aluminum
- Copper
- Plastics
- Electronic parts
- Oil and grease (not mixed with solvents)

9.6 Customer service

Have the following information available if you require customer service assistance:

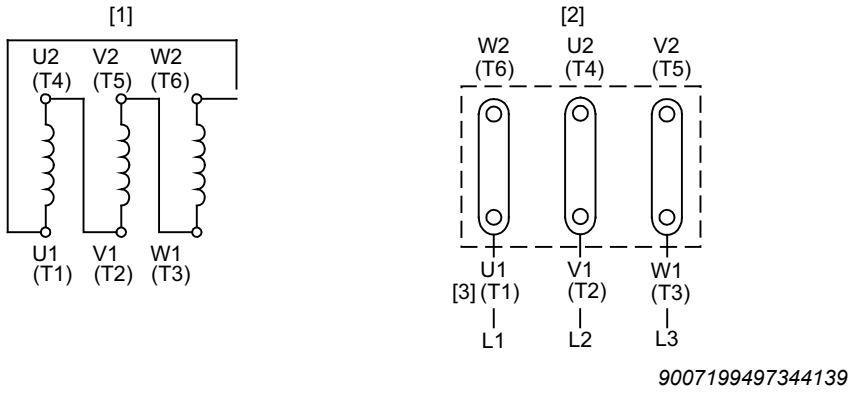
- Nameplate data (complete)
- Nature and extent of the problem
- Time the failure occurred and any accompanying circumstances
- Assumed cause
- Ambient conditions e.g.:
  - Ambient temperature
  - Humidity
  - Installation altitude
  - Dirt
  - etc.

25957074/EN – 06/2019

10 Appendix

10.1 Wiring diagrams

INFORMATION



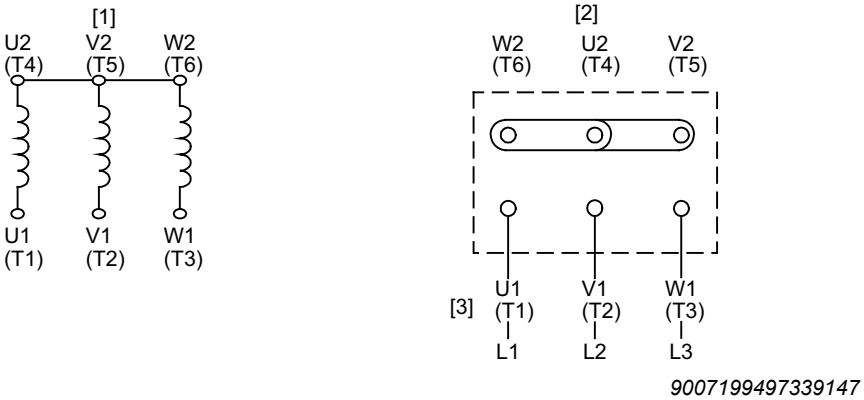
The motor should be connected as shown in the connection wiring diagram or the terminal assignment diagram, which are supplied with the motor. The following section only shows a selection of the common types of connections. You can obtain the relevant wiring diagrams free of charge from SEW-EURODRIVE.

10.1.1 Delta and star connection in wiring diagram R13 (68001 xx 06)

For all motors with one speed, direct on-line, or ⅄/△ start-up.

Delta connection

The following illustration shows the △ connection for lower voltage.



9007199497344139

[1] Motor winding
[2] Motor terminal board
[3] Supply cables

Star connection

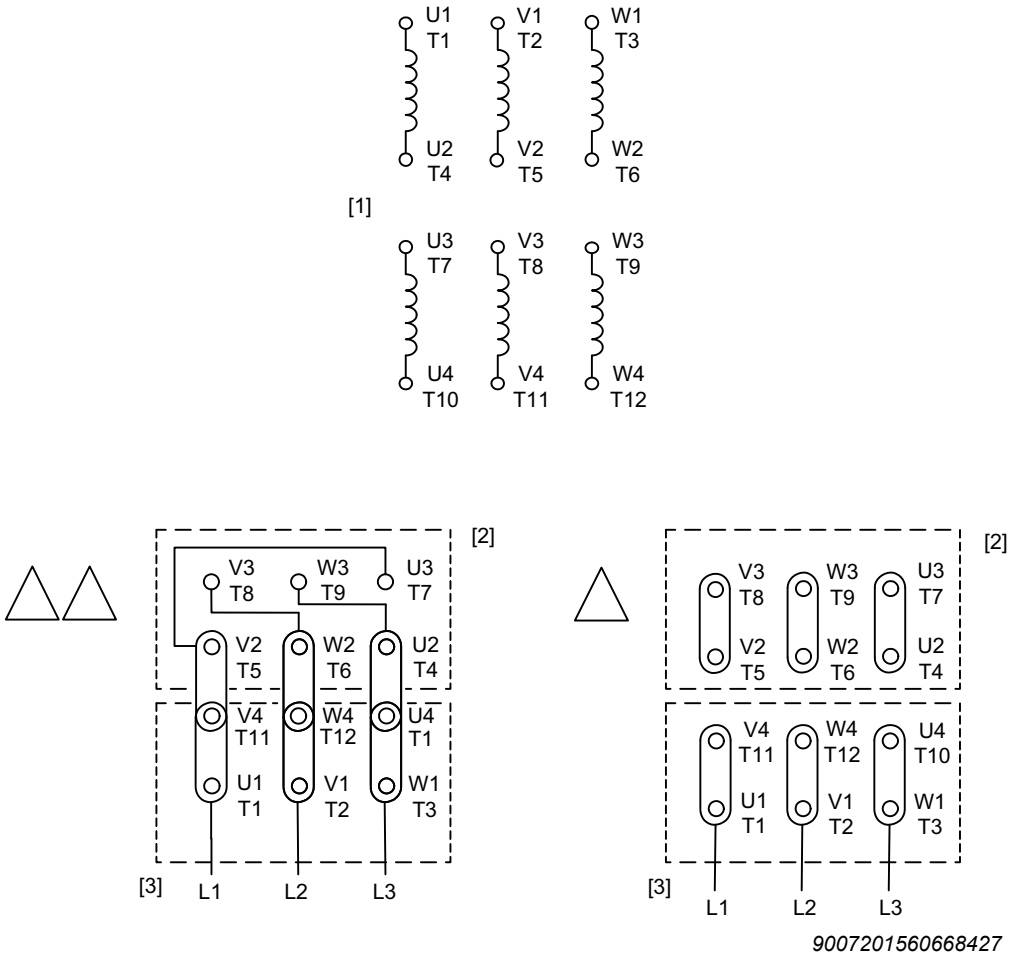
The following illustration shows the ⅄ connection for high voltage.

9007199497339147

[1] Motor winding
[2] Motor terminal board
[3] Supply cables

Proceed as follows to reverse the direction of rotation:

1. Swap the supply cables L1 – L2.



25957074/EN – 06/2019

10.1.2 Delta connection with wiring diagram R72 (68192 xx 09)

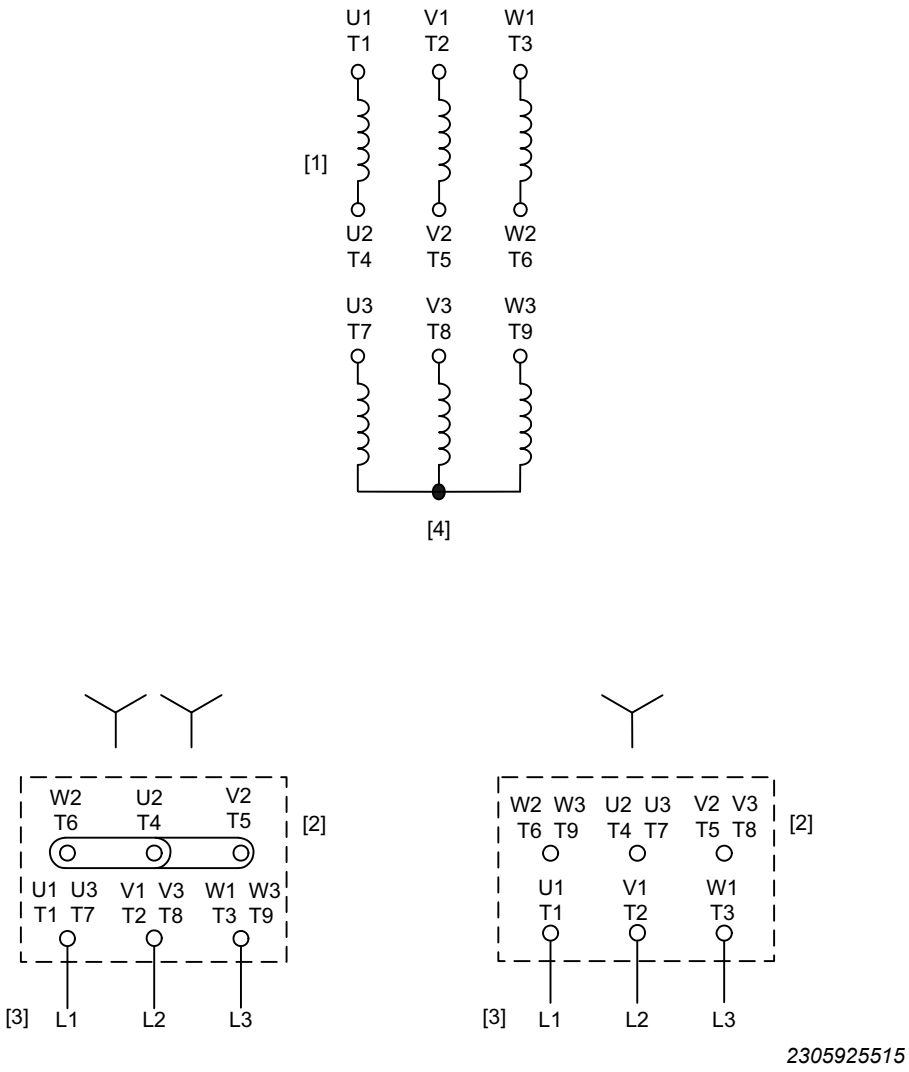
For all motors with one speed and direct power-on.

Delta connection, Double-delta connection

The following figure shows the △ connection for high voltages and the △△ connection for lower voltages.

[1] Motor winding
[2] Motor terminal board
[3] Supply cables

Proceed as follows to reverse the direction of rotation:



1. Swap the supply cables L1 – L2.

10.1.3 Star connection with wiring diagram R76 (68043 xx 06)

For all motors with one speed and direct power-on.

Star connection, double-star connection

The following figure shows the ⅄ connection for high voltages and the ⅄ ⅄ connection for lower voltages.

2305925515

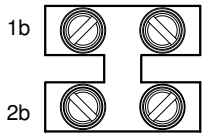
[1] Motor winding
[2] Motor terminal board
[3] Supply cables
[4] Star point connected in motor

Proceed as follows to reverse the direction of rotation:

1. Swap the supply cables L1 – L2.

10.1.4 Motor protection with /TF or /TH for DR..71 – 280, DRN63 – 280, DR2..63 – 80 motors

INFORMATION

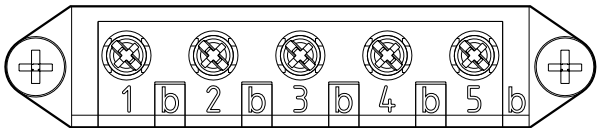


The following shows an example terminal assignment. The actual terminal assignment is included in the motor delivery as wiring diagram.

/TF, /TH

The following figures show examples for connection of motor protection with /TF PTC thermistor sensors or /TH bimetallic thermostats.

Either a two-pole connection terminal or a five-pole terminal strip is available for connecting to the trip switch.

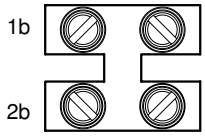


Example: /TF, /TH to 2-pin terminal strip

9007199728684427

1b	2b
TF/TH	TF/TH

Example: 2 × /TF, /TH to 5-pin terminal strip



18014398983427083

1b	2b	3b	4b	5b
1.TF/TH	1.TF/TH	2.TF/TH	2.TF/TH	–

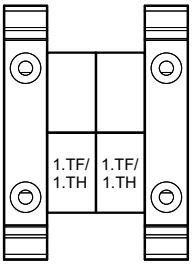
10.1.5 Motor protection with /TF or /TH for DR..315, DRN315 motors

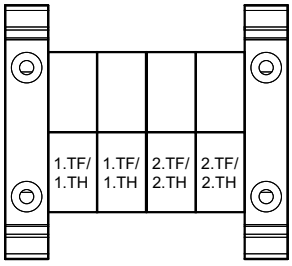
INFORMATION



The following shows an example terminal assignment. The actual terminal assignment is included in the motor delivery as wiring diagram.

/TF, /TH

The following figures show examples for connection of motor protection with /TF PTC thermistor sensors or /TH bimetallic thermostats.

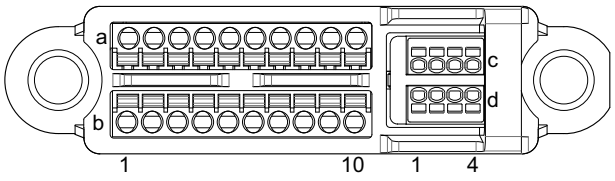


Depending on the version, an "x-pin" terminal strip is available for connection to the trip switch.

Example: /TF, /TH to terminal strip

473405707

Example: 2x /TF, /TH to terminal strip



473410187

25957074/EN – 06/2019

10.1.6 EI7.B built-in encoder

Connection via terminal strip

The encoder is equipped with a 10-pole terminal strip for connection:

9007207579353739

INFORMATION

The ranges 1a – 10a, 1c – 4c and 1d – 4d have been pre-configured by SEW-EURODRIVE. The must not be changed.

Range 1b – 10b is intended for customer adjustments.

Basic connection:

Connections 1a – 10a, 1c – 4c and 1d – 4d lead to the encoder or to the motor.

Connections 1b – 10b lead to the cable gland.

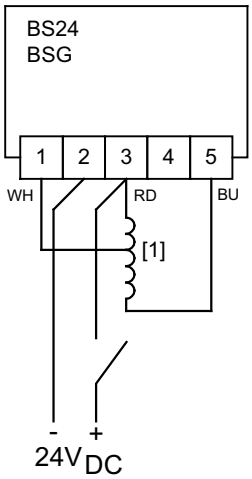
10.1.7 BGE..; BS..; BSG..; BUR.. brake control

BG../BGE..

Wiring diagram B100

The following illustration shows the wiring for BG.. and BGE.. brake rectifiers for the AC-side shut-off as well as the DC and AC-side shutoff.



242604811

[1] Brake coil

BS24/BSG..

Wiring diagram B100

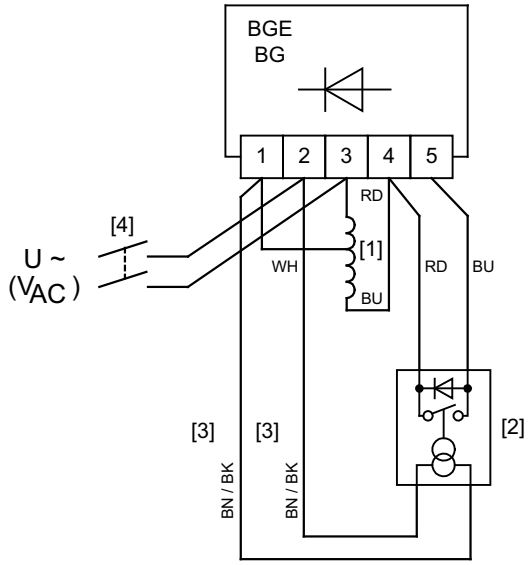
The following illustration shows the DC 24 V connection of the BS24 brake protection or BSG.. control unit.

9007199497347467

[1] Brake coil

BUR

NOTICE



Malfunction caused by incorrect brake connection for frequency inverter operation.

The drive system might be damaged.

- Do not connect the brake to the terminal board of the motor.

Wiring diagram B100

The following figure shows the wiring for BUR.. brake control

242608139

[1] Brake coil
[2] UR11/UR15 voltage relay

BN = UR 11 (42 – 150 V)
BK = UR 15 (150 – 500 V)

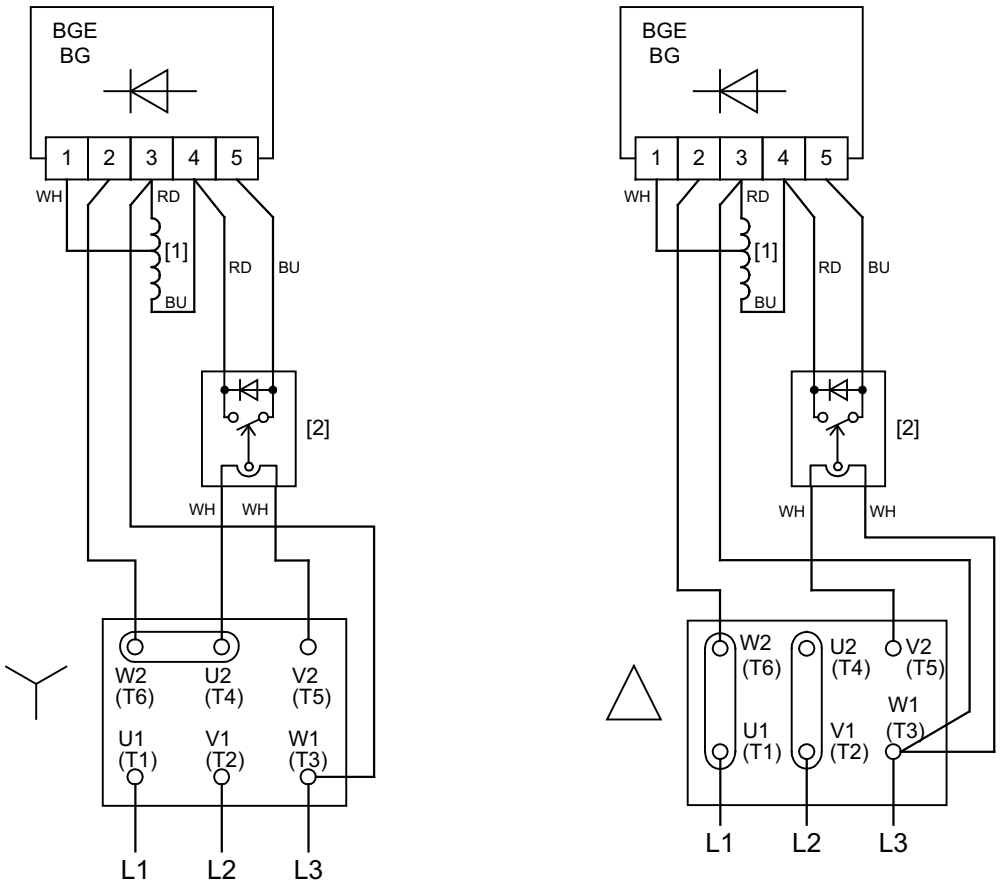
25957074/EN – 06/2019

10.1.8 BSR.. brake control

Brake voltage = phase-to-neutral voltage

BSR.. brake control for single speed drives in line operation (basic wiring diagram R13)

Wiring diagram R13A/R13B



The white interconnecting wires are the ends of a converter loop and, depending on the motor connection, must be connected to the motor terminal block instead of the △ or ⅄ bridge.

The following figure shows the factory wiring for BSR.. brake control.

For example

Motor: AC 230 V/AC 400 V

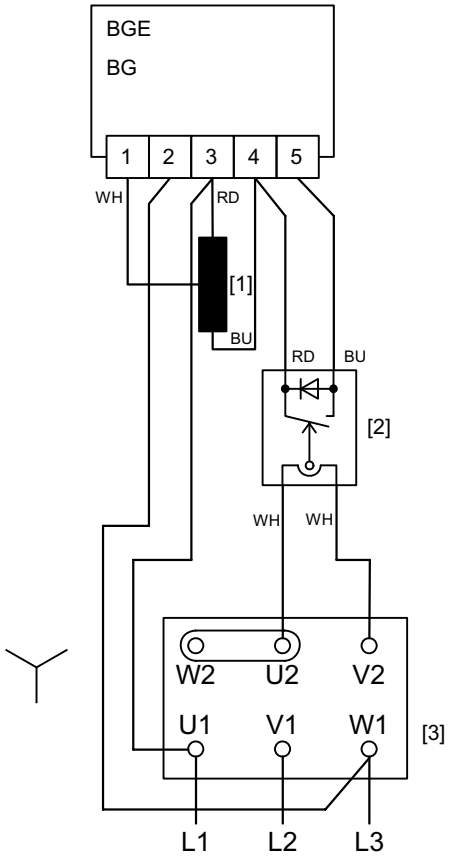
Brake: AC 230 V

18014398752081803

[1] Brake coil
[2] SR10/11/15/19 current relay

Brake voltage = Line voltage

Wiring diagram R13C



The white interconnecting wires are the ends of a converter loop and, depending on the motor connection, must be connected to the motor terminal block instead of one of the ⅄ bridges before startup.

The following figure shows the factory wiring for BSR.. brake control:

Example

Motor: AC 400 V

Brake: AC 400 V

17564599179

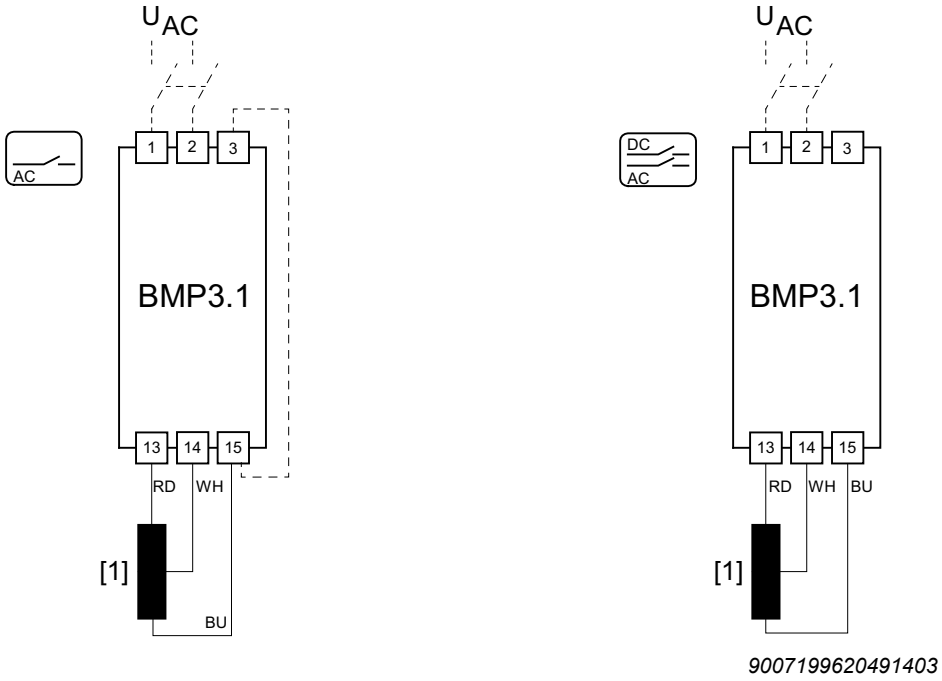
[1] Brake coil
[2] SR10/11/15/19 current relay
[3] Terminal board

Further wiring diagrams for BSR.. brake control

Wiring diagrams for BSR.. brake control in combination with the following drives are available from SEW-EURODRIVE upon request.

- Multi-voltage motors according to basic wiring diagram R76 or R72
- Single speed drive with cage clamp terminal /KCC (basic wiring diagram A13 or C13)

25957074/EN – 06/2019



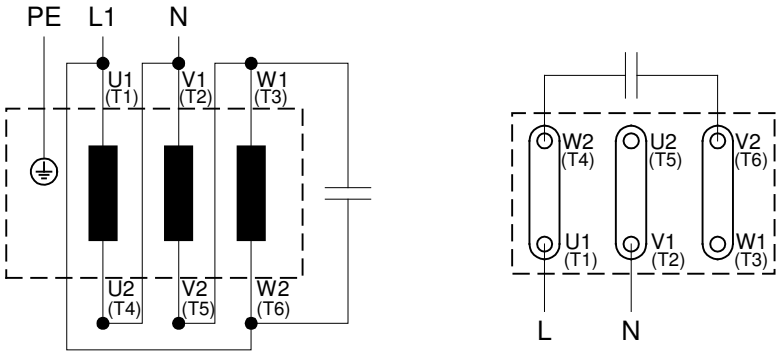
10.1.9 BMP3.1 brake control in the terminal box

INFORMATION

Separate supply cables are required for the voltage supply.

BMP3.1

The following illustration shows the wiring for the BMP3.1 brake rectifier for cut-off in the AC circuit and cut-off in the DC and AC circuit.

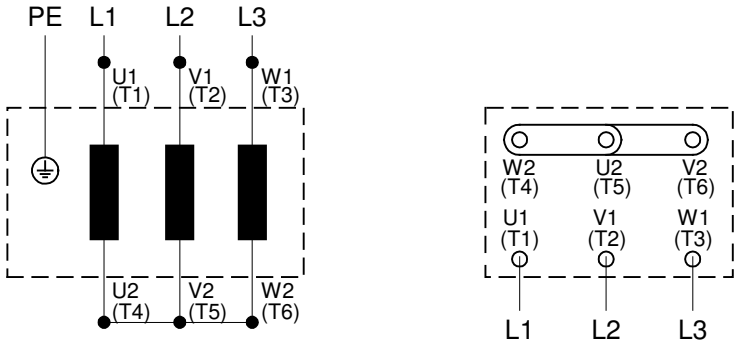


9007199620491403

[1] Brake coil

10.1.10 Forced cooling fan /V

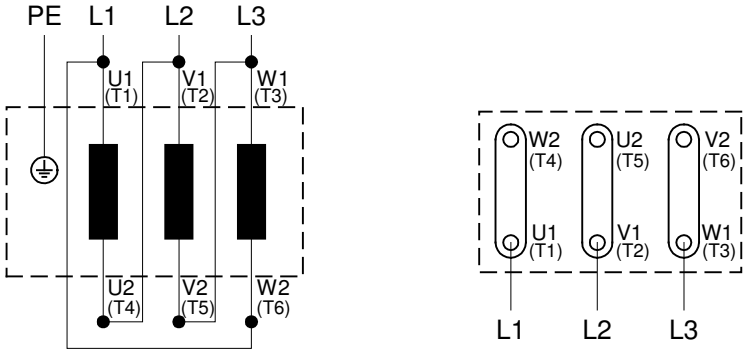
Delta Steinmetz



The following figure shows the wiring of the V forced cooling fan for delta-Steinmetz connection for 1-phase operation.

9007199778089483

Star connection

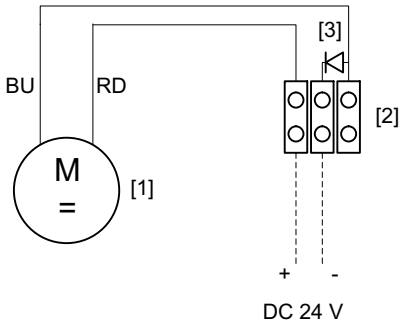


The following figure shows the wiring of the /V forced cooling fan for star connection.

9007199778091147

Delta connection

The following figure shows the wiring of the /V forced cooling fan for delta connection.



18014399032833803

25957074/EN – 06/2019

DC 24 V connection

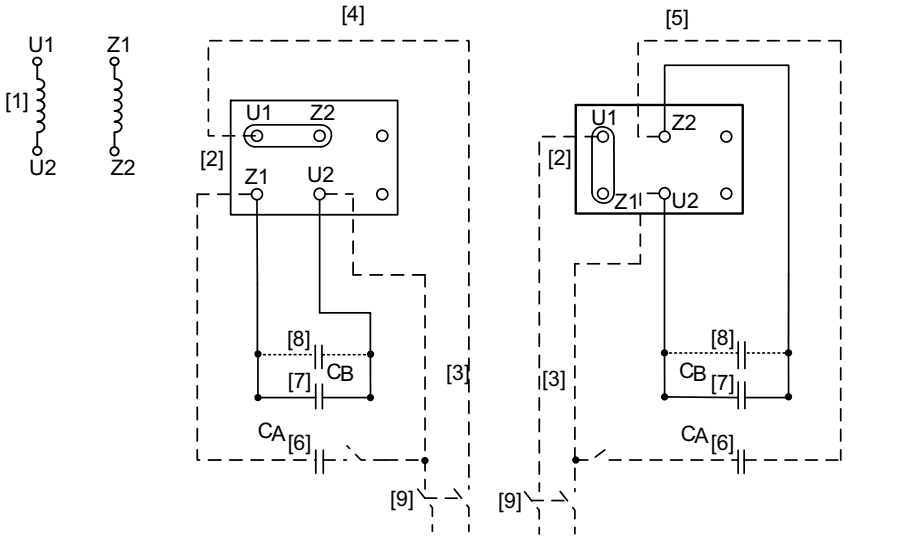
The following figure shows the wiring of the /V forced cooling fan for DC 24 V.

9007201648125067

[1] Forced cooling fan
[2] Terminal strip
[3] Polarity reversal protection diode

NOTICE

Damage to the forced cooling fan due to incorrect connection.

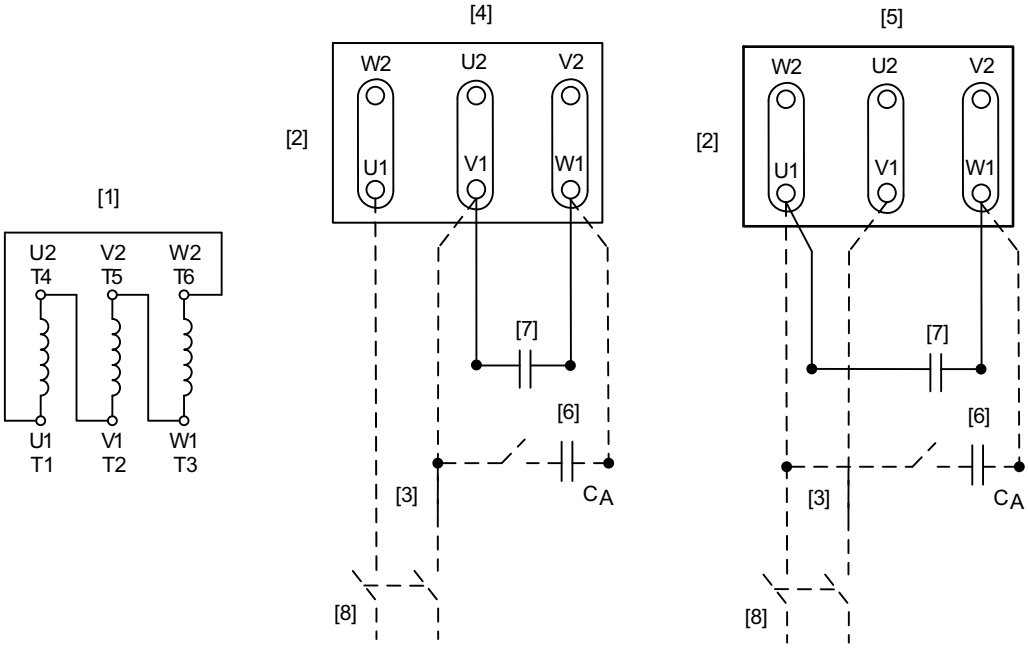


The drive system might be damaged.

- Observe the polarity when connecting the forced cooling fan.

25957074/EN – 06/2019

10.1.11 DRK... single-phase motor



ER10 wiring diagram

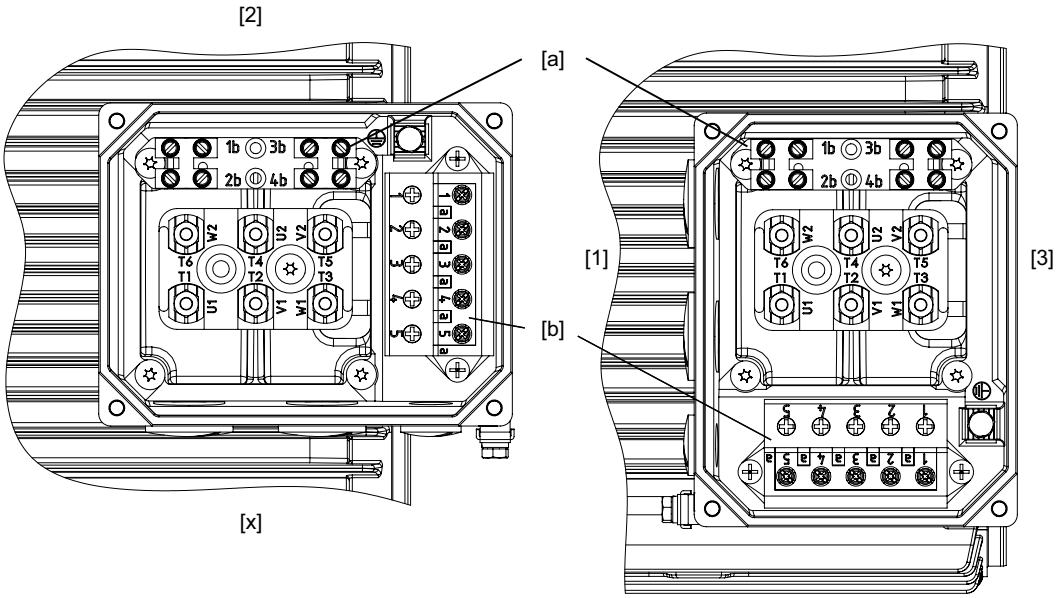
11919510027

[1]	Motor winding	[6]	Starting capacitor, switchable
[2]	Motor terminal	[7]	Running capacitor
[3]	Incoming cables	[8]	Further running capacitors (if available)
[4]	Counterclockwise rotation		
[5]	CW rotation, connected at factory	[9]	All-pole power switch

ER11 wiring diagram

11919511947

[1]	Motor winding	[5]	CW rotation, connected at factory
[2]	Motor terminal board	[6]	Starting capacitor, switchable
[3]	Incoming cables	[7]	Running capacitor
[4]	Counterclockwise rotation	[8]	All-pole power switch



25957074/EN – 06/2019

10.2 Auxiliary terminals

The following figure shows the arrangement of the auxiliary terminals for the different terminal box positions.

Terminal box position 2 and X, here X[1)]

Terminal box position 1 and 3, here 3

9007202826949515

1) If auxiliary terminal 2 is not provided, you can install auxiliary terminal 1 in the same position.

[1]	Terminal box position 1	[X]	Terminal box position X
[2]	Terminal box position 2	[a]	Auxiliary terminal 1
[3]	Terminal box position 3	[b]	Auxiliary terminal 2

Regardless of the terminal box position, auxiliary terminal 1 must always be mounted parallel to the terminal board.

The terminal structure can vary depending on the terminal box design.
