Metering pumps having an atmospheric discharge system pressure of less than 20 psi and will benefit from the installation of a back pressure control valve. Metering pumps in general require downstream back pressure to ensure smoother function of the discharge check assemblies, which enhances the accuracy of the discharge flow.

Pressure Relief Valves

Diaphragm Pressure Relief Valves are designed to relieve excess line pressure that exceeds the set pressure of the valve. This protects the system piping from overpressure that could result in hazardous leakage and/or damage to the pump and other system components.

The Pressure Relief Valves are normally recommended to be set between 5 and 10 PSIG above the system operating pressure.

The valve is of an in-line flow through design with bottom NPT relief port for piping back to supply tank or feed side of pump.

The valve is available with an optional gauge port, pre-plugged at the factory or can be ordered complete with gauge to suit application. This eliminates the need to install extra fittings in the line to accommodate the addition of a gauge for the purpose of reading and setting of pressure.

CAUTION:
The gauge port is solely for the installation of the gauge and cannot be used for the bleeding or venting of the system. Improper operation and/or hazardous consequences could result. ***(see gauge installation instructions)***

Pressure Relief Valves: Reason for Selection and Use

When using motor driven metering pumps, a pressure relief valve should always be installed on the downstream side of the pump to protect the system from over pressure which can cause pipe leakage and/or rupture.

Installation and Maintenance of Back Pressure Valves

Back pressure control valves are installed on the discharge line of the pump. The valve should be located within a 2 (two)-foot distance of the pump discharge to ensure check valve seating. When pumping to a process line without an injection valve, the back pressure valve should be installed as close as possible to the injection point to prevent siphoning.

When used in conjunction with a pressure relief valve, always locate the back pressure valve on the downstream side of the relief valve.

The valve is supplied from the factory pre-set at 50 psig. To increase the pressure setting, back off the lock nut located beneath the colour coded handle. Turn the handle clockwise to increase pressure setting or counter clockwise to reduce pressure setting. Approximately one (1) full turn of the handle is equal to 10 psig.

If maintenance is required on the valve:

1. Ensure that the valve is properly isolated from the line, not under pressure and properly flushed of chemical before proceeding to disassembly.
2. Turn knob on the top of valve, counterclockwise until all spring pressure is released **before** proceeding to undo retaining nuts, to remove top of valve for diaphragm replacement.
3. All working components ie. diaphragm, spring can be accessed by removing the four retaining nuts located on the top of the valve (item # 9 of parts breakdown). For ¼" and ¼" x ½" Top Valves, use 5/32" Allen Key / #4 Hex Key. For ½" sizes and up, use a 3/16" Allen Key / #5 Hex key.
4. When replacing the diaphragm, ensure the PTFE coated side of the diaphragm is facing down when viewed from the top of the valve. The installed diaphragm also functions as the body seal. (Torque nuts to 55 inch pounds when reassembling.)

Set Pressure Safety Feature

The valve adjustment handle/bolt length is designed to prevent operators from engaging the spring to a coil binding situation that would cause serious function and safety concerns.

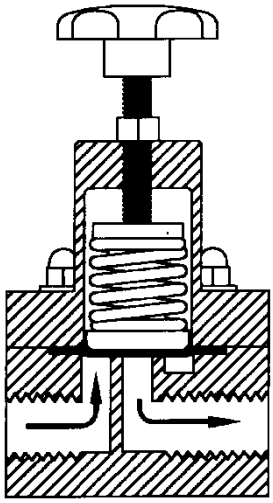
In order to achieve max pressures within the top 10% of the valve range, the lock nut on the adjustment handle/bolt must be removed prior to setting the pressure. Ensure that all system pressure has been released before removing the lock nut and re-installing the approved valve handle/bolt.

The valve handle/bolt is the only approved adjustment component to be used on our valves. Deviation from this will void manufacturer warranty and liability.

Installation and Maintenance of Pressure Relief Valves

Pressure relief valves are installed on the discharge line of a pump and should be located as close as possible to the metering pump. The valve is of an in-line flow through design with a bottom NPT relief port for piping back to the supply tank or feed side of the pump.

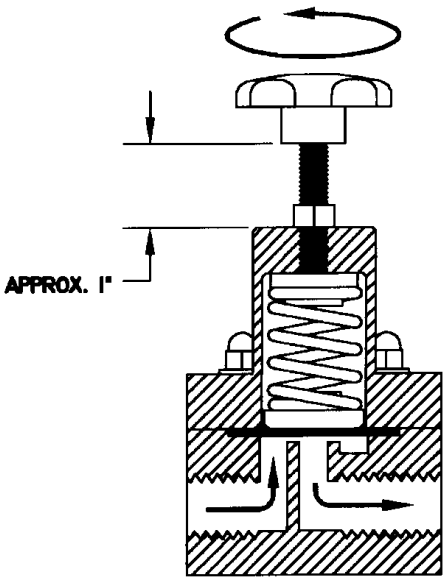
Never install shut-off/isolation valves between pump discharge and in-line pressure relief valves. When using in conjunction with a back pressure control valve, always install back pressure valve downstream of pressure relief valve. The relief port on the pressure relief valve should be piped back to the feed tank or suction side of the pump (see typical installation schematics).



CAUTION:
The plastic valve bodies have standard NPT threads, which are tapered. When installing pipe into the body, hand tighten only to avoid cracking.

Gauge Installation Instructions: (When ordered with valve only)

For the convenience of pressure setting and reading, there is an optional plugged gauge port provided, if the valve has not been ordered complete with gauge. **Important:** use a ***TORX style # T-45*** wrench or screwdriver **only** to remove plug from plastic valves. Any other tool will strip the body of the plug and require an extractor to remove the threaded plug.

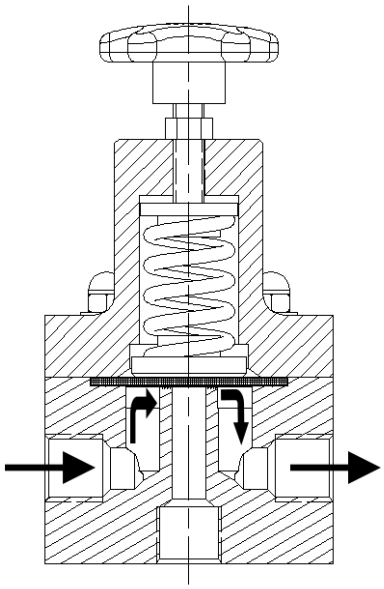


CAUTION:
Before removing the gauge port plug to install a gauge, ensure that the discharge line is not under pressure and lines are flushed with water prior to proceeding. Ensure that the gauge you are using is chemical resistant to the fluid before installing.

Manual Air Release for Back Pressure Valve Only

DIAPHRAGM POSITION AT
50 PSI BACK PRESSURE

The valve is shipped with a factory set pressure of 50 psig. The diagram to the left shows a cut-away view of the position of the diaphragm on the seat.



AIR RELEASE POSITION WITH
HANDLE BACKED OFF

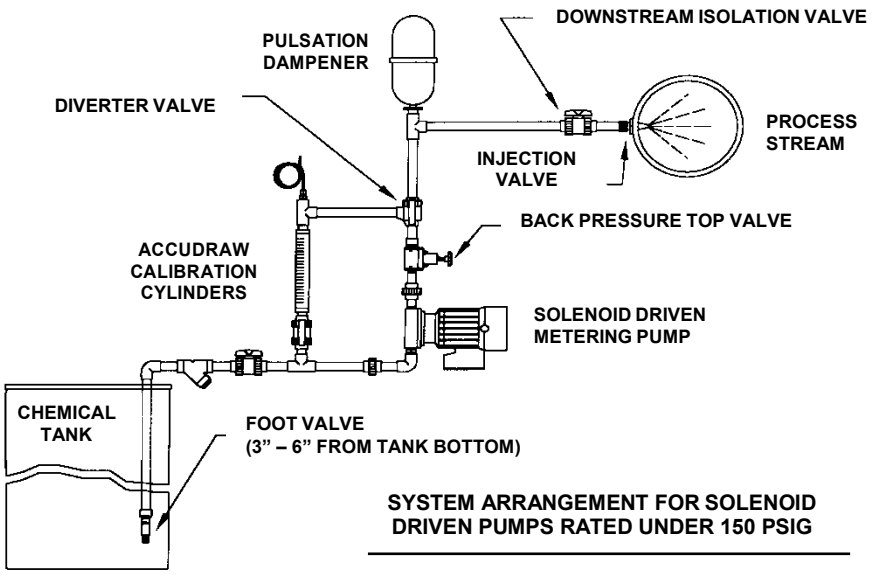
To adjust the valve to relieve air or gas downstream:

1. Back off lock nut located beneath the colour coded handle.

2. Turn handle counter clockwise until approximately 1 inch of thread is exposed.

3. At this adjustment, the spring has relieved all tension from the diaphragm allowing air or gas to be vented downstream.

Flow through design Pressure Relief Valve



The bottom port relieves over pressure.

PROJECT			

ALL New Clamping Device for TOP VALVE, Back Pressure and Pressure Relief Valves

This new polypropylene-clamping device now makes it even easier than ever to support TOP VALVE, back pressure or pressure relief valves in service, to help eliminate pipe strain and the need for expensive mounting brackets.

It's simple to install, economical to purchase and we've reworked the top of the valve body now available on all new valves, to assist with the support.

TV-_ _ -CLAMP

Sample Installation

Part #

TV-25-CLAMP to fit ¼" Valves and ¼ - ½" Valves

TV-51-CLAMP to fit ½" through 2" Valves

Flow Rates

Subject: Flow capacity through TOP VALVE, back pressure and pressure relief valves. Under continuous flow conditions: @ **50 PSI** with ambient temperature water

¼" valve	4	USGPM
¼"/½" valve	4	USGPM
½" valve	6	USGPM
¾" valve	8	USGPM
1" valve	14	USGPM
1½"valve	25	USGPM
2" valve	40	USGPM

Note: Capacities will increase with pressure. (If pressure is doubled, flow rate will approximately double.) For capacities of valves with pulsating flow use approximately ⅓ of the above given flow values.

Temperature Correction Factors: Thermoplastics

Temperature Effects: Thermoplastics and thermosets will decrease in tensile strength as the temperature increases: therefore, the working pressure must be reduced accordingly. The following factors will apply:

Operating Temperatures		{Factors}			
F	***C***	***PVC***	***CPVC***	***PP***	***PVDF***
70	21	1.00	1.00	1.00	1.00
80	27	1.00	1.00	1.00	1.00
90	32	1.00	1.00	1.00	1.00
100	38	.90	1.00	1.00	1.00
110	43	.83	1.00	.91	1.00
115	46	.75	1.00	.87	1.00
120	49	.66	1.00	.83	1.00
125	52	.58	.97	.79	1.00
130	54	.50	.95	.75	1.00
140	60	.33	.90	.66	1.00
150	66	NR	.80	.60	.97
160	71	NR	.70	.53	.93
170	77	NR	.60	.43	.86
180	82	NR	.50	.33	.80
200	93	NR	.33	NR	.66
210	99	NR	NR	NR	.60
240	116	NR	NR	NR	.40
280	138	NR	NR	NR	.16

Example:
Maximum Pressure for PVDF valve at 280°F (138°C)
Factor = 0.16 x 150psig = 24psig max. pressure
Factor = 0.16 x 1034kPa = 165.44kPa max. pressure

The maximum pressure rating for valves regardless of size is 150 PSIG (1034 kPa) at 73° F (22°C)

NR = not recommended

Primary Fluid Systems, Inc. takes no responsibility for the enclosed data.

NOTE: If the material of the valve you have chosen is rated below the working pressure of your system than you must reconsider your choice. The standard valve top material of construction is PVC and should be taken into temperature consideration. (Other materials of construction are available, consult price list or factory)

NOTE: When considering working temperature, include ambient and potential collective surface temperature (Radiant Heat).

LIMITED WARRANTY

Primary Fluid Systems Inc. (Primary) warrants its products against defects in workmanship or materials for one (1) year under normal use. Three-(3) year available when application card is completed and returned to factory. Application card can be obtained by emailing request to sales@primaryfluid.com

Primary's obligations and liabilities under this warranty shall be limited to replacement of the product, or a refund of an amount not to exceed the purchase price of the product(s) to which such warranty claim is made. Repairs or replacements are made subject to our inspection of the returned product(s). Primary's decision of one of these alternatives shall be the buyer's exclusive remedy.

This warranty does not extend to damage by corrosion or other decomposition by chemical action. Primary does not warrant damages caused by (a) improper use of the product, (b) unauthorized modification or attachment to product, (c) misuse, abuse, accident or negligent handling or installation of product, or (d) alterations or repairs made by purchaser.

The materials of construction offered are recommendations only, subject in all cases to acceptance by purchaser. These recommendations do not constitute any guarantee against corrosion or decomposition, but are based on previous experience and best available information of the industry.

Statements and instructions set forth herein are based on the best information and practices known to Primary, but it should not be assumed that every acceptable safety procedure is contained herein. Of necessity Primary cannot guarantee that actions in accordance with such statements and instructions will result in the complete elimination of hazards and it assumes no liability for accidents that may occur.

Except as specifically provided herein, Primary makes no warranty, representations, promise or guarantee, either express or implied, statutory or otherwise, with respect to the product and technical information provided, including the products' quality, performance, merchantability, or fitness for a particular purpose.

In no event will Primary be liable for indirect, special, incidental, economic, covert or consequential damages arising out of the use or inability to use the product, including without limitation, damages or costs relating to the loss of profits, business and good will even if advised of the possibility of such damages. In no event shall Primary's liability exceed the amount paid by you for the product.

The warranty and remedies set forth herein are exclusive and in lieu of all others, oral or written, express or implied. No Primary dealer, distributor, agent or employee is authorized to make any modification or addition to this warranty. This warranty gives you specific legal rights and you may also have other rights which vary from state to state.

TRANSPORT & STORAGE

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS".
Man, machine and environment are endangered if the safety instructions are not observed.

General

sera products are checked for perfect condition and function previous to shipment.
Check for transport damage immediately after arrival of goods. If damage is found, this is to be reported immediately to the responsible carrier and the manufacturer.

Storage

An undamaged packaging protects the unit during storage and should only be opened when the product is installed.
Proper storage increases the service life of the product and includes prevention of negative influences such as heat, moisture, dust, chemicals etc.

The following storage specifications are to be obsered:

- Storage place: cool, dry, dustfree and slightly ventilated
- Storage temperature and relative air humidity see Chapter „TECHNICAL DATA".
- The maximum storage time for the standard packaging is 12 months.

If these values are exceeded, metal products should be sealed in foil and protected from condensation water with a suitable desiccant.

Do not store solvents, fuels, lubricants, chemicals, acids, disinfectants and similar in the storage room.

Type key

1 — Type of drive (combinations possible)

C	controllable
M	not adjustable
R	adjustable

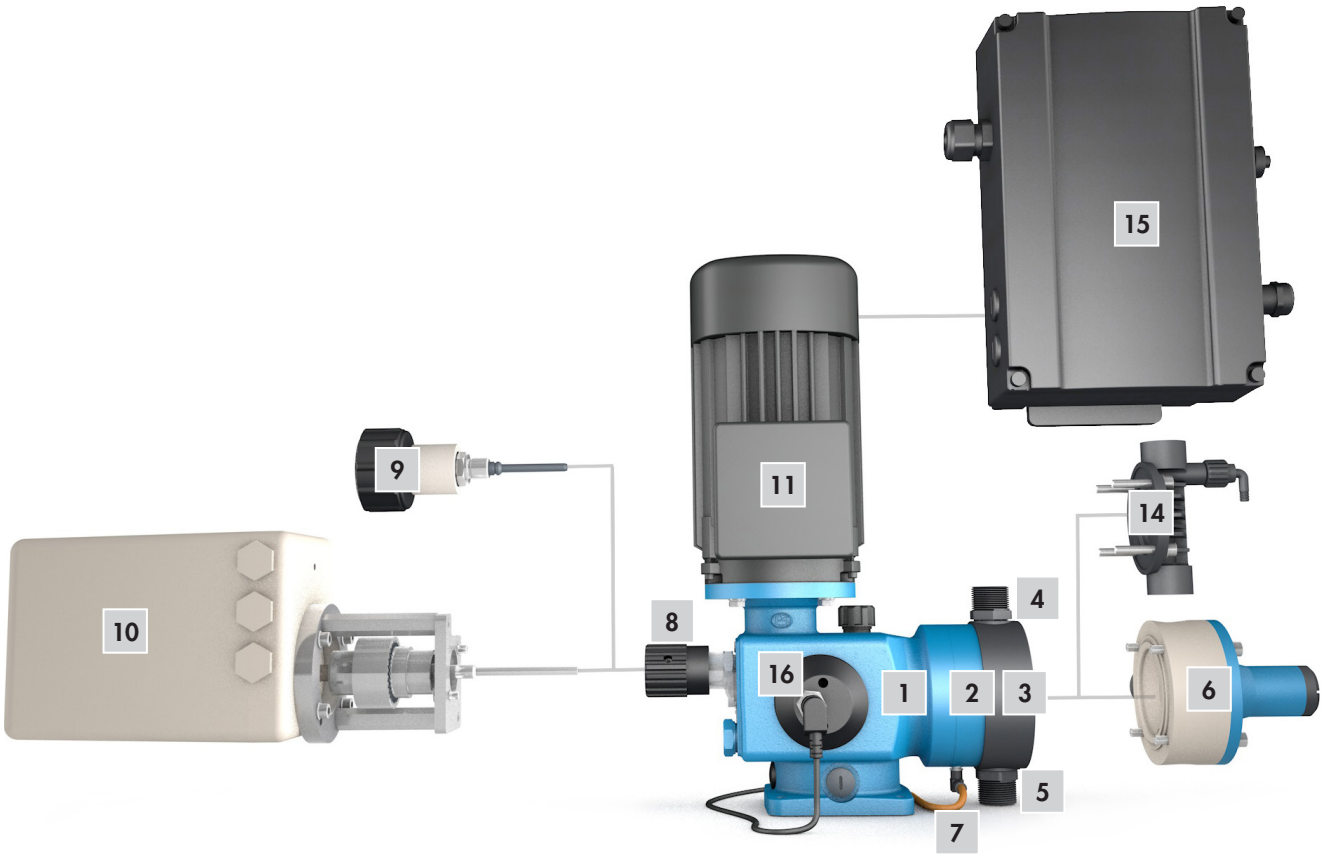
Type plate

Each **sera** pump is factory provided with a type plate. The following information can be found on this type plate.

No.	Designation
1	Pump type
2	Serial number of the pump
3	Minimum/maximum permissible pressure in the pump inlet Minimum/maximum permissible pressure in the inlet cross section which the pump can be used for. Please consider that pressure depends on rotation speed, delivery rate, temperature and static pressure at the inlet.
4	Maximum permissible pressure in the pump outlet Maximum permissible pressure in the outlet cross section which the pump can be used for. Please consider that pressure depends on rotation speed, delivery rate, temperature and static pressure at the outlet.
5	Nominal delivery rate Delivery rate which the pump was ordered for, based on the nominal rotation speed nN, the nominal delivery height p2max. and the delivery medium stated in the supply contract.
6	Nominal stroke frequency

Notes attached to the product



Symbols which are directly attached to the pump, e.g. arrows for direction of rotation or symbols for fluid connections are to be observed and kept in legible condition.

Materials

The materials used are stated in the order confirmation and the product description.

sera dosing pumps are run-dry safe oscillating displacement pumps that are characterised by high tightness of the dosing head. The fluid is conveyed by a deformable diaphragm.

Stroke mechanism (1)

Piston diaphragm pumps of this type series use a rotary cam drive to transmit the rotation of the drive motor to the displacement body.
In case of the rotary cam drive, the eccentric (**1.1**) provides the pressure stroke while the suction stroke is performed by a pressure spring (return spring) (**1.2**).
The effective stroke length can be changed by means of an adjustable scale knob (**1.3**) which prevents the connecting rod from following the rotary cam up to the rear dead centre during suction stroke (see stroke length adjustment).

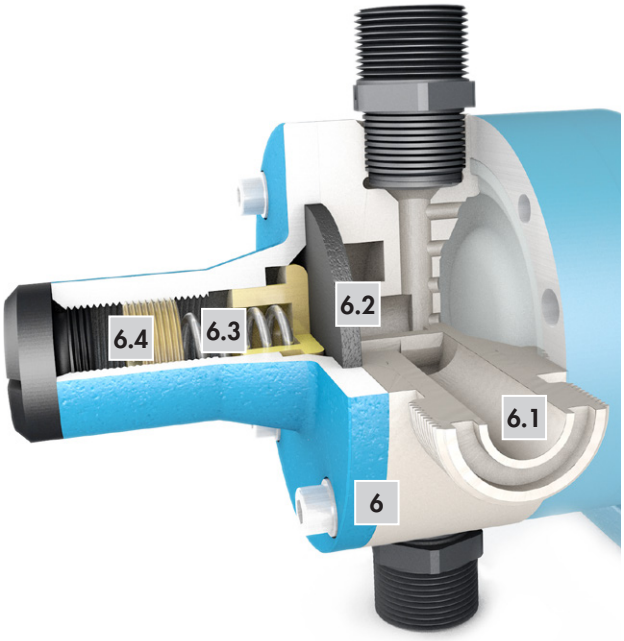
Assembly pump (2)

The drive diaphragm (**2.2**) connected to the drive via the connecting rod (**2.1**) transmits the stroke movement directly to the pumped medium.

Pump body (3)

Depending on the applied backpressure, movements of the plastic pump body in elastic materials are possible.
This does not affect the pumps's service life or operational reliability.

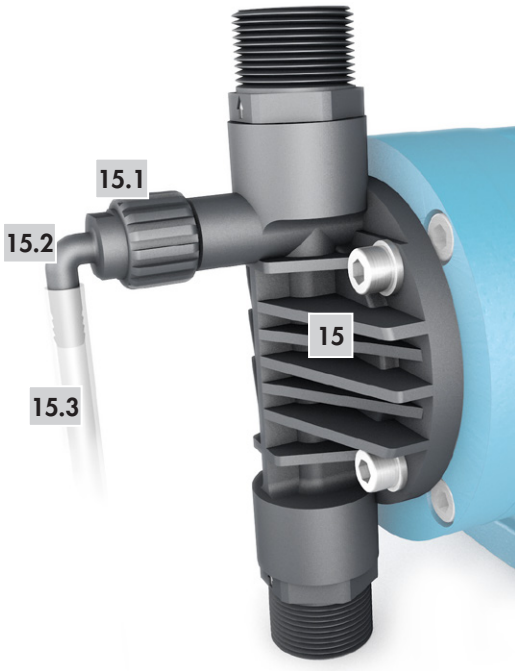
Pressure valve / Suction valve (4/5)



The pump valves are ball valves that only work properly in a vertical position. The condition of the valves has a deciding effect on the operating capability of the pump. Valves must be exchanged as complete units. When replacing the valves it is important to check the flow direction (**4.1/5.1**) .

ATTENTION

Pressure valve above, suction valve below!



Pump body with integrated overflow valve (6)

The integrated diaphragm overflow valve protects the pump from unacceptable overpressure at closed pressure line. Pipes and fittings, however, are not protected and have to be protected separately, if necessary. It can be used for liquid media without solid matters according to the manufacturer specifications.
Pump bodies with integrated overflow valve are equipped with an additional relief channel (**6.1**) through which the pumped medium is drained in case of an unacceptable overpressure.
The relief channel is closed by the mechanically prestressed diaphragm (**6.2**) of the overflow valve.
The mechanical prestress which is executed by a pressure spring (**6.3**) can be adjusted with a set screw (**6.4**). If the pressure of the pumped medium on the diaphragm exceeds the set pressure, the diaphragm is lifted and the pumped medium flows into the relief channel.
When the pressure in the pump body falls below the pressure set the diaphragm closes the inlet channel again.

Pump body with manual vent valve (14) (409.2-1,6e; -2,4e)

The vent valve is used to release the manual pressure in the pump body (**15**) during commissioning. Open vent valve when pump primes first time.
When vent valve is opened gas including medium escapes into the feedback line. The vent valve must be closed again as soon as only medium without gas constituent escapes. The pump now feeds the medium into the pressure line.
Open again for another ventilation. The vent valve consists of a vent screw (**15.1**) with integrated hose nozzle Ø 6,5 (**15.2**), which must be fitted with a hose (**15.3**) (inside diameter 6 mm) as feedback line. The leaking medium incl. the gas admixtures must be disposed off properly.
The vent screw is inserted during normal operation.

ATTENTION

Open vent screw with great caution and perform max. 1 turn. Take care that the tightness of the thread is still guaranteed.

ATTENTION

The vent screw must always be closed during the driving process.

Diaphragm rupture monitoring device (7)

C409.2 /C410.2 (standard)

sera - pumps of the C409.2 series are equipped with a conductive diaphragm rupture monitoring device.

NOTE

The sensitivity of the diaphragm rupture electrode can be adapted to the conductivity of the medium via the electronics (see the technical manual of the control). Preset ex works to 50% approx. 10 µS/cm.

...409.2 / ...410.2 (option)

sera pumps of the R(F)/M(F)409.2 /R(F)/M(F)410.2 series can be equipped with a conductive diaphragm rupture monitoring device as option.

ATTENTION

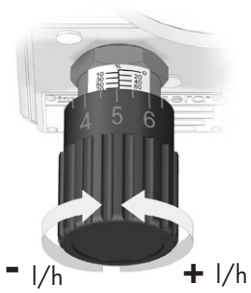
The pumped medium must have a minimum conductivity of at least 5 µS/cm!

An electrode together with an approprate evaluation unit (option, e.g. **sera** diaphragm rupture relay, type ER-104 (or ER-142 for Ex-areas respectively) is used for monitoring. The diaphragm rupture electrode is mounted directly to the pump, the evaluation unit inside the switch cabinet.
The diaphragm rupture electrode type MBE-02 is not mounted by sera due to transport. We put the MBE-02 electrode onto the cable and fix it to the pump in a separate bag.
Put the diaphragm rupture electrode is in the base ring (**2**) of the pump from below (see pig. „Components ...").

Stroke length adjustment

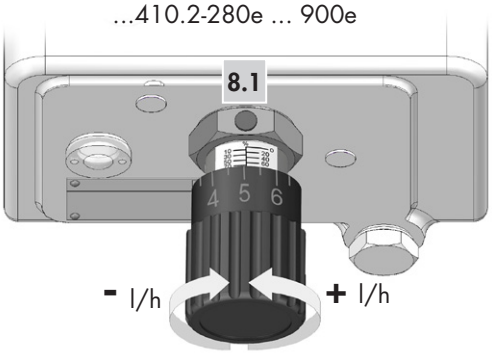
The delivery rate of the pump is set by changing the stroke length. The stroke length is infinitely variable between 0% and 100%..

NOTE



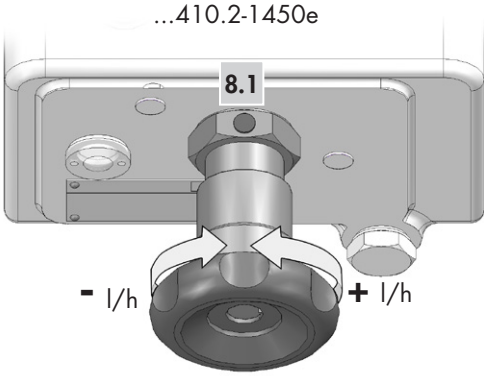
A linear dosing behaviour is achieved with stroke length adjustments between 20% and 100%.

Manual stroke length adjustment (standard) (8)



The effective stroke length of the connecting rod is changed by turning the scale knob.
The stroke length should be adjusted during operation of the pump.
The set stroke length can be read off a scale, e.g. 75%.
With the 20-steps adjustment on the scale knob, the stroke length can be set individually with a tolerance of 0.5%..

A protecting cap can be provided for the protection of the stroke length adjustment against unintentional adjustment.

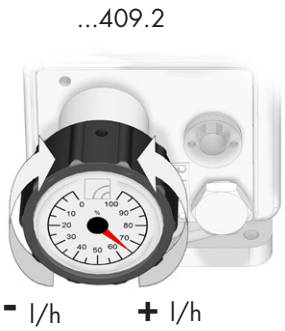


...409.2

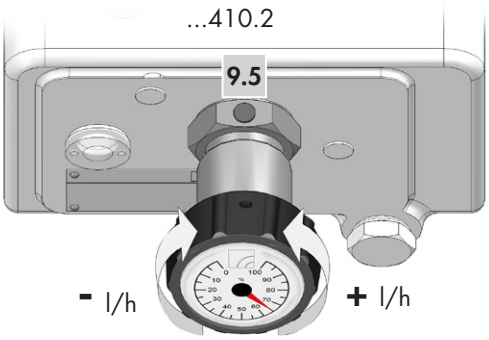
...410.2-280e ... 900e

...410.2-1450e

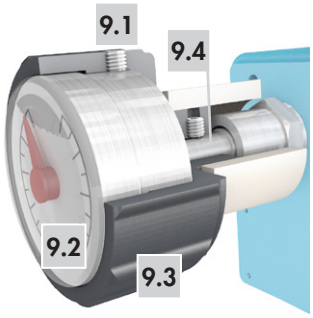
ACHTUNG



The locking (**8.1**) is to be released (us-ing a spanner SW3) before the stroke length is changed. Then the locking must be tightened again. This ensures that the set stroke length does not change during opera-tion.



Manual stroke length adjustment by a dial scale with indication of percent (option) (9)



The stroke length is adjusted by turning the hand wheel.
The stroke length shuold be adjusted during operation of the pump.
The set stroke length can be read off the percent scale (the example shows a set stroke length of 65%).
In delivery state, the stroke length adjustment is factory set to 50%.

ATTENTION

The dial scale with indication of percent may become misadjusted during transport.
If the indicator does not match the 50% setting, then the percent scale must be re-adjusted during operation (!) of the pump!

Adjusting the percent scale:

- Switch on the pump.
- Loosen setscrew (**9.1**).
- Remove percent scale (**9.2**) from the hand wheel (**9.3**).
- Manually turn the percent scale to 0% setting.
- Loosen the locking (**9.5**) ► bei ...410.2.
- Use the hand wheel to set the stroke length to 0%.
- Turn hand wheel clockwise until there is no further stroke movement (connecting rod does no longer hit the adjusting spindle (**9.4**)).
- Insert percent scale again.
- Use the setscrew to secure the percent scale to the hand wheel.
- Adjust desired stroke length.
- Tighten the locking (**9.5**) ► bei ...410.2.

Automatic stroke length adjustment by means of an electrical actuator (10)

The electrical actuator is directly mounted to the stroke mechanism (**1**) of the pump. A clutch transmits the rotary motion of the actuator drive shaft to the adjusting spindle. The axial displacement is compensated in the clutch.
In case of dosing pumps with electrical actuator, a manual adjustment of the stroke length on the pump is no longer possible. (Exception: actuator with hand wheel)
The actuator is equipped with two integrated limit switches as well as a position potentiometer for position feedback as standard. Both limit switches are factory set so that the drive will switch off at a stroke length of 0% and 100%, even if a control voltage is applied.
This guarantees that adjustments can only be made within the permissible range. The position potentiometer is driven by a safety clutch which prevents damage caused by incorrectly adjusted limit switches.
Activation is performed by appropriate control units (see **sera** - accessories).
The set stroke length can be read off on the pump (percent scale).
Information on the electrical connection is given inside the cover of the actuator.

ATTENTION

The adjustment is only possible when the pump is running!

Automatic stroke length adjustment by means of an electrical actuator with integrated positioner

same as Chapter „Automatic stroke length adjustment by means of an electrical actuator (10)", additionally:

This positioner which is integrated in the actuator enables an actuator setting from 0…100% that is proportional to the connected input signal.
As an option, the actuator can also be provided with a collective interference signal. Information on the electrical connection is given inside the cover of the actuator.

Drive motor C409.2 / C410.2

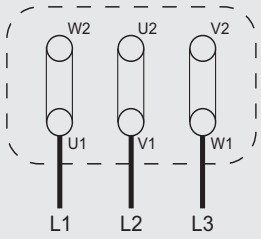
A **sera** motor pump of series C409.2 is driven by a threephase-motor controlled by the electronics.

A protective motor switch is not necessary due to the fact that a thermic overload protection is integrated in the pump for the protection of the motor.

Drive motor ...409.2 / ...410.2

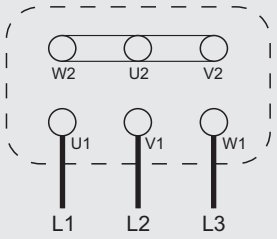
sera motor pumps R(F)/M(F)409.2 /R(F)/M(F)410.2 are driven either by a three-phase motor.
Standard: three-phase motor (with PTC thermistor; suitable for operation with frequency converter).

Motor connection



In case of a three-phase motor

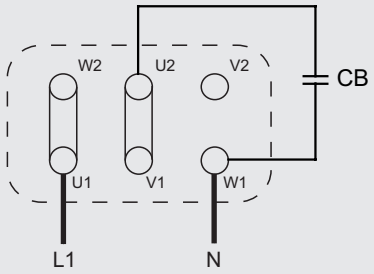
The motor connection depends on the voltage indication on the type plate and the applied supply voltage.



Example:

Indication on the type plate:	Δ 230V/ Y400V 50Hz
Three-phase power system on sit:	Y400V 50 Hz
Correct motor connection:	Star connection (Y)

Δ Delta connection



Y Star connection

In case of an AC motor

The AC motor has a main and an auxiliary winding. The running capacitor is switched in series to the auxiliary phase.

Direction of rotation

The direction of rotation of the drive motor is arbitrary.

Terminal box

Before closing the terminal box, please check that:

- All terminal connections are tightly fitted.
- The interior is clean and free of foreign bodies.
- Unused cable entries are closed and screw plugs are tightened.
- The sealing is correctly inserted in the cover of the terminal box; check proper condition of all sealing surfaces so that the demands of the protection category are fulfilled.

Motor protection

Provide for adequate motor protective equipment in order to protect the motor from overload (e.g. motor protection switch with thermal overcurrent release).
Connect the ground wire to the marked earth screw in accordance with VDE 0100.

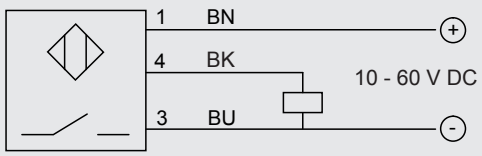
ATTENTION

Fuses do not protect the motor!

Conrol C409.2 Pro+/ C410.2 (12)

Among other things, the control enable the proportional dosing via analogue signals 4 … 20 mA or contact signals with the possibility of pulse division or pulse multiplication.
The graphical display shows information about the current status of the pump.
A connection for flow monitoring or flow rate measurement and an „empty" signal with pre-alarm and dry run alarm are available as standard.

INTERFACE MODULE (13) (accessories C409.2)



The INTERFACE MODULE provides level input and PROFIBUS connectivity (see TM05).

Stroke frequency transmitter (16) (option RF409.2 / RF410.2)

sera pumps R(F)/M(F)409.2 /R(F)/M(F)410.2 are oscillating displacement pumps with an exactly defined stroke volume per each pump stroke.
If these dosing pumps should be used for automatic filling processes or charge dosing, then the single pump strokes must be determined and converted into electrical signals.
For this purpose, a stroke frequency transmitter (inductive contactor) is added to the pump (the option cannot mounted additionally) and reports each single pump stroke to the evaluation unit (e.g. preselection counter, SPC-control unit, etc.).

Technical data	
Rated voltage	10 - 60 V DC
Constant current	< 200 mA
Short circuit-proof:	
Connection mode	plug connector with 2 m cable
LED (green)	indicates supply voltage
LED (yellow)	indicates switching status

Wiring diagram

ATTENTION

When switching inductive loads (protectors, relays, etc.), surge protectors (varistors) must be fitted owing to the high self-induction voltage!

ATTENTION

When the pump is deployed in exlosion-hazardous areas a NAMUR type stoke frequency transmitter (II2G EExia IICT6, acc. to. ATEX95) is to be provided!

HLV ► Manual stroke length adjustment
(Measurements in mm)

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS".
Man, machine and environment are endangered if the safety instructions are not observed.

NOTE

Pump design data for dosing and its temperature can be found in the order confirmation.

NOTE

Operating conditions:
Ambient temperature, relative air humidity and max. installation altitude ► see chapter „Technical data".

- The standard model of the pump is only approved for installation in dry areas in a non-aggressive atmosphere.
- Protect the pump from heat sources, direct sunlight and UV light.
- See "Dimensions" chapter for dimensions of the pump connections and fixing holes.
- Fixing the pump with at least four bolts above the pump base is required for safe operation.
- Install the pump so that there is no vibration and no tension and that it is aligned precisely.
- Install the pump at the optimum possible operating height. Mount the pump so that the valves are vertical.
- Ensure that there is sufficient space around the pump body and the suction and pressure valve so that these parts can be easily dismantled if required.
- Design the nominal diameters of the downstream piping and the valves installed in the system to be the same size or larger than the nominal inlet and outlet diameters of the pump.
- To check the pressure ratios in the piping system, it is recommended to provide connections for pressure measurement fittings (e.g. manometers) near the suction and pressure ports.
- Drain valves must be provided.
- Before connecting the pipes, remove the plastic caps on the suction and pressure ports of the pump.
- Check the fastening bolts for the pump body for tightness and tighten if necessary, see chapter "Overview of the tightening torques".
- Connect pipes to the pump so that there are no forces acting on the pump, such as e.g. misalignment, weight or strain of the pipe.
- Keep the suction pipes as short as possible.
- Use pressure and medium resistant hoses / pipes.
- All pipes and containers connected to the pump must comply with the regulations and must be cleaned, tension-free and intact.
- Display devices must be easily accessible and readable.

In order to avoid cavitation, overload or excessive delivery, the following points should be noted:

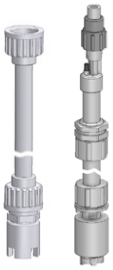
- Avoid high suction heights.
- Keep pipes as short as possible.
- Select sufficiently large nominal diameters.
- Avoid unnecessary choke points.
- Install a pulsation damper.
- Install overpressure protection.
- Install a pressure-sustaining valve, if necessary
- Provide feed line for outgassing media.

WARNING

The pump with a control is only designed for operation outside Ex-zonest!

SUCTION SIDE (1)

The following fittings can be used on the suction side:



1.1 Line strainer

1.2 Suction aid
Siphon vessel

1.3 Suction lance

1.4 Multifunction device

1.5 Foot valve

1.6 Shut-off valve

PRESSURE SIDE (2)

The following fittings can be used on the pressure side:

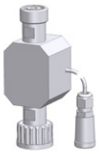
2.1 Vent valve

2.2 Injection fitting

2.3 Dosing valve

2.4 Pulsation damper

2.5 Diaphragm pressure keeping valve



2.6 Diaphragm relief valve

2.7 Multifunction valve

2.8 Flow meter [1]

2.9 Flow monitor [1]

2.10 Shut-off valve

[1] only for diaphragm pumps with a control

SUCTION SIDE (1)

Line strainer (1.1)

Connect suction line slightly above the bottom of the tank and install a line strainer (0.1 – 0.5 mm mesh size – depending on valve nominal diameter of the pump).

ATTENTION

If impurities are not removed, this results in malfunctions of the pump and the system.

Suction aid / siphon vessel (1.2)

For high tanks without connection on the bottom of the tank ► install suction aid / siphon vessel.
Thereby, pay attention to accelerating pressures which may be generated in a long suction pipe.

Suction lance (1.3)

Install a suction lance for removal of chemicals from tanks and barrels.
The integrated foot valve prevents the backflow of the suctioned medium.
The suction lances are equipped with a level switch for „empty“ signal.

Multifunction device (1.4)

The multifunction device is installed in the suction side piping of the pump and is used for determination of the delivery rate of pumps under real operating conditions.
The device can be filled either using a pending tank volume (communicating container) or using a hand vacuum pump.

Foot valve (1.5)

To prevent running dry of the suction line ► install foot valve (check valve) at the end of the suction line.

PRESSURE SIDE (2)

Vent valve (2.1)

If air can be drawn in due to falling liquid level in the suction tank and at the same time delivered to a pressurised line or against a pressure-sustaining valve ► install vent valve in the pressure line.

NOTE

The delivery flow can be interrupted if there is air in the suction line!

Injection fitting (2.2)

Install an injection fitting that routes into a main line to prevent the backflow of the pumped medium in the dosing line.

WARNING

Unwanted mixing in the dosing line occurs if any possible backflow from the main line is not prevented.

Dosing valve (2.3)

Installation of the dosing valve prevents the liquid from the system to be treated being able to penetrate into the dosing line.

Pulsation damper (2.4)

Damping of the pulsation by installation of pulsation dampers if:

- a low-pulsation delivery flow is desired for process reasons,
- acceleration forces caused by the piping geometry must be removed.

Install pulsation damper as close as possible to the pump head.
If both pulsation damper and pressure-sustaining valve should be integrated, install the pressure-sustaining valve between pump and pulsation damper.

WARNING

Undamped acceleration forces can result in the following faults / damage:

- flow rate fluctuations
- dosing errors
- pressure surges
- valve shocks
- increased wear on the suction and pressure sides of the pump
- mechanical destruction of the pump
- leaks and valve shocks if the permissible maximum pressure on the pump pressure
- side is exceeded
- damage to the piping and its installed fittings

Diaphragm pressure-keeping valve (2.5)

If dosing into a main line with negative pressure ► install pressure-keeping valve in the dosing line.

ATTENTION

It must be ensured during the installation that excess delivery (due to positive pressure difference (≥ > 1 bar) between pressure and suction sides) is avoided.

Diaphragm relief valve (2.6)

If the permissible pressure in the system can be exceeded by closing any shut-off valve or by clogging of the line ► install diaphragm relief valve.

When using an external overflow valve, the following is applicable for the return line:

- Route the return line sloping downward into the storage tank which is under atmospheric pressure or into an open drainage channel.
- Or connect directly to the pump suction line, but only if there is no check valve in the suction line (e.g. foot valve of a suction lance).

ATTENTION

Shut-off valves must not be closed when the pump is running!

WARNING

An overpressure protection device (e.g. relief valve) must generally be provided if the permissible operating pressure can be exceeded.

ATTENTION

If the permissible operating pressure is exceeded and the pump is not equipped with overpressure protection, the pump will be damaged.

WARNING

The pumped medium can spray out if the pump is damaged.

Multifunction valve (2.7)

The multifunction valve provides the following functions:

- pressure-keeping valve function,
- overflow valve function,
- pressure relief function,
- venting.

The multifunction valve is mounted directly on the pump pressure port.

Flow meter (2.8)

For measurement and monitoring of the flow rate ► install flow meter.
The application range is restricted to media that are similar to water.
The flow meter is screwed upright on the pressure port of the pump and connected to the pump electronics via the input for flow monitoring.

Flow monitor (2.9)

To record the flow rate of the pump ► install flow monitor.
The application range is restricted to media that are similar to water.
The flow monitor is screwed upright on the suction port of the pump and connected to the pump electronics via the input for flow monitoring.

Operation in Ex-zone C409.2 / C410.2

WARNING

The pump with a control is only designed for operation outside Ex-zonest!

Operation in Ex-zone R/M 409.2 / R/M 410.2

WARNING

The prerequisite for the use in explosion-hazardous areas is an appropriate design of the pump.

The product supplied by **sera** meets the requirements of directive 2014/34/EU if it is correspondingly marked. This guarantees safe operation in explosion-hazardous areas.

WARNING

It is the operator's task to define the field of application and to check whether the pump is suited for this application. He/she must clearly define the zone, the device category, the explosion group and the temperature class.

WARNING

Avoid build up electrostatic conditions!

WARNING

To avoid contamination of the valves strainers in the suction line have to be installed!

Identification

The pump has a label stating the zone/device category /explosion group/temperature class in compliance with directive 2014/34/EU.

Ex II2G c IIBT4 bzw.
Ex II2G c IICT4
(note special specifications in the confirmation of order.)

Installation

The intended operating conditions in explosion-hazardous areas according to directive 2014/34/EU are stated in the confirmation of order or the product description. The indicated limit values should not be fallen below or exceeded. Installation regulations given in the operating instructions must be adhered to.

WARNING

Use only suitable tools for performing assembly and maintenance work on machines or plants in explosion-hazardous areas. Directive 99/92/EC must be observed.

Potential equalization

After mounting the pump the proper connection to the site potential equalization is to be ensured. The max. bleed resistor (1MΩ) has to be checked and documented.

Start-up

After installation, the pump must immediately be used for the suction of fluids, i.e. the pump must immediately be started after the tank has been installed and filled.

Operation

The intended operating conditions in explosion-hazardous areas according to directive 2014/34/EU are stated in the confirmation of order or the product description. The indicated limit values should not be fallen below or exceeded. Details about explosion zone, device category, explosion group and temperature class can be seen from the Declaration of Conformity.

Degassing of the pumped medium:

- Never let the pump run dry.
- Check the liquid level in the tank during operation of the pump.
- Make sure that the pump is switched off when the liquid level in the tank falls below the minimum level required (explosive atmosphere may be carried over)..

Vapour bubbles from the pumped medium are harmless as they have no explosive potential.

WARNING

Formation of an explosive gas mixture must be prevented.

Temperature indications

Permissible ambient temperature: -10°C ≤ Ta ≤ +40°C

Maintenance

The maintenance notes listed in Chapter 10 are generally applicable. **Exception:**

ATTENTION

The oil level in the stroke mechanism of the pump must be checked once a week!

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS“.
Man, machine and environment are endangered if the safety instructions are not observed.

Adequate fastening at the pump foot and compliance with the operating parameters specified in the technical data are required for the operation of the pump.

Checks before every start-up:

- Check all connections for tightness.
- Tighten fixing bolts of the pump body with the specified tightening torques (see „Overview of the tightening torques“ chapter).
- Check of the electrical connections.
- Check of the mains voltage on the rating plate with the local conditions.

Driving motor

Preconditions:

- Make sure that voltage and frequency correspond with the indications on the type plate of the motor. Permissible voltage tolerance (DIN VDE 0530).
- For rated voltage ► + 10 %
- For rated voltage range ► ± 5 %
- The connecting cable must be dimensioned according to the motor characteristics.
- Secure connecting cable with a strain relief.
- The nominal motor power refers to an ambient temperature and an installation site ► see chapter „TECHNICAL DATA“ . Motor output will be reduced if these values are exceeded (see VDE 0530).
- Adapted for “moderate” groupe of climates according to IEC 721-2-1.

NOTE

Operating voltage range see chapter „TECHNICAL DATA“.

NOTE

Pump without control:
Motor connection see chapter „Drive motor“ in the PRODUCT DESCRIPTION.

NOTE

Pump with a control:
Electrical iterfaces see the additional operation instructions for the CONTROL.

ATTENTION

Pump with a control:
The pump restarts in the selected operating mode with the specified parameters after switching on again or after restoration of the power supply following a power failure.

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS“.
Man, machine and environment are endangered if the safety instructions are not observed.

Check the following at regular intervals:

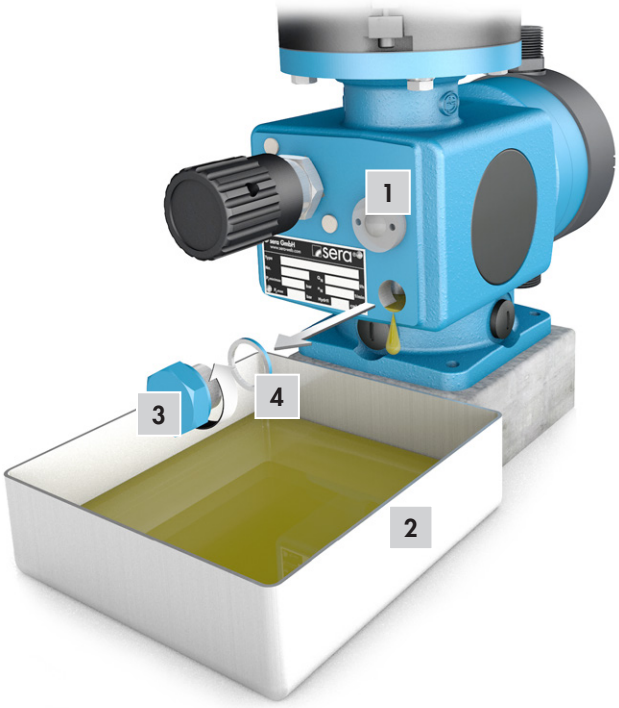
- Tight fit of piping.
- Tight fit of pressure and suction valve.
- Proper condition of the electrical connections.
- Tight fit of the screws for fastening the pump body (check this at least every three months).
- For the tightening torques of the mounting screws, please see Chapter „Overview of the tightening torques“.
- Additionally with motor pumps: Check oil level regularly (oil eye).

Drive motor

The electric motor should always be kept clean so that neither dust, dirt, oil nor other contaminates may affect the correct operation.

In addition, we recommend to ensure that:

- The motor does not produce strong vibrations
- Suction and blowing openings for the supply of cooling air are not closed or restricted (may lead to unnecessary high temperatures in the windings)

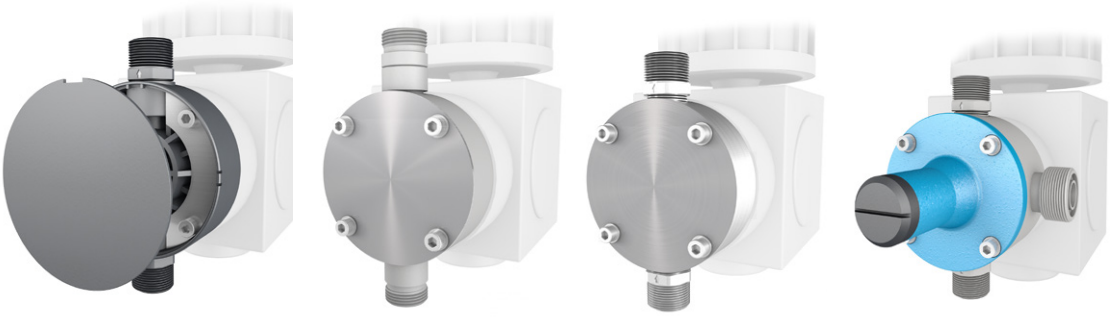


The ball bearings inserted in the motor are lubricated for life.

Oil change

Check oil level at regular intervals (oil sight glass (**1**))

Perform an oil change once a year.
To do so, proceed as follows:



- Unscrew the venting screw (**5**).
- Prepare an appropriate container (**2**).
- Open the screw plug (**3**) and drain off oil.
- Close hole with screw plug (pay attention to the sealing ring (**4**)!).
- Fill oil in threaded hole of the venting screw.
- Screw in venting screw (**5**).

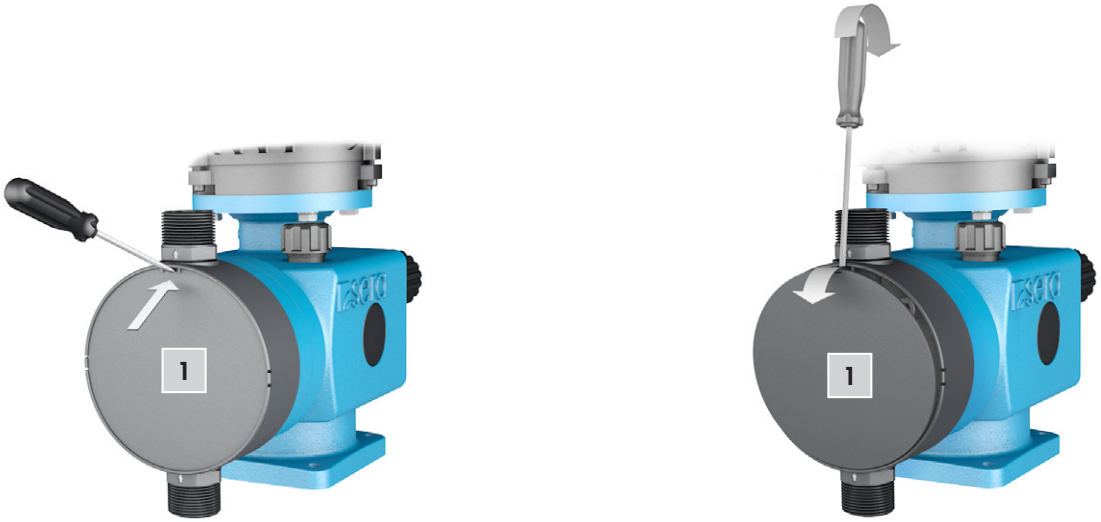
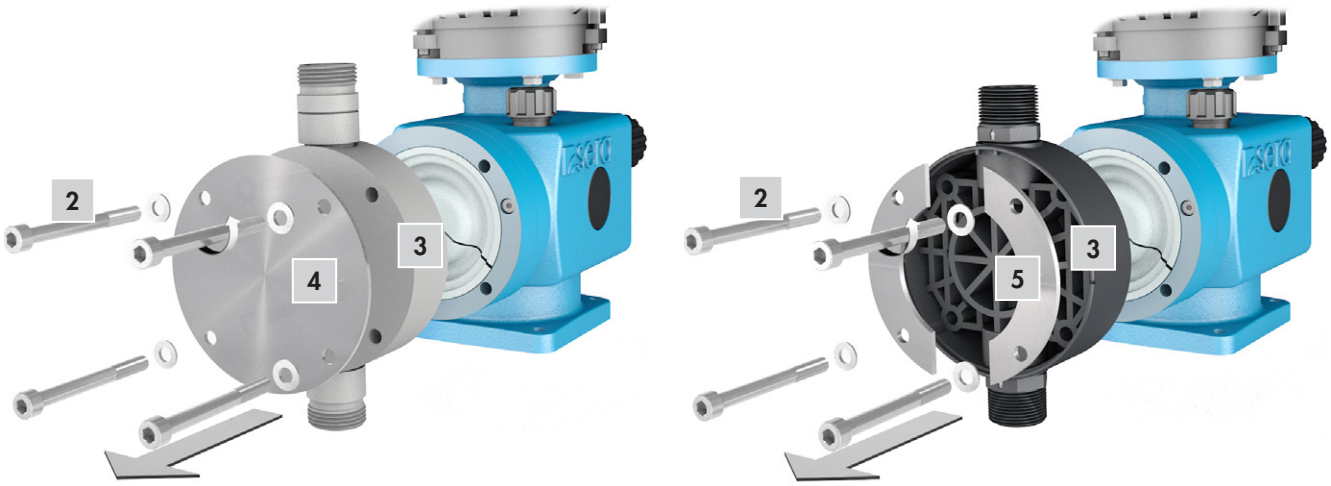
Changing the Diaphragm



In order to ensure a correct function of the diaphragm pump and to fulfil the required safety and protective provisions it is absolutely necessary to check and replace the diaphragms at regular intervals.

After 3000 operating hours or at the latest after one year, a service message requiring diaphragm replacement is shown on the graphical display of the pump with a control (see additional instructions of the control). An earlier diaphragm replacement can be necessary depending on the medium and the application area.

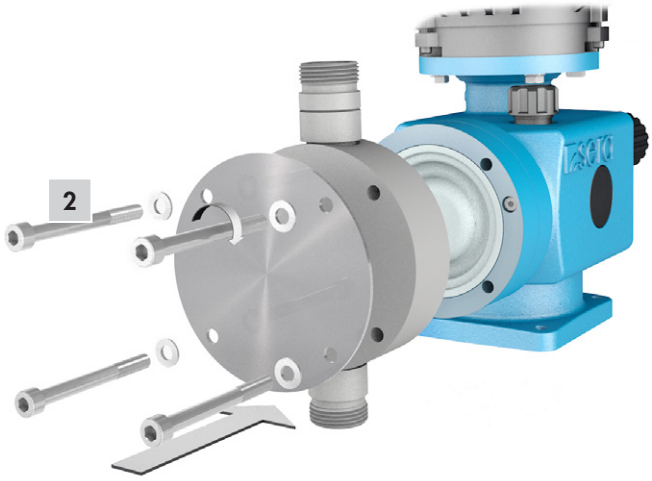


WARNING

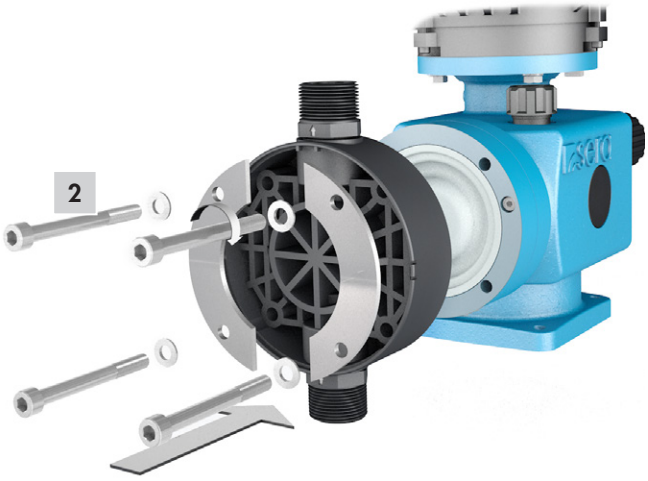
Pump with a control:
Observe the instructions on the graphical display for the replacement of wear parts!

- Set the stroke length adjustment to a stroke length of 0% (front position).
- Remove cover plate (**1**) of the pump body (FRP design, ...409.2).

- Loosen fixing bolts (**2**) on the pump body.
- Remove pump body (3), front plate (**4**) (PVC design) or insertion plates (**5**) (FRP design, ...409.2) to the front.



- Unscrew defective drive diaphragm (**6**) from the push rod (**7**).
- Unscrew pressure plate (**8**) from the set screw of the dia-phragm (with EPDM, FPM drive diaphragm).

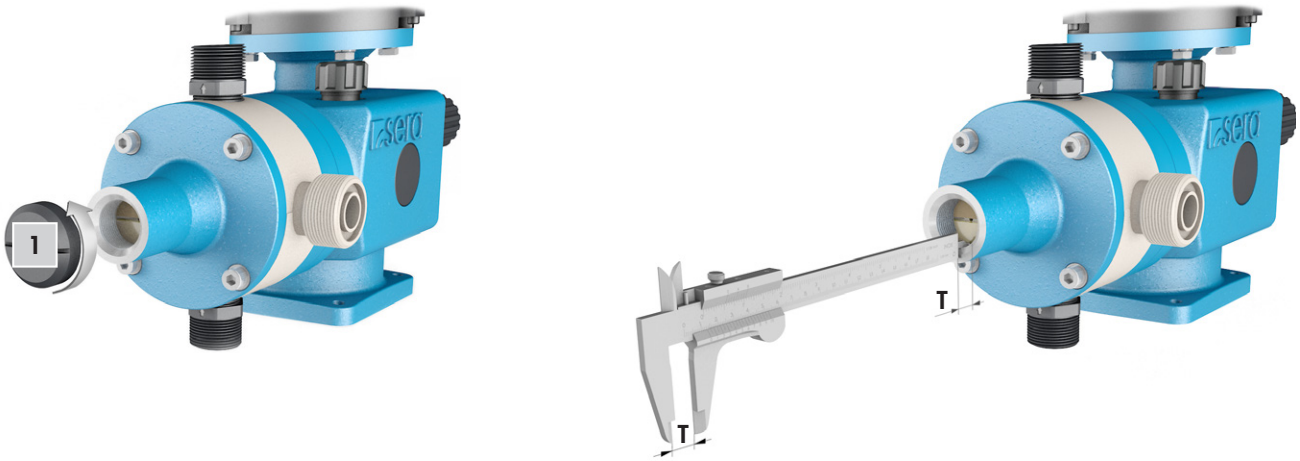


- Clean pressure plate and screw plate on the new diaphragm.

Assemble the pump in reversed order:

- Screw on new diaphragm hand-tight – the diaphragm must be in the middle position.
- Set the stroke length to 50%.
- If the pump is not equipped with a stroke length adjustment (M-design), move the diaphragm to the middle position by turning the fan blade of the drive motor.
- Observe tightening torques of the fixing bolts (**2**); see chapter „Overview of the tightening torques“.
- When assembling the pump body, please note:suction valve below, pressure valve above!

Add the suction and pressure line and connect pump to the power supply. The diaphragm pump is then again ready for operation.

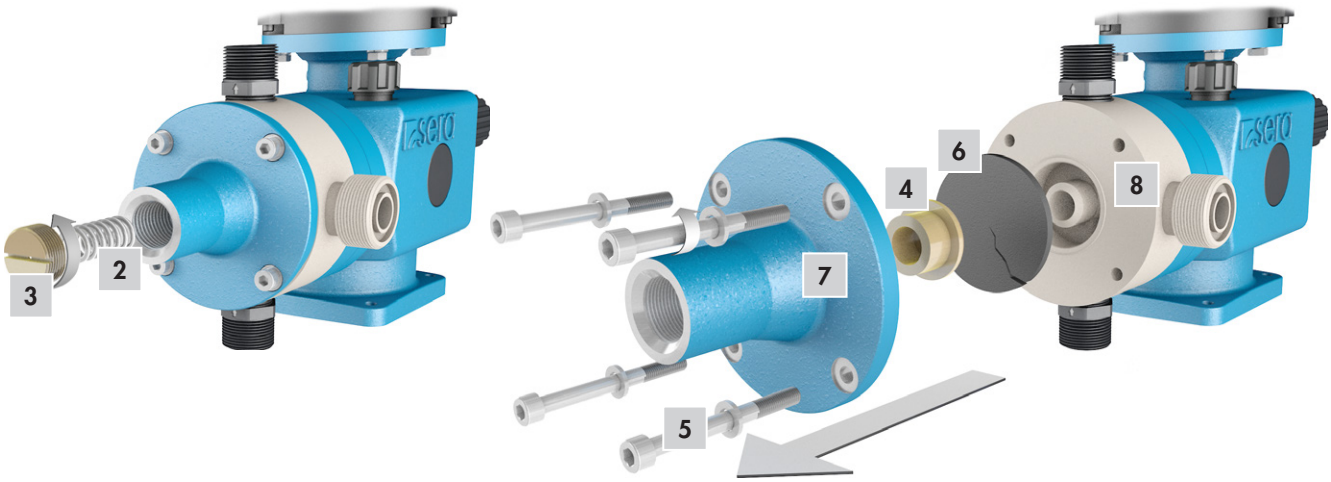


Overflow valve

Proceed as follows to change the diaphragm of the overflow valve (only pumps with integrated overflow valve).

NOTE

All diaphragms should be replaced completely.



- Loosen and unscrew the lid (**1**) of the overflow valve.

NOTE

Before the set screw is unscrewed the dimension **T** (dis-tance between top edge of the cover and the set screw) is to be determined and documented.
This ensures that the overflow valve can be reset to the same pressure NOTE! during subsequent assembly.

- Unscrew the set screw (**3**).
- Remove pressure spring (**2**).
- Loosen and unscrew fixing screws (**5**).
- Remove cover (**7**) and pump body (**8**) to the front.
- Remove pressure disk (**4**) and diaphragm (**6**).
- Check overflow valve for damage and contamination.

- Insert a new diaphragm. In case of PTFE-laminated diaphragms the PTFE-coated side must point towards the pump body.

Assemble the pump in reversed order.

NOTE

The individual components should be cleaned thoroughly before assembly!!

NOTE

When the set nut is screwed in the dimension "**T**" which was determined beforehand is of great importance.

The initial opening pressure of the overflow valve is only reached when the NOTE! set screw is screwed in exactly according to dimension "**T**"!

ATTENTION

The screw-in depth of the set screw must not exceed the initial value. If the set pressure is increased, **sera** has to be consulted beforehand!

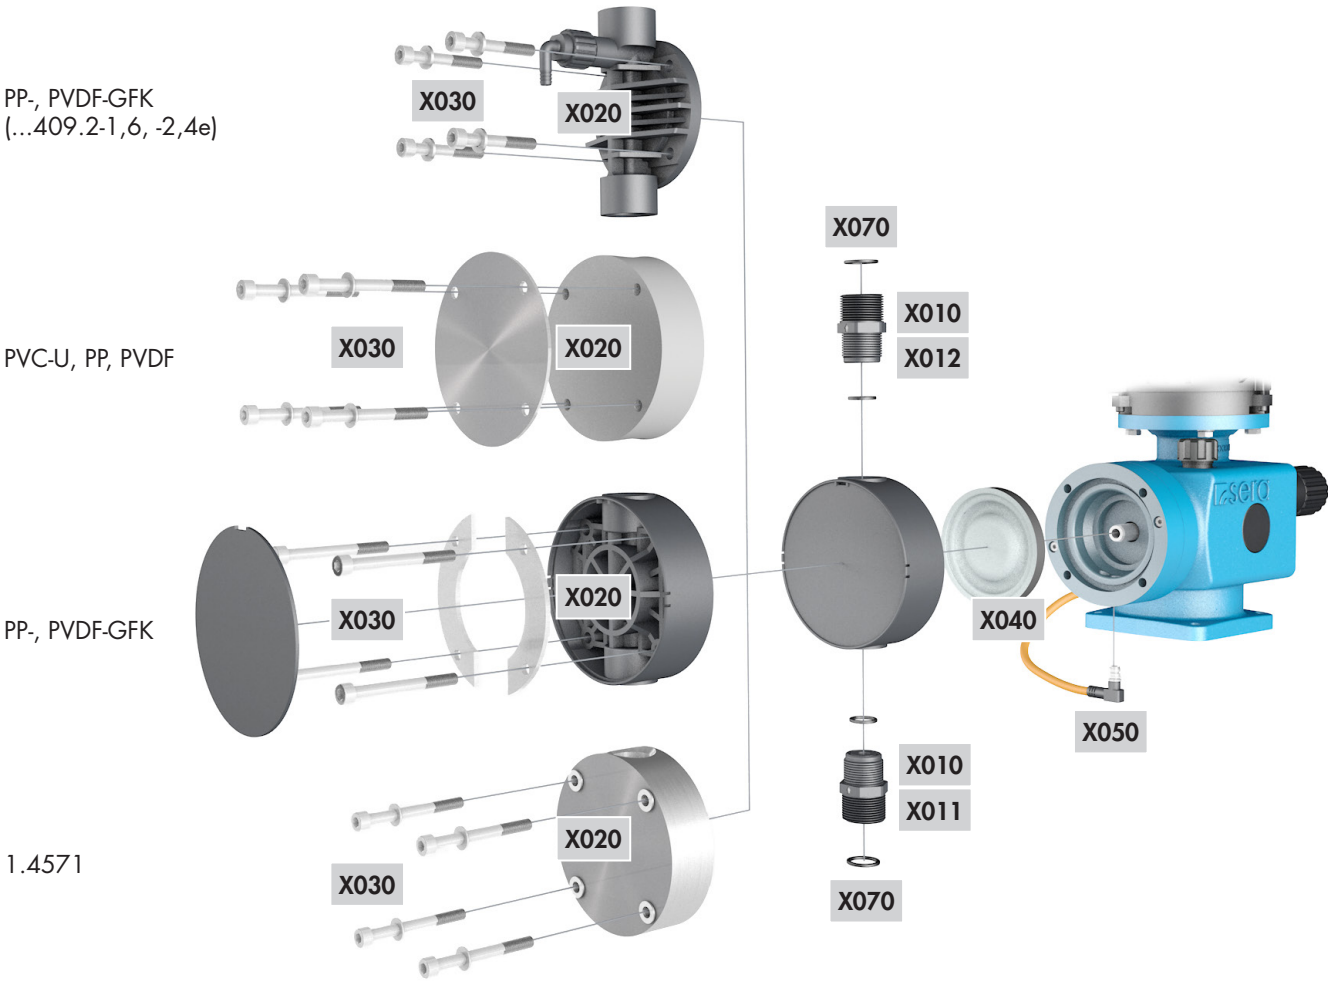
ATTENTION

Never screw in the set screw to a depth so that the pressure spring is compressed to solid length!

Spare and wearing parts

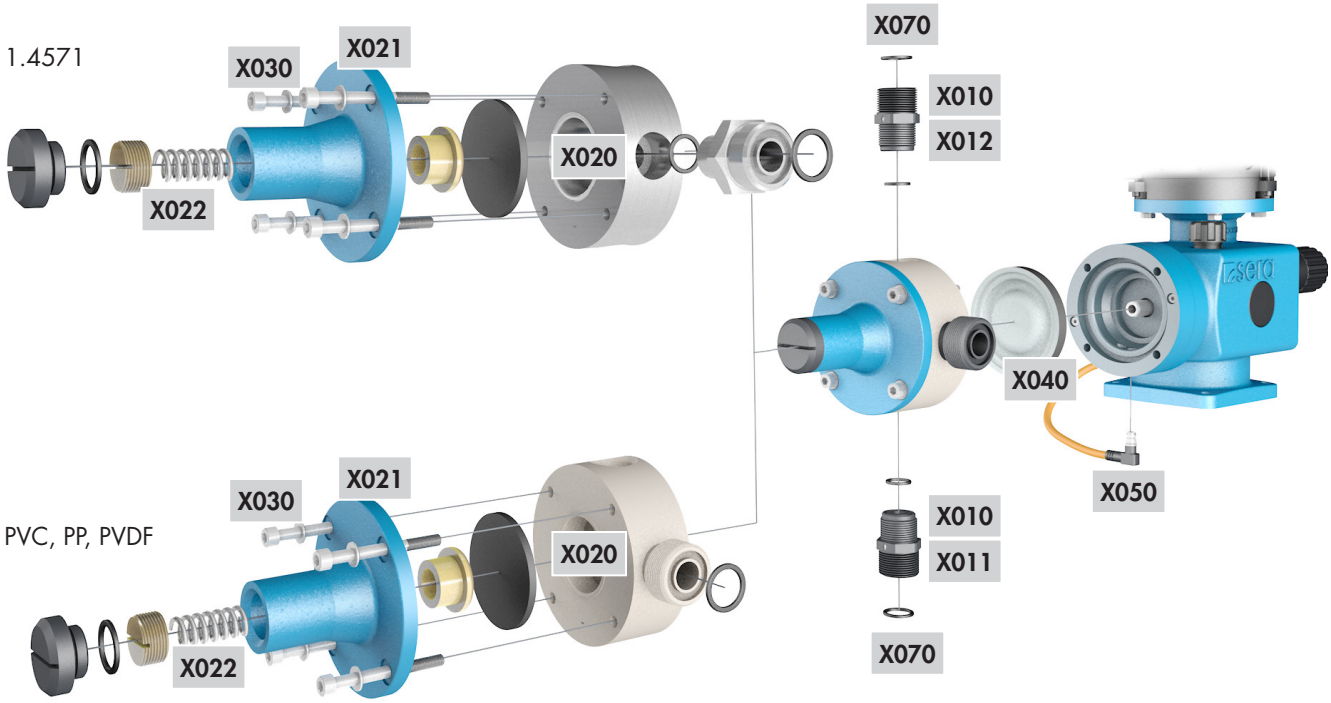
The following parts are considered as wearing parts of the pump:

- Drive diaphragm (diaphragm kit)
- Diaphragm (diaphragm kit) ► diaphragm of the integrated overflow valve
- Diaphragm rupture electrode (diaphragm kit)
- Valve kit (including O-ring kit)
- O-ring kit



Depending on their use and period of use, wearing parts must be replaced at regular intervals in order to ensure a safe function of the diaphragm pump.

We recommend to replace the wearing parts after 3000 operating hours or at least once a year.



In case of a premature diaphragm rupture caused by hard operating conditions, switch off the diaphragm pump and replace the diaphragms (see chapter „Changing the diaphragm").

The following parts are considered as spare parts of the pump:

- Pump body kit (including mounting kit)
- Mounting kit
- Cover kit ► pump with integrated overflow valve
- Setting kit ► pump with integrated overflow valve

sera products are sophisticated technical products which are only shipped after having been thoroughly tested and checked at our factory.
Should there be any faults, these can be detected and rectified easily and quickly based the instructions in the tables.

NOTE

Analysis of the error messages in the display for the pumps with a control ► see the operation instructions of the control!

Fault type															Possible cause	Corrective action
Corrective action!	Display, LED not lit! ▲ Pump with control	Motor does not start! ▲ diaphragm pump	Damage to stroke mechanism / drive!	Pump does not draw in!	Pump does not deliver!	Flow rate is not reached!	Delivery head is not reached!	Flow rate fluctuates!	Maximum permissible flow rate exceeded!	Pipe oscillates heavily!	Too high noise development!	Service life of the drive diaphragm too low!	Drive is overloaded (periodically occurring noises)!	Leakage on pump head!		
				■	■	■									Suction height too high.	Reduce suction height or suction resistance.
				■	■	■		■							Suction pipe leaking.	Check seals, tighten pipe connections.
				■	■							■	■	■	Shut-off valves in piping closed.	Open shut-off valves or check opening state ► check pump for possible damage.
				■	■	■									No pumped medium in storage tank.	Fill storage tank.
				■	■	■	■	■							Pump valves leaking.	Remove and clean valves.
				■	■		■	■							Pump valves (ball seats) damaged.	Remove and clean valves, check function; replace valves if necessary.
				■	■										Pump valves incorrectly mounted or valve balls missing.	Check installation position and completeness ► replace missing parts or install correctly.
				■	■	■		■							Filter in suction line clogged.	Clean filter.
				■	■	■	■	■					■		Electrical data of the pump do not match mains data.	Check order data. Check electrical installation. Adjust motor to the network on site (for diaphragm pumps).
					■	■	■	■		■		■	■	■	Backpressure too high.	Measure pressure with manometer directly above pressure valve if possible and compare with permissible backpressure.
				■	■	■	■	■							Foreign matter in the pump valves.	Remove and clean valves.
								■	■						Pressure on suction side higher than at the end of the pressure pipe.	Check geodetic conditions, install float valve or pressure keeping valve if necessary.
						■	■	■		■	■	■	■	■	Acceleration height too high due to pipe geometry.	Check acceleration height on suction and pressure sides with manometer and compare with design data ► install a pulsation damper if necessary.
												■		■	Materials coming into contact with the medium not suitable for the pumped medium.	Check whether the pumped medium matches the design data and select other materials if necessary.

FAULT ANALYSIS / CORRECTIVE ACTION

Fault type															Possible cause	Corrective action
Corrective action!	Display, LED not lit! ▲ Pump with control	Motor does not start! ▲ diaphragm pump	Damage to stroke mechanism / drive!	Pump does not draw in!	Pump does not deliver!	Flow rate is not reached!	Delivery head is not reached!	Flow rate fluctuates!	Maximum permissible flow rate exceeded!	Pipe oscillates heavily!	Too high noise development!	Service life of the drive diaphragm too low!	Drive is overloaded (periodically occurring noises)!	Leakage on pump head!		
				■		■	■	■							Viscosity of the pumped medium too high.	Check viscosity of the pumped medium and compare with design data ► reduce concentration or increase temperature if necessary.
					■	■		■							Pumped medium is outgassing in the suction pipe and/or the pump body.	Check geodetic conditions and compare with data of the pumped medium. Operate pump with suction side supply, reduce temperature of the pumped medium.
				■											Air in suction line while pressure is present on the pressure side.	Vent pressure side.
	■														Power supply failed / switched off.	Restore power supply.
				■	■	■	■	■							Pipe connections leaking.	Tighten connections according to type of material. Be careful with plastic ► risk of fracture!!
				■	■										Pumped medium frozen in pipe.	PRemove pump and check for possible damage - increase temperature of the pumped medium.
■	■				■										No mains power connection.	Connect mains power supply.
				■											Pump valves dry.	Moisten pump body and valves. Open vent valve.
				■	■	■								■	Temperature too low.	Check flowability of the dosing medium. Temperature of the medium see „Technical data“.
				■	■	■	■	■				■		■	Diaphragm rupture.	Replace the diaphragm according to the descriptions in Chapter „Replacing the diaphragm“.
■															Reversible thermal fuse of the pump has tripped.	Let temperature of the pump cool down. Check ambient temperature.
	■														Fuse in electronics blown. ► Pump with control	Return pump for repair.
				■	■	■	■								Compensating valve not adjusted to operating conditions. ► diaphragm pump KM	Set compensating valve according to operating conditions. ► diaphragm pump KM

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS“.
Man, machine and environment are endangered if the safety instructions are not observed.

Shut-down

- Switch off piston diaphragm pump.
- Rinse pump head and remove pumped medium; make sure that the rinsing agent is suitable for pumped medium and pump head.

Disposal

- Shut-down system. Please see “Shut-down“.

Dismantling and transport

- Shut-down system. Please see “Shut-down“.
- Remove all fluid residues from pump body, clean thoroughly, neutralize and decontaminate.
- Package unit and ship.

NOTE

A clearance certificate must be filled in when systems are returned to the manufacturer.
Acceptance will be rejected if this clearance certificate is not attached.

Complete disposal

- Remove all fluid residues from unit.
- Drain off lubricants and dispose of according to regulations!
- Dismount materials and send them to a suitable waste disposal company!

NOTE

Inspection / repair of machines and machine parts is only carried out after the opposite clearance certificate was filled in correctly and completely by authorized and qualified personnel.

NOTE

Acceptance will be refused if parts are returned to the manufacturer without a proper clearance certificate.

All industrial companies are obligated by the legal provisions for occupational health, e.g. the workplaces ordinances, the Ordinance on Hazardous Substances, the regulations for prevention of accidents and the environmental protection regulations such as the Waste Management Act and the German Household Water Act to protect their employees or man and the environment from detrimental effects when handling hazardous substances.

Should special safety precautions be necessary despite careful draining and cleaning of the product the necessary information are to be provided.

Machines which are operated with radioactive media shall only be inspected and/or repaired in the safety area of the owner by a **sera** specialized fitter.

The clearance certificate is part of the inspection-/repair order.
sera reserves the right to refuse acceptance of the order for other reasons.

NOTE

Please make a copy and leave the original with the operating instructions!
(can also be downloaded from: www.sera-web.com)

ACCUGUARD Diaphragm Seals

Without proper protection, process fluids can contaminate and damage in-line instrumentation. ACCUGUARD Diaphragm Seals are designed to protect and isolate pressure gauges and expensive instrumentation from corrosive, high temperature, or viscous, process media.

Features

- Transfers process pressure accurately without direct contact with process fluids
- Removes the need for expensive instrumentation
- Easily installed and available in five chemically resistant Materials of Construction
- Optional Diaphragm Materials
- Available with ¼" & ½" Bottom Connection Sizes in FNPT & BSPT Female Connection Types
- Thermoplastic Units Rated to 240 PSIG (16 BARG) @ 21°C (70°F)
- 316L S/S Units Rated to 5800 PSIG (400 BARG) @ 21°C (70°F)
- Approved – 316 S/S Diaphragm Seals with CRN (Canadian Registration Number)

HOW TO ORDER - AccuGuard

Example Part Number: AG25A25A-PVC-V-M-[Optional Gauge]

AG 25 A 25 A - PVC - V - M - [Optional Gauge]

See Gauge List

AccuGuard Diaphragm Seal

Connection Size (Top)
25 = 1/4"

Connection Type (Top)
A = FNPT

Connection Size (Bottom)
25 = 1/4"
50 = 1/2"

Connection Type (Bottom)
A = FNPT
B = BSPT

Options
M = Mounted Gauge/Glycerin Filled

Diaphram Materials
V = Viton (Thermoplastic Body Only)
E = EPDM (Thermoplastic Body Only)
T = PTFE (Thermoplastic Body Only)
S/S = 316 S/S (S/S & S/SV Body Only)

Body Materials
PVC = Polyvinylchloride
CPVC = CPVC Corzan
PP = Polypropylene (Not Available with PTFE Diaphragm)
PVDF = Polyvinyldene Fluoride (PTFE Diaphragm Only)
S/S = 316L Stainless Steel
S/SV = Vented 316L Stainless Steel

- Optional Gauge Appears as Separate Line Item When Ordered
- Diaphragm Seals With Gauges = Glycerin Filled As Standard
- 1/4" & 1/2" MNPT Nipples Available - Call Factory for Details

ACCUGUARD GAUGES

ACCUGUARD Pressure Gauges are designed to enhance the performance of chemical feed systems. Adding a pressure gauge to any system will help to ensure that optimal pressures are monitored and maintained.

Series Information

Series	Gauge Diameter	Gauge Connection Size and Type	Gauge Housing	Gauge Internals	Liquid Filled	*Accuracy Rating
Economy	2" / 2.5"	1/4" NPT	Steel Case	Brass	No	± 2.5%
Intermediate	2.5" / 4"	1/4" NPT	304 S/S	Brass	Yes	± 1.6%
Premium	2.5" / 4"	1/4" NPT	304S/S	316L S/S	Yes	± 1.6%

*Accuracy Rating = Full Scale Range

HOW TO ORDER - AccuGuard Gauges

Example Part Number: GE2-160-CB

G E 2 - 160 - CB

AccuGuard Gauge

Gauge Series
- E = Economy
- I = Intermediate
- P = Premium

Gauge Diameter
- 2 = 2 Inches
- 2.5 = 2-1/2 Inches
- 4 = 4 Inches

Gauge Mounting Orientation
- CB = Center Back
- BM = Bottom Mount

Gauge Indication
- 60 = 0-60 PSIG / 0-400 KPA
- 160 = 0-160 PSIG / 0-1100 KPA
- 200 = 0-200 PSIG / 0-1400 KPA
- 300 = 0-300 PSIG / 0-2000 KPA
- 400 = 0-400 PSIG / 0-2800 KPA

4" Gauge Diameter Available in Bottom Mount Orientation Only

ACCUDRAW® PVC Calibration Instructions

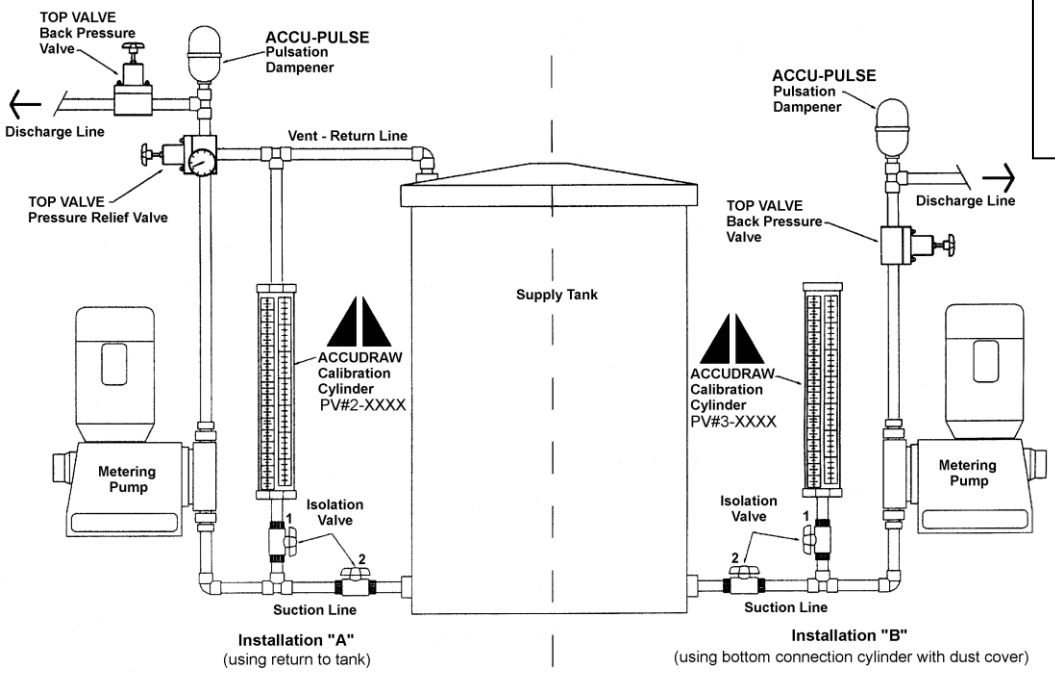
Note: Before starting either of the calibration procedures below, ensure that the pump is primed and void of any trapped air.

Using the USGPH scale: (scale is based on **time**, in one (1) minute volume discharge)

1. Fill the calibration to the top "0" mark on the USGPH scale.
2. Close isolation valve (#2) from supply tank, open isolation valve (#1) below cylinder and start the pump.
3. Use a stopwatch to measure the time of one (1) minute (60 seconds) and record the volume dispensed by the metering pump, using the draw down scale.
4. Adjust the pump volume control higher or lower to meet with your desired output.
5. Repeat above steps 1 through 4, until the desired output is met.
6. Divide the measured USGPH number by 60 to determine the **USGPM volume**, if required.

If you wish to shorten the time of dispensing for calibration by one half (1/2) or one quarter (1/4), you must multiply the measured volume by the same number used to divide the time by.

e.g. 10 USGPH in 1 minute equals
5 USGPH X 2 in 30 seconds or
2.5 USGPH X 4 in 15 seconds



Using the ml scale: (scale is based on **volume** pumped, over any given time)

1. Fill the calibration cylinder to the top "0" mark on the ml scale.
2. Close isolation valve (#2) from supply tank, open isolation valve (#1) below cylinder and start the pump.
3. Use a stopwatch to measure the time it takes to pump down a given volume (ml) in 60 seconds.
4. Multiply the volume by 60 to determine the **ml per hour** volume, if required.
5. Adjust the pump volume control higher or lower to meet with your desired output.
6. Repeat above steps 1 through 5, until the desired output is met.

If you wish to shorten the time of dispensing for calibration by one half (1/2) or one quarter (1/4), you must multiply the volume by the same number used to divide the time by to determine ml per minute or hour.

e.g. 100 ml in 60 seconds equals
50 ml X 2 in 30 seconds or
25 ml X 4 in 15 seconds

Typical Installations ("A" and "B")

Conversion Factors
1ml = 1 cc
1000 ml – 1 liter
ml/sec x 60 = ml/min
1 US gal/min x 0.063 = liters/sec
1 US gal = 3.786 liters

Caution:
Do not use as a Pressure Vessel.

Metering Pump Accessories Save $$$$

Prevent unsafe and inefficient systems by design.

ACCUDRAW Calibration Cylinders

PVC **Glass** **Poly**

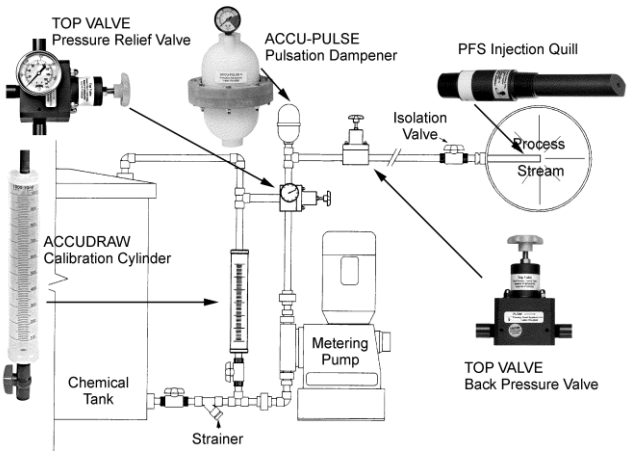
- *PVC, glass, polypropylene*
- *translucent, chemical resistant*
- *coloured graduations and lettering*
- *threaded or socket connections*
- *standard sizes 100 ml to 20,000 ml*

Custom built in other sizes and materials.

TOP VALVE Back Pressure/Pressure Relief

- *long life diaphragm*
- *range of 0 – 150 PSIG*
- *air release, optional gauge port*
- *PVC, CPVC, PVDF, PTFE, polypropylene, stainless, Alloy 20 and Hastelloy C*
- *7 sizes ¼" – 2" NPT*
- *colour coded handles indicate size*

Designed to enhance the <u>accuracy</u> and <u>safety</u> of your metering pumps.



ACCU-PULSE
Pulsation Dampeners

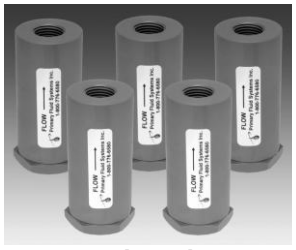
Designed to remove pulsating flows from positive displacement pumps.

- *increase system efficiency and pump life*
- *decrease maintenance and costs*
- *protect pipes, meters, valves and instrumentation from pulsation and vibration*
- *ensure meter accuracy, longevity and repeatability*
- *prevent foaming and splashing*
- *extensive range of materials and sizes*
- *lightweight, compact design*

Typical Metering Pump System

AutoCad drawings available from our web site.
Visit www.primaryfluid.com

PFS Injection Quills



Designed to inject chemical into the center stream of process.

- *provides for a more homogenous mix in the pipeline*
- *built-in checks to prevent back siphoning*
- *2 sizes 6" and 8" length*
- *½" or ¾" NPT, BPST, or Flg'd Conn.*
- *PVC, CPVC, PVDF, polypropylene, Stainless, Hastelloy C & Titanium*
- *pressure to 3000 PSIG*
- *temperature to 260°C (500°F)*

Custom built in other sizes and materials.

Accu-Vent

Designed to automatically vent gases and vapours.

- *vents gases and vapors released from Sodium Hypochlorite, Sulfuric Acid & Hydrogen Peroxide*
- *CPVC (Corzan) and Viton corrosion resistant wetted materials of construction*
- *specially designed float material automatically vents built up gases on system start up and under working pressure*
- *standard 1/2" or 3/4" NPT threaded connections or optional socket weld*
- *available in other materials*

PFS Corporation Stops

Designed to inject chemical into the center stream of process.

- *isolation valve allows for ease of maintenance*
- *available in 6 materials of construction*
- *wetted components have comparable or greater chemical resistance than quill construction material*
- *standard and custom lengths available*
- *connection in NPT, metric or flanged*

Custom built in other sizes & materials.

1. CHARACTERISTICS AND INSTALLATION

1.1 Operating Principle

The PCM Moineau progressive cavity pump (or eccentric screw pump) essentially consists of two internal helical gears, which both have the following features:

- The stator, which is the external element, has one more tooth than the rotor, which is the internal element.

- In any given cross-section, each section of the rotor is in contact with the stator.

- The pitches of the helices of the two elements are in a ratio according to the number of teeth.

The rotation generates an axial displacement, from the suction to the discharge, of the closed cavities bounded by the rotor and stator.

The PCM MOINEAU pump is a volumetric pump whose capacity is equal to the volume of a cavity.

The stator of pumps is said to be 'floating', meaning that it has one free end. This principle, associated with an elastic coupling, simplifies the transmission of the rotational movement between the drive and the rotor.

Mounting the stator in this floating configuration provides the following advantages:

Direction of rotation (Note: This pump is not reversible!)

The pump's direction of rotation is shown on the upper part of the pump body.

The pump is designed to be used in one directly of rotation only. It is up to the installer to check the revolving field of the electrical installation to ensure that the pump is running in the correct direction of rotation.

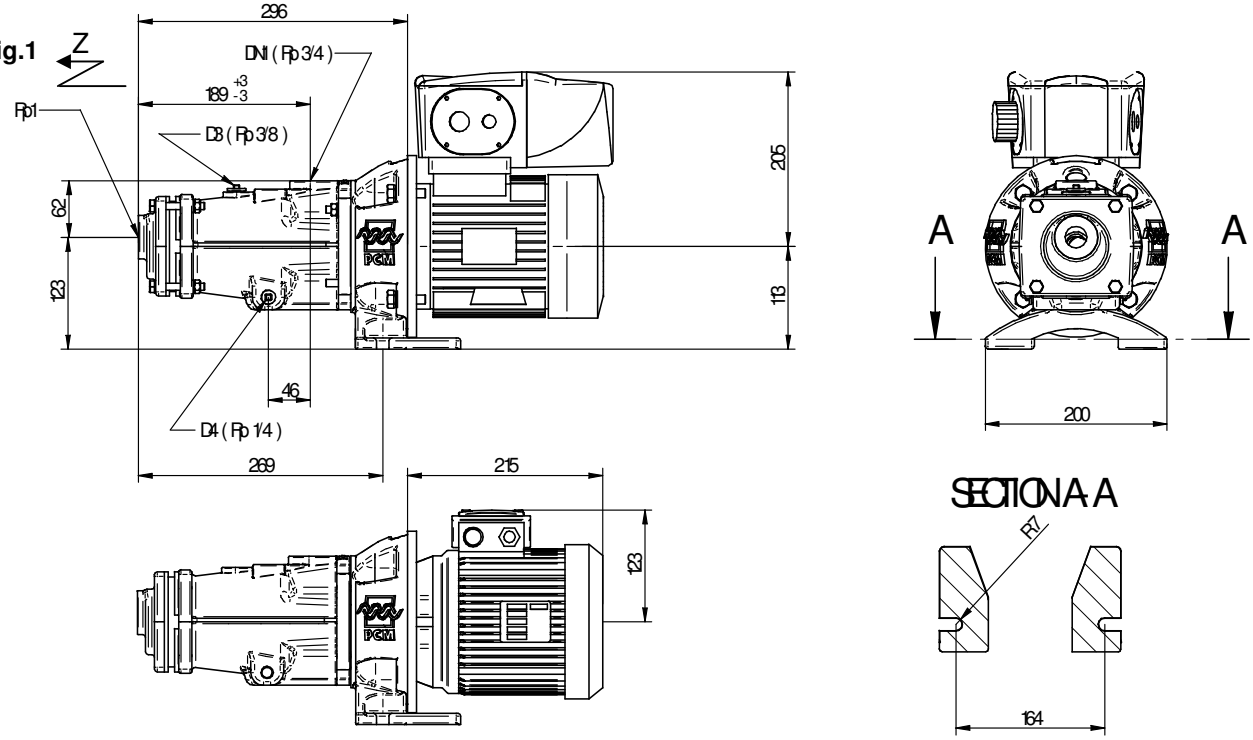
1.2 Characteristics

1.2.1 Build Properties

Defined in the table below

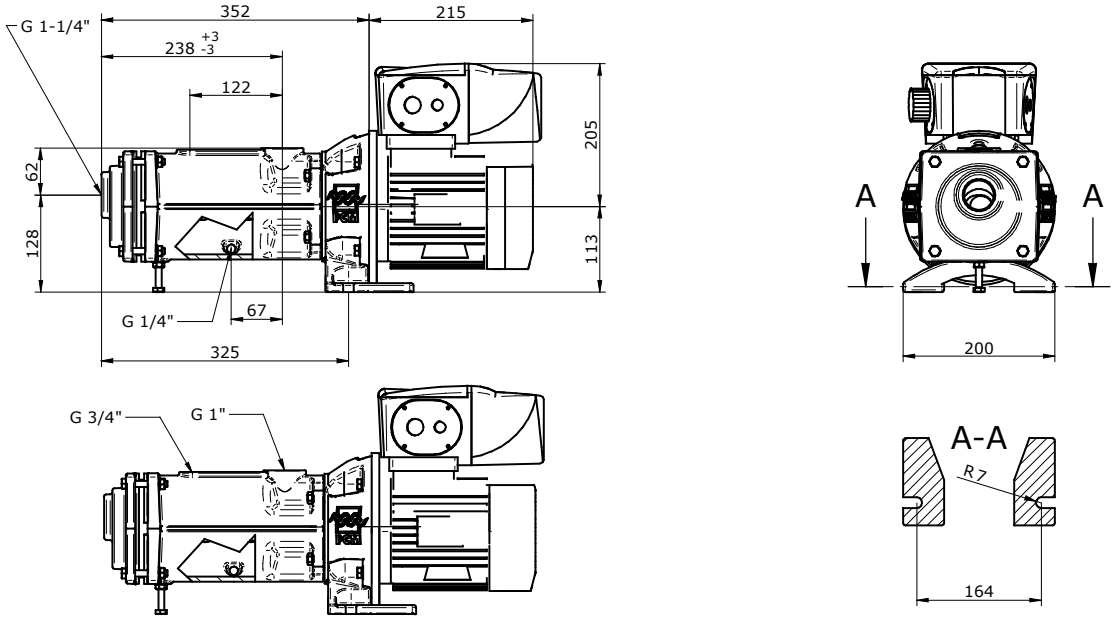
Component	011M6F	075M6F	1M6F	2M6F	3M6F
Stator	NBR / CSM / FKM / CR				
Plot	NBR / CSM / FKM / CR				
Single mechanical seal	Carbon/Silicon carbide				
Rotor	X30Cr13				
Body/Port/ Spacer	EN-GJL250				

The material descriptions comply with the AFNOR standard.

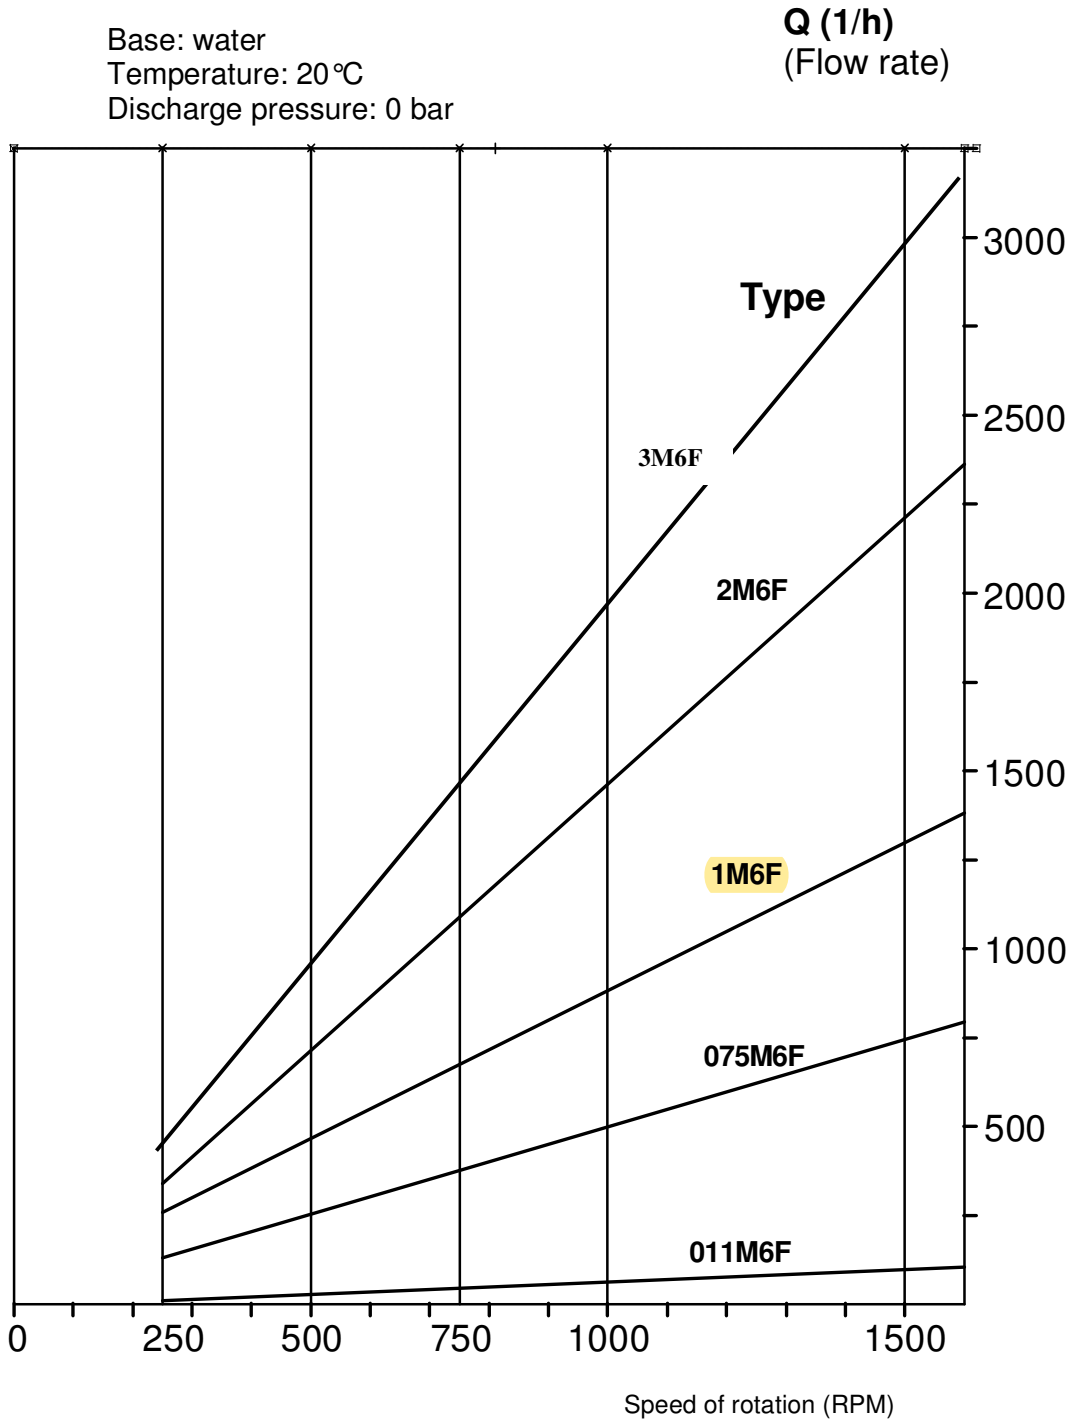


NOTE: By default, our pumps are protected by a particular paint. The procedure and details of the application of this paint are defined in the technical description.

1.2.1.1 Overall Dimensions



Motor-driven pumps 011M6F / 075M6F / 1M6F / 2M6F



Z = 120 mm

Fig.1

3M6F

For more precise details, look at the curve for your pump, or ask **PCM Services** to send you this information.

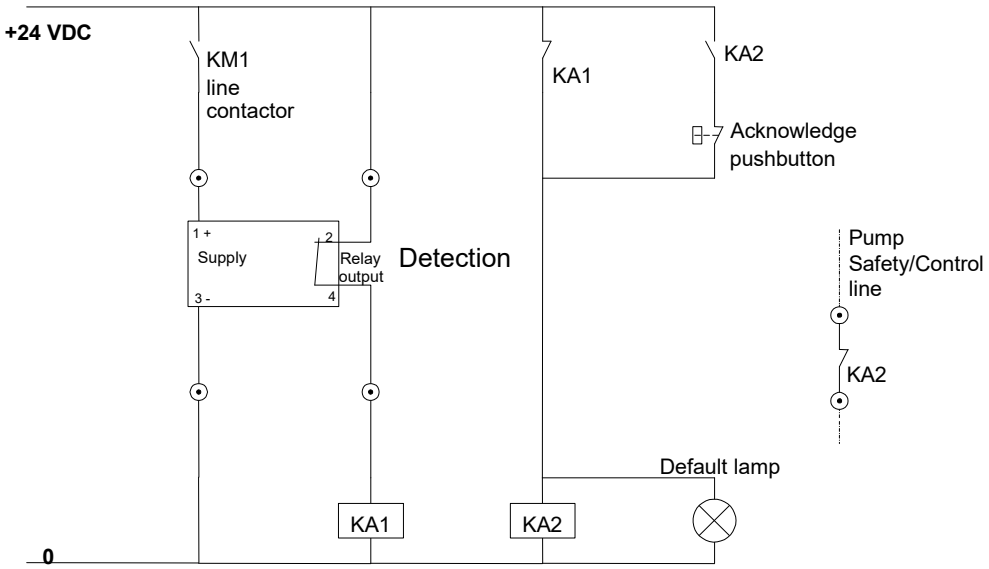
5.2 Technical description

Power supply	24VDC ±20%
Electric consumption	<70mA
Output, dry contact, NC	Relay
Maximum switchable voltage	250VAC 60VDC
Maximum switchable current	2AAC 2ADC
Flow detection range	
Water	1 to 150 cm/s
Oil	3 to 300 cm/s
Pre-set (MPM & ENV versions)	10cm/s
Ambient temperature	-20 … +70°C
Fluid temperature	-20 … +80°C
Fluid temperature (food versions)	-20 … +80 95°C for 3h 120°C for 2h
Temperature gradient	250°C/min
Time lag and default	't' adjustable from 0 to 25s
Acceptable pressure	depending on connector
Probe material	316L stainless steel
Box material	PBT plastic
Protection index	IP67
Connector	M12 – 4 conductors

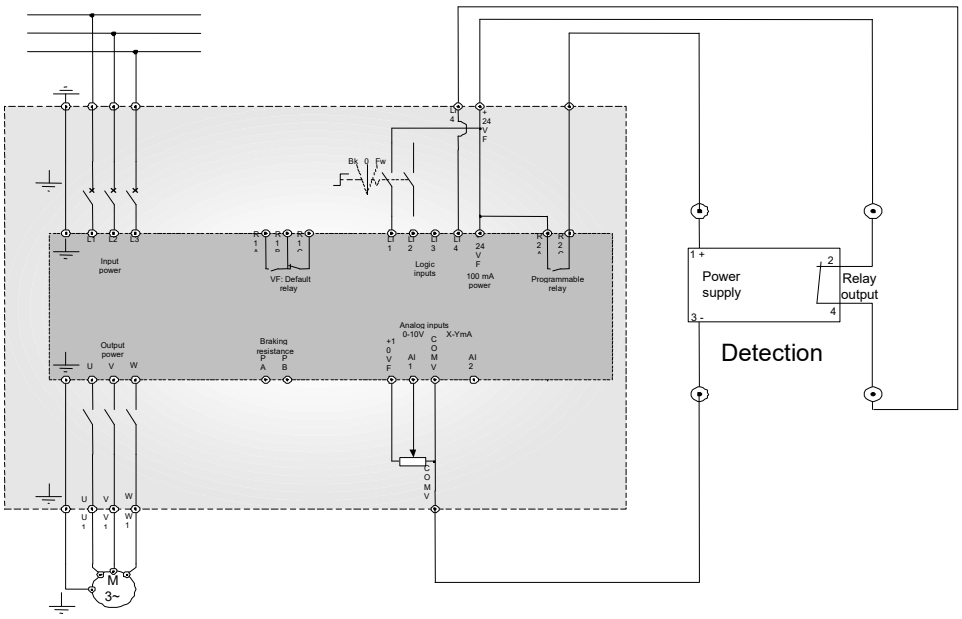


☎: (33) 01 41 08 15 15

5.3 Cabling diagram

5.3.1 General principle

5.3.2 Auto-hold with indicator lamp and acknowledgement



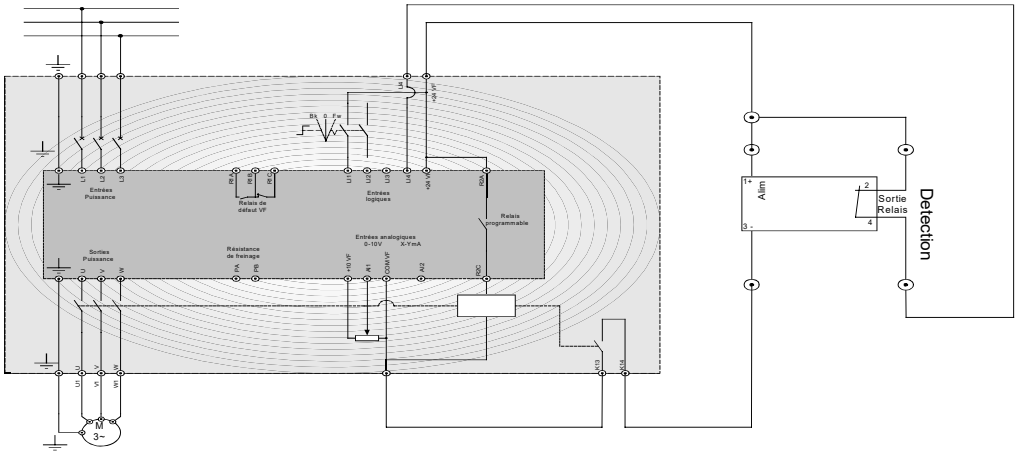
☎: (33) 01 41 08 15 15

5.3.3 Cabling for remote frequency converter

The time lag for the integrated probe and relay version protects the pump by controlling the power-supply frequency converter:

5.3.3.1 Power less than or equal to 4kW

Example of a SCHNEIDER ELECTRIC frequency converter.
See the remote frequency converter instruction documentation:



* The R2 output must be configured to ‘SrA’ with the ‘Ftd’ value at minimum

* The LI4 input must be configured to ‘FSt’

5.3.3.2 Power great than or equal to 5.5kW, version IP55

Example of SCHNEIDER ELECTRIC frequency converter.
See the remote frequency converter instruction documentation:

* The R2 output is to be configured to ‘OCC‘
* The LI4 input is to be configure to ‘FSt’

☎: (33) 01 41 08 15 15

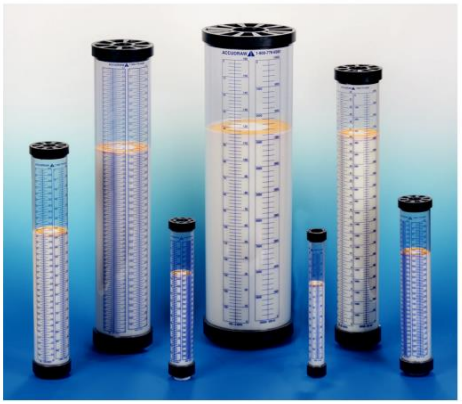
ACCUDRAW® Calibration Cylinders

"For Accuracy That Counts"



For complete product information visit our website: primaryfluid.com

Flanged: Glass, PVC

Flanged: PVC

PV#4

Sizing and Ordering Information:

ACCUDRAW Standard Materials of Construction

AC = All polypropylene construction (see below for options)
PV = All polyvinylchloride construction (see below for options)
ACS = Glass*

Note: Cylinders are NOT pressure vessels

Example: AC#1-1000B

AC = PP (polypropylene)
#1 = Bottom threaded connection only
1000 = 1000 ml
B = BSP Thread

e.g. Part # AC #1 - 1000 B

Type:
AC = Polypropylene
PV = PVC
ACS = Glass

Style:
1 = Bottom threaded conn. only
2 = Top and Bottom threaded conn.
3 = Bottom threaded conn. c/w removable vented dust cap
4 = Top/Bottom threaded conn. c/w removable "O" ring sealed top and float ring level indicator
* ***Glass calibration cylinders available in Style 2 only***

Graduation Scale:
PP - ml only
PVC - ml and GPH
Glass - ml only

Std. connection is NPT thread
Optional: add suffix as follows
S = Socket weld connection (PVC only)
GTV = Glass/TFE construction
GKV = Glass/PVDF construction
GCV = Glass/CPVC construction
GSV = Glass/SS construction
B = BSP Thread
F= Flanged

Substitute **E** for **V**
for **EPDM** wetted "O" ring seal

Size:			Material	Conn.
100	= 100 ml	(1.6 GPH)	PP, PVC, Glass	½"
250	= 250 ml	(4 GPH)	PP, PVC, Glass	½"
500	= 500 ml	(8 GPH)	PP, PVC, Glass	½"
1000	= 1000 ml	(16 GPH)	PP, PVC, Glass	½"
2000	= 2000 ml	(32 GPH)	PP, PVC, Glass	1"
4000	= 4000 ml	(64 GPH)	PP, PVC, Glass	1"
6000	= 6000 ml		Glass only	2"
8000	= 8000 ml		Glass only	2"
10000	= 10000 ml	(160 GPH)	PVC, Glass	2"
15000	= 15000 ml	(240 GPH)	PVC only	2"
20000	= 20000 ml	(320 GPH)	PVC, Glass	2"

Custom sizes and materials available.

Back Pressure/Anti-Siphon and Pressure Relief Valves

Description

This line of diaphragm style, back pressure/anti-siphon and pressure relief valves features a completely adjustable pressure range to 350 PSIG and a built-in air release to reduce priming difficulties. The valves are available in sizes from 1/4" through 2", eight materials of construction, offer a three year warranty and are available with socket weld, flanged or special threaded connections. High temperature to (300°F/149°C) valves are available. *CRN certification available. Please contact factory.*

Ordering Information

e.g. Part # TVBP50-S/S-V-S

TV - B - P - 50 - S/S - V - S

TOP VALVE

Valve Type:
- B = Backpressure
- P = Pressure Relief (3 port)
- P2 = Pressure Relief (2 port)

Valve Style or Connection:

P	= Backpressure, FNPT thread
R	= Pressure Relief, FNPT thr'd (3 port)
FW	= Welded Flange
FT	= Thread Companion Flanged
F	= Flanged Non-Metallic
S	= Socket
B	= BSP thread
T	= High Temperature (300°F/149°C)
H	= High Pressure (to 350 psig) Metallic Bodies
M	= Mid-Range Pressure (to 230 psig) Thermoplastic Bodies
U	= Union Type Connection

Valve Port Connection Size:

25 = 1/4"	10 = 1"
45 = 1/4" X 1/2"	15 = 1 1/2"
50 = 1/2"	20 = 2"
75 = 3/4"	

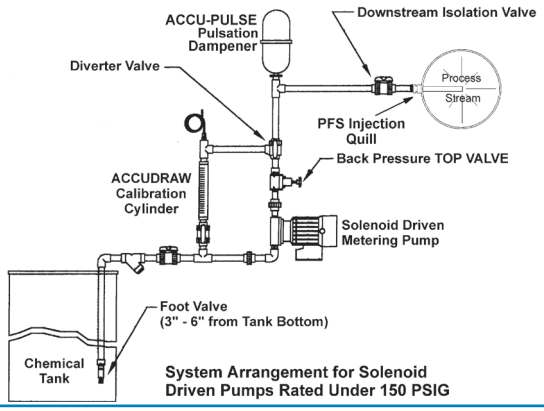
Top Options:
- C = CPVC Top (standard)
- A = Aluminum Top
- S = 316L S/S Top
- XXX = Custom spring range

Miscellaneous Options:
- E = EPDM Diaphragm
- P = PVC Diaphragm
- V = Viton Diaphragm
- G = Gauge Port

Body Material of Construction:

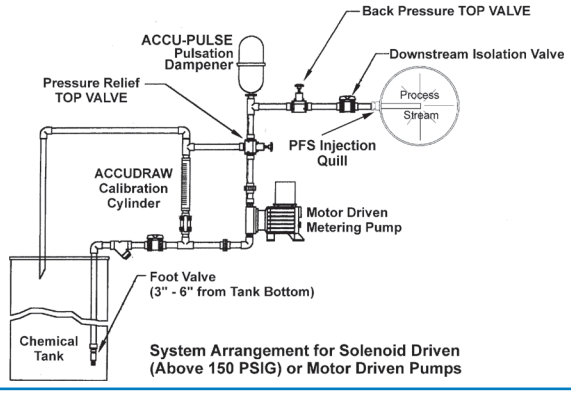
PVC	= polyvinylchloride
CPVC	= Corzan
PP	= polypropylene
TFE	= 24% glass filled PTFE
PVDF	= polyvinylfluoride
S/S	= 316L Stainless Steel
ALL20	= Alloy 20
Hast	= Hastelloy C 276

Flow Rates



Flow capacity through TOP VALVE back pressure/anti-siphon and pressure relief valves under continuous flow conditions **@ 50 PSIG** with ambient temperature water.

Size	1/4"	1/4" / 1/2"	1/2"	3/4"	1"	1 1/2"	2"
Flow rate USGPM	4	4	6	8	14	25	40



Note: Capacities will increase with pressure. If pressure is doubled, flow rate wll approximately double. For capacities of valves with pulsating flow, use approximately 1/3 of the given flow rates.

Typical Installations

The installations below are typical installation examples only. Consult your engineering department for the appropriate installation of your application or call Primary Fluid Systems Inc. for advice.

ACCUGUARD Diaphragm Seals

Without proper protection, process fluids can contaminate and damage in-line instrumentation. ACCUGUARD Diaphragm Seals are designed to protect and isolate pressure gauges and expensive instrumentation from corrosive, high temperature, or viscous, process media.

Features

- Transfers process pressure accurately without direct contact with process fluids
- Removes the need for expensive instrumentation
- Easily installed and available in five chemically resistant Materials of Construction
- Optional Diaphragm Materials
- Available with ¼" & ½" Bottom Connection Sizes in FNPT & BSPT Female Connection Types
- Thermoplastic Units Rated to 240 PSIG (16 BARG) @ 21°C (70°F)
- 316L S/S Units Rated to 5800 PSIG (400 BARG) @ 21°C (70°F)
- Approved – 316 S/S Diaphragm Seals with CRN (Canadian Registration Number)

HOW TO ORDER - AccuGuard

Example Part Number: AG25A25A-PVC-V-M-[Optional Gauge]

AG 25 A 25 A - PVC - V - M - [Optional Gauge]

See Gauge List

AccuGuard Diaphragm Seal

Connection Size (Top)
- 25 = 1/4"

Connection Type (Top)
- A = FNPT

Connection Size (Bottom)
- 25 = 1/4"
- 50 = 1/2"

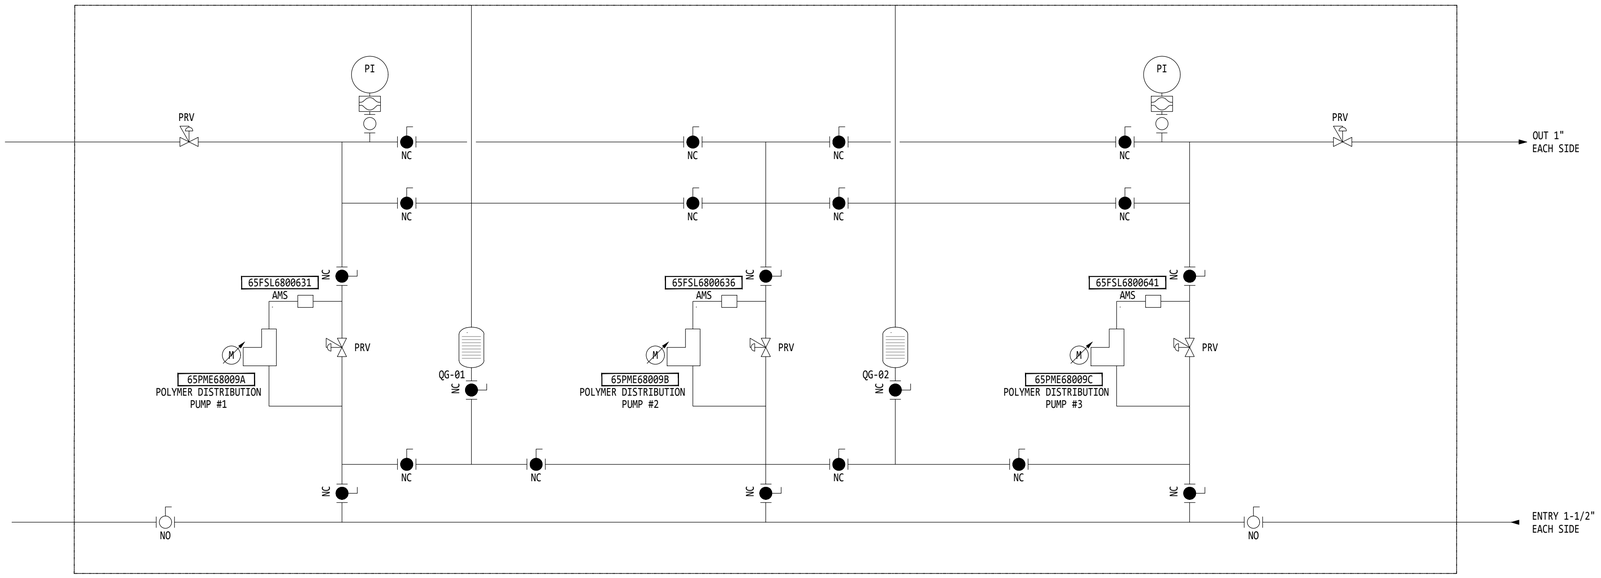
Connection Type (Bottom)
- A = FNPT
- B = BSPT

Options
- M = Mounted Gauge/Glycerin Filled

Diaphram Materials
- V = Viton (Thermoplastic Body Only)
- E = EPDM (Thermoplastic Body Only)
- T = PTFE (Thermoplastic Body Only)
- S/S = 316 S/S (S/S & S/SV Body Only)

Body Materials
- PVC = Polyvinylchloride
- CPVC = CPVC Corzan
- PP = Polypropylene (Not Available with PTFE Diaphragm)
- PVDF = Polyvinyldene Fluoride (PTFE Diaphragm Only)
- S/S = 316L Stainless Steel
- S/SV = Vented 316L Stainless Steel

- Optional Gauge Appears as Separate Line Item When Ordered



- Diaphragm Seals With Gauges = Glycerin Filled As Standard

- 1/4" & 1/2" MNPT Nipples Available - Call Factory for Details

INTRODUCTION

The following instructions are to provide information on the Installation, operation and maintenance of TOP VALVE, 150# rated diaphragm style Back Pressure and Pressure Relief Valves, manufactured by Primary Fluid Systems Inc. The valves are designed to improve the performance and safe operation of most pumps used for metering applications.

Various materials of construction are available dependent on the requirements of the application and the type of fluids being transferred.

The valve(s) are factory set at 50 PSIG with a field adjustment range of 15-150 PSIG*. Other factory set pressure ranges (within the range of the valve) are available upon request.

Special Features of TOP VALVE

- PVC, PP, TFE, CPVC, PVDF, Hastelloy C, Alloy 20 or 316 S/S wetted construction
- PTFE laminated to EPDM backer diaphragm
- Turn down handle limits pressure to 150 PSIG
- Handle shaped for ease of adjustment
- Color-coded handles indicate size at a glance
- (Optional) Built-in matching material gauge port plug is easily removed for gauge option
- Rectangular shape for ease of installation
- Specially designed spring provides consistent pressure adjustments through the range (15-150 PSIG*)
- Valve top specially designed for mounting clamp to help reduce pipeline stress when required
- Built-in downstream manual air release, for ease of pump priming
- Built-in anti-siphon

***Pressures under 15 PSIG require rubber elastomeric diaphragm.**

Back Pressure Valve

Diaphragm Back Pressure Valves serve two primary functions. The first is to provide a constant discharge pressure on the pump, which improves the performance, efficiency and consistency of the delivered volume. Secondly, the valve performs as an anti-siphon mechanism against positive or negative pressures in the downstream line. The valve is designed to allow for the venting of air into the downstream pipeline. This provides for easier priming of metering pumps that function under a suction lift. This is accomplished by a simple adjustment of the handle.

The valve is available with an optional gauge port, pre-plugged at the factory or can be ordered complete with gauge to suit application. This eliminates the need to install extra fittings in the line to accommodate the addition of a gauge for the purpose of reading and setting of pressure.

CAUTION:
The gauge port is solely for the installation of the gauge and must not be used for the bleeding or venting of the system. Improper operation of the valve and/or hazardous consequences could result. ***(see gauge installation instructions)***

Back Pressure Valves: Reason for Selection and Use

Metering pumps having an atmospheric discharge system pressure of less than 20 psi and will benefit from the installation of a back pressure control valve. Metering pumps in general require downstream back pressure to ensure smoother function of the discharge check assemblies, which enhances the accuracy of the discharge flow.

Pressure Relief Valves

Diaphragm Pressure Relief Valves are designed to relieve excess line pressure that exceeds the set pressure of the valve. This protects the system piping from overpressure that could result in hazardous leakage and/or damage to the pump and other system components.

The Pressure Relief Valves are normally recommended to be set between 5 and 10 PSIG above the system operating pressure.

The valve is of an in-line flow through design with bottom NPT relief port for piping back to supply tank or feed side of pump.

The valve is available with an optional gauge port, pre-plugged at the factory or can be ordered complete with gauge to suit application. This eliminates the need to install extra fittings in the line to accommodate the addition of a gauge for the purpose of reading and setting of pressure.

CAUTION:
The gauge port is solely for the installation of the gauge and cannot be used for the bleeding or venting of the system. Improper operation and/or hazardous consequences could result. ***(see gauge installation instructions)***

Pressure Relief Valves: Reason for Selection and Use

When using motor driven metering pumps, a pressure relief valve should always be installed on the downstream side of the pump to protect the system from over pressure which can cause pipe leakage and/or rupture.

Installation and Maintenance of Back Pressure Valves

Back pressure control valves are installed on the discharge line of the pump. The valve should be located within a 2 (two)-foot distance of the pump discharge to ensure check valve seating. When pumping to a process line without an injection valve, the back pressure valve should be installed as close as possible to the injection point to prevent siphoning.

When used in conjunction with a pressure relief valve, always locate the back pressure valve on the downstream side of the relief valve.

The valve is supplied from the factory pre-set at 50 psig. To increase the pressure setting, back off the lock nut located beneath the colour coded handle. Turn the handle clockwise to increase pressure setting or counter clockwise to reduce pressure setting. Approximately one (1) full turn of the handle is equal to 10 psig.

If maintenance is required on the valve:

1. Ensure that the valve is properly isolated from the line, not under pressure and properly flushed of chemical before proceeding to disassembly.
2. Turn knob on the top of valve, counterclockwise until all spring pressure is released **before** proceeding to undo retaining nuts, to remove top of valve for diaphragm replacement.
3. All working components ie. diaphragm, spring can be accessed by removing the four retaining nuts located on the top of the valve (item # 9 of parts breakdown). For ¼" and ¼" x ½" Top Valves, use 5/32" Allen Key / #4 Hex Key. For ½" sizes and up, use a 3/16" Allen Key / #5 Hex key.
4. When replacing the diaphragm, ensure the PTFE coated side of the diaphragm is facing down when viewed from the top of the valve. The installed diaphragm also functions as the body seal. (Torque nuts to 55 inch pounds when reassembling.)

Set Pressure Safety Feature

The valve adjustment handle/bolt length is designed to prevent operators from engaging the spring to a coil binding situation that would cause serious function and safety concerns.

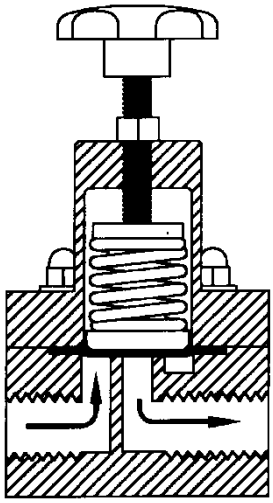
In order to achieve max pressures within the top 10% of the valve range, the lock nut on the adjustment handle/bolt must be removed prior to setting the pressure. Ensure that all system pressure has been released before removing the lock nut and re-installing the approved valve handle/bolt.

The valve handle/bolt is the only approved adjustment component to be used on our valves. Deviation from this will void manufacturer warranty and liability.

Installation and Maintenance of Pressure Relief Valves

Pressure relief valves are installed on the discharge line of a pump and should be located as close as possible to the metering pump. The valve is of an in-line flow through design with a bottom NPT relief port for piping back to the supply tank or feed side of the pump.

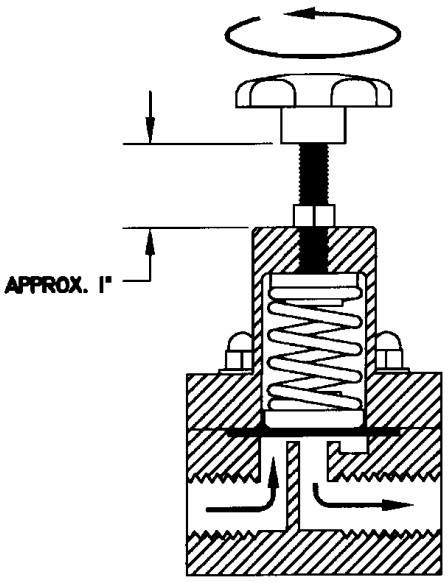
Never install shut-off/isolation valves between pump discharge and in-line pressure relief valves. When using in conjunction with a back pressure control valve, always install back pressure valve downstream of pressure relief valve. The relief port on the pressure relief valve should be piped back to the feed tank or suction side of the pump (see typical installation schematics).



CAUTION:
The plastic valve bodies have standard NPT threads, which are tapered. When installing pipe into the body, hand tighten only to avoid cracking.

Gauge Installation Instructions: (When ordered with valve only)

For the convenience of pressure setting and reading, there is an optional plugged gauge port provided, if the valve has not been ordered complete with gauge. **Important:** use a ***TORX style # T-45*** wrench or screwdriver **only** to remove plug from plastic valves. Any other tool will strip the body of the plug and require an extractor to remove the threaded plug.

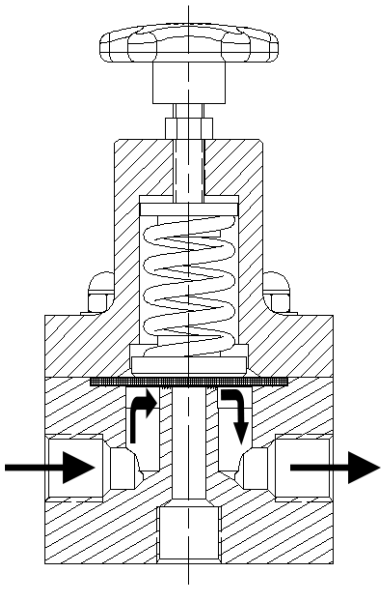


CAUTION:
Before removing the gauge port plug to install a gauge, ensure that the discharge line is not under pressure and lines are flushed with water prior to proceeding. Ensure that the gauge you are using is chemical resistant to the fluid before installing.

Manual Air Release for Back Pressure Valve Only

DIAPHRAGM POSITION AT
50 PSI BACK PRESSURE

The valve is shipped with a factory set pressure of 50 psig. The diagram to the left shows a cut-away view of the position of the diaphragm on the seat.



AIR RELEASE POSITION WITH
HANDLE BACKED OFF

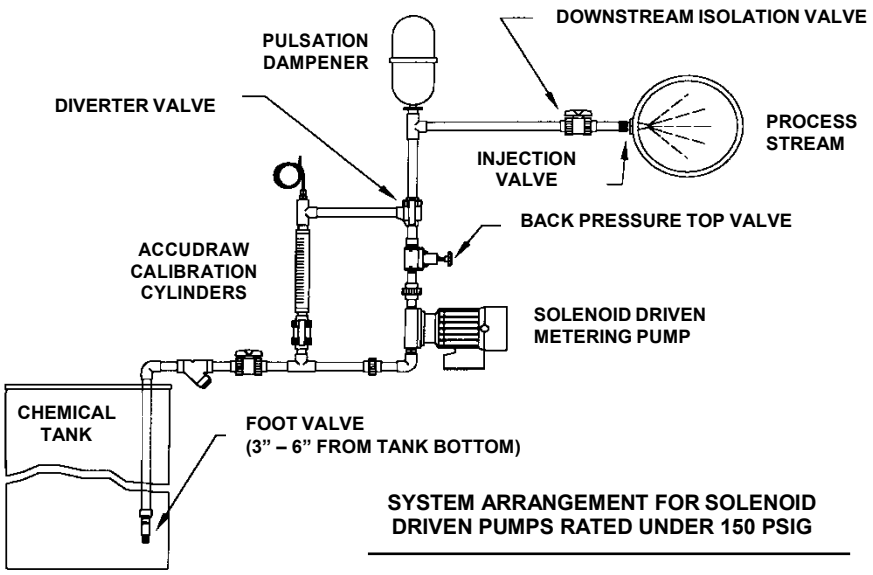
To adjust the valve to relieve air or gas downstream:

1. Back off lock nut located beneath the colour coded handle.

2. Turn handle counter clockwise until approximately 1 inch of thread is exposed.

3. At this adjustment, the spring has relieved all tension from the diaphragm allowing air or gas to be vented downstream.

Flow through design Pressure Relief Valve



The bottom port relieves over pressure.

ALL New Clamping Device for TOP VALVE, Back Pressure and Pressure Relief Valves

This new polypropylene-clamping device now makes it even easier than ever to support TOP VALVE, back pressure or pressure relief valves in service, to help eliminate pipe strain and the need for expensive mounting brackets.

It's simple to install, economical to purchase and we've reworked the top of the valve body now available on all new valves, to assist with the support.

TV-_ _ -CLAMP

Sample Installation

Part #

TV-25-CLAMP to fit ¼" Valves and ¼ - ½" Valves

TV-51-CLAMP to fit ½" through 2" Valves

Flow Rates

Subject: Flow capacity through TOP VALVE, back pressure and pressure relief valves. Under continuous flow conditions: @ **50 PSI** with ambient temperature water

¼" valve	4	USGPM
¼"/½" valve	4	USGPM
½" valve	6	USGPM
¾" valve	8	USGPM
1" valve	14	USGPM
1½"valve	25	USGPM
2" valve	40	USGPM

Note: Capacities will increase with pressure. (If pressure is doubled, flow rate will approximately double.) For capacities of valves with pulsating flow use approximately ⅓ of the above given flow values.

Temperature Correction Factors: Thermoplastics

Temperature Effects: Thermoplastics and thermosets will decrease in tensile strength as the temperature increases: therefore, the working pressure must be reduced accordingly. The following factors will apply:

Operating Temperatures		{Factors}			
F	***C***	***PVC***	***CPVC***	***PP***	***PVDF***
70	21	1.00	1.00	1.00	1.00
80	27	1.00	1.00	1.00	1.00
90	32	1.00	1.00	1.00	1.00
100	38	.90	1.00	1.00	1.00
110	43	.83	1.00	.91	1.00
115	46	.75	1.00	.87	1.00
120	49	.66	1.00	.83	1.00
125	52	.58	.97	.79	1.00
130	54	.50	.95	.75	1.00
140	60	.33	.90	.66	1.00
150	66	NR	.80	.60	.97
160	71	NR	.70	.53	.93
170	77	NR	.60	.43	.86
180	82	NR	.50	.33	.80
200	93	NR	.33	NR	.66
210	99	NR	NR	NR	.60
240	116	NR	NR	NR	.40
280	138	NR	NR	NR	.16

Example:
Maximum Pressure for PVDF valve at 280°F (138°C)
Factor = 0.16 x 150psig = 24psig max. pressure
Factor = 0.16 x 1034kPa = 165.44kPa max. pressure

The maximum pressure rating for valves regardless of size is 150 PSIG (1034 kPa) at 73° F (22°C)

NR = not recommended

Primary Fluid Systems, Inc. takes no responsibility for the enclosed data.

NOTE: If the material of the valve you have chosen is rated below the working pressure of your system than you must reconsider your choice. The standard valve top material of construction is PVC and should be taken into temperature consideration. (Other materials of construction are available, consult price list or factory)

NOTE: When considering working temperature, include ambient and potential collective surface temperature (Radiant Heat).

LIMITED WARRANTY

Primary Fluid Systems Inc. (Primary) warrants its products against defects in workmanship or materials for one (1) year under normal use. Three-(3) year available when application card is completed and returned to factory. Application card can be obtained by emailing request to sales@primaryfluid.com

Primary's obligations and liabilities under this warranty shall be limited to replacement of the product, or a refund of an amount not to exceed the purchase price of the product(s) to which such warranty claim is made. Repairs or replacements are made subject to our inspection of the returned product(s). Primary's decision of one of these alternatives shall be the buyer's exclusive remedy.

This warranty does not extend to damage by corrosion or other decomposition by chemical action. Primary does not warrant damages caused by (a) improper use of the product, (b) unauthorized modification or attachment to product, (c) misuse, abuse, accident or negligent handling or installation of product, or (d) alterations or repairs made by purchaser.

The materials of construction offered are recommendations only, subject in all cases to acceptance by purchaser. These recommendations do not constitute any guarantee against corrosion or decomposition, but are based on previous experience and best available information of the industry.

Statements and instructions set forth herein are based on the best information and practices known to Primary, but it should not be assumed that every acceptable safety procedure is contained herein. Of necessity Primary cannot guarantee that actions in accordance with such statements and instructions will result in the complete elimination of hazards and it assumes no liability for accidents that may occur.

Except as specifically provided herein, Primary makes no warranty, representations, promise or guarantee, either express or implied, statutory or otherwise, with respect to the product and technical information provided, including the products' quality, performance, merchantability, or fitness for a particular purpose.

In no event will Primary be liable for indirect, special, incidental, economic, covert or consequential damages arising out of the use or inability to use the product, including without limitation, damages or costs relating to the loss of profits, business and good will even if advised of the possibility of such damages. In no event shall Primary's liability exceed the amount paid by you for the product.

The warranty and remedies set forth herein are exclusive and in lieu of all others, oral or written, express or implied. No Primary dealer, distributor, agent or employee is authorized to make any modification or addition to this warranty. This warranty gives you specific legal rights and you may also have other rights which vary from state to state.

ACCUGUARD Diaphragm Seals

Without proper protection, process fluids can contaminate and damage in-line instrumentation. ACCUGUARD Diaphragm Seals are designed to protect and isolate pressure gauges and expensive instrumentation from corrosive, high temperature, or viscous, process media.

Features

- Transfers process pressure accurately without direct contact with process fluids
- Removes the need for expensive instrumentation
- Easily installed and available in five chemically resistant Materials of Construction
- Optional Diaphragm Materials
- Available with ¼" & ½" Bottom Connection Sizes in FNPT & BSPT Female Connection Types
- Thermoplastic Units Rated to 240 PSIG (16 BARG) @ 21°C (70°F)
- 316L S/S Units Rated to 5800 PSIG (400 BARG) @ 21°C (70°F)
- Approved – 316 S/S Diaphragm Seals with CRN (Canadian Registration Number)

HOW TO ORDER - AccuGuard

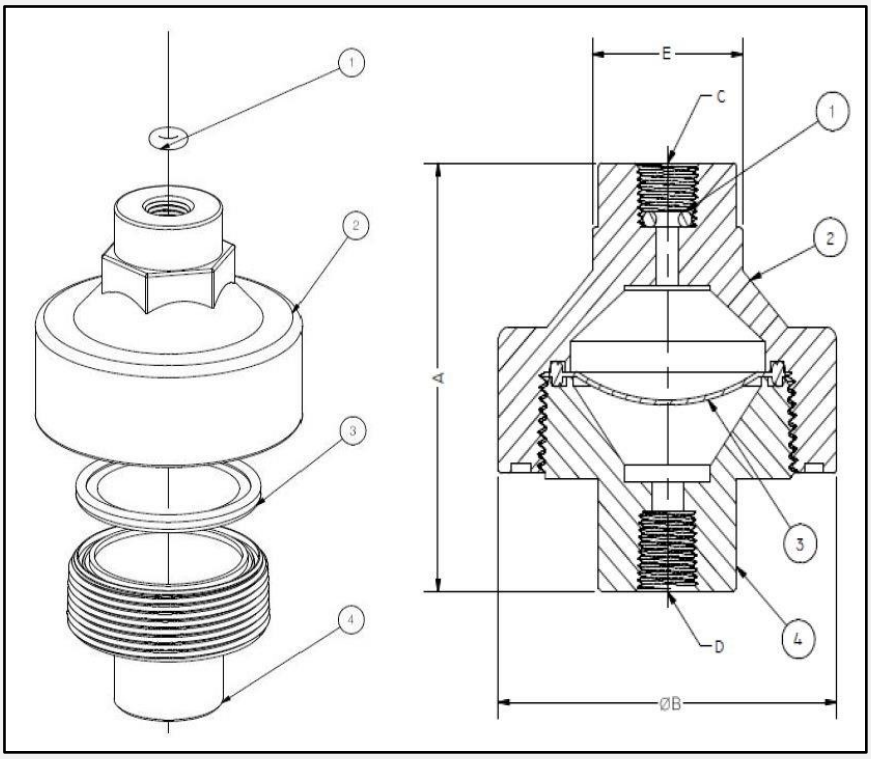
ACCUGUARD Diaphragm Seals

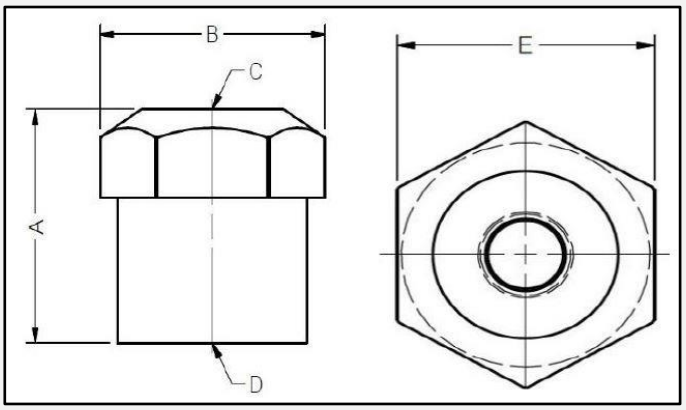
Technical Information

Temperature Correction Factors: Thermoplastics Temperature Effects:



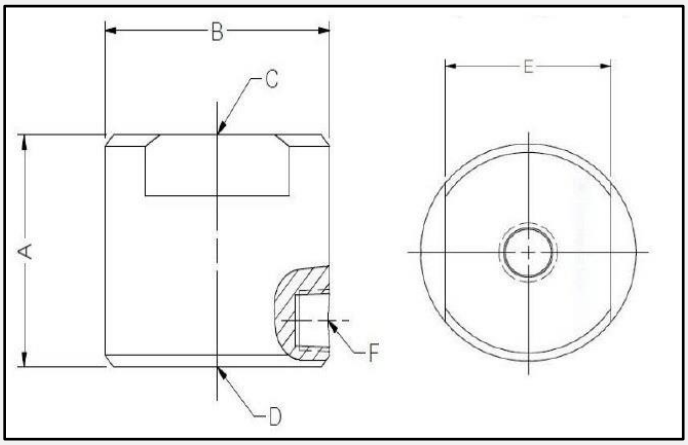
Thermoplastics and thermosets will decrease in tensile strength as the temperature increases: therefore, the working pressure must be reduced accordingly. For additional Information, please visit: www.eco-valve.com.

Canadian Registration Number:



Approved - 316L S/S ACCUGUARD Diaphragm Seals with CRN (Canadian Registration Number) Certification for all of Canada.

Dimensions & Parts



Thermoplastic Diaphragm Seals

Alloy Diaphragm Seals

Vented Alloy Diaphragm Seals

Dimensional Information

Dimension	Thermoplastic	Alloy	Vented Alloy
A	3.3" [84.68mm]	1.5" [38.61mm]	1.57" [40.00mm]
B	3.1" [78.49mm]	1.7" [43.43mm]	2.05" [52.00mm]

ACCUGUARD GAUGES

ACCUGUARD Pressure Gauges are designed to enhance the performance of chemical feed systems. Adding a pressure gauge to any system will help to ensure that optimal pressures are monitored and maintained.

Series Information

Series	Gauge Diameter	Gauge Connection Size and Type	Gauge Housing	Gauge Internals	Liquid Filled	*Accuracy Rating
Economy	2" / 2.5"	1/4" NPT	Steel Case	Brass	No	± 2.5%
Intermediate	2.5" / 4"	1/4" NPT	304 S/S	Brass	Yes	± 1.6%
Premium	2.5" / 4"	1/4" NPT	304S/S	316L S/S	Yes	± 1.6%

*Accuracy Rating = Full Scale Range

HOW TO ORDER - AccuGuard Gauges

Example Part Number: GE2-160-CB

G E 2 - 160 - CB

AccuGuard Gauge

Gauge Series
- E = Economy
- I = Intermediate
- P = Premium

Gauge Diameter
- 2 = 2 Inches
- 2.5 = 2-1/2 Inches
- 4 = 4 Inches

Gauge Mounting Orientation
- CB = Center Back
- BM = Bottom Mount

Gauge Indication
- 60 = 0-60 PSIG / 0-400 KPA
- 160 = 0-160 PSIG / 0-1100 KPA
- 200 = 0-200 PSIG / 0-1400 KPA
- 300 = 0-300 PSIG / 0-2000 KPA
- 400 = 0-400 PSIG / 0-2800 KPA

4" Gauge Diameter Available in Bottom Mount Orientation Only

DECLARATION OF INCORPORATION

We declare that the subassembly described in the technical description cannot be put into service until the machine in which it is to be incorporated has been declared compliant with the provisions of machine directive 98/37/CE modified 98/79/CE and with the related national legislation.

The subassembly complies with harmonised standards EN ISO 12100.

0. INTRODUCTION

0.1 General Information

The pump you have just acquired was manufactured and inspected with the greatest of care.

This manual aims to help you keep your pump in good working order.

The information contained in this manual may not be copied or published in any form whatsoever, whether by printing, photography, recording on microfilm or any other means (electronic or mechanical) without the prior written consent of *PCM Pompes SA*.

The information given in this document is subject to change without notice. PCM Pompes SA or its representatives decline all responsibility in the event of damage resulting from the use of this manual. This exemption from responsibility applies to damage of all types, including (without any limit) compensatory damages, whether direct or indirect, loss of data, profits or return of capital, loss or damage caused to the property of others, and third-party claims. PCM Pompes SA or its representatives accept no responsibility and do not guarantee the accuracy, completeness, or up-to-date nature of the information contained in this manual.

Markings

Information shown on the pump motor unit or on an identification plate attached to the pump:

a) Manufacturer name and address.
b) Serial number.
c) Maximum allowable flow rate at 0 bar or rotation rate of pump motor unit.
d) Maximum allowable pump pressure, according to its motor.
e) Customer reference (optional).
This information is essential when ordering spare parts (contact **PCM Services**).

Pump characteristics (e.g. flow rate, pressure, speed of rotation, construction, direction of rotation of pump, etc.) must not be modified without written permission from PCM Services.

0.2 Limits of Guarantee

Before performing any servicing on the pump, please check that all necessary precautions have been taken: pump switched off, upstream and downstream valves closed, pipework cleaned and purged, electrical power supply disconnected, and all the usual steps to be applied according to the personnel safety regulations in force.

On receiving the pump, examine it immediately to check that it shows no obvious sign of damage. If it is visibly damaged, write a clear annotation on the carrier's documents stating that the merchandise was received damaged and briefly describing the nature of the damage. If you decide to accept such equipment, send a registered letter with return receipt, to reach the carrier within forty-eight hours, with a copy to **PCM Services**.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

Storage and handling conditions are given in detail in Section 3, Para. 3.2 and 3.3.

To avoid all risk of accident or damage (in particular, when hazardous products are being pumped), it is essential to refrain from using this equipment for an application other than the one originally intended (refer to technical description in Appendix).

To maintain the original qualities of the pump and to preserve the PCM guarantee on the equipment as well as compliance with the machines directive, it is essential to use PCM parts only.

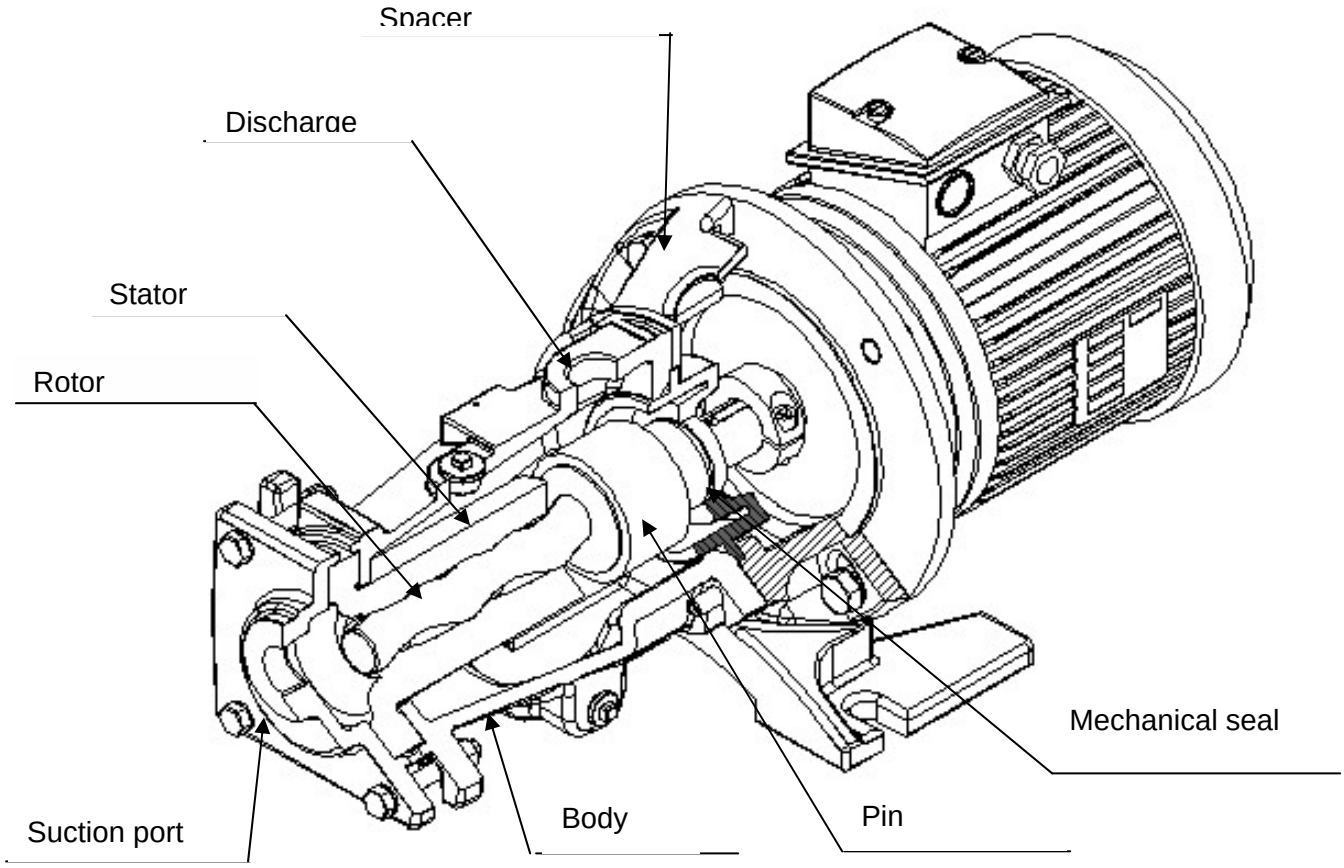
0.3 Safety and Environment

PCM is committed to an environmental protection initiative in accordance with the recommendations of the ISO 14001 standard.

PCM has set up a system through which its customers can ask PCM to handle the disposal of waste material (used pumps and spare parts). This system is especially useful for the disposal of parts containing elastomers, such as the stators of Moineau pumps or tubes from peristaltic pumps.

All returns must be sent to the PCM factory, carriage paid. The equipment must be clean, with the pump and drive completely emptied of products, and must arrive with the sheet entitled: **risk prevention** (see Section 4: Appendices).

All items returned for this purpose must be legibly marked with the words '**Equipment to be recycled'**.



Send to :

PCM
Rue René Moineau

FRANCE

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

1. CHARACTERISTICS AND INSTALLATION

1.1 Operating Principle

The PCM Moineau progressive cavity pump (or eccentric screw pump) essentially consists of two internal helical gears, which both have the following features:

- The stator, which is the external element, has one more tooth than the rotor, which is the internal element.

- In any given cross-section, each section of the rotor is in contact with the stator.

- The pitches of the helices of the two elements are in a ratio according to the number of teeth.

The rotation generates an axial displacement, from the suction to the discharge, of the closed cavities bounded by the rotor and stator.

The PCM MOINEAU pump is a volumetric pump whose capacity is equal to the volume of a cavity.

The stator of pumps is said to be 'floating', meaning that it has one free end. This principle, associated with an elastic coupling, simplifies the transmission of the rotational movement between the drive and the rotor.

Mounting the stator in this floating configuration provides the following advantages:

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

Direction of rotation (Note: This pump is not reversible!)

The pump's direction of rotation is shown on the upper part of the pump body.

The pump is designed to be used in one directly of rotation only. It is up to the installer to check the revolving field of the electrical installation to ensure that the pump is running in the correct direction of rotation.

1.2 Characteristics

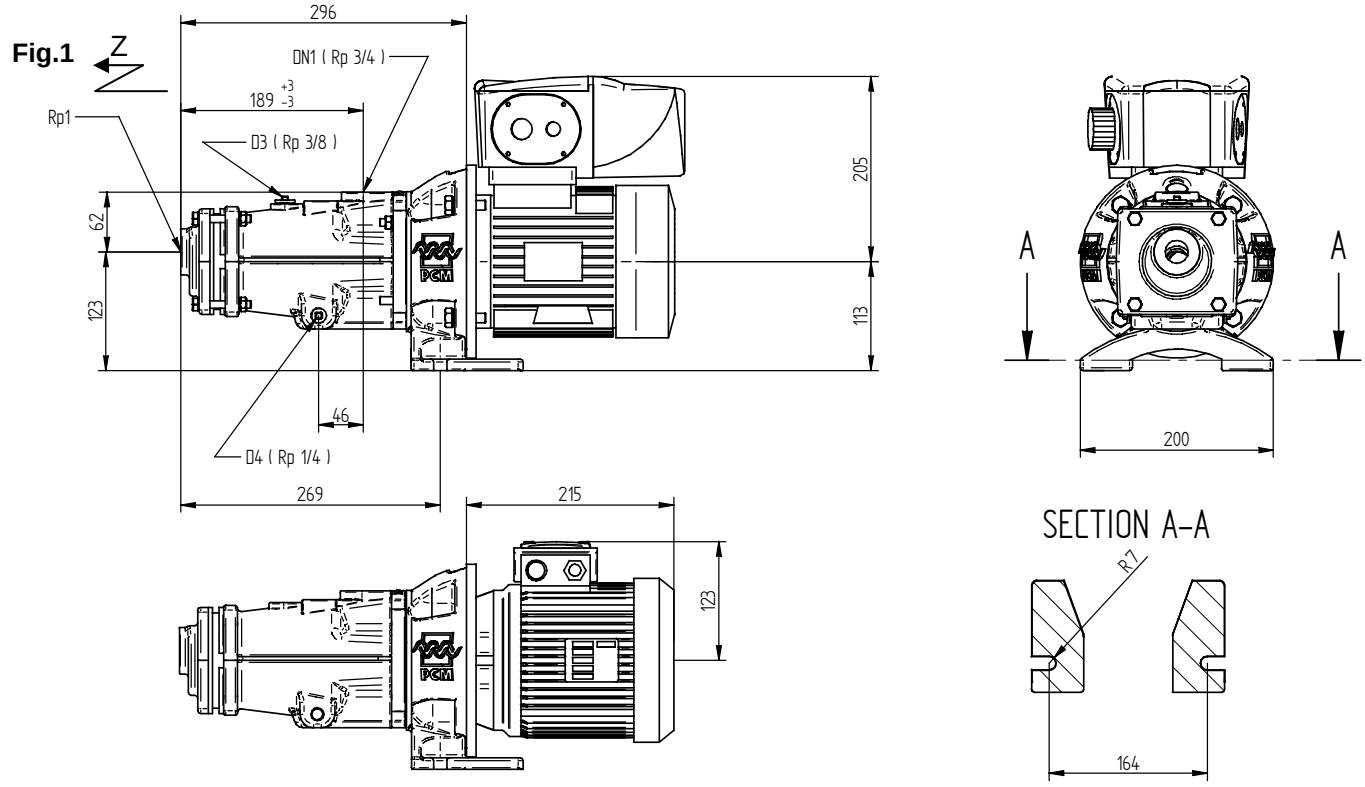
1.2.1 Build Properties

Defined in the table below

Component	011M6F	075M6F	1M6F	2M6F	3M6F
Stator	NBR / CSM / FKM / CR				
Plot	NBR / CSM / FKM / CR				
Single mechanical seal	Carbon/Silicon carbide				
Rotor	X30Cr13				
Body/Port/ Spacer	EN-GJL250				

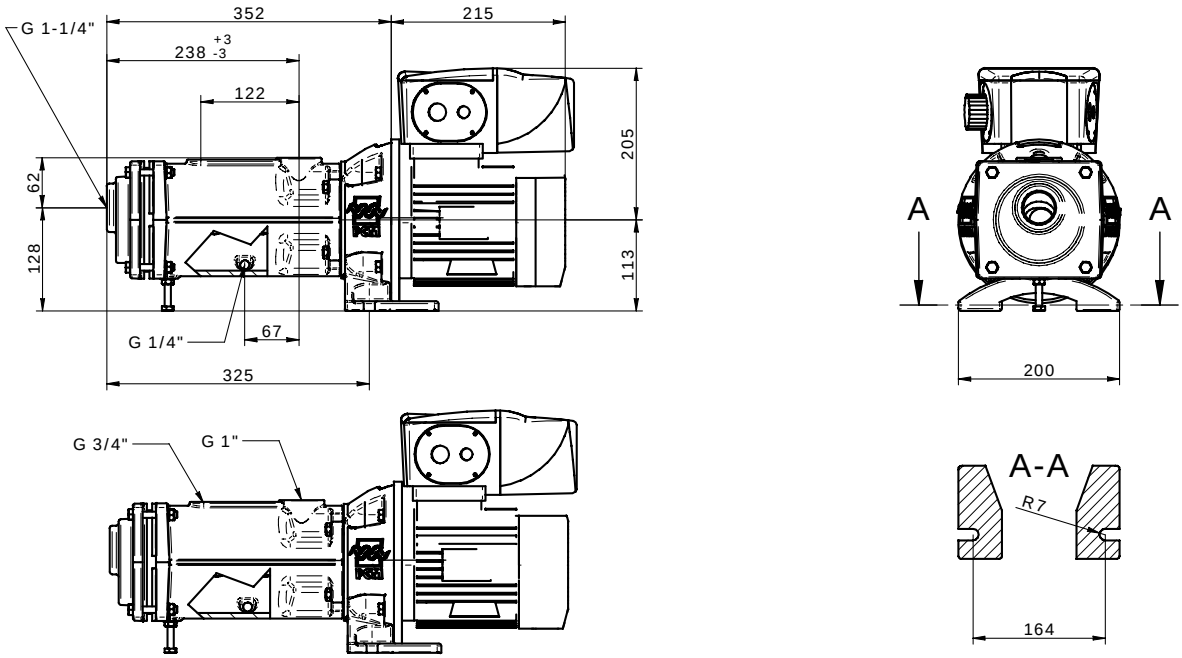
The material descriptions comply with the AFNOR standard.

NOTE: By default, our pumps are protected by a particular paint. The procedure and details of the application of this paint are defined in the technical description.



☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

1.2.1.1 Overall Dimensions



Motor-driven pumps 011M6F / 075M6F / 1M6F / 2M6F

Z = 120 mm

Fig.1

3M6F

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

1.2.2 Operating Characteristics

Pump characteristics (e.g. flow rate, pressure, speed of rotation, construction, etc.) must not be modified without written permission from PCM Services.

They are indicated in the technical description of the equipment delivered. The A-weighted equivalent acoustic pressure level of pumps manufactured by PCM Pompes is below 80 dB(A), in compliance with the European directive in force concerning noise from motor-driven equipment.

M Series floating stator Moineau pumps are used in the following industries: starch industry, construction, ceramics, sanitation & environmental, oil production, petrochemical industry, petroleum, soap manufacture, etc.

With their robust design, MF Series Moineau pumps are used to convey a variety of liquids: clear, viscous, abrasive, heterogeneous, charged, fragile, or emulsifying.

IMPORTANT NOTE

The maximum temperature for use is determined by the stator material and the specifications given in the technical description provided in Appendix.

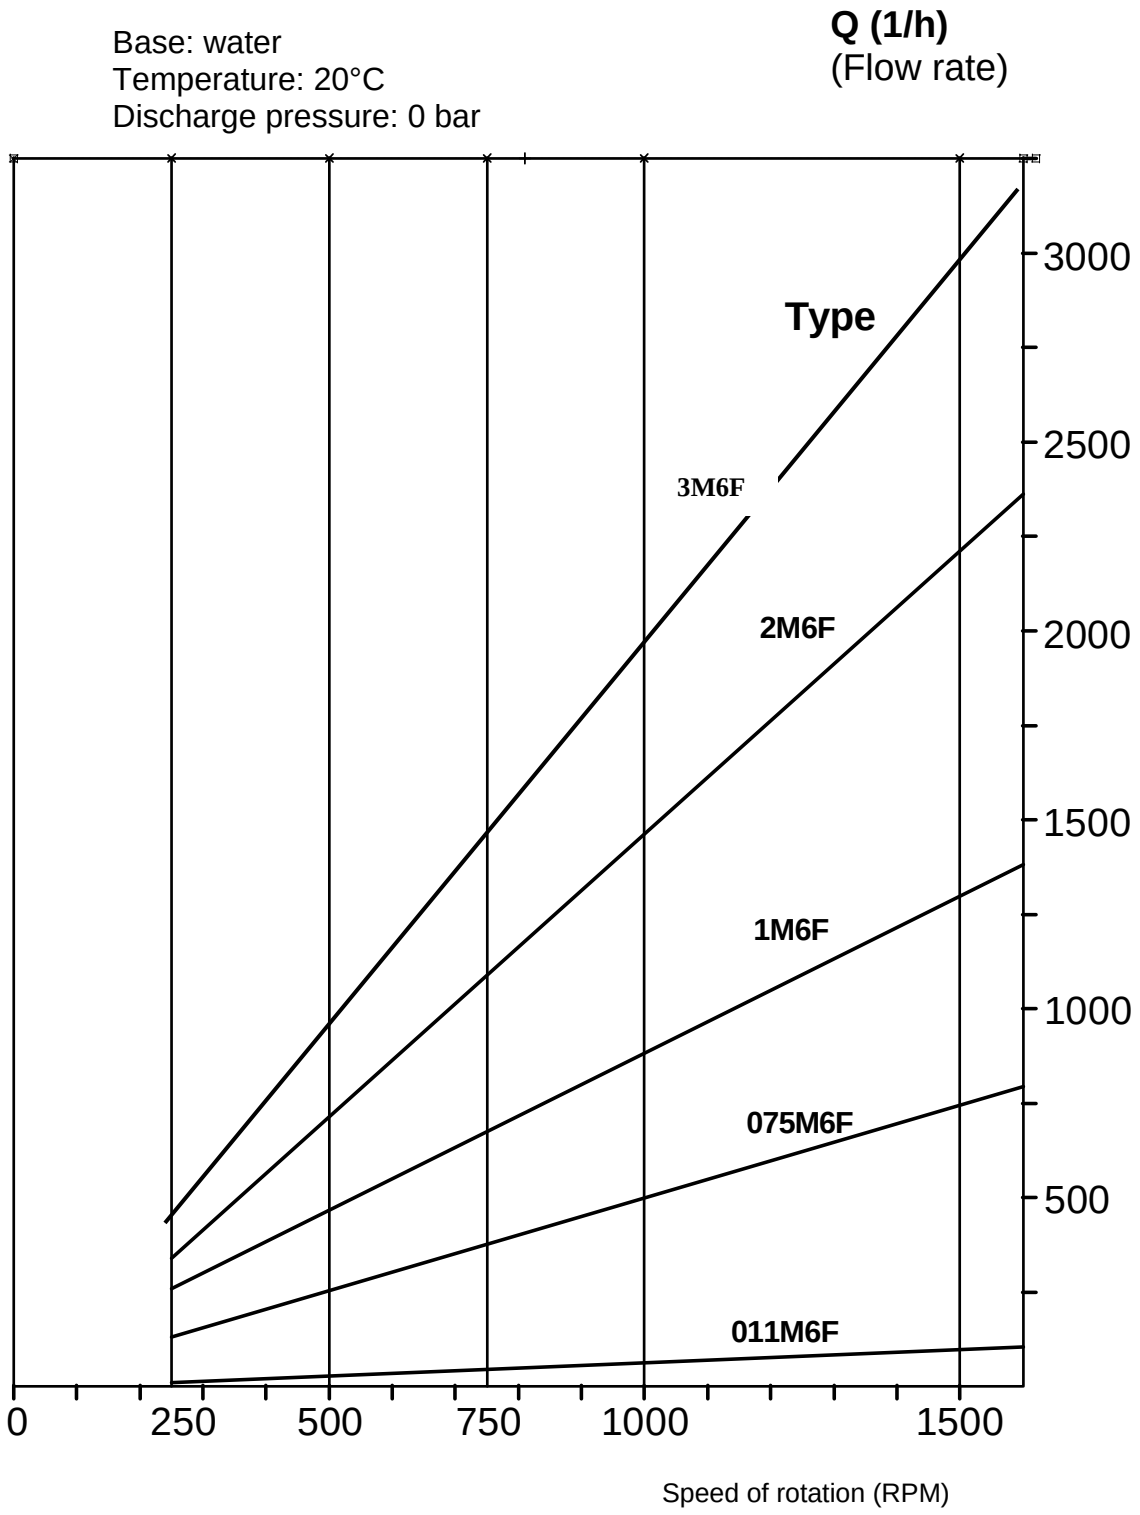
The maximum speeds are given by the curves on the following page.

Do not use the pump under conditions other than those described in this document without first obtaining authorisation from PCM Services.

Pump performance curves

The rotational speeds and pressures shown on the following curves represent performance characteristics obtained with water at 20°C. When operating conditions differ from this standard, the performance characteristics must be adjusted according to:

- Product characteristics (viscosity, fragility, abrasion).



- The characteristics of the application (operating speed, discharge pressure, available NPSH).

The following curves were generated under the following conditions:

- Based on water at 20°C
- Discharge pressure = 0 bar

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

Base: water
Temperature: 20°C
Discharge pressure: 0 bar

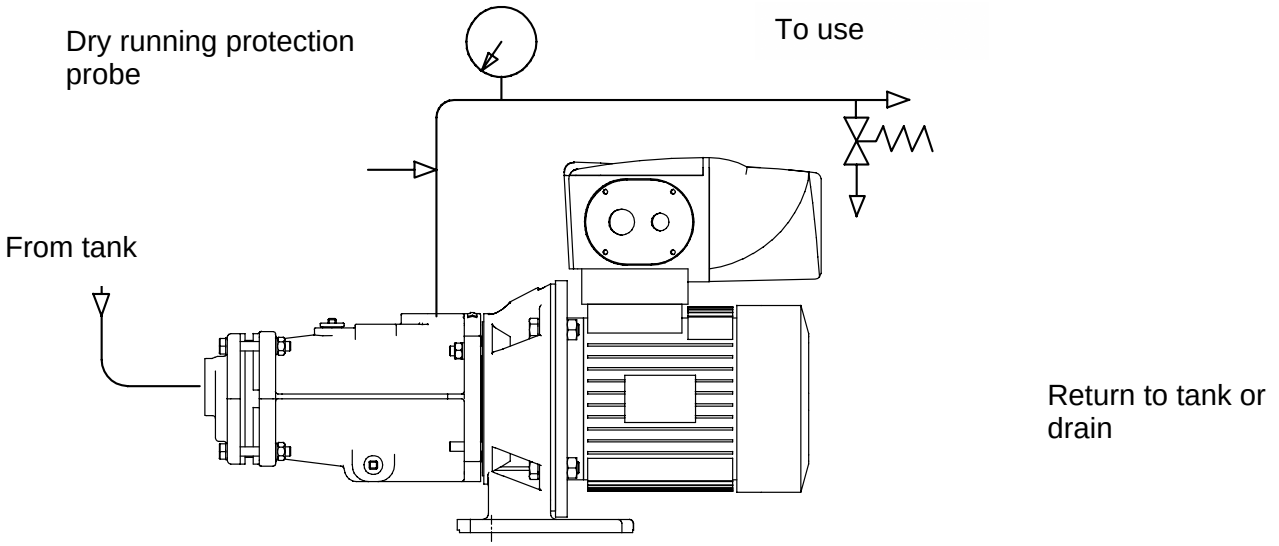
For more precise details, look at the curve for your pump, or ask **PCM Services** to send you this information.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

1.3 Installation

All Moineau pumps are inspected in our workshop before dispatch.

1.3.1 Installation Precautions



It is important to leave enough space around the pump to allow access for maintenance and adjustments. Avoid installing the pump in a location where the ambient temperature might not be within the operating temperature limits of the pump (refer to the technical description in Appendix). For an outdoor installation, it is recommended that you provide a protective covering above the equipment and a freeze protection system.

Caution! It is essential to install the pump horizontally, because in a vertical installation, the mechanical seal can be damaged unless precautions are taken.

It is also recommended that you install a removable fitting for ease of servicing the entire pump motor unit. The pump must not support the weight of the pipework.
A safety valve or pressure-sensitive switch and a pressure gauge are located at the discharge for the purposes of protection and to allow the pump's operating characteristics to be monitored. A dry running protection probe protects the pump when there is a shortage of the product to be pumped. Please ask PCM about its wide selection of accessories to suit your requirements.

Tips for Optimum Pump Operation

a) Preferably the pump is in floaded suction condition.all
b) Place the pump as close as possible to the suction point.
c) If a valve is present in the circuit, it is **ESSENTIAL** to provide a safety valve or pressure-sensitive switch.

NOTE: Without protection on the circuit, a valve at the discharge is often the cause of operating errors leading to damage to the pump or pipework.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

1.3.2 Connecting the Pipes

An easily removable component should be installed on the stator end side. This allows the stator and the rotor to be removed easily (see dimension Z, Para. 1.2.1.1), without removing the whole pump from its mounting site. The weights of the pipes must not be supported by the pump. The allowable torques and forces on the fittings are given in Para. 1.2.1.

1.3.3 Anchoring

The pump and its drive mechanism must be secured to an adequately sized concrete block using screws and rawl plugs or foundation bolts. The unit shall be placed on a flat surface so that the spacer is maintained on the installation plane. If necessary, wedge the assembly to ensure that the unit is stable (refer to overall dimensions, Para. 1.2.1.1).

1.3.4 Connecting the Motor Unit

Caution! All procedures must be performed by qualified personnel. PCM Pompes declines all responsibility if this requirement is not fulfilled. Before performing any connections, ensure that the electrical power supply has the characteristics listed on the motor plate. There is also a connection diagram in the motor terminal box (instructions in Appendix).

For thermal protection: the setting is the current indicated on the motor plate.

When all connections have been made, the motor should be run at low speed for **a few seconds** (if possible using a mechanical or frequency variator) and you should check the direction of rotation of the motor as compared to the arrow marked on it.

Caution! Pumps do not tolerate dry running.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

2. OPERATION

2.1 Commissioning

2.1.1 Before Start-up

Ensure that:

_ Electrical connections are compliant.
_ The reduction gear has been filled with lubricant or the level is adequate.
_ The venting plug on the reduction gear is present and its protection has been removed.
_ The direction of shaft rotation corresponds to the specified direction of circulation.
_ The product to be pumped is present in the tank and the pump body.
_ The mechanical seal is lubricated if the pump is equipped with a self-lubricating seal.
_ All valves installed upstream and downstream from the pump are open.
_ The variator end stops are properly adjusted.
_ The temperature and type of product to be pumped are compliant.

2.1.2 Start-up

NEVER ALLOW THE PUMP TO RUN DRY!

To guard against this possibility, PCM may recommend a dry running protection system.

If the pump is not charged, you are advised to fill the pump body by hand. If the pump is temporarily not primed, the small amount of liquid remaining in the pump is enough to lubricate the stator until the next priming. During the first few minutes of operation, check for the following:

_ The liquid being pumped reaches the end of the discharge pipe.
_ The pump does not vibrate.
_ No unusual noise.
_ Sealing system functions well (refer to the specialist documentation in the appended instructions, according to the sealing system).
_ Check that the pressure stabilises, if a pressure gauge is installed.
_ No abnormal heating in the following areas:

- Stator
- Sealing system.

Check that the following parameters match the design parameters of the pump:

_ Speed, flow rate, pressure, viscosity, and temperature.

If the values are not those indicated, consult PCM Services.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

2.2 Normal Operating Procedure

2.2.1 Start-up Procedure

Check the following points before each start-up:

_ Presence of the product to be pumped.

_ Suction and discharge pipe valves are open.

_ Correct temperature of the product to be pumped.

2.2.2 General Operating Instructions

During operation, ensure that:

_ The pump is continuously supplied with the product and with its source of energy.

_ The discharge pressure remains stable and below the maximum capacity of the pump.

_ The temperature of the product being pumped remains within the operating limits.

_ The operating instructions in force on the production site are observed.

2.2.3 Cleaning

External Cleaning

Any soiling likely to damage the paint and corrode the pump must be removed from the equipment.

Internal Cleaning

Cleaning procedures and frequency of cleaning depend on the specific use of the pump and on the product being pumped. The basic procedure, however, is described below.

With the pump in operation, supply it at the suction with a cleaning product that is compatible with the product to be pumped and with the materials of which the pump is made. The cleaning time will be defined by the process using the pump. At the end of this time, shut down the pump in accordance with Para. 2.2.4.

2.2.4 Shutdown Procedure

The shutdown procedure depends on the type of product being pumped. Refer to the specific characteristics located in the technical description in the Appendix.

The shutdown procedure is therefore defined by the process.

The minimum procedure, however, is to switch off the pump and then to close the suction and discharge valves.

Caution! If the product decants, the pump must be cleaned so that it can then be re-started without damage.

2.3 Operating procedure in the event of an incident

In the event of operating malfunctions such as the following:

_ Pump does not start up.

_ Pump does not prime itself.

_ Flow rate is too low or irregular.

_ Pump stops running.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

_ Pump does not deliver.
_ Pump is unusually noisy.

Proceed as follows:

_ Shut down the pump in accordance with the shutdown procedure described in Para. 2.2.4.
_ Hydraulically isolate the pump (suction and discharge).
_ Refer to Para. 3.5.1 - Troubleshooting.

2.4 Automation

The use of devices that automatically enable or disable pump operation is recommended.

Examples: pressure-sensitive switch, valves with electrical position contact, dry running protection probe (capacitance probe).

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3. MAINTENANCE

3.1 List of spare parts

For the list of spare parts for your pump, contact **PCM Services** giving the serial number of your equipment. This number is shown on the manufacturer identification plate (see Para. 0.1).

You can ask us to overhaul your pump. Within three days of receiving it, we will supply a quotation showing the cost of the overhaul and how long it will take to do. Contact **PCM Services.**

3.2 Handling Equipment and Procedure

To handle the complete pump, refer to the procedure in force and comply with legislation concerning the safety of personnel. Slinging must be performed by trained, qualified personnel in accordance with the instructions given in this manual. Any failure to observe this rule releases PCM from all responsibility.

Before lifting the pump, ensure that all its components are securely fastened to each other. For small pumps, slinging has not been provided for.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3.3 Storage Conditions

A) In standard PCM packaging

. Pumps and pump parts must be stored in their original packaging, in a stable position, protected from impact, and in a dry location.

B) After unwrapping

. Protect the equipment from impact and from dust.

C) Packaged according to S.E.I. 4c

Every six months,

. Replace the desiccant pouches,

. Check the machined surfaces and grease them if necessary.

NOTE: Once a month, run the pump 4 or 5 revolutions with the motor fan.

3.4 Preventive Maintenance

All maintenance procedures must be performed by trained, qualified personnel in compliance with the instructions given in this manual.

Any failure to observe this rule releases PCM from all responsibility.

Before performing any servicing on the pump, please check that all necessary precautions have been taken: pump switched off, upstream and downstream valves closed, pipes cleaned and purged, electrical power supply disconnected and made inaccessible. All the usual precautions must be taken, in accordance with the texts in force regarding the safety of personnel.

3.4.1 Periodic Inspection

For operation eight hours per day, five days per week:

_ Complete leaktightness of the pump: Once a week.

_ Tightness of the assembly mounting hardware (port, stator, body, spacer, drive): Once a month.

_ Level of lubricant in the drive, if applicable: Once a month.

_ Anchoring: Once a year.

_ Motor current and cleanliness of drive ventilation grille: Once a month.

_ Condition of power supply electrical cable sheaths: Once a year.

3.4.2 Lubrication

The pump drive is supplied with oil. Check the oil level before putting the pump in service.

Consult the manufacturer documentation supplied in Appendix for the precautions to be taken when lubricating the drive, where applicable.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

The following table indicates the recommended lubricants to be used when servicing the pump:

Component to be lubricated	Recommended lubricants	Supplier
Connection between reduction gear/Control shaft (36)	GERALYN 2 grease	FUCHS LUBRITECH
Stator Item 1 (for assembly)	GLYCERINE	

3.4.3 Torque

The general torque values for the mounting hardware are given in the following table:

Diameter of mounting hardware	Min. torque	Max. torque
M4	0.9 Nm	1.6 Nm
M5	1.8 Nm	3.3 Nm
M6	3.1 Nm	5.6 Nm
M8	7.4 Nm	13 Nm
M10	15 Nm	27 Nm
M12	30 Nm	45 Nm
M14	52 Nm	74 Nm
M16	61 Nm	110 Nm

3.4.4 Specialist Tools

No specialist tools.

3.5 Corrective Maintenance

3.5.1 Troubleshooting

	Incident													
Causes	The pump does not start.	Pump no longer delivers	Pump does not prime itself.	Pump stops running.	Flow rate too low	Insufficient discharge pressure	Drive is overloaded	Pump is noisy or vibrates	Leak in shaft seal	Premature stator wear	Premature rotor wear	Flow rate is not constant	Joints deteriorate quickly	Solutions (see paragraph 3.5.1.1)
The stator is swollen.	x			x			x			x			x	**1**
Rotor drive system is broken.	x	x	x	x										**2**
Product temperature is too high.	x		x	x	x	x	x	x		x	x		x	**3**
Sedimentation or precipitation of the fluid in the pump body	x	x	x	x			x	x		x	x		x	**4**
The solid bodies contained in the liquid are too voluminous.	x	x		x			x			x	x		x	**5**
The electrical installation is not compliant.	x			x	x	x	x					x		**6**
The devices driving the pump are worn or broken.	x	x	x	x	x	x		x				x		**7**
Pump is blocked by a foreign body.	x	x		x			x			x	x		x	**8**
The stator has become hard and brittle.		x	x		x	x	x	x		x	x		x	**9**
The stator is sectioned at its rim.			x		x	x								**10**
The stator is worn.		x	x		x	x		x		x				**11**
The rotor is worn.		x	x		x	x		x		x				**12**
Leak in mechanical seal.			x						x					**13**
Incorrect direction of rotation.			x			x								**14**
Product temperature is lower than expected.		x	x		x	x								**15**
Net positive suction head is too low NPSHd<NPSHr		x			x	x		x		x	x	x	x	**16**
The pump suction is aspirating air.		x			x	x				x		x		**17**
Speed of rotation is too low.		x			x	x								**18**
Pump installation location, pipework and accessories should all be checked.	x	x		x	x		x	x		x		x	x	**19**
The pump is running dry.		x	x					x		x				**20**
Viscosity of the pumped product is higher than expected.		x		x	x		x							**21**
Pressure at discharge is too high.	x	x		x	x		x	x		x	x		x	**22**
Speed of rotation is too high.							x	x		x	x		x	**23**
For a new pump or new stator: excessive static tightening.	x						x							**24**
Shaft is damaged (according to model).		x	x		x	x			x			x		**25**
The roller bearings are worn (according to model).								x	x					**26**
Stability of pump motor unit (according to model).								x						**27**

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3.5.1.1 Solutions

1) The stator material swells when in contact with the product being pumped. Check that the material and the product are those specified in the order. If necessary, contact **PCM Services.**

2) Determine the cause of failure by checking points 1, 3, 4, 5, 8, 22, and 23, and then replace the damaged parts.

3) The operating temperature limit is defined according to the stator material.

4) Clean the pump body and rinse the pump after each use.

5) Remove these bodies using a strainer, or consult **PCM Services** about obtaining another pump.

6) Check the network voltage, motor connections, circuit breaker calibration, and number of phases.

7) Replace defective parts and check the load on the drive.

8) Disassemble the pump, clean it, and replace any defective components.

9) Check that the temperature is not higher than initially planned and that the product being pumped is the intended product. For any change of parameters, consult **PCM Services** to determine a different pump construction.

10) This type of damage is typically caused by an overpressure. Consult **PCM Services.**

11) Replace the stator and check the condition of the rotor.

12) Determine the cause of the wear: abrasion, corrosion, cavitation; consult **PCM Services** to define a new rotor material if necessary, and install the new part.

13) Remove the mechanical seal and replace it with a new one.

14) Change the electrical connections.

15) Contact **PCM Services**, who will recommend a tighter stator.

16) Reduce head loss in the suction pipe, lower the temperature, and raise the suction level.

17) Check the installation for leaks.

18) Consult **PCM Services** to determine the best way to increase the speed.

19) Check all pipes for obstruction by a foreign body, for a defective valve, for a continuous leak: improperly sealed valve, leaky poppet, etc.

20) Re-arrange the overall layout of the installation, or provide a dry running protection system.

21) For any viscosity change, consult **PCM Services** who will re-calculate the parameters.

22) Measure the pressure using a pressure gauge, and compare it to the pressure stated in the technical description.

23) Consult **PCM Services** to determine the best way to decrease the speed.

24) Fill the pump, and rotate the motor screw about ten revolutions by hand.

25) Replace the shaft and the mechanical seal.

26) Remove the bearing or reduction gear, and replace the roller bearings and seals.

27) Adjust the feet or check the mountings.

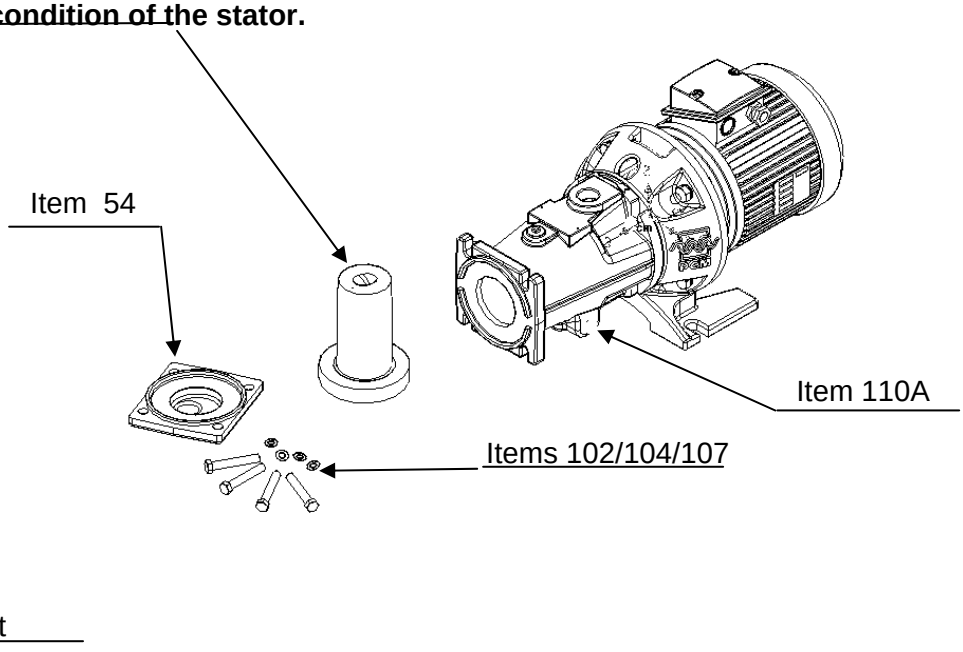
☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3.5.2 Pump Disassembly (see diagram in Section 3: Maintenance)

Before performing any servicing on the pump, please check that all necessary precautions have been taken: upstream and downstream valves closed, pipework cleaned and purged, electrical power supply disconnected, and all the usual steps to be applied according to the personnel safety regulations in force.

DISASSEMBLY CHART

3.5.2.1 Disassembling the Pump on the Operating Site

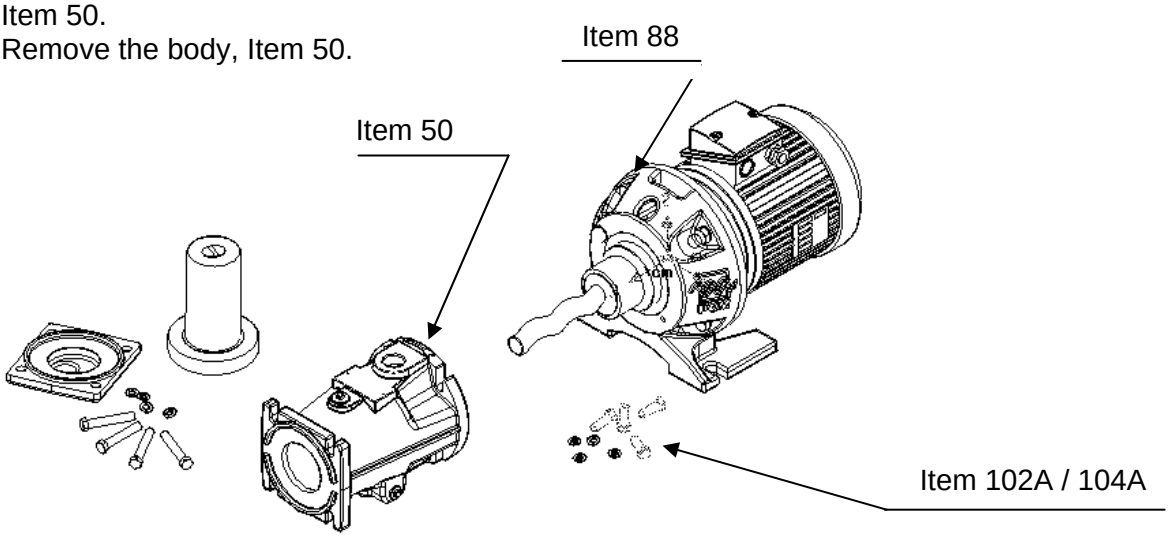


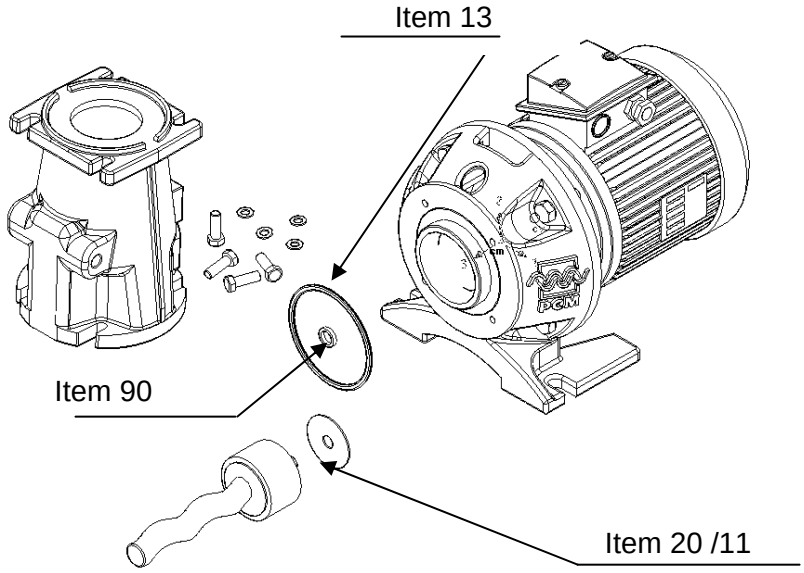
Obey the instructions given in Para. 3.5.2.
Drain the pump by removing the plug, Item 110 A.
Remove the pump from the installation and isolate it from the electrical circuit whilst identifying the motor connections (to obtain the correct direction of rotation after reassembly).

3.5.2.2 Removing the Stator Item 1

Drain the pump by removing the plug, Item 110 A.
Withdraw the removable component of the pipework on the stator port side, Item 54.
Disconnect the screws, nuts, and washer, Items 102/104/107.
Remove the port, Item 54, from the stator, Item 1.
Remove the motor cowl.
Extract the stator, Item 1, by using a spanner to rotate the drive shaft.

Check the condition of the stator.



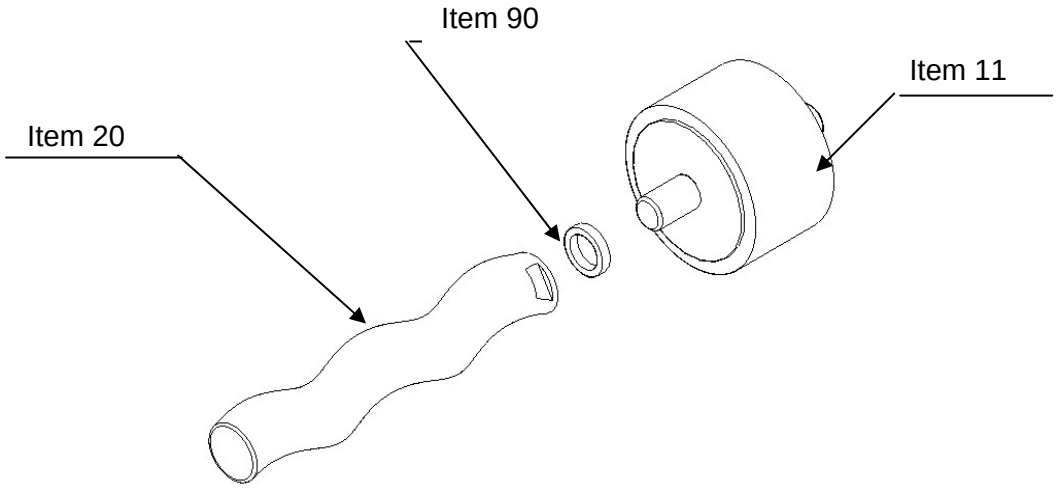


☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3.5.2.3 Disassembling the Shafting, Item 20/11

Perform the steps listed in Para. 3.5.2.2.
Use appropriate means to support the motor unit.
Remove the four screws and washers, Item 102A/104A, securing the spacer Item 88 to the body Item 50.
Remove the body, Item 50.

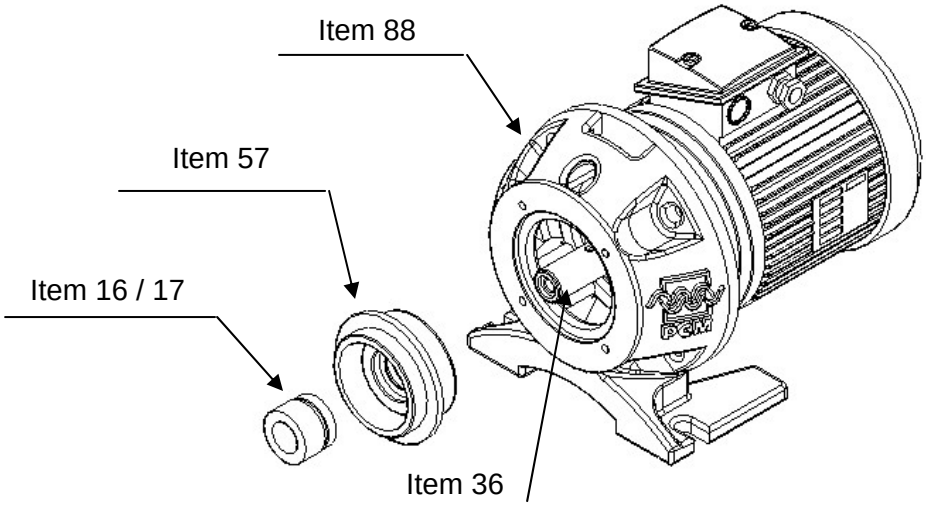
Use a strap wrench to turn the pin, Item 11, whilst immobilising the drive shaft in order to free the shafting, Item 20/11, from the reduction gear outlet shaft.
Isolate the shafting, Item 20/11, and place it in a safe location, protected from impacts.
It is recommended that you check the condition of the seals, Items 13 and 90, and if necessary replace them during reassembly.



☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 🖳 : www.pcm.eu

Caution! During reassembly, coat the bore of the control shaft that receives the reduction gear output shaft with grease before reinstalling the collet.

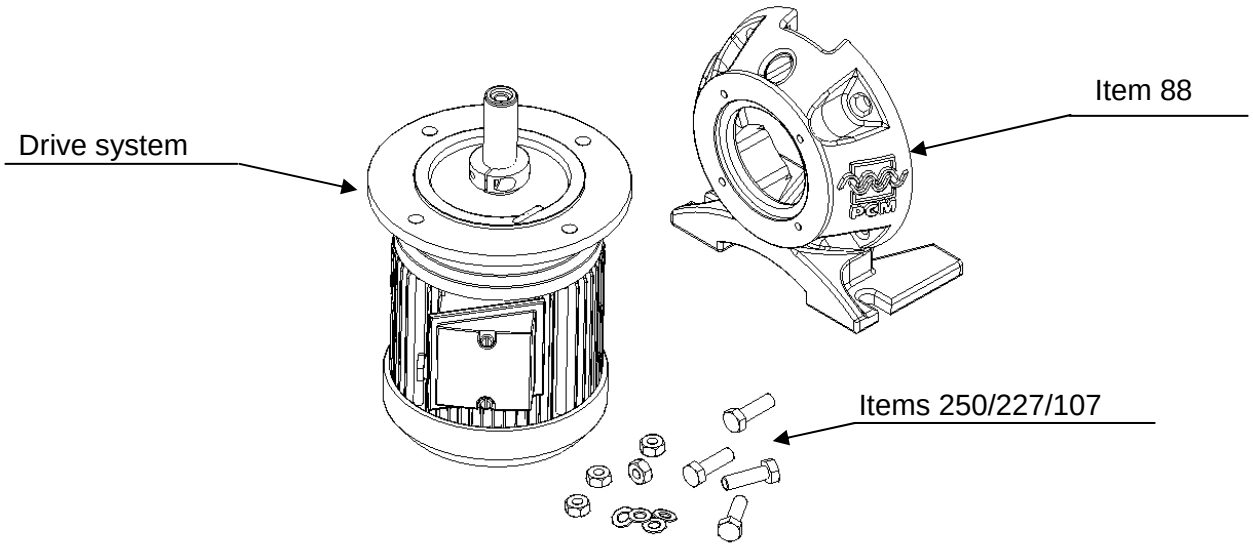
3.5.2.4 Removal of Rotor Assembly Item 20 and Pin Item 11



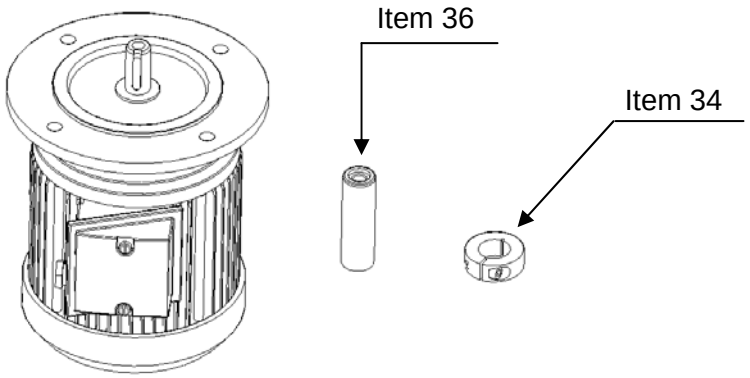
Perform the steps listed in Para. 3.5.2.2.
Perform the steps listed in Para. 3.5.2.3.

Using the plats at the end of the rotor, loosen the pin Item 11 with the strap wrench.
It is recommended that you check the condition of the seal, Item 90, and if necessary replace it during reassembly.

3.5.2.5 Disassembly of Mechanical Seal, Item 16/17



Perform the steps listed in Para. 3.5.2.2.
Perform the steps listed in Para. 3.5.2.3.
Slide the rotating part, Item 16, of the mechanical seal on the control shaft,
Item 36, by handling the bellows and the spring only.
Remove the seal support, Item 57, from the spacer, Item 88.
Press on the rear face of the counter-bearing, Item 17, and extract it from the seal support, Item 57.



☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3.5.2.6 Removing the Shaft

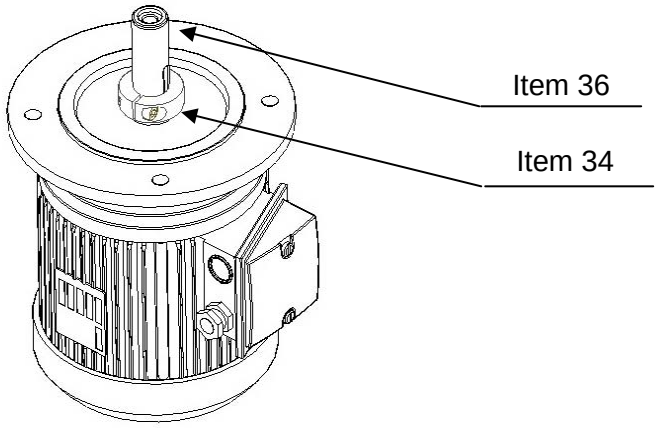
First, de-couple the spacer, Item 88, from the drive system by removing the screws, washers, and nuts Items 250/227/107.

Next, loosen the shaft ring, Item 34, and slide the control shaft, Item 36.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3.5.3 Pump Reassembly (see diagram in Section 3: Maintenance)

To preserve optimum operating characteristics for the pump, it is essential to use original PCM parts only. Pump maintenance must be performed by qualified personnel only, in compliance with the recommendations in force.

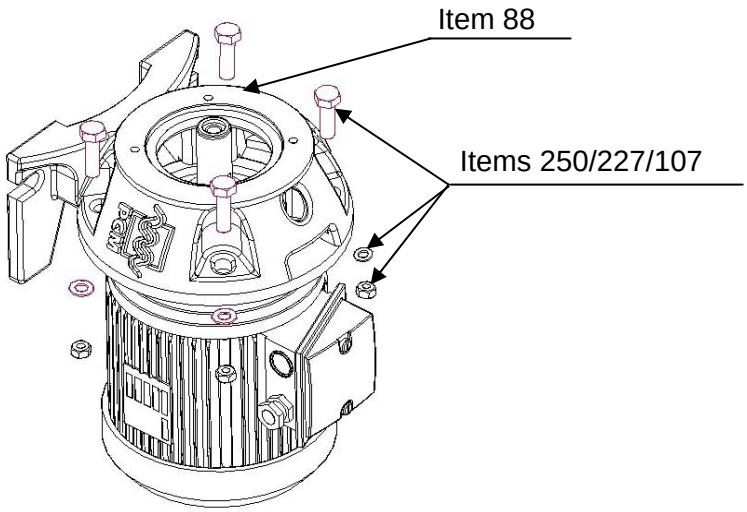


REASSEMBLY

3.5.3.1 Reinstalling the Shaft, Item 36, and Collet, Item 34

Caution! During reassembly, coat the bore of the shaft, Item 36, that receives the motor output shaft with grease before reinstalling the collet, Item 34 (see Para. 3.4.2).

Slide the shaft, Item 36, on the drive shaft.



Tighten the screw of the collet, Item 34 (see Para. 3.4.3).

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3.5.3.2 Reinstalling the Spacer

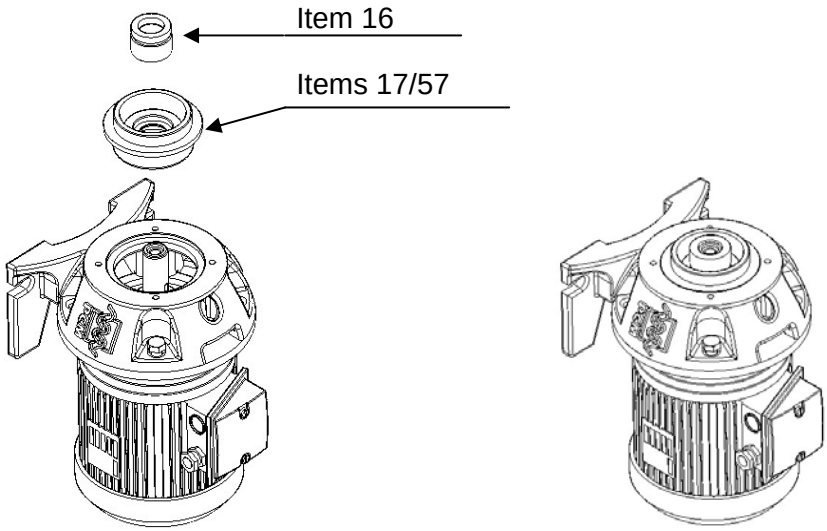
Perform the steps listed in Para. 3.5.3.1.
Install the spacer, Item 88, using fasteners, Items 250/227/107.
Centre the spacer, Item 88, on the reduction gear flange, and position the opening at the bottom.
Tighten to the appropriate torque (see Para. 3.4.3).

3.5.3.3 Reassembly of Mechanical Seal, Item 16/17

Perform the steps listed in Para. 3.5.3.1.
Perform the steps listed in Para. 3.5.3.2.

The parts that receive the mechanical seal must be clean and free of defects.

During storage, never place the bearing and counter-bearing on the bearing surface without a protective foil.

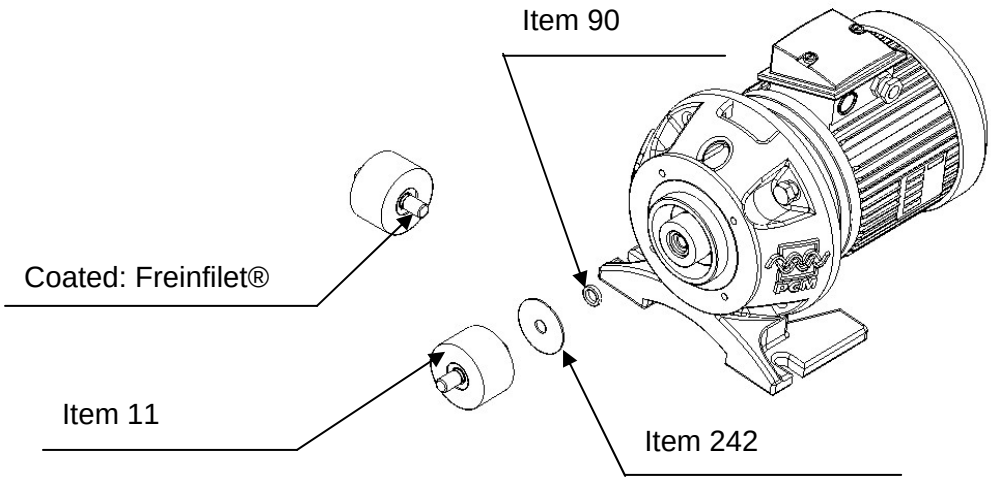


Ensure that installation is performed under conditions of strict cleanliness.

During assembly, never force a part into position.

Never use oil or grease during assembly.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

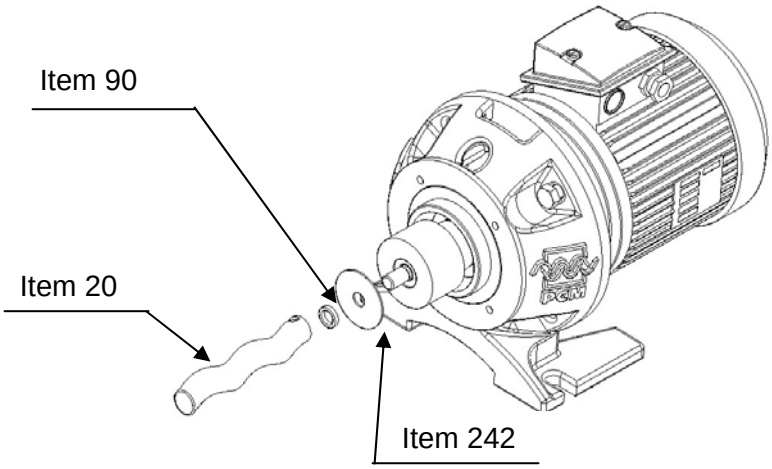


Slowly and steadily push the counter-bearing Item 17 into the housing of its support Item 57.
Place the rotating unit (spring unit) Item 16 on the control shaft Item 36 by turning it slightly clockwise. To reduce friction during assembly, the elastomer bellows and the output shaft must be moistened using low surface tension water (i.e. water with a rinsing agent added), or with a rinsing agent alone.
Eliminate scratches from the bearing surfaces using ethyl alcohol and cellulose cloths (no fabrics, no rags!).
After that, do not touch the bearing surfaces with your bare fingers.

3.5.3.4 Reassembling the Shafting, Item 20/11

Perform the steps listed in Para. 3.5.3.1.
Perform the steps listed in Para. 3.5.3.2.
Perform the steps listed in Para. 3.5.3.3.
Ensure that the seal, Item 90, is located on the shaft, Item 36.
Tighten the pin, Item 11, coated with Freinfilet® thread locking compound (see Para. 3.4.2) with the washer, Item 242, on
the shaft, Item 36.

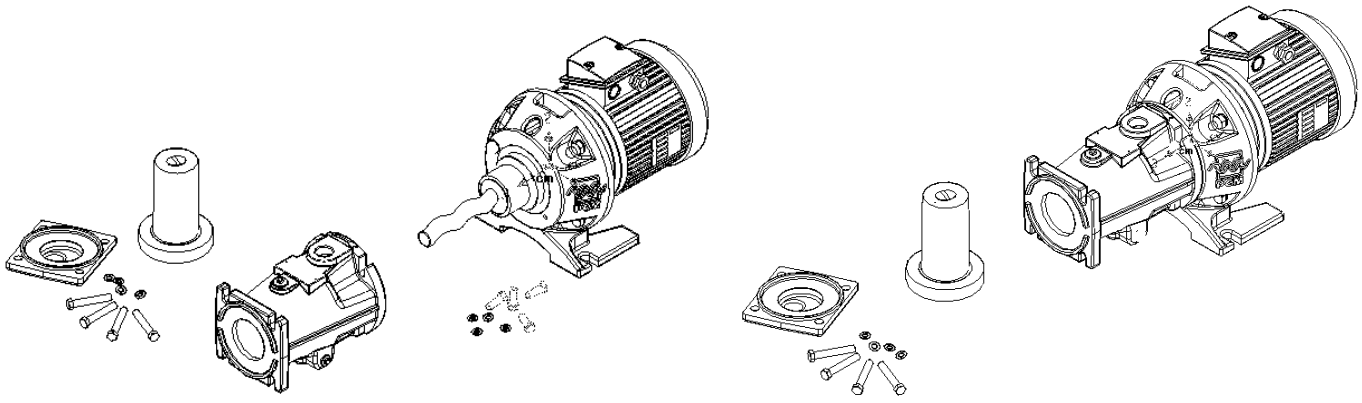
Tighten to the appropriate torque (see Para. 3.4.3).



☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3.5.3.5 Reinstalling the Rotor

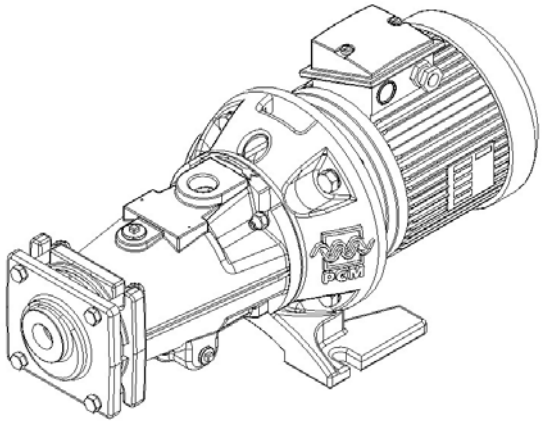
Perform the steps listed in Para. 3.5.3.1.
Perform the steps listed in Para. 3.5.3.2.
Perform the steps listed in Para. 3.5.3.3.
Perform the steps listed in Para. 3.5.3.4.
Check that the seal, Item 90, is present.
Tighten the rotor, Item 20, coated with Freinfilet® (see Para. 3.4.2) with the washer, Item 242, on the pin, Item 11, whilst immobilising the drive shaft.



Tighten to the appropriate torque (see Para. 3.4.3).

3.5.3.6 Reinstalling the Body Item 50 and Stator Item 1

Perform the steps listed in Para. 3.5.3.1.
Perform the steps listed in Para. 3.5.3.2.
Perform the steps listed in Para. 3.5.3.3.
Perform the steps listed in Para. 3.5.3.4.
Perform the steps listed in Para. 3.5.3.5.
Reinstall the body using the fasteners.



Lubricate the stator (see Para. 3.4.2).
Install the stator.
Position the port, Item 54, at the end of the stator, Item 1.
Lock the assembly using the screws, nuts, and washers.

Tighten to the appropriate torque (see Para. 3.4.3).

Reinstall the motor cowl.

☎: +33 (0)1 41 08 15 15 🖷 : +33 (0)1 41 08 15 00 💻 : www.pcm.eu

3.5.3.7 Reinstalling the Pump on the Operating Site

Place the pump in position, seal the connectors according to type, and connect the motor (refer to all of Section 1.3).
Familiarise yourself with the characteristics of the product in order to take all necessary precautions concerning the safety of personnel.
Apply the start-up instructions (see Para. 2.1.1, and then 2.1.2 and 2.2.1).

3.6 Storing the Equipment when not in Use

Proceed as follows:

– Release the suction and discharge pressures.

– Drain the pipework and the pump.

– Clean the pipework and pump using a product that is compatible with the product to be pumped and the pump materials.

– For a better cleaning result, run the pump.

– Shut down the pump.

– Isolate the pump from the rest of the circuit.

3.6.1 Preserving the Rubber Components

We recommend that you store all rubber parts in a cool location, away from light to avoid damage by UV rays.

3.7 Accessories

Special instructions supplied in Appendix.

ACCUDRAW® PVC Calibration Instructions

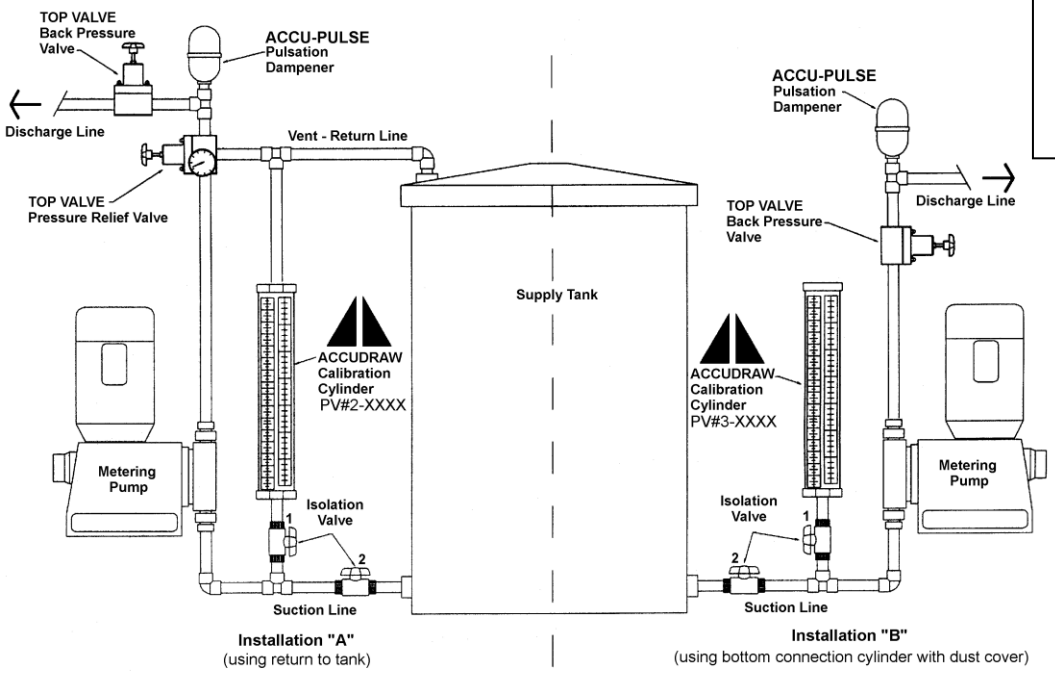
Note: Before starting either of the calibration procedures below, ensure that the pump is primed and void of any trapped air.

Using the USGPH scale: (scale is based on **time**, in one (1) minute volume discharge)

1. Fill the calibration to the top "0" mark on the USGPH scale.
2. Close isolation valve (#2) from supply tank, open isolation valve (#1) below cylinder and start the pump.
3. Use a stopwatch to measure the time of one (1) minute (60 seconds) and record the volume dispensed by the metering pump, using the draw down scale.
4. Adjust the pump volume control higher or lower to meet with your desired output.
5. Repeat above steps 1 through 4, until the desired output is met.
6. Divide the measured USGPH number by 60 to determine the **USGPM volume**, if required.

If you wish to shorten the time of dispensing for calibration by one half (1/2) or one quarter (1/4), you must multiply the measured volume by the same number used to divide the time by.

e.g. 10 USGPH in 1 minute equals
5 USGPH X 2 in 30 seconds or
2.5 USGPH X 4 in 15 seconds



Using the ml scale: (scale is based on **volume** pumped, over any given time)

1. Fill the calibration cylinder to the top "0" mark on the ml scale.
2. Close isolation valve (#2) from supply tank, open isolation valve (#1) below cylinder and start the pump.
3. Use a stopwatch to measure the time it takes to pump down a given volume (ml) in 60 seconds.
4. Multiply the volume by 60 to determine the **ml per hour** volume, if required.
5. Adjust the pump volume control higher or lower to meet with your desired output.
6. Repeat above steps 1 through 5, until the desired output is met.

If you wish to shorten the time of dispensing for calibration by one half (1/2) or one quarter (1/4), you must multiply the volume by the same number used to divide the time by to determine ml per minute or hour.

e.g. 100 ml in 60 seconds equals
50 ml X 2 in 30 seconds or
25 ml X 4 in 15 seconds

Typical Installations ("A" and "B")

Conversion Factors
1ml = 1 cc
1000 ml – 1 liter
ml/sec x 60 = ml/min
1 US gal/min x 0.063 = liters/sec
1 US gal = 3.786 liters

Caution:
Do not use as a Pressure Vessel.

Metering Pump Accessories Save $$$$

Prevent unsafe and inefficient systems by design.

ACCUDRAW Calibration Cylinders

PVC **Glass** **Poly**

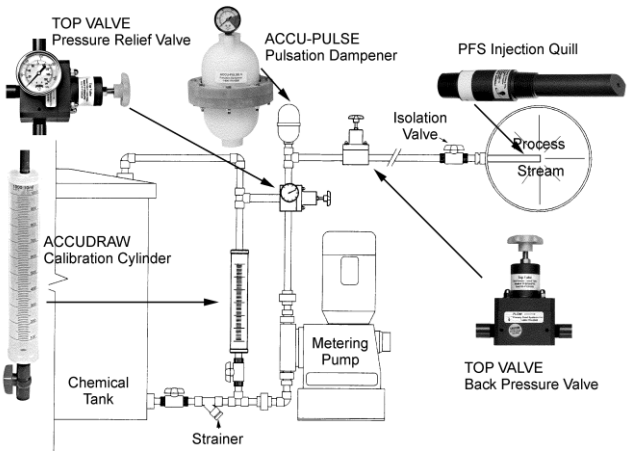
- *PVC, glass, polypropylene*
- *translucent, chemical resistant*
- *coloured graduations and lettering*
- *threaded or socket connections*
- *standard sizes 100 ml to 20,000 ml*

Custom built in other sizes and materials.

TOP VALVE Back Pressure/Pressure Relief

- *long life diaphragm*
- *range of 0 – 150 PSIG*
- *air release, optional gauge port*
- *PVC, CPVC, PVDF, PTFE, polypropylene, stainless, Alloy 20 and Hastelloy C*
- *7 sizes ¼" – 2" NPT*
- *colour coded handles indicate size*

Designed to enhance the <u>accuracy</u> and <u>safety</u> of your metering pumps.



ACCU-PULSE
Pulsation Dampeners

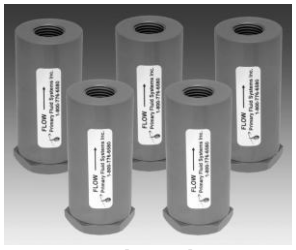
Designed to remove pulsating flows from positive displacement pumps.

- *increase system efficiency and pump life*
- *decrease maintenance and costs*
- *protect pipes, meters, valves and instrumentation from pulsation and vibration*
- *ensure meter accuracy, longevity and repeatability*
- *prevent foaming and splashing*
- *extensive range of materials and sizes*
- *lightweight, compact design*

Typical Metering Pump System

AutoCad drawings available from our web site.
Visit www.primaryfluid.com

PFS Injection Quills



Designed to inject chemical into the center stream of process.

- *provides for a more homogenous mix in the pipeline*
- *built-in checks to prevent back siphoning*
- *2 sizes 6" and 8" length*
- *½" or ¾" NPT, BPST, or Flg'd Conn.*
- *PVC, CPVC, PVDF, polypropylene, Stainless, Hastelloy C & Titanium*
- *pressure to 3000 PSIG*
- *temperature to 260°C (500°F)*

Custom built in other sizes and materials.

Accu-Vent

Designed to automatically vent gases and vapours.

- *vents gases and vapors released from Sodium Hypochlorite, Sulfuric Acid & Hydrogen Peroxide*
- *CPVC (Corzan) and Viton corrosion resistant wetted materials of construction*
- *specially designed float material automatically vents built up gases on system start up and under working pressure*
- *standard 1/2" or 3/4" NPT threaded connections or optional socket weld*
- *available in other materials*

PFS Corporation Stops

Designed to inject chemical into the center stream of process.

- *isolation valve allows for ease of maintenance*
- *available in 6 materials of construction*
- *wetted components have comparable or greater chemical resistance than quill construction material*
- *standard and custom lengths available*
- *connection in NPT, metric or flanged*

Custom built in other sizes & materials.

DIAPHRAGM PUMPS

INSPIRED. SOLUTIONS. FOR CUSTOMERS.

DIAPHRAGM PUMPS - ALLROUNDERS

sera diaphragm pumps are oscillating displacement pumps for dosing liquids. The medium to be pumped is separated from the drive by a diaphragm. This is thus protected from damaging influences of the medium.

They are used everywhere where leak-free and exact dosing is important, such as for aggressive, odorous, abrasive, radioactive, flammable, viscous or toxic media.

Delivery rate adjustment by means of stroke frequency adjustment using external frequency converter and manual stroke length adjustment for optimal adaptation to every requirement.

APPLICATIONS

- Beverage industry
- Food industry
- Manufacture of paints and varnishes
- Power plants
- Water treatment
- Shipbuilding
- Electroplating
- Textile industry
- Waste water treatment

AUTOMATIC DELIVERY RATE ADJUSTMENT

- Three-phase motors suitable for frequency converter operation for stroke frequency change using an external frequency converter
- Actuators with position controllers for automatic stroke length change

OVERVIEW OF ADVANTAGES

- High dosing accuracy
- Long diaphragm service lives
- Linear control characteristics
- Leak-free
- Low-maintenance
- ATEX-compliant versions are available (not in stock)
- Unlimited dry running safety

OPTIONAL VERSIONS

- Diaphragm monitoring
- Suction height 8 mWC
- Controllable variant (C version)

VERSIONS

MATERIALS
The high quality of the materials guarantees reliable continuous operation. The optimum material is available for every requirement.

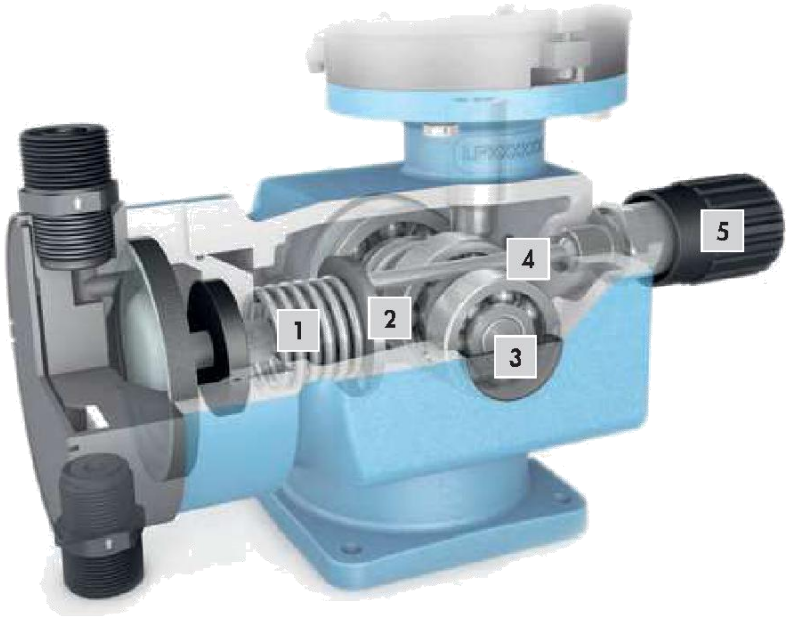
PUMP BODY AND VALVES
PVC, PP, PVDF, PP-GFP, PVDF-GFP, 1.4571

VALVE BALLS
PTFE, 1.4401

VALVE SEALS
EPDM, FPM, FEP-coated

DRIVE DIAPHRAGMS
PTFE-coated

MANUAL VENTILATION VALVE (2,4e)
PP-GFP, PVDF-GFP



DRIVE
The drive unit in each case consists of a proven motor make, coupled with stroke gearing in a robust case.
sera cases are also suitable for the harshest operating conditions. Material thickness and surface treatment even resist chemical attacks.

The flow rate is constant or continuously adjustable. This is done manually by changing the stroke length for the controllable version. The delivery rate can be adjusted automatically using the following options:

- Three-phase motors suitable for frequency converter operation for stroke frequency change using an external frequency converter
- Actuators with position controllers for automatic stroke length change

SPECIAL VERSIONS
We provide the individual solution for special dosing tasks:
Among other things, pump bodies with special nominal diameters, heating equipment, valves as double valves, with spring loading, with elastic ball seats, rinsing equipment for interval or final rinsing for prevention of deposits in the pump body, attachment of stroke counter, diaphragm rupture monitoring, special materials such as titanium or Hastelloy, design that can be cleaned.

ACCESSORIES
All necessary accessory parts for the optimal installation of dosing pumps such as pressure relief valves, pressure-maintaining valves, pulsation dampers, dosing valves, dosing tanks, flow monitors etc. can be ordered from us.

1	Return spring
2	Push rod plate
3	Eccentric shaft
4	Adjusting spindle
5	Adjusting wheel

Sizing and Ordering Information:

ACCUDRAW Standard Materials of Construction

AC = All polypropylene construction (see below for options)
PV = All polyvinylchloride construction (see below for options)
ACS = Glass*

Note: Cylinders are NOT pressure vessels

Example: AC#1-1000B

AC = PP (polypropylene)
#1 = Bottom threaded connection only
1000 = 1000 ml
B = BSP Thread

e.g. Part # AC #1 - 1000 B

Type:
AC = Polypropylene
PV = PVC
ACS = Glass

Style:
1 = Bottom threaded conn. only
2 = Top and Bottom threaded conn.
3 = Bottom threaded conn. c/w removable vented dust cap
4 = Top/Bottom threaded conn. c/w removable "O" ring sealed top and float ring level indicator
** **Glass calibration cylinders available in Style 2 only***

Graduation Scale:
PP - ml only
PVC - ml and GPH
Glass - ml only

Std. connection is NPT thread
Optional: add suffix as follows
S = Socket weld connection (PVC only)
GTV = Glass/TFE construction
GKV = Glass/PVDF construction
GCV = Glass/CPVC construction
GSV = Glass/SS construction
B = BSP Thread
F = Flanged

Substitute **E** for **V** for **EPDM** wetted "O" ring seal

Size:			Material	Conn.

Back Pressure/Anti-Siphon and Pressure Relief Valves

Description

This line of diaphragm style, back pressure/anti-siphon and pressure relief valves features a completely adjustable pressure range to 350 PSIG and a built-in air release to reduce priming difficulties. The valves are available in sizes from 1/4" through 2", eight materials of construction, offer a three year warranty and are available with socket weld, flanged or special threaded connections. High temperature to (300°F/149°C) valves are available. *CRN certification available. Please contact factory.*

ACCUGUARD GAUGES

ACCUGUARD Pressure Gauges are designed to enhance the performance of chemical feed systems. Adding a pressure gauge to any system will help to ensure that optimal pressures are monitored and maintained.

Series Information

Series	Gauge Diameter	Gauge Connection Size and Type	Gauge Housing	Gauge Internals	Liquid Filled	*Accuracy Rating
Economy	2" / 2.5"	1/4" NPT	Steel Case	Brass	No	± 2.5%
Intermediate	2.5" / 4"	1/4" NPT	304 S/S	Brass	Yes	± 1.6%
Premium	2.5" / 4"	1/4" NPT	304S/S	316L S/S	Yes	± 1.6%

*Accuracy Rating = Full Scale Range

HOW TO ORDER - AccuGuard Gauges

Example Part Number: GE2-160-CB

G E 2 - 160 - CB

AccuGuard Gauge

Gauge Series
- E = Economy
- I = Intermediate
- P = Premium

Gauge Diameter
- 2 = 2 Inches
- 2.5 = 2-1/2 Inches
- 4 = 4 Inches

Gauge Mounting Orientation
- CB = Center Back
- BM = Bottom Mount

Gauge Indication
- 60 = 0-60 PSIG / 0-400 KPA
- 160 = 0-160 PSIG / 0-1100 KPA
- 200 = 0-200 PSIG / 0-1400 KPA
- 300 = 0-300 PSIG / 0-2000 KPA
- 400 = 0-400 PSIG / 0-2800 KPA

4" Gauge Diameter Available in Bottom Mount Orientation Only

ACCUGUARD Diaphragm Seals

Without proper protection, process fluids can contaminate and damage in-line instrumentation. ACCUGUARD Diaphragm Seals are designed to protect and isolate pressure gauges and expensive instrumentation from corrosive, high temperature, or viscous, process media.

Features

- Transfers process pressure accurately without direct contact with process fluids
- Removes the need for expensive instrumentation
- Easily installed and available in five chemically resistant Materials of Construction
- Optional Diaphragm Materials
- Available with ¼" & ½" Bottom Connection Sizes in FNPT & BSPT Female Connection Types
- Thermoplastic Units Rated to 240 PSIG (16 BARG) @ 21°C (70°F)
- 316L S/S Units Rated to 5800 PSIG (400 BARG) @ 21°C (70°F)
- Approved – 316 S/S Diaphragm Seals with CRN (Canadian Registration Number)

HOW TO ORDER - AccuGuard

Example Part Number: AG25A25A-PVC-V-M-[Optional Gauge]

AG 25 A 25 A - PVC - V - M - [Optional Gauge]

See Gauge List

AccuGuard Diaphragm Seal

Connection Size (Top)
- 25 = 1/4"

Connection Type (Top)
- A = FNPT

Connection Size (Bottom)
- 25 = 1/4"
- 50 = 1/2"

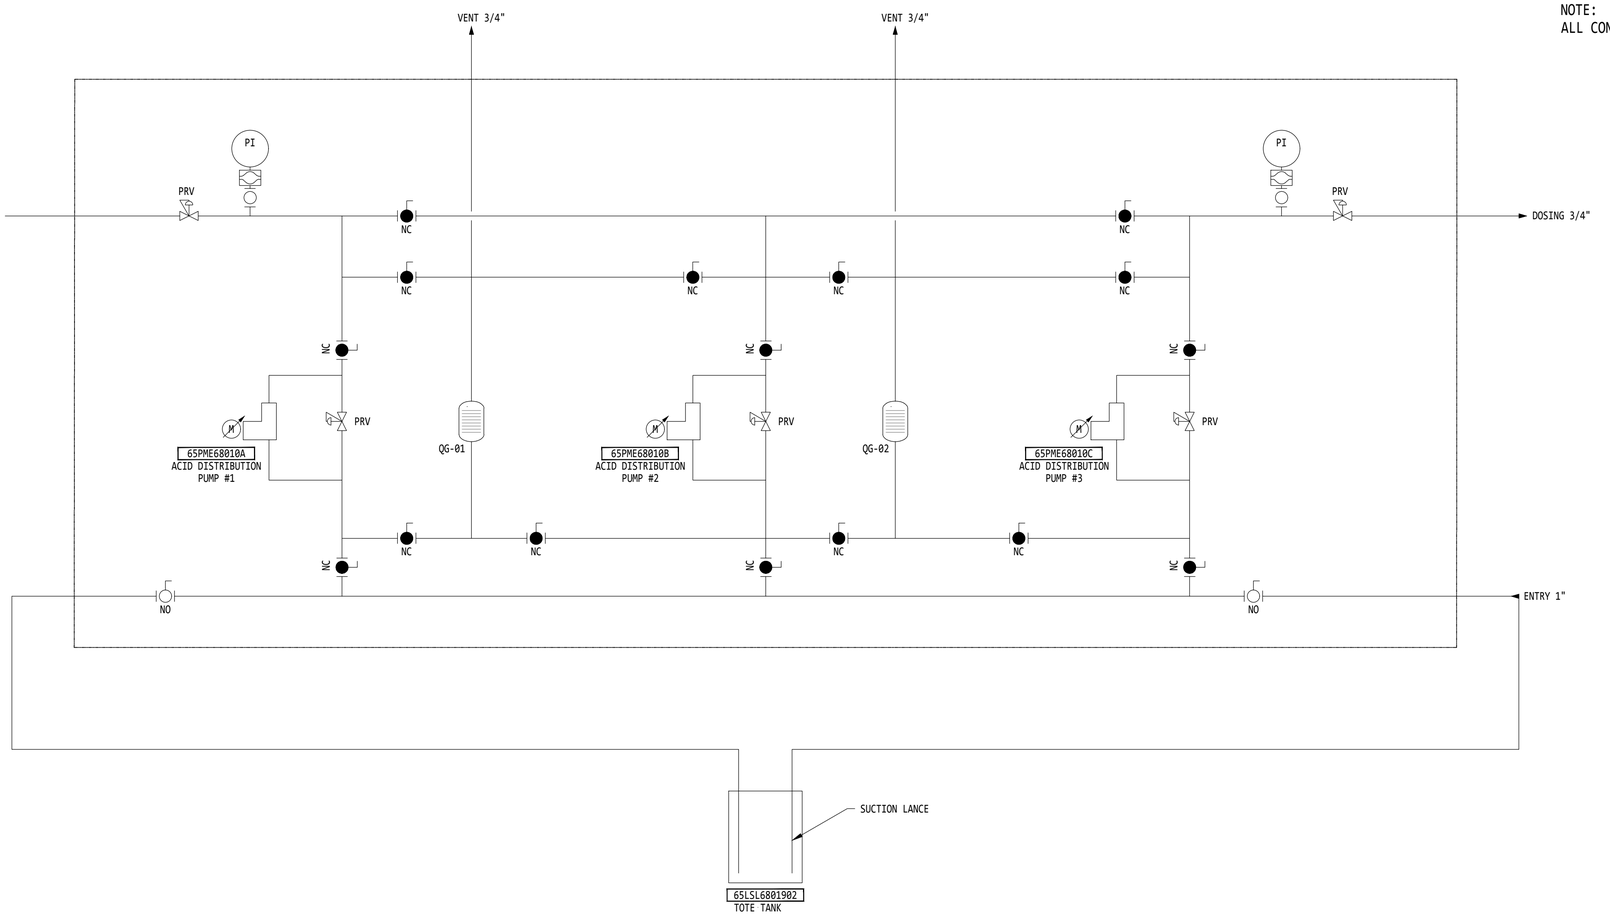
Connection Type (Bottom)
- A = FNPT
- B = BSPT

Options
- M = Mounted Gauge/Glycerin Filled

Diaphram Materials
- V = Viton (Thermoplastic Body Only)
- E = EPDM (Thermoplastic Body Only)
- T = PTFE (Thermoplastic Body Only)
- S/S = 316 S/S (S/S & S/SV Body Only)

Body Materials
- PVC = Polyvinylchloride
- CPVC = CPVC Corzan
- PP = Polypropylene (Not Available with PTFE Diaphragm)
- PVDF = Polyvinyldene Fluoride (PTFE Diaphragm Only)
- S/S = 316L Stainless Steel
- S/SV = Vented 316L Stainless Steel

- Optional Gauge Appears as Separate Line Item When Ordered



- Diaphragm Seals With Gauges = Glycerin Filled As Standard

- 1/4" & 1/2" MNPT Nipples Available - Call Factory for Details

INTRODUCTION

The following instructions are to provide information on the Installation, operation and maintenance of TOP VALVE, 150# rated diaphragm style Back Pressure and Pressure Relief Valves, manufactured by Primary Fluid Systems Inc. The valves are designed to improve the performance and safe operation of most pumps used for metering applications.

Various materials of construction are available dependent on the requirements of the application and the type of fluids being transferred.

The valve(s) are factory set at 50 PSIG with a field adjustment range of 15-150 PSIG*. Other factory set pressure ranges (within the range of the valve) are available upon request.

Special Features of TOP VALVE

- PVC, PP, TFE, CPVC, PVDF, Hastelloy C, Alloy 20 or 316 S/S wetted construction
- PTFE laminated to EPDM backer diaphragm
- Turn down handle limits pressure to 150 PSIG
- Handle shaped for ease of adjustment
- Color-coded handles indicate size at a glance
- (Optional) Built-in matching material gauge port plug is easily removed for gauge option
- Rectangular shape for ease of installation
- Specially designed spring provides consistent pressure adjustments through the range (15-150 PSIG*)
- Valve top specially designed for mounting clamp to help reduce pipeline stress when required
- Built-in downstream manual air release, for ease of pump priming
- Built-in anti-siphon

***Pressures under 15 PSIG require rubber elastomeric diaphragm.**

Back Pressure Valve

Diaphragm Back Pressure Valves serve two primary functions. The first is to provide a constant discharge pressure on the pump, which improves the performance, efficiency and consistency of the delivered volume. Secondly, the valve performs as an anti-siphon mechanism against positive or negative pressures in the downstream line. The valve is designed to allow for the venting of air into the downstream pipeline. This provides for easier priming of metering pumps that function under a suction lift. This is accomplished by a simple adjustment of the handle.

The valve is available with an optional gauge port, pre-plugged at the factory or can be ordered complete with gauge to suit application. This eliminates the need to install extra fittings in the line to accommodate the addition of a gauge for the purpose of reading and setting of pressure.

CAUTION:
The gauge port is solely for the installation of the gauge and must not be used for the bleeding or venting of the system. Improper operation of the valve and/or hazardous consequences could result. ***(see gauge installation instructions)***

Back Pressure Valves: Reason for Selection and Use

Metering pumps having an atmospheric discharge system pressure of less than 20 psi and will benefit from the installation of a back pressure control valve. Metering pumps in general require downstream back pressure to ensure smoother function of the discharge check assemblies, which enhances the accuracy of the discharge flow.

Pressure Relief Valves

Diaphragm Pressure Relief Valves are designed to relieve excess line pressure that exceeds the set pressure of the valve. This protects the system piping from overpressure that could result in hazardous leakage and/or damage to the pump and other system components.

The Pressure Relief Valves are normally recommended to be set between 5 and 10 PSIG above the system operating pressure.

The valve is of an in-line flow through design with bottom NPT relief port for piping back to supply tank or feed side of pump.

The valve is available with an optional gauge port, pre-plugged at the factory or can be ordered complete with gauge to suit application. This eliminates the need to install extra fittings in the line to accommodate the addition of a gauge for the purpose of reading and setting of pressure.

CAUTION:
The gauge port is solely for the installation of the gauge and cannot be used for the bleeding or venting of the system. Improper operation and/or hazardous consequences could result. ***(see gauge installation instructions)***

Pressure Relief Valves: Reason for Selection and Use

When using motor driven metering pumps, a pressure relief valve should always be installed on the downstream side of the pump to protect the system from over pressure which can cause pipe leakage and/or rupture.

Installation and Maintenance of Back Pressure Valves

Back pressure control valves are installed on the discharge line of the pump. The valve should be located within a 2 (two)-foot distance of the pump discharge to ensure check valve seating. When pumping to a process line without an injection valve, the back pressure valve should be installed as close as possible to the injection point to prevent siphoning.

When used in conjunction with a pressure relief valve, always locate the back pressure valve on the downstream side of the relief valve.

The valve is supplied from the factory pre-set at 50 psig. To increase the pressure setting, back off the lock nut located beneath the colour coded handle. Turn the handle clockwise to increase pressure setting or counter clockwise to reduce pressure setting. Approximately one (1) full turn of the handle is equal to 10 psig.

If maintenance is required on the valve:

1. Ensure that the valve is properly isolated from the line, not under pressure and properly flushed of chemical before proceeding to disassembly.
2. Turn knob on the top of valve, counterclockwise until all spring pressure is released **before** proceeding to undo retaining nuts, to remove top of valve for diaphragm replacement.
3. All working components ie. diaphragm, spring can be accessed by removing the four retaining nuts located on the top of the valve (item # 9 of parts breakdown). For ¼" and ¼" x ½" Top Valves, use 5/32" Allen Key / #4 Hex Key. For ½" sizes and up, use a 3/16" Allen Key / #5 Hex key.
4. When replacing the diaphragm, ensure the PTFE coated side of the diaphragm is facing down when viewed from the top of the valve. The installed diaphragm also functions as the body seal. (Torque nuts to 55 inch pounds when reassembling.)

Set Pressure Safety Feature

The valve adjustment handle/bolt length is designed to prevent operators from engaging the spring to a coil binding situation that would cause serious function and safety concerns.

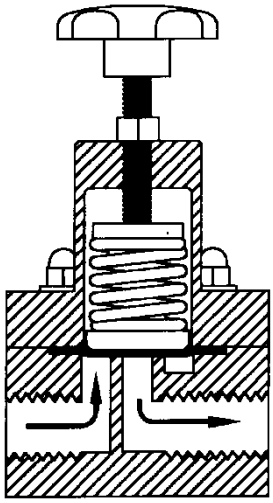
In order to achieve max pressures within the top 10% of the valve range, the lock nut on the adjustment handle/bolt must be removed prior to setting the pressure. Ensure that all system pressure has been released before removing the lock nut and re-installing the approved valve handle/bolt.

The valve handle/bolt is the only approved adjustment component to be used on our valves. Deviation from this will void manufacturer warranty and liability.

Installation and Maintenance of Pressure Relief Valves

Pressure relief valves are installed on the discharge line of a pump and should be located as close as possible to the metering pump. The valve is of an in-line flow through design with a bottom NPT relief port for piping back to the supply tank or feed side of the pump.

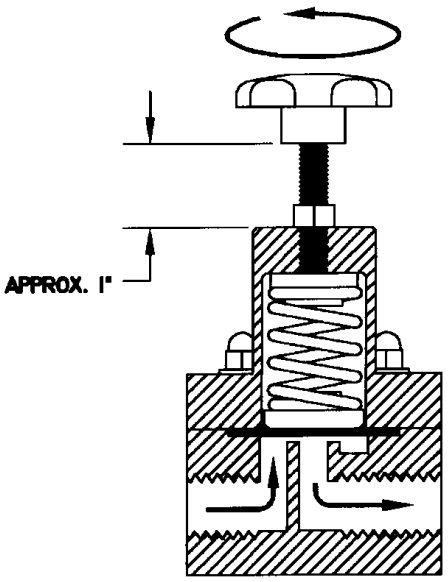
Never install shut-off/isolation valves between pump discharge and in-line pressure relief valves. When using in conjunction with a back pressure control valve, always install back pressure valve downstream of pressure relief valve. The relief port on the pressure relief valve should be piped back to the feed tank or suction side of the pump (see typical installation schematics).



CAUTION:
The plastic valve bodies have standard NPT threads, which are tapered. When installing pipe into the body, hand tighten only to avoid cracking.

Gauge Installation Instructions: (When ordered with valve only)

For the convenience of pressure setting and reading, there is an optional plugged gauge port provided, if the valve has not been ordered complete with gauge. **Important:** use a ***TORX style # T-45*** wrench or screwdriver **only** to remove plug from plastic valves. Any other tool will strip the body of the plug and require an extractor to remove the threaded plug.

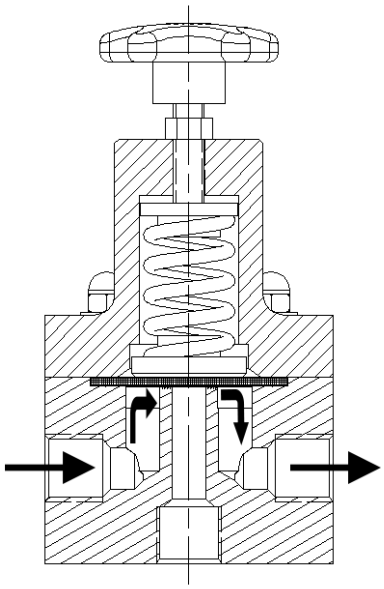


CAUTION:
Before removing the gauge port plug to install a gauge, ensure that the discharge line is not under pressure and lines are flushed with water prior to proceeding. Ensure that the gauge you are using is chemical resistant to the fluid before installing.

Manual Air Release for Back Pressure Valve Only

DIAPHRAGM POSITION AT
50 PSI BACK PRESSURE

The valve is shipped with a factory set pressure of 50 psig. The diagram to the left shows a cut-away view of the position of the diaphragm on the seat.



AIR RELEASE POSITION WITH
HANDLE BACKED OFF

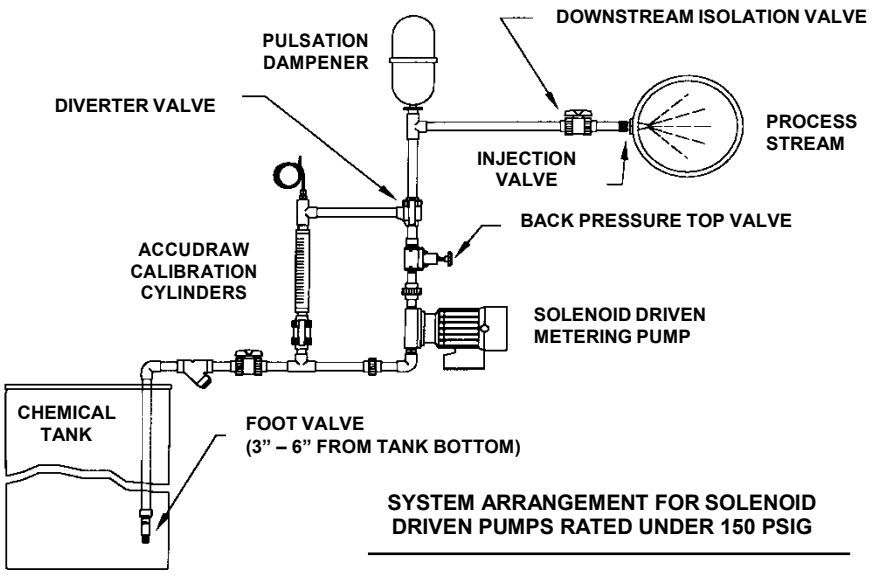
To adjust the valve to relieve air or gas downstream:

1. Back off lock nut located beneath the colour coded handle.

2. Turn handle counter clockwise until approximately 1 inch of thread is exposed.

3. At this adjustment, the spring has relieved all tension from the diaphragm allowing air or gas to be vented downstream.

Flow through design Pressure Relief Valve



The bottom port relieves over pressure.

PROJECT			

ALL New Clamping Device for TOP VALVE, Back Pressure and Pressure Relief Valves

This new polypropylene-clamping device now makes it even easier than ever to support TOP VALVE, back pressure or pressure relief valves in service, to help eliminate pipe strain and the need for expensive mounting brackets.

It's simple to install, economical to purchase and we've reworked the top of the valve body now available on all new valves, to assist with the support.

TV-_ _ -CLAMP

Sample Installation

Part #

TV-25-CLAMP to fit ¼" Valves and ¼ - ½" Valves

TV-51-CLAMP to fit ½" through 2" Valves

Flow Rates

Subject: Flow capacity through TOP VALVE, back pressure and pressure relief valves. Under continuous flow conditions: @ **50 PSI** with ambient temperature water

¼" valve	4	USGPM
¼"/½" valve	4	USGPM
½" valve	6	USGPM
¾" valve	8	USGPM
1" valve	14	USGPM
1½"valve	25	USGPM
2" valve	40	USGPM

Note: Capacities will increase with pressure. (If pressure is doubled, flow rate will approximately double.) For capacities of valves with pulsating flow use approximately ⅓ of the above given flow values.

Temperature Correction Factors: Thermoplastics

Temperature Effects: Thermoplastics and thermosets will decrease in tensile strength as the temperature increases: therefore, the working pressure must be reduced accordingly. The following factors will apply:

Operating Temperatures		{Factors}			
F	***C***	***PVC***	***CPVC***	***PP***	***PVDF***
70	21	1.00	1.00	1.00	1.00
80	27	1.00	1.00	1.00	1.00
90	32	1.00	1.00	1.00	1.00
100	38	.90	1.00	1.00	1.00
110	43	.83	1.00	.91	1.00
115	46	.75	1.00	.87	1.00
120	49	.66	1.00	.83	1.00
125	52	.58	.97	.79	1.00
130	54	.50	.95	.75	1.00
140	60	.33	.90	.66	1.00
150	66	NR	.80	.60	.97
160	71	NR	.70	.53	.93
170	77	NR	.60	.43	.86
180	82	NR	.50	.33	.80
200	93	NR	.33	NR	.66
210	99	NR	NR	NR	.60
240	116	NR	NR	NR	.40
280	138	NR	NR	NR	.16

Example:
Maximum Pressure for PVDF valve at 280°F (138°C)
Factor = 0.16 x 150psig = 24psig max. pressure
Factor = 0.16 x 1034kPa = 165.44kPa max. pressure

The maximum pressure rating for valves regardless of size is 150 PSIG (1034 kPa) at 73° F (22°C)

NR = not recommended

Primary Fluid Systems, Inc. takes no responsibility for the enclosed data.

NOTE: If the material of the valve you have chosen is rated below the working pressure of your system than you must reconsider your choice. The standard valve top material of construction is PVC and should be taken into temperature consideration. (Other materials of construction are available, consult price list or factory)

NOTE: When considering working temperature, include ambient and potential collective surface temperature (Radiant Heat).

LIMITED WARRANTY

Primary Fluid Systems Inc. (Primary) warrants its products against defects in workmanship or materials for one (1) year under normal use. Three-(3) year available when application card is completed and returned to factory. Application card can be obtained by emailing request to sales@primaryfluid.com

Primary's obligations and liabilities under this warranty shall be limited to replacement of the product, or a refund of an amount not to exceed the purchase price of the product(s) to which such warranty claim is made. Repairs or replacements are made subject to our inspection of the returned product(s). Primary's decision of one of these alternatives shall be the buyer's exclusive remedy.

This warranty does not extend to damage by corrosion or other decomposition by chemical action. Primary does not warrant damages caused by (a) improper use of the product, (b) unauthorized modification or attachment to product, (c) misuse, abuse, accident or negligent handling or installation of product, or (d) alterations or repairs made by purchaser.

The materials of construction offered are recommendations only, subject in all cases to acceptance by purchaser. These recommendations do not constitute any guarantee against corrosion or decomposition, but are based on previous experience and best available information of the industry.

Statements and instructions set forth herein are based on the best information and practices known to Primary, but it should not be assumed that every acceptable safety procedure is contained herein. Of necessity Primary cannot guarantee that actions in accordance with such statements and instructions will result in the complete elimination of hazards and it assumes no liability for accidents that may occur.

Except as specifically provided herein, Primary makes no warranty, representations, promise or guarantee, either express or implied, statutory or otherwise, with respect to the product and technical information provided, including the products' quality, performance, merchantability, or fitness for a particular purpose.

In no event will Primary be liable for indirect, special, incidental, economic, covert or consequential damages arising out of the use or inability to use the product, including without limitation, damages or costs relating to the loss of profits, business and good will even if advised of the possibility of such damages. In no event shall Primary's liability exceed the amount paid by you for the product.

The warranty and remedies set forth herein are exclusive and in lieu of all others, oral or written, express or implied. No Primary dealer, distributor, agent or employee is authorized to make any modification or addition to this warranty. This warranty gives you specific legal rights and you may also have other rights which vary from state to state.

NOTE

Record the exact type and serial number here ► can be read off the type plate on the pump.
These data are important in the case of queries or for ordering spare and/or wear parts and must always be stated.

TYPE:

SERIAL NO:

NOTE

Keep the operating manual for future use!

ATTENTION

Subject to technical modifications!

Quality notes

The **sera** quality management and quality assurance system is certified in accordance with DIN EN ISO 9001:2015.
The **sera** product complies with the applicable safety requirements and accident prevention regulations.

About this instructions

Special notes in these instructions are marked with text and danger symbols.

NOTE

Notes or instructions that faciliate work and ensure a safe operation.

ATTENTION

The non-observance of these safety instructions can result in malfunctions or material damages.

WARNING

The non-observance of these safety instructions can lead to material damages and personal injuries.

Note on the additional instructions „SAFETY INSTRUCTIONS“.

These technical manual is divided into the following main parts:

TRANSPORT & STORAGE

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS".
Man, machine and environment are endangered if the safety instructions are not observed.

General

sera products are checked for perfect condition and function previous to shipment.
Check for transport damage immediately after arrival of goods. If damage is found, this is to be reported immediately to the responsible carrier and the manufacturer.

Storage

An undamaged packaging protects the unit during storage and should only be opened when the product is installed.
Proper storage increases the service life of the product and includes prevention of negative influences such as heat, moisture, dust, chemicals etc.

The following storage specifications are to be obsered:

- Storage place: cool, dry, dustfree and slightly ventilated
- Storage temperature and relative air humidity see Chapter „TECHNICAL DATA".
- The maximum storage time for the standard packaging is 12 months.

If these values are exceeded, metal products should be sealed in foil and protected from condensation water with a suitable desiccant.

Do not store solvents, fuels, lubricants, chemicals, acids, disinfectants and similar in the storage room.

Type key

1 — Type of drive (combinations possible)

C	controllable
M	not adjustable
R	adjustable

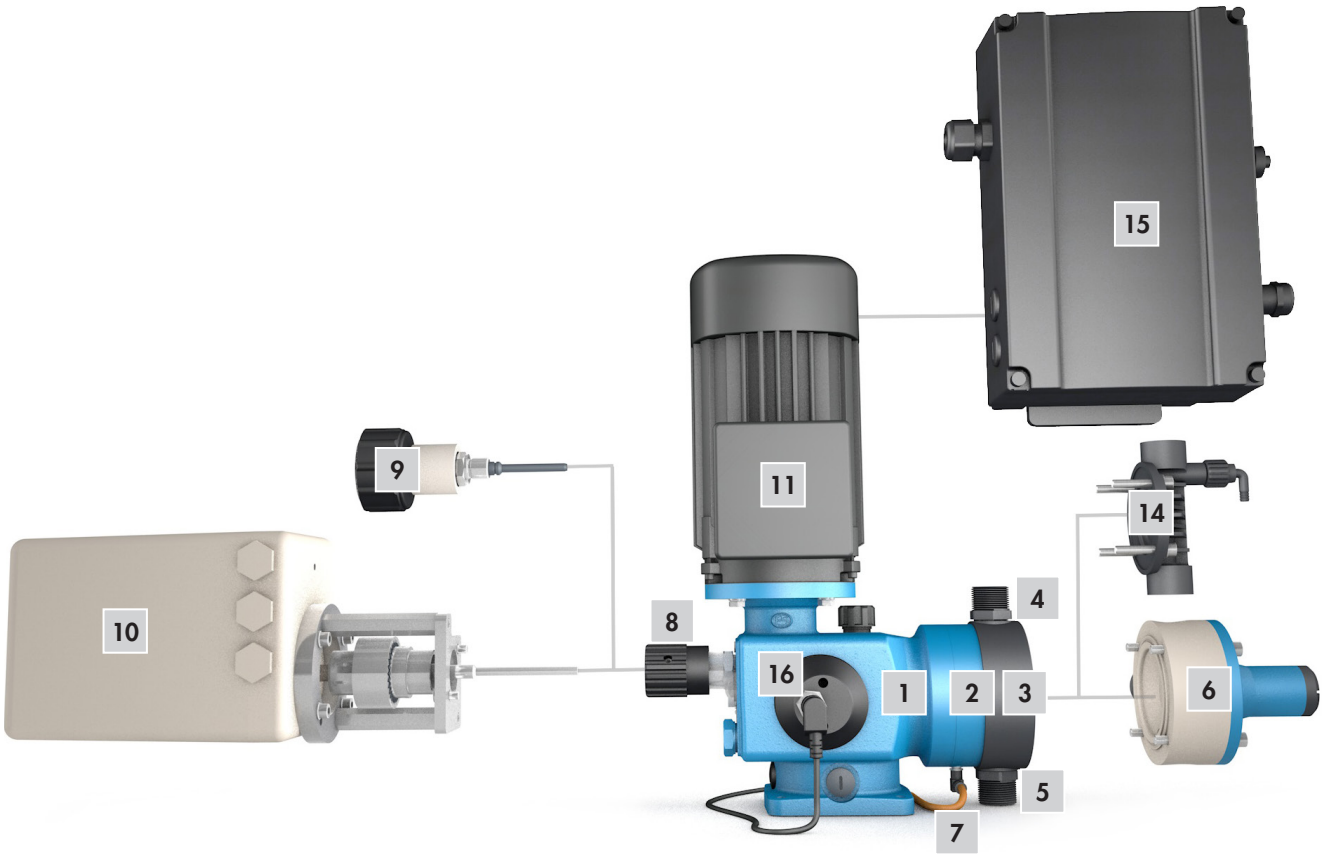
Type plate

Each **sera** pump is factory provided with a type plate. The following information can be found on this type plate.

No.	Designation
1	Pump type
2	Serial number of the pump
3	Minimum/maximum permissible pressure in the pump inlet Minimum/maximum permissible pressure in the inlet cross section which the pump can be used for. Please consider that pressure depends on rotation speed, delivery rate, temperature and static pressure at the inlet.
4	Maximum permissible pressure in the pump outlet Maximum permissible pressure in the outlet cross section which the pump can be used for. Please consider that pressure depends on rotation speed, delivery rate, temperature and static pressure at the outlet.
5	Nominal delivery rate Delivery rate which the pump was ordered for, based on the nominal rotation speed nN, the nominal delivery height p2max. and the delivery medium stated in the supply contract.
6	Nominal stroke frequency

Notes attached to the product



Symbols which are directly attached to the pump, e.g. arrows for direction of rotation or symbols for fluid connections are to be observed and kept in legible condition.

Materials

The materials used are stated in the order confirmation and the product description.

sera dosing pumps are run-dry safe oscillating displacement pumps that are characterised by high tightness of the dosing head. The fluid is conveyed by a deformable diaphragm.

Stroke mechanism (1)

Piston diaphragm pumps of this type series use a rotary cam drive to transmit the rotation of the drive motor to the displacement body.
In case of the rotary cam drive, the eccentric (**1.1**) provides the pressure stroke while the suction stroke is performed by a pressure spring (return spring) (**1.2**).
The effective stroke length can be changed by means of an adjustable scale knob (**1.3**) which prevents the connecting rod from following the rotary cam up to the rear dead centre during suction stroke (see stroke length adjustment).

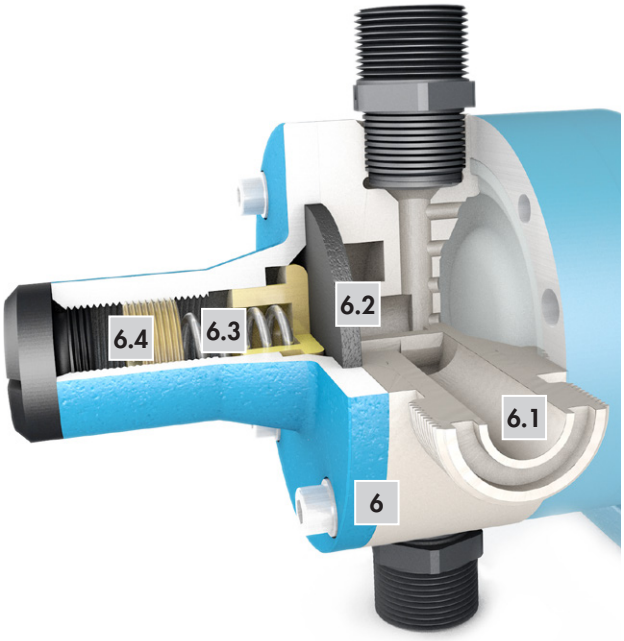
Assembly pump (2)

The drive diaphragm (**2.2**) connected to the drive via the connecting rod (**2.1**) transmits the stroke movement directly to the pumped medium.

Pump body (3)

Depending on the applied backpressure, movements of the plastic pump body in elastic materials are possible.
This does not affect the pumps's service life or operational reliability.

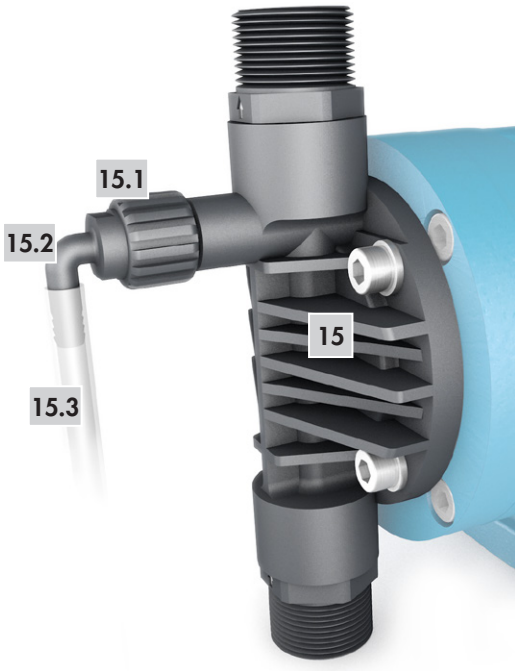
Pressure valve / Suction valve (4/5)



The pump valves are ball valves that only work properly in a vertical position. The condition of the valves has a deciding effect on the operating capability of the pump. Valves must be exchanged as complete units. When replacing the valves it is important to check the flow direction (**4.1/5.1**) .

ATTENTION

Pressure valve above, suction valve below!



Pump body with integrated overflow valve (6)

The integrated diaphragm overflow valve protects the pump from unacceptable overpressure at closed pressure line. Pipes and fittings, however, are not protected and have to be protected separately, if necessary. It can be used for liquid media without solid matters according to the manufacturer specifications.
Pump bodies with integrated overflow valve are equipped with an additional relief channel (**6.1**) through which the pumped medium is drained in case of an unacceptable overpressure.
The relief channel is closed by the mechanically prestressed diaphragm (**6.2**) of the overflow valve.
The mechanical prestress which is executed by a pressure spring (**6.3**) can be adjusted with a set screw (**6.4**). If the pressure of the pumped medium on the diaphragm exceeds the set pressure, the diaphragm is lifted and the pumped medium flows into the relief channel.
When the pressure in the pump body falls below the pressure set the diaphragm closes the inlet channel again.

Pump body with manual vent valve (14) (409.2-1,6e; -2,4e)

The vent valve is used to release the manual pressure in the pump body (**15**) during commissioning. Open vent valve when pump primes first time.
When vent valve is opened gas including medium escapes into the feedback line. The vent valve must be closed again as soon as only medium without gas constituent escapes. The pump now feeds the medium into the pressure line.
Open again for another ventilation. The vent valve consists of a vent screw (**15.1**) with integrated hose nozzle Ø 6,5 (**15.2**), which must be fitted with a hose (**15.3**) (inside diameter 6 mm) as feedback line. The leaking medium incl. the gas admixtures must be disposed off properly.
The vent screw is inserted during normal operation.

ATTENTION

Open vent screw with great caution and perform max. 1 turn. Take care that the tightness of the thread is still guaranteed.

ATTENTION

The vent screw must always be closed during the driving process.

Diaphragm rupture monitoring device (7)

C409.2 /C410.2 (standard)

sera - pumps of the C409.2 series are equipped with a conductive diaphragm rupture monitoring device.

NOTE

The sensitivity of the diaphragm rupture electrode can be adapted to the conductivity of the medium via the electronics (see the technical manual of the control). Preset ex works to 50% approx. 10 µS/cm.

...409.2 / ...410.2 (option)

sera pumps of the R(F)/M(F)409.2 /R(F)/M(F)410.2 series can be equipped with a conductive diaphragm rupture monitoring device as option.

ATTENTION

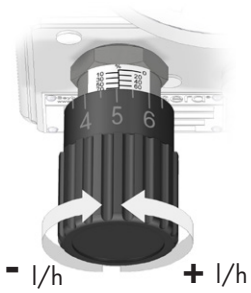
The pumped medium must have a minimum conductivity of at least 5 µS/cm!

An electrode together with an approprate evaluation unit (option, e.g. **sera** diaphragm rupture relay, type ER-104 (or ER-142 for Ex-areas respectively) is used for monitoring. The diaphragm rupture electrode is mounted directly to the pump, the evaluation unit inside the switch cabinet.
The diaphragm rupture electrode type MBE-02 is not mounted by sera due to transport. We put the MBE-02 electrode onto the cable and fix it to the pump in a separate bag.
Put the diaphragm rupture electrode is in the base ring (**2**) of the pump from below (see pig. „Components ...").

Stroke length adjustment

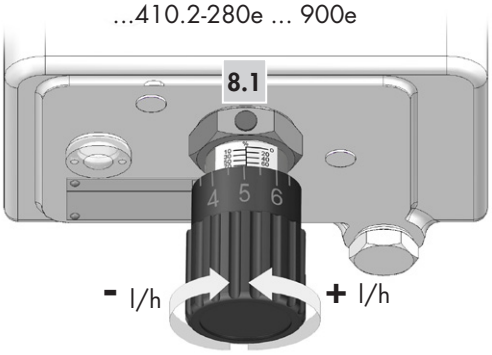
The delivery rate of the pump is set by changing the stroke length. The stroke length is infinitely variable between 0% and 100%..

NOTE



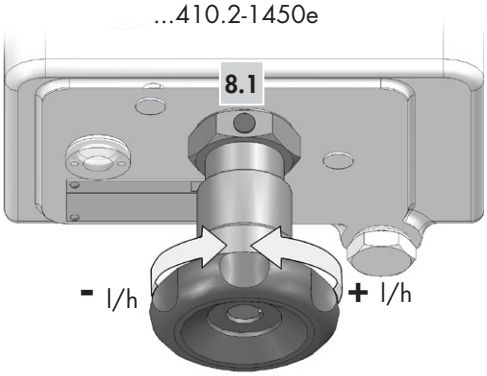
A linear dosing behaviour is achieved with stroke length adjustments between 20% and 100%.

Manual stroke length adjustment (standard) (8)



The effective stroke length of the connecting rod is changed by turning the scale knob.
The stroke length should be adjusted during operation of the pump.
The set stroke length can be read off a scale, e.g. 75%.
With the 20-steps adjustment on the scale knob, the stroke length can be set individually with a tolerance of 0.5%..

A protecting cap can be provided for the protection of the stroke length adjustment against unintentional adjustment.

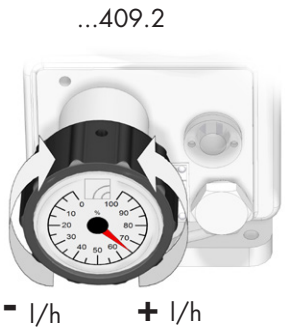


...409.2

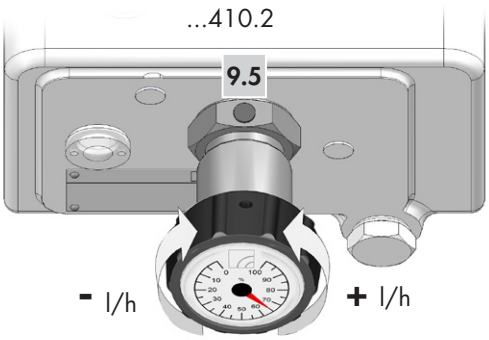
...410.2-280e ... 900e

...410.2-1450e

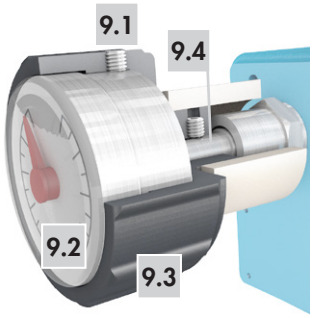
ACHTUNG



The locking (**8.1**) is to be released (us-ing a spanner SW3) before the stroke length is changed. Then the locking must be tightened again. This ensures that the set stroke length does not change during opera-tion.



Manual stroke length adjustment by a dial scale with indication of percent (option) (9)



The stroke length is adjusted by turning the hand wheel.
The stroke length shuold be adjusted during operation of the pump.
The set stroke length can be read off the percent scale (the example shows a set stroke length of 65%).
In delivery state, the stroke length adjustment is factory set to 50%.

ATTENTION

The dial scale with indication of percent may become misadjusted during transport.
If the indicator does not match the 50% setting, then the percent scale must be re-adjusted during operation (!) of the pump!

Adjusting the percent scale:

- Switch on the pump.
- Loosen setscrew (**9.1**).
- Remove percent scale (**9.2**) from the hand wheel (**9.3**).
- Manually turn the percent scale to 0% setting.
- Loosen the locking (**9.5**) ► bei ...410.2.
- Use the hand wheel to set the stroke length to 0%.
- Turn hand wheel clockwise until there is no further stroke movement (connecting rod does no longer hit the adjusting spindle (**9.4**)).
- Insert percent scale again.
- Use the setscrew to secure the percent scale to the hand wheel.
- Adjust desired stroke length.
- Tighten the locking (**9.5**) ► bei ...410.2.

Automatic stroke length adjustment by means of an electrical actuator (10)

The electrical actuator is directly mounted to the stroke mechanism (**1**) of the pump. A clutch transmits the rotary motion of the actuator drive shaft to the adjusting spindle. The axial displacement is compensated in the clutch.
In case of dosing pumps with electrical actuator, a manual adjustment of the stroke length on the pump is no longer possible. (Exception: actuator with hand wheel)
The actuator is equipped with two integrated limit switches as well as a position potentiometer for position feedback as standard. Both limit switches are factory set so that the drive will switch off at a stroke length of 0% and 100%, even if a control voltage is applied.
This guarantees that adjustments can only be made within the permissible range. The position potentiometer is driven by a safety clutch which prevents damage caused by incorrectly adjusted limit switches.
Activation is performed by appropriate control units (see **sera** - accessories).
The set stroke length can be read off on the pump (percent scale).
Information on the electrical connection is given inside the cover of the actuator.

ATTENTION

The adjustment is only possible when the pump is running!

Automatic stroke length adjustment by means of an electrical actuator with integrated positioner

same as Chapter „Automatic stroke length adjustment by means of an electrical actuator (10)", additionally:

This positioner which is integrated in the actuator enables an actuator setting from 0…100% that is proportional to the connected input signal.
As an option, the actuator can also be provided with a collective interference signal. Information on the electrical connection is given inside the cover of the actuator.

Drive motor C409.2 / C410.2

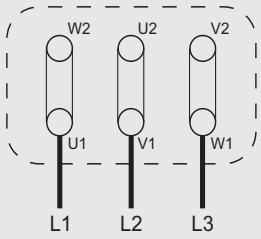
A **sera** motor pump of series C409.2 is driven by a threephase-motor controlled by the electronics.

A protective motor switch is not necessary due to the fact that a thermic overload protection is integrated in the pump for the protection of the motor.

Drive motor ...409.2 / ...410.2

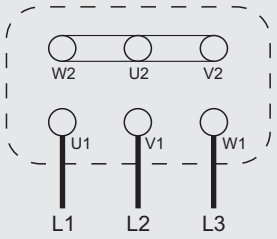
sera motor pumps R(F)/M(F)409.2 /R(F)/M(F)410.2 are driven either by a three-phase motor.
Standard: three-phase motor (with PTC thermistor; suitable for operation with frequency converter).

Motor connection



In case of a three-phase motor

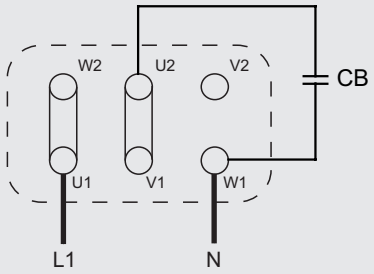
The motor connection depends on the voltage indication on the type plate and the applied supply voltage.



Example:

Indication on the type plate:	Δ 230V/ Y400V 50Hz
Three-phase power system on sit:	Y400V 50 Hz
Correct motor connection:	Star connection (Y)

Δ Delta connection



Y Star connection

In case of an AC motor

The AC motor has a main and an auxiliary winding. The running capacitor is switched in series to the auxiliary phase.

Direction of rotation

The direction of rotation of the drive motor is arbitrary.

Terminal box

Before closing the terminal box, please check that:

- All terminal connections are tightly fitted.
- The interior is clean and free of foreign bodies.
- Unused cable entries are closed and screw plugs are tightened.
- The sealing is correctly inserted in the cover of the terminal box; check proper condition of all sealing surfaces so that the demands of the protection category are fulfilled.

Motor protection

Provide for adequate motor protective equipment in order to protect the motor from overload (e.g. motor protection switch with thermal overcurrent release).
Connect the ground wire to the marked earth screw in accordance with VDE 0100.

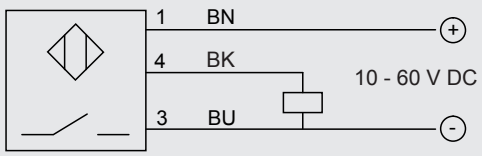
ATTENTION

Fuses do not protect the motor!

Conrol C409.2 Pro+/ C410.2 (12)

Among other things, the control enable the proportional dosing via analogue signals 4 … 20 mA or contact signals with the possibility of pulse division or pulse multiplication.
The graphical display shows information about the current status of the pump.
A connection for flow monitoring or flow rate measurement and an „empty" signal with pre-alarm and dry run alarm are available as standard.

INTERFACE MODULE (13) (accessories C409.2)



The INTERFACE MODULE provides level input and PROFIBUS connectivity (see TM05).

Stroke frequency transmitter (16) (option RF409.2 / RF410.2)

sera pumps R(F)/M(F)409.2 /R(F)/M(F)410.2 are oscillating displacement pumps with an exactly defined stroke volume per each pump stroke.
If these dosing pumps should be used for automatic filling processes or charge dosing, then the single pump strokes must be determined and converted into electrical signals.
For this purpose, a stroke frequency transmitter (inductive contactor) is added to the pump (the option cannot mounted additionally) and reports each single pump stroke to the evaluation unit (e.g. preselection counter, SPC-control unit, etc.).

Technical data	
Rated voltage	10 - 60 V DC
Constant current	< 200 mA
Short circuit-proof:	
Connection mode	plug connector with 2 m cable
LED (green)	indicates supply voltage
LED (yellow)	indicates switching status

Wiring diagram

ATTENTION

When switching inductive loads (protectors, relays, etc.), surge protectors (varistors) must be fitted owing to the high self-induction voltage!

ATTENTION

When the pump is deployed in exlosion-hazardous areas a NAMUR type stoke frequency transmitter (II2G EExia IICT6, acc. to. ATEX95) is to be provided!

HLV ► Manual stroke length adjustment
(Measurements in mm)

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS".
Man, machine and environment are endangered if the safety instructions are not observed.

NOTE

Pump design data for dosing and its temperature can be found in the order confirmation.

NOTE

Operating conditions:
Ambient temperature, relative air humidity and max. installation altitude ► see chapter „Technical data".

- The standard model of the pump is only approved for installation in dry areas in a non-aggressive atmosphere.
- Protect the pump from heat sources, direct sunlight and UV light.
- See "Dimensions" chapter for dimensions of the pump connections and fixing holes.
- Fixing the pump with at least four bolts above the pump base is required for safe operation.
- Install the pump so that there is no vibration and no tension and that it is aligned precisely.
- Install the pump at the optimum possible operating height. Mount the pump so that the valves are vertical.
- Ensure that there is sufficient space around the pump body and the suction and pressure valve so that these parts can be easily dismantled if required.
- Design the nominal diameters of the downstream piping and the valves installed in the system to be the same size or larger than the nominal inlet and outlet diameters of the pump.
- To check the pressure ratios in the piping system, it is recommended to provide connections for pressure measurement fittings (e.g. manometers) near the suction and pressure ports.
- Drain valves must be provided.
- Before connecting the pipes, remove the plastic caps on the suction and pressure ports of the pump.
- Check the fastening bolts for the pump body for tightness and tighten if necessary, see chapter "Overview of the tightening torques".
- Connect pipes to the pump so that there are no forces acting on the pump, such as e.g. misalignment, weight or strain of the pipe.
- Keep the suction pipes as short as possible.
- Use pressure and medium resistant hoses / pipes.
- All pipes and containers connected to the pump must comply with the regulations and must be cleaned, tension-free and intact.
- Display devices must be easily accessible and readable.

In order to avoid cavitation, overload or excessive delivery, the following points should be noted:

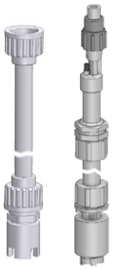
- Avoid high suction heights.
- Keep pipes as short as possible.
- Select sufficiently large nominal diameters.
- Avoid unnecessary choke points.
- Install a pulsation damper.
- Install overpressure protection.
- Install a pressure-sustaining valve, if necessary
- Provide feed line for outgassing media.

WARNING

The pump with a control is only designed for operation outside Ex-zonest!

SUCTION SIDE (1)

The following fittings can be used on the suction side:



1.1 Line strainer

1.2 Suction aid
Siphon vessel

1.3 Suction lance

1.4 Multifunction device

1.5 Foot valve

1.6 Shut-off valve

PRESSURE SIDE (2)

The following fittings can be used on the pressure side:

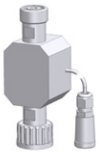
2.1 Vent valve

2.2 Injection fitting

2.3 Dosing valve

2.4 Pulsation damper

2.5 Diaphragm pressure keeping valve



2.6 Diaphragm relief valve

2.7 Multifunction valve

2.8 Flow meter [1]

2.9 Flow monitor [1]

2.10 Shut-off valve

[1] only for diaphragm pumps with a control

SUCTION SIDE (1)

Line strainer (1.1)

Connect suction line slightly above the bottom of the tank and install a line strainer (0.1 – 0.5 mm mesh size – depending on valve nominal diameter of the pump).

ATTENTION

If impurities are not removed, this results in malfunctions of the pump and the system.

Suction aid / siphon vessel (1.2)

For high tanks without connection on the bottom of the tank ► install suction aid / siphon vessel.
Thereby, pay attention to accelerating pressures which may be generated in a long suction pipe.

Suction lance (1.3)

Install a suction lance for removal of chemicals from tanks and barrels.
The integrated foot valve prevents the backflow of the suctioned medium.
The suction lances are equipped with a level switch for „empty“ signal.

Multifunction device (1.4)

The multifunction device is installed in the suction side piping of the pump and is used for determination of the delivery rate of pumps under real operating conditions.
The device can be filled either using a pending tank volume (communicating container) or using a hand vacuum pump.

Foot valve (1.5)

To prevent running dry of the suction line ► install foot valve (check valve) at the end of the suction line.

PRESSURE SIDE (2)

Vent valve (2.1)

If air can be drawn in due to falling liquid level in the suction tank and at the same time delivered to a pressurised line or against a pressure-sustaining valve ► install vent valve in the pressure line.

NOTE

The delivery flow can be interrupted if there is air in the suction line!

Injection fitting (2.2)

Install an injection fitting that routes into a main line to prevent the backflow of the pumped medium in the dosing line.

WARNING

Unwanted mixing in the dosing line occurs if any possible backflow from the main line is not prevented.

Dosing valve (2.3)

Installation of the dosing valve prevents the liquid from the system to be treated being able to penetrate into the dosing line.

Pulsation damper (2.4)

Damping of the pulsation by installation of pulsation dampers if:

- a low-pulsation delivery flow is desired for process reasons,
- acceleration forces caused by the piping geometry must be removed.

Install pulsation damper as close as possible to the pump head.
If both pulsation damper and pressure-sustaining valve should be integrated, install the pressure-sustaining valve between pump and pulsation damper.

WARNING

Undamped acceleration forces can result in the following faults / damage:

- flow rate fluctuations
- dosing errors
- pressure surges
- valve shocks
- increased wear on the suction and pressure sides of the pump
- mechanical destruction of the pump
- leaks and valve shocks if the permissible maximum pressure on the pump pressure
- side is exceeded
- damage to the piping and its installed fittings

Diaphragm pressure-keeping valve (2.5)

If dosing into a main line with negative pressure ► install pressure-keeping valve in the dosing line.

ATTENTION

It must be ensured during the installation that excess delivery (due to positive pressure difference (≥ > 1 bar) between pressure and suction sides) is avoided.

Diaphragm relief valve (2.6)

If the permissible pressure in the system can be exceeded by closing any shut-off valve or by clogging of the line ► install diaphragm relief valve.

When using an external overflow valve, the following is applicable for the return line:

- Route the return line sloping downward into the storage tank which is under atmospheric pressure or into an open drainage channel.
- Or connect directly to the pump suction line, but only if there is no check valve in the suction line (e.g. foot valve of a suction lance).

ATTENTION

Shut-off valves must not be closed when the pump is running!

WARNING

An overpressure protection device (e.g. relief valve) must generally be provided if the permissible operating pressure can be exceeded.

ATTENTION

If the permissible operating pressure is exceeded and the pump is not equipped with overpressure protection, the pump will be damaged.

WARNING

The pumped medium can spray out if the pump is damaged.

Multifunction valve (2.7)

The multifunction valve provides the following functions:

- pressure-keeping valve function,
- overflow valve function,
- pressure relief function,
- venting.

The multifunction valve is mounted directly on the pump pressure port.

Flow meter (2.8)

For measurement and monitoring of the flow rate ► install flow meter.
The application range is restricted to media that are similar to water.
The flow meter is screwed upright on the pressure port of the pump and connected to the pump electronics via the input for flow monitoring.

Flow monitor (2.9)

To record the flow rate of the pump ► install flow monitor.
The application range is restricted to media that are similar to water.
The flow monitor is screwed upright on the suction port of the pump and connected to the pump electronics via the input for flow monitoring.

Operation in Ex-zone C409.2 / C410.2

WARNING

The pump with a control is only designed for operation outside Ex-zonest!

Operation in Ex-zone R/M 409.2 / R/M 410.2

WARNING

The prerequisite for the use in explosion-hazardous areas is an appropriate design of the pump.

The product supplied by **sera** meets the requirements of directive 2014/34/EU if it is correspondingly marked. This guarantees safe operation in explosion-hazardous areas.

WARNING

It is the operator's task to define the field of application and to check whether the pump is suited for this application. He/she must clearly define the zone, the device category, the explosion group and the temperature class.

WARNING

Avoid build up electrostatic conditions!

WARNING

To avoid contamination of the valves strainers in the suction line have to be installed!

Identification

The pump has a label stating the zone/device category /explosion group/temperature class in compliance with directive 2014/34/EU.

Ex II2G c IIBT4 bzw.
Ex II2G c IICT4
(note special specifications in the confirmation of order.)

Installation

The intended operating conditions in explosion-hazardous areas according to directive 2014/34/EU are stated in the confirmation of order or the product description. The indicated limit values should not be fallen below or exceeded. Installation regulations given in the operating instructions must be adhered to.

WARNING

Use only suitable tools for performing assembly and maintenance work on machines or plants in explosion-hazardous areas. Directive 99/92/EC must be observed.

Potential equalization

After mounting the pump the proper connection to the site potential equalization is to be ensured. The max. bleed resistor (1MΩ) has to be checked and documented.

Start-up

After installation, the pump must immediately be used for the suction of fluids, i.e. the pump must immediately be started after the tank has been installed and filled.

Operation

The intended operating conditions in explosion-hazardous areas according to directive 2014/34/EU are stated in the confirmation of order or the product description. The indicated limit values should not be fallen below or exceeded. Details about explosion zone, device category, explosion group and temperature class can be seen from the Declaration of Conformity.

Degassing of the pumped medium:

- Never let the pump run dry.
- Check the liquid level in the tank during operation of the pump.
- Make sure that the pump is switched off when the liquid level in the tank falls below the minimum level required (explosive atmosphere may be carried over)..

Vapour bubbles from the pumped medium are harmless as they have no explosive potential.

WARNING

Formation of an explosive gas mixture must be prevented.

Temperature indications

Permissible ambient temperature: -10°C ≤ Ta ≤ +40°C

Maintenance

The maintenance notes listed in Chapter 10 are generally applicable. **Exception:**

ATTENTION

The oil level in the stroke mechanism of the pump must be checked once a week!

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS“.
Man, machine and environment are endangered if the safety instructions are not observed.

Adequate fastening at the pump foot and compliance with the operating parameters specified in the technical data are required for the operation of the pump.

Checks before every start-up:

- Check all connections for tightness.
- Tighten fixing bolts of the pump body with the specified tightening torques (see „Overview of the tightening torques“ chapter).
- Check of the electrical connections.
- Check of the mains voltage on the rating plate with the local conditions.

Driving motor

Preconditions:

- Make sure that voltage and frequency correspond with the indications on the type plate of the motor. Permissible voltage tolerance (DIN VDE 0530).
- For rated voltage ► + 10 %
- For rated voltage range ► ± 5 %
- The connecting cable must be dimensioned according to the motor characteristics.
- Secure connecting cable with a strain relief.
- The nominal motor power refers to an ambient temperature and an installation site ► see chapter „TECHNICAL DATA“ . Motor output will be reduced if these values are exceeded (see VDE 0530).
- Adapted for “moderate” groupe of climates according to IEC 721-2-1.

NOTE

Operating voltage range see chapter „TECHNICAL DATA“.

NOTE

Pump without control:
Motor connection see chapter „Drive motor“ in the PRODUCT DESCRIPTION.

NOTE

Pump with a control:
Electrical iterfaces see the additional operation instructions for the CONTROL.

ATTENTION

Pump with a control:
The pump restarts in the selected operating mode with the specified parameters after switching on again or after restoration of the power supply following a power failure.

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS“.
Man, machine and environment are endangered if the safety instructions are not observed.

Check the following at regular intervals:

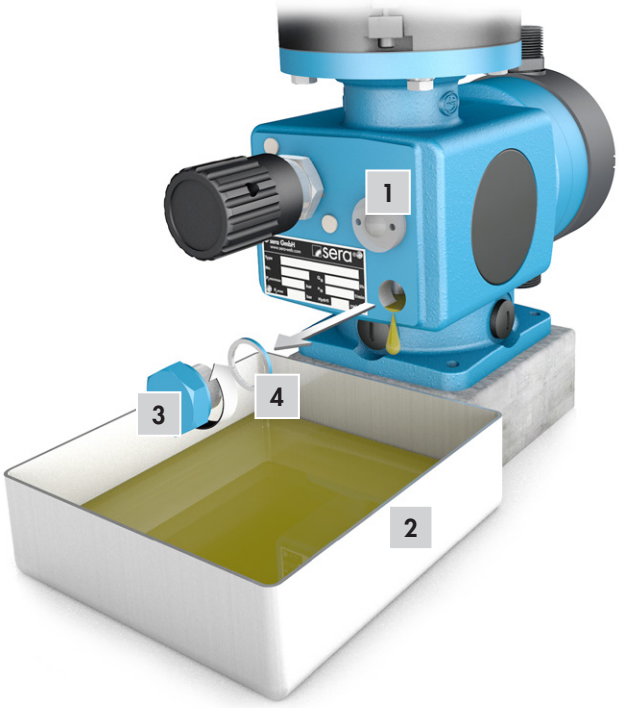
- Tight fit of piping.
- Tight fit of pressure and suction valve.
- Proper condition of the electrical connections.
- Tight fit of the screws for fastening the pump body (check this at least every three months).
- For the tightening torques of the mounting screws, please see Chapter „Overview of the tightening torques“.
- Additionally with motor pumps: Check oil level regularly (oil eye).

Drive motor

The electric motor should always be kept clean so that neither dust, dirt, oil nor other contaminates may affect the correct operation.

In addition, we recommend to ensure that:

- The motor does not produce strong vibrations
- Suction and blowing openings for the supply of cooling air are not closed or restricted (may lead to unnecessary high temperatures in the windings)

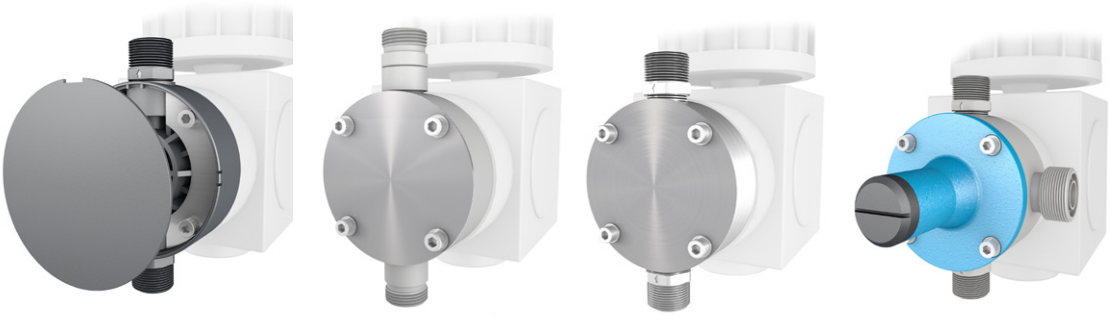


The ball bearings inserted in the motor are lubricated for life.

Oil change

Check oil level at regular intervals (oil sight glass (**1**))

Perform an oil change once a year.
To do so, proceed as follows:



- Unscrew the venting screw (**5**).
- Prepare an appropriate container (**2**).
- Open the screw plug (**3**) and drain off oil.
- Close hole with screw plug (pay attention to the sealing ring (**4**)!).
- Fill oil in threaded hole of the venting screw.
- Screw in venting screw (**5**).

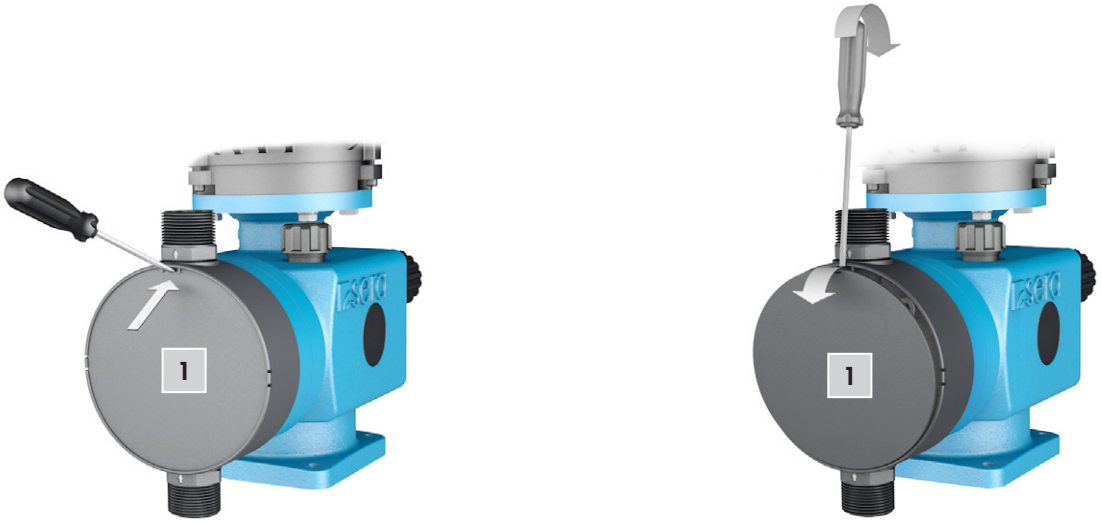
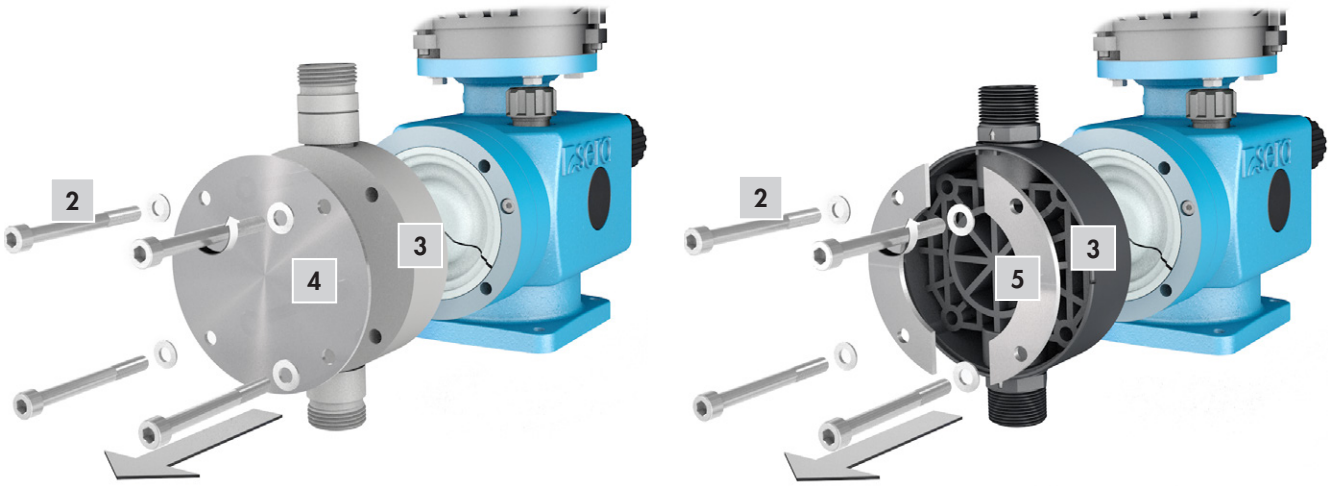
Changing the Diaphragm



In order to ensure a correct function of the diaphragm pump and to fulfil the required safety and protective provisions it is absolutely necessary to check and replace the diaphragms at regular intervals.

After 3000 operating hours or at the latest after one year, a service message requiring diaphragm replacement is shown on the graphical display of the pump with a control (see additional instructions of the control). An earlier diaphragm replacement can be necessary depending on the medium and the application area.

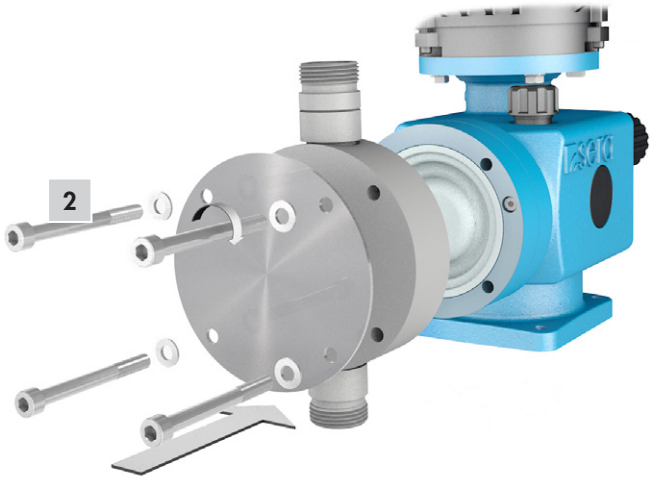


WARNING

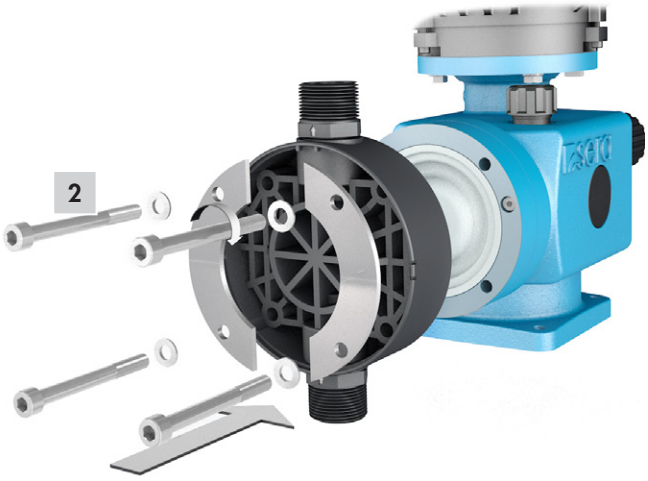
Pump with a control:
Observe the instructions on the graphical display for the replacement of wear parts!

- Set the stroke length adjustment to a stroke length of 0% (front position).
- Remove cover plate (**1**) of the pump body (FRP design, ...409.2).

- Loosen fixing bolts (**2**) on the pump body.
- Remove pump body (3), front plate (**4**) (PVC design) or insertion plates (**5**) (FRP design, ...409.2) to the front.



- Unscrew defective drive diaphragm (**6**) from the push rod (**7**).
- Unscrew pressure plate (**8**) from the set screw of the dia-phragm (with EPDM, FPM drive diaphragm).

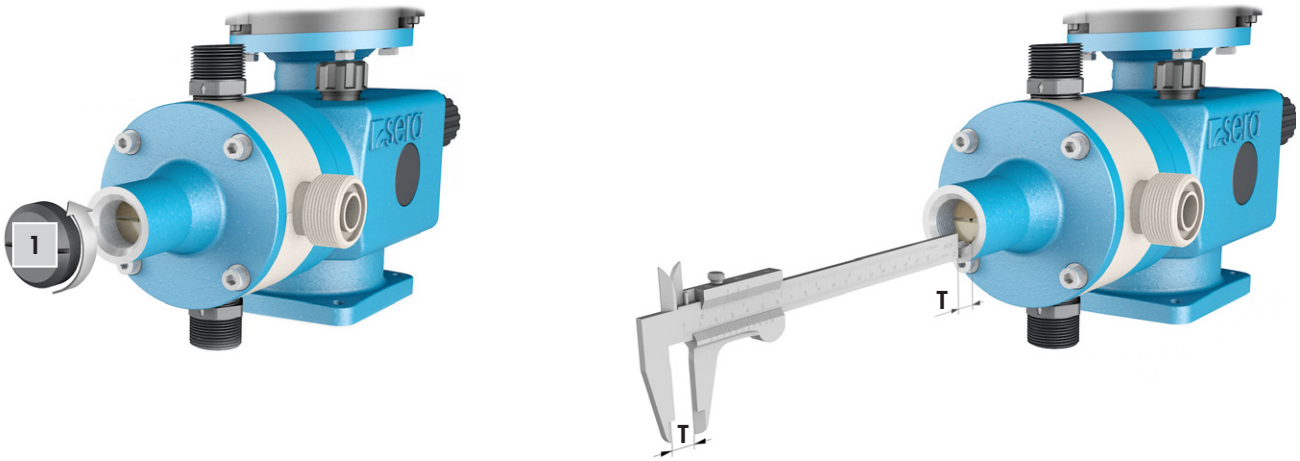


- Clean pressure plate and screw plate on the new diaphragm.

Assemble the pump in reversed order:

- Screw on new diaphragm hand-tight – the diaphragm must be in the middle position.
- Set the stroke length to 50%.
- If the pump is not equipped with a stroke length adjustment (M-design), move the diaphragm to the middle position by turning the fan blade of the drive motor.
- Observe tightening torques of the fixing bolts (**2**); see chapter „Overview of the tightening torques“.
- When assembling the pump body, please note:suction valve below, pressure valve above!

Add the suction and pressure line and connect pump to the power supply. The diaphragm pump is then again ready for operation.

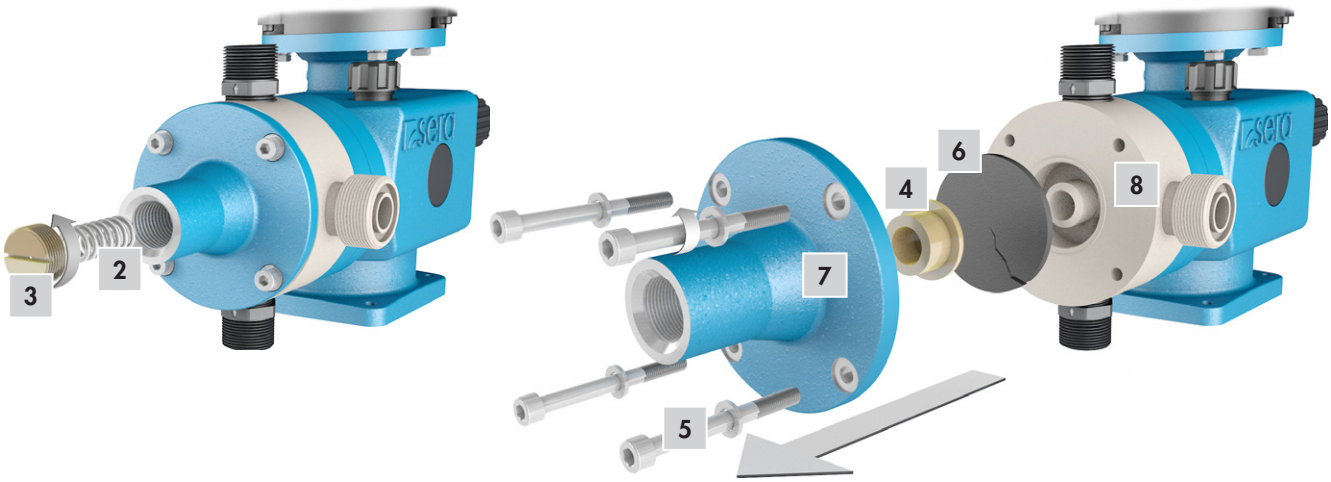


Overflow valve

Proceed as follows to change the diaphragm of the overflow valve (only pumps with integrated overflow valve).

NOTE

All diaphragms should be replaced completely.



- Loosen and unscrew the lid (**1**) of the overflow valve.

NOTE

Before the set screw is unscrewed the dimension **T** (dis-tance between top edge of the cover and the set screw) is to be determined and documented.
This ensures that the overflow valve can be reset to the same pressure NOTE! during subsequent assembly.

- Unscrew the set screw (**3**).
- Remove pressure spring (**2**).
- Loosen and unscrew fixing screws (**5**).
- Remove cover (**7**) and pump body (**8**) to the front.
- Remove pressure disk (**4**) and diaphragm (**6**).
- Check overflow valve for damage and contamination.

- Insert a new diaphragm. In case of PTFE-laminated diaphragms the PTFE-coated side must point towards the pump body.

Assemble the pump in reversed order.

NOTE

The individual components should be cleaned thoroughly before assembly!!

NOTE

When the set nut is screwed in the dimension "**T**" which was determined beforehand is of great importance.

The initial opening pressure of the overflow valve is only reached when the NOTE! set screw is screwed in exactly according to dimension "**T**"!

ATTENTION

The screw-in depth of the set screw must not exceed the initial value. If the set pressure is increased, **sera** has to be consulted beforehand!

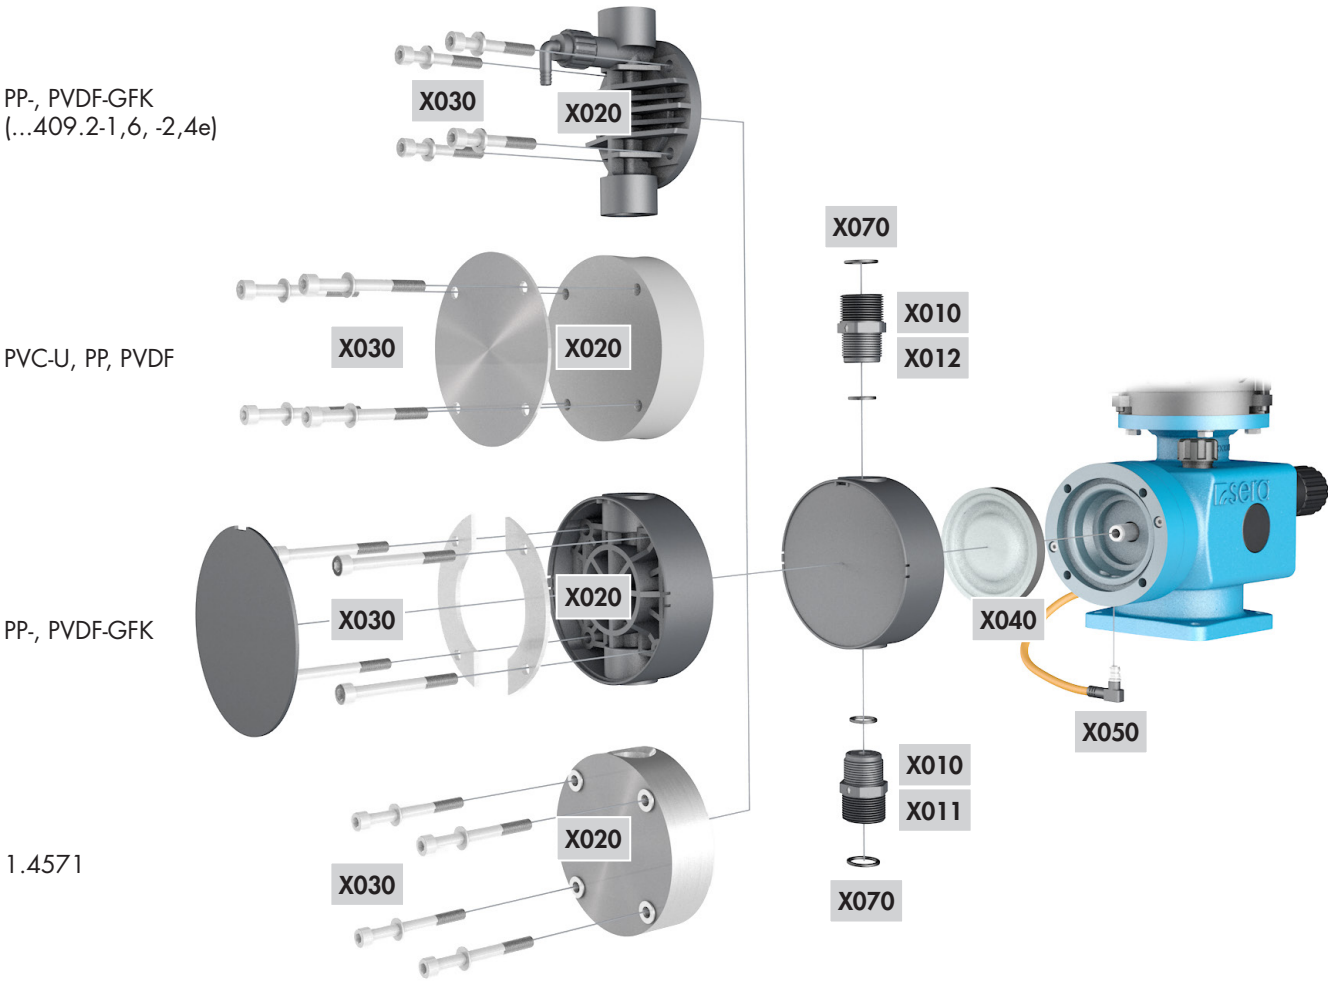
ATTENTION

Never screw in the set screw to a depth so that the pressure spring is compressed to solid length!

Spare and wearing parts

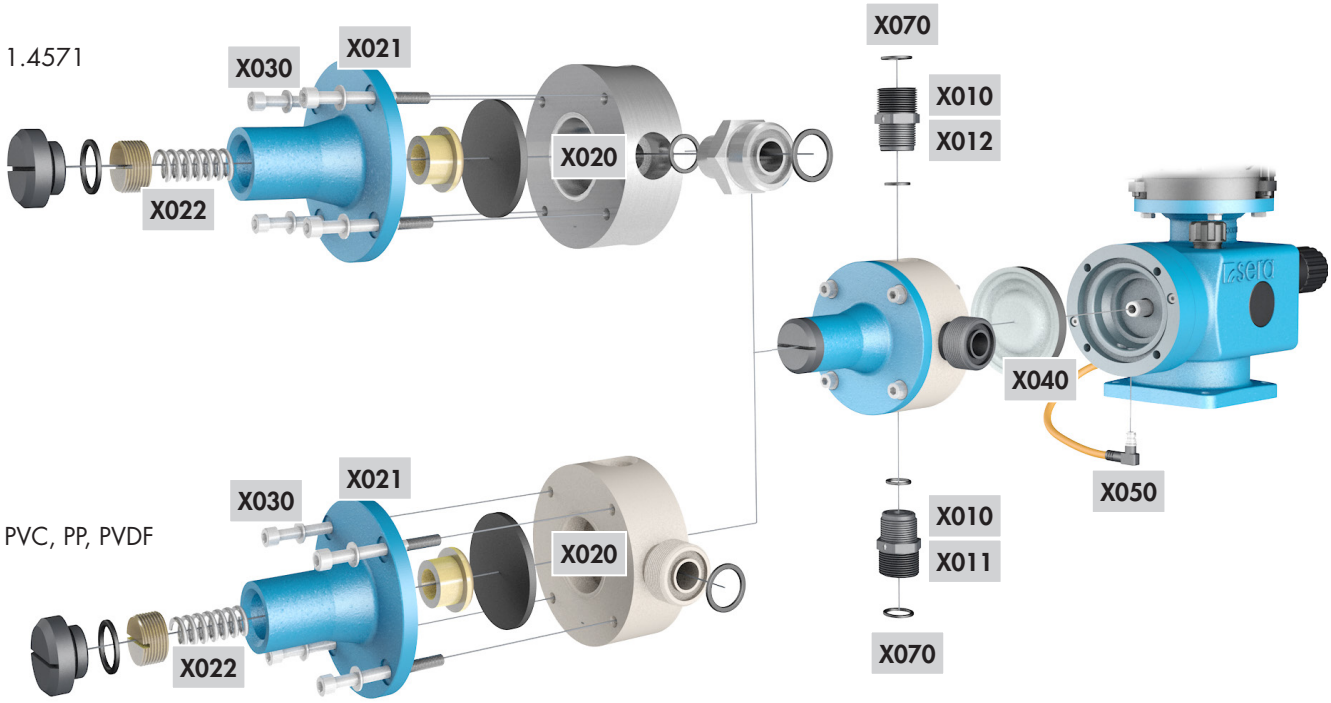
The following parts are considered as wearing parts of the pump:

- Drive diaphragm (diaphragm kit)
- Diaphragm (diaphragm kit) ► diaphragm of the integrated overflow valve
- Diaphragm rupture electrode (diaphragm kit)
- Valve kit (including O-ring kit)
- O-ring kit



Depending on their use and period of use, wearing parts must be replaced at regular intervals in order to ensure a safe function of the diaphragm pump.

We recommend to replace the wearing parts after 3000 operating hours or at least once a year.



In case of a premature diaphragm rupture caused by hard operating conditions, switch off the diaphragm pump and replace the diaphragms (see chapter „Changing the diaphragm").

The following parts are considered as spare parts of the pump:

- Pump body kit (including mounting kit)
- Mounting kit
- Cover kit ► pump with integrated overflow valve
- Setting kit ► pump with integrated overflow valve

Pos.	Kit	Materials	consisting of

sera products are sophisticated technical products which are only shipped after having been thoroughly tested and checked at our factory.
Should there be any faults, these can be detected and rectified easily and quickly based the instructions in the tables.

NOTE

Analysis of the error messages in the display for the pumps with a control ► see the operation instructions of the control!

Fault type															Possible cause	Corrective action
Corrective action!	Display, LED not lit! ▲ Pump with control	Motor does not start! ▲ diaphragm pump	Damage to stroke mechanism / drive!	Pump does not draw in!	Pump does not deliver!	Flow rate is not reached!	Delivery head is not reached!	Flow rate fluctuates!	Maximum permissible flow rate exceeded!	Pipe oscillates heavily!	Too high noise development!	Service life of the drive diaphragm too low!	Drive is overloaded (periodically occurring noises)!	Leakage on pump head!		
				■	■	■									Suction height too high.	Reduce suction height or suction resistance.
				■	■	■		■							Suction pipe leaking.	Check seals, tighten pipe connections.
				■	■							■	■	■	Shut-off valves in piping closed.	Open shut-off valves or check opening state ► check pump for possible damage.
				■	■	■									No pumped medium in storage tank.	Fill storage tank.
				■	■	■	■	■							Pump valves leaking.	Remove and clean valves.
				■	■		■	■							Pump valves (ball seats) damaged.	Remove and clean valves, check function; replace valves if necessary.
				■	■										Pump valves incorrectly mounted or valve balls missing.	Check installation position and completeness ► replace missing parts or install correctly.
				■	■	■		■							Filter in suction line clogged.	Clean filter.
				■	■	■	■	■					■		Electrical data of the pump do not match mains data.	Check order data. Check electrical installation. Adjust motor to the network on site (for diaphragm pumps).
					■	■	■	■		■		■	■	■	Backpressure too high.	Measure pressure with manometer directly above pressure valve if possible and compare with permissible backpressure.
				■	■	■	■	■							Foreign matter in the pump valves.	Remove and clean valves.
								■	■						Pressure on suction side higher than at the end of the pressure pipe.	Check geodetic conditions, install float valve or pressure keeping valve if necessary.
						■	■	■		■	■	■	■	■	Acceleration height too high due to pipe geometry.	Check acceleration height on suction and pressure sides with manometer and compare with design data ► install a pulsation damper if necessary.
												■		■	Materials coming into contact with the medium not suitable for the pumped medium.	Check whether the pumped medium matches the design data and select other materials if necessary.

FAULT ANALYSIS / CORRECTIVE ACTION

Fault type															Possible cause	Corrective action
Corrective action!	Display, LED not lit! ▲ Pump with control	Motor does not start! ▲ diaphragm pump	Damage to stroke mechanism / drive!	Pump does not draw in!	Pump does not deliver!	Flow rate is not reached!	Delivery head is not reached!	Flow rate fluctuates!	Maximum permissible flow rate exceeded!	Pipe oscillates heavily!	Too high noise development!	Service life of the drive diaphragm too low!	Drive is overloaded (periodically occurring noises)!	Leakage on pump head!		
				■		■	■	■							Viscosity of the pumped medium too high.	Check viscosity of the pumped medium and compare with design data ► reduce concentration or increase temperature if necessary.
					■	■		■							Pumped medium is outgassing in the suction pipe and/or the pump body.	Check geodetic conditions and compare with data of the pumped medium. Operate pump with suction side supply, reduce temperature of the pumped medium.
				■											Air in suction line while pressure is present on the pressure side.	Vent pressure side.
	■														Power supply failed / switched off.	Restore power supply.
				■	■	■	■	■							Pipe connections leaking.	Tighten connections according to type of material. Be careful with plastic ► risk of fracture!!
				■	■										Pumped medium frozen in pipe.	PRemove pump and check for possible damage - increase temperature of the pumped medium.
■	■				■										No mains power connection.	Connect mains power supply.
				■											Pump valves dry.	Moisten pump body and valves. Open vent valve.
				■	■	■								■	Temperature too low.	Check flowability of the dosing medium. Temperature of the medium see „Technical data“.
				■	■	■	■	■				■		■	Diaphragm rupture.	Replace the diaphragm according to the descriptions in Chapter „Replacing the diaphragm“.
■															Reversible thermal fuse of the pump has tripped.	Let temperature of the pump cool down. Check ambient temperature.
	■														Fuse in electronics blown. ► Pump with control	Return pump for repair.
				■	■	■	■								Compensating valve not adjusted to operating conditions. ► diaphragm pump KM	Set compensating valve according to operating conditions. ► diaphragm pump KM

WARNING

Observe and follow the safety instructions by all means.
See the additional instructions „SAFETY INSTRUCTIONS“.
Man, machine and environment are endangered if the safety instructions are not observed.

Shut-down

- Switch off piston diaphragm pump.
- Rinse pump head and remove pumped medium; make sure that the rinsing agent is suitable for pumped medium and pump head.

Disposal

- Shut-down system. Please see “Shut-down“.

Dismantling and transport

- Shut-down system. Please see “Shut-down“.
- Remove all fluid residues from pump body, clean thoroughly, neutralize and decontaminate.
- Package unit and ship.

NOTE

A clearance certificate must be filled in when systems are returned to the manufacturer.
Acceptance will be rejected if this clearance certificate is not attached.

Complete disposal

- Remove all fluid residues from unit.
- Drain off lubricants and dispose of according to regulations!
- Dismount materials and send them to a suitable waste disposal company!

NOTE

Inspection / repair of machines and machine parts is only carried out after the opposite clearance certificate was filled in correctly and completely by authorized and qualified personnel.

NOTE

Acceptance will be refused if parts are returned to the manufacturer without a proper clearance certificate.

All industrial companies are obligated by the legal provisions for occupational health, e.g. the workplaces ordinances, the Ordinance on Hazardous Substances, the regulations for prevention of accidents and the environmental protection regulations such as the Waste Management Act and the German Household Water Act to protect their employees or man and the environment from detrimental effects when handling hazardous substances.

Should special safety precautions be necessary despite careful draining and cleaning of the product the necessary information are to be provided.

Machines which are operated with radioactive media shall only be inspected and/or repaired in the safety area of the owner by a **sera** specialized fitter.

The clearance certificate is part of the inspection-/repair order.
sera reserves the right to refuse acceptance of the order for other reasons.

NOTE

Please make a copy and leave the original with the operating instructions!
(can also be downloaded from: www.sera-web.com)

Clearance Certificate

Product

Type _____ Serial-No. _____

the product was carefully emptied before shipping / delivery, and cleaned inside and outside. ☐ **YES**

Conveying medium

Designation _____ Concentration _____ %

Properties

Please tick!

If either of the listed properties, then enclose the appropriate safety and handling instructions.

☐ Harmless

☐ Toxic ☐ Corrosive ☐ Flammable ☐ Oxidising ☐ Unhealthy

☐ Explosive ☐ Dangerous for the environment ☐ Irritant ☐ Bio-hazardous ☐ Radioactive

The product was used with health or water-polluting substances and came up with labeling requirements and pollution prone media in contact. ☐ **YES** ☐ **NO**

Special security arrangements with respect to health or water-hazardous media are in the further handling ☐ **not required** ☐ **required**

The following safety precautions regarding rinsing, residual liquids and waste disposal are required:

Process data

The product was used with the following operating conditions described conveying medium:

ACCUGUARD Diaphragm Seals

Without proper protection, process fluids can contaminate and damage in-line instrumentation. ACCUGUARD Diaphragm Seals are designed to protect and isolate pressure gauges and expensive instrumentation from corrosive, high temperature, or viscous, process media.

Features

- Transfers process pressure accurately without direct contact with process fluids
- Removes the need for expensive instrumentation
- Easily installed and available in five chemically resistant Materials of Construction
- Optional Diaphragm Materials
- Available with ¼" & ½" Bottom Connection Sizes in FNPT & BSPT Female Connection Types
- Thermoplastic Units Rated to 240 PSIG (16 BARG) @ 21°C (70°F)
- 316L S/S Units Rated to 5800 PSIG (400 BARG) @ 21°C (70°F)
- Approved – 316 S/S Diaphragm Seals with CRN (Canadian Registration Number)

HOW TO ORDER - AccuGuard

Example Part Number: AG25A25A-PVC-V-M-[Optional Gauge]

AG 25 A 25 A - PVC - V - M - [Optional Gauge]

See Gauge List

AccuGuard Diaphragm Seal

Connection Size (Top)
25 = 1/4"

Connection Type (Top)
A = FNPT

Connection Size (Bottom)
25 = 1/4"
50 = 1/2"

Connection Type (Bottom)
A = FNPT
B = BSPT

Options
M = Mounted Gauge/Glycerin Filled

Diaphram Materials
V = Viton (Thermoplastic Body Only)
E = EPDM (Thermoplastic Body Only)
T = PTFE (Thermoplastic Body Only)
S/S = 316 S/S (S/S & S/SV Body Only)

Body Materials
PVC = Polyvinylchloride
CPVC = CPVC Corzan
PP = Polypropylene (Not Available with PTFE Diaphragm)
PVDF = Polyvinyldene Fluoride (PTFE Diaphragm Only)
S/S = 316L Stainless Steel
S/SV = Vented 316L Stainless Steel

- Optional Gauge Appears as Separate Line Item When Ordered
- Diaphragm Seals With Gauges = Glycerin Filled As Standard
- 1/4" & 1/2" MNPT Nipples Available - Call Factory for Details

ACCUGUARD GAUGES

ACCUGUARD Pressure Gauges are designed to enhance the performance of chemical feed systems. Adding a pressure gauge to any system will help to ensure that optimal pressures are monitored and maintained.

Series Information

Series	Gauge Diameter	Gauge Connection Size and Type	Gauge Housing	Gauge Internals	Liquid Filled	*Accuracy Rating
Economy	2" / 2.5"	1/4" NPT	Steel Case	Brass	No	± 2.5%
Intermediate	2.5" / 4"	1/4" NPT	304 S/S	Brass	Yes	± 1.6%
Premium	2.5" / 4"	1/4" NPT	304S/S	316L S/S	Yes	± 1.6%

*Accuracy Rating = Full Scale Range

HOW TO ORDER - AccuGuard Gauges

Example Part Number: GE2-160-CB

G E 2 - 160 - CB

AccuGuard Gauge

Gauge Series
- E = Economy
- I = Intermediate
- P = Premium

Gauge Diameter
- 2 = 2 Inches
- 2.5 = 2-1/2 Inches
- 4 = 4 Inches

Gauge Mounting Orientation
- CB = Center Back
- BM = Bottom Mount

Gauge Indication
- 60 = 0-60 PSIG / 0-400 KPA
- 160 = 0-160 PSIG / 0-1100 KPA
- 200 = 0-200 PSIG / 0-1400 KPA
- 300 = 0-300 PSIG / 0-2000 KPA
- 400 = 0-400 PSIG / 0-2800 KPA

4" Gauge Diameter Available in Bottom Mount Orientation Only

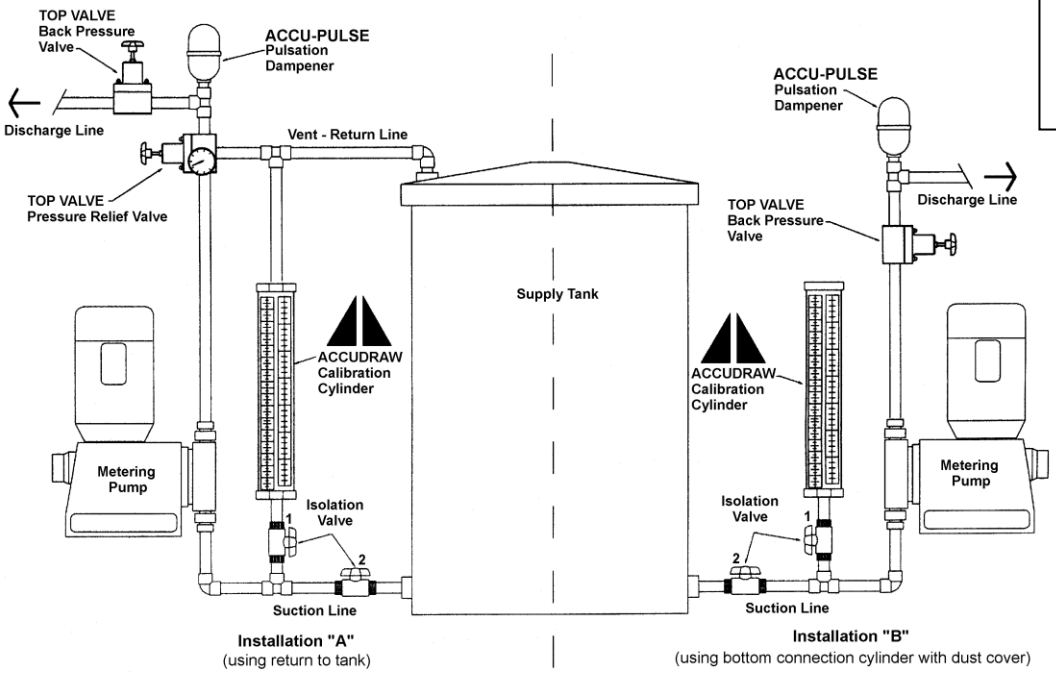
ACCUDRAW®

Glass Cylinder Calibration Instructions

Note: Before starting the calibration procedure below, ensure that the pump is primed and void of any trapped air.

Using the ml scale: (scale is based on **volume** pumped, over any given time)

1. Fill the calibration cylinder to the top mark with the liquid to be dispensed. This can be accomplished by manually filling the cylinder, or, if the feed tank level is higher than the cylinder, by opening the isolation valve below the cylinder and back filling the cylinder.



Caution: Never leave unattended when back filling the cylinder.

2. With the calibration cylinder full of the liquid to be dispensed, start the metering pump and operate at 100% output until all air is removed from both suction lines and pump head.
3. Shut pump "OFF".
4. With calibration cylinder full, close isolation Valve (#2) from supply tank, and open isolation valve (#1) below cylinder.
5. Start the pump.
6. Using a stop watch, measure the volume dispensed in 60 seconds.
7. Multiply the measured volume by 60 to find your **ml per hour** volume.
8. Adjust the pump volume control, higher or lower to meet with your desired output.
9. Repeat above steps 4 through 8 until your desired output is met.

If you wish to shorten the time of dispensing for calibration by one half (1/2) or one quarter (1/4), you must multiply the volume by the same number used to divide the time by to determine ml per minute or hour.

e.g. 100 ml in 60 seconds equals
50 ml X 2 in 30 seconds or
25 ml X 4 in 15 seconds

Typical Installations ("A" and "B")

Conversion Factors
1ml = 1 cc
1000 ml – 1 liter
ml/sec x 60 = ml/min
1 US gal/min x 0.063 = liters/sec
1 US gal = 3.786 liters

Caution:
Do not use as a Pressure Vessel

Metering Pump Accessories Save $$$$
Prevent unsafe and inefficient systems by design.

ACCUDRAW Calibration Cylinders

PVC **Glass** **Poly**

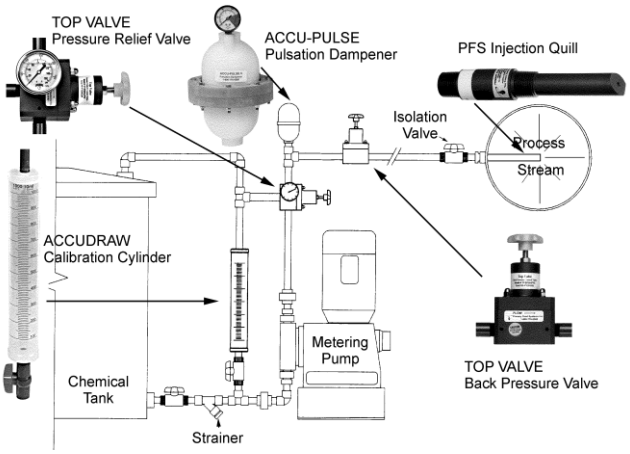
- *PVC, glass, polypropylene*
- *translucent, chemical resistant*
- *coloured graduations and lettering*
- *threaded or socket connections*
- *standard sizes 100 ml to 20,000 ml*

Custom built in other sizes and materials.

TOP VALVE Back Pressure/Pressure Relief

- *long life diaphragm*
- *range of 0 – 150 PSIG*
- *air release, optional gauge port*
- *PVC, CPVC, PVDF, PTFE, polypropylene, stainless, Alloy 20 and Hastelloy C*
- *7 sizes ¼" – 2" NPT*
- *colour coded handles indicate size*

Designed to enhance the <u>accuracy</u> and <u>safety</u> of your metering pumps.



ACCU-PULSE
Pulsation Dampeners

Designed to remove pulsating flows from positive displacement pumps.

- *increase system efficiency and pump life*
- *decrease maintenance and costs*
- *protect pipes, meters, valves and instrumentation from pulsation and vibration*
- *ensure meter accuracy, longevity and repeatability*
- *prevent foaming and splashing*
- *extensive range of materials and sizes*
- *lightweight, compact design*

Typical Metering Pump System

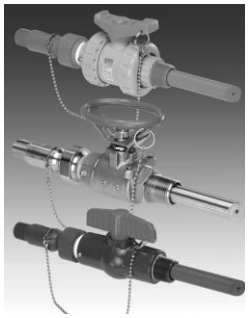
AutoCad drawings available from our web site.
Visit www.primaryfluid.com

PFS Injection Quills

Designed to inject chemical into the center stream of process.

- *provides for a more homogenous mix in the pipeline*
- *built-in checks to prevent back siphoning*
- *2 sizes 6" and 8" length*
- *½" or ¾" NPT, BPST, or Flg'd Conn.*
- *PVC, CPVC, PVDF, polypropylene, Stainless, Hastelloy C & Titanium*
- *pressure to 3000 PSIG*
- *temperature to 260°C (500°F)*

Custom built in other sizes and materials.



Accu-Vent

Designed to automatically vent gases and vapours.

- *vents gases and vapors released from Sodium Hypochlorite, Sulfuric Acid & Hydrogen Peroxide*
- *CPVC (Corzan) and Viton corrosion resistant wetted materials of construction*
- *specially designed float material automatically vents built up gases on system start up and under working pressure*
- *standard 1/2" or 3/4" NPT threaded connections or optional socket weld*
- *available in other materials*

PFS Corporation Stops

Designed to inject chemical into the center stream of process.

- *isolation valve allows for ease of maintenance*
- *available in 6 materials of construction*
- *wetted components have comparable or greater chemical resistance than quill construction material*
- *standard and custom lengths available*
- *connection in NPT, metric or flanged*

Custom built in other sizes & materials.

Technical Sheet

WWW.POMPESCP.COM

Client:	***ASDR***	***Assembly serial number:***	***0194***
Quotation:	***PP-204196***	***Drawing number :***	***351-CPVC-250***
Mounting type: box ☒ wall ☐		Pump model: **RF409.2-180e**	
With door ☒ Without door ☐		S/N pump 1: WP387558 S/N pump 2: WP387559	
Simplex ☐ Duplex ☐ Triplex ☒ Quadruplex ☐		S/N pump 3: WP387560 S/N pump 4:	
Skid Material: HDPE ☒ SS ☐		Pump capacity L/H : 216	
Skid dimension: _____48___X____64___X_____24___		Maximum pressure (PSI): 58.01	
O-ring: Viton ☒ EPDM ☐ Teflon ☐		Pump head material: PVDF	
Relief valve model: TVBPP75-CPVC		Valve material: CPVC	
Back pressure valve model: TVBPP75-CPVC		Valve: simple ☒ double ☐	
Valve material: CPVC		Ball type: FKM	
Calibration cylinder model: (ACS2-4000)X2		O-ring: Viton	
Pressure gauge model:GI2.5-160CB		Diaphragm:AG25A50A-CPVC-T-M	
Piping : PVC ☐ SS ☐ PVDF ☐ CPVC ☒			
Piping dimension: ½'' ☐ ¾'' ☒ 1'' ☒ 1 ¼'' ☐ 1 ½'' ☐ 2'' ☐			

Pressure test and tightness		***Adjusting valves***	
Pressure test period, min.:	10	Release valve, PSI:	50
Pressure test, PSI:	60	Back pressure valve, PSI:	50

ASDR

Project #: 6526-S-265-605B
Client: Agnico-Eagle Mines (Meliadine)
Project: AMMONIA & TSS WATER

Prépared by: Dan Misiano
Revision: R0
Revision date: 2021-05-14

6526-S-265-605B-135-Spare Parts List

Item Description	Qty	Modèle/compagnie	Supplier	Client tag#	Material	Comments:
1.0 SODIUM HYDROXIDE MAKE DOWN SYSTEM : (#65CVI68004)						
CPLG bolts W/ LOCKNUTS 18-8SS	1	C.0625.04.375-S 5CB 5/8" x 4-3/8" / OAL CEMA	ASDR	65DVI68004	SS	
Sectional screw x 14' - 10" LG	1	9S412 / OAL CEMA	ASDR	65DVI68004	SS	screw stober. H. & mtd. On 3" sch.40 pipe variable pitch, cema 2-bolt drilled, screw to be 2/3 pitch first 12", balance to be full pitch
3 HP @ 34 RPM Class II drive	1	- / oal cema	ASDR	65DVI68004	-	consisting of: • (1) 3 HP 1750 RPM PREMIUM EFF., TEFC, MTR; • (1) NORD SK4282100LP/4 SCREW CONVEYOR DRIVE W/ ADAPTER & ADJUSTABLE PACKING KIT • 2-0" DRIVE SHAFT & MOTOR MOUNT.
2"DIA.WAM-SHIELD SEAL	1	SE.4CP / WAM	ASDR	65DVI68004	-	
single flange butterfly valve 10" DIA.,	1	WAM V1FS250.ZB / WAM	ASDR	65R0V68001	304SS	cast aluminum body, 304SS DISC
Electromechanical rotary actuator AE7022X19	1	WAM AE070A1D / WAM	ASDR	65R0V68001	-	575V 60HZ 0.75KW for VFS
Position limit switch	1	WAM MIC23 / WAM	ASDR	65DVI68004	-	
Seal for VFS0250 & assembly	1	WAM 20.99.480.1/D / WAM	ASDR	65DVI68004	-	
Sealing block for SBB125,53"ODX20"IDX51"	1	WAM361002300 / WAM	ASDR	65DVI68004	Neoprene	Bolt circle, 24 holes of 1" DIA, black neoprene, 1/4" THK.
Electric vibrator,	1	- / WAM	ASDR	65VIB68001	-	0.18KW, 575V 60 HZ (SBB)
Transfer Centrifugal Pump	1	FC5010-17 / WEBTROL	ASDR	65PSO68002	-	Motor 1 HP, 145JM frame
Mixer	1	FGP-075 / SHARPE MIXERS	ASDR	65AGI68010 65AGI68025	-	575V
Mixer Fixer kit 3/4"	1	/ SHARPE MIXERS	ASDR	65AGI68010 65AGI68025	-	includes items: • A10797 - Motor gasket • PG10333 - Pinion gear kit model M5 gearbox • 5L104012 - Split coupling • 1220965-1 - Nosecone seal (food grade Viton) ¾'' • A2975 - Brass tipped set screw (2 req'd) • RB-12 - Nosecone bearing kit ¾'' • N06 - Gear nut • W06 - Star washer • A10712 - Gearbox gasket (G/M5) • 12545 - Gearbox seal • 6206-RS1/C3 - Gearbox bearing • DG10334 - Helical gear with key model M5 gearbox
Nosecone assembly	1	CNA075 / SHARPE MIXERS	ASDR	65AGI68010 65AGI68025	-	includes items: • RB-12 - Nosecone bearing kit ¾'' • 1220965-1 - Nosecone seal (food grade Viton) ¾'' • A2975 - Brass tipped set screw (2 req'd)
Rotary level indicator	1	WAM ILT .C.2 / WAM	ASDR	N/A	-	110/220V AC 50/60HZ
Speed switch	1	WAMM.WM100 / WAM	ASDR	65CVI68004	-	
rubber flexible connection	1	WAMXJN.273.236 / WAM	ASDR	65CVI68004	Neoprene	- 10" DIA X 12" LG X 1/8" THK.

Ultrasonic sensor	1	FMU30-CAHGAARGF / Endress+Hauser	ASDR	65LIT6801712	-	
2.0 SODIUM THIOSULFATE MAKE DOWN SYSTEM : (#65CVI68004)						
CPLG bolts W/ LOCKNUTS 18-8SS	1	C.0625.04.375-S 5CB 5/8" x 4-3/8" / OAL CEMA	ASDR	65CVI68004	SS	
Sectional screw x 14' - 10" LG	1	9S412 / OAL CEMA	ASDR	65CVI68005	SS	screw stober. H. & mtd. On 3" sch.40 pipe variable pitch, cema 2-bolt drilled, screw to be 2/3 pitch first 12", balance to be full pitch
3 HP @ 34 RPM Class II drive	1	- / oal cema	ASDR	65CVI68005	-	consisting of: • (1) 3 HP 1750 RPM PREMIUM EFF., TEFC, MTR; • (1) NORD SK4282100LP/4 SCREW CONVEYOR DRIVE W/ ADAPTER & ADJUSTABLE PACKING KIT • 2-0" DRIVE SHAFT & MOTOR MOUNT.
2"DIA.WAM-SHIELD SEAL	1	SE.4CP / WAM	ASDR	65CVI68005	-	
single flange butterfly valve 10" DIA.,	1	WAM V1FS250.ZB / WAM	ASDR	65ROV68002	304SS	cast aluminum body, 304SS DISC
Electromechanical rotary actuator AE7022X19	1	WAM AE070A1D / WAM	ASDR	65ROV68002	-	575V 60HZ 0.75KW for VFS
Position limit switch	1	WAM MIC23 / WAM	ASDR	65CVI68005	-	
Seal for VFS0250 & assembly	1	WAM 20.99.480.1/D / WAM	ASDR	65CVI68005	-	
Sealing block for SBB125,53"ODX20"IDX51"	1	WAM361002300 / WAM	ASDR	65CVI68005	Neoprene	Bolt circle, 24 holes of 1" DIA, black neoprene, 1/4" THK.
Electric vibrator,	1	- / WAM	ASDR	65VIB68002	-	0.18KW, 575V 60 HZ (SBB)
Transfer Centrifugal Pump	1	FC5010-17 / WEBTROL	ASDR	65PSO68003	SS	Motor 1 HP, 145JM frame
Mixer	1	FGP-075 / SHARPE MIXERS	ASDR	65AGI68011 65AGI68026	-	575V
Mixer Fixer kit 3/4''	1	/ SHARPE MIXERS	ASDR	65AGI68011 65AGI68026	-	includes items: • A10797 - Motor gasket • PG10333 - Pinion gear kit model M5 gearbox • 5L104012 - Split coupling • 1220965-1 - Nosecone seal (food grade Viton) ¾'' • A2975 - Brass tipped set screw (2 req'd) • RB-12 - Nosecone bearing kit ¾'' • N06 - Gear nut • W06 - Star washer • A10712 - Gearbox gasket (G/M5) • 12545 - Gearbox seal • 6206-RS1/C3 - Gearbox bearing • DG10334 - Helical gear with key model M5 gearbox
Nosecone assembly	1	CNA075 / SHARPE MIXERS	ASDR	65AGI68011 65AGI68026	-	includes items: • RB-12 - Nosecone bearing kit ¾'' • 1220965-1 - Nosecone seal (food grade Viton) ¾'' • A2975 - Brass tipped set screw (2 req'd)
Rotary level indicator	1	WAM ILT .C.2 / WAM	ASDR	N/A	-	110/220V AC 50/60HZ

Weight and Capacity	
Hopper weight @ full capacity	16 618 lb
Empty hopper weight	3 118 lb
Product weight @ full capacity	13 500 lb
Usable space	263 ft³
Type	Gravity
Structure weight	1 975 lb
Construction material	
Hopper	Stainless steel 304
Structure	Carbon steel
Paint	
Structure	Gray powder coat
Weld and surface finish	
Inside of the hopper	TIG, discoloured 2B
Outside of the hopper	TIG, discoloured 2B
Structure	MIG, painted

Weight and capacity	
Empty receiver weight (receiver + rotary valve)	700 lb
Full receiver weight	790 lb
Useful volume	1.75 ft.cu.
Total volume	6.12 ft.cu.
Type	Vacuum
Structure weight	N/A
Anti-explosion reference	
Pred	N/A
Pstat pression	N/A
Pstat vacuum	N/A
Construction materials	
Body	Stainless steel 304
Head	Stainless steel 304
Structure	N/A
Paint	
Inside / outside head	N/A
Structure	N/A
Welding and surface finish	
Inner body	TIG, discolored 2B
Outside body	TIG, discolored 2B
Inside / outside head	TIG, discolored 2B
Structure	N/A

Weight and part	
Total weight	835 Lbs each
Motor	15hp254TC 575/3/60 1765rpm
Blower model (Tuthill)	4005-A7L2CV1-A
Filter cartrige	12OD x 14 Lg
Vacuum relief	Set to 15" Hg
Material and paint	
Frame	Carbon steel and gray powder coat
Filter cage	Carbon steel and gray powder coat
Security garde	Carbon steel and yellow powder coat
Specification	
Blower speed	3180 rpm
Sound intensity (approx)	89 dB@ 1m
Débit	220 scfm

Re: Purchase Order No.: C12-205018
ACO No.: 78337
Project No.: NA

This document is to certify that the rotationally molded polyethylene containers i.e., one CT-7340- PE 1.9sg Closed Tank (142"D x 146"T, 33200L) & one CT-8740 PE 1.9sg Closed Tank (142"D x 169"T, 39600L) with Serial numbers 2108289356 & 2108289346 respectively; manufactured for the above referenced purchase order as well as all required parts were manufactured and tested (including the Hydrostatic /Leak Test) in accordance to your purchase order, ACO Container Systems' ISO 9001:2015 quality standards and ACO Container Systems' packing slip.

We trust this will meet your satisfaction and appreciate the opportunity to be of service to you and your valued client.

Thank you for your business,

Tasneem Alam

Quality Checklist

Order Number 15026 Customer Name PCP INC

Item No. 15026 Date Received 7/27/21

Materials of Construction:
☐ Carbon Steel ☑ Stainless Steel ☐ Other _____

Dimensional Checks:
Trough Straightness – To be within ¼-inch in both horizontal and vertical directions

Overall length 216 1/4" Height 30 1/2"

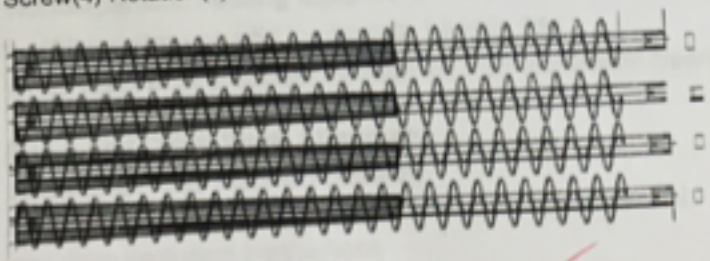
Width 13 1/8"

Screw to Trough Clearance ☐ Per Order or Drawing 1/2"

Overall Length of Conveyor ☐ Per Order or Drawing 216 1/4"

Inlet to Discharge Centerline Locations ☐ Per Order or Drawing 164"

Inlet Size ☐ Per Order or Drawing 10" 2



Discharge Size ☐ Per Order or Drawing Ø 10" ID

Inlet and Discharge Hole Patterns & Diameter ☐ Per Order or Drawing _____

Screw Pitch ☐ ½ ☐ 2/3 ☐ FULL ☑ VARIABLE _____

Visual Checks:

Screw Welding	☑ STD		☐ CW1	☐ CW2
Screw(1) Rotation(s)	☐ R/H	☐ L/H	☐ CW	☑ CCW
Screw(2) Rotation(s)	☐ R/H	☐ L/H	☐ CW	☐ CCW
Screw(3) Rotation(s)	☐ R/H	☐ L/H	☐ CW	☐ CCW
Screw(4) Rotation(s)	☐ R/H	☐ L/H	☐ CW	☐ CCW

Bare Pipe of Screw Located Over Discharge ☑ YES ☐ NO

Variable Pitch Located at Inlet End ☑ YES ☐ NO

Inlet and Discharge Welding ☐ CONTINUOUS INSIDE ☐ SKIP WELDED INSIDE continuous outside

Inlet and Discharge Flange Straightness

Drive Location ☑ INLET END ☐ DISCHARGE END

Drive Position ☑ 12:00 ☐ 3:00 ☐ 6:00 ☐ 9:00

Motor Size and Type HP 3 ☑ TEFC ☐ PREMIUM EFFICIENT

☐ EXPLOSION PROOF ☐ OTHER _____

Fit and Measure Checks:

Accessory Components ☐ SPEED SWITCHES ☐ LIMIT SWITCHES
☐ SAFETY PULL SWITCHES ☐ OTHER _____

Inspection Hold Points:

Assembler and Leadman to check the following prior to Run Test:

Type of Assembly Bolts Required - Stainless steel ✓ Zinc plated____

All assembly bolts in place and tightened to the proper torque value ☑ YES ☐ NO

Bolts marked with a paint marker on both the nut and the threaded end of the bolt to assure that all bolts have been tightening properly ☑ YES ☐ NO

Hold-downs properly located and adjusted ☐ YES ☑ NO

Coupling shafts in place and bolts tightened to proper value ☐ YES ☑ NO

Hangers and hanger bearings in location and properly secured ☐ YES ☑ NO

Shaft Seals are located in proper location and securely fastened ☑ YES ☐ NO

Pillow Block Bearings:

Expansion bearing must be located at the non-drive end. Internal locking ring must be removed to allow for expansion.
Non-expansion or fixed bearing must be located at the drive end. Internal locking ring must be in place to prevent expansion.

Bearings assembled per manufacturers instructions ☐ YES ☑ NO
Expansion bearing located on non-drive end ☐ YES ☑ NO
Non-expansion bearing located on drive end ☐ YES ☑ NO
Non-expansion bearing fastened to drive shaft by tightening locking collar ☐ YES ☑ NO
Locking collar secured in place by keeper ring ☐ YES ☑ NO
Snap rings in appropriate location on non-expansion bearing ☐ YES ☑ NO

Drive and Drive Shaft Alignment:

Drive shaft keys installed correctly ☑ YES ☐ NO
Drive couplings installed with proper gap and alignment per manufacturers instructions ☑ YES ☐ NO
Drive coupling setscrew tightened to proper value ☑ YES ☐ NO
Guards in specified location and securely fastened ☑ YES ☐ NO

Assembler Signature _____ **Date** 7/27/21

Assembly Leadman Signature _____ **Date** 7/27/21

Quality Manager Signature: _____ **Date** 7/27/21

Run Testing:

Direction of Rotation ☐ CLOCKWISE ☑ COUNTER CLOCK WISE

Motor Current Draw 2.30 AMPS ☐ HAND TURNED

Drive Movement ☑ NO VISUAL MOVEMENT ☐ ACCEPTABLE ☐ UNACCEPTABLE

Carbon Steel Surface Finish:

☐ HAND TOOL CLEAN - SSPC-SP2 ☐ POWER TOOL CLEAN - SSPC-SP3

☑ COMMERCIAL BLAST - SSPC-SP6 ☐ NEAR WHITE BLAST - SSPC-SP10

Carbon Steel Painting:

Prime Coat ☐ WAM GRAY ENAMEL ☐ OTHER _____

Finish Coat ☐ WAM GRAY ENAMEL ☐ WAM HIGH TEMP SILVER

☐ OTHER _____

Surface Finish:

Internal Surfaces				
Screws -

Ensemble de surpresseur

Job :	**49730-1**		
Client :	**PCP**		
Type	**Vacuum**		
Débit / Pression	**227 SCFM**		
Frame	**3**		
Surpresseur	**4005 - 2 lobes**	**Si autre, spécifiez**	
Transmetteur de pression	**GS22301.300.000**	**Si autre, spécifiez**	
Puissance moteur	**15 HP, frame 254T**		
Voltage moteur	**575VAC, 3 phases, 60Hz**		
Valve sureté	**KUNKLE VACCUM RELIEF #1362-615 SET AT 15 IN.HG**		
Pression ajustement valve sureté	**15" Hg**		
Cartouche de filtration	**CARTOUCHE FILT. PAPER BLOWER WIX42957 (CH) # 3028**		
Poulie moteur	**2B80**		
Hub moteur	**SK 1-5/8"**		
Poulie surpresseur	**2B42**		
Hub surpresseur	**SDS 7/8** SH 7/8"		
Courroies	**BX61**		
Vitesse surpresseur	**3182 RPM**		
Intensité sonore approximative	**91dB**		
Option brise vide	~~NON~~ → OUI		
Diamètre entré boîte à filtre	**4"OD**		
Diamètre sortie d'air base			
Autre option			

Contrôle qualité

Test d'ampérage à vide	**Phase 1 :**	07.90
	Phase 2 :	06.95
	Phase 3 :	07.95
Test d'ampérage à pression max.	**Phase 1 :**	15.50
	Phase 2 :	14.90
	Phase 3 :	15.60
Test d'ouverture de la vanne de sureté	**Ouvre à :**	15" Hg
Numéro de série surpresseur		401205
Numéro de série moteur		Z2105171397

SAFETY DATA SHEET

1. Identification

Product identifier	**HYDREX 9578**
Other means of identification	None.
Recommended use	Disinfectants for drinking water. PROFESSIONAL USE ONLY
Recommended restrictions	No other uses are advised.
Manufacturer/Importer/Supplier/Distributor information	
Supplier	Veolia Water Technologies Canada Inc.
Address	2000 Argentia Road, Plaza IV, Suite 430 Mississauga, ON L5N 1W1 Canada
Contact Person	Hydrex Product Specialist
Telephone	(905) 286-4846
Fax	(905) 286-0488
e-mail	vwtcanada-hydrex@veolia.com
24-Hour Emergency telephone	24 Hour Number: +1-760-476-3962 (Code:333239)
Supplier	Not available.

2. Hazard identification

Physical hazards	Oxidizing solids	Category 2
Health hazards	Acute toxicity, oral	Category 4
	Skin corrosion/irritation	Category 1B
	Serious eye damage/eye irritation	Category 1
Environmental hazards	Hazardous to the aquatic environment, acute hazard	Category 1

Label elements

Signal word	Danger
Hazard statement	May intensify fire; oxidizer. Harmful if swallowed. Causes severe skin burns and eye damage. Very toxic to aquatic life.
Precautionary statement	
Prevention	Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking. Keep away from clothing and other combustible materials. Wash thoroughly after handling. Do not eat, drink or smoke when using this product. Avoid release to the environment. Wear protective gloves/protective clothing/eye protection/face protection.
Response	IF SWALLOWED: Rinse mouth. Do NOT induce vomiting. IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water. IF INHALED: Remove person to fresh air and keep comfortable for breathing. IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a POISON CENTER/doctor. Wash contaminated clothing before reuse. In case of fire: Use appropriate media to extinguish. Collect spillage.
Storage	Store locked up.
Disposal	Dispose of contents/container in accordance with local/regional/national/international regulations.
Other hazards	None known.
Supplemental information	None.

3. Composition/information on ingredients

Mixtures

Chemical name	Common name and synonyms	CAS number	%
Calcium hypochlorite	CALCIUM HYPOCHLORITE MIXTURE, DRY HYPOCHLOROUS ACID, CALCIUM SALT (AS TOTAL AVAILABLE CHLORINE) HTH Lime chloride	7778-54-3	60 - 80
Hydrated Lime	Hydrated lime LIME WATER MILK OF LIME SLAKED LIME	1305-62-0	5 -15
Non-hazardous ingredients			5 - 10

All concentrations are in percent by weight unless ingredient is a gas. Gas concentrations are in percent by volume.

4. First-aid measures

Inhalation Move to fresh air. Call a physician if symptoms develop or persist.

Skin contact If on clothing: Rinse immediately contaminated clothing and skin with plenty of water before removing clothes. Rinse skin with water/shower. Call a physician or poison control center immediately. Chemical burns must be treated by a physician. Wash contaminated clothing before reuse.

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Call a physician or poison control center immediately.

Ingestion Call a physician or poison control center immediately. Rinse mouth. Do not induce vomiting. If vomiting occurs, keep head low so that stomach content doesn't get into the lungs.

Most important symptoms/effects, acute and delayed Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result.

Indication of immediate medical attention and special treatment needed Provide general supportive measures and treat symptomatically. Chemical burns: Flush with water immediately. While flushing, remove clothes which do not adhere to affected area. Call an ambulance. Continue flushing during transport to hospital. Keep victim warm. Keep victim under observation. Symptoms may be delayed.

General information Take off all contaminated clothing immediately. Contact with combustible material may cause fire. Ensure that medical personnel are aware of the material(s) involved, and take precautions to protect themselves. Show this safety data sheet to the doctor in attendance. Wash contaminated clothing before reuse.

5. Fire-fighting measures

Suitable extinguishing media Water fog. Foam. Dry chemical powder. Carbon dioxide (CO2).

Unsuitable extinguishing media An explosion can occur if either a carbon tetrachloride or a dry ammonium compound fire extinguisher is used to extinguish a fire involving calcium hypochlorite.

Specific hazards arising from the chemical Greatly increases the burning rate of combustible materials. Containers may explode when heated. During fire, gases hazardous to health may be formed.

Special protective equipment and precautions for firefighters Self-contained breathing apparatus and full protective clothing must be worn in case of fire.

Fire fighting equipment/instructions In case of fire and/or explosion do not breathe fumes. Move containers from fire area if you can do so without risk. Use water spray to cool unopened containers.

Specific methods Cool containers exposed to flames with water until well after the fire is out.

General fire hazards May intensify fire; oxidizer. Contact with combustible material may cause fire.

6. Accidental release measures

Personal precautions, protective equipment and emergency procedures Keep unnecessary personnel away. Keep people away from and upwind of spill/leak. Keep away from clothing and other combustible materials. Wear appropriate protective equipment and clothing during clean-up. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Ensure adequate ventilation. Local authorities should be advised if significant spillages cannot be contained. For personal protection, see section 8 of the SDS.

Methods and materials for containment and cleaning up

Eliminate all ignition sources (no smoking, flares, sparks, or flames in immediate area). Keep combustibles (wood, paper, oil, etc.) away from spilled material. Ventilate the contaminated area. Minimize dust generation and accumulation. Wear appropriate protective equipment and clothing during clean-up. Prevent product from entering drains.

Large Spills: Seek advice of a specialist. Following product recovery, flush area with water.

Small Spills: Transfer to a container that contains water. Carefully destroy the hypochlorite by adding hydrogen peroxide. Hydrogen peroxide reacts with calcium hypochlorite to form calcium chloride and oxygen gas. Do not close container. Other chemicals that can be used are sodium sulfite and sodium bisulfite. Once calcium hypochlorite is reduced, the remaining solution should be neutralized cautiously with dilute hydrochloric acid or sulfuric acid to near neutral pH level. Clean surface thoroughly to remove residual contamination.

Never return spills to original containers for re-use. For waste disposal, see section 13 of the SDS.

Environmental precautions

Avoid release to the environment. Inform appropriate managerial or supervisory personnel of all environmental releases. Prevent further leakage or spillage if safe to do so. Avoid discharge into drains, water courses or onto the ground.

7. Handling and storage

Precautions for safe handling

Minimize dust generation and accumulation. Routine housekeeping should be instituted to ensure that dusts do not accumulate on surfaces. Keep away from heat. Take any precaution to avoid mixing with combustibles. Keep away from clothing and other combustible materials. Do not get in eyes, on skin, or on clothing. Do not taste or swallow. When using, do not eat, drink or smoke. Provide adequate ventilation. Wear appropriate personal protective equipment. Wash hands thoroughly after handling. Avoid release to the environment. Observe good industrial hygiene practices.

Conditions for safe storage, including any incompatibilities

Store locked up. Keep away from heat. Store in a cool, dry place out of direct sunlight. Store in tightly closed container. Store in a well-ventilated place. Do not store near combustible materials. Store away from incompatible materials (see Section 10 of the SDS). Store in cool, dry place. To maintain good product quality and a shelf life of 12 months, store between 5°C (41°F) and 30°C (86°F). Keep from contact with oxidizing materials, highly oxygenated or halogenated solvents, organic compounds containing reducible functional groups, or aqueous ammonia. Charcoal (activated or not). Urea. Organic sulfur compounds.

8. Exposure controls/personal protection

Occupational exposure limits

US. ACGIH Threshold Limit Values

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. Alberta OELs (Occupational Health & Safety Code, Schedule 1, Table 2)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. British Columbia OELs. (Occupational Exposure Limits for Chemical Substances, Occupational Health and Safety Regulation 296/97, as amended)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. Manitoba OELs (Reg. 217/2006, The Workplace Safety And Health Act)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. Ontario OELs. (Control of Exposure to Biological or Chemical Agents)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Canada. Quebec OELs. (Ministry of Labor - Regulation respecting occupational health and safety)

Components	Type	Value
HYDRATED LIME (CAS 1305-62-0)	TWA	5 mg/m3

Biological limit values No biological exposure limits noted for the ingredient(s).

Appropriate engineering controls Good general ventilation should be used. Ventilation rates should be matched to conditions. If applicable, use process enclosures, local exhaust ventilation, or other engineering controls to maintain airborne levels below recommended exposure limits. If exposure limits have not been established, maintain airborne levels to an acceptable level. Eye wash facilities and emergency shower must be available when handling this product.

Individual protection measures, such as personal protective equipment

Eye/face protection Avoid contact with eyes. Wear chemical goggles. Provide an emergency eye wash fountain and quick drench shower in the immediate work area.

Skin protection

Hand protection Wear protective gloves. PVC or rubber gloves are recommended.

Other Wear appropriate chemical resistant clothing. Use of an impervious apron is recommended.

Respiratory protection In case of insufficient ventilation, wear suitable respiratory equipment. NIOSH RECOMMENDATIONS FOR CHLORINE CONCENTRATIONS IN AIR: Up to 5 ppm: (APF = 10) Chemical cartridge respirator; SAR. Up to 10 ppm: (APF = 25) SAR operated in a continuous-flow mode; Powered, air-purifying respirator with cartridge(s).

Thermal hazards Not applicable.

General hygiene considerations Keep from contact with clothing and other combustible materials. Remove and wash contaminated clothing promptly. Keep away from food and drink. Always observe good personal hygiene measures, such as washing after handling the material and before eating, drinking, and/or smoking. Routinely wash work clothing and protective equipment to remove contaminants.

9. Physical and chemical properties

Appearance

Physical state Solid.

Form Powder. or Granular.

Color White. or Light grey.

Odor Slight Chlorine.

Odor threshold Not available.

pH Not available.

Melting point/freezing point Not available.

Initial boiling point and boiling range Not available.

Flash point Not available.

Evaporation rate Not available.

Flammability (solid, gas) Not available.

Upper/lower flammability or explosive limits

Flammability limit - lower (%) Not available.

Flammability limit - upper (%) Not available.

Explosive limit - lower (%) Not available.

Explosive limit - upper (%) Not available.

Vapor pressure Not available.

Vapor density 6.9

Relative density Not available.

Solubility(ies)

Solubility (water) > 200 g/l

Partition coefficient (n-octanol/water)	-2.46
Auto-ignition temperature	Not available.
Decomposition temperature	212 °F (100 °C)
Viscosity	Not available.
Other information	
Explosive properties	Not explosive.
Oxidizing properties	May intensify fire; oxidizer.
Specific gravity	2.35
pH of 1% Solution	12 - 12.5

10. Stability and reactivity

Reactivity	Greatly increases the burning rate of combustible materials.
Chemical stability	Material is stable under normal conditions.
Possibility of hazardous reactions	Hazardous polymerization does not occur.
Conditions to avoid	Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. Avoid temperatures exceeding the decomposition temperature. Contact with incompatible materials.
Incompatible materials	Water, moisture. Acids. Oxidizing agents. Combustible material. Reducing agents. Maleic anhydride. Nitroethane. Nitromethane. Nitroparaffins. Nitropropane. Phosphorus. Cyanides. Ethanol. Metals. Sulfur compounds.
Hazardous decomposition products	Hydrogen chloride. Oxygen. Chlorine compounds.

11. Toxicological information

Information on likely routes of exposure

Inhalation	May cause irritation to the respiratory system.
Skin contact	Causes severe skin burns.
Eye contact	Causes serious eye damage.
Ingestion	Causes digestive tract burns. Harmful if swallowed.
Symptoms related to the physical, chemical and toxicological characteristics	Burning pain and severe corrosive skin damage. Causes serious eye damage. Symptoms may include stinging, tearing, redness, swelling, and blurred vision. Permanent eye damage including blindness could result.

Information on toxicological effects

Acute toxicity Harmful if swallowed.

Components	Species	Test Results
Calcium hypochlorite (CAS 7778-54-3)		
Acute		
Dermal		
Solid		
LD50	Rat	2200 mg/kg
Inhalation		
Dust		
LC50	Rat	480 mg/m3
Oral		
LD50	Rat	850 mg/kg
Hydrated Lime (CAS 1305-62-0)		
Acute		
Oral		
LD50	Rat	7300 mg/kg

Skin corrosion/irritation	Causes severe skin burns and eye damage.
Serious eye damage/eye irritation	Causes serious eye damage.

Respiratory or skin sensitization

Canada - Alberta OELs: Irritant

Hydrated Lime (CAS 1305-62-0)	Irritant

Respiratory sensitization Not a respiratory sensitizer.

Skin sensitization This product is not expected to cause skin sensitization.

Germ cell mutagenicity No data available to indicate product or any components present at greater than 0.1% are mutagenic or genotoxic.

Carcinogenicity

IARC Monographs. Overall Evaluation of Carcinogenicity

Calcium hypochlorite (CAS 7778-54-3)	3 Not classifiable as to carcinogenicity to humans.

Reproductive toxicity This product is not expected to cause reproductive or developmental effects.

Specific target organ toxicity - single exposure May cause respiratory irritation.

Specific target organ toxicity - repeated exposure Not classified.

Aspiration hazard Not an aspiration hazard.

12. Ecological information

Ecotoxicity Very toxic to aquatic life.

Product		Species	Test Results
HYDREX 9578			
Aquatic			
Crustacea	EC50	Daphnia	1.16 mg/l, 48 hours estimated
Fish	LC50	Fish	0.26 mg/l, 96 hours estimated
Components		**Species**	**Test Results**
Calcium hypochlorite (CAS 7778-54-3)			
Aquatic			
Crustacea	EC50	Rotifer (Philodina acuticornis)	0.07 mg/l, 48 hours
Fish	LC50	Atlantic silverside (Menidia menidia)	0.04 mg/l, 96 hours
Hydrated Lime (CAS 1305-62-0)			
Acute			
Other	EC50	Pseudokirchnerella subcapitata	184.57 mg/l, 72 hours
	LD50	Bird	111 mg/kg
Aquatic			
Acute			
Crustacea	LC50	Crustacea	50 - 500 mg/l, 96 hours
Fish	LC50	Threespine stickleback (Gasterosteus aculeatus)	262 - 785 mg/l, 96 hours
		Western mosquitofish (Gambusia affinis)	220 mg/l, 48 hours
		Zambezi barbel (Clarias gariepinus)	33.88 mg/l, 96 hours

Persistence and degradability No data is available on the degradability of any ingredients in the mixture.

Bioaccumulative potential No data available.

Partition coefficient n-octanol / water (log Kow)

HYDREX 9578	-2.46

Mobility in soil No data available.

Other adverse effects No other adverse environmental effects (e.g. ozone depletion, photochemical ozone creation potential, endocrine disruption, global warming potential) are expected from this component.

13. Disposal considerations

Disposal instructions	Collect and reclaim or dispose in sealed containers at licensed waste disposal site. Do not allow this material to drain into sewers/water supplies. Do not contaminate ponds, waterways or ditches with chemical or used container. Dispose of contents/container in accordance with local/regional/national/international regulations.
Local disposal regulations	Dispose in accordance with all applicable regulations.
Hazardous waste code	The waste code should be assigned in discussion between the user, the producer and the waste disposal company.
Waste from residues / unused products	Dispose of in accordance with local regulations. Empty containers or liners may retain some product residues. This material and its container must be disposed of in a safe manner (see: Disposal instructions).
Contaminated packaging	Since emptied containers may retain product residue, follow label warnings even after container is emptied. Empty containers should be taken to an approved waste handling site for recycling or disposal.

14. Transport information

TDG

UN number	UN2880
UN proper shipping name	CALCIUM HYPOCHLORITE, HYDRATED, with not less than 5.5% but not more than 16% water
Transport hazard class(es)	
Class	5.1
Subsidiary risk	-
Packing group	II
Environmental hazards	Not available.
Special precautions for user	Read safety instructions, SDS and emergency procedures before handling.

IATA

UN number	UN2880
UN proper shipping name	Calcium hypochlorite, hydrated with >= 5.5% but <= 16% water
Transport hazard class(es)	
Class	5.1
Subsidiary risk	-
Packing group	II
Environmental hazards	No.
ERG Code	5L
Special precautions for user	Read safety instructions, SDS and emergency procedures before handling.
Other information	
Passenger and cargo aircraft	Allowed with restrictions.
Cargo aircraft only	Allowed with restrictions.

IMDG

UN number	UN2880
UN proper shipping name	CALCIUM HYPOCHLORITE, HYDRATED or CALCIUM HYPOCHLORITE, HYDRATED MIXTURE with not less than 5.5% but not more than 16% water
Transport hazard class(es)	
Class	5.1
Subsidiary risk	-
Packing group	II
Environmental hazards	
Marine pollutant	No.
EmS	F-H, S-Q
Special precautions for user	Read safety instructions, SDS and emergency procedures before handling.

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code Not applicable.

IATA; IMDG; TDG

15. Regulatory information

Canadian regulations This product has been classified in accordance with the hazard criteria of the HPR and the SDS contains all the information required by the HPR.

Controlled Drugs and Substances Act

Not regulated.

Export Control List (CEPA 1999, Schedule 3)

Not listed.

Greenhouse Gases

Not listed.

Precursor Control Regulations

Not regulated.

International regulations

Stockholm Convention

Not applicable.

Rotterdam Convention

Not applicable.

Kyoto protocol

Not applicable.

Montreal Protocol

Not applicable.

Basel Convention

Not applicable.

International Inventories

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	Yes
Canada	Domestic Substances List (DSL)	Yes
Canada	Non-Domestic Substances List (NDSL)	No
China	Inventory of Existing Chemical Substances in China (IECSC)	Yes
Europe	European Inventory of Existing Commercial Chemical Substances (EINECS)	Yes
Europe	European List of Notified Chemical Substances (ELINCS)	No
Japan	Inventory of Existing and New Chemical Substances (ENCS)	Yes
Korea	Existing Chemicals List (ECL)	Yes
New Zealand	New Zealand Inventory	Yes
Philippines	Philippine Inventory of Chemicals and Chemical Substances (PICCS)	Yes
Taiwan	Taiwan Chemical Substance Inventory (TCSI)	No
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	Yes

*A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)
A "No" indicates that one or more components of the product are not listed or exempt from listing on the inventory administered by the governing country(s).

GERERAL INFORMATIONS

- The owner is responsible for making sure that the installed equipment is safe and does not compromise the health of the people working with or near the machine.

- The owner is responsible to make sure that the equipment does meet the environmental standards of the country where the equipment is installed.

- The owner has the responsibility to correctly train everybody working near or with the machine and to make sure that they are familiar with the potential risks.

- The owner is responsible for getting the proper authorizations from his insurer.

- The owner is responsible for the proper cleaning and maintenance of the equipment in order to get its best performance and reliability.

- Even though the pieces of equipment are installed by qualified Groupe Sinox employees, the owner is responsible for cleaning out the machine before its first start-up and to make sure there is no risk of food contamination.

- The owner is not authorized to alter or modify the equipment. The client might make minor changes or tuning with only the approbation of Groupe Sinox.

- Make sure every piece of equipment not energized and properly locked-out, tagged-out, tried-out before working on the system. Not doing so may result in severe injuries or death.

Warnings

This machine may have one or more moving or rotating parts, protected or not, and pressurized systems. Different energy sources like hydraulic or pneumatic systems, heavy moving parts and electrical circuits may be part of the machine.

The safe use of the machine, the supervision and proper training of the workers is the owner's responsibilities. The employer must guarantee that the machine is safe for his employees. Not using the machine as prescribed in this manual or using it in an unsafe way may result in serious injuries or death.

Groupe Sinox will do its best to deliver a safe equipment and give the assistance needed to make the system safe but cannot guarantee that every information contained in this manual will result in a complete elimination of all hazards.

OPERATION

Filtering system

During the operation, the air filled with the product's dust, enters in the dust collector. The heavier particles will fall down in the base of the collector while the lighter ones are going towards the filters. These particles will be separated from the air when the dust passes through the filters. The cleaned air will be evacuated from the dust collector and the particles will fall to the base when a filter's cleaning cycle occurs.

Filter's Cleaning System

The filter's cleaning system is basically a pressurized air pulse going from the inside of the filter to the outside. The pulse cleans the filters, pushes the particles back in the collector and prevent the filter from clogging. The air pulses are liberated one filter at a time from one to the other. This sequence is defined in the program. By doing this, one filter is cleaned while all the others are continuing to filter the air.

An electric signal from the PLC is sent to each pilot valve and let the pilot air out, opening the pulse valve. This then creates the desired pulse.

The pilot valves are installed directly on the pulse valves making one unique assembly.

BEFORE OPERATION

- Make sure every part is well placed and secured.
- Make sure the workers are well trained and informed of the potential hazards.
- Make sure every steps of the start-up are done.
- Make sure the machine is plugged and that the energy sources are as designed.
- Make sure that the compressed air is free of any contaminant and water.
- If components are installed outside, make sure to have the right air dryer.
- Make sure every mechanical part is lubricated as required.
- Make sure every protection device is correctly installed.
- Make sure the machine is clean.
- Do not stay in front or close to moving and pressurized parts as particles can be projected in the air.
- Make sure every rotating part turns the correct direction.
- **WARNING:** Some parts can break if the rotation occurs in the wrong direction.
- Trigger manually every sensor to make they are functioning properly.
- If it is possible, put all adjustment speed at their slowest set point.
- Introduce products gradually in the system.
- Make sure the system meets all requirements.
- Make sure you are familiar with every aspect of the control operation before introducing new equipment in your system.

CLEANING AND MAINTENANCE

We recommend checking and cleaning the equipment periodically to assure the best efficiency.

Pneumatic conveying systems must be stopped when opening access traps and doors. Not doing so may result in a production shutdown, a higher risk of component breakage or injuries.

IMPORTANT: Make sure that all energy sources are shut down and that locking procedures are respected before doing any maintenance on the equipment.

Refer to the manufacturer's standard equipment manuals included in this document for any details about operations and maintenance on these items.

We recommend following this procedure before proceeding to maintenance jobs:

- Unplug every electric source
- Unplug the control wire
- Close and unplug the compressed air source
- Purge every air tank
- Proceed to visual inspections frequently to detect possible product leaks on different parts of the system.
- Proceed to check the interior by opening of the top of the collector. Make sure there is no product accumulation. If it is the case, check every component of the system to make sure they work properly.
- Make sure the rotary valve is working properly.
- We recommend checking the filters monthly or as needed.
- Filter clogging may affect conveying efficiency.
- We recommend filter cleaning or replacements 2 times a year.

Emptying rejects tank

- Emptying the rejects tank can be done while the dust collector is in operation.
- If emptying the tank while operating, close the discharge valve before doing so.
- Release the clamp upon the tank, empty the tank and put it back in place.
- Make sure the seal and the clamps are correctly installed.
- Don’t use tools to tighten the clamps.

Filter's cleaning system adjustments and options

- Pulse time and in-between pulse delay are modifiable by programming only. No adjustments can be done by the operator.
- Standard settings are:

  Pulse time: 0.10 second

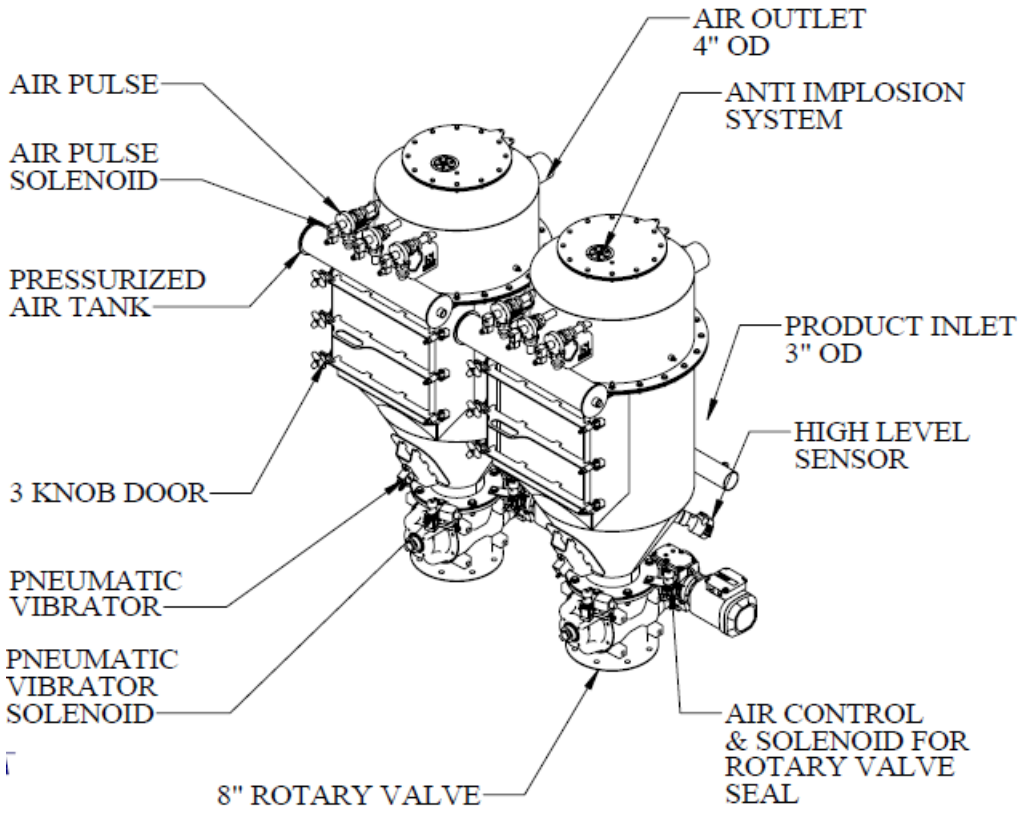
  In-between pulse delay: 15 to 20 seconds
- The filter's cleaning system is supposed to be working while the fan is turning.

Installing and replacing the filters

- Shut down and lock out the system and close compressed air alimentation.
- Make sure to keep in mind the risk related to your product.
- Wear safety equipment as needed. Wear a harness if there's a risk of falling into the dust collector.
- The dust collector might be considered as a confined space. Please follow the procedures related to confined spaces.
- Untighten the handles under the filters and remove the cartridges. Warning: the filters may be heavier than usual due to the product stuck in the cartridge.
- Clean the filters or dispose properly.
- Clean the contact surfaces on the filters and on the equipment.
- Install the filters and make sure they are correctly centred. Hand tighten the handles. Never use tools to tighten the filters.

TECHNICAL INFORMATION

Filter-receiver 49729 (each)



Sinox number:	**49729.000.000**
Conception :	Vacuum
Total Volume :	6.12 cubic feet
Usable Volume :	1.75 cubic feet
Product inlet diameter :	3'' OD
Air outlet diameter :	4'' OD
Unloading outlet diameter :	8'' OD
Filtering cartridge quantity:	3
Filtering cartridge model:	PNE-00009
Pulse valve quantity :	2
Pulse valve model :	49729.999.004
Unloading valve type:	Butterfly valve 8'' wafer type

Accessories:

Pneumatic vibrator : Oli Vibrator , # MEC-00001

High level sensor : Endress & Hausser # ELE-00002

TROUBLESHOOTING

Reduced product flow

- Check the dosing equipment: Rotating valves speed.
- Check the blower's belt tension.
- Check the blower's power supply
- Check pressure sensors adjustments and settings.
- Inspect your system for leaks in pipe sections or on the access doors.
- Check if rotary valve vents clear from products.
- Check the rotary valve conditions. Product stuck in-between the cells may impact efficiency.
- Look out for humidity in the product. If so, find out the main cause.
- Check blower filter. If it is dirty, find out the main cause.
- Check and clean receptors' filters.

Solenoid valve not responding

- You should hear a ‘’CLIC’’ when the valve port move.
- If no sound is produced when activating the solenoid valve, proceed to disassembly and clean moving parts.
- Check that the electrical signal goes to the solenoid valve and that it is the correct type (24VDC or 110VAC).
- Check the pneumatic pressure in the valve’s inlet. Some valve needs a minimum pressure to open. This information is contained in the manufacturer technical data sheets. Adjust pressure regulator as needed.

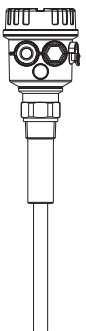
Pulse not working properly

- Check compressed air source.
- Look for leaks in the system.
- Make sure that the pulse time is not too long. This inhibits the pressure from building in the air tank.
- Look for worn or dirty parts on solenoid valves and clean/replace as needed.
- Make sure that the control panel is connected and working properly.

Filtering cartridge life shortened

- Make sure that the compressed air used to clean the filtering cartridge is dry and clean. Humidity can reduce efficiency and shorten the filter's life.
- Make sure there's no oil in the compressed air as well and that the air pressure is good. The pressure in the tank must be at least 80 PSI.
- Do not fill the collector up to the filters. This will reduce filtering efficiency and reduce filter life.
- Make sure every pulse valve is working properly
- Make sure to use the dust collector as designed for.

Improper filtration



- Check for any hole in the filtering cartridge.
- Look for leaks between the filter and the flange. To check this, inspect the clean side of the filters.
- Replace filter if required.
- Make sure the filters are completely dry.
- Make sure the filter installed are designed for your application.

STANDARD EQUIPMENT TECHNICAL DATA

HIGH LEVEL SENSOR

# Sinox:	ELE-00002
Manufacturer :	Endress & Hauser
Model :	FTM20-CN46A
Connection :	1 1/2 NPT
Voltage :	120VAC/24VDC
Quantity per receiver:	1x

de - Sicherheitshinweise

Der Soliphant T FTM20, FTM21 ist ein Füllstandgrenzschalter für fein- bis grobkörnige Schüttgüter. Bei unsachgemäßem Einsatz können Gefahren von ihm ausgehen.

Das Gerät darf **nur von qualifiziertem und autorisiertem Fachpersonal** unter strenger Beachtung dieser Betriebsanleitung, der einschlägigen Normen, der gesetzlichen Vorschriften und der Zertifikate (je nach Anwendung) eingebaut, angeschlossen, in Betrieb genommen und gewartet werden.

In der Gebäudeinstallation ist ein Netzschalter für das Gerät leicht erreichbar in dessen Nähe zu installieren.

Er ist als Trennvorrichtung für das Gerät zu kennzeichnen.

Nur isoliertes Werkzeug verwenden!
Nur Originalteile verwenden!

en - Notes on Safety

The Soliphant T FTM20, FTM21 is a point level switch for fine to coarse-grained bulk solids.

If used incorrectly it is possible that application-related dangers may arise.

The level limit switch may be installed, connected, commissioned, operated and maintained **by qualified and authorised personnel only**, under strict observance of these operating instructions, any relevant standards, legal requirements, and, where appropriate, the certificate.

Install an easily accessible power switch in the proximity of the device.

Mark the power switch as a disconnector for the device.

Use only insulated tools!
Use only original parts!

fr - Conseils de sécurité

Le Soliphant T FTM20, FTM21 est un détecteur de niveau pour produits solides en vrac de faible à grosse granulométrie.

Il peut être source de danger en cas d'utilisation non conforme aux prescriptions.

L'appareil ne doit être installé, raccordé, mis en service et entretenu **que par un personnel qualifié et autorisé**, qui tiendra compte des indications contenues dans la présente mise en service, des normes en vigueur et des certificats disponibles (selon l'application).

Installer un commutateur réseau à proximité immédiate de l'appareil, en veillant à ce qu'il soit facilement accessible.

Marquer ce commutateur comme prise de coupure de l'appareil.

Utilisez uniquement des outils isolés!
Utilisez uniquement des pièces d'origine!

es - Notas sobre seguridad

El Soliphant T FTM20, FTM21 sólo se puede usar como detector de nivel límite con sólidos finos y sólidos granulados.
Su empleo inapropiado puede resultar peligroso.
El equipo deberá ser montado, conectado, instalado y mantenido **única y exclusivamente por personal cualificado y autorizado**, bajo rigurosa observación de las presentes instrucciones de servicio, de las normativas y legislaciones vigentes, así como de los certificados (dependiendo de la aplicación).
Instalar un interruptor de fácil acceso en las proximidades del equipo.
Identificar el interruptor como desconectador del equipo.

Utilice solamente herramientas aisladas!
Use sólo las piezas originales!

it - Note sulla sicurezza

Il sensore Soliphant T FTM20, FTM21 può essere usato solamente come interruttore di livello per materiali solidi di grandezza da medio fine a grezza.
Un'installazione non corretta può determinare pericolo.
Lo strumento può essere montato **solamente da personale qualificato ed autorizzato**.
La messa in esercizio e la manutenzione devono rispettare le indicazioni di collegamento, le norme e i certificati di seguito riportati.
Installare un interruttore per l'alimentazione in prossimità del dispositivo.
Marcare l'interuttore come disconnessione del dispositivo.

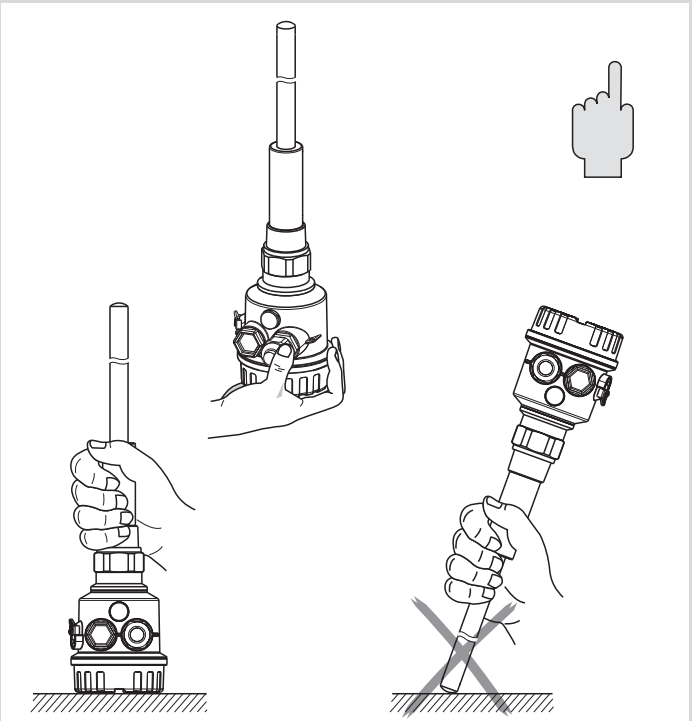
Utilizzare solo strumenti isolati!
Utilizzare solo parti originali!

nl - Veiligheidsinstructies

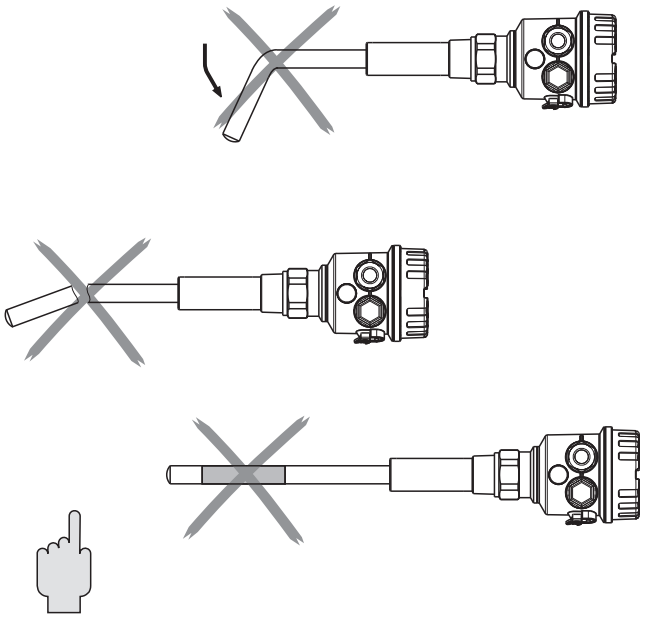
De Soliphant T FTM20, FTM21 mag alleen gebruikt worden als niveauschakelaar voor poeders tot grofkorrelig stortgoed.
Indien niet correct gebruikt kunnen gevaarlijke situaties ontstaan.
Het instrument **alleen door gekwalificeerd en geautoriseerd personeel** laten inbouwen, aansluiten, in bedrijf nemen en onderhouden.
Neem de instructies in deze Inbedrijfstellingsvoorschriften, de desbetreffende normen, de wettelijke voorschriften en eventuele certificaten in acht.
Installeer een makkelijk bereikbare voedingschakelaar in de nabijheid van het instrument.
Kenmerk de voedingschakelaar specifiek voor het instrument.

Gebruik uitsluitend geïsoleerd gereedschap!
Gebruik alleen originele onderdelen!

de - Behandlung
Am Gehäuse, Flansch oder Verlängerungsrohr anfassen.



en - Handling
Hold by housing, flange or extension tube.



fr - Manipulation
Tenir par le boîtier, la bride ou le tube prolongateur.

es - Modo de empleo
Coger por el cabezal, brida o tubo de extensión.

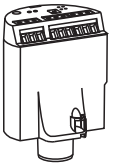
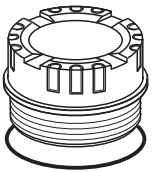
Fehlfunktion	Ursache	Maßnahme
Schaltet nicht	Versorgungsspannung fehlt	Versorgung prüfen
	Signalleitung defekt	Signalleitung prüfen
	Elektronikeinsatz defekt	Austauschen
	Dichte des Schüttgutes zu gering	Am Elektronikeinsatz Dichte auf >200 g/l einstellen; siehe Seite 19
	Stab verkrustet	Stab säubern
	FEM24: Kontakte verschweißt (nach einem Kurzschluss)	FEM24 austauschen; Sicherung in den Kontaktstromkreis
Schaltet falsch	Minimum-/Maximum-Sicherheitsschaltung vertauscht	Am Elektronikeinsatz Sicherheitsschaltung richtig einstellen
Fehlschaltung, sporadisch	Extreme Funkstörung	Verbindungskabel abschirmen
	Extreme Vibrationen	Sensor mechanisch entkoppeln, Schwingstab um 90° drehen
	Wasser im Gehäuse	Entleeren; Deckel und Kabeldurchführungen festzuschrauben
	FEM22: Ausgang überlastet	Last, (Leitungs-) Kapazität verringern



Fault	Reason	Remedy
Does not switch	No power	Check power
	Faulty signal line	Check signal line
	Faulty electronic insert	Exchange
	Density of bulk solids too low	Set density to >200 g/l at electronic insert; see page 19
	Rod encrusted	Clean rod
	FEM24: Contacts welded together (after short-circuit)	Exchange FEM24; put fuse in contact circuit
Switches incorrectly	Min-/Max-fail-safe mode set wrongly	Set correct mode at electronic insert
Sporadic faulty switching	Extreme RFI	Use screened cable
	Extreme vibration	Decouple sensor mechanically, turn oscillating rod 90°
	Water in housing	Drain; Screw cover and cable bushings tight
	FEM22: Output overloaded	Reduce load, (cable) capacitance

Défaut	Cause	Mesure
Ne commute pas	Tension d'alimentation manquante	Vérifier la tension d'alimentation
	Câble de signal défectueux	Vérifier le câble de signal
	Electronique défectueuse	Remplacer
	Densité du produit trop faible	Régler la densité sur >200 g/l sur l'électronique; voir page 19
	Lames vibrantes encrassées	Nettoyer les lames vibrantes
	FEM24: contacts soudés (après un court-circuit)	Remplacer FEM24; fusible dans le circuit courant
Mauvaise commutation	Sécurité min/max inversée	Régler correctement le circuit de sécurité sur l'électronique
Mauvaise commutation, sporadique	Parasites puissants	Blinder le câble de liaison
	Vibrations importantes	Découpler le capteur mécaniquement, tourner la fourche de 90°
	Eau dans le boîtier	Vidanger; Visser fermement le couvercle et les entrées de câble
	FEM22: surcharge de la sortie	Réduire la charge et la capacité (de ligne)



Fallo	Causa	Solución
No conmuta	No hay alimentación	Comprobar alimentación
	Señal defectuosa	Comprobar cable de señal
	Electrónica defectuosa	Cambio
	Densidad del producto demasiado baja	Fijar densidad a >200 g/l en la electrónica; ver pág. 19
	Sonda con adherencias	Limpiar la varilla
	FEM24: Contactos soldados juntos (después del corto circuito)	Cambiar FEM24; poner fusible en el circuito de contacto
Conmuta incorrectamente	El modo de fallo mín. / máx. está mal ajustado	Ajustar el modo correcto en la electrónica
Fallos de conmutación esporádicos	RFI extremo	Utilizar cable apantallado
	Vibraciones extremas	Desacoplar el instrumento mecánicamente, girar las horquillas 90°
	Agua en el cabezal	Drenaje; Roscar la cubierta y el prensaestopas firmemente
	FEM22: Salida con sobretensión	Reducir carga, capacidad (cable)

Guasto	Motivo	Rimedio
Non commuta	Mancanza alimentazione	Controllare l'alimentazione
	Linea segnale guasta	Controllare segnale linea
	Inserto elettronico guasto	Sostituire
	Densità del materiale solido troppo bassa	Impostare la densità a >200 g/l sull'inserto elettronico; vds. pag. 19
	Asta incrostata	Pulire l'asta
	FEM24: contatti saldati insieme (dopo il corto circuito)	Sostituire FEM24; mettere il fusibile nel circuito di contatto
Commuta non correttamente	Modalità di sicurezza min-/max-impostata in modo errato	Impostare la modalità corretta nell'inserto elettronico
Commutazione sporadicamente difettosa	RFI forte	Usare cavo schermato
	Forte vibrazione	Il sensore meccanicamente disaccoppiare, ruotare l'asta di 90°
	Acqua nella custodia	Vuotare; Avvitare correttamente il coperchioe il passacavi
	FEM22: Uscita sovraccaricata	Ridurre il carico, capacità (cavo)

Fout	Oorzaak	Maatregel
Schakelt niet	Voeding ontbreekt	Voeding kontroleren
	Signaalleiding defect	Signaalleiding kontroleren
	Insert defect	Vervangen
	Dichtheid van het stortgoed te gering	Op elektronica-insert dichtheid op >200 g/l instellen; zie pag 19
	Trilstaaf te veel vervuild	Trilstaaf reinigen
	FEM24: Contacten verkleeft (na een kortsluiting)	FEM24 vervangen; zekering in circuit aanbrengen
Schakelt foutief	Minimum-/Maximum-fail-safe instelling verwisseld	FEM fail-safe keuze correct instellen
Sporadische foutschakeling	Extreme RFI invloed	Verbindingskabel afschermen
	Extreme vibraties	Sensor mechanisch ontkoppelen, trilstaaf 90° draaien
	Water in de behuizing	Drogen; Deksel en wartels vast aandraaien
	FEM22: uitgang overbelast	Schakelbelasting verminderen

2V Series

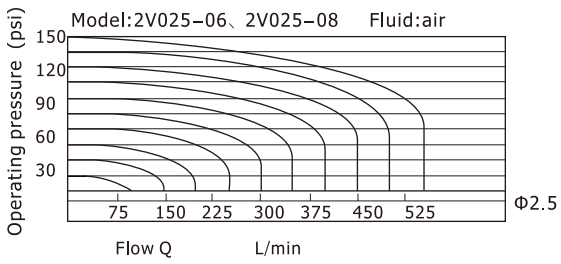
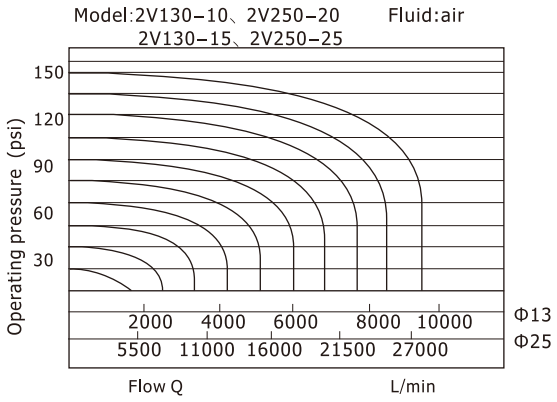
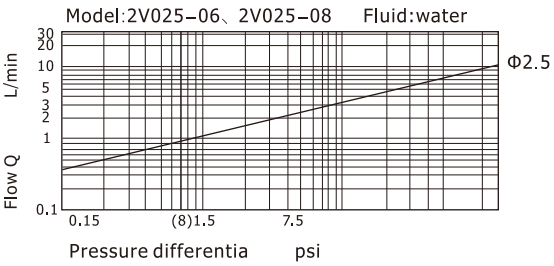
Product feature



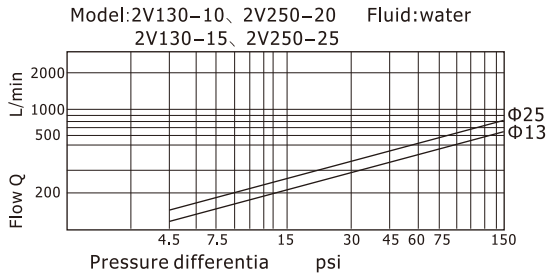
2V025 series



1. Direct acting and normally closed type 2/2 way solenoid valve. Its high sensitivity allows it to change direction quickly.
2. The structure is small and compact.
3. The valve body is made of brass which is heat resistance and the coil conforms to Class B classification. The seals are made of fluorine rubber (VITON) which is suitable for several types of working medium.



2V130 and 250 series



1.This 2/2 way diaphragm piloted solenoid valve has low energy consumption and large air flow .
2. The starting pressure is low and the operational differential pressureis < 0.05MPa.
3. The valve body is made of brass which is heat resistance and the coil conforms to Class B classification . The seals are made of NBR.

DRESSER NUT VALVES

CLEAN AIR SOLUTIONS | PRODUCT LEAFLET

GOYEN
DRESSER NUT VALVES

PRODUCT LEAFLET

DD Series

DESCRIPTION

High performance diaphragm valve with dresser nut ports. Available with integral pilot or as remotely piloted valve. Outlet at 90° to inlet.

SUITABLE FOR

Dust collector applications, in particular for reverse pulse jet filter cleaning and its variations, including bag filters, cartridge filters and envelope filters, ceramic filters and sintered metal fibre filters.

CONSTRUCTION

Body and Dresser Nuts: Aluminium (diecast)
Ferrule: 305 SS
Armature: 430FR SS
Seals: Nitrile or Viton
Spring: 304 SS
Screws: 302 or 304 SS
Dresser Nut Seals: Nitrile or Viton
Diaphragm Seat: PA-66 (standard), Viton coated mild steel or High Density PE

Refer to Q Series Solenoid product data sheet for solenoid construction details.

OPERATION

Recommended on-time range: 50–500 ms
Recommended time between pulses: 1 minute or greater

MAINTENANCE

Before conducting any maintenance activity on the system ensure that components are fully isolated from pressure and power supplies. Pressure and power should not be reapplied until the valve has been fully assembled. Diaphragm and pilot inspection should be conducted annually.

APPROVALS

- ATEX II 3 GD (RCA/RCAC only)
- CSA (C, US) [C22.2 No 139–10 and UL 429:2009] (CA & RCA)
- C-Tick (CA)
- EMC 2004/108/EC (CA)
- Low Voltage Directive 2006/95/EC (CA)

INSTALLATION

For your safety do not pressurise system until all valves and pipes are fully secured.

Do not attempt to remove a fitted valve while system is under pressure.

1. Prepare supply and blowtube pipes* to suit valve specification. Avoid installing valves underneath the tank.
2. Ensure tank and pipes are free from dirt, rust or other particulate.
3. Ensure supply air is clean and dry.
4. Mount valve to inlet pipes and blowtube to valve, tighten dresser nuts.
5. Tanks and pipes must be independently supported from valve.
6. Make electrical connections to solenoid or connect RCA pilot port to pilot valve (RCA valves only).
7. Apply moderate pressure to system and check for installation leaks.
8. Fully pressurise system.
9. Test fire and listen for proper actuation and crisp pulse noise.

Valve is not a structural component. Do not rely on valve to retain tanks or pipe.

* OD as shown below.

PRODUCT LEAFLET

RCAC20DD4 - REVERSE PULSE JET VALVES

DIMENSIONS IN MM (AND INCHES)

DESCRIPTION

High-performance diaphragm valve with dresser nut ports. Equipped with 'Shockwave' springless diaphragm. The 4 series valves are available as remote pilot valves and may be converted to an integral pilot using either the RCA3DM or RCA3PV screw-in pilots. Outlet is at 90° to inlet.

SUITABLE FOR

Dust collector applications, in particular for reverse pulse jet filter cleaning and its variations, including bag filters, cartridge filters and envelope filters, ceramic filters and sintered metal fibre filters.

CONSTRUCTION

Body and Dresser Nuts: Aluminium (diecast)

Screws: 304 Stainless steel

Dresser Nut Seals: Nitrile or Viton

Diaphragm: Proprietary highperformance engineering thermoplastic Elastomer or Viton

OPERATION

Recommended on-time range: 50 to 500 ms
Recommended time between pulses:
1 minute or greater

Please Note: We recommend using Schedule 40 pipe. Thickness OD is as shown below.

GENERAL NOTES
The vibrators are made in accordance with the EC machine regulation 89/392/E1EC. The standards EN 292, part 1 and part 2 have been particularly observed.
The vibrators produce non-directed vibrations. They are used to keep a constant flow in hoppers and silo's, to drive chutes and are also used in screens and vibrating tables. Generally for loosening, conveying and separating of bulk materials and for the reduction of friction.
The vibrators are ideal for use in the food industry, explosive atmosphere's, wet environment's and outside. The frequency and the centrifugal force are determined by the operating pressure.

NOTE
For extraordinary maintenance, if necessary, contact:

ALLGEMEINES
Die Vibratoren der Serie **S**, **OR** und **OT** entsprechen der EU-Maschinenrichtlinie 89/392/EWG und insbesondere den Normen EN 292, Teil 1 und 2.
Dieser Vibratortyp erzeugt ungerichtete Schwingungen.
Sie werden zur Behälterentleerung, als Antriebe für Rinnen, Siebe und Vibrationstische eingesetzt und im allgemeinen zum Lösen, Fördern, Verdichten und Trennen von Schüttgütern und zur Reduzierung von Reibung.
Unter Beachtung der Bedienungsvorschriften des Betreibers können diese Vibratoren auch für die Nahrungsmittelherstellung sowie in EX- und Naßbereichen eingesetzt werden.
Ein Einsatz der Vibratoren im Freien ist möglich.
Frequenz und die davon abhängige Zentrifugalkraft werden durch den Betriebsdruck bestimmt.

HINWEIS
Für etwaige außerordentliche Wartungsarbeiten wenden Sie sich bitte ausschließlich an:

REMARQUES GÉNÉRALES
Les vibrateurs **S**, **OT** et **OR** correspondent à la directive Machines 89/392/C.E.E. Il a été tenu compte des normes EN 292, l' et 1-2 parties. Ces vibrateurs génèrent des vibrations multidirectionnelles. Ils sont utilisés pour le vidage de silos, l'entraînement de goulottes l'activation de couloirs vibrants, de tamis et de tables vibrantes et, d'une façcon generale en général, pour ,décolmater, transporter, compacter, et séparer les matières en vrac et réduire les frictions. Si les prescriptions d'emploi élaborées par l'utilisateur sont respectées, ils peuvent être mis en oeuvre pour la fabrication de denrées alimentaires ainsi qu'en milieu explosif ou humide. Les vibrateurs peuvent aussi fonctionner à l'extérieur. La fréquence et la force centrifuge sont déterminées par la pression de service.

REMARQUE
Pour les entretiens extraordinaires s'adresser exclusivement à :

NOTE GENERALI
I vibratori sono costruiti in conformità alla norma 89/392/CE sui macchinari. Si è in particolare tenuto conto di quanto stabilito dalle norme EN 292, parte 1 e parte 2.
I vibratori producono vibrazioni multidirezionali. Sono impiegati per mantenere un flusso costante nelle tramogge e nei sili, per attivare dosatori, vagli e tavole vibranti e in generale per distaccare, trasportare, compattare e separare materiale sfuso e per ridurre l'attrito.
I vibratori sono perfettamente indicati per l'impiego nell'industria alimentare, in atmosfera esplosiva, in ambienti umidi e all'esterno. La frequenza delle vibrazioni e la forza centrifuga sono determinati dalla pressione d'esercizio.

NOTA
Per eventuali manutenzioni straordinarie rivlgersi esclusivamente a:

OLI SRL
Via Canalazzo, 35
41036 Medolla (MO)
ITALY

Tel.: + 39.0535 - 46400
Fax: + 39.0535 - 46350

General indications
- Ball vibrators "S" consist of an anodized aluminium body inside which a tempered steel ball rotates on an anti-wear tempered steel seating. Vibrator "S" generates vibrations of small amplitudes.

Examples of application
- Separation, transport, compacting of materials.
- Gushing of material from of silos, hoppers, screens, etc.
- Cleaning filters.
- On conveyor chains (for examples cans, bottles, etc.) they facilitate the flow and eliminate problems of blockage.

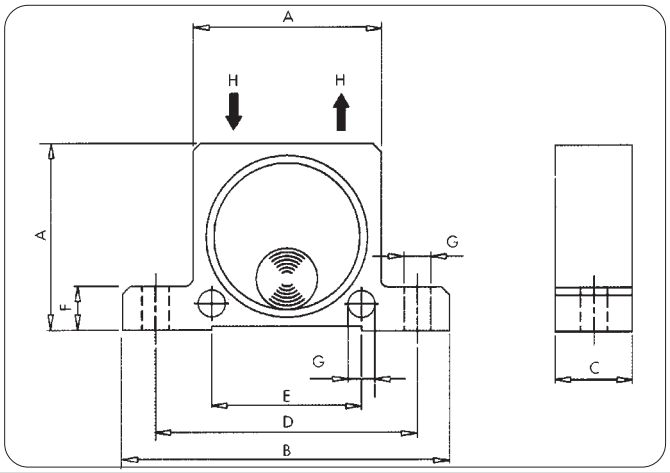
Maximum operating temperature:
- 20°C / +200°C

Allgemeine Angaben
- Die Kugelvibratoren Serie „S" bestehen aus einem Gehäuse aus eloxiertem Aluminium, innerhalb dessen sich eine Kugel aus gehärtetem Stahl in einem Sitz aus gehärtetem verschleißfestem Stahl dreht. Der Vibrator „S" erzeugt Schwingungen kleinern Ausmaßes.

Anwendungsbeispiele
- Materialien abscheiden, befördern, verdichten.
- Silos, Trichtern, Sieben, etc. freimachen.
- Filter reinigen.
- Auf Förderketten (z.B. Dosen, Flaschen, etc.) vereinfachen sie den Materialfluss und beseitigen Probleme mit etwaigen Blockierungen.

Max. Betriebstemperatur
-20°C / +200°C

Indications générales
- Les vibrateurs à bille de la série "S" sont constitués d'un corps en aluminium anodisé dans lequel tourne une bille en acier trempé sur un siège en acier trempé anti-usure. Le vibrateur "S" produit des vibrations de petite amplitude.



Exemples d'application
- Séparation, transport, compactage de produits
- Débourrage de silos, trémie, tamis, etc.
- Nettoyage des filtres.
- Sur les chaînes de transport (par ex. boîtes, bouteilles, etc.) ils facilitent l'écoulement et éliminent les problèmes de blocage.

Température maximum de service
-20°C / +200°C

Indicazioni generali
- I vibratori a sfera serie "S" sono costituiti da un corpo in alluminio anodizzato all'interno del quale ruota una sfera in acciaio temprato su una sede di acciaio temprato antiusura. Il vibratore "S" genera vibrazioni di piccola ampiezza di spostamento.

Esempi di applicazione
- Separazione, trasporto, compattazione materiali.
- Sgorgo di sili, tramogge, vagli, ecc.
- Pulizia filtri.
- Su catene di trasporto (per es. barattoli, bottiglie, ecc.) facilitano il deflusso ed eliminano i problemi di bloccaggio.

Temperatura massima d'esercizio
- 20°C / +200°C

General indications
- Vibration is generated by a strongly unbalanced turbine which rotates on two high-speed ball bearings.
- OT vibrators develop a high work moment and a high vibration frequency.
- Vibrations present a large amplitude even with low operating pressure.

Examples of application
- Food and Pharmacentical industries.
- Bins and hoppers.
- Goreens.

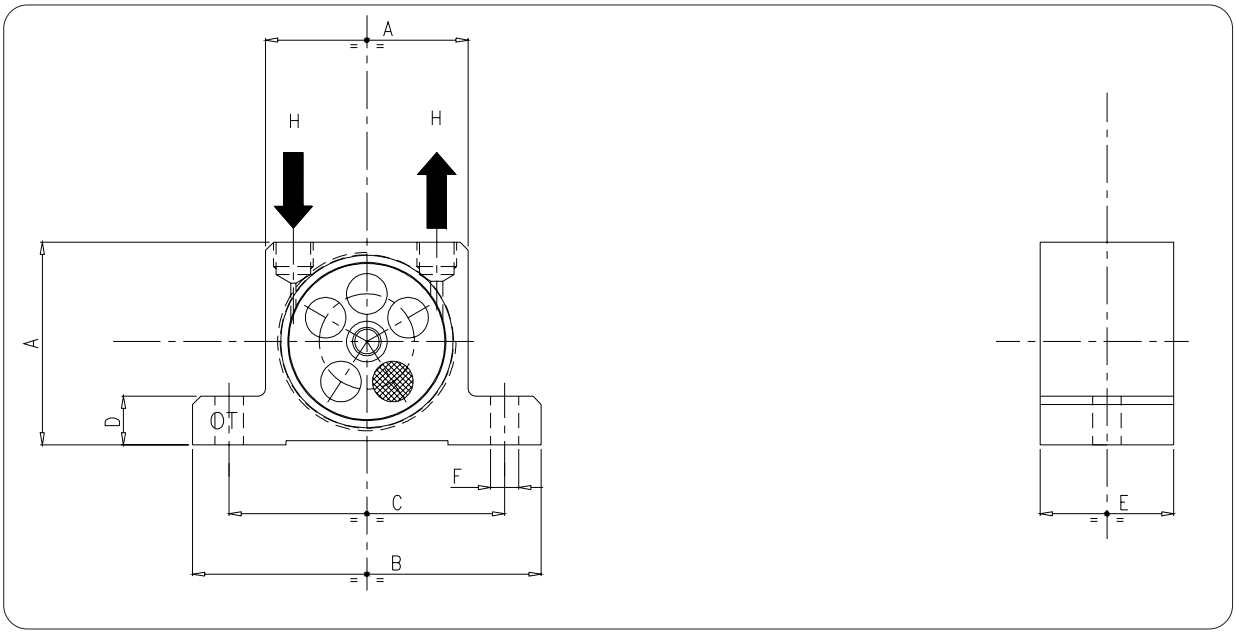
Maximum operating temperature:
- 20°C / +120°C

Allgemeines
- Die Vibration wird durch eine exzentrisch angeordnete Turbine erzeugt, die sich mit hoher Geschwindigkeit auf 2 Kugellagern dreht.
- Zwei überdimensionierte, für den Dauereinsatz bei hohen Drehzahlen geeignete Lager garantieren einen hohen Wirkungsgrad und ermöglichen den Einsatz ungeölter Druckluft.
- OT Vibratoren sind vollkommen wartungsfrei und zeichnen sich aus durch hohe Drehzahlen bei gleichzeitig geringem Luftverbrauch.

Anwendungsbeispiele
- Nahrungsmittel und Pharmaindustrie.
- Trichter und Behälterbau.
- Siebanlagen.

Max. Betriebstemperatur
-20°C / +120°C

Indications générales
- la vibration est engendrée par une turbine déséquilibrée montée sur 2 roulements à bille à haute vitesse.
- Les vibrateur à turbine OT engendrent un couple élevé et une haute fréquence de vibration.
- Les vibrations ont une amplitude de considérable même à basse pression d'exercice.



Exemple d'application
- Industries alimentaire et pharmaceutique
- Trémies et d'autres récipients.
- Tamis.

Température maximum de service
-20°C / +120°C

Indicazioni generali
- La vibrazione è generata da una turbina sbilanciata che gira su 2 cuscinetti a sfera ad alta velocità.
- I vibratori a turbina OT generano un elevato momento di lavoro ed una alta frequenza di vibrazione.
- Le vibrazioni hanno una notevole ampiezza anche a basse pressioni di esercizio.

Esempi di applicazione
- Industria alimentare e farmaceutica.
- Sili e tramogge.
- Vagli.

Temperatura massima d'esercizio
- 20°C / +120°C

N.B.: data abtained from a vibrating table supported by springs that perfectly simulates the major part of the applications possible. Frequency and centrifugla force increase when the vibrator is applied to more rigid structures.

For activation a 2/2 way electrovalve and filtered compressed air are required.

N.B.: daten wurden auf einem gefederten Rütteltisch ermittelt, aud dem die Mehrzahl der möglichen Anwendungen perfekt simuliert wurde. Frequenz und Zentrifugalkraft nehmen bei einer Befestigung des Vibrators auf weniger elastischen Unterlagen zu.

Zur Betätigung ist ein 2/2 Wege-Ventil und gefilter Druckluft erforderlich

N.B.: les données ont été relevées sur un banc vibrant à ressorts, de manière à simuler parfaitement la plupart des applications possibles. La frequence et la force centrifuge seront plus grandes où le vibrateur est appliqué sur une structure plus rigide.

Pour l'actionnement on a besoin d'une èlectrovanne à 2/2 voies et d'air filtré

N.B.: dati rilevati utilizzando un banco vibrante a molle, in modo da simulare perfettamente la maggior parte delle possibili applicazioni. Frequenza e forza centriga saranno maggiori applicando il vibratore su strutture più rigide.

Per l'azionamento occorrono una elettrovalvola a 2/2 vie ed aria filtrata.

General indications
- The roller vibrators series "R" are formed by an anodized aluminium body inside which a hardened steel roller wheels an a cast iron race.
- Vibration is generated by a rotor which describes an epicycloidal movement inside a steel race.
- The OR vibrators generate a very high frequency with low consumption as compared to the force given.

Examples of application
- Bins and hoppers
- Moulding dies
- Compacting
- Separation

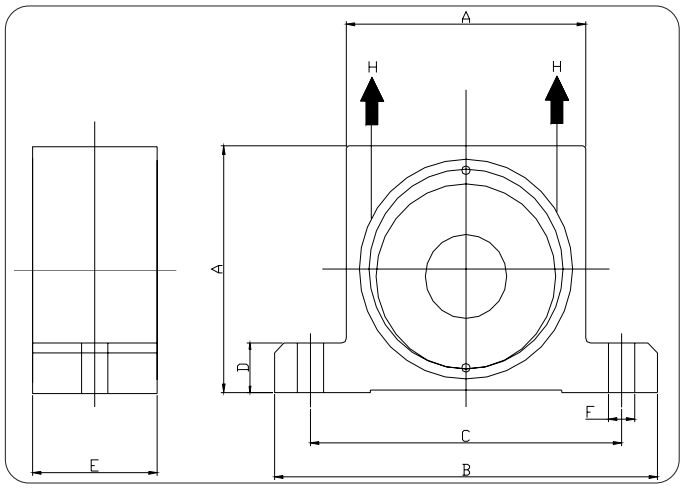
Maximum operating temperature
0°C / +200°C

Allgemeines
- Die Rollen „R" Rüttler bestehen aus einemm Körper aus eloxiertem Aluminium, innerhalb mit einer Rolle aus gehärtetem Stahl, die auf Gusseisen Laufbahn rotiert.
- Die Vibration wird durch eine Rolle erzeugt, die innerhalb eines speziell gehärteten Stahlringes eine epizyklische Bewegung beschreibt.
- OR Vibratoren entwickeln hohe Fliehkräfte und laufen in jeder Einbaulage sicher an.

Anwendungsbeispiele
- Trichter und Behälter
- Gussformen
- Verdichter
- Klassierer

Max. Betriebstemperatur
0°C / +200°C

Indications générales
- Les vibrateurs à rouleaux, série "R", comprennent un corps en aluminium anodisé avec un rouleau en acier trempé sur piste en fonte roulant à l'interieur.
- La vibration est engendrée par un rouleau qui accomplit un mouvement épicycloïdal à l'intérieur d'une piste en acier.
- Les vibrateurs à rouleau OR, engendrent une fréquence trés élevée avec une consommation d'air réduite par rapport à la force développée.



Exemple d'application
- Trémies et d'autres récipients
- Moules
- Compactage
- Séparation

Température maximum de service
0°C / +200°C

Indicazioni generali
- I vibratori a rulli serie "R" sono costituiti da un corpo in alluminio anodizzato all'interno del quale ruota un rullo in acciaio temprato su pista in ghisa.
- La vibrazione è generata da un rotore che compie un movimento epicicloidale all'interno di una pista di acciaio.
- I vibratori a rullo OR generano una frequenza molto elevata con un consumo ridotto, in relazione alla forza resa.

Esempi di applicazione
- Sili e tramogge
- Forme
- Compattazione
- Separazione

Temperatura massima d'esercizio
0°C / +200°C

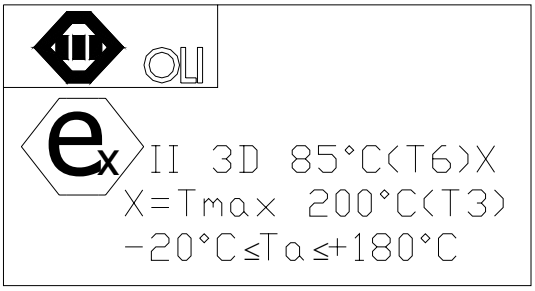
Rating plate for S or OR vibrator - *Schild für Vibrator S oder OR*
Plaque pour vibrateur S ou OR - *Targhetta per vibratore S e OR*

B) IDENTIFICATION OF COMPONENT
For correct identification of the component, refer to the code on the rating plate.

NOTE: The pneumatic vibrator must not be CE marked since it is a component.

B) IDENTIFIKATION DES BAUTEILS
Zur korrekten Identifikation des Bauteils Bezug auf den Code nehmen, der auf dem Schild steht.



Anm.: Der pneumatische Vibrator darf nicht mit der CE-Kennzeichnung versehen werden, da es sich um ein Bauteil handelt.

IDENTIFICATION DU COMPOSANT
Pour identifier correctement le composant, faire référence au code qui se trouve sur la plaque signalétique.

N.B. : En tant que composant le vibrateur pneumatique ne porte pas le marquage CE.

IDENTIFICAZIONE DELCOMPONENTE
Per una corretta identificazione del componente, bisogna fare riferimento al codice che si trova sulla targhetta.

N.B.: il vibratore pneumatico non deve essere marcato CE in quanto componente.

This manual, prepared by the manufacturer, forms an integral part of the pneumatic vibrator S/OR/OT supply. It must therefore accompany the filter right up to its final scrapping, and must be available ready at hand for quick consultation by the operators concerned and those in charge of operations at the work site. If the machine changes hands, this manual must be handed over to the new owner. Before carrying out any operation on or using the pneumatic vibrator, the personnel concerned must have read this manual carefully and completely. If the manual is lost, or in such a condition as to make it illegible, download a new copy from the OLI s.r.l internet site, and check the date of the last revision. This manual provides warnings and indications concerning the safety regulations for preventing accidents at the work site. However, the operators MUST scrupulously follow the safety regulations meant for them according to the existing legislation. Modifications to the safety regulations made over time must be integrated and implemented.

With the basic features of the machines as described, the Manufacturer reserves every right to make modifications to parts, details and accessories considered to be necessary for improving the product for design or commercial reasons, at any time without any obligation to update the publication imme-diately.
The latest version of the present catalogue is available under **www.olivibra.it**

Dieses Handbuch, das vom Hersteller erstellt wurde, ist integrierender Teil des Druckluft Vibrator S/OR/OT. Daher muss es unbedingt dem Filter folgen, bis er demontiert wird, und leicht zu finden sein, wenn der Bediener oder die Baustellenleitung in ihm nachschlagen wollen. Bei einem Besitzerwechsel des Gerätes muss das Handbuch dem neuen Besitzer ausgehändigt wer-den. Bevor das Betriebspersonal irgendwelche Arbeiten an oder mit Druckluft Vibrator ausführt, muss es dieses Handbuch unbedingt mit großer Aufmerksamkeit durchgelesen haben. Falls das Handbuch verloren geht oder unleserlich wird, kann man sich eine neue Kopie von den Internetseiten des Herstellers OLI s.r.l herunterladen, um dann das Datum der letzten Aktualisierung des Handbuchs zu prüfen. Dieses Handbuch liefert Hinweise und Angaben zu den Sicherheits- und Unfallverhütungsbestimmungen am Arbeitsplatz. Die Sicherheitsbestimmungen, die laut der geltenden Bestimmungen vom Bedienungspersonal zu beachten sind, müssen auf jeden Fall immer beachtet werden.
Etwaige Änderungen der Sicherheitsbestimmungen, die im Laufe der Zeit vorgenommen werden, sind immer zu erfassen und umzusetzen.

Der Hersteller behält sich das Recht vor, unter Beibehaltung der wesentlichen Eigenschaften der beschriebenen Geräte etwaige Änderungen an Organen, Teilen und Zubehör vorzunehmen, die im Zuge der Produktverbesserung erforderlich sind oder aus konstruktiven oder kommerziellen Erfordernissen heraus ausgeführt werden. Solche Änderungen können jederzeit vorgenommen werden und verpflichten den Hersteller nicht, diese Veröffentlichung gleichzeitig auf den neuesten Stand zu bringen.
Die letzte Version dieses Katalogs steht im Internet unter **www.olivibra.it**

Le présent Manuel, rédigé par le constructeur, fait partie intégrante de la fourniture du vibrateur pneumatique S/OR/OT; comme tel il doit absolument suivre le filtre jusqu'à son démantèlement et être à portée de la main pour une consultation rapide de la part des opérateurs concernés et par la direction des travaux du chantier. En cas de changement de propriété de la machine, le manuel doit être remis au nouveau propriétaire. Avant d'effectuer une quelconque opération avec ou sur le vibrateur pneumatique, le personnel concerné doit absolument et obligatoirement avoir lu très attentivement le présent manuel. Si le manuel est égaré ou abîmé de manière à ne plus être lisible, une copie doit être téléchargée à partir du site internet de OLI s.r.l en vérifiant la date de la dernière mise à jour. Le présent manuel fournit les recommandations et les indications concernant les consignes de sécurité pour la prévention contre les accidents du travail. Dans tous les cas les consignes de sécurité conformément aux normes en vigueur doivent être observées avec la plus grande attention par les différents opérateurs.
Les modifications éventuelles des consignes de sécurité devront être adoptées et mises en oeuvre.

Les caractéristiques essen tielles des machines décrites étant entendues, le constru cteur se réserve le droit d'ap porter à tout moment et sans engagement de mettre à jour en temps utile cette publication, des modifications aux organes, pièces et accessoires qu'il retiendra avantageuses pour l'amélioration du produit ou pour des exigences de fabrication ou de commer cialisation.
La version toujours mise à jour de ce catalogue est dis-ponible sul le site internet **www.olivibra.it**

Il presente manuale, redatto dal costruttore, è parte integrante del vibratore pneumatico S/OR/OT; come tale deve assolutamente seguire il filtro fino al suo smantellamento ed essere facilmente reperibile per una rapida consultazione da parte degli operatori interessati e della direzione lavori del cantiere. In caso di cambio di proprietà della macchina il manuale deve essere consegnato alla nuova proprietà. Prima di eseguire qualsiasi operazione con, o sul vibratore pneumatico ; il personale interessato deve assolutamente ed obbligatoriamente aver letto con la massima attenzione il presente manuale. Qualora il manuale venga smarrito, sgualcito e tale da non essere completamente leggibile, si deve scaricare una nuova copia dal sito internet della OLI s.r.l e verificarne la data dell'ultimo aggiornamento. Il presente manuale fornisce avvertenze ed indicazioni relative alle norme di sicurezza per la prevenzione degli infortuni sul lavoro. Vanno comunque, ed in ogni caso, osservate con il massimo scrupolo da parte dei vari operatori le norme di sicurezza poste a loro carico dalle vigenti normative.
Eventuali modifiche delle norme di sicurezza che nel tempo dovessero aver luogo dovranno essere recepite ed attuate.

Ferme restando le caratteristiche essenziali delle macchine descritte, il costruttore si riserva il diritto di apportare le eventuali modifiche di organi, dettagli ed accessori che riterrà convenienti per il miglioramento del prodotto, o per esigenze di carattere costruttivo o commerciale, in qualunque momento e senza impegnarsi ad aggiornare tempestivamente questa pubblicazione.
La versione sempre aggiornata del presente catalogo è reperibile sul sito internet **www.olivibra.it**

CERTIFICATE OF CONFORMITY

The equipment is accompanied by a declaration of conformity to existing regulations, but, since it is a component to be integrated into a system or plant, its safety is connected to compliance with all the directives applicable in final assembly of the machine.
Improper use of the pneumatic vibrator without following the instructions in this manual frees the Manufacturer of all responsibility for poor working of the pneumatic vibrator.
As this is a subject in the process of significant technical and normative evolution, the Manufacturer reserves the right to upgrade its products as fast as possible with all the technological know-how and official standards applicable (EN, UNI) which are available at the time.

KONFORMITÄTSERKLÄRUNG

Das Gerät wird von einer den geltenden Richtlinien entsprechenden Konformitäts-erklärung begleitet, aber als Bestandteil einer kompletten Anlage ist seine Betriebs-sicherheit mit der Beachtung aller Richtlinien verbunden, die nach dem Einbau in die Anlage oder Maschine anwendbar sind.
Jede bestimmungswidrige Benutzung des Druckluft Vibrator ohne Befolgung der Angaben dieses Handbuchs entbindet den Hersteller von jeglicher Haftung hinsichtlich der fehlerhaften Funktion des Druckluft Vibrator.
Da es sich um Produkte handelt, die einer schnellen technischen Entwicklung unterliegen, behält es sich der Hersteller vor, die eigenen Erzeugnisse so schnell wie möglich an alle technologischen Erkenntnisse und die anwendbaren offiziellen Normen (EN, UNI) anzupassen, die von Fall zu Fall erforderlich sind.

CERTIFICAT DE CONFORMITÉ

L'appareillage est accompagné d'une déclaration de conformité aux directives en vigueur, mais en tant que composant devant s'intégrer dans une installation complète, sa sécurité est étro itement lié au respect de toutes les directives applicables dans l'assemblage de la machine finale.
Toute utilisation impropre du vibrateur pneumatique sans suivre les indications du présent manuel dégage le constructeur de toutes responsabilités ayant trait à un mauvais fonctionnement du vibrateur pneumatique lui-même.
Etant donnée qu'il s'agit d'une matière en forte évolution technique et réglementaire, le constructeur se réserve d'adapter avec rapidité ses propres produits manufacturés à toutes les connaissances techno logiques et les normes of ficielles applicables (EN, UNI) au fur et à mesure de leur parution.

ATTESTATO DI CONFORMITA'

L'apparecchiatura è accompagnata da una dichiarazione di conformità alle direttive vigenti, ma, in quanto componente da integrarsi in un impianto completo, la sua sicurezza è legata al rispetto di tutte le direttive applicabili nell'assemblamento della macchina finale.
Ogni utilizzo improprio del vibratore pneumatico senza seguire le indicazioni del presente manuale solleverà il costruttore da ogni responsabilità inerenti ad un cattivo funzionamento del vibratore pneumatico stesso.
Trattandosi di materia in forte evoluzione tecnica e normativa, il costruttore si riserva di adeguare con la massima celerità i propri manufatti a tutte le conoscenze tecnologiche e le norme ufficiali applicabili (EN, UNI) che di volta in volta si rendessero disponibili.

OLI S.r.l.

Via Canalazzo, 35 – I - Medolla (MO)
ITALY

CERTIFICATE OF CONFORMITY
with the Directives of the European Union

The OLI percussion guns model
S/OR/OT....ATEX (Code: SX....)
are manufactured in conformity with the following directives:

- Directive "Machines" **98/37/CE** of 22nd June, 1998
- Directive "ATEX" **94/9/CE** of 23rd March, 1994

The conformity has been verified according to the conditions included in the following standard documents:

- **EN 1127-1**
- **EN 13463-1**
- **EN 292-1-2**
- **EN 1050**

Serie S, OR, OT ⟨Ex⟩ II 3 D 85°C (T6) X

Serie S, OR, X Tmax.=200°C (T3) Tamb. -20°C +180°C
Serie OT, X Tmax.=135°C (T4) Tamb. -20°C +120°C

This equipment must never be put into operation before the machine or plant into which it has been integrated has been declared in conformity with the Directives in force.

Medolla, 1st November, 2003

BESCHEINIGUNG DER KONFORMITÄT mit den Richtlinien der Europäischen Union

Die Familie der pneumatischen Vibratoren OLI
Modell **S/OR/OT....ATEX** (Code: SX....) wurde
konstruiert und wird gefertigt in Konformität mit den folgenden Direktiven:

- Direktive "Maschinen" **98/37/CE** vom 22. Juni 1998
- Direktive "ATEX" **94/9/CE** vom 23. März 1994

Die Konformität wurde gemäß den in den folgenden Normendokumenten enthaltenen Bedingungen verifiziert:

- **EN 1127-1**
- **EN 292-1-2**
- **EN 13463-1**
- **EN 1050**

Serie S, OR, OT ⟨Ex⟩II 3 D 85°C (T6) X

Serie S, OR, X Tmax.=200°C (T3) Tamb. -20°C +180°C
Serie OT, X Tmax.=135°C (T4) Tamb. -20°C +120°C

Dieses Bauteil darf niemals in Betrieb genommen werden, bevor die Maschine/Anlage, in welche es eingebaut wurde, mit den Bestimmungen der geltenden Richtlinien für konform erklärt wurde.

ATTESTATO DI CONFORMITA'
alle Direttive Della Comunità Europea

La famiglia dei vibratori pneumatici **OLI**
modello **S/OR/OT....ATEX** (Code: SX....)
è stata progettata e costruita in conformità alle direttive:

- Direttiva "Macchine" **98/37/CE** del 22 giugno 1998
- Direttiva "ATEX" **94/9/CE** del 23 marzo 1994

La conformità è stata verificata sulla base dei requisiti delle norme o dei documenti normativi riportati di seguito:

- **EN 1127-1**
- **EN 292-1-2**
- **EN 13463-1**
- **EN 1050**

Serie S, OR, OT ⟨Ex⟩II 3 D 85°C (T6) X

Serie S, OR, X Tmax.=200°C (T3) Tamb. -20°C +180°C
Serie OT, X Tmax.=135°C (T4) Tamb. -20°C +120°C

Il presente componente non deve essere messo in servizio prima che la macchina all'interno della quale sia stata incorporata non sia stata dichiarata conforme alle disposizioni delle Direttive vigenti.

Medolla, 1 Novembre 2003
OLI S.r.l.

Adriano Marchesini
(General Manager)

SAFETY
Whilst carrying out any work on the **S**, **OT** or **OR** Pneumatic Vibrators Make sure that the compressed air is shut off on any supply lines. All pipes must be tightly connected.
A pipe coming loose under pressure may cause injury. Vibrations can cause loosening of bolted connections and equipment. This may cause damage to persons and machines.
Take note of the enclosed drawings.

Alterations to the unit may change the characteristics of the vibrator or even damage the unit and will cause the rejection of any warranty claims.

SICHERHEIT
Sicherstellen, daß während des Einbaus oder bei Arbeiten am Vibrator und an den Zuleitungen, die Druckluft abgestellt ist. Die Schlauchleitungen müssen fest verbunden sein.
Ein unter Druck stehender, sich lösender Schlauch, kann Verletzungen verursachen. Des weiteren können Vibrationen ein Lösen der Schraubverbindungen und Geräte verursachen. Personen- und Materialschäden können die Folge sein.
Die beiliegenden Zeichnungen sind zu beachten.

Veränderungen am Gerät können dessen Eigenschaften verändern bzw. dasselbe beschädigen, was zum Erlöschen aller Garantieansprüche führen kann.

SÉCURITÉ
Assurez-vous, lors du montage ou de tous autres travaux effectués sur le vibrateur ou les conduites d'amenée, que l'alimentation en air comprimé est interrompue. Les flexibles doivent être solidement raccordés. Un flexible sous pression qui se détache peut provoquer des blessures. Les raccords vissés et les appareils peuvent se desserrer sous l'effet des vibrations, ce qui risque de provoquer des dommages corporels et matériels.
Tenez compte des croquis, ci-joint.

Toute modification du vibrateur est susceptible d'en altérer les propriétés ou de le détruire et rend caduque tous recours en garantie entraîne l'extinction des droits de garantie.

SICUREZZA
Durante l'installazione o in caso di interventi ai vibratori pneumatici **S**, **OR** o **OT**, assicurarsi di avere interrotto l'alimentazione d'aria compressa su tutte le linee. Tutti i tubi devono essere saldamente collegati.
Il distacco di un tubo sotto pressione può provocare lesioni. Le vibrazioni possono allentare i raccordi a vite e gli apparecchi, con rischio di danni a persone e macchinari.
Prendere visione dei disegni inclusi.

Eventuali modifiche apportate all'unità possono variare le caratteristiche del vibratore, se non addirittura danneggiare l'unità stessa, con conseguente annullamento di qualsiasi diritto di garanzia.

Air Compressor
The Air Compressor needs to be kept clean and filtered (filter <50pm). Compressed air or nitrogen of 2 to 6 bar (30 to 90 PSI) is required. **The vibrators are designed for lubrication-free operation. The life time of the S and OR vibrator will be extended with lubrication. Non-filtered air will damage the vibrators.**

Antriebsmittel
Saubere, gefilterte (Filter < 50µm) Druckluft oder Stickstoff (2 bis 6 bar). **Die Verwendung nicht gefilterter Luft führt zum Ausfall der Vibratoren. Alle Vibratoren können ölfrei betrieben werden, ein Nebelöler verlängert die Lebensdauer von S und OR.**

Fluide d'entraînement
Le fluide d'entraînement est l'air comprimé exempt d'impuretés et filtré (filtre < 50 µm), ou l'azote, sous une pression de 2 à 6 bars (30 à 90 PSI). **Les vibrateurs sont conçus pour fonctionner sans huile, un graisseur prolongera la durée de vie des S et OR.**
L'utilisation d'air non filtré entraîne la défaillance des vibrateurs.

Compressore pneumatico
Il compressore pneumatico va tenuto pulito e l'aria filtrata (filtro < 60 mm). Si richiede azoto o aria compressa alla pressione compresa tra 2 e 6 bar (da 30 a 90 PSI). **I vibratori sono progettati per l'uso esente da lubrificante. La lubrificazione prolunga la durata dei vibratori S e OR. L'impiego di aria non filtrata danneggia il vibratore.**

Maximum operating pressure

The maximum operating pressure must not exceed 6 bar (90 PSI).

Max. Betriebsdruck

Der max. Betriebsdruck darf 6 bar (90PSI) nicht überschreiten.

Pression maximale de service

La pression maximale de service ne doit pas dépasser 6 bars (90 PSI).

Pressione massima d'esercizio

La pressione massima d'esercizio non deve superare i 6 bar (90 PSI).

The **pneumatic vibrators** described in this Manual are designed and tested for use in potentially explosive areas classified as zone 22 cat. II 3 D according to directive 94/9/CE.
The powders handled must have explosiveness index St1 or St2 and this must be notified to OLI s.r.l. at the time of placing the order to allow correct selection of the component.

The user must make sure the plant in which the **pneumatic vibrator** is installed has been set in safety condition from the point of view of explosion risk before being started up, and that the "document on protection against explosions" has also been prepared as specified by Directive ATEX 99/92/CE. (This only applies to the European market).

Die **pneumatischen Vibratoren**, die in diesem Handbuch beschrieben werden, sind für den Einsatz in explosionsgefährdeter Bereichen ausgelegt und konstruiert worden, die als Zone 22 Kat. II 3 D gemäß der Richtlinie 94/9/EG klassifiziert worden sind. Die aufbereiteten Stäube müssen Staubexplosionsklasse St1 oder St2 haben und müssen der Firma OLI s.r.l. bei der Bestellung angegeben werden, um eine korrekte Auslegung des Bauteils zu ermöglichen.

Der Anwender muss sicherstellen, dass die Anlage, in welcher der **pneumatische Vibrator** installiert werden soll, hinsichtlich der Explosionsgefahr auf ausreichende Weise in einen sicheren Zustand gebracht worden ist, bevor sie in Betrieb genommen wird, und dass zudem das „Explosionsschutzdokument" verfasst worden ist, so wie es die ATEX-Richtlinie 99/92/EG vorsieht (Dies gilt nur für den europäischen Markt).

Les vibrateurs pneumatiques décrits dans ce manuel ont été conçus et testés pour être utilisé dans les environnement explosibles classés comme zone 22 cat. II 3 D d'après la directive 94/9/CE. Les poussières traitées doivent avoir des indices d'explosivité St1 ou St2 ; pour un choix correct du composant celles-ci doivent être indiquées à OLI s.r.l. au moment de la commande.

L'utilisateur doit contrôler, avant la mise en marche, que l'installation dans laquelle est monté le **vibrateur pneumatique** a été mise en sécurité en ce qui concerne le risque d'explosion. Il faut aussi que le "document sur la protection contre les explosions" ait été rédigé conformément à la Directive ATEX 99/92/CE (Ceci n'est valable que pour le marché européen).

I vibratori pneumatici descritti in questo manuale sono stati progettati e testati per un utilizzo in zone potenzialmente esplosive classificate come zona 22 cat. II 3 D secondo la direttiva 94/9/CE. Le polveri trattate dovranno avere indici di esplosività St1 o St2 e devono essere comunicate alla OLI s.r.l. al momento dell'ordine per una scelta corretta del componente.

L'utilizzatore dovrà assicurarsi che l'impianto all'interno del quale verrà installato il **vibratore pneumatico** sia stato adeguatamente messo in sicurezza da un punto di vista di rischio esplosione prima di essere avviato e che inoltre sia stato redatto il "documento sulla protezione contro le esplosioni" come previsto dalla Direttiva ATEX 99/92/CE. (Questo vale unicamente per il mercato europeo).

The caracteristic of the dusts must be communicated to OLI to allow correct sizing of the machine and safety devices.

Der behandelte Staub sollen bei der Bestellung OLI bekanz gegeben, damit das Filter und die Sicherheitsvorrichtungen korrekt ausgelegt werden können.

Les poudres traitées doivent être communiquées à la Sté OLI au moment de la commande pour dimensionner correctement la machine et les dispositifs de sécurité.

Le caratteristiche delle polveri devono essere comunicate a OLI per un corretto dimensionamento della macchina e dei dispositivi di sicurezza.

In accordance with the Directive ATEX 94/9/CE, the manufacturer defines the outside of the pneumatic vibrator as:

CAT. II 3 D

IMPORTANT: specify that the non ATEX versions must not be used in potentially explosive environments.

The **pneumatic vibrators** are designed and constructed in such a manner as to avoid unusual overheating during operation. To operate in safe conditions, **check to make sure the powders handled have a minimum ignition temperature higher than the temperature value indicated on the code plate**.

- The **pneumatic vibrators** must be installed with sufficient clearance around to allow assembly/disassembly operations, cleaning and maintenance.

Before carrying out any operation on the component, make sure it is in safe condition.

IMPORTANT: In this Manual "**setting the component in safety condition**" will include the following operations:

- **Make sure the component is disconnected from all electric supply sources.**
- **Make sure the component is disconnected from all compressed air supply sources.**
- **The area around the component must be suitably lighted (operators can be provided with electric lights suitable for zone 22 cat. II 3 D).**

For carrying out operations on the components (maintenance and cleaning), the operators must use suitable personal protection devices (PPD):

- **Antistatic safety footwear (certified)**
- Antistatic protective clothing (certified)
- Helmet
- Antistatic cut proof gloves
- **Protective masks**

It is also necessary to use all the safety devices specified in the safety sheet of the product handled.

NOTE: All the electrical equipment used for maintenance or cleaning operations on the outside of the component must be ATEX certified for zone 22 cat. II 3 D.

Im Sinne der ATEX-Richtlinie 94/9/EG definiert der Hersteller die Außenumgebung des pneumatischen Klopfers als:

KAT. II 3 D

WICHTIG: Die Versionen, die nicht ATEX sind, dürfen nicht in explosionsgefährdeten Bereichen arbeiten.

Die pneumatischen Vibratoren sind so entwickelt und konstruiert worden, dass es während ihres Betriebs nicht zu Überhitzungen kommt. Um unter sicheren Voraussetzungen arbeiten zu können, **ist sicherzustellen, dass die aufbereiteten Stäube eine Mindestzündtemperatur haben, die unterhalb des Temperaturwerts liegt, der auf dem Typenschild steht.**

- **Die pneumatischen Vibratoren** müssen so installiert werden, dass ringsum genügend Raum zur Verfügung steht, um die normalen Arbeiten für Ein- und Ausbau, Reinigung und Wartung vornehmen zu können.

Bevor man irgendeinen Eingriff an dem Bauteil vornimmt, ist sicherzustellen, dass es sich in einem sicheren Zustand befindet.

WICHTIG: Auf den weiteren Seiten dieses Handbuchs werden wir die Ausdrucksweise „**den Bauteil in einen sicheren Zustand versetzen"** benutzen, um folgende Vorgänge anzugeben:

- **Sicherstellen, dass der Bauteil von allen elektrischen Versorgungsquellen abgetrennt ist.**
- **Sicherstellen, dass der Bauteil von allen pneumatischen Versorgungsquellen abgetrennt ist.**
- **Dafür sorgen, dass der Bereich rings um den Bauteil korrekt ausgeleuchtet wird (indem die Arbeitnehmer eventuell mit elektrischen Lampen ausgestattet werden, die für die Zone 22 Kat. II 3 D geeignet sind).**

Für jeden Eingriff, der auf dem Bauteil vorzunehmen ist (Wartungen und Reinigungen), müssen die Arbeitnehmer mit angemessenen persönlichen Schutzausrüstungen (PSA) versehen sein:

- **antistatisches unfallsicheres Schuhwerk (zertifiziert)**
- **antistatische Schutzkleidung (zertifiziert)**
- **Schutzhelm**
- **antistatische Schnittschutzhandschuhe**
- **Schutzmasken**

Außerdem sind alle Schutzvorrichtungen zu verwenden, die von dem Sicherheitsdatenblatt des behandelten Produkts vorgesehen sind.

Anm.: Alle elektrische Ausrüstungen, die eventuell für die Wartungseingriffe und die Reinigung außerhalb des Bauteils benutzt werden, müssen für Zone 22 Kat. II 3 D nach ATEX zertifiziert sein.

Le constructeur, aux termes de la directive ATEX 94/9/CE, définit l'extérieur du vibrateur pneumatique comme:

CAT. II 3 D

IMPORTANT: Spécifier que les versions non ATEX ne doivent pas travailler dans des atmosphères explosibles.

Les vibrateurs pneumatiques ont été conçus et construits de manière à ne pas provoquer d'échauffements anormaux pendant le fonctionnement. Pour travailler en condition de sécurité **il faut vérifier que les poussières traitées on une température d'inflammation minimale supérieure à la valeur de température indiqué sur la plaque signalétique**.

- **Les vibrateurs pneumatiques** doivent être installés avec autour un espace suffisant pour effectuer les opérations ordinaires de montage/démontage, nettoyage et maintenance.

Avant d'effectuer toute intervention sur le composant vérifier que celui-ci a été mis en sécurité.

IMPORTANT: Dans le présent manuel nous indiquons par "**mettre en sécurité le composant"** les opérations suivantes:

- **Contrôler si le composant est débranché de toutes les alimentations électriques.**
- **Contrôler si le composant est débranché de toutes les alimentations pneumatiques.**
- **Eclairer correctement la zone qui entoure le composant (en dotant éventuellement les opérateurs de lampes électriques appropriées pour zone 22 cat. II 3 D).**

Pour toute opération à effectuer sur le composant (entretien et nettoyage), les opérateurs doivent être munis des équipements de protection individuelle (EPI):

- **Chaussures de protection antistatiques (certifiées)**
- **Vêtements de protection antistatiques (certifiés)**
- **Casque**
- **Gants anti-coupure antistatiques**
- **Masques de protection**

Il faut aussi utiliser tous les dispositifs de protection prévus par la fiche de sécurité du produit traité.

N.B.: Tous les appareillages électriques, utilisés pour les interventions de maintenance et de nettoyage réalisées à l'extérieur du composant doivent être certifiés ATEX pour zone 22 cat. II 3 D.

Il costruttore, ai sensi della direttiva ATEX 94/9/CE, definisce l'esterno del vibratore pneumatico come:

CAT. II 3 D

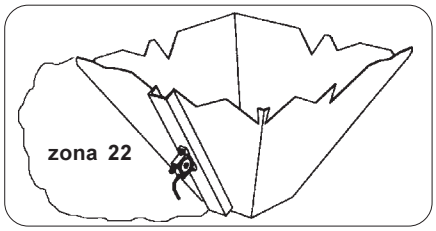
IMPORTANTE: Specificare che le versioni non ATEX non devono operare in atmosfere potenzialmente esplosive.

I vibratori pneumatici sono stati progettati e costruiti in modo tale da non provocare surriscaldamenti anomali durante il funzionamento. Per poter operare in condizioni di sicurezza **occorre verificare che le polveri trattate abbiano una minima temperatura di ignizione superiore al valore di temperatura indicato sulla targhetta.**

- **I vibratori pneumatici** dovranno essere installati con uno spazio circostante sufficiente per effettuare le normali operazioni di montaggio/smontaggio, pulitura e manutenzione.

Prima di effettuare un qualsiasi intervento sul componente assicurarsi che questa sia messa in sicurezza.

IMPORTANTE: In seguito nel presente manuale indicheremo con la dicitura **"mettere in sicurezza il componente"** le seguenti operazioni:



- **Accertarsi che il componente sia scollegata da tutte le alimentazioni elettriche.**
- **Accertarsi che il componente sia scollegata da tutte le alimentazioni pneumatiche.**
- **Provvedere a illuminare correttamente la zona circostante al componente (eventualmente dotando gli operatori di lampade elettriche idonee per zona 22 cat. II 3 D.**

Per qualsiasi operazione da effettuarsi sul componente (manutenzioni e pulizia), gli operatori dovranno essere muniti degli appositi dispositivi di protezione individuale (DPI):

- **Scarpe antinfortunistiche antistatiche (certificate)**
- **Indumenti protettivi antistatici (certificati)**
- **Casco**
- **Guanti antitaglio antistatici**
- **Mascherine protettive**

Inoltre occorre utilizzare tutti i dispositivi di protezione previsti dalla scheda di sicurezza del prodotto trattato.

N.B. Tutte le apparecchiature elettriche eventualmente utilizzate per interventi manutentivi o di pulizia eseguiti all'esterno componente devono essere certificate ATEX per zona 22 cat. II 3 D.

Noise level
Depending on the type of vibrator and air pressure the noise level is 75-85 dB(A) (with silencer). If the air pressure is lower, the noise level is also lower. We recommend in order to avoid unnecessary noise for the environment, the vibrators should not be operated without a silencer.

NOTE
- The employer must take the necessary measures in the work area to reduce to the minimum the risk deriving from daily exposure to noise.

Betriebsgeräusche
Je nach Typ (mit Schalldämpfer) und 6 bar Luftdruck bei 75 - 85 dB(A), bei geringerem Luftdruck weniger. Ein Betrieb ohne Schalldämpfer ist nicht empfehlenswert, um die Lärm-Umweltbelastung so gering wie möglich zu halten.

ANM.:
- Der Arbeitgeber muss im Betrieb alle technischen Maßnahmen durchführen, um Gefahren, die sich aus der täglichen Lärmexposition ergeben, auf ein Minimum zu reduzieren.

Niveau de bruit
En fonction du type de vibrateur (avec silencieux) et pour une pression de 6 bars,(90 PSI) le niveau de bruit est compris entre 75 et 85 dB(A). Il est plus faible quand la pression est moindre. Ne pas faire fonctionner le vibrateur sans silencieux pour ne pas provoquer des nuisances sonores inutiles.

REMARQUE:
- L'employeur doit mettre en oeuvre, dans le milieu de travail, les mesures techniques appropriées pour limiter au minimum les risques dérivants de l'exposition journalière au bruit.

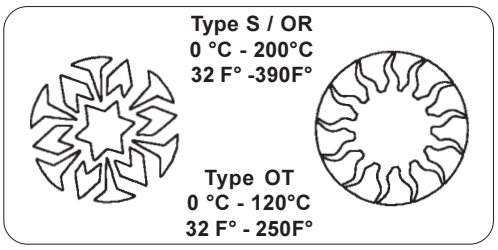
Rumorosità
A seconda del tipo di vibratore e della pressione dell'aria, il livello di rumorosità sarà pari a 75-85 dB(A) (con silenziatore). In caso di pressione dell'aria inferiore, anche la rumorosità risulterà ridotta. Al fine di evitare rumori inutili nell'ambiente, si raccomanda di azionare sempre il vibratore provvisto di silenziatore.

NOTA
- Il datore di lavoro dorà attuare, nell'ambiente di lavoro, le misure tecniche adeguate per ridurre al minimo i rischi derivanti dall'esposizione giornaliera al rumore.

Permissible operating conditions
Permissible temperature range:
S/OR -20°C to +200°C
OT -20°C to +120°C

S and **OR** require heat resistant hose nipples and silencers for temperatures above 120°C (272°F)
OT Vibrators may be operated inside liquids if the exhaust air is piped into the atmosphere.

Zulässige Betriebsbedingungen
Betriebstemperaturen
S / OR -20°C bis 200°C
OT -20°C bis 120°C.



S-und **OR**-Vibratoren Betriebstemperaturen über 120°C erfordern den Einsatz von Anschlußtüllen und Schalldämpfern in temperaturbeständiger Ausführung. Sofern vorhanden, den Nebelöler einstellen (2-5 Tropfen/h).
OT-Vibratoren
Der Betrieb in Flüssigkeiten erfordert die Abführung der Druckluft an die Atmosphäre.

Conditions de service admissibles
Températures admissibles:
S/OR -20° C à 200° C
OT -20° C à 120° C

Pendant le fonctionnement la plage de température admissible de -20°C à +120°C ne doit pas être dépassé. Des températures d'utilisation entre 120°C et 200°C nécessitent des raccords et des silencieux appropriés.
Pour l'utilisation des OT sous l'eau l'échappement doit se faire a l'air libre

Condizioni d'esercizio ammesse
Range di temperatura ammesso:
S/OR da -20°C a +200°C
OT da -20°C a +120°C

In caso di temperature superiori a 120°C (272°F), i vibratori **S** e **OR** dovranno essere dotati di silenziatori e raccordi per flessibili resistenti al calore.
I vibratori OT possono essere azionati all'interno di liquidi purché l'aria di scarico sia convogliata nell'atmosfera.

OLI S.r.l provides a 12-month warranty on their products. This period starts from the date of the consignment note.
The warranty is not applicable for breakage and/or defects caused by incorrect installation or use, or incorrect maintenance, or modifications not authorized by the Manufacturer.
The warranty does not extend to parts that wear out following normal use and electrical components.
The warranty elapses if the pneumatic vibrator:
- has been tampered with or modified,
- has not been used correctly,
- has been used without respecting the limits indicated in this manual and/or has been subjected to excessive mecha nical stress,
- has not been subjected to the necessary maintenance or these operations have been carried out partly and/or incorrectly,
- has been damaged due to carelessness during transport, installation and use,
- has been fitted with spare parts that are not original.

On receiving the product, the user must check these for defects deriving from transport and/or incomplete supply.
Defects, damage or incom pleteness of the supply must be immediately communicated to the Manufacturer in writing and countersigned by the haulage transporter.

OLI S.r.l. gewährt auf ihre Erzeugnisse eine Garantie von 12 Monaten. Die Garantiezeit beginnt mit dem Datum des Lieferscheins.
Die Garantie ist nicht anwendbar, wenn es sich um Schäden und/oder Defekte handelt, die auf falschem Einbau oder Gebrauch, nicht korrekter Wartung oder Änderungen beruhen, die ohne die Genehmigung des Herstellers ausgeführt wurden.
Die Garantie deckt keine Teile ab, die infolge des normalen Gebrauchs verschleißen, und auch keine elektrischen Teile.
Genauer geagt verfällt die Garantie in folgenden Fällen:
- Das Druckluft Vibratoren wurde manipuliert oder abgeändert;
- wurde nicht angewandt;
- bei seinem Gebrauch wurden die in diesem Handbuch genannten Einsatzbeschränkungen nicht beachtet und/oder es wurde zu starken mechanischen Belastun gen ausgesetzt;
- er wurde nicht der erforderlichen Wartung unterzogen oder diese wurde nur teilweise und/oder nicht korrekt ausgeführt;
- es wurde beschädigt, weil Transport, Einbau oder Gebrauch ohne die erforderliche Sorgfalt vorgenommen wurden;
- es wurden keine Original-Ersatzteile verwendet.

Beim Empfang der Ware hat der Empfänger sicherzustellen, dass die Ware keine durch den Transport verursachten Schäden oder Defekte aufweist, und/ oder dass der Lieferumfang vollstän-dig ist.
Etwaige Defekte, Schäden oder Fehlmengen sind mittels schriftlicher und vom Frachtführer gegengezeichneter Mitteilung sofort dem Hersteller zu melden.

La Société OLI S.r.l reconnaît une période de 12 mois de garantie sur les produits de sa fabrication. La période prend effet à compter de la date indiquée sur le bon de livraison.
La garantie ne s'applique pas à la suite de ruptures et/ou de défauts provoqués par un montage et une utilisation impropre, des entretiens qui ne sont réalisés correctement ou des modifications apportées sans autorisation du constructeur.
La garantie s'étend aux pièces qui s'usent à la suite d'une utilisation normale et aux parties électriques.
Plus précisément la garantie est sans effet si le vibrateurs pneumatique :
- a été manipulé ou modifié,
- a été utilisé de manière incor recte,
- a été utilisé sans respecter les limites indiquées dans la présen te notice et/ou qu'il a été soumis à des contraintes mécaniques excessives
- il n'a pas été soumis aux entretiens nécessaires ou que ces opérations ont été effectuées partiellement, de manière incom plète ou incorrecte
- a subit des dommages par négligence pendant le transport, la mise en place et l'utilisation,
- a été réparé avec des pièces qui ne sont pas d'origine.

Dès réception de la marchan dise, le destinataire doit vérifier que celle-ci n'a pas de défauts ou subit de dégâts dus au tran sport et que la fourniture n'est pas incomplète.
Tout défaut, dommage ou four niture incomplète doit immédia tement être signalée au construc teur par communication écrite et contresignée par le tran sporteur.

La OLI S.r.l riconosce un periodo di 12 mesi di garanzia sui prodotti di propria costruzione. Il periodo decorre dalla data della bolla di consegna.
La garanzia non è applicabile a seguito di rotture e/o difetti causati da errata installazione o utilizzo, oppure da manutenzioni non corrette o modifiche apportate senza autorizzazione del costruttore.
La garanzia non si estende alle parti che si logorano in seguito al normale uso e alle parti elettriche.
A miglior precisazione la garanzia decade nei casi in cui il vibratore pneumatico:
- sia stato manomesso o modificato,
- sia stato utilizzato non correttamente,
- sia stato utilizzato non rispettando i limiti indicati nel presente manuale e/o sia stato sottoposto ad eccessive sollecitazioni meccaniche,
- non sia stato sottoposto alle necessarie manutenzioni o queste siano state eseguite solo in parte e/o non correttamente,
- abbia subito danni per incuria durante il trasporto, l'installazione e l'utilizzo,
- siano state inserite parti di ricambio non originali.

Al ricevimento del prodotto, il destinatario deve verificare che lo stesso non presenti difetti o danni derivanti dal trasporto e/o incompletezza della fornitura.
Eventuali difetti, danni o incompletezza vanno immediatamente segnalati al costruttore mediante comunicazione scritta e controfirmata dal vettore.

TRANSPORT

When the filter is delivered, make sure that the type and quantity of the materials consigned comply with the information on the order confirmation.
Immediately inform the haulage contractor in writing if damage is discovered, using the relative space on the consignment form.
The driver is obliged to accept the complaint and to issue you with a copy. If the filter has been supplied carriage forward, either sent your complaint to us or straight to the haulage contractor. Damages will only be reimbursed if you have notified the matter on receipt of the goods.
Prevent all type of damage during the unloading and handling operations.
Always bear in mind you are dealing with mechanical equipment which must be treated with care.

TRANSPORT

Bei Erhalt der Ware sicherstellen, ob Typ und Menge mit den Daten auf der Bestellung übereinstimmen.
Etwaige Transportschäden sind sofort auf dem Schriftwege zu melden, und zwar durch Eintragen auf dem Lieferschein.
Der Fahrer ist verpflichtet, diese Reklamation anzunehmen und Ihnen eine Kopie davon auszuhändigen. Wenn die Lieferung frei Haus erfolgt, senden Sie Ihre Reklamation an uns, andernfalls direkt an den Frachtführer. Die Entschädigung erfolgt nur, wenn der Schaden gleich bei Empfang der Ware gemeldet wird.
Vermeiden Sie jede Art der Beschädigung beim Abladen und Bewegen.
Immer berücksichtigen, daß es sich um mechanische Elemente handelt, die mit Vorsicht zu behandeln sind.

TRANSPORT

Au moment où vous recevez la machine, vérifiez si la typologie et la quantité correspondent bien aux données qui se trouvent sur la confirmation de la commande.
Si vous constatez des dommages, vous devez immédiatement le déclarer en l'écrivant dans l'emplacement réservé à cet effet sur la lettre de voiture.
Le chauffeur est obligé d'accepter votre réclamation et de vous en laisser une copie. Si la fourniture a été livrée franco destination, envoyez-nous votre réclamation, sinon envoyez-la directement au transporteur.
Vous ne pourrez être remboursé des dommages et intérêts que si vous avez déclaré le dommage au moment où vous avez reçu la machine. Faites bien attention à ne pas abîmer la machine durant son déchargement et sa manutention.
Rappelez-vous qu'il s'agit de matériel mécanique qui doit être déplacé avec le plus grand soin.

TRASPORTO

Al ricevimento della merce controllare se la tipologia e la quantità corrispondono con i dati della conferma d'ordine.
Eventuali danni devono essere fatti presenti immediatamente per iscritto nell'apposito spazio della lettera di vettura.
L'autista è obbligato ad accettare un tale reclamo e lasciarne una copia a Voi. Se la fornitura è franco destino, inviate il vs. reclamo e noi, altrimenti direttamente allo spedizioniere. Il risarcimento avviene soltanto se avete fatto presente il danno all'atto del ricevimento.
Evitate ogni tipo di danneggiamento durante lo scarico e le movimentazioni.
Tenete conto che si tratta di materiale meccanico che deve essere movimentato con cura.

PACKING

NOTE:
It is the installer's responsibility to dispose off the packaging in a suitable manner, in compliance with existing legislation.

PACKUNG

N.B.:
Der Anlagenaufsteller ist dafür verantwortlich, das Verpackungsmaterial auf angemessene Art und in Übereinstimmung mit den einschlägigen, geltenden Gesetzen zu entsorgen.

EMBALLAGE

N.B.:
L'installateur doit, à ses frais, éliminer les emballages de manière adéquate et conformément aux lois en vigueur en la matière.

IMBALLO

N.B.:
è a cura dell'installatore smaltire gli imballi in modo adeguato e secondo le leggi vigenti in materia.

1)STORAGE PRIOR TO INSTALLATION
- Avoid damp, salty environments, if possible.
- Place the component on wooden platforms and store it protected from unfavourable weather conditions.

2)PROLONGED MACHINE SHUTDOWNS AFTER ASSEMBLY
- Before starting up the component, set it in safety status.
- Before starting up the component, check the condition of the electric and pneumatic system and all parts for which long shutdowns may affect working.

3) POSSIBLE REUSE AFTER PERIODS OF INACTIVITY
- During component halts, avoid-damp, salty environments.
- Place the component on wooden platforms and store it protected from unfavourable weather conditions.
- Set the component in safety status before starting it up.
- Before starting up the component, check the condition of the electric and pneumatic systems and all parts for which long shutdowns may affect working.
- Before starting up the component, clean it thoroughly by following the indications on the powder safety sheet.
- If the component operates in conditions and with materials different from the previous application, check the compatibility of this use according to the indications in the INDICATIONS FOR USE section.

1) EINLAGERUNG VOR DEM EINBAU
- Feuchte und salzhaltige Luft für die Einlagerung vermeiden.
- Den Bauteil auf einer Holzpalette setzen und vor Witterung schützen.

2) LÄNGERE BETRIEBSRUHE NACH DEM EINBAU
- Vor der Inbetriebnahme ist der Bauteil in einen sicheren Zustand zu bringen.
- Vor der Inbetriebnahme des Bauteils die elektrische und pneumatische Anlage und alle Teile, deren Funktionstüchtigkeit die bei einem längeren Stillstand in Frage gestellt werden könnte, prüfen.

3) MÖGLICHE WIEDERVERWENDUNG NACH EINEM LÄNGEREN STILLSTAND
- Während des Stillstands des Bauteils Räume mit feuchter und salzhaltiger Luft vermeiden.
- Den Bauteil auf eine Holzpalette setzen und vor Witterung schützen.
- Vor der Inbetriebnahme ist der Bauteil in einen sicheren Zustand zu bringen.
- Vor der Inbetriebnahme des Bauteils die elektrische und pneumatische Anlage und alle Teile, deren Funktionstüchtigkeit die bei einem längeren Stillstand in Frage gestellt werden könnte, prüfen.
- Vor der Inbetriebnahme des Bauteils ist ein vollständiger Abreinigungszyklus vorzunehmen, wobei das zu beachten ist, was auf dem Sicherheits-Datenblatt des entsprechenden Erzeugnisses steht.
- Wenn der Bauteil unter Bedingungen oder mit Material betrieben wird, das vom vorherigen Einsatz abweicht, ist die Verträglichkeit für den neuen Einsatz mit den BEDIENSUNGSANLEITUNG zu vergleichen.

1) EMMAGASINAGE AVANT LA MISE EN PLACE
- Si possible éviter les locaux humides et les saumâtres
- Placer le composant sur des palettes en bois et les ranger à l'abri des intempéries.

2) ARRÊT MACHINE PROLONGÉ APRÈS LE MONTAGE
- Avant la mise en service mettre le composant en sécurité.
- Avant la mise en service du composant contrôler l'intégrité de l'équipement électrique et de toutes les parties pour lesquelles un arrêt prolongé pourrait compromettre le fonctionnement.

3) RÉ-UTILISATION APRÈS UNE PÉRIODE D'INACTIVITÉ
- Pendant la période d'inactivité du composant éviter les locaux humides et saumâtres
- Placer le composant sur des palettes en bois et les ranger à l'abri des intempéries.
- Avant la mise en service mettre le composant en sécurité
- Avant la mise en service du composant contrôler l'intégrité de l'équipement électrique et de toutes les parties pour lesquelles un arrêt prolongé pourrait compromettre le fonctionnement.
- Avant la mise en service du composant effectuer un cycle complet de nettoyage en respectant ce qui est indiqué sur la fiche de sécurité de la poussière.
- Si le composant travaille dans des conditions et avec des matières différentes de l'application précédente, vérifier la compatibilité de cette utilisation d'après ce qui est indiqué dans la section MODE D'EMPLOI.

1) IMMAGAZZINAGGIO PRIMA DELL'INSTALLAZIONE
- Evitare possibilmente ambienti umidi e salmastri.
- Sistemare il componente su pedane di legno e locarle al riparo dalle intemperie.

2) FERMO COMPONENTE PROLUNGATO DOPO IL MONTAGGIO
- Prima della messa in servizio mettere in sicurezza il componente.
- Prima della messa in servizio del componente controllare l'integrità dell'impianto elettrico, pneumatico, e di tutte le parti per le quali un prolungato arresto potrebbe compromettere la funzionalità.

3)POSSIBILE REIMPIEGO DOPO PERIODO DI INATTIVITA'
- Durante il fermo componente evitare ambienti umidi e salmastri.
- Sistemare il componente su pedane di legno e locarle al riparo dalle intemperie.
- Prima della messa in servizio mettere in sicurezza il componente.
- Prima della messa in servizio del componente controllare l'integrità dell'impianto elettrico, pneumatico, e delle parti per le quali un prolungato arresto potrebbe compromettere la funzionalità.
- Prima della messa in servizio del componente eseguire un ciclo completo di pulizia rispettando quanto riportato sulla scheda di sicurezza della polvere.
- Se il componente opera in condizioni e con materiali diversi dall'applicazione precedente, verificare la compatibilità di tale utilizzo secondo quanto riportato nel sezione INDICAZIONE PER L'USO.

NOTE
The pneumatic vibrator must be positioned in such a manner that:
- the area around the pneumatic vibrator must be made safe as per Directive ATEX 94/9/CE.

By safe place is meant an outside area in which suitable warning notices are present during the working of the pneumatic vibrator, see Sect. 26 residual risks, and where there are no plant parts that can get damaged or inflammable material deposit.

INSTALLATION
The unit must be fastened to a clean and level surface with two fastening screws (for screw size and tightening torque see table).
Use self-locking screw retention washers (no spring washers).
Use self-locking nuts or e.g. Loctite 270 against loosening.

It is highly recommended to use a reinforcement section (U-section) as substructure. This reinforcement section should be welded to the object. This allows optimal transfer of the vibration energy - and saves any direct damage to the object.

ASSEMBLY INSTRUCTIONS:
The frame on which the pneumatic vibrator is mounted must be in equipotential.
The vibrator must be fixed to the frame by means of bolts and washers; the toothed washer (UNI8842) must be fitted in contact with the body.
The wire terminal must be connected to an earth wire.
Checklist for Assembly and Commissioning:
1) Install the unit carefully. Secure the fastening screws.
2) Install service unit (filter, regulator), valve and supply line.
3) If necessary install lubricator and adjust oil flow (2 to 5 drops an hour) .
4) Check: Are fastening screws secured?
   Have notes on hose length and nominal width been observed?

ANM
Der pneumatische Vibrator muss so angeordnet werden, dass:
- der Bereich rings um den pneumatischen Vibrator gemäß der Richtlinie ATEX 94/9/EG sicher gestaltet ist.

Unter einem sicheren Ort versteht man einen Außenbereich, in dem während des Betriebs des pneumatischen Klopfers eine entsprechende Beschilderung angebracht ist. Siehe Teil 26 Restrisiken. Außerdem dürfen keine Anlagenteile vorhanden sein, die beschädigt werden könnten, oder Lager mit entflammbaren Materialien.
EINBAU
Der Einbau erfolgt mittels zweier Befestigungsschrauben. Die Oberfläche muß sauber und eben sein (Schraubengröße und Anzugsmomente: siehe Tabelle).
Selbstsichernde Unterlegscheiben, jedoch keine Federringe verwenden.
Selbstsichernde Muttern gegen Lösen oder aber z.B. Loctite 270 verwenden.

Besonders zu empfehlen ist ein Versteifungsprofil (U-Stahl) als Unterbau. Das Versteifungsprofil muß an das zu vibrierende Objekt angeschweißt werden. Dadurch wird die Vibrationsenergie optimal übertragen.

MONTAGEANLEITUNGEN:
Die Struktur, auf welcher der pneumatische Vibrator installiert ist, muss Potentialausgleich haben.
Der Vibrator muss mit den dafür bestimmten Schrauben und Unterlegscheiben an der Struktur befestigt werden. Die Zahnscheibe (UNI8842) muss im Kontakt mit dem Gehäuse montiert werden. Die Kabelöse muss an einem Erdungskabel angeschlossen werden.
Checkliste für Montage und Inbetriebnahme
1) Geräte sorgfältig montieren. Befestigungsschrauben sichern.
2) Wartungseinheit (Filter, Regler), Ventil, Zuleitung einbauen.
3) Ggfls. Nebelöler einstellen (2-5 Tropfen/h) und Abluft ableiten.
4) Prüfen, ob Befestigungsschrauben gesichert sind und Angaben über Schlauchlänge und Nennweite beachtet wurden.

REMARQUE
Le vibrateur pneumatique doit être mis en place en respectant les règles suivantes :
- la zone tout autour du vibrateur pneumatique doit être mise en sécurité conformément à la directive ATEX 94/4/CE.

Par lieu sûr on entend une zone extérieure dans laquelle, pendant le fonctionnement du vibrateur pneumatique, sont apposés des panneaux de signalisation appropriés (voir sect. 26 risques résiduels). En outre il ne doit pas y avoir de parties d'installation endommageables ou des dépôts de matières inflammables.
MONTAGE
Le montage est réalisé par deux vis de fixation sur une surface propre et plane (taille des vis et couple de serrage, voir tableau) et avec des rondelles d'arrêt autobloquantes (pas de rondelles ressorts). Contre le desserrage, utilisez des écrous indesserrables ou un agent liquide antidesserrage, par ex. Loctite 270.

Nous recommandons de prévoir comme support un profilé de raidissement (fer U) soudé sur l'objet à vibrer, ce qui permet une transmission optimale de l'énergie de vibration.

INSTRUCTIONS DE MONTAGE:
La structure sur laquelle est monté le vibrateur pneumatique doit être en équipotentialité.
Le vibrateur doit être fixé à la structure au moyen de vis et de rondelles; la rondelle crantée (UNI8842) doit être montée en contact avec le corps. La cosse doit être branchée à un câble de mise à la terre.
Check-list de montage et de mise en service :
1) Monter soigneusement l'appareil, serrer et bloquer les vis de fixation.
2) Monter l'unité de conditionnement (filtre, régulateur), la vanne, la conduite d'amenée.
3) En cas de nécessité, régler le graisseur.
4) Vérification: Les vis de fixation sont-elles freinées ?
   La longueur des flexibles et leur diamètre nominal ont-elles été respectées ?

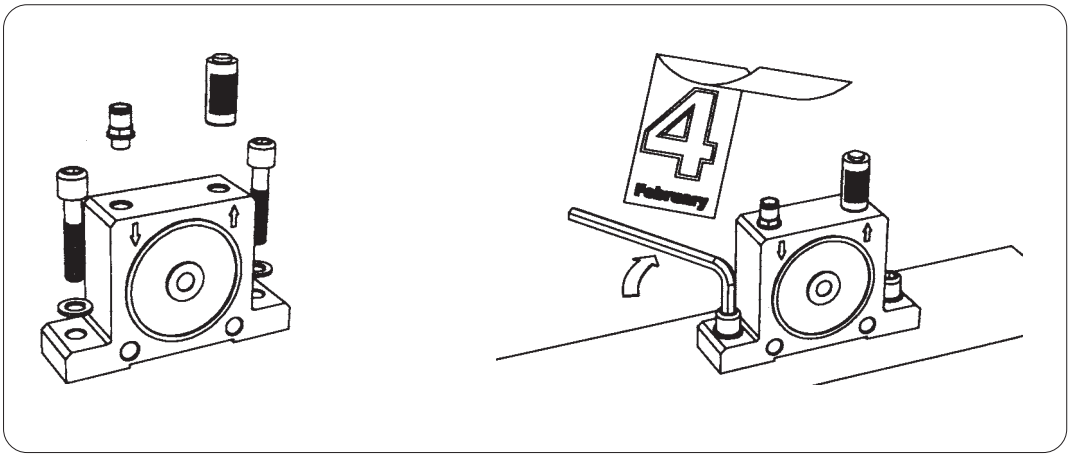
NOTA
Il vibratore pneumatico, deve essere posizionato in modo che:
- la zona circostante al vibratore pneumatico deve essere resa sicura come da direttiva ATEX 94/9/CE.

Per luogo sicuro s'intende una zona esterna nella quale durante il funzionamento vibratore pneumatico, sia apposta l'adeguata cartellonistica, vedi sez.26 rischi residui, inoltre non siano presenti parti d'impianto danneggiabili o depositi di materiali infiammabili.

INSTALLAZIONE
- Fissare l'unità ad una superficie piana e pulita utilizzando due viti di serraggio (per la misura delle viti e la coppia di serraggio si veda la tabella).
- Utilizzare rondelle d'arresto autobloccanti (non utilizzare rondelle elastiche). Per evitare che le rondelle si allentino, utilizzare dadi antobloccanti o Loctite 270.

Si raccomanda di impiegare come sottostruttura un profilato di rinforzo (sezione a U), da saldare all'oggetto in lavorazione. Ciò consente il trasferimento ottimale dell'energia vibrante, preservando l'oggetto da eventuali danneggiamenti.

ISTRUZIONI PER IL MONTAGGIO :
La struttura su cui è montato il vibratore pneumatico deve essere in equipotenzialità.
Il vibratore deve essere fissato alla struttura mediante le apposite viti e rondelle; la rondella dentata (UNI8842) deve essere montata a contatto con il corpo.
Il capicorda deve essere collegato ad un cavo per la messa a terra.
Checklist per montaggio e messa in funzione:
1) Installare l'unità con precauzione. Serrare le viti di fissaggio.
2) Installare l'unità di servizio (filtro, regolatore), la valvola e la linea di alimentazione.
3) Se necessario, installare il lubrificatore e regolare il flusso d'olio (da 2 a 5 gocce all'ora).
4) Controllare: Le viti di fissaggio sono serrate?
   Sono state rispettare le indicazioni relative alla lunghezza del tubo e allo spessore nominale?



Type	Thread *Gewinde* Filetage *Filetto*	Tightening torque *Anzugsmoment* Couple de serrage *Coppia di serraggio*	Supply line thread *Anschlußgewinde* Filetage *Filettatura ingresso aria*	Supply line diameter *Zuleitung* Conduite d'amenée *ø Nominale tubo alimentazione*
S8 - S10	M 6	10.4 Nm	1/8"	DN 6
S13 - S16 - S20 - S25	M 8	25.0 Nm	1/4"	DN 10
S30 - S36	M 10	51.0 Nm	3/8"	DN 12
OR50	M 6	10.4 Nm	1/8"	DN 6
OR65	M 8	25.0 Nm	1/4"	DN 10
OR80	M 10	51.0 Nm	1/4"	DN 12
OR100	M 12	85.0 Nm	3/8"	DN 12
OT8 - OT10 - OT105	M 6	10.4 Nm	1/8"	DN 6
OT13 - OT16 - OT165	M 8	25.0 Nm	1/4"	DN 8
OT20 - OT25 - OT255	M 8	25.0 Nm	1/4"	DN 10
OT30 - OT36 - OT365	M 10	51.0 Nm	3/8"	DN 12

- The user is entirely responsible if the pneumatic vibrator is installed in any way other than that indicated above.
- The component does not require special lighting; the component installer is however responsible for ensuring uniform lighting in the area on the basis of the indications of the relevant regulation.
- It is the installer's responsibility to check the suitability of the site for plant installation.
- Depending on the assembly height, the necessary Personal Protection Devices (PPD) must be provided.

- Positionierungen des pneumatischen Vibrators, die von denen abweichen als oben angegeben sind, führen dazu, dass die gesamte Verantwortlichkeit auf den Anwender übergeht.
- Der Bauteil braucht keine besondere Beleuchtung. Der Monteur des Bauteils ist auf jeden Fall dazu angehalten, das Vorhandensein einer gleichmäßigen Ausleuchtung des Bereichs zu gewährleisten, so wie es die geltenden Bestimmungen angeben.
- Der Monteur ist dafür verantwortlich, die Eignung des Raums zu prüfen, in dem die Anlage aufgestellt wird.
- Je nach der Einbauhöhe sind angemessene PSA (persönliche Schutzausrüstungen) bereitzustellen.

- Tout positionnement différent du vibrateur pneumatique rend l'utilisateur entièrement responsable.
- Le composant n'exige pas un éclairage particulier; l'installateur du composant doit assurer la présence d'un éclairage approprié dans la zone sur la base des indications de la réglementation concernée.
- L'installateur doit vérifier la conformité du site qui accueille l'installation.
- En fonction de la hauteur de montage prévoir les DPI (dispositifs de protection individuelle) nécessaires.

- Posizionamenti del vibratore pneumatico diversi da quanto sopra indicato determinano la totale assunzione di responsabilità da parte dell'utilizzatore.
- Il componente non necessita di un'illuminazione particolare; l'installatore del componente è comunque tenuto ad assicurare la presenza di un'omogenea illuminazione nell'area in base alle indicazioni della normativa pertinente.
- E' a carico dell'installatore verificare l'idoneità del sito che ospiterà l'impianto.
- In funzione dell'altezza di montaggio predisporre i DPI (dispositivi di protezione individuali) necessari".

NOTE	ANM.:	REMARQUE	NOTA
Check the earth connection.	Die Erdung prüfen.	Vérifier la mise à la terre.	Verificare la messa a terra.

COMPRESSED AIR REQUISITES
The compressed air supplied to the various utilities must have certain special features:
1) **clean**: free of scale which could damage the solenoid valves present on the pneumatic actuator.
2) **dehumidified**: use of a condensate trap is advisable.
3) **lubricated**: Specify the models that require lubrication and those that do not (Tables Data)

Attention: before connecting the compressed air to the pneumatic actuator utilities, empty the pipes

ANFORDERUNGEN AN DIE DRUCKLUFT
Die Druckluft, die verschiedene Verbraucher versorgen muss, muss folgende Eigenschaften haben:
1) **rein:** sie darf keine Teilchen enthalten, mit denen die Magnetventile des pneumatischen Antriebs beschädigt werden könnten.
2) **trocken:** Die Verwendung eines Kondensatabscheiders ist empfehlenswert.
3) **geschmiert:** Die Modelle benutzen, die Schmierung brauchen bzw. nicht (Daten der Tabellen).

Achtung. Vor dem Anschließen der Druckluft an die Verbraucher des pneumatischen Antriebs sind die Leitungen zu entleeren.

AIR COMPRIMÉ REQUIS
L'air comprimé qui doit alimenter les différentes utilisations doit avoir les requis suivants :
1) **Propre**: sans impuretés pouvant endommager les électrovannes présentes sur le percuteur pneumatique.
2) **Déshumidifié**: il convient de prévoir l'utilisation d'un séparateur d'eau de condensation.
3) **Lubrifié**.

Attention: avant de brancher l'air comprimé aux utilisations du vibrateur pneumatique vider les tuyauterie

s.

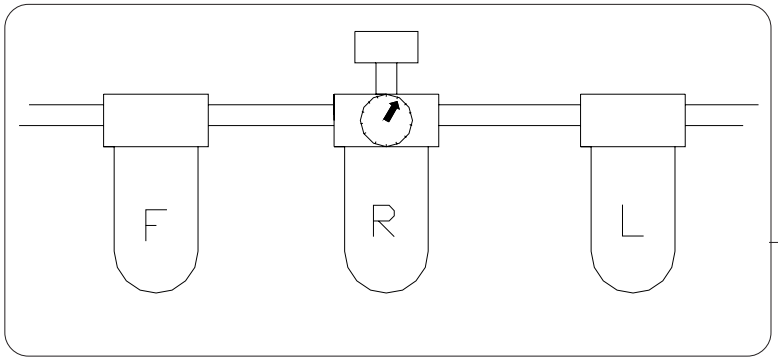
REQUISITI ARIA COMPRESSA
L'aria compressa che deve alimentare le varie utenze ha bisogno di particolari caratteristiche:
1) pulita: esente da scorie che potrebbero danneggiare le elettrovalvole presenti sull'attuatore pneumatico.
2) deumidificata: è opportuno prevedere l'utilizzo di un separatore di condensa.
3) lubrificata: Inserire i modelli che richiedono lubrificazione e quali no. (Dati tabelle)

Attenzione: prima di collegare l'aria compressa alle utenze dell'attuatore pneumatico vuotare le tubazioni.

PNEUMATIC CONNECTION
Supply line
The air resistance increases with the length of the pipe. For pipe lengths of up to 3m then the minimum length is required for the following cross section. For longer supply lines it is recommended to use bigger cross sections.
Air discharge
If the air flowing out is discharged and the vibrator is at full power, the discharge pipe must have a bigger nominal width than the supply pipe.

PNEUMATISCHE ANSCHLÜSSE
Zuleitung
Der Luftwiderstand steigt mit der Schlauchlänge. Bei Schlauchlängen bis max. 3 m bis zum nächstgrößeren Leitungsquerschnitt sind die in der Tabelle angegebenen Mindestquerschnitte zu empfehlen.
Für längere Zuleitungen sollten die Querschnitte größer sein.
Ableitung
Wenn die austretende Luft abgeführt wird und der Vibrator die volle Leistung erzielen soll, so muß der Ableitungsschlauch eine größere Nennweite haben als der Zuleitungsschlauch.

RACCORDEMENTS PNEUMATIQUES
Conduite d'amenée
La résistance de l'air augmente avec la longueur des flexibles. Avec des flexibles d'une longueur maximum de 3 m, nous recommandons les sections figurant dans le tableau. Pour les conduites d'amenée plus longues, nous recommandons des sections plus importantes.
Conduite d'évacuation
Si l'air sortant est évacué, il est nécessaire que le flexible d'évacuation présente un diamètre supérieur à celui de la conduite d'amenée d'air.



COLLEGAMENTI PNEUMATICI
Linea di alimentazione
La resistenza dell'aria aumenta con la lunghezza del tubo. In caso di tubi fino a 3 metri di lunghezza, si raccomandano le sezioni minime indicate in tabella. Per tubi di lunghezza superiore, si consiglia di utilizzare sezioni maggiori.
Scarico dell'aria
In caso di scarico dell'aria che fuoriesce e se il vibratore è a piena potenza, il tubo di scarico deve avere uno spessore nominale maggiore di quello del tubo di alimentazione.

The air inlet has a smaller opening than the air outlet. Both are marked on the front side by arrows.
The pressurized air infeed must be fixed safely.
Mixing up air inlet and air outlet leads to loss in performance.

Der Lufteinlaß hat eine kleinere Öffnung als der Luftauslaß. Beide sind auf der Vorderseite durch Pfeile gekennzeichnet.
Die Druckluftzuführung muß sicher befestigt werden.
Eine Verwechslung von Luftein- und Luftausgang hat einen Leistungsverlust zur Folge.

L'entrée d'air a une ouverture plus petite que la sortie d'air. Toutes les deux sont marquées avec des flèches. La conduite d'air comprimé doit être fixée de manière sûre.
La confusion d'entrée et sortie a comme conséquence une perte de performance.

L'entrata dell'aria presenta un'apertura più piccola rispetto all'uscita. Entrambe sono contrassegnate sulla parte anteriore da frecce.
Il raccordo di alimentazione dell'aria sotto pressione deve essere fissato in modo sicuro.
La miscelazione di aria in entrata e in uscita provoca perdite nelle prestazioni.

use oil only - *Nur Öl benutzen*
Utiliser uniquement de l'huile - *usare solo olio*

ISOVG5
(5 cST / 40°C)

ATTENTION: use pipes and accessories suitable for the operating temperatures.

WARNING: Fix flexible compressed air hose pipes and provide necessary precautions against unwanted detachment of a pipe section.

ACHTUNG: Leitungen und Zubehörteile benutzen, die für die Betriebstemperaturen geeignet sind.
WARTUNG: Die Druckluftschläuche fachmännisch befestigen und die notwendigen Vorkehrungen gegen ein unvorgesehenes Ablösen eines Teils der Leitung treffen.

ATTENTION: adopter des tuyauteries et des accessoires appropriés aux températures d'utilisation.
IMPORTANT: Fixer correctement les tuyaux d'air comprimé et prendre les précautions nécessaires contre le décrochage soudain d'un tronçon de tuyauterie.

ATTENZIONE :adottare tubazioni e accessori idonei alle temperature d'utilizzo.

IMPORTANTE: Fissare correttamente i tubi flessibili dell'aria compressa e predisporre le dovute precauzioni contro il distacco improvviso di un tratto di tubazione.

ELECTRICAL CONTROLLER
Connect the earth wire to the point provided on the pneumatic vibrator.

Set the component in safety status before carrying out any operation.

COMMISSIONING AND OPERATION
The vibrator can be commissioned immediately after the correct installation. Make sure that the pressure in the air system is able to meet the air consumption value specified in the operating instructions. Otherwise the vibrator will not be able to work according to the technical specifications.

Screw connections must be checked and retightened after 1 hour of operation and then at regular intervals (normally every month).

ELEKTRISCHE ANSCHLÜSSE
Das Erdungskabel mit der Stelle verbinden, die auf dem pneumatischen Vibrator dafür vorgesehen ist.

Vor der Ausführung jeder beliebigen Arbeit das Bauteil in einen sicheren Zustand versetzen.

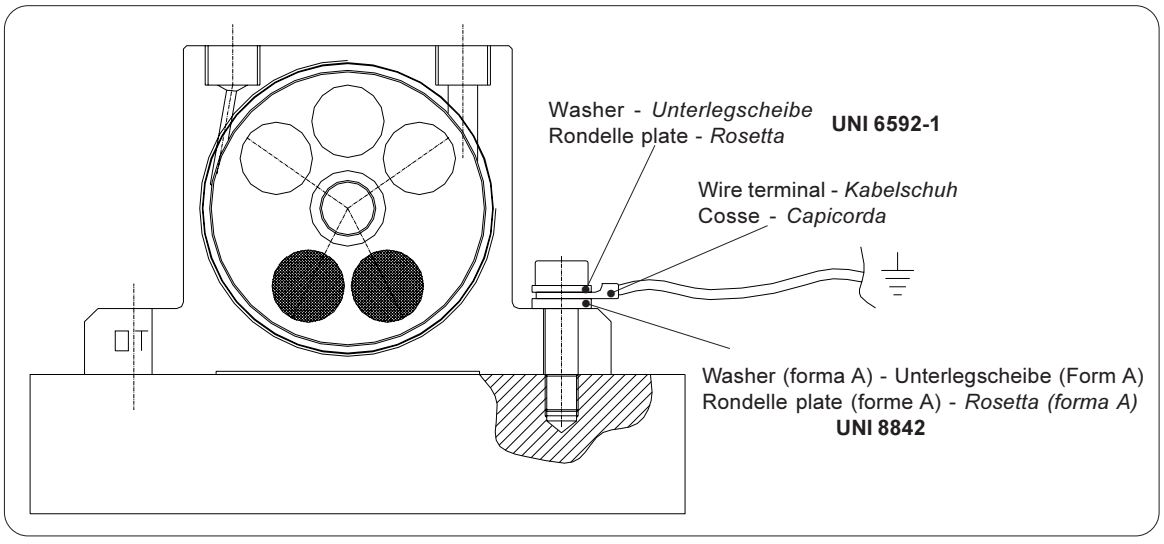
INBETRIEBNAHME UND BETRIEB
Die Inbetriebnahme der Vibratoren erfolgt sofort nach der fachgerechten Montage. Sicherstellen, daß der in der Betriebsanleitung angegebene Luftverbrauchswert vom Druckluftsystem auch geliefert wird. Andernfalls wird der Vibrator die technischen Daten nicht erzielen.

Nach einer Stunde Betrieb die Schraubverbindungen erstmalig, danach regelmäßig (möglichst einmal monatlich) überprüfen und ggfls. nachziehen.

RACCORDEMENTS ÉLECTRIQUES
Brancher le câble de mise à la terre à l'endroit prévu sur le vibrateur pneumatique.

Avant toute opération mettre le composant en condition de sécurité.

MISE EN SERVICE ET UTILISATION
À l'issue d'un montage approprié, la mise en service du vibrateur peut intervenir immédiatement. Assurez-vous que la consommation d'air indiquée dans les instructions de service peut être effectivement fournie par votre système d'alimentation en air comprimé. Sinon, le vibrateur ne pourra atteindre les caractéristiques techniques prévues.



Les vis visses devront être vérifiées après la première heure de service, puis régulièrement (tous les mois). Le cas échéant, les vis seront resserrées.

COLLEGAMENTI ELETTRICI
Collegare il cavo di messa a terra all'apposito punto dedicato sul vibratore pneumatico

Prima di qualsiasi intervento mettere il componente in sicurezza.

MESSA IN FUNZIONE E USO
Se installato correttamente, il vibratore può essere messo immediatamente in funzione. Assicurarsi che la pressione del sistema pneumatico sia in grado di soddisfare il valore di consumo d'aria specificato nelle istruzioni per l'uso. In caso contrario il vibratore non potrà funzionare in conformità alle specifiche tecniche.

Controllare i raccordi a vite e serrarli di nuovo dopo un'ora di funzionamento e poi a intervalli regolari (in genere una volta al mese).

Set the component in safety status before carrying out any operation.

- If work is to be carried out on parts at the top of the pneumatic vibrator, use a work area platform which must be selected in such a manner as to avoid risk of slipping, tripping or falling of operators.

S and **OR**-vibrators are maintenance-free. From outside they can be cleaned with a water jet. Operate the vibrator for a short while after.

WARNING
Dirty compressed air causes clogging of filter and silencer.
If necessary empty the filter, clean filter element and silencer (wash out).

REPLACING "OT" SERIES BEARINGS

Vor der Ausführung jeder beliebiger Arbeit ist der Bauteil in einen Zustand versetzen.

- Wo sich Teile des pneumatischen Vibrators in größerer Höhe befinden, eine Arbeitsplattform zu benutzen, die so zu wählen ist, dass eine Gefährdung des Personals in Form von Ausrutschen, Hängenbleiben oder Absturz vermieden wird.

S-und **OR**- Vibratoren sind wartungsfrei. Sie können von außen mit einem Wasserstrahl gereinigt werden. Nach der Reinigung den Vibrator kurz betätigen.

ACHTUNG
Schmutzige Druckluft führt zur Verschmutzung von Filter und Schalldämpfer.
Filter ggfls. leeren, den Filtereinsatz und den Schalldämpfer reinigen bzw. auswaschen.

ERSETZEN DER LAGER SERIEN „OT"

Avant toute opération mettre le composant en condition de sécurité.

- Pour atteindre des parties du vibrateur pneumatique en hauteur, utiliser une plate-forme aérienne de travail qui devra être choisie de manière à éviter tout danger de glissement ou de chute des opérateurs.

Les **S** et **OR** ne réclament pas d'entretien. Ils peuvent être nettoyés extérieurement à l'eau sous pression. Après le nettoyage, faire brièvement fonctionner le vibrateur.

ATTENTION
L'air chargé d'impuretés provoque l'encrassement du filtre et du silencieux.
En cas de nécessité, purger le filtre, nettoyer la garniture du filtre et le silencieux (en les lavant).

REMPLACEMENT DES ROULEMENTS SERIE "OT"

Prima di qualsiasi intervento mettere il componente in sicurezza.

- Là dove si debbano raggiungere parti del vibratore pneumatico in quota utilizzare una piattaforma aerea di lavoro che dovrà essere scelta in modo da evitare pericoli di scivolamento, inciampo o caduta per gli operatori.

I vibratori **S** e **OR** sono esenti da manutenzione. Possono essere puliti esternamente mediante getto d'acqua. Dopo avere eseguito questa operazione, farli funzionare per un breve intervallo di tempo.

ATTENZIONE
L'aria compressa contenente impurità provoca l'insudiciamento del filtro e del silenziatore. Se necessario, svuotare il filtro, pulire la cartuccia e il silenziatore (risciacquo).

SOSTITUZIONE CUSCINETTI SERIE "OT"

OT 10 S	
OT 13	6000 ZTN9/C3
OT 16	
OT 16 S	
OT 20	6203 ZTN9/C3
OT 25	
OT 25 S	
OT 30	6303 ZTN9/C3
OT 36	
OT 36 S	

PERIODIC CHECKS

Set the component in safety status before carrying out any operation.

- Clean dust deposits on a weekly basis.
- Check the tightening of the screw connectors on a monthly basis.
- Check tightening torque of the fixing screws on a monthly basis.
- Check the equipotential with the structure on which the vibrator is mounted, on a monthly basis.
- Change the ball bearings on the OT model every 3000 hours.

CLEANING

Set the component in safety status before carrying out any operation.

While cleaning the dust deposited on the component, avoid throwing up dust into the surroundings and avoid dust deposits.

- The user must choose suitable cleaning products depending on the type of plant and the product handled, taking care to avoid toxic and inflammable products.
- If the pneumatic vibrator is to be used with food products, use non toxic detergents suitable for the type of application.
- The cleaning frequency depends on the type of product handled and the plant.
- In case of harmful, toxic products, cleaning wastes must be conveyed into closed tanks and disposed off according to the indications in the products safety sheet.

REGELMÄSSIGE KONTROLLEN

Vor der Ausführung beliebiger Arbeiten das Bauteil in einen sicheren Zustand versetzen.

- Etwaige Staubansammlungen einmal pro Woche entfernen.
- Die Schraubanschlüsse einmal pro Monat auf festen Sitz prüfen.
- Einmal pro Monat das Anzugsmoment der Befestigungsschrauben prüfen.
- Einmal pro Monat die Struktur, an der der Vibrator befestigt ist, auf Potentialausgleich prüfen.
- Alle 3000 Betriebsstunden bei Modell OT die Kugellager prüfen.

REINIGUNG

Vor der Ausführung beliebiger Arbeiten das Bauteil in einen sicheren Zustand versetzen.

Beim Entfernen von Staub, der sich eventuell auf dem Bauteil gebildet hat, dafür sorgen, dass der Staub nicht in die Umgebung verteilt wird, und vermeiden, dass sich zu viel Staub ansammelt.

- Der Anwender muss Reinigungsmittel verwenden, die zum Typ der Anlage und zum behandelten Produkt passen. Er muss auf jeden Fall dafür sorgen, dass keine giftigen oder feuergefährlichen Produkte verwendet werden.
- Falls der pneumatische Vibrator zum Verarbeiten von Lebensmitteln benutzt wird, ist es vorgeschrieben, ungiftige Reinigungsmittel zu verwenden, die zur Anwendung passen.
- Die Häufigkeit der Reinigung hängt von der Beschaffenheit des zu behandelnden Produkts und der Anlage ab.
- Falls man schädliche oder giftige Erzeugnisse verarbeitet, müssen die Reinigungsabwässer in einer geeigneten, geschlossenen Wanne gesammelt und gemäß den Angaben auf dem Sicherheits-Datenblatt entsorgt werden.

CONTROLES PERIODIQUES

Avant toute operation mettre le composant en condition de sécurité.

- Chaque semaine éliminer les dépôts de poussière qui se sont accumulés.
- Tous les mois vérifier le serrage des raccords à vis.
- Tous les mois vérifier le couple de serrage des vis de fixation.
- Tous les mois vérifier l'équipotentialité avec la structure sur laquelle est fixé le vibrateur.
- Tous les 3000 heures remplacer les roulements à bille sur le modèle OT.

NETTOYAGE

Avant toute operation mettre le composant en condition de sécurité.

En éliminant la poussière présente sur le composant faire attention à ne pas la disperser dans le milieu environnant et éviter toute accumulation.

- L'utilisateur doit utiliser des produits appropriés pour le nettoyage en fonction du type d'installation et du produit traité, en faisant attention à ne pas employer de produits toxique ou inflammables.
- Si le vibrateur pneumatique travaille avec des produits alimentaires il est obligatoire d'utiliser des détergents non toxiques, mais appropriés au type d'application.
- La fréquence des opérations de nettoyage dépend de la nature du produit traité et de l'équipement.
- En cas de produits nocifs ou toxiques, les eaux usées du nettoyage doivent être convoyées dans une cuve fermée adéquate et éliminées conformément à ce qui est prévu par la fiche de sécurité du produit.

CONTROLLI PERIODICI

Prima di qualsiasi intervento mettere il componente in sicurezza.

- Settimanalmente rimuovere eventuali cumuli di polvere di deposito.
- Verificare mensilmente, il serraggio dei raccordi a vite.
- Verificare mensilmente, la coppia di serraggio delle viti di fissaggio.
- Verificare mensilmente, l'equipotenzialità con la struttura su cui viene fissato il vibratore.
- Sostituire ogni 3000 ore sul modello OT i cuscinetti a sfera.

PULIZIA

Prima di qualsiasi intervento mettere il componente in sicurezza.

Nella rimozione della polvere eventualmente presente nel componente, aver cura di non disperdere la polvere stessa nell'ambiente circostante e avere cura di evitare cumuli.

- L'utilizzatore dovrà provvedere alla scelta dei prodotti idonei alle fasi di pulizia in base alla tipologia di impianto ed al prodotto trattato facendo comunque attenzione a non usare prodotti tossici o infiammabili.
- Nel caso che il vibratore pneumatico operi con prodotti alimentari è obbligatorio usare detergenti non tossici, ma idonei al tipo di applicazione.
- La frequenza delle operazioni di pulizia dipendono dalla natura del prodotto trattato e dell'impianto.
- Nel caso di prodotti nocivi, tossici, i reflui della pulitura dovranno essere convogliati in idonea vasca chiusa e smaltiti secondo quanto previsto dalla scheda di sicurezza del prodotto.

On the basis of the use of the pneumatic vibrator, the installer must inform the operator by means of specific signals, regarding the residual risks:

1. Mechanical risk

For maintenance operations, it is compulsory for the operator to always use personal protection equipment.

Special warning notices on each section of the machine indicate the obligatory personal protection equipment:

2. Presence of possible residual high temperature after percussion gun stop

During the course of maintenance and cleaning operations and in certain operating sections, the operator may enter into contact with very hot parts of the percussion gun, with the machine stopped.

Special warning notices, located at strategic points indicate the risk due to the presence of very hot surfaces and the obligation for the operator to wear personal protection equipment, especially protective gloves.

3. Presence of potentially hazardous dusts

In the event of both routine and extraordinary maintenance, the operator must wear suitable personal protection equipment, and in particular, use a safety mask for the respiratory tract depending on the type of dust daalt as well as gloves and clothing.

For more details, refer to the safety chart of the product handled.

Je nach Verwendung des Druckluft Vibratoren muss der Installateur das Personal durch besondere Hinweisschilder auf folgende Restrisiken hinweisen:

1.Gefahren mechanischer Art

Für die Wartungsarbeiten muss das Personal immer seine persönlichen Schutzausrüstungen benutzen.

Besondere Warnschilder an den einzelnen Abschnitten des Geräts geben an, welche persönlichen Schutzausrüstungen jeweils erforderlich sind:

2. Vorliegen möglicher hoher Temperaturen nach dem Stillstand der Klopfer

Im Laufe einiger Wartungs- und Reinigungsarbeiten und in einigen Arbeitsabschnitten kann das Personal bei stehendem Gerät in Kontakt mit Teilen der Klopfer geraten, die eine hohe Temperatur aufweisen.

Besondere Warnschilder, die an den strategischen Stellen angebracht sind, weisen auf die Gefahren hin, die sich durch die hohe Temperatur der Oberflächen ergeben und weisen das Personal darauf hin, dass es zur Verwendung der persönlichen Schutzausrüstungen verpflichtet ist, insbesondere zum Tragen von Schutzhandschuhen..

3. Vorhandensein potentiell gefährlicher Stäube

Bei regelmäßiger und außerordentlicher Wartung muss das Personal geeignete pers önliche Schutzausrüstungen verwenden und insbesondere Masken zum Schutz der Atemwege mit geeigneter Klasse für den aufbereiteten Staub, wie auch Schutzhandschuhe und Schutzkleidung tragen.

Für nähere Angaben ist Bezug auf das Sicherheitsdatenblatt des verwendeten Produkts zu nehmen.

L'installateur, en fonction de l'utilisation du vibrateur pneumatiques, doit informer les opérateurs, au moyen d'indications et de signalisations prévues à cet effet, sur les risques résiduels suivants :

1. Dangers de nature mécanique

Pour les activités d'entretien l'opérateur a l'obligation d'utiliser toujours les dispositifs de protection individuelle.

Des plaques d'avertissements apposées dans chaque section de la machine indiquent quels sont les dispositifs de protection individuelle qui sont obligatoires :

2. Présence de hautes températures résiduelles après l'arrêt du percuteur

Au cours des interventions d'entretien et de nettoyage et dans certaines sections de travail, l'opérateur peut entrer en contact, quand la machine est arrêtée, avec des parties du filtre dont les surfaces sont à des températures élevées.

Des plaques d'avertissement, apposées dans les endroits stratégiques, signalent le danger dû à la présence de surfaces à des températures élevées et l'obligation de l'opérateur d'utiliser les dispositifs de protection individuelle, en particulier des gants de protection.

3. Présence de poussières potentiellement dangereuses

Aussi bien dans le cas d'interventions d'entretien ordinaires ou extraordinaires, l'opérateur doit se doter des dispositifs de protection individuelle et en particulier il doit utiliser des masques de classe appropriée pour protéger les voies respiratoires en fonction du type de poussière traitée ainsi que de gants ou de vêtements adéquats.

Pour plus de détails consulter la fiche de sécurité du produit utilisé.

L'installatore, in base all'utilizzo del vibratore pneumatico, deve informare gli operatori, tramite appositi segnali, in merito ai seguenti rischi residui :

1. Pericoli di natura meccanica

Per le attività di manutenzione è fatto obbligo all'operatore di impiegare sempre i dispositivi di protezione individuale.

Apposite targhe monitorie nelle singole sezioni di macchina indicano quali dispositivi di protezione individuale si rendono obbligatori:

2. Presenza di possibili alte temperature residue dopo l'arresto del percussore

Nel corso di interventi manutentivi e di pulizia e in alcune sezioni di lavoro, l'operatore può entrare in contatto, a macchina ferma, con parti del percussore pneumatico con superfici ad elevata temperatura.

Apposite targhe monitorie, collocate nei punti strategici indicano il pericolo dovuto alla presenza di superfici ad elevata temperatura e l'obbligo per l'operatore di utilizzare dispositivi di protezione individuale, in particolare guanti protettivi.

3. Presenza di polveri potenzialmente pericolose

Nel caso di interventi sia ordinari che straordinari di manutenzione l'operatore deve dotarsi di idonei dispositivi di protezione individuale ed in particolare deve utilizzare maschere a protezione delle vie respiratorie di classe idonea in base al tipo di polvere trattata nonché di guanti o indumenti.

Per maggiori dettagli si deve far riferimento alla scheda di sicurezza del prodotto utilizzato.

- In certain handling of dusts, where hazardous substances are present, the operator concerned who has to access the machine for routine and extraordinary maintenance operations must wear suitable protective devices as indicated on the notice signs provided.

In case of operations involving heating (welding, cutting) it is necessary to clean the surface of the pneumatic vibrator first, removing all dust deposits (the layers, the deposits and accumulated combustible powder MUST be considered like any other source which can result in an explosive atmosphere).
Authorization for operations involving heating MUST be given by technical personnel specializ-ed and trained in the risk of explosion from dusts (capable of checking residual risk, suitability of tools and a knowledge of the procedures).
(The person responsible for safety must issue a “Fire Permit” to the operator).

4. Hazards deriving from pressurized circuits (hydraulic, pneumatic)

During mainten- ance and/or repair operations pressure must be discharged from the plants and accumulators (if present), according to the instructions given along-side the components and in the respective user manuals.

5. Hazard generated by noise

The user and employer are obliged to respect the legal standards as regards protection from daily personal exposure of operators to noise (in Italy L.D.277/91).

- Bei bestimmten Staubbehandlungen, wo schädliche Substanzen auftreten, muss das Personal, falls es im Laufe der regelmäßigen oder außerordentlichen Wartung damit in Kontakt kommt, persönliche Schutzausrüstungen tragen, so wie auf den vorhandenen Schildern angegeben.

Bei der Ausführung von erhitzenden Arbeiten (Schweißen, Schneiden) ist es erforderlich, die Oberfläche des pneumatischen Vibrators vorbeugend zu behandeln, um alle Staubablagerungen und in Abwesenheit atembarer Stäube durchgeführt werden. Bei der Ausführung von erhitzenden Arbeiten (Schweißen, Schneiden) ist es erforderlich, den Vibrator so vorzubereiten, dass alle Staubablagerungen entfernt werden (Schichten, Ablagerungen und Ansammlungen von brennbarem Staub MÜSSEN wie jede andere Staubquelle betrachtet werden, die zur Entstehung einer explosiven Atmosphäre beitragen kann).
Die Genehmigung zur Ausführung von Arbeiten im erwärmten Zustand DARF NUR durch spezialisiertes technisches Personal erteilt werden, das über die Explosionsgefahr durch Staub unterrichtet ist (das in der Lage ist, das Restrisiko festzustellen, das die geeigneten Werkzeuge und auch die Prozeduren kennt). Der Werkschutzverantwortliche muss dem Personal eine „Genehmigung zur Feuerarbeit” ausstellen.

4. Gefahren durch unter Druck stehende Leitungen (hydraulisch, pneumatisch)

Während der Wartungsarbeiten und/oder Reparaturen sind die Anlagen und die etwaigen Akkumulatoren zu entleeren, so wie es in den Anweisungen an de jeweiligen Komponenten oder in den entsprechenden Handbüchern steht.

5. Gefährdung der Arbeitnehmer durch Lärm

Der Anwender und der Arbeitgeber sind zur Einhaltung der gesetzlichen Bestimmungen in Sachen Schutz gegen tägliche persönliche Lärmexposition der Arbeitnehmer verpflichtet (in Italien D.Lgs.277/91).

- Dans des traitements déterminés de poussières où il y a la présence de substances nocives, l’opérateur qui doit y avoir accès, dans le cours des interventions ordinaires ou extraordinaires, doit porter les dispositifs de protection appropriés comme signalé par les panneaux indicateurs qui s’y trouvent.

Tous les entretiens à l’intérieur du vibrateur pnumatique DOIVENT être effectués quand l’installation est arrêtée et en absence de poussière dispersée dans l’air. Dans le cas de travaux à chaud (soudure, découpe) il faut préalablement nettoyer les surfaces du vibrateur pneumatique,, en éliminant tous les dépôts de poussière (les couches, les dépôts et les tas de poussière combustible DOIVENT être considérés comme une autre source pouvant donner lieu à une atmosphère explosive).
L'autorisation à l’exécution des travaux à chaud DOIT être donnée par du personnel technique spécialisé et formé sur le risque d’explosion des poussières (en mesure4 de vérifier le risque résiduel, l’aptitude des outils et la connaissance des procédures).
Le responsable de la sécurité devra délivrer un “permis de feu” à l’opérateur.

4. Dangers dérivant des circuits sous pression (hydrauliques, pneumatiques)

Pendant les opérations d’entretien et/ou de réparation il faut décharger les installations et les éventuels accumulateurs, conformément aux instructions qui se trouvent à proximité des composants et dans les notices d’instructions correspondantes.

5. Dangers provoqués par le bruit

L’utilisateur ainsi que l’employeur ont l’obligation de faire respecter les normes de loi en matière de protection contre l’exposition personnelle quotidienne des opérateurs au bruit (en Italie D.Lgs.277/91).

- In determinati trattamenti di polveri dove vi è la presenza di sostanze nocive, l'operatore che dovesse accedere, nel corso di interventi ordinari o straordinari, deve indossare gli idonei dispositivi di protezione come indicato dalla cartellonistica ivi presente.

Tutte le manutenzioni all'interno del vibratore pneumatico DEVONO essere effettuate ad impianto fermo e in assenza di polvere aerodispersa. In caso di lavori a caldo (saldatura, taglio) è necessario bonificare preventivamente le superfici del vibratore pneumatico, rimuovendo tutti i depositi di polvere (gli strati, i depositi ed i cumuli di polvere combustibile DEVONO essere considerati come qualsiasi altra sorgente che può dare origine ad un'atmosfera esplosiva).
L'autorizzazione all'esecuzione dei lavori a caldo DEVE essere data da personale tecnico specializzato e formato sul rischio esplosione da polveri (in grado di verificare il rischio residuo, l'idoneità degli utensili e la conoscenza delle procedure). Il responsabile della sicurezza dovrà rilisciare un “permesso di lavoro fuoco” all’operatore.

4. Pericoli derivanti da circuiti in pressione (idraulici, pneumatici)

Durante le operazioni di manutenzione e/o riparazione occorre porre in scarico gli impianti e gli eventuali accumulatori, secondo le istruzioni riportate in prossimità dei componenti e nei rispettivi manuali d'uso.

5. Pericoli generati da rumore

E' fatto obbligo all'utilizzatore e al datore di lavoro di rispettare le norme di legge in termine di protezione contro l'esposizione personale quotidiana degli operatori al rumore (in Italia D.Lgs.277/91).

FAULT	ACTION
The vibrator does not start	Check the presence of compressed-air
	Check the presence of foreign elements in the piping or in the vibrator
The vibrator increase in noisiness	Check the fastening of the fixing screws and in case, make the supporting plate stiff
	Lubrificate the pneumatic line
The vibrator loose its vibrating effect	Check the feed pressure (MAX 6 BAR)
	Check the fastening of the fixing screws and in case, make the supporting plate stiff
	Lubrificate the pneumatic line

STÖRUNG	ABHILFE
Der Rüttler starts nicht	Die Druckluft kontrollieren
	Eventuelle Fremdkörper in der Leitung oder in den Rüttler kontrollieren
Mehr Rüttlergeräusch	Den Spanndruck der Befestigungsschrauben kontrollieren und die Stutzplatte eventuell verstärken
	Die pneumatische Vorrichtung schmieren
Verlust an Vibrierwirkung	Den Einlassdruck (MAX 6 BAR) kontrollieren
	Den Spanndruck der Befestigungsschrauben kontrollieren und die Stutzplatte eventuell verstärken
	Die pneumatische Vorrichtung schmieren

PROBLÈME	SOLUTION
Le vibrateur ne démarre pas	Vérifier la présence d'air comprimé
	Vérifier la présence d'éléments étrangers dans la tubuluru ou le vibrateur
Il rumore del vibratore aumenta	Vérifier le serrage des vis et éventuellement raidir la plaque d'appui
	Lubrifier la ligne pneumatique
Il vibratore cala l'effetto vibrante	Vérifier la pression d'alimentation (MAX 6 BAR)
	Vérifier le serrage des vis et éventuellement raidir la plaque d'appui
	Lubrifier la ligne pneumatique

PROBLEMA	SOLUZIONE
Il vibratore non parte	Controllare presenza aria compressa
	Controllare presenza elementi estranei nella tubazione o nel vibratore
Il rumore del vibratore aumenta	Controllare il serraggio delle viti di fissaggio ed eventualmente irrigidire la piastra di supporto
	Lubrificare la linea pneumatica
Il vibratore cala l'effetto vibrante	Controllare la pressione di alimentazione (MAX 6 BAR)
	Controllare il serraggio delle viti di fissaggio ed eventualmente irrigidire la piastra di supporto
	Lubrificare la linea pneumatica

SCRAPPING COMPONENT

- Before proceeding with disposal of the pneumatic vibrator, clean it thoroughly and dispose off the residual dust in accordance with the indications in the safety chart.
- The operators in charge of disposal must use suitable personal protection equipment.
- For scrapping or demolition of the component, separate the plastic parts (seals and components) and send these to special collection centres.
- The other parts must be sent for recycling ferrous materials.

VERSCHROTTUNG DES BAUTEILS

- Bevor das Druckluft Vibrator entsorgt wird, dieses vollkommen reinigen und den enthaltenen Reststaub in Übereinstimmung mit dem Sicherheitsdatenblatt entsorgen.
- Die Arbeitnehmer, die sich um die Entsorgung kümmern, müssen angemessene persönliche Schutzausrüstungen verwenden.
- Wenn der Bauteil verschrottet werden soll, sind die kunststoffhaltigen Teile (Dichtungen und Komponenten) auszubauen und über die entsprechenden Sammelstellen dem Recycling zuzuleiten.
- Die restlichen Teile sind als Eisenschrott zu behandeln.

DEMANTELEMENT DU COMPOSANT

- Avant mettre le vibrateur pneumatique à la décharge le nettoyer complètement et éliminer les poussières restantes conformément aux indications fournies par la fiche de sécurité.
- Les personnes préposées à la mise à la décharge doivent porter des dispositifs personnels de protection appropriés.
- - En cas de mise à la décharge ou de démantèlement du composan, il faut démonter les pièces en matière plastique (joints et composants) et les mettre à la décharge dans des déchetteries spécialisées.
- Les pièces restantes sont à destiner à la récupération des matériaux ferreux.

ROTTAMAZIONE COMPONENTE

- Prima di procedere allo smaltimento del vibratore pneumatico provvedere alla sua completa pulizia ed allo smaltimento delle polveri residue in accordo con le indicazioni della scheda di sicurezza.
- Gli operatori addetti allo smaltimento devono indossare dispositivi di protezione personale adeguati.
- In caso di rottamazione o demolizione a fine vita del componente, avere cura di smontare le parti in materiale plastico (guarnizioni e componenti) e destinarle agli appositi centri di raccolta.
- Le restanti parti sono da destinare al recupero dei materiali ferrosi.

RETURNING THE MACHINE

When returning the component, use the original packaging if it has been preserved, otherwise place it in a box and cover it with nylon shrink-wrap, to protect it as best as possible from impact during transport. In any event, make sure there is no residue material inside the component.

RÜCKGABE DES GERÄTES

Falls der Bauteil zurückgegeben werden soll und man die Originalverpackung aufbewahrt hat, ist er darin einzupacken. Andernfalls ist er in einen Karton zu packen und mit Schrumpffolie zu schützen, wobei man versucht, sie so gut wie möglich vor etwaigen Stößen beim Transport zu schützen. Auf jeden Fall sicherstellen, dass sich keine Materialreste mehr in der Bauteil befinden.

RESTITUTION MACHINE

En cas de restitution du composant, si l'emballage a été conservé, le remettre dans celui-ci, sinon le mettre dans une caisse et le protéger avec du nylon thermorétractable, en essayant de la protéger le plus possible contre les chocs provoqués par le transport. Dans tous les cas s'assurer que la machine ne contient pas de résidus de matière.

RESO MACCHINA

In caso di reso del componente se si è conservato l'imballo reinserirla nello stesso, altrimenti inserirlo in una scatola e proteggerlo con del nylon termoretraibile, cercando di proteggerlo al meglio da eventuali urti derivanti dal trasporto. In ogni caso assicurarsi che il componente non abbia residui di materiale.

N.B. Rights reserved to modify technical specifications
N.B. Angaben ohne Gewähr. Änderungen können ohne Vorankündigung vorgenommen werden.
N.B. Toutes données portées dans le présent catalogue n'engagent pas le fabricant. Elles peuvent être modifiéés à tout moment.
N.B. Tutti i dati riportati nel presente catalogo non sono impegnativi e possono subire variazioni in qualsiasi momento.

DISCHARGE ROTARY VALVE

# Sinox :	49730.999.901
Valve type:	ACS VALVES,Rotary Airlock
Valve dimension :	8’’
Motor size:	0.75
Speed :	20 RPM
Quantity per receiver:	1x

Installation, Operation & Maintenance Manual

ACS Rotary Airlock Valve/Feeders

ACS VALVES

Introduction

These instructions are intended to familiarize the user with the product and its permitted use. Operating the product in compliance with these instructions helps to ensure reliability in service and avoid risks. Installation and maintenance of equipment should always be performed by qualified personnel in compliance with applicable codes and regulations.

Equipment owners are responsible for understanding the contents of this document and compliance with applicable government laws and regulations and appropriate industry standards.

Control of the equipment must be in accordance with OSHA Standard 1910.147 "Control of Hazardous Energy (Lockout-Tagout)" or similar hazardous energy control procedure as defined by CSA or ANSI. "Lockout/Tagout" refers to specific practices and procedures to safeguard employees from the unexpected energization or startup of machinery and equipment, or the release of hazardous energy during service or maintenance activities. This requires, in part, that a designated individual turns off and disconnects the machinery or equipment from its energy source(s) before performing service or maintenance and that the authorized employee(s) either lock or tag the energy- isolating device(s) to prevent the release of hazardous energy and take steps to verify that the energy has been isolated effectively.

Rotary Valve for Metering, Feeding and Airlock Applications

ACS valves are designed and built to application-specific requirements, including custom rotor configurations, factory-applied internal coatings, and sanitary materials of construction.

Safety First

SAFETY ALERT SYMBOLS

This Safety alert symbol is used to call your attention to an important safety message on equipment, safety decals and in manuals, to warn you of possible danger to your personal safety. When you see this symbol, be alert; your personal safety or the safety of the other persons is involved.

THE FOLLOWING DEFINITIONS FOR IDENTIFYING HAZARD LEVELS ARE:

DANGER (RED) – Danger is used to indicate the presence of a hazard that WILL cause SEVERE personal injury, death, or substantial property damage of the warning is ignored.

WARNING (ORANGE) – Warning is used to indicate the presence of a hazard that CAN cause SEVERE personal injury, death, or substantial property damage if the warning is ignored ends maintenance cycles.

CAUTION (YELLOW) – Caution is used to indicate the presence of a hazard that WILL, or CAN cause MINOR personal injury or property damage if the warning is ignored.

SAFETY PRECAUTIONS

Prior to starting work on the equipment, we recommend the following:

1. Always de-energize all electrical equipment by following lock out/tag out procedures. If working on a quick clean design valve, disconnect all sources of power before cleaning or performing maintenance on your quick clean valve.
2. Do not operate rotary airlock valves & feeders with the inlet or the outlet flange openings unguarded or disconnected from system components. Inlet & outlet flange guards are mandatory. These flange guards are available for purchase upon request.
3. Always allow equipment to come to a complete stop. Never attempt to artificially brake the motion of the equipment.
4. Warning labels must be located on the equipment and near access openings to remind operating personnel of the risk.
5. Block the rotor from turning if the drive chain is disconnected or the gear drive has been removed.

HAZARD WARNINGS AND SAFETY PRECAUTIONS

The safety warnings below are basic guidelines and by no means all inclusive. National and local safety codes and even common sense should be used by qualified personnel to carry out installation and maintenance of the equipment. The hazards listed below are the most likely to be encountered during installation, operation and maintenance of your equipment.

Shear Hazard

There are shear points wherever the rotor and housing meet. Contact with moving rotor blades will amputate fingers, hands, arms or legs and may result in death. Accidents can occur when operators reach through upstream or downstream equipment mounted adjacent to the valve through access openings to clean or remove blockage.

Drive Chain Hazard

There are pinch points where the chain and sprocket engage. Exposed moving parts can cause severe injury or death. Never operate the valve without the guard installed. Follow Lockout/Tagout procedure before removing guard.

Exposed Rotating Shafts

Exposed shaft locations exist at the seal access area and tail shaft. Contact with rotating shafts can crush or amputate fingers, hands or arms. Avoid touching or contact with the exposed shaft. Tail shaft guards are available as an option.

Electrical Hazard

Electrocution accidents are most likely during maintenance of the electrical system. Follow Lockout/Tagout procedures before working on the equipment.

Automatic Startup of the Valve - Quick Clean on Rail Design

Rotary airlocks are often controlled by an automated system and may start without warning. Ensure that Lockout/Tagout procedure is followed before working on the equipment. The quick clean on rail design is specifically designed for ease of cleaning by the operator without tools. There is a factory supplied safety switch for protection of personnel and equipment which must be installed and operational to prevent accidental start-up of the valve.

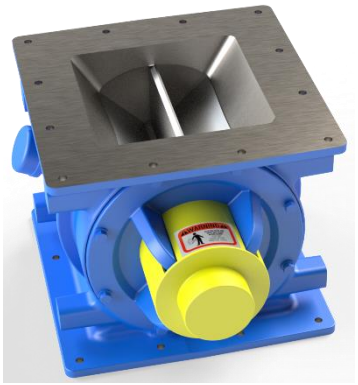
Pressurized System

Danger from opening of equipment if the process is under pressure or from compressed air. Ensure that process pressure has been relieved prior to opening unit.

ACS VALVES

SAFETY LABELS AND GUARDS

This piece of equipment contains several warning decals located in many different locations. It is the owner/operator's responsibility to maintain the integrity of these decals and to ensure that all operators of the equipment are aware of them and understand their meaning. Replacement decals are available free of charge by calling customer service department at 1-800-655-3447 or 1-905-765-2004.



This piece of equipment may contain one or more safety guards to protect the operator(s) from injury. It is the owner/operator's responsibility to maintain and ensure that they are in place when the equipment is in operation. If you have any safety or operational questions related to the design or applications of the Rotary Airlock Feeder we encourage you to contact our factory at 1-800-665-3447 or 1-905-765-2004.

General Information

Record the MODEL and SERIAL NUMBER of the ACS Rotary Airlock, including the same information for the auxiliary equipment (gearmotors, motors, sheaves size, type and any special modifications to standard).

For additional information, application assistance or special service, contact the factory. For ready reference, please record this information on the lines in the adjacent table. The SERIAL NUMBER is clearly indicated on the valve nameplate installed on the valve.

Typical Nameplate showing Serial Number location. Serial no. should be provided when consulting the factory

DATE OF DELIVERY

ACS VALVES

WARNING – All owners and operators should read this manual, or be instructed in safe operating and maintenance procedures, before attempting to uncrate, install, operate, adjust or service this equipment. Read All Instructions contained in this manual before installing and operating this equipment.

Receiving Your Equipment

Equipment should be carefully inspected immediately after receipt to make certain the unit is in good condition and all items listed on the packing list are included. All damages or shortages should be reported immediately to ACS. Purchaser should take immediate steps to file reports and damage claims with the carrier. All damages incurred to the units in transit are the responsibilities of the common carrier. Any claims for in transit damage or shortage must be brought against the carrier by the Purchaser.

HANDLING AND STORAGE OF YOUR EQUIPMENT

Moving the valve during unloading or installation site should always be done with the use of a hand truck, forklift or overhead crane with slings. Do not lift by its flanges or shaft. We recommend installing lifting eyes on the inlet flange for lifting chains or slings. Take care to prevent the unit from rotating due to unbalanced weight distribution.

Short Term Storage

If the equipment is not put into immediate use it should be stored in a clean, dry location. Care should be taken to keep the equipment covered when moving from a cold location to a warm location, otherwise condensation may occur. If condensation does occur, allow it to dry thoroughly before applying power. If the unit is not going to be installed shortly after arrival, it should be stored in a warm, dry location to protect from corrosion to the machined surfaces. Flange covers should be left in place until ready to install.

Long Term Storage

If the equipment storage is required for longer than 90 days, additional precautions are required.

1. Storage should be indoors in a temperature-controlled facility such as a warehouse or enclosed building.
2. Leave weatherproof covering in place. Keep vented parts exposed.
3. Make certain unpainted portions are covered and retouch any scratches or flaked areas.
4. If condensate plugs or drain plugs have been used, make sure they are operative.
5. Consult vendors instruction manual for guidance on recommendations for long term storage. i.e., If motor is equipped with space heaters make sure space heaters are properly connected and operative.
6. A systematic inspection and maintenance schedule should be established. If rotating apparatus is to be stored for 6 months or longer, it should, in addition to the precautions above, be given a visual inspection every month.
7. Contact ACS for recommendations where equipment has been in storage for periods longer than 12 months.

Design and Construction

Rotary airlock construction consists of a housing with two endplates, rotor and drive package. The housing has a top inlet and bottom outlet and is precision machined to provide close tolerances between the rotor and housing internal surfaces. The endplates have a raised face that extend into the body bore to provide sealing and proper alignment of the rotor. The rotor is a one piece design with multiple vanes that extend radially from the shaft to the housing. The rotor shaft extends through the endplates and is supported by two outboard bearings. Product sealing uses a glandless teflon sleeve with elastomeric seal rings.

Model Nomenclature

This is the model designation and size. A CI 12 is our CI series with a 12-inch inlet and outlet.

C.F.R.

Cubic Feet per Revolution, or the displaced volume of material that the airlock moves from inlet to the outlet in one revolution of the rotor. C.F.R. is calculated assuming that the rotor pockets are 100% filled; actual C.F.R. will vary due to pocket fill efficiency and rotor speed. Capacity can be determined by multiplying the C.F.R. by the speed and density of the product.

ROTARY VALVE CAPACITY (CUBIC FEET/HR.)

VALVE SIZE (INCHES)	ROTOR SPEED (RPM)									
6	6	30	48	60	72	84	96	108	120	132
8	12	60	96	120	144	168	192	216	240	264
10	24	120	192	240	288	336	384	432	480	528
12	45	225	360	450	540	630	720	810	900	990
14	66	330	528	660	792	924	1056	1188	1320	1452
16	84	420	672	840	1008	1176	1344	1512	1680	1848
18	162	810	1296	1620	1944	2268	2592	2916	3240	3564

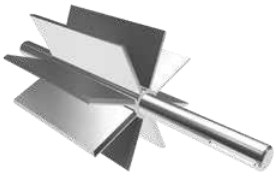
	1	5	8	10	12	14	16	18	20	22

Clearance

This refers to the measurement between the rotor vane tip and housing and/or endplate. The standard design clearances are 0.004"-0.007" for sizes up to 12" but these are increased for higher temperatures or special materials such as stainless steel.

Temperature Ratings



The standard temperature rating is 250 F. Special high-temperature airlocks rated at temperatures above 250 F are available on special order. Refer to the Order documentation for the temperature rating of your airlock

Rotor Types

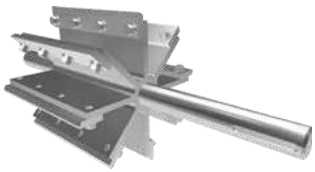
Several Rotor options are available including open or closed end design, adjustable or fixed vanes, additional vanes on higher differential pressure services, serrated vane edges, rounded pockets for sanitary services, flexible tips, reduced volume or metering styles and staggered pockets.

Open End Rotor

Open end rotors are easier to clean and maintain compared to closed end, which could ultimately lead to less material build up and wear on your valve. They are also better suited to mechanical seal applications. This is also a better option with lighter materials, as closed end rotors are more likely to have materials escape into the space between the endplates and the rotor disc.

Open End Rotor

Closed End Rotor

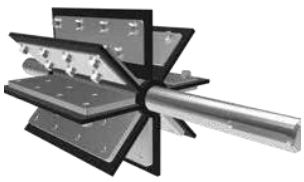


A closed end rotor has a round disc at both ends that are welded to the blades and shaft. There is a gap between the disc and the endplates that allows any material that does end up outside of the rotor to fall out the bottom easily. Closed end rotors are used with extremely abrasive material, and flake or chip material as the shield protects the outboard bearings and endplates from damage. It also prevents material from building up on the endplates, causing wear.

Closed End Rotor

Adjustable Rotor

With very harsh and abrasive material, tips will wear prematurely. With this type of valve, you can adjust the tips by sliding them up as they wear to keep them compliant and keep the clearance as close to their starting point as possible. This ultimately helps your valves last longer. This is available for open or closed type rotors.

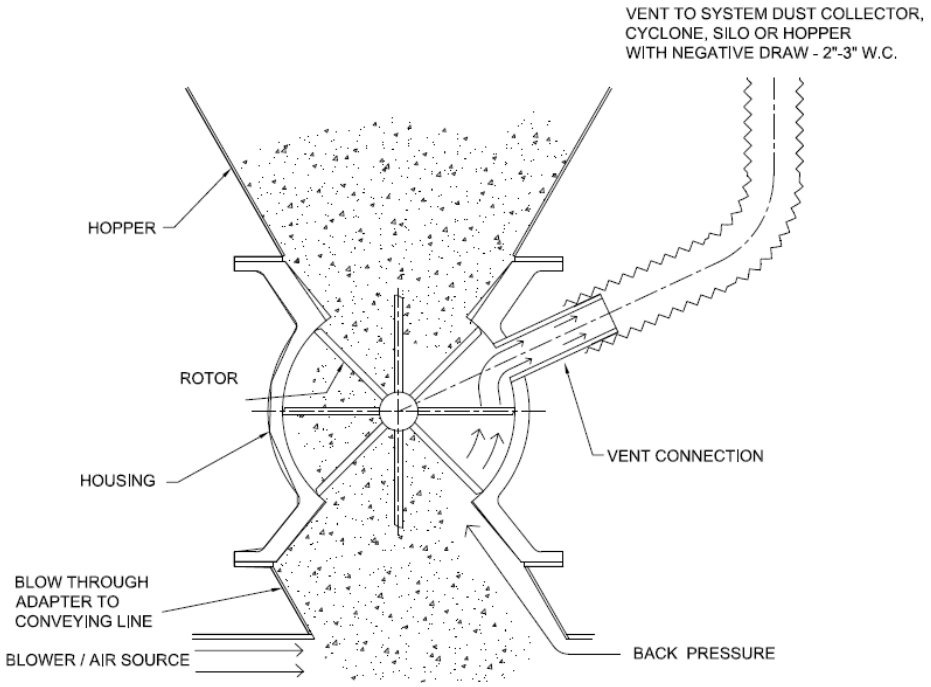


Adjustable Rotor

Flex Tip Style Rotor

There are a few different types of flex tip rotors, depending on what material you're working with, but various grades of EPDM, Polyurethane or Rubber Belting are the most common. The purpose of this type of rotor is to prevent material jams inside the valve. Unlike the helical rotor, which slices the jammed material, the flex tips can bend out of the way while moving the material through the valve and keeping a tight seal.

IMPORTANT: Flex Tip Rotors are not compliant for NFPA services.



Flex Tip Rotor

Operation

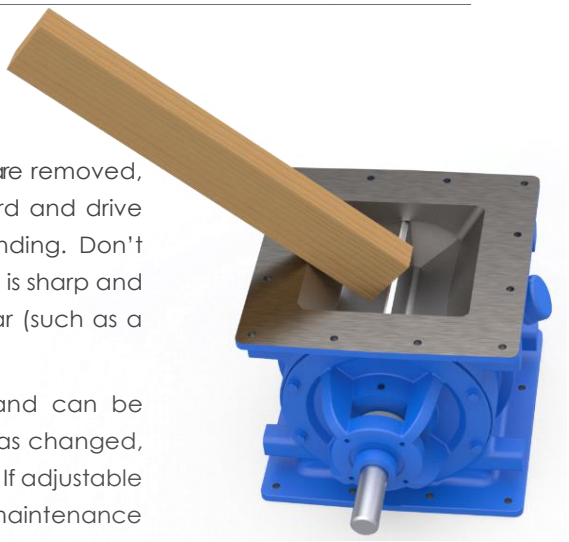
The Rotary Airlock is one of the most important units in your material handling system. The function of the airlock is to hold pressure or vacuum in a pneumatic system and to meter products into conveying lines or storage areas, (bins, tanks, hopper, etc.). The airlock operates by filling each rotor pocket with material at the high point of rotation and then empties into conveying lines or storage areas at the low point of rotation.

In the case of conveying lines, a blow-through is used to allow the velocity of the air to move the material through the conveying line. After each rotor pocket has emptied into the blow-through it still contains pressurized air. With some products, this air can escape up through the bulk material as soon as the edge of the rotor blade passes the edge of the inlet opening. The release of this pressurized air assists in maintaining a continuous flow of product to the airlock inlet. With some products, this air must be vented to atmosphere or to a system that has a negative pressure such as a dust collector, as it tends to prevent the flow of material into the airlock. The rotation produces a continuous flow of material at the discharge end of the conveying line.

The airlock rotor is precision machined to obtain the desired high degree of accuracy and close tolerance. Rotors may be supplied either with fixed or adjustable tips. The airlock rotor is mounted on bearings at each end of the rotor shaft. Rotor clearance is small to prevent excessive air leakage back to the product inlet.

Rotary Airlock Installed on Pressure Conveying Line with Vent

CAUTION – Equipment is shipped factory assembled. Accessories such as blow through adaptors may be mounted to the inlet of the valve for safe shipping even though they are designed to be mounted on the outlet of the valve.



Always check the general arrangement drawing, rotation arrows or contact ACS factory if there are any questions regarding how the equipment and accessories are to be installed and mounted.

Installation

Inspection:

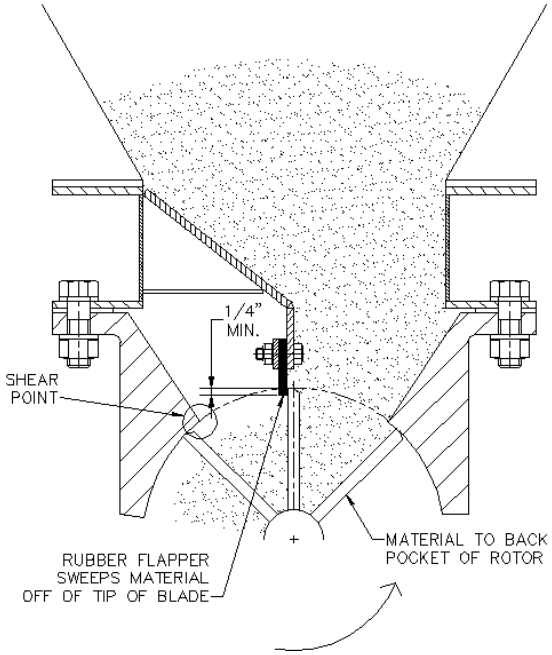
Once the protective flange cover and shipping materials are removed, check the valve and drive components. Remove the guard and drive chain to confirm that the rotor turns freely without any binding. Don't attempt to turn the rotor assembly by hand as the rotor vane is sharp and can easily cut or pinch hands or fingers. Use a soft push bar (such as a wooden 2 x 4) to ensure that it rotates freely.

The as-built clearance is recorded on the inlet flange and can be measured with feeler gauges. If the clearance measured has changed, this is an indication that the rotor has shifted during shipment. If adjustable tips are provided, re-adjust as per instructions found in maintenance section of this manual. If airlock clearances and rotations are correct, replace chain drive, position and anchor package.

After removing the protective flange cover, use soft push bar to turn the rotor

Mounting to Inlet and Discharge:

Numerous types of bulk materials feeding devices can be connected to the inlet opening of an airlock. Bins, hoppers, mixers and screw conveyors can be adapted for attachment to the airlock by rigidly attaching to the airlock flange using silicone caulk or flexible gasket to obtain an air-tight connection. Be sure all seams in the feeding device are air-tight. Moving feed devices such as sifters require special consideration to support the valve and a flexible connection.

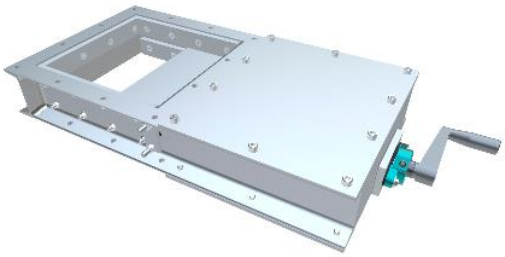


If the airlock package is to be hung from a hopper, storage tank, etc. it may be necessary for some type of structural steel support. However, in most cases, the hopper or tank flange will have enough strength to support the weight of the airlock package. It is not good practice to use the airlock to support equipment loads either in compression on the top flange or in tension from the bottom flange. Excessive loads will cause the housing to distort, which will cause reduced clearance with the rotor. This will result in excessive noise, binding and galling. Flanges of components, which attach to the airlock must be flat and "square" with the airlock flanges. The flanges of the airlock housing should never be forced in place or attached to warped or twisted mating connections. This practice can result in broken airlock housing or loss of clearance as noted above.

If the airlock is to be installed with either the inlet or discharge exposed, a guard must be mounted to the appropriate flange to reduce the risk of personal injury to operators, maintenance personnel and others who may be near the equipment. Any object placed in the inlet area or discharge area of the airlock will be sheared off. Inlet and discharge guards are available from ACS. Contact Sales for further information.

Accessories

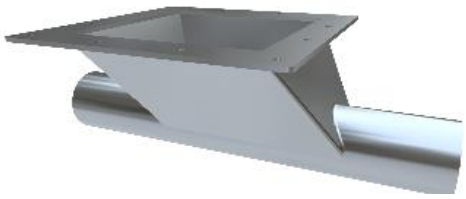
Inlet Shear Protector



Prevents shearing of material, as well as jamming of material in rotor clearances. Available for various flange configurations and materials, flat or spool style, vented or without. The vented style is provided for connecting to a vent sock or dust collection system where pressure from the discharge can disrupt material entering the inlet. It is designed to be bolted above the inlet using sealant or flexible gaskets. Available for square (CI) or round (MD), vented,

Inlet Shear Protector

Maintenance Slide Gate



Designed for gravity-flow applications; variable slide gate actuation settings enable partial material flow, as well as full-open or closed settings. They allow the airlock to be removed or serviced without removing material from the feed hopper. Available in various configurations, materials. Manual, air or electric actuators are available. The slide gate is installed directly above the inlet and the mounting arrangement can be oriented for easier access.

Maintenance Slide Gate

Blow Through Adapter

Adapter to connect the discharge of the rotary valve to a pneumatic or vacuum conveying line. Install using sealant or flexible gasket and through bolts.

Blow Through Adapter

Flange Guard

Mandatory safety feature for rotary valves with an open or exposed discharge. Available in steel or stainless steel construction. They are designed to mount directly on the inlet or discharge with sealant or flexible gasket.

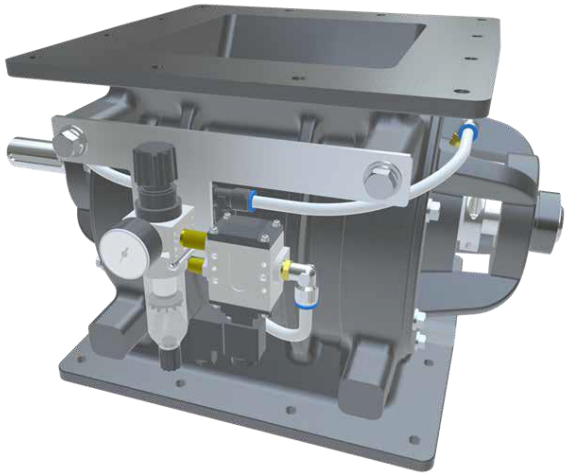
Flange Guard

Zero Speed Switch Assembly

Shaft speed-monitoring device, which signals when the shaft has stopped rotating. The switch is mounted on the non-drive end of the valve. Typically, the drive shaft is drilled and tapped for mounting but there is an optional magnetic mounted connector for field retro-fit.

Standard assembly includes: motion switch, target, bracket and guard.

Refer to manufacturer's instruction manual for installation and maintenance or settings.



Zero Speed Switch Assembly

Air Purge Kit

The Air Purge Kit is used to provide compressed air the shaft seal area and/or rotor pocket on airlocks with either open or closed end rotors. This kit may also be used to provide compressed air to the end plate cavity on the airlocks with closed end rotors. The Air Purge Kit includes a Filter/ Regulator, 0-30 psi pressure gauge, poly tubing and miscellaneous push to connect fittings.

Rotor Pocket Purge Kit

Shaft Seal Purge Kit

WARNING – Equipment must be wired in accordance with local, state and national electrical codes to the appropriate power circuits before it can be operated. This installation is the responsibility of the airlock owner. Installation must be done by qualified personnel who are familiar with proper installation practices of the equipment and with the control functions of the devices they are installing.

Initial Start-up Procedure

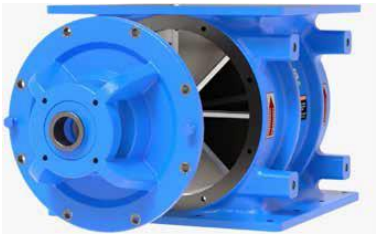
Prior to Starting

1. Remove the drive guard. Make sure that the drive chain is properly tensioned. If this is a direct drive unit, skip to 4.
2. Check tension in drive chain. There should be 3/8 to ½" slack in the top of the chain. Adjust if necessary.
3. Make sure the chain is properly lubricated. The chains are pre-lubricated by the vendor.
4. The gearmotors are shipped filled with oil. Check the oil level in the drive gearbox and top off if necessary. Oil level and drain plugs must be accessible. Remove any shipping provisions from the breather plug. Refer to the manufacturer's instructions included with the shipment.
5. Make sure that the airlock, feed device, and conveying line are free of foreign material.
6. Verify that all electrical connections have been properly made.
7. Replace all guards and covers.

Start-Up

1. Energize the electrical service (and instrument air if applicable.)
2. Jog the airlock to verify the direction of rotation is correct. Listen for sounds of unwanted mechanical contact and correct if necessary. Reverse operation can result in jamming and possible motor overload.
3. Start the airlock and operate it for a period with no load. Check for excessive noise or other indications of improper operation. Investigate and correct if necessary.
4. Start feed device or fill the hopper. As material flows into the airlock, listen for excessive noise or other indications of improper operation. Investigate and correct.
5. Verify that the current draw of the motor does not exceed its full load amp rating. Refer to motor nameplate for rating.
6. While the system is operating check for air leaks. Correct as needed.
7. Monitor the operation of the main components for heat, noise or vibration as these are indications of a potential problem.

WARNING – Prior to beginning any service or maintenance activities, ensure that "Lockout/ tagout" procedures have been completed to safeguard employees from the unexpected energization or start-up of machinery and equipment. If working on a quick clean design valve, disconnect all sources of power before cleaning or performing maintenance on your quick clean valve.



Maintenance Procedures

Regular maintenance is important to the operation and life of your airlock. Areas requiring regular inspection and maintenance are the rotor clearance, seals and/or packing and the drive package including motor, gear and drive chain.

General Disassembly Procedure

1. Remove the auxiliary equipment (zero speed switch, air purge piping) if supplied.
2. For chain driven units, loosen and remove chain drive guard.
3. Loosen the 4 tensioning nuts at the motor mount until there is slack in the chain. Remove the chain and rotor sprocket from drive shaft.
4. For direct driven units, remove the gearmotor. Remove the end cap from the gearmotor. **NOTE:** some models (FT Direct Drive) use a retaining bolt and lock washer in the end of the shaft which must be removed first.
5. Remove the (4) hex bolts located on mounting plate. Use the (2) 3/8"-16 NC threaded holes for installing jacking bolts to separate the gearmotor from the mounting plate.
6. While supporting the weight of the gearmotor, move the gearmotor away from the mounting plate and remove from driveshaft once it is clear.
7. With the gearmotor removed, the motor mounting plate is accessible. Remove fasteners and motor mount.

Removing Endplates

Removing Endplates

1. Remove bolts that attach end cover to housing.
2. Loosen and remove bearing lock collar. Remove set screw from collar and flatten the mark formed by set screw using a small flat punch. Loosen collar by rotating collar in direction opposite shaft rotation. Use drift pin in the non-threaded hole. Tap with hammer to rotate collar. Slide collar off shaft.
3. If equipped with an ACST-4 Shaft Seal, use a 1/4" Allen key (5/16" for larger valves) loosen the lock collar clamping the teflon seal to the shaft (both sides). NOTE: On valves equipped with "Push Type" seal assembly, loosen the pusher nuts, allowing pusher to retract from teflon packing.
4. Attach wheel puller behind bearing housing. Tighten slowly until cover moves away from housing. If cover tends to bind on shaft, tap puller bolt with rubber mallet as you tighten.
5. With the endplate removed, the rotor and housing is accessible.

Removing Rotor

The rotor can be removed if damaged or clearances are worn. Usually the drive side is pulled to avoid removing drive sprocket, but the procedure is similar for both cases. The rotor should be accessible from the inlet or outlet side of the housing.

1. Remove the auxiliary equipment and drive package. Refer to general disassembly procedure.
2. Loosen and remove bearing lock-collar on non-drive end. Remove set screw from collar and flatten mark formed by set screw using a small flat punch. Loosen collar by rotating collar in the same direction as the shaft rotation. Use drift pin in the non-threaded set screw hole and tap with hammer to rotate collar. Slide collar off shaft. Remove any burrs left from the set screw.
3. For airlocks supplied with packing gland seals, loosen the packing gland bolts (2 ea.) on the non- drive side. For airlocks with Teflon shaft seals, loosen the shaft seal collar, located within the end plate bearing port.
4. Remove the bolts on end cover (side to be pulled).
5. Attach wheel puller behind bearing housing. Tighten slowly until cover slides off shaft. If cover tends to bind on shaft, tap puller bolt with rubber mallet as you tighten.
   Note: Larger model sizes have jacking holes to assist with removing the endplate.
6. Slowly remove rotor from housing.

Replacing Rotor

1. Carefully check to see if rotor or housing have burrs. (shaft, blade tips, shrouds, and housing matching surfaces). If burrs are found, file them smooth using a fine file and then polish with emery paper.
2. Wipe off rotor and shaft to clean any foreign material. Also, check end cover to see that matching edges to housing are clean.
3. Gently slide rotor into housing. Rotor normally will not slide the last few inches easily. Use a rubber mallet to move rotor vanes past the end of the housing, far enough to start end cover bolts. Install endplate,
4. Centre rotor in housing by tapping end of shaft. Check end clearance with feeler gauge or dial indicator in case of a closed rotor and re-position until the end clearance is equal.
5. Tighten bearing lock collars in the direction opposite to shaft rotation.
6. Tighten packing gland bolts evenly or tighten shaft seal collar.
7. Turn rotor by hand. Check clearances and see that rotor turns freely in housing. If rotor does not turn freely, adjust as necessary.

Replacing Bearings and Seals

Our standard design uses sealed permanently lubricated bearings and ACST-4 seals consisting of a PTFE (teflon) sleeve and 3 quad rings with shaft collar which require replacement when worn. It's recommended to always replace the seals and bearings at the same time.

1. Remove endplate from housing as described in procedure REMOVING ENDPLATES.
2. The bearing, split locking collar, teflon bushing and quad ring seals will come out with the endplate.
3. Remove bearing by pressing away from the seal arrangement. Use of a small diameter soft punch can also be used to "drive" the bearing out of its seat.
4. Pry the lock collar off teflon seal and set aside. Pry the teflon seal straight up and out of the quad ring assembly. Remove quad rings by poking with a sharp object and prying out of seat. Repeat for remaining two (2) rings.
5. Install new quad rings and Teflon sleeve in end plate. Apply a small amount of lubricant to the teflon seal and gently push into the quad ring bore.
6. Install teflon seal lock collar.
7. Align bearing with machined hole in end cover taking care to make sure of direction and orientation before pressing the new bearing in place.
8. Install endplate onto driveshaft, move into position, install and tighten fasteners.
9. Slide bearing collar on shaft. Rotate the collar in the opposite direction of shaft rotation until eccentric faces of collar and inner bearing ring engage.
10. Check clearances and see that rotor turns freely in housing. If rotor does not turn freely, adjust as necessary.
11. Lock the bearing in place by rotating the collar using a drift or flat punch in the non-threaded hole and tapping the collar with a light weight hammer in the opposite direction of rotation until snug. Tighten set screws.
12. Position teflon sleeve and shaft seal collar. Tighten seal collar.

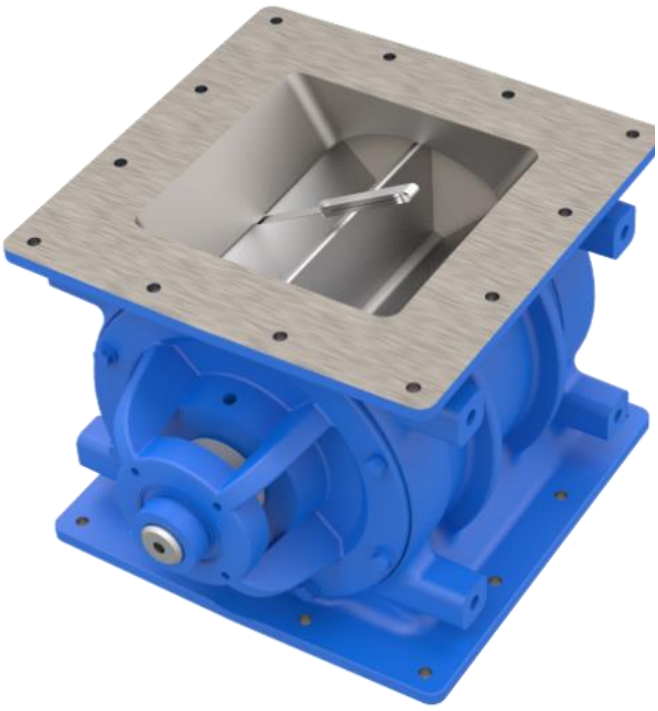
Rotor Machining

Rotor machining may be required if there are operating problems caused by the rotor clearances being too small for the application. In this case the rotor can be removed and machined to suit. **Please contact ACS for directions and instructions.**

CAUTION –The rotor is precision machined to extremely close operating clearances between the rotor vane tips and the housing. Take extra care to protect the shaft center holes on the rotor in the event there is repairs or rework needed.

Checking Rotor Clearance

Rotor clearance should be checked as part of the maintenance program as increased clearance will affect the performance. Rotor clearance should be within the allowable range as indicated in the table below (See table or if your model isn't shown contact ACS) determined by its size and design operating conditions.



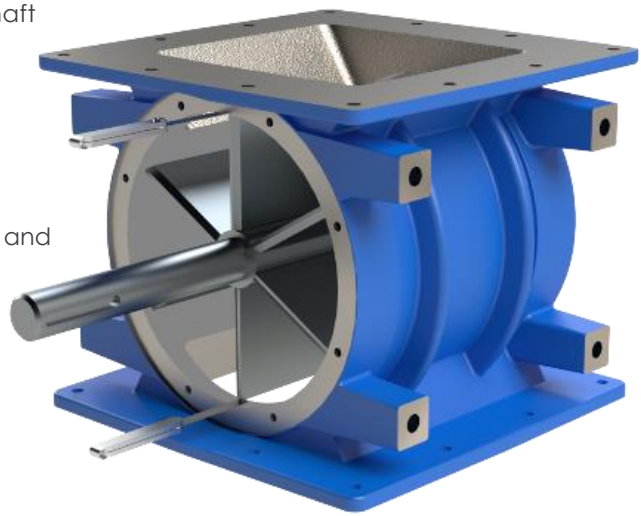
Fixed and flexible tip rotors have no adjustment at tips but should be checked for wear or damage to determine if the airlock is functioning in the system properly.

ROTOR CLEARANCE		
Model & Size	**Standard**	**High Temperature**
CI / MD / DR-S 4 through 12	0.004" to 0.007"	0.007" to 0.010"
CI / MD 14 through 16	0.007" to 0.010"	0.012" to 0.016"
CI 18 through 22	0.012" to 0.016"	0.016" to 0.020"
CI 24 through 30	Refer to Factory	Refer to Factory

If the inlet or outlet of the valve is accessible, the clearances can be measured directly through this opening. Remove the drive guard and disconnect the drive chain (if applicable).

1. Number each blade for ease of checking and measure the gap between the rotor blade and housing at each end of the blade and center.
2. Check the inlet and outlet. Measure the side clearance between end of the blade and the endplate.

   Increased clearances will allow more leakage through the airlock resulting in reduced performance. The allowable loss of performance will indicate when repair or replacement is required.

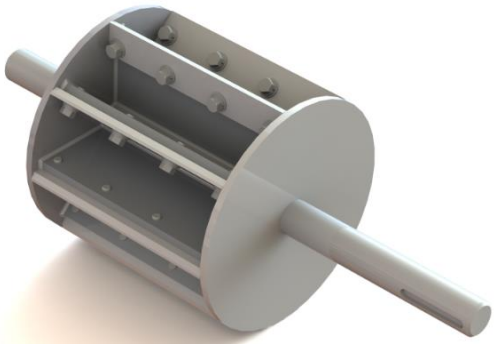


Checking clearance of rotor with feeler gauge

If the inlet or outlet is not accessible, inspection is performed with the endplate removed. It's easier to do this from the tail side (non-drive end) as it's not necessary to remove your drive package.

1. Loosen, but don't remove the shaft seal and bearing locking collars on both ends as described in the general disassembly procedure.
2. To measure the clearance between the rotor and the endplate, attach a dial indicator to the end of the shaft and push the shaft towards one endplate.
3. Set the indicator to zero and then push the shaft towards the other endplate. The indicator will show the total clearance. The side clearance is half the total measurement.
4. Remove tail side endplate by following the disassembly procedure.
5. Insert the feeler gauges between the housing and both the bottom and top rotor blades until you feel friction from both feeler gauges.

Side clearance check with indicator

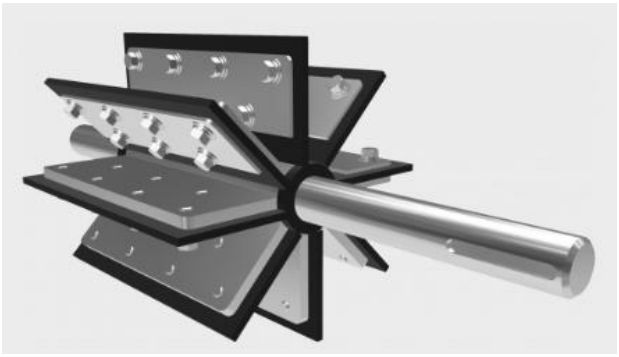


Clearance check with endplate removed with feeler gauges

Adjustable Rotor Tip Clearance

Airlocks equipped with adjustable rotor tips can have their clearances renewed when worn for extended operating life.

1. With the drive chain disconnected, number the blades as a means of showing when the adjustment has been completed. Loosen, but do not remove the fasteners.
2. Insert 2 sets of the appropriate size of feeler gauge between the rotor tip and housing on the inlet side. One at each end. Push blade against the feeler gauge and tighten fasteners.
3. Turn rotor so that the same blade appears on the outlet side and measure the clearance to determine which position is tighter. Adjustment should be made on the remaining blades from the side of the airlock that is tighter.



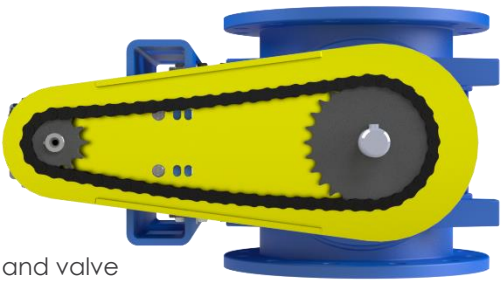
Adjustable Rotor-Closed type

4. Make a final check of clearances by turning the rotor and checking each blade at each end, center and both sides of the housing.

Adjustable Rotor Tip Adjustment and Replacement

For adjustment of rotor clearances, see Checking Rotor Clearance

1. Remove drive guard and chain.
2. Remove the rotor blade fasteners and rotor vanes to be replaced. It is recommended that you replace the backing plates and hardware in the same position they were removed.
3. Make sure the blades are on the leading edge of the rotor.
4. Fasten the new blades onto the valve using a thread adhesive. As you tighten each bolt, ensure the blade is centered between end caps.
5. Begin tightening the bolts one at a time starting from the end caps. Note that flexible material expands when it's tightened so take care not to over compress the vane tips.
6. Turn rotor by hand all the way around. Be sure the clearance is not any less for the full rotation. When tightening each bolt and blade, ensure the rotor can be turned by hand.



Flexible Tip Rotor

7. Repeat this procedure until all blades are installed and rotor can still be turned by hand.
8. Replace chain.
9. Adjust motor plate & replace guard.

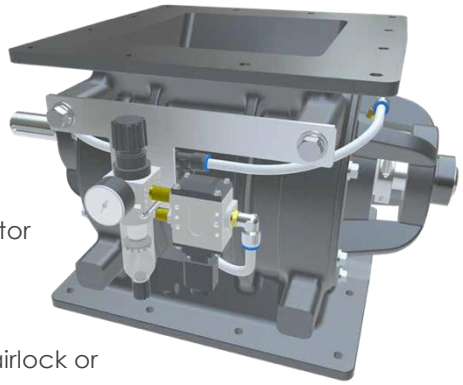
Checking and Adjusting Drive Chain

Check tension of airlock drive chain every 200 hours of operation. Chain tension will change due to normal wear.

Drive Chain

1. Remove chain guard. Airlock drive chain should have a small amount of slack (3/8" to 1/2") between gearmotor and valve sprockets. The chain should be loose enough to allow a slight up and down motion with hand pressure applied midway between sprockets. To adjust airlock drive chain, loosen two bolts securing gearmotor and change position of gearmotor to obtain desired degree of tightness. Tighten mounting parts and reinstall chain guard.
2. Chain manufacturer's guidelines recommend to clean and lubricate the chain periodically.

Zero Speed Switch



Refer to the manufacturer's instruction manual for installation details. If sensor does not detect Whirligig Target check the sensing range of the sensor being used and move sensor closer to the target.

Gear Drive and Motor

Inspect, lubricate and service the gear drive and motor in accordance with the manufacturer's instructions.

Air Purge Pressure Adjustment

Shut off the compressed air supply and bleed off air pressure before attempting to install or service the air purge assembly. After installation is complete and while the filter/regulator is shut off completely, the air supply should be turned on.

Purge Kit

1. After verifying that all connections are tight the regulator should be adjusted to provide the appropriate purge pressure to the airlock using the following guidelines.
2. Initial setting, prior to conveying product through the airlock or system should be 5 PSIG.
3. If the airlock is either receiving product from or discharging product to a pressure system, the regulator should be set at 5 PSIG above the system conveying pressure.
4. If the airlock is used in a gravity flow application or is receiving or discharging only to a vacuum system, the regulator should remain set at 5 PSIG.

AIR PURGE ASSEMBLY FOR AIRLOCKS WITH OPEN OR CLOSED END ROTORS		
Item	**Qty**	**Description**
1	1	Filter/Regulator with gauge and bracket
2	1	3/8" Male Branch Tee Poly fitting
3	4 ft.	3/8" O.D. Seal Tubing
4*	2	3/8" PTC to 1/8" MNPT Connector
5	1	0-30 PSI, 2" Face, 1/4" CTR Back Gauge
6**	2	3/8" Poly to 3/8" MNPT Connector
7**	2	3/8" Union Tee
8**	2	3/4" x 3/8" Hex Bushing
	1	Air Purge Kit (includes items 1 thru 8)

Please Note: *Fittings for purging shaft seal **Fittings for purging end plate cavity

ACS Rotary Valve Lubrication Chart

Standard bearings on CI and MD series airlocks are sealed for life bearings and do not require lubrication, but greaseable bearings are supplied according to the service conditions.

The following chart is a list of oil lubrication product suppliers including a maintenance schedule for gear reducers based upon an ambient factory atmosphere and normal factory operating conditions. This chart is only a suggested list of suppliers and maintenance schedule times, end users may select from their own list of supplier products and adjust the recommended scheduled maintenance times to suit their own facility conditions.

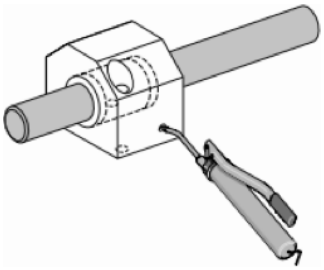
S37(0.25), S47(0.35) S57(0.50), S67(1.00) S77(1.90), S87(3.30) SAF series standard M4 Pos. SAF37(0.50), SAF47(1.00) SAF57(1.50), SAF67(2.90) SAF77(5.80), SAF87(10.80)	Check oil every 3,000 hrs. Replace oil every 10,000 hrs.
	High temperature (-20°C to +80°C)	Shell Omala S4 WE 680 Mobil Glygoyle 680 Castrol Optiflex A 680		Check oil every 3,000 hrs. Replace oil every 6,000 hrs.
	Low temperature (-40°C to +30°C)	Shell Omala S4 GX 150 Mobil SHC 629 Castrol Optigear Synthetic X 150		Check oil every 3,000 hrs. Replace oil every 18,000 hrs.

The following chart is a list of grease lubrication product suppliers including a maintenance schedule for bearing and roller chains based upon an ambient factory atmosphere and normal factory operating conditions. This chart is only a suggested list of suppliers and maintenance schedule times, end users may select from their own list of supplier products and adjust the recommended scheduled maintenance times to suit their own facility conditions.



BEARINGS AND ROLLER CHAIN				
Component	**Application**	**Oil or grease type(s)**	**Quantity (ml)**	**Frequency (hrs)**
Greaseable Insert Bearing	Standard (-30°C to +130°C)	Shell Alvania RL2 Mobil Mobilith SHC 220 Castrol Tribol 4020-220-2	ø1.000" (20), ø1.500" (30) ø1.938" (35), ø2.438" (38) ø2.500" (40), ø2.938" (45)	Grease every 3,000 hrs.
	High temperature (-20°C to +180°C)	Shell Stamina RL2 Mobil Mobiltemp SHC 100 Castrol Tribol 4747-220-2		Grease every 2,200 hrs
	Food grade (-10°C to +100°C)	Shell Cassida Grease RLS2 Mobil Mobilith SHC 220 Castrol Molub-Alloy 823-2 FM		Grease every 2,200 hrs
Linear Bearing sets for Quick Clean RotorRail Design	Standard (-20°C to 80°C)	NLGI 00 or 2, DIN 51818 or DIN 51825, KP2K-20 Lithium based High Performance grease	Lubricate on shaft until lubricant emerges	Grease every 3,000 hrs. See Note
Roller Drive Chain	Manual lubrication where the user applies oil periodically with a brush or aerosol spray. Roller chain manufacturer's recommend frequency is once every eight hours, but a longer interval may be used if experience shows it is adequate. The amount of oil and the frequency of its application must be adequate to prevent the formation of a reddish brown discoloration in the chain joints. Manufacturer's recommend high quality oil be used. SAE 20 is recommended for ambient temperatures below 32 F (0 C), SAE 30 from 32 to 104 F (0 to 40 C) and SAE 40 The chain should be periodically cleaned with a petroleum cleaner and inspected.			

Note:

Linear bearing sets for quick clean on rails come pre- lubricated by the manufacturer. Service lubrication intervals are dependent on the severity of the service and the environment they are installed. Monitor the lubrication condition of the Linear Bushings and Linear Sets after start-up. If necessary, adapt the lubrication intervals.

Between in-service lubrication intervals, check that:

- there is no dirt, even coolants/ cutting fluids can be critical;
- no chips can become trapped around the Linear Bushing guideway;
- there is no red-brown discoloration of the lubricant. if there is, lubricate immediately, increase the lube quantity, reduce the lubrication interval, ask for advice if in doubt;
- the seals are functioning correctly.

Clean shafts and shaft support rails if necessary.

Troubleshooting

Inspection and repair procedures given below provide guidance for restoring the package to peak operation. In many cases, repair consists of component replacement.

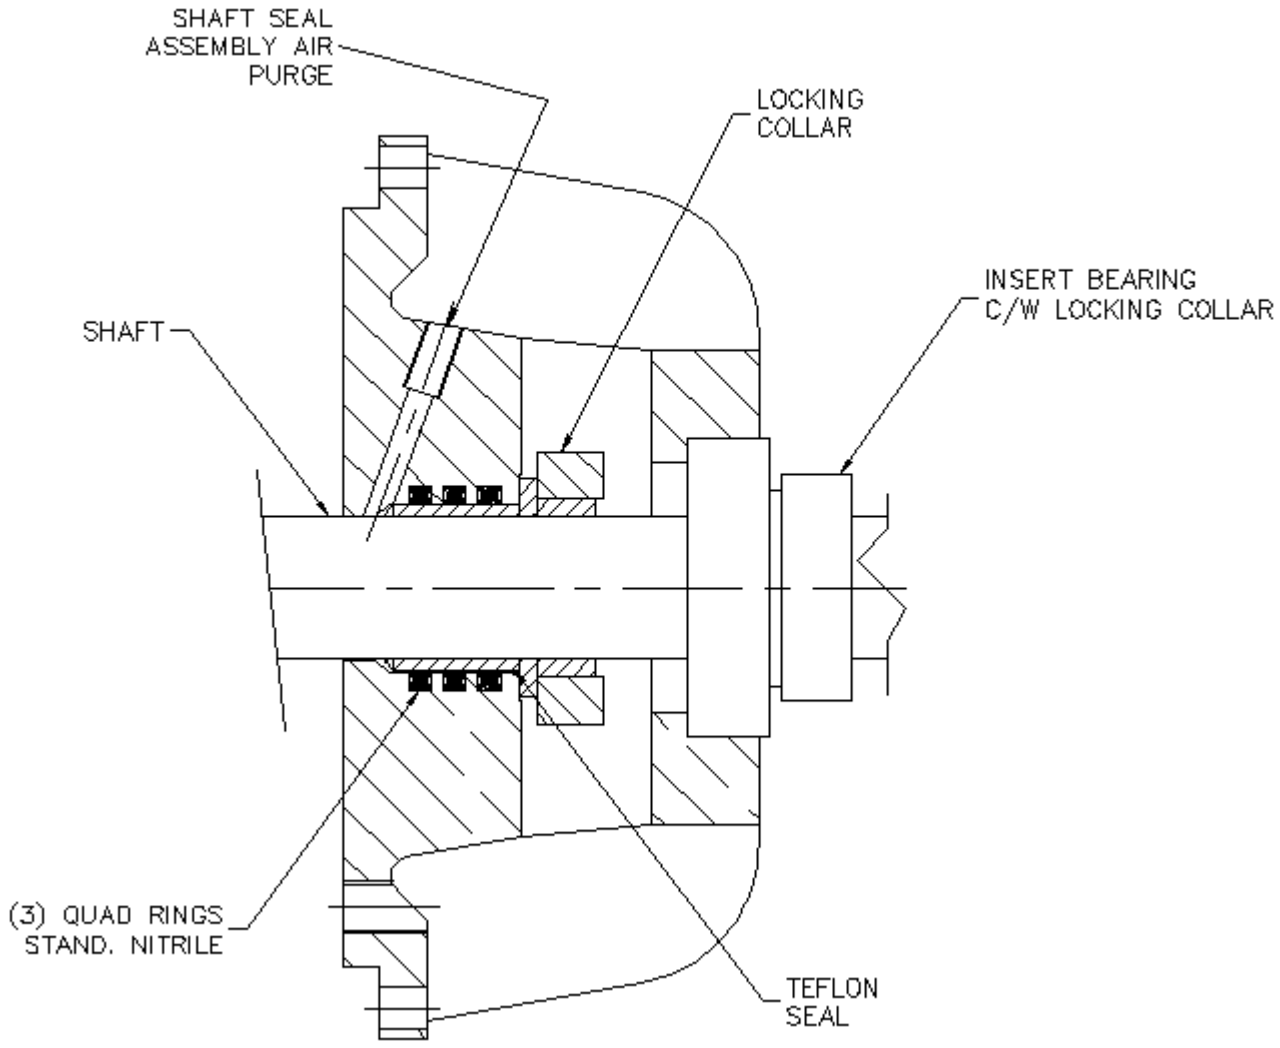
A. If airlock is not operating efficiently or satisfactory, remove from system, inspect and repair in accordance with preceding information.

B. Inspect airlock drive chain and sprockets for wear, loose links, and damage. Replace chain and sprockets if damage is noted. Be sure the same size sprockets are replacements for original sprockets.

C. Inspect base structure, chain guard, and brackets, for damage and deformation. Replace defective parts.

D. Check all accessory equipment to assure proper operation. Replace any components found to be defective.

When requesting service assistance, please have the following information at hand.



1. Serial no. and/or ACS Sales Order no. or drawing number if available.
2. Application conditions of service including such as product, temperature, ambient temperature.
3. Vacuum or pressure gauge reading above and below the valve,
4. Airlock speed.
5. Method of feeding the valve.
6. Blower speed.
7. Pressure switch setting.
8. Blower motor amperage reading.
9. Gearmotor amperage reading
10. Conveying line length. a) Horizontal run b) Vertical run c) Number of elbows.
11. Photos or video of the installation.

ACS VALVES

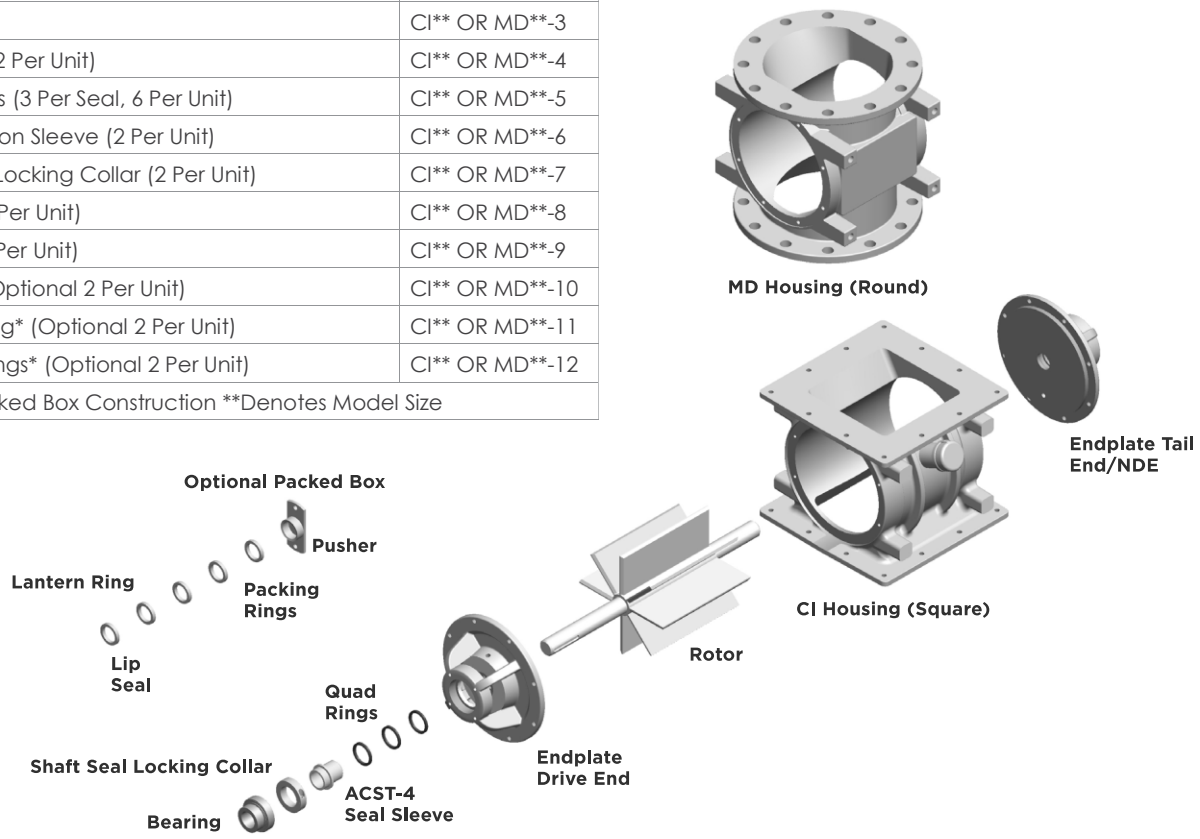
FAULTS, CAUSES AND REMEDIES		
Fault	**Possible Cause**	**Possible Remedy**
Excessive noise during operation	Incorrect direction of rotation.	Check markings for correct direction. Rewire motor if necessary, to correct.
	Insufficient rotor clearance due to material buildup or thermal expansion	Check clearances and for signs of contact. Clean material buildup. Adjust clearance as described in manual. Contact ACS for assistance.
	Drive chain rubbing on guard	Adjust guard and/or sprocket position.
	Drive shaft rubbing on guard	Adjust guard position.
	Bearing failure	Remove and inspect bearings. Replace if necessary, as described in manual.
Airlock does not rotate	No power to airlock	Check motor, settings for electrical issues.
	Chain not connected	Check chain for signs of wear, repair or replace chain.
	Foreign object caught in inlet throat	Inspect and remove.
	Faulty or damaged gearbox	Check for signs of wear or damage. Replace gearbox if necessary.
Material flow problems	Supply source or feed device plugged, empty, or not operating	Check supply source.
	Conveying line piping layout, size or increased pressure	Inspect and review conveying line layout.
	Airlock turning too fast	Adjust motor speed or replace sprockets.
	Excessive rotor pocket fill	Inlet shear protector.
	Excessive moisture in Product	Clean rotor. Check flange connections for proper seal. Check process for proper product condition.
	Excessive blowby air	Check and adjust rotor clearances. Install vent or vented shear protector.
Short seal life	Conveying line piping layout	Inspect and review conveying line layout.
	Incorrect air purge pressure	Adjust air purge pressure as described in relevant section in Instruction Manual
	Seal out of position	Inspect and reposition seal.

Spare Parts and Service

Use only ACS replacement parts. Parts are available from ACS directly or our authorized representative. For prompt, efficient service, always provide the following information when ordering parts: Serial number, model number and part description and reference number, as given in this manual.

ACST-4 SEAL AND BEARING DETAIL

Spare Parts and Service



For assistance in service or ordering parts, contact the Sales Department at:

ACS Valves

611 Argyle Street North, Caledonia, ON, N3W1M1 Phone: 1-800-665-3447 / 905-765-2004

Or visit our website at http://www.acsvalves.com

Motor and Speed Reducer Parts and Service

The motor and speed reducer are covered by their own manufacturer's warranty. If there is a problem, check with the local supplier or service representative referencing the manufacturer model and serial number for prompt service or contact ACS Valves Sales for support.

Gearmotors and Gear Reducers

OPERATING INSTRUCTIONS

01 805 52 US

GENERAL
These operationg instructions are intended to help you install and operate the drive. For trouble free service, proper installation and operation are essential. Additionally, these instructions contain important recommendations on maintenance.

Before shipment, every SEW-Eurodrive gear unit is tested, checked and properly packed. However, please inspect the drive immediately upon arrival for shortage or transit damage. Note the damage or shortage on the freight bill of lading and file a claim with the carrier. Also, notify SEW-Eurodrive of the shortage or damage.

LUBRICANTS
All gearmotors and gear reducers are supplied with the correct grade and quantity of lubricating oil for the specified mounting position. Exceptions include reducers shipped without input assemblies. The recommended lubricants are found on page 2.

LONG TERM STORAGE
If the drive is not installed immediately, it should be stored in a dry, protected area. If the drive is to be stored for an extended period of time and was not ordered from SEW for long term storage, contact your nearest SEW assembly plant for information on Long Term Storage or request **Document #2115**.

Drives which are used for standby service should be stored as a sealed gearcase.

INSTALLATION OF COMPONENTS ON DRIVE SHAFTS
Do not hammer on the shafts. Hammering can cause brinelling of the reducer's bearings shortening the bearing life. We recommend heating the components to approximately 175°F (when possible) and sliding them on the shaft. This will reduce possible damage to the reducer's bearings. **Document #2116**.

For both standard and metric SEW shaft tolerances, refer to the SEW Catalog or request **Document #2154.**

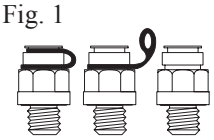
Shaft couplings should be properly aligned to prevent vibration, coupling wear, and premature failure of the shaft bearings.

To prevent the output shaft and bearings from being subjected to excessive loads, the maximum overhung load, as shown in SEW-Eurodrive catalogs, should not be exceeded. Please consult our engineering department if the load may exceed the recommended figure given or where there are combined radial and axial loads. In such cases, the exact operating conditions must be stated including speed, direction of rotation, position, magnitude and direction of the external radial and axial loads being applied.

SHAFT MOUNTED REDUCERS
SEW-Eurodrive supplies the recommended hollowshaft mounting paste with every hollowshaft reducer. The mounting paste is to be applied on the keyed output shaft. The mounting paste is to aid in the prevention of rusting and fretting corrosion between the reducer hollowshaft and the shaft of the driven machine. The mounting paste will aid in shaft removal when necessary.

Warning! Always ensure exposed, rotating parts are properly covered to ensure safety.

For additional information on shaft mounted reducers, drive shaft configuration and tolerances, refer to the SEW-Eurodrive Catalog or request **Documents #2201 and #2202**.



INSTALLATION AND OPERATION
The drive installation site should be selected to ensure:

- Ambient temperatures below 40°C (104°F).
- Unimpeded flow of air to the motor and variable speed units.
- Accessibility to the drain, level and breather plugs.
- Adequate space for the removal of brakemotor fanguard for brake adjustment and maintenance.

The drive unit should be mounted on a flat, vibration damping, and torsionally rigid structure. Careful alignment is critical. Mounting to an uneven surface will cause housing distortion. The flatness tolerance of the supporting surface should not exceed:

- For gear units size 80 and smaller — 0.004 inch.
- For gear units above size 80 — 0.008 inch.

Fig. 1

For transportation, the units are supplied with the breather plug already mounted. After the unit is installed, the black rubber seal located on the breather MUST BE REMOVED (Fig. 1). In addition, the oil level should be checked. Remove the plated (non-painted) oil level plug. The oil level is correct when the surface of the oil is level with the lowest point of that tapped hole, the exception is S37. Units W20 and W30 are sealed in any position.

After installation, the actual mounting position should be confirmed against the mounting postion shown on the gear reducer nameplate. Adequate lubrication is only guaranteed if the unit is mounted in the specific nameplated mounting position.

Refer to the SEW Catalog or request **Document #2111, #2112, #2113, or #2114 (R, F, K, orS, respectively)** if a specific mounting position diagram is needed.

MAINTENANCE
Warning! Always ensure equipment is secure and electrical power is off before removing or performing maintenance on the drive assembly. Oil levels and oil quality should be checked at regular intervals, determined by usage and the environment. Grease and oil should be changed per the recommendations on page 2. Check coupling alignment, chain or belt tension, and mounting bolt torque periodically. Keep the drive relatively free of dust and dirt.

For additional information, call the SEW FAXline, 1-800-601-6195, and request document number shown.

LUBRICANTS

LUBRICATION SCHEDULE FOR SEW-EURODRIVE GEAR UNITS									
Gear Reducer Type[1)]	**Lubrication Type**	**Ambient air temperature range °F**	**ISO Viscosity Grade**	**Mobil Oil Co.**	**CHEVRON Oil Co.**	**Shell Oil Co.**	**Texaco Oil Co.**	**BP Oil Co.**	**Kluber Oil Co.**
R F K	**Oil**	+14 to +104	VG220	Mobilgear 630	Chevron Non-Leaded Gear Compound 220	Shell Omala Oil 220	Meropa 220	BP Energol GP-XP 220	Kluberoil GEM 1-220
		-4 to +77	VG150 VG100	Mobilgear 629	Chevron Non-Leaded Gear Compound 150	Shell Omala Oil 100	Meropa 150	BP Energol GP-XP 100	Kluberoil GEM 1-150
S	**Oil**	+32 to +104	VG680	Mobilgear 636	Chevron Non-Leaded Gear Compound 680	Shell Omala Oil 680	Meropa 680	BP Energol GP-XP 680	Kluberoil GEM 1-680
		+5 to +77	VG220	Mobilgear 630	Chevron Non-Leaded Gear Compound 220	Shell Omala Oil 220	Meropa 220	BP Energol GP-XP 220	Kluberoil GEM 1-220
General	**Synth. Oil**	+176 to -40	Consult Factory For Use of Synthetic Oils						
	Synth. Grease	+176 to -40	Consult Factory For Use of Grease Filled Reducers						
Ball & Roller Bearings	**Grease** Used for normal application Temp. Range: -22°F to 140°F			**Mobilux EP2**	**Chevron Dura-Lith EP2**	**Shell Alvania Grease R3**	**Multifak EP2**	**BP Energrease LS3**	**CENTOPLEX 2EP**

[1)] Applies to all reducers with or without motor and input shaft.

Oil levels and oil quality should be checked at frequent intervals, depending on usage. Oil changes are required at intervals of 10,000 operating hours or every two years, whichever comes first. If a synthetic oil lubricant is used, then this period can be extended to 20,000 operating hours or every four years, whichever comes first. In applications where hostile operating conditions exist, such as high humidity, corrosive environment, or large temperature changes, the lubricant should be changed at more frequent intervals.

The gear units W20 and W30 are supplied with a synthetic oil which is good for the life of the reducer, independent of the mounting position.

Grease packed bearings should be cleaned and regreased every 10,000 hours or 20,000 hours for synthetic grease. Input (high speed) bearings should not be overgreased. They should be filled with grease not to exceed 1/3 of the bearing's free volume. For output bearings and bearings with replaceable grease shields, fill to 2/3 of their free volume.

ATTENTION

When the recommended lubricant is not avilable, it is permissible to use a lubricant having equivalent characteristics but we do not recommend that lubricants of different brands be mixed. Under no circumstances should synthetic lubricants be mixed with one another or with one having a mineral base.

LUBRICANTS

The approximate lubricant in US **gallons and liters** per mounting position is as follows:

	Mounting Position											
	M1 [1]		M2 [1]		M3 [2]		M4		M5 [2]		M6 [2]

[1] On compound gear units the primary (larger) gear unit is provided with the oil quantity in parenthesis.

[2] On compound gear units having mounting positions M3, M5, or M6 the secondary (smaller) gear unit is provided with the oil filling of the M1 flanged mounting position.

For additional information on R-Series mounting positions, refer to the SEW Catalog or call the SEW FAXline, 1-800-601-6195, and request Document #2111.

LUBRICANTS

The approximate lubricant in US **gallons and liters** per mounting position is as follows:

Gear Unit	Mounting Position											
	M1		M2		M3		M4		M5		M6	
	Gallons	Liters	Gallons	Liters	Gallons	Liters	Gallons	Liters	Gallons	Liters	Gallons	Liters

[1] On compound gear units the primary (larger) gear unit is provided with the oil quantity in parenthesis.

[2] When combined with a 2-pole motor at M4 mounting position, the oil quantity must be reduced to 0.28 gallons (1.05 liters).

For additional information on S-Series mounting positions, refer to the SEW Catalog or call the SEW FAXline, 1-800-601-6195, and request Document #2114.

For compound drives the R reducer requires its own oil filling as shown in the chart:

GERERAL INFORMATIONS

- The owner is responsible for making sure that the installed equipment is safe and does not compromise the health of the people working with or near the machine.

- The owner is responsible to make sure that the equipment does meet the environmental standards of the country where the equipment is installed.

- The owner has the responsibility to correctly train everybody working near or with the machine and to make sure that they are familiar with the potential risks.

- The owner is responsible for getting the proper authorizations from his insurer.

- The owner is responsible for the proper cleaning and maintenance of the equipment in order to get its best performance and reliability.

- Even though the pieces of equipment are installed by qualified Groupe Sinox employees, the owner is responsible for cleaning out the machine before its first start-up and to make sure there is no risk of food contamination.

- The owner is not authorized to alter or modify the equipment. The client might make minor changes or tuning with only the approbation of Groupe Sinox.

- Make sure every piece of equipment is de-energized with all sources of energy and locked-out, tagged-out, and tried-out (LOTOTO) before working on the system. Not doing so may result in severe injuries or death.

Warnings

This machine may have one or more moving or rotating parts, protected or not, and pressurized systems. Different energy sources like hydraulic or pneumatic systems, heavy moving parts and electrical circuits may be part of the machine.

The safe use of the machine, the supervision and proper training of the workers is the owner's responsibilities. The employer must guarantee that the machine is safe for his employees. Not using the machine as prescribed in this manual or using it in an unsafe way may result in serious injuries or death.

Groupe Sinox will do its best to deliver a safe equipment and give the assistance needed to make the system safe but cannot guarantee that every information contained in this manual will result in a complete elimination of all hazards.

OPERATION

The scale hopper is design to receive a quantity of product through the filter receiver. As the scale hopper is the equipped with an exhaust the air will need to be filtered and then can be released.

BEFORE OPERATION

- Make sure every part is well placed and secured.
- Make sure the workers are well trained and informed of the potential hazards.
- Make sure every steps of the start-up are done.
- Make sure the machine is plugged and that the energy sources are as prescribed.
- Make sure that the compressed air is free of any contaminant and water.
- If components are installed outside, make sure to have the right air dryer.
- Make sure every mechanical part is lubricated as required.
- Make sure every protection device is correctly installed.
- Make sure the machine is clean.
- Do not stay in front or close to moving and pressurized parts as particles can be projected in the air.
- Make sure every rotating part turns the correct direction.
- **WARNING:** Some parts can break if the rotation occurs in the wrong direction.
- If it is possible, put all adjustment speed at their slowest set point.
- Introduce products gradually in the system.
- Make sure the system meets all requirements.
- Trigger manually every sensor to make they are functioning properly.

- Make sure you are familiar with every aspect of the control operation before introducing new equipment in your system.

CLEANING AND MAINTENANCE

We recommend checking and cleaning the equipment periodically to assure the best efficiency.

Pneumatic conveying systems must be stopped when opening access traps and doors. Not doing so may result in a production shutdown, a higher risk of component breakage or injuries.

IMPORTANT: Make sure that all energy sources are shut down and that locking procedures are respected before doing any maintenance on the equipment.

Refer to the manufacturer's standard equipment manuals included in this document for any details about operations and maintenance on these items.

We recommend following this procedure before proceeding to maintenance jobs:

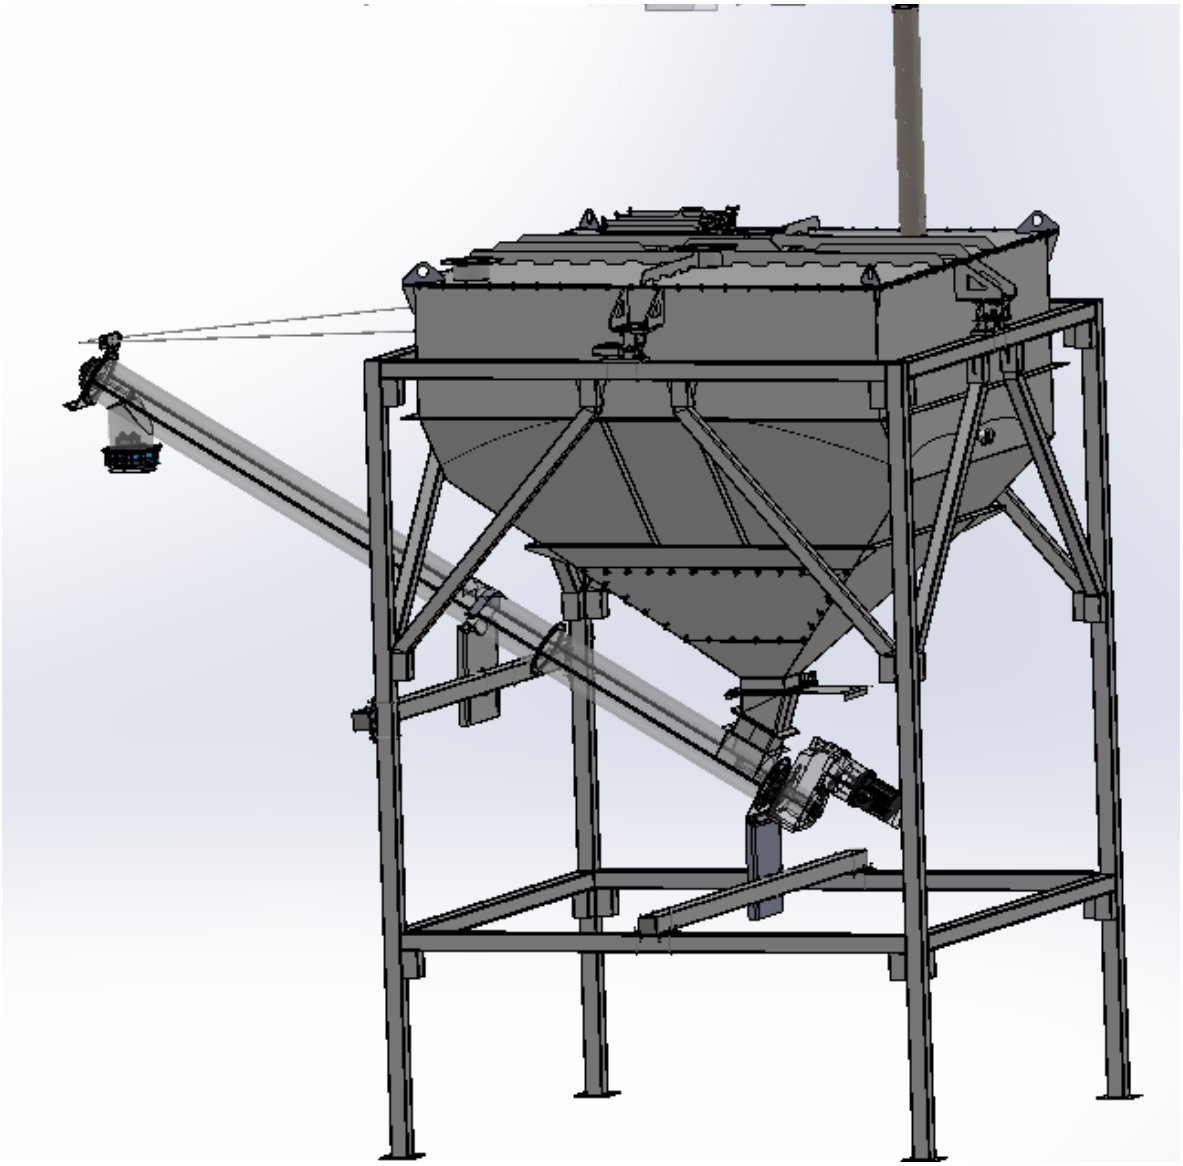
- Unplug every electric source
- Unplug the control wire
- Close and unplug the compressed air source
- Purge every air tank
- Proceed to visual inspections frequently to detect possible product leaks on different parts of the system.
- Proceed to check the interior by opening of the top of the collector. Make sure there is no product accumulation. If it is the case, check every component of the system to make sure they work properly.

- Make sure the rotary valve is working properly.
- We recommend checking the filters monthly or as needed.
- Filter clogging may affect conveying efficiency.
- We recommend filter cleaning or replacements 2 times a year.

TECHNICAL INFORMATION

Sinox number:	49733
Conception:	Lightly Vacuum (exhaust fan)
Volume:	263 cubic feet
Product inlet diameter:	2x 8'' dia. flanged
Air inlet diameter:	5-9/16'' flanged
Air exhaust diameter:	8'' Flanged
Unloading outlet diameter:	9-3/8'' square flanged
Unloading valve type:	through a manual gate valve

Accessories:



Pneumatic vibrator: Oli Vibrator , # 2033

High level sensor: Endress & Hauser # 2017

Impactor: Oli linear vibrator #2036

Loadcell :15 000 lbs capacity, # 50192

DRAWINGS

TROUBLESHOOTING

Reduced product flow

- Check the dosing equipment. Rotating valves speed or screw doser speed.
- Check the blower's belt tension.
- Check the blower's power supply
- Check pressure sensors adjustments and settings.
- Inspect your system for leaks in pipe sections or access doors.
- Check diverter valve position and look for internal leaks.
- Check if rotary valve vents clear from products.
- Check the rotary valve conditions. Product stuck in the cells may impact efficiency.
- Look out for humidity in the product. If so, find out the main cause.
- Check blower filter. If it is dirty, find out the main cause.
- Check and clean receptors' filters.

Solenoid valve not responding

- You should hear “CLIC” and the valve port should move.
- If no sound is produced when activating the solenoid valve, proceed to disassembly and clean moving parts.
- Check that the electrical signal goes to the solenoid valve and that it is the correct type (24VDC or 110VAC).
- Check the pneumatic pressure in the valve’s inlet. Some valve needs a minimum pressure to open. This information is contained in the manufacturer technical data sheets. Adjust pressure regulator as needed.

STANDARD EQUIPMENT TECHNICAL DATA

HIGH LEVEL SENSOR

# Sinox:	ELE-00002
Manufacturer :	Endress & Hauser
Model :	FTM20-CN46A
Connection :	1/2” NPT

Technical Information

Minicap FTC260, FTC262

Capacitive Limit Detection
Compact switch for limit detection with active build-up compensation; No calibration necessary
Version available for dust explosion areas

Applications

Minicap is designed for limit detection of light bulk solids, with a grain size up to max. 30 mm and a dielectric constant $\varepsilon_r \geq 1.6$, e.g. grain products, flour, milk powder, animal feed, cement, chalk or gypsum.

Versions:

- Minicap FTC260 (left): with 140 mm rod probe, with FDA listed material; for bulk solids and liquids
- Minicap FTC262 (right): with max. 6 m rope probe; for bulk solids
- Relay output (potential-free change-over contact / SPDT) with AC or DC power
- PNP output with three-wire DC power

Your Benefits

- Complete unit consisting of the probe and electronic insert:
  – simple mounting
  – no calibration on start-up
- Active build-up compensation
  – accurate switch point even with heavy build-up on the probe
  – high operational safety
- Mechanically rugged
  – no wearing parts
  – long operating life
  – no maintenance
- The rope probe of the Minicap FTC262 can be shortened
  – optimum matching to the measuring point in the silo
  – less stocks required

Function and system design

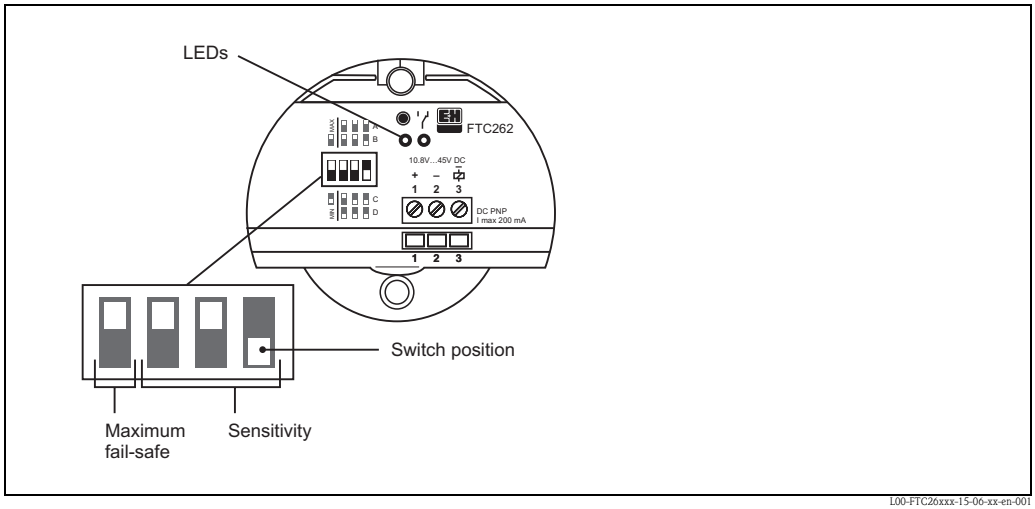
General Information

Technical specifications to DIN 19259

Measuring principle

Limit Detection

A metal plate at the end of the probe, within the insulation, and the integrated counter-electrode together with the surroundings combine to form the two electrodes of a capacitor.
If the probe is covered or free of material, then the capacitance changes and the Minicap switches.



Active Build-up Compensation

The Minicap detects build-up on the probe and compensates for its effects so that the switch point is always accurate. The effects of build-up compensation depend on:

- the thickness of the build-up on the probe,
- conductivity of the material,
- the sensitivity setting on the electronic insert.

Setting the Sensitivity

The Minicap is so calibrated at the factory that it correctly switches in most cases.
Greater sensitivity can be set using a multi-pole switch on the electronic insert. This is only necessary, however,if there is very strong build-up on the probe, or if the dielectric constant of the material ε_r is very small.

Factory setting on switches

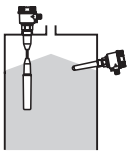
Function Range

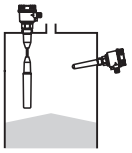
There is a loose relationship between the dielectric constant ε_r and density ρ of the material.
However, this depends on the solid.
The table on the left indicates whether the Minicap can be used or if application limits are exceeded.

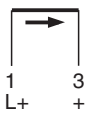
Grain, seed, legumes and their products			
Examples	ρ in g/l (approx.)	ε_r (approx.)	Function
Rice	770	3.0	yes
Cornstarch (packed)	680	2.6	yes
Flour (wheat)	580	2.4	yes
Corn grist	500	2.1	yes
Sunflower seeds	380	1.9	yes
Noodles	370	1.9	yes
Bran (wheat)	250	1.7	yes
Popcorn	30	1,1	no
Minerals, inorganic materials			
Cement	1050	2.2	yes
Plaster	730	1.8	yes
Chalk (packed)	540	1.6	(yes)
Chalk (loose)	360	1.4	no
Plastics			
ABS granulate	630	1.7	yes
PA granulate	620	1.7	yes
PE granulate	560	1.5	no
PVC powder	550	1.4	no
PU-PU dust	80	1.1	no
Grey background: Application limits of Minicap exceeded. Recommendation: Soliphant FTM to be used.			

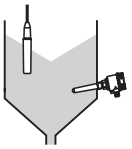
In general:
If the dielectric constant of the solid is not known, then the density (apparent weight) of the solid is a deciding factor.
Under normal conditions the Minicap functions in foodstuffs with a density of 250 g/l and above or in plastic or mineral materials with a density of 600 g/l and above.

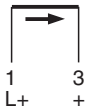
Minimum/Maximum Fail-Safe Mode

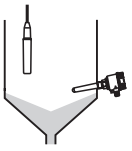












The Minicap FTC260 can be set to minimum or maximum fail-safe mode (see following table).

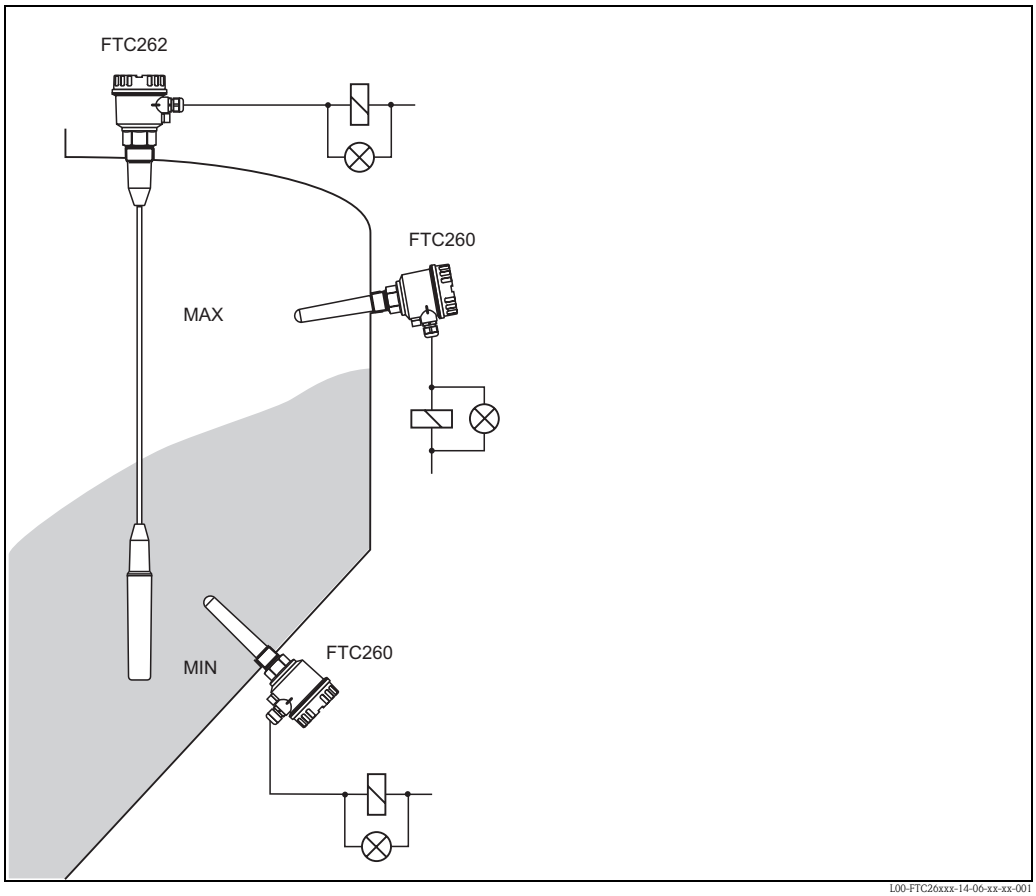
AC or DC version with relay output
(potential-free change-over contact):

- Maximum fail-safe mode:
  The relay is de-energised when the probe is covered or the power supply fails.
- Minimum fail-safe mode:
  The relay is de-energised when the probe is free or the power supply fails.

DC version with PNP output:

- Maximum fail-safe mode:
  The switch output is blocked when the probe is covered or the power supply fails.
- Minimum fail-safe mode:
  The switch output is blocked when the probe is free or the power supply fails.

Switch position	Level	Relay output SPDT	Transistor output PNP	Red LED for switching status	Green LED for stand-by
 Maximum fail-safe mode	 Probe covered	 3 4 5 Relay de-energised	 1 3 L+ blocked	☼	☼
	 Probe free	 3 4 5 Relay energised	 1 3 L+ + connected	●	☼
 Minimum fail-safe mode	 Probe covered	 3 4 5 Relay energised	 1 3 L+ + connected	●	☼
	 Probe free	 3 4 5 Relay de-energised	 1 3 L+ blocked	☼	☼
 Power failure		 3 4 5 Relay de-energised	 1 3 L+ blocked	●	●



L00-FTC26xxx-15-06-xx-en-002

Selecting the switch position and function

Measuring System

Minicap is an electronic switch. The complete measuring system consists of:

- the Minicap FTC260 or FTC262
- a power supply and
- controllers, switching devices, signal transmitters (e.g. lamps, horns, PCS, PLC, etc.)

Limit detection in silos containing solids

Input

Measured variable

Limit detection

Measuring range

- FTC260: $\varepsilon_r \geq 1.6$
- FTC262: $\varepsilon_r \geq 1.5$

Output

Output signal

- DC, PNP transistor output:
  Switching: PNP
  I_{max} 200 mA
  – overload and short circuit protection
  – residual voltage at transistor
  at $I_{max} < 2.9$ V
- AC / DC, Relay output:
  Contact: change-over,
  potential-free
  $U\sim_{max}$ 253 V, $I\sim_{max}$ 4 A (AC)
  $P\sim_{max}$ 1000 VA, cos φ = 1
  $P\sim_{max}$ 500 VA, cos φ > 0.7
  $I\overline{\overline{\ }}_{max}$ 4 A up to $U\overline{\overline{\ }}$ 30 V (DC)
  $I\overline{\overline{\ }}_{max}$ 0.2 A up to $U\overline{\overline{\ }}$ 253 V (DC)

Signal on alarm

- DC, PNP transistor output:
  < 100 µA
- AC / DC, Relay output:
  relay de-energised

Switching delay when free or covered

- FTC260: 0.5 s
- FTC262: 0.8 s

Overvoltage category

Category III (EN 61010)

Protection class

Protection class to EN 61010-1

- FTC260: Class II
- FTC262: Class I

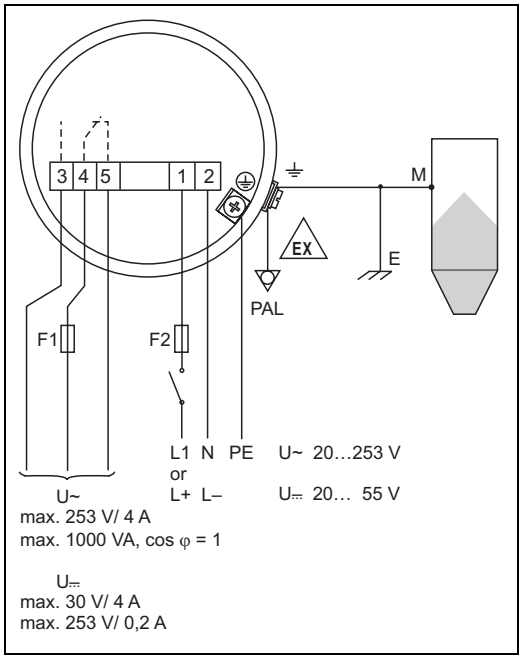
Power supply

Electrical connection

To ensure that the Minicap operates safely and without electrical interference, it must be connected to an earthed silo with metal or reinforced concrete walls.
For silos made of non-conductive materials, the external earth wire of the Minicap must be connected to a conductive and earthed component which is earthed near to the silo.
The protective earth can be connected to the internal earth terminal of the Minicap.
Connections can be made with standard instrument cabling.

See TI241F/00/EN for information on EMC (testing procedures, installation).

Connect the potential matching lead (PAL) when using in dust explosion hazardous areas.
Note national regulations!



Minicap AC or DC connection and relay output

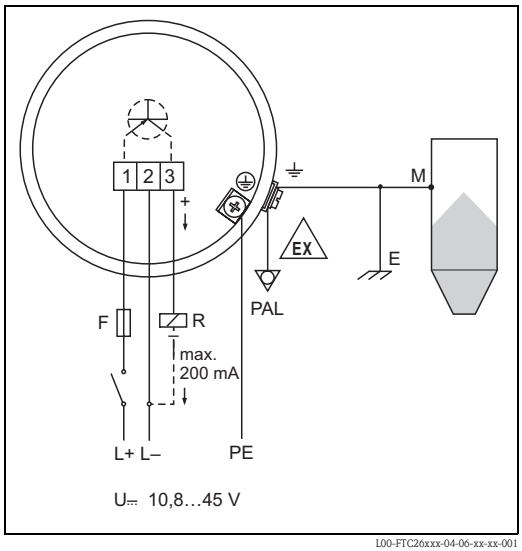
F1: Fine-wire fuse to protect the relay contact, dependent on the connected load

F2: Fine-wire fuse, 500 mA

M: Earth connection to silo or metal components on silo

E: Earth

No ground lines (PE) or potential matching lines (PAL) are required with Minicap FTC260.



Minicap with three-cable DC connection; Transistor output PNP

F: Fine-wire fuse, 500 mA

R: Connected load, e.g. PLC, PCS, relay

M: Earth connection to silo or metal components on silo

E: Earth

Minicap is protected against reverse polarity. The green LED for standby goes out if the connections are reversed.

No ground lines (PE) or potential matching lines (PAL) are required with Minicap FTC260.

Supply voltage

- DC, PNP transistor output:
  U⎓ 10.8...45 V
  – transient pulses to 55 V
  – current consumption max. 30 mA
  – reverse polarity protected
- AC / DC, Relay output:
  U~ 20...253 V
  or U⎓ 20...55 V
  – current consumption max. 130 mA

Terminal compartment

- Stranded wires max. 1.5 mm^2 in end sleeves
- Electric wire max. 2.5 mm^2

Performance characteristics

Reference operating conditions

(for plastic vessels)

- Ambient temperature: 23 °C
- Medium temperature: 23 °C
- Medium pressure p_e: 0 bar
- Medium: dielectric constant $\varepsilon_r = 2.6$
- Conductivity: < 1 µS
- Sensitivity setting: C

Hysteresis

- FTC260: Horizontal 4 mm,
  Vertical 7 mm
- FTC262: Vertical 5 mm

Switch point

- FTC260: Horizontal: centre of probe –5 mm,
  Vertical: 40 mm above probe tip
- FTC262: Vertical: 35 mm above probe tip

Power up response

- FTC260: Correct switching aftermax. 1.5 s
- FTC262: Correct switching after max. 2 s

Long-term drift

- FTC260: Horizontal 3 mm,
  Vertical 6 mm
- FTC262: Vertical 6 mm

Influence of medium temperature

- FTC260: Depending on material to be measured
- FTC262: Depending on material to be measured

Operating conditions

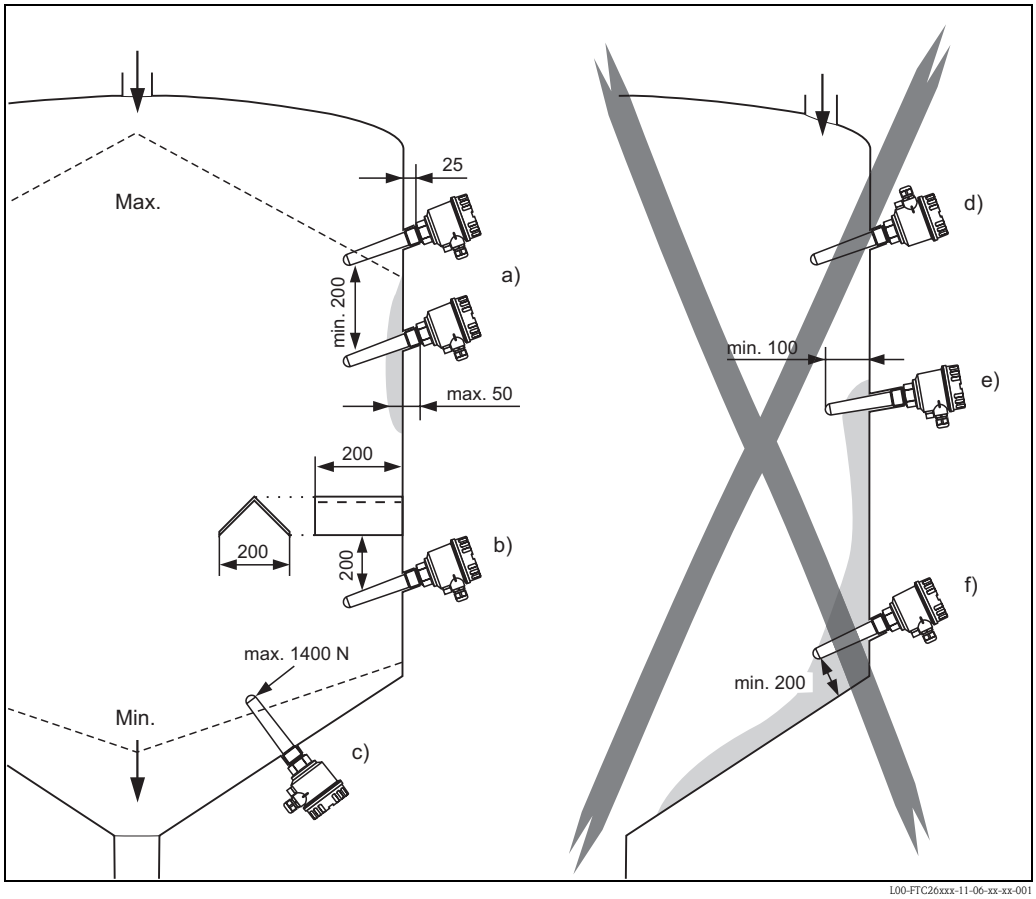
Installation

Silo Material

The Minicap can be installed in a wide range of silos made of different materials (e.g. metal, plastic, concrete).

Mounting Point

Note the angle of the material mounds and the outlet funnel when determining the mounting point or probe length of the FTC262.



The Minicap switches when the probe tip is covered by a few centimeters of material or when it is free.

Material flow should not be directed at the probe.

Installation instructions FTC260

Correct Installation

Incorrect Installation

General information and recommendations for installing the Minicap FTC260 limit switch (Dimensions in mm)

Correct Installation

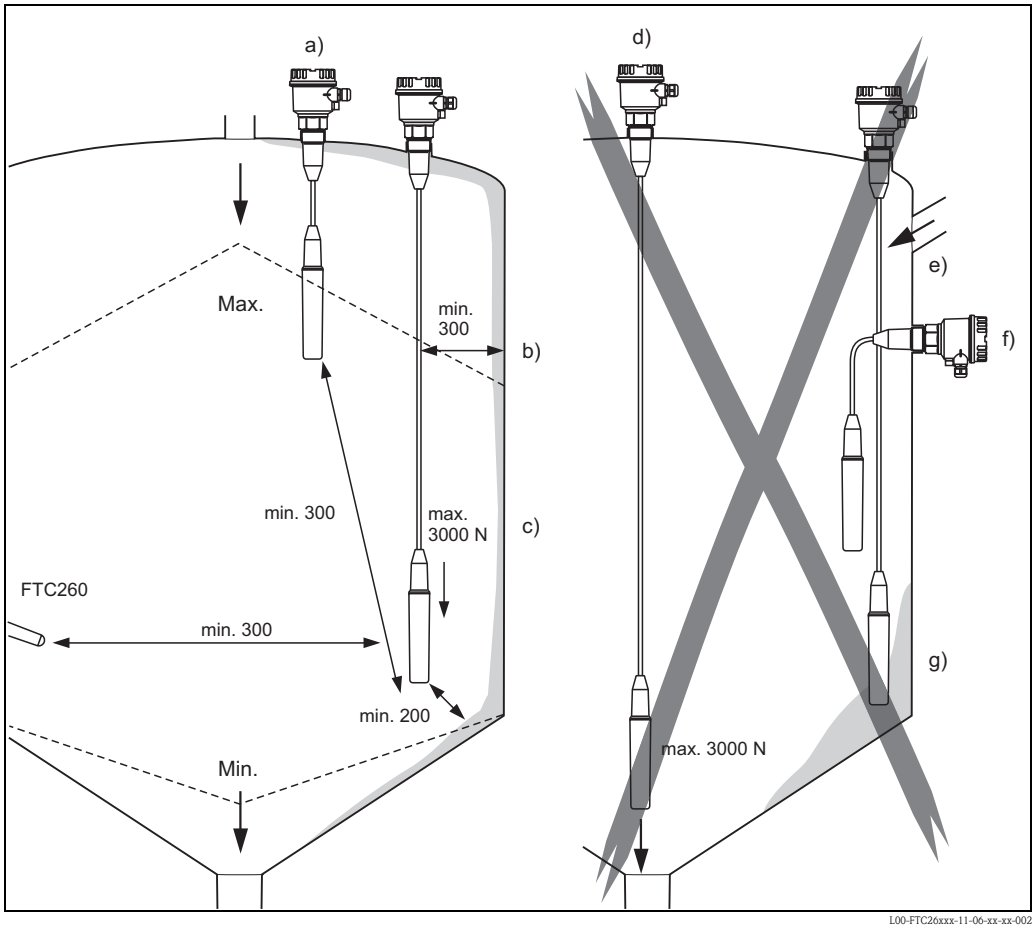
a. Minimum distance:
To prevent mutual interference with the FTC260, the probes must be at least 200 mm from each other.

b. Mounting point:
The tip of the probes must point slightly downwards so that the material can slide off more easily.
The protective cover protects the probe rod from collapsing mounds or mechanical strain at the outflow when the Minicap FTC260 is set to minimum detection.

c. Mechanical load:
The maximum lateral load on the probe rod must be taken into account when used for minimum detection. It should therefore only be used for minimum detection with loose materials that have good flow characteristics.

Incorrect Installation

d. The probe can be damaged by the inflowing material and cause faulty switching.
Cable gland pointed upwards can allow moisture to enter.



e. Threaded socket too long with material build-up on the silo wall.
(less than the minimum mounting depth of 100 mm).

f. Mounted near build-up in the silo.
The probe tip is too near to a silo wall (less than a minimum distance of 200 mm).

Installation instructions FTC262

Correct Installation

Incorrect Installation

General information and recommendations for installing the Minicap FTC262 limit switch (Dimensions in mm)

Correct Installation

a. Minimum distances:
Sufficent distance from the material filling curtain and the other probe.

b. Mounting point:
Do not install in the centre of the outlet cone. Ensure there is sufficient distance from the silo wall and from material build-up on the wall.

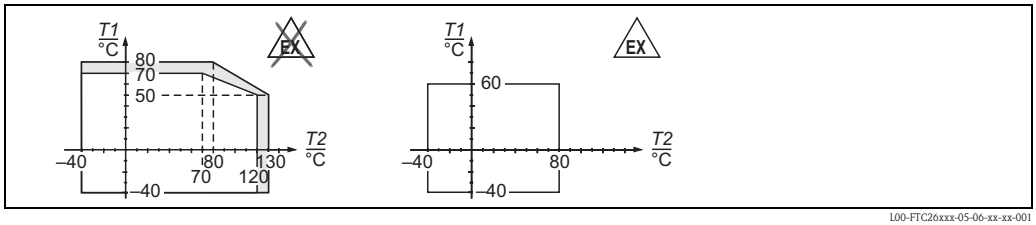
c. Mechanical load:
Note the tensile strain on the probe rope and the strength of the silo roof when used for minimum detection.
Very high tensile forces may occur at the material outlet especially with heavy, powdery bulk materials which tend to form build-up. These forces are significantly greater over the outlet than at the silo wall. For minimum detection Minicap FTC262 should only be used for light, easily flowing solids, and that do not tend to form build-up.

Incorrect Installation

d. In the centre of the material outflow; the high tensile forces at this point may tear off the probe or damage the silo roof.

e. The probe may be damaged by inflowing material.

f. Mounted laterally



g. Too near silo wall; when swinging gently the probe can hit the wall or touch any build-up which may have formed. This can result in error switching

Environment

Ambient temperature range *T1*	–40…+70 °C (–40…+160 °F) (…+60 °C, Dust-Ex version] (see the temperature diagrams)

GENERAL NOTES
The vibrators are made in accordance with the EC machine regulation 89/392/E1EC. The standards EN 292, part 1 and part 2 have been particularly observed.
The vibrators produce non-directed vibrations. They are used to keep a constant flow in hoppers and silo's, to drive chutes and are also used in screens and vibrating tables. Generally for loosening, conveying and separating of bulk materials and for the reduction of friction.
The vibrators are ideal for use in the food industry, explosive atmosphere's, wet environment's and outside. The frequency and the centrifugal force are determined by the operating pressure.

NOTE
For extraordinary maintenance, if necessary, contact:

ALLGEMEINES
Die Vibratoren der Serie **S**, **OR** und **OT** entsprechen der EU-Maschinenrichtlinie 89/392/EWG und insbesondere den Normen EN 292, Teil 1 und 2.
Dieser Vibratortyp erzeugt ungerichtete Schwingungen.
Sie werden zur Behälterentleerung, als Antriebe für Rinnen, Siebe und Vibrationstische eingesetzt und im allgemeinen zum Lösen, Fördern, Verdichten und Trennen von Schüttgütern und zur Reduzierung von Reibung.
Unter Beachtung der Bedienungsvorschriften des Betreibers können diese Vibratoren auch für die Nahrungsmittelherstellung sowie in EX- und Naßbereichen eingesetzt werden.
Ein Einsatz der Vibratoren im Freien ist möglich.
Frequenz und die davon abhängige Zentrifugalkraft werden durch den Betriebsdruck bestimmt.

HINWEIS
Für etwaige außerordentliche Wartungsarbeiten wenden Sie sich bitte ausschließlich an:

REMARQUES GÉNÉRALES
Les vibrateurs **S**, **OT** et **OR** correspondent à la directive Machines 89/392/C.E.E. Il a été tenu compte des normes EN 292, l' et 1-2 parties. Ces vibrateurs génèrent des vibrations multidirectionnelles. Ils sont utilisés pour le vidage de silos, l'entraînement de goulottes l'activation de couloirs vibrants, de tamis et de tables vibrantes et, d'une façcon generale en général, pour ,décolmater, transporter, compacter, et séparer les matières en vrac et réduire les frictions. Si les prescriptions d'emploi élaborées par l'utilisateur sont respectées, ils peuvent être mis en oeuvre pour la fabrication de denrées alimentaires ainsi qu'en milieu explosif ou humide. Les vibrateurs peuvent aussi fonctionner à l'extérieur. La fréquence et la force centrifuge sont déterminées par la pression de service.

REMARQUE
Pour les entretiens extraordinaires s'adresser exclusivement à :

NOTE GENERALI
I vibratori sono costruiti in conformità alla norma 89/392/CE sui macchinari. Si è in particolare tenuto conto di quanto stabilito dalle norme EN 292, parte 1 e parte 2.
I vibratori producono vibrazioni multidirezionali. Sono impiegati per mantenere un flusso costante nelle tramogge e nei sili, per attivare dosatori, vagli e tavole vibranti e in generale per distaccare, trasportare, compattare e separare materiale sfuso e per ridurre l'attrito.
I vibratori sono perfettamente indicati per l'impiego nell'industria alimentare, in atmosfera esplosiva, in ambienti umidi e all'esterno. La frequenza delle vibrazioni e la forza centrifuga sono determinati dalla pressione d'esercizio.

NOTA
Per eventuali manutenzioni straordinarie rivlgersi esclusivamente a:

OLI SRL

Fax: + 39.0535 - 46350

General indications
- Ball vibrators "S" consist of an anodized aluminium body inside which a tempered steel ball rotates on an anti-wear tempered steel seating. Vibrator "S" generates vibrations of small amplitudes.

Examples of application
- Separation, transport, compacting of materials.
- Gushing of material from of silos, hoppers, screens, etc.
- Cleaning filters.
- On conveyor chains (for examples cans, bottles, etc.) they facilitate the flow and eliminate problems of blockage.

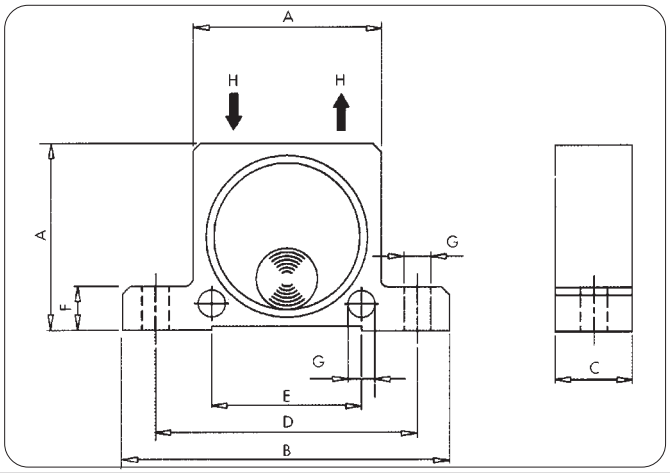
Maximum operating temperature:
- 20°C / +200°C

Allgemeine Angaben
- Die Kugelvibratoren Serie „S" bestehen aus einem Gehäuse aus eloxiertem Aluminium, innerhalb dessen sich eine Kugel aus gehärtetem Stahl in einem Sitz aus gehärtetem verschleißfestem Stahl dreht. Der Vibrator „S" erzeugt Schwingungen kleinern Ausmaßes.

Anwendungsbeispiele
- Materialien abscheiden, befördern, verdichten.
- Silos, Trichtern, Sieben, etc. freimachen.
- Filter reinigen.
- Auf Förderketten (z.B. Dosen, Flaschen, etc.) vereinfachen sie den Materialfluss und beseitigen Probleme mit etwaigen Blockierungen.

Max. Betriebstemperatur
-20°C / +200°C

Indications générales
- Les vibrateurs à bille de la série "S" sont constitués d'un corps en aluminium anodisé dans lequel tourne une bille en acier trempé sur un siège en acier trempé anti-usure. Le vibrateur "S" produit des vibrations de petite amplitude.



Exemples d'application
- Séparation, transport, compactage de produits
- Débourrage de silos, trémie, tamis, etc.
- Nettoyage des filtres.
- Sur les chaînes de transport (par ex. boîtes, bouteilles, etc.) ils facilitent l'écoulement et éliminent les problèmes de blocage.

Température maximum de service
-20°C / +200°C

Indicazioni generali
- I vibratori a sfera serie "S" sono costituiti da un corpo in alluminio anodizzato all'interno del quale ruota una sfera in acciaio temprato su una sede di acciaio temprato antiusura. Il vibratore "S" genera vibrazioni di piccola ampiezza di spostamento.

Esempi di applicazione
- Separazione, trasporto, compattazione materiali.
- Sgorgo di sili, tramogge, vagli, ecc.
- Pulizia filtri.
- Su catene di trasporto (per es. barattoli, bottiglie, ecc.) facilitano il deflusso ed eliminano i problemi di bloccaggio.

Temperatura massima d'esercizio
- 20°C / +200°C

General indications
- Vibration is generated by a strongly unbalanced turbine which rotates on two high-speed ball bearings.
- OT vibrators develop a high work moment and a high vibration frequency.
- Vibrations present a large amplitude even with low operating pressure.

Examples of application
- Food and Pharmacentical industries.
- Bins and hoppers.
- Goreens.

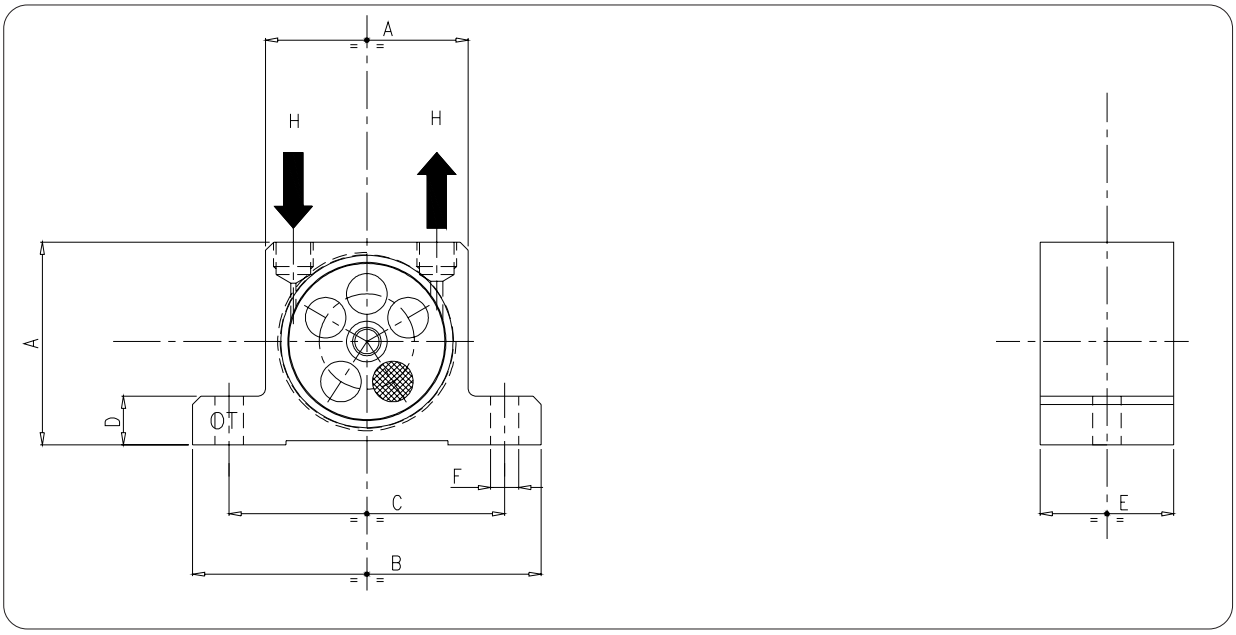
Maximum operating temperature:
- 20°C / +120°C

Allgemeines
- Die Vibration wird durch eine exzentrisch angeordnete Turbine erzeugt, die sich mit hoher Geschwindigkeit auf 2 Kugellagern dreht.
- Zwei überdimensionierte, für den Dauereinsatz bei hohen Drehzahlen geeignete Lager garantieren einen hohen Wirkungsgrad und ermöglichen den Einsatz ungeölter Druckluft.
- OT Vibratoren sind vollkommen wartungsfrei und zeichnen sich aus durch hohe Drehzahlen bei gleichzeitig geringem Luftverbrauch.

Anwendungsbeispiele
- Nahrungsmittel und Pharmaindustrie.
- Trichter und Behälterbau.
- Siebanlagen.

Max. Betriebstemperatur
-20°C / +120°C

Indications générales
- la vibration est engendrée par une turbine déséquilibrée montée sur 2 roulements à bille à haute vitesse.
- Les vibrateur à turbine OT engendrent un couple élevé et une haute fréquence de vibration.
- Les vibrations ont une amplitude de considérable même à basse pression d'exercice.



Exemple d'application
- Industries alimentaire et pharmaceutique
- Trémies et d'autres récipients.
- Tamis.

Température maximum de service
-20°C / +120°C

Indicazioni generali
- La vibrazione è generata da una turbina sbilanciata che gira su 2 cuscinetti a sfera ad alta velocità.
- I vibratori a turbina OT generano un elevato momento di lavoro ed una alta frequenza di vibrazione.
- Le vibrazioni hanno una notevole ampiezza anche a basse pressioni di esercizio.

Esempi di applicazione
- Industria alimentare e farmaceutica.
- Sili e tramogge.
- Vagli.

Temperatura massima d'esercizio
- 20°C / +120°C

N.B.: data abtained from a vibrating table supported by springs that perfectly simulates the major part of the applications possible. Frequency and centrifugla force increase when the vibrator is applied to more rigid structures.

For activation a 2/2 way electrovalve and filtered compressed air are required.

N.B.: daten wurden auf einem gefederten Rütteltisch ermittelt, aud dem die Mehrzahl der möglichen Anwendungen perfekt simuliert wurde. Frequenz und Zentrifugalkraft nehmen bei einer Befestigung des Vibrators auf weniger elastischen Unterlagen zu.

Zur Betätigung ist ein 2/2 Wege-Ventil und gefilter Druckluft erforderlich

N.B.: les données ont été relevées sur un banc vibrant à ressorts, de manière à simuler parfaitement la plupart des applications possibles. La frequence et la force centrifuge seront plus grandes où le vibrateur est appliqué sur une structure plus rigide.

Pour l'actionnement on a besoin d'une èlectrovanne à 2/2 voies et d'air filtré

N.B.: dati rilevati utilizzando un banco vibrante a molle, in modo da simulare perfettamente la maggior parte delle possibili applicazioni. Frequenza e forza centriga saranno maggiori applicando il vibratore su strutture più rigide.

Per l'azionamento occorrono una elettrovalvola a 2/2 vie ed aria filtrata.

General indications
- The roller vibrators series "R" are formed by an anodized aluminium body inside which a hardened steel roller wheels an a cast iron race.
- Vibration is generated by a rotor which describes an epicycloidal movement inside a steel race.
- The OR vibrators generate a very high frequency with low consumption as compared to the force given.

Examples of application
- Bins and hoppers
- Moulding dies
- Compacting
- Separation

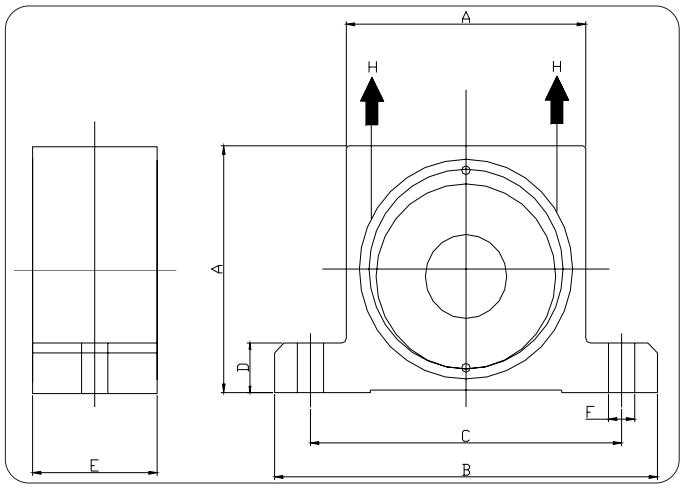
Maximum operating temperature
0°C / +200°C

Allgemeines
- Die Rollen „R" Rüttler bestehen aus einemm Körper aus eloxiertem Aluminium, innerhalb mit einer Rolle aus gehärtetem Stahl, die auf Gusseisen Laufbahn rotiert.
- Die Vibration wird durch eine Rolle erzeugt, die innerhalb eines speziell gehärteten Stahlringes eine epizyklische Bewegung beschreibt.
- OR Vibratoren entwickeln hohe Fliehkräfte und laufen in jeder Einbaulage sicher an.

Anwendungsbeispiele
- Trichter und Behälter
- Gussformen
- Verdichter
- Klassierer

Max. Betriebstemperatur
0°C / +200°C

Indications générales
- Les vibrateurs à rouleaux, série "R", comprennent un corps en aluminium anodisé avec un rouleau en acier trempé sur piste en fonte roulant à l'interieur.
- La vibration est engendrée par un rouleau qui accomplit un mouvement épicycloïdal à l'intérieur d'une piste en acier.
- Les vibrateurs à rouleau OR, engendrent une fréquence trés élevée avec une consommation d'air réduite par rapport à la force développée.



Exemple d'application
- Trémies et d'autres récipients
- Moules
- Compactage
- Séparation

Température maximum de service
0°C / +200°C

Indicazioni generali
- I vibratori a rulli serie "R" sono costituiti da un corpo in alluminio anodizzato all'interno del quale ruota un rullo in acciaio temprato su pista in ghisa.
- La vibrazione è generata da un rotore che compie un movimento epicicloidale all'interno di una pista di acciaio.
- I vibratori a rullo OR generano una frequenza molto elevata con un consumo ridotto, in relazione alla forza resa.

Esempi di applicazione
- Sili e tramogge
- Forme
- Compattazione
- Separazione

Temperatura massima d'esercizio
0°C / +200°C

This manual, prepared by the manufacturer, forms an integral part of the pneumatic vibrator S/OR/OT supply. It must therefore accompany the filter right up to its final scrapping, and must be available ready at hand for quick consultation by the operators concerned and those in charge of operations at the work site. If the machine changes hands, this manual must be handed over to the new owner. Before carrying out any operation on or using the pneumatic vibrator, the personnel concerned must have read this manual carefully and completely. If the manual is lost, or in such a condition as to make it illegible, download a new copy from the OLI s.r.l internet site, and check the date of the last revision. This manual provides warnings and indications concerning the safety regulations for preventing accidents at the work site. However, the operators MUST scrupulously follow the safety regulations meant for them according to the existing legislation. Modifications to the safety regulations made over time must be integrated and implemented.

With the basic features of the machines as described, the Manufacturer reserves every right to make modifications to parts, details and accessories considered to be necessary for improving the product for design or commercial reasons, at any time without any obligation to update the publication imme-diately.
The latest version of the present catalogue is available under **www.olivibra.it**

Dieses Handbuch, das vom Hersteller erstellt wurde, ist integrierender Teil des Druckluft Vibrator S/OR/OT. Daher muss es unbedingt dem Filter folgen, bis er demontiert wird, und leicht zu finden sein, wenn der Bediener oder die Baustellenleitung in ihm nachschlagen wollen. Bei einem Besitzerwechsel des Gerätes muss das Handbuch dem neuen Besitzer ausgehändigt wer-den. Bevor das Betriebspersonal irgendwelche Arbeiten an oder mit Druckluft Vibrator ausführt, muss es dieses Handbuch unbedingt mit großer Aufmerksamkeit durchgelesen haben. Falls das Handbuch verloren geht oder unleserlich wird, kann man sich eine neue Kopie von den Internetseiten des Herstellers OLI s.r.l herunterladen, um dann das Datum der letzten Aktualisierung des Handbuchs zu prüfen. Dieses Handbuch liefert Hinweise und Angaben zu den Sicherheits- und Unfallverhütungsbestimmungen am Arbeitsplatz. Die Sicherheitsbestimmungen, die laut der geltenden Bestimmungen vom Bedienungspersonal zu beachten sind, müssen auf jeden Fall immer beachtet werden.
Etwaige Änderungen der Sicherheitsbestimmungen, die im Laufe der Zeit vorgenommen werden, sind immer zu erfassen und umzusetzen.

Der Hersteller behält sich das Recht vor, unter Beibehaltung der wesentlichen Eigenschaften der beschriebenen Geräte etwaige Änderungen an Organen, Teilen und Zubehör vorzunehmen, die im Zuge der Produktverbesserung erforderlich sind oder aus konstruktiven oder kommerziellen Erfordernissen heraus ausgeführt werden. Solche Änderungen können jederzeit vorgenommen werden und verpflichten den Hersteller nicht, diese Veröffentlichung gleichzeitig auf den neuesten Stand zu bringen.
Die letzte Version dieses Katalogs steht im Internet unter **www.olivibra.it**

Le présent Manuel, rédigé par le constructeur, fait partie intégrante de la fourniture du vibrateur pneumatique S/OR/OT; comme tel il doit absolument suivre le filtre jusqu'à son démantèlement et être à portée de la main pour une consultation rapide de la part des opérateurs concernés et par la direction des travaux du chantier. En cas de changement de propriété de la machine, le manuel doit être remis au nouveau propriétaire. Avant d'effectuer une quelconque opération avec ou sur le vibrateur pneumatique, le personnel concerné doit absolument et obligatoirement avoir lu très attentivement le présent manuel. Si le manuel est égaré ou abîmé de manière à ne plus être lisible, une copie doit être téléchargée à partir du site internet de OLI s.r.l en vérifiant la date de la dernière mise à jour. Le présent manuel fournit les recommandations et les indications concernant les consignes de sécurité pour la prévention contre les accidents du travail. Dans tous les cas les consignes de sécurité conformément aux normes en vigueur doivent être observées avec la plus grande attention par les différents opérateurs.
Les modifications éventuelles des consignes de sécurité devront être adoptées et mises en oeuvre.

Les caractéristiques essen tielles des machines décrites étant entendues, le constru cteur se réserve le droit d'ap porter à tout moment et sans engagement de mettre à jour en temps utile cette publication, des modifications aux organes, pièces et accessoires qu'il retiendra avantageuses pour l'amélioration du produit ou pour des exigences de fabrication ou de commer cialisation.
La version toujours mise à jour de ce catalogue est dis-ponible sul le site internet **www.olivibra.it**

Il presente manuale, redatto dal costruttore, è parte integrante del vibratore pneumatico S/OR/OT; come tale deve assolutamente seguire il filtro fino al suo smantellamento ed essere facilmente reperibile per una rapida consultazione da parte degli operatori interessati e della direzione lavori del cantiere. In caso di cambio di proprietà della macchina il manuale deve essere consegnato alla nuova proprietà. Prima di eseguire qualsiasi operazione con, o sul vibratore pneumatico ; il personale interessato deve assolutamente ed obbligatoriamente aver letto con la massima attenzione il presente manuale. Qualora il manuale venga smarrito, sgualcito e tale da non essere completamente leggibile, si deve scaricare una nuova copia dal sito internet della OLI s.r.l e verificarne la data dell'ultimo aggiornamento. Il presente manuale fornisce avvertenze ed indicazioni relative alle norme di sicurezza per la prevenzione degli infortuni sul lavoro. Vanno comunque, ed in ogni caso, osservate con il massimo scrupolo da parte dei vari operatori le norme di sicurezza poste a loro carico dalle vigenti normative.
Eventuali modifiche delle norme di sicurezza che nel tempo dovessero aver luogo dovranno essere recepite ed attuate.

Ferme restando le caratteristiche essenziali delle macchine descritte, il costruttore si riserva il diritto di apportare le eventuali modifiche di organi, dettagli ed accessori che riterrà convenienti per il miglioramento del prodotto, o per esigenze di carattere costruttivo o commerciale, in qualunque momento e senza impegnarsi ad aggiornare tempestivamente questa pubblicazione.
La versione sempre aggiornata del presente catalogo è reperibile sul sito internet **www.olivibra.it**

CERTIFICATE OF CONFORMITY

The equipment is accompanied by a declaration of conformity to existing regulations, but, since it is a component to be integrated into a system or plant, its safety is connected to compliance with all the directives applicable in final assembly of the machine.
Improper use of the pneumatic vibrator without following the instructions in this manual frees the Manufacturer of all responsibility for poor working of the pneumatic vibrator.
As this is a subject in the process of significant technical and normative evolution, the Manufacturer reserves the right to upgrade its products as fast as possible with all the technological know-how and official standards applicable (EN, UNI) which are available at the time.

KONFORMITÄTSERKLÄRUNG

Das Gerät wird von einer den geltenden Richtlinien entsprechenden Konformitäts-erklärung begleitet, aber als Bestandteil einer kompletten Anlage ist seine Betriebs-sicherheit mit der Beachtung aller Richtlinien verbunden, die nach dem Einbau in die Anlage oder Maschine anwendbar sind.
Jede bestimmungswidrige Benutzung des Druckluft Vibrator ohne Befolgung der Angaben dieses Handbuchs entbindet den Hersteller von jeglicher Haftung hinsichtlich der fehlerhaften Funktion des Druckluft Vibrator.
Da es sich um Produkte handelt, die einer schnellen technischen Entwicklung unterliegen, behält es sich der Hersteller vor, die eigenen Erzeugnisse so schnell wie möglich an alle technologischen Erkenntnisse und die anwendbaren offiziellen Normen (EN, UNI) anzupassen, die von Fall zu Fall erforderlich sind.

CERTIFICAT DE CONFORMITÉ

L'appareillage est accompagné d'une déclaration de conformité aux directives en vigueur, mais en tant que composant devant s'intégrer dans une installation complète, sa sécurité est étro itement lié au respect de toutes les directives applicables dans l'assemblage de la machine finale.
Toute utilisation impropre du vibrateur pneumatique sans suivre les indications du présent manuel dégage le constructeur de toutes responsabilités ayant trait à un mauvais fonctionnement du vibrateur pneumatique lui-même.
Etant donnée qu'il s'agit d'une matière en forte évolution technique et réglementaire, le constructeur se réserve d'adapter avec rapidité ses propres produits manufacturés à toutes les connaissances techno logiques et les normes of ficielles applicables (EN, UNI) au fur et à mesure de leur parution.

ATTESTATO DI CONFORMITA'

L'apparecchiatura è accompagnata da una dichiarazione di conformità alle direttive vigenti, ma, in quanto componente da integrarsi in un impianto completo, la sua sicurezza è legata al rispetto di tutte le direttive applicabili nell'assemblamento della macchina finale.
Ogni utilizzo improprio del vibratore pneumatico senza seguire le indicazioni del presente manuale solleverà il costruttore da ogni responsabilità inerenti ad un cattivo funzionamento del vibratore pneumatico stesso.
Trattandosi di materia in forte evoluzione tecnica e normativa, il costruttore si riserva di adeguare con la massima celerità i propri manufatti a tutte le conoscenze tecnologiche e le norme ufficiali applicabili (EN, UNI) che di volta in volta si rendessero disponibili.

OLI S.r.l.

Via Canalazzo, 35 – I - Medolla (MO)
ITALY

CERTIFICATE OF CONFORMITY
with the Directives of the European Union

The OLI percussion guns model
S/OR/OT....ATEX (Code: SX....)
are manufactured in conformity with the following directives:

- Directive "Machines" **98/37/CE** of 22nd June, 1998
- Directive "ATEX" **94/9/CE** of 23rd March, 1994

The conformity has been verified according to the conditions included in the following standard documents:

- **EN 1127-1**
- **EN 13463-1**
- **EN 292-1-2**
- **EN 1050**

Serie S, OR, OT ⟨Ex⟩ II 3 D 85°C (T6) X

Serie S, OR, X Tmax.=200°C (T3) Tamb. -20°C +180°C
Serie OT, X Tmax.=135°C (T4) Tamb. -20°C +120°C

This equipment must never be put into operation before the machine or plant into which it has been integrated has been declared in conformity with the Directives in force.

Medolla, 1st November, 2003

BESCHEINIGUNG DER KONFORMITÄT mit den Richtlinien der Europäischen Union

Die Familie der pneumatischen Vibratoren OLI
Modell **S/OR/OT....ATEX** (Code: SX....) wurde
konstruiert und wird gefertigt in Konformität mit den folgenden Direktiven:

- Direktive "Maschinen" **98/37/CE** vom 22. Juni 1998
- Direktive "ATEX" **94/9/CE** vom 23. März 1994

Die Konformität wurde gemäß den in den folgenden Normendokumenten enthaltenen Bedingungen verifiziert:

- **EN 1127-1**
- **EN 292-1-2**
- **EN 13463-1**
- **EN 1050**

Serie S, OR, OT ⟨Ex⟩II 3 D 85°C (T6) X

Serie S, OR, X Tmax.=200°C (T3) Tamb. -20°C +180°C
Serie OT, X Tmax.=135°C (T4) Tamb. -20°C +120°C

Dieses Bauteil darf niemals in Betrieb genommen werden, bevor die Maschine/Anlage, in welche es eingebaut wurde, mit den Bestimmungen der geltenden Richtlinien für konform erklärt wurde.

ATTESTATO DI CONFORMITA'
alle Direttive Della Comunità Europea

La famiglia dei vibratori pneumatici **OLI**
modello **S/OR/OT....ATEX** (Code: SX....)
è stata progettata e costruita in conformità alle direttive:

- Direttiva "Macchine" **98/37/CE** del 22 giugno 1998
- Direttiva "ATEX" **94/9/CE** del 23 marzo 1994

La conformità è stata verificata sulla base dei requisiti delle norme o dei documenti normativi riportati di seguito:

- **EN 1127-1**
- **EN 292-1-2**
- **EN 13463-1**
- **EN 1050**

Serie S, OR, OT ⟨Ex⟩II 3 D 85°C (T6) X

Serie S, OR, X Tmax.=200°C (T3) Tamb. -20°C +180°C
Serie OT, X Tmax.=135°C (T4) Tamb. -20°C +120°C

Il presente componente non deve essere messo in servizio prima che la macchina all'interno della quale sia stata incorporata non sia stata dichiarata conforme alle disposizioni delle Direttive vigenti.

Medolla, 1 Novembre 2003
OLI S.r.l.

(General Manager)

SAFETY
Whilst carrying out any work on the **S**, **OT** or **OR** Pneumatic Vibrators Make sure that the compressed air is shut off on any supply lines. All pipes must be tightly connected.
A pipe coming loose under pressure may cause injury. Vibrations can cause loosening of bolted connections and equipment. This may cause damage to persons and machines.
Take note of the enclosed drawings.

Alterations to the unit may change the characteristics of the vibrator or even damage the unit and will cause the rejection of any warranty claims.

SICHERHEIT
Sicherstellen, daß während des Einbaus oder bei Arbeiten am Vibrator und an den Zuleitungen, die Druckluft abgestellt ist. Die Schlauchleitungen müssen fest verbunden sein.
Ein unter Druck stehender, sich lösender Schlauch, kann Verletzungen verursachen. Des weiteren können Vibrationen ein Lösen der Schraubverbindungen und Geräte verursachen. Personen- und Materialschäden können die Folge sein.
Die beiliegenden Zeichnungen sind zu beachten.

Veränderungen am Gerät können dessen Eigenschaften verändern bzw. dasselbe beschädigen, was zum Erlöschen aller Garantieansprüche führen kann.

SÉCURITÉ
Assurez-vous, lors du montage ou de tous autres travaux effectués sur le vibrateur ou les conduites d'amenée, que l'alimentation en air comprimé est interrompue. Les flexibles doivent être solidement raccordés. Un flexible sous pression qui se détache peut provoquer des blessures. Les raccords vissés et les appareils peuvent se desserrer sous l'effet des vibrations, ce qui risque de provoquer des dommages corporels et matériels.
Tenez compte des croquis, ci-joint.

Toute modification du vibrateur est susceptible d'en altérer les propriétés ou de le détruire et rend caduque tous recours en garantie entraîne l'extinction des droits de garantie.

SICUREZZA
Durante l'installazione o in caso di interventi ai vibratori pneumatici **S**, **OR** o **OT**, assicurarsi di avere interrotto l'alimentazione d'aria compressa su tutte le linee. Tutti i tubi devono essere saldamente collegati.
Il distacco di un tubo sotto pressione può provocare lesioni. Le vibrazioni possono allentare i raccordi a vite e gli apparecchi, con rischio di danni a persone e macchinari.
Prendere visione dei disegni inclusi.

Eventuali modifiche apportate all'unità possono variare le caratteristiche del vibratore, se non addirittura danneggiare l'unità stessa, con conseguente annullamento di qualsiasi diritto di garanzia.

Air Compressor
The Air Compressor needs to be kept clean and filtered (filter <50pm). Compressed air or nitrogen of 2 to 6 bar (30 to 90 PSI) is required. **The vibrators are designed for lubrication-free operation. The life time of the S and OR vibrator will be extended with lubrication. Non-filtered air will damage the vibrators.**

Antriebsmittel
Saubere, gefilterte (Filter < 50µm) Druckluft oder Stickstoff (2 bis 6 bar). **Die Verwendung nicht gefilterter Luft führt zum Ausfall der Vibratoren. Alle Vibratoren können ölfrei betrieben werden, ein Nebelöler verlängert die Lebensdauer von S und OR.**

Fluide d'entraînement
Le fluide d'entraînement est l'air comprimé exempt d'impuretés et filtré (filtre < 50 µm), ou l'azote, sous une pression de 2 à 6 bars (30 à 90 PSI). **Les vibrateurs sont conçus pour fonctionner sans huile, un graisseur prolongera la durée de vie des S et OR.**
L'utilisation d'air non filtré entraîne la défaillance des vibrateurs.

Compressore pneumatico
Il compressore pneumatico va tenuto pulito e l'aria filtrata (filtro < 60 mm). Si richiede azoto o aria compressa alla pressione compresa tra 2 e 6 bar (da 30 a 90 PSI). **I vibratori sono progettati per l'uso esente da lubrificante. La lubrificazione prolunga la durata dei vibratori S e OR. L'impiego di aria non filtrata danneggia il vibratore.**

Maximum operating pressure

The maximum operating pressure must not exceed 6 bar (90 PSI).

Max. Betriebsdruck

Der max. Betriebsdruck darf 6 bar (90PSI) nicht überschreiten.

Pression maximale de service

La pression maximale de service ne doit pas dépasser 6 bars (90 PSI).

Pressione massima d'esercizio

La pressione massima d'esercizio non deve superare i 6 bar (90 PSI).

The **pneumatic vibrators** described in this Manual are designed and tested for use in potentially explosive areas classified as zone 22 cat. II 3 D according to directive 94/9/CE.
The powders handled must have explosiveness index St1 or St2 and this must be notified to OLI s.r.l. at the time of placing the order to allow correct selection of the component.

The user must make sure the plant in which the **pneumatic vibrator** is installed has been set in safety condition from the point of view of explosion risk before being started up, and that the "document on protection against explosions" has also been prepared as specified by Directive ATEX 99/92/CE. (This only applies to the European market).

Die **pneumatischen Vibratoren**, die in diesem Handbuch beschrieben werden, sind für den Einsatz in explosionsgefährdeter Bereichen ausgelegt und konstruiert worden, die als Zone 22 Kat. II 3 D gemäß der Richtlinie 94/9/EG klassifiziert worden sind. Die aufbereiteten Stäube müssen Staubexplosionsklasse St1 oder St2 haben und müssen der Firma OLI s.r.l. bei der Bestellung angegeben werden, um eine korrekte Auslegung des Bauteils zu ermöglichen.

Der Anwender muss sicherstellen, dass die Anlage, in welcher der **pneumatische Vibrator** installiert werden soll, hinsichtlich der Explosionsgefahr auf ausreichende Weise in einen sicheren Zustand gebracht worden ist, bevor sie in Betrieb genommen wird, und dass zudem das „Explosionsschutzdokument" verfasst worden ist, so wie es die ATEX-Richtlinie 99/92/EG vorsieht (Dies gilt nur für den europäischen Markt).

Les vibrateurs pneumatiques décrits dans ce manuel ont été conçus et testés pour être utilisé dans les environnement explosibles classés comme zone 22 cat. II 3 D d'après la directive 94/9/CE. Les poussières traitées doivent avoir des indices d'explosivité St1 ou St2 ; pour un choix correct du composant celles-ci doivent être indiquées à OLI s.r.l. au moment de la commande.

L'utilisateur doit contrôler, avant la mise en marche, que l'installation dans laquelle est monté le **vibrateur pneumatique** a été mise en sécurité en ce qui concerne le risque d'explosion. Il faut aussi que le "document sur la protection contre les explosions" ait été rédigé conformément à la Directive ATEX 99/92/CE (Ceci n'est valable que pour le marché européen).

I vibratori pneumatici descritti in questo manuale sono stati progettati e testati per un utilizzo in zone potenzialmente esplosive classificate come zona 22 cat. II 3 D secondo la direttiva 94/9/CE. Le polveri trattate dovranno avere indici di esplosività St1 o St2 e devono essere comunicate alla OLI s.r.l. al momento dell'ordine per una scelta corretta del componente.

L'utilizzatore dovrà assicurarsi che l'impianto all'interno del quale verrà installato il **vibratore pneumatico** sia stato adeguatamente messo in sicurezza da un punto di vista di rischio esplosione prima di essere avviato e che inoltre sia stato redatto il "documento sulla protezione contro le esplosioni" come previsto dalla Direttiva ATEX 99/92/CE. (Questo vale unicamente per il mercato europeo).

The caracteristic of the dusts must be communicated to OLI to allow correct sizing of the machine and safety devices.

Der behandelte Staub sollen bei der Bestellung OLI bekanz gegeben, damit das Filter und die Sicherheitsvorrichtungen korrekt ausgelegt werden können.

Les poudres traitées doivent être communiquées à la Sté OLI au moment de la commande pour dimensionner correctement la machine et les dispositifs de sécurité.

Le caratteristiche delle polveri devono essere comunicate a OLI per un corretto dimensionamento della macchina e dei dispositivi di sicurezza.

conformément aux normes 94/9/CE, VDI 3673 and VDI 2263 - *secondo le norme 94/9/CE, VDI 3673 and VDI 2263.*

In accordance with the Directive ATEX 94/9/CE, the manufacturer defines the outside of the pneumatic vibrator as:

CAT. II 3 D

IMPORTANT: specify that the non ATEX versions must not be used in potentially explosive environments.

The **pneumatic vibrators** are designed and constructed in such a manner as to avoid unusual overheating during operation. To operate in safe conditions, **check to make sure the powders handled have a minimum ignition temperature higher than the temperature value indicated on the code plate**.

- The **pneumatic vibrators** must be installed with sufficient clearance around to allow assembly/disassembly operations, cleaning and maintenance.

Before carrying out any operation on the component, make sure it is in safe condition.

IMPORTANT: In this Manual "**setting the component in safety condition**" will include the following operations:

- **Make sure the component is disconnected from all electric supply sources.**
- **Make sure the component is disconnected from all compressed air supply sources.**
- **The area around the component must be suitably lighted (operators can be provided with electric lights suitable for zone 22 cat. II 3 D).**

For carrying out operations on the components (maintenance and cleaning), the operators must use suitable personal protection devices (PPD):

- **Antistatic safety footwear (certified)**
- Antistatic protective clothing (certified)
- Helmet
- Antistatic cut proof gloves
- **Protective masks**

It is also necessary to use all the safety devices specified in the safety sheet of the product handled.

NOTE: All the electrical equipment used for maintenance or cleaning operations on the outside of the component must be ATEX certified for zone 22 cat. II 3 D.

Im Sinne der ATEX-Richtlinie 94/9/EG definiert der Hersteller die Außenumgebung des pneumatischen Klopfers als:

KAT. II 3 D

WICHTIG: Die Versionen, die nicht ATEX sind, dürfen nicht in explosionsgefährdeten Bereichen arbeiten.

Die pneumatischen Vibratoren sind so entwickelt und konstruiert worden, dass es während ihres Betriebs nicht zu Überhitzungen kommt. Um unter sicheren Voraussetzungen arbeiten zu können, **ist sicherzustellen, dass die aufbereiteten Stäube eine Mindestzündtemperatur haben, die unterhalb des Temperaturwerts liegt, der auf dem Typenschild steht.**

- **Die pneumatischen Vibratoren** müssen so installiert werden, dass ringsum genügend Raum zur Verfügung steht, um die normalen Arbeiten für Ein- und Ausbau, Reinigung und Wartung vornehmen zu können.

Bevor man irgendeinen Eingriff an dem Bauteil vornimmt, ist sicherzustellen, dass es sich in einem sicheren Zustand befindet.

WICHTIG: Auf den weiteren Seiten dieses Handbuchs werden wir die Ausdrucksweise „**den Bauteil in einen sicheren Zustand versetzen"** benutzen, um folgende Vorgänge anzugeben:

- **Sicherstellen, dass der Bauteil von allen elektrischen Versorgungsquellen abgetrennt ist.**
- **Sicherstellen, dass der Bauteil von allen pneumatischen Versorgungsquellen abgetrennt ist.**
- **Dafür sorgen, dass der Bereich rings um den Bauteil korrekt ausgeleuchtet wird (indem die Arbeitnehmer eventuell mit elektrischen Lampen ausgestattet werden, die für die Zone 22 Kat. II 3 D geeignet sind).**

Für jeden Eingriff, der auf dem Bauteil vorzunehmen ist (Wartungen und Reinigungen), müssen die Arbeitnehmer mit angemessenen persönlichen Schutzausrüstungen (PSA) versehen sein:

- **antistatisches unfallsicheres Schuhwerk (zertifiziert)**
- **antistatische Schutzkleidung (zertifiziert)**
- **Schutzhelm**
- **antistatische Schnittschutzhandschuhe**
- **Schutzmasken**

Außerdem sind alle Schutzvorrichtungen zu verwenden, die von dem Sicherheitsdatenblatt des behandelten Produkts vorgesehen sind.

Anm.: Alle elektrische Ausrüstungen, die eventuell für die Wartungseingriffe und die Reinigung außerhalb des Bauteils benutzt werden, müssen für Zone 22 Kat. II 3 D nach ATEX zertifiziert sein.

Le constructeur, aux termes de la directive ATEX 94/9/CE, définit l'extérieur du vibrateur pneumatique comme:

CAT. II 3 D

IMPORTANT: Spécifier que les versions non ATEX ne doivent pas travailler dans des atmosphères explosibles.

Les vibrateurs pneumatiques ont été conçus et construits de manière à ne pas provoquer d'échauffements anormaux pendant le fonctionnement. Pour travailler en condition de sécurité **il faut vérifier que les poussières traitées on une température d'inflammation minimale supérieure à la valeur de température indiqué sur la plaque signalétique**.

- **Les vibrateurs pneumatiques** doivent être installés avec autour un espace suffisant pour effectuer les opérations ordinaires de montage/démontage, nettoyage et maintenance.

Avant d'effectuer toute intervention sur le composant vérifier que celui-ci a été mis en sécurité.

IMPORTANT: Dans le présent manuel nous indiquons par "**mettre en sécurité le composant"** les opérations suivantes:

- **Contrôler si le composant est débranché de toutes les alimentations électriques.**
- **Contrôler si le composant est débranché de toutes les alimentations pneumatiques.**
- **Eclairer correctement la zone qui entoure le composant (en dotant éventuellement les opérateurs de lampes électriques appropriées pour zone 22 cat. II 3 D).**

Pour toute opération à effectuer sur le composant (entretien et nettoyage), les opérateurs doivent être munis des équipements de protection individuelle (EPI):

- **Chaussures de protection antistatiques (certifiées)**
- **Vêtements de protection antistatiques (certifiés)**
- **Casque**
- **Gants anti-coupure antistatiques**
- **Masques de protection**

Il faut aussi utiliser tous les dispositifs de protection prévus par la fiche de sécurité du produit traité.

N.B.: Tous les appareillages électriques, utilisés pour les interventions de maintenance et de nettoyage réalisées à l'extérieur du composant doivent être certifiés ATEX pour zone 22 cat. II 3 D.

Il costruttore, ai sensi della direttiva ATEX 94/9/CE, definisce l'esterno del vibratore pneumatico come:

CAT. II 3 D

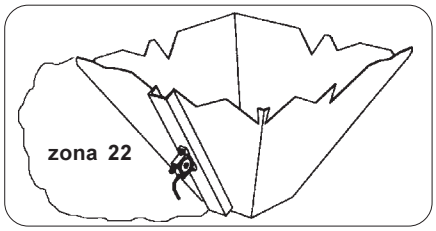
IMPORTANTE: Specificare che le versioni non ATEX non devono operare in atmosfere potenzialmente esplosive.

I vibratori pneumatici sono stati progettati e costruiti in modo tale da non provocare surriscaldamenti anomali durante il funzionamento. Per poter operare in condizioni di sicurezza **occorre verificare che le polveri trattate abbiano una minima temperatura di ignizione superiore al valore di temperatura indicato sulla targhetta.**

- **I vibratori pneumatici** dovranno essere installati con uno spazio circostante sufficiente per effettuare le normali operazioni di montaggio/smontaggio, pulitura e manutenzione.

Prima di effettuare un qualsiasi intervento sul componente assicurarsi che questa sia messa in sicurezza.

IMPORTANTE: In seguito nel presente manuale indicheremo con la dicitura **"mettere in sicurezza il componente"** le seguenti operazioni:



- **Accertarsi che il componente sia scollegata da tutte le alimentazioni elettriche.**
- **Accertarsi che il componente sia scollegata da tutte le alimentazioni pneumatiche.**
- **Provvedere a illuminare correttamente la zona circostante al componente (eventualmente dotando gli operatori di lampade elettriche idonee per zona 22 cat. II 3 D.**

Per qualsiasi operazione da effettuarsi sul componente (manutenzioni e pulizia), gli operatori dovranno essere muniti degli appositi dispositivi di protezione individuale (DPI):

- **Scarpe antinfortunistiche antistatiche (certificate)**
- **Indumenti protettivi antistatici (certificati)**
- **Casco**
- **Guanti antitaglio antistatici**
- **Mascherine protettive**

Inoltre occorre utilizzare tutti i dispositivi di protezione previsti dalla scheda di sicurezza del prodotto trattato.

N.B. Tutte le apparecchiature elettriche eventualmente utilizzate per interventi manutentivi o di pulizia eseguiti all'esterno componente devono essere certificate ATEX per zona 22 cat. II 3 D.

Noise level
Depending on the type of vibrator and air pressure the noise level is 75-85 dB(A) (with silencer). If the air pressure is lower, the noise level is also lower. We recommend in order to avoid unnecessary noise for the environment, the vibrators should not be operated without a silencer.

NOTE
- The employer must take the necessary measures in the work area to reduce to the minimum the risk deriving from daily exposure to noise.

Betriebsgeräusche
Je nach Typ (mit Schalldämpfer) und 6 bar Luftdruck bei 75 - 85 dB(A), bei geringerem Luftdruck weniger. Ein Betrieb ohne Schalldämpfer ist nicht empfehlenswert, um die Lärm-Umweltbelastung so gering wie möglich zu halten.

ANM.:
- Der Arbeitgeber muss im Betrieb alle technischen Maßnahmen durchführen, um Gefahren, die sich aus der täglichen Lärmexposition ergeben, auf ein Minimum zu reduzieren.

Niveau de bruit
En fonction du type de vibrateur (avec silencieux) et pour une pression de 6 bars,(90 PSI) le niveau de bruit est compris entre 75 et 85 dB(A). Il est plus faible quand la pression est moindre. Ne pas faire fonctionner le vibrateur sans silencieux pour ne pas provoquer des nuisances sonores inutiles.

REMARQUE:
- L'employeur doit mettre en oeuvre, dans le milieu de travail, les mesures techniques appropriées pour limiter au minimum les risques dérivants de l'exposition journalière au bruit.

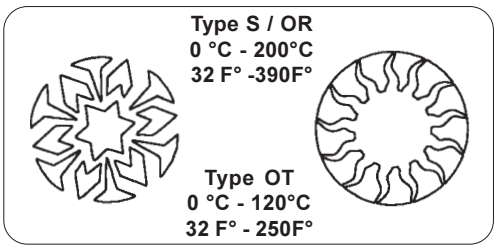
Rumorosità
A seconda del tipo di vibratore e della pressione dell'aria, il livello di rumorosità sarà pari a 75-85 dB(A) (con silenziatore). In caso di pressione dell'aria inferiore, anche la rumorosità risulterà ridotta. Al fine di evitare rumori inutili nell'ambiente, si raccomanda di azionare sempre il vibratore provvisto di silenziatore.

NOTA
- Il datore di lavoro dorà attuare, nell'ambiente di lavoro, le misure tecniche adeguate per ridurre al minimo i rischi derivanti dall'esposizione giornaliera al rumore.

Permissible operating conditions
Permissible temperature range:
S/OR -20°C to +200°C
OT -20°C to +120°C

S and **OR** require heat resistant hose nipples and silencers for temperatures above 120°C (272°F)
OT Vibrators may be operated inside liquids if the exhaust air is piped into the atmosphere.

Zulässige Betriebsbedingungen
Betriebstemperaturen
S / OR -20°C bis 200°C
OT -20°C bis 120°C.



S-und **OR**-Vibratoren Betriebstemperaturen über 120°C erfordern den Einsatz von Anschlußtüllen und Schalldämpfern in temperaturbeständiger Ausführung. Sofern vorhanden, den Nebelöler einstellen (2-5 Tropfen/h).
OT-Vibratoren
Der Betrieb in Flüssigkeiten erfordert die Abführung der Druckluft an die Atmosphäre.

Conditions de service admissibles
Températures admissibles:
S/OR -20° C à 200° C
OT -20° C à 120° C

Pendant le fonctionnement la plage de température admissible de -20°C à +120°C ne doit pas être dépassé. Des températures d'utilisation entre 120°C et 200°C nécessitent des raccords et des silencieux appropriés.
Pour l'utilisation des OT sous l'eau l'échappement doit se faire a l'air libre

Condizioni d'esercizio ammesse
Range di temperatura ammesso:
S/OR da -20°C a +200°C
OT da -20°C a +120°C

In caso di temperature superiori a 120°C (272°F), i vibratori **S** e **OR** dovranno essere dotati di silenziatori e raccordi per flessibili resistenti al calore.
I vibratori OT possono essere azionati all'interno di liquidi purché l'aria di scarico sia convogliata nell'atmosfera.

OLI S.r.l provides a 12-month warranty on their products. This period starts from the date of the consignment note.
The warranty is not applicable for breakage and/or defects caused by incorrect installation or use, or incorrect maintenance, or modifications not authorized by the Manufacturer.
The warranty does not extend to parts that wear out following normal use and electrical components.
The warranty elapses if the pneumatic vibrator:
- has been tampered with or modified,
- has not been used correctly,
- has been used without respecting the limits indicated in this manual and/or has been subjected to excessive mecha nical stress,
- has not been subjected to the necessary maintenance or these operations have been carried out partly and/or incorrectly,
- has been damaged due to carelessness during transport, installation and use,
- has been fitted with spare parts that are not original.

On receiving the product, the user must check these for defects deriving from transport and/or incomplete supply.
Defects, damage or incom pleteness of the supply must be immediately communicated to the Manufacturer in writing and countersigned by the haulage transporter.

OLI S.r.l. gewährt auf ihre Erzeugnisse eine Garantie von 12 Monaten. Die Garantiezeit beginnt mit dem Datum des Lieferscheins.
Die Garantie ist nicht anwendbar, wenn es sich um Schäden und/oder Defekte handelt, die auf falschem Einbau oder Gebrauch, nicht korrekter Wartung oder Änderungen beruhen, die ohne die Genehmigung des Herstellers ausgeführt wurden.
Die Garantie deckt keine Teile ab, die infolge des normalen Gebrauchs verschleißen, und auch keine elektrischen Teile.
Genauer geagt verfällt die Garantie in folgenden Fällen:
- Das Druckluft Vibratoren wurde manipuliert oder abgeändert;
- wurde nicht angewandt;
- bei seinem Gebrauch wurden die in diesem Handbuch genannten Einsatzbeschränkungen nicht beachtet und/oder es wurde zu starken mechanischen Belastun gen ausgesetzt;
- er wurde nicht der erforderlichen Wartung unterzogen oder diese wurde nur teilweise und/oder nicht korrekt ausgeführt;
- es wurde beschädigt, weil Transport, Einbau oder Gebrauch ohne die erforderliche Sorgfalt vorgenommen wurden;
- es wurden keine Original-Ersatzteile verwendet.

Beim Empfang der Ware hat der Empfänger sicherzustellen, dass die Ware keine durch den Transport verursachten Schäden oder Defekte aufweist, und/ oder dass der Lieferumfang vollstän-dig ist.
Etwaige Defekte, Schäden oder Fehlmengen sind mittels schriftlicher und vom Frachtführer gegengezeichneter Mitteilung sofort dem Hersteller zu melden.

La Société OLI S.r.l reconnaît une période de 12 mois de garantie sur les produits de sa fabrication. La période prend effet à compter de la date indiquée sur le bon de livraison.
La garantie ne s'applique pas à la suite de ruptures et/ou de défauts provoqués par un montage et une utilisation impropre, des entretiens qui ne sont réalisés correctement ou des modifications apportées sans autorisation du constructeur.
La garantie s'étend aux pièces qui s'usent à la suite d'une utilisation normale et aux parties électriques.
Plus précisément la garantie est sans effet si le vibrateurs pneumatique :
- a été manipulé ou modifié,
- a été utilisé de manière incor recte,
- a été utilisé sans respecter les limites indiquées dans la présen te notice et/ou qu'il a été soumis à des contraintes mécaniques excessives
- il n'a pas été soumis aux entretiens nécessaires ou que ces opérations ont été effectuées partiellement, de manière incom plète ou incorrecte
- a subit des dommages par négligence pendant le transport, la mise en place et l'utilisation,
- a été réparé avec des pièces qui ne sont pas d'origine.

Dès réception de la marchan dise, le destinataire doit vérifier que celle-ci n'a pas de défauts ou subit de dégâts dus au tran sport et que la fourniture n'est pas incomplète.
Tout défaut, dommage ou four niture incomplète doit immédia tement être signalée au construc teur par communication écrite et contresignée par le tran sporteur.

La OLI S.r.l riconosce un periodo di 12 mesi di garanzia sui prodotti di propria costruzione. Il periodo decorre dalla data della bolla di consegna.
La garanzia non è applicabile a seguito di rotture e/o difetti causati da errata installazione o utilizzo, oppure da manutenzioni non corrette o modifiche apportate senza autorizzazione del costruttore.
La garanzia non si estende alle parti che si logorano in seguito al normale uso e alle parti elettriche.
A miglior precisazione la garanzia decade nei casi in cui il vibratore pneumatico:
- sia stato manomesso o modificato,
- sia stato utilizzato non correttamente,
- sia stato utilizzato non rispettando i limiti indicati nel presente manuale e/o sia stato sottoposto ad eccessive sollecitazioni meccaniche,
- non sia stato sottoposto alle necessarie manutenzioni o queste siano state eseguite solo in parte e/o non correttamente,
- abbia subito danni per incuria durante il trasporto, l'installazione e l'utilizzo,
- siano state inserite parti di ricambio non originali.

Al ricevimento del prodotto, il destinatario deve verificare che lo stesso non presenti difetti o danni derivanti dal trasporto e/o incompletezza della fornitura.
Eventuali difetti, danni o incompletezza vanno immediatamente segnalati al costruttore mediante comunicazione scritta e controfirmata dal vettore.

TRANSPORT

When the filter is delivered, make sure that the type and quantity of the materials consigned comply with the information on the order confirmation.
Immediately inform the haulage contractor in writing if damage is discovered, using the relative space on the consignment form.
The driver is obliged to accept the complaint and to issue you with a copy. If the filter has been supplied carriage forward, either sent your complaint to us or straight to the haulage contractor. Damages will only be reimbursed if you have notified the matter on receipt of the goods.
Prevent all type of damage during the unloading and handling operations.
Always bear in mind you are dealing with mechanical equipment which must be treated with care.

TRANSPORT

Bei Erhalt der Ware sicherstellen, ob Typ und Menge mit den Daten auf der Bestellung übereinstimmen.
Etwaige Transportschäden sind sofort auf dem Schriftwege zu melden, und zwar durch Eintragen auf dem Lieferschein.
Der Fahrer ist verpflichtet, diese Reklamation anzunehmen und Ihnen eine Kopie davon auszuhändigen. Wenn die Lieferung frei Haus erfolgt, senden Sie Ihre Reklamation an uns, andernfalls direkt an den Frachtführer. Die Entschädigung erfolgt nur, wenn der Schaden gleich bei Empfang der Ware gemeldet wird.
Vermeiden Sie jede Art der Beschädigung beim Abladen und Bewegen.
Immer berücksichtigen, daß es sich um mechanische Elemente handelt, die mit Vorsicht zu behandeln sind.

TRANSPORT

Au moment où vous recevez la machine, vérifiez si la typologie et la quantité correspondent bien aux données qui se trouvent sur la confirmation de la commande.
Si vous constatez des dommages, vous devez immédiatement le déclarer en l'écrivant dans l'emplacement réservé à cet effet sur la lettre de voiture.
Le chauffeur est obligé d'accepter votre réclamation et de vous en laisser une copie. Si la fourniture a été livrée franco destination, envoyez-nous votre réclamation, sinon envoyez-la directement au transporteur.
Vous ne pourrez être remboursé des dommages et intérêts que si vous avez déclaré le dommage au moment où vous avez reçu la machine. Faites bien attention à ne pas abîmer la machine durant son déchargement et sa manutention.
Rappelez-vous qu'il s'agit de matériel mécanique qui doit être déplacé avec le plus grand soin.

TRASPORTO

Al ricevimento della merce controllare se la tipologia e la quantità corrispondono con i dati della conferma d'ordine.
Eventuali danni devono essere fatti presenti immediatamente per iscritto nell'apposito spazio della lettera di vettura.
L'autista è obbligato ad accettare un tale reclamo e lasciarne una copia a Voi. Se la fornitura è franco destino, inviate il vs. reclamo e noi, altrimenti direttamente allo spedizioniere. Il risarcimento avviene soltanto se avete fatto presente il danno all'atto del ricevimento.
Evitate ogni tipo di danneggiamento durante lo scarico e le movimentazioni.
Tenete conto che si tratta di materiale meccanico che deve essere movimentato con cura.

PACKING

NOTE:
It is the installer's responsibility to dispose off the packaging in a suitable manner, in compliance with existing legislation.

PACKUNG

N.B.:
Der Anlagenaufsteller ist dafür verantwortlich, das Verpackungsmaterial auf angemessene Art und in Übereinstimmung mit den einschlägigen, geltenden Gesetzen zu entsorgen.

EMBALLAGE

N.B.:
L'installateur doit, à ses frais, éliminer les emballages de manière adéquate et conformément aux lois en vigueur en la matière.

IMBALLO

N.B.:
è a cura dell'installatore smaltire gli imballi in modo adeguato e secondo le leggi vigenti in materia.

1)STORAGE PRIOR TO INSTALLATION
- Avoid damp, salty environments, if possible.
- Place the component on wooden platforms and store it protected from unfavourable weather conditions.

2)PROLONGED MACHINE SHUTDOWNS AFTER ASSEMBLY
- Before starting up the component, set it in safety status.
- Before starting up the component, check the condition of the electric and pneumatic system and all parts for which long shutdowns may affect working.

3) POSSIBLE REUSE AFTER PERIODS OF INACTIVITY
- During component halts, avoid-damp, salty environments.
- Place the component on wooden platforms and store it protected from unfavourable weather conditions.
- Set the component in safety status before starting it up.
- Before starting up the component, check the condition of the electric and pneumatic systems and all parts for which long shutdowns may affect working.
- Before starting up the component, clean it thoroughly by following the indications on the powder safety sheet.
- If the component operates in conditions and with materials different from the previous application, check the compatibility of this use according to the indications in the INDICATIONS FOR USE section.

1) EINLAGERUNG VOR DEM EINBAU
- Feuchte und salzhaltige Luft für die Einlagerung vermeiden.
- Den Bauteil auf einer Holzpalette setzen und vor Witterung schützen.

2) LÄNGERE BETRIEBSRUHE NACH DEM EINBAU
- Vor der Inbetriebnahme ist der Bauteil in einen sicheren Zustand zu bringen.
- Vor der Inbetriebnahme des Bauteils die elektrische und pneumatische Anlage und alle Teile, deren Funktionstüchtigkeit die bei einem längeren Stillstand in Frage gestellt werden könnte, prüfen.

3) MÖGLICHE WIEDERVERWENDUNG NACH EINEM LÄNGEREN STILLSTAND
- Während des Stillstands des Bauteils Räume mit feuchter und salzhaltiger Luft vermeiden.
- Den Bauteil auf eine Holzpalette setzen und vor Witterung schützen.
- Vor der Inbetriebnahme ist der Bauteil in einen sicheren Zustand zu bringen.
- Vor der Inbetriebnahme des Bauteils die elektrische und pneumatische Anlage und alle Teile, deren Funktionstüchtigkeit die bei einem längeren Stillstand in Frage gestellt werden könnte, prüfen.
- Vor der Inbetriebnahme des Bauteils ist ein vollständiger Abreinigungszyklus vorzunehmen, wobei das zu beachten ist, was auf dem Sicherheits-Datenblatt des entsprechenden Erzeugnisses steht.
- Wenn der Bauteil unter Bedingungen oder mit Material betrieben wird, das vom vorherigen Einsatz abweicht, ist die Verträglichkeit für den neuen Einsatz mit den BEDIENSUNGSANLEITUNG zu vergleichen.

1) EMMAGASINAGE AVANT LA MISE EN PLACE
- Si possible éviter les locaux humides et les saumâtres
- Placer le composant sur des palettes en bois et les ranger à l'abri des intempéries.

2) ARRÊT MACHINE PROLONGÉ APRÈS LE MONTAGE
- Avant la mise en service mettre le composant en sécurité.
- Avant la mise en service du composant contrôler l'intégrité de l'équipement électrique et de toutes les parties pour lesquelles un arrêt prolongé pourrait compromettre le fonctionnement.

3) RÉ-UTILISATION APRÈS UNE PÉRIODE D'INACTIVITÉ
- Pendant la période d'inactivité du composant éviter les locaux humides et saumâtres
- Placer le composant sur des palettes en bois et les ranger à l'abri des intempéries.
- Avant la mise en service mettre le composant en sécurité
- Avant la mise en service du composant contrôler l'intégrité de l'équipement électrique et de toutes les parties pour lesquelles un arrêt prolongé pourrait compromettre le fonctionnement.
- Avant la mise en service du composant effectuer un cycle complet de nettoyage en respectant ce qui est indiqué sur la fiche de sécurité de la poussière.
- Si le composant travaille dans des conditions et avec des matières différentes de l'application précédente, vérifier la compatibilité de cette utilisation d'après ce qui est indiqué dans la section MODE D'EMPLOI.

1) IMMAGAZZINAGGIO PRIMA DELL'INSTALLAZIONE
- Evitare possibilmente ambienti umidi e salmastri.
- Sistemare il componente su pedane di legno e locarle al riparo dalle intemperie.

2) FERMO COMPONENTE PROLUNGATO DOPO IL MONTAGGIO
- Prima della messa in servizio mettere in sicurezza il componente.
- Prima della messa in servizio del componente controllare l'integrità dell'impianto elettrico, pneumatico, e di tutte le parti per le quali un prolungato arresto potrebbe compromettere la funzionalità.

3)POSSIBILE REIMPIEGO DOPO PERIODO DI INATTIVITA'
- Durante il fermo componente evitare ambienti umidi e salmastri.
- Sistemare il componente su pedane di legno e locarle al riparo dalle intemperie.
- Prima della messa in servizio mettere in sicurezza il componente.
- Prima della messa in servizio del componente controllare l'integrità dell'impianto elettrico, pneumatico, e delle parti per le quali un prolungato arresto potrebbe compromettere la funzionalità.
- Prima della messa in servizio del componente eseguire un ciclo completo di pulizia rispettando quanto riportato sulla scheda di sicurezza della polvere.
- Se il componente opera in condizioni e con materiali diversi dall'applicazione precedente, verificare la compatibilità di tale utilizzo secondo quanto riportato nel sezione INDICAZIONE PER L'USO.

NOTE
The pneumatic vibrator must be positioned in such a manner that:
- the area around the pneumatic vibrator must be made safe as per Directive ATEX 94/9/CE.

By safe place is meant an outside area in which suitable warning notices are present during the working of the pneumatic vibrator, see Sect. 26 residual risks, and where there are no plant parts that can get damaged or inflammable material deposit.

INSTALLATION
The unit must be fastened to a clean and level surface with two fastening screws (for screw size and tightening torque see table).
Use self-locking screw retention washers (no spring washers).
Use self-locking nuts or e.g. Loctite 270 against loosening.

It is highly recommended to use a reinforcement section (U-section) as substructure. This reinforcement section should be welded to the object. This allows optimal transfer of the vibration energy - and saves any direct damage to the object.

ASSEMBLY INSTRUCTIONS:
The frame on which the pneumatic vibrator is mounted must be in equipotential.
The vibrator must be fixed to the frame by means of bolts and washers; the toothed washer (UNI8842) must be fitted in contact with the body.
The wire terminal must be connected to an earth wire.
Checklist for Assembly and Commissioning:
1) Install the unit carefully. Secure the fastening screws.
2) Install service unit (filter, regulator), valve and supply line.
3) If necessary install lubricator and adjust oil flow (2 to 5 drops an hour) .
4) Check: Are fastening screws secured?
   Have notes on hose length and nominal width been observed?

ANM
Der pneumatische Vibrator muss so angeordnet werden, dass:
- der Bereich rings um den pneumatischen Vibrator gemäß der Richtlinie ATEX 94/9/EG sicher gestaltet ist.

Unter einem sicheren Ort versteht man einen Außenbereich, in dem während des Betriebs des pneumatischen Klopfers eine entsprechende Beschilderung angebracht ist. Siehe Teil 26 Restrisiken. Außerdem dürfen keine Anlagenteile vorhanden sein, die beschädigt werden könnten, oder Lager mit entflammbaren Materialien.
EINBAU
Der Einbau erfolgt mittels zweier Befestigungsschrauben. Die Oberfläche muß sauber und eben sein (Schraubengröße und Anzugsmomente: siehe Tabelle).
Selbstsichernde Unterlegscheiben, jedoch keine Federringe verwenden.
Selbstsichernde Muttern gegen Lösen oder aber z.B. Loctite 270 verwenden.

Besonders zu empfehlen ist ein Versteifungsprofil (U-Stahl) als Unterbau. Das Versteifungsprofil muß an das zu vibrierende Objekt angeschweißt werden. Dadurch wird die Vibrationsenergie optimal übertragen.

MONTAGEANLEITUNGEN:
Die Struktur, auf welcher der pneumatische Vibrator installiert ist, muss Potentialausgleich haben.
Der Vibrator muss mit den dafür bestimmten Schrauben und Unterlegscheiben an der Struktur befestigt werden. Die Zahnscheibe (UNI8842) muss im Kontakt mit dem Gehäuse montiert werden. Die Kabelöse muss an einem Erdungskabel angeschlossen werden.
Checkliste für Montage und Inbetriebnahme
1) Geräte sorgfältig montieren. Befestigungsschrauben sichern.
2) Wartungseinheit (Filter, Regler), Ventil, Zuleitung einbauen.
3) Ggfls. Nebelöler einstellen (2-5 Tropfen/h) und Abluft ableiten.
4) Prüfen, ob Befestigungsschrauben gesichert sind und Angaben über Schlauchlänge und Nennweite beachtet wurden.

REMARQUE
Le vibrateur pneumatique doit être mis en place en respectant les règles suivantes :
- la zone tout autour du vibrateur pneumatique doit être mise en sécurité conformément à la directive ATEX 94/4/CE.

Par lieu sûr on entend une zone extérieure dans laquelle, pendant le fonctionnement du vibrateur pneumatique, sont apposés des panneaux de signalisation appropriés (voir sect. 26 risques résiduels). En outre il ne doit pas y avoir de parties d'installation endommageables ou des dépôts de matières inflammables.
MONTAGE
Le montage est réalisé par deux vis de fixation sur une surface propre et plane (taille des vis et couple de serrage, voir tableau) et avec des rondelles d'arrêt autobloquantes (pas de rondelles ressorts). Contre le desserrage, utilisez des écrous indesserrables ou un agent liquide antidesserrage, par ex. Loctite 270.

Nous recommandons de prévoir comme support un profilé de raidissement (fer U) soudé sur l'objet à vibrer, ce qui permet une transmission optimale de l'énergie de vibration.

INSTRUCTIONS DE MONTAGE:
La structure sur laquelle est monté le vibrateur pneumatique doit être en équipotentialité.
Le vibrateur doit être fixé à la structure au moyen de vis et de rondelles; la rondelle crantée (UNI8842) doit être montée en contact avec le corps. La cosse doit être branchée à un câble de mise à la terre.
Check-list de montage et de mise en service :
1) Monter soigneusement l'appareil, serrer et bloquer les vis de fixation.
2) Monter l'unité de conditionnement (filtre, régulateur), la vanne, la conduite d'amenée.
3) En cas de nécessité, régler le graisseur.
4) Vérification: Les vis de fixation sont-elles freinées ?
   La longueur des flexibles et leur diamètre nominal ont-elles été respectées ?

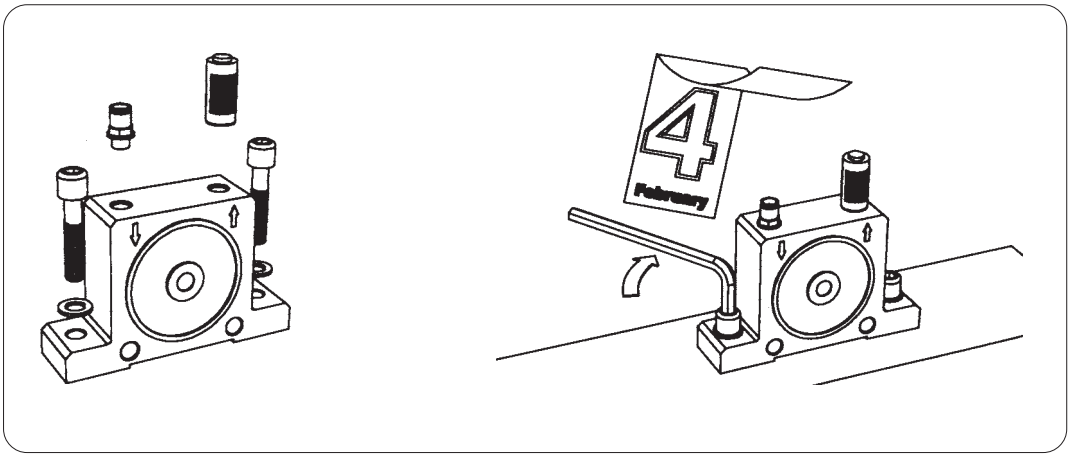
NOTA
Il vibratore pneumatico, deve essere posizionato in modo che:
- la zona circostante al vibratore pneumatico deve essere resa sicura come da direttiva ATEX 94/9/CE.

Per luogo sicuro s'intende una zona esterna nella quale durante il funzionamento vibratore pneumatico, sia apposta l'adeguata cartellonistica, vedi sez.26 rischi residui, inoltre non siano presenti parti d'impianto danneggiabili o depositi di materiali infiammabili.

INSTALLAZIONE
- Fissare l'unità ad una superficie piana e pulita utilizzando due viti di serraggio (per la misura delle viti e la coppia di serraggio si veda la tabella).
- Utilizzare rondelle d'arresto autobloccanti (non utilizzare rondelle elastiche). Per evitare che le rondelle si allentino, utilizzare dadi antobloccanti o Loctite 270.

Si raccomanda di impiegare come sottostruttura un profilato di rinforzo (sezione a U), da saldare all'oggetto in lavorazione. Ciò consente il trasferimento ottimale dell'energia vibrante, preservando l'oggetto da eventuali danneggiamenti.

ISTRUZIONI PER IL MONTAGGIO :
La struttura su cui è montato il vibratore pneumatico deve essere in equipotenzialità.
Il vibratore deve essere fissato alla struttura mediante le apposite viti e rondelle; la rondella dentata (UNI8842) deve essere montata a contatto con il corpo.
Il capicorda deve essere collegato ad un cavo per la messa a terra.
Checklist per montaggio e messa in funzione:
1) Installare l'unità con precauzione. Serrare le viti di fissaggio.
2) Installare l'unità di servizio (filtro, regolatore), la valvola e la linea di alimentazione.
3) Se necessario, installare il lubrificatore e regolare il flusso d'olio (da 2 a 5 gocce all'ora).
4) Controllare: Le viti di fissaggio sono serrate?
   Sono state rispettare le indicazioni relative alla lunghezza del tubo e allo spessore nominale?



Type	Thread *Gewinde* Filetage *Filetto*	Tightening torque *Anzugsmoment* Couple de serrage *Coppia di serraggio*	Supply line thread *Anschlußgewinde* Filetage *Filettatura ingresso aria*	Supply line diameter *Zuleitung* Conduite d'amenée *ø Nominale tubo alimentazione*

OT8 - OT10 - OT105	M 6	10.4 Nm	1/8"	DN 6
OT13 - OT16 - OT165	M 8	25.0 Nm	1/4"	DN 8
OT20 - OT25 - OT255	M 8	25.0 Nm	1/4"	DN 10
OT30 - OT36 - OT365	M 10	51.0 Nm	3/8"	DN 12

- The user is entirely responsible if the pneumatic vibrator is installed in any way other than that indicated above.
- The component does not require special lighting; the component installer is however responsible for ensuring uniform lighting in the area on the basis of the indications of the relevant regulation.
- It is the installer's responsibility to check the suitability of the site for plant installation.
- Depending on the assembly height, the necessary Personal Protection Devices (PPD) must be provided.

- Positionierungen des pneumatischen Vibrators, die von denen abweichen als oben angegeben sind, führen dazu, dass die gesamte Verantwortlichkeit auf den Anwender übergeht.
- Der Bauteil braucht keine besondere Beleuchtung. Der Monteur des Bauteils ist auf jeden Fall dazu angehalten, das Vorhandensein einer gleichmäßigen Ausleuchtung des Bereichs zu gewährleisten, so wie es die geltenden Bestimmungen angeben.
- Der Monteur ist dafür verantwortlich, die Eignung des Raums zu prüfen, in dem die Anlage aufgestellt wird.
- Je nach der Einbauhöhe sind angemessene PSA (persönliche Schutzausrüstungen) bereitzustellen.

- Tout positionnement différent du vibrateur pneumatique rend l'utilisateur entièrement responsable.
- Le composant n'exige pas un éclairage particulier; l'installateur du composant doit assurer la présence d'un éclairage approprié dans la zone sur la base des indications de la réglementation concernée.
- L'installateur doit vérifier la conformité du site qui accueille l'installation.
- En fonction de la hauteur de montage prévoir les DPI (dispositifs de protection individuelle) nécessaires.

- Posizionamenti del vibratore pneumatico diversi da quanto sopra indicato determinano la totale assunzione di responsabilità da parte dell'utilizzatore.
- Il componente non necessita di un'illuminazione particolare; l'installatore del componente è comunque tenuto ad assicurare la presenza di un'omogenea illuminazione nell'area in base alle indicazioni della normativa pertinente.
- E' a carico dell'installatore verificare l'idoneità del sito che ospiterà l'impianto.
- In funzione dell'altezza di montaggio predisporre i DPI (dispositivi di protezione individuali) necessari".

NOTE	ANM.:	REMARQUE	NOTA
Check the earth connection.	Die Erdung prüfen.	Vérifier la mise à la terre.	Verificare la messa a terra.

COMPRESSED AIR REQUISITES
The compressed air supplied to the various utilities must have certain special features:
1) **clean**: free of scale which could damage the solenoid valves present on the pneumatic actuator.
2) **dehumidified**: use of a condensate trap is advisable.
3) **lubricated**: Specify the models that require lubrication and those that do not (Tables Data)

Attention: before connecting the compressed air to the pneumatic actuator utilities, empty the pipes

ANFORDERUNGEN AN DIE DRUCKLUFT
Die Druckluft, die verschiedene Verbraucher versorgen muss, muss folgende Eigenschaften haben:
1) **rein:** sie darf keine Teilchen enthalten, mit denen die Magnetventile des pneumatischen Antriebs beschädigt werden könnten.
2) **trocken:** Die Verwendung eines Kondensatabscheiders ist empfehlenswert.
3) **geschmiert:** Die Modelle benutzen, die Schmierung brauchen bzw. nicht (Daten der Tabellen).

Achtung. Vor dem Anschließen der Druckluft an die Verbraucher des pneumatischen Antriebs sind die Leitungen zu entleeren.

AIR COMPRIMÉ REQUIS
L'air comprimé qui doit alimenter les différentes utilisations doit avoir les requis suivants :
1) **Propre**: sans impuretés pouvant endommager les électrovannes présentes sur le percuteur pneumatique.
2) **Déshumidifié**: il convient de prévoir l'utilisation d'un séparateur d'eau de condensation.
3) **Lubrifié**.

Attention: avant de brancher l'air comprimé aux utilisations du vibrateur pneumatique vider les tuyauterie

s.

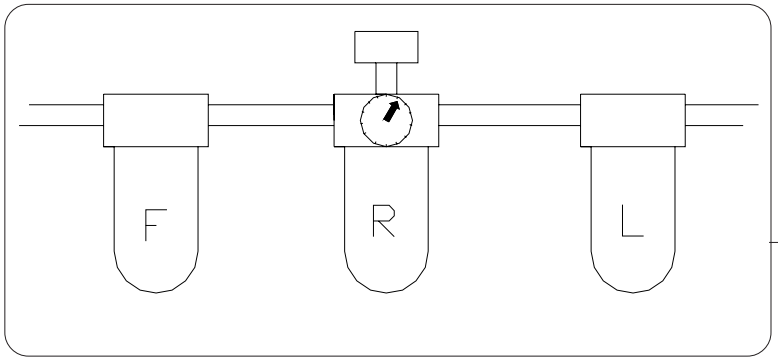
REQUISITI ARIA COMPRESSA
L'aria compressa che deve alimentare le varie utenze ha bisogno di particolari caratteristiche:
1) pulita: esente da scorie che potrebbero danneggiare le elettrovalvole presenti sull'attuatore pneumatico.
2) deumidificata: è opportuno prevedere l'utilizzo di un separatore di condensa.
3) lubrificata: Inserire i modelli che richiedono lubrificazione e quali no. (Dati tabelle)

Attenzione: prima di collegare l'aria compressa alle utenze dell'attuatore pneumatico vuotare le tubazioni.

PNEUMATIC CONNECTION
Supply line
The air resistance increases with the length of the pipe. For pipe lengths of up to 3m then the minimum length is required for the following cross section. For longer supply lines it is recommended to use bigger cross sections.
Air discharge
If the air flowing out is discharged and the vibrator is at full power, the discharge pipe must have a bigger nominal width than the supply pipe.

PNEUMATISCHE ANSCHLÜSSE
Zuleitung
Der Luftwiderstand steigt mit der Schlauchlänge. Bei Schlauchlängen bis max. 3 m bis zum nächstgrößeren Leitungsquerschnitt sind die in der Tabelle angegebenen Mindestquerschnitte zu empfehlen.
Für längere Zuleitungen sollten die Querschnitte größer sein.
Ableitung
Wenn die austretende Luft abgeführt wird und der Vibrator die volle Leistung erzielen soll, so muß der Ableitungsschlauch eine größere Nennweite haben als der Zuleitungsschlauch.

RACCORDEMENTS PNEUMATIQUES
Conduite d'amenée
La résistance de l'air augmente avec la longueur des flexibles. Avec des flexibles d'une longueur maximum de 3 m, nous recommandons les sections figurant dans le tableau. Pour les conduites d'amenée plus longues, nous recommandons des sections plus importantes.
Conduite d'évacuation
Si l'air sortant est évacué, il est nécessaire que le flexible d'évacuation présente un diamètre supérieur à celui de la conduite d'amenée d'air.



COLLEGAMENTI PNEUMATICI
Linea di alimentazione
La resistenza dell'aria aumenta con la lunghezza del tubo. In caso di tubi fino a 3 metri di lunghezza, si raccomandano le sezioni minime indicate in tabella. Per tubi di lunghezza superiore, si consiglia di utilizzare sezioni maggiori.
Scarico dell'aria
In caso di scarico dell'aria che fuoriesce e se il vibratore è a piena potenza, il tubo di scarico deve avere uno spessore nominale maggiore di quello del tubo di alimentazione.

The air inlet has a smaller opening than the air outlet. Both are marked on the front side by arrows.
The pressurized air infeed must be fixed safely.
Mixing up air inlet and air outlet leads to loss in performance.

Der Lufteinlaß hat eine kleinere Öffnung als der Luftauslaß. Beide sind auf der Vorderseite durch Pfeile gekennzeichnet.
Die Druckluftzuführung muß sicher befestigt werden.
Eine Verwechslung von Luftein- und Luftausgang hat einen Leistungsverlust zur Folge.

L'entrée d'air a une ouverture plus petite que la sortie d'air. Toutes les deux sont marquées avec des flèches. La conduite d'air comprimé doit être fixée de manière sûre.
La confusion d'entrée et sortie a comme conséquence une perte de performance.

L'entrata dell'aria presenta un'apertura più piccola rispetto all'uscita. Entrambe sono contrassegnate sulla parte anteriore da frecce.
Il raccordo di alimentazione dell'aria sotto pressione deve essere fissato in modo sicuro.
La miscelazione di aria in entrata e in uscita provoca perdite nelle prestazioni.

use oil only - *Nur Öl benutzen*
Utiliser uniquement de l'huile - *usare solo olio*

ISOVG5
(5 cST / 40°C)

ATTENTION: use pipes and accessories suitable for the operating temperatures.

WARNING: Fix flexible compressed air hose pipes and provide necessary precautions against unwanted detachment of a pipe section.

ACHTUNG: Leitungen und Zubehörteile benutzen, die für die Betriebstemperaturen geeignet sind.
WARTUNG: Die Druckluftschläuche fachmännisch befestigen und die notwendigen Vorkehrungen gegen ein unvorgesehenes Ablösen eines Teils der Leitung treffen.

ATTENTION: adopter des tuyauteries et des accessoires appropriés aux températures d'utilisation.
IMPORTANT: Fixer correctement les tuyaux d'air comprimé et prendre les précautions nécessaires contre le décrochage soudain d'un tronçon de tuyauterie.

ATTENZIONE :adottare tubazioni e accessori idonei alle temperature d'utilizzo.

IMPORTANTE: Fissare correttamente i tubi flessibili dell'aria compressa e predisporre le dovute precauzioni contro il distacco improvviso di un tratto di tubazione.

ELECTRICAL CONTROLLER
Connect the earth wire to the point provided on the pneumatic vibrator.

Set the component in safety status before carrying out any operation.

COMMISSIONING AND OPERATION
The vibrator can be commissioned immediately after the correct installation. Make sure that the pressure in the air system is able to meet the air consumption value specified in the operating instructions. Otherwise the vibrator will not be able to work according to the technical specifications.

Screw connections must be checked and retightened after 1 hour of operation and then at regular intervals (normally every month).

ELEKTRISCHE ANSCHLÜSSE
Das Erdungskabel mit der Stelle verbinden, die auf dem pneumatischen Vibrator dafür vorgesehen ist.

Vor der Ausführung jeder beliebigen Arbeit das Bauteil in einen sicheren Zustand versetzen.

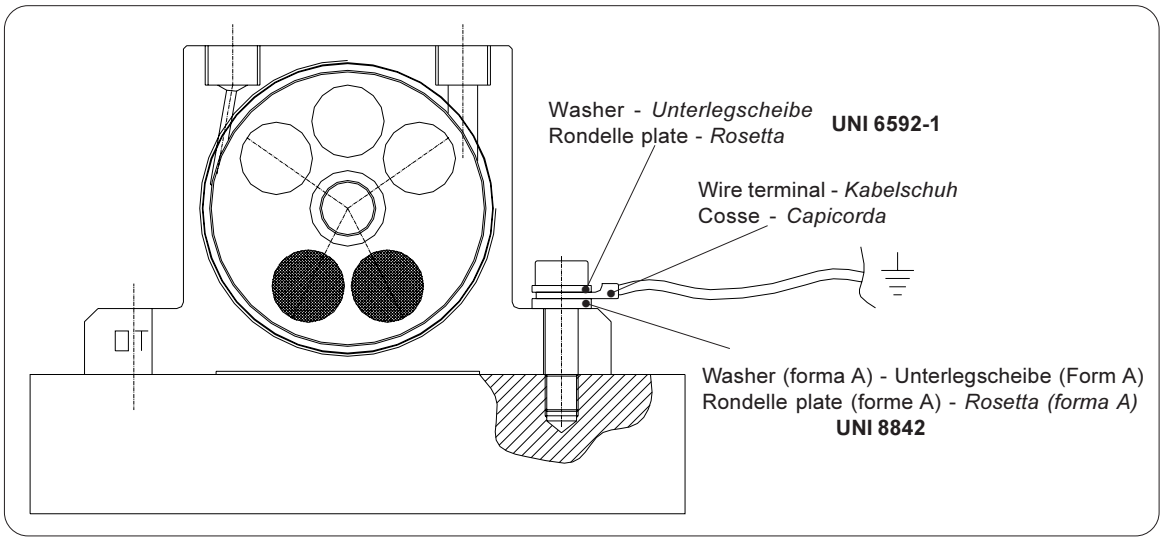
INBETRIEBNAHME UND BETRIEB
Die Inbetriebnahme der Vibratoren erfolgt sofort nach der fachgerechten Montage. Sicherstellen, daß der in der Betriebsanleitung angegebene Luftverbrauchswert vom Druckluftsystem auch geliefert wird. Andernfalls wird der Vibrator die technischen Daten nicht erzielen.

Nach einer Stunde Betrieb die Schraubverbindungen erstmalig, danach regelmäßig (möglichst einmal monatlich) überprüfen und ggfls. nachziehen.

RACCORDEMENTS ÉLECTRIQUES
Brancher le câble de mise à la terre à l'endroit prévu sur le vibrateur pneumatique.

Avant toute opération mettre le composant en condition de sécurité.

MISE EN SERVICE ET UTILISATION
À l'issue d'un montage approprié, la mise en service du vibrateur peut intervenir immédiatement. Assurez-vous que la consommation d'air indiquée dans les instructions de service peut être effectivement fournie par votre système d'alimentation en air comprimé. Sinon, le vibrateur ne pourra atteindre les caractéristiques techniques prévues.



Les vis visses devront être vérifiées après la première heure de service, puis régulièrement (tous les mois). Le cas échéant, les vis seront resserrées.

COLLEGAMENTI ELETTRICI
Collegare il cavo di messa a terra all'apposito punto dedicato sul vibratore pneumatico

Prima di qualsiasi intervento mettere il componente in sicurezza.

MESSA IN FUNZIONE E USO
Se installato correttamente, il vibratore può essere messo immediatamente in funzione. Assicurarsi che la pressione del sistema pneumatico sia in grado di soddisfare il valore di consumo d'aria specificato nelle istruzioni per l'uso. In caso contrario il vibratore non potrà funzionare in conformità alle specifiche tecniche.

Controllare i raccordi a vite e serrarli di nuovo dopo un'ora di funzionamento e poi a intervalli regolari (in genere una volta al mese).

Set the component in safety status before carrying out any operation.

- If work is to be carried out on parts at the top of the pneumatic vibrator, use a work area platform which must be selected in such a manner as to avoid risk of slipping, tripping or falling of operators.

S and **OR**-vibrators are maintenance-free. From outside they can be cleaned with a water jet. Operate the vibrator for a short while after.

WARNING
Dirty compressed air causes clogging of filter and silencer.
If necessary empty the filter, clean filter element and silencer (wash out).

REPLACING "OT" SERIES BEARINGS

Vor der Ausführung jeder beliebiger Arbeit ist der Bauteil in einen Zustand versetzen.

- Wo sich Teile des pneumatischen Vibrators in größerer Höhe befinden, eine Arbeitsplattform zu benutzen, die so zu wählen ist, dass eine Gefährdung des Personals in Form von Ausrutschen, Hängenbleiben oder Absturz vermieden wird.

S-und **OR**- Vibratoren sind wartungsfrei. Sie können von außen mit einem Wasserstrahl gereinigt werden. Nach der Reinigung den Vibrator kurz betätigen.

ACHTUNG
Schmutzige Druckluft führt zur Verschmutzung von Filter und Schalldämpfer.
Filter ggfls. leeren, den Filtereinsatz und den Schalldämpfer reinigen bzw. auswaschen.

ERSETZEN DER LAGER SERIEN „OT"

Avant toute opération mettre le composant en condition de sécurité.

- Pour atteindre des parties du vibrateur pneumatique en hauteur, utiliser une plate-forme aérienne de travail qui devra être choisie de manière à éviter tout danger de glissement ou de chute des opérateurs.

Les **S** et **OR** ne réclament pas d'entretien. Ils peuvent être nettoyés extérieurement à l'eau sous pression. Après le nettoyage, faire brièvement fonctionner le vibrateur.

ATTENTION
L'air chargé d'impuretés provoque l'encrassement du filtre et du silencieux.
En cas de nécessité, purger le filtre, nettoyer la garniture du filtre et le silencieux (en les lavant).

REMPLACEMENT DES ROULEMENTS SERIE "OT"

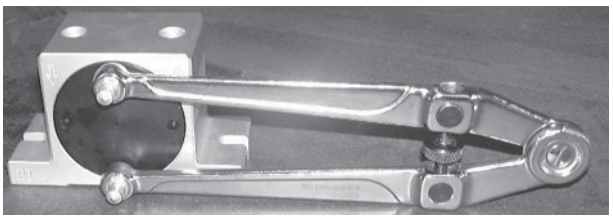
Prima di qualsiasi intervento mettere il componente in sicurezza.

- Là dove si debbano raggiungere parti del vibratore pneumatico in quota utilizzare una piattaforma aerea di lavoro che dovrà essere scelta in modo da evitare pericoli di scivolamento, inciampo o caduta per gli operatori.

I vibratori **S** e **OR** sono esenti da manutenzione. Possono essere puliti esternamente mediante getto d'acqua. Dopo avere eseguito questa operazione, farli funzionare per un breve intervallo di tempo.

ATTENZIONE
L'aria compressa contenente impurità provoca l'insudiciamento del filtro e del silenziatore. Se necessario, svuotare il filtro, pulire la cartuccia e il silenziatore (risciacquo).

SOSTITUZIONE CUSCINETTI SERIE "OT"



REPLACING "OT" SERIES BEARINGS

Use exclusively bearings of the following type for replacement:

Ausschließlich Lager des folgenden Typs verwenden:

Remplacer exclusivement avec des roulements type:

Sostituire esclusivamente con cuscinetti tipo:

OT type	SKF bearing type
OT 8	607 ZTN9/C3
OT 10	
OT 10 S	
OT 13	6000 ZTN9/C3
OT 16	
OT 16 S	
OT 20	6203 ZTN9/C3
OT 25	
OT 25 S	
OT 30	6303 ZTN9/C3
OT 36	
OT 36 S	

PERIODIC CHECKS

Set the component in safety status before carrying out any operation.

- Clean dust deposits on a weekly basis.
- Check the tightening of the screw connectors on a monthly basis.
- Check tightening torque of the fixing screws on a monthly basis.
- Check the equipotential with the structure on which the vibrator is mounted, on a monthly basis.
- Change the ball bearings on the OT model every 3000 hours.

CLEANING

Set the component in safety status before carrying out any operation.

While cleaning the dust deposited on the component, avoid throwing up dust into the surroundings and avoid dust deposits.

- The user must choose suitable cleaning products depending on the type of plant and the product handled, taking care to avoid toxic and inflammable products.
- If the pneumatic vibrator is to be used with food products, use non toxic detergents suitable for the type of application.
- The cleaning frequency depends on the type of product handled and the plant.
- In case of harmful, toxic products, cleaning wastes must be conveyed into closed tanks and disposed off according to the indications in the products safety sheet.

REGELMÄSSIGE KONTROLLEN

Vor der Ausführung beliebiger Arbeiten das Bauteil in einen sicheren Zustand versetzen.

- Etwaige Staubansammlungen einmal pro Woche entfernen.
- Die Schraubanschlüsse einmal pro Monat auf festen Sitz prüfen.
- Einmal pro Monat das Anzugsmoment der Befestigungsschrauben prüfen.
- Einmal pro Monat die Struktur, an der der Vibrator befestigt ist, auf Potentialausgleich prüfen.
- Alle 3000 Betriebsstunden bei Modell OT die Kugellager prüfen.

REINIGUNG

Vor der Ausführung beliebiger Arbeiten das Bauteil in einen sicheren Zustand versetzen.

Beim Entfernen von Staub, der sich eventuell auf dem Bauteil gebildet hat, dafür sorgen, dass der Staub nicht in die Umgebung verteilt wird, und vermeiden, dass sich zu viel Staub ansammelt.

- Der Anwender muss Reinigungsmittel verwenden, die zum Typ der Anlage und zum behandelten Produkt passen. Er muss auf jeden Fall dafür sorgen, dass keine giftigen oder feuergefährlichen Produkte verwendet werden.
- Falls der pneumatische Vibrator zum Verarbeiten von Lebensmitteln benutzt wird, ist es vorgeschrieben, ungiftige Reinigungsmittel zu verwenden, die zur Anwendung passen.
- Die Häufigkeit der Reinigung hängt von der Beschaffenheit des zu behandelnden Produkts und der Anlage ab.
- Falls man schädliche oder giftige Erzeugnisse verarbeitet, müssen die Reinigungsabwässer in einer geeigneten, geschlossenen Wanne gesammelt und gemäß den Angaben auf dem Sicherheits-Datenblatt entsorgt werden.

CONTROLES PERIODIQUES

Avant toute operation mettre le composant en condition de sécurité.

- Chaque semaine éliminer les dépôts de poussière qui se sont accumulés.
- Tous les mois vérifier le serrage des raccords à vis.
- Tous les mois vérifier le couple de serrage des vis de fixation.
- Tous les mois vérifier l'équipotentialité avec la structure sur laquelle est fixé le vibrateur.
- Tous les 3000 heures remplacer les roulements à bille sur le modèle OT.

NETTOYAGE

Avant toute operation mettre le composant en condition de sécurité.

En éliminant la poussière présente sur le composant faire attention à ne pas la disperser dans le milieu environnant et éviter toute accumulation.

- L'utilisateur doit utiliser des produits appropriés pour le nettoyage en fonction du type d'installation et du produit traité, en faisant attention à ne pas employer de produits toxique ou inflammables.
- Si le vibrateur pneumatique travaille avec des produits alimentaires il est obligatoire d'utiliser des détergents non toxiques, mais appropriés au type d'application.
- La fréquence des opérations de nettoyage dépend de la nature du produit traité et de l'équipement.
- En cas de produits nocifs ou toxiques, les eaux usées du nettoyage doivent être convoyées dans une cuve fermée adéquate et éliminées conformément à ce qui est prévu par la fiche de sécurité du produit.

CONTROLLI PERIODICI

Prima di qualsiasi intervento mettere il componente in sicurezza.

- Settimanalmente rimuovere eventuali cumuli di polvere di deposito.
- Verificare mensilmente, il serraggio dei raccordi a vite.
- Verificare mensilmente, la coppia di serraggio delle viti di fissaggio.
- Verificare mensilmente, l'equipotenzialità con la struttura su cui viene fissato il vibratore.
- Sostituire ogni 3000 ore sul modello OT i cuscinetti a sfera.

PULIZIA

Prima di qualsiasi intervento mettere il componente in sicurezza.

Nella rimozione della polvere eventualmente presente nel componente, aver cura di non disperdere la polvere stessa nell'ambiente circostante e avere cura di evitare cumuli.

- L'utilizzatore dovrà provvedere alla scelta dei prodotti idonei alle fasi di pulizia in base alla tipologia di impianto ed al prodotto trattato facendo comunque attenzione a non usare prodotti tossici o infiammabili.
- Nel caso che il vibratore pneumatico operi con prodotti alimentari è obbligatorio usare detergenti non tossici, ma idonei al tipo di applicazione.
- La frequenza delle operazioni di pulizia dipendono dalla natura del prodotto trattato e dell'impianto.
- Nel caso di prodotti nocivi, tossici, i reflui della pulitura dovranno essere convogliati in idonea vasca chiusa e smaltiti secondo quanto previsto dalla scheda di sicurezza del prodotto.

On the basis of the use of the pneumatic vibrator, the installer must inform the operator by means of specific signals, regarding the residual risks:

1. Mechanical risk

For maintenance operations, it is compulsory for the operator to always use personal protection equipment.

Special warning notices on each section of the machine indicate the obligatory personal protection equipment:

2. Presence of possible residual high temperature after percussion gun stop

During the course of maintenance and cleaning operations and in certain operating sections, the operator may enter into contact with very hot parts of the percussion gun, with the machine stopped.

Special warning notices, located at strategic points indicate the risk due to the presence of very hot surfaces and the obligation for the operator to wear personal protection equipment, especially protective gloves.

3. Presence of potentially hazardous dusts

In the event of both routine and extraordinary maintenance, the operator must wear suitable personal protection equipment, and in particular, use a safety mask for the respiratory tract depending on the type of dust daalt as well as gloves and clothing.

For more details, refer to the safety chart of the product handled.

Je nach Verwendung des Druckluft Vibratoren muss der Installateur das Personal durch besondere Hinweisschilder auf folgende Restrisiken hinweisen:

1.Gefahren mechanischer Art

Für die Wartungsarbeiten muss das Personal immer seine persönlichen Schutzausrüstungen benutzen.

Besondere Warnschilder an den einzelnen Abschnitten des Geräts geben an, welche persönlichen Schutzausrüstungen jeweils erforderlich sind:

2. Vorliegen möglicher hoher Temperaturen nach dem Stillstand der Klopfer

Im Laufe einiger Wartungs- und Reinigungsarbeiten und in einigen Arbeitsabschnitten kann das Personal bei stehendem Gerät in Kontakt mit Teilen der Klopfer geraten, die eine hohe Temperatur aufweisen.

Besondere Warnschilder, die an den strategischen Stellen angebracht sind, weisen auf die Gefahren hin, die sich durch die hohe Temperatur der Oberflächen ergeben und weisen das Personal darauf hin, dass es zur Verwendung der persönlichen Schutzausrüstungen verpflichtet ist, insbesondere zum Tragen von Schutzhandschuhen..

3. Vorhandensein potentiell gefährlicher Stäube

Bei regelmäßiger und außerordentlicher Wartung muss das Personal geeignete pers önliche Schutzausrüstungen verwenden und insbesondere Masken zum Schutz der Atemwege mit geeigneter Klasse für den aufbereiteten Staub, wie auch Schutzhandschuhe und Schutzkleidung tragen.

Für nähere Angaben ist Bezug auf das Sicherheitsdatenblatt des verwendeten Produkts zu nehmen.

L'installateur, en fonction de l'utilisation du vibrateur pneumatiques, doit informer les opérateurs, au moyen d'indications et de signalisations prévues à cet effet, sur les risques résiduels suivants :

1. Dangers de nature mécanique

Pour les activités d'entretien l'opérateur a l'obligation d'utiliser toujours les dispositifs de protection individuelle.

Des plaques d'avertissements apposées dans chaque section de la machine indiquent quels sont les dispositifs de protection individuelle qui sont obligatoires :

2. Présence de hautes températures résiduelles après l'arrêt du percuteur

Au cours des interventions d'entretien et de nettoyage et dans certaines sections de travail, l'opérateur peut entrer en contact, quand la machine est arrêtée, avec des parties du filtre dont les surfaces sont à des températures élevées.

Des plaques d'avertissement, apposées dans les endroits stratégiques, signalent le danger dû à la présence de surfaces à des températures élevées et l'obligation de l'opérateur d'utiliser les dispositifs de protection individuelle, en particulier des gants de protection.

3. Présence de poussières potentiellement dangereuses

Aussi bien dans le cas d'interventions d'entretien ordinaires ou extraordinaires, l'opérateur doit se doter des dispositifs de protection individuelle et en particulier il doit utiliser des masques de classe appropriée pour protéger les voies respiratoires en fonction du type de poussière traitée ainsi que de gants ou de vêtements adéquats.

Pour plus de détails consulter la fiche de sécurité du produit utilisé.

L'installatore, in base all'utilizzo del vibratore pneumatico, deve informare gli operatori, tramite appositi segnali, in merito ai seguenti rischi residui :

1. Pericoli di natura meccanica

Per le attività di manutenzione è fatto obbligo all'operatore di impiegare sempre i dispositivi di protezione individuale.

Apposite targhe monitorie nelle singole sezioni di macchina indicano quali dispositivi di protezione individuale si rendono obbligatori:

2. Presenza di possibili alte temperature residue dopo l'arresto del percussore

Nel corso di interventi manutentivi e di pulizia e in alcune sezioni di lavoro, l'operatore può entrare in contatto, a macchina ferma, con parti del percussore pneumatico con superfici ad elevata temperatura.

Apposite targhe monitorie, collocate nei punti strategici indicano il pericolo dovuto alla presenza di superfici ad elevata temperatura e l'obbligo per l'operatore di utilizzare dispositivi di protezione individuale, in particolare guanti protettivi.

3. Presenza di polveri potenzialmente pericolose

Nel caso di interventi sia ordinari che straordinari di manutenzione l'operatore deve dotarsi di idonei dispositivi di protezione individuale ed in particolare deve utilizzare maschere a protezione delle vie respiratorie di classe idonea in base al tipo di polvere trattata nonché di guanti o indumenti.

Per maggiori dettagli si deve far riferimento alla scheda di sicurezza del prodotto utilizzato.

- In certain handling of dusts, where hazardous substances are present, the operator concerned who has to access the machine for routine and extraordinary maintenance operations must wear suitable protective devices as indicated on the notice signs provided.

In case of operations involving heating (welding, cutting) it is necessary to clean the surface of the pneumatic vibrator first, removing all dust deposits (the layers, the deposits and accumulated combustible powder MUST be considered like any other source which can result in an explosive atmosphere).
Authorization for operations involving heating MUST be given by technical personnel specializ-ed and trained in the risk of explosion from dusts (capable of checking residual risk, suitability of tools and a knowledge of the procedures).
(The person responsible for safety must issue a “Fire Permit” to the operator).

4. Hazards deriving from pressurized circuits (hydraulic, pneumatic)

During mainten- ance and/or repair operations pressure must be discharged from the plants and accumulators (if present), according to the instructions given along-side the components and in the respective user manuals.

5. Hazard generated by noise

The user and employer are obliged to respect the legal standards as regards protection from daily personal exposure of operators to noise (in Italy L.D.277/91).

- Bei bestimmten Staubbehandlungen, wo schädliche Substanzen auftreten, muss das Personal, falls es im Laufe der regelmäßigen oder außerordentlichen Wartung damit in Kontakt kommt, persönliche Schutzausrüstungen tragen, so wie auf den vorhandenen Schildern angegeben.

Bei der Ausführung von erhitzenden Arbeiten (Schweißen, Schneiden) ist es erforderlich, die Oberfläche des pneumatischen Vibrators vorbeugend zu behandeln, um alle Staubablagerungen und in Abwesenheit atembarer Stäube durchgeführt werden. Bei der Ausführung von erhitzenden Arbeiten (Schweißen, Schneiden) ist es erforderlich, den Vibrator so vorzubereiten, dass alle Staubablagerungen entfernt werden (Schichten, Ablagerungen und Ansammlungen von brennbarem Staub MÜSSEN wie jede andere Staubquelle betrachtet werden, die zur Entstehung einer explosiven Atmosphäre beitragen kann).
Die Genehmigung zur Ausführung von Arbeiten im erwärmten Zustand DARF NUR durch spezialisiertes technisches Personal erteilt werden, das über die Explosionsgefahr durch Staub unterrichtet ist (das in der Lage ist, das Restrisiko festzustellen, das die geeigneten Werkzeuge und auch die Prozeduren kennt). Der Werkschutzverantwortliche muss dem Personal eine „Genehmigung zur Feuerarbeit” ausstellen.

4. Gefahren durch unter Druck stehende Leitungen (hydraulisch, pneumatisch)

Während der Wartungsarbeiten und/oder Reparaturen sind die Anlagen und die etwaigen Akkumulatoren zu entleeren, so wie es in den Anweisungen an de jeweiligen Komponenten oder in den entsprechenden Handbüchern steht.

5. Gefährdung der Arbeitnehmer durch Lärm

Der Anwender und der Arbeitgeber sind zur Einhaltung der gesetzlichen Bestimmungen in Sachen Schutz gegen tägliche persönliche Lärmexposition der Arbeitnehmer verpflichtet (in Italien D.Lgs.277/91).

- Dans des traitements déterminés de poussières où il y a la présence de substances nocives, l’opérateur qui doit y avoir accès, dans le cours des interventions ordinaires ou extraordinaires, doit porter les dispositifs de protection appropriés comme signalé par les panneaux indicateurs qui s’y trouvent.

Tous les entretiens à l’intérieur du vibrateur pnumatique DOIVENT être effectués quand l’installation est arrêtée et en absence de poussière dispersée dans l’air. Dans le cas de travaux à chaud (soudure, découpe) il faut préalablement nettoyer les surfaces du vibrateur pneumatique,, en éliminant tous les dépôts de poussière (les couches, les dépôts et les tas de poussière combustible DOIVENT être considérés comme une autre source pouvant donner lieu à une atmosphère explosive).
L'autorisation à l’exécution des travaux à chaud DOIT être donnée par du personnel technique spécialisé et formé sur le risque d’explosion des poussières (en mesure4 de vérifier le risque résiduel, l’aptitude des outils et la connaissance des procédures).
Le responsable de la sécurité devra délivrer un “permis de feu” à l’opérateur.

4. Dangers dérivant des circuits sous pression (hydrauliques, pneumatiques)

Pendant les opérations d’entretien et/ou de réparation il faut décharger les installations et les éventuels accumulateurs, conformément aux instructions qui se trouvent à proximité des composants et dans les notices d’instructions correspondantes.

5. Dangers provoqués par le bruit

L’utilisateur ainsi que l’employeur ont l’obligation de faire respecter les normes de loi en matière de protection contre l’exposition personnelle quotidienne des opérateurs au bruit (en Italie D.Lgs.277/91).

- In determinati trattamenti di polveri dove vi è la presenza di sostanze nocive, l'operatore che dovesse accedere, nel corso di interventi ordinari o straordinari, deve indossare gli idonei dispositivi di protezione come indicato dalla cartellonistica ivi presente.

Tutte le manutenzioni all'interno del vibratore pneumatico DEVONO essere effettuate ad impianto fermo e in assenza di polvere aerodispersa. In caso di lavori a caldo (saldatura, taglio) è necessario bonificare preventivamente le superfici del vibratore pneumatico, rimuovendo tutti i depositi di polvere (gli strati, i depositi ed i cumuli di polvere combustibile DEVONO essere considerati come qualsiasi altra sorgente che può dare origine ad un'atmosfera esplosiva).
L'autorizzazione all'esecuzione dei lavori a caldo DEVE essere data da personale tecnico specializzato e formato sul rischio esplosione da polveri (in grado di verificare il rischio residuo, l'idoneità degli utensili e la conoscenza delle procedure). Il responsabile della sicurezza dovrà rilisciare un “permesso di lavoro fuoco” all’operatore.

4. Pericoli derivanti da circuiti in pressione (idraulici, pneumatici)

Durante le operazioni di manutenzione e/o riparazione occorre porre in scarico gli impianti e gli eventuali accumulatori, secondo le istruzioni riportate in prossimità dei componenti e nei rispettivi manuali d'uso.

5. Pericoli generati da rumore

E' fatto obbligo all'utilizzatore e al datore di lavoro di rispettare le norme di legge in termine di protezione contro l'esposizione personale quotidiana degli operatori al rumore (in Italia D.Lgs.277/91).

FAULT	ACTION
The vibrator does not start	Check the presence of compressed-air
	Check the presence of foreign elements in the piping or in the vibrator
The vibrator increase in noisiness	Check the fastening of the fixing screws and in case, make the supporting plate stiff
	Lubrificate the pneumatic line
The vibrator loose its vibrating effect	Check the feed pressure (MAX 6 BAR)
	Check the fastening of the fixing screws and in case, make the supporting plate stiff
	Lubrificate the pneumatic line

STÖRUNG	ABHILFE
Der Rüttler starts nicht	Die Druckluft kontrollieren
	Eventuelle Fremdkörper in der Leitung oder in den Rüttler kontrollieren
Mehr Rüttlergeräusch	Den Spanndruck der Befestigungsschrauben kontrollieren und die Stutzplatte eventuell verstärken
	Die pneumatische Vorrichtung schmieren
Verlust an Vibrierwirkung	Den Einlassdruck (MAX 6 BAR) kontrollieren
	Den Spanndruck der Befestigungsschrauben kontrollieren und die Stutzplatte eventuell verstärken
	Die pneumatische Vorrichtung schmieren

PROBLÈME	SOLUTION
Le vibrateur ne démarre pas	Vérifier la présence d'air comprimé
	Vérifier la présence d'éléments étrangers dans la tubuluru ou le vibrateur
Il rumore del vibratore aumenta	Vérifier le serrage des vis et éventuellement raidir la plaque d'appui
	Lubrifier la ligne pneumatique
Il vibratore cala l'effetto vibrante	Vérifier la pression d'alimentation (MAX 6 BAR)
	Vérifier le serrage des vis et éventuellement raidir la plaque d'appui
	Lubrifier la ligne pneumatique

PROBLEMA	SOLUZIONE
Il vibratore non parte	Controllare presenza aria compressa
	Controllare presenza elementi estranei nella tubazione o nel vibratore
Il rumore del vibratore aumenta	Controllare il serraggio delle viti di fissaggio ed eventualmente irrigidire la piastra di supporto
	Lubrificare la linea pneumatica
Il vibratore cala l'effetto vibrante	Controllare la pressione di alimentazione (MAX 6 BAR)
	Controllare il serraggio delle viti di fissaggio ed eventualmente irrigidire la piastra di supporto
	Lubrificare la linea pneumatica

SCRAPPING COMPONENT

- Before proceeding with disposal of the pneumatic vibrator, clean it thoroughly and dispose off the residual dust in accordance with the indications in the safety chart.
- The operators in charge of disposal must use suitable personal protection equipment.
- For scrapping or demolition of the component, separate the plastic parts (seals and components) and send these to special collection centres.
- The other parts must be sent for recycling ferrous materials.

VERSCHROTTUNG DES BAUTEILS

- Bevor das Druckluft Vibrator entsorgt wird, dieses vollkommen reinigen und den enthaltenen Reststaub in Übereinstimmung mit dem Sicherheitsdatenblatt entsorgen.
- Die Arbeitnehmer, die sich um die Entsorgung kümmern, müssen angemessene persönliche Schutzausrüstungen verwenden.
- Wenn der Bauteil verschrottet werden soll, sind die kunststoffhaltigen Teile (Dichtungen und Komponenten) auszubauen und über die entsprechenden Sammelstellen dem Recycling zuzuleiten.
- Die restlichen Teile sind als Eisenschrott zu behandeln.

DEMANTELEMENT DU COMPOSANT

- Avant mettre le vibrateur pneumatique à la décharge le nettoyer complètement et éliminer les poussières restantes conformément aux indications fournies par la fiche de sécurité.
- Les personnes préposées à la mise à la décharge doivent porter des dispositifs personnels de protection appropriés.
- - En cas de mise à la décharge ou de démantèlement du composan, il faut démonter les pièces en matière plastique (joints et composants) et les mettre à la décharge dans des déchetteries spécialisées.
- Les pièces restantes sont à destiner à la récupération des matériaux ferreux.

ROTTAMAZIONE COMPONENTE

- Prima di procedere allo smaltimento del vibratore pneumatico provvedere alla sua completa pulizia ed allo smaltimento delle polveri residue in accordo con le indicazioni della scheda di sicurezza.
- Gli operatori addetti allo smaltimento devono indossare dispositivi di protezione personale adeguati.
- In caso di rottamazione o demolizione a fine vita del componente, avere cura di smontare le parti in materiale plastico (guarnizioni e componenti) e destinarle agli appositi centri di raccolta.
- Le restanti parti sono da destinare al recupero dei materiali ferrosi.

RETURNING THE MACHINE

When returning the component, use the original packaging if it has been preserved, otherwise place it in a box and cover it with nylon shrink-wrap, to protect it as best as possible from impact during transport. In any event, make sure there is no residue material inside the component.

RÜCKGABE DES GERÄTES

Falls der Bauteil zurückgegeben werden soll und man die Originalverpackung aufbewahrt hat, ist er darin einzupacken. Andernfalls ist er in einen Karton zu packen und mit Schrumpffolie zu schützen, wobei man versucht, sie so gut wie möglich vor etwaigen Stößen beim Transport zu schützen. Auf jeden Fall sicherstellen, dass sich keine Materialreste mehr in der Bauteil befinden.

RESTITUTION MACHINE

En cas de restitution du composant, si l'emballage a été conservé, le remettre dans celui-ci, sinon le mettre dans une caisse et le protéger avec du nylon thermorétractable, en essayant de la protéger le plus possible contre les chocs provoqués par le transport. Dans tous les cas s'assurer que la machine ne contient pas de résidus de matière.

RESO MACCHINA

In caso di reso del componente se si è conservato l'imballo reinserirla nello stesso, altrimenti inserirlo in una scatola e proteggerlo con del nylon termoretraibile, cercando di proteggerlo al meglio da eventuali urti derivanti dal trasporto. In ogni caso assicurarsi che il componente non abbia residui di materiale.

- Operation is governed by an electrical control panel and the pressurisation of the reservoir inside the percussion gun is achieved by means of a compressed air supply system.

When the electrical control panel sends an electrical signal to a solenoid valve the following occurs:
- a mass is projected against the wall of the silo/hopper causing vibrations (see Tab.).

- Der Betrieb wird über eine Schalttafel überwacht, während eine pneumatische Versorgungsleitung für die Druckbeaufschlagung des Raums/ Behälters innerhalb des Klopfers sorgt.

Wenn die elektrische Schalttafel einem Magnetventil, das auf dem Klopfer montiert ist, ein Signal sendet, kommt es zum:
- Ausstoß einer Masse gegen die Silo-/Trichterwand, was zu Vibrationen führt (siehe Tab.).

- Le fonctionnement est contrôlé par un tableau électrique et une ligne d'alimentation pneumatique garantit le remplissage sous pression du compartiment/réservoir à l'intérieur du percuteur.

L'impulsion transmise par le tableau électrique à une électrovanne montée sur le percuteur produit l'effet suivant :
- lancement d'une masse contre la paroi du silo/trémie en provoquant une vibration (Voir tab.).

- Il funzionamento è controllato da un quadro elettrico mentre da una linea di alimentazione pneumatica viene assicurato il riempimento in pressione del vano/serbatoio all'interno del percussore.

A seguito di un impulso trasmesso dal quadro elettrico ad una elettrovalvola montata sul percussore si ha:
- il lancio di una massa contro la parete del silo/tramoggia provocando una vibrazione (vedi tab.).

A) INDIRIZZO RIVENDITORE O PUNTO DI ASSISTENZA LOCALE

N.B.: The installer must provide the customer with the entire manufacturer's documentation together with the sheet filled in by the customer regarding the features of the powders to be handled, so that during all operations of the percussion gun, the safety precautions relevant to the powders handled are clearly indicated.

N.B.: Der Monteur muss der Dokumentation des Herstellers die vom Kunden ausgefüllte Karte mit den Eigenschaften der aufzubereitenden Stäube beilegen und dem Kunden alles selbst aushändigen. So werden während jedes Eingriffs am pneumatischen Klopfer alle Vorsichtsmaßnahmen beachtet, die spezifisch für die zu behandelnden Stäube anwendbar sind.

N.B.: l'installateur devra joindre à la documentation du constructeur, la fiche des caractéristiques des poudres à traiter rédigée par le client et remettre le tout à ce même client. De cette manière chaque intervention sur le percuteur pneumatique indiquera les consignes de sécurité spécifiques des matières traitées.

N.B.: l'installatore dovrà allegare assieme alla documentazione del costruttore, la scheda compilata dal cliente sulle caratteristiche delle polveri da trattare, e consegnare il tutto al cliente stesso, in modo tale che durante ogni intervento al percussore pneumatico siano indicate le precauzioni di sicurezza specifiche delle polveri trattate.

B) IDENTIFICATION OF COMPONENT

Refer to the code on the rating plate affixed to the machine, to identify equipment.

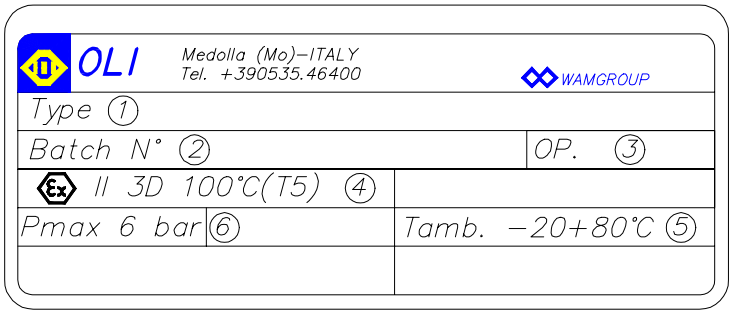
N.B.: the pneumatic vibrator must not be CE marked since it is a component.

B) IDENTIFIKATION DES BAUTEILS

Zur korrekten identifikation auf den Bestellcode in der Auftragsbestätigung, in der Rechnung und auf der Verpackung Bezug nehmen.

N.B.: Der pneumatische Klopfer braucht nicht mit der CE-Kennzeichnung versehen zu werden, insofern es sich um ein Bauteil handelt.

IDENTIFICATION DU COMPOSANT



Pour identifier correctement le composant, faire référence au code qui se trouve sur la plaque signalétique.

N.B.: En tant que composant le vibrateur pneumatique ne porte pas le marquage CE.

IDENTIFICAZIONE DELCOMPONENTE

Per una corretta identificazione del componente, bisogna fare riferimento al codice che si trova sulla targhetta.

N.B.: il vibratore pneumatico non deve essere marcato CE in quanto componente.

This manufacturer's Manual forms an integral part of the MARTSHOCK pneumatic percussion gun supply, and must therefore accompany the equipment right up to its demolition and must be available close at hand for rapid consultation by the operators concerned and the works manager. If the component changes hands, the Manual must be handed over to the new owner. Before carrying out any operation with or on the percussion gun, the personnel concerned must have compulsorily read this Manual carefully.
If the Manual is lost, crumpled or becomes illegible, a copy can be downloaded from the OLI s.r.l. website and the date of the last update must be checked.
This Manual contains all the warnings and indications relative to the safety regulations for the prevention of accidents at the work site. In any case, maximum care must be taken by the different operators concerned to strictly follow the Safety regulations imposed on them by existing standards.
Modifications made to the safety regulations over time will be duly noted and implemented.

Dieses vom Hersteller abgefasste Handbuch ist integrierender Bestandteil des Lieferumfangs des pneumatischen Klopfers MARTSHOCK und muss als solcher dem Bauteil unbedingt bis zu seiner Verschrottung folgen und einfach zu finden sein, damit der Bediener oder die Baustellenleitung bei Bedarf schnell darin nachschlagen kann. Bei einem Besitzerwechsel muss das Handbuch dem neuen Besitzer ausgehändigt werden. Bevor irgendwelche Arbeiten an oder mit dem pneumatischen Klopfer ausgeführt wird, muss das betreffende Personal dieses Handbuch aufmerksam durchlesen.
Sollte das Handbuch verloren gehen, unleserlich oder unbrauchbar sein, kann man von der Website des Herstellers OLI s.r.l. eine neue Ausfertigung herunterladen, um dann das Datum der letzten Aktualisierung zu prüfen. Dieses Handbuch liefert Hinweise und Angaben zu den Sicherheitsbestimmungen für die Unfallverhütung am Arbeitsplatz. Die Sicherheitsbestimmungen, die von den geltenden Normen als verbindlich vorgeschrieben werden, müssen vom Personal in jedem Fall gewissenhaft beachtet werden.
Etwaige Änderungen der Sicherheitsnormen, die im Laufe der Zeit vorgenommen werden, müssen erfasst und umgesetzt werden.

Le présent manuel, rédigé par le fabricant, fait partie intégrante du percuteur pneumatique MARTSHOCK et comme tel doit absolument suivre la machine jusqu'à son démantèlement. Il doit être facilement consultable par les opérateurs concernés et par la direction des travaux du chantier. En cas de changement de propriétaire du composant, le manuel doit être remis au nouveau propriétaire. Avant d'effectuer toute opération avec ou sur le percuteur pneumatique, le personnel concerné doit absolument avoir lu attentivement le présent manuel.
Si le manuel a été égaré ou n'est plus complètement lisible, télécharger une nouvelle copie sur le site Internet de OLI s.r.l. et vérifier la date de la dernière mise à jour. Le présent manuel fournit des recommandations et des indications sur les consignes de sécurité pour la prévention contre les accidents du travail. Les consignes de sécurité prévues par les normes en vigueur doivent, dans tous les cas, être scrupuleusement respectées.
Toute modification aux normes de sécurité devra être mise en conformité.

Il presente manuale, redatto dal costruttore, è parte integrante del corredo del percussore pneumatico MARTSHOCK, come tale deve assolutamente seguire il componente fino al suo smantellamento ed essere facilmente reperibile per una rapida consultazione da parte degli operatori interessati e della direzione lavori del cantiere. In caso di cambio di proprietà del componente il manuale deve essere consegnato alla nuova proprietà. Prima di eseguire qualsiasi operazione con, o sul percussore pneumatico; il personale interessato deve assolutamente ed obbligatoriamente aver letto con la massima attenzione il presente manuale. Qualora il manuale venga smarrito, sgualcito e tale da non essere completamente leggibile, si deve scaricare una nuova copia dal sito internet della OLI s.r.l. e verificarne la data dell'ultimo aggiornamento. Il presente manuale fornisce avvertenze ed indicazioni relative alle norme di sicurezza per la prevenzione degli infortuni sul lavoro. Vanno in ogni modo, ed in ogni caso, osservate con il massimo scrupolo da parte dei vari operatori le norme di sicurezza poste a loro carico dalle vigenti normative.
Eventuali modifiche delle norme di sicurezza che nel tempo dovessero aver luogo dovranno essere recepite ed attuate.

The latest version of the present catalogue is available under www.olivibra.it.

Die jüngste Version dieses Katalogs steht im Internet unter www.olivibra.it.

La version toujours mise à jour de ce catalogue est disponible sul le site internet www.olivibra.it.

La versione sempre aggiornata del presente catalogo è reperibile sul sito internet www.olivibra.it.

The equipment is accompanied by a certificate of conformity to applicable directives, but as it is a component to be included in a complete plant, its safety is linked to compliance with all the directives applicable in the assembly of the final component. Any improper use of the Pneumatic Hammer with failure to follow the indications given in this Manual will free the Manufacturer of all responsibility for faulty working of the Pneumatic Hammer. Since the subject is undergoing considerable technical and normative evolution, the Manufacturer reserves the right to update all its products as soon as possible with all the technological know-how and official standards applicable (EN, UNI) that are available from time to time.

Zum Lieferumfang des Geräts gehört eine Konformitätsbescheinigung mit Bezugnahme auf die geltenden Richtlinien. Da es sich hier aber um ein Bauteil handelt, das in eine komplette Anlage eingebaut wird, ist seine Sicherheit mit der Beachtung aller Richtlinien verbunden, die sich auf den abschließenden Einbau des Bauteils beziehen. Jede bestimmungswidrige Verwendung des pneumatischen Klopfers unter Nichtbefolgung der Angaben in dem vorliegenden Handbuch enthebt den Hersteller von jeder Haftung hinsichtlich eines fehlerhaften Betriebs des Klopfers. Da es sich um Geräte handelt, die hinsichtlich Technik und Normenwerken ständiger Weiterentwicklung unterliegen, behält es sich der Hersteller vor, die eigenen Erzeugnisse so rasch wie möglich an alle technologischen Fortschritte und die anwendbaren offiziellen Normen (EN, UNI) anzupassen, die von Fall zu Fall zur Verfügung stehen.

L'appareillage est accompagné d'un certificat de conformité aux directives en vigueur, mais en tant que composant à intégrer dans une installation complète, sa sécurité est liée au respect de toutes les directives applicables dans l'assemblage du composant final. Toute utilisation impropre du percuteur pneumatique sans suivre les indications du présent manuel dégage OLI s.r.l. de toute responsabilité due à un mauvais fonctionnement du percuteur. S'agissant de matériel en forte évolution technique et réglementaire, OLI s.r.l. se réserve le droit d'adapter ses produits le plus rapidement possible à toutes les connaissances technologiques et aux normes officielles applicables (EN, UNI) rendues disponibles.

L'apparecchiatura è accompagnata da una attestato di conformità alle direttive vigenti, ma, in quanto componente da integrarsi in un impianto completo, la sua sicurezza è legata al rispetto di tutte le direttive applicabili nell'assemblamento del componente finale. Ogni utilizzo improprio del percussore pneumatico senza seguire le indicazioni del presente manuale solleverà la OLI s.r.l. da ogni responsabilità inerenti ad un cattivo funzionamento del percussore stesso. Trattandosi di materia in forte evoluzione tecnica e normativa, OLI s.r.l. si riserva di adeguare con la massima celerità i propri manufatti a tutte le conoscenze tecnologiche e le norme ufficiali applicabili (EN, UNI) che di volta in volta si rendessero disponibili.

WARNING
This equipment is NOT suitable for use with food-grade materials.

WARNHINWEISE
Diese Geräte eignen sich auf NICHT für die Benutzung mit Lebensmitteln.

RECOMMANDATIONS
Ces machines NE sont PAS indiquées pour les applications sur les produits alimentaires

AVVERTENZE
Queste macchine NON sono comunque idonee per applicazioni per prodotti alimentari.

INDICATIONS FOR USE
The **Pneumatic Hammers** described in this Manual are designed and tested for use in potentially explosive areas classified as zone 22 cat. II 3 D according to directive 94/9/CE. The powders handled must have explosiveness index St1 or St2 and this must be notified to the Manufacturer at the time of placing the order to allow correct selection of the component.

The user must make sure the plant in which the **Pneumatic Hammer** is installed has been set in safety condition from the point of view of explosion risk before being started up, and that the "document on protection against explosions" has also been prepared as specified by Directive ATEX 99/92/CE. (This only applies to the European market).

GEBRAUCHSANWEISUNGEN
Die **pneumatischen Klopfer**, die in diesem Handbuch beschrieben werden, wurden zum Einsatz in explosionsgefährdeten Bereichen konstruiert und getestet, die nach der Richtlinie 94/9/EG als Zone 22 Kat. II 3 D eingestuft wurden. Die aufbereiteten Stäube müssen Staubexplosionsklasse St1 oder St2 haben und müssen dem Hersteller bei Bestellung angegeben werden, um eine korrekte Auslegung des Bauteils zu ermöglichen.

Der Anwender muss sicherstellen, dass die Anlage, in welche der **pneumatische Klopfer** installiert werden soll, hinsichtlich der Explosionsgefahr auf ausreichende Weise in einen sicheren Zustand versetzt wurde, bevor sie in Betrieb genommen wird, und dass zudem das „Explosionsschutzdokument" verfasst erstellt wurde, so wie es die ATEX-Richtlinie 99/92/EG vorsieht (gilt nur für den europäischen Markt)..

INDICATIONS D'UTILISATION
Les percuteurs pneumatiques décrits dans ce manuel ont été conçus et testés pour être utilisé dans les environnement explosibles classés comme zone 22 cat. II 3 D d'après la directive 94/9/CE. Les poussières traitées doivent avoir des indices d'explosivité St1 ou St2 ; pour un choix correct du composant celles-ci doivent être indiquées à OLI s.r.l. au moment de la commande.

L'utilisateur doit contrôler, avant la mise en marche, que l'installation dans laquelle est monté le **percuteur pneumatique** a été mise en sécurité en ce qui concerne le risque d'explosion. Il faut aussi que le "document sur la protection contre les explosions" ait été rédigé conformément à la Directive ATEX 99/92/CE (Ceci n'est valable que pour le marché européen).

INDICAZIONI PER L'USO
I percussori pneumatici descritti in questo manuale sono stati progettati e testati per un utilizzo
in zone potenzialmente esplosive classificate come zona 22 cat. II 3 D secondo la direttiva 94/9/CE. Le polveri trattate dovranno avere indici di esplosività St1 o St2 e devono essere comunicate alla OLI s.r.l. al momento dell'ordine per una scelta corretta del componente.

L'utilizzatore dovrà assicurarsi che l'impianto all'interno del quale verrà installato il **percussore pneumatico** sia stato adeguatamente messo in sicurezza da un punto di vista di rischio esplosione prima di essere avviato e che inoltre sia stato redatto il "documento sulla protezione contro le esplosioni" come previsto dalla Direttiva ATEX 99/92/CE. (Questo vale unicamente per il mercato europeo).

At the time of placing the order, the client must specify the features of the powders to be handled as well as the process temperatures (see Table below).

Es ist wichtig, dass der Kunde bei der Bestellung die Eigenschaften der aufzubereitenden Pulver und auch die Prozesstemperatur angibt. Siehe folgende Tabelle.

Dans la phase de commande il est important que le client spécifie les caractéristiques des poudres à traiter ainsi que les températures du processus, voir tableau ci-dessous.

E' importante da parte del cliente in fase d'ordine specifiche le caratteristiche delle polveri da trattare e anche le temperature di processo, vedi tabella sotto.

In accordance with the Directive ATEX 94/9/CE, the manufacturer defines the outside of the percussion gun as:

CAT. II 3 D

- **IMPORTANT: specify that the non ATEX versions must not be used in potentially explosive environments.**
- The **percussion guns** are designed and constructed in such a manner as to avoid unusual overheating during operation. To operate in safe conditions, check to **make sure the powders handled have a minimum ignition temperature higher than the temperature value indicated on the code plate**.
- The **percussion guns** must be installed with sufficient clearance around to allow assembly/disassembly operations, cleaning and maintenance.

Before carrying out any operation on the component, make sure it is in safe condition.

Im Sinne der ATEX-Richtlinie 94/9/EG definiert der Hersteller die äußere Umgebung des pneumatischen Klopfers als:

KAT. II 3 D

- **WICHTIG: Die Versionen, die nicht ATEX sind, dürfen nicht in explosionsgefährdeten Bereichen betrieben werden.**
- Die **pneumatischen Klopfer** wurden so entwickelt und konstruiert, dass es während ihres Betriebs nicht zu Überhitzungen kommt. Um unter sicheren **Voraussetzungen arbeiten zu können, ist sicherzustellen, dass die aufbereiteten Stäube eine Mindestzündtemperatur haben, die unterhalb des Temperaturwerts liegt, der auf dem Typenschild steht.**
- **Die pneumatischen Klopfer** müssen so installiert werden, dass ringsum genügend Raum zur Verfügung steht, um die normalen Arbeiten für Ein- und Ausbau, Reinigung und Wartung vornehmen zu können.

Bevor man irgendeinen Eingriff an dem Bauteil vornimmt, ist sicherzustellen, dass es sich in einem sicheren Zustand befindet.

Le constructeur, aux termes de la directive ATEX 94/9/CE, définit l'extérieur du percuteur pneumatique comme:

CAT. II 3 D

- **IMPORTANT: les versions non ATEX ne doivent pas travailler dans des atmosphères explosibles.**
- **Les percuteurs pneumatiques** ont été conçus et construits de manière à ne pas provoquer d'échauffements anormaux pendant le fonctionnement. Pour travailler en condition de sécurité **il faut vérifier que les poussières traitées on une température d'inflammation minimale supérieure à la valeur de température indiqué sur la plaque signalétique**.
- **Les percuteurs pneumatiques** doivent être installés avec autour un espace suffisant pour effectuer les opérations ordinaires de montage/démontage, nettoyage et maintenance.

Avant d'effectuer toute intervention sur le composant vérifier que celui-ci a été mis en sécurité.

Il costruttore, ai sensi della direttiva ATEX 94/9/CE, definisce l'esterno del percussore pneumatico come:

CAT. II 3 D

- **IMPORTANTE: le versioni non ATEX non devono operare in atmosfere potenzialmente esplosive.**
- **I percussori pneumatici** sono stati progettati e costruiti in modo tale da non provocare surriscaldamenti anomali durante il funzionamento. Per poter operare in condizioni di sicurezza **occorre verificare che le polveri trattate abbiano una minima temperatura di ignizione superiore al valore di temperatura indicato sulla targhetta.**
- **I percussori pneumatici** dovranno essere installati con uno spazio circostante sufficiente per effettuare le normali operazioni di montaggio/smontaggio, pulitura e manutenzione.

Prima di effettuare un qualsiasi intervento sul componente assicurarsi che questo sia messa in sicurezza.

IMPORTANT: In this Manual "**setting the component in safety condition**" will include the following operations:

- **Make sure the component is disconnected from all electric supply sources.**
- **Make sure the component is disconnected from all compressed air supply sources.**
- **The area around the component must be suitably lighted (operators can be provided with electric lights suitable for zone 22 cat. II 3 D)**.

WICHTIG: Auf den folgenden Seiten dieses Handbuchs wird die Formulierung **„das Bauteil in einen sicheren Zustand versetzen"** verwendet, um folgende Aktivitäten zu beschreiben:

- **Sicherstellen, dass das Bauteil von allen elektrischen Versorgungsquellen getrennt ist.**
- **Sicherstellen, dass das Bauteil von allen pneumatischen Versorgungsquellen getrennt ist.**
- **Dafür sorgen, dass der Bereich rings um das Bauteil ausreichend beleuchtet ist (eventuell Personal mit elektrischen Lampen ausstatten, die für Zone 22 Kat. II 3 D geeignet sind).**

IMPORTANT: Dans le présent manuel nous indiquons par "**mettre en sécurité le composant"** les opérations suivantes:

- Contrôler si le composant est débranché de toutes les alimentations électriques.
- Contrôler si le composant est débranché de toutes les alimentations pneumatiques.
- Eclairer correctement la zone qui entoure le composant (en dotant éventuellement les opérateurs de lampes électriques appropriées pour zone 22 cat. II 3 D).

IMPORTANTE: In seguito nel presente manuale indicheremo con la dicitura **"mettere in sicurezza il componente"** le seguenti operazioni:

- **Accertarsi che il componente sia scollegato da tutte le alimentazioni elettriche.**
- **Accertarsi che il componente sia scollegato da tutte le alimentazioni pneumatiche.**
- **Provvedere a illuminare correttamente la zona circostante al componente (eventualmente dotando gli operatori di lampade elettriche idonee per zona 22 cat. II 3 D).**

For carrying out operations on the components (maintenance and cleaning), the operators must use suitable personal protection devices (PPD):

- **Antistatic safety footwear (certified)**
- **Antistatic protective clothing (certified)**
- **Helmet**
- **Antistatic cut proof gloves**
- **Protective masks**

Für jeden Eingriff, der am Bauteil vorzunehmen ist (Wartung und Reinigungen), muss das Personal mit geeigneten persönlichen Schutzausrüstungen (PSA) ausgestattet werden:

- **antistatisches, unfallsicheres Schuhwerk (zertifiziert)**
- **antistatische Schutzkleidung (zertifiziert)**
- **Schutzhelm**
- **antistatische Schnittschutzhandschuhe**
- **Schutzmasken**

Pour toute opération à effectuer sur le composant (entretien et nettoyage), les opérateurs doivent être munis des équipements de protection individuelle (EPI):

- **Chaussures de protection antistatiques (certifiées)**
- **Vêtements de protection antistatiques (certifiés)**
- **Casque**
- **Gants anti-coupure antistatiques**
- **Masques de protection**

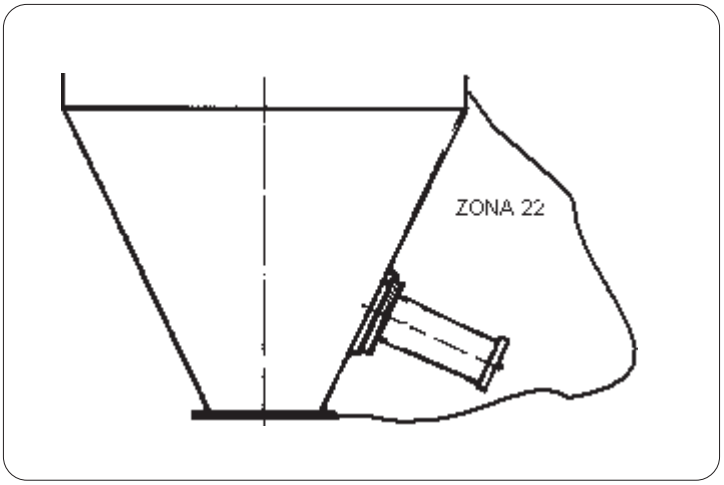
Per qualsiasi operazione da effettuarsi sul componente (manutenzioni e pulizia), gli operatori dovranno essere muniti degli appositi dispositivi di protezione individuale (DPI):

- **Scarpe antinfortunistiche antistatiche (certificate)**
- **Indumenti protettivi antistatici (certificati)**
- **Casco**
- **Guanti antitaglio antistatici**
- **Mascherine protettive**

It is also necessary to use all the safety devices specified in the safety sheet of the product handled.

N.B.: All the electrical equipment used for maintenance or cleaning operations on the outside of the component must be ATEX certified for zone 22 cat. II 3 D.

Außerdem sind alle Schutzvorrichtungen zu verwenden, die das Sicherheitsdatenblatt des behandelten Produkts vorsieht.



N.B.: Alle elektrische Ausrüstungen, die eventuell für die Wartungseingriffe und die Reinigung außerhalb des Bauteils benutzt werden, müssen für Zone 22 Kat. II 3 D nach ATEX zertifiziert sein.

Il faut aussi utiliser tous les dispositifs de protection prévus par la fiche de sécurité du produit traité.

N.B.: Tous les appareillages électriques, utilisés pour les interventions de maintenance et de nettoyage extérieur doivent être certifiés ATEX pour zone 22 cat. II 3 D.

Inoltre occorre utilizzare tutti i dispositivi di protezione previsti dalla scheda di sicurezza del prodotto trattato.

N.B. Tutte le apparecchiature elettriche eventualmente utilizzate per interventi manutentivi o di pulizia eseguiti all'esterno componente devono essere certificate ATEX per zona 22 cat. II 3 D.

NOISE
The operating noise levels of the PS percussion guns depend on a number of factors amongst which the more important are:
1) thickness and size of the metal panels
2) filling coefficient
3) type of material
4) operating pressure
- The values given in Table 4 are only indicative.
- Measurements were taken at a distance of 1 m with the percussion gun installed on a full hopper at a height of 1,6 m from the ground.

LÄRM
Der Lärmpegel der Modelle PS hängt von unterschiedlichen Faktoren ab, von denen folgende einen großen Einfluss haben:
1) Stärke und Größe des Blechs
2) Füllkgrad
3) Beschaffenheit des Materials
4) Betriebsdruck
- Die Tabelle 4 ist daher nur als richtungsgebend zu verstehen.
- Die Tabellewerte wurden im Abstand von 1 Meter mit auf dem gefüllten Trichter installierten Klopfer in 1,6 m Höhe über dem Boden gemessen.

BRUIT
Le niveau sonore des modèles PS dépend de plusieurs facteurs dont les suivants sont considérés particulièrement importants:
1) épaisseur et dimension de la tôle
2) coefficient de remplissage
3) nature du produit
4) pression de service
- Le tableau 4 n'a qu'une valeur indicative.
- Les valeurs indiquées ont été mesurées à la distance de 1 m avec le percuteur monté sur une trémie remplie de produit à 1,6 m du sol.

RUMORE
Il livello di rumorosità del modelli PS dipende da diversi fattori tra i quali rivestono particolare importanza:
1) spessore e dimensione della lamiera
2) coefficiente di riempimento
3) natura del materiale
4) pressione di esercizio
- La tabella 4 ha pertanto un valore indicativo.
- I valori riportati sono stati misurati alla distanza di 1m con il percussore installato su tramoggia piena di materiale a 1,6 m da terra.

CERTIFICATE OF CONFORMITY
with the Directives of the European Union

The OLI Pneumatic Hammers model
PS....ATEX (Code: PSX....)
are manufactured in conformity with the following directives:

- Directive "Machines" **98/37/CE** of 22nd June, 1998
- Directive "ATEX" **94/9/CE** of 23rd March, 1994

The conformity has been verified according to the conditions included in the following standard documents:

- **EN 1127-1**
- **EN 292-1-2**
- **EN 13463-1**
- **EN 1050**

Serie PS Ex II 3 D 100°C (T5)

Ambient temperature from -20°C to +80°C

This equipment must never be put into operation before the machine or plant into which it has been integrated has been declared in conformity with the Directives in force.

Medolla, 1st November, 2003

BESCHEINIGUNG DER KONFORMITÄT mit den Richtlinien der Europäischen Union

Die Familie der pneumatischen Klopfer OLI
Modell **PS....ATEX** (Code: PSX....) wurde
konstruiert und wird gefertigt in Konformität mit den folgenden Direktiven:

- Direktive "Maschinen" **98/37/CE** vom 22. Juni 1998
- Direktive "ATEX" **94/9/CE** vom 23. März 1994

Die Konformität wurde gemäß den Anforderungen der folgenden Normen oder Normendokumente verifiziert:

- **EN 1127-1**
- **EN 13463-1**
- **EN 292-1-2**
- **EN 1050**

Serie PS ⟨Ex⟩ II 3 D 100°C (T5)

Umgebungstemperatur -20°C bis +80°C

Dieses Bauteil darf niemals in Betrieb genommen werden, bevor die Maschine/Anlage, in welche es eingebaut wurde, den Bestimmungen der geltenden Richtlinien als konform erklärt wurde.

Medolla, den 1. November 2003

CERTIFICAT DE CONFORMITE
aux Directives de l'Union Européenne

La famille des percuteurs pneumatiques OLI
Modèle **PS....ATEX** (Code: PSX....)
a été projetée et produit conformément aux directives suivantes:

- Directive "Machines" **98/37/CE** du 22 Juin 1998
- Directive "ATEX" **94/9/CE** du 23 Mars 1994

La conformité a été vérifiée sur la base des conditions requises par les normes ou les documents normatifs reportés ci-dessous:

- **EN 1127-1**
- **EN 292-1-2**
- **EN 13463-1**
- **EN 1050**

Serie PS Ex II 3 D 100°C (T5)

Temperature ambiente -20°C à +80°C

Ce composant ne doit pas être mis en service tant que la machine dans laquelle il a été incorporé n'a pas été déclarée conforme aux dispositions des directives en vigueur.

ATTESTATO DI CONFORMITA'
alle Direttive Della Comunità Europea

La famiglia dei percussori pneumatici **OLI**
modello **PS....ATEX** (Code: PSX....)
è stata progettata e costruita in conformità alle direttive:

- Direttiva "Macchine" **98/37/CE** del 22 giugno 1998
- Direttiva "ATEX" **94/9/CE** del 23 marzo 1994

La conformità è stata verificata sulla base dei requisiti delle norme o dei documenti normativi riportati di seguito:

- **EN 1127-1**
- **EN 13463-1**
- **EN 292-1-2**
- **EN 1050**

Serie PS Ex II 3 D 100°C (T5)

T. amb. -20°C +80°C

Il presente componente non deve essere messo in servizio prima che la macchina all'interno della quale sia stata incorporata non sia stata dichiarata conforme alle disposizioni delle Direttive vigenti.

Medolla, 1 Novembre 2003
OLI S.r.l.

Adriano Marchesini
(General Manager)

The Manufacturer provides a 12-month warranty on their products. This period starts from the date of the consignment note.
The warranty is not applicable for breakage and/or defects caused by incorrect installation or use, or incorrect maintenance, or modifications not authorized by the Manufacturer.
The warranty does not extend to parts that wear out following normal use and electrical components.
The warranty elapses if the filter:
- has been tampered with or modified,
- has not been used correctly,
- has been used without respecting the limits indicated in this manual and/or has been subjected to excessive mecha nical stress,
- has not been subjected to the necessary maintenance or these operations have been carried out partly and/or incorrectly,
- has been damaged due to carelessness during transport, installation and use,
- has been fitted with spare parts that are not original.

On receiving the product, the user must check these for defects deriving from transport and/or incomplete supply.
Defects, damage or incom pleteness of the supply must be immediately communicated to the Manufacturer in writing and countersigned by the haulage transporter.

Der Hersteller gewährt auf seine Erzeugnisse eine Garantie von 12 Monaten. Die Garantiezeit beginnt mit dem Datum des Lieferscheins.
Die Garantie ist nicht anwendbar, wenn es sich um Schäden und/oder Defekte handelt, die auf falschem Einbau oder Gebrauch, nicht korrekter Wartung oder Änderungen beruhen, die ohne die Genehmigung des Herstellers ausgeführt wurden.
Die Garantie deckt keine Teile ab, die infolge des normalen Gebrauchs verschleißen, und auch keine elektrischen Teile.
Die Garantie verfällt in folgenden Fällen:
- Das Gerät wurde manipuliert oder abgeändert;
- wurde nicht korrekt verwendet;
- bei seinem Gebrauch wurden die in diesem Handbuch genannten Einsatzbeschränkungen nicht beachtet und/oder es wurde zu starken mechanischen Belastungen ausgesetzt;
- er wurde nicht der erforderlichen Wartung unterzogen, oder diese wurde nur teilweise und/oder nicht korrekt ausgeführt;
- es wurde beschädigt, weil Transport, Einbau oder Gebrauch ohne die erforderliche Sorgfalt vorgenommen wurden;
- es wurden keine Original-Ersatzteile verwendet.

Beim Empfang der Ware hat der Empfänger sicherzustellen, dass die Ware keine durch Transport verursachten Schäden oder Defekte aufweist und/oder dass der Lieferumfang vollständig ist.
Etwaige Defekte, Schäden oder Fehlmengen sind mittels schriftlicher und vom Frachtführer gegengezeichneter Mitteilung sofort dem Hersteller zu melden.

Le constructeur reconnaît une période de 12 mois de garantie sur les produits de sa fabrication. La période prend effet à compter de la date indiquée sur le bon de livraison.
La garantie ne s'applique pas à la suite de ruptures et/ou de défauts provoqués par un montage et une utilisation impropre, des entretiens qui ne sont réalisés correctement ou des modifications apportées sans autorisation du constru cteur.
La garantie s'étend aux pièces qui s'usent à la suite d'une utilisation normale et aux parties électriques.
Plus précisément la garantie est sans effet si le filtre :
- a été manipulé ou modifié,
- a été utilisé de manière incor recte,
- a été utilisé sans respecter les limites indiquées dans la présen te notice et/ou qu'il a été soumis à des contraintes mécaniques excessives
- il n'a pas été soumis aux entretiens nécessaires ou que ces opérations ont été effectuées partiellement, de manière incom plète ou incorrecte
- a subit des dommages par négligence pendant le transport, la mise en place et l'utilisation,
- a été réparé avec des pièces qui ne sont pas d'origine.

Dès réception de la marchan dise, le destinataire doit vérifier que celle-ci n'a pas de défauts ou subit de dégâts dus au tran sport et que la fourniture n'est pas incomplète.
Tout défaut, dommage ou four niture incomplète doit immédia tement être signalée au constru cteur par communication écrite et contresignée par le tran sporteur.

Il costruttore riconosce un periodo di 12 mesi di garanzia sui prodotti di propria costruzione. Il periodo decorre dalla data della bolla di consegna.
La garanzia non è applicabile a seguito di rotture e/o difetti causati da errata installazione o utilizzo, oppure da manutenzioni non corrette o modifiche apportate senza autorizzazione del costruttore.
La garanzia non si estende alle parti che si logorano in seguito al normale uso e alle parti elettriche.
A miglior precisazione la garanzia decade nei casi in cui il filtro:
- sia stato manomesso o modificato,
- sia stato utilizzato non correttamente,
- sia stato utilizzato non rispettando i limiti indicati nel presente manuale e/o sia stato sottoposto ad eccessive sollecitazioni meccaniche,
- non sia stato sottoposto alle necessarie manutenzioni o queste siano state eseguite solo in parte e/o non correttamente,
- abbia subito danni per incuria durante il trasporto, l'installazione e l'utilizzo,
- siano state inserite parti di ricambio non originali.

Al ricevimento del prodotto, il destinatario deve verificare che lo stesso non presenti difetti o danni derivanti dal trasporto e/o incompletezza della fornitura.
Eventuali difetti, danni o incompletezza vanno immediatamente segnalati al costruttore mediante comunicazione scritta e controfirmata dal vettore.

On delivery, check that the nature and quantity of the goods comply with the acknowledgement of order.

Bei Erhalt der Ware sicherstellen, dass Typ und Menge den Daten der Auftragsbestätigung entsprechen.

A la réception de la marchandise contrôler que la typologie et la quantité correspond à ce qui est indiqué sur la confirmation de commande.

Al ricevimento della merce controllare se la tipologia e la quantità corrispondono con i dati della conferma d'ordine.

If any parts are damaged during transport, immediately state your claim in writing in the space provided on the consignment note (way bill). The driver is obliged to accept such a claim and to leave you a copy. If you received the goods free destination send your claim directly to us or to your shipping agent. If you fail to state your claim immediately on receipt of the goods, acceptance may be denied.

Etwaige Schäden müssen sofort auf dem Schriftweg in dem dafür vorgesehenen Feld auf dem Frachtbrief bekannt gegeben werden. Der Fahrer ist verpflichtet, eine solche Reklamation entgegen zu nehmen und dem Warenempfänger eine Kopie davon auszuhändigen. Wenn die Lieferung frei Haus erfolgt, die Reklamation an den Hersteller senden, ansonsten direkt an den Frachtführer. Eine Entschädigung kann nur erfolgen, wenn der Schaden beim Wareneingang erklärt wurde.

Les dommages éventuels doivent être signalés immédiatement par écrit dans l'espace réservé à cet effet sur la lettre de voiture. Le conducteur a l'obligation d'accepter cette déclaration et vous en remettre une copie. Si la fourniture est franco destination, envoyer votre réclamation à nous, sinon directement au transporteur. Le dédommagement n'est possible que si vous avez signalé les dégâts au moment de la réception.

Eventuali danni devono essere fatti presenti immediatamente per iscritto nell'apposito spazio della lettera di vettura. L'autista è obbligato ad accettare un tale reclamo e lasciarne una copia a Voi. Se la fornitura è franco destino, inviate il Vs. reclamo a noi, altrimenti direttamente allo spedizioniere. Il risarcimento avviene soltanto se avete fatto presente il danno all'atto del ricevimento.

Avoid damaging the parts during the unloading and handling operations.

Vorsichtig mit der Ware umgehen, um jede Art der Beschädigung beim Abladen und Handling zu vermeiden.

Mouvementer avec soin des vagues éviter chaque type d'endommagement pendant le déchargement et les mouvementement.

Movimentare con cura onde evitare ogni tipo di danneggiamento durante lo scarico e le movimentazioni.

Type ***Tipo***	**Weight including packing - *Gewicht inkl. Verpackung*** **Poids emballage inclus - *Peso compreso imballo*** **(kg)**
PS032	5.9
PS040	8.0
PS063	15.6
PS080	29.9

UNPACKING

N.B.: It is the installer's responsibility to dispose off the packaging in a suitable manner, in compliance with existing legislation.

AUSPACKEN

N.B.: Der Anlagenaufsteller ist dafür verantwortlich, das Verpackungsmaterial auf angemessene Art und in Übereinstimmung mit den einschlägigen, geltenden Gesetzen zu entsorgen.

ELIMINATION DE L'EMBALLAGE

N.B.: L'installateur a l'obligation d'éliminer les emballages conformément aux lois en la matière.

RIMOZIONE IMBALLO

N.B.: E' a cura dell'installatore smaltire gli imballi in modo adeguato e secondo le leggi vigenti in materia.

1)STORAGE PRIOR TO INSTALLATION
- Avoid damp, salty environments, if possible.
- Place the component on wooden platforms and store it protected from unfavourable weather conditions.

2)PROLONGED MACHINE SHUTDOWNS AFTER ASSEMBLY
- Before starting up the component, set it in safety status.
- Before starting up the component, check the condition of the electric and pneumatic system and all parts for which long shutdowns may affect working.

3) POSSIBLE REUSE AFTER PERIODS OF INACTIVITY
- During component halts, avoid-damp, salty environments.
- Place the component on wooden platforms and store it protected from unfavourable weather conditions.
- Set the component in safety status before starting it up.
- Before starting up the component, check the condition of the electric and pneumatic systems and all parts for which long shutdowns may affect working.
- If the component operates in conditions and with materials different from the previous application, check the compatibility of this use according to the indications in the INDICATIONS FOR USE section.

LIFTING
When the total weight of the equipment does not exceed 30 kg it can be handled manually bearing in mind that the weight that can be lifted by an adult male is 30 kg while that for an adult female is 20 kg.
(L.D. 626/94).

1) EINLAGERUNG VOR DEM EINBAU
- Feuchte und salzhaltige Luft bei der Einlagerung vermeiden.
- Das Bauteil auf eine Holzpalette setzen und vor Witterung schützen.

2) LÄNGERE BETRIEBSUNTERBRECHUNG NACH EINBAU
- Vor der Inbetriebnahme ist das Bauteil in einen sicheren Zustand zu bringen.
- Vor Inbetriebnahme des Bauteils die elektrische und pneumatische Anlage und alle Teile, deren Funktionstüchtigkeit bei einem längeren Stillstand in Frage gestellt werden könnte, prüfen.

3) MÖGLICHE WIEDERVERWENDUNG NACH EINEM LÄNGEREN STILLSTAND
- Während des Stillstands des Bauteils Räume mit feuchter und salzhaltiger Luft vermeiden.
- Das Bauteil auf eine Holzpalette setzen und vor Witterung schützen.
- Vor Inbetriebnahme das Bauteil in einen sicheren Zustand bringen.
- Vor Inbetriebnahme des Bauteils die elektrische und pneumatische Anlage und alle Teile, deren Funktionstüchtigkeit bei einem längeren Stillstand in Frage gestellt werden könnte, prüfen.
- Wenn das Bauteil unter Bedingungen oder mit Material betrieben wird, die vom vorherigen Einsatz abweichen, die Verträglichkeit mit den neuen Einsatzbedingungen mit der BEDIENSUNGSANLEITUNG vergleichen.

HEBEN
Wenn das Gewicht der Ausrüstung nicht mehr als 30 kg ausmacht, kann das Handling der Last von Hand vorgenommen werden. Dabei ist zu berücksichtigen, dass ein erwachsener Mann 30 kg und eine erwachsene Frau 20 kg heben können.
(lt. Gesetzeserlass 626/94).

1) EMMAGASINAGE AVANT LA MISE EN PLACE
- Si possible éviter les locaux humides et les saumâtres
- Placer le composant sur des palettes en bois et les ranger à l'abri des intempéries.

2) ARRÊT MACHINE PROLONGÉ APRÈS LE MONTAGE
- Avant la mise en service mettre le composant en sécurité.
- Avant la mise en service du composant contrôler l'intégrité de l'équipement électrique et de toutes les parties pour lesquelles un arrêt prolongé pourrait compromettre le fonctionnement.

3) RÉ-UTILISATION APRÈS UNE PÉRIODE D'INACTIVITÉ
- Pendant la période d'inactivité du composant éviter les locaux humides et saumâtres
- Placer le composant sur des palettes en bois et les ranger à l'abri des intempéries.
- Avant la mise en service mettre le composant en sécurité
- Avant la mise en service du composant contrôler l'intégrité de l'équipement électrique et de toutes les parties pour lesquelles un arrêt prolongé pourrait compromettre le fonctionnement.
- Si le composant travaille dans des conditions et avec des matières différentes de l'application précédente, vérifier la compatibilité de cette utilisation d'après ce qui est indiqué dans la section MODE D'EMPLOI.

SOULÈVEMENT
Quand le poids de l'appareillage ne dépasse pas au total le poids de 30 kg, la manutention de la charge peut être faite manuellement sans oublier que le poids pouvant être soulevé est de 30 kg pour les mâles et de 20 kg pour les femmes adultes.
(D.Leg. 626/94).

1) IMMAGAZZINAGGIO PRIMA DELL'INSTALLAZIONE
- Evitare possibilmente ambienti umidi e salmastri.
- Sistemare il componente su pedane di legno e locarle al riparo dalle intemperie.

2) FERMO MACCHINA PROLUNGATO DOPO IL MONTAGGIO
- Prima della messa in servizio mettere in sicurezza il componente.
- Prima della messa in servizio del componente controllare l'integrità dell'impianto elettrico, pneumatico, e di tutte le parti per le quali un prolungato arresto potrebbe compromettere la funzionalità.

3)POSSIBILE REIMPIEGO DOPO PERIODO DI INATTIVITA'
- Durante il fermo componente evitare ambienti umidi e salmastri.
- Sistemare il componente su pedane di legno e locarle al riparo dalle intemperie.
- Prima della messa in servizio mettere in sicurezza il componente.
- Prima della messa in servizio del componente controllare l'integrità dell'impianto elettrico, pneumatico, e delle parti per le quali un prolungato arresto potrebbe compromettere la funzionalità.
- Se il componente opera in condizioni e con materiali diversi dall'applicazione precedente, verificare la compatibilità di tale utilizzo secondo quanto riportato nel sezione INDICAZIONE PER L'USO.

SOLLEVAMENTO
Quando il peso dell'apparecchiatura non supera il peso complessivo di 30 kg la movimentazione del carico può essere fatta manualmente ricordando che il peso sollevabile per i maschi adulti e di 30 kg mentre di kg 20 per femmine adulte.
(D.lgs 626/94).

The percussion gun must be positioned in such a manner that:

- the area around the percussion gun must be made safe as per Directive ATEX 94/9/CE.
- By safe place is meant an outside area in which suitable warning notices are present during the working of the percussion gun, see Sect. 26 residual risks, and where there are no plant parts that can get damaged or inflammable material deposits.
- The user is entirely responsible if the percussion gun is installed in any way other than that indicated above.
- The component does not require special lighting; the component installer is however responsible for ensuring uniform lighting in the area on the basis of the indications of the relevant regulation.

N.B.:
- If the percussion gun is installed in new plants, make sure these are free of dust and then proceed with the installation.
- If the percussion gun is installed on operating parts of the plant already containing powder, make sure these are free of powders before proceeding with the installation.

The installer must have a fire permit before proceeding with the installation.

Der pneumatische Klopfer ist so anzuordnen, dass:

- der Bereich rings um den pneumatischen Klopfer gemäß den Angaben der ATEX-Richtlinie 94/9/EG gesichert ist.
- Unter einem sicheren Ort versteht man einen Außenbereich, in dem während des Betriebs des pneumatischen Klopfers eine entsprechende Beschilderung angebracht ist. Siehe Teil 26 Restrisiken. Außerdem dürfen keine Anlagenteile vorhanden sein, die beschädigt werden könnten, oder Lager mit entflammbaren Materialien.
- Anordnungen des pneumatischen Klopfers, die von der oben genannten abweichen, führen dazu, dass der Anwender die Haftung in vollem Umfang selbst übernimmt.
- Das Bauteil verlangt keine besondere Beleuchtung. Der Monteur hat jedoch darauf zu achten, dass der Bereich aufgrund der Angaben der einschlägigen Normen gleichmäßig beleuchtet wird.

N.B.:
- Falls der Klopfer auf neuen Anlagenteilen installiert wird, sicherstellen, dass sie staubfrei sind und dann mit der Installation beginnen.
- Falls der Klopfer auf Teilen der Anlage installiert wird, die in Betrieb sind und Stäube enthalten, vor Beginn der Installation sicherstellen, dass diese keine Stäube enthalten und erst dann die Installation vornehmen.

Es ist erforderlich, dass der Monteur mit Genehmigung für Feuerarbeiten ausgestattet ist, bevor er mit der Installation beginnt.

Le percuteur pneumatique doit être mis en place en respectant les règles suivantes :

- une zone tout autour du percuteur pneumatique doit être mise en sécurité conformément à la directive ATEX 94/4/CE.
- Par lieu sûr on entend une zone extérieure dans laquelle, pendant le fonctionnement du percuteur pneumatique, sont apposés des panneaux de signalisation appropriés (voir sect. 26 risques résiduels). En outre il ne doit pas y avoir de parties d'installation endommageables ou des dépôts de matières inflammables.
- Tout positionnement différent du percuteur pneumatique rend l'utilisateur entièrement responsable.
- Le composant n'exige pas un éclairage particulier; l'installateur du composant doit assurer la présence d'un éclairage approprié dans la zone sur la base des indications de la réglementation concernée.

N.B.:
- En cas d'installation du percuteur sur des parties d'installation neuves, s'assurer que celles-ci sont sans poussières et procéder avec l'installation.
- Au cas où l'installation du percuteur sur les parties d'installation en service contenant des poussières, avant de procéder à l'installation s'assurer que celles-ci sont sans poussières et procéder à l'installation.

Il faut que l'installateur soit munie d'un permis de travail au feu avant de procéder à l'installation.

Il percussore pneumatico, deve essere posizionato in modo che:

- la zona circostante al percussore pneumatico deve essere resa sicura come da direttiva ATEX 94/9/CE.
- Per luogo sicuro s'intende una zona esterna nella quale durante il funzionamento percussore pneumatico, sia apposta l'adeguata cartellonistica, vedi sez.26 rischi residui, inoltre non siano presenti parti d'impianto danneggiabili o depositi di materiali infiammabili.
- Posizionamenti del percussore pneumatico diversi da quanto sopra indicato determinano la totale assunzione di responsabilità da parte dell'utilizzatore.
- Il componente non necessita di un'illuminazione particolare; l'installatore del componente è comunque tenuto ad assicurare la presenza di un'omogenea illuminazione nell'area in base alle indicazioni della normativa pertinente.

N.B.:
· Nel caso dell'installazione del percussore su parti di impianto nuove, assicurarsi che queste siano prive di polvere e procedere con l'installazione.
· Nel caso dell'installazione del percussore su parti di impianto in funzione contenente polvere, prima di procedere all'installazione assicurarsi che queste siano prive di polvere e procedere con l'installazione.

Occorre che l'installatore sia provvisto di permesso di lavoro a fuoco prima di procedere all'installazione.

A) Installation area
- Clean the surface to be welded by removing paints and impurities.
- Weld the striker "1" using a Rutil Basic DIN 1913E5153B (R10) A VSE7016 electrode, making sure the earth wire of the welding gun is **not** connected to the striker stud bolts.
- Weld anchoring for chain "7".

Before inserting the seal, make sure the striker and the surrounding area have reached room temperature.

B) Insert gaskets "2" and "3" and percussion gun "4" on the corresponding stud bolts of the striker.
C) Insert vibration dampers "4", washers "5" and self-locking nuts "6".
D) Tighten the self-locking nuts to bring the value of "M" to the value indicated in the Table below.

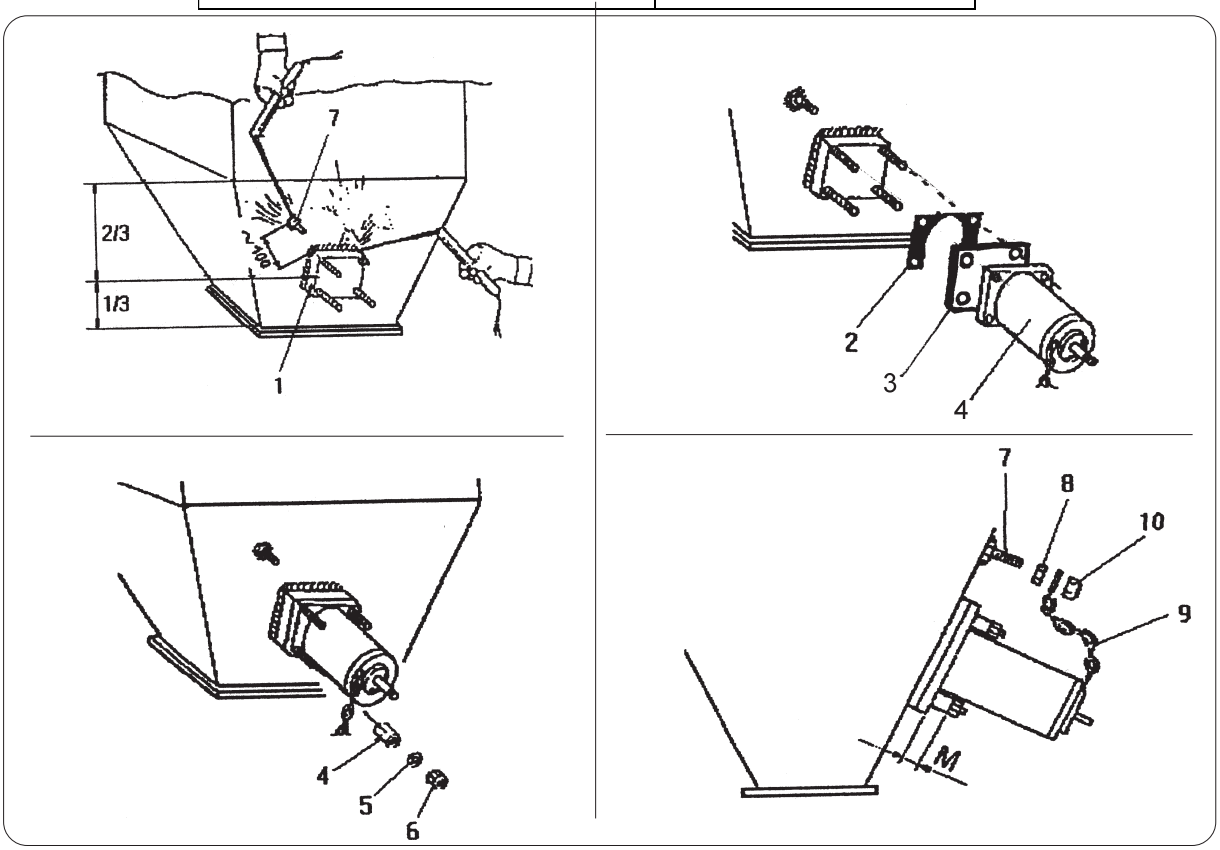
A) Installationsbereich
- Die zu schweißende Fläche reinigen, indem man Anstriche oder Schmutz unterschiedlicher Art entfernt.
- Die Schlagvorrichtung „1" mit der Elektrode Rutil Basico DIN 1913E5153B (R10) AVSE7016 schweißen, wobei darauf zu achten ist, dass das Massekabel der Schweißmaschine **NICHT** an die Stiftschrauben der Schlagvorrichtung angeschlossen wird.
- Die Verankerung für die Kette „7" anschweißen.

Vor dem Aufstecken der Dichtung ist es erforderlich, dass die Schlagvorrichtung und die Bereiche ringsum auf Raumtemperatur abgekühlt sind.

B) Die Dichtungen „2" und „3" und den Klopfer „4" auf die Stiftschrauben der Schlagvorrichtung stecken.
C) Die Stossdämpfer „4", die Unterlegscheiben „5" und die selbstsichernden Muttern „6" aufstecken.
D) Die selbstsichernden Muttern anziehen, bis der Wert „M" auf die Werte der folgenden Tabelle gebracht wird.

A) Zone d'installation
- Nettoyer la surface à souder en enlevant les peintures ou les impuretés.
- Souder l'enclume "1" avec l'électrode Rutil Basico DIN 1913E5153B (R10) AVSE7016, en prenant soin de **NE PAS** relier les fils de masse de la machine à souder aux goujons de l'enclume.
- Souder l'ancrage pour chaîne "7".

Avant d'insérer le joint, il faut que l'enclume et les zones limitrophes aient atteint la température ambiante.



B) Monter les joints "2" et "3" et le percuteur "4" sur les goujons de l'enclume.
C) Placer les amortisseurs "4", les rondelles "5" et les écrous de sûreté "6".
D) Serrer les écrous autobloquants jusqu'à mettre la mesure "M" aux valeurs du tableau placé dessous.

A) Zona d'installazione
- Pulire la superficie da saldare asportando vernici o impurità varie.
- Saldare l'incudine "1" con elettrodo Rutil Basico DIN 1913E5153B (R10) A VSE7016, avendo cura di **NON** collegare il filo di massa della saldatrice ai prigionieri dell'incudine.
- Saldare ancoraggio per catena "7".

Prima di inserire la guarnizione, occorre che l'incudine e le zone limitrofe abbiano raggiunto la temperatura ambiente.

B) Inserire guarnizioni "2" e "3" e il percussore "4" sui corrispondenti prigionieri dell'incudine.
C) Inserire gli amoortizzatori "4", le rondelle "5" e i dadi autobloccanti "6".
D) Serrare i dadi autobloccanti fino a portare la quota "M" ai valori della tabella sottostante.

Type	M (mm)
PS 032-040	16
PS 063-080	25

COMPRESSED AIR REQUISITES

The compressed air supplied to the various utilities must have certain special features:

1) **clean**: free of scale which could damage the solenoid valves present on the percussion gun.
2) **dehumidified**: use of a condensate trap is advisable.
3) **lubricated**:

Attention: before connecting the compressed air to the percussion gun utilities, empty the pipes.

ANFORDERUNGEN AN DIE DRUCKLUFT

Die Druckluft, die verschiedene Verbraucher versorgen muss, muss folgende Eigenschaften haben:

1) **rein:** sie darf keine Teilchen enthalten, mit denen die Magnetventile der pneumatischen Klopfer beschädigt werden könnten.
2) **trocken:** ein Kondensatabscheider ist empfehlenswert.
3) **geschmiert**.

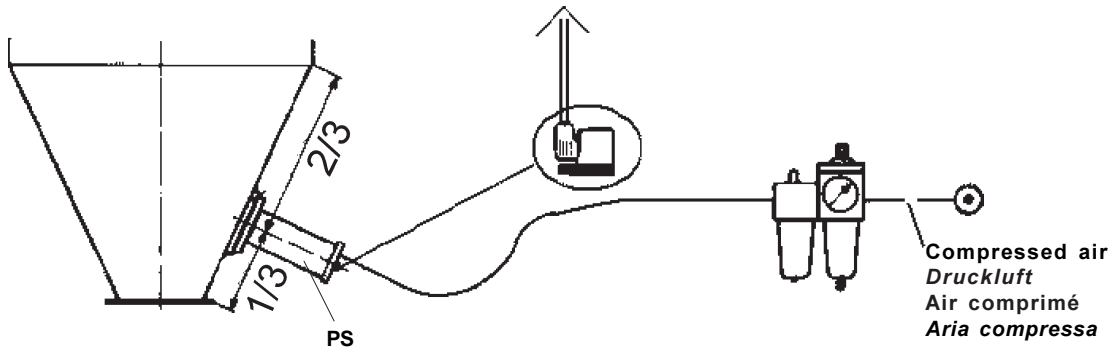
Achtung: Vor dem Anschließen der Druckluft an die Verbraucher der pneumatischen Klopfer sind die Leitungen zu entleeren.

AIR COMPRIME REQUIS

L'air comprimé qui doit alimenter les différentes utilisations doit avoir les requis suivants :

1) **Propre**: sans impuretés pouvant endommager les électrovannes présentes sur le percuteur pneumatique.
2) **Déshumidifié**: il convient de prévoir l'utilisation d'un séparateur d'eau de condensation.
3) **Lubrifié**.

Attention: avant de brancher l'air comprimé aux utilisations du percuteur pneumatique vider les tuyauteries.



REQUISITI ARIA COMPRESSA

L'aria compressa che deve alimentare le varie utenze ha bisogno di particolari caratteristiche:

1) pulita: esente da scorie che potrebbero danneggiare le elettrovalvole presenti sul percussore pneumatico.
2) deumidificata: è opportuno prevedere l'utilizzo di un separatore di condensa.
3) lubrificata:

Attenzione: prima di collegare l'aria compressa alle utenze del percussore pneumatico vuotare le tubazioni.

Connect to electric panel kit code13008170A or code 13008190A *or to the plant control PLC*	*Anschluss an elektrische Schalttafel Code 13008170A oder Code 13008190A oder an SPS zur Steuerung der Anlage vornehmen*
Brancher au kit tableau électrique Code 13008170A ou Code 13008190A ou au PC de gestion de l'installation	*Collegare a kit quadro elettrico cod.13008170A o cod.13008190A o al PLC di gestione dell'impianto*

COMPRESSED AIR CONNECTION

- The operating pressure shall never exceed 6 bar!
- Connection to the compressed air supply shall be sized to guarantee filling of the percussion gun reservoir in a time less than the cleaning time.
- Blowing air consumption (see page.M.10).

ATTENTION
Use pipes and accessories suitable for the operating temperatures!

It is the installer's responsibility to fix the compressed air hose pipes correctly and provide the necessary protection from sudden detachment of a section of the piping.

PNEUMATISCHER ANSCHLUSS

- Der Betriebsdruck darf nie über 6 bar liegen!
- Der Anschluss der pneumatischen Versorgungsquelle muss so ausgelegt werden, dass die Füllung des Behälters des Klopfers in einer Zeitspanne erfolgt, die kürzer als das Abreinigungsintervall ist.
- Druckluftverbrauch pro Abreinigung (siehe Seite M.10).

ACHTUNG
Die für die Einsatztemperaturen geeigneten Leitungen und Zubehör verwenden.

Der Monteur hat dafür zu sorgen, dass die Druckluftschläuche korrekt befestigt sind sowie auch dafür, dass die Schutzvorrichtungen gegen das plötzliche Abtrennen einer Schlauchstrecke angebracht werden.

RACCORDEMENT PNEUMATIQUE

- La pression de service ne doit jamais dépasser les 6 bars !
- Le raccordement de l'alimentation pneumatique doit être dimensionné pour garantir le remplissage du réservoir du percuteur en un temps inférieur à l'intervalle d'impulsion.
- Consommation d'air par impulsion (voir page M.10).

ATTENTION
Adopter des tuyauteries et des accessoires appropriés à la température d'utilisation !

L'installateur doit fixer correctement les tuyaux flexibles de l'air comprimé et prévoir les protections appropriées contre le détachement soudain d'un tronçon de tuyauterie.

COLLEGAMENTO PNEUMATICO

- La pressione di esercizio non deve mai superare 6 bar !
- Il collegamento alimentazione pneumatica deve essere dimensionato per garantire il riempimento del serbatoio del percussore in un tempo inferiore all'intervallo di sparo.
- Consumo d'aria per sparo (vedi pag.M.10).

ATTENZIONE
Adottare tubazioni e accessori idonei alla temperatura di utilizzo!

E' a cura dell'installatore fissare correttamente i tubi flessibili dell'aria compressa e predisporre le dovute protezioni contro il distacco improvviso di un tratto di tubazione.

Solenoid coil - *Spule* - Bobine - *Bobina* Code	Description - *Benennung* Désignation - *Descrizione*	Volt	Hz	W
BOB 024 50 EX	Solenoid coil with connector *Spule mit Steckverbinder* Bobine avec connecteur *Bobina con connettore*	24	50/60	5.3
BOB 024 CC EX		24	=	5.4
BOB 048 50 EX		48	50/60	5.3
BOB 110 50 EX		110	50/60	5.3
BOB 220 50 EX		220	50/60	5.3

Set the percussion gun in equipotential using the special point provided for the purpose on the percussion gun.

Den Potentialausgleich des pneumatischen Klopfers herstellen, indem man die Stelle benutzt, die auf dem pneumatischen Klopfer dafür gekennzeichnet ist.

Mettre le percuteur pneumatique en équipotentialité en utilisant le point prévu.

Mettere in equipotenzialità il percussore pneumatico utilizzando l'apposito punto dedicato sul percussore pneumatico.

START-UP
Before carrying out any operation on the component, make sure it is in safety status.

1) Switch on the compressed air supply.
2) Check that minimum and maximum pressures are within the allowable range.
3) Switch on the power supply adjusting:
a) duration of impulse max. 30 ms
b) impulse interval >= 30" depending on requirements
4) Adjust the operating pressure to obtain the desired percussion.

EINSCHALTEN
Bevor irgendwelche Einriffe an dem Bauteil vorgenommen werden, sicherstellen, dass es sich in einem sicheren Zustand befindet.
1) Die pneumatische Versorgung einschalten.
2) Sicherstellen dass die oberen und unteren Grenzwerte der zulässigen Drücke eingehalten werden.
3) Die elektrische Versorgung aktivieren und wie folgt regeln:
a) Impulsdauer max. 300 ms
b) Impulsintervall > = 30“ je nach Bedarf
4) Den Betriebsdruck so einstellen, dass die gewünschte Klopfwirkung erhalten wird.

PROCEDURE DE MISE EN MARCHE
Avant toute intervention sur le composant s’assurer que celui-ci est mis en sécurité.

1) Mettre en marche l’alimentation pneumatique.
2) Vérifier que les valeurs minimales et maximales admissibles de pression sont respectées.
3) Activer l’alimentation électrique en réglant:
a) Durée d’impulsion maxi. 300 ms
b) Intervalle impulsions > = 30" en fonction des exigences
4) Régler la pression de service pour obtenir l’effet de percussion voulu.

PROCEDURA AVVIAMENTO
Prima di effettuare un qualsiasi intervento sul componente assicurarsi che questo sia messo in sicurezza.

1) Attivare alimentazione pneumatica.
2) Verificare che siano rispettati i valori minimi e massimi di pressione ammessi
3) Attivare alimentazione elettrica regolando:
a) durata impulso max 300 ms
b) intervallo impulsi >= 30" in funzione delle esigenze
4) Regolare la pressione di esercizio per ottenere l’effetto voluto di percussione.

SWITCHING OFF
Before proceeding with disassembly of the percussion gun or its component parts, make sure the electrical and compressed air supplies are disconnected.
Check to make sure the lock is not pressurized.

ABSCHALTEN
Bevor man den Ausbau des pneumatischen Klopfers oder eines seiner Bauteile vornimmt, sicherstellen, dass die elektrische und pneumatische Versorgung unterbrochen wurde.
Sicherstellen, dass der Anzug nicht unter Druck steht.

PROCEDURE DE MISE HORS SERVICE
Avant de procéder au démontage du percuteur ou de chacun de ses composants, s’assurer que les alimentations électriques et pneumatiques ont été débranchées.
Vérifier que le serrage n’est pas sous pression.

PROCEDURA SPEGNIMENTO
Prima di procedere allo smontaggio del percussore o di ogni sua parte componenete, assicurarsi che le alimentazioni elettriche e pneumatiche siano state slacciate.
Verificare che il serraggio non sia in pressione.

MAINTENANCE
Before carrying out any operation on the component, make sure it is in safety status.

If work is to be carried out on parts at the top of the percussion gun, use a work area platform which must be selected in such a manner as to avoid risk of slipping, tripping or falling of operators.

WARTUNG
Bevor irgendwelche Eingriffe an dem Bauteil vorgenommen werden, sicherstellen, dass es sich in einem sicheren Zustand befindet.

Falls man Teile des pneumatischen Klopfers erreichen muss, die sich in größerer Höhe befinden, ist eine Arbeitsplattform zu benutzen, die so zu wählen ist, dass die Gefährdung des Personals durch Ausrutschen, Hängenbleiben oder Absturz vermieden wird.

MAINTENANCE
Avant d’effectuer toute intervention sur le composant s’assurer qu’il est mis en sécurité.

Pour atteindre des parties du percuteur pneumatique en hauteur, utiliser une plate-forme aérienne de travail qui devra être choisie de manière à éviter tout danger de glissement ou de chute.

MANUTENZIONE
Prima di effettuare un qualsiasi intervento sul componente assicurarsi che questa sia messa in sicurezza.

La dove si debbano raggiungere parti del percussore pneumatico in quota utilizzare una piattaforma aerea di lavoro che dovrà essere scelta in modo da evitare pericoli di scivolamento, inciampo o caduta per gli operatori.

- Clean dust deposits on a weekly basis.

- Check tightening of the percussion gun fixing screws and coil on a monthly basis.

- Check the tightening of the screw connectors on a weekly basis.

- Check the equipotential with the structure on which the percussion gun is mounted, on a monthly basis.

- The estimated safe working of the PS percussion gun is 150,000 strikes, after which the component must be replaced, or complete overhauling is required by the dealer or authorized service centre. (see page M.3)

- On a yearly basis, check the seals against which the striker mass acts.

- Check the rating plate and if it is damaged, contact the manufacturer for a replacement.

- Staubansammlungen einmal pro Woche entfernen.

- Die Befestigungsschrauben des Klopfers und der Spule einmal pro Monat auf festen Sitz prüfen.

- Die Schraubanschlüsse einmal pro Monat auf festen Sitz prüfen.

- Einmal im Monat den Potentialausgleich mit der Struktur prüfen, an welcher der Klopfer befestigt ist.

- Der sichere Betrieb des Klopfers PS wird auf 150.000 Schläge geschätzt. Danach ist der Austusch des Bauteils vorzunehmen oder das Teil einer Generalüberholung durch den Händler oder durch eine Vertragswerkstatt unterziehen zu lassen (siehe Seite M.3).

- Einmal pro Jahr den Zustand der Dichtung prüfen, auf den die Klopfmasse einwirkt.

- Das Typenschild auf seine Unversehrtheit prüfen. Wenn es beschädigt ist, beim Hersteller eine Kopie anfordern.

- Chaque semaine éliminer les dépôts de poussière qui se sont accumulés.

- Tous les mois vérifier le serrage des vis de fixation du percuteur et de la bobine.

- Tous les mois vérifier l'équipotentialité avec la structure sur laquelle est fixé le percuteur.

- Le fonctionnement du percuteur PS estimé est de 150.000 coups après quoi il est prévu le remplacement du composant ou la révision complète par le revendeur ou le service après vente agréé (voir page M.3).

- Chaque année vérifier l'état du joint sur lequel intervient la masse percutante.

- Vérifier l'intégrité de la plaque, si elle est endommagée, demander une copie au constructeur.

- Settimanalmente rimuovere eventuali cumuli di polvere di deposito.

- Verificare mensilmente, il serraggio delle viti di fissaggio del percussore e della bobina.

- Verificare mensilmente, il serraggio dei raccordi a vite.

- Verificare mensilmente, l'equipotenzialità con la struttura su cui viene fissato il percussore.

- Il funzionamento sicuro del percussore PS stimato è di 150.000 colpi dopo di che è prevista la sostituzione del componente o la completa revisione da parte del rivenditore o del punto di assistenza autorizzato. (vedi a pag. M.3)

- Annualmente verificare lo stato della guarnizione su cui va ad agire la massa battente.

- Verificare l'integrità della targhetta, se danneggiata, occorre chiederne una copia al costruttore.

Before carrying out any operation on the component, make sure it is in safety status.

While cleaning the dust deposited on the component, avoid throwing up dust into the surroundings and avoid dust deposits.
The frequency of cleaning operations depends on the type of product handled and the plant.
Do not direct water jets against the electrical components.

Bevor irgendwelche Eingriffe an dem Bauteil vorgenommen werden, sicherstellen, dass es sich in einem sicheren Zustand befindet.

Beim Entfernen des eventuell im Bauteil vorhandenen Staubs dafür sorgen, dass der Staub nicht in der Umgebung verteilt wird, und dafür sorgen, dass sich kein Staub ansammelt.

Die Häufigkeit der Reinigungsarbeiten hängt von der Beschaffenheit des behandelten Produkts und von der Anlage ab. Den Wasserstrahl nicht auf elektrische Bauteile richten.

Avant d'effectuer toute intervention sur le composant s'assurer qu'il est mis en sécurité.

En éliminant la poussière présente sur le composant faire attention à ne pas la disperser dans le milieu environnant et éviter toute accumulation.

La fréquence des opérations de nettoyage dépend de la nature du produit traité et de l'équipement. Ne pas diriger le jet d'eau sur les composants électriques.

Prima di effettuare un qualsiasi intervento sul componente assicurarsi che questa sia messa in sicurezza.

Nella rimozione della polvere eventualmente presente nel componente aver cura di non disperdere la polvere stessa nell'ambiente circostante e avere cura ad evitare cumuli.

La frequenza delle operazioni di pulizia dipendono dalla natura del prodotto trattato e dell'impianto.
Non dirigere direttamente il getto d'acqua sui componenti elettrici.

On the basis of the use of the percussion gun, the installer must inform the operator by means of specific signals, regarding the residual risks:

1. Mechanical risk

For maintenance operations, it is compulsory for the operator to always use personal protection equipment.

Special warning notices on each section of the machine indicate the obligatory personal protection equipment:

2. Presence of possible residual high temperature after percussion gun stop

During the course of maintenance and cleaning operations and in certain operating sections, the operator may enter into contact with very hot parts of the percussion gun, with the machine stopped.

Special warning notices, located at strategic points indicate the risk due to the presence of very hot surfaces and the obligation for the operator to wear personal protection equipment, especially protective gloves.

3. Presence of potentially hazardous dusts

In the event of both routine and extraordinary maintenance, the operator must wear suitable personal protection equipment, and in particular, use a safety mask for the respiratory tract depending on the type of dust dealt as well as gloves and clothing.

For more details, refer to the safety chart of the product handled.

Je nach Verwendung des pneumatischen Klopfers muss der Monteur das Personal durch besondere Hinweisschilder auf folgende Restrisiken hinweisen:

1.Gefahren mechanischer Art

Für die Wartungsarbeiten muss das Personal immer seine persönlichen Schutzausrüstungen benutzen.

Besondere Warnschilder an den einzelnen Abschnitten des Geräts geben an, welche persönlichen Schutzausrüstungen jeweils erforderlich sind:

2. Vorliegen möglicher hoher Temperaturen nach dem Stillstand der Klopfer

Im Laufe einiger Wartungs- und Reinigungsarbeiten und in einigen Arbeitsabschnitten kann das Personal bei stehendem Gerät in Kontakt mit Teilen der Klopfer geraten, die eine hohe Temperatur aufweisen.

Besondere Warnschilder, die an den strategischen Stellen angebracht sind, weisen auf die Gefahren hin, die sich durch die hohe Temperatur der Oberflächen ergeben und weisen das Personal darauf hin, dass es zur Verwendung der persönlichen Schutzausrüstungen verpflichtet ist, insbesondere zum Tragen von Schutzhandschuhen.

3. Vorhandensein potentiell gefährlicher Stäube

Bei regelmäßiger und außerordentlicher Wartung muss das Personal geeignete persönliche Schutzausrüstungen verwenden und insbesondere Masken zum Schutz der Atemwege mit geeigneter Klasse für den aufbereiteten Staub, wie auch Schutzhandschuhe und Schutzkleidung tragen.

Für nähere Angaben ist Bezug auf das Sicherheitsdatenblatt des verwendeten Produkts zu nehmen.

L'installateur, en fonction de l'utilisation du percuteur pneumatique, doit informer les opérateurs, au moyen d'indications et de signalisations prévues à cet effet, sur les risques résiduels suivants :

1. Dangers de nature mécanique

Pour les activités d'entretien l'opérateur a l'obligation d'utiliser toujours les dispositifs de protection individuelle.

Des plaques d'avertissements apposées dans chaque section de la machine indiquent quels sont les dispositifs de protection individuelle qui sont obligatoires :

2. Présence de hautes températures résiduelles après l'arrêt du percuteur

Au cours des interventions d'entretien et de nettoyage et dans certaines sections de travail, l'opérateur peut entrer en contact, quand la machine est arrêtée, avec des parties du filtre dont les surfaces sont à des températures élevées.

Des plaques d'avertissement, apposées dans les endroits stratégiques, signalent le danger dû à la présence de surfaces à des températures élevées et l'obligation de l'opérateur d'utiliser les dispositifs de protection individuelle, en particulier des gants de protection.

3. Présence de poussières potentiellement dangereuses

Aussi bien dans le cas d'interventions d'entretien ordinaires ou extraordinaires, l'opérateur doit se doter des dispositifs de protection individuelle et en particulier il doit utiliser des masques de classe appropriée pour protéger les voies respiratoires en fonction du type de poussière traitée ainsi que de gants ou de vêtements adéquats.

Pour plus de détails consulter la fiche de sécurité du produit utilisé.

L'installatore, in base all'utilizzo del percussore pneumatico, deve informare gli operatori, tramite appositi segnali, in merito ai seguenti rischi residui :

1. Pericoli di natura meccanica

Per le attività di manutenzione è fatto obbligo all'operatore di impiegare sempre i dispositivi di protezione individuale.

Apposite targhe monitorie nelle singole sezioni di macchina indicano quali dispositivi di protezione individuale si rendono obbligatori:

2. Presenza di possibili alte temperature residue dopo l'arresto del percussore

Nel corso di interventi manutentivi e di pulizia e in alcune sezioni di lavoro, l'operatore può entrare in contatto, a macchina ferma, con parti del percussore pneumatico con superfici ad elevata temperatura.

Apposite targhe monitorie, collocate nei punti strategici indicano il pericolo dovuto alla presenza di superfici ad elevata temperatura e l'obbligo per l'operatore di utilizzare dispositivi di protezione individuale, in particolare guanti protettivi.

3. Presenza di polveri potenzialmente pericolose

Nel caso di interventi sia ordinari che straordinari di manutenzione l'operatore deve dotarsi di idonei dispositivi di protezione individuale ed in particolare deve utilizzare maschere a protezione delle vie respiratorie di classe idonea in base al tipo di polvere trattata nonché di guanti o indumenti.

Per maggiori dettagli si deve far riferimento alla scheda di sicurezza del prodotto utilizzato.

- In certain handling of dusts, where hazardous substances are present, the operator concerned who has to access the machine for routine and extraordinary maintenance operations must wear suitable protective devices as indicated on the notice signs provided.

All maintenance operations on the outside of the percussion gun MUST BE done with the plant stopped and in the absence of airborne dust. In case of operations involving heating (welding, cutting) it is necessary to clean the percussion gun first, removing all dust deposits (the layers, the deposits and accumulated combustible powder MUST be considered like any other source which can result in an explosive atmosphere).

Authorization for operations involving heating MUST be given by technical personnel specializ-ed and trained in the risk of explosion from dusts (capable of checking residual risk, suitability of tools and a knowledge of the procedures).

(The person responsible for safety must issue a “Fire Permit” to the operator).

4. Hazards deriving from pressurized circuits (hydraulic, pneumatic)

During mainten- ance and/or repair operations pressure must be discharged from the plants and accumulators (if present), according to the instructions given along-side the components and in the respective user manuals.

5. Hazard generated by noise

The user and employer are obliged to respect the legal standards as regards protection from daily personal exposure of operators to noise (in Italy L.D.277/91).

- Bei bestimmten Staubbehandlungen, wo schädliche Substanzen auftreten, muss das Personal, falls es im Laufe der regelmäßigen oder außerordentlichen Wartung damit in Kontakt kommt, persönliche Schutzausrüstungen tragen, so wie auf den vorhandenen Schildern angegeben.

Alle Wartungsarbeiten außerhalb des pneumatischen Klopfers MÜSSEN bei abgeschalteter Anlage und in Abwesenheit atembarer Stäube durchgeführt werden. . Bei der Ausführung von erhitzenden Arbeiten (Schweißen, Schneiden) ist es erforderlich, die Fläche der Struktur, auf welcher der Klopfer PS installiert werden soll, vorbeugend zu behandeln, um alle Staubablagerungen und entfernt werden (Schichten, Ablagerungen und Ansammlungen von brennbarem Staub MÜSSEN wie jede andere Staubquelle betrachtet werden, die zur Entstehung einer explosiven Atmosphäre beitragen kann).

Die Genehmigung zur Ausführung von Arbeiten im erwärmten Zustand DARF NUR durch spezialisiertes, technisches Personal erteilt werden, das über die Explosionsgefahr durch Staub unterrichtet ist (das in der Lage ist, das Restrisiko festzustellen, das die geeigneten Werkzeuge und auch die Prozeduren kennt).

(Der Werkschutzverantwortliche muss dem Arbeitnehmer eine „Genehmigung zur Feuerarbeit” ausstellen.)

4. Gefahren durch unter Druck stehende Leitungen (hydraulisch, pneumatisch)

Während der Wartungsarbeiten und/oder Reparaturen sind die Anlagen und die etwaigen Akkumulatoren zu entleeren, so wie es in den Anweisungen an die jeweiligen Komponenten oder in den entsprechenden Handbüchern steht.

5. Gefährdung der Arbeitnehmer durch Lärm

Der Anwender und der Arbeitgeber sind zur Einhaltung der gesetzlichen Bestimmungen in Sachen Schutz gegen tägliche persönliche Lärmexposition der Arbeitnehmer verpflichtet (in Italien D.Lgs.277/91).

- Dans des traitements déterminés de poussières où il y a la présence de substances nocives, l’opérateur qui doit y avoir accès, dans le cours des interventions ordinaires ou extraordinaires, doit porter les dispositifs de protection appropriés comme signalé par les panneaux indicateurs qui s’y trouvent.

Tous les entretiens à l’extérieur du percuteur pneumatique DOIVENT être effectués quand l’installation est arrêtée et en absence de poussière dispersée dans l’air. Dans le cas de travaux à chaud (soudure, découpe) il faut préalablement nettoyer la surface de la structure sur laquelle doit être monté le percuteur PS, en éliminant tous les dépôts de poussière (les couches, les dépôts et les tas de poussière combustible DOIVENT être considérés comme une autre source pouvant donner lieu à une atmosphère explosive).

L’autorisation à l’exécution des travaux à chaud DOIT être donnée par du personnel technique spécialisé et formé sur le risque d’explosion des poussières (en mesure de vérifier le risque résiduel, l’aptitude des outils et la connaissance des procédures).

(Le responsable de la sécurité devra délivrer un “permis de feu” à l’opérateur.)

4. Dangers dérivant des circuits sous pression (hydrauliques, pneumatiques)

Pendant les opérations d’entretien et/ou de réparation il faut décharger les installations et les éventuels accumulateurs, conformément aux instructions qui se trouvent à proximité des composants et dans les notices d’instructions correspondantes.

5. Dangers provoqués par le bruit

L’utilisateur ainsi que l’employeur ont l’obligation de faire respecter les normes de loi en matière de protection contre l’exposition personnelle quotidienne des opérateurs au bruit (en Italie D.Lgs.277/91).

- In determinati trattamenti di polveri dove vi è la presenza di sostanze nocive, l'operatore che dovesse accedere, nel corso di interventi ordinari o straordinari, deve indossare gli idonei dispositivi di protezione come indicato dalla cartellonistica ivi presente.

Tutte le manutenzioni all'esterno del percussore pneumatico DEVONO essere effettuate ad impianto fermo e in assenza di polvere aerodispersa. In caso di lavori a caldo (saldatura, taglio) è necessario bonificare preventivamente la superficie della struttura su cui andrà installato il percussore PS, rimuovendo tutti i depositi di polvere (gli strati, i depositi ed i cumuli di polvere combustibile DEVONO essere considerati come qualsiasi altra sorgente che può dare origine ad un'atmosfera esplosiva).

L'autorizzazione all'esecuzione dei lavori a caldo DEVE essere data da personale tecnico specializzato e formato sul rischio esplosione da polveri (in grado di verificare il rischio residuo, l'idoneità degli utensili e la conoscenza delle procedure).

(Il responsabile della sicurezza dovrà rilasciare un “permesso di lavoro fuoco” all’operatore).

4. Pericoli derivanti da circuiti in pressione (idraulici, pneumatici)

Durante le operazioni di manutenzione e/o riparazione occorre porre in scarico gli impianti e gli eventuali accumulatori, secondo le istruzioni riportate in prossimità dei componenti e nei rispettivi manuali d'uso.

5. Pericoli generati da rumore

E' fatto obbligo all'utilizzatore e al datore di lavoro di rispettare le norme di legge in termine di protezione contro l'esposizione personale quotidiana degli operatori al rumore (in Italia D.Lgs.277/91).

PROBLEM	POSSIBLE CAUSE	SOLUTION
Ruptured membrane (Item 25, spare parts). **A**	1) Operating and supply pressure > 6 bar.	1) Replace the membrane.. 2) Adjust the pressure setting.
Limited percussion of fluidisation effect. **B**	1) Operating pressure too low.	1) Adjust to > 2 bar until desired effect is obtained
	2) The reservoir does not recharge completely between firings.	2a) Increase interval between firings. 2b) Increase air supply rate. 2c) Check that there are no restrictions in the supply tube.
	3) Another pneumatic appliance connected in parallel.	3) Install a check valve at the inlet of the pneumatic hammer.
	4) Failure of return spring.	4) Replace spring.
No effect. **C**	1) Ruptured membrane (Item 25 spare parts).	1) See point "A".
	2) Percussion mass blocked.	2) Replace mass.
	3) Solenoid does not receive electrical signal.	
	4) No compressed air supply.	
	5) Faulty solenoid.	5) Replace solenoid.
	6) Pilot blocked inside stem (Item 24 in spare parts list)	6a) Replace stem. 6b) Remove any dirt that may have accumulated.
Damaged seals. **D**	1) Ambient temperature not within allowable range (standard -20 +80° C)	1) Replace seals.
Damaged membrane. **(only PJ - item 30 in spare parts list)** **E**	1) Material temperature too high (> 80° C)	1) Replace membrane
	2) Material with incompatible characteristics: - high acidity - highly adhesive	2) Contact the Manufacturer.

PROBLEM	MÖGLICHE URSACHE	LÖSUNG
(A) Membran gerissen (Pos. 25 Ersatzteilliste)	1) Betriebs- und Leitungsdruck zu hoch > 6 bar.	1) Membran ersetzen.
(B) Reduzierte Schlag- und Luftauflockerungswirkung.	1) Betriebsdruck zu niedrig.	2) Tarierdruck einstellen.
	2) Der Behälter kann sich zwischen einem Impuls und dem nächsten nicht ganz füllen.	1) Anlage > 2 bar tarieren bis die gewünschte Wirkung erzielt ist.
	3) Vorhandensein eines anderen parallel angeschlossenen Verbrauchers.	2a) Abstand zwischen Impulsen vergrößern.
	4) Rückholfeder gebrochen.	2b) Luftzufuhr verstärken.
(C) Keine Wirkung	1) Membran gerissen (Pos. 25 Ersatzteilliste).	2c) Sicherstellen, dass in pneumatischem Anschluss keine Verengungen vorhanden sind.
	2) Klopfmasse blockiert.	3) Im Eingang zum Klopfer ein Rückschlagventil montieren.
	3) Spule erhält keinen elektrischen Impuls.	1) Siehe Punkt „A”.
	4) Es kommt keine Druckluft an.	2) Klopfmasse ersetzen.
	5) Spule defekt.	5) Spule ersetzen.
	6) Vorsteuerung innerhalb des Rohrs blockiert (Pos. 24 Ersatzteilliste).	6a) Rohr ersetzen.
(D) Dichtringe beschädigt.	1) Raumtemperatur unzulässig (Standardwerte -20° / +80°C)	6b) Etwaigen Schmutz entfernen.
(E) Membran beschädigt (nur PJ - Pos. 30 Eratzteilliste)	1) Produkttemperatur sehr hoch (> 80°C)	1) Dichtungssatz ersetzen.
	2) Produkt mit unverträglichen Eigenschaften: - hoher Säuregrad - hohe Klebrigkeit	1) Membran ersetzen.

PROBLEME	CAUSE PROBABLE	REMÈDE
Rupture membrane (Pos. 25 liste pièces détachées) **A**	1) Pression de service et de ligne élevée > 6 bars.	1) Remplacer la membrane. 2) Régler l'étalonnage de la pression.
Effet percussion et fluidification réduite **B**	1) Pression de service trop bas.	1) Etalonnage l'installation > 2 bars jusqu'à obtenir l'efficacité voulue.
	2) Le réservoir ne se charge pas complètement entre une impulsion et l'autre.	2a) Augmenter l'intervalle entre les impulsions. 2b) Augmenter l'alimentation de l'air. 2c) Vérifier qu'il n'y ait pas de bridages le long de la connexion pneumatique.
	3) Présence d'une autre utilisation reliée en parallèle.	3) Monter la vanne unidirectionnelle en entrée du percuteur.
	4) Rupteur ressort de retour.	4) Remplacer le ressort
Aucun effet **C**	1) Rupture membrane (Pos. 25 liste pièces détachées)	1) Voir point "A".
	2) Blocage masse percutante.	2) Remplacer la masse percutante.
	3) L'impulsion électrique n'arrive pas à la bobine.	
	4) L'air comprimé n'arrive pas.	
	5) Bobine épuisée.	5) Remplacer les bobines.
	6) Blocage du pilote à l'intérieur du fourreau (Pos. 24 liste pièces détachées).	6a) Remplacer le fourreau. 6b) Nettoyer de toute impureté.
Anneaux d'étanchéité endommagés. **D**	1) Température ambiante non autorisée (Standar -20 +80°C)	1) Remplacer le kit des joints.
Membrane endommagée (seulement PJ - réf. 30 liste pièces détachées) **E**	1) Température produit élevée (> 80°C)	1) Remplacer la membrane.
	2) Produit avec caractéristiques incompatibles: - acidité élevée - caractéristiques d'adhérence élevées	2) Consulter notre Bureau Technique.

PROBLEMA	POSSIBILE MOTIVO	SOLUZIONE
Rottura membrana (Pos. 25 lista ricambi). **A**	1) Pressione esercizio e di linea elevata > 6 bar.	1) Sostituire la membrana. 2) Regolare taratura pressione.
Effetto percussione e fluidificazione ridotto. **B**	1) Pressione esercizio troppo bassa.	1) Tarare impianto > 2 bar fino ad ottenere l'efficacia voluta.
	2) Il serbatoio non si carica completamente fra un impulso e l'altro.	2a) Aumentare l'intervallo fra gli impulsi. 2b) Potenziare l'alimentazione dell'aria. 2c) Verificare che non ci siano strozzature lungo il collegamento pneumatico.
	3) Presenza di un'altro utilizzo collegato in parallelo.	3) Montare valvola unidirezionale in ingresso al percussore.
	4) Rottura molla di ritorno.	4) Sostituire molla
Nessun effetto. **C**	1) Rottura membrana (Pos. 25 lista ricambi).	1) Vedi punto "A".
	2) Blocco massa battente.	2) Sostituire massa battente.
	3) Non arriva l'impulso elettrico alla bobina.	
	4) Non arriva aria compressa.	
	5) Bobina esausta.	5) Sostituire bobina.
	6) Blocco del pilota all'interno del canotto (Pos. 24 lista ricambi).	6a) Sostituire canotto. 6b) Pulire da eventuale presenza di impurità.
Anelli di tenuta danneggiati. **D**	1) Temperatura ambiente non consentita (standard -20 +80° C)	1) Sostituire kit guarnizioni.
Membrana danneggiata. **(solo PJ - rif. 30 lista ricambi)** **E**	1) Temperatura prodotto elevata (> 80° C)	1) Sostituire membrana
	2) Prodotto con caratteristiche incompatibili: - elevata acidità - elevate caratteristiche di adesione	2) Consultare il ns. Uff. Tecnico

SCRAPPING THE COMPONENT

- Before proceeding with scrapping of the percussion gun, clean it thoroughly and dispose off the residual powder in accordance with the indications in the safety sheet.
- The operators responsible for disposal must use suitable personal protection devices.
- In case of scrapping or demolition at the end of life of the component, remove the plastic parts (gaskets and components) and send these to the special collection centres.
- The remaining parts must be sent to the scrap yards.
- For scrapping of the component, observe the lifting procedure indicated in the special sheet supplied.

VERSCHROTTUNG DES BAUTEILS

- Bevor man den pneumatischen Klopfer verschrottet, muss er vollständig gereinigt werden, um auch den restlichen Staub, der in ihm enthalten ist, gemäß den Angaben des Sicherheits-Datenblatts zu entsorgen.
- Das Personal, das sich mit der Entsorgung befasst ist, muss geeignete persönliche Schutzausrüstung benutzen.
- Bei der etwaigen Verschrottung oder Demolierung des Bauteils ist darauf zu achten, dass die Kunststoffteile (Dichtungen und Bestandteile) ausgebaut und den entsprechenden Sammelstellen zugeleitet werden.
- Die restlichen Teile sind als Alteisen für die Rückgewinnung des Materials bestimmt.
- Während der Verschrottung des Bauteils sind die Verfahren zum Handling zu beachten, so wie sie auf dem entsprechenden Blatt angegeben sind.

DEMANTELEMENT COMPOSANT

- Avant de procéder au démantèlement du percuteur pneumatique, le nettoyer complètement et éliminer tous les résidus de poussière conformément aux indications de la fiche de sécurité.
- Les opérateurs préposés au démantèlement doivent porter des équipements de protection individuelle appropriés.
- En cas de mise à la décharge ou de démantèlement en fin de vie du composant, ne pas oublier de démonter les parties en matière plastique (joints et composants) et de les destiner aux centres de tri spécialisés.
- Les autres parties sont à destiner à la récupération des matières ferreuses.
- Pendant les phases de démantèlement du composant respecter les procédures de levage comme indiqué dans la feuille spécifique.

ROTTAMAZIONE COMPONENTE

- Prima di procedere alla rottamazione del percussore pneumatico provvedere alla sua completa pulizia ed allo smaltimento delle polveri residue in accordo con le indicazioni della scheda di sicurezza.
- Gli operatori addetti allo smaltimento devono indossare dispositivi di protezione personale adeguati.
- In caso di rottamazione o demolizione a fine vita del componente, avere cura di smontare le parti in materiale plastico (guarnizioni e componenti) e destinarle agli appositi centri di raccolta.
- Le restanti parti sono da destinare al recupero dei materiali ferrosi.
- Durante le fasi di smantellamento del componente osservare le procedure di sollevamento come indicato nel foglio specifico.

RETURNING THE COMPONENT

- To return the component, replace it in the original packaging if available, or pack it in a box and cover it with heat-shrink nylon to protect it as far as possible from impact during transport.
- In any case, make sure the component does not contain material residue.

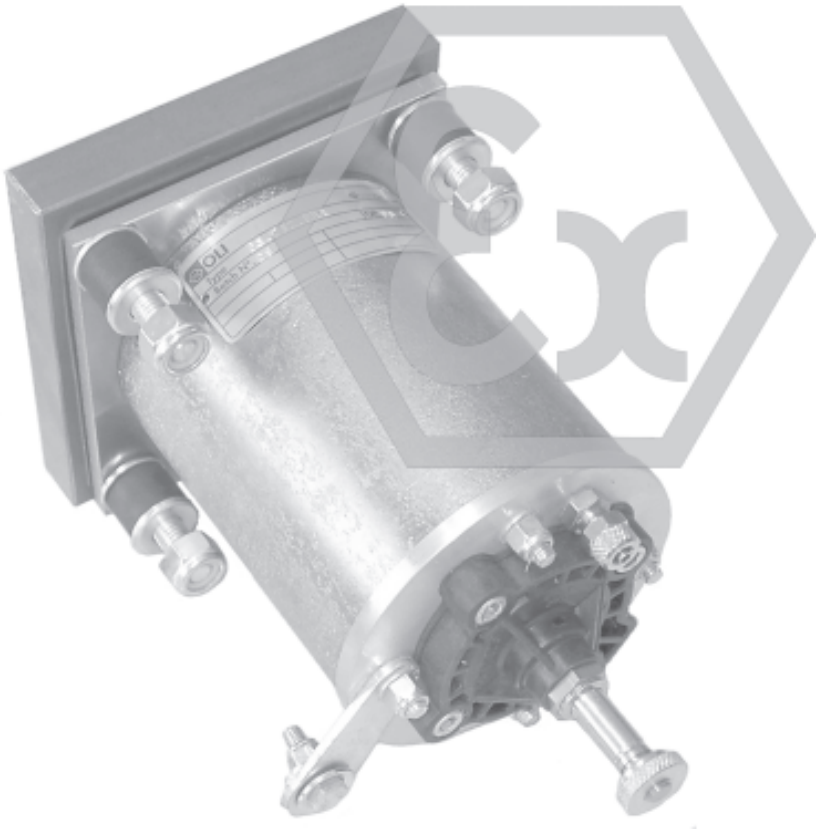
RÜCKGABE DES BAUTEILS

- Bei einer etwaigen Rückgabe des Bauteils, ist die Originalverpackung zu verwenden, sofern sie noch vorhanden ist. Ansonsten ist das Bauteil in einen Karton zu packen und dieser mit Schrumpffolie zu verschließen, wobei man versucht, das Teil so gut wie möglich vor Stößen während des Transports zu schützen.
- Auf jeden Fall sicherstellen, dass keine Materialreste mehr im Bauteil vorhanden sind.

RESTITUTION DU COMPOSANT

- En cas de restitution du composant, si on a conservé l'emballage, le remettre dans celui-ci, sinon le mettre dans une caisse et le recouvrir avec du nylon thermorétractable, en essayant de le protéger contre les chocs pendant le transport.
- Dans tous les cas s'assurer que le composant ne contient pas de résidus de matière.

RESO COMPONENTE



- In caso di reso del componente, se si è conservato l'imballo, reinserirla nello stesso, altrimenti inserirla in una scatola e ricoprirla con del nylon termoretraibile, cercando di proteggerla al meglio da eventuali urti derivanti dal trasporto.
- In ogni caso assicurarsi che il componente non abbia residui di materiale.

LOADCELL

# Sinox:	50192
Manufacturer :	AMCELLS
Model :	Compression
Capacity :	15 000lbs
Quantity per scale hopper:	4x

SSB Series
• Single-Ended Shear Beam • Alloy Steel
• NTEP Approved (C of C# 97-163)
Ordering Code : SSB – (capacity)
* Specifications subject to change without notice.

Capacities 100, 250, 500, 1K, 2K, 2.5K, 3K, 4K, 5Kse,
5K, 10K, 15K, 20K lb
Rated Output (R.O.) 3.0 MV/V ± 1%
CABLE LENGTH : 20 feet

CAPACITY (lb)	A	B	C	D	E	F	G
100 — 5Kse	5.12	1.25	0.62	1.00	3.00	0.53	1/2—20

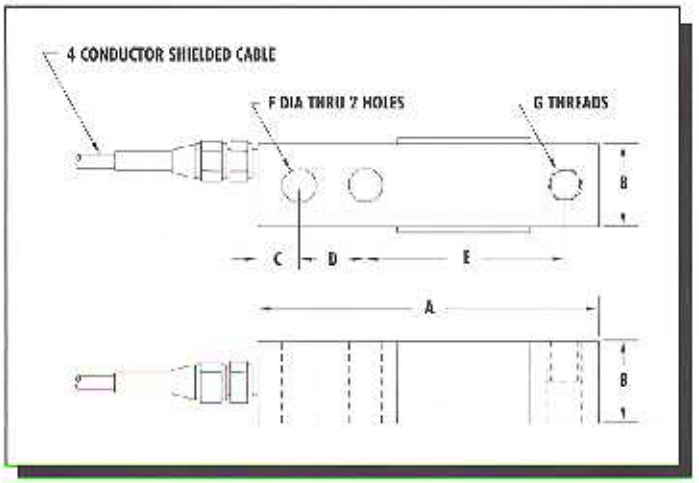
SSB Series

- Single-Ended Shear Beam
- Alloy Steel
- NTEP Approved [C of C #97-163]



Ordering Code: SSB-(capacity)

* Specifications subject to change without notice.

SPECIFICATIONS:

Capacities:	100, 250, 500, 1K, 2K, 2.5K, 3K, 4K, 5Ksc, 5K, 10K, 15K, 20K Lb
Rated Output (R.O.):	3.0 MV/V ± 1%
Zero Balance:	± 2% of R.O.
Non-Linearity:	0.02% of R.O.
Hysteresis:	0.02% of R.O
Non-Repeatability:	0.02% of R.O
Creep (1 Hour):	0.05% of Load
Insulation:	> 5,000M Ohm
Input Impedance:	385 ± 30 Ohm
Output Impedance:	350 ± 4 Ohm
Safe Overload:	150% F.S.
Ultimate Overload:	300% F.S.
Compensated Temperature Range:	-10°C to 40°C
Operating Temperature Range:	-40°C to 80°C
Temperature Effect on Output:	20 ppm/°C of Load
Temperature Effect on Zero:	20 ppm/°C of R.O.
Recommended Excitation:	10V DC/AC
Maximum Excitation:	20V DC/AC

Capacity (lb)	A	B	C	D	E	F	G
100 - 5Kse	5.12	1.25	0.62	1.00	3.00	0.53	1/2-20

Color Code: Red + Excitation, Green + Signal, Black - Excitation, White - Signal
Cable Length: 20 ft.

NATIONAL CONFERENCE ON WEIGHTS AND MEASURES NTEP

VIBRATOR & IMPACTOR PRESSURE REGULATOR

# Sinox:	PNE-00112
Manufacturer:	FESTO FESTO, 529419, REGULATEUR MS4-LR-1/4-D7-AS
Pneumatic connexion:	1/4 NPT
Operating range:	0-150PSI
Quantity per receiver:	1x

Pressure Regulators MS4N-LR/LRB – Inch Series

The pressure regulator maintains a constant working pressure (secondary side), regardless of the pressure variations in the system (primary side) and the air consumption.

- Pressure regulators
  – MS4-LR
  – MS4-LRB, manifold units
- Pneumatic connection: ⅛ NPT, ¼ NPT, ⅜ NPT
- Supply pressure: 12 … 206 psi
- Controlled pressure range: 4.4 … 176 psi
- Flow rate: 10.6 … 74.1 scfm

Product Range Overview

Pressure Regulators MS4N-LR – Inch Series

Technical Data

ISO Symbol

- Good control characteristics with low hysteresis and primary pressure compensation
- High flow rate with minimal pressure drop
- Available with or without secondary venting
- Setting values are secured by locking the rotary knob
- Lockable rotary knob
- Three pressure regulation ranges
- Two pressure gauge connections for different fitting options
- Reverse flow option for exhausting from output 2 to output 1
- Optional pressure sensor with display
- Optional rotary knob pressure gauge

General Technical Data				
Pneumatic connection 1, 2			1/8 NPT	1/4 NPT
Supply pressure		[psi]	12 ... 206	
Pressure regulation range	D5	[psi]	4.4 ... 59	
	D6	[psi]	4.4 ... 103	
	D7	[psi]	7.4 ... 176 (7.4 ... 147 with variant pressure sensor AD...)	
Max. hysteresis		[psi]	3.7	

Standard Nominal Flow Rate qnN[1] [scfm]			
Pneumatic connection 1, 2		1/8 NPT	1/4 NPT
Pressure regulation range	D5	42.4[2]	74.1[2]
	D6	40.6	63.5
	D7	35.3	60.0

1) Measured at p1 = 147 psi and p2 = 88 psi, Δp = 15 psi
2) Measured at p1 = 147 psi and p2 = 44 psi, Δp = 15 psi

Operating and Environmental Conditions			
Variant		Standard	Pressure sensor with display AD...
Operating medium		Compressed air	Filtered compressed air, lubricated or unlubricated, filtration grade 40 µm
Ambient temperature	[°F]	14 ... 140	32 ... 122
Temperature of medium	[°F]	14 ... 140	32 ... 122
Storage temperature	[°F]	14 ... 140	14 ... 140
Assembly position		Any	
Corrosion resistance	CRC[1]	2	

1) Corrosion resistance class 2 according to Festo standard 940 070
Components requiring moderate corrosion resistance. Externally visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment or media such as coolants or lubricating agents.

Pressure Regulators MS4N-LRB – Inch Series

Technical Data

ISO Symbol

LRB-manifold
with through pressure supply for manifold assembly

- This pressure regulator is suitable for manifold assemblies with through air supply on both sides. Pressure output is at the front or rear.
- For configuring a regulator manifold with independent pressure regulation ranges
- Good control characteristics with low hysteresis and primary pressure compensation
- Available with or without secondary venting
- Setting values are secured by locking the rotary knob
- Lockable rotary knob
- Four pressure regulation ranges
- Reverse flow option for exhausting from output 2 to output 1
- Optional pressure sensor with display

General Technical Data			
Size			MS4
Pneumatic connection 1			¼ NPT
Pneumatic connection 2			¼ NPT
			QS-¼-U push-in tubing connector
			QS-5/16-U push-in tubing connector
Supply pressure		[psi]	12 ... 206
Pressure regulation range	D5	[psi]	4.4 ... 59
	D6	[psi]	4.4 ... 103
	D7	[psi]	7.4 ... 176 (7.4 ... 147 with variant pressure sensor AD...)
Max. hysteresis		[psi]	3.7

Standard Nominal Flow Rate qnN[1] [scfm]				
Variant		Standard	Angled outlet block	
			QS-¼-U	QS-5/16-U
Pressure regulation range	D5	67.1[2]	10.6[2]	22.9[2]
	D6	60.0	12.4	29.7
	D7	53.0	12.4	22.6

1) Measured at p1 = 147 psi and p2 = 88 psi, □p = 15 psi
2) Measured at p1 = 147 psi and p2 = 44 psi, □p = 15 psi

1.1. GENERAL NOTES

- The system was designed based on the information and instructions provided by our client. However, the customer has the responsibility to ensure that the system provided will suit the application for which it is intended.
- The customer must ensure that the system provided meets all standards and not compromise the health or safety of staff working with or near the equipment.
- The customer must ensure that air emissions from the system conform to standards and is responsible for obtaining the necessary permit application if necessary.
- The customer is responsible for ensuring that all persons who will work with or around equipment are properly trained and familiar with potential hazards.
- The customer is also responsible for verifying approval by the insurer.
- Even when the system is installed by Sinox, the customer is responsible for cleaning all components and be sure to flush and clean the system to eliminate any possibility of contaminant entry in the final product.
- The customer is also responsible for maintaining the system provided to ensure optimal performances at all time.
- The customer cannot make any modifications of any kind without the expressed approval from Sinox. The End user will be responsible for making minor adjustments and modifications even when they are approved by Sinox.
- The customer is responsible to make sure that the equipment is no longer energized and that proper Lock-out, Tag-out, Try-out (LOTOTO) procedures are duly respected when maintaining / repairing the equipment supplied by Sinox.

1.2.VERIFICATION BEFORE START UP

- Check that the power & voltages are correct for the equipment.
- Ensure that the compressed air line is free of dirt, water or clogged before and during connection/operation.
- Drain the water supply line for a while and check that it is free of dirt or trapped air.
- Check all openings, man holes, doors, etc. to be sure these are not open and that the switches if present are making proper contact.
- Verify that all temporary supports or braces have been removed.
- Verify that the dust collector filtration devices are in place.
- Verify that the air outlet of the receiver isn't plugged or obstructed.
- Simulate all systems conditions and verify if all sequences are as expected including all alarm conditions.
- Get familiar with all aspects of the controls before introducing product into the system.

1.3.TROUBLESHOOTING

REDUCED CONVEYING RATE

• Check the adjustment of dosing equipment Ex: rotary valves or auger speed.

• Check the fit collars suction probes when applicable.

• Check if there are sliding belts on the blower.

• Check the power supply of the blower

• Check adjustments of pressure sensors and reaction along with position of all the different valves and check for possible internal leakage valves

• Check for leaks in the piping or doors and access doors

• Make sure the vent lines of rotary valves are not blocked

• Check if the product remains stuck inside the pocket of rotary valves reducing their effectiveness

• Check if the product is unusually wet, or if the security filters are clogged.

LOW DURATION LIFE FILTERS

• Check if the compressed air used for cleaning pulse is dry. Moisture causes damage and reduces the life of the filter

• Make sure there are no oil in the compressed air

• Check the air supply is sufficient. The pressure should be at least 80 psi

• Make sure not to fill the hopper above the filter level. This has the effect of reducing the cleaning efficiency and the lifetime of the filters. Adjust the fill time if required

• Check whether all pulse valves are functioning normally.

• Check the cleaning cycle

• Make sure the receiver is used for the purpose for which it was designed.

POOR FILTRATION

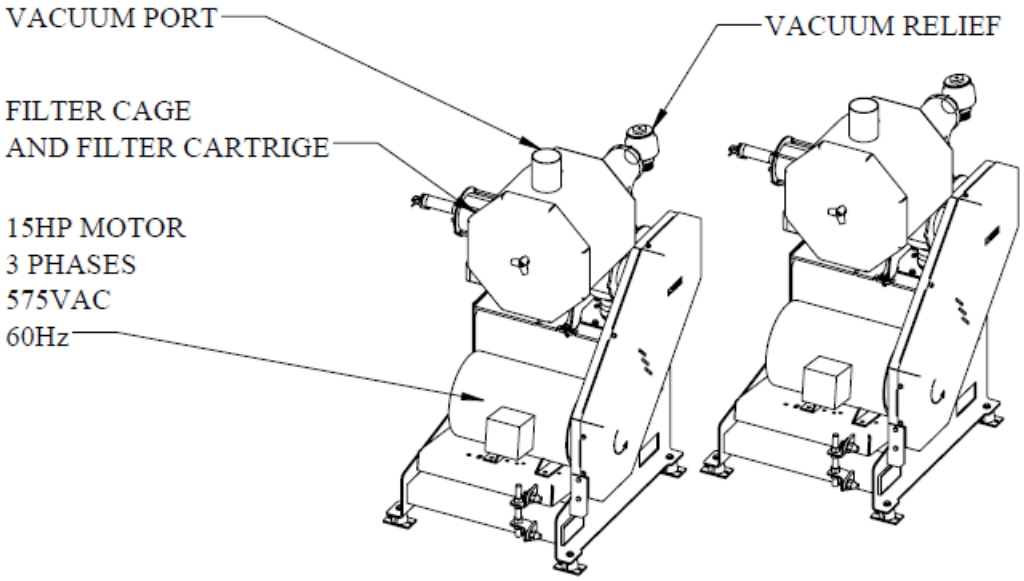
• Check the filters are not breakthroughs, damaged or clogged and replace them if required

• Check if there are leaks in the seal under the flange of the filter. Verification is done by inspecting the clean side.

INOPERATIVE SOLENOID VALVE

• To check if the solenoid valve is working, you should hear a click when activated and should hear air escaping it.

• If no click is heard, remove the valve and clean moving parts. If the heart is damaged or does not move freely, it must be replaced. Spare parts kits are available



• If there is no air flow, check if the power goes well (24Volts). If there is current, check the voltage across the solenoid. If the voltage rises to its maximum during normal operation cycle is that it is damaged. You must change the valve.

2. BLOWER PACKAGE DETAIL

2.1. BLOWER PACKAGE J-49730

Design : Vacuum
Flow : 227 CFM at 8.68" Hg
Vacuum inlet connection : 4'' OD
Exhaust air outlet : 4'' FNPT
Power/Voltage : 15 HP, 460VAC,3 phases, 60 Hz
Motor speed : 1750 RPM
Blower model : Competitor 4005 - 2 lobes
Blower set speed : 3182 RPM
Relief valve model : Kunkle
Relief valve set point : 15''Hg max
Motor pulley : 2B80
Blower pulley : 2B42
Belts : BX61
Filter cartridge : Sinox # 3028

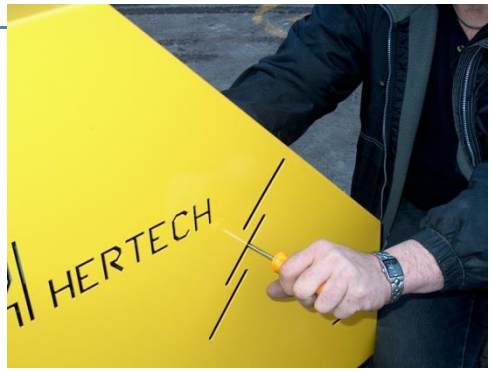
VACUUM PORT
VACUUM RELIEF
FILTER CAGE
AND FILTER CARTRIGE
15HP MOTOR
3 PHASES
575VAC
60Hz

2.3.OPERATION AND MAINTENANCE



Refer to manufacturers' manuals included in Section **Technical data** of this document for specific operation instruction and maintenance of each component.

Tension adjustment system

NOTE: Make sure that power is OFF before performing belt adjustment or verification.

Belts can be easily adjusted by turning a simple nut.
NOTE: Over tightening belts could damage blower shaft or bearings.

The slotted holes in the guards permit an easy and fast verification of the belt tensioning.
Refer to the belt supplier recommendations for more precise adjustment.

Lubrification and Maintenance

Refer to blower manual enclos

INTRODUCTION

CONGRATULATIONS on the purchase of a new **CP Series Rotary Positive Displacement Blower** from Tuthill Vacuum & Blower Systems. Please examine the blower for shipping damage, and if any damage is found, report it immediately to the carrier. If the blower is to be installed at a later date, make sure it is stored in a clean, dry location and rotated regularly. Make sure covers are kept on all openings. If the blower is stored outdoors, be sure to protect it from weather and corrosion.

CP Series blowers are built to exacting standards and, if properly installed and maintained, will provide many years of reliable service. Read and follow every step of these instructions when installing and maintaining the blower.

NOTE: Record the blower model and serial numbers of the machine in the OPERATING DATA form on the inside back cover of this manual. Use this identification on any replacement part orders, or if service or application assistance is required.

APPLICABLE DOCUMENTATION

The applicable documents associated with this manual are:

- 2006/42/CE – Machinery Directive
- EN 1012-1:1996 - Compressors and vacuum pumps - Safety Requirements - Part 1: Compressors

SCOPE OF MANUAL

The scope of this manual and the Declaration of Incorporation includes the bare shaft rotary positive displacement blower.

02

CONVENTIONS AND DATA PLATE

GRAPHIC CONVENTIONS IN THIS MANUAL

This manual is the result of a risk assessment according to the applicable documents referenced in ***Applicable Documentation on page 1***. The following hazard levels are referenced within this manual:

⚠ DANGER

Indicates a hazardous situation that, if not avoided, will result in death or serious injury.

⚠ WARNING

Indicates a hazardous situation that, if not avoided, could result in death or serious injury.

⚠ CAUTION

Indicates a hazardous situation that, if not avoided, could result in minor or moderate injury.

NOTICE

Indicates a situation that can cause damage to the engine, personal property, and/or the environment or cause the equipment to operate improperly.

NOTE: Indicates a procedure, practice, or condition that should be followed in order for the equipment to function in the manner intended.

⚠ CAUTION

Read manual before operation or bodily harm may result. Attention should be given to the safety related sections of this manual.

Figure 2-1 – General Operation and Symbols on Data Plate

The following information is contained on the data plate:

⚠ WARNING

Keep body and clothing away from machine.

During operation, keep body and clothing away from inlet and outlet of the blower.

⚠ WARNING

Do not operate without guards in place.

⚠ CAUTION

Hearing protection is required while the blower is in operation. Noise levels may reach as high as 81 dBA.

⚠ CAUTION

Do not touch hot surfaces.

The upper limit of the blower operation is 400°F (205°C). Do not touch the blower while it is in operation and assure blower is cool when not in operation.

MODEL NUMBER:	The specific model of the blower
SERIAL NUMBER:	Unique to each blower
YEAR:	Year of manufacture
MAWP:	Maximum Allowable Working Pressure The standard MAWP is per ***Table 4-2 – Maximum Operating Limits on page 9***. The MAWP shall not be exceeded.

03

LIFTING

⚠ WARNING

The blower must be handled using an appropriate device such as a fork truck or appropriate lifting device. *See Table 4-1 on page 8* for approximate weights. Care should be taken to assure blower does not over-turn during handling and installation.

04

DESCRIPTION

NOTICE

Refer to specific data sheets for flow capacities and vacuum capacities.

NOTE: Refer to diagrams in this manual for proper rotation and orientation in inlet and discharge.

Tuthill Vacuum & Blower Systems CP Series model rotary lobe blowers are positive displacement type units, whose pumping capacity is determined by size, operating speed, and differential pressure conditions. Blowers employ rotors rotating in opposite directions within a housing closed at the ends by end plates.

The inlet to the discharge is sealed with operating clearances that are very small. Internal lubrication is not needed, as there is no moving contact.

Clearances between the rotors during rotation are maintained by a pair of accurately machined helical timing gears, mounted on the two shafts extended outside the air chamber. The intermeshing rotary lobes are designed to rotate and trap air or gas between each rotor and the housing. As the rotor lobes rotate past the edge of the suction port, the trapped air or gas is essentially at suction pressure and temperature. Since the blower is a constant volume device, the trapped air remains at suction pressure until the leading rotor lobe opens into the discharge port. The close clearances between the rotors inhibit back slippage of the trapped volume from between the rotors, and the trapped volume is forced into the discharge piping. Compression occurs not internal to the blower but by the amount of restriction, either downstream of the blower discharge port or upstream of the blower inlet port.

Figure 4-1 illustrates the air movement within the machine. In addition, the machine can operate in either direction.

Never attempt to control capacity by means of a throttle valve in the intake or discharge piping. This will increase the power load on the drive system, will increase operating temperatures, and can overload and/or seriously damage the blower. Likewise, if the possibility exists that flow to the blower inlet may be cut off during normal operation of a process, install an adequate vacuum relief valve. A pressure-type relief valve in the discharge line near the blower is also recommended for protection against cutoff or blocking in this line. Use check valves on each blower when more than one blower is connected to a discharge line.

When a belt drive is used, it is possible to adjust blower speed to obtain the desired capacity by changing the diameter of one or both sheaves, or by using a variable-speed motor pulley. In a direct-coupled arrangement, a variable-speed motor or transmission is required. Gas blowers can use bypasses, but some applications may require additional cooling. If there is a large volume of high-pressure air or gas downstream of the blower, a check valve in the piping downstream of the blower will protect the blower from overspeeding in a backward direction upon shutdown.

Consult a Tuthill Vacuum & Blower Systems sales professional if questions arise.

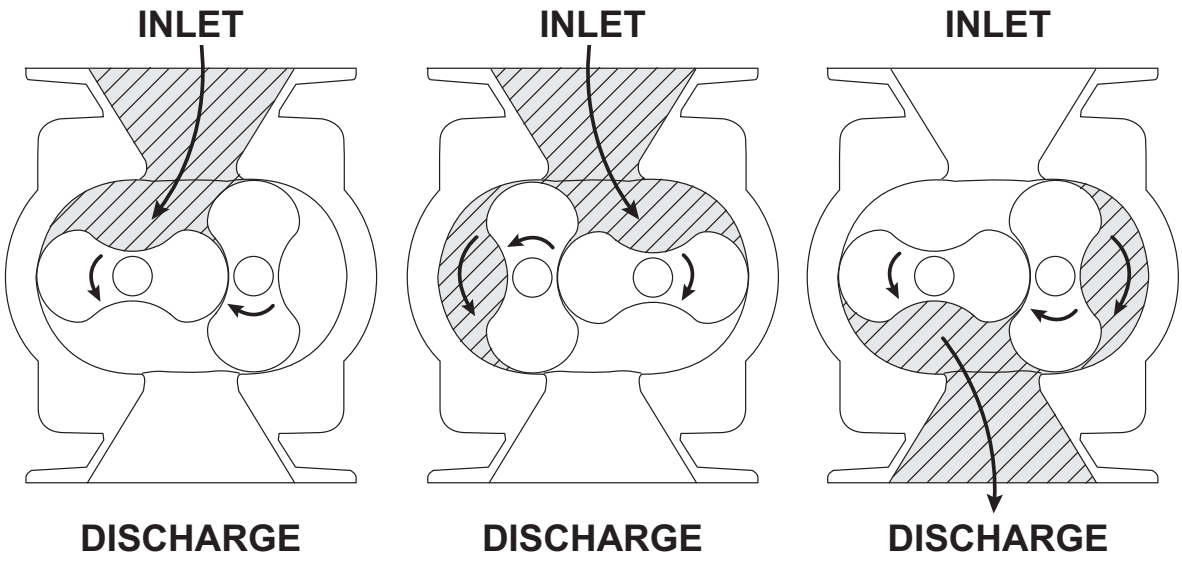

Figure 4-1 – General Operation Principle

FLOW BY DIRECTION AND ROTATION

⚠ WARNING

Refer to diagrams in this manual for proper rotation and orientation in inlet and discharge.

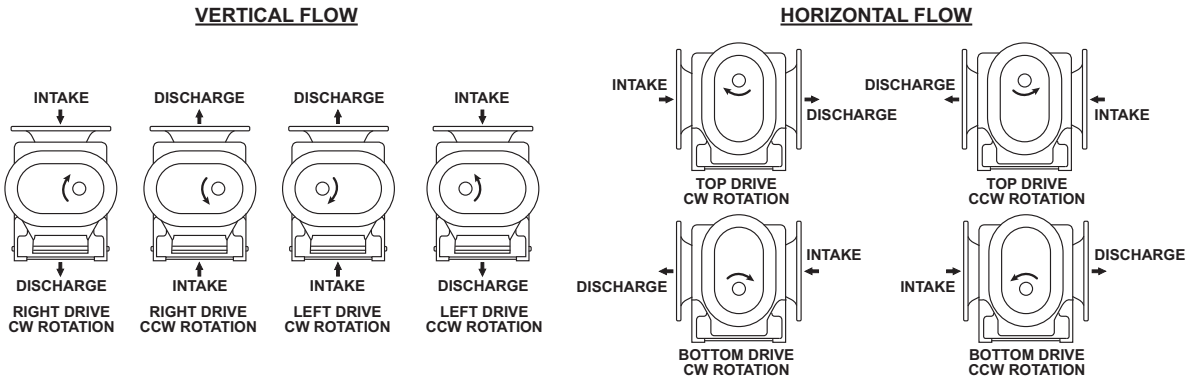

Figure 4-2 – Flow Direction by Rotation

SPECIFICATIONS

MODEL	APPROXIMATE OIL CAPACITY[1]				PORT SIZE	MAXIMUM RPM	APPROXIMATE WEIGHT
	VERTICAL FLOW		HORIZONTAL FLOW

5003	18.3 oz (541 mL)	10.2 oz (302 mL)	7.1 oz (210 mL)	5.4 oz (160 mL)	2.5 in. (64 mm)	2,850	152 lb (69 kg)
5006	18.3 oz (541 mL)	10.2 oz (302 mL)	7.1 oz (210 mL)	5.4 oz (160 mL)	4 in. (102 mm)	2,850	185 lb (84 kg)
5009	18.3 oz (541 mL)	10.2 oz (302 mL)	7.1 oz (210 mL)	5.4 oz (160 mL)	4 in. (102 mm)	2,850	222 lb (101 kg)
6005	25.5 oz (754 mL)	18.0 oz (532 mL)	16.9 oz (500 mL)	9.0 oz (266 mL)	3 in. (76 mm)	2,350	250 lb (113 kg)
6008	25.5 oz (754 mL)	18.0 oz (532 mL)	16.9 oz (500 mL)	9.0 oz (266 mL)	5 in. (127 mm)	2,350	310 lb (141 kg)
6015	25.5 oz (754 mL)	18.0 oz (532 mL)	16.9 oz (500 mL)	9.0 oz (266 mL)	6 in. (152 mm)	2,350	456 lb (207 kg)
7006	28.7 oz (849 mL)	–	20.3 oz (600 mL)	–	4 in. (102 mm)	2,050	425 lb (193 kg)
7011	28.7 oz (849 mL)	–	20.3 oz (600 mL)	–	6 in. (152 mm)	2,050	555 lb (252 kg)
7018	28.7 oz (849 mL)	–	20.3 oz (600 mL)	–	8 in. (152 mm)	2,050	675 lb (306 kg)

[1] Oil capacities are based on filling from dry condition. Less oil may be needed depending on emptiness of oil reservoir(s) after draining. Always fill the gear housing until oil drips out of the oil level hole. Replace plugs in their respective holes. Following this procedure will ensure proper oil level.
[2] Gear End amounts apply to all CP Series blowers.
[3] Drive End amounts apply only to Splash Lubrication models.

Table 4-1 – Specifications

MODEL	MAXIMUM RPM	MAXIMUM PRESSURE DIFFERENTIAL*	MAXIMUM VACUUM*	MAXIMUM TEMPERATURE RISE*	MAWP
2002	5,275	12 psi (827 mbar)	16 inch-Hg (542 mbar)	225°F (125°C)	15 psi (1,034 bar)
2004	5,275	7 psi (483 mbar)	16 inch-Hg (542 mbar)	185°F (103°C)	15 psi (1,034 bar)
3002	3,600	15 psi (1,034 mbar)	16 inch-Hg (542 mbar)	210°F (117°C)	15 psi (1,034 bar)
3003	3,600	12 psi (827 mbar)	15 inch-Hg (508 mbar)	180°F (100°C)	15 psi (1,034 bar)
3006	3,600	7 psi (483 mbar)	15 inch-Hg (508 mbar)	170°F (94°C)	15 psi (1,034 bar)
4002	3,600	15 psi (1,034 mbar)	16 inch-Hg (542 mbar)	220°F (122°C)	17 psi (1,172 bar)
4005	3,600	10 psi (690 mbar)	16 inch-Hg (542 mbar)	210°F (117°C)	15 psi (1,034 bar)
4007	3,600	7 psi (483 mbar)	15 inch-Hg (508 mbar)	170°F (94°C)	15 psi (1,034 bar)
5003	2,850	15 psi (1,034 mbar)	16 inch-Hg (542 mbar)	195°F (108°C)	17 psi (1,172 bar)
5006	2,850	15 psi (1,034 mbar)	16 inch-Hg (542 mbar)	195°F (108°C)	15 psi (1,034 bar)
5009	2,850	7 psi (483 mbar)	15 inch-Hg (508 mbar)	160°F (89°C)	15 psi (1,034 bar)
6005	2,350	18 psi (1,241 mbar)	16 inch-Hg (542 mbar)	250°F (139°C)	18 psi (1,241 bar)
6008	2,350	14 psi (965 mbar)	16 inch-Hg (542 mbar)	240°F (133°C)	15 psi (1,034 bar)
6015	2,350	7 psi (483 mbar)	12 inch-Hg (406 mbar)	180°F (100°C)	15 psi (1,034 bar)
7006	2,050	15 psi (1,034 mbar)	16 inch-Hg (542 mbar)	235°F (131°C)	17 psi (1,172 bar)
7011	2,050	10 psi (690 mbar)	16 inch-Hg (542 mbar)	210°F (117°C)	15 psi (1,034 bar)
7018	2,050	6 psi (414 mbar)	12 inch-Hg (406 mbar)	120°F (67°C)	15 psi (1,034 bar)

* Maximum conditions based upon 70°F (21°C) inlet temperature and 14.7 psi (1 bar) absolute inlet pressure.

Table 4-2 – Maximum Operating Limits

⚠ WARNING

The maximum pressure differential is based on the difference between the inlet pressure and the outlet pressure. The maximum pressure differential shall not be exceeded. Exceeding the maximum pressure differential will cause serious damage to the equipment and could cause bodily injury.

⚠ WARNING

The maximum allowable working pressure (MAWP) is based on the absolute pressure of the blower housing and is NOT the maximum allowable pressure differential. Exceeding the MAWP will cause serious damage to the equipment and could cause bodily injury.

To permit continued satisfactory performance, a blower must be operated within certain approved limiting conditions. The manufacturer's warranty is, of course, also contingent on such operation.

Maximum limits for pressure, temperature, and speed are specified in ***Table 4-2 on page 9*** for various blower sizes when operated under the standard atmospheric conditions. Do not exceed any of these limits.

NOTICE

*Specially ordered blowers with nonstandard construction, or with rotor end clearances greater than shown in **Assembly Clearances on page 40**, will not have the operating limits specified here. Contact your Tuthill Vacuum & Blower Systems sales representative for specific information.*

NOTICE

Special attention must be paid when a blower has a higher than standard ambient suction temperature. Special recommendations for operating parameters and/or additional cooling may be recommended. Consult the factory or local representative for appropriate information.

05

INSTALLATION

GENERAL

⚠ DANGER

The blower is not intended to be used with explosive products or in explosive environments. The blower is not intended to be used in applications that include hazardous and toxic gases. Consult the factory for support.

⚠ DANGER

It is the responsibility of the installer to assure that proper guarding is in place and compliant with all applicable regulatory requirements.

⚠ WARNING

The bare shaft blower can generate excessive noise. Methods to reduce the noise levels by installing inlet and outlet silencers will be required. Even with inlet and outlet silencers, hearing protection will be required.

⚠ WARNING

Customers are warned to provide adequate protection, warning and safety equipment necessary to protect personnel against hazards in the installation and operation of this equipment in the system or facility.

⚠ WARNING

The standard MAWP is per *Table 4-2*. The MAWP shall not be exceeded unless specific factory testing of the pressure containing components of the blower has been performed.

⚠ WARNING

***Table 4-2* states the maximum operating speed in RPM (rotations per minute) and maximum temperature. Do not exceed these limits. The installation of the blower shall take these critical operating parameters into account and adequate control features implemented.**

⚠ WARNING

Upon completion of the installation, and before applying power, rotate the drive shaft by hand. It must move freely. If it does not, look for uneven mounting, piping strain, excessive belt tension or coupling misalignment or any other cause of binding. If blower is removed and still does not move freely, check inside the blower housing for foreign material.

NOTICE

Remove the protective covers from the shaft and inspect for damage.

Carefully check to ensure that no transit damage has been sustained. If damage has occurred from shipment, file a claim with the carrier immediately. Preserve the shipping container for inspection by the carrier.

NOTICE

In the event that your unit sustains damage while being shipped to your facility, do not return it to the factory without first obtaining shipping instructions from us.

Do not remove protective covers and plugs until the connections are complete. Mount the blower on a flat, level surface. Use a baseplate that is rigid, solidly supported, and structurally sound. Shim under the legs where necessary so that each leg of the blower supports an equal share of the blower weight. This is necessary to prevent twisting of the blower. Make sure the feet rest evenly on the mounting surface before fastening down. Twisting or cramping the blower during mounting will cause rotor contact and binding during operation, resulting in a condition called “soft foot.” ***See Soft Foot on page 14*** for further details and preventative measures.

A blower that is factory-mounted on a base should not require such adjustments. However, since the assembly can become twisted in shipping or installation, check for soft foot after installing the base. Shims may be needed for alignment. Loosen the foot hold-down screws to check foot contact with the mounting surface. Mount the base on a solid foundation or heavy flooring, using shims as necessary at bolting points to prevent warping the assembly.

Transmission of small operating vibrations to a support structure may be objectionable in some applications. Use of vibration isolators or vibration-absorbing materials can be effective in overcoming this transmission. To avoid causing distortion, apply the treatment under the common motor/blower base or mounting plate rather than directly under the feet alone.

Make sure piping is accurately squared with the blower and supported independently. Stress imparted from incorrectly aligned piping or mounting will create problems with bearing and seal life, possibly leading to premature internal contact. The blower should sit stress free and evenly on its supporting surface. Take care to evenly tighten the mounting bolts to avoid imparting undue stress into the blower. Stress can be checked in a free state with feeler stock or verified on a previously installed blower with the aid of a dial indicator. Spring or gap should be less than 0.002 in. (0.05 mm).

Use only clean, new pipe and make certain it is free of scale, cuttings, weld beads, dirt, or any other foreign material. To guard against damage to the blower, make sure that an inlet filter is used. Clean the filter of collected debris after 3 hours of operation and periodically thereafter. ***See Piping Connections on page 18*** for additional details.

Figure 5-1 shows a typical complete installation of the blower and accessories. Note the absence of throttle or shut-off valves in both discharge and intake piping. If it is possible for airflow to be cut off in either line, add a pressure and/or vacuum relief valve. In some installations, it may be desirable to use only an inlet silencer-cleaner supported directly from the blower connection. Keep the weight of accessories and piping to a minimum to prevent blower casing distortion. If the weight exceeds 10% of blower weight, support the components independently of the blower and connect them with a flexible hose or connectors. The approximate weight of the blower is listed in ***Table 4-1 on page 8***.

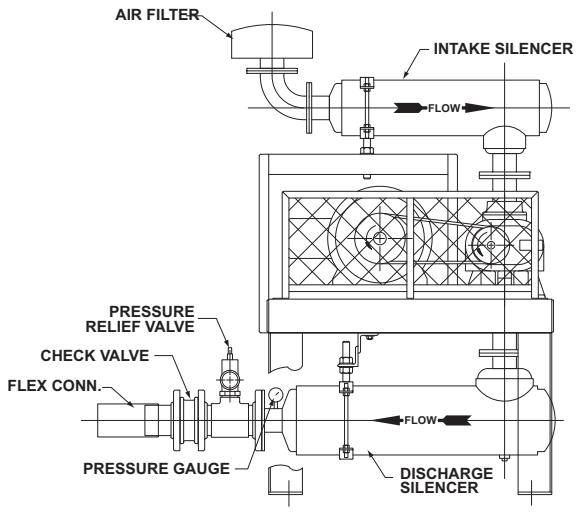

Figure 5-1 – Typical Blower Installation

A blower may be driven by direct-coupling to the driver or by V-belt drive for the purpose of obtaining other speeds within the approved range. ***See Motor Drives on page 19*** for more information.

Blowers from Tuthill Vacuum & Blower Systems are internally and externally treated after factory assembly and testing to protect against rusting in normal atmospheric conditions prior to installation. The maximum period of internal protection is considered to be 6 months under average conditions, provided closing plugs and seals are not removed. Protection against chemical or salt-water atmosphere is not provided. Avoid opening the blower until ready to begin installation, as protection will be quickly lost due to evaporation. For recommended preparations for long-term storage (longer than 6 months), ***see Long-Term Storage on page 29***.

Location

Install the blower in a room or outdoor area that supplies adequate space and lighting for routine maintenance. Make sure that indoor installation areas are well ventilated and kept as cool as possible, because operating the blower at elevated temperatures can result in nuisance overload or temperature shutdowns. An unprotected outdoor installation is satisfactory only when correct lubrication for the expected temperatures is provided, as per ***Recommended Lubricants on page 42***.

Foundation

The blower does not need a special foundation. However, it does require a solid, level floor and adequate frame support. Bolt the blower system to the floor and seal any cracks.

Blower Air Intake

To minimize maintenance, supply the blower with the cleanest air possible. The air must not contain any flammable or toxic gases, as the blower will concentrate these gases. This could result in damage to the blower and surrounding property and lead to personal injury or death. Do not block or restrict the opening of the blower, as the motor could overheat and fail.

Do not use blowers on explosive or hazardous gases. Do not exceed the limits described in ***Table 4-2 on page 9*** on performance criteria such as pressure differential, running speed, and discharge temperature.

If it is necessary to take air from a remote source, such as in a vacuum application, make sure the diameter of the piping is at least equal to the diameter of the blower inlet. For distances greater than 20 ft (6 m), enlarge the pipe diameter to reduce inlet restriction. Excessive restriction will reduce the efficiency of the blower and elevate its discharge temperature. The piping used should also be corrosion-resistant and free of scale and dirt. Keep the inlet covered to keep out foreign objects and rain. Vacuum kits are available.

Soft Foot

Soft foot is a condition in which one of the blower feet does not sit flat on the base. Soft foot is usually due to irregularities in the surface to which the blower is mounted. When the bolt on the foot gets tightened, a slight distortion occurs that can affect bearing and seal life as well as internal contact between parts.

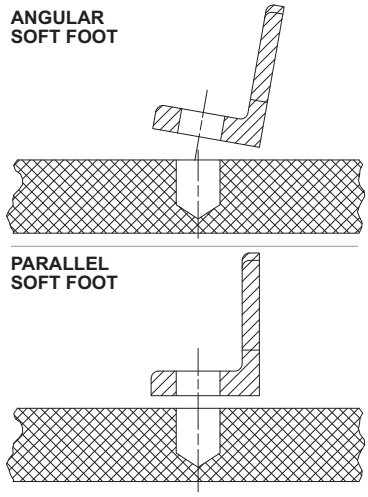

Figure 5-2 – Illustrations of Soft Foot

1. Place the blower on the base.
2. Check each foot for gaps between the foot and base (soft foot). Shim as necessary to fill the gap within 0.002 in. (0.05 mm).
   Figure 5-2 shows the two most common types of soft foot conditions. If either type is present at a measurement of more than 0.003 in. (0.076 mm), the blower may fail prematurely.
3. Tighten all bolts.
4. Mount a dial indicator on the base contacting one foot at 12 o'clock position.
5. Loosen the bolt on that foot. Observe indicator travel and add shims as needed to reduce "spring" to less than 0.002 in. (0.05 mm). Repeat steps 4 and 5 on the remaining feet.

SAFETY

Tuthill Vacuum & Blower Systems recommends the use of relief valves to protect against excessive pressure or vacuum conditions. Test these valves at initial start-up to be sure they are properly adjusted to relieve at or below the maximum pressure differential rating of the blower.

⚠ DANGER

It is the responsibility of the installer to assure that proper guarding is in place and compliant with all applicable regulatory requirements.

⚠ DANGER

Internal and external rotating parts of the blower and driving equipment can produce serious physical injuries. The blower should never be run with the inlet or discharge piping removed. If it becomes necessary to inspect the rotating parts of the blower or to change V-belts, be absolutely sure that all power to the motor controls has been shut off, the motor controls are locked out, and properly tagged before proceeding.

⚠ DANGER

Assure that properly sized vacuum breaks/ relief valves are used on the inlet side of the blower. Also assure that properly sized pressure relief valves are used on the outlet of the blower. The sizing shall be such to assure that the proper flow can be achieved without exceeding the rated vacuum and pressure ratings.

⚠ DANGER

Blower housing and associated piping or accessories may become hot enough to cause major skin burns on contact.

⚠ WARNING

Use lock out/tag out procedures to disable the electrical energy source before any service or work is done on the blower.

⚠ WARNING

Avoid extended exposure in close proximity to machinery with high intensity noise levels. Wear adequate ear protection.

NOTE: Use proper care and good procedures in handling, lifting, installing, operating, and maintaining the equipment.

LUBRICATION

Every blower from Tuthill Vacuum & Blower Systems is factory-tested, oil-drained, and shipped dry to its installation point. Fill both independent oil reservoirs to the proper level before operation.

Shaft bearings at the gear end of the blower are splash-lubricated by one or both gears dipping into an oil reservoir formed in the gear end plate and cover. Shaft bearings at the drive end of the blower are lubricated by a slinger assembly dipping into an oil reservoir. Before starting the blower, fill the oil sumps as described in ***Filling Procedure on page 16***.

Add oil to the blower in the quantity listed in***Table 4-1 on page 8***. Make sure oil level is maintained within the notched area of the sight glass. ***See Figure 5-3***. Lower drive blowers have “bull’s eye” type oil level gauges. Maintain oil levels at the center of the glass.

⚠ WARNING

Never attempt to change or add lubrication while the blower is running. Failure to heed this warning could result in damage to the equipment or personal injury. Oil must be checked when the blower is NOT running.

⚠ WARNING

Properly dispose of the spent lubricants. Refer to the manufacturer of the lubricant and any regulations to assure proper and safe disposal.

⚠ WARNING

Do not start the blower until you are sure oil has been put in the gear housing and rear cover. Operation of the blower without proper lubrication will cause the blower to fail and void the warranty.

NOTICE

*Most CP Series blowers are shipped from the factory in a left hand drive, vertical flow configuration. If drive shaft location is changed, the oil level plugs, sight glasses and breathers must be relocated to proper positions, as shown in **Figure 5-3**. Failure to change plug location will result in blower failure and void the product warranty.*

Filling Procedure

See Figure 5-3. See Recommended Lubricants on page 42 for suggested lubricants and grease.

1. Remove the fill plugs or breathers from both gear end and drive end plates.
2. Slowly pour oil through the fill until oil appears in the oil sight glass. Bring the oil level to the center of the sight glass.
3. Verify oil level is at proper level in both gear end and drive end sight glasses.
4. Replace the fill plugs or breathers that were removed in step 1.

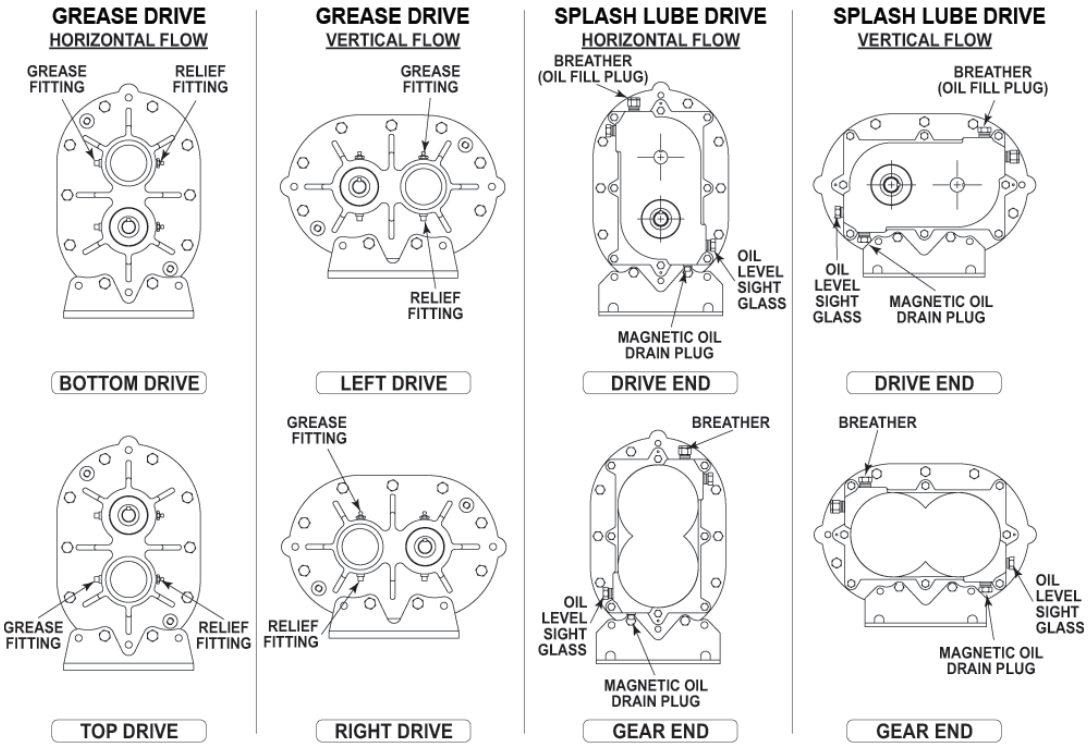

Figure 5-3 – Location of Oil Fill, Drain and Level Gauges on CP Series Blowers

Frequently Asked Questions Regarding Lubrication

What is the functional detriment if the "wrong oil" is used?

The lubricant is selected based on bearing speed, gear speed, and operating temperature. If the lubricant is too light, it increases wear by not separating the sliding surfaces and it will not remove the heat adequately. If the lubricant is too thick, the drag in the bearings is increased, causing them to run hotter. Thicker lubricant will not flow as readily into the gears and it will reduce the available backlash. Lubricants at our conditions are incompressible.

What is the functional detriment if the oil is not serviced?

If the lubricant is not serviced at the proper interval, the shearing action in the bearing and the gears will begin to take its toll and the lubricant will thicken. The blower will run hotter and the wear on moving parts will increase. The lubricant will generally appear dirtier, caused by material rubbing off the components. The lubricant will discolor because of overheating. An indicator of the breakdown of a lubricant is the increase in the Total Acid Number (TAN) and a change of 10 percent in the base viscosity.

Several things are happening as the lubricant goes through the blower. First, it is absorbing frictional energy in the form of heat. This heat has to be dissipated through either surface contact with cooler materials or in a rest volume of lubricant. While reducing the friction, the lubricant is also going through a shearing process and the molecular structure is broken down.

The result is that the lubricant will begin to thicken because of the shorter molecular chains and the drop out of additive packages. The thickened lubricant will cause more drag, increasing the friction and heat and further degrading the lubricant.

Operation of the blower (environment, run time, speed, and pressure) has a direct effect on duty cycles. The published cycles are based on worst-case conditions.

Hazards Associated With Breakdown or Ignition of Lubrication

⚠ DANGER

There is a risk associated with the lubrication media breaking down and resulting in a hazardous fluid or vapor. There may also be a hazard associated with the ignition of the lubrication media. Refer to the lubrication manufacturer's applicable instruction for safety precautions.

Release Lubricated Bearings – Grease Lubrication Series Only

Service the drive end bearing at regular intervals (see ***Table 5-1***). Use NLGI #2 premium-grade, petroleum-base grease with high temperature resistance and good mechanical stability, such as PneuLube grease, available from a local Tuthill Vacuum & Blower System professional. Use a pressure gun to force new grease into each bearing until traces of clean grease come out of the relief fitting.

SPEED IN RPM	OPERATING HOURS PER DAY		
	8	16	24
	GREASING INTERVALS IN WEEKS		
750 – 1,000	7	4	2
1,000 – 1,500	5	2	1
1,500 – 2,000	4	2	1
2,000 – 2,500	3	1	1
2,500 – 3,000	2	1	1
3,000 and up	1	1	1

Table 5-1 – Suggested Lubrication Intervals for Grease Lubricated Bearings

NOTICE

To avoid blowing out the drive shaft seal, do not grease too rapidly.

NOTE: See *Figure 5-3* for locations of grease fittings and grease reliefs for horizontal and vertical flow blowers.

PIPING CONNECTIONS

⚠ WARNING

Pipe loading on the blower should be negligible as pipe loading can cause distortion of the blower. Use proper supports and pipe hangers to assure that there is no loading.

NOTICE

Remove the protective covers from the inlet and outlet ports and inspect for dirt and foreign material.

Inlet and outlet connections on all blowers are large enough to handle maximum volume with minimum friction loss. Maintain same-diameter piping. Do not support silencers by the blower. Avoid stress loads and bending moments.

Be certain all piping is clean internally before connecting to the blower. Place a 16-mesh wire screen backed with hardware cloth at or near the inlet connections for the first 50 hours of use until the system is clean. Clean the screen after 3 hours of operation and completely discard it once the system is clean, as it will eventually deteriorate and small pieces going into the blower can cause serious damage. A horizontal or vertical airflow piping configuration is easily achieved by rearranging the mounting feet position.

Hazards Associated With Hazardous Process Fluids

⚠ DANGER

It shall be the responsibility of the installer to ensure that piping is adequate, sealing between pipe joints is adequate for the process fluids and proper process and pressure protection devices are in place. It is also the responsibility of the installer to assure that process gases are not vented in a manner that would be hazardous.

Refer to the manufacturer of the process media to assure that proper safety precautions are in place.

Blockage or Restriction

⚠ WARNING

Damage to the blower could occur if there is blockage in the inlet or outlet ports or piping. Care should be taken when installing the blower to assure that there are no foreign objects or restrictions in the ports or piping.

MOTOR DRIVES

Two drive connections commonly used are direct drive and V-belt drive.

Direct Coupled

When installing the motor directly to the blower, align the shafts to the coupling according to the coupling manufacturer's instructions. Blowers shipped with the motor directly coupled and mounted on a common base have been aligned prior to shipment. Further alignment is not normally necessary, but be sure to check the alignment and make adjustments if necessary prior to starting the blower.

Coupling halves must correctly fit the blower and drive shafts so that only light tapping is required to install each half. The two shafts must be accurately aligned. A direct-coupled blower and motor must be aligned with the two shafts having no more than 0.005 in. (13 mm) Total Indicator Reading (TIR). Make sure the face is aligned within 0.002 in. (0.05 mm).

Establish proper gap between coupling halves according to the coupling manufacturer's instructions with the motor armature. Proper gap will minimize the chance for end thrust on the blower shaft. Re-align and grease all direct-coupled base-mounted blowers after field installation.

V-Belts

If the motor and blower are V-belt connected, the sheaves on both the motor and blower shafts should be as close to the shaft bearings as possible. Blower sheave is not more than 1/4 in. (6.5 mm) from the blower drive end cover. The drive sheave is as close to the driver bearing as possible. Take care when installing sheaves on the blower and motor shafts. Make sure the face is accurately in line to minimize belt wear.

Adjust the belt tension to the manufacturer's specifications using a belt tension tester. Check new belts for proper tension after 24 hours of run time. When manufacturer data is not available, industry guidelines recommend 1/64 in. deflection for each inch of span (0.157 mm deflection per centimeter of span) at 8 – 10 lb (3.6 – 4.5 kg) of force in the center of the belt.

Insufficient tensioning is often indicated by slipping (squealing) at start-up. Do not use belt dressing on V-belts. Keep sheaves and V-belts free of oil and grease. Remove tension from belts if the drive is to be inactive for an extended period of time. For more specific information, consult the drive manufacturer. In a V-belt drive, the blower sheave must fit its shaft accurately, run true, and be mounted as close to the bearing housing as possible to minimize bearing loads.

A tight or driving fit will force the drive shaft out of its normal position and cause internal damage. A loose fit will result in shaft damage or breaking. Make sure the motor sheave fits correctly and is properly aligned with the blower sheave.

Adjust the motor position on its sliding base so that belt tension is in accordance with drive manufacturer's instructions. Always avoid excessive belt tension. Recheck tension after the first 10 hours of operation and periodically thereafter to avoid slippage and loss of blower speed.

Check the blower after installation and before applying power by rotating the drive shaft by hand.

If the drive shaft does not rotate freely:

- Look for uneven mounting, piping strain, excessive belt tension, or coupling misalignment
- Check the blower to make sure oil was added to the reservoirs

Setting V-Belt Tension

Proper belt tension is essential to long blower life. ***Figure 5-4***, ***Figure 5-5***, and the following procedure are provided to aid in field-adjusting V-belts (when the blower is so equipped) for maximum performance. A visual inspection of the V-belt drive should yield the appearance shown in ***Figure 5-4***.

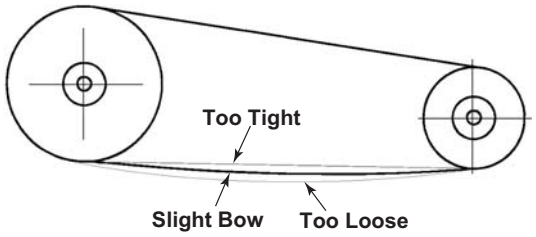

Figure 5-4 – General appearance of a V-belt drive

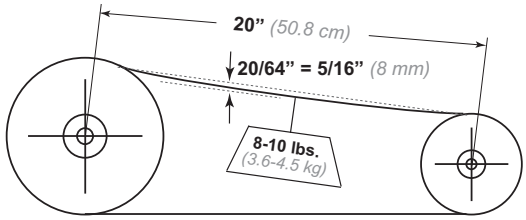

Figure 5-5 – Setting of proper tension for a V-belt drive

Factors outside the control of the belt tensioning system used on an individual blower package assembly, such as environmental factors and quality of the belts installed, may contribute to decreased belt life. Such factors can cause wear of the belts beyond the ability of the tensioning system to compensate.

As such, it is recommended to check belt tension monthly and make any manual adjustments found necessary.

1. Turn off and lock out power.
2. Remove the belt guard fasteners (if equipped).
3. Remove the belt guard.
4. Check and adjust the belt tension as necessary. Tension should be 1/64 in. deflection per inch of span (0.157 mm deflection per centimeter of span) between sheaves, with 8 – 10 lb (3.6 – 4.5 kg) force applied at the center point of the top section of belt.
5. Install the belt guard, making sure that all drive components are free of contact with the guard.
6. Install the belt guard fasteners that were removed in step 2.
7. Unlock the power and start the blower.
8. Resume normal operation.

V-Belt Troubleshooting

PROBLEM	POSSIBLE CAUSES	SOLUTION
Belts slip (sidewalls glazed)	Not enough tension	Replace belts; apply proper tension.
Drive squeals	Shock load	Apply proper tension.
	Not enough arc of contact	Increase center distance.
	Heavy starting load	Increase belt tension.
Belt(s) turned over	Broken cord caused by prying on sheave	Replace set of belts and install correctly.
	Overloaded drive	Redesign drive.
	Impulse loads	Apply proper tension.
	Misalignment of sheave and shaft	Re-align drive.
	Worn sheave grooves	Replace sheaves.
	Excessive belt vibration	Check drive design. Check equipment for solid mounting. Consider use of banded belts.
Mismatched belts	New belts installed with old belts	Replace belts in matched sets only.
Breakage of belt(s)	Shock loads	Apply proper tension; recheck drive.
	Heavy starting loads	Apply proper tension; recheck drive. Use compensator starting.
	Belt pried over sheaves	Replace set of belts correctly.
	Foreign objects in drives	Provide drive guard.
Rapid belt wear	Sheave grooves worn	Replace sheaves.
	Sheave diameter too small	Redesign drive.
	Mismatched belts	Replace with matched belts.
	Drive overloaded	Redesign drive.
	Belt slips	Increase tension.
	Sheaves misaligned	Align sheaves.
	Oil or heat condition	Eliminate oil. Ventilate drive.

MOTOR AND ELECTRICAL CONNECTIONS

⚠ WARNING

The motor and connections shall be protected to assure that product and environmental condensation does not come in contact with the electrical connections.

NOTICE

It is the responsibility of the installer to assure that the motor is in compliance with the latest edition of IEC 60204-1 and all electrical connections are performed per IEC 60204-1, this includes overcurrent protection.

Wire the motor and other electrical devices, such as solenoid valves and temperature switch, to the proper voltage and amperage as indicated on the nameplate of the component being wired. Turn the blower by hand after wiring is completed to determine that there are no obstructions and that the blower turns freely. Then, momentarily start the blower to check the direction of rotation. ***Figure 4-2*** shows direction of airflow in relation to rotor rotation. The airflow direction can be reversed by reversing the appropriate motor leads.

06

OPERATION

GENERAL

⚠ DANGER

The blower is not intended to be used with explosive products or in explosive environments. The blower is not intended to be used in applications that include hazardous and toxic gases. Consult the factory for support.

⚠ WARNING

Do not operate without guards in place.

⚠ WARNING

Maximum operating speed: *Table 4-2* states the maximum operating speed in RPM (rotations per minute), the maximum pressure differential, maximum vacuum and maximum temperature rise. Do not exceed these limits.

⚠ WARNING

The blower can generate excessive noise. Hearing protection is required while the unit is in operation.

Before starting the blower for the first time under power, recheck the installation thoroughly to reduce the likelihood of difficulties. Use the following checklist as a guide, but consider any other special conditions in your installation.

1. Be certain no bolts, rags, or dirt have been left in blower.
2. Be certain that inlet piping is free of debris. If an open outdoor air intake is used, be sure the opening is clean and protected by an inlet filter. This also applies to indoor use.
3. If installation is not recent, check blower leveling, drive alignment, belt tension, and tightness of all mounting bolts.
4. Be certain the proper volume of oil is in the oil reservoir chambers.
5. Be certain the driving motor is properly lubricated and connected through suitable electrical overload devices.
6. With electrical power off and locked out to prevent accidental starting, rotate the blower shaft several times by hand to make sure the blower is rotating freely. Unevenness or tight spots are indicators of a condition that should be corrected before progressing.

7. Check motor rotation by momentarily pushing the START button and then checking the flow direction of the blower. Reverse the motor connections if the flow is in the wrong direction.

Carry out initial operation under “no load” conditions by opening all valves and venting the discharge to the atmosphere, if possible. Then, start the motor briefly, listen for unusual noises, and make sure the blower coasts freely to a stop. If no problem appears, repeat this check and let the motor run slightly longer. If any questions exist, investigate before proceeding.

Assuming all tests are satisfactory, the blower will now be ready for continuous full-load operation. During the first several days, check periodically to make sure all conditions remain acceptable and steady. These checks may be particularly important if the blower is part of a process system where conditions may vary. At the first opportunity, stop the blower and clean or remove the inlet filter. Also recheck leveling, coupling alignment or belt tension, and mounting bolts for tightness.

START-UP CHECKLIST

It is recommended that these start-up procedures be followed in sequence and checked off (☑) in the boxes provided in any of the following cases.

• During initial installation • After any shutdown period	• After maintenance work has been performed • After blower has been moved to a new location
DATES CHECKED:	☐ ☐ ☐
☐☐☐☐	Check the unit for proper lubrication. Proper oil level is critical. ***See Lubrication on page 15***. ***See Recommended Lubricants on page 42*** for information on acceptable lubricants for the product.
☐☐☐☐	Check the V-belt drive for proper belt alignment and tension.
☐☐☐☐	Carefully turn the rotors by hand to be certain they do not bind.

⚠ WARNING

Disconnect power. Make certain power is off and locked out before touching any rotating element of the blower, motor, or drive components.

☐☐☐☐	“Bump” the unit with the motor to check rotation (counterclockwise when facing the shaft) and to be certain it turns freely and smoothly.
☐☐☐☐	Start the unit and operate it for 30 minutes at no load. During this time, feel the cylinder for hot spots. If minor hot spots occur, ***see Troubleshooting on page 38.***
☐☐☐☐	Apply the load and observe the operation of the unit for 1 hour.
☐☐☐☐	If minor malfunctions occur, discontinue operation and ***see Troubleshooting on page 38***.

⚠ DANGER

The blower is not intended to be used with explosive products or in explosive environments. The blower is not intended to be used in applications that include hazardous and toxic gases. Consult the factory for support.

⚠ WARNING

Physical harm may occur if human body parts are in contact or exposed to the process vacuum. Assure that all connections are protected from human contact.

⚠ WARNING

If rated vacuum or pressure levels are exceeded, process fluids will migrate to other parts of the blower and system.

⚠ CAUTION

Do not touch hot surfaces.

Do not touch the blower while it is in operation and assure blower is cool when not in operation.

NOTICE

The upper temperature limits are not intended for continuous operation. Consult with factory for detailed information assistance.

STOPPING

⚠ CAUTION

Do not stop the blower if there are high outlet pressures in the outlet piping. Unload the outlet piping prior to shutting down the blower.

Stop the blower by turning off the motor. Isolate the blower from the vacuum system and vent the blower to the atmosphere.

RECOMMENDED SHUTDOWN PROCEDURE TO MINIMIZE RISK OF FREEZING OR CORROSION

When an air piping system has high humidity or moisture, water condensation can occur after the blower is shut down and it begins to cool. Condensation creates an environment favorable to corrosion of the iron internal surfaces and to ice formation in cold weather. Both conditions can close the operating clearances, causing the blower to fail upon future start-up.

The following shutdown procedure minimizes the risk of moisture condensation, corrosion, and freezing.

NOTICE

Care must be taken not to overload or overheat the blower during this procedure.

1. Isolate the blower from the moist system piping, allowing the blower to intake atmospheric air. Operate the blower under a slight load, allowing the blower to heat within safe limits. The heat generated by the blower will quickly evaporate residual moisture.
2. For carpet cleaning applications, after the work is completed, allow the blower to run 3 – 5 minutes with the suction hose and wand attached. The suction hose and wand will provide enough load to the blower to evaporate the moisture quickly.
3. For extended shutdown, inject a small amount of a light lubricating oil such as 3-in-One® or a spray lubricant such as WD-40® into the inlet of the blower just before shutdown *(3-in-One and WD-40 are registered trademarks of WD-40 Company)*. The lubricant will provide an excellent protective coating on the internal surfaces. If using a spray lubricant, take care to prevent the applicator tube from getting sucked into the blower. The applicator tube will damage the blower, likely to a degree where repair would be required.
4. If the blower is being taken out of commission for an extended period of time, ***see Long-Term Storage on page 29***.

07

MAINTENANCE

GENERAL

Regular inspection of the blower and its installation, along with complete checks on operating conditions, will pay dividends in added life and usefulness. Also, service the drive per the manufacturer's instructions and lubricate the coupling or check the belt drive tension. Use thermometers and gauges to make sure that blower operating temperature and pressure remain within allowed limits.

⚠ DANGER

The blower and parts may contain hazardous media. Assure that pump and parts are evacuated of hazardous media prior to servicing.

⚠ CAUTION

The electrical service must be isolated and de-energized prior to maintenance. Apply appropriate procedures to assure electrical supply is de-energized and cannot be inadvertently energized during maintenance.

Assure piping and product is isolated prior to maintenance of blower. Apply appropriate procedures to assure piping and product is isolated and that inadvertent opening of valves cannot occur during maintenance.

⚠ CAUTION

During routine maintenance, inspect and assure that guards are in place and secure.

Pay special attention to lubrication of timing gears and bearings according to the information in ***Lubrication on page 15***.

When a blower is taken out of service, it may require internal protection against rusting or corrosion. The need for such protection must be a matter of judgment based on existing conditions as well as length of downtime. Under atmospheric conditions producing rapid corrosion, protect the blower immediately. ***See Long-Term Storage on page 29***.

REGULAR MAINTENANCE

A well-designed maintenance program will add years of service to the blower.

Check a newly installed blower frequently during the first month of operation, especially lubrication. With the blower at rest, check the oil level in both the gear (drive) end and free (non-drive) end of the blower and add oil as needed. Complete oil changes are recommended every 1,000 – 1,200 operating hours, or more frequently depending on the type of oil and operating temperature. Also change the oil more frequently if pumping corrosive vapors or where excessive operating temperatures are encountered. The following is recommended as a minimum maintenance program.

DAILY	WEEKLY	MONTHLY
1. Check and maintain oil level, and add oil as necessary. 2. Check for unusual noise or vibration (***see Troubleshooting on page 38***).	1. Clean all air filters. A clogged air filter can seriously affect the efficiency of the blower and cause overheating and oil usage. 2. Check the relief valve to make sure it is operating properly.	1. Inspect the entire system for leaks. 2. Inspect the condition of the oil and change if necessary. 3. Check drive belt tension and tighten if necessary.

NOTICE

Oil levels should be checked every 24 hours of operation.

Proper oil drain schedules require oil be changed before the contaminant load becomes so great that the lubricating function of the oil is impaired or heavy disposition of suspended contaminants occurs. To check the condition of the oil, drain a sample into a clean container and check for the presence of water or solids. Slight discoloration of the oil should not necessitate an oil change.

SPARE PARTS

Should adjustments or replacement be needed, repairs can often be performed locally as described in this manual after obtaining the required parts. Personnel should have a good background of mechanical experience and be thoroughly familiar with the procedures outlined in this manual. For major repairs not covered in this manual, contact the nearest Tuthill Vacuum & Blower Systems service representative.

When ordering parts, supply the blower nameplate information, as well as the item number and parts description as per the parts lists and assembly drawings. Repair kits are available for all models. These kits contain all the seals, bearings, O-rings, locks, and special retaining screws necessary for an overhaul. For convenience when ordering parts, complete the **Operating Data Form** included on the inside back cover of this manual.

In developing a stock of spare parts, consider the following factors:

- The degree of importance in maintaining the blower in a “ready” condition
- The time lag in parts procurement
- Cost
- Shelf life (seals and O-rings)

FACTORY SERVICE AND REPAIR

With proper care, Tuthill Vacuum & Blower Systems blowers will give years of reliable service. The parts are machined to close tolerances and require special tools by mechanics who are skilled at this work. Should major repairs become necessary, contact the factory for the location of the nearest service facility. Blowers that are still under warranty must be returned to the factory, freight prepaid, for service.

NOTICE

Current regulations require Material Safety Data Sheet to be completed and forwarded to Tuthill Corporation on any unit being returned for any reason which has been handling or involved with hazardous gases or materials. This is for the protection of the employees of Tuthill Corporation who are required to perform service on this equipment. Failure to do so will result in service delays.

NOTICE

When returning a blower to the factory for repair, under warranty, please note the factory will not accept any unit that arrives without authorization. Contact the Service Department for return authorization.

LONG-TERM STORAGE

Any time the blower will be stored for an extended period of time, make sure it is protected from corrosion by following this procedure:

1. Spray the interior (lobes, housing, and end plates) with rust preventative. Repeat as conditions dictate and on an at least a yearly basis.
2. Fill both end covers completely full of oil.
3. Firmly attach a prominent tag stating that the end covers are full of oil and must be drained and refilled to proper levels before start-up.
4. Apply a rust-preventative grease to the drive shaft.
5. Spray all exposed surfaces, including the inlet and discharge flanges, with rust preventative.
6. Seal the inlet, discharge, and vent openings. It is not recommended that the blower be set in place, piped to the system, and allowed to remain idle for a prolonged amount of time. If any component is left open to the atmosphere, the rust preventative will escape and lose its effectiveness.
7. During storage, make sure the blower does not experience excessive vibration.
8. Attach a desiccant bag to one of the covers to prevent condensation from occurring inside the blower. Make sure any desiccant bag (or bags) is attached to the covers so that they will be removed before start-up of the blower.
9. Store the blower in an air conditioned and heated building if possible. If air conditioned and heated storage is not possible, make conditions as dry as possible.
10. If possible, rotate the drive shaft by hand at least monthly to prevent seals from setting in one position.

08

DISASSEMBLY AND REASSEMBLY

DISASSEMBLY OF BLOWER

⚠ WARNING

Before performing any repair or replacement, disconnect and lock out power.

With proper maintenance and lubrication, normal life expectancy for gears, bearings, and seals can be achieved. However, over time these parts must be repaired or replaced to maintain the efficiency of the blower. This section is written in a way that will allow you to completely disassemble the blower. The inspection of certain repairable or replaceable parts is referred to at the point of disassembly where these parts are exposed. If repair or replacement is deemed necessary at any point of inspection, appropriate instruction is given to achieve.

1. Remove the oil drain plugs in the bottom of the end covers and drain the oil.
2. Remove eight cap screws and remove the gear cover.

NOTE: It may be necessary to tap the sides with a mallet or wooden block to break the seal joint.

Gears are not exposed for visual inspection prior to disassembly.

Inspect the gears for the following:

- Broken teeth
- Chipped teeth
- Uneven wear
- Excessive wear
- Any other abnormalities

3. Position the blower with the drive gear on the left when facing the gears. Remove the socket-head screws and washers.
4. Align the timing marks, count 3 teeth up, and place reference marks on the gears (see ***Figure 8-1***).

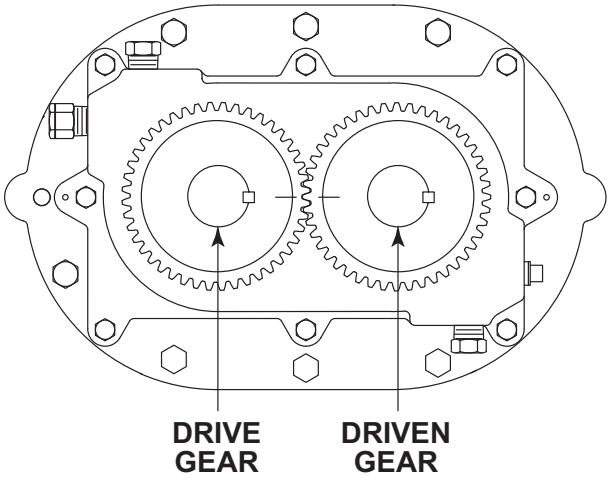

Figure 8-1 – Timing Marks Matched

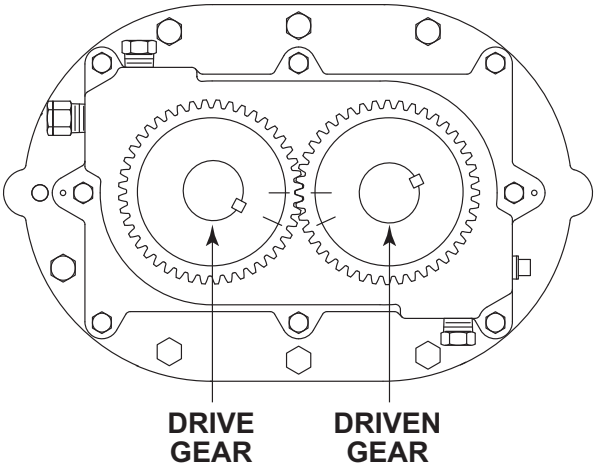

Figure 8-2 – Timing Marks Advanced 3 Teeth (Reference Marks Aligned)

5. Align the reference marks (see ***Figure 8-2***).
6. Use a puller to remove the driven gear. A bar puller or jaw puller (see ***Figure 8-3***) can be used.

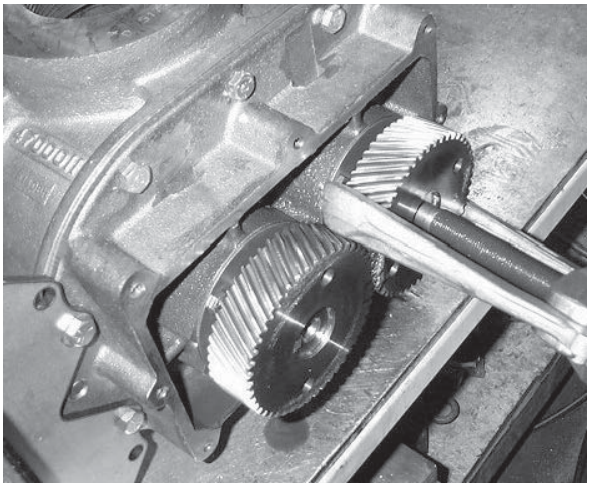

Figure 8-3 – Pulling Driven Gear with Jaw Puller or Bar Puller

7. Remove the drive gear using a bar puller or jaw puller (see ***Figure 8-4***).

Figure 8-4 – Pulling Driven Gear with Bar Puller

NOTE: If the unit becomes locked up, switch gears.

8. Remove the shim and spacer, and note from which shaft the shim is removed.
9. Turn the blower around and remove the 8 cap screws securing the drive end cover.
10. Remove the cover.
11. Loosen the set screws on the oil slingers and remove the oil slingers from the rotor shafts (see ***Figure 8-5***).

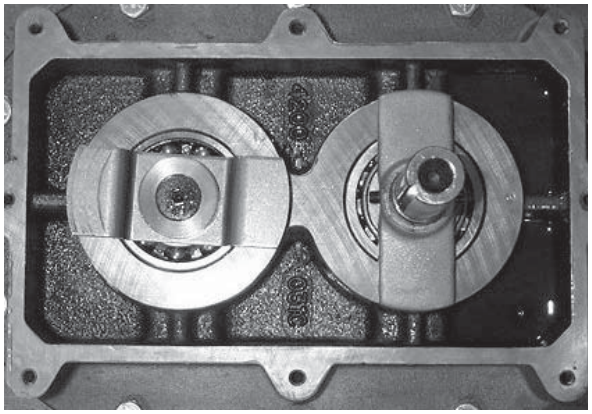

Figure 8-5 – Set Screws for Slingers

12. Remove the 10 cap screws that secure the drive end plate to the housing.

13. Use a jaw puller or jackscrews to remove the drive end plate (see ***Figure 8-6*** and ***Figure 8-7***).

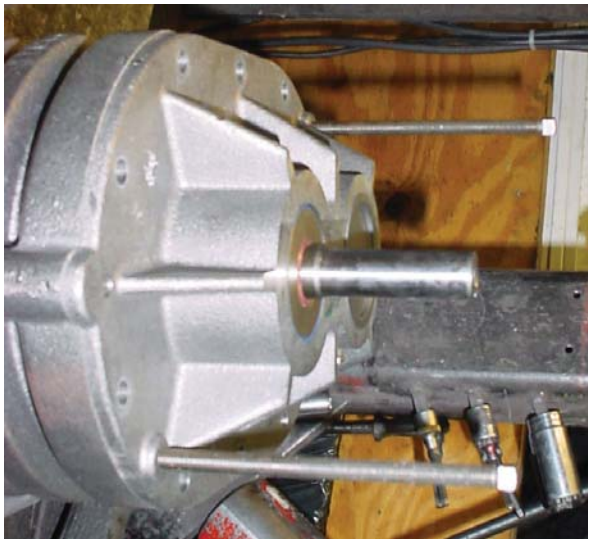

Figure 8-6 – Removing Drive End End Plate Using Jackscrews (21 Series)

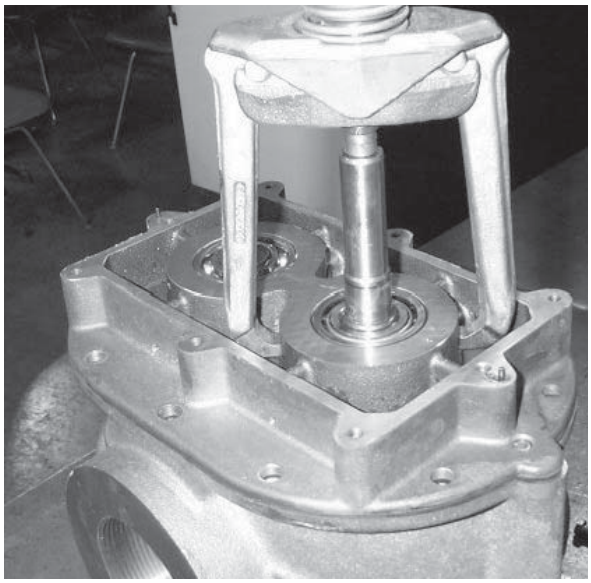

Figure 8-7 – Pulling Drive End Plate (22 Series)

14. Press the rotors out of the free (non-drive) end plate in press if available. If press is not available, support the end plate and rotors in the housing. Block up the housing and use a soft mallet to drive the rotors out (see ***Figure 8-8***). A jaw-type puller can also be used.

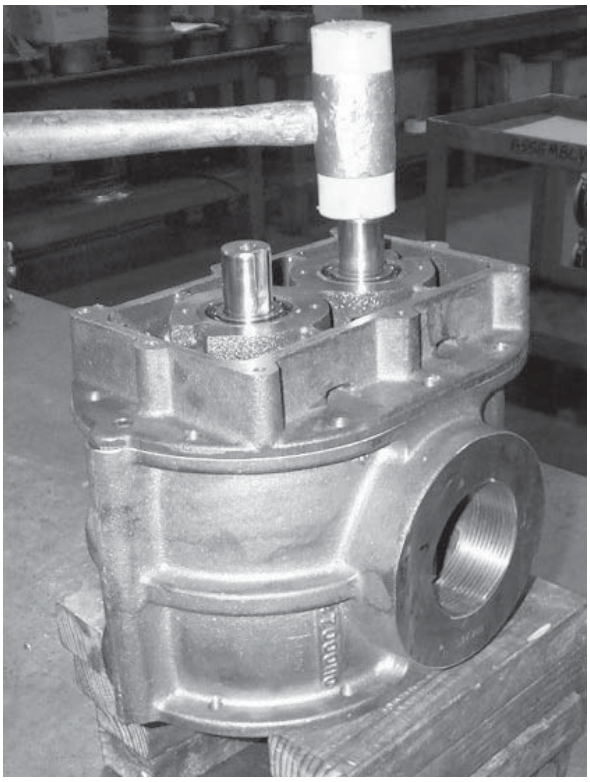

Figure 8-8 – Driving Rotors Out Using Soft Mallet

15. Using a tube or round bar of a slightly smaller diameter than the shaft clearance holes in the end plates, tap the bearings out of the end plates. Remove the bearing retainers before knocking out the bearings (see ***Figure 8-9***).

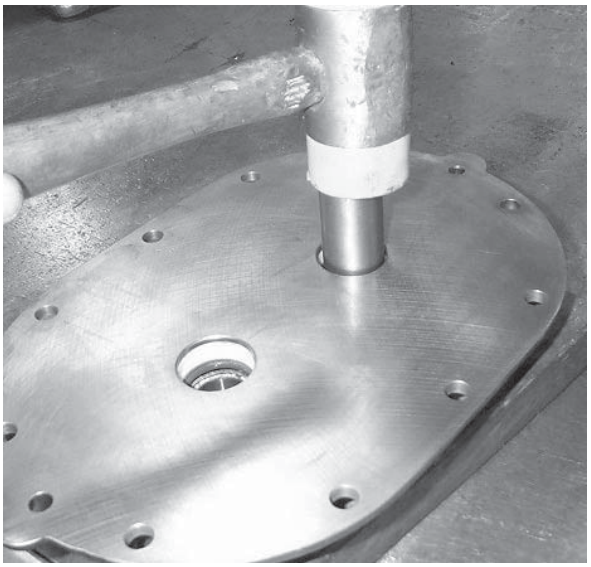

Figure 8-9 – Tapping Bearings Out of End Plates

16. Remove the seals from both end plates with a punch or dull chisel. The seals will be damaged during removal and must be replaced. Inspect all parts for wear or damage.

17. Clean and inspect all parts for burrs, and polish the seal journals with at least 320-grit emery or crocus cloth.

REASSEMBLY OF BLOWER

After thoroughly cleaning the seal and bearing bores of both end plates, apply a thin coat of sealant on the outside diameter of the new seals and press them into the end plate using a tool that will bear on the outer edge of the seal. The spring side of the seal should be facing you. Apply a thin coat of grease to the seal lip.

See ***Special Tool Drawings on page 44*** for drawings and dimensions of the seal and bearing pressing tools.

Using the drive end plate as a fixture, support the plate high enough so the input shaft of the drive rotor clears the assembly surface (see ***Figure 8-10***). Place the rotors in the fixture with the drive rotor to the left (see ***Figure 8-10*** and ***Figure 8-14***).

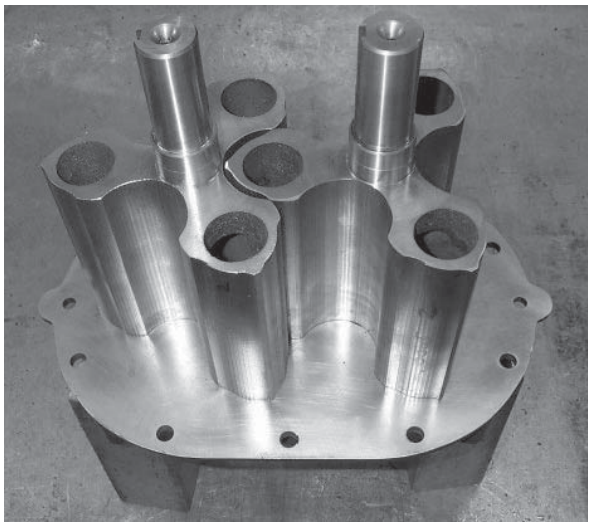

Figure 8-10 – Rotors Assembled on Drive End Plate (Model 4000 with Tri-Lobe Rotors Shown)

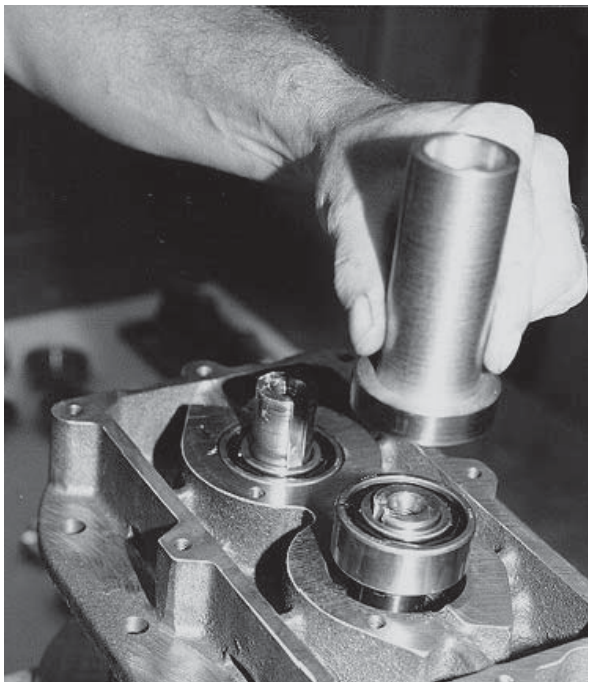

Figure 8-11 – Tapping Bearings into End Plates

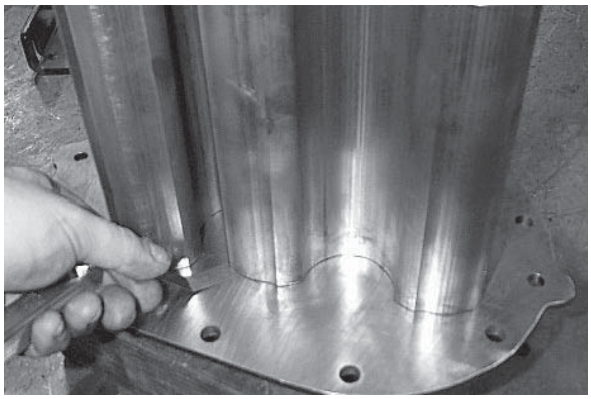

Figure 8-12 – Checking Gear End Clearances

Figure 8-13 – Check Drive End Clearances

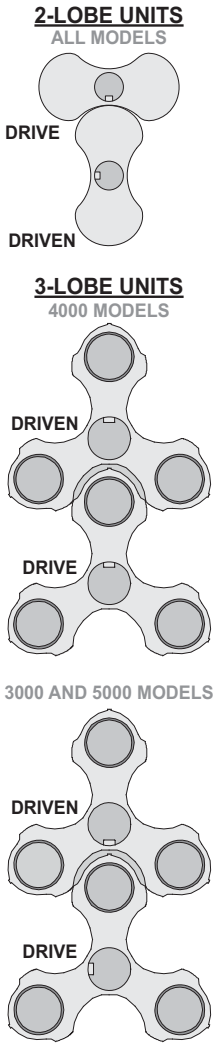

Figure 8-14 – Rotor Keyway Positions

1. Place end plate on rotors.
2. Apply a thin coat of lubricant on the rotor shafts and the inner race of the bearings. Tap the bearings into place using a tube with a flanged end that will contact both the inner and outer bearing races (see ***Figure 8-11***).
3. Install bearing retainers to both bearings.
4. Check clearances between the end of the rotors and the face of the end plate. ***See Assembly Clearances on page 40*** for proper clearances for your model blower.

5. If clearances check OK, put a spacer on each shaft. Timing shims that were removed should be put back on the shaft from which they were removed.

6. Add keys to keyways.

7. Lubricate shafts and bores on gears. Begin by pressing on the DRIVE gear. This will be pressed on the drive rotor, which is to the left.

8. Start the driven gear on the shaft and align the reference timing marks and press gear on. Lock gears in place with socket head screw and washer. Turn assembly over and rest the unit on the socket head screws and washers on the gear end, securing the unit with support blocks.

9. Set dowel pins in housing and position housing over the rotors and fasten with cap screws. Check drive end clearance (see ***Figure 8-13***). A depth mic can be used.

10. Press seals into drive endplate.

11. Set on drive end plate and fasten with cap screws.

12. Lubricate shafts and bearings. Install the ball bearing on the driven rotor and the roller bearing on the input shaft. Install oil slingers to appropriate rotors.

NOTE: Oil slingers are on the Splash Lubrication/ Air Service models only. The Grease Lubrication/Air Service blowers will not have oil slingers.

13. Apply a bead of a good quality RTV silicone sealant to the inner surface of the drive end cover that mates to the drive end plate. Install drive end cover and drive shaft seal.

14. Install any removed plugs and sight glasses, and replace breather if required.

⚠ WARNING

Keep hands and loose clothing away from lobes and gears.

Adjusting Rotor Interlobe Clearance

1. Use feeler gauges to take interlobe readings, and record them on each side of housing as indicated in ***Figure 8-15***. As shim is removed or added behind the helical gear, the gear rotates as it is moved in or out and the driven rotor turns with it, thus changing the clearance between rotor lobes.

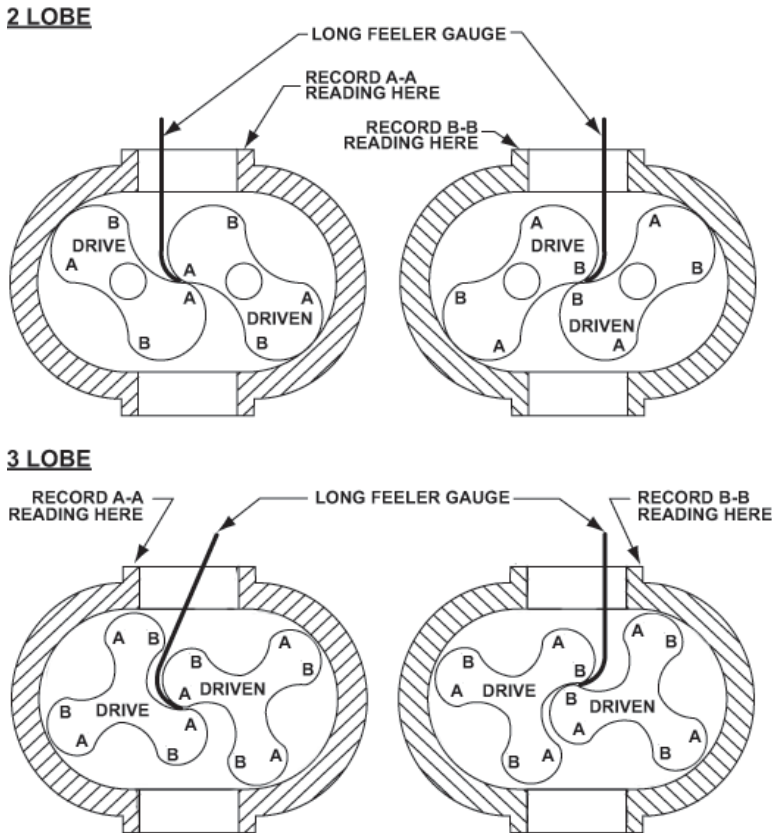

Figure 8-15 – Checking Rotor Interlobe Clearances

2. Changing the shim thickness will change the rotor lobe clearance.

3. To determine the amount of shim to add or remove, subtract the smaller value from the larger value.

EXAMPLE: Referring to ***Figure 8-15***, check the clearance at AA (right-hand reading) and BB (left-hand reading). If the AA reading is 0.009 in. (0.23 mm) and the BB reading 0.003 in. (0.08 mm), adjust by removing 0.006 in. (0.15 mm) shims from the driven rotor. The readings will change one half the amount removed: 0.003 in. (0.08 mm). AA should then read 0.006 in. (0.15 mm) and BB should read 0.006 in. (0.15 mm). The final readings should be within 0.002 in. (0.05 mm) of each other.

MODEL	CHANGE	SHIM CHANGE
2000	1	1
3000/4000/5000	1	1
6000	1	1.5
7000	1	1.8

NOTE: Both the drive and driven gears can be shimmed.

Lubrication, Final Assembly and Mounting

1. Apply a bead of a high-quality RTV silicone sealant to the inner surface of the gear end cover that mates to the gear end plate. Install the gear end cover with cap screws and tighten evenly.

2. Fill both end covers with oil. ***See Lubrication on page 15*** for the filling procedure, and see ***Recommended Lubricants on page 42*** for recommended lubricants.

3. To make sure the blower has not been distorted during mounting in the installation, turn the lobes by hand to make sure they are not making contact before connecting to the driver.

09

TROUBLESHOOTING

Although Tuthill Vacuum & Blower Systems blowers are well designed and manufactured, problems may occur due to normal wear and the need for readjustment. The following chart lists symptoms that may occur along with probable causes and remedies.

SYMPTOM	PROBABLE CAUSE	REMEDIES
Loss of oil	Gear housing not tightened properly	Tighten gear housing bolts.
	Lip seal failure	Disassemble and replace lip seal.
	Insufficient sealant	Remove gear housing and replace sealant. ***See Disassembly of Blower on page 30***.
	Loose drain plug	Tighten drain plug.
Excessive bearing or gear wear	Improper lubrication	Correct oil level. Replace dirty oil. ***See Lubrication on page 15***.
	Excessive belt tension	Check belt manufacturer's specifications for tension and adjust accordingly.
	Coupling misalignment	Check carefully. Re-align if necessary.
Lack of volume	Slipping belts	Check belt manufacturer's specifications for tension and adjust accordingly.
	Worn lobe clearances	Check for proper clearances. ***See Assembly Clearances on page 40***.
	Speed too low	Increase blower speed within limits.
	Obstruction in piping	Check system to ensure an open flow path.
Knocking	Blower out of time	Re-time.
	Distortion due to improper mounting or pipe strains	Check mounting alignment and relieve pipe strains.
	Excessive pressure differential	Reduce to manufacturer's recommended pressure. Examine relief valve and reset if necessary.
	Worn gears	Replace timing gears. ***See Disassembly of Blower on page 30***.

SYMPTOM	PROBABLE CAUSE	REMEDIES
Excessive blower temperature	Too much or too little oil in gear reservoir	Check oil level. ***See Lubrication on page 15***.
	Too low operating speed	Increase blower speed within limits.
	Clogged filter or silencer	Remove cause of obstruction.
	Excessive pressure differential	Reduce pressure differential across the blower.
	Elevated inlet temperature	Reduce inlet temperature.
	Worn lobe clearances	Check for proper clearances. ***See Assembly Clearances on page 40***.
Rotor end or tip drag	Insufficient assembled clearances	Correct clearances. ***See Assembly Clearances on page 40***.
	Case or frame distortion	Check mounting and pipe strain.
	Excessive operating pressure	Reduce pressure differential.
	Excessive operating temperature	Reduce pressure differential or reduce inlet temperature.
Vibration	Belt or coupling misalignment	Check carefully. Re-align if necessary.
	Lobes rubbing	Check cylinder for hot spots, and then check for lobe contact at these points. Correct clearances. ***See Assembly Clearances on page 40***.
	Worn bearings or gears	Check condition of gears and bearings. Replace if necessary.
	Unbalanced or rubbing lobes	Possible build-up on casing or lobes, or inside lobes. Remove build-up and restore clearances.
	Driver or blower loose	Check mounting and tighten if necessary.
	Piping resonance	Check pipe supports, check resonance of nearby equipment, and check foundation.

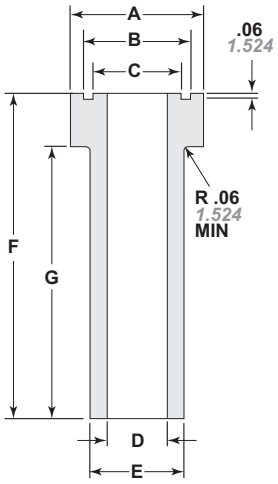
RECOMMENDED LUBRICANTS

RECOMMENDED LUBRICANTS FOR ROTARY BLOWERS AND VACUUM BOOSTERS

RECOMMENDED SYNTHETIC BASED LUBRICANTS FOR BLOWERS				
AMBIENT TEMPERATURE	**TUTHILL**	**VISCOSITY GRADE**	**ISO 100**	**ISO 150**
0° to 32°F (-18° to 0°C)	PneuLube™ (ISO 100)	Specific Gravity 16°C (62°F)	0.859	0.865
		Viscosity 40°C (104°F)	91.8 cSt	142.7 cSt
32° to 90°F (0° to 32°C)		Viscosity 100°C (212°F)	13.1 cSt	18.0 cSt
		Viscosity Index	142	140
		Pour Point	-51°C (-60°F)	-51°C (-60°F)
90° to 120°F* (32° to 50°C)		Flash Point	246°C (475°F)	246°C (475°F)
		Copper Corrosion Rating	1A	1A



RECOMMENDED SYNTHETIC BASED, FOOD GRADE LUBRICANTS FOR BLOWERS		
AMBIENT TEMPERATURE	**LUBRICANT MEETING U.S. FDA REGULATION 21 CFR 178.3570 GOVERNING PETROLEUM PRODUCTS WHICH MAY HAVE INCIDENTAL CONTACT WITH FOOD, AND USDA H1 REQUIREMENTS**	**LUBRICANT MEETING U.S. FDA REGULATIONS 21 CFR 172.878 AND 178.3620(A) FOR DIRECT AND INDIRECT FOOD CONTACT**
0° to 32°F (-18° to 0°C)	PneuLube™ FG (ISO 100)	CONSULT FACTORY
32° to 90°F (0° to 32°C)		
90° to 120°F* (32° to 50°C)		

RECOMMENDED LUBRICANTS FOR M-D VACUUM BOOSTERS	
REQUIREMENTS	
• Suitable for high vacuum service • 100 cSt @ 40°C • Vapor pressure of 1 micron or less @ 70°F (21°C) • Straight mineral (no additives) or PAO synthetic oil	
RECOMMENDED GREASE FOR CP BLOWERS:	
TUTHILL	
Tuthill PneuLube™ NLGI #2 premium grade, petroleum base lithium grease.	Food Grade HTEP grease, NLGI No. 2 grade. Must meet all requirements of FDA Regulation 21 CFR 178.3570 (the former USDA H-1 approval requirements) for lubricants having incidental contact with food.
* For higher ambient temperatures, please consult the factory.	
RECOMMENDED OIL FOR OXYGEN-ENRICHED SERVICE	
Blowers used in oxygen-enriched service should use only non-flammable, PFPEsynthetic lubricant. Blowers used in hydrogen service should use only PneuLube synthetic oil. Tuthill Vacuum & Blower Systems cannot accept responsibility for damage to seals, O-rings and gaskets caused by use of synthetic lubricants not recommended by Tuthill Vacuum and Blower Systems	

Tuthill

DECLARATION OF INCORPORATION

Herewith we declare that the items detailed below are in conformity with the provisions of the Machinery Directive 2006/42/EC.

Information on the items detailed are compiled per the Machinery Directive 2006/42/EC, Annex VII, part A and are the responsibility of the person listed below.

The items detailed below must not be put into service until the machinery into which it is to be incorporated has been declared in conformity with the provisions of the relevant directive(s).

Other directives and standards that apply to this Declaration of Incorporation:

EN 1012-1:1996 - Compressors and vacuum pumps - Safety requirements - Part 1: Compressors

The scope of the Declaration of Incorporation is for bare shaft Rotary Positive Displacement (CP Series) Blowers

2000, 3000, 4000, 5000, 6000, 7000

David L. Schardt

David Schardt
Vice President of Engineering
Tuthill Vacuum & Blower Systems

WARRANTY – BLOWER PRODUCTS

Subject to the terms and conditions hereinafter set forth and set forth in General Terms of Sale, Tuthill Vacuum & Blower Systems (the Seller) warrants products and parts of its manufacture, when shipped, and its work (including installation and start-up) when performed, will be of good quality and will be free from defects in material and workmanship. This warranty applies only to Seller's equipment, under use and service in accordance with seller's written instructions, recommendations and ratings for installation, operating, maintenance and service of products, for a period as stated in the table below. Because of varying conditions of installation and operation, all guarantees of performance are subject to plus or minus 5% variation. (Non-standard materials are subject to a plus or minus 10% variation)

PRODUCT TYPE	TYPE OF APPLICATION	
	ATMOSPHERIC AIR OR PROCESS AIR WITHOUT LIQUIDS PRESENT	PROCESS GASES OTHER THAN AIR, OR ANY LIQUID INJECTED APPLICATION
New *(Qx™ models only)*	30 months from date of shipment, or 24 months after initial startup date, whichever occurs first.	Consult Factory
New *(all other models)*	24 months from date of shipment, or 18 months after initial startup date, whichever occurs first	18 months from date of shipment, or 12 months after initial startup date, whichever occurs first
Repair/Reman	12 months from date of shipment, or remaining warranty period, whichever is greater	12 months from date of shipment, or remaining warranty period, whichever is greater

THIS WARRANTY EXTENDS ONLY TO BUYER AND/OR ORIGINAL END USER, AND IN NO EVENT SHALL THE SELLER BE LIABLE FOR PROPERTY DAMAGE SUSTAINED BY A PERSON DESIGNATED BY THE LAW OF ANY JURISDICTION AS A THIRD PARTY BENEFICIARY OF THIS WARRANTY OR ANY OTHER WARRANTY HELD TO SURVIVE SELLER'S DISCLAIMER.

All accessories furnished by Seller but manufactured by others bear only that manufacturer's standard warranty.

All claims for defective products, parts, or work under this warranty must be made in writing immediately upon discovery and, in any event within one (1) year from date of shipment of the applicable item and all claims for defective work must be made in writing immediately upon discovery and in any event within one (1) year from date of completion thereof by Seller. Unless done with prior written consent of Seller, any repairs, alterations or disassembly of Seller's equipment shall void warranty. Installation and transportation costs are not included and defective items must be held for Seller's inspection and returned to Seller's Ex-works point upon request.

THERE ARE NO WARRANTIES, EXPRESSED, IMPLIED OR STATUTORY WHICH EXTEND BEYOND THE DESCRIPTION ON THE FACE HEREOF, INCLUDING WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS OF PURPOSE.

After Buyer's submission of a claim as provided above and its approval, Seller shall at its option either repair or replace its product, part, or work at the original Ex-works point of shipment, or refund an equitable portion of the purchase price.

The products and parts sold hereunder are not warranted for operation with erosive or corrosive material or those which may lead to build up of material within the product supplied, nor those which are incompatible with the materials of construction. The Buyer shall have no claim whatsoever and no product or part shall be deemed to be defective by reason of failure to resist erosive or corrosive action nor for problems resulting from build-up of material within the unit nor for problems due to incompatibility with the materials of construction.

Any improper use, operation beyond capacity, substitution of parts not approved by Seller, or any alteration or repair by others in such manner as in Seller's judgment affects the product materially and adversely shall void this warranty.

No employee or representative of Seller other than an Officer of the Company is authorized to change this warranty in any way or grant any other warranty. Any such change by an Officer of the Company must be in writing.

The foregoing is Seller's only obligation and Buyer's only remedy for breach of warranty, and except for gross negligence, willful misconduct and remedies permitted under the General Terms of Sale in the sections on CONTRACT PERFORMANCE, INSPECTION AND ACCEPTANCE and the PATENTS Clause hereof, the foregoing is BUYER'S ONLY REMEDY HEREUNDER BY WAY OF BREACH OF CONTRACT, TORT OR OTHERWISE, WITHOUT REGARD TO WHETHER ANY DEFECT WAS DISCOVERED OR LATENT AT THE TIME OF DELIVERY OF THE PRODUCT OR WORK. In no event shall Buyer be entitled to incidental or consequential damages. Any action for breach of this agreement must commence within one (1) year after the cause of action has occurred.

May 2008

OPERATING DATA FORM / PRODUCT REGISTRATION

It is to the user's advantage to have the requested data filled in below and available in the event a problem should develop in the blower or the system. This information is also helpful when ordering spare parts.

Model No. _____ V-Belt Size _____ Length _____

Section 1

General Information

Overview This manual contains general procedures that apply to Baldor Motor products. Be sure to read and understand the Safety Notice statements in this manual. For your protection, do not install, operate or attempt to perform maintenance procedures until you understand the Warning and Caution statements.
A Warning statement indicates a possible unsafe condition that can cause harm to personnel.
A Caution statement indicates a condition that can cause damage to equipment.

Important: **This instruction manual is not intended to include a comprehensive listing of all details for all procedures required for installation, operation and maintenance. This manual describes general guidelines that apply to most of the motor products shipped by Baldor. If you have a question about a procedure or are uncertain about any detail, Do Not Proceed. Please contact your Baldor distributor for more information or clarification.**

Before you install, operate or perform maintenance, become familiar with the following:

- NEMA Publication MG-2, Safety Standard for Construction and guide for Selection, Installation and Use of Electric Motors and Generators.
- IEC 34–1 Electrical and IEC72–1 Mechanical specifications
- ANSI C51.5, the National Electrical Code (NEC) and local codes and practices.

Limited Warranty

www.baldor.com/support/warranty_standard.asp

Safety Notice: **This equipment contains high voltage! Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt installation, operation and maintenance of electrical equipment. Be sure that you are completely familiar with NEMA publication MG-2, safety standards for construction and guide for selection, installation and use of electric motors and generators, the National Electrical Code and local codes and practices. Unsafe installation or use can cause conditions that lead to serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.**

WARNING: **Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.**

WARNING: **Disconnect all electrical power from the motor windings and accessory devices before disassembly of the motor. Electrical shock can cause serious or fatal injury.**

WARNING: **Be sure the system is properly grounded before applying power. Do not apply AC power before you ensure that all grounding instructions have been followed. Electrical shock can cause serious or fatal injury. National Electrical Code and Local codes must be carefully followed.**

WARNING: **Avoid extended exposure to machinery with high noise levels. Be sure to wear ear protective devices to reduce harmful effects to your hearing.**

WARNING: **Surface temperatures of motor enclosures may reach temperatures which can cause discomfort or injury to personnel accidentally coming into contact with hot surfaces. When installing, protection should be provided by the user to protect against accidental contact with hot surfaces. Failure to observe this precaution could result in bodily injury.**

WARNING: **This equipment may be connected to other machinery that has rotating parts or parts that are driven by this equipment. Improper use can cause serious or fatal injury. Only qualified personnel should attempt to install operate or maintain this equipment.**

WARNING: **Do not by-pass or disable protective devices or safety guards. Safety features are designed to prevent damage to personnel or equipment. These devices can only provide protection if they remain operative.**

WARNING: **Avoid the use of automatic reset devices if the automatic restarting of equipment can be hazardous to personnel or equipment.**

WARNING: **Be sure the load is properly coupled to the motor shaft before applying power. The shaft key must be fully captive by the load device. Improper coupling can cause harm to personnel or equipment if the load decouples from the shaft during operation.**

WARNING: **UL Listed motors must only be serviced by UL Approved Authorized Baldor Service Centers if these motors are to be returned to a hazardous and/or explosive atmosphere.**

WARNING: **Thermostat contacts automatically reset when the motor has slightly cooled down. To prevent injury or damage, the control circuit should be designed so that automatic starting of the motor is not possible when the thermostat resets.**

WARNING: **Use proper care and procedures that are safe during handling, lifting, installing, operating and maintaining operations. Improper methods may cause muscle strain or other harm.**

WARNING: **Pacemaker danger – Magnetic and electromagnetic fields in the vicinity of current carrying carrying conductors and permanent magnet motors can result result in a serious health hazard to persons with cardiac pacemakers, metal implants, and hearing aids. To avoid risk, stay way from the area surrounding a permanent magnet motor.**

WARNING: **Before performing any motor maintenance procedure, be sure that the equipment connected to the motor shaft cannot cause shaft rotation. If the load can cause shaft rotation, disconnect the load from the motor shaft before maintenance is performed. Unexpected mechanical rotation of the motor parts can cause injury or motor damage.**

Continued on next page.

Safety Notice Continued

WARNING: **Do not use non UL/CSA listed explosion proof motors in the presence of flammable or combustible vapors or dust. These motors are not designed for atmospheric conditions that require explosion proof operation.**

WARNING: **Motors that are to be used in flammable and/or explosive atmospheres must display the UL label on the nameplate along with CSA listed logo. Specific service conditions for these motors are defined in NFPA 70 (NEC) Article 500.**

WARNING: **Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions, should be permanently guarded to prevent accidental contact by personnel. Accidental contact with body parts or clothing can cause serious or fatal injury.**

Caution: **To prevent premature equipment failure or damage, only qualified maintenance personnel should perform maintenance.**

Caution: **Do not over tension belts. Excess tension may damage the motor or driven equipment.**

Caution: **Do not over–lubricate motor as this may cause premature bearing failure.**

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.**

Caution: **If eye bolts are used for lifting a motor, be sure they are securely tightened. The lifting direction should not exceed a 20 º angle from the shank of the eye bolt or lifting lug. Excessive lifting angles can cause damage.**

Caution: **To prevent equipment damage, be sure that the electrical service is not capable of delivering more than the maximum motor rated amps listed on the rating plate.**

Caution: **If a HI POT test (High Potential Insulation test) must be performed, follow the precautions and procedure in NEMA MG1 and MG2 standards to avoid equipment damage.**

Caution: **The space heaters are designed to operate at or below the maximum surface temperature stated on the nameplate. If the marked ambient and/or voltage are exceeded this maximum surface temperature can be exceeded and can damage the motor windings. If applied in a division 2 or zone 2 environment this excessive temperature may cause ignition of hazardous materials.**

Caution: **Shaker Duty motors must be properly lubricated prior to Start Up to prevent damage. See Section 3.**

If you have any questions or are uncertain about any statement or procedure, or if you require additional information please contact your Baldor distributor or an Authorized Baldor Service Center.

Receiving

Each Baldor Electric Motor is thoroughly tested at the factory and carefully packaged for shipment. When you receive your motor, there are several things you should do immediately.

1. Observe the condition of the shipping container and report any damage immediately to the commercial carrier that delivered your motor.
2. Verify that the part number of the motor you received is the same as the part number listed on your purchase order.

Handling

The motor should be lifted using the lifting lugs or eye bolts provided.

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.**

1. Use the lugs or eye bolts provided to lift the motor. Never attempt to lift the motor and additional equipment connected to the motor by this method. The lugs or eye bolts provided are designed to lift only the motor. Never lift the motor by the motor shaft or the hood of a WPII motor.
2. To avoid condensation inside the motor, do not unpack until the motor has reached room temperature. (Room temperature is the temperature of the room in which it will be installed). The packing provides insulation from temperature changes during transportation.
3. When lifting a WPII (Weather Proof Type 2) motor, do not lift the motor by inserting lifting lugs into holes on top of the cooling hood. These lugs are to be used for hood removal only. A spreader bar should be used to lift the motor by the cast lifting lugs located on the motor frame.
4. If the motor must be mounted to a plate with the driven equipment such as pump, compressor etc., it may not be possible to lift the motor alone. For this case, the assembly should be lifted by a sling around the mounting base. The entire assembly can be lifted as an assembly for installation. Do not lift the assembly using the motor lugs or eye bolts provided. Lugs or eye bolts are designed to lift motor only. If the load is unbalanced (as with couplings or additional attachments) additional slings or other means must be used to prevent tipping. In any event, the load must be secure before lifting. If the load is unbalanced (as with couplings or additional attachments) additional slings or other means must be used to prevent tipping. In any event, the load must be secure before lifting.

Storage

Storage requirements for motors and generators that will not be placed in service for at least six months from date of shipment.

Improper motor storage will result in seriously reduced reliability and failure. An electric motor that does not experience regular usage while being exposed to normally humid atmospheric conditions is likely to develop rust in the bearings or rust particles from surrounding surfaces may contaminate the bearings. The electrical insulation may absorb an excessive amount of moisture leading to the motor winding failure.

A wooden crate "shell" should be constructed to secure the motor during storage. This is similar to an export box but the sides & top must be secured to the wooden base with lag bolts (not nailed as export boxes are) to allow opening and reclosing many times without damage to the "shell".

Minimum resistance of motor winding insulation is 5 Meg ohms or the calculated minimum, which ever is greater. Minimum resistance is calculated as follows: Rm = kV + 1

where: (Rm is minimum resistance to ground in Meg–Ohms and kV is rated nameplate voltage defined as Kilo–Volts.)

Example: For a 480VAC rated motor Rm =1.48 meg–ohms (use 5 M Ω).

For a 4160VAC rated motor Rm = 5.16 meg–ohms.

Preparation for Storage

1. Some motors have a shipping brace attached to the shaft to prevent damage during transportation. The shipping brace, if provided, must be removed and stored for future use. The brace must be reinstalled to hold the shaft firmly in place against the bearing before the motor is moved.
2. Store in a clean, dry, protected warehouse where control is maintained as follows:
   a. Shock or vibration must not exceed 2 mils maximum at 60 hertz, to prevent the bearings from brinelling. If shock or vibration exceeds this limit vibration isolation pads must be used.
   b. Storage temperatures of 10 ºC (50 ºF) to 49 ºC (120 ºF) must be maintained.
   c. Relative humidity must not exceed 60%.
   d. Motor space heaters (when present) are to be connected and energized whenever there is a possibility that the storage ambient conditions will reach the dew point. Space heaters are optional.

Note: Remove motor from containers when heaters are energized, reprotect if necessary.

3. Measure and record the resistance of the winding insulation (dielectric withstand) every 30 days of storage.
   a. If motor insulation resistance decreases below the minimum resistance, contact your Baldor District office.
   b. Place new desiccant inside the vapor bag and re–seal by taping it closed.
   c. If a zipper–closing type bag is used instead of the heat–sealed type bag, zip the bag closed instead of taping it. Be sure to place new desiccant inside bag after each monthly inspection.
   d. Place the shell over the motor and secure with lag bolts.
4. Where motors are mounted to machinery, the mounting must be such that the drains and breathers are fully operable and are at the lowest point of the motor. Vertical motors must be stored in the vertical position. Storage environment must be maintained as stated in step 2.
5. Motors with anti–friction bearings are to be greased at the time of going into extended storage with periodic service as follows:
   a. Motors marked "Do Not Lubricate" on the nameplate do not need to be greased before or during storage.
   b. Ball and roller bearing (anti–friction) motor shafts are to be rotated manually every 3 months and greased every 6 months in accordance with the Maintenance section of this manual.
   c. Sleeve bearing (oil lube) motors are drained of oil prior to shipment. The oil reservoirs must be refilled to the indicated level with the specified lubricant, (see Maintenance). The shaft should be rotated monthly by hand at least 10 to 15 revolutions to distribute oil to bearing surfaces.
   d. "Provisions for oil mist lubrication" – These motors are packed with grease. Storage procedures are the same as paragraph 5b.
   e. "Oil Mist Lubricated" – These bearings are protected for temporary storage by a corrosion inhibitor. If stored for greater than 3 months or outdoor storage is anticipated, connected to the oil mist system while in storage. If this is not possible, add the amount of grease indicated under "Standard Condition" in Section 3, then rotate the shaft 15 times by hand.

6. All breather drains are to be fully operable while in storage (drain plugs removed). The motors must be stored so that the drain is at the lowest point. All breathers and automatic “T” drains must be operable to allow breathing and draining at points other than through the bearings around the shaft. Vertical motors should be stored in a safe stable vertical position.
7. Coat all external machined surfaces with a rust preventing material.
   An acceptable product for this purpose is Exxon Rust Ban # 392.
8. Carbon brushes should be lifted and held in place in the holders, above the commutator, by the brush holder fingers. The commutator should be wrapped with a suitable material such as cardboard paper as a mechanical protection against damage.

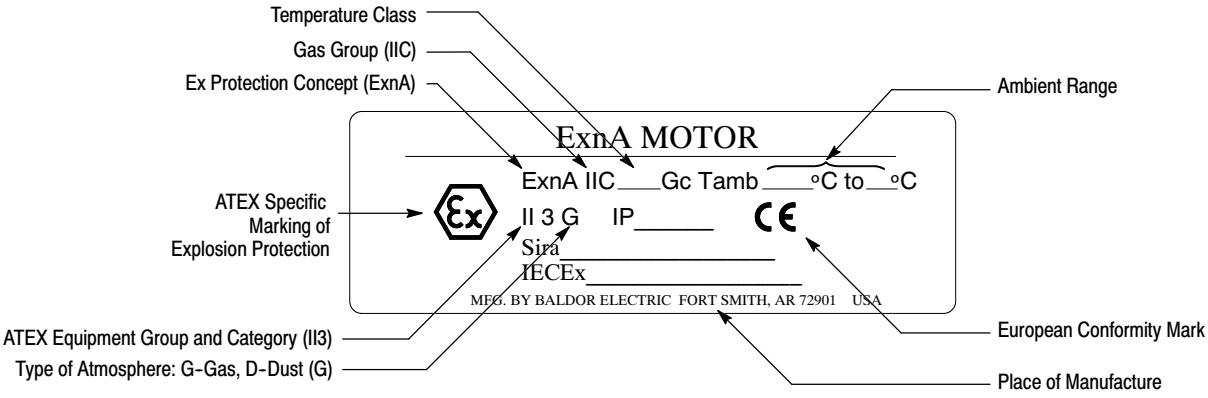
Non–Regreaseable Motors

Non–regreasable motors with “Do Not Lubricate” on the nameplate should have the motor shaft rotated 15 times to redistribute the grease within the bearing every 3 months or more often.

All Other Motor Types

Before storage, the following procedure must be performed.

1. Remove the grease drain plug, if supplied, (opposite the grease fitting) on the bottom of each bracket prior to lubricating the motor.
2. The motor with regreasable bearing must be greased as instructed in Section 3 of this manual.
3. Replace the grease drain plug after greasing.
4. The motor shaft must be rotated a minimum of 15 times after greasing.
5. Motor Shafts are to be rotated at least 15 revolutions manually every 3 months and additional grease added every nine months (see Section 3) to each bearing.
6. Bearings are to be greased at the time of removal from storage.



Removal From Storage

1. Remove all packing material.
2. Measure and record the electrical resistance of the winding insulation resistance meter at the time of removal from storage. The insulation resistance must not be less than 50% from the initial reading recorded when the motor was placed into storage. A decrease in resistance indicates moisture in the windings and necessitates electrical or mechanical drying before the motor can be placed into service. If resistance is low, contact your Baldor District office.
3. Regrease the bearings as instructed in Section 3 of this manual.
4. Reinstall the original shipping brace if motor is to be moved. This will hold the shaft firmly against the bearing and prevent damage during movement.

Equipment Marking for IEC Certified Product

IEC certified products have special markings that identify the protection concept and environment requirements. An example is shown in Figure 1-1.

Figure 1-1 IEC Certified Product Markings

Specific Conditions of Use:

If the motor certificate number is followed by the symbol "X", this indicates that the motor has specific conditions of use which are indicated on the certificate. It is necessary to review the product certification certificate in conjunction with this instruction manual.

Operation On Frequency Converters:

If the motor is evaluated for operation with an adjustable speed drive, the type of converter (for example PWM for Pulse Width Modulated) and safe speed ranges (for example 0- 120Hz) will be specified in the certification documents or on motor nameplates. It is necessary to consult the adjustable speed drive

manual for proper set up. IECEx Certificates are available online at www.iecex.com

Unit Conversions	
Inches to Millimeters	Inches x 25.4 = mm
Millimeters to Inches	mm x .03937 = Inches
Horsepower to Kilowatts	Hp x .746 = Kw
Kilowatts to Horsepower	Kw x 1.341 = Hp
Pounds to Kilograms	Lbs x .454 = Kg
Kilograms to Pounds	Kg x 2.205 = Lbs

EMC Compliance Statement for European Union

The motors described in this instruction manual are designed to comply 2004/108/EC . These motors are commercial in design and not intended for residential use. When used with converters, please consult converter manufacturers literature regarding recommendations on cable types, cable shielding, cable shielding termination, connection recommendations and any filters which may be recommended for EMC compliance. For additional information, consult Baldor MN1383.

Section 2

Installation & Operation

Overview

Installation should conform to the National Electrical Code as well as local codes and practices. When other devices are coupled to the motor shaft, be sure to install protective devices to prevent future accidents. Some protective devices include, coupling, belt guard, chain guard, shaft covers etc. These protect against accidental contact with moving parts. Machinery that is accessible to personnel should provide further protection in the form of guard rails, screening, warning signs etc.

Location

It is important that motors be installed in locations that are compatible with motor enclosure and ambient conditions. Improper selection of the motor enclosure and ambient conditions can lead to reduced operating life of the motor.

Proper ventilation for the motor must be provided. Obstructed airflow can lead to reduction of motor life.

1. **Open Drip–Proof/WPI** motors are intended for use indoors where atmosphere is relatively clean, dry, well ventilated and non–corrosive.
2. **Totally Enclosed and WPII** motors may be installed where dirt, moisture or dust are present and in outdoor locations.

Severe Duty, IEEE 841 and Washdown Duty enclosed motors are designed for installations with high corrosion or excessive moisture conditions. These motors should not be placed into an environment where there is the presence of flammable or combustible vapors, dust or any combustible material, unless specifically designed for this type of service. IEEE841 motors are suitable for application in Class I Division 2 and Class I Zone 2 areas on sine wave power in accordance with the applicable codes and standards.

Hazardous Locations are those where there is a risk of ignition or explosion due to the presence of combustible gases, vapors, dust, fibers, or flyings. Facilities requiring special equipment for hazardous locations are typically classified in accordance with local requirements. In the US market, guidance is provided by the National Electric Code.

EMC Compliance Statement for European Union

The motors described in this instruction manual are designed to comply 2004/108/EC . These motors are commercial in design and not intended for residential use.

Mounting Location

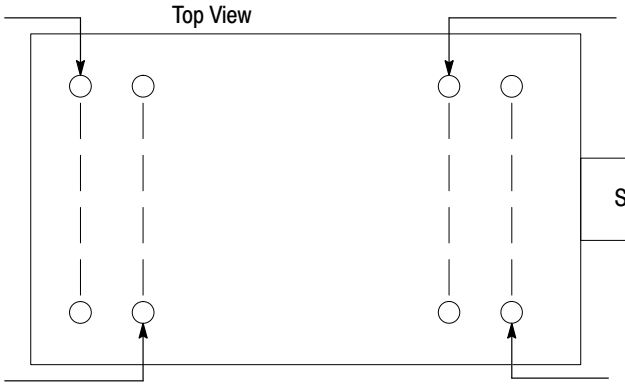
The motor should be installed in a location compatible with the motor enclosure and specific ambient. To allow adequate air flow, the following clearances must be maintained between the motor and any obstruction:

Table 2-1 Enclosure Clearance

TEFC / TENV (IC0141) Enclosures	
Fan Cover Air Intake	180 – 210T Frame 1” (25mm)
Fan Cover Air Intake	250 – 449T Frame 4” (100mm)
	IEC 112 – 132 1” (25mm)
	IEC 160 – 280 4” (100mm)
Exhaust	Envelope equal to the P Dimension on the motor dimension sheet
OPEN/Protected Enclosures	
Bracket Intake	Same as TEFC
Frame Exhaust	Exhaust out the sides envelope A minimum of the P dimension plus 2” (50mm) Exhaust out the end same as intake.

The motor must be securely installed to a rigid foundation or mounting surface to minimize vibration and maintain alignment between the motor and shaft load. Failure to provide a proper mounting surface may cause vibration, misalignment and bearing damage.

Foundation caps and sole plates are designed to act as spacers for the equipment they support. If these devices are used, be sure that they are evenly supported by the foundation or mounting surface.



When installation is complete and accurate alignment of the motor and load is accomplished, the base should be grouted to the foundation to maintain this alignment.

The standard motor base is designed for horizontal or vertical mounting. Adjustable or sliding rails are designed for horizontal mounting only. Consult your Baldor distributor or authorized Baldor Service Center for further information.

Frame Mounting Holes

Some motors have standardized frames containing 6 or 8 mounting holes. 6 hole frames are not suitable for field reversal of mounting from F–1 to F–2, etc. Figure 2-1 indicates the proper mounting holes to use.

Figure 2-1 6 & 8 Hole Motor Frame Mounting

For short frame designations 182, 213, 254, 284, 324, 364, 404, 444 (NEMA)

Allows F-1 to F-2 Conversion on 8 hole frames.
Not present on 6 hole frames.
Not used on 8 hole frames.

For long frame designations 184, 215, 256, 286, 326, 365, 405, 445 (NEMA) (IEC) 112M, 132M, 160L, 200L, 225M, 250M, 280M

Always use these holes, closer to the shaft 112S, 132S, 160M, 180M, 200M, 225S, 250S, 280S, (IEC)

Caution: **Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.**

In the case of assemblies on a common base, any lifting means provided on the motor should not be used to lift the assembly and base but, rather, the assembly should be lifted by a sling around the base or by other lifting means provided on the base. Assure lifting in the direction intended in the design of the lifting means. Likewise, precautions should be taken to prevent hazardous overloads due to deceleration, acceleration or shock forces.

Alignment

Accurate alignment of the motor with the driven equipment is extremely important. The pulley, sprocket, or gear used in the drive should be located on the shaft as close to the shaft shoulder as possible. It is recommended to heat the pulley, sprocket, or gear before installing on the motor shaft. Forcibly driving a unit on the motor shaft will damage the bearings.

1. Direct Coupling
   For direct drive, use flexible couplings if possible. Consult the drive or equipment manufacturer for more information. Mechanical vibration and roughness during operation may indicate poor alignment. Use dial indicators to check alignment. The space between coupling hubs should be maintained as recommended by the coupling manufacturer.
2. End-Play Adjustment
   The axial position of the motor frame with respect to its load is also extremely important. The standard motor bearings are not designed for excessive external axial thrust loads. Improper adjustment will cause failure.
3. Pulley Ratio
   The best practice is to not exceed an 8:1 pulley ratio.

Caution: **Do not over tension belts. Excess tension may damage the motor or driven equipment.**

4. Belt Drive
   Align sheaves carefully to minimize belt wear and axial bearing loads (see End-Play Adjustment). Belt tension should be sufficient to prevent belt slippage at rated speed and load. However, belt slippage may occur during starting.

Doweling & Bolting

After proper alignment is verified, dowel pins should be inserted through the motor feet into the foundation. This will maintain the correct motor position should motor removal be required. (Baldor•Reliance motors are designed for doweling.)

1. Drill dowel holes in diagonally opposite motor feet in the locations provided.
2. Drill corresponding holes in the foundation.
3. Ream all holes.
4. Install proper fitting dowels.
5. Mounting bolts must be carefully tightened to prevent changes in alignment.

Use a flat washer and lock washer under each nut or bolt head to hold the motor feet secure.

Flanged nuts or bolts may be used as an alternative to washers.

WARNING: **Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions, should be permanently guarded to prevent accidental contact by personnel. Accidental contact with body parts or clothing can cause serious or fatal injury.**

Guarding

Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions. This is particularly important where the parts have surface irregularities such as keys, key ways or set screws. Some satisfactory methods of guarding are:

1. Covering the machine and associated rotating parts with structural or decorative parts of the driven equipment.
2. Providing covers for the rotating parts. Covers should be sufficiently rigid to maintain adequate guarding during normal service.

Power Connection

Motor and control wiring, overload protection, disconnects, accessories and grounding should conform to the National Electrical Code and local codes and practices.

For ExnA hazardous location motors, it is a specific condition of use that all terminations in a conduit box be fully insulated. Fully insulated and lugged terminations must be bolted and provided with lock washer to prevent rotation. Flying leads must be insulated with two full wraps of electrical grade insulating tape or heat shrink tubing.

Grounding

In the USA consult the National Electrical Code, Article 430 for information on grounding of motors and generators, and Article 250 for general information on grounding. In making the ground connection, the installer should make certain that there is a solid and permanent metallic connection between the ground point, the motor or generator terminal housing, and the motor or generator frame. In non–USA locations consult the appropriate national or local code applicable.

Motors with resilient cushion rings usually must be provided with a bonding conductor across the resilient member. Some motors are supplied with the bonding conductor on the concealed side of the cushion ring to protect the bond from damage. Motors with bonded cushion rings should usually be grounded at the time of installation in accordance with the above recommendations for making ground connections. When motors with bonded cushion rings are used in multimotor installations employing group fusing or group protection, the bonding of the cushion ring should be checked to determine that it is adequate for the rating of the branch circuit over current protective device being used.

There are applications where grounding the exterior parts of a motor or generator may result in greater hazard by increasing the possibility of a person in the area simultaneously contacting ground and some other nearby live electrical parts of other ungrounded electrical equipment. In portable equipment it is difficult to be sure that a positive ground connection is maintained as the equipment is moved, and providing a grounding conductor may lead to a false sense of security.

Select a motor starter and over current protection suitable for this motor and its application. Consult motor starter application data as well as the National Electric Code and/or other applicable local codes.

For motors installed in compliance with IEC requirements, the following minimum cross sectional area of the protective conductors should be used:

Crosssectional area of phase conductors, S	Minimum crosssectional area of the corresponding protective conductor, S_p
mm^2	mm^2
$S < 16$	S
$16 < S \leq 35$	16
$S > 35$	$0{,}5\ S$

Equipotential bonding connection shall made using a conductor with a cross-sectional area of at least 4 mm^2.

Conduit Box

For ease of making connections, an oversize conduit box is provided. Most conduit boxes can be rotated 360 ° in 90 ° increments. Auxiliary conduit boxes are provided on some motors for accessories such as space heaters, RTD's etc.

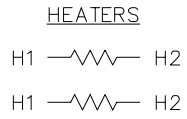
AC Power

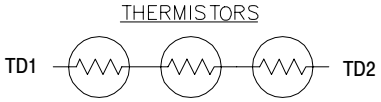
Motors with flying lead construction must be properly terminated and insulated.

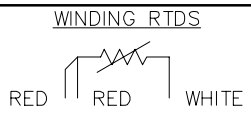
Connect the motor leads as shown on the connection diagram located on the name plate or inside the cover on the conduit box. Be sure the following guidelines are met:

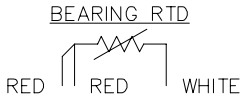
1. AC power is within ±10% of rated voltage with rated frequency. (See motor name plate for ratings).

OR









2. AC power is within ±5% of rated frequency with rated voltage.

OR

3. A combined variation in voltage and frequency of ±10% (sum of absolute values) of rated values, provided the frequency variation does not exceed ±5% of rated frequency.

Performance within these voltage and frequency variations are shown in Figure 2-3.

Figure 2-2 Accessory Connections

	One heater is installed in each end of motor. Leads for each heater are labeled H1 & H2. (Like numbers should be tied together).
	Three thermistors are installed in windings and tied in series. Leads are labeled TD1 & TD2.
	Winding RTDs are installed in windings (2) per phase. Each set of leads is labeled 1TD1, 1TD2, 1TD3, 2TD1, 2TD2, 2TD3 etc.
	* One bearing RTD is installed in Drive endplate (PUEP), leads are labeled RTDDE. * One bearing RTD is installed in Opposite Drive endplate (FREP), leads are labeled RTDODE. * Note RTD may have 2–Red/1–White leads; or 2–White/1–Red Lead.

Rotation

All three phase motors are reversible. To reverse the direction of rotation, disconnect and lock out power and interchange any two of the three line leads for three phase motors. For single phase motors, check the connection diagram to determine if the motor is reversible and follow the connection instructions for lead numbers to be interchanged. Not all single phase motors are reversible.

Adjustable Frequency Power Inverters used to supply adjustable frequency power to induction motors produce wave forms with lower order harmonics with voltage spikes superimposed. Turn–to–turn, phase–to–phase, and ground insulation of stator windings are subject to the resulting dielectric stresses. Suitable precautions should be taken in the design of these drive systems to minimize the magnitude of these voltage spikes. Consult the drive instructions for maximum acceptable motor lead lengths, and proper grounding.

Note: Main power leads for CE Marked Motors may be marked U,V,W – for standard configurations, please consult connection diagrams.

Caution: **The space heaters are designed to operate at or below the maximum surface temperature stated on the nameplate. If the marked ambient and/or voltage are exceeded this maximum surface temperature can be exceeded and can damage the motor windings. If applied in a division 2 or zone 2 environment this excessive temperature may cause ignition of hazardous materials.**

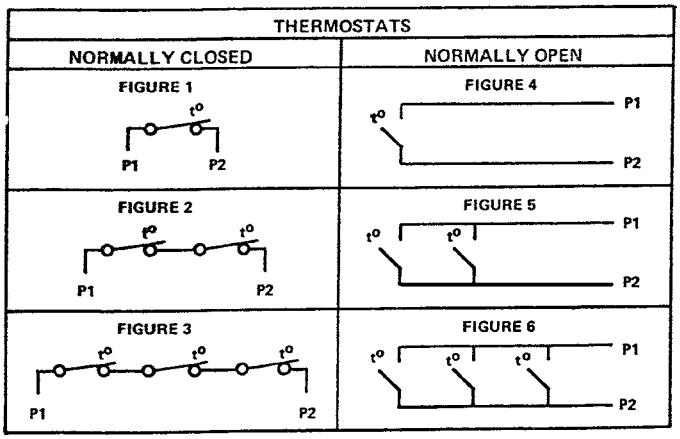
THERMOSTATS



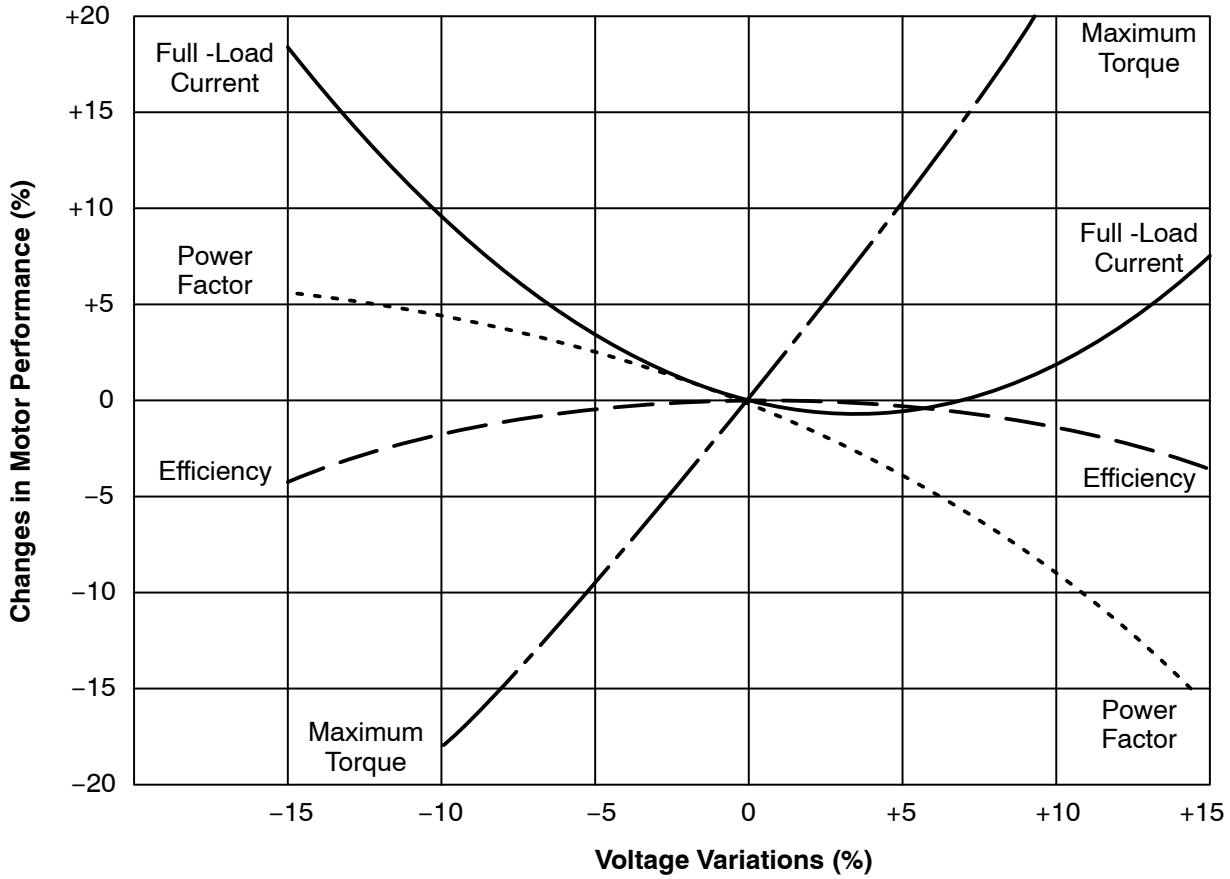


Figure 2-3 Typical Motor Performance VS Voltage Variations

Initial Lubrication

Baldor•Reliance motors are shipped from the factory with the bearings properly packed with grease and ready to operate. Where the unit has been subjected to extended storage (6 months or more) the bearings should be relubricated (regreasable type) prior to starting. When motors are equipped for oil mist lubrication refer to the instruction manual for installation, operation, and maintenance of oil mist lubrication systems.

Caution: **Shaker Duty motors must be properly lubricated prior to Start Up to prevent damage. See Section 3.**

First Time Start Up

Be sure that all power to motor and accessories is off. Be sure the motor shaft is disconnected from the load and will not cause mechanical rotation of the motor shaft.

1. Make sure that the mechanical installation is secure. All bolts and nuts are tightened etc.
2. If motor has been in storage or idle for some time, check winding insulation integrity.
3. Inspect all electrical connections for proper termination, clearance, mechanical strength and electrical continuity.
4. Be sure all shipping materials and braces (if used) are removed from motor shaft.
5. Manually rotate the motor shaft to ensure that it rotates freely.
6. Replace all panels and covers that were removed during installation.
7. Momentarily apply power and check the direction of rotation of the motor shaft.
8. If motor rotation is wrong, be sure power is off and change the motor lead connections. Verify rotation direction before you continue.
9. Start the motor and ensure operation is smooth without excessive vibration or noise. If so, run the motor for 1 hour with no load connected.

10. After 1 hour of operation, disconnect power and connect the load to the motor shaft.
    Verify all coupling guards and protective devices are installed. Ensure motor is properly ventilated.
11. If motor is totally enclosed fan–cooled or non–ventilated it is recommended that condensation drain plugs, if present, be removed. These are located in the lower portion of the end–shields. Totally enclosed fan–cooled “XT” motors are normally equipped with automatic drains which may be left in place as received.

Coupled Start Up

This procedure assumes a coupled start up. Also, that the first time start up procedure was successful.

1. Check the coupling and ensure that all guards and protective devices are installed.
2. Check that the coupling is properly aligned and not binding.
3. The first coupled start up should be with no load. Apply power and verify that the load is not transmitting excessive vibration back to the motor though the coupling or the foundation.
   Vibration should be at an acceptable level.
4. Run for approximately 1 hour with the driven equipment in an unloaded condition.

The equipment can now be loaded and operated within specified limits. Do not exceed the name plate ratings for amperes for steady continuous loads.

Jogging and Repeated Starts

Repeated starts and/or jogs of induction motors generally reduce the life of the motor winding insulation. A much greater amount of heat is produced by each acceleration or jog than by the same motor under full load. If it is necessary to repeatedly start or jog the motor, it is advisable to check the application with your local Baldor distributor or Baldor Service Center.

Heating - Duty rating and maximum ambient temperature are stated on the motor name plate.
Do not exceed these values. If there is any question regarding safe operation, contact your local Baldor distributor or Baldor Service Center.

Hazardous Locations

Hazardous locations are those where there is a risk of ignition or explosion due to the presence of combustible gases, vapors, dust, fibers or flyings.

Selection

Facilities requiring special equipment for hazardous locations are typically classified in accordance with local requirements. In the US market, guidance is provided by the National Electric Code. In international hazardous location areas, guidance for gas / vapor / mist classification is given in IEC60079–14, or for dust in IEC61241–14. This classification process lets the installer know what equipment is suitable for installation in that environment, and identifies what the maximum safe temperature or temperature class is required.
It is the customer or users responsibility to determine the area classification and select proper equipment.

Areas are classified with respect to risk and exposure to the hazard. In the US market, areas are typically classified as follows Class, Division, Group and Temperature Class. In some newer installations in the US and in most international markets, areas are classified in Zones.

Protection Concepts

Class I Division 1 / Zone 1 [Equipment Group I (mining) or II (surface), Equipment Protection Level (EPL) Gb, Mb]

Baldor offers a range of motors suitable for installation in a Division 1 or Zone 1 environment.
These motors are known as explosion proof or flameproof.
Motors that are explosion proof or flameproof use specially machined flameproof joints between the end bell or bracket and the frame, as well as along the rotating shaft and at connection box covers and entries.
The fit of these flameproof joints are designed to contain the combustion or quench the flame of an explosive gas atmosphere prior to it exiting the motor. These flameproof joints have lengths and widths selected and tested based on the gas group present in the atmosphere. Baldor•Reliance motors are typically designed to meet Class I (Division 1) Group C and D (explosion proof) or Ex d IIB (flameproof).

An application note regarding equipment applied in accordance with the US National Electric Code (NFPA 70–2008) – according to Article 500.8(C) Marking, sub clause (2) in the fine print note, it is noted that Equipment not marked to indicate a division is suitable for both Division 1 and Division 2 locations.
These motors are not gas tight. To the contrary, this protection concept assumes that due to the normal heating and cooling cycle of motor operation that any gas present will be drawn into the motor. Since flameproof or explosion proof motors are designed to contain the combustion and extinguish any flame transmission, for this protection concept, only external surface temperatures are of concern. Thermal limiting devices such as thermostats, thermistors or RTDs may be provided on these motors to limit the external surface temperature during overload conditions.

If thermostats are provided as a condition of certification, it is the installer's responsibility to make sure that these devices are properly connected to a suitable switching device. The ATEX directive requires that motor shutdown on thermal trip be accomplished without an intermediate software command. Where intermediate circuitry is involved the circuit shall fall within the scope of a safety, controlling and regulating device as defined in article 1(2) of European Directive 94/9/EC, and shall be covered by an appropriate EC Type Examination Certificate.

Flameproof motors, internationally referred to as Ex d use a protection concept similar to that used in Class I Division 1 motors, with minor differences in the flameproof joints and cable entry designs. Flameproof and explosion proof motors are both type tested. Representative motors are connected to a reference gas and ignited in laboratory conditions to verify that the flame is not transmitted outside the motor enclosure and to determine the maximum internal pressure encountered.

Explosion proof and Flame proof motors shipped without a conduit box require use of a certified box of suitable dimensions and that is appropriate for the classification. Openings in connection boxes must be closed with suitably certified and dimensioned device.

Hazardous location motors equipped with NPT pipe nipples are designed and built such that the pipe nipple is securely attached to the motor frame. This is accomplished externally by interference between the threads as well as tack welding. The conduit box is securely attached to the pipe nipple at the factory per:

1. Standard Commercial NPT & Explosion Proof IEC/ATEX parts : L-1 gauging notch +/- 1 thread (ref. ANSI/ASME B1.20.1 and Clarification Sheet ExNB/98/06/010/CS) Note: Clarification Sheet ExNB/98/06/010/CS provides inspection criteria to meet (6 threads minimum per engineering part drawing for ATEX parts).
2. Explosion Proof UL conduit boxes & MSHA parts: L-1 gauging notch "+1 min to + 3 1/2 max threads. Note: Provides inspection criteria to meet (5 threads minimum per engineering part drawing for MSHA parts and meet UL 1203 requirement for L-1 gauging notch flush to + 3 1/2 max threads).

This allows the end user to position the conduit box according to the application then secure when in place. For obvious reasons having the conduit box snug prior to affixing to the pipe nipple is preferable. However, the guidance in numbers 1 and 2 above can be used in determining thread engagement.

Note: In the United States most non-mining applications have rigid conduit for cabling, therefore not tack welding the conduit box to the pipe nipple is standard. In markets outside the United States, flexible conduit/cabling are common and end users should take note to secure the conduit box to the pipe nipple once in position. Further, the flexible leads should be secured to inhibit forces acting on the conduit box.

Class I Division 2 / Zone 2 Ex nA, [Equipment Protection Level (EPL) Gc]

This protection concept relies on having no sources of ignition present such as arcing parts or hot surfaces. For this protection concept, internal temperatures as well as external temperatures are considered. In many cases, the internal temperatures are higher than the external temperatures and therefore become the limiting factor in determination of temperature code designation. In these applications, it is very important to use a motor that has been evaluated thermally for use with an inverter or converter, if variable speed operation is desired. Thermostats used for Class I Division 2 and Ex nA motors are used to protect the motor only. For motors using flying lead construction, it is important to use connection lugs and insulate with heat shrink tubing or a double wrap of insulation grade electrical tape to avoid the risk of spark or ignition.

Class II Division 1 / Zone 21 [Equipment Group III, Equipment Protection Level (EPL) Db]

This area classification is one where the risk of ignitable concentrations of dust is present at all or some of the time. The protection concepts used for Class II Division 1 is similar to flamepath, except with additional dust exclusion paths designed for the rotating shaft. In the international designations, this concept is referred to as dust ignition proof or Ex tD. External surface temperature remains the limiting factor. Thermal limiting devices such as thermostats, thermistors or RTDs may be provided on these motors to limit the external surface temperature during overload conditions. If thermostats are provided as a condition of certification, it is the installer's responsibility to make sure that these devices are properly connected to a suitable switching device.

Note: In the North American area classification system, Class III exists for fibers and flyings.
In the IEC designation, both dusts and flyings are absorbed into Group III.

Class II Division 2 / Zone 22 [Equipment Group III, Equipment Protection Level (EPL) Dc]

This area classification is one where the risk of exposure to ignitable concentrations of dust are not likely to occur under normal operating conditions and relies heavily on the housekeeping practices within the installation.

Sine Wave Power Operation for Division 1 or 2 and Zone 1 or 2 and Zone 21 or 22 Hazardous Location.

These motors are designed to operate at or below the maximum surface temperature (or T–Code) stated on the nameplate. Failure to operate the motor properly can cause this maximum surface temperature to be exceeded. If applied in a Division 1 or 2 / Zone 1 or 2 and Zone 21 or 22 environment, this excessive temperature may cause ignition of hazardous materials. Operating the motor at any of the following conditions can cause the marked surface temperature to be exceeded.

1. Motor load exceeding service factor nameplate value
2. Ambient temperatures above nameplate value
3. Voltages above or below nameplate value
4. Unbalanced voltages
5. Loss of proper ventilation
6. Altitude above 3300 feet / 1000 meters
7. Severe duty cycles of repeated starts
8. Motor stall
9. Motor reversing
10. Single phase operation of polyphase equipment
11. Variable frequency operation

Variable Frequency Power Operation for Division 1 or 2 and Zone 1 or 2 and Zone 21 or 22

Hazardous Location (motors with maximum surface temperature listed on the nameplate).
Only motors with nameplates marked for use on inverter (variable frequency) power, and labeled for specific hazardous areas may be used in those hazardous areas on inverter power. The motor is designed to operate at or below the maximum surface temperature (or T−Code) stated on the nameplate.
Failure to operate the motor properly can cause this maximum surface temperature to be exceeded.

If applied in a Division 1 or 2 / Zone 1 or 2 and Zone 21 or 22 environment, this excessive temperature may cause ignition of hazardous materials. Operating the motor at any of the following conditions can cause the marked surface temperature to be exceeded.

1. Motor load exceeding service factor nameplate value
2. Ambient temperature above nameplate value
3. Voltage (at each operating frequency) above or below rated nameplate value
4. Unbalanced voltages
5. Loss of proper ventilation
6. Operation outside of the nameplate speed / frequency range
7. Altitudes above 3300 feet / 1000 meters
8. Single phase operation of polyphase equipment
9. Unstable current wave forms
10. Lower than name plate minimum carrier frequency

Thermal Limiting
Thermal limiting devices are temperature sensing control components installed inside the motor to limit the internal temperature of the motor frame by interrupting the circuit of the holding coil of the magnetic switch or contactor. They are required for most Division 1 and Zone 1 applications. For Division 2 or Zone 2 applications, motors should be selected that preclude running temperatures from exceeding the ignition temperatures for the designated hazardous material. In Division 2 or Zone 2 classified locations, thermal limiting devices should only be used for winding protection and not considered for limiting all internal motor temperatures to specific ignition temperatures.

Equipotential Bonding and Shaft Current Reduction
Larger motors (ie WP construction) may require proper bonding between motor enclosures and covers to avoid the risk of stray currents during start up. Fastening methods and bonding straps must not be modified. Bearing currents can exist in some motors for both line−fed and inverter−fed applications. Larger line−fed motors may require at least one insulated bearing to prevent a flow of current through the bearings. Do not defeat such insulation whether the motor is line−fed or inverter−fed applications. Inverter−fed motors may require additional bearing insulation or even a shaft brush. Do not defeat such features. When the motor and the coupled load are not on a common conductive baseplate, it may also be necessary to electrically bond together the stationary parts of the motor and the coupled equipment.

Repair of Motors used in Hazardous Locations

Repair of hazardous certified motors requires additional information, skill, and care. It is the customer's responsibility to select service shops with proper qualifications to repair hazardous location motors. Contact the manufacture for additional repair details. Use only original manufacturer's parts.

Repair of Explosion Proof or Flame Proof Motors Class I Division 1 and Zone 1

In the North American market, recertification programs are offered by Underwriters Laboratories and Canadian Standards Association which allow authorized service shops to mark the rebuilt motors as certified. In the international markets using IEC based requirements, repair should be undertaken only after consulting IEC60079–19 Explosive Atmospheres–Part 19 Equipment repair, overhaul and reclamation. If use of a certified repair facility is desired, consult the IECEX Repair Scheme at http://www.iecex.com/service_facilities.htm

Explosion proof and flameproof motors achieve their safety based on the mechanical construction – flameproof joints and bearing clearance, and the electrical design including any thermal limiting devices. If it is necessary to repair a flameproof or explosion proof motor, it is critical that the mechanical flameproof joints be maintained. Consult Baldor Electric Company for flameproof joint construction details.
Use only Baldor•Reliance supplied parts. Baldor does not recommend reclamation of parts.
Since this protection method also relies on temperature being maintained, make sure that any rewinding uses the original electrical designs, including any thermal protection that may be present.

Repair of Dust Ignition Proof Motors – Class II Division 1 and 2, Zone 21 and 22.

For Dust Ignition Proof, proper sealing is required. Do not modify the motor construction to add any additional opening, and ensure that proper sealing is maintained in the connection box and at the shaft seal. Since this protection method also relies on temperature being maintained, make sure that any rewinding uses the original electrical designs, including any thermal protection that may be present

Repair of Class I Division 2 and Zone 2 motors

For Division 2 and Zone 2, the internal and external temperatures are of concern. Since this protection method also relies on temperature being maintained, make sure that any rewinding uses the original electrical designs, including any thermal protection that may be present. Use only Baldor replacement thermostats, if provided.

Section 3

Maintenance & Troubleshooting

WARNING: UL and EX Listed motors must only be serviced by UL or EX Approved Authorized Baldor Service Centers if these motors are to be returned to a hazardous and/or explosive atmosphere.

General Inspection

Inspect the motor at regular intervals, approximately every 500 hours of operation or every 3 months, whichever occurs first. Keep the motor clean and the ventilation openings clear. The following steps should be performed at each inspection:

WARNING: Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.

1. Check that the motor is clean. Check that the interior and exterior of the motor is free of dirt, oil, grease, water, etc. Oily vapor, paper pulp, textile lint, etc. can accumulate and block motor ventilation. If the motor is not properly ventilated, overheating can occur and cause early motor failure.
2. Perform a dielectric with stand test periodically to ensure that the integrity of the winding insulation has been maintained. Record the readings. Immediately investigate any significant decrease in insulation resistance.
3. Check all electrical connectors to be sure that they are tight.

Relubrication & Bearings

Bearing grease will lose its lubricating ability over time, not suddenly. The lubricating ability of a grease (over time) depends primarily on the type of grease, the size of the bearing, the speed at which the bearing operates and the severity of the operating conditions. Good results can be obtained if the following recommendations are used in your maintenance program.

Type of Grease A high grade ball or roller bearing grease should be used. Baldor motors are pregreased, normally with Polyrex EM (Exxon Mobil) or as stated on the nameplate.
Do not mix greases unless compatibility has been checked and verified.

Ball Bearing Motors

Operating Temperature –25 ºC (–15 ºF) to 50 ºC (120 ºF)

EXXON	POLYREX EM (Standard on Baldor motors)
EXXON	UNIREX N2
EXXON	BEACON 325
CHEVRON OIL	SRI NO. 2 (Compatible with Polyrex EM)
CHEVRON OIL	BLACK PEARL
TEXACO, INC.	PREMIUM RB
TEXACO, INC.	POLYSTAR
AMOCO	RYKON # 2
PENNZOIL	PENNZLUBE EM–2
DARMEX	DARMEX 707
DARMEX	DARMEX 711
PETRO–CANADA	PEERLESS LLG
SHELL OIL	DOLIUM BRB

Minimum Starting Temperature –60 ºC (–76 ºF)

SHELL OIL CO.	AEROSHELL 7 (Standard on Baldor motors)
MOBIL	MOBIL 28
MOBIL	MOBILITH SHC 100 (Low Temperature – Arctic Duty)

Roller Bearing Motors

Operating Temperature –25 ºC (–15 ºF) to 50 ºC (120 ºF)

TEXACO, INC.	PREMIUM RB
MOBIL	MOBILITH SHC 220 (Standard on Baldor motors)
CHEVRON OIL	BLACK PEARL

Relubrication Intervals

Recommended relubrication intervals are shown in Table 3-1. It is important to realize that the recommended intervals of Table 3-2 are based on average use.

Refer to additional information contained in Tables 3-2, 3-3 and 3-4.

Table 3-1 Relubrication Intervals *

NEMA / (IEC) Frame Size	Rated Speed - RPM					
	10000	**6000**	**3600**	**1800**	**1200**	**900**
Up to 210 incl. (132)	**	2700 Hrs.	5500 Hrs.	12000 Hrs.	18000 Hrs.	22000 Hrs.
Over 210 to 280 incl. (180)		**	3600 Hrs.	9500 Hrs.	15000 Hrs.	18000 Hrs.
Over 280 to 360 incl. (225)		**	* 2200 Hrs.	7400 Hrs.	12000 Hrs.	15000 Hrs.
Over 360 to 449 incl. (315)		**	*2200 Hrs.	3500 Hrs.	7400 Hrs.	10500 Hrs.

* Relubrication intervals are for ball bearings.
For vertically mounted motors and roller bearings, divide the relubrication interval by 2.

** For motors operating at speeds greater than 3600 RPM, contact Baldor for relubrication recommendations.

Table 3-2 Service Conditions

Severity of Service	Hours per day of Operation	Ambient Temperature Maximum	Atmospheric Contamination
Standard	8	40 ºC	Clean, Little Corrosion
Severe	16 Plus	50 ºC	Moderate dirt, Corrosion
Extreme	16 Plus	>50 ºC* or Class H Insulation	Severe dirt, Abrasive dust, Corrosion, Heavy Shock or Vibration
Low Temperature		<–29 ºC **	

* Special high temperature grease is recommended (Dow Corning DC44). Note that Dow Corning DC44 grease does not mix with other grease types. Thoroughly clean bearing & cavity before adding grease.

** Special low temperature grease is recommended (Aeroshell 7).

Table 3-3 Relubrication Interval Multiplier

Severity of Service	Multiplier
Standard	1.0
Severe	0.5
Extreme	0.1
Low Temperature	1.0

Some motor designs use different bearings on each motor end. This is normally indicated on the motor nameplate. In this case, the larger bearing is installed on the motor Drive endplate. For best relubrication results, only use the appropriate amount of grease for each bearing size (not the same for both).

Table 3-4 Bearings Sizes and Types

Frame Size NEMA (IEC)	Bearing Description (These are the "Large" bearings (Shaft End) in each frame size)			
	Bearing	Weight of Grease to add * oz (Grams)	Volume of grease to be added	
			in^3	teaspoon
56 to 140 (90)	6203	0.08 (2.4)	0.15	0.5
140 (90)	6205	0.15 (3.9)	0.2	0.8
180 (100–112)	6206	0.19 (5.0)	0.3	1.0
210 (132)	6307	0.30 (8.4)	0.6	2.0
250 (160)	6309	0.47 (12.5)	0.7	2.5
280 (180)	6311	0.61 (17)	1.2	3.9
320 (200)	6312	0.76 (20.1)	1.2	4.0
360 (225)	6313	0.81 (23)	1.5	5.2
400 (250)	6316	1.25 (33)	2.0	6.6
440 (280)	6318	1.52(40)	2.5	8.2
440 (280)	6319	2.12 (60)	4.1	13.4
5000 to 5800 (315–355)	6328	4.70 (130)	9.2	30.0
5000 to 5800 (315–355)	NU328	4.70 (130)	9.2	30.0
360 to 449 (225–280)	NU319	2.12 (60)	4.1	13.4
AC Induction Servo				
76 Frame 180 (112)	6207	0.22 (6.1)	0.44	1.4
77 Frame 210 (132)	6210	0.32 (9.0)	0.64	2.1
80 Frame 250(160)	6213	0.49 (14.0)	0.99	3.3

* Weight in grams = .005 DB of grease to be added

Note: Not all bearing sizes are listed. For intermediate bearing sizes, use the grease volume for the next larger size bearing.

Caution: **To avoid damage to motor bearings, grease must be kept free of dirt. For an extremely dirty environment, contact your Baldor distributor or an authorized Baldor Service Center for additional information.**

Relubrication Procedure Be sure that the grease you are adding to the motor is compatible with the grease already in the motor. Consult your Baldor distributor or an authorized service center if a grease other than the recommended type is to be used.

Caution: **Do not over–lubricate motor as this may cause premature bearing failure.**

With Grease Outlet Plug

1. With the motor stopped, clean all grease fittings with a clean cloth.
2. Remove grease outlet plug.

Caution: **Over–lubricating can cause excessive bearing temperatures, premature lubrication breakdown and bearing failure.**

3. Add the recommended amount of grease.
4. Operate the motor for 15 minutes with grease plug removed. This allows excess grease to purge.
5. Re-install grease outlet plug.

Without Grease Provisions

Note: Only a Baldor authorized and UL or CSA certified service center can disassemble a UL/CSA listed explosion proof motor to maintain it's UL/CSA listing.

1. Disassemble the motor.
2. Add recommended amount of grease to bearing and bearing cavity. (Bearing should be about 1/3 full of grease and outboard bearing cavity should be about 1/2 full of grease.)
3. Assemble the motor.

Sample Relubrication Determination

Assume - NEMA 286T (IEC 180), 1750 RPM motor driving an exhaust fan in an ambient temperature of 43 °C and the atmosphere is moderately corrosive.

1. Table 3-2 list 9500 hours for standard conditions.
2. Table 3-3 classifies severity of service as "Severe".
3. Table 3-5 shows that 1.2 in^3 or 3.9 teaspoon of grease is to be added.

Note: Smaller bearings in size category may require reduced amounts of grease.

Shaker Duty Motors only

Caution: **Shaker Duty motors must be properly lubricated prior to Start Up to prevent damage. See Table 3-6.**

Lubrication should be performed before Start Up and at regular maintenance intervals. Follow these recommendations to ensure proper lubrication.

Recommended Lubricant

For ambient temperatures between –15 °F to 120 °F the following lubricants are recommended: Mobil PolyrexEM, Texaco Premium RB, Exxon Unirex N–2.

Do not mix greases unless compatibility has been checked and verified.

Table 3-5 Lubrication Volume

NEMA Frame Size	Volume in Cubic Inches					
	Normal Duty		Severe Duty		Extreme Duty	
	Start Up	Relub	Start Up	Relub	Start Up	Relub
184TY	1.4	0.5	1.4	0.5	2.7	0.5
215TY	1.6	0.5	1.6	0.5	4.5	1
256TY	7	1			11	2
286TY	9	1			15	3

Lubrication Frequency

Normal Duty 8 hours per day (16 hours per day in a clean environment). Lubricate every 2 months.

Severe Duty 16 hours per day or more in a dirty environment (corrosive atmosphere, chemical fumes, acids, alkalies or extreme high humidity). Lubricate every month or 700 hours of operation.

Extreme Duty operation in extremely dirty or dusty environments and high ambient temperatures exceeding 104 °F (40 °C). Lubricate twice a month or 350 hours of operation.

Lubrication Procedure

1. Locate the grease inlet and outlet. Clean the areas.
2. Remove the plug(s) and install a grease fitting in the inlet if grease fitting is not already installed.
3. Add the recommended amount of lubricant.
4. Run the motor for two hours with the outlet plug removed.
5. Install outlet plug.

Note: To loosen hardened grease it may be necessary to insert a rod or wire into the grease inlet and outlet holes.

Table 3-6 Troubleshooting Chart

Symptom	Possible Causes	Possible Solutions
Motor will not start	Usually caused by line trouble, such as, single phasing at the starter.	Check source of power. Check overloads, fuses, controls, etc.
Excessive humming	High Voltage. Eccentric air gap.	Check input line connections. Have motor serviced at local Baldor service center.
Motor Over Heating	Overload. Compare actual amps (measured) with nameplate rating.	Locate and remove source of excessive friction in motor or load. Reduce load or replace with motor of greater capacity.
	Single Phasing.	Check current at all phases (should be approximately equal) to isolate and correct the problem.
	Improper ventilation.	Check external cooling fan to be sure air is moving properly across cooling fins. Excessive dirt build-up on motor. Clean motor.
	Unbalanced voltage.	Check voltage at all phases (should be approximately equal) to isolate and correct the problem.
	Rotor rubbing on stator.	Check air gap clearance and bearings. Tighten “Thru Bolts”.
	Over voltage or under voltage.	Check input voltage at each phase to motor.
	Open stator winding.	Check stator resistance at all three phases for balance.
	Grounded winding.	Perform dielectric test and repair as required.
	Improper connections.	Inspect all electrical connections for proper termination, clearance, mechanical strength and electrical continuity. Refer to motor lead connection diagram.
Bearing Over Heating	Misalignment.	Check and align motor and driven equipment.
	Excessive belt tension.	Reduce belt tension to proper point for load.
	Excessive end thrust.	Reduce the end thrust from driven machine.
	Excessive grease in bearing.	Remove grease until cavity is approximately 3/4 filled.
	Insufficient grease in bearing.	Add grease until cavity is approximately 3/4 filled.
	Dirt in bearing.	Clean bearing cavity and bearing. Repack with correct grease until cavity is approximately 3/4 filled.
Vibration	Misalignment.	Check and align motor and driven equipment.
	Rubbing between rotating parts and stationary parts.	Isolate and eliminate cause of rubbing.
	Rotor out of balance.	Have rotor balance checked are repaired at your Baldor Service Center.
	Resonance.	Tune system or contact your Baldor Service Center for assistance.
Noise	Foreign material in air gap or ventilation openings.	Remove rotor and foreign material. Reinstall rotor. Check insulation integrity. Clean ventilation openings.
Growling or whining	Bad bearing.	Replace bearing. Clean all grease from cavity and new bearing. Repack with correct grease until cavity is approximately 3/4 filled.

Suggested bearing and winding RTD setting guidelines for Non–Hazardous Locations ONLY

Most large frame AC Baldor motors with a 1.15 service factor are designed to operate below a Class B (80 ºC) temperature rise at rated load and are built with a Class H winding insulation system. Based on this low temperature rise, RTD (Resistance Temperature Detectors) settings for Class B rise should be used as a starting point. Some motors with 1.0 service factor have Class F temperature rise.

The following tables show the suggested alarm and trip settings for RTDs. Proper bearing and winding RTD alarm and trip settings should be selected based on these tables unless otherwise specified for specific applications.

If the driven load is found to operate well below the initial temperature settings under normal conditions, the alarm and trip settings may be reduced so that an abnormal machine load will be identified.

The temperature limits are based on the installation of the winding RTDs imbedded in the winding as specified by NEMA. Bearing RTDs should be installed so they are in contact with the outer race on ball or roller bearings or in direct contact with the sleeve bearing shell.

Table 3-7 Winding RTDs – Temperature Limit In ºC (40 ºC Maximum Ambient)

Motor Load (Typical Design)	Class B Temp Rise ≤ 80 ºC		Class F Temp Rise ≤ 105 ºC		Class H Temp Rise ≤ 125 ºC	
	Alarm	Trip	Alarm	Trip	Alarm	Trip
≤ Rated Load	130	140	155	165	175	185
Rated Load to 1.15 S.F.	140	150	160	165	180	185

Note: • Winding RTDs are factory production installed, not from Mod–Express.

When Class H temperatures are used, consider bearing temperatures and relubrication requirements.

Table 3-8 Bearing RTDs – Temperature Limit In oC (40 ºC Maximum Ambient)

Bearing Type Oil or Grease	Anti–Friction		Sleeve	
	Alarm	Trip	Alarm	Trip
Standard*	95	100	85	95
High Temperature**	110	115	105	110

Notes: * Bearing temperature limits are for standard design motors operating at Class B temperature rise.

** High temperature lubricants include some special synthetic oils and greases.

Greases that may be substituted that are compatible with Polyrex EM (but considered as “standard” lubricants include the following:

– Texaco Polystar – Rykon Premium #2 – Chevron SRI #2

– Mobilith SHC–100 – Pennzoil Pennzlube EM–2 – Chevron Black Pearl

– Darmex 707 – Darmex 711 – Petro–Canada Peerless LLG

See the motor nameplate for replacement grease or oil recommendation.

Contact Baldor application engineering for special lubricants or further clarifications.

MAINTENANCE:

1. Check pop off pressure every 2 to 6 months.
2. Inspect for dirt build up in bodies frequently.
3. Remove yearly for testing, inspection, and overhaul.

Valve failure may be caused by seizing of parts, scored or wire drawn seats and corroded or eroded springs. The first case may be corrected by careful cleaning followed by light sanding of the seating surfaces. For correction of the second, the seating surface may be remachined or carefully hand lapped if damage is less severe. Springs rarely required replacement, but may be purchased from manufacturer should replacement be necessary.

DISASSEMBLY

1351 & 1361 Series - Refer to Relief Valve Assembly Drgs. 1351 & 1361.

1. Remove Regulator Ring Set Screw.
2. Remove hood and mark relative positions of pressure screws, lockn t and cap.
3. Loosen pressure screw locknut and pressure screw to release pressure of spring.
4. Remove Cap.
5. Remove spring and spring plates, spindle and spindle retainer.
6. Mark location of regulator ring and remove.

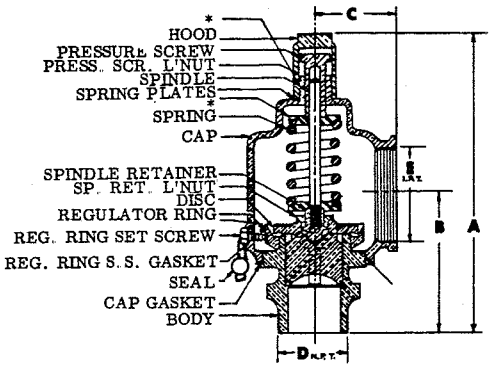
1352 Series - Refer to Pressure Relief Valve Assembly Drg. 1352.

1. Remove fillister head machine screw.
2. Remove roll pin, washer, lever and pressure screw.
3. Remove the spring and disc assembly.
4. Disassemble the disc assembly.

1362 Series - Refer to Vacuum Relief Valve Assembly Drg. 1362

1. Remove fillister head machine screw.
2. Remove pressure screw.
3. Remove the spring and disc assembly.
4. Disassemble the disc assembly.

To Reassemble: Reverse the above procedures - being careful to return parts to their marked positions.
After reassembly, reset valves according to instructions under adjustment, setting and testing.



ADJUSTMENT, SETTING AND TESTING

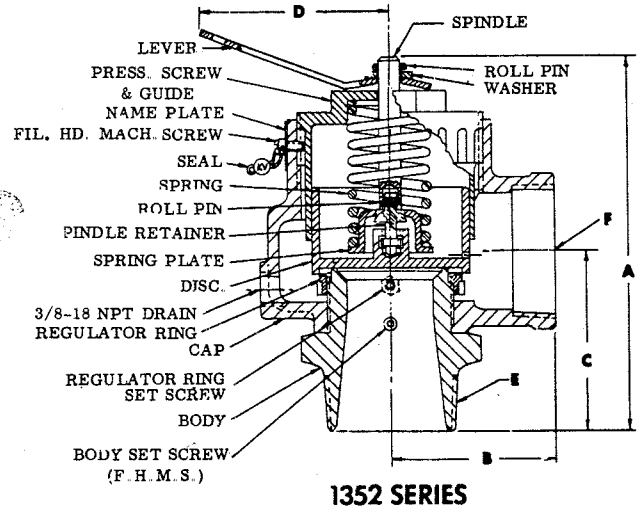
Popping Pressure: 1351 & 1361 Series
Refer to Relief Valve Test Set Ups.
Make sure of gauge accuracy before beginning. Remove hood - exposing pressure screw and locknut, Loosen locknut and raise pressure or vacuum until valve opens or pops. If opening pressure or vacuum is too low, turn down on pressure screw. If pressure or vacuum is too high, back-off pressure screw. After proper pressure has been reached, securely tighten locknut and replace hood.

1352 & 1362 Series
Refer to Relief Valve Test Set Ups.
Make sure of gauge accuracy before beginning. Remove filister head machine screws. Raise pressure or vacuum until valve opens or pops. If opening pressure or vacuum is too low, turn down on pressure screw. If pressure or vacuum is too high, back-off pressure screw. After proper setting has been reached, replace filister head screws, making sure they align with slots provided in pressure screw.

BLOWDOWN ADJUSTMENT

1351 & 1361 Series
When popping pressure is changed, a slight adjustment in blow down may be required. Raising the popping pressure or vacuum lengthens the blow down, and lowering the popping pressure or vacuum shortens the blow down. Raising the regulator ring - towards the disc - will increase blowdown and should be made a notch at a time as the adjustment is sensitive. The normal position would be three or four notches down from touching the disc, but this figure will vary with conditions.
CAUTION: Retighten regulator ring set screw.

1351 & 1361 RELIEF VALVE



1351 Denotes Pressure Valve
1361 Denotes Vacuum Valve
*Joints sealed on 1361 Vacuum Valves with Crane Pipe Compound or equiv.

PART NO.	SEAT DIA.	VALVE SIZE	WT. LBS.	A	B	C	D	E
1351-1	1/2	1/2	1-3/8	4.63	2.38	1.12	1/2	3/4
1351-2	3/4	3/4	2-1/4	6.66	2.53	1.50	3/4	1-1/4
1351-3	1	1	3	6.97	2.75	1.81	1	1-1/2
1351-4	1-1/4	1-1/4	5-1/2	8.59	3.97	2.18	1-1/4	2
1351-5	1-1/2	1-1/2	7-3/4	9.59	4.31	2.31	1-1/2	2-1/2

EU Declaration of Conformity (DoC)

We:

Company Name:	AutomationDirect.com
Postal address:	3505 Hutchinson Road
City:	Cumming
State:	Georgia
Postal Code:	30040
Telephone:	(800) 633-0405

Declare that the DoC is issued under sole responsibility and belongs to the following products:

ProSense - Digital Pressure Sensor

QPSH-AN-42

QPSH-AP-42

QPSL-AN-42

QPSL-AP-42

The objects of the declaration describe above is in conformity with the relevant Union harmonization legislation:

EMC: 2014/30/EU

LV: 2014/35/EU

RoHS2: 2011/65/EU

The following harmonized standards and technical specification have been applied:
Title, Date of standard/specification:

EN 61326-1: 2013

EN 61010-1: 2010

EN 50581: 2012

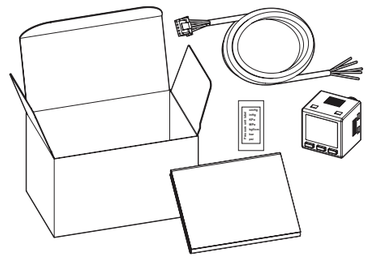
Models:



QPSL-AP-42
QPSL-AN-42
QPSH-AP-42
QPSH-AN-42

Compact combination Pressure Switch / Transmitter with 2 digital outputs (NPN or PNP) which may be set individually and an analog 4-20mA output. Perfect for the factory floor or installed in a control cabinet. The unit comes with a 2 meter cable for easy installation and has 2 optional mounting brackets available.

Box Contents and Unpacking Instructions

- Unpack the QPS Pressure Switch from its shipping carton. Included in the carton is the switch, cable and pressure units label and these instructions.
- Inspect all equipment for completeness. If anything is missing or damaged, immediately call the AutomationDirect returns department @ 1-800-633-0405.
- Inspect the part number to ensure the model received matches the output type required.

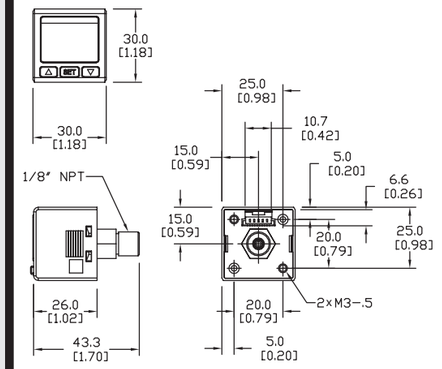
ProSense QPS Digital Pressure Switch / Transmitter Specifications					
Model		**QPSL-AP-42**	**QPSL-AN-42**	**QPSH-AP-42**	**QPSH-AN-42**
Rated Pressure		-14.5 to +14.5 psi		-14.5 to +145 psi	
Maximum Pressure (Proof)		29psi		217psi	
Maximum Vacuum		-14.5 psi			
Pressure Accuracy		± 3% of full scale			
Temperature Influence @ 25°C		± 2% of full scale			
Fluid Measured		Air, Non-corrosive gas, Non-flammable gas			
Input Power		10.8 to 26.4 VDC			
Power Consumption		260mA maximum			
Digital Outputs	**Output Type**	2-PNP	2-NPN	2-PNP	2-NPN
	Maximum Current	100mA each			
	Response Time	2ms, 4ms, 10ms, 30ms, 50ms, 100ms, 250ms, 500ms, 1,000ms, 5,000ms selectable			
	Residual Voltage	1.5 VDC			
Analog Output	**Output Type**	4-20mA			
	Maximum Output Load Resistance	400ΩΩ			
	Linear Accuracy	< ± 2% of full scale			
Process Connection		1/8" NPT outer / M5 inner bore (Nickel Plated Brass)			
Case Materials		Case = ABS Plastic, Lens = Polycarbonate			
Shock Immunity		10 ~ 500 Hz, 10mm 3 axes for 2 hours			
Vibration Immunity		Max. 100m / s2 3 axes 6 directions, 3 times each			
Operating Temperature		0°C to +50°C (32°F to 122°F)			
Storage Temperature		-20°C to +65°C (-4°F to 149°F)			
Altitude		< 2,000m			
Ambient Humidity		35% ~ 80% (non-condensing)			
Approvals		cULus - UL 508 (E157382), CE, RoHS			

WARNING: To minimize the risk of potential safety problems, you should follow all applicable local and national codes that regulate the installation and operation of your equipment. These codes vary from area to area and it is your responsibility to determine which codes should be followed, and to verify that the equipment, installation, and operation are in compliance with the latest revision of these codes.

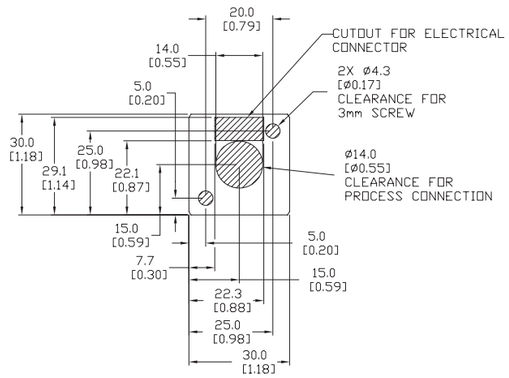
Equipment damage or serious injury to personnel can result from the failure to follow all applicable codes and standards. We do not guarantee the products described in this publication are suitable for your particular application, nor do we assume any responsibility for your product design, installation, or operation.

If you have any questions concerning the installation or operation of this equipment, or if you need additional information, please call us at 1-800-633-0405 or 770-844-4200.

This publication is based on information that was available at the time it was printed. At Automationdirect.com® we constantly strive to improve our products and services, so we reserve the right to make changes to the products and/or publications at any time without notice and without obligation. This publication may also discuss features that may not be available in certain revisions of the product.



WARNING! Electric shock danger



ProSense QPS is a pressure measurement device. DO NOT use it out of its specification. Improper pressure or incorrect wiring may cause injuries to staff or damages to other devices.

1. Keep away from high-voltage and high-frequency environment during the installation to prevent interference. Avoid using the device in environments which contain: (a) dust or corrosive gas; (b) high humidity and high radiation; (c) shock and vibration
2. QPS can only be used for air pressure measurement and should avoid corrosive, inflammable or toxic gas measurement.
3. Make sure the input power is switched off when installing or uninstalling the QPS and the pressure source is off to prevent harm to personnel or equipment.
4. Before switching on the input power, check the signal connection, e.g. the input voltage and polarity. Voltage that is too high may cause damage to the QPS.
5. Use dry cloth and DO NOT use acid or alkaline liquid to clean the device.
6. Outputs remain active in Setup Mode.

10 - Pressure connection

Menu Navigation

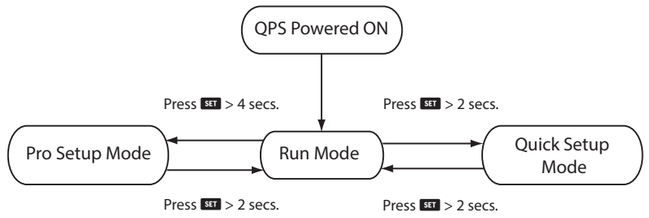
Changing modes:

The QPS will be in the "Run Mode" when it is powered on, displaying PV and SV. Press SET for more than 2 seconds in this mode to switch to the "Quick Setup Mode". Press SET for more than 4 seconds in the "Run Mode" to switch to "Pro Setup Mode". Press SET more than 2 seconds in the "Quick Setup Mode" or "Pro Setup Mode" to return to the "Run Mode".

Setting up parameters:

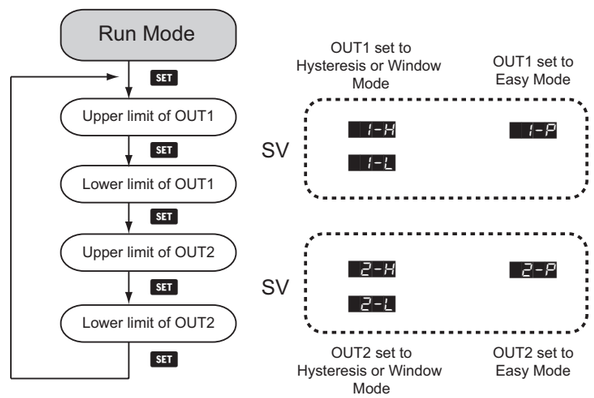
In the three modes, press SET once to select the parameter to set up. When you find the parameter to set up or modify, use ▼ ▲ to modify the setting.

Resetting the ProSense QPS to factory default values:



Hold SET button for 4-5 seconds until display changes to read Pro. Press the SET button 9 times until the display shows oFF rSt

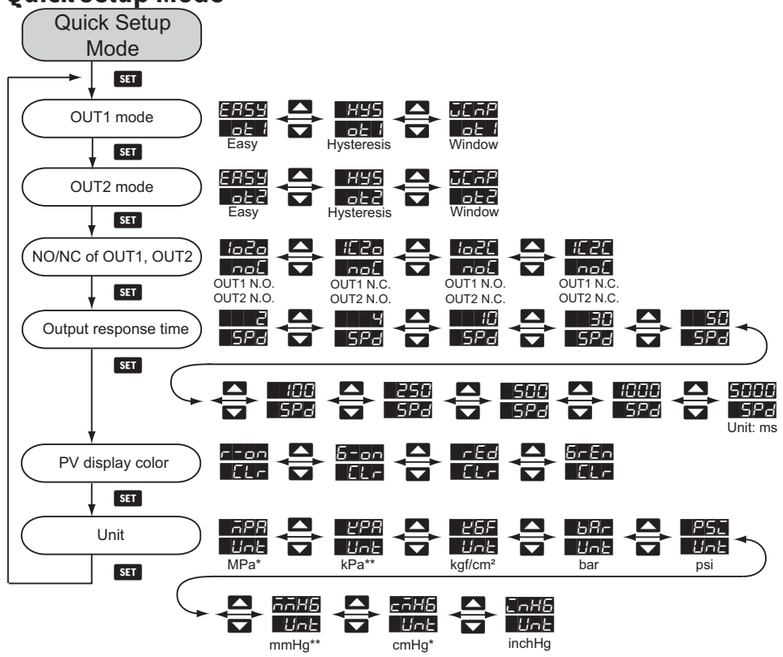
Using the ▼▲ buttons change the value to on and press SET



When complete the display will read Std SUb

Caution: Outputs remain active in Setup Mode

Accessing QPS Setup Modes:



Run Mode

Run Mode	
1-H	Output 1 high setpoint for hysteresis or window modes
1-L	Output 1 low setpoint for hysteresis or window modes
1-P	Output 1 high setpoint for easy mode
2-H	Output 2 high setpoint for hysteresis or window modes
2-L	Output 2 low setpoint for hysteresis or window modes
2-P	Output 2 high setpoint for easy mode

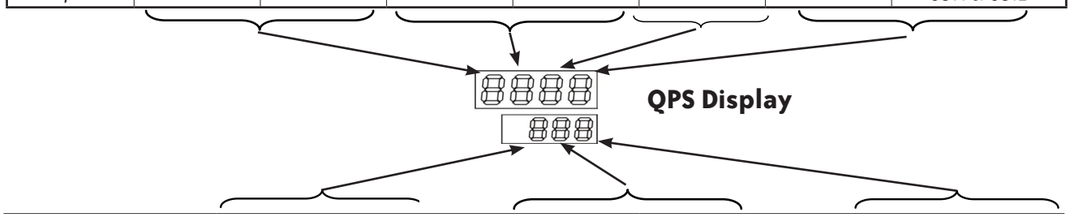
Additional Help and Support

- For additional technical support and questions, call our Technical Support team @ 1-800-633-0405 or 770-844-4200

Pro Setup Mode



Pro Setup Mode			
Pro	Pro Setup Mode - Displays when entering Pro Setup Mode		
SEt	Setup - Displays when entering Pro Setup Mode		
SUb	SV / Setup Item Display selection		
	Std	Display shows SV (Default)	
	oFF	OFF	
	UnIt	Display shows Engineering unit, set by Unt in Quick Setup Mode	
dSP	Display response time rate in milli-seconds (Default = 100)		
HYS	Hysteresis setting for outputs in EASY and WINDOW modes (Default = 3), applies to both outputs		
		QPSH	
	MPa(MPA)	1 = 0.001 MPa thru 8 = 0.008 MPa	-
	kPa(kPA)	-	1 = 0.1 kPa thru 8 = 0.8 kPa
	kgf/cm²(kGF)	1 = 0.01 kgf/cm² thru 8 = 0.08 kgf/cm²	1 = 0.001 kgf/cm² thru 8 = 0.008 kgf/cm²
	bar(bAr)	1 = 0.01 bar thru 8 = 0.08 bar	1 = 0.001 bar thru 8 = 0.008 bar
	psi(PSI)	1 = 0.1 psi thru 8 = 0.8 psi	1 = 0.01 psi thru 8 = 0.08 psi
	mm Hg(mmHG)	-	1 = 1 mm Hg thru 8 = 8 mm Hg
	cm Hg(CmHG)	1 = 1 cm Hg thru 8 = 8 cm Hg	-
	In Hg(InHG)	1 = 1 in Hg thru 8 = 8 in Hg	1 = 0.1 in Hg thru 8 = 0.8 in Hg
PuS	Power Saving Mode - Turns display back light off. Display values can be viewed momentarily by pressing the SET button		
dPy	Switching color display - sets when display changes colors (as set by parameter CLr) based on output status		
	out1	Color changes when Output 1 is ON (Default)	
	out2	Color changes when Output 2 is ON	
	And	Color changes when Output 1 and Output 2 are ON	
	or	Color changes when Output 1 or Output 2 is ON	
Cod	Code - quick reference to determine the settings of the QPS device (See Code Reference Table - Page 3)		
CPy	Copy - used to select master and slave when copying settings to other QPS devices		
	CP-S	Copy Slave Mode	
	CP-n	Copy Master Mode	
ASo	Analog Output Enable (Default = ON)		
rSt	Reset QPS to Factory Defaults		

CODE (Pro Setup Mode Parameter Cod)

CODE provides a quick method to determine the settings of the QPS parameters (Factory Default 0000 302)

Code	1st digit		2nd digit		3rd digit	4th digit	
	OUT1 mode	N.O./N.C.	OUT2 mode	N.O./N.C.	Output Response Time	Color	Switching Color Display
0	Easy	N.O.	Easy	N.O.	2ms	Red when ON	OUT1
1		N.C.		N.C.	4ms		OUT2

5	inch Hg		Unit	6
6	–	500ms	Standard	7
7	–		Off	8
8	–		Unit	–
9	–	1,000ms	Standard	–
A	–		Off	–
b	–		Unit	–

QPS is able to copy the parameters from one device to another.

Electrical connection for copying parameters:

Connect Pin 2 (black) on master to Pin 3 (white) on slave; Pin 3 (white) on master to Pin 2 (black) on slave; Pin 5 (blue) on master and slave to COM on power supply; Pin 1 (brown) on master and slave to +24V on power supply.

Setup for copying paramters:

Slave device: In the "Run Mode", press SET for more than 4 seconds and release the key after you see Pro SEt. You are now in "Pro Setup Mode". Press SET 7 times and find the parameter for setting up the copy function (See Pro Setup Mode chart). Use ▼▲ to select CP-S CPy (CP-S refers to Copy-Slave).

Master device: In the "Run Mode", press SET for more than 2 seconds and release the key after you see Pro SEt. You are now in the "Pro Setup Mode". Press 7 times and find the parameter for setting up the copy function (See Pro Setup Mode chart). Use ▼▲ to select CP-M CPy (CP-M refers to the Copy-Master).

Next, press SET for more than 2 seconds and return to the "Run Mode".

Now you will see CP-A on the display and CP-S on the slave device, indicating that the two devices have been connected. In the lower display Cnt you will see numbers counting up, referring to the number of parameters transmitted successfully between the two devices.

Once the copy of parameters completes, you will see CP-A oK on the master device and CP-S oK on the slave device.

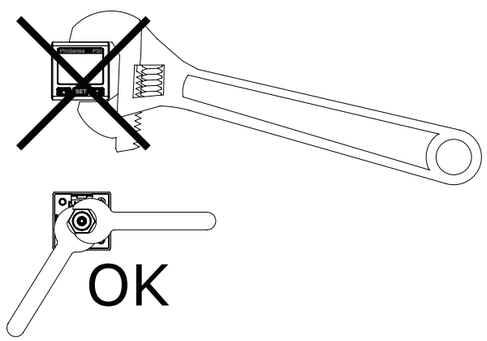
After the copy is complete, power the units off and re-connect them according to the wiring diagram.

Locking the Keys

Lock On: Press SET and ▲ together for 2 seconds until Lock on is displayed. You will then see the display of pressure value (PV) and setpoint value (SV).

Lock Off: Press SET and ▼ together for 2 seconds until Lock oFF is displayed. You will then see the display of pressure value (PV) and setpoint value (SV).

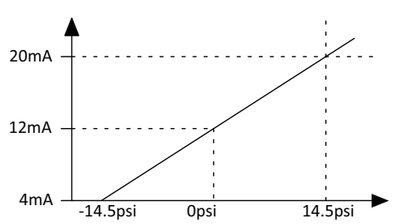
Lock Display: Press any key in the key locking mode, and you will see the display of pressure value (PV) and LCd (SV). Release the key and the PV and SV will return to original values.



Resetting Zero Pressure:

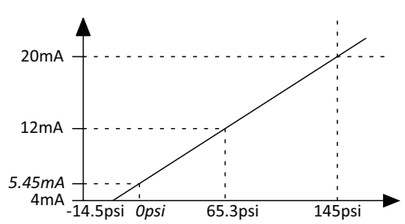
Remove pressure from device before starting.

In the "Run Mode", press ▼▲ simultaneously, and you will see 0000 AdJ. The zeroing will start. Release the keys to end the zeroing sequence.



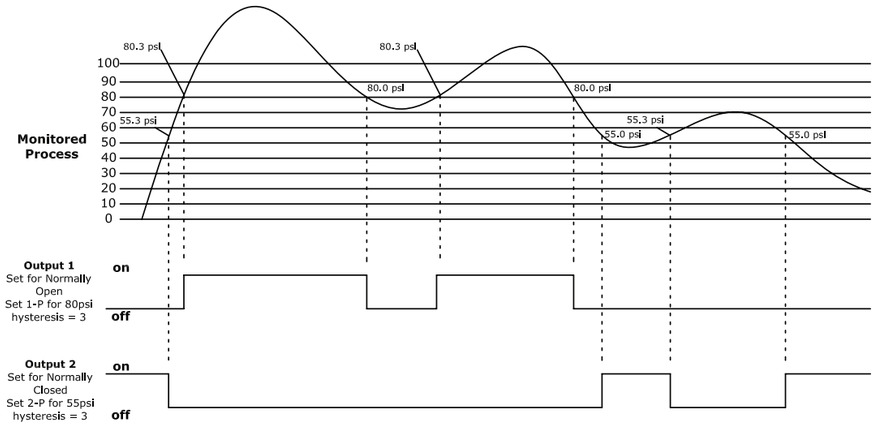
Process Connection

Use a suitable thread sealant Teflon® tape. Do not use liquid thread sealant. Always tighten with an open end or adjustable wrench on the wrench flats. Never use any part of the pressure gauge to tighten other than the wrench flats that are on the gauge socket. Failure to do so will severely damage the pressure gauge.



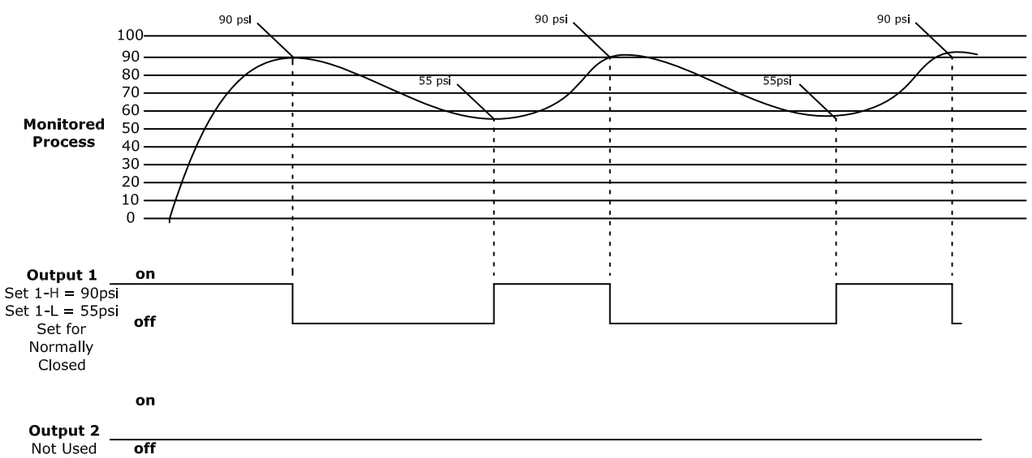
Analog Output

The analog output is directly proportional to the process pressure over the full range of the device. For example if the process pressure is 0 psi the 4-20 mA output of a QPSL will be approximately 12 mA or for the QPSH the pressure at 12 mA would be 65.3 psi and for 0 psi the output would be 5.45 mA. The analog output is enabled as the factory default. It can be disabled with the "Analog Output Enable" parameter in Pro Setup Mode.



QPSL-xx-42

QPSH-xx-42

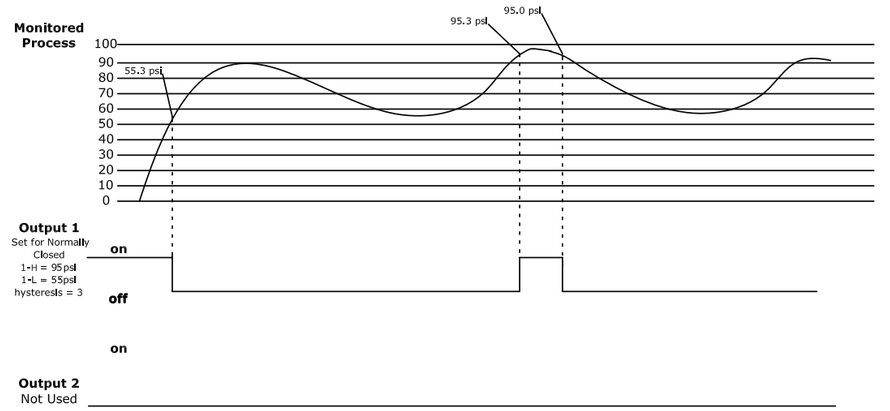


Easy Mode: When the measured pressure is greater than pressure setpoint plus the hysteresis setting (SV+hysteresis), the output will change state. When the measured pressure is less than the pressure setpoint (<SV), the output will change state. Each digital output can be individually set.

Using EASY Mode to Set up a Simple Alarm

Hold SET button for 2-3 seconds until display changes.
Verify Ot1 is set to EASY, if not use the ▼▲ to change and press SET button.
Verify Ot2 is set to EASY, if not use the ▼▲ to change and press SET button.
Verify noC is set to NC2o, if not use the ▼▲ to change and press SET button.
Press and hold the SET button until the display changes to show the Setpoint and Process values.
Using the ▼▲ set the output 1 ON level for 1-P to 80psi.
Briefly press and release the SET button to change to 2-P and set the output 2 ON level to 55psi.
Hold SET button for 4-5 seconds until display changes to Pro.
Press the SET button 3 times so that HYS is on the display.
Verify the value 3 is in the lower display, if not use the ▼▲ to change and press SET button
Press and hold the SET button until the display changes to show the Setpoint and Pressure copy values.

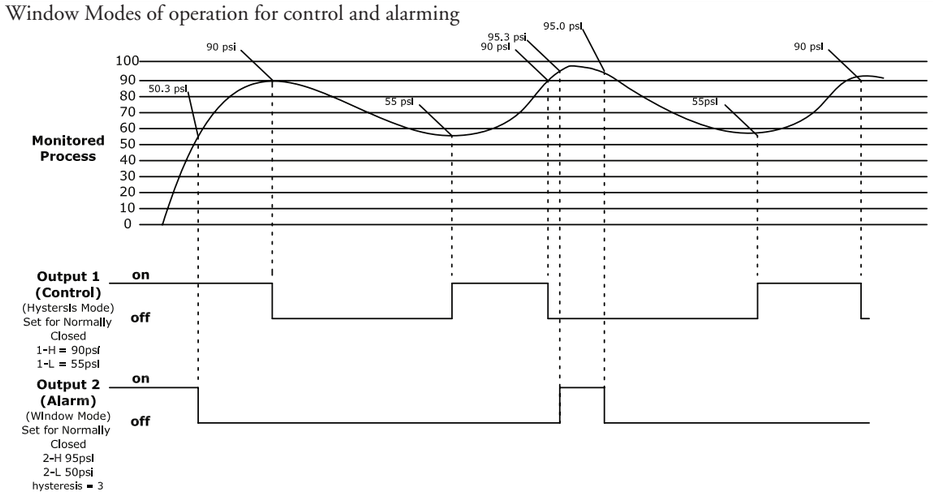
Hysteresis Mode: When the measured pressure is greater than the Hi setpoint, the output will change state. When the measured pressure is less than the Lo setpoint, the output will change state. Each digital output can be individually set.



Using Hysteresis Mode to control the pressure in a tank

Hold SET button for 2-3 seconds until display changes.
Verify Ot1 is set to HYS, if not use the ▼▲ to change and press SET button.
Verify Ot2 is set to EASY, if not use the ▼▲ to change and press SET button.
Verify noC is set to NC2o, if not use the ▼▲ to change and press SET button.
Press and hold the SET button until the display changes to show the Setpoint and Process values.
Using the ▼▲ set the output 1 1-H level to 90psi.
Briefly press and release the SET button to change to 1-L and set it to 55psi.

Hysteresis is defined as: The lag in response of the output in reacting to changes in the process affecting it. For example Setpoint 1-P is set to 80 PSI for output 1 but the output does not change state when the pressure is increasing until the actual pressure reaches 80.3 PSI (1-P+hysteresis), the output will then change back to its neutral state once the pressure drops below the Setpoint of 80 PSI. This function known as Hysteresis is used to prevent the outputs from chattering if the process pressure were to hover close to the Setpoint.



Window Mode: In the example below the output will change state when the measured pressure increases to 55.3psi (1-L SU + HYS)and will change state again when the pressure increases to 90.3psi (1-H SU + HYS). As the measured pressure decreases back to 90psi (1-H SU) the output will change state and will change state again when the pressure decreases to 55psi (1-L SU). Each digital output can be individually set.

Using Window Mode to create alarm condition

Hold SET button for 2-3 seconds until display changes.
Verify Ot1 is set to dirAP, if not use the ▼▲ to change and press SET button.
Verify Ot2 is set to EASY, if not use the ▼▲ to change and press SET button.
Verify noC is set to NC2o, if not use the ▼▲ to change and press SET button.
Press and hold the SET button until the display changes to show the Setpoint and Process values.
Using the ▼▲ set the output 1 1-H level to 95psi.
Briefly press and release the SET button to change to 1-L and set it to 55psi.
Hold SET button for 4-5 seconds until display changes to Pro.
Press the SET button 3 times so that HYS is on the display.
Verify the value 3 is in the lower display, if not use the ▼▲ to change and press SET button
Press and hold the SET button until the display changes to show the Setpoint and Process values.

Hysteresis & Window Modes of operation for control and alarming

Using Hysteresis mode to control the pressure in a tank and window mode to generate an alarm

Wire the QPS using the connection diagrams supplied.
Hold SET button for 2-3 seconds until display changes.
Verify Ot1 is set to HYS, if not use the ▼▲ to change and press button.
Verify Ot2 is set to dirAP, if not use the ▼▲ to change and press button.
Verify noC is set to NC2C, if not use the ▼▲ to change and press button.
Press and hold the SET button until the display changes to show the Setpoint and Process values.
Using the ▼▲ set the output 1 1-H level to 90psi.
Briefly press and release the SET button to change to 1-L and set it to 55psi.
Briefly press and release the SET button to change to 2-H and set it to 95psi.
Briefly press and release the SET button to change to 2-L and set it to 50psi.
Hold SET button for 4-5 seconds until display changes to P-o.
Press the SET button 3 times so that HYS is on the display.
Verify the value 3 is in the lower display, if not use the ▼▲ to change and press SET button.
Press and hold the SET button until the display changes to show the Setpoint and Process values.

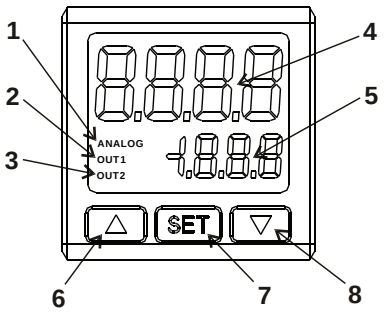
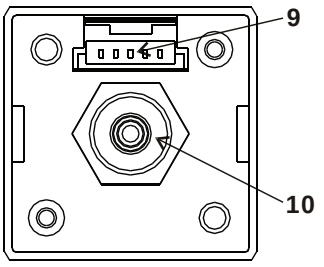
ProSense® Digital Pressure Switch / Transmitter

Overview



- Precision digital pressure switch/transmitter with 2 meter cable
- Two digital outputs (NPN or PNP) which may be set individually and a 4-20 mA analog output
- Two vacuum to pressure ranges (-14.5 to 14.5 and -14.5 psig to 145 psig)
- Air, non-corrosive/non-flammable gases only
- Three operation modes: Easy, Window and Hysteresis
- 3-color digital LCD display
- 6 pressure unit conversions
- Lockable keypad
- Unit parameters are easily copied to other units
- Selectable response times to eliminate output chattering
- Fast zero reset
- Optional panel mount and bracket kits
- 2-year warranty

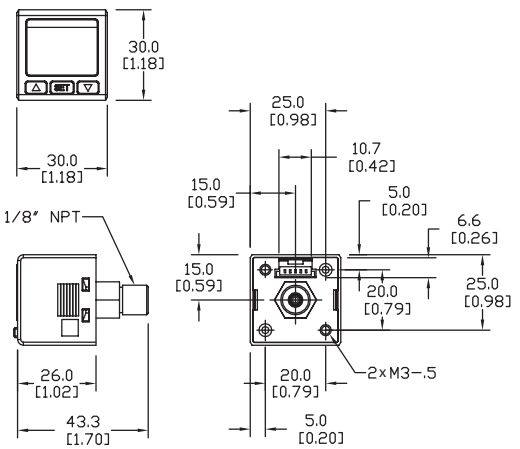


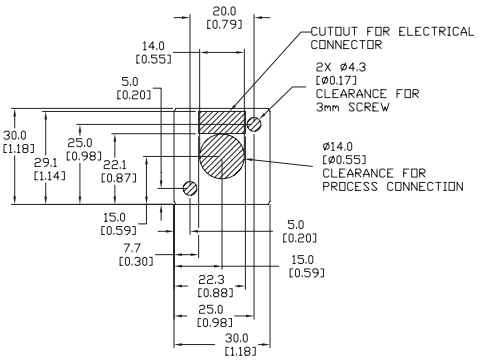
E157382

ProSense QPS Digital Pressure Switch / Transmitter				
Part Number	**Description**	**Pcs/Pkg**	**Wt (lb)**	**Price**
QPSL-AP-42	Digital pressure switch/transmitter -14.5 to 14.5 psig, 2 PNP out, 4-20 mA out, cable included	1	0.24	
QPSL-AN-42	Digital pressure switch/transmitter -14.5 to 14.5 psig, 2 NPN out, 4-20 mA out, cable included	1	0.24	
QPSH-AP-42	Digital pressure switch/transmitter -14.5 to 145 psig, 2 PNP out, 4-20 mA out, cable included	1	0.24	
QPSH-AN-42	Digital pressure switch/transmitter -14.5 to 145 psig, 2 NPN out, 4-20 mA out, cable included	1	0.24	

ProSense QPS Digital Pressure Switch / Transmitter Specifications					
Model		QPSL-AP-42	QPSL-AN-42	QPSH-AP-42	QPSH-AN-42
Pressure Range		-14.5 to +14.5 psig		-14.5 to +145 psig	
Maximum Pressure (Proof)		29 psig		217 psig	
Maximum Vacuum		-14.5 psig			
Pressure Accuracy		± 3% of full scale			
Temperature Influence @ 25°C		± 2% of full scale			
Fluid Measured		Air, Non-corrosive gas, Non-flammable gas			
Input Power		10.8 to 26.4 VDC			
Power Consumption		260mA maximum			
Digital Outputs	Output Type	2-PNP	2-NPN	2-PNP	2-NPN
	Maximum Current	100mA			
	Response Time	2ms, 4ms, 10ms, 30ms, 50ms, 100ms, 250ms, 500ms, 1,000ms, 5,000ms selectable			
	Residual Voltage	1.5 VDC			
Analog Outputs	Output Type	4-20 mA			
	Maximum Output Load Resistance	400Ω			
	Linear Accuracy	< ± 2% of full scale			
Process Connection		1/8" NPT outer / M5 inner bore (Nickel Plated Brass)			
Cable		Included with each unit, 2 meter (6.6 feet), 5 conductor, 26AWG, PVC jacket, and 50mm pigtail leads Replacement cable : QPS-CBL			
IP Rating		IP 40			
Case Materials		Case = ABS Plastic, Lens = Polycarbonate			
Shock Immunity		10 ~ 500 Hz, 10mm 3 axes for 2 hours			
Vibration Immunity		Max. 100m / s2 3 axes 6 directions, 3 times each			
Operating Temperature		0°C to +50°C (32°F to 122°F)			
Storage Temperature		-20°C to +65°C (-4°F to 149°F)			
Altitude		< 2,000m			
Ambient Humidity		35% to 80% (non-condensing)			
Approvals		cULus (E157382), CE, RoHS			

ProSense® Digital Pressure Switch / Transmitter



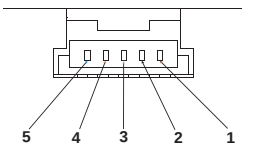


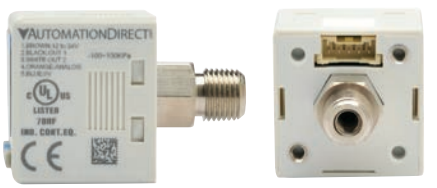
Display, KeyPad, Connections

1 - Analog output indicator
2 - Digital output 1 indicator
3 - Digital output 2 indicator
4 - Pressure Value (PV)/parameter display (8 mm digits)
5 - Setpoint Value (SV)/setup item display (4 mm digits)
6 - Increment UP button
7 - SET or Enter button
8 - Decrement DOWN button
9 - Cable connection
10 - Pressure connection

Dimensions

mm [inches]

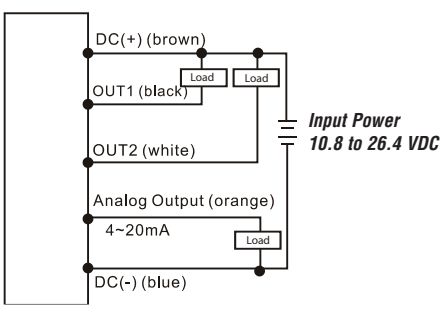




SURFACE MOUNT TEMPLATE

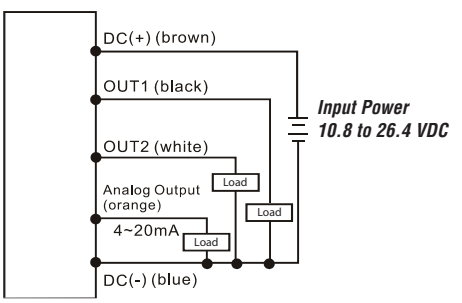
See our website www.AutomationDirect.com for complete Engineering drawings.

Cable Connection Terminals



1 - Positive power supply input (brown)
2 - Digital output 1 signal (black)
3 - Digital output 2 signal (white)
4 - Analog output signal (orange)
5 - Negative power supply input (blue)

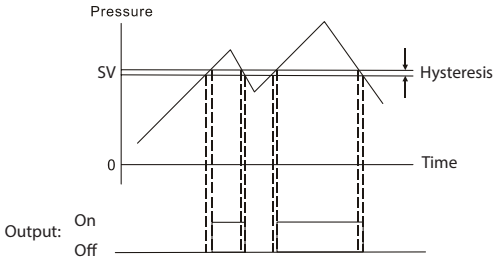
Wiring



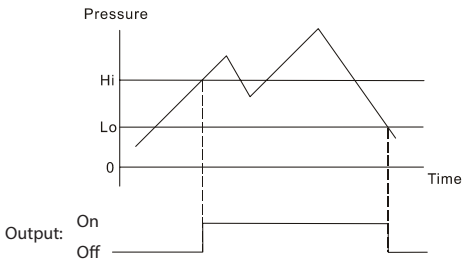
QPSL-AN-42
QPSH-AN-42

Outputs:
NPN discrete
4-20mA analog

QPSL-AP-42
QPSH-AP-42

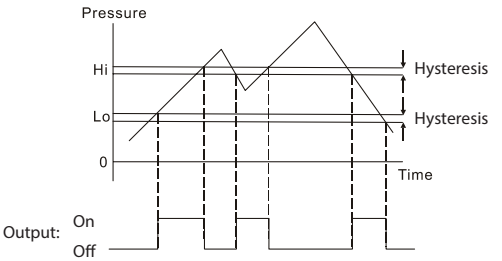


Outputs:
PNP discrete
4-20mA analog

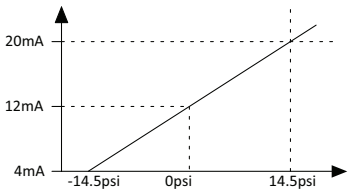


ProSense® Digital Pressure Switch / Transmitter

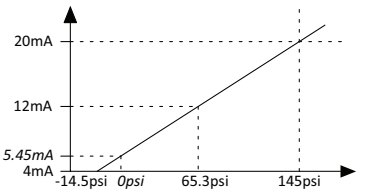
Operating Modes:



Easy Mode: When the measured pressure is greater than pressure setpoint plus the hysteresis setting (SV+hysteresis), the output will change state. When the measured pressure is less than the pressure setpoint (<SV), the output will change state. Each digital output can be individually set.



Hysteresis Mode: When the measured pressure is greater than the Hi setpoint, the output will change state. When the measured pressure is less than the Lo setpoint, the output will change state. Each digital output can be individually set.



Window Mode: The output will change state when the measured pressure increases to the Lo setpoint plus the hysteresis setting (Lo+hysteresis) and will change state again when the pressure increases to the Hi setpoint plus the hysteresis setting (Hi+hysteresis). When the pressure decreases to the Hi setpoint the output will change state and will change state again when the pressure decreases to the Lo setpoint.

Analog Output (4-20mA): The analog output is directly proportional to the process pressure over the full range of the device. For example if the process pressure is 0 psig the 4-20 mA output of a QPSL will be approximately 12 mA or for the QPSH the pressure at 12 mA would be 65.3 psig and for 0 psig the output would be 5.45mA. The analog output is enabled as the factory default. It can be disabled with the "Analog Output Enable" parameter in Pro Setup Mode.

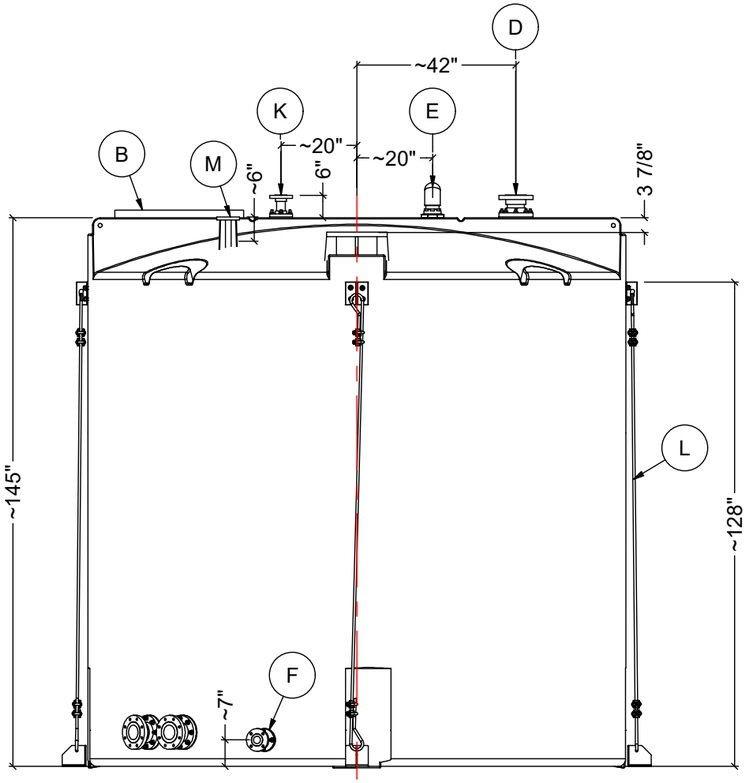
NOTES:



1. TANK IS MANUFACTURED FROM HDPE. (1.9 SG)
2. TANK IS MANUFACTURED TO ASTM-D-1998 STANDARD.
3. ALL TANK DIMENSIONS ARE SUBJECT TO A +/-3% TOLERENCE.
4. FLEXIBLE COUPLINGS ARE REQUIRED FOR ALL EXTERNAL PIPING.
5. ALL FITTING GASKETS ARE EPDM.
6. ACO RECOMMENDS ALL FLANGE GASKETS TO BE MIN. 1/4" THICK.
7. ON LARGER SIZED TANKS SOME MECHANICAL FITTINGS MAY NEED TO BE REMOVED IN ORDER TO AVOID WIDE OR OVERSIZED LOADS.
8. HDPE ALIGNMENT WEDGES ARE REQUIRED ON SOME TOP FITTINGS TO KEEP THEM PERPENDICULAR TO THE GROUND.
9. TANK MUST BE PROPERLY VENTED TO PREVENT PRESSURE OR VACUUM FROM DEVELOPING AS THE TANK IS FILLING OR EMPTYING.

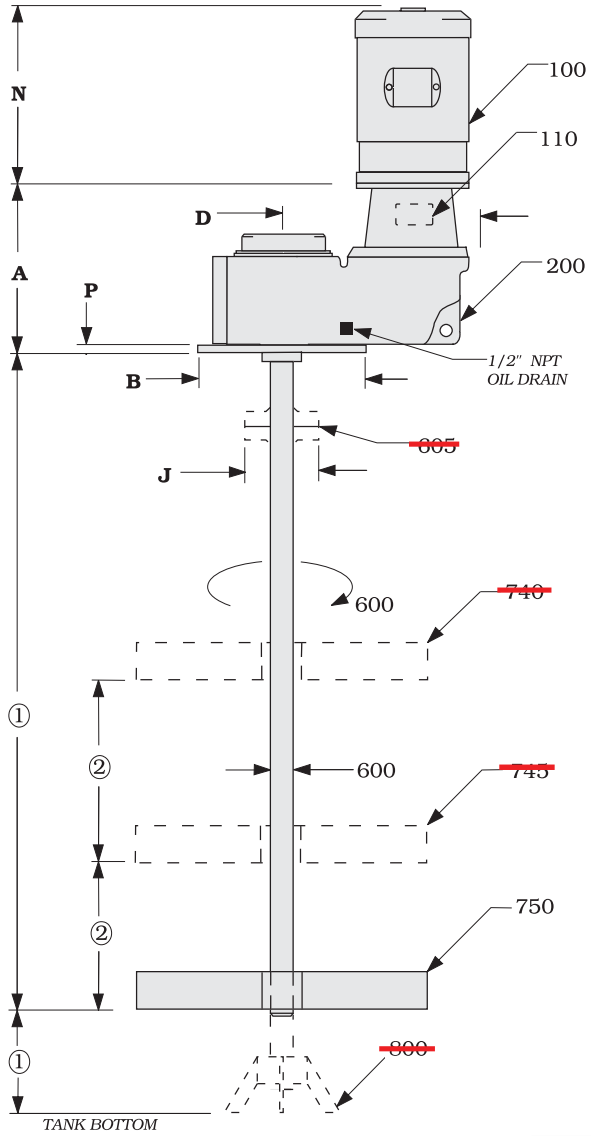
MIXER DATA SHEET

Customer: PCP

Sharpe Ref.# : 341883A
Customer Ref.# : C5-205026

Application : Calcium Hypochlorite Tank 1



Design conditions : Viscosity(cps): 1 , Sp.Grav: 1.10 Temp.: Ambient Pressure: Atmospheric

Tank dimensions : 142 Dia. Tank x 150.0 " overall height from mixer base to tank floor
Tank Volume (gallons)= 8800 Mounted off-center 24"

Equipment :	**N-SERIES HELICAL DRIVE TOP-ENTERING MIXER** Quantity : 1 **Mixer Model # 3N3 -26**
Motor :	3.00 Horsepower, @ 1750 RPM, 3PH, 60Hz, 575 VOLTS CHEM/INV-DUTY 182TC Frame, Motor Furnished by Sharpe , Mounted by Sharpe Cast iron construction, corrosion resistant, Inverter ready with 10:1 turn-down
Mixer Drive :	N3 Parallel Helical Gearbox 25.9:1 Ratio, Rated at 8.03 Horsepower
Mixer mounting :	Mounting Plate Furnished
Wetted Parts :	Mild Steel 1/8" THICK RUBBER COVERED
Shaft :	2.38 "Dia. X 116 " long from mounting base, turning @ 68 RPM Includes No In-Tank Shaft Coupling
Impellers :	48.0 "dia HYF-218 Hydrofoil Impeller ***21 " min. opening required to install impeller*** Bolted Blade Design Pumping Down, Turning Clockwise Looking Down
	Includes rubber covering field kit

Shipping Weight,each = 500 lbs
Design Torque = 4900 lbs-in
Design OHM = 8300 lbs-in

DATA SHEET

Three Phase Induction Motor - Squirrel Cage

Customer	: Vissers
Customer reference	: 3522675-2

Product line	: W22 NEMA Premium Efficiency Three-Phase	Product code :	12446946
		Catalog # :	01518ET3H254TC-W22

Frame	: 254/6TC	Locked rotor time	: 55s (cold) 31s (hot)
Output	: 15 HP (11 kW)	Temperature rise	: 80 K
Poles	: 4	Duty cycle	: Cont.(S1)
Frequency	: 60 Hz	Ambient temperature	: -20°C to +40°C
Rated voltage	: 575 V	Altitude	: 1000 m.a.s.l.
Rated current	: 14.4 A	Protection degree	: IP55
L. R. Amperes	: 92.2 A	Cooling method	: IC411 - TEFC
LRC	: 6.4x(Code G)	Mounting	: F-1
No load current	: 5.76 A	Rotation[1]	: Both (CW and CCW)
Rated speed	: 1770 rpm	Noise level[2]	: 64.0 dB(A)
Slip	: 1.67 %	Starting method	: Direct On Line
Rated torque	: 6.15 kgfm	Approx. weight[3]	: 143 kg
Locked rotor torque	: 220 %		
Breakdown torque	: 260 %		
Insulation class	: F		
Service factor	: 1.25		
Moment of inertia (J)	: 0.1104 kgm²		
Design	: B		

Output	25%	50%	75%	100%
Efficiency (%)	90.2	91.0	91.7	92.4
Power Factor	0.43	0.68	0.78	0.83

Foundation loads	
Max. traction	: 180 kgf
Max. compression	: 323 kgf

		Drive end	Non drive end
Bearing type	:	6309 C3	6209 C3
Sealing	:	V'Ring	V'Ring
Lubrication interval	:	20000 h	20000 h
Lubricant amount	:	13 g	9 g
Lubricant type	:	Mobil Polyrex EM	

Notes

This revision replaces and cancel the previous one, which must be eliminated.
(1) Looking the motor from the shaft end.
(2) Measured at 1m and with tolerance of +3dB(A).
(3) Approximate weight subject to changes after manufacturing process.
(4) At 100% of full load.

These are average values based on tests with sinusoidal power supply, subject to the tolerances stipulated in NEMA MG-1.

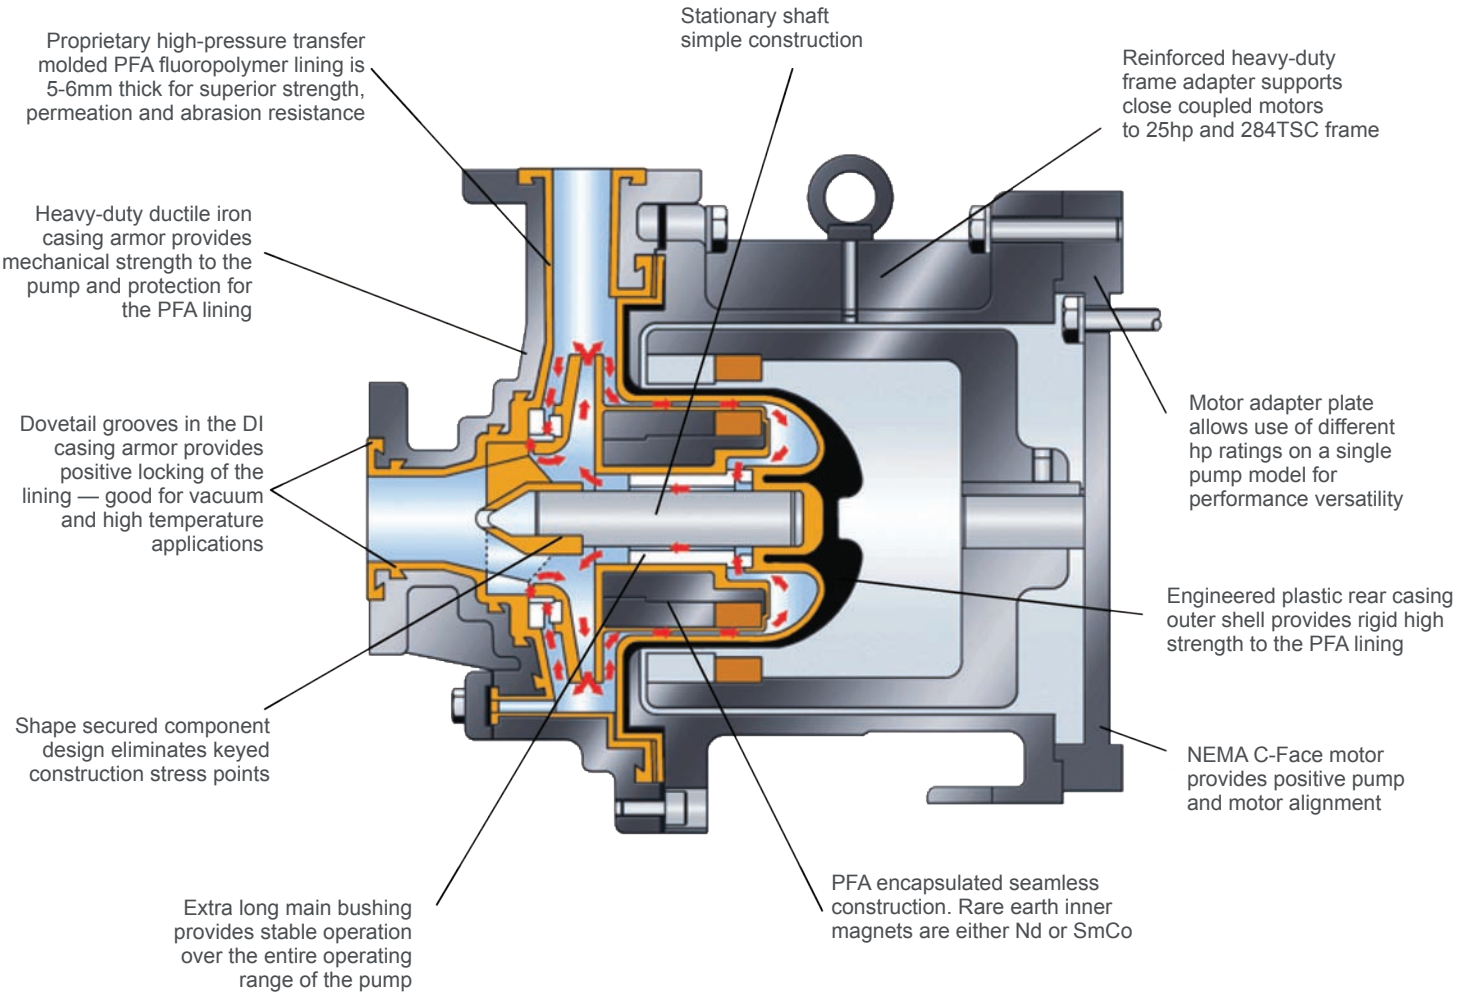
MAGNATEX® Pumps, Inc.

PFA Lined Magnetic Drive Process Pumps



TEXEL® PFA Lined MTA Series Pump Features

- PFA (Perfluoroalkoxytetrafluoroethylene) is a high-strength, high-temperature and abrasion-resistant fluoropolymer material
- Standard lining thickness is 5-6 mm
- PFA lining is mechanically secured to the ductile iron casing armoring by means of recessed dovetails that are cast into the ductile iron casing armor
- Extra long main shaft bushing
- Proprietary high pressure (1200 psi) transfer compression molding process
- Completely seamless inner magnet lining.

Competitive Comparator

MAGNATEX	COMPETITION
PFA offers the broadest range of resistance to chemical attack, lowest permeation rate and highest temperature capability of all the fluoropolymer materials, which ensures the maximum possible service life for Magnatex® lined magnetic drive pumps.	Generally only available in cheaper ETFE (Ethylene Tetrafluoro-ethylene) material, which has less chemical resistance, higher permeability and lower temperature resistance than PFA.
Magnatex PFA linings are 5–6mm thick and therefore will last longer in service than thinner ones of the same material and even longer when compared to the ETFE and PVDF linings offered by most of our competitors.	Most competitors' linings are just 3–4 mm thick, which means they have proportionately less corrosion and permeation resistance than Magnatex lined pumps.
High-pressure molding at 1200 psi produces a positive locking of the lining material and prevents lining movement in high vacuum or low suction pressure applications.	Most competitors have no mechanical means of restraining the casing liner, which can result in lining movement in high vacuum or low suction pressure applications. Shifting or movement of the lining may result in linings collapsing onto the internal rotating ele-ments leading to catastrophic failure of the pump.
The extra long main shaft bushing provides greater stability for operation across the entire hydraulic range of the pump, with smooth, quiet operation and extremely low vibration. Greater shaft support surface area means lower hydraulic loading, less wear and longer service life	Competitors generally offer shorter main shaft bushings, resulting in a smaller surface area to support dynamic shaft loads, which results in a shorter pump life.
High-pressure transfer molding @ 1200psi produces a lining with a dense, uniform thickness and superior surface finish, all of which contribute to superior service life in demanding chemical services. High pressure molding also eliminates any air pockets between the casing lining and the armoring, which is critical in high tem-perature services.	Competitors use a cheaper, atmospheric pressure, rotomolding process, which results in a thinner, less dense, and more perme-able lining material with a less uniform surface finish. Rotomolded linings may have air bubbles trapped behind them, which can lead to linings cracking in high-temperature applications.
Completely seamless inner magnet lining eliminates a potential leak path for the process fluid to reach and attack the inner mag-net. Shape secured main bushing eliminates keyed construction; easing related stress points.	Most competitors have seams in the inner magnet lining that can allow aggressive chemicals to penetrate the lining, which cause the magnet segments to swell and corrode, leading to catastrophic failure of the pump.

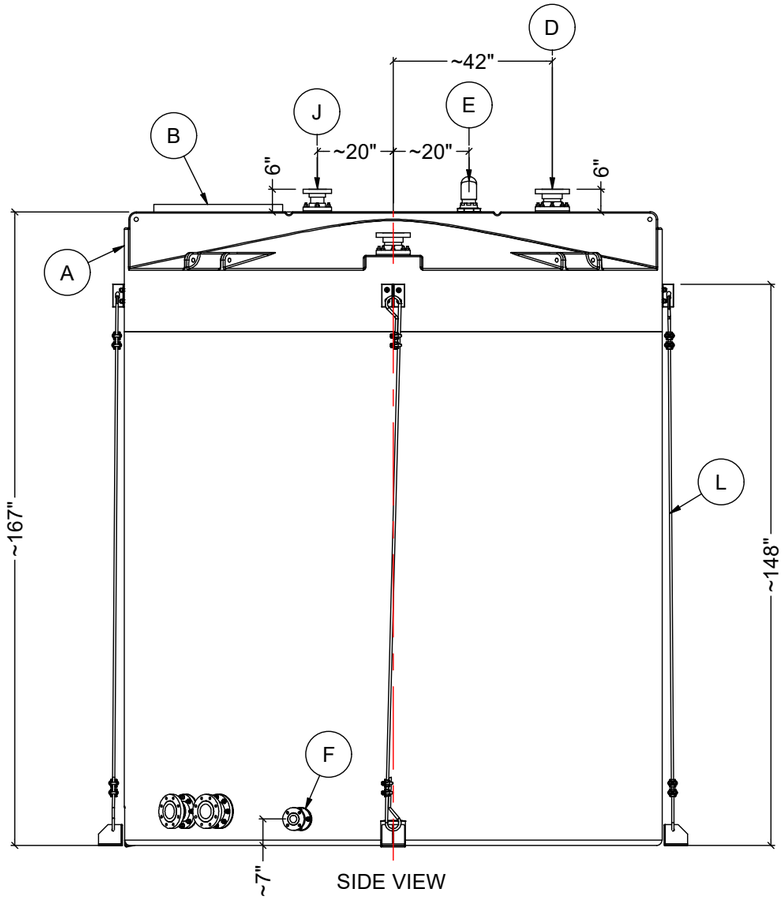
NOTES:



1. TANK IS MANUFACTURED FROM HDPE. (1.9 SG)
2. TANK IS MANUFACTURED TO ASTM-D-1998 STANDARD.
3. ALL TANK DIMENSIONS ARE SUBJECT TO A +/-3% TOLERENCE.
4. FLEXIBLE COUPLINGS ARE REQUIRED FOR ALL EXTERNAL PIPING.
5. ALL FITTING GASKETS ARE EPDM.
6. ACO RECOMMENDS ALL FLANGE GASKETS TO BE MIN. 1/4" THICK.
7. ON LARGER SIZED TANKS SOME MECHANICAL FITTINGS MAY NEED TO BE REMOVED IN ORDER TO AVOID WIDE OR OVERSIZED LOADS.
8. HDPE ALIGNMENT WEDGES ARE REQUIRED ON SOME TOP FITTINGS TO KEEP THEM PERPENDICULAR TO THE GROUND.
9. TANK MUST BE PROPERLY VENTED TO PREVENT PRESSURE OR VACUUM FROM DEVELOPING AS THE TANK IS FILLING OR EMPTYING.

BLADE INSTALLATION: TURBINES PUMP DOWN TURNING CLOCKWISE LOOKING DOWN. APPLY A THIN COAT OF RUBBER REPAIR TO ALL MATING SURFACES AND ASSEMBLE TURBINES ON SHAFT AS SHOWN. TORQUE NUTS WITH LOCKWASHERS ONTO WELDED STUDS. DO NOT USE FLATWASHERS. APPLY RUBBER REPAIR TO THE BOTTOM OF EACH NUT COVER AND THE MATING SURFACES ON THE BRACKETS. INSTALL THREADED NUT COVERS AS SHOWN AND TIGHTEN WITH A STRAP WRENCH. USE THE RUBBER REPAIR PRIMER & PATCH KIT PROVIDED TO COVER THE EXPOSED METAL SEAMS AROUND THE EDGES OF THE BOLT PLATES AND NUT COVERS (SEE INSTRUCTIONS ON KIT).

Sharpe Mixers
A Hayward Gordon Company

N-SERIES AND B-SERIES

Sharpe Mixers' N-Series premium line mixer drives are extremely efficient, durable, and best choice in a diverse range of applications that provide may years of quiet service. Built specifically with strict specifications to meet the high demands of mixing products.

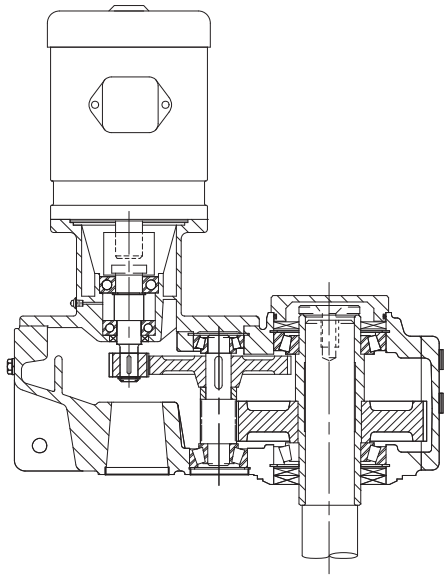
Vertical N-Series and right angle B-Series mixers are available in top and side entering designs, ranging from simple plate mounted with open tank models to complex mechanical seal systems; from high speed dispersers to ultra low speed helix mixers. Sizes range from fractional to over 200 horsepower.

Benefits:

- *Oil safe designs*
- *Custom impellers and seal designs*
- *Special alloys*
- *Polishing and coatings*

Standard Features:

- Heavy duty construction cast iron housing, SAE Class 30
- NEMA frame motors
- SAE 8620 steel helical gearing with overload protection AGMA quality level 12
- Oversized tapered roller bearings
- C-face motor mounting or foot mounted motors
- Oil lubricated gears and bearings with oversize sight glass and fill/drain fittings
- Durable 2-part epoxy finish to provide optimum protection against corrosion
- Flexible high speed coupling isolates motor from shock loads
- Rain cap/shaft guard on hollow quill units protecting personnel from rotating parts and weather conditions



1541 S. 92nd Pl., Seattle, WA 98108 | 206-767-5660 | 800-237-8815 | sharpemixers.com | sales@sharpemixers.com

Oil Safe Design Considerations

- Input bearing cylinders are modified to accept a grease fitting for re-greasable bearings. Larger units include a "charged" greasing cylinder, automatically re-greasing the bearings at set intervals.
- Oversize tapered roller bearings are used for all output bearings to provide excess capacity and maximum life.
- Oversize sight glasses are installed for easy viewing of oil levels.
- Gearbox cases are tapped to accept oil fill/oil drain fittings, which are included for ease of maintenance.
- Hollow quill units are equipped with Sharpe's custom fit rain cap/shaft guard covers to protect the output shaft from weather and to protect personnel from rotating parts. The hollow quill shaft design allows for precise attachment to the mixer shaft without the use of an in-tank coupling. Solid shaft and coupling designs are also available.
- Heat and shock loading is isolated with a flexible coupling between the motor and the gearbox. Standard NEMA frame c-face motor mounting is designed for simple trouble-free installation, with positive registers for repeatable alignment. Motor scoops are also available if foot mounted motors are preferred.
- The entire drive including the motor is covered with a premium 2-part epoxy coating, baked on for maximum corrosion resistance and durability.
- The all-helical gearing is made from SAE 8620 steel, carburized to hardness of 58 to 62 Rockwell C and ground to AGMA Quality Level 12, assuring quiet operation and long life.

TYPICAL MIXING

Industries

- Food & Beverage
- Pharmaceutical & Biotech
- Cosmetic & Personal Care
- Pulp & Paper
- Petroleum
- Chemical
- Municipal
- Waste Treatment
- Mining

Oil Safe Design

Options

- Synthetic lubricating oil
- High or low temperature lubricating oil
- Fluid grease lubricant
- Food grade lubricating oil
- Long term storage preparation

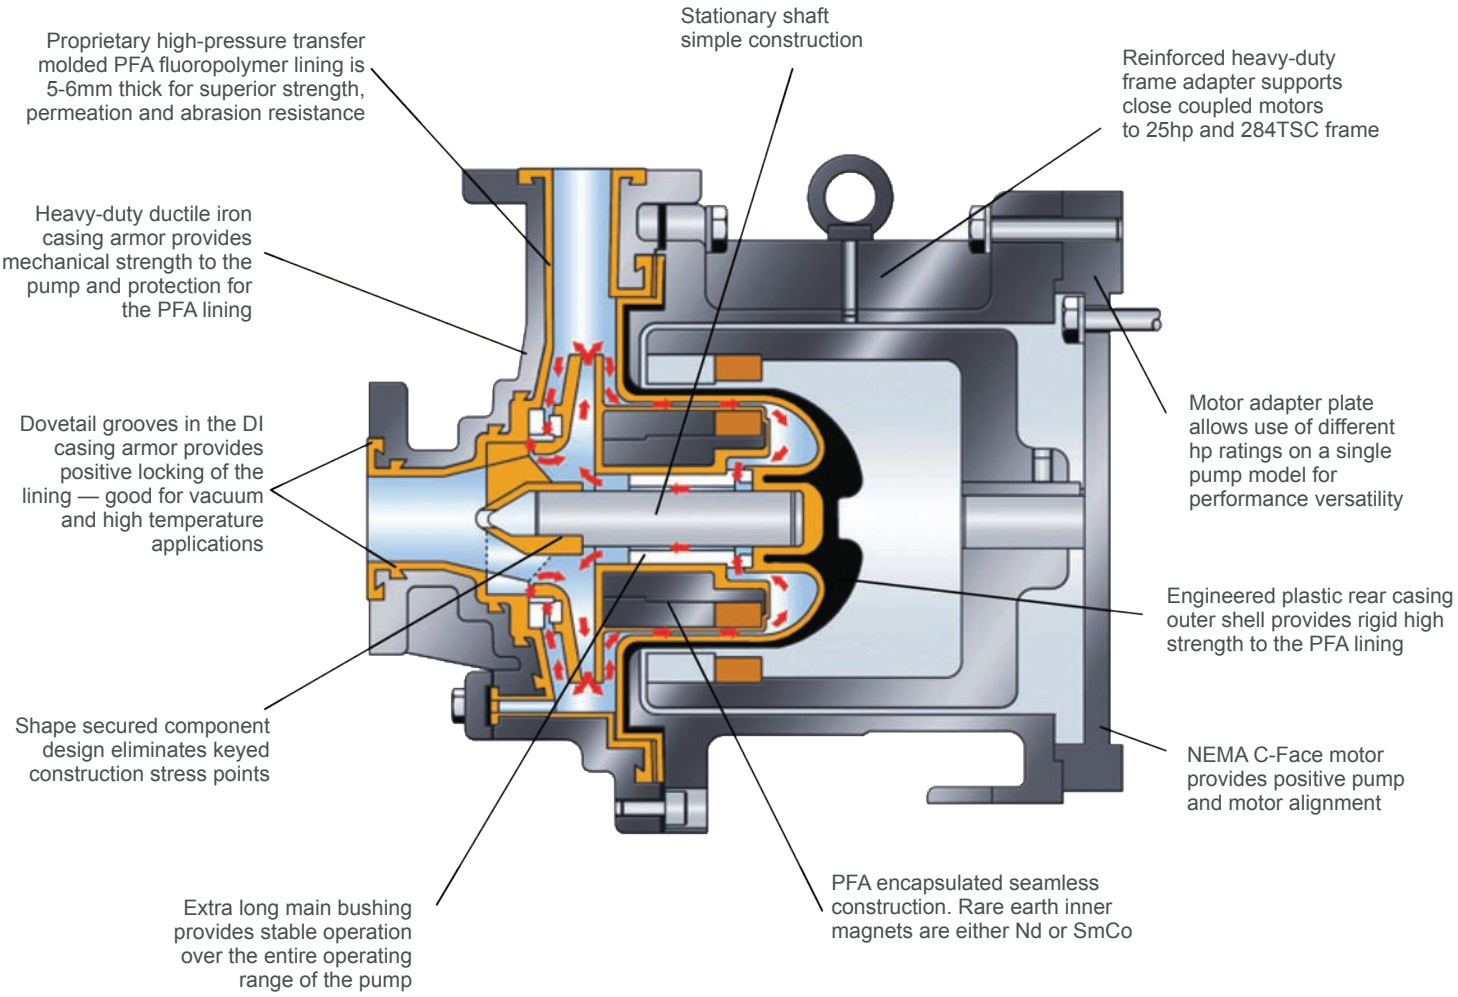
PFA Lined Magnetic Drive Process Pumps



TEXEL® PFA Lined MTA Series Pump Features

- PFA (Perfluoroalkoxytetrafluoroethylene) is a high-strength, high-temperature and abrasion-resistant fluoropolymer material
- Standard lining thickness is 5-6 mm
- PFA lining is mechanically secured to the ductile iron casing armoring by means of recessed dovetails that are cast into the ductile iron casing armor
- Extra long main shaft bushing
- Proprietary high pressure (1200 psi) transfer compression molding process
- Completely seamless inner magnet lining.

Competitive Comparator

MAGNATEX	COMPETITION
PFA offers the broadest range of resistance to chemical attack, lowest permeation rate and highest temperature capability of all the fluoropolymer materials, which ensures the maximum possible service life for Magnatex® lined magnetic drive pumps.	Generally only available in cheaper ETFE (Ethylene Tetrafluoro-ethylene) material, which has less chemical resistance, higher permeability and lower temperature resistance than PFA.
Magnatex PFA linings are 5–6mm thick and therefore will last longer in service than thinner ones of the same material and even longer when compared to the ETFE and PVDF linings offered by most of our competitors.	Most competitors' linings are just 3–4 mm thick, which means they have proportionately less corrosion and permeation resistance than Magnatex lined pumps.
High-pressure molding at 1200 psi produces a positive locking of the lining material and prevents lining movement in high vacuum or low suction pressure applications.	Most competitors have no mechanical means of restraining the casing liner, which can result in lining movement in high vacuum or low suction pressure applications. Shifting or movement of the lining may result in linings collapsing onto the internal rotating ele-ments leading to catastrophic failure of the pump.
The extra long main shaft bushing provides greater stability for operation across the entire hydraulic range of the pump, with smooth, quiet operation and extremely low vibration. Greater shaft support surface area means lower hydraulic loading, less wear and longer service life	Competitors generally offer shorter main shaft bushings, resulting in a smaller surface area to support dynamic shaft loads, which results in a shorter pump life.
High-pressure transfer molding @ 1200psi produces a lining with a dense, uniform thickness and superior surface finish, all of which contribute to superior service life in demanding chemical services. High pressure molding also eliminates any air pockets between the casing lining and the armoring, which is critical in high tem-perature services.	Competitors use a cheaper, atmospheric pressure, rotomolding process, which results in a thinner, less dense, and more perme-able lining material with a less uniform surface finish. Rotomolded linings may have air bubbles trapped behind them, which can lead to linings cracking in high-temperature applications.
Completely seamless inner magnet lining eliminates a potential leak path for the process fluid to reach and attack the inner mag-net. Shape secured main bushing eliminates keyed construction; easing related stress points.	Most competitors have seams in the inner magnet lining that can allow aggressive chemicals to penetrate the lining, which cause the magnet segments to swell and corrode, leading to catastrophic failure of the pump.

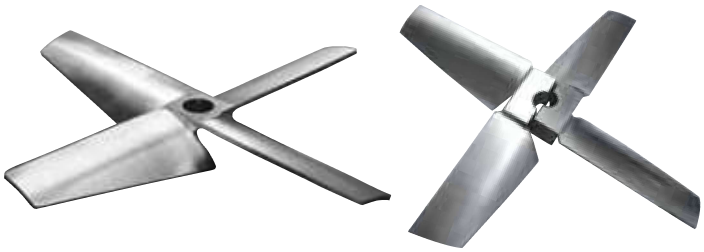
Sharpe Mixers
A Hayward Gordon Company

IMPELLER TECHNOLOGY



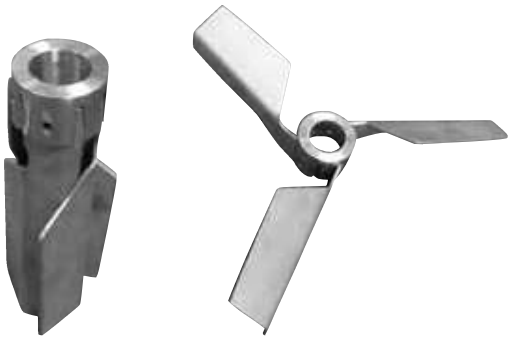
No single impeller can perform well in all applications. Sharpe Mixers provides a variety of industry standard and specialized proprietary impeller designs that are optimized for specific mixing applications.

Hyflo Impellers

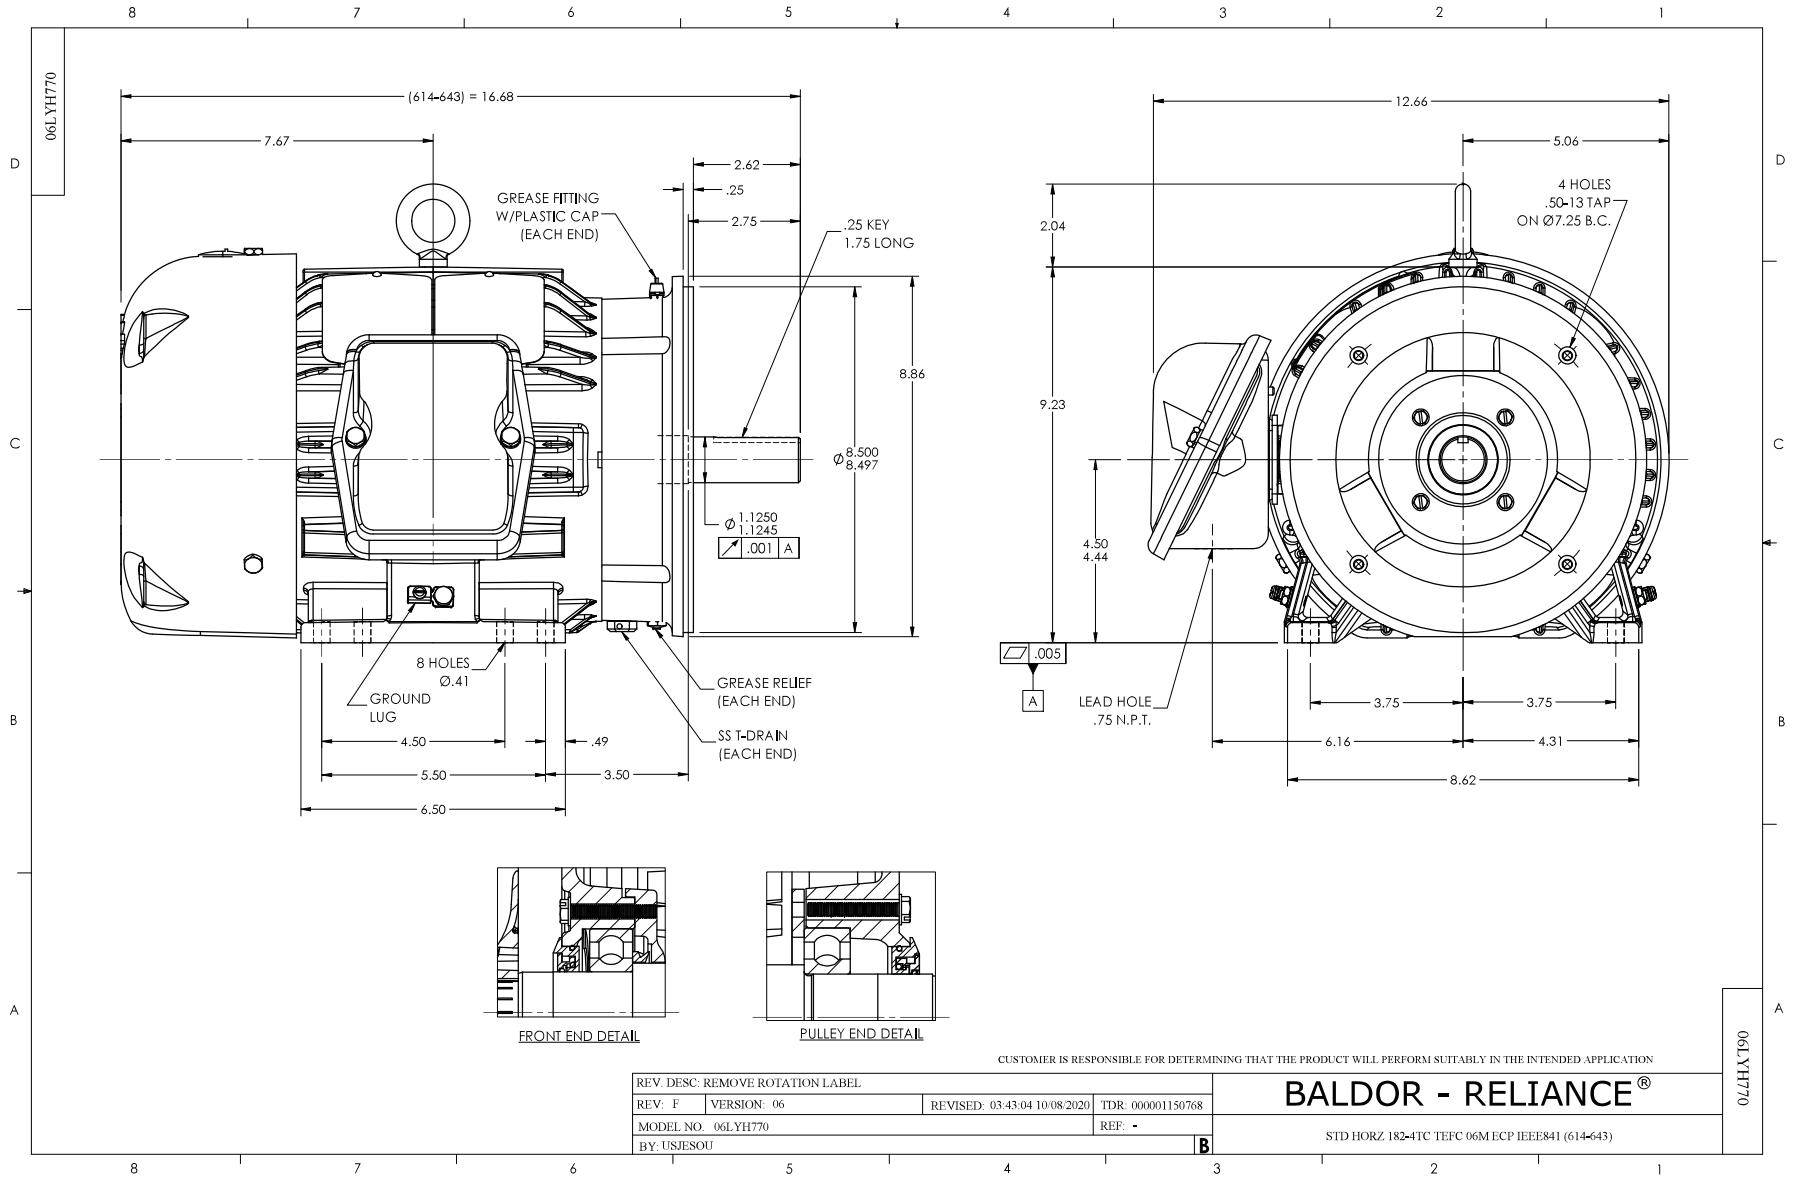
Sharpe Mixers' most popular hydrofoil style impeller generates the most flow for the least amount of power, reducing operating costs and improved performance. Each impeller model is designed for specific applications using high, medium, or low viscosity blending.

HYF-218:

- Best for low viscosity products
- Low blade angle and hydrofoil blade shape reduce shear rates
- Four blade design

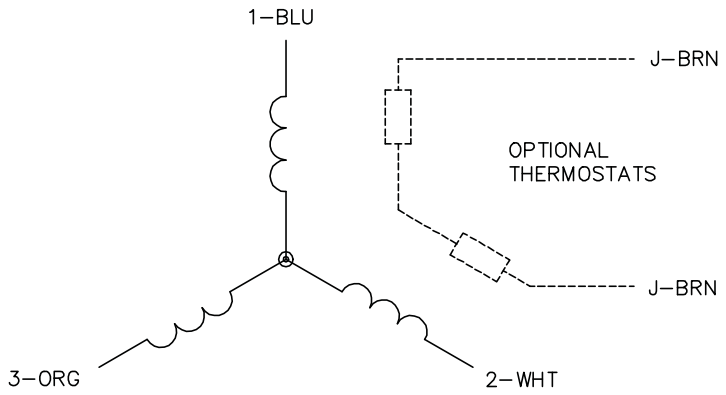


HYF-518:



- Wide blade "Hyflo" high-efficiency hydrofoil impeller
- Best for medium viscosity (N_{Re}<500) products
- Provides equal flow with half the power
- High-solidity design optimum for gas handling applications
- Four blade design

FHY-345:



- Collapsible blades that will fit through small diameter openings
- No tank access required to install mixer
- Patented 3-blade folding impeller

Sharpe Mixers
A Hayward Gordon Company

N-SERIES AND B-SERIES

Sharpe Mixers' N-Series premium line mixer drives are extremely efficient, durable, and best choice in a diverse range of applications that provide may years of quiet service. Built specifically with strict specifications to meet the high demands of mixing products.

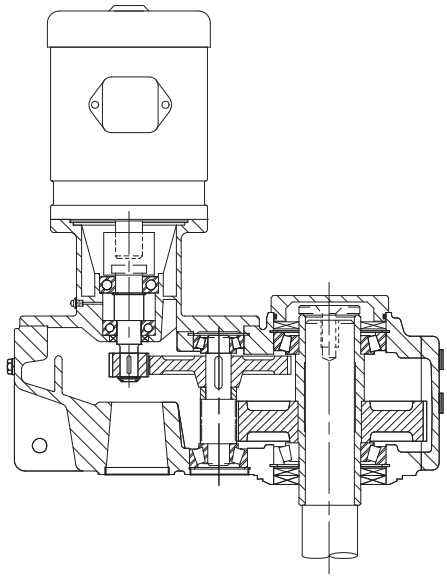
Vertical N-Series and right angle B-Series mixers are available in top and side entering designs, ranging from simple plate mounted with open tank models to complex mechanical seal systems; from high speed dispersers to ultra low speed helix mixers. Sizes range from fractional to over 200 horsepower.

Benefits:

- *Oil safe designs*
- *Custom impellers and seal designs*
- *Special alloys*
- *Polishing and coatings*

Standard Features:

- Heavy duty construction cast iron housing, SAE Class 30
- NEMA frame motors
- SAE 8620 steel helical gearing with overload protection AGMA quality level 12
- Oversized tapered roller bearings
- C-face motor mounting or foot mounted motors
- Oil lubricated gears and bearings with oversize sight glass and fill/drain fittings
- Durable 2-part epoxy finish to provide optimum protection against corrosion
- Flexible high speed coupling isolates motor from shock loads
- Rain cap/shaft guard on hollow quill units protecting personnel from rotating parts and weather conditions



1541 S. 92nd Pl., Seattle, WA 98108 | 206-767-5660 | 800-237-8815 | sharpemixers.com | sales@sharpemixers.com

Oil Safe Design Considerations

- Input bearing cylinders are modified to accept a grease fitting for re-greasable bearings. Larger units include a "charged" greasing cylinder, automatically re-greasing the bearings at set intervals.
- Oversize tapered roller bearings are used for all output bearings to provide excess capacity and maximum life.
- Oversize sight glasses are installed for easy viewing of oil levels.
- Gearbox cases are tapped to accept oil fill/oil drain fittings, which are included for ease of maintenance.
- Hollow quill units are equipped with Sharpe's custom fit rain cap/shaft guard covers to protect the output shaft from weather and to protect personnel from rotating parts. The hollow quill shaft design allows for precise attachment to the mixer shaft without the use of an in-tank coupling. Solid shaft and coupling designs are also available.
- Heat and shock loading is isolated with a flexible coupling between the motor and the gearbox. Standard NEMA frame c-face motor mounting is designed for simple trouble-free installation, with positive registers for repeatable alignment. Motor scoops are also available if foot mounted motors are preferred.
- The entire drive including the motor is covered with a premium 2-part epoxy coating, baked on for maximum corrosion resistance and durability.
- The all-helical gearing is made from SAE 8620 steel, carburized to hardness of 58 to 62 Rockwell C and ground to AGMA Quality Level 12, assuring quiet operation and long life.

SECTION C

N - SERIES GEARBOX LUBRICATION

C1.1 N-SERIES GEARBOXES: See data sheet and/or assembly drawing at the front of this manual to find the model number and number of gear reductions for gearbox supplied. Unit case sizes N9 and smaller have been lubricated at the factory with the proper type (for an ambient temperature range of 20° - 104°F; for different ambient conditions, change to appropriate oil shown in Table C1.3) and amount of lubrication for mixer service. To prevent leakage, the gearbox vent has been replaced with a temporary plug for shipment. The vent is included separately.

WARNING: VENT MUST BE REINSTALLED PRIOR TO START-UP OR DAMAGE TO GEARBOX WILL OCCUR. (If gearbox is supplied with OT or OA, see section at end of manual for venting instruction.)

Check that the oil level is to the proper level before start-up (see Figure C1.1), and that none was lost during shipment/installation. Units with an oil tank(OT) or expansion chamber (OA) will require a lube top off before mixer operation. If an OT or OA is supplied, see section at the end of manual for proper oil level. Change the oil every 10,000 hours or 2 years for mineral lube, 20,000 hours or 4 years with synthetic lube, whichever occurs first. Under extreme conditions it is recommended that the lubricant in the gearbox be changed more frequently. Pipe fittings may be provided to assist in oil draining/filling (see Section C1.2). Refer to Table C1.3 for the lubricant recommended for temperatures in your area. When changing to a different lubricant, clean gearbox with mineral spirits before refilling. Regrease input bearings every 1,000 hours or 6 months, whichever occurs first. See page C-9, Table C2.4 for recommended grease. Open and clean the grease outlet (opposite zirc). Add grease until new grease is forced through the outlet. Remove excess grease. Run one half hour before replacing the grease outlet plugs. Some gearboxes may be supplied with automatic bearing lubricators and will not have a grease fitting on the input. See section C2.3 for more information.

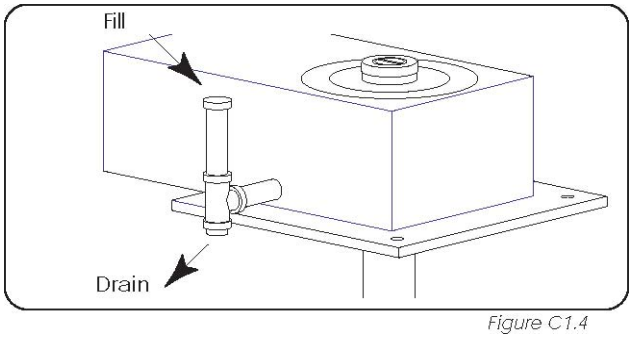
C1.2 On units smaller than N9 pipe fittings have been provided to assist in filling and draining gearbox oil. Install these fittings in place of the 1/2" N.P.T. drain in the side of the gearbox (See Figure C1.4).

Refer to table C1.2 for approximate oil quantities for your gearbox size.



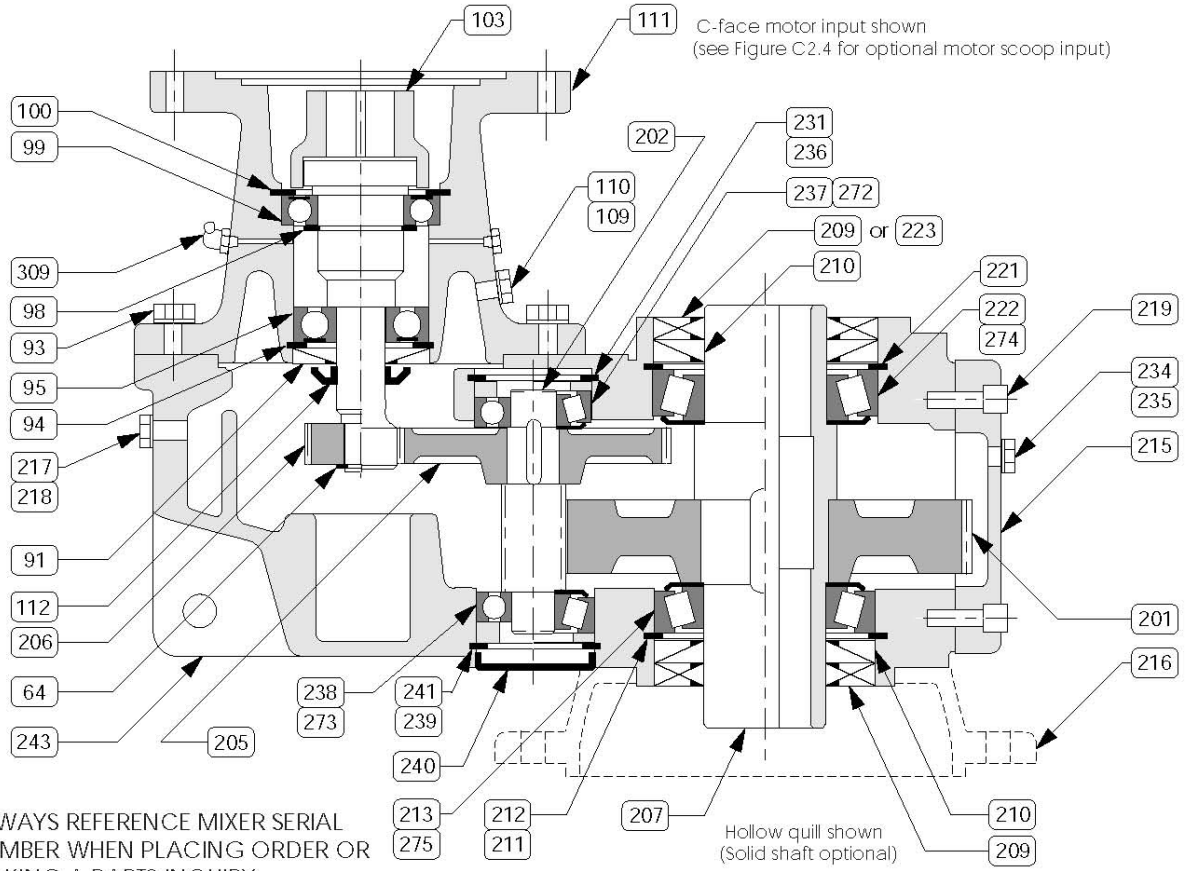


Figure C1.4

GEARBOX PARTS

C2.1 See data sheet and/or assembly drawing in the front of this manual to find the model number of gearbox supplied. The following drawings (Figures C2.1, C2.2, & C2.3) show standard parts for the N-Series gearbox, your model may vary slightly due to size and ratio. C-face motor adapter is shown in assembly drawings. See page C-8 (Figure C2.4) for motor scoop input adapter parts. Bearing and seal part numbers are shown on Tables C2.1 and C2.2. When requesting other part numbers, have serial number and model number off mixer nameplate readily available. If disassembling gearbox, contact factory for complete instructions and exact drawing for accurate placement of shims, snap rings, etc.

ALWAYS REFERENCE MIXER SERIAL NUMBER WHEN PLACING ORDER OR MAKING A PARTS INQUIRY.

TABLE C2.1

C2.2 Input bearings are sheilded on one side only. When replacing bearings, be sure to install them with the sheild facing away from the grease fitting on the input cylinder. NOTE: GEARBOXES SHIPPED BEFORE 1995 MAY REQUIRE DOUBLE SEALED BEARINGS ON THE INPUT. PLEASE CONSULT THE FACTORY TO VERIFY.

CAUTION: DO NOT DISASSEMBLE GEARBOX WITHOUT PRIOR AUTHORIZATION FROM SHARPE MIXERS OR WARRANTY WILL BE VOID. (DISREGARD WHEN MIXER IS OUT OF WARRANTY PERIOD.)

• = Recommended spare part

FIGURE C2.4

C2.3 The input bearings requires relubrication at regular intervals. To lubricate the bearings of the input shaft, add about 0.75 oz of grease every 1,000 hours or 6 months, whichever occurs first. See C1.1 for instructions and table C2.4 for recommended bearing greases. Automatic lubricators are available on request.

The optional automatic lubricators feed grease lubricant to the outboard adapter bearing continuously over time. The lubricator contains 4 oz. (120 cc) of grease. **Each automatic lubricator must be activated by turning the plastic eyelet into the canister until the eyelet breaks off**. This pressurizes the canister and releases grease. With 8 hours/day of operation it must be replaced every 12 months. For longer operating times the replacement interval decreases accordingly.

The automatic lubricator is designed for normal service conditions at ambient temperatures between 32°F (0°C) and 104°F (40°C). If the ambient temperature is outside this range for prolonged periods of time, special lubricants should be used. Consult factory. A canister with food grade lubricant is also available.

C2.4 When replacing output bearings and seals on the gearbox be sure to re-pack bearings and seals with grease (see figure C2.6). See table C2.4 for recommended grease options.

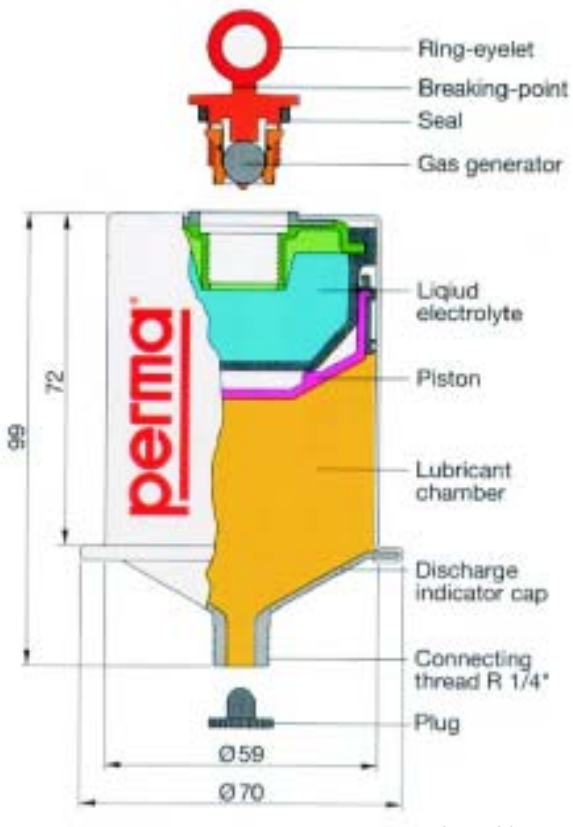

FIGURE C2.5
(dimensions in mm)

Grease Options (applied to greased bearings and seal cavities)

NLGI Grade	Grease Type/Thickener	Ambient Temperature Range	Manufacturer Brand/Type
NLGI 2	Standard/Li-Complex	-22 to 140 deg F (-30 to 60 deg C)	Shell Albida EP 2
	High-Temperature/Polyurea	-13 to 176 deg F (-25 to 80 deg C)	Mobil Polyrex EP 2
	Food-Grade/Al-Complex	-13 to 104 deg F (-25 to 104 deg C)	Mobil Grease FM222

!WARNING! - MAG DRIVE PUMP

DO NOT WORK ON THIS PUMP IF YOU ARE WEARING A MEDICAL DEVICE (DEFIBRILLATOR, PACEMAKER, ETC.) PERSONNEL WHO EXPERIENCE INTERFERENCE WITH THEIR MEDICAL DEVICE SHOULD MOVE AWAY FROM THE PUMP AND REFRAIN FROM HANDLING MAGNETIC PUMP COMPONENTS. SEEK IMMEDIATE MEDICAL ATTENTION IF YOU HAVE EXPERIENCED INTERFERENCE WITH YOUR MEDICAL DEVICE.

The rare earth permanent magnets in this pump have been manufactured such that the magnetic field is directional toward each half of the magnetic coupling. For this reason, the magnetic field that exists outside of the assembled magnetic coupling is minimal. When the two halves are apart, the magnetic field is exposed, which is why we recommend that personnel wearing medical devices DO NOT HANDLE the magnetic coupling components. When the pump is assembled, the magnetic fields from the magnetic coupling components are not exposed and it is safe for wearers of medical devices to be in the general proximity of the assembled pump, whether the pump is in operation or not.

OPERATING & MAINTENANCE INSTRUCTIONS
TEXEL® MTA SERIES CLOSE-COUPLED PUMPS

1. RECEIVING INSPECTION

A. Before uncrating, check for physical damage to the pump assembly. Notify the common carrier **IMMEDIATELY** if any damage is found.

B. Check the nameplate on the pump against receiving and purchase order documents to be sure the correct pump size and materials of construction have been supplied. If a motor has been supplied, check for correct horsepower, speed and voltage.

C. Check to see if flange protectors are intact. If not, check for foreign objects that may have found their way into the pump casing through the flange openings.

D. Remove the motor fan cover and make sure the pump freely rotates by hand using the motor shaft. Only slight resistance should be felt. If the pump has a heavy resistance, or if any noise is heard, call your **TEXEL** representative or **MAGNATEX® PUMPS, INC.** at (713) 972-8666.

2. SAFETY PRECAUTIONS

For safe operation and to prevent personal injury and/or damage to equipment or property, read and follow all warnings described below.

A. Handling the Pump

The pump may be lifted by the eyebolt, however additional support, such as slings or chains or other lifting devices must be used once a motor is attached.

B. Inspection

When conducting operational tests after installation or maintenance, make certain that all drain bolts, casing bolts etc., are tight.

Copyright 2000 Magnatex Pumps. Inc.

C. Application

This pump has been designed and constructed for specific operating conditions and specifications. If pump is to be used for other services, consult with your representative or **MAGNATEX® Pumps, Inc.** at (713)972-8666.

WARNING!
When working on magnetically driven pumps…

- Strong magnetic fields may damage watches, credit cards, computer disks, calculators and computer tapes.

- People with pacemakers should be cautioned that the strong magnetic field might upset the timing or cause the pacemaker to malfunction.

- When working on the pumps, be aware that tools or metal parts brought within close proximity to the magnets may suddenly be attracted trapping fingers in the process.

3. STORAGE PROCEDURES

Storage up to three months:

A. Do not remove flange protectors until time of installation.
B. Store in dry, adequately ventilated room.
C. Tape the motor terminal box opening to prevent foreign matter from entering.

Storage for longer than three months:

A. Follow above steps for storage up to 3 months.
B. Remove the fan cover from the motor and rotate motor and pump several times every 3 months.
C. Motor insulation can degrade over time due to moisture absorption. Therefore, measure and record insulation resistance on delivery of pump/motor assembly and check periodically. Dry motor if required. (Refer to motor instruction manual.)

Storage for longer than one year

A. Follow above steps, for storage longer than 3 months.
B. Perform internal pump inspection and replace gasket.

Copyright 2000 Magnatex Pumps. Inc.

4. INSTALLATION AND PIPING

A. FOUNDATION

The foundation should be firm and heavy to reduce vibrations. The foundation bolts should be mounted in concrete to provide a firm and positive support.

B. LOCATION & PIPING

1. Locate the pump as close as practical to the source of the liquid supply.

2. The suction line should be as short and straight as possible and contain a minimum number of elbows. Any elbow should be the large radius type. Elbows and fittings should be no closer than 10 pipe diameters to the pump suction to allow undisturbed flow to the pump impeller.

3. Generally, suction piping should be one or two sizes larger than the pipe suction. This will keep friction losses to a minimum. This becomes more important as the distance between the pump and the liquid supply increases, or if fittings are located closer than 10 pipe diameters to the pump's suction.

4. The suction piping should have no high spots where air pockets can collect. All joints in the suction line should be tight to prevent air from entering into the system and creating the possibility of vapor locking. This is especially important when suction pressure is lower than atmospheric pressure. A pressure gauge should be installed in the suction line as close as possible to the suction flange.

5. An air vent should be installed at the initial high point in the pump discharge line. A check valve and shut-off valve should be installed as close as possible to the pump discharge nozzle. The check valve is installed to protect the pump from excessive back pressure, including reverse flow/rotation, and back flow during shut down or driver failure. The discharge valve is to regulate the flow and isolate the pump for servicing. A pressure gage should also be installed as close as possible to the discharge nozzle between the pump and the discharge valve.

6. Large particles can block the bushing lubrication ports in the pump causing serious damage. In addition, metallic particles can magnetically attach to the inner magnet also resulting in damage. If possible, a temporary start-up strainer with a 40x40 mesh screen should be installed in the pump's suction line. **BE VERY CAREFUL** not to allow the temporary strainer to be plugged to the point of starving the pump of liquid. This may result in cavitation and the possibility of running the pump dry, which can destroy the pump's bushings. It is recommended to install a pressure gauge between the strainer and pump to monitor possible plugging of the strainer. The discharge pressure should also be closely monitored. Any drop in the discharge pressure without discharge valve throttling could suggest strainer plugging (assuming constant demand to the system).

Copyright 2000 Magnatex Pumps. Inc.

7. ***TEXEL®*** pumps, although very rugged, are not designed to handle excessive stress(see p.18). The resulting forces and moments can result in possible damage to the pump. Piping must be anchored and supported as close as possible to, but independent from the pump. Pump and pipe flanges must be positioned together before attempting to tighten flange bolts.

8. The pump **MUST NOT RUN DRY.** Adequate liquid should always be available to the pump suction. A flow sensor and/or amp/watt monitor should be installed to shut the pump down in the event of dry run. MAGNATEX provides optional protection devices to prevent dry run.

5. OPERATING PROCEDURES

ROTATION CHECK

To confirm the direction of rotation against the rotation arrow on the pump casing use the following procedures:

A. Open the suction and discharge valve and allow the pump to be filled with liquid.

WARNING! NEVER RUN THE PUMP DRY

B. Remove the motor fan cover for visual inspection and rotation.

C. Bump the motor by quickly pushing the motor start & stop buttons. Rotation should be clockwise as seen from motor end. If the direction of rotation is incorrect, reverse two of the three-phase power leads to the motor.

D. After confirming proper rotation, replace the motor fan cover.

PRIMING AND START-UP

A. Open the suction and discharge valves and allow the pump to fill with liquid.
(If the direction of rotation has not been checked, this must be done as detailed in the Rotation Check section above.)

WARNING! NEVER RUN THE PUMP DRY

B. Close the discharge valve to ¼ open.

Copyright 2000 Magnatex Pumps. Inc.

C. Start the motor and immediately check the discharge pressure gauge. The pressure should rise quickly and hold steady. If the pressure rises and then falls back, there is air or vapor in the system. **STOP THE PUMP IMMEDIATELY.** Wait 15 to 20 seconds before restarting the pump.

D. If after repeating step C several times, the pressure gauge does not hold steady or does not yield the expected pressure (from performance curve), contact your TEXEL representative, or **MAGNATEX® PUMPS, Inc**. for assistance. Do not continue to operate the pump under these conditions.

E. Once the pump is fully primed and the discharge pressure is satisfactory, slowly open the discharge valve until the desired operating point is reached.

F. Operators should make frequent visual inspections to insure the pump is running smoothly without noise or vibration. The discharge pressure should hold steady without fluctuation. Any excessive heating of the pump or motor bearings is cause for alarm. The unit should be shut down immediately, an investigation made to find the cause, and corrective action taken.

G. Follow the motor manufacturer's recommendations and keep the motor bearings lubricated properly.

WARNING!

Never throttle the pump by closing the valve on the suction side of the pump. Throttling the suction side can cause serious damage to the pump. Throttle only from the discharge valve.

WARNING!

Never operate the pump against a closed discharge valve. Low flow operation can cause rapid heating of the pumped liquid with possible vaporization and the pump bushing running dry, resulting in serious damage to the pump.

SHUT DOWN

A. Normally pump should be stopped only after discharge valve is closed. If suction valve is close first, cavitations and pump seizure may occur.

B. If suction is flooded, close suction valve after pump is stopped.

C. If pump is shut down for long periods of time, drain liquid from the pump. Freezing liquid may cause pump damage.

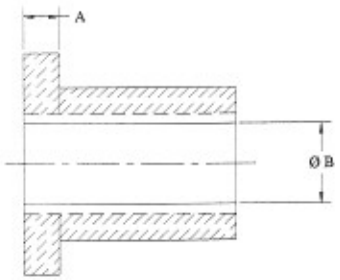
Copyright 2000 Magnatex Pumps. Inc.

6. MAINTENANCE SCHEDULE

A. Daily check

- Check pump for any abnormal noise or vibration.
- Check suction and discharge pressure as well as liquid level of the suction tank,
- Check motor amp draw versus motor rated amps.

B. Periodic Check



For smooth and safe operation of the pump, check each part of the pump during normal preventive maintenance in accordance with instructions given below. Special care should be taken when handling the shaft, thrust rings and bushings.

PART NAME	CHECK POINTS
CASING	• Accumulation of dirt. • Presence of cracks. • Wearing or rubbing.
IMPELLER	• Dirt or foreign matter in the impeller. • Contact of inlet area. • Wear condition of mouth ring.
INNER MAGNET	• Rubbing of the outer surface. • Presence of cracks. • Accumulation of dirt. • Wear condition of bushing. • Clogging of cooling passage in Bushing.
REAR CASING	• Rubbing of rear casing. • Accumulation of dirt. • Wear condition of rear thrust ring. • Presence of cracks.
SHAFT	• Presence of cracks. • Wear condition of bushing.
OUTER MAGNET	• Rubbing of the inner surface. • Position of motor shaft.
MOTOR BEARING	• Presence of abnormal noise.

C. Maximum allowable bushing dimensional losses.

	A (inch/mm)	B (∅) (inch/mm)	C (inch/mm)
New	0.236/6.0	1.024/26	0.315/8.0
At replacement	0.197/5.0	1.063/27	0.276/7.0

Bushing

Mouth Ring

7. DISASSEMBLY OF PUMP

SAFETY PRECAUTIONS:

A. Always wear protective clothing and equipment such as rubber/insulated gloves and safety glasses when disassembling the pump.

WARNING!
There is a danger from chemical contact with skin during and after disassembling the pump.

B. After disassembling the pump, take the proper precautions when handling the shaft and bushing. They can be easily damaged by sharp contact.

C. The inner magnet and outer magnet can exert strong magnetic forces. Do not allow metal chips or metal materials to come close to the Magnets.

WARNING!
Magnet strength results in strong magnetic forces that could cause physical damage to hands and fingers. Caution must be taken to keep fingers and hands from between magnets.

Copyright 2000 Magnatex Pumps. Inc.

PREPARATION FOR DISASSEMBLY

A. Check for safety of the working environment.

B. Lock out the main power supply to avoid unintentional operation. Before disassembling the pump, be sure the work area is appropriately defined with proper warning notices and lockouts are in place.

WARNING!

The pump is a mechanical rotating device… if the pump is switched on with the rotating parts exposed while disassembled, sever injury to personnel may result.

C. Fully close the suction and discharge valves before removing the pump from the piping.

D. Wear protective rubber gloves and safety glasses before loosening flange bolts. Drain the liquid from the pump and piping.

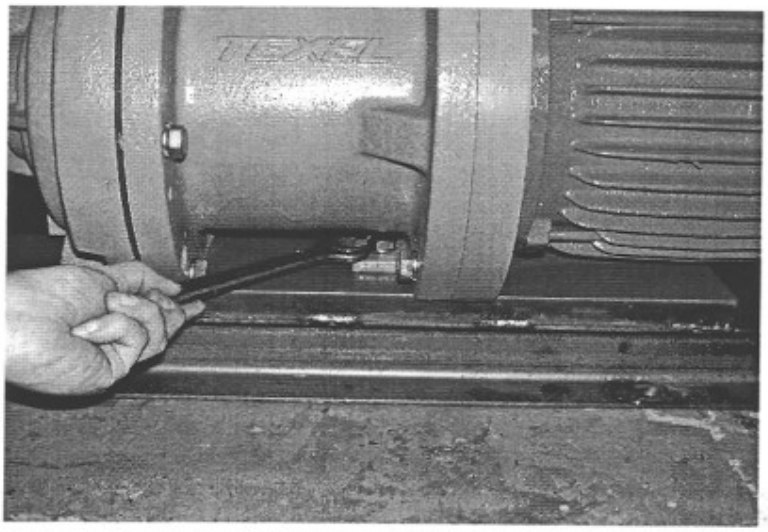
E. If the pump is provided with a casing drain, the following procedure and precaution should be taken for draining the pump.

1. Open the drain cap or remove the drain bolts holding the drain plug to the casing.

2. Slowly loosen the four (4) flange bolts and nuts of the pump discharge flange, until the trapped liquid begins to drain. Be properly positioned to prevent personnel contact while the liquid is draining.

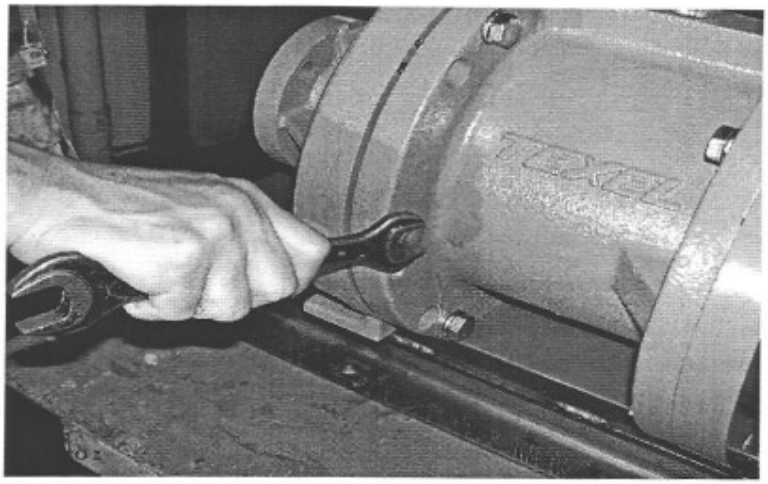
WARNING!

Do not loosen all four bolts that secure the pump flange or the discharge side at the same time. Liquid may leak or splash out causing severe bodily harm. It is dangerous to work in front of the drain port while draining the fluid. Be properly positioned before and during the process of draining the pump.



3. When the pump and discharge piping are completely drained, remove the four (4) bolts and nuts from the discharge flange.

Copyright 2000 Magnatex Pumps. Inc.



DISASSEMBLY

The *TEXEL*® MTA series is a back pull out type pump. Disassemble in accordance with instructions (A) through (G).

A. Detach the bracket foot bolt(s)

B. Detach the six (6) casing bolts (104-3).

Copyright 2000 Magnatex Pumps. Inc.

C. **Remove the casing bolts (104-3); leave the two (2) disassembly/assembly bolts (104-58) in the tapped holes on either side of the bracket (028). Use these bolts to separate the bracket (028) from the casing (001) (photo 3).**

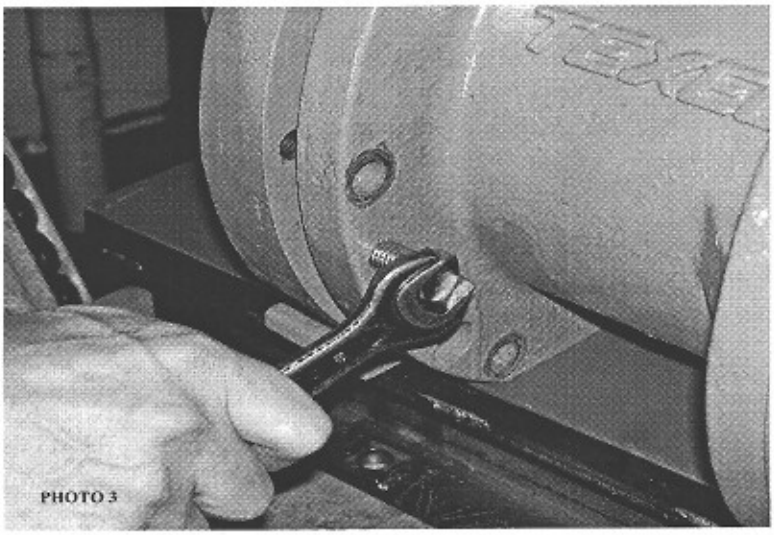


PHOTO 3

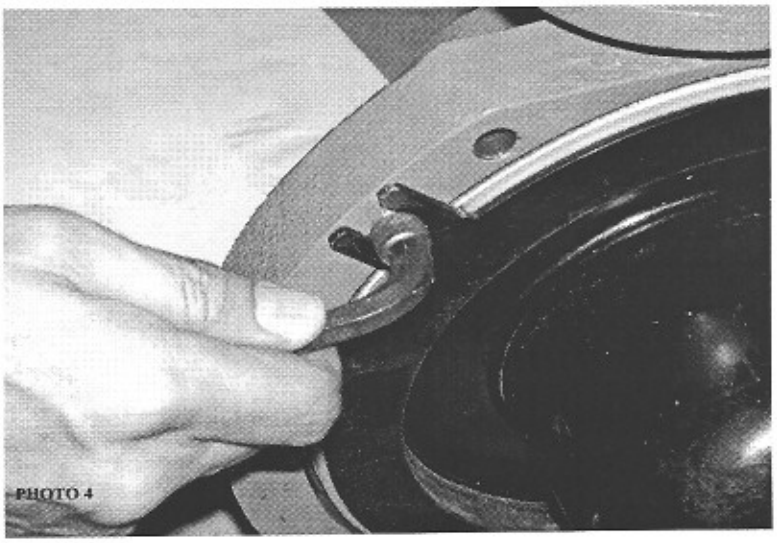
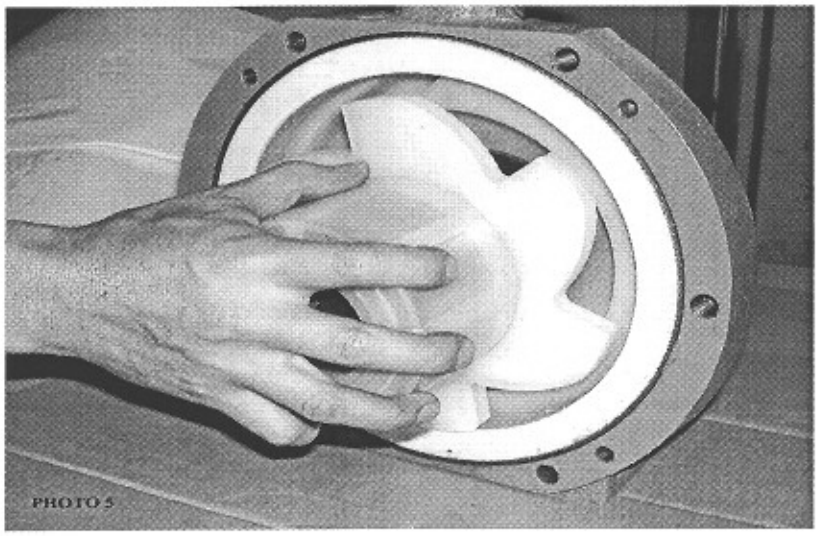
D. **Detach the four (4) rear casing bolts (104-54) and remove the rear casing (060) by moving it backward (photo 4). <u>NOTE: Don't use a wrench when assembling.</u>**





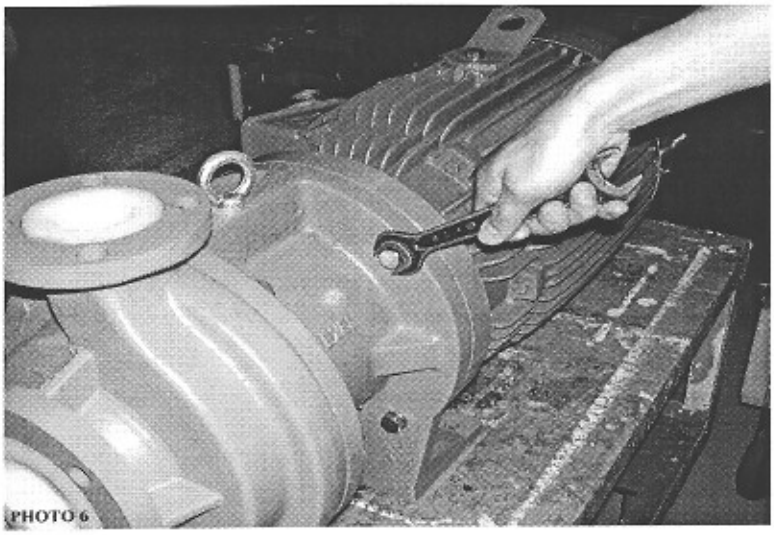


PHOTO 4

Copyright 2000 Magnatex Pumps. Inc.

E. **Remove the inner magnet/ impeller (058+013) by sliding it off the shaft (018) (photo 5).**

PHOTO 5

F. **Detach the four (4) motor liner bolts (104-33) and remove the motor with the outer magnet (057) (photo 6).**

PHOTO 6

Copyright 2000 Magnatex Pumps. Inc.

G. **Loosen the two (2) outer magnet screws (104-46) and remove the outer magnet (057) (photo 7).**

8. ASSEMBLY OF PUMP

To assemble the pump, follow the disassembly procedure in reverse order.

F. **Slip the outer magnet (057) on the motor shaft (018) until the inner surface of the magnet hub is flush with the motor shaft, as shown in (Fig. 3)**

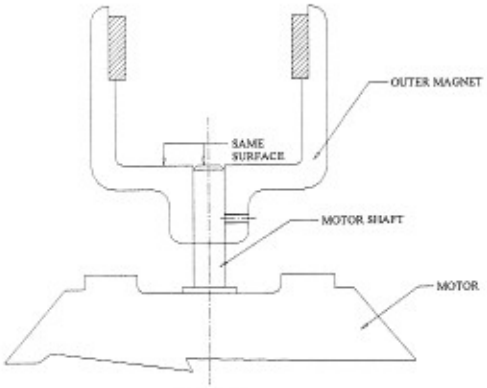

FIG. 3

G. **Bolt the bracket (028) to the motor (901) using the motor liner (902).**

H. **Slide the Inner Magnet/Impeller (058+013) on to the Shaft (018).**

Copyright 2000 Magnatex Pumps. Inc.

I. **Install the casing gasket (101-1) on the casing (001) and attach the rear casing (060) to the casing using the four (4) rear casing bolts (104-54). (Tighten the rear casing bolts lightly by hand). DO NOT USE A WRENCH.**

WARNING!

Since the Inner Magnet and Outer Magnet strongly attract each other, be careful to avoid trapping your fingers between the casing and bracket.

J. **Assemble the casing (001) to the bracket (028). Tighten the casing bolts in a cris-cross pattern to ensure even tightness.**

K. **Install the bracket foot bolt(s) (104-17) and tighten.**

L. **At the completion of assembly, check to assure the motor fan turns smoothly by rotating it with a screwdriver.**

9. REMOVAL AND INSTALLATION OF SHAFT

A. When removing the shaft, insert a small drift punch or plus driver through the hole in the shaft support and tap the driver head gently with a resin mallet.

B. To install the shaft, align the notches in the shaft and the shaft support. Lightly tap the rear of the shaft with a resin mallet until the shaft seats in the shaft support.

10. REMOVAL AND REPLACEMENT OF BUSHING

A. When removing the bushing from the inner magnet, place a small wooden dowel on the impeller side of the bushing and lightly tap out using a resin hammer.

B. To install the bushing, align the bushing notches and the inner magnet side notches. Tap into position using a resin mallet.

11. REMOVAL AND INSTALLATION OF FRONT/REAR THRUST RING(S) AND MOUTH RING.

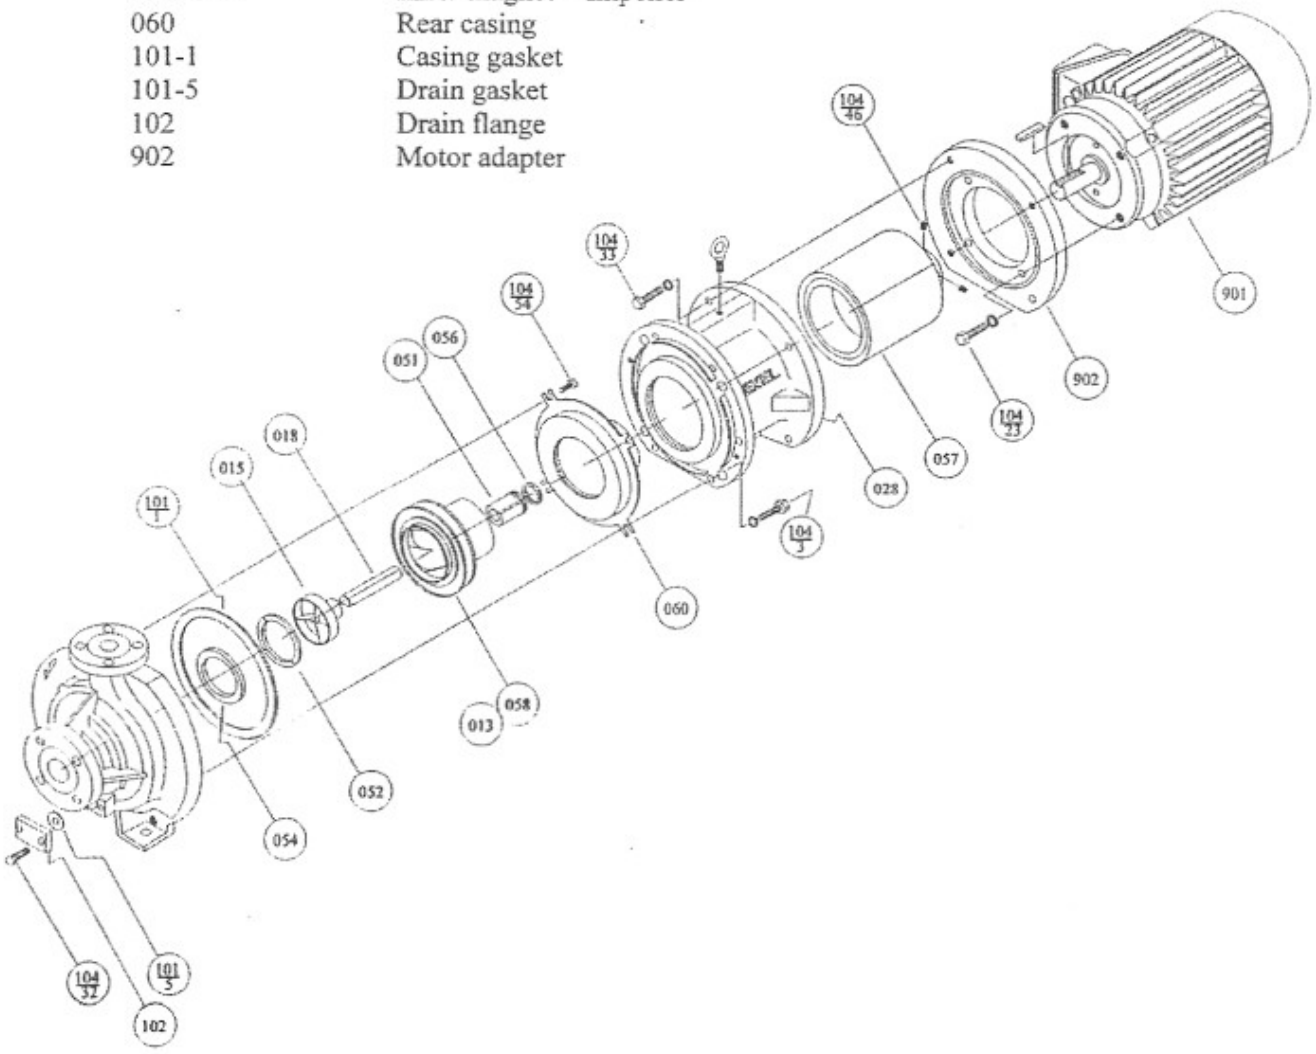
The front/rear thrust rings (054/056) and mouth ring (052) is held in place by holding tabs in two or three places.

Copyright 2000 Magnatex Pumps. Inc.

A. When replacing the thrust rings and mouth ring, melt and deform these tabs using a hot air gun welder.

B. To install the thrust rings and mouth ring, align the notches, re-melt the holding tabs using a hot air gun welder. Use a small wooden dowel (0.16) to flatten any excess tab material.

12. INSTALLATION OF THE SHAFT SUPPORT



The shaft support is pressed in and welded to the Casing. When replacing the Shaft support, remove the welded portion and detach the support from the Casing. When installing the Shaft support, use PFA welding rod and hot air gun welder.

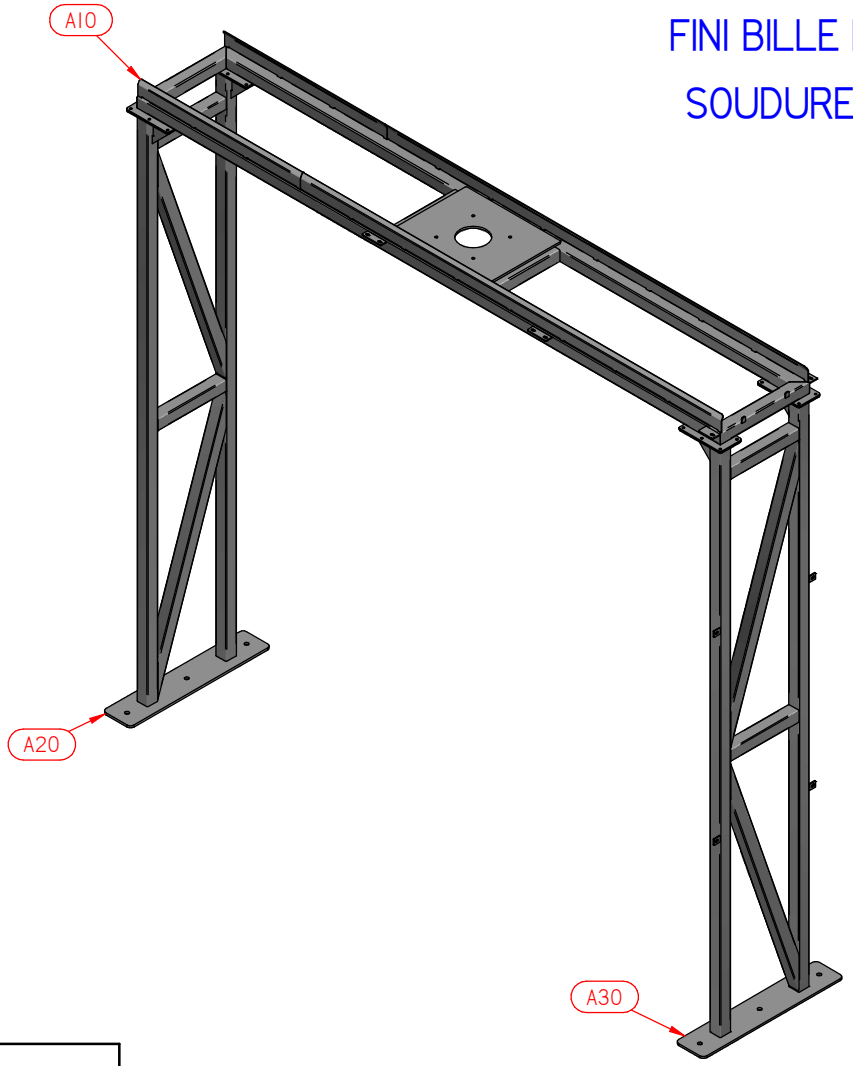
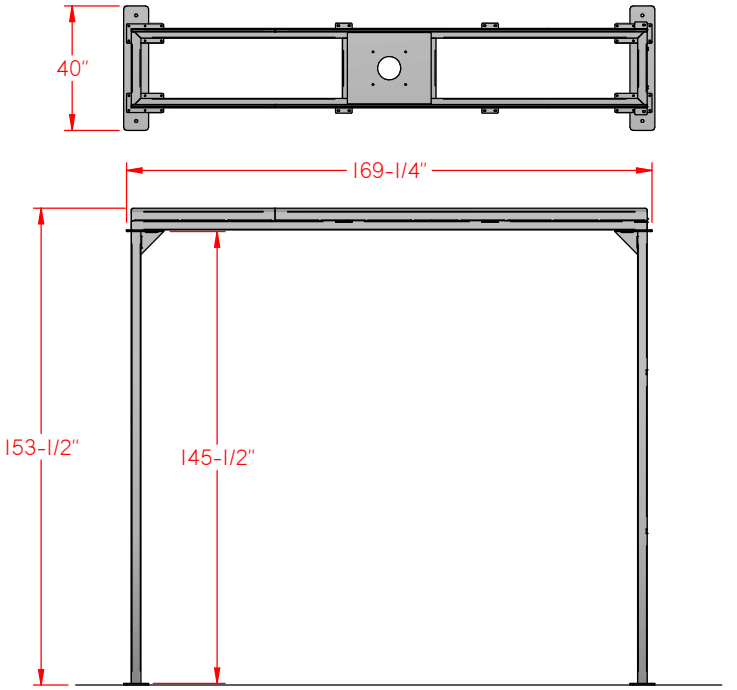
Troubleshooting Chart

Pumping capacity
Pressure deficiency
Check rotation direction
Correct rotation
Reverse rotation
Check shut off pressure with discharge valve fully closed
Replace two of the three phases
Shut off pressure normal
Shut off pressure deficient
Fully open discharge valve
Air release insufficient
Wear inside the pump
Compare pump specifications with gauge reading when pump is in operation
Running head is higher than specified
Running head is lower than specified
Head of the equipment is too high
Observe readouts on the suction gauge
More than 6m(20ft)
Within 6m(20ft)
High resistance in the suction piping
Suction liquid level decreases
Foreign matter clogs In the suction piping or foot valve
Suction head is too high
High saturated steam pressure
Foreign matter clogs in impeller or casing



Over current
Check rotation direction
Correct rotation
Reverse direction
Measure current with discharge valve fully closed
Replace two of the three phases
Normal
Abnormal
Excess flow rate
Heavy resistance is felt when rotated manually
High specific gravity of pumped liquid
Damaged bearing
Clogging from foreign matter in pump
Adjust flow rate
Motor rotor is constrained : repair motor
Disassemble and replace defective parts
Disassemble and remove foreign matter



Vibration & Noise
Check rotation direction
Correct rotation
Reverse rotation
Confirm where vibration and noise come from
Replace two of the three phases
Inside pump
Check vacuum on suction side
More than 6m(20ft)
Within 6m(20ft)
Inside foundation piping
Loosening of outer magnet set screw
Damaged bearing
Wear of bearing
Clogging of foreign matter in pump or misalignment of parts
Cavitation
Resonance of piping or foundation
Water hammer

NOTES:

1. TANK IS MANUFACTURED FROM HDPE. (1.9 SG)
2. TANK IS MANUFACTURED TO ASTM-D-1998 STANDARD.
3. ALL TANK DIMENSIONS ARE SUBJECT TO A +/-3% TOLERENCE.
4. FLEXIBLE COUPLINGS ARE REQUIRED FOR ALL EXTERNAL PIPING.
5. ALL FITTING GASKETS ARE EPDM.
6. ACO RECOMMENDS ALL FLANGE GASKETS TO BE MIN. 1/4" THICK.
7. ON LARGER SIZED TANKS SOME MECHANICAL FITTINGS MAY NEED TO BE REMOVED IN ORDER TO AVOID WIDE OR OVERSIZED LOADS.
8. HDPE ALIGNMENT WEDGES ARE REQUIRED ON SOME TOP FITTINGS TO KEEP THEM PERPENDICULAR TO THE GROUND.
9. TANK MUST BE PROPERLY VENTED TO PREVENT PRESSURE OR VACUUM FROM DEVELOPING AS THE TANK IS FILLING OR EMPTYING.

Re: Purchase Order No.: C12-205018
ACO No.: 78337
Project No.: NA

This document is to certify that the rotationally molded polyethylene containers i.e., one CT-7340- PE 1.9sg Closed Tank (142"D x 146"T, 33200L) & one CT-8740 PE 1.9sg Closed Tank (142"D x 169"T, 39600L) with Serial numbers 2108289356 & 2108289346 respectively; manufactured for the above referenced purchase order as well as all required parts were manufactured and tested (including the Hydrostatic /Leak Test) in accordance to your purchase order, ACO Container Systems' ISO 9001:2015 quality standards and ACO Container Systems' packing slip.

We trust this will meet your satisfaction and appreciate the opportunity to be of service to you and your valued client.

Thank you for your business,

Tasneem Alam

DECLARATION OF COMPLIANCE

Date:	10/13/2021
Customer:	VISSERS SALES CORP.
Customer Order No.:	00017759
Description:	MTA-A10-P-F10-2-FE w/ 7.5HP-2P MOTOR
Service:	10% SODIUM HYPOCHLORITE
Tag Nos.:	N/A
Serial Numbers:	3522675-1A/B
Magnatex Order No.:	3522675

I have reviewed the order documents and hereby certify that the products supplied are in compliance with the requirements of the order in accordance with EN 10204:2004, Type 2.1. Product contact materials are:

- Pump Casing, Rear Casing, Impeller, Inner Magnet lining, and Shaft Support are virgin PFA
- Casing Gasket is PTFE
- Bushing and Mouth Ring are C-PTFE
- Shaft and Thrust Rings are SiC

PMI À RAJOUTER?

N°	Liste des points à vérifier:	Vérifié:	Date:	Commentaire
1	Vérifier les cotes hors tout.	PGD	13-07-21	
2	Vérifier les notes et commentaires de fabrication et d'installation cités dans les dessins (PMI).	PGD	13-07-21	
3	Vérifier la régularité et la qualité des joints de soudure, exemption de toute pollution, tenue mécanique suffisante.Valider l'état de surface requis: Sand blast, traitement à l'acide, polissage, peinture ou tout autre traitement spécial selon demande.	PGD	13-07-21	
4	Tester le fonctionnement des mécanismes: Système d'entrainement , porte, barrure, courroie, chaine, hydraulique, pneumatique, etc.	PGD	13-07-21	
5	Lubrifier au besoin chaines, roue dentée, pignon... (choisir le type du lubrifiant selon l'application: alimentaire, pharmaceutique, industriel, etc.). Vérifier à ce que la maille "patente" des chaînes soient du bon côté			
6	Vérifier s'il n'y a pas de fuite d'air ou d'huile dans les systèmes d'alimentation. Vérifier à ce que tout les conduits pneumatiques et hydrauliques soient fixés et placés de façon à éviter l'usure/coupure par la vibration de l'équipement. Vérifier que chaque fils soient à l'abri d'un happement causé par un mouvement de partie d'équipement.			
7	Vérifier l'alignement des axes, chaines, courroies, rail, etc.	PGD	13-07-21	

CONTRÔLE QUALITÉ

N°	Liste des points à vérifier:	Vérifié:	Date:	Commentaire
8	Vérifier le serrage des boulons et de toute fixation boulonnée. Vérifier à ce que le bout fileté des boulons ne dépassent pas trop de l'écrou. Vérifier si les "lock washers" sont présents là où nécessaire.	PGD	13-07-21	-remontage chez le client
9	Vérifier l'étanchéité des équipements: bassin, réservoir, couvercle et tout système qui devra satisfaire cette qualité.			
10	Vérifier la sécurité machine : Garde pour chaine, système d'entrainement, garde corps sur passerelle, plate forme et escalier. **Utiliser le sécurimètre pour vérifier les distances dangereuses.**	PGD	13-07-21	rail et garde corps
11	Vérifier l'ampérage du moteur au fonctionnement.			
12	Vérifier à ce que chaque boutons soient bien identifiés sur le panneau de contrôle. Vérifier à ce que chaque fils soient bien fixés dans le panneau de contrôle.			
13	Vérifier que chaque capteurs soient bien fixés en place et que chaque fils soient bien fixés et placés de façon à éviter l'usure/coupure par la vibration de l'équipement. Vérifier que chaque fils soient à l'abri d'un happement causé par un mouvement de partie d'équipement.			
14	Vérifier à ce que l'équipement fonctionne de la façon dont il a été conçu. Tester les séquences normales d'opération à pleine vitesse et à pleine charge. **Si requis, faire test selon une durée déterminée par le chargé de projet.**	PGD	13-07-21	
15	Apposer la plaque signalétique sur l'équipement.	PGD	13-07-21	
16	Vérification du projet par le CDP			JF
17	Prise de photos et vidéos	PGD	13-07-21

Nitrogen, Ammonia

DOC316.53.01079

Salicylate Method **Method 10031**

0.4 to 50.0 mg/L NH_3–N (HR) **Test 'N Tube™ Vials**

Scope and application: For water, wastewater and seawater.

Test preparation

Instrument-specific information

Table 1 shows all of the instruments that have the program for this test. The table also shows adapter and light shield requirements for the instruments that use them.

To use the table, select an instrument, then read across to find the applicable information for this test.

Table 1 Instrument-specific information for test tubes

Instrument	Adapters	Light shield
DR 6000, DR 5000	—	—
DR 3900	—	LZV849
DR 3800, DR 2800, DR 2700	—	LZV646
DR 1900	9609900 (D[1])	—
DR 900	4846400	Cover supplied with the instrument

Before starting

Install the instrument cap on the DR 900 cell holder before ZERO or READ is pushed.
DR 3900, DR 3800, DR 2800 and DR 2700: Install the light shield in Cell Compartment #2 before this test is started.
Small sample sizes (such as 0.1 mL) may not be representative of the entire sample. Mix the sample well before the test or use a different portion of the sample to repeat the test.
The reagents that are used in this test contain sodium nitroferricyanide. **Keep cyanide solutions at pH > 11 to prevent exposure to hydrogen cyanide gas.** Collect the reacted samples for safe disposal.
Keep the samples sealed at all times to prevent ammonia contamination from the air.
To prevent airborne cross-contamination of the blank, complete the preparation of the blank before samples and standards are opened. If the sample or standard containers are open, move to a separate area of the lab to prepare the blank.
Review the Safety Data Sheets (MSDS/SDS) for the chemicals that are used. Use the recommended personal protective equipment.
Dispose of reacted solutions according to local, state and federal regulations. Refer to the Safety Data Sheets for disposal information for unused reagents. Refer to the environmental, health and safety staff for your facility and/or local regulatory agencies for further disposal information.

Items to collect

Description	Quantity
Light shield (For information about sample cells, adapters or light shields, refer to Instrument-specific information on page 1.)	1
High Range Test 'N Tube™ AmVer® 3 Nitrogen Ammonia Reagent Set	2

[1] The D adapter is not available with all instrument versions.

Items to collect (continued)

Description	Quantity
Funnel, micro (for reagent addition)	1
Pipet, TenSette® 0.1 to 1.0 mL, with tips	varies

Refer to Consumables and replacement items on page 5 for order information.

Sample collection and storage

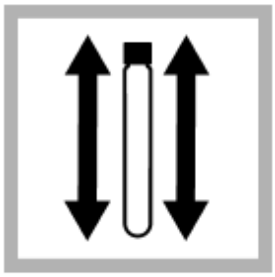
- Collect samples in clean glass or plastic bottles.
- Analyze the samples as soon as possible for best results.
- If chlorine is known to be present, add one drop of 0.1 N Sodium Thiosulfate to 1 L of sample for each 0.3 mg/L Cl_2.
- To preserve samples for later analysis, adjust the sample pH to less than 2 with concentrated hydrochloric acid (about 2 mL per liter). No acid addition is necessary if the sample is tested immediately.
- Keep the preserved samples at or below 6 °C (43 °F) for a maximum of 28 days.
- Let the sample temperature increase to room temperature before analysis.
- Before analysis, adjust the pH to 7 with 5.0 N sodium hydroxide standard solution.
- Correct the test result for the dilution caused by the volume additions.

Test 'N Tube procedure

1. Start program **343 N, Ammonia HR TNT**. For information about sample cells, adapters or light shields, refer to Instrument-specific information on page 1.

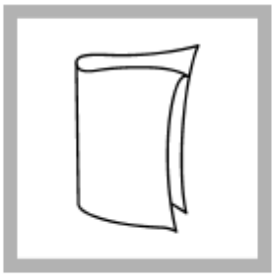
***Note:** Although the program name can be different between instrumentss, the program number does not change.*

2. Prepare the blank: Add 0.1 mL of **ammonia-free water** to one AmVer™ Diluent Reagent Test 'N Tube for High Range Ammonia Nitrogen.



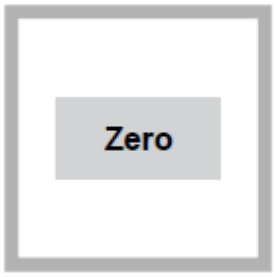
3. Prepare the sample: Add 0.1 mL of **sample** to one AmVer™ Diluent Reagent Test 'N Tube for High Range Ammonia Nitrogen.

4. Add the contents of one Ammonia Salicylate Reagent Powder Pillow for 5-mL samples to each vial.

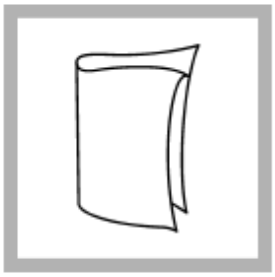


5. Add the contents of one Ammonia Cyanurate Reagent Powder Pillow to each vial.

6. Put the caps on both vials. Shake thoroughly to dissolve the powder.

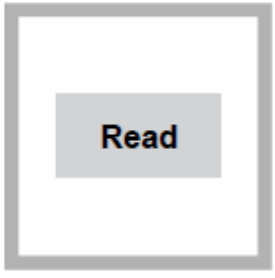


7. Start the instrument timer. A 20-minute reaction time starts.



8. Clean the blank vial.

9. Insert the blank vial into the 16-mm cell holder.



10. Push **ZERO**. The display shows 0.0 mg/L NH_3–N.

11. Clean the sample vial.

12. Insert the sample vial into the 16-mm cell holder.

13. Push **READ**. Results show in mg/L NH_3–N.

Interferences

Interfering substance	Interference level
Calcium	50,000 mg/L as $CaCO_3$
Iron	All levels. Correct for iron interference as follows: 1. Use one of the Iron, Total procedures to measure the iron concentration of the sample. 2. Use an iron standard solution to add iron to the deionized water blank so that the blank has the same iron concentration as the sample. The iron interference will be zeroed out from the test result.
Magnesium	300,000 mg/L as $CaCO_3$
Monochloramine	Monochloramine that is in chloraminated drinking water interferes directly at all levels and gives high results. Use a Free Ammonia and Monochloramine method to determine free ammonia in these sample matrices.

Interfering substance	Interference level
Nitrate	5000 mg/L as NO_3^-–N
Nitrite	600 mg/L as NO_2^-–N
pH	Adjust acidic or basic samples to approximately pH 7. Use 1 N sodium hydroxide standard solution for acidic samples and 1 N hydrochloric acid standard solution for basic samples.
Phosphate	5000 mg/L as PO_4^{3-}–P
Sulfate	6000 mg/L as SO_4^{2-}
Sulfide	Sulfide will intensify the color. Remove sulfide interference as follows: 1. Measure approximately 350 mL of sample in a 500-mL Erlenmeyer flask. 2. Add the contents of one Sulfide Inhibitor Reagent Powder Pillow. Swirl to mix. 3. Filter the sample through a folded filter paper and filter funnel. 4. Use the filtered sample in the test procedure.
Other substances	Less common interferences such as hydrazine and glycine cause intensified colors in the prepared sample. Turbidity and color will give incorrect high values. Samples with severe interferences require distillation. Use the distillation procedure that is supplied with the distillation set.

Accuracy check

Standard additions method (sample spike)

Use the standard additions method (for applicable instruments) to validate the test procedure, reagents and instrument and to find if there is an interference in the sample.

Items to collect:

- Nitrogen, Ammonia Ampule Standard, 150-mg/L NH_3–N
- Ampule breaker
- Pipet, TenSette®, 0.1–1.0 mL and tips
- 25-mL mixing cylinders (3)

1. Use the test procedure to measure the concentration of the sample, then keep the (unspiked) sample in the instrument.
2. Go to the Standard Additions option in the instrument menu.
3. Select the values for standard concentration, sample volume and spike volumes.
4. Open the standard solution.
5. Prepare three spiked samples: use the TenSette pipet to add 0.2 mL, 0.4 mL and 0.6 mL of the standard solution, respectively, to three 25-mL portions of fresh sample. Mix well.
6. Use the test procedure to measure the concentration of each of the spiked samples. Start with the smallest sample spike. Measure each of the spiked samples in the instrument.
7. Select **Graph** to compare the expected results to the actual results.

   Note: *If the actual results are significantly different from the expected results, make sure that the sample volumes and sample spikes are measured accurately. The sample volumes and sample spikes that are used should agree with the selections in the standard additions menu. If the results are not within acceptable limits, the sample may contain an interference.*

Standard solution method

Use the standard solution method to validate the test procedure, the reagents and the instrument.

Items to collect:

- 100-mg/L Ammonia Nitrogen standard
- 50-mL volumetric flask, Class A
- 20-mL volumetric pipet, Class A and pipet filler safety bulb

- Deionized water

1. Prepare a 40.0 mg/L ammonia nitrogen standard solution as follows:
   a. Use a pipet to add 20.0 mL of 100 mg/L ammonia nitrogen standard solution into the volumetric flask.
   b. Dilute to the mark with deionized water. Mix well. Prepare this solution daily.
2. Use the test procedure to measure the concentration of the prepared standard solution.
3. Compare the expected result to the actual result.

   Note: *The factory calibration can be adjusted slightly with the standard adjust option so that the instrument shows the expected value of the standard solution. The adjusted calibration is then used for all test results. This adjustment can increase the test accuracy when there are small variations in the reagents or instruments.*

Method performance

The method performance data that follows was derived from laboratory tests that were measured on a spectrophotometer during ideal test conditions. Users can get different results under different test conditions.

Program	Standard	Precision (95% confidence interval)	Sensitivity Concentration change per 0.010 Abs change
343	40.00 mg/L NH_3–N	38.1–41.9 mg/L NH_3–N	0.312 mg/L NH_3–N

Summary of method

Ammonia compounds combine with chlorine to form monochloramine. Monochloramine reacts with salicylate to form 5-aminosalicylate. The 5-aminosalicylate is oxidized in the presence of a sodium nitroprusside catalyst to form a blue colored compound. The blue color is masked by the yellow color from the excess reagent present to give a green-colored solution. The measurement wavelength is 655 nm for spectrophotometers or 610 nm for colorimeters.

Pollution prevention and waste management

The ammonia salicylate reagent contains sodium nitroferricyanide which, when digested, is converted to total cyanide and can have an effect on total cyanide limits in the effluent. Dispose of reacted solutions according to local, state and federal regulations.

Consumables and replacement items

Required reagents

Description	Quantity/test	Unit	Item no.
Nitrogen Ammonia, Reagent Set, High Range Test 'N Tube™ AmVer™	2	25 tests	2606945

Required apparatus

Chlorine, Free

DOC316.53.01303

USEPA DPD Method[2] **Method 10245[1]**

0.05 to 4.00 mg/L Cl_2 (MR) **Powder Pillows**

Scope and application: For free chlorine (hypochlorous acid and hypochlorite ion) measurements in water, treated waters, estuary and seawater. This product has not been evaluated to test for chlorine and chloramines in medical applications in the United States.

[1] USEPA accepted for reporting wastewater and drinking water analyses.
[2] Procedure is equivalent to USEPA method 330.5 for wastewater and Standard Method 4500-Cl G for drinking water.

Test preparation

Instrument-specific information

Table 1 shows all of the instruments that have the program for this test. The table also shows sample cell and adapter requirements for this test.

To use the table, select an instrument, then read across to find the applicable information for this test.

Table 1 Instrument-specific information

Instrument	Adapter	Sample cell
DR6000	—	2427606 
DR5000	A23618	
DR3900	LZV846 (A)	
DR3800 DR2800 DR2700	LZV584 (C)	
DR1900	9609900 or 9609800 (C)	
DR900	—	2401906 

Before starting

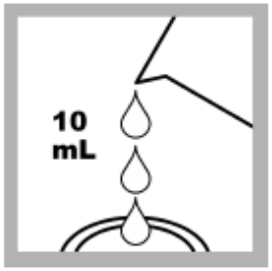
Analyze the samples immediately. The samples cannot be preserved for later analysis.
Install the instrument cap on the DR900 cell holder before ZERO or READ is pushed.
Do not use the same sample cells for free and total chlorine. If trace iodide from the total chlorine reagent is carried over into the free chlorine determination, monochloramine will interfere. It is best to use separate, dedicated sample cells for free and total chlorine measurements.
If the test result is over-range, or if the sample temporarily turns yellow after the reagent addition, dilute the sample with a known volume of high quality, chlorine demand-free water and do the test again. Some loss of chlorine may occur due to the dilution. Multiply the result by the dilution factor. Additional methods are available to measure chlorine without dilution.
For the best results, measure the reagent blank value for each new lot of reagent. Replace the sample with deionized water in the test procedure to determine the reagent blank value. Subtract the reagent blank value from the sample results automatically with the reagent blank adjust option.
Cold waters can cause condensation on the sample cells during color development. Examine the sample cells for condensation before measurements.

Review the Safety Data Sheets (MSDS/SDS) for the chemicals that are used. Use the recommended personal protective equipment.
Dispose of reacted solutions according to local, state and federal regulations. Refer to the Safety Data Sheets for disposal information for unused reagents. Refer to the environmental, health and safety staff for your facility and/or local regulatory agencies for further disposal information.

Items to collect

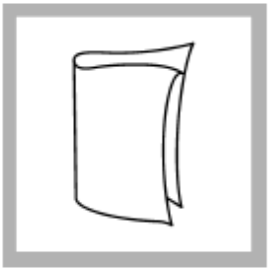
Description	Quantity
DPD Free Chlorine Reagent Powder Pillows, 25-mL	1
Sample cells (For information about sample cells, adapters or light shields, refer to Instrument-specific information on page 1.)	2

Refer to Consumables and replacement items on page 5 for order information.



Sample collection

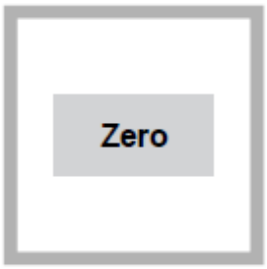
- Analyze the samples immediately. The samples cannot be preserved for later analysis.
- Chlorine is a strong oxidizing agent and is unstable in natural waters. Chlorine reacts quickly with various inorganic compounds and more slowly with organic compounds. Many factors, including reactant concentrations, sunlight, pH, temperature and salinity influence the decomposition of chlorine in water.
- Collect samples in clean glass bottles. Do not use plastic containers because these can have a large chlorine demand.
- Pretreat glass sample containers to remove chlorine demand. Soak the containers in a weak bleach solution (1 mL commercial bleach to 1 liter of deionized water) for at least 1 hour. Rinse fully with deionized or distilled water. If sample containers are rinsed fully with deionized or distilled water after use, only occasional pretreatment is necessary.
- Make sure to get a representative sample. If the sample is taken from a spigot or faucet, let the water flow for at least 5 minutes. Let the container overflow with the sample several times and then put the cap on the sample container so that there is no headspace (air) above the sample.



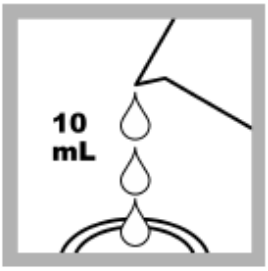
Powder pillow procedure

1. Start program **87 Chlorine, F&T PP MR**. For information about sample cells, adapters or light shields, refer to Instrument-specific information on page 1.

2. **Prepare the blank**: Fill the sample cell with 10 mL of sample.

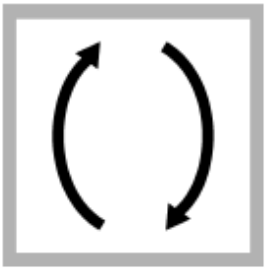


3. Clean the blank sample cell.

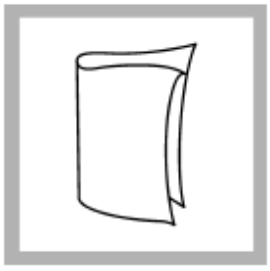


4. Insert the blank into the cell holder.

2022-01-06 This document is valid 24 hours after printing



5. Push **ZERO**. The display shows 0.00 mg/L Cl_2.



6. **Prepare the sample:** Fill a second sample cell with 10 mL of sample.

7. Add the contents of one DPD Free Chlorine Powder Pillow for 25-mL sample to the prepared sample cell.

8. Put the stopper on the prepared sample cell. Invert the sample cell several times to mix. A pink color shows if chlorine is present. Go to the next step immediately.

9. Clean the prepared sample cell.

10. Within one minute of the reagent addition, insert the prepared sample into the cell holder.

11. Push **READ**. Results show in mg/L Cl_2.

Interferences

Interfering substance	Interference level
Acidity	More than 150 mg/L $CaCO_3$. The full color may not develop or the color may fade instantly. Adjust to pH 6–7 with 1 N Sodium Hydroxide. Measure the amount to add on a separate sample aliquot, then add the same amount to the sample that is tested. Correct the test result for the dilution from the volume addition.
Alkalinity	More than 250 mg/L $CaCO_3$. The full color may not develop or the color may fade instantly. Adjust to pH 6–7 with 1 N Sulfuric Acid. Measure the amount to add on a separate sample aliquot, then add the same amount to the sample that is tested. Correct the test result for the dilution from the volume addition.
Bromine, Br_2	Positive interference at all levels
Chlorine Dioxide, ClO_2	Positive interference at all levels
Inorganic chloramines	Positive interference at all levels
Chloramines, organic	May interfere in the result for total chlorine analysis
Hardness	No effect at less than 1000 mg/L as $CaCO_3$

2022-01-06 This document is valid 24 hours after printing

Interfering substance	Interference level
Manganese, Oxidized (Mn^{4+}, Mn^{7+}) or Chromium, Oxidized (Cr^{6+})	Pre-treat the sample as follows: 1. Adjust the sample pH to 6–7. 2. Add 3 drops of Potassium Iodide (30-g/L) to 10 mL of sample. 3. Mix and wait 1 minute. 4. Add 3 drops of Sodium Arsenite (5-g/L) and mix. 5. Use the test procedure to measure the concentration of the treated sample. 6. Subtract this result from the result without the treatment to obtain the correct chlorine concentration.
Ozone	Positive interference at all levels
Peroxides	May interfere
Highly buffered samples or extreme sample pH	Can prevent the correct pH adjustment (of the sample) by the reagents. Sample pretreatment may be necessary. Adjust to pH 6–7 with acid (Sulfuric Acid, 1.000 N) or base (Sodium Hydroxide, 1.00 N).

Monochloramine interference

For conventional free chlorine disinfection (beyond the breakpoint), typical monochloramine concentrations are very low. If monochloramine is present in the sample, its interference in the free chlorine test depends on the sample temperature, relative amount of monochloramine to free chlorine and the time required to do the analysis. Typical interference levels of monochloramine as mg/L Cl_2 in the free chlorine test are shown in Table 2 (1 minute test time). Measure the monochloramine levels with method 10200 for Chloramine (Mono) and Free Ammonia.

Table 2 Monochloramine interference at different sample temperatures

NH_2Cl (as Cl_2)	5 °C (41 °F)	10 °C (50 °F)	20 °C (68 °F)	30 °C (83 °F)
1.2 mg/L	0.15	0.19	0.30	0.29
2.2 mg/L	0.35	0.38	0.55	0.61
3.2 mg/L	0.38	0.56	0.69	0.73

Accuracy check

Standard additions method (sample spike)

Use the standard additions method (for applicable instruments) to validate the test procedure, reagents and instrument and to find if there is an interference in the sample.

Items to collect:

- Chlorine Standard Solution, 2-mL PourRite® Ampule, 25–30 (or 50–75) mg/L
- Ampule breaker
- Pipet, TenSette®, 0.1–1.0 mL and tips

1. Use the test procedure to measure the concentration of the sample, then keep the (unspiked) sample in the instrument.
2. Go to the Standard Additions option in the instrument menu.
3. Select the values for standard concentration, sample volume and spike volumes.
4. Open the standard solution.
5. Prepare three spiked samples: use the TenSette pipet to add 0.1 mL, 0.2 mL and 0.3 mL of the standard solution, respectively, to three 10-mL portions of fresh sample. Mix well.
6. Use the test procedure to measure the concentration of each of the spiked samples. Start with the smallest sample spike. Measure each of the spiked samples in the instrument.

2022-01-06 This document is valid 24 hours after printing

7. Select **Graph** to compare the expected results to the actual results.

Note: *If the actual results are significantly different from the expected results, make sure that the sample volumes and sample spikes are measured accurately. The sample volumes and sample spikes that are used should agree with the selections in the standard additions menu. If the results are not within acceptable limits, the sample may contain an interference.*

Verification of on-line analyzers

This procedure can be used to meet the requirements of USEPA Method 334.0 - Determination of Residual Chlorine in Drinking Water Using an On-line Chlorine Analyzer. The procedure and requirements for compliance with EPA Method 334.0 can be downloaded directly from http://www.hach.com/method334.

Method performance

The method performance data that follows was derived from laboratory tests that were measured on a spectrophotometer during ideal test conditions. Users can get different results under different test conditions.

Program	Standard	Precision (95% confidence interval)	Sensitivity Concentration change per 0.010 Abs change
87	2.68 mg/L Cl_2	2.63–2.73 mg/L Cl_2	0.03 mg/L Cl_2

Summary of method

Chlorine in the sample as hypochlorous acid or hypochlorite ion (free chlorine or free available chlorine) immediately reacts with DPD (N,N-diethyl-p-phenylenediamine) indicator to form a pink color, the intensity of which is proportional to the chlorine concentration. The measurement wavelength is 530 nm for spectrophotometers or 520 nm for colorimeters.

USEPA[1] DPD Method[2] **Method 10250**

0.05 to 4.00 mg/L Cl_2 (MR) **Powder Pillows**

Scope and application: For testing residual chlorine and chloramines in water, wastewater, estuary water and seawater; USEPA-accepted for reporting drinking and wastewater analyses. This product has not been evaluated to test for chlorine and chloramines in medical applications in the United States.

[1] Procedure is equivalent to USEPA and Standard Method 4500-Cl G for drinking water and wastewater analyses.
[2] Adapted from Standard Methods for the Examination of Water and Wastewater.

Test preparation

Instrument-specific information

Table 1 shows all of the instruments that have the program for this test. The table also shows sample cell and adapter requirements for this test.

To use the table, select an instrument, then read across to find the applicable information for this test.

Table 1 Instrument-specific information

Instrument	Adapter	Sample cell
DR 6000	—	2427606 
DR 5000	A23618	
DR 3900	LZV846 (A)	
DR 3800 DR 2800 DR 2700	LZV584 (C)	
DR 1900	9609900 or 9609800 (C)	
DR 900	—	2401906 

Before starting

Samples must be analyzed immediately after collection and cannot be preserved for later analysis.
Install the instrument cap on the DR 900 cell holder before ZERO or READ is pushed.
If the test result is over-range, or if the sample temporarily turns yellow after the reagent addition, dilute the sample with a known volume of high quality, chlorine demand-free water and do the test again. Some loss of chlorine may occur due to the dilution. Multiply the result by the dilution factor. Additional methods are available to measure chlorine without dilution.
For the best results, measure the reagent blank value for each new lot of reagent. Replace the sample with deionized water in the test procedure to determine the reagent blank value. Subtract the reagent blank value from the sample results automatically with the reagent blank adjust option.
A powder pillow for 25-mL samples is intentionally added to 10 mL of sample in this test to get the correct working range.
Review the Safety Data Sheets (MSDS/SDS) for the chemicals that are used. Use the recommended personal protective equipment.

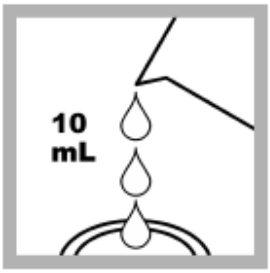
Dispose of reacted solutions according to local, state and federal regulations. Refer to the Safety Data Sheets for disposal information for unused reagents. Refer to the environmental, health and safety staff for your facility and/or local regulatory agencies for further disposal information.
For chloramination disinfection control, use one of the available Chloramine (Mono) methods.
Cold waters can cause condensation on the sample cells during color development. Examine the sample cells for condensation before measurements.
Do not use the same sample cells for free and total chlorine. If trace iodide from the total chlorine reagent is carried over into the free chlorine determination, monochloramine will interfere. It is best to use separate, dedicated sample cells for free and total chlorine measurements.

Items to collect

Description	Quantity
DPD Total Chlorine Reagent powder pillow, 25-mL	1
Sample cells (For information about sample cells, adapters or light shields, refer to Instrument-specific information on page 1.)	2

Refer to Consumables and replacement items on page 5 for order information.

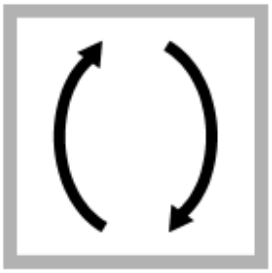
Sample collection



- Analyze the samples immediately. The samples cannot be preserved for later analysis.
- Chlorine is a strong oxidizing agent and is unstable in natural waters. Chlorine reacts quickly with various inorganic compounds and more slowly with organic compounds. Many factors, including reactant concentrations, sunlight, pH, temperature and salinity influence the decomposition of chlorine in water.
- Collect samples in clean glass bottles. Do not use plastic containers because these can have a large chlorine demand.
- Pretreat glass sample containers to remove chlorine demand. Soak the containers in a weak bleach solution (1 mL commercial bleach to 1 liter of deionized water) for at least 1 hour. Rinse fully with deionized or distilled water. If sample containers are rinsed fully with deionized or distilled water after use, only occasional pretreatment is necessary.
- Make sure to get a representative sample. If the sample is taken from a spigot or faucet, let the water flow for at least 5 minutes. Let the container overflow with the sample several times and then put the cap on the sample container so that there is no headspace (air) above the sample.

Powder pillow procedure

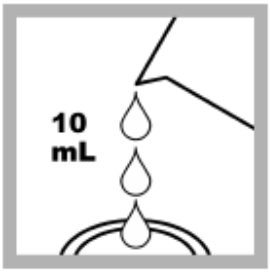
1. Start program **87 Chlorine,F&T PP MR**. For information about sample cells, adapters or light shields, refer to Instrument-specific information on page 1.



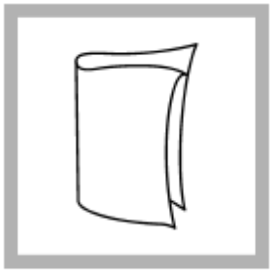
Note: *Although the program name can be different between instruments, the program number does not change.*

2. Prepare the sample: Fill a sample cell with 10 mL of sample.

3. Add the contents of one DPD Total Chlorine Reagent Powder Pillow (for 25-mL samples).

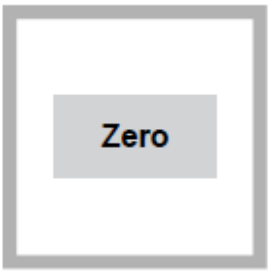


4. Put the stopper on the sample cell. Invert the sample cell for 20 seconds. It is not necessary for all of the reagent to dissolve.

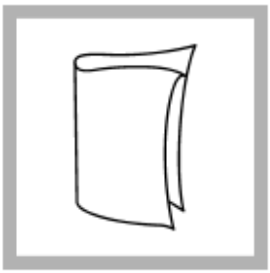


5. Start the instrument timer. A 3-minute reaction time starts.

Do the next four steps during the timer period.



6. Prepare the blank: Fill a second sample cell with 10 mL of sample.



7. Clean the blank sample cell.

8. Insert the blank into the cell holder.

9. Push **ZERO**. The display shows 0.00 mg/L Cl_2.

10. Clean the prepared sample cell.

11. Within 3 minutes after the timer expires, insert the prepared sample into the cell holder.

12. Push **READ**. Results show in mg/L Cl_2.

Interferences

Interfering substance	Interference level
Acidity	More than 150 mg/L $CaCO_3$. The full color may not develop or the color may fade instantly. Adjust to pH 6–7 with 1 N Sodium Hydroxide. Measure the amount to add on a separate sample aliquot, then add the same amount to the sample that is tested. Correct the test result for the dilution from the volume addition.
Alkalinity	More than 250 mg/L $CaCO_3$. The full color may not develop or the color may fade instantly. Adjust to pH 6–7 with 1 N Sulfuric Acid. Measure the amount to add on a separate sample aliquot, then add the same amount to the sample that is tested. Correct the test result for the dilution from the volume addition.
Bromine, Br_2	Positive interference at all levels
Chlorine Dioxide, ClO_2	Positive interference at all levels
Inorganic chloramines	Positive interference at all levels
Chloramines, organic	May interfere
Hardness	No effect at less than 1000 mg/L as $CaCO_3$
Manganese, Oxidized (Mn^{4+}, Mn^{7+}) or Chromium, Oxidized (Cr^{6+})	Pre-treat the sample as follows: 1. Adjust the sample pH to 6–7. 2. Add 3 drops of Potassium Iodide (30-g/L) to 10 mL of sample. 3. Mix and wait 1 minute. 4. Add 3 drops of Sodium Arsenite (5-g/L) and mix. 5. Use the test procedure to measure the concentration of the treated sample. 6. Subtract this result from the result without the treatment to obtain the correct chlorine concentration.
Ozone	Positive interference at all levels
Peroxides	May interfere
Highly buffered samples or extreme sample pH	Can prevent the correct pH adjustment of the sample by the reagents. Sample pre-treatment may be necessary. Adjust to pH 6–7 with acid (Sulfuric Acid, 1.000 N) or base (Sodium Hydroxide, 1.00 N).

Accuracy check

Standard additions method (sample spike)

Use the standard additions method (for applicable instruments) to validate the test procedure, reagents and instrument and to find if there is an interference in the sample.

Items to collect:

- Chlorine Standard Solution, 2-mL PourRite® Ampule, 25–30 mg/L or 50–75 mg/L (use mg/L on label)
- Ampule breaker
- Pipet, TenSette®, 0.1–1.0 mL and tips

1. Use the test procedure to measure the concentration of the sample, then keep the (unspiked) sample in the instrument.
2. Go to the Standard Additions option in the instrument menu.
3. Select the values for standard concentration, sample volume and spike volumes.
4. Open the standard solution.
5. Prepare three spiked samples: use the TenSette pipet to add 0.1 mL, 0.2 mL and 0.3 mL of the standard solution, respectively, to three 10-mL portions of fresh sample. Mix well.

2022-01-06 This document is valid 24 hours after printing

6. Use the test procedure to measure the concentration of each of the spiked samples. Start with the smallest sample spike. Measure each of the spiked samples in the instrument.
7. Select **Graph** to compare the expected results to the actual results.

Note: *If the actual results are significantly different from the expected results, make sure that the sample volumes and sample spikes are measured accurately. The sample volumes and sample spikes that are used should agree with the selections in the standard additions menu. If the results are not within acceptable limits, the sample may contain an interference.*

Verification of on-line analyzers

This procedure can be used to meet the requirements of USEPA Method 334.0 - Determination of Residual Chlorine in Drinking Water Using an On-line Chlorine Analyzer. The procedure and requirements for compliance with EPA Method 334.0 can be downloaded directly from http://www.hach.com/method334.

Method performance

The method performance data that follows was derived from laboratory tests that were measured on a spectrophotometer during ideal test conditions. Users can get different results under different test conditions.

Program	Standard	Precision (95% confidence interval)	Sensitivity Concentration change per 0.010 Abs change
87	2.10 mg/L Cl_2	2.07–2.13 mg/L Cl_2	0.02 mg/L Cl_2

Summary of method

Chlorine can be present in water as free chlorine and as combined chlorine. Both forms can exist in the same water and be determined together as total chlorine. Free chlorine is present as hypochlorous acid and/or hypochlorite ion. Combined chlorine exists as monochloramine, dichloramine, nitrogen trichloride and other chloro derivatives. The combined chlorine oxidizes iodide in the reagent to iodine. The iodine and free chlorine react with DPD (N,N-diethyl-p-phenylenediamine) to form a pink color which is proportional to the total chlorine concentration.

To find the concentration of combined chlorine, run a free chlorine test and a total chlorine test. Subtract the results of the free chlorine test from the total chlorine test to obtain the combined chlorine concentration. The measurement wavelength is 530 nm for spectrophotometers or 520 nm for colorimeters.

Consumables and replacement items

Required reagents

Description	Quantity/test	Unit	Item no.
DPD Total Chlorine Reagent Powder Pillow, 25-mL	1	100/pkg	1406499

Recommended standards and apparatus

Description	Unit	Item no.
Chlorine Standard Solution, 2-mL PourRite® Ampules, 25–30 mg/L	20/pkg	2630020
Chlorine Standard Solution, 2-mL PourRite® Ampules, 50–75 mg/L	20/pkg	1426820
Chlorine Standard Solution, 10-mL Voluette® Ampule, 50–75 mg/L	16/pkg	1426810
Ampule Breaker, 10-mL Voluette® Ampules	each	2196800
PourRite® Ampule Breaker, 2-mL	each	2484600

Optional reagents and apparatus

Description	Unit	Item no.
Beaker, 50-mL	each	50041H
Mixing cylinder, graduated, 25-mL	each	2088640
Water, deionized	4 L	27256
Potassium Iodide, 30-g/L	100 mL	34332
Sodium Arsenite, 5-g/L	100 mL	104732
Sodium Hydroxide Standard Solution, 1.0 N	100 mL MDB	104532
Sulfuric Acid Standard Solution, 1 N	100 mL MDB	127032
Pipet, TenSette®, 0.1–1.0 mL	each	1970001
Pipet tips for TenSette® Pipet, 0.1–1.0 mL	50/pkg	2185696
Pipet tips for TenSette® Pipet, 0.1–1.0 mL	1000/pkg	2185628
Paper, pH, 0–14 pH range	100/pkg	2601300
DPD Total Chlorine Reagent Powder Pillows, 25-mL	1000/pkg	1406428
SpecCheck™ Secondary Standard Kit, Chlorine DPD, MR	each	2980500
Water, organic-free	500 mL	2641549
